CHRYSLER/DODGE

SERVICE MANUAL

2002
SEBRING/STRATUS
SEDAN AND CONVERTIBLE

DaimlerChrysler Corporation reserves the right to make changes in design or to make additions to or improvements in its products without imposing any obligations upon itself to install them on its products previously manufactured.

FOREWORD

The information contained in this service manual has been prepared for the professional automotive technician involved in daily repair operations. Information describing the operation and use of standard and optional equipment is included in the Owner's Manual provided with the vehicle.

Information in this manual is divided into groups. These groups contain description, operation, diagnosis, testing, adjustments, removal, installation, disassembly, and assembly procedures for the systems and components. To assist in locating a group title page, use the Group Tab Locator by clicking to the following page. The first page of the group has a contents section that lists major topics within the group.

A Service Manual Comment form is included at the rear of this manual. Use the form to provide DaimlerChrysler Corporation with your comments and suggestions.

Tightening torques are provided as a specific value throughout this manual. This value represents the midpoint of the acceptable engineering torque range for a given fastener application. These torque values are intended for use in service assembly and installation procedures using the correct OEM fasteners. When replacing fasteners, always use the same type (part number) fastener as removed.

DaimlerChrysler Corporation reserves the right to change testing procedures, specifications, diagnosis, repair methods, or vehicle wiring at any time without prior notice or incurring obligation.

BODY CODE PLATE

DESCRIPTION

The Body Code Plate (Fig. 1) is located in the engine compartment on the driver side strut tower. There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate.

IF TWO BODY CODE PLATES ARE REQUIRED

The last code shown on either plate will be followed by END. When two plates are required, the last code space on the first plate will indicate (CTD)

When a second plate is required, the first four spaces of each line will not be used due to overlap of the plates.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts (Fig. 2) and (Fig. 3).

FASTENER USAGE

DESCRIPTION

WARNING: USE OF AN INCORRECT FASTENER MAY RESULT IN COMPONENT DAMAGE OR PERSONAL INJURY.

Figure art, specifications and torque references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

THREADED HOLE REPAIR

DESCRIPTION

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS

DESCRIPTION - INTERNATIONAL SYMBOLS

METRIC SYSTEM

DESCRIPTION

The metric system is based on quantities of one, ten, one hundred, one thousand and one million.

The following chart will assist in converting metric units to equivalent English and SAE units, or vise versa.

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) is located on the upper left corner of the instrument panel, near the left windshield pillar (Fig. 6). The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to VIN Code Breakdown table for decoding information.

VEHICLE IDENTIFICATION NUMBER (Continued)

VIN CHECK DIGIT

DESCRIPTION

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VEHICLE SAFETY CERTIFICATION LABEL

DESCRIPTION

A vehicle safety certification label is attached to the left side of B-pillar or on the rearward facing of the front door (Fig. 7). This label indicates date of manufacture (month and year), Gross Vehicle Weight Rating (GVWR), Gross Axle Weight Rating (GAWR) front, Gross Axle Weight Rating (GAWR) rear and the Vehicle Identification Number (VIN). The Month, Day and Hour of manufacture is also included.

All communications or inquiries regarding the vehicle should include the Month-Day-Hour and Vehicle Identification Number.

E-MARK LABEL

DESCRIPTION

An E-mark Label (Fig. 8) is located on the rear shut face of the driver's door. The label contains the following information:

- Date of Manufacture
- Month-Day-Hour (MDH)
- Vehicle Identification Number (VIN)
- Country Codes
- Regulation Number
- Regulation Amendment Number
- Approval Number

VECI LABEL

DESCRIPTION

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

MANUFACTURE PLATE

DESCRIPTION

The Manufacturer Plate (Fig. 9) is located in the engine compartment on the passenger side strut tower. The plate contains five lines of information:

- Vehicle Identification Number (VIN)
- Gross Vehicle Mass (GVM)
- Gross Train Mass (GTM)
- Gross Front Axle Rating (GFAR)
- Gross Rear Axle Rating (GRAR)

FLUID TYPES

DESCRIPTION

DESCRIPTION - ENGINE OIL AND LUBRICANTS

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 2).

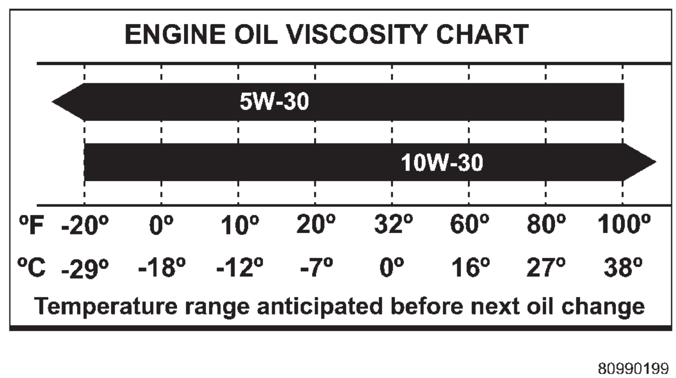

Fig. 2 TEMPERATURE/ENGINE OIL VISCOSITY

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans (Fig. 3).

This symbol means that the oil has been certified by the American Petroleum Institute (API). Diamler-Chrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar or an equivalent oil meeting the specification MS-6395.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

LUBRICANTS AND GREASES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol (Fig. 4) on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

FLUID TYPES (Continued)

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DESCRIPTION - AUTOMATIC/MANUAL TRANSAXLE FLUID

NOTE: Refer to the maintenance schedules in the vehicle owner's manual for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: All transaxles have a common transmission and differential sump. Filling the transaxle accommodates the differential as well.

TRANSMISSION FLUID

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) is required in the 41TE automatic and T350 manual transaxles. Substitute fluids can induce torque converter clutch shudder, or premature geartrain failure.

Mopar® ATF+4 (Automatic Transmission Fluid-Type 9602) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

DESCRIPTION - FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

FLUID TYPES (Continued)

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

MAINTENANCE SCHEDULES

DESCRIPTION

″Maintenance Schedule Information not included in this section, is located in the appropriate Owner's Manual.″

HOISTING

STANDARD PROCEDURE - HOISTING

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN THE ENGINE OR REAR SUSPENSION IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.

CAUTION: Do not position hoisting device on suspension components, damage to vehicle can result. Refer to (Fig. 5), OR (Fig. 6) for proper locations.

JUMP STARTING

STANDARD PROCEDURE - JUMP STARTING

WARNING: DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT. DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR. DO NOT JUMP START A VEHICLE WHEN THE BATTERY FLUID IS BELOW THE TOP OF LEAD PLATES. DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE. DO NOT USE OPEN FLAME NEAR BATTERY. REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT. WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS. REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.

JUMP STARTING (Continued)

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

TO JUMP START A DISABLED VEHICLE:

(1) Raise hood on disabled vehicle and visually inspect engine compartment for:

- Battery cable clamp condition, clean if necessary.
- Frozen battery.
- Yellow or bright color test indicator, if equipped.
- Low battery fluid level.
- Generator drive belt condition and tension.
- Fuel fumes or leakage, correct if necessary.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

(2) When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.

(3) On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.

(4) Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.

(5) On disabled vehicle, connect RED jumper cable clamp to positive (+) terminal. Connect BLACK jumper cable clamp to engine ground as close to the ground cable attaching point as possible (Fig. 7).

(6) Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

(7) Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 minutes), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

TOWING

STANDARD PROCEDURE - TOWING

WARNINGS AND PRECAUTIONS

WARNING: DO NOT ALLOW TOWING ATTACHMENT DEVICES TO CONTACT THE FUEL TANK OR LINES, FUEL LEAK CAN RESULT. DO NOT LIFT OR TOW VEHICLE BY FRONT OR REAR BUMPER, OR BUMPER ENERGY ABSORBER UNITS. DO NOT VENTURE UNDER A LIFTED VEHICLE IF NOT SUPPORTED PROPERLY ON SAFETY STANDS. DO NOT ALLOW PASSENGERS TO RIDE IN A TOWED VEHICLE. USE A SAFETY CHAIN THAT IS INDEPENDENT FROM THE TOWING ATTACHMENT DEVICE.

TOWING (Continued)

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle. Do not attach towing device to front or rear suspension components. Do not secure vehicle to towing device by the use of front or rear suspension or steering components. Remove or secure loose or protruding objects from a damaged vehicle before towing. Refer to state and local rules and regulations before towing a vehicle. Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

RECOMMENDED TOWING EQUIPMENT

To avoid damage to bumper fascia and air dams use of a flat bed towing device or wheel lift (Fig. 8) is recommended. When using a wheel lift towing device, be sure the unlifted end of disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

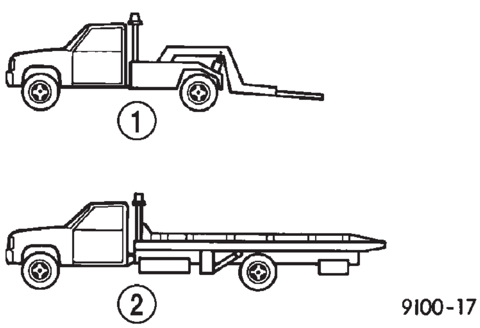

Fig. 8 Recommended Towing Equipment

1 - WHEEL LIFT
2 - FLAT BED

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums or rotors.

LOCKED VEHICLE TOWING

When a locked vehicle must be towed with the front wheels on the ground, use a towing dolly or flat bed hauler.

FLAT TOWING WITH TOW BAR

- Three speed automatic transaxle vehicles can be flat towed at speeds not to exceed 40 km/h (25 mph) for not more than 25 km (15 miles). The steering column must be unlocked and gear selector in neutral.
- Five speed manual transaxle vehicles can be flat towed at any legal highway speed for extended distances. The gear selector must be in the neutral position.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

JR vehicles can be tied to a flat bed device using the reinforced loops located under the front and rear bumpers on the drivers side of the vehicle. There are also four reinforced elongated holes for T or R hooks located on the bottom of the front frame rail torque boxes behind the front wheels and forward of the rear wheels inboard of the rocker panel weld seam.

TOWING – FRONT WHEEL LIFT

DaimlerChrysler Corporation recommends that a vehicle be towed with the front end lifted, whenever possible. A 90 cm (36 in.) length of 4x4 wood beam can be placed between the wheel lift device and the bottom of the fascia to prevent damage to vehicle during the lifting operation. The beam can removed after lifting the front of the vehicle.

TOWING – REAR WHEEL LIFT

If a vehicle cannot be towed with the front wheels lifted, the rear wheels can be lifted provided the following guide lines are observed.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

- Unlock steering column and secure steering wheel in straight ahead position with a clamp device designed for towing.
- Place front wheels on a towing dolly.

SUSPENSION

TABLE OF CONTENTS

SUSPENSION

STANDARD PROCEDURE - LUBRICATION POINTS

There are no serviceable lubrication points on the suspension of this vehicle. All joints are sealed-for-life type and require no maintenance.

FRONT SUSPENSION

TABLE OF CONTENTS

FRONT SUSPENSION

DESCRIPTION - FRONT SUSPENSION

This vehicle's front suspension is a short long arm (SLA) design used in conjunction with a gas pressurized shock absorber and coil spring assembly (Fig. 1).

SLA offers three advantages over the customary MacPherson strut system for front-wheel-drive vehicles.

- Better handling through geometry that keeps the tires more perpendicular to the road
- Better noise isolation

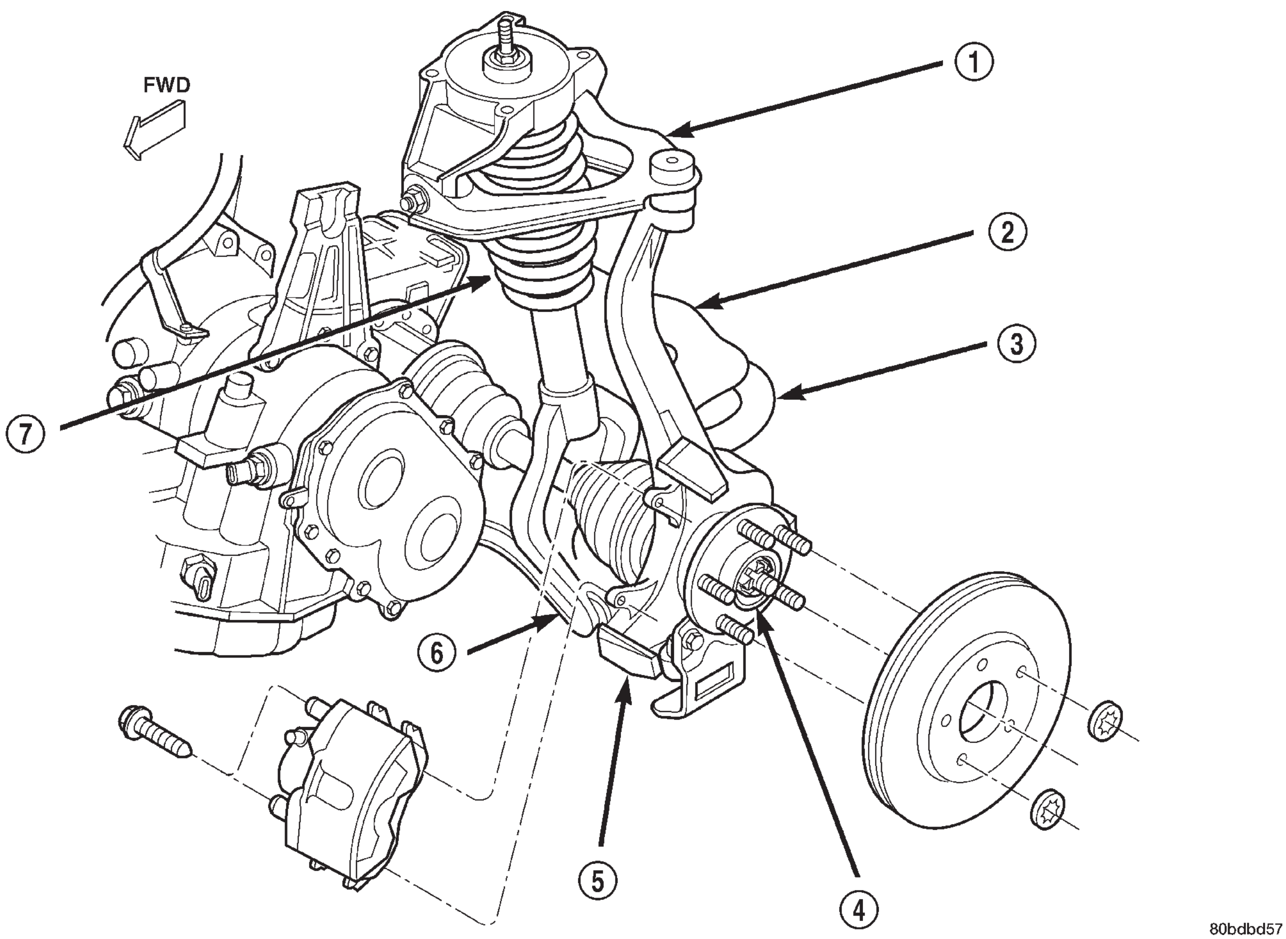

Fig. 1 Front Suspension Components (Typical)

2 - FRONT SUSPENSION CROSSMEMBER
3 - STABILIZER BAR
4 - HUB AND BEARING
5 - STEERING KNUCKLE
6 - LOWER CONTROL ARM
7 - SHOCK ASSEMBLY

FRONT SUSPENSION (Continued)

- Better ride through reduced friction

The upper control arm of the vehicle is mounted using rubber isolation bushings to an aluminum casting which is attached to the shock tower using 4 mounting bolts. This aluminum casting is also used as the upper mount for the front shock/coil spring assembly. The shock absorber is isolated from the aluminum bracket using a microcellular urethane isolator. The lower control arm is mounted to the vehicle's front suspension crossmember using 2 through bolts per control arm. The lower control arm is also isolated from the vehicle using 2 rubber bushings of unique design for the front and rear mounting location. The bottom of the shock absorber is mounted to the lower control arm by a clevis bracket which is part of the shock absorber assembly. The clevis bracket is mounted to and isolated from the lower control arm using a rubber isolation bushing and a through-bolt. The front steering knuckle is mounted to the vehicle by a ball joint located in the upper and lower control arms.

A sealed for life front hub and bearing assembly is attached to the front steering knuckle. The outer C/V joint assembly is splined to the front hub and bearing assembly and is retained by a nut, nut retainer and cotter pin.

OPERATION - FRONT SUSPENSION

The front suspension allows each front wheel on vehicle to adapt to different road surfaces and conditions without affecting the control of the vehicle. Each side of the front suspension is allowed to move independently from the other. Both sides of the front suspension are allowed to pivot so the vehicle can be steered in the direction preferred. Steering of the vehicle is provided by a rack and pinion steering gear which is connected directly to each steering knuckle by an outer tie rod.

WARNING

WARNING: DO NOT REMOVE A SHOCK ROD NUT WHILE THE SHOCK ASSEMBLY IS INSTALLED IN VEHICLE, OR BEFORE THE SHOCK ASSEMBLY SPRING IS COMPRESSED.

CAUTION

CAUTION: Only frame contact hoisting equipment should be used on this vehicle. All vehicles have a fully independent rear suspension. Vehicles must not be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

CAUTION: At no time when servicing a vehicle, can a sheet metal screw, bolt or other metal fastener be installed in the shock tower to take the place of an original plastic clip. Also, NO holes can be drilled into the front shock tower in the area shown in (Fig. 2), for the installation of any metal fasteners into the shock tower. Because of the minimum clearance in this area installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

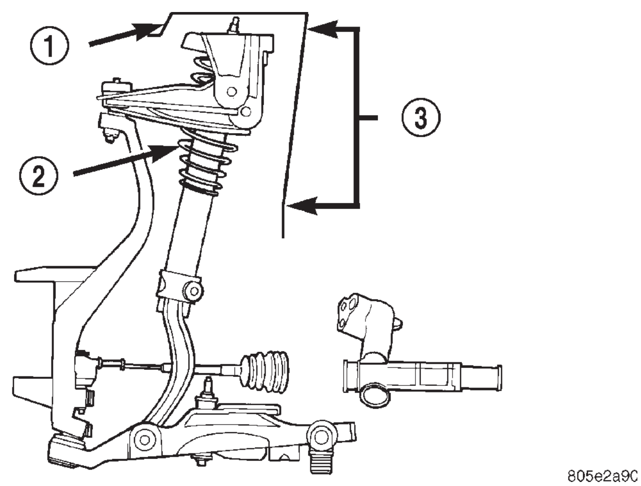

Fig. 2 Shock Tower To Spring Minimum Clearance Area

1 - SHOCK TOWER
2 - COIL SPRING
3 - NO SHEET METAL SCREWS, BOLTS, OR ANY OTHER METAL FASTENERS ARE TO BE INSTALLED IN SHOCK TOWER AREA. ALSO, NO HOLES ARE TO BE DRILLED INTO SHOCK TOWER IN THIS SAME AREA.

NOTE: If a suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

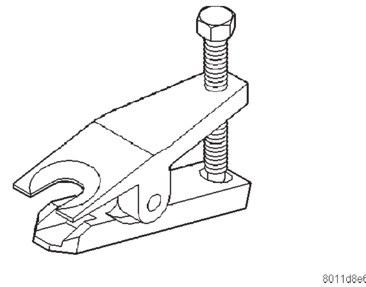
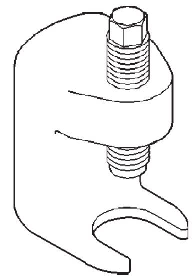
HUB / BEARING

DESCRIPTION

The bearing used on the front hub of this vehicle is the combined hub and bearing unit type assembly. This unit combines the front wheel mounting hub (flange) and the front wheel bearing into a one piece unit. The hub and bearing assembly is mounted to the steering knuckle and is retained by three mounting bolts accessible from the back of the steering knuckle. The hub and bearing unit is not serviceable and must be replaced as an assembly if the bearing or the hub is determined to be defective. The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing assembly.



Remover, Tie Rod



Remover, Lower Ball Joint C-4150A

OPERATION

The hub and bearing has internal bearings that allow the hub to rotate with the driveshaft and tire and wheel.

DIAGNOSIS AND TESTING - HUB AND BEARING

The hub and bearing is designed for the life of the vehicle and requires no type of periodic maintenance. The following procedure may be used for diagnosing the condition of the wheel bearing and hub.

With the wheel, disc brake caliper, and brake rotor removed, rotate the wheel hub. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions during diagnosis, the hub bearing will require replacement. The bearing is not serviceable.

Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease weapage from the bearing is considered normal and should not require replacement of the wheel bearing.

HUB / BEARING (Continued)

To diagnose a bent hub, (Refer to 2 - BRAKES/HYDRAULIC-MECHANICAL/ROTOR - DIAGNOSIS AND TESTING).

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove front tire and wheel assembly from the hub.

CAUTION: Wheel bearing damage will result if hub nut is loose, then vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires.

(3) Loosen hub nut with the brakes applied. **The hub and driveshaft are splined together through the knuckle (bearing) and retained by the hub nut.**

(4) Remove the disc brake caliper, adapter, shoes and rotor from the steering knuckle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)

(5) Remove nut attaching the outer tie rod end to the steering knuckle (Fig. 3). **Nut is to be removed from tie rod end using the following procedure, hold tie rod end stud with a socket while loosening and removing nut with wrench (Fig. 3).**

CAUTION: No tool is to be inserted between the steering knuckle and the lower ball joint to separate stud of lower ball joint from the steering knuckle. The steering knuckle is to be separated from the stud of the ball joint only using the procedure as described in Step 9 below.

(9) Turn steering knuckle so the front of the steering knuckle is facing as far outboard in the wheel well as possible. Using a hammer strike the boss on the steering knuckle, (Fig. 7) until steering knuckle separates from stud of lower ball joint. **When striking steering knuckle, care MUST be taken not to hit lower control arm or ball joint grease seal.**

CAUTION: Pulling steering knuckle out from vehicle after releasing from ball joint can separate inner C/V joint, thus damaging it.

(10) Lift up on steering knuckle separating it from the lower ball joint stud. **Use caution when separating ball joint stud from steering knuckle, so ball joint seal does not get cut.**

NOTE: Care must be taken not to separate the inner C/V joint during this operation. Do not allow driveshaft to hang by inner C/V joint, driveshaft must be supported.

(11) Separate the steering knuckle from the outer C/V joint. Separate steering knuckle from outer C/V joint, by supporting the driveshaft while pulling steering knuckle away from the outer C/V joint (Fig. 8).

(17) Remove the hub and bearing assembly from the front of the steering knuckle.

NOTE: If bearing will not come out of steering knuckle, it can be tapped out using a soft faced hammer.

INSTALLATION

(1) Thoroughly clean all hub and bearing assembly mounting surfaces on steering knuckle.

(2) Install the replacement hub and bearing assembly in steering knuckle aligning bolt boles in bearing flange with holes in steering knuckle.

(3) Install the 3 mounting bolts (Fig. 10) and tighten evenly to ensure bearing is square to face of steering knuckle. The tighten the 3 mounting bolts (Fig. 10) to a torque of 110 N·m (80 ft. lbs.).

(4) Slide drive shaft back into front hub and bearing assembly.

(5) Install the steering knuckle on the lower control arm ball joint.

(6) Install the steering knuckle to lower ball joint castle nut.

(7) Install the steering knuckle onto upper ball joint stud and install nut.

(8) Using a crow foot and torque wrench, tighten the upper and lower ball joint nuts to the following torque specifications.

- Lower ball joint castle nut 74 N·m (55 ft. lbs.).
- Upper ball joint nut 27 N·m (20 ft. lbs.).

(9) Install cotter pin in lower ball joint stud and castle nut.

(10) If equipped with antilock brakes install the speed sensor cable routing bracket on the steering knuckle (Fig. 5) and securely tighten attaching bolt.

CAUTION: When installing tie rod on steering knuckle the heat shield (Fig. 11) must be installed. If heat shield is not installed, tie rod seal boot can fail due to excessive heat from brake rotor.

(11) Install tie rod end into the steering knuckle. Start tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding the stud of the tie rod end stationary, tighten tie rod end to steering knuckle attaching nut (Fig. 3). Then using a crowfoot and socket tighten the attaching nut to a torque of 61 N·m (45 ft. lbs.) (Fig. 11).

(12) Install brake rotor, and caliper, shoes and adapter assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION)

(13) Clean all foreign matter from the threads of the outer C/V joint stub axle. Install hub nut onto the driveshaft stub axle.

(14) With vehicle brakes applied to keep stub axle from turning, tighten hub nut to a torque of 203 N·m (150 ft. lbs.) of torque.

(15) Install wheel and tire assembly. Install wheel lug nuts and progressively tighten in crisscross sequence. Tighten nuts to a torque of 135 N·m (100 ft. lbs.).

(16) Lower vehicle.

KNUCKLE

DESCRIPTION

The steering knuckle is a single casting with legs machined for attachment to the vehicle's upper and lower control arm ball joints. the steering knuckle has the hub and bearing mounted in its center. The axle shaft constant velocity joint stub shaft is splined through the hub and bearing assembly in the center of the knuckle. The steering knuckle also supports and aligns the front brake caliper adapter and caliper assembly.

OPERATION

The steering knuckle pivots between the upper and lower ball joints. The steering gear outer tie rod end connects to the trailing end of each knuckle, allowing the vehicle to be steered.

The center of the knuckle supports the hub and bearing and axle shaft.

DIAGNOSIS AND TESTING - STEERING KNUCKLE

The front suspension steering knuckle is not a repairable component of the front suspension. It must be replaced if found to be damaged in any way. If it is determined that the steering knuckle is bent when servicing the vehicle, no attempt is to be made to straighten the steering knuckle.

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove front tire and wheel assembly from the hub.

CAUTION: Wheel bearing damage will result if hub nut is loosened, then vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires.

(3) Loosen hub nut with the brakes applied.**The hub and driveshaft are splined together through the knuckle (bearing) and retained by the hub nut.**

(4) Remove the disc brake caliper, adapter, shoes and rotor from the steering knuckle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)

(5) Remove nut attaching outer tie rod end to the steering knuckle (Fig. 12). **Nut is to be removed from tie rod end using the following procedure, hold tie rod end stud with a socket while loosening and removing nut with wrench (Fig. 12).**

CAUTION: When striking the steering knuckle, do not hit the heat shield covering the ball joint grease seal. Bending the heat shield against the ball joint grease seal will cause the grease seal to fail.

(9) Turn steering knuckle so the front of the steering knuckle is facing as far outboard in the wheel well as possible. Using a hammer strike the boss on the steering knuckle, (Fig. 16) until the steering knuckle separates from the stud of lower ball joint.

CAUTION: Pulling steering knuckle out from vehicle after releasing from ball joint can separate inner C/V joint, thus damaging it.

(10) Lift up on steering knuckle separating it from the lower ball joint stud. **Use caution when separating ball joint stud from steering knuckle, so ball joint seal does not get cut.**

NOTE: Care must be taken not to separate the inner C/V joint during this operation. Do not allow driveshaft to hang by inner C/V joint, driveshaft must be supported.

(11) Separate the steering knuckle from the outer C/V joint. Separate steering knuckle from outer C/V joint, by supporting the driveshaft while pulling steering knuckle away from the outer C/V joint (Fig. 17).

INSTALLATION

(1) If required install a hub/bearing assembly into the steering knuckle before installing steering knuckle on vehicle. (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - INSTALLATION).

(2) Install the heat shield for the lower control arm ball joint grease seal before beginning the installation of the steering knuckle on the vehicle.

(3) Slide drive shaft back into front hub/bearing assembly. Then install steering knuckle onto the ball joint stud in lower control arm.

(4) Install the steering knuckle to lower ball joint stud castle nut.

(5) Install upper ball joint in steering knuckle. Install the steering knuckle to upper ball joint nut. Tighten the upper ball joint nut to a torque of 27 N·m (20 ft. lbs.). Then, using a crowfoot and torque wrench, tighten the lower ball joint nut to a torque of 75 N·m (55 ft. lbs.) (Fig. 15).

(6) Install the speed sensor cable routing bracket on the steering knuckle (Fig. 14) and securely tighten the attaching bolt.

CAUTION: When installing tie rod on steering knuckle the heat shield (Fig. 19) must be installed. If heat shield is not installed, tie rod seal boot can fail due to excessive heat from brake rotor.

(7) Install tie rod end into the steering knuckle. Start tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary, tighten tie rod end to steering

(10) With vehicle brakes applied to keep braking disc from turning, tighten hub nut to 203 N·m (150 ft. lbs.) of torque.

(11) Install front wheel and tire assembly. Install front wheel lug nuts and progressively tighten in crisscross sequence. Tighten to a torque of 135 N·m (100 ft.lbs.).

(12) Lower vehicle.

(13) Set front toe on vehicle to required specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

LOWER BALL JOINT

DESCRIPTION

The ball joint used in the lower control arm of this vehicle is a sealed for life ball joint. The ball joint can not be replaced as a separate component of the lower control arm assembly. If the ball joint is determined to be defective it will require replacement of the complete lower control arm assembly.

The lower ball joint connection to the steering knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a castle nut and a cotter pin. The cotter pin is used for positive retention of the castle nut.

The lower ball joint is lubricated for life at the time it is assembled in the lower control arm.

NOTE: The ball joint does not require any type of additional lubrication for the life of the vehicle. No attempt should be made to ever add any lubrication to the lower ball joint.

OPERATION

The ball joint is a pivotal joint that allows the knuckle to move up and down, and turn with ease.

DIAGNOSIS AND TESTING - LOWER BALL JOINT

(1) Raise the vehicle on jack stands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Install a dial indicator on the vehicle so it is contacting the top surface of the steering knuckle near the lower ball joint stud castle nut.

(3) Grab wheel and tire assembly and push it up and down firmly.

(4) Record the amount of up and down movement of the steering knuckle recorded on the dial indicator.

(5) Replace lower control arm if the movement in the lower control arm exceeds 1.5 mm (.059 in.).

LOWER BALL JOINT SEAL BOOT

REMOVAL

CAUTION: The replacement of the lower ball joint seal boot can only be done in the event that the seal boot is damaged while performing a service procedure on the vehicle.

LOWER BALL JOINT SEAL BOOT (Continued)

CAUTION: Under no circumstances can a lower ball joint seal boot be replaced if it is determined that the vehicle had been driven with the seal boot damaged. If the vehicle has been driven with a damaged seal boot contamination of the ball joint has occurred. When contamination of the ball joint has occurred the lower control arm must be replaced. This is to ensure excessive wear of the ball joint does not occur from the contamination present in the ball joint.

CAUTION: Excessive wear in the ball joint can lead to a separation of the ball joint from the lower control arm.

CAUTION: The procedure below must be carefully followed when replacing the ball joint seal in the event it is damaged while servicing a vehicle.

CAUTION: The ball joint used in the lower control arm of this vehicle is a lubricated for life ball joint. This ball joint does not required any additional lubrication for the life of the vehicle. Do not alter the lower control arm or ball joint in an attempt to lubricate the lower control arm ball joint. If it is determined that the ball joint is lacking proper lubrication, the lower control arm will need to be replaced.

(1) Remove lower control arm assembly from vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).

(2) Wrap a shop towel around the ball joint and seal boot. This is to prevent dirt and cleaning solvent to enter ball joint when cleaning area around ball joint.

(3) Using **ONLY** a solvent such as Mopar Foamy Engine Degreaser or an equivalent, thoroughly clean lower control arm in area around ball joint and seal. Then using a shop towel saturated with the engine degreaser, carefully wipe off the ball joint seal boot.

(4) Using 2 screwdrivers (Fig. 20) remove the ball joint seal retaining ring from the bottom of the ball joint seal.

(5) Remove ball joint seal from ball joint.

INSTALLATION

CAUTION: The replacement of the lower ball joint seal boot can only be done in the event that the seal boot is damaged while performing a service procedure on the vehicle.

CAUTION: Under no circumstances can a lower ball joint seal boot be replaced if it is determined that the vehicle had been driven with the seal boot damaged. If the vehicle has been driven with a damaged seal boot contamination of the ball joint has occurred. When contamination of the ball joint has occurred the lower control arm must be replaced. This is to ensure excessive wear of the ball joint does not occur from the contamination present in the ball joint.

CAUTION: Excessive wear in the ball joint can lead to a separation of the ball joint from the lower control arm.

CAUTION: The procedure below must be carefully followed when replacing the ball joint seal in the event it is damaged while servicing a vehicle.

CAUTION: The ball joint used in the lower control arm of this vehicle is a lubricated for life ball joint. This ball joint does not required any additional lubrication for the life of the vehicle. Do not alter the lower control arm or ball joint in an attempt to lubricate the lower control arm ball joint. If it is determined that the ball joint is lacking proper lubrication, the lower control arm will need to be replaced.

LOWER BALL JOINT SEAL BOOT (Continued)

CAUTION: When replacing ball joint seal, do not use any other type of grease to lubricate ball joint other than the lubricant provided in the Mopar Ball Joint Seal service kit.

(1) Apply grease from the ball joint seal kit, to the specified areas of the ball joint stud and seal (Fig. 21). Be sure no grease is present on the seal boot installation section of the seal boot or lower control arm (Fig. 21).

(2) Slide ball joint seal boot with upper seal ring installed, (Fig. 21) down tapered section of ball joint stud (Fig. 21). Seal boot is to be installed on stud of ball joint until seal boot is sitting on seal groove in lower control arm.

(3) Carefully position ball joint seal boot in seal retaining groove on lower control arm. After installing seal boot in retaining groove, carefully bleed air out of sealing boot without getting grease pushed into seal boot retaining groove in lower control arm.

(4) Place Retaining Ring Installer, Special Tool, 6875-1 over ball joint seal boot (Fig. 22). Using adjusting knob, adjust tool so bottom edge of tool is even with top of retaining ring groove in seal boot (Fig. 22).

(5) Place seal boot retaining ring on Installer, Special Tool, 6875- 1 (Fig. 23). Then place expandable collar from Installer, Special Tool, 6875 over tapered cone of the special tool (Fig. 23).

(6) Using the expandable collar of Installer, Special Tool, 6875 (Fig. 24) push the seal boot retaining ring down the cone of Installer, Special Tool, 6875.

(7) Continue pushing retaining ring down Installer, Special Tool, 6875, until it is installed in the retaining ring groove of the seal boot (Fig. 25)

(8) Remove Installer, Special Tool, 6875 from the ball joint seal boot. **When removing tool from seal boot be careful not to damage the seal boot with the tool.**

(9) Check retaining ring installation on seal boot to ensure it is fully seated in seal boot groove and the ends are not twisted (Fig. 26). Also, make sure upper sealing ring is on seal boot and correctly installed (Fig. 26). Check seal boot for damage before installing back on car.

(10) Install lower control arm assembly back on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).

LOWER CONTROL ARM

DESCRIPTION

The lower control arm is a ductile iron casting using 2 rubber bushings to isolate it from the front suspension crossmember and body of the vehicle. The isolator bushings consist of 2 metal encased rubber isolated pivot bushings. The front of the lower control arm is bolted to the front crossmember using a bolt through the center of the rubber pivot bushing. The rear of the lower control arm is mounted to the front suspension crossmember using a through-bolt. The lower control arms are inter-connected through a linked rubber isolated sway bar.

OPERATION

The lower control arm supports the lower end of the steering knuckle and allows for the up and down movement of the suspension during the jounce and rebound travel. It also provides a lower mounting point for the shock assembly.

LOWER CONTROL ARM (Continued)

DIAGNOSIS AND TESTING - LOWER CONTROL ARM

If damaged, the lower control arm casting is serviced only as a complete component. Inspect lower control arm for signs of damage from contact with the ground or road debris. If lower control arm shows any sign of damage, inspect lower control arm for distortion. **Do not attempt to repair or straighten a broken or bent lower control arm.**

The replaceable components of the lower control arm are: the ball joint grease seal and the control arm bushings. Inspect both control arm bushings for severe deterioration, and replace if required.

Inspect the lower ball joint for wear. Use the wear inspection procedure in the diagnosis and testing section in this group of service manual to determine if the wear is excessive and ball joint (lower control arm) replacement is required.

Service procedures to replace these components are detailed in the specific component removal and installation sections in this group of the service manual.

REMOVAL

(1) Raise vehicle on jack stands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove the tire and wheel from the vehicle.

NOTE: Removing the tie rod end from the steering knuckle allows the steering knuckle to be turned further. This allows better access to the steering knuckle when striking it to remove the ball joint stud from the steering knuckle.

(3) Remove nut attaching the outer tie rod end to the steering knuckle (Fig. 27). **Nut is to be removed from tie rod end using the following procedure, hold tie rod end stud with a 11/32 socket while loosening and removing nut with wrench (Fig. 27).**

(4) Remove the tie rod end from the steering knuckle using Remover, Special Tool MB-991113 (Fig. 28).

(5) Remove cotter pin and castle nut (Fig. 29) from stud of lower ball joint.

CAUTION: No tool is to be inserted between the steering knuckle and the lower ball joint to separate the lower ball joint from the steering knuckle. The steering knuckle is to be separated from the ball joint only using the procedure as described in step Step 6 below.

CAUTION: When striking the steering knuckle, do not hit the heat shield covering the ball joint grease seal. Bending the heat shield against the ball joint grease seal will cause the grease seal to fail.

(6) Turn steering knuckle so the front of the steering knuckle is facing as far outboard in the wheel opening as possible (Fig. 30). Using a hammer, strike steering knuckle boss (Fig. 30) until steering knuckle separates from the lower ball joint. **When striking**

CAUTION: When removing lower control arm from crossmember care must be taken to prevent hitting lower ball joint seal against steering knuckle, causing damage to the ball joint seal.

(13) Remove the front of the lower control arm from the front suspension crossmember first.

(14) Then, remove the rear of the lower control arm from the front suspension crossmember. When removing rear of lower control arm from crossmember, keep control arm as level as possible. This will keep rear bushing from binding on crossmember making it easier to remove control arm from crossmember.

DISASSEMBLY

DISASSEMBLY - FRONT ISOLATOR BUSHING

To perform removal and replacement of the lower control arm isolator bushings, the lower control arm must be removed from the vehicle.

(1) Remove lower control arm assembly from vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).

(2) Install Bushing Remover, Special Tool 6602-5 and Bushing Receiver, Special Tool MB-990799 on Special Tool C-4212-F.

LOWER CONTROL ARM (Continued)

(3) Install lower control arm on Special Tools assembled for removal of the front isolator bushing. Be sure Special Tool MB-990799 is square on lower control arm and Special Tool 6602-5 is positioned correctly on isolator bushing (Fig. 36).

DISASSEMBLY - REAR ISOLATOR BUSHING

To perform removal and replacement of the lower control arm isolator bushings, the lower control arm must be removed from the vehicle.

(1) Remove lower control arm assembly from vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).

(2) Install Bushing Remover, Special Tool 6756 and Bushing Receiver, Special Tool C-4366-2 on Special Tool C-4212-F (Fig. 37).

(3) Install Special Tools assembled for removal of the rear isolator bushing on the lower control arm. Be sure Special Tool C-4366-2 is square on lower control arm and Special Tool 6756 is positioned correctly on isolator bushing (Fig. 37).

(4) Tighten screw on Remover/Installer Special Tool C-4212-F to press rear bushing out of lower control arm.

DISASSEMBLY - CLEVIS BUSHING

To perform removal and replacement of the lower control arm clevis bushing, the lower control arm must be removed from the vehicle.

ASSEMBLY

ASSEMBLY - FRONT ISOLATOR BUSHING

To perform removal and replacement of the lower control arm isolator bushings, the lower control arm must be removed from the vehicle.

(1) Mount Bushing Installer, Special Tool 6876 on screw portion of Remover/Installer Special Tool C-4212-F (Fig. 39).

(2) Start front bushing into lower control arm **by hand, making sure it is square with its mounting hole in the lower control arm.** Bushing is to be installed in lower control arm from the machined surface side of lower control arm bushing hole.

(3) Install lower control arm on Special Tools assembled for installation of front isolator bushing into lower control arm (Fig. 39). Be sure Special Tool 6758 is square on lower control arm and Special Tool 6876 is positioned correctly on isolator bushing.

(4) Tighten screw on Remover/Installer Special Tool C-4212-F pressing front bushing into lower control arm. Continue pressing front bushing into lower control arm until bushing is sitting flush on the machined surface of the lower control arm. This will correctly position front bushing in lower control arm.

(5) Install lower control arm assembly back on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).

ASSEMBLY - REAR ISOLATOR BUSHING

To perform removal and replacement of the lower control arm isolator bushings, the lower control arm must be removed from the vehicle.

(1) Start rear bushing into lower control arm **by hand, making sure it is square with its mounting hole in the lower control arm.** Bushing is to be installed from the machined surface side of lower control arm bushing hole, with the void in rubber portion of bushing facing away from ball joint (Fig. 40).

(2) Mount Bushing Installer, Special Tool 6760 on screw portion of Remover/Installer Special Tool C-4212-F (Fig. 41).

(3) Install Special Tools assembled for installation of rear isolator bushing into lower control arm on the lower control arm. Be sure Special Tool 6756 is square on lower control arm and Special Tool 6760 is positioned correctly on isolator bushing (Fig. 41).

(4) Tighten screw on Remover/Installer Special Tool C-4212-F pressing rear bushing into lower control arm. Continue pressing rear bushing into lower control arm until bushing is sitting flush on the machined surface (Fig. 41) of the lower control arm. This will correctly position rear bushing in lower control arm.

(5) Install lower control arm assembly back on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).

ASSEMBLY - CLEVIS BUSHING

To perform removal and replacement of the lower control arm clevis bushing, the lower control arm must be removed from the vehicle.

(1) Start clevis bushing into lower control arm **by hand, making sure it is square with its mounting hole in the lower control arm.** Bushing is to be installed in lower control arm from the machined surface side of lower control arm bushing hole.

(2) Mount Bushing Installer, Special Tool 6877 on screw portion of Remover/Installer Special Tool C-4212-F as shown in (Fig. 42).

(3) Install the assembled special tools for installing the clevis bushing into the lower control arm, on the lower control arm and clevis bushing (Fig. 42). Be sure Special Tool 6876 is square on lower control arm and Special Tool 6877 is positioned correctly on clevis bushing (Fig. 42).

(4) Tighten screw on Remover/Installer Special Tool C-4212-F pressing clevis bushing into lower control arm. Continue pressing clevis bushing into lower control arm until bushing is sitting flush with the machined surface of the lower control arm. This will correctly position the clevis bushing in the lower control arm.

(5) Install lower control arm assembly back on vehicle. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).

INSTALLATION

(1) Position rear of lower control arm into front suspension crossmember first. Then install front of lower control arm in front suspension crossmember. Install bolts and nuts (Fig. 35) and (Fig. 34) attaching the front and rear of lower control arm to front suspension crossmember. **Do not tighten front attaching bolt at this time**.

(2) Tighten lower control arm rear attaching nut and bolt (Fig. 34) to a torque of 95 N·m (70 ft. lbs.).

(3) Install the lower control arm ball joint stud into the steering knuckle. Install the steering knuckle to ball joint stud castle nut (Fig. 29).

(4) Install the tie rod end into the steering knuckle. Start the tie rod end to steering knuckle attaching nut onto stud of tie rod end. While holding stud of tie rod end stationary, tighten tie rod end to steering knuckle attaching nut (Fig. 27). Then using a crowfoot and 11/32 socket tighten the attaching nut to a torque of 61 N·m (45 ft. lbs.) (Fig. 43).

(5) Tighten the lower control arm ball joint stud castle nut (Fig. 29) to a torque of 74 N·m (55 ft. lbs.). Install the cotter pin (Fig. 29) in the ball joint stud.

(6) Position sway bar link into its lower control arm mounting hole.

(7) Align sway bar bushing clamp with mounting holes in front suspension crossmember and body of vehicle. Then install and securely tighten the bushing clamp mounting bolts (Fig. 33) to a torque of 61 N·m (45 ft. lbs.).

(8) Install and securely tighten the stabilizer bar link to lower control arm attaching nut to a torque of 102 N·m (75 ft. lbs.). When tightening and torquing attaching nut, hold stud of attaching link from turning with an allen wrench (Fig. 32).

(9) Install the clevis on the lower control arm. Loosely install the clevis to bushing thru-bolt (Fig. 31).

CAUTION: When supporting lower control arm with jack stand, do not position jack stand under the ball joint cap on the lower control arm. Position in area of lower control arm shown in (Fig. 44).

(10) Lower vehicle to the ground with a jack stand positioned under the lower control arm (Fig. 44). Continue to lower vehicle so the total weight of the vehicle is supported by the jack stand and lower control arm.

CAUTION: When tightening the thru-bolt do not turn the bolt in the clevis. The serrations on the bolt and the hole in the clevis will be damaged.

(11) **With the vehicle's suspension at curb height,** tighten the clevis to lower control arm bushing thru-bolt nut (Fig. 31) to a torque of 88 N·m (65 ft. lbs.).

(12) Tighten front lower control arm nut and bolt (Fig. 35) to a torque of 182 N·m (135 ft. lbs.).

(13) Install wheel and tire assembly.

(14) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(15) Remove jack stand from under lower control arm and lower vehicle to the ground.

(16) Check the vehicles alignment specifications and set front Toe to preferred specifications.

SHOCK ASSEMBLY

DESCRIPTION - SHOCK ASSEMBLY

The front shock assembly and suspension of the vehicle is supported by coil springs positioned around shock absorbers. The springs are contained between an upper seat located in the upper mounting bracket and a lower spring seat on the shock absorber.

The top of each shock absorber is bolted to a cast shock absorber/upper control arm bracket which is bolted to the shock tower of the vehicle using 4 mounting bolts.

The bottom of the shock absorber attaches to a clevis bracket using a pinch bolt. The clevis bracket attaches to the lower control arm of the vehicle using a through-bolt and prevailing torque nut.

If shock absorbers require replacement, be sure that they are replaced with shock absorbers meeting the correct specifications for the particular vehicle.

A coil spring is housed within each shock assembly. Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If the coil springs require replacement, be sure that the springs needing replacement, are replaced with springs meeting the correct load rating and spring rate for the vehicle and its specific options.

The components of the shock assembly listed below are serviceable if found to be defective (Fig. 45):

- Upper mounting bracket

7 - JOUNCE BUMPER
8 - DUST SHIELD
9 - CUP
10 - UPPER SPRING ISOLATOR
11 - UPPER MOUNTING BRACKET

The shock absorber/upper control arm mounting bracket also provides a pivotal mounting point for the upper control arm.

OPERATION - SHOCK ASSEMBLY

The shock absorber assembly cushions the ride of the vehicle, controlling vibration, and jounce and rebound of the suspension.

The coil spring controls ride quality and maintains proper ride height.

The spring isolators isolate the coil spring at the top and bottom from coming into metal-to-metal contact with the upper mounting bracket and shock absorber.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce condition.

The shock absorber dampens jounce and rebound motions of the coil spring and suspension.

DIAGNOSIS AND TESTING - SHOCK ASSEMBLY (FRONT)

(1) Inspect for damaged or broken coil springs (Fig. 46).

(2) Inspect for torn or damaged shock absorber dust boots (Fig. 46).

(3) Lift the dust boot and inspect the shock absorber for evidence of fluid running from the upper end of fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off the lower end of the shock absorber). A slight amount of seepage between the shock absorber rod and the seal is not unusual and does not affect performance of the shock absorber. Also inspect jounce bumpers for signs of damage or deterioration (Fig. 46).

SHOCK ASSEMBLY (Continued)

REMOVAL - SHOCK ASSEMBLY

NOTE: Before proceeding, (Refer to 2 - SUSPENSION/FRONT - WARNING).

(1) Loosen wheel nuts.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(3) Remove the wheel and tire assembly.

(4) If both shock assemblies are removed, mark the shock assemblies right and left according to which side of the vehicle they were removed from.

(5) Remove the wheel speed sensor cable routing bracket (Fig. 47) from the steering knuckle.

(6) Remove the nut from the upper ball joint stud.

(7) Remove the upper ball joint stud from the steering knuckle using Puller, Special Tool, C-3894-A (Fig. 48). Pull steering knuckle outward and position toward the rear of the front wheel opening.

(8) Remove pinch bolt attaching shock absorber clevis to shock absorber (Fig. 49).

(9) Remove the nut and thru-bolt (Fig. 50) attaching the shock absorber clevis to the lower control arm.

(10) Remove the clevis from the shock absorber by carefully tapping the clevis off the shock absorber using a soft (brass) drift.

(11) Remove the 4 bolts (Fig. 51) attaching the shock absorber/upper control arm mounting bracket to the shock tower of the vehicle.

DISASSEMBLY - SHOCK ASSEMBLY

The shock assembly must be removed from the vehicle for it to be disassembled and assembled. (Refer to 2 - SUSPENSION/FRONT/SHOCK - REMOVAL)

For the disassembly and assembly of the shock assembly, use strut spring compressor Pentastar Service Equipment (PSE) tool W-7200, or equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

(1) If both shocks are being serviced at the same time, mark the coil spring and shock assembly according to which side of the vehicle the shock was removed from, and which shock the coil spring was removed from.

(2) Position the shock assembly in the strut coil spring compressor following the manufacturer's instructions. Set the lower hooks and install the clamp on the lower end of the coil spring, so the shock is held in place once the shock shaft nut is removed (Fig. 52). Rotate the shock assembly so the upper control arm ball joint sits directly below the front upper hook as shown (Fig. 53). Position the upper hooks on top of the upper mounting bracket (Fig. 53).

WARNING: DO NOT REMOVE THE SHOCK ROD NUT BEFORE THE COIL SPRING IS COMPRESSED. THE COIL SPRING IS HELD UNDER PRESSURE AND MUST BE COMPRESSED, REMOVING SPRING TENSION FROM THE UPPER MOUNTING BRACKET BEFORE THE ROD NUT IS REMOVED.

(3) Compress the coil spring until all coil spring tension is removed from the upper mounting bracket.

(4) Hold the shock rod from rotating using special socket Snap-On A136®, or an equivalent, and remove the retainer nut (Fig. 54).

(5) Remove the upper bushing retainer washer (Fig. 55) from the shock absorber rod.

NOTE: If the coil spring, upper mounting bracket, rod bushings, upper coil spring isolator, or upper control arm need to be serviced, proceed with the next step, otherwise, proceed with step 11.

NOTE: Before removing the coil spring from the spring compressor, note the position of the lower coil spring end to the spring compressor. The coil spring will need to be in this position on reassembly for proper coil spring-to-shock absorber and upper mounting bracket orientation.

(7) Release the tension from the coil spring by backing off the compressor drive fully. Push back the compressor upper hooks and remove the upper mounting bracket and upper control arm from the coil spring.

(8) Note the position of the coil spring in the spring compressor as listed in the above note before removal. This is necessary for proper alignment of the shock assembly components when reassembly is made. Remove the coil spring from the spring compressor.

(9) Remove the shock absorber rod upper isolator bushing from the upper (shock absorber/upper control arm) mounting bracket (Fig. 56).

(10) Remove the shock absorber rod lower isolator bushing and sleeve from the upper (shock absorber/ upper control arm) mounting bracket (Fig. 57). Remove upper coil spring isolator from mounting bracket.

NOTE: If removal of the upper control arm is necessary, (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).

(11) Remove the lower shock rod bushing retainer washer from the shock absorber rod (Fig. 58).

(12) Remove the dust shield and cup as an assembly from the shock absorber rod by pulling both straight up and off the shock rod (Fig. 58). The jounce bumper may come off at the same time. Remove the jounce bumper and metal collar.

(13) Remove the lower spring isolator (Fig. 58) from the lower spring seat on the shock absorber.

(14) Inspect the shock assembly components for the following and replace as necessary:

- Inspect the shock for any condition of rod binding over the full stroke of the shaft.
- Check the upper mounting bracket for cracks, distortion and any sign of damage.
- Inspect the upper mounting bracket-upper control bushings for deterioration.
- Check the upper and lower shock rod isolator bushings for severe deterioration.
- Check the upper and lower spring isolators for severe deterioration.
- Inspect the dust shield for rips and deterioration.
- Inspect the jounce bumper for cracks and signs of deterioration.
- Inspect the coil spring for any sign of damage to the coating.

SHOCK ASSEMBLY (Continued)

ASSEMBLY - SHOCK ASSEMBLY

For the disassembly and assembly of the shock assembly, use strut spring compressor Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

NOTE: If the coil spring, upper mounting bracket, rod bushings, upper coil spring isolator, and upper control arm have been removed from the spring compressor, proceed with the next step, otherwise, proceed with step 7.

NOTE: If installation of the upper control arm on the upper mounting bracket is necessary, (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - INSTALLATION).

(1) Install the upper coil spring isolator on the upper (shock absorber/upper control arm) mounting bracket (Fig. 57).

CAUTION: The top and bottom shock absorber rod isolator bushings are unique to the position which they are installed on the rod. When installing the bushings on the rod, attention must be paid to their location so they are installed correctly (Fig. 59).

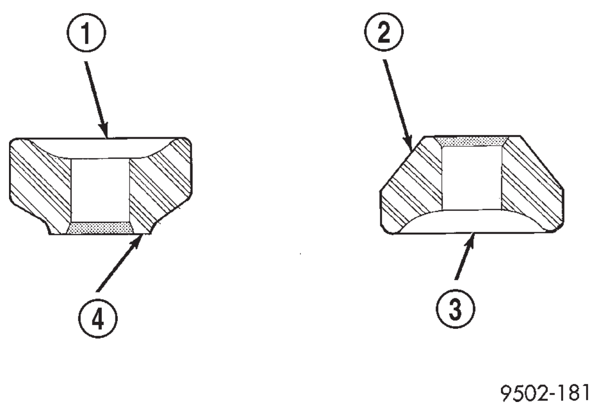

Fig. 59 Shock Absorber Rod Bushing Identification (Typical)

1 - INSTALL ON SHOCK ABSORBER ROD IN THIS DIRECTION
2 - SHOCK ABSORBER ROD UPPER ISOLATOR BUSHING
3 - INSTALL ON SHOCK ABSORBER ROD IN THIS DIRECTION
4 - SHOCK ABSORBER ROD LOWER ISOLATOR BUSHING

(2) Install the sleeve into the lower shock absorber rod isolator bushing (Fig. 57). Install the shock absorber rod lower isolator bushing and sleeve in the bottom of the upper (shock absorber/upper control arm) mounting bracket as shown (Fig. 57). From the top, install the shock absorber rod upper isolator bushing into the center of the upper mounting bracket over the sleeve protruding from the lower isolator bushing (Fig. 56). The smaller end of each bushing is to face away from the upper mounting bracket once installed.

(3) Place the lower end (smaller diameter) of the coil spring in the spring compressor supported by the lower hooks, following the manufacturer's instructions. Position the coil spring lower end tip at the position it was at before coil spring removal from the compressor as noted in Step 8 of DISASSEMBLY (Refer to 2 - SUSPENSION/FRONT/SHOCK - DISASSEMBLY). Proper orientation of the spring in the compressor is necessary for proper alignment of all shock assembly components.

(4) Install the upper (shock absorber/upper control arm) mounting bracket on top of the coil spring matching the coil spring tip to the built-in step in the isolator on the upper mounting bracket. Position the upper control arm ball joint so it lies directly below the front upper hook as shown (Fig. 53).

(5) Position the upper hooks on top of the upper mounting bracket as shown (Fig. 53).

(6) Compress the coil spring.

(7) Install the lower spring isolator on the lower spring seat of the shock absorber (Fig. 58). When installing the spring isolator, be sure the isolator sets in the notch made for the lower coil spring end.

(8) Install the jounce bumper on the shock rod (Fig. 60). Install the jounce bumper with the pointed end pointing downward.

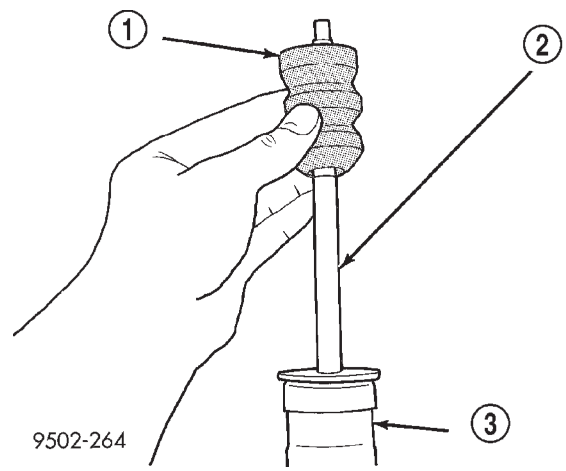

Fig. 60 Jounce Bumper Installation

1 - JOUNCE BUMPER
2 - SHOCK ABSORBER ROD

(9) Install the collar, undercut side facing down, on the rod of the shock absorber (Fig. 61). Be sure the collar is positioned squarely on the step of the shock absorber rod.

(10) Install the dust shield and cup (Fig. 58) onto the shock rod until the cup contacts the collar just

installed. The dust boot will snap over the jounce bumper. Install the lower shock rod bushing retainer washer.

(11) Install the shock through the bottom of the coil spring until the lower spring seat contacts the lower end of the coil spring. The lower coil spring end should set into the notch of the shock absorber lower seat and isolator. Install the clamp temporarily securing the shock absorber to the coil spring (Fig. 52).

(12) Install the upper shock rod bushing retainer washer. Make sure the concave side is facing up.

(13) Install the shock assembly retainer nut. Hold the shock rod from rotating using special socket Snap-On A136 ®, or an equivalent, and tighten the retainer nut using a crow foot wrench (on the end of a torque wrench and extension) to a torque of 55 N·m (40 ft. lbs.) (Fig. 54).

(14) Slowly release the tension from the coil spring by backing off the compressor drive fully. As the tension is relieved, make sure the upper mounting bracket, isolator, and coil spring align properly. Remove the clamp from the lower end of the coil spring and shock. Push back the spring compressor upper and lower hooks, then remove the shock assembly from the spring compressor.

(15) Install shock assembly on the vehicle. (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION)

INSTALLATION - SHOCK ASSEMBLY

(1) Install the shock assembly, with the clevis removed, into shock tower. Aligning the 2 locating pins and the 4 mounting holes on the upper control arm shock absorber mount with the 4 holes in shock tower. Install the 4 upper control arm mount to shock tower mounting bolts (Fig. 51). Tighten the 4 bolts to a torque of 95 N·m (70 ft. lbs.).

(2) Install the clevis on the shock absorber. Clevis is installed by tapping it onto the fluid reservoir of the shock absorber using a soft (brass) drift until fully seated against locating tab on shock absorber (Fig. 62). Orientation tab on locating tab must be positioned in the split of the clevis (Fig. 62).

(3) Install the pinch bolt retaining the shock clevis to the shock absorber (Fig. 49). Tighten the pinch bolt to a torque of 88 N·m (65 ft. lbs.)

(4) Install the clevis bracket to lower control arm thru-bolt (Fig. 50). Do not tighten the thru-bolt at this time.

(5) Install upper ball joint into steering knuckle. Install nut on ball joint stud. Tighten nut to a torque of 27 N·m (20 ft. lbs.).

(6) Install the routing bracket for the wheel speed sensor cable (Fig. 47) on the steering knuckle. Install and securely tighten the routing bracket attaching bolt (Fig. 47).

CAUTION: When supporting lower control arm with jack stand, do not position jack stand under the ball joint cap on the lower control arm. Position in area of lower control arm shown in (Fig. 63).

(7) Lower vehicle to the ground with a jack stand positioned under the lower control arm (Fig. 63). Continue to lower vehicle so the total weight of the

(8) Tighten the shock absorber clevis to lower control arm bushing thru-bolt nut to a torque of 88 N·m (65 ft. lbs.).

(9) Raise the vehicle, then remove the jack stand.

(10) Install the tire and wheel assembly. Progressively tighten the wheel mounting nuts in a criss-cross sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(11) Lower the vehicle.

STABILIZER BAR

DESCRIPTION

The stabilizer bar interconnects both front lower control arms of the vehicle and is attached to the front suspension cradle and the underbody of the vehicle.

Attachment of the stabilizer bar to the front suspension cradle is through 2 rubber-isolator bushings and bushing retainers. The stabilizer bar to lower control arm attachment is done utilizing a ball joint type, stabilizer bar attaching link. All parts of the stabilizer bar are replaceable as individual components, and the bushings attaching the stabilizer bar to crossmember are split for easy removal and installation.

OPERATION

Jounce and rebound movements affecting one wheel are partially transmitted to the opposite wheel of the vehicle to stabilize body roll through the stabilizer bar.

DIAGNOSIS AND TESTING - STABILIZER BAR

Inspect for broken or distorted stabilizer bar bushings, bushing retainers, and worn or damaged stabilizer bar to control arm attaching links.

REMOVAL

REMOVAL - STABILIZER BAR

(1) Raise vehicle on jack stands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove nuts and stabilizer bar attaching link assemblies from the front lower control arms (Fig. 64). When removing attaching link nut, keep stud from turning by installing an allen wrench in the end of the stud (Fig. 64).

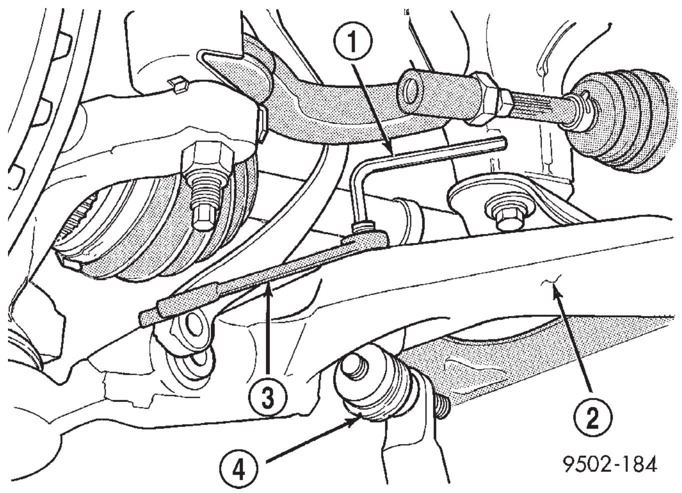

Fig. 64 Stabilizer Bar Attaching Link Nut Removal

2 - LOWER CONTROL ARM
3 - WRENCH
4 - STABILIZER BAR LINK ASSEMBLY

(3) Remove the 4 bolts attaching the stabilizer bar bushing retainers to the front suspension crossmember and body (Fig. 65). Then remove the stabilizer bar assembly from the vehicle.

STABILIZER BAR INSPECTION

Inspect for broken or distorted stabilizer bar bushings, clamps and attaching links. If stabilizer bar to front crossmember bushing replacement is required, bushing can be removed using the stabilizer bar bushing removal procedure in the Disassembly And Assembly section in this group of the service manual.

If inspection determines that replacement of a stabilizer bar to lower control arm attachment link is required, replace the link before installing stabilizer bar.

REMOVAL - STABILIZER BAR BUSHING (FRONT)

(1) Bend back the 4 crimp locations on the stabilizer bar bushing retainer (Fig. 66).

(2) Separate the stabilizer bar bushing retainer.

(3) Stabilizer bar bushings are removed by opening slit and peeling bushing off stabilizer bar.

INSTALLATION

INSTALLATION - STABILIZER BAR

(1) Position stabilizer bar and bushings as an assembly into front crossmember. Install the stabilizer bar bushing retainer to crossmember and body attaching bolts (Fig. 65).

(2) Tighten the bushing retainer attaching bolts to a torque of 61 N·m (45 ft. lbs.).

(3) Align stabilizer bar attaching link assemblies with attaching link mounting holes in the lower control arms. Install stabilizer bar attaching links into both lower control arms. Install the attaching link to lower control arm retaining nuts. Torque the stabilizer bar attaching link nuts to 101 N·m (75 ft. lbs.).

INSTALLATION - STABILIZER BAR BUSHING

(1) Install new stabilizer bar bushings on the stabilizer bar. **Bushings must be installed on sway bar with slit in bushing facing front of vehicle when sway bar is installed.**

(2) Install bushing retainers back on stabilizer bar bushings.

UPPER BALL JOINT

DESCRIPTION

The ball joint is pressed into the upper control arm and has a tapered stud for attachment to the steering knuckle. The ball joint stud is attached and locked into the steering knuckle using a special nut. The ball joint is a sealed-for-life type and requires no maintenance. If the ball joint is defective it will require replacement of the entire upper control arm.

OPERATION

The ball joint is a pivotal joint that allows the knuckle to move up and down and turn with ease.

DIAGNOSIS AND TESTING - UPPER BALL JOINT

With the weight of the vehicle resting on the road wheels, grasp the grease fitting and with no mechanical assistance or added force, attempt to move the grease fitting.

If the ball joint is worn the grease fitting will move easily. If movement is noted, replacement of the upper control arm is required.

UPPER CONTROL ARM

DESCRIPTION

The upper control arm is a high strength steel stamping. The upper control arm uses the 2 rubber bushings of the upper control arm/shock absorber mounting bracket to isolate it from the mounting bracket and the body of the vehicle. The upper control arm is bolted to the top of the steering knuckle through the upper ball joint.

If damaged, the upper control arm is serviced only as a complete component. Inspect the upper control arm for any signs of damage. If control arm shows any sign of damage the upper control arm must be replaced. Do not attempt to repair or straighten a broken or bent upper control arm.

OPERATION

The upper control arm supports the upper end of the steering knuckle and allows for the up and down movement of the suspension during the jounce and rebound travel.

REMOVAL - UPPER CONTROL ARM

(1) Remove the front shock assembly from the vehicle. (Refer to 2 - SUSPENSION/FRONT/SHOCK - REMOVAL)

(2) Disassemble the shock assembly until the upper (shock absorber/upper control arm) mounting bracket is removed from the coil spring. (Refer to 2 - SUSPENSION/FRONT/SHOCK - DISASSEMBLY)

(3) Remove the 2 bolts attaching the upper control arm to the bushings in the upper mounting bracket (Fig. 67).

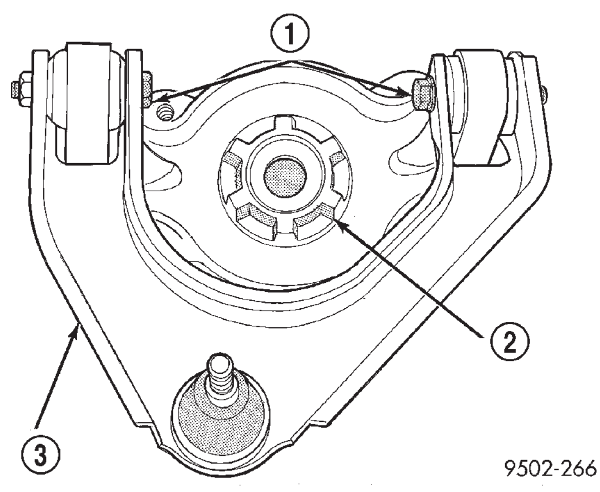

Fig. 67 Upper Control Arm To Mounting Bracket Attachment

1 - CONTROL ARM MOUNTING BOLTS
2 - UPPER CONTROL ARM MOUNTING BRACKET
3 - UPPER CONTROL ARM

(4) Remove the upper control arm from the mounting bracket.

INSPECTION - UPPER CONTROL ARM

If damaged, the upper control arm is serviced only as a complete component. Inspect the upper control arm for any signs of damage. If control arm shows any sign of damage the upper control arm must be replaced. Do not attempt to repair or straighten a broken or bent upper control arm.

INSTALLATION - UPPER CONTROL ARM

(1) Install the upper control arm on the upper (shock absorber/upper control arm) mounting bracket.

(2) Install the 2 bolts attaching the upper control arm to the bushings in the mounting bracket (Fig. 67). The bolts must be installed from center, so the heads are toward the coil spring when it is installed. **The bolts MUST be installed so the head of the bolt will be toward the coil spring when the mounting bracket is installed on shock absorber (Fig. 67).**

CAUTION: For clearance reasons the control arm mounting bolts must be installed from center, so the heads are toward the coil spring when it is installed. Otherwise the bolts may rub the coil spring, damaging it.

(3) Install the control arm mounting bolt nuts. Position the control arm at a 90 degree angle to the mounting bracket and tighten the bolts to a torque of 90 N·m (66 ft. lbs.).

(4) Reinstall the upper mounting bracket and control arm on the coil spring. Reassemble the front shock assembly. (Refer to 2 - SUSPENSION/FRONT/SHOCK - ASSEMBLY)

(5) Reinstall the front shock assembly on the vehicle. (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION)

REAR SUSPENSION

TABLE OF CONTENTS

REAR SUSPENSION

DESCRIPTION - REAR SUSPENSION

The rear suspension used on this vehicle is a fully independent short and long arm style suspension. Each side of the rear suspension consists of these major components:

- a shock assembly
- a knuckle
- an upper control arm
- two lateral links
- a trailing link
- a stabilizer bar (one per vehicle shared by each side)

OPERATION - REAR SUSPENSION

The rear suspension allows each rear wheel on vehicle to adapt to different road surfaces and conditions without affecting the control of the vehicle. Each side of the suspension is allowed to move independently from the other.

WARNING

WARNINGS AND CAUTIONS

WARNING: DO NOT REMOVE A SHOCK ROD NUT WHILE THE SHOCK ASSEMBLY IS INSTALLED IN VEHICLE, OR BEFORE THE SHOCK ASSEMBLY SPRING IS COMPRESSED.

REAR SUSPENSION (Continued)

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on vehicles having a fully independent rear suspension. Vehicles with independent rear suspension can not be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used damage to rear suspension components will occur.

NOTE: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

HUB / BEARING

DESCRIPTION

The hub and bearing is a combined rear wheel hub and wheel bearing unit. All vehicles are equipped with permanently lubricated and sealed for life rear hub and bearing assemblies. There is no periodic lubrication or maintenance recommended for these units.

The hub and bearing is mounted to the rear knuckle's spindle using a retaining nut. The tire and wheel assembly, and rear brake drum or disc attaches to the studs protruding from the hub flange with wheel mounting studs.

OPERATION

The hub and bearing has internal bearings that allow it to rotate with the tire and wheel.

DIAGNOSIS AND TESTING - HUB AND BEARING

The rear hub and bearing assembly is designed for the life of the vehicle and should require no maintenance. The following procedure may be used for evaluation of bearing condition.

With wheel and brake drum removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

REMOVAL - HUB AND BEARING

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove rear wheel and tire assembly.

(3) Remove the rear brake caliper and rotor. (Refer to 5 - BRAKES/HYDRAULIC-MECHANICAL/ROTORS — REMOVAL). Remove the brake rotor by pulling the rotor straight off the wheel mounting studs.

(4) Remove dust cap from rear hub and bearing assembly by prying it off.

(5) Remove hub and bearing retaining nut.

(6) Remove rear hub and bearing from the spindle by pulling it straight off the spindle by hand.

INSTALLATION - HUB AND BEARING

(1) Install the hub and bearing assembly on the knuckle spindle. Install a NEW retaining nut. Tighten the retaining nut to a torque of 250 N·m (185 ft. lbs.).

(2) Install the hub and bearing dust cap using a soft faced hammer.

(3) Install the brake rotor on the hub and bearing.

(4) Install the disc brake caliper. Refer to Brakes.

(5) Install the rear tire and wheel assembly on vehicle. Tighten all wheel stud nuts in crisscross pattern to one-half the specified torque. Repeat pattern, fully tightening the stud nuts to a torque of 135 N·m (100 ft. lbs.).

(6) Lower the vehicle.

KNUCKLE

DESCRIPTION

A cast iron rear knuckle is attached to each side of the vehicle through the upper control arm and ball joint, the rear shock assembly, the lateral links and the trailing link. The knuckle serves as a mounting point for the rear hub and bearing, tire and wheel, and rear brakes.

OPERATION

The knuckle moves up and down with the tire and wheel under jounce and rebound conditions while acting as a mount for the rear hub and bearing, tire and wheel, and rear brakes. The lateral movement of the rear knuckle is controlled using two lateral arms attached to the bottom of the knuckle and by the upper control arm attached to the top of the knuckle.

DIAGNOSIS AND TESTING - KNUCKLE

Inspect the knuckle for physical damage. If it is determined that the knuckle is cracked, bent or broken when servicing the vehicle, no attempt is to be made to repair or to straighten the knuckle. The rear knuckle is not a repairable component of the rear suspension and must be replaced if found to be damaged in any way.

REMOVAL

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove the rear wheel and tire assembly.

(3) Remove rear brake drum from rear hub and bearing assembly.

(4) If vehicle is equipped with antilock brakes remove the rear wheel speed sensor from the brake support plate and brake flex hose routing bracket (Fig. 1).

(8) Remove the nuts and bolts attaching the forward and rear lateral links (Fig. 7) to the rear knuckle.

(9) Back off nut retaining upper control arm ball joint to knuckle until it is flush with the end of the ball joint stud. Leaving the nut on in this fashion will protect threads from damage during next step.

(10) Release ball joint stud from knuckle using Puller, Special Tool, CT-1106 (Fig. 8).

(11) Remove nut retaining upper control arm ball joint to knuckle.

(12) Remove the nut and washer attaching the trailing link to the rear knuckle. Use a wrench on the flat of the trailing link to keep it from turning when removing nut (Fig. 9).

(5) Install rear brake support plate assembly onto the knuckle. Install the 4 bolts attaching rear brake support plate to rear knuckle (Fig. 5). Tighten the attaching bolts to a torque of 61 N·m (45 ft. lbs.).

(6) If vehicle is equipped with ABS brakes, install speed sensor head into rear brake support plate (Fig. 12). Torque speed sensor head mounting bolt to 7 N·m (60 in. lbs.).

(7) Attach routing bracket for speed sensor cable to brake flex hose bracket and securely tighten attaching bolt (Fig. 1).

(8) Install park brake cable into brake support plate. Ensure cable retainer is securely holding cable to support plate. Then connect park brake cable to park brake lever on brake shoe.

(9) Install rear hub and bearing assembly on knuckle and install hub and bearing assembly retaining nut. Tighten retaining nut to a torque of 250 N·m (185 ft. lbs).

(10) Install the brake drum on the hub/bearing assembly.

(11) Install wheel and tire assembly on vehicle. Progressively tighten the wheel mounting nuts in crisscross sequence until all nuts are torqued to half

LATERAL LINK

DESCRIPTION

The lateral links connect the lower front and rear of the knuckle to the rear crossmember. They have rubber isolator bushings at each end to isolate suspension noise from the body of the vehicle. The forward link allows for stabilizer bar attachment through stabilizer bar attachment links.

OPERATION

The lateral movement of the rear knuckle is controlled by the lateral links connecting the front and rear of the knuckle to the rear suspension crossmember. The metal sleeves of the links are adjustable for setting rear wheel alignment.

DIAGNOSIS AND TESTING - LATERAL LINKS

Inspect the lateral link isolator bushings and sleeves for signs of damage or deterioration. If the lateral link isolator bushings or sleeves are damaged or are deteriorated, replacement of the lateral link assembly will be required. The isolator bushings are not serviceable as a separate component of the lateral link assembly.

Inspect the lateral links for signs of contact with the ground or road debris which has bent or caused other damage to the lateral link. If the lateral link is bent or damaged, the lateral link will require replacement. **Do not attempt to repair or straighten a lateral link.**

CAUTION: Do not apply heat to the lateral link adjusting screws or to the jam nuts, when loosening or adjusting the lateral links.

REMOVAL

CAUTION: Do not attempt to straighten or repair a lateral link. Do not apply heat to the lateral link adjusting screws or to the jam nuts, when loosening or adjusting the lateral links.

NOTE: The rear suspension lateral links are only serviced as complete assemblies. The isolator bushings used in the lateral links are not serviced as separate components.

FORWARD LATERAL LINK

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove the rear wheel and tire assembly.

(3) Remove the rear stabilizer bar link from the forward lateral link (Fig. 13).

SHOCK ASSEMBLY

DESCRIPTION - SHOCK ASSEMBLY

The rear shock absorber assemblies support the weight of the vehicle using coil springs positioned around the shock absorbers. The coil springs are contained between the upper mount of the shock absorber and a lower spring seat on the body of the shock absorber.

The top of each shock absorber assembly is bolted to the top of the inner fender through a microcellular urethane isolated mount.

The bottom of the shock absorber assembly attaches to the rear knuckle using a thru-bolt.

The rear coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. Coil springs come in a various rates; be sure the correct spring is in use.

The components of the shock assembly listed below are serviceable:

- Shock rod nut
- Shock mount
- Shock rod bushings
- Upper spring isolator
- Dust shield
- Cup
- Jounce bumper
- Lower spring isolator
- Coil spring
- Strut

OPERATION - SHOCK ASSEMBLY

The shock absorber assembly cushions the ride of the vehicle, controlling vibration, jounce and rebound of the suspension.

The coil spring controls ride quality and maintains ride height.

The jounce bumper limits suspension travel and metal-to-metal contact under full jounce.

The shock absorber dampens jounce and rebound motions of the coil spring and suspension.

DIAGNOSIS AND TESTING - SHOCK ASSEMBLY

(1) Inspect for damaged or broken coil springs.

(2) Inspect for torn or damaged shock absorber dust shield.

(3) Inspect for damaged lower spring isolator.

(4) Lift dust boot and inspect shock absorber for evidence of fluid running from the upper end of fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the shock absorber rod and shock absorber rod seal is not unusual and does not affect performance of the shock absorber. Also inspect jounce bumpers for signs of damage or deterioration.

REMOVAL - SHOCK ASSEMBLY

NOTE: Access for the nuts attaching the rear shock assembly upper mount to the vehicle is through the inside of the trunk.

(1) Roll back carpeting on top of the rear shock tower to access shock mounting nuts.

(2) Remove plastic cover from the top of the shock assembly.

(3) Remove 2 nuts attaching the shock assembly upper mount/spring seat to the shock tower.

(4) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(5) Remove the rear wheel and tire assembly from the vehicle.

(6) Remove two fasteners holding the splash shield to the shock assembly upper mount.

(7) Remove bolt attaching shock absorber to rear knuckle (Fig. 17).

SHOCK ASSEMBLY (Continued)

(8) Remove the shock absorber from the rear knuckle first when removing the shock absorber from vehicle by pushing down on the rear suspension.

(9) Move shock assembly downward and tilt top of shock outward, then remove shock assembly from vehicle through top of wheel opening.

DISASSEMBLY - SHOCK ASSEMBLY

The shock assembly must be removed from the vehicle for it to be disassembled and assembled. (Refer to 2 - SUSPENSION/REAR/SHOCK - REMOVAL)

For the disassembly and assembly of the shock assembly, use strut spring compressor Pentastar Service Equipment (PSE) tool W-7200, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: DO NOT REMOVE THE SHOCK ROD NUT BEFORE THE COIL SPRING IS COMPRESSED. THE COIL SPRING IS HELD UNDER PRESSURE AND MUST BE COMPRESSED, REMOVING SPRING TENSION FROM THE UPPER MOUNTING BRACKET BEFORE THE ROD NUT IS REMOVED.

(1) If both shocks are being serviced at the same time, mark the coil spring and shock assembly according to which side of the vehicle the shock was removed from, and which shock the coil spring was removed from.

(2) Position the shock assembly in the strut coil spring compressor following the manufacturer's instructions. Set the lower hooks and install the clamp on the lower end of the coil spring, so the shock is held in place once the shock shaft nut is removed. Lower the upper hooks and position them on the coil spring near the top.

(3) Compress the coil spring until all coil spring tension is removed from the upper mounting bracket.

(4) Hold the shock rod from rotating using special socket Snap-On® A136, or equivalent, and remove the retainer nut.

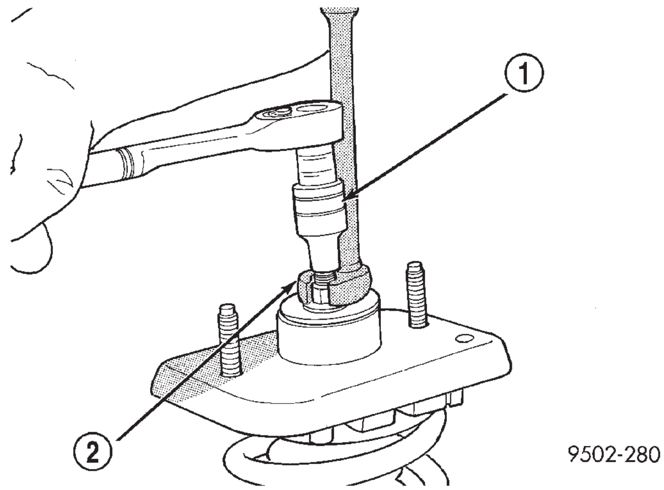

Fig. 18 Retainer Nut Removal/Installation (Typical)

(5) Remove the upper shock rod bushing retainer washer from the shock rod.

(6) Remove the upper shock mount and the rod isolator bushings as an assembly from the rod of the shock absorber.

(7) Remove the upper coil spring isolator from the top of the coil spring.

(8) Remove the lower shock rod bushing washer from the top of the dust boot and shock absorber rod.

(9) Remove the dust shield and cup as an assembly from the shock absorber rod by pulling both straight up and off the shock rod.

(10) Remove the clamp from the bottom of the coil spring and remove the shock absorber, lower spring isolator, jounce bumper, and collar out through the bottom of the coil spring.

(11) Remove the jounce bumper and the collar (Fig. 19) from the rod of the shock absorber.

(12) Remove the lower coil spring isolator (Fig. 20) from the lower spring seat on the shock absorber.

(13) Remove the upper shock rod isolator bushing and sleeve from the upper shock mount.

(14) Remove the lower shock rod isolator bushing from the upper shock mount.

(15) Inspect the shock assembly components for the following and replace as necessary:

- Inspect the shock for any condition of rod binding over the full stroke of the shaft.

• Check the upper shock mount for cracks and distortion, and locating studs for any sign of damage.
• Check the upper and lower shock rod isolator bushings for severe deterioration of the rubber.
• Check the upper and lower coil spring isolators for severe deterioration of the rubber.
• Inspect the dust shield for rips and deterioration.
• Inspect the jounce bumper for cracks and signs of deterioration.
• Inspect the coil spring for any sign of damage to the coating.

(16) If the coil spring needs to be serviced, release the tension from the coil spring by backing off the compressor drive fully. Push back the compressor upper hooks and remove the coil spring from the compressor.

ASSEMBLY - SHOCK ASSEMBLY

(1) If the coil spring has been removed from the compressor, place the lower end (smaller diameter) of the coil spring in the spring compressor supported by the lower hooks at the same position as in disassembly, following the manufacturer's instructions.

(2) Position the upper hooks of the spring compressor on the coil spring near the top as in disassembly.

(3) Compress the coil spring enough to reinstall the shock absorber and upper mount.

(4) Install the lower shock rod isolator bushing in the bottom of the upper shock mount. The smaller end is to be pointed away from the mount when installed.

(5) Install the upper shock rod isolator bushing and sleeve in the upper shock mount until seated into lower bushing. The smaller end of the bushing is to be pointed away from the mount when installed.

(6) Install the lower coil spring isolator on the lower spring seat of the shock absorber (Fig. 20).

(7) Install the jounce bumper as shown on the rod of the shock absorber (Fig. 21).

(8) Install the collar on the rod of the shock absorber assembly with the undercut side of sleeve facing down (Fig. 22). Push the collar down until seated on the step of the shock absorber rod.

(9) Install the shock through the bottom of the coil spring until the lower spring seat contacts the lower end of the coil spring. Install the clamp temporarily securing the shock absorber to the coil spring.

(10) Install dust shield and cup over the jounce bumper and onto the rod of the shock absorber.

(11) Install the lower shock rod bushing retainer washer on the shock absorber rod.

(12) Install the upper spring isolator on the top of the coil spring. The bottom of the isolator is contoured to fit around the inside diameter of the coil spring and has a step built into it that the end of the coil spring must fit into upon installation.

(13) Install the upper shock mount bracket and rod isolator bushings as an assembly on the top of the rod of the shock absorber.

(14) Install the upper shock rod bushing retainer washer. Make sure the concave side is facing up.

(15) Install the shock assembly retainer nut. Hold the shock rod from rotating using special socket Snap-On® A136, or equivalent, and tighten the retainer nut using a crow foot wrench (on the end of a torque wrench and extension) to a torque of 55 N·m (40 ft. lbs.) (Fig. 18).

(16) Position the upper shock mount so it's studs are in line with the bolt hole in the shock absorber lower bracket.

(17) Slowly release the tension from the coil spring by backing off the compressor drive fully. As the tension is relieved, make sure the upper mount, isolator, and coil spring align properly. Remove the clamp from the lower end of the coil spring and shock. Push back the spring compressor upper and lower hooks, then remove the shock assembly from the spring compressor.

(18) Install shock assembly on the vehicle. (Refer to 2 - SUSPENSION/REAR/SHOCK - INSTALLATION)

INSTALLATION - SHOCK ASSEMBLY

(1) Install shock assembly back in vehicle using the reverse sequence of removal.

(2) Install upper shock mount into the mounting holes in rear shock tower.

(3) Push down on rear knuckle to obtain clearance and then install shock absorber clevis bracket on rear knuckle.

(4) Align clevis bracket on shock absorber with bushing in knuckle. Install and tighten bolt to a torque of 95 N·m (70 ft. lbs.).

(5) Lower vehicle far enough to gain access to the trunk.

(6) Install and tighten the 2 shock assembly upper mounting nuts to a torque of 54 N·m (40 ft. lbs.).

(7) Install plastic cover on shock assembly.

(8) Install carpeting back on shock tower.

(9) Install fasteners securing splash shield to shock mount.

(10) Install wheel and tire assembly on vehicle. Install all wheel mounting nuts in proper sequence until all nuts are torqued to half specification. Repeat tightening sequence to full specified torque of 135 N·m (100 ft. lbs.).

(11) Lower vehicle to the ground.

STABILIZER BAR

DESCRIPTION

The stabilizer bar interconnects the forward lateral links of the vehicle's rear suspension and is attached to the rear suspension crossmember of the vehicle.

Attachment of the stabilizer bar to the rear crossmember of the vehicle is through 2 rubber-isolator bushings and bushing retainers. The stabilizer bar to lateral link attachment is done utilizing a rubber isolated stabilizer bar attaching link. All parts of the stabilizer bar are serviceable, and the stabilizer bar to rear suspension isolator bushings are split for easy removal and installation. The split in the stabilizer bar to crossmember bushing must be positioned toward the front of the vehicle, when the stabilizer bar is installed on the vehicle.

OPERATION

Jounce and rebound movements affecting one rear wheel of the vehicle are partially transmitted to the opposite wheel of the vehicle through the stabilizer bar to stabilize body roll.

DIAGNOSIS AND TESTING - STABILIZER BAR

Inspect the stabilizer bar for damage or bending.

Inspect for broken or distorted stabilizer bar bushings, and bushing retainers. When inspecting the stabilizer bar bushings, be sure that the slit in the bushings are positioned so that it is facing toward the front of the vehicle.

STABILIZER BAR (Continued)

Inspect the bushings and sleeves in the stabilizer bar attaching links for damage or deterioration. Inspect the stabilizer bar attaching link to ensure it is not bent or broken. If any of these conditions are present when inspecting the attaching links, replacement of the attaching link is required.

REMOVAL

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove both rear wheel and tire assemblies from the vehicle.

(3) From each side of the vehicle, remove the nut (Fig. 23) attaching the stabilizer bar attaching link/isolator bushings to the stabilizer bar.

(4) Remove the 4 bolts attaching the stabilizer bar bushing clamps to the rear suspension crossmember (Fig. 24).

(5) Remove the rear stabilizer bar to crossmember bushing clamps and bushings from the stabilizer bar.

(6) Remove stabilizer bar from vehicle. Stabilizer bar will come out of vehicle between the exhaust pipe and the rear suspension crossmember.

STABILIZER BAR BUSHING INSPECTION

Inspect for broken or distorted retainers and bushings. If bushing replacement is required, bushings can be removed by opening slit in bushing and removing bushing from around stabilizer bar.

INSTALLATION

(1) Install stabilizer bar back in vehicle with the bushings removed using the reverse sequence of removal.

(2) When stabilizer bar is installed in vehicle, it must be installed with the bend in the end of the stabilizer bar positioned up in vehicle when viewed from the side (Fig. 25).

(3) Install the stabilizer bar onto the stabilizer bar to forward lateral link attaching links (Fig. 23). Install the stabilizer bar to attaching link bushings on attaching links. Tighten the bushing retaining nuts to a torque of 35 N·m (26 ft. lbs.).

(4) Loosely install the stabilizer bar bushing clamps on the rear suspension crossmember

STABILIZER BAR (Continued)

(5) Position the stabilizer bar so it is centered in the vehicle and does not contact other suspension components or vehicle body.

(6) Tighten the bolts attaching the stabilizer bar bushing clamps to the rear crossmember to a torque of 27 N·m (19 ft. lbs.) (Fig. 24).

(7) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(8) Lower vehicle to the ground.

TRAILING LINK

DESCRIPTION

The trailing link on each side of the vehicle bolts to the bottom of the knuckle and to a bracket attached to the floor pan of the vehicle. The trailing link is steel and has rubber isolator bushings, retainer washers and nuts at each end to isolate suspension noise from the body of the vehicle.

OPERATION

Fore and aft movement of the knuckle is controlled by a trailing link.

DIAGNOSIS AND TESTING - TRAILING LINK

Inspect the trailing link bushings and retainers for signs of deterioration or damage. If the trailing link bushings are deteriorated or the retainers are damaged, replacement of the trailing link bushings and or the retainers will be required. The bushings and retainers are serviceable as separate components of the trailing link.

Inspect the trailing link for signs of contact with the ground or road debris which has bent or caused other damage to the trailing link. If the trailing link is bent or damaged the trailing link will require replacement. Do not ever attempt to repair or straighten a trailing link.

REMOVAL

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove rear wheel and tire assembly from the vehicle.

(3) At the knuckle, remove the nut, bushing retainer and outer trailing link bushing (Fig. 26) from the trailing link.

(4) Remove the 4 bolts (Fig. 27) attaching the trailing link hanger bracket to the floor pan and frame rail.

(5) Remove the trailing link and mounting bracket as an assembly from the vehicle.

CAUTION: The installation position of the bushings and retainers on the trailing link is important. When separating the trailing link from the hanger bracket, note the position and orientation on the bushings and retainers to ensure they are re-installed correctly.

TRAILING LINK (Continued)

(6) Separate the trailing link from the hanger bracket. To separate trailing link from hanger bracket, use a large adjustable wrench on flat of trailing link to turn link while holding nut stationary (Fig. 28).

INSTALLATION

CAUTION: The inner and outer trailing link to hanger bracket bushings and retainers must be installed in their correct position on the trailing link. Do not reverse the position of the inner and outer trailing link bushing or retainers on the trailing link.

NOTE: When installing trailing link into hanger bracket, the flat on the trailing link (Fig. 28) must be positioned at the hanger bracket.

(1) Install the (black) inner bushing retainer, and inner bushing (Fig. 29) on the trailing link. Install the trailing link, retainer and bushing on the hanger bracket (Fig. 29). Then install the outer bushing, (gold) outer bushing retainer and nut (Fig. 29) on the trailing link. Using a large adjustable wrench on flat of trailing link to keep it from rotating, tighten the trailing link retaining nut to a torque of 99 N·m (73 ft. lbs.).

(2) Install the (black) inner bushing retainer, and inner bushing (Fig. 29) on the trailing link.

(3) Install knuckle end of trailing link in rear knuckle.

CAUTION: It is important that the following procedure be done when installing the trailing arm hanger bracket to the body of the vehicle. This procedure will ensure that the hanger bracket is installed in the correct position on the vehicle.

(4) Install trailing link hanger bracket on vehicle and loosely install the 4 attaching bolts (Fig. 30). Then install 2 drift pins of appropriate size in positioning holes on hanger bracket and into locating holes in body (Fig. 30). With hanger bracket correctly positioned on vehicle tighten the 4 hanger bracket mounting bolts to a torque of 34 N·m (25 ft. lbs.).

CAUTION: When installing trailing link bushing retainers, the retainers must be installed with cupped side of retainer facing away from bushing and knuckle (Fig. 26).

(5) At the knuckle, install the outer trailing link bushing, (gold) outer bushing retainer and retaining nut on trailing link (Fig. 26). Using a large adjustable wrench on flat of trailing link to keep it from rotating tighten the trailing link retaining nut (Fig. 26) to a torque of 99 N·m (73 ft. lbs.).

UPPER BALL JOINT

DESCRIPTION

The ball joint is pressed into the upper control arm and has a tapered stud for attachment to the steering knuckle. The ball joint stud is attached and locked into the steering knuckle using a special nut. The ball joint is a sealed-for-life type and requires no maintenance.

DIAGNOSIS AND TESTING - UPPER BALL JOINT

With the weight of the vehicle resting on the road wheels, grasp the grease fitting and with no mechanical assistance or added force, attempt to move the grease fitting.

If the ball joint is worn, the grease fitting will move easily. If movement is noted, replacement of the ball joint is required.

UPPER CONTROL ARM

DESCRIPTION

An upper control arm is attached to the top of each rear knuckle, connecting the knuckle to the rear suspension crossmember.

The attachment of the upper control arm to the knuckle is achieved through a ball joint in the upper control arm. The upper control arm is bolted to the rear suspension crossmember using a pivot bar which is rubber isolated from the upper control arm.

OPERATION

The upper control arm supports the upper end of the knuckle and allows for the up and down movement of the suspension under jounce and rebound travel.

REMOVAL

NOTE: The rear control arm, control arm bushings, and pivot bar are serviced as a complete assembly on this vehicle. Do not attempt to disassemble the control arm from the pivot bar to service the rear control arm bushings.

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove both rear wheel and tire assemblies from the vehicle.

(3) Remove the shock absorber clevis bracket to rear knuckle attaching bolt and nut (Fig. 31) on both sides of the vehicle.

(4) Remove muffler support bracket from rear frame rail (Fig. 32).

(5) Remove the rear exhaust pipe hanger bracket from the rear suspension crossmember (Fig. 33). Let exhaust system drop down as far as possible.

(6) If vehicle is equipped with antilock brakes, remove routing clips for wheel speed sensor cable from brackets on both upper control arms (Fig. 34).

(7) If vehicle is equipped with antilock brakes, remove bolts and wheel speed sensor heads from both rear knuckles.

(8) Remove both rear disc brake calipers from knuckles and hang out of way using wire or cord. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL). Do not allow calipers to hang by brake hoses.

(9) Release brake tubing from clips on top of crossmember.

(10) On the side of the vehicle requiring control arm removal, separate the control arm ball joint from the rear knuckle using following procedure:

(a) Back off nut retaining upper control arm ball joint to knuckle until nut is even with end of stud. This action will help avoid damaging the stud threads when the stud is released from the knuckle in the following step.

(b) Remove ball joint stud from knuckle using Puller, Special Tool, CT- 1106 (Fig. 35).

(c) Remove nut retaining upper control arm ball joint to knuckle.

(11) Position a transmission jack and wooden block under the center of the rear suspension crossmember to support and lower crossmember during removal (Fig. 36).

(12) Remove the 4 bolts (Fig. 37) attaching rear suspension crossmember to rear frame rails.

CAUTION: When lowering rear suspension crossmember do not put a strain on the rear brake flex hoses.

(13) Lower the rear suspension crossmember far enough to access the upper control arm pivot bar to crossmember attaching bolts.

(14) Remove the 2 bolts attaching the upper control arm to the rear suspension crossmember (Fig. 38).

(15) Remove the upper control arm from the rear suspension crossmember.

(16) Transfer any required components to the replacement control arm.

DISASSEMBLY - UPPER BALL JOINT

The rear upper control arm must be removed from the vehicle for replacement of the ball joint. (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - REMOVAL)

(1) Position Receiving Cup, Special Tool 6758, to support control arm when removing ball joint assembly (Fig. 39). Install Remover/Installer, Special Tool 6804 on top of ball joint assembly (Fig. 39).

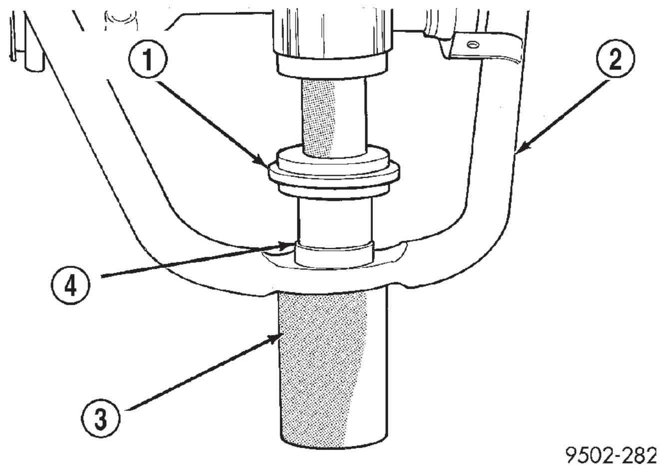

Fig. 39 Removing Ball Joint From Upper Control Arm

2 - CONTROL ARM
3 - SPECIAL TOOL 6758
4 - BALL JOINT

(2) Using an arbor press, press the ball joint assembly out of the control arm.

INSPECTION

Inspect the control arm for physical damage. If it is determined that the upper control arm is broken or bent, the upper control arm must be replaced. The rear suspension upper control arm is not a repairable component and no attempt is to be made to repair or to straighten it. The upper control arm must be replaced if found to be damaged in any way.

Inspect the control arm pivot bushings for deterioration. If found to need replacement, the upper control arm is to be replaced.

The rear control arm, control arm bushings, and pivot bar are serviced as a complete assembly on this vehicle. Do not attempt to disassemble the control arm from the pivot bar to service the rear control arm bushings.

The only component on the upper control arm that is serviceable is the rear upper ball joint and its seal.

ASSEMBLY - UPPER BALL JOINT

(1) By hand, position ball joint assembly into ball joint bore of control arm. Be sure ball joint assembly is not cocked in the bore of the control arm. This will cause binding of the ball joint assembly when being pressed into lower control arm.

(2) Position assembly in an arbor press with Receiving Cup, Special Tool 6758, supporting lower control arm (Fig. 40). Then install Remover/Installer, Special Tool 6804, on the top of the ball joint assembly (Fig. 40).

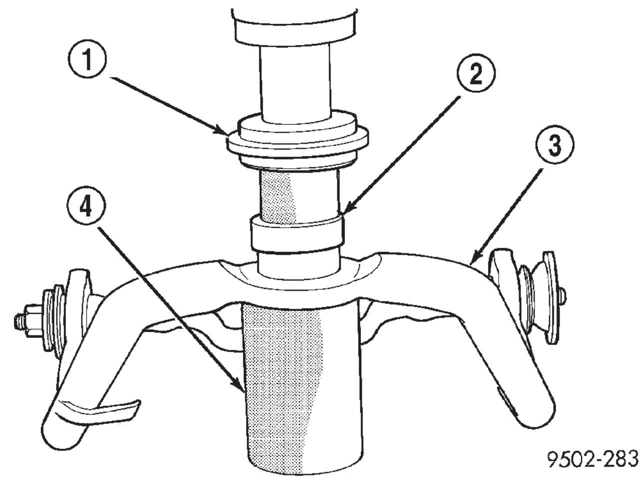

Fig. 40 Installing Ball Joint In Upper Control Arm

2 - BALL JOINT
3 - CONTROL ARM
4 - SPECIAL TOOL 6758

CAUTION: When installing the ball joint in the upper control arm, do not press the ball joint into the control arm all the way. The lip on the ball joint must not touch the surface of the control arm. Refer to Step 3 below when installing the ball joint.

(3) Carefully align all pieces. Using the arbor press, press the ball joint into the control arm until a gap of 3 mm (1/8 inch) is between lip on ball joint and surface of lower control arm.

(4) Reinstall the control arm on the vehicle. (Refer to 2 - SUSPENSION/REAR/UPPER CONTROL ARM - INSTALLATION)

INSTALLATION

(1) Align the pivot bar on the upper control arm with the mounting holes in the rear suspension crossmember. Install the pivot bar attaching bolts (Fig. 38). Tighten the 2 pivot bar attaching bolts to a torque of 108 N·m (80 ft. lbs.).

(2) Using transmission jack, raise rear suspension crossmember up to the rear frame rails and loosely install the 4 attaching bolts (Fig. 37).

UPPER CONTROL ARM (Continued)

(3) Position an appropriate size drift into the positioning hole in each side of rear suspension crossmember and crossmember locating holes in frame rails of the vehicle (Fig. 41). This is required to properly position rear suspension crossmember to the body of the vehicle. Tighten the 4 crossmember to frame rail attaching bolts to 108 N·m (80 ft. lbs.). Remove drifts from rear suspension crossmember.

(4) Remove transmission jack supporting rear suspension crossmember.

(5) Install upper ball joint stud in knuckle. Install and tighten the ball joint stud nut to a torque of 27 N·m (20 ft. lbs.).

(6) Install the brake tubing above the rear suspension crossmember into the routing clips on top of the crossmember.

Install rear brake calipers onto rear knuckles. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSTALLATION)

(7) If vehicle is equipped with antilock brakes, attach wheel speed sensor heads to both rear knuckles. Tighten sensor mounting bolts to a torque of 8 N·m (75 in. lbs.).

(8) If vehicle is equipped with antilock brakes, install routing clips for wheel speed sensor cables onto brackets on both upper control arms (Fig. 34). Securely tighten routing clip attaching bolts.

(9) Install muffler support bracket on rear frame rail (Fig. 32).

(10) Install rear exhaust pipe hanger on rear suspension crossmember (Fig. 33).

(11) Install the shock absorber clevis brackets on the rear knuckles (Fig. 31). Tighten the shock absorber mounting bolts to a torque of 95 N·m (70 ft. lbs.).

(12) Install wheel and tire assembly on vehicle. Progressively tighten the wheel mounting nuts in crisscross sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(13) Lower vehicle.

(14) Check and reset if required, rear wheel Camber and Toe to preferred specifications (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

WHEEL ALIGNMENT

TABLE OF CONTENTS

WHEEL ALIGNMENT

DESCRIPTION - WHEEL ALIGNMENT

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when DaimlerChrysler Corporation's wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

Front
- Camber (using special procedure)
- Toe

Rear
- Camber
- Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to Curb Height Measurement in this section for additional information.

Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

Camber is the inward or outward tilt of the top of the tire and wheel assembly (Fig. 1). Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

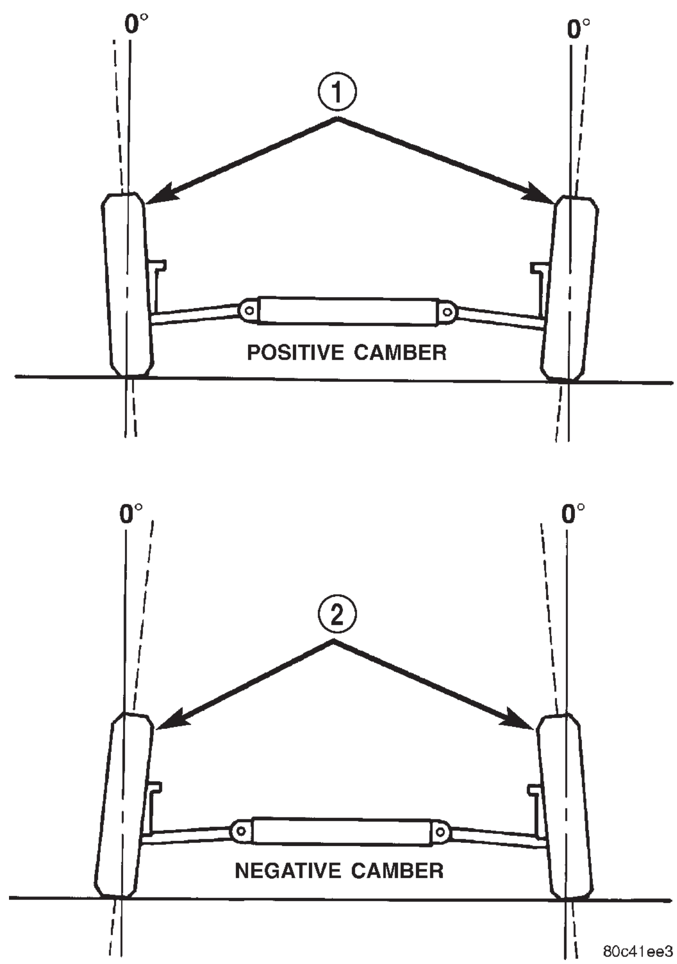

Fig. 1 Camber

1 - WHEELS TILTED OUT AT TOP
2 - WHEELS TILTED IN AT TOP

WHEEL ALIGNMENT (Continued)

CROSS CAMBER

Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is +0.3° and the right camber is 0.0°, the cross camber would be +0.3°.

CASTER

Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly (Fig. 2).

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

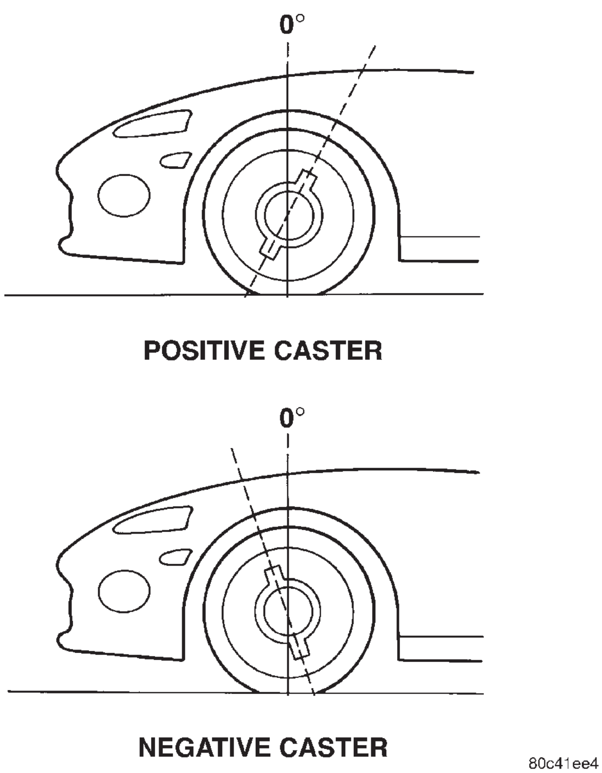

Fig. 2 Caster

CROSS CASTER

Cross caster is the difference between left and right caster.

TOE

Toe is the inward or outward angle of the wheels as viewed from above the vehicle (Fig. 3).

- Toe-in is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equally distant.

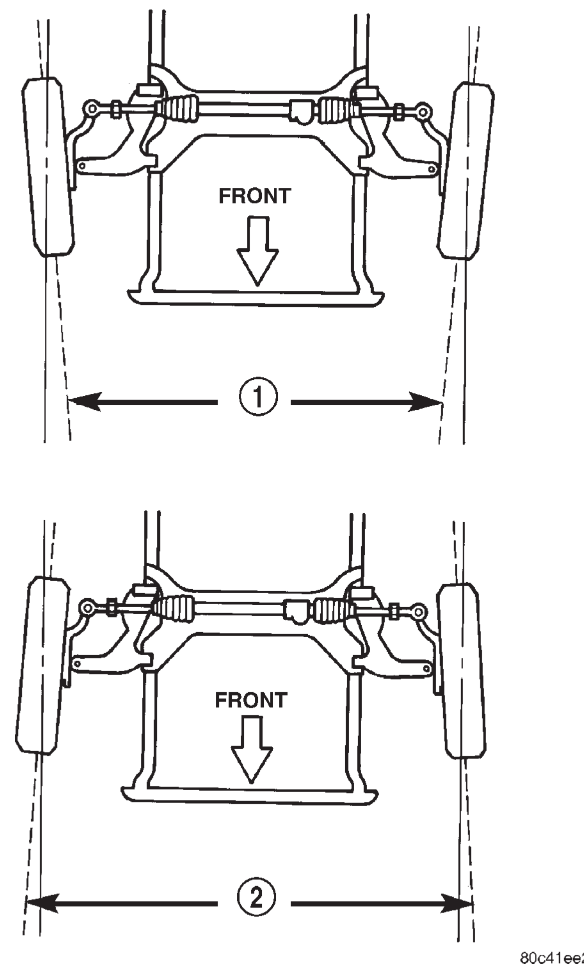

Fig. 3 Toe

1 - TOE-IN
2 - TOE-OUT

WHEEL ALIGNMENT (Continued)

TOE-OUT ON TURNS

Toe-out on turns is the relative positioning of the front wheels while steering through a turn (Fig. 4). This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

Although toe-out on turns is an important angle, it is generally not necessary to check or adjust when performing a wheel alignment.

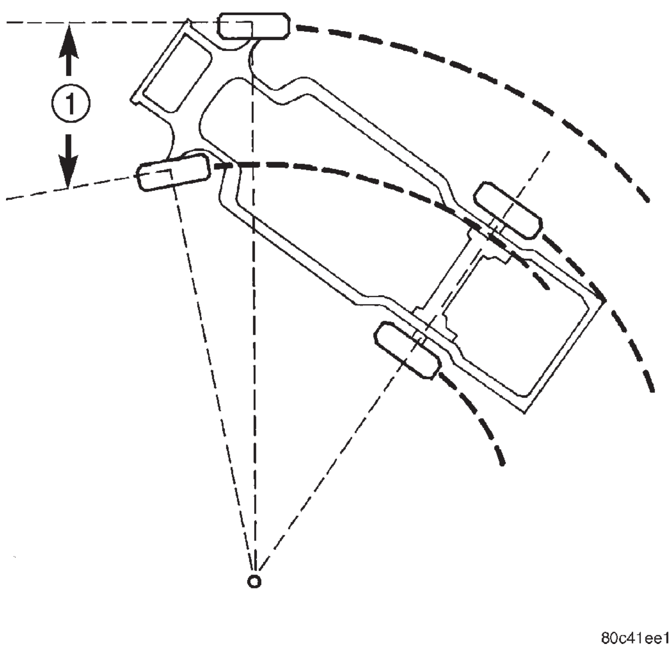

Fig. 4 Toe-Out On Turns

1 - TOE-OUT ON TURNS

DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S. A. I.)

Steering axis inclination is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint (Fig. 5). S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

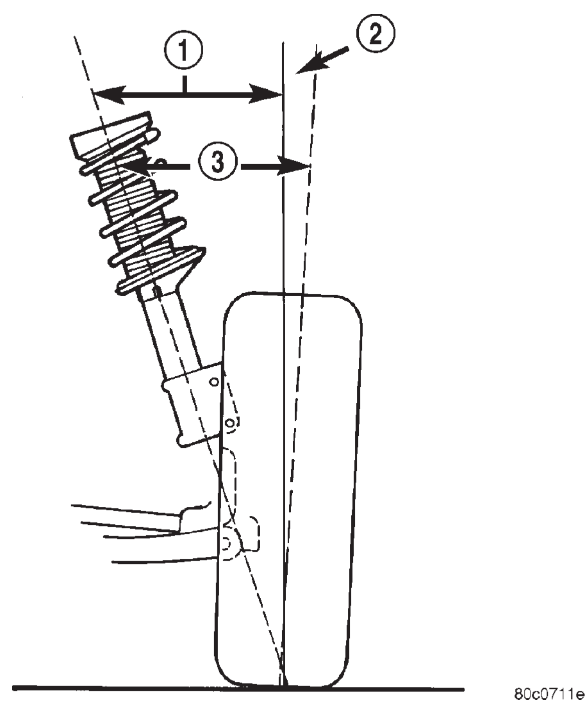

Fig. 5 S.A.I. and I.A.

1 - S.A.I.
2 - CAMBER
3 - I.A.

WHEEL ALIGNMENT (Continued)

INCLUDED ANGLE (I. A.)

Included angle is the sum of the S.A.I. angle plus or minus the camber angle, depending on whether or not the wheel has positive or negative camber (Fig. 5). If camber is positive, add the camber angle to the S.A.I. angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

THRUST ANGLE

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line (Fig. 6). The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

STANDARD PROCEDURE

STANDARD PROCEDURE - PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to the vehicle to ensure proper alignment.

(1) Be sure the fuel tank is full of fuel. If the fuel tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment specifications.

(2) The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.

(3) Check the tires on the vehicle. The tires are to be inflated to the recommended air pressure. All tires must be the same size and in good condition with approximately the same tread wear.

(4) Check the front tire and wheel assemblies for excessive radial runout.

(5) Inspect all suspension component fasteners for looseness and torque.

(6) Inspect the ball joints and all steering linkage for looseness and any sign of wear or damage.

(7) Inspect the rubber bushings on all the suspension components for signs of wear or deterioration. If any bushings show signs of wear or deterioration, they should be replaced prior to aligning the vehicle.

(8) Check vehicle curb height to verify it is within specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE). If curb height is out of specifications, check for broken or sagged springs.

STANDARD PROCEDURE - CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil

WHEEL ALIGNMENT (Continued)

spring. The heights should vary if the suspect spring is weak.

(1) Measure from the inboard edge of the wheel opening fender lip directly above the wheel center (spindle), to the floor or alignment rack surface.

(2) When measuring, maximum left-to-right differential is not to exceed 20 mm (0.79 in.).

(3) Compare the measurements to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart.

CURB HEIGHT SPECIFICATIONS

VEHICLE	FRONT	REAR
ALL	705 mm ± 12 mm 27.75 in. ± 0.47 in.	710 mm ± 12 mm 28.0 in. ± 0.47 in.

STANDARD PROCEDURE - WHEEL ALIGNMENT

(1) Position the vehicle on an alignment rack.

(2) Perform the PRE-WHEEL ALIGNMENT INSPECTION. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

(3) Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

(4) Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

NOTE: Set the rear wheel alignment first before proceeding to the front to set the front wheel alignment.

(5) If rear camber or toe is not within specifications, proceed to REAR CAMBER AND TOE below. If rear camber and toe are within specifications, but front camber and caster are not, proceed to FRONT CAMBER AND CASTER which can be found following REAR CAMBER AND TOE. If rear camber and toe, and front camber and caster are within specifications, proceed to FRONT TOE.

Rear Caster on this vehicle is not adjustable and is not shown as an alignment specification.

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating, bending or modifying any component of the suspension.

REAR CAMBER AND TOE

Rear Camber on this vehicle is adjustable. The rear camber on this vehicle is adjusted using the adjusting screw located in the forward and rear lateral links of the vehicles rear suspension (Fig. 7).

CAUTION: When checking the rear alignment on this vehicle, the alignment rack must be equipped with rear skid plates.

(1) For either rear wheel needing alignment, loosen the adjusting screw jam nuts (Fig. 7) on both the front and the rear lateral links.

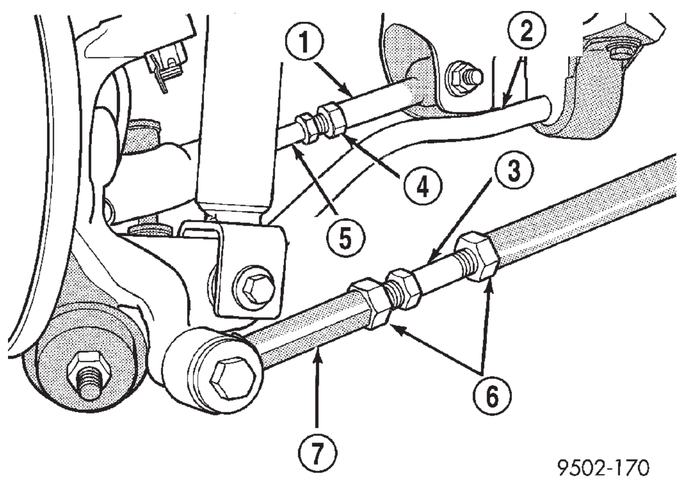

Fig. 7 Lateral Link Adjusting Screw Jam Nuts

1 - FORWARD LATERAL ARM
2 - STABILIZER BAR
3 - ADJUSTING SCREW
4 - JAM NUT
5 - ADJUSTING SCREW
6 - JAM NUTS
7 - REAR LATERAL LINK

CAUTION: Do not attempt to move the adjusting screws without properly loosening the jam nuts. Note that each adjusting screw has one right-handed nut and one left-handed nut.

WHEEL ALIGNMENT (Continued)

CAUTION: When setting rear camber and toe on the vehicle, the maximum lengths of the adjustable lateral link at the locations shown (Fig. 8) must not be exceeded. If these maximum lengths are exceeded, inadequate retention of adjustment link to the inner and outer link may result.

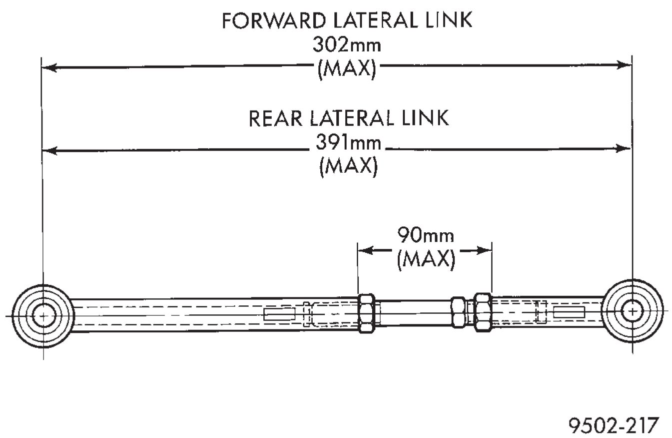

Fig. 8 Rear Lateral Link Maximum Length Dimensions

(2) Rough-in the rear camber setting as close as possible to the preferred specification by mainly adjusting the rear lateral link adjusting screw (Fig. 7). Some adjustment of the forward lateral link adjusting screw will also be required to get the rear camber setting to the preferred specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

(3) Adjust the forward lateral link adjusting screw (Fig. 7)to set rear toe to the preferred specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

NOTE: Adjusting toe will cause a slight change in the camber setting. If during the setting of toe, camber is no longer at the preferred specification, continue to adjust camber and toe until both are at their preferred specifications.

(4) While holding adjustment screws from turning, use a crow foot and torque wrench, and tighten all lateral link adjusting screw jam nuts to a torque of 92 N·m (68 ft. lbs.). This will securely hold the adjusting screws from turning.

(5) Proceed to FRONT CASTER AND CAMBER, or FRONT TOE if front caster and camber are within specifications.

FRONT CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

If front camber is found not to meet alignment specifications, it can be adjusted using a procedure listed here. Before performing the camber adjustment procedure, inspect the suspension components for any signs of damage or bending.

CAMBER ADJUSTMENT PROCEDURE

(1) Open the hood and mark the position of all four shock assembly mounting bolts on the shock tower (Fig. 9) on the side of the vehicle requiring front camber adjustment.

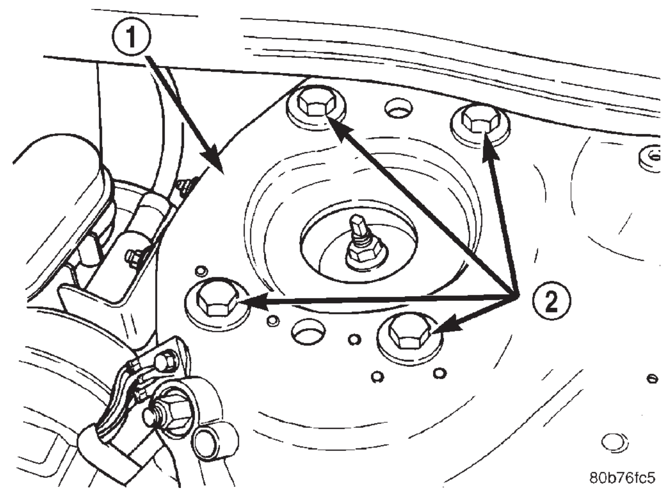

Fig. 9 Shock Assembly Mounting Bolts

1 - SHOCK TOWER
2 - MOUNTING BOLTS

(2) Raise the vehicle by the frame until the tires and front suspension are not supporting the weight of the vehicle.

(3) Loosen the shock assembly mounting bolts on the side marked in step 1. Loosen the bolts enough to allow adequate space for removal of the plastic locating pins that align the upper mounting bracket with the shock tower.

(4) Remove and discard both plastic locating pins from the shock assembly upper mounting bracket using a punch or pliers.

NOTE: Do not leave the plastic locating pins in the cavity of the shock tower or mount. Objectionable noise may result.

WHEEL ALIGNMENT (Continued)

(5) Position the shock assembly inboard or outboard as required to adjust the camber. Make sure the fore and aft position is in the same as indicated by the marks made prior to adjustment, and also the forward and rearward bolts are moved equal amounts inward or outward.

NOTE: Do not attempt to enlarge any existing holes to increase adjustment range.

(6) Torque the upper shock assembly mounting bolts to 90 N·m (68 ft. lbs.)

(7) Lower the vehicle. Jounce the front and rear of vehicle an equal amount of times.

(8) Check and adjust the front camber as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

(9) If toe readings obtained are not within the required specification range, adjust toe to meet the preferred specification setting. Toe is adjustable using the following procedure.

FRONT TOE

(1) Center the steering wheel and lock in place using a steering wheel clamp.

CAUTION: Do not twist front inner tie rod to steering gear rubber boots during front wheel Toe adjustment.

(2) Loosen front inner to outer tie rod end jam nuts (Fig. 10). Grasp inner tie rods at serrations and rotate inner tie rods of steering gear to set front toe to the preferred toe specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS).

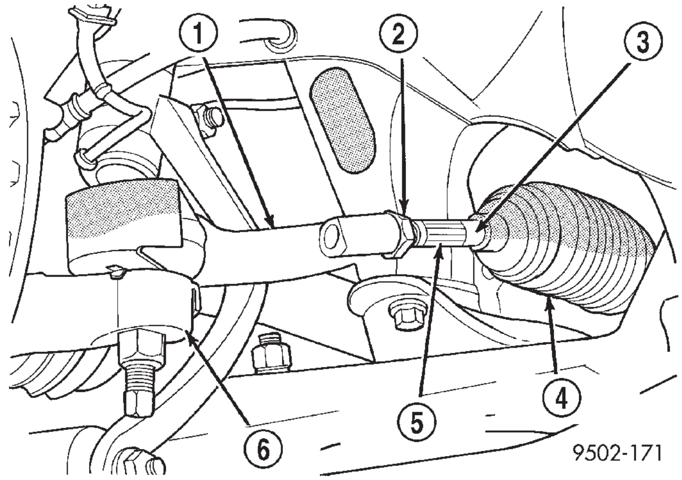

Fig. 10 Front Wheel Toe Adjustment

1 - OUTER TIE ROD
2 - JAM NUT
3 - INNER TIE ROD
4 - STEERING GEAR BOOTS
5 - ADJUSTMENT SERRATIONS
6 - STEERING KNUCKLE

(3) Tighten tie rod jam nuts (Fig. 10) to 61 N·m (45 ft. lbs.) torque.

(4) Adjust steering gear to tie rod boots at the inner tie rod.

(5) Remove steering wheel clamp.

(6) Remove the alignment equipment.

(7) Road test the vehicle to verify the steering wheel is straight and the vehicle does not wander or pull.

DIFFERENTIAL & DRIVELINE

TABLE OF CONTENTS

HALF SHAFT

DESCRIPTION

This vehicle is equipped with an unequal length halfshaft system (Fig. 1). These halfshafts consist of two constant velocity joints connected by a solid shaft. A solid short interconnecting shaft is used on the left side. A long solid interconnecting shaft is used on the right side.

Some halfshafts use a tuned rubber damper weight. When replacing a halfshaft assembly, be sure the replacement halfshaft has the same damper weight as the original.

Both halfshaft assemblies use the same type of inner and outer joints. The inner joint of both halfshaft assemblies is a tripod joint, and the outer joint of both halfshaft assemblies is a Rzeppa joint. Both tripod joints and Rzeppa joints are true constant velocity (C/V) joint assemblies. The inner tripod joint allows for the changes in halfshaft length through the jounce and rebound travel of the front suspension.

On vehicles equipped with ABS brakes, the outer C/V joint is equipped with a tone wheel used to determine vehicle speed for ABS brake operation.

The inner tripod joint of both halfshafts is splined into the transaxle side gears. The inner tripod joints are retained in the side gears of the transaxle using a snap ring located in the stub shaft of the tripod joint. The outer C/V joint has a stub shaft that is splined into the wheel hub and retained by a steel hub nut.

OPERATION

Halfshaft assemblies are designed to transmit power from the transaxle to the front wheels, while allowing for powertrain and suspension flex.

DIAGNOSIS AND TESTING

HALFSHAFT DIAGNOSIS

VEHICLE INSPECTION

(1) Check for grease in the vicinity of the inboard tripod joint and outboard C/V joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

(2) A light film of grease may appear on the right inner tripod joint seal boot; this is considered normal and should not require replacement of the seal boot.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

(1) Damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.

(2) Noise may also be caused by another component of the vehicle coming in contact with the halfshafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

(1) A torn seal boot on the inner or outer joint of the halfshaft assembly.

(2) A loose or missing clamp on the inner or outer joint of the halfshaft assembly.

(3) A damaged or worn halfshaft C/V joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

(1) A worn or damaged halfshaft inner tripod joint.

(2) A sticking tripod joint spider assembly (inner tripod joint only).

(3) Improper wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

(1) Foreign material (mud, etc.) packed on the backside of the wheel(s).

(2) Out of balance front tires or wheels. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

(3) Improper tire and/or wheel runout. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove front tire and wheel assembly.

(3) Remove caliper adapter-to-knuckle bolts.

(4) Remove caliper/adapter assembly and support with mechanic's wire or equivalent (Fig. 2). **Do not support assembly by the flexible brake hose.**

CAUTION: No tool is to be inserted between the steering knuckle and the lower ball joint to separate stud of lower ball joint from the steering knuckle. The steering knuckle is to be separated from the stud of the ball joint only using the procedure as described in Step 10.

(10) Turn steering knuckle so the front of the steering knuckle is facing as far outboard in the wheel well as possible. Using a hammer strike steering knuckle boss until steering knuckle separates from stud of lower ball joint (Fig. 8). **When striking steering knuckle, care MUST be taken not to hit lower control arm or ball joint grease seal.**

NOTE: Care must be taken not to separate the inner C/V joint during this operation. Do not allow driveshaft to hang by inner C/V joint. Driveshaft must be supported.

CAUTION: When inserting pry bar between inner tripod joint and transaxle case, care must be used to ensure no damage occurs to oil seal in transaxle case.

(12) Support the outer end of the halfshaft assembly. Insert a pry bar between inner tripod joint and transaxle case (Fig. 11). Pry against inner tripod joint, until tripod joint retaining snap ring is disengaged from transaxle side gear.

REMOVAL

(1) Remove large boot clamp which retains inner tripod joint sealing boot to tripod joint housing and discard. Remove small clamp which retains inner tripod joint sealing boot to interconnecting shaft and discard. Remove the sealing boot from the tripod housing and slide it down the interconnecting shaft.

CAUTION: When removing the tripod joint housing from the spider assembly, hold the bearings in place on the spider trunions to prevent the bearings from falling away.

(2) Slide the tripod joint housing off the spider assembly and the interconnecting shaft (Fig. 22).

(3) Remove snap ring which retains spider assembly to interconnecting shaft (Fig. 23). Remove the spider assembly from interconnecting shaft. If spider

CAUTION: Seal must not be dimpled, stretched or out of shape in any way. If seal is NOT shaped correctly, equalize pressure in seal and shape it by hand.

