▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF".
   (2) Disconnect the PCM connector.
   (3) IG "ON" and ENG "OFF"
   (4) During taking off the brake : Measure the voltage between terminal 23 of PCM harness connector and chassis ground.
   (5) During stepping on the brake : Measure the voltage between terminal 23 of PCM harness connector and chassis ground.
   Specification :

Item	During taking off the brake	During stepping on the brake
Brake Lamp Switch	0V	Battery voltage
Brake Switch	Battery voltage	0V

   (6) Is the measured voltage within specification ?

YES

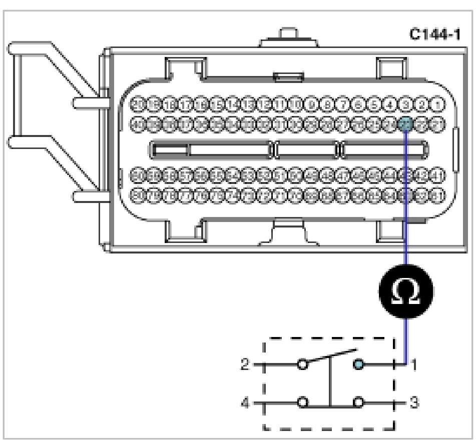
▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check open in harness" as follows.

2. Check open in harness
   (1) IG "OFF".
   (2) Disconnect the brake switch and PCM connector.
   (3) Measure the resistance between terminal 23 of PCM harness connector and terminal 1 of Brake switch harness side.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specification ?

YES

▸ o to "Check voltage" as follows.

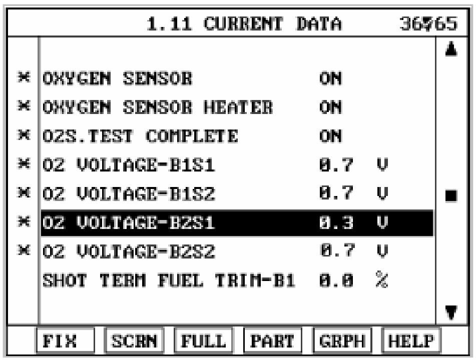
NO

▸ Repair open in circuit and go to "Verification of Vehicle Repair" procedure.

3. Check voltage
   (1) IG "OFF".
   (2) Disconnect the brake switch connector.
   (3) Measure the voltage between brake lamp switch terminal and chassis ground.
   (4) IG "ON" and ENG "OFF"
   (5) Measure the voltage between brake lamp switch terminal and chassis ground.

Specification :

Item	During taking off the brake	During stepping on the brake
Brake Lamp Switch	Battery voltage	Battery voltage
Brake Switch	0V	Battery voltage



(6) Is the measured voltage within specification ?

YES

▸ Substitute with a known - good brake switch and check for proper operation. If the problem is corrected, replace brake switch and go to "Verification of Vehicle Repair" procedure..

NO

▸ Check the fuse between battery and brake switch.
▸ Repair open or short in power circuit of brake switch and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

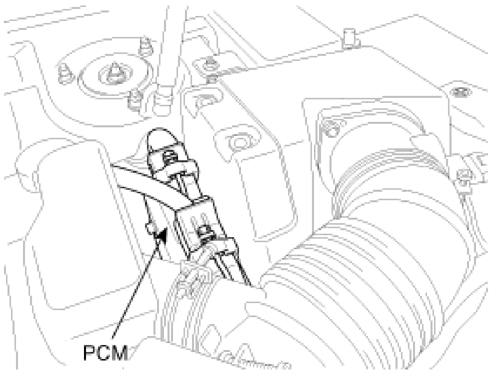
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0601

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM monitors errors through checksum. Every information consists of the combination of 0 and 1, checksum means summing up all values in a row. Thus, errors are recognized comparing checksum value and the memory value at PCM.

DTC DESCRIPTION

If real checksum does not accord with memory checksum, PCM sets P0601 and MIL(Malfunction Indication Lamp) turns on.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Checksum check	• Faulty PCM
Enable onditions	• -	
Threshold value	• Discordance between the real checksum and the memorized checksum	
Diagnosis Time	• -	
MIL On Condition	• 1 driving cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "

5. Are any DTCs present ?

YES

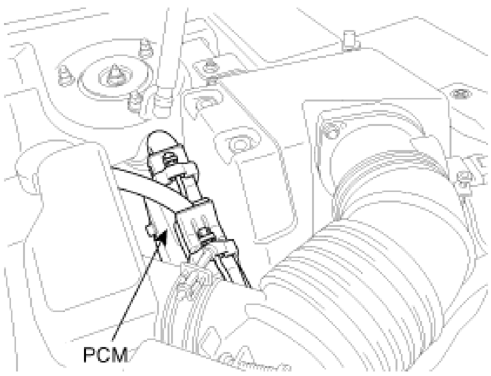
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0602

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM monitors errors through checksum. Every information consists of the combination of 0 and 1, checksum means summing up all values in a row. Thus, errors are recognized comparing checksum value and the memory value at PCM.

DTC DESCRIPTION

If CPU software version dose not accord with main CPU, PCM sets P0602.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Check internal CPU	• Faulty PCM
Enable onditions	• -	
Threshold value	• The version discordance among PCU S/W or Calibration	
Diagnosis Time	• Continuous (More than 125 ms failure for every 125 ms test)	
MIL On Condition	• 1 driving cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by

PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

   YES

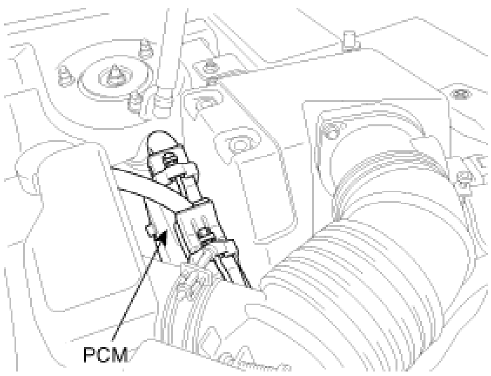
   ▸ Go to the applicable troubleshoooting procedure.

   NO

   ▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0604

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM monitors errors through checksum. Every information consists of the combination of 0 and 1, checksum means summing up all values in a row. Thus, errors are recognized comparing checksum value and the memory value at PCM.

DTC DESCRIPTION

If real checksum does not accord with memory checksum, PCM sets P0604 and MIL(Malfunction Indicatin Lamp) turns on.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Check internal CPU	• Faulty PCM
Enable onditions	• -	
Threshold value	• Discordance between the real checksum and the memorized checksum	
Diagnosis Time	• -	
MIL On Condition	• 1 driving cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0606

COMPONENT LOCATION

GENERAL DESCRIPTION

The Controller Diagnostic receives data from several self-diagnosing devices onboard the powertrain control module. Conditions which are detected include supply voltage out of limits, acceptable temperature exceeded, low-power counter clock failure, and general device fault.

DTC DESCRIPTION

Checking PCM every 10 sec. under detecting condition, if internal error is detected for more than 5 sec., PCM sets P0606. And MIL(Malfunction Indicatin Lamp) turns on.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Check PCM internal error	
Enable onditions	• 7V< Battery voltage< 20V	

Threshold value	• PCM internal error (A/D unit error)	• Faulty PCM
Diagnosis Time	• Continuous (More than 0.5 seconds failure for every 9.3 seconds test)	
MIL On Condition	• 1 driving cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   ▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

   YES

   ▸ Go to the applicable troubleshoooting procedure.

   NO

   ▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P061B

COMPONENT LOCATION

GENERAL DESCRIPTION

Checking torque control state and torque, torque calculation protect RAM. ROM, or ALU when the torque calculated inside of PCM is higher than actually required torque. This type of malfunction is very difficult to find, however if it happens, it influences safety a lot. Therefore, detecting and decreasing torque is strongly required.

DTC DESCRIPTION

If desired torque is calculated much higher than actual torque, PCM senses it and decreases desired torque. The causes of this error are abnormal operation of PCM (RAM,ROM, ALU errors) and hardware malfunction such that actual air flow enters the engine is more than the flow recognized by PCM.If actual checksum do not correspont with memory checksum, PCM sets P061B. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Desired torque error	• Faulty PCM
Enable onditions	• Engine works	
Threshold value	• Desired torque is much higher than actual torque.	
Diagnosis Time	• Continuous	
MIL On Condition	• 1 driving cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0630

GENERAL DESCRIPTION

Regulations require that all 2005 and subsequent model year vehicles shall have the Vehicle Identification Number(VIN) available in a standardized format through the standardized data link connector in accordance with SAE J1979 specifications. Using a scan tool, PERFORM "VIN WRITING" procedure after replacing or reflashing a PCM.

DTC DESCRIPTION

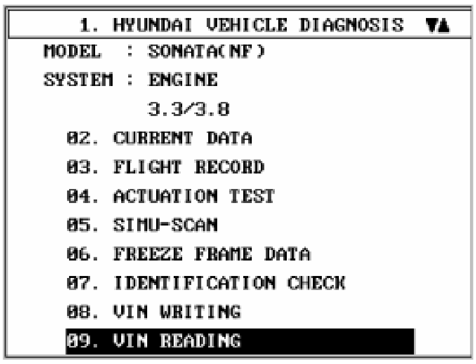
The purpose of this logic is to prevent a vehicle from leaving the assembly plant or service station without a VIN in its EEPROM memory.
If the VIN writing is not programmed or incompatible, the PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• VIN not programmed or incompatible	1. VIN is not programmed. 2. Faulty PCM
Enable onditions	• None	
Threshold value	• Error Code: "ON"	
Diagnosis Time	• Continuous	
MIL On Condition	• 1 driving cycle	

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Ignition "ON"
3. Monitor the ECM status by VIN reading whether it is virgin or learnt



4. Is the ECM status Virgin ?

YES

▸ Perform VIN writing procedure according to the direction on the scantool screen and go to "Verification of Vehicle Reapair" procedure.

NO

▸ Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

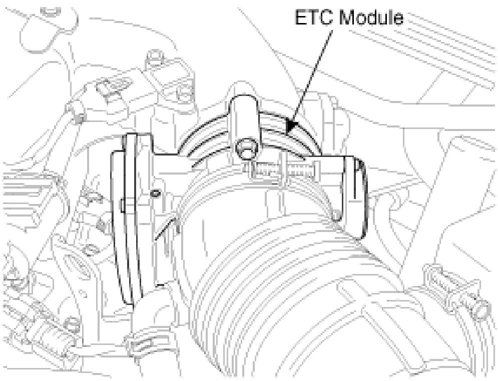
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0638

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Checking output signals from TPS every 8.5 sec. under detecting condition, if the difference between real and target throttle position is above the specified value, PCM sets P0638. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• ETS position control malfunction	• Throttle stuck • Open in motor circuit • Faulty motor • Faulty PCM
Enable Conditions		• Engine works • Battery voltage >5V	
Threshold value	Case1	• l real ETS motor & TPS value - target ETS motor & TPS value l >4.5°	
	Case2	• When real Throttle position <36°, real throttle position - target throttle position < - 4.5°	
	Case3	• real throttle position - target throttle position < - 18°	
Diagnosis Time		• Continuous (More than 0.6 seconds failure for every 15.6 seconds test)	
MIL On Condition		• 1 driving cycle	

SIGNAL WAVEFORM AND DATA

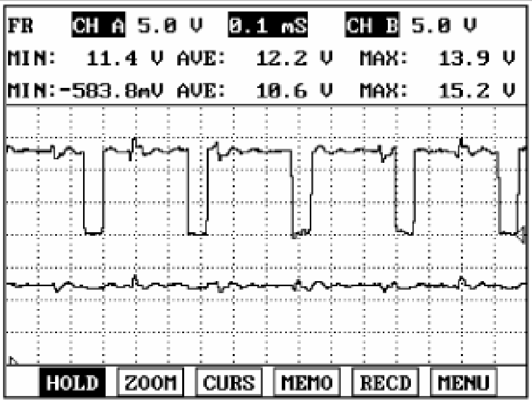


Fig. 1

SPECIFICATION

Throttle opening (°)	Output voltage (V) [Vref = 5.0V]	
	TPS1	**TPS2**
0°	0.0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0.0V

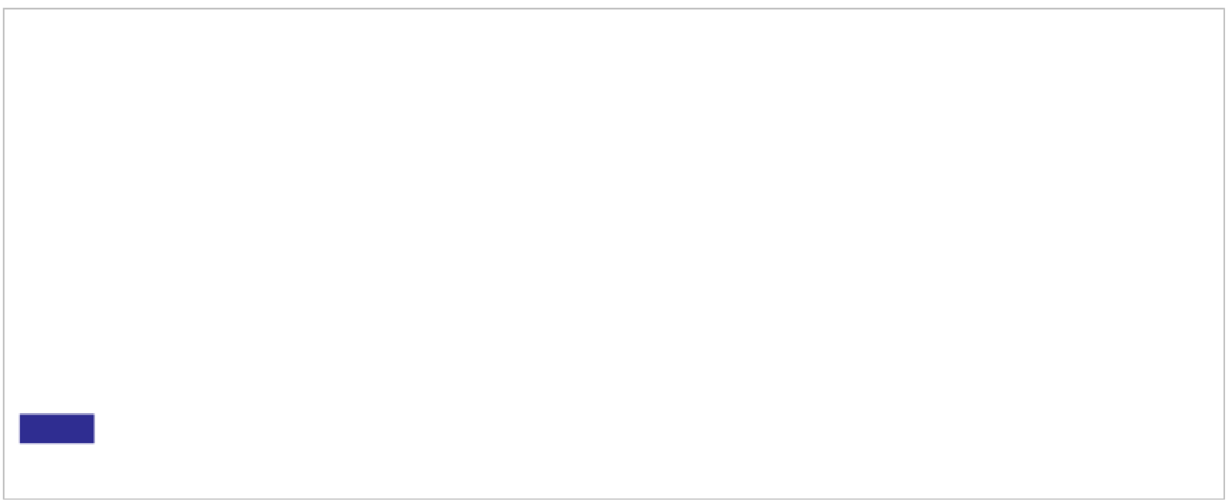
PCM

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Monitor "ETS Motor" items on Current Data



4. Are those related current data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Control Circuit Inspection " procedure.

CONTROL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF".
   (2) Disconnect ETS motor & TPS connector.
   (3) IG "ON" and ENG "OFF"
   (4) Measure the voltage between terminal 2,3 of ETS motor & TPS harness connector and chassis ground.

   Specification : Approx. 12V

   (5) Is the measured voltage within specification?

   YES

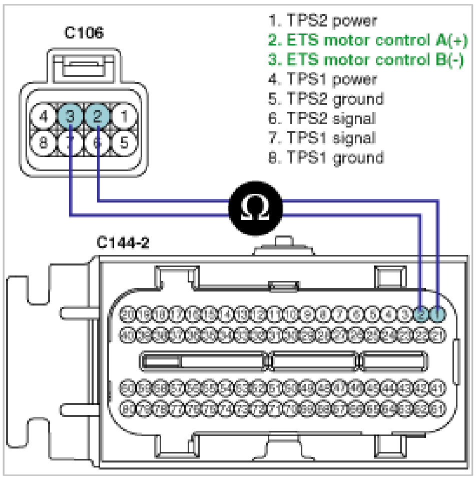
   ▸ Go to "Component inspection" procedure.

   NO

   ▸ Go to "Check open in harness" as follows.

2. Open in control circuit inspection
   (1) IG "OFF"
   (2) Disconnect ETS motor & TPS connector and PCM connector.
   (3) Measure the resistance between terminal 2 of ETS motor & TPS harness connector and terminal 2 of PCM harness connector.
   (4) Measure the resistance between terminal 3 of ETS motor & TPS harness connector and terminal 1 of PCM harness connector.

   Specification : Approx. below 1Ω



(5) Is the measured resistance within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair Open in motor harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check throttle valve for stuck

(1) IG "OFF".

(2) Disconnect the air hose between throttle body and air mass flow sensor.

(3) Check stuck on throttle valve.

(4) Is the throttle valve normal?

YES

▸ Go to check "ETS motor resistance" as follows.

NO

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

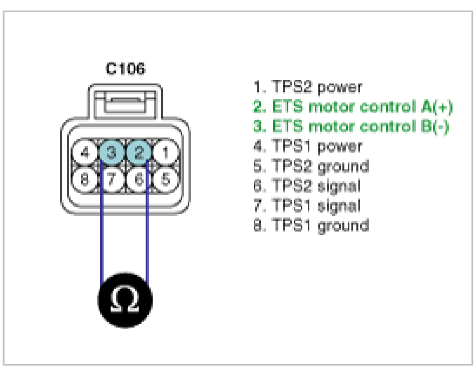
2. Check ETS motor resistance

(1) IG "OFF".

(2) Disconnect ETS motor & TPS connector.

(3) Measure the resistance between terminal 2 and 3 of ETS motor & TPS connector(component side).

Specification : Approx. 1.275 ~ 1.725Ω @ 23°C (73.4°F)



(4) Is the measured resistance within specification?

YES

▸ Go to "ETC motor actuation test" procedure.

NO

▸ Substitute with a known - good ETC motor and check for proper operation. If the problem is corrected, replace ETC motor and go to "Verification of Vehicle Repair" procedure.

※ Procedure of ETS Initialization
1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

3. ETC motor actuation test
   (1) IG "OFF".
   (2) Connect ETS motor & TPS connector.
   (3) After IG "ON", execute the "ETC motor actuation test" by Scantool.
   (4) Does the "ETC motor actuation test" execute normally?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good ETC motor and check for proper operation. If the problem is corrected, replace ETC motor and go to "Verification of Vehicle Repair" procedure.
※ Procedure of ETS Initialization
1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0641

GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Checking the voltage from sensor power supply every 1.87 sec. under detecting condition, if the value within detecting condition lasts for more than 0.2 sec., PCM sets P0641. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Sensor reference voltage check	• Short in sensor power supply line • Faulty PCM
Enable Conditions	• IG "ON"	
Threshold value	• Sensor supply power < 4.5V or > 5.5V	
Diagnosis Time	• Continuous (More than 0.2 seconds failure for every 1.87 seconds test)	
MIL On Condition	• 2 driving cycle

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0646

GENERAL DESCRIPTION

A/C compressor raises pressure to condensen the evaporated refrigerant at evaporator in A/C system more easily. Without A/C signal, A/C compressor does not operate but with ON signal, PCU activate A/C compressor relay. With the relay activation, A/C compressor turns on using the power of the engine.

DTC DESCRIPTION

PCM monitors inputted voltage through A/C compressor relay. Checking voltage every 10 sec. under detecting condition, if the voltage lower than the specified value is detected for more than 5 sec., PCM sets P0646.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects circuit short to low voltage	• Poor connection • Open or short to ground in A/C relay circuit • Faulty A/C relay • Faulty PCM
Enable Conditions	• After 0.5 sec under conditions below • No DTC exists • Engine works • 11V ≤ Battery voltage ≤ 16V	
Threshold value	• Open or short to ground	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• DTC only (NO MIL ON)	

SPECIFICATION

Coil Resistance
70Ω ~ 120Ω

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Check voltage

(1) IG "OFF".

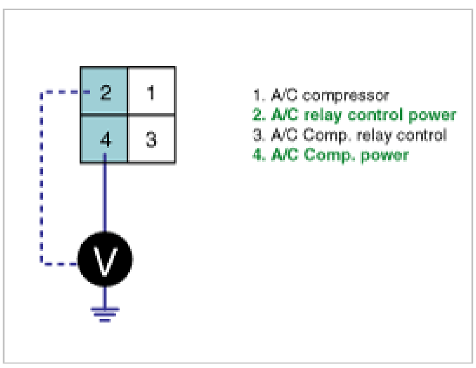
(2) Disconnect A/C relay connector.

(3) IG "ON" and ENG "OFF"

(4) Measure the voltage between terminal 2 of A/C relay harness connector and chassis ground.

(5) Measure the voltage between terminal 4 of A/C relay harness connector and chassis ground.

Specification : B+



(6) Is the measured voltage normal?

YES

▸ Go to "Control circuit inspection" procedure.

NO

▸ Check the fuse between Battery and A/C relay.
▸ Check Chassis ground 1 and 2 for looseness.
▸ Repair Open or Short to ground in power circuit and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short in harness
   (1) IG "OFF".
   (2) Disconnect A/C relay and PCM connector.
   (3) Measure the resistance between terminal 3 of A/C relay harness connector and chassis ground.

Specification : Infinite

   (4) Is the measured resistance within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair Short in Coil control harness and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF".
   (2) Disconnect A/C relay and PCM connector.
   (3) Measure the resistance between terminal 3 of A/C relay harness connector and terminal 64 of PCM harness connector.

Specification : Approx. below 1Ω

   (4) Is the measured resistance within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair Open in Coil control harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check A/C relay
   (1) IG "OFF".

   (2) Disconnect A/C relay.

   (3) Measure the resistance between terminal 2 and 3 of A/C relay.

   (4) Measure the resistance between terminal 1 and 4 of A/C relay.

Terminal	Power approval
1~4	NO
2~3	YES (약 70Ω ~ 120Ω)

   (5) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good A/C relay and check for proper operation. If the problem is corrected, replace A/C relay and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0647

GENERAL DESCRIPTION

A/C compressor raises pressure to condensen the evaporated refrigerant at evaporator in A/C system more easily. Without A/C signal, A/C compressor does not operate but with ON signal, PCU activate A/C compressor relay. With the relay activation, A/C compressor turns on using the power of the engine.

DTC DESCRIPTION

PCM monitors inputted voltage through A/C compressor relay. Checking voltage every 10 sec. under detecting condition, if the voltage higher than the specified value is detected for more than 5 sec., PCM sets P0647.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects circuit short to high voltage	• Poor connection • Short to power in A/C relay circuit • Faulty A/C relay • Faulty PCM
Enable Conditions	• After 0.5 sec under conditions below • No DTC exists • Engine works • 11V ≤ Battery voltage ≤ 16V	
Threshold value	• Short to power	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• DTC only (NO MIL ON)	

SPECIFICATION

Coil Resistance
70Ω ~ 120Ω

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Monitor items related to "A/C" on Current Data

Fig. 1

Fig. 2

4. Are those related current data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Check voltage

(1) IG "OFF".

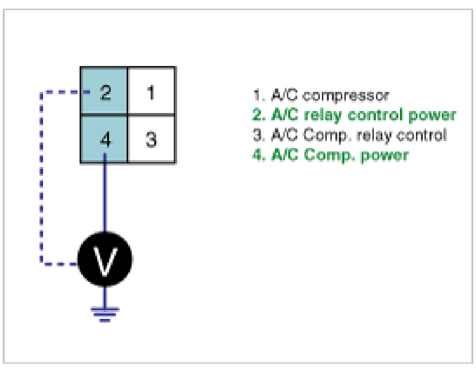
(2) Disconnect A/C relay connector.

(3) IG "ON" and ENG "OFF"

(4) Measure the voltage between terminal 2 of A/C relay harness connector and chassis ground.

(5) Measure the voltage between terminal 4 of A/C relay harness connector and chassis ground.

Specification : B+



(6) Is the measured voltage normal?

YES

▸ Go to "Control circuit inspection" procedure.

NO

▸ Check the fuse between Battery and A/C relay.
▸ Check Chassis ground 1 and 2 for looseness.
▸ Repair Open or Short to ground in power circuit and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short in harness
   (1) IG "ON".
   (2) Disconnect A/C relay.
   (3) Measure the resistance between terminal 3 of A/C relay harness connector and chassis ground.

Specification : Approx. 0V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair Short in Coil control harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check A/C relay
   (1) IG "OFF".
   (2) Disconnect A/C relay.
   (3) Measure the resistance between terminal 2 and 3 of A/C relay.
   (4) Measure the resistance between terminal 1 and 4 of A/C relay.

SPECIFICATION

Terminal	Power approval
1~4	NO

Fuel System > Troubleshooting > P0650

GENERAL DESCRIPTION

As monitoring the errors of several sensors and actuators circuit,if any problem occurs, PCM turns engine check lamp ON at cluster to notify driver occurence of a problem.Generally, engine check lamp turns ON at Ignition ON and turns OFF within couple of seconds after turning engine ON. If engine check lamp turns on during driving, perform diagnosis of engine system and auto-transaxle system.

DTC DESCRIPTION

Checking input signal of engine check lamp every 10 sec. under detecting condition, if open, or short to battery or ground is detected for more than 5 sec., PCM sets P0650.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low, high	• Poor connection • Open or short in MIL circuit • Faulty MIL • Faulty PCM
Enable Conditions	• After 0.5 sec under conditions below • Engine works • 11V ≤ Battery voltage ≤ 16V	
Threshold value	• Open or short	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• DTC only (NO MIL ON)

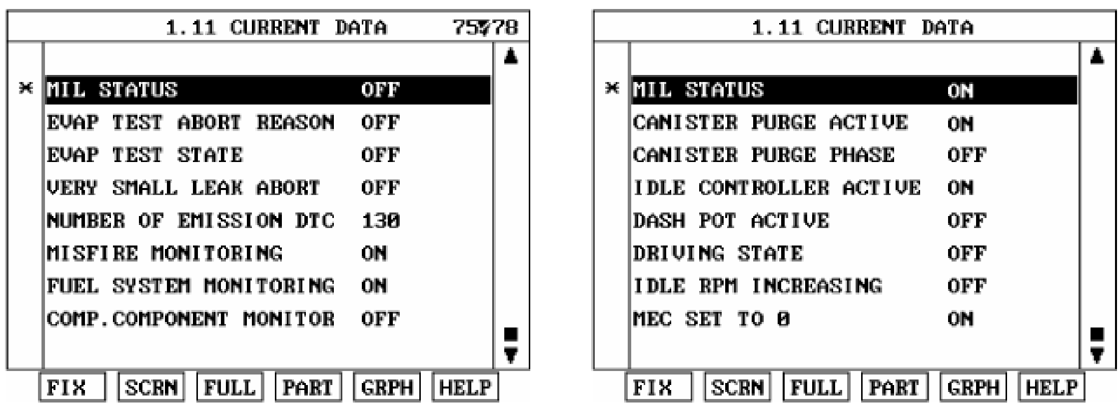
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Compare "Current data" on scantool with "Engine Warning Lamp" on cluster.



4. Is the current data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

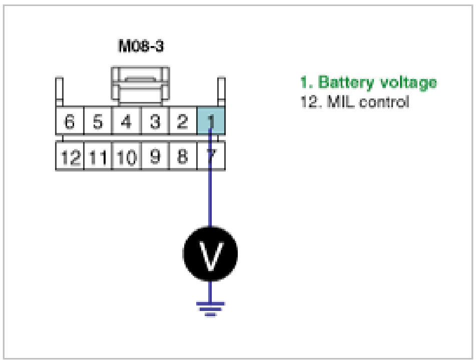
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect Instrument cluster connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of instrument cluster harness connector and chassis ground.

Specification : Approx. B+



4. Is the measured voltage within specification?

YES

▸ Go to "Control Circuit Inspection" procedure.

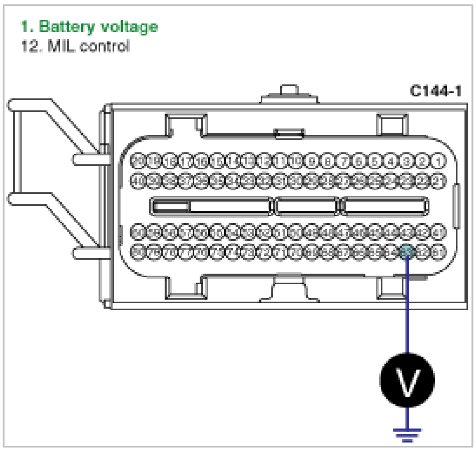
NO

▸ Check fuse between battery and instrument cluster for open or blown-off.
▸ Repair open or short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF" and disconnect PCM connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between 63 of PCM harness connector and chassis ground.

Specification : Approx. B+



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check open in Engine warning lamp's filament.
▸ Repair open or short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check instrument cluster

(1) IG "OFF"

(2) Substitute with a known - good instrument cluster and check for proper operation.

(3) Does it normally operate after replacement?

YES

▶ Replace instrument cluster and go to "Verification of Vehicle Repair" procedure.

NO

▶ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

5. Are any DTCs present ?

YES

▶ Go to the applicable troubleshoooting procedure.

NO

▶ System is performing to specification at this time.

Fuel System > Troubleshooting > P0651

GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Checking the voltage from sensor power supply every 1.87 sec. under detecting condition, if the value within detecting condition lasts for more than 0.2 sec., PCM sets P0651. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Sensor reference voltage check	• Short in sensor power supply line • Faulty PCM
Enable condition	• Key "ON"	
threshold value	• Sensor supply power < 4.5V or > 5.5V	
diagnosis time	• Continuous (More than 0.2 seconds failure for every 1.87 seconds test)	
MIL ON condition	• 2 driving cycles

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF".
   (2) Disconnect TPS connector.
   (3) IG "ON" and ENG "OFF"
   (4) Measure the voltage between terminal 1 of TPS harness connector and chassis ground.

Specification : Approx. 5V

   (5) Is the measured voltage within specification ?

YES

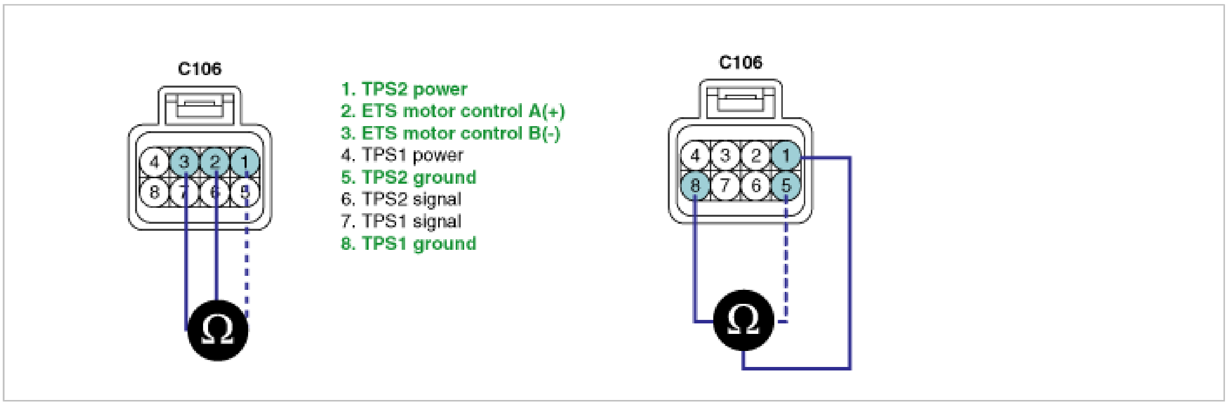
▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check short in harness" as follows.

2. Check short in harness
   (1) IG "OFF".
   (2) Disconnect TPS connector and PCM connector.
   (3) Measure the resistance between terminal 1 and 2 of TPS harness connector.
   (4) Measure the resistance between terminal 1 and 3 of TPS harness connector.
   (5) Measure the resistance between terminal 1 and 5 of TPS harness connector.
   (6) Measure the resistance between terminal 1 and 8 of TPS harness connector.

Specification : Infinite



(7) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair Short in power harness and go to "Verification of Vehicle Repair" procedure.

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

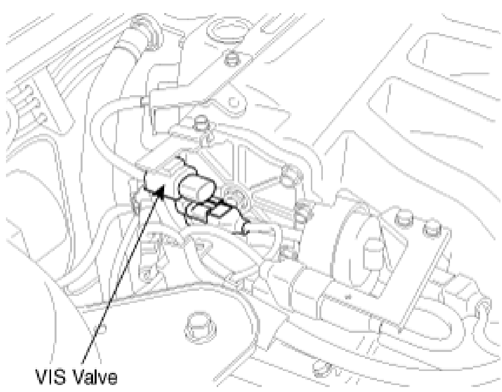
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0660

COMPONENT LOCATION



GENERAL DESCRIPTION

VIS(Variable intake system) is a device which varies the length of intake manifold to genetate maximum power at certain RPM. VIS lengthens intake manifold to improve the torque at low RPM when vehicle speed is low while it shortens intake manifold to raise torque at high RPM when vehicle speed is hign. PCU controlls VIS using RPM signal.

DTC DESCRIPTION

Checking the output voltage from VIS every 10 sec. under detecting condition, if the value within detecting condition lasts for more than 5 sec., PCM sets P0660. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal low, high	• Poor connection • Open or short in VIS circuit • Faulty VIS • Faulty PCM
Enable condition	• After 0.5 sec under conditions below • Engine works • 11V ≤ Battery voltage ≤ 16V	
Threshold value	• Open or short	
Diagnosis time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL ON condition	• 2 driving cycles	

SPECIFICATION

Item	Specification
Coil Resistance (Ω)	21.8 ~ 28.5Ω[22°C (71.6°F)]

MONITOR SCANTOOL DATA

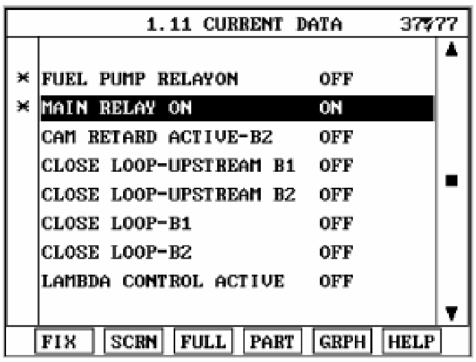
1. Connect scantool to DLC(Data Link Connector)
2. Warm up the engine to normal operating temperature.
3. Monitor "Main Relay" parameter on scantool.



4. Is the "Main Relay" parameter displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

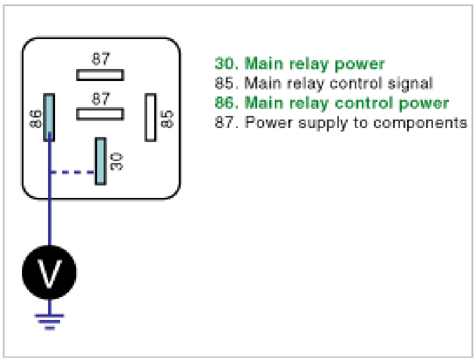
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSEPCTION

1. IG "OFF"
2. Disconnect Main Relay
3. IG "ON" & ENG "OFF".
4. Measure voltage between harness terminal 2 of Main Relay and chassis ground.
5. Measure voltage between harness terminal 5 of Main Relay and chassis ground.

Specification : B+



6. Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspecition" procedure.

NO

▸ Check fuse between battery and main relay is disconnected.
▸ Repair or replace open or short in harness and then go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short in coil control
   (1) IG "OFF".
   (2) Disconnect Main Relay and PCM connector.
   (3) Measure resistance between harness terminal 4 and chassis ground.
   (4) Measure resistance between harness terminal 4 and 5 of Main Relay.

   Specification : Infinite

   (5) Is the measured resistance within specification ?

   YES

   ▸ Go to "Check open in coil control" as follows.

   NO

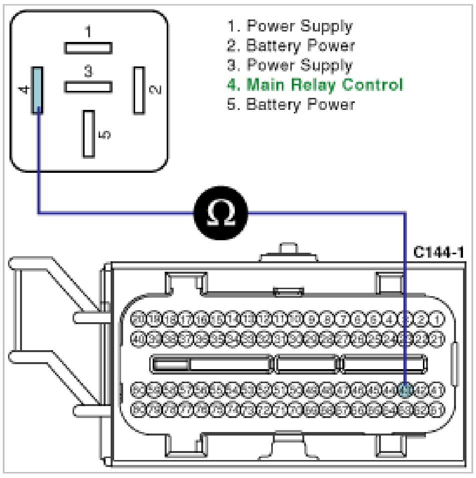
   ▸ Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

2. Check open in coil control
   (1) IG "OFF".

(2) Disconnect Main Relay and PCM connector.

(3) Measure resistance between harness terminal 4 of Main Relay and harness terminal 43/C144-1 of PCM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Main Relay

(1) IG "OFF"

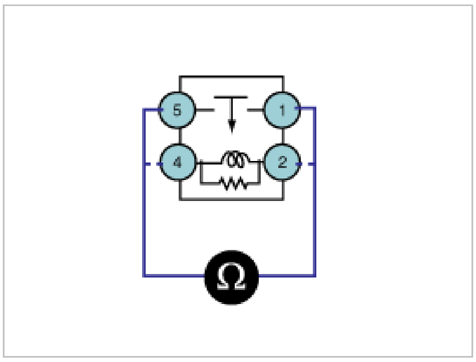
(2) Disconnect Main Relay

(3) Measure resistance between terminal 5 and 3 of Main Relay

(4) Measure resistance between terminal 4 and 2 of Main Relay.

Specification :

Terminal	continuity
3 ~ 5	NO
2 ~ 4	YES (Approx. 70Ω ~ 120Ω)



(5) Is the measured reisistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation.
If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by

PCM.

NO

▸ Substitute with a known - good Main Relay and check for proper operation.
If the problem is corrected, replace Main Relay and go to "Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

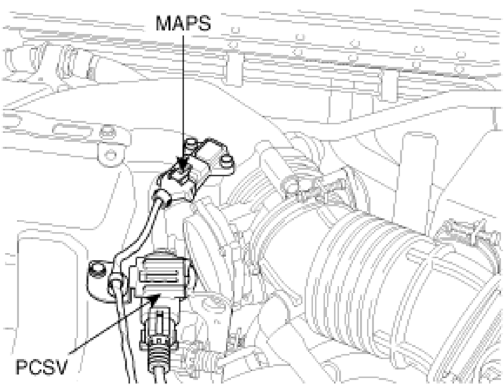
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P1106

COMPONENT LOCATION



GENERAL DESCRIPTION

The amount of intake air flow must be inputted to PCM in order to determine the fuel injection quantity. To measure the pressure inside of intake manifold, MAFS is used at idle and MAPS is required at accelerating. MAPS(Manifold Absolute Pressure) calculates the amount of air indirectly as measuring the pressure inside of intake manifold. This mechanism is alsl called Speed-Density Type.MAPS transfers analog output signal which is proportional to the change of intake manifold pressure, then, with this signal and RPM, PCM calculates the amount of intake air flow. MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

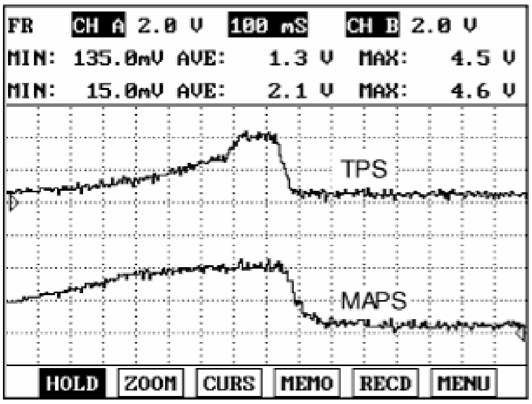
Checking output signals of MAPS every 60 sec. under detecting condition, if an output signal is above 4.5V for more than 2 sec., PCM sets P1106.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a intermittent short to high in either the signal circuit or the MAP sensor	
		• No TPS Active Fault Present	

EnableConditions	Case 1	• No TPS Short Fail Criteria Met • Engine Speed < 2500rpm • Throttle Position ≤ 30%	• Poor connection • Short to batteryin signal circuit • Open in groundcircuit • Faulty MAPS • Faulty PCM
	Case 2	• No TPS Active Fault Present • No TPS Short Fail Criteria Met • Engine Speed > 2500rpm • Throttle Position > 40%	
Threshold value		• MAP signal > 4.5V	
Diagnosis Time		• Continuous (More than 2 sec. failure for every 60 sec. test)	
MIL On Condition		• DTC only (NO MIL ON)	

SIGNAL WAVEFROM AND DATA



Comparing MAPS and TPS, The signals of MAPS and TPS increasess and decrease simultaneously.

SPECIFICATION

Pressure(kPa)	20	35	60	95	101.32
Voltage(V)	0.789	1.382	2.369	3.75	4
Allowable error(V)	± 0.045

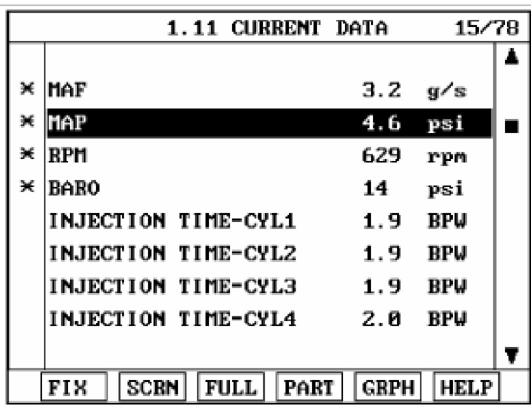
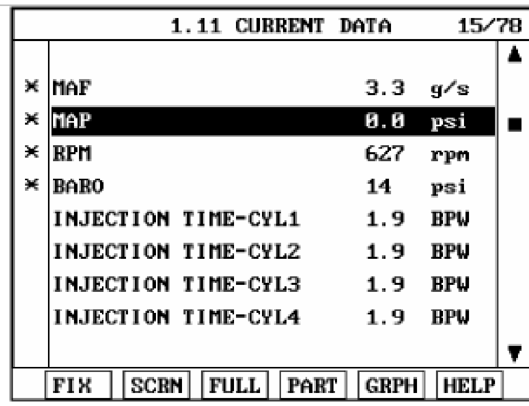
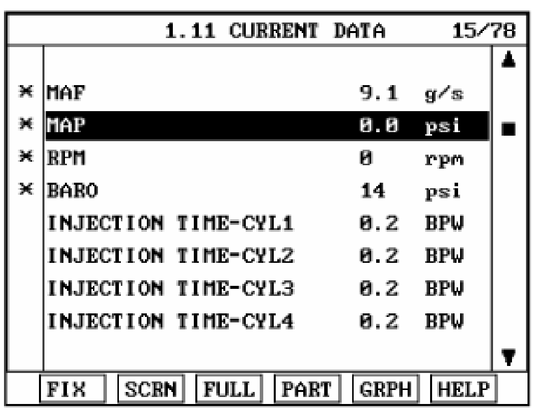
2. Warm up engine to normal operating temperature
3. Monitor "MAPS" parameter on the scantool.



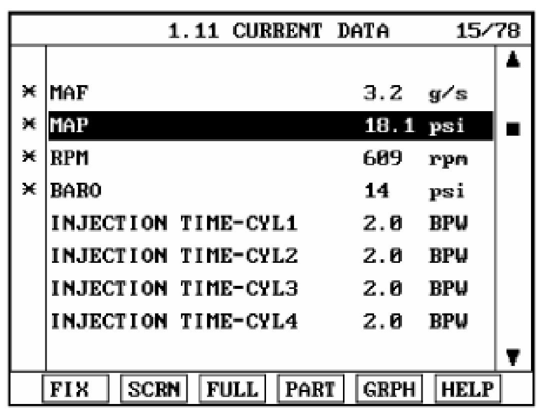
normal at idle



open



short to ground



short to 5V line

4. Is the current data displayed correctly ?

YES

▸Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▶Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▶ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

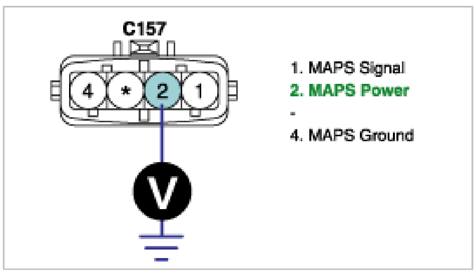
NO

▶ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect MAPS connector
3. IG "ON"
4. Measure the voltage between terminal 2 of MAPS harness connector and ground.

Specification : Approx. 5V



5. Is the measured voltage within specification ?

YES

▶ Go to "Ground Circuit Inspection" procedure.

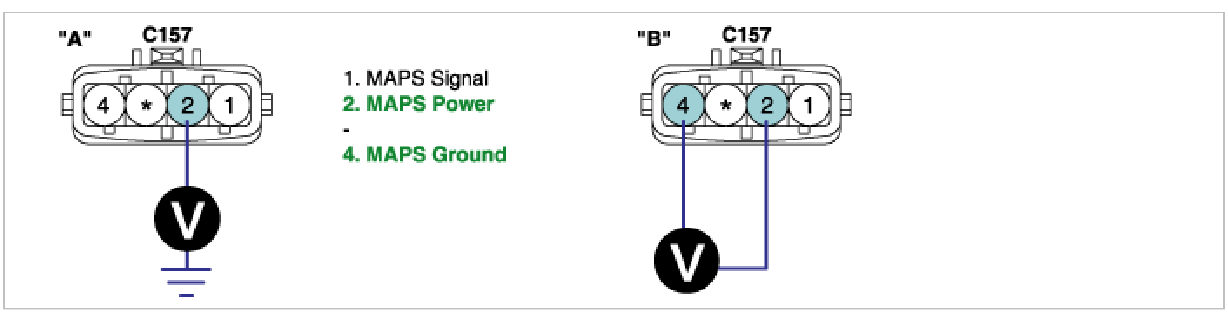
NO

▶ If the voltage is over 5.1V, check short to battery in harness.
▶ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF".
2. Disconnect MAPS connector.
3. IG "ON" & ENG "OFF"
4. Measure the voltage between terminal 2 of MAPS harness connector and chassis ground.
5. Measure the voltage between terminal 2 and 4 of MAPS harness connector.

Specification : "A" - "B" = : Approx. below 200mV



6. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

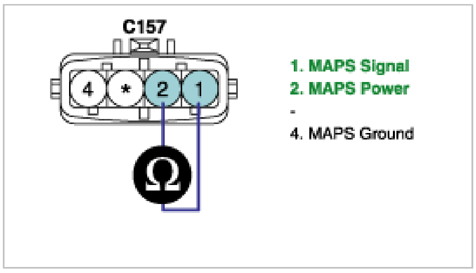
NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect MAPS and PCM connector.
3. Measure resistance between terminal 1 and 2 of MAPS harness connector.

Specification : Infinite



4. Is the measured resistance within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. MAPS performance test
   (1) IG "OFF"
   (2) Connect scantool to Data Link Connector(DLC) and selest "Oscilloscope" then, connect probes to output signal lines of MAPS and TPS.Turn engine "ON" and monitor the waveforms accelerating or decelerating
   (3) Start engine and monitor signal waveform during accelleration and decelleration.
   Specificaton :

Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				

   (4) Is the waveform displayed correctly?(Compare the response time of TPS and MAPS)

YES

▸ Go to "Check PCM".

NO

▸ After replacing MAPS with new one, if it operates normally, replace MAPS and go to "Verification of Vehicle Repair".

2. Check PCM
   (1) IG "OFF" and disconnect MAPS connector.
   (2) Connect scantool and IG "ON" & ENG "OFF"
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal 1 of MAPS harness connector.

   (5) Does the output voltage response to the change of signal by simulation?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

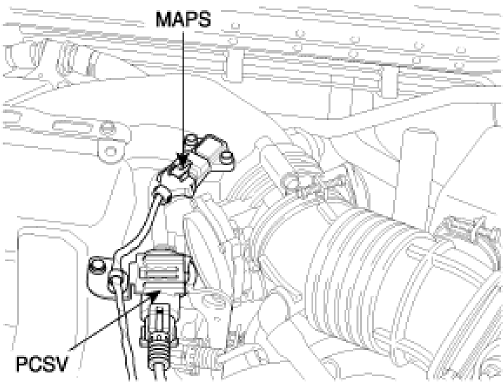
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P1107

COMPONENT LOCATION



GENERAL DESCRIPTION

The amount of intake air flow must be inputted to PCM in order to determine the fuel injection quantity. To measure the pressure inside of intake manifold, MAFS is used at idle and MAPS is required at accelerating. MAPS(Manifold Absolute Pressure) calculates the amount of air indirectly as measuring the pressure inside of intake manifold. This mechanism is alsl called Speed-Density Type.MAPS transfers analog output signal which is proportional to the change of intake manifold pressure, then, with this signal and RPM, PCM calculates the amount of intake air flow. MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

Checking output signals of MAPS every 60 sec. under detecting condition, if an output signal is below 0.25V for more than 2 sec., PCM sets P1107.

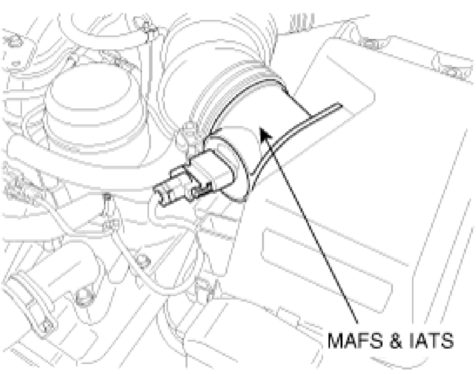
Fuel System > Troubleshooting > P1111

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The PCM applies 5V to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction, ignition timing correction and idle speed correction(Air-density correction).

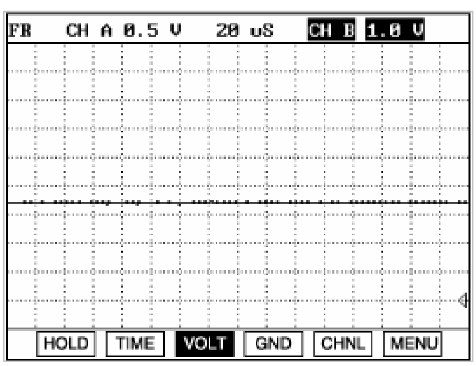
DTC DESCRIPTION

Checking output signals of IATS every 120 sec. under detecting condition, if an ouput signal is over 4.9V for more than 4 sec., PCM sets P1111.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a continuous short to high in either the signal circuit or the sensor	• Poor Connection • Open or short in signal circuit • Open in ground circuit • Faulty IATS • Faulty PCM
Enable Conditions	Case 1	• No VSS Fault Active (No P0501) • No Coolant Short Active Fault Present • No MAF Active Fault Present • Engine Air Flow < 15 g/s • Vehicle Speed < 25kph • Engine Coolant Temperature > 50°C(122 °F) • Engine Running Time > 120 sec.	
	Case 2	• No VSS Fault Active (No P0501) • No Coolant Short Active Fault Present • No MAF Active Fault Present • Engine Air Flow < 15 g/s • Vehicle Speed < 25kph • Ignition off time > 360 min. • Engine Coolant Temperature > -10°C(14 °F) • Engine Running	
Threshold value		• IATS signal > 4.9V	
Diagnosis Time		• Continuous (More than 4 sec. failure for every 120 sec. test)	
MIL On Condition		• DTC only (NO MIL ON)	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

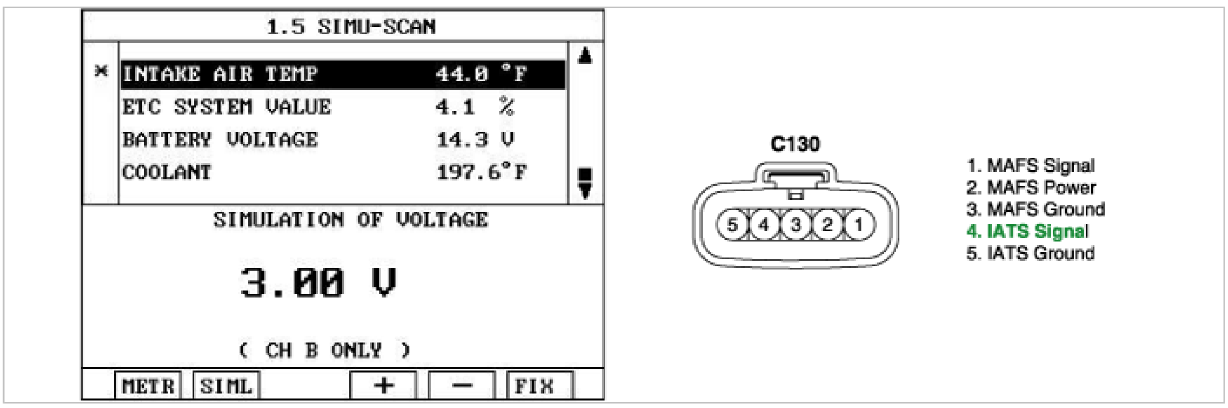
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.

   (4) Simulate voltage at terminal 4 of IATS harness connector.



(5) Does the signal value of IAT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

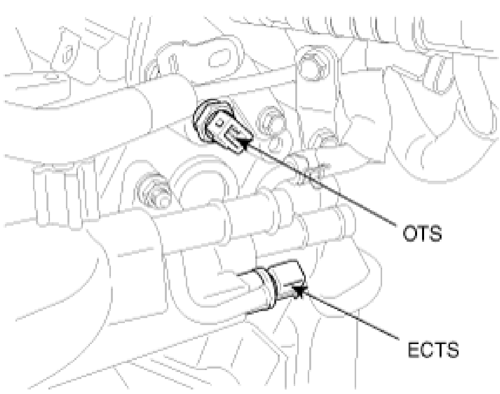
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P1114

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature (ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

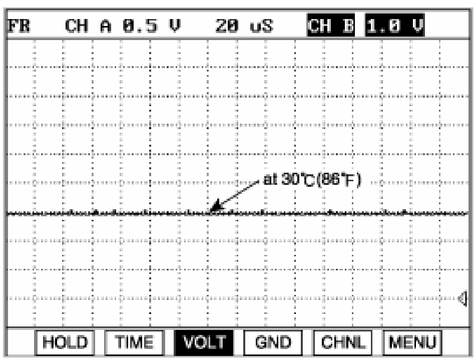
DTC DESCRIPTION

Checking output signals from ECTS every 120 sec. under detecting condition, if an output signal is below 0.1V for more than 4 sec., PCM sets P1114.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a intermittent short to ground in the signal circuit or the sensor	• Poor Connection • Short to ground in signal Circuit • Faulty ECTS • Faulty PCM
Enable Conditions	Case 1	• Engine Running Time > 120sec. • Coolant Short Low Enable Criteria Met	
	Case 2	• Soak Time > 360min. • Engine Running • Coolant Short Low Enable Criteria Met	
Threshold value		• Coolant signal < 0.1V	
Diagnosis Time		• Continuous (More than 4 sec. failure for every 120 sec. test)	
MIL On Condition		• DTC only (NO MIL ON)	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

4. Is the "ECTS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect ECTS connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 3 of ECTS harness connector and chassis ground.

Specification : Approx. 5V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Go to "Check short to ground in harness" as follows.

2. Check short to ground in harness
   (1) IG "OFF" and disconnect ECTS connector and PCM connector.
   (2) Measure resistance between terminal 3 of ECTS harness connector and chassis ground.
   (3) Measure resistance between terminals 1 and 3 of ECTS harness connector.

Specification : Infinite

   (4) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check ECTS
   (1) IG "OFF" and disconnect ECTS connector.
   (2) Measure resistance between terminals 1 and 3 of ECTS connector.(Component side)

Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32

20(68)	2.31 ~ 2.59		

(3) Is the measured resistance within specification?

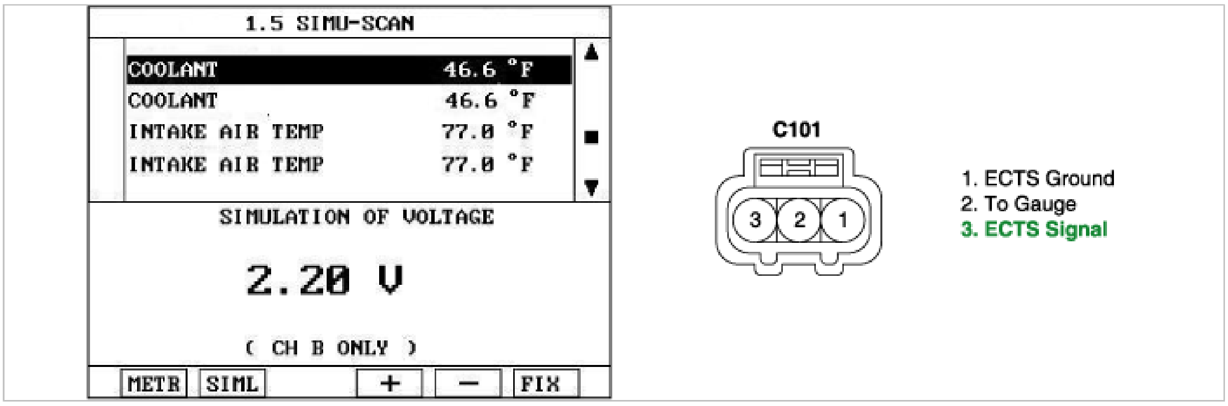
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Connect probe to terminal 3 of ECTS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect ECTS connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 3 of ECTS harness connector and chassis ground.

   Specification : Approx. 5V

   (4) Is the measured voltage within specification ?

   YES

   ▸ Go to "Ground Circuit Inspection" procedure.

   NO

   ▸ If voltage is 0V, go to "Check open in harness" as follows. If it is more than 5.1V, go to "Check short to battery in harness" as follows

2. Check short to battery in harness
   (1) IG "OFF" and disconnect ECTS connector and PCM connector.
   (2) Measure resistance between terminals 2 and 3 of ECTS harness connector.

   Specification : Infinite

   (3) Is the measured resistance within specification?

   YES

   ▸ Go to "Component Inspection" procedure.

   NO

   ▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

3. Check open in harness
   (1) IG "OFF" and disconnect ECTS connector and PCM connector.
   (2) Measure resistance between terminal 3 of ECTS harness connector and terminal 7 of PCM harness connector.

Specification : Below 1Ω

   (3) Is the measured resistance within specification?

YES

▸ Go to "Ground Circuit Inspection" procedure.

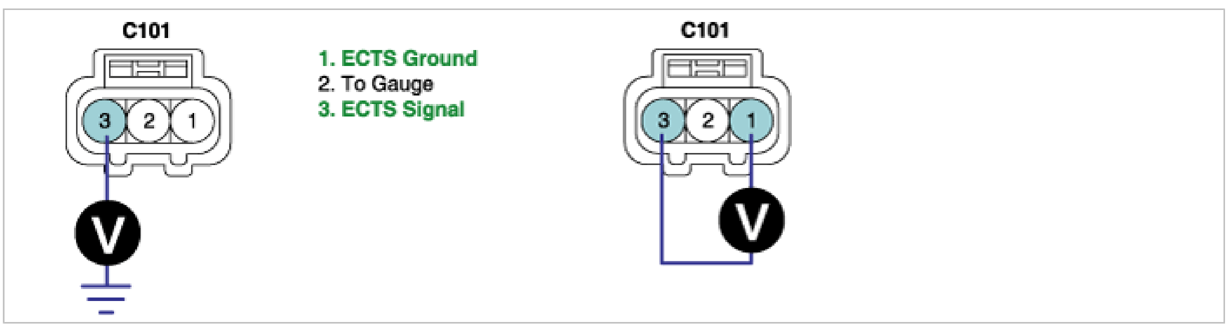
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect ECTS connector.
2. Measure voltage between terminal 3 of ECTS harness connector and chassis ground.
3. Measure voltage between terminals 1 and 3 of ECTS harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check ECTS
   (1) IG "OFF" and disconnect ECTS connector.
   (2) Measure resistance between terminals 1 and 3 of ECTS connector.(Component side)

Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)

-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

(3) Is the measured resistance within specification?

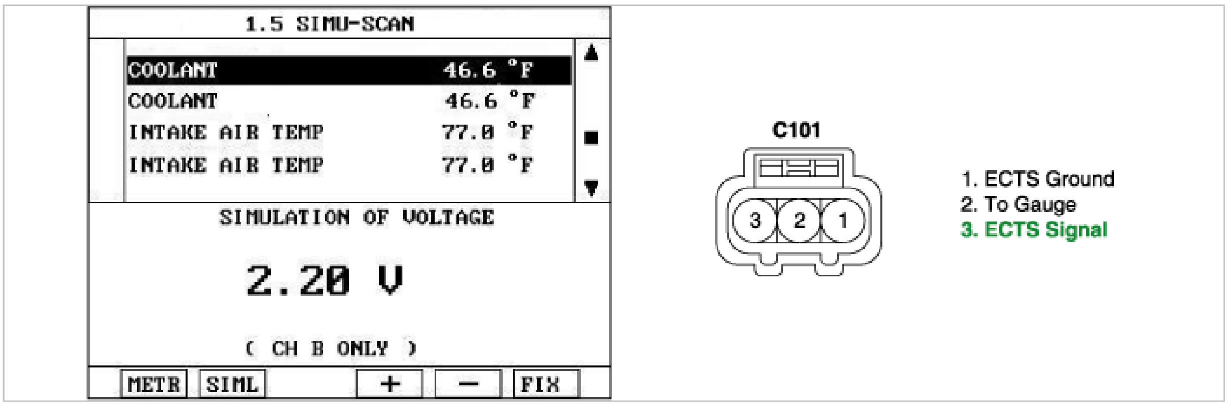
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Connect probe to terminal 3 of ECTS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P1295

COMPONENT LOCATION

GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

If power management mode is recognized under detecting condition, PCM sets P1295. And MIL(Malfunction Indicatin Lamp) turns on.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This code detects if the system is in Power Management Mode	• TPS Malfunction • TPS Malfunction + MAFSMalfunction • MAP Malfunction + TPSMalfunction • Faulty PCM
EnableConditions	• Ignition On	
Threshold value	• Power Management Mode is active	
DiagnosisTime	• -	
MIL On Condition	• 1 Driving Cycle

Fuel System > Troubleshooting > P1523

COMPONENT LOCATION

GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

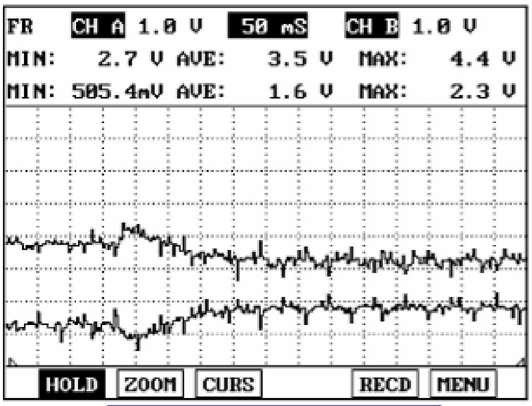
Checking throttle valve return state, under detecting condition, if an output signal is within the threshold value for more than designated time, PCM sets P1523.

DTC DETECTING CONDITION

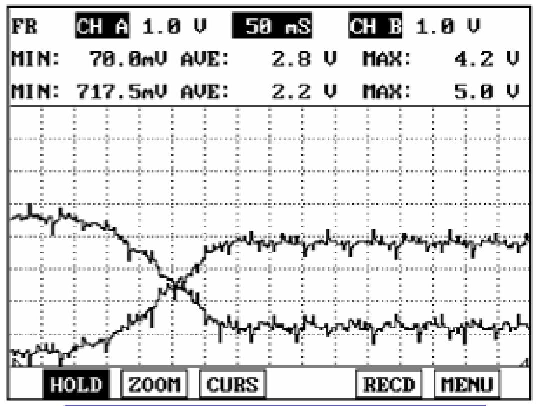
Item	Detecting Condition	Possible cause
DTC Strategy	• This code detects when throttle fails to return to the unpowered default position when power to the ETC motor is turned off. Fault set for failure to return to default position within a time.	• Carbon in throttle • Broken Throttle return spring • throttle sticky • throttle icy • PCM
EnableConditions	• Throttle Actuation Mode Previous NOT Off • Throttle Actuation Mode is Off • ETC Power Control Mode = Normal • TPS 1 & 2 = normal • Sensor Supply voltage = Normal	
Threshold value	• If throttle did not return to default range within cal seconds of turning off, increment fail count. • Normalized value of either TPS within expected default range anytime while enabled. (TPS1 Norm > 0.9V AND TPS1 Norm < 1.85V)OR (TPS2 Norm > 1.85V AND TPS2 Norm < 0.9V)Time depends on engine temperature (Below -20°C(-4 °F): less than 4sec.,Over -20°C(-4 °F) : less than 1sec.)	

DiagnosisTime	• Contineous	
MIL On Condition	• DTC only (NO MIL ON)	

SIGNAL WAVEFROM AND DATA



Stepping on accelleraton pedal.



Pulling out accelleration cable with hand.

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P161B

COMPONENT LOCATION

GENERAL DESCRIPTION

Comparing actual torque and desired torque, PCM diagnoses calculated torque state. Actual torque keeps lower than desired torque, PCM checks if actual torque is higher than desired torque. deviding condition into two state, dynamic and steady states, PCM applies different diagnosis logic. Because the responses due to this code is similar to that of MAF control error, checking MAF at first.

DTC DESCRIPTION

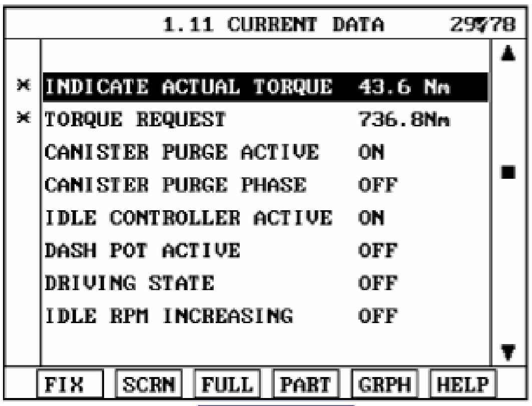
PCM checks if actual torque is higher than desired torque. deviding condition into two state, dynamic and steady states. At diagnosis during steady state, if the difference between actual torque and desired torque is higher than the threshold value, an error is recognized. And at dynamic diagnosis, desired torque of fly wheel and actual dynamic torque is compared. If ETS is on Power Management Mode, total engine torquemodulated by PCM is used instead of total actual engine torque. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

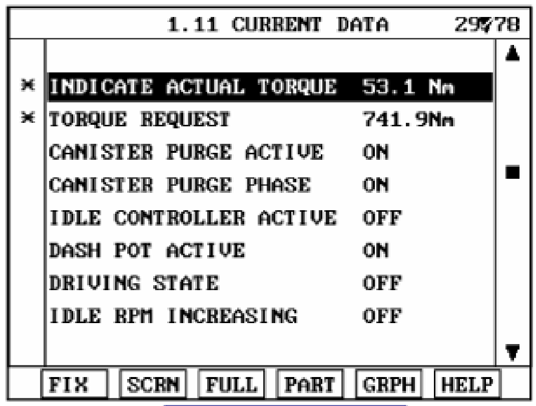
ITEM		Detecting Condition	Possible Cause
DTC Strategy	Case 1	• Determines if Delivered Torque Is Grossly Different fromDesired Torque	• Intake air leakage • Faulty ETS System • Clogged exhaust system • Faulty PCM
	Case 2	• Determines if Delivered Torque is Grossly Different fromDesired Torque	
	Case 3	• Determines if Delivered Torque is Greater than DesiredTorque With Zero Pedal	
Enable Conditions	Case 1	• Engine Running state	
	Case 2	• Engine Running state • Engine Speed > 600rpm • Desired Flywheel Torque Within 20Nm • Steady State Torque Timer > 1sec.	
	Case 3	• Pedal Position < 0.8% • Torque Command Source = Engine off	
Threshold value	Case 1	• When Dynamic torque error (difference between actualand desired torque value) above which the torque toohigh fail criteria is met > 25%While Net Torque ≥ 20NmOR torque throttle load > 1%	
		• Dynamic Torque ErrorThe torque error (differencebetween actual and desired torque value) below whichthe torque too low fail criteria is met < -120%While Desired ETC throttle position < 0%	
	Case 2	• When Steady State Torque Error > 60NmWhile Actual Net Torque ≥ 20NmOR Torque Throttle Load ≥ 2%	
	Case 3	• Maximum limit for the fuel flow rate to pass theredundant torque rationality diagnostic versus enginespeed. > 3g/s	
Diagnosis Time		• Contineous Case1: More than 7.8sec. failure for every 15.6sec.Test Case2: More than 0.03sec. failure for every 0.6sec.Test Case3: More than 7.8sec. failure for every 15.6sec.Test	
MIL On Condition		• 1 Driving Cycle	

MONITOR SCANTOOL DATA

1. Conect scantool to DLC(Data Link Connector)
2. Warm-up the engine to normal operating temperature.
3. Monitor "Actual Torque & Torque Request" parameters on scantool
4. Monitor DTC related to "ETS or CAM" on scantool



Torque at Idle



Torque at accelleration

5. Are there any DTC related to "ETS" or "CAM" on the scantool ?

YES

▸ Repair "ETS" or "CAM" system first, then, go to "Terminal and Connector Inspection" procedure.

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check air leakage
   (1) Check contamination or installation of Gasket
   - ▸ Check throttle body gasket
   - ▸ Check gasket between intake manifold and surge tank.
   - ▸ Check contamination or clog by foreign material of gasket between intake manifold and injector.
   - ▸ Check contamination or open stuck resulting from foreign material between surge tank and PCSV.

   (2) Is there any air leakage ?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check exhaust system for clogging" as follows.

2. Check exhaust system for clogging
   (1) Check exhaust system.
   - ▸ Clogged or broken muffler
   - ▸ Broken catalyst

   (2) Is the exhaust system colgged ?

   YES

   ▸ Go to "Check throttle valve for stuck" as follows.

   NO

   ▸ Repair or repalce as necessary and then, go to "Verification of Vehicle Repair" procedure.

3. Check throttle valve for stuck
   (1) IG "OFF".

   (2) Remove air hose between throttle body and airflow sensor.

(3) Check if throttle valve is sutck by foreign material.

(4) Is the throttle valve normal ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ After getting rid of foreign material, check that throttle valve is normal and check for proper operation. If the problem is corrected,replace ETC and then go to "Verification of Vehicle Repair" procedure.

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

COMPONENT INSPECTION

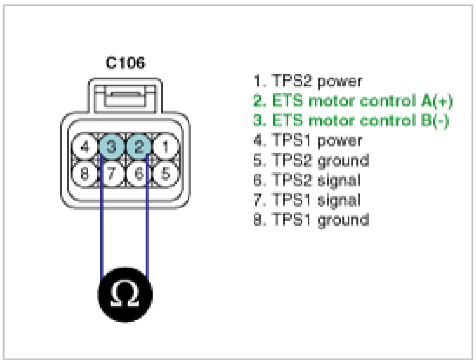
1. Check resistance of ETS Motor

(1) IG "OFF"

(2) Disconnect ETS motor & TPS connector.

(3) Measure resistance between terminal 2 and 3 of ETS motor & TPS connector.(Component Side)

Specification : Approx. 1.275 ~ 1.725Ω@ 23°C(73.4 °F)



(4) Is the measured resistance within specifications ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known-good ETC and check for proper operation. If the problem is corrected,replace ETC and then go to "Verification of Vehicle Repair" procedure.

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

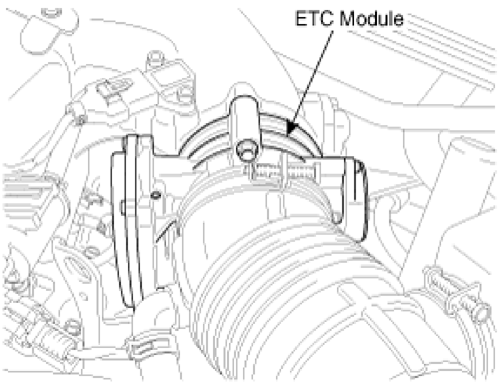
▸ Go to the applicable troubleshooooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2104

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

PCM recognizes vehicle state as forced idle under detecting condition, and sets P2104. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This code detects if the system is in Forced Idle Mode	• Faulty APS • Faulty APS+Brake • Faulty APS + Vehicle speed sensor • Faulty APS + Vehicle speed sensor + Brake • Faulty PCM
EnableConditions	• Ignition "ON"	
Threshold value	• Forced Idle Mode is active	
DiagnosisTime	• -	
MIL On Condition	• 1 Driving Cycles

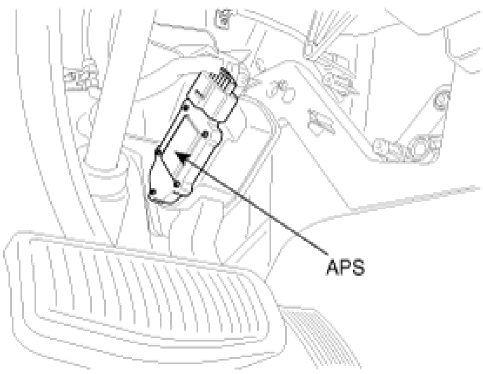
Fuel System > Troubleshooting > P2122

COMPONENT LOCATION



GENERAL DESCRIPTION

APS(Acceleration Position Sensor) measures driver's accelerating intension using a potentiometer and APS signal is transmitted to the PCM. The pedal's position is converted as voltages of potentiometer in the APS.The absence of a mechanical link between the accelerator pedal and throttle valve presents a risk of loss of control of the engine in the event of a failure of the component. Therefore, APS has the two potentiometers whose slides are mechanically solid. APS 2 decides whether or not APS 1 & 2 is faulty.

DTC DESCRIPTION

Checking output signals from APS 1 every 78 sec., under detecting condition, if output signals are detected as out of threshold more than the specified number of times., PCM sets P2122. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a continuous short to ground or open in either the circuit or the sensor (0-100%)	• Poor connection • Open or short to ground in Power circuit • Open or short to ground in Signal Circuit • Faulty APS • Faulty PCM
EnableConditions		• Ignition "ON" • Fail is NOT reported if: VrefA Fail Count > 0OR A/D converter is not failed.	
Threshold	Case 1	• APS1 < 0.125V	
	Case 2	• VrefA Fail Criteria is met	
Diagnosis Time		• Contineous (More than 4sec. Failure for every 78sec. Test)	
MIL On Condition		• 1 Driving Cycle	

SIGNAL WAVEFROM AND DATA

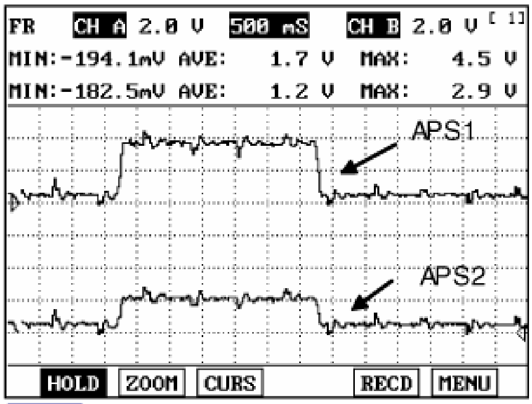


Fig. 1

Fig. 1 : This is a signal waveform of APS 1 & 2 which shows that APS 2 increases voltage just half of APS 1 voltage increase when accelleration.

SPECIFICATION

Pedal Position	Output Voltage(V) [Vref = 5.0V]	
	APS1	**APS2**
C.T	0.7 ~ 0.8V	0.275 ~ 0.475V
W.O.T	3.8 ~ 4.4V	1.75 ~ 2.35V

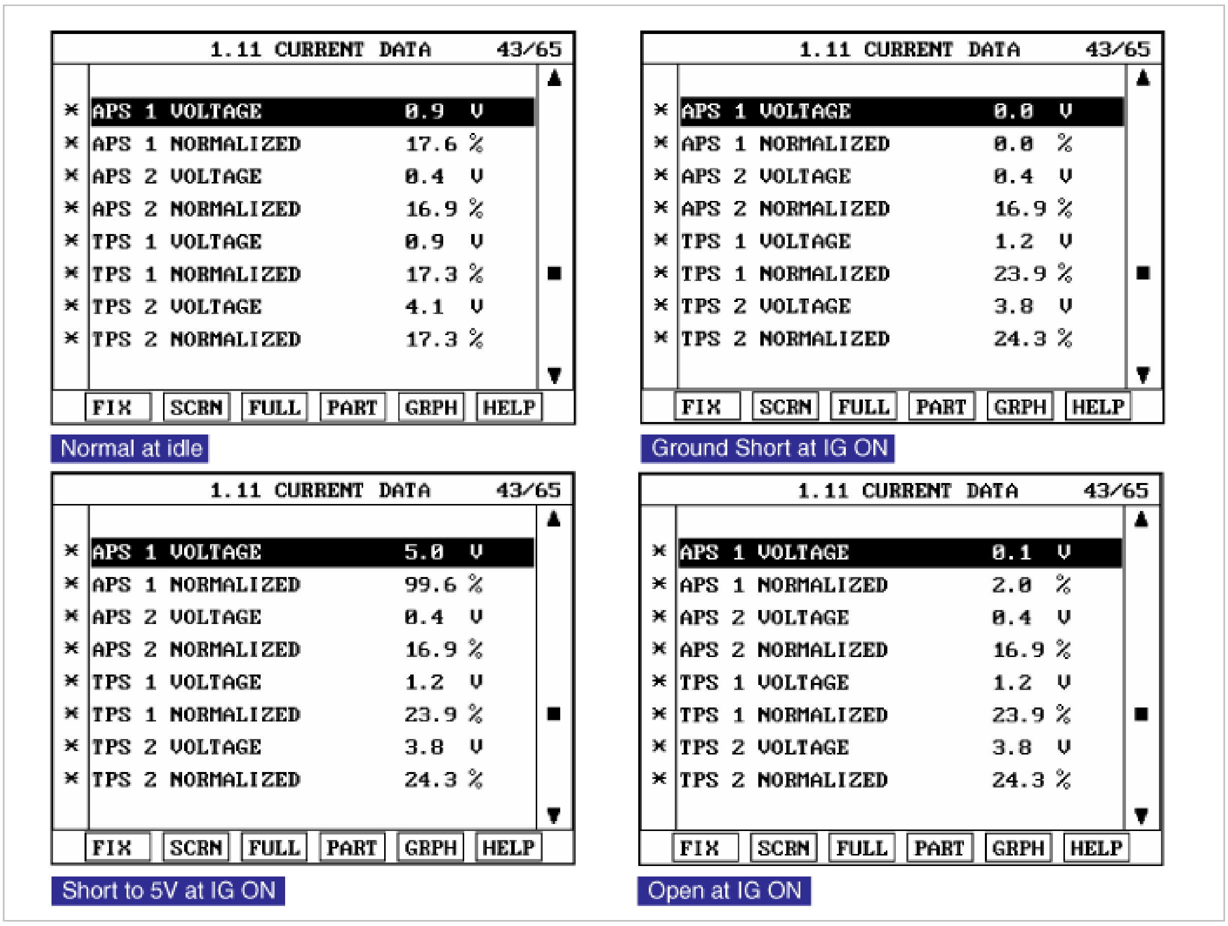
MONITOR SCANTOOL DATA

1. Connect scantool to DLC(Data Link Connector).
2. Warm up the engine to normal operating temperature.
3. Monitor "APS1 & APS2" parameters on the scantool.

Pedal Position	Output Voltage(V) [Vref = 5.0V]	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.275 ~ 0.475V
W.O.T	3.8 ~ 4.4V	1.75 ~ 2.35V



4. Are those "APS1 & APS2" parameters displayed correctly ?

YES

▸Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸Repair as necessary and go to "Verification of Vehicle Repair" procedure

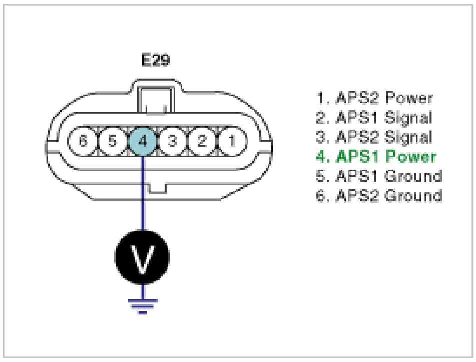
NO

▸Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect APS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between harness terminal 4 of APS and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF".

   (2) Disconnect APS & PCM connector.

   (3) Measure resistance between terminal 2 of APS harness connector and chassis ground.

   (4) Measure resistance between terminal 2 and 5 of APS harness connector.

   (5) Measure resistance between terminal 2 and 6 of APS harness connector.

   Specification : Infinite

   (6) Is the measured resistance within specification ?

   YES

   ▸ Go to "Check open in harness" as follows.

   NO

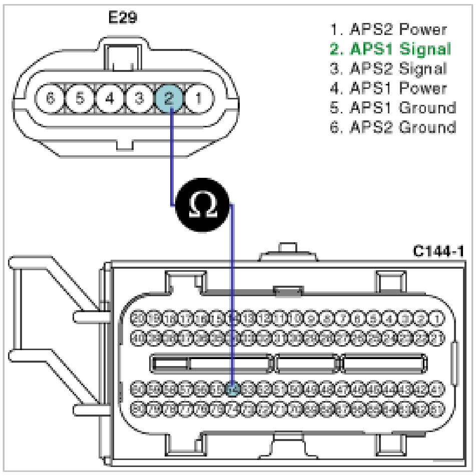
   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF"

   (2) Disconnect "APS" and "PCM" connector.

   (3) Measure resistance between terminal 2 of APS harness connector and terminal 54/C144-1 of PCM harness connector.

   Specification : Approx. below 1Ω



(4) Is the measured resistance within in specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

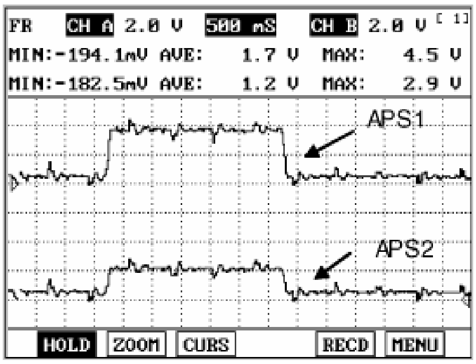
▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check APS
   (1) IG "ON" & ENG "OFF".
   (2) Measure signal waveform of APS by pressing and depressing accellerator pedal.

Specification :

Pedal Position	Output Voltage(V) [Vref = 5.0V]	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.275 ~ 0.475V
W.O.T	3.8 ~ 4.4V	1.75 ~ 2.35V



(3) Is the measured signal waveform O.K ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known-good APS and check for proper operation. If the problem is corrected,replace APS and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

	APS1	**APS2**
C.T	0.7 ~ 0.8V	0.275 ~ 0.475V
W.O.T	3.8 ~ 4.4V	1.75 ~ 2.35V

4. Are those "APS1 & APS2" parameters displayed correctly ?

YES

▸Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

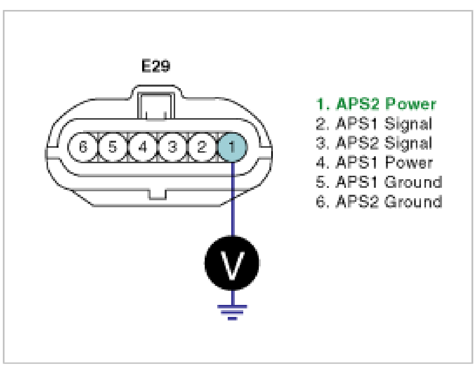
NO

▸ Go to "Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF".
2. Disconnect APS connector.
3. IG "ON" & ENG "OFF".
4. Measure voltage between termial 1 of APS harness connector and chassis ground.

Specification : Approx. 5V



5. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

NO

▸ Repair or replace as necessary and then, go to 'Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF".
   (2) Disconnect APS and PCM connector.
   (3) Measure resistance between terminal 3 of APS harness connector and chassis ground.
   (4) Measure resistance between terminal 3 and 5 of APS harness connector.
   (5) Measure resistance between terminal 3 and 6 of APS harness connector.

Specification : Infinite

   (6) Is the measured resistance within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF".
   (2) Disconnect APS and PCM connector.
   (3) Measure resistance between terminal 3 of APS harness connector and terminal 49/C144-1 of PCM harness connector.

Specification : Approx. below 1Ω

   (4) Is the measured resistance within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

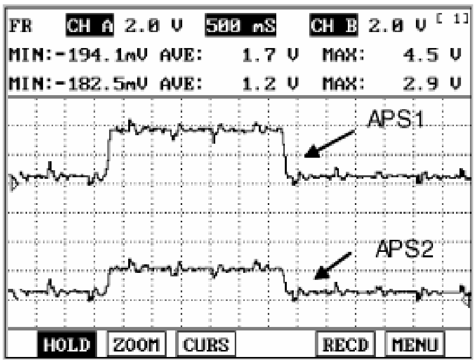
1. Check APS

(1) Ignition "ON" & ENG "OFF".

(2) Measure waveform of APS by pressing and depressing accellerator pedal with scantool.

Specification :

Pedal Position	Output Voltage(V) [Vref = 5.0V]	
	APS1	**APS2**
C.T	0.7 ~ 0.8V	0.275 ~ 0.475V
W.O.T	3.8 ~ 4.4V	1.75 ~ 2.35V



(3) Is the measured signal waveform O.K ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known-good APS and check for proper operation. If the problem is corrected,replace APS and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

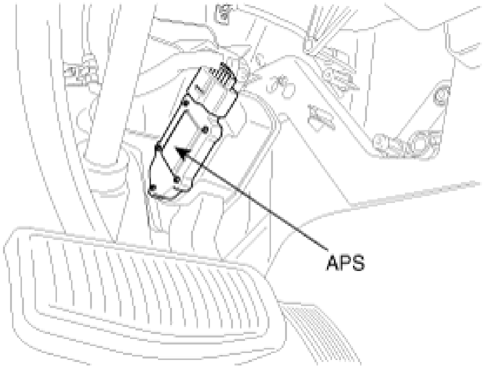
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2128

COMPONENT LOCATION



GENERAL DESCRIPTION

APS(Acceleration Position Sensor) measures driver's accelerating intension using a potentiometer and APS signal is transmitted to the PCM. The pedal's position is converted as voltages of potentiometer in the APS.The absence of a mechanical link between the accelerator pedal and throttle valve presents a risk of loss of control of the engine in the event of a failure of the component. Therefore, APS has the two potentiometers whose slides are mechanically solid. APS 2 decides whether or not APS 1 & 2 is faulty.

DTC DESCRIPTION

Checking output signals from APS 2 every 78 sec., under detecting condition, if output signals are detected as out of threshold more than the specified number of times., PCM sets P2128. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a short to high in either the circuit or the sensor (0-100%)	• Poor connection • Short to battery in Signal Circuit • Open in Ground Circuit • Faulty APS • Faulty PCM
EnableConditions		• Ignition "ON"	
Threshold	Case 1	• APS2 > 3V	
	Case 2	• 4.5V < Sensor Power Supply < 5.5V	
Diagnosis Time		• Contineous (More than 4sec. Failure for every 78sec. Test)	
MIL On Condition		• 1 Driving Cycle	

SIGNAL WAVEFROM AND DATA

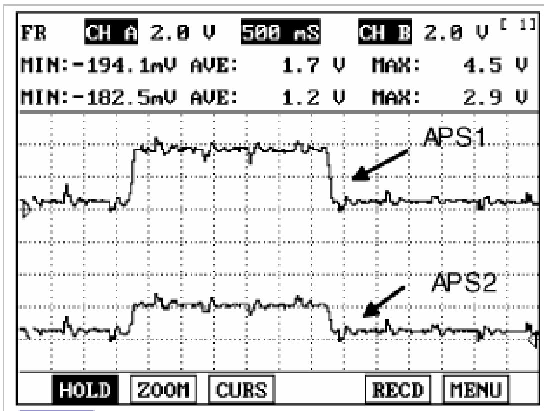


Fig. 1

Fig. 1 : This is a signal waveform of APS 1 & 2 which shows that APS 2 increases voltage just half of APS 1 voltage increase when accelleration.

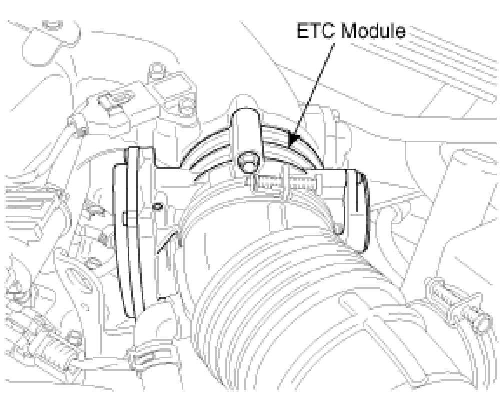
Fuel System > Troubleshooting > P2135

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Checking output signals from TPS 1 and 2 every 109.2 sec., under detecting condition, if output signals difference between TPS1 and TPS2 are detected more than 3.5% for the specified number of times., PCM sets P2135. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Determines if TPS # 1 disagrees with TPS # 2 (0-100%)	• Poor connection • Open or short in TPS circuit • Faulty TPS • Faulty PCM
Enable condition	• Ignition "ON"	
threshold value	• Difference between average values of TPS1 and TPS2 > 4.5%	
diagnosis time	• Continuous (More than 0.1sec failure for every 10.92sec. Test)	
MIL ON condition	• 2 driving cycles	

SPECIFICATION

110°	5.0V	0.0V

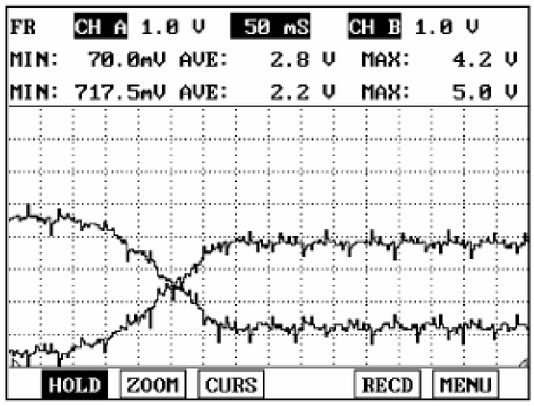
Pressing acclerator pedal at idle



Pulling out accellerator cable with hand at idle

(3) Is the measured signal waveform O.K ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known-good TPS and check for proper operation. If the problem is corrected,replace TPS and then go to "Verification of Vehicle Repair" procedure.
(After replacing ETC, do initialization of ETC as follows)

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

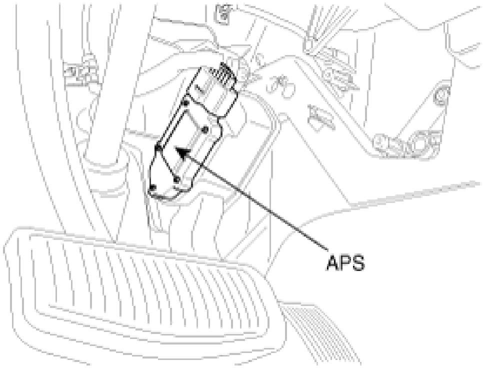
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2138

COMPONENT LOCATION



GENERAL DESCRIPTION

APS(Acceleration Position Sensor) measures driver's accelerating intension using a potentiometer and APS signal is transmitted to the PCM. The pedal's position is converted as voltages of potentiometer in the APS.The absence of a mechanical link between the accelerator pedal and throttle valve presents a risk of loss of control of the engine in the event of a failure of the component. Therefore, APS has the two potentiometers whose slides are mechanically solid. APS 2 decides whether or not APS 1 & 2 is faulty.

DTC DESCRIPTION

Checking output signals from APS 1 and 2 every 93.6 sec., under detecting condition, if output signals difference between APS 1 and 2 are detected more than 4.5% for the specified number of times., PCM sets P2138. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a correlation error between APS 1 and APS 2 (0-100%)	• Poor connection • Open or short in APS Circuit • Faulty APS • Faulty PCM
EnableConditions		• Ignition "ON"	
Threshold	Case 1	• Difference between APS1 and APS2 Normalized values > 4.5%	
	Case 2	• Difference between APS learned minimums > 4.5%

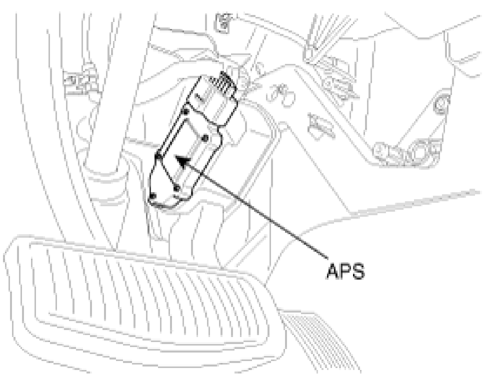
Fuel System > Troubleshooting > P2173

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Comparing real intake air flow and the intake air flow calculated by ETS every 15.6 sec., under detecting condition, if the difference of air flow more than 200g/s is detected for more than 1.3 sec., PCM sets P2173. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• The engine airflow measurements not based on throttle position are compared with throttle position based estimated airflow. If measured airflow is much higher than throttle based estimated airflow, the throttle body may not be throttling the engine.	
	• Engine running	

EnableConditions		• Throttle Actuation Mode is not OFF • MAP Sensor is not failed • MAF Sensor is not failed • IAT sensor is not failed	• Air Leakage between TPS and MAFS • Faulty throttle body • Faulty PCM
Threshold	Case 1	• Speed-Density Airflow - ETC estimated airflow > 9 g/s	
	Case 2	• MAF reading - ETC estimated airflow > 7g/s	
Diagnosis Time		• Contineous (More than 3.9sec. Failure for every 15.6sec. Test)	
MIL On Condition		• 1 Driving Cycle

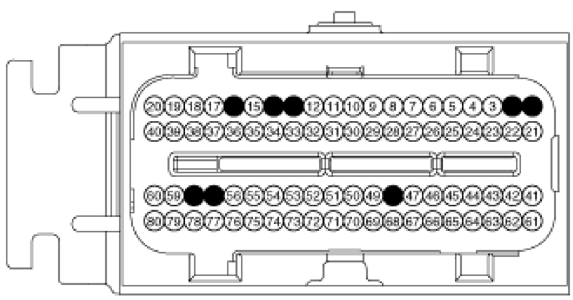
C106

ETC MODULE

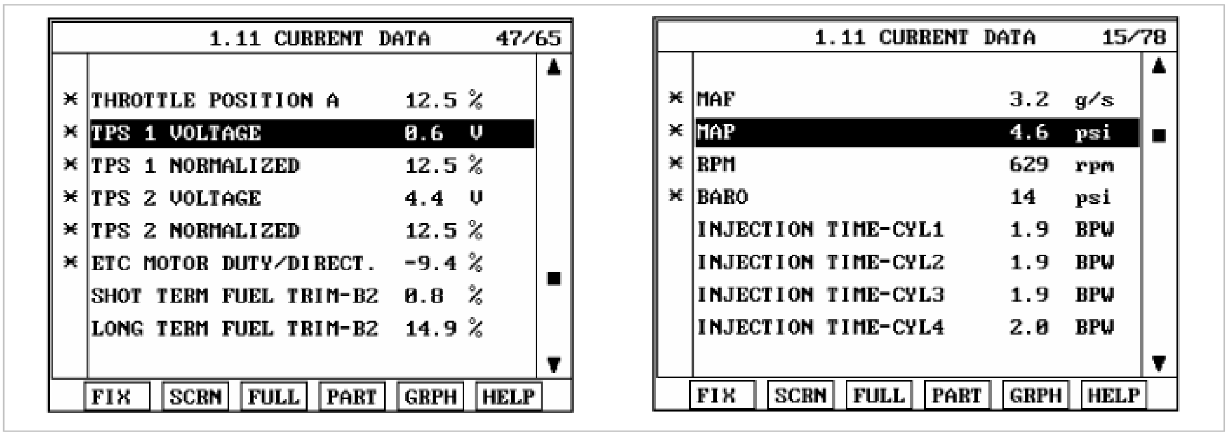


C144-2

PCM

MONITOR SCANTOOL DATA

1. Connect scantool to DLC.(Data Link Connector)
2. Warm up the engine to normal operating temperature.
3. Monitor "TPS1&2, MAPS,MAFS" parameters on scantool



YES

▸Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "System Inspection" procedure.

SYSTEM INSPECTION

1. Visual Inspection
   (1) Check the air hose between MAFS and throttle body is torn or installation.

   (2) Check deforamtion, crack or installation of throttle valve(body)

   (3) Has a problem been found ?

   YES

   ▸ Substitute with a known-good Air hose or throttle body and check for proper operation.
   If the problem is corrected,replace air hose or throttle body and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

GENERAL DESCRIPTION

Air-fuel feed back control is the modulation which increases or decreases fuel injection quantity as determining exhaust gas rich or lean with HO2S adjust combustion is done at ideal air-fuel ratioto so as to raise the efficiency of catalytic convertor. Generally, NOx increases at lean combustion while CO, HC increases in rich combustion. Thus, in order to purge all of these gases with catalytic convertor, air-fuel ratio should be nearly at the ideal ratio. However the range in which all gases purified successfully is too narrow, it is impossible to meet ideal range with open loop control, therefore feed back control using HO2S is required. HO2S output signal changes rapidly near ideal air-fuel ratio and this characteristic is used at feed back control. comparing HO2S output signal and reference value, PCM increases fuel injection quantity at lean condition and decreases at rich condition. As deterioration of engine, due to the characteristic changes of many components of intake and fuel line or inevitable tolerance of components at production process, achieving ideal air-fuel ratio is almost impossible with the fixed fuel injection duration. Regarding the change of cross section by clogged injector, feed back correction is performed yet, it cannot cover all the ranges. It means if the correction range is massively seperated from the ideal value or if the mean of feed back control range too inclines to lean or rich condition, feed back correction does not work efficiently. Therefore processing correction value throughout long time statistically during driving, PCM controlls fuel injection duration as fitting the mean to be the ideal air-fuel ratio value. Through adaptive control, accuracy of the control could be improved and the value of adaptive control varies countiuously during driving and is always up-dated.

DTC DESCRIPTION

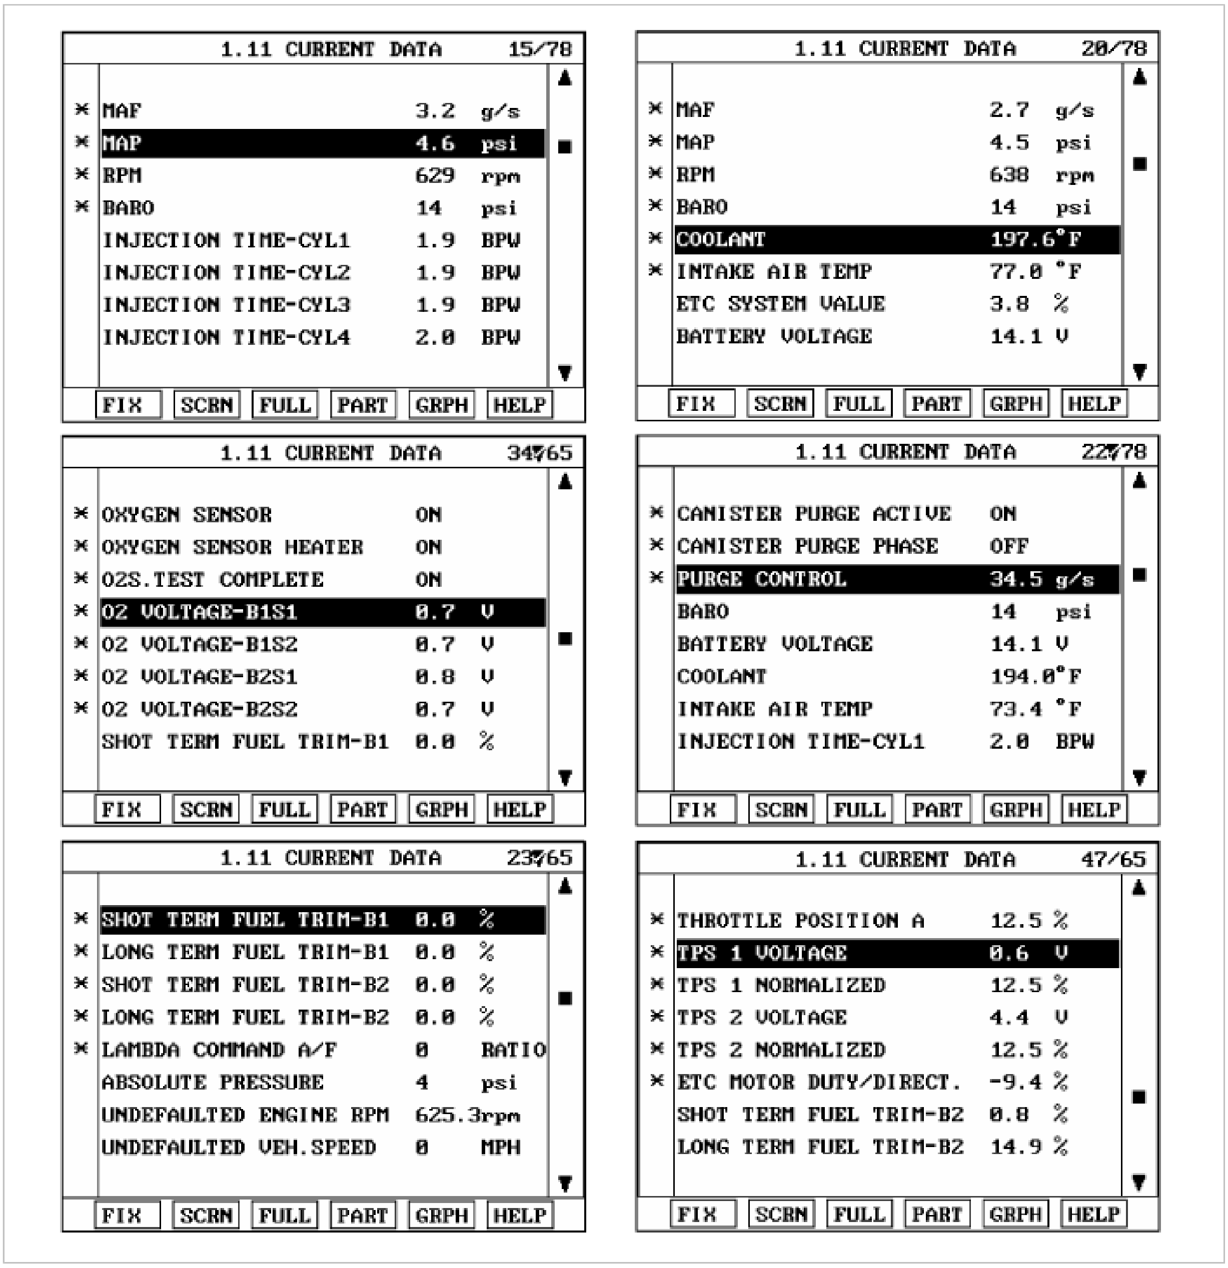
Checking air-fuel ratio correction value every 0.75 sec. at idle, if the value within the detecting condition for more than 0.3 sec., PCM sets P2187. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Fuel Trim Idle Condition Option Limits Exceeded	• Sensors related to Fuel Trim • Intake system • Fuel Pressure • Faulty PCM
EnableConditions	• 550rpm ≤ Engine Speed ≤ 4000rpm • 60°C ≤ Engine coolant temperature ≤ 114.992°C • -10°C ≤ Intake Air Temperature ≤ 60°C • 0° ≤ Throttle Position ≤ 72° • 25kPa ≤ Engine Load ≤ 90kPa • 1.5g/s ≤ Intake Air Flow ≤ 80g/s • Barometric Pressure ≥ 72kPa • Vehicle Speed ≤ 130km/h • System Voltage ≥ 11V • BLM learn Allowed • Closed Loop Active • Other diagnostic fault not active	
Threshold value	• Lean Limit Average > 0.8 (The average of short term fuel trim values) • Lean Limit Average > 1.25 (The average of adaptive index multiplier values)	
DiagnosisTime	• Contineous (More than 0.375sec. Failure for every 0.75sec. Test)	
MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. Connect scantool to DLC(Data Link Connector)
2. Warm up the engine to normal operating temperature.
3. Monitor sensors related to fuel trim(Ex. HO2S,MAFS,MAPS,TPS,MAPS,TPS,ECTS,PCSV,Injectors etc.) with scantool



4. Are those parameters displayed correctly ?

YES

▸Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Terminal and connector inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure.

SYSTEM INSPECTION

1. Check Air leakage
   (1) Check gasket is contaminated or misinstalled.
   - Installation or any damage of Throttle body gasket
   - Installation or any damage of the gasket between intake manifold and surge tank.
   - Clogging of intake manifold or injectors resulting from foreign materials.
   - Open stuck of PCSV caused by foreign materials between surge tank and PCSV.

   (2) Has a problem been found ?

   YES
   - Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO
   - Go to "Check Fuel Line Inspection" as follows.

2. Check Fuel Line Inspection
   (1) Check clog, contamination and installation of each hose as follows.
   - Check connection of each fuel line.
   - Check damage, interference and installation of vaccum hose connected to fuel line.
   - Check that fuel pipe in the fuel line is bent and sqeezed.
   - Check any fuel leakage from fuel pipe in the fuel line.

   (2) Has a problem been found ?

   YES
   - Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO
   - Go to "Check fuel pressure" as follows.

3. Check Fuel Pressure
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"

   (2) Is the measured fuel pressure within specification ?

   YES
   - Go to "Component Inspection" procedure.

   YES
   - Repair or replace as necessary and the, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check PCV
   (1) IG "OFF".

   (2) Remove PCV valve and then, check that plunger in the PCV is moving.

   (3) Is the PCV normal ?

   YES
   - Go to "Check PCSV" as follows.

   NO
   - Substitute with a known-good PCV and check for proper operation. If the problem is corrected,replace PCV and then go to "Verification of Vehicle Repair" procedure.

2. Check PCSV
   (1) IG "OFF".

   (2) Remove PCSV and Vaccum Hose

   (3) Check that PCSV is just one way solenoid valve

   (4) Is the PCSV normal ?

   YES
   - Go to "Check injector" as follows.

   NO
   - Substitute with a known-good PCSV and check for proper operation. If the problem is corrected,replace PCSV and then go to "Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF"

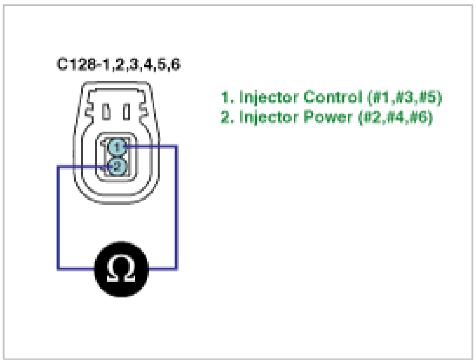
(2) Remove injector.

(3) Check that injector hole is clogged by foreign materials.

(4) Measure resistance between terminal 1 an 2 of injector connector.(Component Side)

Specification :

Temp.	Resistance
20°C (68°F)	11.4 ~ 12.6Ω



(5) Is the measured resistance within specification ?

YES

▸ Go to "Check component related to fuel trim" as follows.

NO

▸ Substitute with a known-good injector and check for proper operation. If the problem is corrected,replace injector and then go to "Verification of Vehicle Repair" procedure.

4. Check component related to fuel trim

(1) Check component related to fuel trim such as HO2S, MAFS,MAPS, TPS, ECTS, PCSV and Injectores) - Refer to each designated trouble shooting guide.

(2) Are those component related to fuel trim O.K ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

      ▸ Go to "Check Fuel Pressure" as follows

2. Check Fuel Pressure
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"

   (2) Is the measured fuel pressure within specification ?

      YES

      ▸ Go to "Component Inspection" procedure.

      NO

      ▸ Repair or replace as necessary and the, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check PCV
   (1) IG "OFF".

   (2) Remove PCV valve and then, check that plunger in the PCV is moving.

   (3) Is the PCV normal ?

      YES

      ▸ Go to "Check PCSV" as follows.

      NO

      ▸ Substitute with a known-good PCV and check for proper operation. If the problem is corrected,replace PCV and then go to "Verification of Vehicle Repair" procedure.

2. Check PCSV
   (1) IG "OFF".

   (2) Remove PCSV and Vaccum Hose

   (3) Check that PCSV is just one way solenoid valve

   (4) Is the PCSV normal ?

      YES

      ▸ Go to "Check injector" as follows.

      NO

      ▸ Substitute with a known-good PCSV and check for proper operation. If the problem is corrected,replace PCSV and then go to "Verification of Vehicle Repair" procedure.

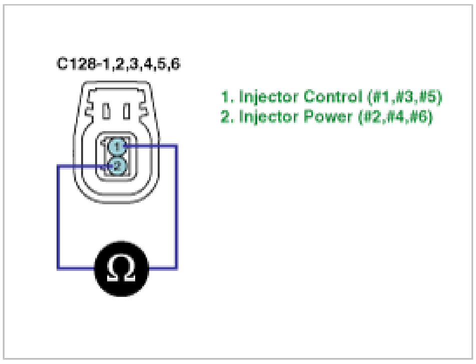
3. Check injector
   (1) IG "OFF"

   (2) Remove injector.

   (3) Check that injector hole is clogged by foreign materials.

   (4) Measure resistance between terminal 1 an 2 of injector connector.(Component Side)
      Specification :

Temp.	Resistance
20°C (68°F)	11.4 ~ 12.6Ω



(5) Is the measured resistance within specification ?

YES

▸ Go to "Check component related to fuel trim" as follows.

NO

▸ Substitute with a known-good injector and check for proper operation. If the problem is corrected,replace injector and then go to "Verification of Vehicle Repair" procedure.

4. Check component related to fuel trim
   (1) Check component related to fuel trim such as HO2S, MAFS,MAPS, TPS, ECTS, PCSV and Injectores) - Refer to each designated trouble shooting guide.

   (2) Are those component related to fuel trim O.K ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2195

COMPONENT LOCATION

GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
This oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S under detecting condition, if an output signal within the detecting condition lasts continuously, PCM sets P2195. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if O2 sensor indicates lean exhaust while in Power Enrichment (PE)	• Poor Connection • Faulty HO2S • Faulty PCM
EnableConditions	• Sensor not in cooled status flag • Not in Transient Conditions status flag • Device control not active • Min airflow present ≥ 2 g/s • Ignition voltage ≥ 10V • Fuel reduction not active • Engine running • Engine running long enough ≥ 60sec. • Power Enrichment conditions present • Engine coolant warm enough ≥ 60°C(140 °F) • Above conditions met long enough ≥ 1.5sec.	
Threshold value	• O2 sensor voltage < 0.35V and Air Fuel Ratio ≤ 13.5	
DiagnosisTime	• Contineous (More than 11.25sec. failure for every 12.5sec. Test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFROM AND DATA

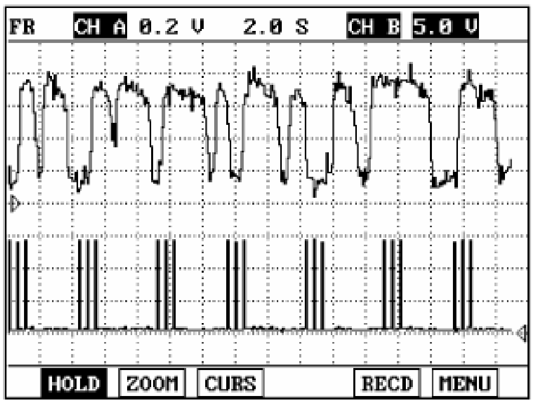


Fig.1:B1S1 & Heater

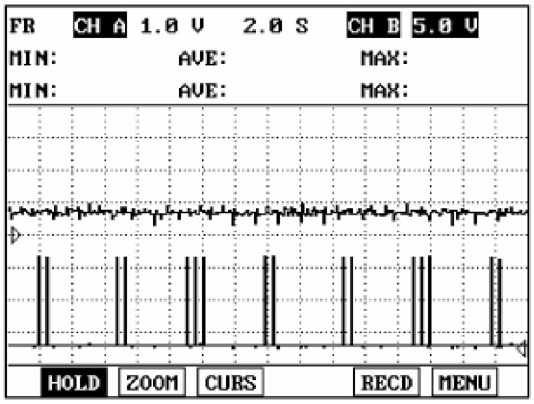

Fig.2:B1S2 & Heater

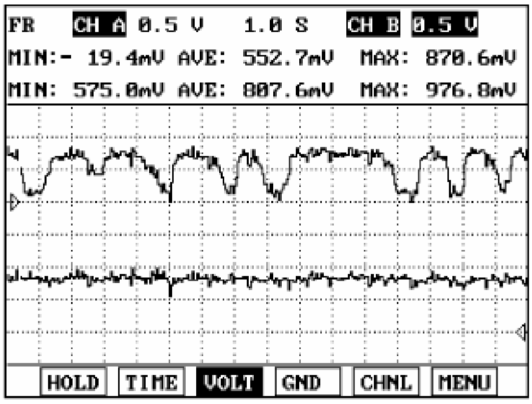

Fig.3:B1S1 & B1S2

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

A/F Ratio	Output Voltage(V)
Rich	0.75 ~ 1.00V
Lean	0 ~ 0.12V

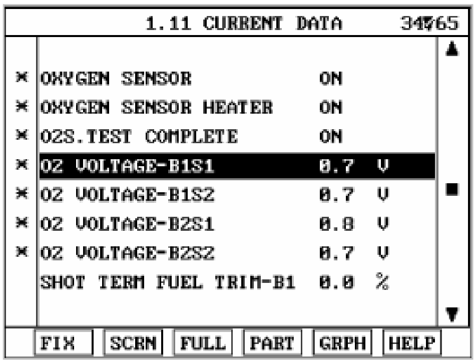
MONITOR SCANTOOL DATA

1. Connect scantool to DLC(Data Link Connector)
2. Warm up the engine to normal operating temperature.
3. Monitor "HO2S(B1S1)" parameter on scantool

Specification : 0.1 ~ 0.9V



4. Does the "HO2S(B1S1)" parameter operates correctly ?

YES

▸Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Visual Inspection
   (1) Visually check HO2S as follow.
      A. Contamination, deformation or age of HO2S(B1/S1)

   (2) Is the HO2S(B1/S1) normal ?

   YES

   ▸ Go to "Check performance of HO2S" as follows.

   NO

   ▸ Substitute with a known-good HO2S(B1S1) and check for proper operation. If the problem is corrected,replace HO2S (B1S1) and then go to "Verification of Vehicle Repair" procedure.

2. Check performance of HO2S
   (1) Connect scantool to DLC(Data Link Connector)

   (2) Warm up the engine to normal operating temperature.

   (3) Monitor signal waveform of HO2S with scantool.

   Specification : 0.1 ~ 0.9V.

   (4) Is the HO2S(B1S1) working properly ?

   YES

   ▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

   > **NOTE**
   >
   > There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

   NO

Specification : 0.1 ~ 0.9V

4. Does the "HO2S(B2S1)" parameter operates correctly ?

YES

▸Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, bending, corrosion, contamination, deterioration, or damage. Repair or replaceas necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Terminal and connector inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸Go to "Component Inspection " procedure.

COMPONENT INSPECTION

1. Visual Inspection
   (1) Visually check HO2S as follow.
      A. Contamination, deformation or age of HO2S(B2/S1)

   (2) Is the HO2S(B2/S1) normal ?

   YES

   ▸ Go to "Check performance of HO2S" as follows.

   NO

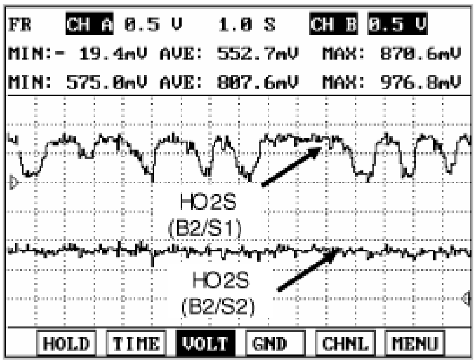
   ▸ Substitute with a known-good HO2S(B2S1) and check for proper operation. If the problem is corrected,replace HO2S (B2S1) and then go to "Verification of Vehicle Repair" procedure.

2. Check performance of HO2S
   (1) Connect scantool to DLC(Data Link Connector)

   (2) Warm up the engine to normal operating temperature.

   (3) Monitor signal waveform of HO2S with scantool.

   Specification : 0.1 ~ 0.9V.



(4) Is the HO2S(B2S1) working properly ?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

NO

▸ Substitute with a known-good HO2S(B2S1) and check for proper operation. If the problem is corrected,replace HO2S (B2S1) and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2270

COMPONENT LOCATION

GENERAL DESCRIPTION

Rear HO2S behind the catalytic conveter checks if purifying process performs well. purifying process is already done, the oxygen

density of exhaust gas through catalytic converter is in the specified value.

DTC DESCRIPTION

Checking output signals from HO2S under detecting condition, if an output signal within the threshold lasts continuously, PCM sets P2270. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

<table>
<tr><th>Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>
<tr><td>DTC Strategy</td><td>• Determines if O2 sensor indicates lean exhaust while in Power Enrichment (PE)</td><td rowspan="5">• Poor Connection
• Faulty HO2S
• Faulty PCM</td></tr>

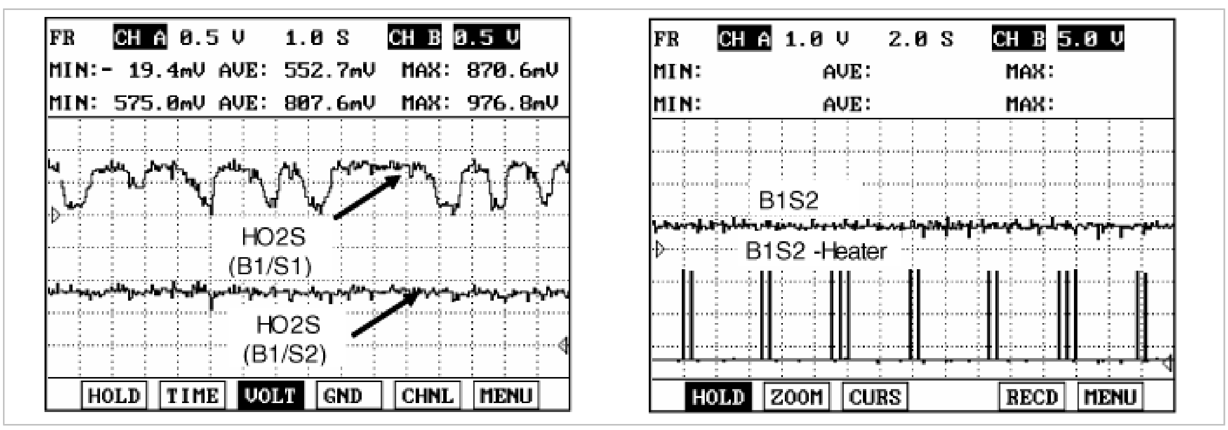
</table>

SIGNAL WAVEFROM AND DATA



After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

A/F Ratio	Output Voltage(V)
Rich	0.75 ~ 1.00V
Lean	0 ~ 0.12V

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2422

COMPONENT LOCATION

GENERAL DESCRIPTION

The vent valve is a device that is designed to close off the fresh air inlet to the canister. Current vent valve designs are powered closed. An electrically operated vent valve solenoid is requiredfor OBD II compliant evaporative systems. Normally the vent valve is in the open (unpowered)state, but to control the vacuum levels in the fuel tank the EVPD will command the vent valvesolenoid to the closed position. This controlled vacuum level will allow the EVPD to determine the integrity of the evaporative system.
The vent valve orifice is much larger than the purge valve orifice or purge lines so that when thevent valve is open, the purge flow is not restricted. The fresh air inlet in the vent valve solenoid is normally filtered with a serviceable dust filter that helps to prevent contaminants from being drawn into the evaporative system (e.g. water, salt, silica, etc.).

