## Introduction

This service manual describes the service procedures for the CBR1000F.

This Model Specific Manual includes every service procedure that is of a specific nature to this particular model. Basic service procedures that are common to other Honda Motorcycle/Motor Scooter/ATVs are covered in the Common Service Manual. This Model Specific Service Manual should be used together with the Common Service Manual in order to provide complete service information on all aspects of this motorcycle.

Performing the first scheduled maintenance is very important. It compensates for the initial wear that occurs during the break-in period.

Sections 1 and 3 apply to the whole motorcycle. Section 2 illustrates procedures for removal/installation of components that may be required to perform service described in the following sections.

Sections 4 through 17 describe parts of the motorcycle, grouped according to location.

Find the section you want on this page, then turn to the table of contents on the first page of the section.

Most sections describe the service procedure through system illustration. Refer to the next page for detail on how to use this manual.

If you are not familiar with this motorcycle, read Technical Feature in section 19.

If you don't know the source of the trouble, go to section 20 Troubleshooting.

All information, illustrations, directions and specifications included in this publication are based on the latest product information available at the time of approval for printing. Honda Motor Co.,LTD. reserves the right to make changes at any time without notice and without incurring any obligation whatever. No part of this publication may be reproduced without written permission. This manual is written for persons who have acquired basic knowledge of maintenance on Honda motorcycles, motor scooters or ATVs.

**Important Safety Notice** 

AWARNING

Indicates a strong possibility of severe personal injury or death if instructions are not followed.

**CAUTION:** 

Indicates a possibility of personal injury or equipment damage if instructions are not followed.

NOTE:

Gives helpful information.

Detailed descriptions of standard workshop procedures, safety principles and service operations are not included. It is important to note that this manual contains some warnings and cautions against some specific service methods which could cause PERSONAL INJURY to service personnel or could damage a vehicle or render it unsafe. Please understand that those warnings could not cover all conceivable ways in which service, whether or not recommended by Honda, might be done or of the possibly hazardous consequences of each conceivable way, nor could Honda investigate all such ways. Anyone using service procedures or tools, whether or not recommended by Honda,must satisfy himself thoroughly that neither personal safety nor vehicle safety will be jeopardized by the service method or tools selected.

## **Type Codes**

· Throughout this manual, the following abbreviations are used to identify individual model.

| Code       | Area Type                          |

## **How To Use This Manual**

## **Finding The Information You Need**

 This manual is devided into sections which cover each of the major components of the motorcycle.

To quickly find the section you are interested in, the first page of each sections is marked with a black tab that lines up with one of the thumb index tabs before this page.

The first page of each section lists the table of contents within the section.

Read the service information and troubleshooting related to the section before you begin working.

 An index of the entire book is provided in the last chapter to directly locate the information you need.

## Note On The Explanation Method Of This Manual

- The removal and installation of parts are for the most part illustrated by large and clear illustrations that should provide the reader with visual aid in understanding the major point for servicing.
- The system illustrations are augmented by call outs whose numbers or letters indicate the order in which the parts should be removed or installed.
- The sequence of steps represented numerically are differentiated from the ones represented alphabetically to notify the reader that they must perform these steps seperately.
  - For example, if the steps prior and up to camshaft removal are performed with the engine installed, but the subsequent steps like cylinder head removal require engine removal, the callouts are grouped in numerical and alphabetical orders.
- The illustrations may contain symbols to indicate necessary service procedures and precautions that need to be taken.
   Refer to the next page for the meaning of each symbol.
- Also in the illustration is a chart that lists information such as the order in which the parts is removed/installed, the name of the
  part, and some extra notes that may needed.
- Step by step instructions are provided to supplement the illustrations when datailed explanation of the procedure is necessary
  or illustrations alone would not suffice.
- · Service procedures required before or after the procedure described on that particular page, or inspection/adjustment procedures required following the installation of parts, are described under the title Requisite Service.
- · Standard workshop procedures and knowledge covered in the Common Service Manual are abbreviated in this manual.

# **Symbols**

The symbols used throughout this manual show specific service procedures. If supplementary information is required pertaining to these symbols, it would be explained specifically in the text without the use of the symbols.

|             | Replace the part (s) with new one (s) before assembly.   |
|-------------|--|
| S. TOOL     | Use special tool.  |
| O.P. TOOL   | Use optional tool. These tools are obtained as you order parts.  |
| 10 (1.0, 7) | Torque specification. 10 N•m (1.0 kg-m, 7 ft-lb)   |
| 7 oit       | Use recommended engine oil, unless otherwise specified.  |
| Mo OII      | Use molybdenum oil solution (mixture of the engine oil and molybdenum grease with the ratio 1 : 1).  |
| GREASE      | Use multi-purpose grease (Lithium Based multi-purpose grease NLGI #2 or equivalent).   |
| <b>-</b>    | Use molybdenum disulfide grease (containing more than 3% molybdenum disulfide, NLGI #2 or equivalent).  Example: Molykote®BR-2 plus manufactured by Dow Corning, U.S.A.  Multi-purpose M-2 manufactured by Mitsubishi Oil Japan  |
| -KMPH       | Use molybdenum disulfide paste (containing more than 40% molybdenum disulfide, NLGI #2 or equivalent).  Example: Molykote®G-n Paste manufactured by Dow Corning, U.S.A.  Honda Moly 60 (U.S.A. only)  Rocol ASP manufactured by Rocol Limited, U.K.  Rocol Paste manufactured by Sumico Lubricant, Japan |
| FISH        | Use silicone grease.   |
| FOCK        | Apply a locking agent. Use the agent of the middle strength, unless otherwise specified.   |
| SEADS       | Apply sealant.   |
| BRAKE       | Use brake fluid DOT 4. Use the recommended brake fluid, unless otherwise specified.  |
| FORK        | Use Fork or Suspension Fluid.  |

# **General Safety**

#### Carbon Monoxide

If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in an enclosed area.

### AWARNING

 The exhaust contains poisonous carbon monoxide gas that can cause loss of consciousness and may lead to death.

Run the engine in an open area or with an exhaust evacuation system in an enclosed area.

#### Gasoline

Work in a well ventilated area. Keep cigarettes, flames or sparks away from the work area or where gasoline is stored.

## AWARNING

 Gasoline is extremely flammable and is explosive under certain conditions. KEEP OUT OF REACH OF CHILDREN.

## **Hot Components**

## AWARNING

 Engine and exhaust system parts become very hot and remain hot for some time after the engine is run.
 Wear insulated gloves or wait until the engine and exhaust system have cooled before handling these parts.

### **Used Engine/Transmission Oil**

#### **AWARNING**

 Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil. KEEP OUT OF REACH OF CHILDREN.

#### **Brake Dust**

Never use an air hose or dry brush to clean brake assemblies.

### AWARNING

 Inhaled asbestos fibers have been found to cause respiratory disease and cancer.

#### **Brake Fluid**

#### **CAUTION**

 Spilling fluid on pained, plastic or rubber parts will damage them. Place a clean shop towel over these parts whenever the system is serviced. KEEP OUT OF REACH OF CHILDREN.

#### Coolant

Under some conditions, the ethylene glycol in engine coolant is combustible and its flame is not visible. If the ethylene glycol does ignite, you will not see any flame, but you can be burned.

### **A** WARNING

- Avoid spilling engine coolant on the exhaust system or engine parts. They may be hot enough to cause the coolant to ignite and burn without a visible flame.
- Coolant (ethylene glycol) can cause some skin irritation and is poisonous if swallowed, KEEP OUT OF REACH OF CHILDREN.
- Keep out of reach of pets. Some pets are attracted to the smell and taste of coolant and can die if they drink it.
- Do not remove the radiator cap when the engine is hot. The coolant is under pressure and could scald you.

If it contacts your skin, wash the affected areas immediately with soap and water. If it contacts your eyes, flush them thoroughly with fresh water and get immediate medical attention. If it is swallowed, the victim must be forced to vomit then rinse mouth and throat with fresh water before obtaining medical attention. Because of these dangers, always store coolant in a safe place, away from the reach of children. Recycle used coolant in an ecologically correct manner.

#### Nitrogen Pressure

For shock absorber with a gas-filled reservoir.

#### **A**WARNING

- Use only nitrogen to pressurize the shock absorber.
   The use of an unstable gas can cause a fire or explosion resulting in serious injury.
- The shock absorber contains nitrogen under high pressure. Allowing fire or heat near the shock absorber could lead to and explosion that could result in serious injury.
- Failure to release the pressure from a shock absorber before disposing of it may lead to a possible explosion and serious injury if it is heated or pierced.

To prevent the possibility of an explosion, release the nitrogen by pressing the valve core. Then remove the valve stem from the shock absorber reservoir.

Before disposal of the shock absorber, release the nitrogen by pressing the valve core. Then remove the valve stem from the shock absorber.

### **Battery Hydrogen Gas & Electrolyte**

#### **A**WARNING

- The battery gives off explosive gases; keep sparks, flames and cigarettes away. Provide adequate ventilation when charging.
- The battery contains sulfuric acid (electrolyte).
   Contact with skin or eyes may cause severe burns.
   Wear protective clothing and a face shield.
  - If electrolyte gets on your skin, flush with water.
  - If electrolyte gets in your eyes, flush with water for at least 15 minutes and call a physician.
- · Electrolyte is poisonous.
  - If swallowed, drink large quantities of water or milk and follow with milk of magnesia or vegetable oil and call a physician. KEEP OUT OF REACH OF CHILDREN.

# **Model Identification**

(1) The frame serial number is stamped on the right side of the steering head.

(2) The engine serial number is stamped on the front of the crankcase.

(3) The carburetor identification number is stamped on the rear side of each carburetor.

(4) The color label is attached as shown. When ordering color-coded parts, always specify the designated color code.

Torque specifications listed below are for important fasteners. Others should be tightened to standard torque values listed above.

Notes: 1. Apply sealant to the threads.

- 2. Apply a locking agent to the threads.
- 3. Apply molybdenum disulfide oil to the threads and flange surface.
- 4. Stake.
- 5. Apply oil to the threads and flange surface.
- 6. Apply clean engine oil to the O-ring.
- 7. Apply grease to the threads and flange surface.
- 8. UBS bolt.
- 9. U-nut.
- 10. ALOC bolt.

## **Service Information**

#### AWARNING

- · Gasoline is extremely flammable and is explosive under certain conditions.
- · Serious burns may result if the exhaust system is not allowed to cool before components are removed or serviced.
- Work in a well ventilated area. Smoking or allowing flames or sparks in the working area or where gasoline is stored can cause a fire or explosion.
- · This section covers removal and installation of the frame body panels, fuel tank and exhaust system.
- · Always replace the exhaust pipe gaskets when removing the exhaust pipe from the engine.
- When installing the exhaust pipe, install the all fasteners loosely. Always tighten the exhaust clamps first, then tighten the mounting fasteners. If you tighten the mounting fasteners first, the exhaust pipe may not seat properly.
- · Always inspect the exhaust system for leaks after installation.