(8) Position sealing boot into the tripod housing retaining groove. Install seal boot retaining clamp evenly on sealing boot.

CAUTION: The following positioning procedure determines the correct air pressure inside the inner tripod joint assembly prior to clamping the sealing boot to inner tripod joint housing. If this procedure is not done prior to clamping sealing boot to tripod joint housing sealing boot durability can be adversely affected.

CAUTION: When venting the inner tripod joint assembly, use care so inner tripod sealing boot does not get punctured, or in any other way damaged. If sealing boot is punctured, or damaged in any way while being vented, the sealing boot can not be used.

(9) Insert a trim stick between the tripod joint and the sealing boot to vent inner tripod joint assembly (Fig. 32). **When inserting trim stick between tripod housing and sealing boot ensure trim stick is held flat and firmly against the tripod housing. If this is not done damage to the sealing boot can occur.** If inner tripod joint has a Hytrel (hard plastic) sealing boot, be sure trim stick is inserted between soft rubber insert and tripod housing not the hard plastic sealing boot and soft rubber insert.

(10) With trim stick inserted between sealing boot and tripod joint housing, position the interconnecting shaft so it is at the center of its travel in the tripod joint housing. Remove the trim stick from between the sealing boot and the tripod joint housing. **This procedure will equalize the air pressure in the tripod joint, preventing premature sealing boot failure.**

(11) Position trilobal boot to interface with the tripod housing. The lobes of the boot must be properly aligned with the recess's of the tripod housing.

(12) Clamp tripod joint sealing boot to tripod joint, using required procedure for type of boot clamp application.

CRIMP TYPE BOOT CLAMP

If seal boot uses crimp type boot clamp:

- Clamp sealing boot onto tripod housing using Crimper, Special Tool C-4975-A.
- Place crimping tool C-4975-A over bridge of clamp (Fig. 33).

TABLE OF CONTENTS

BRAKES - BASE

WARNING

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

CAUTION

CAUTION: During service procedures, grease or any other foreign material must be kept off brake shoe assemblies, and braking surfaces of brake rotor or drum, and external surfaces of hub and bearing assembly.

CAUTION: Handling of brake rotors and calipers must be done in such a way as to avoid damage to the rotor and scratching or nicking of brake lining on the brake shoes.

CAUTION: At no time when servicing a vehicle, can a sheet metal screw, bolt or other metal fastener be installed in the shock tower to take the place of an original plastic clip. Also, NO holes can be drilled into the front shock tower in the area shown in (Fig. 1), for the installation of any metal fasteners into the shock tower. Because of the minimum clearance in this area (Fig. 1), installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring. If a plastic clip is missing, or is lost or broken during servicing a vehicle, replace only with the equivalent part listed in the Mopar parts catalog.

BRAKES - BASE (Continued)

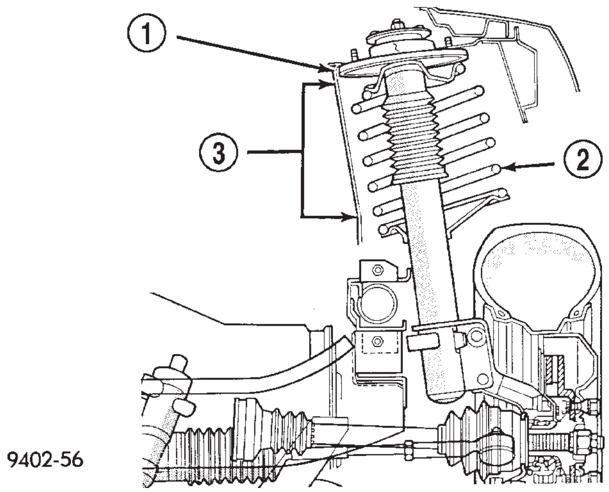

Fig. 1 Shock Tower To Spring Minimum Clearance Area

1 - SHOCK TOWER
2 - COIL SPRING
3 - NO SHEET METAL SCREWS, BOLTS, OR ANY OTHER METAL FASTENERS ARE TO BE INSTALLED INTO SHOCK TOWER IN THIS AREA. ALSO, NO HOLES ARE TO BE DRILLED INTO SHOCK TOWER IN THIS SAME AREA.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle from the recommended locations could result in lifting a vehicle by the hydraulic control unit mounting bracket. Lifting a vehicle by the hydraulic control unit mounting bracket will result in damage to the mounting bracket and the hydraulic control unit.

STANDARD PROCEDURE - BASE BRAKE BLEEDING

NOTE: For bleeding the ABS hydraulic system, refer to in BRAKES - ABS/STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING.

CAUTION: Before removing the master cylinder cap, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder reservoir.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the hydraulic system.

- Left rear wheel
- Right front wheel
- Right rear wheel
- Left front wheel

MANUAL BLEEDING

NOTE: To bleed the brakes manually, the aid of a helper will be required.

(1) Attach a clear plastic hose to the bleeder screw and feed the hose into a clear jar containing enough fresh brake fluid to submerge the end of the hose (Fig. 2).

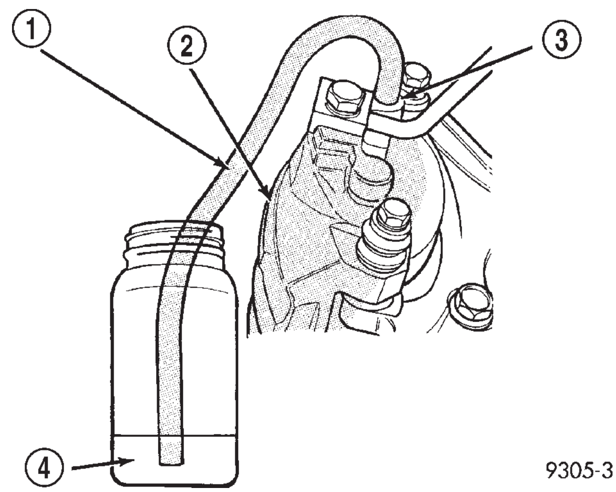

Fig. 2 Proper Method for Purging Air From Brake System (Typical)

1 - CLEAR HOSE
2 - BRAKE CALIPER
3 - BLEEDER SCREW
4 - CLEAN BRAKE FLUID

(2) Have a helper pump the brake pedal three or four times and hold it in the down position.

(3) With the pedal in the down position, open the bleeder screw at least 1 full turn.

(4) Once the brake pedal has dropped, close the bleeder screw. After the bleeder screw is closed, release the brake pedal.

(5) Repeat the above steps until all trapped air is removed from that wheel circuit (usually four or five times).

BRAKES - BASE (Continued)

(6) Bleed the remaining wheel circuits in the same manner until all air is removed from the brake system. Monitor the fluid level in the master cylinder reservoir to make sure it does not go dry.

(7) Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Rebleed the brakes as necessary.

(8) Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

PRESSURE BLEEDING

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

Use bleeder tank, Special Tool C-3496-B or equivalent, with master cylinder reservoir adapter, Special Tool 8224, to pressurize the hydraulic system for bleeding.

Following the same wheel circuit sequence as prescribed for manual bleeding.

(1) Attach a clear plastic hose to the bleeder screw and feed the hose into a clear jar containing enough fresh brake fluid to submerge the end of the hose (Fig. 2).

(2) Open the bleeder screw at least one full turn or more to obtain a steady stream of brake fluid.

(3) After approximately 4–8 ounces of fluid have been bled through the brake circuit and an air-free flow is maintained in the clear plastic hose and jar, close the bleeder screw.

(4) Repeat this procedure at all the remaining bleeder screws.

(5) Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Rebleed the brakes as necessary.

(6) Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

ASPIRATOR VALVE

DESCRIPTION

The aspirator valve is located in the vacuum hose leading to the power brake booster from the engine on V-6 equipped vehicles.

OPERATION

The aspirator valve helps improve vacuum assist response in low vacuum situations.

REMOVAL

(1) Remove hose leading from vacuum source to aspirator valve at valve.

(2) Remove hose leading to booster from valve.

(3) Remove hose leading to air cleaner housing from valve and remove valve from vehicle.

INSTALLATION

(2) Install open port on black half of valve in hose leading to power brake booster.

(3) Install larger port on brown half of valve in hose leading from vacuum source.

BRAKE LINES

DESCRIPTION - BRAKE TUBES AND HOSES

The brake tubes are steel with a corrosion-resistant nylon coating applied to the external surfaces. The flex hoses are made of reinforced rubber with fittings at each end.

OPERATION - BRAKE TUBES AND HOSES

The purpose of the chassis brake tubes and flex hoses is to transfer the pressurized brake fluid developed by the master cylinder to the wheel brakes of the vehicle. The flex hoses are made of rubber to allow for the movement of the vehicle's suspension.

INSPECTION - BRAKE TUBES AND HOSES

Flexible rubber hose is used at both front brakes and at the rear axle. Inspection of brake hoses should be performed whenever the brake system is serviced and every 7,500 miles or 12 months, whichever comes first (every engine oil change). Inspect

BRAKE LINES (Continued)

hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the rubber hose becomes exposed due to cracks or abrasions in the rubber hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

The brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

The flexible brake tube sections used on this vehicle in the primary and secondary tubes from the master cylinder to the ABS hydraulic control unit connections must also be inspected. This flexible tubing must be inspected for kinks, fraying and contact with other components or with the body of the vehicle.

BRAKE PADS/SHOES - FRONT

REMOVAL - FRONT DISC BRAKE SHOES

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(2) Remove both front wheel and tire assemblies.

NOTE: Using this procedure, begin on one side of the vehicle.

(3) Remove the anti-rattle spring from the outboard side of the caliper and adapter (Fig. 5).

(5) Remove the two caliper guide pin bolts (Fig. 7).

(6) Remove caliper from caliper adapter and brake rotor. The outboard shoe will probably stay with the caliper adapter while the inboard shoe will come off with the caliper as the caliper is removed.

CAUTION: Supporting weight of caliper by the flexible brake fluid hose can damage the hose.

(7) Using wire or cord, hang the caliper from the front strut assembly (Fig. 8). Support the caliper firmly to prevent weight of caliper from being supported by the brake fluid hose.

(8) Remove the outboard brake shoe from the caliper adapter.

(9) Pull the inboard brake shoe away from the caliper piston until the retaining clip on shoe is free from the cavity in the caliper piston (Fig. 9).

(10) Repeat the above procedure on other side of the vehicle.

CLEANING - DISC BRAKE SHOES

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the

BRAKE PADS/SHOES - FRONT (Continued)

wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were remove from.

INSTALLATION - FRONT DISC BRAKE SHOES

NOTE: There may be more than 1 lining material released. Make sure proper linings are being installed.

(1) Begin on one side of the vehicle or the other.

(2) Completely retract the caliper piston back into its bore in the brake caliper (This is required for caliper installation on the brake rotor with new brake shoes installed).

(3) If applied, remove the protective paper from the noise suppression gasket on the rear of both the inner and outer brake shoe assemblies.

NOTE: Inboard brake shoes are stamped L or R for left or right side of the vehicle. The P-slot or void on piston insulator must be positioned upward when brake caliper is mounted (Fig. 10).

(4) Install the new inboard brake shoe into the caliper piston by firmly pressing its retaining clip into the piston bore. Be sure the inboard brake shoe is positioned squarely against the face of the caliper piston.

(5) Lubricate both adapter abutments where the shoes slide with a small amount of Mopar® Dielectric grease, or equivalent.

(6) Slide the new outboard brake shoe into the caliper adapter with the lining up against the outside of the brake rotor.

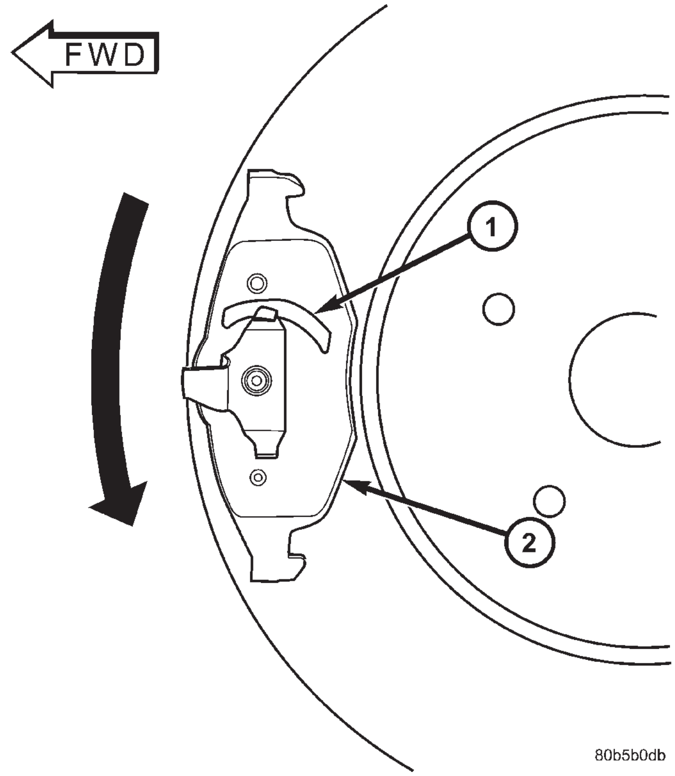

Fig. 10 INBOARD SHOE ORIENTATION TO TURNING ROTOR

1 - P-SLOT/VOID
2 - INBOARD DISC BRAKE SHOE/PAD

CAUTION: Use care when installing the caliper assembly onto the caliper adapter, so the caliper guide pin bushings do not get damaged by the adapter bosses.

(7) Carefully position the brake caliper over the brake rotor and adapter.

(8) Install the caliper guide pin bolts and tighten to a torque of 35 N·m (26 ft. lbs.). **Extreme caution should be taken not to cross thread the caliper guide pin bolts.**

(9) Install the caps over the caliper guide pin bolts (Fig. 6).

(10) Install the new caliper hold down spring (anti-rattle clip) on the outboard side of the caliper. Start the spring into the holes on the caliper, then stretch the clip legs past the abutments on the caliper adapter (Fig. 5).

(11) Repeat the above procedure on other side of the vehicle.

(12) Install the wheel and tire assemblies. Tighten the wheel mounting nuts in proper sequence until all nuts are torqued to half specification, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(13) Lower vehicle.

BRAKE PADS/SHOES - FRONT (Continued)

(14) Pump the brake pedal several times. This will set the shoes to the brake rotor.

(15) Check and adjust brake fluid level as necessary.

(16) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoes.

BRAKE PADS/SHOES - REAR

REMOVAL - REAR DISC BRAKE SHOES

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove rear wheels and tires from vehicle.

(3) Remove the 2 guide pin bolts mounting the caliper to the adapter (Fig. 11).

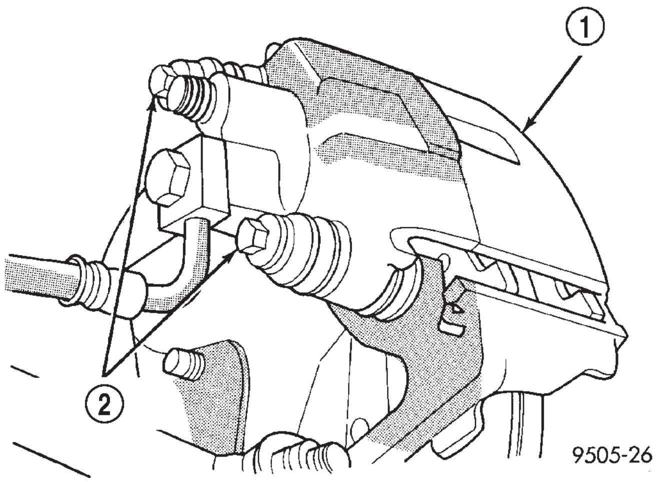

Fig. 11 Caliper Guide Pin Bolts

1 - DISC BRAKE CALIPER
2 - CALIPER GUIDE PIN BOLTS

(4) Remove caliper from adapter and rotor by first rotating the top of the caliper away from adapter, and then lifting the caliper off the lower machined abutment on adapter (Fig. 12).

(5) Support caliper from rear strut to prevent weight of caliper from damaging the flexible brake hose (Fig. 13).

INSPECTION - DISC BRAKE SHOES

Visually inspect brake shoes (pads) for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators on the shoes (if equipped) and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake shoes from the calipers.

Measure each brake shoe. The combined brake shoe and its lining material thickness should be measured at its thinnest point.

- For front disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- For rear disc brake shoes, when a set of brake shoes are worn to a thickness of approximately 7.0 mm (9/32 inch), they should be replaced.
- Typically, if front shoes are worn out, both fronts and rears need to be replaced. Make sure to check rears.

Replace **both** disc brake shoes (inboard and outboard) on each caliper. It is necessary to replace the shoes on the opposite side of the vehicle as well as the shoes failing inspection.

If the brake shoe assemblies do not require replacement, be sure to reinstall the brake shoes in the original position they were remove from.

INSTALLATION - REAR DISC BRAKE SHOES

(1) Completely retract the caliper piston back into the piston bore of the caliper. This is required for caliper installation when new brake pad assemblies are installed on caliper.

(2) Lubricate both adapter abutments with a liberal amount of Mopar® Multipurpose Lubricant, or equivalent.

(3) Install rear rotor on hub making sure it is squarely seated on face of hub (Fig. 14).

(4) Remove protective paper from noise suppression gasket on both inner and outer brake pad assemblies (if equipped).

(5) Install new inboard brake pad into caliper piston by firmly pressing it into bore of piston using thumbs (Fig. 15). **Be sure inboard brake shoe is positioned squarely against face of piston.**

(6) Slide new outboard brake pad onto the caliper (Fig. 15). Be sure retaining clip is squarely seated in the depressed areas on the caliper.

CAUTION: Use care when installing caliper assembly onto adapter, so the guide pin bushings and sleeves do not get damaged by the mounting bosses on adapter.

(7) Carefully lower caliper and brake shoes over rotor reversing the required removal procedure (Fig. 12). Make sure that caliper guide pin bolts, bushings and sleeves are clear of the adapter bosses.

CAUTION: Extreme caution should be taken not to cross thread the caliper guide pin bolts when they are installed.

(8) Install caliper guide pin bolts into adapter. (Fig. 11). Tighten the guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(9) Install the wheels and tires.

(10) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(11) Lower vehicle.

(12) Check brake fluid level.

NOTE: Before vehicle is moved after any brake service work, pump the brake pedal several times to insure the vehicle has a firm brake pedal.

(13) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

DISC BRAKE CALIPERS - FRONT

REMOVAL - FRONT DISC BRAKE CALIPER

(1) Depress the brake pedal past its first inch of travel and hold it in this position using a brake pedal depressor (holding) tool. This is done to isolate the master cylinder from the brake hydraulic system dis-allowing the brake fluid to completely drain out of the brake fluid reservoir.

(2) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

(3) Remove front wheel and tire assembly.

(4) Remove the anti-rattle spring from the out-board side of the caliper and adapter (Fig. 17).

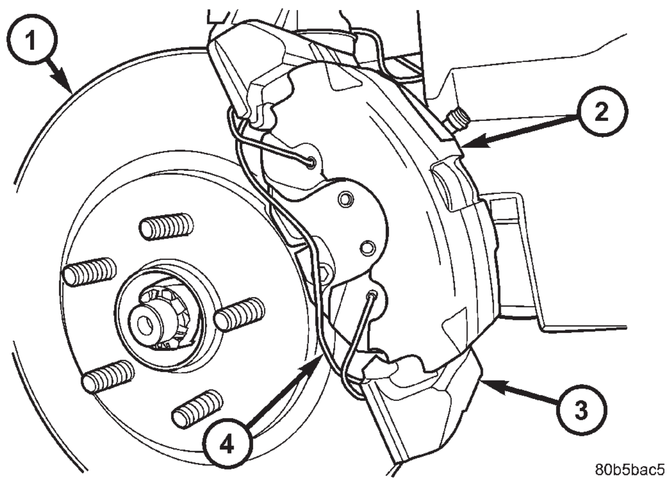

Fig. 17 FRONT DISC BRAKES

1 - BRAKE ROTOR
2 - BRAKE CALIPER
3 - BRAKE CALIPER ADAPTER
4 - ANTI-RATTLE SPRING

(5) Remove the banjo bolt connecting the brake hose to the brake caliper (Fig. 18). There are two washers (one on each side of the brake hose fitting) that will come off with the banjo bolt. Discard these washers.

(6) Remove the two caps in place over the caliper guide pin bolts (Fig. 18).

(7) Remove the two caliper guide pin bolts (Fig. 19).

(8) Remove caliper from caliper adapter and brake rotor. The outboard shoe will probably stay with the caliper adapter while the inboard shoe will come off with the caliper as the caliper is removed.

DISASSEMBLY

DISASSEMBLY - CALIPER GUIDE PIN BUSHINGS (DISC/DISC BRAKES)

Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING or INSPECTION in this section.

(1) Using your fingers, collapse one side of the rubber guide pin bushing. Pull the guide pin bushing out the other side of the brake caliper mounting boss.

(2) Repeat this procedure on the remaining bushing.

DISASSEMBLY - CALIPER PISTON AND SEAL

WARNING: UNDER NO CONDITION SHOULD HIGH PRESSURE AIR EVER BE USED TO REMOVE A PISTON FROM A CALIPER BORE. PERSONAL INJURY COULD RESULT FROM SUCH A PRACTICE.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CLEANING AND INSPECTION in this section.

NOTE: The safest way to remove the piston from the caliper bore is to use the hydraulic pressure of the vehicle's brake system.

(1) Following the removal procedure in DISC BRAKE SHOES found in this section, remove the caliper from the brake rotor and hang the assembly on a wire hook away from rotor and body of the vehicle so brake fluid cannot get on these components. Remove the brake shoes, and place a small piece of wood between the piston and caliper fingers.

(2) Carefully depress the brake pedal to hydraulically push piston out of its bore. Once completed, apply and hold down the brake pedal to any position beyond the first inch of pedal travel using a brake pedal holding tool. This will prevent the fluid in the master cylinder reservoir from completely draining out.

(3) Disconnect the brake fluid flex hose from the caliper assembly and remove it from the vehicle.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

(4) Mount the caliper in a vise equipped with protective jaws.

(5) Remove the piston dust boot from the caliper and discard (Fig. 20).

NOTE: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

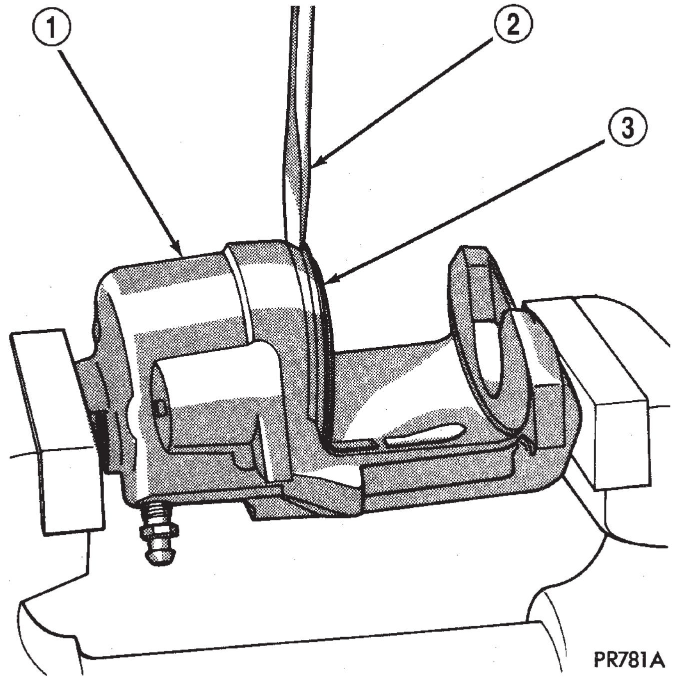

Fig. 20 Removing Caliper/Piston Dust Boot

1 - CALIPER
2 - SCREWDRIVER
3 - BOOT

(6) Using a soft tool such as a plastic trim stick, work the piston seal out of its groove in caliper piston bore (Fig. 21). Discard the old seal.

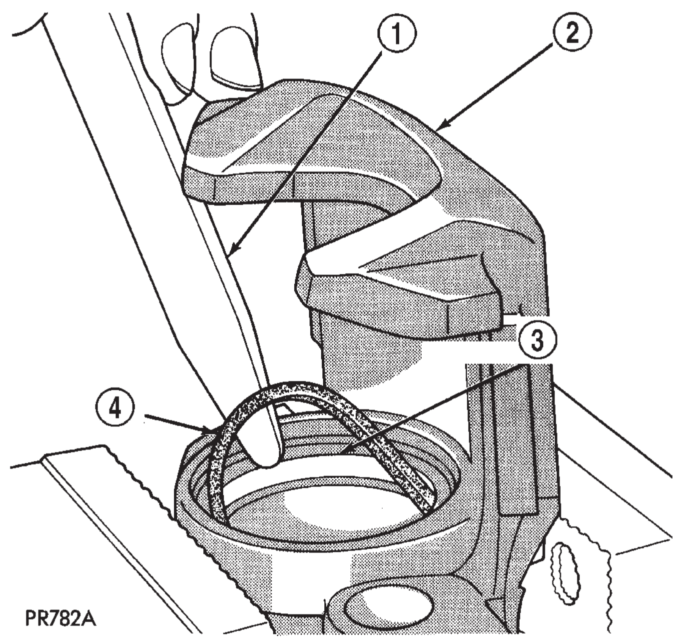

Fig. 21 Removing Piston Seal

DISC BRAKE CALIPERS - FRONT (Continued)

(7) Clean the piston bore and drilled passage ways using alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.

(8) Inspect the piston bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING - CALIPER

WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION - CALIPER

Inspect the disc brake caliper for the following:

• Brake fluid leaks in and around boot area and inboard lining

• Ruptures, brittleness or damage to the piston dust boot

• Damaged, dry or brittle guide pin dust boots

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

ASSEMBLY

ASSEMBLY - CALIPER GUIDE PIN BUSHINGS (DISC/DISC BRAKES)

(1) Fold the guide pin bushing in half lengthwise.

NOTE: To avoid damage to the bushing, do not use a sharp object to install the guide pin bushing.

(2) Insert the folded bushing into the caliper mounting boss using your fingers from the rear of the caliper.

(3) Unfold the bushing using your fingers or a wooden dowel until the bushing is fully seated into the caliper housing. The bushing flanges should be seated evenly on both sides of the bushing hole.

(4) Lubricate inside surfaces of bushing using Mopar® Dielectric Grease or equivalent.

(5) Repeat the procedure for remaining bushing.

ASSEMBLY - CALIPER PISTON AND SEAL

NOTE: Never use an old piston seal.

(1) Dip the new piston seal in clean brake fluid and install it in the groove of the caliper bore. The seal should be started at one area of the groove and gently worked around and into the groove (Fig. 22)using only your clean fingers to seat it.

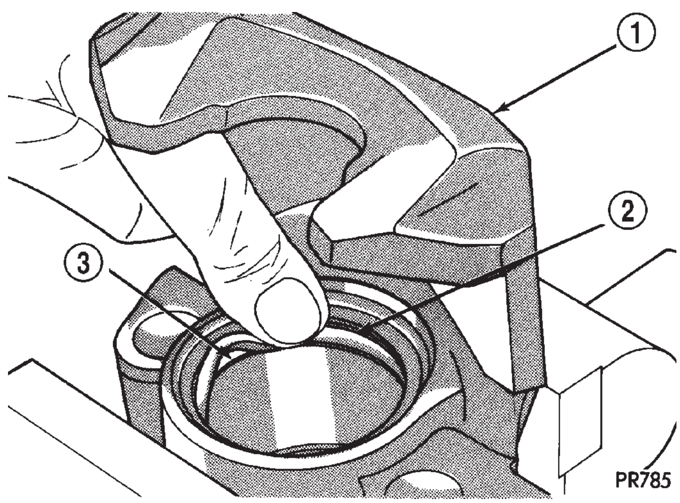

Fig. 22 Installing New Piston Seal

1 - CALIPER
2 - PISTON SEAL
3 - SEAL GROOVE

(2) Coat the new piston boot with clean brake fluid leaving a generous amount inside the boot.

(3) Position the dust boot over the piston after coating it with brake fluid.

DISC BRAKE CALIPERS - FRONT (Continued)

CAUTION: Force applied to the piston to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

(4) Install piston into caliper bore pushing it past the piston seal until it bottoms in the caliper bore (Fig. 23).

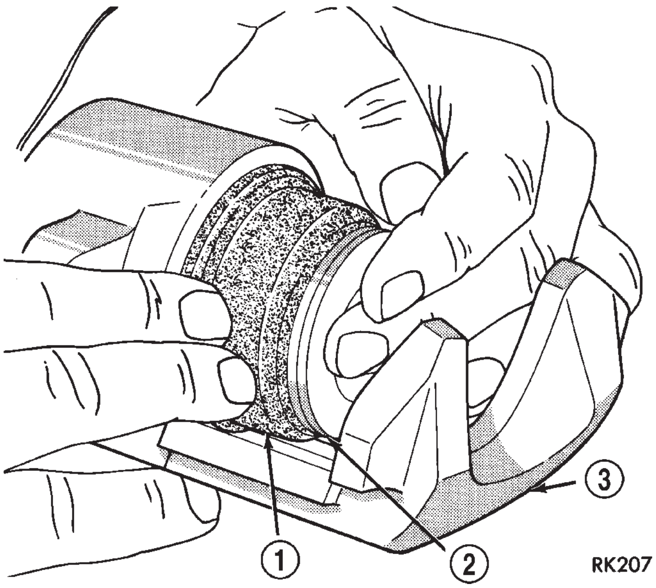

Fig. 23 Installing Piston Into Caliper Bore

1 - BOOT
2 - PISTON

(5) Position the dust boot into the counterbore of the caliper assembly piston bore.

(6) Using a hammer and Installer, Special Tool C-4689 or C-4842 (depending on piston size), and Handle, Special Tool C-4171, drive the boot into the counterbore of the caliper as necessary (Fig. 24).

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

INSTALLATION - FRONT DISC BRAKE CALIPER

(1) Completely retract the caliper piston back into piston bore of the caliper.

(2) Lubricate both caliper adapter abutments where the shoes slide with a sufficient amount of Mopar® Dielectric Grease, or equivalent.

NOTE: If shoes are being tranferred or newly installed, make note that the inboard brake shoes are stamped L or R for left or right side of the vehicle. The P-slot or void on piston insulator must be positioned upward when brake caliper is mounted (Fig. 25).

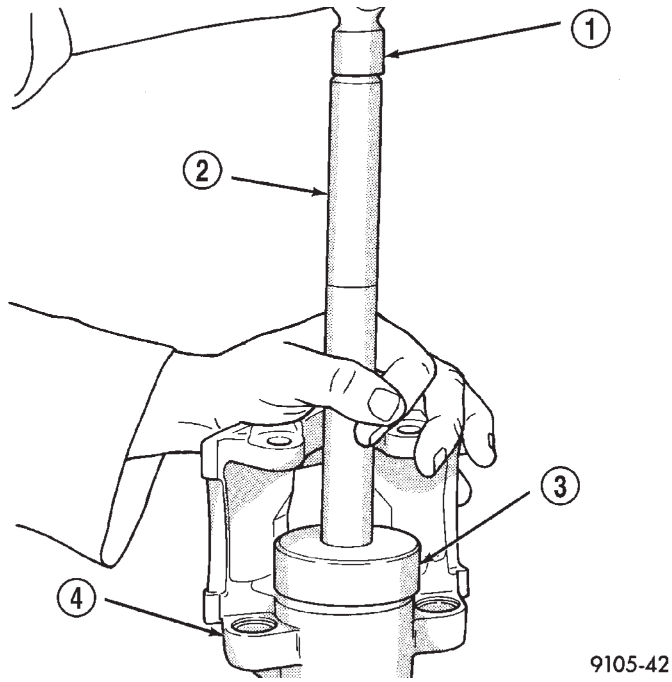

Fig. 24 Installing Dust Boot

CAUTION: Use care when installing the brake caliper assembly onto the adapter, so that the seals on the caliper guide pin bushings do not get damaged by the adapter bosses.

(3) Carefully position the brake caliper (with inboard shoe) over the brake rotor, outboard shoe and adapter. For proper positioning of shoes when installing caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

(4) Install the caliper guide pin bolts and tighten to a torque of 35 N·m (26 ft. lbs.) (Fig. 19). **Extreme caution should be taken not to cross thread the caliper guide pin bolts.**

(5) Install the caps over the ends of the guide pin bolts (Fig. 18).

(6) Install the anti-rattle spring on the outboard side of the caliper (Fig. 17). Start the clip into the holes on the caliper, then stretch the clip legs past the abutments on the caliper adapter.

CAUTION: When connecting the brake hose to the caliper, install new brake hose to caliper special washers.

(7) Install the brake hose on the caliper. To do this, first place one NEW special fitting washer on each side of the hose fitting, then slide the banjo bolt

through the fitting. Next, thread the banjo bolt into the threaded port on the rear of the brake caliper (Fig. 18). Tighten the banjo bolt to a torque of 35 N·m (26 ft. lbs.).

(8) Install the wheel and tire assembly. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification, then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(9) Lower the vehicle.

(10) Remove the brake pedal depressor (holding) tool.

(11) Bleed the hydraulic brake circuit to the brake caliper. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(12) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake shoe linings.

DISC BRAKE CALIPERS - REAR

REMOVAL - REAR DISC BRAKE CALIPER

(7) Reinstall the caliper on the vehicle and bleed the brakes as necessary. Refer to Installation in this section.

INSTALLATION - REAR DISC BRAKE CALIPER

(1) Completely retract caliper piston back into piston bore of caliper assembly.

(2) Lubricate both adapter abutments with a liberal amount of Mopar® Multipurpose Lubricant, or equivalent.

(3) If removed, install the rotor on the hub making sure it is squarely seated on the face of the hub (Fig. 33).

CAUTION: Use care when installing caliper assembly onto adapter so the guide pin bushings and sleeves do not get damaged by the mounting bosses on adapter.

(4) Carefully lower caliper and brake shoes over rotor reversing the removal procedure (Fig. 27).

DISC BRAKE CALIPERS - REAR (Continued)

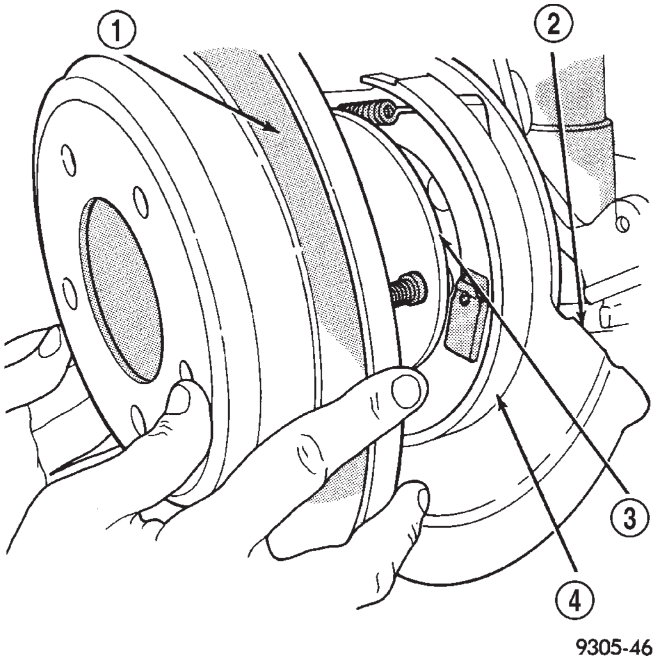

Fig. 33 Installing Rear Rotor

1 - BRAKING DISC

3 - HUB
4 - DRUM-IN-HAT PARKING BRAKE

Make sure that the caliper guide pin bolts, bushings and sleeves are clear of the adapter bosses.

CAUTION: Extreme caution should be taken not to cross thread the caliper guide pin bolts when they are installed.

(5) Install the caliper guide pin bolts (Fig. 26). Tighten the caliper guide pin bolts to a torque of 22 N·m (192 in. lbs.).

(6) Install the brake hose on the caliper. To do this, first place one NEW special fitting washer on each side of the hose fitting, then slide the banjo bolt through the fitting. Next, thread the banjo bolt into the threaded port on the rear of the brake caliper. Tighten the banjo bolt to a torque of 35 N·m (26 ft. lbs.).

(7) Install wheels and tire assembly.

(8) Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified torque of 135 N·m (100 ft. lbs.).

(9) Lower vehicle.

(10) Remove the brake pedal depressor (holding) tool.

(11) Bleed the hydraulic brake circuit to the brake caliper. (Refer to 5 - BRAKES - STANDARD PROCEDURE)

(12) Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

FLUID

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE - BRAKE FLUID LEVEL CHECKING

Brake fluid level should be checked a minimum of twice a year.

Master cylinder reservoirs are marked, FULL and MIN, indicating the allowable brake fluid level range in the master cylinder brake fluid reservoir.

CAUTION: Use only Mopar® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.

Although there is a range, the preferred level is FULL. If necessary, adjust the brake fluid level, bringing it to the FULL mark on the side of the master cylinder brake fluid reservoir.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

FLUID (Continued)

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

JUNCTION BLOCK

DESCRIPTION

A junction block is used on vehicles that are not equipped with antilock brakes (ABS). The junction block is located on the left side of the lower radiator support (Fig. 34). The junction block mounts in the same location as the ABS integrated control unit (ICU) does on vehicles with ABS.

It has six threaded ports to which the brake tubes connect. Two are for the brake tubes coming from the master cylinder. The remaining four ports are for the brake tubes going to each brake assembly. The valve is permanently mounted to a bracket which fastens to the lower radiator support.

The junction block includes two proportioning valves for the rear brakes. One valve is mounted in each end of the block (Fig. 34). The proportioning valves are not serviced separately from the junction block.

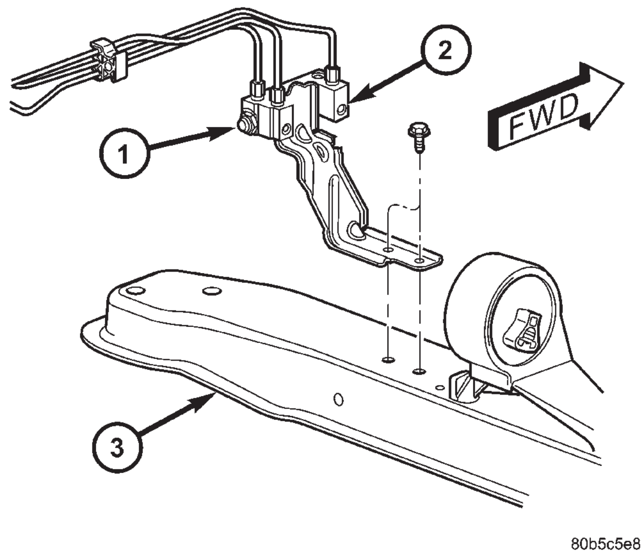

Fig. 34 JUNCTION BLOCK MOUNTING

1 - PROPORTIONING VALVE
2 - JUNCTION BLOCK
3 - LOWER RADIATOR SUPPORT

OPERATION

The junction block distributes the brake fluid coming from the master cylinder primary and secondary ports to the four brake tubes leading to the brakes. Since the junction block mounts in the same location as the ABS integrated control unit (ICU), it allows for the common use of brake tubes on the vehicle whether it is equipped with or without ABS.

The junction block includes two proportioning valves. Placed in the fluid flow passages leading to the rear brake tube ports, they balance front-to-rear braking. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/PROPORTIONING VALVE - OPERATION)

REMOVAL

(1) Disconnect and isolate the negative battery connection at the left front strut tower.

(2) Using a brake pedal holding tool such as shown (Fig. 35), depress brake pedal past its first 1 inch of travel and secure in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

(7) Remove the bolts fastening the junction block mounting bracket to the lower radiator support (Fig. 34).

(8) Remove the junction block and bracket from the vehicle.

INSTALLATION

(1) Install the junction block with mounting bracket onto the lower radiator support. Install and tighten the mounting bolts to 38 N·m (28 ft. lbs.) torque.

(2) Install the four chassis brake tubes (going to each brake) to the junction block (Fig. 36). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(3) Install the two brake tubes coming from the primary and secondary master cylinder ports to the top rear corners of the junction block (Fig. 36). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(4) Install the air cleaner housing. Refer to 9 - ENGINE/AIR INTAKE SYSTEM.

(5) Remove the brake pedal holding tool.

(6) Reconnect the battery negative cable.

(7) Bleed the base brake system. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

MASTER CYLINDER

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

(1) Clamp the master cylinder in a vise using only the mounting flange.

(2) Thread Bleeding Tubes, Special Tool 8358, into master cylinder primary and secondary ports. Position outlet ends of bleeding tubes in reservoir with the outlets below surface of brake fluid when reservoir is filled to its proper level.

(3) Fill brake fluid reservoir with Mopar® brake fluid or equivalent conforming to DOT 3 specifications.

(4) Using a wooden dowel, depress push rod slowly, and then allow pistons to return to released position. Repeat several times until all air bubbles are expelled from master cylinder.

(5) Remove bleeding tubes from master cylinder outlet ports, and then plug outlet ports and install fill cap on reservoir.

(6) Remove master cylinder from vise.

(7) Install the filler cap on master cylinder fluid reservoir.

(8) Install master cylinder. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

REMOVAL

(1) Remove vehicle wiring harness connector from brake fluid level switch in side of master cylinder brake fluid reservoir (Fig. 37).

(3) Using Mopar® Brake Parts Cleaner or equivalent, clean area where master cylinder attaches to booster.

(4) Remove the 2 nuts attaching master cylinder assembly to power brake vacuum booster.

(5) Slide master cylinder assembly straight off its mounting studs on power brake vacuum booster.

INSTALLATION

(1) Position master cylinder assembly on studs of power brake unit, aligning push rod on power brake vacuum booster with piston of master cylinder.

(2) Install the 2 master cylinder to power brake vacuum booster mounting nuts. Tighten both nuts to a torque of 26 N·m (230 in. lbs.).

(3) Connect brake tubes to master cylinder primary and secondary ports. Then tighten the tube nuts to a torque of 17 N·m (145 in. lbs.).

(4) Connect wiring harness connector to brake fluid level switch.

(5) Fill master cylinder with clean, fresh Mopar® Brake Fluid or equivalent.

(6) Road test vehicle to ensure proper operation of brakes.

POWER BRAKE BOOSTER

DIAGNOSIS AND TESTING - POWER BRAKE BOOSTER

BASIC TEST

(1) With engine off, depress and release the brake pedal several times to purge all vacuum from the power brake booster.

(2) Depress and hold the pedal with light effort (15 to 25 lbs. pressure), then start the engine.

The pedal should fall slightly, then hold. Less effort should be needed to apply the pedal at this time. If the pedal fell as indicated, perform the VACUUM LEAK TEST listed after the BASIC TEST. If the pedal did not fall, continue on with this BASIC TEST.

(3) Disconnect the vacuum hose on the side of the vacuum check valve that leads to the speed control, then connect a vacuum gauge to the open vacuum port on the valve.

(4) Start the engine.

(5) When the engine is at warm operating temperature, allow it to idle and check the vacuum at the gauge.

If the vacuum supply is 12 inches Hg (40.5 kPa) or more, the power brake booster is defective and must be replaced. If the vacuum supply is below 12 inches, continue on with this BASIC TEST.

(6) Shut off the engine.

(7) Connect the vacuum gauge to the vacuum reference port on the engine intake manifold.

(8) Start the engine and observe the vacuum gauge.

If the vacuum is still low, check the engine tune and repair as necessary. If the vacuum is above 12 inches, the hose or check to the booster has a restriction or leak.

Once an adequate vacuum supply is obtained, repeat the BASIC TEST.

VACUUM LEAK TEST

(1) Disconnect the vacuum hose on the side of the power brake booster vacuum check valve that leads to the speed control, then connect a vacuum gauge to the open vacuum port on the valve.

(2) Remove the remaining hose on the vacuum check valve that is not the vacuum supply hose coming from the intake manifold. Cap off the open port on the check valve.

(3) Start the engine.

(4) Allow the engine to warm up to normal operating temperature and engine idle.

(5) Using vacuum line pliers, close off the vacuum supply hose near the booster and observe the vacuum gauge.

POWER BRAKE BOOSTER (Continued)

If the vacuum drop exceeds 1.0 inch Hg (3.3 kPa) in one minute, repeat the above steps to confirm the reading. The vacuum loss should be less than 1.0 inch Hg in one minute time span. If the loss is more than 1.0 inch Hg, replace the power brake booster. If it is not, continue on with this test.

(6) Remove the pliers from the hose temporarily.

(7) Apply light effort (approximately 15 lbs. of force) to the brake pedal and hold the pedal steady. Do not move the pedal once the pressure is applied or the test results may vary.

(8) Have an assistant reattach the pliers to the vacuum supply hose.

(9) Allow 5 seconds for stabilization, then observe the vacuum gauge.

If the vacuum drop exceeds 3.0 inches Hg (10 kPa) in 15 seconds, repeat the above steps to confirm the reading. The vacuum loss should be less than 3.0 inches Hg in 15 seconds time span. If the loss is more than 3.0 inches Hg, replace the power brake booster. If it is not, the booster is not defective.

REMOVAL - POWER BRAKE BOOSTER

(1) Remove the remote ground cable from the ground stud located on the left shock tower.

(2) Correctly isolate remote ground cable by installing the ground cable insulator on the strut tower ground stud as shown (Fig. 39). **This will prevent accidental grounding of the remote ground cable.**

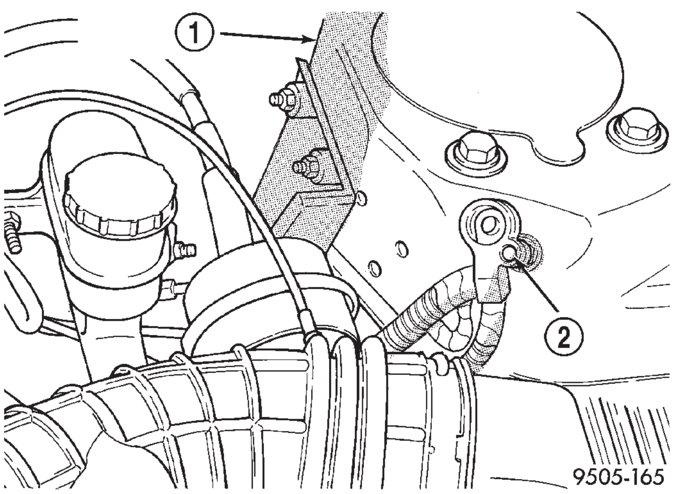

Fig. 39 Correctly Isolated Remote Ground Cable

1 - LEFT STRUT TOWER
2 - GROUND STUD

(3) Disconnect the wiring harness connector and vacuum hose at speed control servo.

(4) Remove speed control servo mounting nuts. Leaving cable attached, move servo out off to the side.

(5) Remove the master cylinder from the booster. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL)

(6) Remove the vacuum hoses from the check valve located on the power brake vacuum booster.

(7) Remove the electrical connector and mounting screw from the purge solenoid mounted on the left frame rail (Fig. 40). Allow the solenoid to drop downward.

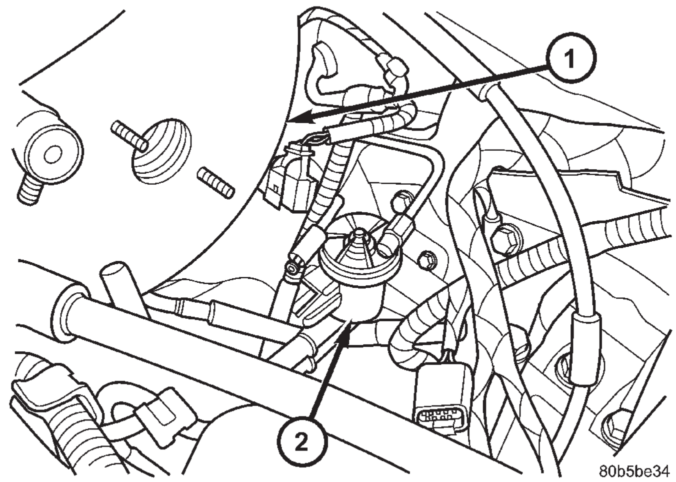

Fig. 40 PURGE SOLENOID

1 - POWER BRAKE BOOSTER
2 - PURGE SOLENOID

(8) Locate the power brake vacuum booster input rod to brake pedal attachment under instrument panel. Position a small screwdriver between the center tang on the power brake booster input rod to brake pedal pin retaining clip (Fig. 41). Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin. Then pull retaining clip off brake pedal pin. **Discard retaining clip. Replace only with a new retaining clip when assembled.**

(9) Remove the 4 nuts attaching power brake vacuum booster to dash panel. Nuts are accessible from under dash panel in area of the steering column and pedal bracket assembly (Fig. 42).

(10) Slide power brake vacuum booster straight forward until mounting studs clear dash panel, and remove from vehicle.

CAUTION: Do not attempt to disassemble the power brake vacuum booster it is to be serviced ONLY as a complete assembly.

INSTALLATION - POWER BRAKE BOOSTER

(1) Position power brake booster onto dash panel.

(2) Install and torque the 4 power brake vacuum booster mounting nuts (Fig. 42) to 29 N·m (250 in. lbs.) torque.

(3) Using lubriplate, or an equivalent, coat the surfaces of the brake pedal pin that contact the power brake vacuum booster input rod.

(4) Connect power brake vacuum booster input rod to brake pedal pin and install a NEW retaining clip. **Use only a new retainer clip DO NOT USE the old clip.**

(5) Install the purge solenoid to the left frame rail and connect its wiring harness (Fig. 40).

(6) Install the vacuum hoses on the booster check valve.

(7) Install the master cylinder and connect the fluid level switch. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

(8) If equipped, install speed control servo on the mounting studs. Install the 2 speed control servo bracket mounting nuts and tighten to a torque of 6 N·m (55 in. lbs.). Install electrical connector and vacuum hose on speed control servo.

(9) Install the throttle cable, and if equipped, the speed control cable on the cam of the throttle body assembly.

(10) Install the remote ground cable on the ground stud located on the left strut tower. Install and securely tighten the ground cable attaching nut.

(11) Check brake lamp operation. If required, adjust brake lamp switch as necessary. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - ADJUSTMENTS)

(12) Road test vehicle to ensure proper operation of the vehicles brake system and speed control.

PROPORTIONING VALVE

DESCRIPTION

Proportioning valves are included on vehicles **without** antilock brakes (ABS). They are located in the junction block. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/JUNCTION BLOCK - DESCRIPTION)

NOTE: Vehicles with ABS do not have proportioning valves. They have electronic variable brake proportioning (EVBP).

OPERATION

Proportioning valves balance front to rear braking by controlling (at a given ratio) brake hydraulic pressure to the rear brakes above a preset level (split point). On light pedal applications equal brake pressure is transmitted to both the front and rear brakes. On heavier pedal applications, through the use of proportioning valves, the pressure transmitted to the rear will be lower than the front brakes. This prevents premature rear wheel skid.

If hydraulic pressure is lost in one-half of the diagonally split brake hydraulic system, the operation of the proportioning valve in the remaining half is not affected.

ROTOR

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be checked and inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. For information on brake rotor machining, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Minimum thickness specifications are cast on the rotor's unmachined surface (Fig. 43). Limits can also be found in the table at the end of this brake rotor information.

ROTOR THICKNESS VARIATION

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

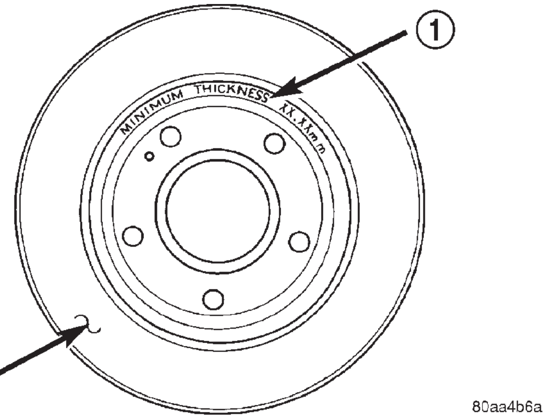

Fig. 43 Minimum Thickness Markings (Typical)

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor at 12 equal points around the rotor braking surface with a micrometer at a radius approximately 25 mm (1 inch) from edge of rotor (Fig. 44). If thickness measurements vary by more than 0.013 mm (0.0005 inch), the rotor should refaced or replaced. For information on brake rotor machining, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

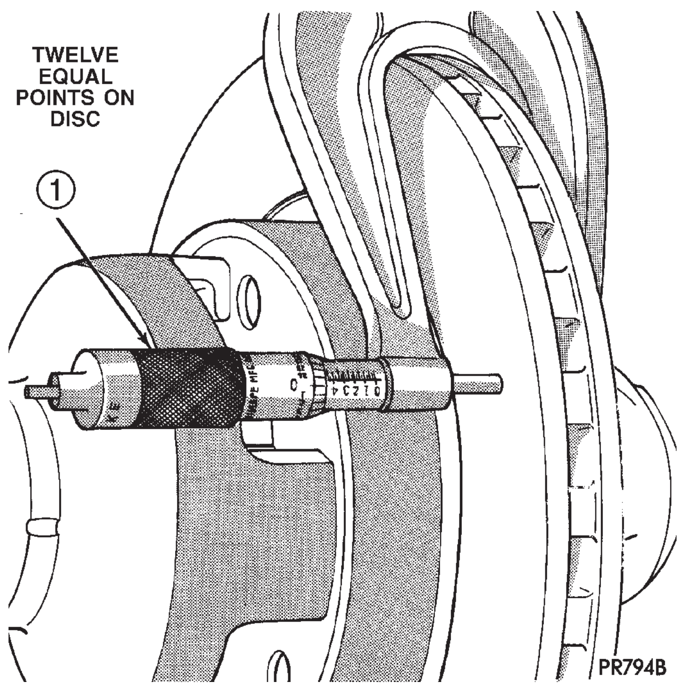

Fig. 44 Checking Rotor For Thickness

1 - MICROMETER

ROTOR (Continued)

ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the rotor. (The hub and rotor runouts are separable). To measure rotor runout on the vehicle, first remove the tire and wheel assembly. Reinstall the wheel mounting nuts on the studs, tightening the rotor to the hub. Mount the Dial Indicator, Special Tool C-3339, with Mounting Adaptor, Special Tool SP-1910 on steering arm. The dial indicator plunger should contact braking surface of rotor approximately 25 mm (one inch) from outer edge of rotor (Fig. 45). Check lateral runout on both sides of the rotor, marking the low and high spots on both. Runout limits can be found in the table at the end of this brake rotor information.

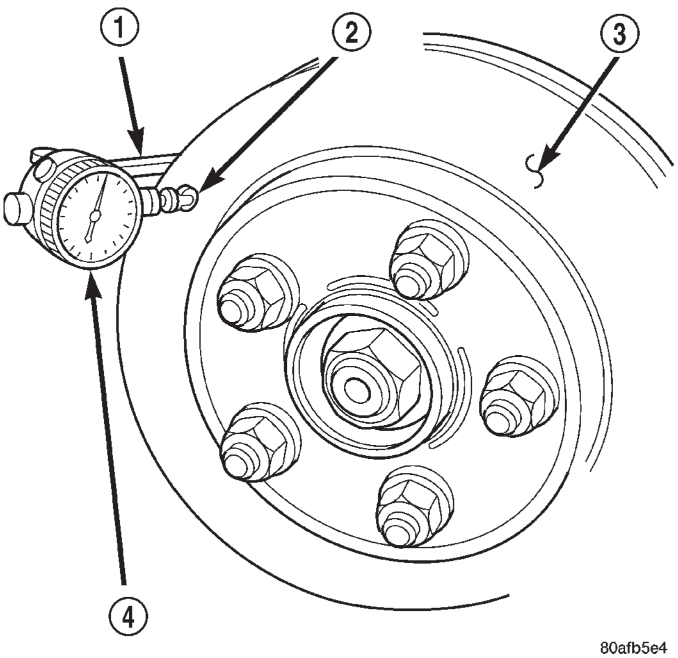

Fig. 45 Checking Rotor Runout

1 - SPECIAL TOOL SP-1910
2 - 25 mm FROM EDGE
3 - DISC SURFACE
4 - SPECIAL TOOL C-3339

If runout is in excess of the specification, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor and the one wheel stud closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed (Fig. 46).

Remove the rotor from the hub.

NOTE: Clean the hub face surface before checking runout. This provides a clean surface to get an accurate indicator reading.

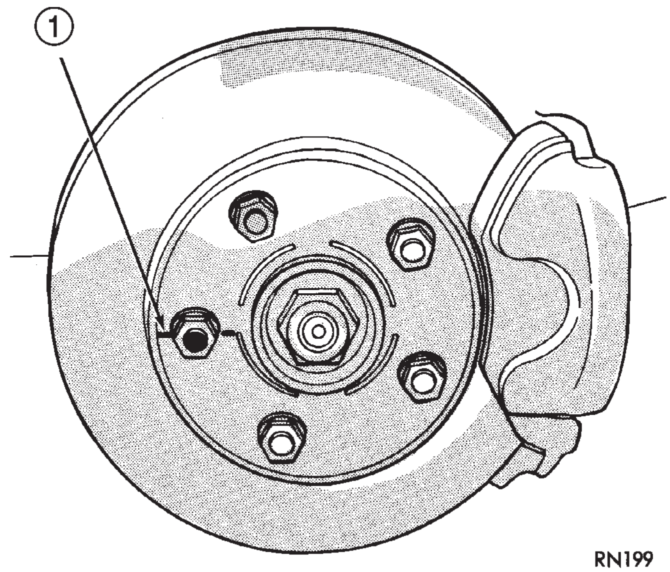

Fig. 46 Marking Rotor and Wheel Stud

1 - CHALK MARK

Mount Dial Indicator, Special Tool C-3339, and Mounting Adaptor, Special Tool SP-1910, to the steering knuckle. Position the indicator stem so it contacts the hub face near the outer diameter. Care must be taken to position stem outside of the stud circle, but inside of the chamfer on the hub rim (Fig. 47).

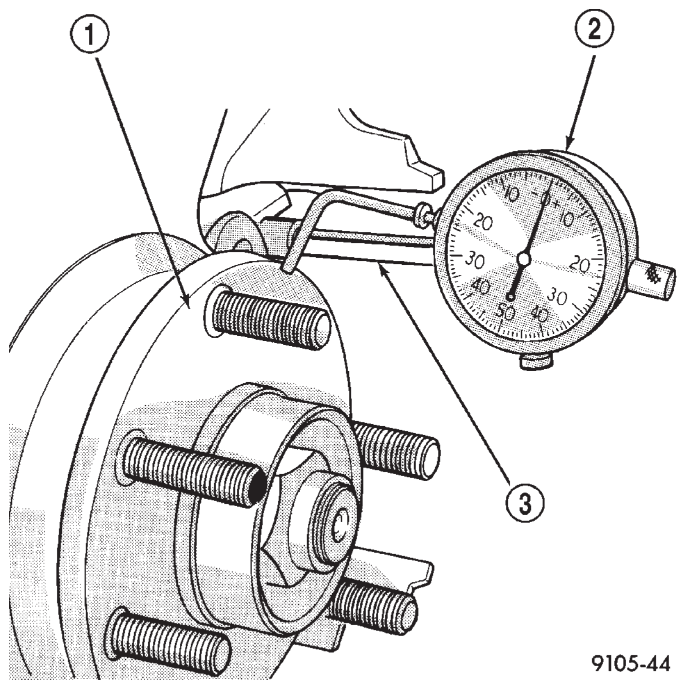

Fig. 47 Checking Hub Runout

1 - HUB SURFACE
2 - SPECIAL TOOL C-3339
3 - SPECIAL TOOL SP-1910

ROTOR (Continued)

Hub runout should not exceed 0.05 mm (0.0019 inch). If runout exceeds this specification, the hub must be replaced. Refer to SUSPENSION.

If the hub runout does not exceed this specification, install the rotor back on the hub, aligning the chalk marks on the rotor with a wheel mounting stud, two studs apart from the original stud (Fig. 48). Tighten nuts in the proper sequence and torque to specifications.

Recheck brake rotor runout to see if the runout is now within specifications.

If runout is not within specifications, reface or replace the brake rotor. For information on brake rotor machining, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (Fig. 49), or replaced.

The use of a hub-mounted on-car brake lathe is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

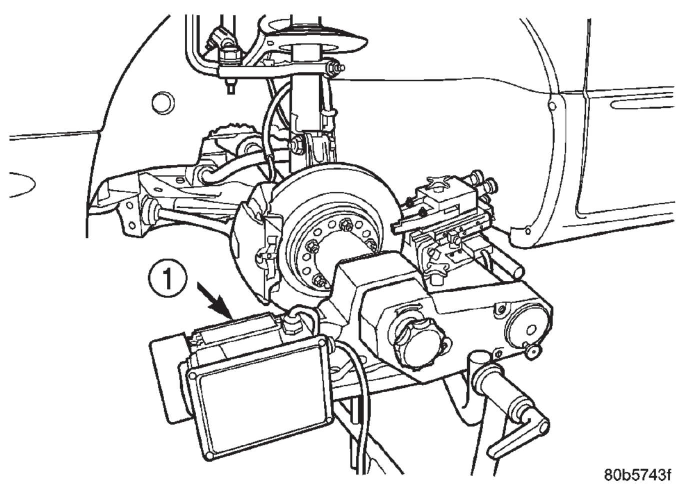

Fig. 49 On-Car Brake Lathe

1 - ON-CAR BRAKE LATHE

ROTOR (Continued)

NOTE: All rotors have markings for minimum allowable thickness cast on an un-machined surface of the rotor (Fig. 50).

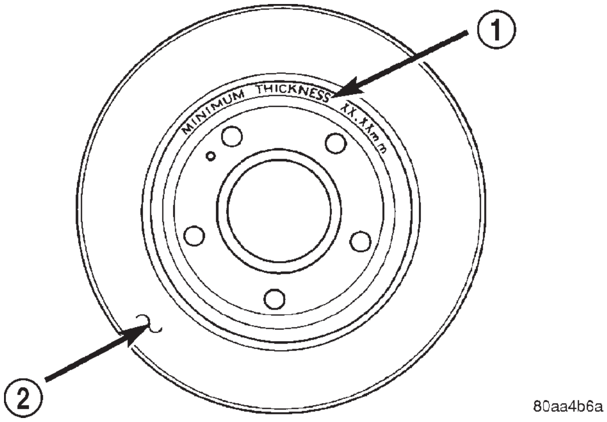

Fig. 50 Minimum Brake Rotor Thickness Markings (Typical)

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

SPECIFICATIONS AND LIMITS

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required.

REMOVAL

REMOVAL - FRONT ROTOR

(1) Raise the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove the front tire and wheel assembly.

(3) Slide the caliper outward in an effort to retract the caliper piston into its bore.

(4) Remove the two bolts securing disc brake caliper adapter to the steering knuckle (Fig. 51).

(5) Remove the disc brake caliper and adapter from the knuckle as an assembly. Hang the assembly out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

(6) Remove the clips retaining the brake rotor to the wheel studs.

(7) Remove the brake rotor.

REMOVAL - REAR ROTOR

(1) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(2) Remove rear tire and wheel.

(3) Remove the caliper and shoes from adapter and hang out of way. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL)

(4) Remove any clips on the wheel mounting studs.

(5) Remove rotor from hub (Fig. 52).

INSTALLATION

INSTALLATION - FRONT ROTOR

(4) Install the tire and wheel assembly. Tighten the wheel mounting nuts to a torque of 135 N·m (100 ft. lbs.).

(5) Lower the vehicle.

(6) Pump the brake pedal several times before moving the vehicle to set the shoes to the brake rotor.

(7) Road test the vehicle and make several stops to seat the brake shoes to the rotor.

INSTALLATION - REAR ROTOR

(1) Install rotor on wheel mounting studs (Fig. 52).

(2) Install caliper and shoes on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION)

(3) Install wheel and tire assembly.

(4) Lower vehicle.

PARKING BRAKE

ADJUSTMENTS

ADJUSTMENT - PARKING BRAKE

This vehicle uses a bent nail type park brake cable tension equalizer (Fig. 53). The bent nail tension equalizer it to be used only one time to set the park brake cable tension. If the park brake cables require adjustment during the life of the vehicle, a **NEW** tension equalizer **MUST** be installed before doing the park cable adjustment procedure.

CAUTION: Discard output cable retaining clip after removing it from park brake cable tension equalizer. Retainer is not to be re-used, a new retainer is to be installed when attaching output cable to tension equalizer.

(4) Using a screwdriver (Fig. 55), unlatch the park brake output cable retainer. Then remove cable retainer from park brake cable tension equalizer.

(5) Remove the park brake cable tension equalizer from the park brake lever output cable and the rear park brake cables (Fig. 56).

CAUTION: A new cable tension equalizer must be installed when adjusting park brake cable tension.

(6) Install a **NEW** park brake cable tension equalizer on the park brake lever output cable and rear park brake cables (Fig. 56).

CAUTION: A new park brake lever output cable retainer must be used when installing output cable on cable tension equalizer. Cable retainer usage is required to ensure output cable can not separate from tension equalizer.

(7) Install a **new** park brake lever output cable to tension equalizer retaining clip (Fig. 57) on tension

(8) Adjust cable tension for the parking brake system using the following steps.

• Position park brake lever so it is in the fully released position.

• Tighten the adjusting nut on the parking brake lever output cable until 26 millimeters of thread is out past top edge of adjustment nut (Fig. 58).

• Actuate the parking brake lever to its fully applied position (15 clicks) 1 time and then reposition the lever to its fully released position.

NOTE: Actuating the parking brake lever to its fully applied position one time after tightening the adjustment nut will yield (stretch) the bent nail portion of the tension equalizer approximately 1/4 inch. This process will correctly set the parking brake cable tension.

REMOVAL

For servicing of either the left or right rear parking brake cable, follow the procedure as listed below.

(1) Remove center floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Lower park brake lever handle.

(3) Loosen adjusting nut (Fig. 59) on park brake cable output cable. This will take tension off park brake cables, allowing rear park brake cables to be easily removed from tension equalizer.

(14) Remove the fasteners securing the 2 brake cable routing clips to the frame rail.

(15) Remove the park brake cable and sealing grommet (Fig. 63) from the floor pan of the vehicle.

INSTALLATION

For servicing of either the left or right rear parking brake cable, follow the procedure as listed below.

(1) Install parking brake cable into floor pan of vehicle making sure sealing grommet is installed in floor pan as far as possible to insure a proper seal (Fig. 63).

(2) Install park brake cable into the rear brake adapter. Be sure locking tabs on cable retainer are expanded to ensure park brake cable is securely held in the adapter.

NOTE: The park brake cable routing and routing clips are different on the right and left side of the vehicle. Be sure the correct routing clips are installed on the correct side of the vehicle.

(4) Install the park brake cable on the park brake shoe actuating lever.

(5) Install the parking brake shoes, hub and bearing, rotor and caliper. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION)

(6) Install rear wheel and tire assembly on vehicle. Tighten all wheel lug nuts in crisscross pattern to one-half specified torque. Then repeat pattern, fully tightening nuts to 135 N·m (100 ft. lbs.).

(7) Lower vehicle.

(8) Grasp park brake cable to floor pan seal grommet by hand, and pull it into floor pan to ensure seal grommet is fully seated into floor pan.

(9) Route park brake cable under carpeting and up to park brake cable hole in console bracket on floor pan.

(10) Install park brake cable into console bracket (Fig. 64). Be sure tabs on park brake cable retainer, have expanded out to hold park brake cable in console bracket.

CAUTION: Discard output cable retaining clip and tension equalizer after removing it from the park brake output cable. A new tension equalizer and retaining clip is to be used when installing a new rear park brake cable.

(11) Using a screwdriver (Fig. 65), unlatch the park brake output cable retainer. Then remove cable

CAUTION: A new retainer (Fig. 67) must be used when installing the park brake mechanism output cable on the cable tension equalizer. Cable retainer usage is required to ensure output cable can not separate from tension equalizer.

(13) Install a NEW park brake lever output cable to tension equalizer retaining clip (Fig. 67) on tension equalizer. The cable retainer must be closed and securely latched.

(14) Adjust cable tension for the parking brake system using the following steps.

- Position parking brake lever so it is in the fully released position.
- Tighten the adjusting nut on the parking brake lever output cable until 26 mm millimeters of thread is out past top edge of adjustment nut (Fig. 68).
- Actuate the parking brake lever to its fully applied position (15 clicks) 1 time and then reposition the lever to its fully released position.

NOTE: Actuating the parking brake lever to its fully applied position one time after tightening the adjustment nut will yield (stretch) the bent nail portion of the tension equalizer approximately 1/4 inch. This process will correctly set the parking brake cable tension.

BRAKES - ABS

TABLE OF CONTENTS

BRAKES - ABS

DESCRIPTION

DESCRIPTION - ANTILOCK BRAKES

This section covers the Mark 20e Antilock Brake System.

The purpose of this four-channel design antilock brake system is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

This ABS system has ABS Plus and Electronic Variable Brake Proportioning (EVBP). (Refer to 5 - ABS - BRAKES - DESCRIPTION)

DESCRIPTION - ABS PLUS

There is an ABS Plus function built into the ABS CAB. ABS Plus is a brake-on stability enhancement. It is designed to help maintain the directional stability of the vehicle during braking.

DESCRIPTION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

OPERATION

OPERATION - ANTILOCK BRAKES

There are a few performance characteristics of the Mark 20e Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with

BRAKES - ABS (Continued)

a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 5–8 km/h (3–5 mph). If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation and each wheel receives its own separate electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS stop, the brakes hydraulic system is still diagonally split. However, the brake system pressure is further split into four control channels. During antilock operation of the vehicle's brake system, the front wheels are controlled independently and are on two separate control channels, and the rear wheels are controlled together for better vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the controller antilock brake (CAB).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 5–7 km/h (3–4 mph). There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 5 km/h (3 mph) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP CYCLE

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning indicator lamp will also be on for up to 5 seconds after the ignition is turned on. These conditions occur as part of ABS self-diagnosis check. The popping sound is a result of brief activation of the solenoids in the integrated control unit.

DRIVE-OFF CYCLE

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 25–40 km/h (15–25 mph). This is caused by brief activation of the ABS pump/motor and is a normal function of ABS as part of the self-diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE warning indicator lamp, nor the amber ABS warning indicator lamp, illuminate and no fault codes are stored in the CAB.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a DRBIII® scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged tone wheels; incorrect tone wheels; damaged steering knuckle wheel speed sensor mounting bosses; loose wheel speed sensor mounting bolts; excessive tone wheel runout; or an excessively large tone wheel-to-wheel speed sensor air gap. Give special attention to these components when diagnosing a vehicle exhibiting premature ABS cycling.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to

BRAKES - ABS (Continued)

verify that premature ABS cycling has been corrected.

OPERATION - ABS PLUS

When the brake pedal is depressed far enough to actuate the brake lamp switch, the CAB monitors and compares the speeds of the front (driving) wheels. It senses vehicle speed, brake application, and detects vehicle cornering and applies the brakes selectively to stabilize the vehicle.

OPERATION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

CAUTION

The ABS uses an electronic control module, the CAB. This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the CAB circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the DRBIII® scan tool as described in this section. Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The CAB 24-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this manual should be serviced.

CAUTION: If welding work is to be performed on the vehicle, using an electric arc welder, the CAB connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS System are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle. Failure to raise a vehicle from the recommended locations could result in lifting a vehicle by the hydraulic control unit mounting bracket. Lifting a vehicle by the hydraulic control unit mounting bracket will result in damage to the mounting bracket and the hydraulic control unit.

BRAKES - ABS (Continued)

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

DIAGNOSIS AND TESTING - INSPECTION AND ROAD TEST

(1) Visually inspect the ABS for damaged or disconnected components and connectors.

(2) Verify the brake lamps are operational. If they are not, repair them prior to continuing.

(3) Connect the DRBIII® scan tool to the Data Link Connector located under the instrument panel to the right of the steering column. If the DRBIII® does not power-up, check the power and ground supplies to the connector.

(4) Turn the ignition key to the ON position. Select ANTILOCK BRAKES.

(5) Read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate chassis diagnostic information.

NOTE: Diagnostic trouble codes (DTCs) are kept in the controller's memory until either erased by the technician using the DRBIII®, or erased automatically after 3500 miles. DTCs are retained by the controller even if the ignition is turned off or the battery is disconnected. More than one DTC can be stored at a time. When accessed, the number of occurrences and the DTC that is stored are displayed.

If no problems are observed, it will be necessary to road test the vehicle.

Many ABS conditions judged to be a problem by the driver may be normal operating conditions. See Antilock Brake System - Operation to become familiarized with the normal characteristics of this antilock brake system.

WARNING: CONDITIONS THAT RESULT IN TURNING ON THE RED BRAKE WARNING INDICATOR LAMP MAY INDICATE REDUCED BRAKING ABILITY.

Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on. If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle. Refer to the Base Brake System - Diagnosis And Testing. If the red BRAKE warning indicator is illuminated, there is also a possibility that there is an ABS problem and the amber ABS warning indicator is not able to illuminate, so the MIC turns on the red BRAKE warning indicator by default.

If the amber ABS warning indicator is on, road test the vehicle as described below. While the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

(6) Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning lamp continues to stay on.

(7) If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 25 km/h (15 mph) to complete the ABS Start-Up and Drive-Off Cycles (see Antilock Brake System - Operation). If at this time the amber ABS warning indicator lamp stays on, refer to the Appropriate Diagnostic Information.

(8) If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the DRBIII®, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the Appropriate Diagnostic Information.

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS though, particularly the ICU (HCU), should only be bled when the HCU is replaced or removed from the vehicle. The ABS must always be bled anytime it is suspected that the HCU has ingested air. Under most circumstances that require the bleeding of the brakes hydraulic system, only the base brake hydraulic system needs to be bled.

It is important to note that excessive air in the brake system will cause a soft or spongy feeling brake pedal.

During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add DOT 3 brake fluid as required.

The ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

BRAKES - ABS (Continued)

(1) Make sure all hydraulic fluid lines are installed and properly torqued.

(2) Connect the DRBIII® scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.

(3) Using the DRB, check to make sure the CAB does not have any fault codes stored. If it does, clear them using the DRB.

WARNING: WHEN BLEEDING THE BRAKE SYSTEM WEAR SAFETY GLASSES. A CLEAR BLEED TUBE MUST BE ATTACHED TO THE BLEEDER SCREWS AND SUBMERGED IN A CLEAR CONTAINER FILLED PART WAY WITH CLEAN BRAKE FLUID. DIRECT THE FLOW OF BRAKE FLUID AWAY FROM YOURSELF AND THE PAINTED SURFACES OF THE VEHICLE. BRAKE FLUID AT HIGH PRESSURE MAY COME OUT OF THE BLEEDER SCREWS WHEN OPENED.

(4) Bleed the base brake system using the standard pressure or manual bleeding procedure. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)

(5) Using the DRB, select ANTILOCK BRAKES, followed by MISCELLANEOUS, then BLEED BRAKES. Follow the instructions displayed. When the scan tool displays TEST COMPLETED, disconnect the scan tool and proceed.

(6) Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

(7) Fill the master cylinder reservoir to the full level.

(8) Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

REMOVAL

This procedure is for the removal and installation of one of the two front wheel speed sensors.

(1) Raise vehicle on jack stands or centered on a frame contact type hoist. See Hoisting in the Lubrication and Maintenance section of this manual, for the required lifting procedure to be used for this vehicle.

(2) Remove the tire and wheel assembly from the vehicle.

(3) Remove the speed sensor cable routing bracket (Fig. 1) from the steering knuckle. Remove the wiring harness sealing grommet retainer and speed sensor routing bracket from the inner fender.

CAUTION: If speed sensor head locating pin has seized to the steering knuckle, do not attempt to remove speed sensor head by grasping with pliers and turning. This will damage the speed sensor head. Use only the following procedure.

(6) If speed sensor head can not be removed from steering knuckle by hand, the locating pin on the speed sensor head has seized to the steering knuckle do to corrosion. Remove speed sensor head from steering knuckle using the following procedure. Remove disc brake caliper from steering knuckle, and remove brake rotor from hub/bearing assembly. Then insert a pin punch through hole in front steering knuckle (Fig. 4) and tap speed sensor head locating pin out of steering knuckle.

INSTALLATION

This procedure is for the removal and installation of one of the two front wheel speed sensors.

CAUTION: Proper installation of wheel speed sensor cables is critical to continued system operation. Be sure that cables are installed in retainers. Failure to install cables in retainers as shown in this section may result in contact with moving parts and/or over extension of cables, resulting in an open circuit.

(1) Connect the wheel speed sensor cable connector to the vehicle wiring harness (Fig. 2) .

(2) Install the speed sensor cable assembly grommet into the front inner fender (Fig. 2) . Install speed sensor cable grommet retainer/routing bracket on the

inner fender of the vehicle and install and securely tighten attaching bolt (Fig. 1) .

CAUTION: When installing the wheel speed sensor cable routing bracket on the steering knuckle, (Fig. 1) the speed sensor cable must be looped toward the shock absorber as shown in (Fig. 5) . If speed sensor cable is not routed in this direction it will rub against the tire or wheel, damaging the speed sensor cable.

(3) Install the speed sensor cable routing bracket on the steering knuckle. Install and tighten routing bracket mounting bolt to a torque of 12 N·m (105 in. lbs.)

(4) Install speed sensor head on steering knuckle (Fig. 6) . When installing speed sensor head on steering knuckle, apply a small amount of grease on speed sensor locating pin (Fig. 6) . Use Mopar, Multi-Purpose Grease or an equivalent on speed sensor head locating pin. Install the speed sensor head attaching screw and tighten to a torque of 6 N·m (55 in. lbs.).

(5) Install the wheel and tire assembly on vehicle.

(6) Road test vehicle to ensure proper operation of the base and ABS systems.

INSTALLATION

INSTALLATION - JR27

CAUTION: Proper installation of wheel speed sensor harness is critical to continued system operation. Be sure that harness is installed properly to avoid harness contact with moving parts or over-extension, resulting in an open circuit.

(1) Install speed sensor head into brake adapter (Fig. 11). Install bolt through routing clip and secure wheel speed sensor in place. Tighten bolt to 8 N·m (75 in. lbs.)

(2) Install speed sensor harness routing clip on upper control arm. Install and securely tighten the routing clip attaching bolt.

(3) Install connector end of speed sensor harness through hole at frame rail.

(4) Install speed sensor harness sealing grommet into hole. Install the sealing grommet retainer and attaching bolt (Fig. 10). Securely tighten retainer attaching bolt.

(5) Lower vehicle.

(6) Connect speed sensor harness connector to vehicle wiring harness (Fig. 9).

(7) Install foam sleeve back over the speed sensor harness connection to prevent rattling (Fig. 8).

(8) Slide the sensor harness connector back behind the wheel house silencer (Fig. 7).

(9) Lay the main silencer pad back into its normal place.

(10) Install the rear seat back and cushion. (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION)

(11) Road test vehicle to ensure proper operation of the base and ABS systems.

(3) Install connector end of speed sensor harness through hole at frame rail.

(4) Install speed sensor harness sealing grommet into hole. Install the sealing grommet retainer and attaching bolt (Fig. 10). Securely tighten retainer attaching bolt.

(5) Install the tire and wheel assembly on vehicle.

(6) Lower vehicle.

(7) Connect speed sensor harness connector to vehicle wiring harness behind rear seat back. **Install sleeve back over the speed sensor harness connection to prevent rattling.**

(8) Road test vehicle to ensure proper operation of the base and ABS systems.

TONE WHEEL

INSPECTION - TONE WHEEL

Tone wheels can cause erratic wheel speed sensor signals. Inspect tone wheels for the following possible causes.

- missing, chipped, or broken teeth
- contact with the wheel speed sensor
- wheel speed sensor to tone wheel alignment
- wheel speed sensor to tone wheel clearance
- excessive tone wheel runout

TONE WHEEL (Continued)

- tone wheel loose on its mounting surface

If a front tone wheel is found to need replacement, the drive shaft must be replaced. No attempt should be made to replace just the tone wheel. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)

If a rear tone wheel is found to need replacement, the tone wheel is incorportaed into the hub and bearing assembly and the hub and bearing must be replaced. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

If wheel speed sensor to tone wheel contact is evident, determine the cause and correct it before replacing the wheel speed sensor or tone wheel.

Check the gap between the speed sensor head and the tone wheel to ensure it is within specifications. (Refer to 5 - BRAKES - ABS/ELECTRICAL - SPECIFICATIONS)

Excessive wheel speed sensor runout can cause erratic wheel speed sensor signals. Refer to SPECIFICATIONS in this section of the service manual for the maximum allowed tone wheel runout (Refer to 5 - BRAKES - ABS/ELECTRICAL - SPECIFICATIONS). If tone wheel runout is excessive, determine if it is caused by a defect in the driveshaft assembly or hub and bearing. Replace as necessary.

Tone wheels are pressed onto their mounting surfaces and should not rotate independently from the mounting surface. Replacement of the front driveshaft or rear hub and bearing is necessary.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) is mounted to the CAB as part of the ICU (Fig. 14). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to supply build pressure to the brakes during an ABS stop.

OPERATION - HYDRAULIC CIRCUITS AND VALVES

The hydraulic fluid control valves control the flow of pressurized brake fluid to the wheel brakes during the different modes of ABS braking. The following paragraphs explain how this works. For purposes of explanation only, it is assumed that only the right front wheel is experiencing antilock braking; the following diagrams show only the right front wheel in an antilock braking operation.

NORMAL BRAKING HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION

The hydraulic diagram (Fig. 12) shows the vehicle in the normal braking mode of the base brake hydraulic system. The diagram shows no wheel spin or slip occurring relative to the speed of the vehicle. The driver is applying the brake pedal; this builds pressure in the brake hydraulic system to engage the brakes and stop the vehicle.

ABS HYDRAULIC CIRCUIT AND SOLENOID VALVE FUNCTION

The hydraulic diagram (Fig. 13) shows the vehicle in the ABS braking mode. The diagram shows one wheel is slipping because the driver is attempting to stop the vehicle at a faster rate than is allowed by the surface on which the tires are riding.

- The normally open and normally closed valves modulate (build/decay) the brake hydraulic pressure as required.
- The pump/motor is switched on so that the brake fluid from the low pressure accumulators is returned to the master cylinder circuits.
- The brake fluid is routed to either the master cylinder or the wheel brake depending on the position of the normally open valve.

ICU (INTEGRATED CONTROL UNIT)

DESCRIPTION

The hydraulic control unit (HCU) and the controller antilock brake (CAB) used with this antilock brake system are combined (integrated) into one unit, which is called the integrated control unit (ICU) (Fig. 14). The ICU is located below the air cleaner housing on the lower radiator support (Fig. 15).

2 - HCU
3 - PUMP/MOTOR WIRING CONNECTOR
4 - CAB

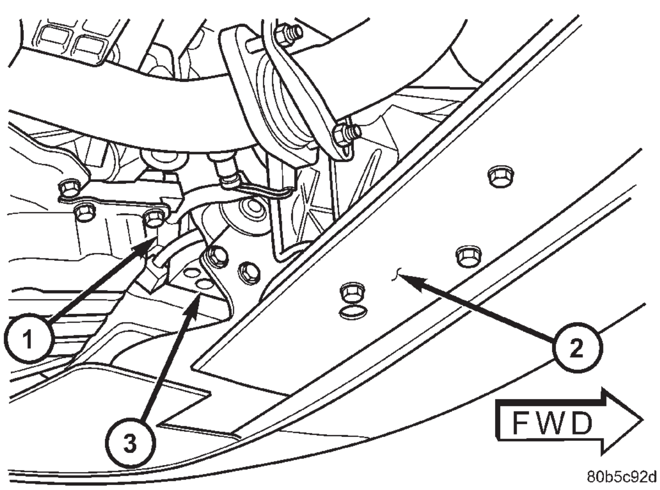

Fig. 15 ICU LOCATION

1 - 24-WAY CAB CONNECTOR
2 - LOWER RADIATOR SUPPORT
3 - ICU

The ICU consists of the following components: the CAB, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), valve block, fluid accumulators, a pump, and an electric motor.

The replaceable components of the ICU are the HCU and the CAB. No attempt should be made to service any individual components of the HCU or CAB. For information on the CAB, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/CONTROLLER ANTILOCK BRAKE - DESCRIPTION).

OPERATION

For information of the ICU, refer to these individual components of the ICU:

• CONTROLLER ANTILOCK BRAKE (CAB) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/CONTROLLER ANTILOCK BRAKE - OPERATION)

• HYDRAULIC CONTROL UNIT (HCU) (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - OPERATION)

For information on the ICU's hydraulic circuits, refer to HYDRAULIC CIRCUITS AND VALVE OPERATION. (Refer to 5 - BRAKES - ABS/HYDRAULIC/MECHANICAL - OPERATION)

REMOVAL - ICU

(1) Remove the remote ground cable from the ground stud on the left strut tower.

(2) Correctly isolate remote ground cable when servicing vehicle by installing the ground cable insulator on the strut tower ground stud. **This will prevent accidental grounding of the remote ground cable.**

(3) Using a brake pedal positioning tool (Fig. 16), depress brake pedal past its first 1 inch of travel and hold in this position. This will isolate the master cylinder reservoir from the brake hydraulic system, not allowing the brake fluid to drain out of the reservoir.

(4) Remove the air cleaner housing. Refer to 9 - ENGINE/AIR INTAKE SYSTEM

(5) Clean any debris away from the fittings on top of the ICU.

(6) Remove the two brake tubes coming from the primary and secondary master cylinder ports at the ICU (Fig. 17).

(7) Remove the four chassis brake tubes going to each brake, mounted in-line across the top of the junction block (Fig. 17).

(8) Disconnect the 24-way wiring harness connector from the CAB (Fig. 17) using the following procedure. Grasp the lock on the 24-way connector and pull it up from the connector as far as possible. This

ASSEMBLY - ICU

(1) Install the CAB (Fig. 20) on the HCU.

(2) Install the 4 bolts mounting the CAB (Fig. 19) to the HCU. Tighten the CAB mounting bolts to a torque of 2 N·m (17 in. lbs.).

(3) Plug the pump/motor wiring harness into the CAB.

(4) Install the ICU in the vehicle and bleed the base and ABS hydraulic systems. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)

INSTALLATION - ICU

(1) Install the ICU back in the vehicle on its mounting bracket (Fig. 18).

(2) Install isolators, washers and attaching bolts, mounting the ICU to its mounting bracket. Tighten the 3 HCU mounting bolts to a torque of 11 N·m (97 in. lbs.).

CAUTION: Before installing the 24-way connector in the CAB be sure that the seal is properly installed in the connector.

(3) Install the 24-way connector into the socket on the CAB (Fig. 17). The connector is installed using the following procedure. Position the 24-way connector in the socket on the CAB and carefully push it down as far as it will go. When connector is fully seated into the CAB socket push in the connector lock as far as it will go. This will pull the connector into the socket on the CAB and lock it in the installed position.

(4) Install the four chassis brake tubes (going to each brake) to the top of the ICU (Fig. 17). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(5) Install the two brake tubes coming from the primary and secondary master cylinder ports to the top corners of the ICU (Fig. 17). Tighten the tube fittings to 17 N·m (145 in. lbs.) torque with the aid of a crow foot wrench.

(6) Install the air cleaner housing. Refer to 9 - ENGINE/AIR INTAKE SYSTEM.

(7) Remove the brake pedal holding tool.

(8) Install the remote ground cable onto the ground stud located on left shock tower.

(9) Bleed the base brakes and the ABS brakes hydraulic system. (Refer to 5 - BRAKES - ABS - STANDARD PROCEDURE)

(10) Road test vehicle to ensure proper operation of the base and ABS systems.

CLUTCH

TABLE OF CONTENTS

CLUTCH

DESCRIPTION

Manual transaxle equipped models (2.0L/2.7L) utilize a modular clutch assembly. The clutch system consists of a modular clutch assembly (Fig. 1), a sleeve type release bearing, a self adjusting clutch cable (2.0L models), hydraulic clutch release system (2.7L models), and a clutch pedal that is part of a brake/clutch pedal bracket assembly.

The modular clutch assembly consists of a single, dry-type clutch disc, a diaphragm style clutch cover, and an integrated flywheel. The clutch cover is riveted to the flywheel, containing the clutch disc within. The modular clutch can only be serviced as an assembly.

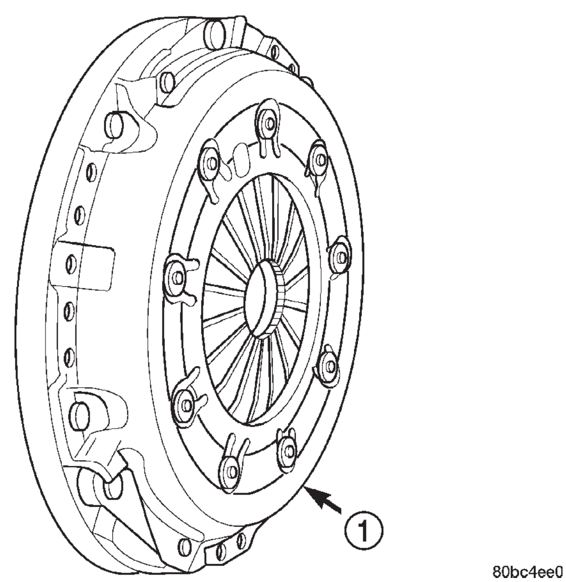

Fig. 1 Modular Clutch Assembly

1 - MODULAR CLUTCH ASSEMBLY

CLUTCH (Continued)

OPERATION

MECHANICAL

The clutch assembly is designed to transmit power from the engine to the manual transaxle. This is accomplished by the friction and clamping force generated when the spring loaded pressure plate locks the clutch disc to the flywheel (Fig. 2). The clutch disc, which is splined to the transaxle input shaft, transmits power until the center of the diaphragm spring is depressed, and the clamp force is removed from the disc.

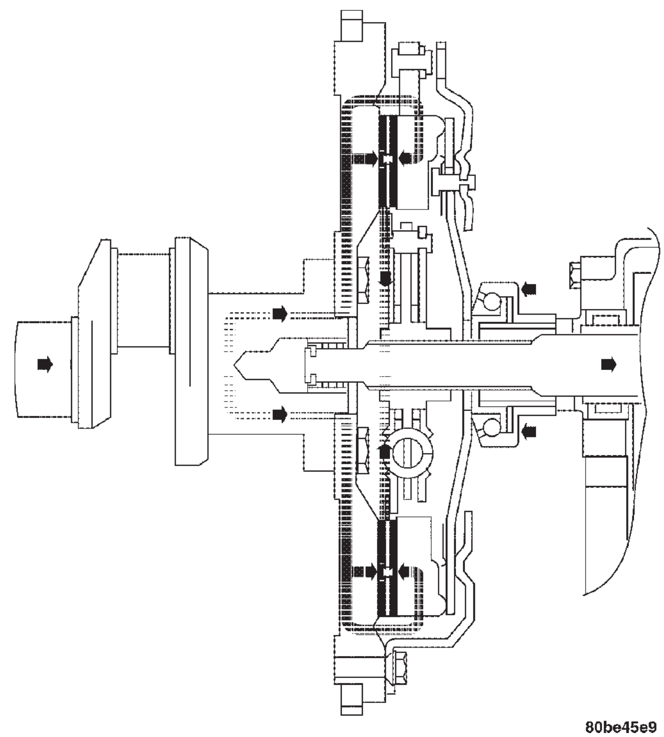

Fig. 2 Clutch Coupling Powerflow - Typical

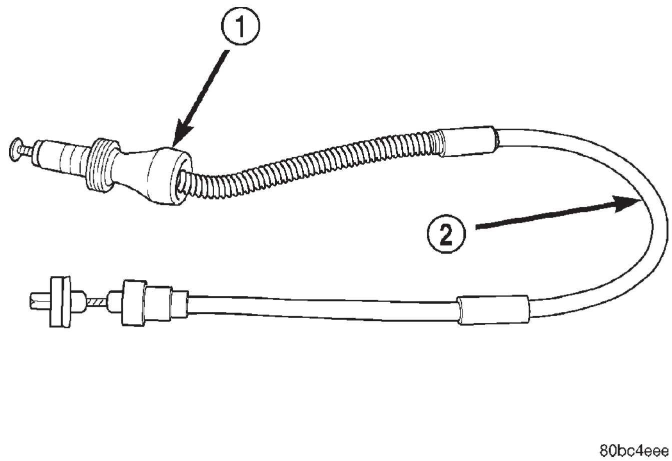

Fig. 3 Clutch Cable Assembly

1 - ADJUSTER MECHANISM
2 - CLUTCH CABLE

RELEASE SYSTEM - 2.0L/T350 TRANSAXLE

A sleeve-type release bearing is used to engage and disengage the clutch cover pressure plate. The release bearing is operated by a pivoting release lever in the clutch housing (Fig. 4). The lever pivots on a ball stud within the housing. The release lever is actuated by a self-adjusting clutch cable (Fig. 3).

The clutch cable has a unique self-adjuster mechanism (Fig. 3) built into the cable which compensates for clutch disc wear. The preload spring maintains tension on the cable. This tension keeps the clutch release bearing (Fig. 4) continuously loaded against the fingers of the clutch cover assembly. The cable requires no maintenance or lubrication.

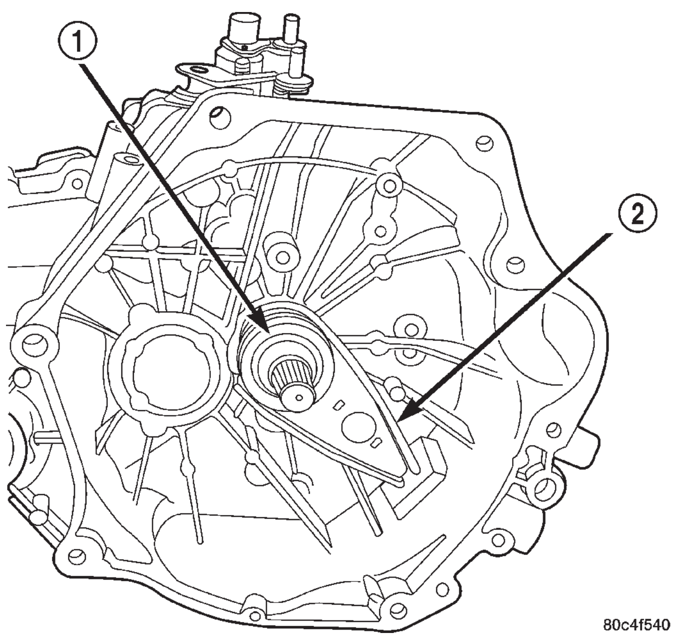

Fig. 4 Clutch Release Bearing and Lever (2.0L/T350)

1 - RELEASE BEARING
2 - LEVER

CLUTCH (Continued)

RELEASE SYSTEM - 2.7L/T850 TRANSAXLE

The clutch hydraulic system is responsible for engaging and disengaging the clutch. Depressing the clutch pedal develops fluid pressure in the clutch master cylinder. This pressure is transmitted to the slave cylinder through a connecting line. In turn, the slave cylinder operates the clutch release lever (Fig. 5).

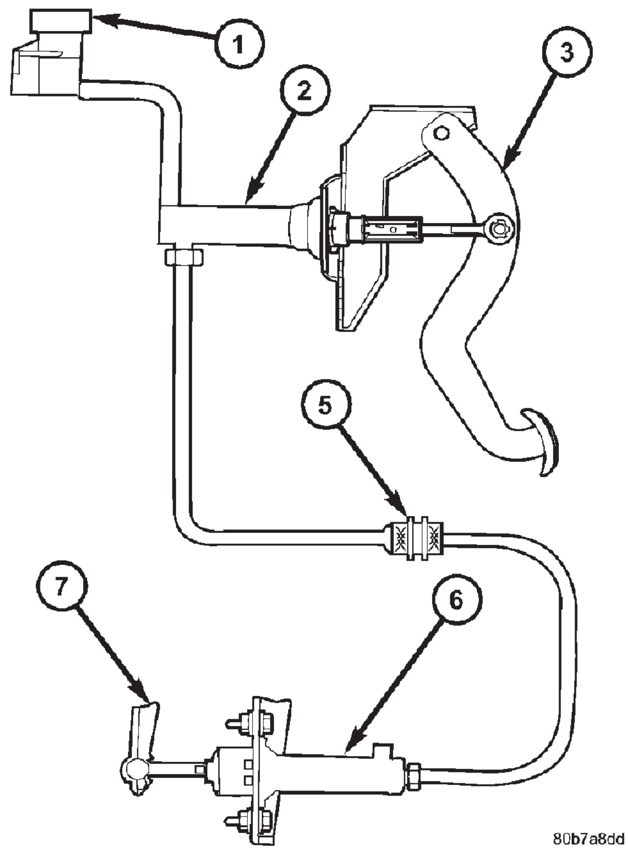

Fig. 5 Clutch Hydraulic System—Typical

1 - RESERVOIR
2 - MASTER CYLINDER
3 - CLUTCH PEDAL
5 - QUICK CONNECT
6 - SLAVE CYLINDER
7 - RELEASE LEVER

The slave cylinder spring causes the release lever to hold the release bearing in constant contact with the diaphragm spring (release bearing preload). During a clutch pedal actuation, the hydraulic fluid pressure applies additional force to the release lever and bearing (Fig. 6). As additional force is applied, the bearing presses the diaphragm spring fingers inward on the fulcrums. This action moves the pressure plate rearward, relieving clamp force on the disc.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH SYSTEM

Clutch problem diagnosis will generally require a road test to determine the type of fault. Component inspection will then determine the problem after road testing.

Drive the vehicle at normal speeds during road test. Shift the transaxle through all gear ranges and observe clutch action. If chatter, grab, slip, or improper release is experienced, remove and inspect the clutch components. If the problem is noise or hard shifting, further diagnosis may be needed. The transaxle or other driveline components may actually be at fault.

CLUTCH (Continued)

SERVICE DIAGNOSIS - CLUTCH GRAB/CHATTER

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC FACING COVERED WITH OIL OR GREASE	Oil leak at engine rear main or transaxle input shaft seal.	Correct leak and replace modular clutch assembly.
	Too much grease applied to splines of disc and input shaft.	Apply lighter coating of grease to splines.
NO FAULT FOUND WITH CLUTCH COMPONENTS	Problem actually related to suspension or driveline component.	Further diagnosis required. Check engine/transmission mounts, suspension attaching parts and other driveline components as needed.
	Engine related problems.	Check EFI and ignition systems.
PARTIAL ENGAGEMENT OF CLUTCH DISC	Clutch cover, spring, or release fingers bent, distorted (rough handling, improper assembly).	Replace modular clutch assembly.
	Clutch disc damaged or distorted.	Replace modular clutch assembly.
	Clutch misalignment.	Verify modular clutch pilot plate alignment to crankshaft. Replace the modular clutch assembly if the pilot plate is loose or bent.

SERVICE DIAGNOSIS - CLUTCH SLIPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC FACING WORN OUT	Normal wear.	Replace modular clutch assembly.
	Driver frequently rides (slips) clutch, results in rapid wear, overheating.	Replace modular clutch assembly.
	Insufficient clutch cover diaphragm spring tension	Replace modular clutch assembly.
CLUTCH DISC FACING CONTAMINATED WITH OIL OR GREASE	Leak at rear main oil seal or transaxle input shaft seal	Replace leaking seals. Replace modular clutch assembly.
	Excessive amount of grease applied to input shaft splines	Apply less grease to input shaft. Replace modular clutch assembly
	Road splash, water entering housing	Seal housing. Inspect clutch assembly.
CLUTCH IS RUNNING PARTIALLY DISENGAGED	Release bearing sticking or binding, does not return to normal running position.	Verify that bearing is actually binding. Then, replace bearing and transmission front bearing retainer if sleeve surface is damaged.
	Cable self-adjuster mechanism sticking or binding causing high preload.	Verify that self-adjuster is free to move.
CLUTCH DISC FACINGS HAVE FRACTURED INTO SMALL PIECES	Leak at rear main or transaxle input shaft seal	Replace seal. Replace modular clutch assembly.
	Excessive heat from slippage	Replace modular clutch assembly

CLUTCH (Continued)

SERVICE DIAGNOSIS - IMPROPER CLUTCH RELEASE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH DISC BINDS ON INPUT SHAFT SPLINES	Clutch disc hub splines damaged during installation	Clean, smooth, and lubricate disc and shaft splines. Replace modular clutch assembly, or clutch disc, and/or input shaft if splines are severely damaged.
	Input shaft splines rough, damaged.	Clean input shaft splines. Then lube.
	Corrosion or rust formations on splines of input shaft and disc	Clean input shaft splines and disc splines, then lube
CLUTCH DISC RUSTED TO FLYWHEEL AND/OR PRESSURE PLATE	Occurs in vehicles stored or not driven for extended period of time. Also occurs after steam cleaning if vehicle is not used for extended period.	Replace modular clutch assembly
CLUTCH WILL NOT DISENGAGE PROPERLY	Disc bent, distorted during transaxle installation	Replace modular clutch assembly
	Clutch cover diaphragm spring damaged during transaxle installation	Replace modular clutch assembly
	Release fork bent, loose, or damaged	Replace fork if worn or damaged
	Clutch cable binding or routed incorrectly.	Check and correct cable routing.
	Self-adjuster in cable not functioning properly, resulting in excess cable slack.	Pull on cable conduit at transaxle (as if disconnecting cable) to check adjuster operation.

SERVICE DIAGNOSIS - CLUTCH PEDAL NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
CLUTCH PEDAL SQUEAKS WHEN DEPRESSED TO FLOOR	Pedal bushings worn out or inadequate lubrication	Replace or lubricate bushings
	Clutch pedal return spring worn out	Lubricate or replace return spring
CLUTCH PEDAL SQUEAKS DURING OPERATION	Clutch release lever pivot stud has inadequate lubrication	Lubricate or replace clutch release lever

DIAGNOSIS AND TESTING - DRIVE PLATE MISALIGNMENT

Common causes of misalignment are:

- Heat warping
- Mounting drive plate on a dirty crankshaft flange
- Incorrect bolt tightening
- Improper seating on the crankshaft shoulder
- Loose crankshaft bolts

Clean the crankshaft flange before mounting the drive plate. Dirt and grease on the flange surface may misalign the flywheel, causing excessive runout. Use new bolts when mounting drive plate to crankshaft. Tighten drive plate bolts to specified torque only. Over-tightening can distort the drive plate hub causing excessive runout.

DIAGNOSIS AND TESTING - CLUTCH COVER AND DISC RUNOUT

Check condition of the clutch cover before installation. A warped cover or diaphragm spring will cause grab and/or incomplete release or engagement. Use care when handling the clutch assembly. Impact can distort the cover, diaphragm spring, and release fingers.

CLUTCH (Continued)

DIAGNOSIS AND TESTING - CLUTCH CHATTER COMPLAINTS

For all clutch chatter complaints, perform the following:

(1) Check for loose, misaligned, or broken engine and transmission mounts. If present, they should be corrected at this time. Test vehicle for chatter. If chatter is gone, there is no need to go any further.

(2) If chatter persists, check hydraulic clutch release system is functioning properly.

(3) Check for loose connections in drivetrain. Correct any problems and determine if clutch chatter complaints have been satisfied. If not:

(a) Remove transaxle.

(b) Check to see if the release bearing is sticky or binding. Replace bearing, if needed.

(c) Check linkage for excessive wear on the pivot stud and fork fingers. Replace all worn parts.

(d) Check clutch assembly for contamination (dirt, oil). Replace clutch assembly, if required.

(e) Check to see if the clutch disc hub splines are damaged. Replace with new clutch assembly, if necessary.

(f) Check input shaft splines for damage. Replace, if necessary.

(g) Check for uneven wear on clutch fingers.

(h) Check for broken clutch cover diaphragm spring fingers. Replace with new clutch assembly, if necessary.

DIAGNOSIS AND TESTING - CLASH-INTO-REVERSE COMPLAINTS

All T350 manual transaxles are equipped with a reverse brake. It prevents clash when shifting into reverse, but only if the vehicle is not moving.

(1) Depress clutch pedal to floor and hold. After three seconds, shift to reverse. If clash is present, clutch has excessive spin time, and the reverse brake may not be functioning.

(2) Remove transaxle.

(3) Check the input shaft spline, clutch disc splines, and release bearing for dry rust. If present, clean rust off and apply a light coat of bearing grease to the input shaft splines. Apply grease on the input shaft splines only where the clutch disc slides. Verify that the clutch disc slides freely along the input shaft spline.

(4) Check to see if the clutch disc hub splines are damaged, and replace with new clutch assembly if required.

(5) Check the input shaft for damaged splines. Replace as necessary.

(6) Check for broken clutch cover diaphragm spring fingers.

(7) Install clutch assembly and transaxle.

(9) Disconnect speed control servo connector. Remove speed control servo/bracket from strut tower and secure out of way.

(10) Raise vehicle on hoist.

(11) Using tool 6638, disconnect clutch hydraulic circuit quick-connect fitting.

(12) Lower vehicle.

(13) Rotate master cylinder ¼ turn counter-clockwise and remove from dash panel/clutch pedal bracket.

(14) Work master cylinder and plumbing out of engine compartment, using care not to bend or damage plumbing. Note routing of plumbing for reassembly.

INSTALLATION

(1) Install master cylinder and plumbing into position as removed. Use care not to bend or damage plumbing.

(2) Install master cylinder pushrod through dash panel hole. Index master cylinder ¼ turn counter-clockwise, then apply pressure towards dash panel and rotate ¼ turn clockwise. If necessary, have helper guide installation from inside vehicle.

(3) Connect master cylinder pushrod to clutch pedal pin. An audible click should be heard. Verify plastic retainer is intact and secures pushrod. **If retainer is damaged, it MUST be replaced.**

(4) Install instrument panel lower close-out panel.

(5) Install fuse box access panel.

(6) Raise vehicle.

(7) Route master cylinder plumbing into position and connect to slave cylinder. An audible click should be heard. Verify by pulling outward on connection.

(8) Lower vehicle.

(9) Install purge solenoid to mounting bracket.

(10) Connect brake master cylinder level sensor connector.

(11) Install speed control servo and connect connector.

(12) Install clutch master cylinder reservoir.

(13) Install air cleaner assembly.

(14) Install battery negative cable.

(15) Verify clutch pedal operation. Actuate clutch pedal at least ten (10) times to purge any trapped air from system.

(16) Check and adjust clutch master cylinder fluid level.

CLUTCH PEDAL INTERLOCK SWITCH

DIAGNOSIS AND TESTING - CLUTCH PEDAL INTERLOCK SWITCH

CLUTCH PEDAL INTERLOCK SWITCH–ELECTRICAL TEST

Disconnect clutch pedal interlock switch harness from instrument panel wiring harness. Using an ohmmeter, check for continuity between the two terminals in the connector on the switch harness. There should be no continuity between the terminals when the switch is in its normal (fully extended) position. When the switch is depressed more than 1.25 mm (0.050), the ohmmeter should show continuity (zero ohms).

If ohmmeter readings do not fall within these ranges, the switch is defective, and must be replaced.

CLUTCH PEDAL INTERLOCK SWITCH–MECHANICAL TEST

With the park brake set and the vehicle **IN NEUTRAL,** turn the key to the start position. The vehicle should not crank. If the vehicle cranks, the switch is defective (shorted out) and must be replaced. If the vehicle does not crank proceed to the next step.

WARNING: BEFORE PERFORMING THIS STEP, BE SURE THAT THE AREA IN FRONT OF THE VEHICLE IS CLEAR OF OBSTRUCTIONS AND PEOPLE. VEHICLE MAY MOVE WHEN PERFORMING THIS TEST.

With the park brake set and the vehicle **IN GEAR,** turn the key to the start position and hold it there.

Slowly depress the clutch pedal and feel for any vehicle motion when the starter is energized. If there is no motion the switch is working properly.

If motion is felt, check to see if the switch is making contact when the pedal is between 25 mm (1.0 in.) and 6 mm (0.25 in.) from the floor. If this condition is met, then the problem is either the clutch or the self-adjusting cable (See “Clutch Will Not Disengage Properly”). If this condition is not met, then the switch mounting tab on the brake bracket is bent, and the brake bracket must be replaced.

If vehicle will not crank, even with clutch pedal pressed to the floor, refer to “Service Diagnosis-Clutch Pedal Position Switch” chart in this section.

SERVICE DIAGNOSIS–CLUTCH PEDAL POSITION SWITCH

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WON’T CRANK WHEN CLUTCH PEDAL IS DEPRESSED TO THE FLOOR	Switch does not have continuity when plunger is depressed 1.25 mm	Defective switch. Replace switch.
	Switch plunger is not depressed when clutch pedal is depressed to the floor.	Floor mat or other obstruction interferes with clutch pedal movement.
	Problem is related to other components in the starting circuit.	Check other components in the starting circuit. Refer to Section 8A.

REMOVAL

(1) Disconnect battery negative cable.
(2) Remove steering column lower panel.
(3) Remove knee bolster.
(4) Disconnect position switch connector.
(5) Depress wing tabs on switch and push switch out of mounting bracket (Fig. 7).

INSTALLATION

(1) Slide switch wires through slot in bracket.
(2) Line up switch tab with slot in bracket and push switch into position (Fig. 7).
(3) Attach switch connector.
(4) Install knee bolster.
(5) Install steering column lower panel.
(6) Connect battery negative cable.

CLUTCH RELEASE BEARING AND LEVER

DESCRIPTION

A conventional release bearing is used to engage and disengage the clutch pressure plate. The clutch release bearing is mounted on the transaxle front bearing retainer. The bearing is attached to and operated by the release lever (Fig. 8) (Fig. 9), which moves the bearing into contact with the clutch cover diaphragm spring.

OPERATION

The release bearing is operated by the release lever (Fig. 8) (Fig. 9). Slave cylinder force causes the release lever to move the release bearing into contact with the diaphragm spring. As additional force is applied, the bearing presses the diaphragm spring fingers inward on the fulcrums. This action moves the pressure plate rearward, relieving clamping force on the clutch disc. Releasing pedal pressure removes clutch hydraulic pressure. The release bearing then moves away from the diaphragm spring which allows the pressure plate to exert clamping force on the clutch disc.

REMOVAL

REMOVAL - T350 EQUIPPED MODELS

(1) Remove the transaxle from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/T350 MANUAL - REMOVAL)

CLUTCH RELEASE BEARING AND LEVER (Continued)

(2) Move the lever and bearing assembly (Fig. 10) to a vertical in-line position. Grasp the release lever with two hands in the pivot stud socket area. Pull with even pressure and the lever will pop off the pivot–stud. Do not use a screwdriver or pry bar to pop off the lever. This may damage the spring clip on the lever.

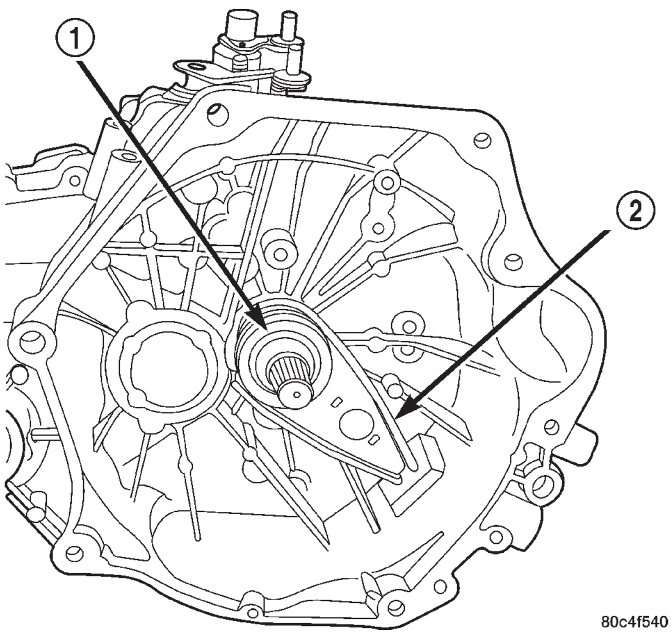

Fig. 10 Clutch Release Bearing and Lever

1 - RELEASE BEARING
2 - RELEASE LEVER

(3) As a unit, remove the lever from the bearing thrust plate. Be careful not to damage retention tabs on bearing.

(4) Examine the condition of the bearing. **It is pre-lubricated and sealed and should not be immersed in oil or solvent.**

(5) The bearing should turn smoothly when held in the hand under a light thrust load. A light drag caused by the lubricant fill is normal. If the bearing is noisy, rough, or dry, replace the complete bearing assembly with a new bearing.

(6) Check the condition of the pivot stud spring clips on back side of clutch release lever. If the clips are broken or distorted, replace the release lever.

REMOVAL - T850 EQUIPPED MODELS

(1) Remove transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/T850 MANUAL - REMOVAL)

(2) Remove modular clutch assembly from input shaft.

(3) Grasp clutch release lever and bearing (Fig. 11) with both hands and pull outward using moderate pressure to release lever from pivot ball(s).

(4) Separate release bearing from lever.

INSTALLATION

INSTALLATION - T350 EQUIPPED MODELS

(1) The pivot ball pocket in the lever, as well as the lever arms should be lubricated with grease prior to installation.

(2) Assemble the lever to the bearing. The small pegs on the bearing must go over the lever arms.

(3) Slide the bearing and lever assembly onto the input shaft bearing retainer, as a unit (Fig. 10).

(4) Snap the clutch release lever onto the pivot ball.

(5) Reinstall transaxle assembly. (Refer to 21 - TRANSMISSION/TRANSAXLE/T350 MANUAL - INSTALLATION)

INSTALLATION - T850 EQUIPPED MODELS

(1) If removed, install **new** release lever pivot ball(s) using slide hammer C-3752 and remover/installer 6891 (Fig. 13) (Fig. 14).

(2) Install clutch release bearing to lever. Apply grease to interface points. Make sure release bearing retainers engage lever pocket as shown in (Fig. 15).

(3) Apply grease to pivot ball, and on release lever at slave cylinder contact point.

(4) Install clutch release bearing/lever assembly into position by sliding bearing onto input bearing retainer, and using moderate hand pressure to seat

CLUTCH RELEASE CABLE (2.0L/T350 MODELS)

DESCRIPTION

2.0L equipped models use a cable style clutch release system. The clutch cable assembly (Fig. 17) carries the movement of the clutch pedal to the clutch release bearing. The cable is designed to maintain tension against the clutch fork, or lever, and has a built in self-adjusting mechanism, which compensates for clutch disc wear.

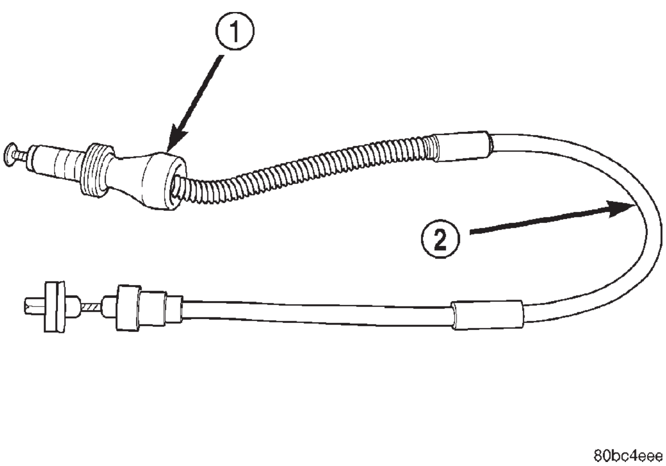

Fig. 17 Clutch Cable Assembly

1 - ADJUSTER MECHANISM
2 - CLUTCH CABLE

REMOVAL

(1) Disconnect battery negative cable.
(2) Remove air cleaner assembly.
(3) Remove bellhousing cap (Fig. 18).
(4) Disconnect clutch cable from release lever (Fig. 18).

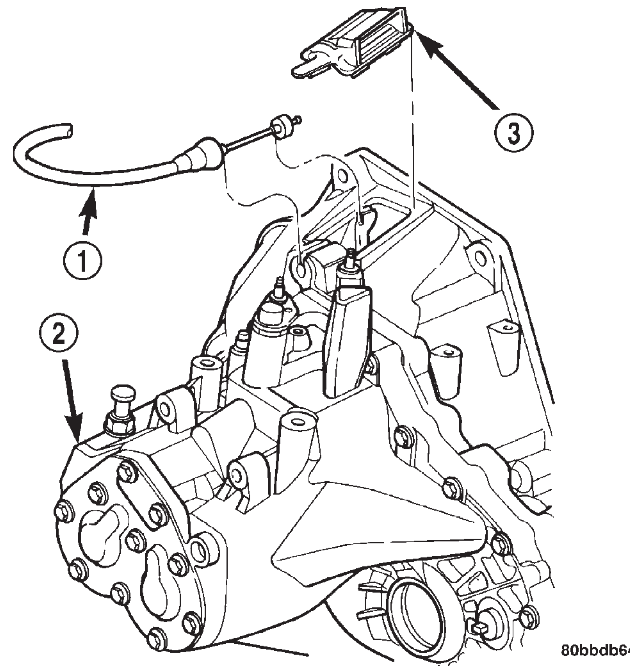

Fig. 18 Clutch Cable at Transaxle

(5) Remove steering column lower shroud.
(6) Remove knee bolster.
(7) Remove upstop spacer retainer clip from pedal pin.

NOTE: Depressing the clutch pedal provides access to the clutch cable strand. Disconnect the cable upstop/spacer from the pedal pivot pin by removing the retaining clip at the top of the clutch pedal. Wedge a flat–blade pry tool between the pin and the retaining tab. While holding the tab slightly separated from the pin, pull the upstop/spacer off the pedal. Now remove the cable end from the upstop/spacer.

(8) Remove clutch release cable core from upstop spacer (Fig. 19).
(9) Loosen but do not remove four (4) brake booster to dash panel nuts.
(10) Remove clutch release cable through engine compartment.

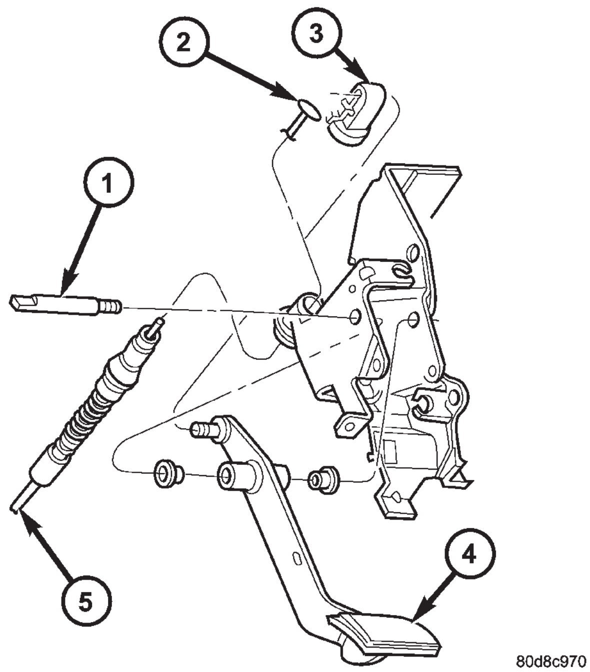

Fig. 19 Clutch Cable at Pedal Bracket Assembly

1 - PIVOT PIN
2 - CABLE END
3 - UPSTOP SPACER
4 - CLUTCH PEDAL
5 - CLUTCH CABLE

INSTALLATION

(1) Feed clutch release cable through dash panel hole and into passenger compartment (Fig. 19).

(2) Connect clutch release cable core to upstop spacer (Fig. 19).

(3) Connect upstop spacer to clutch pedal pin and secure with retainer clip.

(4) Route clutch release cable through engine compartment as removed, and connect clutch release cable to clutch release lever (Fig. 18).

(5) Verify adjuster mechanism operation: With slight pressure, pull the clutch release lever end of the cable to draw the cable taut. Push the clutch cable housing toward the dash panel (With less than 25 lbs. of effort, the cable housing should move 30-50mm.). This indicates proper adjuster mechanism function. If the cable does not adjust, determine if the mechanism is properly seated on the bracket.

(6) Install bellhousing cap (Fig. 18).

(7) Torque brake booster nuts.

(8) Install knee bolster.

(9) Install steering column lower shroud.

(10) Install air cleaner assembly.

(11) Connect battery negative cable.

CLUTCH SLAVE CYLINDER (2.7L/T850 MODELS)

DESCRIPTION

2.7L equipped models that utilize the T850 transaxle use a clutch slave cylinder to operate the release lever and bearing. The clutch slave cylinder fastens to the transaxle bellhousing (Fig. 20), and consists of a hydraulic piston and cylinder, seal, return spring, and integrated hydraulic quick connect fitting for ease of service.

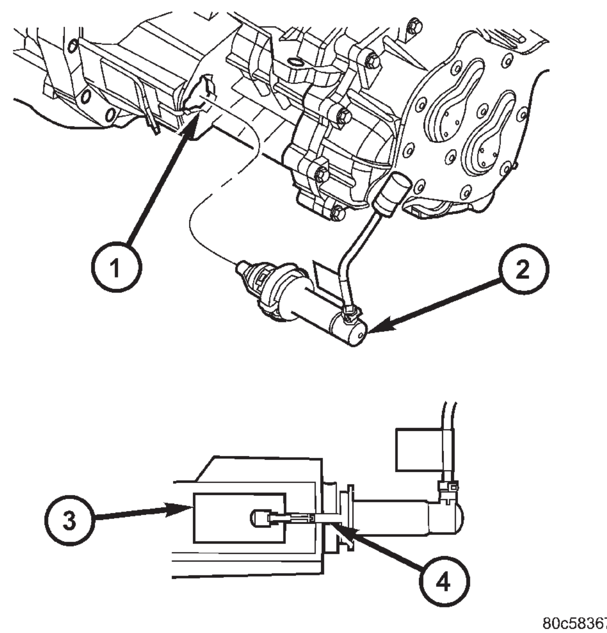

Fig. 20 Slave Cylinder Location

1 - MOUNTING HOLE
2 - SLAVE CYLINDER
3 - ACCESS HOLE
4 - NYLON ANTI-ROTATION TAB

OPERATION

When the clutch pedal is depressed, fluid pressurized by the clutch master cylinder pushes the slave cylinder piston, extending the push rod and operating the clutch release lever and bearing.

CLUTCH SLAVE CYLINDER (2.7L/T850 MODELS) (Continued)

REMOVAL

(1) Raise vehicle on hoist.

(2) Using Tool 6638A, disconnect hyrdraulic clutch circuit quick connect fitting.

(3) Remove clutch slave cylinder (Fig. 21) by lifting nylon tab with a small screwdriver, and then depressing cylinder inward towards case and rotating cylinder 60° counter-clockwise.

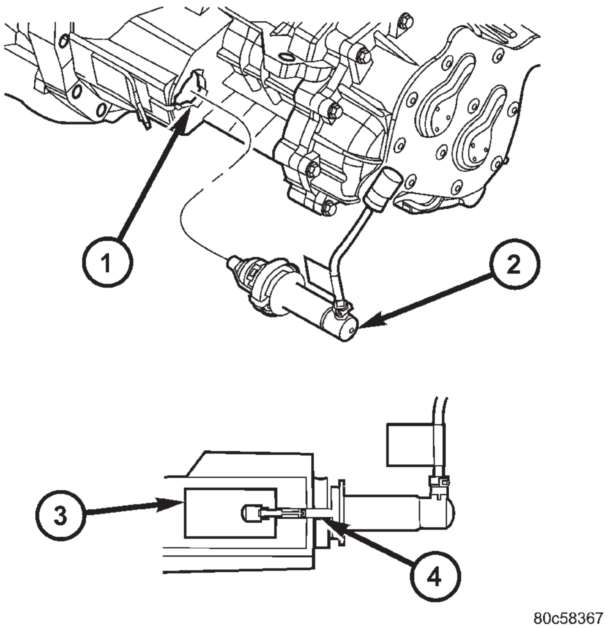

Fig. 21 Slave Cylinder Removal/Installation

1 - MOUNTING HOLE
2 - SLAVE CYLINDER
3 - ACCESS HOLE
4 - NYLON ANTI-ROTATION TAB

INSTALLATION

(1) Install clutch slave cylinder into position, noting orientation of different sized lugs. While depressing inward, rotate slave cylinder clockwise until nylon locating tab rests in transaxle case cutout, and the hydraulic tube is vertical (Fig. 21).

(2) Connect “quick-connect” connection until an audible “click” is heard. Verify connection by pulling outward on connection.

(3) Lower vehicle.

MODULAR CLUTCH

DESCRIPTION

Manual transaxle equipped vehicles utilize a modular clutch assembly (Fig. 22). The transaxle must be removed to gain access to and replace the modular clutch, drive plate, and/or clutch release bearing and lever.

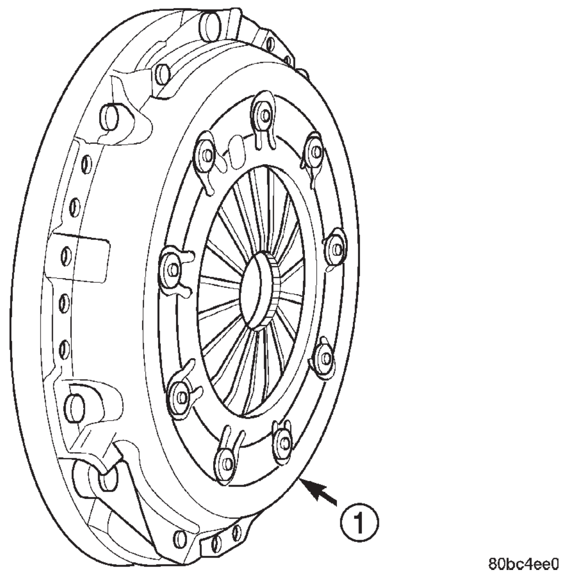

Fig. 22 Modular Clutch Assembly

1 - MODULAR CLUTCH ASSEMBLY

The modular clutch assembly used in this vehicle consists of a single, dry-type clutch disc, a diaphragm style clutch cover, and an integrated flywheel. The clutch cover is riveted to the flywheel, containing the clutch disc within. The modular clutch can only be serviced as an assembly.

The clutch disc has cushion springs riveted to the disc hub assembly. The clutch disc facings are riveted to the cushion springs. The facings are made from a non-asbestos material.

The clutch cover pressure plate assembly is a diaphragm type unit with a one-piece diaphragm spring with multiple release fingers. The pressure plate release fingers are preset during manufacture and are not adjustable.

MODULAR CLUTCH (Continued)

REMOVAL

(1) Remove transaxle and modular clutch assembly from vehicle. Refer to Transmission Removal/Installation.

(2) Remove the modular clutch asseembly fom the transaxle input shaft. Handle carefully to avoid contaminating the friction surfaces (Fig. 23).

INSTALLATION

(1) Install modular clutch assembly onto input shaft (Fig. 23).

(2) Install transaxle to vehicle. Refer to Transaxle Removal/Installation.