DTC DESCRIPTION

This test will detect blockage by commanding the vent solenoid to its normally open state and commanding the purge system to maintain a calibratable constant amount of purge flow. The fuel tank vacuum is monitored using the fuel tank pressure sensor for a calibration-specified amount of time. Anormally functioning evaporative system will maintain a relatively low vacuum level. Whereas, a failing evaporative system will experience an increasing vacuum level until a “fail” threshold is reached, at which time the test reports a “fail” condition.
Checking output signals from FTPS under detecting condition, if FTPS signal is detected higher than 14in H_2O for more than 5sec. when purging at 0.15 g/s. PCM sets P2422.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Test is failed if tank vacuum exceeds a prescribed threshold for a prescribed time when purging at a prescribed rate.	• Faulty Canister Close Valve • Clogging of canister air filter • Open in ground harness of FTPS • Faulty PCM
EnableConditions	• 10 < Ignition Volt < 15.9907 • Barometric pressure > 72 kPa • Engine off time > 720min or Startup IAT-Startup ECT < 12°C(53.6 °F) • Startup ECT -Startup IAT < 12°C(53.6 °F) • 0°C(32 °F) < Startup ECT < 40°C(104 °F) • 0°C(32 °F) < Startup IAT < 40°C(104 °F) • Start-up IAT-IAT < 1°C(33.8 °F) • Engine Run Time > 1sec • Purge enable time < Threshold • Cold Start Time < 300sec. • 15 % < Fuel Level < 85% • Restricted path test time < 120sec.	
Threshold value	• Tank vacuum ≥ 14 inH_2O • Fail time > 5s • Purge rate 0.15 g/s	
DiagnosisTime	• -	
MIL On Condition	• 1 driving cycle

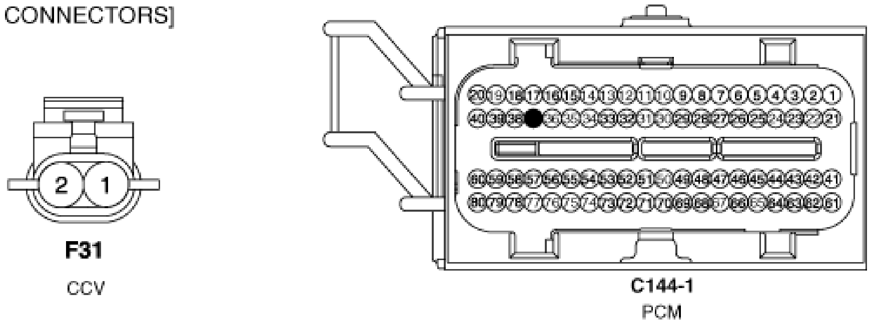
[HARNESS CONNECTORS]



MONITOR SCANTOOL DATA

1. Warm-up engine to normal operating temperature.

> **NOTE**
>
> Evaporative Emissions Systems (EVAP) Leak Tests can be run by the Scan Tool.The tests are automated and provide either a pass-fail result or directions to check for DTCs.

2. Install scan tool and clear DTC
3. Perform "EVAP. LEAKAGE TEST" mode referring to enable conditions as below
4. Monitoring for (pending) DTC by performing " DIAGNOSTIC TROUBLE CODES"or "MONITORING TEST RESULTS". Is the same DTC set ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of vehicle Repair" procedure

SYSTEM INSPECTION

1. Check Canister air filter and CCV
   (1) Visually inspect air filter is clogged.
   (2) Visually inspect duck between air filter and CCV is clogged.
   (3) Check that Canister is deformed or clogged by foreign materials.
   (4) Has a problem been found ?

YES

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

NO

▸ Open in ground harness of FTPS(Fuel tank pressure sensor) can cause this DTC. so check it for open.(Refer to DTC P0454) If the problem is not corrected, substitute with a known-good PCM and check for proper operation.If the problem is corrected, replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2610

COMPONENT LOCATION

GENERAL DESCRIPTION

Continuing to calculate data of several sensor despite turning ignition OFF, when ignition turns ON, PCM enables turning ignition ON to be easy using calculated data.

DTC DESCRIPTION

If there is a value difference between desired torque and real torque for more than 20 sec. or if errors exist inside of memory, PCM sets P2610. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

ITEM		Detecting Condition	Possible Cause
DTC Strategy	Case 1	• The LPC SPI Diagnostic allows the Low Power Counter to count down and simulateneously enables a test timer to run for a calibratable length of time and then compares the time elapsed recorded by the LPC (counter delta) against that recorded by the test timer in order to make a PASS/FAIL determination.	• PCM
	Case 2	• The LPC Reset Test checks for abnormal resets of the Low Power Counter	
EnableCondition	Case 1	• Test not complete • Engine running • Enough runtime > 10sec. • Battery voltage > 8V	
	Case 2	• No Memory Failure Occurred	
	Case 1	• The difference between the Counter Delta (test time as recoded by the low power counter) and the calibration the test timer clocks up to should be less than a maximum tolerance > 20sec.	

Threshold	Case 2	• The InItial Register Read flag is set to TRUE only when the Low Power Counter has been reset due to power supply problems or the like. • The Diagnostic logs a failure when it sees this flag set to TRUE, • Provided the engine is not running, • The battery voltage is not too low • The test has not already run this key cycle.	
Diagnosis Time		• -	
MIL On Condition		• 2 Driving Cycle	

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

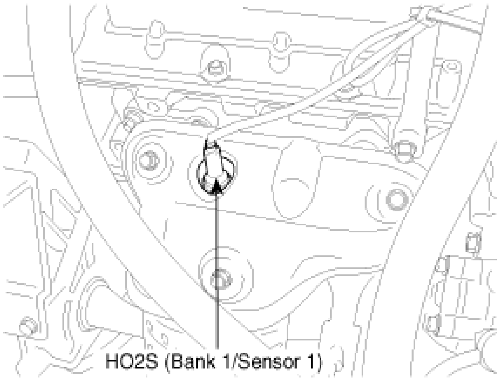
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P2A00

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison. In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Detect when the oxygen sensor reading has forced closed loop fuel control to stop executing, and Open Loop fuel control is in effect. This action will happen for OSP (flat plate) oxygen sensors that are not yet warmed up when the pumping current is in use. The California Air Resources Board (CARB) will not approve the current strategy without this modification. CARB considers this Open Loop operation to be a “default mode of operation,” and thus CARB expects the Malfunction Indicator Lamp (MIL) to be illuminated.
Checking output signals from B1S1 every 12 sec. under detecting condition, if an output signal is near 3.5V for more than 10 sec., PCM sets P2A00. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects Loss of O2 Ready status, which would lead to OpenLoop Fueling operation, a default mode.	• Poor Connection • Faulty HO2S • Faulty PCM
EnableConditions	• Engine Running • Ignition ON • DFCO Not present too long ≤ 15sec. • No Disabling Faults Present • All of the above for minimum time ≥ 20sec.	
Threshold value	• O2 Ready Status lost	
DiagnosisTime	• Contineous (More than 10 second failure for every 12 second test .)	
MIL On Condition	• 1 Driving Cycles	

SIGNAL WAVEFROM AND DATA

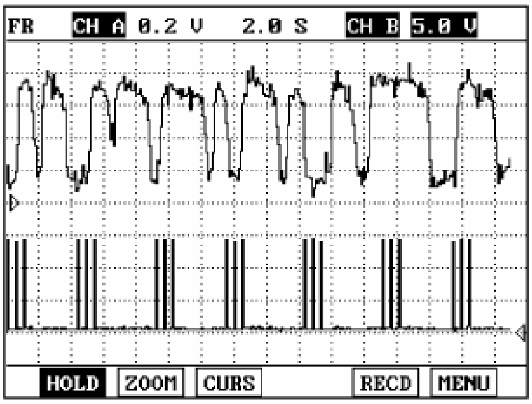


Fig.1 : B1S1 & Heater

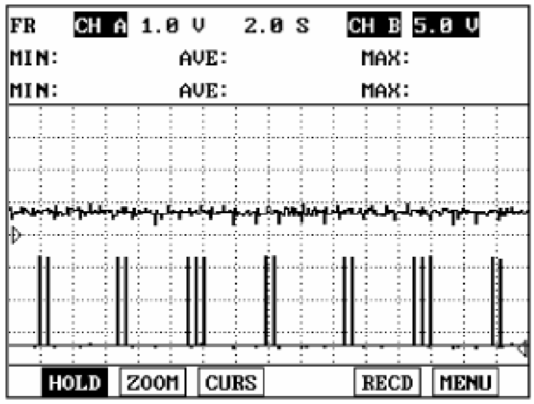

Fig. 2 : B1S2 & Heater

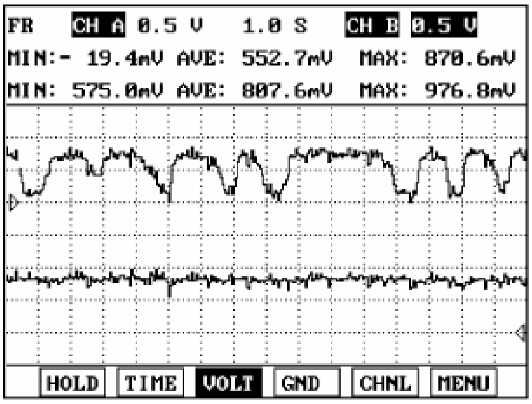

Fig. 3 : B1S1 & B1S2

After warming-up, Releasing accellerator pedal suddenly around 4000rpm the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off. Conversely, sudden depressing accellerator pedal HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will be switching between lean(below 0.48V) to rich(above 0.48V) normally.

SPECIFICATION

HO2S(B1S1)	Warmed up	0 ~ 1V
	Not warmed up	Near 3.5V

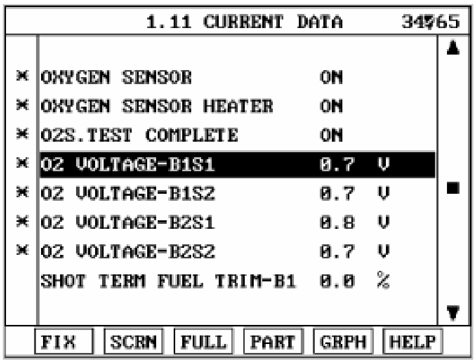
MONITOR SCANTOOL DATA

1. Connect Scantool & Engine "ON"
2. Warm up the engine to normal operating temperature.
3. Monitor HO2S voltage(B1/S1) parameter on scantool

Specification : Voltage will vary from 0.1 to 0.9 V



4. Is the HO2S parameter displayed within specifications ?

YES

▸Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of Vehicle Repair" procedure.

NO

▸Go to "Component Inspection" procedure

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   (1) Visually/physically inspect following items:
      A. Inspect the front HO2S for Contaminated, deteriorated or aged Front HO2S
      B. If contamination is evident on the HO2S, replace contaminated sensor
   (2) Is the HO2S visually / physically O.K ?

   YES

   ▸ Go to "Check Performance of H02S" as below

   NO

   ▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair"

2. Check performance of HO2S
   (1) Connect scantool & Engine "ON"
   (2) Warm-up the engine to normal engine temperature.
   (3) Monitor signal waveform of HO2S with scantool

   Specification : Voltage will vary from 0.1 to 0.9 V

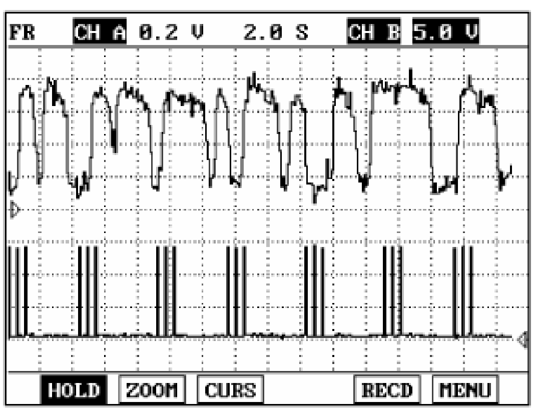


Fig.1: B1S1 & Heater

   (4) Is the sensor signal switching properly ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > U0001

GENERAL DESCRIPTION

As vehicles electronically controlled, various control unit is applied to vehicle and several units are controlled based on the signals from the sensors. Therefore sharing signals of sensors and information is required. To meet this requirement, CAN communication type, which is insensible to external noises and whose communication speed is fast, is applied to power train control.Sharing signals from RPM, APS, gear shifting, torque reduction in ESP, ABS and various modules, adtive control is performed.

DTC DESCRIPTION

Checking CAN communication every 1 sec., under detecting condition, if an output signal within the detecting condition is detected for more than 1.5 sec., PCM sets U0001. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects failures in communication between the PCM and another or allmodules in the vehicle which are on the CAN serial bus.	• CAN Communicatio line • CAN Communication Module
EnableConditions	• Engine Run Time ≥ 2sec. • Ignition Voltage ≥ 11V	
Threshold value	• CAN communicatin error	
DiagnosisTime	• Contineous (More than 1.5sec. Failure for every 1sec. Test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFROM AND DATA

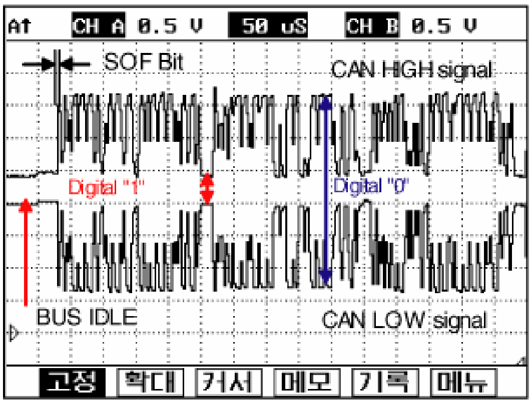

Fig.1

Monitoring CAN HIGH and LOW simultaneously is important in monitoring CAN communication waveform. When CAN HIGH signal rise to 3.5V and LOW signal drops to 1.5V - voltage difference between HIGH and LOW signal is 2V - at BUS IDLE state (DIGITAL "1") whose reference voltage is 2.5V, "0" is recognized. Besides, comparing HIGH and LOW signal if opposite waveform is detected with the reference voltage of 2.5V, Check if current CAM signal is transfers correctly.
Continuous "0"signal above 6BIT means the occurence of error in CAN communication. 1BIT is easily distinguished as calculating the time when "SOF"(START OF FRAME) which notifies the start of frame occurs. Check if "0"signal above 6BIT is detected continuously when monitoring CAN communication waveform.

SPECIFICATION

Format	DIGITAL "0"		DIGITAL "1"(BUS IDLE)		CAN Resistance	
	HIGH	LOW	HIGH	LOW	PCM	ESP
CAN 2.0B	3.5V	1.5V	2.5V	2.5V	120Ω (20°C)	120Ω (20°C)

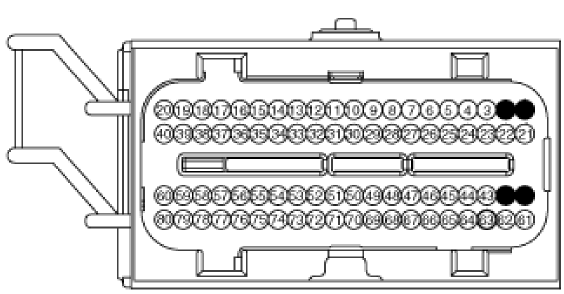
ABS & VDC Control



C144-1

PCM

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector (DLC).

2. Warm engine up to normal operating temperature.
3. Turn "OFF" electrical devices and A/C.
4. Monitor the data from PCM through CAN communication among ABSCM or ESP data

If CAN is normal, vehicle speed data is showed through CAN communication line from ABS or ESP control module.

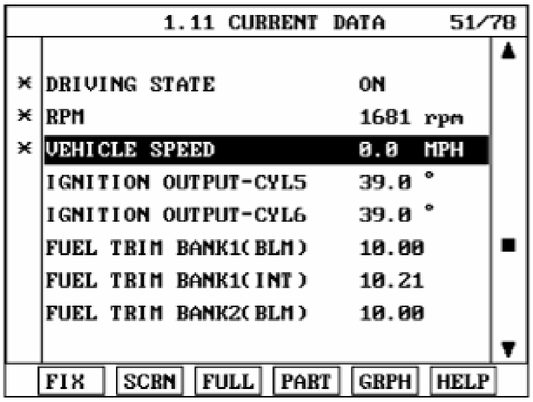


Fig. 1

Fig1 : Vehicle speed data on current data during driving state.

5. Is the data displayed correctly?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

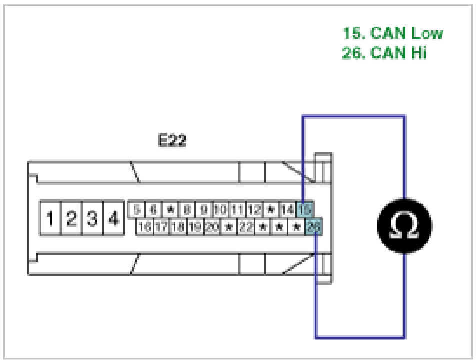
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check CAN communication bus resistance
   (1) Ignition "OFF".
   (2) Check connection state of PCM connector(C144-1) and ESP or ABS connector(E22)
   (3) Measure the resistance between ESP or ABS connector 15 and 26 refering to the checking condition of specification as follows.

Specification : ※ PCM connector, ESP or ABS connector connected : 60Ω ± 5Ω
※ PCM connecotor disconnected, ESP or ABS connector connected : 120Ω ± 10Ω
※ PCM connector connected, ESP or ABS connector disconnected : 120Ω ± 10Ω



(4) Is CAN BUS resistance within the specification?

YES

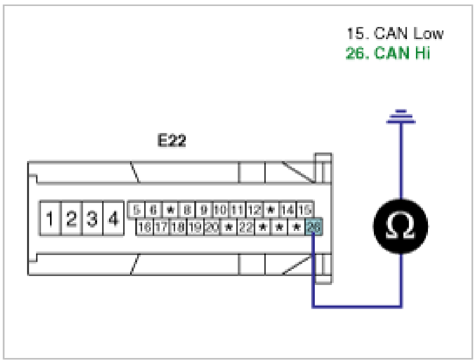
▸ Go to "Check short to ground in CAN BUS" as follows.

NO

▸ When resistance is about 1.0Ω : Go to "3. Check short between CAN communication lines" as follows
▸ When resistance is infinite Ω : Go to "4. Check open in CAN communication line" as follows

2. Check short to ground in CAN communication bus
   (1) Ignition "OFF"
   (2) Disconnect ESP or ABS connector.
   (3) Measure resistance between terminal 26 of ESP or ABS harness connector and chassis ground.

specification : Infinite



(4) Is the measured resistance within the specification?

YES

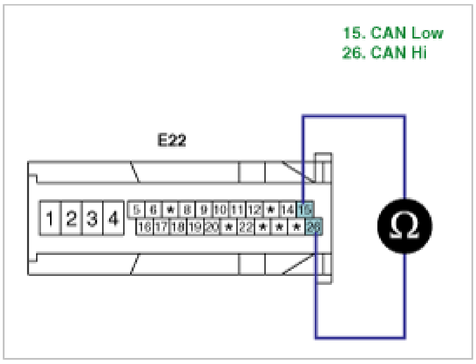
▸ Go to "Component Inspection" procedure

NO

▸ Below 1.0Ω is detected : Repair short to ground in CAN High circuit and go to "Verification of Vehicle Repair" procedure.
▸ Above 120Ω is detected : Repair short to ground in CAN Low circuit and go to "Verification of Vehicle Repair" procedure.

3. Check short between CAN communication lines(LOW and HIGH)
   (1) Ignition "OFF"
   (2) Disconnect PCM connector and ESP or ABS connector.
   (3) Measure resistance between terminal 15 and 26 of ESP or ABS harness connector.

specification : Infinite



(4) Is the measured resistance within the specification?

YES

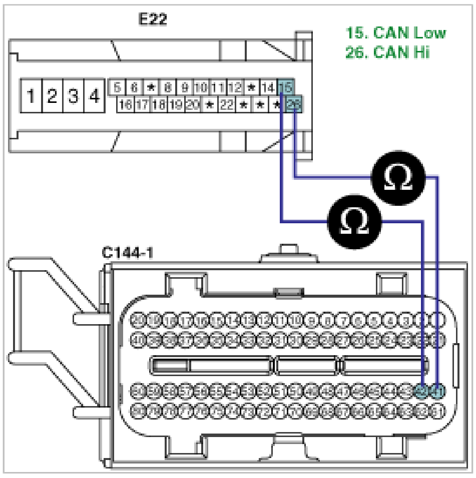
▸ Go to "Component Inspection" procedure.

NO

▸ Below 1.0Ω is detected : Repair short between CAN LOW and HIGH signal line and go to "Verification of Vehicle Repair" procedure.

4. Check open in CAN communication line
   (1) Ignition "OFF".
   (2) Disconnect PCM connector and ESP or ABS connector.
   (3) Measure resistance between terminal 42/C144-1 of PCM harness connector and terminal 15 of ABS or EPS harness connector.(CAN Low)
   (4) Measure resistance between terminal 41/C144-1 of PCM harness connector and terminal 26 of ABS or EPS harness connector (CAN hi)

specification : Below 1.0Ω



(5) Is the measured resistance within the specification?

YES

▸ Go to "Component Inspection" procedure.

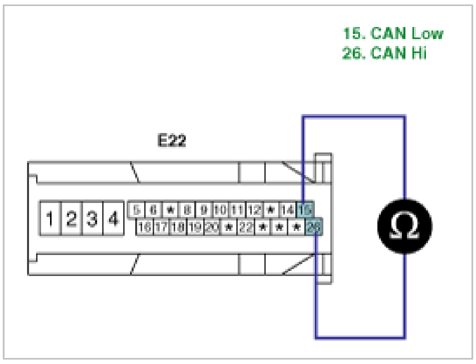
NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check the resistance of CAN BUS inside of module
   (1) Ignition "OFF"
   (2) Measure the resistance between ABS or ESP connector 15 and 26 refering to the checking condition of specification as follows.

Specification : ※ PCM connector disconnected, ESP or ABS connector connected. (TEST "A") : 120Ω ± 10Ω
※ PCM connector connected, ESP or ABS connector disconnected (TEST "B") : 120Ω ± 10Ω



(3) Is the measured resistance within the specification?

YES

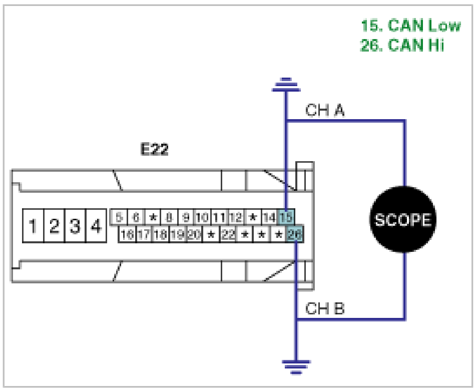
▸ Go to "2. Check CAN communication waveform" as follows

NO

▸ TEST "A" problem : the resistance of CAN BUS inside of ABS or ESP is without specification. Replace ABS or ESP and go to "Verification of Vehicle Repair"
▸ TEST "B" problem : the resistance of CAN BUS inside of PCM is without specification. Replace PCM and go to "Verification of Vehicle Repair"

2. Check CAN communication waveform output
   (1) Ignition "OFF"
   (2) Connect 2 channel scope to ABS or ESP connector terminal 15 and 26.
   (3) Disconnect ABS or ESP connector and check CAN communication waveform after Ignition "ON". (TEST "A")
   (4) Disconnect PCM connector and check CAN communication waveform after Ignition "ON". (TEST "B")

Sspecification : Communication waveform similar to the waveform of "Signal Waveform & Data" is displayed when Ignition "ON"
※ It means communication error of connected module when, being different from reference waveform, 1) CAN HIGH and LOW signals are fixed at 2.5V or 2)HIGH and LOW signals are fixed at 3.5V and 1.5V,respectively



(5) Does correct waveform generate from ECM and TCM?

YES

▸ Go to "Verification of Vehicle Repair"

NO

▸ TEST "A" waveform is abnormal : Repalce PCM due to the communication error with PCM and go to "Verification of Vehicle Repair"
▸ TEST "B" waveform is abnormal : Repalce ABS or ESP due to the communication error with ABS or ESP and go to "Verification of Vehicle Repair"
※ Repeat this process 2~3 times.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

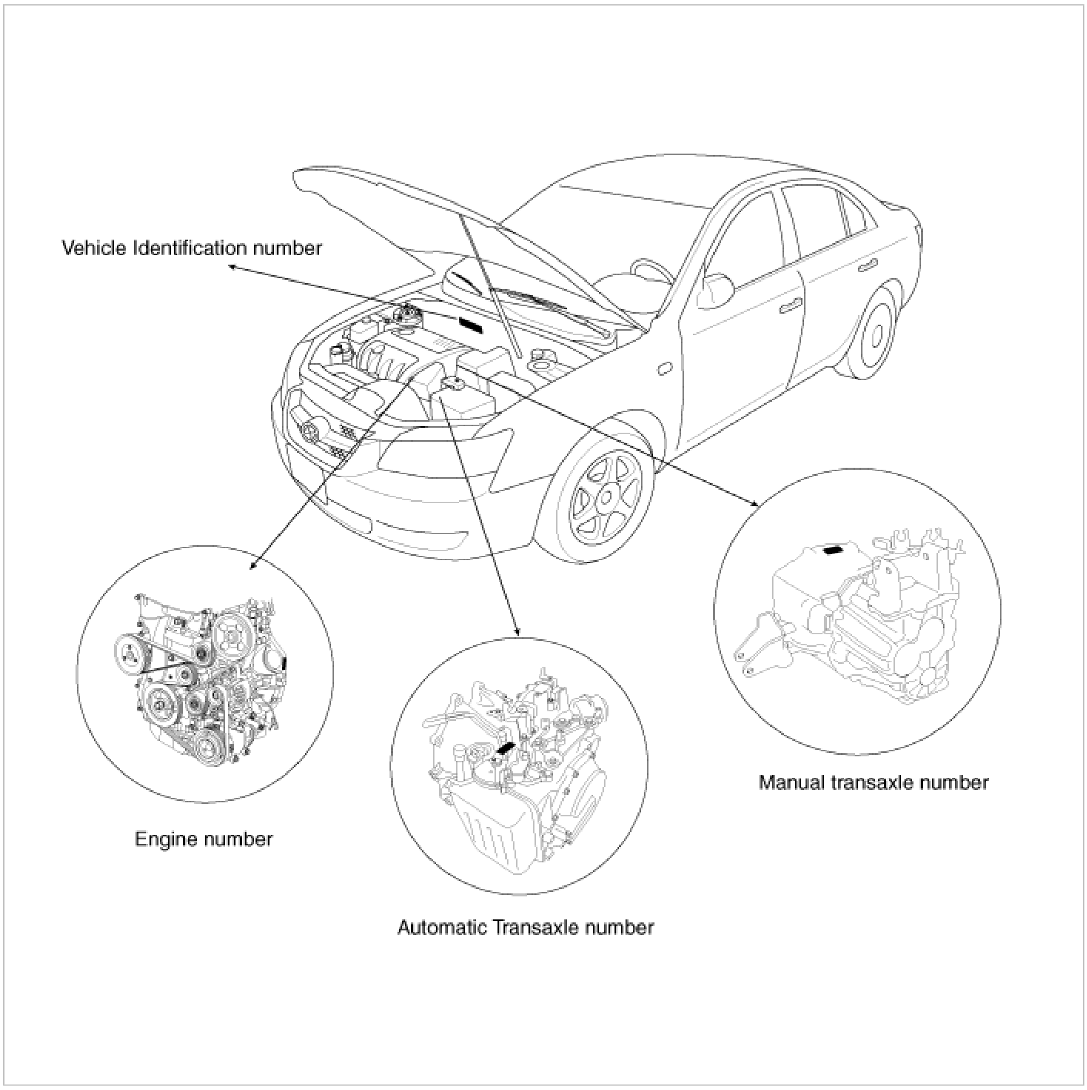
YES

▸ Go to the applicable troubleshoooting procedure.

NO

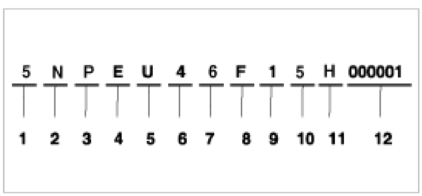
▸ System is performing to specification at this time.

IDENTIFICATION NUMBER LOCATIONS



IDENTIFICATION NUMBER DESCRIPTION

VEHICLE IDENTIFICATION NUMBER



1. Geographic zone
   - K : Korea
2. Manufacturer
   - M : Hyundai motor company
3. Vehicle type
   - 5NP : Passenger cars
   - H : Passenger cars
4. Vehicle line
   - E : SONATA
5. Model & Series
   - S : STANDARD (L)
   - T : DELUXE (GL)
   - U : SUPER DELUXE (GLS)
   - V : GRAND SALON (GDS)

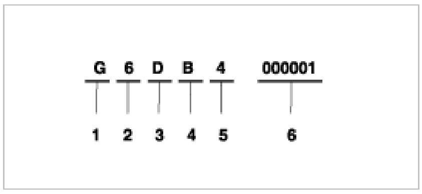
- W : SUPER GRAND SALON (HGS)

6. Body type
   - 4 : Sedan
7. Restraint system
   - 5 : Depowered airbag.
   - 6 : Advanced airbag.
8. Engine type
   - C : Gas 2.4
   - F : Gas 3.3
9. Check digit or others
10. Production year
    - 5 : 2005, 6 : 2006
11. Plant of production
    - H : Alabama in U.S.A
    - A : A-SAN (korea)
12. Vehicle production sequence number
    - 000001 ~ 999999

PAINT CODE

CODE	COLOR
EB	Ebony Black
OT	Special Color
N2	Pure Pearl white
S7	Sleek Silver
B7	Grace Beige
D2	Deep Pearl Blue
W2	Presting Dark R
D3	Aurora Blue
G6	Charming Gray

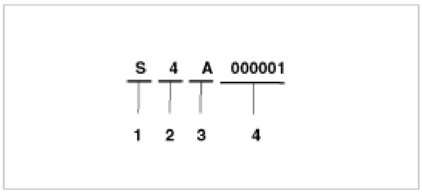
ENGINE IDENTIFICATION NUMBER



1. Engine fuel
   - G : Gasoline
2. Engine range
   - 4 : 4 cycle 4 cylinder
   - 6 : 4 cycle 6 cylinder
3. Engine development order
   - K : Theta engine
   - D : Lamda engine
4. Engine capacity
   - C : 2359 cc (Gasoline)
   - B : 3342 cc (Gasoline)
5. Production year
   - 5 : 2005, 6 : 2006
6. Engine production sequence number
   - 000001 ~ 999999

TRANSMISSION IDENTIFICATION NUMBER

MANUAL

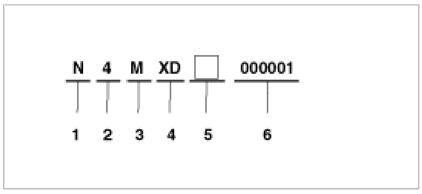


1. Model

- S : M5GF2

2. Production year
   - 4 : 2004, 5 : 2005, 6 : 2006, 7 : 2007
3. Gear ratio
   - A : 4.680
   - B : 4.333
4. Transaxle production sequence number
   - 000001 ~ 999999

AUTOMATIC



1. Model
   - N : F4A42-2
   - U : A5HF1
2. Production year
   - 4 : 2004, 5 : 2005, 6 : 2006, 7 : 2007
3. Gear ratio
   - M : 3.770
   - K : 3.333
4. Detailed classification
   - XD : 2.4 (Theta engine)
   - GD : 3.3 (Lambda engine)
5. Spare
6. Transaxle production sequence number

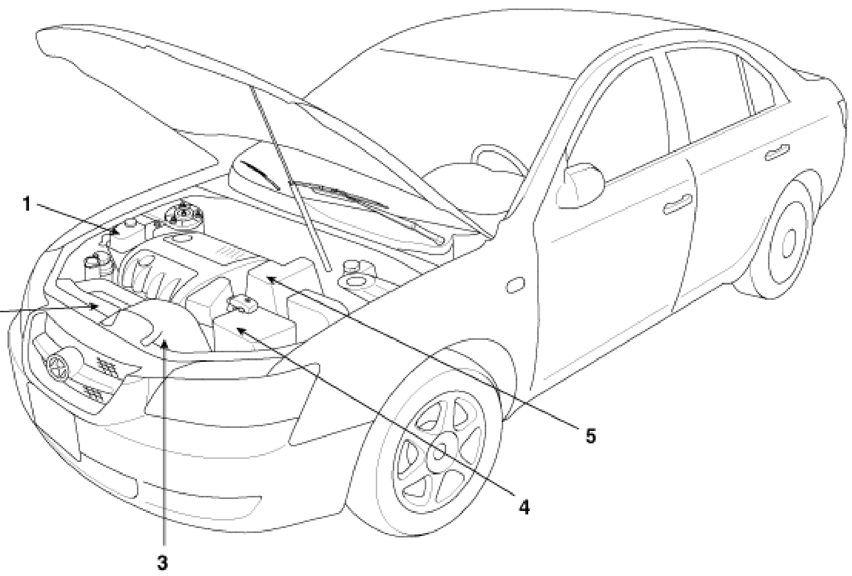
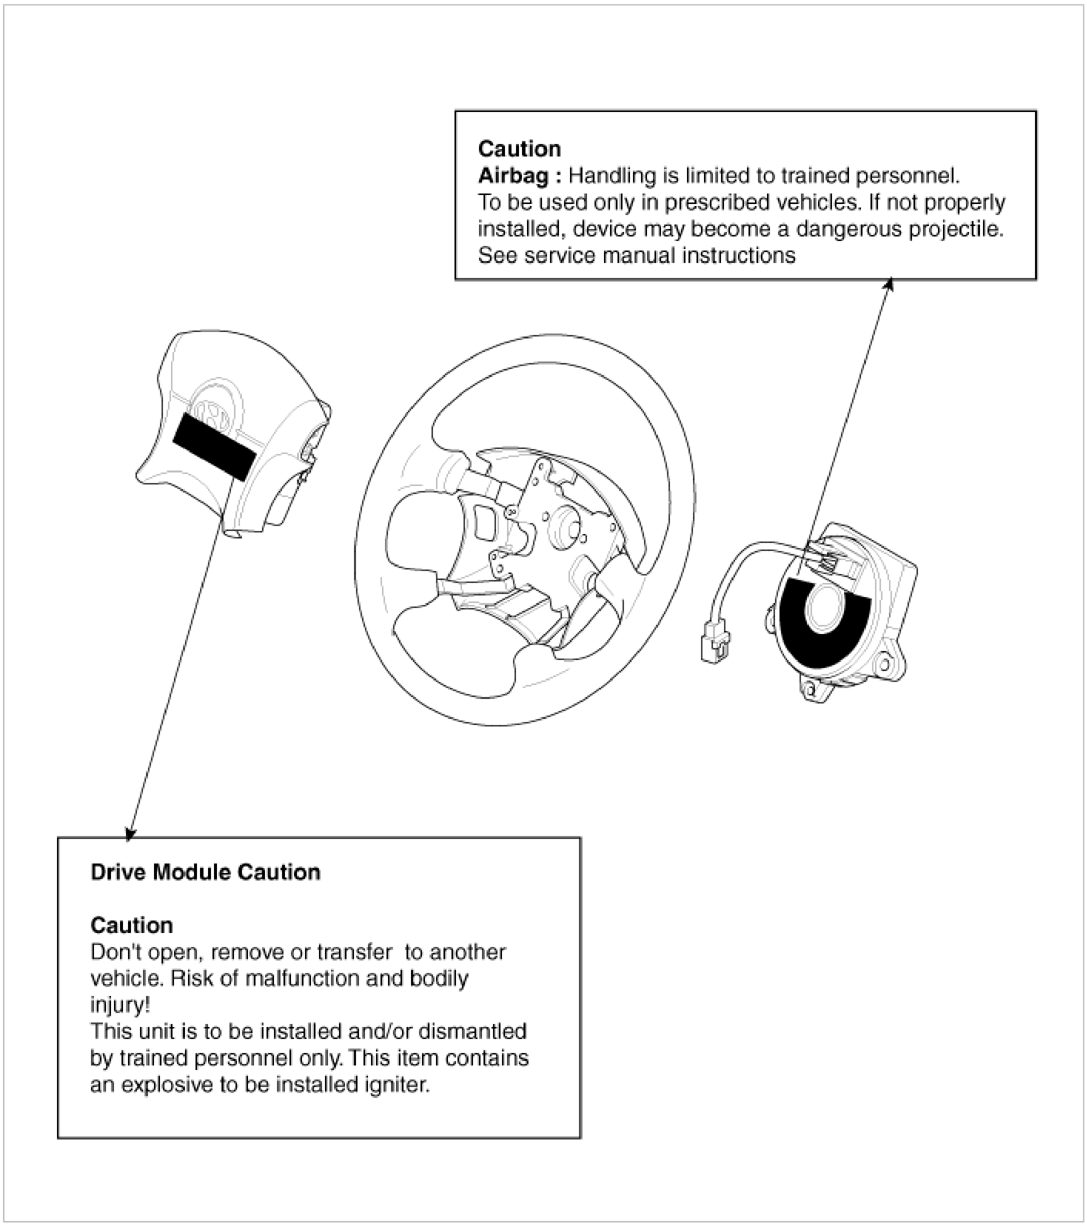
WARNING / CAUTION LABEL LOCATIONS

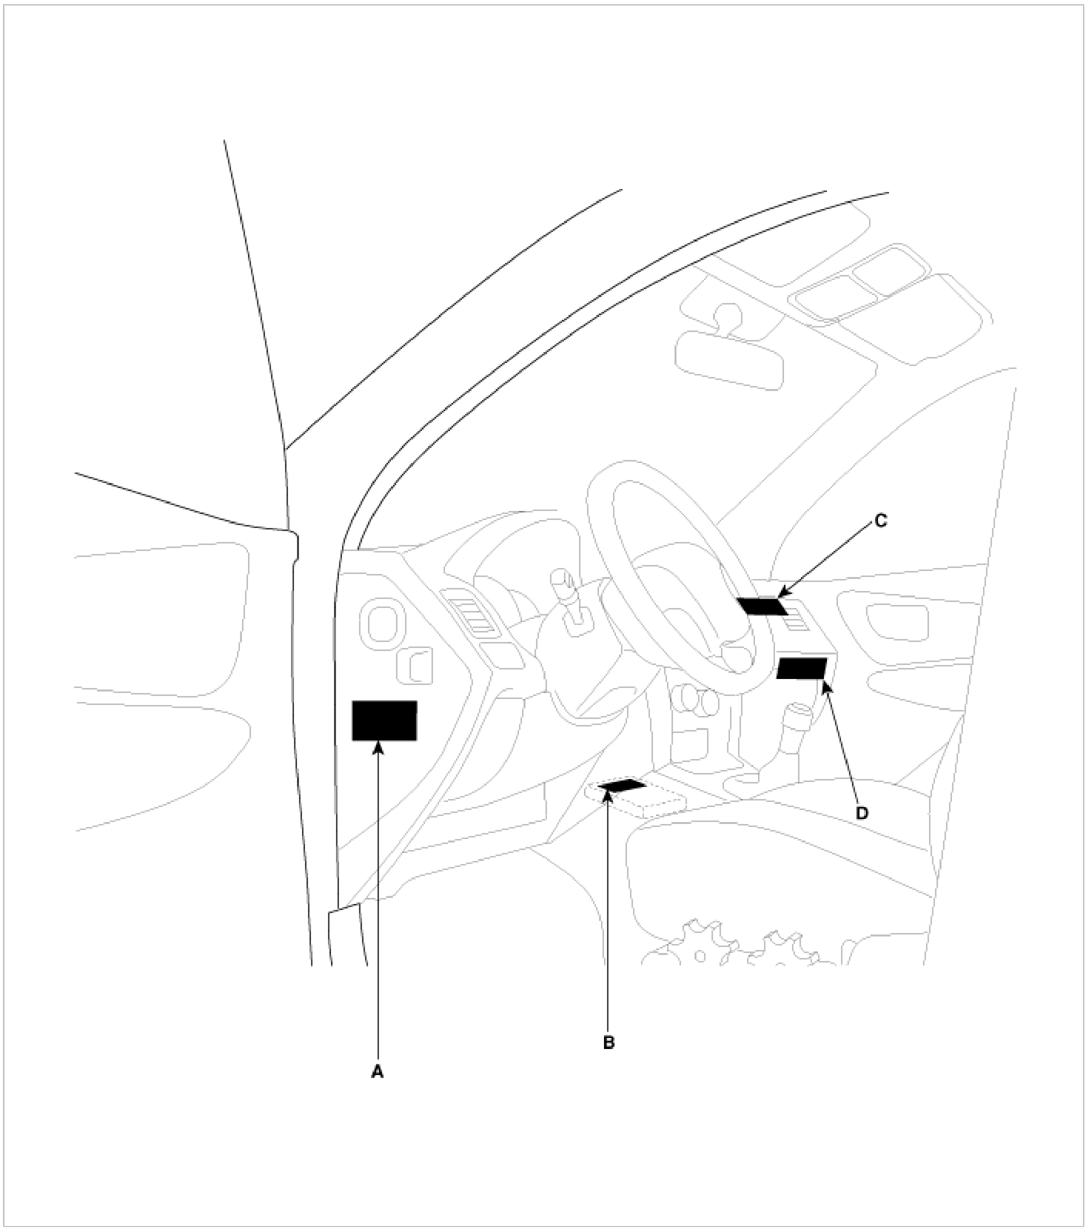


1. COOLANT LEVEL CAUTION
2. FAN CAUTION
3. RADIATOR CAP CAUTION
4. BATTERY CAUTION
5. AIR CLEANER CAUTION

AIR BAG WARNING / CAUTION LABEL



AIR BAG WARING / CAUTION LABEL (CONT'D)



WARNING / CAUTION LABEL (cont'd)

A : WARNING SEE OWNER'S MANUAL. This car is equipped a side airbag for each front seat. • Do not use any accessory seat covers. • Use of other seat covers could reduce the effect of the system. • Do not install any accessories on the side or near the side airbag. • Do not use excessive force on the side of the seal. • For further information, see the owner's manual.

B : CAUTION AIRBAG ESPE UNIT Detach connector before dismounting. Assemble strictly according to manual instructions.

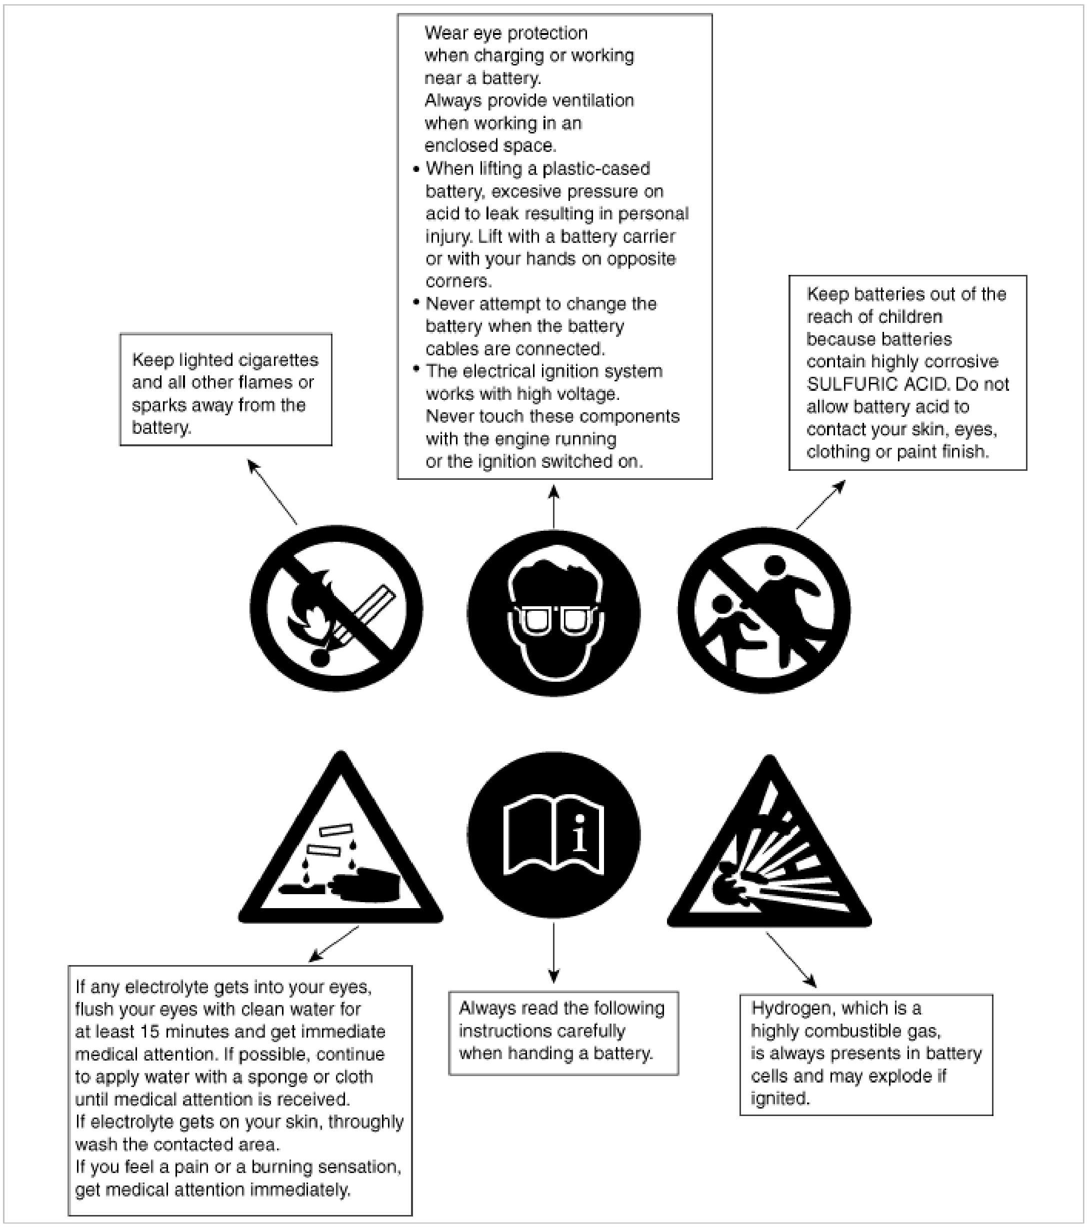
C : PASSENGER MODULE CAUTION CAUTION Don't open, remove or transfer to another vehicle. Risk of malfunction and bodily injury! This unit is to be installed and/or dismantled by trained personnel only. This item contains an explosive igniter.

D : SUPPLEMENTAL RESTRAINT SYSTEM (AIRBAG) INFORMATION • The airbag is a Supplement Restraint System (SRS).

You must always wear seat belts.
- The airbag system condition is normal when the "SRS" lamp in the cluster flashes approximately 6 times after the ignition key is turned on and then goes off.
- If any of the following condition soccur, the system must be serviced.
  - "SRS" lamp does not light up when the key is turned on.
  - "SRS" lamp stays lit or flashes continuously.
  - The airbag has inflated.
- The airbag system must be inspected by an authorized dealer ten years after the vehicle manufacture date shown on the certification label, located on left front door opening area.

WARNING
Failure to the above instructions may result in injury to you or other occupants in the vehicle
- See the "SRS" section in Owner's Manual for more information about airbags.

BATTERY CAUTION LABEL DESCRIPTION



LIFT AND SUPPORT POINTS

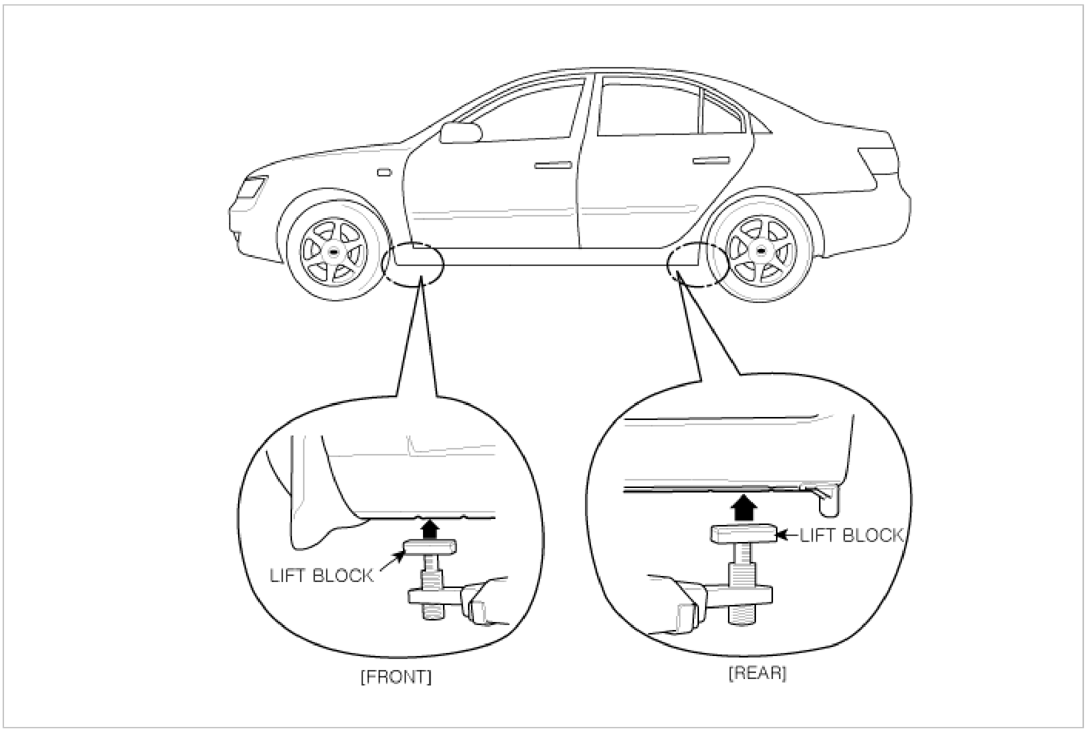
WARNING

When heavy rear components such as suspension, fuel tank, spare tire, tailgate and trunk lid are to be removed, place additional weight in the luggage area before hoisting. When substantial weight is removed from the rear of the vehicle, thecenter of gravity may change and can cause the vehicle to tip forward on the hoist.

NOTE

- Since each tire/wheel assembly weights approximately 30lbs (14kg), placing the front wheels in the luggage area can assist with the weight distribution.
- Use the same support points to support the vehicle on safety stands.

1. Place the lift blocks under the support points as shown in the illustration.
2. Raise the hoist a few inches (centimeters) and rock the vehicle to be sure it is firmly supported.
3. Raise the hoist to full height and inspect the lift points for secure support.



TOWING

If the vehicle needs to be towed, call a professional towing service. Never tow vehicle with just a rope or chain. It is very dangerous.

Emergency Towing

There are three popular methods of towing a vehicle :
If the vehicle cannot be transported by flat-bed, it should be towed with the front wheels off the ground. If due to damage, the vehicle must be tow with the front wheels on the ground, do the following :
Manual Transmission

- Release the parking brake.
- Shift the transmission to neutral

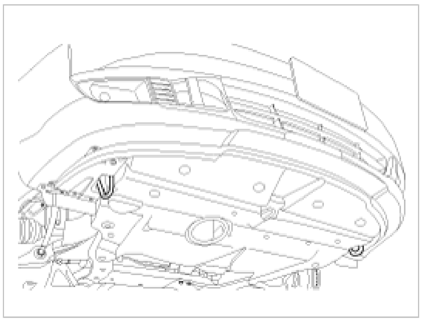
Automatic Transmission

- Release the parking brake.
- Start the engine.
- Shift to [D] position, then [N] position.
- Turn off the engine.

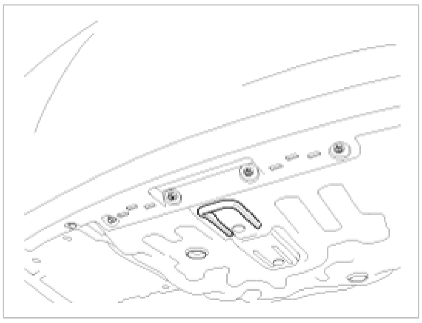
CAUTION

- Improper towing preparation will damage the transmission. Follow the above procedure exactly. If you cannot shift the transmission or start the engine(automatic transmission), your vehicle must be transported on a flatbed.
- It is the best to tow vehicle no farther than 19miles (30km), and keep the speed below 30mph (50km/h).
- Trying to lift or tow your vehicle by the bumpers will cause serious damage. The bumpers are not designed to support the vehicle's weight.

Front :



Rear :



TIGHTENING TORQUE TABLE OF STANDARD PARTS

Bolt nominal diameter (mm)	Pitch (mm)	Torque Nm (kg.cm, lb.ft)	
		Head Mark 4	Head Mark 7
			M5	0.8	3 ~ 4 (30 ~ 40, 2.2 ~ 2.9)	5 ~ 6 (50 ~ 60, 3.6 ~ 4.3)
M6	1.0	5 ~ 6 (50 ~ 50, 3.6 ~ 4.3)	9 ~ 11 (90 ~ 110, 6.5 ~ 8.0)
M8	1.25	12 ~ 15 (120 ~ 150, 9 ~ 11)	20 ~ 25 (200 ~ 250, 14.5 ~ 18.0)
M10	1.25	25 ~ 30 (250 ~ 300, 18 ~ 22)	30 ~ 50 (300 ~ 500, 22 ~ 36)
M12	1.25	35 ~ 45 (350 ~ 450, 25 ~ 33)	60 ~ 80 (600 ~ 800, 43 ~ 58)
M14	1.5	75 ~ 85 (750 ~ 850, 54 ~ 61)	120 ~ 140 (1,200 ~ 1,400, 85 ~ 100)
M16	1.5	110 ~ 130 (1,100 ~ 1,300, 80 ~ 94)	180 ~ 210 (1,800 ~ 2,100, 130 ~ 150)
M18	1.5	160 ~ 180 (1,600 ~ 1,800, 116 ~ 130)	260 ~ 300 (2,600 ~ 3,000, 190 ~ 215)
M20	1.5	220 ~ 250 (2,200 ~ 2,500, 160 ~ 180)	360 ~ 420 (3,600 ~ 4,200, 260 ~ 300)
M22	1.5	290 ~ 330 (2,900 ~ 3,300, 210 ~ 240)	480 ~ 550 (4,800 ~ 5,500, 350 ~ 400)
M24	1.5	360 ~ 420 (3,600 ~ 4,200, 260 ~ 300)	610 ~ 700 (6,100 ~ 7,000, 440 ~ 505)

NOTE

1. The torques shown in the table are standard values under the following conditions :
    - Nuts and bolts are made of galvanized steel bar.

- Galvanized plain steel washers are inserted.
- All nuts, bolts and plain washers are dry.

2. The torques shown in the table are not applicable :
   - When spring washers, toothed washers and the like are inserted.
   - If plastic parts are fastened.
   - If self-tapping screws or self-locking nuts are used.
   - If threads and surfaces are coated with oil.
3. If you reduce the torques in the table to the percentage indicated below, under the following conditions, if will be the standard value.
   - If spring washers are used : 85%
   - If threads and bearing sufaces are stained with oil : 85%

LUBRICANTS

RECOMMENDED LUBRICANTS

Parts		OIL & GREASE STANDARD	
Engine Oil	Gasoline	API SJ or ABOVE	SAE 5W -20 *1, *2
		*1. SAE 5W-20 engine oil is preferred regardless of regional option and engine variation. *2. If 5W-20 engine oil is not available, secondary recommended engine oil can be used for corresponding temperature range.	
Transaxle	Manual	HYUNDAI GENUINE PART MTF 75W/90 (API GL - 4)	
	Auto	DIAMOND ATF SP-III, SK ATF SP-III	
Power Steering		PSF -4	
Breake Steering		DOT 3, DOT 4 or equivalent	
Coolant		Ethlyene glycol base for aluminium radiator	
Transaxle linkage, parking brake cable mechanism, hood, door latch, seat adjuster, tailgate latch, door hinges, tailgate hinge		Multipurpose grease NIGL grade #2	

WARNING

Always use Genuine Hyundai parts and recommedended fluid.
Using any other type of parts and fluid can cause serious damaged if the vehicle.RECOMMENDED LUBRICANTS

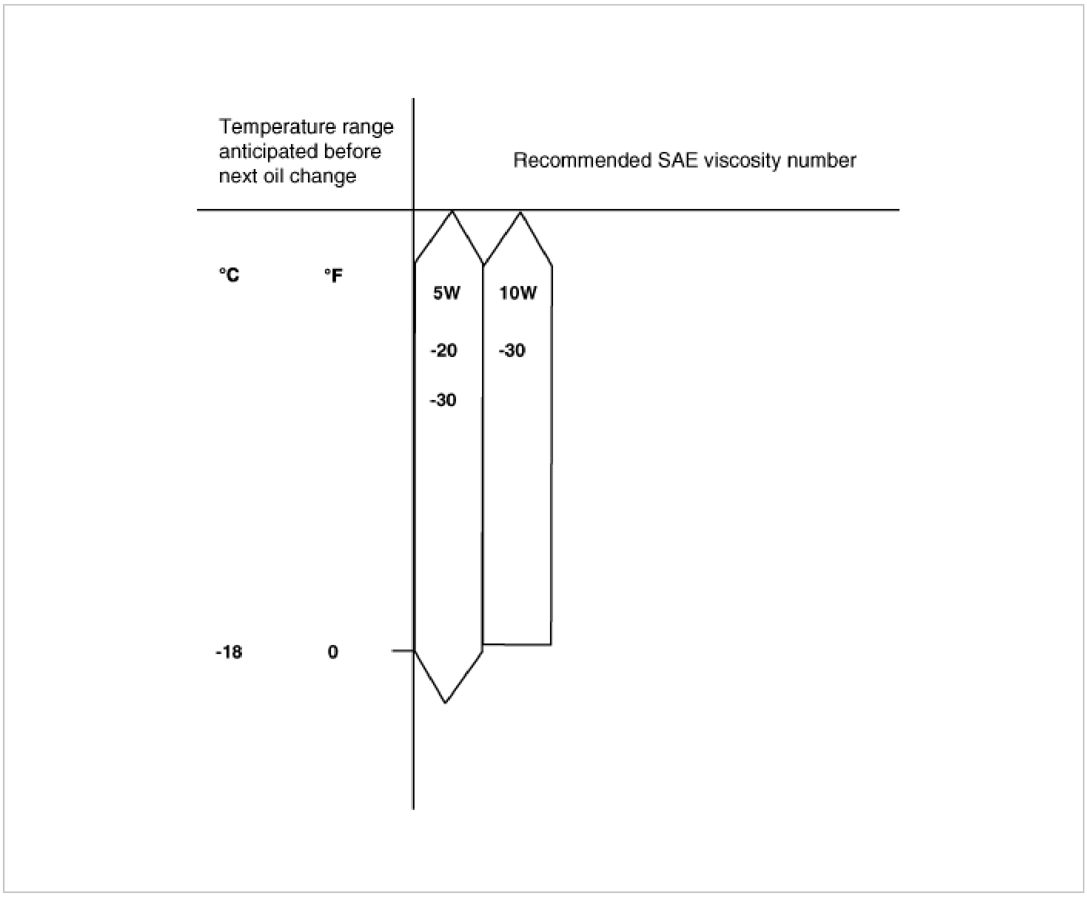
LUBRICANTS CAPACITIES

Description		2.4 (G4KC)	3.3 (G6DB)
Engine oil	Oil pan	3.7 (3.90, 3.26)	5.5 (5.81, 4.84)
	Oil filter	0.3 (0.32, 0.26)	0.4 (0.42, 0.35)
	Drain and refill	4.0 (4.23, 3.52)	5.2 (5.49, 4.58)
	Total	4.0 (4.23, 3.52)	5.9 (6.23, 5.19)
Cooling system		7.8 (8.2, 6.8)	8.9 (9.40, 7.83)
Manual transaxle		2.15 (2.3, 1.86)	-
Automatic transaxle		7.8 (8.2, 6.8)	10.9 (11.51, 9.59)
Power steering		0.9 (0.95, 0.79) ~ 1.0 (1.05, 0.88)	0.9 (0.95, 0.79) ~ 1.0 (1.05, 0.88)

Capacities : [liter (U.S.q-s, Imp.qts)]

SELECTION OF ENGINE OIL : 2.4 Gasoline

Recommended API classification : SJ OR SL ABOVE
Recommended SAE viscosity grades :



NOTE

For best performance and maximum protection of all types of operation, select only those lubricants which :

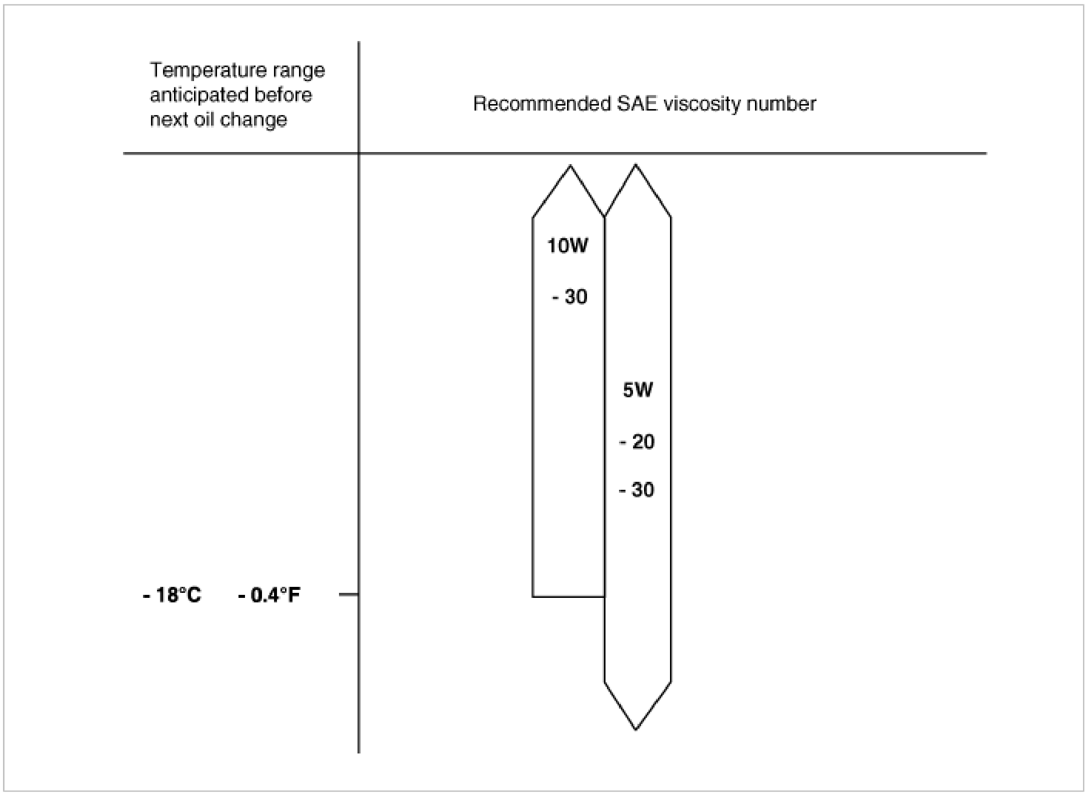
1. Satisfy the requirements of the API classification.
2. Have the proper SAE grade number for expected ambient temperature range.

Lubricants which do not have both an SAE grade number and an API service classification on the container should not be used.

SELECTION OF ENGINE OIL : 3.3 Gasoline

Recommended API classification : SJ OR SL ABOVE

Recommended SAE viscosity grades :



NOTE

For best performance and maximum protection of all types of operation, select only those lubricants which :

1. Satisfy the requirements of the API classification.
2. Have the proper SAE grade number for expected ambient temperature range.

Lubricants which do not have both an SAE grade number and an API service classification on the container should not be used.

GENERAL SERVICE INFORMATION

PROTECTION OF THE VEHICLE

Always be sure to cover fenders, seats, and floor areas before starting work.

CAUTION

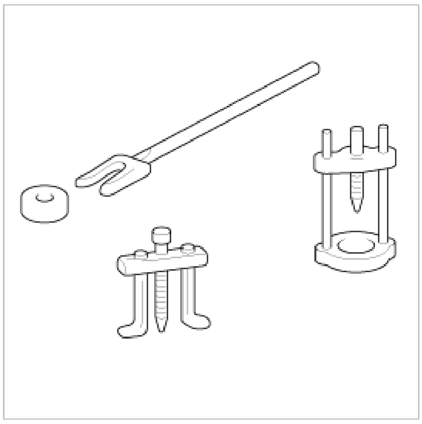
The support rod must be inserted into the hole near the edge of the hood whenever you inspect the engine compartment to prevent the hood from falling and causing possible injury.
Make sure that the support rod has been released prior to closing the hood. Always check to be sure the hood is firmly latched before driving the vehicle.

PREPARATION OF TOOLS AND MESURING EQUIPMENT

Be sure that all necessary tools and measuring equipment are available starting work.

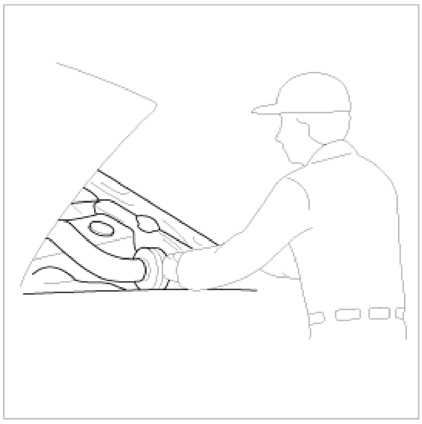
SPECIAL TOOLS

Use special tools when they are required.



REMOVAL OF PARTS

First find the cause of the problem and then determine whether removal or disassembly is required before starting the job.



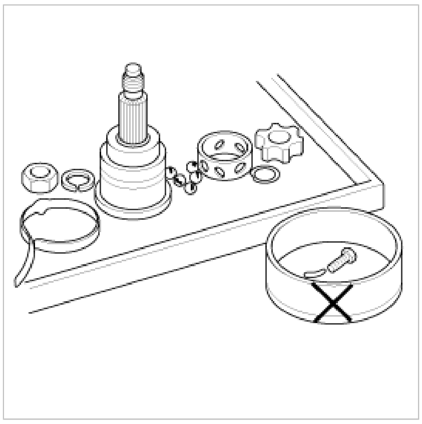
DISASSEMBLY

If the disassembly procedure is complex, requiring many parts to be disassembled, all parts should be disassembled in a way that will not affect their performance or external appearance.

1. **Inspection of parts**
   Each part, when removed, should be carefully inspected for malfunction, deformation, damage, and other problems.

2. **Arrangement of parts**
   All disassembled parts should be carefully arranged for effective reassembly.
   Be sure to separate and correctly identify the parts to be replaced from those that will be used again.

3. **Cleaning parts for reuse**
   All parts to be used again should be carefully and thoroughly cleaned by an appropriate method.

PARTS

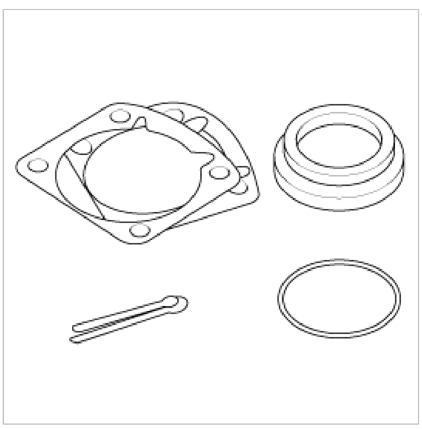
When replacing parts, use HYUNDAI genuine parts.

REPLACEMENT

Standard values, such as torques and certain adjustments, must be strictly observed in the reassembly of all parts.

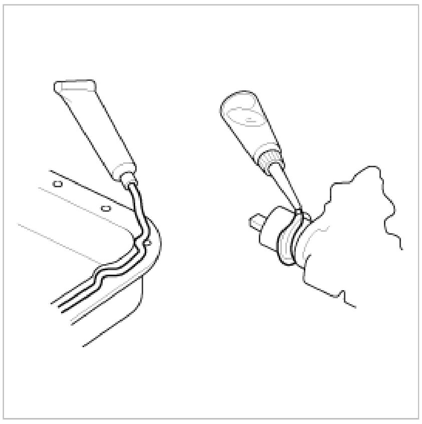
If removed, the following parts should always be replaced with new ones.

1. Oil seals
2. Gaskets
3. O-rings
4. Lock washers
5. Cotter pins (split pins)
6. Plastic nuts



Depending on their location.

7. Sealant should be applied to gaskets.
8. Oil should be applied to the moving components of parts.
9. Specified oil or grease should be applied to the prescribed locations (oil seals, etc) before assembly.

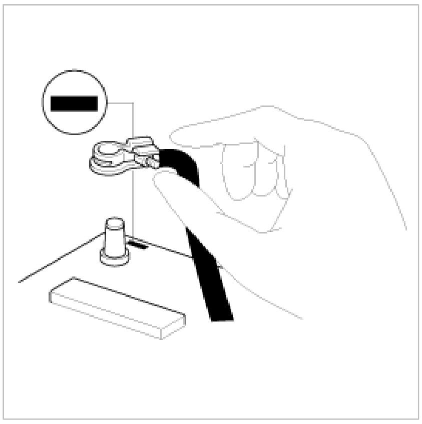


ADJUSTMENT

Use gauges and testers to correclty adjust the parts to standard values.

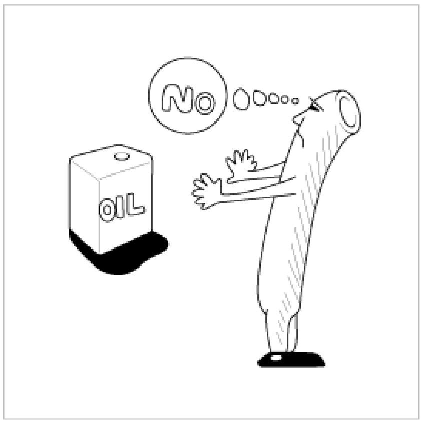
ELECTRICAL SYSTEM

1. Be sure to disconnect the battery cable from the negative (-) terminal of the battery.
2. Never pull on the wires when disconnecting connectors.
3. Locking connectors will click when the connector is secure.
4. Handle sensors and relays carefully. Be careful not to drop them against other parts.



RUBER PARTS AND TUBES

Always prevent gasoline or from touching rubber parts or tubing.

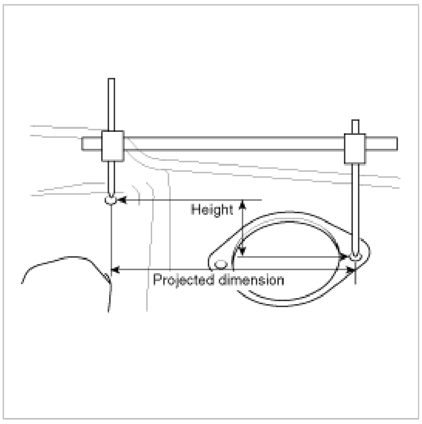


MEASURING BODY DIMENSIONS

1. Basically, all measurements in this manual are taken with a tracking gauge.
2. When a measuring tape is used, check to be sure there is no elongation, twisting or bending.
3. For measuring dimensions, both projected dimensions and actual - measurement dimensions are used in this manual.

DIMENSIONS PROJECTED

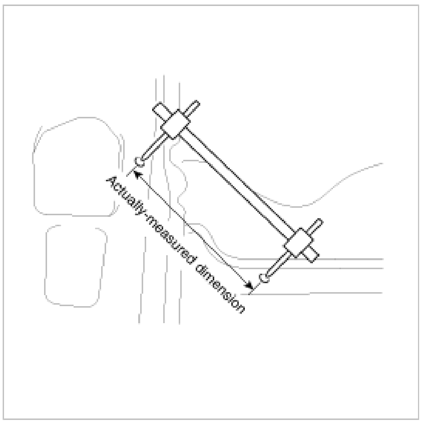
1. These are the dimensions measured when the measurement points are projected from the vehicle's surface, and are the reference dimensions used for used for body alterations.
2. If the length of the tracking gauge probes is adjustable, measure it by lengthening one of two probes as long as the different value in height of the two surfaces.



MEASURING ACTUAL DIMENSIONS

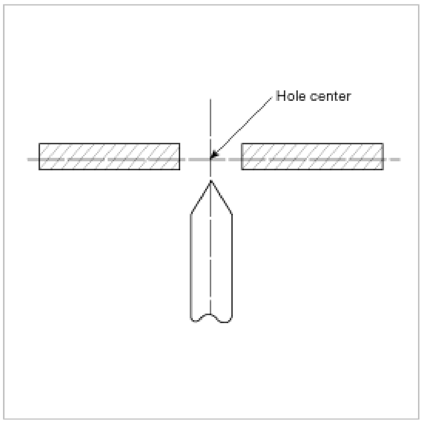
1. These dimensions indicate the actual linear distance between mesaurement points, and are used as the reference dimensions when a tracking gauge is used for measurement.
2. First adjust both probes to the same length (A=A') before measurement.

> NOTE
>
> Check the probes and gauge itself to make sure there is no free play.



MEASUREMENT POINT

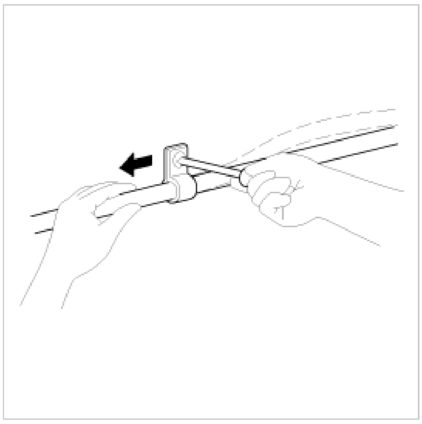
Measurements should be taken at the center of the hole.



CHECKING CABLES AND WIRES

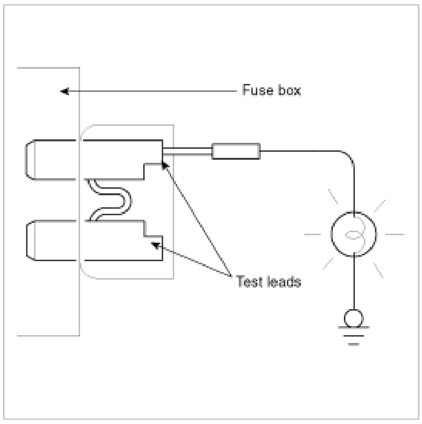
1. Check the terminal for tightness.
2. Check terminals and wires for corrosion from battery electrolyte, etc.
3. Check terminals and wires for open circuits.
4. Check wire insulation and coating for damage, cracks and degrading.
5. Check the conductive parts of terminals for contact with other metallic parts (vehicle body and other parts).
6. Check grounded parts to verify that there is complete continuity between thier attaching bolt(s) and the vehicle's body.
7. Check for incorrect wiring.
8. Check that the wiring is so clamped to prevent contact with sharp corners of the vehicle body, etc. or hot parts (exhaust manifold, etc.)

9. Check that the wiring is clamped firmy to provide enough clearance from the fan pulley, fan belt and other rotating or moving parts.
10. Check that the wiring has a little space so that it can vibrate between fixed and moving parts such as the vehicle body and the engine.



CHECK FUSES

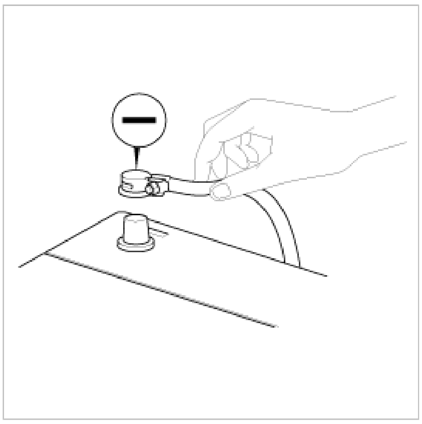
A blade type fuse test taps provided to allow checking the fuse itself without removing if from the fuse box. The fuse is good if the test lamp lights up when one lead is connected to the test taps (one at a time) and the other lead is grounded. (Turn the ignition switch so that the fuse circuit becomes operative)



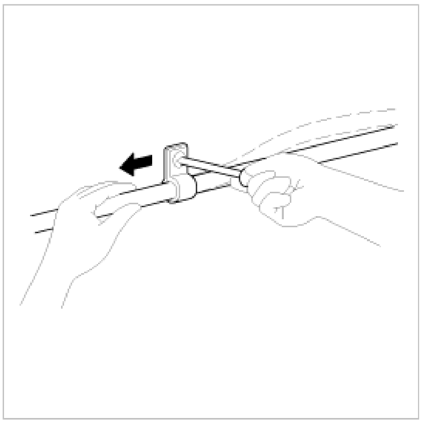
SERVICING THE ELECTRICAL SYSTEM

1. Prior to servicing the electrical system, be sure to turn off the ignition switch and disconnect the battery ground cable.

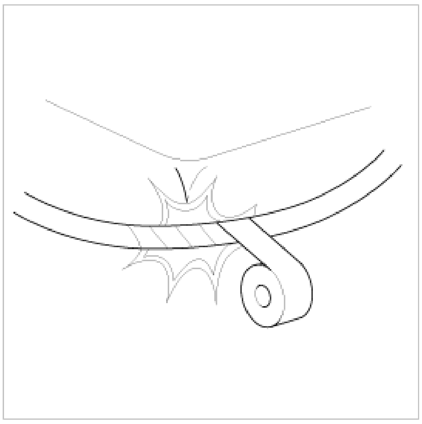
> NOTE
>
> In the course of MFI or ELC system diagnosis, when the battery cable is removed, any diagnostic trouble code retained bythe computer will be cleared. There fore, if necessary, read the diagnostic procedure before removing the battery cable.



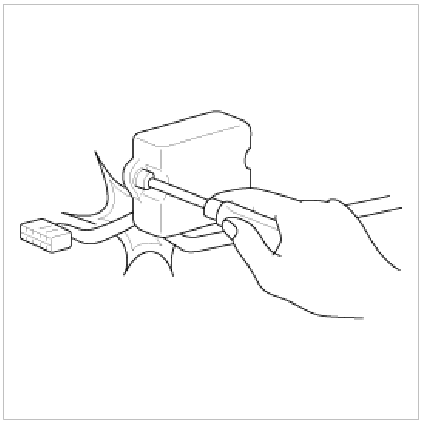
2. Attach the wiring harnesses with clamps so that there is no slack. However, for any harness which passes through the engine or other vibrating parts of the vehicle, allow some slack within a range that does not allow the engine vibrations to cause the harness to come into contact with any of the surrounding parts and then secure the harness by using a clamp.



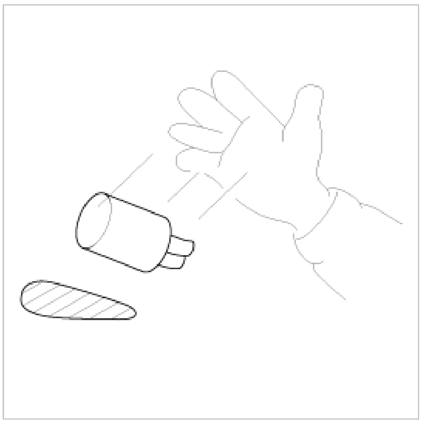
3. If any section of a wiring harness interferes with the edge of a parts, or a corner, wrap the section of the harness with tape or something similar in order to protect it from damage.



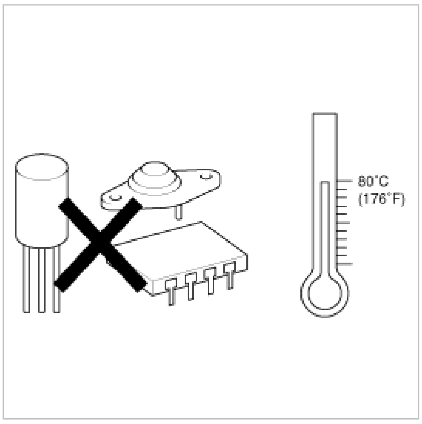
4. When installing any parts, be careful not to pinch or damage any of the wiring harness.



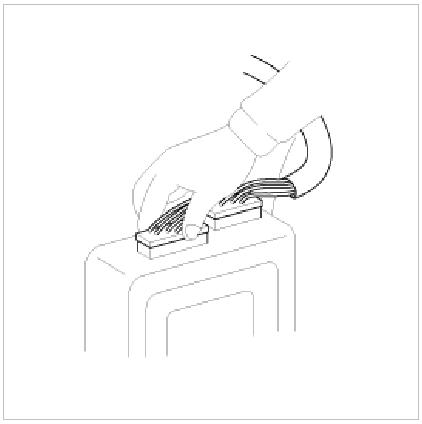
5. Never throw relays, sensors or electrical parts, or expose them to strong shock.



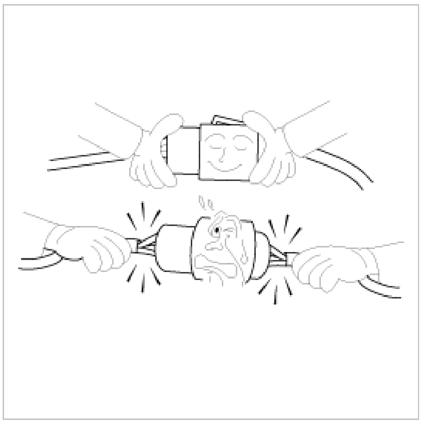
6. The electronic parts used in the computer, relays, etc. are readily damaged by heat. If there is a need for service operations that may cause the temperature to exceed 80°C (176°F), remove the electronic parts before hand.



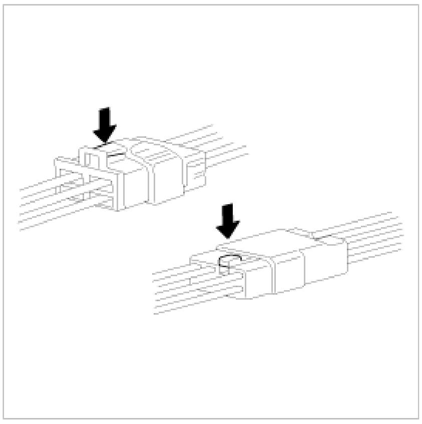
7. Loose connectors cause problems. Make sure that the connectors are always securely fastened.



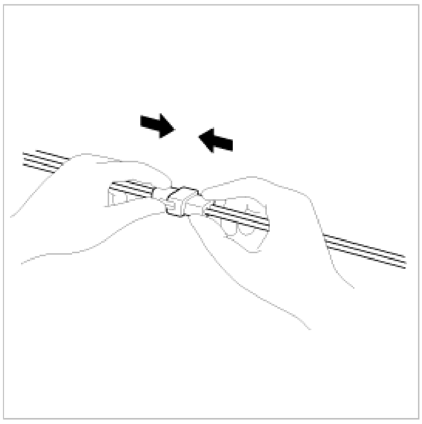
8. When disconnecting a connector, be sure to grip only the connector, not the wires.



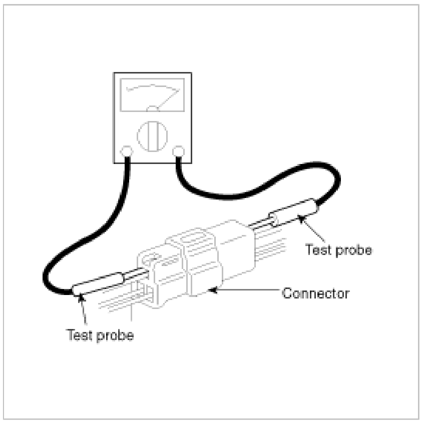
9. Disconnect connectors which have catches by pressing in the direction of the arrows shown the illustration.



10. Connect connectors which have catches by inserting the connectors until they make a clicking sound.



11. When using a circuit tester to check continuity or voltage on connector terminals, insert the test probe into the harness side. If the connector is a sealed connector, insert the test probe through the hole in the rubber cap until it contacts the terminal, being careful not to damage the insulation of the wires.



12. To avoid overloading the wiring, take the electrical current load of the optional equipment into consideration, and determine the appropartate wire size.

Nominal size	SAE gauge No.	Permissible current	
		In engine compartment	Other areas
0.3mm²	AWG 22	-	5A
0.5mm²	AWG 20	7A	13A
0.85mm²	AWG 18	9A	17A
1.25mm²	AWG 16	12A	22A
2.0mm²	AWG 14	16A	30A
3.0mm²	AWG 12	21A	40A
5.0mm²	AWG 10	31A	54A

PRECAUTIONS FOR CATALYTIC CONVERTER

CAUTION

If a large amount of unburned gasoline flow into the converter, it may overheat and create a fire hazard. To prevent this observe the following precautions and explain them to your customer.

1. Use only unleaded gasoline.
2. Do not run the engine while the car is at rest for a long time. Avoid running the engine at fast idle for more than 10minutes and idle speed for more than 20 minutes.
3. Avoid start-jump tests. Do start-jumps only when absolutely necessary. Perform this test as rapidly as possible and, while testing, never race the engine.
4. Do not measure engine compression for an extended time. Engine compression tests must be made as rapidly as possible.
5. Avoid coasting with the ignition turned on and during prolonged braking.
6. Do not dispose of used catalytic converter together with parts contaminated with gasoline or oil.

TROUBLESHOOTING

SYMPTOMS TABLE

Before replacing or repairing air conditioning components, first determine if the malfunction is due to the refrigerant charge, air flow or compressor.
Use the table below to help you find the cause of the problem. The numbers indicate the priority of the likely cause of the problem. Check each part in order. If necessary, replace these parts.
After correcting the malfunction, check the complete system to ensure that performance is satisfactory.
STANDARD :

Symptom	Suspect Area	See page
No blower operation	1. Blower fuse	-
	2. Blower relay	HA - 56
	3. Blower motor	HA - 54
	4. Power mosfet / Resistor	HA - 58, 60
	5. Blower speed control switch	HA - 65, 70
	6. Wire harness	-
No air temperature control	1. Engine coolant capacity	-
	2. Heater & A/C controller	HA - 65, 70
No compressor operation	1. Refrigerant capacity	HA - 3
	2. A/C fuse	-
	3. Magnetic clutch	HA - 18
	4. Compressor	HA - 15
	5. APT (A/C pressure transducer)	HA - 23
	6. A/C switch	-
	7. Evaporator temperature sensor	HA - 27
	8. Wire harness	-
No cool air comes out	1. Refrigerant capacity	HA - 3
	2. Refrigerant pressure	-
	3. Drive belt	-
	4. Magnetic clutch	HA - 18
	5. Compressor	HA - 15
	6. APT (A/C pressure transducer)	HA - 23
	7. Evaporator temperature sensor	HA - 27
	8. A/C switch	-

	9. Heater & A/C controller	HA - 65, 70
	10. Wire harness	-
Insufficient cooling	1. Refrigerant capacity	HA - 3
	2. Drive belt	-
	3. Magnetic clutch	HA - 18
	4. Compressor	HA - 15
	5. Condenser	HA - 20
	6. Expansion valve	HA - 45
	7. Evaporator	HA - 44
	8. Refrigerant lines	HA - 25
	9. APT (A/C pressure transducer)	HA - 23
	10. Heater & A/C controller	HA - 65, 70
No engine idle-up when A/C switch ON	1. Engine ECU	-
	2. Wire harness	-
No air inlet control	1. Heater & A/C controller	HA - 65, 70
No mode control	1. Heater & A/C controller	HA - 65, 70
	2. Mode actuator	HA - 49
No cooling fan operation	1. Cooling fan fuse	-
	2. Fan motor	-
	3. Engine ECU	-
	4. Wire harness	-

Heating,Ventilation, Air Conditioning > Air conditioning System > General Information

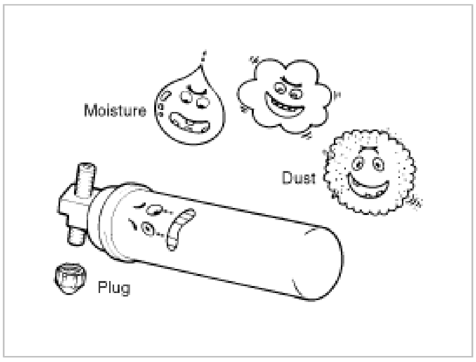
INSTRUCTIONS

WHEN HANDLING REFRIGERANT

1. R-134a liquid refrigerant is highly volatile. A drop on the skin of your hand could result in localized frostbite. When handling the refrigerant, be sure to wear gloves.
2. It is standard practice to wear goggles or glasses to protect your eyes, and gloves to protect your hands. If the refrigerant splashes into your eyes, wash them with clean water immediately.
3. The R-134a container is highly pressurized. Never leave it in a hot place, and check that the storage temperature is below 52°C (126°F)
4. An electronic leak detector should be used to check the system for refrigerant leakage. Bear in mind that the R-134a, upon coming into contact with flame, produces phosgene, a highly toxic gas.
5. Use only recommended the lubricant for R-134a systems. If lubricants other than the recommended one used, system failure may occur.
6. PAG lubricant absorbs moisture from the atmosphere at a rapid rate, therefore the following precautions must be observed:
   A. When removing refrigerant components from a vehicle, cap immediately the components to prevent from the entry of moisture.
   B. When installing refrigerant components to a vehicle, do not remove the cap until just before connecting the components.
   C. Complete the connection of all refrigerant tubes and hoses without delay to prevent the A/C system from taking on moisture.
   D. Use the recommended lubricant from a sealed container only.
7. If an accidental discharge in the system occurs, ventilate the work area before resuming service.

WHEN REPLACING PARTS ON A/C SYSTEM

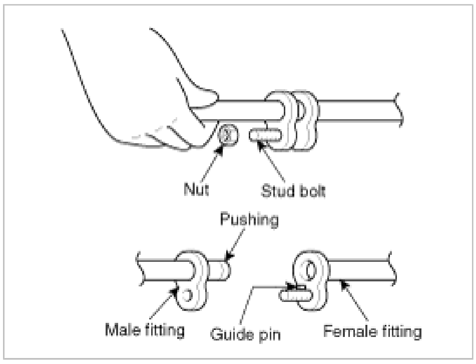
1. Never open or loosen a connection before discharging the system.
2. Seal the open fittings of components with a cap or plug immediately to prevent intrusion of moisture or dust.
3. Do not remove the sealing caps from a replacement component until it is ready to be installed.
4. Before connecting an open fitting, always install a new sealing ring. Coat the fitting and seal with refrigerant oil before making the connection.



WHEN INSTALLING CONNECTING PARTS

FLANGE WITH GUIDE PIN

Check the new O-ring for damage and lubricate it using compressor oil. Tighten the nut to specified torque.



Size	Tightening torque (N.m (kg.m, lb-ft))	
	General bolt, nut	
	4T	7T
M6	5~6 (0.5~0.6, 3.6~4.3)	9~11 (0.9~1.1, 6.5~7.9)
M8	12~14 (1.2~1.4, 8.7~10)	20~26 (2.0~2.6, 14~18)
M10	25~28 (2.5~2.8, 18~20)	45~55 (4.5~5.5, 32~39)
Size	Flange bolt, nut	
	4T	7T
M6	5~7 (0.5~0.7, 3.6~5.0)	8~12 (0.8~1.2, 5.8~8.6)
M8	10~15 (1.0~1.5, 7~10)	19~28 (1.9~2.8, 14~20)
M10	21~31 (2.1~3.1, 15~22)	39~60 (3.9~6.0, 28~43)

NOTE

T means tensile intensity, which is stamped on the head of bolt only numeral.

HANDLING TUBING AND FITTINGS

The internal parts of the refrigeration system will remain in a state of chemical stability as long as pure moisture-free refrigerant and refrigerant oil are used. Abnormal amounts of dirt, moisture or air can upset the chemical stability and cause problems or serious damage.

THE FOLLOWING PRECAUTIONS MUST BE OBSERVED

1. When it is necessary to open the refrigeration system, have everything you will need to service the system ready so the system will not be left open any longer than necessary.
2. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture.
3. All lines and components in parts stock should be capped or sealed until they are ready to be used.
4. Never attempt to rebind formed lines to fit. Use the correct line for the installation you are servicing.
5. All tools, including the refrigerant dispensing manifold, the gauge set manifold and test hoses, should be kept clean and dry.

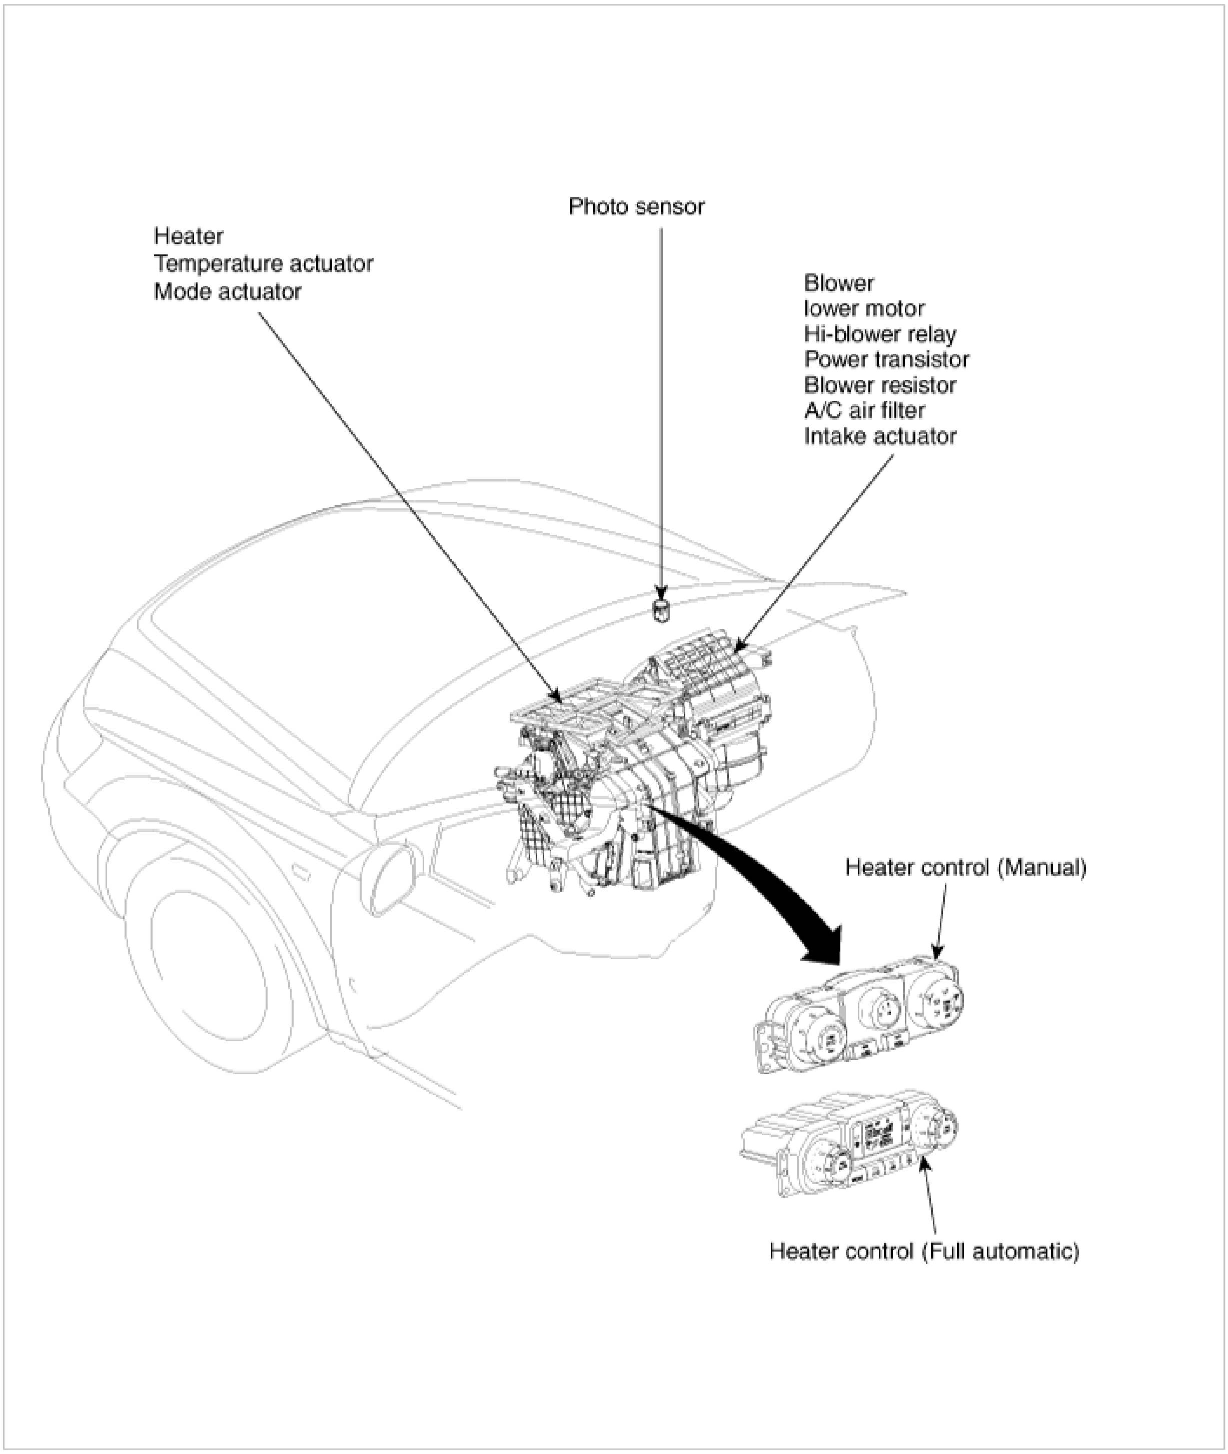
INTERIOR



REFRIGERANT SYSTEM SERVICE BASICS

REFRIGERANT RECOVERY

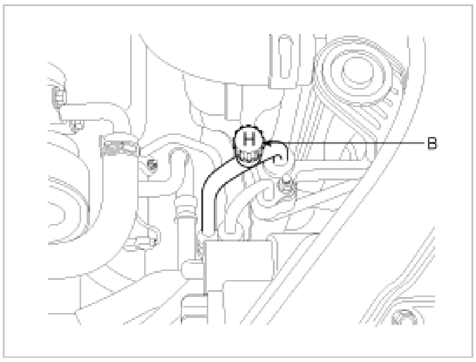
Use only service equipment that is U.L-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a(R-134a) from the air conditioning system.

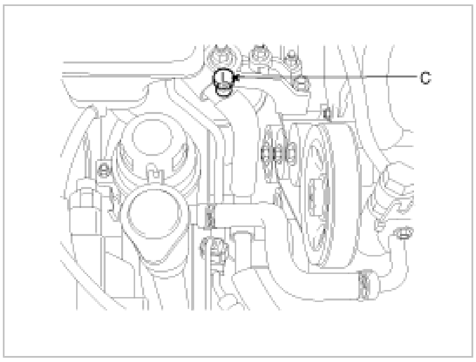
CAUTION

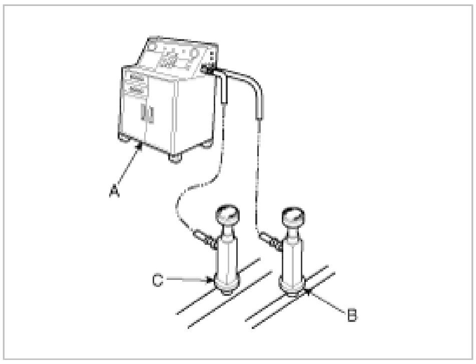
- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

If accidental system discharge occurs, ventilate work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect an R-134a refrigerant.
   Recovery/Recycling/Charging System (A) to the high-pressure service port (B) and the low-pressure service port (C) as shown, following the equipment manufacturer's instructions.





2. Measure the amount of refrigerant oil removed from the A/C system after the recovery process is completed. Be sure to install the same amount of new refrigerant oil back into the A/C system before charging.

SYSTEM EVACUATION

Use only service equipment that is U.L-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a(R-134a) from the air conditioning system.

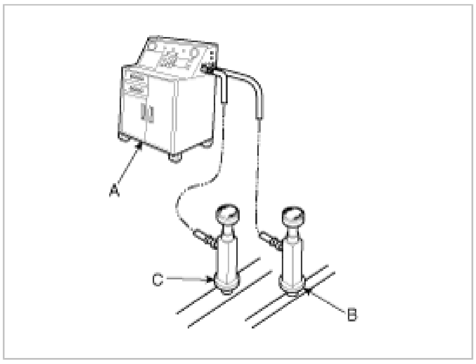
CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

If accidental system discharge occurs, ventilate work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an R-134a refrigerant Recovery/Recycling/Charging System. (If the system has been open for several days, the receiver/dryer should be replaced, and the system should be evacuated for several hours.)

2. Connect an R-134a refrigerant.
   Recovery/Recycling/Charging System (A) to the high-pressure service port (B) and the low-pressure service port (C) as shown, following the equipment manufacturer's instructions.



3. If the low-pressure does not reach more than 93.3 kPa (700 mmHg, 27.6 in.Hg) in 10 minutes, there is probably a leak in the system. Partially charge the system, and check for leaks (Refer to Leak Test.).
4. Remove the low pressure valve from the low-pressure service port.

SYSTEM CHARGING

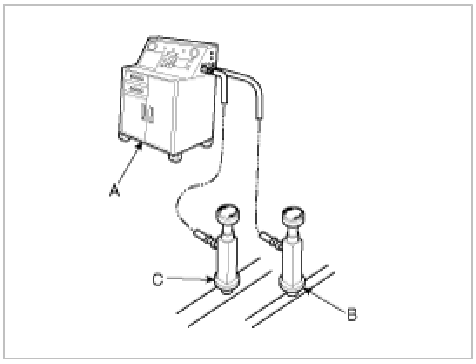
Use only service equipment that is U.L-listed and is certified to meet the requirements of SAE J2210 to remove HFC-134a(R-134a) from the air conditioning system.

CAUTION

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

If accidental system discharge occurs, ventilate work area before resuming service.
Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

1. Connect an R-134a refrigerant.
   Recovery/Recycling/Charging System (A) to the high-pressure service port (B) as shown, following the equipment manufacturer's instructions.



2. Add the same amount of new refrigerant oil to system that was removed during recovery. Use only specified refrigerant oil. Charge the system with 19.4 ± 0.88 oz. (550 ± 25g) of R-134a refrigerant. Do not overcharge the system the compressor will be damaged.

REFRIGERANT LEAK TEST

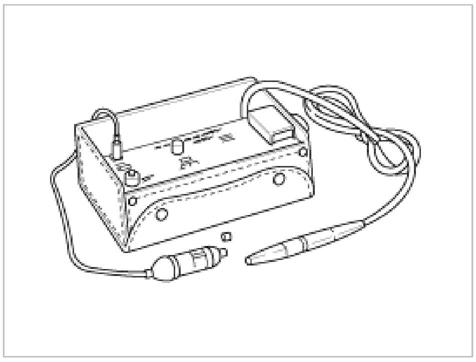
Always conduct a leak test with an electronic leak detector whenever leakage of refrigerant is suspected and when conducting service operations which are accompanied by disassembly or loosening or connection fittings.

NOTE

In order to use the leak detector properly, read the manual supplied by the manufacturer.

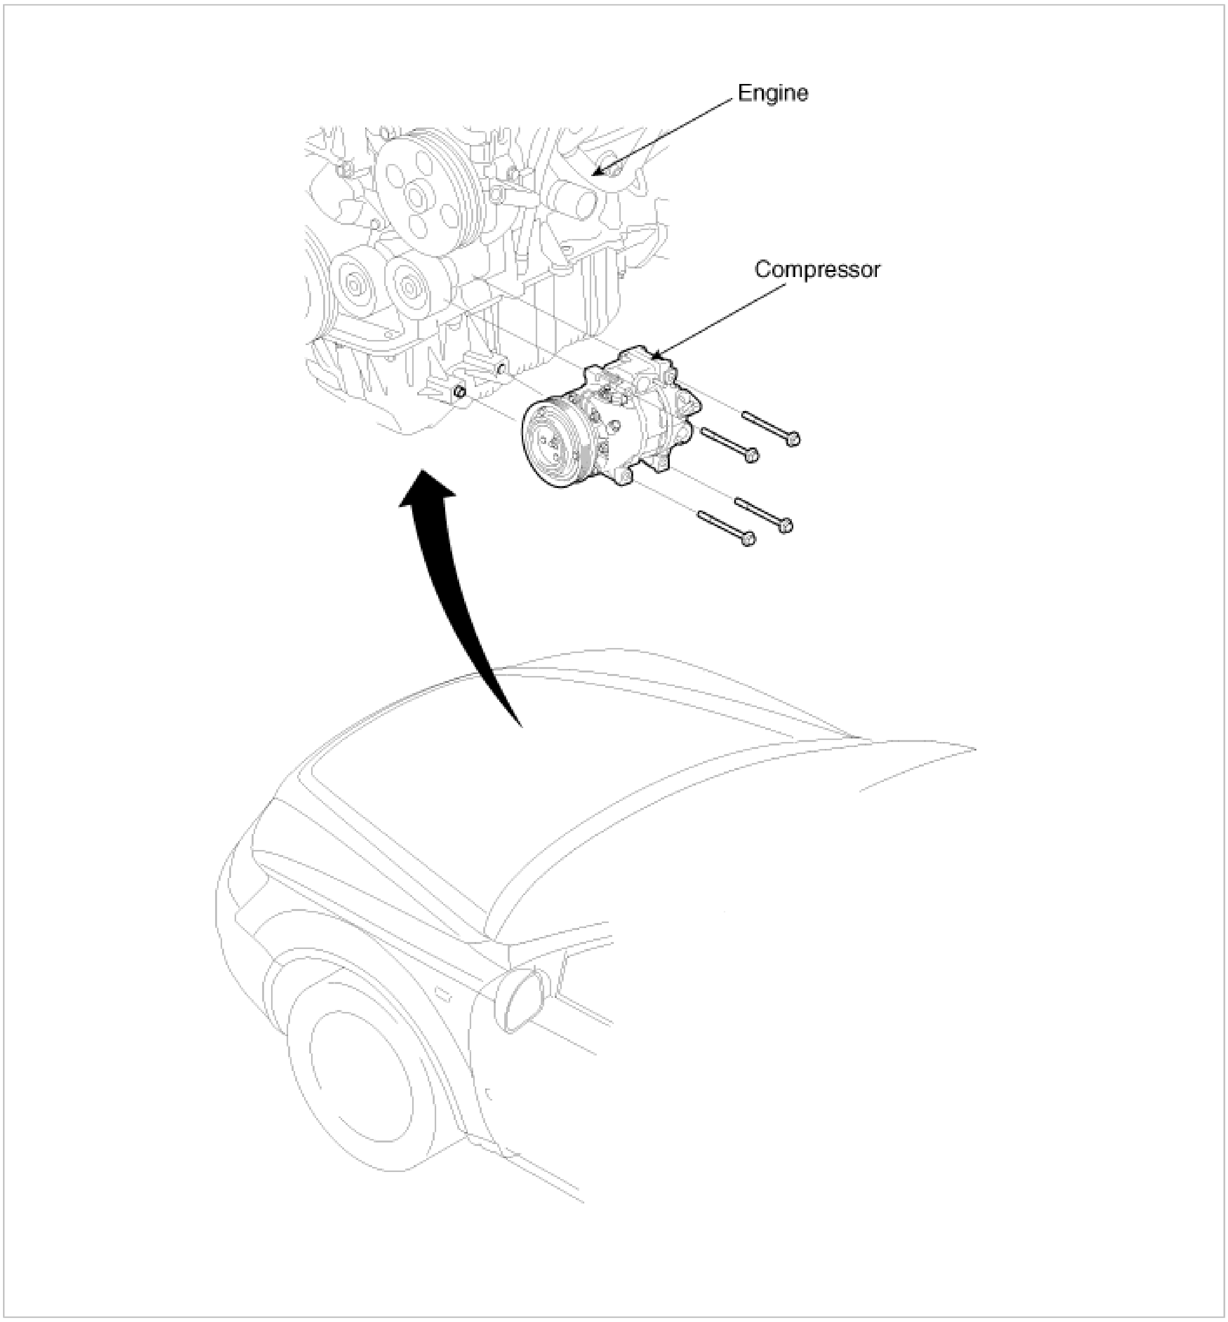
If a gas leak is detected, proceed as follows:

1. Check the torque on the connection fittings and, if too loose, tighten to the proper torque. Check for gas leakage with a leak detector.
2. If leakage continues even after the fitting has been tightened, discharge the refrigerant from the system, disconnect the fittings, and check their seating faces for damage. Always replace, even if the damage is slight.
3. Check the compressor oil and add oil if required.
4. Charge the system and recheck for gas leaks. If no leaks are found, evacuate and charge the system again.

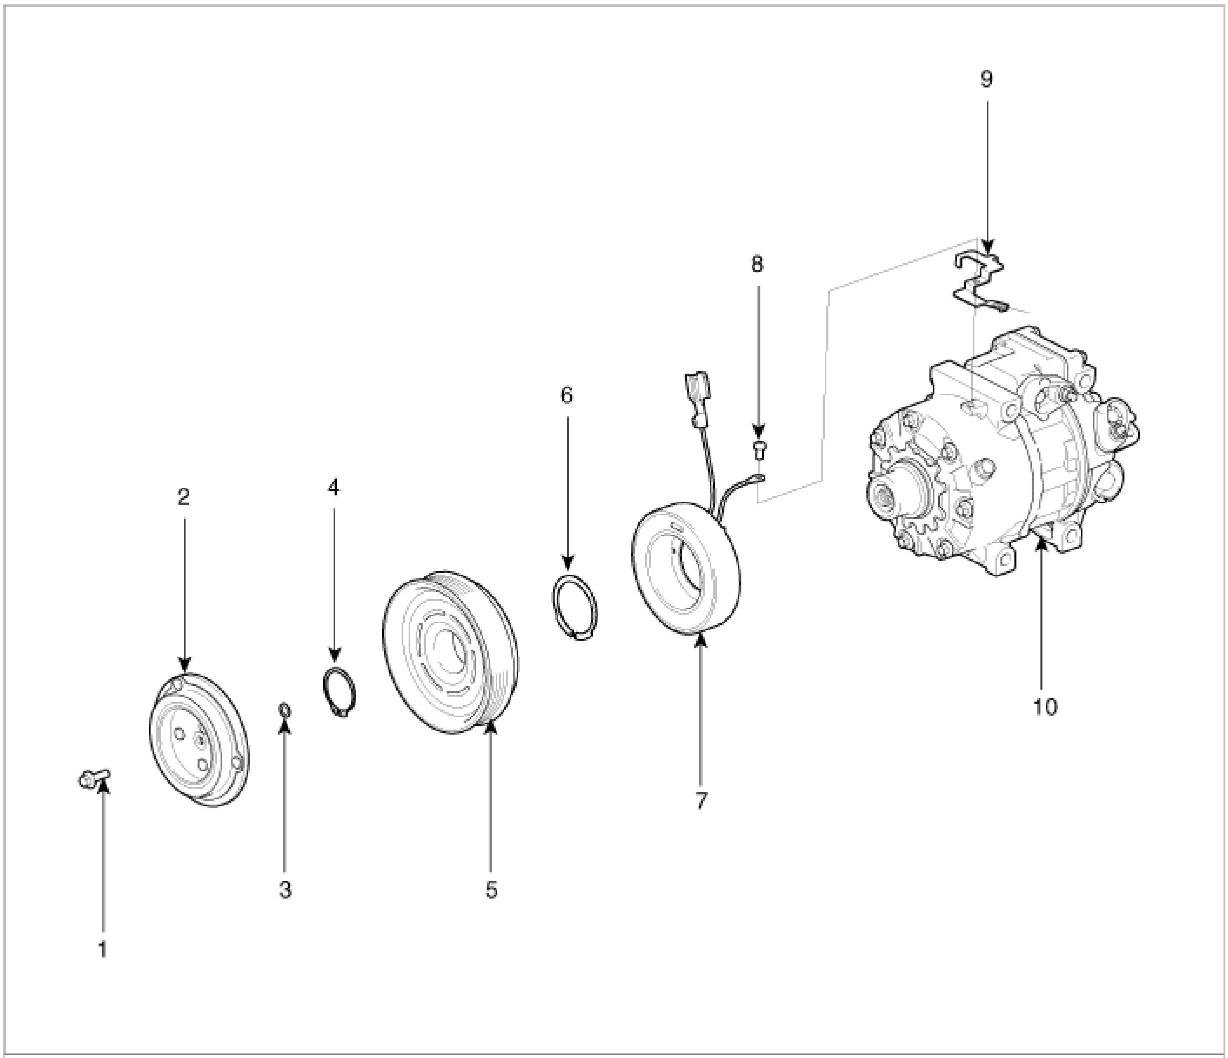


Heating,Ventilation, Air Conditioning > Air conditioning System > Compressor > Components and Components Location

COMPONENT LOCATION



COMPONENTS

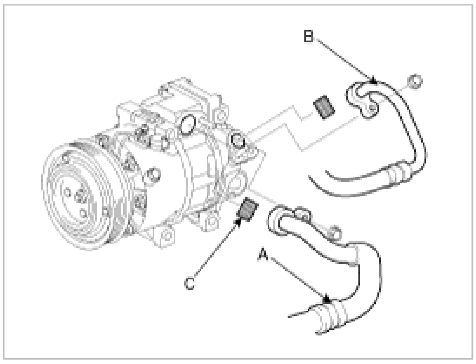


1. Bolt	6. Retainer ring
2. Disc & hub assembly	7. Field coil
3. Shim	8. Screw
4. Retainer ring	9. Connector bracket
5. Pulley	10. Compressor assembly

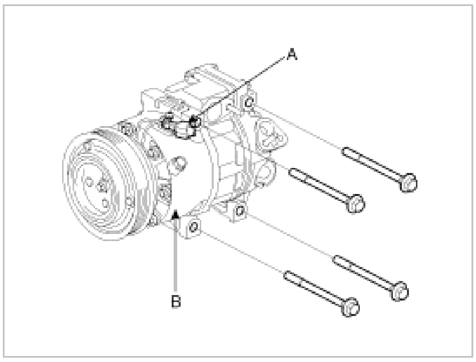
Heating,Ventilation, Air Conditioning > Air conditioning System > Compressor > Repair procedures

REMOVAL

1. If the compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.
2. Disconnect the negative cable from the battery.
3. Recover the refrigerant with a recovery/charging station (Refer to page HA-9).
4. Loosen the drive belt (Refer to the EM-Timing).
5. Remove the bolts, then disconnect the suction line (A) and discharge line (B) from the compressor. Plug (C) or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



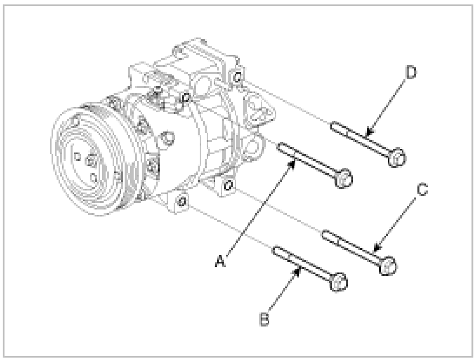
6. Disconnect the compressor clutch connector (A), then remove the mounting bolts and the compressor (B).



INSTALLATION

1. Make sure of the length of compressor mounting bolts, and then tighten it A→B→C→D order.

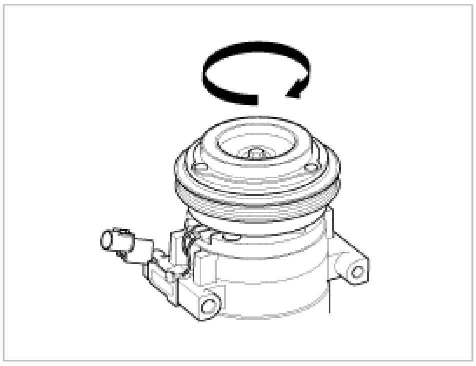
TORQUE : 20~33N.m (2.04 ~ 3.36 kgf.m, 14.7~24.3lb-ft)



2. Install in the reverse order of removal, and note these items.
   A. If you're installing a new compressor, drain all the refrigerant oil from the removed compressor, and measure its volume, Subtract the volume of drained oil from 150cc the result is the amount of oil you should drain from the new compressor (through the suction fitting).
   B. Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the right O-rings for R-134a to avoid leakage.
   C. To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
   D. Immediately after using the oil, replace the cap on the container and seal it to avoid moisture absorption.
   E. Do not spill the refrigerant oil on the vehicle; it may damage the paint; if the refrigerant oil contacts the paint, wash it off immediately.
   F. Adjust the drive belt (Refer to the EM-Timing) Charge the system and test its performance.

INSPECTION

1. Check the plated parts of the disc & hub assembly for color changes, peeling or other damage. If there is damage, replace the clutch set.
2. Check the pulley bearing play and drag by rotating the pulley by hand. Replace the clutch set with a new one if it is noisy or has excessive play/drag.

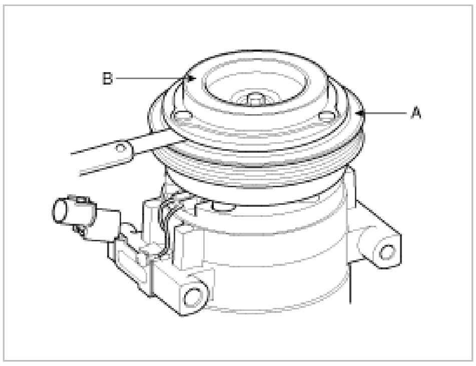


3. Measure the clearance between the pulley (A) and the disc & hub assembly (B) all the way around. If the clearance is not within specified limits, remove the disc & hub assembly (Refer to page HA-17) and add or remove shims as needed to increase or decrease clearance.

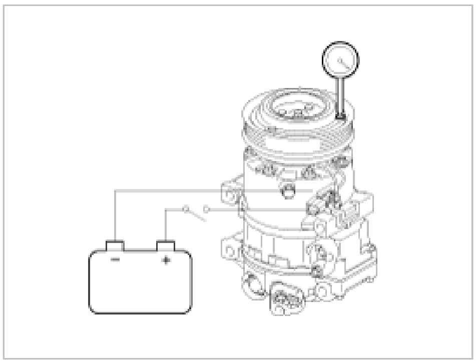
Clearance: 0.5 ± 0.15mm (0.020 ± 0.006 in.)

NOTE

The shims are available in eight thicknesses: 0.7mm, 0.8mm, 0.9mm, 1.0mm, 1.1mm, 1.2mm, 1.3mm and 1.4mm



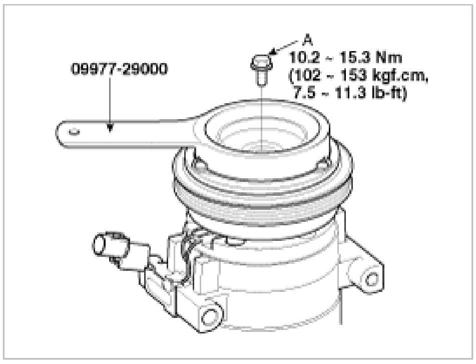
4. Check operation of the magnetic clutch.
Connect the compressor side terminals to the battery (+) terminal and the ground battery (-) terminal to the compressor body.
Check the magnetic clutch operating noise to determine the condition.