# **Troubleshooting**

#### **Excessive Exhaust Noise**

- · Broken exhaust system
- · Exhaust gas leak

#### **Poor Performance**

- · Deformed exhaust system
- · Exhaust gas leak
- Clogged muffler

# **Side Cover**

#### Removal/Installation

Release the clip screw by turning it counterclockwise. Pull the front of the side cover out, then release the boss from the lower fairing rubber grommet.

Release the tabs from the seat cowl, then remove the side cover.

Installation is in the reverse order of removal.

# Seat

#### Removal

Unlock the seat using the ignition key. Release the two hooks from the fuel tank.

Pull the seat rearward and remove it.

### Installation

Installation is in the reverse order of removal

#### NOTE

 At installation, first install the front hooks into the fuel tank, then install the middle and rear hooks into the catches of the grab rail.

## **Seat Cowl**

#### Removal

Remove the seat (page 2-3).

Remove the four grab rail mounting bolts. Remove the grab rail while releasing the seat lock link from the seat lock.

Disconnect the tail/brake light connector.

Remove the seat cowl mounting bolts and collars.

Release the tabs from the frame hooks while pulling the seat cowl backward, then remove the seat cowl.

Remove the hook rubbers.

Remove the three screws and tail/brake light unit.

### Installation

Installation is in the reverse order of removal.

#### NOTE

 At installation, install the hook rubbers securely onto the tabs of the seat cowl.

# Rear Fender

#### Removal

Remove the seat cowl (page 2-4). Disconnect the turn signal connectors.

Remove the trim clips.

Remove the rear fender mounting bolts and nuts, then remove the rear fender A assembly.

Remove the following:

- Bolts
- Turn signal unit
- Setting collars

Remove the ignition control module and turn signal relay from the bracket on the rear fender B.

Pull the rear fender B out of the frame.

#### Installation

Installation is in the reverse order of removal.

#### NOTE

 At installation of the rear fender B, align the boss on the rear fender B with the grommet holes in the battery case.

# **Pivot Cover**

#### Removal/Installation

Remove the side cover (page 2-3).

Remove the two socket bolts.

Release the hook from the frame, then remove the pivot cover.

Installation is in the reverse order of removal.

## **Pivot Under Cover**

## Removal/Installation

#### **A**WARNING

 Do not remove the pivot under cover while the exhaust system is hot.

Remove the pivot covers (page 2-5).

Remove the socket bolts, and pivot under cover.

Installation is in the reverse order of removal.

# **Lower Fairing**

## Removal

Remove the trim clips and maintenance lid.

Remove the trim clips securing the lower fairing and upper

Remove the trim clips connecting the both lower fairings.

Remove the side bumper protector.

Remove the protector cover (page 3-5).

Remove the lower fairing mounting socket bolts and flange bolts.

Remove the retaining clip.

Disconnect the lower hooks then separate and remove the lower fairings.

#### Installation

Installation is in the reverse order of removal.

#### NOTE

· Be careful not to damage the hooks.

# **Upper Fairing**

#### Removal

Remove the lower fairing.

Remove the screws, plastic washers, rubber washer and windscreen.

Remove the windscreen setting nut.

Remove the rearview mirror boot.

Remove the following:

- Bolts
- Rearview mirror
- Setting plate
- Setting rubber

#### NOTE

- At installation, install the setting rubber with its mark facing outward.
- At installation, install the setting plate with its arrow facing out and forward as shown.

## Frame/Body Panels/Exhaust System

Remove the socket bolt on each side. Release the tabs and remove the inner covers.

Remove the screws and instrument panel.

Remove the screws and upper cowl inner.

Remove the upper fairing mounting bolts.

Disconnect the headlight sockets and turn signal connectors

Remove the upper faining from the frame.

Remove the screws and turn signal unit. Remove the bolts and headlight unit.

#### Installation

Installation is in the reverse order of removal.

## **Fuel Tank**

### **A** WARNING

 Gasoline is extremely flammable and is explosive under certain conditions. Work in a well ventilated area. Smoking or allowing flames or sparks in the work area or where gasoline is stored can cause a fire or explosion.

Remove the seat and both side covers (page 2-3)

Remove the fuel tank front mounting bolts and washers. Open the fuel tank and support the tank using the support rod.

Disconnect the fuel level sensor wire connector. Disconnect the fuel valve vacuum tube and fuel tube. Disconnect the fuel tank air vent tube.

Remove the B-clip and washer from the support rod.

Remove the pivot bolt/nut and the fuel tank.

#### Installation

Installation is in the reverse order of removal.

#### Torque:

Fuel tank pivot nut: 10 N·m (1.0 Kg-m, 7 ft-lb) Fuel tank mounting bolt: 10 N·m (1.0 Kg-m, 7 ft-lb)

#### NOTE

· After installation, make sure there are not fuel leaks.

# **Exhaust System**

#### **A** WARNING

• Do not service the exhaust system while it is hot.

#### **Muffler Removal**

Remove the pivot covers and pivot under covers (page 2-5, 6).

Loosen the muffler clamp bolts.

Remove the muffler mounting bolts/nuts, then remove the muffler.

Remove the gasket.

## **Exhaust Pipe Removal**

Remove the following:

- Lower fairing (page 2-6)
- Radiator (page 6-4)
- Mufflers

Remove the exhaust pipe joint nuts.

Remove the exhaust pipe mounting bolt and exhaust pipe. Remove the gaskets.

Install the exhaust pipe and mufflers in the reverse order of removal.

### NOTE

- Always replace the exhaust pipe gaskets and muffler gaskets with new ones.
- At installation, loosely install all fasteners, and tighten the exhaust pipe joint nuts first, then tighten the muffler er clamp bolts and the mounting bolts.

#### Torque:

Exhaust pipe joint nut: 17 N·m (1.7 kg-m, 12 ft-lb) Muffler clamp bolt: 22 N·m (2.2 kg-m, 16 ft-lb)

Muffler/exhaust pipe mounting bolt:

22 N·m (2.2 kg-m, 16 ft-lb)

- The follwing shows the locations of the parts that must be removed for the maintenance items listed below. Refer to the Common Service Manual for items not included in this manual.
- Refer to section 2 (Frame/Body Panels /Exhaust System), for the parts that must be removed for service. For example: Air Cleaner (Contamination, clogging, replacement): Parts
  - Fuel tank The part required must be removed for service.

# **Maintenance Schedule**

Perform the Pre-Ride Inspection in the Owner's Manual at each scheduled maintenance period.

I: Inspect and clean, Adjust, Lubricate, or Replace if necessary.

C: Clean, R: Replace, A: Adjust, L: Lubricate

The following items require some mechanical knowledge. Certain items (particularly those marked \*and \*\*) may require more technical information and tools. Consult their authorized Honda dealer.

- \* Should be serviced by your authorized Honda dealer, unless the owner has the proper tools and service data and is mechanically qualified.
- \*\* In the interest of safety, we recommended these items be serviced only by your authorized Honda dealer.

Notes: 1. At higher odometer readings, repeat at the frequency interval established here.

- 2. Service more frequently when riding in unusually wet or dusty areas.
- 3. Service more frequently when riding in rain or at full throttle.
- 4. Replace every 2 years, or at indicated odometer interval, whichever cames first. Replacement requires mechanical skill.
- 5. Switzerland and Austria type only.
- 6. Refer to Common Service Manual.

## Air Cleaner

Remove the right side cover (page 2-3).

Remove the bolt and intake air duct.

Remove the three screws and air cleaner housing cover.

Remove the retainer and air cleaner element.

Replace the element in accordance with the maintenance schedule (page 3-4).

Also, replace the element any time it is excessively dirty or damaged.

Install a new air cleaner element and secure it with the retainer.

Install the removed parts in the reverse order of removal.

## Valve Clearance

## Inspection

## NOTE

- Inspect and adjust the valve clearance while the engine is cold (below 35°C/95°F).
- The special 3 mm hexagon socket wrench is required for valve clearance adjustment. Modify a commercially available hexagon socket wrench as shown in the illustration.

#### Remove the following:

- Fuel tank (page 2-10)
- Cylinder head cover (page 8-2)

Remove the left crankcase protector cover.

Remove the crankshaft hole cap.

Rotate the crankshaft counterclockwise and align the index mark on the ignition pulse generator rotor with the "T" mark on the crankcase.

#### Maintenance

The timing marks ("IN" and "EX") on the cam sprockets must be flush with the cylinder head surface and facing outward as shown.

If the timing marks on the cam sprockets are facing inward, turn the crankshaft clockwise one full turn and realign the timing marks with the cylinder head surface so they are facing outward.

Insert the feeler gauge between the rocker arm slipper surface and the cam lobe.

Check the valve clearance for the No.1 and No.3 cylinder intake valves using the feeler gauge.

Valve clearance : IN: 0.10  $\pm$  0.02 mm (0.004  $\pm$  0.001 in)

Potate the crankshaft counterclockwise 1/2 turn, align the index mark on the ignition pulse generator with the "T" mark on the crankcase.

Check the valve clearance for the No.2 and No.4 cylinder exhaust valves using a feeler gauge.

Valve clearance : EX: 0.18  $\pm$  0.02 mm (0.007  $\pm$  0.001 in)

Turn the crankshaft counterclockwise 1/2 turn, align the timing marks on the cam sprockets are facing inward and flush with the cylinder head surface.

Check the valve clearance for the No.2 and No.4 cylinder intake valves using a feeler gauge.

Valve clearance: IN: 0.10  $\pm$  0.02 mm (0.004  $\pm$  0.001 in)

Turn the crankshaft counterclockwise 1/2 turn, align the Index mark on the igniton pulse generator with the "T" mark on the crankcase.

Check the valve clearance for the No.1 and No.3 cylinder exhaust valves using a feeler gauge.

Valve clearance: EX:  $0.18 \pm 0.02 \text{ mm} (0.007 \pm 0.001 \text{ in})$ 

## **Adjustment**

Loosen the valve adjusting screw lock nut and turn the adjusting screw with the modified 3 mm hexagon socket wrench until there is a slight drag on the feeler gauge.

Lock nut wrench Lock nut wrench 07GMA-ML70120 or 07GMA-KT80120

Hold the adjusting screw with the hexagon wrench and tighten the lock nut.

Torque: 23 N·m (2.3 kg-m, 17 ft-lb)

 The lock nuts will come loose if the proper torque is not applied.

Install the following:

- Cylinder head cover (page 8-2)
- Fuel tank (page 2-10)

#### NOTE

- Refer to section 2 of the Common Service Manual for caburetor synchronization procedure.
- Synchronize the carburetors with the engine at normal operating temperature, transmission in neutral and the motorcycle supported securely on a level surface.

Remove the fuel tank mounting bolts, raise the fuel tank and support it with the support rod (page 2-10).

Disconnect the fuel valve vacuum tube from the No.1 intake port.