DRIVE BELTS

DESCRIPTION

The accessory drive consists of two Poly-V type belts (Fig. 1) or (Fig. 2). One belt drives the power steering pump, the other drives the generator and air conditioning compressor. Both belts on the 2.7L engine are manually tensioned. The power steering belt on the 2.0L/2.4L engine is manually tensioned. The air conditioning/generator belt on the 2.0L/2.4L engine has an automatic belt tensioner.

OPERATION

The accessory drive belts form the link between the engine crankshaft and the engine driven accessories.

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELTS

Satisfactory performance of the belt driven accessories depends on belt condition and proper belt tension.

DRIVE BELTS (Continued)

ACCESSORY DRIVE BELT DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
INSUFFICIENT ACCESSORY OUTPUT DUE TO BELT SLIPPAGE	1. Belt too loose. 2. Belt excessively glazed or worn.	1. Adjust belt tension. 2. Replace and tighten as specified.
BELT SQUEAL WHEN ACCELERATING ENGINE	1. Belts too loose. 2. Belts glazed.	1. Adjust belt tension. 2. Replace belts.
BELT CHIRP AT IDLE	1. Belts too loose. 2. Foreign material imbedded in belt. 3. Non-uniform belt. 4. Misaligned pulley(s). 5. Non-uniform groove or eccentric pulley.	1. Adjust belt tension. 2. Replace belt. 3. Replace belt. 4. Align accessories. 5. Replace pulley(s).
BELT ROLLED OVER IN GROOVE OR BELT JUMPS OFF	1. Broken cord in belt. 2. Belt too loose, or too tight. 3. Misaligned pulleys. 4. Non-uniform grooves or eccentric pulley.	1. Replace belt. 2. Adjust belt tension. 3. Align accessories. 4. Replace pulley(s).

STANDARD PROCEDURE - CHECKING ACCESSORY DRIVE BELT TENSION - 2.7L

WARNING: DO NOT CHECK BELT TENSION WITH ENGINE RUNNING.

Accessory drive belt tension can be measured with Special Tool 8371 – Belt Tension Gauge Adapter, and the DRBIII® using the following procedures:

(1) Connect 8371 to the DRBIII® following the instructions provided with tool.

(2) Place end of microphone probe approximately 2.54 cm (1 in.) from belt at one of the belt center span locations shown in (Fig. 3).

(3) Pluck the belt a minimum of 3 times. (Use your finger or other suitable tool) The frequency of the belt in hertz (Hz) will display on DRBIII® screen.

(4) Adjust belt to obtain proper frequency (tension). Refer to ACCESSORY DRIVE BELT TENSION CHART for belt tension specifications.

REMOVAL

REMOVAL - 2.0L/2.4L

AIR CONDITIONING COMPRESSOR/GENERATOR BELT

(1) Raise vehicle on hoist.
(2) Remove right front wheel and belt splash shield.
(3) Insert a 3/8” drive breaker bar into the square opening of the belt tensioner pivot bracket.

CAUTION: Avoid excessive force to over compress belt tensioner. This may result in damage to the belt tensioner.

(4) Gently apply a force to rotate belt tensioner clockwise until the belt tensioner bottoms out and the belt can be removed from pulleys (Fig. 4).
(5) Remove belt.
(6) Gently release tensioner.

POWER STEERING PUMP BELT

(1) Raise vehicle on hoist.
(2) Remove right front wheel and belt splash shield.
(3) Remove air conditioning compressor/generator belt.
(4) Loosen pivot bolt and locking bolt/nut.
(5) Release tension on belt by moving pump assembly inward towards engine.
(6) Remove belt.

REMOVAL - 2.7L

AIR CONDITIONING COMPRESSOR/GENERATOR BELT

(1) Raise vehicle on hoist.
(2) Remove right front wheel and belt splash shield.
(3) Loosen tensioner locking bolt and pivot bolt.
(4) Rotate tensioner clockwise to allow enough slack to remove belt.

POWER STEERING PUMP BELT

(1) Raise vehicle on hoist.
(2) Remove right front wheel and belt splash shield.
(3) Remove the air conditioning compressor/generator belt.
(4) Loosen belt adjusting bolt. It is not necessary to loosen the pivot bolt on the power steering pump. There is a bushing incorporated into the power steering pump/bracket that allows it to pivot.
(5) Remove power steering belt.

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

DRIVE BELTS (Continued)

INSPECTION

Belt replacement under any or all of the following conditions is required:

- Excessive wear
- Frayed cords
- Severe glazing

Poly-V Belt system may develop minor cracks across the ribbed side (due to reverse bending). These minor cracks are considered normal and acceptable. Parallel cracks are not (Fig. 5).

NOTE: Do not use any type of belt dressing or restorer on Poly-V Belts.

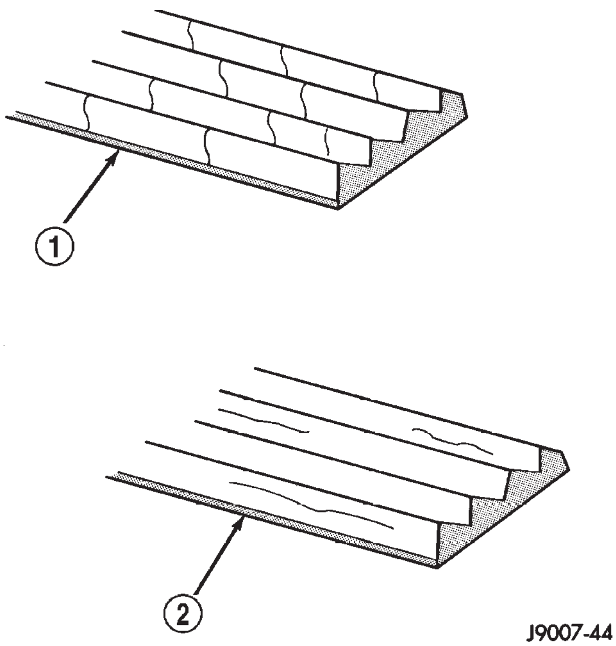

Fig. 5 Drive Belt Wear Pattern

INSTALLATION

INSTALLATION - 2.0L/2.4L

NOTE: When installing drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulley.

AIR CONDITIONING COMPRESSOR/GENERATOR BELT

(1) Install belt over all pulleys except for the air conditioning compressor pulley (Fig. 6).

(2) Insert a 3/8" drive breaker bar into the square opening of the belt tensioner pivot bracket.

CAUTION: Avoid excessive force to over compress belt tensioner. This may result in damage to the belt tensioner.

(3) Gently apply a force to rotate belt tensioner clockwise until the belt tensioner bottoms out and the belt can be installed onto air conditioning compressor pulley (Fig. 4).

(4) Install belt over air conditioning compressor pulley.

(5) Release spring tension onto belt.

(6) Remove breaker bar from belt tensioner pivot bracket.

(7) Install belt splash shield and right front wheel.

(8) Lower vehicle.

POWER STEERING PUMP BELT

(1) Install power steering pump belt on pulleys (Fig. 6).

(2) Insert a 1/2" drive breaker bar into the square opening on the power steering pump bracket.

(3) Hold clockwise pressure on power steering pump bracket and tighten adjusting bolt/nut.

(4) Tighten pivot bolt.

(5) Install air conditioning compressor/generator belt.

(6) Install belt splash shield and right front wheel.

(7) Lower vehicle.

ADJUSTMENTS

ADJUSTMENT - 2.7L ACCESSORY DRIVE BELTS

NOTE: A belt is considered "used" after 15 minutes of run time.

AIR CONDITIONING COMPRESSOR/GENERATOR BELT TENSIONING

WARNING: DO NOT EXERT MORE THAN 190 N·m (140 ft. lbs.) OF FORCE ON AIR CONDITIONING COMPRESSOR/GENERATOR BELT TENSIONER BRACKET DURING TENSIONING PROCEDURE.

NOTE: Ensure lower tensioner bracket bolt is finger tight/seated to prevent bending.

NEW BELT

(1) Engage a torque wrench, with a maximum 2 inch extension in the 1/2 inch square opening of the tensioner bracket (Fig. 8).
(2) Apply 141 N·m (104 ft. lbs.) of torque, counterclockwise to the tensioner bracket while tightening the upper fastener. Torque fastener to 28 N·m (250 in. lbs.) (Fig. 8).
(3) Remove torque wrench from tensioner bracket, and torque lower tensioner bracket fastener to 28 N·m (250 in. lbs.).
(4) Verify proper belt tension (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - STANDARD PROCEDURE - CHECKING ACCESSORY DRIVE BELT TENSION - 2.7L).

ENGINE

TABLE OF CONTENTS

ENGINE

DESCRIPTION - COOLING SYSTEM

The cooling system consists of an engine cooling module, thermostat, coolant recovery/reserve system (2.0L/2.4L) or coolant pressure container (2.7L), coolant, hoses, and a water pump to circulate the coolant. The engine cooling module consists of a radiator, electric fans, shroud, transmission oil cooler, and air conditioning condenser (Fig. 1).

OPERATION

The primary purpose of a cooling system is to maintain engine temperature in a range that will provide satisfactory engine performance and emission levels under all expected driving conditions. It also provides hot water (coolant) for heater performance (Fig. 2) or (Fig. 3).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Diagnostic Trouble Code (DTC) set indicating a stuck open engine thermostat.	1. (Refer to Appropriate Diagnostic Information) Replace thermostat, if necessary. If a (DTC) has not been set, the problem may be with the temperature gauge.
	2. Problem with engine coolant temperature (ECT) sensor or circuit.	2. Refer to the Appropriate Diagnostic Information for checking the ECT sensor
	3. Problem with Temperature gauge.	3. Check Gauge operation. (Refer to the Appropriate Diagnostic Information)
	4. Coolant level low during cold ambient temperature, accompanied by poor heater performance.	4. Check coolant level. (Refer to 7 - COOLING - STANDARD PROCEDURE) Inspect the system for leaks. Repair as necessary.
TEMPERATURE GAUGE READS HIGH OR ENGINE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST FROM SYSTEM.	1. Trailer being towed, a steep hill being climbed, vehicle being operated in slow moving traffic, or engine idling during high ambient (outside) temperatures with air conditioning on. High altitudes could cause these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause of the overheating and repair. Refer to POSSIBLE CAUSES in this section.
	2. Is temperature gauge (if equipped) reading correctly?	2. Check the gauge. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	3. Is temperature warning lamp (if equipped) illuminating unnecessarily?	3. Check warning lamp operation. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	4. Low coolant level.	4. Check for coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING) Repair as necessary.
	5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following step 6.	5. Tighten pressure cap.

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	6. Poor seals at pressure cap.	6. (a) Check condition of cap and cap seals. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - INSPECTION) Replace cap if necessary. (b) Check condition of filler neck. If neck is damaged, replace as necessary.
	7. Wrong pressure cap installed.	7. Vehicles equipped with 2.0L/2.4L engines use different pressure caps than vehicles equipped with 2.7L engines. Verify proper pressure cap part number.
	8. 2.0L/2.4L Vehicles: Coolant level low in radiator, but not in coolant recovery container. This indicates the radiator is not drawing coolant from the coolant recovery container as the engine cools. As the engine cools, a vacuum is formed inside the cooling system. If the radiator cap seals are defective, or the cooling system has a leak, a vacuum cannot be formed.	8. (a) Check condition of pressure cap and seals. Replace cap if necessary. (b) Check condition of filler neck. Replace if damaged. (c) Check condition of hose from filler neck to coolant container. It should be tight at both ends without any kinks or tears. Replace hose as necessary. (d) Check coolant recovery container and hose for blockage. Repair as necessary.
	9. Freeze point of coolant not correct. Mixture ratio may be too rich.	9. Check coolant concentration. (Refer to 7 - COOLING/ENGINE/ COOLANT - DIAGNOSIS AND TESTING) Adjust glycol-to-water ratio as required.
	10. Coolant not flowing through system.	10. (a) 2.0L/2.4L Vehicles: Check for coolant flow at filler neck with some coolant removed, engine warm, and thermostat open. Coolant should be observed flowing through filler neck. If flow is not observed, determine reason for lack of flow and repair as necessary. (b) 2.7L Vehicles: Engine coolant motion should be observable in coolant pressure container when revving the engine while running.
	11. Radiator or A/C condenser fins are dirty or clogged.	11. Clean obstruction from fins.
	12. Radiator core is plugged or corroded.	12. Clean or replace radiator as necessary.
	13. Fuel or ignition system problems.	13. (Refer to the Appropriate Diagnostic Information)

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	14. Dragging Brakes.	14. Inspect brake system and repair as necessary. (Refer to 5 - BRAKES/HYDRAULIC/ MECHANICAL - DIAGNOSIS AND TESTING)
	15. Bug screen or other aftermarket accessory is being used causing reduced air flow.	15. Remove bug screen or accessory.
	16. Thermostat partially or completely closed.	16. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING)
	17. Electric radiator fan not operating properly.	17. Check electric fan operation and repair as necessary.
	18. Cylinder head gasket leaking.	18. Check cylinder head gasket for leaks. (Refer to 9 - ENGINE/ CYLINDER HEAD - DIAGNOSIS AND TESTING)
	19. Heater core leaking.	19. Check heater core for leaks. Repair as necessary.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. The gauge may cycle up and down. This is due to the cycling of the electric radiator fan and/or changing vehicle operating conditions.	1. A normal condition. No correction is necessary. If gauge cycling is going into the hot zone, check electric fan operation and repair as necessary. (Refer to 7 - COOLING/ ENGINE/RADIATOR FAN - DIAGNOSIS AND TESTING)
	2. During cold weather operation with the heater blower in the high position, the gauge reading may drop slightly.	2. A normal condition. No correction is necessary.
	3. Temperature gauge or engine coolant temperature sensor is defective or shorted.	3. Check operation of gauge and repair as necessary. (Refer to the Appropriate Diagnostic Information)
	4. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running).	4. A normal condition. No correction is necessary. The gauge should return to normal range after vehicle is driven.
	5. Gauge reading high after restarting a warmed-up (hot) engine.	5. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	6. Coolant level low (air will build up in the cooling system causing the thermostat to open late).	6. Check cooling system for leaks. Repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING)

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
	7. Cylinder head gasket leaking allowing exhaust gas to enter cooling system. This will cause thermostat to open late.	7. (a) Check for cylinder head gasket leaks. Repair as necessary. (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING) (b) Check for coolant in the engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary.
	8. Water pump impeller or pulley loose on shaft.	8. Check water pump and replace as necessary.
	9. Air leak on the suction side of water pump allows air to build up in cooling system. This will cause the thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT FLOWING INTO RECOVERY CONTAINER. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL, BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN RECOVERY CONTAINER.	1. Pressure relief valve in pressure cap defective or wrong pressure cap installed.	1. Verify proper pressure cap part number. Check condition of pressure cap and seals. Replace as necessary. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING)
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT.	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING)
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH.	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct.	2. Check the freeze point of the coolant. (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust glycol-to-water ratio as required.

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant recovery container system.	1. (a) Radiator pressure cap relief valve stuck. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING) Replace as necessary.
		(b) Hose between coolant recovery container and radiator is kinked. Repair as necessary.
		(c) Vent at coolant recovery container is plugged. Clean vent and repair as necessary.
		(d) Coolant recovery container is internally blocked or plugged. Check for blockage and repair as necessary.
ELECTRIC RADIATOR FAN OPERATES ALL THE TIME.	1. Fan relay, powertrain control module (PCM) or engine coolant temperature sensor defective.	1. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	2. Check for low coolant level.	2. (Refer to 7 - COOLING - STANDARD PROCEDURE) Repair as necessary.
ELECTRIC RADIATOR FAN WILL NOT OPERATE. GAUGE READING HIGH OR HOT	1. Radiator fan motor defective.	1. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	2. Radiator fan relay, powertrain control module (PCM) or engine coolant temperature sensor defective.	2. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	3. Blown fuse in power distribution center (PDC).	3. Determine reason for blown fuse and repair as necessary.
NOISY FAN	1. Radiator fan blade loose.	1. Replace fan assembly.
	2. Radiator fan blade striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or A/C condenser.	3. Remove obstructions and/or clean debris from radiator and/or A/C condenser.
	4. Radiator fan motor defective.	4. Replace as necessary. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - DISASSEMBLY)

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED)	1. Radiator and/or air conditioning condenser is restricted, obstructed or dirty.	1. Remove restriction and/or clean as necessary.
	2. Electric radiator fan not operating when A/C is on.	2. (Refer to the Appropriate Diagnostic Information) Repair as necessary.
	3. Engine is overheating (heat may be transferred from radiator to A/C condenser). High underhood temperature due to engine overheating may also transfer heat to A/C components.	3. Correct overheating condition.
INADEQUATE HEATER PERFORMANCE.	1. Has a diagnostic trouble code (DTC) been set?	1. (Refer to the Appropriate Diagnostic Information)
	2. Coolant level low.	2. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING) Repair as necessary.
	3. Obstructions in heater hose fittings at engine.	3. Remove heater hoses at both ends and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area and repair as necessary.
	5. Water pump is not pumping coolant to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch.	5. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - DIAGNOSIS AND TESTING) Repair as necessary.
HEAT ODOR	1. Various heat shields are used at certain driveline components. One or more of these shields may be missing.	1. Locate missing shields and replace or repair as necessary.
	2. Is temperature gauge reading above the normal range?	2. Refer to the previous Temperature Gauge Reads High in these Diagnostic Charts. Repair as necessary.
	3. Radiator fan operating incorrectly.	3. (Refer to 7 - COOLING/ENGINE/ RADIATOR FAN - DIAGNOSIS AND TESTING) Repair as necessary.
	4. Has undercoating been applied to any unnecessary component?	4. Clean undercoating as necessary.
	5. Engine may be running rich causing the catalytic converter to overheat.	5. (Refer to the Appropriate Diagnostic Information) Repair as necessary.

ENGINE (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
POOR DRIVEABILITY (THERMOSTAT POSSIBLY STUCK OPEN). GAUGE MAY BE READING LOW	1. For proper driveability, good vehicle emissions and for preventing build-up of engine oil sludge, the thermostat must be operating properly. Has a diagnostic trouble code (DTC) been set?	1. (Refer to the Appropriate Diagnostic Information) Replace thermostat if necessary.
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP, RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE.	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contact the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Check the freeze point of the coolant. (Refer to 7 - COOLING/ ENGINE/COOLANT - DIAGNOSIS AND TESTING) Adjust the glycol-to-water ratio as required.
COOLANT LEVEL CHANGES IN COOLANT RECOVERY CONTAINER	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the container was between the MIN and MAX marks when the engine was cold, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

DIAGNOSIS AND TESTING - COOLING SYSTEM FLOW CHECK

To determine whether coolant is flowing through the cooling system, use one of the following procedures:

PREFERRED METHOD

WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- **2.0L/2.4L:** Remove pressure cap when engine is cold. Remove small amount of coolant. Idle engine until thermostat opens. You should observe coolant flow while looking down the filler neck. Once flow is detected install the pressure cap. Replace removed coolant into coolant recovery container.
- **2.7L:** Start engine, coolant flow should be observable in coolant pressure container when revving the engine.

ALTERNATIVE METHOD

- If engine is cold, idle engine until normal operating temperature is reached. Feel the upper radiator hose. If it is hot, coolant is circulating.

ENGINE (Continued)

DIAGNOSIS AND TESTING - COOLING SYSTEM LEAK TESTING

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING PRESSURE CAP. PLACE A SHOP TOWEL OVER THE CAP, AND WITHOUT PUSHING DOWN, ROTATE IT COUNTER-CLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE. WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE COOLANT RECOVERY BOTTLE AND PRESSURE DROPS, PUSH DOWN ON THE CAP AND REMOVE IT COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

Coolant level should be full. Add coolant if necessary. With engine not running, remove pressure cap and wipe the coolant filler neck sealing seat clean.

Attach a cooling system pressure tester (Tool 7700 or equivalent) to the coolant filler neck, as shown in (Fig. 4) or (Fig. 5) and apply 104 kPa (15 psi) pressure. If the pressure drops more than 2 psi in 2 minutes inspect all points for external leaks.

All hoses, radiator and heater, should be moved while at 104 kPa (15 psi) since some leaks occur while driving due to engine rock, etc.

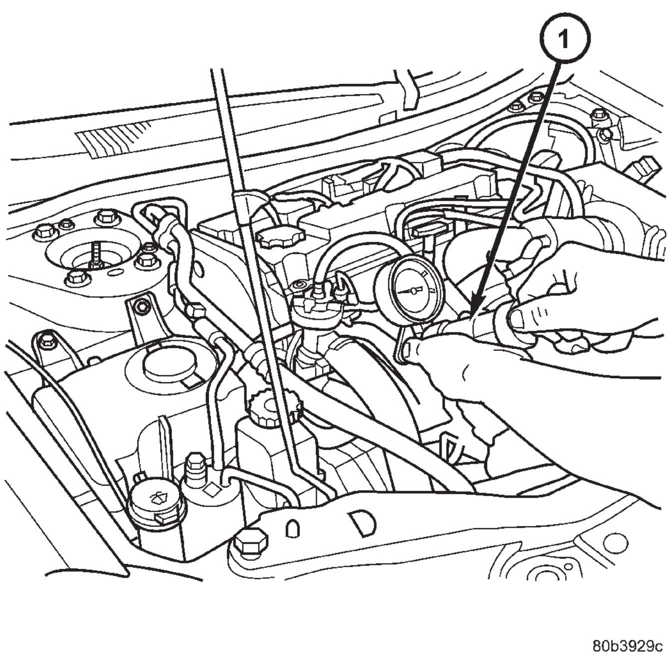

Fig. 4 PRESSURE TESTING COOLING SYSTEM - 2.0L/2.4L

1 - SPECIAL TOOL 7700

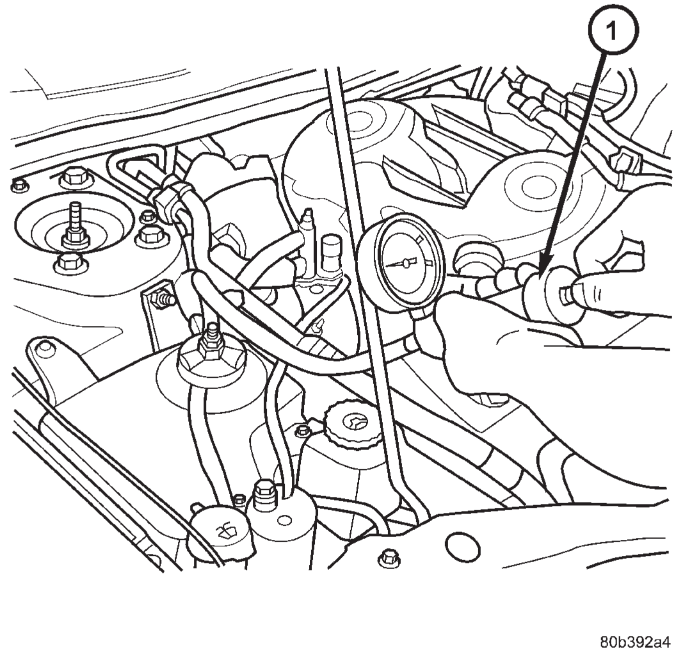

Fig. 5 PRESSURE TESTING COOLING SYSTEM - 2.7L

1 - SPECIAL TOOL 7700

If there are no external leaks after the gauge dial shows a drop in pressure, detach the tester. Start engine and run the engine to normal operating temperature in order to open the thermostat and allow the coolant to expand. Reattach the tester. If the needle on the dial fluctuates, it indicates a combustion leak and is usually a head gasket leak.

WARNING: WITH TOOL IN PLACE PRESSURE BUILDS UP FAST. ANY EXCESSIVE AMOUNT OF PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

If the needle on the dial does not fluctuate, race the engine a few times. If an abnormal amount of coolant or steam is emitted from the tailpipe, it may indicate a faulty head gasket, cracked engine block or cylinder head.

There may be internal leaks which can be determined by removing the oil dipstick. If water globules appear intermixed with the oil, it will indicate a internal leak in the engine. If there is an internal leak, the engine must be disassembled for repair.

ENGINE (Continued)

DIAGNOSIS AND TESTING - COOLING SYSTEM AERATION

Low coolant level in a cross flow radiator will equalize in both tanks with engine off. With engine at running and at operating temperature, the high pressure inlet tank runs full and the low pressure outlet tank drops, resulting in cooling system aeration. Aeration will draw air into the water pump resulting in the following:

- High reading shown on the temperature gauge.
- Loss of coolant flow through the heater core.
- Corrosion in the cooling system.
- Water pump seal may run dry, increasing the risk of premature seal failure.
- Combustion gas leaks into the coolant can also cause the above problems.

DIAGNOSIS AND TESTING - COOLING SYSTEM DEAERATION

2.0L/2.4L

Removal of air from the engine cooling system only occurs when the engine is first warming up. Air in the cooling system will collect under the cooling system pressure cap while the engine is run and will be pushed into the coolant recovery container. When the engine cools down, coolant will be drawn from the coolant recovery container back into the active cooling system. Once the thermostat opens, deaeration no longer occurs. Multiple warm up and cool down cycles may be required to remove all the air in the cooling system. If the system is very low on coolant, deaeration will not occur. Following the proper cooling system fill procedure is essential for proper operation. This system will not function if the wrong cooling system pressure cap is installed. Ensure proper cooling system pressure cap is used. Verify proper pressure cap part number.

2.7L

This engine has a premium system to remove air from the engine cooling system. Removal of air from the engine cooling system occurs continuously when the engine is run at speeds above idle. Thirty minutes of normal driving after a properly completed service fill will deaerate the engine cooling system. This system will not function if the wrong cooling system pressure cap is installed. Ensure proper cooling system pressure cap is used. Verify proper pressure cap part number.

STANDARD PROCEDURE

COOLANT LEVEL CHECK - ROUTINE

NOTE: Do not remove pressure cap for routine coolant level inspections.

The coolant bottle provides a quick visual method for determining the coolant level without removing the pressure cap. **With the engine cold and not running**, simply observe the level of the coolant in the coolant recovery container (2.0L/2.4L) (Fig. 6) or the coolant pressure container (2.7L) (Fig. 7). The level should be between the MIN and MAX marks.

COOLING SYSTEM - DRAINING

When servicing the cooling system, it is essential that coolant does not drip onto the accessory drive belts and/or pulleys. Shield the belts with shop towels before working on the cooling system. If coolant contacts the belts or pulleys, flush both with clean water.

WARNING: MAKE SURE ENGINE COOLING SYSTEM IS COOL BEFORE SERVICING. DO NOT REMOVE ANY CLAMPS OR HOSES , PRESSURE CAP, OR OPEN THE RADIATOR DRAINCOCK. WHEN THE SYSTEM IS HOT AND UNDER PRESSURE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(1) Position a clean collecting container under draincock location.

(2) Open radiator draincock located at the lower right side of radiator. Turn draincock counterclockwise until it stops.

(3) Remove coolant pressure cap and open cooling system bleed valve.

(4) Raise vehicle on hoist.

(5) **2.7L:** Remove heater hose at heater tube located at the right front inner frame rail and direct coolant flow into container.

COOLING SYSTEM - FILLING

CAUTION: Do not use well water or suspect water supply in cooling system. A 50/50 mixture of the recommended ethylene glycol and distilled water is recommended.

NOTE: Make sure all hoses are connected and radiator draincock is closed.

FILLING - 2.0L/2.4L

(1) Close radiator draincock by turning clockwise.

(2) Open cooling system bleed valve (Fig. 8).

(3) Attach a 6.35 mm (0.250 in.) inside diameter clear hose that is 120.0 cm (48 in.) long to the bleed valve. Route the hose away from accessory drive belts and radiator fan. Position the other end of hose into a collecting container. The hose will prevent coolant from contacting accessory drive belts and other components.

(4) Remove cooling system pressure cap and fill cooling system with recommended coolant.

(5) Slowly continue filling until a steady stream of coolant flows from attached hose on bleed valve.

(6) Close bleed valve and remove hose.

(7) Fill coolant to the top of pressure cap neck.

(8) Install cooling system pressure cap.

(9) Fill coolant recovery container to the MAX mark.

(10) Start engine and allow to run until thermostat opens and radiator fans cycle.

NOTE: It may be necessary to add additional coolant to the coolant recovery container after three or four warm-up/cool down cycles to maintain coolant level between the MIN and MAX marks; as additional trapped air is removed from the system.

1 - COOLANT RECOVERY CONTAINER FASTENERS
2 - COOLANT PRESSURE CAP
3 - COOLING SYSTEM BLEED VALVE
4 - POWER STEERING RESERVIOR FASTENER
5 - RECEIVER/DRIER FASTENER

FILLING - 2.7L

(1) Close radiator draincock by turning clockwise.

(2) Open cooling system bleed valve (Fig. 9).

(3) Attach a 6.35 mm (0.250 in.) inside diameter clear hose that is 120.0 cm (48 in.) long to the bleed valve. Route the hose away from accessory drive belts and radiator fan. Position the other end of hose into a collecting container. The hose will prevent coolant from contacting accessory drive belts and other components.

(4) Remove cooling system pressure cap. Attach Special Tool 8195, Filling Aid Funnel to coolant pressure container filler neck.

(5) Use the supplied clip to pinch overflow hose that connects between the two chambers of the pressure container (Fig. 9).

(6) Pour coolant into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape).

(7) Slowly continue filling until a steady stream of coolant flows from attached hose on bleed valve.

(8) Close bleed valve and continue filling system to top of Filling Aid Funnel.

(9) Remove clip from overflow hose.

(10) Allow coolant in Filling Aid Funnel to drain into overflow chamber of pressure container.

(11) Remove Special Tool 8195, Filling Aid Funnel and install pressure cap on pressure container.

(12) Remove hose from bleed valve.

(13) Start engine and allow to run until thermostat opens and radiator fans cycle.

NOTE:
The engine cooling system will push any remaining air into the pressure container within about one half hour of normal driving. As a result, a drop in coolant level in the pressure container may occur.
If the engine cooling system overheats and pushes coolant into the overflow chamber of the pressure container, this coolant will be sucked back into the cooling system ONLY IF THE PRESSURE CAP IS LEFT ON THE PRESSURE CONTAINER. Removing the pressure cap breaks the vacuum path between the two chambers of the pressure container and the coolant will not return to the cooling system.

(14) Shut off engine and allow it to cool down. This permits coolant to be drawn into the pressure chamber.

(15) With engine COLD, observe coolant level in pressure chamber. Coolant level should be within MIN and MAX marks. Adjust coolant level as necessary.

CLEANING

Drain cooling system and refill with clean water. Refer to drain and fill procedures in this section. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty; fill, run, and drain system again, until water runs clear. Refill cooling system with a 50/50 mixture of the recommended ethylene glycol and distilled water (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).

INSPECTION

After performing a cleaning/flush procedure, inspect all hoses, clamps and connections for deterioration and leaks. Inspect radiator and heater core for leaks.

COOLANT

DESCRIPTION

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze and corrosion protection. Do not mix coolant types. If coolant other than Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula or equivalent is added, the mixed coolant will have a reduced service schedule.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula or equivalent ethylene glycol based coolant with corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-34°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution. Mixing of coolants other than specified (non-HOAT), will reduce the 5 year/100,000 mile corrosion protection.

OPERATION

The cooling system is designed around the coolant. The coolant must accept heat from the engine metal, in the cylinder head area near the exhaust valves and engine block. The coolant carries heat to the radiator where the tube/fin radiator can transfer the heat to the air. Properly mixed, the coolant raises the boiling point, prevents freezing in cold climates, and prevents corrosion.

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASED COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPENED OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN AND PETS. DISPOSE OF GLYCOL BASED COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C

COOLANT (Continued)

(-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer (Special Tool 8286)(Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant—corrosion protection will be severely reduced.

STANDARD PROCEDURE

COOLANT - ADDING ADDITIONAL

NOTE: 2.0L/2.4L - The pressure cap should only be removed if the coolant recovery container is empty.

When additional coolant is needed, it should be added to the coolant recovery container (2.0L/2.4L)/ coolant pressure container (2.7L). Use only 50/50 concentration of ethylene glycol type antifreeze and distilled water.

STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

COOLANT RECOVERY CONTAINER - 2.0L/2.4L

DESCRIPTION

The coolant recovery system consists of a container and an overflow hose that is connected to the coolant outlet connector (Fig. 13). The coolant recovery container is mounted in the right side engine compartment.

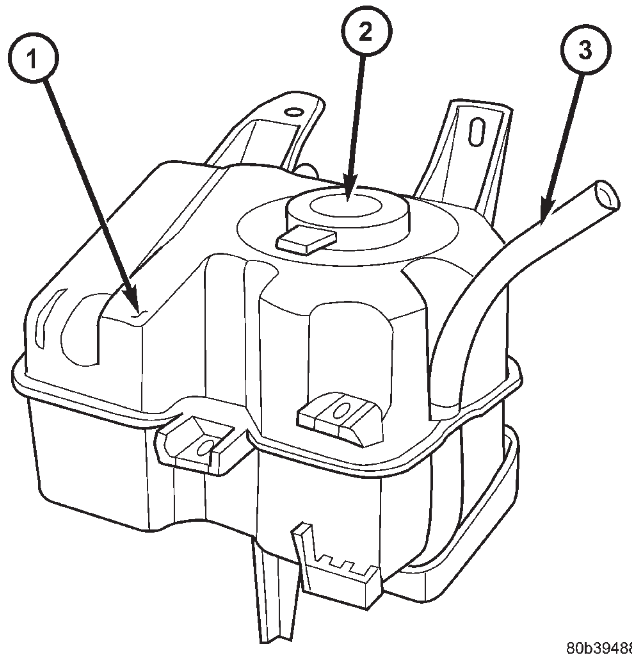

Fig. 13 Coolant Recovery Container - 2.0L/2.4L

1 - COOLANT RECOVERY CONTAINER
2 - CONTAINER FILL CAP
3 - OVERFLOW HOSE

OPERATION

This system works in conjunction with the pressure cap to utilize thermal expansion and contraction of the coolant to keep the coolant free of trapped air. It provides a volume for expansion and contraction, provides a convenient and safe method for checking coolant level, and adjusting level at atmospheric pressure without removing the pressure cap. It also provides some reserve coolant to cover minor leaks and evaporation or boiling losses.

COOLANT RECOVERY CONTAINER - 2.0L/2.4L (Continued)

REMOVAL

(1) Remove the power steering reservoir attaching screw.

(2) Remove the air conditioning receiver/dryer attaching screw.

(3) Unsnap the washer hose from the coolant recovery container.

(4) Disconnect the overflow hose from coolant outlet connector.

(5) Remove coolant recovery container screws.

(6) Remove coolant recovery container.

INSTALLATION

(1) Install container in mounting position and install attaching screws.

(2) Connect the overflow hose to the coolant outlet connector.

(3) Snap the washer hose into groove on coolant recovery container.

(4) Install the air conditioning receiver/dryer attaching screw.

(5) Install the power steering reservoir attaching screw.

(6) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

COOLANT PRESSURE CONTAINER - 2.7L

DESCRIPTION

The coolant pressure container consists of a pressure chamber and a overflow chamber (Fig. 14). The coolant pressure container is mounted in the right side engine compartment. An overflow hose connects the pressure chamber to the overflow chamber.

NOTE: Coolant will normally be in the pressure chamber side of the coolant bottle. The overflow chamber should normally be empty

OPERATION

The pressure chamber keeps the coolant free of trapped air, provides a volume for expansion and contraction, and provides a convenient and safe method for checking and adjusting coolant level at atmospheric pressure. It also provides some reserve coolant to cover minor leaks, evaporation or boiling losses. The overflow chamber allows coolant recovery in case of an overheat.

REMOVAL

(1) Drain coolant below the coolant pressure container level.

(2) Remove the power steering reservoir attaching screw.

(3) Remove the air conditioning receiver/dryer attaching screw.

(4) Unsnap washer hose from the bottle.

(5) Disconnect the hose from coolant outlet connector to the bottle.

(6) Remove pressure container attaching screws.

(7) Reposition pressure container and disconnect the heater hose at the container.

(8) Remove coolant pressure container.

INSTALLATION

(1) Connect heater hose to coolant pressure container.

(2) Install container in mounting position and install attaching screws.

(3) Connect the coolant outlet connector hose to the bottle.

(4) Snap washer hose into groove on coolant pressure container.

(5) Install the air conditioning receiver/dryer attaching screw.

(6) Install the power steering reservoir attaching screw.

(7) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

ENGINE BLOCK HEATER

DESCRIPTION

DESCRIPTION - 2.0L/2.4L

The block heater is operated by ordinary house current (110 Volt A.C.) through a power cord and connector located in the engine compartment. The heater is mounted in a core hole (in place of a core hole plug) in the engine block, with the heating element immersed in coolant (Fig. 15).

CAUTION: The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.

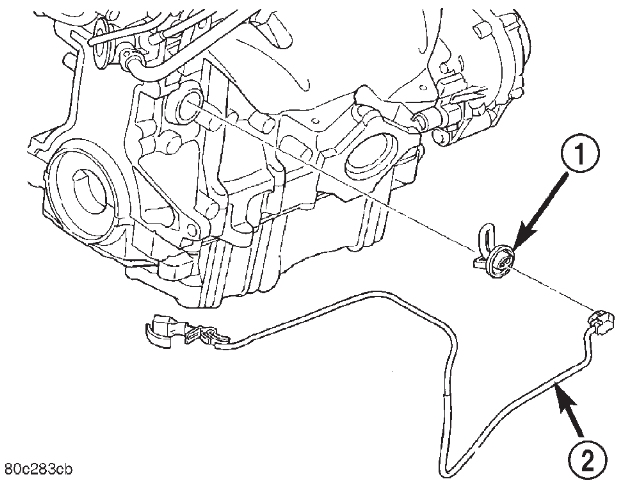

Fig. 15 Engine Block Heater

1 - BLOCK HEATER
2 - POWER CORD

DESCRIPTION - 2.7L

The engine block heater is mounted in the cylinder block, near the right rear corner (Fig. 16). The block heater is a dry cylinder type design and is powered by 110 volt AC. **The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.**

OPERATION

OPERATION - 2.0L/2.4L

The block heater element is submerged in the cooling system's coolant. When electrical power (110 volt A.C.) is applied to the element, it creates heat. This heat is transferred to the engine coolant. This provides easier engine starting and faster warm-up when vehicle is operated in areas having extremely low temperatures.

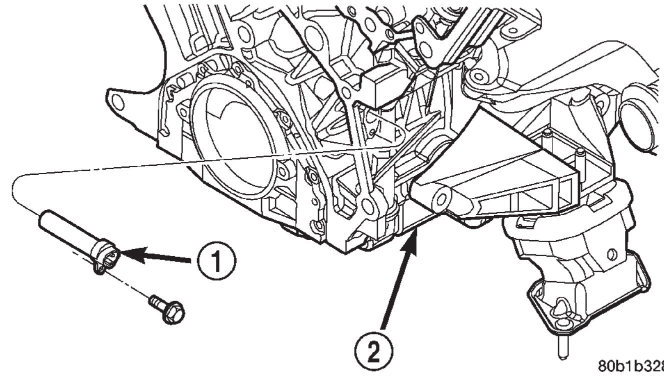

Fig. 16 Engine Block Heater

1 - BLOCK HEATER
2 - ENGINE — RIGHT SIDE

OPERATION - 2.7L

When power is applied (110 volt A.C.) to the block heater, the heating element transfers heat through the aluminum engine block and into the coolant without directly penetrating the cooling system.

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER TESTING

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

REMOVAL

REMOVAL - 2.0L/2.4L

(1) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
(2) Raise vehicle on hoist.
(3) Detach power cord plug from heater.
(4) Loosen screw in center of heater. Remove heater assembly (Fig. 17).

REMOVAL - 2.7L

(1) Raise vehicle on hoist.
(2) Detach power cord plug from heater (Fig. 18).
(3) Remove block heater attaching screw located below heater terminals.
(4) Remove block heater from cylinder block.

INSTALLATION

INSTALLATION - 2.0L/2.4L

(1) Thoroughly clean core hole and heater seat.

(2) Insert heater assembly with element loop positioned **upward** (Fig. 17).

(3) With heater seated, tighten center screw securely to assure a positive seal.

CAUTION: To prevent damage, the power cord must be secured in it's retaining clips, and not positioned so it could contact linkages or exhaust manifold.

(4) Connect power cord to heater.

(5) Lower vehicle.

(6) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

INSTALLATION - 2.7L

(1) Thoroughly clean cylinder block heater cavity.

(2) Insert heater assembly into block such that mounting hole is located below heater terminals (Fig. 18).

(3) Install mounting screw and tighten to 12 N·m (105 in. lb.).

CAUTION: To prevent damage, the power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds.

(4) Attach power cord to heater.

(5) Lower vehicle.

ENGINE COOLANT TEMPERATURE SENSOR

DESCRIPTION

2.0L/2.4L ENGINE

The Engine Coolant Temperature (ECT) Sensor threads into the thermostat housing just below the coolant outlet connector (Fig. 19). The ECT Sensor is a negative thermal coefficient sensor.

2.7L ENGINE

The Engine Coolant Temperature (ECT) Sensor threads into the coolant outlet connector (Fig. 20). The ECT Sensor is a negative thermal coefficient sensor.

OPERATION

The ECT sensor provides an input to the PCM. As temperature increases, resistance of the sensor decreases. As coolant temperature varies, the ECT sensor resistance changes resulting in a different voltage value at the PCM ECT sensor signal circuit. The ECT sensor provides input for various PCM operations. The PCM uses the input to control air-fuel mixture, timing, and radiator fan on/off times. The PCM uses ECT sensor input to send messages over the PCI bus to various modules for other functions such as temperature gauge and AC operation.

REMOVAL

(1) With engine cold, partially drain cooling system below level of ECT sensor.

(2) Disconnect ECT sensor electrical connector (Fig. 19) or (Fig. 20).

(3) Remove ECT sensor.

INSTALLATION

(1) Install ECT sensor. Torque sensor to 19 N·m (168 in. lbs.).

ENGINE COOLANT THERMOSTAT

DESCRIPTION

DESCRIPTION - 2.0L/2.4L

The thermostat is located on the front of the engine (radiator side) in the thermostat housing/coolant outlet connector (Fig. 21). The thermostat has a air bleed vent located in the flange and an O-ring with a locating dimple incorporated on it. There is a relief in the housing for positioning the air bleed.

DESCRIPTION - 2.7L

The thermostat is located on the lower left side of engine, near the front (Fig. 22). The thermostat is on the inlet side of the water pump. It has an air bleed located in the thermostat flange. The air bleed allows internal trapped air during cooling system filling to be released.

OPERATION

The engine cooling thermostat is a wax pellet driven, reverse poppet choke type. The thermostat is designed to provide the fastest warm up possible by preventing leakage through it and to guarantee a minimum engine operating temperature of 88 to 93°C (192 to 199°F). The thermostat also will automatically reach wide open so it will not restrict flow to the radiator as temperature of the coolant rises in hot weather to around 104°C (220°F). Above this temperature the coolant temperature is controlled by the radiator, fan, and ambient temperature, not the thermostat.

The thermostat is operated by a wax filled container (pellet) which is sealed. When heated coolant reaches a predetermined temperature, the wax expands enough to overcome the closing spring and water pump pressure, which forces the valve to open.

DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT TESTING

The thermostat is operated by a wax filled container (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

The thermostat that opens too soon type failure mode is included in the on-board diagnosis. The check engine light will not be lit by an open too soon condition. If it has failed open, a diagnostic trouble code (DTC) will be set. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes, (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING). Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this. (Refer to 7 - COOLING/ENGINE - DIAGNOSIS AND TESTING)

REMOVAL

REMOVAL - 2.0L/2.4L

WARNING: DO NOT REMOVE PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(1) Partially drain cooling system below thermostat level.

(2) Disconnect hoses at coolant outlet connector.

(3) Remove bolts attaching coolant outlet connector (Fig. 21).

(4) Remove coolant outlet connector and thermostat.

REMOVAL - 2.7L

(1) Disconnect negative cable from remote jumper terminal.

WARNING: DO NOT REMOVE PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(3) Raise vehicle on hoist.

(4) Remove right front wheel and belt splash shield.

(5) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(6) Remove lower generator mounting bolt.

(7) Lower vehicle.

(8) Disconnect generator electrical connectors.

(9) Disconnect AC clutch and AC pressure sensor electrical connectors. Reposition wiring harness.

(10) Remove oil dipstick and tube. Plug hole in oil pan where dipstick tube mounts with water tight stopper.

WARNING: IF HOLE FOR DIPSTICK TUBE IN OIL PAN IS NOT PLUGGED, COOLANT WILL ENTER OIL PAN. SERIOUS ENGINE DAMAGE CAN OCCUR.

(11) Remove remaining generator mounting bolts. Remove generator.

(12) Disconnect hoses at thermostat housing.

(13) Remove thermostat housing bolts (Fig. 22).

(14) Remove thermostat and housing.

INSTALLATION - 2.7L

(1) Clean gasket sealing surfaces.

NOTE: Install thermostat with the bleed valve located at the 12 o'clock position.

(2) Install thermostat and gasket into the thermostat housing.

(3) Install thermostat and housing to cylinder block. Tighten attaching bolts to 12 N·m (105 in. lbs.) (Fig. 22).

(4) Connect hoses at thermostat housing.

(5) Install generator and attaching bolts.

CAUTION: Before removing plug in oil pan, clean residual coolant from area.

(6) Remove plug in oil pan and install engine oil dipstick tube.

(7) Reconnect AC clutch and AC pressure sensor connectors.

(8) Reconnect generator connectors.

(9) Raise vehicle on hoist.

(10) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(11) Install belt splash shield and right front wheel.

(12) Lower vehicle.

(13) Reconnect negative battery cable.

(14) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

HOSE CLAMPS

DESCRIPTION - HOSE CLAMPS

The cooling system uses constant tension spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

Vehicles equipped with a 2.7L engine, use unique "Low Profile" type constant tension hose clamps at the coolant outlet connector hoses.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter (Fig. 24) or (Fig. 25).

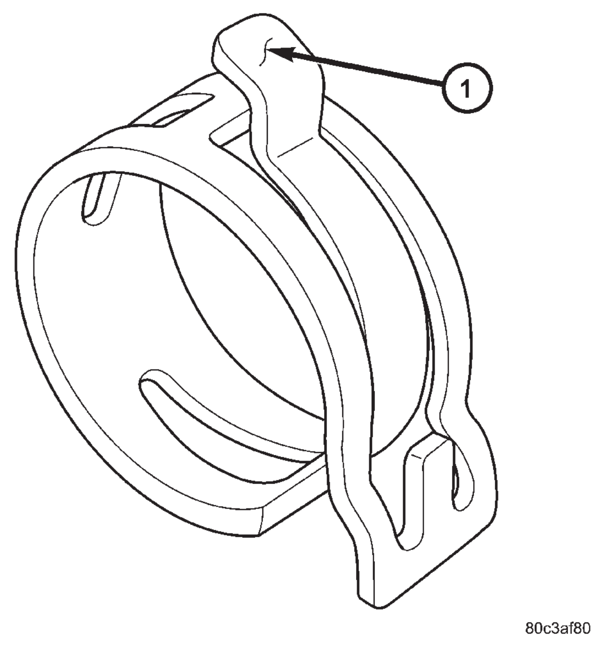

Fig. 24 "Low Profile" Spring Clamp Size Location

1 - SPRING CLAMP SIZE LOCATION

OPERATION - HOSE CLAMPS

The constant tension type hose clamps maintain constant clamping force on the hose connections as the temperature of the cooling system rises and falls. Worm gear type hose clamps may not have sufficient clamping force in colder weather conditions if installed during warm weather.

HOSE CLAMPS (Continued)

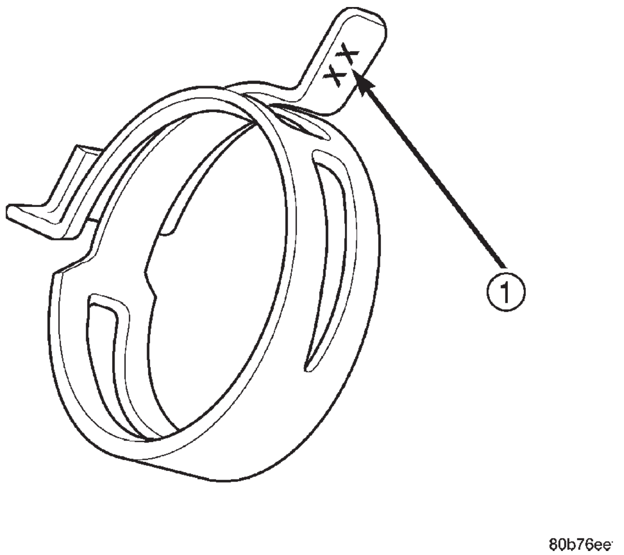

Fig. 25 Spring Clamp Size Location

1 - SPRING CLAMP SIZE LOCATION

To remove a spring type hose clamp, use Special Tool 8495 Hose Clamp Pliers, or equivalent, (Fig. 26) to compress the hose clamp.

NOTE: Special Tool 8495 was specifically designed for use on the "Low Profile" type hose clamps used at the coolant outlet connector hoses on the 2.7L engine. The pliers are also compatible with other styles of constant tension type hose clamps.

RADIATOR

DESCRIPTION

The radiator is a cross flow type (horizontal tubes) with design features that provide greater strength as well as sufficient heat transfer capabilities to keep the engine coolant within operating temperatures. The radiator cooling tubes are made of aluminum and the side tanks are plastic (Fig. 27).

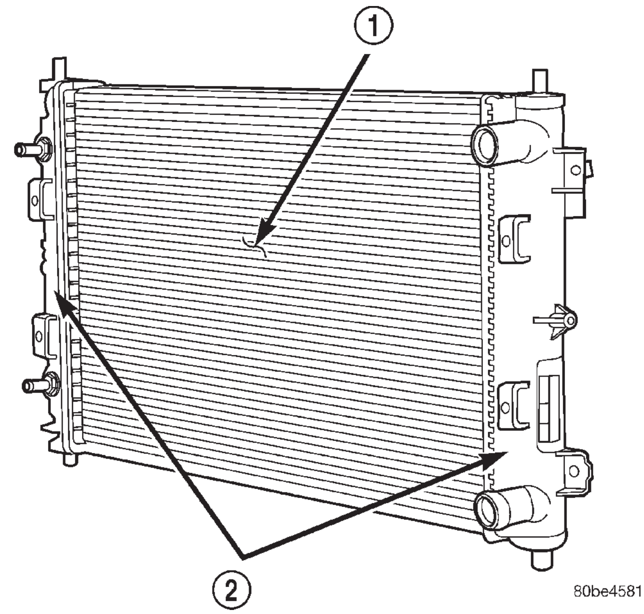

Fig. 27 Radiator - Typical

1 - COOLING TUBES
2 - TANKS

OPERATION

The radiator functions as a heat exchanger, using air flow across the exterior of the radiator tubes. This heat is then transferred from the coolant and into the passing air.

REMOVAL

(1) Disconnect negative cable from auxiliary jumper terminal.

WARNING: DO NOT REMOVE PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(3) Remove upper radiator crossmember (Fig. 28).

CAUTION: Plastic tanks, while stronger than brass are subject to damage by impact, such as wrenches.

(4) Disconnect the radiator fan electrical connector.

(5) Remove radiator fan.

(6) Disconnect hoses from radiator.

(7) Remove screw that holds support bracket for transmission cooler tubes at left side of radiator (if equipped).

CAUTION: Avoid bending the condenser inlet tube. Care should be taken not to damage radiator or condenser cooling fins.

(8) Remove the air conditioning condenser attaching screws located at the front of the radiator (Fig. 29). Disengage AC condenser from radiator. It is not necessary to discharge the air conditioning system to remove radiator.

(9) Radiator can now be lifted free from engine compartment. **Care should be taken not to damage radiator or condenser cooling fins during removal.**

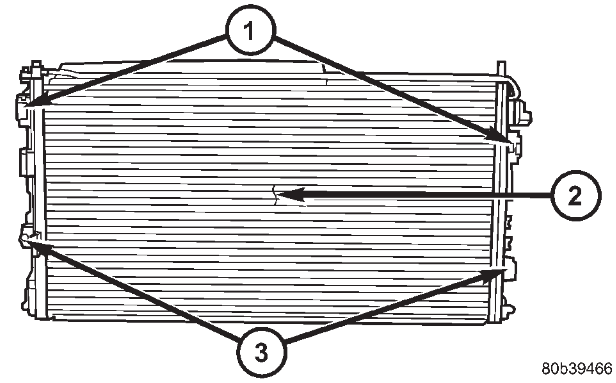

Fig. 29 A/C CONDENSER MOUNTING

1 - A/C CONDENSER LOCATING TABS
2 - COMBINATION A/C CONDENSER AND TRANSMISSION OIL COOLER
3 - A/C CONDENSER MOUNTING SCREWS

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

(1) Slide radiator into position and seat the radiator assembly lower rubber isolators in the mount holes.

(2) Attach air conditioning condenser to radiator. Tighten mounting screws to 5 N·m (45 in. lbs.).

(3) Install transmission oil cooler tube support bracket and attaching screw to left side of radiator. Tighten mounting screw to 5 N·m (45 in. lbs.).

(4) Connect hoses to radiator.

(5) Install radiator fan.

(6) Connect radiator fan electrical connector.

(7) Install upper radiator crossmember.

(8) Connect negative cable to auxiliary jumper terminal.

(9) Fill cooling system(Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

RADIATOR DRAINCOCK

REMOVAL

CAUTION: Use of pliers on draincock is not recommended. Damage may occur to radiator or draincock.

NOTE: It is not necessary to remove draincock during a routine coolant drain.

(1) Drain the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(2) Open the draincock by turning it counterclockwise until it stops.
(3) Turn the draincock back (clockwise) 1/8 turn.
(4) Pull the draincock (Fig. 30) from the radiator tank.

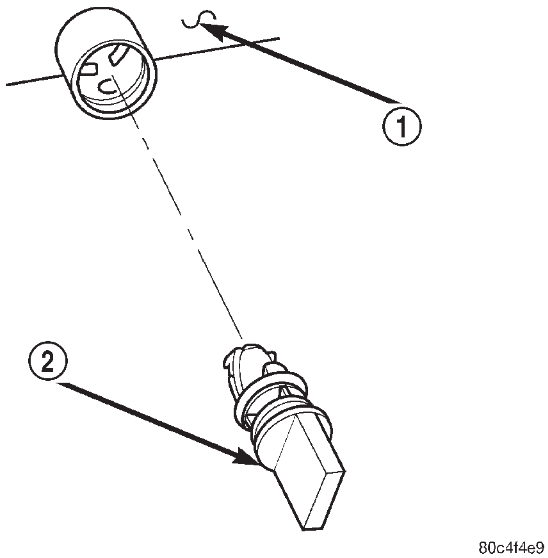

Fig. 30 Draincock

1 - RADIATOR TANK
2 - DRAINCOCK

INSTALLATION

(1) Align draincock stem to radiator tank opening.
(2) Push draincock into the radiator tank opening.
(3) Tighten the draincock by turning clockwise until it stops.
(4) Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

PRESSURE CAP

DESCRIPTION

CAUTION: Vehicles equipped with 2.0L/2.4L engines use a different pressure cap than vehicles equipped with 2.7L engines. The pressure caps are NOT interchangeable. Verify proper pressure cap part number.

The cooling system is equipped with a pressure cap that releases built up pressure, maintaining a range of 97-124 kPa (14-18 psi).

There is also a vent valve in the center of the cap. This valve also opens when coolant is cooling and contracting, allowing coolant to return to radiator from coolant reserve/recovery system container by vacuum through connecting hose. **If valve is stuck shut, the radiator hoses will be collapsed on cool down. Clean the vent valve (Fig. 31) to ensure proper sealing when boiling point is reached.**

5 - RUBBER SEALS
6 - VENT VALVE
7 - COOLANT OUTLET CONNECTOR (2.0L/2.4L)/PRESSURE CONTAINER (2.7L)
8 - FILLER NECK

OPERATION

CAUTION: Vehicles equipped with 2.0L/2.4L engines use a different pressure cap than vehicles equipped with 2.7L engines. The pressure caps are NOT interchangeable. Verify proper pressure cap part number.

PRESSURE CAP (Continued)

The pressure cap allows the cooling system to operate at higher than atmospheric pressure. The higher pressure raises the coolant boiling point; this allows increased radiator cooling capacity.

The gasket in the cap seals the filler neck, so that vacuum can be maintained, allowing coolant to be drawn back into the cooling system from the reserve container.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PRESSURE CAP TESTING

CAUTION: Vehicles equipped with 2.0L/2.4L engines use a different pressure cap than vehicles equipped with 2.7L engines. The pressure caps are NOT interchangeable. Verify proper pressure cap part number.

Dip the pressure cap in water. Clean any deposits off the vent valve or its seat and apply cap to end of the Pressure Cap Test Adaptor that is included with the Cooling System Tester 7700. Working the plunger, bring the pressure to 104 kPa (15 psi) on the gauge. If the pressure cap fails to hold pressure of at least 97 kPa (14 psi), replace the pressure cap.

CAUTION: The Cooling System Tester Tool is very sensitive to small air leaks that will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to the tool. Turn tool upside down and recheck pressure cap to confirm that cap is bad.

If the pressure cap tests properly while positioned on Cooling System Tester (Fig. 32), but will not hold pressure or vacuum when positioned on the filler neck. Inspect the filler neck and cap top gasket for irregularities that may prevent the cap from sealing properly.

DIAGNOSIS AND TESTING - COOLING SYSTEM PRESSURE RELIEF TESTING

WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON THE PRESSURE CAP IS A SAFETY PRECAUTION. WHEN HOT, THE COOLING SYSTEM BUILDS UP PRESSURE. TO PREVENT SCALDING OR OTHER INJURY, THE PRESSURE CAP SHOULD NOT BE REMOVED WHILE THE SYSTEM IS HOT AND/OR UNDER PRESSURE.

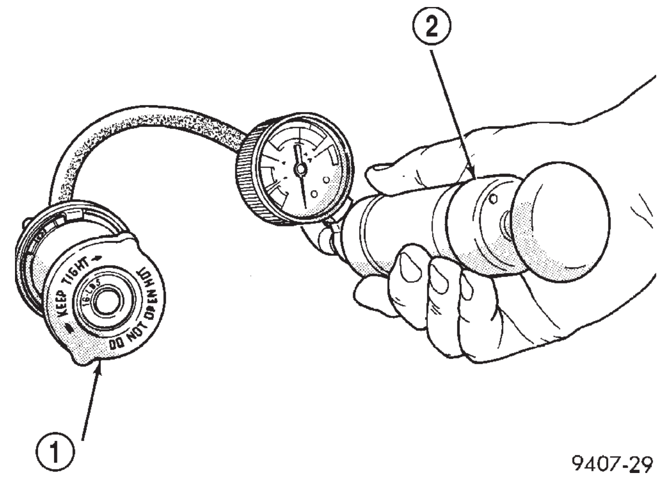

Fig. 32 Testing Cooling System Pressure Cap

1 - PRESSURE CAP
2 - PRESSURE TESTER

CAUTION: Vehicles equipped with 2.0L/2.4L engines use a different pressure cap than vehicles equipped with 2.7L engines. The pressure caps are NOT interchangeable. Verify proper pressure cap part number.

The pressure cap upper gasket to filler neck seal can be checked by removing the overflow hose at the filler neck overflow nipple (Fig. 33). Attach the radiator pressure tester to the **filler neck overflow nipple,** and pump air into the system. The pressure cap upper gasket should relieve pressure at 69-124 kPa (10-18 psi), and hold pressure at 55 kPa (8 psi) minimum.

PRESSURE CAP (Continued)

There is no need to remove the pressure cap at any time **except** for the following purposes:

- Check and adjust coolant freeze point
- Refill system with new coolant
- Conducting service procedures
- Checking for leaks

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT 15 MINUTES BEFORE REMOVING CAP. PLACE A SHOP TOWEL OVER THE CAP, AND WITHOUT PUSHING DOWN, ROTATE IT COUNTERCLOCKWISE TO THE FIRST STOP. ALLOW FLUIDS TO ESCAPE THROUGH THE OVERFLOW TUBE. WHEN THE SYSTEM STOPS PUSHING COOLANT AND STEAM INTO THE CRS TANK AND PRESSURE DROPS, PUSH DOWN ON THE CAP AND REMOVE IT COMPLETELY. SQUEEZING THE RADIATOR INLET HOSE WITH A SHOP TOWEL (TO CHECK PRESSURE) BEFORE AND AFTER TURNING TO THE FIRST STOP IS RECOMMENDED.

CLEANING

Use only a mild soap to clean the pressure cap.

INSPECTION

CAUTION: Vehicles equipped with 2.0L/2.4L engines use a different pressure cap than vehicles equipped with 2.7L engines. The pressure caps are NOT interchangeable. Verify proper pressure cap part number.

2.0L/2.4L

Hold the cap in your hand, **right side up** (Fig. 34). The vent valve at the bottom of the cap should fall open. Turn the cap upside down. The vent valve should close.

Replace the cap for any of the following conditions:

- Rubber gasket has swollen, preventing the valve from opening
- Any light can be seen between the vent valve and the rubber gasket (with cap upside down)
- Gasket on the bottom of the cap shows noticeable thinning
- Cap has been through more than one engine overheat.

2.7L

Hold the cap in your hand, **right side up** (Fig. 34). The vent valve at the bottom of the cap should be normally closed. The vent valve should open with a slight pull with your finger nail.

Replace the cap for any of the following conditions:

- Rubber gasket has swollen, preventing the valve from opening
- Any light can be seen between the vent valve and the rubber gasket. **Use only a replacement cap that has a spring to hold the vent shut.**
- Gasket on the bottom of the cap shows noticeable thinning
- Cap has been through more than one engine overheat.

RADIATOR FAN(S)

DESCRIPTION

The radiator fan module includes a support shroud with two electrically driven motors with fan blades (Fig. 35). The radiator fan module is fastened to the radiator. The motors, shroud, and fan blades are serviced separately.

RADIATOR FAN(S) (Continued)

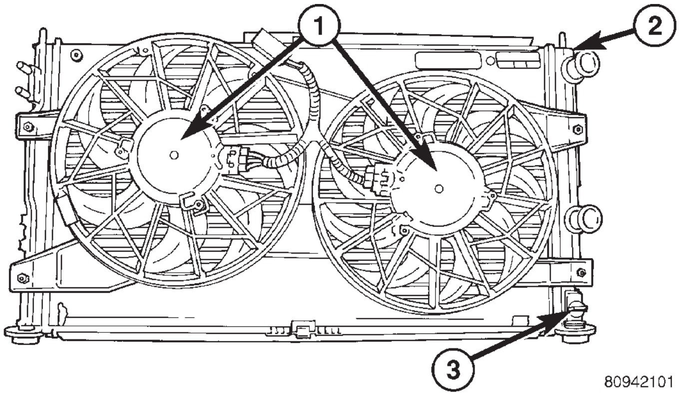

Fig. 35 Fan Module

1 - RADIATOR FAN MOTOR
2 - RADIATOR
3 - RADIATOR DRAINCOCK

OPERATION

The radiator fans are controlled by the Powertrain Control Module (PCM) which energizes a high speed or low speed fan relay. The electric motor drives the cooling fan to produce air flow across the radiator fins.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RADIATOR FAN CONTROL

Fan control is accomplished three ways. The fan runs when the air conditioning pressure reaches a set psi see charts below. In addition to this control, the fan is turned on by the temperature of the coolant which is sensed by the coolant temperature sensor which sends the message to the Powertrain Control Module (PCM). The PCM turns on the fan through a fan relay. On models equipped with automatic transmission, a transmission fluid thermister may have some influences on fan operation. See Wiring Diagrams Manual for circuity and diagnostics provided.

The Powertrain Control Module (PCM) provides fan control for the following conditions:

- The fan will not run during cranking until the engine starts no matter what the coolant temperature is.
- Fan will run when the air conditioning clutch is engaged, low pressure cutout switch is closed and once set compressor head pressure is reached. See charts.
- Fan will run according to the following information charts.

Refer to the appropriate Diagnostic Information for testing the fan motor with the DRBIII®.

For wiring diagrams of the fan motor systems refer to Wiring Diagrams.

REMOVAL

(1) Remove upper radiator crossmember.

(2) Disconnect radiator fan electrical connector (Fig. 36).

(3) Remove fasteners and upper clip attaching fan assembly to radiator (Fig. 36).

(4) Remove radiator fan assembly by lifting upward.

INSPECTION

There are no repairs to be made to the fan. If the fan is warped, cracked, or otherwise damaged, it must be replaced with **only** the recommended replacement part for adequate strength, performance and safety.

INSTALLATION

(1) Install radiator fan to radiator. Install retaining clip and tighten fasteners to 5 N·m (45 in. lbs.) (Fig. 36).

(2) Connect radiator fan electrical connector.

(3) Install upper radiator crossmember.

THERMOSTAT HOUSING

REMOVAL

REMOVAL - 2.0L

(1) Disconnect negative battery cable.

(2) Partially drain cooling system below thermostat housing level.

(3) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Disconnect and remove generator.

(5) Remove thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).

(6) Disconnect engine coolant temperature sensor connector.

(7) Disconnect heater supply hose.

(8) Remove housing attaching bolts (Fig. 37).

(9) Remove housing and gasket (Fig. 37).

REMOVAL - 2.4L

(1) Partially drain cooling system below thermostat housing level.

(2) Remove thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).

(3) Disconnect engine coolant temperature sensor connector.

(4) Disconnect heater supply hose.

(5) Remove housing attaching bolts (Fig. 38).

(6) Remove housing and gasket (Fig. 38).

INSTALLATION

INSTALLATION - 2.0L

(1) Clean all gasket sealing surfaces.

(2) Install gasket and housing (Fig. 37). Tighten bolts to 28 N·m (20 ft. lbs.).

(3) Reconnect heater supply hose.

(4) Reconnect engine coolant temperature sensor connector.

(5) Install thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).

(6) Install generator. Reconnect generator connectors.

(7) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(8) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(9) Connect negative battery cable.

INSTALLATION - 2.4L

(1) Clean all gasket sealing surfaces.

(2) Install gasket and housing (Fig. 38). Tighten bolts to 28 N·m (20 ft. lbs.).

(3) Reconnect heater supply hose.

(4) Reconnect engine coolant temperature sensor connector.

(5) Install thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).

(6) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

WATER PUMP

DESCRIPTION

DESCRIPTION - 2.0L/2.4L

The water pump has a diecast aluminum body and housing with a stamped steel impeller. The water pump bolts directly to the block (Fig. 39) and is driven by the timing belt. Cylinder block to water pump sealing is provided by a rubber O-ring.

DESCRIPTION - 2.7L

The 2.7L pump has a die cast aluminum housing and a plastic swept vane impeller. It bolts directly to the cylinder block, behind the timing chain cover (Fig. 40). The water pump is driven by the back side of the engine's primary timing chain.

3 - GASKET

OPERATION

The water pump is the heart of the cooling system. The coolant is pumped through the engine block, cylinder head, heater core, and radiator.

DIAGNOSIS AND TESTING - WATER PUMP

To determine whether coolant is flowing through the cooling system, use one of the following procedures:

PREFERRED METHOD

WARNING: DO NOT REMOVE THE COOLING SYSTEM PRESSURE CAP OR ANY HOSE WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- **2.0L/2.4L:** Remove pressure cap when engine is cold. Remove small amount of coolant. Idle engine until thermostat opens. You should observe coolant flow while looking down the filler neck. Once flow is detected install the pressure cap. Replace removed coolant into coolant recovery container.
- **2.7L:** Start engine, coolant flow should be observable in coolant pressure container when revving the engine.

ALTERNATIVE METHOD

- If engine is cold, idle engine until normal operating temperature is reached. Feel the upper radiator hose. If it is hot, coolant is circulating.

REMOVAL

REMOVAL - 2.0L/2.4L

(1) Disconnect negative battery cable.

(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(3) Remove timing belt, camshaft sprockets, and rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(4) Remove water pump to engine attaching screws (Fig. 41).

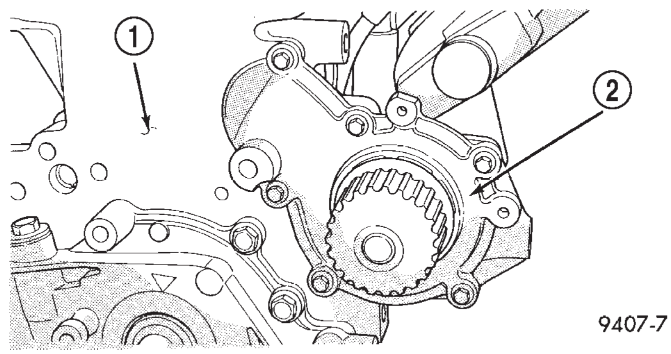

Fig. 41 Water Pump

1 - CYLINDER BLOCK
2 - PUMP BODY

REMOVAL - 2.7L

NOTE: It is normal for the water pump to weep a small amount of coolant from the weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident on side of the cylinder block from the weep hole passage (shaft seal failure). Be sure to perform a thorough analysis before replacing water pump.

WATER PUMP (Continued)

WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN RESULT.

(1) Disconnect negative battery cable.

(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

NOTE: The water pump is driven by the primary timing chain.

(3) Remove the timing chain cover, timing chain, and all chain guides (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(4) Remove bolts attaching water pump to block (Fig. 42).

(5) Remove water pump and gasket.

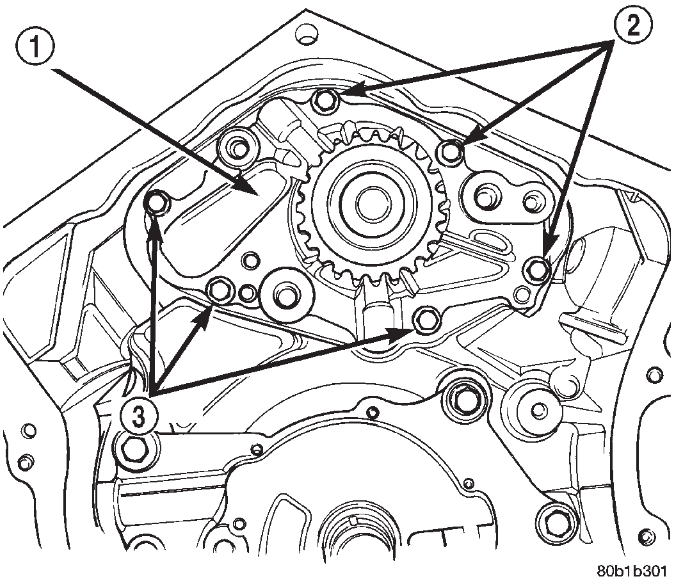

Fig. 42 WATER PUMP - 2.7L

CLEANING

Clean gasket mating surfaces as necessary.

INSPECTION

INSPECTION - 2.0L/2.4L

Replace water pump body assembly if it has any of these defects:

(1) Cracks or damage on the body.

(2) Coolant leaks from the shaft seal, evident by wet coolant traces on the pump body.

(3) Loose or rough turning bearing.

(4) Impeller rubs either the pump body or the engine block.

(5) Impeller loose or damaged.

(6) Sprocket or sprocket flange loose or damaged.

INSPECTION - 2.7L

Inspect and replace the water pump if it has any of the following defects:

(1) Damage or cracks on the pump body.

(2) Coolant leaks; if the shaft seal is leaking, this will be evident by traces of thick deposits of dried glycol running down from the pump weep passage (Fig. 43), and components below. A thin black stain below pump weep hole/passage is considered normal operation.

(3) Impeller rubs inside of cylinder block.

(4) Excessively loose or rough turning bearing.

NOTE: It is normal for the water pump to weep a small amount of coolant from the weep hole. Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the weep passage (Fig. 43). This indicates a shaft seal failure and pump must be replaced. Be sure to perform a thorough analysis before replacing water pump.

INSTALLATION

INSTALLATION - 2.0L/2.4L

(1) Install new O-ring gasket in water pump body O-ring groove (Fig. 44).

CAUTION: Make sure O-ring is properly seated in water pump groove before tightening screws. An improperly located O-ring may cause damage to the O-ring and cause a coolant leak.

1 - IMPELLER
2 - PUMP BODY
3 - O-RING

(2) Assemble pump body to block and tighten screws to 12 N·m (105 in. lbs.) (Fig. 41).

(3) Rotate pump by hand to check for freedom of movement.

(4) Install rear timing belt cover, camshaft sprockets, and timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(5) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

INSTALLATION - 2.7L

(1) Clean all sealing surfaces.

(2) Install water pump and gasket. Tighten mounting bolts to 12 N·m (105 in. lbs.).

(3) Install timing chain guides, timing chain, and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(4) Reconnect negative battery cable.

(5) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

WATER PUMP INLET TUBE

REMOVAL

REMOVAL - 2.0L

(1) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(2) Raise vehicle on hoist.

(3) Remove Air Conditioning Compressor/Generator accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Disconnect and remove generator.

(5) Remove generator bracket.

(6) Disconnect lower radiator hose and heater hose from the inlet tube (Fig. 45).

(7) Remove fasteners that hold the inlet tube to the block.

(8) Rotate inlet tube while removing from the engine block (Fig. 45).

REMOVAL - 2.4L

(1) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(2) Raise vehicle on hoist.

(3) Disconnect lower radiator hose and heater hose from the inlet tube (Fig. 45).

(4) Remove fasteners that hold the inlet tube to the block.

WATER PUMP INLET TUBE (Continued)

INSTALLATION

INSTALLATION - 2.0L

(1) Inspect the O-ring for damage before installing the tube into the cylinder block (Fig. 45).

(2) Lube O-ring with coolant and install tube into the cylinder block opening.

(3) Install fasteners and tighten to 12 N·m (105 in. lbs.).

(4) Reconnect lower radiator hose and heater hose to inlet tube (Fig. 45).

(5) Install generator bracket.

(6) Install generator, reconnect connectors.

(7) Install Air Conditioning Compressor/Generator accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(8) Lower vehicle.

(9) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

INSTALLATION - 2.4L

(1) Inspect the O-ring for damage before installing the tube into the cylinder block (Fig. 45).

(2) Lube O-ring with coolant and install tube into the cylinder block opening.

(3) Install fasteners and tighten to 12 N·m (105 in. lbs.).

(4) Reconnect lower radiator hose and heater hose to inlet tube (Fig. 45).

(5) Lower vehicle.

(6) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

TRANSMISSION

STANDARD PROCEDURE - FLUSHING COOLERS AND TUBES

The recommended procedure for cooler flushing is to use Tool 6906 Cooler Flusher.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1–1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES. KEEP LIT CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

WARNING: KEEP THE AREA WELL VENTILATED. DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

(1) Remove cover plate filler plug on Tool 6906. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Use Mopar® Transmission Cooler Flush (MS-552) or equivalent solution conforming to MS-552. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

(4) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(5) Connect the CLEAR return line to the INLET (To) cooler line

(6) Turn pump ON for two to three minutes to flush cooler and lines.

(7) Turn pump OFF.

(8) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(9) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(10) Place CLEAR suction line into a one quart container of Mopar® ATF+4 (Automatic Transmission Fluid—Type 9602).

(11) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(12) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

TRANSMISSION COOLER HOSES

DESCRIPTION

The transmission oil cooling circuit uses special aggressive fittings for the transmission oil cooler hoses. Whenever a transmission oil cooler hose is removed from a transmission fitting (at transmission), it must be cut off flush with the fitting, and a service splice kit must be used upon reassembly. Refer to instructions provided with splice kit. Whenever a transmission oil cooler hose is removed from a transmission oil cooler tube (at transmission oil cooler), it must be replaced with a new hose. Removing the hose from the aggressive fitting will scrape material from inside the hose making the hose larger. Failure to replace the hose or install a service splice kit will result in transmission oil leaks.

When hose clamp replacement is necessary, replace with the same type of hose clamp. Always use proper hose clamp pliers on clamps. Use of improper hose clamp pliers may bend hose clamps out-of-round resulting in transmission oil leaks.

TRANSMISSION OIL COOLER

DESCRIPTION

An external oil-to-air type automatic transmission oil cooler is mounted to the front of the radiator and is integral to the A/C condenser (Fig. 1). The six upper tubes are used for transaxle oil cooling, and the remaining tubes below are for the A/C system.

The cooler uses tubes and rubber hoses to feed oil to and from the automatic transaxle. The replaceable inlet and outlet tubes use an O-ring for sealing. The trans oil cooler is replaced with the A/C condenser.

OPERATION

The oil flows from the transmission to the oil-to-air cooler. Heat is then transferred into the air.

REMOVAL

(1) Remove AC condenser(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

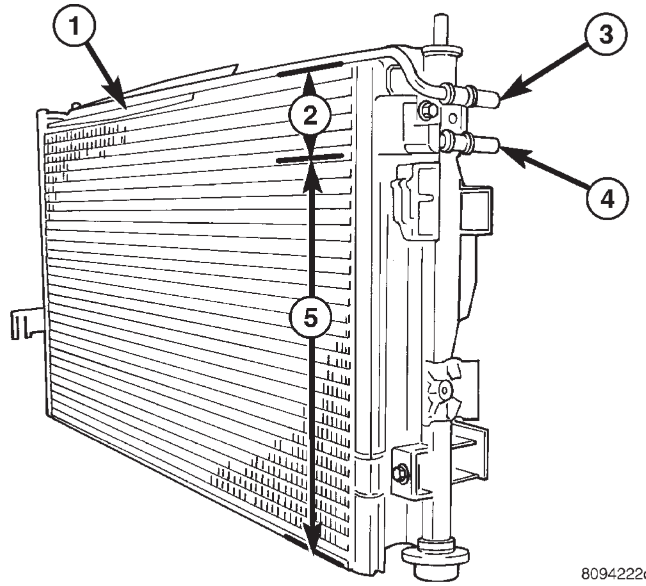

Fig. 1 Transmission Oil Cooler

1 - AIR CONDITIONING CONDENSER/TRANSMISSION OIL COOLER
2 - TRANSMISSION OIL COOLER PORTION
3 - TRANSMISSION COOLER OUTLET
4 - TRANSMISSION COOLER INLET
5 - AIR CONDITIONING CONDENSER PORTION

CLEANING

Check the AC condenser for debris on the cooling fin surfaces. Clean as necessary. For internal cleaning/flushing procedures, (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).

INSPECTION

Inspect all hoses, tubes, clamps and connections for leaks, cracks, or damage. Replace as necessary. Use only approved transmission oil cooler hoses that are molded to fit the space available.

INSTALLATION

(1) Install AC condenser(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

AUDIO

TABLE OF CONTENTS

AUDIO

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered as optional equipment. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the ON or Accessory positions.

The audio system includes the following components:
- Antenna
- CD Changer
- Power amplifier (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Speakers

The vehicle has two speaker systems:

STANDARD SPEAKER SYSTEM

- Two instrument panel mounted speakers (JR 27)
- Two door speakers
- Two rear shelf panel speakers (JR 41)
- Two rear quarter trim panel speakers (JR 27)
- Separate top-up vs top-down equalization curves in the radio (JR 27)

PREMIUM GOLD AMPLIFIED SPEAKER SYSTEM

- Amplifier mounted under the front passenger seat
- 150 watt Amplifier with separate top-up vs. top-down equalization curves (JR27)
- Two instrument panel speakers
- Two door speakers
- Two rear shelf panel speakers (JR 41)
- Two rear quarter trim panel speakers (JR 27)

OPERATION

See the owner's manual in the vehicle glove box for more information on the features, use and operation of each of the available audio systems.

DIAGNOSIS AND TESTING - AUDIO

Any diagnosis of the Audio system should begin with the use of the DRB III® diagnostic tool. For information on the use of the DRB III®, refer to the appropriate Diagnostic Service Manual.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

ANTENNA BODY & CABLE

DIAGNOSIS AND TESTING - ANTENNA BODY AND CABLE

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to antenna coaxial cable shield test.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The ohmmeter test lead connections for each test are shown in the illustration (Fig. 1).

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the body wiring) from the coaxial cable connector just in front of the front seat crossmember of the passenger seat to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector just in front of the front seat crossmember of the passenger seat to the coaxial cable connector at the radio.

TEST 1

Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

(1) Disconnect and isolate the antenna coaxial cable connector just in front of the front seat crossmember of the passenger seat.

(2) Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to ground. Check the ohmmeter reading for continuity.

ANTENNA BODY & CABLE (Continued)

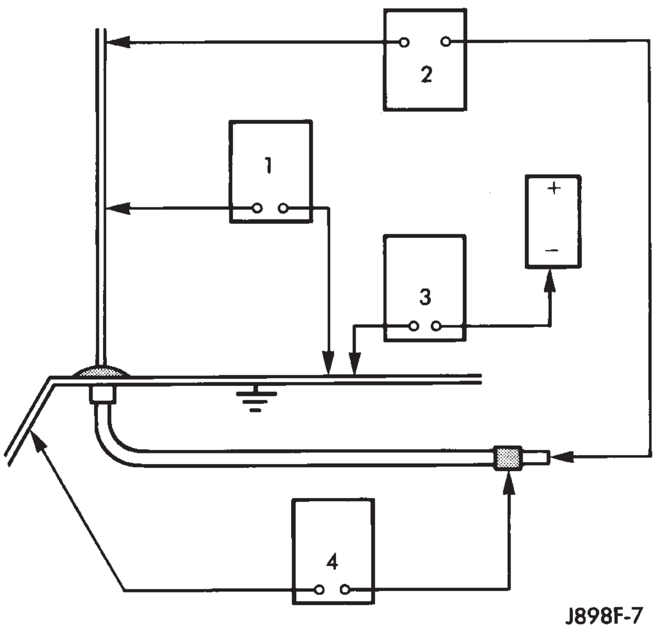

Fig. 1 Antenna Tests - Typical

(3) There should be no continuity. If OK, go to Test 2. If not OK, replace the faulty antenna body and cable.

TEST 2

Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and primary cable unit, instrument panel antenna secondary cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

(1) Disconnect the instrument panel (secondary) antenna cable coaxial connector from the back of the radio.

(2) Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.

(3) There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to Test 3. If not OK, isolate and test each of the individual antenna conductor components. Replace only the faulty antenna conductor component.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

(1) This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.

(2) Reconnect the battery negative cable.

(3) Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.

(4) There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the battery negative terminal and the vehicle body. If OK, go to Test 4. If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.

TEST 4

Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:

(1) Disconnect and isolate the antenna coaxial cable connector just in front of the front seat crossmember of the passenger seat.

(2) Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the outer crimp on the antenna coaxial cable connector just in front of the front seat crossmember of the passenger seat. Check the ohmmeter reading for continuity.

(3) There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to fender mating surfaces and tighten the antenna cap nut to specifications.

(4) Check the resistance again with an ohmmeter. If the resistance is still more then one ohm, replace the faulty antenna body and cable.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Pull the right side trunk liner aside.

(3) Remove antenna mast by unscrewing mast from antenna body.

(4) Remove screw from mounting bracket.

ANTENNA BODY & CABLE (Continued)

(5) Pull antenna body down through the rubber grommet.

(6) Unplug antenna lead from base of antenna body.

INSTALLATION

(1) Insert antenna lead to base of antenna body.

(2) Push antenna body up through the rubber grommet.

(3) Install screw into mounting bracket. Tighten screw to 12 N·m (106 in. lbs.)

(4) Install antenna mast.

(5) Install trunk liner.

(6) Connect battery negative cable.

AMPLIFIER

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the retaining fasteners. Adjust or remove the seat as necessary to gain access.

(3) Disconnect the wire harness connector.

(4) Remove the amplifier.

INSTALLATION

(1) Connect wire harness connector to amplifier.

(2) Install amplifier. Tighten the forward screw to 3 N·m (26.5 in. lbs.) and the rear nut to 2 N·m (18 in. lbs.).

(3) Connect battery negative cable.

CD CHANGER

DESCRIPTION

The 4 Disc In-Dash CD Changer (if equipped) is located in the instrument panel below the radio. The remote changer does not use a cartridge or magazine for the CD's. Up to 4 CD's can be directly loaded into this unit, one at a time.

OPERATION

Due to its compact design, the CD changer can carry out only one operation at a time. For example, you can not load a new disc while playing another at the same time. Each operation happens sequentially.

The radio unit provides control over all features of the CD changer with the exception of the CD load and eject functions, which are controlled by buttons located on the front of the CD changer. All features you would expect, such as Disc Up/Down, Track Up/Down, Random and Scan are controlled by the radio, which also displays all relevant CD changer information on the radio display.

On JR27 models, the CD changer will not operate with the ignition in the OFF position. With the ignition OFF, CD's can not be removed from the changer.

The CD changer contains a Load/Eject button and an indicator LED for each of the four disc positions as well as an illuminated disc opening. The individual LED indicates whether a CD is currently loaded or ready to load in that particular chamber of the CD changer. Pressing the individual Load/Eject button for a particular chamber will eject a disc currently present in that chamber. If the chamber is currently empty, actuating the Load/Eject button will position that chamber to receive and load a new disc in that chamber.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove lower center trim bezel.

(3) Remove screws from radio.

(4) Remove screws from CD changer (Fig. 2).

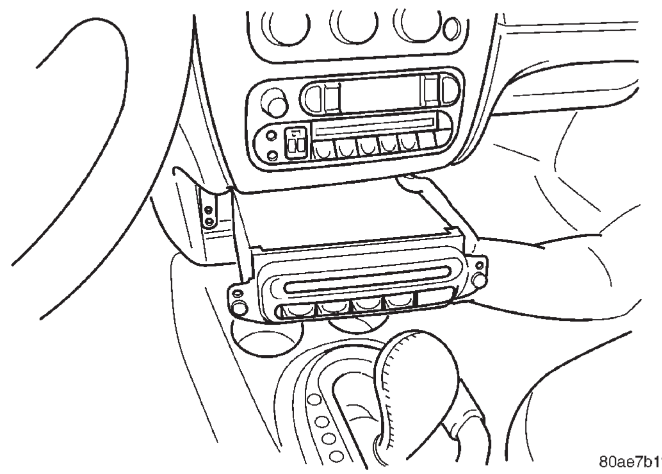

Fig. 2 CD CHANGER

(5) Remove CD changer from Instrument panel.

(6) Disconnect wire connector from CD changer.

INSTALLATION

(1) Connect wire harness connector to CD changer.

(2) Insert CD changer into instrument panel. Make sure that bumper on back of changer is inserted into instrument panel opening.

(3) Pull radio from instrument panel far enough to reach behind. Pull CD changer cable through radio opening while inserting changer into instrument panel.

(4) Install radio.

(5) Install screws to radio and CD changer.

(6) Install lower center trim bezel.

(7) Connect battery negative cable.

POWER ANTENNA - BUX

DIAGNOSIS AND TESTING - POWER ANTENNA - BUX

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

(1) Using an ohmmeter, check for continuity between the antenna body and ground. There should be no measurable resistance. If OK, go to Step 2. If not, repair or clean ground as necessary.

(2) Disconnect the wire harness connector at the antenna. Check for battery voltage at pin A1. If OK, go to Step 3. If not, check circuit fuse or check for a shorted or open wire.

(3) With the ignition in the ON or ACC position, turn radio ON and check for battery voltage at pin A2. If OK, replace power antenna (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA MODULE - REMOVAL). If not, check for a shorted or open wire.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

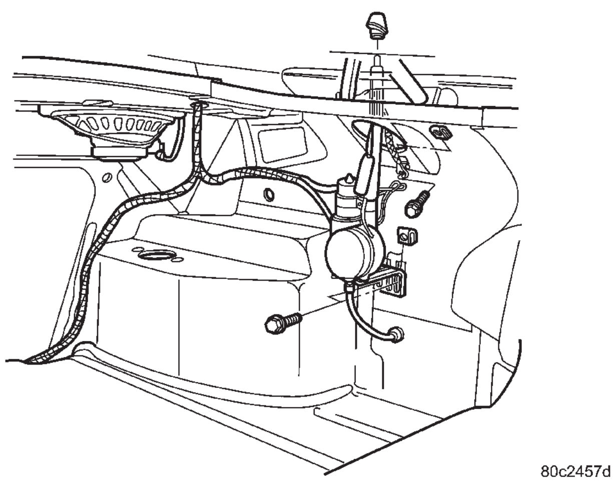

Fig. 3 POWER ANTENNA - TYPICAL

(2) Disconnect drain tube.
(3) Disconnect electrical connector.
(4) Disconnect antenna cable.
(5) Remove ground strap fastener (if equipped).
(6) Remove mounting bolts from antenna (Fig. 3).
(7) Pull antenna through grommet in quarter panel.

INSTALLATION

(1) Push antenna up through grommet in quarter panel.
(2) Install mounting bolts to antenna. Tighten to 12 N·m (110 in. lbs.).
(3) Connect antenna cable.
(4) Connect electrical connector to antenna.
(5) Connect drain tube.
(6) Install ground strap (if equipped) and fastener. Tighten to 12 N·m (110 in. lbs.).

PREMIUM

The optional premium speaker system includes speakers in six locations: One 15.2 cm X 22.9 cm (6 in. X 9 in.) speaker is installed in each front door, one 15.2 cm X 22.9 cm (6 in. X 9 in.) speaker is installed outboard at each end of the rear shelf panel and one 6.4 cm (2.5 in.) speaker installed in each end of the instrument panel. The system includes a separate 120–watt amplifier located under the front passenger seat.

OPERATION

Two wires connected to each speaker, one feed circuit (+) and one return circuit (–), allow the audio output signal electrical current to flow through the voice coil. For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

CHIME/BUZZER

TABLE OF CONTENTS

CHIME/BUZZER

DESCRIPTION

The chime warning/reminder system includes signals for fasten seat belts, certain warning indicators, exterior lamps left ON, key left in ignition and door ajar.

For diagnosis and testing, use the DRB lll® scan tool and the proper Body Diagnostic Procedures manual.

OPERATION

DOOR AJAR CHIME

The BCM will sound an audible chime when the key is in the ignition and the drivers door is open. This is to prevent partial closing of vehicle doors.

An audible chime will sound when the vehicle begins to move and the transmission range indicator display will indicate DOOR.

FASTEN SEAT BELTS

At power up, a seat belt lamp bulb check will be conducted by the instrument cluster. If the driver side seat belt buckle is unbuckled during the bulb check, an accompanying chime will sound within the duration of the bulb check.

SINGLE WARNING CHIME

After bulb check at power-up, if any of the following indicators are still activated, the cluster will request a single chime from the BCM. ABS, Air Bag, Check Engine, Charging System, Engine Temperature, Low Fuel (after 10 sec. for accurate fuel info), and BRAKE (if speed is greater than 2 mph).

EXTERIOR LAMPS LEFT ON

An audible chime tone that indicates the exterior lamps were left on.

KEY LEFT IN IGNITION

An audible chime tone that indicates the key was left in ignition.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CHIME CONDITIONS

For Removal and Installation of Junction Block (JB) (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).

For Removal and Installation of Body Control Module (BCM), refer to Electrical, Electronic Control Modules, Body Control Modules, Removal, and Installation.

NO TONE WHEN IGNITION SWITCH IS TURNED ON AND DRIVERS SEAT BELT IS UNBUCKLED AND FULLY RETRACTED

(1) Check driver's seat belt retractor switch for a ground when belt is retracted.

(2) Use DRB III® scan tool to perform PCI data bus diagnostics on the BCM for battery, ignition and seat belt switch inputs.

(3) Use DRB III® scan tool to perform actuator diagnostics on BCM Chime.

(4) Check for tone in any other function.

(5) Remove BCM from Junction Block. Check for battery voltage at terminal JB-12 and ignition feed at terminal JB-6 of BCM (Fig. 1). Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(6) If voltage not OK, repair as necessary.

NO FASTEN SEAT BELT LAMP WHEN IGNITION SWITCH IS TURNED ON

(1) At power-up, the cluster will turn ON the seat belt warning indicator for 6 ± 1 seconds as required regardless of the driver side seat belt buckle status. If the warning indicator does not turn ON, verify if the socketted red LED is seated properly and good contact with the PC-board is present. If not seated properly, then seat the LED properly by twisting the socket counterclockwise. If seated properly, replace the LED.

SEAT BELT LAMP ON FOR MORE THAN 7 SECONDS AFTER DRIVER SEAT BELT BUCKLE SWITCH IS FASTENED AND IGNITION ON

(1) Use a DRB III® scan tool to verify status of the driver seat belt buckle switch as received by the instrument cluster. Compare to the actual seat belt buckle status: If buckled, lamp is OFF or if unbuckled, lamp is ON. If the status received by the instrument cluster does match the actual buckle seat belt switch status (buckled/unbuckled), then check the driver seat belt switch and wiring for proper connection.

NO TONE OR DOOR INDICATED IN PLACE OF ODOMETER WHEN A DOOR IS AJAR AND VEHICLE BEGINS MOVING

The vehicle must be moving for the chime to occur. However the door indicator will come ON regardless of the vehicle movement. The PCI data bus, Transmission Control Module (TCM) and Powertrain Control Module (PCM) must be operational.

(1) Check all door jamb switches.

(2) Use DRB III® scan tool to perform PCI data bus diagnostics on BCM for battery and ignition switch input

(3) Inspect BCM connectors and wires for proper connection.

(4) Remove BCM from Junction Block. Check for battery voltage at terminal JB-12 and ignition feed at terminal JB-6 of BCM. Refer to the appropriate wiring information.

(5) If voltage not OK, repair as necessary.

NO TONE WHEN HEADLAMPS ARE ON, IGNITION SWITCH IS OFF AND DRIVER'S DOOR IS OPEN.

(1) Check left door jamb switch for good ground when driver's door is open.

(2) Use DRB III® scan tool to perform PCI data bus diagnostics on BCM for battery, ignition switch input, headlamp and driver's door input and Chime Output Test.

(3) Check headlamp switch.

(4) Inspect BCM connectors and wires for proper connection.

(5) Remove BCM from Junction Block. Check for battery voltage at terminal JB-12 and ignition feed at terminal JB-6 of BCM. Refer to the appropriate wiring information.

(6) If voltage not OK, repair as necessary.

NO TONE WHEN IGNITION KEY IS LEFT IN IGNITION SWITCH AND IT IS IN THE OFF POSITION WITH DRIVER'S DOOR IS OPEN

(1) Check left door jamb switch for good ground when drivers door is open.

(2) Use DRB III® scan tool to perform PCI data bus diagnostics on BCM for battery, ignition switch input, key-in-switch and driver's door input and Chime Output Test.

(3) Check key-in switch.

(4) Inspect BCM connectors and wires for proper connection.

(5) Remove BCM from Junction Block. Check for battery voltage at terminal JB-12 and ignition feed at terminal JB-6 of BCM. Refer to the appropriate wiring information.

(6) If voltage not OK, repair as necessary.

CHIME/BUZZER (Continued)

CHIMES CONTINUE WHEN HEADLAMPS ARE TURNED OFF AND/OR KEY IS REMOVED FROM IGNITION

(1) Use DRB III® scan tool to perform PCI data bus diagnostics on BCM for headlamp or key-in-ignition inputs.

(2) Check wiring for a grounded condition between key-in switch and BCM. Check headlamp switch to BCM wiring for short to battery.

(3) Inspect BCM connectors and wires for proper connection.

DIAGNOSIS AND TESTING - EXTERIOR LAMPS LEFT ON

To test the headlamps left on function, turn ignition off, turn exterior lamps on with driver's door open. Chime should sound until headlamps are turned off or drivers door is closed.

DIAGNOSIS AND TESTING - KEY LEFT IN IGNITION SWITCH

To test the key left in ignition function:

- The ignition switch must be in the OFF position with key in ignition.
- Driver's door open.
- Chime should sound until key is removed from ignition or drivers door is closed.

DIAGNOSIS AND TESTING - FASTEN SEAT BELTS

To test, the ignition switch must be in the OFF position before testing the fasten seat belts. Turn the ignition switch to the ON position with the driver's seat belt unbuckled. The seat belt warning lamp should light for 5 to 7 seconds and the chime should sound 5 to 7 seconds.

ELECTRONIC CONTROL MODULES

ELECTRONIC CONTROL MODULES

STANDARD PROCEDURE - PCM/SKIM PROGRAMMING

NOTE: Before replacing the PCM for a failed driver, control circuit or ground circuit, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal component failures (i.e. relay and solenoids) and shorted circuits (i.e. pull-ups, drivers and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has set.

When a PCM (SBEC) and the SKIM are replaced at the same time perform the following steps in order:

(1) Program the new PCM (SBEC)

(2) Program the new SKIM

(3) Replace all ignition keys and program them to the new SKIM.

PROGRAMMING THE PCM (SBEC)

The SKIS Secret Key is an ID code that is unique to each SKIM. This code is programmed and stored in the SKIM, PCM and transponder chip (ignition keys). When replacing the PCM it is necessary to program the secret key into the new PCM using the DRB III. Perform the following steps to program the secret key into the PCM.

(1) Turn the ignition switch on (transmission in park/neutral).

(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.

(3) Select PCM REPLACED (GAS ENGINE).

(4) Enter secured access mode by entering the vehicle four-digit PIN.

(5) Select ENTER to update PCM VIN.

ELECTRONIC CONTROL MODULES (Continued)

NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

(6) Press ENTER to transfer the secret key (the SKIM will send the secret key to the PCM).

(7) Press Page Back to get to the Select System menu and select ENGINE, MISCELLANEOUS, and SRI MEMORY CHECK.

(8) The DRB III will ask, Is odometer reading between XX and XX? Select the YES or NO button on the DRB III. If NO is selected, the DRB III will read, Enter odometer Reading<From I.P. odometer>. Enter the odometer reading from the Instrument Panel and press ENTER.

PROGRAMMING THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).

(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.

(3) Select PCM REPLACED (GAS ENGINE).

(4) Program the vehicle four-digit PIN into SKIM.

(5) Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKIM, the SKIM must be replaced.

(6) Select YES to update VIN (the SKIM will learn the VIN from the PCM).

(7) Press ENTER to transfer the secret key (the PCM will send the secret key to the SKIM).

(8) Program ignition keys to SKIM.

NOTE: If the PCM and the SKIM are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new SKIM.

PROGRAMMING IGNITION KEYS TO THE SKIM

(1) Turn the ignition switch on (transmission in park/neutral).

(2) Use the DRB III and select THEFT ALARM, SKIM then MISCELLANEOUS.

(3) Select PROGRAM IGNITION KEY'S.

(4) Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKIM. Once a key is learned to a SKIM it (the key) cannot be transferred to another vehicle.

If ignition key programming is unsuccessful, the DRB III will display one of the following messages:

Programming Not Attempted - The DRB III attempts to read the programmed key status and there are no keys programmed into SKIM memory.

Programming Key Failed (Possible Used Key From Wrong Vehicle) - SKIM is unable to program key due to one of the following:

- faulty ignition key transponder
- ignition key is programmed to another vehicle.

8 Keys Already Learned, Programming Not Done - SKIM transponder ID memory is full.

(5) Obtain ignition keys to be programmed from customer (8 keys maximum).

(6) Using the DRB III, erase all ignition keys by selecting MISCELLANEOUS and ERASE ALL CURRENT IGN. KEYS.

(7) Program all ignition keys.

Learned Key In Ignition - Ignition key transponder ID is currently programmed in SKIM memory.

BODY CONTROL MODULE

DESCRIPTION

The Body Control Module (BCM) is concealed below the driver side end of the instrument panel in the passenger compartment, where it is secured to the dash panel side of the Junction Block (JB).

The BCM utilizes integrated circuitry and information carried on the Programmable Communications Interface (PCI) data bus network along with many hard wired inputs to monitor many sensor and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the BCM allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the PCI data bus.

OPERATION

The Body Control Module (BCM) is designed to control and integrate many of the electronic features and functions of the vehicle. The microprocessor-based BCM hardware and software monitors many hard wired switch and sensor inputs as well as those resources it shares with other electronic modules in the vehicle through its communication over the PCI data bus network. The internal programming and all of these inputs allow the BCM microprocessor to determine the tasks it needs to perform and their priorities, as well as both

BODY CONTROL MODULE (Continued)

the standard and optional features that it should provide. The BCM programming then performs those tasks and provides those features through both PCI data bus communication with other electronic modules and through hard wired low current outputs to a number of relays. These relays provide the BCM with the ability to control numerous high current accessory systems in the vehicle.

The BCM monitors its own internal circuitry as well as many of its input and output circuits, and will store a Diagnostic Trouble Code (DTC) in electronic memory for any failure it detects. These DTCs can be retrieved and diagnosed using a DRBIII® scan tool. Refer to the appropriate diagnostic information.

REMOVAL

The Junction Block and Body Control Module (BCM) are attached to each other. After removal they can be separated.

(1) Disconnect and isolate the remote battery negative cable from the terminal on the shock tower.

(2) Open the front driver's door and remove end cap.

(3) Remove power mirror switch bezel, radio bezel, and small bezel on the right side of the steering column.

(4) Remove the left lower instrument panel trim.

(5) Remove silencer.

(6) Remove wire harness connectors from Junction Block.

(7) Remove Junction Block three mounting screws.

(8) Remove Junction Block/BCM by pulling straight down from the mounting bayonet.

(9) Disconnect BCM wire connectors and remove the assembly.

(10) Remove Junction Block/BCM from vehicle.

(11) With the Junction Block/BCM removed from the vehicle, separate the BCM from the Junction Block by removing the four screws.

(12) Disconnect BCM from the Junction Block.

(13) Unsnap the remote keyless entry module from the BCM.

NOTE: The Remote Keyless Entry (RKE) module is attached to the BCM. This must be transferred (if equipped) to the new BCM if being replaced.

NOTE: If BCM is replaced, the VTSS must be enabled in the new BCM via the DRB III® in order to start the vehicle.

INSTALLATION

(1) Snap the remote keyless entry module onto the BCM.

(2) Connect BCM to the Junction Block.

(3) Connect the BCM and junction block together with the four screws.

(4) Install the Junction Block/BCM into vehicle.

(5) Connect BCM wire connectors and install the assembly onto instrument panel.

(6) Install the Junction Block/BCM by pushing straight up.

(7) Install the Junction Block three mounting screws.

(8) Install the wire harness connectors to the Junction Block.

(9) Install the silencer.

(10) Install the left lower instrument panel trim.

(11) Install the power mirror switch bezel, radio bezel, and small bezel to the right of the steering column.

(12) Install the left end cover.

(13) Connect the remote battery negative cable to the remote terminal on the shock tower.

CONTROLLER ANTILOCK BRAKE

DESCRIPTION

The controller antilock brake (CAB) is a microprocessor-based device which monitors the antilock brake system (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The CAB is mounted to the HCU as part of the integrated control unit (ICU) (Fig. 1). The CAB uses a 24-way electrical connector on the vehicle wiring harness. The power source for the CAB is through the ignition switch in the RUN or ON position. The CAB is on the PCI bus.

OPERATION

The primary functions of the controller antilock brake (CAB) are to:

- Monitor the antilock brake system for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in an ABS mode.
- Store diagnostic information.
- Provide communication to the DRBIII® scan tool while in diagnostic mode.
- Illuminate the amber ABS warning indicator lamp.

The CAB constantly monitors the antilock brake system for proper operation. If the CAB detects a fault, it will turn on the amber ABS warning indicator lamp and disable the antilock braking system. The normal base braking system will remain operational.

CONTROLLER ANTILOCK BRAKE (Continued)

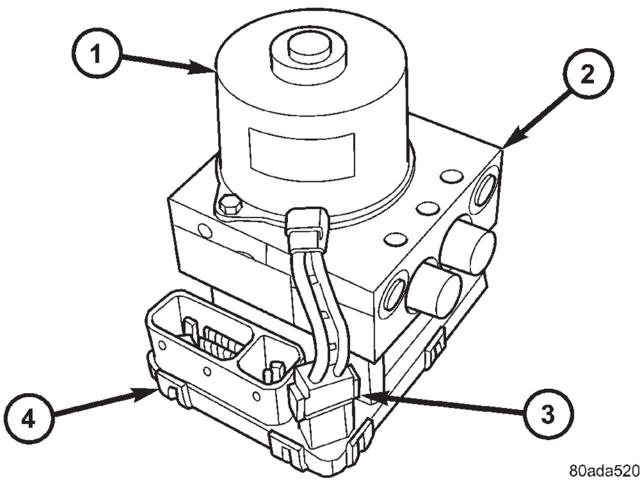

Fig. 1 INTEGRATED CONTROL UNIT (TYPICAL)

1 - PUMP/MOTOR
2 - HCU
3 - PUMP/MOTOR CONNECTOR
4 - CAB

The CAB continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the CAB commands the CAB command coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The CAB continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

The CAB contains a self-diagnostic program that monitors the antilock brake system for system faults. When a fault is detected, the amber ABS warning indicator lamp is turned on and the fault diagnostic trouble code (DTC) is then stored in a diagnostic program memory. These DTC's will remain in the CAB memory even after the ignition has been turned off. The DTC's can be read and cleared from the CAB memory by a technician using the DRBIII® scan tool. If not cleared with a DRBIII® scan tool, the fault occurrence and DTC will be automatically cleared from the CAB memory after the identical fault has not been seen during the next 3,500 miles.

CAB INPUTS

- Wheel speed sensors (four)
- Brake lamp switch
- Ignition switch
- System and pump voltage
- Ground
- Diagnostic communication (PCI)

CAB OUTPUTS

- Amber ABS warning indicator lamp actuation (via BUS)
- Instrument cluster (MIC) communication (PCI)
- Diagnostic communication (PCI, via BUS)

REMOVAL

(1) Disconnect the battery negative cable.

(2) Raise vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(3) Pull up on the CAB connector lock and disconnect the 24–way electrical connector and the pump/motor connector from the CAB.

(4) Remove the bolts securing the integrated control unit's (ICU's) mounting bracket to the lower radiator support.

(5) Carefully move the ICU toward the right side of the car. Move the ICU far enough to access the CAB mounting screws. **Be careful not to bend the brake tubes connected to the ICU.**

(6) Remove the screws securing the CAB to the HCU half of the ICU. Remove the CAB.

INSTALLATION

(1) Install screws to secure the CAB to the HCU half of the ICU. Tighten the mounting screws to 2 N·m (17 in. lbs.) torque.

(2) Remount the ICU mounting bracket to the lower radiator support. Tighten the mounting bolts to 28 N·m (21 ft. lbs.) torque.

(3) Reconnect the 24–way electrical and the pump/motor connector.

(4) Lower vehicle.

(5) Connect negative battery cable.

(6) Connect a DRBIII® to the vehicle and initialize the system.

POWERTRAIN CONTROL MODULE

DESCRIPTION

OPERATION

The Powertrain Control Module (PCM) is a digital computer containing a microprocessor (Fig. 2). The PCM receives input signals from various switches and sensors referred to as Powertrain Control Module Inputs. Based on these inputs, the PCM adjusts various engine and vehicle operations through devices referred to as Powertrain Control Module Outputs.

POWERTRAIN CONTROL MODULE (Continued)

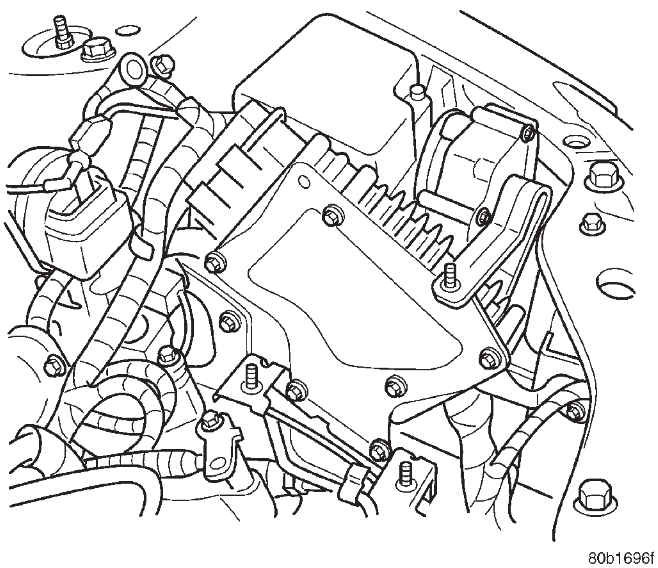

Fig. 2 Powertrain Control Module (PCM)

NOTE: PCM Inputs:

- Air Conditioning Pressure Transducer
- ASD Relay
- Battery Voltage
- Brake Switch
- Camshaft Position Sensor
- Crankshaft Position Sensor
- Distance Sensor (from transmission control module)
- EGR Position Feedback
- Engine Coolant Temperature Sensor
- Heated Oxygen Sensors
- Ignition sense
- Intake Air Temperature Sensor
- Knock Sensor
- Leak Detection Pump Feedback
- Manifold Absolute Pressure (MAP) Sensor
- Park/Neutral (from transmission control module)
- PCI Bus
- Power Steering Pressure Switch
- Proportional Purge Sense
- SCI Receive
- Speed Control
- Throttle Position Sensor
- Torque Management Input (From TCM)
- Transaxle Control Module (TCM)
- Transaxle Gear Engagement (From TCM)
- Vehicle Speed (from transmission control module)

NOTE: PCM Outputs:

- Air Conditioning Clutch Relay
- Automatic Shut Down (ASD) and Fuel Pump Relays
- Data Link Connector (PCI and SCI Transmit)
- Double Start Override
- EGR Solenoid
- Fuel Injectors
- Generator Field
- High Speed Fan Relay
- Idle Air Control Motor
- Ignition Coils
- Leak Detection Pump
- Low Speed Fan Relay
- MTV Actuator
- Proportional Purge Solenoid
- SRV Valve
- Speed Control Relay
- Speed Control Vent Relay
- Speed Control Vacuum Relay
- 8 Volt Output
- 5 Volt Output

Based on inputs it receives, the powertrain control module (PCM) adjusts fuel injector pulse width, idle speed, ignition timing, and canister purge operation and EGR if equipped. The PCM regulates the cooling fans, air conditioning and speed control systems. The PCM changes generator charge rate by adjusting the generator field.

The PCM adjusts injector pulse width (air-fuel ratio) based on the following inputs.

- Manifold Absolute Pressure
- Engine Speed (crankshaft position sensor)
- Battery Voltage
- Intake Air Temperature Sensor
- Engine Coolant Temperature
- Exhaust Gas Oxygen Content (heated oxygen sensors)
- Throttle Position

The PCM adjusts engine idle speed through the idle air control motor based on the following inputs.

- Brake Switch
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position
- Vehicle Speed (from Transmission Control Module)

The PCM adjusts ignition timing based on the following inputs.

- Intake Air Temperature
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Knock Sensor
- Manifold Absolute Pressure
- Park/Neutral (transmission gear selection)
- Transaxle Gear Engagement
- Throttle Position

The automatic shut down (ASD) and fuel pump relays are mounted externally, but turned on and off by the powertrain control module through the same circuit.

POWERTRAIN CONTROL MODULE (Continued)

The camshaft and crankshaft signals are sent to the powertrain control module. If the PCM does not receive both signals within approximately one second of engine cranking, it deactivates the ASD and fuel pump relays. When these relays are deactivated, power is shut off to the fuel injectors, ignition coils, fuel pump and the heating element in each oxygen sensor.

The PCM contains a voltage converter that changes battery voltage to a regulated 8.0 volts. The 8.0 volts power the camshaft position sensor, crankshaft position sensor and vehicle speed sensor. The PCM also provides a 5.0 volts supply for the engine coolant temperature sensor, intake air temperature sensor, manifold absolute pressure sensor and throttle position sensor EGR (if equipped).

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage in new PCM. Use the DRB scan tool to change the mileage in the PCM. Refer to the appropriate Powertrain Diagnostic Manual and the DRB scan tool. If equipped with SKIM, must use SKIM function to reprogram VIN number in new PCM.

DIAGNOSTIC TROUBLE CODE

DESCRIPTION

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

NOTE: For a list of DTC's, refer to the charts in this section.

(M) Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.

P0058	O2 sensor 2/2 Heater Circuit	Shorted condition detected in the oxygen sensor heater element control feedback sense circuit.
P0068	Manifold Pressure/Throttle Position Correlation	MAP sensor signal does not correlate to throttle position sensor signal. Possible vacuum leak.
P0070	Ambient Temp Sensor Stuck	A rationality error has been detected in the ambient temp. sensor test.
P0071 (M)	Ambient Temp Sensor Performance	Ambient change less than 3° C in 200 Miles
P0072	Ambient Temp Sensor Low	Ambient temp. sensor input below the minimum acceptable voltage
P0073	Ambient Temp Sensor High	Ambient temp. sensor input above the maximum acceptable voltage
P0106 (M)	Barometric Pressure Out of Range	MAP sensor input voltage out of an acceptable range detected during reading of barometric pressure at key-on.
P0107 (M)	Map Sensor Voltage Too Low	MAP sensor input below minimum acceptable voltage.
P0108 (M)	Map Sensor Voltage Too High	MAP sensor input above maximum acceptable voltage.
P0110	Intake Air Temp Sensor Stuck	A rationality error has been detected for the intake air temp. sensor.
P0111 (M)	Intake Air Temp Sensor Performance	Intake Air change less than 3° C in 200 Miles
P0112 (M)	Intake Air Temp Sensor Voltage Low	Intake air (charge) temperature sensor input below the minimum acceptable voltage.
P0113 (M)	Intake Air Temp Sensor Voltage High	Intake air (charge) temperature sensor input above the maximum acceptable voltage.
P0116	Engine Coolant Temp Performance	A rationality error has been detected in the coolant temp sensor.
P0117 (M)	ECT Sensor Voltage Too Low	Engine coolant temperature sensor input below the minimum acceptable voltage.
P0118 (M)	ECT Sensor Voltage Too High	Engine coolant temperature sensor input above the maximum acceptable voltage.
P0121 (M)	TPS Voltage Does Not Agree With MAP	TPS signal does not correlate to MAP sensor signal.
P0122 (M)	Throttle Position Sensor Voltage Low	Throttle position sensor input below the acceptable voltage range.
P0123 (M)	Throttle Position Sensor Voltage High	Throttle position sensor input above the maximum acceptable voltage.
P0125 (M)	Engine Coolant Temp Not Reached	Time to enter Closed Loop Operation (Fuel Control) is excessive.
P0128	Thermostat Rationality	A rationality error has been detected for the thermostat
P0129	Barometic Pressure Out-of-Range low	MAP sensor input voltage out of an acceptable range detected during reading of barometric pressure.

GENERIC SCAN TOOL CODE	DRB SCAN TOOL DISPLAY	DESCRIPTION OF DIAGNOSTIC TROUBLE CODE
P0130	1/1 O2 Sensor Heater Relay Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P0131 (M)	1/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0132 (M)	1/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0133 (M)	1/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0134 (M)	1/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor input.
P0135 (M)	1/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0136	1/2 O2 Sensor Heater Relay Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P0137 (M)	1/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0138 (M)	1/2 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0139 (M)	1/2 O2 Sensor Slow Response	Oxygen sensor response not as expected.
P0140 (M)	1/2 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0141 (M)	1/2 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0143	1/3 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0144	1/3 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage maintained above normal operating range.
P0145	1/3 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0146	1/3 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0147	1/3 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0151 (M)	2/1 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.
P0152 (M)	2/1 O2 Sensor Shorted To Voltage	Oxygen sensor input voltage sustained above normal operating range.
P0153 (M)	2/1 O2 Sensor Slow Response	Oxygen sensor response slower than minimum required switching frequency.
P0154 (M)	2/1 O2 Sensor Stays at Center	Neither rich or lean condition is detected from the oxygen sensor.
P0155 (M)	2/1 O2 Sensor Heater Failure	Oxygen sensor heater element malfunction.
P0157 (M)	2/2 O2 Sensor Shorted To Ground	Oxygen sensor input voltage maintained below normal operating range.

P0498	NVLD Canister Vent Valve Solenoid Circuit Low	A shorted low condition detected in NVLD solenoid circuit.
P0499	NVLD Canister Vent Valve Solenoid Circuit High	A shorted high condition detected in NVLD solenoid circuit.
P0500 (M)	No Vehicle Speed Sensor Signal	No vehicle speed sensor signal detected during road load conditions.
P0501	Vehicle Speed Sensor #1 Performance	A rationality error has been detected for no vehicle speed sensor signal detected during road load conditions.
P0505 (M)	Idle Air Control Motor Circuits	Replace idle air control motor.
P0508 (M)	Idle Air Control Motor Circuit Low	Idle Air Control Motor Circuit input below acceptable current
P0509 (M)	Idle Air Control Motor Circuit High	Idle Air Control Motor Circuit input above acceptable current
P0511	Idle Air Control Valve Solenoid Circuit	An open or shorted condition detected in the IAC control circuit.
P0513	Invalid SKIM Key	The engine controller has received an invalid key from the Smart Key Immobilizer Module.
P0516	Battery Temperature Sensor Low	Battery Temp. sensor input below minimum acceptable voltage.
P0517	Battery Temperature Sensor High	Battery Temp. sensor input above maximum acceptable voltage.
P0519	Idle Speed Performance	A rationality error has been detected for target RPM not met during drive idle condition. Possible Vacuum leak or IAC lost steps.
P0522	Oil Pressure Sens Low	Oil pressure sensor input below acceptable voltage.
P0523	Oil Pressure Sens High	Oil pressure sensor input above acceptable voltage.
P0532	A/C Pressure Sensor Low	A/C pressure sensor input below the minimum acceptable voltage.
P0533	A/C Pressure Sensor High	A/C pressure sensor input above the maximum acceptable voltage.
P0551 (M)	Power Steering Switch Failure	Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed.
P0562	Battery Voltage Low	Battery voltage sense input below the minimum acceptable voltage.
P0563	Battery Voltage High	Battery voltage sense input above the maximum acceptable voltage.
P0579	Speed Control Switch #1 Performance	Cruise switch stuck in a valid voltage range.
P0580	Speed Control Switch #1 Low	Speed control switch input below minimum acceptable voltage.

P0586	Speed Control Vent Solenoid Circuit	An open or shorted condition detected in speed control vent solenoid control circuit.
P0594	Speed Control Servo Power Circuit	An open or shorted condition open/short condition detected in the speed control servo power control circuit.
P0600 (M)	PCM Failure SPI Communications	No communication detected between co-processors in the control module.
P0601 (M)	Internal Controller Failure	Internal control module fault condition (check sum) detected.
P0604	Internal Trans Controller	Transmission control module RAM self test fault detected. -Aisin transmission.
P0605	Internal Trans Controller	Transmission control module ROM self test fault detected -Asian transmission.
P0615	Starter Relay Circuit	Open or shorted condition detected in the starter relay control circuit.
P0622 (G)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0627	Fuel Pump Relay Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P0630	VIN Not Programmed In PCM	VIN is not programmed in the control module EEPROM.
P0632	Odometer Not Programmed In PCM	Odometer is not programmed in the control module EEPROM.
P0633	SKIM Key Not Programmed In PCM	SKIM secert key is not programmed in the control module EEPROM.
P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay control circuit.
P0660	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P0685	ASD Relay Control Circuit	An open or shorted condition detected in the ASD relay control circuit.
P0688	ASD Relay Sense Circuit Low	ASD voltage sensed when ASD relay is energized or ASD voltage not sensed when ASD relay is not energized.
P0700 (M)	Check Transmission DTC's	This SBEC III or JTEC DTC indicates that the EATX has an active fault and has requested illuminated the MIL via a BUS message. The specific fault must be acquired from the EATX.
P0703 (M)	Brake Switch Stuck Pressed or Released	Incorrect input state detected in the brake switch circuit. (Changed from P1595).

P0711	Trans Temp Sensor, No Temp Rise After Start	Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality.
P0712	Trans Temp Sensor Voltage Too Low	Transmission fluid temperature sensor input below acceptable voltage.
P0713	Trans Temp Sensor Voltage Too High	Transmission fluid temperature sensor input above acceptable voltage.
P0720	Low Output SPD Sensor RPM, Above 15 MPH	The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits.
P0740 (M)	Torque Con Clu, No RPM Drop at Lockup	Relationship between engine and vehicle speeds indicated failure of torque convertor clutch lock-up system (TCC/PTU sol).
P0743	Torque Converter Clutch Solenoid/ Trans Relay Circuits	An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Asian transmission
P0748	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions.
P0751	O/D Switch Pressed (Lo) More Than 5 Minutes	Overdrive override switch input is in a prolonged depressed state.
P0753	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions.
P0756	AW4 Shift Sol B (2-3) Functional Failure	Shift solenoid B (2-3) functional fault - Asian transmission
P0783	3-4 Shift Sol, No RPM Drop at Lockup	The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear.
P0801	Reverse Gear Lockout Circuit Open or Short	An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit.
P0833	Clutch Upstop Switch Performance	Rationality error detected for clutch upstop switch performance
P0850	Park/Natural Switch Performance	A rationality error has been detected for park/neutral switch performance.
P1105	Baro Read Solenoid Circuit	Open or shorted condition detected in the baro read solenoid control circuit.
P1115	General Temperature Rationality	General temperature sensor rationality error.
P1192 (M)	Inlet Air Temp. Circuit Low	Inlet Air Temp. sensor input below acceptable voltage
P1193 (M)	Inlet Air Temp. Circuit High	Inlet Air Temp. sensor input above acceptable voltage.
P1194	PWM O2 Heater Performance	Incorrect or irrational performance has been detected for the PWM O2 heater circuit.

P1197	1/2 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (was P0139)
P1198	Radiator Temperature Sensor Volts Too High	Radiator coolant temperature sensor input above the maximum acceptable voltage.
P1199	Radiator Temperature Sensor Volts Too Low	Radiator coolant temperature sensor input below the minimum acceptable voltage.
P1281	Engine is Cold Too Long	Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat).
P1282	Fuel Pump Relay Control Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P1288	Intake Manifold Short Runner Solenoid Circuit	An open or shorted condition detected in the short runner tuning valve circuit.
P1289	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P1290	CNG Fuel System Pressure Too High	Compressed natural gas system pressure above normal operating range.
P1291	No Temp Rise Seen From Intake Heaters	Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount.
P1292	CNG Pressure Sensor Voltage Too High	Compressed natural gas pressure sensor reading above acceptable voltage.
P1293	CNG Pressure Sensor Voltage Too Low	Compressed natural gas pressure sensor reading below acceptable voltage.
P1294 (M)	Target Idle Not Reached	Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps.
P1295	No 5 Volts to TP Sensor	Loss of a 5 volt feed to the Throttle Position Sensor has been detected.
P1296	No 5 Volts to MAP Sensor	Loss of a 5 volt feed to the MAP Sensor has been detected.
P1297 (M)	No Change in MAP From Start To Run	No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading.
P1298	Lean Operation at Wide Open Throttle	A prolonged lean condition is detected during Wide Open Throttle.
P1299 (M)	Vacuum Leak Found (IAC Fully Seated)	MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P1389	No ASD Relay Output Voltage At PCM	No Z1 or Z2 voltage sensed when the auto shutdown relay is energized.
P1390 (M)	Timing Belt Skipped 1 Tooth or More	Relationship between Cam and Crank signals not correct.

OPERATION - SENSOR RETURN - PCM INPUT

The sensor return circuit provides a low electrical noise ground reference for all of the systems sensors. The sensor return circuit connects to internal ground circuits within the Powertrain Control Module (PCM).

OPERATION - SCI RECEIVE - PCM INPUT

SCI Receive is the serial data communication receive circuit for the DRB scan tool. The Powertrain Control Module (PCM) receives data from the DRB through the SCI Receive circuit.

OPERATION - IGNITION SENSE - PCM INPUT

The ignition sense input informs the Powertrain Control Module (PCM) that the ignition switch is in the crank or run position.

PCM REPLACEMENT

DESCRIPTION

USE THE DRB SCAN TOOL TO REPROGRAM THE NEW PCM WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

OPERATION - PCM GROUND

Ground is provided through multiple pins of the PCM connector. Depending on the vehicle there may be as many as three different ground pins. There are power grounds and sensor grounds.

The power grounds are used to control the ground side of any relay, solenoid, ignition coil or injector. The signal ground is used for any input that uses sensor return for ground, and the ground side of any internal processing component.

The SBEC III case is shielded to prevent RFI and EMI. The PCM case is grounded and must be firmly attached to a good, clean body ground.

Internally all grounds are connected together, however there is noise suppression on the sensor ground. For EMI and RFI protection the case is also grounded separately from the ground pins.

OPERATION

OPERATION - 8-VOLT SUPPLY - PCM OUTPUT

The PCM supplies 8 volts to the crankshaft position sensor, camshaft position sensor.

OPERATION - 5 VOLT SUPPLY - PCM OUTPUT

The PCM supplies 5 volts to the following sensors:

- A/C pressure transducer
- Engine coolant temperature sensor
- Manifold absolute pressure sensor
- Throttle position sensor
- Linear EGR solenoid
- Battery temperature
- Knock sensor

STANDARD PROCEDURE - OBTAINING DIAGNOSTIC TROUBLE CODES

BULB CHECK

Key on: Bulb illuminated until vehicle starts, as long as all once per trip (readiness) monitors completed. If monitors have **not** been completed, then: Key on: bulb check for about 8 seconds, lamp then flashes if once per trip (readiness) monitors have **not** been completed until vehicle is started, then MIL is extinguished.

OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

OBTAINING DTC'S USING IGNITION KEY

(1) Cycle the ignition key On - Off - On - Off - On within 5 seconds.

(2) The Odometer will show the P-code for the DTC code number. Refer to the Emission section for the DTC chart for a detailed explanation of the DTC codes.

(3) If no DTC's are present, the cluster will display one of two texts: "P1684" and "done" or only "done".

• P1684 is only a status and indicates that the PCM memory has been cleared within the last 50 ignition cycles and does not indicate a problem.

• done indicates that NO DTCs are present and the procedure is complete.

REMOVAL

USE THE DRBIII® SCAN TOOL TO REPROGRAM THE NEW PCM WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage and vehicle identification number (VIN) in the new PCM. Use the DRBIII® scan tool to change the milage and VIN in the PCM. If this step is not done a diagnostic trouble code (DTC) may be set and SKIM must be done or car will not start if it is a SKIM equipped car. If a SKIM car you must do a secret key transfer also. Refer to the appropriate Powertrain Diagnostic Manual and the DRBIII® scan tool.

To avoid possible voltage spike damage to PCM, ignition key must be off, and the negative battery cable must be disconnected before unplugging the PCM connectors. Note radio programs.

(1) Disconnect the negative battery cable.

(2) Remove the air cleaner box.

(3) Disconnect PCM 2 40-way connector (Fig. 3).

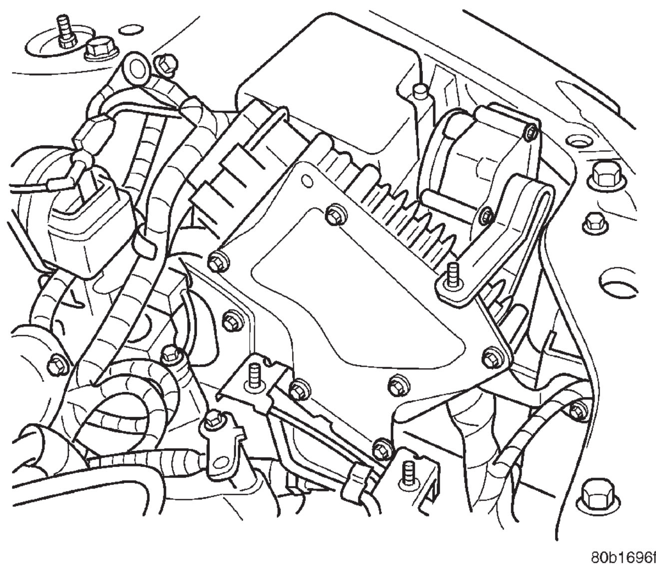

Fig. 3 PCM LOCATION

(4) Reposition wiring harness out of the way.