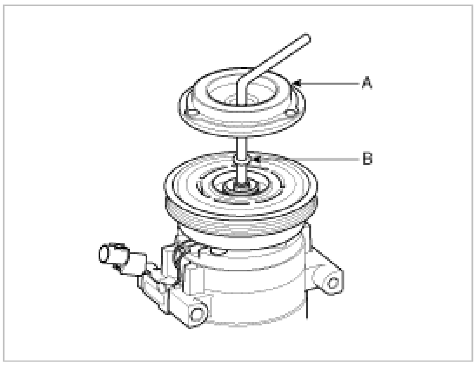
DISASSEMBLY

1. Remove the center bolt (A) while holding the disc & hub assembly with a commercially available disc & hub assembly bolt remover; Special tool number 09977-29000.

TORQUE : 10~15N.m (1.02~1.53 kgf.m, 7.5~11.3 lb-ft)



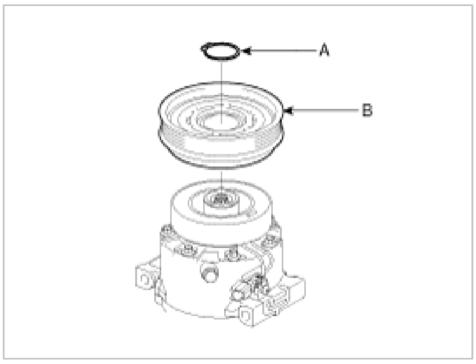
2. Remove the disc & hub assembly (A) and shim (B), taking care not to lose the shims. If the clutch needs adjustment, increase or decrease the number and thickness of shims as necessary, then reinstall the disc & hub assembly, and recheck its clearance (Refer to page HA-18).



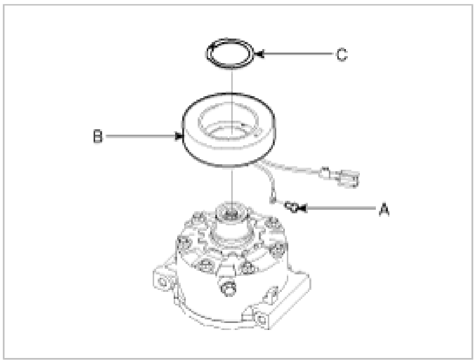
3. If you remove the field coil, remove retainer ring (A) with retainer ring pliers.

NOTE

- Be careful not to damage the pulley (B) and compressor during removal/installation.
- Once retainer ring (A) is removed, replace it with a new one.



4. Remove the screw (A) from the field coil ground terminal and then remove the field coil (B) and retainer ring (C).



5. Reassemble the compressor clutch in the reverse order of disassembly, and note these items :
   A. Clean the pulley and compressor sliding surfaces with non-petroleum solvent.
   B. Install new retainer rings, and make sure they are fully seated in the groove.
   C. Make sure that the pulley turns smoothly after its reassembled.

Heating,Ventilation, Air Conditioning > Air conditioning System > Compressor oil > Repair procedures

OIL SPECIFICATION

- The HFC-134a system requires synthetic (PAG) compressor oil whereas the R-12 system requires mineral compressor oil. The two oils must never be mixed.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.

HANDLING OF OIL

- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately. (HFC-134a Compressor Oil absorbs moisture very easily.)
- The compressor oil must be stored in steel containers, not in plastic containers.

COMPRESSOR OIL CHECK

The oil used to lubricate the compressor is circulating with the refrigerant.
Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of oil.

Oil total volume in system: PAG 150cc (5.07 fl.oz)

OIL RETURN OPERATION

There is close affinity between the oil and the refrigerant.
During normal operation, part of the oil recirculates with the refrigerant in the system. When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1. Open all the doors and the engine hood.
2. Start the engine and air conditioning switch to "ON" and set the blower motor control knob at its highest position.
3. Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4. Stop the engine.

REPLACEMENT OF COMPONENT PARTS

When replacing the system component parts, supply the following amount of oil to the component parts to be installed.

Component parts to be installed	Amount of Oil
Evaporator	50 cc (1.70 fl.oz)
Condenser	30 cc (1.02 fl.oz)
Receiver/dryer	30 cc (1.02 fl.oz)
Refrigerant line(One piece)	10 cc (0.34 fl.oz)

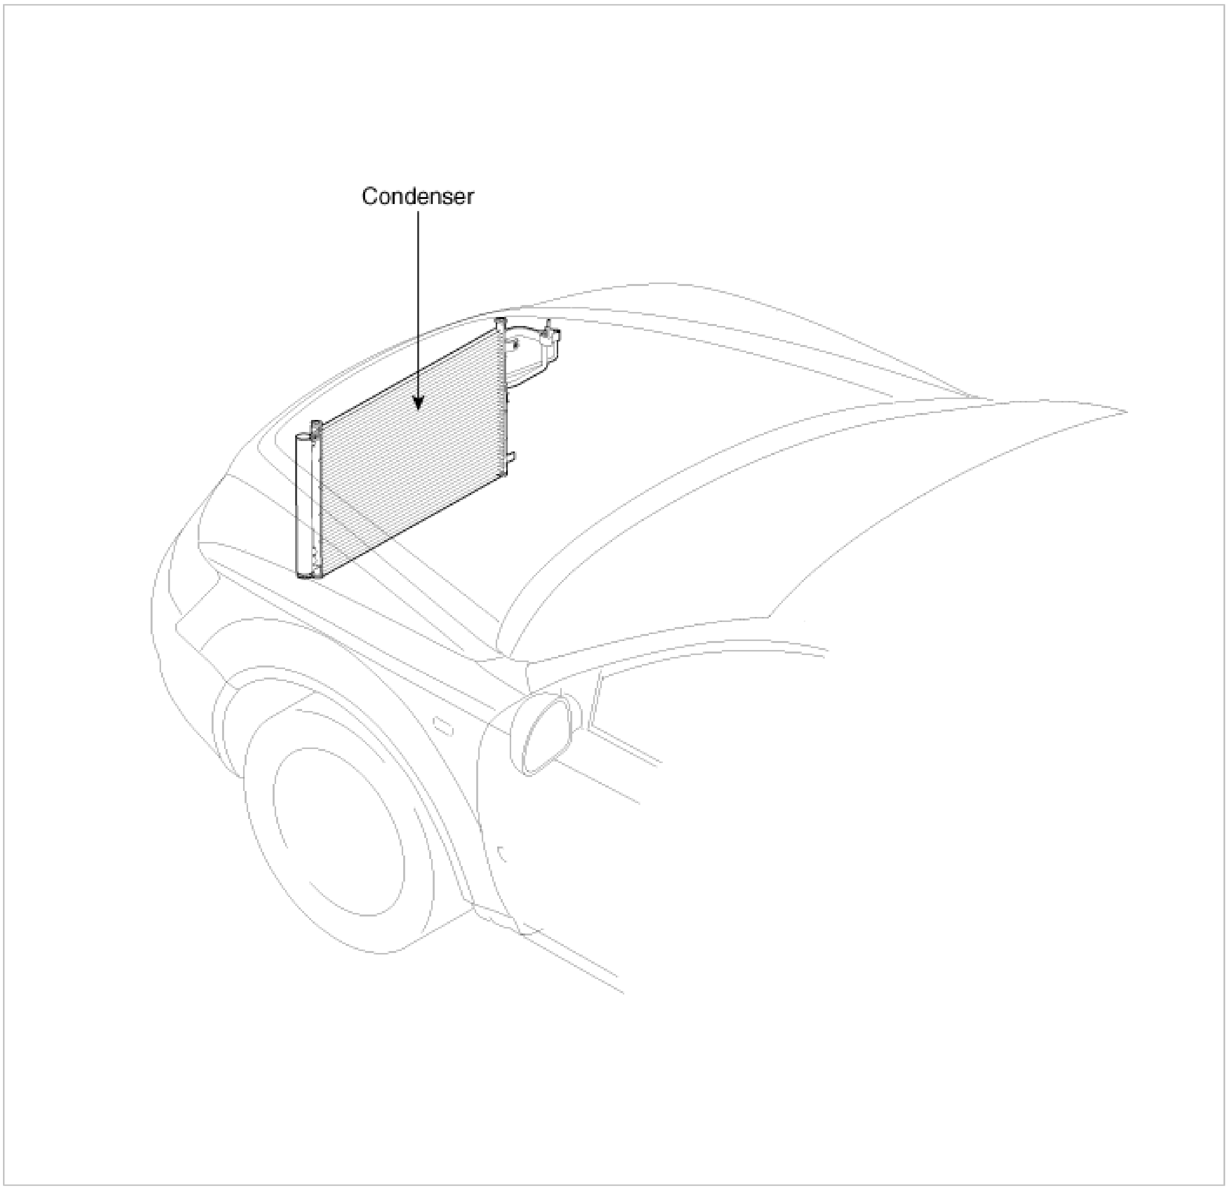
For compressor replacement, subtract the volume of oil drained from the removed compressor from the specified volume, and drain the calculated volume of oil from the new compressor:
The specified volume - volume of removed compressor = volume to drain from the new compressor.

NOTE

Even if no oil is drained from the removed compressor, don't drain more than 50cc from new compressor.

Heating,Ventilation, Air Conditioning > Air conditioning System > Condenser > Components and Components Location

COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > Condenser > Repair procedures

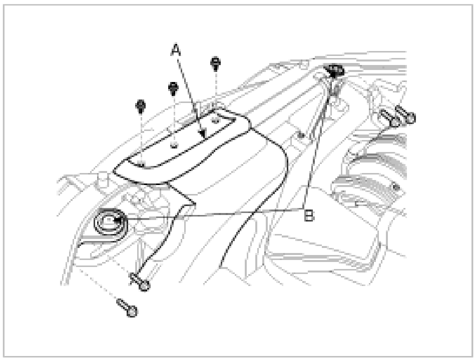
INSPECTION

1. Check the condenser fins for clogging and damage. If clogged, clean them with water, and blow them with compressed air. If bent, gently bend them using a screwdriver or pliers.
2. Check the condenser connections for leakage, and repair or replace it, if required.

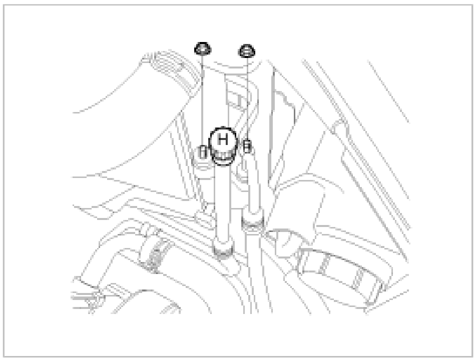
REPLACEMENT

CONDENSER

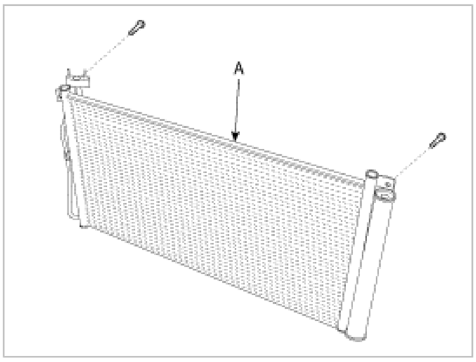
1. Recover the refrigerant with a recovery/ recycling/ charging station (Refer to page HA-9).
2. Disconnect the negative (-) battery terminal.
3. Remove the air duct (A) after loosening 3 fasteners.
4. Remove the radiator bracket (B) after loosening the bolts.



5. Remove the 2 nuts, then disconnect the discharge line and condenser line from the condenser.
   Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



6. Remove the bolts, then remove the condenser (A) by lifting it up. Be careful not to damage the radiator and condenser fins when removing the condenser.



7. Install in the reverse order of removal, and note these items :
   A. If you're installing a new condenser, add refrigerant oil.
   B. Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the right O-rings for R-134a to avoid leakage.
   C. Be careful not to damage the radiator and condenser fins when installing the condenser.
   D. Be sure to install the lower mount cushions of condenser securely into the holes.
   E. Charge the system, and test its performance. (Refer to HA-10)

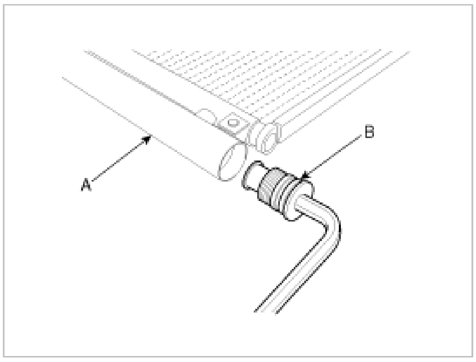
DESICCANT

1. Remove the condenser, and then remove the bottom cap (B) from the receiver/drier tank (A).

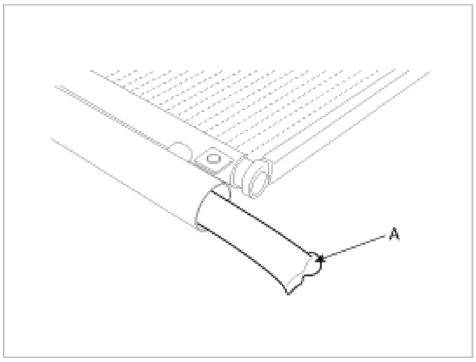
TORQUE : 20~25N.m (2.0~2.5kgf·m, 14.5~18.2lb-ft)

WARNING

Use of impact wrench may cause cracking on the receiver/drier tank connecting pipe to the condenser.



2. Remove the desiccant (A) from the receiver/drier tank using a long nose plier.



Check for crumbled desiccant and clogged bottom cap filter.

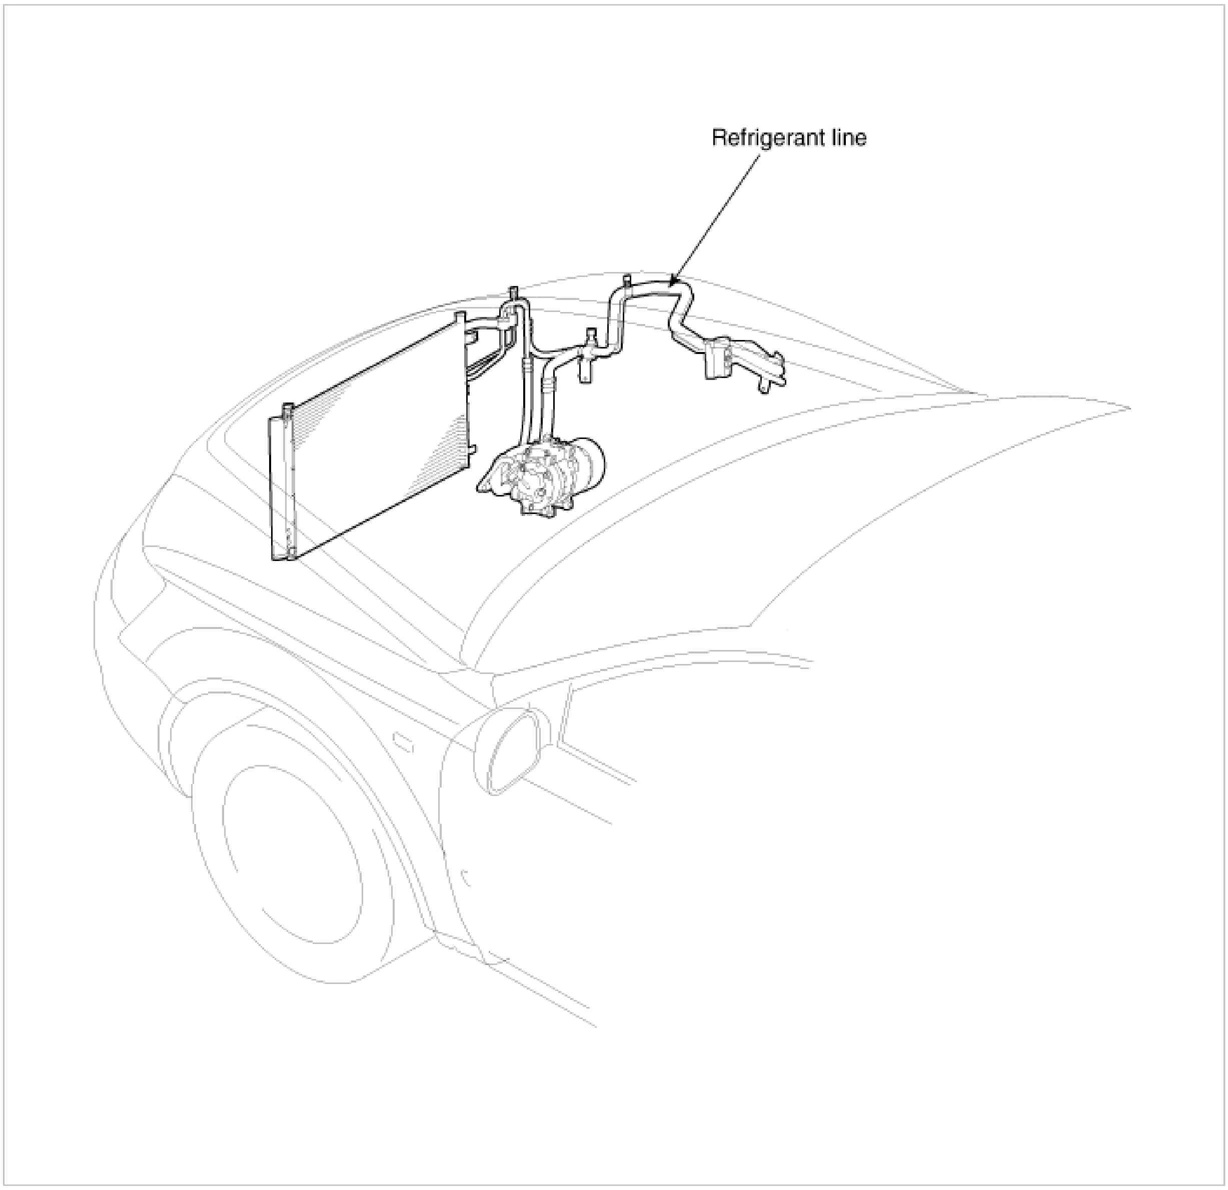
3. Apply air conditioning compressor oil along the O-rings and threads of the new bottom cap.
4. Insert the new desiccant into the receiver drier tank. The desiccant must be sealed in vacuum before it is exposed to air for use.
5. Install the new bottom cap to the receiver drier tank.

NOTE

- Always replace the desiccant and bottom cap at the same time.
- Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the right O-rings for R-134a to avoid leakage.
- Be careful not to damage the radiator and condenser fins when installing the condenser.
- Be sure to install the lower mount cushions of condenser securely into the holes.
- Charge the system, and test its performance. (Refer to HA-10)

Heating,Ventilation, Air Conditioning > Air conditioning System > Refrigerant line > Components and Components Location

COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > Refrigerant line > Repair procedures

REPLACEMENT

1. Discharge refrigerant from refrigeration system (Refer to page HA-9).
2. Replace faulty tube or hose.

> CAUTION
>
> Cap the open fittings immediately to keep moisture or dirt out of the system.

3. Tighten joint of bolt or nut to specified torque.

> CAUTION
>
> Connections should not be torque tighter than the specified torque.

Part tightened	N.m	kgf.m	lb-ft
Condenser x Discharge hose	5 ~ 7	0.5 ~ 0.6	3.7 ~ 5.2
Condenser x Liquid tube			
Compressor x Discharge hose	5 ~ 7	0.5 ~ 0.6	3.7 ~ 5.2
Compressor x Suction hose			

Expansion valve x Evaporator	12 ~ 15	1.2 ~ 1.5	8.7 ~ 10.8

4. Evacuate air in refrigeration system and charge system with refrigerant (Refer to page HA-9).

Specified amount: 550 ± 25g (19.4 ± 0.88 oz.)

5. Inspect for leakage of refrigerant.
   Using a gas leak detector, check for leakage of refrigerant (Refer to page HA-11).
6. Inspect A/C operation.

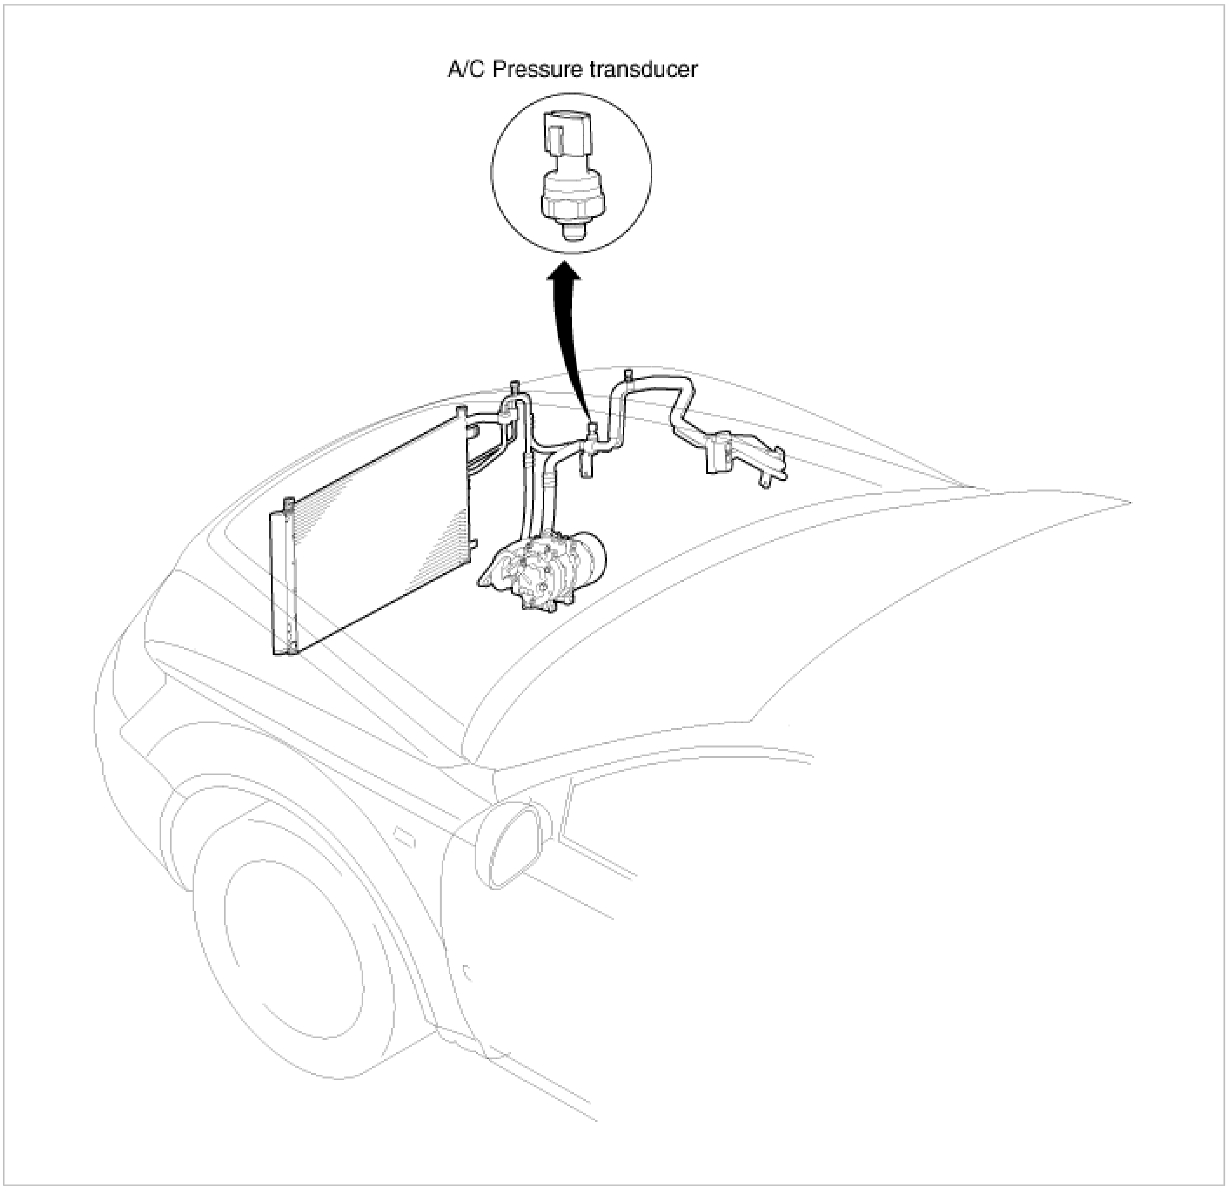
Heating,Ventilation, Air Conditioning > Air conditioning System > A/C pressure transducer > Description and Operation

DESCRIPTION

A/C pressure transducer convert the pressure value of high pressure line into voltage value after measure it. By converted voltage value, engine ECU controls cooling fan by operating it high speed or low speed. Engine ECU stop the operation of compressor when the temperature of refrigerant line is so high or so low irregularly to optimize air conditioning system.

Heating,Ventilation, Air Conditioning > Air conditioning System > A/C pressure transducer > Components and Components Location

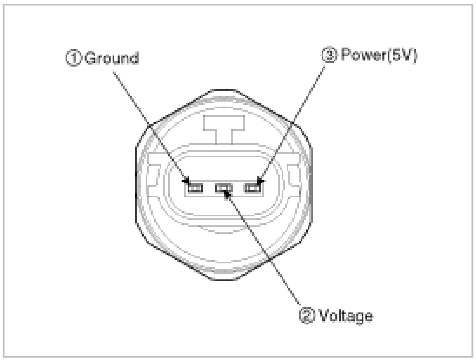
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > A/C pressure transducer > Repair procedures

INSPECTION

1. Measure the pressure of high pressure line by measuring voltage output between NO.1 and NO.2 terminals.



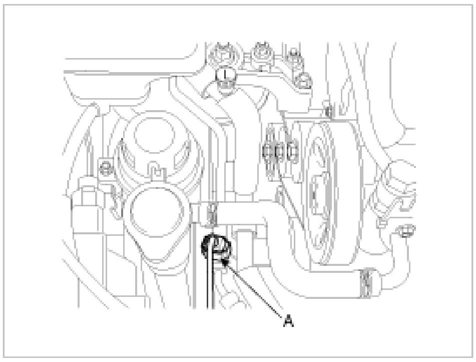
2. Inspection the voltage value whether it is sufficient to be regular value or not.

Voltage = 0.00878835 * Pressure (psig) + 0.5

3. If the measured voltage value is not specification, replace the A/C pressure transducer.

REPLACEMENT

1. Disconnect negative (-) battery terminal.
2. Disconnect A/C pressure transducer connector(A) (3P) from wiring harness.



3. Remove the A/C pressure transducer.

CAUTION

Take care that liquid suction pipe is not bent.

4. Installation is the reverse order of removal.

TORQUE : 10~12 N.m (1.02~1.22 kgf.m, 7.4~8.8 lb-ft)

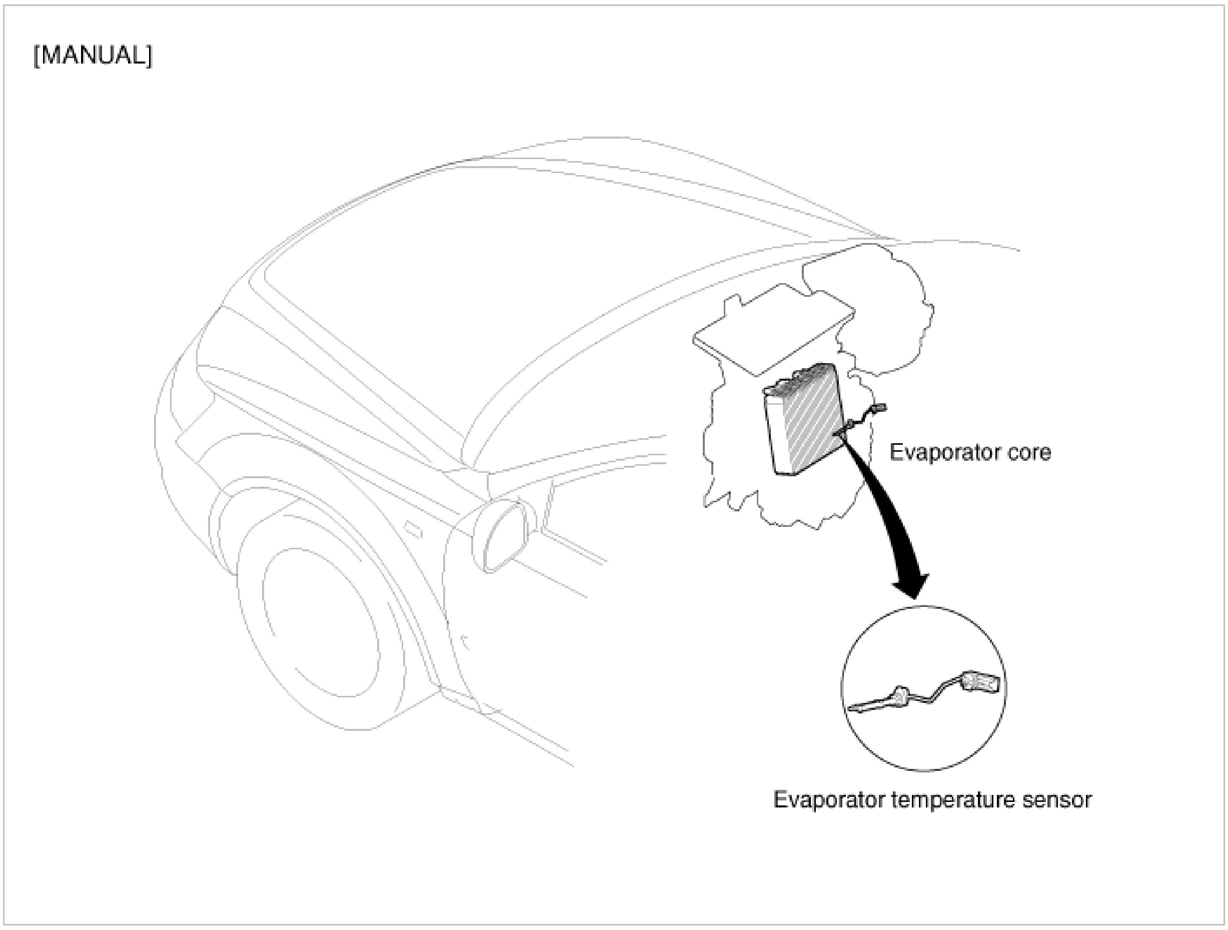
Heating,Ventilation, Air Conditioning > Air conditioning System > Evaporator temperature sensor > Description and Operation

DESCRIPTION

The evaporator temperature sensor will detect the evaporator core temperature and interrupt compressor relay power in order to prevent evaporator freezing by excessive cooling.
It is a negative type thermistor whose resistance is inversely proportional to temperature.

Heating,Ventilation, Air Conditioning > Air conditioning System > Evaporator temperature sensor > Components and Components Location

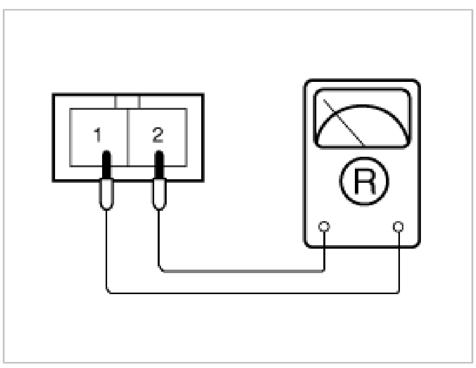
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > Evaporator temperature sensor > Repair procedures

INSPECTION

1. Ignition "ON".
2. Turn on the A/C switch.
3. Disconnect evaporator temperature sensor.
4. Using the multi-tester, Measure resistance between terminal "1" and "2" of evaporator temperature sensor.



Specification

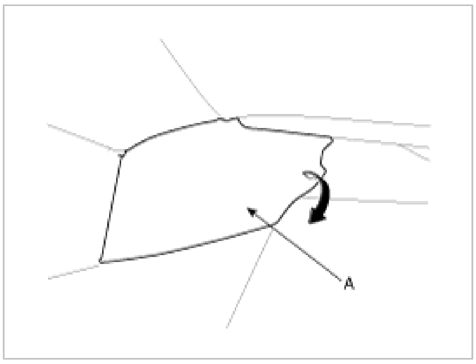
Evaporator core temperature [°C(°F)]	Resistance [KΩ]
-10 (14)	18.31
0 (32)	11.60
10 (50)	7.55
15 (59)	5.04

30 (86)	3.44
40 (104)	2.40

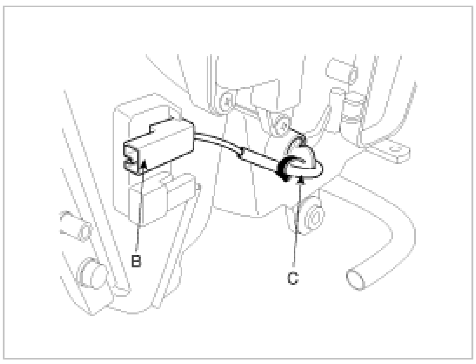
5. If the measured resistance is not specification, substitute with a known-good evaporator temperature sensor and check for proper operation.
6. If the problem is corrected, replace the evaporator temperature sensor.

REPLACEMENT

1. Pull out out the passenger's crash pad center low cover (A).



2. Disconnect the connector pin (B).
3. Remove the evaporator temperature sensor (C) by pulling it after rotating 90° in a counterclockwise direction.

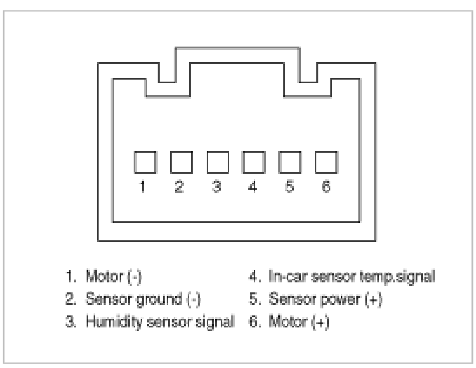


4. Installation is the reverse order of removal.

Heating,Ventilation, Air Conditioning > Air conditioning System > In-car sensor > Description and Operation

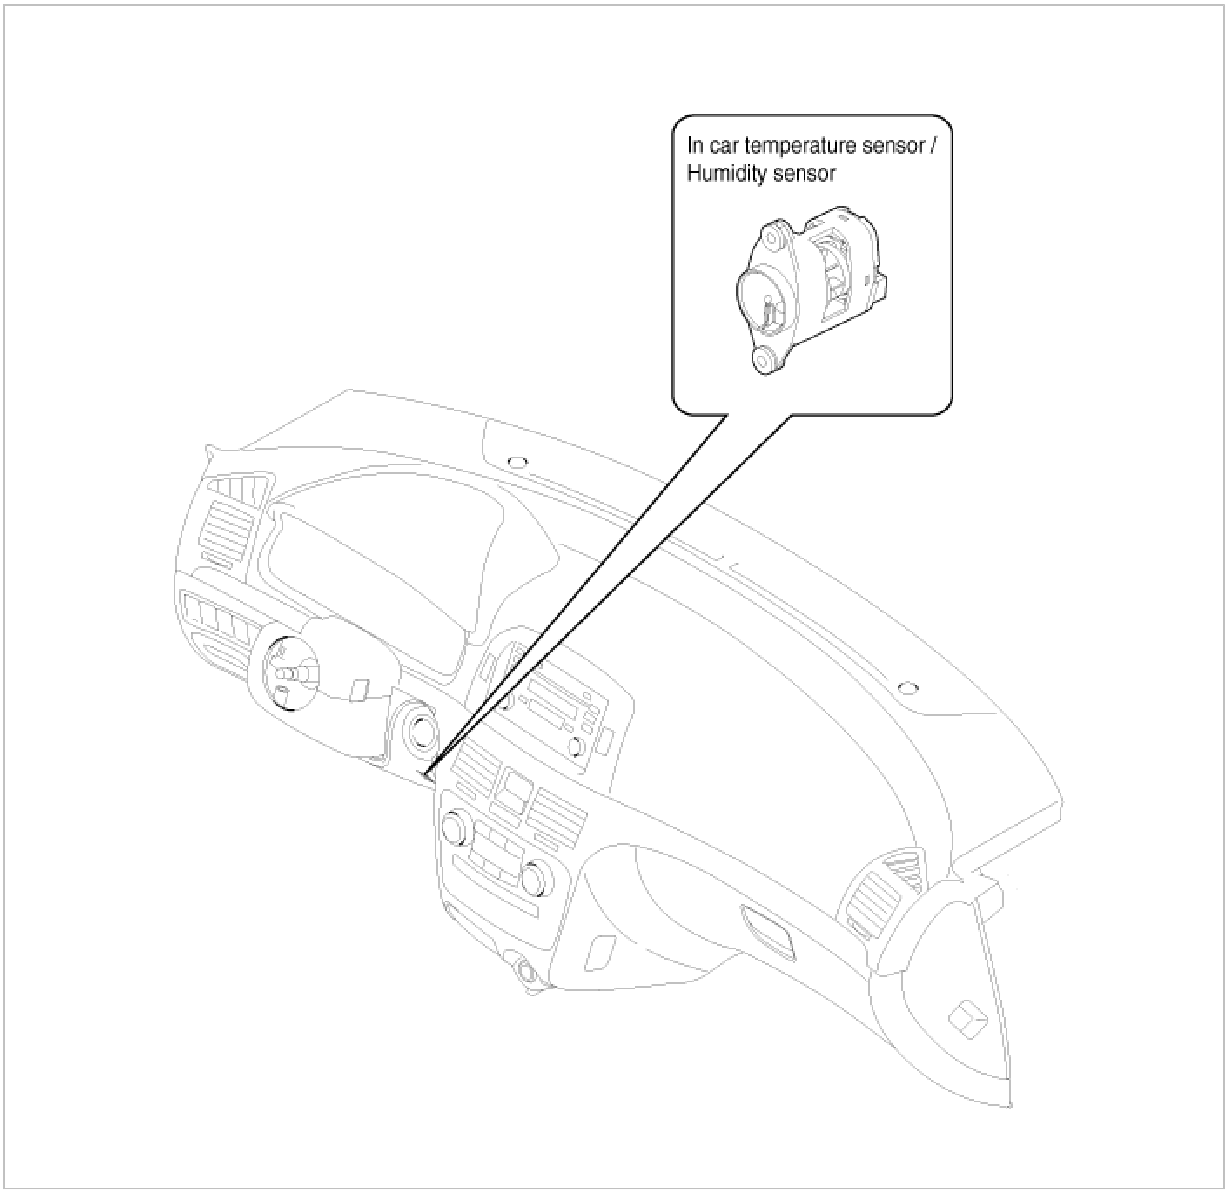
DESCRIPTION

1. In-car air temperature sensor is located at the lower crash pad.
2. The sensor contains a thermistor which measures the temperature of the inside. The signal, decided by the resistance value which changes in accordance with perceived inside temperature, is delivered to heater control unit and according to this signal the control unit regulates incar temperature to intended value.



Heating,Ventilation, Air Conditioning > Air conditioning System > In-car sensor > Components and Components Location

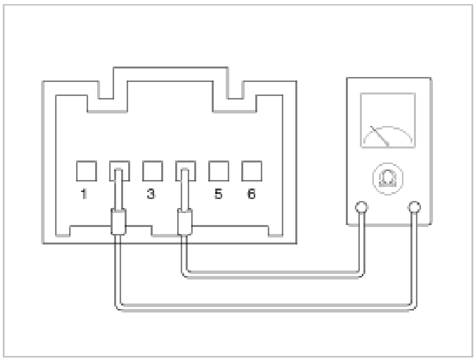
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > In-car sensor > Repair procedures

INSPECTION

1. Ignition "OFF".
2. Disconnect in-car sensor.
3. Using the multi-tester, Measure resistance between terminal "2" and "4" of in-car sensor.

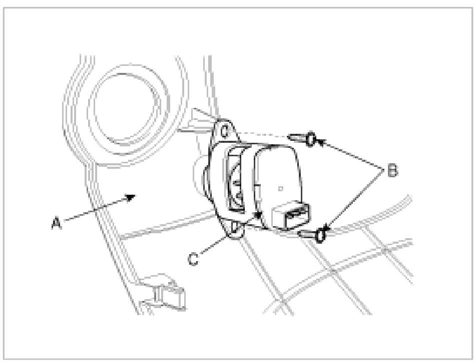


Specification

Temperature [°C(°F)]	Resistance between terminals 2 and 4 (KΩ)
-15 (5)	216.1 ± 3.2%
0 (32)	97.71 ± 2.4%
15 (59)	47.13 ± 1.7%
25 (77)	30.00 ± 1.2%
35 (95)	19.59 ± 1.6%
50 (122)	10.81 ± 2.2%

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the lower crash panel (A) (Refer to the Body group).
3. Disconnect the connector of in-car sensor.
4. Loosen the mounting screws (B) and then remove the in-car sensor (C).



5. Installation is the reverse order of removal.

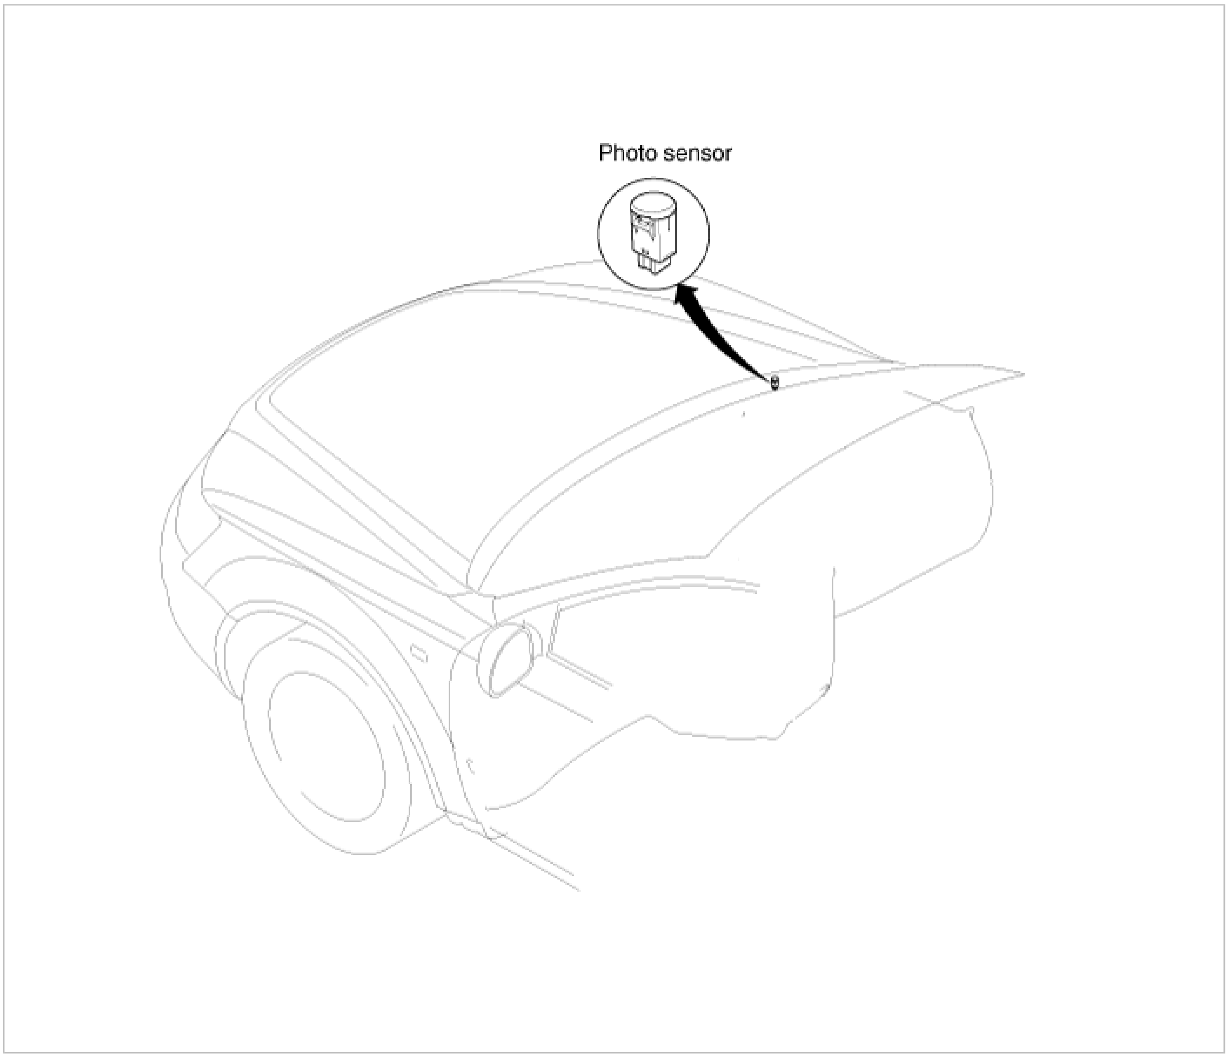
Heating,Ventilation, Air Conditioning > Air conditioning System > Photo sensor > Description and Operation

DESCRIPTION

1. The photo sensor is located at the right part of defrost nozzle.
2. The photo sensor contains a photovoltaic (sensitive to sunlight) diode. The solar radiation received by its light receiving portion, generates an electromotive force in proportion to the amount of radiation received which is transferred to the automatic temperature control module so that the solar radiation compensation will be performed.

Heating,Ventilation, Air Conditioning > Air conditioning System > Photo sensor > Components and Components Location

COMPONENT LOCATION

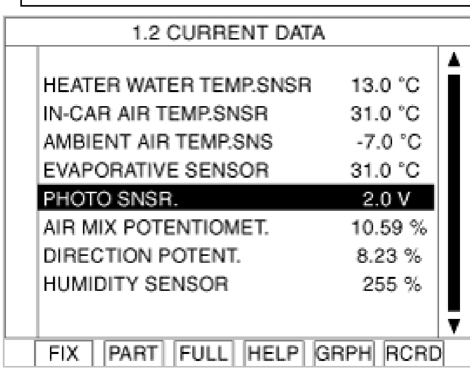


Heating,Ventilation, Air Conditioning > Air conditioning System > Photo sensor > Repair procedures

INSPECTION

1. Ignition "ON".
2. Using the scan tool.
3. Emit intensive light toward photo sensor using sunshine, and check the output absolute voltage change.
4. The absolute voltage will rise with higher intensive light and reduce with lower intensive light.

> **NOTE**
>
> When checking photo sensor, select a place where is exposed to sunshine directly.

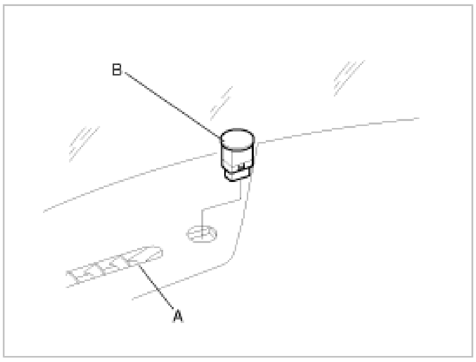


1.2 CURRENT DATA	
HEATER WATER TEMP.SNSR	13.0 °C
IN-CAR AIR TEMP.SNSR	31.0 °C
AMBIENT AIR TEMP.SNS	-7.0 °C
EVAPORATIVE SENSOR	31.0 °C
PHOTO SNSR.	2.0 V
AIR MIX POTENTIOMET.	10.59 %
DIRECTION POTENT.	8.23 %
HUMIDITY SENSOR	255 %

FIX | PART | FULL | HELP | GRPH | RCRD

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Using the (-) driver, Remove the photo sensor (B) from the right part of defrost nozzle (A).
3. Disconnect the connector.

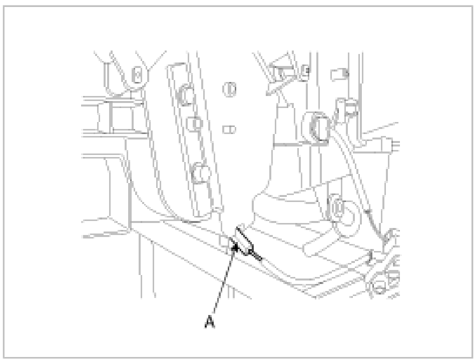


4. Installation is the reverse order of removal.

Heating,Ventilation, Air Conditioning > Air conditioning System > Water temperature sensor > Description and Operation

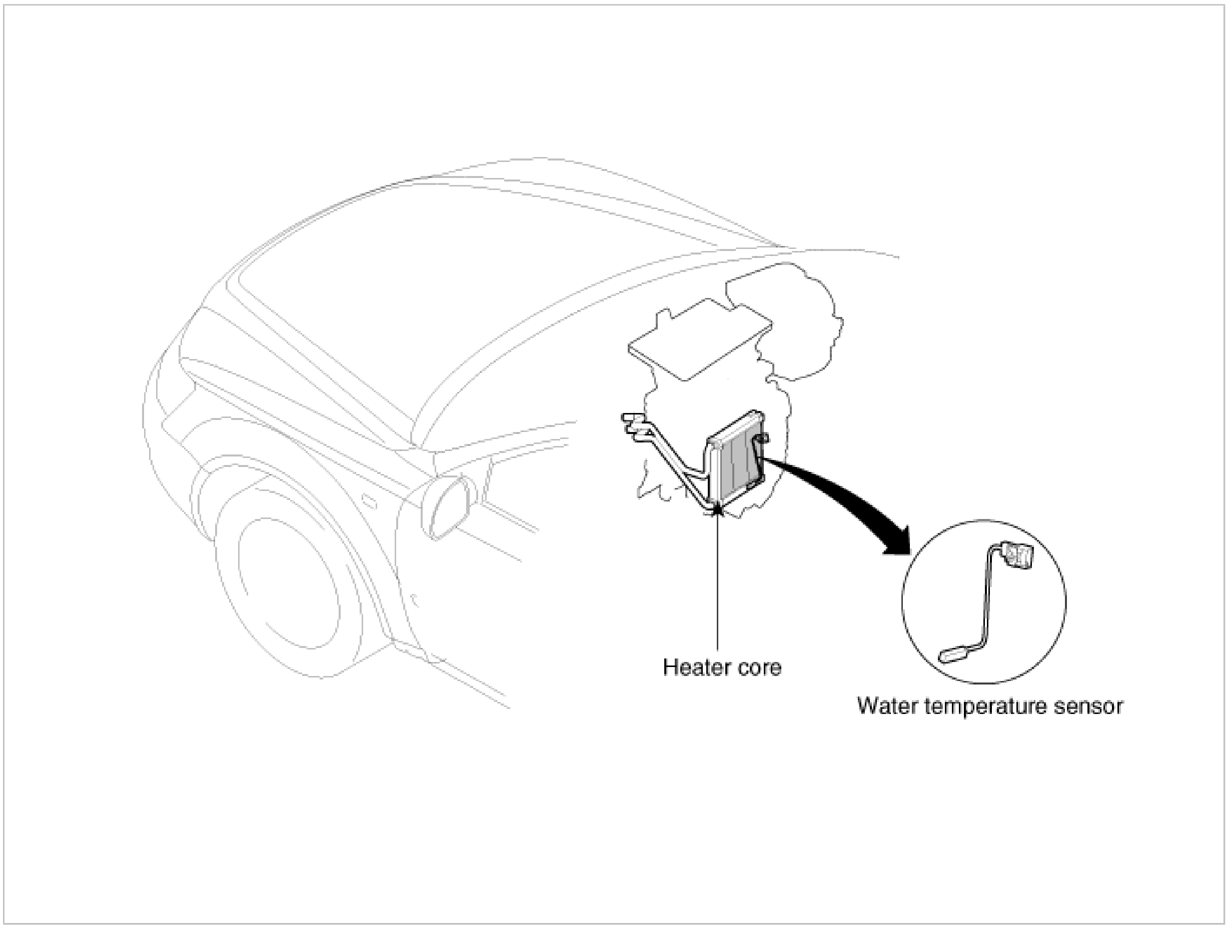
DESCRIPTION

1. Water temperature sensor (A) is located at the heater unit.
2. It detects coolant temperature. Its signal is used for cold engine lockout control. When the driver operates the heater before the engine is warmed up, the signal from sensor causes the heater control unit to reduce blower motor speed until coolant temperature reaches the threshold value.



Heating,Ventilation, Air Conditioning > Air conditioning System > Water temperature sensor > Components and Components Location

COMPONENT LOCATION



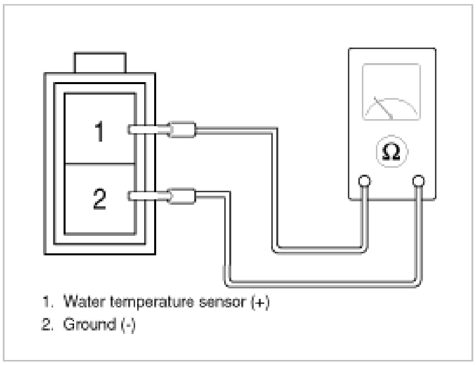
Heating,Ventilation, Air Conditioning > Air conditioning System > Water temperature sensor > Repair procedures

INSPECTION

1. Ignition "OFF".
2. Disconnect water temperature sensor connector.
3. Using the multi-tester, Measure resistance between terminal "1" and "2" of water temperature sensor.
   Specification

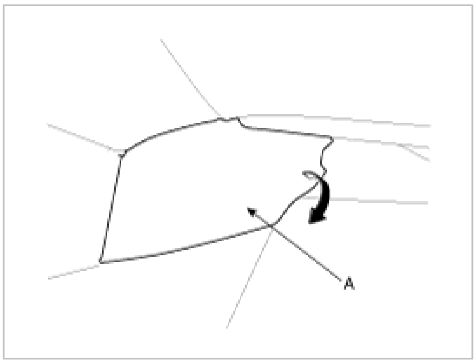
Coolant temperature [°C(°F)]	Resistance between terminals 1and 2 (KΩ)
-10 (14) 0 (32) 20 (68) 40 (104) 60 (140) 80 (176)	55.27 32.61 12.48 5.33 2.50 1.27

4. If the measured resistance is not specification, substitute with a known-good water temperature sensor and check for proper operation.
5. If the problem is corrected, replace the water temperature sensor.

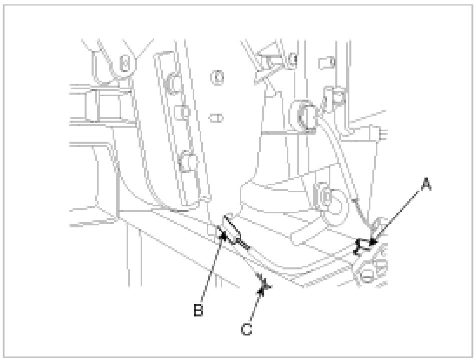


REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Pull out the passenger's crash pad center low cover (A).



3. Remove the under cover after loosening 2 screws.
4. Disconnect the connector (A) of water temperature sensor.
5. Pull the water temperature sensor(B) out at the heater unit with the stopper (C).



6. Install in the reverse order of removal.

> NOTE
>
> Take care that wire of water temperature sensor is not to be damaged.

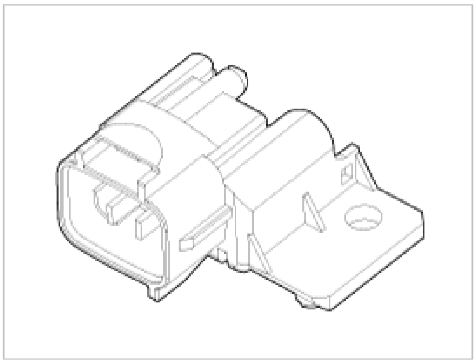
Heating,Ventilation, Air Conditioning > Air conditioning System > Ambient sensor > Description and Operation

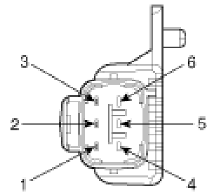
DESCRIPTION

1. The ambient temperature sensor is located at the front of the condenser and detects ambient air temperature. It is a negative type thermistor; resistance will increase with lower temperature, and decrease with higher temperatures.
2. The sensor output will be used for discharge temperature control, temperature regulation door control, blower motor level control, mix mode control and in-car humidity control.

> NOTE

If the ambient temperature is below 2.0°C (35.6°F), the A/C compressor will be stopped.
The compressor will be operated by manual operating.

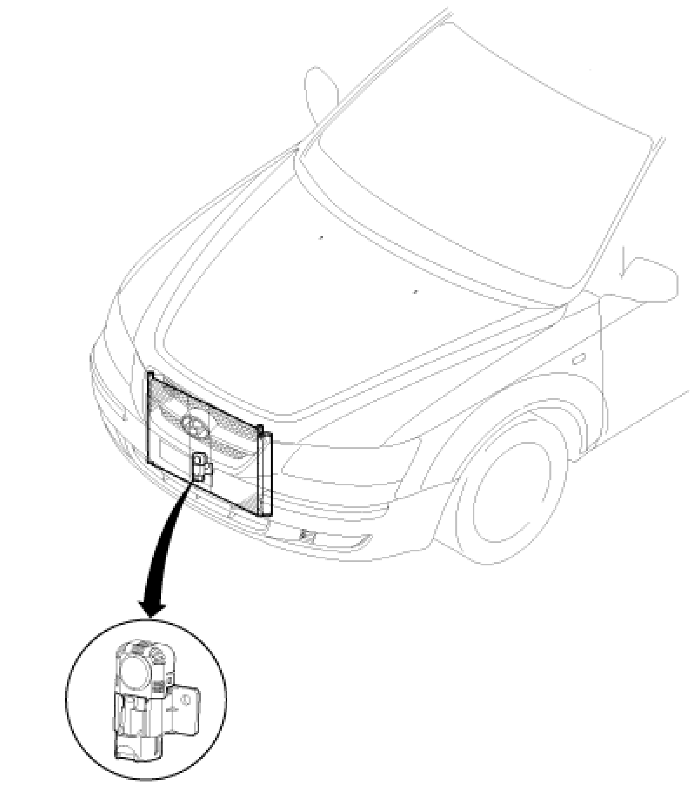




1. Ambient temperature sensor (+)
2. Ambient temperature sensor ground (-)
3. -
4. AQS signal
5. AQS ground (-)
6. IG 2 (+)

Heating,Ventilation, Air Conditioning > Air conditioning System > Ambient sensor > Components and Components Location

COMPONENT LOCATION



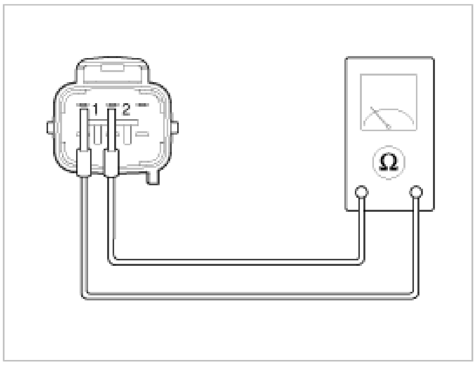
Heating,Ventilation, Air Conditioning > Air conditioning System > Ambient sensor > Repair procedures

INSPECTION

1. Ignition "OFF".
2. Disconnect ambient temperature sensor connector.
3. Check the resistance of ambient temperature sensor between terminals 1 and 2 whether it is changed by changing temperature of the ambient temperature sensor.
   Specification

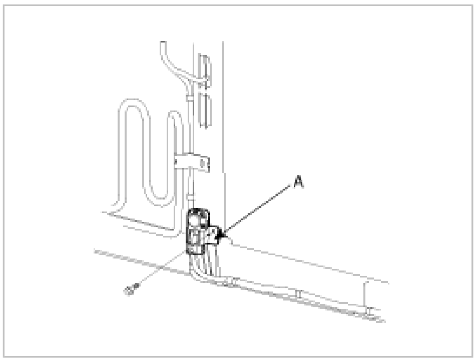
Ambient temperature [°C(°F)]	Resistance between terminals 1 and 2 (KΩ±3%)
-20 (-4) 0 (32) 25 (77) 50 (122) 80 (176)	271.1 95.1 30.0 10.9 3.83

4. If the measured resistance is not specification, substitute with a known-good ambient temperature sensor and check for proper operation.
5. If the problem is corrected, replace the ambient temperature sensor.



REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper. (Refer to BD group)
3. Remove the ambient temperature sensor(A) after loosening the mounting bolt.



4. Installation is the reverse order of removal.

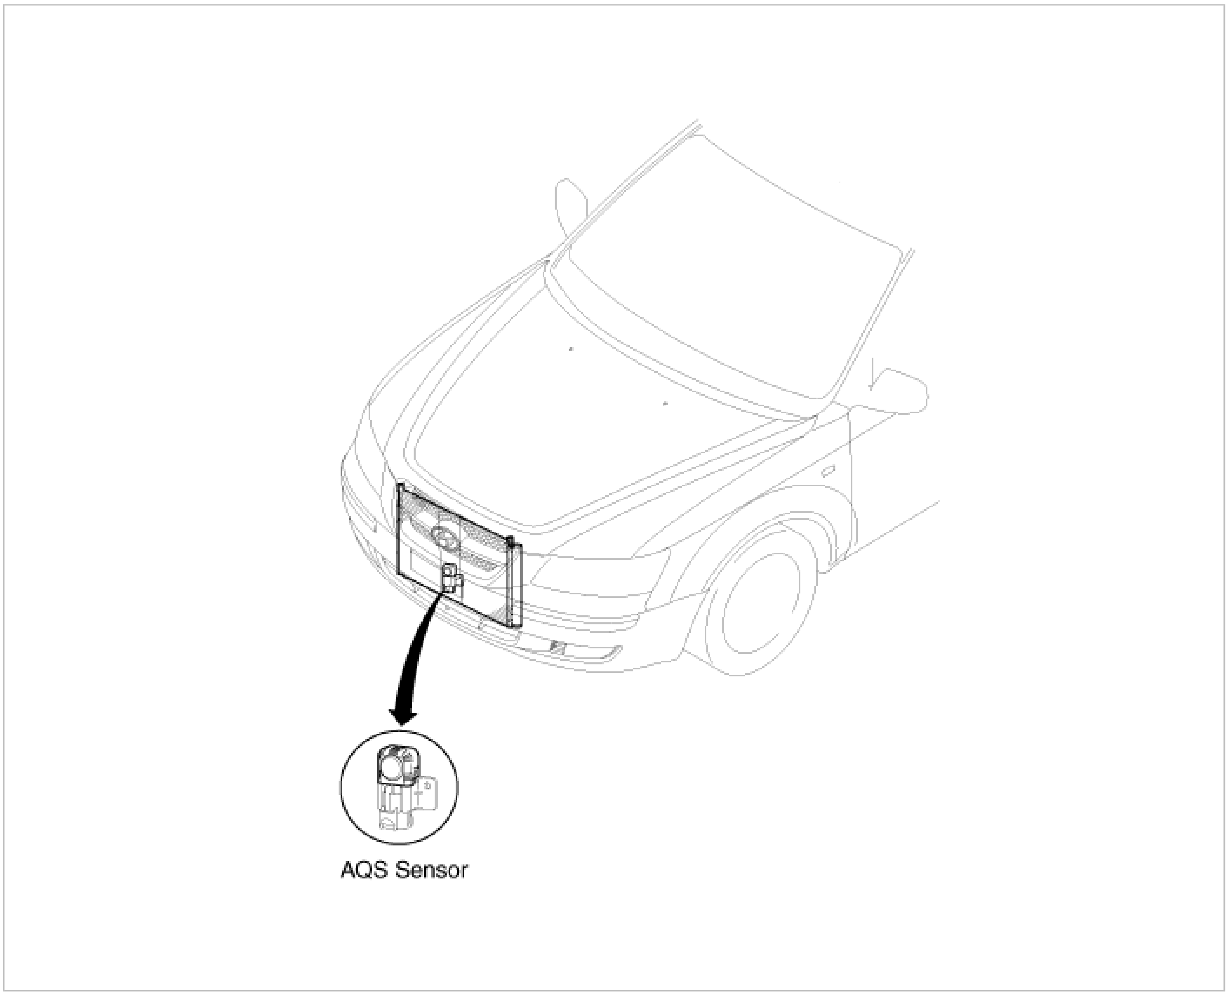
Heating,Ventilation, Air Conditioning > Air conditioning System > A.Q.S (Air Quality Sensor) > Description and Operation

DESCRIPTION

1. A.Q.S is located at center support in front of the engine radiator, and detects hazardous elements in ambient air providing output signal to control.
2. It will detect sulfurous acid gas, carbon dioxide, carbon monoxide, hydrocarbon and allergen.

Heating,Ventilation, Air Conditioning > Air conditioning System > A.Q.S (Air Quality Sensor) > Components and Components Location

COMPONENT LOCATION

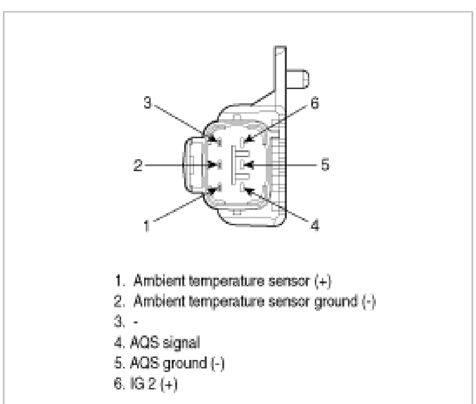


Heating,Ventilation, Air Conditioning > Air conditioning System > A.Q.S (Air Quality Sensor) > Repair procedures

INSPECTION

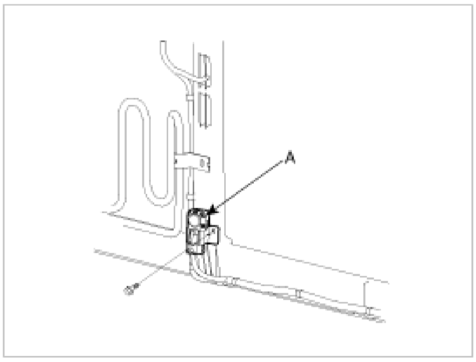
1. Ignition "ON".
2. Using the scan tool.
3. Check the output voltage of AQS between terminals 4 and 5.
   Specification

Condition	Output signal	Intake
Normal condition	4 ~ 5V	Fresh
Hazardous gas detection	0 ~ 1V	Recirculation



REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper (Refer to the BD group).
3. Remove the AQS sensor (A) after loosening the mounting screws.

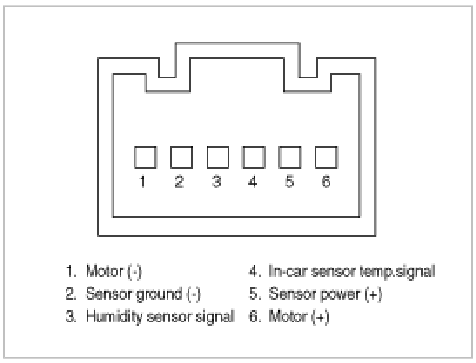


4. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Air conditioning System > Humidity Sensor > Description and Operation

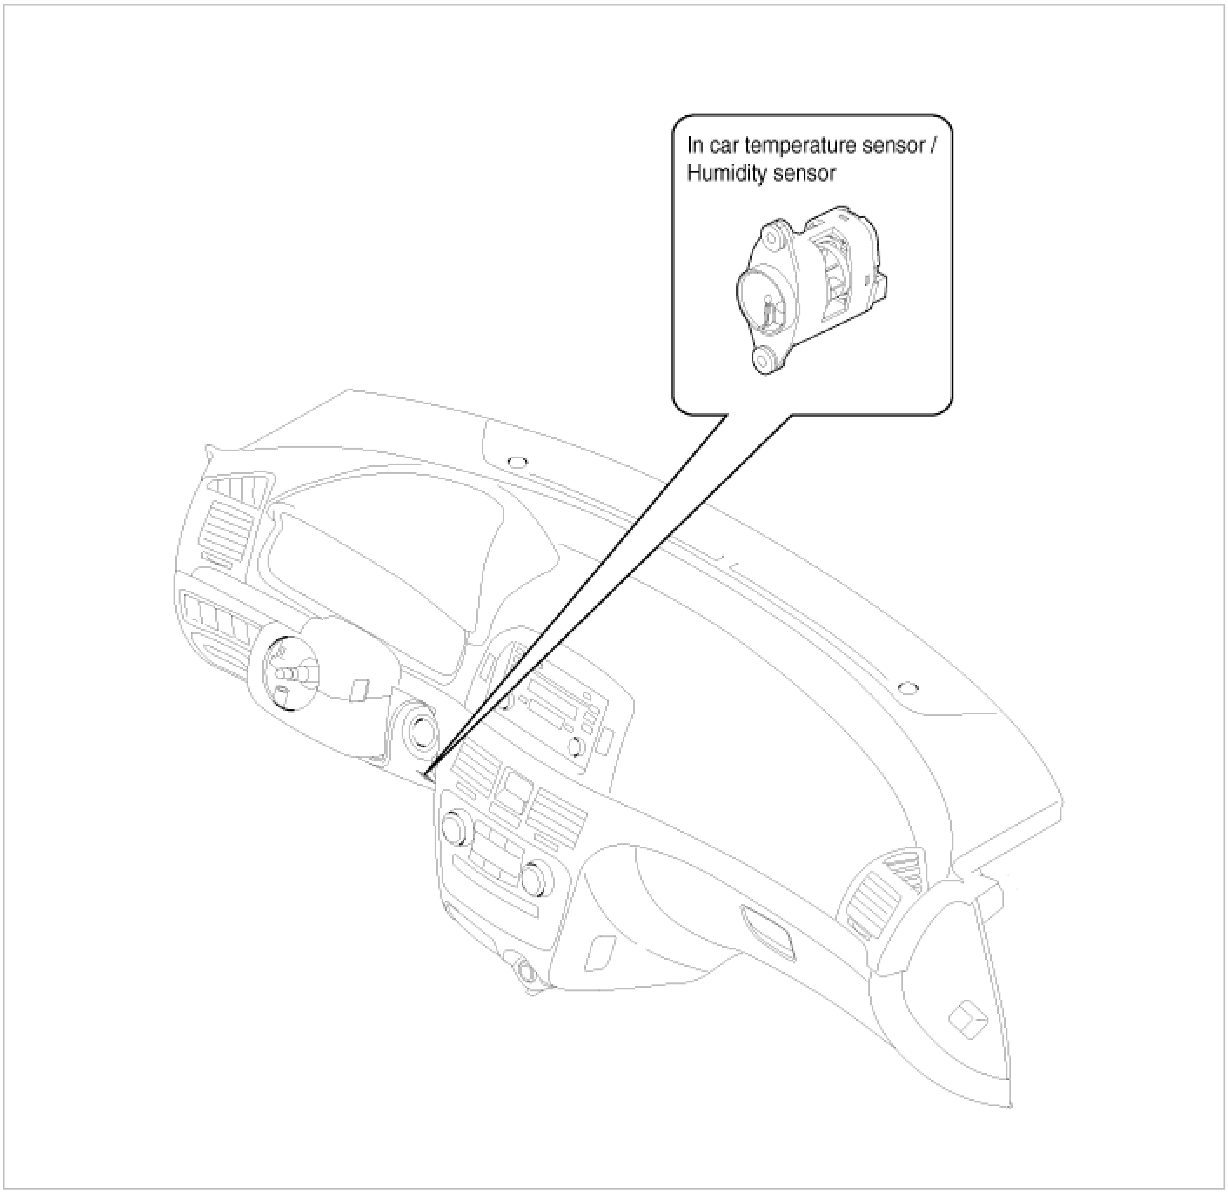
DESCRIPTION

1. Humidity sensor is located at the lower crash pad and detects in-car humidity for in-car humidity control.
2. If ambient air temperature or in-car humidity is outside certain range, it will turn on A/C to control in-car humidity preventing in car fogging.
   Air conditioner operation depends on ambient temperature and humidity.



Heating,Ventilation, Air Conditioning > Air conditioning System > Humidity Sensor > Components and Components Location

COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Air conditioning System > Humidity Sensor > Repair procedures

INSPECTION

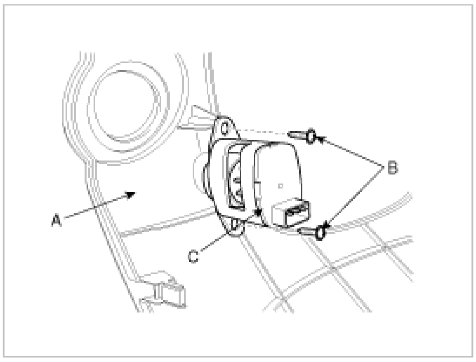
1. Ignition "ON".
2. Using the scan tool.
3. Check the frequency of humidity sensor between terminals 2 and 3.

Humidity (%)	Frequency between terminals 2 and 3(Hz)
0	7351± 10%
10	7224± 10%
20	7100± 5%
30	6976 ± 5%
50	6728 ± 5%
60	6600 ± 5%
70	6468 ± 5%
80	6330 ± 5%
90	6186 ± 10%
100	6033 ± 10%

4. If the measured resistance is not specification, substitute with a known-good humidity sensor and check for proper operation.
5. If the problem is corrected, replace the Humidity sensor.

REPLACEMENT

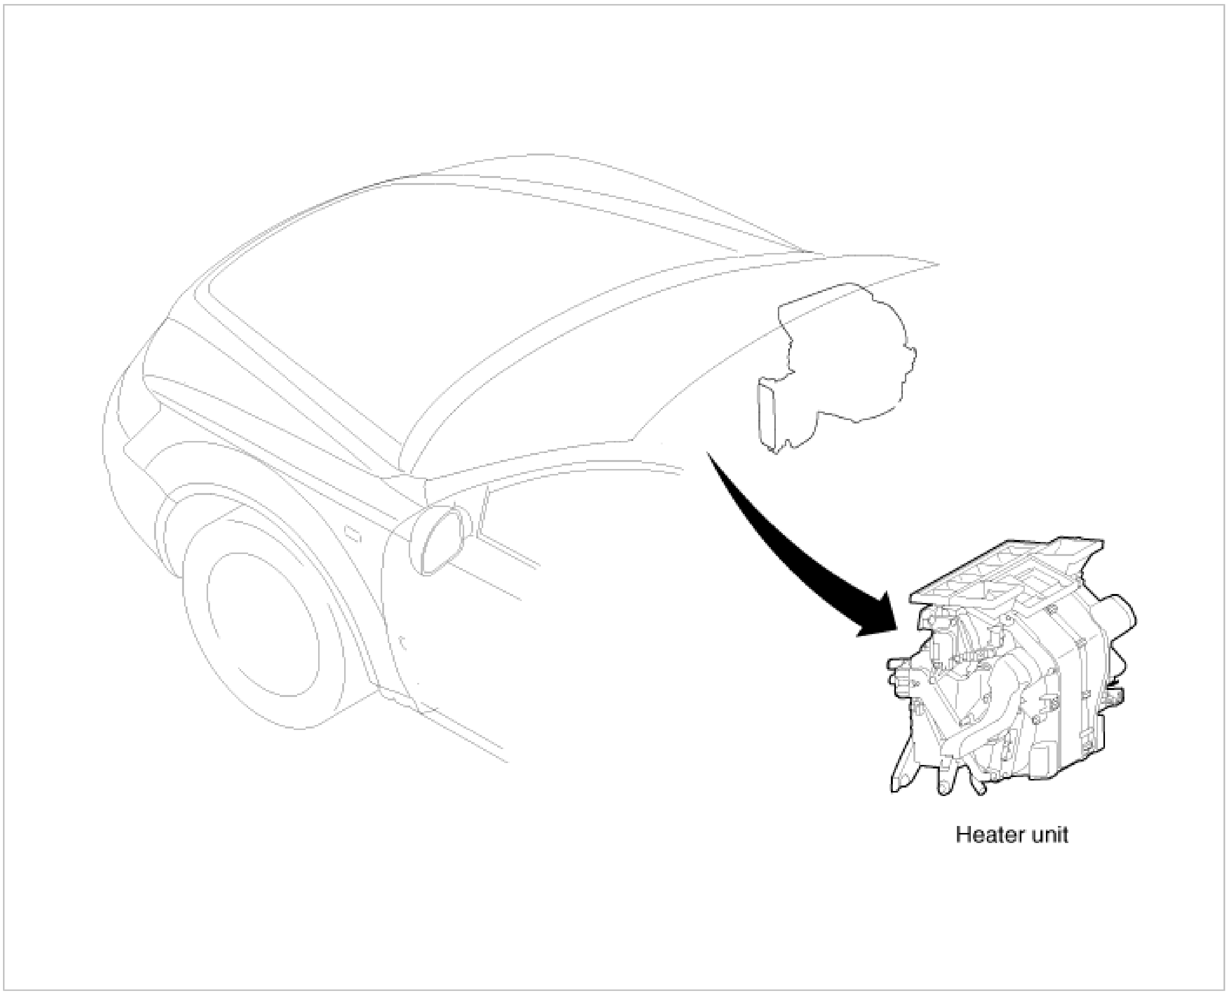
1. Disconnect the negative (-) battery terminal.
2. Remove the lower crash panel (A) (Refer to BD group).
3. Disconnect humidity sensor connector.
4. Loosen the mounting screws (B) and then remove the humidity sensor (C).



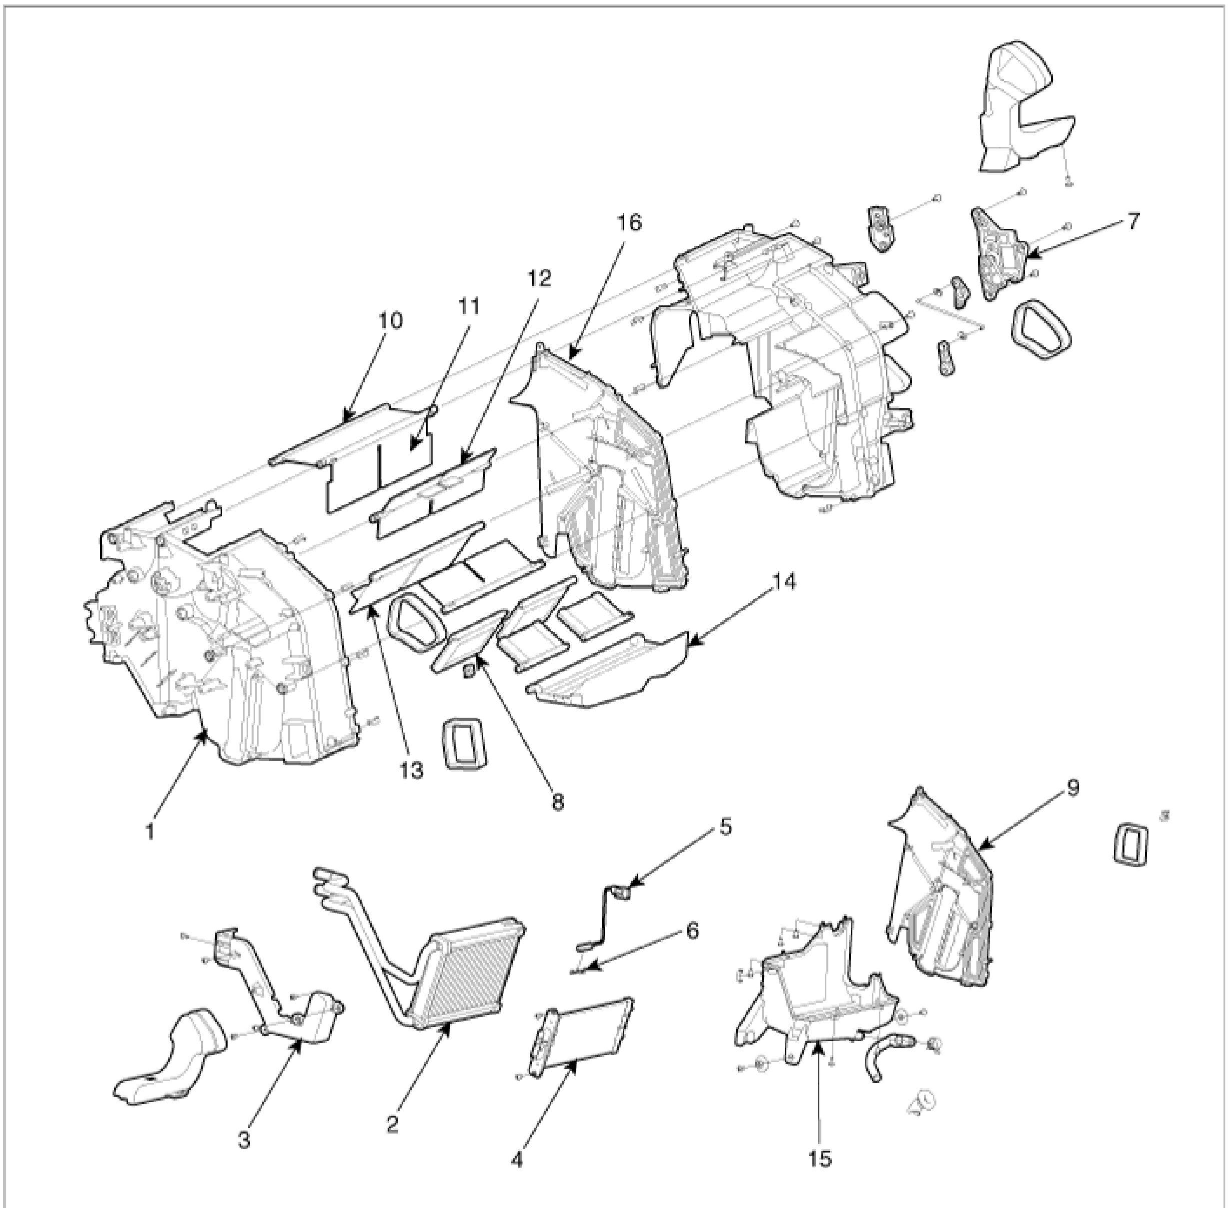
5. Installation is the reverse order of removal.

Heating,Ventilation, Air Conditioning > Heater > Heater Unit > Components and Components Location

COMPONENT LOCATION



COMPONENTS



1. Heater & Evaporator case
2. Heater core
3. Heater core cover
4. PTC heater (Diesel only)
5. Water temperature sensor
6. Water temperature sensor stopper
7. Temperature control actuator

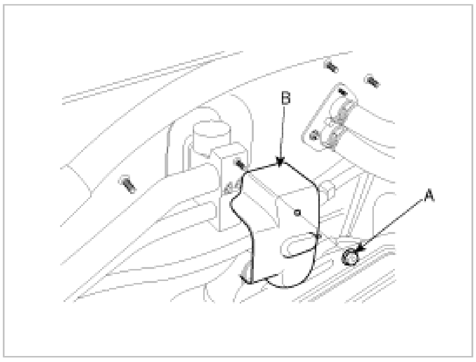
3. Temperature control actuator (Dual type)	8. Upper case seal
4. Mode cam	9. Heater & Evaporator upper case
5. Evaporator core	

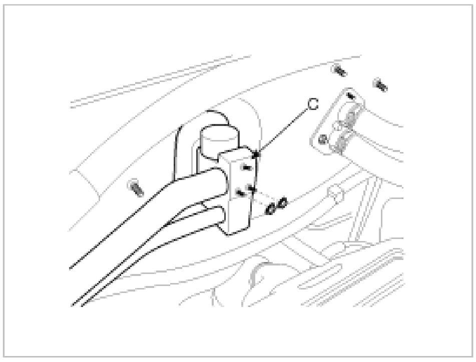
Heating,Ventilation, Air Conditioning > Heater > Heater Unit > Repair procedures

REPLACEMENT

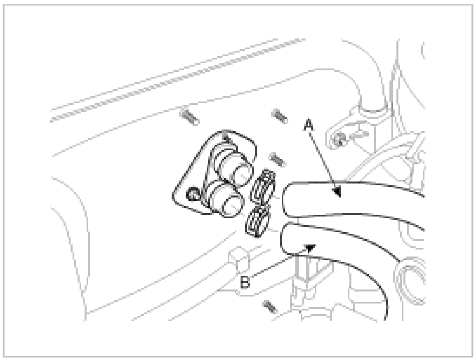
1. Disconnect the negative (-) battery terminal.
2. Recover the refrigerant with a recovery/ recycling/ charging station.
3. When the engine is cool, drain the engine coolant from the radiator.
4. Remove the expansion valve cover after loosening the nut (A).



5. Remove the expansion valve (C) from evaporator core after loosening nuts. Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.



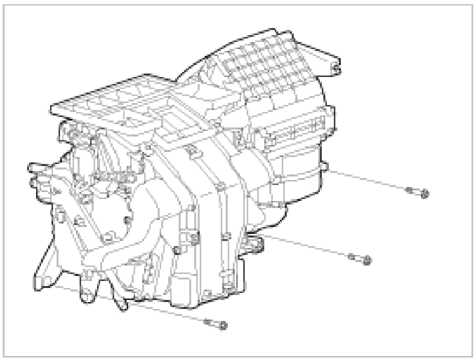
6. Disconnect the inlet (A) and outlet (B) heater hoses from the heater unit.



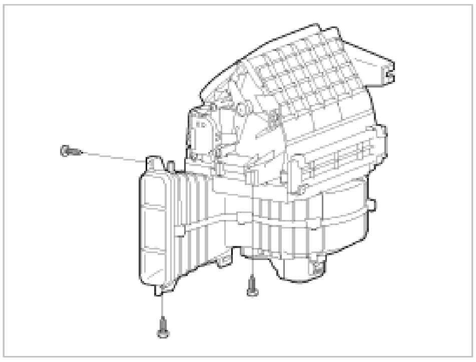
CAUTION

Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on electrical parts or painted surfaces. If any coolant spills, rinse it off immediately.

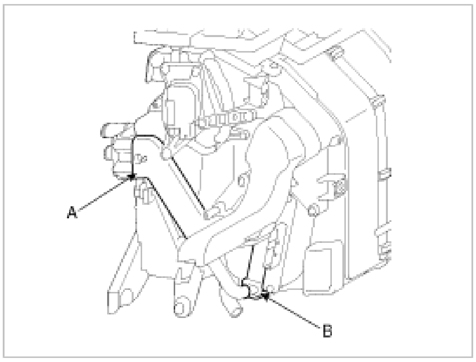
7. Remove the crash pad. (Refer to BD group)
8. Remove the cowl cross member. (Refer to BD group)
9. Disconnect the connectors from the temperature control actuator, the mode control actuator and the evaporator temperature sensor, then remove the mounting nut and the mounting bolts.
10. Remove the heater & evaporator unit after loosening the mounting bolts.



11. Remove the blower unit from heater unit after loosening fixing screws on the connected part.



12. Remove the side bracket (A) and heater core (B).



13. Be careful that inlet and outlet pipes are not to be bent during heater core removal, and pull out the heater core.
14. Install the heater core in the reverse order of removal.
15. Install in the reverse order of removal, and note these items :
    A. If you're installing a new evaporator, add refrigerant oil.
    B. Replace the O-rings with new ones at each fitting, and apply a thin coat of refrigerant oil before installing them. Be sure to use the right O-rings for R-134a to avoid leakage.
    C. Immediately after using the oil, replace the cap on the container, and seal it to avoid moisture absorption.
    D. Do not spill the refrigerant oil on the vehicle ; it may damage the paint ; if the refrigerant oil contacts the paint, wash it off immediately.
    E. Apply sealant to the grommets.
    F. Make sure that there is no air leakage.
    G. Charge the system and test its performance.
    H. Do not interchange the inlet and outlet heater hoses and install the hose clamps securely.
    I. Refill the cooling system with engine coolant.

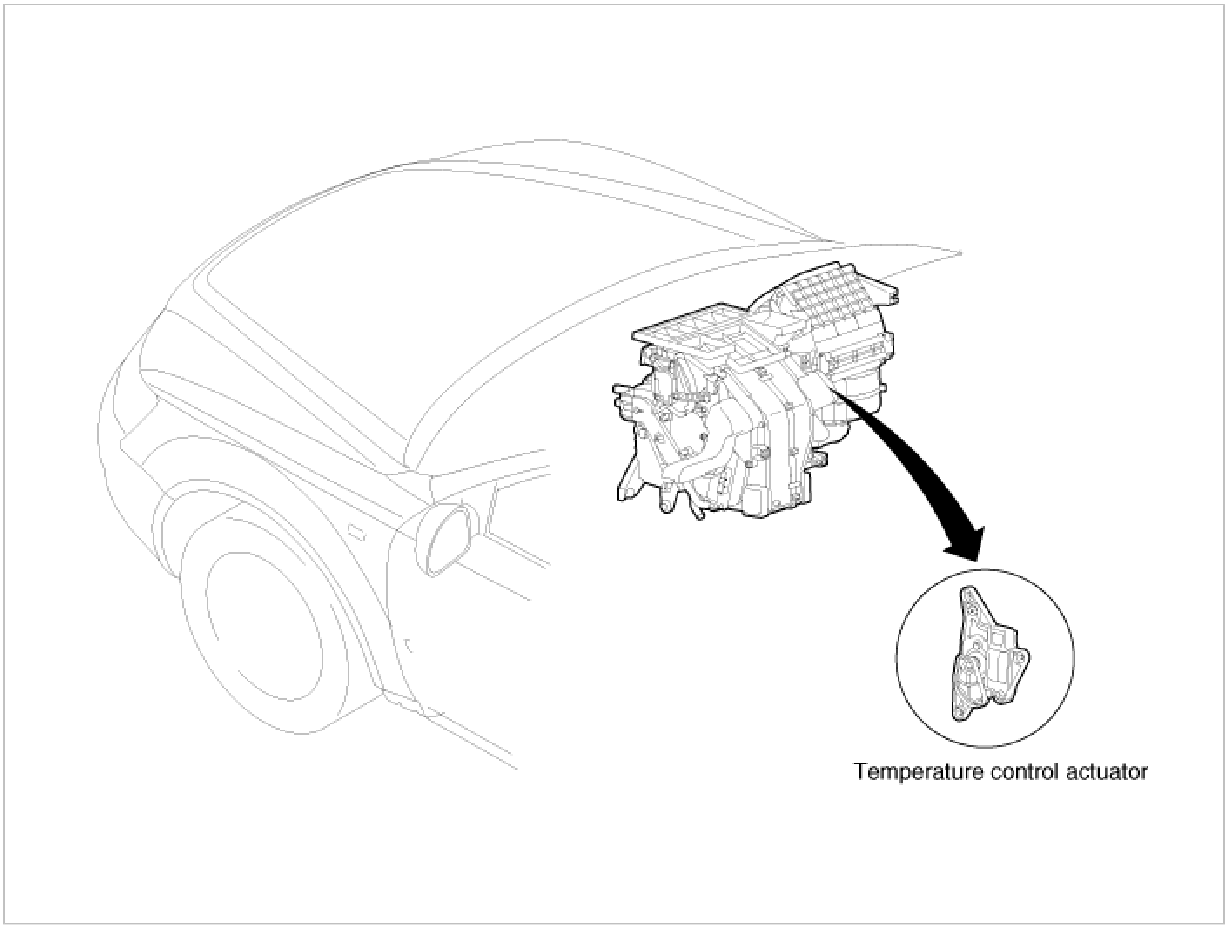
Heating,Ventilation, Air Conditioning > Heater > Temperature Control Actuator > Description and Operation

DESCRIPTION

1. Heater unit includes mode control actuator and temperature control actuator.
2. Temperature control actuator is located at the heater unit. Signal from control unit adjusts position of temperature door by operating temperature switch and then temperature will be regulated by the hot/cold air ratio determined by position of temperature door.

Heating,Ventilation, Air Conditioning > Heater > Temperature Control Actuator > Components and Components Location

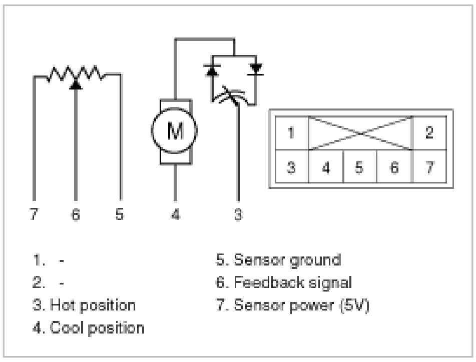
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Heater > Temperature Control Actuator > Repair procedures

INSPECTION

1. Ignition "OFF".
2. Disconnect the connector of temperature control actuator.
3. Verify that the temperature control actuator operates to the hot position when connecting 12V to the terminal 3 and grounding terminal 4.
4. Verify that the temperature control actuator operates to the cool position when the connections in are reversed.



5. Check the voltage between terminals 5 and 6.
Specification

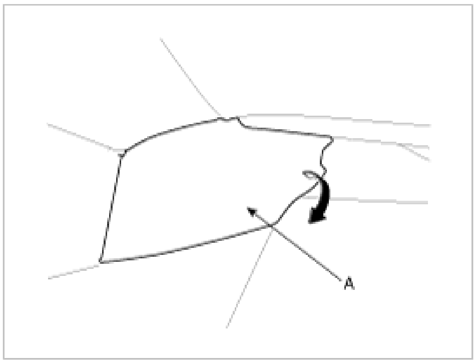
Door position	Voltage (5-6)	Error detecting
Max. cooling	0.3 ± 0.15V	Low voltage : 0.1V or less
Max. heating	4.7 ± 0.15V	High voltage : 4.9V or more

It will feedback current position of actuator to controls.

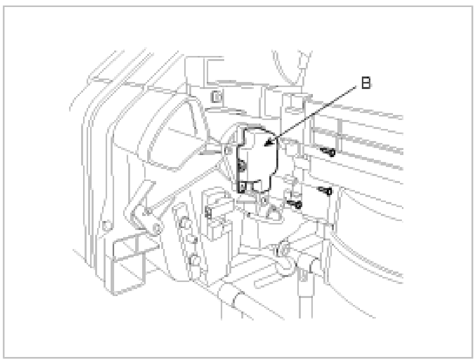
6. If the measured voltage is not within specification, substitute with a known-good temperature control actuator and check for proper operation.
7. If the problem is corrected, replace the temperature control actuator.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Pull out the passenger’s crash pad center lower cover (A).



3. Disconnect the connector of temperature control actuator after removing the air duct.
4. Loosen the mounting screw and then remove the temperature control actuator (B).



5. Install in the reverse order of removal.

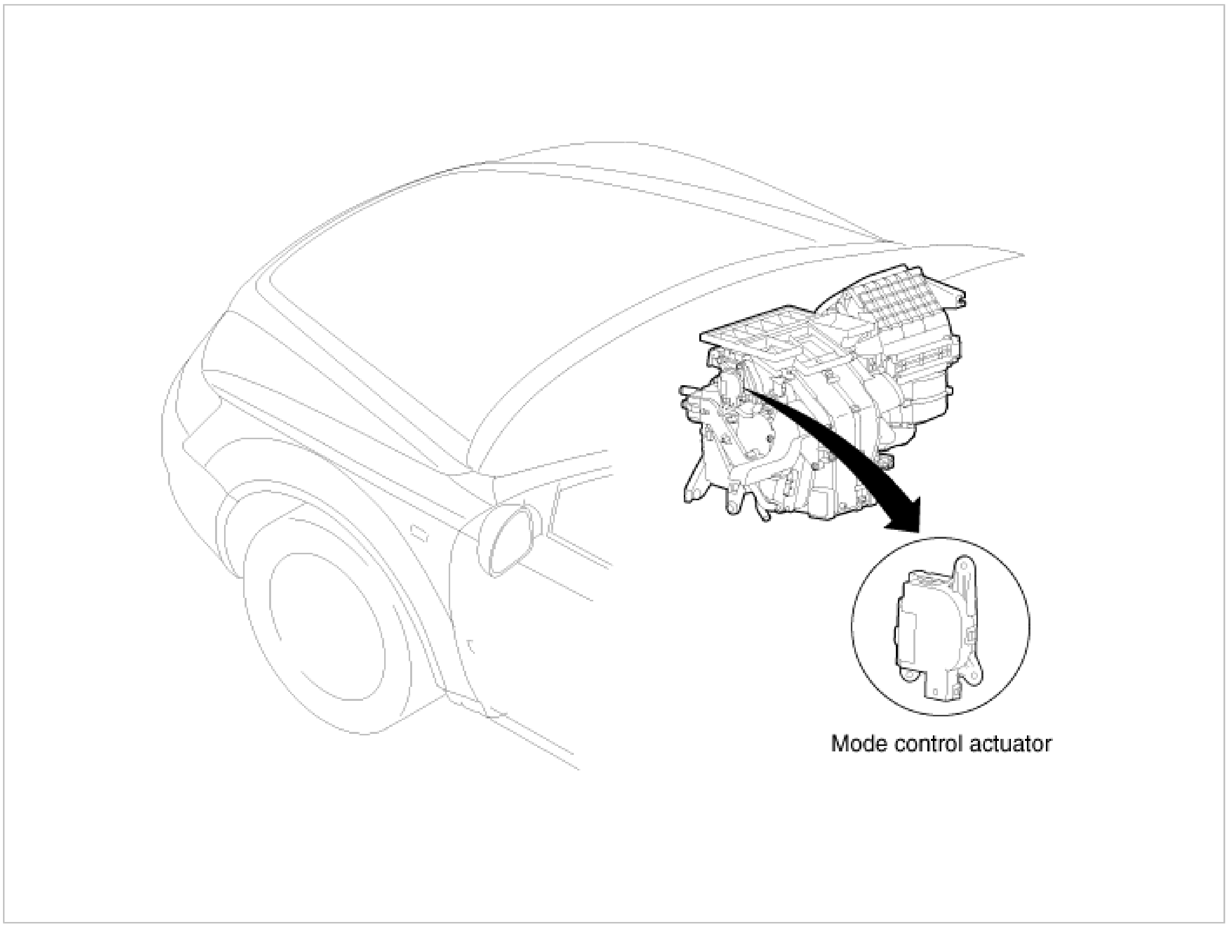
Heating,Ventilation, Air Conditioning > Heater > Mode Control Actuator > Description and Operation

DESCRIPTION

The mode control actuator is located at the heater unit.
It adjusts position of mode door by operating mode control actuator based on signal of A/C control unit. Pressing mode select switch makes the mode control actuator shift in order of vent→ BI/LEVEL → floor → mix.

Heating,Ventilation, Air Conditioning > Heater > Mode Control Actuator > Components and Components Location

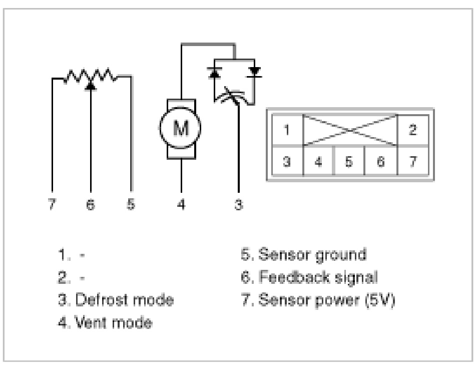
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Heater > Mode Control Actuator > Repair procedures

INSPECTION

1. Ignition "OFF”.
2. Disconnect the connector of mode control actuator.
3. Verify that the mode control actuator operates to the defrost position when connecting 12V to the terminal 3 and grounding terminal 4.
4. Verify that the mode control actuator operates to the vent position when connecting in the reverse.



5. Check the voltage between terminals 5 and 6.

Door position	Voltage (5-6)	Error detecting
Vent	0.3 ± 0.15V	Low voltage : 0.1V or less
Defrost	4.7 ± 0.15V	High voltage : 4.9V or more

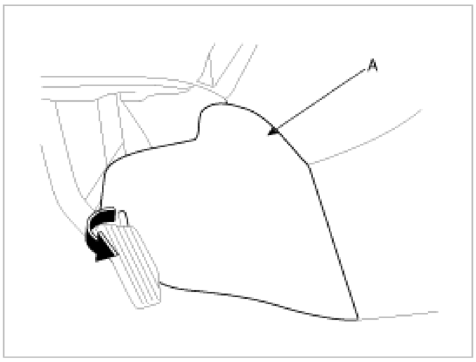
It will feedback current position of actuator to controls.

6. If the measured voltage is not specification, substitute with a known-good mode control actuator and check for proper operation.

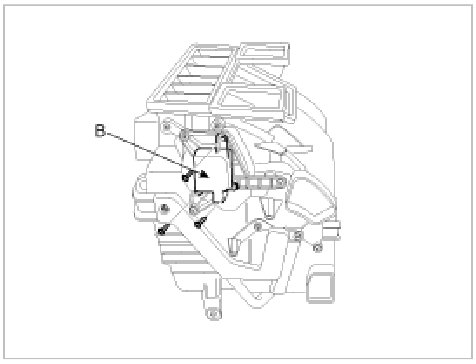
7. If the problem is corrected, replace the mode control actuator.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Pull out the driver's crush pad center lower cover (A).



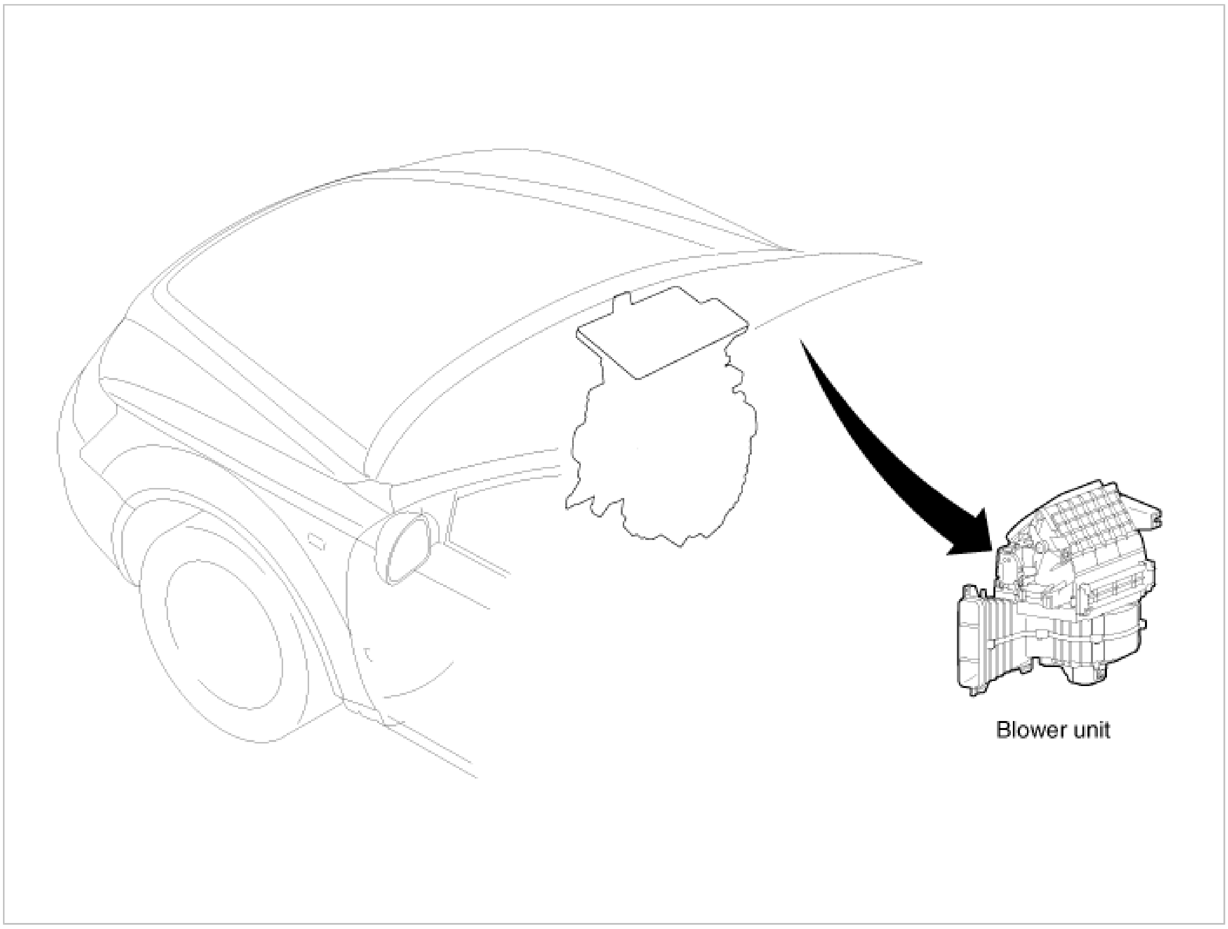
3. Disconnect the connector of mode control actuator after removing the air duct.
4. Loosen the mounting screws and then remove the mode control actuator (B).



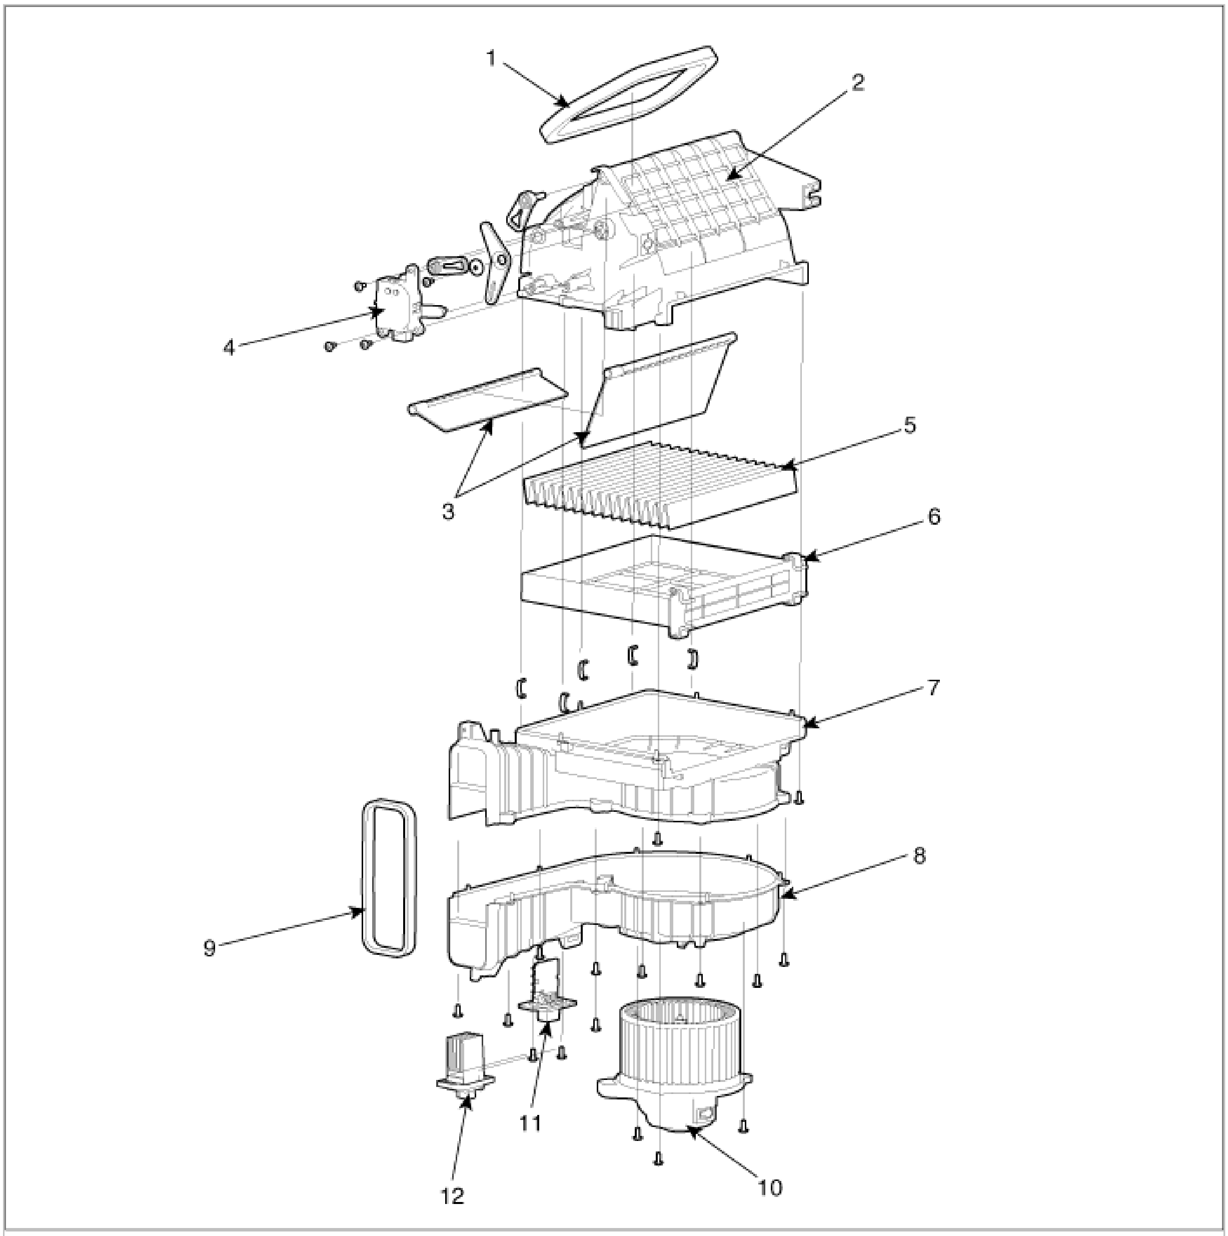
5. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Blower > Blower Unit > Components and Components Location

COMPONENT LOCATION



COMPONENTS

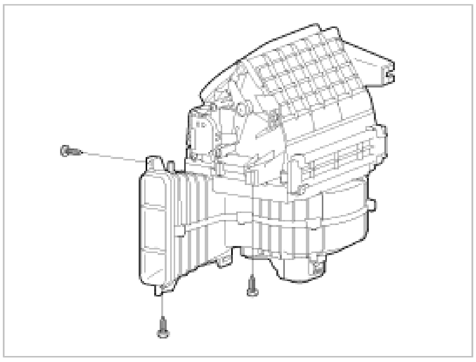


1. Outlet duct seal	7. Blower upper case
2. Inlet duct case	8. Blower lower case
3. Inlet door	9. Blower seal
4. Intake actuator	10. Blower motor
5. Air filter	11. Resistor (MANUAL)
6. Air filter housing	12. Power mosfet (AUTOMATIC)

Heating,Ventilation, Air Conditioning > Blower > Blower Unit > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the heater & blower unit (Refer to HA-51)
3. Disconnect the connectors from the intake actuator, blower relay, the blower motor, resistor (MANUAL) and power mosfet (AUTOMATIC).
4. Remove the self-tapping screws and the blower unit.

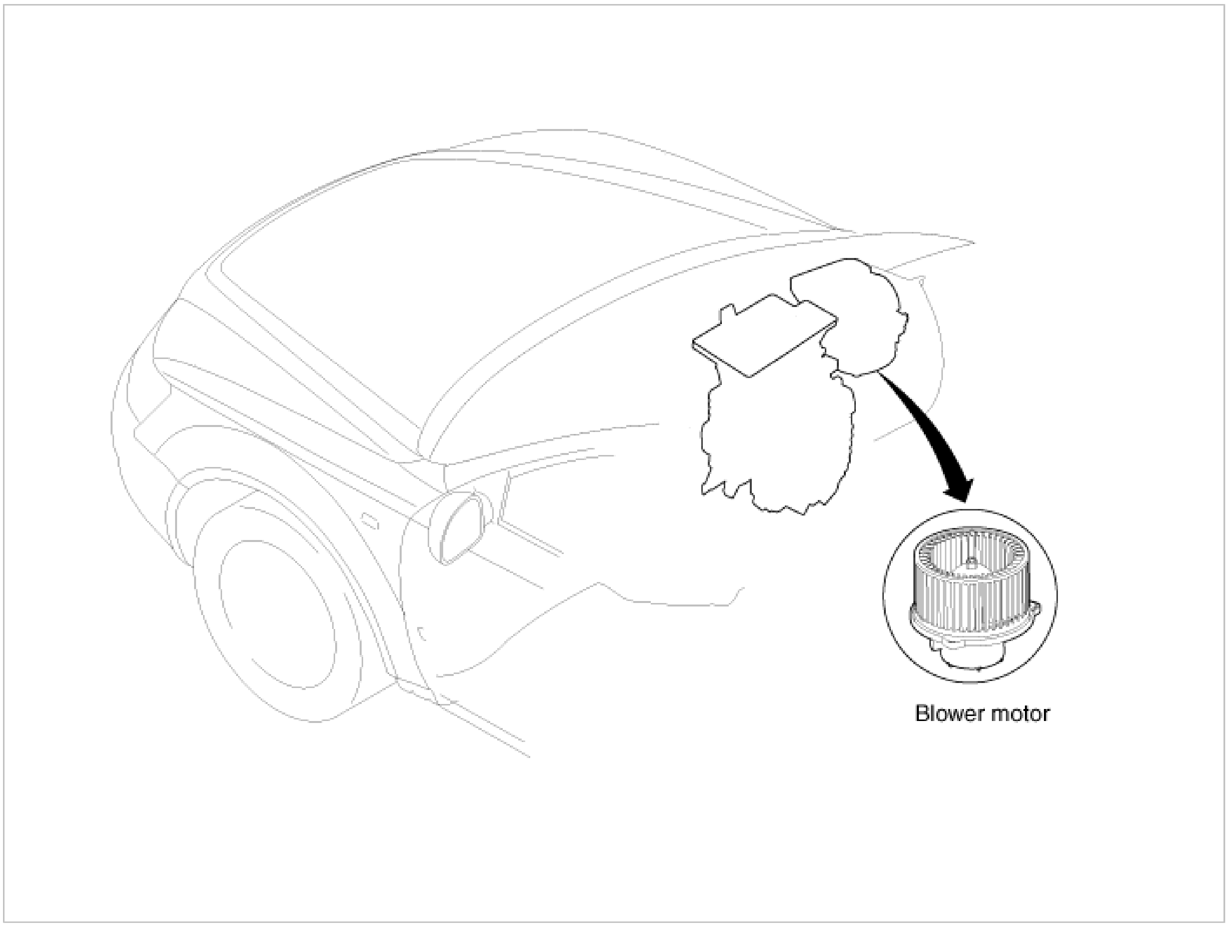


> **NOTE**
>
> Make sure that there is no air leaking out of the blower and duct joints.

5. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Blower > Blower Motor > Components and Components Location

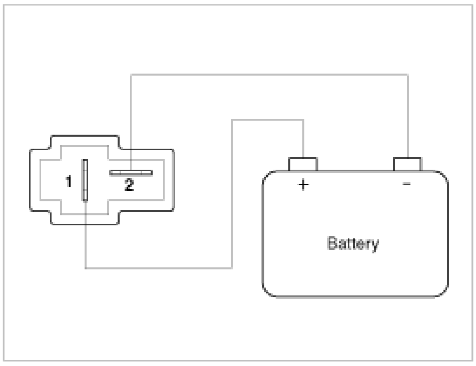
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Blower > Blower Motor > Repair procedures

INSPECTION

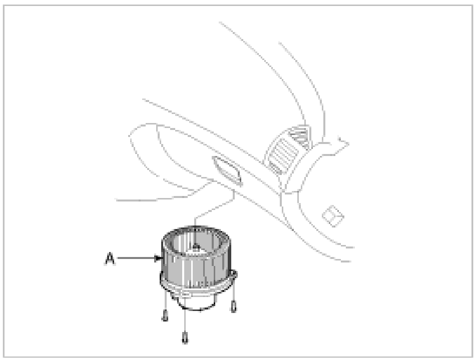
1. Connect the battery voltage and check the blower motor rotation.



2. If the blower motor does not operate properly, substitute with a known-good blower motor and check for proper operation.
3. If the problem is corrected, replace the blower motor.

REPLACEMENT

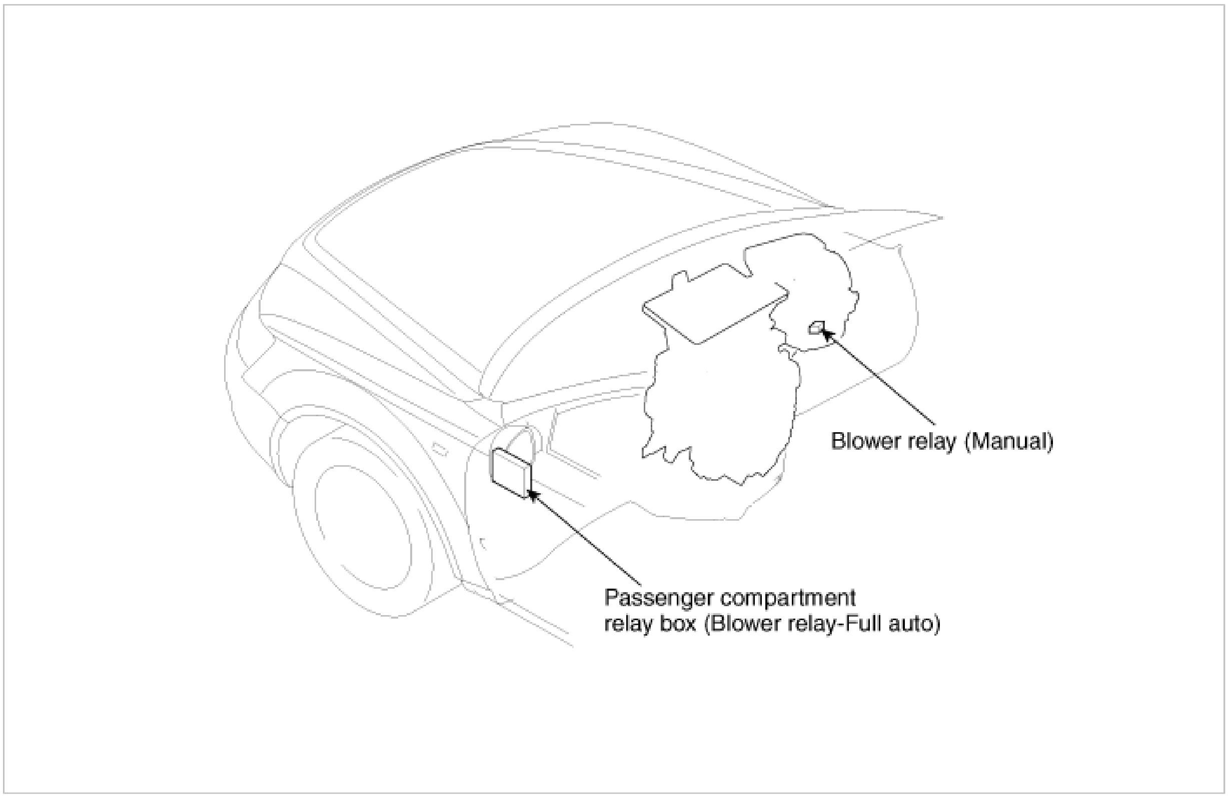
1. Disconnect the negative (-) battery terminal.
2. Remove the under cover after loosening 2 screws.
3. Disconnect the connector of the blower motor.
4. Remove the blower motor (A) after loosening the mounting 3 screws.