Remove the No.2, 3 cylinder intake port rubber cap.

### NOTE

 Remove the No.2, 3 intake port rubber cap by pinching the end of the cap. Do not pinch the cap body or it will be damaged.

Remove the No.4 vacuum plug from the cylinder head intake port.

Screw the adaptors in the No.4 intake port vacuum holes. Connect the vacuum gauge tubes to the No.2, 3 intake ports.

Connect the vacuum gauge tube to the No.1 intake port Connect the vacuum pump to the fuel tank vacuum tube. Operate the pump and open the fuel valve.

Start the engine and adjust the idle speed using the throttle stop screw.

Idle speed: 1,000  $\pm$  100 min<sup>-1</sup> (rpm) (Except SW, AR type) 1,050  $\pm$  50 min<sup>-1</sup> (rpm) (SW type) 1,050  $\pm$  100 min<sup>-1</sup> (rpm) (AR type)

Check the each carburetor intake vacuum pressure is within 20 mm (0.8 in) Hg of the base carburetor.

Synchronize the carburetors by turning the adjusting screws.

## NOTE

- The No.3 carburetor cannot be adjusted; it is the base carburetor.
- The No.3 cylinder intake vacuum pressure is the base vacuum pressure.

Synchronize to specification by turning the adjusting screw with the phillips screwdriver as shown.

Recheck the idle speed and each cylinder intake vacuum pressure so it is within 20 mm (0.8 in) Hg of the base carburetor reading after snapping the throttle grip 3-4 times.

Remove the vacuum gauge tubes.

Install the vacuum plug and rubber caps.

Connect a fuel valve vacuum tube to the No.1 cylinder intake port.

## **Drive Chain**

#### Replacement

#### NOTE

 The CBR1000F uses a drive chain with a staked master link.

Loosen the drive chain.

Assemble the special tool.

S. TOOL

Drive chain cutter – Link plate holder

07HMH-MR10102 07PMH-MZ20110

#### NOTE

When using the special tool, follow the manufacturer's operating instructions.

Locate the crimped pin ends of the master link from the outside of the chain and remove the link with the chain cutter.

Drive chain cutter

Remove the drive chain.

Remove exceeded drive chain link from the new drive chain using the drive chain cutter.

### NOTE

 Include the master link when you count the drive chain links.

Replacement chain: DID.: 50ZV-120ZB

RK: 50LRO-120LJ-FZ

Specified links: 114 links

S. TOOL

**Drive chain Cutter** 

07HMH-MR10102

#### **CAUTION**

 Never reuse the old drive chain, master link, master link plate and O-rings.

Install the new drive chain as shown.

Assemble the new master link, O-rings and plate.

#### **CAUTION**

 Insert the master link from the inside of the drive chain and install the plate with the identification mark facing the outside.

Assemble and set the drive chain cutter.

Check that the master link pins are installed propely by measuring the master link pin length projected from the plate.

Projection: DID: 1.15–1.55 mm (0.045–0.061 in) RK: 1.2–1.4 mm (0.05–0.06 in)

Stake the master link pins.

Make sure that the pins are staked properly by measuring the diameter of the staked area using a slide calipers.

Diameter of the staked area:

DID: 5.5-5.8 mm (0.22-0.23 in) RK: 5.55-5.85 mm (0.219-0.230 in)

After staking, check the staked area of the master link for cracks.

In there is any cracking, replace the master link, O-rings and plate.

#### **CAUTION**

Drive chain with clip-type master link must not be used.

# **Brake Pad Wear**

Visually inspect the brake pad wear.

Replace the brake pads if either pad is worm to the bottom of the wear grooves.

# **Brake System**

#### NOTE

- The CBR1000F is equipped with the Dual Conbined Brake System.
- · Check the front and rear brake operation as follows.

Place the motorcycle on its center stand and shift the transmission into neutral.

Turn the front brake link 8 mm bolt clockwise using a wrench.

Make sure the rear wheel does not turn while the front brake link is turned clockwise.

#### **CAUTION**

 Do not turn the brake link 8 mm bolt counterclockwise or the bolt may be loosened.

Also check the smooth operation of the brake link.

Jack-up the motorcycle and the front wheel off the ground.

Apply rear brake pedal.

Make sure the front wheel does not turn while the rear brake pedal is applied.

# **Headlight Aim**

## **A** WARNING

An improperly adjusted headlight may blind oncoming drivers, or it may fail to light the load for a safe distance.

#### NOTE

 Adjust the headlight beam as specified by local laws and regulations.

Remove the trim clips and maintenance lid.

### Vertical Beam Adjustment

Adjust the vertical beam with the adjusting knobs.

Turn the adjuster knob clockwise, beam moves down. Turn the adjuster knob counterclockwise, beam moves up.

#### Horizontal Beam Adjustment

Adjust the horizontal beam, turning the adjuster using a pillips screwdriver as shown.

#### Left headlight:

Turn the adjuster screw clockwise, headlight beam moves to the left side.

Turn the adjuster screw counterclockwise, beam moves to the right side.

#### Right headlight:

Turn the adjusting screw clockwise, beam moves to the right side.

Turn the adjusting screw counterclockwise, beam moves to the left side.

## Service Information

#### **A**WARNING

- If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that can cause loss of consciousness and may lead to death. Run the engine in an open area or with an exhaust evacuation system in an enclosed area.
- Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this
  is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap
  and water as soon as possible after handling used oil.
- The service procedures in this section must be performed with the engine oil drained.
- · When removing and installing the oil pump use care not to allow dust or dirt to enter the engine.
- If any portion of the oil pump is worn beyond the specified service limits, replace the oil pump as an assembly.
- · After the oil pump has been installed check that there are no oil leaks and that oil pressure is correct.

# **Troubleshooting**

#### Oil Level Low

- Oil consumption
- · External oil leak
- · Worn piston ring or incorrect piston ring installation
- · Worn valve guide or seal

#### Low Or No Oil Pressure

- · Clogged oil orifice
- · Incorrect oil being used

#### No Oil Pressure

- Oil level too low
- · Oil pump drive sprocket broken
- · Oil pump damaged (pump shaft)
- Internal oil leaks

#### Low Oil Pressure

- · Clogged oil strainer screen
- · Oil pump worn or damaged
- · Internal oil leak
- Incorrect oil being used
- · Low oil level

#### **High Oil Pressure**

- · Plugged oil filter, gallery, or metering orifice
- · Incorrect oil being used

# Oil Pump Disassembly/Assembly

## NOTE

- If any portion of the oil pump is worn beyond the specified service limit, replace the oil pump as an assembly.
- · Before assembling them, clean all disassembled parts thoroughly with clean engine oil.
- Refer to section 4 of the Common Service Manual for inspection information.
- Refer to page 1-6 for specification.

## **Service Information**

#### **A** WARNING

- · Gasoline is extremely flammable and is explosive under certain conditions.
- Bending or twisting the control cables will impair smooth operation and could cause the cables to stick or bind, resulting in loss of vehicle control.
- Work in a well ventilated area. Smoking or allowing flames or sparks in the work area or where gasoline is stored can cause a fire or explosion.

#### **CAUTION**

- Be sure to remove the diaphragms before cleaning air and fuel passages with compressed air. The diaphragms might be damaged.
- · Refer to section 2 for fuel tank removal and installation.
- · When disassembling fuel system parts, note the locations of the O-rings. Replace them with new ones on reassembly.
- Before disassembling the carburetor, place the suitable container under the carburetor drain tube loosen the bolt and drain the carburetor.
- After removing the carburetor, wrap the intake ports of the engine with a shop towel or cover it with piece of tape to prevent any foreign material from dropping into the engine.

#### NOTE

• If the vehicle is to be stored for more than one month, drain the float bowls. Fuel left in the float bowls may cause clogged jets resulting in hard starting or poor driveability.

# **Troubleshooting**

#### **Engine Won't Start**

- · Too much fuel getting to the engine
  - Air cleaner clogged
  - Flooded carburetors
- · Intake air leak
- · Fuel contaminated/deteriorated
- · No fuel to carburetor
  - Fuel strainer cloqued
  - Fuel tube clogged
  - Fuel valve stuck
  - Fuel pump malfunction
  - Float level misadjusted
  - Fuel tank breather tube clogged

#### Lean Mixture

- · Fuel jets clogged
- · Float valve faulty
- · Float level too low
- · Fuel line restricted
- · Carburetor air bent tube clogged
- · Intake air leak
- · Fuel pump malfunction
- · Throttle valve faulty
- · Vacuum piston faulty

#### **Rich Mixture**

- · Starting enrichment valve in ON position
- · Float valve faulty
- · Float level too high
- · Air jets clogged
- · Air cleaner element contaminated
- · Flooded carburetor

#### Engine Stall, Hard To Start, Rough Idling

- · Fuel line restricted
- Ignition malfunction
- · Fuel mixture too lean/rich
- · Fuel contaminated/deteriorated
- · Intake air leak
- · Idle speed misadjusted
- · Float level misadjusted
- · Fuel tank breather tube clogged
- · Fuel pump malfunction
- · Pilot screw misadiusted
- · Slow circuit or bystarter circuit clogged
- Emission control system is malfunction (SW, AR type only)

#### Afterburn When Engine Braking Is Used

- · Lean mixture in slow circuit
- Air cut-off valve malfunction (SW,AR type only)
- Emission control system is malfunction (SW, AR type only)
  - Secondary air supply system faulty
  - Loose, disconnected or deteriorated hoses of the emission control system

#### **Backfiring Or Misfiring During Acceleration**

- · Ignition system malfunction
- · Fuel mixture too lean

## Poor Performance (Driveability) And Poor Fuel Economy

- · Fuel system clogged
- · Ignition system malfunction
- · Emission control system is malfunction (SW, AR type only)
  - Secondary air supply system faulty
  - Loose, disconnected or deteriorated hoses of the emission control system

#### Jet Needle Removal/Installation

#### Removal

Remove the vacuum piston (page 5-8)

Temporarily install the 4mm screw or equivalent (Example; vacuum chamber screw).

Pull the screw and remove the jet needle holder.

#### **CAUTION**

- · Be careful not to damage the diaphragm.
- Do not remove the jet needle holder by pushing the jet needle.

Check the O-ring on the jet needle holder is in good condition and replace if necessary.

Apply oil to the O-ring.

Install the jet needle holder into the vacuum piston until you felt the click so that the O-ring is installed into the groove in the vacuum piston.

Install the vacuum piston (page 5-8).

#### Air Funnel Installation

Check the O-ring is in good condition and replace if necessary.

Install the O-ring into the carburetor body groove.

Install the air funnel into the holder.

Align the cut out on the air funnel with the groove in the carburetor body, then install the air funnel/holder.

Install and tighten the air funnel holder screws.

## **Carburetor Body Cleaning**

Clean the fuel strainer in the float valve using the compressed air from the float valve seat side.