(5) Remove the 2 bolts and 1 nut and remove PCM and bracket (Fig. 4).

(7) Remove PCM.

INSTALLATION

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage and vehicle identification number (VIN) in the new PCM. Use the DRB® scan tool to change the millage and VIN in the PCM. If this step is not done a diagnostic trouble code (DTC) may be set and SKIM must be done or car will not start if it is a SKIM equipped car. If a SKIM car you must do a secret key transfer also. Refer to the appropriate Powertrain Diagnostic Manual and the DRB® scan tool.

(1) Install PCM to bracket (Fig. 5).

(2) Install PCM and bracket (Fig. 4). Tighten bolt to 4 N·m (35 in. lbs.) torque.

(3) Reposition wiring harness.

(4) Attach 2 40-way connector to PCM (Fig. 3).

(5) Connect negative battery cable and reprogram radio and clock.

(6) Using DRBIII® scan tool, program mileage and vehicle identification number (VIN) into PCM. Refer to the DRBIII® scan tool and the appropriate Powertrain Diagnostic Manual.

SENTRY KEY IMMOBILIZER MODULE

DESCRIPTION

The Sentry Key Immobilizer Module (SKIM) contains a Radio Frequency (RF) transceiver and a microprocessor. The SKIM retains in memory the ID numbers of any Sentry Key that is programmed to it. The maximum number of keys that may be programmed to each module is eight (8). The SKIM also communicates over the PCI bus with the Powertrain Control Module (PCM), the Body Control Module (BCM), and the DRB III® scan tool. The SKIM transmits and receives RF signals through a tuned antenna enclosed within a molded plastic ring formation that is integral to the SKIM housing. When the SKIM is properly installed on the steering column, the antenna ring fits snugly around the circumference of the ignition lock cylinder housing. If this ring is not mounted properly, communication problems may arise in the form of transponder-related faults.

For added system security, each SKIM is programmed with a unique ″Secret Key″ code. This code is stored in memory and is sent over the PCI bus to the PCM and to each key that is programmed to work with the vehicle. The ″Secret Key″ code is therefore a common element found in all components of the Sentry Key Immobilizer System (SKIS). In the event that a SKIM replacement is required, the ″Secret Key″ code can be restored from the PCM by following the SKIM replacement procedure found in the DRB III® scan tool. Proper completion of this task will allow the existing ignition keys to be reprogrammed. Therefore, new keys will NOT be needed. In the event that the original ″Secret Key″ code can not be recovered, new ignition keys will be required. The DRB III® scan tool will alert the technician if key replacement is necessary. Another security code, called a PIN, is used to gain secured access to the SKIM for service. The SKIM also stores in its memory the Vehicle Identification Number (VIN), which it learns through a bus message from the assembly plant tester. The SKIS scrambles the information that is communicated between its components in order to reduce the possibility of unauthorized SKIM access and/or disabling.

SENTRY KEY IMMOBILIZER MODULE (Continued)

OPERATION

When the ignition switch is moved to the RUN position, the SKIM transmits an RF signal to the transponder in the ignition key. The SKIM then waits for a response RF signal from the transponder in the key. If the response received identifies the key as valid, the SKIM sends a ″valid key″ message to the PCM over the PCI bus. If the response received identifies the key as invalid or no response is received from the transponder in the ignition key, the SKIM sends an ″invalid key″ message to the PCM. The PCM will enable or disable engine operation based upon the status of the SKIM messages. It is important to note that the default condition in the PCM is ″invalid key.″ Therefore, if no response is received by the PCM, the engine will be immobilized after two (2) seconds of running.

The SKIM also sends indicator light status messages to the BCM to operate the light. This is the method used to turn the light ON solid or to flash it after the indicator light test is complete to signify a fault in the SKIS. If the light comes ON and stays ON solid after the indicator light test, this signifies that the SKIM has detected a system malfunction and/or that the SKIS has become inoperative. If the SKIM detects an invalid key **OR** a key-related fault exists, the indicator light will flash following the indicator light test. The SKIM may also request an audible chime if the customer key programming feature is available and the procedure is being utilized. Refer to Electrical, Vehicle Theft Security, Transponder Key, Standard Procedure - Transponder Programming.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove knee bolster (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

(3) Remove the steering column upper and lower shrouds (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(4) Disengage the steering column wire harness from the Sentry Key Immobilizer Module (SKIM).

1 - IGNITION KEY CYLINDER
2 - STEERING COLUMN
3 - SENTRY KEY IMMOBILIZER MODULE (SKIM)
4 - SKIM CONNECTOR
5 - SKIM ANTENNA

(5) Remove the two screws securing the SKIM module to the top of the steering column.

(6) Rotate the SKIM and its mounting bracket upwards and then to the side away from the steering column to slide the SKIM antenna ring from around the ignition switch lock cylinder housing.

(7) Remove the SKIM from the vehicle.

INSTALLATION

(1) If the SKIM is replaced with a new unit, a DRB lll® scan tool MUST be used to initialize the new SKIM and to program at least two Sentry Key transponders. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE) Sentry Key Immobilizer Module Initialization.

(2) Carefully position the SKIM, the mounting bracket and the antenna ring onto the steering column.

(3) Install the two retaining screws (Fig. 6).

(4) Connect the wire harness connector.

(5) Install the steering column upper and lower shrouds (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(6) Install the knee bolster (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

(7) Connect the battery negative remote cable.

TRANSMISSION CONTROL MODULE

DESCRIPTION

The Transmission Control Module (TCM) is located between the Power Distribution Center (PDC) and the left headlamp assembly, in the left side of the engine compartment (Fig. 7).

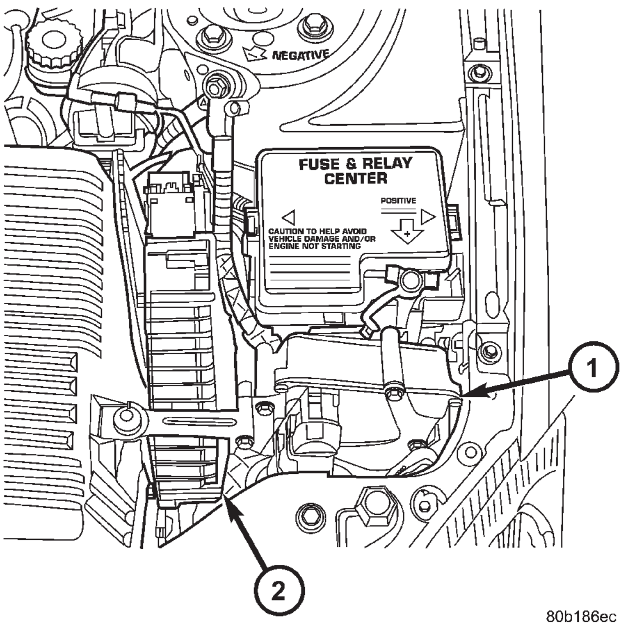

Fig. 7 Transmission Control Module Location

1 - TRANSMISSION CONTROL MODULE (TCM)
2 - POWERTRAIN CONTROL MODULE (PCM)

OPERATION

The TCM is the controlling unit for all electronic operations of the transaxle. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transaxle. Direct inputs are hardwired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the J1850 communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition “ON” voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor (CKP)
- Transmission Range Sensor (TRS)
- Pressure Switches (L/R, 2/4, OD)
- Transmission Temperature Sensor (Integral to TRS)
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Speed Control ON/OFF Switch
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Brake Switch Status
- DRB Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids (LR/CC, 2/4, OD and UD)
- Vehicle Speed (to PCM)
- Torque Reduction Request (to PCM)

An example of a TCM **indirect output** is:

- Transmission Temperature (to PCM)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indices (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with DRB scan tool)

CLUTCH VOLUME INDEX (CVI)

An important function of the TCM is to monitor Clutch Volume Index (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transaxle gear ratio. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur (Fig. 8).

TRANSMISSION CONTROL MODULE (Continued)

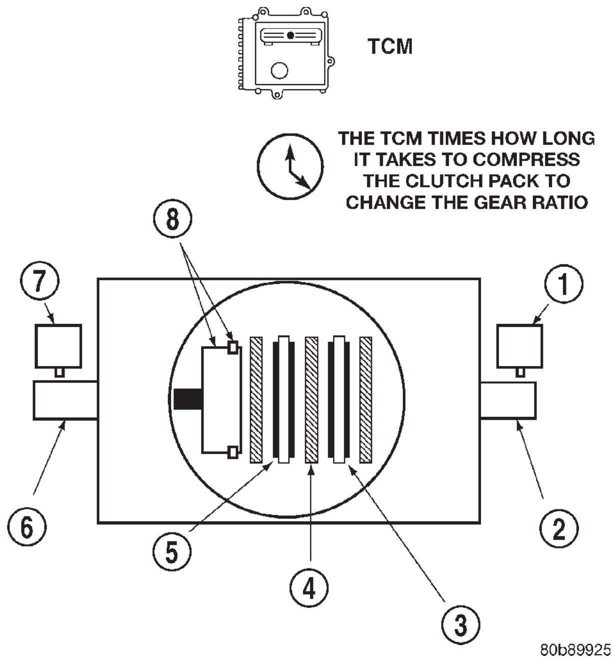

Fig. 8 Example of CVI Calculation

1 - OUTPUT SPEED SENSOR
2 - OUTPUT SHAFT
3 - CLUTCH PACK
4 - SEPARATOR PLATE
5 - FRICTION DISCS
6 - INPUT SHAFT
7 - INPUT SPEED SENSOR
8 - PISTON AND SEAL

Gear ratios can be determined by using the DRB Scan Tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the clutch assemblies (broken return springs, out of position snap rings, excessive clutch pack clearance, improper assembly, etc.) can cause inadequate or out-of-range clutch volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES				
Clutch	When Updated			Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 70°	< 5°	35 to 83
2/4	1-2 shift	> 110°	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

TRANSMISSION CONTROL MODULE (Continued)

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature at start-up below -16° F	Park, Reverse, Neutral and 2nd gear only (prevents shifting which may fail a clutch with frequent shifts)
Cold	Oil temperature at start-up above -12° F and below 36° F	– Delayed 2-3 upshift (approximately 22-31 mph) – Delayed 3-4 upshift (45-53 mph) – Early 4-3 costdown shift (approximately 30 mph) – Early 3-2 coastdown shift (approximately 17 mph) – High speed 4-2, 3-2, 2-1 kickdown shifts are prevented – No EMCC
Warm	Oil temperature at start-up above 36° F and below 80 degree F	– Normal operation (upshift, kickdowns, and coastdowns) – No EMCC
Hot	Oil temperature at start-up above 80° F	– Normal operation (upshift, kickdowns, and coastdowns) – Full EMCC, no PEMCC except to engage FEMCC (except at closed throttle at speeds above 70-83 mph)
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	– Delayed 2-3 upshift (25-32 mph) – Delayed 3-4 upshift (41-48 mph) – 3rd gear FEMCC from 30-48 mph – 3rd gear PEMCC from 27-31 mph
Super Overheat	Oil temperature above 260° F	– All ″Overheat″ shift schedule features apply – 2nd gear PEMCC above 22 mph – Above 22 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

STANDARD PROCEDURE

STANDARD PROCEDURE - PINION FACTOR SETTING

NOTE: This procedure must be performed if the Transmission Control Module (TCM) has been replaced with a NEW or replacement unit. Failure to perform this procedure will result in an inoperative or improperly calibrated speedometer.

The vehicle speed readings for the speedometer are taken from the output speed sensor. The TCM must be calibrated to the different combinations of equipment (final drive and tires) available. Pinion Factor allows the technician to set the Transmission Control Module initial setting so that the speedometer readings will be correct. To properly read and/or reset the Pinion Factor, it is necessary to use a DRBIII® scan tool.

(1) Plug the DRBIII® scan tool into the diagnostic connector located under the instrument panel.

(2) Select the Transmission menu.

(3) Select the Miscellaneous menu.

(4) Select Pinion Factor. Then follow the instructions on the DRBIII® scan tool screen.

STANDARD PROCEDURE - QUICK LEARN PROCEDURE

The quick learn procedure requires the use of the DRBIII® scan tool. This program allows the electronic transaxle system to recalibrate itself. This will provide the best possible transaxle operation.

NOTE: The quick learn procedure should be performed if any of the following procedures are performed:

- Transaxle Assembly Replacement
- Transmission Control Module Replacement
- Solenoid/Pressure Switch Assembly Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the DRBIII® indicates the procedure is complete
- The calculated oil temperature must be above 60° and below 200°

(1) Plug the DRBIII® scan tool into the diagnostic connector. The connector is located under the instrument panel.

(2) Go to the Transmission screen.

(3) Go to the Miscellaneous screen.

(4) Select Quick Learn Procedure. Follow the instructions of the DRBIII® to perform the Quick Learn Procedure.

REMOVAL

NOTE: If the transmission control module (TCM) is being replaced with a new or replacement unit, the Pinion Factor and Quick Learn procedures must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Disconnect battery negative cable at strut tower.

(2) Remove air cleaner assembly and transmission control module (TCM)-to-powertrain control module (PCM) bracket nut.

(3) Partially remove air cleaner assembly to clear PCM bracket stud.

(4) Remove TCM-to-PDC bracket screw (Fig. 9).

(5) Partially remove TCM/mounting bracket assembly and disconnect TCM 60-way connector.

(6) Remove TCM/mounting bracket assembly (Fig. 9).

INSTALLATION

NOTE: If transmission control module is being replaced with a new or replacement unit, the Pinion Factor and Quick Learn procedures must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE) (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

(1) Install TCM mounting bracket to TCM (Fig. 10) and torque screws to 11 N·m (72 in. lbs.).

(2) Install TCM 60-way connector and torque to 4 N·m (35 in. lbs.).

(3) Install TCM/bracket into position (Fig. 9).

(4) Install and torque TCM bracket-to-PDC bracket mounting screw to 5 N·m (40 in. lbs.).

(5) Install air cleaner assembly into position.

(6) Install and torque air cleaner-to-PCM stud nut to 5 N·m (40 in. lbs.).

(7) Connect battery negative cable.

TABLE OF CONTENTS

BATTERY SYSTEM

DESCRIPTION

A single 12-volt battery system is standard factory-installed equipment on this model. All of the components of the battery system are located in the front of the vehicle, just ahead of the left front wheel and tire assembly. The service information for the battery system in this vehicle covers the following related components, which are covered in further detail later in this section:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the batteries positive and negative terminals to the vehicle electrical system.
- **Battery Hold-down** - The battery hold-down hardware secures the battery in the battery tray.

BATTERY SYSTEM (Continued)

- **Battery Heater Blanket** - The battery heater blanket is used to improve battery cold start ability.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and in some applications, an anchor point for the battery hold-down hardware.

For battery system maintenance schedules and jump starting procedures, refer to the owner's manual in the vehicle glove box. Optionally, refer to the Lubrication and Maintenance section of the service manual for the proper battery jump starting procedures. While battery charging can be considered a maintenance procedure, the battery charging procedures and related information are located in the standard procedures section of this service manual. Refer to Standard Procedures for the proper battery charging procedures.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a single complete system. In order for the engine to start and the battery to charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to Charging System for the proper charging system on-board diagnostic test procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro420 automotive battery and charging system tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro420 electrical system tester.

ABNORMAL BATTERY DISCHARGING

Any of the following conditions can result in abnormal battery discharging:

- Corroded or loose battery posts and terminal clamps.
- A loose or worn generator drive belt.
- Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
- Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw systems in use.
- A faulty circuit or component causing excessive ignition-off draw.
- A faulty or incorrect charging system component. Refer to Charging System for the proper charging system diagnosis and testing procedures.

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Clean the battery cable terminals of all corrosion. Remove any corrosion using a wire brush or cleaning tool, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

(2) Clean the battery tray and battery holddown hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution. Paint any exposed bare metal.

(3) If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film (Fig. 1). Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to Battery System Specifications for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

(4) If equipped, clean the battery heater blanket with a sodium bicarbonate (baking soda) and warm water cleaning solution using a stiff bristle parts cleaning brush to remove any acid film.

(5) Clean any corrosion from the battery terminals with a wire brush or terminal cleaner, and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules found in this service manual and the owner's manual, it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

(1) Inspect the battery cable terminals for damage. Replace any battery cable that has a damaged or deformed terminal.

(2) Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.

(3) If equipped, slide the battery heater blanket off of the battery case. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminals for looseness. Batteries with damaged cases or loose terminals must be replaced.

(4) If equipped, inspect the battery heater blanket for tears, cracks, deformation or other damage. Replace any battery heater blanket that has been damaged.

(5) If equipped, inspect the battery built-in test indicator sight glass for an indication of the battery condition. If the battery is discharged, charge as required. Refer to Standard Procedures for the proper battery built-in indicator test procedures. Also refer to Standard Procedures for the proper battery charging procedures.

SPECIFICATIONS - BATTERY SYSTEM

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

• **Group Size** - The outside dimensions and terminal placement of the battery conform to standards

BATTERY SYSTEM (Continued)

established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.

- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

BATTERY

DESCRIPTION

Maintenance-free batteries have non-removable battery vent caps (Fig. 2). Water cannot be added to this battery. Under normal service the composition of this battery reduces gassing and water loss at normal charge rates. If the battery electrolyte level becomes low, this battery must be replaced.

The battery is a device used to store electrical energy potential in a chemical form. When an electrical load is applied to the battery terminals, an electrochemical reaction occurs within the battery. This reaction causes the battery to discharge electrical current.

The battery is made up of six individual cells that are connected in series. Each cell contains positive charged plate groups made of lead oxide, and negatively charged plate groups made of sponge lead. The dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

BATTERY (Continued)

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery is equipped with removable cell caps, add distilled water whenever the electrolyte level is below the top of the plates. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro420 automotive battery tester is designed to help the dealership technicians diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a vehicle. If the instruction manual is not available refer to the standard procedure in this section, which includes the directions for using the Micro420 electrical system tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

DIAGNOSIS AND TESTING - BATTERY

The battery must be completely charged and the top, posts and terminal clamps should be properly cleaned and inspected before diagnostic procedures are performed. Refer to Battery System Cleaning for the proper cleaning procedures, and Battery System Inspection for the proper battery inspection procedures. Refer to Standard Procedures for the proper battery charging procedures.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS ARE IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

The condition of a battery is determined by two criteria:

- **State-Of-Charge** - This can be determined by checking the specific gravity of the battery electrolyte (built-in indicator test or hydrometer test), or by checking the battery voltage (open-circuit voltage test).
- **Cranking Capacity** - This can be determined by performing a battery load test, which measures the ability of the battery to supply high-amperage current.

First, determine the battery state-of-charge. This can be done in one of three ways. If the battery has a built-in test indicator, perform the built-in indicator test to determine the state-of-charge. If the battery has no built-in test indicator but does have removable cell caps, perform the hydrometer test to determine the state-of-charge. If the battery cell caps are not removable, or a hydrometer is not available, perform the open-circuit voltage test to determine the state-of-charge. Refer to open-circuit voltage test in the Standard Procedures section of this group.

Second, determine the battery cranking capacity by performing a load test. The battery must be charged before proceeding with a load test if:

- The battery built-in test indicator has a black or dark color visible.
- The temperature corrected specific gravity of the battery electrolyte is less than 1.235.
- The battery open-circuit voltage is less than 12.4 volts.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

A battery is fully-charged when:

- All battery cells are gassing freely during charging.
- A green color is visible in the sight glass of the battery built-in test indicator.
- Three corrected specific gravity tests, taken at one-hour intervals, indicate no increase in the specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.4 volts or greater.

STANDARD PROCEDURE

STANDARD PROCEDURE - USING MICRO 420 ELECTRICAL TESTER

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.

BATTERY TESTING

(1) If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal

BATTERY (Continued)

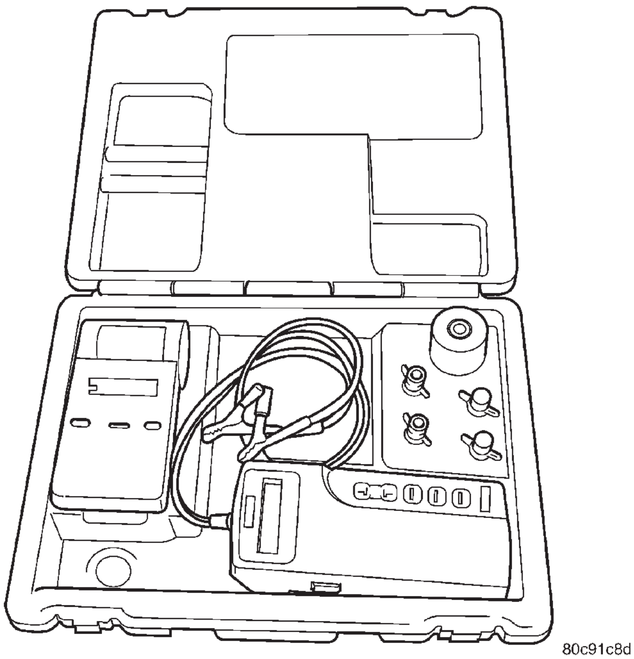

Fig. 3 MICRO 420 BATTERY TESTER

stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.

(2) If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminal**. If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.

(3) Connect the tester (Fig. 3) to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (–).

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

(4) Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.

(5) If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

(6) While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

STANDARD PROCEDURE - BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 tester shows Good Battery.
- Three hydrometer tests, taken at one-hour intervals, indicate no increase in the temperature-corrected specific gravity of the battery electrolyte.
- Open-circuit voltage of the battery is 12.4 volts or above.

WARNING: NEVER EXCEED TWENTY AMPERES WHEN CHARGING A COLD (-1° C [30° F] OR LOWER) BATTERY. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

BATTERY (Continued)

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.4 volts or greater, perform a test using the Micro 420 tester to determine the battery cranking capacity.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. Refer to Battery System Cleaning for the proper battery system cleaning procedures, and Battery System Inspection for the proper battery system inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

(1) Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt (Fig. 4). If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

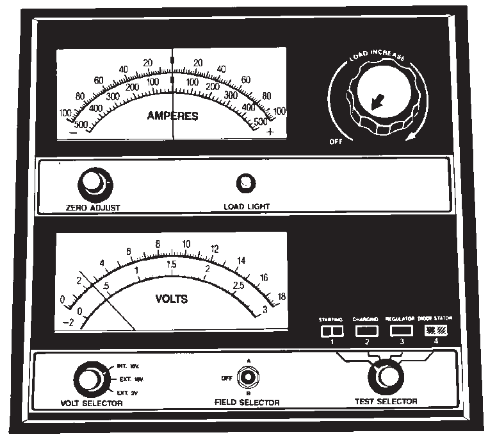

Fig. 4 Voltmeter

(2) Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

(3) Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

BATTERY (Continued)

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

• **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.

• **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

• **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.

• **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

STANDARD PROCEDURE - OPEN-CIRCUIT VOLTAGE TEST

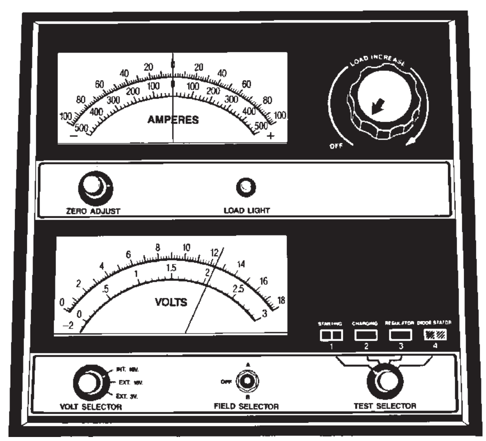
A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery. Refer to Standard Procedures for the proper battery charging procedures.

(1) Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

(2) Disconnect and isolate both battery cables, negative cable first.

(3) Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage (Fig. 5).



898A-7

Fig. 5 Testing Open-Circuit Voltage

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity. Refer to Standard Procedures for the proper battery load test procedures.

BATTERY (Continued)

STANDARD PROCEDURE - IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Power Distribution Center (PDC). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

(1) Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
EATX	Yes, 20 min, Ignition Key	60 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	Yes, 1 min, Ignition Key	Up To 4.0 amps	N/A
Body Control Module	Yes, 1 min, Ignition Key	Up To 3.0 amps	N/A

(2) If equipped, determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

(3) Disconnect the battery negative cable.

(4) Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

(5) After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-re-

BATTERY (Continued)

place process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

(6) Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

REMOVAL

The battery is accessible without removing the left front wheel and tire assembly..

(1) Verify that the ignition switch and all accessories are OFF.

(2) Turn the steering wheel to the full left position.

(3) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: NEVER GET UNDER A LIFTED VEHICLE IF NOT SUPPORTED PROPERLY ON SAFETY STANDS.

(4) Remove battery splash shield. Refer to the Body section of the service manual for the procedure.

(5) Disconnect the heater blanket cord, if equipped.

(6) Remove the short bolt from the battery hold down and remove the hold down (Fig. 6).

(7) Disconnect the negative and positive battery cables from the battery.

(8) Slide the battery toward rear of vehicle and lift out of the battery tray.

(9) Remove battery from vehicle.

INSTALLATION

(1) Position the battery in the battery tray.

(2) Connect the positive and negative battery cables. Torque to 16 N·m (150 in. lbs.).

(3) Connect the heater blanket cord, if equipped.

(4) Install the battery hold down and install the hold down bolt. Torque to 16 N·m (150 in. lbs.).

(5) Install battery splash shield. Refer to the Body section for the procedure.

(6) Connect the negative battery cable.

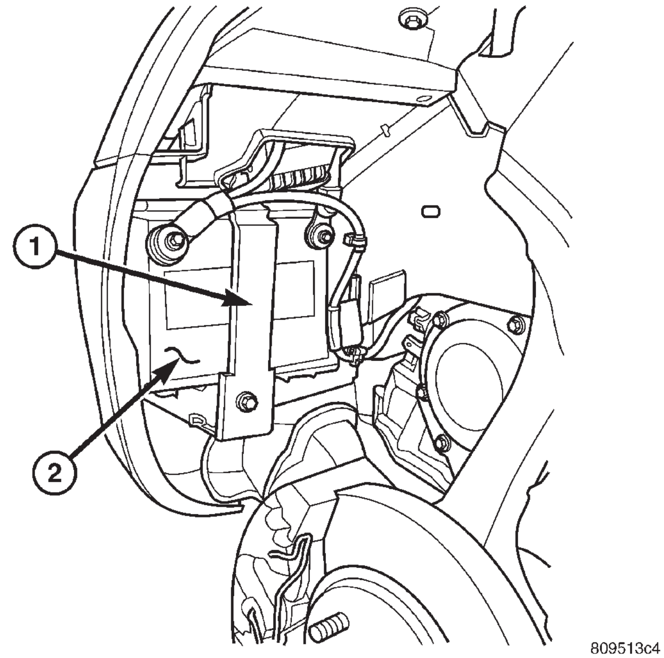

Fig. 6 BATTERY LOCATION

BATTERY HOLDDOWN

DESCRIPTION

The battery hold down includes three bolts and two hold down brackets (Fig. 7). The battery hold down brackets are formed steel brackets with holes on both ends.

When installing a battery into the battery tray, it is important that the hold down hardware is properly installed and that the fasteners are tightened to the proper specifications. Improper hold down fastener tightness, whether too loose or too tight, can result in damage to the battery, the vehicle, or both.

OPERATION

The battery hold down secures the battery in the battery tray. This hold down is designed to prevent battery movement during the most extreme vehicle operation conditions. Periodic removal and lubrication of the battery hold down hardware is recommended to prevent hardware seizure at a later date.

REMOVAL

(1) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.

(2) Raise and support the vehicle.

(3) Remove the left front wheel and tire assembly from the vehicle.

(4) Remove battery splash shield. Refer to the Body section for the procedure.

(5) Remove the short bolt from the battery hold down and remove the hold down.

INSTALLATION

(1) Install the battery hold down and install the hold down bolt. Torque to 14 N·m (150 in. lbs.).

(2) Install battery splash shield. Refer to the Body section for the procedure.

(3) Connect the negative battery cable.

BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a clamping type female battery terminal made of soft lead that is die cast onto one end of the battery cable wire. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to the appropriate wiring information in this service manual for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection

BATTERY CABLES (Continued)

of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

The battery positive cable terminal clamp is die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the Power Distribution Center (PDC), and the other wire has an eyelet terminal that connects the battery positive cable to the B(+) terminal stud of the engine starter motor solenoid. The battery negative cable terminal clamp is also die cast onto the ends of two wires. One wire has an eyelet terminal that connects the battery negative cable to the vehicle powertrain through a stud on the right side of the engine cylinder block. The other wire has an eyelet terminal that connects the battery negative cable to the vehicle body through a ground screw on the right front fender inner shield, near the battery.

DIAGNOSIS AND TESTING - BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and load tested. Refer to Standard Procedures for the proper battery charging and load test procedures.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Power Distribution Center (PDC), in the engine compartment. See the fuse and relay layout label affixed to the underside of the PDC cover for ASD relay identification and location.

(1) Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp (Fig. 8). Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

REMOVAL

(1) Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.

(2) Disconnect and isolate the remote battery negative cable terminal.

(3) One at a time, trace and disconnect the battery cable retaining pushpins, fasteners and routing clips until the cables are free from the vehicle.

(4) Feed the battery cable assembly out of the vehicle.

INSTALLATION

(1) Position the battery cable in the vehicle.

(2) One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cable is installed exactly in the factory installed location in the vehicle. Refer to the Wiring Diagram section of the service manual for reference.

(3) Connect the battery negative cable terminal.

BATTERY TRAY

DESCRIPTION

The battery is placed in a steel tray located in the left front corner of the vehicle (Fig. 12). A hole in the bottom of the battery tray is fitted with a battery temperature sensor. Refer to Charging System for more information on the battery temperature sensor. Refer to Battery Hold down for more information on hold down hardware.

BATTERY TRAY (Continued)

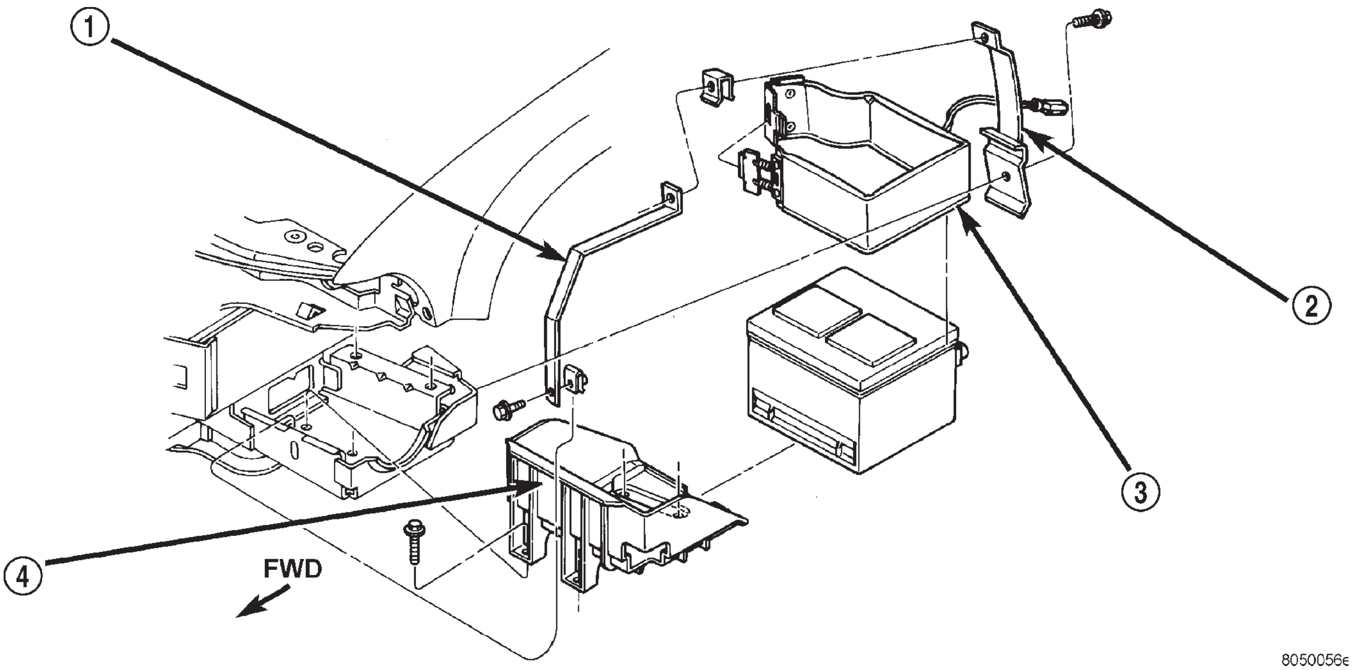

Fig. 12 BATTERY TRAY/HOLDDOWN HARDWARE

1 - BATTERY HOLDOWN STRAP
2 - BATTERY HOLDOWN STRAP
3 - BATTERY HEATER BLANKET
4 - BATTERY TRAY

OPERATION

The battery tray provides a secure mounting location and supports the battery. On some vehicles, the battery tray also provides the anchor point/s for the battery holddown hardware. The battery tray and the battery holddown hardware combine to secure and stabilize the battery in the engine compartment, which prevents battery movement during vehicle operation. Unrestrained battery movement during vehicle operation could result in damage to the vehicle, the battery, or both.

REMOVAL

(1) Disconnect and isolate the remote negative battery cable.

(2) Remove the battery from the vehicle (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

(3) Remove the left headlamp assembly from the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(4) Remove the battery tray retaining bolts (Fig. 13) and remove the battery tray from the vehicle.

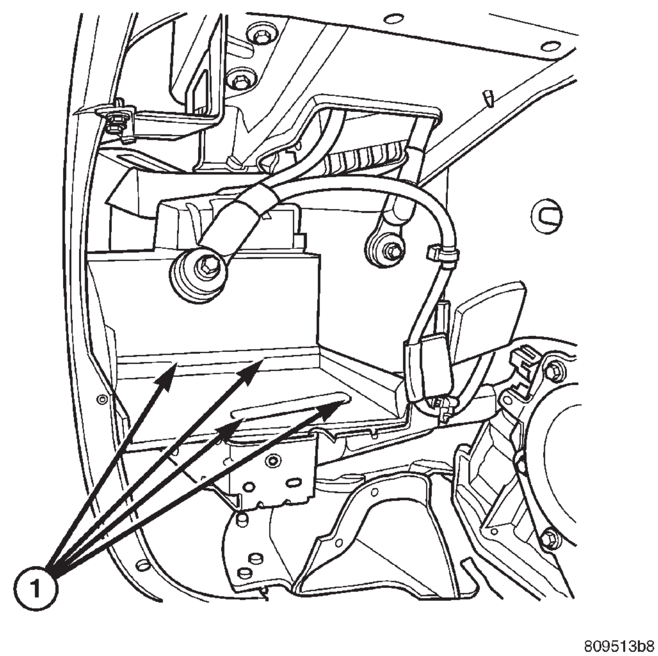

Fig. 13 JR BATTERY TRAY

INSTALLATION

(1) Install the battery tray and retaining bolts. Torque the bolts to 14 N·m (160 in. lbs.).

(2) Install the battery in the vehicle (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

(3) Install the left headlamp assembly in the vehicle (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

(4) Connect the remote negative battery cable.

BATTERY HEATER BLANKET

DESCRIPTION

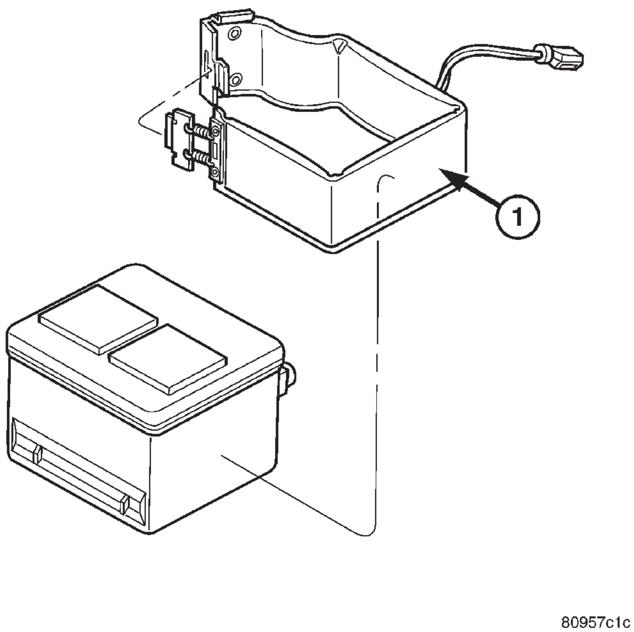

Fig. 14 BATTERY HEATER BLANKET

1 - BATTERY HEATER BLANKET

A heater blanket (Fig. 14) is used to improve the battery cold-start ability. This blanket operates on 110 volt AC current and is used with Alaska and Canada cold weather packages.

The heater blanket cannot be adjusted or repaired. If the blanket is faulty or damaged it must be replaced.

OPERATION

The temperature of the battery can affect battery performance. Only DAIMLERCHRYSLER approved battery blanket/block heater combination should be used. The battery blanket heater is designed to provide optimum charging system performance in very cold ambient temperatures below -17.8°C (0°F).

DIAGNOSIS AND TESTING - BATTERY HEATER BLANKET

(1) Remove the battery heater blanket from the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/THERMAL GUARD - REMOVAL).

(2) Clean the battery heater blanket with baking soda solution and wipe dry.

(3) Inspect blanket for cuts, abrasion or other damage. If heater is damaged replace.

(4) Position the heater flat and re-connect the blanket heater to the vehicles electrical system.

(5) Connect the 110 volt AC power cord to 110 volt source for a maximum of 3 minutes.

(6) Disconnect the 110 volt power cord.

(7) Immediately feel the heater blanket on the inside, it should be warm to the touch. If warm the heater is OK, if not OK proceed.

(8) Disconnect the heater blanket from the vehicles electrical system. Using an Ohmmeter, connect the leads across the two wire terminals coming from the heater blanket. A resistance value of 220 to 280 ohms should be present. If not replace the blanket. If OK proceed.

(9) Ensure that the 110 volt AC power cord is suppling voltage to the heater blanket. If OK replace the heater blanket. If not verify the 110 volt AC power from another source. Inspect the power cord for damage and replace if necessary.

REMOVAL

(1) Remove the battery and the battery heater blanket from the battery tray as a unit (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).

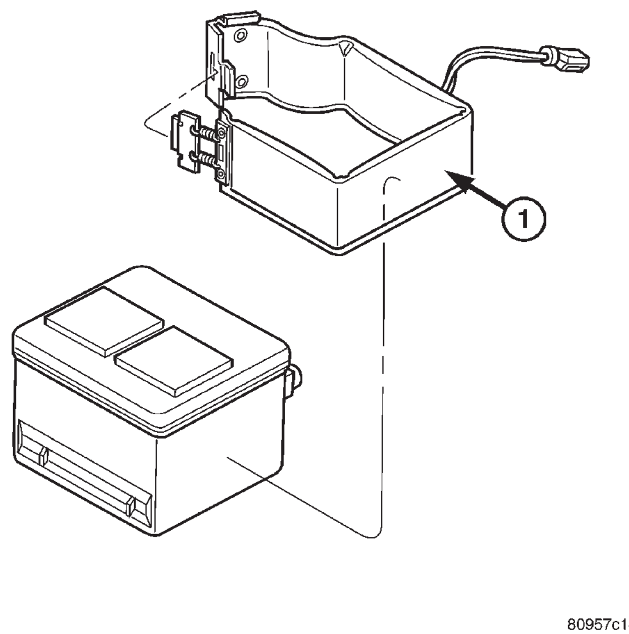

Fig. 15 BATTERY HEATER BLANKET

1 - BATTERY HEATER BLANKET

(2) Carefully slide the heater blanket straight off the battery case (Fig. 15).

INSTALLATION

(1) Clean and inspect the battery heater blanket.

(2) Install the battery heater blanket on the battery case.

(3) Install the battery and the battery heater blanket into the battery tray as a unit (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

CHARGING

TABLE OF CONTENTS

CHARGING

DESCRIPTION - CHARGING SYSTEM

The charging system consists of:

- Generator
- Decoupler Pulley (If equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the Ignition System section for information)
- Battery (refer to the Battery section for information)
- Battery temperature sensor (calculated battery temperature if equipped)
- Voltmeter (refer to the Instrument Cluster section for information if equipped)
- Wiring harness and connections (refer to the Wiring section for information)
- Accessory drive belt (refer to the Cooling section for more information)

OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. The ASD relay is energized when the PCM grounds the ASD control circuit. This voltage is connected through the PCM or IPM (intelligent power module)(if equipped) and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

An Inlet air temperature sensor is used to calculate the temperature near the battery. This temperature data, along with data from monitored line voltage (battery voltage sense circuit), is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly to maintain system voltage at the targeted system voltage based on battery temperature.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects and illuminate the lamp. Refer to On-Board Diagnostics in the Electronic Control Modules(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - DESCRIPTION) section for more DTC information.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The signal to activate the lamp is sent via the PCI bus circuits. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 50 engine starts if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the DRBIII® scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The DRBIII® Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/ BATTERY - STANDARD PROCEDURE)

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRBIII® scan tool. Perform the following inspections before attaching the scan tool.

(1) Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.

(2) Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.

(3) Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.

(4) Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/ CHARGING - SPECIFICATIONS).

(5) Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications(Refer to 7 - COOLING/ ACCESSORY DRIVE - SPECIFICATIONS).

(6) Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.

(7) Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.

(8) Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

BATTERY TEMPERATURE SENSOR

OPERATION

The PCM uses the temperature of the battery area to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as temperature around the battery increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

The battery temperature sensor is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled depending upon the battery temperature sensor input (example: disable purge and EGR, enable LDP). Most OBD II monitors are disabled below 20°F.

REMOVAL

The battery temperature sensor is not serviced separately. If replacement is necessary, the PCM must be replaced.

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced. The generator produces DC voltage.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Noise emitting from the generator may be caused by:

- Worn, loose or defective bearings
- Loose or defective drive pulley
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

VOLTAGE REGULATOR

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and calculated battery temperature or inlet air temperature sensor (refer to Battery Temperature Sensor or Inlet Air Temperature Sensor, if equipped, for more information). It then determines a target charging voltage. If sensed battery voltage is lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is at the target voltage. A circuit in the PCM cycles the ground side of the generator field at 250 times per second (250Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

STARTING

TABLE OF CONTENTS

STARTING

DESCRIPTION

The starting system has (Fig. 1):

- Ignition switch
- Starter relay
- Transmission Range Sensor or Park/Neutral Switch
- Wiring harness
- Battery
- Starter motor with an integral solenoid
- Powertrain Control Module (PCM)

OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections
- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- To disable ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for the proper relay location.

STARTER SOLENOID

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED.

(1) Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.

(2) Perform Starter Solenoid test BEFORE performing the starter relay test.

(3) Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.

(4) Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.

(5) Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.

(a) If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.

(b) If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to

STARTER RELAY

WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK/NEUTRAL POSITION WITH THE PARKING BRAKE APPLIED.

RELAY TEST

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

Remove the starter relay from the PDC as described in this group to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ±5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery B+ lead to terminals 86 and a ground lead to terminal 85 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.

(4) The coil battery terminal (86) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the Ignition Switch Test procedure in this group.

(5) The coil ground terminal (85) is connected to the electromagnet in the relay. It is grounded through the transmission range sensor only when the gearshift selector lever is in the Park or Neutral positions. Check for continuity to ground at the cavity for relay terminal 85. If not OK with an automatic transmission, check for an open or short circuit to the transmission range sensor and repair. It is grounded by the PCM if the conditions are right to start the car. For automatic trans. cars the PCM must see Park Neutral switch and near zero engine rpm. For manual trans. cars the PCM only needs to see near zero engine rpm. To diagnose the Park Neutral switch of the trans range sensor refer to the transaxle section for more information. Check for continuity to ground while the ignition switch is in the start position. If not OK and the vehicle has an automatic trans. verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 85. Repair open circuit as required. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the Transaxle section for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to Diagnosis and Testing in the Clutch section.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the Ignition Section or Wiring Diagrams for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to the Battery section for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to Wiring Diagrams for more information.

DIAGNOSIS AND TESTING - STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

STARTING (Continued)

• **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the Battery section for more information.

• **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.

• **Transmission Range Sensor** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.

• **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.

• **Starter** - Visually inspect the starter for indications of physical damage and loose or corroded wire harness connections.

• **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.

• **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.

• **Power Distribution Center (PDC)** - Visually inspect the B+ connections at the PDC for physical damage and loose or corroded harness connections.

DIAGNOSIS AND TESTING - FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

(1) To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(2) Gain access to battery terminals.

(3) With all wiring harnesses and components properly connected, perform the following:

(a) Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.

STARTING (Continued)

(b) Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.

(c) Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.

(4) Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.

(a) Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.

(b) If resistance tests do not detect feed circuit failures, replace the starter motor.

DIAGNOSIS AND TESTING - FEED CIRCUIT TEST

NOTE: The following results are based upon the vehicle being at room temperature.

The following procedure will require a suitable volt-ampere tester (Fig. 3).

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

(1) Check battery before performing this test. Battery must be fully charged.

(2) Connect a volt-ampere tester to the battery terminals. Refer to the operating instructions provided with the tester being used.

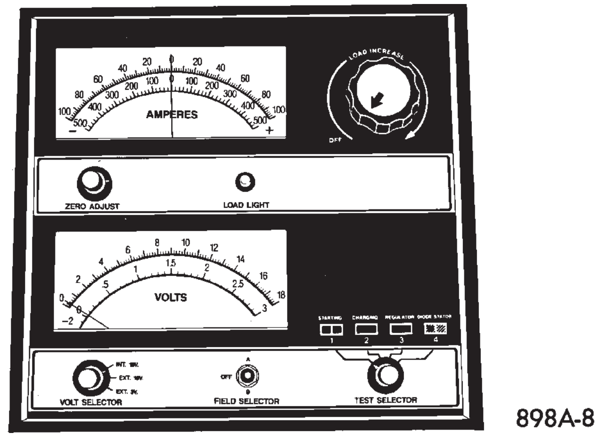

Fig. 3 Volt Ampere Tester

(3) To disable the ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.

(4) Verify that all lights and accessories are OFF, and the transmission shift selector is in the PARK and SET parking brake.

CAUTION: Do not overheat the starter motor or draw the battery voltage below 9.6 volts during cranking operations.

(5) Rotate and hold the ignition switch in the START position. Observe the volt-ampere tester (Fig. 3).

- If voltage reads above 9.6 volts, and amperage draw reads above 280 amps, check for engine seizing or faulty starter.
- If voltage reads 12.4 volts or greater and amperage reads 0 to 10 amps, check for corroded cables and/or bad connections.
- Voltage below 9.6 volts and amperage draw above 300 amps, the problem is the starter. Replace the starter refer to starter removal.

(6) After the starting system problems have been corrected, verify the battery state-of-charge and charge battery if necessary. Disconnect all testing equipment and connect ASD relay. Start the vehicle several times to assure the problem has been corrected.

STARTER MOTOR RELAY

DESCRIPTION

The Starter Relay is a micro relay located in the Power Distribution Center (PDC), positioned in the left front corner of the engine compartment.

OPERATION

As battery power is applied to the relay from the ignition switch, battery power is applied to the starter motor through the relay to the starter solenoid.

REMOVAL

The relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for relay location.

STARTER SOLENOID

OPERATION

The Starter Solenoid is a switching device used to activate the high amperage starter motor circuit from a low amperage control circuit.

HEATED GLASS SYSTEM

TABLE OF CONTENTS

HEATED GLASS SYSTEM

DESCRIPTION

The rear window defogger system is used to defog and deice the rear window in cases of freeze up and humid conditions. The rear window defogger switch is located to the right of the mode select knob on the HVAC control module on this model.

The Rear Window Defogger electrical system involves the operation of the Manual Temperature Control (MTC) head, the Body Control Module (BCM), and the rear window defogger relay and wiring. The system consists of a rear glass with two vertical bus bars and a series of electrically connected grid lines fired on the inside surface. The Body Control Module (BCM) operates a relay located in the right side trunk area on all models.

OPERATION

The system consists of a rear glass with two vertical bus bars and a series of electrically connected grid lines on the inside surface. The control switch is located in the HVAC Control Module. The relay is located in the junction block. The timer is located in the Body Control Module (BCM).

Circuit protection for heated grid is provided by:

- A 40 amp EBL fuse located in the power distribution center
- Rear window defogger relay (EBL) located in the Junction Block

When the button is depress to the ON position, current is directed to the rear defogger grid lines. A yellow indicator above the button will illuminate while the defogger is ON. The heated grid lines will heat the rear glass and clear the window surface of fog or frost.

CAUTION: Grid lines can be damaged or scraped off with sharp instruments, care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

HEATED GLASS SYSTEM (Continued)

DIAGNOSIS AND TESTING - HEATED GLASS SYSTEM

Electrically heated rear window defogger operation can be checked in vehicle in the following manner:

(1) Turn ignition switch to the ON position.

(2) Make sure defogger switch is OFF.

(3) Remove the battery negative remote cable from the terminal. Using a ammeter (capable of a 30 AMP range), connect the ammeter is series between the battery cable and the remote terminal. Turn the Defogger control switch ON, a distinct increase in amperage draw should be noted.

(4) The rear window defogger operation can be checked by feeling the glass. A distinct difference in temperature between the grid lines and adjacent clear glass can be detected in 3 to 4 minutes of operation.

(5) Using a DC voltmeter (Fig. 1) contact terminal B with the negative lead, and terminal A with the positive lead. The voltmeter should read 10-14 volts.

(6) Step 3, Step 4, and Step 5 above will confirm system operation. Indicator light illumination means that there is power available at the output of the relay only, and does not necessarily verify system operation.

(7) If the indicator light is not on, then check fuse #6 in the junction block.

(8) If turning the switch ON produced no distinct current draw on the ammeter the problem should be isolated in the following manner:

(a) Confirm the ignition switch is ON.

(b) Ensure that the heated rear glass feed wire is connected to the terminal or pigtail and that the ground wire is in fact grounded.

(c) Ensure that the 40 amp EBL fuse in the Power Distribution Center is OK.

(9) When the above steps have been completed and the system is still inoperative, one or more of the following is defective:

(a) Control switch in the HVAC control module

(b) Rear window defogger relay (EBL) in the Junction Block

(c) Timer circuit in the Body Control Module

(d) Rear window grid lines, all grid lines would have to be broken or one of the feed wires are not connected for the system to be inoperative.

(10) If depressing the switch button ON produces severe voltmeter deflection, the circuit should be closely checked for a shorting condition.

(11) If the system operation has been verified but indicator bulb does not light, check fuse 6 in the junction block. If not OK, replace as necessary. If OK, test the HVAC control module.

(12) For detailed wiring information, refer to **Wiring Diagrams**.

REAR WINDOW DEFOGGER RELAY

DESCRIPTION

The rear window defogger relay is an electromechanical device that switches fused battery current to the rear glass heating grid and the Light-Emitting Diode (LED) indicator of the rear window defogger switch, when the Body Control Module (BCM) rear window defogger timer and logic circuitry grounds the relay coil.

The rear window defogger relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The rear window defogger relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

REAR WINDOW DEFOGGER RELAY (Continued)

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER RELAY

(1) Check fuses.

(a) Fuse 15 in the Junction Block

(b) 40 amp EBL fuse in the Power Distribution Center.

(2) Remove the rear window defogger relay (EBL) from the Junction Block (Fig. 2).

(3) Using voltmeter, test battery voltage:

(a) Test rear window defogger relay terminals 13 for battery voltage. If voltage is OK, go to Step b. If voltage is not OK, repair A4 circuit.

(b) Test the rear window defogger relay terminal for battery voltage with the key in the run position. If voltage is OK, go to Step c. If voltage is not OK, repair A31circuit.

(c) Use a known good relay. If not OK, repair circuits as necessary. Refer to Wiring Diagrams. If OK, replace relay.

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Open the driver's door and remove instrument panel end cover.

(3) Remove Rear Window Defogger (EBL) relay from the Junction Block.

INSTALLATION

(1) Install Rear Window Defogger (EBL) relay in the Junction Block.

(2) Install the instrument panel end cover.

(3) Connect the battery negative remote cable.

REAR WINDOW DEFOGGER SWITCH

DESCRIPTION

The rear window defogger control switch and circuit are integrated into the HVAC control assembly. Refer to the HVAC control assembly for additional information.

OPERATION

When actuating the switch it sends a ground signal to the Body Control Module (BCM). The BCM actuates the relay allowing current to flow through the grid lines for fifteen minutes upon initial actuation. Then ten minutes with each subsequent actuation or until either the switch or ignition is turned off. An indicating lamp illuminates the rear window defogger switch.

DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER SWITCH

The rear window defogger control switch and timer circuit may be tested in the vehicle with or without a scan tool, such as the DRB III®.

TESTING WITH SCAN TOOL

Using a scan tool, refer to the proper Body Diagnostic Procedures Manual.

TESTING WITHOUT SCAN TOOL

(1) Remove the HVAC control head from the instrument panel however, do not disconnect any of the electrical connectors if possible.

(2) Using a ohmmeter, check leads between Pins 5 and 1 of the HVAC electrical connector. Depress the rear window defogger button and the resistance reading should be 360 ohms (± 10%). If not OK, replace HVAC. If OK, check for the following possible causes:

- Rear window relay (EBL)
- Blown fuse
- Cut wire
- Poor ground
- Poor connection
- Defective BCM
- Bulkhead connector inoperative

Refer to **Wiring Diagrams** for complete circuit diagrams.

REAR WINDOW DEFOGGER GRID LINES

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING – REAR WINDOW DEFOGGER GRID LINES

The horizontal grid lines and vertical bus bar lines printed and fired on inside surface of rear window glass comprise an electrical parallel circuit. The electrically conductive lines are composed of a silver-ceramic material which when fired on glass becomes bonded to the glass and is highly resistant to abrasion. It is possible, however, that a break may occur in an individual grid line resulting in no current flow through the line. To detect breaks in grid lines the following procedure is required:

(1) Turn ignition switch to the ON position. Depress the control switch button to ON position. The indicator light should come on.

(2) Using a DC voltmeter with 0-15 volt range, contact the ground terminal with negative lead of voltmeter. With positive lead of voltmeter, contact feed terminal. The voltmeter should read 10-14 volts. A lower voltage reading indicates a poor ground connection.

(3) Connect the negative lead of voltmeter to a good body ground point. The voltage reading should not be more than two tenth of a volt difference. If more than two tenth of a volt repair the ground circuit.

(4) Connect negative lead of voltmeter to ground terminal and touch each grid line at Mid-Point with Positive lead. A reading of approximately 6 volts indicates a line is good. A reading of 0 volts indicates a break in line between Mid-Point and feed terminal. A reading of 10-14 volts indicates a break between Mid-Point and ground terminal. Move toward break and voltage will change as soon as break is crossed. Refer to **Wiring Diagrams** for circuit information.

STANDARD PROCEDURE - REAR WINDOW DEFOGGER GRID LINE REPAIR

WARNING: THE REPAIR KIT MAY CAUSE SKIN OR EYE IRRITATION. THE KIT CONTAINS EPOXY RESIN AND AMINE TYPE HARDENER AND HARMFUL:

- **DO NOT TAKE INTERNALLY, IF SWALLOWED INDUCE VOMITING AND CALL A PHYSICIAN IMMEDIATELY.**
- **IF SKIN CONTACT OCCURS, WASH AFFECTED AREAS WITH SOAP AND WATER.**
- **IF EYE CONTACT OCCURS, FLUSH WITH PLENTY OF WATER.**

USE WITH ADEQUATE VENTILATION. DO NOT USE NEAR FIRE OR OPEN FLAME THE CONTENTS CONTAIN FLAMMABLE SOLVENTS. KEEP OUT OF REACH OF CHILDREN.

The repair of the grid lines or the terminal is possible using the Mopar® Grid Line Repair Package or equivalent.

(1) Mask repair area so conductive epoxy can be extended onto the line or the bus bar (Fig. 3).

(2) Follow instructions in repair kit for preparing damaged area.

(3) Remove package separator clamp and mix plastic conductive epoxy thoroughly. Fold in half and cut center corner to dispense epoxy.

(4) Apply conductive epoxy through slit in masking tape. Overlap both ends of the break by 19 mm (3/4 inch).

(5) For a terminal or pigtail replacement, mask adjacent areas so epoxy can be extended onto line as well as bus bar. Apply a thin layer of epoxy to area where terminal was fastened and to adjacent line.

(6) Apply a thin layer of conductive epoxy on terminal and place terminal on desired location. To prevent terminal from moving while the epoxy is curing, it must be wedged or clamped.

(7) Carefully remove masking tape from grid line.

CAUTION: Do not allow the glass surface to exceed 204°C (400°F), glass may fracture.

(8) Allow epoxy to cure 24 hours at room temperature or use heat gun with a 260° to 371°C (500° to 700°F) range for 15 minutes. Hold gun approximately 254 mm (10 inches) from repaired area.

(9) After conductive epoxy is properly cured remove wedge from terminal and check out operation of rear window defogger. Do not attach connectors until curing is complete.

HEATED SEAT SYSTEM

TABLE OF CONTENTS

HEATED SEAT SYSTEM

DESCRIPTION

Individually controlled electrically heated front seats are available factory-installed optional equipment on this model. Vehicles with this option can be visually identified by the heated seat switch mounted in the center console. The heated seat system allows the front seat driver to select from six different levels of supplemental electrical seat heating, or no seat heating to suit their individual comfort requirements. The heated seat system for this vehicle includes the following major components, which are explained in detail later in this section:

- **Heated seat switch -** One heated seat switch is used per vehicle. The switch is mounted in the center console, behind the gear selector and has two rotary knobs, one for the driver and one for the passenger front seats. There are three Light Emitting Diodes (LED's) in the heated seat switch. The first LED illuminates the heated seat symbol on the switch anytime the ignition switch is in the ON position. The remaining LED's illuminate the numbers on the switch, indicating that the heated seat system is on.
- **Heated seat module -** One heated seat module is used per vehicle, this module contains the solid state electronic control and diagnostic logic circuitry for the heated seat system. One heated seat module is used per vehicle and is mounted under the drivers front seat cushion. Refer to the Electronic Control Modules section of the service manual for heated seat module information.
- **Heated seat elements -** Three heated seat elements are used per vehicle, two in the seat cushion and one in the seat back. These three elements, which are integral to the individual front seat cushion and front seat back trim covers are connected in series with the heated seat module.
- **Heated seat sensor -** One heated seat sensor is used per vehicle, one for the single heated seat and is integrated into the seat cushion heating element. The temperature sensor is a negative temperature coefficient thermistor.

Following are general descriptions of the major components in the heated seat system. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system. Refer to **Wiring Diagrams** in the index of this service manual for the location of complete heated seat system wiring diagrams.

OPERATION

The heated seat module receives fused battery current through Junction Block (JB) only when the ignition switch is in the run position. The heated seat switches receive battery current through a fused ignition switch output (run) circuit only when the ignition switch is in the Run position. The heated seat module shares a common ground circuit with each of the heated seat elements. The heated seat elements will only operate when the surface temperature of the seat cushion cover at the heated seat sensors is below the designed temperature set points of the system.

The heated seat module will automatically turn off the heated seat elements if it detects a short in the heated seat element circuit or a heated seat sensor value that is out of range. The heated seat system will remain ON anytime the ignition switch is turned to the ON position and the heated seat switch is at any of the #1 through #6 positions.

HEATED SEAT SYSTEM (Continued)

The heated seat module monitors inputs from the heated seat sensors and the heated seat switches. In response to these inputs the heated seat module uses its internal programming to control outputs to the heated seat elements in both front seats and to control the heated seat LED indicator lamps located in both of the heated seat switches.

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

Refer to **Wiring Diagrams** in the index of this service manual for the location of complete heated seat system wiring diagrams. Before testing the individual components in the heated seat system, perform the following preliminary checks:

- If the heated seat switch numerals (1-6) do not illuminate with the ignition switch in the ON position and the heated seat switch in 1-6 positions, check the fuse in the junction block. If the fuse checks OK, test the heated seat switch as described in this section.
- If the heated seat switch numerals (1-6) illuminate, but the heating elements do not heat, check the fuse located in the power distribution center. If the fuse checks OK, test the seat heating elements as described in this section.

HEATED SEAT ELEMENT

DESCRIPTION

Vehicles equipped with the optional heated seat system have two sets of electrically operated heating element grids located in each outboard seating position of the front seat, one set for the seat cushion and the other set for the seat back. Each of the heated seat element grids consists of a single length of resistor wire that is routed in a zigzag pattern and captured between the leather trim cover and the foam rubber backing on the underside of its respective seat cushion trim cover and seat back trim cover assembly. Short pigtail wires with connectors are soldered to each end of each resistor wire element grid, which connect all of the element grids for each seating position to each other in series with the heated seat module through the seat wire harness.

One temperature sensor is used for each outboard seating position of the front seat, and it is located in the center insert area of the seat cushion cover. The heated seat sensors and their pigtail wires are also captured between the leather trim cover and the foam rubber backing on the underside of their respective seat cushion trim cover assemblies. The heated seat sensors are Negative Thermal Coefficient (NTC) thermistors. The sensors for both front seats receive a voltage feed from a single output of the heated seat module, but the module receives individual sensor inputs from the driver side and passenger side sensors.

The heated seat elements and sensors cannot be repaired. If damaged or faulty, the front seat cushion trim cover or front seat back trim cover assembly must be replaced.

OPERATION

One end of the heated seat element resistor wire is connected to a ground feed at all times through a splice in the heated seat module ground circuit. Battery current is directed to the other end of the heated seat element resistor wire by the energized N-channel Field Effect Transistor (N-FET) located within the heated seat module. The heated seat module will energize the N-FET only when the heated seat switch is in the Low or High position and the heated seat sensor indicates that the seat cushion surface temperature is below the selected (Low or High) temperature set point. As electrical current passes through the heating element grid, the resistance of the wire used in the element disperses some of that electrical current in the form of heat. The heat produced by the heated seat element grid then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

The resistance of the heated seat sensor increases and decreases as the surface temperature of the seat cushion cover changes. The heated seat module supplies each sensor with a voltage feed, then detects the sensor resistance by monitoring the voltage of the separate sensor return circuits. The heated seat module compares the heated seat sensor resistance (seat cushion surface temperature) with the heated seat switch resistance (Low or High set point) to determine when the heated seat element grids need to be cycled on or off in order to maintain the selected temperature set point.

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

Refer to **Heated Seat System** in this section for the location of the proper heated seat system diagnosis and testing procedures. To check the heated seat element and sensor circuits, proceed as follows. The wire harness connectors for the seat cushion heated seat element and sensor and for the seat back heated seat element are located under the seat, near the rear edge of the seat cushion frame. Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

HEATED SEAT ELEMENT (Continued)

SEAT CUSHION

(1) Disconnect and isolate the battery negative cable. Disconnect the green 4-way heated seat wire harness connector. Using an ohmmeter, check for continuity between pins A and B of the seat cushion wire harness connector (Fig. 1). There should be continuity. If OK, test the seat back element as described below. If not OK, check the green 2-way seat cushion connector. If OK, replace the faulty seat cushion cover and element assembly.

SEAT BACK

(1) Disconnect and isolate the battery negative cable. Disconnect the green 2-way heated seat back wire harness connector. Using an ohmmeter, check the resistance between the two pins. There should be continuity. If OK, test the heated seat control module as described in this section. If not OK, replace the faulty seat back cover and element assembly.

HEATED SEAT SWITCH

DESCRIPTION

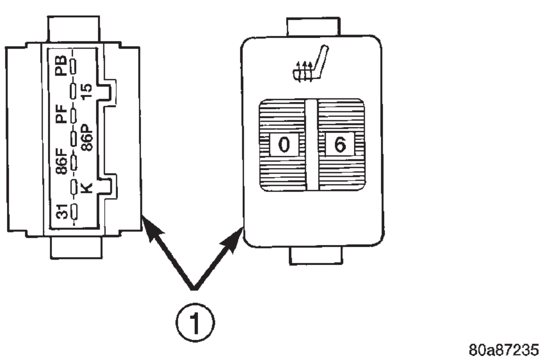

Fig. 2 Heated Seat Switch

1 - HEATED SEAT SWITCH

The heated seat switch used on vehicles with this option is mounted in the center console. The switch is snapped into a mounting hole in the center console. The heated seat switch incorporates two rotary knobs, one for the driver and one for the front seat passenger (Fig. 2). These knobs have numerals 1-6 to indicate the desired rate of supplemental seat heating. The instrument panel wire harness connectors for the heated seat switch is keyed to match the connector receptacle on the switch so that the heated seat switch can only be connected in the proper orientation.

The heated seat switch cannot be repaired. If the indicator or back lighting lamps are faulty or damaged, the individual heated seat switch unit must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The two six-position rotating-type switches provide a hard-wired voltage signal to the heated seat module to power the heated seat element of the selected seat and maintain the requested temperature setting.

There are three Light Emitting Diodes (LED's) in the heated seat switch. The first LED illuminates the heated seat symbol on the switch anytime the ignition switch is in the On position. The remaining LED's illuminate the numbers on the switch, indicating that the system is on..

DIAGNOSIS AND TESTING - HEATED SEAT SWITCH

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the heated seat switch as described in this group and inspect the connector for damage.

(2) Unplug the 7-way connector from the switch and check the harness terminals for proper ignition voltage and ground. Refer to **Wiring Diagrams** for complete heated seat system wiring diagrams.

HEATED SEAT SWITCH (Continued)

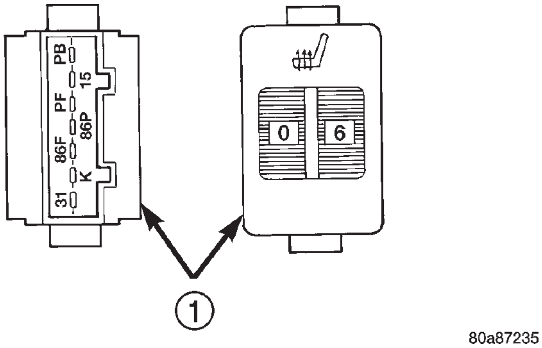

Fig. 3 Heated Seat Switch

1 - HEATED SEAT SWITCH

(3) Check the drivers switch for resistance between pin terminals PB and 86B (Fig. 3). Resistance should vary from 0-500 ohms, as the switch is rotated from #1 – #6. If not OK, replace the heated seat switch.

(4) Check the passenger switch for resistance between pin terminals PF and 86F (Fig. 3). Resistance should vary from 0-500 ohms, as the switch is rotated from #1 – #6. If OK, test the heated seat module. If not OK, replace the heated seat switch.

(5) If the switch is still suspected of possible malfunction, replace the inoperative heated seat switch with a known good unit and test the operation of the heated seat system. If OK, discard the faulty heated seat switch. If not OK, refer to **Heated Seat Module** in Electronic Control Modules for the location of the proper heated seat module diagnosis and testing procedures. Also refer to the Body Diagnostic Manual for additional diagnosis and testing procedures.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center console. Refer to the Body section of this manual for the procedure.

(3) Disconnect the center console wire harness connector from the connector receptacle on the back of the heated seat switch.

(4) Remove the heated seat switch by depressing the retaining tabs and pushing straight out of the center console.

INSTALLATION

CAUTION: Be certain to install the switch in the correct position. The “UP” labeling on the switch must face “UP” upon installation.

(1) Connect the center console wire harness connector on the connector receptacle on the back of the heated seat switch.

(2) Verify switch/system operation.

(3) Install the center console. Refer to the Body section of this manual for the procedure.

(4) Install the heated seat switch in the center console mounting hole.

(5) Reconnect the battery negative cable.

HEATED SEAT MODULE

DESCRIPTION

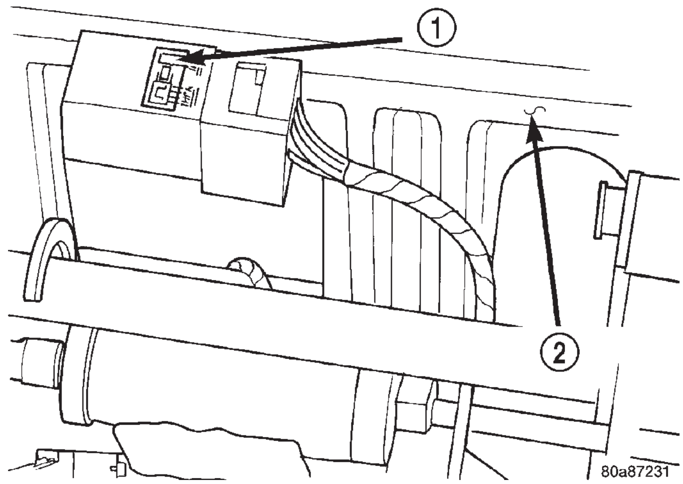

Fig. 4 Heated Seat Control Module

1 - HEATED SEAT CONTROL MODULE
2 - SEAT CUSHION FRAME

Two heated seat modules are used on this vehicle, one for each front seat. The heated seat modules are located under each front seat (Fig. 4). The heated seat module has a single connector receptacle that allows the module to be connected to all of the required inputs and outputs through the body wire harness.

The heated seat module is an electronic microprocessor controlled device designed and programmed to use inputs from the ignition switch, the two heated seat switches and the two heated seat sensors to operate and control the heated seat elements in both front seats.

The heated seat module cannot be repaired. If the heated seat module is damaged or faulty, the entire module must be replaced.

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded at all times through the body harness. Inputs to the module include a resistor multiplexed heated seat switch request circuit for each of the two heated seat switches and the heated seat sensor inputs from the seat cushions of each front seat. In response to those inputs the heated seat module controls battery current feeds to the heated seat elements and sensors.

HEATED SEAT MODULE (Continued)

When a heated seat switch (Driver or Passenger) request signal is received by the heated seat module, the module energizes the selected heated seat sensor circuit and the sensor provides the module with an input indicating the surface temperature of the selected seat cushion.

The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F). If the seat cushion surface temperature input is below the temperature set point for the selected temperature setting, the heated seat module energizes an N-channel Field Effect Transistor (N-FET) within the module which energizes the heated seat elements in the selected seat cushion and back. When the sensor input to the module indicates the correct temperature set point has been achieved, the module de-energizes the N-FET which de-energizes the heated seat elements. The heated seat module will continue to cycle the N-FET as needed to maintain the selected temperature set point.

DIAGNOSIS AND TESTING - HEATED SEAT MODULE

Refer to **Wiring Diagrams** for the location of complete heated seat system wiring diagrams.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Before testing the heated seat control module, test the heated seat switch 6-way connector located under each front seat for proper voltage supply and ground path. If testing of the heated seat elements and switch reveals no problems, remove the module as described in this section. Turn the ignition switch ON:

(1) Check for battery voltage at the red wire of the heated seat control module connector. If OK go to Step 2. If not OK, check the 20 amp MAXI fuse located in the Power Distribution Center.

(2) Turn the heated seat switch ON and check for 9 - 16.5 volts at the white / black wire of the heated seat control module connector. If OK go to Step 3. If not OK, check the 10 amp fuse in cavity #11 of the junction block and the 20 amp fuse in cavity #8 of the power distribution center.

(3) Check for 7 - 16.5 volts at the purple wire of the heated seat control module connector. If OK go to Step 4. If not OK, test the heated seat switch and harness as described in this section.

(4) Check for 9 - 16.5 volts at the red / white wire of the heated seat control module connector. The surface temperature at the front seat heating element sensor must be below the temperature setting (1-6) on the heated seat switch, for the red / white wire to indicate battery voltage. If OK go to Step 5. If not OK, test the heated seat switch and harness as described in this section.

(5) Check for continuity between a known good ground and the black wire of the heated seat control module connector. If OK replace the heated seat control module. If not OK, carefully inspect the harness for an open or short.

REMOVAL

(1) Move the appropriate power seat track to its upper-most and rearward-most stop position.

(2) Disconnect and isolate the negative battery cable.

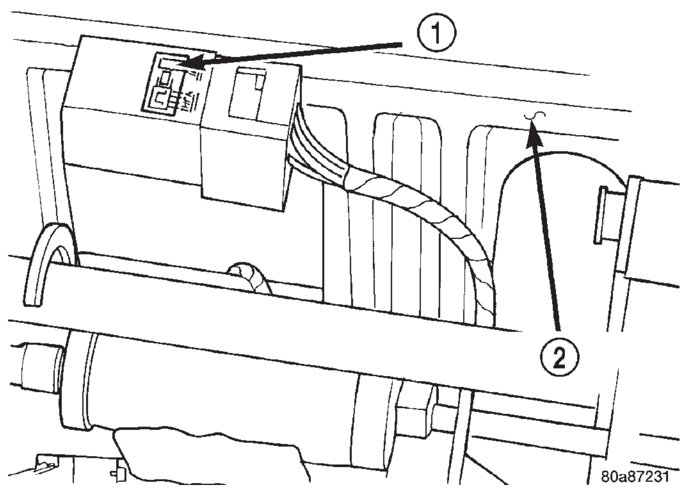

Fig. 5 Heated Seat Control Module

1 - HEATED SEAT CONTROL MODULE
2 - SEAT CUSHION FRAME

(3) Reach under the front of the seat cushion and separate the heated seat module from the seat cushion frame (Fig. 5).

(4) Disconnect the wire harness connector from the connector receptacle on the back of the heated seat module.

(5) Remove the heated seat module from the vehicle.

INSTALLATION

(1) Position the heated seat module under the seat.

(2) Connect the wire harness connector on the back of the heated seat module.

(3) Reposition the drivers power seat track.

(4) Connect the negative battery cable.

HORN SYSTEM

DESCRIPTION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAG, REFER TO ELECTRICAL, RESTRAINTS FOR SAFETY PRECAUTIONS. DISCONNECT THE NEGATIVE CABLE FROM THE BATTERY BEFORE SERVICING COMPONENTS INVOLVING THE AIRBAG SYSTEM. ACCIDENTAL DEPLOYMENT OF AIRBAG AND PERSONAL INJURY CAN RESULT.

The horn circuit consists of a horn switch, clock spring, wiring, horn relay, and horns. The horn switch is a membrane switch located in the airbag trim cover. One horn is located below each headlamp.

OPERATION

The horn circuit feed is from the fuse to the horn relay in the Junction Block. When the horn contact is depressed, it completes the ground circuit. Then the horn relay coil closes a set of contacts which allows current to flow to the horns. The horn(s) are grounded at the shock tower through the headlamp and dash harness. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING - HORN SYSTEM

CAUTION: Continuous sounding of horns will cause horn relay to fail.

Check fuse 8 in the Junction Block, and refer to Horn System Test table.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

HORN

DIAGNOSIS AND TESTING - HORN

Check horn fuse 16 in the Power Distribution Center and fuse 8 in the Junction Block. If fuse is blown refer to FUSE BLOWN section. If fuse is OK, refer to FUSE OK section.

FUSE BLOWN

(1) Verify condition of battery terminals and voltage, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DESCRIPTION). If battery connections and battery charge is OK, go to Step 2.

(2) Using a voltmeter, test for battery voltage at both sides of horn fuse 8. If voltage is OK, on both sides of fuse, go to Fuse OK. If voltage is OK, on one side of fuse, the fuse is blown, go to Step 3.

(3) Using a suitable ammeter in place of the fuse, test amperage draw of the horn circuit. If amperage draw is greater than 20 amps without the horn switch depressed, a grounded circuit exists between the fuse and the horn relay. Go to Step 4. If amperage draw is greater than 20 amps with the horn switch depressed, a grounded circuit exists between the horn relay and the horn. Go to Step 6.

(4) Remove the horn relay from the Junction Block. If the amperage draw drops to 0 amps, the horn switch or circuit is shorted. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If amperage does not drop go to Step 5.

(5) Disconnect both horns. If amperage does not drop with both horns disconnected and the horn switch depressed, go to Step 7. If the amperage draw drops go to Step 6.

(6) Disconnect the wire connector from one of the horns. If amperage drops and the connected horn sounds, reverse the procedure, and replace the faulty horn.

(7) Using a continuity tester, with the horns disconnected test continuity of the X2 cavity of the horn relay to ground. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If continuity is detected, the circuit is grounded between the Junction Block and the horns. Locate and repair pinched harness. If the amperage draw does not drop to 0 amps, repair short at the Junction Block.

FUSE OK

(1) Remove the horn relay from the Junction Block.

(2) Using a continuity tester, Depress horn switch and test continuity from the X3 cavity of the horn relay to ground. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(a) If continuity is detected, go to Step 3.

(b) If NO continuity, go to Step 4.

(3) Using a suitable jumper wire, jump across the fuse F62 cavity and the X2 cavity of the horn relay in the Junction Block.

(a) If the horn sounds, replace the horn relay.

(b) If the horn does not sound, go to Step 4.

(4) Remove airbag/horn pad from steering wheel. Refer to ELECTRICAL/RESTRAINTS.

(5) Test continuity across horn switch connectors with horn switch depressed.

(a) If continuity is detected, repair open circuit between the relay and the horn switch.

(b) If NO continuity, replace airbag cover.

(6) Install horn relay into Junction Block.

(7) Disconnect the wire connectors from horns.

(8) Using a voltmeter, with the horn switch depressed test voltage across horn connector terminals of the wire harness.

(a) If voltage is detected, replace horns.

(b) If NO voltage, go to Step 9.

(9) With the horn switch depressed, test for voltage between the X2 circuit and ground.

(a) If voltage OK, repair system ground at right cowl area. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(b) If NO voltage, repair open X2 circuit between the relay and the horns.

HORN RELAY

DESCRIPTION

The horn relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (or footprint) is different, current capacity is lower, and the relay case dimensions are smaller than on the conventional ISO relay.

OPERATION

The horn relay is a electromechanical device that switches current to the horn when the Driver Airbag Module is depressed.

The horn relay is located in the Junction Block. Refer to the Junction Block label for horn relay identification and location.

If a problem is encountered with a continuously sounding horn, it can usually be quickly resolved by removing the horn relay from the Junction Block until further diagnosis is completed. The horn relay cannot be repaired and, if faulty, it must be replaced.

DIAGNOSIS AND TESTING - HORN RELAY

(1) Remove horn relay from the Junction Block.

(2) Using ohmmeter, test between the Junction Block relay terminal 7 and ground for continuity.

(a) When the horn contact is not depressed, no continuity.

(b) Continuity to ground when horn contact is depressed.

(c) If continuity is not correct, repair horn contact or wiring as necessary. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(3) Insert a jumper wire between terminals 8 and 10 of the horn relay in the Junction Block.

(a) If horns sound replace relay.

(b) If the horns do not sound, install horn relay and refer to Horn Test.

(4) Using voltmeter, test battery voltage:

(a) Test Junction Block horn relay terminals 6 and 8 for voltage from fuse 8.

(b) If not OK, repair as necessary. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

HORN SWITCH

DESCRIPTION

The horn switch is molded into the airbag trim cover. The horn switch can not be serviced separately. For service procedures, refer to ELECTRICAL/RESTRAINTS.

IGNITION CONTROL

TABLE OF CONTENTS

IGNITION CONTROL

DESCRIPTION - IGNITION SYSTEM

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The distributorless ignition system used on these engines is referred to as the Direct Ignition System (DIS). The system's three main components are the coils, crankshaft position sensor, and camshaft position sensor. The coil on plug ignition system utilizes an ignition coil for every cylinder, it is mounted directly over the each spark plug.

OPERATION - IGNITION SYSTEM

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft & camshaft position. For a description of both sensors, refer to Camshaft Position Sensor and Crankshaft Position Sensor.

AUTO SHUT DOWN RELAY

DESCRIPTION

The relay is located in the Power Distribution Center (PDC). For the location of the relay within the PDC, refer to the PDC cover for location. Check electrical terminals for corrosion and repair as necessary

OPERATION

The ASD sense circuit informs the PCM when the ASD relay energizes. A 12 volt signal at this input indicates to the PCM that the ASD has been activated. This input is used only to sense that the ASD relay is energized.

When energized, the ASD relay supplies battery voltage to the fuel injectors, ignition coils and the heating element in each oxygen sensor.

When energized, the ASD relay provides power to operate the injectors, ignition coil, generator field, O2 sensor heaters (both upstream and downstream), (EGR solenoid and PCV heater if equipped) and also provides a sense circuit to the PCM for diagnostic purposes. If the PCM does not receive 12 volts from this input after grounding the ASD relay, it sets a Diagnostic Trouble Code (DTC). The PCM energizes the ASD any time there is a Crankshaft Position sensor signal that exceeds a predetermined value. The ASD relay can also be energized after the engine has been turned off to perform an O2 sensor heater test, if vehicle is equipped with OBD II diagnostics.

As mentioned earlier, the PCM energizes the ASD relay during an O2 sensor heater test. This test is performed only after the engine has been shut off. The PCM still operates internally to perform several checks, including monitoring the O2 sensor heaters.

CAMSHAFT POSITION SENSOR

DESCRIPTION

The camshaft position sensor for the 4 cylinder engine is mounted on the end of the cylinder head (Fig. 1).

OPERATION

The CMP sensor contains a hall effect device that provide cylinder identification to the Powertrain Control Module (PCM). The sensor generates pulses as groups of notches on the camshaft sprocket pass underneath it. The PCM keeps track of crankshaft rotation and identifies each cylinder by the pulses generated by the notches on the camshaft sprocket. Crankshaft pulses follow each group of camshaft pulses.

When metal aligns with the sensor, voltage goes low (less than 0.3 volts). When a notch aligns with the sensor, voltage spikes high (5.0 volts). As a group of notches pass under the sensor, the voltage switches from low (metal) to high (notch) then back to low. The number of notches determine the amount of pulses. If available, an oscilloscope or DRBIII® PEP Module can display the square wave patterns of each timing event.

REMOVAL

REMOVAL - 4 CYLINDER

The camshaft position sensor is mounted to the rear of the cylinder head.

(1) Remove the negative battery cable.

(2) Disconnect the PCV hose and reposition.

(1) Install target magnet in end of camshaft. Tighten mounting screw to 3 N·m (30 in. lbs.) torque. Over torqueing could cause cracks in magnet. If magnet cracks replace it.

(2) Install camshaft position sensor. Tighten sensor mounting screws to 12.9 N·m (115 in. lbs.) torque.

(3) Carefully attach electrical connector to camshaft position sensor. Installation at an angle may damage the sensor pins.

(4) Connect the PCV Valve hose.

(5) Connect the negative battery cable.

INSTALLATION - 2.7L

The camshaft position sensor is mounted in the front of the head.

(1) Install sensor in the chain case cover and push sensor in until contact is made with the boss on the head. While holding the sensor in this position, install and tighten the retaining bolt to 12 N·m (105 in. lbs.) torque.

(2) Attach electrical connector to sensor.

IGNITION COIL

DESCRIPTION

The ignition coil assembly for the 4 cylinder engines consists of 2 or 3 independent coils molded together. The coil assembly for the 4 cylinder engines

IGNITION COIL (Continued)

is mounted on the cylinder head cover. Spark plug cables route to each cylinder from the coil. The coil assemblies for the 2.7L are mounted on the intake manifold. It is a coil on plug assembly and each cylinder has an ignition coil assembly.

OPERATION

The coil for the 4 cylinder engines fires two spark plugs every power stroke. One plug is the cylinder under compression, the other cylinder fires on the exhaust stroke. The Powertrain Control Module (PCM) determines which of the coils to charge and fire at the correct time.

The Auto Shutdown (ASD) relay provides battery voltage to the ignition coil. The PCM provides a ground contact (circuit) for energizing the coil. When the PCM breaks the contact, the magnetic energy in the coil transfers to the secondary causing the spark. The PCM will de-energize the ASD relay if it does not receive the crankshaft position sensor and camshaft position sensor inputs. Refer to Auto Shutdown (ASD) Relay—PCM Output, in this section for relay operation.

KNOCK SENSOR

DESCRIPTION

The knock sensor threads into the cylinder block. The knock sensor is designed to detect engine vibration that is caused by detonation.

OPERATION

When the knock sensor detects a knock in one of the cylinders, it sends an input signal to the PCM. In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM

KNOCK SENSOR (Continued)

receives as an input the knock sensor voltage signal. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except WOT. The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening affects knock sensor performance, possibly causing improper spark control.

REMOVAL

REMOVAL - 4 CYLINDER

The knock sensor threads into the side of the cylinder block (Fig. 10).

(1) Disconnect electrical connector from knock sensor.

(2) Use a crow foot socket to remove the knock sensors.

SPARK PLUG

DESCRIPTION

DESCRIPTION - STANDARD 4 CYLINDER

All engines use resistor spark plugs. They have resistance values ranging from 6,000 to 20,000 ohms when checked with at least a 1000 volt spark plug tester.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

Refer to the Specifications section for gap and type of spark plug.

DESCRIPTION - PLATINUM PLUGS

The V6 engines use platinum resistor spark plugs. They have resistance values of 6,000 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications, Refer to the Specifications section.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips and they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad is welded to both or center electrode end(s) as show in (Fig. 12). Extreme care must be used to prevent spark plug cross threading, misgaping (Fig. 13) and ceramic insulator damage during plug removal and installation.

CAUTION: Cleaning of the platinum plug may damage the platinum tip.

SPARK PLUG CABLE

DESCRIPTION

Spark Plug cables are sometimes referred to as secondary ignition wires. The wires transfer electrical current from the ignition coil pack to individual spark plugs at each cylinder. The resistive spark plug cables are of nonmetallic construction. The cables provide suppression of radio frequency emissions from the ignition system.

Check the spark plug cable connections for good contact at the coil, and spark plugs. Terminals should be fully seated. The insulators should be in good condition and should fit tightly on the coil, and spark plugs. Spark plug cables with insulators that are cracked or torn must be replaced.

Clean Spark Plug cables with a cloth moistened with a non-flammable solvent. Wipe the cables dry. Check for brittle or cracked insulation. The spark plug cables and spark plug boots are made from high temperature silicone materials. All spark plug cable leads are properly identified with cylinder numbers. The inside of most the spark plug boot is coated with a special high temperature silicone grease for greater sealing and to minimize boot bonding to the spark plug insulator.

REMOVAL

Failure to route the cables properly could cause the radio to reproduce ignition noise, cross ignition of the spark plugs or short circuit the cables to ground.

Remove spark plug cable from coil first.

Always remove the spark plug cable by grasping the top of the spark plug insulator, turning the boot 1/2 turn and pulling straight up in a steady motion.

INSTALLATION

Failure to route the cables properly could cause the radio to reproduce ignition noise, cross ignition of the spark plugs or short circuit the cables to ground.

Install spark plug insulators over spark plugs. Ensure the top of the spark plug insulator covers the upper end of the spark plug tube, then connect the other end to coil pack.

INSTRUMENT CLUSTER

TABLE OF CONTENTS

INSTRUMENT CLUSTER

DESCRIPTION

The mechanical instrument cluster is an electro-mechanical module which receives most of its information directly from the various control modules, via the PCI data bus.

The cluster includes:

- Speedometer
- Tachometer
- Vacuum Fluorescent Display (VF) odometer/trip odometer and transmission range indicator with automatic transmission
- Fuel gauge
- Temperature gauge

The warning and information indicators include the following:

- Check Engine
- Airbag
- Charging system
- Low oil pressure
- High temperature
- Low fuel
- Seat belt
- Cruise (optional)
- Brake/park brake
- Anti-lock brake system (optional)
- High beam
- Front and Rear Fog lamps (optional)
- Vehicle Theft Security System alarm LED indicator (optional)
- Turn signals

VF display warnings:

- Door
- Deck

OPERATION

The gauges are the magnetic air-core type. Pointers should rest at or below the low graduation.

It receives its information from the Body Control Module (BCM), Powertrain Control Module (PCM), Transmission Control Module (TCM), Controller Anti-Lock Brakes (CAB), and Occupant Restraint Controller (ORC), via the PCI data bus. Upon receipt of information, the cluster will determine the gauge position and whether the PCI bus controlled warnings should be turned ON or OFF.

- The **ABS** is a learned feature by receiving an ABS message on the bus. Once learned, the ABS must be unlearned manually by sending a diagnostic message using a DRB III® scan tool.
- The **AIRBAG** light is always supported, but can be unlearned automatically by using the VIN information and the non-receipt of AIRBAG messages. Receipt of AIRBAG messages will override non-airbag VIN information.
- The cluster provides the **Auto-Stick (A/S)** or **Non Auto-Stick** information via the PCI bus. The TCM will learn A/S or non A/S vehicle configuration per cluster information on the bus.
- The cluster is set to support vehicles equipped with a TCM (automatic transmission). In MTX (manual transmission) vehicles, the cluster will turn OFF gear information upon receipt of vehicle configuration from the PCM. At initial power-up, you might be able to potentially see the ATX gear letters. Once the MTX information is received, the gear letters will be turned off.

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

As a quick diagnosis, the cluster will perform a functional check of the odometer display, transmission range display and warning indicators after the ignition is switched to RUN/START. If the cluster is not receiving any PCI bus messages, the cluster will appear non functional and "no bus" will appear in the odometer display.

INSTRUMENT CLUSTER (Continued)

A self-test of the cluster can also be initiated by pressing and holding the odometer reset button and switching the ignition from lock to unlock. The cluster will then step through several displays for functional verification. By pressing the trip odometer reset button while going through the self-test, you can temporarily freeze the test. Pressing the bottom again will continue sequence. The cluster will store bus communication faults with other modules. It will also store faults for the AIRBAG and ABS lamps. During the self-diagnostics, the AIRBAG and ABS lamps are tested.

If the cluster is not functioning properly, refer to the proper Body Diagnostic Procedures manual.

If the cluster is not receiving PCI bus messages, refer to the pre-diagnostic test described in Body Diagnostic Procedures manual.

In order to diagnose the instrument cluster functions, a DRB lll® scan tool and the proper Body Diagnostic Procedures Manual are required.

If the diagnostic procedure determines that a replacement of an instrument cluster component is required, refer to Electrical, Instrument Cluster, Removal, and Installation.

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove left end cover.

(3) Using a trim stick (special tool #C-4755) or equivalent, gently pry up on the power mirror switch. Disconnect the switch and remove.

(4) Using a trim stick or equivalent, gently pry up on instrument panel center trim bezel.

(5) Disconnect the HVAC control connector.

Remove the one screw to the inboard passenger trim bezel on the right of the steering column and remove by unsnapping clips.

(6) Remove the one screw from the passenger side trim bezel and remove trim by unsnapping clips.

(7) Remove 4 screws to left lower instrument panel trim.

(8) Remove the five screws to the cluster bezel. Using a trim stick or equivalent, gently pry out the cluster bezel.

(9) If the vehicle is equipped with a Compass Mini-Trip Computer (CMTC/Traveler), disconnect the module and then remove the cluster bezel assembly.

(10) For better access and prevention of scratching the cluster lens, tilt the steering column to its lowest position and depress the hazard switch.

(11) Remove the cluster attaching screws.

(12) Pull the cluster rearward to disconnect the 26–way self docking connector and then carefully tilt cluster downward slightly and slide cluster sideways to remove cluster assembly.

NOTE: When replacing a cluster, the original optional bulbs (ABS, rear fog, front fog, and security LED) must be transferred to the new cluster if so equipped.

INSTALLATION

(1) Carefully slide the cluster into its location and push the cluster forward to connect it to the mating half of its mating connector on the instrument panel.

(2) Install the four cluster attaching screws.

(3) Position the cluster bezel and if so equipped, connect the traveler connector, then snap the cluster bezel into position.

(4) Install the five screws to the cluster bezel.

(5) Install the four screws to the left lower instrument panel trim.

(6) Connect the mirror switch connector and firmly snap it into place.

(7) Install the one screw to the trim bezel to the right side of the steering column.

(8) Firmly snap into place and then install one screw to the passenger side trim bezel.

(9) Connect the HVAC control connectors.

(10) Position the center bezel over the retaining slots and firmly snap instrument panel center bezel into place.

(11) Install the left end cover.

(12) Connect the battery negative cable.

INSTRUMENT CLUSTER MASK/LENS

REMOVAL

(1) Remove instrument cluster from vehicle. Refer to Electrical, Instrument Cluster, Removal.

(2) Remove six screws to mask/lens.

(3) Separate mask/lens from instrument cluster and remove.

INSTALLATION

(1) Align mask/lens with instrument cluster dial assembly and housing and install the six retaining screws.

(2) Install the instrument cluster into vehicle. Refer to Electrical, Instrument Cluster, Installation.

(3) Connect the negative battery cable remote terminal to the remote battery post.

VACUUM FLUORESCENT DISPLAY

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.

(2) Remove instrument cluster from vehicle. Refer to Electrical, Instrument Cluster, Removal.

(3) Remove six cluster back cover retaining screws and remove the cover.

(4) Carefully unplug the connector from printed circuit board.

(5) Remove six attachment screws and then remove cluster mask/lens from the instrument cluster.

(6) Carefully pull the dial assembly from the housing to separate connection with the PC-board.

(7) Remove two screws from the back of the dial assembly to remove the VF-display.

(8) Remove the VF-display from the cluster.

INSTALLATION

(1) Position the VF-display onto the dial assembly and install the two screws.

(2) Carefully push the dial assembly into the housing to make the connection with the PC-board.

(3) Install the six attachment screws and then install cluster mask/lens to the instrument cluster.

(4) Carefully plug the connector into the printed circuit board.

(5) Install the cover and the six cluster back cover retaining screws.

(6) Install the instrument cluster into vehicle. Refer to Electrical, Instrument Cluster, Installation.

(7) Connect the negative battery cable remote terminal to the remote battery post.

LAMPS/LIGHTING - EXTERIOR

DESCRIPTION

LAMP SYSTEMS

Lighting circuits are protected by fuses or circuit breakers. Lighting circuits require an overload protected power source, on/off device, lamps and body ground to operate properly. Plastic lamps require a wire in the harness to supply body ground to the lamp socket. If a socket has become corroded, clean socket and bulb base with abrasive fiber sanding pad or metallic bristle brush. Replace sockets and bulbs that are deformed from corrosion that could prevent continuous body ground.

Wire connectors can make intermittent contact or become corroded. Before coupling wire connectors, inspect the terminals inside the connector. Male terminals should not be bent or disengaged from the insulator. Female terminals should not be sprung open or disengaged from the insulator. Bent and sprung terminals can be repaired using needle nose pliers and pick tool. Corroded terminals appear chalky or green. Corroded terminals should be replaced to avoid recurrence of the problem symptoms.

Begin electrical system failure diagnosis by testing related fuses and circuit breakers in the fuse block and engine compartment. Verify that bulbs are in good condition and test continuity of the circuit ground. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

DAYTIME RUNNING LAMP (CANADA ONLY)

JR vehicles built for use in Canada are equipped with a Daytime Running Lamp (DRL) system. The DRL system operates the high beam filaments at a lower intensity when the engine is operating and the exterior lamp switch is in either the OFF or parking lamp ON position and the parking brake is not applied. The DRL system is controlled by the Daytime Running Lamp Module located on the back of the junction block, behind the instrument panel (Fig. 1). The DRL module overrides the headlamp switch when the headlamps are turned OFF. The headlamps operate normally when the headlamps are turned ON. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

HEADLAMP TIME DELAY SYSTEM

The optional Headlamp Time Delay system is controlled by the Body Controller (BC) and a relay located in the junction block. The headlamp time delay system can be activated by turning ON the headlamps when the engine is running, turn OFF the ignition switch, then turn OFF the headlamp switch. The BC will allow the headlamps to remain ON for 90 seconds before they automatically turn off. Refer to the Owner's Manual for more information.

DIAGNOSIS AND TESTING - LAMPS/LIGHTING - EXTERIOR

WARNING: EYE PROTECTION SHOULD BE USED WHEN SERVICING GLASS COMPONENTS. PERSONAL INJURY CAN RESULT.

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result. Do not use bulbs other than those indicated in the Bulb Application table. Damage to lamp and/or Daytime Running Lamp Module can result. Do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owners Manual.

When a vehicle experiences problems with the headlamp system, verify the condition of the battery connections, fuses, charging system, headlamp bulbs, wire connectors, relay, high beam switch, dimmer switch, and headlamp switch. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Each vehicle is equipped with various lamp assemblies. A good ground is necessary for proper lighting operation. Grounding is provided by the lamp socket when it comes in contact with the metal body, or through a separate ground wire.

When changing lamp bulbs check the socket for corrosion. If corrosion is present, clean it with a wire brush.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges are not holding the component in place.

BRAKE LAMP SWITCH

DESCRIPTION

The brake lamp switch is located under the instrument panel at the brake pedal arm (Fig. 2). It controls operation of the vehicle's brake lamps. Also, if the vehicle is equipped with speed control, the brake lamp switch will deactivate speed control when the brake pedal is depressed.

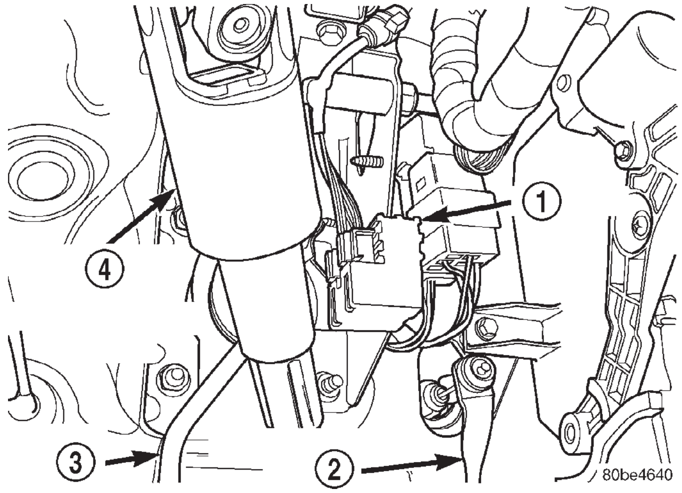

Fig. 2 Brake Lamp Switch

1 - SWITCH
2 - ACCELERATOR PEDAL
3 - BRAKE PEDAL
4 - STEERING COLUMN INTERMEDIATE SHAFT

OPERATION

When the brake pedal is depressed, the plunger on the outside of the switch extends outward. This action closes the electrical contacts within the switch, completing the circuit to the brake lamps at the rear of the vehicle, thus illuminating the brake lamps and the center-high-mounted stop lamp (CHMSL).

DIAGNOSIS AND TESTING - BRAKE LAMP SWITCH

NOTE: Before proceeding with this diagnostic test, verify the adjustment of the brake lamp switch to rule out misadjustment. Refer to ADJUSTMENTS.

If the electrical circuit has been tested and the brake lamp switch is suspected of being faulty, it can be tested using the following method.

(1) Remove the switch from the vehicle. Refer to REMOVAL for the proper procedure.

(2) With the switch in the released position (plunger extended), use an ohmmeter to test each of the three internal switches as shown (Fig. 3). You should achieve the results as listed in the figure.

BRAKE LAMP SWITCH (Continued)

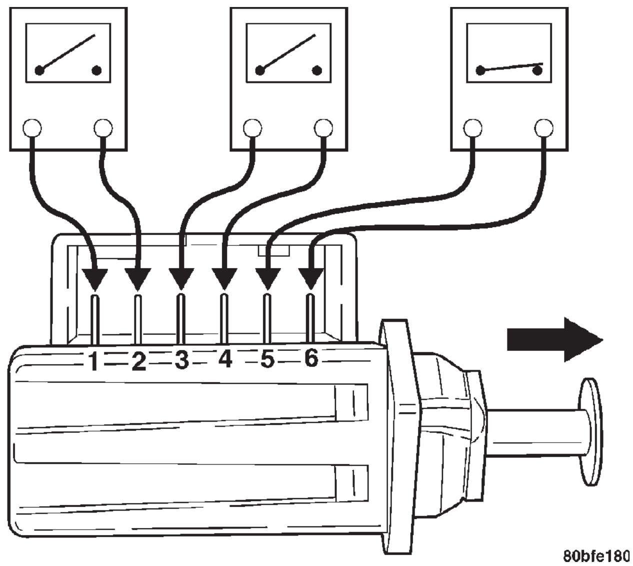

Fig. 3 Switch Test - Released Position

(3) Gently push the plunger on the brake lamp switch in until it stops.

(4) With the switch in the depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown (Fig. 4). You should achieve the results as listed in the figure.

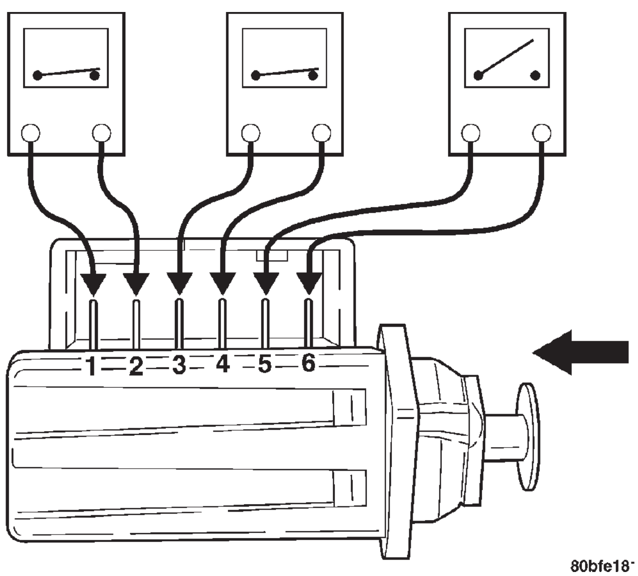

Fig. 4 Switch Test - Depressed Position

If you do not achieve the results as listed in both figures, the switch is faulty and must be replaced.

(5) Install the switch in the vehicle. Refer to INSTALLATION for the proper procedure.

REMOVAL

(1) Remove the brake lamp switch from its bracket (Fig. 5). The brake lamp switch is removed by depressing and holding the brake pedal while rotating brake lamp switch in a counter-clockwise direction approximately 30 degrees. Pull the switch rearward and remove it from its mounting bracket.

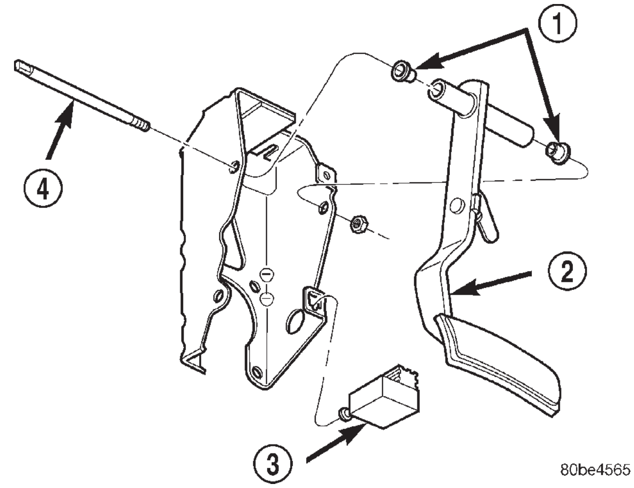

Fig. 5 Switch And Bracket

(2) Disconnect the wiring harness connector from the switch.

INSTALLATION

NOTE: Prior to installing brake lamp switch into the mounting bracket, the plunger must be moved to its fully extended position using the procedure in Step 1.

(1) Hold the brake lamp switch firmly in one hand. Using the other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.

(2) Connect the wiring harness connector to the brake lamp switch.

(3) Install the brake lamp switch in the brake pedal bracket (Fig. 5). Install it using the following procedure:

- Depress the brake pedal as far down as possible.
- Install the switch in its bracket by aligning the index tab on the switch with the slot in the mounting bracket.
- When the switch is fully seated in its bracket, rotate the switch clockwise approximately 30° to lock the switch into place. It should be aligned straight up and down (Fig. 6).

CAUTION: Do not use excessive force when pulling back on the brake pedal to adjust the brake lamp switch. If too much force is used, the switch or striker can be damaged.

(4) Gently release/pull back on the brake pedal until the pedal stops moving. This will ratchet the switch plunger backward to the correct adjustment position.

(5) Check the brake lamps to verify they are operating properly and not staying on when the pedal is in the released position.

ADJUSTMENTS

ADJUSTMENT - BRAKE LAMP SWITCH

(1) Remove the brake lamp switch from its bracket (Fig. 7). The brake lamp switch is removed by depressing and holding the brake pedal while rotating brake lamp switch in a counter-clockwise direction approximately 30 degrees. Pull the switch rearward and remove it from its mounting bracket.

(2) Disconnect the wiring harness connector from the switch if necessary.

(3) Hold the brake lamp switch firmly in one hand. Using the other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.

(4) Connect the wiring harness connector to the brake lamp switch if previously disconnected.

(5) Install the brake lamp switch in the brake pedal bracket (Fig. 7). Install it using the following procedure:

- Depress the brake pedal as far down as possible.
- Install the switch in its bracket by aligning the index tab on the switch with the slot in the mounting bracket.

COMBINATION FLASHER (Continued)

REMOVAL

The flasher is mounted to the back side of the multi-function switch. To gain access, the upper steering column cover must be removed (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL). The flasher can be removed by pulling it forward. The flasher is serviced separately from the multi-function switch. The flasher is black in color for ease of identification (Fig. 12).

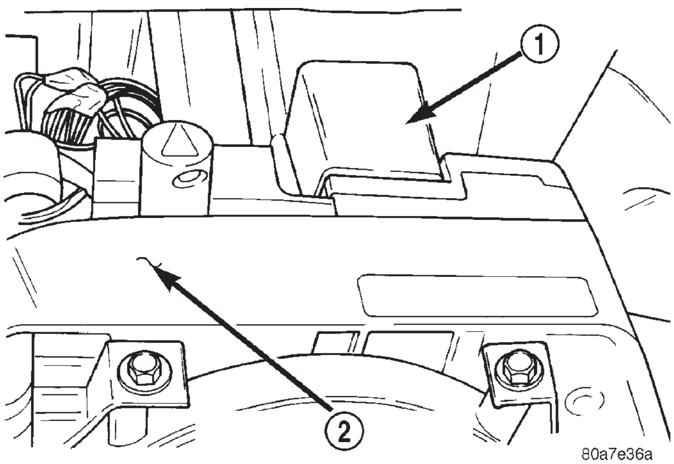

Fig. 12 COMBINATION FLASHER LOCATION

1 - COMBINATION FLASHER
2 - MULTI-FUNCTION SWITCH

INSTALLATION

The flasher is mounted to the back side of the multi-function switch. To gain access, the upper steering column cover must be removed (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL). Push the flasher toward the rear of the vehicle. The flasher is black in color for ease of identification.

TRUNK LAMP UNIT

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Using a flat bladed tool, pry lamp housing from rear shelf.
(3) Disconnect wire harness connector.
(4) Remove bulb.

INSTALLATION

(1) Install bulb.
(2) Connect wire harness connector to the lamp.
(3) Install housing into rear shelf.
(4) Connect battery negative cable.

FOG LAMP

REMOVAL

(1) Disconnect and isolate battery negative cable.
(2) Remove fog lamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FOG LAMP UNIT - REMOVAL).
(3) Disconnect wire connector from back of fog lamp.
(4) Rotate bulb base counterclockwise one quarter turn.
(5) Pull bulb from back of lamp.

INSTALLATION

(1) Install bulb and twist clockwise.
(2) Connect the fog lamp harness connector.
(3) Install foglamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FOG LAMP UNIT - INSTALLATION).
(4) Connect battery negative cable.

FOG LAMP UNIT

STANDARD PROCEDURE

STANDARD PROCEDURE - FOG LAMP UNIT ALIGNMENT

Prepare a alignment screen (Fig. 13) (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS). A properly aligned fog lamp unit will project a pattern on the alignment screen 100 mm (4 in.) below the fog lamp center line and straight ahead.

To adjust fog lamp unit alignment, rotate alignment screw to achieve the specified low beam hot spot pattern (Fig. 14).

STANDARD PROCEDURE - FOG LAMP UNIT ALIGNMENT - EXPORT

Prepare an alignment screen (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - ADJUSTMENTS). A properly aligned fog lamp will project a pattern on the alignment screen 200 mm (8 in.) below the fog lamp centerline and straight ahead (Fig. 15). To adjust fog lamp alignment, rotate alignment screw to achieve the specified low beam hot spot pattern.

HAZARD WARNING SWITCH

DESCRIPTION

The hazard warning switch push button protrudes from the top of the steering column (Fig. 19). The hazard warning switch push button is identified with a double triangle, which is the international control symbol for hazard warning.

OPERATION

The hazard warning system is actuated by a push button located on the top of the steering column between the steering wheel and the instrument panel. The hazard switch is identified with a double triangle on top of the button. Push and release the button to turn the hazard function ON or OFF. The button will move out from the steering column in the ON position and will remain in toward the column in the OFF position.

HEADLAMP

REMOVAL

CAUTION: Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result.

(1) Disconnect and isolate battery negative cable.
(2) Remove headlamp unit retaining screws.
(3) Remove headlamp unit to expose back of unit.
(4) Disconnect wire connector from back of headlamp bulb.
(5) Rotate retaining ring counterclockwise.
(6) Remove retaining ring.
(7) Pull headlamp bulb and remove from headlamp unit.

HEADLAMP LEVELING MOTOR

DIAGNOSIS AND TESTING - HEADLAMP LEVELING MOTOR

HEADLAMP LEVELING MOTOR DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE MOTOR DOES NOT OPERATE	1. Poor connection at motor.	1. Secure connector on motor.
	2. No voltage at motor.	2. Repair circuit. Refer to Group 8W, Wiring.
	3. Defective motor.	3. Replace motor.
BOTH MOTORS DO NOT OPERATE	1. No voltage at headlamp leveling switch.	1. Repair circuit or replace fuse. Refer to Group 8W, Wiring.
	2. No voltage at both motors.	2. Repair circuit or replace fuse. Refer to Group 8W, Wiring.
	3. Poor connection at motors.	3. Secure connectors on motors.
	4. Both motors defective.	4. Replace motors.

HEADLAMP LEVELING MOTOR (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

(3) Rotate motor clock-wise and pull straight from headlamp unit. (Fig. 21).

NOTE: Significant force will be required to disconnect the leveling motor pushrod from the headlamp assembly.

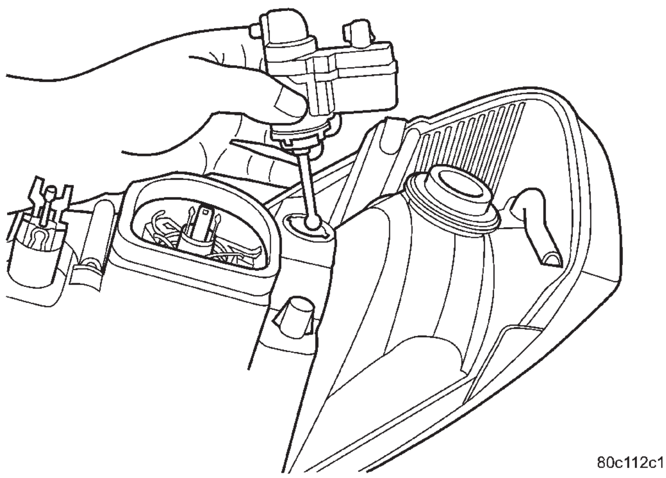

Fig. 21 HEADLAMP LEVELING MOTOR

INSTALLATION

(1) Insert and rotate the leveling motor into the headlamp unit.

NOTE: Be certain the leveling motor ball stud is fully inserted in headlamp leveling socket assembly.

(2) Install headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

(3) Connect battery negative cable.

HEADLAMP LEVELING SWITCH

DIAGNOSIS AND TESTING - HEADLAMP LEVELING SWITCH

(1) Remove the headlamp leveling switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP LEVELING SWITCH - REMOVAL).

(2) Using an ohmmeter, check the resistance readings between headlamp leveling switch pins. Refer to the headlamp leveling switch resistance table (Fig. 22).

HEADLAMP SWITCH

DESCRIPTION

HEADLAMP DIMMER SWITCH

The headlamp dimmer switch is incorporated into the turn signal switch. Proper procedures can be found in Group 8J, Turn Signal and Flashers. More information can be found in Group 8W, Wiring Diagrams.

HEADLAMP SWITCH

Service procedures for the headlamp switch can be found in Group 8E, Instrument Panel and Gauges. More information can be found in Group 8W, Wiring Diagrams.

HEADLAMP UNIT

STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT

HEADLAMP ALIGNMENT PREPARATION

(1) Verify headlamp dimmer switch and high beam indicator operation.
(2) Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.
(3) Verify proper tire inflation.
(4) Clean headlamp lenses.
(5) Verify that luggage area is not heavily loaded.
(6) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION

(1) Position vehicle on a level surface perpendicular to a flat wall 7.62 meters (25 ft.) away from front of headlamp lens (Fig. 24).
(2) If necessary, tape a line on the floor 7.62 meters (25 ft.) away from and parallel to the wall.
(3) From the ground up 1.27 meters (5 ft.), tape a line on the wall at the center line of the vehicle. Sight along the center line of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.
(4) Rock vehicle side-to-side three times to allow suspension to stabilize.
(5) Jounce front suspension three times by pushing downward on front bumper and releasing.
(6) Measure the distance from the center of headlamp lens to the ground. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.
(7) Measure distance from the center line of the vehicle to the center of each headlamp being aligned. Transfer measurements to screen (with tape) to each side of vehicle center line. Use these lines for left/right adjustment reference.

HEADLAMP ADJUSTMENT

A properly aimed left and right low beam headlamp will project the center of the low beam hot spot on the alignment screen below the horizontal center line and 6 in. (152 mm) right of headlamp center line (Fig. 24). The high beam headlamps cannot be aligned. The high beam pattern should be correct when the low beams are aligned properly.

To adjust headlamp alignment, rotate alignment screws to achieve the specified low beam hot spot pattern (Fig. 25).

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove the two retaining screws.
(3) Remove upper fascia retainers by prying under the head of the fasteners with a flat bladed tool.
(4) Remove headlamp unit from fender side first, then pull headlamp unit out (Fig. 26).
(5) Disconnect the wiring harness from the bulbs.
(6) Remove the headlamp unit.

INSTALLATION

(1) Connect wire harness to the bulbs.
(2) Install headlamp unit.
(3) Install the retaining screws.
(4) Install upper fascia retainers.
(5) Connect the battery negative cable.

HEADLAMP UNIT - EXPORT

STANDARD PROCEDURE - HEADLAMP UNIT ALIGNMENT - EXPORT

HEADLAMP ALIGNMENT PREPARATION

(1) Verify headlamps are on low setting.

(2) Verify that the headlamp leveling switch is in the “0” position.

(3) Inspect and correct damaged or defective components that could interfere with proper headlamp alignment.

(4) Verify proper tire inflation.

(5) Clean headlamp lenses.

(6) Verify that luggage area is loaded as the vehicle is routinely used.

(7) Fuel tank should be FULL. Add 2.94 kg (6.5 lbs.) of weight over the fuel tank for each estimated gallon of missing fuel.

ALIGNMENT SCREEN PREPARATION

(1) Position vehicle on a level surface perpendicular to a flat wall 10 meters (32.8 ft.) away from front of headlamp lens (Fig. 27).

(2) Place 75 kg in the driver's seat to simulate the ride height of the vehicle when driven.

(3) If necessary, tape a line on the floor 10 meters (32.8 ft.) away from and parallel to the wall.

(4) From the floor up 1.27 meters (5 ft.), tape a line on the wall at the centerline of the vehicle. Sight along the centerline of the vehicle (from rear of vehicle forward) to verify accuracy of the line placement.

(5) Rock vehicle side-to-side three times and allow suspension to stabilize.

(6) Jounce front suspension three times by pushing downward on front bumper and releasing.

(7) Measure the distance from the center of headlamp lens to the floor. Transfer measurement to the alignment screen (with tape). Use this line for up/down adjustment reference.

(8) Place a tape line 130 mm below and parallel to the center of headlamp line.

(9) Measure distance from the centerline of the vehicle to the center of each headlamp being aligned. Transfer measurements to screen (with tape) to each side of vehicle centerline. Use these lines for left/right adjustment reference.

HEADLAMP ALIGNMENT

A properly aimed low beam headlamp will project a high intensity light pattern on the screen with the horizontal cut-off line aligned with the tape line 130 mm (5.12 in.) below the headlamp centerline (Fig. 27). The intersection of the horizontal and 15 degree cut-off lines in the projected pattern should align to the intersection of the headlamp centerline vertical tape line and the tape line 130 mm (5.12 in.) below the headlamp horizontal centerline. The high beam pattern should be correct when the low beams are aligned properly.

To adjust headlamp alignment, rotate alignment screws to achieve the specified low beam hot spot pattern (Fig. 28).

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the two retaining screws.

(3) Remove upper fascia retainers by prying under the head of the fasteners with a flat bladed tool.

(4) Remove headlamp unit from fender side first, then pull headlamp unit out (Fig. 29).

(5) Disconnect the wiring harness from the bulbs.

(6) Disconnect electrical connector from headlamp leveling motor.

(7) Remove the headlamp unit.

INSTALLATION

(1) Connect wire harness.

(2) Connect wire harness to headlamp leveling motor.

(3) Install headlamp unit.

(4) Install the retaining screws.

(5) Install upper fascia retainers.

(6) Connect the battery negative cable.

MULTI-FUNCTION SWITCH

DESCRIPTION

The multi-function switch (Fig. 32) contains:

- Turn signals
- Hazard warning
- Headlamps
- Headlamp beam select
- Parking lamps
- Panel dimmer
- Fog Lamp
- Headlamp optical horn
- Windshield wiper
- Pulse wipe
- Mist wipe
- Windshield washer switches.

The multi-function switch is mounted center of the steering column. There are two levers, one on each side of the steering column.

MULTI-FUNCTION SWITCH (Continued)

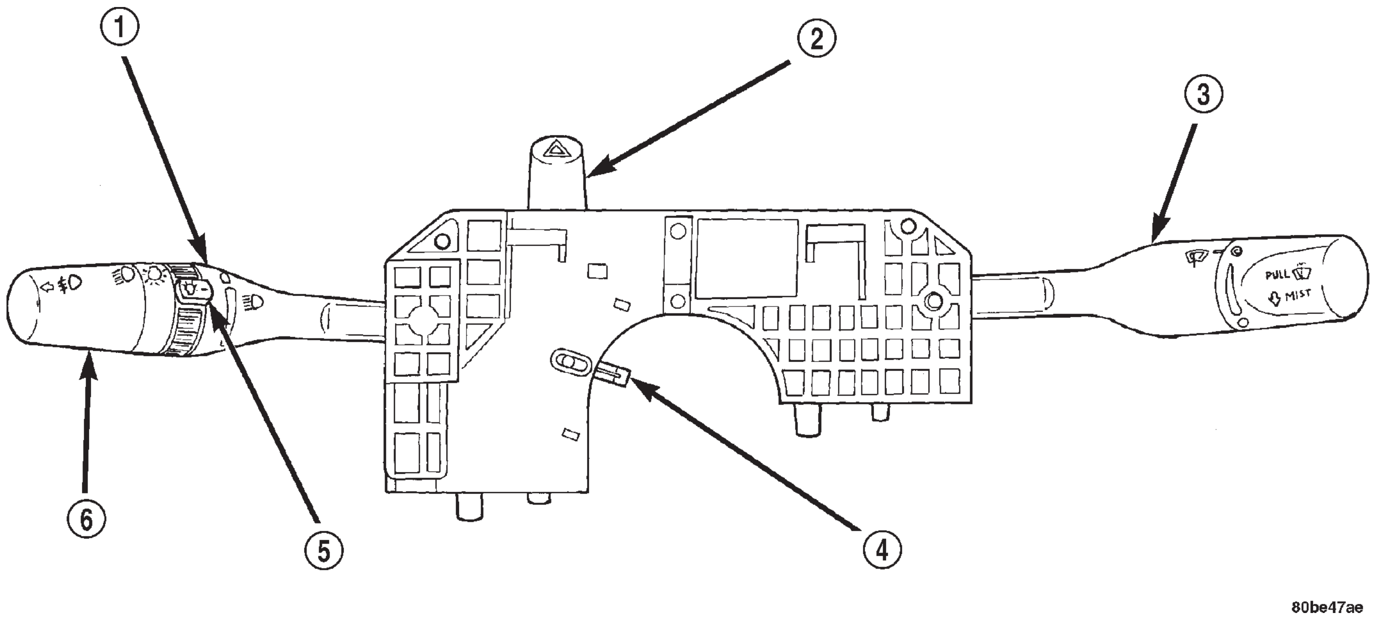

Fig. 32 MULTI-FUNCTION SWITCH

1 - TURN SIGNAL CONTROL STALK
2 - HAZARD WARNING BUTTON
3 - WINDSHIELD WIPER/WASHER CONTROL
4 - CANCELING ACTUATOR
5 - PANEL DIMMER SWITCH
6 - EXTERIOR LIGHTING CONTROL

OPERATION

The left side controls the signaling and lighting. The right side controls the windshield wiper and washer system. When the driver wishes to signal his intentions to change direction of travel, he moves the left lever upward to cause the right signals to flash and downward to cause the left signals to flash. After completion of a turn the system is deactivated automatically. As the steering wheel returns to the straight ahead position the turn signals are canceled. A canceling cam is molded to the clock spring mechanism which comes in contact with the cancel actuator on the multi-function switch. The canceling cam lobe pushes on the cancel actuator and returns the switch to the off position.

If only momentary signaling such as indication of a lane change is desired, the switch is actuated to a left or right intermediate detent position. In this position the signal lamps flash as described above, but the switch returns to the OFF position as soon as the lever is released.

When the system is activated, one of two indicator lamps mounted in the instrument cluster flashes in unison with the turn signal lamps, indicating to the driver that the system is operating. The windshield wiper and wash system is covered in Wipers/Washers.

DIAGNOSIS AND TESTING - MULTI-FUNCTION SWITCH

(1) Remove multi-function switch, refer to Electrical, Lamps/Lighting - Exterior, Multi-function Switch, Removal and Installation.

(2) Using an ohmmeter, test for continuity (no resistance) between the terminals of the switch as shown in the MULTI-FUNCTION SWITCH CONTINUITY/RESISTANCE table and (Fig. 33).

The switch assembly is mounted over the center of the steering column. Should any function of the switch fail, the entire switch assembly must be replaced.

CLUSTER ILLUMINATION AND WARNING LAMPS

REMOVAL

(1) Remove the Instrument Cluster. Refer to Electrical, Instrument Cluster, Removal.

(2) Turn over cluster and expose the illumination bulbs or warning indicator bulbs/socketed LEDs by removing the cluster cardboard back cover. For accurate identification of the defective bulb or LED, see the labels on the PC board.

(3) After Identifying the defective bulb or LED, twist it out of the cluster using a counterclockwise motion.

INSTALLATION

(1) Install the new bulb/LED socket into the cluster using a clockwise motion.

(2) Install the cluster cardboard back cover.

(3) Install the Instrument Cluster. Refer to Electrical, Instrument Cluster, Installation.

COMPAPSS MINI TRIP COMPUTER/TRAVELER ILLUMINATION LAMP

REMOVAL

(1) Remove the CMTC/Traveler from the instrument panel. Refer to Body, Instrument Panel, Compass Mini-Trip Computer, Removal.

(2) With the CMTC removed from the cluster bezel, remove the tape from the lamp access opening at the bottom of the CMTC/Traveler.

(3) With a screwdriver, twist the bulb assembly 1/4 turn counterclockwise. Remove bulb and replace.

INSTALLATION

(1) With a screwdriver, twist the bulb 1/4 turn clockwise.

(2) Install the tape to the access opening at the bottom of the CMTC/Traveler to prevent any light leaking.

(3) Install the CMTC/Traveler. Refer to Body, Instrument Panel, Compass Mini-Trip Computer, Installation.

CONSOLE COURTESY LAMP - JR27 ONLY

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Using a flat bladed tool, gently pry lamp from console (Fig. 1).

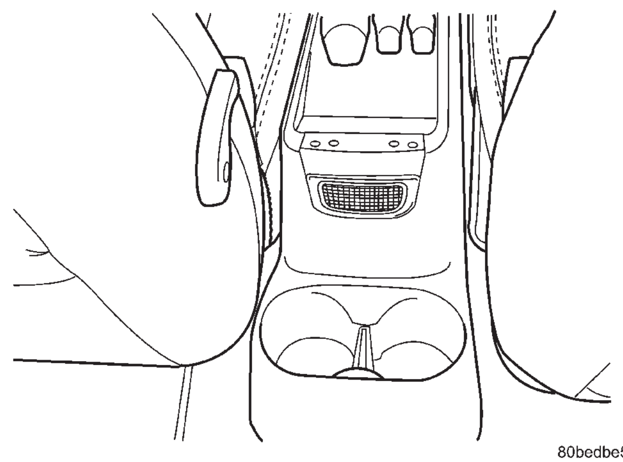

Fig. 1 CONSOLE COURTESY LAMP

(3) Disconnect wire harness connector.

(4) Remove bulb from lamp.

INSTALLATION

(1) Install bulb to lamp.

(2) Connect the wire harness connector.

(3) Press lamp into the center console.

(4) Connect the battery negative cable.

DOME LAMP

REMOVAL

(1) Disconnect and isolate battery negative cable.

(2) From the left side of the vehicle insert a flat bladed pry tool under the lens (Fig. 2).

(3) Separate lamp from headliner.

(4) Disconnect wire harness connector.

INSTALLATION

(1) Connect wire connector to dome lamp.
(2) Center dome lamp in headlining opening.
(3) Push upward on dome lamp to engage it to the headliner.
(4) Connect battery negative cable.

DOME LAMP BULB

REMOVAL

(1) Disconnect and isolate battery negative cable.
(2) From the left side of the vehicle, insert a flat bladed pry tool under the lens.
(3) Remove bulb.

INSTALLATION

(1) Insert bulb into lamp.
(2) Push lens into place.
(3) Connect battery negative cable.

DOOR COURTESY LAMP - JR27 ONLY

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Using a flat bladed tool, gently pry the lamp from the door trim panel.
(3) Disconnect the wire harness connector.
(4) Remove bulb.

INSTALLATION

(1) Install bulb to the lamp.
(2) Connect the wire harness connector.
(3) Press the lamp into the door trim panel.
(4) Connect the battery negative cable.

ILLUMINATED ENTRY

DESCRIPTION

The Illuminated Entry System is available on vehicles equipped with the Remote Keyless Entry system. The Illuminated Entry System turns ON the courtesy lamps when the remote keyless entry system is activated. The Remote Keyless Entry Module and the Body Controller are used to control the system. Courtesy lamps will turn on for 30 seconds (±1 second) and fade to OFF over a five second period.

The Illuminated Entry System also turns ON the courtesy lamps (and ignition switch lamp) when door is opened. The courtesy lamps will remain ON while the door is open, then fade to OFF 30 seconds (±1 second) after the last door is closed.