5. Installation is the reverse order of removal.

Heating,Ventilation, Air Conditioning > Blower > Blower Relay > Components and Components Location

COMPONENT LOCATION

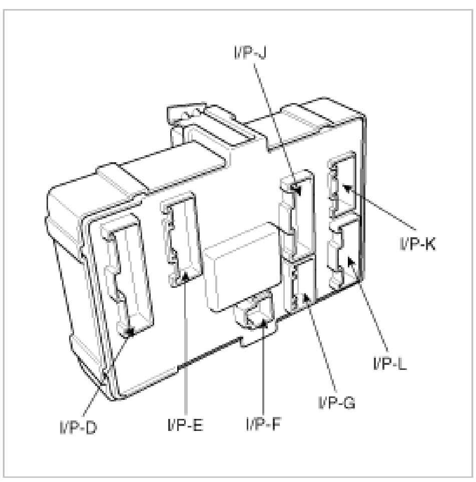


Heating,Ventilation, Air Conditioning > Blower > Blower Relay > Repair procedures

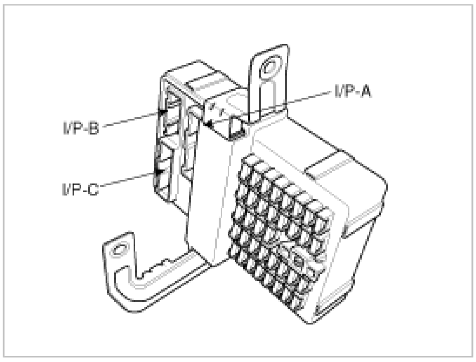
INSPECTION

FULL AUTO TYPE

1. Disconnect the negative (-) battery terminal.
2. Remove the passenger compartment relay box.
   Check for continuity between the terminals.
3. There should be continuity between the No.9 in the I/P-K and No.15 in the I/P-A terminals when power and ground are connected to the No.16 in the I/P-D and No.13 I/P-B terminals in the passenger compartment relay box.
4. There should be no continuity between the No.9 in the I/P-K and No.15 in the I/P-A terminals when power is disconnected.



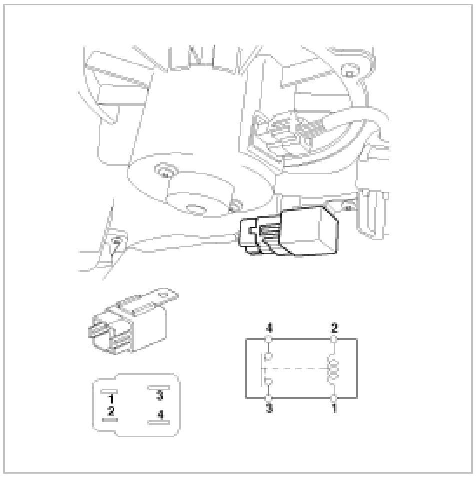
Position \ Terminal	I/P-K (9)	I/P-A (15)	I/P-D (16)	I/P-B (13)
Disconnected			○	○
Connected	○	○	⊖	⊕



5. If the blower motor voltage does not operate properly, substitute with a known-good blower relay and check for proper operation.
6. If the problem is corrected, replace the blower relay.

HI-BLOWER RELAY INSPECTION

1. There should be continuity between the No.3 and No.4 terminals when power and ground are connected to the No.1 and No.2 terminals.
2. There should be no continuity between the No.3 and No.4 terminals when power is disconnected.

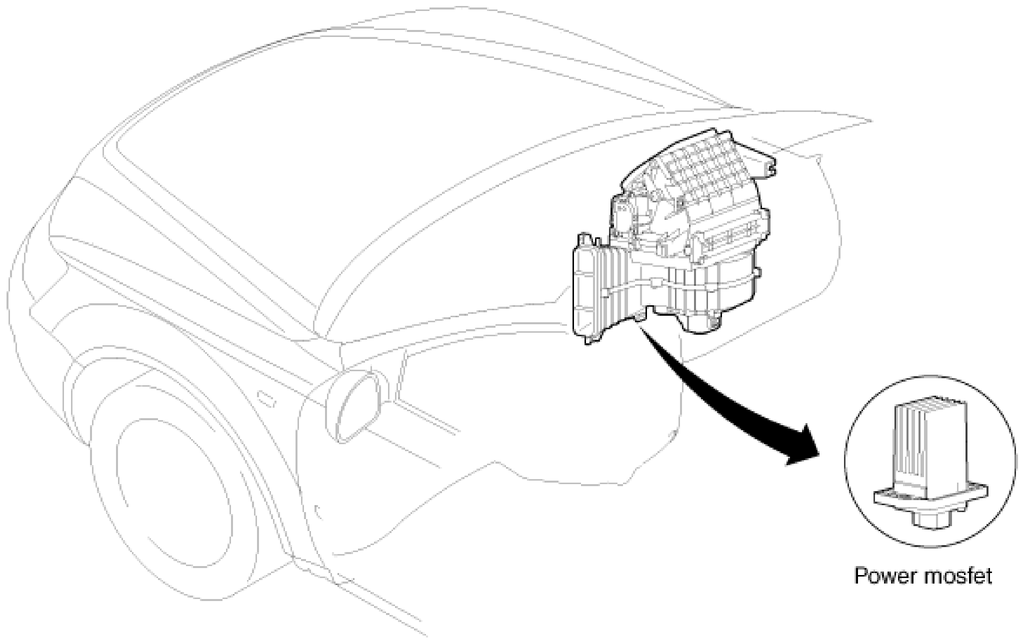


Terminal / Position	3	4	1	2
Disconnected			○	○
Connected	○	○	⊕	⊖

Heating,Ventilation, Air Conditioning > Blower > Power Mosfet > Components and Components Location

COMPONENT LOCATION

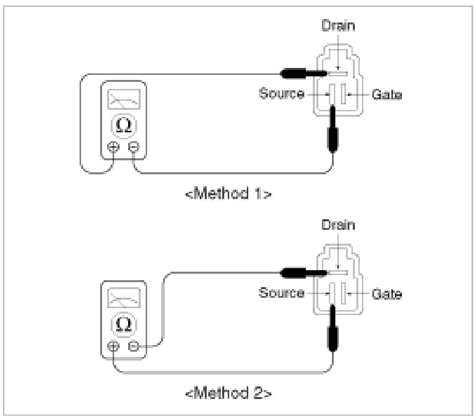
[AUTOMATIC]



Heating,Ventilation, Air Conditioning > Blower > Power Mosfet > Repair procedures

INSPECTION

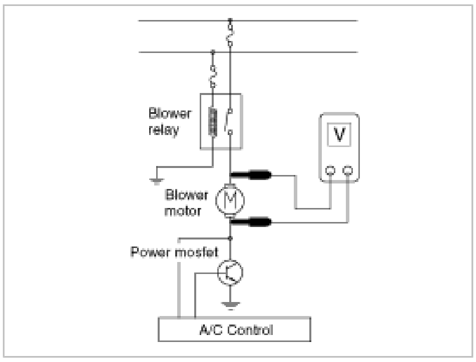
1. Disconnect the negative (-) battery terminal.
2. Remove the power mosfet.Measure resistance between Drain and Source using resistance tester. You can estimate whether power mosfet is failure or not refering to the specification.



FET Fail Check

Resistance (Drain-Source)		Specification	
Measuring method		1	2
Mosfet	Drain	+	-
	Source	-	+
Classification	Normal	∞	About 3 MΩ
	Short	About 0~300Ω	About 0~300Ω
	Open	∞	∞

3. If If the measured resistance is not normal specification, replace the power mosfet.
4. If it is normal, install the power mosfet and ignition "ON".
   Manually operate the control switch and measure the voltage between pin 1 and 2 of blower motor.
5. Select the control switch to raise voltage until high speed.

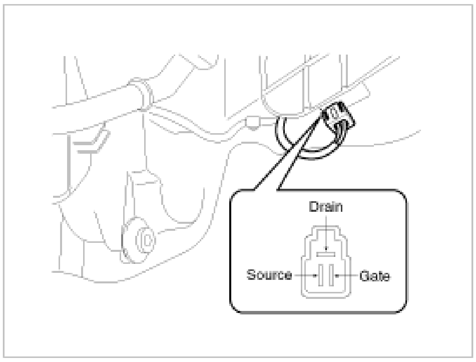


Fan	Motor voltage(V) ± 0.5V
First speed	3.8
Second speed	4.9
Third speed	6.1
Fourth speed	7.2
Fifth speed	8.3
Sixth speed	9.5
Seventh speed	10.6
Eighth speed	Battery (+)

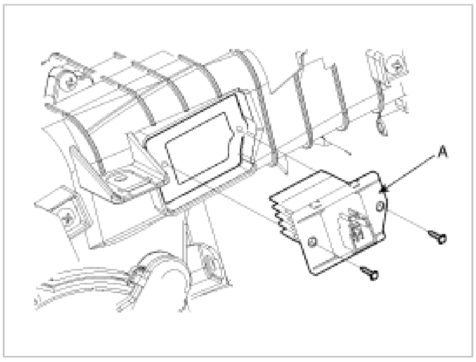
6. If the measured voltage is not within specification, substitute with a known-good power mosfet and check for proper operation.
7. If the problem is corrected, replace the power mosfet.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Disconnect the connector of the power mosfet at the below blower unit.



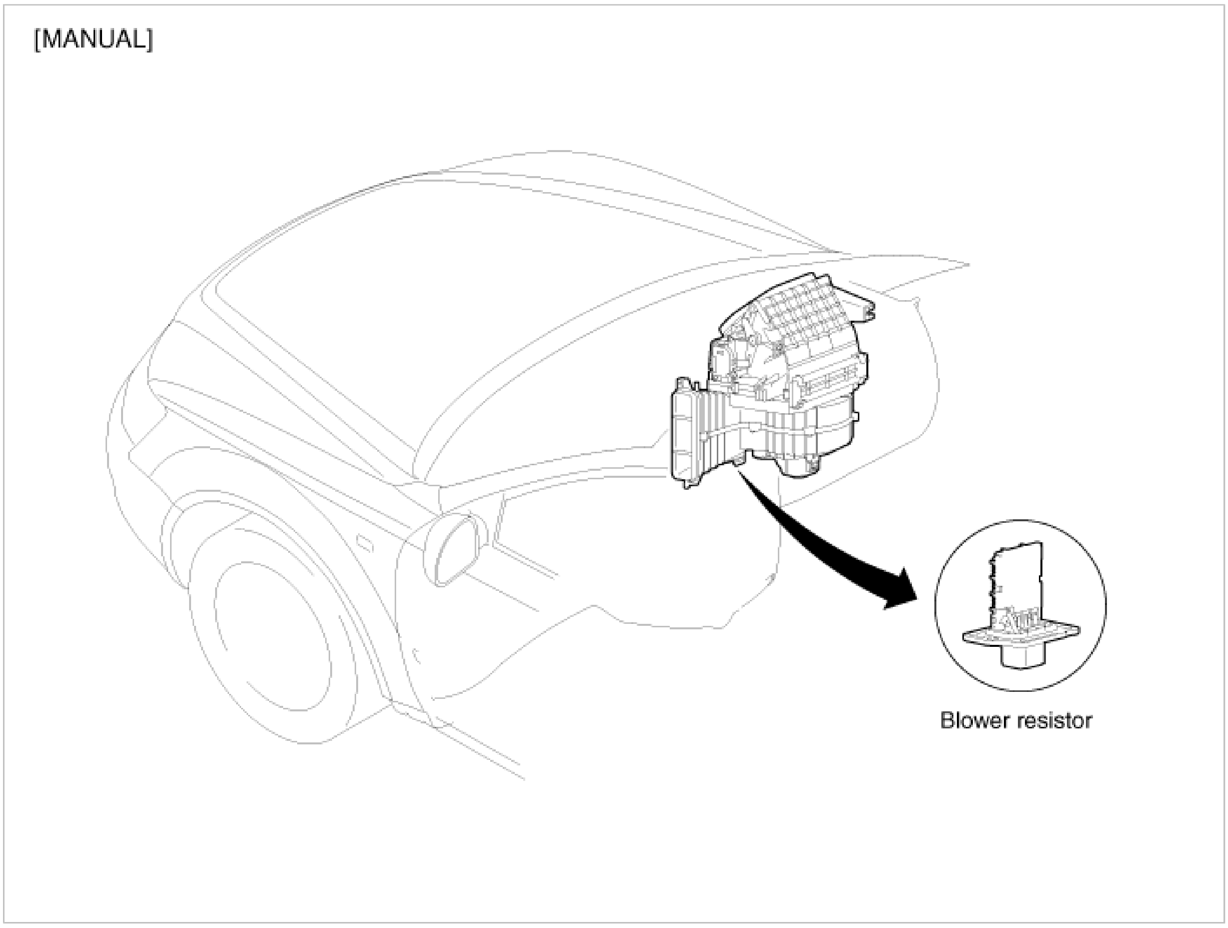
3. Remove the power mosfet (A) after loosening the mounting screws.



4. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Blower > Blower Resistor > Components and Components Location

COMPONENT LOCATION

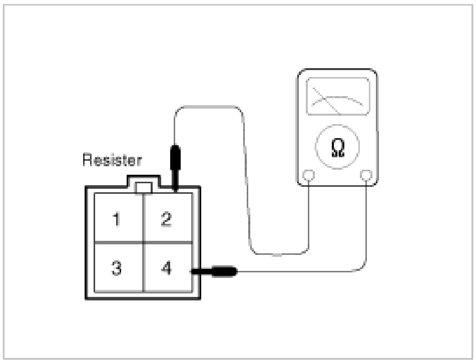


Heating,Ventilation, Air Conditioning > Blower > Blower Resistor > Repair procedures

INSPECTION

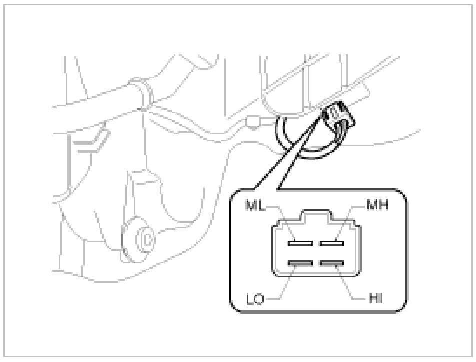
1. Measure terminal-to-terminal resistance of the blower resistor.
2. If measured resistance is not within specification, the blower resistor must be replaced. (After removing the resistor)

Terminal / Speed / Resistance ohmmeter	2	1	4	3	Resistance (Ω)
	MH	ML	HI	LO	
Measurement of resistance between each terminal			O	O	2.9 ± 5%
		O	O		1.5 ± 5%
	O		O		0.5 ± 5%

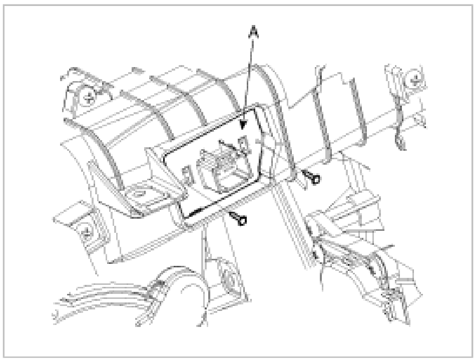


REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Disconnect the connector of the blower resistor at the below blower unit.



3. Remove the blower resistor(A) after loosening the mounting screws.



4. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Blower > A/C Air Filter > Description and Operation

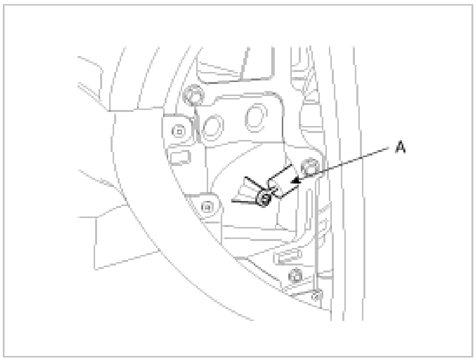
DESCRIPTION

This has particle filter which eliminates foreign materials and odor. The particle filter includes odor filter as well as conventional dust filter to ensure a comfortable interior environment.

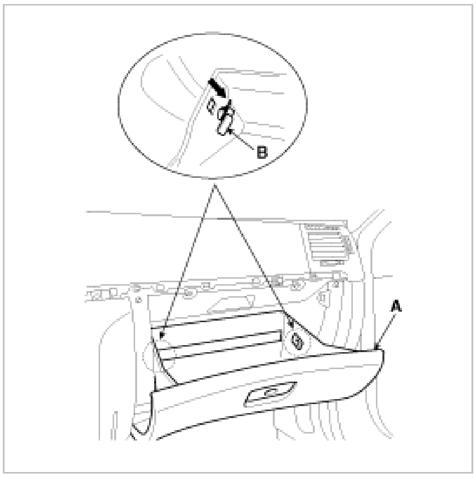
Heating,Ventilation, Air Conditioning > Blower > A/C Air Filter > Repair procedures

REPLACEMENT

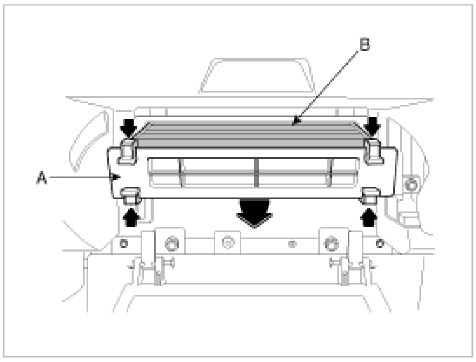
1. Remove the damper (A) from the glove box after removing side cover.



2. Open the glove box (A). Lower the glove box down completely by removing the glove box stopper (B) to the glove box.



3. Remove the filter cover (A) with pushing the knob.
4. Replace the air filter (B), install it after making sure of the direction of air filter.



NOTE

In case of driving in an air-polluted area or rugged terrain, check and replace the air filter as frequently as possible.

Replacement period : 15,000 km (9320 mile)

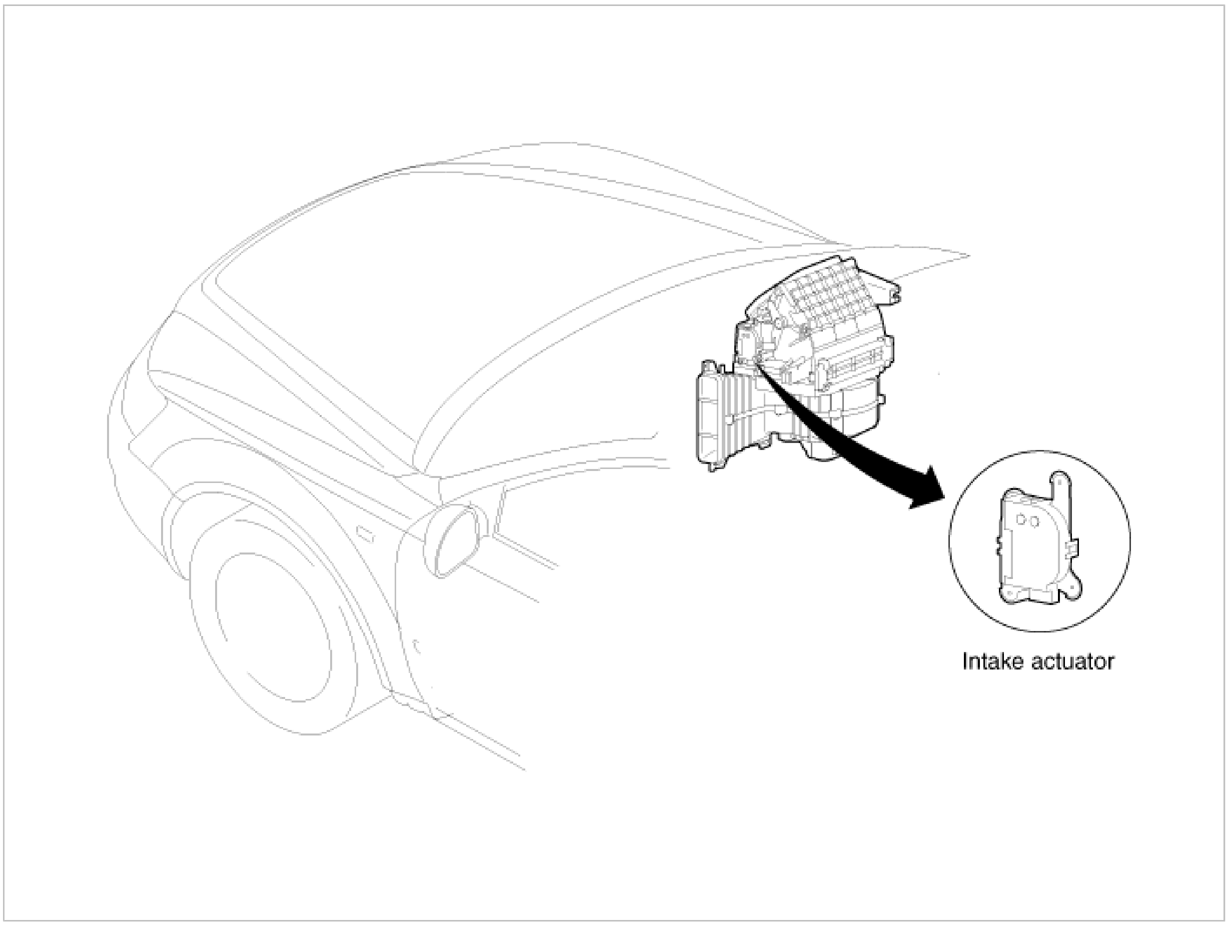
Heating,Ventilation, Air Conditioning > Blower > Intake Actuator > Description and Operation

DESCRIPTION

1. The intake actuator is located at the blower unit.
2. It regulates the intake door by signal from control unit.
3. Pressing the intake selection switch will shift between recirculation and fresh air modes.

Heating,Ventilation, Air Conditioning > Blower > Intake Actuator > Components and Components Location

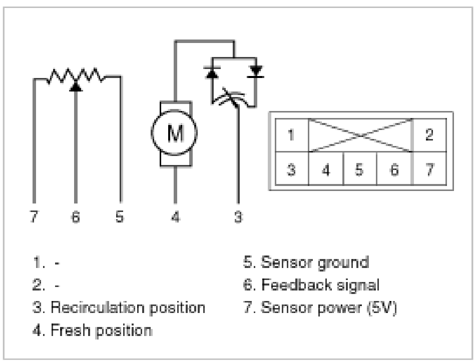
COMPONENT LOCATION



Heating,Ventilation, Air Conditioning > Blower > Intake Actuator > Repair procedures

INSPECTION

1. Ignition "OFF".
2. Disconnect the connector of intake actuator.
3. Verify that the intake actuator actuator operates to the recirculation position when connecting 12V to the terminal 3 and grounding terminal 4.
4. Verify that the intake actuator operates to the fresh position when the connections are reversed.



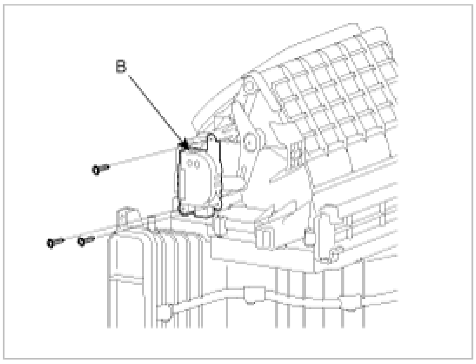
Door position	Voltage (5 - 6)	Error detecting
Recirculation	0.3 ± 0.15V	Low voltage : 0.1V or less
Fresh	4.7 ± 0.15V	High voltage : 4.9V or more

5. If the intake actuator does not operate properly, substitute with a known-good intake actuator and check for proper operation.

6. If the problem is corrected, replace the intake actuator.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the glove box (Refer to the BD group).
3. Disconnect the intake actuator connector.
4. Loosen the mounting screw and then remove the intake actuator (B) from the blower unit (A).



5. Install in the reverse order of removal.

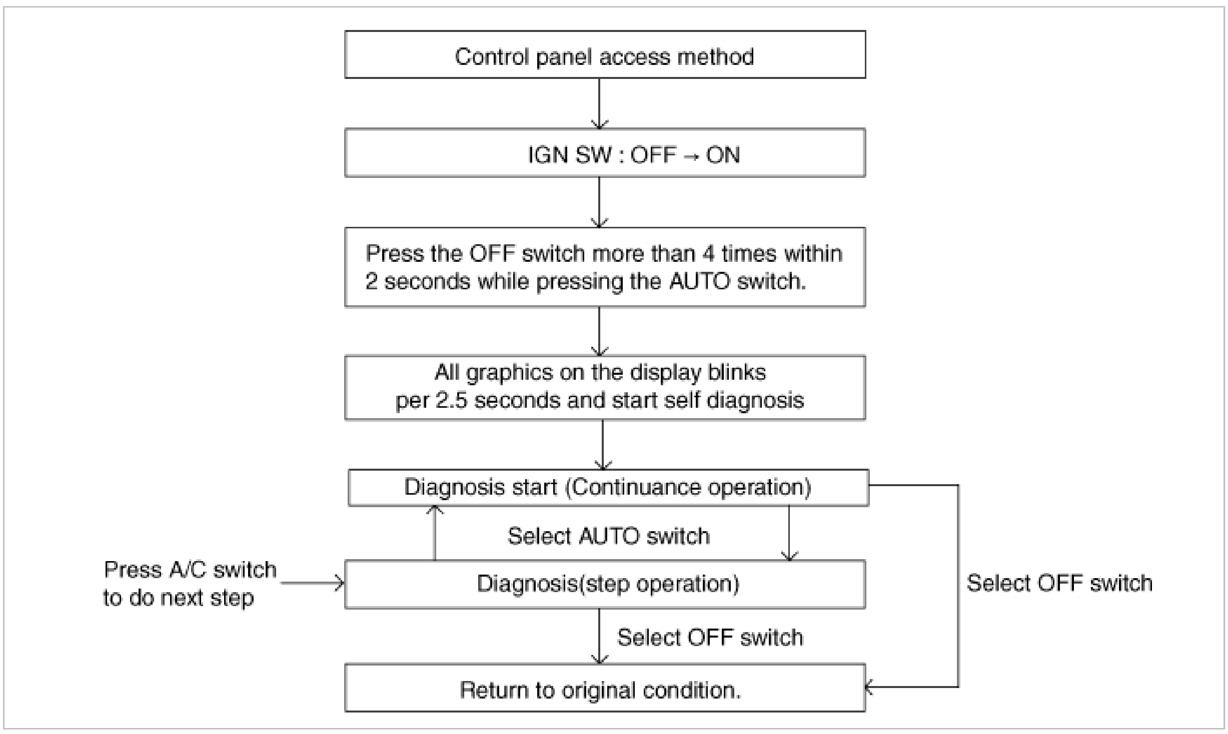
SELF-DIAGNOSIS

Self-diagnosis process

The F.A.T.C. module self test feature will detect electrical malfunction and provide error codes for system components with suspected failures.



NOTE

Turn off the A/C system during the DTC check.

HOW TO READ SELF-DIAGNOSTIC CODE

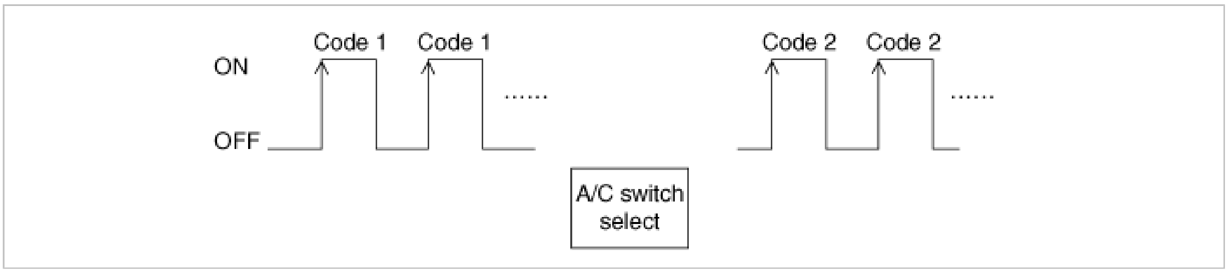
1. After the display panel flickers three times every 0.5 second, the corresponding fault code flickers on the setup temperature display panel every 0.5 second and will show two figures.
2. Fault code

Fault code		

Control unit	Scan tool (DTC)	Fail description
00	-	Normal
11	B1234	In-car temperature sensor open (High)
12	B1233	In-car temperature sensor short (Low)
13	B1238	Ambient temperature sensor open (High)
14	B1237	Ambient temperature sensor short (Low)
15	B1202	Water temperature sensor open (High)
16	B1203	Water temperature sensor short (Low)
17	B1242	Evaporator temperature sensor open (High)
18	B1241	Evaporator temperature sensor short (Low)
19	B1245	Air mix potentiometer open (Low) - Driver
19	B1246	Air mix potentiometer short (High) - Driver
20	B2406	Air mix motor failure (Driver)
21	B1249	Direction potentiometer open (Low) - Driver
21	B1250	Direction potentiometer short (High) - Driver
22	B2409	Direction control motor failure (Driver)
23	B1200	Humidity sensor open (High)
24	B1201	Humidity sensor short (Low)
25	B1208	Intake potentiometer open (Low)
25	B1209	Intake potentiometer short (High)
26	B2408	Intake motor failure
27	B1257	AQS sensor open (High)
28	B1258	AQS sensor short (Low)
29	B1259	AQS sensor failure

3. Fault code display
   (1) Continuance operation

   (2) Step operation



4. If a fault code is displayed during the DTC check, Inspect a malfunction cause by referring to the DTC code.
5. Fail safe
   (1) In-car temperature sensor: Control with the value of 25°C(77°F)
   (2) Ambient temperature sensor: Control with the value of 20°C(67°F)
   (3) Evaporator temperature sensor: Control with the value of -2°C(28.4°F)

(4) Humidity sensor: Control with the value of 10%

(5) Temperature sensor : Control with the value of -2°C (28.4°F)

(6) Temperature control actuator (Air mix potentiometer):
If temperature setting 17°C-24.5°C, fix at maximum cooling position.
If temperature setting 25°C-32°C, fix at maximum heating position.

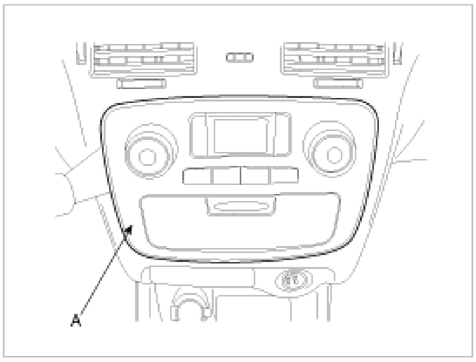
(7) Mode control actuator (Direction potentiometer):
Fix vent position, while selecting vent mode.
Fix defrost position, while selecting all except vent mode.

(8) Intake control actuator :
Fix fresh position, while selecting fresh mode.
Fix recirculation position, while selecting recirculation mode.

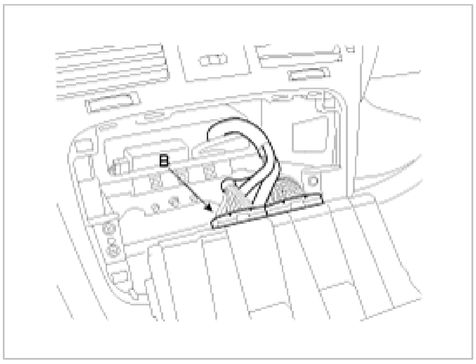
(9) AQS sensor : AQS operation OFF.
A. Intake position : The position before selecting AQS switch.

REPLACEMENT

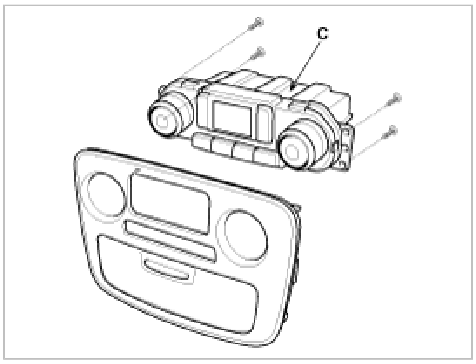
1. Disconnect the negative (-) battery terminal.
2. Remove the center facia panel (A) after pulling it by using a regular screw driver (-).



3. Disconnect the connectors (B) from the center facia.



4. Remove the heater & A/C controller (C).



5. Install in the reverse order of removal.

Heating,Ventilation, Air Conditioning > Controller > B1200 Humidity Sensor Open(High)

Component Location

General Description

Humidity sensor located at heater control unit detects in-car humidity for in-car humidity control. If ambient air temperature or in-car humidity is outside a specified range, A/C will be activated to control in-car humidity to prevent fogging of the windows.

DTC Description

The ECM sets DTC B1200 if there is an open circuit in humidity sensor signal harness or the measured frequency value of sensor is more than the threshold value(about 7,100Hz)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Frequency check	● Open Circuit in signal harness ● Fault Humidity Sensor ● Faulty A/C control unit
Threshold value	● > 7,100Hz	
Detecting time	● 10msec	
FAIL SAFE	● Control with the vlaue of 10%	

Schematic Diagram

Signal Waveform

※ Frequency value of humidity sensor as a function of humidity.

Relative humidity(%)	Frequency(Hz)	Relative humidity(%)	Frequency(Hz)
20	7100	60	6600
30	6976	70	6468
40	6853	80	6330
50	6728	90	6186

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "Humidity Sensor" Parameter on the Scantool. While drying the humidity sensor with the implement such as hair drier
4. Are the DTC B1200 present and is parameter of "Humidity Sensor" fixed ?
   ※Parameter of "Humidity Sensor" will be fixed at 10%, if there is any fault in Humidity Sensor

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by

interference from other electrical systems, and mechanical or chemical damage.

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect Humidity Sensor.
3. Measure resistance between terminal "3" of Humidity Sensor and terminal "4" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Ground Circuit Inspection " procedure.

NO

1) Check for open in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect Humidity Sensor.
3. Measure resistance between terminal "2" of Humidity Sensor and terminal "12" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Humidity Sensor

1. Engine "ON"
2. Connect Humidity Sensor.
3. Measure Frequency between terminal "3" and "2" of Humidity sensor while increasing humidity.
   A. Specification : Refer the specifications in fig5)
4. Is the measured frequency within specifications in fig5)? (tolerance limits ±5%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good Humidity sensor and check for proper operation.

If the problem is corrected, replace Humidity sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect Humidity Sensor.
3. Measure voltage value between terminal "4" of A/C control unit and chassis ground.
   A. Specification : 5V
4. Is the measured voltage within specifications?

   YES

   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   1) Substitute with a known-good A/C Control Unit and check for proper operation.
   If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

   YES

   1) Go to the applicable troubleshooting procedure

   NO

   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1201 Humidity Sensor Short(Low)

Component Location

General Description

Humidity sensor located at heater control unit detects in-car humidity for in-car humidity control. If ambient air temperature or in-car humidity is outside a specified range, A/C will be activated to control in-car humidity to prevent fogging of the windows.

DTC Description

The ECM sets DTC B1201 if there is a short circuit in humidity sensor signal harness or the measured frequency value of the sensor is less than the threshold value(about 6,186Hz)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Frequency check	● Open Circuit in power harness ● Short Circuit in signal harness ● Faulty Humidity Sensor ● Faulty A/C control unit
Threshold value	● < 6,186Hz	
Detecting time	● 10msec	
FAIL SAFE	● Control with the vlaue of 10%	

Schematic Diagram

Signal Waveform

※ Frequency value of humidity sensor as a function of humidity.

Humidity(%)	Frequency(Hz)	Humidity(%)	Frequency(Hz)
20	7100	60	6600
30	6976	70	6468
40	6853	80	6330
50	6728	90	6186

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "Humidity Sensor" Parameter on the Scantool. While drying the humidity sensor with the implement such as hair drier
4. Are the DTC B1201 present and is parameter of "Humidity Sensor" fixed ?
   ※Parameter of "Humidity Sensor" will be fixed at 10%, if there is any fault in Humidity Sensor

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor’s and/or A/C control unit’s connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect Humidity Sensor.
3. Measure resistance between terminal "3" of Humidity sensor and chassis ground.
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

   YES

   1) Go to "Power Circuit Inspection " procedure.

   NO

   1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Power Supply Circuit Inspection

Check for open in power harness

1. Ignition "ON"
2. Disconnect Humidity Sensor.

3. Measure voltage value between terminal "5" of Humidity Sensor and chassis ground
   A. Specification :5V

4. Is the measured voltage value within specifications?

   YES

   1) Go to "Component Inspection " procedure.

   NO

   1) Check for open in power harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Humidity Sensor

1. Engine "ON"
2. Connect Humidity Sensor.
3. Measure Frequency between terminal "3" and "2" of Humidity sensor while increasing humidity.
   A. Specification : Refer the specifications in fig3)

4. Is the measured frequency within specifications in fig5)? (tolerance limits ±5%)

   YES

   1) Go to "Check A/C Control Unit" procedure

   NO

   1) Substitute with a known-good Humidity sensor and check for proper operation.
   If the problem is corrected, replace Humidity sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect Humidity Sensor.
3. Measure voltage value between terminal "4" of A/C control unit and chassis ground.
   A. Specification : 5V

4. Is the measured voltage within specifications?

   YES

   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   1) Substitute with a known-good A/C Control Unit and check for proper operation.
   If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

   YES

   1) Go to the applicable troubleshooting procedure

   NO

   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1202 Water Temperature Sensor Open (High)

Component Location

General Description

A water temp sensor located at heater unit detects coolant temperature. Its signal is used for cold engine lockout control.When the driver operates the heater before the engine is warmed up, the signal from sensor causes the heater control unit to reduce blower motor speed until coolant temperature reaches the threshold value.

DTC Description

The ECM sets DTC B1202 if there is an open circuit in water temp sensor signal harness or the measured resistance value of the sensor is more than the threshold value(about 176.3kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Open Circuit in harness ● Fault water temp. Sensor ● Fault A/C Control Unit
Threshold value	● > 176.3kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 28.4°F	

Schematic Diagram

Signal Waveform

※ Resistance value of water temp sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	176.3	77	10
5	73.6	95	6.5
32	32.9	140	2.5
59	15.8	176	1.2

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "WATER TEMP SENSOR" Parameter on the Scantool.
4. Are the DTC B1202 present and is parameter of "WATER TEMP SENSOR" fixed?
   ※ Parameter of "WATER TEMP SENSOR" will be fixed at 28.4°F, if there is any fault in WATER TEMP SENSOR

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by

interference from other electrical systems, and mechanical or chemical damage.

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect water temp. sensor.
3. Measure resistance between terminal "1" of water temp. sensor and terminal "7" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Ground Circuit Inspection " procedure.

NO

1) Check for open in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect water temp. sensor.
3. Measure resistance between terminal "2" of water temp. sensor and chasis ground
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check WATER TEMP Sensor

1. Ignition "OFF"
2. Disconnect water temp. sensor.
3. Measure resistance between terminal "1" and "2" of water temp. sensor.
   A. Specification : Refer the specifications in fig3)
4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good water temp. sensor and check for proper operation. If the problem is corrected, replace water temp. sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect water temp. sensor.
3. Measure Voltage between terminal "7" of A/C Control Unit and chasis ground
   A. Specification : Approx. 5V
4. Is the measured voltage within specifications?
   - YES
     1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
   - NO
     1) Substitute with a known-good A/C Control Unit and check for proper operation.
     If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?
   - YES
     1) Go to the applicable troubleshooting procedure
   - NO
     1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1203 Water Temperature Sensor Short (Low)

Component Location

General Description

A water temp sensor located at heater unit detects coolant temperature. Its signal is used for cold engine lockout control. When the driver operates the heater before the engine is warmed up, the signal from sensor causes the heater control unit to reduce blower motor speed until coolant temperature reaches the threshold value.

DTC Description

The ECM sets DTC B1203 if there is a short circuit in water temp sensor signal harness or the measured resistance value of the sensor is less than the threshold value(about 1.2kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Short circuit in harness ● Fault water temp. Sensor ● Fault A/C Control Unit
Threshold value	● <1.2kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 28.4°F	

Schematic Diagram

Signal Waveform

※ Resistance value of water temp sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	176.3	77	10
5	73.6	95	6.5
32	32.9	140	2.5
59	15.8	176	1.2

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "WATER TEMP SENSOR" Parameter on the Scantool.
4. Are the DTC B1203 present and is parameter of "WATER TEMP.SENSOR" fixed ?
   ※ Parameter of "WATER TEMP SENSOR" will be fixed at 28.4°F, if there is any fault in WATER TEMP SENSOR

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor'ss and/or A/C control unit'ss connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect water temp. sensor.
3. Measure resistance between terminal "1" of water temp. sensor and chassis ground.
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

   YES

   1) Go to "Component Inspection" procedure.

   NO

   1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check WATER TEMP Sensor

1. Ignition "OFF"
2. Disconnect water temp. sensor.
3. Measure resistance between terminal "1" and "2" of water temp. sensor.

A. Specification : Refer the specifications in fig3)

4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good water temp. sensor and check for proper operation. If the problem is corrected, replace water temp. sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect water temp. sensor.
3. Measure Voltage between terminal "7" of A/C Control Unit and chasis ground
   A. Specification : Approx. 5V
4. Is the measured voltage within specifications?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1233 In-car Temperature Sensor Short (Low)

Component Location

General Description

The incar temperature sensor is located at heater control unit. It contains a thermistor which measures the temperature of the inside. The signal,decided by the resistance value which changes in accordance with perceived inside temperature, is delivered to heater control unit and according to this signal, the control unit regulates incar temperature to intended value

DTC Description

The ECM sets DTC B1233 if there is a short circuit in incar temp sensor signal harness or the measured resistance value of the sensor is less than the threshold value(about 7.46kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause

DTC Strategy	● Resistance check	● Short circuit in harness ● Fault incar temp.sensor ● Fault A/C Control Unit
Threshold value	● <7.46kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 77°F	

Schematic Diagram

Signal Waveform

※ Resistance value of water temp sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	509.57	77	30
5	216.07	95	15.59
32	97.71	122	10.81
59	47.13	140	7.46

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "INCAR TEMP.SENSOR" Parameter on the Scantool.

4. Are the DTC B1233 present and is parameter of "INCAR TEMP.SENSOR" fixed ?
   ※ Parameter of "INCAR TEMP.SENSOR" will be fixed at 77°F, if there is any fault in INCAR SENSOR

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor’s and/or A/C control unit’s connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect incar sensor.
3. Measure resistance between terminal "4" of incar sensor and chassis ground
   A. Specification :Approx. ∞ Ω

4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection" procedure.

NO

1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Incar Temp. sensor

1. Ignition "OFF"
2. Disconnect incar sensor.
3. Measure resistance between terminal "4" and "2" of incar sensor
   A. Specification : Refer the specifications in fig3)
4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good incar sensor and check for proper operation. If the problem is corrected, replace incar sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine : "ON"
2. Disconnect incar sensor.
3. Measure Voltage between terminal "5" of A/C Control Unit and chassis ground
   A. Specification :Approx. 5V
4. Is the measured voltage within specifications?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1234 In-car Temperature Sensor Open (High)

Component Location

General Description

The incar temperature sensor is located at heater control unit. It contains a thermistor which measures the temperature of the inside. The signal,decided by the resistance value which changes in accordance with perceived inside temperature, is delivered to heater control unit and according to this signal, the control unit regulates incar temperature to intended value

DTC Description

The ECM sets DTC B1234 if there is an open circuit in incar temp sensor signal harness or the measured resistance value of the sensor is more than the threshold value(about 509.57kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Open Circuit in harness ● Fault incar temp.sensor ● Fault A/C Control Unit
Threshold value	● > 509.57kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 25°C	

Schematic Diagram

Signal Waveform

※ Resistance value of water temp sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	509.57	77	30
5	216.07	95	15.59
32	97.71	122	10.81
59	47.13	140	7.46

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "INCAR TEMP.SENSOR" Parameter on the Scantool.
4. Are the DTC B1234 present and is parameter of "INCAR TEMP.SENSOR" fixed ?
   ※ Parameter of "INCAR TEMP.SENSOR" will be fixed at 77°F, if there is any fault in INCAR SENSOR

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect incar temp.sensor.
3. Measure resistance between terminal "4" of incar temp.sensor and terminal "5" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Ground Circuit Inspection " procedure.

NO

1) Check for open in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect incar temp.sensor.
3. Measure resistance between terminal "2" of incar temp.sensor and terminal "12" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Incar Temp. sensor

1. Ignition "OFF"
2. Disconnect incar sensor.
3. Measure resistance between terminal "4" and "2" of incar sensornsor
   A. Specification : Refer the specifications in fig3)
4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good incar sensor and check for proper operation. If the problem is corrected, replace incar sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine : "ON"

2. Disconnect incar sensor.
3. Measure Voltage between terminal "5" of A/C Control Unit and chassis ground
   A. Specification :Approx. 5V

4. Is the measured voltage within specifications?

   YES

   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

   YES

   1) Go to the applicable troubleshooting procedure

   NO

   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1237 Ambient Temperature Sensor Short (Low)

Component Location

General Description

The ambient temperature sensor located at the center stay of the condensor detects ambient air temperature. It is a negative type thermistor whose resistance is inversely proportional to temperature. Its output is used for sensor fail-safe, temperature regulation door lock, blower motor level control, mix mode control and in-car humidity control

DTC Description

The ECM sets DTC B1237 if there is a short circuit in ambient temp sensor signal harness or the measured resistance value of the sensor is less than the threshold value(about 7.48kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Resistance check	• Short circuit in harness • Faulty ambient temp.sensor • Faulty A/C Control Unit
Threshold Value	• <7.48kΩ	
Detecting Time	• 0.3sec	
Fail Safe	• Control with the value of 68°F	

Specification

※ Resistance value of ambient temp.sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	527.99	77	30
5	218.21	95	19.6

32	97.83	122	10.82
59	47.12	140	7.48

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "AMBIENT TEMP.SENSOR" Parameter on the Scantool..
   ※ Parameter of "AMBIENT TEMP.SENSOR" will be fixed at 68°F, if there is any fault in AMBIENT TEMP.SENSOR.
4. Are the DTC B1237 present and is parameter of "AMBIENT TEMP.SENSOR" fixed ?
   YES
   1) Go to "Inspection & Repair" procedure
   NO
   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?
   YES
   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure
   NO
   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect ambient sensor.
3. Measure resistance between terminal "1" of ambient sensor and chassis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications??
   YES
   1) Go to "Component Inspection" procedure.
   NO
   1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Ambient sensor

1. Ignition "OFF"
2. Disconnect ambient sensor.

3. Measure resistance between terminal "1" and "2" of ambient sensor
   A. Specification : Refer the specifications in fig3)

4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)
   YES
   1) Go to "Check A/C Control Unit" procedure
   NO
   1) Substitute with a known-good incar sensor and check for proper operation. If the problem is corrected, replace incar sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine : "ON"
2. Disconnect ambient sensor.
3. Measure voltage between terminal "3" of A/C Control Unit and chassis ground
   A. Specification :Approx. 5V

4. Is the measured voltage within specifications?
   YES
   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
   NO
   1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?
   YES
   1) Go to the applicable troubleshooting procedure
   NO
   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1238 Ambient Temperature Sensor Open (High)

Component Location

General Description

The ambient temperature sensor located at the center stay of the condensor detects ambient air temperature. It is a negative type thermistor whose resistance is inversely proportional to temperature. Its output is used for sensor fail-safe, temperature regulation door lock, blower motor level control, mix mode control and in-car humidity control

DTC Description

The ECM sets DTC B1238 if there is an open circuit in ambient temp sensor signal harness or the measured resistance value of the sensor is more than the threshold value(about 527kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Short circuit in harness ● Faulty ambient temp.sensor ● Faulty A/C Control Unit
Threshold Value	● > 527kΩ	
Detecting Time	● 0.3sec	
Fail Safe	● Control with the value of 68°F	

Specification

※ Resistance value of ambient temp.sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
-22	527.99	77	30
5	218.21	95	19.6
32	97.83	122	10.82
59	47.12	140	7.48

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "AMBIENT TEMP.SENSOR" Parameter on the Scantool..
   ※ Parameter of "AMBIENT TEMP.SENSOR" will be fixed at 68°F, if there is any fault in AMBIENT TEMP.SENSOR.
4. Are the DTC B1238 present and is parameter of "AMBIENT TEMP.SENSOR" fixed ?
   YES
   1) Go to "Inspection & Repair" procedure
   NO
   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?
   YES
   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure
   NO
   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect ambient temp.sensor.
3. Measure resistance between terminal "1" of ambient temp.sensor and terminal "3" of A/C Control Unit

A. Specification :Approx. ∞ Ω

4. Is the measured resistance within specifications?
   - YES
     1) Go to "Ground Circuit Inspection " procedure.
   - NO
     1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect ambient temp.sensor.
3. Measure resistance between terminal "2" of ambient temp.sensor and chassis ground.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?
   - YES
     1) Go to "Component Inspection " procedure.
   - NO
     1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Ambient sensor

1. Ignition "OFF"
2. Disconnect ambient sensor.
3. Measure resistance between terminal "1" and "2" of ambient sensor
   A. Specification : Refer the specifications in fig3)
4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)
   - YES
     1) Go to "Check A/C Control Unit" procedure
   - NO
     1) Substitute with a known-good ambient sensor and check for proper operation. If the problem is corrected, replace ambient sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine : "ON"
2. Disconnect ambient sensor.
3. Measure voltage between terminal "3" of A/C Control Unit and chassis ground
   A. Specification :Approx. 5V
4. Is the measured voltage within specifications?
   - YES
     1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
   - NO
     1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

   YES

   1) Go to the applicable troubleshooting procedure

   NO

   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1241 Evaporator Sensor Short(Low)

Component Location

General Description

The Evaporator sensor located on heater unit detects the core temperature and interrupts compressor relay power, in order to prevent evaporator freezing by excessive cooling. It is a negative type thermistor whose resistance is inversely proportional to temperature

DTC Description

The ECM sets DTC B1241 if there is a short circuit in evaporator sensor signal harness or the measured resistance value of the sensor is less than the threshold value(about 0.9kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Short circuit in harness. ● Fault Evaporator sensor ● Fault A/C Control Unit
Threshold value	● < 0.9kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 28.4°F	

Schematic Diagram

Signal Waveform

※ Resistance value of evaporator sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
14	13.6	59	3.9
32	8	86	2
41	6.2	104	1.3
50	4.9	122	0.9

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "EVAPORATIVE SENSOR" Parameter on the Scantool.

4. Are the DTC B1241 present and is parameter of "EVAPORATIVE SENSOR" fixed ?
   ※ Parameter of "EVAPORATIVE SENSOR" will be fixed at 28.4°F, if there is any fault in EVAPORATIVE SENSOR.
   - YES
     1) Go to "Inspection & Repair" procedure
   - NO
     1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?
   - YES
     1) Repair as necessary and go to "Verification of Vehicle Repair" procedure
   - NO
     1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect evaporator sensor.
3. Measure resistance between terminal "1" of evaporator sensor and chassis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?
   - YES
     1) Go to "Component Inspection" procedure.
   - NO
     1) Check for short to ground in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check evaporator sensor

1. Ignition "OFF"
2. Disconnect evaporator sensor.
3. Measure resistance between terminal "1" and "2" of evaporator sensor
   A. Specification : Refer the specifications in fig3)
4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)
   - YES
     1) Go to "Check A/C Control Unit" procedure
   - NO
     1) Substitute with a known-good evaporator sensor and check for proper operation. If the problem is corrected, replace evaporator sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect evaporator sensor.
3. Measure voltage between terminal "6" of A/C Control Unit and chassis ground
   A. Specification :Approx. 5V
4. Is the measured voltage within specifications?
   YES
   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO
   1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?
   YES
   1) Go to the applicable troubleshooting procedure

   NO
   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1242 Evaporator Sensor Open(HIGH)

Component Location

General Description

The Evaporator sensor located on heater unit detects the core temperature and interrupts compressor relay power, in order to prevent evaporator freezing by excessive cooling. It is a negative type thermistor whose resistance is inversely proportional to temperature

DTC Description

The ECM sets DTC B1242 if there is an open circuit in evaporator sensor signal harness or the measured resistance value of the sensor is more than the threshold value(about 13.6kΩ)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Resistance check	● Open Circuit in harness ● Fault Evaporator sensor ● Fault A/C Control Unit
Threshold value	● > 13.6kΩ	
Detecting time	● 0.3sec	
FAIL SAFE	● Control with the value of 28.4°F	

Schematic Diagram

Signal Waveform

※ Resistance value of evaporator sensor as a function of temperature.

Temperature(°F)	Resistance(kΩ)	Temperature(°F)	Resistance(kΩ)
14	13.6	59	3.9
32	8	86	2
41	6.2	104	1.3
50	4.9	122	0.9

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "EVAPORATIVE SENSOR" Parameter on the Scantool.
4. Are the DTC B1242 present and is parameter of "EVAPORATIVE SENSOR" fixed ?
   ※ Parameter of "EVAPORATIVE SENSOR" will be fixed at 28.4°F, if there is any fault in EVAPORATIVE SENSOR.
   YES
   1) Go to "Inspection & Repair" procedure
   NO
   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?
   YES
   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure
   NO
   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect evaporator sensor.
3. Measure resistance between terminal "1" of evaporator sensor and terminal "6" of A/C Control Unit
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?
   YES
   1) Go to "Ground Circuit Inspection " procedure.
   NO
   1) Check for open in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect evaporator sensor.
3. Measure resistance between terminal "2" of evaporator sensor and chassis ground.

A. Specification :Approx. 0 Ω

4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check evaporator sensor

1. Ignition "OFF"
2. Disconnect evaporator sensor.
3. Measure resistance between terminal "1" and "2" of evaporator sensor

A. Specification : Refer the specifications in fig3)

4. Is the measured resistance within specifications in fig3)? (tolerance limits ±3%)

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good evaporator sensor and check for proper operation. If the problem is corrected, replace evaporator sensor and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Disconnect evaporator sensor.
3. Measure voltage between terminal "6" of A/C Control Unit and chassis ground

A. Specification :Approx. 5V

4. Is the measured voltage within specifications?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1245 Air Mix Potentiometer Open(Low) - Driver

Component Location

General Description

Temperature control actuator located at heater unit regulates the temperature by the procedure as follows. Signal from control unit adjusts position of temp door by operating temp motor and then temperature will be regulated by the hot/cold air ratio decided by position of temp door

DTC Description

The ECM sets DTC B1245 if there is an open circuit or poor connection of connected part in the air mix potentiometer.

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
Monitor Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty DR Air Mix potentiometer
Threshold value	●<0.1V	
Detecting time	● 0.3sec	
FAIL SAFE	● setting temperature : 62 - 76°F fix at max. cooling position ● setting temperature : 77 - 90°F fix at max. heating position	

Specification

※ Voltage value of Air Mix potentiometer as a function of setting temperature

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR AIR MIX potentiometer" Parameter on the Scantool. While operating temp switch
4. Are the DTC B1245 present and is parameter of "DR AIR MIX Potentiometor" fixed ?
   ※ Parameter of "DR AIR MIX potentiometer" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in DR AIR MIX potentiometer.

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect DR Air Mix potentiometer
3. Measure resistance between terminal "6" of DR Air Mix potentiometer and terminal "18" of A/C control unit.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Check for short to ground in harness" procedure.

NO

1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect DR Air Mix Actuator
3. Measure resistance between terminal "6" of DR Air Mix potentiometer and chassis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Power Circuit Inspection" procedure

NO

1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Power Supply Circuit Inspection

Check for short or open in harness

1. Ignition "ON"
2. Connect DR Air Mix Potentiometer.
3. Measure voltage between terminal "7" of DR Air Mix potentiometer and chassis ground
   A. Specification :Approx.5V
4. Is the measured voltage within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for short or open in power harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Air Mix Potentiometer.
3. Connect (+) terminal of battery to terminal 3 of Air Mix potentiometer and (-) terminal to terminal 4
4. Verify that the temperature actuator operates to the hot position
5. Verify that the temperature actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)

6. Dose the actuator work properly?
   YES
   1) Go to "Check potentiometer" procedure.
   NO
   1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Air Mix potentiometer
3. Measure voltage between terminal "5" and "6" of DR AIR MIX potentiometer while operating the temp switch.
   A. Specification : Refer the specifications in fig3)

Door position	Voltage (5-6)	Threshold value
MAX. Cooling	0.3±0.15V	Low voltage : 0.08V or less
MAX. Heating	4.7±0.15V	High voltage : 4.9V or more

4. Is the measured voltage within specifications in fig3)?
   YES
   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
   NO
   1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?
   YES
   1) Go to the applicable troubleshooting procedure
   NO
   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1246 Air Mix Potentiometer Short(High) - Driver

Component Location

General Description

Temperature control actuator located at heater unit regulates the temperature by the procedure as follows. Signal from control unit adjusts position of temp door by operating temp motor. then temperature will be regulated by the hot/cold air ratio decided by position of temp door

DTC Description

The ECM sets DTC B1246 if there is a short to power harness in the air mix potentiometer.

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
Monitor Strategy	● Voltage check	● Open circuit in harness ● Short circuit in harness ● Faulty DR Air Mix potentiometer
Threshold value	●>4.9V	
Detecting time	● 0.3sec	
FAIL SAFE	● setting temperature : 62 - 76°F fix at max. cooling position ● setting temperature : 77 - 90°F fix at max. heating position	

Specification

※ Voltage value of Air Mix potentiometer as a function of setting temperature

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR AIR MIX potentiometer" Parameter on the Scantool. While operating temp switch
4. Are the DTC B1246 present and is parameter of "DR AIR MIX Potentiometor" fixed ?
   ※ Parameter of "DR AIR MIX potentiometer" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in DR AIR MIX potentiometer.

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short in harness

1. Ignition "OFF"
2. Disconnect DR Air mix potentiometer
3. Measure resistance between terminal "6" and "7" of DR Air mix potentiometer
   A. Specification :Approx. ∞ Ω

4. Is the measured resistance within specifications?

YES

1) Go to "Ground Circuit Inspection" procedure

NO

1) Check for short to power harness in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect DR Air mix potentiometer.
3. Measure resistance between terminal "5" of DR Air mix potentiometer and chassis ground.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Air mix potentiometer.
3. Connect (+) terminal of battery to terminal 3 of Air mix potentiometer and (-) terminal to terminal 4
4. Verify that the temperature actuator operates to the hot position
5. Verify that the temperature actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Air mix potentiometer
3. Measure voltage between terminal "5" and "6" of DR Air mix potentiometer while operating the temp switch.
   A. Specification : Refer the specifications in fig3)

Door position	Voltasge (5-6)	Threshold value
MAX. Cooling	0.3±0.15V	voltage value > 0.08V
MAX. Heating	4.7±0.15V	voltage value > 4.9V

4. Is the measured voltage within specifications in fig3)?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1249 Direction Potentiometer Open(Low) - Driver

Component Location

General Description

The mode control actuator mounted on heater unit adjusts position of mode door by operating Direction Motor based on signal of A/C control unit. Pressing mode select switch makes the mode control actuator shift in order of vent→ B/L → floor → mix.

DTC Description

The ECM sets DTC B1249 if there is an open circuit or poor connection of connected part in the Direction potentiometer.

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty DR Direction potentiometer
Threshold value	● <0.1V	
Detecting time	● 0.3sec	
FAIL SAFE	● Fix vent position ● Fix in defrost mode	

Specification

※ Voltage value of Direction potentiometer as a function of position of mode switch

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR DIRECTION POTENTIO" parameter on the scantool. While operating mode switch

4. Are the DTC B1249 present and is parameter of "DR DIRECTION POTENTIO" fixed ?
※ Parameter of "DR DIRECTION POTENTIO" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in DR direction potentiometer
   - YES
     1) Go to "Inspection & Repair" procedure
   - NO
     1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?
   - YES
     1) Repair as necessary and go to "Verification of Vehicle Repair" procedure
   - NO
     1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect DR Direction Actuator
3. Measure resistance between terminal "6 of DR Direction Potentiometer and terminal "21" of A/C control unit.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?
   - YES
     1) Go to "Check for short to ground in harness" procedure.
   - NO
     1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect DR Direction Actuator
3. Measure resistance between terminal "6" of DR Direction Potentiometer and chasis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?
   - YES
     1) Go to "Power Circuit Inspection" procedure
   - NO
     1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Power Supply Circuit Inspection

1. Ignition "ON"
2. Connect DR Direction Potentiometer.
3. Measure voltage between terminal "7" of DR Direction Potentiometer and chasis ground
   A. Specification :Approx.5V

4. Is the measured voltage within specifications?

YES

1) Go to "Component Inspection" procedure.

NO

1) Check for short or open in power harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Direction Potentiometer.
3. Connect (+) terminal of battery to terminal 3 of DR Direction potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Direction Potentiometer.
3. Measure voltage between terminal "5" and "6" of DR Direction Potentiometer while operating mode switch
   A. Specification : Refer the specifications in fig3)

<table>
<tr><td>Door position</td><td>Voltasge (5-6)</td><td>Error detecting</td></tr>

4. Is the measured voltage within specifications in fig3)?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC

2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1250 Direction Potentiometer Short(High) - Driver

Component Location

General Description

The mode control actuator mounted on heater unit adjusts position of mode door by operating Direction Motor based on signal of A/C control unit. Pressing mode select switch makes the mode control actuator shift in order of vent→ B/L → floor → mix.

DTC Description

The ECM sets DTC B1250 if there is a short to power harness in the Direction potentiometer.

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
Monitor Strategy	● Voltage check	● Open circuit in harness ● Short circuit in harness ● Faulty DR Direction potentiometer
Threshold value	● >4.9V	
Detecting time	● 0.3sec	
FAIL SAFE	● Fix vent position	

Specification

※ Voltage value of Direction potentiometer as a function of position of mode switch

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR DIRECTION POTENTIO" parameter on the scantool. While operating mode switch
4. Are the DTC B1250 present and is parameter of "DR DIRECTION POTENTIO" fixed ?
※Parameter of "DR DIRECTION POTENTIO" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in DR direction Potentiometer

YES

1) Go to "Inspection & Repair" procedure

NO

1) Fault is intermittent caused by poor contact in the sensor’s and/or A/C control unit’s connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short in harness

1. Ignition "OFF"
2. Disconnect DR Direction potentiometer
3. Measure resistance between terminal "6" and "7" of DR Direction potentiometer
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

   YES

   1) Go to "Ground Circuit Inspection " procedure

   NO

   1) Check for short to power harness in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect DR Direction Actuator.
3. Measure resistance between terminal "5" of DR Direction Actuator and chassis ground.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

   YES

   1) Go to "Component Inspection " procedure.

   NO

   1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Direction Potentiometor.
3. Connect (+) terminal of battery to terminal 3 of DR Direction potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

   YES

   1) Go to "Check potentiometer" procedure.

   NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Direction Potentiometer.
3. Measure voltage between terminal "5" and "6" of DR Direction potentiometer while operating mode switch .
   A. Specification : Refer the specifications in fig3)

Door position	Voltasge (5-6)	Error detecting
VENT	0.3±0.15V	Undervoltage : 0.08V or less Overvoltage : 4.92V or more
BI-LEVEL(1)	1.35±0.4V	
BI-LEVEL(2)	2.25±0.4V	
FLOOR	3.0±0.4V	
MIX	3.6±0.4V	
DEF	4.7±0.15V	

4. Is the measured voltage within specifications in fig3)?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B2406 Air Mix Motor(Driver)

Component Location

General Description

Temperature control actuator located at heater unit regulates the temperature by the procedure as follows. Signal from control unit adjusts position of temp door by operating temp motor. then temperature will be regulated by the hot/cold air ratio decided by position of temp door

DTC Description

The ECM sets DTC B2406 if the air mix actuator dosen‘t move to intended position within 40sec (The ECM attempts to move the temp door for a 2 second duration at a frequency of 3 times every 20 seconds before storing a DTC.)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty DR Air Mix potentiometer ● Faulty A/C Control Unit
Threshold value	●< 0.1V	
Detecting time	● 0.3sec	
FAIL SAFE		

Specification

※ Voltage value of Air Mix potentiometer as a function of setting temperature

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR AIR MIX Potentiometer" Parameter on the Scantool. While operating temp switch
4. Are the DTC B2406 present and is parameter of "DR AIR MIX Potentiometer" fixed?
   ※ There is any fault in DR AIR MIX Motor. If the parameter of "DRIVER AIR MIX DOOR" is 30% or less when the actuator operates to the hot position, or If the parameter is 60% and more when the actuator operates to the cold position

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor’s and/or A/C control unit’s connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect DR Air Mix Actuator
3. Measure resistance between terminal "3,4" of DR Air Mix Motor and terminal "16,17" of A/C control unit.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Check for short to ground in harness" procedure.

NO

1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect DR Air Mix Actuator
3. Measure resistance between terminal "3,4" of DR Air Mix Motor and chasis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Visual/Physical Inspection " procedure

NO

1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Visual / Physical Inspection

Check actuator

※Check if DR Air Mix Actuator works properly through ACTUATION TEST.

1. Ignition : ON
2. Connect Scantool and select " ACTUATION TEST" mode and press [F1]
3. Dose DR Air Mix Actuator work properly?

YES

1) Go to "Component Inspection" procedure

NO

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Air Mix Potentiometer.
3. Connect (+) terminal of battery to terminal 3 of DR Air Mix Actuator and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Air Mix Actuator
3. Measure voltage between terminal "5" and "6" of DR AIR MIX potentiometer while operating the temp switch.
   A. Specification : Refer the specifications in fig5)

Door position	Voltage (5-6)	Threshold value
MAX. Cooling	0.3±0.15V	Voltage value > 0.08V
MAX. Heating	4.7±0.15V	Voltage value > 4.9V

4. Is the measured voltage within specifications in fig3)?

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Connect A/C Control Unit.
3. Measure voltage between terminal "16" and "17" of A/C Control Unit while operating the temp switch.
   A. Specification :Approx. 12V
4. Is the measured voltage within specifications?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B2409 Direction Control Motor(Driver)

Component Location

General Description

The mode control actuator mounted on heater unit adjusts position of mode door by generating Direction Motor in accordance with signal of A/C control unit. Pressing mode select switch makes the mode control actuator shift in order of vent→ B/L → floor → mix.

DTC Description

The ECM sets DTC B2409 if the direction motor dosen’t move to intended position within 40sec(The ECM attempts to move the temp door for a 2 second duration at a frequency of 3 times every 20 seconds before storing a DTC.)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty DR Direction potentiometer ● Faulty A/C Control Unit
Threshold value	● < 0.1V	
Detecting time	● 0.3sec	
FAIL SAFE		

Specification

※ Voltage value of Direction potentiometer as a function of position of mode switch

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the "DR AIR MIX Potentiometer" Parameter on the Scantool. While operating mode switch
4. Are the DTC B2409 present and is parameter of "DR DIRECTION POTENTIO" fixed?
   ※ There is any fault in DR Direction Motor. If the parameter of "DR DIRECTION POTENTIO" is 10% or less on "VENT" mode, or If the parameter is 90% or more on "DEF" mode.

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect DR Direction Actuator.
3. Measure resistance between terminal "3,4" of DR Direction Motor and terminal "19,20" of A/C control unit.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Check for short to ground in harness" procedure.

NO

1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect DR Direction Actuator.
3. Measure resistance between terminal "3,4" of DR Direction Motor and chasis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Visual/Physical Inspection " procedure

NO

1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Visual / Physical Inspection

Check actuator

※ Check if DR Direction Actuator works properly through ACTUATION TEST.

1. Ignition : ON
2. Connect Scantool and select " ACTUATION TEST" mode and press [F1]
3. Dose DR Direction Actuator work properly?

YES

1) Go to "Component Inspection" procedure

NO

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect DR Direction Potentiometer.
3. Connect (+) terminal of battery to terminal 3 of DR Direction potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect DR Direction Potentiometer.
3. Measure voltage between terminal "5" and "6" of DR Direction Potentiometor while operating the mode switch.
   A. Specification : Refer the specifications in fig5)

Door position	Voltasge (5-6)	Error detecting
VENT	0.3±0.15V	Undervoltage : 0.08V or less Overvoltage : 4.92V or more
BI-LEVEL(1)	1.35±0.4V	
BI-LEVEL(2)	2.25±0.4V	
FLOOR	3.0±0.4V	
MIX	3.6±0.4V	
DEF	4.7±0.15V	

4. Is the measured voltage within specifications in fig3)?

YES

1) Go to "Check A/C Control Unit" procedure

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Connect A/C Control Unit.
3. Measure voltage between terminal "19" and "20" of A/C Control Unit while operating the mode switch.
   A. Specification :Approx. 12V
4. Is the measured voltage within specifications?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1208 Intake Potentiometer Open (Low)

Component Location

General Description

Intake door located at heater unit controls the inlet of car. When driver operates the intake switch, ECU receives mode signal from intake switch and operates intake door actuator to turn intake door to intended position. (with FRE mode signal, intake door is closed and with REC mode signal, intake door is opened)

DTC Description

The ECM sets DTC B1208 if there is an open circuit or poor connection in the Intake potentiometer

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty Intake potentiometer
Threshold value	● < 0.1V	
Detecting time	● 0.3sec	
FAIL SAFE	● Fix at FRE	

Specification

※ Voltage value of Intake potentiometer as a function of position of Intake door

Door position	Voltage	Threshold value
FRE	0.3±0.15V	Voltage value > 0.08V
REC	4.7±0.15V	Voltage value > 4.9V

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the " Intake potentiometer" Parameter on the Scantool. While operating intake switch
4. Are the DTC B1208 present and is parameter of "Intake potentiometer" fixed?
   ※ Parameter of "Intake potentiometer" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in Intake potentiometer

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "W/Harness Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "6" of Intake potentiometer and terminal "24" of A/C control unit.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Check for short to ground in harness" procedure.

NO

1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "6" of Intake potentiometer and chassis ground
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Power Circuit Inspection" procedure

NO

1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Power Supply Circuit Inspection

Check for short or open in harness

1. Ignition "ON"
2. Connect Intake potentiometer
3. Measure voltage between terminal "7" of Intake potentiometer and chassis ground.
   A. Specification :Approx.5V
4. Is the measured voltage within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for short or open in power harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect Intake potentiometer.
3. Connect (+) terminal of battery to terminal 3 of Intake potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and

then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect Intake potentiometer.
3. Measure voltage between terminal "5" and "6" of Intake potentiometer while operating Intake switch
   A. Specification : Refer the specifications in fig3)
4. Is the measured voltage within specifications in fig3)?

   YES

   1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

   YES

   1) Go to the applicable troubleshooting procedure

   NO

   1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B1209 Intake Potentiometer Short (High)

Component Location

General Description

Intake door located at heater unit controls the inlet of car. When driver operates the intake switch, ECU receives mode signal from intake switch and operates intake door actuator to turn intake door to intended position. (with FRE mode signal, intake door is closed and with REC mode signal, intake door is opened)

DTC Description

The ECM sets DTC B1209 if there is a short to power in the Intake potentiometer.

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	• Voltage check	• Open circuit in harness • Short circuit in harness • Faulty Intake potentiometer
Threshold value	• < 4.9V	
Detecting time	• 0.3sec	
FAIL SAFE	• Fix at FRE	

Specification

※ Voltage value of Intake potentiometer as a function of position of Intake door

Door position	Voltage	Threshold value
FRE	0.3±0.15V	Voltage value > 0.08V
REC	4.7±0.15V	Voltage value > 4.9V

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the " Intake potentiometer" Parameter on the Scantool. While operating intake switch
4. Are the DTC B1209 present and is parameter of "Intake potentiometer" fixed?
   ※ Parameter of "Intake potentiometer" will be fixed at 100%(or any value above 90%), or 0% (or any value below 10%), if there is any fault in Intake potentiometer

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "W/Harness Inspection" procedure

Signal Circuit Inspection

Check for short in harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "6" and "7" of Intake potentiometer.
   A. Specification :Approx. ∞ Ω
4. Is the measured resistance within specifications?

   YES

   1) Go to "Ground Circuit Inspection " procedure

   NO

   1) Check for short to power harness in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Ground Circuit inspection

Check for open in ground harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "5" of Intake potentiometer and chassis ground.
   A. Specification :Approx. 0 Ω
4. Is the measured resistance within specifications?

YES

1) Go to "Component Inspection " procedure.

NO

1) Check for open in ground harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect Intake potentiometer.
3. Connect (+) terminal of battery to terminal 3 of Intake potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?

YES

1) Go to "Check potentiometer" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect Intake potentiometer.
3. Measure voltage between terminal "5" and "6" of Intake potentiometer while operating Intake switch
   A. Specification : Refer the specifications in fig3)
4. Is the measured voltage within specifications in fig3)?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Heating,Ventilation, Air Conditioning > Controller > B2408 Intake Motor

Component Location

General Description

Intake door located at heater unit controls the inlet of car. When driver operates the intake switch, ECU receives mode signal from intake switch and operates intake door actuator to turn intake door to intended position. (with FRE mode signal, intake door is closed and with REC mode signal, intake door is opened)

DTC Description

The ECM sets DTC B2408 if the intake motor dosen't move to intended position within 40sec(The ECM attempts to move the intake door for a 2 second duration at a frequency of 3 times every 20 seconds before storing a DTC.)

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage check	● Poor connection of connected part ● Open circuit in harness ● Short circuit in harness ● Faulty Intake potentiometer
Threshold value	●< 0.1V	
Detecting time	● 0.3sec	
FAIL SAFE		

Specification

※ Voltage value of Intake potentiometer as a function of position of Intake door

Door position	Voltage	Threshold value
FRE	0.3±0.15V	Voltage value > 0.08V
REC	4.7±0.15V	Voltage value > 4.9V

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the " Intake potentiometer" Parameter on the Scantool. While operating Intake switch
4. Are the DTC B2408 present and is parameter of "Intake potentiometer" fixed?
   ※ There is any fault in Intake potentiometer. If the parameter of "Intake potentiometer" is 30% or less when the actuator operates to the FRE position, or If the parameter is 60% and more when the actuator operates to the REC position

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for open in harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "3,4" of Intake potentiometer and terminal "22,23" of A/C control unit.
   A. Specification :Approx. 0 Ω

4. Is the measured resistance within specifications?

YES

1) Go to "Check for short to ground in harness" procedure.

NO

1) Check for open in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Check for short to ground in harness

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Measure resistance between terminal "3,4" of Intake potentiometer and chassis ground
   A. Specification :Approx. ∞ Ω

4. Is the measured resistance within specifications?

YES

1) Go to "Visual/Physical Inspection " procedure

NO

1) Check for short to ground in signal harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Visual / Physical Inspection

Check actuator

※ Check if Intake potentiometer works properly through ACTUATION TEST.

1. Ignition : ON
2. Connect Scantool and select " ACTUATION TEST" mode and press [F1]

3. Dose Intake potentiometer work properly?

YES

1) Go to "Component Inspection" procedure

NO

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check actuator motor

1. Ignition "OFF"
2. Disconnect Intake potentiometer
3. Connect (+) terminal of battery to terminal 3 of Intake potentiometer and (-) terminal to terminal 4
4. Verify that the mode actuator operates to the hot position
5. Verify that the mode actuator operates to the cool position with reverse connecting.((+) to 4 and (-) to 3)
6. Dose the actuator work properly?
   - YES
     1) Go to "Check potentiometer" procedure.
   - NO
     1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check potentiometer

1. Ignition "ON"
2. Connect Intake potentiometer.
3. Measure voltage between terminal "5" and "6" of Intake potentiometer while operating Intake switch
   A. Specification : Refer the specifications in fig3)
4. Is the measured voltage within specifications in fig3)?
   - YES
     1) Go to "Check A/C Control Unit" procedure
   - NO
     1) Substitute with a known-good actuator and check for proper operation. If the problem is corrected, replace actuator and then go to "Verification of Vehicle Repair" procedure.

Check A/C Control Unit

1. Engine "ON"
2. Connect A/C Control Unit.
3. Measure voltage between terminal "22" and "23" of A/C Control Unit while operating the Intake switch.
   A. Specification :Approx. 12V
4. Is the measured voltage within specifications?
   - YES
     1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.
   - NO
     1) Substitute with a known-good A/C Control Unit and check for proper operation. If the problem is corrected, replace A/C Control Unit and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?
   - YES
     1) Go to the applicable troubleshooting procedure
   - NO
     1) System is performing to specification at this time.

Component Location

General Description

AQS(Air Quality System) keeps air inside in the most suitable state for driver. In polluted area AQS detects hazardous gas and intercepts inflow automatically, Inversely, In fresh area it allows the inflow of air to prevent the shortage of air and the accumulation of carbon dioxide. AQS sensor is located at front side of condensor and once hazardous gas is detected, it delivers the voltage signal to ECU for closing intake door.

DTC Description

The ECM sets DTC B1257 if there is an open circuit in AQS sensor signal harness or the measured voltage value of the sensor is more than the threshold value

Heating,Ventilation, Air Conditioning > Controller > B1259 AQS Sensor Fault

Component Location

General Description

AQS(Air Quality System) keeps air inside in the most suitable state for driver. In polluted area AQS detects hazardous gas and intercepts inflow automatically, Inversely, In fresh area it allows the inflow of air to prevent the shortage of air and the accumulation of carbon dioxide. AQS sensor is located at front side of condensor and once hazardous gas is detected, it delivers the voltage signal to ECU for closing intake door.

DTC Description

The ECM sets DTC B1259 if preheating time of AQS sensor is over 40sec or signal from AQS sensor is not within specifications

DTC Detecting Condition

Item	Detecting Condition	Possible Cause
DTC Strategy	● Voltage/time check	● Poor connection of connected part ● Faulty AQS sensor
Threshold value	● Voltage : Preheating - 2.5V±0.3V Normal - 4.3V±0.3V Gas detected - 0.9V±0.3V	
Detecting time	-	
FAIL SAFE	● AQS function OFF ● Intake door : return to previous state	

Specification

※ Voltage value of AQS sensor as a function of position of operating condition.

Operating condition	Voltage	Note
Right after IGN "ON"	2.5V ± 0.3V	Preheating(35 ± 2sec)
Normal	4.3V ± 0.3V	Intake door : REC
Gas detected	0.9V ± 0.3V	Intake door : FRE

Schematic Diagram

Monitor Scantool Data

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON"
3. Monitor the " AQS sensor " Parameter on the Scantool. While making hazardous gas such as tobacco fumes around the AQS sensor
4. Are the DTC B1259 present and is parameter of " AQS sensor " fixed?
   ※ Parameter of " AQS sensor" will be fixed even though hazardous gas is around AQS sensor, if there is any fault in AQS sensor

   YES

   1) Go to "Inspection & Repair" procedure

   NO

   1) Fault is intermittent caused by poor contact in the sensor's and/or A/C control unit's connector or was repaired and A/C control unit memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   1) Repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   1) Go to "Signal Circuit Inspection" procedure

Signal Circuit Inspection

Check for short to ground in harness

1. Ignition "ON"
2. Disconnect AQS sensor
3. Measure voltage value between terminal "6" of AQS sensor and chassis groundit
   A. Specification : 12V
4. Is the measured resistance within specifications?

   YES

   1) Go to "Component Inspection" procedure.

   NO

1) Check for open in harness. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

Component Inspection

Check Ambient sensor

1. Engine "ON"
2. Connect AQS sensor
3. Measure voltage value between terminal "4" and "5" of AQS sensor
   A. Specification : Refer the specifications in fig3)
4. Is the measured voltage within specifications in fig3)?

YES

1) Check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

1) Substitute with a AQS sensor and check for proper operation. If the problem is corrected, replace AQS sensor and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and selet "Diagnostic Trouble Codes(DTCs)" mode and then clear DTC
2. Operate the vehicle and monitor the DTC on the scantool
3. Are any DTCs present?

YES

1) Go to the applicable troubleshooting procedure

NO

1) System is performing to specification at this time.

Precautions

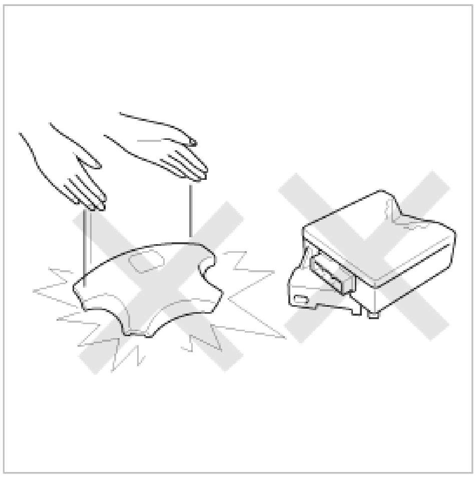
General Precautions

Please read the following precautions carefully before performing the airbag system service. Observe the instructions described in this manual, or the airbags could accidentally deploy and cause damage or injury.

- Except when performing electrical inspections, always turn the ignition switch OFF and disconnect the negative cable from the battery, and wait at least three minutes before beginning work.

> NOTE
>
> The contents in the SRSCM memory are not erased even if the ignition switch is turned OFF or the battery cables are disconnected from the battery.

- Use the replacement parts which are manufactured to the same standards as the original parts and quality.
  Do not install used SRS parts from another vehicle.
  Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it.
  Do not install any part that shows signs of having been dropped or improperly handled, such as dents, cracks or deformation.

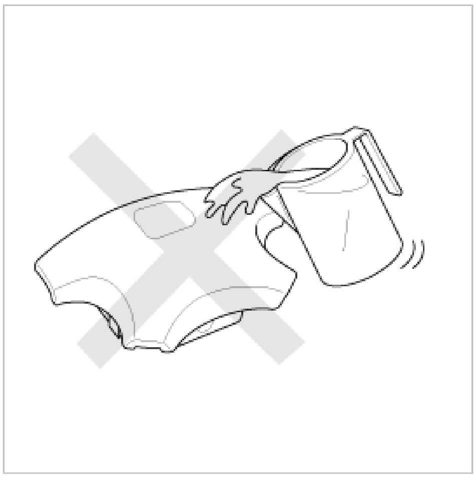


- Before removing any of the SRS parts (including the disconnection of the connectors), always disconnect the SRS connector.

Airbag Handling and Storage

Do not disassemble the airbags; They have no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.
For temporary storage of the air bag during service, please observe the following precautions.

- Store the removed airbag with the pad surface up.
- Keep free from any oil, grease, detergent, or water to prevent damage to the airbag assembly.



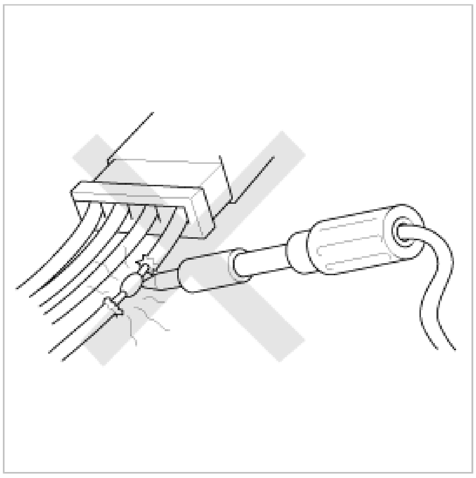
- Store the removed airbag on secure, flat surface away from high heat source (exceeding 200 °F / 93 °C).
- Never perform electrical inspections to the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag assembly during removal, inspection, or replacement.

- Refer to the scrapping procedures for disposal of the damaged airbag.
- Be careful not to bump or impact the SRSCM or the side impact sensors whenever the ignition switch is ON, wait at least three minutes after the ignition switch is turned OFF before begin work.
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRSCM and the side impact sensor. The airbags could accidentally deploy and cause damage or injury.
- After a collision in which the airbags were deployed, replace the front airbags and the SRSCM. After a collision in which the side airbag was deployed, replace the side airbag, the front impact sensor and side impact sensor on the side where the side airbag deployed and the SRSCM. After a collision in which the airbags or the side air bags did not deploy, inspect for any damage or any deformation on the SRSCM and the side impact sensors. If there is any damage, replace the SRSCM, the front impact sensor and/or the side impact sensors.
- Do not disassemble the SRSCM, the front impact sensor or the side impact sensors
- Turn the ignition switch OFF, disconnect the battery negative cable and wait at least three minutes before beginning installation or replacement of the SRSCM.
- Be sure the SRSCM, the front impact sensor and side impact sensors are installed securely with the mounting bolts.
- Do not spill water or oil on the SRSCM,or the front impact sensor or the side impact sensors and keep them away from dust.
- Store the SRSCM, the front impact sensor and the side impact sensors in a cool (less than 104°F/40°C) and dry (less than 80% relative humidity, no moisture) area.

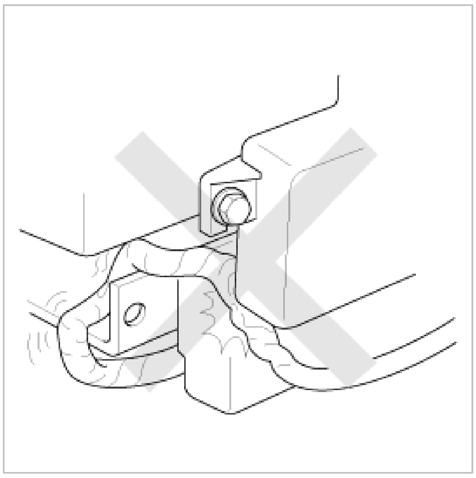
Wiring Precautions

SRS wiring can be identified by special yellow outer covering (except the SRS circuits under the front seats).
Observe the instructions described in this section.

- Never attempt to modify, splice, or repair SRS wiring.
  If there is an open or damage in SRS wiring, replace the harness.



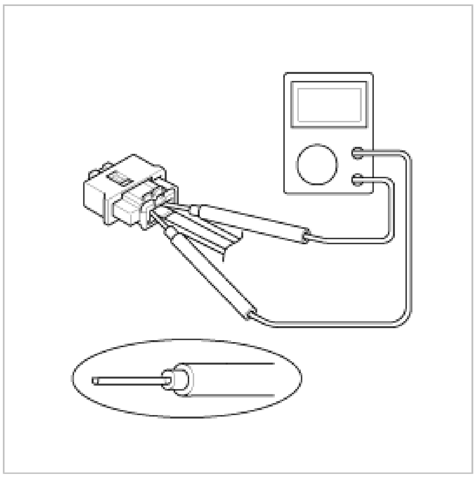
- Be sure to install the harness wires so that they are not pinched, or interfere with other parts.



- Make sure all SRS ground locations are clean, and grounds are securely fastened for optimum metal-to-metal contact. Poor grounding can cause intermittent problems that are difficult to diagnose.

Precautions for Electrical Inspections

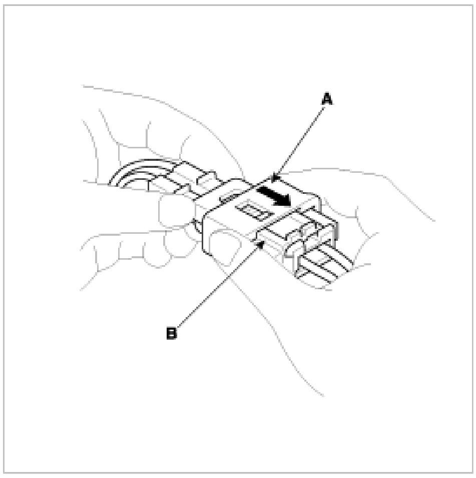
- When using electrical test equipment, insert the probe of the tester into the wire side of the connector.
  Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.



• Use a u-shaped probe. Do not insert the probe forcibly.
• Use specificed service connectors for troubleshooting.
  Using improper tools could cause an error in inspection due to poor metal contact.

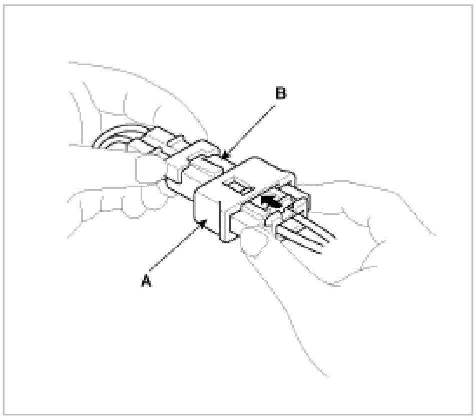
Spring-loaded Lock Connector

Airbag Connector(I)

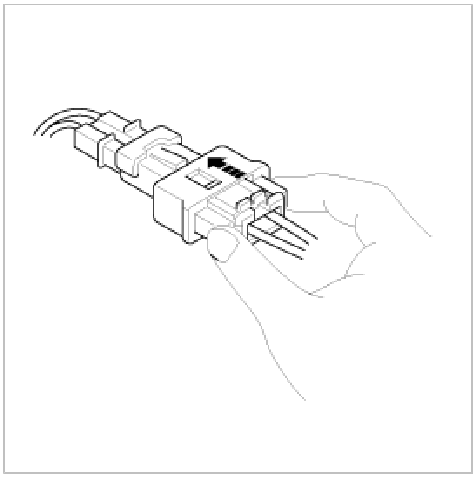


Connecting

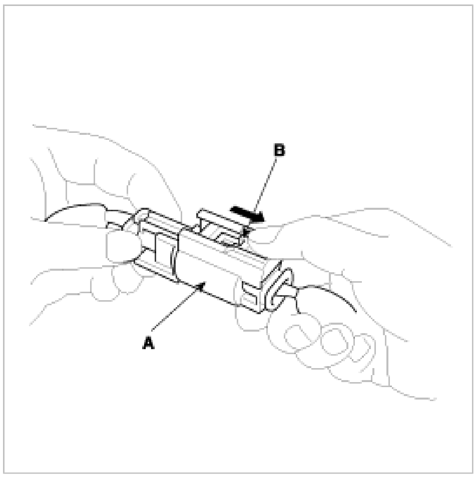
1. To reconnect, hold the pawl-side connector half, and press on the back of the sleeve-side connector half in the direction shown. As the two connectpr halves are pressed together, the sleeve (A) is pushed back by the pawl (B). Do not touch the sleeve.



2. When the connector halves are completely connected, the pawl is released, and the spring-loaded sleeve locks the connector.

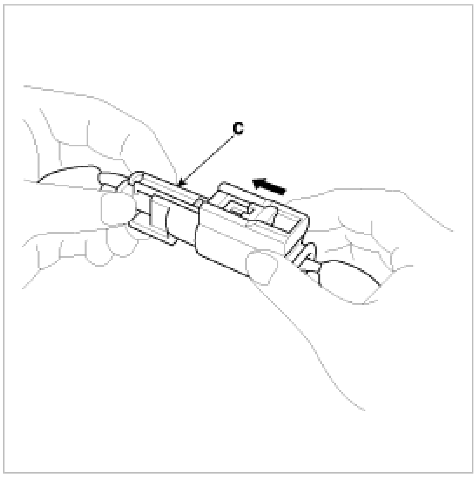


Airbag Connector(II)



Connecting

Hold both connector halves and press firmly until the projection (C) of the sleeve-side connector clicks to lock.



COMPONENT REPLACEMENT AFTER DEPLOYMENT

NOTE

Before doing any SRS repairs, use the Hi-Scan Pro to check for DTCs. Refer to the Diagnostic Trouble Code list for repairing of the related DTCs.

When the front airbag(s) deployed after a collision, replace the following items.

- SRSCM
- Deployed airbag(s)
- Seat belt pretensioner(s)
- Seat belt buckle pretensioner(s)

- Front impact sensors
- SRS wiring harnesses
- Clock spring (when Driver Airbag deployed)

hen the seat belt pretensioner(s) deployed after a collision, replace the following items.

- Seat belt pretensioner(s)
- Seat belt buckle pretensioner(s)
- SRSCM (if B1658 detected)
- Front impact sensors
- SRS wiring harnesses

hen the side/curtain airbag(s) deployed after a collision, replace the following items.

- SRSCM
- Deployed airbag(s)
- Side impact sensor(s) for the deployed side(s)
- SRS wiring harnesses

After the vehicle is completely repaired, confirm the SRS airbag system is OK.

- Turn the ignition switch ON, the SRS indicator should come on for about 6 seconds and then go off.

Restraint > General Information > General Information

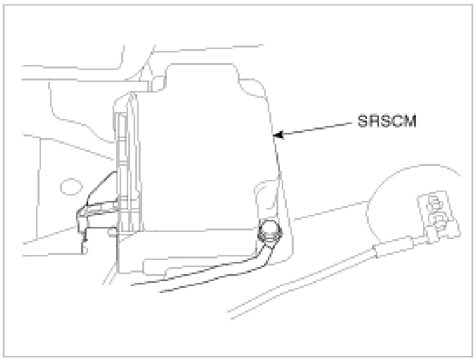
General

The supplemental restraint system (SRS) is designed to supplement the seat belt to help reduce the risk of severe injury to the driver and passenger by activating and deploying the driver, passenger, side airbag and belt pre-tensioner in certain frontal or side collisions. The SRS (Airbag) consists of : a driver side airbag module located in the center of the steering wheel, which contains the folded cushion and an inflator unit ; a passenger side airbag module located in the passenger side crash pad contains the folded cushion assembled with inflator unit ; side airbag modules located in the driver and passenger seat contains the folded cushion and an inflator unit ; curtain airbag modules located inside the headliner which contains folded cushions and inflator units. The Passenger Occupant classification System (OCS) utilizes a sensor mat placed between the passenger seat cover and cushion pad to measure the occupant's loading force on the vehicle seat. Seat Track Position Sensor (STPS) is located in the driver and passenger seat it, interfaces with the SRS Control module (SRSCM) and will help determine whether to suppress either stage of the multi-stage airbag system. SRSCM is located under the center console. The impact sensing function of the SRSCM is carried out by electronic accelerometer that continuously measures the vehicle's acceleration and delivers a corresponding signal through amplifying and filtering circuitry to the microprocessor.

SRSCM (SRS Control Module)

The SRS airbag system consists of electrical and electronic components. Be cautious of the airbag parts. The SRSCM will detect front impact with an inside sensor, side impact with a side impact sensor, airbag deployment request signal, and determine airbag module deployment.

1. DC/DC converter: DC/DC converter in power supply unit includes up/down transformer converter, and provides ignition voltage for 2 front airbag ignition circuits and inside operation voltage. If inside operation voltage is below critical value setting, it will perform re-setting.
2. Safety sensor: The safety sensor is located in the airbag ignition circuit. The safety sensor will operate airbag circuit at any deployment condition and release airbag circuit safely at normal driving condition. The safety sensor is a double contact electro-mechanical switch that will close detecting deceleration above certain criteria.
3. Back up power supply: SRSCM has a separate back up power supply, it will supply deployment energy instantly in low voltage condition or upon power failure by front crash.
4. Self diagnosis: SRSCM will constantly monitor current SRS operation status and detect system failure when the vehicle power supply is on, system failure may be checked with trouble codes using the scan tool. (Hi-Scan)
5. Airbag warning lamp : Upon detecting error, the SRSCM will transmit a signal to the airbag warning lamp located in the cluster. The lamp will indicate SRS error. When the ignition key is on, the SRS lamp will be turned on for about 6 seconds, then will be turned off for a self check. If it remains on, the error is indicated.
6. Trouble code registration: Upon error occurrence in the system, the SRSCM will store a DTC corresponding to the error. DTC can be cleared only by Hi-Scan.
7. Self diagnostic connector: Data stored in SRSCM memory will be output to the Hi-Scan or other external output devices through the data link connector located below the driver side crash pad.
8. Once the airbag is deployed, the SRSCM should not be used again and replaced.
9. SRSCM will determine whether a passenger has put on a seat belt using built-in switch signal in the seat belt buckle, and deploy the front passenger seat airbag accordingly.
10. Side airbag deployment will be determined by SRSCM that will detect satellite sensor impact signal upon side crash, irrespective to seat belt condition.



Restraint > General Information > Special Service Tools

SPECIAL SERVICE TOOLS

Tool(Number and Name)	Illustration	Use
Deployment tool 0957A-34100A		Airbag deployment tool
Deployment adapter 0957A-38510		Use with deployment tool. (DAB,PAB)
Deployment adapter 0957A-38500		Use with deployment tool. (CAB,BPT,)
Deployment adapter 0957A-3F100		Use with deployment tool. (SAB)
Deployment adapter 0957A-2E210		Use with deployment tool. (BUPT)
Dummy load 0957A-38200		Simulator to check the resistance of each wiring harness
Dummy adapter 0957A-2D100		Use with dummy load (SAB)
Dummy adapter 0957A-1C000		Use with dummy load (DAB,CAB,BPT)

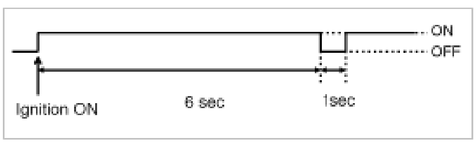
BUPT: Buckle Pretensioner

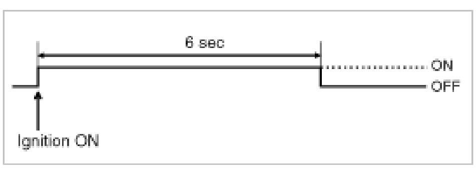
Restraint > General Information > Description and Operation

Warning Lamp Activation

1. Active fault or more than 10 faults are memorized
   A. warning lamp turns on continuously for 6 seconds after IG ON.
   B. warning lamp turns off for 1 second.
   C. warning lamp turns on continuously.



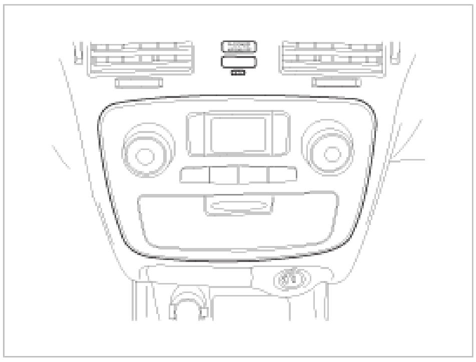
2. No current fault or Less than 10 faults are memorized
   A. warning lamp turns on continuously for 6 seconds after IG ON.
   B. warning lamp turns off continuously.



3. Failure recognition time table

	Active fault	Historical fault
internal fault	2sec.	4sec.
external fault	2sec.	4sec.
battery voltage high/low	10sec.	10sec.

TELLTALE LAMP ACTIVATION



The Telltale Lamp indicates the Passenger Airbag(PAB) enable and disablestatus based on occupant status of passenger seat. If the passenger seat isempty or occupied with a child (or child seat), the Passenger Airbag is disabledand the Telltale Lamp is turned ON to inform the driver that the PAB is disabled.As soon as operating voltage is applied to the SRSCM ignition input, the SRSCMactivates the telltale lamp for 4 seconds. OCS will send an indeterminatestatus to the SRSCM as a default setting for the passenger airbag deployment duringthe prove out period. After a crash, if OCS gets reset and sends the indeterminate status,the telltale lamp will be ON as long as the occupant status is in the indeterminatestatus. Occupant status information and telltale ststus are as below table.

OCS statusresponse message	Tell-tale Lamp	Passenger Airbag	Belt pretensioner (Passenger)	Buckle pretensioner (Passenger)	Side airbag (Passenger)
Initial 4 seconds	ON→OFF	Default	Default	Default	Default
Class 0 = Empty	ON	Disabled	Disabled	Disabled	Disable
Class 1 = Child	ON	Disabled	Disabled	Disabled	Enable
Class 2 = Adult	OFF	Enable	Enable	Enable	Enable
Defect	Default	Default	Default	Default	Default

After turning the ignition on, the telltale lamp will turn on for 4 seconds and turn off for 3 seconds during the initialization phase and be turned off for 3 seconds until a message is received from OCS system.

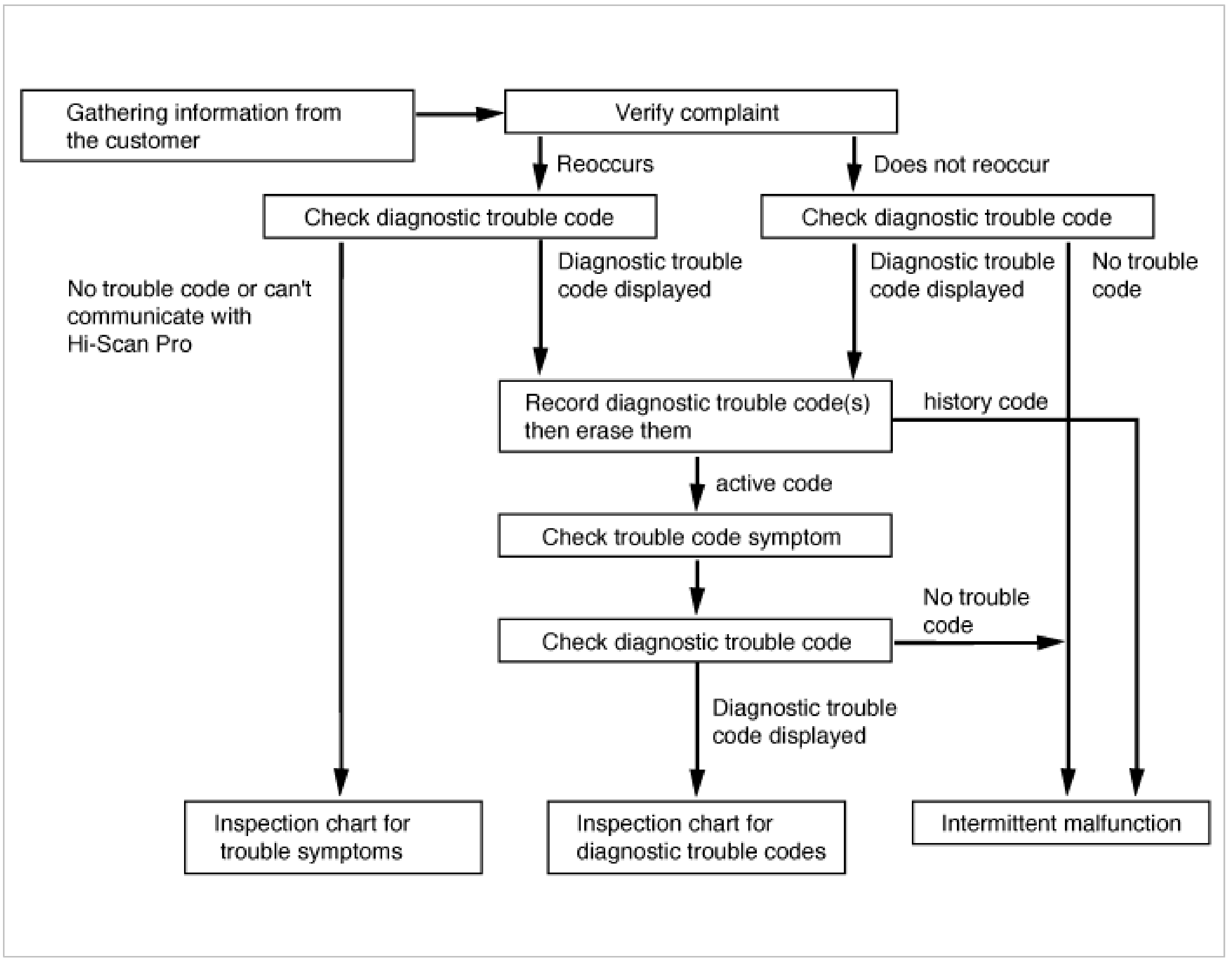
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting

Hi-Scan check

1. Turn the ignition switch off.
2. Connect the Hi-Scan Pro connector to the datalink connector located under the crash pad.
3. Connect the Hi-Scan Pro power cable.
4. Turn the ignition switch on and power on the Hi-Scan Pro.
5. Read DTCs.
6. Find and repair the trouble, and clear the DTCs using Hi-Scan Pro.
7. Disconnect the Hi-Scan Pro.

DIAGNOSTIC TROUBLESHOOTING FLOW

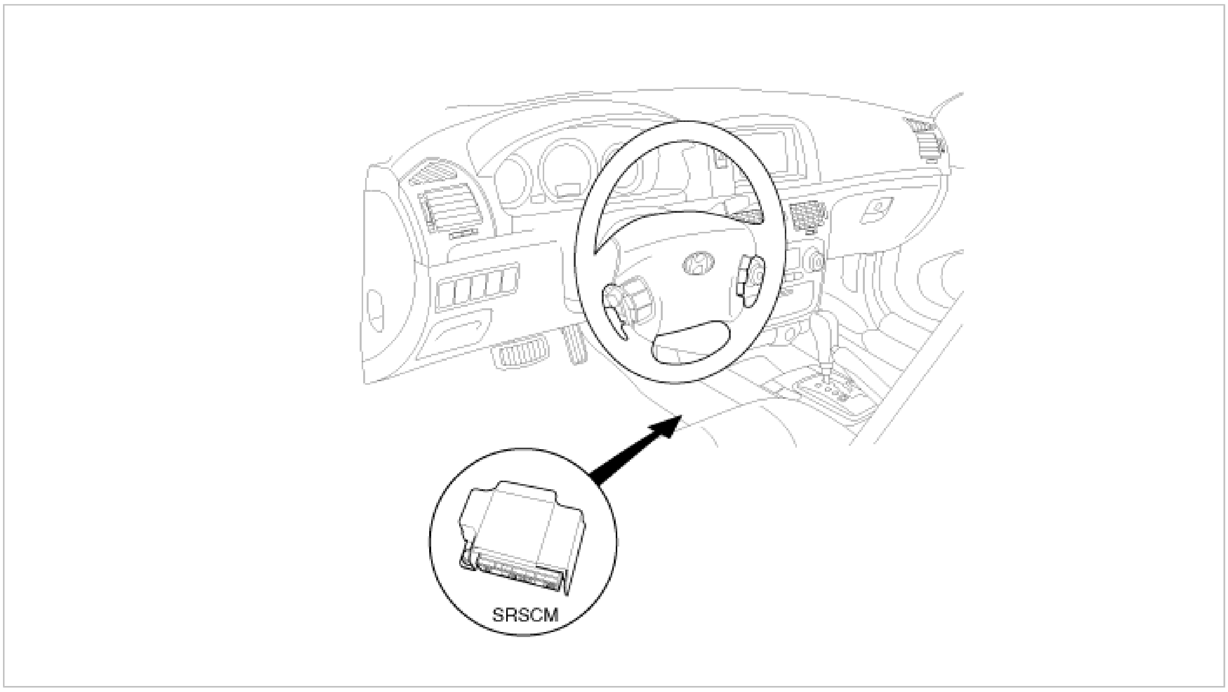


Restraint > Supplemental Restraint System Control Module (SRnodeM) > SRS Control Module (SRnodeM) > Description and Operation

DESCRIPTION

Restraint > Supplemental Restraint System Control Module (SRnodeM) > SRS Control Module (SRnodeM) > Components and Components Location

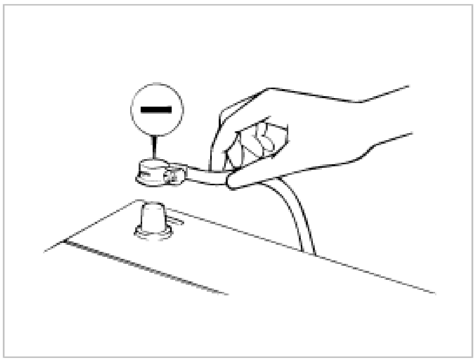
components



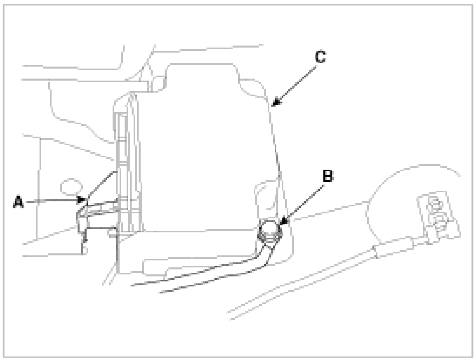
Restraint > Supplemental Restraint System Control Module (SRnodeM) > SRS Control Module (SRnodeM) > Repair procedures

REMOVAL

1. Disconnect the negative(-) cable from battery and wait for at least 3 minutes.



2. Remove ignition key from the vehicle.
3. Remove the center console.(Refer to "BD" group in this Workshop Manual).
4. Pull back the lever, then disconnect the SRSCM harness connector(A). Loosen the bolt(B), then remove the SRSCM(C).



SRSCM mounting bolt :
0.97~1.39 kgf.m(9.5 ~ 13.6 Nm ,7.0 ~ 10.03 lb-ft)

5. Installation is the reverse of removal.

NOTE

- Turn the ignition switch ON; the SRS indicator light should turn on for about six seconds and then go off.
- Always use new bolts when intalling the SRSCM.

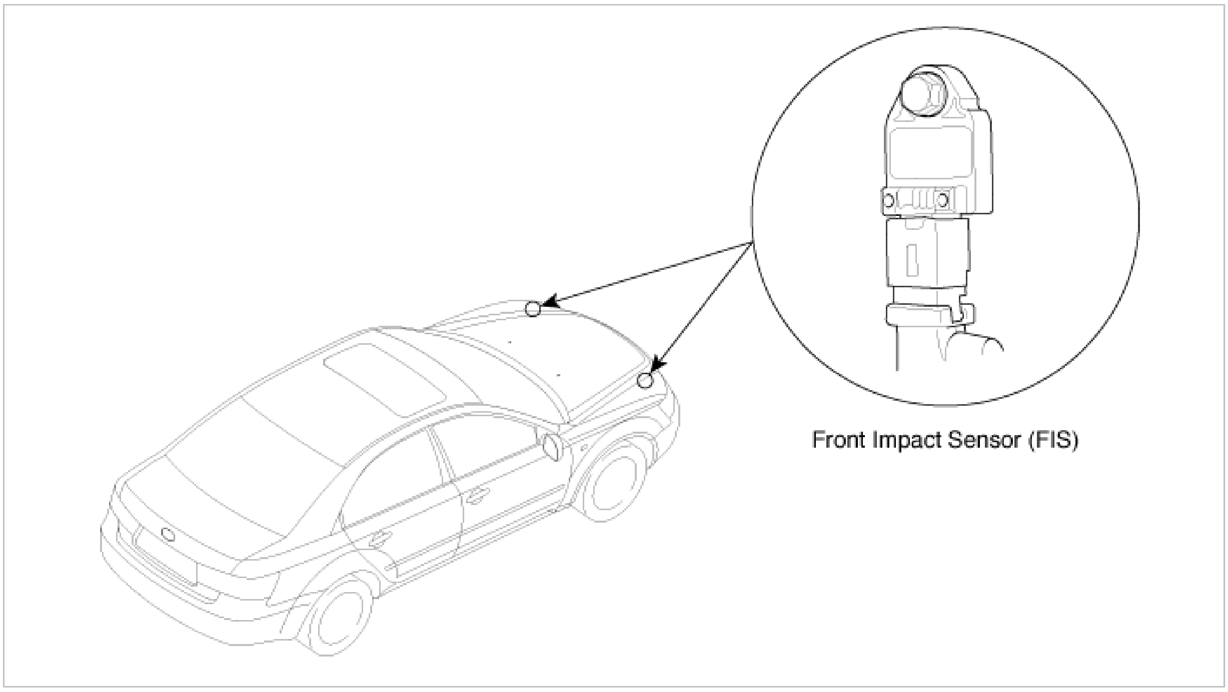
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Front Impact Sensor (FIS) > Description and Operation

DESCRIPTION

The front impact sensors (FIS) are installed inside the member inner. They are remote sensors that detect acceleration due to collision at their mounting locations. The primary purpose of the Front Impact Sensor (FIS) is to provide an indication of a collition. the Front Impact Sensor(FIS) sends acceleration data to the SRSCM.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Front Impact Sensor (FIS) > Components and Components Location

components



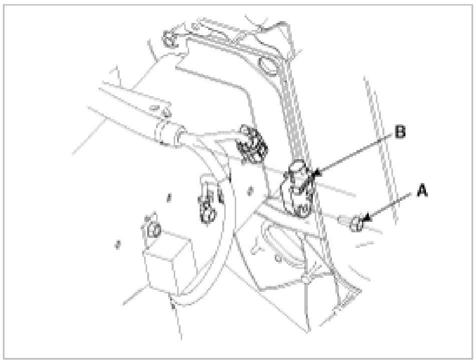
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Front Impact Sensor (FIS) > Repair procedures

removal

CAUTION

- Removal of the airbag must be performed according to the precautions/ procedures described previously.
- Before disconnecting the front impact sensor connector, disconnect the front airbag connector(s).
- Do not turn the ignition switch ON and do not connect the battery cable while replacing the front impact sensor.

1. Disconnect the negative battery cable, and wait at least three minutes before beginning work.
2. Remove the bolt(A) then remove the front impact sensor(B).



3. Installation is the reverse of removal.

NOTE

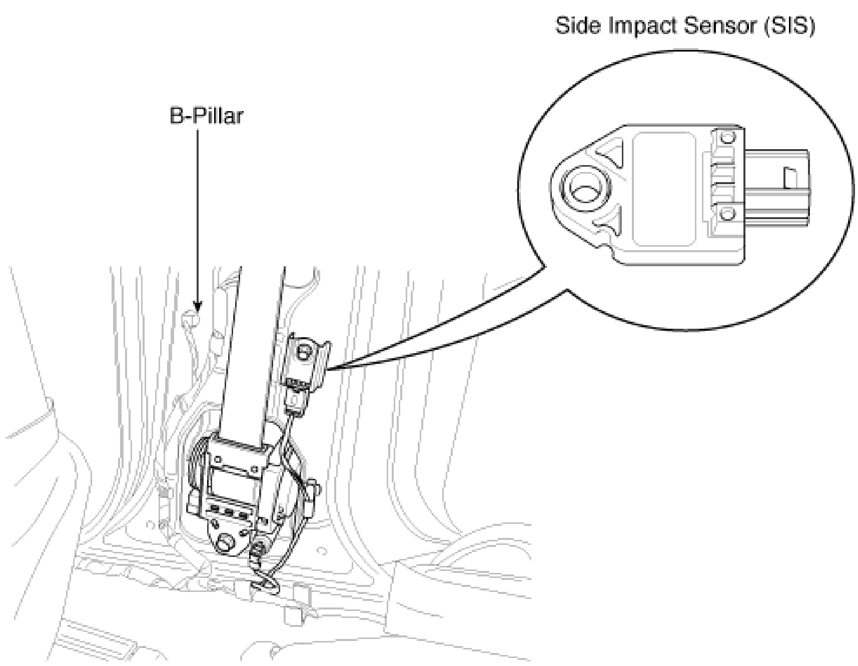
After installing the front impact sensor, confirm proper system operation: Turn the ignition switch ON: the SRS indicator light should turn on for about six seconds and then go off.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Side Impact Sensor (SIS) > Description and Operation

DESCRIPTION

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Side Impact Sensor (SIS) > Components and Components Location

components



Restraint > Supplemental Restraint System Control Module (SRnodeM) > Side Impact Sensor (SIS) > Repair procedures

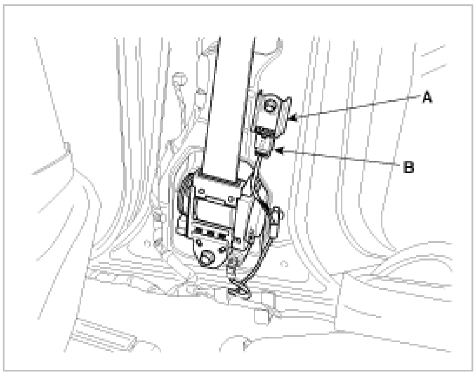
removal

CAUTION

- Removal of the airbag must be performed according to the precautions/procedures described previously.

• Before disconnecting the side impact sensor connector(s), disconnect the side airbag connector(s).
• Do not turn the ignition switch ON and do not connect the battery cable while replacing the side impact sensor.

1. Disconnect the negative battery cable, and wait at least three minutes before beginning work.
2. Remove the front door scuff trim (Refer to BD group - interior).
3. Remove the center pillar trim (Refer to BD group - interior).
4. Remove the bolt(A) then remove the side impact sensor (B).



Installation

CAUTION

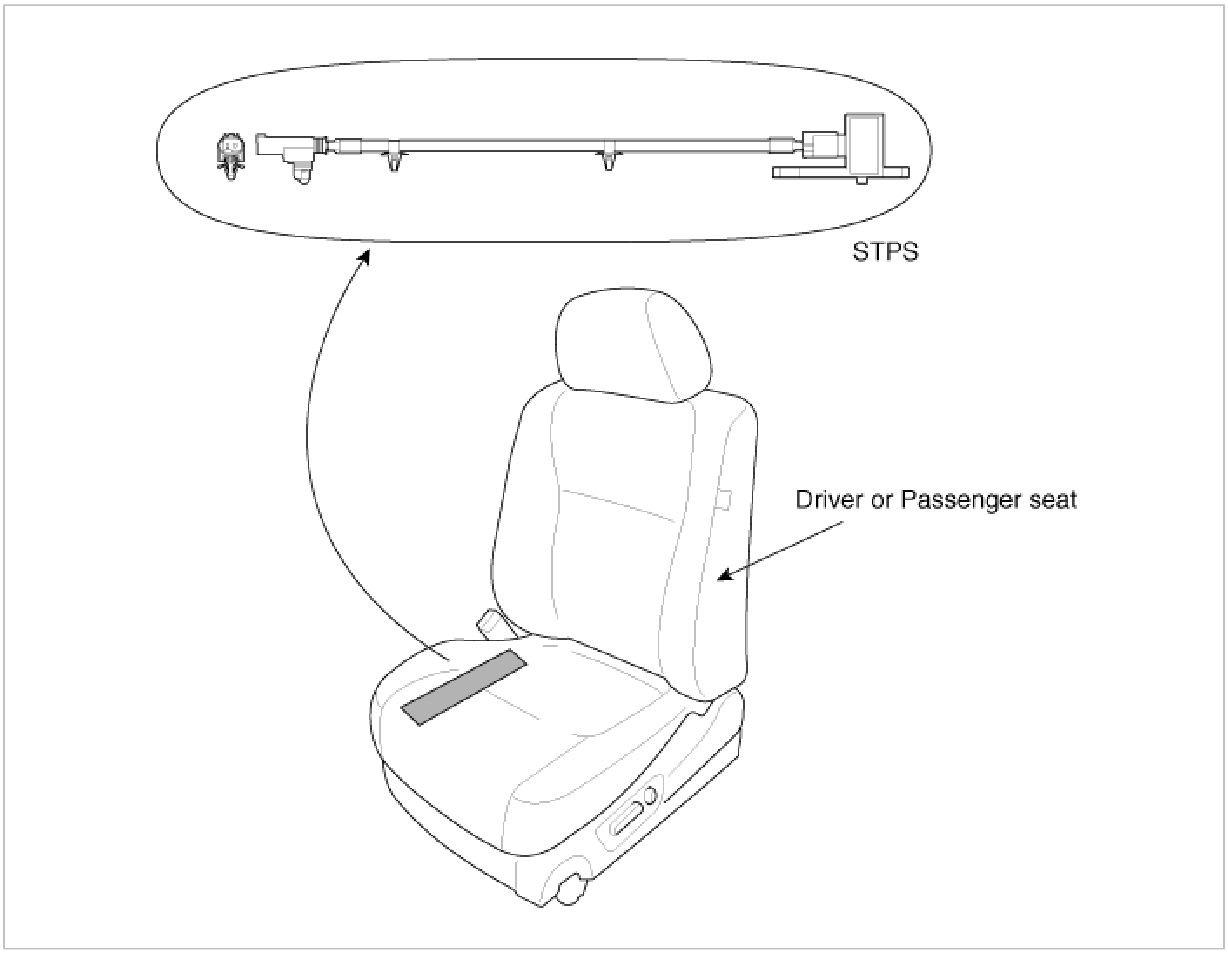
• Be sure to install the harness wires so that they are not pinched or interfere with other parts.
• Do not turn the ignition switch ON and do not connect the battery cable while replacing the side impact sensor.