## **Carburetor Combination**

### NOTE

- No.3 carburetor is the base carburetor.
- Before tightening the carburetor connecting bolt/nut, check that not clearance between the each carburetor joints.
- Tighten the each connecting bolts/nuts gradually and alternately, be sure the bolt thread projections are equal height. Hold the nut and tighten the other side nut.

## **Pilot Screw Adjustment**

### **Idle Drop Procedure**

#### **A** WARNING

 If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead to death.

#### NOTE

- Make sure the carburetor synchronization is within specification before pilot screw adjustment (page 1 -6).
- The pilot screw is factory pre-set and no adjustment can be done unless it is replaced.
- The engine must be warm for accurate adjustment.
   Ten minutes of stop-and-go riding is sufficient.
- Use a tachometer with graduation of 50 min<sup>-1</sup>(rpm) or smaller that will accurately indicate a 50 min<sup>-1</sup> (rp m) change.
- Turn each pilot screw clockwise until it seats lightly and then back it out to the specification.

Initial Opening: Except SW,AR type: 3turns out SW type: 1-3/4 turns out AR type: 2-5/8 turns out

#### **CAUTION**

- Damage the pilot screw seat will occur if the pilot screw is tightened against the seat.
- 2. Warm up the engine to operating temperature.
- 3. Stop the engine and attach the tachometer according to the manufacturer's instruction .
- 4. Start the engine and adjust the idle speed with the throttle stop screw.

Idle Speed: Except SW,AR type: 1,100 ± 100 min<sup>-1</sup> (rpm) SW type: 1,050 ± 50 min<sup>-1</sup> (rpm) AR type : 1,050 ± 100 min<sup>-1</sup> (rpm)

5. Turn all pilot screws 1/2 turns counterclockwise from the initial setting.

Pilot screw wrench

07908-4220201 (Except SW type) 07KMA-MS60101 (SW type)

- If the engine speed increase by 50 min<sup>-1</sup>(rpm) or more, turn all pilot screws out by successive 1/2 turn increments until engine speed does not increase.
- 7. Adjust the idle speed with the throttle stop screw.
- 8. Turn the No.3 carburetor pilot screw in until the engine speed drops 50 min<sup>-1</sup>(rpm).
- Then turn the No.3 pilot screw counterclockwise 1 (G, SW, AR type: 3/4) turn from the position obtained in step 8.
- 10. Adjust the idle speed with the throttle stop screw.
- 11. Perform steps 8, 9 and 10 for the No.1, 2 and 4 carburetor pilot screw.

## **Service Information**

### **A**WARNING

- Wait until the engine is cool before slowly removing the radiator cap. Removing the cap while the engine is hot and the coolant is under pressure may cause serious scalding.
- · Radiator coolant is toxic. Keep it away from eyes, mouth, skin and clothes.
  - If any coolant gets in your eyes, rinse them water and consult a doctor immediately.
  - If any coolant is swallowed, induce vomiting, gargle and consult a physician immediately.
  - If any coolant gets on your skin or clothes, rinse thoroughly with plenty of water.
- · KEEP OUT OF REACH OF CHILDREN.
- · Add coolant at the reserve tank. Do not remove the radiator cap except to refill or drain the system.
- · All cooling system services can be done with the engine in the frame.
- · Avoid spilling coolant on painted surfaces.
- · After servicing the system, check for leaks with a cooling system tester.
- Refer to section 25 of the Common Service Manual for fan motor switch and thermo sensor inspection.

## **Troubleshooting**

### **Engine Temperature Too High**

- · Faulty radiator cap
- · Insufficient coolant
- · Passages blocked in radiator, hoses or water jacket
- · Air in system
- · Faulty water pump
- · Thermostat stuck closed
- Faulty temperature gauge or thermo sensor
- · Faulty cooling fan motor
- · Faulty fan motor switch

#### **Engine Temperature Too Low**

- · Faulty temperature gauge or gauge sensor
- Thermostat stuck open
- · Faulty cooling fan motor switch

#### **Coolant Leaks**

- · Faulty water pump mechanical seal
- · Deteriorated O-rings
- · Damaged or deteriorated gasket
- · Loose hose connection or clamp
- · Damaged or deteriorated hose

## **Service Information**

• During removal and installation, support the motorcycle using a safety stand or hoist.

### **AWARNING**

- · Do not support the engine using the oil filter.
- The following components can be serviced with the engine installed in the frame.
  - Alternator (Section 14)
  - Clutch/gearshift linkage (Section 9)
  - Cylinder haed/valves (Section 8)
  - Oil cooler (Section 4)
  - Oil pump (Section 4)
  - Water pump (Section 6)
- The following components require engine removal for service.
  - Crankshaft/transmission (Section 10)
  - Shift forks/shift drum (Section 10)

## **Drive Sprocket Removal/Installation**

## **Engine Removal**

#### **A**WARNING

• Do not support the engine using the oil filter.

#### NOTE

- · Support the motorcycle using safety stand or a hoist.
- A floor jack or other adjustable support is required to support and maneuver the engine. The jack height must be continually adjusted to relieve stress for ease of bolt removal.
- Turn the ignition switch OFF and disconnect the battery ground (-) terminal.

## Service Information

- Camshaft lubricating oil is fed through oil passages in the cylinder head. Clean the oil passages before assembling the
  cylinder head.
- Clean all disassembled parts with clean solvent and dry them by blowing them off with compressed air before inspection.
- · When disassembling, mark and store the disassembled parts to ensure that they are reinstalled in their proper locations.

## **Troubleshooting**

- Engine top-end problem usually affect engine performance. These can be diagnosed by a compression or leak down test, or by tracing noises to the top-end with a sounding rod or stethoscope.
- If performance is poor at low speeds, check for white smoke in the crankcase breather tube. If the tube is smoky, check for a seized piston ring.

#### Compression Too Low, Hard Starting Or Poor Performance At Low Speed

- Valves
  - Incorrect valve adjustment
  - Burned or bent valves
  - Incorrect valve timing
  - Broken valve spring
  - Uneven valve seating
- · Cylinder head
  - Leaking or damaged head gasket
  - Warped or cracked cylinder head
- · Cylinder, piston
  - Leaking cylinder head gasket
  - Loose spark plug
  - Worn, stuck or broken piston ring
  - Worn or damaged cylinder and piston

#### Compression Too High, Overheating Or Knocking

Excessive carbon build-up in cylinder head or on top of piston

#### **Excessive Smoke**

- · Cylinder head
  - Worn valve stem or valve guide
  - Damaged stem seal
- · Cylinder, piston
  - Worn cylinder, piston, or piston rings
  - Improper installation of piston rings
  - Scored or scratched piston or cylinder wall

#### **Excessive Noise**

- · Cylinder head
  - Incorrect valve adjustment
  - Sticking valve or broken valve spring
  - Damaged or worn camshaft
  - Loose or worn cam chain
  - Worn or damaged cam chain
  - Worn or damaged cam chain tensioner
  - Worn cam sprocket teeth
- Cylinder, piston
  - Worn cylinder and piston
  - Worn piston pin and piston pin hole

#### Rough Idle

· Low cylinder compression

#### **Camshaft Installation**

Remove the timing hole cap (page 3-5).

Turn the crankshaft counterclockwise and align the index mark on the ignition pulse generator rotor with the "T" mark on the crankcase cover.

#### NOTE

 The camshaft has an "IN" mark for intake, or an " EX" mark for exhaust.

Apply molybdenum disulfide oil to the camshaft journals of the cylinder head and camshaft holder.

Position the cam sprockets onto the camshaft with the timing marks facing left of the engine.

Place the intake and exhaust camshaft onto the cylinder head with the No.1 cylinder cam lobe as shown.

Apply molybdenum disulfide grease to the journal of the holders.

Install each camshaft holder on its original position.

### NOTE

• The camshaft holders have their location marks.

"IN R": Intake right
"IN L": Intake left
"R": Exhaust right
"EX L": Exhaust left

Tighten the camshaft holder bolts to the specified torque in a crisscross pattern in 2-3 steps.

Align the "IN" marks on the intake cam sprocket and "EX" mark on the exhaust cam sprocket with the cylinder head upper surface.

#### CAUTION

 Tighten the camshaft holder bolts on only one-side might cause a camshaft holder to break.

Install the cam chain over the cam sprocket.

Install the cam sprockets onto the camshaft flange shoulders while depressing the cam chain tensioner arm with a screwdriver.

#### NOTE

 Make sure that the cam chain is engaged on the sprocket of the crankshaft.

Apply a locking agent to the threads of the sprocket bolts. Align the cam sprocket bolt holes by turning the camshaft slightly and install the cam sprocket bolts.

Tighten the sprocket bolts, rotate the crankshaft one revolution and tighten the other bolts.

Torque: 17 N · m (1.7 kg-m, 12 lb-ft)

Realign the index mark on the ignition pulse generator rotor with the "T" mark on the crankcase.

Make sure that the "IN" and "EX" marks on the sprockets align with the cylinder head upper surface.

Fill the cam chain tensioner oil chamber with clean engine oil .

Recheck valve timing.

## Cylinder Head Disassembly/Assembly

- Mark all parts during disassembly so they can be placed back their original position.
- Remove carbon deposits from the combustion chamber and clean off the head gasket surface, before assembly.
  - Avoid damaging the gasket surface.
  - Gaskets will come off easier soaked in solvent.
- · Valve guide replacement see section 9 of the Common Service Manual.

## **Service Information**

- Clutch and gearshift linkage maintenance can be done with the engine in the frame.
- Transmission oil viscosity and level have an effect on clutch disengagement. When the clutch does not disengage or the vehicle creeps with clutch disengaged, inspect the transmission oil level before servicing the clutch system.

## **Troubleshooting**

#### **Hard To Shift**

- · Incorrect clutch adjustment
- · Loose stopper plate bolt
- Damaged stopper plate and pin
- · Damaged gearshift spindle

#### Transmission Jumps Out Of Gear

- · Worn shift drum stopper arm
- · Weak or broken shift arm return spring
- · Loose stopper plate bolt

#### Gearshift Pedal Will Not Return

- · Weak or broken gearshift spindle return spring
- · Bent gearshift spindle

#### **Clutch Slips When Accelerating**

- · Worn clutch discs
- · Weak clutch springs
- Transmission oil mixed with molybdenum or graphite additive

### **Motorcycle Creeps With The Engine Idling**

- Clutch plates warped
- · Faulty clutch lifter
- · Incorrect engine oil weight

## Clutch Slave Cylinder Removal/Installation

#### **CAUTION**

- Avoid spilling fluid on painted, plastic,or rubber parts. Place a rag over these parts whenever the system is serviced.
- When removing the oil bolt, cover the end of the clutch hose to prevent contamination.
- · Do not allow the foreign material to enter the system.

#### NOTE

· Use DOT 4 brake fluid from a sealed container.

#### **Clutch Outer Removal**

Remove the lock washer and clutch center.

Pull the clutch outer guide with needle nose pliers.

Remove the needle bearing.

Remove the clutch outer from the mainshaft.