The courtesy and ignition switch lamps will fade to OFF immediately when the ignition is switched to ON.

The Illuminated Entry System cannot be activated during the 30 second (±1 second) period after the ignition switch is turned OFF. After a door is opened and closed during this 30 second period, the system will function as previously described.

When the battery voltage has been interrupted to the Illuminated Entry System, the system will not function until the remote keyless entry UNLOCK is actuated.

DIAGNOSIS AND TESTING - ILLUMINATED ENTRY

When testing the system, all doors must be closed to prevent courtesy lamps from lighting. Verify that remote keyless entry system is operating properly before testing illuminated entry circuits. The body controller uses input from the remote keyless entry system to switch ON the courtesy lamps.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

READING LAMP

REMOVAL

(1) Disconnect and isolate battery negative cable.
(2) Using a trim stick, pry lamp from headliner (Fig. 3).

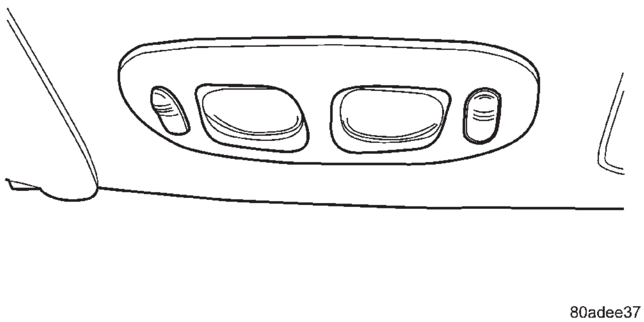

Fig. 3 READING LAMP

(3) Disconnect wire harness connector.
(4) Pull bulb socket from lamp.
(5) Pull bulb from socket.

INSTALLATION

(1) Push bulb into socket.
(2) Install bulb socket to lamp.
(3) Install wire harness connector.
(4) Install reading lamp to headliner.
(5) Connect battery negative cable.

TRANSMISSION RANGE INDICATOR ILLUMINATION

REMOVAL

(1) Remove gear shift knob.
(2) Using a plastic trim stick, Special Tool C-4755, disengage the forward or rear edge of transmission range indicator bezel from floor console.
(3) Pull upward carefully on transmission range indicator bezel and disengage tabs from rear floor console bezel.
(4) Disconnect wire connector to lamp assembly.
(5) Remove transmission range indicator bezel and lamp assembly from vehicle.

INSTALLATION

(1) Position transmission range indicator bezel and lamp assembly to vehicle.
(2) Connect wire connector to lamp assembly.
(3) Engage tabs on transmission range indicator bezel to slots in rear floor console bezel.
(4) Push downward on transmission range indicator bezel to engage to bezel to floor console.

VANITY LAMP

REMOVAL

The vanity lamp is incorporated into the visor assembly. If the vanity lamp needs to be replaced, the entire visor must be replaced. The bulbs are serviced separately.
(1) Disconnect and isolate the battery negative cable.

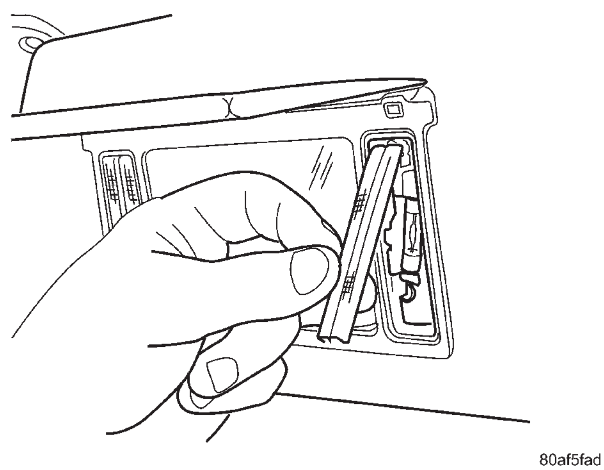

Fig. 4 VANITY LAMP

(2) Using a pick or other suitable tool, pry the lens from the lamp (Fig. 4).
(3) Remove bulb.

INSTALLATION

(1) Install bulb.
(2) Snap lamp lens into position.
(3) Connect the battery negative cable.

COMPASS/MINI-TRIP COMPUTER

TABLE OF CONTENTS

COMPASS/MINI-TRIP COMPUTER

DESCRIPTION

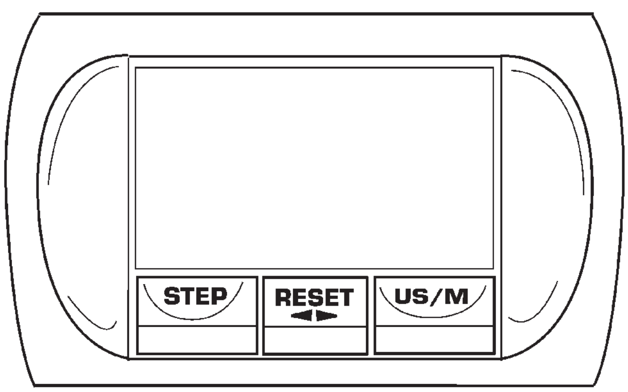

Fig. 1 COMPASS/MINI-TRIP COMPUTER

The Compass Mini-Trip Computer (CMTC) system is located in the center of the instrument panel, between the HVAC outlets. The Compass Mini-Trip Computer is an electronic control module with a vacuum fluorescent display and two function buttons (Fig. 1). The Compass Mini-Trip Computer communicates on the J1850 Programmable Communication Interface Data Bus Circuit.

The functions that are available via activation of the STEP button are as follows:

- Compass and Temperature
- Average Fuel Economy
- Distance to Empty
- Instantaneous Fuel Economy
- Trip Odometer
- Elapsed Time
- Blank Screen

The Compass Mini-Trip Computer cannot be repaired and, if faulty or damaged it must be replaced. The incandescent lamp for the STEP and US/METRIC button illumination is serviceable. Consult your Mopar® Parts Catalog for a specific part number.

OPERATION

Actuation of the STEP button will cause the Compass Mini-Trip Computer to change mode of operation and actuation of the US/M button will toggle between English and Metric unit of measurement. A reset of the trip computer information is accomplished by actuating the Step and US/M buttons simultaneously. To reset only the trip condition currently displayed, press and release the STEP and US/M buttons simultaneously for one second until a chime sounds. To reset all trip conditions, hold down the STEP and US/M buttons simultaneously (about 2 seconds) until a second chime sounds and then release the buttons.

The Compass Mini-Trip Computer is active only when the ignition switch is in the ON position. When the ignition switch is turned ON, the Compass Mini-Trip Computer will return to the last function screen that was displayed prior to the ignition being turned OFF.

COMPASS MINI-TRIP COMPUTER MESSAGES

The Compass Mini-Trip Computer will not display information for any of the screens for which it did not receive the proper data over the J1850 PCI bus for that particular screen. Refer to Mini Trip Computer Diagnosis and Testing in this section for more information.

The Compass Mini-Trip Computer receives the following messages from the Body Control Module (BCM):

- Verification of US/M Status
- Display Brightness (Dimming) and Lamp Status

COMPASS/MINI-TRIP COMPUTER (Continued)

- Trip Odometer Data
- Elapsed Ignition On Time Data
- Fuel Efficiency (Average and Instantaneous)
- Distance to Empty
- Outside Temperature

The Compass Mini-Trip Computer transmits the following messages to the Body Control Module (BCM):

- Status Request : Beep, Reset, US/M Toggle
- Current Display
- Compass Heading

The Compass Mini-Trip Computer receives the following message from the Single Board Engine Controller (SBEC):

- Vehicle Speed

DIAGNOSIS AND TESTING - COMPASS MINI-TRIP COMPUTER

The Compass Mini-Trip Computer is capable of performing a diagnostic self check on many of its internal functions. Compass Mini-Trip Computer diagnostics may be performed using a DRB lll® scan tool and the proper Body Diagnostic Procedures Manual or by the following procedure.

(1) With the ignition switch in the OFF position, press both the US/M and STEP button.

(2) Turn ignition switch to the ON position.

The Compass Mini-Trip Computer will perform internal checks while lighting all segments of the vacuum florescent display. Upon completion of the internal check, the Compass Mini-Trip Computer will display one of five messages;

- **PASS** - Passed Self Test
- **FAIL** - Failed Self Test
- **BUS** - Not receiving J1850 messages from Single Board Engine Controller (SBEC) and Body Control Module (BCM)
- **bus1** - Not receiving J1850 messages from Single Board Engine Controller (SBEC)
- **bus2** - Not receiving J1850 messages from Body Control Module (BCM)

If any segment of the Compass Mini-Trip Computer fails to light replace the computer.

If FAIL is displayed, repeat the test. If it still fails, replace the Compass Mini-Trip Computer module.

If a BUS(X) message is displayed, check the corresponding J1850 PCI Data Bus Circuit for proper operation. Refer to the appropriate diagnostic manual for additional diagnostics.

COMPASS CALIBRATION

If the “CAL” indicator is lit, the compass should be calibrated. The vehicle will be shipped with the “CAL” light on. If during normal driving, the compass appears to be inaccurate, calibration may be required.

To Calibrate the Compass

(1) Put the CMTC into COMPASS/TEMP mode using the STEP button.

(2) Depress the STEP and US/M buttons simultaneously until CAL appears in the display.

(3) Drive the vehicle in about two circles (Fig. 2) on a level surface in an area free of large metal objects, such as other vehicles, large buildings, bridges, underground cables, railroad tracks, etc.

NOTE: The compass will usually calibrate after the vehicle has been driven in a circle comprising five quadrants or one and a quarter turns.

When the “CAL” indicator goes off, the compass is calibrated and should display correct headings (for all conditions). Verify proper calibration by checking North (N), South (S), East (E), and West (W). If the compass does not appear accurate, repeat the calibration procedure in another area.

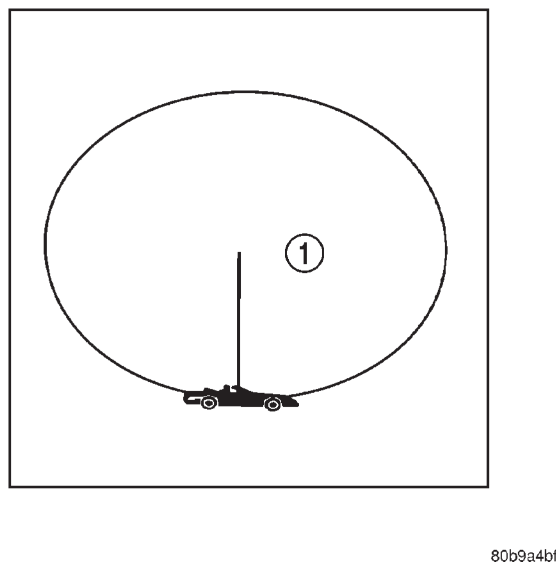

Fig. 2 Compass Calibration

1 - radius = 15' — 45'
speed = 7–10 mph

VARIANCE SETTING PROCEDURE

Variance is the difference between magnetic North and geographic North.

(1) Depress the STEP and US/M buttons simultaneously until VAR appears in the display, then release the buttons.

(2) The CMTC will display the current variance zone (1-15). If the variance needs to be changed use the STEP button to select the correct zone number from the figure below (Fig. 3). After selecting the desired variance zone, the CMTC will return to normal operation after 5 seconds or by pressing the STEP and US/M buttons simultaneously.

COMPASS/MINI-TRIP COMPUTER (Continued)

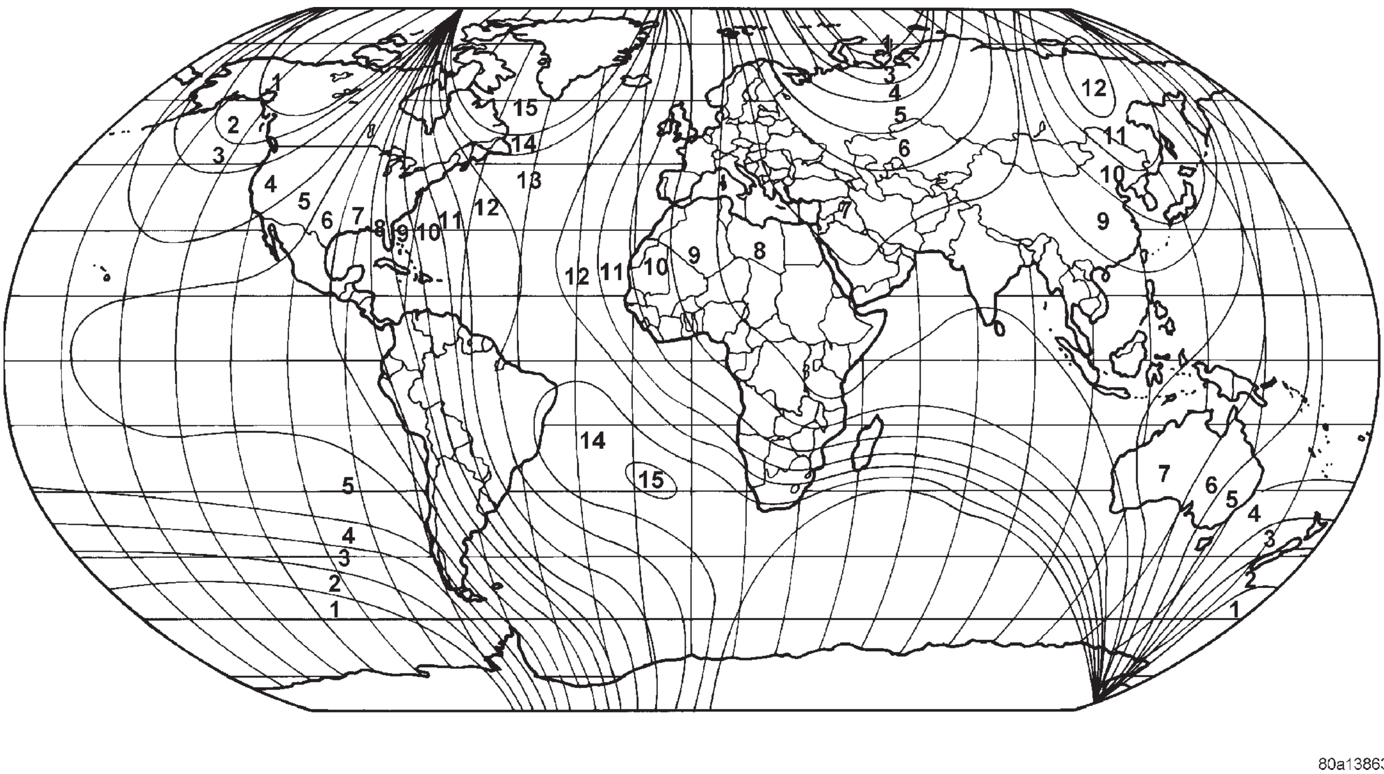

Fig. 3 Variance Settings

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove the Instrument Cluster Bezel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(3) With the cluster bezel removed, remove the two screws attaching the Compass Mini-Trip Computer (Traveler) Module to the cluster bezel (Fig. 4).

(4) Unsnap the retaining clip (Fig. 4) and remove Compass Mini-Trip Computer (Traveler) from the cluster bezel.

INSTALLATION

(1) Snap the Compass Mini-Trip Computer on the cluster bezel and install the retaining screws.

(2) Install the Instrument Cluster Bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(3) Connect the battery negative remote cable.

POWER SYSTEMS

TABLE OF CONTENTS

POWER LOCKS

TABLE OF CONTENTS

POWER LOCKS

DESCRIPTION

POWER DOOR LOCKS

The power lock system allows all doors to be locked or unlocked electrically by operating the switch on either front door trim panel. The power lock system operates on non-switched battery current supplied through a fuse in the junction block so that the system remains functional, regardless of the ignition switch position.

AUTOMATIC DOOR LOCKS

The system includes an automatic door locking feature actuated by the Body Control Module (BCM). **The vehicle is built with the system enabled.** The system can be enabled/disabled by the customer. Refer to the owner's manual for information.

The BCM will automatically lock all doors when all of the conditions below are met:

- All doors are closed
- The vehicle speed exceeds 15 ± 1 M.P.H.
- The throttle position sensor tip-in is greater than 10 ± 2 degrees

When the system is disabled the door locks will work by use of the door lock switches only. When this system is enabled the automatic door locks will work automatically.

Auto unlock on exit is a feature which, when enabled, automatically unlocks all doors upon the ignition switch being turned off and the opening of the driver's door. Auto unlock on exit is only operable when the automatic door locks are enabled.

POWER LOCKS (Continued)

CENTRAL LOCKING

The central locking system is part of the Vehicle Theft Security System. This feature allows the doors to be locked/unlocked all at once with the turn of the key in the drivers or passengers side door.

CHILD PROTECTION LOCK

The child protection locks are on the rear doors only. When enabled, they render the inside remote door release handles inoperative.

DOOR LOCK INHIBIT

The door lock inhibit feature is designed to prevent the locking of keys in a vehicle. The drivers door cannot be locked unless the keys are removed from the ignition switch.

REMOTE KEYLESS ENTRY

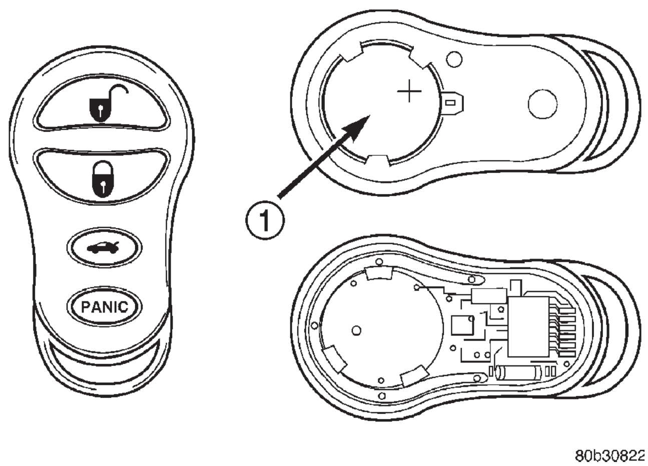

Fig. 1 REMOTE KEYLESS ENTRY TRANSMITTER

1 - BATTERIES

The system allows locking and unlocking of vehicle door(s), deck lid release, and panic by remote control using a hand held radio frequency transmitter (Fig. 1). The vehicle must be in PARK before the trunk lid can be unlatched with the transmitter.

The receiver may receive signals from up to four transmitters. Each transmitter has its own code, and the code is programmed and stored into receiver memory. If a transmitter is replaced or additional transmitters are added, the codes for all units have to be reprogrammed into the receiver memory. If a receiver module is replaced, the transmitter codes must be stored in the new receiver memory.

HORN CHIRP TOGGLE

Once the transmitters have been programmed, the horn chirp can be enabled/disabled by sending the horn chirp toggle operation code to the Body Control Module (BCM).

OPERATION

POWER DOOR LOCKS

All doors can be locked or unlocked electrically by operating the switch on either front door panel.

The rear doors can be locked or unlocked by actuation of the front door switch, or can be locked or unlocked mechanically and independently with their respective locking knobs.

The front doors can be locked or unlocked mechanically with the locking knob regardless of electrical locking and unlocking actuation with the front door knobs.

The right and left front door on all vehicles can be locked or unlocked mechanically from the outside with the key or electrically as described above. The left and right front doors can also be unlocked by actuation of the inside remote door handle.

AUTOMATIC DOOR LOCKS

The BCM controls the power locks when the door lock switch is activated. If the door lock switch is pressed for longer than eight consecutive seconds, the BCM will de-energize the door lock relay.

The automatic door lock system can be enabled/disabled either by the customer or with the DRB lll® scan tool. Refer to the DRB lll® or the vehicle owners manual for enabling/disabling procedures.

The BCM will automatically re-lock all doors if the above conditions are met and if any of the doors become ajar and then closes again.

The power latches are also equipped with a thermal protection system which prevents the latches from burning out.

CENTRAL LOCKING

Using the key, turn the driver's or passenger door cylinder lock to the lock position, all doors will lock. This feature operates differently on each door. Turn key in the driver's door to the unlock position once will unlock driver's door only. Turning the key a second time to the unlock position within five seconds of the first time will unlock all doors. Turn key once in the passenger's door to the unlock position will unlock all doors.

The lock/unlock operation will arm/disarm the Vehicle Theft Security System and will also activate/cancel the illuminated entry feature.

CHILD PROTECTION LOCK

The lock when engaged, will disable the inside door handle from opening the door. The lock is part of the latch/lock assembly. The lock is engaged by moving a lever that is located on the rearward inside edge of the door.

POWER LOCKS (Continued)

DOOR LOCK INHIBIT

With the key in the ignition switch in the ON or OFF position and the driver's door open the BCM will ignore the command to lock the power door locks. Once the key is removed, or the driver's door is closed, the body control module will allow the power door locks to lock.

REMOTE KEYLESS ENTRY

The transmitter has four buttons for operation. They are LOCK, UNLOCK, DECK LID RELEASE, and PANIC.

- The **UNLOCK** button will unlock the driver's door and enable illuminated entry. Pushing and releasing the button once will unlock the driver's door. Pushing and releasing the button two times, within a five second interval, will unlock all doors.The unlock sequence can be toggled between driver door first and all door unlock functions.
- Upon pressing the **LOCK** button, the horn will sound a short CHIRP (if enabled) and flash the park lamps to notify that the all door lock signal was received and set. Illuminated entry is cancelled and the interior lamps are faded to off.
- **DECK LID RELEASE** - The Deck Lid release button changes from a default "press twice" actuation to a "press and hold" (for approximately one third of a second) default. Note that this is customer programmable to "no delay" if so desired.
- Pushing and holding the **PANIC** button will cause the panic alarm to sound for three minutes, until the panic button is pressed and held a second time, or the vehicle reaches a speed of 15 mph.

The receiver is capable of retaining a Vehicle Access Code (VAC) even when power is removed.

Each Remote Keyless Entry (RKE) module must have at least one and no more than four transmitters.

HORN CHIRP TOGGLE

This can be done using a DRB III® scan tool or by the customer. The horn chirp will enter the opposite state of its current programmed state by receiving this operation code. The BCM is responsible for keeping track of the horn chirp status.

DIAGNOSIS AND TESTING - REMOTE KEYLESS ENTRY

When trouble shooting problems with the Remote Keyless Entry System, always verify that the power door lock/unlock switches are functional. If the doors do not lock/unlock with the power switches, the following components should be analyzed:

- Door Lock Switches
- Body Control Module
- Lock and unlock relays
- Door lock/unlock motors
- Remote keyless entry system
- Radio/clock

A blown fuse is the probable cause. The remote keyless entry fuse 13 is located in the Junction Block. If neither terminal measures battery voltage, check for an open or shorted circuit to the Junction Block, repair as needed. If battery voltage is still not available, check the high current fuse G in the Power Distribution Center, located in the engine compartment.

To diagnose the Remote Keyless Entry (RKE) System, use a DRB III® scan tool and refer to Power Door Lock System in the proper Body Diagnostic Procedures manual.

DOOR CYLINDER LOCK SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(3) Disconnect the wiring clip and pigtail wire connector (Fig. 2).

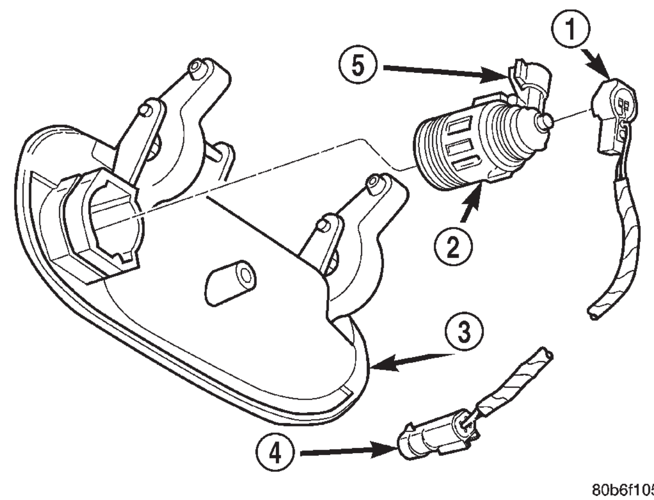

Fig. 2 DOOR CYLINDER LOCK SWITCH

(4) Remove the Door Cylinder Lock Switch from door lock cylinder.

DOOR CYLINDER LOCK SWITCH (Continued)

INSTALLATION

(1) Install the Door Cylinder Lock Switch onto the door lock cylinder.

(2) Connect the wiring clip and pigtail wire connector.

(3) Install door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION).

(4) Connect the battery negative cable.

DOOR LOCK MOTOR

DIAGNOSIS AND TESTING - DOOR LOCK MOTOR

Make certain battery is in normal condition before circuits are tested.

To determine which motor is faulty, check each individual door for electrical lock and unlock or disconnect the motor connectors one at a time, while operating the door lock switch. In the event that none of the motors work, the problem maybe caused by a shorted motor, a bad switch, or a bad relay. Disconnecting a defective motor will allow the others to work.

To test an individual door lock motor, disconnect the electrical connector from the motor. To lock the door, connect a 12 volt power source to the positive pin of the lock motor and a ground wire to the other pin (Fig. 3). To unlock the door reverse the wire connections at the motor pin terminals. If these results are NOT obtained, replace the motor.

The door lock motor is integral to the door latch. If found defective, the entire door latch must be replaced.

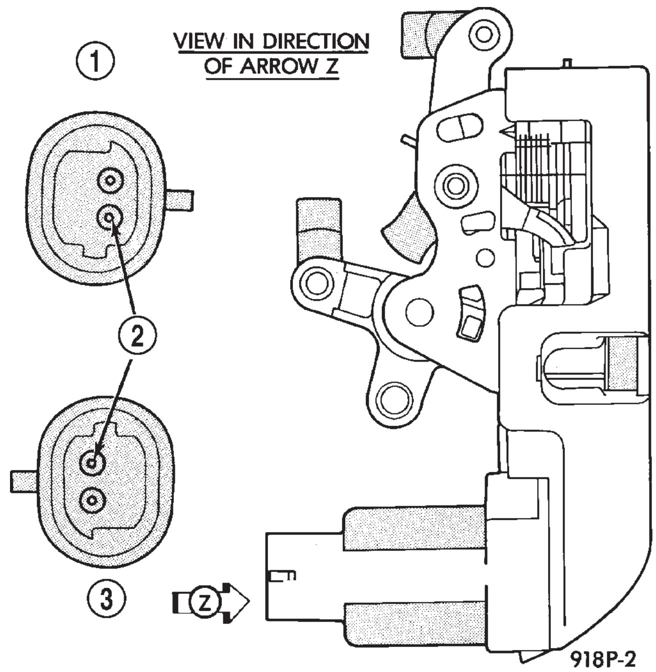

Fig. 3 DOOR LOCK MOTOR - TYPICAL

1 - PASSENGER SIDE CONNECTOR
2 - + TO LOCK

DOOR LOCK / UNLOCK SWITCH

DIAGNOSIS AND TESTING - DOOR LOCK / UNLOCK SWITCH

VOLTAGE

The following wiring test sequence determines whether or not voltage is continuous through the body harness to switch.

(1) Remove switch from door trim panel.

(2) Carefully separate multiple terminal block on wiring harness from switch body.

(3) Connect one lead of test light to a ground terminal:

• Touch other test light lead to battery feed B+ terminal.

• If test light comes on, the wiring circuit between the battery and switch is functional.

• If test light does not come on, check fuse 13 in the Junction Block for a blown fuse. Refer to Wiring Diagrams for circuit information.

DOOR LOCK SWITCH

Remove the switch from its mounting location. Using an ohmmeter, refer to the DOOR LOCK SWITCH CONTINUITY table to determine if the continuity is correct in the LOCK and UNLOCK switch positions. If these results are not obtained, replace the switch.

DOOR LOCK SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
LOCK	1 AND 4	2700 Ω ± 10%
UNLOCK	1 AND 4	620 Ω ± 10%

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - REMOVAL).

(3) Disconnect switch wire connector.

(4) Remove switch using a trim stick (special tool #C-4755) or equivalent.

DOOR LOCK / UNLOCK SWITCH (Continued)

INSTALLATION

(1) Install the switch by snapping into place.
(2) Connect switch wire connector.
(3) Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
(4) Connect the battery negative remote cable.

DECKLID RELEASE SOLENOID

DIAGNOSIS AND TESTING - DECKLID RELEASE SOLENOID

(1) Confirm motor lead wire is connected and 10 volts or more are available at solenoid.
(2) Provide proper ground through latch mounting screws.
(3) Remove latch and examine plunger. Plunger should spring back when pressed.
(4) Insure that solenoid plunger travel is adequate approximately 16 mm (5/8 inch).

REMOVAL

(1) Disconnect and isolate the negative battery cable remote terminal from the remote battery post.
(2) Raise deck lid to the full up position.
(3) Remove latch cover push pins then remove cover.
(4) Remove two retaining nuts to latch and motor, then remove latch and motor assembly.

INSTALLATION

(1) Install the latch and motor assembly. Install the two retaining nuts.
(2) Install latch cover and push pins.
(3) Close the deck lid.
(4) Connect the negative battery cable remote terminal to the remote battery post.

DECKLID RELEASE SWITCH

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post.
(2) Remove left lower instrument panel cover. Refer to Body, Instrument Panel, Left Lower Instrument Panel Trim, Removal.
(3) Disconnect the wire connector.
(4) Pinch four tabs around side of decklid release switch on the rear side of the left lower instrument panel trim, and push switch through opening.

INSTALLATION

(1) Position the decklid release switch over opening of the left lower instrument panel trim, and push switch through opening.
(2) Connect the wire connector.
(3) Install the left lower instrument panel cover. Refer to Body, Instrument Panel, Left Lower Instrument Panel Trim, Installation.
(4) Connect the negative battery cable remote terminal to the remote battery post.

KEYLESS ENTRY TRANSMITTER

STANDARD PROCEDURE - TRANSMITTER PROGRAMMING

The Remote Keyless Entry (RKE) Transmitter(s) can be programmed with the use of the DRB III® scan tool, or by the customer.

PROGRAMMING TRANSMITTER WITH THE DRB III® SCAN TOOL

For procedures on programming the transmitter(s) with the DRB III® scan tool, refer to the proper Body Diagnostic Procedures Manual.

PROGRAMMING BY CUSTOMER

For a customer to be able to program RKE transmitters themselves, at least one RKE transmitter must be programmed already. This procedure is to add additional transmitters. If all transmitters are lost, the DRB III® scan tool must be used to program the new transmitter(s).

(1) With ignition ON, press and hold the RKE UNLOCK button for at least 4 seconds. While holding the UNLOCK button, press the PANIC button.
(2) Verify that the Body Control Module (BCM) chimes to indicate that you have entered RKE transmitter programming mode.
(3) To program the RKE transmitters, press and hold the LOCK and UNLOCK buttons simultaneously for at least 3 seconds, and then press the UNLOCK button.
(4) Verify that the BCM chimes after each transmitter is programmed.
(5) To exit program mode, turn off ignition or wait 32 seconds. The BCM will chime again.

KEYLESS ENTRY TRANSMITTER (Continued)

SPECIFICATIONS

TRANSMITTER

BATTERY

The transmitter has two 3 volt batteries, which can be removed and replaced without special tools. Insert a dime in the side slot of the transmitter and twist. the halves should separate and the batteries are stacked on top of each other. The batteries are available at local retail stores. Recommended batteries are Panasonic CR 2016 or equivalent. Battery life is about two years.

RANGE

Operation range is within 12 meters (40 ft.) of the module/receiver.

REMOTE KEYLESS ENTRY MODULE

REMOVAL

(1) Disconnect the remote battery negative cable from the terminal on the shock tower.

The Junction Block and Body Control Module (BCM) are attached to each other. After removal they can be separated.

(2) Open the front driver's door and remove end cap.

(3) Remove instrument panel outboard bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - REMOVAL).

(4) Remove instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

(5) Remove instrument panel inboard bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - REMOVAL).

(6) Remove the left lower instrument panel trim.

(7) Remove silencer.

(8) Remove wire harness connectors from Junction Block.

(9) Remove Junction Block three mounting screws.

(10) Remove Junction Block/BCM by pulling straight down from the mounting bayonet.

(11) Disconnect BCM wire connectors and remove the assembly.

(12) Remove Junction Block/BCM from vehicle.

(13) With the Junction Block/BCM removed from the vehicle, separate the BCM from the Junction Block.

(14) Disconnect BCM from the Junction Block.

(15) Unsnap the remote keyless entry module from the BCM.

NOTE: The Remote Keyless Entry (RKE) module is attached to the BCM. This must be transferred (if equipped) to the new BCM if being replaced.

NOTE: If BCM is replaced, the VTSS must be enabled in the new BCM via the DRB III® in order to start the vehicle.

INSTALLATION

(1) Snap the remote keyless entry module onto the BCM.

(2) Connect BCM to the Junction Block.

(3) Connect the BCM and junction block together.

(4) Install the Junction Block/BCM into vehicle.

(5) Connect BCM wire connectors and install the assembly onto instrument panel.

(6) Install the Junction Block/BCM by pushing straight up.

(7) Install the Junction Block three mounting screws.

(8) Install the wire harness connectors to the Junction Block.

(9) Install the silencer.

(10) Install the left lower instrument panel trim.

(11) Install the instrument panel inboard bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - INSTALLATION).

(12) Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

(13) Install the instrument panel outboard bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TRIM - INSTALLATION).

(14) Install the left end cover.

(15) Connect the remote battery negative cable to the remote terminal on the shock tower.

POWER MIRRORS

TABLE OF CONTENTS

POWER MIRRORS

DESCRIPTION

Power mirrors are controlled by a single switch located on the instrument panel to the left of the steering column.

OPERATION

The power mirrors are connected to battery feed at all times. Each mirror head contains two electric motors and two drive mechanisms. One motor and drive controls mirror up-and-down movement, and the other controls right-and-left movement.

The vehicle is equipped with an Ignition Off Draw Fuse which is used when it is originally shipped from the factory. This fuse is located in the Junction Block and helps prevent battery discharge during storage when disconnected. This fuse is included in the power mirror circuitry and should be checked if the mirrors are inoperative.

DIAGNOSIS AND TESTING - POWER MIRRORS

(1) Disconnect and isolate the battery negative cable.

(2) Remove the power mirror switch. (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).

(3) Disconnect wire connector from the switch.

(4) Using two jumper wires, one connected to a 12 volt battery source, and the other connected to a good body ground. Refer to the Mirror Motor Test table for appropriate mirror response, using the mirror switch wiring harness connector (Fig. 1).

(5) If test results are not obtained as shown in the Mirror Motor Test table, check for open or shorted circuit, or replace mirror assembly as necessary.

If mirror motor tests OK, go to Mirror Switch Test.

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick, pry the trim bezel from the instrument panel.

(3) Disconnect wire harness connector from switch.

(4) Remove switch from bezel.

INSTALLATION

(1) Install switch to trim bezel.

(2) Connect wire harness connector to switch.

(3) Install trim bezel to instrument panel.

(4) Connect battery negative cable.

POWER SEAT SYSTEM

TABLE OF CONTENTS

POWER SEAT SYSTEM

DESCRIPTION

The power seat system on this model allows the driver to electrically adjust their seating positions in eight directions for optimum control and comfort, using the power seat switch located on the outboard seat cushion side shield (Fig. 1). The power seat system receives battery current through a 40 amp fuse in the Power Distribution Center (PDC) and a 20 amp circuit breaker in the junction block so that the power seats remain operational, regardless of the ignition switch position.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SIDE AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The power seat system allows the seating position to be adjusted forward, rearward, up, down, front up, front down, rear up, or rear down. A eight-way power seat is standard on premium models and optional on others. This option includes a six-way adjustable seat cushion track and a two-way power seat back. The eight-way power seat is also available with the heated seat system (Export Only). Refer to **Heated Seat System** for more information on the heated seat option. The power seat system includes the following components:

- Power seat switch
- Power seat track.
- Power seat system fuse and circuit breaker

Refer to Wiring Diagrams for complete circuit diagrams. Following are component descriptions, theory of operation and removal and installation procedures for the power seat system components.

Fig. 1 Driver Power Seat - Convertible

POWER SEAT SYSTEM (Continued)

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the power seat system.

DIAGNOSIS AND TESTING - POWER SEAT SYSTEM

WARNING: SOME VEHICLES ARE EQUIPPED WITH SEAT MOUNTED, SIDE AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

Before any testing of the power seat system is attempted, the battery should be fully-charged and all of the power seat system wire harness, connections and pins checked for damage. For complete circuit diagrams, refer to **Wiring Diagrams**.

With the dome lamp on, apply the power seat switch in the direction of the failure. If the dome lamp dims, the seat may be jamming. Check under and behind the seat for binding or obstructions. If the dome lamp does not dim, proceed with testing of the individual components and circuits in the power seat system.

VOLTAGE TEST

The following test will determine whether or not voltage is continuous through the body harness and to the seat switch.

(1) Remove the front seat cushion side shield from the seat to be tested. Refer to the Body section of the service manual for the procedure.

(2) Using a voltmeter, connect the ground lead to Pin 5 and positive lead to Pin 1 of the seat switch connector. If battery voltage is present circuit is OK. If no voltage is present check circuit breaker and repair as necessary.

CIRCUIT BREAKER TEST

Find correct circuit breaker on fuse block. Pull out slightly but be sure that circuit breaker terminals still contact terminals in fuse block. Connect ground wire of voltmeter to a good ground. With probe of voltmeter positive wire, check both terminals of circuit breaker for battery voltage. If only one terminal checks at battery voltage, circuit breaker is defective and must be replaced. If neither terminal shows battery voltage, check for open or shorted circuit to circuit breaker.

DRIVER SEAT SWITCH

DESCRIPTION

Vehicles equipped with power seats utilize a eight-way power seat switch. Hard-top models utilize an power seat switch with two knobs ganged together on the outboard seat cushion side shield. Convertible models utilize an power seat switch with three knobs ganged together. The switches are secured to the back of the seat cushion side shield with two screws. However, the control knobs for the hard-top eight-way power seat switch unit must be removed before the seat switch can be removed from the side shield.

The power seat can be adjusted in eight different ways using either of the power seat switches. The power seat can be adjusted up, down, forward, rearward, front up, front down, rear up and rear down, using either of the power seat switches.

The individual switches in the power seat switch module cannot be repaired. If one switch is damaged or faulty, the entire power seat switch module must be replaced. Refer to the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

OPERATION

When a power seat switch control knob or knobs are actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track or recliner adjuster motor. The selected adjuster motor operates to move the seat track or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel

DRIVER SEAT SWITCH (Continued)

limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker must not be allowed to continue, or the motor may be damaged. See the owner's manual in the vehicle glove box for more information on the power seat switch functions and the seat adjusting procedures.

DIAGNOSIS AND TESTING - DRIVER SEAT SWITCH

(1) Remove the power seat switch from its mounting position. Refer to the procedure in this section.

(2) Using an ohmmeter, perform the switch continuity tests. Refer to the appropriate Switch Continuity Test table and the seat switch connector (Fig. 2) or (Fig. 3)below. If there is no continuity in any of the switch positions, replace switch.

REMOVAL

(1) Open hood, disconnect and isolate the negative battery cable remote terminal from the remote battery post.

WARNING: SOME VEHICLES ARE EQUIPPED WITH SIDE AIRBAGS. BEFORE ATTEMPTING TO DIAGNOSE OR SERVICE ANY SEAT OR POWER SEAT SYSTEM COMPONENT YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(2) Remove the seat cushion side shield from the front seat (Fig. 4). Refer to the Body section of the service manual for the procedure.

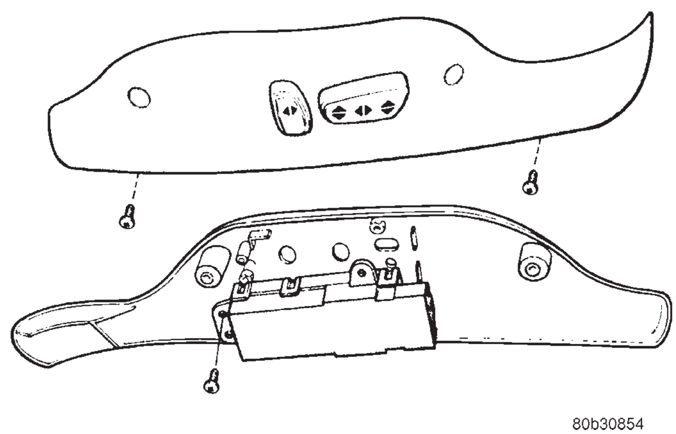

Fig. 4 Power Seat Switch - Hardtop Only

(3) On hardtop models, remove the knobs from the seat switch by gently prying straight off.
(4) Remove the switch attaching screws.
(5) Remove switch from cushion side shield

INSTALLATION

(1) Position the switch and install the switch attaching screws.
(2) Install the knobs on the switch (if required).
(3) Connect wiring electrical connector on switch.
(4) Install the seat cushion side shield. Refer to the Body section of the service manual for the procedure.
(5) Connect the negative battery cable remote terminal on the remote battery post.

POWER SEAT TRACK

DESCRIPTION

The eight-way power seat options include a single electrically operated power seat track unit located under the drivers seat. The power seat track unit replaces the standard equipment manual seat track. There are three reversible motors that operate the power seat adjuster. The motors are connected to worm-drive gearboxes that move the seat adjuster through a combination of screw-type drive units. The lower half of the power seat track is secured at the front with two bolts to the floor panel seat cross member, and at the rear with two bolts to the floor panel. Four fasteners secure the bottom of the seat cushion frame to four studs on the upper half of the power seat track unit.

The front and rear of a seat are operated by different motors. They can be raised or lowered independently of each other. When the center seat switch is pushed in the Up or Down direction, both the front and rear motors operate in unison. The forward-rearward motor is operated by pushing the center seat switch in the Forward or Rearward direction, which moves the entire seat in the selected direction on all models.

Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers must not be allowed to continue, or the motors may be damaged. Make the necessary repairs.

The power seat adjuster and motors cannot be repaired, and are serviced only as a complete unit. If any component in this unit is faulty or damaged, the entire power seat adjuster and motors assembly must be replaced.

OPERATION

The power seat track unit includes three reversible electric motors that are secured to the upper half of the track unit. Each motor moves the seat adjuster through a combination of worm-drive gearboxes and screw-type drive units.

The front and rear of the seat are operated by two separate vertical adjustment motors. These motors can be operated independently of each other, tilting the entire seat assembly forward or rearward; or, they can be operated in unison by selecting the proper power seat switch functions, which will raise or lower the entire seat assembly. The third motor is the horizontal adjustment motor, which moves the seat track in the forward and rearward directions.

DIAGNOSIS AND TESTING - POWER SEAT TRACK

(1) Remove power seat switch from seat.

(2) Disconnect wire harness connector.

(3) Check Pin 1 for battery voltage and Pin 5 for ground. On convertible models refer to step 5.

(4) To test the seat motors, refer to the, and verify proper seat responses. Using two jumper wires, connect one to a battery supply and the second to a ground. Connect the other ends to the seat wire harness connector as described in the Switch Harness Connector Circuit Test table (Fig. 5).

(5) Using a voltmeter, connect the ground lead to PIN B of the switch harness connector. Connect the positive lead to PIN A (Fig. 6). If battery voltage is present, the ground and voltage circuits to the power seat switch are OK. Check the power seat switch for proper operation (Refer to 8 - ELECTRICAL/POWER SEATS/DRIVER SEAT SWITCH - DIAGNOSIS AND TESTING). If the seat switch checks out OK, remove the seat assembly and check the circuits from the power seat switch to the power seat track adjuster motors for proper continuity. If the circuits appear to be OK, replace the power seat track and adjuster motors as an assembly.

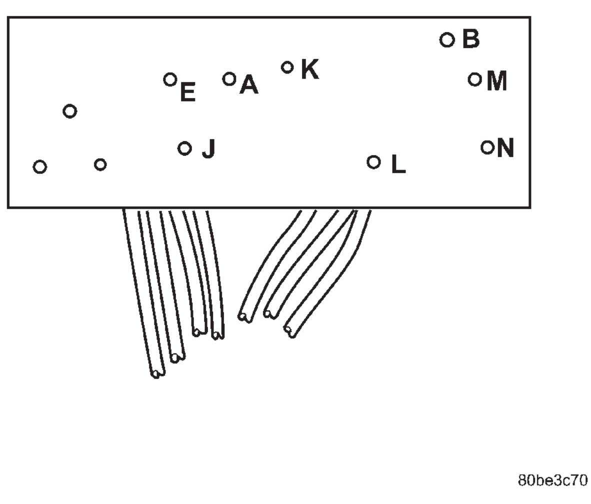

Fig. 6 Seat Switch Electrical Connector - Convertible

REMOVAL

Before the seat track can be removed, the front seat assembly must be removed from the vehicle. Refer to the Body section of this manual for the Front Seat Removal and Installation procedure.

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove the appropriate front seat from the vehicle. Once the front seat is removed, lay it on a clean surface upside down to expose the underside of the seat assembly.

(3) Remove the seat cushion side shields from the seat assembly. Refer to the Body section of this manual for the Seat Cushion Side Shield Removal and Installation procedure.

(4) Disconnect the necessary power seat electrical connectors.

(5) Remove the bolts retaining the power seat track to the seat assembly and remove.

INSTALLATION

(1) Position the seat track and install the retaining bolts. Torque the bolts to 12 N·m (108 in. lbs.).

(2) Connect the necessary power seat electrical connectors.

(3) Install the seat cushion side shields on the seat assembly. Refer to the Body section of this manual for the Seat Cushion Side Shield Installation procedure.

(4) Install the appropriate front seat in the vehicle. Refer to the Body section of this manual for the Seat Installation procedure.

(5) Connect the battery negative remote cable.

POWER WINDOWS

TABLE OF CONTENTS

POWER WINDOWS

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed through a 30 amp circuit breaker in the junction block, only when the ignition switch is in the RUN position.

The power top switch (JR27 only) has three distinct functions:

- **Top Down -** This is the first detent on the down side of the switch. Holding the switch in this position will lower the top only.
- **Top Down/4 window down -** This is the second detent on the switch. Holding the switch in this position lowers the convertible top and all 4 windows down simultaneously only if held in this position.
- **Top Up -** Holding the switch in this position raises the convertible top to the closed position. It will also lower all 4 windows approximately 3 inches to prevent seal damage.

The power window system includes the power window switches on each door trim panel, the circuit breaker in the junction block, and the power window motors inside each door. For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to Group 23 - Body.

OPERATION

Front and rear door window lift motors are of the permanent magnet type. A battery positive and negative connection to either of the two motor terminals will cause the motor to rotate in one direction. Reversing current through these same two connections will cause the motor to rotate in the opposite direction.

Each individual motor is grounded through the master switch.

DIAGNOSIS AND TESTING - POWER WINDOWS

CIRCUIT TEST

The following circuit test sequence determines whether or not voltage is continuous through the body harness to switch.

(1) Remove the driver door trim panel.

(2) Carefully separate wiring harness connector from switch body.

(3) Using a voltmeter, connect the ground lead to the Pin 10 of the wiring harness connector.

(4) Using the positive lead, check Pin 1 of the harness connector for battery voltage. If OK, refer to Window Switch Test. If not OK, check 30 amp circuit breaker in the Junction Block. If the circuit breaker is OK, repair wire as necessary. For wiring, specific connector type and location, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

POWER WINDOWS (Continued)

WINDOW DROP RELAY TEST - JR27 ONLY

The following test should be performed if all windows do not lower when the top switch is in the down position.

(1)
Check for battery voltage at pins 5, 11 and 12 of the window drop relay wire connector. If OK, go to Step 2. If not OK, check the circuit breaker and fuse or check for a shorted or open wire. Repair as necessary.

(2) Check pin 6 of the window drop relay wire connector for ground while pressing the top down switch. If not OK, check the power top up/down relay wiring. If OK, replace the window drop relay.

WINDOW DROP RELAY

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove door trim panel.

(3) Peel back the waterdam to expose the window drop relay.

(4) Disconnect the wire harness connector.

(5) Remove the window drop relay from the door panel.

INSTALLATION

(1) Install the window drop relay to the door panel.

(2) Connect the wire harness connector.

(3) Place the waterdam into position on the door panel,

(4) Install door trim panel.

(5) Connect the battery negative cable.

WINDOW MOTOR

DIAGNOSIS AND TESTING - WINDOW MOTOR

(1) Remove door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Connect positive (+) lead from a test battery to either of the two motor terminals.

(3) Connect negative (-) lead from test battery to remaining motor terminal.

(4) The motor should now rotate in one direction to either move window up or down.

(a) If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.

(b) Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.

(c) Reverse battery leads in Step 1 and Step 2 and window should now move. If window does not move, replace motor.

(5) If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.

(6) If window does not move, check to make sure that it is free.

(7) It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.

(8) To determine if the glass is free, disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the window regulator. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL).

WARNING: FAILURE TO CLAMP THE SECTOR GEAR TO THE MOUNTING PLATE WHEN REMOVING THE MOTOR CAN RESULT IN INJURY.

(3) Secure the sector and mounting plate with a C clamp or similar clamping tool. This will prevent a sudden and forceful movement of the regulator when the motor is removed.

(4) Remove the motor from the regulator.

INSTALLATION

(1) Install motor on regulator by positioning motor gearbox so that it engages regulator sector teeth. A slight rotational or rocking movement may be necessary to bring the motor gearbox mounting holes into proper position.

(2) Install the motor fasteners. Tighten to 8 N·m (70 in. lbs.).

(3) Install regulator. (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - INSTALLATION).

WINDOW SWITCH

DIAGNOSIS AND TESTING - WINDOW SWITCH

For switch testing, remove the switch. (Refer to 8 - ELECTRICAL/POWER WINDOWS/POWER WINDOW SWITCH - REMOVAL). Using an ohmmeter, refer to Window Switch Continuity Charts to determine if continuity is correct (Fig. 1) and (Fig. 2). If the results are not obtained, replace the switch.

The master window switch has an Auto-Down feature. Actuation of the master switch to the second down position will move the drivers side window completely down. The electronic switch will automatically disconnect the motor approximately 1 second after the window bottoms out. Failure of the electronic switch to detect stall current, will cause the switch to disconnect after approximately 13 seconds. The auto down function can be canceled by any movement of that switch.

RESTRAINTS

TABLE OF CONTENTS

RESTRAINTS

WARNING

WARNINGS

WARNING: THIS SYSTEM IS A SENSITIVE, COMPLEX UNIT. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE CABLE BEFORE BEGINNING AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION PROCEDURES. THIS WILL DISABLE THE AIRBAG SYSTEM. FAILURE TO DISCONNECT THE BATTERY COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.
ALLOW SYSTEM CAPACITOR TO DISCHARGE FOR TWO MINUTES BEFORE REMOVING AIRBAG COMPONENTS.
DO NOT PLACE AN INTACT UNDEPLOYED AIRBAG FACE DOWN ON A SOLID SURFACE, THE AIRBAG WILL PROPEL INTO THE AIR IF ACCIDENTALLY DEPLOYED AND COULD RESULT IN PERSONAL INJURY. WHEN CARRYING OR HANDLING AN UNDEPLOYED AIRBAG, THE TRIM SIDE OF THE AIRBAG SHOULD BE POINTING TOWARDS THE BODY TO MINIMIZE POSSIBILITY OF INJURY IF ACCIDENTAL DEPLOYMENT OCCURS.
REPLACE AIRBAG SYSTEM COMPONENTS WITH MOPAR® REPLACEMENT PARTS. SUBSTITUTE PARTS MAY APPEAR INTERCHANGEABLE, BUT INTERNAL DIFFERENCES MAY RESULT IN INFERIOR OCCUPANT PROTECTION.
WEAR SAFETY GLASSES, RUBBER GLOVES, AND LONG SLEEVED CLOTHING WHEN CLEANING POWDER RESIDUE FROM VEHICLE AFTER AIRBAG DEPLOYMENT. POWDER RESIDUE EMITTED FROM A DEPLOYED AIRBAG CAN CAUSE SKIN IRRITATION. FLUSH AFFECTED AREA WITH COOL WATER IF IRRITATION IS EXPERIENCED. IF NASAL OR THROAT IRRITATION IS EXPERIENCED, EXIT THE VEHICLE FOR FRESH AIR UNTIL THE IRRITATION CEASES. IF IRRITATION CONTINUES, SEE A PHYSICIAN.
DO NOT USE A REPLACEMENT AIRBAG THAT IS NOT IN THE ORIGINAL PACKAGING. IMPROPER DEPLOYMENT AND PERSONAL INJURY CAN RESULT.
THE FACTORY INSTALLED FASTENERS, SCREWS AND BOLTS USED TO FASTEN AIRBAG COMPONENTS ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. DO NOT USE SUBSTITUTE FASTENERS, USE ONLY ORIGINAL EQUIPMENT FASTENERS LISTED IN THE PARTS CATALOG WHEN FASTENER REPLACEMENT IS REQUIRED.
AIRBAGS SHOULD BE STORED IN A COOL DRY LOCATION AWAY FROM EXCESSIVE HEAT AND STATIC ELECTRICAL ACTIVITY WITH THE FABRIC AIRBAG FACING UP, A PREMATURE DEPLOYMENT CAN RESULT.

CAUTION:
Deployed and Nondeployed Air Bags may or may not have live pyrotechnic material within the air bag inflator. Do not dispose of Driver and Passenger Airbags unless you are sure of complete deployment. Please refer to the Hazardous Substance Control System for Proper Disposal. Dispose of deployed air bags in a manner consistent with state, provincial, local, and federal regulations.

DIAGNOSIS AND TESTING - AIRBAG SYSTEM

(1) With the battery negative remote cable disconnected, connect the DRB III® scan tool to the Data Link connector.
(2) Turn the ignition key to the ON position. Exit vehicle with the scan tool.
(3) After checking that no one is inside the vehicle, connect the battery negative remote terminal.
(4) Read and record the **ACTIVE** Diagnostic Trouble Code (DTC) data.
(5) Read and record any **STORED** DTC's.
(6) Refer to the proper Body Diagnostic Procedures manual if any DTC's are found in Step 4 and Step 5.
(7) Erase stored DTC's if there are no active codes. If problems remain, DTC's will not erase. Refer to the proper Body Diagnostic Procedures manual to diagnose the problem. If the airbag warning lamp either fails to light, or goes on and stays on, there is a system malfunction. Refer to the proper Body Diagnostic Procedures manual to diagnose the problem. To test the airbag warning lamp operation in the cluster only, refer to Electrical, Instrument Cluster, Diagnosis and Testing - Instrument Cluster.

STANDARD PROCEDURE - CLEAN UP

Roll or fold the Airbag towards the instrument panel surface or steering wheel and tape the door shut or the bag to the steering wheel.

Use a vacuum cleaner to remove any residual powder from the vehicle interior. Work from the outside in to avoid kneeling or sitting in a contaminated area. Vacuum the heater and A/C outlets as well. If the heater or air conditioner was in RECIRC mode at time of airbag deployment, operate blower motor on low speed and vacuum powder residue expelled from the heater and A/C outlets. Multiple vacuum cleaning may to necessary to clean the interior of the vehicle.

RESTRAINTS (Continued)

SERVICE OF DEPLOYED AIRBAG

DRIVER AIRBAG

After a Driver Airbag has been deployed:
- Driver Airbag
- Steering Wheel
- Clock Spring
- Steering Column assembly

The component above must be replaced because they cannot be reused. Replace any other components if damaged.

PASSENGER AIRBAG

After a Passenger Airbag has been deployed:
- Passenger Airbag
- Instrument Panel and Pad Assembly

The components above must be replaced. Inspect and replace others if damaged.

INSPECTION - AIRBAG SYSTEM MAINTENANCE

Check the airbag warning lamp for proper operation as follows:

(1) Turn the ignition switch to the ON position. The airbag warning lamp should illuminate. If it does not, test the system using a DRB III® scan tool and Body Diagnostic Procedures Manual. Repair as required. Erase stored DTC's.

(2) The airbag warning lamp lights, but fails to go out after ten seconds. Test the system using a DRB III® scan tool and the proper Body Diagnostic Procedures manual. Repair as required. Erasing stored Diagnostic Trouble Codes (DTC's) is not required.

CHILD TETHER CUP

REMOVAL

(1) Remove the rear shelf trim panel from vehicle.

(2) Turn the shelf panel over so that the bottom side is upward to access the Child Tether Cup locks.

(3) With a trim stick (special tool #C-4733) or equivelant, push attachment locks toward the center of the cup to release the Child Tether Cup from the rear shelf panel.

(4) Remove the Child Tether Cup.

INSTALLATION

(1) Place the Child Tether Cup into position on top of the rear shelf trim panel.

(2) Press rearward until cup engages into the rear shelf trim panel.

(3) Push the front of cup down into the rear shelf trim panel.

(4) Install the rear shelf panel.

CHILD TETHER CUP COVER

REMOVAL

(1) Open the Child Tether Cup Cover to the full open position.

(2) Push cover towards the rear of the vehicle until the cover detaches from the cup.

INSTALLATION

(1) Place the Child Tether Cup cover into position on top of the rear shelf trim panel.

(2) Push downward on the Child Tether Cup Cover until it locks into position (you will hear it click into place).

CLOCK SPRING

DESCRIPTION

The clock spring assembly is mounted near the top of the steering column behind the steering wheel. The clock spring is used to maintain a continuous electrical circuit between the fixed instrument panel wire harness connector on the steering column and several electrical components that rotate with the steering wheel. The rotating components include the driver airbag, the horn switch, and the vehicle speed control switches.

The clock spring cannot be repaired. If the clock spring is faulty, damaged, or if the driver airbag has been deployed, the clock spring must be replaced.

OPERATION

The clock spring assembly consists of a plastic case which contains a flat, ribbon-like, electrically conductive tape that winds and unwinds like a clock spring with the steering wheel rotation. The electrically conductive tape consists of several fine gauge copper wire leads sandwiched between two narrow strips of plastic film.

Like the clock spring in a timepiece, the clock spring tape has travel limits and can be damaged by being wound too tightly. To prevent this from occurring, the clock spring is centered when it is installed on the steering column. Centering the clock spring indexes the clock spring tape to other steering components so that it can operate within its designed travel limits. However, if the clock spring is removed for service or if the steering column is disconnected from the steering gear allowing the clock spring tape to change position relative to the other steering components, it must be re-centered following completion of the service or it may be damaged. Refer to Electrical, Restraints, Clock Spring, Standard Procedure - Clock Spring Centering.

CLOCK SPRING (Continued)

STANDARD PROCEDURE - CLOCK SPRING CENTERING

WARNING: IF THE ROTATING TAPE WITHIN THE CLOCK SPRING IS NOT POSITIONED PROPERLY WITH THE STEERING WHEEL AND THE FRONT WHEELS, THE CLOCK SPRING MAY FAIL DURING USE. THE CLOCK SPRING IS CENTERED WHEN YELLOW APPEARS IN THE CENTERING WINDOW AND THE ARROW ON THE LABEL POINTS TO THE DRIVE PIN. IF THE CLOCK SPRING IS NOT CENTERED, THIS PROCEDURE MUST BE USED TO CENTER THE CLOCK SPRING.

(1) Adjust the steering wheel so that the tires are in a straight ahead position.

(2) Remove driver airbag from steering wheel.

(3) Disconnect wire connectors from back of airbag.

(4) Remove steering wheel.

(5) Depress the plastic locking pin to disengage lock mechanism.

(6) With lock mechanism disengaged, rotate the clock spring rotor clockwise until the rotor stops. Do not apply excessive force.

(7) From the end of travel, rotate the rotor three turns counterclockwise. The wires should end up at the top. Release the plastic locking pin to engage clock spring lock mechanism.

(8) Install steering wheel and airbag.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

REMOVAL

(1) Disconnect and isolate the battery negative remote cable. Wait two minutes for the capasitor to discharge.

(2) Remove the steering wheel. Refer to Steering, Column, Steering Wheel, Removal. Carefully feed all wires through the steering wheel armature to avoid damaging wires. When replacing a deployed Driver Airbag, a new clock spring must be installed.

(3) Remove multi-function switch. Refer to Electrical, Lamps/Lighting - Exterior, Multi-Function Switch, Removal.

(4) Remove the clock spring by lifting the top lock housing latches up slightly to guide it over the lock housing. The clock spring cannot be serviced and must be replaced if defective, damaged, or the vehicle has sustained an impact where the front airbags were deployed.

INSTALLATION

If reinstalling a clock spring, make sure the clock spring is centered by performing the clock spring centering procedure. Refer to Electrical, Restraints, Clock Spring, Standard Procedure - Clock Spring Centering.

(1) Align the top locking tab with the slot on the lock housing. Gently push into place.

(2) Install the multi-function switch and tighten to 1.5 to 2.5 N·m (14 to 22 in. lbs.) torque. Refer to Electrical, Lamps/Lighting - Exterior, Multi-Function Switch, Installation.

(3) Carefully route the wires through the hole in the steering wheel armature and install the steering wheel.

(4) Route the speed control wires through guides located inside the steering wheel back cover. Connect the speed control wires to switches and install switches.

(5) Connect horn lead to the airbag mounting bracket.

(6) Connect the two yellow airbag leads (black and grey connectors) to the Driver Airbag and push secondary latch into place. Ensure the wires do not get pinched during installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

CURTAIN AIRBAG

DESCRIPTION

Vehicles equipped with the Side Impact Airbag System utilize two Curtain Airbags mounted in each respective side of the headliner, stretching from the middle of the A-pillar at the instrument panel along the roof line to the C-pillar at the rear shelf panel. This system is designed to provide supplemental restraint to driver or outboard passengers in the event of a side impact collision.

OPERATION

The Side Impact Airbag Control Module (SIACM) controls the curtain airbags. If the SIACM determines the impact is severe enough, the appropriate SIACM will send a message to inflate the respective curtain airbag. The appropriate airbag will inflate, dropping down from the ceiling between the headliner and windows/pillars, to provide supplemental restraint to driver or outboard passengers in the event of a side impact collision. Once a curtain airbag has been deployed, the complete curtain airbag, headliner, upper A, B, and C-pillar trim panel, and all damaged parts must be replaced on the deployed side.

CURTAIN AIRBAG (Continued)

REMOVAL

(1) Disconnect and isolate the battery negative remote cable. Wait two minutes for the capacitor to discharge.

(2) Remove the Headliner. Refer to Body, Interior, Headliner, Removal.

(3) Disconnect the wire harness connector from the rear of the inflator.

(4) Remove the retaining bolt to the front tether at the instrument panel on the A-pillar.

(5) Remove the five short retaining bolts along the roof line.

(6) Remove the four long retaining bolts to the rear along the roof line and at the C-pillar.

(7) Remove all push fasteners and discard. Make sure they are completely removed.

(8) Remove the curtain airbag from the vehicle.

INSTALLATION

If replacing curtain airbag because of an airbag deployment, the inflator pan (quarter trim upper support at C-pillar) must be inspected, especially if the vehicle is equipped with a sunroof. The sunroof drain is connected to the inflator pan, and if cracked, could result in leaks. Also, the headliner must be replaced due to crease lines occurring during the airbag deployment.

(1) Install the curtain airbag into the vehicle. Make sure the airbag is not twisted upon installation.

(2) Install all push fasteners.

(3) Install the two long retaining bolts at the C-pillar to attach inflator. Torque bolts to 11 ± 1 N·m (97.36 ± 10 in. lbs.).

(4) Install the remaining two long retaining bolts to attach the curtain airbag. Torgue bolts to 6 ± 1 N·m (97.36 ± 10 in. lbs.).

(5) Install the five short retaining bolts along the roof line. Torque bolts to 6 ± 1 N·m (53.11 ± 10 in. lbs.).

(6) Install the short retaining bolt to the front tether at the instrument panel on the A-pillar. Torque bolts to 6 ± 1 N·m (53.11 ± 10 in. lbs.). Make sure the tether is not twisted.

(7) Connect the wire harness connector to the rear of the inflator.

(8) Install the Headliner. Refer to Body, Interior, Headliner, Installation. Use a new headliner if curtain airbag was deployed on either side of the vehicle.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG

DESCRIPTION

WARNING: THE DRIVER AIRBAG TRIM COVER AND HORN SWITCH ASSEMBLY ARE THE ONLY SERVICEABLE PARTS OF THE DRIVER AIRBAG. DO NOT DISASSEMBLE OTHER PARTS WITHIN AS THEY ARE NOT SERVICEABLE.

The Driver Airbag located in the center of the steering wheel is the most visible part of the system. I contains the airbag inflator, cushion, cover assembly, and their supporting components. The airbag utilizes a dual stage inflator and two initiator wire connections. the trim cover assembly, consisting of cover and horn switch in the only serviceable part of the airbag. The cushion, inflator, and inflator adaptor are covered with a wrap so the cushion does not unfold when servicing the trim cover and horn switch assembly

OPERATION

When supplied with the proper electrical signal from the ORC, the inflator produces gas and discharges it directly into the pillow. The airbag will deploy and the pillow will fully inflate.

REMOVAL

(1) Open hood and disconnect the negative battery cable remote terminal from the remote battery post. Wait two minutes for the capacitor to discharge.

(2) Remove speed control switch screws from steering wheel back cover, remove switches and disconnect the wires.

(3) Remove two bolts retaining Driver Airbag.

(4) Lift airbag and disconnect the two Connector Positive Assurance (CPA) airbag initiators (Fig. 1), and horn switch wire connectors.

(5) Remove Driver Airbag from vehicle.

WARNING: WHEN REPLACING A DEPLOYED DRIVER AIRBAG, THE CLOCK SPRING MUST ALSO BE REPLACED. REFER TO ELECTRICAL, RESTRAINTS, CLOCK SPRING, REMOVAL, AND INSTALLATION.

DRIVER AIRBAG (Continued)

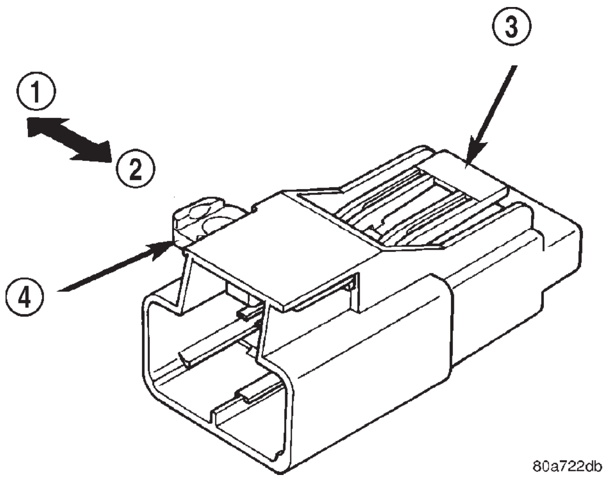

Fig. 1 CONNECTOR POSITIVE ASSURANCE (CPA) CONNECTOR

1 - UNLOCK
2 - LOCK
3 - PRESS LOCK
4 - RED LOCKING TAB

INSTALLATION

(1) With the battery disconnected, connect the lead wire from the clock spring to the horn switch and both airbag initiator connectors. The airbag initiator connectors are color-coded. The grey connector from the clock spring goes to the grey connector on the airbag, and the black connector goes to the black connector on the airbag.

(2) Install the two torx bolts holding the driver airbag. torque to 9.6 ± 1 N·m (85 ±10 in. lbs.).

(3) Connect the wire connectors to the speed control switches and install switches. Torque the speed control switch mounting screws to 1.5 N·m (13 in. lbs).

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

DRIVER AIRBAG TRIM COVER

REMOVAL

The horn switch is integral to the driver airbag trim cover. If the horn switch is faulty or the driver airbag cover is scratched or distorted, the driver airbag trim cover and horn switch unit must be replaced.

(1) Disconnect and isolate the battery negative remote cable. If either of the airbags has not been deployed, wait two minutes for the system capacitor to discharge before further service.

(2) Remove the driver airbag. Refer to Electrical, Restraints, Driver Airbag, Removal.

(3) Disconnect the horn switch ground wire (black) connector from the airbag mounting plate tab.

(4) Disconnect the horn switch feed wire (red) connector from the airbag mounting plate tab.

(5) Remove the four hex nuts that secure the airbag mounting plate to the airbag.

(6) Remove the airbag mounting plate form the airbag.

(7) Remove the airbag trim cover from the airbag inflator adaptor by rotating the trim cover mounting flaps off of the mounting studs and disengaging the three tab and slot details.

NOTE: The folded cushion will remain intact by the bag wrap. Do not remove the bag wrap when servicing the airbag trim cover.

INSTALLATION

WARNING: USE EXTREME CARE TO PREVENT ANY FOREIGN MATERIAL FROM ENTERING THE DRIVER AIRBAG, OR BECOMING ENTRAPPED BETWEEN THE AIRBAG CUSHION AND THE DRIVER AIRBAG TRIM COVER. FAILURE TO OBSERVE THIS COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.
THE DRIVER AIRBAG TRIM COVER MUST NEVER BE PAINTED. REPLACEMENT TRIM COVERS ARE SERVICED IN THE ORIGINAL COLORS. PAINT MAY CHANGE THE WAY IN WHICH THE MATERIAL OF THE TRIM COVER RESPONDS TO AN AIRBAG DEPLOYMENT. FAILURE TO OBSERVE THIS COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Carefully position the driver airbag in the trim cover. Be certain that the horn switch wires are routed properly in the notches adjacent to the trim cover upper mounting flap. Rotate the upper and lower trim cover mounting flaps over the four airbag studs. Ensure that the airbag inflator adapter tabs pass through the mating trim cover slots.

(2) Install the airbag mounting plate to the airbag. Be certain that the four studs pass through the mounting plate holes. Ensure that the mounting plate side flanges are positioned outside the trim cover ribbing.

(3) Install the four nuts on the airbag. Torque nuts to 9 ± 1 N·m (80 ± 10 in. lbs.).

(4) Secure the horn switch feed wire (red) connector to the airbag mounting plate.

(5) Secure the horn switch ground (black) connector to the airbag mounting plate tab.

DRIVER AIRBAG TRIM COVER (Continued)

(6) Install the driver airbag. Refer to Electrical, Restraints, Driver Airbag, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

FRONT SEAT BELT BUCKLE - JR27 ONLY

REMOVAL

NOTE: The torque prevailing nut holding the front seat belt buckle to the seat adjuster is not reusable. Verify availability prior to proceeding.

(1) Move seat to the rear most position.
(2) Disconnect and isolate the battery negative cable.
(3) Disconnect the electrical connectors to the seat belt buckle.
(4) Remove nut holding seat belt buckle to seat adjuster. Discard nut.
(5) Remove seat belt buckle from seat.

INSTALLATION

(1) Verify that the black spacer washer is properly installed over the shoulder of the weld nut on the seat adjuster.
(2) Install seat belt buckle to bolt on seat adjuster.
(3) Verify that the seat belt buckle is sitting on the shoulder of the weld nut on the seat adjuster.
(4) Install nut to hold seat belt buckle to seat adjuster. Tighten the seat belt buckle nut to 45 N·m (33 ft. lbs.) torque.

NOTE: Verify that a minimum of three threads extend beyond the seat belt buckle nut. If not, check that the bolt is fully engaged to the seat adjuster.

(5) Connect the electrical connectors to the seat belt buckle.
(6) Connect the battery negative cable.
(7) Readjust the seat.

FRONT SEAT BELT & RETRACTOR - JR27 ONLY

REMOVAL

Inspect the condition of the shoulder belt and lap belt. Replace any belt that is cut, frayed, torn, or damaged in any way. Also, replace the shoulder belt if the retractor is either damaged or inoperative.

(1) Disconnect and isolate the battery negative cable.
(2) Remove the front seat from vehicle. Refer to Body, Seats, Front Seat, Removal.

NOTE: The torque prevailing nut used to secure the lower seat belt anchor is not reusable. Verify availability prior to proceeding.

(3) Remove seat back cover to gain access to seat belt retractor. Refer to Body, Seats, Front Seat Cover, Removal.
(4) Remove seat belt retractor cover.
(5) Remove and discard bolts attaching seat belt retractor to seat frame (Fig. 2).

CAUTION: Do not reuse the bolts attaching the seat belt retractor to the seat frame.

(6) Remove seat belt retractor from seat frame.
(7) Disconnect wire connector from seat belt retractor.

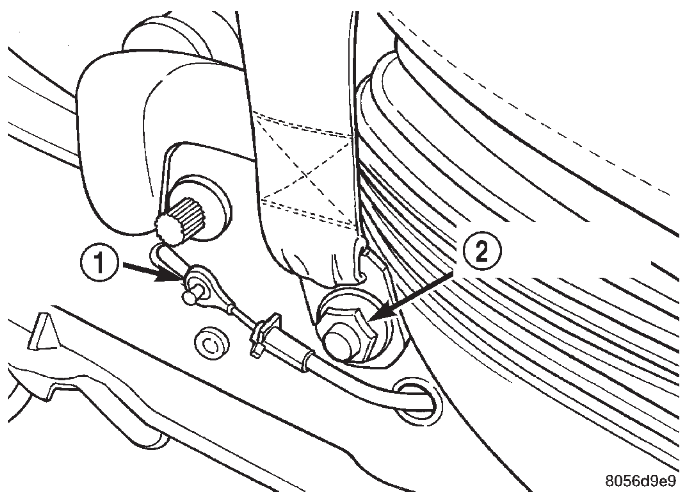

Fig. 2 LOWER SEAT BELT ANCHOR AND RECLINER CABLE

1 - RECLINER CABLE
2 - LOWER SEAT BELT ANCHOR

FRONT SEAT BELT & RETRACTOR - JR27 ONLY (Continued)

INSTALLATION

Inspect the condition of the shoulder and lap belt. Replace any belt that is cut, frayed, torn, or damaged in any way. Also, replace the shoulder belt if the retractor is either damaged or inoperative.

(1) Position seat belt retractor to seat frame.

(2) Connect wire connector to seat belt retractor.

(3) Install new bolts to hold seat belt retractor to seat frame. Tighten the retractor bolts to 16.2 N·m (12 ft. lbs.) torque.

(4) Install seat belt retractor cover.

(5) Install seat cover. Refer to Body, Seats, Front Seat Cover, Installation.

(6) Attach lower seat belt anchor to bolt on seat adjuster.

(7) Verify that seat belt is routed such that it will not be twisted when engaged to the seat belt buckle.

(8) Verify that a minimum of three threads extend beyond the lower seat belt anchor nut and that the lower seat belt anchor swivels freely. If both conditions are not found, check that the bolt is fully engaged to the seat adjuster.

(9) Install seat in vehicle. Refer to Body, Seats, Front Seat, Installation.

CAUTION: Failure to follow proper installation procedure may result in the seat track latch pins not being synchronized.

(10) Connect the battery negative cable.

OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

The Occupant Restraint Controller (ORC) contains the impact sensor and energy reserve capacitor. The sensor is calibrated for the specific vehicle and reacts to the severity and direction of the impact.

OPERATION

The ORC monitors the system to determine the system readiness. The ORC stores sufficient energy to deploy the airbags in case battery power is lost prior to impact. The ORC contains on-board diagnostics, and illuminates the AIRBAG warning lamp in the cluster when a diagnostic trouble code occurs. The warning equipment is tested for a few seconds every time the vehicle is started.

REMOVAL

(1) Disconnect and isolate the battery negative remote cable. Wait two minutes for the capacitor to discharge.

(2) For a manual transmission, remove shifter knob and boot.

(3) For automatic transmission models, remove shifter knob and unsnap shift indicator bezel.

(4) Remove the four attaching screws to floor console.

(5) Remove parking brake lever. Refer to Brakes, Parking Brake, Parking Brake Lever, Removal.

(6) Remove three mounting nuts to ORC.

(7) Disconnect wire harness connectors and remove ORC from mounting studs.

INSTALLATION

CAUTION: Use supplied nuts only.

(1) With the battery disconnected, position the ORC (arrow pointing forward) on center tunnel area mounting studs.

(2) Connect wire harness connector.

(3) Attach the three mounting nuts and tighten to 10 to 14 N·m (85 to 125 in. lbs.) torque.

(4) Install the parking brake lever. Refer to Brakes, Parking Brake, Parking Brake Lever, Installation.

(5) Install the floor console.

(6) Install the four attaching screws to floor console.

(7) For automatic transmission models, install the shift indicator bezel and shifter knob.

(8) For a manual transmission, install the shifter boot and knob.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

PASSENGER AIRBAG

DESCRIPTION

WARNING: NEVER DISASSEMBLE THE PASSENGER AIRBAG, THERE ARE NO SERVICEABLE PARTS WITHIN.

The most visible part of the Passenger Airbag is the passenger airbag decorative cover located just above the front right side of the instrument panel.

The passenger airbag is mounted to the instrument panel assembly. The passenger inflator assembly is within the airbag housing. The airbag is mounted to the instrument panel retainer and support structure.

The Passenger Airbag consists of:

- Dual Initiator Inflator Assembly

PASSENGER AIRBAG (Continued)

- Reaction Canister
- Airbag Pillow
- Passenger Airbag Cover/Door

OPERATION

When supplied with the proper electrical signal from the ORC, the inflator produces gas and discharges it directly into the pillow. The airbag will deploy and the pillow will fully inflate.

REMOVAL

If the airbag has been deployed, the instrument panel and pad assembly must be replaced.

(1) Disconnect and isolate the battery negative remote cable. Wait two minutes for the capacitor to discharge.

(2) Open and lower glove box fully to gain access to Passenger Airbag attaching screws inside of the glove box. Glove box removal not required.

(3) Disconnect wire connector from the Passenger Airbag.

(4) Remove the two nuts and two screws attaching airbag assembly to the instrument panel collar. The two nuts are on the outer sides of the passenger airbag, underneath up near the top of the instrument panel. The two screws are mounted straight through the tabs at the bottom front of the airbag, in the instrument panel reinforcement.

(5) Disengage airbag door tabs from the instrument panel retainer and lift the Passenger Airbag up and out of panel cavity.

INSTALLATION

If replacing Passenger Airbag due to a deployment, use a new instrument panel and pad assembly. Transfer all of the components.

(1) With the battery disconnected, place the Passenger Airbag into the panel cavity. Press the airbag door tabs down to engage on the instrument panel retainer.

(2) Install the two nuts and two screws attaching airbag assembly to the instrument panel collar and torque nuts and screws to 7.5 ± 1 N·m (66 in. lbs.). The two nuts are on the outer sides of the passenger airbag, underneath up near the top of the instrument panel. The two screws are mounted straight through the tabs at the bottom front of the airbag, in the instrument panel reinforcement.

(3) Connect Passenger Airbag wire connector.

(4) Pinch in on sides of the glove box and raise it up into the instrument panel opening.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

REAR SEAT BELT BUCKLE - JR27 ONLY

REMOVAL

(1) Remove rear seat cushion. Refer to Body, Seats, Rear Seat Cushion, Removal.

(2) Remove nuts holding seat belt buckle assembly to floor pan.

(3) Remove rear seat belt buckle assembly (Fig. 3).

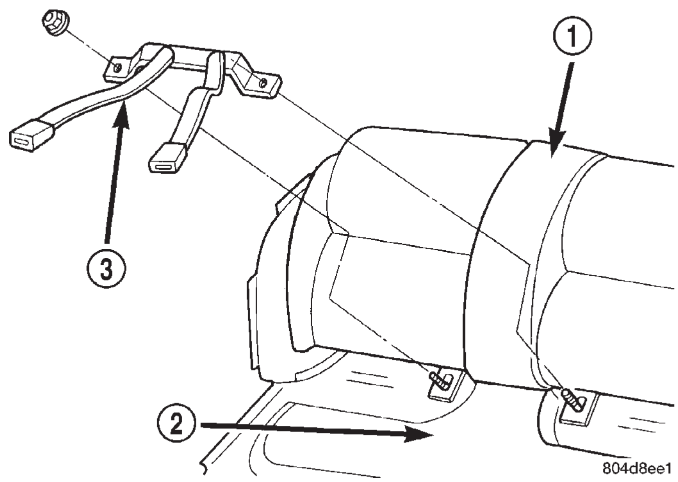

Fig. 3 REAR SEAT BELT BUCKLE ASSEMBLY

1 - REAR SEAT BACK
2 - FLOOR PAN
3 - REAR SEAT BELT BUCKLE ASSEMBLY

INSTALLATION

(1) Position rear seat belt buckle assembly onto studs on floor pan (Fig. 3).

(2) Install nuts holding rear seat belt buckle assembly to floor pan. Torque rear seat belt buckle assembly nuts to 40 N·m (350 in. lbs.).

(3) Install rear seat cushion. Refer to Body, Seats, Rear Seat Cushion, Installation.

REAR SEAT BELT & RETRACTOR - JR27 ONLY

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove rear seat cushion. Refer to Body, Seats, Rear Seat Cushion, Removal.

(3) Remove rear seat back. Refer to Body, Seats, Rear Seat Back, Removal.

(4) Remove quarter trim panel. Refer to Body, Interior, Lower Quarter Trim Panel, Removal.

(5) Remove bolt attaching seat belt anchor to floor pan (Fig. 4).

(6) Remove bolt attaching seat belt retractor to rear seat support assembly.

(7) Remove rear seat belt and retractor assembly from vehicle.

INSTALLATION

(1) Position rear seat belt and retractor assembly to rear seat support assembly.

(2) Engage hook on seat belt retractor to slot in rear seat support assembly.

(3) Install bolt attaching seat belt retractor to rear seat support assembly. Tighten seat belt fastener to 40 N·m (350 in. lbs.) torque.

(4) Route seat belt through channel and snap bezel onto top of channel.

(5) Install bolt attaching seat belt anchor to floor pan. Tighten seat belt fastener to 40 N·m (350 in. lbs.) torque.

(6) Verify that seat belt is not twisted when engaged to seat belt buckle and that the tab on the lower seat belt anchor is between the formations on the floor pan (Fig. 4).

(7) Install quarter trim panel. Refer to Body, Interior, Lower Quarter Trim Panel, Installation.

(8) Install rear seat back. Refer to Body, Seats, Rear Seat Back, Installation.

(9) Install rear seat cushion. Refer to Body, Seats, Rear Seat Cushion, Installation.

(10) Connect the battery negative cable.

SEAT BELT HEIGHT ADJUSTER

REMOVAL

(1) Remove adjuster knob and turning loop cover.

(2) Remove bolt attaching turning loop to belt height adjuster.

(3) Remove upper B-pillar trim panel.

(4) Remove bolt attaching seat belt height adjuster to B-pillar.

(5) Remove seat belt height adjuster from vehicle.

INSTALLATION

(1) Place seat belt height adjuster into position.

(2) Install two bolts attaching seat belt height adjuster to B-pillar. Torque bolts to 55 ± 5 N·m (40.5 ± 5 ft. lbs.).

(3) Install upper B-pillar trim panel.

(4) Install the bolt attaching the turning loop to the height adjuster. Torque bolt to 55 ± 5 N·m (40.5 ± 5 ft. lbs.).

(5) Install turning loop cover and adjuster knob.

TAPPING PLATE REPAIR

The Tapping Plate used to mount the seat belt height adjuster is designed to deform outboard during certain significant vehicle crash events. Should a deformed tapping plate be found on a damaged vehicle that is to be repaired, the following procedure can be used to reposition the tapping plate relative to the B-pillar, thus enabling replacement of the seat belt height adjuster.

(1) Using a large diameter screw socket as a spacer, hand start a three inch 7/16–20 bolt and washer into the threaded tapping plate hole.

(2) Continue to apply blt torque and deform the tapping plate back flush with the B-pillar inner.

SEAT BELT - REAR INBOARD

REMOVAL

(1) Remove rear seat cushion.

(2) Remove nut attaching seat belt to floor (Fig. 5).

(3) Remove seat belt from vehicle.

SEAT BELT - REAR INBOARD (Continued)

INSTALLATION

(1) Place seat belt in position.

(2) Install nut attaching seat belt to floor. Tighten nut to 61 ± 5 N·m (83 ± 5 ft. lbs.) torque.

(3) Install rear seat cushion.

SEAT BELT - REAR OUTBOARD

REMOVAL

(1) Remove rear seat cushion.

(2) Remove bolt attaching seat belt anchor to floor pan.

(3) Remove upper and lower quarter trim panel.

(4) Remove bolt attaching rear D-ring to quarter upper panel.

(5) Remove bolt attaching rear seat belt retractor to inner quarter panel.

(6) Remove retractor and belt from vehicle.

INSTALLATION

(1) Place retractor and belt into position.

(2) Install bolt attaching rear seat belt retractor to inner quarter panel. Torque bolt to 40 N·m (29.5 ft. lbs.).

(3) Route seat belt webbing and D-ring through upper trim panel. Install bolt attaching D-ring to quarter panel. Torque bolt to 40 N·m (29.5 ft. lbs.).

(4) Install upper quarter trim panel.

(5) Install bolt attaching seat belt anchor to floor pan. Torque bolt to 40 N·m (29.5 ft. lbs.).

(6) Install rear seat cushion.

SEAT BELT & RETRACTOR - FRONT OUTBOARD

DESCRIPTION

The seat belt system incorporates Tensioner Modules. They are integral to the front seat belt retractors and cannot be serviced. If found defective they must be replaced. In the event of an impact, the retractor assembly must be replaced regardless of belt condition. The tensioner is a one time pyrotechnic device.

OPERATION

At the onset of an impact event, each tensioner uses a pyrotechnic device which is triggered simultaneously with the front airbags to rapidly retract the seat belts. With the slack removed, the occupant's forward motion in an impact will be reduced as will the likelihood of contacting interior components. After an impact that deploys the airbags, the seat belt tensioner assembly must be replaced.

The Occupant Restraint Controller (ORC) monitors the seat belt tensioner circuit resistance and reports active and stored Diagnostic Trouble Codes (DTC's) if any problem is found.

WARNING: WHEN THE FRONT AIRBAG IS DEPLOYED, THE TENSIONER WILL HAVE DEPLOYED ALSO AND MUST BE REPLACED.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove adjuster knob and turning loop cover.

(3) Remove bolt that attaches the turning loop to the height adjuster.

(4) Remove upper B-pilllar trim panel.

(5) Remove the lower B-pillar trim panel.

(6) Disconnect the wire harness connector from the B-pillar retractor.

(7) Remove the bolt attaching the seat belt retractor (and lower anchor) to the base of the B-pillar.

(8) Remove retractor and belt from vehicle.

INSTALLATION

(1) Place retractor and belt into position.

(2) Install bolt attaching seat belt retractor and lower anchor to the base of the B-pillar. Torque bolt to 55 ± 5 N·m (40.5 ft. lbs.).

(3) Connect retractor wire harness connector to the B-pillar.

(4) Route belt and install the lower B-pillar trim panel.

(5) Install the upper B-pillar trim and bolt that attaches the turning loop to the height adjuster. Torque bolt to 55 ± 5 N·m (40.5 ft. lbs.).

(6) Install the turning loop cover and adjuster knob.

(7) Connect the battery negative remote cable.

SEAT BELT & RETRACTOR - REAR CENTER

REMOVAL

(1) Remove the rear shelf trim panel. Refer to Body, Interior, Rear Shelf Trim Panel, Removal.

(2) Remove the nut attaching the center rear seat belt retractor to the rear shelf.

(3) Remove rear seat cushion.

(4) Remove nut attaching center rearr seat belt anchor to floor pan.

(5) Remove the center rear seat belt retractor assembly from the vehicle.

INSTALLATION

WARNING: INSPECT THE CONDITION OF THE SHOULDER/LAP BELT. REPLACE THE RETRACTOR IF THE BELT IS CUT, FRAYED, TORN, OR DAMAGED IN ANY WAY.

(1) Install the center rear seat belt retractor assembly on the rear shelf. Torque the bolt to 40 N·m (30 ft. lbs.).

(2) Route webbing and bezel through rear shelf trim panel.

(3) Install the rear shelf trim panel. Refer to Body, Interior, Rear Shelf Trim Panel, Installation.

(4) Install the nut attaching the center rear seat belt anchor to the floor pan stud. Be certain the rear seat belts are properly routed to avoid twisted or tangled belts and/or buckles. Torque nut to 40 N·m (30 ft. lbs.).

(5) Install the rear seat cushion.

WARNING: THE REAR SEAT BACK RETAINING NUT ALSO SERVES AS THE CENTER SEAT BELT ANCHOR (Fig. 3). BE CERTAIN TO TORQUE THIS NUT TO 40 N·m (30 ft. lbs.).

SEAT BELT TENSIONER - JR27 ONLY

DESCRIPTION

The seat belt system incorporates Seat Belt Tensioners. The tensioner is designed to hold the occupant in their respective seat by retracting the seat belt up to four inches. They are integral to the front seat belt buckles and cannot be serviced. If found defective they must be replaced. After an airbag deployment, the tensioner must be replaced.

OPERATION

At the onset of an impact event, each tensioner uses a pyrotechnic device which is triggered simultaneously with the airbags to rapidly retract the seat belts. With the slack removed, the occupant's forward motion in an impact will be reduced as will the likelihood of contacting interior components. After an impact that deploys the airbags, the seat belt tensioner assembly must be replaced.

The Occupant Restraint Controller (ORC) monitors the seat belt tensioner circuit resistance and reports active and stored Diagnostic Trouble Codes (DTC's) if any problem is found.

Once a vehicle has been in an accident, the tensioner must be replaced along with any deployed airbags and broken or damaged parts. Refer to the proper Body Diagnostic Procedures manual for diagnosis and testing.

WARNING: WHEN THE FRONT AIRBAG IS DEPLOYED, THE TENSIONER WILL HAVE DEPLOYED ALSO AND SHOULD BE REPLACED.

SIDE IMPACT AIRBAG CONTROL MODULE

DESCRIPTION

Vehicles equipped with side impact airbags use two Side Impact Airbag Control Modules (SIACM). One is located on each respective side body B-pillar.

SIDE IMPACT AIRBAG CONTROL MODULE (Continued)

OPERATION

The impact sensor provides verification of the direction and severity of the side impact. The right side SIACM controls the right seat airbag. The left side SIACM controls the left seat airbag. In the event of a side impact the appropriate SIACM will send an electronic signal to its airbag, deploying the airbag. The SIACM communicates with the Occupant Restraint Controller (ORC) via the PCI bus circuit.

The accelerometer pulses are sent to a microprocessor, which contains a decision algorithm. When an impact is severe enough to require airbag protection, the SIACM microprocessor sends a signal to deploy the side airbag that completes the electrical circuits to the right or left side airbag. The sensor is calibrated for the specific vehicle and reacts to the severity and direction of the impact.

Each SIACM has its own energy reserve capacitor. This is to insure that the airbag may be fired even if the battery power is lost at time of impact.

REMOVAL

(1) Disconnect and isolate the battery negative cable remote terminal.

(2) Remove the lower B-pillar trim from the appropriate side of the vehicle. Refer to Body, Interior, B-Pillar Lower Trim, Removal.

(3) Disconnect the side impact airbag control module electrical connector.

(4) Remove the SIACM retaining screws and remove the module from the vehicle.

INSTALLATION

(1) Position the SIACM in B-pillar and install the retaining screws. Torque the screws to 10 N·m (85 in. lbs.).

(2) Connect the SIACM electrical connector.

(3) Install the lower B-pillar trim. Refer to Body, Interior, B-Pillar Lower Trim, Installation.

WARNING: DO NOT CONNECT THE BATTERY NEGATIVE CABLE REMOTE TERMINAL. REFER TO ELECTRICAL, RESTRAINTS, DIAGNOSIS AND TESTING - AIRBAG SYSTEM FIRST.

SPEED CONTROL

TABLE OF CONTENTS

SPEED CONTROL

DESCRIPTION

DESCRIPTION

The speed control system is electronically controlled and vacuum operated. The electronic control is integrated into the Powertrain Control Module. The controls are located on the steering wheel. The ON/OFF, and SET buttons are located on the left side of the airbag module. The RESUME/ACCEL, CANCEL and COAST buttons are located on the right side of the airbag module (Fig. 1).

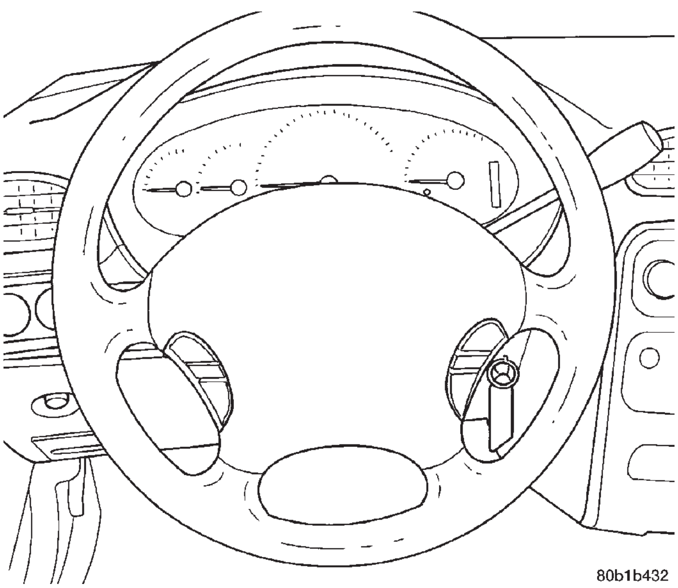

Fig. 1 SPEED CONTROL SWITCHES - Typical

The system is designed to operate at speeds above 30 mph (48 km/h).

WARNING: THE USE OF SPEED CONTROL IS NOT RECOMMENDED WHEN DRIVING CONDITIONS DO NOT PERMIT MAINTAINING A CONSTANT SPEED, SUCH AS IN HEAVY TRAFFIC OR ON ROADS THAT ARE WINDING, ICY, SNOW COVERED, OR SLIPPERY.

INTERACTIVE SPEED CONTROL

DESCRIPTION

Interactive means that communication between the PCM and the TCM is taking place. Interactive speed control avoids unnecessary shifting for smoother, quieter operation and when downshifts are required, makes the shifts smoother.

CLIMBING A GRADE

DESCRIPTION

When climbing a grade the interactive speed control tries to maintain the set speed by increasing the throttle opening, while inability/delaying downshifts.

OPERATION

If opening the throttle alone cannot maintain the set speed and the vehicle speed drops more than three mph below the set speed, the transmission will downshift to third gear. If the vehicle continues to lose speed, by more than 6 mph, the transmission will downshift again maintain the set speed. After the vehicle encounters a less-steep grade, or has crested the grade (reduced the load on the powertrain) and can maintain the set speed at a reduced throttle position, the transmission will upshift, as appropriate, until the set speed can be maintained in Overdrive.

SPEED CONTROL (Continued)

DOWNSHIFT DELAY

DESCRIPTION

Downshift delay features have been added to reduce the number and frequency of downshifts when operating in hilly or mountainous country.

OPERATION

While operating, interactive speed control delays or avoids downshifts by allowing up to nearly wide open throttle without the TCM scheduling a downshift. If the interactive speed control is not engaged or the throttle is manually overridden by the driver while interactive speed control is engaged, the downshift delay feature is not activated.

Torque converter lock and unlock shifts are not affected by the downshift delay feature and will occur at the same throttle angle at a given speed regardless of whether interactive speed control operates or not.

GRADE HUNTING

DESCRIPTION

All vehicles equipped with a four speed automatic transmission have a grade hunting feature for the 2nd to 3rd gear upshift and the 3rd to Overdrive upshift.

OPERATION

The TCM identifies the powertrain loading conditions and selects the proper gear to maintain the current vehicle speed. Under moderate loading conditions the transaxle will stay in 3rd gear until the top of the grade is reached or the powertrain loading is reduced.

If powertrain loading is severe, the transaxle may shift into 2nd gear and remain there until powertrain loading is reduced, then a 2nd to 3rd gear upshift will be scheduled. Grade hunting features always operate regardless of whether or not the interactive speed control is engaged. **If the interactive speed control is not engaged and powertrain loading is not reduced, the driver may have to completely lift off of the throttle before an upshift will occur**. If the driver does lift off the throttle to induce an upshift under these conditions, vehicle speed will reduce and the Overdrive to 3rd and 3rd to 2nd gear downshifts will reoccur when the throttle is reapplied. If grade hunting is repeatedly induced by the driver, transaxle damage may result.

AUTOMATIC SPEED CONTROL OVERSPEED REDUCTION

DESCRIPTION

Transmission control software includes an automatic speed control overspeed reduction feature. This maintains vehicle speed at the selected set point when descending a grade.

OPERATION

The Transmission Control Module (TCM) first senses that the speed control is set. If the set speed is exceeded by more than 4 mph (6.5 km/hr) and the throttle is closed, the TCM causes the transaxle to downshift to THIRD gear. After downshifting, the automatic speed control resumes normal operation. To ensure that an upshift is appropriate after the set speed is reached, the TCM waits until the speed control system opens the throttle at least 6 degrees before upshifting to OVERDRIVE again.

If the driver applies the brakes, canceling automatic speed control operation with the transaxle still in THIRD gear, the TCM maintains this gear until the driver opens the throttle at least 6 degrees to avoid an inappropriate upshift. The upshift is also delayed for 2.5 seconds after reaching the 6 degrees throttle opening in anticipation that the driver might open the throttle enough to require THIRD gear. This will avoid unnecessary and disturbing transmission cycling. If the automatic speed control RESUME feature is used after braking, the upshift is delayed until the set speed is achieved to reduce cycling and provide better response.

OPERATION

When speed control is activated by depressing the ON switch, the PCM allows a set speed to be stored in RAM for speed control. To store a set speed, depress and release the SET switch while the vehicle is moving at a speed between 25 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral. The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.
- Depressing the clutch pedal
- Operating in 1st or 2nd gear (autostick, if equipped)

NOTE: Turning the system off by depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM.

SPEED CONTROL (Continued)

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral
- A rapid increase rpm (indicates that the clutch has been disengaged)
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph per second (indicates that the co-efficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)
- If the actual speed is greater than 20 mph over the set speed.
- Autostick shifts into 1st or 2nd gear (autostick, if equipped)

Once the speed control has been disengaged, depressing the RESUME switch when speed is greater than 25 mph allows the vehicle to resume control to the target speed that was stored in the PCM.

While the speed control is engaged, the driver can increase the vehicle speed by depressing the ACCEL switch. The new target speed is stored in the PCM when the ACCEL switch is released. The PCM also has a ″tap-up″ feature in which target speed increases by 2 mph for each momentary switch activation of the ACCEL switch. The PCM also provides a means to decelerate to a new lower target speed without disengaging speed control. Depress and hold the COAST switch until the desired speed is reached, then release the switch.

The PCM also has a “Tap Down” feature in which target speed decreases at 1 mph for each momentary switch activation of the coast switch.

SERVO

DESCRIPTION

The servo unit consists of a solenoid valve body, and a vacuum chamber. The solenoid valve body contains three solenoids:

- Vacuum
- Vent
- Dump

The vacuum chamber contains a diaphragm with a cable attached to control the throttle linkage.

OPERATION

The PCM controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. The servo unit cannot be repaired and is serviced only as a complete assembly.

Power is supplied to the servo by the PCM through the brake switch. The PCM controls the ground path for the vacuum and vent solenoids.

The dump solenoid is energized anytime it receives power. If power to the dump solenoid is interrupted, the solenoid dumps vacuum in the servo. This provides a safety backup to the vent and vacuum solenoids.

The vacuum and vent solenoids must be grounded by the PCM to operate. When the PCM grounds the vacuum servo solenoid, the solenoid allows vacuum to enter the servo and pull open the throttle plate using the cable. When the PCM breaks the ground, the solenoid closes and no more vacuum is allowed to enter the servo. The PCM also operates the vent solenoid via ground. The vent solenoid opens and closes a passage to bleed or hold vacuum in the servo as required.

The PCM cycles the vacuum and vent solenoids to maintain the set speed, or to accelerate and decelerate the vehicle. To increase throttle opening, the PCM grounds the vacuum and vent solenoids. To decrease throttle opening, the PCM removes the grounds from the vacuum and vent solenoids.

REMOVAL

(1) Disconnect the negative battery cable (Fig. 2).

(2) Remove 2 nuts attaching servo bracket to shocktower.

(3) Disconnect electrical connectors and vacuum hose.

(4) Remove two nuts attaching speed control cable and mounting bracket to servo.

(5) Pull cable away from servo to expose retaining clip and remove clip attaching cable to servo (Fig. 3).

(6) Remove servo mounting bracket.

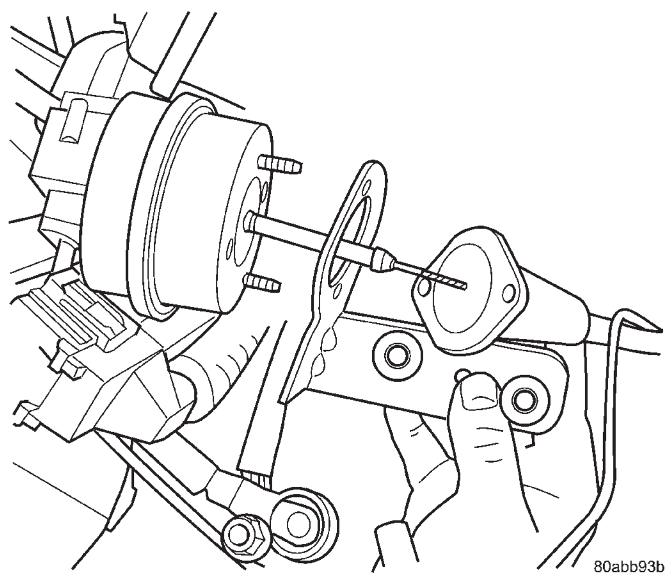

Fig. 3 SPEED CONTROL CABLE AND BRACKET

INSTALLATION

(1) With throttle in full open position feed cable sleeve through hole in bracket, then align hole in speed control cable sleeve with hole in servo pin and install retaining clip (Fig. 3).

(2) Connect vacuum hose to servo.

(3) Connect electrical connector.

(4) Insert servo studs through holes in speed control cable and mounting bracket (Fig. 3).

(5) Install nuts, tighten to 6.7 N·m (60 in. lbs.).

(6) Install servo and bracket to stud plate in shocktower and tighten nuts.

(7) Connect negative battery cable (Fig. 2).

SWITCH

DESCRIPTION

There are two separate switch pods that operate the speed control system and are located on the steering wheel.

OPERATION

The speed control system has five separate resistive switches that provide a single multiplexed (MUX) voltage inputs to the PCM.The switch names are: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, COAST, and CANCEL. Based on conditions when the buttons are pushed (and released), the five voltages ranges provided to the PCM result in the following functions: ON, OFF, SET, COAST, RESUME, ACCEL, TAP-UP, TAP-DOWN, COAST, and CANCEL. Refer to the Speed Control Section for more information

Also the PCM receives an input from the brake switch to sense whether the brake pedal has been depressed. When the PCM receives the brake depressed input, it turns off power to the speed control servo and disengages speed control. Also the power to the servo is supplied through the brake switch, which opens the circuit when the brake pedal is depressed.

The individual switches cannot be repaired. If one switch fails, the entire switch module must be replaced.

REMOVAL

The speed control switches are mounted in the steering wheel and wired through the clock spring device under the airbag module.

WARNING: IF REMOVAL OF AIRBAG MODULE IS NECESSARY, REFER TO the RESTRAINT SYSTEMS section for more information.

(1) Remove the negative battery cable.
(2) Turn off ignition.
(3) Remove screw from back of the switch (Fig. 4).

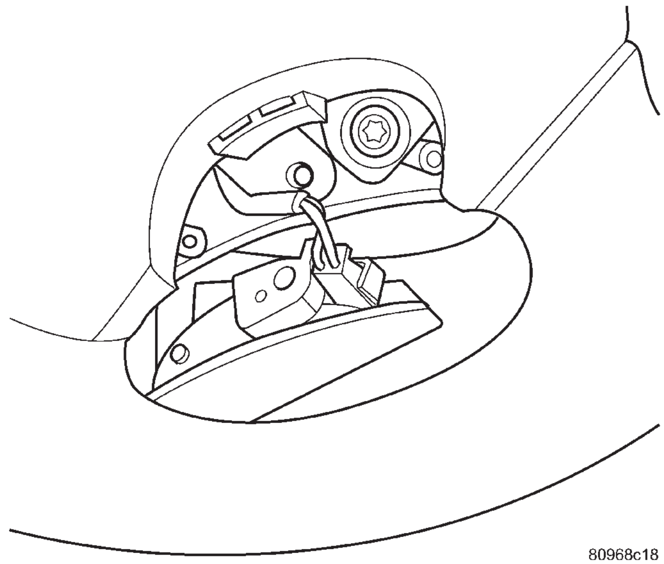

Fig. 4 SPEED CONTROL SWITCH

(4) Rock switch away from airbag and steering wheel.
(5) Disconnect two-way electrical connector.
(6) Repeat for the other switch.

INSTALLATION

(1) Connect two-way electrical connector.
(2) Install switch.
(3) Install screw into the back of the switch.
(4) Repeat for the other switch.
(5) Install the negative battery cable.

VACUUM RESERVOIR

DESCRIPTION

The vacuum reservoir is located under the left front headlamp, in front of the battery. It is made of plastic and does not contain any other parts, such as a check valve.

OPERATION

The reservoir stores engine vacuum. Manifold vacuum is supplied from the brake booster check valve. The speed control vacuum supply hose has a check valve at the source (brake booster) to maintain the highest available vacuum level in the servo, reservoir and vacuum hoses. When engine vacuum drops, as in climbing a grade while driving, the reservoir supplies the vacuum needed to maintain proper speed control operation. The vacuum reservoir cannot be repaired and must be replaced if faulty.

REMOVAL

The vacuum reservoir is located below the left front headlamp (Fig. 5).

(1) Remove the front fascia, refer to the Frames and Bumper/Front Fascia section for more information.

(2) Remove bolt from reservoir.

(3) Disconnect vacuum hose from reservoir.

(4) Remove the vacuum reservoir by sliding it up slightly and seperating the nail head pegs (molded into the reservoir) from the frame rail..

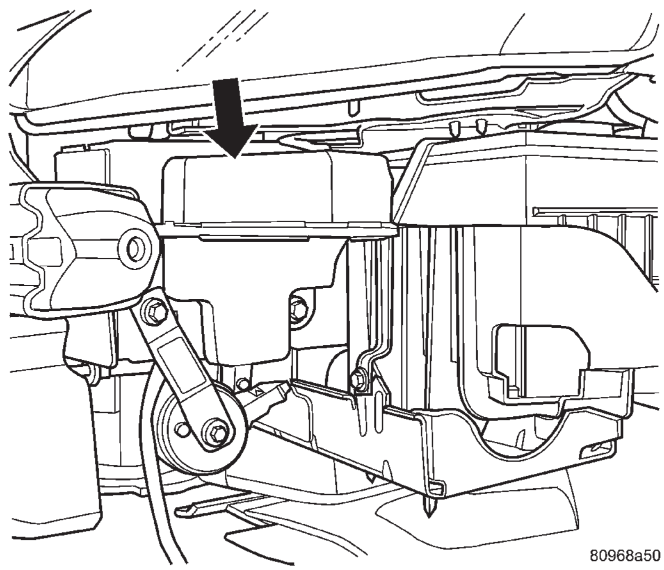

Fig. 5 VACUUM RESERVOIR

INSTALLATION

(1) Connect vacuum hose to reservoir by inserting nail head pegs on reservoir into the keyhole slots in the frame rail and slide down to lock it into place.

(2) Install the vacuum reservoir (Fig. 5).

(3) Install bolt through to reservoir to frame rail.

(4) Install the front fascia, refer to the Frames and Bumper/Front Fascia section for more information.

VEHICLE THEFT SECURITY

TABLE OF CONTENTS

VEHICLE THEFT SECURITY

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is designed to protect against whole vehicle theft. The system monitors vehicle doors, decklid, and ignition action for unauthorized operation. The alarm activates:

- Sounding of the horn
- Flashing of the park and tail lamps
- Flashing of the headlamps

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is available as a factory-installed option on this vehicle. It is designed to provide passive protection against unauthorized vehicle use by disabling the engine, after two (2) seconds of running, whenever an invalid key is used to start the vehicle. The SKIS is active whenever the ignition is on and does not require any customer intervention. The primary components of the system are the Sentry Key Immobilizer Module (SKIM), Sentry Key (ignition key w/ a transponder molded into the head), indicator light, Body Control Module (BCM), and the Powertrain Control Module (PCM). The SKIM is mounted to the steering column with the molded, integral antenna mounted on the light halo surrounding the ignition lock cylinder. The indicator light, is located in the message center.

OPERATION

VEHICLE THEFT SECURITY SYSTEM

Upon failure of proper SKIM communication to the PCM, the PCM will shut off fuel after two seconds of run time. The engine will not re-crank on the key cycle that the failure occurred, a full key down sequence must be performed for the engine to crank again. After six consecutive fuel shut-offs, the engine will no longer crank on subsequent key cycles. The failure must be corrected and a valid communication process between the SKIM and the PCM must occur for the engine to crank and start again.

The electronics for the VTSS are part of the Body Control Module (BCM). The system is armed when the vehicle is locked using the:

- Power door lock switches (with any door ajar)
- Remote Keyless Entry transmitter.
- Door Cylinder Lock Switches.

For vehicles equipped with SKIS, the doors do not have to be locked to enable the fuel shut off feature.

After the vehicle is locked and the last door is closed, the set LED indicator in the top cover will flash quickly for 16 seconds, indicating that arming is in progress. If no monitored systems are activated during this period, the system will arm. The LED will extinguish unless the decklid is open. If the decklid is open, the LED will flash at a slower rate. This indicates that the system is armed.

If fault is detected on any key cylinder input, the indicator LED will remain solid during the arming process, although the system will still arm. If the indicator LED does not illuminate at all upon door closing it indicates that the system is not arming.

Passive disarming occurs upon normal vehicle entry by unlocking either door with the ignition key/ remote transmitter. This disarming will also halt the alarm once it has been activated.

A tamper alert exists to notify the driver that the VTSS had been activated. This alert consists of 3 horn pulses when the vehicle is disarmed.

NOTE: The VTSS will not arm by pushing down the door lock mechanism. This will manually override the system.

VEHICLE THEFT SECURITY (Continued)

For Door Cylinder Lock Switch Removal and Installation, refer to Electrical, Power Locks, Door Cylinder Lock Switch, Removal, and Installation.

If the VTSS is triggered, the horn will pulse, headlamps/marker lamps will flash, and the VTSS warning lamp will flash. If the BCM determines the threat to be false and the VTSS is not triggered again, the system will shut down and rearm itself after three minutes. If a trigger is still active, the alarm will continue for an additional 15 minutes without the horn. The VTSS monitoring portion of the system is split into two sections.

ARMING THE VTSS

(1) With the key removed from the ignition lock and any door open (excluding decklid), actuate one of the following:

- Power door lock button to LOCK,
- Key fob LOCK button
- Door lock key cylinder to locked position.

(2) Close all opened doors. decklid can remain open.

NOTE: If the decklid is open, it will not be secure. Once the decklid is closed, a separate 16 second counter will start. Once 16 seconds has been reached, the decklid will then be secure, providing a VTSS disarm request has not been received during the 16 second decklid arming period.

(3) After the last door is closed, an arming timeout period of sixteen seconds will start, then the VTSS will become armed.

(4) If a 16 second time-out sequence was in process and a new arm signal was actuated, the 16 second timeout will restart from the time of the second actuation.

If the security lamp does not illuminate at all upon final door closure, it indicates that the system is not arming.

The current VTSS status armed or disarmed shall be maintained in memory to prevent battery disconnects from disarming the system.

TRIGGERING THE VTSS

After the VTSS is armed, the following actions will trigger the alarm:

- Opening any door.
- Turning the ignition to the ON, ACC, or UNLOCK position.
- Opening decklid without first receiving a RKE input or decklid key input.

CAUTION: The VTSS indicator LED will trigger and engine will continue to run if the vehicle is equipped with SKIS and the proper key is used to start the vehicle. This condition will occur if the VTSS has been triggered. If valid key is used, VTSS will disarm

SENTRY KEY IMMOBILIZER SYSTEM

The SKIS includes keys from the factory which are pre-programmed. Each SKIM will recognize a maximum of eight Sentry Keys. If the customer would like to own additional keys other than those provided with the vehicle, they can be purchased from any authorized dealer. These keys must be programmed to the SKIM on the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer with a DRB III® scan tool or by a customer if this feature is available in their market and they have two (2) valid keys already available to them. Refer to the Service Procedures portion of this system for additional details. The SKIS performs a self-test each time the ignition switch is turned to the ON position and will store Diagnostic Trouble Codes (DTC's) if a system malfunction is detected. The SKIS can be diagnosed and any stored DTC's can be retrieved using a DRB III® scan tool as described in the appropriate Body Diagnostic Procedures manual.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS, WARNINGS, BEFORE ATTEMPTING COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: The following tests may not prove conclusive in the diagnosis of this system. The most reliable, efficient, and accurate means to diagnose the Sentry Key Immobilizer System involves the use of a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures Manual.

The Sentry Key Immobilizer System (SKIS) and the Programmable Communication Interface (PCI) bus network should be diagnosed using a DRB III® scan tool. The DRB III® will allow confirmation that the PCI bus is functional, that the Sentry Key Immobilizer Module (SKIM) is placing the proper messages on the PCI bus, and that the Powertrain Control Module (PCM) is receiving the PCI bus messages. Refer to the proper Body Diagnostic Procedures manual, and Wiring Diagrams for complete circuit descriptions and diagrams.

(1) Check the fuses in the Integrated Power Module (IPM). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

VEHICLE THEFT SECURITY (Continued)

(2) Disconnect and isolate the battery negative remote cable from the remote terminal. Unplug the wire harness connector at the SKIM. Check for continuity between the ground circuit cavity of the SKIM wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the SKIM wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the fuse in the IPM as required.

(4) Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the SKIM wire harness connector. If OK, use a DRB III® scan tool and the proper Body Diagnostic Procedures manual to complete the diagnosis of the SKIS. If not OK, repair the open circuit to the fuse in the IPM as required.

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds. Using a DRB III® scan tool. Refer to the proper Body Diagnostic Procedures Manual for test procedures.

TRANSPONDER KEY

DESCRIPTION

The Sentry Key Immobilizer System (SKIS) uses a transponder chip that is integral to each ignition key (Fig. 1) to communicate with the Sentry Key Immobilizer Module (SKIM). Ignition keys are supplied with the vehicle when it is shipped from the factory. The transponder chip is undermolded within the head of the key. This undermold is hidden beneath an overmolded rubber cap.

OPERATION

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the SKIM has a unique "Secret Key" code programmed into it by the manufacturer as well. When a Sentry Key is programmed into the memory of the SKIM, the SKIM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the "Secret Key" code from the SKIM. Once the Sentry Key learns the "Secret Key" code of the SKIM, it is also permanently pro-

2 - TRANSPONDER
3 - MOLDED CAP REMOVED
4 - SENTRY KEY

grammed into the transponder's memory. Therefore, blank keys for the SKIS must be programmed by the SKIM in addition to being cut to match the mechanical coding of the ignition lock cylinder. Refer to Electrical, Vehicle Theft Security, Transponder Key, Standard Procedure - Transponder Programming.

The Sentry Key's transponder is within the range of the SKIM's transceiver antenna ring when it is inserted into the ignition lock cylinder. When the ignition switch is turned to the ON position, the SKIM communicates with the Sentry Key via a radio frequency (RF) signal. The SKIM determines if a valid key is present based on the information it receives from the Sentry Key. If a valid key is detected, that fact is communicated to the PCM via the PCI bus and the vehicle is allowed to continue running. If an invalid key is received by the PCM or no status at all is communicated, the vehicle will stall after two (2) seconds of running. The indicator light will be flashing at this point. The Sentry Key's transponder can not be repaired. If it is faulty or damaged, it must be replaced.

Common communication problems:

- Two transponder keys too close together.
- Speed Pass too close to transponder key.

Solid indicator that there is a system failure.

- Loss of PCM communication.
- Failed antenna circuit.

TRANSPONDER KEY (Continued)

STANDARD PROCEDURE - TRANSPONDER PROGRAMMING

USING A DRB III® SCAN TOOL

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Immobilizer System (SKIS) when it is shipped from the factory. The Sentry Key Immobilizer Module (SKIM) can be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition lock cylinder of the vehicle for which it will be used. The vehicle's four digit PIN code will be required to complete this task since you will need it to enter the Secured Access Mode in the SKIM. The following steps must be completed using a DRB III® scan tool:

(1) Insert the blank key into the ignition and turn it to the RUN position.

(2) Using a DRB III® scan tool, select ″Theft Alarm,″ ″SKIM,″ ″Miscellaneous,″ and then ″Program New Key.″

(3) Enter the four digit PIN code using the DRB III® scan tool. When programming is completed, the SKIM will exit Secured Access Mode and the DRB III® scan tool will display the results of your attempt to program the key. One of five distinct results may be displayed. All five are listed below:

- ″**Programming Successful**″ is displayed if the Sentry Key programming is successful.
- ″**Learned Key in Ignition**″ is displayed if the key in the ignition has already been programmed into that vehicle's SKIM.
- ″**Eight Keys Already Learned (At The Maximum) Programming Not Done**″ is displayed if eight keys have already been programmed into the SKIM. In this case, if a new key needs to be added due to a lost or defective key, the ″Erase All Keys″ command (which requires entering the Secured Access Mode) has to be performed. Following the ″Erase All Keys″ command, all keys that will be used to operate the vehicle **MUST** be reprogrammed to the SKIM.
- ″**Programming Not Attempted**″ is displayed after an ″Erase All Keys″ function is executed.
- ″**Programming Key Failed**″ is displayed if further diagnosis is required.

To learn additional keys, turn the ignition OFF, remove the learned key, insert the next new blank key, and repeat the steps from the beginning.

"CUSTOMER LEARN" MODE

This feature is only available on domestic vehicles or those which have a U.S. country code designator. This procedure requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not available, Sentry Key programming will require the use of a DRB III® scan tool.

The steps required to program Sentry Keys with two valid Sentry Keys follows:

(1) Obtain the blank Sentry Key(s) that need to be programmed. Cut the keys to match the ignition lock cylinder mechanical key codes.

(2) Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the ON position.

(3) After the ignition switch has been in the ON position for longer than three seconds, but no more than fifteen seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key in the ignition lock cylinder with the second valid Sentry Key and turn the ignition switch back to the ON position. The second valid Sentry Key must be inserted within 15 seconds of removing the first valid Sentry key.

(4) About ten seconds after the completion of Step 3, the indicator light will start to flash and a single audible chime tone will sound to indicate that the system has entered the ″Customer Learn″ programming mode.

(5) Within sixty seconds of entering the ″Customer Learn″ programming mode, turn the ignition switch to the OFF position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the ON position.

(6) About ten seconds after the completion of Step 5, a single audible chime tone will sound and the indicator light will stop flashing and stay on solid for three seconds and then turn off to indicate that the blank Sentry Key has been successfully programmed. The SKIS will immediately exit the ″Customer Learn″ programming mode and the vehicle may be started using the newly programmed Sentry Key.

These steps must be completed in their entirety for each additional Sentry Key to be programmed. If any of the above steps are not completed in the given sequence, or within the allotted time, the SKIS will exit the ″Customer Learn″ programming mode and the programming will be unsuccessful. The SKIS will also automatically exit the ″Customer Learn″ programming mode if:

- It sees a non-blank Sentry Key when it should see a blank.
- If it has already programmed eight (8) valid Sentry Keys.
- If the ignition switch is turned to the OFF position for more than about fifty (50) seconds.

NOTE: If you attempt to start the vehicle while in "Customer Learn" mode (LED flashing), the vehicle will behave as though an invalid key is being used (i.e. the engine will stall after two (2) seconds of running). No faults will be logged.

TRANSPONDER KEY (Continued)

NOTE: Once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle.

VTSS/SKIS INDICATOR LAMP

DESCRIPTION

The Sentry Key Immobilizer System (SKIS) uses an indicator light to convey information on the status of the system to the customer. This light is shared with the Vehicle Theft Security System (VTSS). The light is located in the Instrument Cluster. The indicator light is controlled by the Body Control Module (BCM) based upon messages it receives from the Sentry Key Immobilizer Module (SKIM) on the PCI bus.

OPERATION

When the ignition is turned ON, the BCM performs a four second bulb check, regardless of SKIM messages. After the bulb check, the lamp is controlled according to SKIM messages. Then, the SKIM sends messages to the BCM to operate the light based upon the results of the SKIS self tests. The light may be actuated in two possible ways, flashing or on solid. If the light comes on and stays on solid after a power-up test, this indicates that the SKIM has detected a system malfunction. If the SKIM detects an invalid key when the ignition switch is moved to the ON position, it sends a message on the PCI bus to the BCM, to flash the light. The SKIM can also send a message to flash the light and generate a single audible chime at the same time. These two events occurring simultaneously indicate that the SKIS has been placed into the ″Customer Learn″ mode. Refer to Electrical, Vehicle Theft Security, Transponder Key, Standard Procedure - Transponder Programming for more information on the ″Customer Learn″ mode. If the light comes on and stays on after the power-up test, diagnosis of the SKIS should be performed using a DRB III® scan tool and the appropriate Body Diagnostic Procedures manual. The light is not a serviceable component.

WIPERS/WASHERS

WIPERS/WASHERS

DESCRIPTION

WIPER SYSTEM

The wiper/washer switch is mounted on the right side of the multi-function switch (Fig. 1) on the steering column, behind the steering wheel.

The wiper system has LOW, HIGH, and INTERMITTENT switch positions. The intermittent wiper

WIPERS/WASHERS (Continued)

system, in addition to low and high speed, has a delay mode and a pulse wipe mode.

The intermittent wiper function is integral to the wiper switch. All electronics and relay are inside the switch assembly. The wiper switch also includes the MIST feature which provides a single wipe when actuated.

The wiper motor is not serviced separately from the motor assembly. The wiper linkage is crimped onto the motor and cannot be detached. If the motor is found faulty, the entire motor assembly must be replaced.

WASHER SYSTEM

This vehicle is equipped with an electrically operated windshield washer pump. The washers are operated by a switch in the multi-function switch control lever (Fig. 1). The lever is located on the right side of the steering column.

The electric pump assembly is mounted directly to the reservoir. A permanently lubricated motor is coupled to an impeller type pump. The pump and reservoir are serviced as separate assemblies.

OPERATION

WIPER SYSTEM

Move the control lever up to select the desired wiper speed. Move the lever upward to the second detent for Low speed wiper operation, or to the third detent for High speed operation.

Use the intermittent wiper when weather conditions make a single wiping cycle, with a variable pause between cycles, desirable. Move the lever to the DEL position, then select the delay interval by turning the end of the lever. The delay can be regulated from a maximum of approximately 18 ± 0.5 seconds between cycles, to a cycle every second ± 0.5 second.

The windshield wipers will only operate with the ignition switch in the ACCESSORY or IGNITION RUN position. The wiper circuit is protected against over loads by a fuse in the fuse block and a circuit breaker within the wiper motor. This protects the circuitry of the wiper system and the vehicle. The wiper motor has permanent magnet fields.

The intermittent wiper delay mode has a range of 1 ± 0.5 to 18 ± 0.5 seconds. Pulse wipe is accomplished by holding stalk lever in the WASH position momentarily. The wiper blades then sweep once or twice after the WASH at low speed and then return to the previous wiper switch mode.

The wiper system completes the wipe cycle when the switch is turned OFF. The blades park in the lowest portion of the wipe pattern.

Push down on the wiper lever to activate a single wipe to clear off road mist or spray from a passing vehicle. As long as the lever is held down, the wipers will continue to operate.

WASHER SYSTEM

To use the washer, pull the stalk lever toward you and hold while spray is desired. If the stalk lever is pulled while in the delay range, the wiper will operate for two wipe cycles (± 1) after the stalk lever is released, and then resume the intermittent interval previously selected.

The wash function can be accessed in the OFF position of the wiper control switch. Pulling the washer stalk lever rearward when the switch is in the OFF position will operate the wipers and washer motor pump continuously until the stalk lever is released. Releasing the stalk lever will stop the washer pump but the wipers will complete the current wipe cycle followed by an average of two more wipe cycles (± 1) before the wipers park and the module turns off.

If the stalk lever is pulled while in the OFF position, the wipers will operate for two wipe cycles, then turn OFF.

Fluid, gravity fed from the reservoir, is forced by the pump through rubber hoses to the hood mounted nozzles which direct the fluid streams to the windshield.

DIAGNOSIS AND TESTING - WINDSHIELD WASHERS

Whenever a windshield washer malfunction occurs, first verify that the windshield washer wire harness is properly connected to all connectors before starting normal diagnosis and repair procedures. Refer to the WINDSHIELD WASHER DIAGNOSIS table.

(5) Remover rubber grommet from reservoir and throw away.

INSTALLATION

(1) A new grommet is required for installation.

(2) Firmly grasping pump by hand twist and push into reservoir. Care must be taken not to tear grommet or puncture reservoir.

(3) If fascia was partially removed, reinstall bumper fascia as needed. Refer to Frame & Bumpers, Bumpers, Front Fascia, Installation.

(4) Refill reservoir with the washer solvent.

(5) Connect the battery negative remote cable.

WIPER ARMS

REMOVAL

(1) Place the wiper arm/blades in the PARK position and turn ignition OFF.

(2) Unsnap arm cover. By hand rock gently side to side and slide away from arm pivot. To remove the left side raise hood for clearance

(3) Loosen retention nut.

(4) Remove the arm from the pivot by using a universal claw puller or by hand rock gently side to side and slide. Raise blade and arm off glass and rock side to side while applying pressure with the puller till loose. Ensure that the puller is not on the collar below the arm.

(5) Remove arm retention nut and arm.

INSTALLATION

(1) Place arm on pivot shaft, align blade with wiper location made on windshield

(2) Start retention nut.

(3) Raise arm and blade off windshield while tightening retention nut. Tighten nut to 33 to 40 N·m (23 to 29 ft. lbs.).

(4) Install arm head cover.

ADJUSTMENTS

High speed, wet windshield operation, the right blade tip may override the cowl screen slightly. This is normal and should not affect wiper system performance.

(1) Lift arms and blade assemble to a over centered position.

(2) Turn ignition switch to ON or ACC position.

(3) Use LOW speed setting and cycle the wiper motor to the PARK position.

(4) Turn ignition OFF.

(5) Carefully lower arm and blades to the windshield.

(6) Measure the distance from the blade tip to the cowl screen edge. The blade should be 18 to 42 mm (.75 to 1.60 inches.).

(7) If not OK, check for worn parts.

(8) In the event the blade tip strikes the cowl screen or molding remove arm. Position arm on windshield and tighten to 33 to 40 N·m (23 to 29 ft. lbs.) torque (Fig. 3).