1. Install the new side impact sensor with the bolt then connect the SRS harness connector to the side impact sensor.
2. Reinstall the belt pretensioner.
3. Reconnect the negative battery cable.
4. After installing the side impact sensor, confirm proper system operation: Turn the ignition switch ON: the SRS indicator light should turn on about six seconds and then go off.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Seat Track Position Sensor (STPS) > Description and Operation

DESCRIPTION

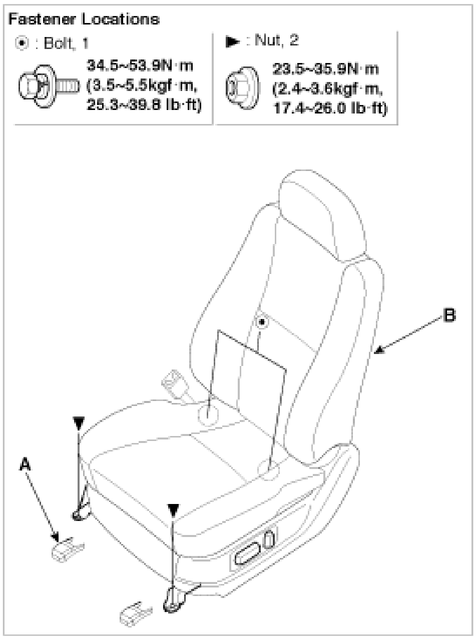
COMPONENTS



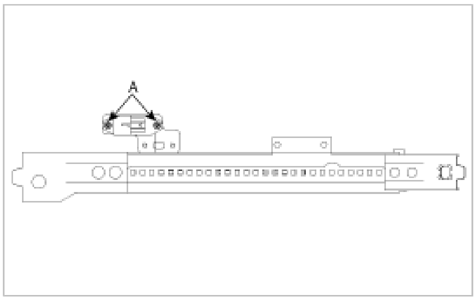
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Seat Track Position Sensor (STPS) > Repair procedures

REPLACEMENT

1. Remove the seat assembly mounting cover (A).
2. After loosening the seat assembly mounting bolt and nut, remove the seat assembly (B).



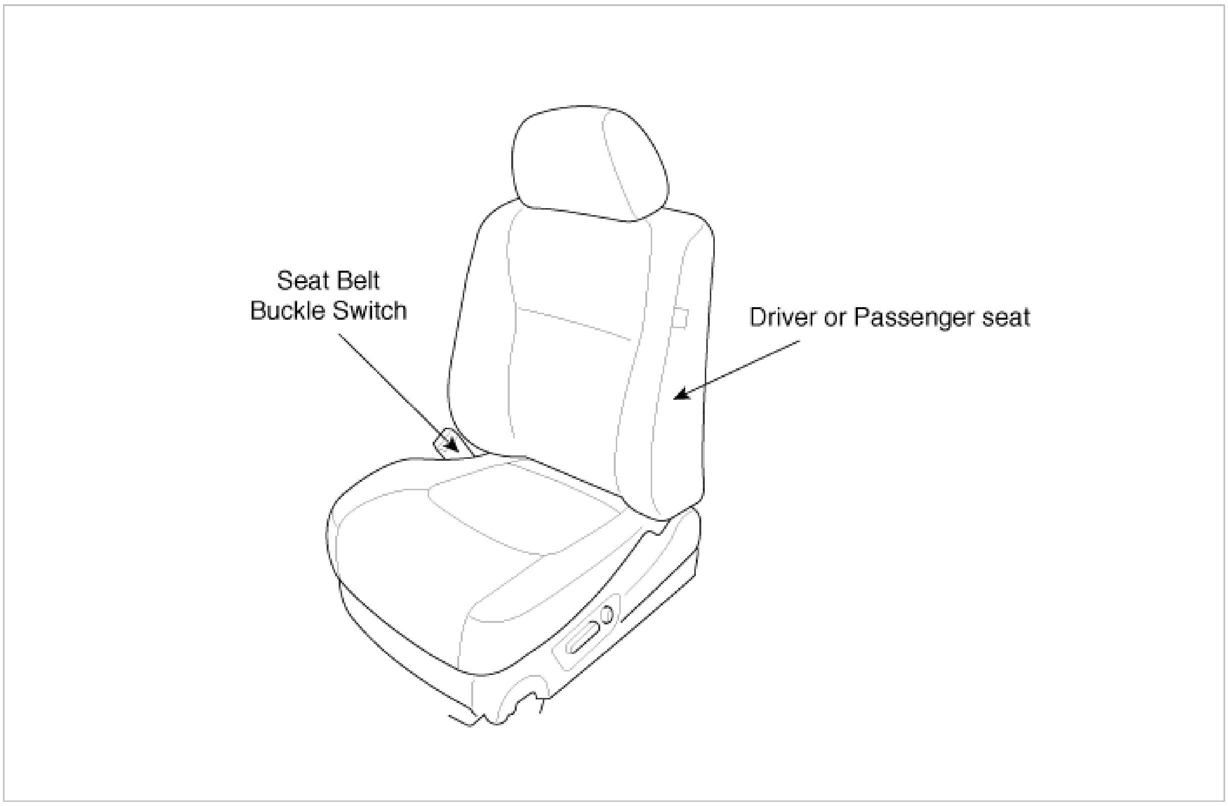
3. Disconnect the STPS connector and remove the mounting bolts(A).



Restraint > Supplemental Restraint System Control Module (SRnodeM) > Seat Belt Buckle Switch (BS) > Description and Operation

DESCRIPTION

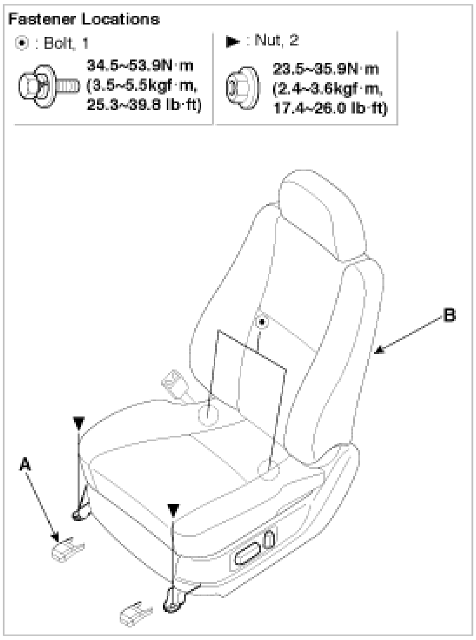
COMPONENTS



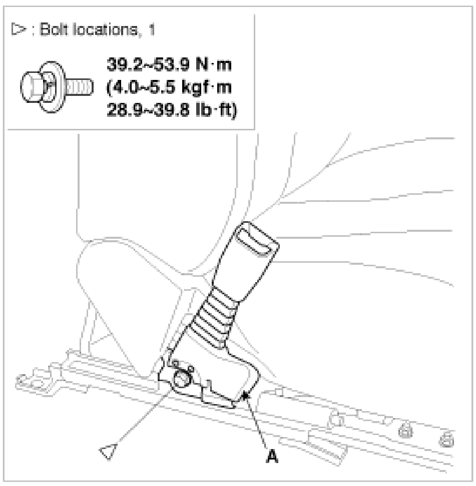
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Seat Belt Buckle Switch (BS) > Repair procedures

REPLACEMENT

1. Remove the seat assembly mounting cover (A).
2. After loosening the seat assembly mounting bolt and nut, remove the seat assembly (B).



3. Remove the wire harness of buckle from seat.
4. Remove the seat belt buckle (A).



5. Installation is the reverse of removal.

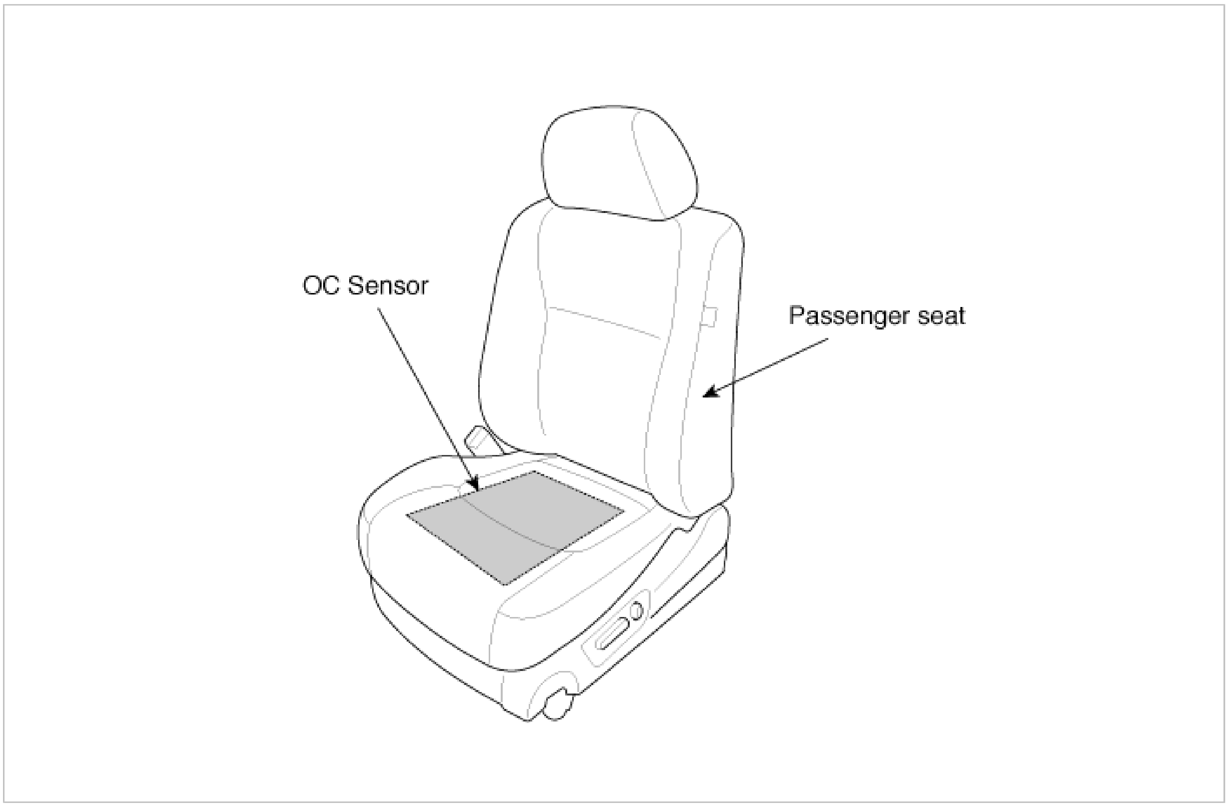
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Occupant Classification Sensor (OCS) > Description and Operation

DESCRIPTION

The system is intended to classify the occupancy status of the front passenger seat in a motor vehicle based on the measured force on the bottom seat cushion.
The system also communicates to the SRSCM whether to allow or inhibit the deployment of the passenger airbags and/or pretensioner based upon this status.
The System also measures dynamic responses of the occupant. This information is used to idenitify when a child seat is cinched down tightly with the seat belt, and to also determine if the seat is unoccupied.
However, the dynamic measurements are not intended, nor capable of monitoring the seating position of the occupant, nor can they determine the proximity of the occupant to the inflator modules.
The system should not be confused with an occupant position recognition system, or any other occupant proximity sensor.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Occupant Classification Sensor (OCS) > Components and Components Location

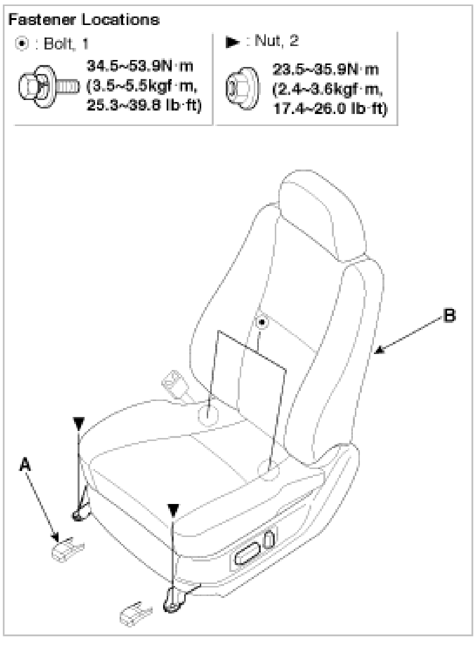
COMPONENTS



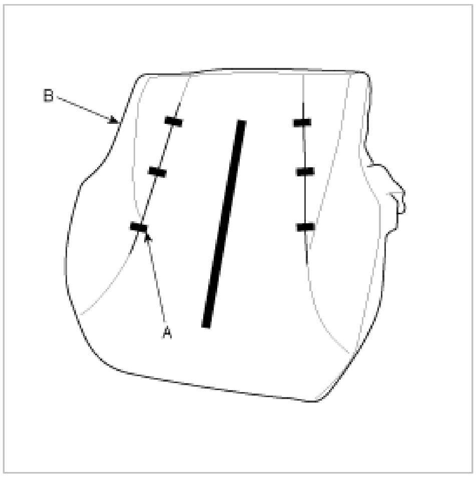
Restraint > Supplemental Restraint System Control Module (SRnodeM) > Occupant Classification Sensor (OCS) > Repair procedures

REPLACEMENT

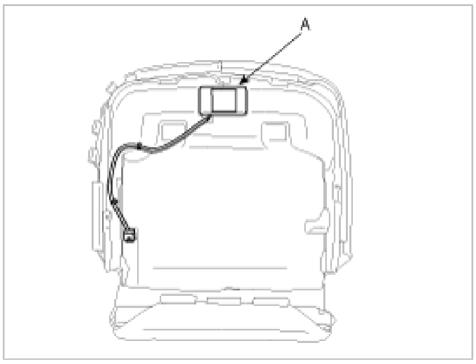
1. Remove the passenger seat assembly mounting cover (A).
2. After loosening the passenger seat assembly mounting bolt and nut, remove the seat assembly (B).



3. Remove the seat cushion. (Refer to BD-Seat)
4. After removing the hogring clip(A) on the front of seat cushion and remove the seat cushion cover(B).



5. Remove the OCS module(A).



Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1101

DTC Description

The SRSCM sets above DTC(s) if it detects that the battery voltage of restraints system is too high or too low. When the voltage returns to normal, the SRS warning light automatically goes off and a malfunction is no longer indicated.

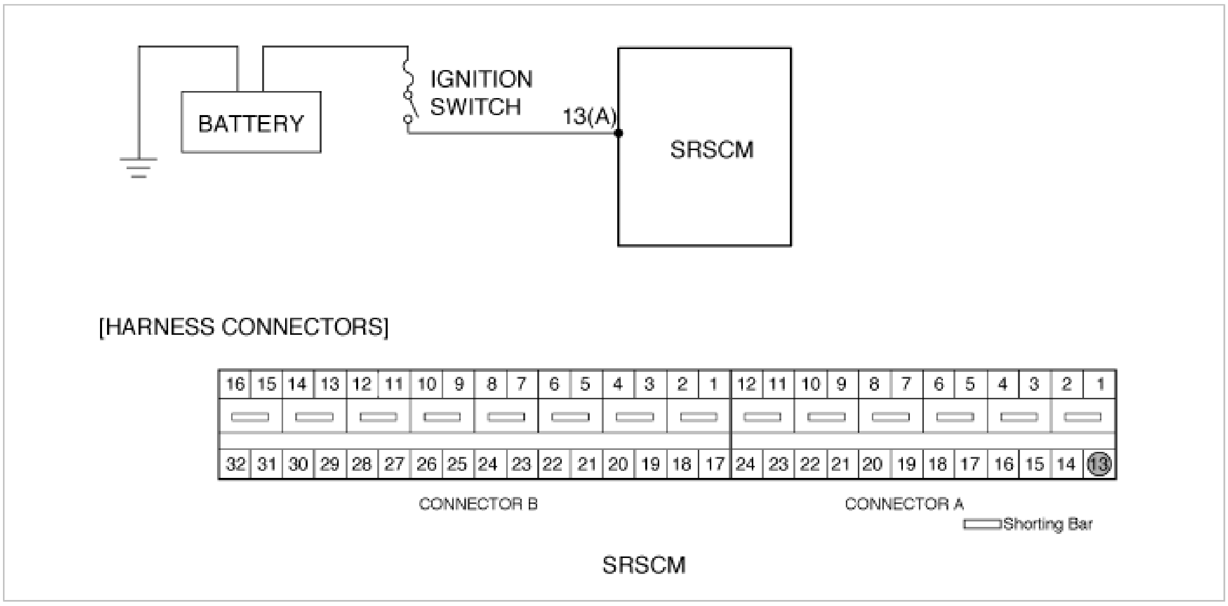
DTC Detecting Condition

DTC Condition		Probable cause
B1101	Battery Voltage > 16.0 V for 10 seconds after IG ON	• Battery • Alternator • Wiring Harness • SRSCM
B1102	Battery Voltage < 9.0 V for 10 seconds after IG ON	

Specification

Voltage : 9.0 ≤ V ≤ 16.0 V

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

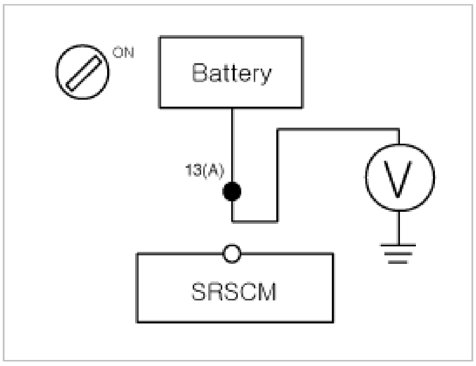
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SOURCE VOLTAGE
   (1) Turn the ignition switch to ON.
   (2) Measure voltage between the terminal 13(A) of SRSCM harness connector and chassis ground.

specification(voltage) : 9.0 ≤ V ≤ 16.0 V



Is the measured voltage within specification?

NO

▸ Check the battery.

YES

▸ Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

3. CHECK THE BATTERY
   (1) Check the battery.
   - Refer to "EE" group in this SERVICE MANUAL.

   Is the battery normal?

YES

▸ Check the alternator.

NO

▸ Repair or replace the battery(Refer to "EE" group in this SERVICE MANUAL).

4. CHECK ALTERNATOR
   (1) Check the altenator.
   - Refer to "EE" group in this SERVICE MANUAL.

   Is the alternator normal?

YES

▸ Check wiring harness.

NO

▸ Repair or replace the alternator(Refer to "EE" group in this SERVICE MANUAL).

5. CHECK WIRING HARNESS
   (1) Check the wiring harness between the battery and SRSCM.
   Check the wiring harness between the battery and chassis ground.
   Is the wiring harness normal?

YES

▸ Check the DTC again.

NO

▸ Repair or Replace the wiring harness.

6. CHECK THE DTC AGAIN
   (1) Turn the ignition switch to LOCK and wait for at least 30 seconds.

> **CAUTION**
>
> Check again that the battery negative (-) terminal is disconnected from the battery.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC?

YES

▸ Perform the troubleshooting procedures associated with those codes.

NO

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1102

DTC Description

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

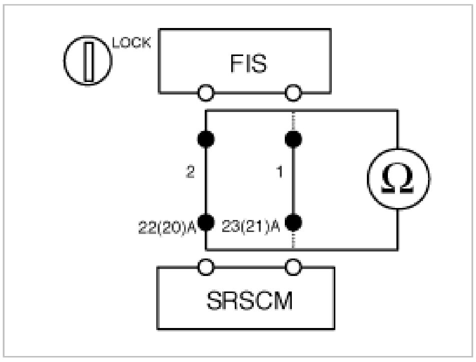
2. CHECK FIS CIRCUIT
   (1) Disconnect the battery, wait 3 minutes.
   (2) Disconnect the FIS and SRSCM.
   (3) Measure the resistance between terminal 1 of the FIS harness connector and terminal A 23(21) of SRSCM harness connector.
   (4) Measure the resistance between terminal 2 of the FIS harness connector and terminal A 22(20) of SRSCM harness connector.

   specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸Check Front Impact Sensor.

NO

▸ Repair or replace the wiring harness between the FIS and the SRSCM.

3. CHECK FRONT IMPACT SENSOR
   (1) Replace the front impact sensor(FIS) with a new one.
   - Refer to "Front Impact Sensor(FIS)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to FIS?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace the Front Impact Sensor(FIS).

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1329

DTC Description

The detecting system for front crash consists of the SRSCM and two Front Impact Sensors (FIS). The SRSCM sets above DTC(s) if it detects that any FIS is defective or there is communication error between any FIS and the SRSCM.

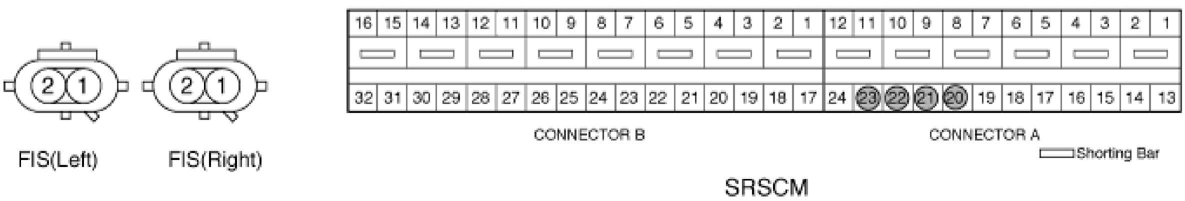
[HARNESS CONNECTOR]



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

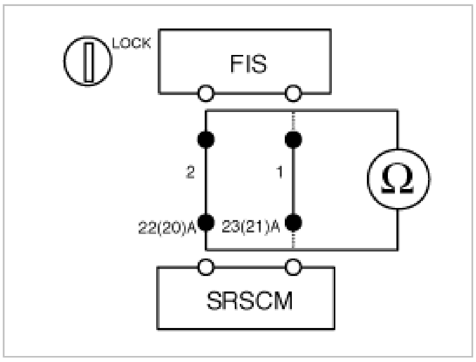
Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK FIS CIRCUIT
   (1) Disconnect the battery, wait 3 minutes.
   (2) Disconnect the FIS and SRSCM.

(3) Measure the resistance between terminal 1 of the FIS harness connector and terminal A 23(21) of SRSCM harness connector.

(4) Measure the resistance between terminal 2 of the FIS harness connector and terminal A 22(20) of SRSCM harness connector.

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸Check Front Impact Sensor.

NO

▸ Repair or replace the wiring harness between the FIS and the SRSCM.

3. CHECK FRONT IMPACT SENSOR
   (1) Replace the front impact sensor(FIS) with a new one.
   - Refer to "Front Impact Sensor(FIS)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to FIS?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace the Front Impact Sensor(FIS).

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

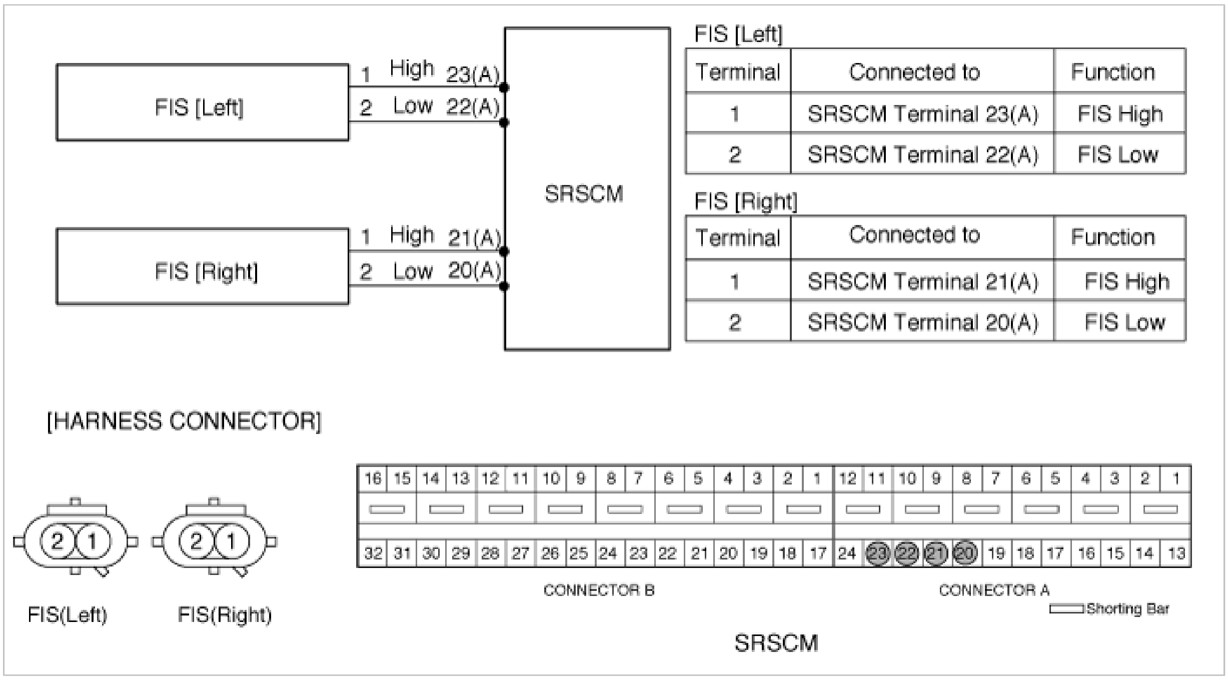
DTC Description

The detecting system for front crash consists of the SRSCM and two Front Impact Sensors (FIS). The SRSCM sets above DTC(s) if it detects that any FIS is defective or there is communication error between any FIS and the SRSCM.

DTC Detecting Condition

DTC	Condition	Probable cause
B1328 B1329 B1333 B1334	• Open between FIS and SRSCM • Front Impact Sensor(FIS) Malfunction • SRSCM Malfunction	• Wiring Harness • Front Impact Sensor(FIS) squib • SRSCM

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.

(3) Remove the DAB module and disconnect the DAB connector.

(4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(5) Disconnect the SRSCM connector.

2. CHECK FIS CIRCUIT

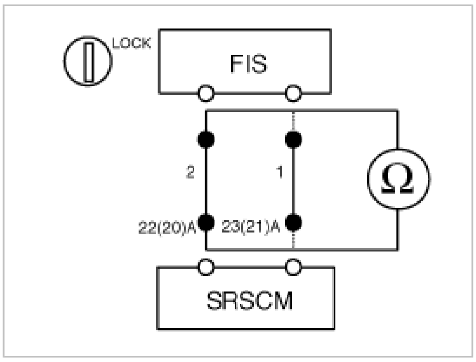
(1) Disconnect the battery, wait 3 minutes.

(2) Disconnect the FIS and SRSCM.

(3) Measure the resistance between terminal 1 of the FIS harness connector and terminal A 23(21) of SRSCM harness connector.

(4) Measure the resistance between terminal 2 of the FIS harness connector and terminal A 22(20) of SRSCM harness connector.

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸Check Front Impact Sensor.

NO

▸ Repair or replace the wiring harness between the FIS and the SRSCM.

3. CHECK FRONT IMPACT SENSOR

(1) Replace the front impact sensor(FIS) with a new one.

- Refer to "Front Impact Sensor(FIS)" section in this SERVICE MANUAL.

(2) Install the DAB module and connect the DAB connector.

(3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(4) Connect the SRSCM connector.

(5) Connect the negative (-) terminal to the battery.

(6) Connect a Hi-Scan(Pro) to the data link connector.

(7) Turn the ignition switch to ON and check the vehicle again.
Does Hi-Scan (Pro) indicate any DTC related to FIS?

YES

▸ Go to next step.

NO

▸ Replace the Front Impact Sensor(FIS).

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1346

DTC Description

The Driver Airbag circuit consists of the SRSCM, Clockspring and the Driver Airbag (DAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of DAB squib is too high or low.

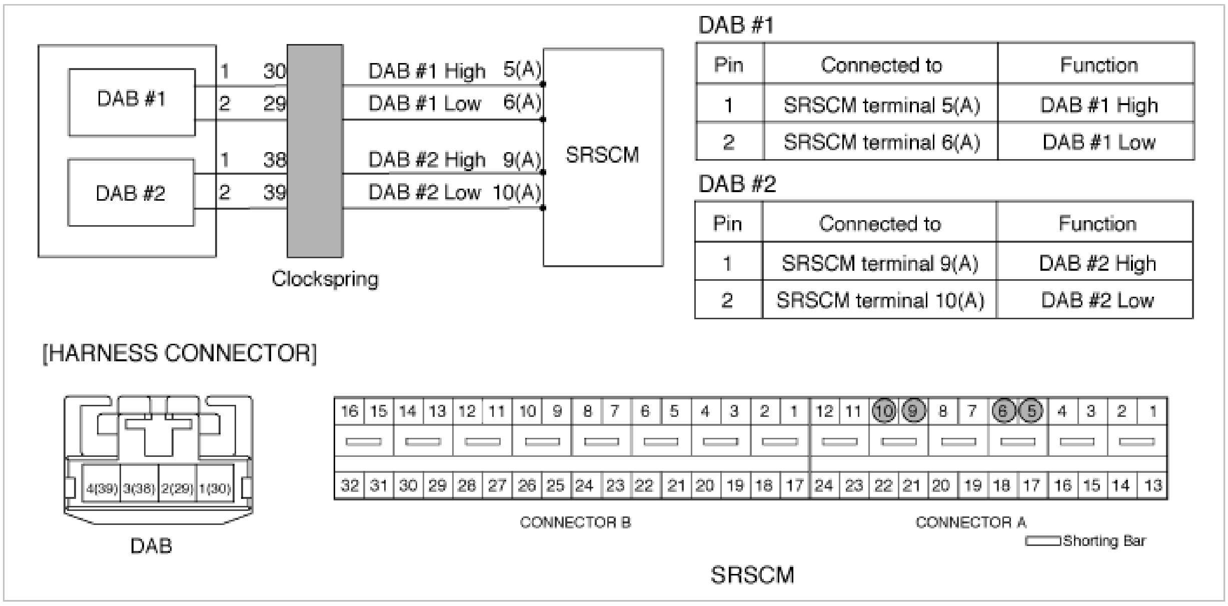
DTC Detecting Condition

DTC	Condition	Probable cause
B1346 B1347	• Too high or low resistance between DAB high(+) and DAB low (-) • Driver Airbag (DAB) Malfunction • Clockspring Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Driver Airbag (DAB) squib • Clockspring • SRSCM • Partially connected connector

Specification

DAB resistance : $1.9 \le R \le 3.0\ \Omega$

Schematic Diagram



DAB #1

Pin	Connected to	Function
1	SRSCM terminal 5(A)	DAB #1 High
2	SRSCM terminal 6(A)	DAB #1 Low

DAB #2

Pin	Connected to	Function
1	SRSCM terminal 9(A)	DAB #2 High
2	SRSCM terminal 10(A)	DAB #2 Low

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

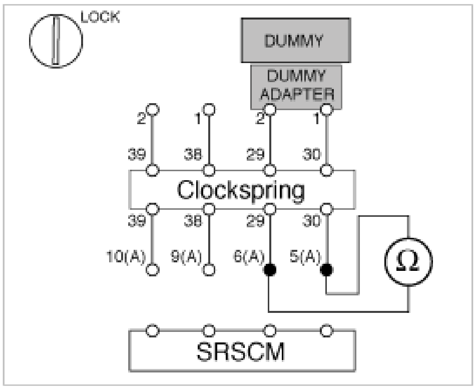
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB,SAB,CAB,BPT,BUPT,FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK DAB RESISTANCE

> **CAUTION**
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on DAB harness connector.
●Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 5 and 6 of SRSCM harness connector(A).

DAB resistance : $1.9 \le R \le 3.0\ \Omega$



(3) Is the measured resistance within specification?

NO

▸ Check open circuit.

YES

▸ Replace the Driver Airbag(DAB) module.

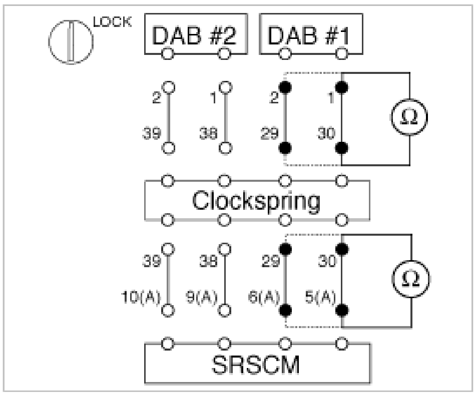
3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of DAB stage #1 harness connector and the terminal 30 of clockspring harness connector.

   (2) Measure resistance between the terminal 2 of DAB stage #1 harness connector and the terminal 29 of clockspring harness connector.

   (3) Measure resistance between the terminal 30 of clockspring harness connector and the terminal 5 of SRSCM harness connector(A).

   (4) Measure resistance between the terminal 29 of clockspring harness connector and the terminal 6 of SRSCM harness connector(A).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸ Check short circuit.

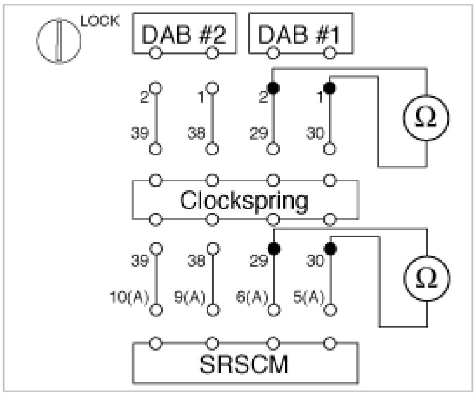
NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of DAB stage #1 harness connector.

   (2) Measure resistance between the terminal 29 and 30 of clockspring harness connector.

specification(resistance) : ∞ Ω



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1347

   (3) Remove the DAB module and disconnect the DAB connector.
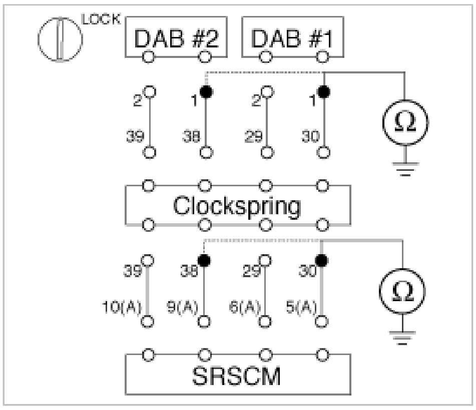
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 1 of DAB stage #1 harness connector and chassis ground.(DAB stage #1)
   (2) Measure resistance between the terminal 1 of DAB stage #2 harness connector and chassis ground.(DAB stage #2)
   (3) Measure resistance between the terminal 30 of clockspring harness connector and chassis ground.(DAB stage #1)
   (4) Measure resistance between the terminal 38 of clockspring harness connector and chassis ground.(DAB stage #2)

specification(resistance) : infinite



(5) Is the measured resistance within specification?

YES

▸Check the DAB Module.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

3. CHECK THE DAB MODULE
   (1) Replace the Driver Airbag(DAB) with a new one.
   - Refer to "Driver Airbag(DAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to DAB?

YES

▸Check the clockspring.

NO

▸Replace the Driver Airbag(DAB).

4. CHECK THE CLOCKSPRING
   (1) Check the clockspring.
   Is the clockspring normal?

YES

▸ Go to next step.

NO

▸ Replace the clockspring.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1349

DTC Description

The Driver Airbag circuit consists of the SRSCM, Clockspring and the Driver Airbag (DAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects short to battery line on the DAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1349 B1484	• Short to battery line between DAB and clockspring • Short to battery line between clockspring and SRSCM • Driver Airbag (DAB) Malfunction • Clockspring Malfunction • SRSCM Malfunction	• Short to battery line on wiring harness • Driver Airbag (DAB) squib • Clockspring • SRSCM

Schematic Diagram

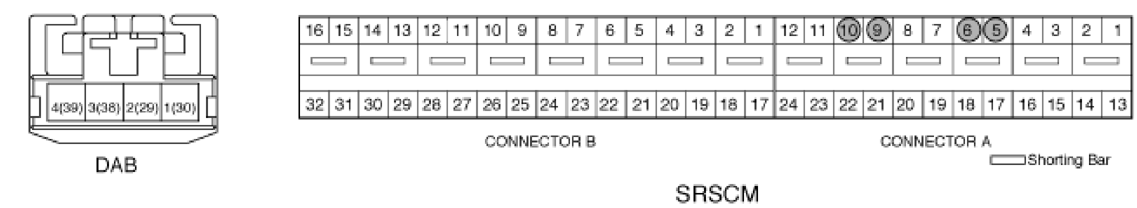
[HARNESS CONNECTOR]



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

CAUTION

Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION

(1) Turn the ignition switch to LOCK.

(2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.

(3) Remove the DAB module and disconnect the DAB connector.

(4) Disconnect the connectors of the PAB,SAB,CAB,BPT,BUPT,FIS and SIS.

(5) Disconnect the SRSCM connector.

2. CHECK SHORT TO BATTERY LINE

(1) Connect the negative (-) terminal to the battery.

(2) Turn the ignition switch to ON.

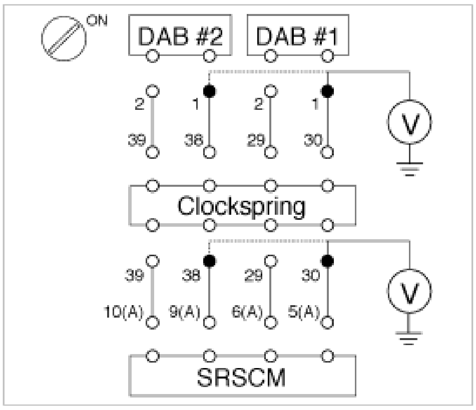
(3) Measure voltage between the terminal 1 of DAB stage #1 harness connector and chassis ground(-).(DAB stage #1)

(4) Measure voltage between the terminal 1 of DAB stage #2 harness connector and chassis ground(-).(DAB stage #2)

(5) Measure voltage between the terminal 30 of clockspring harness connector and chassis ground(-).(DAB stage #1)

(6) Measure voltage between the terminal 38 of clockspring harness connector and chassis ground(-).(DAB stage #2)

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸Check the DAB module.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

3. CHECK THE DAB MODULE

(1) Replace the Driver Airbag(DAB) with a new one.

● "Refer to "Driver Airbag(DAB)" section in this SERVICE MANUAL.

(2) Install the DAB module and connect the DAB connector.

(3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(4) Connect the SRSCM connector.

(5) Connect the negative (-) terminal to the battery.

(6) Connect a Hi-Scan(Pro) to the data link connector.

(7) Turn the ignition switch to ON and check the vehicle again.

Does Hi-Scan (Pro) indicate any DTC related to DAB?

YES

▸Check the clockspring.

NO

▸Replace the Driver Airbag(DAB).

4. CHECK THE CLOCKSPRING

(1) Check the clockspring.

Is the clockspring normal?

YES

▸ Go to next step.

NO

▸ Replace the clockspring.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1352

DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of PAB squib is too high or low.

DTC Detecting Condition

DTC	Condition	Probable cause
B1352 B1353	• Too high or low resistance between PAB high(+) and PAB low (-) • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Passenger Airbag (PAB) squib • SRSCM • Partially connected connector

Specification

PAB resistance : $1.8 \le R \le 2.4\ \Omega$

Schematic Diagram

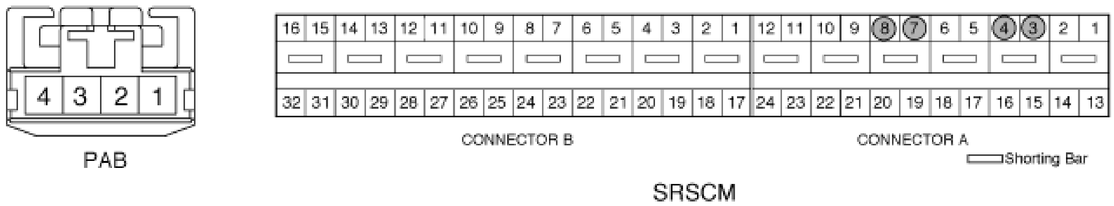
[HARNESS CONNECTOR]



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

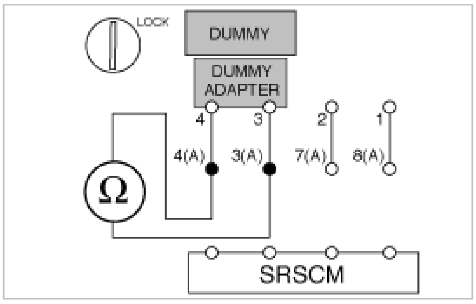
2. CHECK PAB RESISTANCE

> CAUTION
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on PAB harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 4 and 3 of SRSCM harness connector(A).

PAB resistance : $1.8 \le R \le 2.4\ \Omega$



(3) Is the measured resistance within specification?

YES

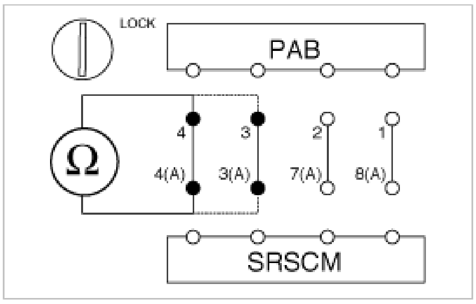
▸ Replace the Passenger Airbag(PAB) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 4 of PAB harness connector and the terminal 4 of SRSCM harness connector(A).
   (2) Measure resistance between the terminal 3 of PAB harness connector and the terminal 3 of SRSCM harness connector(A).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

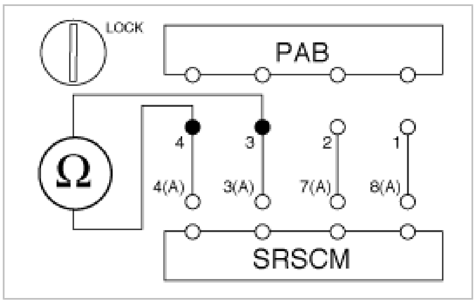
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the PAB and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 4 and 3 of PAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▶ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▶Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1353

DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of PAB squib is too high or low.

DTC Detecting Condition

DTC	Condition	Probable cause
B1352 B1353	• Too high or low resistance between PAB high(+) and PAB low (-) • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Passenger Airbag (PAB) squib • SRSCM • Partially connected connector

Specification

PAB resistance : $1.8 \leq R \leq 2.4\ \Omega$

Schematic Diagram

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

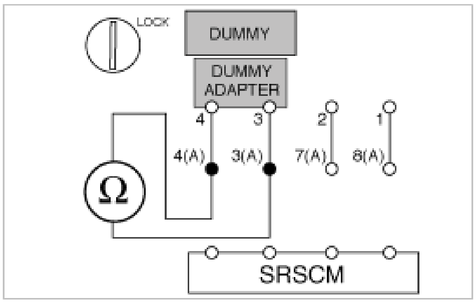
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK PAB RESISTANCE

> **CAUTION**
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on PAB harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 4 and 3 of SRSCM harness connector(A).

PAB resistance : $1.8 \le R \le 2.4\ \Omega$



(3) Is the measured resistance within specification?

YES

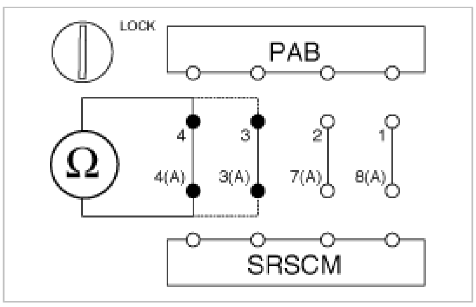
▸ Replace the Passenger Airbag(PAB) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 4 of PAB harness connector and the terminal 4 of SRSCM harness connector(A).
   (2) Measure resistance between the terminal 3 of PAB harness connector and the terminal 3 of SRSCM harness connector(A).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

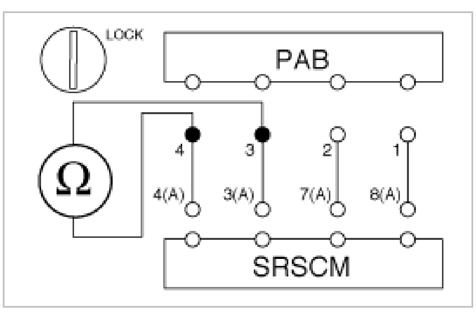
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the PAB and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 4 and 3 of PAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1354

DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects short to ground on the PAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1354 B1487	• Short to ground between PAB module and SRSCM • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Short to ground on wiring harness • Passenger Airbag (PAB) squib • SRSCM

Schematic Diagram

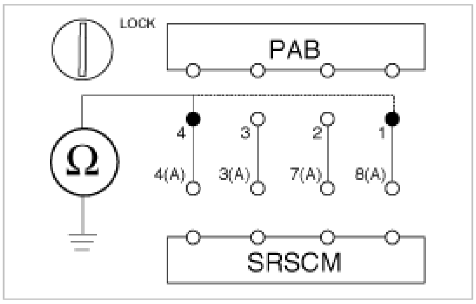
   (5) Disconnect the SRSCM connector.

2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 4 of PAB harness connector and chassis ground.(PAB stage #1)
   (2) Measure resistance between the terminal 1 of PAB harness connector and chassis ground.(PAB stage #2)

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Check the PAB Module.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

3. CHECK THE PAB MODULE
   (1) Replace the Passenger Airbag (PAB) with a new one.
   - Refer to "Passenger Airbag (PAB)" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to PAB?

YES

▸ Go to next step.

NO

▸Replace PAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

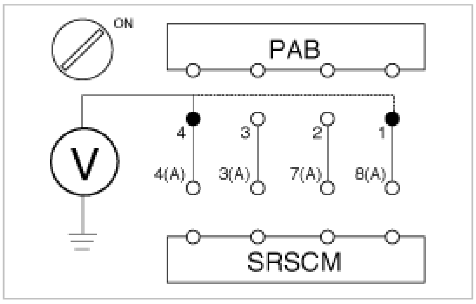
   (3) Measure voltage between the terminal 4 of PAB harness connector and chassis ground(-).(PAB stage #1)
   (4) Measure voltage between the terminal 1 of PAB harness connector and chassis ground(-).(PAB stage #2)

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the PAB Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the PAB and the SRSCM.

3. CHECK THE PAB MODULE
   (1) Replace the Passenger Airbag(PAB) with a new one.
   - Refer to "Passenger Airbag(PAB)" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to PAB?

YES

▸ Go to next step.

NO

▸Replace PAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1361

DTC Description

The Seat Belt Pretensioner circuit consists of the SRSCM and two Seat Belt Pretensioner (BPT).
The SRSCM sets above DTC(s) if it detects that the resistance of BPT squib is too high or low.

DTC Detecting Condition

DTC	Condition	Probable cause
B1361 B1362 B1367 B1368	• Too high or low resistance between BPT high(+) and BPT low (-) • Seat Belt Pretensioner (BPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Belt Pretensioner (BPT) squib • SRSCM

Specification

BPT resistance : $1.9 \le R \le 2.8\ \Omega$

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(5) Disconnect the SRSCM connector.

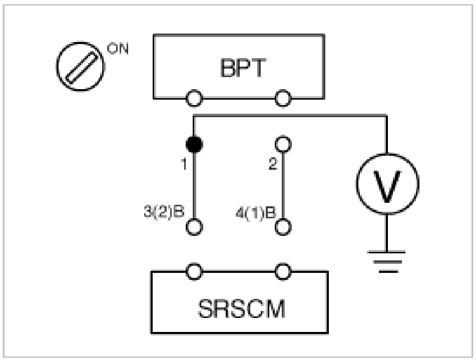
2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of BPT harness connector and chassis ground(-).

   specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▶Check the BPT Module.

NO

▶Repair the short to battery line circuit on wiring harness between the BPT and the SRSCM.

3. CHECK THE BPT MODULE
   (1) Replace the Belt Pretensioner (BPT) with a new one.
   - Refer to "Belt Pretensioner (BPT)" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Belt Pretensioner (BPT)?

YES

▶ Go to next step.

NO

▶Replace BPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▶ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1367

DTC Description

The Seat Belt Pretensioner circuit consists of the SRSCM and two Seat Belt Pretensioner (BPT).
The SRSCM sets above DTC(s) if it detects that the resistance of BPT squib is too high or low.

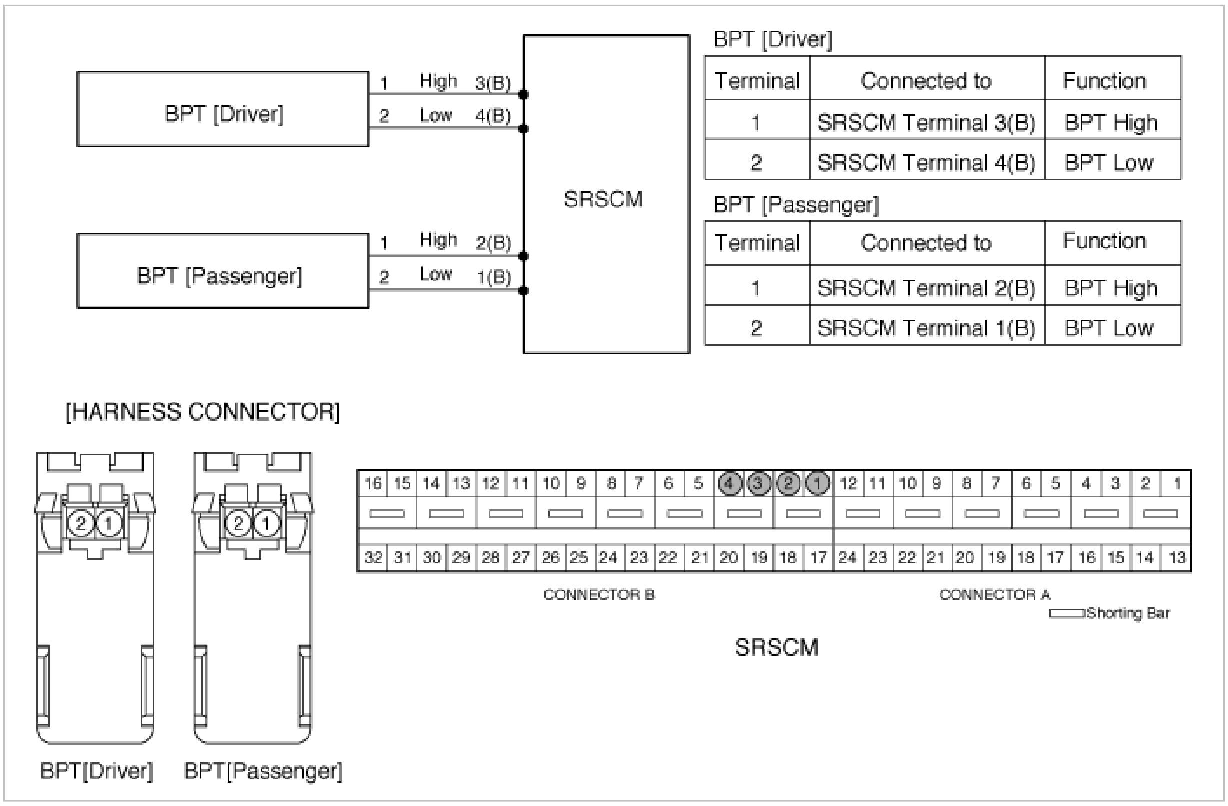
DTC Detecting Condition

DTC	Condition	Probable cause
B1361 B1362 B1367 B1368	• Too high or low resistance between BPT high(+) and BPT low (-) • Seat Belt Pretensioner (BPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Belt Pretensioner (BPT) squib • SRSCM

Specification

BPT resistance : 1.9 ≤ R ≤2.8 Ω

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

CAUTION

Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK BPT RESISTANCE

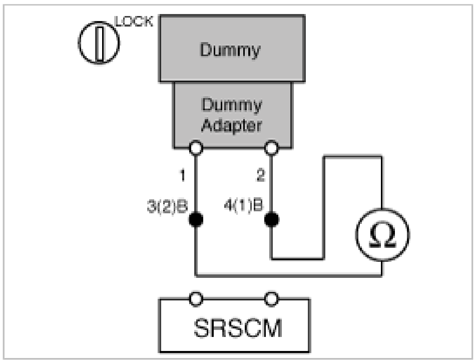
CAUTION

Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on BPT harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 3(2) and 4(1) of SRSCM harness connector(B).

BPT resistance : $1.9 \leq R \leq 2.8\ \Omega$



Is the measured resistance within specification?

YES

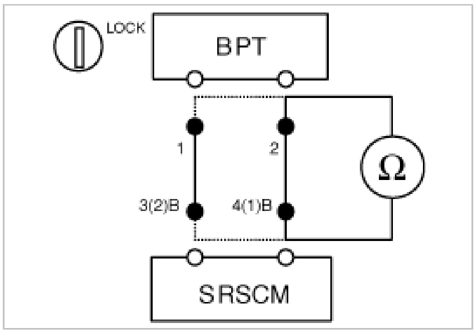
▸ Replace the Seat Belt Pretensioner(BPT) module.

NO

▸Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of BPT harness connector and the terminal 3(2) of SRSCM harness connector (B).
   (2) Measure resistance between the terminal 2 of BPT harness connector and the terminal 4(1) of SRSCM harness connector (B).

specification(resistance) : below $1\ \Omega$



Is the measured resistance within specification?

YES

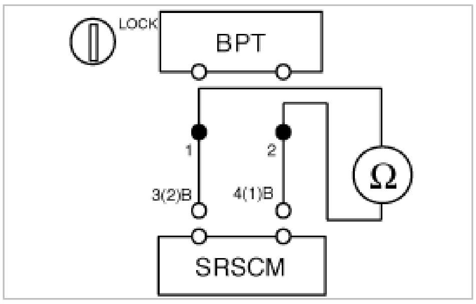
▸ Check short circuit.

NO

▸ Repair or replace the wiring harness between the BPT and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of BPT harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the BPT and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1368

DTC Description

The Seat Belt Pretensioner circuit consists of the SRSCM and two Seat Belt Pretensioner (BPT).
The SRSCM sets above DTC(s) if it detects that the resistance of BPT squib is too high or low.

DTC Detecting Condition

DTC	Condition	Probable cause
B1361 B1362 B1367 B1368	• Too high or low resistance between BPT high(+) and BPT low (-) • Seat Belt Pretensioner (BPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Belt Pretensioner (BPT) squib • SRSCM

Specification

BPT resistance : 1.9 ≤ R ≤2.8 Ω

> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

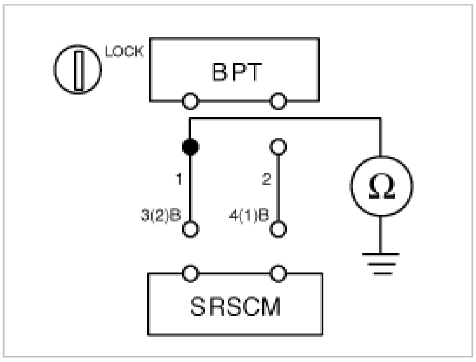
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 1 of BPT harness connector and chassis ground.

   specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸Check the BPT Module.

NO

▸ Repair or replace the wiring harness between the BPT and the SRSCM.

3. CHECK THE BPT MODULE
   (1) Replace the Belt Pretensioner (BPT) with a new one.
   - Refer to "Belt Pretensioner (BPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Belt Pretensioner (BPT)?

   YES

   ▸Go to next step.

   NO

   ▸Replace BPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON.

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1370

DTC Description

The Seat Belt Pretensioner consists of the SRSCM and two Seat Belt Pretensioner (BPT). The SRSCM sets above DTC(s) if it detects short to battery line on the BPT circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1364 B1370	• Short to battery line between BPT and SRSCM • Seat Belt Pretensioner (BPT) Malfunction • SRSCM Malfunction	• Short to battery line circuit on wiring harness • Seat Belt Pretensioner (BPT) squib • SRSCM

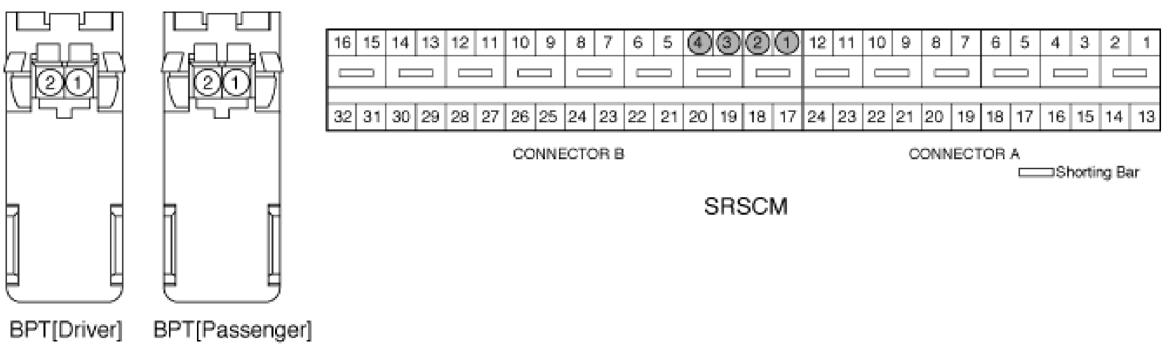
[HARNESS CONNECTOR]



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

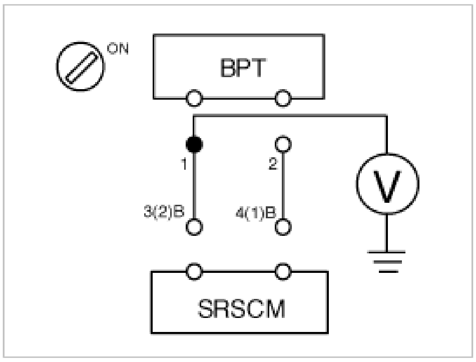
(5) Disconnect the SRSCM connector.

2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.

   (2) Turn the ignition switch to ON.

   (3) Measure voltage between the terminal 1 of BPT harness connector and chassis ground(-).

   specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸Check the BPT Module.

NO

▸Repair the short to battery line circuit on wiring harness between the BPT and the SRSCM.

3. CHECK THE BPT MODULE
   (1) Replace the Belt Pretensioner (BPT) with a new one.
   - Refer to "Belt Pretensioner (BPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Belt Pretensioner (BPT)?

YES

▸ Go to next step.

NO

▸Replace BPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

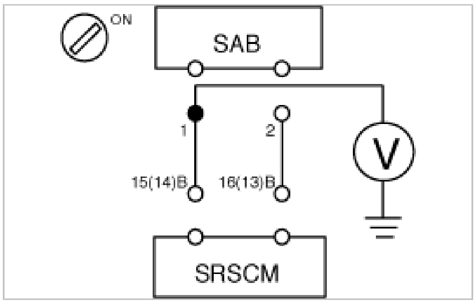
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of SAB harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the SAB Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the SAB and the SRSCM.

3. CHECK THE SAB MODULE
   (1) Replace the Side Airbag(SAB) with a new one.
   - Refer to "Side Airbag(SAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Side Airbag(SAB)?

YES

▸ Go to next step.

NO

▸Replace SAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▶ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▶Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1382

DTC Description

The Side Airbag circuit consists of the SRSCM and two Side Airbag (SAB). The SRSCM sets above DTC(s) if it detects that the resistance of SAB squib is too high or low.

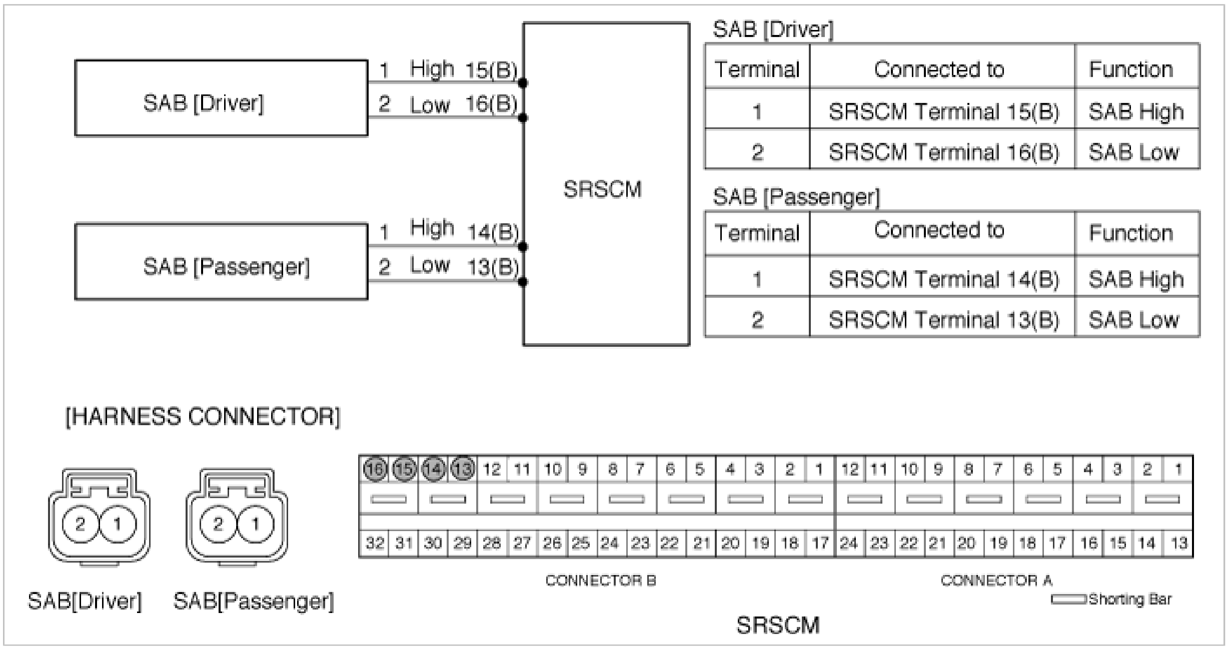
DTC Detecting Condition

DTC	Condition	Probable cause
B1378 B1379 B1382 B1383	• Too high or low resistance between SAB high(+) and SAB low (-) • Side Airbag (SAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Side Airbag (SAB) squib • SRSCM

Specification

SAB resistance : 1.8 ≤ R ≤ 2.6 Ω

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

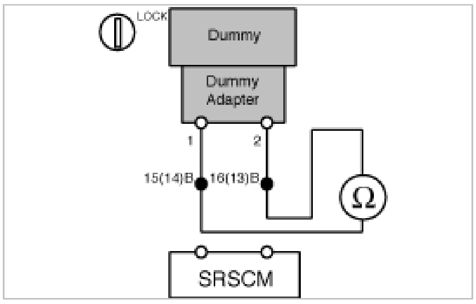
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SAB RESISTANCE

> **CAUTION**
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on SAB harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 15(14) and 16(13) of SRSCM harness connector(B).

SAB resistance : $1.8 \le R \le 2.6\ \Omega$



Is the measured resistance within specification?

YES

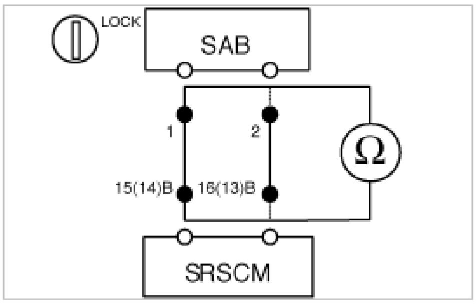
▸Replace the Side Airbag(SAB) module.

NO

▸Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of SAB harness connector and the terminal 15(14) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of SAB harness connector and the terminal 16(13) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

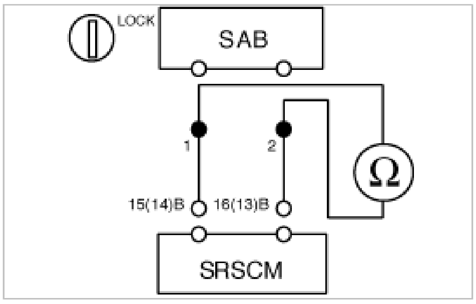
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the SAB nd the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of SAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the SAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▶ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▶Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1383

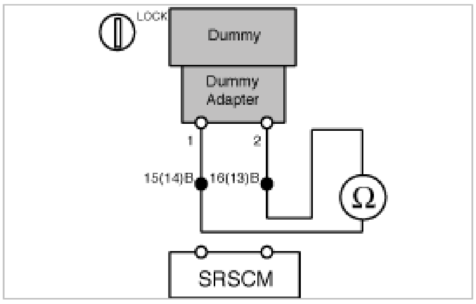
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on SAB harness connector.
- Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 15(14) and 16(13) of SRSCM harness connector(B).

SAB resistance : $1.8 \le R \le 2.6\ \Omega$



Is the measured resistance within specification?

YES

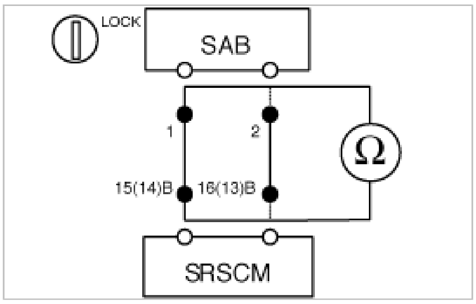
▸Replace the Side Airbag(SAB) module.

NO

▸Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of SAB harness connector and the terminal 15(14) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of SAB harness connector and the terminal 16(13) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

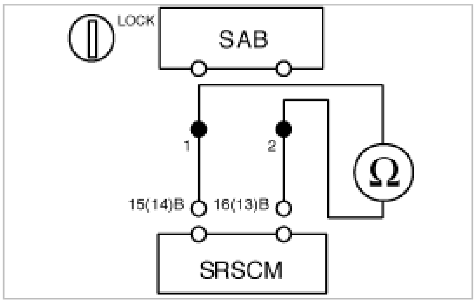
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the SAB nd the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of SAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the SAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1384

DTC Description

The Side Airbag circuit consists of the SRSCM and two Side Airbag (SAB). The SRSCM sets above DTC(s) if it detects short to ground on the SAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1380 B1384	• Short to ground between SAB and SRSCM • Side Airbag (SAB) Malfunction • SRSCM Malfunction	• Short to ground circuit on wiring harness • Side Airbag (SAB) squib • SRSCM

Schematic Diagram

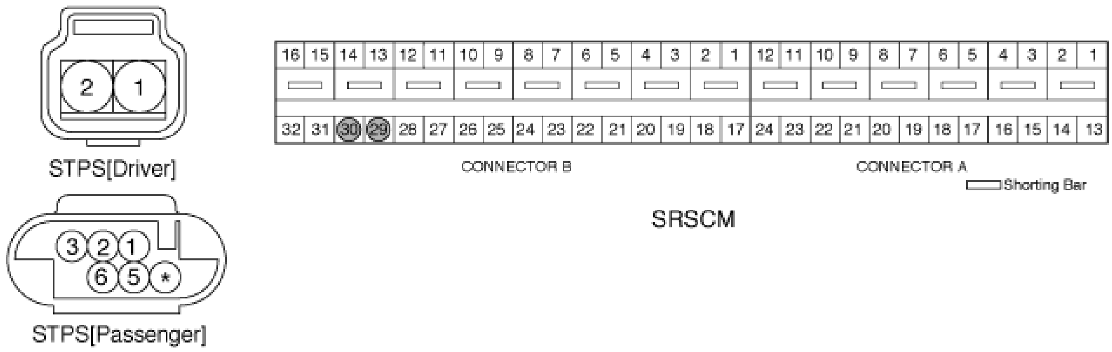
[HARNESS CONNECTOR]



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

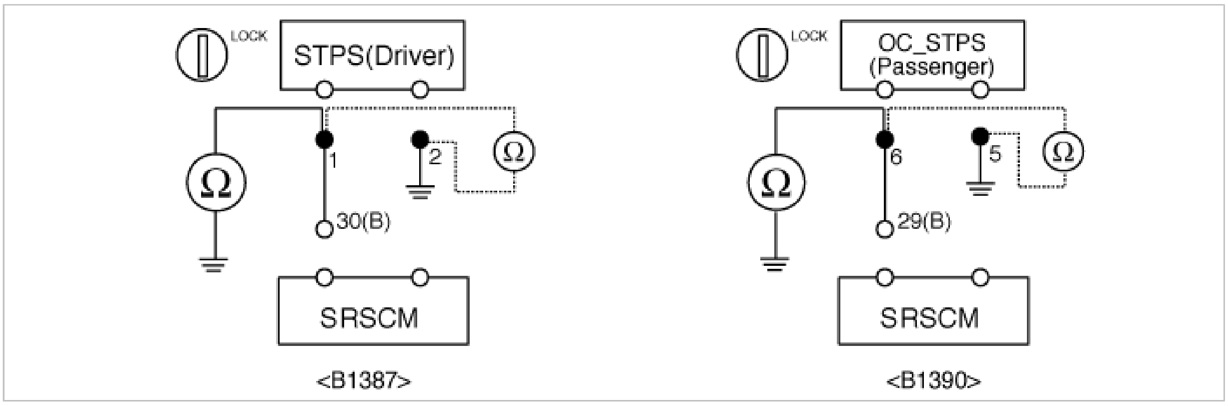
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT OR SHORT TO GROUND
   (1) Disconnect the STPS connector.
   (2) Measure resistance between the terminal 1(6) of STPS harness connector and chassis ground.
   (3) Measure resistance between the terminal 1(6) and 2(3) of STPS harness connector.

specification(resistance) : infinite



(4) Is the measured resistance within specification?

YES

▸ Check the STPS.

NO

▸ Repair or replace the wiring harness between the STPS and the SRSCM.

3. CHECK THE SEAT TRACK POSITION SENSOR (STPS)

(1) Measure current between the terminal 1(6) of STPS and 30(29) of SRSCM(B).

Specification(current) : 12 ~ 17 mA (Reward status), 5 ~ 7 mA (Forward status)

(2) Is the measured current within specification?

YES

▸ Goto next stop.

NO

▸ Replace the STPS.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1391

DTC Description

The Seat Track Position Sensor (STPS) circuit consists of the SRSCM and two STPS. The SRSCM sets above DTC(s) if it detects short or short to battery line on the STPS circuit. The "Seat Forward" status currently represents a seat position in which the deployment of the second stage airbag is prohibited.

DTC Detecting Condition

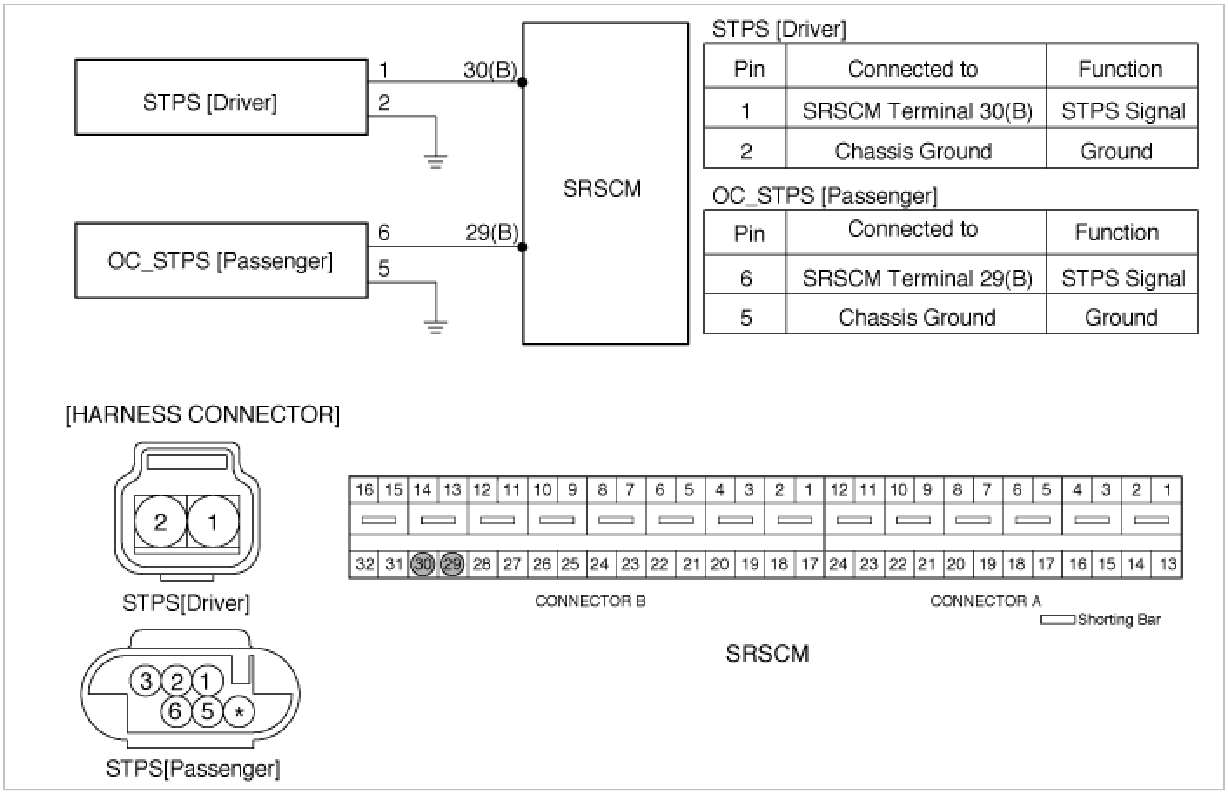
DTC	Condition	Probable cause
B1388 B1391	• Open between STPS and SRSCM • Short to battery line between STPS and SRSCM • STPS Malfunction • SRSCM Malfunction	• Open or short to battery line circuit on wiring harness • STPS • SRSCM

Specification

[Seat position diagnostic current limits]

Open/Short to Battery	Grey Zone	Forward	Grey Zone	Defect	Grey Zone	Rearward	Grey Zone	Short/Short to ground
< 3.98 mA	3.98 - 4.79 mA	4.79 - 7.16 mA	7.16 - 8.62 mA	8.62 - 9.94 mA	9.94 - 11.97 mA	11.97 - 17.29 mA	17.29 - 20.83 mA	> 20.83 mA

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK OPEN CIRCUIT
   (1) Disconnect the STPS connector.
   (2) Measure resistance between the terminal 1 of STPS harness connector and the terminal 30 of SRSCM harness connector (B).<B1388>
   (3) Measure resistance between the terminal 6 of STPS harness connector and the terminal 29 of SRSCM harness connector (B).<B1391>

specification(resistance) : below 1 Ω

   (4) Is the measured resistance within specification?

YES

▸ Check short to ground.

NO

▸ Repair the open circuit on wiring harness between the STPS and the SRSCM.

3. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1(6) of STPS harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V

   (4) Is the measured voltage within specification?

YES

▸ Check the STPS.

NO

▸ Repair the short to battery line circuit on wiring harness between the STPS and the SRSCM.

4. CHECK THE SEAT TRACK POSITION SENSOR (STPS)

(1) Measure current between the terminal 1(6) of STPS and 30(29) of SRSCM(B).

Specification(current) : 12 ~ 17 mA (Reward status), 5 ~ 7 mA (Forward status)

(2) Is the measured current within specification?

YES

▸ Goto next stop.

NO

▸ Replace the STPS.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1392

DTC Description

The Seat Track Position Sensor (STPS) circuit consists of the SRSCM and two STPS. The SRSCM sets above DTC(s) if it detects the STPS fault. The "Seat Forward" status currently represents a seat position in which the deployment of the second stage airbag is prohibited.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1395

DTC Description

DTC code is detected when short is broken out between airbag module and the other module. And warning lamp operates after DTC is detected.

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

   NO

   ▸ Go to next step.

   YES

   ▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. CHECK CIRCUIT
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
   (6) Measure resistance between airbag module wiring harness and the other wiring harness.(ex. DAB vs PAB, DAB vs SAB, DAB vs CAB, DAB vs BPT, DAB vs BUPT etc.)

   specification(resistance) : infinite

   Is the measured resistance within specification?

   YES

   ▸ Replace SRSCM, then go to " CLEAR THE DTC AND CHECK THE VEHICLE AGAIN ".

   NO

▸ Repair or replace the wiring harness, then go to " CLEAR THE DTC AND CHECK THE VEHICLE AGAIN ".

2. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1400

DTC Description

The detecting system for side crash consists of the SRSCM and two Side Impact Sensors (SIS).The SRSCM sets above DTC(s) if it detects that any SIS is defective or there is communication error between any front SIS and the SRSCM.

DTC Detecting Condition

DTC	Condition	Probable cause
B1400 B1403 B1409 B1410	• Open between SIS and SRSCM • Side Impact Sensor (SIS) Malfunction • SRSCM Malfunction	• Wiring Harness • Side Impact Sensor (SIS) squib • SRSCM

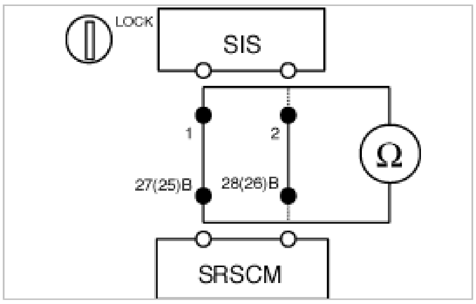
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK SIS CIRCUIT
   (1) Measure resistance between the terminal 1 of SIS harness connector and the terminal 27(25) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of SIS harness connector and the terminal 28(26) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸Check Side Impact Sensor.

NO

▸ Repair or replace the wiring harness between the SIS and the SRSCM.

3. CHECK THE SIDE IMPACT SENSOR
   (1) Replace the Side Impact Sensor(SIS) with a new one.
   - Refer to "Side Impact Sensor(SIS)" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Side Impact Sensor(SIS)?

YES

▸ Go to next step.

NO

▸ Replace SIS.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .

2	SRSCM Terminal 23(B)	OC Signal
3	Chassis ground	Ground

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

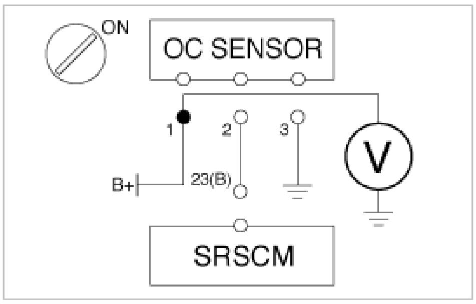
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK POWER TO OC SENSOR

(1) Connect the negative (-) terminal to the battery.

(2) Turn the ignition switch to ON.

(3) Measure voltage between the terminal 1 of OC Sensor harness connector and chassis ground.

specification(voltage) : Battery voltage



(4) Is the measured voltage within specification?

YES

▸ Check short to battery line.

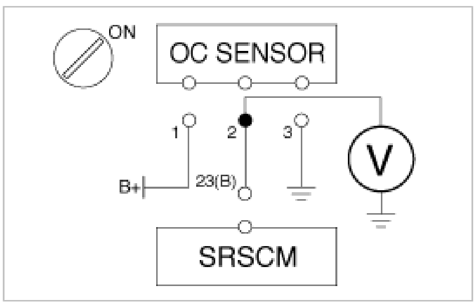
NO

▸ Repair or replace the wiring harness between the OC Sensor and ignition switch.

3. CHECK SHORT TO BATTERY LINE

(1) Measure voltage between the terminal 2 of OC Sensor harness connector and chassis ground.

specification(voltage) : Approximately 0 V



(2) Is the measured voltage within specification?

YES

▸ Check short to ground.

NO

▸ Repair the short to battery line circuit on wiring harness between the OC Sensor and the SRSCM.

4. CHECK SHORT TO GROUND

(1) Disconnect the negative(-) terminal from the battery.

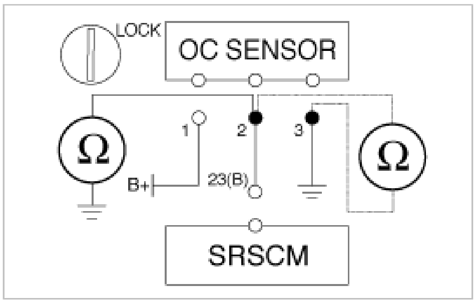
(2) Turn the ignition switch to LOCK.

(3) Disconnect the negative (-) terminal from the battery.

(4) Measure resistance between the terminal 2 of OC Sensor harness connector and chassis ground.

(5) Measure resistance between the terminal the terminal 2 and 3 of OC Sensor harness connector

Specification(resistance) : Infinite



(6) Is the measured resistance within specification?

YES

▸ Check OC Sensor Circuit.

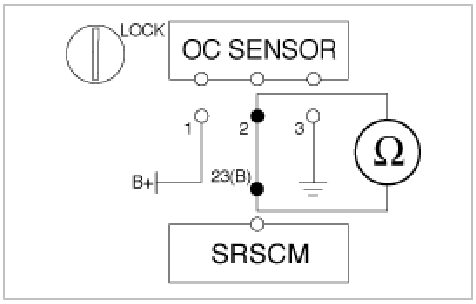
NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

5. CHECK OC SENSOR CIRCUIT
   (1) Measure resistance between the terminal 2 of OC Sensor harness connector and the terminal 23 of the SRSCM harness connector(B).

---

specification(resistance) : below 1 Ω



(2) Is the measured resistance within specification?

YES

▸ Check OC Sensor.

NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

6. CHECK OC SENSOR
   (1) Replace the OC Sensor with a new one.
   - Refer to "OC SENSOR" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect the a Hi-Scan(Pro) the the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.

   (8) Does Hi-Scan(Pro) indicate any DTC related to OC Sensor?

YES

▸ Go to next step.

NO

▸ Replace the OC Sensor.

7. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1449

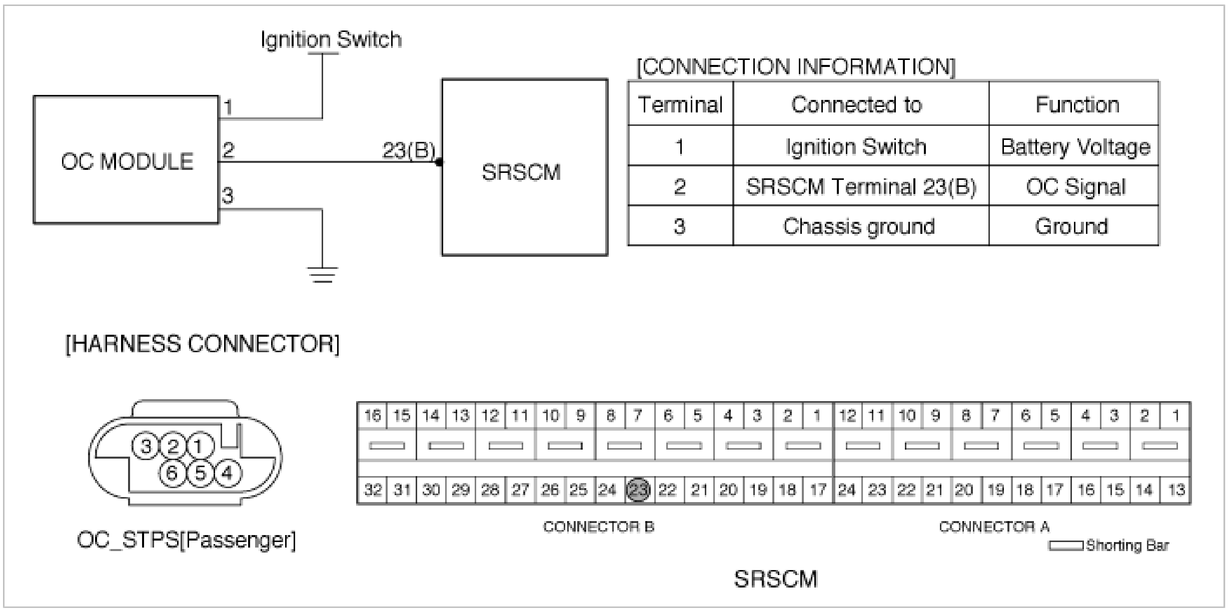
DTC Description

The passenger occupant classification system consists of the SRSCM and the OC module. The above DTC is recorded when a defect or communication error of the OC module is detected in the OC module circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1448 B1449 B1450	• OC module Malfunction • SRSCM Malfunction	• Wiring Harness • OC module • SRSCM

Schematic Diagram



Terminal & Connector Inspection

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK POWER TO OC SENSOR
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of OC Sensor harness connector and chassis ground.

specification(voltage) : Battery voltage

   (4) Is the measured voltage within specification?

YES

▸ Check short to battery line.

NO

▸ Repair or replace the wiring harness between the OC Sensor and ignition switch.

3. CHECK SHORT TO BATTERY LINE
   (1) Measure voltage between the terminal 2 of OC Sensor harness connector and chassis ground.

specification(voltage) : Approximately 0 V

   (2) Is the measured voltage within specification?

YES

▸ Check short to ground.

NO

▸ Repair the short to battery line circuit on wiring harness between the OC Sensor and the SRSCM.

4. CHECK SHORT TO GROUND

(1) Disconnect the negative(-) terminal from the battery.

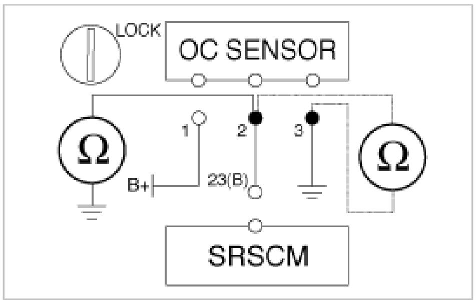
(2) Turn the ignition switch to LOCK.

(3) Disconnect the negative (-) terminal from the battery.

(4) Measure resistance between the terminal 2 of OC Sensor harness connector and chassis ground.

(5) Measure resistance between the terminal the terminal 2 and 3 of OC Sensor harness connector

Specification(resistance) : Infinite



(6) Is the measured resistance within specification?

YES

▸ Check OC Sensor Circuit.

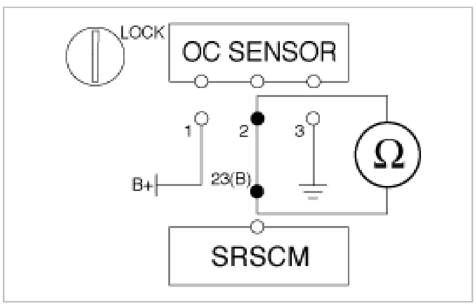
NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

5. CHECK OC SENSOR CIRCUIT

(1) Measure resistance between the terminal 2 of OC Sensor harness connector and the terminal 23 of the SRSCM harness connector(B).

specification(resistance) : below 1 Ω



(2) Is the measured resistance within specification?

YES

▸ Check OC Sensor.

NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

6. CHECK OC SENSOR

(1) Replace the OC Sensor with a new one.

- Refer to "OC SENSOR" section in this SERVICE MANUAL.

(2) Install the DAB module and connect the DAB connector.

(3) Connect the connectors of the PAB, SAB, CAB, BPT, FIS and SIS.

(4) Connect the SRSCM connector.

(5) Connect the negative (-) terminal to the battery.

(6) Connect the a Hi-Scan(Pro) the the data link connector.

(7) Turn the ignition switch to ON and check the vehicle again.

(8) Does Hi-Scan(Pro) indicate any DTC related to OC Sensor?

YES

▸ Go to next step.

NO

▸ Replace the OC Sensor.

7. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

YES

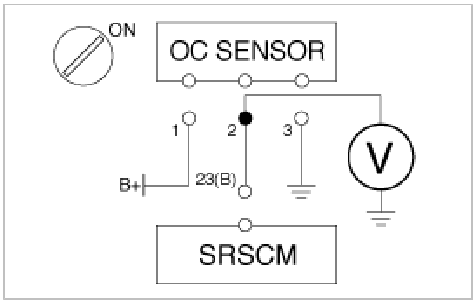
▸ Check short to battery line.

NO

▸ Repair or replace the wiring harness between the OC Sensor and ignition switch.

3. CHECK SHORT TO BATTERY LINE
   (1) Measure voltage between the terminal 2 of OC Sensor harness connector and chassis ground.

specification(voltage) : Approximately 0 V



(2) Is the measured voltage within specification?

YES

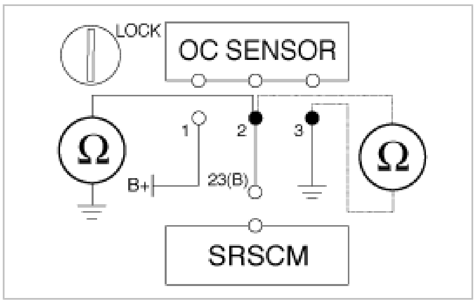
▸ Check short to ground.

NO

▸ Repair the short to battery line circuit on wiring harness between the OC Sensor and the SRSCM.

4. CHECK SHORT TO GROUND
   (1) Disconnect the negative(-) terminal from the battery.
   (2) Turn the ignition switch to LOCK.
   (3) Disconnect the negative (-) terminal from the battery.
   (4) Measure resistance between the terminal 2 of OC Sensor harness connector and chassis ground.
   (5) Measure resistance between the terminal the terminal 2 and 3 of OC Sensor harness connector

Specification(resistance) : Infinite



(6) Is the measured resistance within specification?

YES

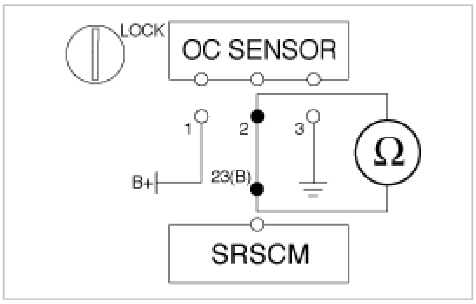
▸ Check OC Sensor Circuit.

NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

5. CHECK OC SENSOR CIRCUIT
   (1) Measure resistance between the terminal 2 of OC Sensor harness connector and the terminal 23 of the SRSCM harness connector(B).

specification(resistance) : below 1 Ω



(2) Is the measured resistance within specification?

YES

▸ Check OC Sensor.

NO

▸ Repair or replace the wiring harness between the OC Sensor and the SRSCM.

6. CHECK OC SENSOR
   (1) Replace the OC Sensor with a new one.
      ● Refer to "OC SENSOR" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect the a Hi-Scan(Pro) the the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   (8) Does Hi-Scan(Pro) indicate any DTC related to OC Sensor?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace the OC Sensor.

7. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1473

DTC Description

The CAB squib circuit consists of the SRSCM and CAB.It causes the SRS to deploy when the SRS deployment conditions are satisfied.The above DTC is recorded when the CAB resistance too high or low is detected in the CAB squib circuit.

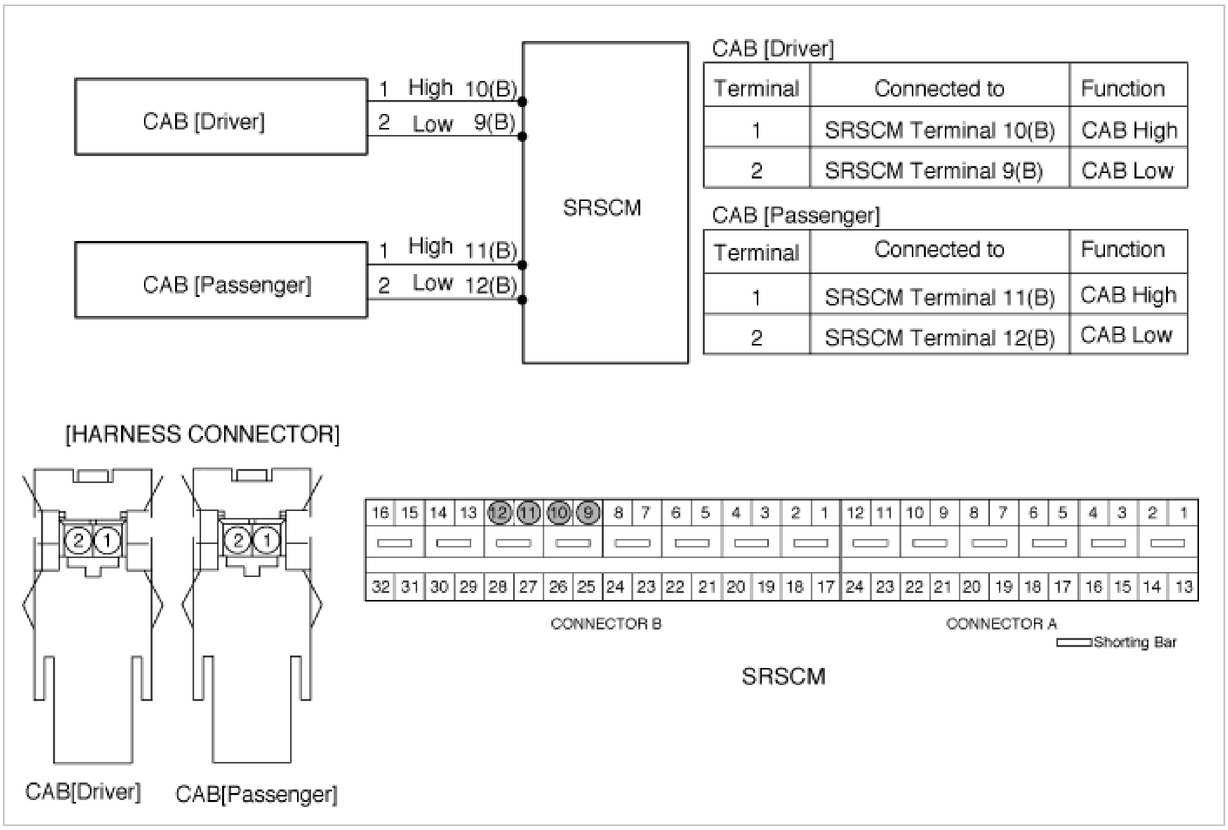
DTC Detecting Condition

DTC	Condition	Probable cause
B1473 B1474 B1477 B1478	• Too high or low resistance between CAB high(+) and CAB low (-) • Curtain Airbag (CAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Cirtain Airbag (CAB) squib • SRSCM • Partially connected connector

Specification

CAB resistance : 1.9 ≤ R ≤ 2.7 Ω

Schematic Diagram



CAB [Driver]

Terminal	Connected to	Function
1	SRSCM Terminal 10(B)	CAB High
2	SRSCM Terminal 9(B)	CAB Low

CAB [Passenger]

Terminal	Connected to	Function
1	SRSCM Terminal 11(B)	CAB High
2	SRSCM Terminal 12(B)	CAB Low

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

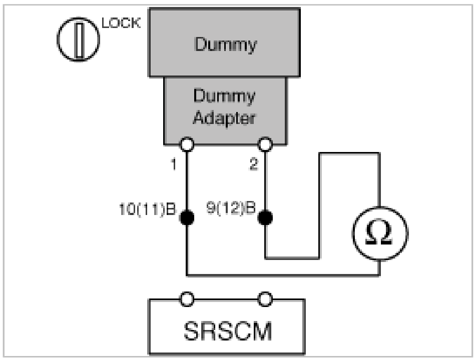
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK CAB RESISTANCE

> CAUTION
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on CAB harness connector.
- Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 10(11) and 9(12) of SRSCM harness connector(B).

CAB resistance : $1.9 \leq R \leq 2.7\ \Omega$



Is the measured resistance within specification?

YES

▸Replace the Curtain Airbag(CAB) module.

NO

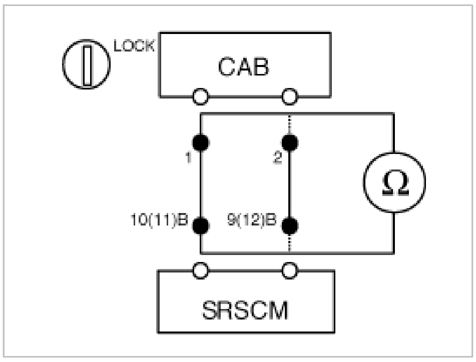
▸Check open circuit.

3. CHECK OPEN CIRCUIT

(1) Measure resistance between the terminal 1 of CAB harness connector and the terminal 10(11) of SRSCM harness connector(B).

(2) Measure resistance between the terminal 2 of CAB harness connector and the terminal 9(12) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸Check short circuit.

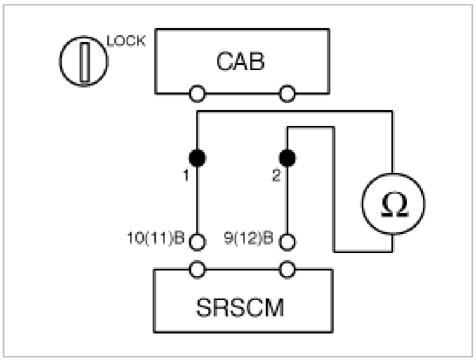
NO

▸Repair or replace the wiring harness between the CAB and the SRSCM.

4. CHECK SHORT CIRCUIT

(1) Measure resistance between the terminal 1 and 2 of CAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the CAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1474

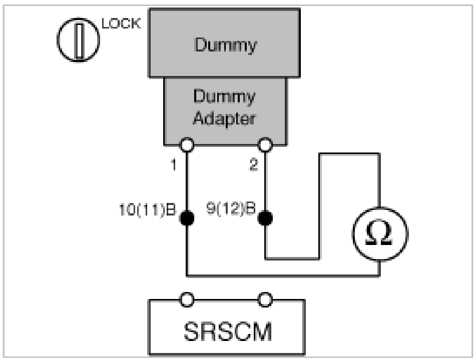
(2) Measure resistance between the terminal 10(11) and 9(12) of SRSCM harness connector(B).

CAB resistance : 1.9 ≤ R ≤ 2.7 Ω



Is the measured resistance within specification?

YES

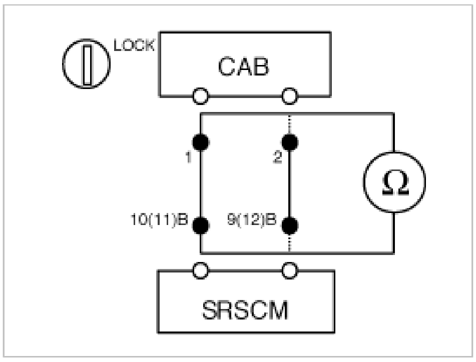
▸Replace the Curtain Airbag(CAB) module.

NO

▸Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of CAB harness connector and the terminal 10(11) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of CAB harness connector and the terminal 9(12) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

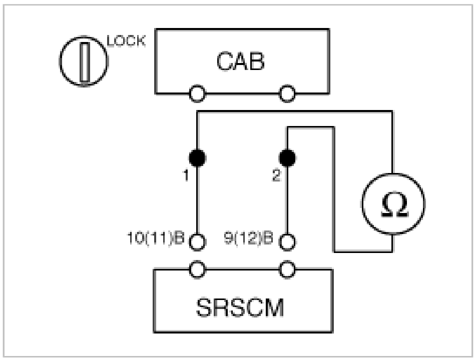
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the CAB and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of CAB harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the CAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1475

DTC Description

The CAB squib circuit consists of the SRSCM and CAB.It causes the SRS to deploy when the SRS deployment conditions are satisfied.The above DTC is recorded when short to ground is detected in the CAB squib circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1475 B1479	• Short to ground between CAB and SRSCM • Curtain Airbag (CAB) Malfunction • SRSCM Malfunction	• Short to ground circuit on wiring harness • Curtain Airbag (CAB) squib • SRSCM

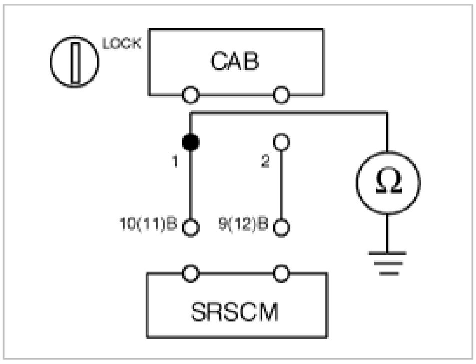
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 1 of CAB harness connector and chassis ground.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Check the CAB Module.

NO

▸ Repair or replace the wiring harness between the CAB and the SRSCM.

3. CHECK THE CAB MODULE
   (1) Replace the Curtain Airbag(CAB) with a new one.
   - Refer to "Curtain Airbag(CAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Curtain Airbag(CAB)?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace CAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

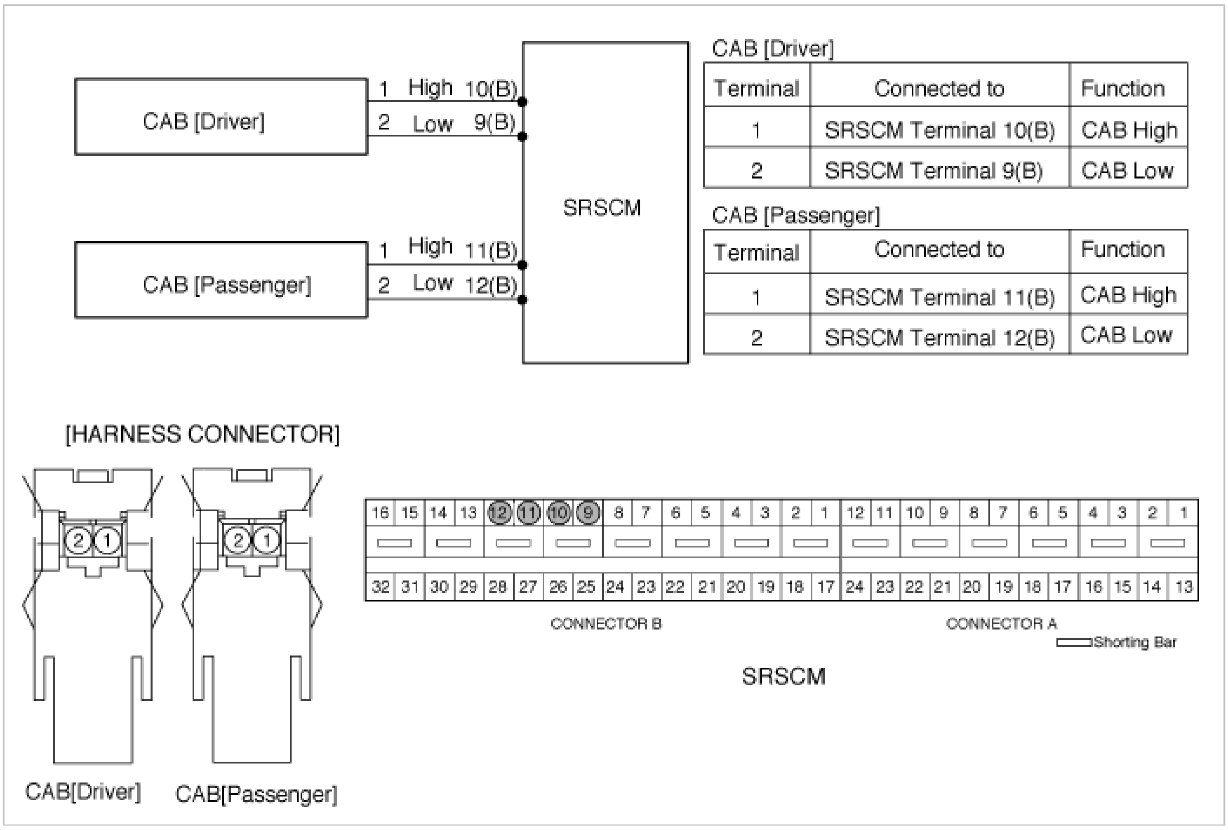
Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

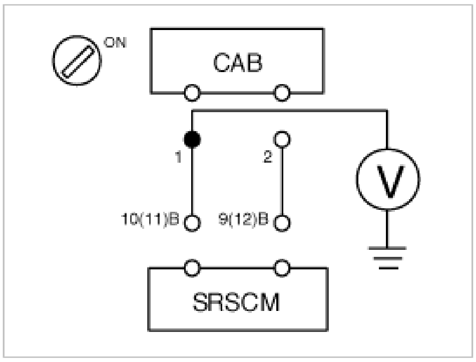
Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(5) Disconnect the SRSCM connector.

2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of CAB harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the CAB Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the CAB and the SRSCM.

3. CHECK THE CAB MODULE
   (1) Replace the Curtain Airbag(CAB) with a new one.
   - Refer to "Curtain Airbag(CAB)" section in this SERVICE MANUAL.
   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Curtain Airbag(CAB)?

YES

▸ Go to next step.

NO

▸ Replace CAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

The CAB squib circuit consists of the SRSCM and CAB.It causes the SRS to deploy when the SRS deployment conditions are satisfied.The above DTC is recorded when the CAB resistance too high or low is detected in the CAB squib circuit.

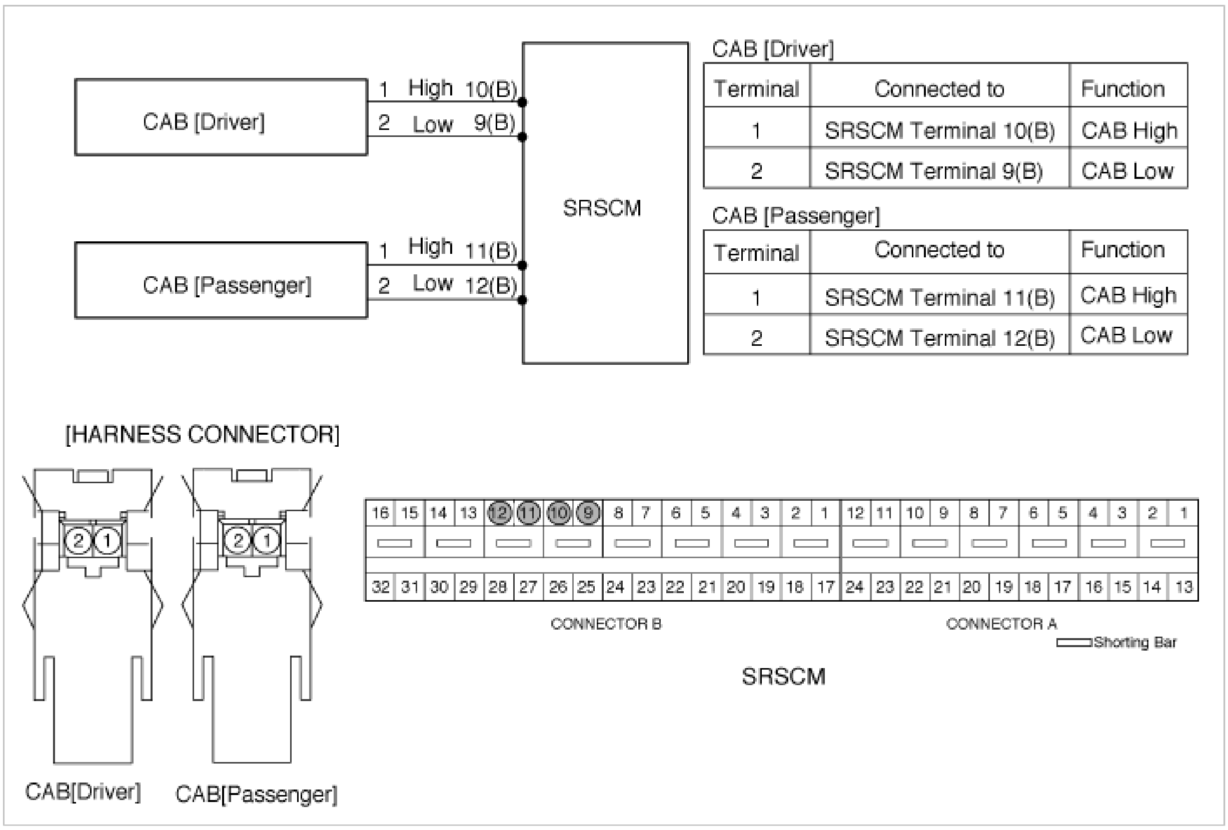
DTC Detecting Condition

DTC	Condition	Probable cause
B1473 B1474 B1477 B1478	• Too high or low resistance between CAB high(+) and CAB low (-) • Curtain Airbag (CAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Cirtain Airbag (CAB) squib • SRSCM • Partially connected connector

Specification

CAB resistance : 1.9 ≤ R ≤ 2.7 Ω

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

CAUTION

Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK CAB RESISTANCE

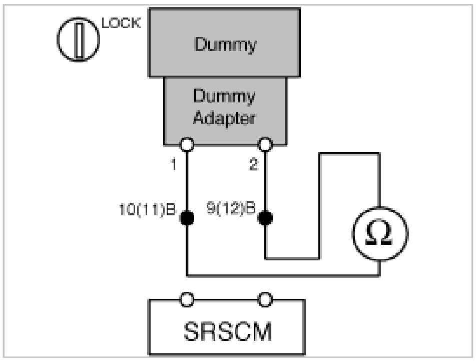
CAUTION

Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on CAB harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 10(11) and 9(12) of SRSCM harness connector(B).

CAB resistance : $1.9 \le R \le 2.7\ \Omega$



Is the measured resistance within specification?

YES

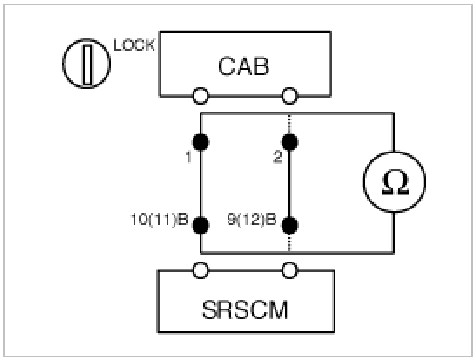
▸Replace the Curtain Airbag(CAB) module.

NO

▸Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of CAB harness connector and the terminal 10(11) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of CAB harness connector and the terminal 9(12) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

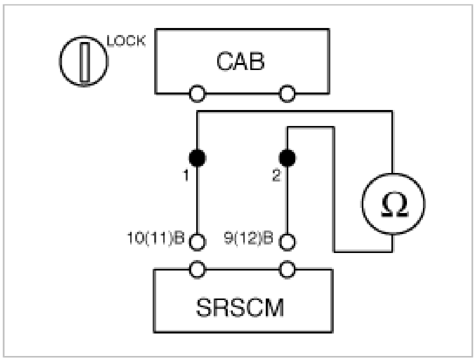
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the CAB and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of CAB harness connector.

   specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the CAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

DTC Description

The CAB squib circuit consists of the SRSCM and CAB.It causes the SRS to deploy when the SRS deployment conditions are satisfied.The above DTC is recorded when the CAB resistance too high or low is detected in the CAB squib circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1473 B1474 B1477 B1478	• Too high or low resistance between CAB high(+) and CAB low (-) • Curtain Airbag (CAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Cirtain Airbag (CAB) squib • SRSCM • Partially connected connector

Specification

CAB resistance : 1.9 ≤ R ≤ 2.7 Ω

   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
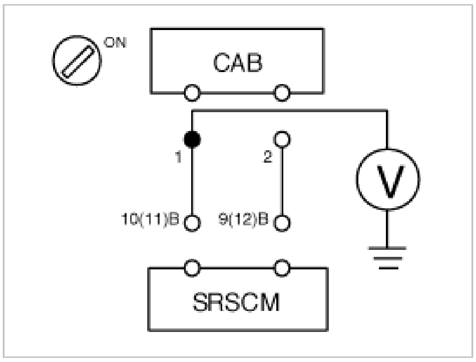
2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of CAB harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the CAB Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the CAB and the SRSCM.

3. CHECK THE CAB MODULE
   (1) Replace the Curtain Airbag(CAB) with a new one.
   - Refer to "Curtain Airbag(CAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.
   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Curtain Airbag(CAB)?

YES

▸ Go to next step.

NO

▸ Replace CAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1481

DTC Description

The Driver Airbag circuit consists of the SRSCM, Clockspring and the Driver Airbag (DAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of DAB squib is too high or low.

DTC Detecting Condition

DTC	Condition	Probable cause
B1481 B1482	• Too high or low resistance between DAB high(+) and DAB low (-) • Driver Airbag (DAB) Malfunction • Clockspring Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Driver Airbag (DAB) squib • Clockspring • SRSCM

Specification

DAB resistance : 1.9 ≤ R ≤ 3.0 Ω

   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK DAB RESISTANCE

> CAUTION
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on DAB harness connector.
   ●Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.
   (2) Measure resistance between the terminal 9(A) and 10(A) of SRSCM harness connector.

DAB resistance : 1.9 ≤ R ≤ 3.0 Ω

   (3) Is the measured resistance within specification?

NO

▸ Check open circuit.

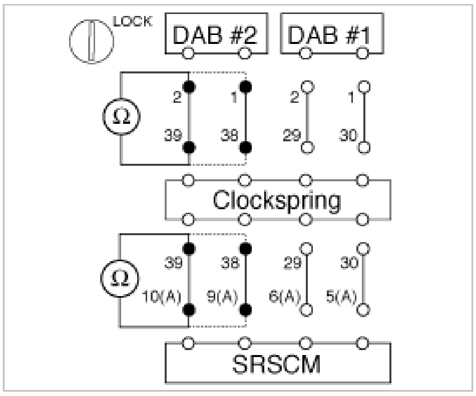
YES

▸ Replace the Driver Airbag(DAB) module.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of DAB stage #2 harness connector and the terminal 30 of Clockspring harness connector.
   (2) Measure resistance between the terminal 2 of DAB stage #2 harness connector and the terminal 29 of Clockspring harness connector.
   (3) Measure resistance between the terminal 38 of Clockspring harness connector and the terminal 9 of SRSCM harness connector(A).

(4) Measure resistance between the terminal 39 of Clockspring harness connector and the terminal 10 of SRSCM harness connector(A).

specification(resistance) : below 1 Ω



(5) Is the measured resistance within specification?

YES

▸ Check short circuit.

NO

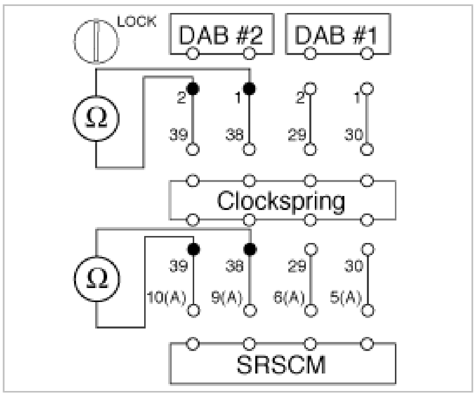
▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

4. CHECK SHORT CIRCUIT

(1) Measure resistance between the terminal 1 and 2 of DAB stage #2 harness connector.

(2) Measure resistance between the terminal 38 and 39 of Clockspring harness connector.

specification(resistance) : ∞ Ω



(3) Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

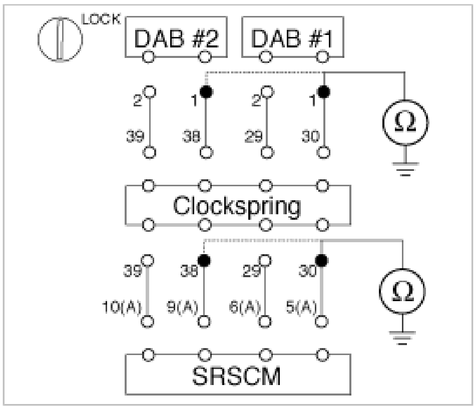
specification(resistance) : infinite



(5) Is the measured resistance within specification?

YES

▸Check the DAB Module.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

3. CHECK THE DAB MODULE

(1) Replace the Driver Airbag(DAB) with a new one.

● Refer to "Driver Airbag(DAB)" section in this SERVICE MANUAL.

(2) Install the DAB module and connect the DAB connector.

(3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(4) Connect the SRSCM connector.

(5) Connect the negative (-) terminal to the battery.

(6) Connect a Hi-Scan(Pro) to the data link connector.

(7) Turn the ignition switch to ON and check the vehicle again.
Does Hi-Scan (Pro) indicate any DTC related to DAB?

YES

▸Check the clockspring.

NO

▸Replace the Driver Airbag(DAB).

4. CHECK THE CLOCKSPRING

(1) Check the clockspring.
Is the clockspring normal?

YES

▸ Go to next step.

NO

▸ Replace the clockspring.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1484

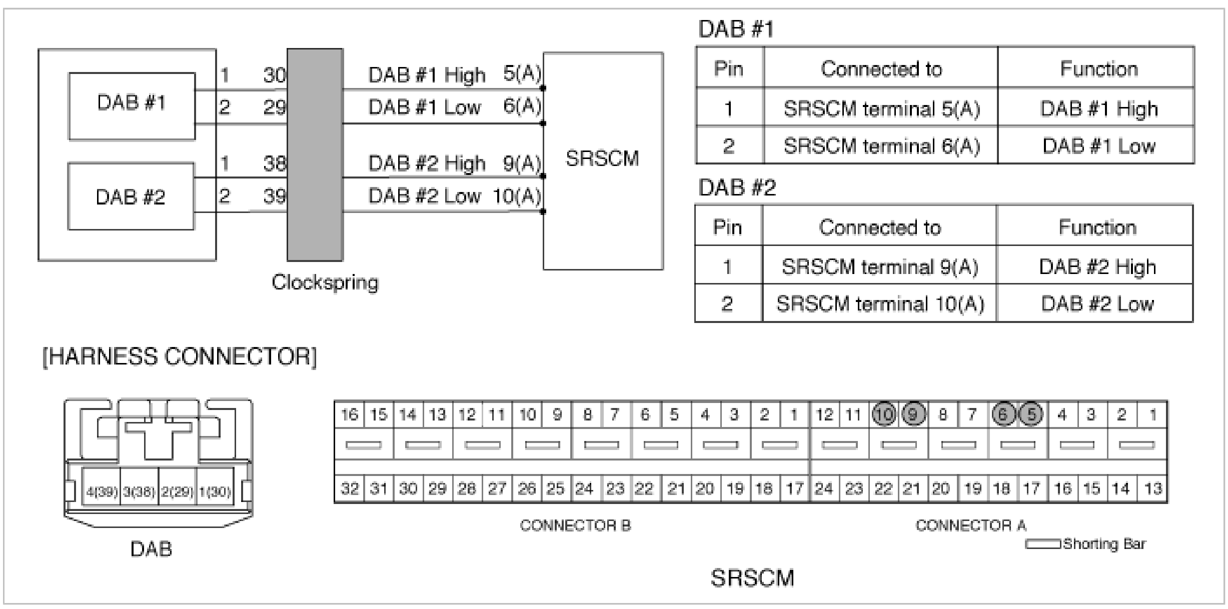
DTC Description

The Driver Airbag circuit consists of the SRSCM, Clockspring and the Driver Airbag (DAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects short to battery line on the DAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1349 B1484	• Short to battery line between DAB and clockspring • Short to battery line between clockspring and SRSCM • Driver Airbag (DAB) Malfunction • Clockspring Malfunction • SRSCM Malfunction	• Short to battery line on wiring harness • Driver Airbag (DAB) squib • Clockspring • SRSCM

Schematic Diagram



DAB #1

2	SRSCM terminal 10(A)	DAB #2 Low

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.

2. Inspect terminals for damage and corrosion.

CAUTION

Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

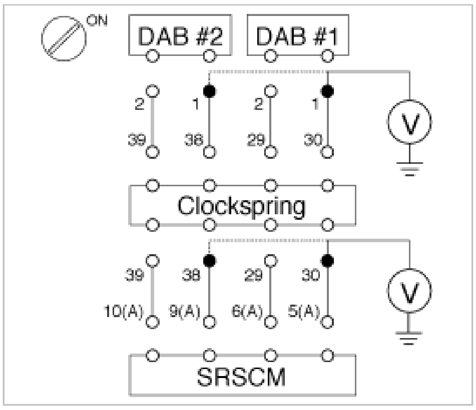
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB,SAB,CAB,BPT,BUPT,FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of DAB stage #1 harness connector and chassis ground(-).(DAB stage #1)
   (4) Measure voltage between the terminal 1 of DAB stage #2 harness connector and chassis ground(-).(DAB stage #2)
   (5) Measure voltage between the terminal 30 of clockspring harness connector and chassis ground(-).(DAB stage #1)
   (6) Measure voltage between the terminal 38 of clockspring harness connector and chassis ground(-).(DAB stage #2)

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸Check the DAB module.