Remove the washer.

#### NOTE

 At clutch outer removal, remove the clutch outer turning the crankshaft until the primary drive gear clears the crank weight.

#### Clutch Outer Installation

Install the washer.

Install the clutch outer to the mainshaft.

Install the needle bearing.

Align the primary drive gear and crankshaft teeth with the screw driver, and install the clutch outer guide.

#### **Lock Nut Installation**

Install the washer, clutch center and lock washer.

Hold the clutch center with the clutch center holder.

## **Service Information**

- The crankcase must be separated to service the crankshaft and transmission.
- The following parts must be removed before disassembling the crankcase.
  - Oil pump (page 4-4)
  - Cylinder head/Cylinder/Piston (Section 8)
  - Clutch slave cylinder (page 9-2)
  - AC generator cover (page 14-9)
  - Starter motor (page 16-7)
- · Be careful not to damage the crankshaft main journal bearing while removing or installing the crankshaft.
- All bearing inserts are select fitted and are identified by color code. Select replacement bearings from the selection table (page 10-20).
- · After installing new bearings, recheck them with plastigauge to verify clearance.
- · Apply molybdenum disulfide oil to the main journals and crankpins during assembly.

## **Troubleshooting**

#### **Excessive Noise**

- · Worn connecting rod big-end bearing
- · Bent connecting rod
- · Worn crankshaft main bearing
- Worn transmission bearing

#### **Hard To Shift**

- · Improper clutch operation
- · Incorrect transmission oil weight
- · Incorrect clutch adjustment
- · Bent shift fork
- · Bent fork shaft
- · Bent fork claw
- · Damaged shift drum cam grooves
- Bent shift spindle

#### Transmission Jumps Out Of Gear

- · Worn gear dogs or slots
- · Bent fork shaft
- · Broken shift drum stopper

- Water pump (page 6-3)

- Gearshift linkage (page 9-12)

Pulse generator/rotor (Section 15)

- Clutch (page 9-6)

- · Worn or bent shift forks
- · Broken shift linkage return spring

#### **Engine Vibration**

Excessive crankshaft runout

## **Balancer Removal/Installation**

- Replace the weight, shaft and needle bearings as a set.
- After installation, adjust the balancer backlash (page 10-4).

### **Requisite Service**

## Crankshaft/Transmission

#### **Backlash Adjustment**

#### NOTE

 Adjust the backlash while the engine is cold (below 35°C/95°F) and stopped.

Loosen the pinch bolt and turn the shaft counterclockwise up to dead end and back off by one graduation.

Apply locking agent to the threads of the pinch bolt and tighten it securely.

## Mainshaft Disassembly/Assembly

- · Apply molybdenum oil to the shifter gear grooves.
- Always install the thrust washers and snap rings with the chamfered (rolled) edge facing away from the thrust load.
- After installing a snap ring, slightly open the ring and rotate it in its groove to be sure it is fully seated.
- Do not use worn snap rings which could easily spin in the groove. They may be too loose to properly seat in the groove.
- · Align the gap in the snap ring with the groove of spline.

#### **Chain Tensioner Installation**

Push the notch on the chain tensioner with a screwdriver and push the tensioner rod until hole on the rod appears. Insert a pin or equivalent into the hole to lock the tensioner. Install the tensioner to the crankcase.

Apply a locking agent to the threads of the bolts. Tighten the bolts to the specified torque.

Torque: 12 N • m (1.2 kg-m, 9ft-lb)

Remove the pin from the hole of the tensioner rod.

## **Crankshaft Removal/Installation**

- · Mark all parts during disassembly so they can be replaced in their original locations.
- All bearing inserts are select fitted and are identified by color code. Select replacement bearings from the code table (page 10-20). After installing new bearings, recheck them with plastigauge to verify the clearance.
- · Apply molybdenum disulfide oil to the connecting rod/main journal bearings, main journal and crankpin.

## **Crankshaft Bearing Replacement**

### **Main Journal Bearing Selection**

Record the crankcase I.D. letters from the pad on the left side of the crankcase.

#### NOTE

• Letters (A, B or C) on the upper crankcase are the codes for the main journal I.D.s from the left.

Record the corresponding main journal O.D. code numbers from the crank weight.

#### NOTE

 Numbers (1 or 2) on the crank weight are the codes for the main journal O.D.s from the left.

Cross reference the case and journal codes to determine the replacement bearing color code.

### **Main Journal Bearing Selection Table**

## **Connecting Rod Bearing Selection**

Inspect the connecting rod bearing and crankpin oil clearance (See section 14 of the Common Service Manual).

Record the connecting rod I.D. code number (1 or 2) or measure the I.D. with the bearing cap installed without bearing insert.

If you replace the crankshaft, record corresponding crankpin O.D. code number (A or B).

Reuse crankshaft, measure the crankpin O.D. with the micrometer.

# (1) CONNECTING ROD I.D. CODE

#### NOTE

 Numbers (A or B) on the crank weight are the codes for the crank pin O.D.s. from the left.

Cross-reference the crankpin and rod codes to determine the replacement bearing color.

## **Crankcase Combination**

## NOTE

- Refer to page 10-24 for crankcase sealant area and detail of the bolt location.
- Install the sealing washers to the bolts indicated "▼" marks on the crankcase.
- From the inside to outside, tighten the bolts in a crisscross pattern in several steps.

## **Liquid Sealant Apply Area**

Apply a light but through coating of sealant to the upper crankcase mating surface except to the main bearing journal bolt areas and the oil passage area as shown.

#### **Crankcase Bolt Location**

Clean the crankcase bolts thoroughly with solvent and blow dry.

Apply clean engine oil to the crankcase bolt threads and seating surface and install them.

#### NOTE

 The sealing washer locations are indicated on the upper crankcase using the "V" mark.

Loosely install the all lower crankcase bolt.

Make sure the upper and lower crankcase are seated securely.

From inside to outside, tighten the main journal bolts in a crisscross pattern in 2 or 3 steps.

#### Torque: 37 N • m (3.7 kg-m, 27 ft-lb)

Tighten the 8mm bolt, and then tighten the 6mm bolt securely.

Torque: 8mm bolt: 24 N · m (2.4 kg-m, 17 ft-lb)

Install the upper crankcase bolts and the sealing washers.

## NOTE

 The sealing washer locations are indicated on the upper crankcase using the "▼" mark.

## **Service Information**

## **A**WARNING

- A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
- · When servicing the front wheel, support the motorcycle securely with a jack or other support under the engine.
- · Refer to the section 13 for brake system information.
- Use only tires marked "TUBELESS" and tubeless valves on rims marked "TUBELESS TIRE APPLICABLE".

## **Troubleshooting**

## **Hard Steering**

- · Faulty steering head bearings
- · Damaged steering head bearings
- · Insufficient tire pressure
- · Steering head bearing adjustment nut too tight

## Steers To One Side Or Does Not Track Straight

- · Unevenly adjusted right and left forks
- Bent fork
- Bent axle
- · Wheel installed incorrectly
- Faulty steering head bearings
- · Bent frame
- · Worn wheel bearing
- · Worn swingarm pivot components

## Front Wheel Wobbling

- Bent rim
- · Worn front wheel bearings
- · Faulty tire
- · Unbalanced tire and wheel

#### Wheel Turns Hard

- · Faulty wheel bearing
- · Bent front axle
- · Brake drag

### **Soft Suspension**

- Insufficient fluid in fork
- Weak fork springs
- · Low tire pressure

#### **Hard Suspension**

- · Incorrect fluid weight
- Bent fork tubes
- · Clogged fork fluid passage
- · High tire pressure

## **Front Suspension Noisy**

- · Insufficient fluid in fork
- · Loose fork fasteners

# Right Handlebar Removal/Installation

## **Á** WARNING

· Contaminants in the system may cause a reduction or loss of braking ability.

## **CAUTION**

· Spilling brake fluid will damage painted, plastic, or rubber parts.

### NOTE

- Using wires, hang the front brake master cylinder at least as high as the position it was originally installed at to prevent air from getting into the master cylinder. Do not twist the brake hose.
- · Route the cables and wire harnesses properly.

## Front Wheel Removal/Installation

## **A** WARNING

• A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality degreasing agent.

### CAUTION

- Do not jack up the motorcycle using the oil filter.
- Do not suspend the brake caliper using the brake hose. Do not twist the brake hose more than necessary.
- Do not twist the secondary master cylinder push rod more than necessary.

### NOTE

- When servicing the front wheel, place a jack or other adjustable support under engine .
- · Do not operate the brake lever or pedal after the wheel is removed.
- · Apply thin layer of grease to the front axle surface.
- Check the clearance between the brake disc and caliper bracket on each side after installation. The clearance should be at least 0.7mm (0.03in).
- · After installation, operate the brake lever and pedal, and check the brake operation.

Torque: 25 N· m (2.5 kg-m, 18 ft-lb)

Turn the steering stem lock to lock at lease five times, then retighten the steering adjustment nut to the specified torque.

Install the new lock washer onto the steering stem.
Align the tabs of the lock washer with the grooves in the adjustment nut and bend two opposite tabs (shorter) down into the adjustment nut groove.

Install and finger tighten the lock nut.

Hold the lock nut and further tighten the lock nut within 1/4 turn (90°) enough to align its grooves with the lock washer tabs.

Bend the lock washer tabs up into the lock nut grooves.

## **A**WARNING

- A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
- · When servicing the rear wheel, place the motorcycle on its center stand.
- · Refer to the section 13 for brake system information.
- Use only tires marked "TUBELESS" and tubeless valves on rims marked "TUBELESS TIRE APPLICABLE".

## **Troubleshooting**

## Soft Suspension

- · Weak shock absorber spring
- · Oil leakage from damper unit
- · Low tire pressure

### **Hard Suspension**

- · Damaged shock absorber mount bushing
- Bent damper rod
- · Damaged swingarm pivot bearings
- Bent swingarm pivot
- · High tire pressure

## Steers To One Side Or Dose Not Track Straight

- · Bent rear axle.
- Axle alignment/chain adjustment not equal on both sides

## Rear Wheel Wobbling

- · Bent rim
- · Worn rear wheel bearings
- · Faulty tire
- · Unbalanced tire and wheel
- · Low tire pressure
- · Faulty swingarm pivot bearing(s)

## **Service Information**

## **A** WARNING

• A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.

#### **CAUTION**

- The CBR1000F equipped Dual Combined Brake System. Must be follow the system air bleeding procedure (page 13-25) if you disconnect or service the any brake hydraulic system.
- · Do not disassemble the secondary master cylinder push rod or the correct brake performance is not obtained.
- Spilled brake fluid will severely damage instrument lenses and painted surfaces. It is also harmful to some rubber parts. Be careful whenever you remove the reservoir cap: make sure the front reservoir is horizontal first.
- Never allow contaminations (dirt, water, etc.) to get into and open reservoir.
- Once the hydraulic system has been opened, or if the brake feel spongy, the system must be bled.
- Always use fresh DOT 4 brake fluid from a sealed container when servicing the system. Do not mix different types of fluid as they may not be compatible.
- · Always check brake operation before riding the motorcycle.