WIPER BLADES

DESCRIPTION

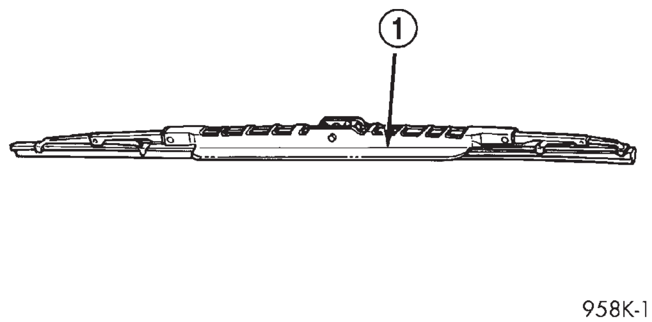

Fig. 4 WIPER BLADE-TYPICAL

1 - AIR FOIL

The wiper blades are a rubber element with a steel vertebrae that are mounted on the end of the windshield wiper arm and sweep across the front windshield to clear it of water, snow, and debris (Fig. 4).

OPERATION

When the wiper blade rubber element is exposed to the weather for a long period of time, it tends to lose wiping ability. Periodic cleaning of the wiper blade element is suggested to remove the accumulation of salt and road film. The wiper blades, arms, and windshield should be cleaned with a sponge or cloth and a mild detergent or non-abrasive cleaner. If the blades continue to streak or smear, they should be replaced. The driver and the passenger blade elements are 550 mm (21.65 in.) in length.

REMOVAL

(1) Turn wiper switch ON, position blades to a convenient place on the windshield by turning the ignition switch ON and OFF. Turn ignition switch OFF, when blade is in the desirable position.

(2) Lift wiper arm to raise blade off glass.

(3) Remove blade assembly from arm by pushing release tab under arm tip and slide blade away from arm tip (Fig. 5) and (Fig. 6).

(4) The driver's side wiper blade has a air foil on it and the air foil points downward as in (Fig. 4).

(5) Gently place wiper arm tip on windshield.

CLEANING

Wiper blades exposed to the weather for a long period of time tend to lose their wiping effectiveness. Periodic cleaning of the wiper blade is recommended to remove the accumulation of salt and road grime. The wiper blades, arms and windshield should be cleaned with a sponge or cloth and a mild detergent or nonabrasive cleaner. If the wiper blades continue to streak or smear, they should be replaced. The wiper blade should run smoothly across the windshield in both directions. The wiper blade should slightly roll over center when the blade reverses direction. A wiper blade insert that has lost flexibility or a wiper arm that has lost spring tension, will cause the blade to skip or chatter across the windshield. If the wiper blades are new and the wiper arm spring tension is OK and a chattering sound is emitted from the wiper(s), the wiper blade is not rolling over center. If this condition exists, refer to the Wiper Arm Alignment paragraph of this group.

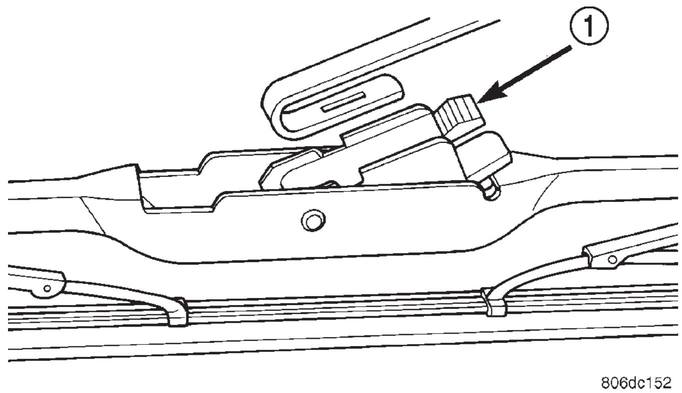

Fig. 6 REMOVE BLADE FROM ARM

1 - RELEASE TAB

INSTALLATION

(1) Gently lift the wiper arm tip off windshield.

(2) The driver's side wiper blade has a air foil on it and the air foil points downward (Fig. 4).

(3) Install teh blade assembly onto the wiper arm by firmly snapping it onto the the arm tip (Fig. 5) and (Fig. 6).

(4) Lower blade to glass

WIPER BLADES (Continued)

(5) When complete turn ignition switch ON. Turn wiper switch OFF allowing the wiper blades to PARK. Then turn ignition switch OFF.

WIPER BLADE ELEMENT

REMOVAL

(1) Lift wiper arm to raise blade off the windshield.

(2) Remove blade assembly from arm by pushing release tab under arm tip and slide blade away from arm tip (Fig. 5) and (Fig. 6). Gently place wiper arm tip on windshield.

(3) Remove wiping rubber element by pulling stopper of the rubber element, out of the claws of blade assemble (Fig. 7). The wiper rubber element and two vertebra will be removed.

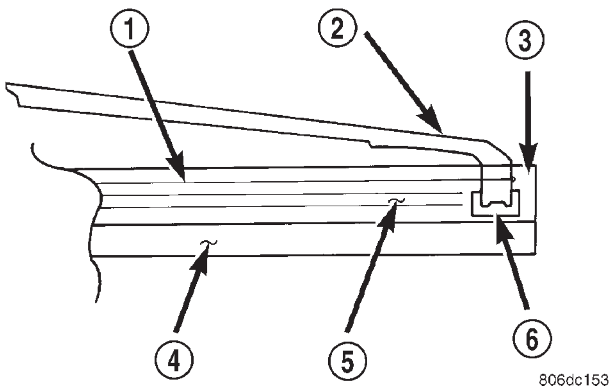

Fig. 7 WIPER BLADE AND ELEMENT

1 - VERTEBRA
2 - CLAW
3 - TO GRASP AND PULL
4 - RUBBER ELEMENT
5 - CHANNEL
6 - SLOT

INSTALLATION

(1) Slide the rubber element into the blade assembly through the claws.

(2) Slide the metal vertebra into the top element slot, with the vertebra curved to match the windshield

(3) Ensure that the final blade claw is locked into the slot at the end of the rubber element (Fig. 7).

WIPER LINKAGE

REMOVAL

(1) Remove wiper arms and blades.

(2) Remove the cowl screen.

(3) Remove wiper motor assembly.

(4) Disconnect wiper arm linkage by using an ball joint/tie rod separator. Separate the right and left ball cap from the ball.

(5) Disconnect drive link from the motor crank. Using an ball joint/tie rod separator and separate the ball cap from the ball.

INSTALLATION

(1) Connect the drive link to the motor crank. If motor output crank nut was removed, tighten nut to 25 to 30 N·m (19 to 23 ft. lbs.).

(2) Align link ball cap over ball and gently press fit against shoulder of cap to lock cap into position.

(3) Install the wiper motor assembly.

(4) Install the cowl screen.

(5) Install the wiper arms.

WIPER MOTOR ASSEMBLY

REMOVAL

(1) Disconnect and isolate the battery negative remote cable.

(2) Remove wiper arms and blades.

(3) Remove the cowl screen.

(4) Remove the four wiper motor assembly mounting screws then lift assembly to gain access to wire harness clip.

(5) Disconnect harness clip from the forward mounting leg.

(6) Disconnect wire connector at motor and remove assembly.

INSTALLATION

(1) Connect wire connector at motor and remove assembly.

(2) Connect harness clip to the forward mounting leg.

(3) Place assembly into position, install the mounting bolts, and tighten the mounting bolts to 10 to 12 N·m (89 to 106 in. lbs.) torque.

(4) Install the cowl screen.

(5) Install the wiper arms and blades.

(6) Connect the battery negative remote cable.

WIRING DIAGRAM INFORMATION

DESCRIPTION

DESCRIPTION - HOW TO USE WIRING DIAGRAMS

DaimlerChrysler Corporation wiring diagrams are designed to provide information regarding the vehicles wiring content. In order to effectively use the wiring diagrams to diagnose and repair DaimlerChrysler Corporation vehicles, it is important to understand all of their features and characteristics.

Diagrams are arranged such that the power (B+) side of the circuit is placed near the top of the page, and the ground (B-) side of the circuit is placed near the bottom of the page (Fig. 1).

All switches, components, and modules are shown in the at rest position with the doors closed and the key removed from the ignition (Fig. 2).

Components are shown two ways. A solid line around a component indicates that the component is complete. A dashed line around the component indicates that the component is being shown is not complete. Incomplete components have a reference number to indicate the page where the component is shown complete.

It is important to realize that no attempt is made on the diagrams to represent components and wiring as they appear on the vehicle. For example, a short piece of wire is treated the same as a long one. In addition, switches and other components are shown as simply as possible, with regard to function only.

SYMBOLS

International symbols are used throughout the wiring diagrams. These symbols are consistent with those being used around the world (Fig. 3).

DESCRIPTION - CIRCUIT FUNCTIONS

All circuits in the diagrams use an alpha/numeric code to identify the wire and it's function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart. This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

DESCRIPTION - SECTION IDENTIFICATION AND INFORMATION

The wiring diagrams are grouped into individual sections. If a component is most likely found in a particular group, it will be shown complete (all wires, connectors, and pins) within that group. For example, the Auto Shutdown Relay is most likely to be found in Group 30, so it is shown there complete. It can, however, be shown partially in another group if it contains some associated wiring.

Splice diagrams in Section 8W-70 show the entire splice and provide references to other sections the splices serves. Section 8W-70 only contains splice diagrams that are not shown in their entirety somewhere else in the wiring diagrams.

Section 8W-80 shows each connector and the circuits involved with that connector. The connectors are identified using the name/number on the diagram pages.

DESCRIPTION - CONNECTOR, GROUND AND SPLICE INFORMATION

CAUTION: Not all connectors are serviced. Some connectors are serviced only with a harness. A typical example might be the Supplemental Restraint System connectors. Always check parts availability before attempting a repair.

IDENTIFICATION

In-line connectors are identified by a number, as follows:

- In-line connectors located in the engine compartment are C100 series numbers
- In-line connectors located in the Instrument Panel area are C200 series numbers.
- In-line connectors located in the body are C300 series numbers.
- Jumper harness connectors are C400 series numbers.
- Grounds and ground connectors are identified with a “G” and follow the same series numbering as the in-line connectors.
- Splices are identified with an “S” and follow the same series numbering as the in-line connectors.
- Component connectors are identified by the component name instead of a number. Multiple connectors on a component use a C1, C2, etc. identifier.

LOCATIONS

Section 8W-91 contains connector/ground/splice location illustrations. The illustrations contain the connector name (or number)/ground number/splice number and component identification. Connector/ground/splice location charts in section 8W-91 reference the figure numbers of the illustrations.

The abbreviation T/O is used in the component location section to indicate a point in which the wiring harness branches out to a component. The abbreviation N/S means Not Shown in the illustrations

WARNING

WARNINGS - GENERAL

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: ALWAYS WEAR SAFETY GLASSES FOR EYE PROTECTION.

WARNING: USE SAFETY STANDS ANYTIME A PROCEDURE REQUIRES BEING UNDER A VEHICLE.

WARNING: BE SURE THAT THE IGNITION SWITCH ALWAYS IS IN THE OFF POSITION, UNLESS THE PROCEDURE REQUIRES IT TO BE ON.

WARNING: SET THE PARKING BRAKE WHEN WORKING ON ANY VEHICLE. AN AUTOMATIC TRANSMISSION SHOULD BE IN PARK. A MANUAL TRANSMISSION SHOULD BE IN NEUTRAL.

WARNING: OPERATE THE ENGINE ONLY IN A WELL-VENTILATED AREA.

WARNING: KEEP AWAY FROM MOVING PARTS WHEN THE ENGINE IS RUNNING, ESPECIALLY THE FAN AND BELTS.

WARNING: TO PREVENT SERIOUS BURNS, AVOID CONTACT WITH HOT PARTS SUCH AS THE RADIATOR, EXHAUST MANIFOLD(S), TAIL PIPE, CATALYTIC CONVERTER AND MUFFLER.

WARNING: DO NOT ALLOW FLAME OR SPARKS NEAR THE BATTERY. GASES ARE ALWAYS PRESENT IN AND AROUND THE BATTERY.

WARNING: ALWAYS REMOVE RINGS, WATCHES, LOOSE HANGING JEWELRY AND AVOID LOOSE CLOTHING.

DIAGNOSIS AND TESTING - WIRING HARNESS

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below.

- Jumper Wire - This is a test wire used to connect two points of a circuit. It can be used to bypass an open in a circuit.

WARNING: NEVER USE A JUMPER WIRE ACROSS A LOAD, SUCH AS A MOTOR, CONNECTED BETWEEN A BATTERY FEED AND GROUND.

- Voltmeter - Used to check for voltage on a circuit. Always connect the black lead to a known good ground and the red lead to the positive side of the circuit.

CAUTION: Most of the electrical components used in today’s vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

WIRING DIAGRAM INFORMATION (Continued)

• Ohmmeter - Used to check the resistance between two points of a circuit. Low or no resistance in a circuit means good continuity.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

• Probing Tools - These tools are used for probing terminals in connectors (Fig. 5). Select the proper size tool from Special Tool Package 6807, and insert it into the terminal being tested. Use the other end of the tool to insert the meter probe.

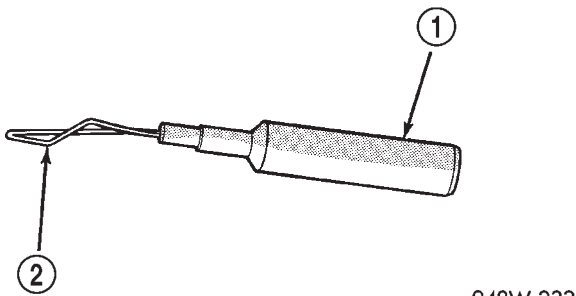

Fig. 5 PROBING TOOL

1 - SPECIAL TOOL 6801
2 - PROBING END

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem. Before condemning a component or wiring assembly, check the following items.

• Connectors are fully seated
• Spread terminals, or terminal push out
• Terminals in the wiring assembly are fully seated into the connector/component and locked into position
• Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
• Damaged connector/component casing exposing the item to dirt or moisture
• Wire insulation that has rubbed through causing a short to ground
• Some or all of the wiring strands broken inside of the insulation
• Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

(1) Verify the problem.

(2) Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to the wiring diagrams.

(3) Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.

(4) Isolate the problem area.

(5) Repair the problem area.

(6) Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to the wiring diagrams.

STANDARD PROCEDURE

STANDARD PROCEDURE - ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

All ESD sensitive components are solid state and a symbol (Fig. 6) is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the part is ESD sensitive, assume that it is.

(1) Always touch a known good ground before handling the part. This should be repeated while handling the part and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.

(2) Avoid touching electrical terminals of the part, unless instructed to do so by a written procedure.

(3) When using a voltmeter, be sure to connect the ground lead first.

(4) Do not remove the part form it's protective packing until it is time to install the part.

(5) Before removing the part from it's pakage, ground the pakage to a known good ground on the vehicle.

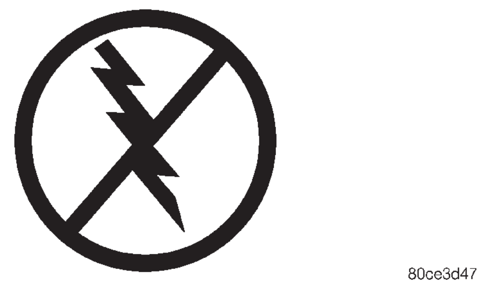

Fig. 6 ELECTROSTATIC DISCHARGE SYMBOL

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING OF VOLTAGE POTENTIAL

(1) Connect the ground lead of a voltmeter to a known good ground (Fig. 7).

(2) Connect the other lead of the voltmeter to the selected test point. The vehicle ignition may need to be turned ON to check voltage. Refer to the appropriate test procedure.

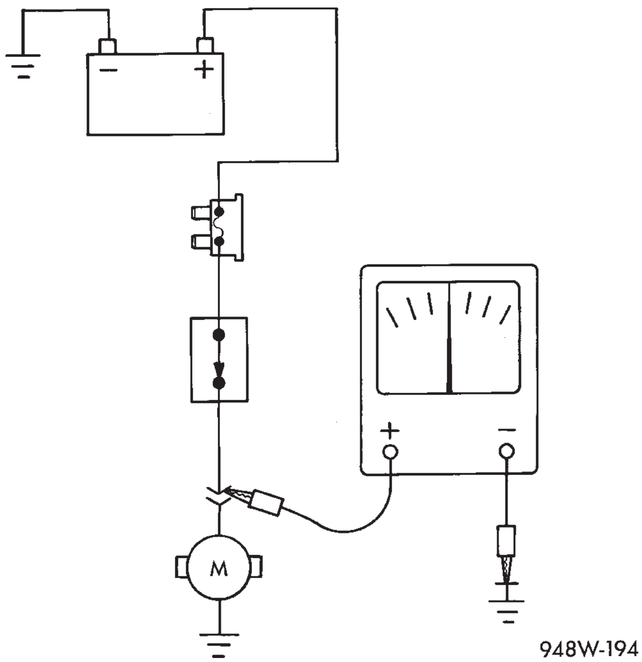

Fig. 7 TESTING FOR VOLTAGE POTENTIAL

STANDARD PROCEDURE - TESTING FOR CONTINUITY

(1) Remove the fuse for the circuit being checked or, disconnect the battery.

(2) Connect one lead of the ohmmeter to one side of the circuit being tested (Fig. 8).

(3) Connect the other lead to the other end of the circuit being tested. Low or no resistance means good continuity.

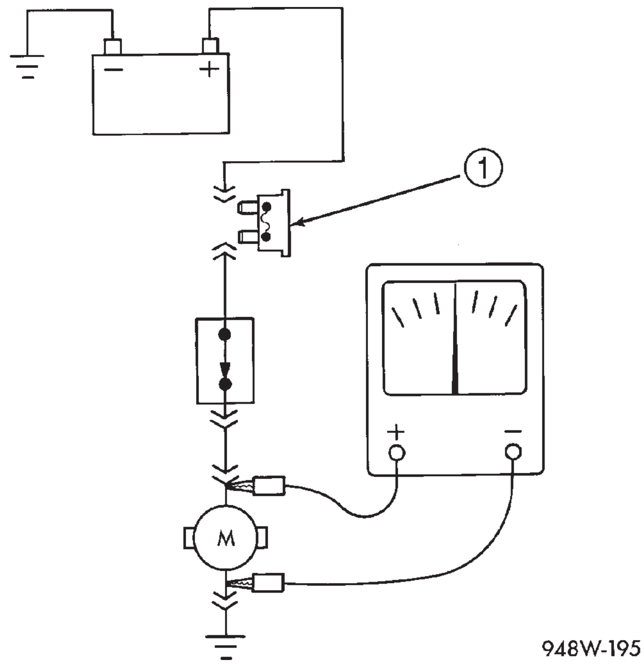

Fig. 8 TESTING FOR CONTINUITY

1 - FUSE REMOVED FROM CIRCUIT

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND

(1) Remove the fuse and disconnect all items involved with the fuse.

(2) Connect a test light or a voltmeter across the terminals of the fuse.

(3) Starting at the fuse block, wiggle the wiring harness about six to eight inches apart and watch the voltmeter/test lamp.

(4) If the voltmeter registers voltage or the test lamp glows, there is a short to ground in that general area of the wiring harness.

STANDARD PROCEDURE - TESTING FOR A SHORT TO GROUND ON FUSES POWERING SEVERAL LOADS

(1) Refer to the wiring diagrams and disconnect or isolate all items on the suspected fused circuits.

(2) Replace the blown fuse.

(3) Supply power to the fuse by turning ON the ignition switch or re-connecting the battery.

(4) Start connecting or energizing the items in the fuse circuit one at a time. When the fuse blows the circuit with the short to ground has been isolated.

WIRING DIAGRAM INFORMATION (Continued)

STANDARD PROCEDURE - TESTING FOR A VOLTAGE DROP

(1) Connect the positive lead of the voltmeter to the side of the circuit closest to the battery (Fig. 9).

(2) Connect the other lead of the voltmeter to the other side of the switch, component or circuit.

(3) Operate the item.

(4) The voltmeter will show the difference in voltage between the two points.

CONNECTOR

REMOVAL

(1) Disconnect battery.
(2) Release Connector Lock (Fig. 10).
(3) Disconnect the connector being repaired from its mating half/component.
(4) Remove the dress cover (if applicable) (Fig. 10).
(5) Release the Secondary Terminal Lock, if required (Fig. 11).
(6) Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector (Fig. 12).

INSTALLATION

(1) Insert the removed terminal in the same cavity on the repair connector.
(2) Repeat steps for each terminal in the connector, being sure that all wires are inserted into the proper cavities. For additional connector pin-out identification, refer to the wiring diagrams.
(3) When the connector is re-assembled, the secondary terminal lock must be placed in the locked position to prevent terminal push out.

DIODE

REMOVAL

(1) Disconnect the battery.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 13).

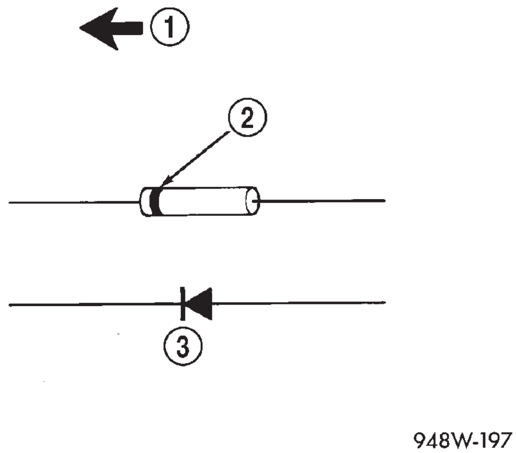

Fig. 13 DIODE IDENTIFICATION

1 - CURRENT FLOW
2 - BAND AROUND DIODE INDICATES CURRENT FLOW
3 - DIODE AS SHOWN IN THE DIAGRAMS

INSTALLATION

(1) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(2) Install the new diode in the harness, making sure current flow is correct. If necessary, refer to the appropriate wiring diagram for current flow (Fig. 13).

(3) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(4) Tape the diode to the harness using electrical tape. Make sure the diode is completely sealed from the elements.

(5) Re-connect the battery and test affected systems.

TERMINAL

REMOVAL

(1) Follow steps for removing terminals described in the connector removal section.

(2) Cut the wire 6 inches from the back of the connector.

INSTALLATION

(1) Select a wire from the terminal repair kit that best matches the color and gage of the wire being repaired.

(2) Cut the repair wire to the proper length and remove one–half (1/2) inch of insulation.

(3) Splice the repair wire to the wire harness (see wire splicing procedure).

(4) Insert the repaired wire into the connector.

(5) Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.

(6) Re-tape the wire harness starting at 1–1/2 inches behind the connector and 2 inches past the repair.

(7) Connect battery and test all affected systems.

WIRE

STANDARD PROCEDURE - WIRE SPLICING

When splicing a wire, it is important that the correct gage be used as shown in the wiring diagrams.

(1) Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.

(2) Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.

(3) Place the strands of wire overlapping each other inside of the splice clip (Fig. 14).

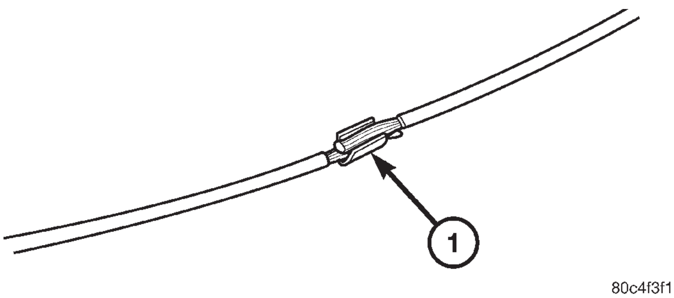

Fig. 14 SPLICE BAND

CONNECTOR/GROUND/SPLICE LOCATION

DESCRIPTION

This section provides illustrations identifying connector, ground, and splice locations in the vehicle. Connector, ground, and splice indexes are provided. Use the wiring diagrams in each section for connector, ground, and splice identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

CONNECTORS

Connector Name/Number	Color	Location	Fig.
A/C Compressor Clutch (2.0L/2.4L)	GY	Top of Compressor	13, 16
A/C Compressor Clutch (2.7L)	GY	Top of Compressor	15, 16
A/C Evaporator Temperature Sensor	BK	Right Side of HVAC	32
A/C-Heater Control C1	NAT	Rear of Control, Center of Instrument Panel	21, 25
A/C-Heater Control C2	BK	Rear of Control, Center of Instrument Panel	21, 25
A/C Pressure Transducer	GY	Top of A/C Compressor	16
Airbag Control Module (Occupant Restraint Controller)	GY	Center Body Near Shifter Assembly	21, 34
Ambient Temperature Sensor	BK	Front Center of Engine Compartment	1

TABLE OF CONTENTS

POWER DISTRIBUTION

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, centralized and convenient to access distribution of the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, comfort and convenience systems. At the same time, these systems were designed to provide centralized locations for conducting diagnosis of faulty circuits, and for sourcing the additional current requirements of many aftermarket vehicle accessory and convenience items.

These power distribution systems also incorporate various types of circuit control and protection features, including:

- Fuses
- Fuse cartridges
- Fusible links
- Automatic resetting circuit breakers
- Relays
- Flashers
- Timers
- Circuit splice blocks.

The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB)
- Accessory power outlet.

INSTALLATION

(1) Install base mount ring.

(2) Connect the base wires.

(3) Firmly snap base into position inside of the center console.

(4) Connect the battery negative cable.

IOD FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse that is disconnected within the Junction Block (JB) when the vehicle is shipped from the factory. Dealer personnel are to reconnect the IOD fuse in the JB as part of the preparation procedures performed just prior to new vehicle delivery.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock. The only reason the IOD fuse is disconnected is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is disconnected from Junction Block (JB) fuse cavity 5 when the vehicle is shipped from the assembly plant. Dealer personnel must reconnect the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that disconnecting the IOD fuse will not eliminate IOD, but only reduce this normal condition.

IOD FUSE (Continued)

If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Battery** for the location of additional service information covering the battery.

REMOVAL

NOTE: When removing or installing the IOD fuse, it is important that the ignition switch be in the Off position. Failure to place the ignition switch in the Off position can cause the radio display to become scrambled when the IOD fuse is installed. Removing and installing the IOD fuse again with the ignition switch in the Off position will usually correct the scrambled radio display condition.

(1) Turn the ignition switch to the Off position.
(2) Remove the cover from the left end cap of the instrument panel.
(3) Remove fuse 5 from the Junction Block.

INSTALLATION

(1) Insert fuse 5 into the Junction Block.
(2) Install the cover to instrument panel end cap.

JUNCTION BLOCK

DESCRIPTION

An electrical Junction Block (JB) is located in the left end cap of the instrument panel. The JB combines the functions previously provided by a separate fuse block module and relay center. It also serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle. It eliminates the need for numerous splice connections and serves in place of a bulkhead connector between many of the engine compartment, instrument panel, and body wire harnesses.

The JB is positioned on a mounting bracket up and under the left instrument panel (Fig. 4). It is secured by three screws. The JB is concealed behind the left instrument panel endcap. The left instrument panel endcap is a snap-fit fuse access cover that conceals the JB fuses and includes the fuse layout to ensure proper fuse identification. The left instrument panel endcap must be removed to access components other than the fuses in the JB.

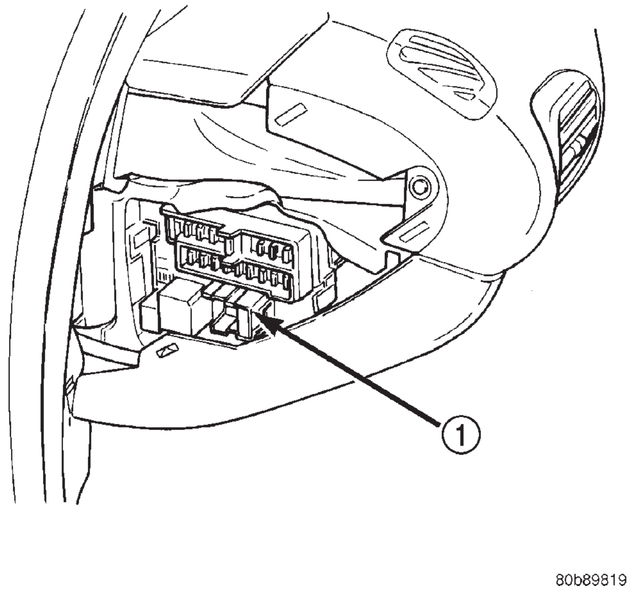

Fig. 4 Junction Block Location
1 - JUNCTION BLOCK

OPERATION

All of the current entering and leaving the JB does so through wire harnesses, which are connected to the JB through integral connector receptacles molded into the JB housing. The JB houses blade-type fuses, blade-type automatic resetting circuit breakers, full International Standards Organization (ISO) relays, and ISO micro-relays. Internal connection of all the JB circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The fuses, circuit breakers, relays, and are available for service replacement. The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire Junction Block assembly must be replaced.

REMOVAL

WARNING:
ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL/RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The Junction Block (JB) and Body Control Module (BCM) are attached to each other. After removal they can be separated. Junction Block and Body Control Module assemblies are located on the driver's side of the vehicle (Fig. 5).

(11) With the Junction Block/BCM removed from the vehicle, separate the BCM from the Junction Block.
(12) Remove the two BCM attaching screws and release the two BCM locking latches from the Junction Block.
(13) Disconnect BCM from the Junction Block.

INSTALLATION

(1) Connect BCM to the Junction Block.
(2) Install the BCM to the Junction Block and install the attaching screws.
(3) Install Junction Block/BCM to vehicle.
(4) Connect BCM wire connectors.
(5) Install Junction Block mounting screws.
(6) Connect wire harness connectors to Junction Block.
(7) Install silencer.
(8) Install instrument cluster hood.
(9) Install center bezel.
(10) Install end cap.
(11) Connect battery negative cable.

POWER DISTRIBUTION CENTER

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equipment Power Distribution Center (PDC). The molded plastic PDC housing is located in the left front corner of the engine compartment. The PDC housing has a molded plastic cover that includes an integral hinge feature on the inboard side, and an integral latch on the outboard side. The PDC cover is easily removed for service access and has a convenient fuse and

POWER DISTRIBUTION CENTER (Continued)

relay layout label affixed to the inside surface of the cover to ensure proper component identification.

The PDC housing is secured in the engine compartment on the left front corner with three screws to the transmission and engine control module bracket. A small red molded plastic protective cover on the top near the rear of the PDC is unsnapped to access the battery/generator cable input connection stud. All of the PDC outputs are through the integral engine compartment wire harness, which exits from the rear of the PDC housing.

OPERATION

All of the current from the battery/generator cable connection enters the Power Distribution Center (PDC) through a 140 ampere fusible link that is secured to the top of the PDC housing. The PDC houses up to fourteen maxi-fuse cartridges, which replace all in-line fusible links. The PDC also houses up to eleven blade-type fuses, up to four full International Standards Organization (ISO) relays, and up to eight ISO micro-relays. Internal connection of all the PDC circuits is accomplished by an intricate network of hard wiring and bus bars. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

The fusible link, fuse cartridges, fuses and relays are available for service replacement. The PDC unit cannot be repaired and is only serviced as a unit with the engine compartment wire harness. If the PDC is faulty or damaged, the engine compartment wire harness assembly must be replaced.

REMOVAL

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the Air Inlet System (housing and resonator).

(3) Disconnect each of the engine compartment wire harness connectors. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(4) Remove the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components.

(5) Disengage each of the retainers that secure the engine compartment wire harness to the vehicle body and chassis components.

(6) Remove the three screws retaining the PDC to its mounting bracket.

(7) Remove the PDC and the engine compartment wire harness from the engine compartment as a unit.

INSTALLATION

The Power Distribution Center (PDC) is serviced as a unit with the engine compartment wire harness. If any internal circuit of the PDC or the PDC housing is faulty or damaged, the entire PDC and engine compartment wire harness unit must be replaced.

NOTE: If the power distribution center is being replaced with a new unit, be certain to transfer each of the fuses, fuse cartridges, fusible links and relays from the old power distribution center to the proper cavities of the new power distribution center. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(1) Position the PDC over the mounting bracket between the Powertrain and Transmission Control Modules in the engine compartment.

(2) Align the PDC mounting slots with the blades on the PDC mounting bracket.

(3) Install the three mounting screws into the PDC.

(4) Route the engine compartment wire harness from the PDC through the engine compartment, engaging each of the harness retainers to the mounting provisions in the vehicle body and chassis components. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

(5) Install and tighten the fasteners that secure each of the engine compartment wire harness ground eyelets to the vehicle body and chassis components.

(6) Reconnect each of the engine compartment wire harness connectors.

(7) Connect the battery negative cable.

POWER OUTLET

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Remove left side console lower cover.
(3) Disconnect wire harness connectors from power outlet.
(4) Twist power outlet retainer from the back of power outlet.
(5) Remove power outlet.

INSTALLATION

(1) Install power outlet to instrument panel.
(2) Install retainer to power outlet.
(3) Connect wire harness connectors.
(4) Install left side console lower cover.
(5) Connect battery negative cable.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Ream guide(s) and replace valve(s) with oversize valve(s) and seal(s).
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

ENGINE 2.0L DOHC (Continued)

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

ENGINE 2.0L DOHC (Continued)

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.

(9) Drain engine oil and remove oil filter.

(10) Install a new oil filter.

(11) Fill engine with specified amount of approved oil.

(12) Connect negative battery cable.

(13) Start engine and check for any leaks.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year

ENGINE 2.0L DOHC (Continued)

this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed-plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 3)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 3)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 3)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

ENGINE 2.0L DOHC (Continued)

STANDARD PROCEDURE - MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 4). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

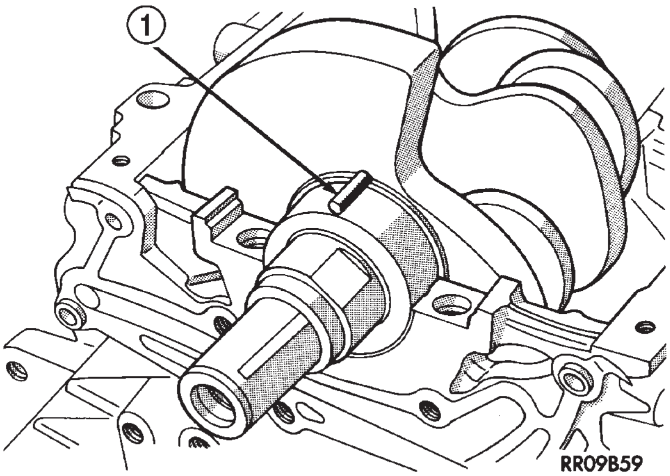

Fig. 4 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

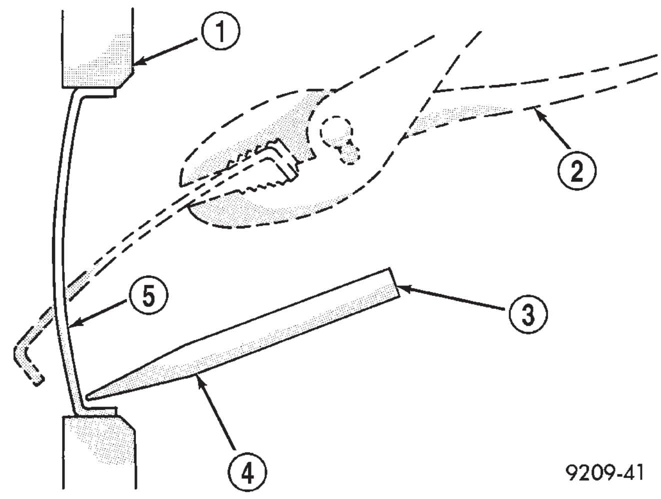

Fig. 5 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect negative battery cable.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Discharge A/C system using a suitable refrigerant recovery machine.

ENGINE 2.0L DOHC (Continued)

(5) Remove throttle body air inlet hose and air cleaner housing assembly.

(6) Remove upper radiator crossmember.

(7) Disconnect upper and lower radiator hoses at radiator.

(8) Manual Transmission equipped vehicles:

- Disconnect speed sensor connector.
- Disconnect back up lamp switch connector.
- Disconnect transmission shift cables.
- Disconnect clutch cable.

(9) Automatic Transmission equipped vehicles:

- Disconnect transmission shift cable.
- Disconnect transmission electrical harness connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).
- Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(10) Disconnect A/C lines at condenser. Remove cooling module assembly (radiator, fan module, and condenser).

(11) Disconnect engine electrical harness from PCM and bulkhead connectors.

(12) Raise vehicle on hoist.

(13) Remove both front wheels.

(14) Remove left and right splash shields.

(15) Remove both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).

(16) Drain engine oil.

(17) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(18) Remove power steering pump from bracket. **Do not** disconnect power steering lines from pump. Reposition pump and support with suitable retaining strap.

(19) Disconnect heater return hose from pipe connection at right front frame rail area.

(20) Disconnect A/C compressor electrical connectors.

(21) Disconnect exhaust pipe from manifold.

(22) Remove through bolts from front and rear engine mounts.

(23) Remove rear mount bracket from transmission.

(24) Remove structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

(25) Remove transmission dust shield.

(26) Automatic Transmission equipped vehicles:

- Mark flex plate to torque converter position. Remove torque converter bolts.

(27) Lower vehicle.

(28) Disconnect positive cable from battery and PDC.

(29) Disconnect ground cable from left side transaxle mount bracket.

(30) Disconnect throttle and speed control cables.

(31) Disconnect coolant recovery container overflow hose.

(32) Disconnect heater hose at thermostat housing.

(33) Disconnect all ground straps attaching to engine.

(34) Disconnect brake booster and vapor purge vacuum hoses.

(35) Disconnect fuel line from fuel rail.

(36) Disconnect generator connectors.

(37) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(38) Remove generator.

(39) Remove A/C suction line at compressor. Cap suction port and line.

(40) Remove A/C compressor.

(41) Raise vehicle enough to allow engine dolly 6135 and cradle 6710 with posts 6848 to be installed under vehicle (Fig. 6).

(42) Loosen cradle engine mounts to allow movement for positioning onto engine locating holes on the engine bedplate, compressor and support bracket. Install adapters 6909 to the two post at rear of engine. Lower vehicle and position cradle mounts until the engine is resting on posts. Tighten post mounts to cradle frame. This will keep mounts from moving when removing or installing engine/transmission assembly. Secure engine/transmission to dolly/cradle with safety straps.

(43) Lower vehicle so weight of the engine and transmission ONLY is on the cradle.

(44) Remove right and left side vertical engine mount bolts.

(45) Slowly raise vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for removal clearance.

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine/transaxle assembly under vehicle and slowly lower vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for installation clearance.

(2) Continue lowering vehicle until right side engine mount and left side transaxle mount align to their mounting locations. Install mounting bolts and torque to 61 N·m (45 ft. lbs.).

(3) Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.
(4) Install A/C compressor.
(5) Connect A/C suction line to compressor.
(6) Install generator.
(7) Install intake manifold. Torque fasteners to 12 N·m (105 in. lbs.) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
(8) Connect generator connectors.
(9) Connect fuel line to fuel rail.
(10) Connect brake booster and vapor purge hoses.
(11) Connect all ground straps to engine.
(12) Connect heater hose to thermostat housing.
(13) Connect coolant recovery container overflow hose.
(14) Connect throttle and speed control cables.
(15) Connect ground cable to left side transaxle mount bracket.
(16) Connect positive cable to battery and PDC.
(17) Raise vehicle on hoist.
(18) Automatic Transmission equipped vehicles:
• Install torque converter bolts.
(19) Install transmission dust shield.
(20) Install structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).
(21) Install rear mount bracket to transmission.
(22) Install front and rear engine mount through bolts. Torque fasteners to 61 N·m (45 ft. lbs.).
(23) Connect exhaust pipe to exhaust manifold. Torque fasteners to 28 N·m (250 in. lbs.).
(24) Connect A/C compressor electrical connectors.
(25) Connect heater return hose to pipe connection at right front frame rail area.
(26) Install power steering pump to bracket.
(27) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(28) Install both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
(29) Install new oil filter.
(30) Install left and right splash shields.
(31) Install both front wheels.
(32) Lower vehicle.
(33) Connect engine electrical harness to PCM and bulkhead connectors.
(34) Install cooling module assembly (radiator, fan module, and condenser). Connect A/C lines to condenser.
(35) Manual Transmission equipped vehicles:
• Connect clutch cable.
• Connect transmission shift cables.
• Connect back up lamp switch connector.
• Connect speed sensor connector.
(36) Automatic Transmission equipped vehicles:
• Connect transmission shift cable.
• Connect transmission electrical connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).
• Connect transmission oil cooler lines using service splice kit. Refer to instructions provided with kit.
(37) Connect upper and lower radiator hoses.
(38) Install upper radiator crossmember.
(39) Install throttle body air inlet hose and air cleaner housing assembly.
(40) Fill engine crankcase with proper oil to correct level.
(41) Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
(42) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(43) Connect negative battery cable.
(44) Start engine and run until normal operating temperature is reached.

AIR CLEANER ELEMENT

REMOVAL

(1) Disconnect negative battery cable.
(2) Disconnect inlet air temperature sensor electrical connector.
(3) Disconnect fresh air makeup hose from throttle body air inlet hose.
(4) Disconnect PCV hose from intake manifold.
(5) Loosen hose clamp at throttle body air inlet hose. Remove hose from throttle body.
(6) Push in on locking tabs to disengage air inlet hose from air cleaner housing. Remove throttle body air inlet hose and air cleaner element together.
(7) Separate air cleaner element from throttle body air inlet hose.

INSTALLATION

(1) Clean any debris from inside air cleaner housing.
(2) Install air cleaner element onto throttle body air inlet hose.
(3) Install throttle body air inlet hose into air cleaner housing. Push in on hose until an audible "click" is heard from locking tabs.
(4) Install hose on throttle body. Tighten hose clamp.
(5) Connect PCV hose to intake manifold.
(6) Connect fresh air makeup hose.
(7) Connect inlet air temperature sensor electrical connector.
(8) Connect negative battery cable.

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect negative battery cable.
(2) Disconnect inlet air temperature sensor electrical connector.
(3) Disconnect fresh air makeup hose from throttle body air inlet hose.
(4) Loosen hose clamp at throttle body air inlet hose. Remove hose from throttle body (Fig. 7).
(5) Remove push pin securing air duct to upper radiator support.
(6) Remove nut on bracket that holds air cleaner housing.
(7) Pull air cleaner housing straight up off locating pins (Fig. 7).

INSTALLATION

(1) Install air cleaner housing straight down on locating pins (Fig. 7).
(2) Install nut on bracket that holds air cleaner housing and tighten.

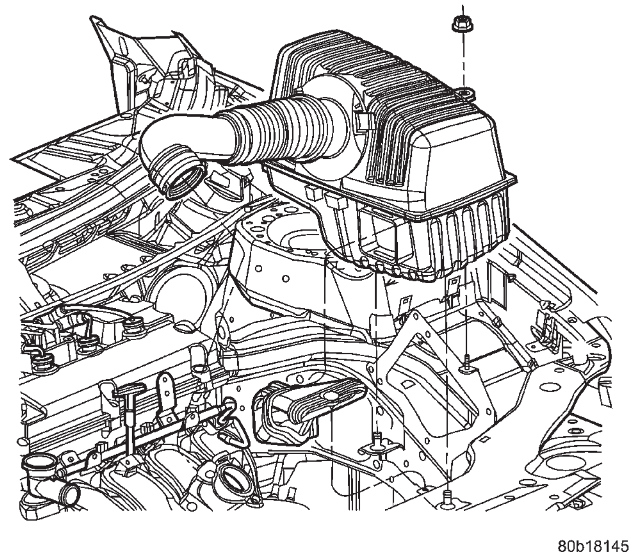

Fig. 7 Air Cleaner Housing

(3) Install push pin that secures air duct to upper radiator support.
(4) Install throttle body air inlet hose to throttle body. Tighten hose clamp.
(5) Connect fresh air makeup hose.
(6) Connect inlet air temperature sensor electrical connector.
(7) Connect negative battery cable.

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder (Fig. 8). The valves are arrange in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries providing lubrication passages to the hydraulic lash adjusters, camshafts, and valve mechanisms.

OPERATION

The cylinder head closes the combustion chamber, allowing the pistons to compress the fuel/air mixture for ignition. The valves are actuated by the lobe profiles on the camshaft to open and close at specified duration to either allow clean air in the combustion chamber or the exhaust gases out; depending on the stroke of the engine.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

(1) Perform fuel system pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative battery cable.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Remove throttle body air inlet hose and air cleaner housing assembly.

(5) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(6) Disconnect heater hose from thermostat housing.

(7) Remove heater tube support bracket from cylinder head.

(8) Disconnect camshaft position sensor electrical connector.

(9) Disconnect EGR solenoid electrical connector (If equipped).

(10) Raise vehicle on hoist.

CYLINDER HEAD (Continued)

(11) Disconnect exhaust pipe from exhaust manifold.

(12) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(13) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(14) Remove front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(15) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(16) Remove camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove timing belt idler pulley and rear timing belt cover.

(18) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(19) Remove camshafts and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(20) Remove cylinder head bolts and remove cylinder head from engine block.

(21) Inspect and clean cylinder head (Refer to 9 - ENGINE - STANDARD PROCEDURE).

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block. (Refer to 9 - ENGINE - STANDARD PROCEDURE) Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Cylinder head must be flat within 0.1 mm (0.004 in.) (Fig. 9).

(2) Inspect camshaft bearing journals for scoring.

(3) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(4) Using a small hole gauge and a micrometer, measure valve guides in 3 places top, middle and bottom (Fig. 10). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.

(5) Check valve guide height (Fig. 11).

INSTALLATION - CYLINDER HEAD

NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts must be replaced (Fig. 12).

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced.

(2) Position new cylinder head gasket on block with part number facing up (Fig. 13). Ensure gasket is seated over the locating dowels in block.

(3) Install cylinder head on block.

(4) Tighten the cylinder head bolts in the sequence shown in (Fig. 14). Using the 4 step torque turn method, tighten according to the following values:

First:
- All bolts to 34 N·m (25 ft. lbs.)

Second:
- Bolts 1–6 to 68 N·m (50 ft. lbs.)
- Bolts 7–10 to 49 N·m (35 ft. lbs.)

Third:
- Bolts 1–6 to 68 N·m (50 ft. lbs.)
- Bolts 7–10 to 49 N·m (35 ft. lbs.)

CAUTION: Do not use a torque wrench for the Fourth step.

Fourth:
- **Turn all bolts an additional 1/4 Turn**

(5) Install rocker arms and camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(6) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(7) Install rear timing belt cover and timing belt idler pulley (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(8) Install camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(9) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Install front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(11) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(12) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Connect exhaust pipe to exhaust manifold. Torque fasteners to 28 N·m (250 in. lbs.).

(14) Connect camshaft position sensor electrical connector.

(15) Connect EGR solenoid electrical connector (If equipped).

CYLINDER HEAD (Continued)

(16) Install heater tube support bracket to cylinder head.

(17) Connect heater hose to thermostat housing.

(18) Install intake manifold (Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(19) Install throttle body air inlet hose and air cleaner housing assembly.

(20) Fill cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(21) Connect negative battery cable.

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Remove timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Hold each camshaft sprocket with Special Tool C-4687 and adaptor C-4687-1, while removing center bolt (Fig. 15).

(3) Remove camshaft sprockets.

(4) Remove rear timing belt cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(5) Remove camshaft seal using Special Tool C-4679A (Fig. 16).

(4) Install camshaft sprockets. Hold each camshaft sprocket with Special Tool C-4687 and adaptor C-4687-1 and tighten center bolt to 115 N·m (85 ft. lbs.) (Fig. 15).

(5) Install timing belt and front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

Both nodular iron camshafts have six bearing journal surfaces and two cam lobes per cylinder (Fig. 18). Flanges at the rear journals control camshaft end play. Provision for a cam position sensor is located on the intake camshaft on the rear of the cylinder head. A hydrodynamic oil seal is used for oil control at the front of the camshaft.

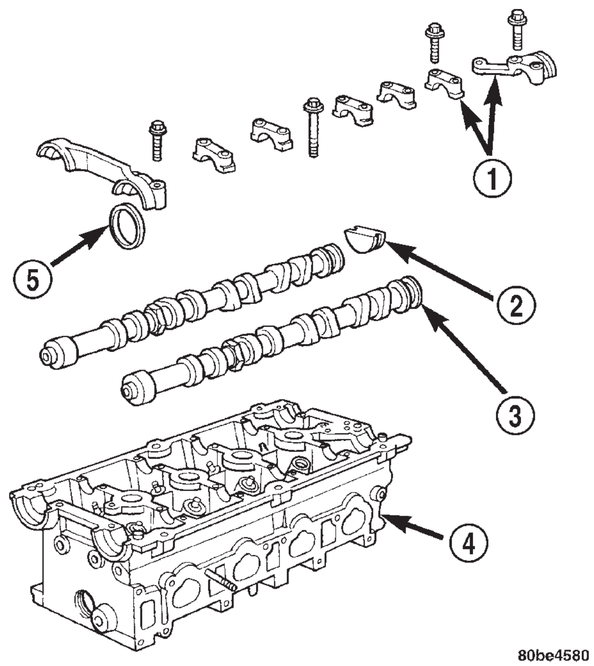

Fig. 18 Cylinder Head and Camshafts

1 - CAMSHAFT BEARING CAPS
2 - PLUG
3 - CAMSHAFT
4 - CYLINDER HEAD
5 - CAMSHAFT OIL SEAL

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE - CAMSHAFT END-PLAY

(1) Oil camshaft journals and install camshaft **WITHOUT** cam follower assemblies. Install rear cam caps and tighten screws to specified torque.

(2) Using a suitable tool, move camshaft as far rearward as it will go.

(3) Zero dial indicator (Fig. 19).

(4) Move camshaft as far forward as it will go.

(5) Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).

(6) If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

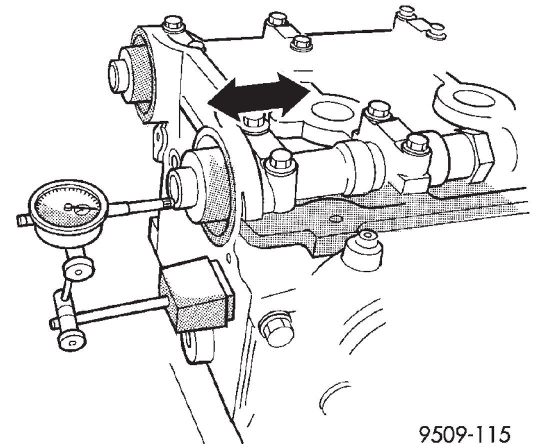

Fig. 19 Camshaft End Play - Typical

REMOVAL

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove camshaft position sensor and camshaft target magnet (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL).

(3) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(4) Remove camshaft sprockets and rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(5) Bearing caps are identified for location. Remove the outside bearing caps first (Fig. 20).

(6) Loosen the camshaft bearing cap attaching fasteners in sequence shown (Fig. 21) one camshaft at a time.

CAUTION: Camshafts are not interchangeable. The intake cam number 6 thrust bearing face spacing is wider.

(7) Identify the camshafts before removing from the head. The camshafts are not interchangeable.

(8) Remove camshafts from cylinder head.

NOTE: If removing rocker arms, identify for reinstallation in the original position.

CLEANING

Clean camshaft with a suitable solvent.

CAMSHAFT(S) (Continued)

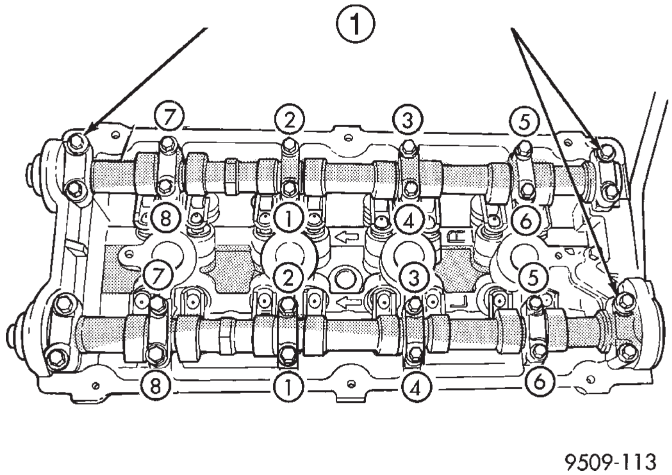

Fig. 21 Camshaft Bearing Cap - Removal

1 - REMOVE OUTSIDE BEARING CAPS FIRST

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 22). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

(3) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 22) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

CAUTION: Ensure that NONE of the pistons are at top dead center when installing the camshafts.

(1) Lubricate all camshaft bearing journals, rocker arms and camshaft lobes.

(2) Install all rocker arms in original positions, if reused.

(3) Position camshafts on cylinder head bearing journals. Install right and left camshaft bearing caps No. 2 – 5 and right No. 6. Tighten M6 fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 23).

(4) Apply Mopar® Gasket Maker to No. 1 and No. 6 bearing caps (Fig. 24). Install bearing caps and tighten M8 fasteners to 28 N·m (250 in. lbs.).

(8) Install rear timing belt cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(9) Install timing belt and front timing belt cover-(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

CYLINDER HEAD COVER

REMOVAL

(1) Remove ignition coil and plug wires.

(2) Disconnect PCV and make-up air hoses from cylinder head cover.

(3) Remove the cylinder head cover fasteners.

(4) Remove cylinder head cover from cylinder head.

CLEANING

Clean cylinder head and cover mating surfaces using a suitable solvent.

INSPECTION

Inspect cover rails for flatness.

INSTALLATION

NOTE: Replace spark plug well seals when installing a new cylinder head cover gasket.

(1) Install new cylinder head cover gaskets (Fig. 25) and spark plug well seals (Fig. 26).

(2) Replace cylinder head cover bolt seals (Fig. 27).

CAUTION: Do not allow oil or solvents to contact the timing belt as they can deteriorate the rubber and cause tooth skipping.

1 – SEALER LOCATION

CAUTION: When installing cylinder head cover bolts, be careful not to interchange the two (2) center bolts with the seven (7) perimeter bolts. The two (2) center bolts contain an aluminum washer between the bolt head and torque limiter for sealing purposes.

(4) Install cylinder head cover assembly to cylinder head. Install all bolts, ensuring the two (2) bolts containing the sealing washer are located in the center locations of cover. Tighten bolts in sequence shown in (Fig. 29). Using a 3 step torque method as follows:

(a) Tighten all bolts to 4.5 N·m (40 in. lbs.).
(b) Tighten all bolts to 9.0 N·m (80 in. lbs.).
(c) Tighten all bolts to 12 N·m (105 in. lbs.).

(5) Connect PCV and make-up air hoses to cylinder head cover.

(6) Install ignition coil and plug wires. Tighten fasteners to 12 N·m (105 in. lbs.).

HYDRAULIC LASH ADJUSTERS

DIAGNOSIS AND TESTING

HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

HYDRAULIC LASH ADJUSTERS (Continued)

(5) The oil restrictor (integral to the cylinder head gasket) in the vertical oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace as necessary.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove rocker arm (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL).

(3) Remove hydraulic lifter (Fig. 30).

(4) Repeat removal procedure for each hydraulic lifter.

(5) If reusing, mark each hydraulic lifter for reassembly in original position. Lifters are serviced as an assembly.

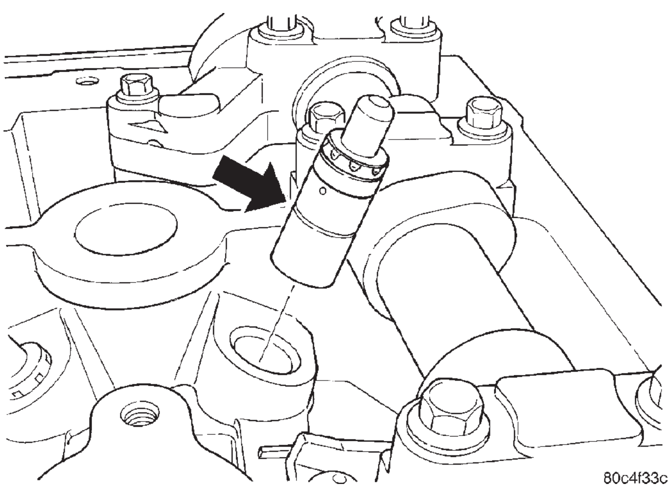

Fig. 30 Hydraulic Lifter

INSTALLATION

(1) Install hydraulic lifter (Fig. 30). Ensure the lifters are at least partially full of engine oil. This is indicated by little or no plunger travel when the lifter is depressed.

(2) Install rocker arm (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION).

(3) Repeat installation procedure for each hydraulic lifter.

(4) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel. They have chrome plated stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have three-bead lock keepers to retain springs and to promote valve rotation.

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using roller camshaft followers which pivot on hydraulic lash adjusters.

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

ROCKER ARMS

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Disconnect negative battery cable.

(2) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(3) Remove spark plugs.

(4) Rotate engine until the camshaft lobe, on the rocker arm being removed, is positioned on its base circle (heel). Also, the piston should be a minimum of 6.3 mm (0.25 in) below TDC position.

CAUTION: If cam follower assemblies are to be reused, always mark position for reassembly in their original positions.

ROCKER ARMS (Continued)

(5) Using Special Tools 8215-A and 8436 slowly depress valve assembly until rocker arm can be removed (Fig. 31).

(6) Repeat removal procedure for each rocker arm.

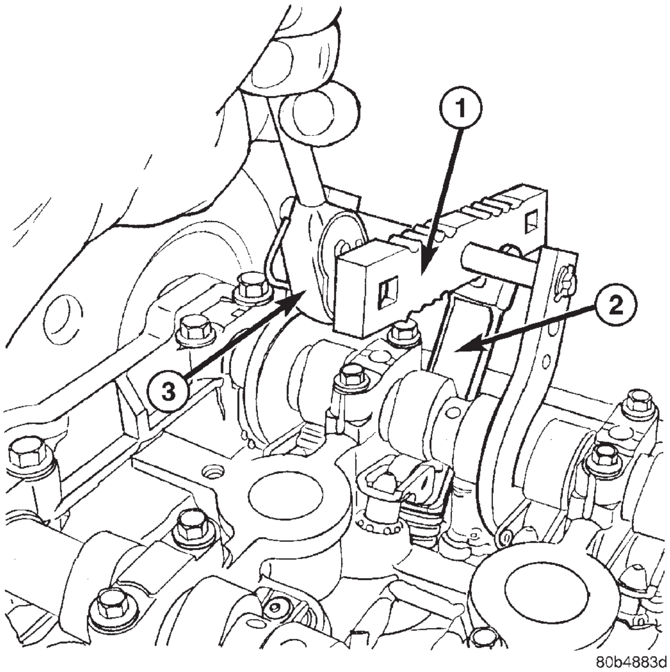

Fig. 31 Rocker Arm - Removal/Installation

1 - SPECIAL TOOL 8215-A
2 - SPECIAL TOOL 8436

INSPECTION

Inspect the rocker arm for wear or damage (Fig. 32). Replace as necessary.

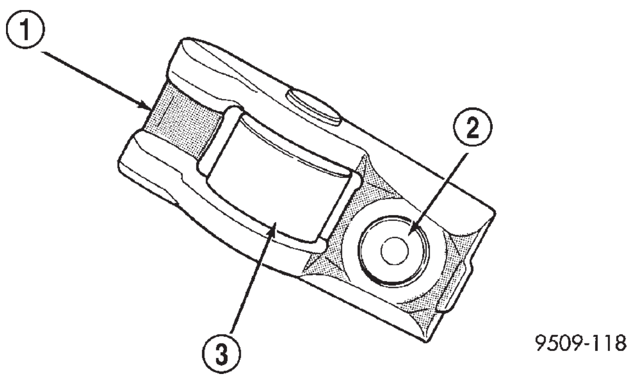

Fig. 32 Rocker Arm

1 - TIP
2 - LASH ADJUSTER POCKET
3 - ROLLER

INSTALLATION

(1) Lubricate rocker arm with clean engine oil.

(2) Using Special Tools 8215-A and 8436 slowly depress valve assembly until rocker arm can be installed on the hydraulic lifter and valve stem (Fig. 31).

(3) Repeat installation procedure for each rocker arm.

(4) Install spark plugs.

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Connect negative battery cable.

VALVE SPRINGS AND SEALS

REMOVAL

REMOVAL - CYLINDER HEAD ON

(1) Disconnect negative battery cable.

(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(3) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(5) Rotate crankshaft until piston is at TDC.

(6) With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.

(7) Using Special Tool MD-998772-A with adapter 6779 (Fig. 33), compress valve springs and remove valve locks.

(8) Remove valve spring(s).

(9) Remove valve stem seal(s) by a using valve stem seal tool (Fig. 35).

REMOVAL - CYLINDER HEAD OFF

(1) With cylinder head removed from cylinder block, compress valve springs using a universal valve spring compressor.

(2) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(3) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.

(4) Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION)

VALVE SPRINGS AND SEALS (Continued)

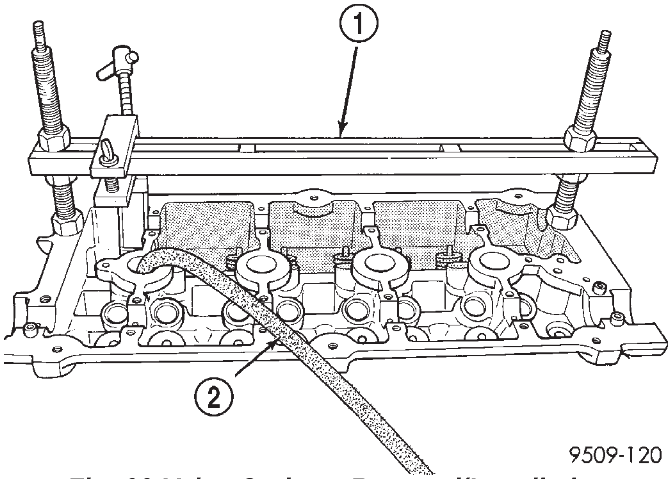

Fig. 33 Valve Spring - Removal/Installation

1 - VALVE SPRING COMPRESSOR MD 998772A
2 - AIR HOSE

INSPECTION

(1) Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:

- Valve Closed Nominal Tension—76 lbs. @ 38.0 mm (1.50 in.)
- Valve Open Nominal Tension—136 lbs. @ 29.75 mm (1.17 in.)

(2) Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.

INSTALLATION

INSTALLATION - CYLINDER HEAD ON

(1) Install valve seal/valve spring seat assembly (Fig. 34). Push the assembly down to seat it onto the valve guide.

(2) Install valve spring and retainer, use Special Tool MD-998772-A with adapter 6779 to compress valve springs only enough to install locks (Fig. 33). Correct alignment of tool is necessary to avoid nicking valve stems.

(3) Remove air hose and install spark plugs.

(4) Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(7) Connect negative battery cable.

1 - VALVE RETAINING LOCKS
2 - VALVE SPRING
3 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY
4 - VALVE SPRING RETAINER

INSTALLATION - CYLINDER HEAD OFF

(1) Coat valve stems with clean engine oil and insert in cylinder head.

(2) Install new valve stem seals on all valves using a valve stem seal tool (Fig. 35). The valve stem seals should be pushed firmly and squarely over valve guide.

CAUTION: When oversize valves are used, the corresponding oversize valve seal must also be used. Excessive guide wear may result if oversize seals are not used with oversize valves.

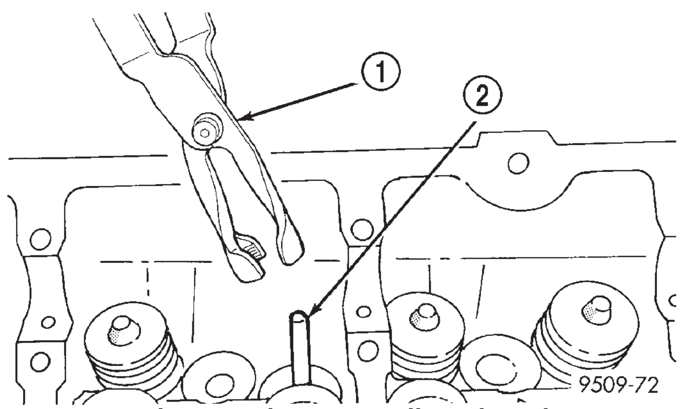

Fig. 35 Valve Stem Oil Seal Tool

1 - VALVE SEAL TOOL
2 - VALVE STEM

(3) Install valve springs and retainers. Compress valve springs only enough to install locks, taking care not to misalign the direction of compression.

VALVE SPRINGS AND SEALS (Continued)

Nicked valve stems may result from misalignment of the valve spring compressor.

CAUTION: When depressing the valve spring retainers with valve spring compressor the locks can become dislocated. Ensure both locks are in the correct location after removing tool.

(4) Check the valve spring installed height B after refacing the valve and seat (Fig. 36). Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

ENGINE BLOCK

DESCRIPTION

The cast iron cylinder block is a two-piece assembly, consisting of the cylinder block and bedplate (Fig. 37). The bedplate incorporates the main bearing caps and bolts to the cylinder block. This design offers a much stronger lower end and increased cylinder block rigidity. The rear oil seal retainer is integral with the block. The bedplate and block are serviced as an assembly.

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

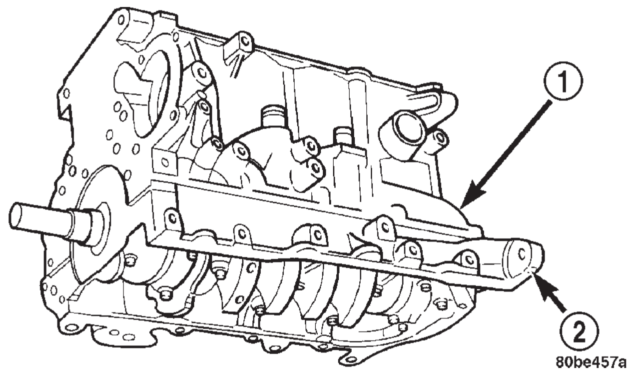

Fig. 37 Cylinder Block and Bedplate

1 - CYLINDER BLOCK
2 - BEDPLATE

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 38).

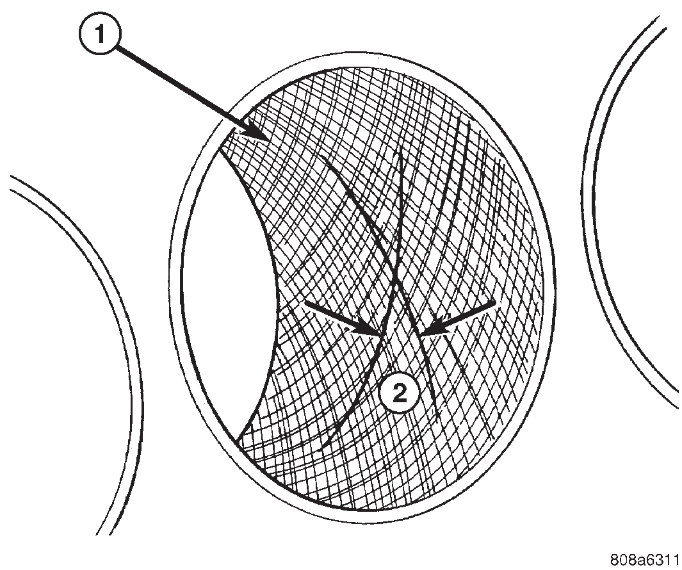

Fig. 38 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

ENGINE BLOCK (Continued)

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 39) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B (Fig. 39). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

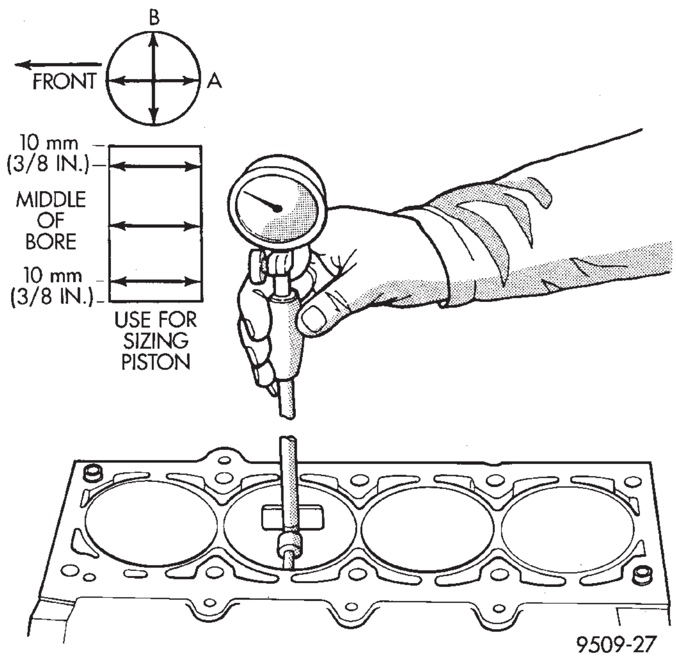

Fig. 39 Checking Cylinder Bore Size

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD AND BEARING - FITTING

(1) Measure connecting rod bearing clearance using Plastigage (Fig. 40). For more information on use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for connecting rod specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

CAUTION: Do not rotate crankshaft or the Plastigage may be smeared.

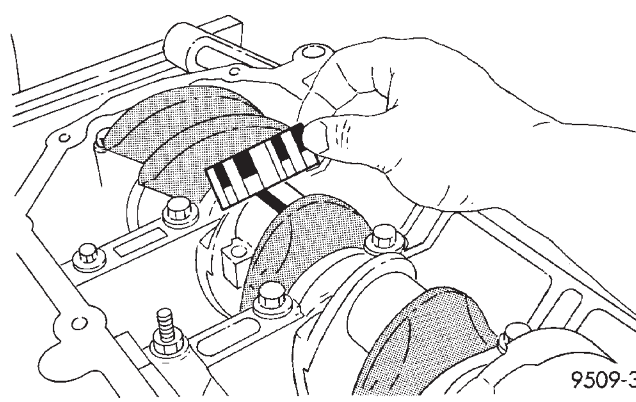

Fig. 40 Connecting Rod Bearing

NOTE: The rod bearing bolts should not be reused.

(2) Before installing **NEW** bolts, lubricate the threads with clean engine oil.

CONNECTING ROD BEARINGS (Continued)

(3) Install each bolt finger tight than alternately torque each bolt to assemble the cap properly.

(4) Tighten the bolts to 27 N·m PLUS 1/4 turn (20 ft. lbs. PLUS 1/4 turn) **Do not use a torque wrench for last step.**

(5) Using a feeler gauge, check connecting rod side clearance (Fig. 41). Refer to Engine Specifications for connecting rod specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

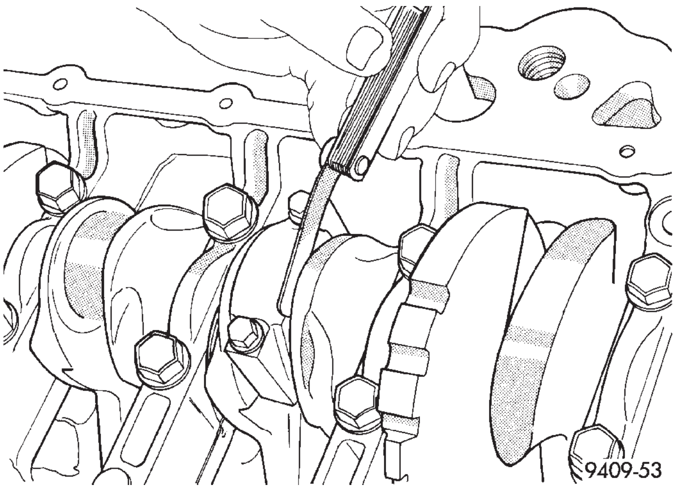

Fig. 41 Connecting Rod Side Clearance

CRANKSHAFT

DESCRIPTION

The crankshaft is made of nodular cast iron and includes five main bearing journals and four connecting rod journals (Fig. 42). The number three journal is the location for the thrust bearing. The mains and connecting rod journals have undercut fillet radiuses that are rolled for added strength. To optimize bearing loading, eight counterweights are used.

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

STANDARD PROCEDURE - CRANKSHAFT END PLAY

(1) Mount a dial indicator to front of engine, locating probe on nose of the crankshaft (Fig. 43).

(2) Move crankshaft all the way to the rear of its travel.

(3) Zero the dial indicator.

(4) Move crankshaft all the way to the front of its travel and read the dial indicator. For crankshaft specifications (Refer to 9 - ENGINE - SPECIFICATIONS)

REMOVAL

(1) Remove engine assembly (Refer to 9 - ENGINE - REMOVAL).

(2) Separate transaxle from engine.

(3) Remove drive plate/flexplate.

(4) Remove crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL)

(5) Mount engine on a suitable repair stand.

(6) Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(7) Remove front timing belt cover, front engine mount bracket, and timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

CRANKSHAFT (Continued)

(8) Remove the timing belt tensioner and pulley bracket (Refer to 9 - ENGINE/VALVE TIMING/ TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).

(9) Remove camshaft sprockets and rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT / CHAIN COVER(S) - REMOVAL).

(10) Remove crankshaft sprocket (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - REMOVAL).

(11) Remove oil filter and adapter (Fig. 44).

(12) Remove oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(13) Remove oil pump pick-up tube.

(14) Remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(15) Remove crankshaft position sensor (Fig. 44).

(16) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(17) Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(18) Remove all main bearing cap and bedplate bolts from the engine block (Fig. 45).

(19) Using a mallet tap the bedplate loose from the engine block dowel pins.

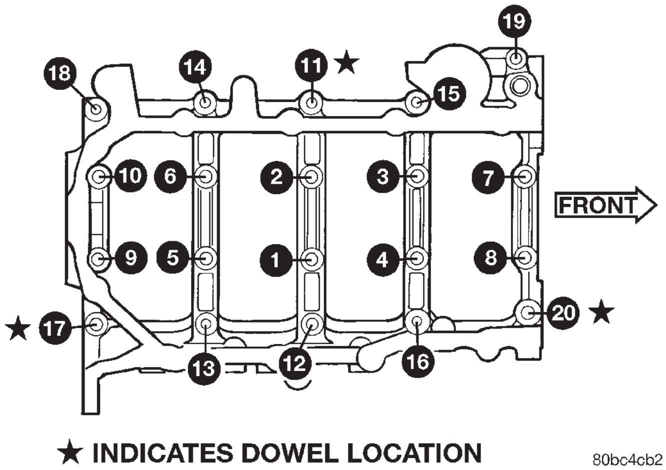

Fig. 45 Bedplate Bolts

CAUTION: Do not pry up on one side of the bedplate. Damage may occur to cylinder block and bedplate alignment.

(20) Bedplate should be removed evenly from the cylinder block dowel pins.

(21) Lift out crankshaft from cylinder block. Be sure not to damage the main bearings or journals when removing the crankshaft.

CRANKSHAFT MAIN BEARINGS LOCATION

The crankshaft is supported in five main bearings. All upper bearing shells in the crankcase have oil grooves. All lower bearing shells installed in the (bedplate) main bearing cap are plain. Crankshaft end play is controlled by a flanged bearing on the number three main bearing journal (Fig. 46).

NOTE: The upper and lower main Bearing shells are Not interchangeable. The lower shells have a revised tab to prevent improper installation.

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 47). Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

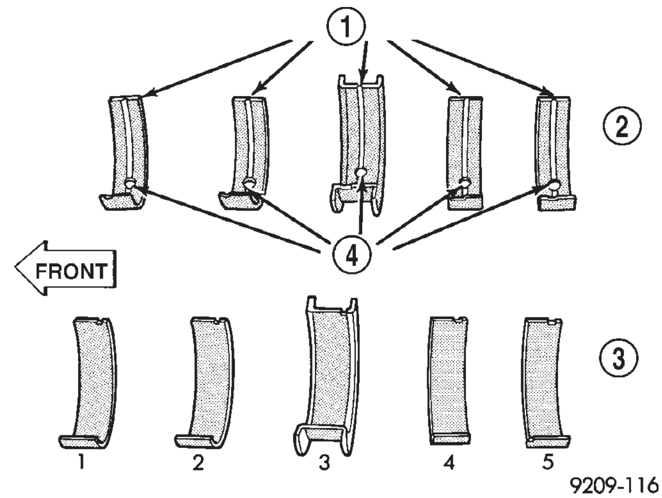

Fig. 46 Main Bearing Identification

1 - OIL GROOVES
2 - UPPER BEARINGS
3 - LOWER BEARINGS
4 - OIL HOLES

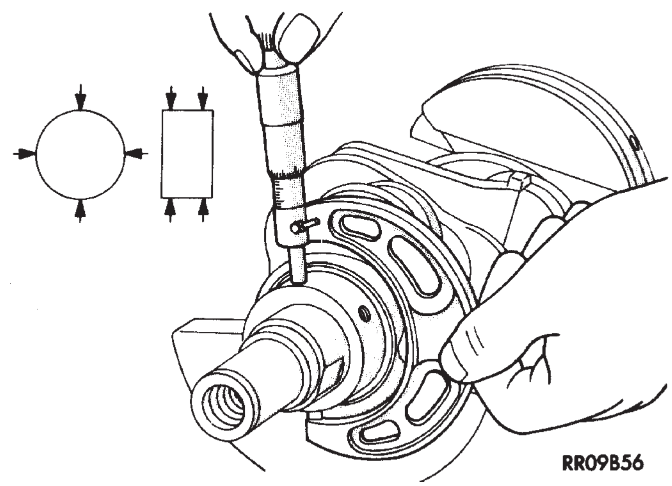

Fig. 47 Crankshaft Journal Measurements

Upper and lower No. 3 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine (Fig. 47). All bearing cap bolts removed during service procedures are to be cleaned and oiled before installation. Bearing shells are available in standard and the following undersized: 0.016 mm (0.0006 in.), 0.032 mm (0.0012 in.), 0.250 mm (0.010 in.). Never install an undersize bearing that will reduce clearance below specifications.

INSTALLATION

(1) Install the main bearing shells with the lubrication groove in the cylinder block. Install O-ring into recess in the block (Fig. 48).

1 - LUBRICATION GROOVES
2 - O-RING
3 - OIL HOLES

(2) Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

CAUTION: Do Not get oil on the bedplate mating surface. It will affect the sealer ability to seal the bedplate to cylinder block.

(3) Oil the bearings and journals and install crankshaft in cylinder block.

CAUTION: Use only the specified anaerobic sealer on the bedplate or damage may occur to the engine.

(4) Apply 1.5–2.0 mm (0.059–0.078 in.) bead of Mopar® Bed Plate Sealant to cylinder block as shown in (Fig. 49).

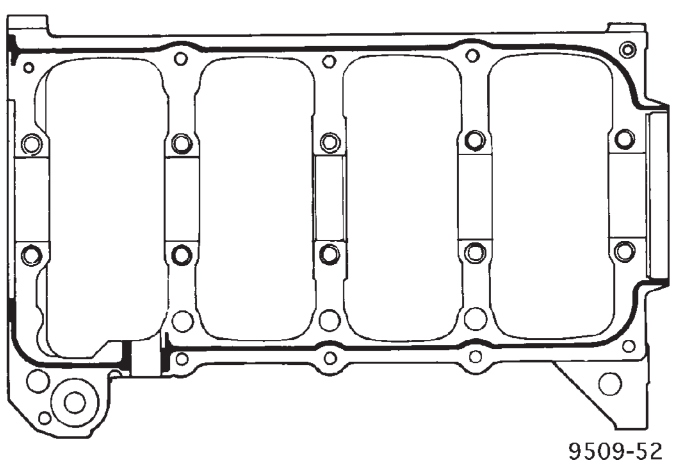

Fig. 49 Main Bearing Caps/Bedplate Sealing

(5) Install lower main bearings into main bearing cap/bedplate. Make certain the bearing tabs are seated into the bedplate slots. Install the main bearing/bedplate into engine block.

(6) Before installing the bolts oil threads with clean engine oil, wipe off any excess oil.

(7) Install main bearing bedplate to engine block bolts 11, 17 and 20 finger tight. Tighten these bolts down together until the bedplate contacts the cylinder block (Fig. 50).

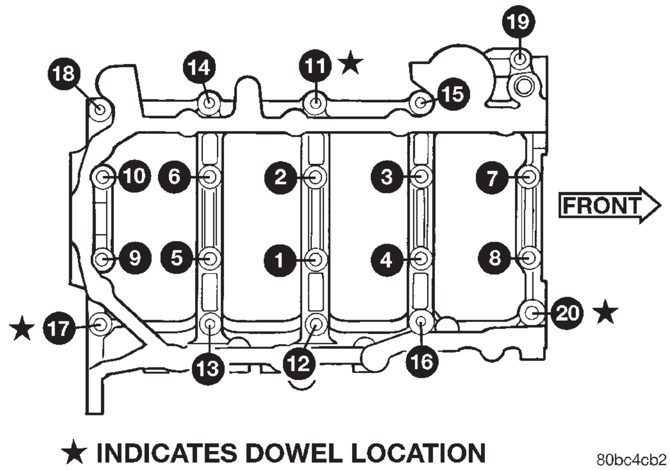

Fig. 50 Main Bearing Caps/Bedplate Torque Sequence

(8) Install main bearing bedplate to engine block bolts (1–10) and torque each bolt to 81 N·m (60 ft. lbs.) in sequence shown in (Fig. 50).

(9) Install main bearing bedplate to engine block bolts (11–20), with baffle studs in positions 12, 13 and 16 and torque each bolt to 34 N·m (25 ft. lbs.) in sequence shown in (Fig. 50).

(10) After the main bearing bedplate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

(11) Check crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(12) Install connecting rod bearings and caps (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE). Install new connecting rod bolts and tighten to 27 N·m (20 ft. lbs.) plus 1/4 turn.

(13) Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(14) Install oil pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(15) Install oil filter adapter and oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER ADAPTER - INSTALLATION).

CRANKSHAFT (Continued)

(16) Install timing belt rear cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(17) Install front crankshaft oil seal and crankshaft sprocket (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).

(18) Install the timing belt tensioner and pulley bracket (Refer to 9 - ENGINE/VALVE TIMING/ TMNG BELT/CHAIN TENSIONER&PULLEY - INSTALLATION).

(19) Install the timing belt, front engine mount bracket, and front timing belt cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(20) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(21) Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.

(22) Install the crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(23) Install the drive plate/flex plate.

(24) Install the transaxle to engine.

(25) Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).

(26) Perform camshaft and crankshaft timing relearn procedure as follows:

- Connect the DRB III® scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
- Turn the ignition switch on and access the “miscellaneous” screen.
- Select “re-learn cam/crank” option and follow directions on DRB screen.

REMOVAL

(1) Remove the accessory drive belts. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)

(2) Remove the crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(3) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(4) Remove the crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 51).

(5) Remove the crankshaft sprocket key from crankshaft (Fig. 52).

CAUTION: Do not nick shaft seal surface or seal bore.

INSTALLATION

CAUTION: If burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

(1) Place Special Tool 6926-1 on crankshaft. This is a pilot tool with a magnetic base (Fig. 57).

(2) Position seal over pilot tool. Make sure you can read the words **THIS SIDE OUT** on seal (Fig. 57). Pilot tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.

CAUTION: If the seal is driven into the block past flush, this may cause an oil leak.

(3) Drive the seal into the block using Special Tool 6926-2 and handle C-4171 (Fig. 58) until the tool bottoms out against the block (Fig. 59).

PISTON & CONNECTING ROD

DESCRIPTION

NOTE: The engine DOES NOT have provisions for a free wheeling valve train. Non free wheeling valve train means, in the event of a broken timing belt, pistons will contact the valves.

The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged powdered metal connecting rods. The pistons pin is offset 1 mm (0.0394 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The pistons and connecting rods are serviced as an assembly.

OPERATION

The piston and connecting rod is the link between the combustion force to the crankshaft.

STANDARD PROCEDURE - PISTON TO CYLINDER BORE FITTING

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin about 14 mm (9/16 inch.) from the bottom of the skirt as shown in (Fig. 61). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line shown in (Fig. 60). Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Correct piston to bore clearance must be established in order to assure quiet and economical operation.

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

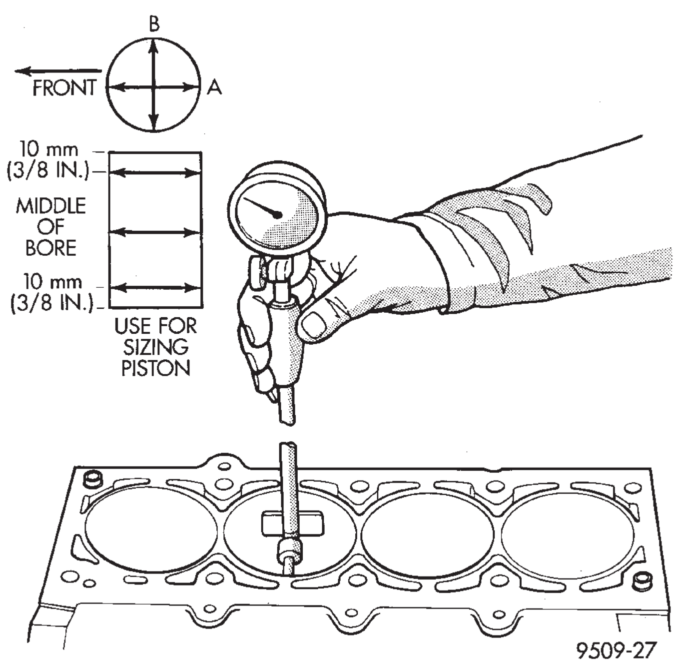

Fig. 60 Checking Cylinder Bore

PISTON & CONNECTING ROD (Continued)

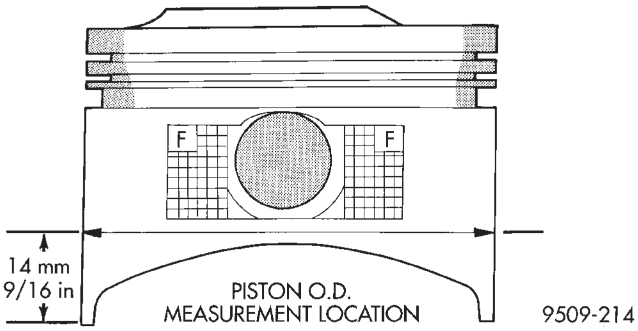

Fig. 61 Piston Measurement

REMOVAL

(1) Remove the cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(2) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(3) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**. Mark piston with matching cylinder number (Fig. 62).

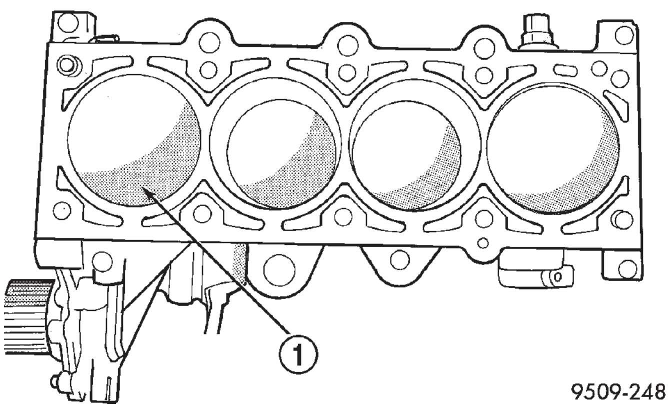

Fig. 62 Piston Markings

1 - WEIGHT DESIGNATION AND DIRECTIONAL ARROW WILL BE IMPRINTED IN THIS AREA

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(4) Using a permanent ink marker or scribe tool mark the cylinder number on the side of the rod and cap (Fig. 63) for identification.

(5) Pistons will have a stamping in the approximate location shown in (Fig. 62). These stamps will be either a directional arrow or a weight identification for the assembly. L is for light and H is for heavy. These assemblies should all be the same weight class. Service piston assemblies are marked with a S and can be used with either L or H production assemblies. The weight designation stamps should face toward the timing belt side of the engine.

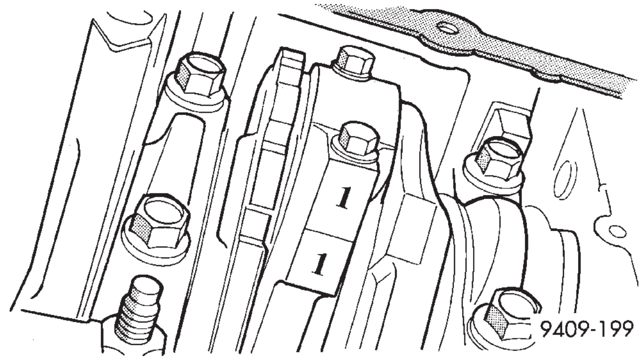

Fig. 63 Identify Connecting Rod to Cylinder

(6) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(7) Remove connecting rod cap bolts **Do not use old bolts if reinstalling connecting rod.**

(8) To protect crankshaft journal and fractured rod surfaces, install Special Tool 8189, connecting rod guides onto connecting rod (Fig. 64). Carefully push each piston and rod assembly out of cylinder bore.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.

(9) Remove Special Tool 8189, connecting rod guides and re-install bearing cap on the mating rod.

NOTE: Piston and rods are serviced as an assembly.

(10) Remove piston rings. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - REMOVAL)

PISTON & CONNECTING ROD (Continued)

INSTALLATION

(1) Install piston rings on piston. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION)

(2) Before installing pistons and connecting rod assemblies into the bore, ensure the compression ring gaps are staggered, and neither is in line with the oil ring rail gap.

(3) Before installing the ring compressor, ensure the oil ring expander ends are butted and the rail gaps are located as shown in (Fig. 71).

(4) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston (Fig. 65). **Be sure position of rings does not change during this operation**.

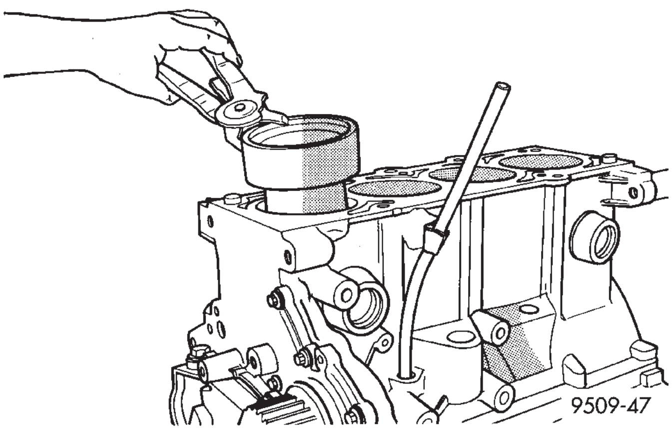

Fig. 65 Installing Piston

(5) The weight stamp designation L or H will be in the front half of the piston should face toward the front of the engine (Fig. 62).

(6) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

(7) Position upper bearing half and install Special Tool 8189, connecting rod guides onto connecting rod (Fig. 64).

(8) Insert rod and piston assembly into cylinder bore and carefully guide rod over the crankshaft journal.

(9) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(10) Remove Special Tool 8189, connecting rod guides.

(11) Install connecting rod lower bearing half and cap. Install **New** bolts and tighten to 27 N·m (20 ft. lbs.) plus 1/4 turn.

(12) Install the cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)

(13) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

PISTON RINGS

STANDARD PROCEDURE - PISTON RING - FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioned below normal ring travel in the cylinder bore. Check gap with feeler gauge (Fig. 66). For piston ring specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

(1) Using a suitable ring expander, remove upper and intermediate piston rings (Fig. 68).

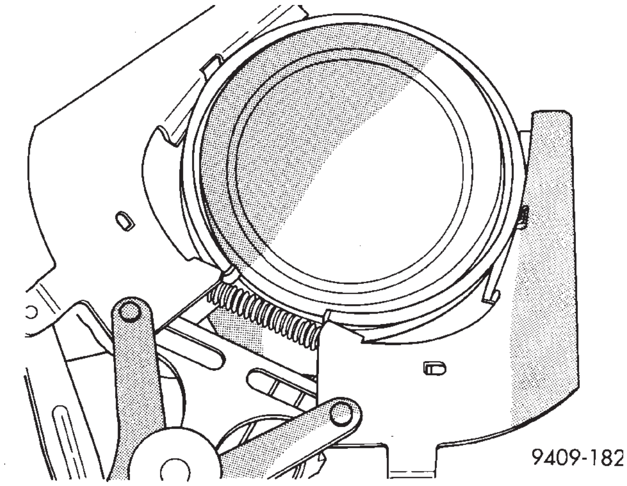

Fig. 68 Piston Rings—Removing and Installing

(2) Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.

(3) Clean ring grooves of any carbon deposits.

INSTALLATION

NOTE: The identification mark on face of upper and intermediate piston rings must point toward top of piston.

Install rings with manufacturers identification mark facing up, to the top of the piston (Fig. 69).

a. Oil ring expander.
b. Upper oil ring side rail.
c. Lower oil ring side rail.
d. No. 2 Intermediate piston ring.
e. No. 1 Upper piston ring.

(1) Install oil ring expander (Fig. 69).

(2) Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander (Fig. 70).**

STRUCTURAL COLLAR

REMOVAL

(1) Raise vehicle on hoist.

NOTE: To remove transaxle dust cover, the front bending strut must be removed.

(2) Remove structural collar from oil pan to transaxle (Fig. 72).

INSTALLATION

CAUTION: The torque procedure for the structural collar must be followed, as damage to oil pan or collar could occur.

(1) Install the structural collar (Fig. 72) using the following 3 step torque sequence:
- Step 1: Install the collar to oil pan bolts and tighten to 3 N·m (30 in. lbs.).
- Step 2: Install collar to transaxle bolts and tighten to 108 N·m (80 ft. lbs.).
- Step 3: Final torque the collar to oil pan bolts to 54 N·m (40 ft. lbs.).

(2) Lower vehicle.

REMOVAL

(1) Disconnect negative battery cable.
(2) Support engine under oil pan with wooden block and floor jack.
(3) Remove three right side engine mount vertical bolts to front engine bracket.
(4) Raise vehicle on hoist.
(5) Remove right front wheel and belt splash shield.
(6) Support engine under oil pan with a wooden block and screw jack (Fig. 73).
(7) Remove front and rear engine mount through bolts.
(8) Slowly lower engine down with screw jack.
(9) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(10) Remove crankshaft damper bolt.
(11) Remove damper using Special Tool 8454 Puller and Insert 6827–A (Fig. 74).

INSTALLATION

(1) Install crankshaft vibration damper using M12 1.75 x 150 mm bolt, washer, thrust bearing and nut from Special Tool 6792 (Fig. 75).
(2) Install crankshaft vibration damper bolt and tighten to 136 N·m (100 ft. lbs.).

(3) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Raise engine with screw jack enough to install front and rear engine mount through bolts. Torque fasteners to 61 N·m (45 ft. lbs.).

(5) Install belt splash shield and right front wheel.

(6) Lower vehicle.

(7) Support engine under oil pan with wooden block and floor jack.

(8) Slowly raise engine with floor jack until engine mount bracket aligns with right side engine mount. Install three vertical bolts to front engine bracket. Torque fasteners to 61 N·m (45 ft. lbs.).

(9) Remove floor jack.

(10) Connect negative battery cable.

ENGINE MOUNTING

ADJUSTMENTS

ENGINE SUPPORT ADJUSTMENT

The right and left support assemblies are slotted to allow for right/left drive train adjustment in relation to drive shaft assembly length.

Check and reposition right and left engine support assemblies as required. Adjust drive train position, if required, for the following conditions:

- Drive shaft distress: See Group 2, Suspension and Driveshaft.
- Any front end structural damage (after repair).
- Support Assembly replacement.

ENGINE SUPPORT ADJUSTMENT

(1) Remove the load on the engine motor mounts by carefully supporting the engine and transmission assembly with a floor jack.

(2) Loosen the right engine support assembly vertical fasteners.

(3) Loosen the left engine support assembly vertical bolts.

(4) Pry the engine right or left as required to achieve the proper drive shaft assembly length. Refer to Group 2, Suspension and Driveshaft for driveshaft identification and related assembly length measuring.

(5) Tighten right engine support assembly vertical bolts to 61 N·m (45 ft. lbs.). and tighten left engine support assembly bolts to 61 N·m (45 ft. lbs.).

(6) Recheck drive shaft length.

LEFT MOUNT

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove throttle body air inlet hose and air cleaner housing assembly.

(3) Remove two nuts securing speed control servo bracket to left shock tower. Reposition servo.

(4) Support transmission with floor jack and wooden block.

(5) Remove the three vertical bolts from mount to transmission bracket (A) (Fig. 76).

(6) Slightly lower transmission with floor jack.

(7) Remove mount to frame rail fasteners (B) and remove mount (Fig. 76).

INSTALLATION

(1) Position mount to frame rail. Install mount to frame rail fasteners (B) (Fig. 76). Torque fasteners to 33 N·m (24 ft. lbs.).

(2) Raise transmission into position with floor jack.

(3) Install three vertical bolts from mount to transmission bracket (A) (Fig. 76). Torque fasteners to 61 N·m (45 ft. lbs.).

(4) Remove floor jack and wooden block.

(5) Install speed control servo to left shock tower. Torque fasteners to 6.7 N·m (60 in. lbs.)

(6) Install throttle body air inlet hose and air cleaner housing assembly.

(7) Connect negative battery cable.

RIGHT MOUNT

REMOVAL

(1) Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).

(2) Remove heater tube front attaching screw.

(3) Raise vehicle on a hoist and remove inner splash shield.

(4) Remove heater tube rear attaching screw.

(5) Remove the right engine support assembly vertical fasteners from frame rail (Fig. 77).

(6) Lower vehicle. Remove the load on the engine motor mounts by carefully supporting the engine assembly with floor jack and wooden block on oil pan.

RIGHT MOUNT (Continued)

(7) Remove the bolts attaching the engine support assembly to the engine bracket (Fig. 77).

(8) Remove right engine mount.

INSTALLATION

(1) Position right engine mount and install frame rail to mount bolts. Tighten bolts to 61 N·m (45 ft. lbs.) (Fig. 77).

(2) Install the mount to engine support bracket bolts and tighten to 61 N·m (45 ft. lbs.) (Fig. 77).

(3) Raise vehicle on a hoist.

(4) Install heater tube rear attaching screw.

(5) Install inner splash shield and lower vehicle.

(6) Install heater tube front attaching screw.

(7) Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

FRONT MOUNT

REMOVAL

(1) Raise vehicle.

(2) Remove front mount to bracket horizontal through bolt (Fig. 78).

(3) Remove front mount vertical bolts (Fig. 78).

(4) Remove front mount.

(2) Loose install front mount to bracket through bolt.

(3) Install front mount vertical bolts. Tighten bolts to 61 N·m (45 ft. lbs.) (Fig. 78).

(4) Tighten horizontal through bolt to 61 N·m (45 ft. lbs.) (Fig. 78).

(5) Lower vehicle.

REAR MOUNT

REMOVAL

(1) Remove throttle body air inlet hose and air cleaner housing assembly.

(2) Remove three vertical bolts attaching rear mount bracket to transaxle case (Fig. 79).

(3) Raise vehicle on hoist.

(4) Remove rear mount bracket through bolt (Fig. 79).

(5) Remove horizontal bolt attaching rear mount bracket to transaxle case (Fig. 79).

(6) Remove mount bracket.

(7) Remove rear mount to suspension crossmember attaching bolts.

(8) Remove rear mount.

INSTALLATION

(1) Position rear mount on suspension crossmember and loosely install bolts.

(2) Position mount bracket on transaxle and install bolts. Tighten to 110 N·m (80 ft. lbs.) (Fig. 79).

(3) Install rear mount to bracket through bolt and tighten to 61 N·m (45 ft. lbs.) (Fig. 79).

(4) Tighten rear mount to crossmember bolts to 61 N·m (45 ft. lbs.) (Fig. 79).

(5) Lower vehicle. Install throttle body air inlet hose and air cleaner housing assembly.

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump (Fig. 80) is mounted in the front engine cover and driven by the crankshaft.

9 - FILTER
10 - O-RING
11 - NIPPLE

LUBRICATION (Continued)

OPERATION

Refer to (Fig. 81) for lubrication system flow.

Engine oil drawn from the oil pan sump through the pickup tube is pressurized by the pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. A vertical hole at the number five bulkhead routes pressurized oil through a restrictor and up past a cylinder head bolt to an oil gallery running the length of the cylinder head. The restrictor, an integral part of the cylinder head gasket, provides increased oil flow to the main oil gallery. The camshaft journals are partially slotted to allow a predetermined amount of pressurized oil to pass into the bearing cap cavities with small holes directed to spray lubricate the camshaft lobes. Oil returning to the pan from pressurized components supplies lubrication to the valve stems. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

Check oil pressure using a gauge at oil pressure switch location.

(1) Remove oil pressure switch.

(2) Install oil pressure test gauge assembly C-3292 with adaptor 8406. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM.

(3) Warm engine to normal operating temperature.

(4) Monitor gauge readings at idle and 3000 rpm. Oil Pressure: **Idle** 25 kPa (4 psi) minimum, **3000 RPM** 170-550 kPa (25-80 psi).

(5) If oil pressure is 0 at idle, shut off engine and check the following:

- Pressure relief valve stuck open
- Clogged oil pick-up screen
- Damaged oil pick-up tube O-ring

OIL

STANDARD PROCEDURE

ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick and observe oil level (Fig. 82). Add oil only when the level is at or below the ADD mark (Fig. 83).

OIL (Continued)

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.
(2) Remove oil fill cap (Fig. 82).
(3) Raise vehicle on hoist.
(4) Place a suitable drain pan under crankcase drain.
(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
(6) Remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)
(7) Install and tighten drain plug in crankcase.
(8) Install new oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)
(9) Lower vehicle and fill crankcase with specified type and amount of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)
(10) Install oil fill cap.
(11) Start engine and inspect for leaks.
(12) Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

OIL FILTER

REMOVAL

CAUTION: When servicing the oil filter (Fig. 84), avoid deforming the filter. Use an appropriate oil filter removing tool. Position filter wrench strap close the seam at the base of the filter. The oil filter seam that joins the can to the base, is reinforced by the base plate.

(1) Turn filter counterclockwise to remove (Fig. 84).

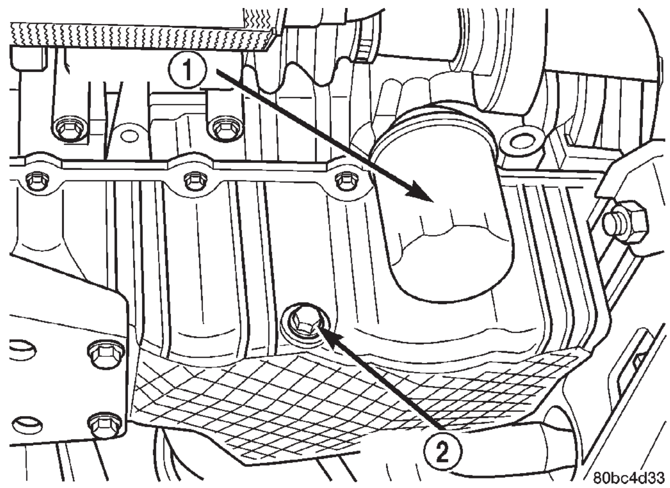

Fig. 84 Engine Oil Filter

1 - OIL FILTER
2 - DRAIN PLUG

INSTALLATION

(1) Clean and check the filter mounting surface. The surface must be smooth, flat and free of debris or old pieces of rubber.
(2) Lubricate new filter gasket.
(3) Screw filter on until gasket contacts base (Fig. 84). Tighten to 20 N·m (15 ft. lbs.).

OIL FILTER ADAPTER

REMOVAL

(1) Remove the oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(2) Remove assembly by unscrewing adaptor fitting (Fig. 85).

(3) Remove O-ring seal.

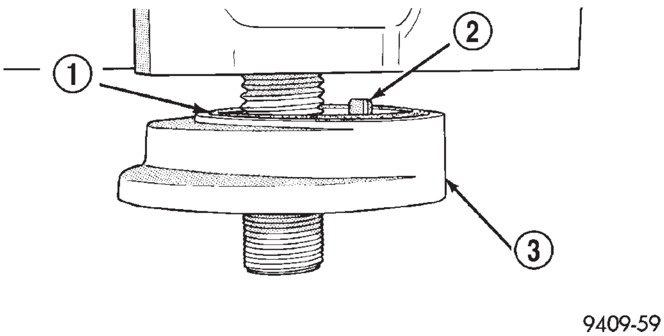

Fig. 85 Engine Oil Filter Adapter to Engine Block

1 - O-RING

3 - OIL FILTER ADAPTER

INSTALLATION

(1) Position O-ring in the groove on adapter.

(2) Align roll pin into engine block and tighten assembly to 80 N·m (60 ft. lbs.) (Fig. 85).

(3) Install oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).

OIL PAN

REMOVAL

(1) Disconnect negative cable from battery.

(2) Raise vehicle on hoist.

(3) Drain engine oil and remove oil filter.

(4) Remove oil filter adaptor from engine block (Fig. 86) (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER ADAPTER - REMOVAL).

(5) Remove structural collar (Fig. 87).

(6) Remove lateral bending brace.

(7) Remove transaxle dust cover.

(8) Remove oil pan bolts.

(9) Remove oil pan.

INSTALLATION

(1) Clean oil pan and all sealing surfaces.

(2) Apply Mopar® Silicone Rubber Adhesive Sealant at the oil pump to engine block parting line (Fig. 88).

(3) Position a new oil pan gasket onto pan.

(4) Install oil pan and tighten screws to 12 N·m (105 in. lbs.).

OIL PRESSURE SENSOR/ SWITCH

REMOVAL

(1) Raise vehicle.

(2) Position oil collecting container under pressure switch location.

(3) Disconnect oil pressure switch electrical connector and remove switch (Fig. 89).

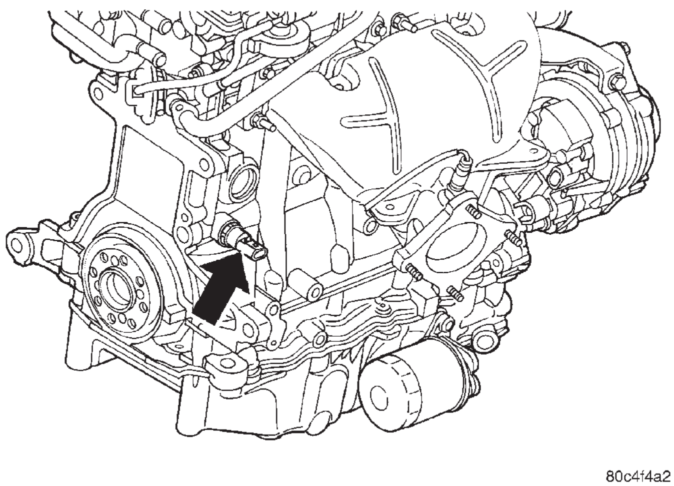

Fig. 89 Engine Oil Pressure Switch

INSTALLATION

(1) Install oil pressure switch and connect electrical connector (Fig. 89) .

(2) Lower vehicle.

(3) Start engine and allow to run a minimum of 2 minutes.

(4) Shut engine off and check engine oil level. Adjust level as necessary.

OIL PUMP

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Remove the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(4) Remove the timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(5) Remove the timing belt tensioner pulley bracket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT TENSIONER & PULLEY - REMOVAL).

(6) Remove the camshaft sprockets and the rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(7) Drain engine oil. Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(8) Remove crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 90).

DISASSEMBLY

(1) To remove the relief valve, proceed as follows:

(2) Remove the threaded plug and gasket from the oil pump (Fig. 92).

CAUTION: Oil pump pressure relief valve must be installed as shown in (Fig. 92) or serious damage may occur.

(3) Remove spring and relief valve (Fig. 92).

(4) Remove oil pump cover screws, and lift off cover.

(5) Remove pump rotors.

(6) Wash all parts in a suitable solvent and inspect carefully for damage or wear (Fig. 93).

INSPECTION

(1) Clean all parts thoroughly. Mating surface of the oil pump should be smooth. Replace pump cover if scratched or grooved.

(2) Lay a straightedge across the pump cover surface (Fig. 94). If a 0.076 mm (0.003 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

(3) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 7.64 mm (0.301 in.) or less (Fig. 95), or if the diameter is 79.95 mm (3.148 in.) or less, replace outer rotor.

(4) If inner rotor measures 7.64 mm (0.301 in) or less replace inner rotor (Fig. 96).

1 - FEELER GAUGE
2 - INNER ROTOR
3 - OUTER ROTOR

(7) Place a straightedge across the face of the pump housing, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 99). **ONLY** if rotors are in specs.

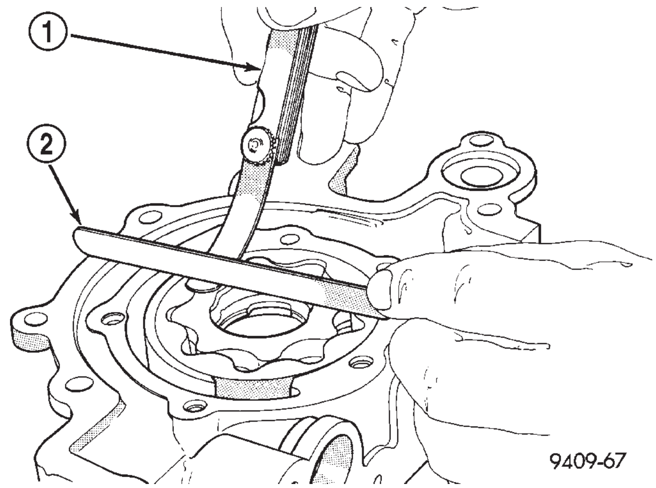

Fig. 99 Measuring Clearance Over Rotors

1 - FEELER GAUGE
2 - STRAIGHT EDGE

(8) Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

(9) The relief valve spring has a free length of approximately 60.7 mm (2.39 in.) it should test between 18 and 19 pounds when compressed to 40.5 mm (1.60 in.). Replace spring that fails to meet specifications.

(10) If oil pressure is low and pump is within specifications, inspect for worn engine bearings, damaged or missing oil pick-up tube O-ring, clogged oil pick-up tube screen, clogged oil filter and stuck open pressure relief valve or other reasons for oil pressure loss.

ASSEMBLY

(1) Install oil pump rotors (Fig. 93).

(2) Install oil pump cover and screws (Fig. 93). Tighten screws to 12 N·m (105 in. lbs.).

CAUTION: Oil pump pressure relief valve must be installed as shown in (Fig. 92) or serious damage may occur.

(3) Install spring and relief valve (Fig. 92).

(4) Install threaded plug and gasket to the oil pump (Fig. 92). Tighten plug to 41 N·m (30 ft. lbs.).

INSTALLATION

(1) Make sure all surfaces are clean and free of oil and dirt.

(2) Apply Mopar® Gasket Maker to oil pump as shown in (Fig. 100). Install oil ring into oil pump body discharge passage.

(3) Prime oil pump before installation.

(4) Align oil pump rotor flats with flats on crankshaft as you install the oil pump to the block.

NOTE: Front crankshaft seal MUST be out of pump to align, or damage may result.

(5) Torque all oil pump attaching bolts to 28 N·m (250 in. lbs.).

(6) Install new front crankshaft seal using Special Tool 6780 (Fig. 101).

(8) Install oil pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(9) Install timing belt rear cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/ TIMING BELT COVER(S) - INSTALLATION).

(10) Install the timing belt tensioner pulley bracket (Refer to 9 - ENGINE/VALVE TIMING/ TMNG BELT/CHAIN TENSIONER&PULLEY - INSTALLATION).

(11) Install the timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

(12) Install the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(13) Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(14) Fill engine crankcase with proper oil to correct level.

(15) Connect negative cable to battery.

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is a one piece composite plastic design that attaches to the cylinder head with fasteners. The manifold is a long branch design to enhance low and mid-range torque.

OPERATION

The intake manifold delivers air to the combustion chambers. This air allows the fuel delivered by the fuel injectors to ignite when the spark plug fire.

INTAKE MANIFOLD (Continued)

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.
(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.
(3) If engine RPM'S change, the area of the suspected leak has been found.
(4) Repair as required.

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

(1) Perform fuel system pressure release procedure **before attempting any repairs.**(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(2) Disconnect negative battery cable.
(3) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
(4) Remove throttle body air inlet hose and air cleaner housing assembly.
(5) Remove throttle and speed control cables from throttle lever and bracket.
(6) Remove EGR tube (if equipped).
(7) Remove engine oil dipstick and tube from engine block. Plug hole in block to prevent debris or fluid from entering engine crankcase.
(8) Disconnect necessary vacuum hoses from intake manifold.
(9) Disconnect the fuel supply line quick connect at the fuel rail assembly.

WARNING: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

(10) Remove fastener holding fuel rail bracket to side of cylinder head.
(11) Disconnect the following electrical connectors:
- Fuel Injectors
- Knock Sensor
- ECT Sensor
- IAC
- TPS
- MAP Sensor
- A/C Pressure Sensor
- A/C Compressor Clutch
- Generator

(12) Reposition wiring harness.
(13) Remove fuel rail support bracket (Fig. 103).
(14) Remove fuel rail.

Fig. 103 Fuel Rail Support Bracket

(15) Remove coolant outlet connector (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - REMOVAL).
(16) Remove intake manifold fasteners. Remove intake manifold.

CLEANING

(1) Discard gasket(s).
(2) Clean all sealing surfaces.

INSPECTION

(1) Inspect manifold for cracks or distortion. Replace manifold if necessary.
(2) Inspect manifold for gasket surface damage or warpage. Replace manifold if necessary.

INSTALLATION

(1) Install new intake manifold and gasket. Gradually tighten fasteners to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 104).
(2) Install coolant outlet connector (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - INSTALLATION).
(3) Install fuel rail.
(4) Install fuel rail support bracket (Fig. 103).
(5) Connect previously disconnected electrical connectors.

INTAKE MANIFOLD (Continued)

(6) Install fastener holding fuel rail bracket to side of cylinder head.

(7) Inspect quick connect fittings for damage, replace if necessary. Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.

(8) Connect vacuum hoses to intake manifold.

(9) Install engine oil dipstick and tube.

(10) Install EGR tube (if equipped).

(11) Install throttle and speed control cables to bracket. Connect cables to the throttle lever.

(12) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(13) Connect negative battery cable.

(14) With the DRB scan tool use ASD Fuel System Test to pressurize system to check for leaks.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) relay will remain energized for 7 minutes or until the ignition switch is turned to the OFF position, or Stop All Test is selected.

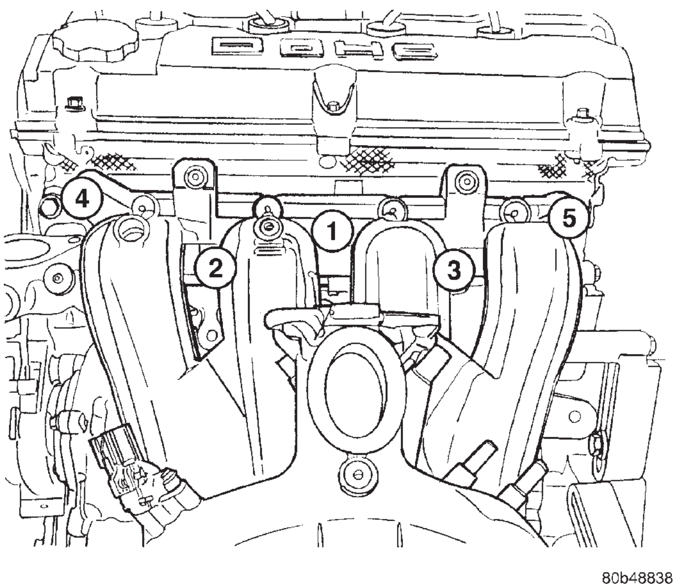

Fig. 104 Intake Manifold Tightening Sequence

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifold is made of Hi-Silicone Moly nodular cast iron for strength and high temperatures. The manifold attaches to the cylinder head.

OPERATION

The exhaust manifold collects the exhaust gasses exiting the combustion chambers. Then it channels the exhaust gasses to the exhaust pipe attached to the manifold.

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist.

(3) Remove complete exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).

(4) Remove rear engine mount and transaxle bracket.

(5) Remove exhaust manifold heat shield (Fig. 105).

(6) Disconnect oxygen sensor electrical connector.

(7) Remove exhaust manifold retaining fasteners and remove exhaust manifold.

(8) Remove and discard manifold gasket.

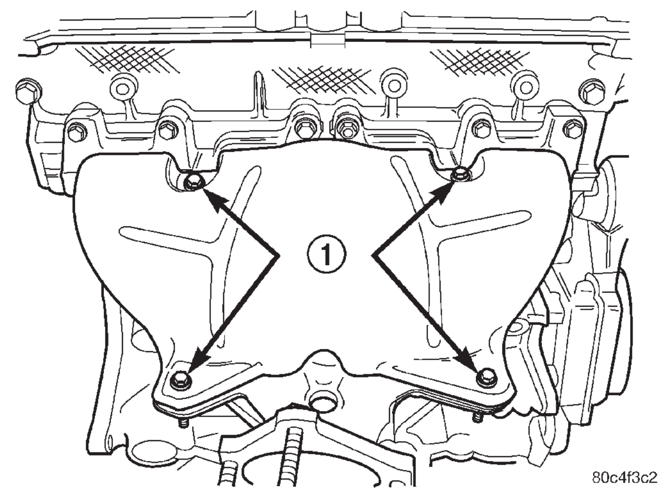

Fig. 105 Exhaust Manifold Heat Shield Bolts

1 - BOLTS

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

(1) Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.

EXHAUST MANIFOLD (Continued)

(2) Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

(1) Install new exhaust manifold gasket. **DO NOT APPLY SEALER**.

(2) Position exhaust manifold in place. Gradually tighten fasteners in sequence shown in (Fig. 106) to 23 N·m (200 in. lbs.).

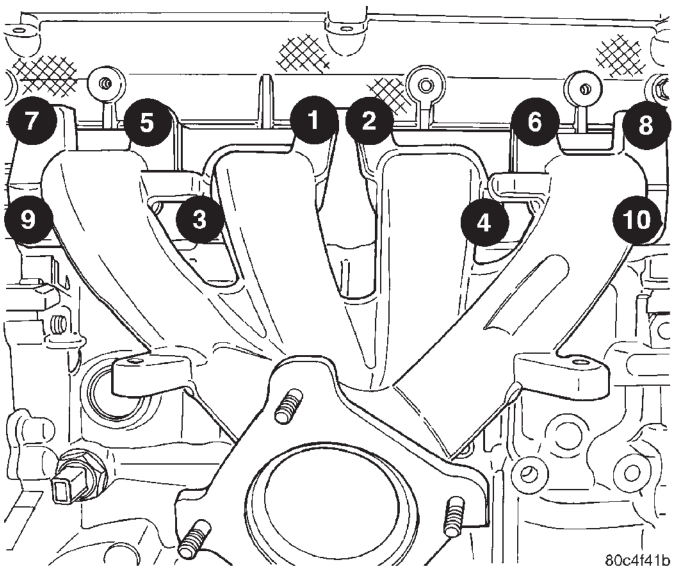

Fig. 106 Exhaust Manifold Tightening Sequence

(3) Install exhaust manifold heat shield.

(4) Connect oxygen sensor electrical connector.

(5) Install rear engine mount and transaxle bracket.

(6) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION). Tighten fasteners to 28 N·m (250 in. lbs.).

(7) Lower vehicle.

(8) Connect negative battery cable.

VALVE TIMING

STANDARD PROCEDURE

STANDARD PROCEDURE - CAMSHAFT/ CRANKSHAFT SYNCHRONIZATION WITH DRBIII

The camshaft and crankshaft synchronization procedure must be performed after a following component(s) replacement:

- Camshaft
- Camshaft Position Sensor
- Camshaft Sensor Target Magnet
- Crankshaft
- Cylinder Block
- Cylinder Head
- Water Pump
- Timing Belt and Timing Belt Tensioner
- Powertrain Control Module (PCM)

(1) Perform camshaft and crankshaft timing relearn procedure as follows:

- Connect the DRB III® scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
- Turn the ignition switch on and access the “miscellaneous” screen.
- Select “re-learn cam/crank” option and follow directions on DRB III® screen.

STANDARD PROCEDURE - VALVE TIMING VERIFICATION

(1) Remove number one spark plug.

(2) Using a dial indicator, set number one cylinder to TDC on the compression stroke.

(3) Remove the access plug from the front timing belt cover.

(4) Check the timing marks on the camshaft sprockets, they should align with each other (Fig. 107).

REMOVAL

FRONT COVER

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Remove right front wheel and accessory drive belt splash shield.
(4) Remove the accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(6) Remove accessory drive belt automatic tensioner.
(7) Disconnect generator connectors. Remove generator and bracket.
(8) Lower vehicle.
(9) Position a jack under engine. Raise jack enough to support engine weight.
(10) Remove the right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).
(11) Remove front engine mount bracket (Fig. 108).
(12) Remove the front timing belt cover (Fig. 108).

REAR COVER

(1) Remove front timing belt cover.

CAUTION: Camshaft(s) or crankshaft should not be rotated after timing belt is removed. Damage to valve components may occur. Always align timing marks before removing timing belt.

(2) Remove timing belt, timing belt tensioner, and tensioner pulley bracket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL) and (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT TENSIONER & PULLEY - REMOVAL).
(3) Hold camshaft sprockets with Special Tools C-4687 and Adaptor C-4687-1 (Fig. 109), while removing attaching bolts.
(4) Remove camshaft sprockets.
(5) Remove rear timing belt cover attaching bolts.
(6) Remove rear cover.

INSTALLATION

REAR COVER

(1) Install rear cover and tighten bolts to 12 N·m (105 in. lbs.).
(2) Install camshaft sprockets. While holding sprockets with Special Tools C-4687 and Adaptor C-4687-1 (Fig. 109), tighten attaching bolts to 115 N·m (85 ft. lbs.).
(3) Install tensioner pulley bracket, timing belt, and timing belt tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT TENSIONER & PULLEY - INSTALLATION) and (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).
(4) Install front cover.

FRONT COVER

(1) Install front cover and tighten bolts to 12 N·m (105 in. lbs.).

(2) Install engine front engine mount bracket (Fig. 108).

(3) Install right side engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(4) Remove jack from under engine.

(5) Install generator bracket and generator. Reconnect generator connectors.

(6) Install accessory drive belt automatic tensioner.

(7) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install accessory drive belt splash shield and right front wheel.

(10) Connect negative battery cable.

REMOVAL

REMOVAL - TIMING BELT

CAUTION: Camshaft(s) or crankshaft should not be rotated after timing belt is removed. Damage to valve components may occur. Always align timing marks before removing timing belt.

(1) Disconnect negative battery cable.

(2) Remove the front timing belt cover (Fig. 110) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

CAUTION: Align camshaft and crankshaft timing marks before removing the timing belt by rotating the engine with the crankshaft.

(3) Rotate crankshaft until timing marks are aligned at both the camshafts and crankshaft.

(4) Loosen the timing belt tensioner fasteners.

INSTALLATION

INSTALLATION - CRANKSHAFT SPROCKET

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(1) Install crankshaft sprocket using Special Tool 6792 (Fig. 114).

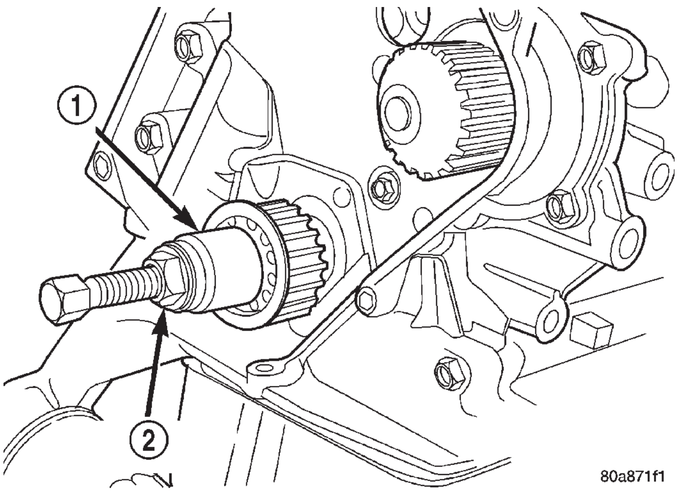

Fig. 114 Crankshaft Sprocket—Installation

1 - SPECIAL TOOL 6792
2 - TIGHTEN NUT TO INSTALL

(2) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).
(3) Connect negative battery cable.

INSTALLATION - CAMSHAFT SPROCKETS

(1) Install camshaft sprockets. Hold camshaft sprockets with Special Tools C-4687 and Adaptor C-4687-1 while tightening center bolts to 115 N·m (85 ft. lbs.) (Fig. 112).
(2) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).
(3) Connect negative battery cable.

INSTALLATION - TIMING BELT

(1) When the timing belt tensioner is removed from the engine it is necessary to compress the plunger into the tensioner body.
(2) Place the timing belt tensioner into a vise equipped with soft jaws and slowly compress the plunger (Fig. 115).

CAUTION: Index the tensioner in the vise the same way it is installed on the engine. This is to ensure proper pin orientation when tensioner is installed on the engine.

(3) Compress the plunger until a 1.9 mm (5/64) Allen wrench or pin can be inserted through the body and the plunger (Fig. 115).

(7) Install the timing belt in this direction: Starting at the crankshaft, go around the water pump sprocket, idler pulley, camshaft sprockets and then around the tensioner pulley (Fig. 119).

(8) Move crankshaft sprocket to TDC to take up belt slack. Install tensioner to block, but do not tighten fasteners.

(9) Using a torque wrench on the tensioner pulley bolt, apply 28 N·m (250 in. lbs.) of torque against the timing belt.

(10) With torque applied to the tensioner pulley/timing belt, move the tensioner up against the pulley pivot bracket and tighten tensioner bolts to 31 N·m (23 ft. lbs.). (Fig. 119).

(11) Pull the tensioner plunger retaining pin. Pretension is correct when the pin can be removed and installed into tensioner housing and plunger.

(12) Rotate crankshaft 2 revolutions and check the alignment of the timing marks (Fig. 117) and (Fig. 118).

(13) Check belt tension by installing pin into tensioner housing. If pin cannot be re-installed, repeat belt tension procedure.

(14) Install the front timing belt cover (Fig. 110) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(15) Connect negative battery cable.

(16) Perform camshaft and crankshaft timing relearn procedure as follows:

- Connect the DRB III® scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
- Turn the ignition switch on and access the "miscellaneous" screen.
- Select "re-learn cam/crank" option and follow directions on DRB III® screen.

TIMING BELT TENSIONER & PULLEY

REMOVAL

(1) Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(2) Remove the bolts attaching the tensioner pulley bracket assembly to engine.

(3) Remove the tensioner pulley bracket assembly (Fig. 120).

(1) Position tensioner pulley bracket assembly to the engine and install attaching bolts. Tighten bolts to 31 N·m (23 ft. lbs.).

(2) Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

ENGINE 2.4L DOHC

TABLE OF CONTENTS

ENGINE 2.4L DOHC

DESCRIPTION

The 2.4 Liter (148 cu. in.) in-line four cylinder engine is a double over head camshaft with hydraulic lifters and four valve per cylinder design (Fig. 1). The engine is free-wheeling; meaning it has provisions for piston-to-valve clearance. However valve-to-valve interference can occur, if camshafts are rotated independently.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block (Fig. 2).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Hydraulic Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Ream guide(s) and replace valve(s) with oversize valve(s) and seal(s).
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

• Exhaust and intake valve leaks (improper seating).