NO

▸ Repair or replace the wiring harness between the DAB and the clockspring or between the clockspring and the SRSCM.

3. CHECK THE DAB MODULE
   (1) Replace the Driver Airbag(DAB) with a new one.
   - "Refer to "Driver Airbag(DAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.
   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (4) Connect the SRSCM connector.
   (5) Connect the negative (-) terminal to the battery.
   (6) Connect a Hi-Scan(Pro) to the data link connector.

(7) Turn the ignition switch to ON and check the vehicle again.
Does Hi-Scan (Pro) indicate any DTC related to DAB?

YES

▸Check the clockspring.

NO

▸Replace the Driver Airbag(DAB).

4. CHECK THE CLOCKSPRING

(1) Check the clockspring.
Is the clockspring normal?

YES

▸ Go to next step.

NO

▸ Replace the clockspring.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1485

DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of PAB squib is too high or low.

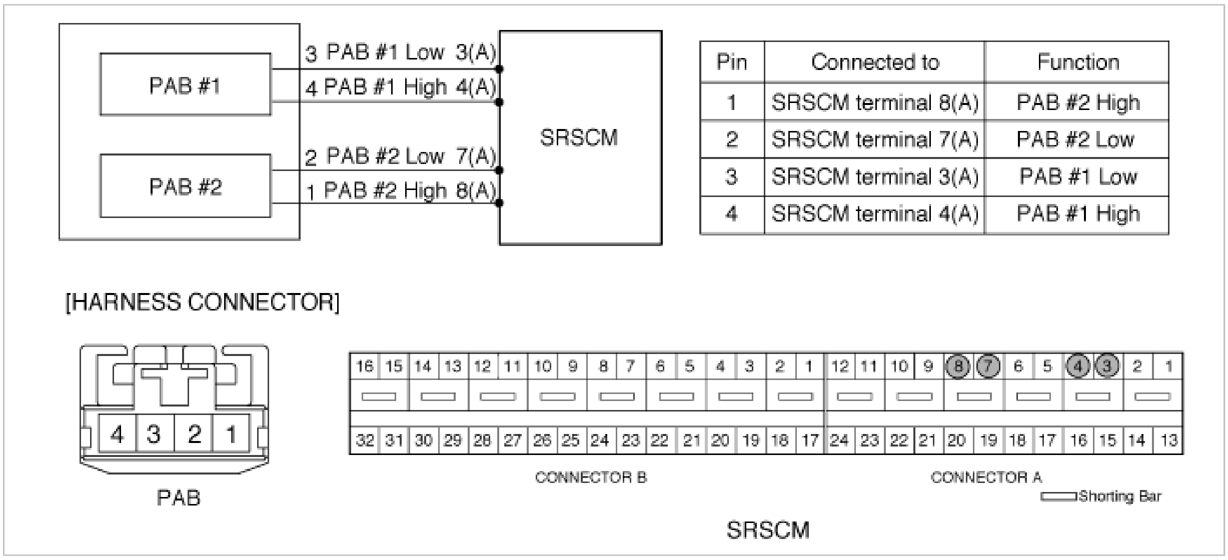
DTC Detecting Condition

DTC	Condition	Probable cause
B1485 B1486	• Too high or low resistance between PAB high(+) and PAB low (-) • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Passenger Airbag (PAB) squib • SRSCM

Specification

PAB resistance : 1.8 ≤ R ≤ 2.4 Ω

Schematic Diagram



Pin	Connected to	Function
1	SRSCM terminal 8(A)	PAB #2 High
2	SRSCM terminal 7(A)	PAB #2 Low
3	SRSCM terminal 3(A)	PAB #1 Low
4	SRSCM terminal 4(A)	PAB #1 High

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

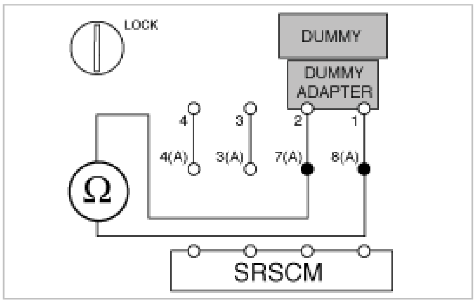
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK PAB RESISTANCE

> **CAUTION**
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on PAB harness connector.
   - Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

   (2) Measure resistance between the terminal 6 and 7 of SRSCM harness connector.

PAB resistance : $1.8 \leq R \leq 2.4\ \Omega$



(3) Is the measured resistance within specification?

YES

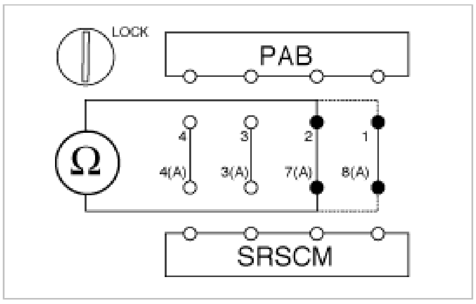
▸ Replace the Passenger Airbag(PAB) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of PAB harness connector and the terminal 8(A) of SRSCM harness connector.
   (2) Measure resistance between the terminal 2 of PAB harness connector and the terminal 7(A) of SRSCM harness connector.

specification(resistance) : below 1 Ω



(3) Is the measured resistance within specification?

YES

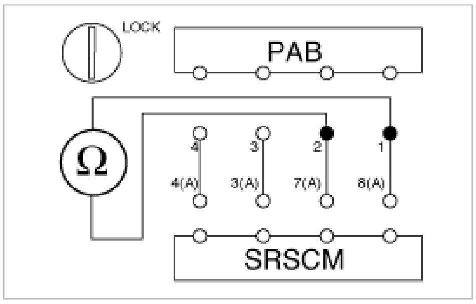
▸Check short circuit.

NO

▸Repair or replace the wiring harness between the PAB and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of PAB harness connector.

specification(resistance) : infinite



(2) Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1486

DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects that the resistance of PAB squib is too high or low.

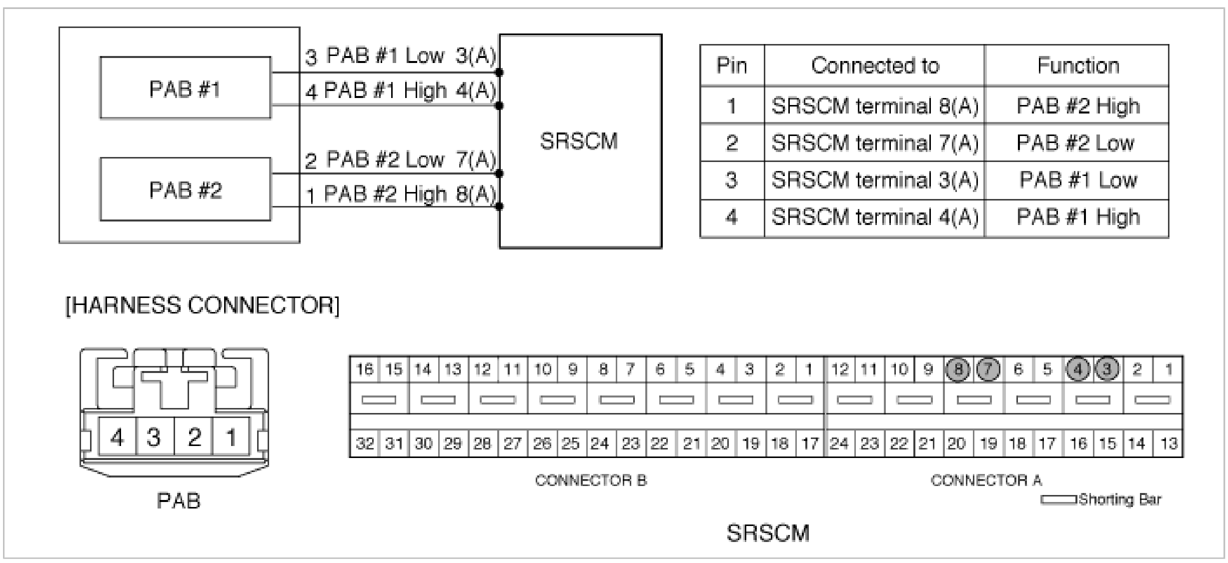
DTC Detecting Condition

DTC	Condition	Probable cause
B1485 B1486	• Too high or low resistance between PAB high(+) and PAB low (-) • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Passenger Airbag (PAB) squib • SRSCM

Specification

PAB resistance : 1.8 ≤ R ≤ 2.4 Ω

Schematic Diagram



Pin	Connected to	Function
1	SRSCM terminal 8(A)	PAB #2 High
2	SRSCM terminal 7(A)	PAB #2 Low

4	SRSCM terminal 4(A)	PAB #1 High

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK PAB RESISTANCE

> CAUTION
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

   (1) Connect the Dummy and the Dummy Adapter on PAB harness connector.
   ● Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.
   (2) Measure resistance between the terminal 6 and 7 of SRSCM harness connector.

PAB resistance : $1.8 \leq R \leq 2.4\ \Omega$

   (3) Is the measured resistance within specification?

YES

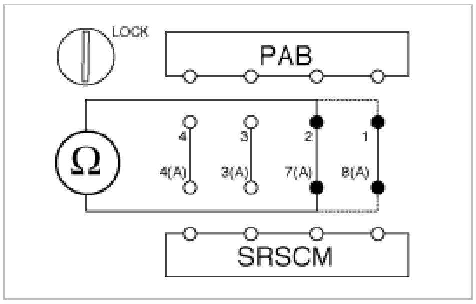
▸ Replace the Passenger Airbag(PAB) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of PAB harness connector and the terminal 8(A) of SRSCM harness connector.
   (2) Measure resistance between the terminal 2 of PAB harness connector and the terminal 7(A) of SRSCM harness connector.

specification(resistance) : below 1 Ω



(3) Is the measured resistance within specification?

YES

▸Check short circuit.

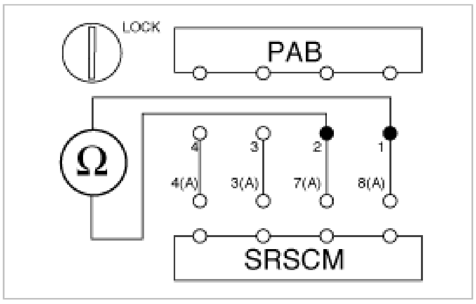
NO

▸Repair or replace the wiring harness between the PAB and the SRSCM.

4. CHECK SHORT CIRCUIT

(1) Measure resistance between the terminal 1 and 2 of PAB harness connector.

specification(resistance) : infinite



(2) Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1487

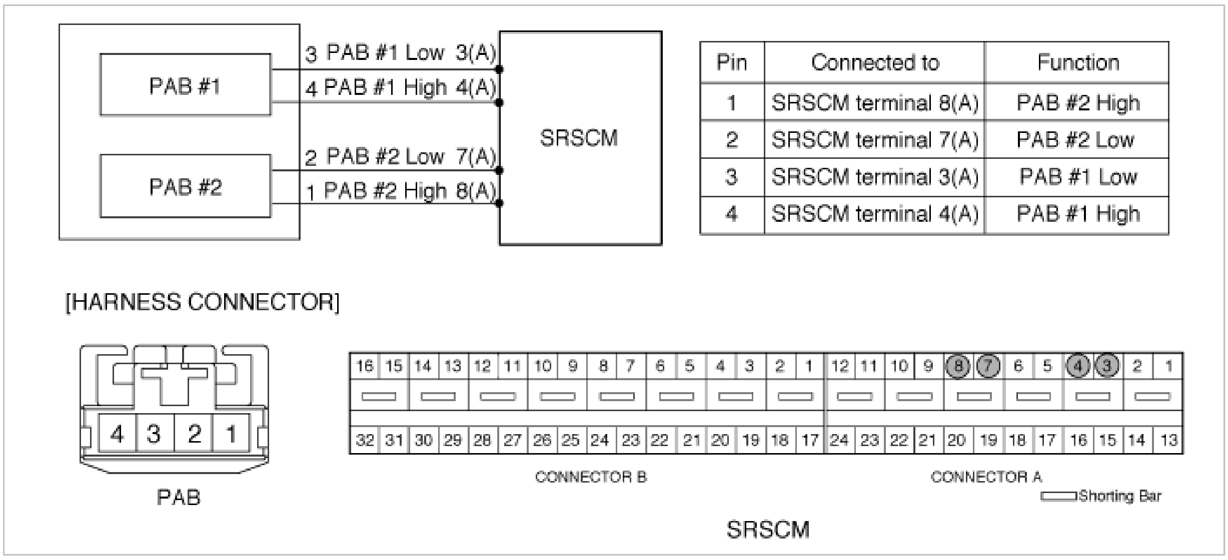
DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits. The SRSCM sets above DTC(s) if it detects short to ground on the PAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1354 B1487	• Short to ground between PAB module and SRSCM • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Short to ground on wiring harness • Passenger Airbag (PAB) squib • SRSCM

Schematic Diagram



Pin	Connected to	Function
1	SRSCM terminal 8(A)	PAB #2 High
2	SRSCM terminal 7(A)	PAB #2 Low

YES

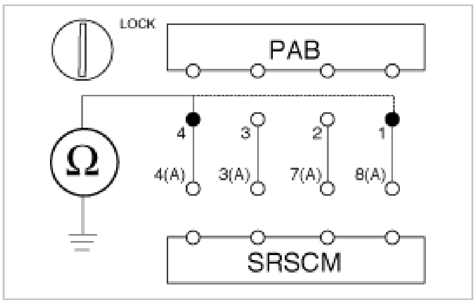
▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 4 of PAB harness connector and chassis ground.(PAB stage #1)

(2) Measure resistance between the terminal 1 of PAB harness connector and chassis ground.(PAB stage #2)

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Check the PAB Module.

NO

▸ Repair or replace the wiring harness between the PAB and the SRSCM.

3. CHECK THE PAB MODULE
   (1) Replace the Passenger Airbag (PAB) with a new one.
   - Refer to "Passenger Airbag (PAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to PAB?

YES

▸ Go to next step.

NO

▸Replace PAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1488

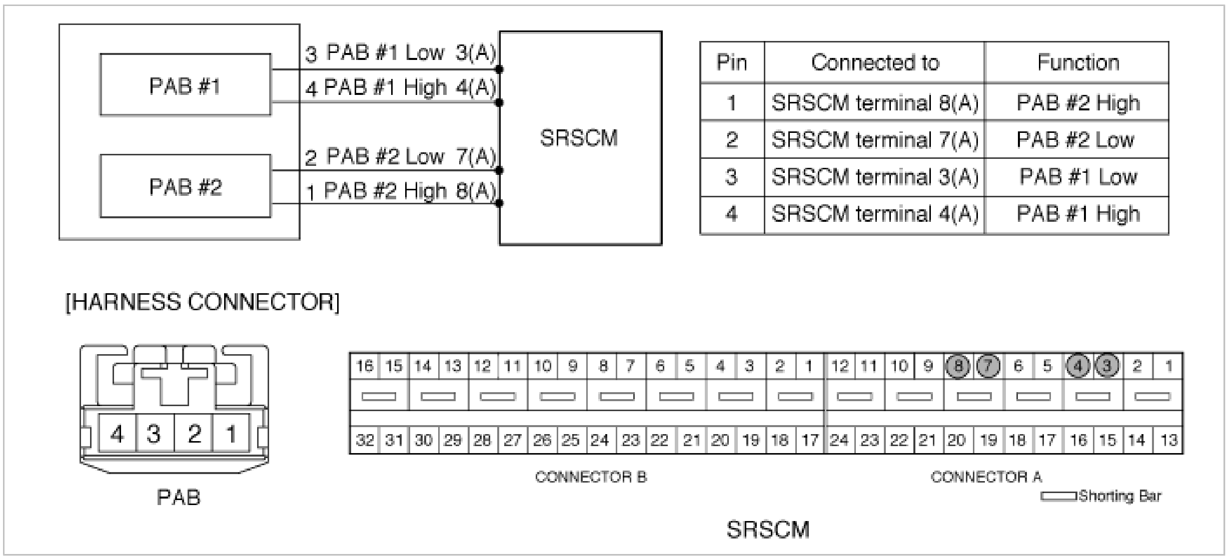
DTC Description

The Passenger Airbag circuit consists of the SRSCM and the Passenger Airbag (PAB) which has two squib circuits.The SRSCM sets above DTC(s) if it detects short to battery line on the PAB circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1355 B1488	• Short to battery line between PAB and SRSCM • Passenger Airbag (PAB) Malfunction • SRSCM Malfunction	• Short to battery line circuit on wiring harness • Passenger Airbag (PAB) squib • SRSCM

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

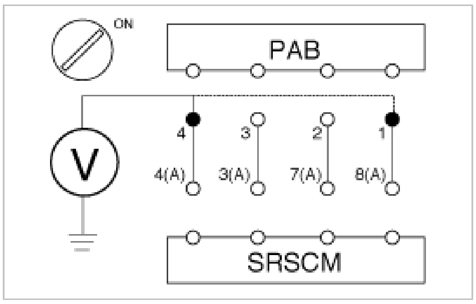
Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.

(3) Measure voltage between the terminal 4 of PAB harness connector and chassis ground(-).(PAB stage #1)

(4) Measure voltage between the terminal 1 of PAB harness connector and chassis ground(-).(PAB stage #2)

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the PAB Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the PAB and the SRSCM.

3. CHECK THE PAB MODULE
   (1) Replace the Passenger Airbag(PAB) with a new one.
   - Refer to "Passenger Airbag(PAB)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to PAB?

   YES

   ▸ Go to next step.

   NO

   ▸Replace PAB module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON.

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1511

DTC Description

   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
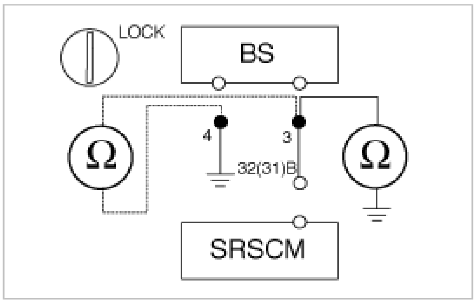
2. CHECK SHORT OR SHORT TO GROUND
   (1) Disconnect the BS connector.
   (2) Measure resistance between the terminal 3 of BS harness connector and chassis ground.
   (3) Measure resistance between the terminal 3 and 4 of BS harness connector.

   specification(Resistance) : Infinite



(4) Is the measured resistance within specification?

YES

(5) ▸ Go to next step.

NO

▸ Repair the short or short to ground circuit on wiring harness between the BS and the SRSCM.

3. CHECK THE SEAT BELT BUCKLE SWITCH (BS)

(1) Measure current between the terminal 3 of BS and 32(31) of SRSCM harness connector(B).

specification(current) : 12 ~ 18 mA (Buckled status) , 4 ~ 7 mA (Unbuckled status)

(2) Is the wiring harness normal?

YES

▸ Go to next stop.

NO

▸ Replace the BS.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN

(1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON .

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

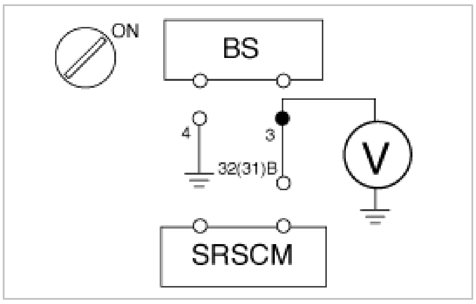
(2) Turn the ignition switch to ON.

(3) Measure voltage between the terminal 3 of BS harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



(4) Is the measured voltage within specification?

YES

▸ Check the Seat belt buckle switch(BS).

NO

▸ Repair the short to battery line circuit on wiring harness between the BS and the SRSCM.

4. CHECK THE SEAT BELT BUCKLE SWITCH (BS)

(1) Measure current between the terminal 3 of BS and 32(31) of SRSCM harness connector(B).

specification(current) : 12 ~ 18 mA (Buckled status) , 4 ~ 7 mA (Unbuckled status)

(2) Is the wiring harness normal?

YES

▸ Go to next stop.

NO

▸ Replace the BS.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
(1) Install the DAB module and connect the DAB connector.
(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
(3) Connect the SRSCM connector.
(4) Connect the negative (-) terminal to the battery.
(5) Connect a Hi-Scan(Pro) to the data link connector.
(6) Turn the ignition switch to ON .
(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
(9) Turn the ignition switch to ON and wait for at least 30 seconds.
(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1514

DTC Description

The Seat Belt Buckle Switch (BS) circuit consists of the SRSCM and two BS. The SRSCM sets above DTC(s) if it detects short or short to ground on the BS circuit. This system decides whether the driver or passenger seat belt is locked or not.

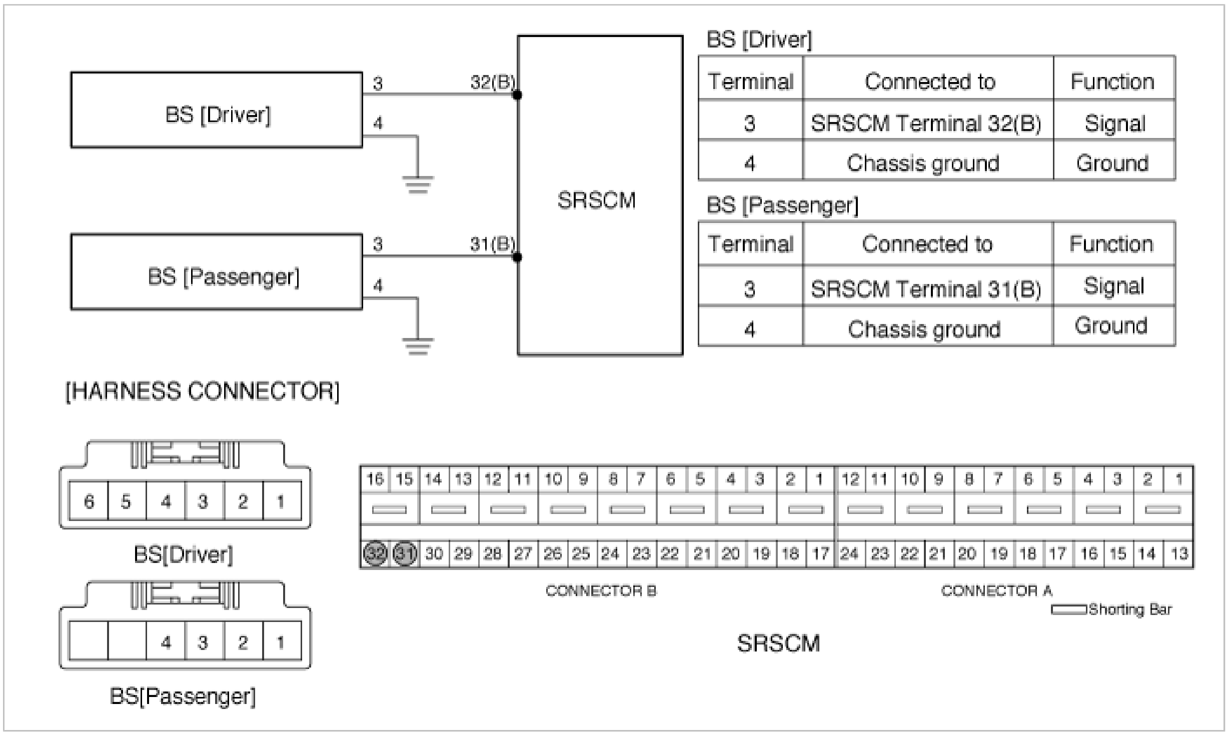
DTC Detecting Condition

DTC	Condition	Probable cause
B1512 B1514	• Short or Short to ground between BS and SRSCM (Current I < 22.0 mA) • Seat Belt Buckle Switch (BS) Malfunction • SRSCM Malfunction	• short or short to ground circuit on wiring harness • Seat Belt Buckle Switch (BS) • SRSCM

Specification

Open/Short to Battery	Grey Zone	Unbuckled	Grey Zone	Defect	Grey Zone	Buckled	Grey Zone	Short/Shortto ground
< 2.98 mA	2.98 - 3.6 mA	3.6 - 7.4 mA	7.4 - 8.9 mA	8.9 - 9.7 mA	9.7 - 11.7 mA	11.7 - 18.3 mA	18.3 - 22.0 mA	> 22.0 mA

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

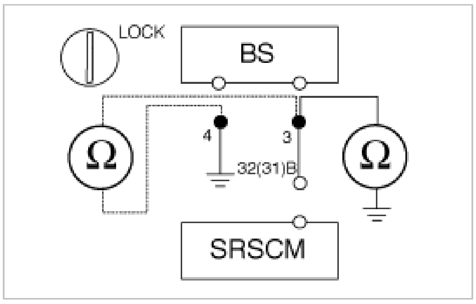
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT OR SHORT TO GROUND
   (1) Disconnect the BS connector.
   (2) Measure resistance between the terminal 3 of BS harness connector and chassis ground.
   (3) Measure resistance between the terminal 3 and 4 of BS harness connector.

specification(Resistance) : Infinite



(4) Is the measured resistance within specification?

YES

(5) ▸ Go to next step.

NO

▸ Repair the short or short to ground circuit on wiring harness between the BS and the SRSCM.

3. CHECK THE SEAT BELT BUCKLE SWITCH (BS)
   (1) Measure current between the terminal 3 of BS and 32(31) of SRSCM harness connector(B).

   specification(current) : 12 ~ 18 mA (Buckled status) , 4 ~ 7 mA (Unbuckled status)

   (2) Is the wiring harness normal?

   YES

   ▸ Go to next stop.

   NO

   ▸ Replace the BS.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1515

DTC Description

The Seat Belt Buckle Switch (BS) circuit consists of the SRSCM and two BS. The SRSCM sets above DTC(s) if it detects the BS faults. This system decides whether the driver or passenger seat belt is locked or not.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1620

General Description

SRSCM (Supplement Restraint System Control Module) decides to deploy the airbag module by sensing the frontal impact sensed by the sensor built in to the SRSCM.

1. DC/DC convertor : The DC/DC convertors of the power supply includes a step up and a step down converter, which provides the firing voltage for four firing circuits and the internal operating voltage. If the internal operatingvoltage falls below a defined threshold, a reset is executed.
2. Arming sensor/safing sensor : The arming/safing sensor built in to the airbag firing circuit has the function of arming the airbag circuit under all required deployment conditions and maintaining the airbag firing circuits unarmed under normal driving conditions. The safing sensor is a dual-contact electromechanical switch which closes if it experiences a deceleration exceedinga specified threshold
3. Back-up power : The SRSCM reserves an energy supply to provide deployment energy for a short second when the vehicle voltage is low or if lost in avehicle frontal crash.
4. Malfunction detection : The SRSCM continuously monitors the current SRS operation status while the ignition key is turned on and detects possible malfunction of the system. The malfunction can be displayed in the form of a diagnostic trouble code using Hi-Scan.
5. MIL (Malfunction Indication Lamp) notification : If any fault is detected, the SRSCM sends a signal to the indicator lamp on the cluster to warn thevehicle driver.The MIL indicator is the key item in notifying the driver of SRS faults. Verify lamp and SRSCM operation by flashing 6 times when the ignition switches first turned on.
6. Malfunction recording : Once a fault occurs in the system, the SRSCM records the fault in the memory in the form of DTC and the DTC can only beerased only by Hi-Scan.
7. Data link connector : Data stored in he SRSCM memory is read by Hi-Scan through the data link connector.
8. After firing the airbags once, the SRSCM cannot be used again and must be replaced.
9. Crash output : The crash output is used to control an external device which will unlock the doors in case of a crash event. The crash output is specified as follows : 0-200 μA in OFF mode and 200mA in ON mode. In case of the unlock command the switch is closed for 200 mS.

DTC Description

The SRSCM shall also cyclically monitor the following :

1. Functional readliness of the firing circuit activation transistors.
2. Adequacy of deployment energy reserves.
3. Safing sensor integtity : detection of faulty closure.
4. Plausibility of accelerometer signal.
5. Operation of SRSCM components.

DTC Detecting Condition

DTC	Condition	Probable cause
B1620	• Internal faults : accelerometer sensor fault, FLIC fault, energy back up capacitor fault, watch dog	• SRSCM

Verification of vehicle repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scan tool, clear the DTCs.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System is performing to specification at this time.

Inspection Procedure

1. Ignition "OFF" , connect scantool.
2. Ignition "ON" & engine "OFF", select "Diagnistic Trouble Codes(DTCs)" mode.
3. Monitor diagnostic trouble code and present of trouble code.
4. Using a scan tool, clear the DTCs.
5. Is DTC present problem?

YES

▸ Substitute with a known-good SRSCM and check for proper operation.If the problem is corrected, replace SRSCM and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Do not change the SRSCM, the SRSCM is OK at this moment.Fault is intermittent it has been repaired and SRSCM memory is not cleared yet. Thoroughly check SRSCM for looseness, bending, corrosion, contamination, deterioration, and/or damage.Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1650

General Description

SRSCM (Supplement Restraint System Control Module) decides to deploy the airbag module by sensing the frontal impact sensed by the sensor built in to the SRSCM.

1. DC/DC convertor : The DC/DC convertors of the power supply includes a step up and a step down converter, which provides the firing voltage for four firing circuits and the internal operating voltage. If the internal operatingvoltage falls below a defined threshold, a reset is executed.
2. 5. MIL (Malfunction Indication Lamp) notification : If any fault is detected, the SRSCM sends a signal to the indicator lamp on the cluster to warn thevehicle driver.The MIL indicator is the key item in notifying the driver of SRS faults. Verify lamp and SRSCM operation by flashing 6 times when the ignition switches first turned on.
6. Malfunction recording : Once a fault occurs in the system, the SRSCM records the fault in the memory in the form of DTC and the DTC can only beerased only by Hi-Scan.
7. Data link connector : Data stored in he SRSCM memory is read by Hi-Scan through the data link connector.
8. After firing the airbags once, the SRSCM cannot be used again and must be replaced.
9. Crash output : The crash output is used to control an external device which will unlock the doors in case of a crash event. The crash output is specified as follows : 0-200 μA in OFF mode and 200mA in ON mode. In case of the unlock commandthe switch is closed for 200 mS.

DTC Description

The frontal Crash recorded in the SRS Control module.

DTC Detecting Condition

DTC	Condition	Probable cause
B1651 B1652	• Crash recorded in the SRSCM(side)	• SRSCM

Verification of vehicle repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scan tool, clear the DTCs.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System is performing to specification at this time.

Inspection Procedure

1. Ignition "OFF", connect scantool.
2. Ignition "ON" & engine "OFF", select "Diagnistic Trouble Codes(DTCs)" mode.
3. Monitor diagnostic trouble code and present of trouble code.
4. Using a scan tool, clear the DTCs.
5. Is DTC present problem?

YES

▸ The side crash is recorded. Replace SRS Control Module assy. And then goto next step.

NO

▸ System is OK at this moment.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting >

B1655

General Description

SRSCM (Supplement Restraint System Control Module) decides to deploy the airbag module by sensing the frontal impact sensed by the sensor built in to the SRSCM.

1. DC/DC convertor : The DC/DC convertors of the power supply includes a step up and a step down converter, which provides the firing voltage for four firing circuits and the internal operating voltage. If the internal operatingvoltage falls below a defined threshold, a reset is executed.
2. Arming sensor/safing sensor : The arming/safing sensor built in to the airbag firing circuit has the function of arming the airbag circuit under all required deployment conditions and maintaining the airbag firing circuits unarmed under normal driving conditions. The safing sensor is a dual-contact electromechanical switch which closes if it experiences a deceleration exceedinga specified threshold
3. Back-up power : The SRSCM reserves an energy supply to provide deployment energy for a short second when the vehicle voltage is low or if lost in avehicle frontal crash.
4. Malfunction detection : The SRSCM continuously monitors the current SRS operation status while the ignition key is turned on and detects possible malfunction of the system. The malfunction can be displayed in the form of a diagnostic trouble code using Hi-Scan.
5. MIL (Malfunction Indication Lamp) notification : If any fault is detected, the SRSCM sends a signal to the indicator lamp on the cluster to warn thevehicle driver.The MIL indicator is the key item in notifying the driver of SRS faults. Verify lamp and SRSCM operation by flashing 6 times when the ignition switches first turned on.
6. Malfunction recording : Once a fault occurs in the system, the SRSCM records the fault in the memory in the form of DTC and the DTC can only beerased only by Hi-Scan.
7. Data link connector : Data stored in he SRSCM memory is read by Hi-Scan through the data link connector.
8. After firing the airbags once, the SRSCM cannot be used again and must be replaced.
9. Crash output : The crash output is used to control an external device which will unlock the doors in case of a crash event. The crash output is specified as follows : 0-200 μA in OFF mode and 200mA in ON mode. In case of the unlock commandthe switch is closed for 200 mS.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1659

General Description

DTC is detected when a rear Crash is recorded in the SRS Control module .Although it is detected , any airbag doesn't inflate. And DTC code is only eliminated by using HI-scan.

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK, remove battery(-) cable. wait for 1 min.
   (2) Connect battery(-) cable ,connect Hi-scan. Turn on the ignition , wait for 30 sec.
   (3) IGN ON, Engine off. select "Diagnostic Trouble Codes(DTCs)" mode.
   (4) Monitor diagnostic trouble code and present of trouble code.
   (5) Using a scan tool, clear the DTCs.
   Is a DTC monitored?

   YES

▸ If a DTC can,t be eliminated, replace the SRSCM. Then go to next step.

NO

▸ System is OK at this moment.

2. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1670

General Description

SRSCM (Supplement Restraint System Control Module) decides to deploy the airbag module by sensing the frontal impact sensed by the sensor built in to the SRSCM.

1. DC/DC convertor : The DC/DC convertors of the power supply includes a step up and a step down converter, which provides the firing voltage for four firing circuits and the internal operating voltage. If the internal operatingvoltage falls below a defined threshold, a reset is executed.
2. Arming sensor/safing sensor : The arming/safing sensor built in to the airbag firing circuit has the function of arming the airbag circuit under all required deployment conditions and maintaining the airbag firing circuits unarmed under normal driving conditions. The safing sensor is a dual-contact electromechanical switch which closes if it experiences a deceleration exceedinga specified threshold
3. Back-up power : The SRSCM reserves an energy supply to provide deployment energy for a short second when the vehicle voltage is low or if lost in avehicle frontal crash.

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1701

DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects that the resistance of BUPT squib is too high or low.

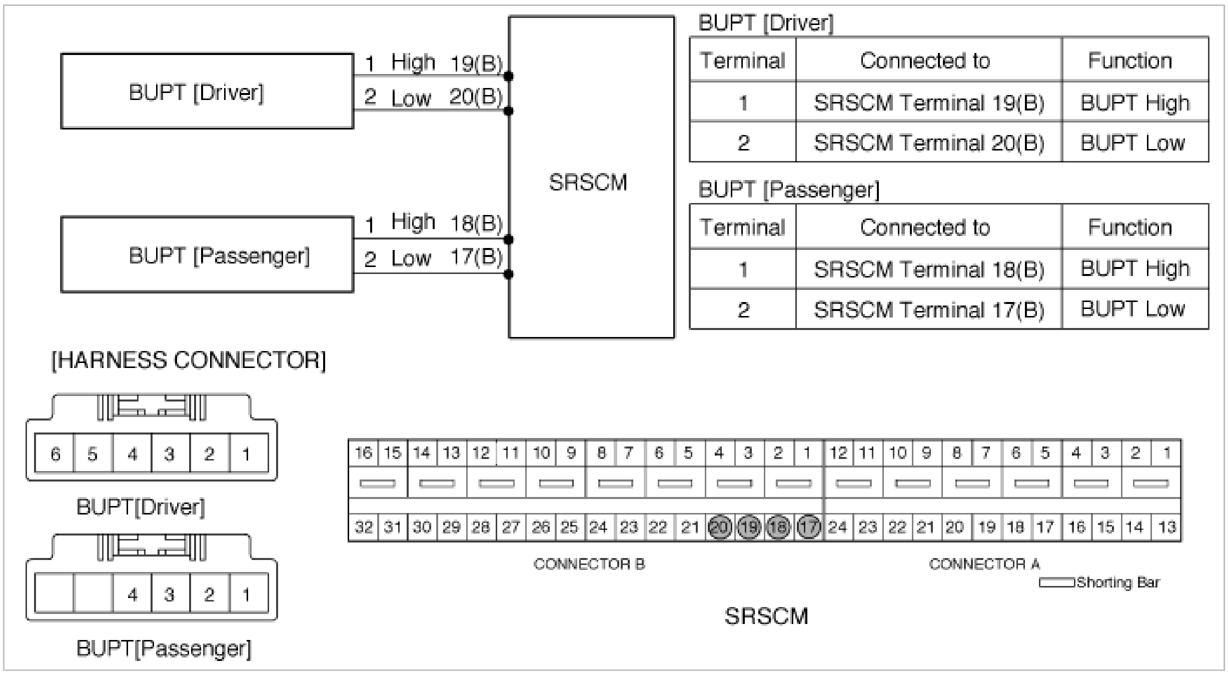
DTC Detecting Condition

DTC	Condition	Probable cause
B1701 B1702 B1706 B1707	• Too high or low resistance between BUPT high(+) and BUPT low (-) • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Buckle Pretensioner (BUPT) squib • SRSCM • Partially connected connector

Specification

BUPT resistance : $1.9 \leq R \leq 2.7\ \Omega$

Schematic Diagram



BUPT [Driver]

Terminal	Connected to	Function
1	SRSCM Terminal 19(B)	BUPT High
2	SRSCM Terminal 20(B)	BUPT Low

BUPT [Passenger]

Terminal	Connected to	Function
1	SRSCM Terminal 18(B)	BUPT High
2	SRSCM Terminal 17(B)	BUPT Low

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

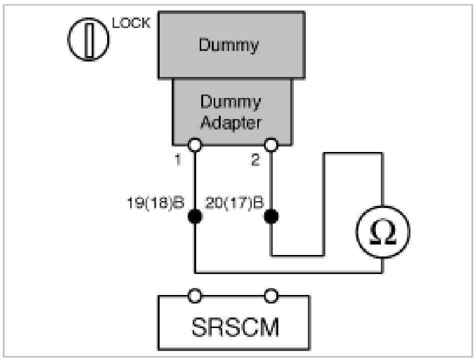
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK BUPT RESISTANCE

> **CAUTION**
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on BUPT harness connector.
- Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 19(18) and 20(17) of SRSCM harness connector(B).

BUPT resistance : 1.9 ≤ R ≤ 2.7 Ω



Is the measured resistance within specification?

YES

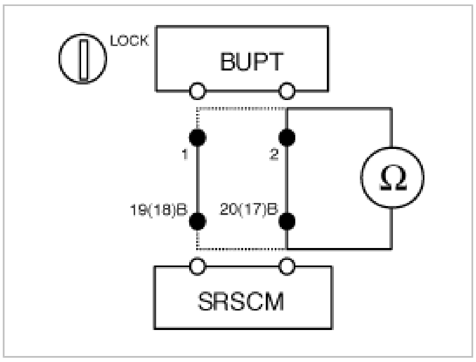
▸ Replace the Buckle Pretensioner(BUPT) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of BUPT harness connector and the terminal 19(18) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of BUPT harness connector and the terminal 20(17) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

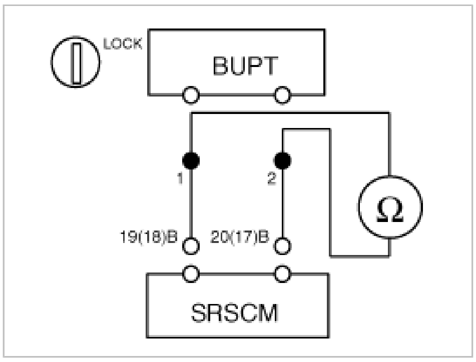
▸ Check short circuit.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of BUPT harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1702

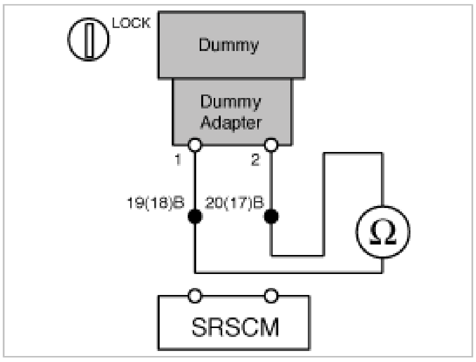
   (2) Measure resistance between the terminal 19(18) and 20(17) of SRSCM harness connector(B).

BUPT resistance : $1.9 \le R \le 2.7\ \Omega$



Is the measured resistance within specification?

YES

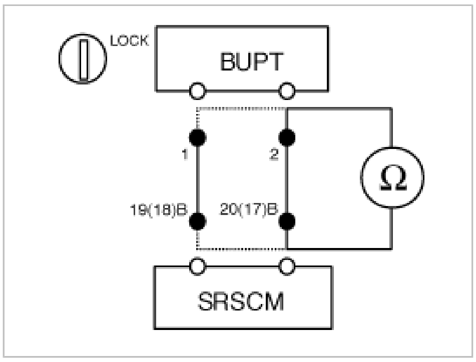
▸ Replace the Buckle Pretensioner(BUPT) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of BUPT harness connector and the terminal 19(18) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of BUPT harness connector and the terminal 20(17) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

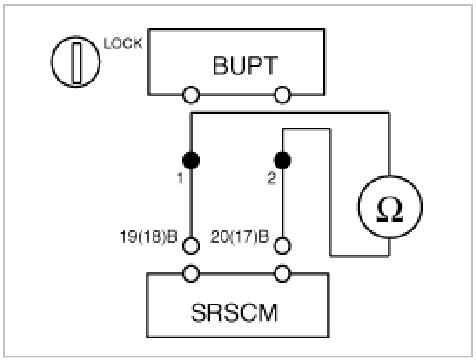
▸ Check short circuit.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of BUPT harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1703

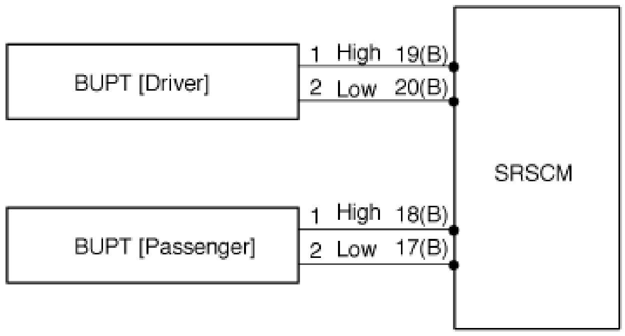
DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects short to ground on the BUPT circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1703 B1708	• Short to ground between BUPT and SRSCM • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Short to ground circuit on wiring harness • Seat Buckle Pretensioner (BUPT) squib • SRSCM

Schematic Diagram

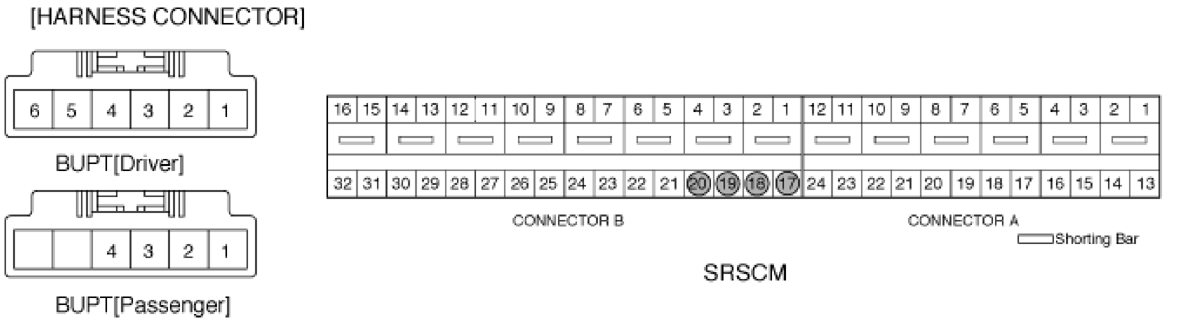


BUPT [Driver]

Terminal	Connected to	Function
1	SRSCM Terminal 19(B)	BUPT High
2	SRSCM Terminal 20(B)	BUPT Low

BUPT [Passenger]

Terminal	Connected to	Function
1	SRSCM Terminal 18(B)	BUPT High
2	SRSCM Terminal 17(B)	BUPT Low



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

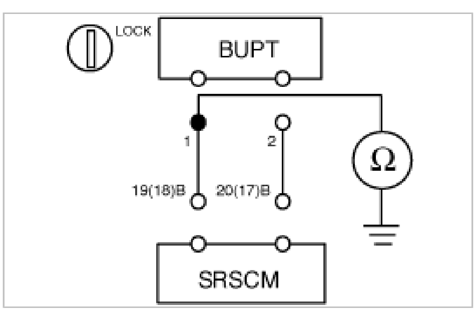
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 1 of BUPT harness connector and chassis ground.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Check the BUPT Module.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

3. CHECK THE BUPT MODULE
   (1) Replace the Buckle Pretensioner(BUPT) with a new one.
   - Refer to "Buckle Pretensioner(BUPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Buckle Pretensioner(BUPT)?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace BUPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1704

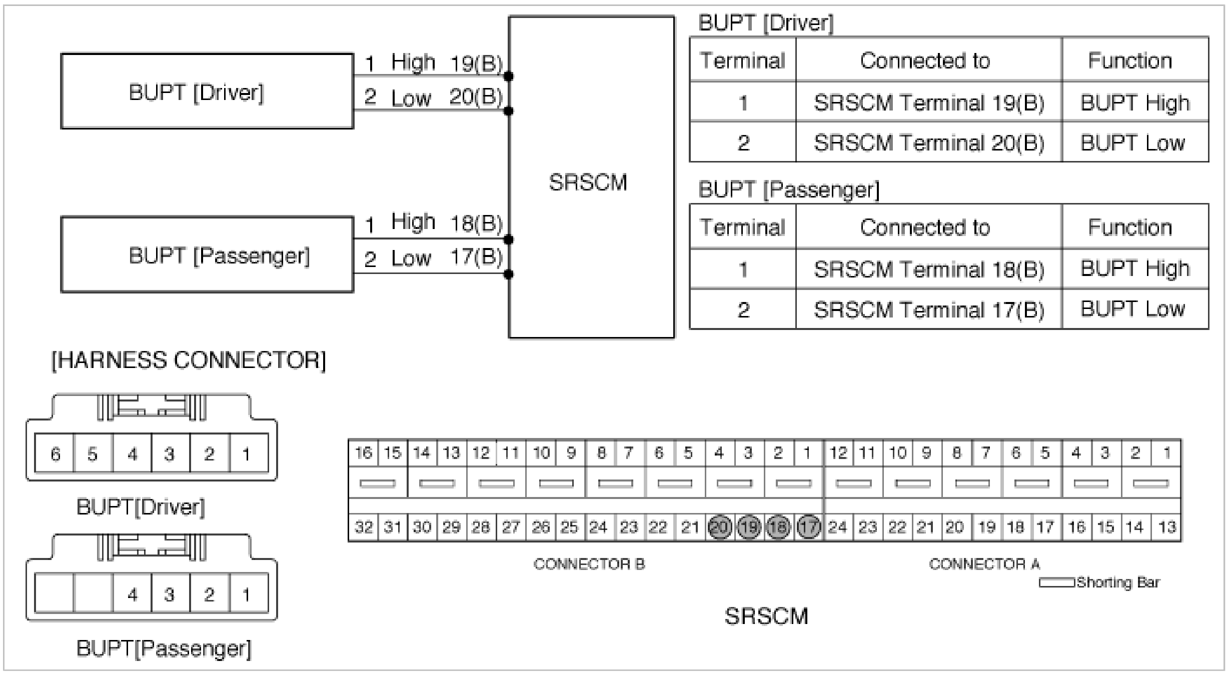
DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects short to battery on the BUPT circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1704 B1709	• Short to battery between BUPT and SRSCM • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Short to battery line circuit on wiring harness • Buckle Pretensioner (BUPT) squib • SRSCM

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

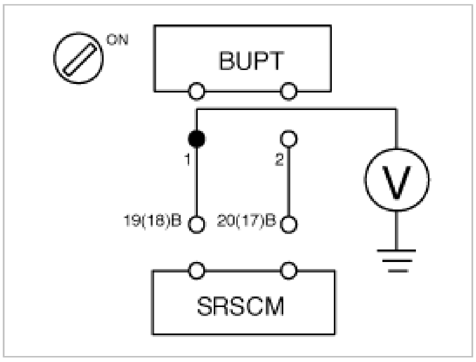
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of BUPT harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▸ Check the BUPT Module.

NO

▸ Repair the short to battery line circuit on wiring harness between the BUPT and the SRSCM.

3. CHECK THE BUPT MODULE
   (1) Replace the Buckle Pretensioner(BUPT) with a new one.
   - Refer to "Buckle Pretensioner(BUPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Connect a Hi-Scan(Pro) to the data link connector.
   Does Hi-Scan (Pro) indicate any DTC related to Buckle Pretensioner(BUPT)?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace BUPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON.

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸ Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1706

DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects that the resistance of BUPT squib is too high or low.

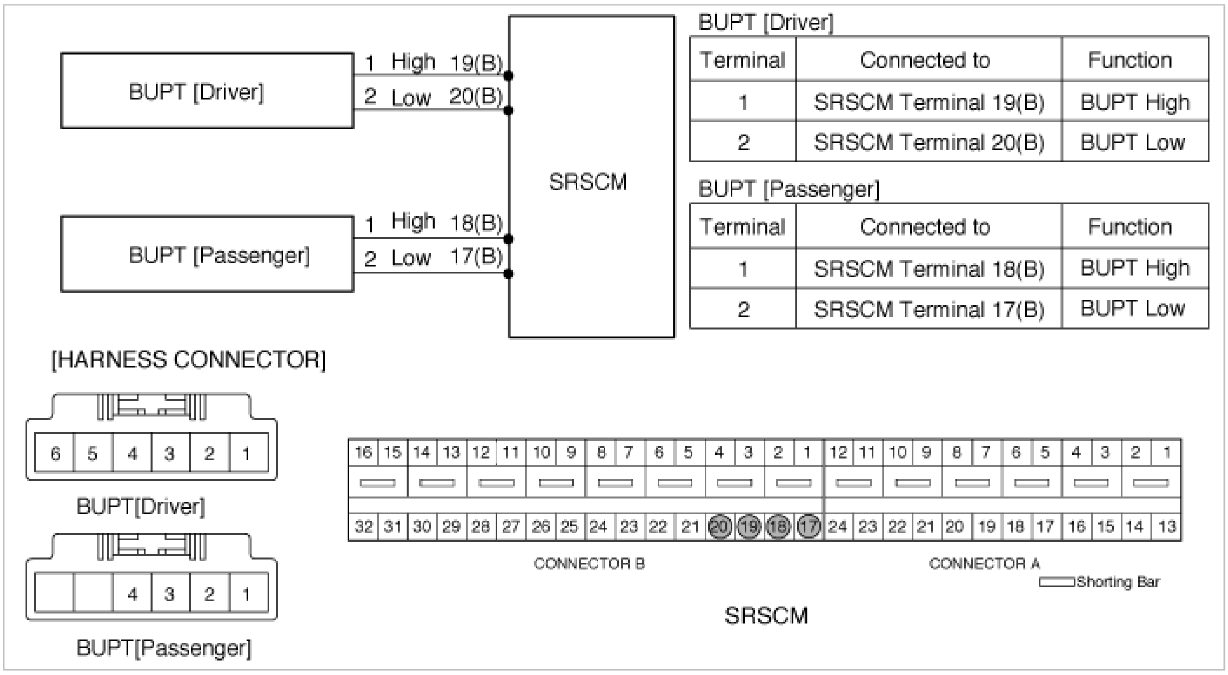
DTC Detecting Condition

DTC	Condition	Probable cause
B1701 B1702 B1706 B1707	• Too high or low resistance between BUPT high(+) and BUPT low (-) • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Buckle Pretensioner (BUPT) squib • SRSCM • Partially connected connector

Specification

BUPT resistance : 1.9 ≤ R ≤ 2.7 Ω

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION

(1) Turn the ignition switch to LOCK.

(2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.

(3) Remove the DAB module and disconnect the DAB connector.

(4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(5) Disconnect the SRSCM connector.

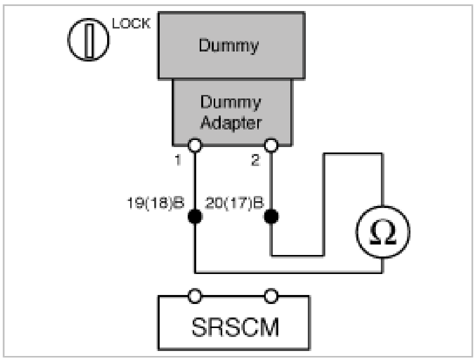
2. CHECK BUPT RESISTANCE

CAUTION
Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on BUPT harness connector.
- Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 19(18) and 20(17) of SRSCM harness connector(B).

BUPT resistance : 1.9 ≤ R ≤ 2.7 Ω



Is the measured resistance within specification?

YES

▸ Replace the Buckle Pretensioner(BUPT) module.

NO

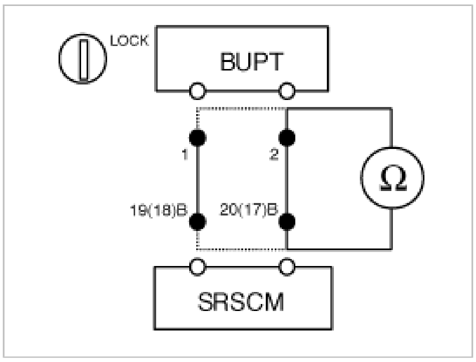
▸ Check open circuit.

3. CHECK OPEN CIRCUIT

(1) Measure resistance between the terminal 1 of BUPT harness connector and the terminal 19(18) of SRSCM harness connector(B).

(2) Measure resistance between the terminal 2 of BUPT harness connector and the terminal 20(17) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸ Check short circuit.

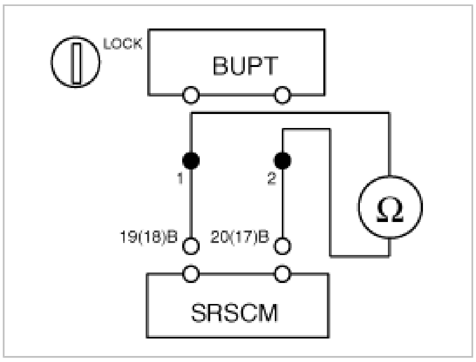
NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

4. CHECK SHORT CIRCUIT

(1) Measure resistance between the terminal 1 and 2 of BUPT harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1707

DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects that the resistance of BUPT squib is too high or low.

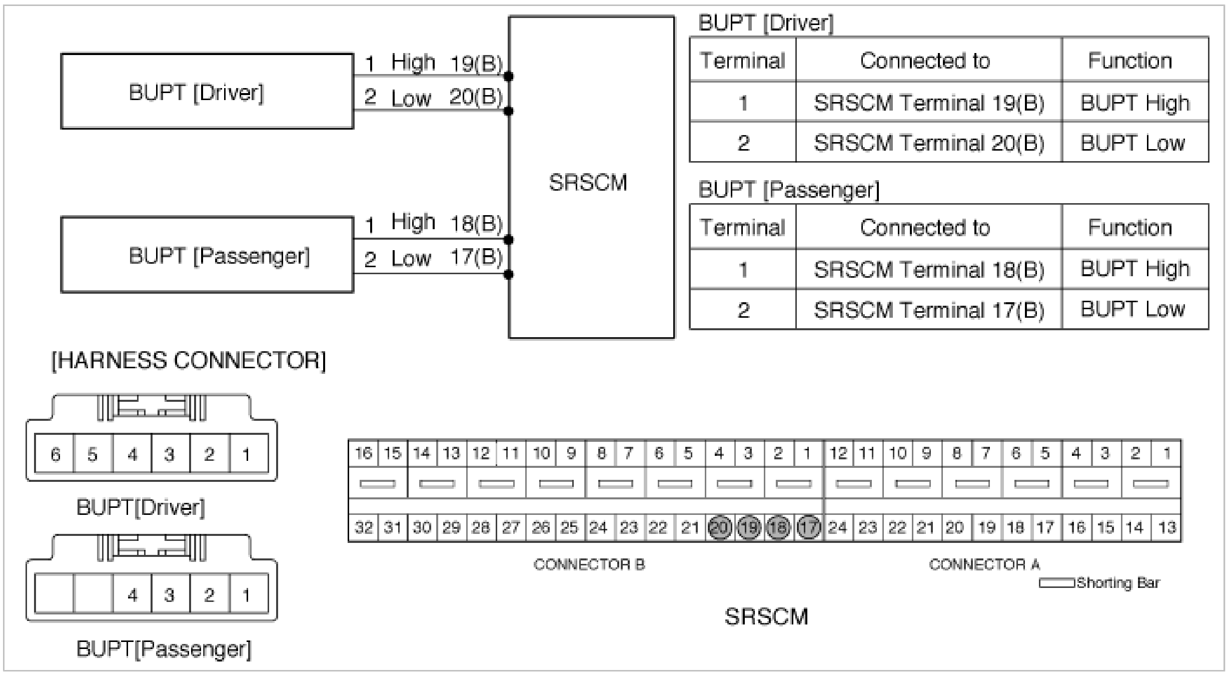
DTC Detecting Condition

DTC	Condition	Probable cause
B1701 B1702 B1706 B1707	• Too high or low resistance between BUPT high(+) and BUPT low (-) • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Open or short circuit on wiring harness • Seat Buckle Pretensioner (BUPT) squib • SRSCM • Partially connected connector

Specification

BUPT resistance : 1.9 ≤ R ≤ 2.7 Ω

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

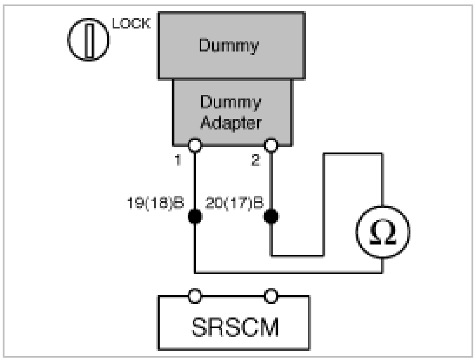
1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK BUPT RESISTANCE

> **CAUTION**
>
> Never attempt to measure the circuit resistance of the airbag module(squib) even if you are using the specified tester.

(1) Connect the Dummy and the Dummy Adapter on BUPT harness connector.
- Refer to "SPECIAL SERVICE TOOL" section in this SERVICE MANUAL for the SST No. of Dummy and Dummy Adapter.

(2) Measure resistance between the terminal 19(18) and 20(17) of SRSCM harness connector(B).

BUPT resistance : 1.9 ≤ R ≤ 2.7 Ω



Is the measured resistance within specification?

YES

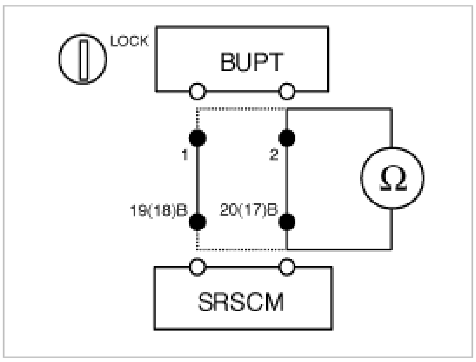
▸ Replace the Buckle Pretensioner(BUPT) module.

NO

▸ Check open circuit.

3. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 1 of BUPT harness connector and the terminal 19(18) of SRSCM harness connector(B).
   (2) Measure resistance between the terminal 2 of BUPT harness connector and the terminal 20(17) of SRSCM harness connector(B).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

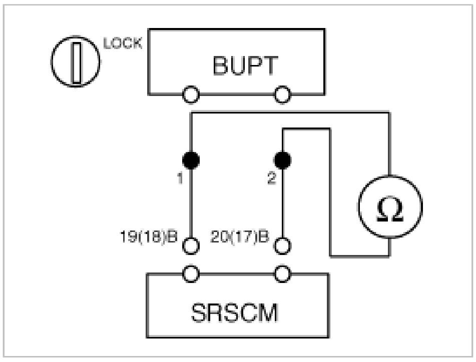
▸ Check short circuit.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

4. CHECK SHORT CIRCUIT
   (1) Measure resistance between the terminal 1 and 2 of BUPT harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

5. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON .
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).
   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.
   (9) Turn the ignition switch to ON and wait for at least 30 seconds.
   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1708

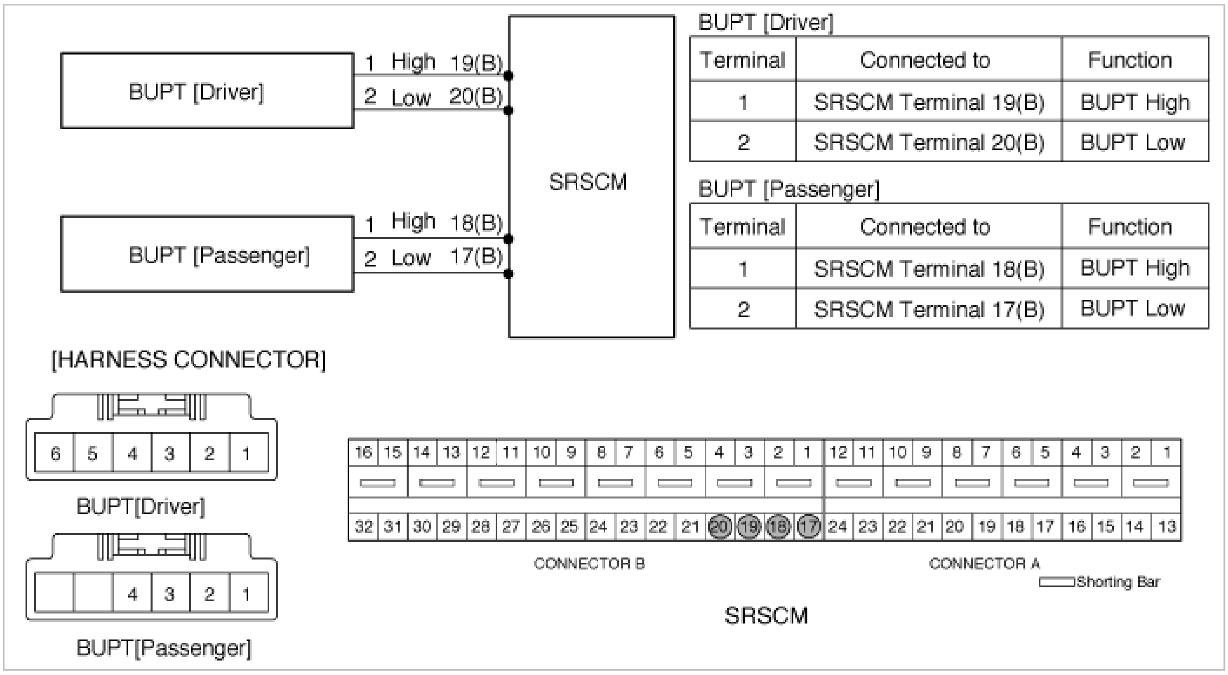
DTC Description

The Buckle Pretensioner circuit consists of the SRSCM and two Buckle Pretensioner (BUPT). The SRSCM sets above DTC(s) if it detects short to ground on the BUPT circuit.

DTC Detecting Condition

DTC	Condition	Probable cause
B1703 B1708	• Short to ground between BUPT and SRSCM • Seat Buckle Pretensioner (BUPT) Malfunction • SRSCM Malfunction	• Short to ground circuit on wiring harness • Seat Buckle Pretensioner (BUPT) squib • SRSCM

Schematic Diagram



BUPT [Driver]

Terminal	Connected to	Function
1	SRSCM Terminal 19(B)	BUPT High
2	SRSCM Terminal 20(B)	BUPT Low

BUPT [Passenger]

Terminal	Connected to	Function
1	SRSCM Terminal 18(B)	BUPT High
2	SRSCM Terminal 17(B)	BUPT Low

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

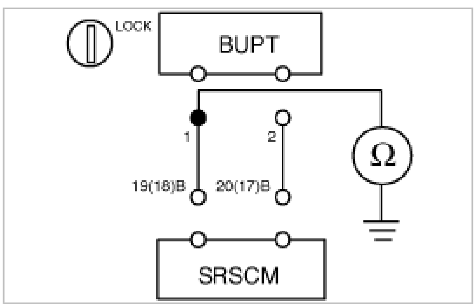
YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.
2. CHECK SHORT TO GROUND
   (1) Measure resistance between the terminal 1 of BUPT harness connector and chassis ground.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

▸ Check the BUPT Module.

NO

▸ Repair or replace the wiring harness between the BUPT and the SRSCM.

3. CHECK THE BUPT MODULE
   (1) Replace the Buckle Pretensioner(BUPT) with a new one.
   - Refer to "Buckle Pretensioner(BUPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Turn the ignition switch to ON and check the vehicle again.
   Does Hi-Scan (Pro) indicate any DTC related to Buckle Pretensioner(BUPT)?

   YES

   ▸ Go to next step.

   NO

   ▸ Replace BUPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON .

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B1709

Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> **CAUTION**
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

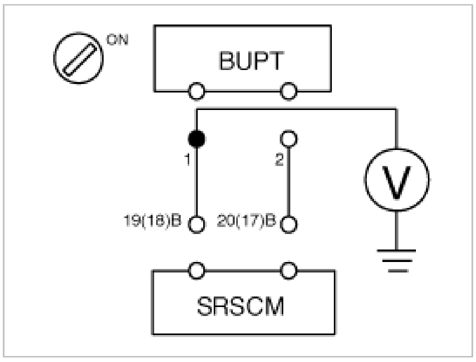
▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK SHORT TO BATTERY LINE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of BUPT harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

▶ Check the BUPT Module.

NO

▶ Repair the short to battery line circuit on wiring harness between the BUPT and the SRSCM.

3. CHECK THE BUPT MODULE
   (1) Replace the Buckle Pretensioner(BUPT) with a new one.
   - Refer to "Buckle Pretensioner(BUPT)" section in this SERVICE MANUAL.

   (2) Install the DAB module and connect the DAB connector.

   (3) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (4) Connect the SRSCM connector.

   (5) Connect the negative (-) terminal to the battery.

   (6) Connect a Hi-Scan(Pro) to the data link connector.

   (7) Connect a Hi-Scan(Pro) to the data link connector.
   Does Hi-Scan (Pro) indicate any DTC related to Buckle Pretensioner(BUPT)?

   YES

   ▶ Go to next step.

   NO

   ▶ Replace BUPT module.

4. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

   (3) Connect the SRSCM connector.

   (4) Connect the negative (-) terminal to the battery.

   (5) Connect a Hi-Scan(Pro) to the data link connector.

   (6) Turn the ignition switch to ON.

   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

   (8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

   (9) Turn the ignition switch to ON and wait for at least 30 seconds.

   (10) Check the vehicle again with the Hi-Scan(Pro).
   Does the above DTC(s) go off?

   YES

   ▶ Problem is intermittent or was repaired and SRSCM memory was not cleared.

   NO

   ▶ Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehiclenormally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B2500

DTC Description

The SRS warning lamp is located in the cluster. When the airbag system is normal, the SRS SRI flashes for approx. 6 seconds after the ignition switch is turned " ON ", and then turns off automatically.If there is a malfunction in the airbag system, the SRS

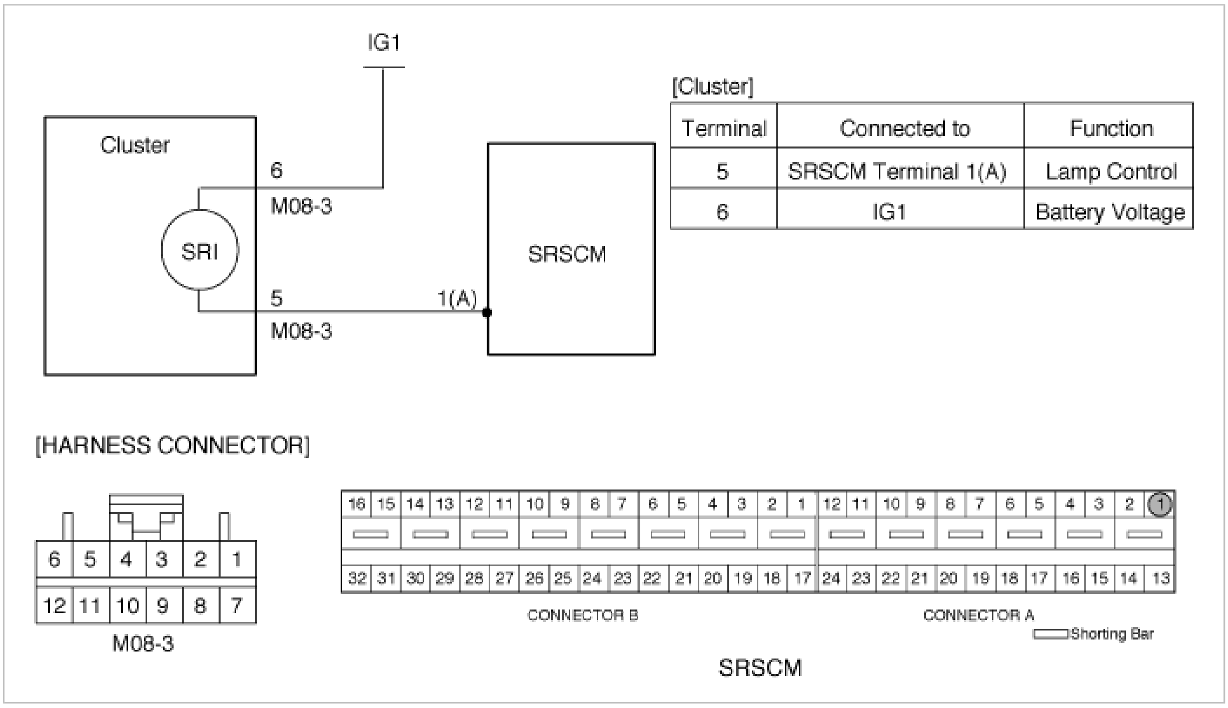
SRI lights up to inform the driver of the abnormality.The SRSCM shall measure the voltage at the SRS SRI output pin, both when the lamp is on and when the lamp is off, to detect whether the commanded state matches the actual state.

> NOTE
>
> The SRI will be continuously illuminated if the SRSCM is loose or disconnects.

DTC Detecting Condition

DTC	Condition	Probable cause
B2500	• Airbag fuse • Warning Lamp Bulb • Open between warning lamp and SRSCM • Short to ground or battery line between the warning lamp and SRSCM • SRSCM Malfunction	• Fuse • Warning lamp bulb • Wiring Harness • SRSCM

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

> CAUTION
>
> Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.

(2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.

(3) Remove the DAB module and disconnect the DAB connector.

(4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(5) Disconnect the SRSCM connector.

2. CHECK THE FUSE

(1) Remove the airbag fuse and the airbag warning lamp fuse from junction block.

(2) Inspect the fuses.

Are the fuses normal?

YES

▸ Check the warning lamp bulb.

NO

▸ Repair or replace the fuses.

3. CHECK THE WARNING LAMP BULB

(1) Remove the bulb from the instrument cluster.

(2) Inspect the bulb.

Is the bulb normal?

YES

▸Check source voltage.

NO

▸ Repair or replace the bulb.

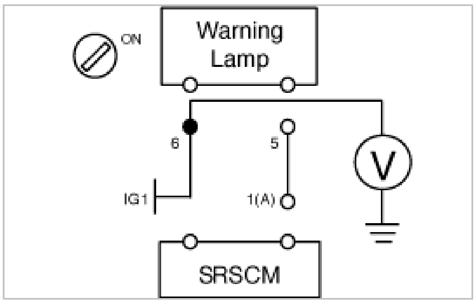
4. CHECK SOURCE VOLTAGE

(1) Connect the negative (-) terminal to the battery.

(2) Turn the ignition switch to ON.

(3) Measure voltage between the terminal 6 of the instrument Cluster harness connector and chassis ground(-).

specification(voltage) : 9 ~ 16 V



Is the measured voltage within specification?

YES

▸Check short to battery line.

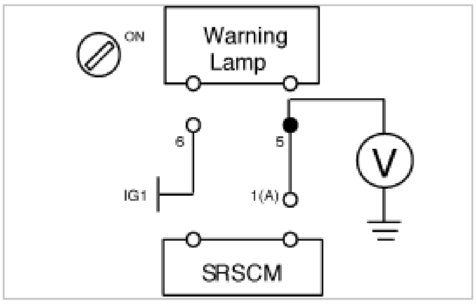
NO

▸Repair or replace the wiring harness between ignition switch and the Warning Lamp.

5. CHECK SHORT TO BATTERY LINE

(1) Measure voltage between the terminal 5 of the instrument Cluster harness connector and chassis ground(-).

specification(voltage) : Approximately 0 V



Is the measured voltage within specification?

YES

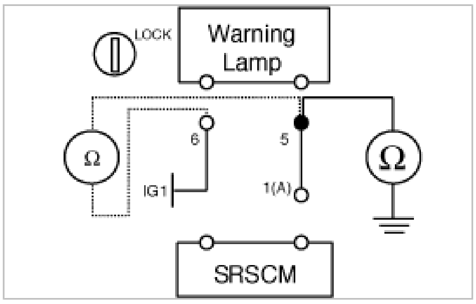
▸ Check short or short to ground.

NO

▸ Repair the short to battery line circuit on wiring harness between the SRSCM and the Warning Lamp.

6. CHECK SHORT OR SHORT TO GROUND
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative(-) terminal from the battery.
   (3) Measure resistance between the terminal 5 of the instrument cluster harness connector and chassis ground.
   (4) Measure resistance between the terminal 5 and 6 of the Instrument Cluster harness connector.

specification(resistance) : infinite



Is the measured resistance within specification?

YES

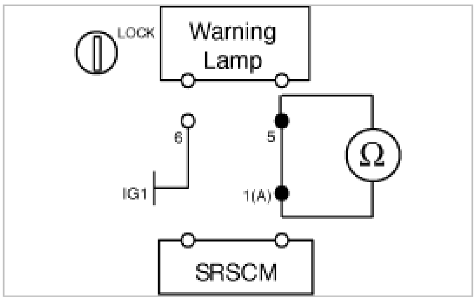
▸Check open circuit.

NO

▸ Repair the short or short to ground circuit on wiring harness between the SRSCM and the Warning Lamp.

7. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 5 of the Instrument Cluster connector and the terminal 1 of SRSCM harness connector(A).

specification(resistance) : below 1 Ω



Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair the open circuit on wiring harness between the SRSCM and the Warning Lamp.

8. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.
   (2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (3) Connect the SRSCM connector.
   (4) Connect the negative (-) terminal to the battery.
   (5) Connect a Hi-Scan(Pro) to the data link connector.
   (6) Turn the ignition switch to ON.
   (7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Supplemental Restraint System Control Module (SRnodeM) > Troubleshooting > B2502

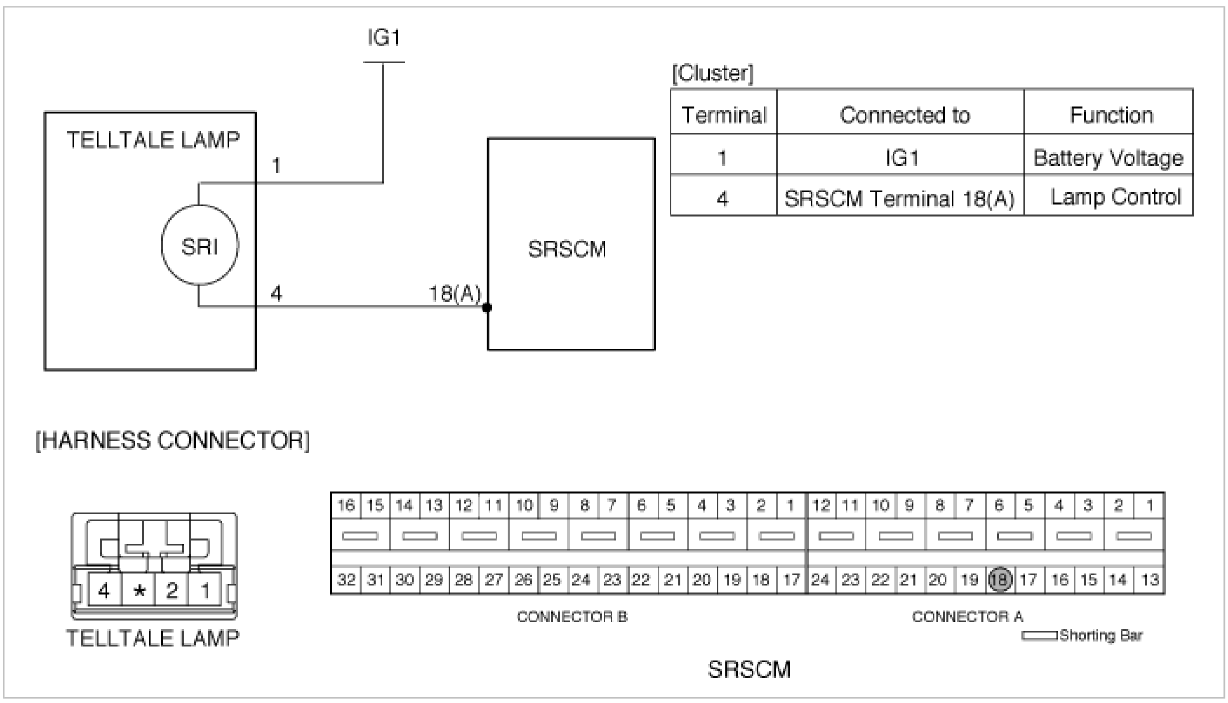
DTC Description

The Telltale Lamp circuit consisits of the Telltale Lamp and the SRSCM. SRSCM set the above DTC that the Telltale Lamp failure is detected.

DTC Detecting Condition

DTC	Condition	Probable cause
B2502	• Airbag fuse • Telltale Lamp Bulb • Open between Telltale Lamp and SRSCM • Short to ground or battery line between the Telltale Lamp and SRSCM • SRSCM Malfunction	• Fuse • Telltale Lamp Bulb • Wiring Harness • SRSCM

Schematic Diagram



Terminal & Connector Inspection

1. Visually inspect all connectors related to the affected circuit for damage and secure connection.
2. Inspect terminals for damage and corrosion.

CAUTION

Avoid damaging connectors during the inspection process.

3. Are any problems found?

NO

▸ Go to next step.

YES

▸ After repairing the trouble part, check whether DTC occurs or not.

Inspection Procedure

1. PREPARATION
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative (-) terminal from the battery and wait for at least 3 minutes.
   (3) Remove the DAB module and disconnect the DAB connector.
   (4) Disconnect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.
   (5) Disconnect the SRSCM connector.

2. CHECK THE FUSE
   (1) Remove the airbag fuse and the airbag telltale lamp fuse from junction block.
   (2) Inspect the fuses. Are the fuses normal?

   YES

   ▸ Check the telltale lamp bulb.

   NO

   ▸ Repair or replace the fuses.

3. CHECK THE TELLTALE LAMP BULB
   (1) Remove the bulb from the instrument cluster.
   (2) Inspect the bulb. Is the bulb normal?

   YES

   ▸Check source voltage.

   NO

   ▸ Repair or replace the bulb.

4. CHECK SOURCE VOLTAGE
   (1) Connect the negative (-) terminal to the battery.
   (2) Turn the ignition switch to ON.
   (3) Measure voltage between the terminal 1 of the Telltale Lamp harness connector and chassis ground(-).

   specification(voltage) : 9 ~ 16 V

   
   (4) Is the measured voltage within specification?

   YES

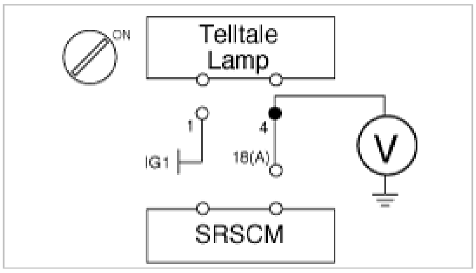
   ▸Check short to battery line.

   NO

   ▸Repair or replace the wiring harness between ignition switch and the Telltale Lamp.

5. CHECK SHORT TO BATTERY LINE
   (1) Measure voltage between the terminal 4 of the Telltale Lamp harness connector and chassis ground(-).

   specification(voltage) : Approximately 0 V



(2) Is the measured voltage within specification?

YES

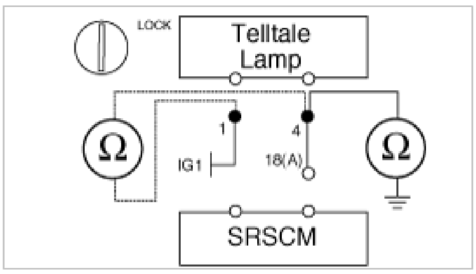
▸ Check short or short to ground.

NO

▸ Repair the short to battery line circuit on wiring harness between the SRSCM and the Telltale Lamp.

6. CHECK SHORT OR SHORT TO GROUND
   (1) Turn the ignition switch to LOCK.
   (2) Disconnect the negative(-) terminal from the battery.
   (3) Measure resistance between the terminal 4 of the Telltale Lamp harness connector and chassis ground.
   (4) Measure resistance between the terminal 1 and 4 of the Telltale Lamp harness connector.

specification(resistance) : infinite



(5) Is the measured resistance within specification?

YES

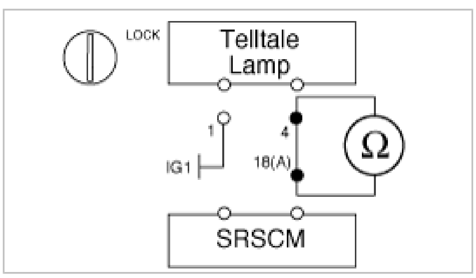
▸Check open circuit.

NO

▸ Repair the short or short to ground circuit on wiring harness between the SRSCM and the Telltale Lamp.

7. CHECK OPEN CIRCUIT
   (1) Measure resistance between the terminal 4 of the Telltale Lamp harness connector and the terminal 18(A) of SRSCM harness connector.

specification(resistance) : below 1 Ω



(2) Is the measured resistance within specification?

YES

▸ Go to next step.

NO

▸ Repair the open circuit on wiring harness between the SRSCM and the Telltale Lamp.

8. CLEAR THE DTC AND CHECK THE VEHICLE AGAIN
   (1) Install the DAB module and connect the DAB connector.

(2) Connect the connectors of the PAB, SAB, CAB, BPT, BUPT, FIS and SIS.

(3) Connect the SRSCM connector.

(4) Connect the negative (-) terminal to the battery.

(5) Connect a Hi-Scan(Pro) to the data link connector.

(6) Turn the ignition switch to ON.

(7) Clear the DTC stored in the SRSCM memory with the Hi-Scan(Pro).

(8) Turn the ignition switch to LOCK and wait for at least 30 seconds.

(9) Turn the ignition switch to ON and wait for at least 30 seconds.

(10) Check the vehicle again with the Hi-Scan(Pro).
Does the above DTC(s) go off?

YES

▸ Problem is intermittent or was repaired and SRSCM memory was not cleared.

NO

▸Replace the SRSCM with a new one, and then check the vehicle again. At this time, if the vehicle normally operates with a new SRSCM, the fault may be the SRSCM(Replace SRSCM).

Restraint > Airbag Module > Description and Operation

AIRBAG DISPOSAL

Special Tool Required

Before scrapping any airbags or side airbags (including those in a whole vehicle to be scrapped), the airbags or side airbags must be deployed. If the vehicle is still within the warranty period, before deploying the airbags or side airbags, the Technical Manager must give approval and/or special instruction. Only after the airbags or side airbags have been deployed (as the result of vehicle collision, for example), can they be scrapped.
If the airbags or side airbags appear intact (not deployed), treat them with extreme caution. Follow this procedure.

Deploying Airbags In the vehicle

If a SRS equipped vehicle is to be entirely scrapped, its airbags or side airbags should be deployed while still in the vehicle. The airbags or side airbags should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the ignition switch OFF, and disconnect the battery negative cable and wait at least three minutes.
2. Confirm that each airbag or side airbag are securely mounted.
3. Confirm that the special tool is functioning properly by following the check procedure.
   Driver's Airbag :
4. Remove the driver's airbag , then disconnect #1,#2 driver's airbag connector.
   Then install the SST(0957A-38510).
   Passenger's Airbag :
5. Remove the passenger's airbag, then disconnect passenger's airbag connector.
   Then install the SST(0957A-38510).
   Side Airbag :
6. Remove the side airbag, then disconnect side airbag connector.
   Then install the SST(0957A-3F100).
   Curtain Airbag :
7. Remove the curtain airbag, then disconnect curtain airbag connector.
   Then instal the SST(0957A-38500).
   Belt pretensioner :
8. Remove the belt pretensioner, then disconnect belt pretensioner connector.
   Then instal the SST(0957A-38500).
   Buckle pretensioner :
9. Remove the buckle pretensioner, then disconnect buckle pretensioner connector.
   Then install the SST(0957A-2E210).
10. Place the deployment tool at least thirty feet (10 meters) away from the airbag.
11. Connect a 12 volt battery to the tool.
12. Push the tool's deployment switch. The airbag should deploy. Repeat for 2nd circuit if deploying DAB or PAB. (deployment is both highly audible and visible: a loud noise and rapid inflation of the bag, followed by slow deflection)
13. Dispose of the complete airbag. No part of it can be reused. Place it in a sturdy plastic bag and seal it securely.

Deploying the Airbag Out of the vehicle

If an intact airbag has been removed from a scrapped vehicle, or has been found defective or damage during transit, storage or service, it should be deployed as follows :

1. Confirm that the special tool is functioning properly by following the check procedure on this page.
2. Position the airbag face up, outdoors on flat ground at least thirty feet (10meters) from any obstacles or people.

Disposal of Damaged Airbag

1. If installed in a vehicle, follow the removal procedure of driver's airbag, front passenger's and side airbag.
2. In all cases, make a short circuit by twisting together the two airbag inflator wires.
3. Package the airbag in exactly the same packing that the new replacement part come in.

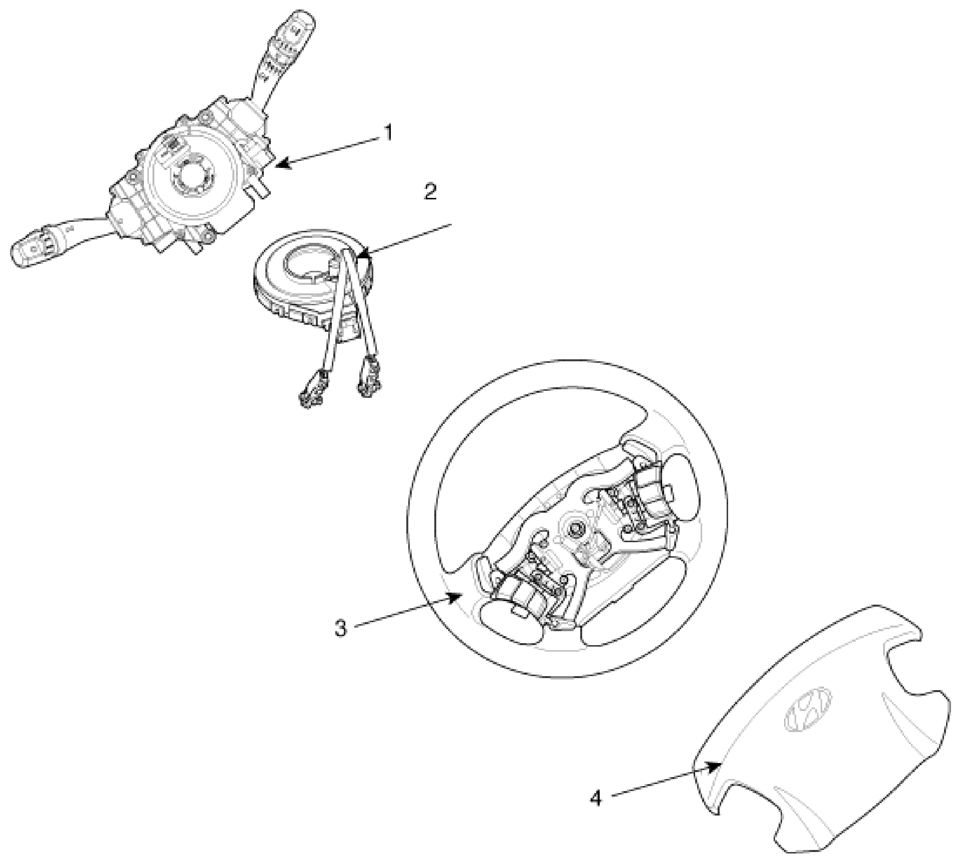
Restraint > Airbag Module > Driver Airbag (DAB) Module and Clock Spring > Description and Operation

DESCRIPTION

Driver Airbag (DAB) is installed in steering wheel and electrically connected to SRSCM via clockspring. It protects the driver from danger by deploying a bag when frontal crash occurs. The SRSCM determines deployment of Driver Airbag (DAB) by using the Front Impact Sensor (FIS) signal. The driver airbag is a two stage device. If the crash algorithm determines that only the first stage is to be activated, the second stage will be automatically disposed of after a programmable time has elapsed since the first stage deployment. The ACU shall be capable to deploy all firing loops for at least 150ms after IGN has been disconnected.

Restraint > Airbag Module > Driver Airbag (DAB) Module and Clock Spring > Components and Components Location

components



1. Multi-Function Switch
2. Clock Spring
3. Steering Wheel
4. Driver Airbag (DAB)

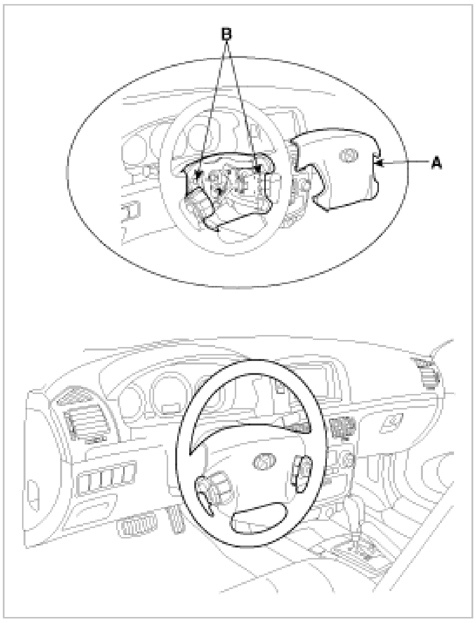
Restraint > Airbag Module > Driver Airbag (DAB) Module and Clock Spring > Repair procedures

REMOVAL

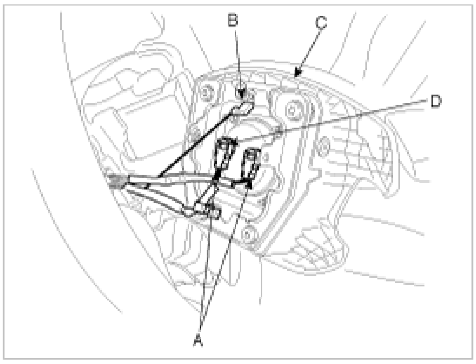
DAB REMOVAL

1. Disconnect the battery negative cable and wait at least three minutes before beginning work.
2. After removing the cover (A), loosen the two Torx bolt (B).

> NOTE
>
> • Use the magnetic tool, because the bolts(B) are not seperated completely.



3. Disconnect the connectors(A) after lifting up the pin(D) and the horn connector(B). Remove the driver's airbag(C) from the steering wheel.

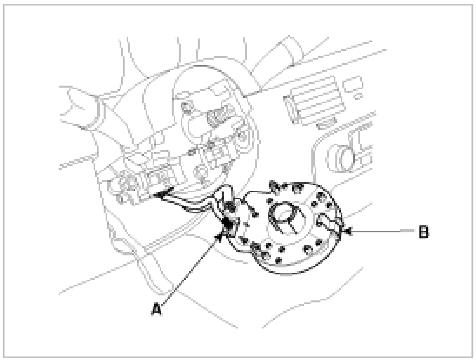


CAUTION

The removed airbag module should be stored in a clean and dry place with the pad cover face up.

CLOCK SPRING REMOVAL

1. Disconnect the negative battery cable, and wait at least 3 minutes before beginning work.
2. Remove the DAB.
3. Remove the steering wheel (Refer to ST- Steering wheel group).
4. Remove the steering column shroud.(Refer to ST-steering column and shaft)
5. Remove clock spring connector(A), then remove clock spring(B).



6. Verify front wheelS are pointed straight ahead.
7. Turn clockspring clockwise until it stopS. (softly, do not force)
   Turn it counter clockwise 3 truns until front wheel is pointed forward.
8. Install on to steering column.

9. Installation is the reverse of removal.

NOTE

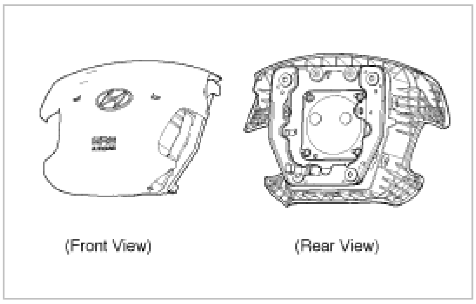
After installing the clock spring, confirm proper system operation; Turn the ignition switch ON: the SRS indicator light should turn on for about 6 seconds and then go off.

INSPECTION

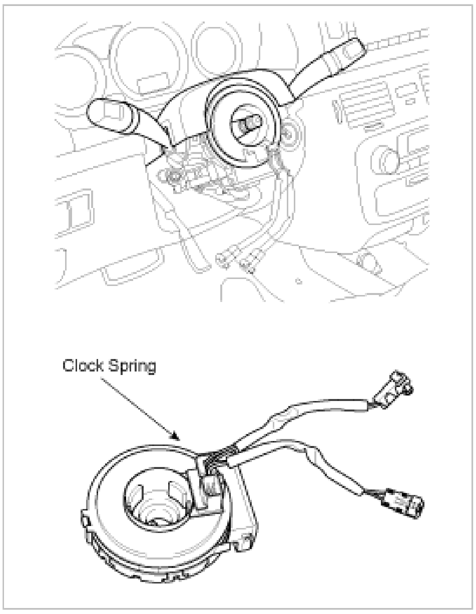
CAUTION

Never attempt to measure the circuit resistance of the airbag module (squib) even if you are using the specified tester. If the circuit resistance is measured with a tester, accidental airbag deployment will result in serious personal injury.

1. Check pad cover for dents, cracks or deformities.
2. Check the airbag module for denting, cracking or deformation.
3. Check hooks and connectors for damage, terminals for deformities, and harness for binds.
4. Check airbag inflator case for dents, cracks or deformities.



5. Install the airbag module to the steering wheel to check for fit or alignment of the wheel.
   A. If, as a result of the following checks, even one abnormal point is discovered, replace the clock spring with a new one.
   B. Check connectors and protective tube for damage, and terminals for deformities.



Restraint > Airbag Module > Passenger Airbag (PAB) Module > Description and Operation

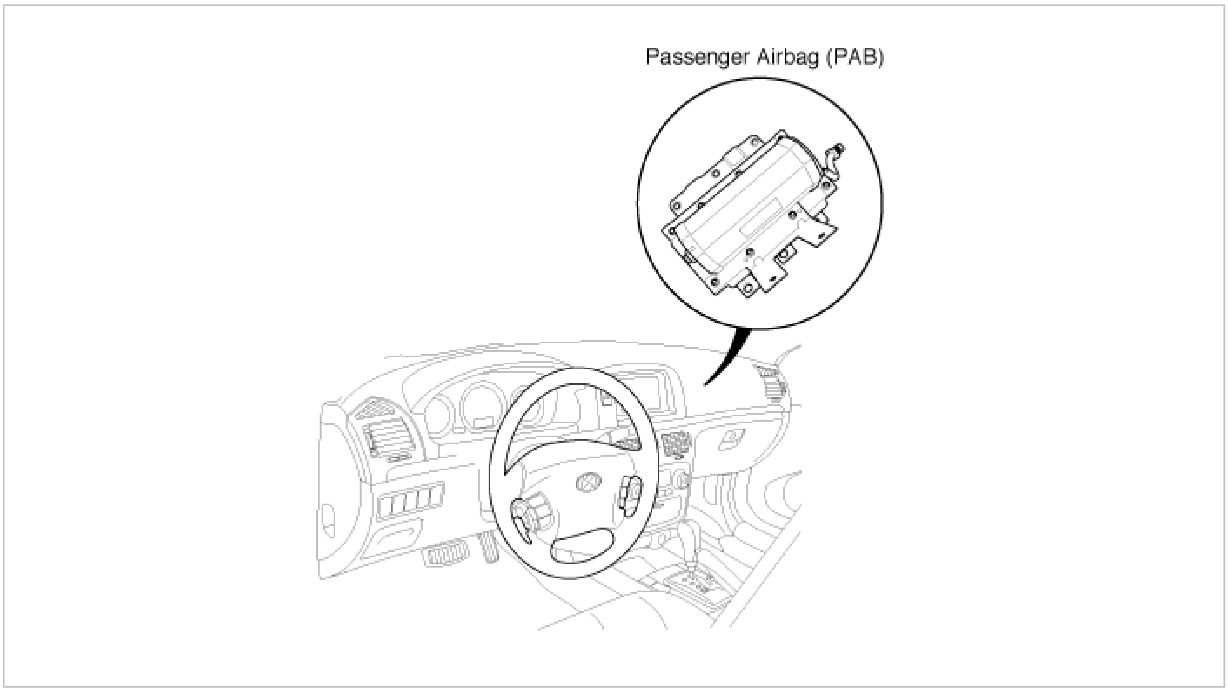
DESCRIPTION

The passenger Airbag (PAB) is installed inside the dash and protects the front passenger in the event of a frontal crash. The SRSCM determines if and when to deploy the PAB from the front impact sensor (FIS) signal. The PAB is a two-stage device; if the SRSCM determines that only the first stage should activate, the second stage will dispose after first-stage deployment. In case of loss of vehicle power, the driver firing loops have a 150 ms battery backup.

Restraint > Airbag Module > Passenger Airbag (PAB) Module > Components and Components

Location

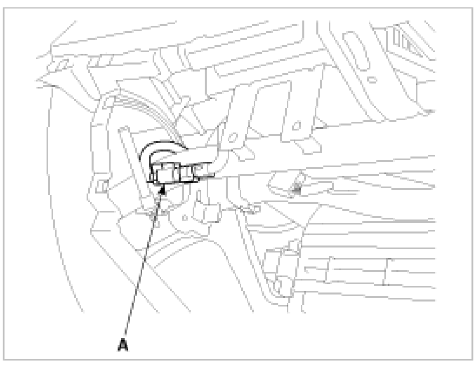
components



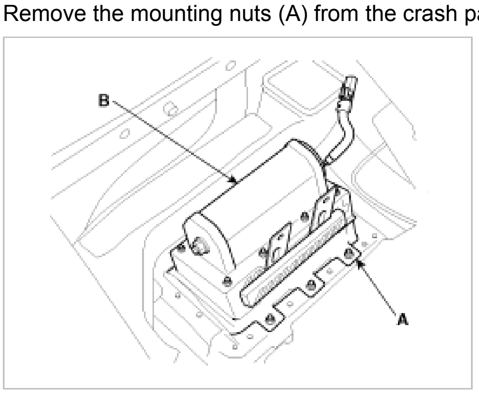
Restraint > Airbag Module > Passenger Airbag (PAB) Module > Repair procedures

REMOVAL

1. Disconnect the battery negative cable and wait at least three minutes before beginning work.
2. Remove the glove box (Refer to group - glove box) , then disconnect the connector(A).



3. Remove the crash pad. (Refer to BD group - crash pad)
4. Remove the mounting nuts (A) from the crash pad. Then remove the passenger's airbag (B).



5. Installation is the reverse of removal.

NOTE

After installing the clock spring, confirm proper system operation; Turn the ignition switch ON: the SRS indicator light should turn on for about 6 seconds and then go off.

Restraint > Airbag Module > Side Airbag (SAB) Module > Description and Operation

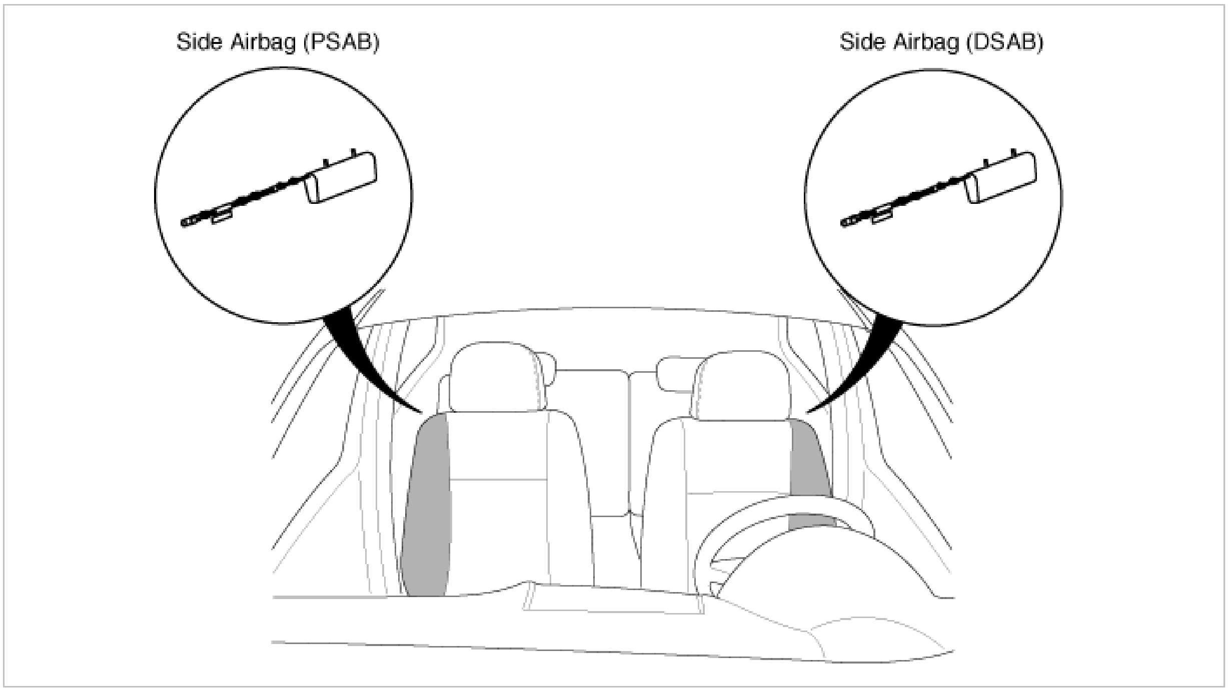
DESCRIPTION

CAUTION

Never attempt to measure the circuit resistance of the airbag module (squib) even if you are using the specified tester. If the circuit resistance is measured with a tester, accidental airbag deployment may result in serious personal injury.

Restraint > Airbag Module > Side Airbag (SAB) Module > Components and Components Location

components



Restraint > Airbag Module > Side Airbag (SAB) Module > Repair procedures

REMOVAL

1. Disconnect the battery negative cable and wait at least 3 minutes before beginning work.
2. Remove the front seat assembly(Refer to BD-Front Seat)
3. Remove the seat-back assembly.(Refer to BD-Front Seat)
4. Installation is the reverse of removal.

NOTE

After installing the side airbag, confirm proper system operation: Turn the ignition switch ON; the SRS indicator light should turn on about six seconds and then go off.

Restraint > Airbag Module > Curtain Airbag (CAB) Module > Description and Operation

DESCRIPTION

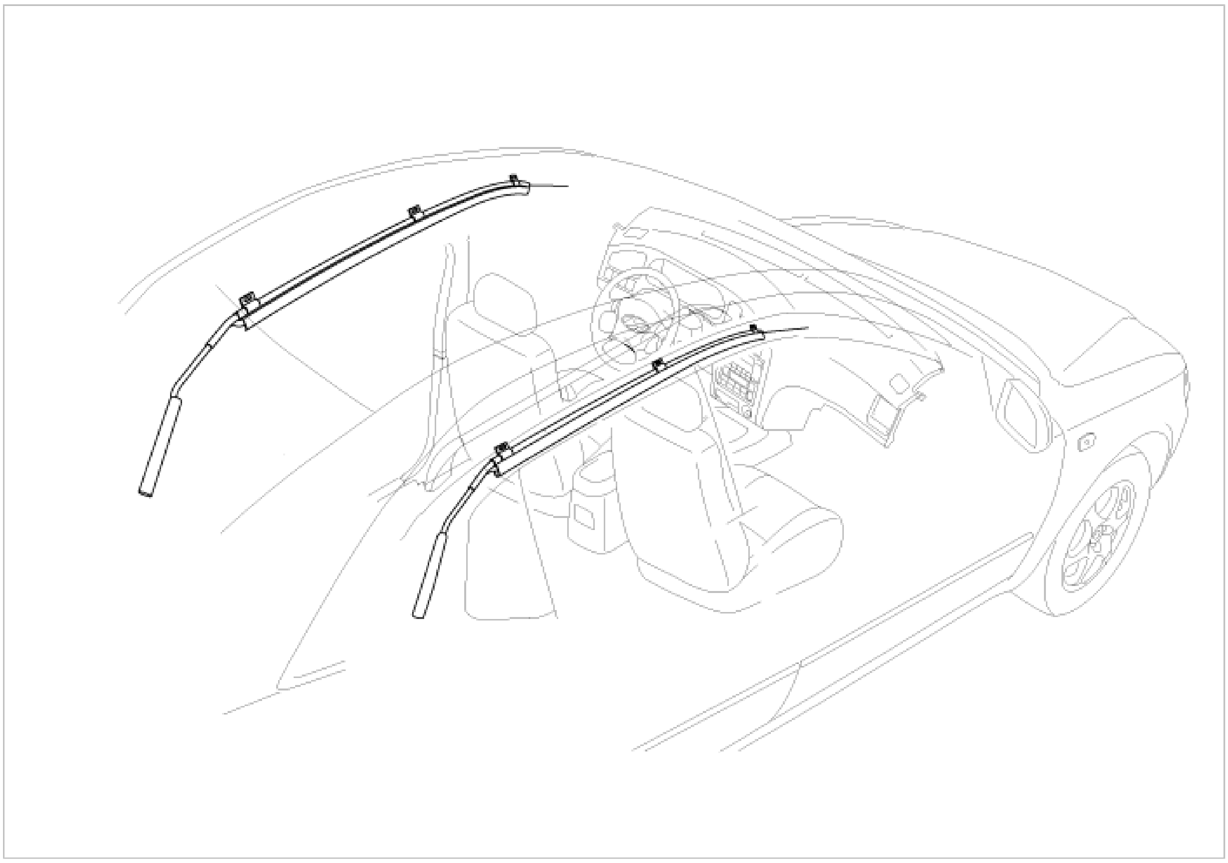
Curtain airbags are installed inside the headliner (LH and RH) and protect the driver and passanger from danger when side crash occurs. The SRSCM determines deployment of curtain airbag by using side impact sensor (SIS) signal.

CAUTION

Never attempt to measure the circuit resistance of the airbag module even if you are using the specified tester. If the circuit resistance is measured with a tester, accidental airbag deployment will result in serious personal injury.

Restraint > Airbag Module > Curtain Airbag (CAB) Module > Components and Components Location

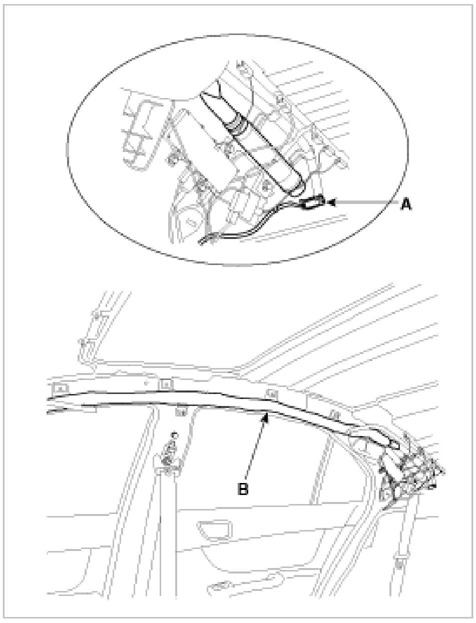
components



Restraint > Airbag Module > Curtain Airbag (CAB) Module > Repair procedures

removal

1. Disconnect the battery negative cable and wait at least 3 minutes before beginning work.
2. Remove the following parts (Refer to BD- group).
   A. Front and rear seat
   B. Interior trim
   C. Trunk trim
   D. Headlining
3. Disconnect the connector (A).
4. After loosening the mounting bolts, remove the curtain airbag (B).



5. Installation is the reverse of removal

> **NOTE**
>
> After installing the curtain airbag, confirm proper system operation: Turn the ignition switch ON; the SRS indicator light should turn on about seconds and then go off.

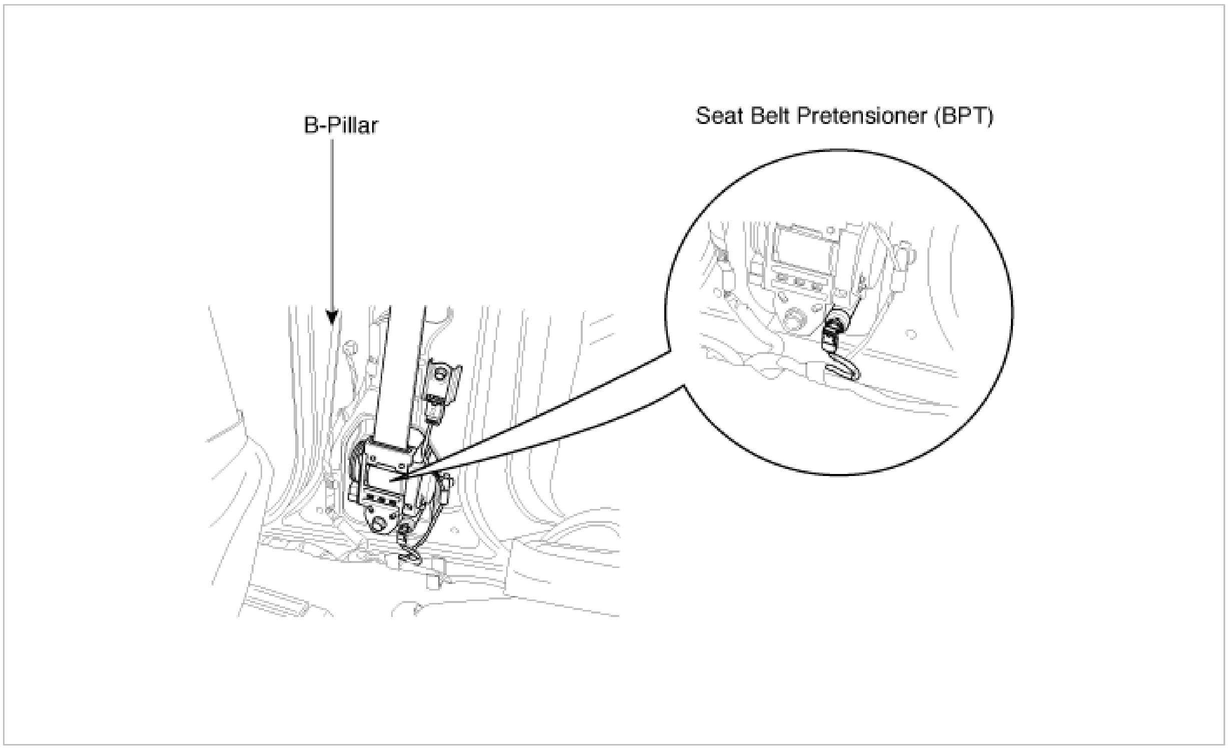
Restraint > Seat Belt Pretensioner > Seat Belt Retractor Pretensioner (BPT) > Description and Operation

DESCRIPTION

> **CAUTION**
>
> - Never attempt to measure the circuit resistance of the Seat Belt Pretensioner (BPT) even if you are using the specified tester. If the circuit resistance is measured with a tester, the pretensioner will be ignited accidentally. This will result in serious personal injury.
> - Both the seat belt and the seat belt buckle must be replaced if they worn during an accident, even if the pretensioners did not deploy.

Restraint > Seat Belt Pretensioner > Seat Belt Retractor Pretensioner (BPT) > Components and Components Location

components

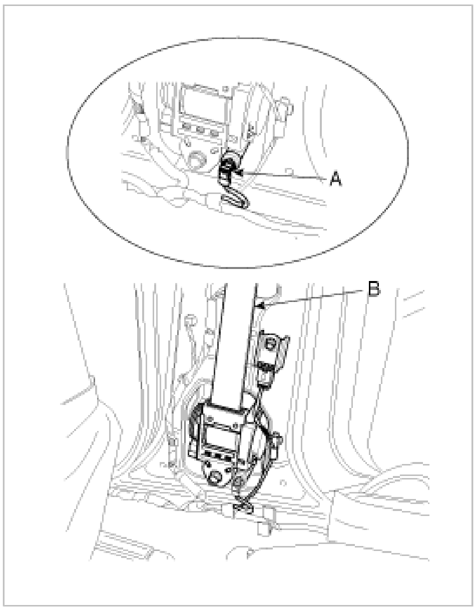


Restraint > Seat Belt Pretensioner > Seat Belt Retractor Pretensioner (BPT) > Repair procedures

removal

SEAT BELT PRETENSIONER

1. Disconnect the battery negative cable, and wait at least three minutes before beginning work.
2. Remove the front seat assembly (Refer to BD group - seat)
3. Remove the front door scuff trim (Refer to BD group - interior)
4. Remove the center pillar trim (Refer to BD group - interior)
5. Remove the lower anchor bolt (Refer to BD group - belt)
6. Remove the upper anchor bolt (Refer to BD group - belt)
7. Disconnect the connector (A).
8. Lossen the mounting bolt.
   Remove the pretensioner (B).

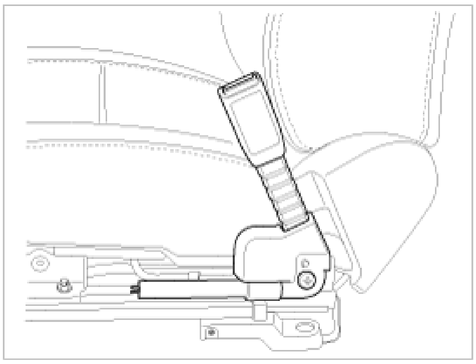
9. Installation is the reverse of removal.

NOTE

After installing the belt pretensioner, confirm proper system operation: Turn the ignition switch ON: the SRS indicator light should turn on about six seconds and then go off.

SEAT BELT BUCKLE PRETENSIONER

1. Disconnect the (-) battery cable and wait at least three minutes before beginning work.
2. Remove the front seat assembly(Refer to BD group - seat)
3. Remove the buckle pretensioner bolt.



4. Remove the seat belt buckle pretensioner.
5. Installation is the reverse of removal.

SPECIAL TOOLS

Tool (Number and Name)	Illustration	Use
09222-32100 Valve stem oil seal installer		Installation of the oil pump oil seal
09555-21000 Bar		Removal and installation of the oil seal (Use with 09573-33100, 09573-33000,09573-21000)
09561-11001 Steering wheel puller		Removal of steering wheel
09568-4A000 Tie rod end puller		Separation of the tie rod end bail joint
09572-21000 Oil pressure gauge		Measurement of the oil pressure (Use with 09572-22100, 09572-21200)
09572-21200 Oil pressure gauge adapter		Measurement of the oil pressure (Use with 09572-21000, 09572-22100)
09572-22100 Oil pressure gauge adapter		Measurement of the oil pressure (Use with 09572-21000, 09572-21200)
09573-33000 Oil seal installer		Installation of the back up washer and oil seal (Use with 09753-21000,09573-33100, 09555-21000)
09573-33100 Oil seal guide		Removal and installation of the oil seal (Use with 09573-21000, 09573-33000,09555-21000)
09573-21000		Installing the oil seal of the rack housing

Oil seal installer gauge		
09434-14200 Counter shaft bearing installer		Installing the gear box oil seal
09565-11100 Preload socket		Measuring the pinion shaft preload

Steering System > General Information > Troubleshooting

TROUBLESHOOTING

Symptom Pro	bable cause	Remedy
Excessive play in steering	Loose yoke plug	Retighten
	Loose steering gear mounting bolts	Retighten
	Loose or worn tie rod end	Retighten or replace as necessary
Steering wheel operation is not smooth (Insufficient power assist)	V-belt slippage	Readjust
	Damaged V-belt	Replace
	Low fluid level	Replenish
	Air in the fluid	Bleed air
	Twisted or damaged hoses	Correct the routing or replace
	Insufficient oil pump pressure	Repair or replace the oil pump
	Sticky flow control valve	Replace
	Excessive internal oil pump leakage	Replace the damaged parts
	Excessive oil leaks from rack and pinion in gear box	Replace the damaged parts
	Distorted or damaged gear box or valve body seals	Replace
Steering wheel does not return properly	Excessive turning resistance of tierod end	Replace
	Yoke plug excessively tight	Adjust
	Tie rod and/or ball joint cannot turn smoothly	Replace
	Loose mounting of gear box mounting bracket Worn steering shaft joint and/or	Retighten
	Worn steering shaft joint and/or body grommet	Correct or replace
	Distorted rack	Replace
	Damaged pinion bearing	Replace
	Twisted or damaged hoses	Reposition or replace
	Damaged oil pressure control valve	Replace

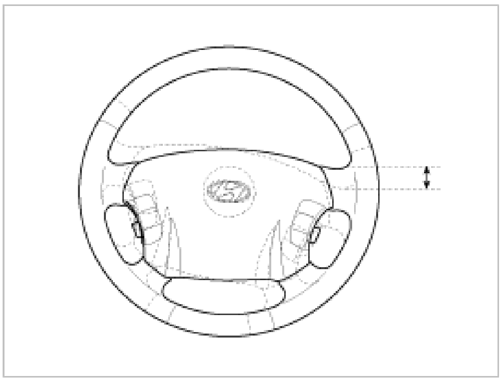
	Damaged oil pump input shaft bearing	Replace
Noise	Hissing Noise in Steering Gear There is some noise with all power steering systems. One of the most common is a hissing sound when the steering wheel is turned and the car is not moving. This noise will be most evident when turning the wheel while the brakes are being applied. There is no relationship between this noise and steering performance. Do not replace the valve unless the "hissing" noise becomes extreme. A replaced valve will also make a slight noise, and is not always a solution for the condition.	
Rattling or chucking noise in the rack and pinion	Interference with hoses from vehicle body	Reposition
	Loose gear box bracket	Retighten
	Loose tie rod end and/or ball joint	Retighten
	Worn tie rod and/or ball joint	Replace
Noise in the oil pump	Low fluid level	Replenish
	Air in the fluid	Bleed air
	Loose pump mounting bolts	Retighten

SERVICE ADJUSTMENT PROCEDURE

CHECKING STEERING WHEEL FREE PLAY

1. Start the engine and with the steering wheel in the straight ahead position.
2. Measure the play while turning the steering wheel to the left and right.