# **Troubleshooting**

### **CAUTION**

 The Dual Combined Brake System simultaneously engage both front and rear brakes when either the front brake lever or rear brake pedal is applied. Always follow the troubleshooting procedures when you starting troubleshooting.

Check the following items before you start troubleshooting.

- 1. No problem in suspension components.
- 2. System air bleeding is completely done.
- After air bleeding, secondary master cylinder orifice bolt is tightened securely.

### **CAUTION**

- If the orifice bolt is loosened, feel vibration when you start applying the brake pedal.
- 4. Check that the secondary master cylinder link operation.

Push the left front brake caliper by hand, check the smooth operation.

If the link is not smooth or excessive play, inspect the following:

- Worn or damaged link bearing
- Loose linkage mounting bolt
- Sticking or damaged secondary master cylinder piston

### Poor Lever/Pedal Brake Performance

- · Air in hydraulic system
- · Low fluid level
- · Leaking hydraulic system
- · Improper break-in front and rear brake discs or pads
- · Clogged fluid passage
- · Contaminated brake pad/disc
- · Contaminated caliper
- · Contaminated master cylinder
- · Worn or damaged brake pad/disc
- Worn caliper piston seal
- · Worn master cylinder cups
- · Sticking/worn caliper piston
- · Sticking/worn master cylinder piston
- · Warped/deformed brake disc
- · Damaged wheel
- · Caliper not sliding properly
- · Bent brake lever/pedal

Above items are normal but still poor performance, check for nose dive during braking. If the nose dive eccessive, check for secondary master cylinder hydraulic system.

#### **Brake Lever/Pedal Hard**

- · Clogged/restricted brake system
- Sticking/worn caliper piston
- · Caliper not sliding properly
- · Worn caliper piston seal
- · Sticking/worn master cylinder piston
- Bent brake lever/pedal
- · Sticking/worn brake lever or brake pedal pivot

### **Brake Drags**

- · Contaminated brake pad/disc
- · Misaligned wheel
- · Worn brake pad/disc
- · Warped/deformed brake disc
- · Caliper not sliding properly
- · Improper secondary master cylinder push rod installed length
- · Clogged/restricted brake hydraulic system
- · Clogged secondary master cylinder oil orifice (rear wheel drags)
- · Sticking/worn caliper piston
- · Clogged master cylinder port

First locking the rear wheel when only the brake lever is applied/ First locking the front wheel when only the brake pedal is applied (In the case that all items are normal in "Poor Lever/Pedal Brake Performance")

- · Improper secondary master cylinder push rod installed length
- Faulty PCV (Proportional Control Valve)

# Front Brake Pad Replacement

### **A** WARNING

- A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
- · Check the brake system by applying the brake lever and pedal after pad replacement.

## NOTE

- The brake pad replacement can be serviced without disconnecting the hydraulic system.
- Clean the caliper inside especially around the caliper pistons before installing the brake pads.
- · Always replace the brake pads in pairs to assure even disc pressure.
- Operate the brake lever and pedal to seat the caliper pistons against the pads after the pad replacement.

Remove the boot from the secondary master cylinder.

Set the snap ring pliers to the snap ring. Hold the snap ring pliers and tilt the push rod, then remove the push rod assembly from the master cylinder.

Install the new snap ring onto the push rod.

Install the push rod assembly into the master cylinder. Install the snap ring into the master cylinder groove securely.

Make sure the snap ring is seated into the master cylinder groove and stopper plate as shown.

Check that the snap ring is rotated freely into the groove.

Measure the snap ring end gap is 5.2 mm or more.

# System Air Bleeding

## **A**WARNING

 A contaminated brake disc or pad reduces stopping power.

### NOTE

- Once the hydraulic system has been opened, or if the brake feels spongy, the system must be bled.
- When using a commercially available brake bleeder, follow the manufacturer's operating instructions.

Support the motorcycle on its center stand.

Remove the secondary master cylinder orifice bolt rubber cap.

Loosen the orifice bolt fully until its seats on the snap ring.

#### **NOTE**

- Make sure that the secondary master cylinder orifice bolt is loosened before you starting the air bleeding procedure, or it may be difficult to bleed the air completely.
- After air bleeding, tighten the orifice bolt securely. If the orifice bolt is not tightened, correct brake performance is not obtained.
- It it not necessary to loosen the orifice bolt when you bleed the air from the lever brake line only.

### Lever Brake Line Air Bleeding

Remove the following:

- Screws
- Reservoir cover
- Set plate
- Diaphragm

Turn the brake lever adjuster so that the lever is further away from the handlebar.

Operate the brake lever several times (about 8-10 times), bleed the air from the master cylinder.

Connect a commercially available Brake Bleeder to the front brake caliper outer bleed valve.

### NOTE

• When using a brake bleeder, follow the manufacturer's operating instructions.

Pump the brake bleeder and loosen the bleed valve.

Add DOT 4 brake fluid when the fluid level in the master cylinder is low.

Repeat the above procedures until not air bubbles appear in the tube.

#### NOTE

- Check the fluid level often while bleeding the brakes to prevent air from being pumped into the system.
- Use only DOT 4 brake fluid from a sealed container.
- If air is entering the bleeder from around the bleed valve threads, seal the threads with teflon tape.

If the brake bleeder is not available, perform the following procedures.

Connect the transparent bleeder tube to the bleed valve and place the outer end of the hose in a container.

 Loosen the bleed valve 1/4 turn and pump the brake lever until the brake fluid flow out. Pump the brake lever 5-10 times, then pull in the brake lever all the way and loosen the bleed valve.

### NOTE

 Do not release the brake lever while opening the bleed valve.

Close the bleed valve.

- 2. Release the brake lever slowly and wait several seconds after it reaches the end of its travel.
- Repeat above step 1 and 2 until bubbles cease to appear in the fluid at the end of the bleed tube and lever resistance is felt.

Tighten each bleed valve to the specified torque.

Torque: 5.4 N·m (0.54 kg-m, 3.9 ft-lb)

Fill the reservoir up to the "UPPER" level.

### Specified brake fluid: DOT 4 brake fluid

Install the following:

- Diaphragm
- Set plate
- Reservoir cover
- Screws

Turn the adjuster, adjust the brake lever position.

## **Pedal Brake Line Air Bleeding**

#### NOTE

- For correct air bleeding, comprehend the pedal brake line referring to the Technical Feature in section 19.
- Make sure the secondary master cylinder orifice bolt is loosened fully until it seats on the snap ring.
- Bleed the air from the pedal brake line in the sequence as follow:
- 1. Right front brake caliper center bleeder
- 2. Left front brake caliper center bleeder
- 3. Rear brake caliper center bleeder
- 4. Rear brake caliper outer bleeder

Remove the right side cover (page 2-3). Remove the bolt and intake air duct.

Remove the rear master cylinder reservoir tank mounting bolt.

Remove the following:

- Reservoir cap
- Set plate
- Diaphragm

Fill the reservoir DOT 4 brake fluid.
Pump the brake pedal while filling the brake fluid and feed fluid into the master cylinder.

 Connect a commercially available Brake Bleeder to the right front brake caliper center bleed valve.

#### NOTE

• When using a brake bleeder, follow the manufacturer's operating instructions.

Pump the brake bleeder and loosen the bleed valve.

Operate the brake bleeder and feed the brake fluid until fluid flow out from the bleeder valve.

Close the bleeder valve.

- 2. Feed the brake fluid at the left front brake caliper center bleeder valve as same procedures in step 1.
- 3. Feed the brake fluid at the rear brake caliper center bleeder valve as same procedures in step 1.
- 4. Feed the brake fluid at the rear brake caliper outer bleeder valve as same procedures in step 1.
- 5. Repeat step 1-4 until the pedal resistance is felt.

Next bleed the air from the system without using a brake bleeder tool.

Connect the transparent bleeder tube to the bleed valve and place the outer end of the hose in a container.

1. Pump the brake pedal 5-10 times, then release the pedal. Loosen the bleed valve, then pushing down the brake pedal all the way.

## NOTE

 Do not release the brake pedal while opening the bleed valve.

Close the bleed valve.

- Release the brake pedal slowly and wait several seconds after it reaches the end of its travel.
- Repeat above step 1 and 2 until bubbles cease to appear in the fluid at the end of the bleed tube and pedal resistance is felt.

### NOTE

- After the bubbles cease to appear in the fluid, repeat air bleeding procedure about 2-3 times.
- Elaborately bleed the air from the rear brake caliper outer bleeder valve (From secondary master cylinder -to- Proportional control valve -to- rear caliper line).

Tighten the each bleed valve to the specified torque.

Torque: 5.4 N·m (0.54 kg-m, 3.9 ft-lb)

Fill the reservoir up to the "UPPER" level.

### Specified brake fluid: DOT 4 brake fluid

Install the following:

- Diaphragm
- Set plate
- Reservoir cover

Tighten the secondary master cylinder orifice bolt to the specified torque.

### Torque: 5.4 N·m (0.54 kg-m, 4.0 ft-lb)

#### NOTE

 After air bleeding, tighten the orifice bolt securely. If the orifice bolt is not tightened, correct brake performance is not obtained.

Install the secondary master cylinder orifice bolt rubber cap.

Check the brake system operation (page 3-13).

Install the removed parts the reverse order of removal.

# **Service Information**

## **A**WARNING

- The battery gives off explosive gases; keep sparks, frames, and cigarettes away. Provide adequate ventilation when charging or using the battery in an enclosed space.
- The battery contains sulfuric acid (electrolyte). Contact with skin or eyes may cause severe burns. Wear protective clothing and a face shield.
  - If electrolyte gets on your skin, flush with water.
  - If electrolyte gets in your eyes, flush with water for at least 15 minutes and call a physician immediately.
- Electrolyte is poisonous. If swallowed, drink large quantities of water or milk and follow with milk of magnesia or vegetable oil and call a physician. KEEP OUT OF REACH OF CHILDREN.
- · Always turn off the ignition switch before disconnecting any electrical component.

#### **CAUTION**

- Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is ON and current is present.
- For extended storage, remove the battery, give it a full charge, and store it in a cool, dry space. For maximum service life, charge the stored battery every two weeks.
- · For battery remaining in a stored motorcycle, disconnect the negative battery cable from the battery terminal.
- · Use only distilled water in the battery.