• Leaks between adjacent cylinders or into water jacket.

• Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

ENGINE 2.4L DOHC (Continued)

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

ENGINE 2.4L DOHC (Continued)

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.

(9) Drain engine oil and remove oil filter.

(10) Install a new oil filter.

(11) Fill engine with specified amount of approved oil.

(12) Connect negative battery cable.

(13) Start engine and check for any leaks.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

ENGINE 2.4L DOHC (Continued)

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed-plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 3)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 3)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 3)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

STANDARD PROCEDURE - MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

(1) Remove oil film from surface to be checked. Plastigage is soluble in oil.

(2) Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes (Fig. 4). (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap bolts of the bearing being checked to the proper specifications.

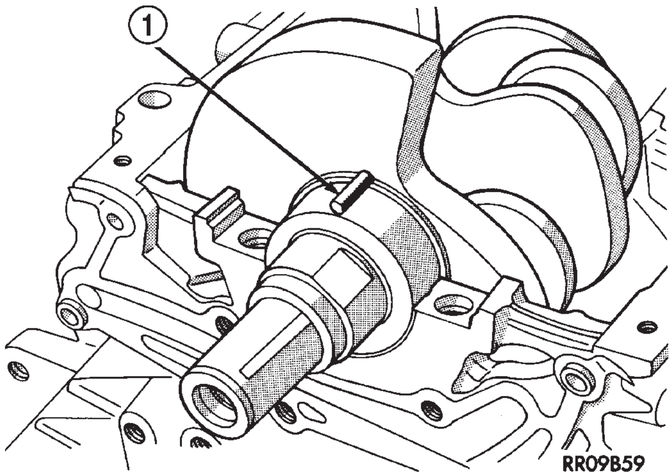

Fig. 4 Plastigage Placed in Lower Shell—Typical

1 - PLASTIGAGE

(3) Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

(4) Install the proper crankshaft bearings to achieve the specified bearing clearances.

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

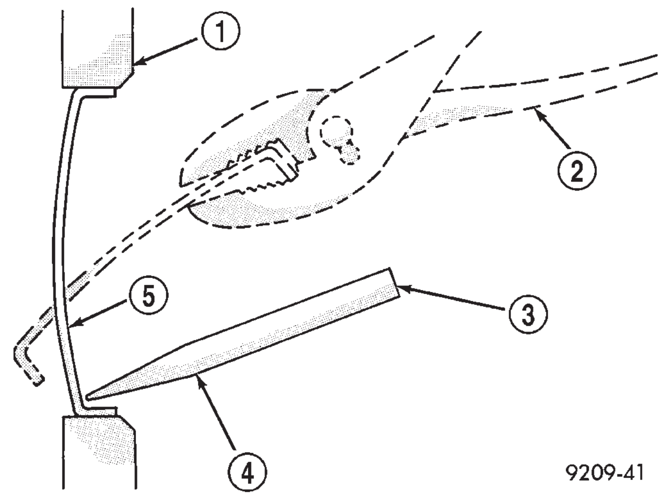

Fig. 5 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL - ENGINE ASSEMBLY

(1) Perform fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect negative battery cable.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Discharge A/C system using a suitable refrigerant recovery machine.

ENGINE 2.4L DOHC (Continued)

(5) Remove throttle body air inlet hose and air cleaner housing assembly.

(6) Remove upper radiator crossmember.

(7) Disconnect upper and lower radiator hoses at radiator.

(8) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(9) Disconnect A/C lines at condenser. Remove cooling module assembly (radiator, fan module, and condenser).

(10) Disconnect transmission electrical harness connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).

(11) Disconnect transmission shift cable.

(12) Disconnect engine electrical harness from PCM and bulkhead connectors.

(13) Raise vehicle on hoist.

(14) Remove both front wheels.

(15) Remove left and right splash shields.

(16) Remove both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).

(17) Drain engine oil.

(18) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(19) Remove power steering pump from bracket. **Do not** disconnect power steering lines from pump. Reposition pump and support with suitable retaining strap.

(20) Disconnect heater return hose from pipe connection at right front frame rail area.

(21) Disconnect A/C compressor electrical connectors.

(22) Disconnect exhaust pipe from manifold.

(23) Remove through bolts from front and rear engine mounts.

(24) Remove rear mount bracket from transmission.

(25) Remove structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

(26) Mark flex plate to torque converter position. Remove torque converter bolts.

(27) Lower vehicle.

(28) Disconnect positive cable from battery and PDC.

(29) Disconnect ground cable from left side transaxle mount bracket.

(30) Disconnect throttle and speed control cables.

(31) Disconnect coolant recovery container overflow hose.

(32) Disconnect heater hose at thermostat housing.

(33) Disconnect all ground straps attaching to engine.

(34) Disconnect brake booster and vapor purge vacuum hoses.

(35) Disconnect fuel line from fuel rail.

(36) Disconnect generator connectors.

(37) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(38) Remove generator.

(39) Remove A/C suction line at compressor. Cap suction port and line.

(40) Remove A/C compressor.

(41) Raise vehicle enough to allow engine dolly 6135 and cradle 6710 with posts 6848 to be installed under vehicle (Fig. 6).

(42) Loosen cradle engine mounts to allow movement for positioning onto engine locating holes on the engine bedplate, compressor and support bracket. Install adapters 6909 to the two post at rear of engine. Lower vehicle and position cradle mounts until the engine is resting on posts. Tighten post mounts to cradle frame. This will keep mounts from moving when removing or installing engine/transmission assembly. Secure engine/transmission to dolly/cradle with safety straps.

(43) Lower vehicle so weight of the engine and transmission ONLY is on the cradle.

(44) Remove right and left side vertical engine mount bolts.

(45) Slowly raise vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for removal clearance.

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine/transaxle assembly under vehicle and slowly lower vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for installation clearance.

(2) Continue lowering vehicle until right side engine mount and left side transaxle mount align to their mounting locations. Install mounting bolts and torque to 61 N·m (45 ft. lbs.).

(3) Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.

(4) Install A/C compressor.

(5) Connect A/C suction line to compressor.

(6) Install generator.

(7) Install intake manifold. Torque fasteners to 12 N·m (105 in. lbs.) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
(8) Connect generator connectors.
(9) Connect fuel line to fuel rail.
(10) Connect brake booster and vapor purge hoses.
(11) Connect all ground straps to engine.
(12) Connect heater hose to thermostat housing.
(13) Connect coolant recovery container overflow hose.
(14) Connect throttle and speed control cables.
(15) Connect ground cable to left side transaxle mount bracket.
(16) Connect positive cable to battery and PDC.
(17) Raise vehicle on hoist.
(18) Install torque converter bolts.
(19) Install structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).
(20) Install rear mount bracket to transmission.
(21) Install front and rear engine mount through bolts. Torque fasteners to 61 N·m (45 ft. lbs.).
(22) Connect exhaust pipe to exhaust manifold. Torque fasteners to 28 N·m (250 in. lbs.).
(23) Connect A/C compressor electrical connectors.
(24) Connect heater return hose to pipe connection at right front frame rail area.
(25) Install power steering pump to bracket.
(26) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
(27) Install both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
(28) Install new oil filter.
(29) Install left and right splash shields.
(30) Install both front wheels.
(31) Lower vehicle.
(32) Connect engine electrical harness to PCM and bulkhead connectors.
(33) Connect transmission shift cable.
(34) Connect transmission electrical connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).
(35) Install cooling module assembly (radiator, fan module, and condenser). Connect A/C lines to condenser.
(36) Connect transmission oil cooler lines using service splice kit. Refer to instructions provided with kit.
(37) Connect upper and lower radiator hoses.
(38) Install upper radiator crossmember.
(39) Install throttle body air inlet hose and air cleaner housing assembly.
(40) Fill engine crankcase with proper oil to correct level.
(41) Evacuate and recharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
(42) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
(43) Connect negative battery cable.
(44) Start engine and run until normal operating temperature is reached.

AIR CLEANER ELEMENT

REMOVAL

(1) Disconnect negative battery cable.

(2) Disconnect inlet air temperature sensor electrical connector.

(3) Disconnect fresh air makeup hose from throttle body air inlet hose.

(4) Disconnect PCV hose from intake manifold.

(5) Loosen hose clamp at throttle body air inlet hose. Remove hose from throttle body.

(6) Push in on locking tabs to disengage air inlet hose from air cleaner housing. Remove throttle body air inlet hose and air cleaner element together.

(7) Separate air cleaner element from throttle body air inlet hose.

INSTALLATION

(1) Clean any debris from inside air cleaner housing.

(2) Install air cleaner element onto throttle body air inlet hose.

(3) Install throttle body air inlet hose into air cleaner housing. Push in on hose until an audible “click” is heard from locking tabs.

(4) Install hose on throttle body. Tighten hose clamp.

(5) Connect PCV hose to intake manifold.

(6) Connect fresh air makeup hose.

(7) Connect inlet air temperature sensor electrical connector.

(8) Connect negative battery cable.

AIR CLEANER HOUSING

REMOVAL

(1) Disconnect negative battery cable.

(2) Disconnect inlet air temperature sensor electrical connector.

(3) Disconnect fresh air makeup hose from throttle body air inlet hose.

(4) Loosen hose clamp at throttle body air inlet hose. Remove hose from throttle body (Fig. 7).

(5) Remove push pin securing air duct to upper radiator support.

(6) Remove nut on bracket that holds air cleaner housing.

(7) Pull air cleaner housing straight up off locating pins (Fig. 7).

INSTALLATION

(1) Install air cleaner housing straight down on locating pins (Fig. 7).

(2) Install nut on bracket that holds air cleaner housing and tighten.

(3) Install push pin that secures air duct to upper radiator support.

(4) Install throttle body air inlet hose to throttle body. Tighten hose clamp.

(5) Connect fresh air makeup hose.

(6) Connect inlet air temperature sensor electrical connector.

(7) Connect negative battery cable.

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder (Fig. 8). The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the hydraulic lash adjusters, camshafts, and valve mechanisms.

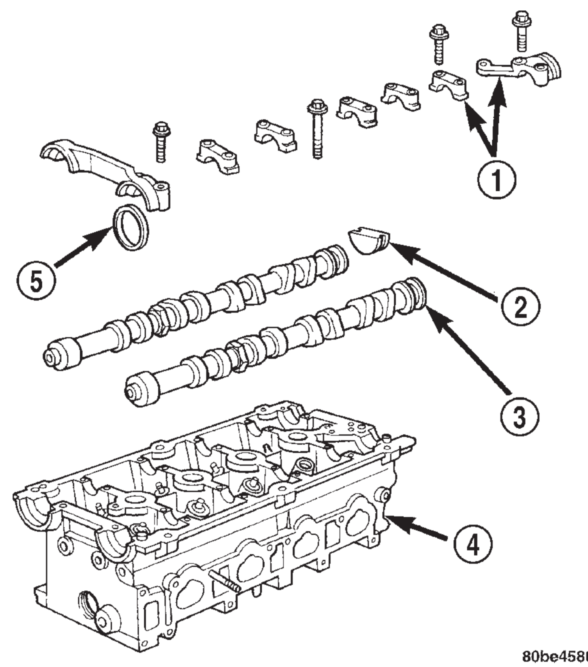

Fig. 8 Cylinder Head and Camshafts

1 - CAMSHAFT BEARING CAPS
2 - PLUG
3 - CAMSHAFT
4 - CYLINDER HEAD
5 - CAMSHAFT OIL SEAL

OPERATION

The cylinder head closes the combustion chamber, allowing the pistons to compress the fuel/air mixture for ignition. The valves are actuated by the lobe profiles on the camshaft to open and close at specified duration to either allow clean air in the combustion chamber or the exhaust gases out; depending on the stroke of the engine.

CYLINDER HEAD (Continued)

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

(1) Perform fuel system pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative battery cable.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Remove throttle body air inlet hose and air cleaner housing assembly.

(5) Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(6) Disconnect heater hose from thermostat housing.

(7) Remove heater tube support bracket from cylinder head.

(8) Disconnect camshaft position sensor electrical connector.

(9) Disconnect EGR solenoid electrical connector.

(10) Raise vehicle on hoist.

(11) Disconnect exhaust pipe from exhaust manifold.

(12) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(13) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(14) Remove upper and lower timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(15) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(16) Remove camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove timing belt idler pulley and rear timing belt cover.

(18) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(19) Remove camshafts and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

(20) Remove cylinder head bolts and remove cylinder head from engine block.

(21) Inspect and clean cylinder head (Refer to 9 - ENGINE - STANDARD PROCEDURE).

CYLINDER HEAD (Continued)

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Cylinder head must be flat within 0.1 mm (0.004 in.) (Fig. 9).

(2) Inspect camshaft bearing journals for scoring.

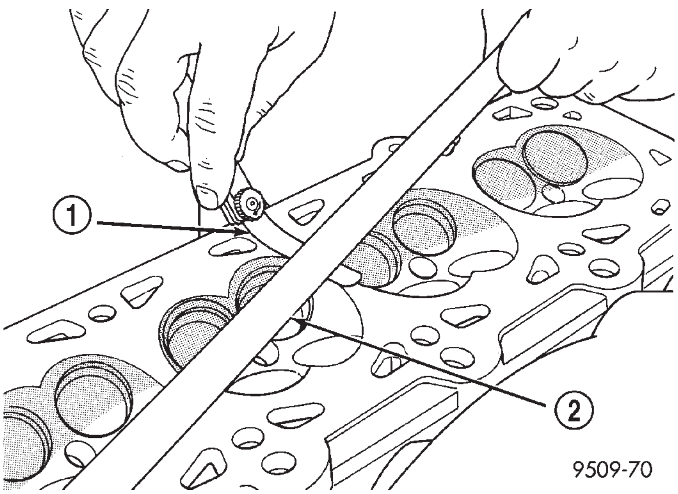

Fig. 9 Checking Cylinder Head Flatness

1 - FEELER GAUGE
2 - STRAIGHT EDGE

(3) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(4) Using a small hole gauge and a micrometer, measure valve guides in 3 places top, middle and bottom (Fig. 10). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.

(5) Check valve guide height (Fig. 11).

INSTALLATION - CYLINDER HEAD

NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts must be replaced (Fig. 12).

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced.

(1) Before installing the bolts, the threads should be coated with engine oil.

(2) Position cylinder head gasket on block.

(3) Install cyllinder head on block.

(4) Tighten the cylinder head bolts in the sequence shown in (Fig. 13). Using the 4 step torque turn method, tighten according to the following values:

- First: All to 34 N·m (25 ft. lbs.)
- Second: All to 68 N·m (50 ft. lbs.)
- Third: All to 68 N·m (50 ft. lbs.)

(5) Install rocker arms and camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(6) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(7) Install rear timing belt cover and timing belt idler pulley (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(8) Install camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(9) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Install upper and lower timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(11) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(12) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Connect exhaust pipe to exhaust manifold. Torque fasteners to 28 N·m (250 in. lbs.).

(14) Connect camshaft position sensor electrical connector.

(15) Connect EGR solenoid electrical connector.

(16) Install heater tube support bracket to cylinder head.

(17) Connect heater hose to thermostat housing.

(18) Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(19) Install throttle body air inlet hose and air cleaner housing assembly.

(20) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(21) Connect negative battery cable.

CAMSHAFT OIL SEAL(S)

REMOVAL

(1) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Hold each camshaft sprocket with Special Tool 6847 while removing center bolt (Fig. 14).

(3) Remove camshaft sprockets.

(4) Remove rear timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Remove camshaft seal using Special Tool C-4679A (Fig. 15).

CAUTION: Do not nick shaft seal surface or seal bore.

(4) Install camshaft sprockets. Hold each sprocket with Special Tool 6847 and tighten center bolt to 115 N·m (85 ft. lbs.) (Fig. 14).

(5) Install timing belt and front covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

Both camshafts have six bearing journal surfaces and two cam lobes per cylinder (Fig. 17). Flanges at the rear journals control camshaft end play. Provision for a cam position sensor is located on the intake camshaft on the rear of the cylinder head. A hydro-dynamic oil seal is used for oil control at the front of the camshaft.

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE - MEASURING CAMSHAFT END PLAY

(1) Oil camshaft journals and install camshaft **WITHOUT** rocker arms. Install rear cam caps and tighten screws to specified torque.

(2) Using a suitable tool, move camshaft as far rearward as it will go.

(3) Zero dial indicator (Fig. 18).

(4) Move camshaft as far forward as it will go.

(5) Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).

(6) If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

REMOVAL

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).

(2) Remove camshaft position sensor and camshaft target magnet (Refer to 8 - ELECTRICAL/IGNITION CONTROL/CAMSHAFT POSITION SENSOR - REMOVAL).

(3) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

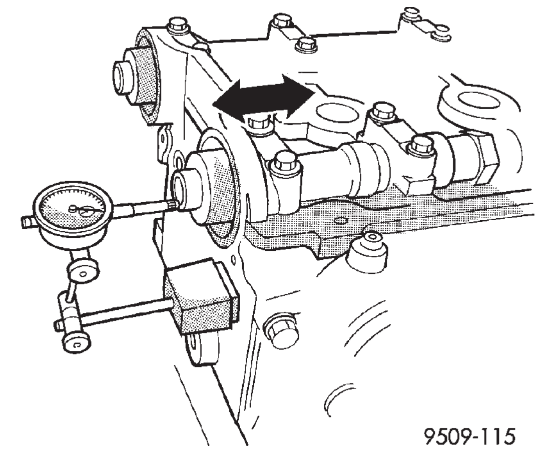

Fig. 18 Camshaft End Play - Typical

(4) Remove camshaft sprockets and timing belt rear cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - REMOVAL).

(5) Bearing caps are identified for location. Remove the outside bearing caps first (Fig. 19).

(6) Loosen the camshaft bearing cap attaching fasteners in sequence shown (Fig. 20) one camshaft at a time.

CAUTION: Camshafts are not interchangeable. The intake cam number 6 thrust bearing face spacing is wider.

(7) Identify the camshafts before removing from the head. The camshafts are not interchangeable.

(8) Remove camshafts from cylinder head.

NOTE: If removing rocker arms, identify for reinstallation in the original position.

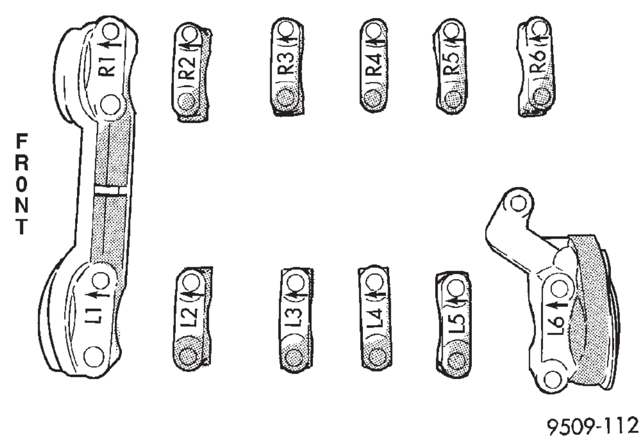

Fig. 19 Camshaft Bearing Cap Identification

CAMSHAFT(S) (Continued)

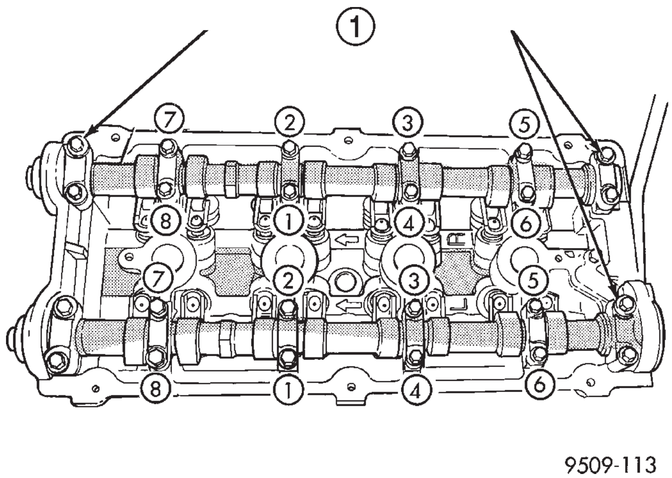

Fig. 20 Camshaft Bearing Cap - Removal

1 - REMOVE OUTSIDE BEARING CAPS FIRST

CLEANING

Clean camshaft with a suitable solvent.

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 21). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

(3) Measure the lobe actual wear (unworn area - wear zone = actual wear) (Fig. 21) and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

CAUTION: Ensure that NONE of the pistons are at top dead center when installing the camshafts.

(1) Lubricate all camshaft bearing journals, rocker arms and camshaft lobes.

(2) Install all rocker arms in original positions, if reused.

(3) Position camshafts on cylinder head bearing journals. Install right and left camshaft bearing caps No. 2 – 5 and right No. 6. Tighten M6 fasteners to 12 N·m (105 in. lbs.) in sequence shown in (Fig. 22).

(4) Apply Mopar® Gasket Maker to No. 1 and No. 6 bearing caps (Fig. 23). Install bearing caps and tighten M8 fasteners to 28 N·m (250 in. lbs.).

(5) Install camshaft oil seals (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT OIL SEAL(S) - INSTALLATION).

(6) Install camshaft target magnet and camshaft position sensor.

(7) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).

(8) Install timing belt rear cover and camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT COVER(S) - INSTALLATION).

(9) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

CYLINDER HEAD COVER

REMOVAL

(1) Remove ignition coil and plug wires (Fig. 24). Remove ground strap.

(2) Remove the cylinder head cover fasteners.

(3) Remove cylinder head cover from cylinder head.

CLEANING

Clean cylinder head and cover mating surfaces using a suitable solvent.

INSPECTION

Inspect cover rails for flatness.

INSTALLATION

NOTE: Replace spark plug well seals when installing a new cylinder head cover gasket.

(1) Install new cylinder head cover gaskets and spark plug seals (Fig. 25).

CAUTION: Do not allow oil or solvents to contact the timing belt as they can deteriorate the rubber and cause tooth skipping.

(2) Apply Mopar® Engine RTV GEN II at the camshaft cap corners and at the top edge of the 1/2 round seal.

(3) Install cylinder head cover assembly to head and tighten fasteners in sequence shown in (Fig. 26). Using the 3 step torque method:

(a) Tighten all fasteners to 4.5 N·m (40 in. lbs.)
(b) Tighten all fasteners to 9.0 N·m (80 in. lbs.)
(c) Tighten all fasteners to 12 N·m (105 in. lbs.)

(4) Install ignition coil and plug wires. Tighten fasteners to 12 N·m (105 in. lbs.).

(5) Install ground strap.

HYDRAULIC LASH ADJUSTERS

DIAGNOSIS AND TESTING

HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor (integral to the cylinder head gasket) in the vertical oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

a. Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

b. Remove suspected lash adjusters, and replace as necessary.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Remove rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

(3) Remove hydraulic lash adjuster (Fig. 27).

(4) Repeat removal procedure for each hydraulic lash adjuster.

(5) If reusing, mark each hydraulic lash adjuster for reassembly in original position. Lash adjusters are serviced as an assembly.

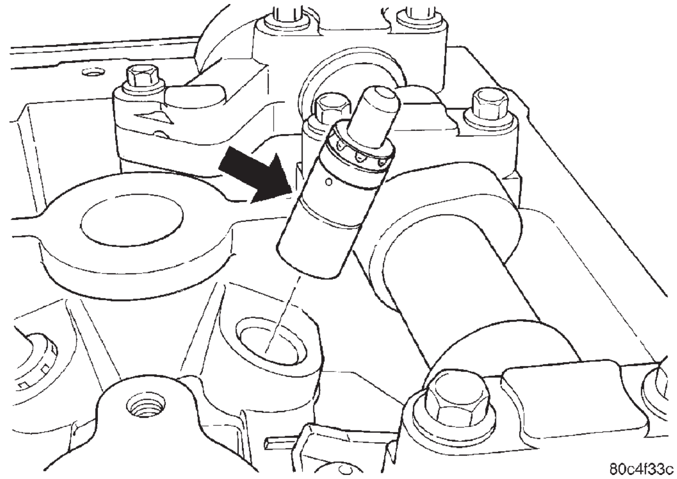

Fig. 27 Hydraulic Lash Adjuster

INSTALLATION

(1) Install hydraulic lash adjuster (Fig. 27). Ensure the lash adjusters are at least partially full of engine oil. This is indicated by little or no plunger travel when the lifter is depressed.

(2) Install rocker arm. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION)

(3) Repeat installation procedure for each hydraulic lash adjuster.

(4) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel. They have chrome plated stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have three-bead lock keepers to retain springs and to promote valve rotation.

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using roller rocker arms which pivot on hydraulic lash adjusters.

CLEANING

(1) Clean all valves thoroughly and discard burned, warped and cracked valves.

ROCKER ARMS

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

(1) Disconnect negative battery cable.
(2) Remove cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
(3) Remove spark plugs.
(4) Rotate engine until the camshaft lobe, on the follower being removed, is positioned on its base circle (heel). Also, the piston should be a minimum of 6.3 mm (0.25 in) below TDC position.

CAUTION: If cam follower assemblies are to be reused, always mark position for reassembly in their original positions.

(5) Using Special Tools 8215-A and 8436 slowly depress valve assembly until rocker arm can be removed (Fig. 28).
(6) Repeat removal procedure for each rocker arm.

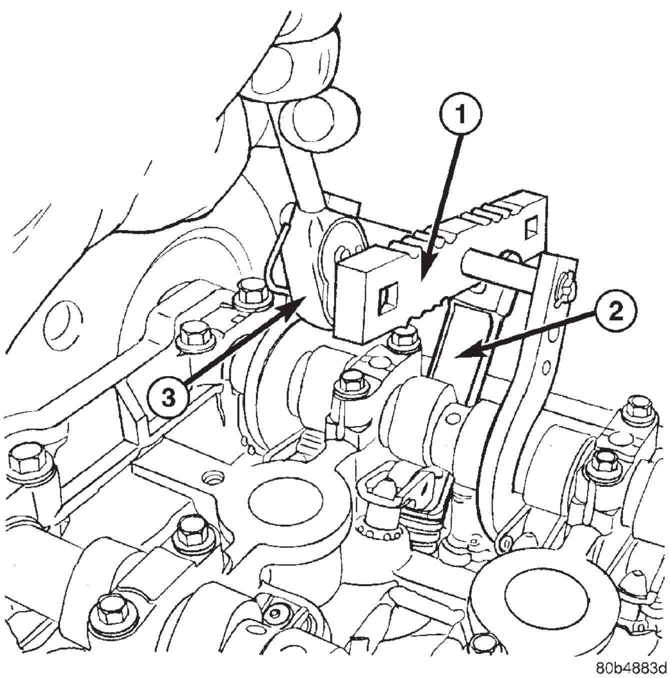

Fig. 28 Rocker Arm - Removal/Installation

1 - SPECIAL TOOL 8215-A

INSPECTION

Inspect the rocker arm for wear or damage (Fig. 29). Replace as necessary.

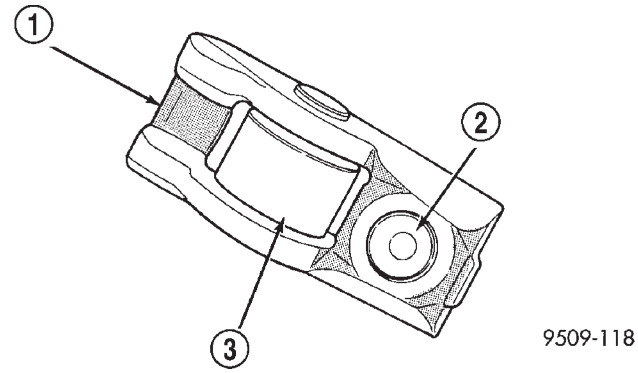

Fig. 29 Rocker Arm

1 - TIP
2 - LASH ADJUSTER POCKET
3 - ROLLER

INSTALLATION

(1) Lubricate rocker arm with clean engine oil.
(2) Using Special Tools 8215-A and 8436 slowly depress valve assembly until rocker arm can be installed on the hydraulic lifter and valve stem (Fig. 28).
(3) Repeat installation procedure for each rocker arm.
(4) Install spark plugs.
(5) Install cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
(6) Connect negative battery cable.

VALVE SPRINGS & SEALS

REMOVAL

REMOVAL - CYLINDER HEAD ON

(1) Disconnect negative battery cable.
(2) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(3) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
(4) Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
(5) Rotate crankshaft until piston is at TDC.
(6) With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.

VALVE SPRINGS & SEALS (Continued)

(7) Using Special Tool MD-998772-A with adapter 6779 (Fig. 30), compress valve springs and remove valve locks.

(8) Remove valve spring(s).

(9) Remove valve stem seal(s) by a using valve stem seal tool (Fig. 32).

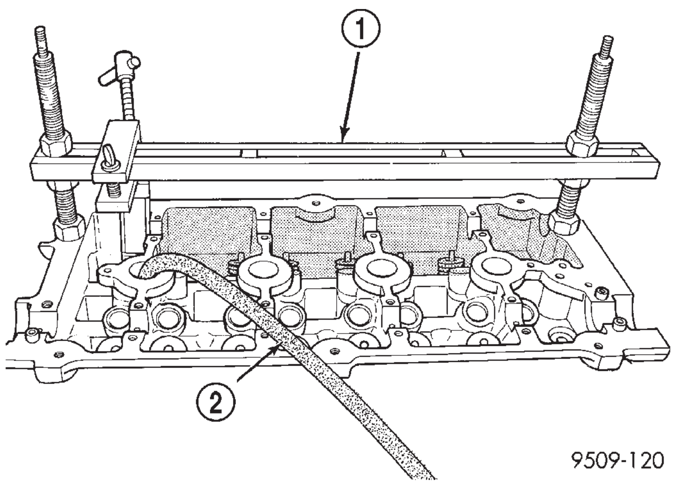

Fig. 30 Valve Spring - Removal/Installation

1 - VALVE SPRING COMPRESSOR MD 998772A
2 - AIR HOSE

REMOVAL - CYLINDER HEAD OFF

(1) With cylinder head removed from cylinder block, compress valve springs using a universal valve spring compressor.

(2) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(3) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.

(4) Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION)

INSPECTION

(1) Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:

- Valve Closed Nominal Tension—76 lbs. @ 38.0 mm (1.50 in.)
- Valve Open Nominal Tension—136 lbs. @ 29.75 mm (1.17 in.)

(2) Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.

INSTALLATION

INSTALLATION - CYLINDER HEAD ON

(1) Install valve seal/valve spring seat assembly (Fig. 31). Push the assembly down to seat it onto the valve guide.

(2) Install valve spring and retainer, use Special Tool MD-998772-A with adapter 6779 to compress valve springs only enough to install locks (Fig. 30). Correct alignment of tool is necessary to avoid nicking valve stems.

(3) Remove air hose and install spark plugs.

(4) Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

(5) Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(6) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(7) Connect negative battery cable.

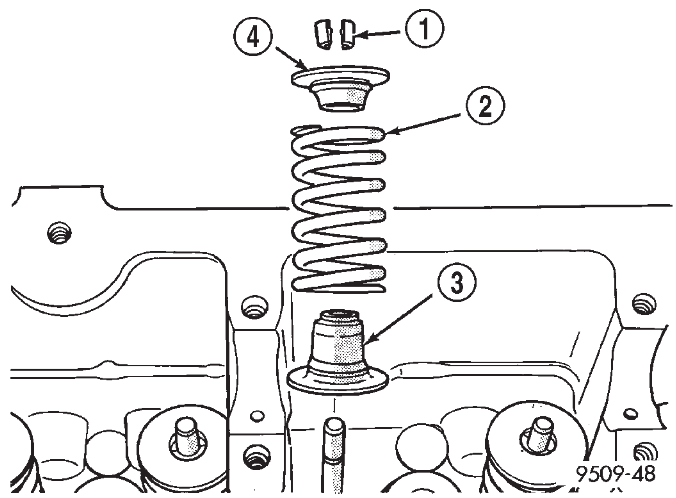

Fig. 31 Valve Stem Seal/Valve Spring Seat

1 - VALVE RETAINING LOCKS
2 - VALVE SPRING
3 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY
4 - VALVE SPRING RETAINER

INSTALLATION - CYLINDER HEAD OFF

(1) Coat valve stems with clean engine oil and insert in cylinder head.

(2) Install new valve stem seals on all valves using a valve stem seal tool (Fig. 32). The valve stem seals should be pushed firmly and squarely over valve guide.

CAUTION: When oversize valves are used, the corresponding oversize valve seal must also be used. Excessive guide wear may result if oversize seals are not used with oversize valves.

VALVE SPRINGS & SEALS (Continued)

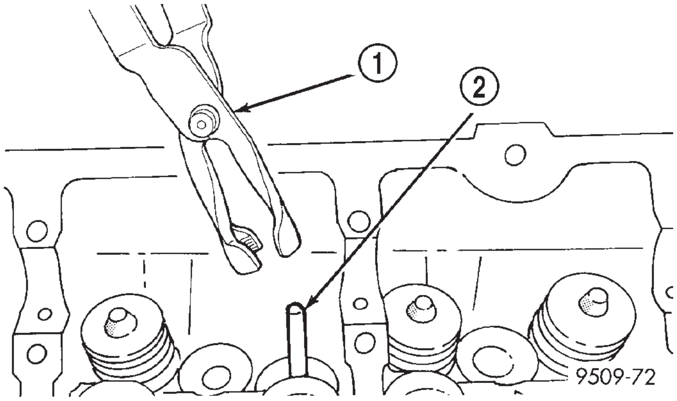

Fig. 32 Valve Stem Oil Seal Tool

1 - VALVE SEAL TOOL
2 - VALVE STEM

(3) Install valve springs and retainers. Compress valve springs only enough to install locks, taking care not to misalign the direction of compression. Nicked valve stems may result from misalignment of the valve spring compressor.

CAUTION: When depressing the valve spring retainers with valve spring compressor the locks can become dislocated. Ensure both locks are in the correct location after removing tool.

(4) Check the valve spring installed height B after refacing the valve and seat (Fig. 33). Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

ENGINE BLOCK

DESCRIPTION

The cast iron cylinder block is a two-piece assembly, consisting of the cylinder block and bedplate (Fig. 34). The bedplate incorporates the main bearing caps and bolts to the cylinder block. This design offers a much stronger lower end and increased cylinder block rigidity. The rear oil seal retainer is integral with the block. The bedplate and block are serviced as an assembly.

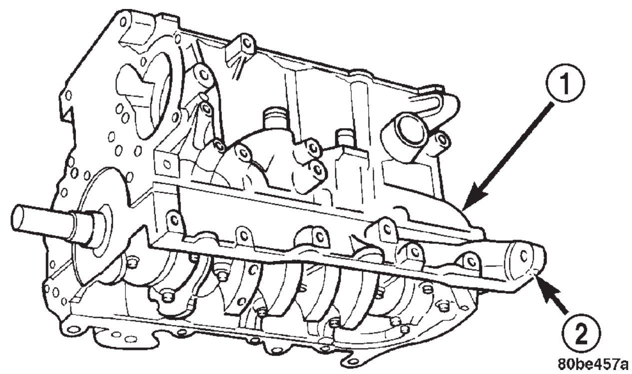

Fig. 34 Cylinder Block and Bedplate

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON TO CYLINDER BORE FITTING

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin about 14 mm (9/16 inch.) from the bottom of the skirt as shown in (Fig. 36). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line shown in (Fig. 35). Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Correct piston to bore clearance must be established in order to assure quiet and economical operation.

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

ENGINE BLOCK (Continued)

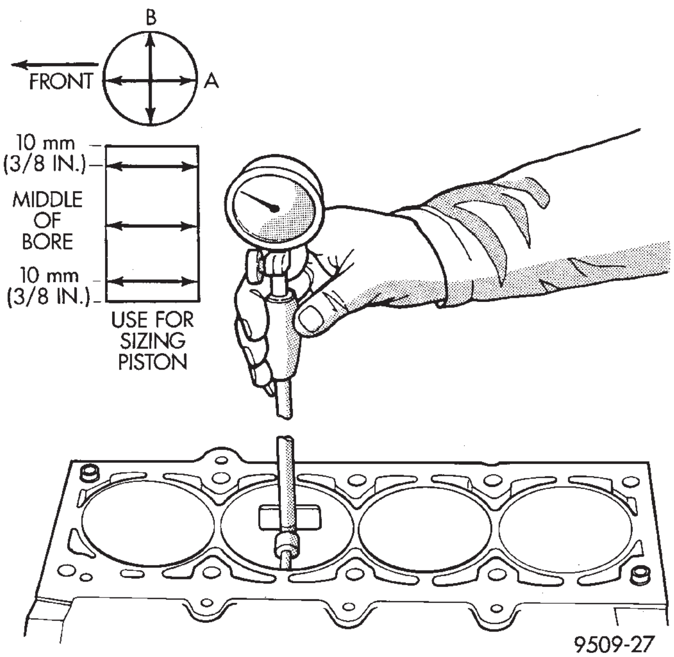

Fig. 35 Checking Cylinder Bore

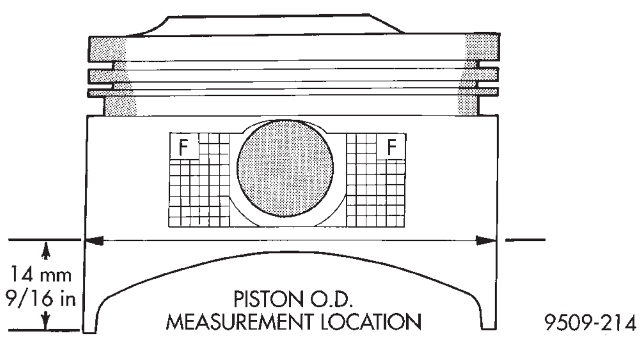

Fig. 36 Piston Measurement

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 37).

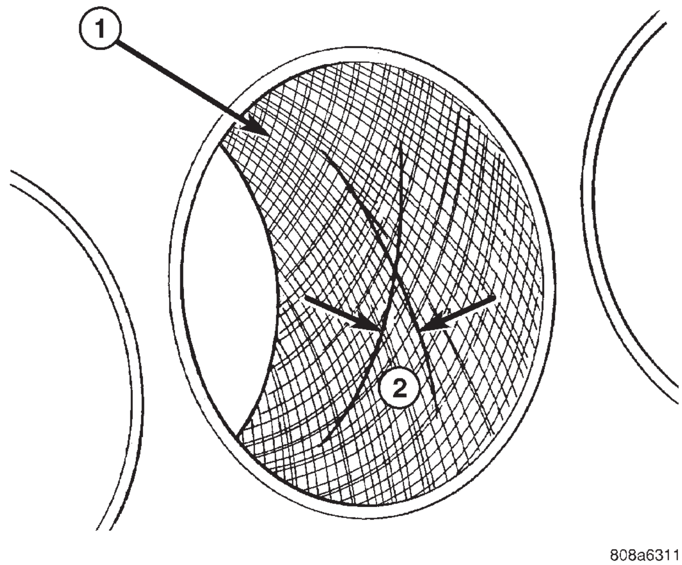

Fig. 37 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

ENGINE BLOCK (Continued)

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 38) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

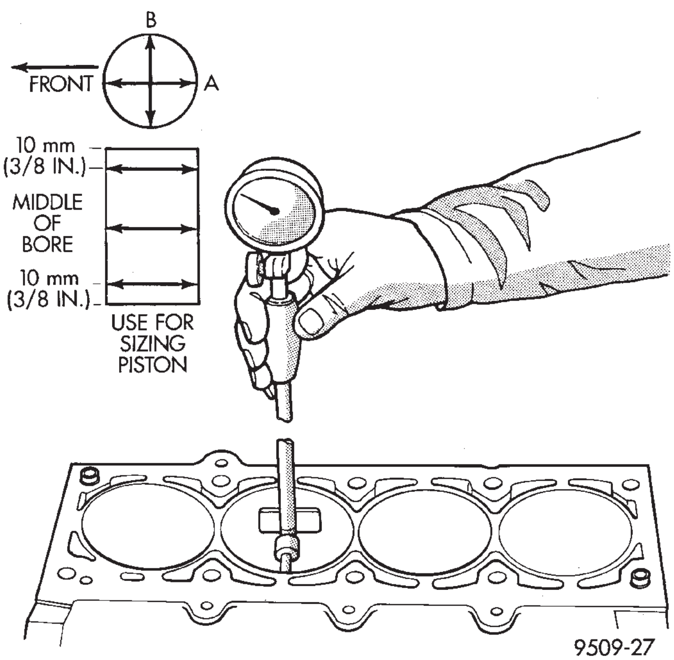

Fig. 38 Checking Cylinder Bore Size

Measure the cylinder bore at three levels in directions A and B (Fig. 38). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CONNECTING ROD BEARINGS

STANDARD PROCEDURE

CONNECTING ROD - FITTING

(1) For measuring connecting rod bearing clearance procedure and use of Plastigage(Refer to 9 - ENGINE - STANDARD PROCEDURE). For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS)

NOTE: The rod bearing bolts should not be reused.

(2) Before installing the **NEW** bolts the threads should be oiled with clean engine oil.

(3) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

(4) Tighten the bolts to 27 N·m PLUS 1/4 turn (20 ft. lbs. PLUS 1/4 turn) **Do not use a torque wrench for last step.**

(5) Using a feeler gauge, check connecting rod side clearance (Fig. 39). Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT

DESCRIPTION

The crankshaft is made of nodular cast iron and includes five main bearing journals and four connecting rod journals (Fig. 40). The number three journal is the location for the thrust bearing. The mains and connecting rod journals have undercut fillet radiuses that are rolled for added strength. To optimize bearing loading, eight counterweights are used.

CRANKSHAFT (Continued)

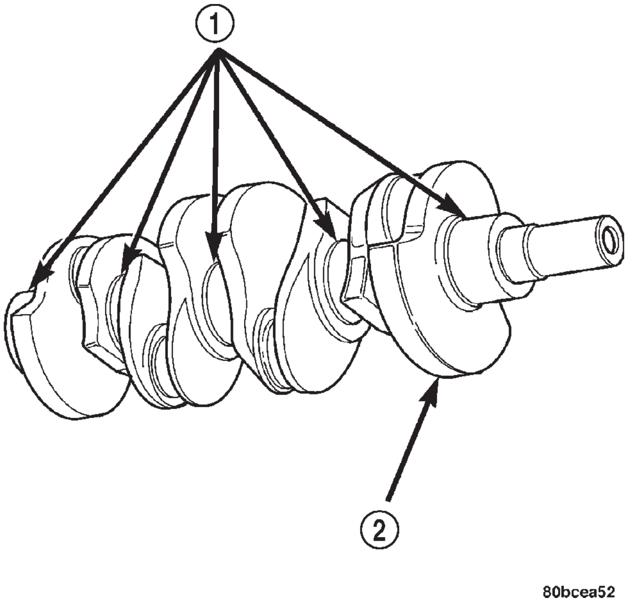

Fig. 40 Crankshaft - Typical

1 - MAIN BEARING JOURNALS
2 - COUNTER BALANCE WEIGHTS

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

STANDARD PROCEDURE - MEASURING CRANKSHAFT END PLAY

(1) Mount a dial indicator to front of engine with the locating probe on nose of crankshaft (Fig. 41).
(2) Move crankshaft all the way to the rear of its travel.
(3) Zero the dial indicator.
(4) Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

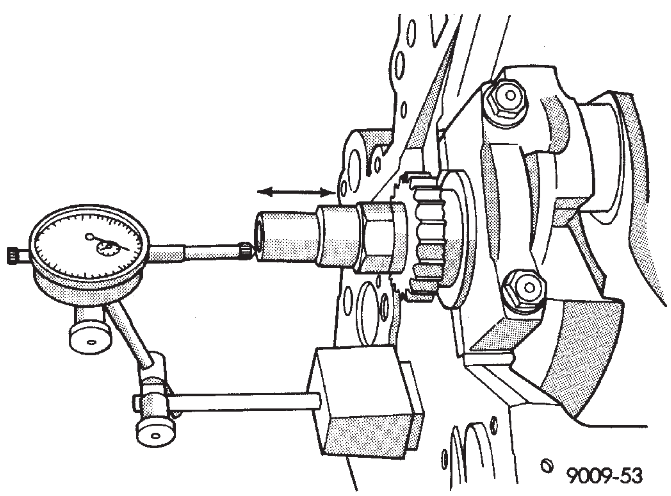

Fig. 41 Checking Crankshaft End Play—Typical

REMOVAL

NOTE: Crankshaft can not be removed when engine is in vehicle.

(1) Remove engine assembly from vehicle. (Refer to 9 - ENGINE - REMOVAL)
(2) Separate engine from transaxle.
(3) Remove flex plate and crankshaft rear oil seal.
(4) Mount engine on a repair stand.
(5) Drain engine oil and remove oil filter.
(6) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
(7) Remove engine mount support bracket.
(8) Remove the crankshaft damper and timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)
(9) Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
(10) Remove the crankshaft sprocket and oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL)
(11) Remove balance shafts and housing assembly. (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - REMOVAL)

NOTE: If piston/connecting rod replacement is necessary, remove cylinder head.

(12) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(13) Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(14) Remove all bedplate bolts from the engine block (Fig. 42).
(15) Using a mallet gently tap the bedplate loose from the engine block dowel pins.

CAUTION: Do not pry up on one side of the bedplate. Damage may occur to cylinder block to bedplate alignment and thrust bearing.

(16) Bedplate should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins and thrust bearing.
(17) Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

CRANKSHAFT (Continued)

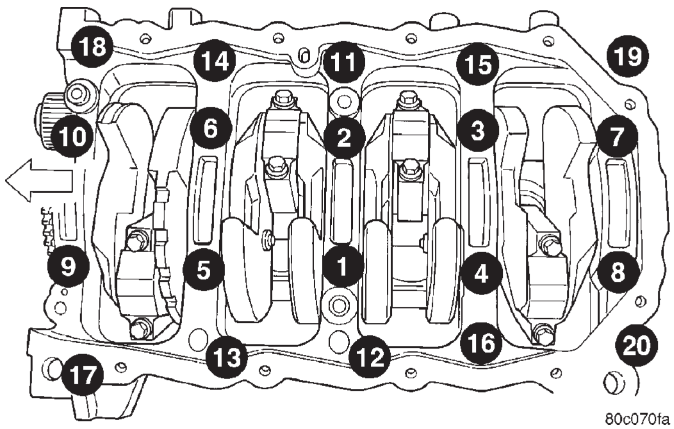

Fig. 42 Bedplate Bolt Tightenening Sequence

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring (Fig. 43). Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

CAUTION: With the nodular cast iron crankshafts, it is important that the final paper or cloth polish be in the same direction as normal rotation in the engine.

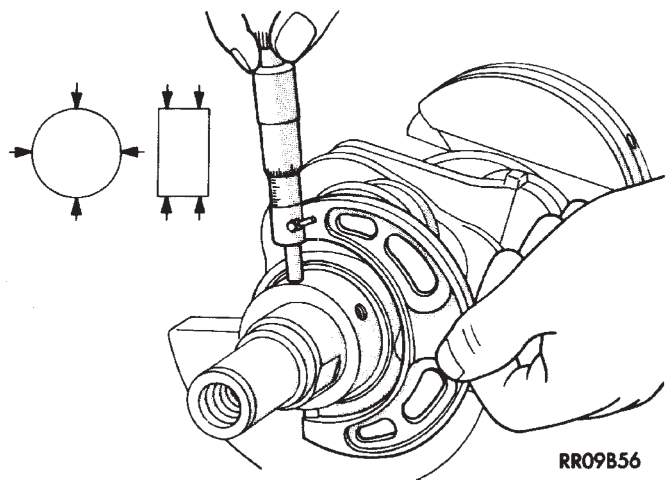

Fig. 43 Crankshaft Journal Measurements

Upper and lower No. 3 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine (Fig. 47). All bearing cap bolts removed during service procedures are to be cleaned and oiled before installation. Bearing shells are available in standard and the following undersized: 0.016 mm (0.0006 in.), 0.032 mm (0.0012 in.), 0.250 mm (0.010 in.). Never install an undersize bearing that will reduce clearance below specifications.

INSTALLATION

(1) Install the main bearing upper shells with the lubrication groove in the cylinder block (Fig. 44).

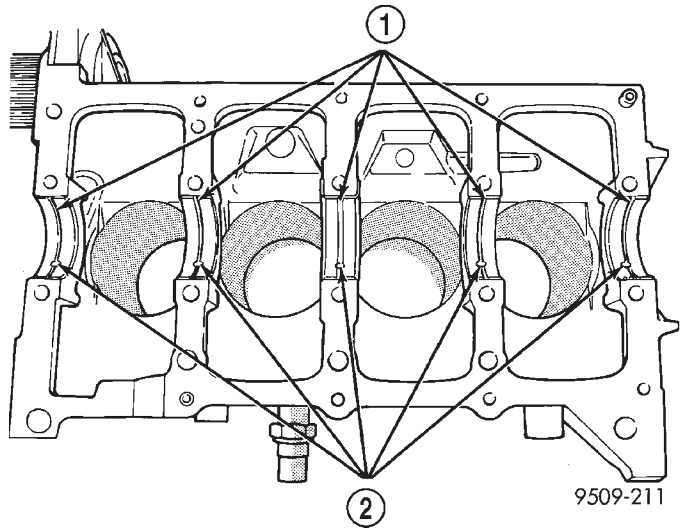

Fig. 44 Installing Main Bearing Upper Shell

1 - LUBRICATION GROOVES
2 - OIL HOLES

(2) Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

CAUTION: Do not get oil on the bedplate mating surface. It will affect the sealer ability to seal the bedplate to cylinder block.

(3) Oil the bearings and journals. Install crankshaft.

CAUTION: Use only the specified anaerobic sealer on the bedplate or damage may occur to the engine.

(4) Apply 1.5 to 2.0 mm (0.059 to 0.078 in.) bead of Mopar® Bed Plate Sealant to cylinder block as shown in (Fig. 45).

(5) Install lower main bearings into main bearing cap/bedplate. Make certain the bearing tabs are seated into the bedplate slots. Install the main bearing/bedplate into engine block.

(6) Before installing the bolts the threads should be oiled with clean engine oil, wipe off any excess oil.

(7) Install main bearing bedplate to engine block bolts 11, 17, and 20 finger tight. Tighten these bolts down together until the bedplate contacts the cylinder block.

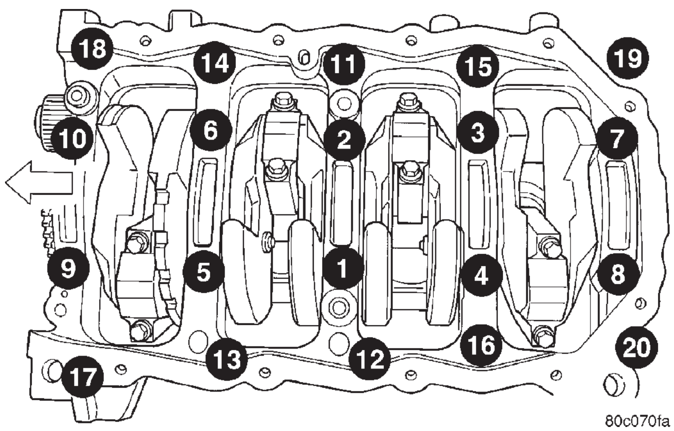

Fig. 46 Bedplate Bolt Torque Sequence

(8) To ensure correct thrust bearing alignment, perform the following steps:

• Step 1: Rotate crankshaft until number 4 piston is at TDC.

• Step 2: Move crankshaft rearward to limits of travel.

• Step 3: Then, move crankshaft forward to limits of travel.

• Step 4: Wedge an appropriate tool between the rear of the cylinder block **(NOT BED PLATE)** and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.

• Step 5: Install and tighten bolts (1–10) in sequence shown in (Fig. 46) to 41 N·m (30 ft. lbs.).

• Step 6: Remove wedge tool used to hold crankshaft.

(9) Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown in (Fig. 46).

(10) Tighten bolts (1–10) to 75 N·m (55 ft. lbs.) in sequence shown in (Fig. 46).

(11) Install main bearing bedplate to engine block bolts (11–20), and torque each bolt to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 46).

(12) Tighten bolts (11–20) again to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 46).

(13) After the main bearing bedplate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

(14) Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.

(15) Install balance shafts and housing assembly. (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT - INSTALLATION)

(16) Install the oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION)

(17) Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(18) Install the timing belt rear cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(19) Install crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(20) Install the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(21) Install the timing belt front covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

(22) Install engine mount support bracket.

(23) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

(24) Install the oil filter.

(25) Install crankshaft rear oil seal. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)

(26) Install flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).

(27) Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).

(28) Install the engine assembly. (Refer to 9 - ENGINE - INSTALLATION)

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - MAIN BEARING - FITTING

For crankshaft specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT MAIN BEARINGS

The crankshaft is supported in five main bearings. All upper and lower bearing shells in the crankcase have oil grooves. Crankshaft end play is controlled by a flanged bearing on the number three main bearing journal (Fig. 47).

CRANKSHAFT MAIN BEARINGS (Continued)

Upper and lower Number 3 bearing halves are flanged to carry the crankshaft thrust loads and are NOT interchangeable with any other bearing halves in the engine (Fig. 47). All bearing cap bolts removed during service procedures are to be cleaned and oiled before installation. Bearing shells are available in standard and the following undersized: 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.). Never install an undersize bearing that will reduce clearance below specifications. Replace or machine the crankshaft as necessary to obtain proper bearing clearances.

(1) Install the main bearing shells with the lubrication groove in the cylinder block (Fig. 48).

(2) Make certain oil holes in block line up with oil holes in bearings. Bearing tabs must seat in the block tab slots.

CAUTION: Do not get oil on the bedplate mating surface. It will may effect the sealer ability to seal the bedplate to cylinder block.

(3) Oil the bearings and journals and install crankshaft.

CAUTION: Use only the specified anaerobic sealer on the bedplate or damage may occur to the engine. Ensure that both cylinder block and bedplate surfaces are clean.

(4) Apply 1.5 to 2.0 mm (0.059 to 0.078 in.) bead of anaerobic sealer Mopar® Bed Plate Sealant to cylinder block as shown in (Fig. 49).

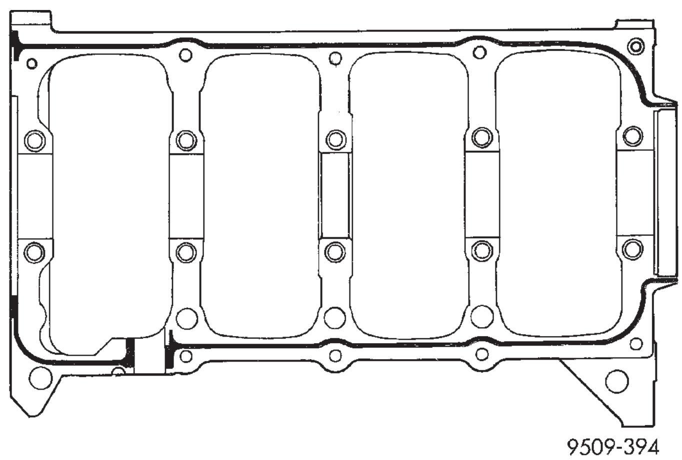

Fig. 49 Main Bearing Caps/Bedplate Sealing

(5) Install lower main bearings into main bearing cap/bedplate. Make certain the bearing tabs are seated into the bedplate slots.

(6) Position the main bearing/bedplate onto the engine block.

CRANKSHAFT MAIN BEARINGS (Continued)

(7) Before installing bolts, lubricate the threads with clean engine oil, wipe off any excess oil.

(8) Install main bearing bedplate to engine block bolts 11, 17 and 20 finger tight. Tighten these bolts down together until the bedplate contacts the cylinder block.

(9) To ensure correct thrust bearing alignment, perform the following steps:

- Step 1: Rotate crankshaft until number 4 piston is at TDC.
- Step 2: Move crankshaft rearward to limits of travel.
- Step 3: Then, move crankshaft forward to limits of travel.
- Step 4: Wedge an appropriate tool between the rear of the cylinder block **(NOT BED PLATE)** and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
- Step 5: Install and tighten bolts (1–10) in sequence shown in (Fig. 50) to 41 N·m (30 ft. lbs.).
- Step 6: Remove wedge tool used to hold crankshaft.

(10) Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown in (Fig. 50).

(11) Tighten bolts (1–10) to 75 N·m (55 ft. lbs.) in sequence shown in (Fig. 50).

(12) Install main bearing bedplate to engine block bolts (11–20), and torque each bolt to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 50).

(13) Tighten bolts (11–20) again to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 50).

(14) After the main bearing bedplate is installed, check the crankshaft turning torque. The turning torque should not exceed 5.6 N·m (50 in. lbs.).

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(4) Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(5) Remove crankshaft sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 51).

CAUTION: Do not nick shaft seal surface or seal bore.

(6) Use Tool 6771 to remove front crankshaft oil seal (Fig. 52). Be careful not to damage the seal surface of cover.

INSTALLATION

(1) Install new seal by using Special Tool 6780 (Fig. 53).

(2) Place seal into opening with seal spring towards the inside of engine. Install seal until flush with cover.

(3) Install crankshaft sprocket using Special Tool 6792 (Fig. 54).

(4) Install timing belt and timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

REMOVAL

(1) Remove transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 41TE - REMOVAL).

(2) Remove flex plate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).

(3) Insert a 3/16 flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 55)through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

INSTALLATION

CAUTION: If burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

(1) Place Special Tool 6926-1 Seal Guide on crankshaft (Fig. 56).

(2) Position seal over guide tool (Fig. 56). Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged powdered metal connecting rods. The pistons pin is offset 1 mm (0.0394 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. Hex head cap screws are used to provide alignment and durability in the assembly. The pistons and connecting rods are serviced as an assembly.

OPERATION

The piston and connecting rod is the link between the combustion force to the crankshaft.

REMOVAL

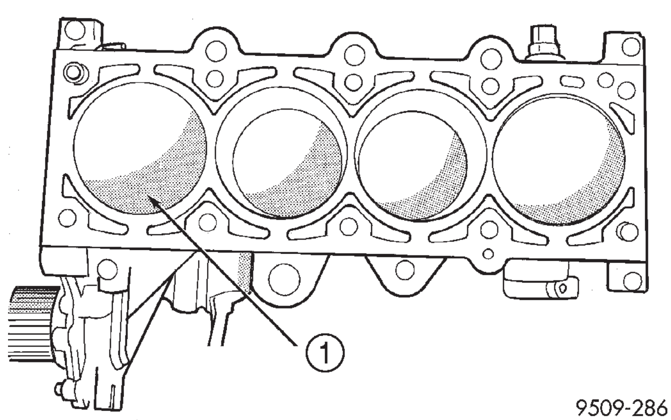

Fig. 60 Piston Markings

1 - DIRECTIONAL ARROW WILL BE IMPRINTED IN THIS AREA

NOTE: Cylinder Head must be removed before Pistons and Rods (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

PISTON & CONNECTING ROD (Continued)

(1) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.

(2) Pistons have a directional stamping in the front half of the piston facing towards the **front** of engine (Fig. 60).

(3) Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - REMOVAL).

(5) Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap (Fig. 61).

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(6) Remove connecting rod bolts and cap. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.

(7) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(8) Push piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(9) After removal, install bearing cap on the mating rod.

(10) Repeat procedure for each piston and connecting rod assembly.

(11) Piston and connecting rods are serviced as an assembly.

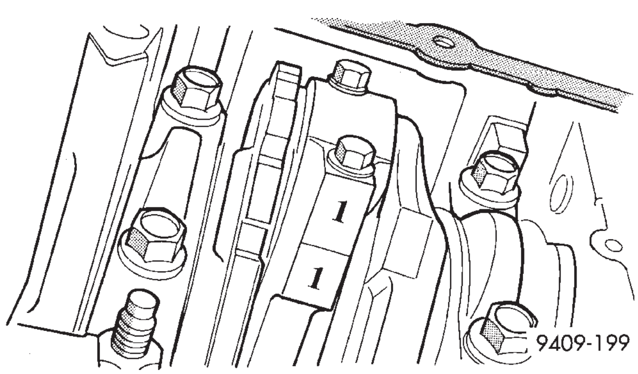

Fig. 61 Identify Connecting Rod to Cylinder

INSTALLATION

(1) Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 62).

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 62). As viewed from top.

1 - GAP OF LOWER SIDE RAIL
2 - NO. 1 RING GAP
3 - GAP OF UPPER SIDE RAIL
4 - NO. 2 RING GAP AND SPACER EXPANDER GAP

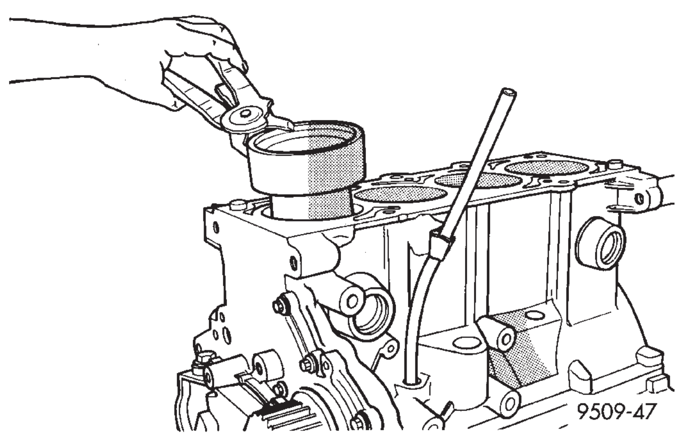

Fig. 63 Piston—Installation

(3) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston (Fig. 63). **Be sure position of rings does not change during this operation** .

(4) The directional stamp on the piston should face toward the front of the engine (Fig. 60).

PISTON & CONNECTING ROD (Continued)

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston assembly into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

NOTE: The connecting rod cap bolts should not be reused.

(7) Before installing the **NEW** bolts the threads should be coated with clean engine oil.

(8) Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.

CAUTION: Do not use a torque wrench for second part of last step.

(9) Tighten the bolts to 27 N·m PLUS 1/4 turn (20 ft. lbs. PLUS 1/4 turn).

(10) Using a feeler gauge, check connecting rod side clearance (Fig. 64).

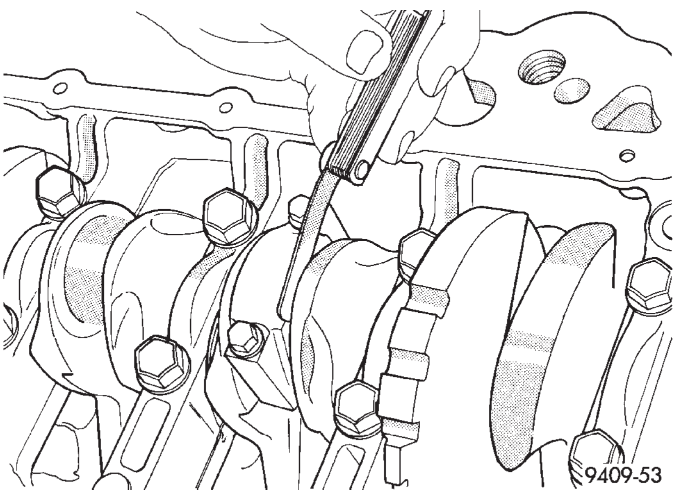

Fig. 64 Checking Connecting Rod Side Clearance

(11) Install Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).

(12) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

PISTON RINGS

STANDARD PROCEDURE

PISTON RING - FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge (Fig. 65). Refer to Engine Specifications.

(1) Install rings with manufacturers I.D. mark facing up, to the top of the piston (Fig. 67).

CAUTION: Install piston rings in the following order:

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(2) Install the side rail by placing one end between the piston ring groove and the expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander** (Fig. 68).

(3) Install upper side rail first and then the lower side rail.

(4) Install No. 2 piston ring and then No. 1 piston ring.

(5) Position piston ring end gaps as shown in (Fig. 69).

(6) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative battery cable.

(2) Support engine under oil pan with wooden block and floor jack.

(3) Remove three right side engine mount vertical bolts to front engine bracket.

(4) Raise vehicle on hoist.

(5) Remove right front wheel and belt splash shield.

(6) Support engine under oil pan with a wooden block and screw jack (Fig. 70).

(7) Remove front and rear engine mount through bolts.

(8) Slowly lower engine down with screw jack.

(9) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

INSTALLATION

(1) Install crankshaft vibration damper using M12 1.75 x 150 mm bolt, washer, thrust bearing and nut from Special Tool 6792 (Fig. 72).

(2) Install crankshaft vibration damper bolt and tighten to 136 N·m (100 ft. lbs.).

(3) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Raise engine with screw jack enough to install front and rear engine mount through bolts. Torque fasteners to 61 N·m (45 ft. lbs.).

(5) Install belt splash shield and right front wheel.

(6) Lower vehicle.

(7) Support engine under oil pan with wooden block and floor jack.

(8) Slowly raise engine with floor jack until engine mount bracket aligns with right side engine mount. Install three vertical bolts to front engine bracket. Torque fasteners to 61 N·m (45 ft. lbs.).

(9) Remove floor jack.

(10) Connect negative battery cable.

STRUCTURAL COLLAR

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove front engine mount through bolt.

(3) Remove bolts attaching torque reaction bracket to engine and transaxle (Fig. 73). Remove torque reaction bracket.

(4) Remove bolts attaching structural collar to oil pan and transaxle (Fig. 73). Remove structural collar.

INSTALLATION

CAUTION: Torque procedure for structural collar and torque reaction bracket must be followed or damage could occur to oil pan, collar, and/or bracket.

(1) Perform the following steps for installing structural collar and torque reaction bracket. Refer to (Fig. 73):

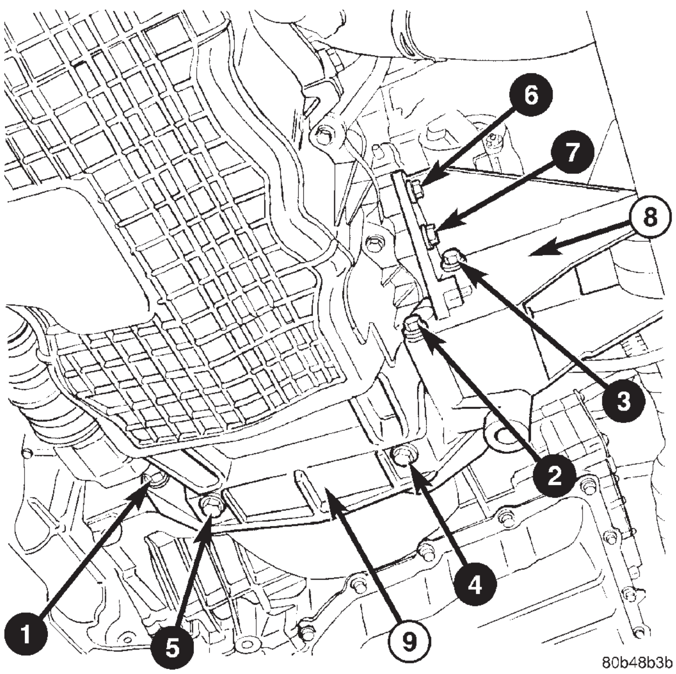

Fig. 73 Structural Collar and Torque Reaction Bracket

1-7 - BOLT TIGHTENING SEQUENCE
8 - TORQUE REACTION BRACKET
9 - STRUCTURAL COLLAR

- Step 1: Place collar into position between transaxle and oil pan. Install collar to transaxle bolt (1), **hand tight only**.
- Step 2: Install collar to oil pan bolts (4) and (5), **hand tight only**.
- Step 3: Position torque reaction bracket in place. Install attaching bolts (2) and (3), **hand tight only**.
- Step 4: Final torque bolts (1-3) to 101 N·m (75 ft. lbs.).
- Step 5: Install bolts (6) and (7) through torque reduction bracket into engine block, **hand tight only**.
- Step 6: Final torque bolts (4) and (5) to 45 N·m (35 ft. lbs.).
- Step 7: Final torque bolts (6) and (7) to 61 N·m (45 ft. lbs.).

(2) Install front engine mount through bolt and torque to 61 N·m (45 ft. lbs.).

(3) Lower vehicle.

ENGINE MOUNTING

ADJUSTMENTS

ENGINE SUPPORT ADJUSTMENT

The right and left support assemblies are slotted to allow for right/left drive train adjustment in relation to drive shaft assembly length.

Check and reposition right and left engine support assemblies as required. Adjust drive train position, if required, for the following conditions:

- Drive shaft distress: See Group 2, Suspension and Driveshaft.
- Any front end structural damage (after repair).
- Support Assembly replacement.

ENGINE SUPPORT ADJUSTMENT

(1) Remove the load on the engine motor mounts by carefully supporting the engine and transmission assembly with a floor jack.

(2) Loosen the right engine support assembly vertical fasteners.

(3) Loosen the left engine support assembly vertical bolts.

(4) Pry the engine right or left as required to achieve the proper drive shaft assembly length. Refer to Group 2, Suspension and Driveshaft for driveshaft identification and related assembly length measuring.

(5) Tighten right engine support assembly vertical bolts to 61 N·m (45 ft. lbs.). and tighten left engine support assembly bolts to 61 N·m (45 ft. lbs.).

(6) Recheck drive shaft length.

LEFT MOUNT

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove throttle body air inlet hose and air cleaner housing assembly.
(3) Remove two nuts securing speed control servo bracket to left shock tower. Reposition servo.
(4) Support transmission with floor jack and wooden block.
(5) Remove the three vertical bolts from mount to transmission bracket (A) (Fig. 74).
(6) Slightly lower transmission with floor jack.
(7) Remove mount to frame rail fasteners (B) and remove mount (Fig. 74).

INSTALLATION

(1) Position mount to frame rail. Install mount to frame rail fasteners (B) (Fig. 74). Torque fasteners to 33 N·m (24 ft. lbs.).
(2) Raise transmission into position with floor jack.
(3) Install three vertical bolts from mount to transmission bracket (A) (Fig. 74). Torque fasteners to 61 N·m (45 ft. lbs.).
(4) Remove floor jack and wooden block.
(5) Install speed control servo to left shock tower. Torque fasteners to 6.7 N·m (60 in. lbs.)
(6) Install throttle body air inlet hose and air cleaner housing assembly.
(7) Connect negative battery cable.

REAR MOUNT

REMOVAL

(1) Remove throttle body air inlet hose and air cleaner housing assembly.
(2) Remove three vertical bolts attaching rear mount bracket to transaxle case (Fig. 75).
(3) Raise vehicle on hoist.
(4) Remove rear mount bracket through bolt (Fig. 75).
(5) Remove horizontal bolt attaching rear mount bracket to transaxle case (Fig. 75).
(6) Remove mount bracket.
(7) Remove rear mount to suspension crossmember attaching bolts.
(8) Remove rear mount.

INSTALLATION

(1) Position rear mount on suspension crossmember and loosely install bolts.
(2) Position mount bracket on transaxle and install bolts. Tighten to 110 N·m (80 ft. lbs.) (Fig. 75).
(3) Install rear mount to bracket through bolt and tighten to 61 N·m (45 ft. lbs.) (Fig. 75).

RIGHT MOUNT

REMOVAL

(1) Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).

(2) Remove heater tube front attaching screw.

(3) Raise vehicle on a hoist and remove inner splash shield.

(4) Remove heater tube rear attaching screw.

(5) Remove the right engine support assembly vertical fasteners from frame rail (Fig. 76).

(6) Lower vehicle. Remove the load on the engine motor mounts by carefully supporting the engine assembly with floor jack and wooden block on oil pan.

(7) Remove the bolts attaching the engine support assembly to the engine bracket (Fig. 76).

(8) Remove right engine mount.

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump (Fig. 78) is mounted in the front engine cover and driven by the crankshaft.

LUBRICATION (Continued)

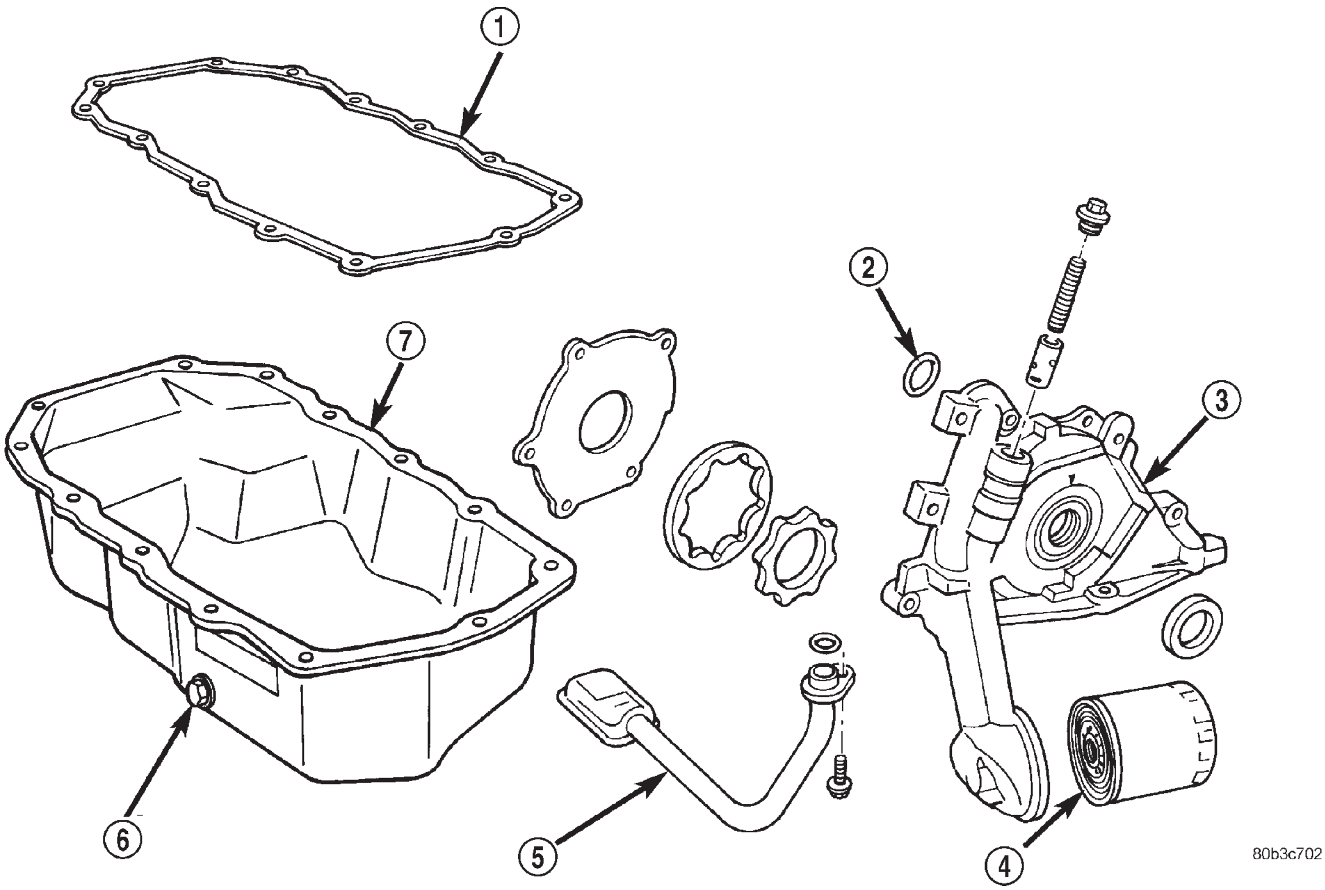

Fig. 78 Lubrication Components - Typical

1 - OIL PAN GASKET
2 - O-RING
3 - OIL PUMP BODY
4 - FILTER
5 - OIL PICK-UP TUBE
6 - DRAIN PLUG
7 - OIL PAN

OPERATION

Engine oil drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an oil passage from the number one main bearing cap through the balance shaft carrier support leg. This passage directly supplies oil to the front bearings and internal machined passages in the shafts that routes oil from front to the rear shaft bearing journals. A vertical hole at the number five bulkhead routes pressurized oil through a restrictor (integral to the cylinder head gasket) up past a cylinder head bolt to an oil gallery running the length of the cylinder head. The camshaft journals are partially slotted to allow a predetermined amount of pressurized oil to pass into the bearing cap cavities. Lubrication of the camshaft lobes are provided by small holes in the camshaft bearing caps that are directed towards each lobe. Oil returning to the pan from pressurized components supplies lubrication to the valve stems. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Disconnect and remove oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)

(2) Install Special Tools C-3292 Gauge with 8406 Adaptor fitting.

(3) Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. (Refer to 9 - ENGINE - SPECIFICATIONS)

LUBRICATION (Continued)

CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

(4) If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open, a clogged oil pick-up screen or a damaged oil pick-up tube O-ring.

(5) After test is complete, remove test gauge and fitting.

(6) Install oil pressure switch and connector. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION)

OIL

STANDARD PROCEDURE

ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick and observe oil level (Fig. 79). Add oil only when the level is at or below the ADD mark (Fig. 80).

OIL (Continued)

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.
(2) Remove oil fill cap (Fig. 82).
(3) Raise vehicle on hoist.
(4) Place a suitable drain pan under crankcase drain.
(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
(6) Remove oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)
(7) Install and tighten drain plug in crankcase.
(8) Install new oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)
(9) Lower vehicle and fill crankcase with specified type and amount of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)
(10) Install oil fill cap.
(11) Start engine and inspect for leaks.
(12) Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

OIL FILTER

DESCRIPTION

The engine oil filter (Fig. 81) is a high quality full-flow, disposable type. Replace the oil filter with a Mopar® or the equivalent.

REMOVAL

(1) Raise vehicle on hoist.
(2) Position an oil collecting container under oil filter location.

CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

(3) Using a suitable filter wrench, turn oil filter (Fig. 81) counterclockwise to remove.

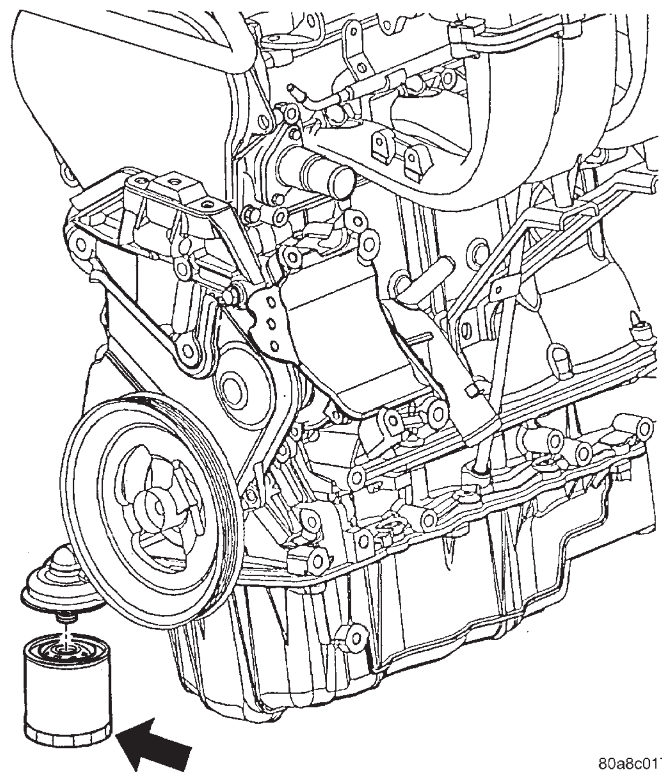

Fig. 81 Oil Filter

INSTALLATION

(1) Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.
(2) Lubricate new oil filter gasket with clean engine oil.
(3) Screw oil filter (Fig. 81) on until the gasket contacts base. Tighten to 21 N·m (15 ft. lbs.).

OIL PAN

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist and drain engine oil.

(3) Remove structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/ STRUCTURAL COVER - REMOVAL).

(4) Remove bolts attaching oil pan.

(5) Remove oil pan.

(6) Clean oil pan and all gasket surfaces.

INSTALLATION

(1) Apply Mopar® Engine RTV GEN II at the oil pump to engine block parting line (Fig. 82).

(2) Install the oil pan gasket to the block (Fig. 83).

(3) Install pan and tighten the screws to 12 N·m (105 in. lbs.).

(4) Install structural collar and torque reaction bracket (Refer to 9 - ENGINE/ENGINE BLOCK/ STRUCTURAL COVER - INSTALLATION).

(5) Lower vehicle and fill engine crankcase with proper oil to correct level.

(6) Connect negative battery cable.

OIL PRESSURE SENSOR/ SWITCH

REMOVAL

(1) Raise vehicle.

(2) Position oil collecting container under pressure switch location.

(3) Disconnect oil pressure switch electrical connector and remove switch (Fig. 84).

INSTALLATION

(1) Install oil pressure switch and connect electrical connector (Fig. 89) .

(2) Lower vehicle.

(3) Start engine and allow to run a minimum of 2 minutes.

(4) Shut engine off and check engine oil level. Adjust level as necessary.

OIL PUMP

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Remove Timing Belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(4) Remove Oil Pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove Crankshaft Sprocket using Special Tool 6793 and insert C-4685-C2 (Fig. 85).

DISASSEMBLY

(1) To remove the relief valve, proceed as follows:

(a) Remove the threaded plug and gasket from the oil pump (Fig. 87).

(b) Remove spring and relief valve (Fig. 87).

(2) Remove oil pump cover screws, and lift off cover.

(3) Remove pump rotors.

(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

CLEANING

(1) Clean all parts thoroughly in a suitable solvent.

OIL PUMP (Continued)

INSPECTION

(1) Clean all parts thoroughly. Mating surface of the oil pump should be smooth (Fig. 88). Replace pump cover if scratched or grooved.

(2) Lay a straightedge across the pump cover surface (Fig. 89). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

(3) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 9.40 mm (0.370 in.) or less (Fig. 90), or if the diameter is 79.95 mm (3.148 in.) or less, replace outer rotor.

(4) If inner rotor measures 9.40 mm (0.370 in.) or less replace inner rotor (Fig. 91).

(5) Slide outer rotor into pump housing, press to one side with fingers and measure clearance between rotor and housing (Fig. 92). If measurement is 0.39 mm (0.015 in.) or more, replace housing only if outer rotor is in specification.

(6) Install inner rotor into pump housing. If clearance between inner and outer rotors (Fig. 93) is 0.203 mm (0.008 in.) or more, replace both rotors.

(7) Place a straightedge across the face of the pump housing, between bolt holes. If a feeler gauge of 0.102 mm (0.004 in.), or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 94), **ONLY** if rotors are in specifications.

ASSEMBLY

(1) Assemble pump, using new parts as required. **Install the inner rotor with chamfer facing the cast iron oil pump cover.**

(2) Prime oil pump before installation by filling rotor cavity with engine oil.

(3) Install cover and tighten screws to 12 N·m (105 in. lbs.).

CAUTION: Oil pump pressure relief valve must be installed as shown in (Fig. 87) or serious damage may occur.

(4) Install relief valve, spring, gasket and cap as shown in (Fig. 87). Tighten cap to 41 N·m (30 ft. lbs.).

1 - APPLY GASKET MAKER TO OIL PUMP BODY FLANGE

(3) Prime oil pump before installation.

(4) Align oil pump rotor flats with flats on crankshaft as you install the oil pump to the block.

NOTE: Front crankshaft seal MUST be out of pump to align, or damage may result.

(5) Install new front crankshaft seal using Special Tool 6780 (Fig. 96).

(6) Install crankshaft sprocket using Special Tool 6792 (Fig. 97).

(7) Install oil pump pick-up tube.

(8) Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(9) Install Timing Belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(11) Replace oil filter.

(12) Lower vehicle.

(13) Fill engine crankcase with proper oil to correct level.

(14) Connect negative battery cable.

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is a one piece composite plastic design that attaches to the cylinder head with fasteners. The manifold is a long branch design to enhance low and mid-range torque.

OPERATION

The intake manifold delivers air to the combustion chambers. This air allows the fuel delivered by the fuel injectors to ignite when the spark plugs fire.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.
(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.
(3) If engine RPM'S change, the area of the suspected leak has been found.
(4) Repair as required.

REMOVAL

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

(1) Perform fuel system pressure release procedure **before attempting any repairs.**(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
(2) Disconnect negative battery cable.
(3) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).
(4) Remove throttle body air inlet hose and air cleaner housing assembly.
(5) Remove throttle and speed control cables from throttle lever and bracket.
(6) Remove EGR tube.
(7) Remove engine oil dipstick and tube from engine block. Plug hole in block to prevent debris or fluid from entering engine crankcase.
(8) Disconnect necessary vacuum hoses from intake manifold.
(9) Disconnect the fuel supply line quick connect at the fuel rail assembly.

WARNING: WRAP SHOP TOWELS AROUND HOSE TO CATCH ANY GASOLINE SPILLAGE.

(10) Remove fastener holding fuel rail bracket to side of cylinder head.
(11) Disconnect the following electrical connectors:
- Fuel Injectors
- Knock Sensor
- ECT Sensor
- IAC
- TPS
- MAP Sensor
- A/C Pressure Sensor
- A/C Compressor Clutch
- Generator

(12) Reposition wiring harness.
(13) Remove fuel rail support bracket (Fig. 98).
(14) Remove fuel rail.

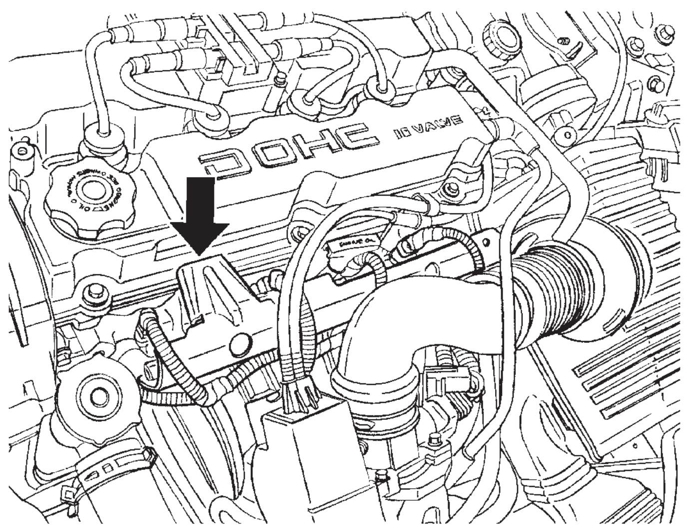

Fig. 98 Fuel Rail Support Bracket

(15) Remove coolant outlet connector (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - REMOVAL).
(16) Remove intake manifold fasteners. Remove intake manifold.

CLEANING

(1) Discard gasket(s).
(2) Clean all sealing surfaces.

INSPECTION

(1) Inspect manifold for cracks or distortion. Replace manifold if necessary.

INTAKE MANIFOLD (Continued)

(2) Inspect manifold for gasket surface damage or warpage. Replace manifold if necessary.

INSTALLATION

(1) Install new intake manifold and gasket. Gradually tighten fasteners to 28 N·m (250 in. lbs.) in sequence shown in (Fig. 99).

(2) Install coolant outlet connector (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - INSTALLATION).

(3) Install fuel rail.

(4) Install fuel rail support bracket (Fig. 98).

(5) Connect previously disconnected electrical connectors.

(6) Install fastener holding fuel rail bracket to side of cylinder head.

(7) Inspect quick connect fittings for damage, replace if necessary. Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.

(8) Connect vacuum hoses to intake manifold.

(9) Install engine oil dipstick and tube.

(10) Install EGR tube (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/ TUBE - INSTALLATION).

(11) Install throttle and speed control cables to bracket. Connect cables to the throttle lever.

(12) Fill cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(13) Connect negative battery cable.

(14) With the DRB scan tool use ASD Fuel System Test to pressurize system to check for leaks.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) relay will remain energized for 7 minutes or until the ignition switch is turned to the OFF position, or Stop All Test is selected.

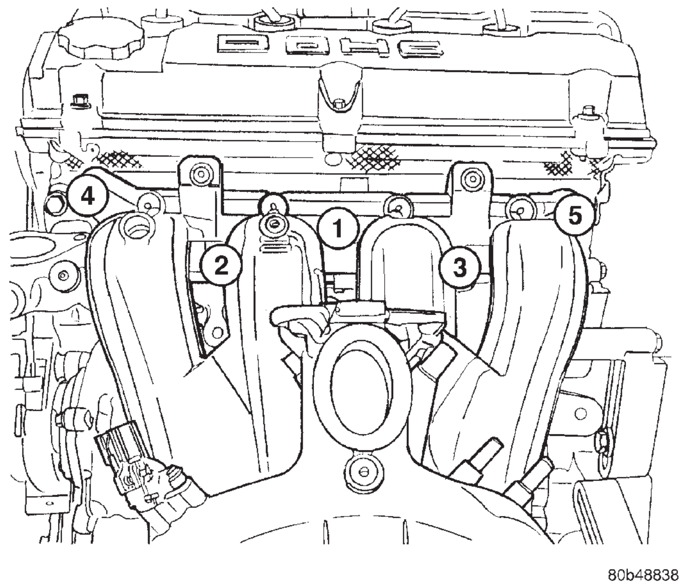

Fig. 99 Intake Manifold Tightening Sequence

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist.

(3) Remove complete exhaust system (Refer to 11 - EXHAUST SYSTEM - REMOVAL).

(4) Remove rear engine mount and transaxle bracket.

(5) Remove exhaust manifold heat shield (Fig. 100).

(6) Disconnect oxygen sensor electrical connector.

(7) Remove exhaust manifold retaining fasteners and remove exhaust manifold.

(8) Remove and discard manifold gasket.

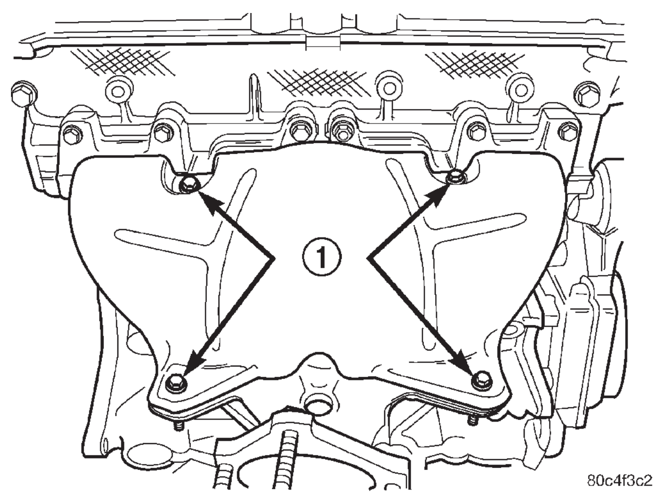

Fig. 100 Exhaust Manifold Heat Shield Bolts

1 - BOLTS

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifold is made of Hi-Silicone Moly nodular cast iron for strength and high temperatures. The manifold attaches to the cylinder head.

OPERATION

The exhaust manifold collects the exhaust gasses exiting the combustion chambers. Then it channels the exhaust gasses to the exhaust pipe attached to the manifold.

EXHAUST MANIFOLD (Continued)

CLEANING

(1) Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

(1) Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.

(2) Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

(1) Install new exhaust manifold gasket. **DO NOT APPLY SEALER**.

(2) Position exhaust manifold in place. Tighten fasteners in sequence shown in (Fig. 101) to 23 N·m (200 in. lbs.). Repeat this procedure until all fasteners are at specified torque.

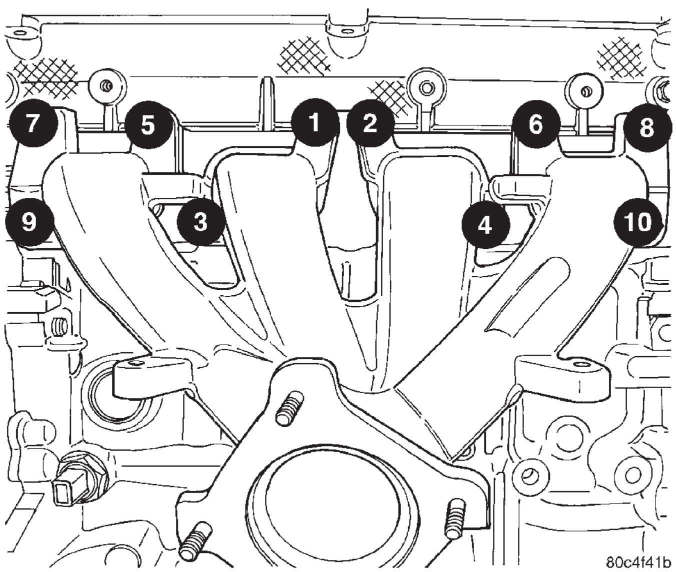

Fig. 101 EXHAUST MANIFOLD TIGHTENING SEQUENCE

(3) Install exhaust manifold heat shield.

(4) Connect oxygen sensor electrical connector.

(5) Install rear engine mount and transaxle bracket.

(6) Install exhaust system (Refer to 11 - EXHAUST SYSTEM - INSTALLATION). Tighten fasteners to 28 N·m (250 in. lbs.).

(7) Lower vehicle.

(8) Connect negative battery cable.

BALANCE SHAFTS AND CARRIER ASSEMBLY

DESCRIPTION

The 2.4L engine is equipped with two nodular cast iron balance shafts installed in a cast aluminum carrier attached to the lower cylinder block (Fig. 102).

OPERATION

The balance shafts are driven by the crankshaft via a roller chain and sprockets. The balance shafts are connected by helical gears. The dual counter rotating shafts decrease second order vertical shaking forces caused by component movement.

REMOVAL

BALANCE SHAFTS/CHAIN/SPROCKETS

NOTE: For service procedures requiring only temporary relocation of carrier assembly refer to BALANCE SHAFT CARRIER procedure below.

(1) Drain engine oil.

(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) If replacing crankshaft sprocket, remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(4) Remove chain cover, guide and tensioner (Fig. 103).

(5) Remove screw retaining balance shaft drive sprocket (Fig. 104). Remove chain and sprocket.

(6) Using two wide pry bars, work the crankshaft sprocket back and forth until it is off the crankshaft-shaft.

(7) Remove gear cover retaining stud (double ended to also retain chain guide). Remove cover and balance shaft gears (Fig. 105).

(8) Remove rear cover and balance shafts (Fig. 106).

(9) Remove four carrier to crankcase attaching bolts to separate carrier from engine bedplate.

BALANCE SHAFT CARRIER

The following components will remain intact during carrier removal: Gear cover, gears, balance shafts and the rear cover (Fig. 102).

(1) Drain engine oil.

(2) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove chain cover, guide and tensioner (Fig. 103).

(4) Remove screw retaining balance shaft drive sprocket (Fig. 104).

(5) Move balance shaft inboard through drive chain sprocket. Sprocket will hang in lower chain loop.

(6) Remove carrier to crankcase attaching bolts to remove carrier.

INSTALLATION

BALANCE SHAFT INSTALLATION/TIMING

Balance shaft and carrier assembly installation is the reverse of the removal procedure. **During installation crankshaft-to-balance shaft timing must be established. Refer to Timing procedure in this section.**

(1) With balance shafts installed in carrier (Fig. 102) position carrier on crankcase and install four attaching bolts and tighten to 54 N·m (40 ft. lbs.).

(2) Turn balance shafts until both shaft key ways are up, parallel to vertical centerline of engine. Install short hub drive gear on sprocket driven shaft and long hub gear on gear driven shaft. After installation gear and balance shaft keyways must be up with gear timing marks meshed as shown in (Fig. 107).

(3) Install gear cover and tighten double ended stud/washer fastener to 12 N·m (105 in. lbs.).

(4) Align flat on balance shaft drive sprocket to the flat on crankshaft (Fig. 108).

(5) Install balance shaft drive sprocket on crankshaft using Special Tool 6052 (Fig. 109).

(6) Turn crankshaft until number 1 cylinder is at top dead center (TDC). The timing marks on the chain sprocket should line up with the parting line on the left side of number one main bearing cap. (Fig. 110).

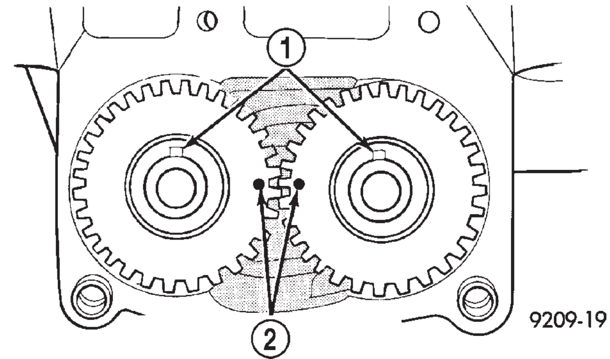

Fig. 107 Gear Timing

2 - GEAR ALIGNMENT DOTS

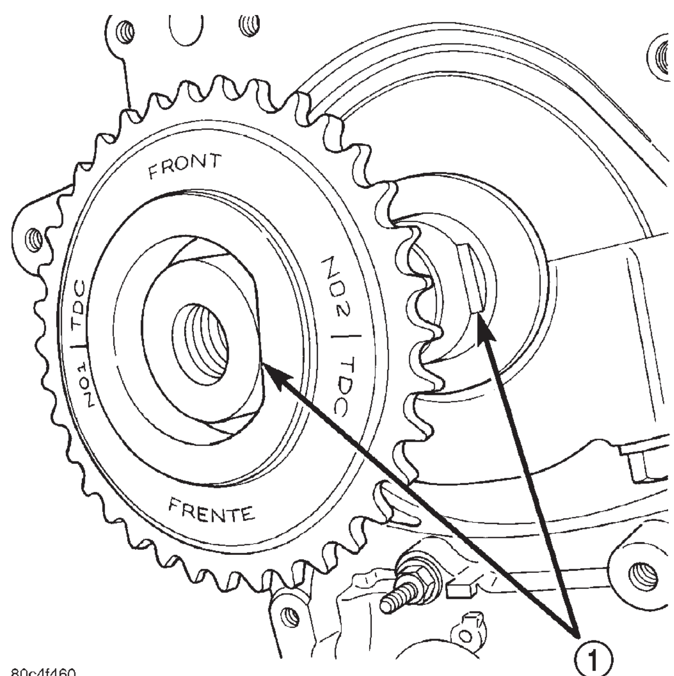

Fig. 108 Balance Shaft Sprocket Alignment to Crankshaft

1 - ALIGN FLATS

(7) Place chain over crankshaft sprocket so that the plated link of the chain is over the number 1 cylinder timing mark on the balance shaft crankshaft sprocket (Fig. 110).

(8) Place balance shaft sprocket into the timing chain (Fig. 110) and align the timing mark on the sprocket (dot) with the (lower) plated link on the chain.

NOTE: The lower plated link is 8 links from the upper link.

(9) With balance shaft keyways pointing up (12 o'clock) slide the balance shaft sprocket onto the nose of the balance shaft. The balance shaft may have to be pushed in slightly to allow for clearance.

NOTE: THE TIMING MARK ON THE SPROCKET, THE (LOWER) NICKEL PLATED LINK, AND THE ARROW ON THE SIDE OF THE GEAR COVER SHOULD LINE UP WHEN THE BALANCE SHAFTS ARE TIMED CORRECTLY.

(10) If the sprockets are timed correctly, install the balance shaft bolts and tighten to 28 N·m (250 in. lbs.). A wood block placed between crankcase and crankshaft counterbalance will prevent crankshaft and gear rotation.

(11) **CHAIN TENSIONING:**

(a) Install chain tensioner loosely assembled.

(b) Position guide on double ended stud making sure tab on the guide fits into slot on the gear cover. Install and tighten nut/washer assembly to 12 N·m (105 in. lbs.).

(c) Place a shim 1 mm (0.039 in.) thick x 70 mm (2.75 in.) long or between tensioner and chain. Push tensioner and shim up against the chain. **Apply firm pressure 2.5–3 Kg (5.5–6.6 lbs.) directly behind the adjustment slot to take up all slack.** Chain must have shoe radius contact as shown in (Fig. 111).

(d) With the load applied, tighten top tensioner bolt first, then bottom pivot bolt. Tighten bolts to 12 N·m (105 in. lbs.). Remove shim.

(e) Install carrier covers and tighten screws to 12 N·m (105 in. lbs.).

(12) If removed, install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(13) Install pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(14) Fill engine crankcase with proper oil to correct level.

TIMING BELT COVER(S)

REMOVAL

FRONT COVER - UPPER

(1) Remove upper timing belt cover fasteners (Fig. 112) and remove cover.

FRONT COVER - LOWER

(1) Disconnect negative battery cable.
(2) Raise vehicle on hoist.
(3) Remove right front wheel and belt splash shield.
(4) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
(5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
(6) Remove AC/Generator belt tensioner.
(7) Lower vehicle.
(8) Disconnect generator connectors.
(9) Remove generator and bracket.
(10) Raise vehicle on hoist.
(11) Remove fasteners attaching lower timing cover (Fig. 112).
(12) Remove lower timing cover.

REAR COVER

(1) Remove upper and lower front timing belt covers.
(2) Remove Timing Belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
(3) Remove timing belt idler pulley.
(4) Remove both camshaft sprockets. Hold camshaft sprockets with Special Tool 6847 while removing center bolts (Fig. 113).
(5) Remove rear timing belt cover fasteners and remove cover from engine (Fig. 114).

INSTALLATION

FRONT COVER - UPPER

(1) Install timing belt cover. Torque fasteners to 9 N·m (80 in. lbs.) (Fig. 112).

FRONT COVER - LOWER

(1) Install lower timing belt cover and torque fasteners to 9 N·m (80 in. lbs.) (Fig. 112).
(2) Lower vehicle.
(3) Install generator and bracket.
(4) Connect generator connectors.
(5) Raise vehicle.
(6) Install AC/Generator belt tensioner.

(9) Install belt splash shield and right front wheel.

(10) Lower vehicle.

(11) Connect negative battery cable.

REAR COVER

(1) Install rear timing belt cover and fasteners. Torque fasteners to specified values (Fig. 114).

(2) Install camshaft sprockets. Hold camshaft sprockets with Special Tool 6847 while tightening center bolts to 115 N·m (85 ft. lbs) (Fig. 113).

(3) Install timing belt idler pulley.

(4) Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(5) Install upper and lower front timing belt covers.

REMOVAL

REMOVAL - TIMING BELT

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist. Remove right front wheel.

(3) Remove belt splash shield.

(4) Remove accessory drive belts.

(5) Remove crankshaft damper bolt, and remove damper.

(6) Remove AC/Generator belt tensioner.

(7) Disconnect generator connections. Remove generator and bracket.

(8) Remove upper and lower timing belt covers (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL) (Fig. 115).

(9) Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).

(10) Remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

(11) Remove engine support bracket (Fig. 115).

CAUTION: When aligning crankshaft and camshaft timing marks always rotate engine from crankshaft. Camshaft should not be rotated after timing belt is removed. Damage to valve components may occur. Always align timing marks before removing timing belt.

(12) Before the removal of the timing belt, rotate crankshaft until the TDC mark on oil pump housing aligns with the TDC mark on crankshaft sprocket (trailing edge of sprocket tooth) (Fig. 116).

NOTE: The crankshaft sprocket TDC mark is located on the trailing edge of the sprocket tooth. Failure to align trailing edge of sprocket tooth to TDC mark on oil pump housing will cause the camshaft timing marks to be misaligned.

(13) Install 6 mm Allen wrench into belt tensioner. Before rotating the tensioner, insert the long end of a 1/8” or 3 mm Allen wrench into the pin hole on the front of the tensioner (Fig. 117). While rotating the tensioner counterclockwise, push in lightly on the 1/8” or 3 mm Allen wrench, until it slides into the locking hole.

(14) Remove timing belt.

CLEANING

Do Not attempt to clean a timing belt. If contamination from oil, grease, or coolants have occurred, the timing belt should be replaced.

Clean all sprockets using a suitable solvent. Clean all sprocket grooves of any debris.

INSTALLATION

INSTALLATION - CRANKSHAFT SPROCKET

CAUTION: The crankshaft sprocket is set to a predetermined depth from the factory for correct timing belt tracking. If removed, use of Special Tool 6792 is required to set the sprocket to original installation depth. An incorrectly installed sprocket will result in timing belt and engine damage.

(1) Install crankshaft sprocket using Special Tool 6792 (Fig. 120).

(2) Install timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

(3) Connect negative battery cable.

INSTALLATION - CAMSHAFT SPROCKETS

(1) Install camshaft sprockets. Hold camshaft sprockets with Special Tool 6847 while tightening center bolts to 115 N·m (85 ft. lbs.) (Fig. 118).

(2) Install timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(3) Connect negative battery cable.

INSTALLATION - TIMING BELT

(1) Set crankshaft sprocket to TDC by aligning the sprocket with the arrow on the oil pump housing.

(2) Set camshafts timing marks so that the exhaust camshaft sprocket is a 1/2 notch below the intake camshaft sprocket (Fig. 121).

CAUTION: Ensure that the arrows on both camshaft sprockets are facing up.

(3) Install timing belt. Starting at the crankshaft, go around the water pump sprocket, idler pulley, camshaft sprockets and then around the tensioner (Fig. 122).

(4) Move the exhaust camshaft sprocket counter-clockwise (Fig. 122) to align marks and take up belt slack.

NOTE: A new tensioner is held in the wound position by a pull pin.

(5) Remove the pull pin or Allen wrench from the belt tensioner.

(6) Once the timing belt has been installed and tensioner released, rotate the crankshaft two (2) complete revolutions. Verify that the TDC marks on crankshaft and timing marks on the camshafts are aligned as shown in (Fig. 123).

(7) Install engine mount support bracket (Fig. 115).

(8) Install upper timing belt cover. Torque fasteners to 9 N·m (80 in. lbs.) (Fig. 115).

(9) Install the lower timing belt cover. Torque fasteners to 9 N·m (80 in. lbs.) (Fig. 115).

(10) Install generator and bracket. Connect generator connections.

(11) Install AC/Generator belt tensioner.

(12) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(13) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(14) Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).

(15) Install accessory drive belts.

(16) Install belt splash shield.

(17) Install right front wheel.

(18) Connect negative battery cable.

TIMING BELT TENSIONER & PULLEY

REMOVAL

(1) Remove the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL).

(2) Remove timing belt idler pulley.

(3) Hold camshaft sprocket with Special Tool 6847 while removing bolt (Fig. 124). Remove both cam sprockets.

(4) Remove rear timing belt cover fasteners and remove cover from engine (Fig. 125).

(5) Remove lower bolt attaching timing belt tensioner assembly to engine and remove tensioner **as an assembly** (Fig. 126).

INSTALLATION

(1) Align timing belt tensioner assembly to engine and install lower mounting bolt **but do not tighten** (Fig. 126). To properly align tensioner assembly—install one of the engine bracket mounting bolts (M10) 5 to 7 turns into the tensioner's upper mounting location (Fig. 126).

(2) Torque the tensioner's lower mounting bolt to 61 N·m (45 ft. lbs.). Remove the upper bolt used for tensioner alignment.

(3) Install rear timing belt cover and fasteners (Fig. 125).

(4) Install timing belt idler pulley and torque mounting bolt to 61 N·m (45 ft. lbs.).

(5) Install camshaft sprockets. Use Special Tool 6847 to hold sprockets (Fig. 124), torque bolts to 115 N·m (85 ft. lbs.).

(6) Install the timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION).

ENGINE 2.7L DOHC

TABLE OF CONTENTS

ENGINE 2.7L DOHC

DESCRIPTION

The 2.7 Liter (167 Cubic Inches) 60 degree V-6 engine is a double overhead camshaft design with hydraulic lifters and four valves per cylinder (Fig. 1). The engine does not have provisions for a free wheeling valve train.

The cylinders are numbered from front to rear, with the right bank odd numbered, and the left bank even numbered (Fig. 2). The firing order is 1–2–3–4–5–6.

The engine identification number is located on the rear of the cylinder block just below the left cylinder head (Fig. 3)

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to Service Diagnosis—Mechanical Chart and Service Diagnosis—Performance Chart, for possible causes and corrections of malfunctions. Refer to FUEL SYSTEM for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Check engine oil level and add oil if necessary.

(2) Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

(3) Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.

(4) Remove the Auto Shutdown (ASD) relay from the PDC.

(5) Be sure throttle blade is fully open during the compression check.

(6) Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

(7) Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.

(8) Repeat the previous step for all remaining cylinders.

(9) Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.

(10) If one or more cylinders have abnormally low compression pressures, repeat the compression test.

(11) If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

ENGINE 2.7L DOHC (Continued)

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

(5) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:

- Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
- Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
- Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
- If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.

(4) If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

ENGINE 2.7L DOHC (Continued)

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

(7) After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

(1) Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.

(2) Remove negative battery cable.

(3) Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

(4) With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.

(5) Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

(6) Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)

(7) Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

(8) Install new spark plugs.

(9) Drain engine oil and remove oil filter.

(10) Install a new oil filter.

(11) Fill engine with specified amount of approved oil.

(12) Connect negative battery cable.

(13) Start engine and check for any leaks.

STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

ENGINE 2.7L DOHC (Continued)

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed-plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 4)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 4)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 4)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 5).

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

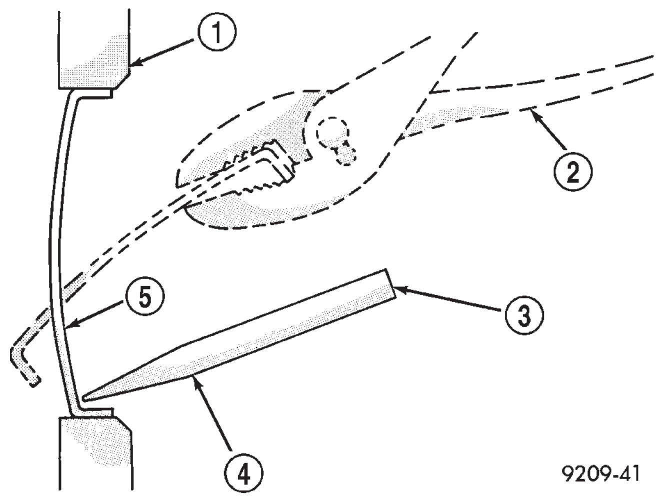

Fig. 5 Core Hole Plug Removal

1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL - ENGINE ASSEMBLY

(1) Release fuel pressure(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect negative battery cable.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Discharge A/C system using a suitable refrigerant recovery machine.

(5) Remove throttle body air inlet hose and air cleaner housing assembly.

(6) Raise vehicle on hoist.

(7) Remove both front wheels.

(8) Remove left and right splash shields.

(9) Remove fasteners attaching lower front fascia to crossmember.

(10) Remove fasteners attaching lower air shield to crossmember.

(11) Remove front bumper fascia.

(12) Lower vehicle.

(13) Remove upper radiator crossmember.

(14) Disconnect upper and lower radiator hoses at radiator.

(15) Using a blade or suitable hose cutter, cut transaxle oil cooler lines off flush with fittings. Plug lines and fittings to prevent debris from entering transaxle or cooler circuit. A service splice kit will be installed upon reassembly.

(16) Disconnect A/C lines at condenser. Remove cooling module (fan, radiator, A/C condenser).

(17) Disconnect transmission electrical harness connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).

(18) Disconnect transmission shift cable.

(19) Disconnect engine electrical harness from PCM and bulkhead connectors.

(20) Remove fasteners attaching ABS brake module to lower radiator crossmember. Support module with a suitable retaining strap.

(21) Disconnect brake line from retaining clips that attach to lower radiator crossmember.

(22) Raise vehicle.

(23) Remove both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).

(24) Remove front engine mount through bolt. Remove front engine mount from lower radiator crossmember.

(25) Remove lower radiator crossmember.

(26) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(27) Remove power steering pump and bracket as an assembly. **Do not** disconnect power steering lines from pump. Reposition pump and support with suitable retaining strap.

(28) Disconnect heater return hose from pipe connection at right front frame rail area.

(29) Disconnect A/C compressor electrical connector.

(30) Remove A/C compressor mounting bolts. Reposition A/C compressor and support with suitable retaining strap. Generator can be removed with engine assembly.

(31) Remove structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

(32) Remove the exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - REMOVAL).

(33) Remove rear engine mount and transaxle bracket.

(34) Drain engine oil.

(35) Remove transaxle torque converter housing cover.

ENGINE 2.7L DOHC (Continued)

(36) Mark flex plate to torque converter position. Remove torque converter bolts.

(37) Lower vehicle.

(38) Disconnect positive cable from battery and PDC.

(39) Disconnect ground cable from left side transaxle mount bracket.

(40) Disconnect throttle and speed control cables.

(41) Disconnect coolant pressure bottle coolant hose from engine coolant outlet connector.

(42) Disconnect heater hose from engine coolant outlet connector.

(43) Disconnect ground strap at right shock tower.

(44) Disconnect fuel line.

(45) Disconnect brake booster and vapor purge vacuum hoses.

(46) Disconnect all ground straps attaching to engine.

(47) Position vehicle height to allow engine dolly 6135 and cradle 6710 with posts 6848 to be installed under vehicle.

(48) Loosen cradle engine mounts to allow movement for positioning onto engine locating holes on the engine block, compressor mount bracket and oil pan rail. Lower vehicle and position cradle until the engine is resting on posts (Fig. 6). Tighten post mounts to cradle frame to prevent movement when removing or installing engine/transaxle assembly. Secure engine/transaxle assembly to dolly/cradle with safety straps.

(49) Lower vehicle so weight of the engine and transmission ONLY is on the cradle.

(50) Remove right and left side engine mount bolts.

(51) Slowly raise vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for removal clearance.

INSTALLATION - ENGINE ASSEMBLY

(1) Position engine/transaxle assembly under vehicle and slowly lower vehicle in short length spans. Inspect at each interval for potential engine or transaxle contact to vehicle components. Move the cradle/dolly fixture as necessary to allow for installation clearance (Fig. 6).

(2) Continue lowering vehicle until right side engine mount and left side transaxle mount align to their mounting locations. Install mounting bolts and torque to 61 N·m (45 ft. lbs.).

(3) Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.

(4) Reattach all ground straps to engine.

(5) Connect brake booster and vapor purge vacuum hoses.

(6) Connect fuel line.

(7) Connect ground strap to right shock tower.

(8) Connect heater hose to coolant outlet connector.

(9) Connect coolant pressure bottle coolant hose to coolant outlet connector.

(10) Connect throttle and speed control cables.

(11) Connect ground cable to left side transaxle mount bracket.

(12) Connect positive cable to battery and PDC.

(13) Raise vehicle.

(14) Install torque converter bolts.

(15) Install torque converter housing cover.

(16) Install rear engine mount and transaxle bracket.

(17) Install exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - INSTALLATION).

(18) Install structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(19) Install A/C compressor to bracket.

(20) Connect A/C compressor clutch electrical connector.

(21) Connect heater return hose to pipe connection at right front frame rail area.

(22) Install power steering pump and bracket assembly.

ENGINE 2.7L DOHC (Continued)

(23) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(24) Install lower radiator crossmember.

(25) Install front engine mount to lower radiator crossmember. Install front engine mount through bolt.

(26) Install both axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).

(27) Lower vehicle.

(28) Connect brake line to retaining clips that attach to lower radiator crossmember.

(29) Install fasteners attaching ABS module to lower radiator crossmember.

(30) Connect engine electrical harness to PCM and bulkhead connectors.

(31) Connect transmission shift cable.

(32) Connect transmission electrical harness connectors (C104 & C105) (Refer to 8 - ELECTRICAL/CONNECTOR/GROUND LOCATIONS - DESCRIPTION).

(33) Install cooling module (fan, radiator, A/C condenser). Connect A/C lines to condenser.

(34) Connect transmission oil cooler lines using service splice kit. Refer to instructions provided with kit.

(35) Connect upper and lower radiator hoses to radiator.

(36) Install upper radiator crossmember.

(37) Raise vehicle.

(38) Ensure oil pan drain plug is tight. Install new oil filter.

(39) Install front bumper fascia and lower air shield to lower radiator crossmember.

(40) Install left and right splash shields.

(41) Install both front wheels.

(42) Lower vehicle.

(43) Install throttle body air inlet hose and air cleaner housing assembly.

(44) Fill engine crankcase with proper oil to correct level.

(45) Evacuate and recharge Air Conditioning system (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).

(46) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(47) Connect negative battery cable.

(48) Start engine and run until operating temperature is reached.

CYLINDER HEAD

DESCRIPTION

The cylinder heads are made of an aluminum alloy (Fig. 15). The cylinder head features four valves per cylinder with pressed in powdered metal valve guides. The cylinder heads provide enclosures for the timing chain drive, necessitating a unique right and left cylinder head.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

(1) Perform fuel pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative cable from remote jumper terminal.

(3) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(4) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(5) Remove the vibration dampner (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(6) Remove exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - REMOVAL).

(11) Rotate crankshaft until crankshaft sprocket timing mark aligns with timing mark on oil pump housing.

(12) Remove primary timing chain. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(13) Remove camshaft bearing caps **gradually** in REVERSE sequence of installation (10–1) (Fig. 17).

(14) Remove camshafts and valvetrain components from cylinder head (Fig. 18). Note component locations for re-installation in original locations.

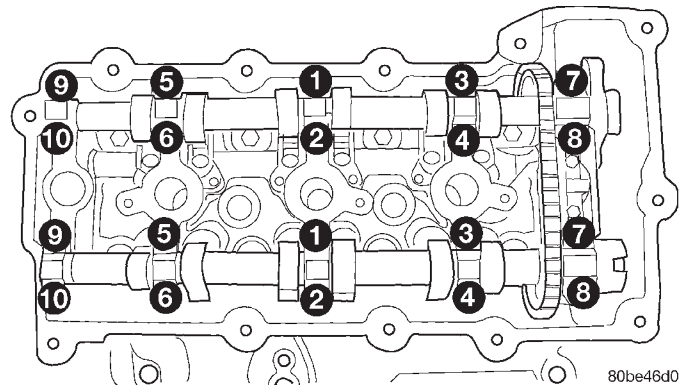

Fig. 17 CAMSHAFT BEARING CAPS

CAUTION: Ensure cylinder head bolts 11–9 (Fig. 19) are removed before attempting the removal of cylinder head, as damage to cylinder head and/or block may occur.

(15) Remove cylinder head bolts in reverse sequence of installation (Fig. 19) starting with bolts 11–9, then bolts 8–1.

(16) Remove cylinder head(s).

(17) Remove and discard cylinder head gasket.

(18) Clean cylinder head and block sealing surfaces. (Refer to 9 - ENGINE/CYLINDER HEAD - CLEANING)

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

(1) Before cleaning, check for leaks, damage and cracks.

(2) Clean cylinder head and oil passages.

(3) Check cylinder head for flatness (Fig. 20).

(4) Cylinder head must be flat within:

- Standard dimension = less than 0.05 mm (0.002 inch.)
- Service Limit = 0.2 mm (0.008 inch.)
- Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

INSTALLATION

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced (Fig. 21)

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt must be replaced (Fig. 21)

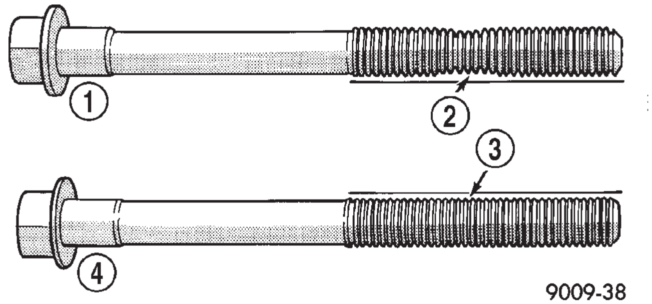

Fig. 21 Check for Stretched Bolts

1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE

CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.

(1) Clean sealing surfaces of cylinder head and block. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

(2) Install new head gasket over locating dowels.

(3) Install cylinder head to block, assuring head is properly positioned over locating dowels.

(4) Lubricate bolt threads with clean engine oil and install bolts.

(5) Tighten bolts in sequence shown in (Fig. 22), using the following steps and torque values:

- Step 1: Bolts 1–8 to 48 N·m (35 ft. lbs.)
- Step 2: Bolts 1–8 to 75 N·m (55 ft. lbs.)
- Step 3: Bolts 1–8 to 75 N·m (55 ft. lbs.)
- Step 4: Bolts 1–8 to +90° Turn **Do not use a torque wrench for this step.**
- Step 5: Bolts 9–11 to 28 N·m (250 in. lbs.)

(6) Install all valvetrain components and camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION) Tighten camshaft bearing caps in sequence shown in (Fig. 23) to 12 N·m (105 in. lbs.).

CAMSHAFT(S)

DESCRIPTION

The assembled fabricated camshafts are composed of five bearing journals machined into a hollow steel tube (Fig. 24). Six steel lobes, a secondary timing drive sprocket, and a primary sprocket/thrust flange are pressed onto the camshaft tube using a unique assembly process. Camshaft end play is controlled by the primary camshaft sprocket attachment flange on the intake camshafts and by a thrust flange on the exhaust camshafts.

OPERATION

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

REMOVAL

(1) Remove the primary timing chain. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(2) Remove secondary chain tensioner mounting bolts.

NOTE: Camshaft bearing caps have been marked during engine manufacturing. For example, number one exhaust camshaft bearing is marked “1E>”

(3) Slowly loosen camshaft bearing cap bolts in reverse order of installation (Fig. 25).

(4) Remove camshaft bearing caps.

(7) Inspect camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSPECTION)

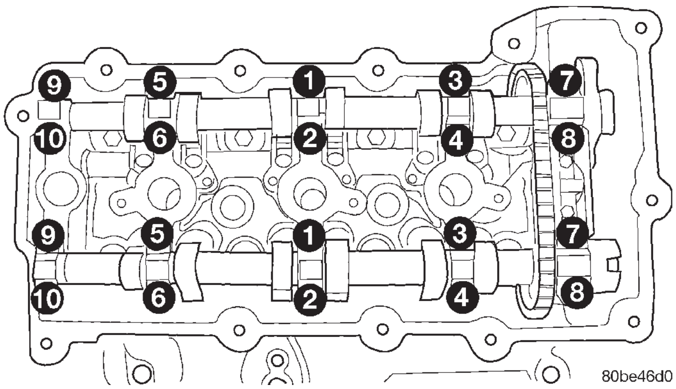

Fig. 25 Camshaft Bearing Cap Tightening Sequence

INSPECTION

(1) Inspect camshaft bearing journals for damage and binding (Fig. 26). If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

(2) Inspect camshaft sprockets for excessive wear. Replace camshafts if necessary.

(3) Check the cam lobe surfaces for abnormal wear and damage. Replace camshaft if defective. Measure the actual wear (Fig. 26)and replace, if out of limits—standard value is 0.0254 mm (0.001 in.); wear **limit** is 0.254 mm (0.010 in.).

INSTALLATION

CAUTION: When the timing chain is removed and the cylinder heads are installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

(1) Assemble camshaft chain on the cams. Ensure that plated links are facing toward the front. Align the plated links to the dot on the camshaft sprockets (Fig. 28).

(2) If camshaft chain tensioner is already in the compressed and locked position, proceed to step (4).

(3) When the camshaft chain tensioner is removed, it is necessary to compress and lock the tensioner using the following procedures:

(a) Place tensioner into a soft jaw vise (Fig. 27).

(b) SLOWLY compress tensioner until fabricated lock pin or the equivalent can be inserted into the locking holes.

(c) Remove compressed and locked tensioner from the vise.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel, and have chrome plated stems to prevent scuffing (Fig. 15). The four valves per cylinder (two intake and two exhaust) are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers to retain springs and to promote valve rotation.

OPERATION

The intake valve allows the air/fuel mixture to enter the combustion chamber. The exhaust valve allows the burned air/fuel mixture to exit the combustion chamber. Also, the intake and exhaust valves seal the combustion chamber during the compression and power strokes.

STANDARD PROCEDURE - VALVE AND VALVE SEAT REFACING

The intake and exhaust valves have a 44.5 to 45 degree face angle. The valve seats have a 45 to 45.5 degree face angle. The valve face and valve seat angles are shown in (Fig. 33).

VALVES

Inspect the remaining margin after the valves are refaced. (Refer to 9 - ENGINE - SPECIFICATIONS)

VALVE SEATS

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.

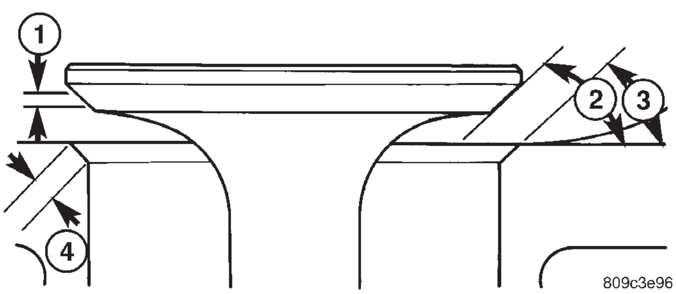

Fig. 33 Valve Face and Seat

1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY**with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to top edge of valve face, then lower valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of valve face, then raise valve seat with a 65 degree stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise cylinder head must be replaced.

(4) When seat is properly positioned the width of the intake 1.00 to 1.50 mm (0.0394 to 0.0591 in.) and exhaust seats should be 1.25 to 1.75 mm (0.049 to 0.069 in.) (Fig. 33).

(5) Check the valve spring installed height after refacing the valve and seat (Fig. 34).

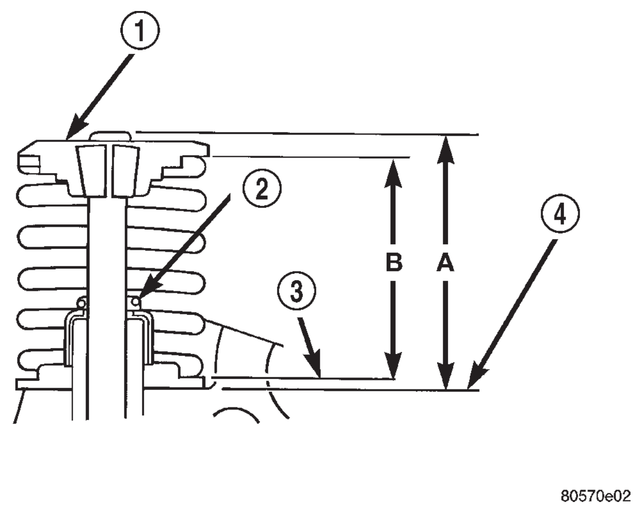

Fig. 34 Checking Valve Tip Height and Valve

1 - SPRING RETAINER
2 - GARTER SPRING
3 - VALVE SPRING SEAT TOP
4 - CYLINDER HEAD SURFACE

VALVE AND SPRING INSTALLED HEIGHT

(1) Coat valve stems with clean engine oil and insert them in cylinder head.

(2) If valves or seats have been refaced, check valve tip height (A) (Fig. 34). If valve tip height for intake valve is greater than 47.59 (1.8737 in.) or 49.14 (1.9347 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(3) Install valve seal/spring seat assembly over valve guides on all valve stems (Fig. 35). Ensure that the garter spring is intact around the top of the rubber seal.

(4) Position valve springs and retainer on spring seat (Fig. 35).

(5) Compress valve spring with a valve spring compressor.

(6) Install retainer locks and release tool.

(7) If valves and/or seats are refaced, measure the installed height of springs (B) (Fig. 34). Measurement is taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

REMOVAL

(1) Remove cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL)

(2) Remove valve spring. (Refer to 9 - ENGINE/ CYLINDER HEAD/VALVE SPRINGS - REMOVAL)

(3) Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.**

(4) Remove valve. Identify each valve to ensure installation in original location.