Standard value :
Steering wheel free play : 30 mm (1.1 in)



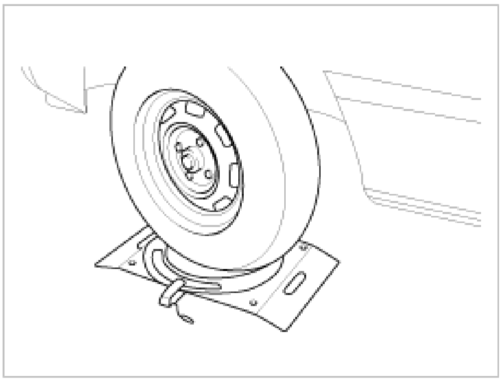
3. If the play exceeds the standard value, inspect the connection between the steering shaft and tie rod ends.

CHECKING STEERING ANGLE

1. Place the front wheel on a turning radius gauge and measure the steering angle.

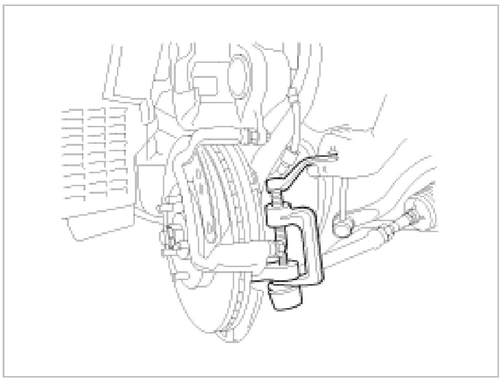
Standard value :	
Wheel angle	
Inside wheel	39.17°±2°
Outside wheel	31.56°

2. If the measured value is not within the standard value, adjust the toe and inspect again.



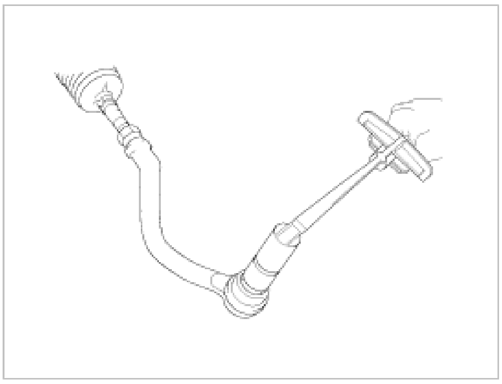
CHECKING THE TIE ROD END BALL JOINT STARTING TORQUE

1. Disconnect tie rod and knuckle with the special tool(09568-4A000).



2. Shake the ball joint stud several times to check for looseness.

Tie rod end ball joint starting torque :
30 kg·cm or less



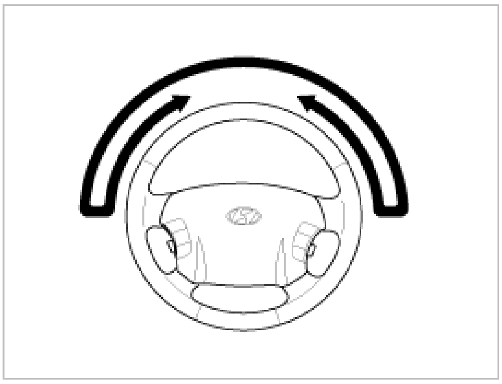
3. If the starting torque exceeds the upper limit of the standard value, replace the tie rod end.
4. Even if the starting torque is below the lower limit of the standard value, check the play of the ball joint and replace if necessary.

CHECKING STEERING WHEEL RETURN

1. The force required to turn the steering wheel and the wheel return should be the same for both moderate and sharp turns.
2. When the steering wheel is turned 90° and held for a couple of seconds while the vehicle is being driven at 20-30 kph (12-19 mph), the steering wheel should return at least 20° from its central position when it is released.

NOTE

If the steering wheel is turned very quickly, steering may be momentarily difficult. This is not a malfunction because the oil pump output will be somewhat decreased.



CHECKING POWER STEERING BELT TENSION

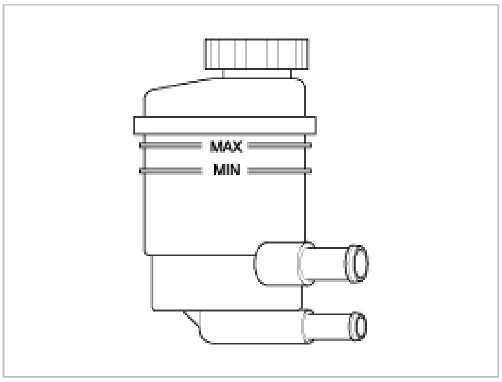
Refer to EM group(Timing system).

CHECKING POWER STEERING FLUID LEVEL

1. Position the vehicle on a level surface.
2. Start the engine. With the vehicle kept stationary, turn the steering wheel several times continuously to raise the fluid temperature to 50-60°C (122-140°F).
3. With the engine at idle, turn the steering wheel fully clockwise and counter-clockwise several times.
4. Make sure that there is no foaming or cloudiness in the reservoir fluid.
5. Stop the engine and check for any difference in fluid level between a stationary and a running engine.

NOTE

1. If the fluid level varies 5 mm (0.2 in) or more, bleed the system again.
2. If the fluid level suddenly rises after stopping the engine, further bleeding is required.
3. Incomplete bleeding will produce a chattering sound in the pump and noise in the flow control valve, and lead to decreased durability of the pump.



REPLACING POWER STEERING FLUID

1. Jack up the front wheels and support them with jackstands.
2. Disconnect the return hose from the oil reservoir and plug the oil reservoir.
3. Connect a vinyl hose to the disconnected return hose, and drain the oil into a container.
4. Disconnect the high-tension cable at the ignition coil side. While operating the starter motor intermittently, turn the steering wheel all the way to the left and then to the right several times to drain the fluid.
5. Connect the return hoses, then fill the oil reservoir with the specified fluid.
6. Start the engine. Check for oil leakage.
7. Stop the engine.
8. Bleed the system.

Power steering fluid type : PSF-4
Total quantity : Approx 1.0 liter

AIR BLEEDING

1. Disconnect the high tension cable, and while operating the starting motor intermittently (for 15-20 seconds), turn the steering wheel all the way to the left and then to the right five or six times.

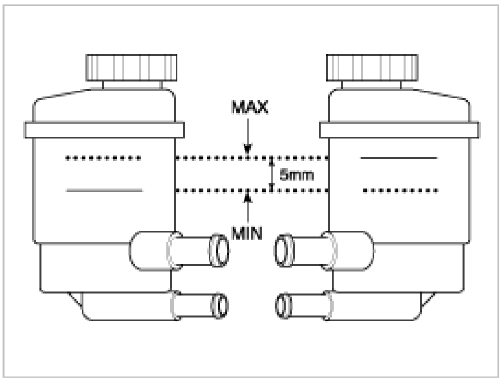
> **NOTE**
>
> 1. During air bleeding, replenish the fluid supply so that the level never falls below the lower position of the filter.
> 2. If air bleeding is done while the vehicle is idling, the air will be broken up and absorbed into the fluid. Be sure to do the bleeding only while cranking.

2. Connect the high tension cable, and start the engine(idling).
3. Turn the steering wheel to the left and the right until there are no air bubbles in the oil reservoir.

> **CAUTION**
>
> Do not hold the steering wheel turned all the way to either side for more than ten seconds.

4. Confirm that the fluid is not milky, and that the level is up to the position specified on the level gauge.
5. Confirm that there is little change in the surface o the fluid when the steering wheel is turned left and right.

> **CAUTION**
>
> 1. If the surface of the fluid changes considerably, air bleeding should be done again.
> 2. If the fluid level rises suddenly when the engine is stopped, it indicates that there is still air in the system.
> 3. If there is air in the system, a jingling noise may be heard from the pump and the control valve may also produce unusual noises.
>   Air in the system will shorten the life of the pump and other parts.

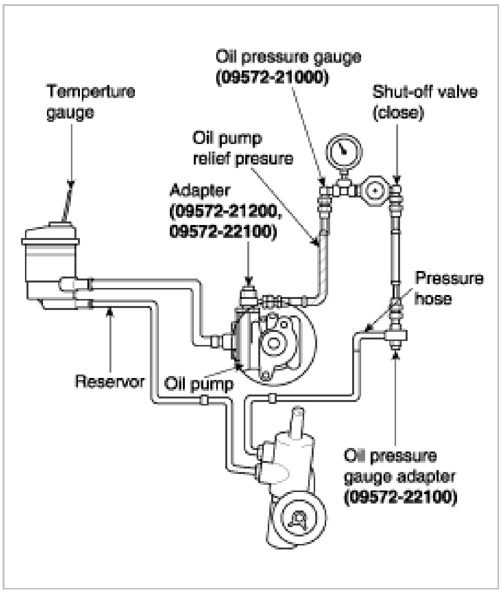


OIL PUMP PRESSURE TEST (OIL PUMP RELIEF PRESSURE)

1. Disconnect the pressure hose from the oil pump. Connect the special tool between the oil pump and pressure hose as illustrated.
2. Bleed the air, and then start the engine and turn the steering wheel several times so that the fluid temperature rises to approximately 50°C (122°F).
3. Set the engine speed to 1,000 rpm.
4. Close the shut-off valve of the special tool and measure the fluid pressure to confirm the it is within the range.

standard vaule :
Relief pressure: 90 +3/-2 kgf/cm^2

> **CAUTION**
>
> Don’t keep the shut-off valve on the pressure gauge closed for longer than 10 seconds.



5. Remove the special tools, and tighten the pressure hose to the specified torque.

Tightening torque :
55-65 Nm (5.5-6.5 kgf·m)

6. Bleed the system.

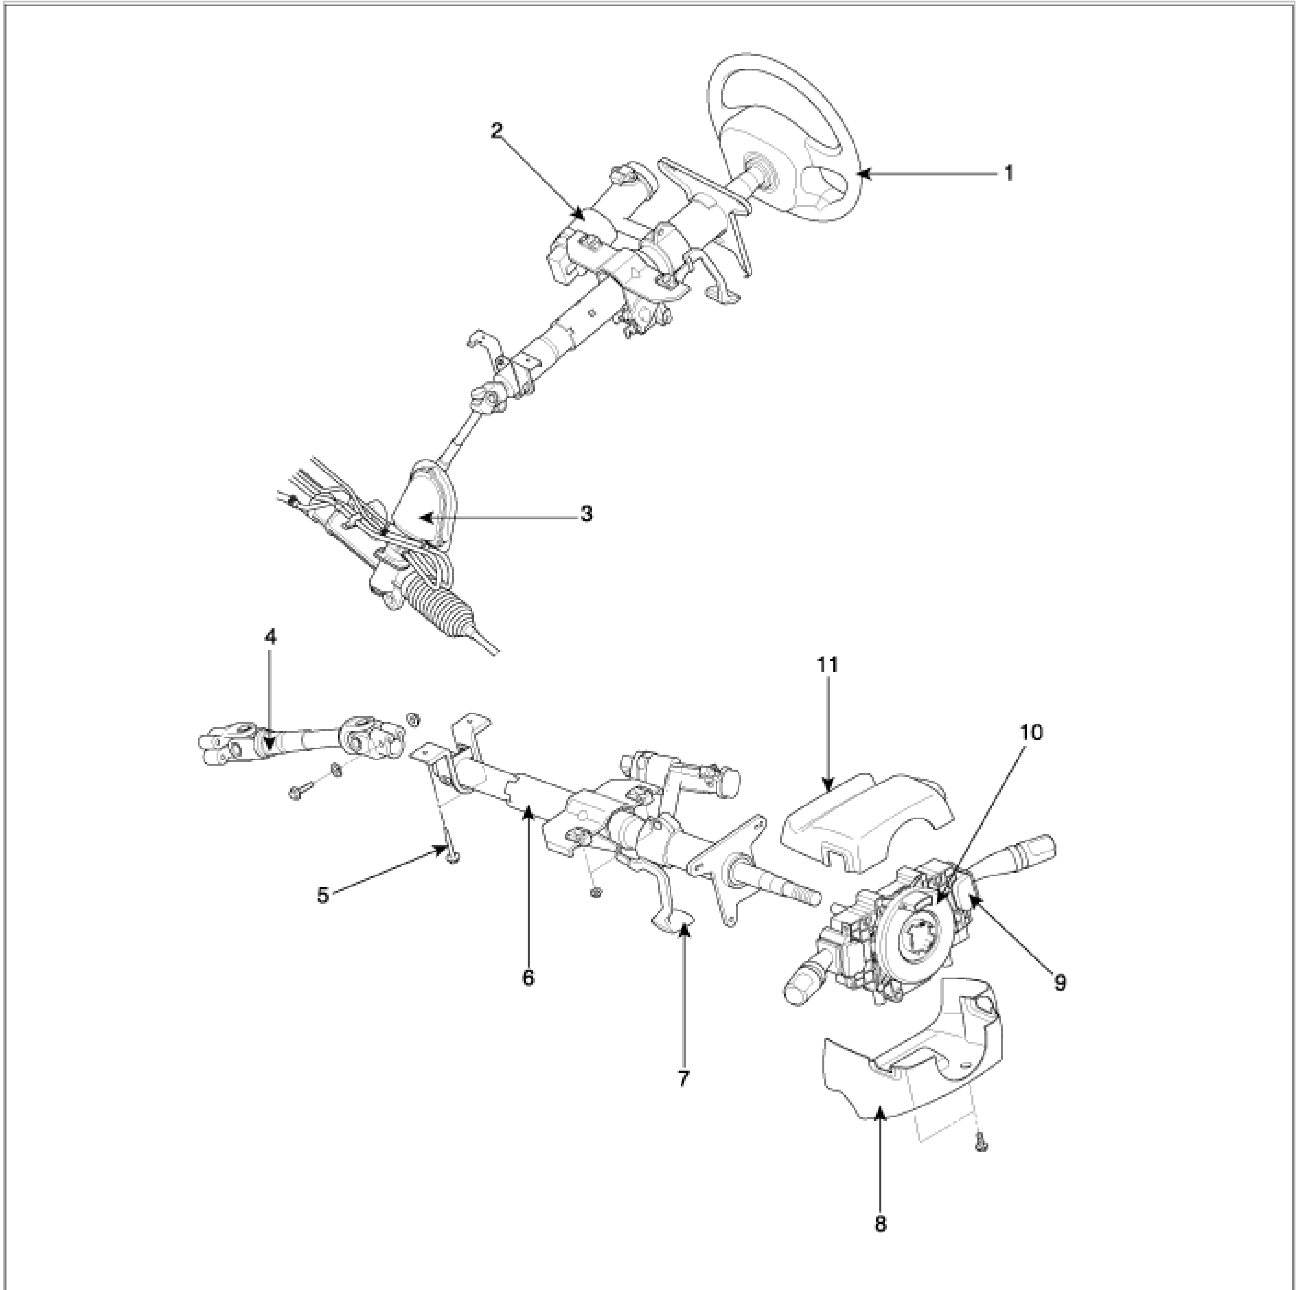
Steering System > Steering Column & Shaft > Steering Column/Shaft > Components and Components Location

COMPONENTS

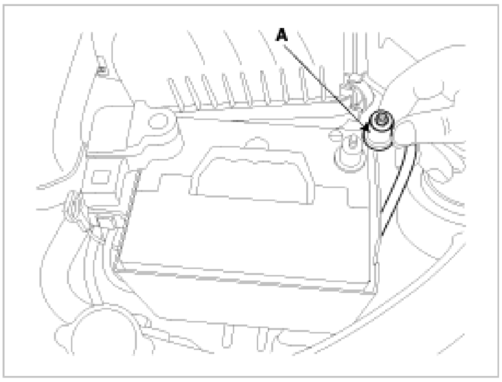


1. Steering wheel
2. Key lock assembly
3. Dust cover assembly
4. Universal joint assembly
5. Steering column shaft mounting bolt
6. Steering colum shaft assembly
7. Tilt lever
8. Steering column lower shroud
9. Multifunction switch
10. Clock spring
11. Steering column upper shroud

Steering System > Steering Column & Shaft > Steering Column/Shaft > Repair procedures

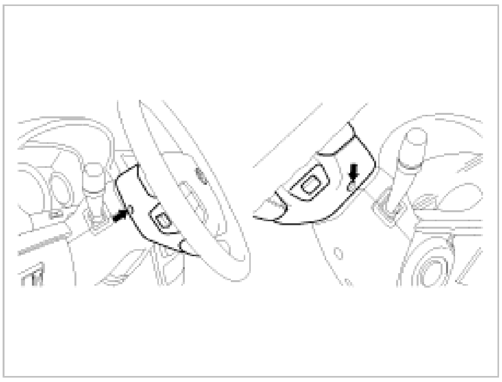
REMOVAL

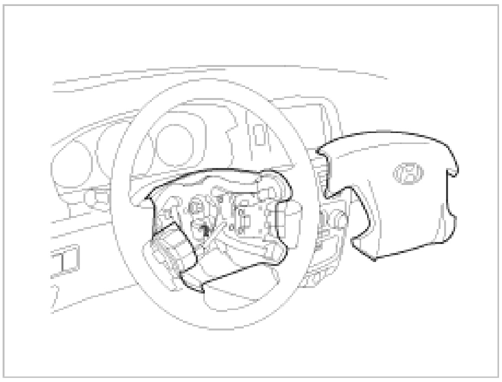
1. Disconnect the negative (-) terminal(A) from the battery.



2. Loosen the tapping screws and lift up the horn pad and remove it.
3. Remove the lock nut and the washer.

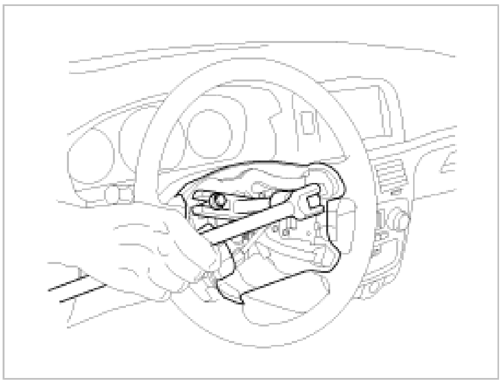
> **CAUTION**
>
> Before doing these procedures, see the SRS section (RT Group. Only for vehicles equipped with SRS).





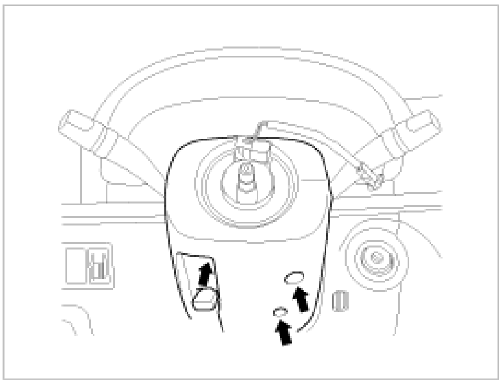
4. Remove the steering wheel with (09561-11001).

> **CAUTION**
>
> Do not hammer on the steering wheel to remove it doing so may damage the collapsible mechanism.

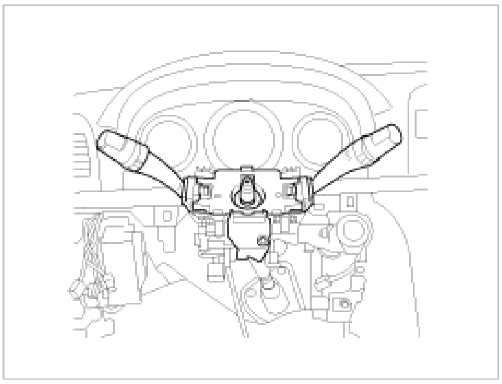


5. Remove the steering column lower and upper shrouds.

6. Remove the lower cover.



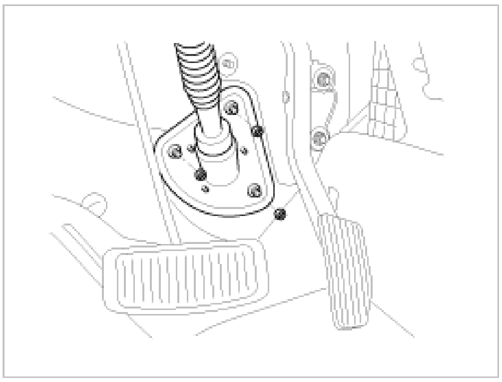
7. Disconnect the connectors and remove the multifunction switch.



8. Remove the bolts securing the coupling and universal joint. Pull out the universal joint from the gear box.

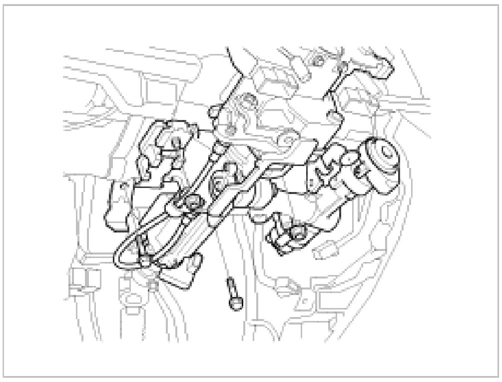
> **CAUTION**
>
> Keep the neutral-range to prevent the damage of the clock spring inner cable when you handlethe steering wheel.

9. Remove the dust cover mounting bolts.



10. Remove the steering column mounting bolts (4bolts).

11. Remove the steering column and shaft with the universal joint and cover.



INSTALLATION

1. Before installation, apply multipurpose grease to the groove inside the bearing and contracting surfaces of the boot and cover assembly.
2. Connect the steering lower shaft and joint assembly.

> NOTE
>
> When installing, mount the U-joint to the gear box first, then to the steering column shaft.

3. Install the dust cover to the column shaft assembly.
4. Install the steering column assembly to the column member assembly.
5. Install the multifunction switch and connect the connectors.

> CAUTION
>
> When installing the clock spring, refer the RT group to prevent the damage of clock spring inner cable.

6. Install the lower cover and steering column upper and lower shroud.
7. Install the steering wheel.

> NOTE
>
> When installing, do not use a hammer because the collapsible column shaft could be damaged.

INSPECTION

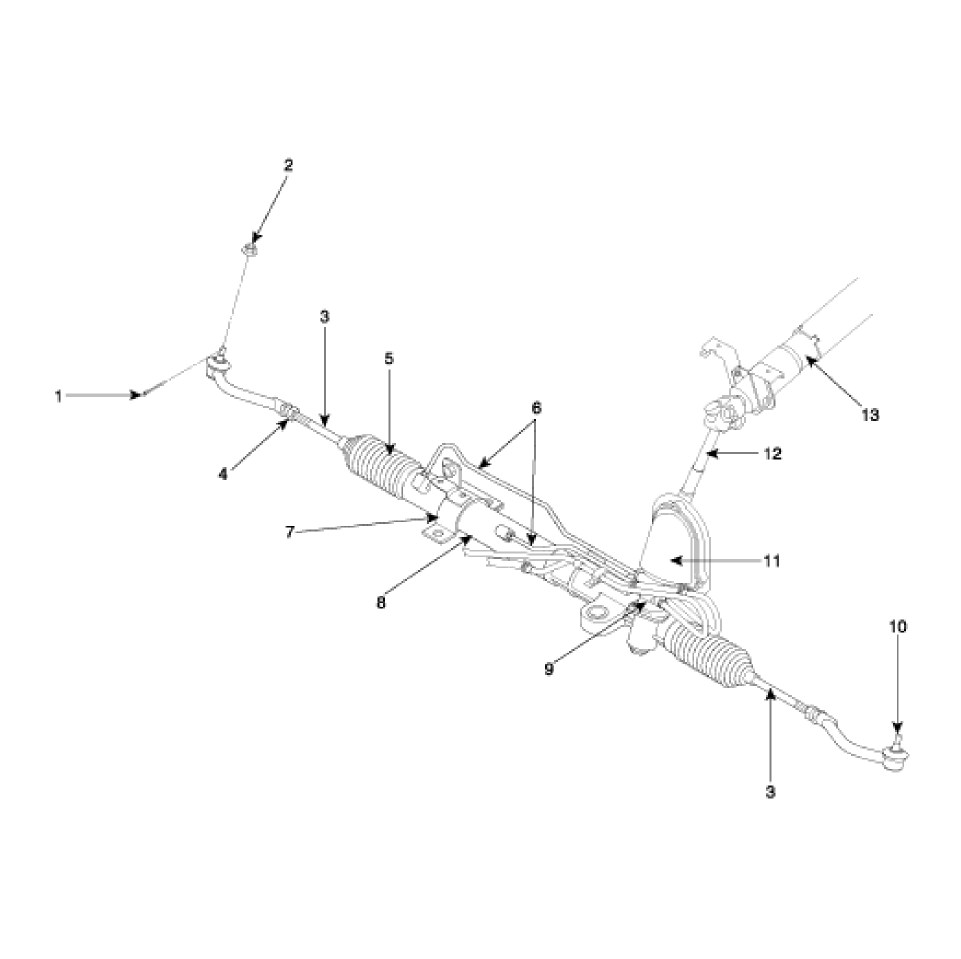
1. Check the steering shaft for damage, play and round movement.
2. Check the upper and lower bearing for wear or damage.
3. Check the joints for excessive play, damage or rough movement
4. Check the tilt bracket for cracks or damage.
5. Check the cover or boot for damage.
6. Check that the steering lock mechanism operates properly. If necessary, replace.

REASSEMBLY

1. Reassembly is reverse of the removal.
2. Make parallel the steering shaft's groove to the hook of the steering lock, when installing the steering lock assembly.

Steering System > Hydraulic Power Steering System > Power Steering Gear Box > Components and Components Location

COMPONENTS



1. Split pin

6. Oil seal	14. Rack	22. Oil seal
7. Yoke plug	15. Tie rod end	23. Rack stopper
8. Lock nut	16. Lock nut	

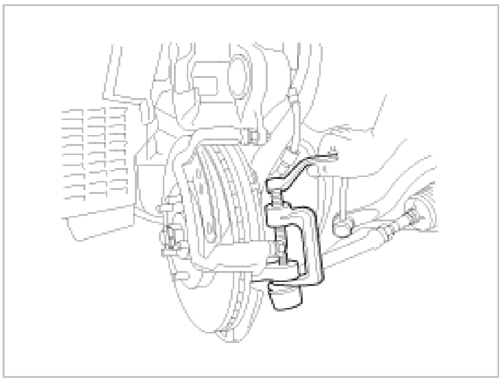
Steering System > Hydraulic Power Steering System > Power Steering Gear Box > Repair procedures

REMOVAL

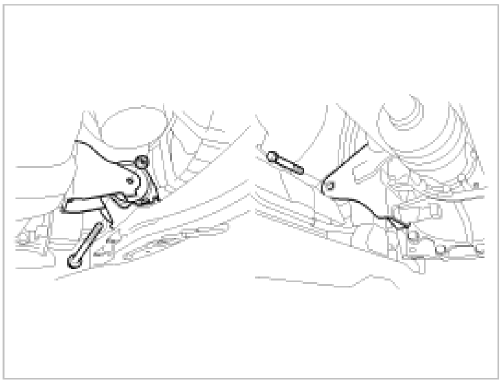
1. Drain the power steering fluid.
2. Remove the joint assembly connecting bolt.

> CAUTION
>
> Keep the neutral-range to prevent the damage of the clock spring inner cable when you handlethe steering wheel.

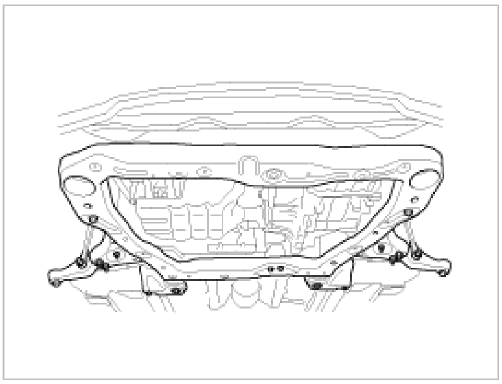
3. Using the special tool (09568-4A000), disconnect the tie rod end from the knuckle arm.



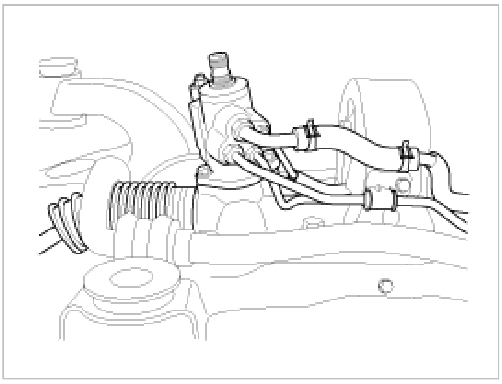
4. Remove the front fork and the knuckle ball joint from the front lower arm.
5. Remove the connecting bolts of front and rear roll stopper.



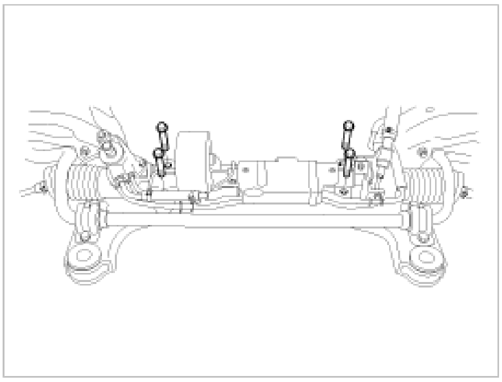
6. Remove the mounting bolts(10EA) of cross member complete assembly.



7. Disconnect the pressure hose and the return tube.

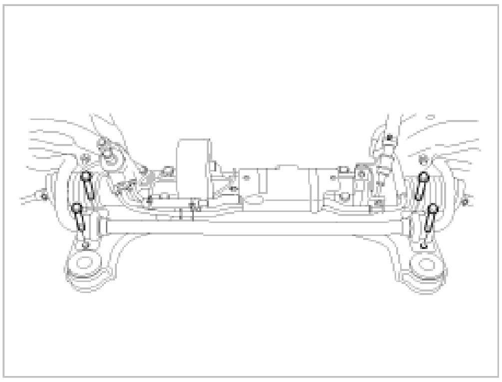


8. Remove the steering gear box mounting bolts and remove the steering gear box assembly and the mounting rubber.



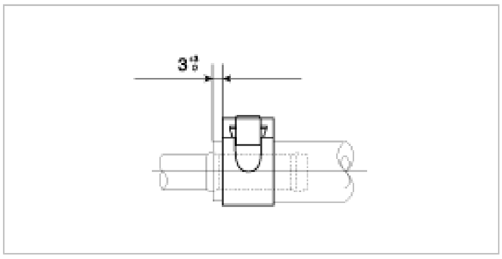
> **CAUTION**
>
> When removing the gear box, pull it out carefully and slowly to avoid damaging the boots.

9. Remove the stabilizer bar.



INSTALLATION

> **NOTE**
>
> Be sure to connect between a tube and a hose as shown in the illustration.



1. Installation is reverse of removal.

Tightening torque :

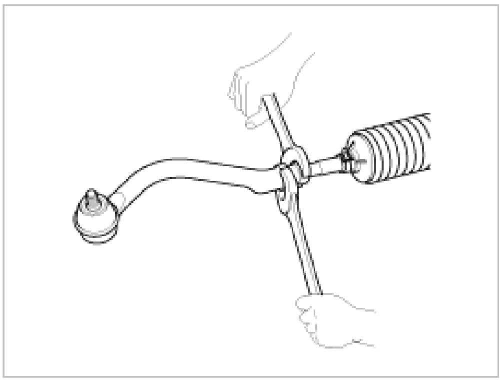
Items	Nm(kgf·m, lb-ft)

Pressure hose to gear box	12~18(1.2~1.8, 8.6~13)
Return tube to gear box	12~18(1.2~1.8, 8.6~13)
Tie rod end lock nut	50~55(5~5.5, 36.1~39.7)
Pinion and valve assembly to self locking nut	20~30(2~3, 14.4~21.6)
lock nut	50~70(5~7, 36.1~50.6)
Tie rod end self locking nut	24~34(2.4~3.4, 17.3~24.5)
Mounting bracket to crossmember	60~80(6~8, 43.3~57.8)

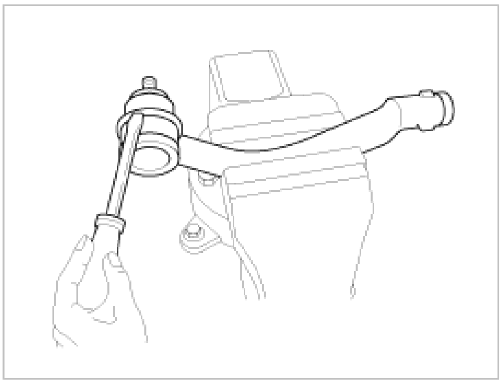
2. After installation, bleed the air in the power steering system(See page ST-11).

DISASSEMBLY

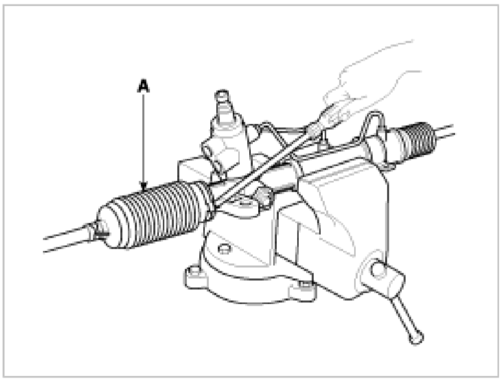
1. Remove the tie rod end from the tie rod.



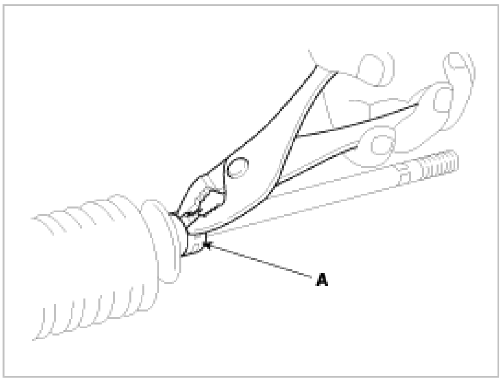
2. Remove the dust cover from the ball joint.



3. Remove the bellows band(A).



4. Remove the bellows clip(A).

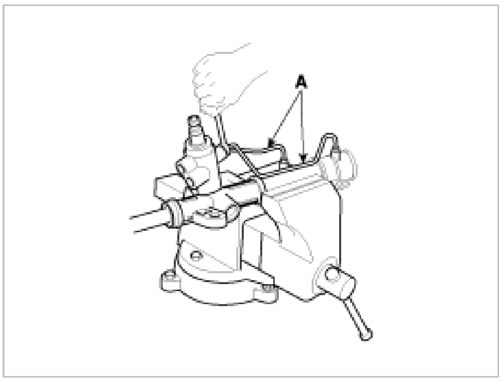


5. Pull the bellows out toward the tie rod.

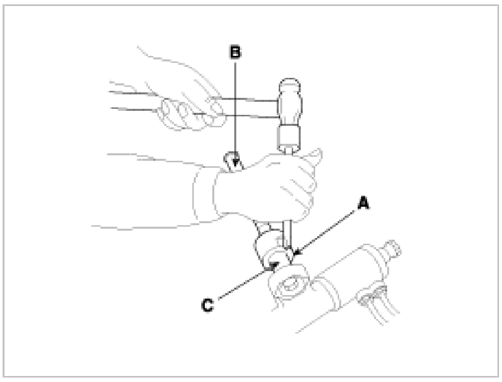
NOTE

Check for rust on the rack when the bellows are replaced.

6. Remove the feed tube(A) from the rack housing.



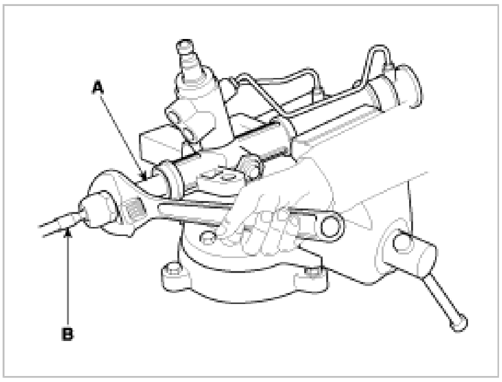
7. While moving the rack slowly, drain the fluid from the rack housing.
8. Unstake the tab washer(A) which fixes the tie rod(B) and rack(C) with a chisel.



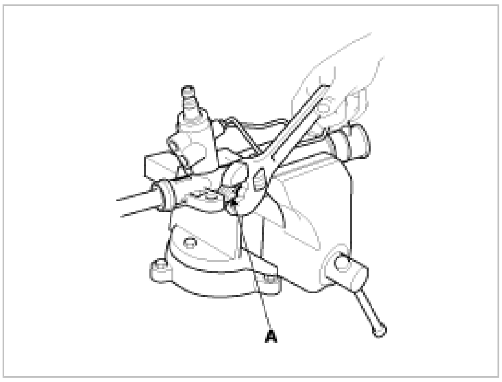
9. Remove the tie rod(B) from the rack(A).

CAUTION

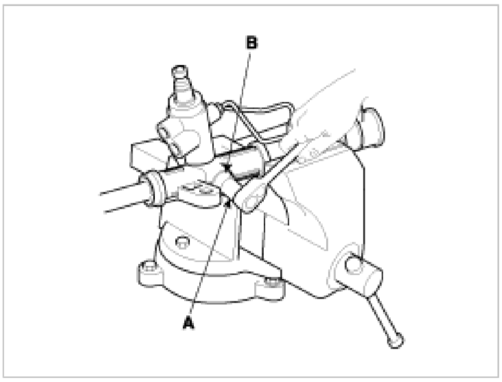
Remove the tie rod(B) from the rack(A), taking care not to twist the rack.



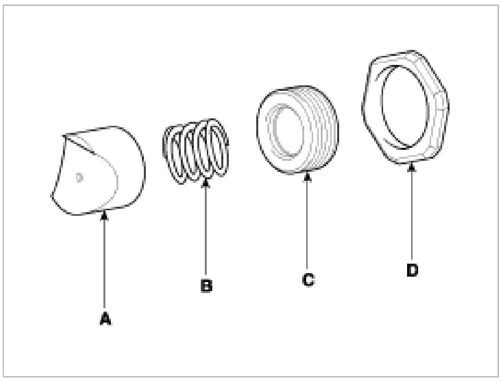
10. Remove the yoke plug locking nut(A).



11. Remove the yoke plug(B) with a 14mm socket(A).

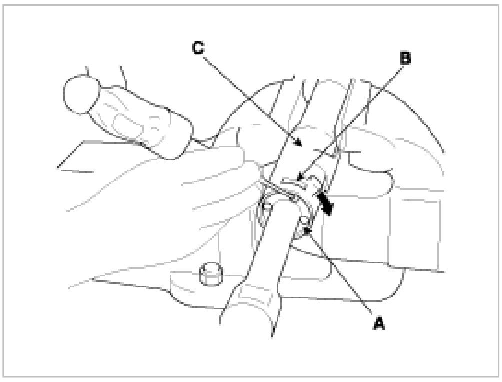


12. Remove the lock nut(D), yoke plug(C), rack support spring(B) and rack support yoke(A) from the gear box.

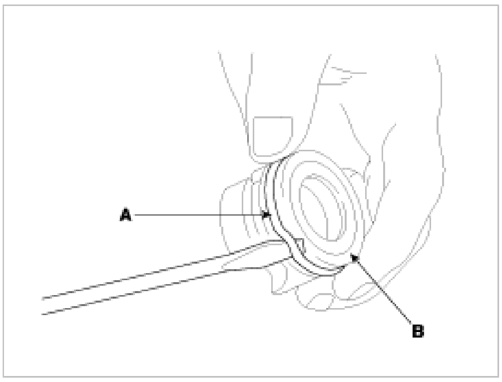


13. When the end of the circlip comes out of the notched hole of the housing rack cylinder, turn the rack stopper counterclockwise and remove the circlip.

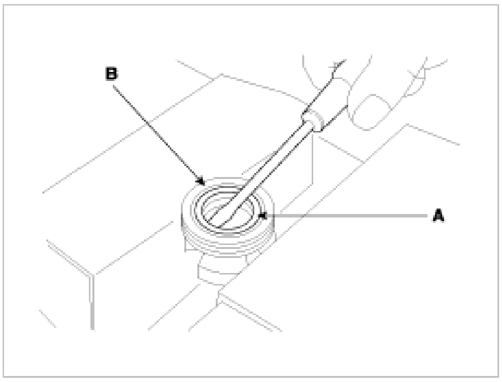
> **CAUTION**
>
> Be careful not to damage the rack.



14. Remove the rack bushing and rack from the rack housing.
15. Remove the O-ring(A) from the rack bushing(B).



16. Remove the oil seal(B) from the rack bushing(A).

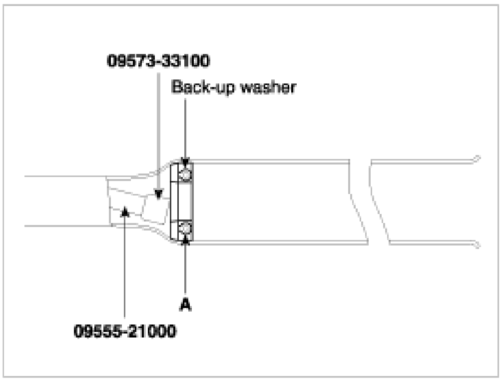


17. Remove the valve body from the valve body housing with a soft hammer.
18. Using the special tool, remove the oil seal and ball bearing from the valve body housing.
19. Remove the oil seal and O-ring from the rack housing.

> **CAUTION**
>
> Be careful not to damage the pinion valve cylinder inside of the rack housing.

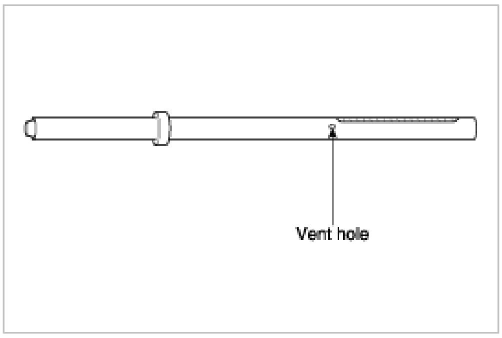
20. Using the special tool(09573-21200, 09555-33100), remove the oil seal(A) from the rack housing.

> **CAUTION**
>
> Be careful not to damage the rack cylinder inside of the rack housing.

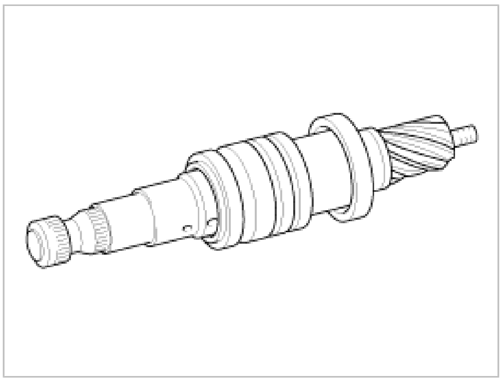


INSPECTION

1. Rack
   (1) Check for rack tooth face damage or wear.
   (2) Check for oil seal contact surface damage.
   (3) Check for rack bending or twisting.
   (4) Check for oil seal ring damage or wear.
   (5) Check for oil seal damage or wear.



2. Pinion valve
   (1) Check for pinion gear tooth face damage or wear.
   (2) Check for oil seal contact surface damage.
   (3) Check for seal ring damage or wear.
   (4) Check for oil seal damage or wear.



3. Bearing
   (1) Check for seizure or abnormal noise during a bearing rotation.
   (2) Check for excessive play.
   (3) Check for missing needle bearing rollers.
4. Others
   (1) Check for damage of the rack housing cylinder bore.

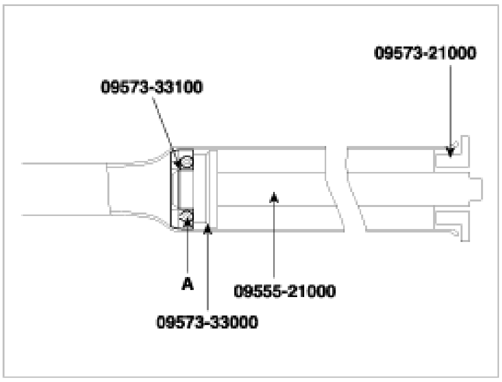
(2) Check for boot damage, cracking or aging.

REASSEMBLY

1. Apply the specified fluid to the entire surface of the rack oil seal.

Recommended fluid : PSF-4

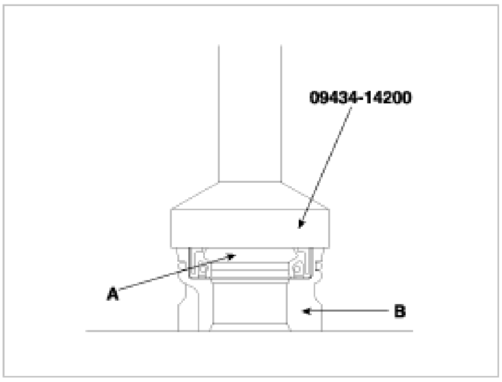
2. Install the backup washer and oil seal(A) to the specified position in the rack housing.



3. Apply the specified fluid to the entire surface of the rack bushing oil seal.

Recommended fluid : PSF-4

4. Install the oil seal(A) in the rack bushing(B).

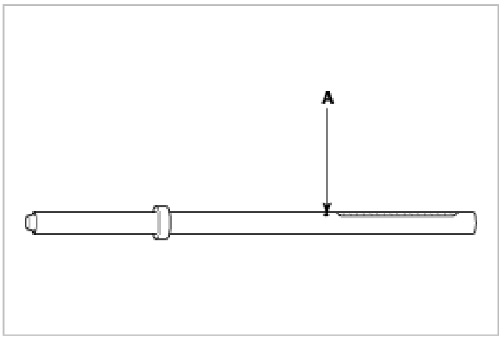


5. Apply the specified fluid to the entire surface of the O-ring and install it in the rack bushing.
6. Apply the specified grease to the rack teeth.

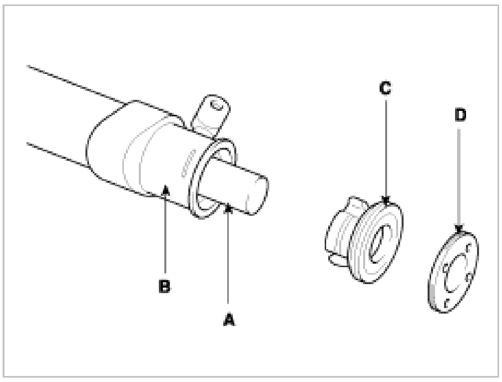
Recommended grease
Multipurpose grease SAE J310a NLGI No.2

NOTE

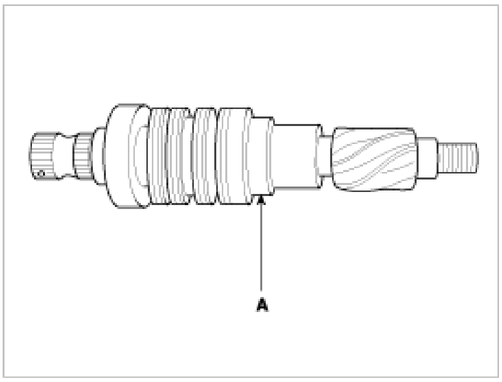
Do not plug the vent hole(A) in the rack with grease.



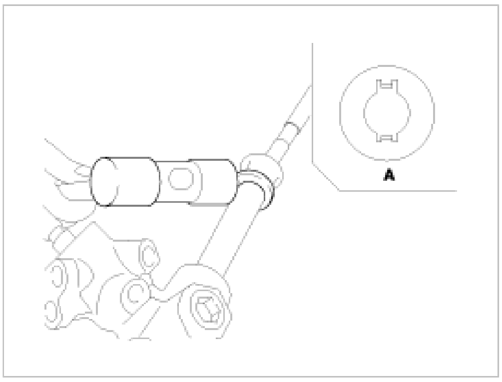
7. Insert the rack(A) into the rack housing(B) and install the rack bushing(C).



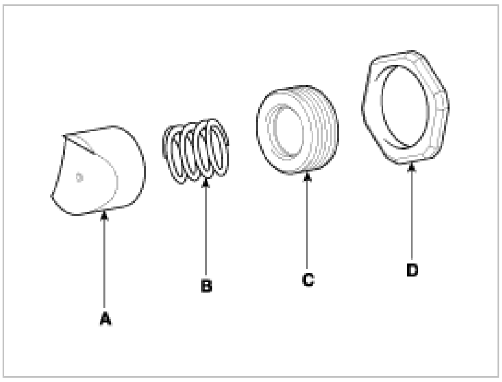
8. Using a special tool, install the oil seal and the ball bearing in the valve body housing.
9. After applying the specified fluid and grease to the pinion valve assembly(A), install it in the rack housing assembly.



10. Install the tie rod and punch on a point over the tie rod with a chisel.



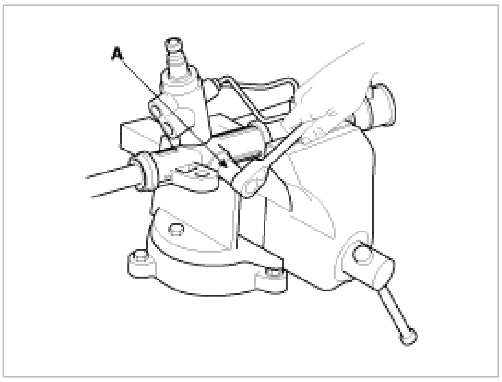
11. Install the rack support yoke(A), rack support spring(B), yoke plug(C) and lock nut(D) in the order shown in the illustration. Apply semi-drying sealant to the threaded section of the yoke plug before installation.



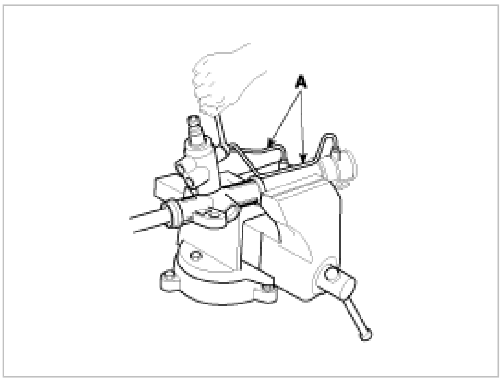
12. With the rack placed in the center position, attach the yoke plug to the rack housing. Tighten the yoke plug to 12 Nm (120 kg·cm, 8.9 lb·ft), with a 14mm socket(A). Loosen the yoke plug approximately from 30° to 60° and tighten the yoke nut to the specified torque.

Tightening torque

50 ~ 70 N·m (5 ~ 7 kgf·m, 37 ~ 52 lb-ft)

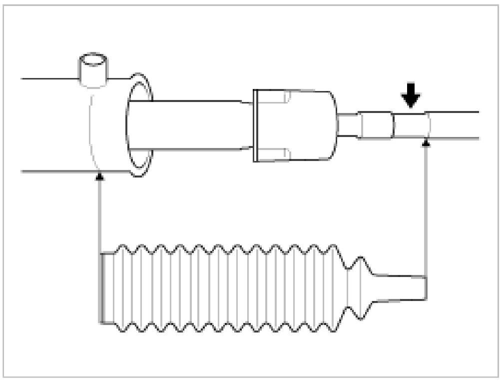


13. Tighten the feed tube(A) to the specified torque and install the mounting rubber using adhesive.



14. Apply the specified grease to the bellows mounting position (fitting groove) of the tie rod.

Recommended grease : Silicone grease

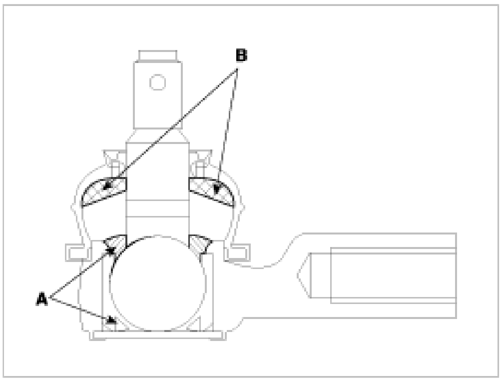


15. Install the new attaching band to the bellows.

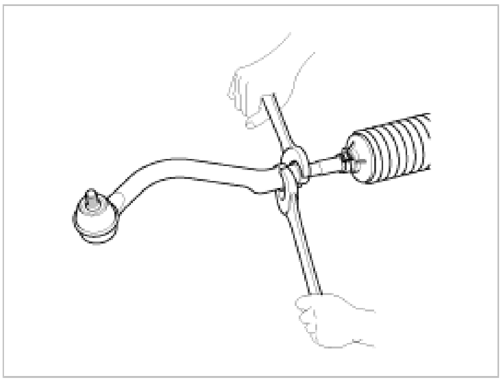
> **NOTE**
>
> When the bellows are installed, a new band must be used.

16. Install the bellows in position, taking care not to twist it.
17. Fill the dust cover inner side and lip with the specified grease, and fix the dust cover in position with the clip ring attached in the groove of the tie rod end.

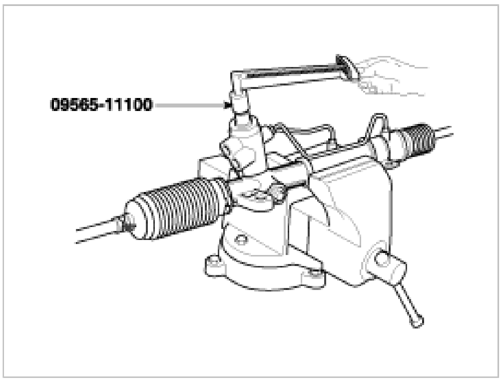
Recommended grease
A : POLY LUB GLY 801K or equivalent
B : SHOWA SUNLIGHT MB2 or equivalent
Dust cover inner side and lip : THREE BOND



18. Install the tie rod to the tie rod end.

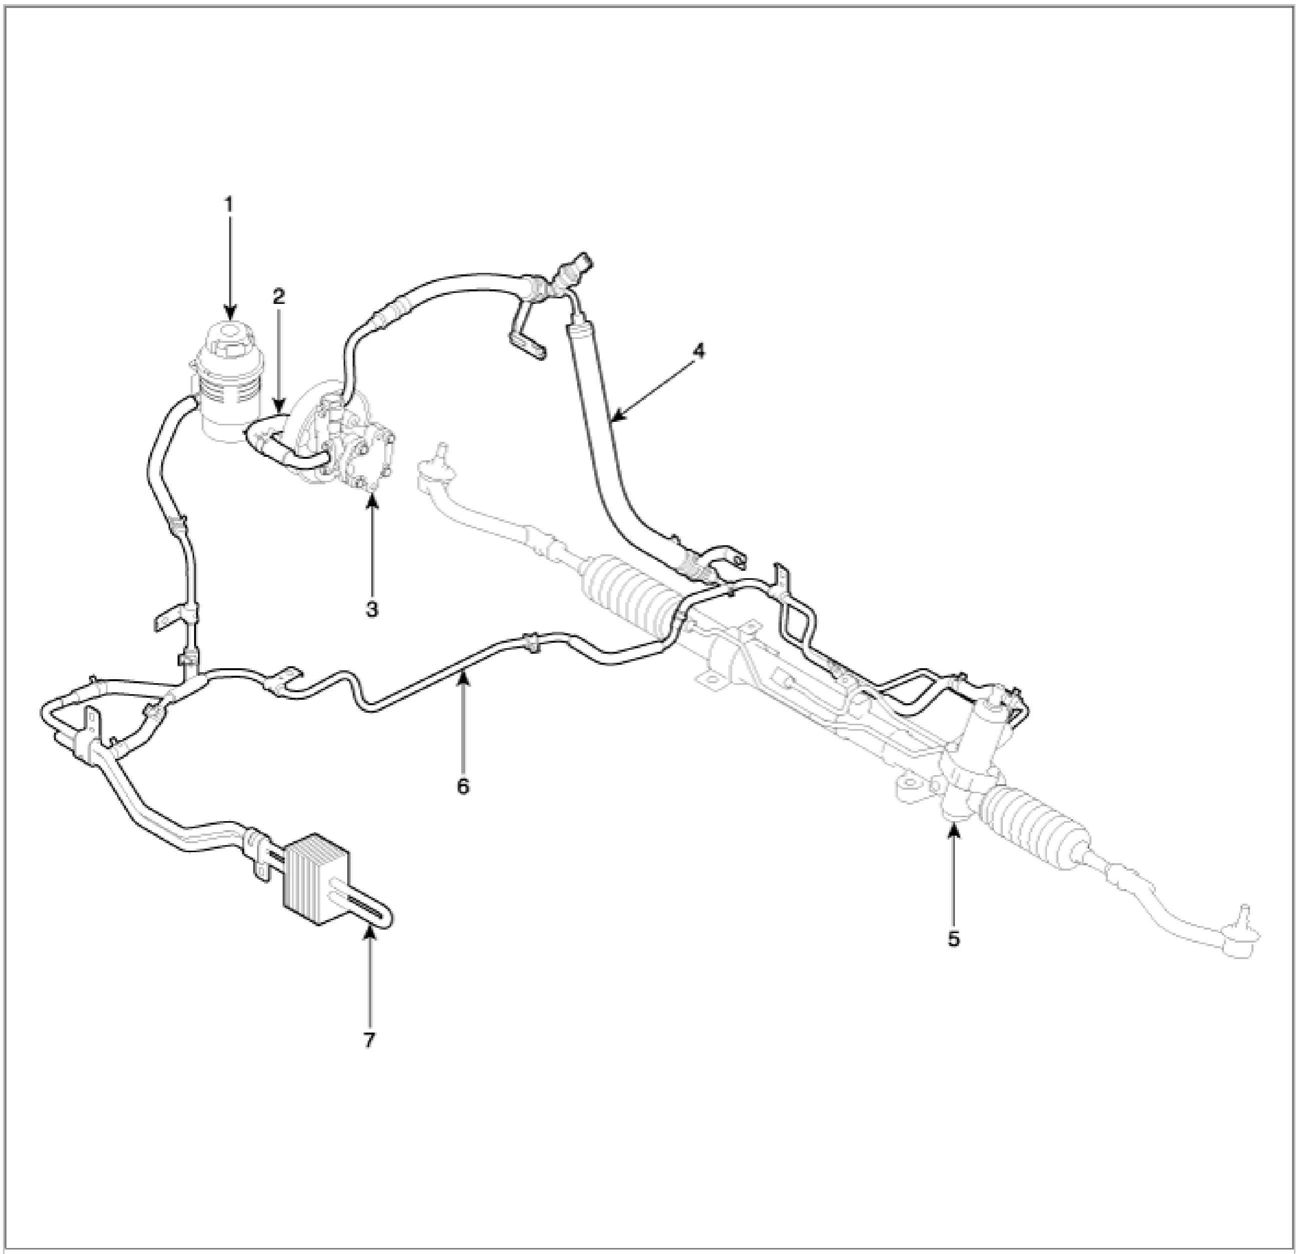


19. Check for total pinion preload.



Steering System > Hydraulic Power Steering System > Power Steering Hoses > Components and Components Location

COMPONENTS

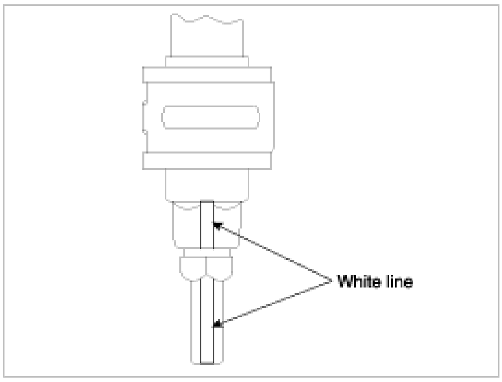


1. Power steering oil reservoir
2. Suction hose
3. Oil pump
4. Pressure hose
5. Power steering gear box
6. Return tube
7. Cooler tube

Steering System > Hydraulic Power Steering System > Power Steering Hoses > Repair procedures

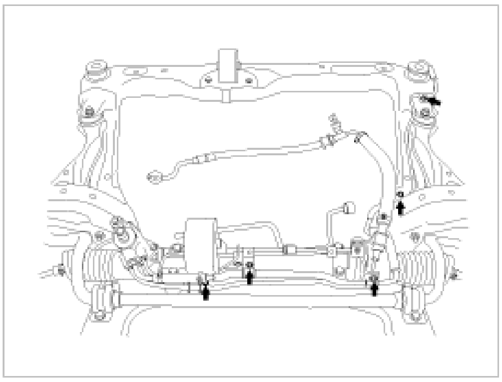
REMOVAL

While installing the tube and hose assembly, be sure to align white marks on each fitting.

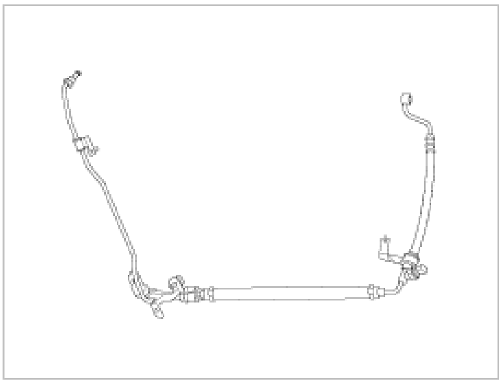


PRESSURE HOSE, TUBE AND RETURN TUBE, HOSE

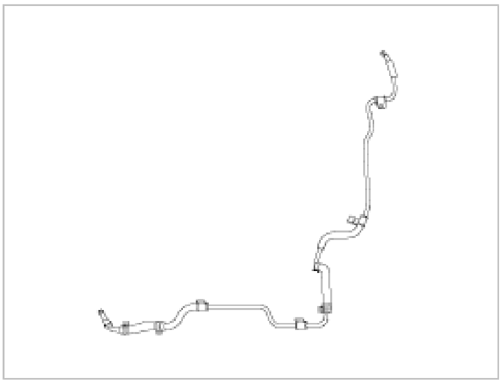
1. Remove the mounting clamps from the pressure tube and the return tube.



2. Remove the pitting of both the pressure tube and the return tube from the gear box.
3. Remove the pressure hose and tube.



4. Remove the return tube and hose.



INSTALLATION

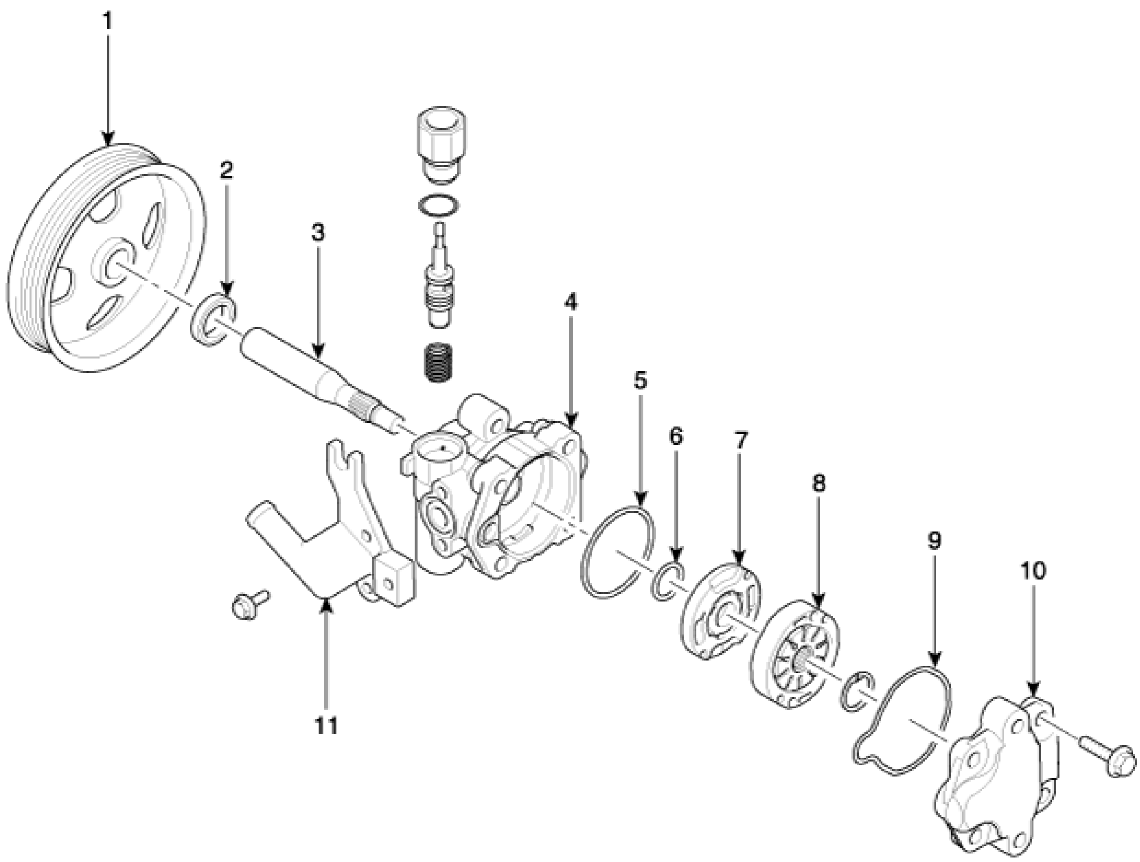
Installation is the reverse of removal.

NOTE

- Install the return tube and hoses so that they are not twisted and it does not come in contact with any other parts.
- After installation, air bleed the system.

Steering System > Hydraulic Power Steering System > Power Steering Oil Pump > Components and Components Location

COMPONENTS

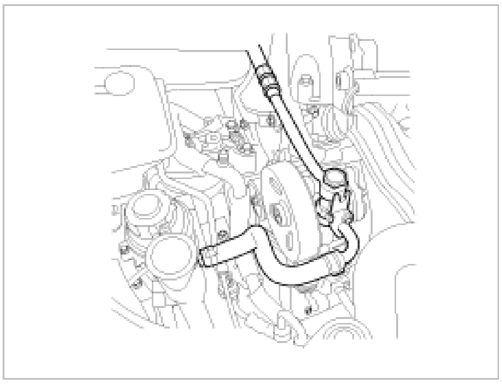


1. Pulley	5. O-ring (Outer)	9. Gasket
2. Dust spacer	6. O-ring (Inner)	10. Oil pump cover assembly
3. Pulley shaft	7. Front side plate	11. Suction pipe
4. Front housing	8. Cam ring	

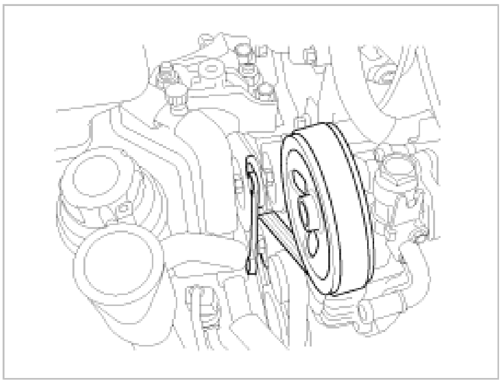
Steering System > Hydraulic Power Steering System > Power Steering Oil Pump > Repair procedures

REMOVAL

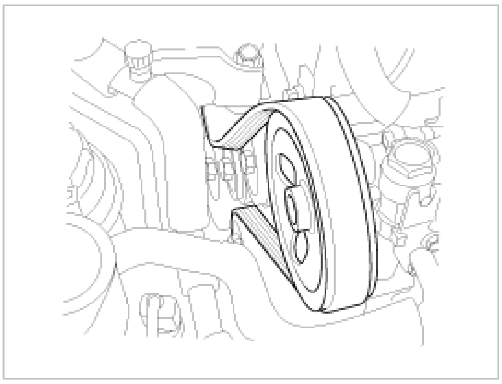
1. Remove the pressure hose from the oil pump and the suction hose from the suction pipe, then drain the powersteering oil.



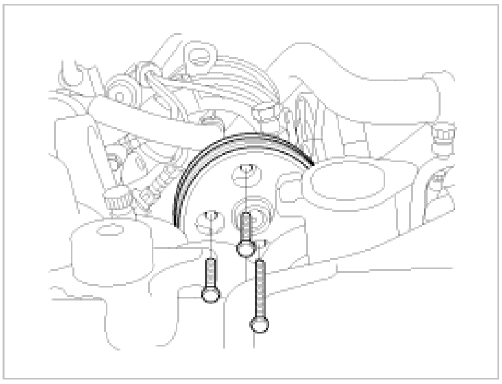
2. Release the tension of the powersteering V-type belt by lifting the auto-tensioner pulley.



3. Remove the V-type belt from the pulley of the powersteering oil pump.

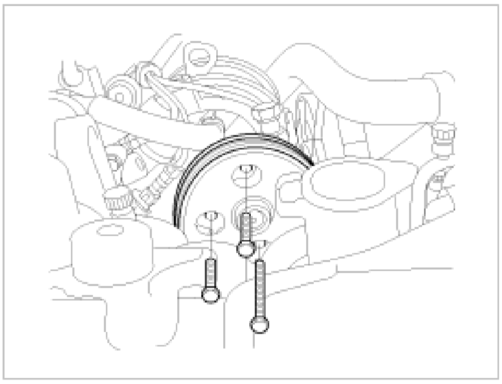


4. Remove the powersteering oil pump assembly by removing the three bolts as shown below.



INSTALLATION

1. Install the oil pump to the oil pump bracket.

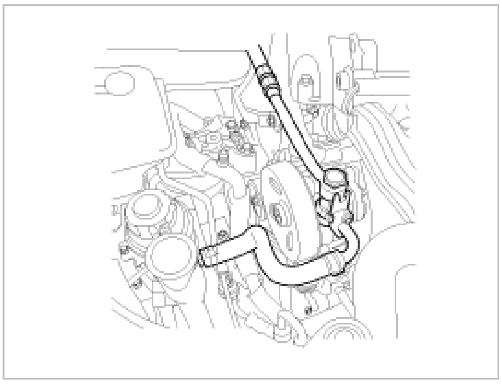


2. Install the "V"-type belt by pulling the auto tensioner.
3. Install the suction hose.

> **CAUTION**
>
> Install the pressure hose to the oil pump.

4. Install the pressure hose to the oil pump.

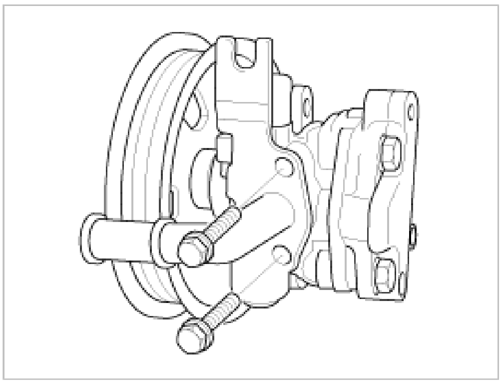
> **NOTE**
>
> Install the pressure hose being careful so that it does not twist and come in contact with other components.



5. Add power steering fluid (PSF-4).
6. Air bleed the system.
7. Check the oil pump pressure.

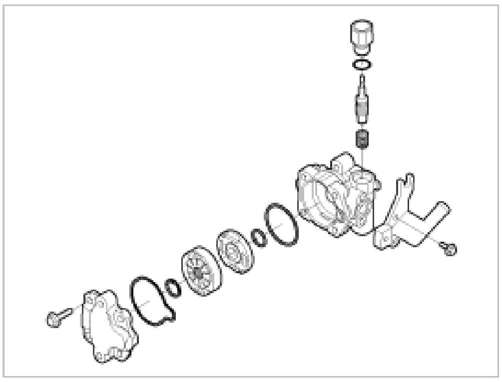
DISASSEMBLY

1. Remove the bolts from the oil pump body, and then remove the suction pipe and O-ring.

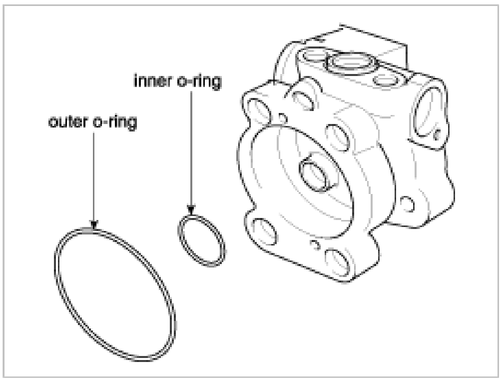


2. Loosen the four bolts and remove the oil pump cover assembly.
3. Remove the cam ring.
4. Remove the rotor and vanes.

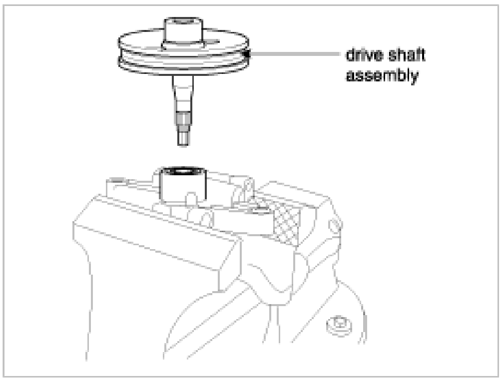
5. Remove the oil pump side plate.



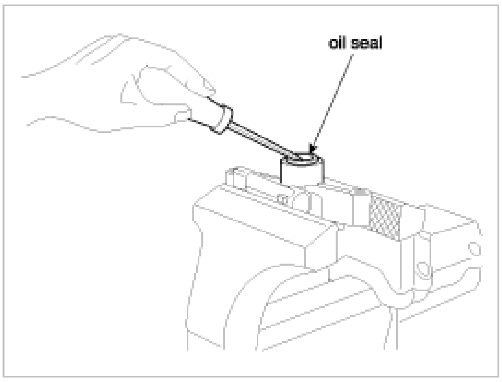
6. Remove the inner and outer O-ring.
7. Remove the inner O-ring and outer O-ring.



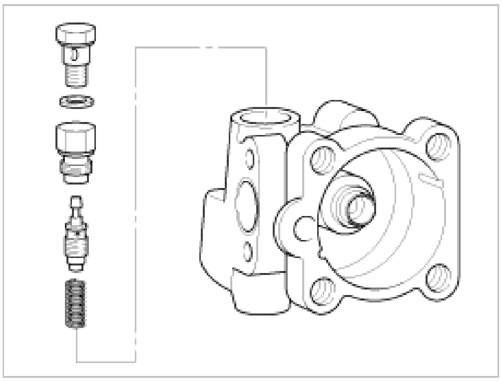
8. Remove the snap ring and take out the pulley and the drive shaft assembly.



9. Remove the oil seal from the oil pump body.



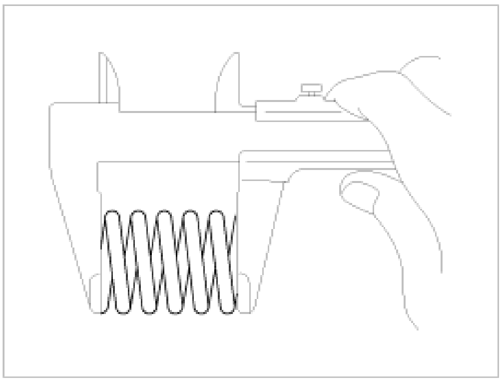
10. Remove the connector from the oil pump body, and take out the flow control valve and the flow control spring.



INSPECTION

1. Check the free length of the flow control spring.

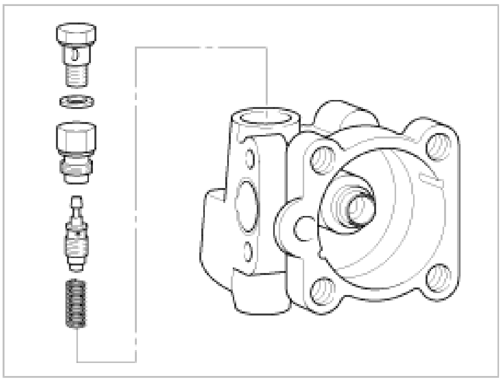
Free length of the flow control spring : 36.5mm



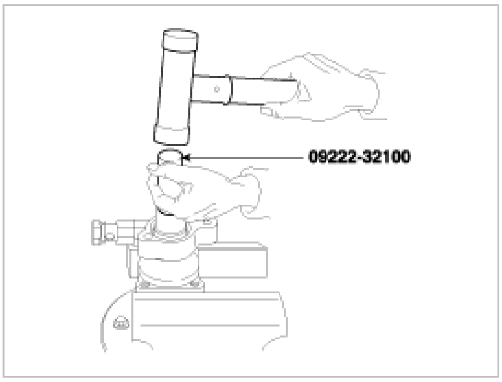
2. Check that the flow control valve is not bent.
3. Check the shaft for wear and damage.
4. Check the V-belt for wear and deterioration.
5. Check the grooves of the rotor and vanes for stratified abrasion.
6. Check the contact surface of the cam ring and vanes for stratified abrasion.
7. Check vanes for damage.
8. Check that there is no striped wear in the side plate or contacting part between the shaft and the pump cover surface.

REASSEMBLY

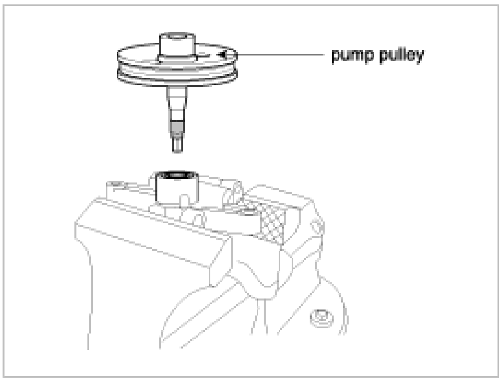
1. Install the flow control spring, the flow control valve and the connector in to the pump body.



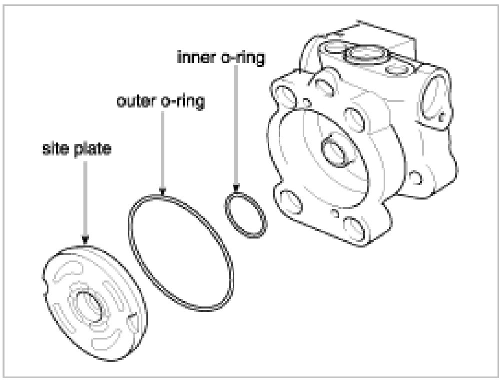
2. Install the oil seal in the pump body by using the special tool(09222-32100).



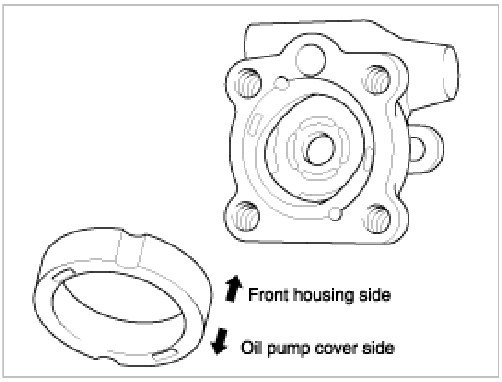
3. Install the pump pulley.



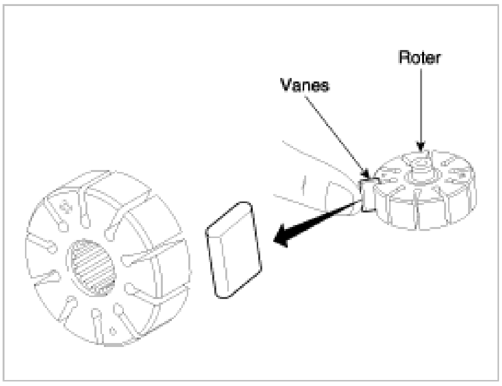
4. Assemble the inner O-ring and the outer O-ring and install the site plate.



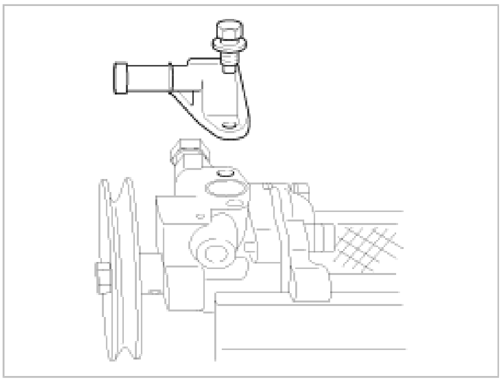
5. After inserting the lock pin into the groove of the front housing, install the camring attending to the direction.



6. Install the rotor.
7. Install the vanes.



8. Install the gasket and oil pump cover assembly.
9. Install the suction pipe and O-ring.



Specifications

Front Suspension System

Items			Specification
Type			Double Wishbone
Shock Absorber	Type		Gas
	Stroke mm(in)		96(3.78)
	Expansion mm(in)		424.0±3(16.69±0.118)
	Compression mm(in)		328.0 +3/-∞ (12.91+0.118/-∞)
	Damping force (0.3 m/s)	Expansion N(kgf)	2.4ℓ : 1060±160(106±16) 3.3ℓ : 1640±220(164±22)
		Compression N(kgf)	2.4ℓ : 440±90(44±9) 3.3ℓ : 690±130(69±13)
	I.D color		2.4ℓ : Gray, 3.3ℓ : Purple
Spring	2.4GSL	Free height mm(in)	380.1(14.96)
		I.D color	Pink - Yellow
	3.3GSL	Free height mm(in)	390.5(15.37)
		I.D color	Pink - Orange

Rear Suspension System

Items			Specification
Type			Multi Link
Shock Absorber	Type		Gas
	Stroke mm(in)		160.5(6.32)
	Expansion mm(in)		584.6±3(23.016±0.118)
	Compression mm(in)		424.1 +3/-∞ (16.697+0.118/-∞)

TIGHTENING TORQUE

FRONT SUSPENSION

Items	Nm	kgf·m	lb-ft
Front strut assembly mounting nut	45 ~ 60	4.5 ~ 6.0	32.5 ~ 43.4
Front strut assembly self-locking nut	20 ~ 25	2.0 ~ 2.5	14.5 ~ 18.1
Front shock absorber to fork nut	60 ~ 80	6 ~ 8	43.4 ~ 57.8
Front lower arm ball joint self-locking nut	75 ~ 90	7.5 ~ 9.0	54.2 ~ 65.1
Front lower arm ball joint mounting bolt	100 ~ 120	10 ~ 12	72.3 ~ 86.8
Front upper arm ball joint self-locking nut	35 ~ 45	3.5 ~ 4.5	25.3 ~ 32.5
Front upper arm mounting bolt	55 ~ 65	5.5 ~ 6.5	39.8 ~ 47.0
Front lower arm bushing(A) mounting bolt	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Front lower arm bushing(G) mounting bolt	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Front lower arm connector nut (to fork)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Front stabilizer link self-locking nut	100 ~ 120	10~12	72.3 ~ 86.8
Front stabilizer bar bracket mounting bolt(to Subframe)	45 ~ 55	4.5~ 5.5	32.5 ~ 39.8
Wheel nut	90 ~ 110	9 ~ 11	65.1 ~ 79.5

REAR SUSPENSION

Items	Nm	kgf·m	lb-ft
Rear strut assembly self-locking nut	20 ~ 25	2.0 ~ 2.5	14.5 ~ 18.1
Rear strut assembly bracket mounting bolt	50 ~ 65	5.0~ 6.5	36.2 ~ 47.0
Rear shock absorber nut (to rear axle assembly)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Rear upper arm ball joint nut (to rear axle assembly)	80 ~ 90	8 ~ 9	57.8 ~ 65.1
Rear upper arm self-locking nut (to cross member)	100 ~ 120	10 ~ 12	72.3 ~ 86.8
Rear lower arm mounting bolt (to rear axle assembly)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Rear lower arm mounting nut (to cross member)	110 ~ 120	11 ~ 12	79.5 ~ 86.8
Assist arm mounting bolt (to rear axle assembly)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Assist arm mounting nut (to cross member)	110 ~ 120	11 ~ 12	79.5 ~ 86.8
Trailing arm mounting nut (to body)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Trailing arm self-locking nut (to rear axle assembly)	140 ~ 160	14 ~ 16	101.2 ~ 115.7
Cross member mounting bolt	140~ 160	14 ~ 16	101.2 ~ 115.7
Rear stabilizer bar bracket mounting bolt	45 ~ 55	4.5 ~ 5.5	32.5 ~ 39.8
Rear stabilizer link self-locking nut	35 ~ 45	3.5 ~ 4.5	25.3 ~ 32.5

CAUTION

Replace the self-locking nuts with new ones after removal.

LUBRICANTS

Items	The recommended	Quantity
Front upper arm ball joint	LUBCHEM SB 6042M	As required
Front lower arm ball joint	LUBCHEM SB 6042M	As required
Rear upper arm ball joint	LUBCHEM SB 6042M	As required
Stabilizer link ball joint (Front and Rear)	BJM-2	1.2 ~ 1.7 g

Suspension System > General Information > Special Service Tools

SPECIAL SERVICE TOOLS

Tool (Number and Name)	Illustration	Use
09568-4A000 Ball joint remover		Removal of Ball joint (Front upper arm/lower arm, & Rear upper arm)
09532-11600 Preload socket		Measurement of the front lower arm ball joint starting torque. (Use with torque wrench)
09546-26000 Strut spring compressor		Compression of the coil spring
09214-32000 Mount bushing remover and installer		Removal & installation of lower arm bushing(G) (Use with 09216-21100)
09216-21100 Mount bushing remover and installer		Removal & installation of lower arm bushing(G) (Use with 09216-32000)
09216-21600 Mount bushing remover and installer arbor		Removal and installation of trailing arm bushing (Use with 09552-38100)
09552-38100 Rear trailing arm bushing remover and installer		Removal and installation of the rear trailing arm bushing (Use with 09216-21600)

SUSPENSION INSPECTION :

Can Cause Shimmy ☐ Clunk ☐ Squeak ☐ Harshness ☐

Suspension Bushing : Loose ☐ Worn ☐ Missing ☐ OK ☐

Front stabilizer ☐ Rear stabilizer (sway bar) ☐ Rear trailing arm ☐

Front lower arm ☐ Rear suspension front ☐ Rear suspension rear arm ☐

Other ________________________________

Suspension/Components : Loose Worm Missing OK

Ball Joint ☐ Shock absorbers F/R ☐ Springs F/R ☐ The rod ends/sleeve ☐

SYMPTOM CHART

Symptom	Suspect Area	Remedy (See page)
Squeak or grunt-noise from the front suspension, occurs more in cold ambient temperatures-more noticeable over rough roads or when turning	Front stabilizer bar	Under these conditions, the noise is acceptable.
Clunk-noise from the front suspension, occurs in and out of turns	Loose front struts or shocks	Inspect for loose nuts or bolts. Tighten to specifications. See page SS-26.
Clunk-noise from the rear suspension, occurs when shifting from reverse to drive	Loose rear suspension components	Inspect for loose or damaged rear suspension components. Repair or install new components as necessary. See page SS-41.
Click or pop-noise from the front suspension-more noticeable over rough roads or over bumps	Worn or damaged ball joints	Install new lower arm as necessary. See page SS-34.

Click or pop-noise occurs when vehicle is turning	Worn or damaged ball joints	Install new lower arm as necessary. See page SS-34.
Click or snap-occurs when accelerating around a corner	Damaged or worn Birfield joint	Repair or install a new Birfied joint as necessary. See DS group - driveshaft.
Front suspension noise-a squeak, creak or rattle noise-occurs mostly over bumps or rough roads	Steering components Loose or bent front struts or shock absorbers Damaged spring or spring mounts Damaged or worn arm bushings Worn or damaged stabilizer bar bushing or links	Go to detailed test A. See page SS-11.
Groaning or grinding-noise from the front strut, occurs when driving on bumpy roads or turning the vehicle	Uneven seating surface between the insulator and panel by the burrs around the strut insulator mounting bolts and the insulator boltes mounting holes	Repair or install a new parts as necessary. See page SS-29.
Rear suspension noise - a squeak, creak or rattle noise - occurs mostly over bumps or rough roads	Loose or bent rear shock absorbers Damaged spring or spring mounts Damaged or worn control arm bushings	Go to detailed test B. See page SS-12.
Shudder-occurs during acceleration from a slow speed or stop	Rear axle assembly mispositioned Damaged or worn front suspension components	Check the axle mounts and Rear suspension the rear suspension for damage or wear. Repair as necessary. Check for a loose stabilizer bar, damaged or loose strut/strut bushings or loose or worn ball joints. Inspect the steering linkage for wear or damage. Repair or Install new components as necessary.
Shimmy-most noticeable on coast/deceleration-also hard steering condition	Excessive positive caster	Check the caster alignment angle. Correct as necessary. See page SS-57.
Tire noise-hum/moan at constant speeds	Abnormal wear patterns	Spin the tire and Check for tire wear. Install a new tire as necessary. Inspect for damaged/worn suspension components. Carry out wheel alignment. See page SS-56, SS-61.
Tire noise-noise tone lowers as the vehicle speed is lowered	Out-of-balance tire	Balance the tire and road test. Install a new tire as necessary. See page SS-61.
Tire noise - ticking noise, change with speed	Nail puncture or stone in tire tread	Inspect the tire. Repair as necessary. See page SS-61.
Wheel and tire-vibration and noise concern is directly related to vehicle speed and is not affected by acceleration, coasting or decelerating	Damaged or worn tire	Go to detailed test C. See page SS-13.
Tire wobble or shudder - occurs at lower speeds	Damaged wheel bearings	Spin the tire and check for abnormal wheel bearing play or roughness. Adjust or Install new wheel bearings as necessary. See DS group - front/rear axle.
	Damaged wheel	Inspect the wheel for damage. Install a new wheel as necessary. See page SS-61.
	Damaged or worn suspension components	Inspect the suspension components for wear or damage. Repair as necessary.

		See page SS-43.
	Loosen wheel nuts	Check the wheel nuts. Tighten to specification. See page SS-61.
	Damaged or uneven tire wear	Spin the tire and Check for abnormal tire wear or damage. Install a new tire as necessary. See page SS-60.
Tire shimmy or shake - occurs at lower speeds	Wheel/tire out of balance	See page SS-56.
	Uneven tire wear	Check for abnormal tire wear. Install a new tire as necessary. See page SS-60.
	Excessive radial runout of wheel or tire	Carry out a radial runout test of the wheel and tire. Install a new tire as necessary. See page SS-61.
	Worn or damaged wheel studs or elongate stud holes	Inspect the wheel studs and wheels. Install new components as necessary. See page SS-61.
	Excessive lateral runout of the wheel or tire	Carry out a lateral runout test of the wheel and tire. Check the wheel, tire and hub. Repair or Install new components as necessary. See page SS-61.
	Foreign materal between the brake disc and hub.	Clean the mounting surfaces of the brake disc and hub. See DS group - front/rear axle.
High speed shake or shimmy-occurs at high speeds	Excessive wheel hub runout Damaged or worn tires Damaged or worn wheel bearings Worn or damaged suspension or steering linkage Brake disc or drum imbalance	Go to detailed test D. See page SS-16.
Drift left or right	Tires Steering linkage Alignment Base brake system	Go to detailed test E. See page SS-18.
Steering wheel	Alignment Steering linkage Front lower arm ball joint	Go to detailed test F. See page SS-19.
Tracks incorrectly	Rear suspension Caster	Go to detailed test G. See page SS-20.
Rough ride	Front strut and spring assembly Rear shock absor and spring assembly	Go to detailed test H. See page SS-21.
Excessive noise	Front or rear stabilizer bar components Springs Suspension components Shock absorbers	Go to detailed test I. See page SS-21.
Incorrect tire wear	Tire or unbalanced wheels Tire inflation Strut Alignment	Go to detailed test J. See page SS-22.
Vibration	Wheel/tire Front wheel drivshaft(s)	Go to detailed test K. See page SS-23.

	Steering system Strut and spring assembly Spring and strut mounting Front lower arm ball joint Front lower arm mounting bolt bushing Stabilizer bar bushings Wheel hubs and bearing Rear suspension arms and bushings	
Vehicle leans	Tire/wheel Vehicle load Suspension components Incorrect ride height	Inflate tires to specification. See page SS-60. Redistribute the load as necessary. Visually inspect the suspention system. Correct the ride height as necessary.
Poor returnability	High knuckle rotating torque Alignment	Go to detailed test E. See page SS-18.

DETAILED TEST A : FRONT SUSPENSION NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
ROAD TEST THE VEHICLE	
	1. Test drive the vehicle. 2. During the road test, drive the vehicle over a rough road. Determine from which area/component the noise is originating. ● Is there a squeak, creak or rattle noise ? → **YES** Go to → **NO** The suspension system is OK. Conduct a diagnosis on other suspect systems.
INSPECT THE STEERING SYSTEM	
	1. Check the steering system for wear or damage. Carry out a steering linkage test. Inspect the tire wear pattern. See page SS-25. ● Are the steering components worn or damaged ? → **YES** Repair the steering system. Install new components as necessary. Test the system for normal operation. → **NO** Go to
FRONT SHOCK ABSORBER/STRUT CHECK	
	1. Check the front shock absorbers/strut mounts for loose bolts or nuts. 2. Check the front shock absorbers/struts for damage. Carry out a shock absorber check. ● Are the front shock absorbers/struts loose or damaged ? → **YES** Tighten to specifications if loose. Install new front shock absorbers/struts if damaged. Test the system for normal operation. → **NO** Go to
CHECK THE FRONT SPRINGS	
	Check the front spring and front spring mounts/brackets for wear or damage ● Are the front springs or spring mounts/brackets worn or damaged ? → **YES** Repair or Install new components as necessary. Test the system for normal

	operation. → **NO** Go to**A5.**
CHECK THE STABILIZER BAR	
	1. Check the stabilizer bar bushing and links for damage or wear. 2. Check the stabilizer bar for damage. 3. Check for loose or damaged stabilizer brackets. ● Are the stabilizer bar/track bar components loose, worn or damaged ? → **YES** Repair or Install new components as necessary. Test the system for normal operation. → **NO** Suspension system is OK. Conduct diagnosis on other suspect systems.

DETAILED TEST B : REAR SUSPENSION NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
ROAD TEST THE VEHICLE	
	1. Test drive the vehicle. 2. During the road test, drive the vehicle over a rough road. Determine from which area/component the noise is originating. ● Is there a squeak, creak or rattle noise ? → **YES** Go to → **NO** The suspension system is OK. Conduct a diagnosis on other suspect systems.
REAR SHOCK ABSORBER/STRUT CHECK	
	1. Raise and support the vehicle. See GI group - lift support point. 2. Check the rear shock absorber/strut mounts for loose bolts or nuts. 3. Check the rear shock absorbers/strut for damage. Carry out a shock absorber check. ● Are the rear shock absorbers/struts loose or damaged ? → **YES** Tighten to specifications if loose. Install new rear shock absorbers/struts if damaged. Test the system for normal operation. → **NO** Go to
CHECK THE REAR SPRINGS	
	Check the rear springs and rear spring mounts/brackets for wear or damage. ● Are the rear springs or spring mounts/brackets worn or damaged ? → **YES** Repair or Install new components as necessary. Test the system for normal operation. → **NO** Go to**B4.**
CHECK THE TRAILING ARMS	
	1. Inspect the trailing arm bushings for wear or damage. Check for loose trailing arm bolts. 2. Inspect for twisted or bent trailing arms. ● Are the trailing arms loose, damaged or worn ?

	→ **YES** Repair or Install new components as necessary. Test the system for normal operation. → **NO** Suspension system is OK. Conduct diagnosis on other suspect systems.

DETAILED TEST C : WHEEL AND TIRE

CONDITIONS	DETAILS/RESULTS/ACTIONS
ROAD TEST THE VEHICLE	
	NOTE Wheel or tire vibrations felt in the steering wheel are most likely related to the front wheel or tire. Vibration felt through the seat are most likely related to the rear wheel or tire. This may not always be true, but it can help to isolate the problem to the front or rear of the vehicle. Test drive the vehicle at different speed ranges. During the road test, if the vibration can be eliminated by placing the vehicle in neutral or is affected by the speed of the engine, the cause is not the wheels or tires. ● Is there a vibration and noise ? → **YES** Go to**C2.** → **NO** The wheel and tires are OK. Conduct a diagnosis on other suspect systems.
CHECK THE FRONT WHEEL BEARINGS	
	Check the front wheel bearings. Refer to Wheel Bearing Check (See DS group - front axle). ● Are the wheel bearings OK ? → **YES** Go to**C3.** → **NO** Inspect the wheel bearings. Adjust or Repair as necessary. Test the system for normal operation.
INSPECT THE TIRES	
	1. Check the tires for missing weights. 2. Check the wheels for damage. 3. Inspect the tire wear pattern. See page SS-25. ● Do the tires have an abnormal wear pattern ? → **YES** Correct the condition that caused the abnormal wear. Install new tire(s). Test the system for normal operation. → **NO** Go to
TIRE ROTATION DIAGNOSIS	
	1. Spin the tires slowly and watch for signs of lateral runout. 2. Spin the tires slowly and watch for signs of radial runout.. ● Are there signs of visual runout ? → **YES** Go to

	→ **NO** Check the wheel and tire balance. Correct as necessary. Test the system for normal operation.
RADIAL RUNOUT CHECK ON THE TIRE	
	Measure the radial runout of the wheel and tire assembly. A typical specification for total radial runout is 1.15mm (0.059 inch). ● Is the radial runout within specifications ? → **YES** Go to**C8.** → **NO** Go to**C6.**
RADIAL RUNOUT CHECK ON THE WHEEL	
	Measure the radial runout of the wheel. A typical specification for total radial runout is 1.14mm (0.045 inch.). ● Is the radial runout within specifications ? → **YES** Install a new tire. Test the system for normal operation. → **NO** Go to**C7.**
CHECK THE HUB/BRAKE DISC OR DRUM PILOT RUNOUT OR BOLT CIRCLE RUNOUT	
	Measure the pilot or bolt circle runout. A typical specification for radial runout is : ● pilot runout - less than 0.15mm (0.006 inch.) ● bolt circle runout - less than 0.38 mm (0.015 inch.) ● Is the radial runout within specification ? → **YES** Install a new wheel. Test the system for normal operation. → **NO** Repair or Install new components as necessary. See page SS-28 for the front suspension or SS-43 for the rear suspension.
LATERAL RUNOUT CHECK ON THE TIRE	
	Measure the lateral runout of the wheel and tire assembly. A typical specification for total lateral runout is 2.5mm (0.098 inch). ● Is the lateral runout within specifications ? → **YES** Wheel and tires are OK. Conduct diagnosis on other suspect systems. → **NO** Go to**C9.**
LATERAL RUNOUT CHECK ON THE WHEEL	
	Measure the lateral runout of the wheel. A typical specification for total radial runout is 1.2mm (0.047 inch.) ● Is the lateral runout within specifications ? → **YES**

	Install a new tire. Test the system for normal operation. → **NO** Go to**C10.**
CHECK THE FLANGE FACE LATERAL RUNOUT	
	Measure the flange face lateral runout. A typical specification for lateral runout is : ● hub/brake disc - less than 0.13mm (0.005 inch) ● Is the lateral runout within specifications ? → **YES** Install a new wheel. Test the system for normal operation. → **NO** Repair or Install new components as necessary. See page SS-27 for the front suspension or SS-44 for the rear suspension.

DETAILED TEST D :

CONDITIONS	DETAILS/RESULTS/ACTIONS
CHECK FOR FRONT WHEEL BEARING ROUGHNESS	
	1. Raise and support the front end of the vehicle so that the front wheel and tire assemblies can spin. See GI group - lift support point. 2. Spin the front tires by hand. ● Do the wheel bearings feel rough ? → **YES** Inspect the wheel bearings. Repair as necessary. Test the system for normal operation. → **NO** Go to
CHECK THE END PLAY OF THE FRONT WHEEL BEARINGS	
	Check the end play of the front wheel bearings. ● Is the end play OK ? → **YES** Go to**D3.** → **NO** Adjust or Repair as necessary. Test the system for normal operation.
MEASURE THE LATERAL RUNOUT AND THE RADIAL RUNOUT OF THE FRONT WHEELS ON THE VEHICLE	
	Measure the lateral runout and the radial runout of the front wheels on the vehicle. Go to detailed test C. ● Are the measurements within specifications ? → **YES** Go to**D4.** → **NO** Install new wheels as necessary and Balance the assembly. Test the system for normal operation.
MEASURE THE LATERAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
	Measure the lateral runout of the front tires on the vehicle. Go to detailed test

	C. ● Is the runout within specifications ? → **YES** Go to**D5.** → **NO** Install new tires as necessary and Balance the assembly. Test the system for normal operation.
MEASURE THE RADIAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
	Measure the radial runout of the front tires on the vehicle. Go to detailed test C. ● Is the runout within specifications ? → **YES** Balance the front wheel and tire assemblies. If any tire cannot be balanced, Install a new tire. Test the system for normal operation. → **NO** Go to**D6.**
MATCH MOUNT THE TIRE AND WHEEL ASSEMBLY	
	Mark the high runout location on the tire and also on the wheel. Break the assembly down and rotate the tire 180 degrees (halfway around) on the wheel. Inflate the tire and measure the radial runout. ● Is the runout within specifications ? → **YES** Balance the assembly. Test the system for normal operation. → **NO** If the high spot is not within 101.6mm (4 inches) of the first high spot on the tire, Go to**D7.**
MEASURE THE WHEEL FLANGE RUNOUT	
	Dismount the tire and mount the wheel on a wheel balancer. Measure the runout on both wheel flanges. Go to detailed test C ● Is the runout within specifications ? → **YES** Locate and Mark the low spot on the wheel. Install the tire, matching the high spot on the tire with the low spot on the wheel. Balance the assembly. Test the system for normal operation. If the condition persists, Go to**D8.** → **NO** Install a new wheel. Check the runout on the new wheel. If the new wheel is within limits, locate and Mark the low spot. Install the tire, matching the high spot on the tire with the low spot on the wheel. Balance the assembly. Test the system for normal operation. If the condition persists, Go to**D8.**
CHECK FOR VIBRATION FROM THE FRONT OF THE VEHICLE	
	Spin the front wheel and tire assemblies with a wheel balancer while the vehicle is raised on a hoist. Feel for vibration in the front fender or while seated in the vehicle. ● Is the vibration persent ?

	→ **YES** Substitute known good wheel and tire assemblies as necessary. Test the system for normal operation. → **NO** Check the driveline components. Test the system for normal operation.

DETAILED TEST E : DRIFT LEFT OR RIGHT

CONDITIONS	DETAILS/RESULTS/ACTIONS
CHECK THE TIRES	
	Inspect the tires for excessive wear or damage. ● Are the tires excessively worn or damaged ? → **YES** Install new tires. → **NO** Go to**E2.**
CHECK THE STEERING LINKAGE	
	1. Raise and support the vehicle. 2. Check the steering components for indications of excessive wear or damage. See ST group - specification. ● Is there an indication of excessive wear or damage ? → **YES** Repair or Install new components as necessary. → **NO** Go to
CHECK THE VEHICLE ALIGNMENT	
	1. Place the vehicle on an alignment rack. Check the vehicle alignmnt. ● Is the alignment within specification ? → **YES** Go to → **NO** Adjust the alignment as necessary. See page SS-56 (wheel alignment).
BRAKE DRAG DIAGNOSIS	
	Apply the brakes while driving. ● Does drift or pull occur when the brakes are applied ? → **YES** See BR group - specification. → **NO** If the steering wheel is in the center, the vehicle is OK. If the steering wheel is off-center, Go to Detailed Test**F.**

DETAILED TEST F : STEERING WHEEL OFF-CENTER

CONDITIONS	DETAILS/RESULTS/ACTIONS
CHECK THE CLEAR VISION	
	Place the vehicle on an alignment rack.

	● Is the clear vision within specification ? → **YES** Go to**F2.** → **NO** Adjust the clear vision to specification.
INSPECT THE STEERING COMPONENTS	
	1. Raise and support the vehicle. 2. Inspect the steering components for excessive wear or damage. See ST group - specification. ● Are the steering components excessively worn or damaged ? → **YES** Repair or Install new components as necessary. → **NO** If it tracks corectly, vehicle is OK. If it tracks incorrectly, Go to Detailed Test

DETAILED TEST G : TRACKS INCORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
CHECK THE CASTER	
	Place the vehicle on an alignment rack. ● Is the caster within specification ? → **YES** Go to**G2.** →**NO** Replace bent or damaged parts.
CHECK THE REAR SUSPENSION	
	1. Measure the vehicle wheel base for LH and RH. 2. Compare the measurements. ● Are the measurements the same ? → **YES** If the ride is smooth, vehicle is OK. If the ride is rough, Go to Detailed Test → **NO** Inspect the rear suspension components for wear or damage. Repair or Install new components as necessary. See page SS-41 (rear suspension).

DETAILED TEST H : ROUGH RIDE

CONDITIONS	DETAILS/RESULTS/ACTIONS
CHECK THE FRONT SHOCK ABSORBER	
	1. Raise support the vehicle. 2. Inspect the front shock absorber for oil leaks or damage. ● Are the tires excessively worn or damaged ? → **YES** Install new front shock absorbers. See page SS-29 (front strut assembly). → **NO** Go to
CHECK THE REAR SHOCK ABSORBERS	

	Inspect the rear shock absorbers for oil leaks or damage. ● Are the rear shock absorbers leaking ? → **YES** Install new rear shock absorbers. See page SS-43 (rear strut assembly). → **NO** The vehicle is OK. Go to**TROUBLESHOOTING.**

DETAILED TEST I : EXCESSIVE NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
INSPECT THE SUSPENSION	
	1. Raise and support the vehicle. 2. Inspect the shock absorber mounting bolts. ● Are the mounting bolts loose or broken ? → **YES** Tighten or Install new shock absorber mounting bolts. See page SS-29 and SS-43 (front/rear suspension) → **NO** Go to
INSPECT THE SPRING AND TORSION BARS	
	Inspect the springs and stabilizer bars for damage. ● Are the spring or stabilizer bars damaged ? → **YES** Install new spring and/or stabilizer bars. See page SS-48 and SS-55 (front/rear stabilizer bars). → **NO** Go to**I3.**
INSPECT THE FRONT SUSPENSION	
	Inspect the front suspension components for excessive wear or damage. ● Are the front suspension components worn or damaged ? → **YES** Install new front suspension components. See page SS-26 (front suspension). → **NO** The vehicle is OK. Go to**TROUBLESHOOTING.**

DETAILED TEST J : INCORRECT TIRE WEAR

CONDITIONS	DETAILS/RESULTS/ACTIONS
INSPECT THE TIRES	
	1. Raise and support the vehicle. 2. Inspect the tires for uneven wear on the inner or outer shoulder. ● Is there uneven tire wear ? → **YES** Align the vehicle. Install new tires if badly worn. → **NO** Go to

UNEVEN TIRE WEAR	
	Inspect the tires for a feathering pattern. ● Do the tires have a feathering pattern ? → **YES** Align the vehicle. Install new tires if badly worn. → **NO** Go to**J3.**
CHECK FOR CUPPED TIRE	
	Inspect the tires for cupping or dishing. ● Are the tires cupped or dished ? → **YES** Balance and Rotate the tires. → **NO** The vehicle is OK. Go to**TROUBLESHOOTING.**

DETAILED TEST K : VIBRATION

CONDITIONS	DETAILS/RESULTS/ACTIONS
ROAD TEST	
	Accelerate the vehicle to the speed at which the customer indicated the vibration occured. ● Is the vibration present ? → **YES** Go to**K2.** → **NO** The vehicle is OK. Go to**TROUBLESHOOTING.**
INSPECT THE TIRES	
	1. Raise and support the vehicle with a frame contact hoist. 2. Inspect the tires for extreme wear or damage, cupping, or flat spots. ● Are the tires OK ? → **YES** Go to → **NO** Check the suspension components for misalignment, abnormal wear, or damage that may have contributed to the tire wear. Correct the suspension concerns and Install new tires.
INSPECT THE WHEEL BEARINGS	
	Spin the tires by hand to check for wheel bearing rougness. ● Is the front wheel bearing OK ? → **YES** Go to**K4.** → **NO** Install new front wheel bearings as necessary. See Ds group - front axle.
TIRE/WHEEL BALANCE	

	Check the tire/wheel balance. ● Are the tires balanced ? → **YES** Go to**K5.** → **NO** Balance the tires and wheels as necessary.
MEASURE THE RUNOUTS	
	For each wheel position measure, locate and mark the following items. See page SS-61 (wheel/tire). - High point of the tire/wheel assembly total radial runout - High point of the wheel radial runout - High point of the wheel lateral runout ● Are the runouts as specified ? → **YES** Go to**K7.** → **NO** Go to**K6.**
SUBSTITUTE THE WHEELS AND TIRE	
	1. Substitute a known good set of wheels and tires. 2. Carry out a road test. 3. If the vehicle still exhibits a shake or vibration, note the vehicle speed and/or engine rpm which it occurs. ● Is the vibration felt ? → **YES** Engine/transmission imbalance. See the specification of TR group, EM group, FL group and EC group. → **NO** Install the original tire/wheel assemblies one by one, Road testing at each step until the damaged tire(s)/wheel(s) as necessary. Test the system for normal operation.

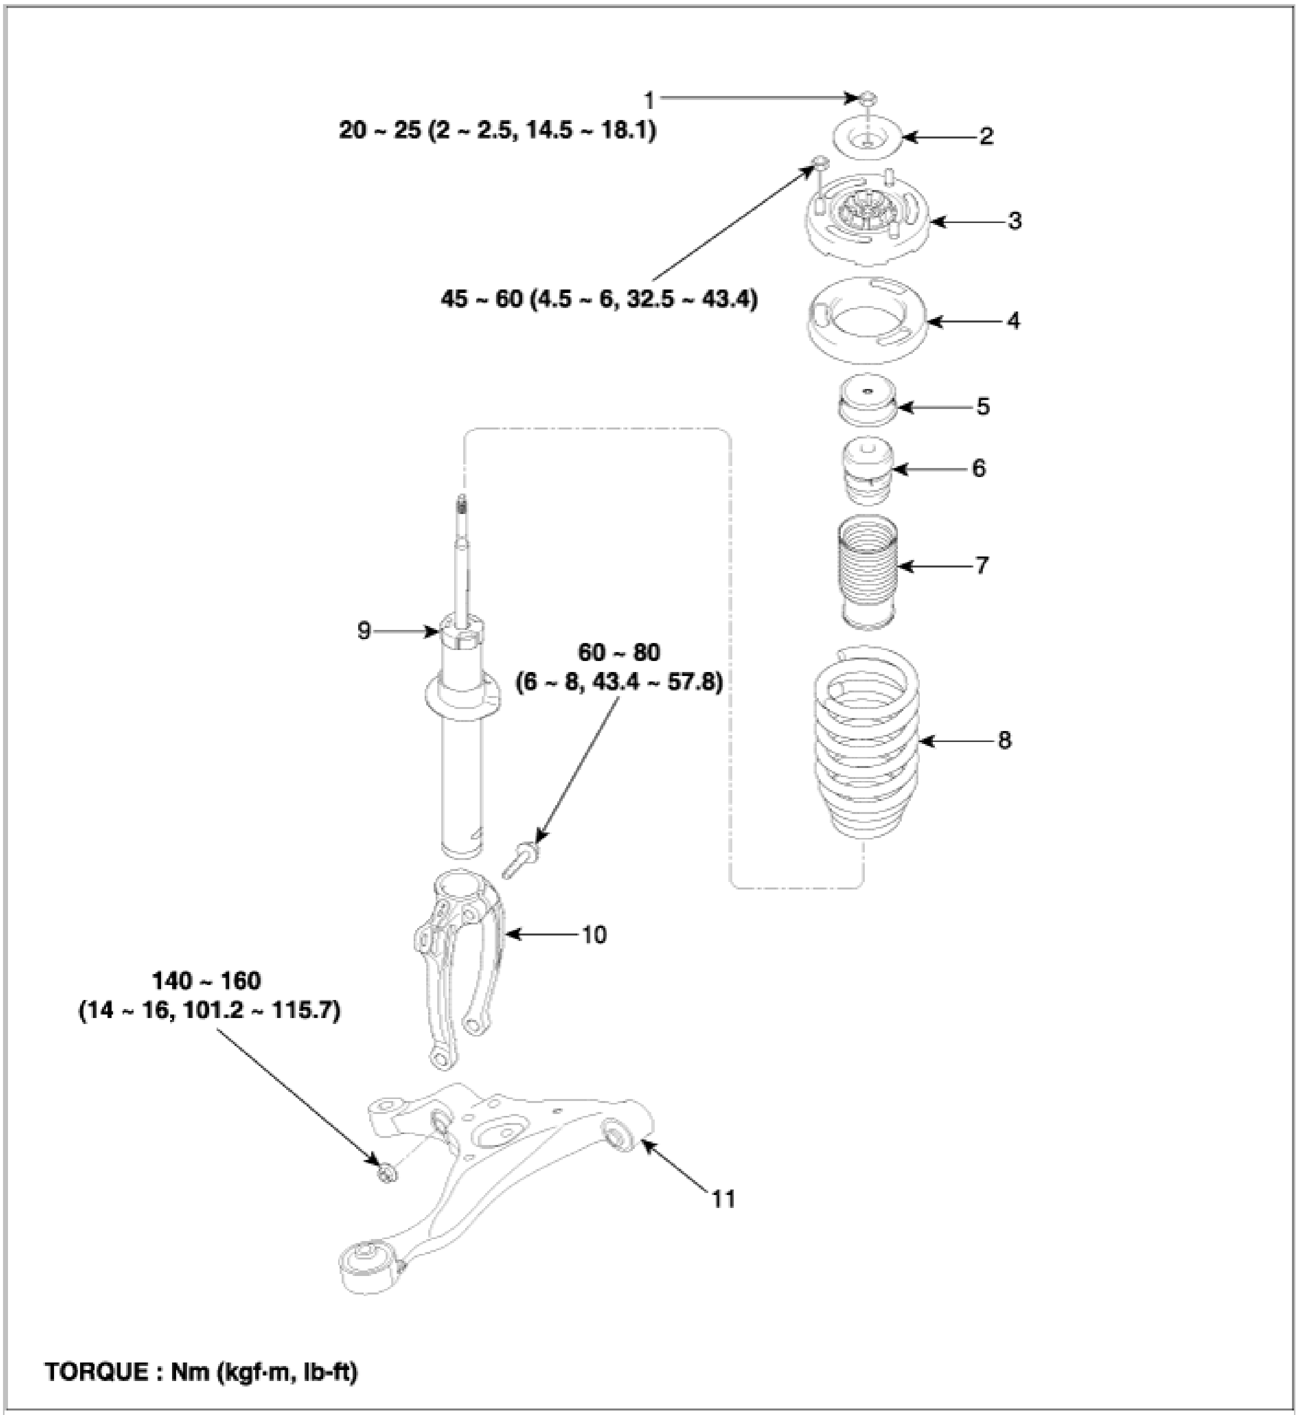
Wheel /tire noise, vibration and harshness concerns are directly related to vehicle speed and are not generally affected by acceleration, coasting or decelerating. Also, out-of-balance wheel and tires can vibrate at more than one speed. A vibration that is affected by the engine rpm, or is eliminated by placing the transmission in Neutral is not related to the tire and wheel. As a general rule, tire and wheel vibrations felt in the steering wheel are related to the front tire and wheel assemblies. Vibrations felt in the seat or floor are related to the rear tire and wheel assemblies. This can initially isolate a concern to the front or rear.
Careful attention must be paid to the tire and wheels. There are several symptoms that can be caused by damaged or worn tire and wheels. Carry out a careful visual inspection of the tires and wheel assemblies. Spin the tires slowly and watch for signs of lateral or radial runout. Refer to the tire wear chart to determine the tire wear conditions and actions

WHEEL AND TIRE DIAGNOSIS		
Rapid wear at the center	Rapid wear at both shoulders	Wear at one shoulder
		• Center-tread down to fabric due to excessive over inflated tires • Lack of rotation	• Under-inflated tires • Worn suspension components • Excessive cornering speeds	• Toe adjustment out of specification • Camber out of specification • Damaged strut

• Excessive toe on drive wheels • Heavy acceleration on drive	• Lack of rotation	• Damaged lower arm
Partial wear	Feathered edge	Wear pattern
		• Caused by irregular burrs on brake drums	• Toe adjustment out of specification • Damaged or worn tie rods • Damaged knuckle	• Excessive toe on non-drive wheels • Lack of rotation

Suspension System > Front Suspension System > Front Strut Assembly > Components and Components Location

COMPONENTS



1. Self-locking nut	4. Upper pad	7. Dust cover	10. Fork
2. Plate	5. Cup assembly	8. Spring	11. Front lower arm
3. Bracket	6. Urethane bumper	9. Shock absober	

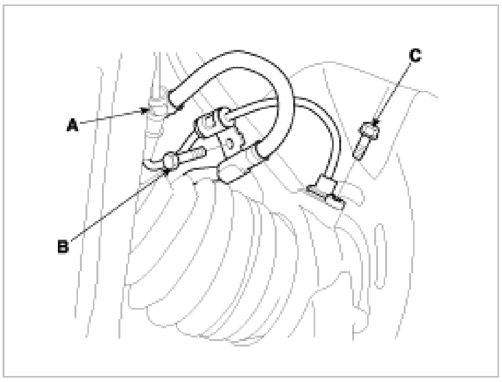
Suspension System > Front Suspension System > Front Strut Assembly > Repair procedures

REMOVAL

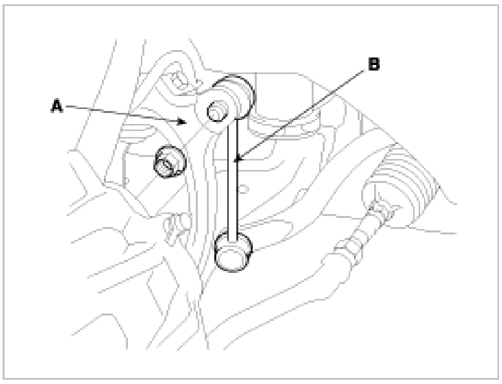
1. Loosen the wheel nuts slightly.
   Raise the front of the vehicle, and make sure it is securely supported.
2. Remove the front wheel and tire from front hub.

> **CAUTION**
>
> Be careful not to damage the hub bolts when removing the front wheel and tire.

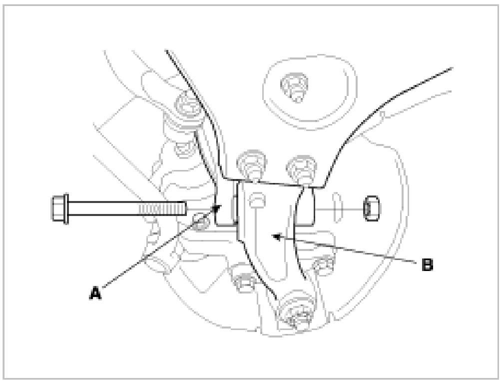
3. Remove the brake hose bracket(A) and speed sensor cable mounting bolt(B) from the front axle assembly.