### **CAUTION**

- Avoid filling the battery above the UPPER LEVEL line to prevent an electrolyte overflow which could corrode the engine or nearby parts.
- Battery can be damaged if over charged or undercharged, or if left to discharge for long periods. These same conditions contribute to shortening the "life span" of the battery. Even under normal use, the performance of battery deteriorates after 2-3 years.
- Battery voltage may recover after battery charging, but under heavy load, battery voltage will drop quickly and eventually die out. For this reason, the charging system is often suspected to be the problem. Battery overcharge often result eventually problems in the battery itself, which may appear to be an overcharge symptom. If one of the battery cells is shorted and battery voltage does not increase, the regulator/rectifier supplies excess voltage to the battery. Under these conditions, the electrolyte level goes down quickly.
- Before troubleshooting the charging system, check the proper use and maintenance of the battery. Check if the battery
  is frequently under heavy load, such as having the headlight and taillight ON for long periods of time without riding the
  motorcycle.
- The battery will self-discharge when the motorcycle is not is use. For this reason, charge the battery every two weeks to prevent sulfation from forming.
- Filling a new battery with electrolyte will produce some voltage, but in order to achieve its maximum performance, always charge the battery. Also, the battery life is lengthened when it is initial-charged.
- · When checking the charging system, always follow the steps in the troubleshooting flow chart (page 15-3).
- · For battery testing/charging, refer to section 22 of the Common Service Manual.
- · For charging system location, see page 15-2.

# **System Location**

# **Troubleshooting**

### **Battery Overcharging**

· Faulty regulator/rectifier

### **Battery Undercharging**

#### NOTE

In order to obtain accurate test reading when charging system, the battery specific gravity must be greater than 1.27
(20°C/68°F) and in good condition. Common Service Manual section 22 for check the battery condition.

# **Battery Removal/Installation**

# **Charging System Inspection**

### Leakage Test

Turn the ignition switch off, and disconnect the ground (–) cable from the battery.

Connect the ammeter (+) probe to the ground cable and the ammeter (-) probe to the battery (-) terminal.

With the ignition switch off, check for current leakage.

### NOTE

- When measuring the current using a tester, set it to a high range, and then bring the range down to an appropriate level. Current flow larger than the range selected may blow out the fuse in the tester.
- While measuring current, do not turn the ignition switch ON. A sudden surge of current may blow out the fuse in the tester.

If current leakage exceeds the specified value, a shorted circuit is likely.

### **Regulated Voltage Inspection**

### NOTE

 Before performing this test, be sure the battery is fully charged and that its specific gravity is greater than 1.27 (20°C/68°F).

Start the engine and warm it to operating temperature, then turn the ignition switch OFF.

Connect the multimeter between the battery terminals.

# **A** WARNING

- If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area.
- The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead to death.

Start the engine and increase the engine speed gradually and check that the voltage is regulated.

### **CAUTION**

· Be careful not to short any tester probes.

Regulated Voltage: 12.6-15.0V/5,000 min<sup>-1</sup> (rpm)

# Regulator/Rectifier

### **System Inspection**

Remove the seat cowl (page 2-4).

Disconnect the regulator/rectifier 6P connector.

Check the connectors for loose or corroded terminal.

Measure the following between connector terminal of the wire harness side.

| ltem                        | Terminals                      | Specification                    |  |  |

If the charging coil line reading is out of specification, check the alternator (page 14-8).

### Unit Inspection

Provided the circuit on the wire harness side is normal and there are no loose connections at the connector, inspect the regulator/rectifier unit by measuring the resistance between the terminals.

### NOTE

- · You'll get false readings if the probes touch you fingers.
- · Use the specified multimeters. Using other equipment may no allow you to obtain the correct results. This is due to the characteristic of semiconductors, which have different values depending on the applied voltage.

## Specific Multimeter:

- 07411-0020000

(KOWA Digital type)

- 07308-0020001

(SANWA Analogue type)

· Select the following range:

SANWA: x kΩ **KOWA: x 100** 

- · An old battery stored in the multimeter could cause inaccurate readings. Check the battery if the multimeter resistance incorrectly.
- When using the KOWA multimeter, remember value that all readings should be multiplied by 100.

Replace the regulator/rectifier unit if the resistance value between the terminals is abnormal.

# **Service Information**

#### **A**WARNING

If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an
enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead
to death.

#### **CAUTION**

- Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is ON and current is present.
- When checking the ignition system, always follow the steps in the troubleshooting flow chart (page 15-3).
- The ignition control module may be damaged if dropped. Also, if the connector is disconnected when current is present, the excessive voltage may damage the unit. Always turn off the ignition switch before servicing.
- Ignition timing cannot be adjusted since the ignition control module is non-adjustable. If ignition timing is incorrect, check the system components and replace any faulty parts.
- A faulty ignition system is often related to poorly connected or corroded connectors. Check those connections before
  proceeding.
- Use spark plugs of the correct heat range. Using spark plugs with an incorrect heat range can damage the engine. Refer
  to section 2 of the Common Service Manual.
- For neutral switch inspection, refer to section 25 of the Common Service Manual. For switch location, see page 15-2 or this manual (System Location).
- For alternator removal and installation, see section 14.
- For side stand switch, engine stop switch and ignition switch inspection, check for continuity chart of the Wiring Diagram, page 18-1. Disconnect the ignition and engine stop switch connectors in the upper fairing (page 1-23), side stand switch connector under the lower fairing and check it.

# **Troubleshooting**

- · Inspect the followings before diagnosing the system.
  - Loose spark plug caps or spark plug wire connections.
  - Water got into the spark plug cap. (Leaking the ignition secondry voltage)
  - Loose or poor contact of ignition system connectors.

### **Engine Starts, But Side Stand Switch Does Not Function At All**

#### NOTE

The side stand switch should function follows:

- When the transmission is shifted into a gear from neutral with the side stand down, the ignition shouts off and the engine stops.
- When in neutral, the neutral switch line (a) of the ignition control module is connected to ground via the side stand switch. When the side stand is up, the side stand switch line (b) of the ignition control module passes to ground via the side stand switch. The ignition control module monitors lines (a) and (b), and provides spark only when one or both of those lines is connected to ground via the neutral switch or the side stand switch.

# **System Inspection**

#### NOTE

- If no spark at all plugs, check all connections for loose or poor contact before measuring each peak voltage.
- Use genuine digital tester or commercially available digital multitester impedance: 10 M $\Omega$ /DCV minimum.
- The display value differs depending upon the initial impedance of the multitester.
- If using Imrie diagnostic tester (model 625), follow the manufacture's instruction.

Connect the peak voltage adaptor to the digital multitester.

# **Ignition Coil Primary Voltage Inspection**

### NOTE

- Check all system connections before this inspection.
   If the system is disconnected, incorrect peak voltage might be measured.
- Check all cylinder compression at each cylinder and spark plugs and caps are installed correctly in all cylinders. If the peak voltage is measured with the cylinder compression being low, the measurement will be higher than the standard voltage.

Support the motorcycle using the center stand.

Disconnect all spark plug caps from the spark plug.

Connect good known spark plugs on each spark plug cap, then ground the spark plugs to the cylinder as done in a spark test.

Connect the peak voltage adaptor probes between the primary ignition terminals with the connectors remained connected.

#### Connection:

No.1/4 coil : Black/White (+) and Body ground (-) No.2/3 coil : Black/White (+) and Body ground (-)

Turn the ignition switch is ON and engine stop switch to RUN.

Check for initial voltage at this time.

The battery voltage should be measured.

If the initial voltage is not measured, check power supply circuit referring the troubleshooting (page 15-3).

Crank the engine with the starter motor and read each ignition coil primary peak voltage.

#### Connection:

No.1/4 coil : Black/White (+) and Body ground (-) No.2/3 coil : Black/White (+) and Body ground (-)

Peak voltage: 100 V minimum

#### **A** WARNING

 Avoid touching the spark plugs and tester probes to prevent electric shock.

#### NOTE

Although measured values are different for each ignition coil, they are normal as long as each voltage is higher than the specified voltage.

### Ignition Pulse Generator Peak Voltage Inspection

#### NOTE

 Measure the peak voltage with the cylinder compression is applied. Leave all spark plugs in the cylinder head.

Remove the seat cowl (page 2-4).

Remove the ignition control module multi-connector. Connect the peak voltage adaptor probes to the ignition pulse generator terminals of ignition control module multi-connector.

Connection: Yellow (+) and White/Yellow (-)

Crank the engine with the starter motor and read the ignition pulse generator peak voltage.

Peak voltage: 0.7 V minimum

#### **AWARNING**

 Avoid touching the tester probes to prevent electric shock.

If the measured value is out of specification, measure the peak voltage at the ignition pulse generator 4P connector using the same procedure as for the previous measurement.

#### **A**WARNING

 Avoid touching the tester probes to prevent electric shock.

If the peak voltage is within the specification, check for and open or short circuit in White/Yellow and Yellow wires.

If the peak voltage is out of the specification, replace the ignition pulse generator (page 15-11).

# **Ignition Coil**

## Inspection

Measure the primary coil resistance between the terminals.

Standard: 2.5 – 3.2  $\Omega$  (20°C/68°F)

Measure the resistance between the spark plug caps.

Standard: 21 - 27kΩ (20°C/68°F)

If the measured value out of the specification, remove the spark plug caps from the spark plug wires and measure the resistance between the spark plug wires.

Standard: 11 – 17 kΩ (20°C/68°F)

### Removal/Installation

Disconnect the spark plug cap from the cylinder head. Remove the ignition coil mounting bolts.

Disconnect the primary wires and remove the ignition coil.

Installation is in the reverse order of removal.

# **Ignition Pulse Generator Inspection**

#### NOTE

 It is not necessary to remove the ignition pulse generator from the engine.

Remove the seat cowl (page 2-4).

Disconnect the ignition control module multi-connector. Measure the resistance between the White/Yellow and Yellow terminals.

#### Standard: 460 - 580 $\Omega$ (20°C/68°F)

If the measured value is out of specification, measure the resistance at the ignition pulse generator 4P connector using the same procedure as for the previous measurement.

#### NOTE

- The ignition control module system is factory pre-set and cannot be adjusted. Ignition timing inspection procedures are given to inspect the function of the ignition control module components.
- Connect the timing light to the other spark plug wire if you see that the ignition timing is incorrect, and you might be able to see the timing is correct.

Warm up the engine to operating temperature.

#### **A** WARNING

- If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area.
- The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and may lead to death.

Stop the engine and remove the crankshaft hole cap. Connect a timing light to the spark plug wire. Start the engine and let it idle.

The timing is correct if the "F" mark on the ignition pulse generator rotor aligns with the index mark on the crankcase.

Increase the engine speed by rotating the throttle stop screw and make sure the "F" mark begins to move counter-clockwise at approximately 1,600 min<sup>-1</sup> (rpm).

### **A**WARNING

- Always turn the ignition switch OFF before servicing the starter motor. The motor could suddenly start, causing serious injury.
- · A weak battery may be unable to turn the starter motor quickly enough, or supply adequate ignition current.
- If the current is kept flowing through the starter motor to turn it while the engine is not cranking over, the starter motor may be damaged.
- For the following components inspections, refer to the following pages; for the parts locations, see page 16-3 of this manual (System Location).