INSPECTION

VALVES

(1) Clean and inspect valves thoroughly. Replace burned, warped and cracked valves.

(2) Measure valve stems for wear (Fig. 36). For valve specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Valve stems are chrome plated and should not be polished (Fig. 36).

VALVE GUIDES

(1) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(2) Measure valve stem-to-guide clearance as follows:

(3) Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.

(4) Attach dial indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 37).

(5) Move valve to and from the indicator. For clerance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

NOTE: Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.

INSTALLATION

(1) Coat valve stems with clean engine oil and insert them in cylinder head.

(2) If valves or seats have been reground, check valve tip height (A) (Fig. 38). If valve tip height for intake valve is greater than 47.59 mm (1.8737 in.) or 49.14 mm (1.9347 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

(3) Install valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength, chrome-silicon steel (Fig. 15). The springs are common for intake and exhaust applications. The valve spring seat is integral with the valve stem seal, which incorporates a garter spring to maintain consistent lubrication control to the valve stem.

OPERATION

The valve spring returns the valve against its seat for a positive seal of the combustion chamber.

REMOVAL

REMOVAL - IN VEHICLE

(1) Perform fuel system pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Disconnect negative cable from remote jumper terminal.

(3) Remove air cleaner housing and inlet hose.

(4) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(5) Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(6) Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL), timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL), and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(7) Remove camshafts and rocker arms. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL)

(8) With air hose attached to spark plug adapter installed in the cylinder being serviced, apply 620.5–689 kPa (90–100 psi) air pressure. This is to hold valves in place while servicing components.

(9) Using Special Tool MD 998772A with adapter 6779, compress valve spring and remove valve locks, retainer, and valve spring.

(10) Remove valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL).

INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested (Fig. 40). **As an example;** the compression length of a spring to be tested is 38.00 mm (1.496 in.). Turn the table of Tool C-647 until surface is in line with the 38.00 mm (1.496 in.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace any springs that do not meet specifications.

INSTALLATION

INSTALLATION - IN VEHICLE

(1) The valve stem seal/valve spring seat should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install locks

(2) Follow the same procedure on the remaining cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston is at TDC on the cylinder that the valve spring is to be removed.**

(3) Remove spark plug adapter tool and Special Tool MD 998772A.

(4) Install rocker arm(s).

(5) Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION), timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION), and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(6) Install cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(7) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

(8) Install air cleaner housing and inlet hose.

(9) Connect negative cable.

INSTALLATION - OFF VEHICLE

(1) If removed, install valve(s). (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - INSTALLATION)

(2) If valves or seats have been reground, check valve tip height (A) (Fig. 41). If valve tip height for intake valve is greater than 47.59 mm (1.8737 in.) or 49.14 mm (1.9347 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

(3) Install valve seal/spring seat assembly over valve guides on all valve stems (Fig. 42). Ensure that the garter spring is intact around the top of the rubber seal. Install valve springs, valve retainers.

VALVE SPRINGS (Continued)

(4) Compress valve springs with a valve spring compressor install locks and release tool. **If valves and/or seats are reground, measure the installed height of springs (B) (Fig. 41), make sure measurements are taken from top of spring seat to the bottom surface of spring retainer.** If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

VALVE STEM SEALS

REMOVAL

(1) Remove valve spring. (Refer to 9 - ENGINE/ CYLINDER HEAD/VALVE SPRINGS - REMOVAL)

(2) Remove valve stem seal by using a valve seal tool (Fig. 43).

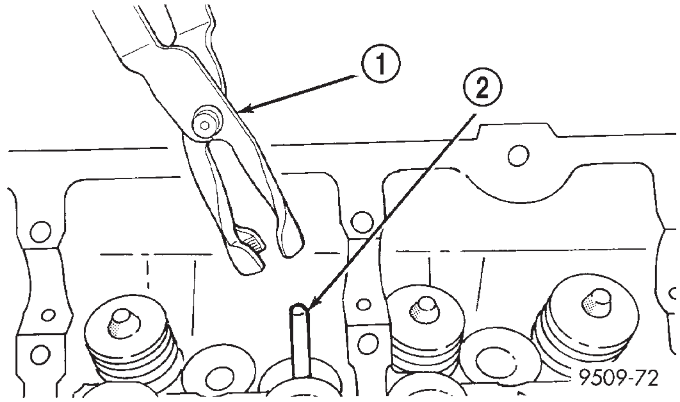

Fig. 43 Valve Stem Seal—Removal

1 - VALVE SEAL TOOL
2 - VALVE STEM

INSTALLATION

(1) The valve stem seal/valve spring seat should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide.

(2) Install valve spring. (Refer to 9 - ENGINE/ CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

HYDRAULIC LASH ADJUSTERS

DIAGNOSIS AND TESTING - HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of a NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to LASH ADJUSTER (TAPPET) NOISE CHART indicating possible lash adjuster (tappet) noise sources and possible sources that could lead to a misdiagnosis.

Refer to LASH ADJUSTER (TAPPET) NOISE CHART for possible causes and correction of a lash adjuster (tappet) type noise.

HYDRAULIC LASH ADJUSTERS (Continued)

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level—too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct engine oil level.
2. Insufficient running time after rebuilding cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in lash adjuster (after 1 hour run time).	3. See below: (a) Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If lash adjuster(s) are still spongy, replace with new adjuster/rocker arm assembly.
4. Low oil pressure	4. See below: (a) Check and correct engine oil level. (b) Check engine oil pressure. (c) Check for excessive bearing clearance and correct. (d) Check for worn oil pump.
5. Oil passage to cylinder head(s) plugged with debris.	5. Check cylinder head oil passages and cylinder head gasket restrictor for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Ream guide(s) and replace valve(s) with oversize valves and seal(s).
7. Air injested into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris injestion.	8. Clean debris from engine and replace lash adjuster(s).

REMOVAL

(1) Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Remove rocker arm(s). (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

CAUTION: If lash adjusters and rocker arms are to be reused, always mark position for reassembly in their original positions.

(3) Remove lash adjuster(s).

INSTALLATION

(1) Install hydraulic lash adjuster making sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

(2) Install rocker arm(s) (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION) and cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ROCKER ARMS

DESCRIPTION

The rocker arms are composed of steel stampings with an integral roller bearing (Fig. 44). The rocker arms incorporate a 0.5 mm (0.0197 in.) oil hole in the lash adjuster socket for roller/camshaft lobe lubrication (Fig. 44).

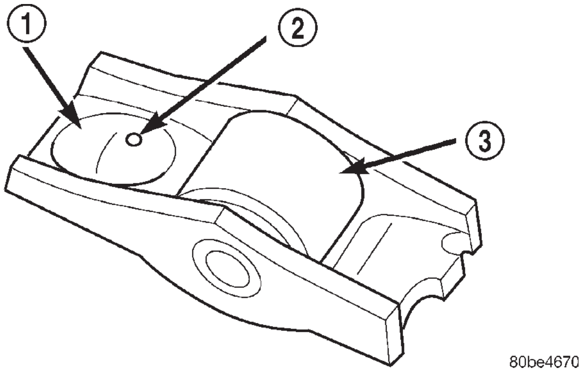

Fig. 44 Rocker Arm

1 – LASH ADJUSTER POCKET
2 – OIL SQUIRT HOLE
3 – ROLLER

OPERATION

The rocker arm is the pivot point between the camshaft lobe and the valve.

REMOVAL

(1) Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

CAUTION: Always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

(2) Rotate engine until the cam lobe is on its base circle (heel), on the rocker arm being removed.

CAUTION: Depress valve spring only enough to remove rocker arm.

(3) Using Special Tools 8215-A and 8216-A Adaptor, depress valve spring only enough to release tension on rocker arm (Fig. 45).

(4) Remove rocker arm from cylinder head.

CAUTION: If rocker arms are to be reused, identify position of rocker arms for reassembly in their original positions.

(5) Repeat procedure for each rocker arm removed.

(6) Inspect the rocker arm for wear or damage. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSPECTION)

INSTALLATION

(1) Lubricate rocker arms with clean engine oil before installation.

ROCKER ARMS (Continued)

(2) Rotate engine until cam lobe is on its base circle (heel) of rocker arm being installed.

(3) Using Special Tools 8215-A and 8216-A Adaptor, depress valve spring only enough to install rocker arm (Fig. 45).

(4) Install rocker arm in original position (if reused) over valve and lash adjuster. Release tension on valve spring.

NOTE: Inspect rocker arm for proper engagement into lash adjuster and valve tip.

(5) Repeat procedure for each rocker arm being installed.

(6) Install cylinder head cover(s). Refer to procedure in this section.

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of heat treated aluminum with cast-in-place iron liners (Fig. 47). The block is a closed deck design with the right bank forward. To provide high rigidity and improved NVH, the block has cast-in contours and ribs, along with powdered metal 6 bolt main caps (4 vertical, 2 horizontal), with a die cast aluminum structural beam windage tray mounted to the main caps.

The block design allows coolant flow between the cylinder bores and an internal coolant by-pass to the thermostat.

STANDARD PROCEDURE - CYLINDER BORE HONING

(1) Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

(2) Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

(3) Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 40-60 degrees, the cross hatch angle is most satisfactory for proper seating of rings (Fig. 48).

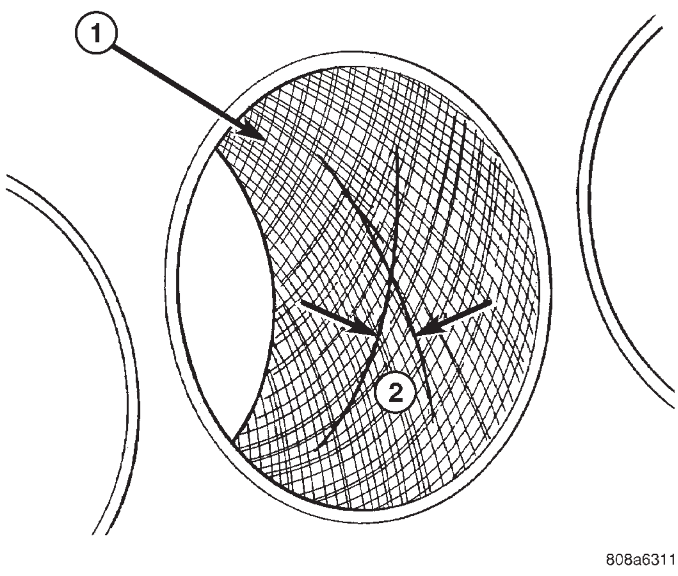

Fig. 48 Cylinder Bore Cross-Hatch Pattern

1 - CROSS-HATCH PATTERN
2 - 40°–60°

(4) A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

ENGINE BLOCK

(1) Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

(2) If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).

(3) Examine block and cylinder bores for cracks or fractures.

(4) Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Fig. 49) (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B (Fig. 49). Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

ENGINE BLOCK (Continued)

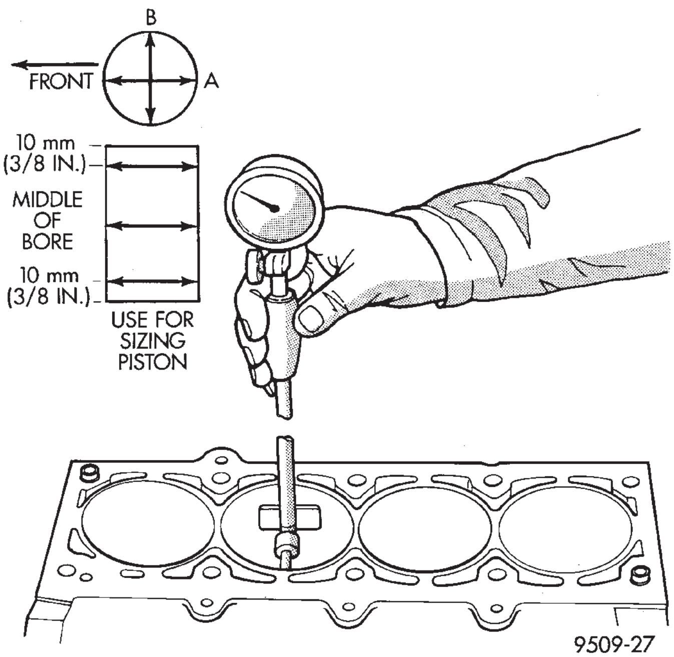

Fig. 49 Checking Cylinder Bore Size

CONNECTING ROD BEARINGS

STANDARD PROCEDURE - CONNECTING ROD AND BEARING FITTING

CONNECTING ROD BEARING

Fit all connecting rods on one bank until complete. The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces as engine damage may occur.

The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Also, assure that the hole in upper bearing half aligns with oil squirt hole in rod. Install cap with the tangs on the same side as the rod.

CAUTION: Assure that hole in upper bearing half aligns with hole in connecting rod as engine damage may occur.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.015 mm (0.0006 in.). Bearings are available 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.) undersize. **Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.**

(1) For measuring Main Bearing Clearance and Connecting Rod Bearing Clearance use plastigage (Fig. 50). For more information on using plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for bearing clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

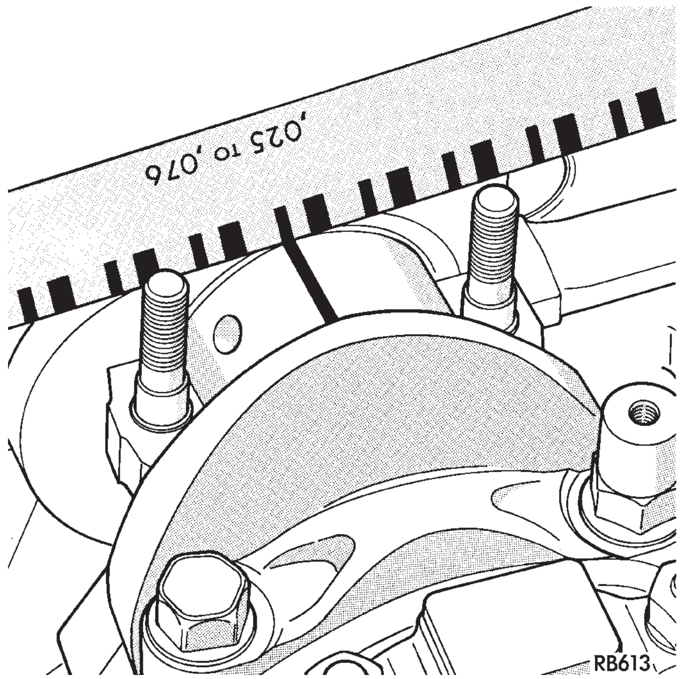

Fig. 50 Checking Connecting Rod Bearing Clearance—Typical

CONNECTING ROD BOLTS

NOTE: The connecting rod bearing cap bolts must be examined before reuse. If the threads are necked down due to stretching, the bolt(s) must be replaced (Fig. 51).

NOTE: Connecting rod bolts are retained in the rod cap with a light press fit. If bolts are to be removed, use a hammer and punch to drive bolts from connecting rod cap using care not to damage fractured cap surface.

(1) Examine connecting rod bolt for stretching. Stretching can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt should be replaced.

(2) Before installing the bolts, lubricate the threads with engine oil.

(3) Install bolts finger tight. Then alternately torque each nut to assemble the cap properly.

(4) Tighten the nuts to specification. (Refer to 9 - ENGINE - SPECIFICATIONS)

CONNECTING ROD SIDE CLEARANCE

(1) Mount a dial indicator to a stationary point on engine. Locate probe perpendicular to and resting against the connecting rod cap being checked. Move connecting rod all the way to rear of its travel. Zero the dial indicator. Move connecting rod forward to limit of travel and read the dial indicator (Fig. 52). Compare measurement to specification listed in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Repeat procedure for each connecting rod. Turn crankshaft for connecting rod accessibility.

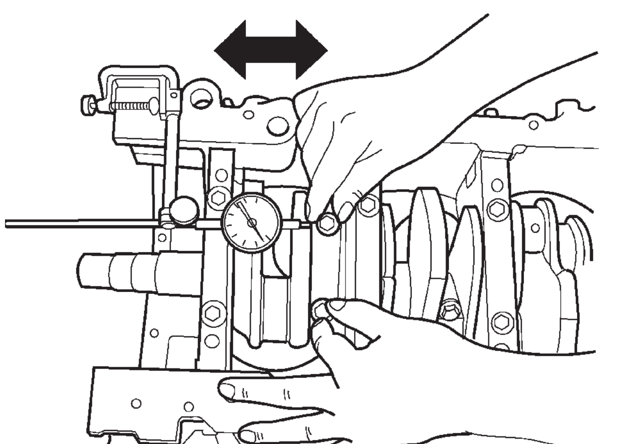

Fig. 52 Connecting Rod Side Clearance Measuring

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of a forged micro alloy steel. The six throw, nine counterweight crankshaft is supported by four select fit main bearings with the number three serving as the thrust washer location (Fig. 47). The select fit identification markings will be on the rear side of the number nine (rearmost) counterweight. The six separate connecting rod throws are an even-firing design which reduces torque fluctuations while a vibration damper is used to control torsional vibration.

The crankshaft oil seals are a one piece design. The front seal is retained by the timing chain cover, and the rear seal in a housing that attaches to the cylinder block.

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

STANDARD PROCEDURE - CRANKSHAFT END PLAY

(1) Mount a dial indicator to a stationary point at front of engine. Locate the probe perpendicular against nose of crankshaft (Fig. 53).

(2) Move crankshaft all the way to the rear of its travel.

(3) Zero the dial indicator.

(4) Move crankshaft all the way to the front and read the dial indicator. For crankshaft end play clearances (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

(1) Remove engine from vehicle (Refer to 9 - ENGINE - REMOVAL).

(2) Mount engine on an engine stand.

(3) Drain engine oil and remove oil filter.

(4) Remove oil pan and oil pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(5) Remove idler pulley bracket for accessory drive belt.

(6) Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(7) Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(8) Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

(9) Remove primary timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - REMOVAL).

(10) Remove crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - REMOVAL).

(11) Remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

(12) Remove crankshaft rear oil seal retainer (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL).

(13) Remove structural windage tray (Fig. 54).

(14) Turn crankshaft until connecting rod cap to be removed is accessible.

NOTE: Connecting rod bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(15) Mark connecting rod bearing cap positions using a permanent ink marker or scribe tool.

(16) Remove connecting rod bearing caps. Use care to prevent damage to the crankshaft bearing surfaces.

CAUTION: Care should be taken not to damage the fractured rod and cap joint face surfaces or damage to the engine may occur.

(17) Remove main bearing cap bolts and tie bolts (Fig. 55).

(18) Remove main bearing caps (Fig. 55).

CAUTION: When removing crankshaft, use care not to damage bearing surfaces on the crankshaft

INSTALLATION

NOTE: Upper and lower bearing halves are NOT interchangeable.

CAUTION: Main bearings are select fit (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE).

(1) Lubricate upper main bearing halves with engine oil (Fig. 57).

CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

(2) Install crankshaft (Fig. 56).

NOTE: Make sure that the coated and oil groove side of crankshaft thrust washer faces the crankshaft thrust surface.

(6) Install main bearings and caps.

NOTE: Lubricate main bearing cap bolts with engine oil before installation.

The main bearing cap bolts must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, and lastly the main cap tie (horizontal) bolts.

(7) Install the inside main bearing cap bolts and tighten to 20 N·m + 1/4 Turn (15 ft. lbs. + 1/4 Turn) (Fig. 55).

(8) Measure crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(9) Install connecting rods and measure side clearance (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

(10) Install windage tray (Fig. 54). Lubricate bolts with engine oil and tighten to 27 N·m + 1/4 Turn (20 ft. lbs. + 1/4 turn).

(11) Install the main cap tie (horizontal) bolts and tighten to 28 N·m (250 in. lbs.) (Fig. 55).

(12) Install rear crankshaft oil seal retainer and oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION) (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).

(13) Install oil pump assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).

(14) Install crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).

(15) Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).

(16) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).

(17) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(18) Install idler pulley bracket for accessory drive belt.

(19) Install oil pick-up tube and O-ring.

(20) Install oil pan and oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(21) Install oil dipstick tube.

(22) Install engine assembly (Refer to 9 - ENGINE - INSTALLATION).

(23) Fill engine crankcase with proper oil to correct level (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING FITTING

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the block and crankshaft have grade identification marks.

The grade marks for the cylinder block main bearing bore grade is located on the pan rail just below the left side engine mount bracket (Fig. 60). These marks are read left to right, corresponding to main bore 1, 2, 3, 4.

The grade marks for the crankshaft are located on the rearmost crankshaft counter weight as shown in (Fig. 59). The crankshaft journal grade marks are read left to right, corresponding with journal number 1, 2, 3, 4.

Refer to the MAIN BEARING SELECTION CHART—2.7L to properly select the main bearings. For an example, if the main bore grade is 3 and the journal grade is 2, the proper select fit bearing would be (2) +0.003 mm (+0.0002 in.).

CRANKSHAFT MAIN BEARINGS (Continued)

NOTE: Service main bearings have a number from 1–5 marked in ink on the bearing surface (Fig. 61). For verification, use the MAIN BEARING SELECTION CHART—2.7L for number to size identification.

The upper main bearing has a oil feed hole and a center groove to allow lubrication of the main journal and must be properly positioned in the block.

NOTE: Although cylinder bores are graded for size, there is only one piston size.

(2) Remove drive plate.

(3) Insert a 3/16” wide flat bladed screwdriver between the dust lip and the metal case of the crankshaft seal. Angle the screwdriver (Fig. 64) through the dust lip against the metal case of the seal. Pry out seal.

CAUTION: Do not allow the screwdriver blade to contact the crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

INSTALLATION

CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), clean surface using 400 grit sand paper to prevent seal damage during installation.

(1) Place Special Tool 6926-1 Guide on crankshaft (Fig. 65). This is a pilot tool with a magnetic base.

(2) Position seal over pilot tool. Assure that lip of seal is facing towards the crankshaft during installation. The pilot tool remains on crankshaft during seal installation.

(3) Using Special Tool 6926-2 Installer, and C-4171 Handle (Fig. 65), drive seal into the retainer housing until seal is flush with housing surface.

PISTON & CONNECTING ROD

DESCRIPTION

The pistons are made of a high strength aluminum alloy with an anodized top ring groove. Piston skirts are coated with a solid lubricant for scuff resistance. The connecting rods are made of powdered metal with a "fractured cap" design. The connecting rod attaches to the piston with a full floating pin retained by lock rings. The piston and connecting rod are serviced as an assembly (Fig. 68).

OPERATION

The piston and connecting rod is the link between the combustion force to the crankshaft.

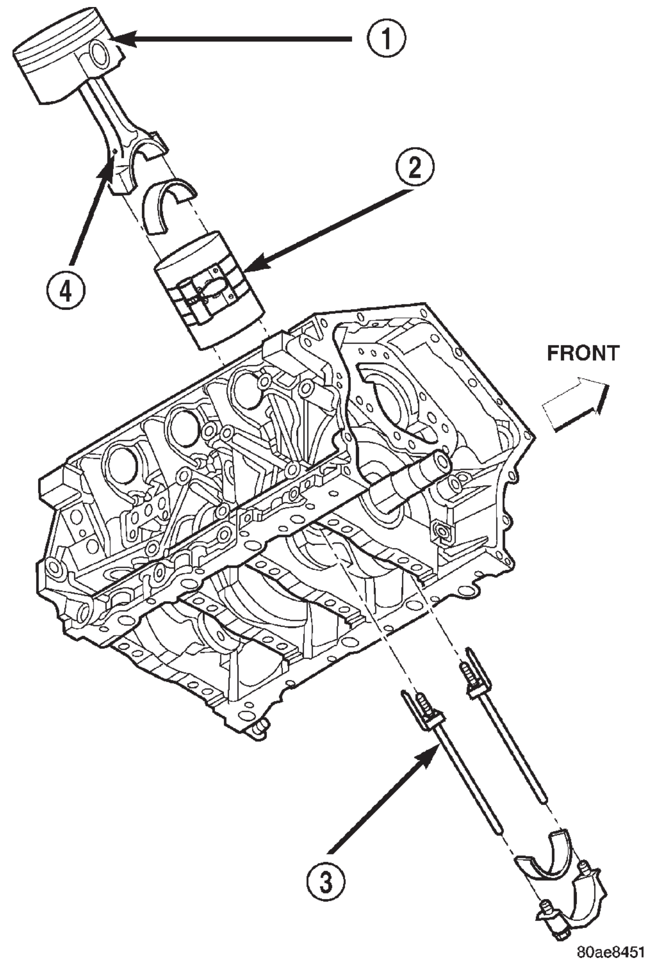

Fig. 68 Piston and Connecting Rod

1 - "F" TOWARD FRONT OF ENGINE
2 - RING COMPRESSOR
3 - SPECIAL TOOL 8189
4 - OIL SQUIRT HOLE

STANDARD PROCEDURE - FITTING PISTONS

The pistons have been cast and machined to one size and weight. The piston and rod assemblies are matched to weigh the same for engine balance.

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin at size location shown in (Fig. 69). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line. Refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS) **Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).**

PISTON PINS

The pistons have been cast and machined to one size and weight. The piston and rod assemblies are matched to weigh the same for engine balance.

PISTON & CONNECTING ROD (Continued)

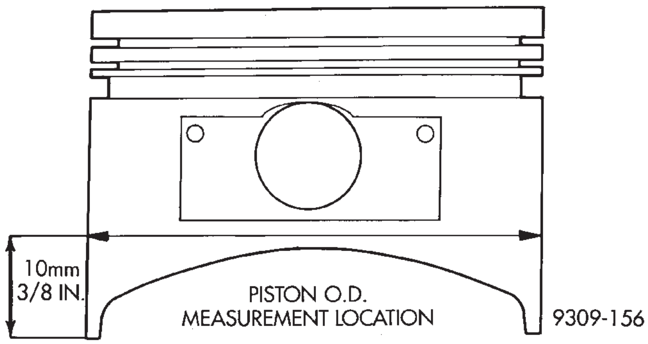

Fig. 69 Piston Measurements

The piston pin is full floating and is held in place by lock rings. **Do Not switch pistons with other rods**. Pistons and connecting rods are serviced as an assembly for balance.

REMOVAL

(1) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

NOTE: Connecting rod bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

(2) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool (Fig. 70).

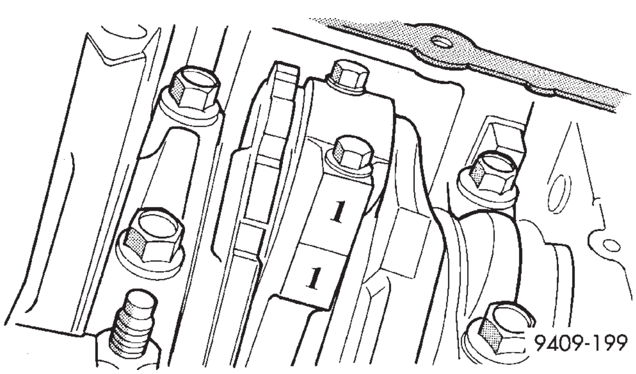

Fig. 70 IDENTIFY CONNECTING ROD TO CYLINDER

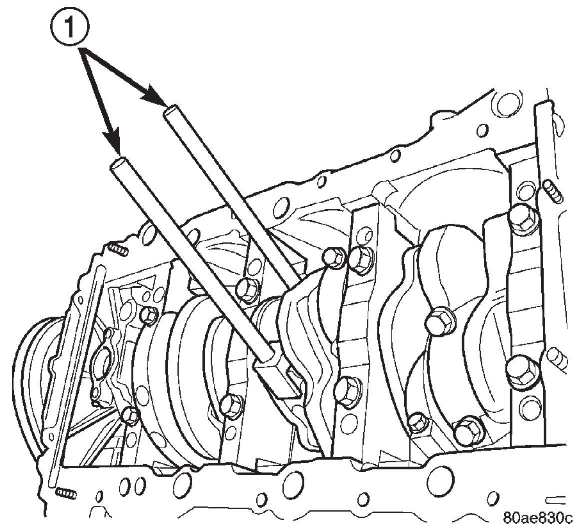

Fig. 71 CONNECTING ROD GUIDES

1 - SPECIAL TOOL 8189 CONNECTING ROD GUIDES

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

(3) Remove connecting rod cap. Install Special Tool 8189 Connecting Rod Guides into the connecting rod being removed (Fig. 71). Remove each piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(4) After removal, install bearing cap on the mating rod to prevent damage to the fractured cap to rod surfaces.

INSTALLATION

(1) Install the piston rings. (Refer to 9 - ENGINE/ ENGINE BLOCK/PISTON RINGS - INSTALLATION)

(2) Before installing piston and connecting rod assemblies into the bore, ensure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(3) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 79).

(4) Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston and tighten with the special wrench. **Ensure position of rings does not change during this operation.**

CAUTION: Ensure the hole in bearing half aligns with hole in connecting rod, as damage to engine may occur.

(5) Position bearing onto connecting rod. Ensure that hole in bearing half is aligned to hole in connecting rod. Lubricate bearing surface with clean engine oil.

(6) Install Special Tools 8189 Connecting Rod Guides into connecting rod (Fig. 71).

(7) The pistons are marked on top with an arrow and with an “F” (Front) above the pin boss. These marks must be pointing toward the front of engine on both cylinder banks. The connecting rod oil squirt hole faces the major thrust (right) side of the block (Fig. 73).

(8) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal (Fig. 72).

CAUTION: Do Not interchange piston assemblies bank to bank, as engine damage may occur.

(9) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(10) Lubricate rod bolts and bearing surface with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) Plus 1/4 turn.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch.) from bottom of cylinder bore. Check gap with feeler gauge (Fig. 74). Refer to (Refer to 9 - ENGINE - SPECIFICATIONS) for clearance measurements.

(2) Check piston ring to groove clearance (Fig. 75). For clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

PISTON RINGS (Continued)

REMOVAL

(1) Remove piston and connecting rod. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL)

(2) Remove No. 1 and No.2 piston rings (Fig. 77) from piston using a ring expander tool (Fig. 78).

(3) Remove upper oil ring side rail (Fig. 77).

(4) Remove lower oil ring side rail (Fig. 77).

(5) Remove oil ring expander (Fig. 77).

INSTALLATION

(1) Measure clearance of piston rings to the cylinder bore and piston. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE)

CAUTION: Install piston rings in the following order:

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(2) Install oil ring expander.

Install the side rail by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander during this step (Fig. 76).**

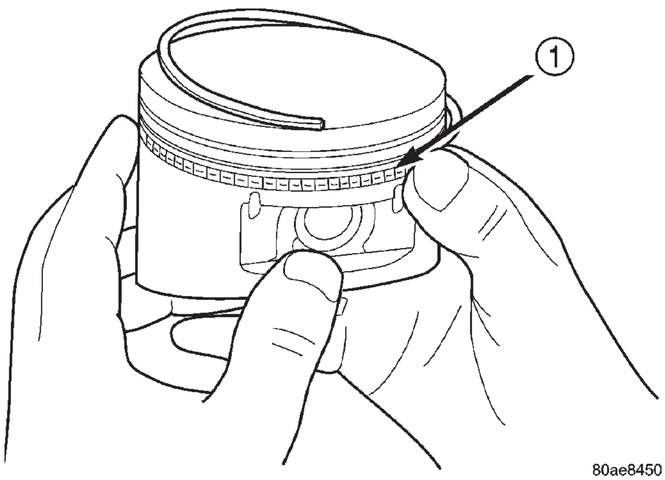

Fig. 76 SIDE RAIL - INSTALLATION

1 - SIDE RAIL END

(3) Install upper side rail first and then the lower side rail.

NOTE: The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston (Fig. 77)

(4) Install No. 2 piston ring and then No. 1 piston ring (Fig. 78).

(5) Position piston ring end gaps as shown in (Fig. 79).

(6) Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative battery cable.

(2) Raise vehicle on hoist.

(3) Remove right front wheel and belt splash shield.

INSTALLATION

(1) Install damper using Special Tools 8179 Screw, with Nut and Thrust Bearing from 6792, and 6792-1 Installer (Fig. 81).

(2) Install damper center bolt. Tighten center bolt to 170 N·m (125 ft. lbs.).

(3) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(4) Install belt splash shield and right front wheel.

(5) Lower vehicle.

(6) Connect negative battery cable.

STRUCTURAL COLLAR

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove bolts attaching structural collar to oil pan and transmission housing (Fig. 82).

(3) Remove collar (Fig. 82).

INSTALLATION

CAUTION: The collar must be tightened using this service procedure, as damage to transaxle case and/or oil pan may occur.

(1) Position structural collar (Fig. 82) on oil pan and transaxle.

(2) Loosely install all bolts.

(3) Tighten the collar to oil pan bolts to 55 N·m (40 ft. lbs.).

(4) Tighten collar to transaxle bolts to 55 N·m (40 ft. lbs.).

(5) Lower vehicle.

ENGINE MOUNTING

ADJUSTMENTS

ENGINE SUPPORT ADJUSTMENT

The right and left support assemblies are slotted to allow for right/left drive train adjustment in relation to drive shaft assembly length.

Check and reposition right and left engine support assemblies as required. Adjust drive train position, if required, for the following conditions:

- Drive shaft distress: See Group 2, Suspension and Driveshaft.
- Any front end structural damage (after repair).
- Support Assembly replacement.

ENGINE SUPPORT ADJUSTMENT

(1) Remove the load on the engine motor mounts by carefully supporting the engine and transmission assembly with a floor jack.

(2) Loosen the right engine support assembly vertical fasteners.

(3) Loosen the left engine support assembly vertical bolts.

(4) Pry the engine right or left as required to achieve the proper drive shaft assembly length. Refer to Group 2, Suspension and Driveshaft for driveshaft identification and related assembly length measuring.

(5) Tighten right engine support assembly vertical bolts to 61 N·m (45 ft. lbs.). and tighten left engine support assembly bolts to 61 N·m (45 ft. lbs.).

(6) Recheck drive shaft length.

LEFT MOUNT

REMOVAL

(1) Disconnect negative battery cable.

(2) Remove throttle body air inlet hose and air cleaner housing assembly.

(3) Remove two nuts securing speed control servo bracket to left shock tower. Reposition servo.

(4) Support transmission with floor jack and wooden block.

(5) Remove the three vertical bolts from mount to transmission bracket (A) (Fig. 74).

(6) Slightly lower transmission with floor jack.

(7) Remove mount to frame rail fasteners (B) and remove mount (Fig. 74).

INSTALLATION

(1) Position mount to frame rail. Install mount to frame rail fasteners (B) (Fig. 83). Torque fasteners to 33 N·m (24 ft. lbs.).

(2) Raise transmission into position with floor jack.

(3) Install three vertical bolts from mount to transmission bracket (A) (Fig. 83). Torque fasteners to 61 N·m (45 ft. lbs.).

(4) Remove floor jack and wooden block.

(5) Install speed control servo to left shock tower. Torque fasteners to 6.7 N·m (60 in. lbs.)

(6) Install throttle body air inlet hose and air cleaner housing assembly.

(7) Connect negative battery cable.

REAR MOUNT

REMOVAL

(1) Remove throttle body air inlet hose and air cleaner housing assembly.

(2) Remove three vertical bolts attaching rear mount bracket to transaxle case (Fig. 84).

(3) Raise vehicle on hoist.

(4) Remove rear mount bracket through bolt (Fig. 84).

(5) Remove horizontal bolt attaching rear mount bracket to transaxle case (Fig. 84).

(6) Remove mount bracket.

INSTALLATION

(1) Position rear mount on suspension crossmember and loosely install bolts.

(2) Position mount bracket on transaxle and install bolts. Tighten to 110 N·m (80 ft. lbs.) (Fig. 75).

(3) Install rear mount to bracket through bolt and tighten to 61 N·m (45 ft. lbs.) (Fig. 75).

(4) Tighten rear mount to crossmember bolts to 61 N·m (45 ft. lbs.) (Fig. 75).

(5) Lower vehicle. Install throttle body air inlet hose and air cleaner housing assembly.

RIGHT MOUNT

REMOVAL

(1) Remove coolant pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - REMOVAL).

(2) Remove heater tube front attaching screw.

(3) Raise vehicle on a hoist and remove inner splash shield.

(4) Remove heater tube rear attaching screw.

(5) Remove the right engine support assembly vertical fasteners from frame rail (Fig. 85).

(6) Lower vehicle. Remove the load on the engine motor mounts by carefully supporting the engine assembly with floor jack and wooden block on oil pan.

(7) Remove the bolts attaching the engine support assembly to the engine bracket (Fig. 85).

(8) Remove right engine mount.

RIGHT MOUNT (Continued)

INSTALLATION

(1) Position right engine mount and install frame rail to mount bolts. Tighten bolts to 61 N·m (45 ft. lbs.) (Fig. 85).

(2) Install the mount to engine support bracket bolts and tighten to 61 N·m (45 ft. lbs.) (Fig. 85).

(3) Raise vehicle on a hoist.

(4) Install heater tube rear attaching screw.

(5) Install inner splash shield and lower vehicle.

(6) Install heater tube front attaching screw.

(7) Install coolant bottle (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - INSTALLATION).

FRONT MOUNT

REMOVAL

(1) Raise vehicle.

(2) Remove front mount to bracket horizontal through bolt (Fig. 86).

(3) Remove front mount vertical bolts (Fig. 86).

(4) Remove front mount.

(2) Loose install front mount to bracket through bolt.

(3) Install front mount vertical bolts. Tighten bolts to 61 N·m (45 ft. lbs.) (Fig. 77).

(4) Tighten horizontal through bolt to 61 N·m (45 ft. lbs.) (Fig. 77).

(5) Lower vehicle.

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump body is mounted to the engine block. The pump inner rotor is driven by the crankshaft. A structural windage tray is used to increase power by minimizing oil windage at high engine RPM. An engine oil cooler is used on some models.

OPERATION

Oil from the oil pan is pumped by a geroter type oil pump directly coupled to the crankshaft (Fig. 87). Oil pressure is controlled by a relief valve mounted inside the oil pump housing. See (Fig. 87), (Fig. 88), and (Fig. 89) for engine oil lubrication circuits.

DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

(1) Remove the oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)

(2) Install oil pressure test gauge assembly, Special Tools C-3292 with 8406 adaptor.

(3) Start engine and monitor gauge readings.

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM

(4) Oil Pressure (engine at operating temperature): **Curb Idle** 34.5 kPa (5 psi) minimum **3000 RPM** 300–724 kPa (45–105 psi).

(5) If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open or a clogged oil pickup screen.

(6) Install oil pressure switch after testing is completed. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION)

OIL

DESCRIPTION

For engine oil type and capacity (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL)

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Change engine oil and filter at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

TO CHANGE ENGINE OIL

(1) Run engine until achieving normal operating temperature.

(2) Position the vehicle on a level surface and turn engine off.

(3) Hoist and support vehicle on safety stands. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

(4) Remove oil fill cap (Fig. 90).

(5) Place a suitable drain pan under crankcase drain.

(6) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.

(7) Remove oil filter. Refer to (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)

(8) Install drain plug in crankcase.

(9) Install new oil filter. Refer to (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION)

(10) Lower vehicle and fill crankcase with specified type and amount of engine oil, (Fig. 90). (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL) (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)

(11) Install oil fill cap.

(12) Start engine and inspect for leaks.

(13) Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

STANDARD PROCEDURE - ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading (Fig. 90). Add only when the level is at or below the ADD mark.

OIL FILTER

REMOVAL

(1) Raise vehicle on hoist.

(2) Position a suitable collecting container under oil filter location (Fig. 91).

(3) Remove oil filter using a suitable oil filter wrench (Fig. 91). Dispose of oil filter following enviromental guidelines.

INSTALLATION

(1) Wipe filter base clean, then inspect gasket sealing surface.

(2) Lubricate gasket of new filter with clean engine oil.

(3) Install oil filter (Fig. 91) and tighten to 16 N·m (12 ft. lbs.) of torque after gasket contacts base. Use filter wrench if necessary.

(4) Fill crankcase with proper engine oil to correct level if drained. Start engine and check for leaks.

OIL PAN

REMOVAL

(1) Disconnect negative battery cable.
(2) Remove engine oil dipstick and tube.
(3) Raise vehicle on hoist.
(4) Drain engine oil and remove oil filter.
(5) Remove structural collar (Fig. 92) (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

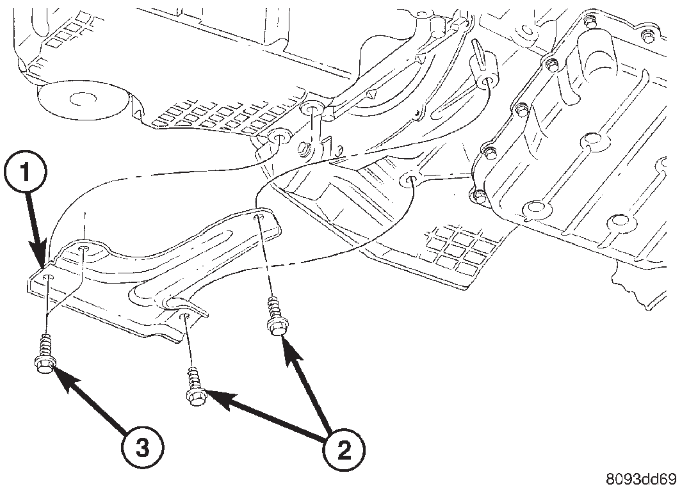

Fig. 92 Structural Collar (Note: cross-under pipe not shown)

1 - STRUCTURAL COLLAR
2 - BOLT (2) - COLLAR TO TRANSAXLE

(6) Remove exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - REMOVAL).
(7) Remove torque converter housing cover.
(8) Remove lower bolt attaching the A/C compressor to oil pan.

CAUTION: Assure removal of the two bolts attaching the timing cover to the oil pan, as damage to the timing cover and/or oil pan may occur.

(9) Remove oil pan attaching fasteners. Remove oil pan and gasket (Fig. 93).

INSTALLATION

(1) Clean oil pan and sealing surfaces. Inspect oil pan and timing chain cover gaskets. Replace as necessary.
(2) Apply an 1/8 inch bead of Mopar® Engine RTV GEN II to the front T-joints (oil pan gasket to timing cover gasket interface) and the rear T-joints (oil pan gasket to crankshaft rear oil seal retainer gasket interface) (Fig. 93).

(3) Install oil pan gasket to block.

NOTE: To prevent oil leaks at oil pan to timing chain cover, the following tightening sequence procedure must be performed.

(4) Install oil pan and fasteners (Fig. 93) using the following tightening sequence:
(a) Install oil pan bolts and nuts **finger tight only—just tight enough to compress the gasket's rubber seal**.
(b) Install timing chain cover to pan bolts and tighten to 12 N·m (105 in. lbs.).
(c) Tighten oil pan bolts to 28 N·m (250 in. lbs.).
(d) Tighten oil pan nuts to 12 N·m (105 in. lbs.).
(5) Install lower bolt attaching the A/C compressor to oil pan. Tighten bolt to 28 N·m (21 ft. lbs.).
(6) Install torque converter housing cover.
(7) Install oil filter and drain plug.
(8) Install exhaust cross-under pipe(Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - INSTALLATION).
(9) Install structural collar (Fig. 92)(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).
(10) Lower vehicle.
(11) Install engine oil dipstick and tube.
(12) Fill engine crankcase with proper oil to correct level.
(13) Connect negative battery cable.

OIL PRESSURE RELIEF VALVE

REMOVAL

(1) Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(2) Remove the pressure relief valve by remove the threaded retaining cap from the oil pump housing.

CAUTION: Oil pump pressure relief valve must be installed as shown in (Fig. 94) or engine damage may occur.

(3) Remove spring and relief valve (Fig. 94).

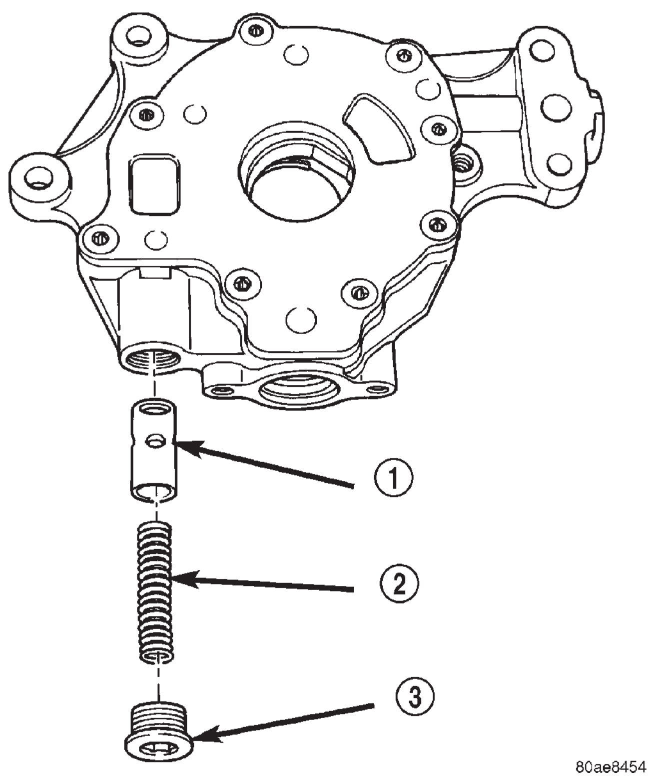

Fig. 94 Oil Pressure Relief Valve

1 - RELIEF VALVE
2 - SPRING
3 - RETAINER CAP

INSTALLATION

(1) Lubricate relief valve with oil.

CAUTION: The pressure relief valve must be installed as shown in (Fig. 94), or engine damage may occur.

(2) Install relief valve, spring and retainer cap (Fig. 94). Tighten cap to 12 N·m (105 in. lbs.).

(3) Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)

OIL PRESSURE SWITCH

DESCRIPTION

The engine oil pressure switch is located on the right side of the engine block. The switch screws into the engine main oil gallery. The normally closed switch provides an input through a single wire to the low pressure indicator light on the instrument cluster.

REMOVAL

(1) Raise vehicle on hoist.

(2) Remove heat shield that covers oil pressure switch.

(3) Disconnect oil pressure switch electrical connector.

(4) Position an oil collecting container under switch location.

(5) Remove switch by unscrewing from the engine block.

INSTALLATION

(1) Apply Mopar® Thread Sealant to the switch threads.

(2) Install oil pressure switch.

(3) Connect electrical connector.

(4) Install oil pressure switch heat shield.

(5) Lower vehicle.

(6) Start engine and check for leaks.

(7) Check engine oil level and adjust as neccessary.

OIL PUMP

REMOVAL

The oil pump pressure relief valve can be serviced by removing the oil pan.

(1) Remove crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL)

(2) Remove timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

(3) Remove timing chain and sprockets. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

(4) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)

(5) Remove oil pick-up tube and O-ring (Fig. 96).

(6) Ensure that crankshaft position is at 60° ATDC of No.1 cylinder, or crankshaft sprocket mark aligns with mark on oil pump (Fig. 95). This position will properly locate oil pump upon installation.

(7) Remove oil pump attaching bolts (Fig. 96).

(8) Remove oil pump.

(4) Remove pump rotors.

(5) Wash all parts in a suitable solvent.

(6) Inspect components carefully for damage or wear. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION)

CLEANING

(1) Clean all parts thoroughly in a suitable solvent.

INSPECTION

(1) Disassemble the oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - DISASSEMBLY)

(5) Measure thickness and diameter of outer rotor. If outer rotor thickness measures 9.474 mm (0.373 in.) or less (Fig. 100), or if the diameter is 89.174 mm (3.5108 in.) or less, replace outer rotor.

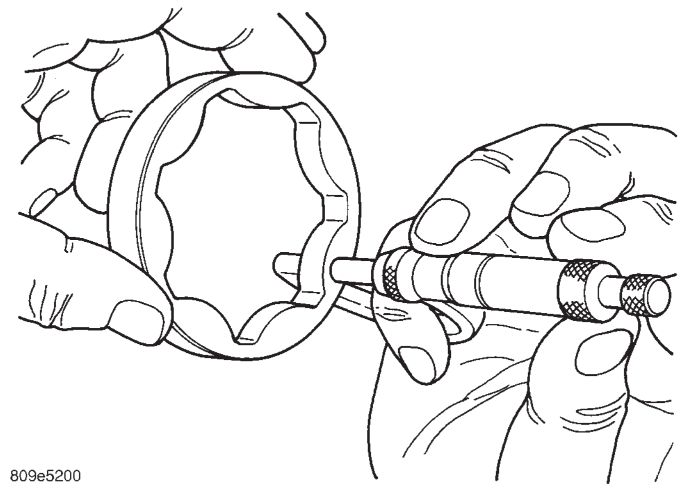

Fig. 100 MEASURING OUTER ROTOR THICKNESS

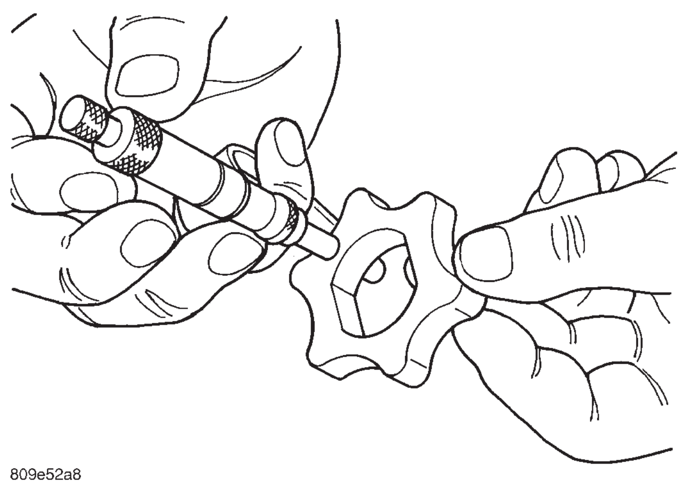

Fig. 101 MEASURING INNER ROTOR THICKNESS

(6) If inner rotor measures 9.474 mm (0.373 in.) or less replace inner rotor (Fig. 101).

(7) Slide outer rotor into body, press to one side with fingers and measure clearance between rotor and body (Fig. 102). If measurement is 0.39 mm (0.015 in.) or more, replace body only if outer rotor is in specifications.

(8) Install inner rotor into body. If clearance between inner and outer rotors (Fig. 103) is 0.20 mm (0.008 in.) or more, replace both rotors.

(9) Place a straightedge across the face of the body, between bolt holes. If a feeler gauge of 0.077 mm (0.003 in.) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 104) **ONLY** if rotors are in specification.

(10) Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

(11) The relief valve spring has a free length of approximately 49.5 mm (1.95 in.) it should test between 23 – 25 pounds when compressed to 34 mm (1.34 in.). Replace spring that fails to meet specifications.

(12) Assemble oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - ASSEMBLY)

ASSEMBLY

(1) Assemble pump using new parts as required.

(2) Tighten cover screws to 12 N·m (105 in. lbs.) (Fig. 98).

(3) Tighten oil pressure relief valve retaining cap to 12 N·m (105 in. lbs.) (Fig. 97).

(4) Prime oil pump before installation by filling rotor cavity with engine oil.

INSTALLATION

CAUTION: Crankshaft position must be at 60° ATDC of No.1 cylinder before installing oil pump (Fig. 95). This position will properly locate oil pump. If not properly located, severe damage to oil pump can occur.

(1) Prime oil pump before installation by filling rotor cavity with engine oil.

(2) If crankshaft has been rotated, it must be repositioned to 60° ATDC of No.1 cylinder prior to oil pump installation (Fig. 95).

(3) Install oil pump carefully over crankshaft and into position.

INTAKE MANIFOLD

DESCRIPTION

The two piece intake manifold is made of a composite material. The intake manifold features a compact, low rumble design that maximizes engine performance while minimizing induction noise.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine.

(2) Spray a small stream of water (Spray Bottle) at the suspected leak area.

(3) If engine RPM'S change, the area of the suspected leak has been found.

(4) Repair as required.

STANDARD PROCEDURE - INTAKE MANIFOLD VACUUM PORT REPAIR

The composite intake manifold vacuum ports can be repaired. Although, if the manifold plenum chamber is damaged or cracked, the manifold must be replaced.

To repair a broken or damaged vacuum nipple (port) on the composite intake manifold, perform the following procedure:

PARTS REQUIRED	TOOLS REQUIRED
Brass Nipple – 3/8″ O.D. x 1/4″ pipe thread (Speed Control Port)	Pipe Tap – 1/4″ - 18 NPT
Brass Nibble – 1/2″ O.D. x 1/4″ pipe thread (Brake Booster Port)	Drill Bit – 7/16″
	File/Sand Paper

NOTE: While performing this procedure, avoid getting the manifold material residue into the plenum chamber.

(1) File or sand the remaining port back until a flat surface is obtained (plane normal to nipple (port) axis).

(2) Drill out the nipple (port) base using a 7/16" drill bit (Fig. 105).

(3) Using a 1/4"–18 NPT pipe tap, cut internal threads (Fig. 105). Use caution to start tap in a axis same as original nipple.

(4) Apply Mopar® Thread Sealant to threads of repair nipple(s).

(5) Install repair nipple(s). Do not over torque repair nipple(s).

REMOVAL

REMOVAL - INTAKE MANIFOLD UPPER

(1) Disconnect negative battery cable.

(2) Remove throttle body air inlet hose and air cleaner housing assembly.

(3) Remove throttle cable shield. Remove throttle and speed control cables from throttle arm and bracket.

(4) Remove throttle cable bracket.

(5) Disconnect electrical connectors from the following components:

- Manifold Absolute Pressure (MAP) Sensor
- Throttle Position Sensor (TPS) Sensor
- Idle Air Control (IAC) Motor

(6) Disconnect Vapor Purge hose, Brake Booster hose, Speed Control Servo, Positive Crankcase Ventilation (PCV) hose.

(7) Loosen upper fastener at throttle body support bracket.

(8) Remove manifold attaching bolts (Fig. 107).

(9) Remove upper manifold (Fig. 106).

(10) Inspect manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION)

REMOVAL - INTAKE MANIFOLD LOWER

(1) Release fuel system pressure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)

(2) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(3) Disconnect electrical connectors from the fuel injectors.

(4) Remove fuel supply hose from fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)

(5) Remove screw attaching fuel rail support bracket to the throttle body support bracket.

(6) Remove bolts attaching fuel rail.

(7) Remove fuel rail and injectors as an assembly.

(8) Remove manifold attaching bolts (Fig. 108).

(9) Remove lower manifold.

(10) Inspect manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION)

INTAKE MANIFOLD (Continued)

INSPECTION

INSPECTION - INTAKE MANIFOLD UPPER

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged or clogged EGR ports

If the manifold exihibits any damaged or warped conditions, replace the manifold. Clean EGR ports as neccessary.

If a vacuum port is damaged, a repair procedure can be performed (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE).

INSPECTION - INTAKE MANIFOLD LOWER

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged fuel injector ports

If the manifold exihibits any of these conditions, replace the manifold.

INSTALLATION

INSTALLATION - INTAKE MANIFOLD UPPER

(1) Clean and inspect sealing surfaces. Gaskets can be reused, if free of cuts or tears.

NOTE: Make sure fuel injectors and wiring harnesses are in correct position to not interfere with upper manifold installation.

(2) Position upper manifold onto lower manifold (Fig. 106).

(3) Install manifold attaching bolts and tighten in sequence shown in (Fig. 107) to 12 N·m (105 in. lbs.).

(4) Tighten upper fastener at throttle body support bracket.

(5) Connect speed control servo, PCV , brake booster, and vapor purge hoses.

(6) Connect electrical connectors to the following components:

- Manifold Absolute Pressure (MAP) Sensor
- Throttle Position Sensor (TPS) Sensor
- Idle Air Control (IAC) Motor

(7) Install throttle cable bracket.

(8) Connect throttle and speed control cables to bracket and throttle arm. Install throttle cable shield.

(9) Install throttle body air inlet hose and air cleaner housing assembly.

(10) Connect negative battery cable.

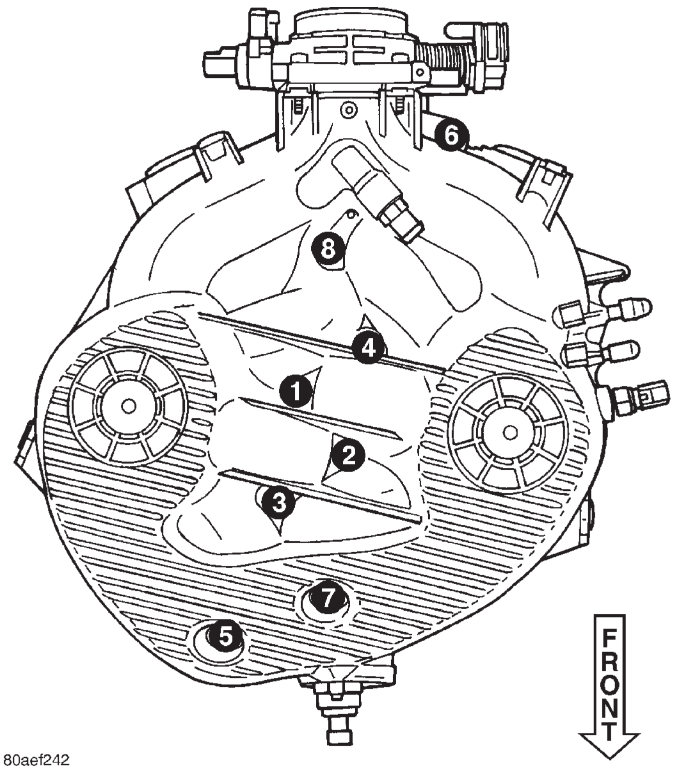

Fig. 107 Upper Intake Manifold Tightening Sequence

INSTALLATION - INTAKE MANIFOLD LOWER

(1) Clean and inspect sealing surfaces of cylinder head and manifold. Gaskets can be reused provided they are free of cuts or tears.

(2) Position manifold on cylinder head surfaces.

NOTE: For ease of installing upper intake manifold, install a bolt 2 – 3 turns to the rearmost attaching hole of intake. This will properly position lower manifold.

(3) Install fuel rail with injectors.

(4) Install manifold attaching bolts and tighten in sequence shown in (Fig. 108) to 12 N·m (105 in. lbs.). Remove bolt used for aligning manifold.

(5) Connect the fuel injector electrical connectors.

NOTE: Make sure fuel injectors are located in the correct location and position, as upper intake manifold interference could occur.

(6) Install screw attaching fuel rail support bracket to the throttle body support bracket.

(7) Connect fuel supply hose to fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)

(8) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

EXHAUST MANIFOLD

DESCRIPTION

The exhaust manifolds are made of cast nodular iron. The outlets are designed for attachment of catalytic converters.

REMOVAL

FRONT EXHAUST MANIFOLD

(1) Disconnect negative battery cable.
(2) Disconnect and remove oxygen sensor.
(3) Raise vehicle on hoist.
(4) Remove exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - REMOVAL).
(5) Remove front catalytic converter (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL).
(6) Lower vehicle.
(7) Remove exhaust manifold attaching bolts and remove manifold.

REAR EXHAUST MANIFOLD

(1) Disconnect negative battery cable.
(2) Remove throttle body air inlet hose and air cleaner housing assembly.
(3) Remove bolts attaching EGR tube from exhaust manifold and EGR valve. Discard gaskets.
(4) Raise vehicle on hoist.
(5) Remove exhaust system from vehicle (Refer to 11 - EXHAUST SYSTEM - REMOVAL).
(6) Remove exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - REMOVAL).
(7) Remove rear catalytic converter (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL).
(8) Disconnect and remove rear upstream oxygen sensor.
(9) Remove rear exhaust manifold heat shield.
(10) Remove exhaust manifold attaching bolts and remove manifold.

INSPECTION

(1) Inspect exhaust manifolds for damage or cracks.
(2) Check manifold flatness.
(3) Inspect the exhaust manifold gasket for obvious discoloration or distortion.
(4) Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

INSTALLATION

FRONT EXHAUST MANIFOLD

(1) Install exhaust manifold and gasket. Tighten bolts starting at the center working outward to 23 N·m (200 in. lbs.).
(2) Raise vehicle on hoist.
(3) Install front catalytic converter and manifold heat shield. Tighten fasteners to 28 N·m (250 in. lbs.) (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).
(4) Install exhaust cross-under pipe. Tighten fasteners to 28 N·m (250 in. lbs.) (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - INSTALLATION).
(5) Lower vehicle.
(6) Install oxygen sensor and connect electrical connector.
(7) Connect negative battery cable.

(2) Install rear catalytic converter and manifold heat shield. Tighten fasteners to 28 N·m (250 in. lbs.) (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).

(3) Install oxygen sensor and connect electrical connector.

(4) Install exhaust cross-under pipe. Tighten fasteners to 28 N·m (250 in. lbs.) (Refer to 11 - EXHAUST SYSTEM/CROSS-OVER PIPE - INSTALLATION).

(5) Install exhaust system. Tighten fasteners to 28 N·m (250 in. lbs.) (Refer to 11 - EXHAUST SYSTEM - INSTALLATION).

(6) Lower vehicle.

(7) Install EGR tube using new gaskets. Tighten screws to 11 N·m (95 in. lbs.).

(8) Install throttle body air inlet hose and air cleaner housing assembly.

(9) Connect negative battery cable.

VALVE TIMING

DESCRIPTION

The timing drive system has been designed to provide quiet performance and reliability to support a **NON** free-wheeling engine. The system consists of a primary and secondary chain drive.

The **primary** timing chain drive (Fig. 109) uses a single, double-flexure, inverted tooth type chain. The primary chain drives both of the intake camshafts directly from a sprocket mounted on the crankshaft. In addition, the water pump is driven by the “back side” of the primary chain, necessitating the double-flexure type chain.

The chain is controlled by three fixed chain guides and a pivoting tensioner arm (Fig. 109). These guides utilize low-friction and long wearing nylon plastic wear faces. To tension the primary chain, a fully automatic spring-loaded, engine oil-fed, hydraulic tensioner is used. The tensioner is mounted in the right cylinder head with the plunger contacting the pivoting tensioner arm. A mechanical ratchet mechanism inside the tensioner prevents excessive chain slack upon engine start-up as the chain wears. The tensioner is designed with an internal oil reservoir to assure noise-free performance, even during engine start-up before oil pressure reaches the tensioner.

For lubrication the primary chain utilizes oil leakage from the front of the oil pump. This oil spills on the crankshaft sprocket, which is then carried by the chain throughout the primary drive.

The **secondary** timing chain drive system uses two conventional roller-type chains, one at each cylinder bank (Fig. 24). The purpose of the secondary chain is to provide a mechanical driven connection between the intake and exhaust camshafts. The intake camshafts drive the exhaust camshafts. The sprockets for both intake and exhaust camshafts are a press-fit and are only serviced as an assembly with the camshafts.

To tension the secondary chain a spring-loaded, hydraulic tensioner is used at each bank and attaches to each cylinder head between the intake and exhaust camshafts (Fig. 24). The tensioner incorporates upper and lower chain guide faces. The lower guide face is attached directly to the tensioner’s hydraulic plunger. Also, the tensioner uses an internal oil reservoir design to prevent engine start-up noise. The secondary chains are lubricated via an oil passage through the upper guide face on each tensioner.

STANDARD PROCEDURE

ENGINE TIMING - VERIFICATION

Correct timing is critical for the NON free-wheeling designed, 2.7L engine. Engine timing can be verified by using the following procedures:

(1) Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

(2) Rotate engine until number one cylinder is at TDC on the EXHAUST stroke.

(3) View the intake camshaft sprocket timing mark. The mark should be 90° from the cylinder head cover sealing surface (Fig. 110)on both right and left cylinder banks.

(4) Count chain pins from the mark on the intake camshaft towards the exhaust camshaft. Engine is timed correctly when there are 12 chain pins between the timing marks on the intake camshaft and exhaust camshaft (Fig. 110).

(5) If marks are not correctly aligned, proceed to Timing Chain and Sprockets for service procedures. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

TIMING CHAIN COVER

REMOVAL

(1) Disconnect negative battery cable.

(2) Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(3) Remove coolant pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - REMOVAL).

(4) Raise vehicle on hoist.

(5) Remove right front wheel and belt splash shield.

(6) Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Remove crankshaft vibration dampner (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(8) Remove AC/Generator belt tensioner/bracket assembly.

(9) Disconnect heater hose from tube at right front frame rail area.

(10) Lower vehicle.

(11) Remove screws securing heater supply tube to right frame rail. Reposition heater supply tube.

(12) Place a floor jack with wooden block under oil pan to support engine.

(13) Remove right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - REMOVAL).

(14) Remove upper timing chain cover bolts.

(15) Raise vehicle on hoist.

(16) Remove remaining bolts securing timing chain cover to engine (Fig. 111).

(17) Remove timing chain cover.

(18) Discard timing chain cover gasket. Remove front crankshaft oil seal from cover.

1 - PLACE A 1/8 INCH BEAD OF SEALER AT PARTING LINE

INSTALLATION

(1) Inspect and clean timing chain cover sealing surfaces.

(2) Before installing timing cover gasket apply a 1/8 inch bead of Mopar® Engine RTV GEN II to the parting lines between the oil pan and cylinder block (Fig. 112).

(3) Install timing cover and gasket. Tighten M10 cover bolts to 54 N·m (40 ft. lbs.) and M6 bolts to 12 N·m (105 in. lbs.) (Fig. 111).

(4) Install front crankshaft oil seal using Special Tool 6780-2 sleeve and 6780-1 installer.

(5) Lower vehicle.

(6) Install right engine mount (Refer to 9 - ENGINE/ENGINE MOUNTING/RIGHT MOUNT - INSTALLATION).

(7) Install screws attaching heater supply tube to right front frame rail area.

(8) Raise vehicle on hoist.

(9) Connect heater hose to supply tube at right front frame rail area.

(10) Install AC/Generator belt tensioner/bracket assembly.

(11) Install crankshaft vibration damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)

(12) Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Install belt splash shield and right front wheel.

(14) Lower vehicle.

(15) Install coolant pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - INSTALLATION).

(16) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(17) Connect negative battery cable.

TIMING CHAIN AND SPROCKETS

REMOVAL

REMOVAL - TIMING CHAIN

(1) Disconnect negative battery cable.

(2) Drain cooling system (Refer to 7 - COOLING/ ENGINE - STANDARD PROCEDURE).

(3) Remove upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)

(4) Remove cylinder head covers, crankshaft vibration damper, and timing chain cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL)

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

(5) Align crankshaft sprocket timing mark to mark on oil pump housing (Fig. 113). The mark on oil pump housing is 60° ATDC of #1 cylinder.

CAUTION: When the timing chain is removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

(6) Remove power steering pump and bracket as an assembly. **Do not** disconnect power steering lines from pump. Reposition pump and support with suitable retaining strap.

(7) Remove primary timing chain tensioner retainer cap and tensioner from right cylinder head (Fig. 114).

(8) Disconnect and remove camshaft position sensor from left cylinder head (Fig. 115).

(9) Remove timing chain guide access plugs from cylinder heads (Fig. 115).

NOTE: When camshaft sprocket bolts are removed, the camshafts will rotate in a clockwise direction.

REMOVAL - CRANKSHAFT SPROCKET

(1) Remove primary timing chain. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)

CAUTION: Use care not to turn crankshaft while removing crankshaft sprocket, as damage to valves and or pistons could occur.

(2) Remove crankshaft sprocket by first installing the crankshaft damper bolt. Apply grease or equivalent to damper bolt head and position Special Tools 5048-1, 5048-6, and 8539 on sprocket and crankshaft nose (Fig. 116). Remove sprocket using care not to rotate the crankshaft.

INSTALLATION

INSTALLATION - TIMING CHAIN

(1) Inspect all sprockets and chain guides. Replace if worn.

(2) For crankshaft sprocket installation procedures (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSTALLATION).

(3) If removed, install right and left side short chain guides (Fig. 115). Tighten attaching bolts to 28 N·m (250 in. lbs.).

(4) Align crankshaft sprocket timing mark to the mark on oil pump housing (Fig. 117).

NOTE: Lubricate timing chain and guides with engine oil before installation.

(5) Place left side primary chain sprocket onto the chain so that the timing mark is located in-between the two (plated) timing links (Fig. 117).

(6) Lower the primary chain with left side sprocket through the left cylinder head opening.

NOTE: The camshaft sprockets can be allowed to float on the camshaft hub during installation.

(7) Loosely position left side camshaft sprocket over camshaft hub.

(8) Align timing (plated) link to the crankshaft sprocket timing mark (Fig. 117).

(9) Position primary chain onto water pump drive sprocket.

(10) Align right camshaft sprocket timing mark to the timing (plated) link on the timing chain (Fig. 117) and loosely position over camshaft hub.

(11) Verify that all chain timing (plated) links are properly aligned to the timing marks on all sprockets (Fig. 117).

(12) Install left side lower chain guide and tensioner arm (Fig. 115). Tighten attaching bolts to 28 N·m (250 in. lbs.).

NOTE: Inspect O-ring on chain guide access plugs before installing. Replace O-ring as necessary.

(13) Install chain guide access plugs to cylinder heads (Fig. 115). Tighten plugs to 20 N·m (15 ft. lbs.).

NOTE: To reset the primary timing chain tensioner, engine oil will first need to be purged from the tensioner (Fig. 118).

(14) Purge oil from timing chain tensioner using the following procedure:

(a) Place the check ball end of tensioner into the shallow end of Special Tool 8186 (Fig. 118).

(b) Using hand pressure, slowly depress tensioner until oil is purged from tensioner (Fig. 118).

TIMING CHAIN AND SPROCKETS (Continued)

(15) Reset timing chain tensioner using the following procedure:

(a) Position cylinder plunger into the deeper end of Special Tool 8186 (Fig. 119).

(b) Apply a downward force until tensioner is reset (Fig. 119).

NOTE: If oil was not first purged from the tensioner, use slight finger pressure to assist the center arm pin of Special Tool 8186 to unseat the tensioner's check ball.

CAUTION: Ensure the tensioner is properly reset. The tensioner body must bottom against the top edge of Special Tool 8186. Failure to properly perform the resetting procedure may cause tensioner jamming.

(16) Install the reset chain tensioner into the right cylinder head (Fig. 114).

(17) Position tensioner retaining plate and tighten bolts to 12 N·m (105 in. lbs.) (Fig. 114).

(18) Starting at the right cylinder bank, first position the camshaft damper (if equipped) on camshaft hub, then insert a 3/8" square drive extension with a breaker bar into intake camshaft drive hub. Rotate camshaft until the camshaft hub aligns to the camshaft sprocket and damper attaching holes. Install the sprocket attaching bolts and tighten to 28 N·m (250 in. lbs.) (Fig. 115).

(19) Turn the left side camshaft by inserting a 3/8" square drive extension with a breaker bar into intake camshaft drive hub and rotate camshaft until the sprocket attaching bolts can be installed. Tighten sprocket bolts to 28 N·m (250 in. lbs.) (Fig. 115).

(20) Rotate engine slightly clockwise to remove timing chain slack, if necessary.

(21) Activate the timing chain tensioner by using a flat bladed pry tool to gently pry tensioner arm towards the tensioner slightly (Fig. 120). Then release the tensioner arm. Verify the tensioner is activated (extends).

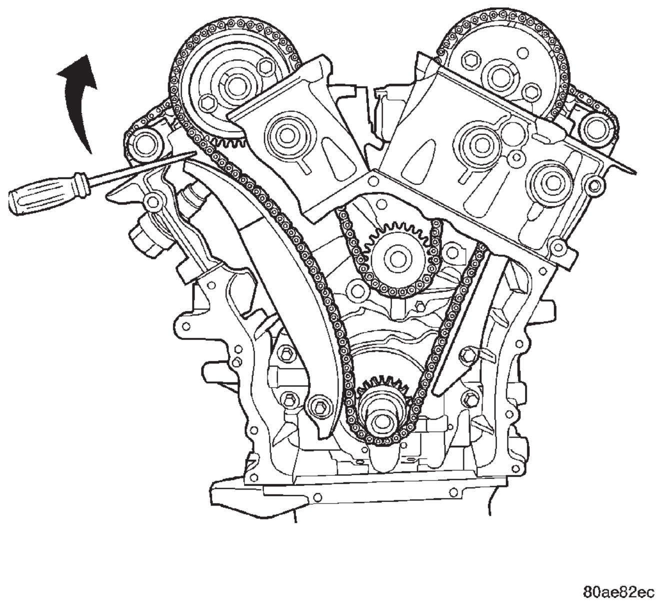

Fig. 120 TIMING CHAIN TENSIONER ACTIVATING

(22) Install power steering pump and bracket assembly.

(23) Install camshaft position sensor and connect electrical connector.

(24) Install the timing chain cover, crankshaft vibration damper, and cylinder head covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

(25) Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

NOTE: After installation of a reset tensioner, engine noise will occur after initial start-up. This noise will normally disappear within 5–10 seconds.

(26) Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

(27) Connect negative battery cable.

INSTALLATION - CRANKSHAFT SPROCKET

(1) Install crankshaft sprocket using Special Tools 6780-1 and 8179 (Fig. 121) until sprocket bottoms against crankshaft step flange. Use care not to rotate crankshaft.

1 - SPECIAL TOOL 6780–1
2 - SPECIAL TOOL 8179

(2) Verify that crankshaft sprocket is installed to proper depth by measuring from sprocket outer face to end of crankshaft (Fig. 122). Measurement should read: 39.05 ±0.50 mm (1.5374 ±0.020 in.).

(3) Install primary timing chain. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)

EXHAUST SYSTEM

DESCRIPTION

The exhaust system on the 2.0L/2.4L engine models consists of a front mounted catalytic converter, resonator/pipe assembly, muffler/pipe assembly, band clamps, and support isolators. The upstream oxygen sensor is located in the exhaust manifold. The downstream oxygen sensor is located in the catalytic converter.

The exhaust system on the 2.7L engine model consists of front and rear bank catalytic converters, cross-under pipe, connector pipe, resonator/pipe assembly, muffler/pipe assembly, band clamps, and support isolators. The upstream oxygen sensors are located in the front and rear exhaust manifolds. The downstream oxygen sensors are located in the cross-under pipe.

Resonators, mufflers, and exhaust pipes are tuned to each powertrain combination. (Fig. 1), (Fig. 2), and (Fig. 3).

OPERATION

The exhaust system contains, quiets, and cleans the exhaust gases generated by the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXCESSIVE EXHAUST SYSTEM NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.
	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. EGR Valve to manifold gasket leakage.	3. Tighten fasteners or replace gasket.
	4. EGR Valve to EGR tube gasket leakage.	4. Tighten fasteners or replace gasket.
	5. EGR tube to manifold tube leakage.	5. Tighten tube nut.
	6. Exhaust flex-joint to manifold leak.	6. Tighten joint fasteners and/or replace gasket.
	7. Exhaust flex-joint.	7. Replace catalytic converter assembly.
	8. Pipe and shell noise from front exhaust pipe.	8. Characteristic of single wall pipe.
EXCESSIVE EXHAUST NOISE	1. Leak at exhaust pipe joints.	1. Tighten clamps at leaking joints.
	2. Burned or rusted out muffler assembly or exhaust pipe.	2. Replace muffler resonator tailpipe assembly or exhaust pipe with catalytic converter assembly.
	3. Burned or rusted out resonator.	3. Replace muffler resonator tailpipe assembly.
	4. Restriction in exhaust system.	4. Perform Exhaust System Restriction Check. Replace component as necessary.
	5. Converter material in muffler.	5. Replace muffler and converter assemblies. Check fuel injection and ignition systems for proper operation.

DIAGNOSIS AND TESTING - EXHAUST SYSTEM RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the DRB III® and PEP module pressure tester.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

(1) Disconnect and remove the upstream (before catalytic converter) oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - REMOVAL)

(2) Install the Exhaust Back Pressure Fitting Adaptor CH8519.

(3) Connect the Low Pressure Sensor (15 psi) CH7063 to the back pressure fitting.

(4) Following the PEP module instruction manual, connect all required cables to the DRB III® and PEP module. Select the available menu options on the DRBIII® display screen for using the digital pressure gauge function.

(5) Apply the park brake and start the engine.

EXHAUST SYSTEM (Continued)

(6) With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on the DRBIII®. Back pressure should not exceed specified limit. Refer to specification in table below EXHAUST BACK PRESSURE LIMITS.

NOTE: For applications with dual catalytic converters, repeat test on opposite converter using the previous steps.

(7) If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures, (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSPECTION). Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) RPM	3.45 Kpa (0.5 psi)

REMOVAL - EXHAUST SYSTEM

NOTE: Some service procedures require the removal of the entire exhaust system in order to gain better access to certain components for removal and installation. The following procedure explains how to remove the entire exhaust system. Refer to specific procedures if replacing individual exhaust components.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

(1) Raise vehicle on hoist and apply penetrating oil to fasteners that connect the exhaust system to the exhaust manifold (2.0L/2.4L)/cross-under pipe (2.7L).
(2) Remove ground strap from muffler.
(3) Vehicles equipped with 2.0L/2.4L engines, disconnect downstream oxygen sensor connector.
(4) Remove fasteners that attach exhaust system to exhaust manifold (2.0L/2.4L)/cross-under pipe (2.7L).

CAUTION: Do not use any tools to remove the rubber isolators—remove by hand only. Soapy water or silicone-based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum-based lubricant on the isolators, as damage to the rubber material can occur.

(5) Remove support isolators from muffler supports (Fig. 2).
(6) Remove exhaust system from vehicle.

NOTE: Band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off the exhaust pipe.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used for the following reasons:

- To insure proper alignment with other parts in the system.
- Provide acceptable exhaust noise levels and does not change exhaust system back pressure that could affect emissions and performance.

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off.

INSTALLATION - EXHAUST SYSTEM

NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

(1) Loosely install fasteners that attach exhaust system to exhaust manifold (2.0L/2.4L)/cross-under pipe (2.7L).
(2) Install support isolators to muffler supports.
(3) Align exhaust system to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them. Tighten fasteners that attach exhaust system to exhaust manifold (2.0L/2.4L)/cross-under pipe (2.7L) to 28 N·m (250 in. lbs.).
(4) Vehicles equipped with 2.0L/2.4L engines, reconnect the downstream oxygen sensor connector.
(5) Connect ground strap to muffler.
(6) Lower vehicle.

EXHAUST SYSTEM (Continued)

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

(1) Loosen clamps and support brackets.

(2) Align the exhaust system starting at the front, working rearward.

(3) Tighten all clamps and brackets once alignment and clearances are achieved.

CATALYTIC CONVERTER - 2.0L/2.4L

DESCRIPTION

The under-floor, three-way catalytic converter inlet is connected to the exhaust manifold by use of a flex joint and gasket. The outlet connects to the exhaust system.

CAUTION: When servicing, care must be exercised not to dent or bend the bellows or bellows cover of the flex-joint. Should this occur, the flex-joint will eventually fail and require the catalytic converter be replaced.

An exhaust flex-joint coupling (Fig. 4) is used to secure the catalytic converter to the engine manifold.

The exhaust flex-joint is welded to the catalytic converter.

OPERATION

The three-way catalytic converter simultaneously converts three exhaust emissions into harmless gases. Specifically, HC and CO emissions are converted into water (H_2O) and carbon dioxide (CO_2). Oxides of Nitrogen (NOx) are converted into elemental Nitrogen (N) and water. The three-way catalyst is most efficient in converting HC, CO and NOx at the stoichiometric air fuel ratio of 14.7:1.

CATALYTIC CONVERTER - 2.0L/2.4L (Continued)

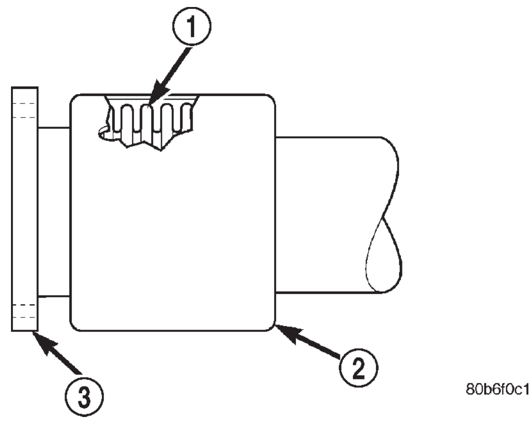

Fig. 4 FLEX-JOINT COUPLING - TYPICAL

1 - BELLOWS
2 - COVER
3 - FLANGE

The oxygen content in a catalyst is important for efficient conversion of exhaust gases. When a high oxygen content (lean) air/fuel ratio is present for an extended period, oxygen content in a catalyst can reach a maximum. When a rich air/fuel ratio is present for an extended period, the oxygen content in the catalyst can become totally depleted. When this occurs, the catalyst fails to convert the gases. This is known as catalyst ″punch through.″

Catalyst operation is dependent on its ability to store and release the oxygen needed to complete the emissions-reducing chemical reactions. As a catalyst deteriorates, its ability to store oxygen is reduced. Since the catalyst's ability to store oxygen is somewhat related to proper operation, oxygen storage can be used as an indicator of catalyst performance. Refer to the appropriate Diagnostic Information for diagnosis of a catalyst related Diagnostic Trouble Code (DTC).

The combustion reaction caused by the catalyst releases additional heat in the exhaust system, causing temperature increases in the area of the reactor under severe operating conditions. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. **Do not** remove spark plug wires from plugs or by any other means short out cylinders, if exhaust system is equipped with a catalytic converter. Failure of the catalytic converter can occur due to temperature increases caused by unburned fuel passing through the converter. This deterioration of the catalyst core can result in excessively high emission levels, noise complaints, and exhaust restrictions.

Unleaded gasoline must be used to avoid ruining the catalyst core. Do not allow engine to operate above 1200 RPM in neutral for extended periods over 5 minutes. This condition may result in excessive exhaust system/floor pan temperatures because of no air movement under the vehicle.

The flex joint allows flexing as the engine moves, preventing breakage that could occur from the back-and-forth motion of a transverse mounted engine.

CAUTION: Due to exterior physical similarities of some catalytic converters with pipe assemblies, extreme care should be taken with replacement parts. There are internal converter differences required in some parts of the country (particularly vehicles built for States with strict emission requirements) and between model years.

REMOVAL

NOTE: In the following procedure it is not necessary to separate the muffler/pipe assembly from the resonator/pipe assembly. They can both be removed as an assembly.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

(1) Raise vehicle on hoist and apply penetrating oil to resonator/pipe assembly band clamp, and the fasteners that connect the catalytic converter to the exhaust manifold.

(2) Remove ground strap from muffler.

(3) Loosen band clamp for resonator/pipe assembly.

CAUTION: Do not use any tools to remove the rubber isolators–remove by hand only. Soapy water or silicone–based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum–based lubricant on the isolators, as damage to the rubber material can occur.

(4) Remove support isolators from muffler supports.

(5) Remove resonator/pipe and muffler/pipe as an assembly.

(6) Disconnect downstream oxygen sensor connector.

(7) Remove fasteners that attach catalytic converter to the exhaust manifold. Remove catalytic converter from vehicle.

(8) Remove and discard gasket.

INSPECTION

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

INSTALLATION

NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

(1) Clean manifold to converter sealing surfaces.
(2) Position new gasket on exhaust manifold.

NOTE: If catalytic converter is being replaced, transfer downstream oxygen sensor to new converter.

(3) Loosely attach catalytic converter to exhaust manifold.
(4) Loosely install resonator/pipe and muffler/pipe assembly to catalytic converter outlet pipe.
(5) Install support isolators to muffler supports.
(6) Align exhaust system to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them. Tighten fasteners attaching catalytic converter to exhaust manifold to 28 N·m (250 in. lbs.).
(7) Tighten resonator/pipe assembly band clamp to 54 N·m (40 ft. lbs.).
(8) Connect ground strap to muffler.
(9) Lower vehicle.

CATALYTIC CONVERTER - FRONT - 2.7L

REMOVAL

(1) Disconnect negative battery cable.
(2) Disconnect upstream oxygen sensor connector.
(3) Remove 3 converter attaching nuts that are visible from the engine compartment (Fig. 5).
(4) Raise vehicle on hoist.
(5) Remove exhaust cross-under pipe (Refer to 11 - EXHAUST SYSTEM/CROSS-UNDER PIPE - REMOVAL).
(6) Remove remaining bolt attaching converter to exhaust manifold.
(7) Remove catalytic converter.
(8) Remove and discard gasket.

SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

(1) Raise vehicle on hoist and apply penetrating oil to band clamp of component being removed (Fig. 1).
(2) Remove ground strap from muffler.
(3) Loosen band clamp for muffler/pipe assembly.

CAUTION: Do not use any tools to remove the rubber isolators–remove by hand only. Soapy water or silicone–based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum–based lubricant on the isolators, as damage to the rubber material can occur.

(4) Remove support isolators from muffler supports (Fig. 2).
(5) Remove muffler/pipe assembly from resonator pipe.

NOTE: Band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off the exhaust pipe.

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used for the following reasons:

- To insure proper alignment with other parts in the system.
- Provide acceptable exhaust noise levels and does not change exhaust system back pressure that could affect emissions and performance.

INSTALLATION

NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

(1) Loosely install muffler/pipe assembly onto resonator pipe.
(2) Install support isolators to muffler supports.

HEAT SHIELDS

DESCRIPTION

The exhaust system heat shields are attached to the under body of the vehicle (Fig. 8).

OPERATION

Heat shields are needed to protect both the vehicle and the environment from the high temperatures developed near the catalytic converter.

Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields on cars so equipped. Light over spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

REMOVAL

(1) Release decklid latch and open decklid.

(2) Remove left rear tail lamp and disengage license plate wire connector from tail lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - REMOVAL).

(3) Peel back trunk carpeting at taillamps and remove nut and washer from fascia to quarter panel bracket. Discard washer.

(4) Remove push-in fasteners attaching decklid slam bumpers to top of fascia.

(5) Remove push-in fastener attaching center of fascia to rear closure panel.

(6) Remove screws attaching fascia to rear wheelhouse splash shields (Fig. 6).

(7) Remove screws attaching fascia to quarter panel at the wheelhouse opening.

(8) Slide fascia rearward to disengage hooks holding fascia to bottom of quarter panel.

(9) Remove fascia from vehicle.

INSTALLATION

(1) Position fascia on vehicle.

(2) Slide fascia forward to engage hooks attaching fascia to bottom of quarter panel.

(3) Install push-in fastener attaching center of fascia to rear closure panel.

(4) Install push-in fasteners attaching decklid slam bumpers to top of fascia.

(5) Install new nut and washer to fascia to quarter panel bracket located in the trunk area.

(6) Install screws attaching fascia to quarter panel at wheelhouse opening.

(7) Install fasteners attaching fascia to rear wheelhouse splash shields.

(8) Engage license plate wire connector to left tail lamp.

FRAME

SPECIFICATIONS - FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

FRONT SUSPENSION CROSSMEMBER

REMOVAL

(1) Hoist and support vehicle on safety stands. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Place a suitable lifting device under front suspension crossmember.

(3) Remove bolts attaching suspension strut to the lower control arm. (Refer to 2 - SUSPENSION/FRONT/STRUT - REMOVAL).

(4) Disengage lower ball joints from lower control arms. (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).

(5) Remove bolts attaching front of suspension crossmember to frame rails under upper control arms.

(6) Loosen bolts attaching rear of suspension crossmember to frame rail torque boxes.

(7) Allow the front of the suspension crossmember to swing away from the frame rails.

(8) Remove bolts attaching steering gear to top of suspension crossmember (Fig. 14).

CAUTION: Do not allow steering gear to hang by the pressure or return hoses, damage to hoses can result.

(9) Using mechanics wire, tie steering gear to structure above.

(10) Raise crossmember back into position.

(11) Remove bolts attaching rear of crossmember to frame rail torque boxes.

(12) Lower front suspension crossmember away from bottom of vehicle.

INSTALLATION

(1) Raise front suspension crossmember into position on vehicle.

(2) Loosely install bolts attaching rear of crossmember to frame rail torque boxes.

(3) Lower crossmember and install bolts attaching steering gear to top of suspension crossmember.

(4) Raise crossmember into position.

(5) Tighten bolts holding rear of suspension crossmember to frame rail torque boxes.

REAR SUSPENSION CROSSMEMBER

DESCRIPTION

This vehicle is equipped with a bolt in type rear suspension crossmember. The crossmember on this vehicle is the same for all of the optional suspensions that are available on the vehicle.

REAR SUSPENSION CROSSMEMBER (Continued)

REMOVAL

(1) Raise vehicle on jackstands or centered on a frame contact type hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - SERVICE PROCEDURE).

(2) Remove both rear wheel and tire assemblies from the vehicle.

(3) Remove the shock absorber clevis bracket to rear knuckle attaching bolt and nut on both sides of the vehicle (Fig. 15).

(4) Remove muffler support bracket from rear frame rail (Fig. 16).

(5) Remove the rear exhaust pipe hanger from the rear suspension crossmember (Fig. 17). Let exhaust system drop down as far as possible.

(6) Position a transmission jack and wooden block under the center of the rear suspension crossmember to support and lower crossmember during removal (Fig. 18).

(7) If vehicle is equipped with antilock brakes, remove routing clips for wheel speed sensor cable from brackets on upper control arm (Fig. 19).

(8) Remove the nuts and bolts on each side of vehicle attaching the 4 lateral links to the knuckles.

(9) Remove the 4 bolts attaching the rear suspension crossmember to rear frame rails (Fig. 20).

(11) Lower the rear suspension crossmember, lateral arms and stabilizer bar as far as possible using the transmission jack. Then with the aid of a helper remove rear suspension crossmember from the vehicle.

NOTE: When installing the lateral links on the crossmember, the lateral link attaching bolts must be installed as listed below. Install the forward lateral link to crossmember bolts so that the head of the bolt will be toward the front of the vehicle when the crossmember is installed. Install the rear lateral link to crossmember bolts so that the threaded end of the bolt will be facing toward the front of the vehicle when the crossmember is installed.

(12) Transfer the lateral links, stabilizer bar mounting brackets and the stabilizer bar and bushings to the replacement crossmember before installing the replacement crossmember in the vehicle.

Tighten the stabilizer bar mounting bracket to rear crossmember mounting bolts to 27 N·m (20 ft. lbs.) torque. Tighten the 4 lateral link to crossmember attaching bolts to 95 N·m (80 ft. lbs.) torque.

INSTALLATION

(1) Install the rear suspension crossmember, lateral arms and rear stabilizer bar back into the vehicle as an assembly.

(2) With the aid of a helper position rear suspension crossmember back in vehicle and support it using the transmission jack.

(3) Align the upper control arm pivot bars with the mounting holes in the rear suspension crossmember. Install and tighten the 4 pivot bar to crossmember attaching bolts (Fig. 21) to 107 N·m (80 ft. lbs.) torque.

(4) Using transmission jack, raise rear suspension crossmember up to the rear frame rails and loosely install the 4 attaching bolts.

(5) Position a drift of the appropriate size into the positioning hole in each side of rear suspension crossmember and locating holes in the frame rail of the body. (Fig. 22). This is required to properly position rear suspension crossmember side-to-side and front-to-rear in the body of the vehicle. Then tighten the 4 crossmember to frame rail attaching bolts to 95 N·m (70 ft. lbs.) torque. Remove drifts from rear suspension crossmember.

(6) Align lateral links with knuckles and install the lateral arm to knuckle attaching bolts. Tighten the 4 lateral arm to spindle attaching bolts to 95 N·m (70 ft. lbs.) torque.

(7) Remove transmission jack supporting rear suspension crossmember.

(8) Install muffler support bracket on rear frame rail (Fig. 16). Install rear exhaust pipe hanger on rear suspension crossmember (Fig. 17).

(9) If vehicle is equipped with antilock brakes, install the wheel speed sensor cable routing clip on upper control arm mounting bracket (Fig. 19). Install and securely tighten attaching bolt.

(10) Install wheel and tire assembly on vehicle. Tighten the wheel mounting stud nuts in proper sequence until all nuts are torqued to half specification. Then repeat the tightening sequence to the full specified 129 N·m (95 ft. lbs.) torque.

(11) Lower vehicle to the ground.

(12) Check and reset if required, rear wheel alignment to meet the preferred specifications.

FRONT TOW HOOK

REMOVAL

(1) Raise vehicle and support on safety stands.

(2) Remove bolts (Fig. 23).

(3) Remove tow hook from vehicle.

2 - TOW HOOK (RECOVERY BRACKET)

INSTALLATION

(1) Place tow in position.

(2) Install bolts (Fig. 23). Tighten to 55 to 115 N·m (55 to 85 ft. lbs.) torque.

(3) Remove safety stands and lower vehicle.

FUEL SYSTEM

TABLE OF CONTENTS

FUEL DELIVERY

TABLE OF CONTENTS

FUEL DELIVERY

DESCRIPTION

The front wheel drive car uses a plastic fuel tank located rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is replaceable, it is mounted on the outside and on top of the fuel tank. Refer to the Maintenance Schedules in the Introduction section of this manual for recommended fuel filter replacement intervals.

OPERATION

The fuel system is provided fuel pressure by an in-tank pump module. The PCM controls the operation of the fuel system by providing battery voltage to the fuel pump through the fuel pump relay. The PCM requires only three inputs and a good ground to operate the fuel pump relay. The three inputs are:

- Ignition voltage
- Crankshaft Position (CKP) sensor
- Camshaft Position (CMP) sensor

DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Appropriate Diagnostic Information)

STANDARD PROCEDURE

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE

(1) Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(2) Start and run engine until it stalls.

(3) Attempt restarting engine until it will no longer run.

(4) Turn ignition key to OFF position.

(5) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

(6) Return fuel pump relay to PDC.

(7) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB III® scan tool must be used to erase a DTC.

STANDARD PROCEDURE - DRAINING FUEL TANK

Two different procedures may be used to drain fuel tank (lowering tank or using DRB scan tool).

The quickest draining procedure involves lowering the fuel tank.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRBIII® scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures. Disconnect the fuel line at the fuel rail and remove the plastic retainer from the fuel rail. Take plastic retainer and install it back into the fuel line from body. Attach end of special test hose tool number 6539 at fuel line connection from the body line. Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty. When done remove the special test hose tool number 6539 from the body line. Remove the plastic retainer from the special test hose tool number 6539 and reinstall it into the fuel line from the body. Install the fuel line to the fuel rail.

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

(1) Remove fuel filler cap.

(2) Perform the Fuel System Pressure Release procedure.

(3) Disconnect negative cable from battery.

(4) Raise vehicle and support.

(5) Certain models are equipped with a separate grounding wire (strap) connecting the fuel fill tube assembly to the body. Disconnect wire by removing screw.

(6) Open fuel fill door and remove screws mounting fuel filler tube assembly to body. Do not disconnect rubber fuel fill or vent hoses from tank at this time.

(7) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.

(8) Remove fuel tank mounting strap nuts from mounting strap studs.

(9) **Lower the tank just enough so that the filler tube fitting is the highest point of the fuel tank.**

FUEL DELIVERY (Continued)

(10) Remove filler tube from fuel tank. Tank will be drained through this fitting.

WARNING: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(11) Drain fuel tank into holding tank or a properly labeled **Gasoline** safety container.

CAUTION: GASOLINE OR GASOLINE VAPORS ARE HIGHLY FLAMMABLE. A FIRE COULD OCCUR IF AN IGNITION SOURCE IS PRESENT. NEVER DRAIN OR STORE GASOLINE OR DIESEL FUEL IN AN OPEN CONTAINER, DUE TO THE POSSIBILITY OF FIRE OR EXPLOSION.

(12) If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this section.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge level sending unit is attached to the side of fuel pump module. The level sensor is a variable resistor.

OPERATION

Its resistance changes with the amount of fuel in the tank. The float arm attached to the sensor moves as the fuel level changes.

The fuel level input is used as an input for OBD II. If the fuel level is below 15% or above 85% of total tank capacity several monitors are disabled. There are diagnostics for the level circuit open and shorted.

REMOVAL

Remove fuel pump module. Refer to Fuel Pump Module in this section.

(1) Depress retaining tab and remove the fuel pump/level sensor connector from the bottom of the fuel pump module electrical connector (Fig. 1).

INSTALLATION

(1) Insert level sensor wires into bottom of opening in module.

(2) Wrap wires into groove in back of level sensor.

(3) While feeding wires into guide grooves, slide level sensor up into channel until it snaps into place. Ensure tab at bottom of sensor locks in place.

(4) Install level sensor wires in connector. Push the wires up through the connector and then pull them down until they lock in place. Ensure signal and ground wires are installed in the correct position.

(5) Install locking wedge on connector.

(6) Push connector up into bottom of fuel pump module electrical connector.

(7) Install fuel pump module. Refer to Fuel Pump Module in this section.

FUEL PRESSURE REGULATOR

DESCRIPTION

A combination fuel filter and fuel pressure regulator is used on all gas powered engines. It is located on the top of the fuel pump module.

It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter (Fig. 5) is also part of the assembly.

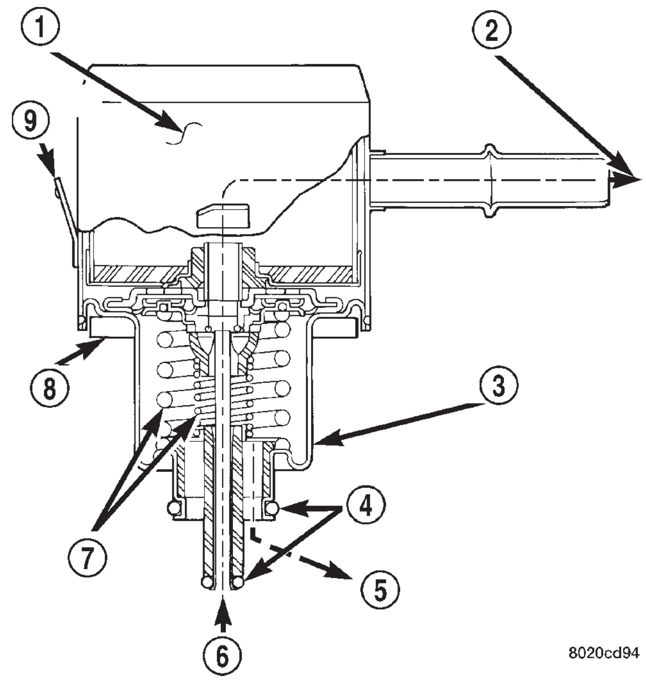

Fig. 5 Side View—Filter/Regulator

4 - O-RINGS
5 - EXCESS FUEL BACK TO TANK
6 - FUEL INLET
7 - CALIBRATED SPRINGS
8 - RUBBER GROMMET AT PUMP MODULE
9 - LOCKING TAB

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is calibrated to maintain fuel system operating pressure of approximately 400 kPa ±34 kPa (58 psi ±5 psi.) at the fuel injectors.

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 5).

The fuel pump module contains a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine.

If fuel pressure at the pressure regulator exceeds approximately 58 psi, an internal diaphragm closes and excess fuel pressure is routed back into the tank through the pressure regulator. A separate fuel return line is not used with any gas powered engine.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE, EVEN WITH ENGINE OFF. BEFORE SERVICING THE FUEL FILTER/FUEL PRESSURE REGULATOR, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Refer to Fuel System Pressure Release in the Fuel Delivery System section of this group. The fuel filter/fuel pressure regulator is located on the top of fuel pump module. Fuel pump module removal is not necessary.

(2) Raise vehicle on hoist.

(3) Remove fuel tank, refer to the Fuel Tank Removal (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).

(4) Disconnect fuel supply line at the Filter/Regulator nipple (refer to Quick Connect Fittings in this section).

(5) Depress locking spring tab on side of Fuel/Regulator (Fig. 6) and rotate 90° counter-clockwise and pull out.

NOTE: Make sure that the upper and lower O-rings are on the Filter/Regulator assembly.

INSTALLATION

Lightly lubricate the O-rings with engine oil.

(2) While applying downward pressure, rotate the Filter/Regulator clockwise until the the spring tab engages the locating slot (Fig. 7).

(3) Install the fuel tank, refer to Fuel Tank Installation (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).

(4) Connect the fuel line to the Filter/Regulator.

(5) Lower vehicle from hoist.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor. The fuel pump module is suspended in fuel in the fuel tank.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains a check valve. The valve, in the pump outlet, maintains pump pressure during engine off conditions, for a short while. It is normal for fuel pressure to drop to zero after cooldown. The fuel pump relay provides voltage to the fuel pump. The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 kpa ±34 kpa (58 psi ± 5 psi).

NOTE: Checkvalve maintains volume of fuel in the rail and lines, not pressure.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module contains the fuel pump, fuel reservoir, level sensor, inlet strainer, and fuel pressure regulator/filter (Fig. 8).

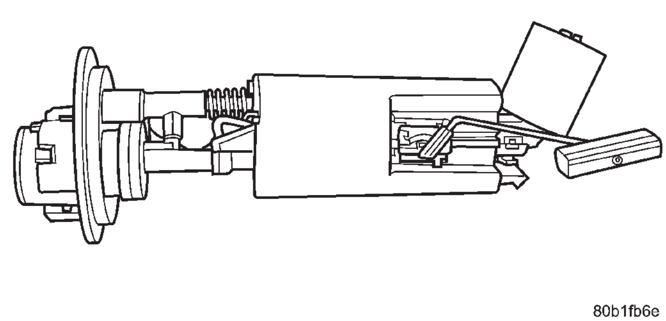

Fig. 8 FUEL PUMP MODULE

OPERATION

The Chrysler fuel pump module is an in-tank unit with an integral fuel level sensor and pressure regulator. The pump is driven by a 12 volt DC motor any time the fuel pump relay is energized. Serviceable components on the module include:

- Inlet strainer
- Fuel level sensor

FUEL PUMP MODULE (Continued)

- Fuel Filter/Pressure regulator

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains two check valves. One valve relieves internal fuel pump pressure and regulates maximum pump output. The second valve, in the pump outlet, maintains pump pressure during engine off conditions.

The fuel system use a positive displacement, gerotor, with a permanent magnet electric motor. This fuel system does not contain the traditional fuel return lines. The regulator contains a calibrated spring which forces a diaphragm against the fuel filter return port. When pressure exceeds the calibrated amount, the diaphragm retracts, allowing excess pressure and fuel to vent into the tank.

The maximum deadhead pressure is approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 ±34 kPa (58 ± 5 psi).

The inlet strainer, level sensor and fuel pressure regulator/filter are the only serviceable items.

REMOVAL

(1) Release fuel pressure, Refer to Fuel System Pressure Release Procedure in the Fuel Delivery section.

(2) Remove Fuel Tank refer to the Fuel Tank Removal/Installation in this group.

WARNING: THE FUEL RESERVOIR OF THE FUEL PUMP MODULE DOES NOT EMPTY OUT WHEN THE TANK IS DRAINED. THE FUEL IN THE RESERVOIR WILL SPILL OUT WHEN THE MODULE IS REMOVED.

(3) Disconnect fuel line from fuel pump module by depressing quick connect retainers with thumb and fore finger.

(4) Slide fuel pump module electrical connector lock to unlock.

(5) Disconnect the electrical connection from the fuel pump module, by pushing down on connector retainer and pulling connector off of module.

(6) Use Special Tool #6856 to remove fuel pump module locknut (Fig. 9).

(7) Remove fuel pump and O-ring seal from tank. Discard old seal.

INSTALLATION

(1) Wipe seal area of tank clean and place a new seal in position in the tank opening.

(2) Position fuel pump in the tank. Make sure the alignment tabs on the underside of the fuel pump module flange sits in the notches on the fuel tank (Fig. 10).

(3) Position the locknut over the fuel pump module.

(4) Tighten the locknut using Special Tool #6856 to 55 N·m (40.5 ft. lbs.).

CAUTION: Over tightening the pump lock ring may result in a leak.

(5) Connect the electrical connector.

(6) Connect the fuel line to the fuel pump.

(7) Install the fuel tank, refer to fuel tank installation (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).

(8) Lower vehicle.

(9) Connect the battery cable.

(10) Fill fuel tank. Use the DRB III® scan tool to pressurize the fuel system. Check for leaks.

FUEL RAIL

REMOVAL

REMOVAL - 4 CYLINDER

(1) Perform fuel system pressure release procedure **before servicing or starting repairs.** Refer to Fuel System Pressure Release Procedure in this section.

(2) Disconnect negative cable from battery.

(3) Remove wiring harness from fuel rail support bracket (Fig. 11).

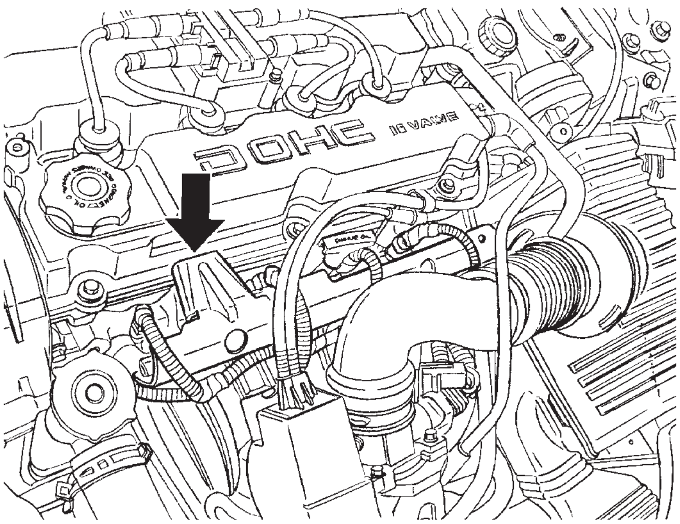

Fig. 11 FUEL RAIL AND BRACKET

(4) Remove fuel rail support bracket.

(5) Disconnect the wiring connectors for fuel injectors harness (Fig. 12).

(6) Remove wiring harness from fuel rail brackets.

(7) Disconnect the connectors from the fuel injectors.

(8) Remove throttle and speed control cables from the fuel rail (Fig. 13).

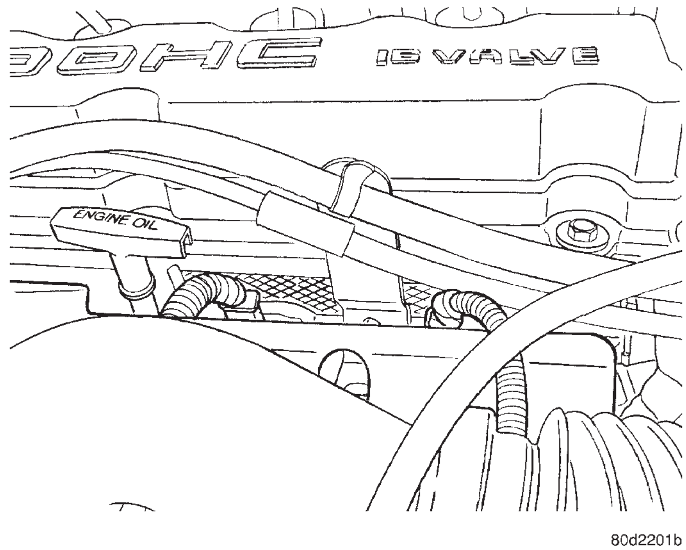

Fig. 13 THROTTLE AND SPEED CONTROL CABLE

(9) Remove fuel hose quick connect fitting from the chassis tube. **Refer to Fuel Hoses, Clamps and Quick Connect Fittings in this Section.** Place a shop towel under the connections to absorb any fuel spilled from the fitting.

WARNING: WRAP A SHOP TOWEL AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(10) Remove fuel rail attaching bolts.

(11) Remove fuel rail. Be careful not to damage the injector O-rings upon removal from their ports.

REMOVAL - 2.7L

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL RAIL. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

(1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.

(2) Disconnect the negative battery cable.

(3) Remove intake manifold plenum. Refer to the Engine section for information.

(4) Remove intake manifold plenum mounting bolts. Lift Plenum up off of engine. Cover intake manifold to prevent foreign material from entering engine.

FUEL RAIL (Continued)

(5) Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.

(6) If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder (Fig. 14).

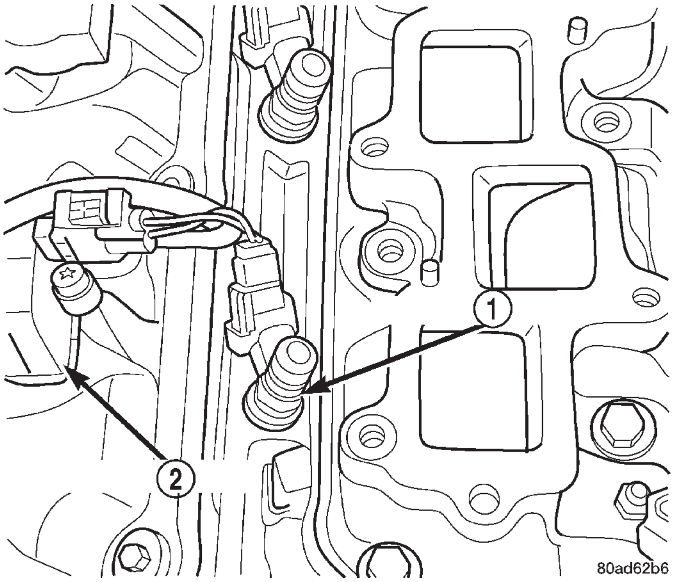

Fig. 14 Injector Electrical Connectors

(7) Remove electrical connectors from the fuel injectors.

(8) Remove mounting bolts on both sides of fuel rail.

(9) Lift fuel rail straight up off of cylinder head.

(10) Remove retaining clips from fuel injectors at fuel rail.

(11) Remove fuel injector from fuel rail.

INSTALLATION

INSTALLATION - 4 CYLINDER

(1) Ensure injector holes are clean. Replace O-rings if damaged.

(2) Lubricate injector O-rings with a drop of clean engine oil to ease installation.

(3) Put the tip of each injector into their ports. Push the assembly into place until the injectors are seated in the ports.

(4) Install the 2 fuel rail mounting bolts to intake manifold. Tighten bolts to 11.9 N·m (105 in. lbs.) torque.

(5) Install the fuel rail mounting bolt to cylinder head. Tighten bolt to 22 N·m (195 in. lbs.) torque

(6) Connect the connectors to the fuel injectors.

(7) Install fuel rail support bracket and loosely install all bolts (Fig. 11).

(8) Tighten three fasteners to intake manifold to 28.3 N·m (250 in. lbs.) torque.

(9) Tighten two bolts to fuel rail to 8.5 N·m (75 in. lbs.) torque.

(10) Install wiring harness to brackets (Fig. 12).

(11) Connect the throttle and speed control cables to fuel rail bracket (Fig. 13).

(12) Connect negative battery cable.

(13) Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

INSTALLATION - 2.7L

(1) Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.

(2) Install retaining clips on fuel injectors.

(3) Push injectors into fuel injector rail until clips are in the correct position.

(4) Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 11.9 N·m (105 in. lbs.) torque.

(5) Connect the fuel supply tube quick connect fitting to the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section.

(6) Connect the electrical connectors to the fuel injectors.

(7) Install intake manifold plenum. Refer to the Engine section for information.

(8) Connect negative cable to battery.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module. The tank is made from High density Polyethylene (HDPE) material.If equipped with ORVR (Onboard Refueling Vapor Recovery) it has been added to the fuel tank to control refueling vapor emissions.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two rollover valves mounted into the top of the fuel tank (or pump module).

An evaporation control system is connected to the rollover valve(s)/control valve(Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ORVR - OPERATION) to reduce emissions of fuel

FUEL TANK (Continued)

vapors into the atmosphere, when the tank is vented due to vapor expansion in the tank. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hoses/tubes to the charcoal canister(s) for temporary storage (prior to being drawn into the intake manifold). All models are equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to the Emission Control System for additional information.

INLET CHECK VALVE

All vehicles have an inlet check valve on the inside of the fuel tank at the filler inlet

The valve prevents fuel from splashing back on customer during vehicle refueling. The valve is a non-serviceable item.

REMOVAL

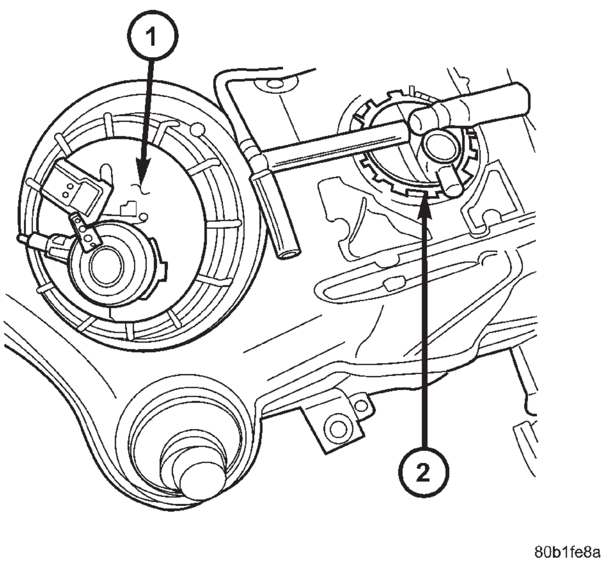

Fig. 15 FUEL TANK

1 - Fuel Pump Module
2 - ORVR Control Valve

(1) Remove fuel filler cap and perform Fuel System Pressure Release procedure.

(2) Disconnect negative cable from battery.

(3) Drain fuel tank dry into holding tank or a properly labeled **GASOLINE** safety container.

(4) Raise vehicle on hoist and support.

(5) Use a transmission jack to support fuel tank. Remove bolts from fuel tank straps.

(6) Lower tank slightly.

(7) Disconnect the fuel filler vent tube.

(8) Disconnect fuel line and vapor line.

(9) Disconnect the vacuum line from the LDP.

(10) Disconnect fuel filler tube by loosing the clamp and removing hose.

(12) Push down on connector retainer and pull connector off module.

(13) Lower tank from vehicle (Fig. 15) and (Fig. 16).

FUEL TANK (Continued)

INSTALLATION

(1) Position fuel tank on transmission jack.

(2) Raise tank into position and carefully work filler tube onto the fuel tank. A light coating of clean engine oil on the tube end may be used to aid assembly. Connect fuel filler tube hose and tighten clamp.

(3) Connect fuel pump/module electrical connector. Place retainer in locked position.

(4) Connect the EVAP, vapor, and vacuum lines.

(5) Lubricate the fuel supply line with clean 30 weight engine oil, install the quick connect fuel fitting. Refer to Tube/Fitting Assembly in the Fuel Delivery section of this section.

(6) Attach filler vent line to filler tube. Pull on connector to make sure of connection.

(7) Place LDP air filter under right rear tank strap before tightening.

(8) Tighten strap bolts to 54 N·m (40 ft. lbs.) torque. Remove transmission jack.

(9) Tighten filler hose clamp to 3.6 N·m (31.8 in. lbs.).

CAUTION: Ensure straps are not twisted or bent before or after tightening strap nuts.

(10) Fill fuel tank, replace cap, and connect battery negative cable.

(11) Use the DRBIII® scan tool to pressurize the fuel system. Check for leaks.

FUEL TANK FILLER TUBE

REMOVAL

(1) Disconnect negative cable from battery.

(2) Drain fuel tank.

(3) Remove 3 screws from filler neck to quarter panel (Fig. 18).

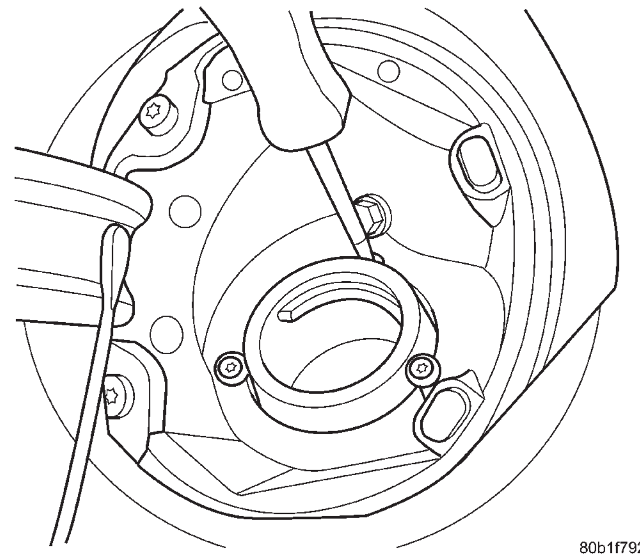

Fig. 18 FILLER DOOR

(4) Raise and support vehicle on host.

(5) Remove the ground strap (Fig. 19).

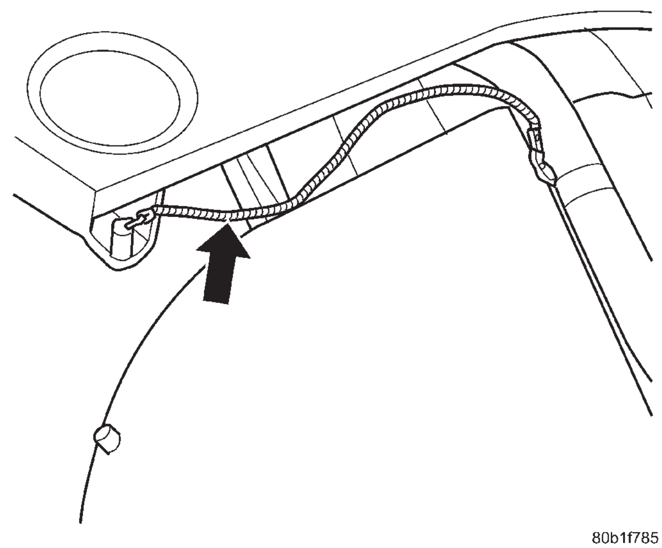

Fig. 19 GROUND STRAP

(6) Loosen clamps at filler neck.

(7) Remove filler neck from the fuel tank.

(8) Use transmission jack to support the fuel tank.

(9) Remove the rear bolts for fuel tank straps.

(10) Lower the fuel tank enough to reach the filler tube vent line connection.

(11) Disconnect the filler tube vent line.

(12) Remove the fuel filler tube.

INSTALLATION

(1) Install filler neck to filler hose.

(2) Connect the fuel filler vent tube.

(3) Raise fuel tank into position.

(4) Install fuel tank straps and tighten bolts to 54 N·m (39.8 ft. lbs).

(5) Remove the transmission jack.

(6) Tighten clamps 3.6 N·m (31.8 in. lbs.).

(7) Install ground strap (Fig. 19) 7.5 N·m (66 in. lbs.).

(8) Lower vehicle.

(9) Install 3 screws to filler neck and quarter panel (Fig. 18) 1.9 N·m (16 in. lbs.).

(10) Fill tank and check for leaks.

(11) Connect negative cable from battery.

FUEL TANK VENT TUBE

REMOVAL

(1) Perform fuel system pressure release.
(2) Disconnect negative cable from battery.
(3) Drain fuel tank.
(4) Raise and support vehicle on host.
(5) Lower fuel tank, refer to Fuel Tank Removal/Installation in this section.
(6) Remove vent hose from top of tank.
(7) Remove vent hose from fuel filler neck.

INSTALLATION

(1) Install vent hose and tighten clamp.
(2) Install fuel tank, refer to Fuel Tank Removal/Installation in this section.
(3) Install vent hose to fuel filler neck and tighten clamp.
(4) Lower vehicle.
(5) Fill fuel tank and check for leaks.
(6) Connect negative cable to battery.

INLET FILTER

REMOVAL

(1) Remove fuel pump module. Refer to Fuel Pump Module Removal in this section.
(2) Using a thin straight blade screwdriver, pry back the locking tabs on fuel pump reservoir and remove the strainer (Fig. 20).

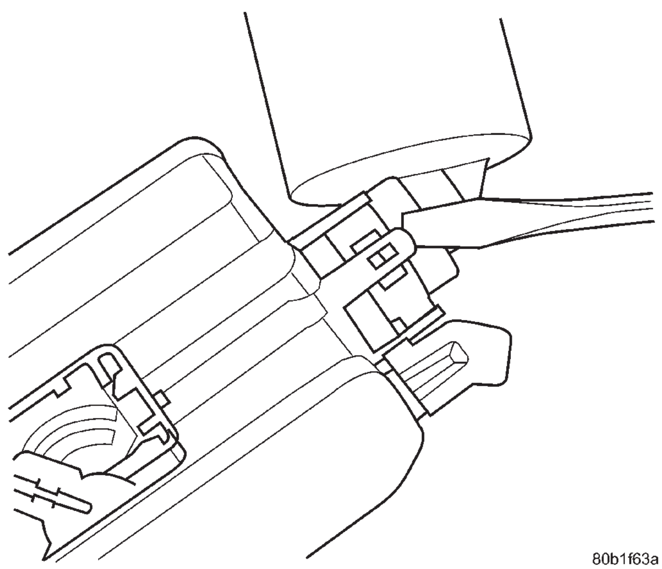

Fig. 20 INLET STRAINER

(3) Remove strainer O-ring from the fuel pump reservoir body (Fig. 21).
(4) Remove any contaminants in the fuel tank by washing the inside of the fuel tank.

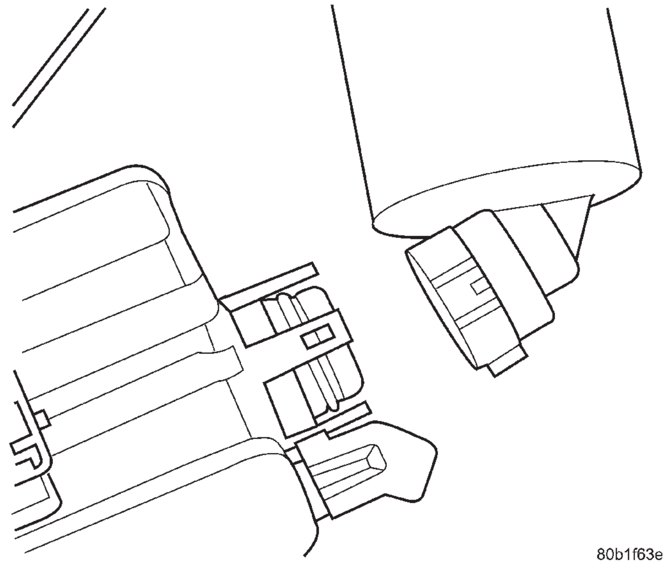

Fig. 21 INLET STRAINER REMOVED

INSTALLATION

(1) Lubricate the strainer O-ring with clean engine oil.
(2) Insert strainer O-ring into outlet of strainer so that it sits evenly on the step inside the outlet.
(3) Push strainer onto the inlet of the fuel pump reservoir body. Make sure the locking tabs on the reservoir body lock over the locking tangs on the strainer.
(4) Install fuel pump module. Refer to Fuel Pump Module Installation in this section.

QUICK CONNECT FITTING

STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

REMOVAL

When disconnecting a quick-connect fitting, the retainer will remain on the fuel tube nipple.

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE DISCONNECTING A QUICK-CONNECT FITTINGS. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE.

(1) Perform Fuel Pressure Release Procedure. Refer to the Fuel Pressure Release Procedure in this section.
(2) Disconnect negative cable from battery or auxiliary jumper terminal.
(3) Squeeze retainer tabs together and pull fuel tube/quick-connect fitting assembly off of fuel tube nipple. The retainer will remain on fuel tube.

QUICK CONNECT FITTING (Continued)

INSTALLATION

CAUTION: Never install a quick-connect fitting without the retainer being either on the fuel tube or already in the quick-connect fitting. In either case, ensure the retainer locks securely into the quick-connect fitting by firmly pulling on fuel tube and fitting to ensure it is secured.

(1) Using a clean lint free cloth, clean the fuel tube nipple and retainer.

(2) Prior to connecting the fitting to the fuel tube, coat the fuel tube nipple with clean 30 weight engine oil.

(3) Push the quick-connect fitting over the fuel tube until the **retainer seats and a click is heard.**

(4) The plastic quick-connect fitting has windows in the sides of the casing. When the fitting completely attaches to the fuel tube, the retainer locking ears and the fuel tube shoulder are visible in the windows. If they are not visible, the retainer was not properly installed (Fig. 22). **Do not rely upon the audible click to confirm a secure connection.**

(5) Connect negative cable to battery or auxiliary jumper terminal.

CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) Relay remains energized for several minutes, until the test is stopped, or until the ignition switch is turned to the Off position.

(6) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting (Fig. 23). These tabs are supplied for disconnecting the quick-connect fitting from component being serviced.

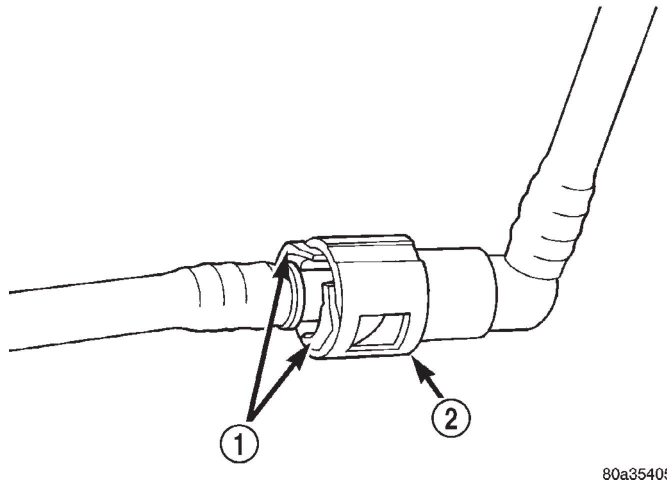

Fig. 23 Typical Two-Tab Type Quick-Connect Fitting

1 - TAB(S)
2 - QUICK-CONNECT FITTING

CAUTION: The interior components (O-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 23) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is discon-

nected. The O-rings and spacer will remain in quick-connect fitting connector body.

(5) Inspect quick-connect fitting body and component for damage. Replace as necessary.

CAUTION: When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

(6) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(7) Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.

(8) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(9) Connect negative cable to battery or auxiliary jumper terminal.

(10) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 24) usually black in color.

CAUTION: The interior components (O-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.

(2) Disconnect negative battery cable from battery or auxiliary jumper terminal.

(3) Clean fitting of any foreign material before disassembly.

(4) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 24). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(5) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(6) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(8) Insert quick-connect fitting into component being serviced until a click is felt.

(9) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(10) Connect negative battery cable to battery or auxiliary jumper terminal.

(11) Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

FUEL INJECTION

TABLE OF CONTENTS

FUEL INJECTION

OPERATION

OPERATION - INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

OPERATION - MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

(1) Engine coolant temperature must be over 35°F.

- If the coolant is over 35° the PCM will wait 38 seconds.
- If the coolant is over 50°F the PCM will wait 15 seconds.
- If the coolant is over 167°F the PCM will wait 3 seconds.

(2) For other temperatures the PCM will interpolate the correct waiting time.

(3) O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

(4) The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide Open Throttle
- Ignition switch OFF

(5) The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately

FUEL INJECTION (Continued)

1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content
- A/C control positions
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

FUEL INJECTION (Continued)

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C sense
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C sense
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL CORRECTION or ADAPTIVE MEMORIES

DESCRIPTION

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30 to 35° F, the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

OPERATION

Short Term

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O2 Sensor input. The maximum range of

FUEL INJECTION (Continued)

authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

Ther number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells is a specific MAP voltage range Typical Adaptive Memory Fuel Cells .

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O2 Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.