# **Troubleshooting**

### NOTE

- Check for the following before troubeshooting the system.
  - Blown main fuse (30A) or sub fuse (10A).
  - Loose battery and starter motor cable.
  - Discharged battery.
- The starter motor does not turn when the engine stop switch is OFF.
- The starter motor should turn when the transmission is in neutral.
- The starter motor should turn when the transmission is in any gear with relative circuit satisfied, indicated below chart.

| Gear Position | Side Stand     | Clutch Lever | Starter Motor |

## Starter motor will not turn

Normal

#### Starter motor turns slowly

- · Low specific gravity in battery (or dead battery)
- · Poorly connected battery terminal cable
- · Poorly connected starter motor cable
- · Faulty starter motor

#### Starter motor turns, but engine does not turn

- · Starter motor is running backward
  - Case assembled improperly
  - terminals connected improperly
- · Faulty starter clutch
- Damaged reduction gear
- · Damaged starter idle gear

# Starter relay switch "click", but engine does not turn over

- · Crankshaft does not turn due to engine problem
- Excessive reduction gear friction

#### AWARNING

- A halogen headlight bulb becomes very hot while the headlight is ON, and remain hot for a while after it is turned OFF. Be sure to let it cool down before servicing.
- Use a flame and heated water/coolant mixture for the thermo sensor inspection. Keep all flammable materials away from the burner. Wear protective clothing, gloves and eye protection.
- Note the following when replacing the halogen headlight bulb.
  - Wear clean gloves while replacing the bulb. Do not put finger prints on the headlight bulb, as they may create hot spots
    on the bulb and cause it to break.
  - If you touch the bulb with your bare hands, clean it cloth moistened with alcohol to prevent its early failure.
  - Be sure to install the dust cover after replacing the bulb.
- All plastic connectors have locking tabs that must be released before disconnecting, and must be aligned when reconnecting.
- · Always turn off the ignition switch before disconnecting any electrical component.
- A continuity test can be made with switches installed on the motorcycle.
- · Check the battery condition before performing any inspection that requires proper battery voltage.

# 19. Technical Feature

# **Dual Combined Brake System**

- (1) FRONT MASTER CYLINDER
- (2) PCV (PROPORTIONAL CONTROL VALVE)
- (3) REAR BRAKE CALIPER
- (4) REAR MASTER CYLINDER
- (5) FRONT BRAKE CALIPER
- (6) LINK MECHANISM
- (7) SECONDARY MASTER CYLINDER

The Dual Combined Brake System was designed to simultaneously engage both front and rear brakes when either the front brake lever or rear brake pedal is applied.

The Dual Combined Brake System in fact is operated in the same way as a conventional brake system, but simplifies braking operations, increases braking performance and gives the rider a greater feeling of confidence without requiring special practice or training.

# **Operating Principles**

Hand Brake

On initial operation, the hand brake works like any conventional motorcycle front brake system. A squeeze on the front brake lever pressurizes the master cylinder which transmits its increased hydraulic pressure to the two outer pistons of the front calipers, causing a corresponding braking force to be applied to the front wheel.

In response to the braking force applied by the front caliper onto the spinning brake rotor, the caliper is pulled in the direction of wheel rotation, around its lower linkage pivot. This forward caliper motion also acts on one end of a pivoting "L" angle link, the other end of which is connected to the secondary master cylinder. This direct pressure on the secondary master cylinder is then transmitted to the outer pistons of the rear caliper by way of the in-line proportional control valve.

#### **Foot Brake**

When the rear brake pedal is pressed, hydraulic pressure from the rear master cylinder is routed through two lines. One connects directly to the rear caliper and acts on the center piston. The outer line runs to the center pistons of the two front calipers.

As during hand brake operation, hydraulic pressure from the secondary master cylinder passes through the PCV (Proportional Control Valve), and acts on the outer pistons of the rear brake caliper. Because hydraulic pressure from the foot brake master cylinder is also being applied by the rear caliper's center piston, the braking force applied to the rear wheel is greater than that applied when using the hand brake lever only.

# 3-Piston Caliper

The Dual Combined Brake System 3-piston caliper is controlled by two independent hydraulic systems. The two outer pistons are connected by an internal passage and operated by either the lever-actuated master cylinder or, in case of the rear brake caliper, by the secondary master cylinder. The center piston of all three calipers is connected to the pedal-actuated hydraulic system and controlled by its master cylinder. These three pistons act on each caliper's active brake pad and allow it to be controlled by either or both of the two separate hydraulic systems.

# **PCV** (Proportional Control Valve)

The PCV (Proportional Control Valve) controls three distinct steps in the braking curve.

Initially, the PCV's output pressure increases in direct proportion to the increasing input pressure originating from the secondary master cylinder (Fig. 1). Following this, the automobile-type PCV causes the output pressure to increase at a slower rate than the input pressure, resulting in the first change in the pressure curve (Fig. 2).

As input pressure continues to increase, the cut piston activates, closing the valve and causing the output pressure to hold at a constant value (Fig. 3).

A further increase in input pressure forces the decompression piston down, which expands a sub-camber that draws pressure off the output side of the PCV (Fig. 4).

## **Engine Does Not Start Or Is Hard To Start**

#### 1. Check the fuel flow to carburetor—— Not Reaching Carburetor——— Clogged fuel tube or fuel strainer screen Reaching Carburetor · Sticking float valve · Clogged fuel tank breather · Disconnected or faulty auto fuel valve vacuum tube ----- Weak Or No Spark -2. Perform a spark test - Faulty spark plug · Fouled spark plug Good Spark · Faulty ignition control module · Broken or shorted spark plug wire · Broken or shorted ignition coil · Faulty ignition switch · Faulty ignition pulse generator · Faulty engine stop switch · Loose or disconnected ignition system wires 3. Test cylinder compression — Low Compression--• Improper valve clearance Valve stuck open Compression Normal Worn cylinder or piston · Damaged cylinder head gasket · Seized valve Improper valve timing Improper valve and seat contact 4. Start by following normal procedure - Engine Starts But Stops -Improper choke operation Carburetor incorrectly adjusted **Engine Does Not Fire** · Intake pipe leaking Improper ignition timing (Faulty ignition coil or ignition pulse genera-Fuel contaminated 5. Remove and inspect spark plug — Wet Plug — Flooded carburetor · Choke closed Throttle valve open · Air cleaner dirty

## **Engine Lacks Power**

#### Possible Cause

- Clogged oil passage 11. Remove cylinder head cover and — Valve Train Not Lubricate inspect lubrication · Clogged oil control orifice Properly Faulty oil pump Valve Train Lubricate Properly 12. Check for engine overheating — Overheating — Coolant level low · Fan motor not working (Faulty fan motor switch) Not Overheating · Thermostat stuck closed · Excessive carbon build-up in combustion chamber · Use of poor quality fuel · Clutch slipping · Lean fuel mixture →• Worn piston and cylinder 13. Accelerate or run at high speed — Engine Knocks — Wrong type of fuel **Engine Does Not Knock**  Excessive carbon build-up in combustion chamber Ignition timing too advanced (Faulty ignition control module) Lean fuel mixture

## Poor Performance At Low And Idle Spped

### Possible Cause 1. Check ignition timing — Incorrect — - improper valve clearance · Improper ignition timing (Faulty ignition control module) Correct 2. Check carburetor pilot screw — Incorrect — See section 5 adjustment Correct 3. Check for leaking intake pipe ——— Leaking ———— Loose insulator clamp Damaged insulator No Leak 4. Perform spark test — Weak or Intermittent Spark — Faulty, carbon or wet fouled spark · Faulty ignition control module Good Spark Faulty ignition coil · Broken or shorted spark plug wires Faulty engine stop switch · Faulty ignition pulse generator Faulty ignition switch

· Loose or disconnected ignition

system wires

## **Poor Performance At High Speed**

#### **Possible Cause**

## **Poor Handling**

### **Possible Cause** Steering stem adjustment nut too 1. If steering is heavy ----· Damaged steering head bearings · Bent steering stem 2. If either wheel is wobbling Excessive wheel bearing play Bent rim · Swingarm pivot bearing excessively worn · Bent frame 3. If the motorcycle pulls to one side Incorrect drive chain adjustment · Front and rear wheel not aligned · Bent fork legs · Bent swingarm · Bent frame

# 21. CBR1000F Addendum

### How To Use This Manual

This addendum contains information for the CBR1000F(S). Refer to the CBR1000F shop manual (62MZ200) for service procedures and data not included in this addendum.

ALL INFORMATION, ILLUSTRATIONS, DIRECTIONS AND SPECIFICATIONS INCLUDED IN THIS PUBLICATION ARE BASED ON THE LATEST PRODUCT INFORMATION AVAILABLE AT THE TIME OF APPROVAL FOR PRINTING. HONDA MOTOR CO., LTD. RESERVES THE RIGHT TO MAKE CHANGES AT ANY TIME WITHOUT NOTICE AND WITHOUT INCURRING ANY OBLIGATION WHATEVER. NO PART OF THIS PUBLICATIONS MAY BE REPRODUCED WITHOUT WRITTEN PERMISSION. THIS MANUAL IS WRITTEN PERSONS WHO HAVE ACQUIRED BASE KNOWLEDGE OF MAINTENANCE ON HONDA MOTORCYCLES, MOTOR SCOOTERS OR ATVS.

### Important Safety Notice -

**A** WARNING

Indicates a strong possibility of severe personal injury or death if instructions are not followed.

**CAUTION:** 

Indicates a possibility of personal injury or equipment damage if instructions are not followed.

NOTE:

Gives helpful information.

Detailed descriptions of standard workshop procedures, safety principles and service operations are not included. It is important to note that this manual contains some warnings and cautions against some specific service methods which could cause PERSONAL INJURY to service personnel or could damage a vehicle or render it unsafe. Please understand that those warnings could not cover all conceivable ways in which service, whether or not recommended by Honda, might be done or of the possibly hazardous consequences of each conceivable way, nor could Honda investigate all such ways. Anyone using service procedures or tools, whether or not recommended by Honda,must satisfy himself thoroughly that neither personal safety nor vehicle safety will be jeopardized by the service method or tools selected.

#### **Type Codes**

· Throughout this manual, the following abbreviations are used to identify individual model.

## **Model Identification**

(1) The frame serial number is stamped on the right side of the steering head.

(2) The engine serial number is stamped on the front of the crankcase.

(3) The carburetor identification number is stamped on the rear side of each carburetor.

(4) The color label is attached as shown. When ordering color-coded parts, always specify the designated color code.

Torque specifications listed below are for important fasteners. Others should be tightened to standard torque values listed above

Notes: 1. Apply sealant to the threads.

- 2. Apply a locking agent to the threads.
- 3. Apply molybdenum disulfide oil to the threads and flange surface.
- 4. Stake.
- 5. Apply oil to the threads and flange surface.
- 6. Apply clean engine oil to the O-ring.
- 7. Apply grease to the threads and flange surface.
- 8. UBS bolt.
- 9. U-nut.
- 10. ALOC bolt.