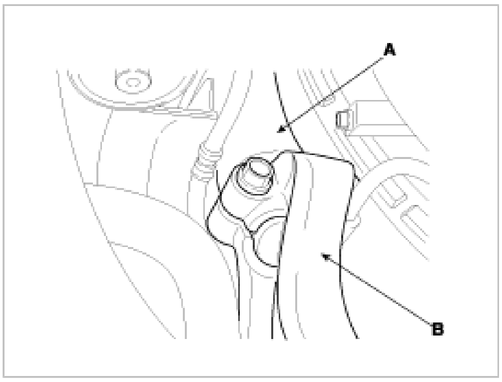
4. Remove the speed sensor bolt(C).
5. Remove the front stabilizer link(B) from the fork(A).



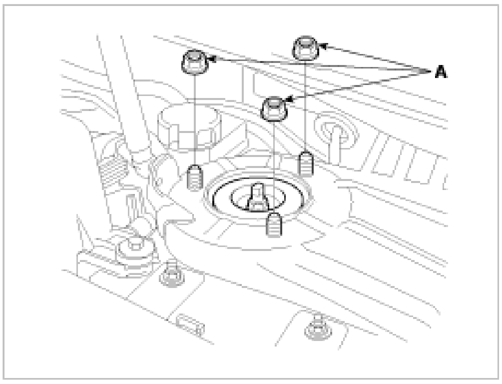
6. Remove the fork(A) from the front lower arm connector(B).



7. Remove the front strut assembly(A) from the fork(B).



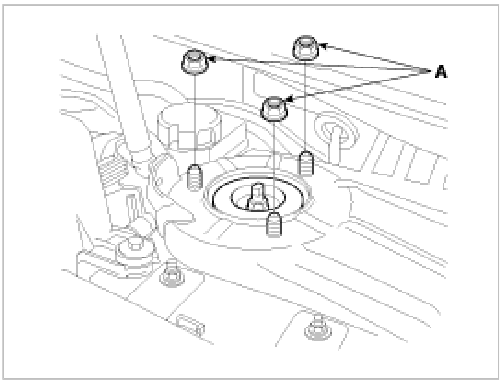
8. Remove the strut upper mounting nuts(A).



INSTALLATION

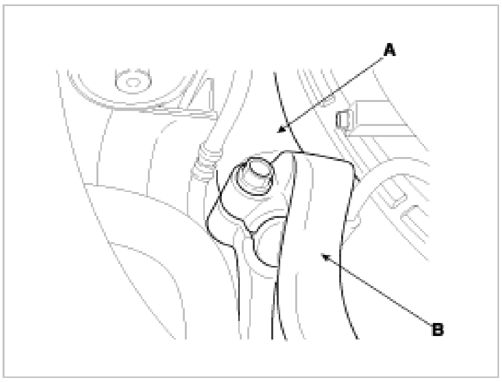
1. Install the strut assembly(B) and then install the strut lower mounting bolts(A).

Tightening torque Nm (kgf·m, lb-ft) :
45 ~ 60 (4.5 ~ 6.0, 32.5 ~ 43.4)



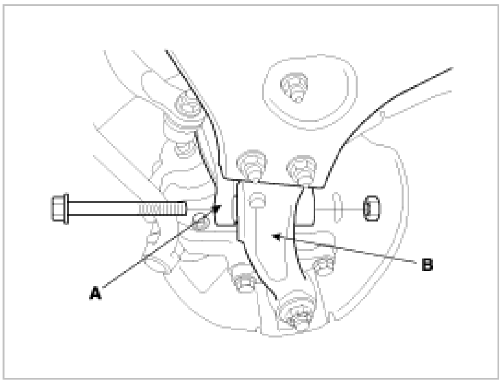
2. Install the fork(B) to the strut assembly(A) with the I.D. mark facing outward.

Tightening torque Nm (kgf·m, lb-ft) :
60 ~ 80 (6.0 ~ 8.0, 43.4 ~ 57.8)



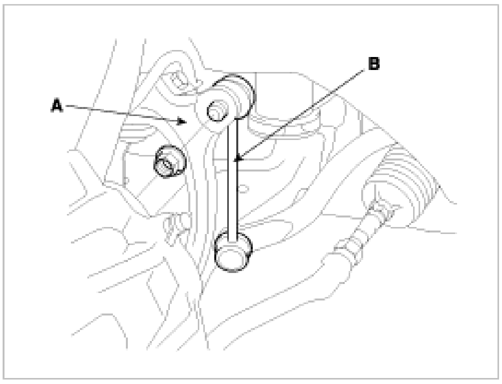
3. Install the fork(A) to the front lower arm connector(B).

Tightening torque Nm (kgf·m, lb-ft) :
140 ~ 160 (14~16, 101.2~115.7)

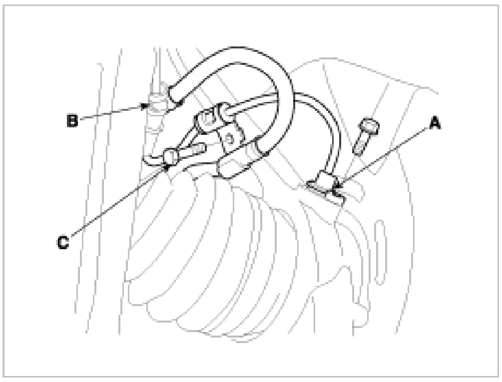


4. Install the front stabilizer link(B) to the fork(A).

Tightening torque Nm (kgf·m, lb-ft) :
100 ~ 120 (10 ~ 12, 72.3 ~ 86.8)



5. Install the speed sensor bolt(A).



6. Install the brake hose bracket(B) to the fork and speed sensor cable mounting bolt(C) to the axle assembly.
7. Install the wheel and the tire to the front hub.

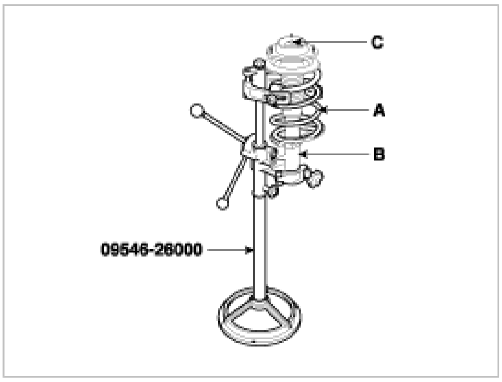
Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the front wheel and tire.

DISASSEMBLY

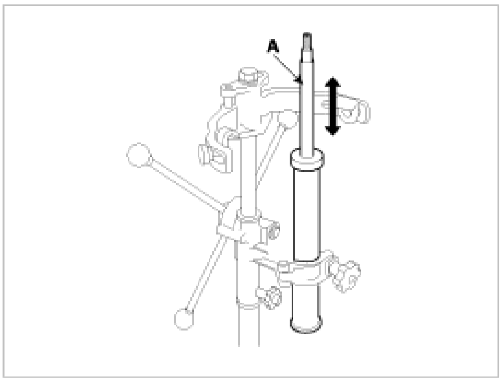
1. Using the special tool (09546-26000), compress the coil spring(A).



2. Remove the self-locking nut(C) from the strut assembly(B).
3. Remove the insulator, spring seat, coil spring and dust cover from the strut assembly.

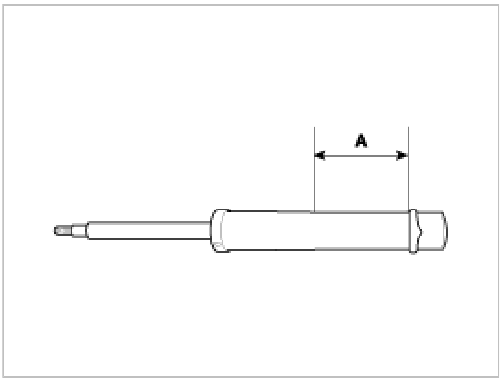
INSPECTION

1. Check the strut insulator for wear or damage.
2. Check rubber parts for damage or deterioration.
3. Compress and extend the piston rod(A) and check that there is no abnormal resistance or unusual sound during operation.



DISPOSAL

1. Fully extend the piston rod.
2. Drill a hole on the A section to remove gas from the cylinder.



> **CAUTION**
>
> The gas coming out is harmless, but be careful of chips that may fly when drilling.

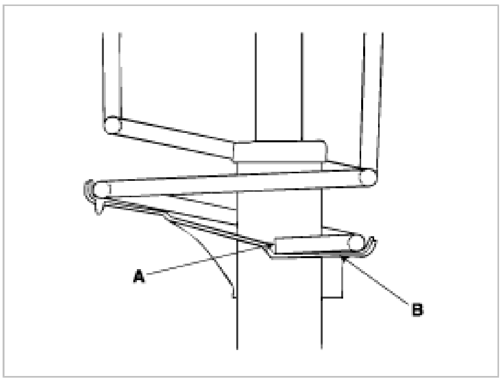
REASSEMBLY

1. Compress coil spring using special tool (09546- 26000).
   Install compressed coil spring onto shock absorber.

NOTE

1) There are two clolor marks on the coil spring. One corresponds to model option (see page SS-2), and the other corresponds to load classification. Ensure that the correct parts are being installed.
2) Install the coil spring with the identification mark directed toward the knuckle.

2. After fully extending the piston rod, install the spring upper seat and insulator assembly.
3. After seating the upper and lower ends of the coil spring(A) in the upper and lower spring seat grooves(B) correctly, tighten new self-locking nut temporarily.



4. Remove the special tool(09546-26000).
5. Tighten the self-locking nut to the specified torque.

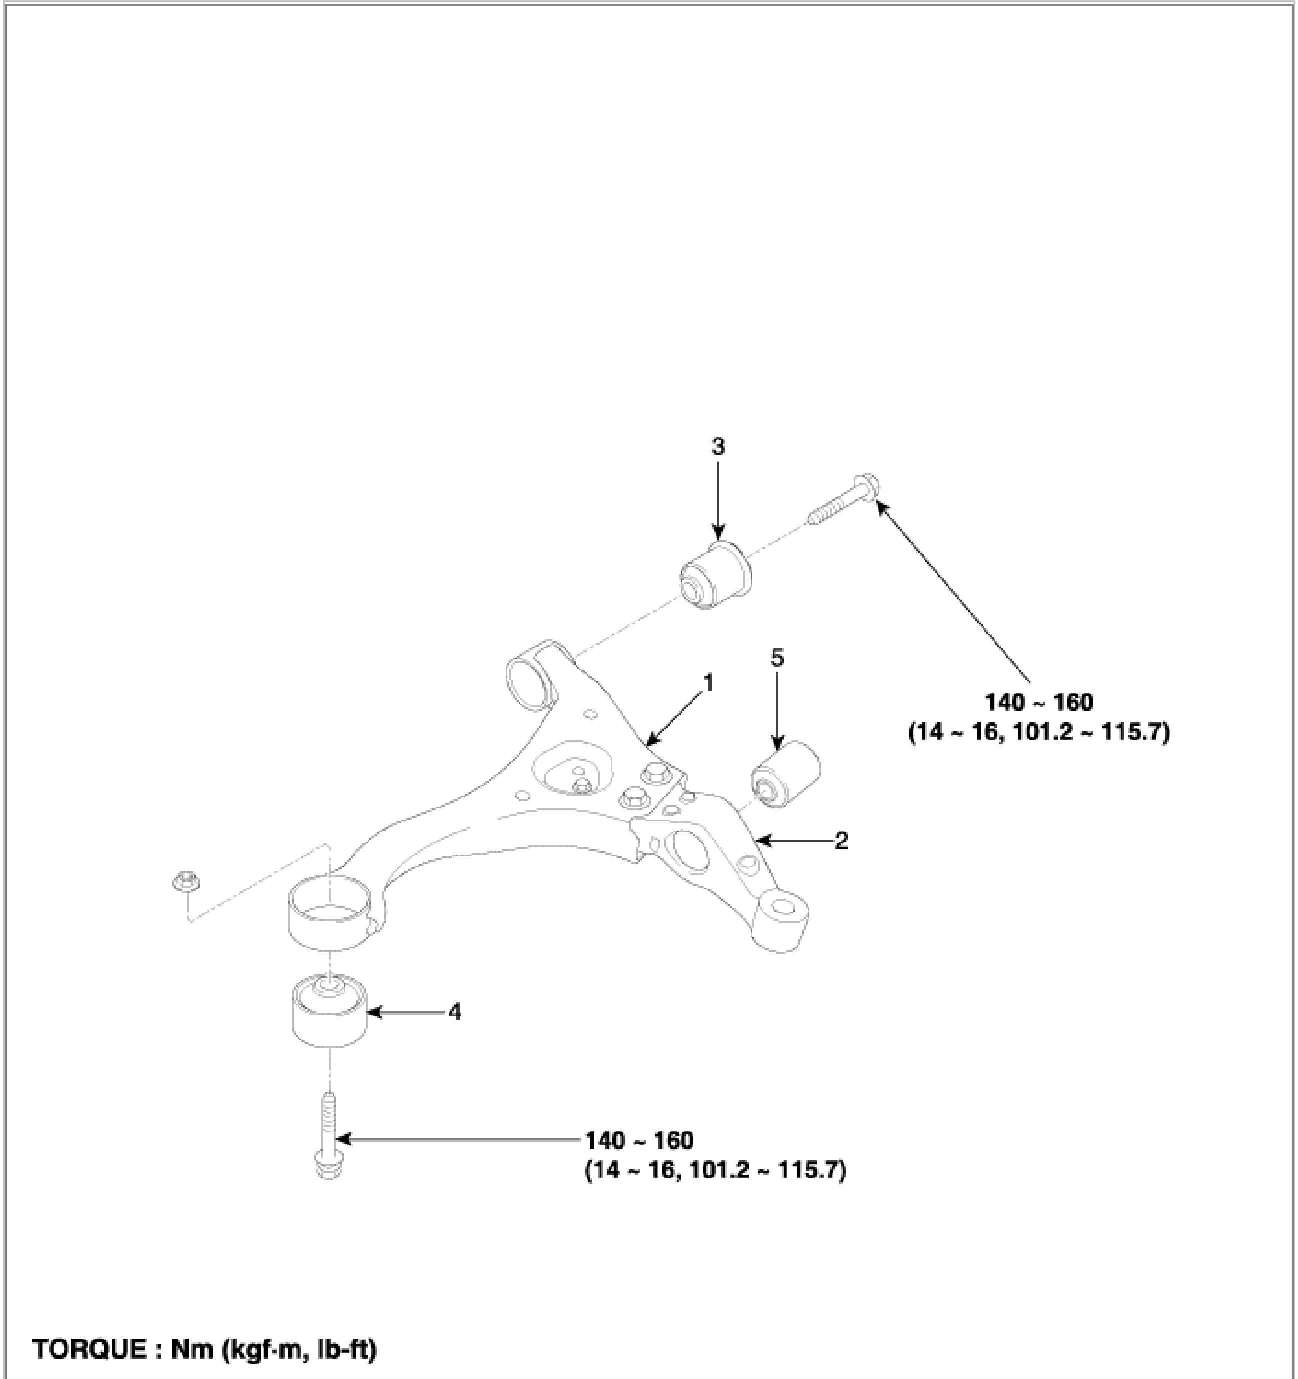
Tightening torque Nm (kgf·m, lb-ft) :
20 ~ 25 (2.0 ~ 2.5, 14.5 ~ 18.1)

CAUTION

Do not reuse the self-locking nut.

Suspension System > Front Suspension System > Front Lower Arm > Components and Components Location

COMPONENTS



1. Front lower arm
2. Connector
3. Bushing (A)
4. Bushing (G)
5. Bushing

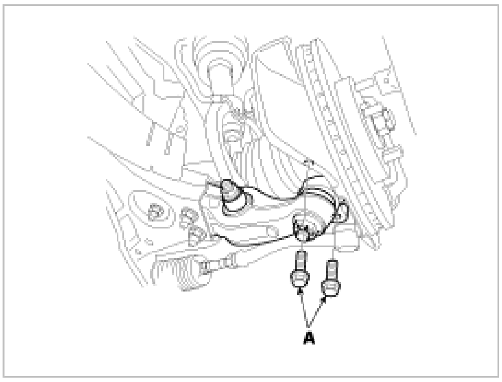
Suspension System > Front Suspension System > Front Lower Arm > Repair procedures

REMOVAL

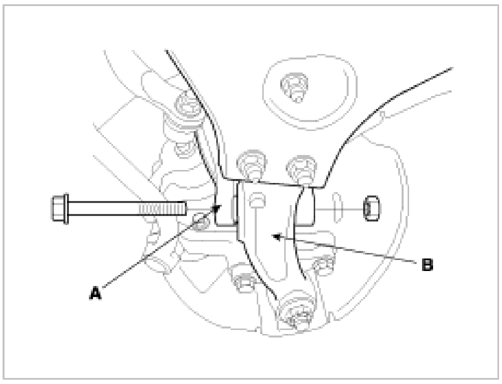
1. Loosen the wheel nuts slightly.
   Raise the front of the vehicle, and make sure it is securely supported.
2. Remove the front wheel and tire from front hub.

> CAUTION
>
> Be careful not to damage the hub bolts when removing the front wheel and tire.

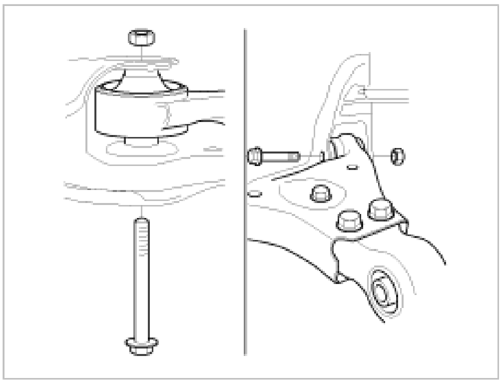
3. Remove the lower arm ball joint mounting bolts(A).



4. Remove the front lower arm connector(B) from the fork(A).

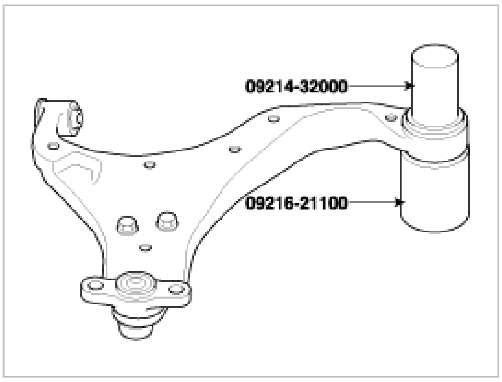


5. Remove the lower arm mounting bolts.

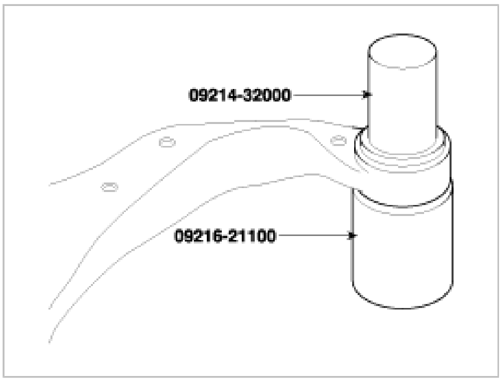


REPLACEMENT

1. Using the special tools(09214-32000 & 09216- 211000), remove the bushing from the lower arm.



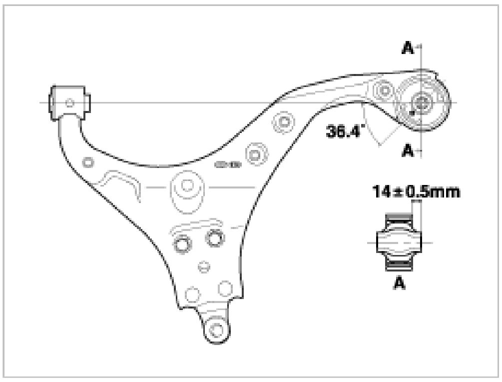
2. Apply soap solution to the following parts.
   A. Outer surface of the bushing.
   B. Inner surface of the lower bushing mounting part.
3. Using the special tools(09214-32000 & 09216-21100), install the busing on the lower arm.



CAUTION

Insert bushing in the direction shown in the illustration.

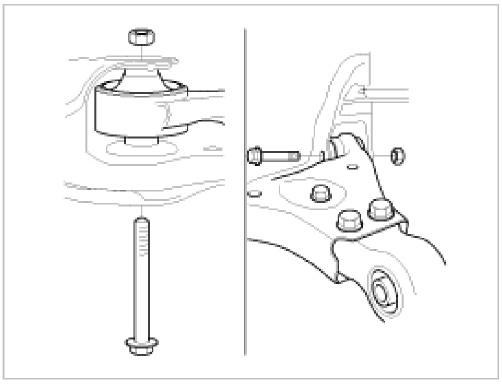
Separation force is over 800 Nm (800Kgf, 1763 lbf)



INSTALLATION

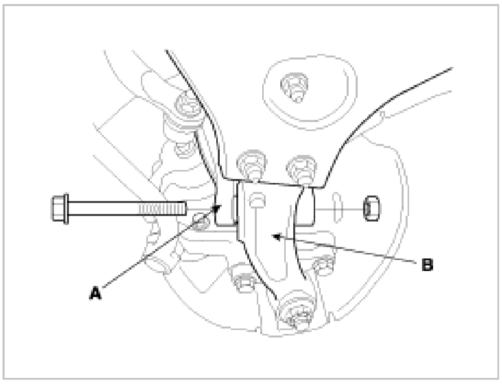
1. Install the lower arm mounting bolts.

Tightening torque Nm (kgf·m, lb-ft) :
Bushing(A) ; 140 ~ 160 (14 ~ 16, 101.2 ~ 115.7)
Bushing(G) ; 140 ~ 160 (14 ~ 16, 101.2 ~ 115.7)



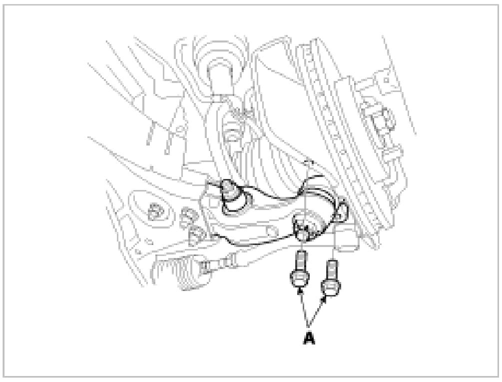
2. Install the lower arm connector(B) to the fork(A).

Tightening torque Nm (kgf·m, lb-ft) :
140~160 (14~16, 101.2~115.7)



3. Install the lower arm ball joint mounting bolts(A).

Tightening torque Nm (kgf·m, lb-ft) :
100 ~ 120 (10 ~ 12, 72.3 ~ 86.8)



4. Install the wheel and the tire to the front hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the front wheel and tire.

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the lower arm for bending or breakage.
3. Check the ball joint dust cover for cracks.
4. Check all bolts.
5. Check the lower arm ball joint for rotating torque.
   (1) If a crack is noted in the dust cover, replace the ball joint assembly.
   (2) Shake the ball joint stud several times.
   (3) Measure the ball joint rotating torque.

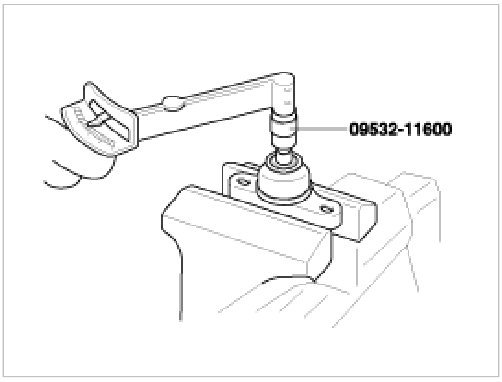
Standard value :
0.4 ~ 2 Nm (4 ~ 20 kgf·cm, 0.29 ~ 1.45 lb-ft)

NOTE

Measure torque using the special tool(09532-11600) and torque wrench at the range of 0.5 - 2 rpm after moving the ball joint stud at degree 3° several times at room temperature.

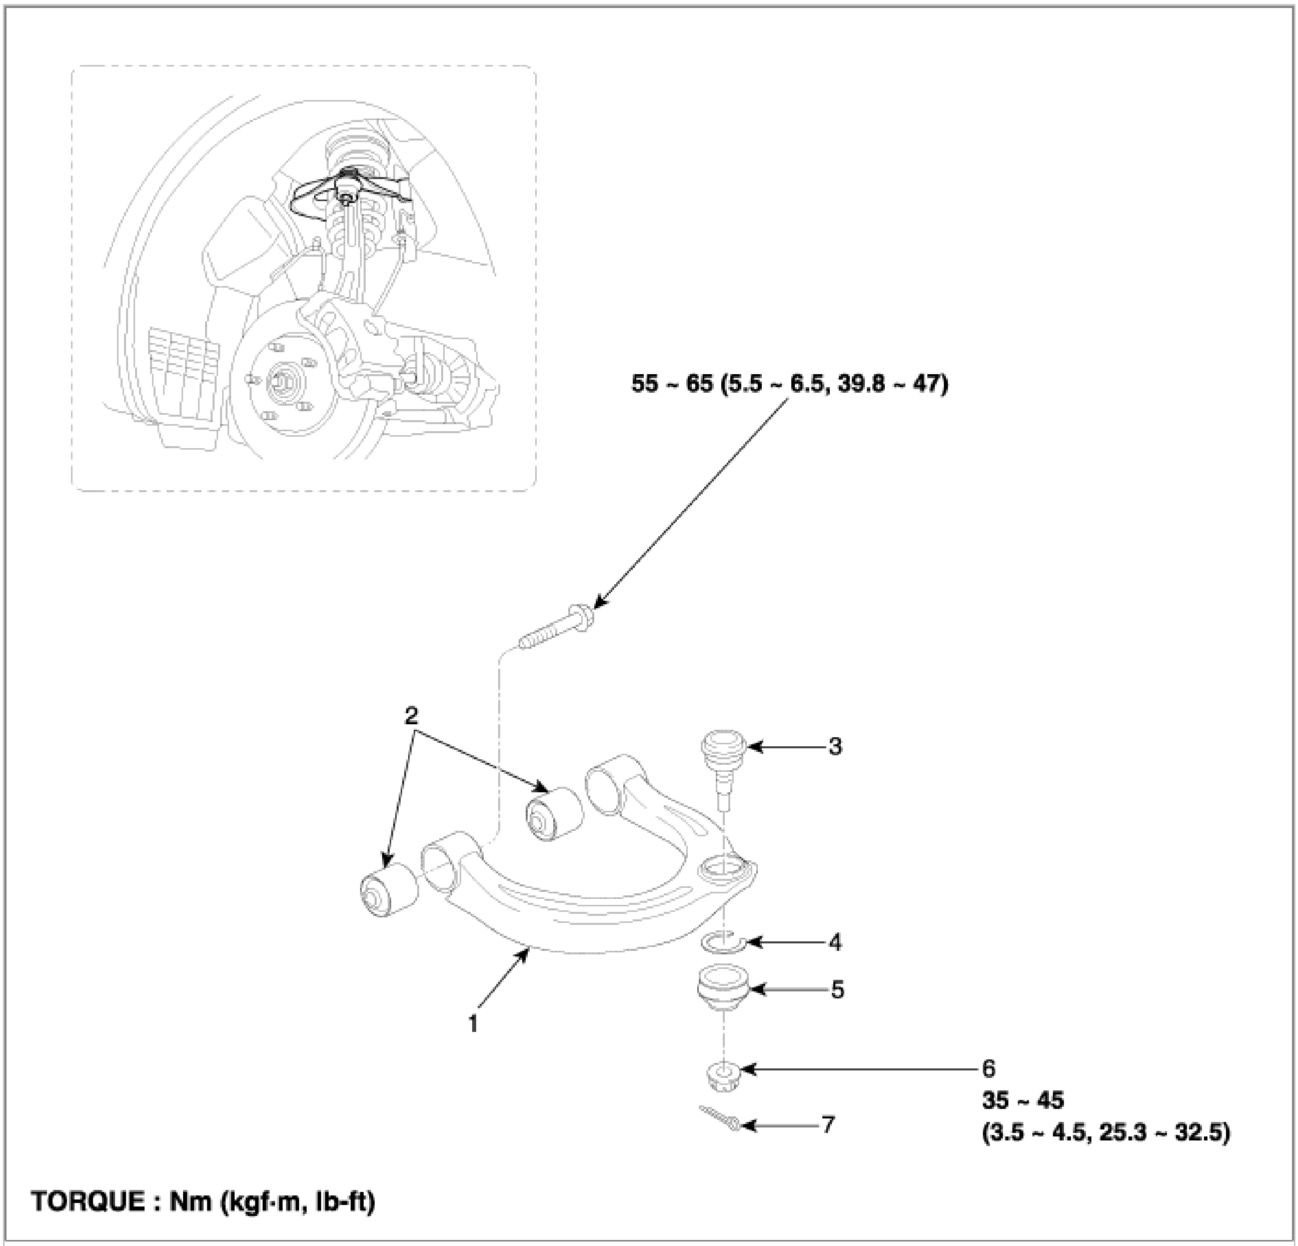
(4) If the rotating torque is below the lower limit of standard value, replace the ball joint assembly.

(5) Even if the rotating toque is below the lower limit of the standard value, the ball joint may be reused unless it has drag and excessive play.



Suspension System > Front Suspension System > Front Upper Arm > Components and Components Location

COMPONENTS



1. Front upper arm
2. Bushing
3. Ball joint
4. Snap ring
5. Boot
6. Self-locking nut
7. Split pin

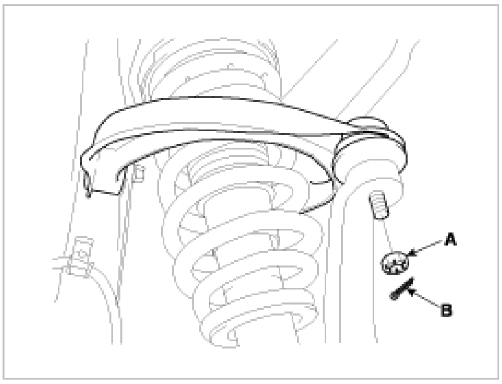
Suspension System > Front Suspension System > Front Upper Arm > Repair procedures

REMOVAL

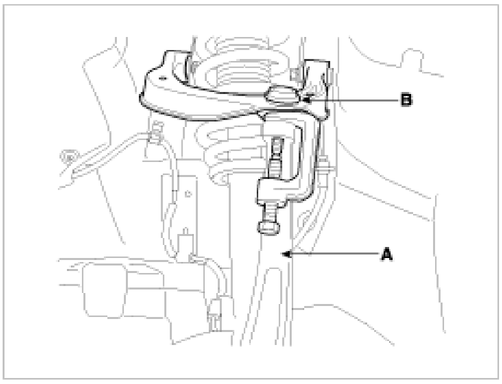
1. Loosen the wheel nuts slightly.
   Raise the front of the vehicle, and make sure it is securely supported.
2. Remove the front wheel and tire from front hub.

> **CAUTION**
>
> Be careful not to damage the hub bolts when removing the front wheel and tire.

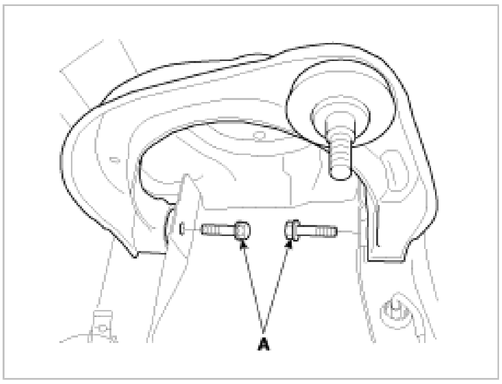
3. Remove the upper arm ball joint self-locking nut(A) and the split pin(B).



4. Using the special tools(09568-4A000), disconnect the upper arm ball joint from the knuckle.



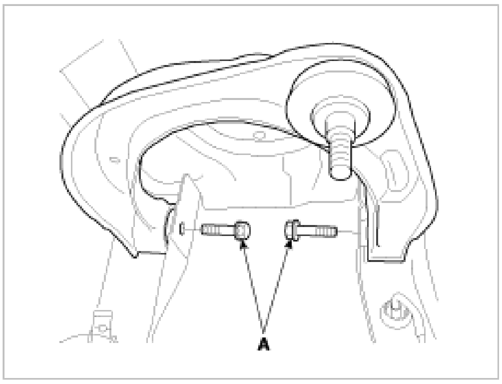
5. Remove the front strut assembly (Refer to SS-10).
6. Remove the two upper arm mounting bolts(A) from the body.



INSTALLATION

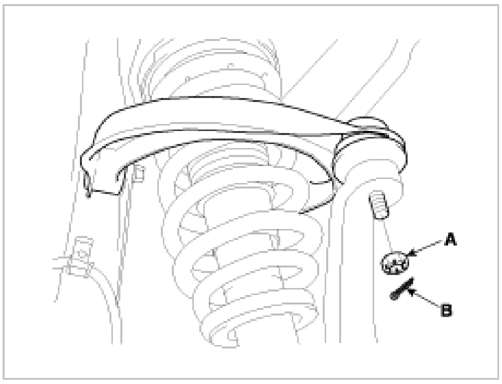
1. Install the two upper arm mounting bolts(A) to the body.

Tightening torque Nm (kgf·m, lb-ft) :
55 ~ 65 (5.5 ~ 6.5, 39.8 ~ 47.0)



2. Install the front strut assembly (Refer to SS-12).
3. Install the upper arm ball joint self-locking nut(A) and the split pin(B).

Tightening torque Nm (kgf·m, lb-ft) :
35 ~ 45 (3.5 ~ 4.5, 25.3 ~ 32.5)



4. Install the wheel and the tire to the front hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the front wheel and tire.

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the upper arm for bending or breakage.
3. Check the ball joint for rotating torque.
   (1) If there is a crack in the dust cover, replace it and add grease.
   (2) Shake the stabilizer link ball joint stud several times.
   (3) Mount the self-locking nut on the ball joint, and then measure the ball joint rotating torque.

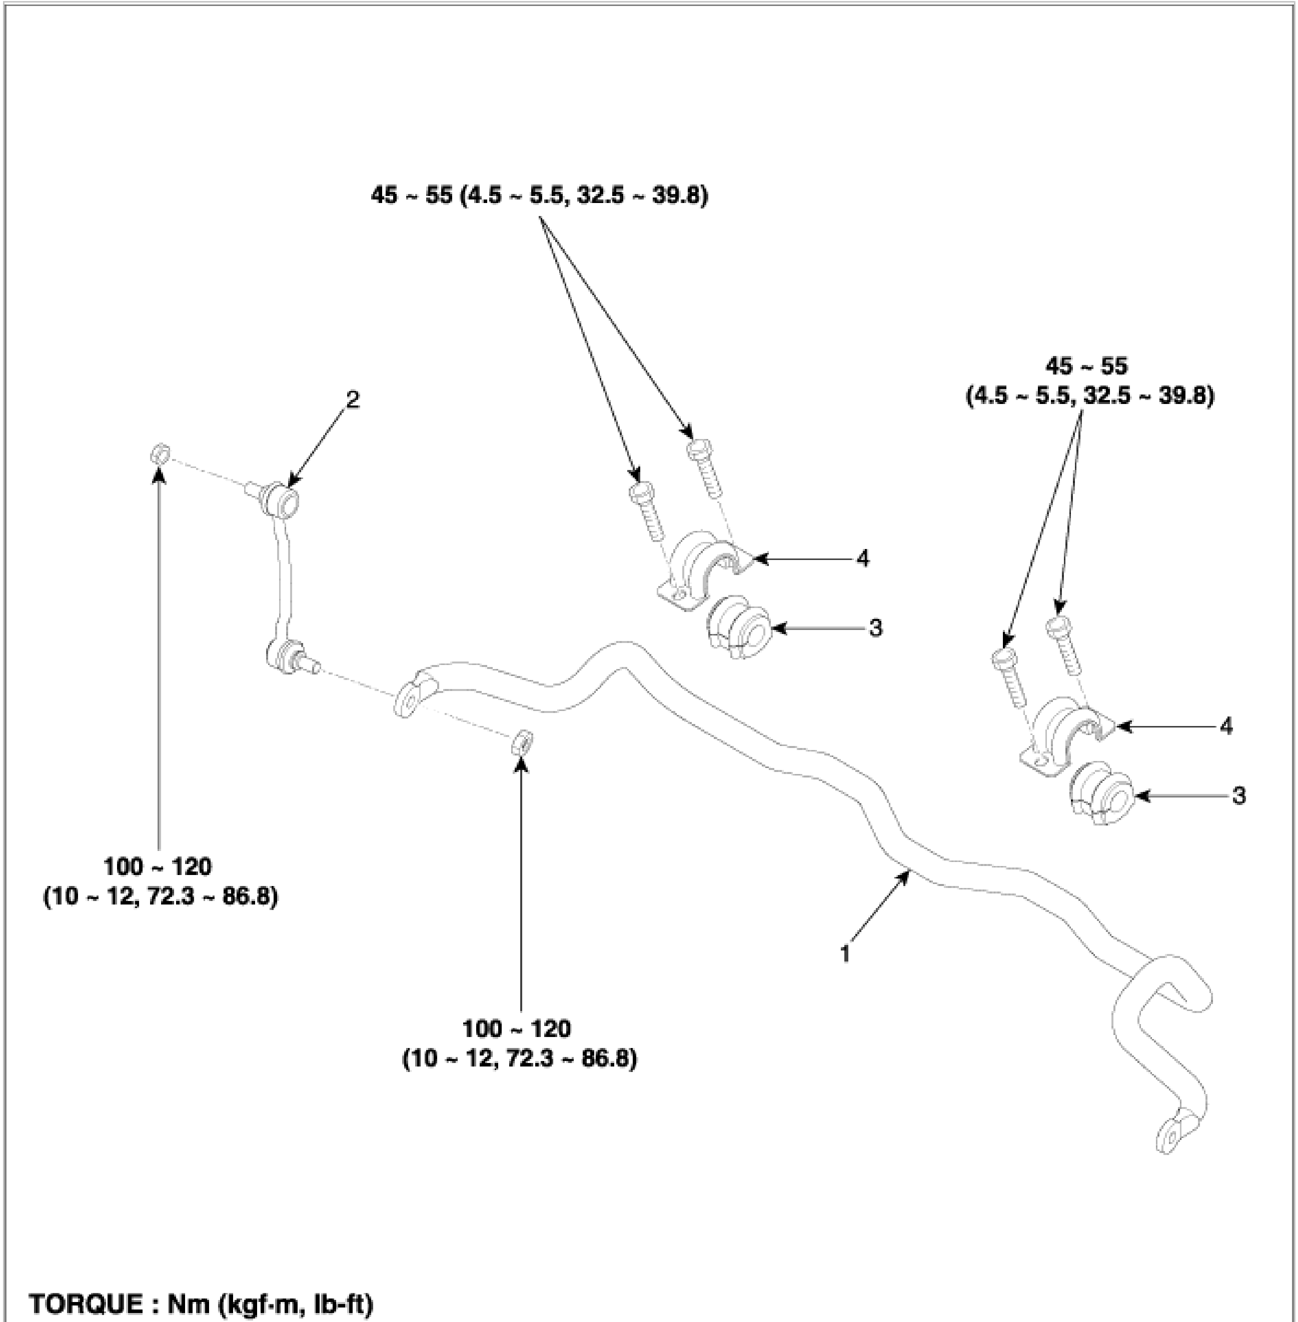
Standard value :
0.5 ~ 1.5 Nm (5 ~ 15 kgf·cm, 0.36 ~ 1.09 lb-ft)

   (4) If the rotating torque exceeds the upper limit of standard value, replace the upper arm assembly.
   (5) Even if the rotating toque is below the lower limit of the standard value, the ball joint may be reused unless it has drag and excessive play.

Suspension System > Front Suspension System > Front Stabilizer Bar > Components and

Components Location

COMPONENTS



1. Front stabilizer bar
2. Stabilizer link
3. Bushing
4. Bracket

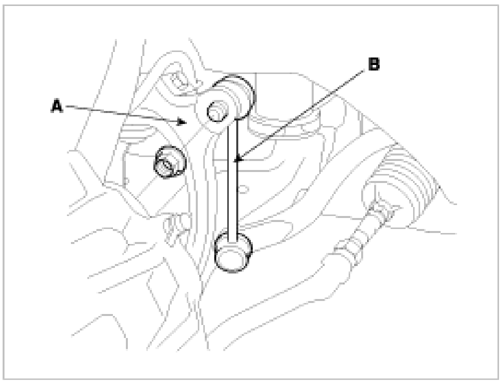
Suspension System > Front Suspension System > Front Stabilizer Bar > Repair procedures

REMOVAL

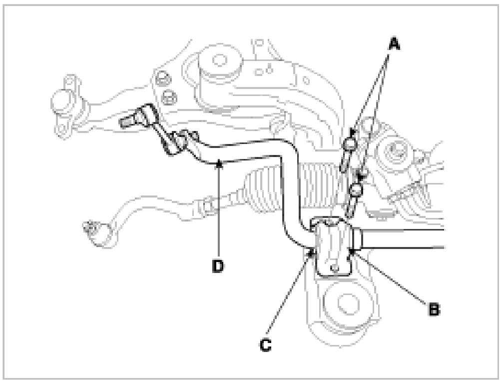
1. Loosen the wheel nuts slightly.
   Raise the front of the vehicle, and make sure it is securely supported.
2. Remove the front wheel and tire from front hub.

> **CAUTION**
>
> Be careful not to damage the hub bolts when removing the front wheel and tire.

3. Remove the stabilizer link(B) from the fork(A).



4. Remove the two mounting bolts of the rear side of the subframe, supporting the subframe with a jack.
5. Remove the rear mounting bolts(A) of subframe.

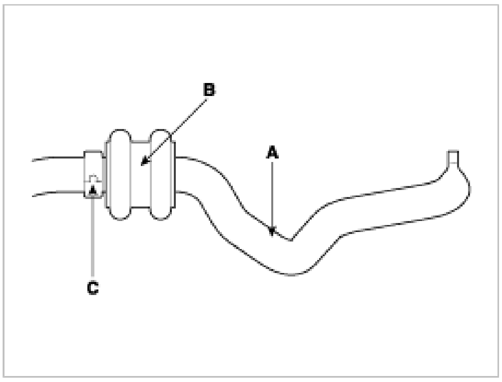


6. Remove the stabilizer bracket(B) and bushing(C).
7. Remove the stabilizer bar(D).

> CAUTION
>
> Be careful not to damage the pressure tube.

INSTALLATION

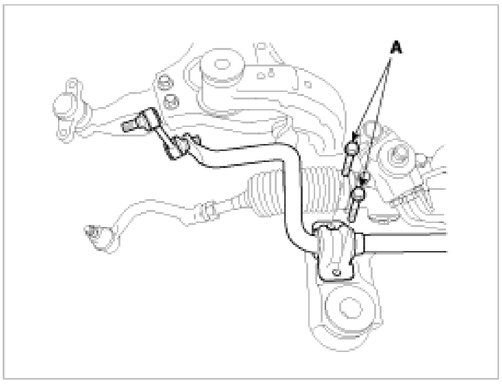
1. Install the bushing(B) on the stabilizer bar(A).



> NOTE
>
> Bring clamp(C) of stabilizer bar(A) into contact with bushing(B).

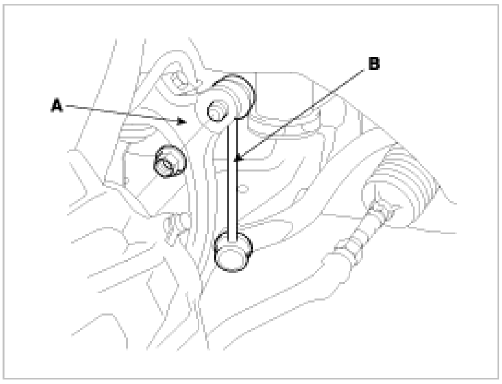
2. Install the bracket on the bushing(B).
3. After tightening the bolts of the bushing bracket temporarily, install the bushing bracket on the opposite side.
4. Install the rear stabilizer bark bracket mounting bolts(A) to the subframe.

Tightening torque Nm (kgf·m, lb-ft) :
45 ~ 55 (4.5 ~ 5.5, 32.5 ~ 39.8)



5. Install the stabilizer link(B) to the fork(A).

Tightening torque Nm (kgf·m, lb-ft) :
100 ~ 120 (10 ~ 12, 72.3 ~ 86.8)



6. Install the wheel and the tire to the front hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the front wheel and tire.

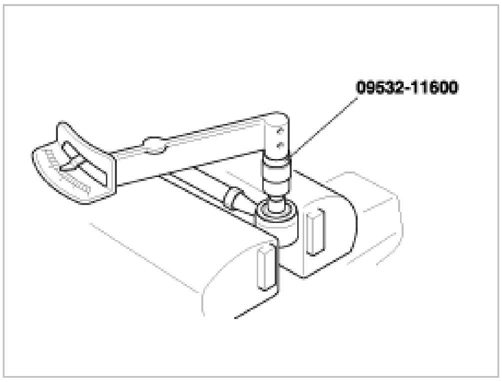
INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the stabilizer bar for bending or breakage.
3. Check the ball joint for rotating torque.
   (1) If there is a crack in the dust cover, replace it and add grease.
   (2) Shake the stabilizer link ball joint stud several times.
   (3) Mount the self-locking nut on the ball joint, and then measure the ball joint rotating torque.

Standard value :
0.7 ~ 2 Nm (7 ~ 20 kgf·cm, 0.51 ~ 1.45 lb-ft)

NOTE

Measure torque using the special tool(09532-11600) and torque wrench at the range of 0.5 - 2 rpm after moving the ball joint stud at degree 3° several times at room temperature.

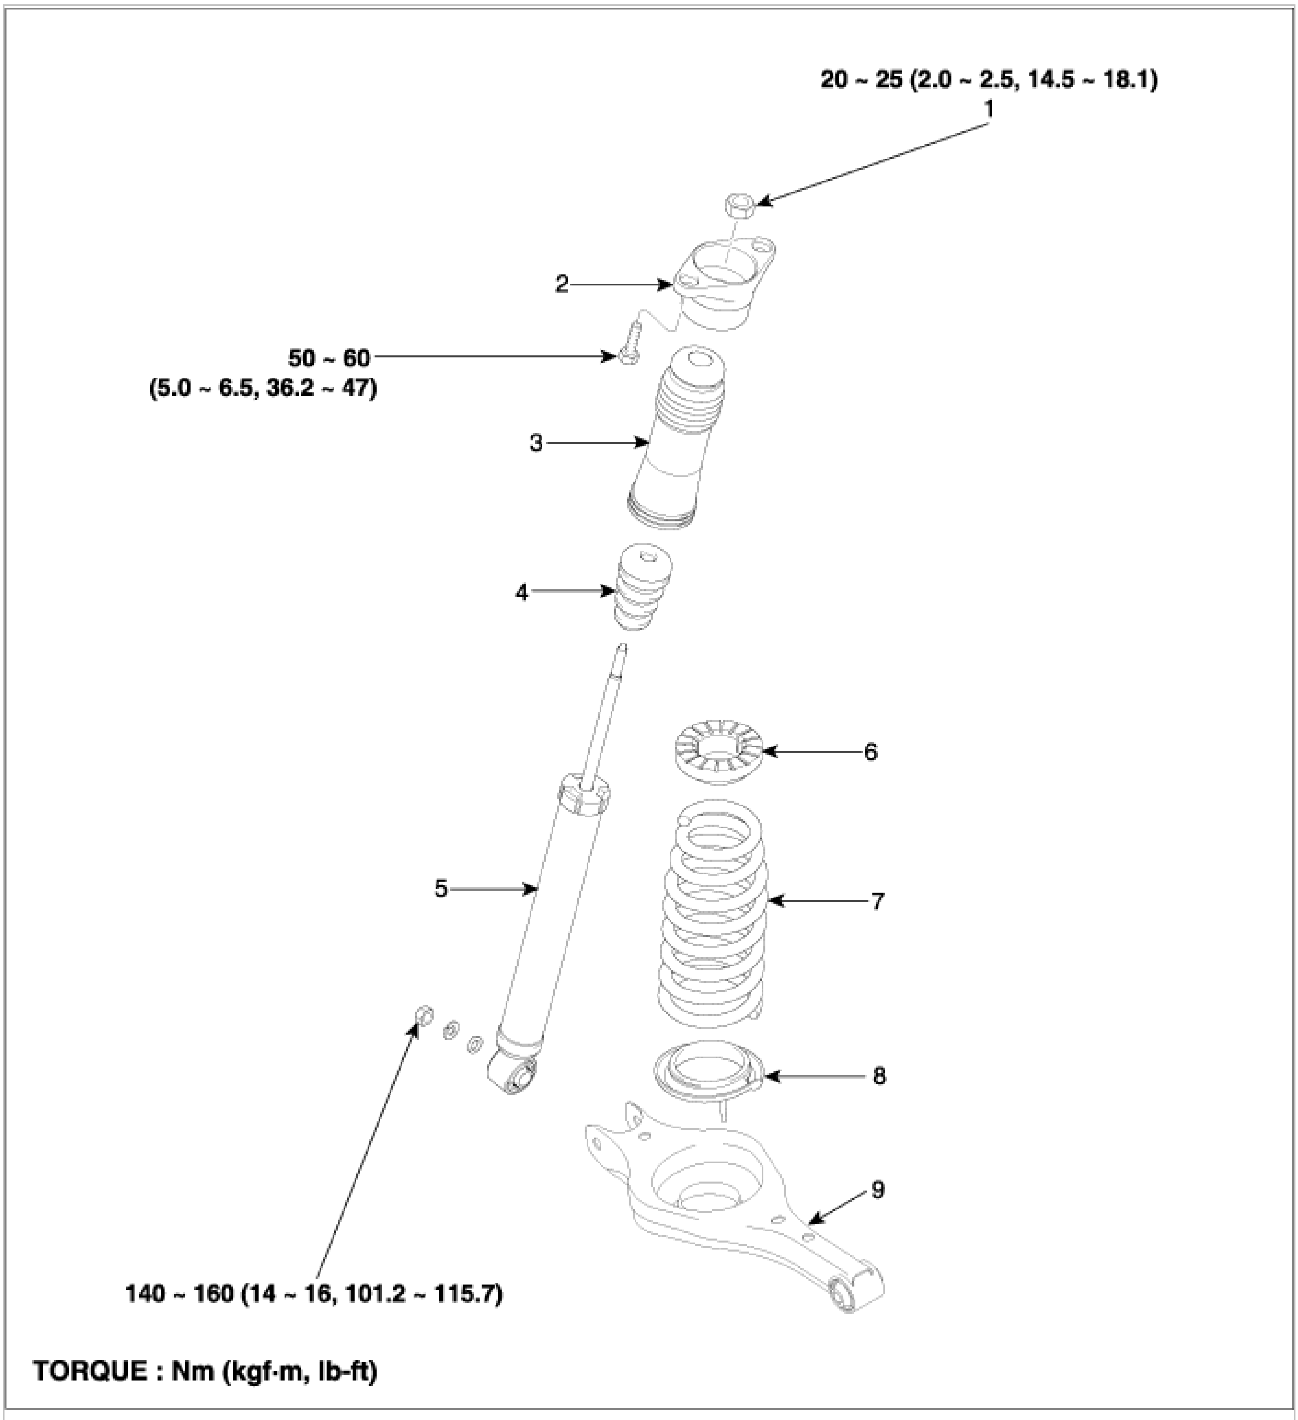


(4) If the rotating torque exceeds the upper limit of standard value, replace the upper arm assembly.

(5) Even if the rotating toque is below the lower limit of the standard value, the ball joint may be reused unless it has drag and excessive play.

Suspension System > Rear Suspension System > Rear Strut Assembly > Components and Components Location

COMPONENTS



1. Self-locking nut	4. Urethane bumper	7. Spring
2. Bracket	5. Shock absorber	8. Lower pad
3. Dust cover	6. Upper pad	9. Rear lower arm

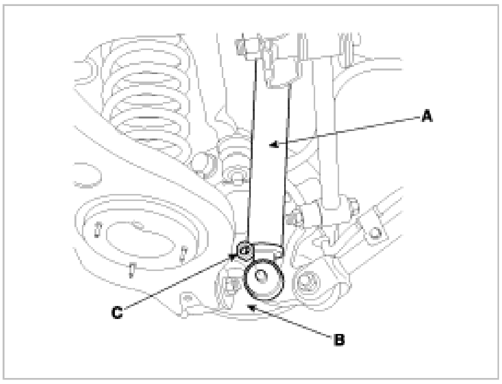
Suspension System > Rear Suspension System > Rear Strut Assembly > Repair procedures

REMOVAL

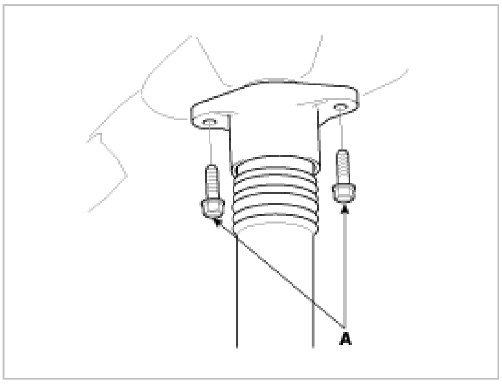
1. Loosen the wheel nuts slightly.
   Raise the rear of the vehicle, and make sure it is securely supported.
2. Remove the rear wheel and tire from rear hub.

> **CAUTION**
>
> Be careful not to damage the hub bolts when removing the rear wheel and tire.

3. Remove the rear shock absorber assembly bolts(C) from the rear axle assembly(B), then remove the shock absorber assembly(A).



4. Remove the two rear shock absorber assembly mounting bolts(A).

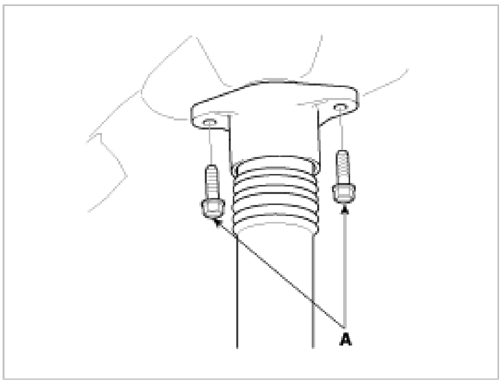


5. Disassembly the rubber bumper and the dust cover from the rear shock absorber.

INSTALLATION

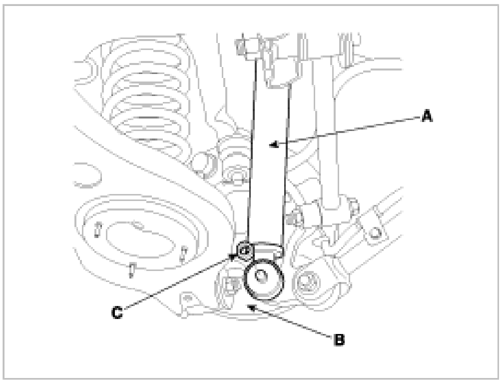
1. Assembly the rubber bumper and the dust cover to the rear shock absorber, after pulling the rod of the rear shock absorber completely.
2. Install the two rear shock absorber mounting bolts(A).

Tightening torque Nm (kgf·m, lb-ft) :
50 ~ 65 (5.0 ~ 6.5, 36.2 ~ 47.0)



3. Install the shock absorber assembly(A) to the rear axle assembly(B) with the specified torque.

Tightening torque Nm (kgf·m, lb-ft) :
140 ~ 160 (14~16, 101.2~115.7)



4. Install the wheel and the tire to the rear hub.

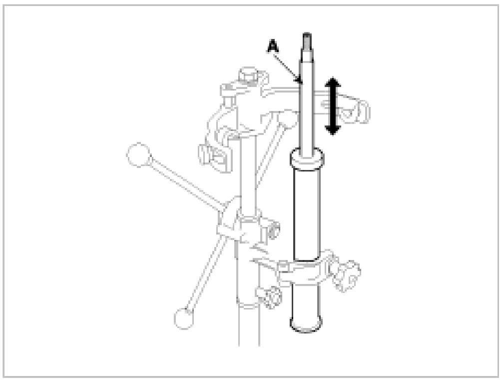
Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the rear wheel and tire.

INSPECTION

1. Check the rubber parts for damage or deterioration.
2. Check the shock absorber for abnormal resistance or unusual sounds.

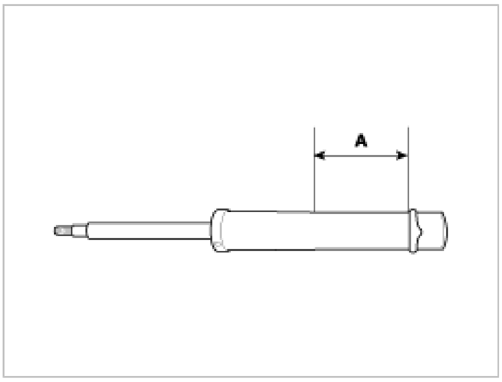


DISPOSAL

1. Fully extend the shock absorber rod.
2. Drill a hole to remove gas from the cylinder.

CAUTION

The gas coming out is harmless, but be careful of chips that may fly up when drilling. Be sure to use face shield and safety goggles.



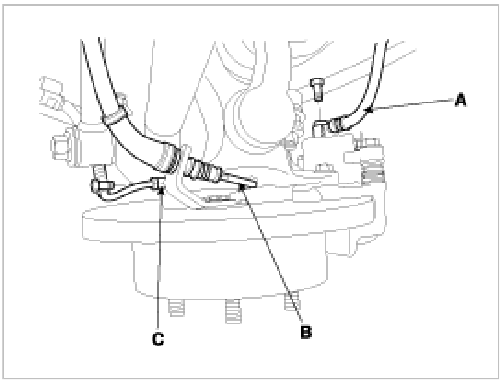
Suspension System > Rear Suspension System > Rear Upper Arm > Repair procedures

REMOVAL

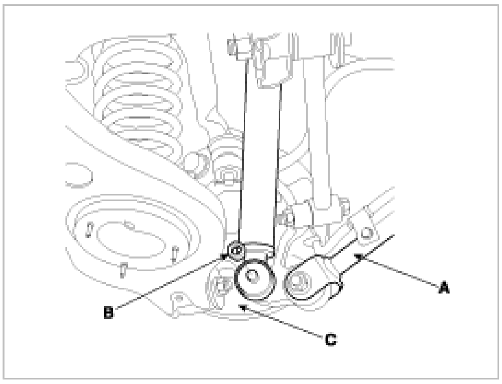
1. Loosen the wheel nuts slightly.
   Raise the rear of the vehicle, and make sure it is securely supported.
2. Remove the rear wheel and tire from rear hub.

> CAUTION
>
> Be careful not to damage the hub bolts when removing the rear wheel and tire.

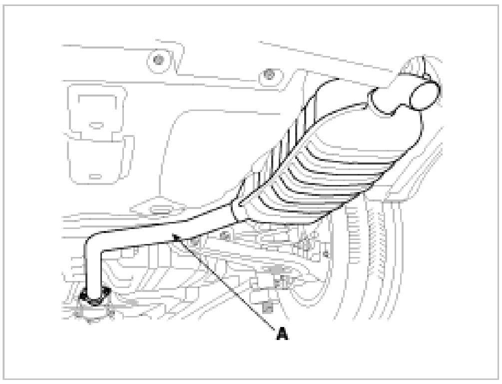
3. Remove the brake hose(A), the parking brake cable(B), and the wheel speed sensor(C).



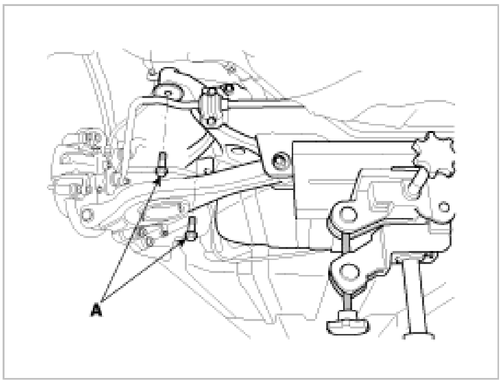
4. Remove the trailing arm(A) and the shock absorber(B) from the rear axle assembly(C), supporting with a jack.



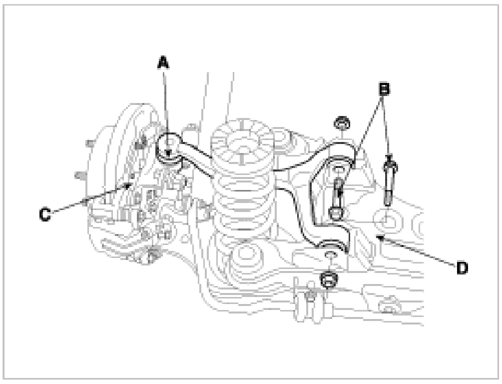
5. Remove the muffler(A).



6. Remove the four rear cross member mounting bolts(A), while supporting with a jack.



7. Remove the split pin and the upper arm ball joint self-locking nut(A).

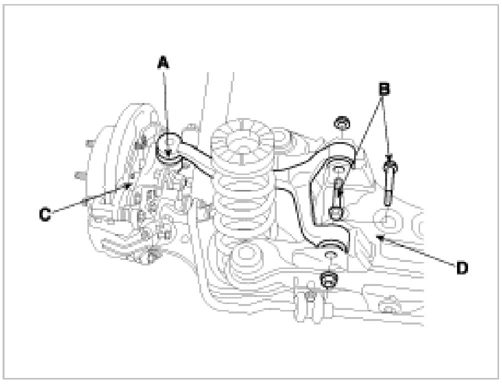


8. Remove the upper arm ball joint from the rear axle assembly(C) with special tool (09568-4A000).
9. Remove the two upper arm mounting bolts(B) from the cross member(D).

INSTALLATION

1. Install the upper arm to the cross member(D) with two mounting bolts(B).

Tightening torque Nm (kgf·m, lb-ft) :
100 ~ 120 (10 ~ 12, 72.3 ~ 86.8)

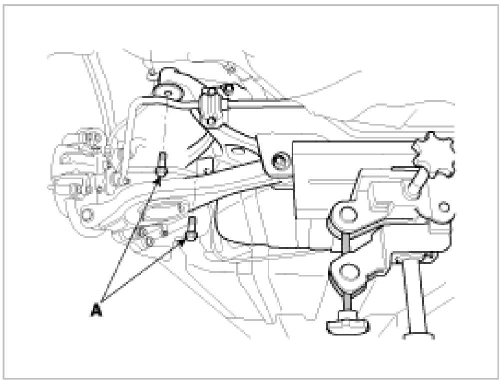


2. Install the upper arm ball joint self-locking nut(A) to the rear axle assembly(C) with a specified torque, and then install the split pin.

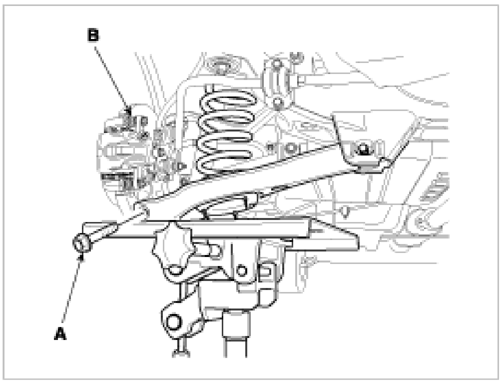
Tightening torque Nm (kgf·m, lb-ft) :
80 ~ 90 (8 ~ 9, 57.8 ~ 65.1)

3. Install the cross member(A).

Tightening torque Nm (kgf·m, lb-ft) :
140 ~ 160 (14~16, 101.2~115.7)

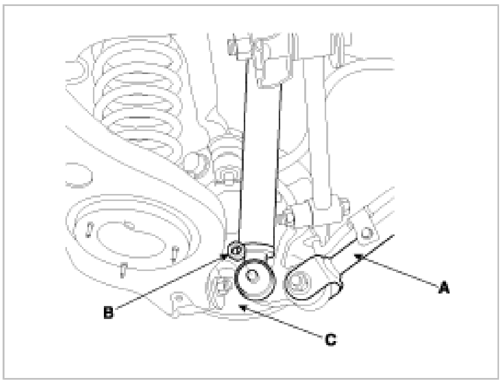


4. Install the spring, the lower seat, and the upper pad.
5. Install the lower arm bolt(A) to the axle assembly(B), while supporting with a jack.

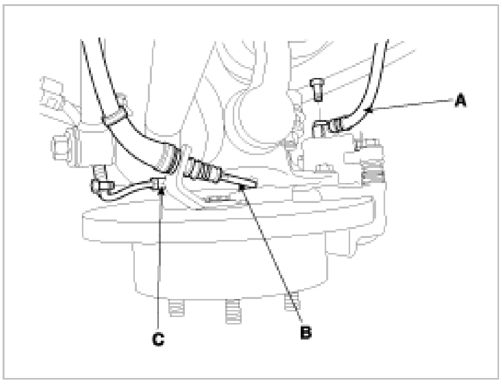


6. Install the trailing arm(A) and the shock absorber(B) to the rear axle assembly(C).

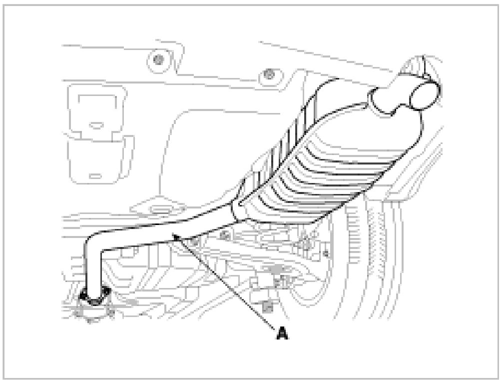
Tightening torque Nm (kgf·m, lb-ft) :
140 ~ 160 (14~16, 101.2~115.7)



7. Install the brake hose(A), the parking brake cable(B), and the wheel speed sensor(C).



8. Install the muffler(A).



9. Install the wheel and the tire to the rear hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the rear wheel and tire.

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the upper arm for bending or breakage.
3. Check the ball joint for rotating torque.
   (1) If there is a crack in the dust cover, replace it and add grease.
   (2) Shake the stabilizer link ball joint stud several times.
   (3) Mount the self-locking nut on the ball joint, and then measure the ball joint rotating torque.

   Specified torque :
   1 ~ 5 Nm (10 ~ 50 kgf·cm, 0.73 ~ 3.64 lb-ft)

   NOTE

   Measure torque using the special tool(09532-11600) and torque wrench at the range of 0.5 - 2 rpm after moving the ball joint stud at degree 3° several times at room temperature.

   (4) If the rotating torque exceeds the upper limit of standard value, replace the upper arm assembly.
   (5) Even if the rotating toque is below the lower limit of the standard value, the ball joint may be reused unless it has drag and excessive play.

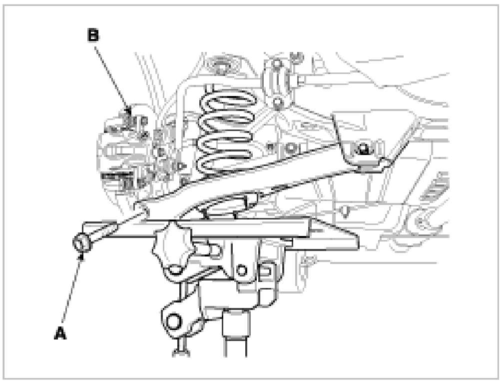
Suspension System > Rear Suspension System > Rear Lower Arm > Repair procedures

REMOVAL

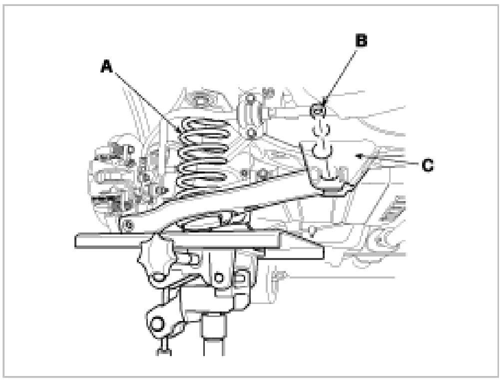
1. Loosen the wheel nuts slightly.
   Raise the rear of the vehicle, and make sure it is securely supported.
2. Remove the rear wheel and tire from rear hub.

> CAUTION
>
> Be careful not to damage the hub bolts when removing the rear wheel and tire.

3. Remove the lower arm bolt(A) from the rear axle assembly(B), while supporting with a jack as shown below.



4. Remove the spring(A), the lower seat, and the upper pad.

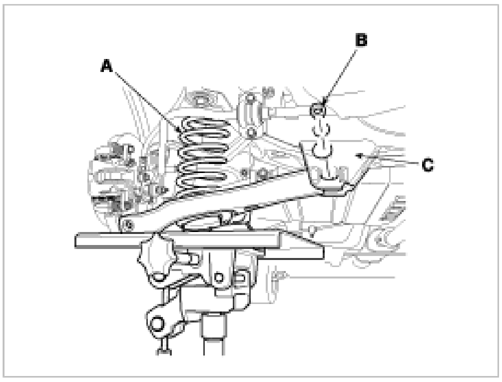


5. Remove the lower arm mounting bolts(B) from the cross member(C).

INSTALLATION

1. Install the lower arm mounting bolts(B) to the cross member(C) with a specified torque.

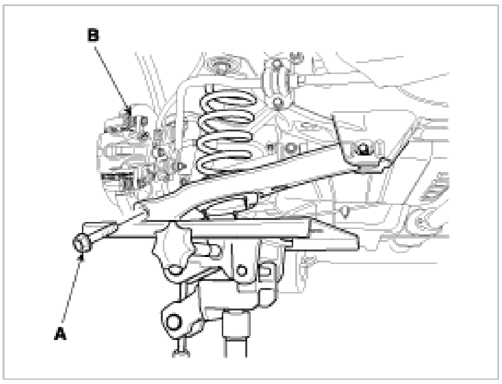
Tightening torque Nm (kgf·m, lb-ft) :
110 ~ 120 (11 ~ 12, 79.5 ~ 86.8)



2. Install the spring(A), the lower seat, and the upper pad.
3. Install the lower arm bolt(A) from the rear axle assembly(B) with a specified torque, while supporting with a jack as shown below.

Tightening torque Nm (kgf·m, lb-ft) :

140~160 (14 ~ 16, 101.2~115.7)



4. Install the wheel and the tire to the rear hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the rear wheel and tire.

INSPECTION

Rear lower arm

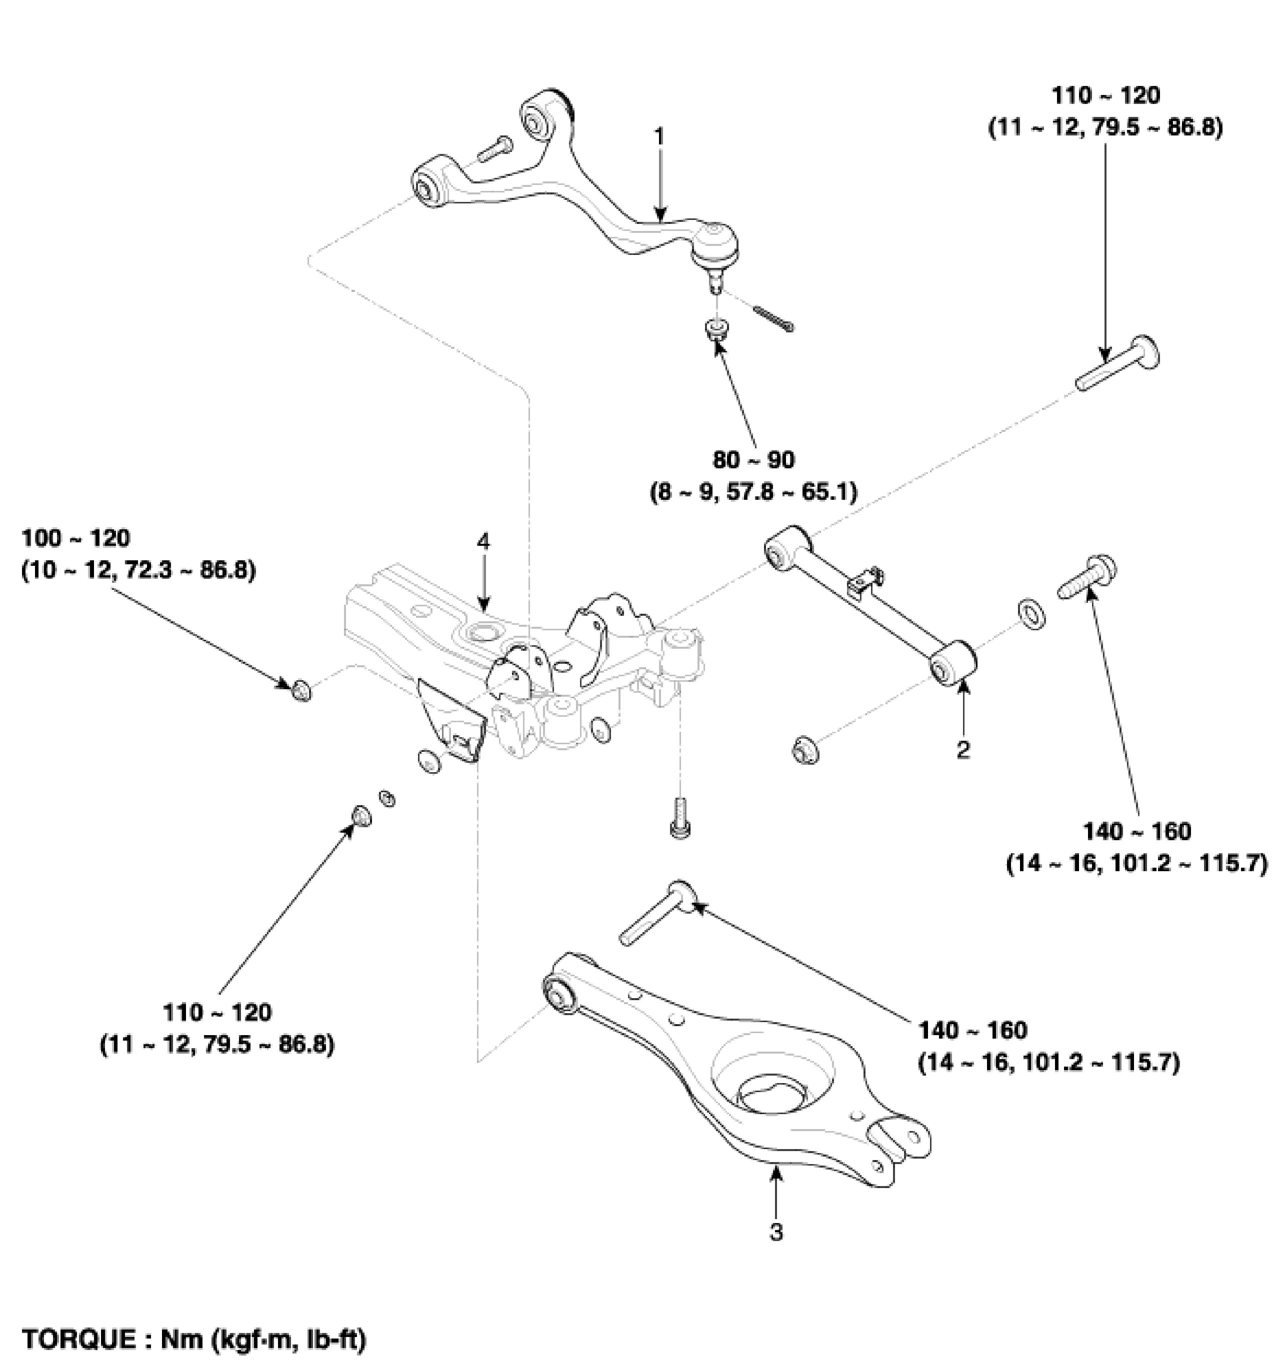
1. Check the bushing for wear and deterioration.
2. Check the center arm for bending or breakage.
3. Check the bolts for damage.

Spring

1. Check the spring for distortion, aging or damage.
2. Check the spring upper pad for aging or damage.

Suspension System > Rear Suspension System > Upper Arm, Lower Arm And Assist Link > Components and Components Location

COMPONENTS



1. Rear upper arm	3. Rear lower arm
2. Assist arm	4. Cross member

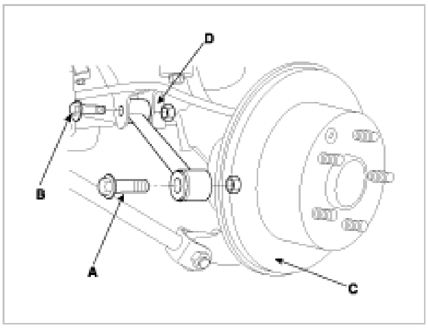
Suspension System > Rear Suspension System > Rear Assist Arm > Repair procedures

REMOVAL

1. Loosen the wheel nuts slightly.
   Raise the rear of the vehicle, and make sure it is securely supported.
2. Remove the rear wheel and tire from rear hub.

> CAUTION
>
> Be careful not to damage the hub bolts when removing the rear wheel and tire.

3. Remove the assist arm mounting bolt(A) from the rear axle assembly(C).

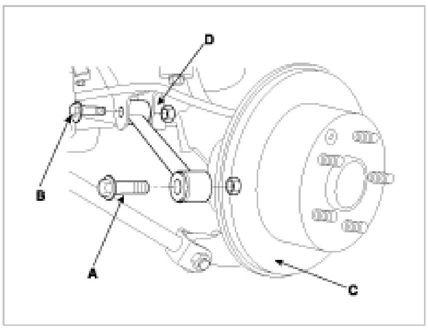


4. Remove the assist arm mounting bolt(B) from the cross member(D).

INSTALLATION

1. Install the assist arm mounting bolt(B) to the cross member(D).

Tightening torque Nm (kgf·m, lb-ft) :
110 ~ 120 (11 ~ 12, 79.5 ~ 86.8)



2. Install the assist arm mounting bolt(A) from the rear axle assembly(C).

Tightening torque Nm (kgf·m, lb-ft) :
140~160 (14~16, 101.2~115.7)

3. Install the wheel and the tire to the rear hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

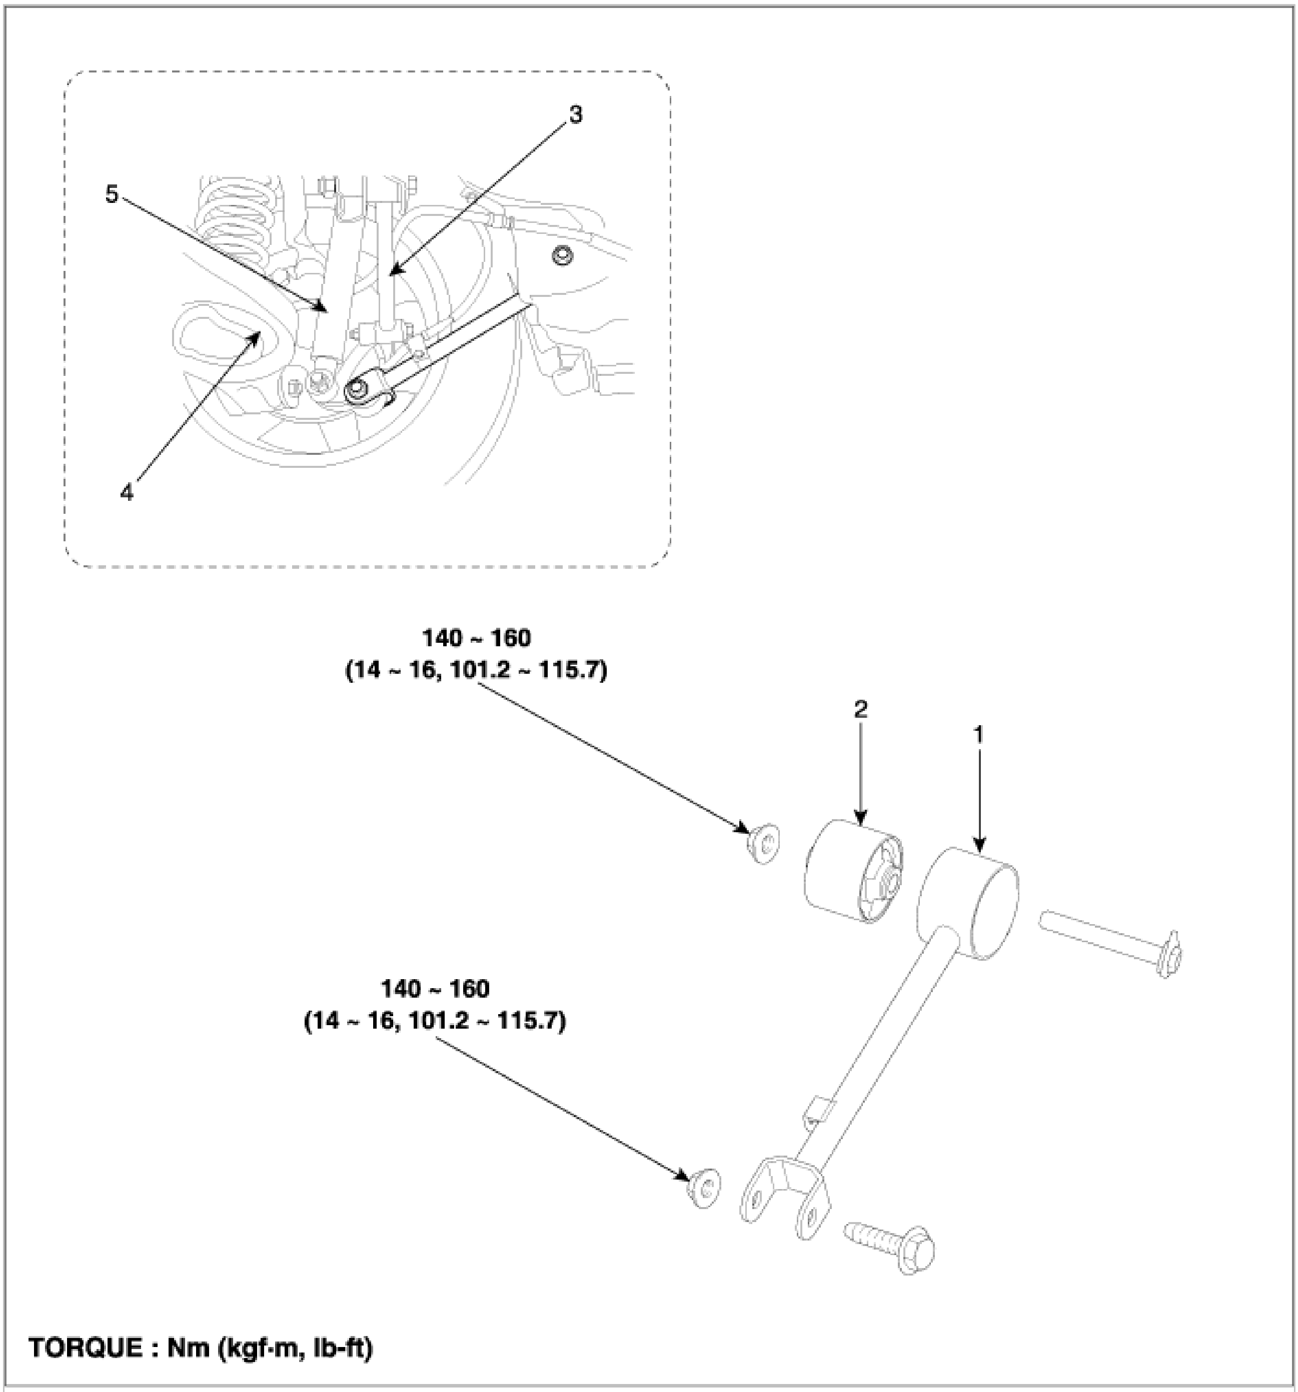
Be careful not to damage the hub bolts when installing the rear wheel and tire.

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the assist arm for bending or breakage.
3. Check all the bolts for damage.

Suspension System > Rear Suspension System > Trailing Arm > Components and Components Location

COMPONENTS

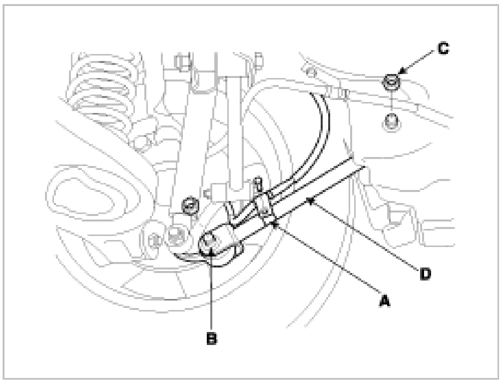


1. Trailing arm
2. Bushing
3. Assist arm
4. Rear lower arm
5. Rear strut assembly

Suspension System > Rear Suspension System > Trailing Arm > Repair procedures

REMOVAL

1. Remove the wheel speed sensor bracket(A).

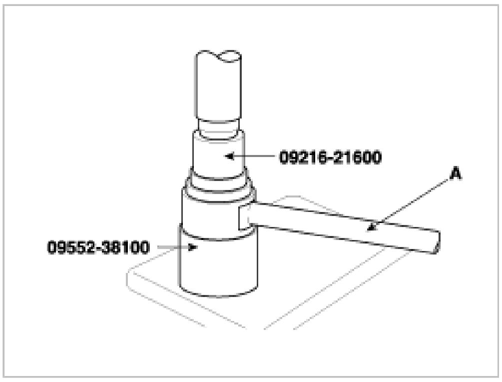


2. Remove the trailing arm mounting nut(B) from the rear axle assembly.
3. Remove the trailing arm mounting nut(C) from the body.
4. Remove the trailing arm(D).

REPLACEMENT

TRAILING ARM BUSHING

1. Using the special tools(09216-21600, 09552-38100), press-fit the bushing.



2. Remove the bushing from the trailing arm(A).
3. Using the special tool(09552-38000), replace the bushing.

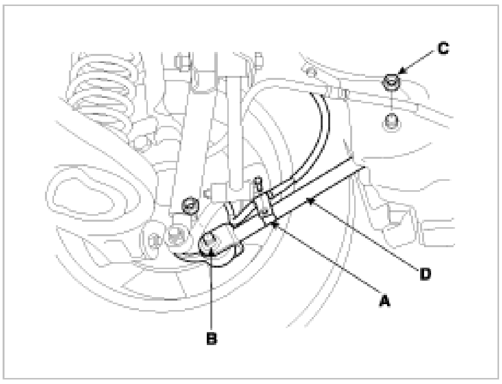
over 100 kN (1000 kgf, 2204 lb)

NOTE

Be sure to press the bushing with the jut of the bushing aligned to the longitude of the trailing arm.

INSTALLATION

1. Place the trailing arm(D) as shown below.



2. Install the trailing arm nuts.

NOTE

Fully tighten the trailing arm mounting nuts with the vehicle on the ground in unloaded condition.

A. Install the trailing arm mounting nut(B).

Tightening torque Nm (kgf·m, lb-ft) :
140~160 (14~16, 101.2~115.7)

B. Install the trailing arm bracket mounting nut(C).

Tightening torque Nm (kgf·m, lb-ft) :
140~160 (14~16, 101.2~115.7)

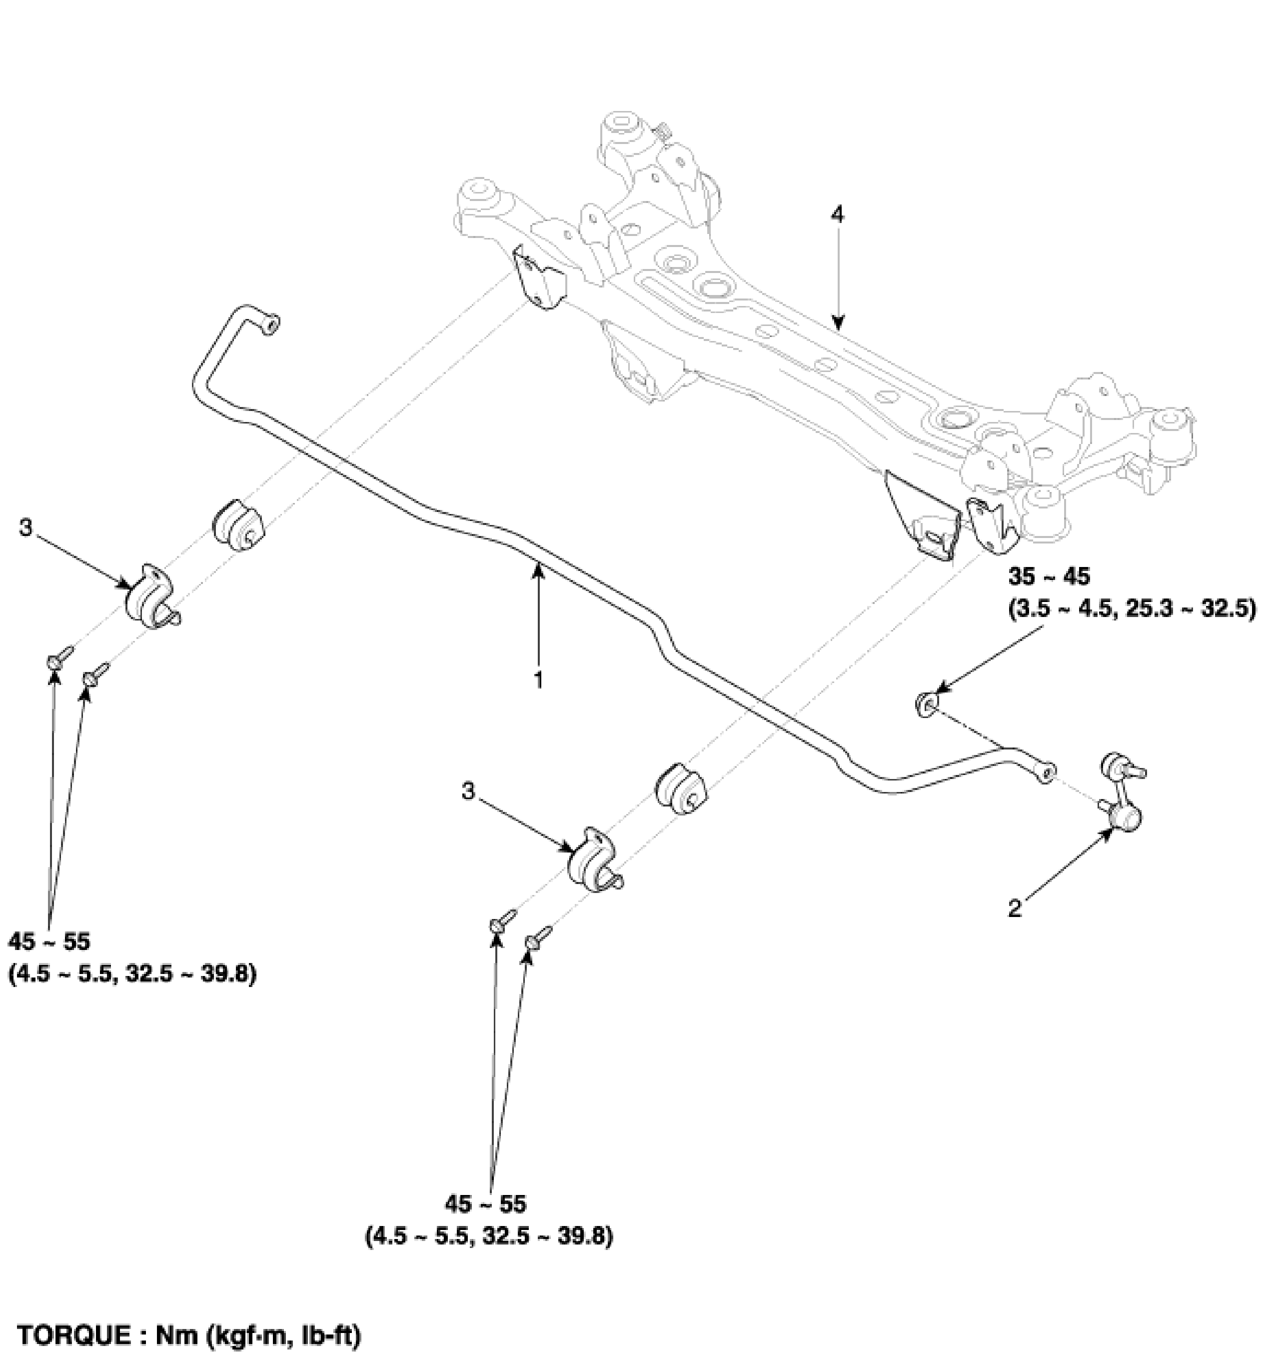
3. Install the wheel speed sensor bracket(A).

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the trailing arm for bending or breakage.
3. Check all the bolts for damage.

Suspension System > Rear Suspension System > Rear Stabilizer Bar > Components and Components Location

COMPONENTS



1. Rear stabilizer bar	3. Bracket
2. Stabilizer link	4. Cross member

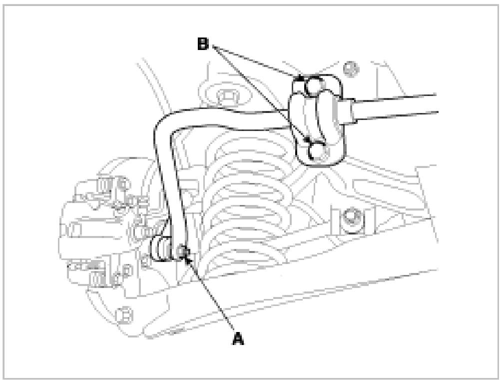
Suspension System > Rear Suspension System > Rear Stabilizer Bar > Repair procedures

REMOVAL

1. Loosen the wheel nuts slightly.
   Raise the rear of the vehicle, and make sure it is securely supported.
2. Remove the rear wheel and tire from rear hub.

> **CAUTION**
>
> Be careful not to damage the hub bolts when removing the rear wheel and tire.

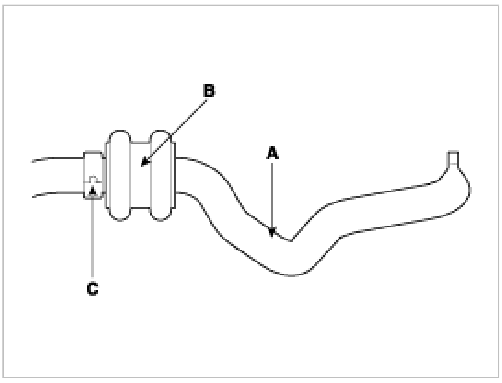
3. Remove the left/right nuts(A) of the rear stabilizer links.
4. Remove the left/right mounting nuts(B) of the rear stabilizer bar brackets.



5. Remove the rear stabilizer bar(C).

INSTALLATION

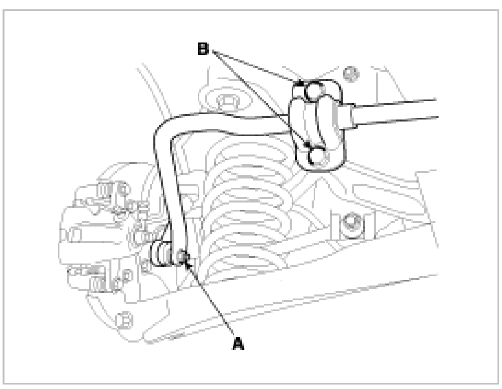
1. Install the bushing(B) on the stabilizer bar(A).



> **NOTE**
>
> Bring clamp(C) of stabilizer bar(A) into contact with bushing(B).

2. One side bracket should be temporarily tightened, and then install the bushing on the opposite side.
3. Install the stabilizer bracket bolt(B).

Tightening torque Nm (kgf·m, lb-ft) :
45 ~ 55 (4.5 ~ 5.5, 32.5 ~ 39.8)



4. Install the stabilizer link mounting nut(A).

Tightening torque Nm (kgf·m, lb-ft) :
35 ~ 45 (3.5 ~ 4.5, 25.3 ~ 32.5)

5. Repeat step 3 and 4 for the other side.
6. Install the wheel and the tire to the rear hub.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

Be careful not to damage the hub bolts when installing the rear wheel and tire.

INSPECTION

1. Check the bushing for wear and deterioration.
2. Check the stabilizer bar for bending or breakage.
3. Check the ball joint for rotating torque.
   (1) If there is a crack in the dust cover, replace it and add grease.
   (2) Shake the stabilizer link ball joint stud several times.
   (3) Mount the self-locking nut on the ball joint, and then measure the ball joint rotating torque.

Specified torque :
0.7 ~ 2 Nm (7 ~ 20 kgf·m, 0.51 ~ 1.45 lb-ft)

NOTE

Measure torque using the special tool(09532-11600) and torque wrench at the range of 0.5 - 2 rpm after moving the ball joint stud at degree 3° several times at room temperature.

   (4) If the rotating torque exceeds the upper limit of standard value, replace the upper arm assembly.
   (5) Even if the rotating toque is below the lower limit of the standard value, the ball joint may be reused unless it has drag and excessive play.

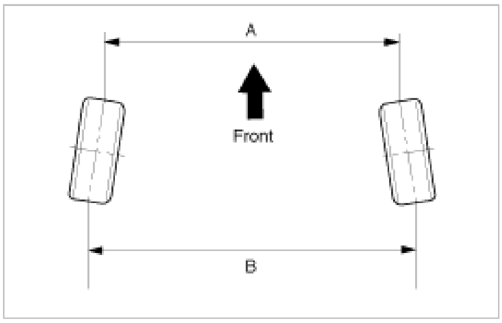
Suspension System > Tires/Wheels > Tire > Repair procedures

Wheel Alignment

When using commercially available computerized four wheel alignment equipment (caster, camber, toe) to inspect the front wheel alignment, always position the car on a level surface with the front wheels facing straight ahead.
Prior to inspection, make sure that the front suspension and steering system are in normal operating condition and that the wheels and tires face straight ahead and the tires are inflated to the specified pressure.

Toe

Toe is a measurement of how much the front of the wheels are turned in or out from the straight-ahead position.



Item	Description
A - B < 0	Positive (+) toe (toe in)
A - B > 0	Negative (-) toe (toe out)

When the wheels are turned in toward the front of the vehicle, toe is positive (+) (toe in). When the wheels are turned out toward the front of the vehicle, toe is negative(-) (toe out). Toe is measured in degrees, from side to side, and totaled.

[Front]

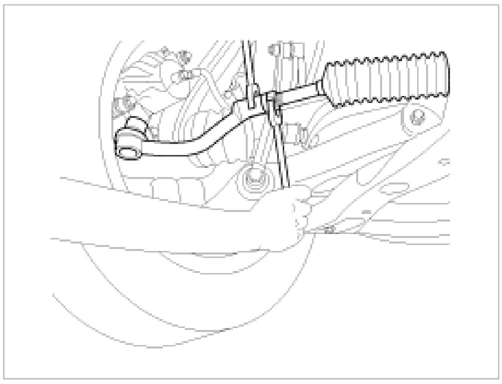
Toe-in(B-A or angle a+b) is adjusted by turning the tie rod turnbuckles. Toe-in on the left front wheel can be reduced by turning the tie rod toward the rear of the car. Toe- in change is adjusted by turning the tie rods for the right and left heels simultaneously at the same amount as follows.

Standard value :
Toe-in
Total : 0°±0.2°
Individual : 0°±0.1°

NOTE

- Toe-in adjustment should be made by turning the right and left tie rods at the same amount.
- When adjusting toe-in, loosen the outer bellows clip to prevent twisting the bellows.
- After the adjustment, tighten the tie rod end lock nuts firmly and reinstall the bellows clip.
- Adjust each toe-in to be the range of ±1°.

Tie rod(A) Specified torque :
50~55N.m (5~5.5kgf.m, 36.2~39.8lb-ft)



[Rear]

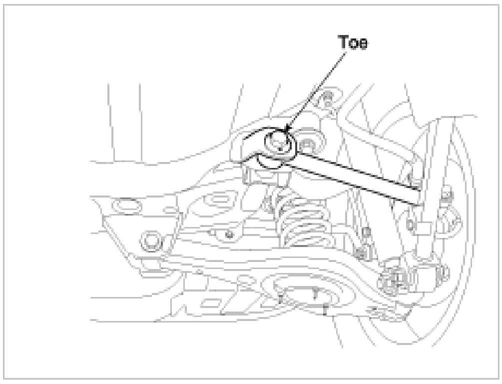
Standard value :
Toe-in
Total : 0.2°±0.2°
Individual : 0.1°±0.1°

Adjust the toe-in by turning the cambolt of the assist arm.

Left cambolt : Clockwise → toe-in
Right cambolt : Clockwise → toe-out
The variation of toe by a rotation of the cambolt :
About 0.4°

CAUTION

- Each toe should be within 0.1° ± 0.1° .
  If the difference between right and left is not within +0.2° , repeat adjustment.
- After adjusting the cambolt, tighten the nut to the specified torque.

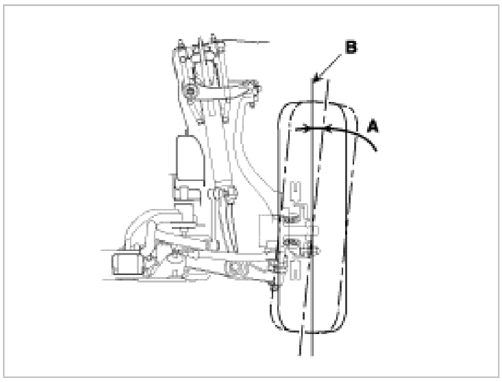


Specified torque
110 ~ 120N.m (11 ~ 12kgf.m, 79.5 ~ 86.8lb-ft)

Camber

[Front]

Camber is the inward or outward tilting of the wheels at the top.



Item	Description
A	Positive camber angle
B	True vertical

When the wheel tilts out at the top, then the camber is positive(+).
When the wheel tilts in at the top, then the camber is negative(-).

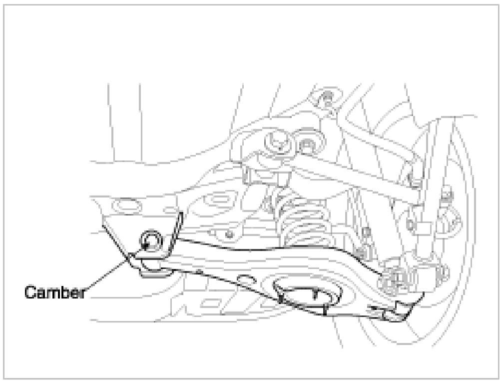
Standard value : -0°±0.5°
Difference between right and left angle is within 0.5°

NOTE

Camber is pre-set at the factory and doesn't need to be adjusted. If the camber is not within the standard value, replace the bent or damaged parts.

[Rear]

Standard value : -0.5°±0.5°
Difference between right and left angle is within 0.5°



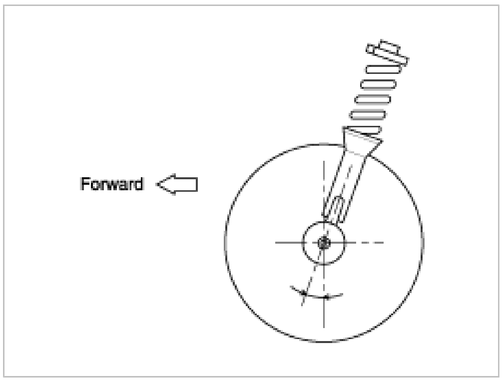
Adjust the camber by turning the cambolt of the rear lower arm.

Left cambolt : Clockwise → camber(+)
Right cambolt : Clockwise →camber(-)
The variation of camber by a rotation of the cambolt :
About 0.2°

Caster

Caster is the tilting of the strut axis either forward or backward from vertical. A backward tilt is positive (+) and a forward tilt is negative (-).
Caster is pre-set at the factory and doesn't need to be adjusted. If the caster is not within the standard value, replace the bent or damaged parts.

Caster : 4.8°±0.75°



NOTE

- The worn loose or damaged parts of the front suspension assembly must be replaced prior to measuring front wheel alignment.
- Camber and caster are pre-set to the specified value at the factory and don't need to be adjusted.
- If the camber and caster are not within specifications, replace bent or damaged parts.
- The difference of left and right wheels about the camber and the caster must be within the range of 0° ± 0.5°.

TIRE WEAR

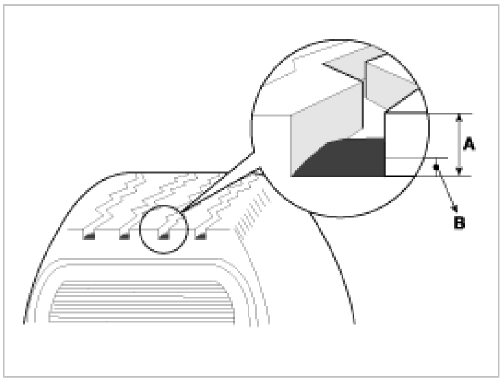
1. Measure the tread depth of the tires.

   Tread depth [limit] : 1.6 mm (0.063 in)

2. If the remaining tread(A) depth is less than the limit, replace the tire.

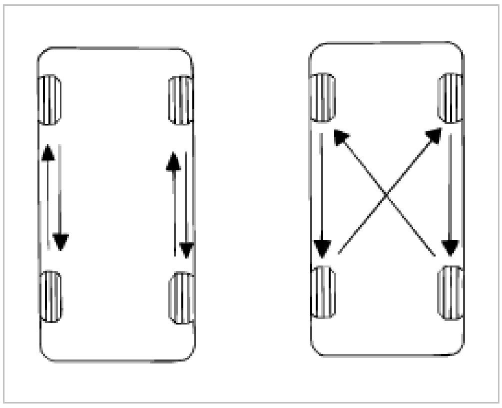
NOTE

When the tread depth of the tires is less than 1.6 mm (0.063 in), the wear indicators(B) will appear.



TIRE ROTATION

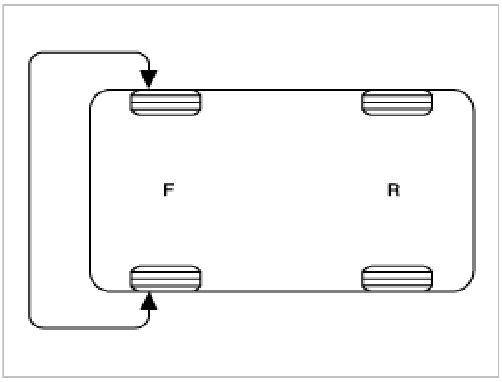
Rotate the tires in the pattern illustrated.



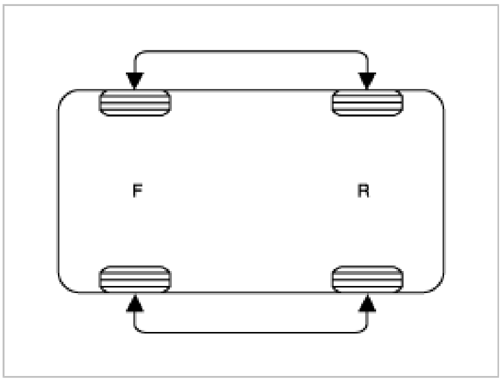
CHECKING FOR PULL AND WANDER

If the steering pulls to one side, rotate the tires according to the following wheel rotation procedure.

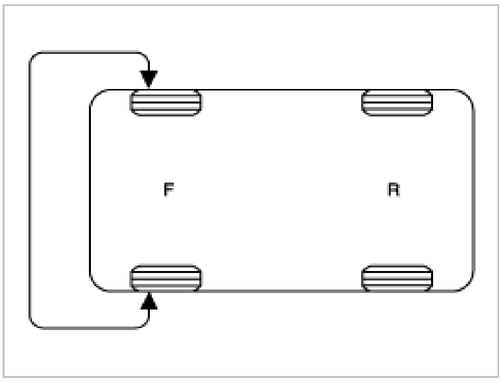
1. Rotate the front right and front left tires, and perform a road test in order to confirm vehicle stability.



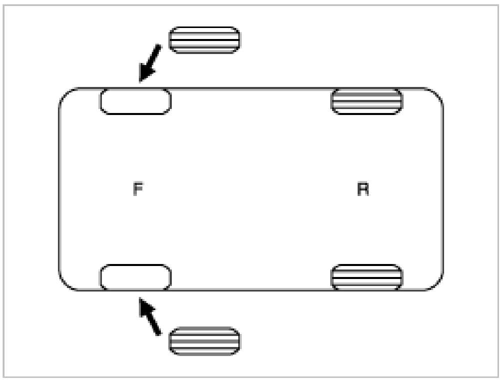
2. If the steering pulls to the opposite side, rotate the front and rear tires, and perform a road test again.



3. If the steering continues to pull to one side, rotate the front right and left tires again, and perform a road test.



4. If the steering continues to pull to the opposite side, replace the front wheels with new ones.

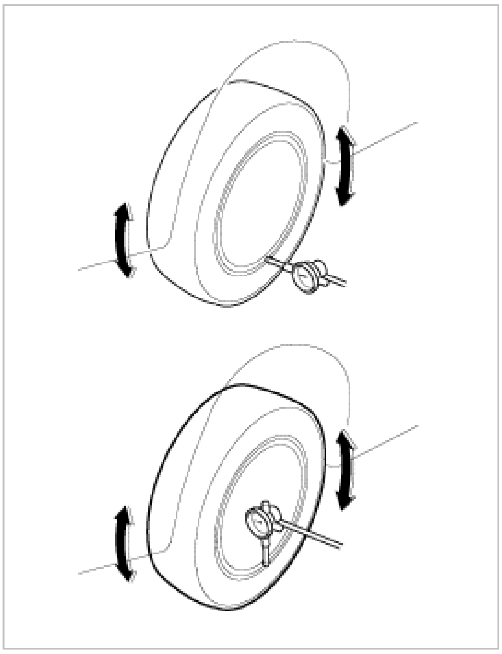


Suspension System > Tires/Wheels > Wheel > Repair procedures

WHEEL RUNOUT

1. Jack up the vehicle and support it with jack stands.
2. Measure the wheel runout with a dial indicator as illustrated.
3. Replace the wheel if the wheel runout exceeds the limit.

Limit		Radial	Axial
Runout mm(in)	Steel	0.9	1.4
	Aluminium	0.3	0.3



WHEEL NUT TIGHTENING

1. Tightening torque.

Tightening torque Nm (kgf·m, lb-ft) :
90 ~ 110 (9 ~ 11, 65.1 ~ 79.5)

CAUTION

When using an impact gun, final tightening torque should be checked using a torque wrench.

2. Tightening order.
   Check the torque again after tightening the wheel nuts diagonally.

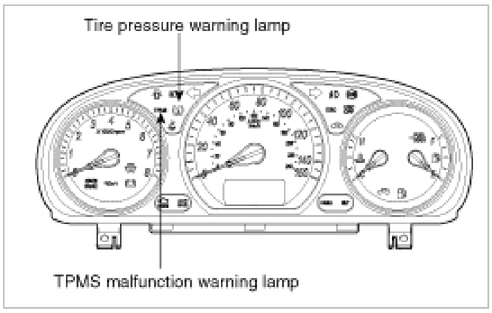
Suspension System > Tire Pressure Monitoring System > Description and Operation

DESCRIPTION

WARNING LAMPS



TREAD Lamp

- Tire Under Inflation / Leak Warning.

1. Turn on condition
   A. When tire pressure is below allowed threshold
   B. When rapid leak is detected by the sensor.
   C. Indicates that tire needs to be re-inflated to placard pressure / repaired.
2. Turn off condition
   A. Under-inflation ; When tire pressure is above (warning threshold + hysteresis).
   B. Rapid Leak ; When tire pressure is above (leak warning threshold).

DTC Warning

TPMS

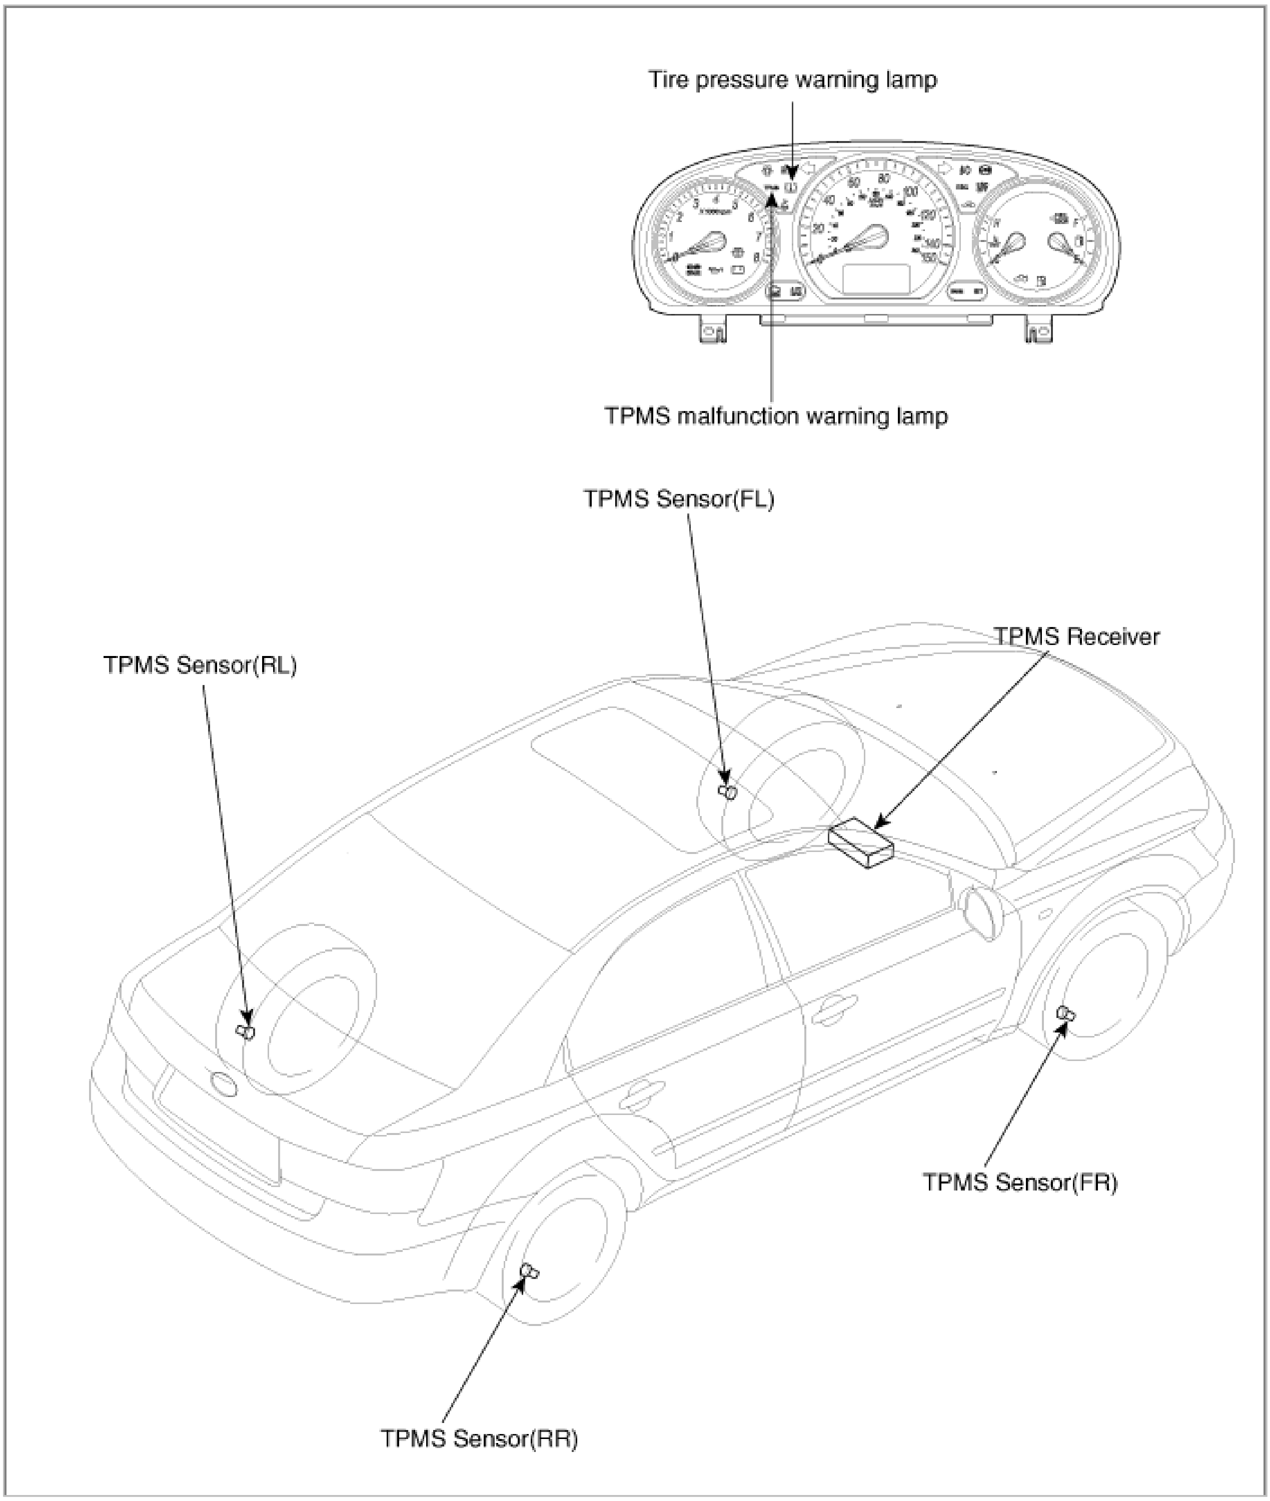
1. Turn on condition
   A. When the system detects a fault that is external to the receiver/ sensor.
   B. When the system detects a receiver fault.
   C. When the system detects a sensor fault.
2. Turn off condition
   A. If the fault is considered as 'critical', then the lamp is held on throughout the current Ignition cycle (even if the DTC has been demoted). This is because it is important to bring the problem to the drivers attention. On the following Ignition cycle, the demotion conditions will be re-checked. If the demotion conditions occur, the lamp will be turned off. It will be held on until DTC demotion checking is completed.
   B. 'Non critical' faults are those that can occur temporarily e.g. vehicle battery under voltage. The lamp is therefore turned off when the DTC demotion condition occurs.

SYSTEM FAULT

1. General Function
   A. The system monitors a number of inputs across time in order to determine that a fault exists.
   B. Faults are prioritized according to which has the most likely cause.
   C. Maximum fault store is equal to 15.
   D. Certain faults are not covered through DTC. The main ones are:
      1) Speed input. This is important since it is required for Auto-Learn & DTC. Requires diagnostic check of speed while driving vehicle to diagnose.
      2) Sensor thermal shutdown (over 257°F/125°C).
      3) Control module Micro-controller lock up ; requires observation of lamps at Ignition ON to diagnose.
      4) Ignition Line stuck ; requires observation of lamps at Ignition ON to diagnose.

Suspension System > Tire Pressure Monitoring System > Components and Components Location

components



Suspension System > Tire Pressure Monitoring System > Troubleshooting

TROUBLESHOOTING

- the lamp check should occur and then all lamps / LED's should turn off.
- **If the lamp test does not occur:**
  - Check connectors and fuse/harnessing - open / short circuits.
  - Check DTC's.
  - If diagnostics cannot be entered, replace the receiver with a known good one (follow configuration & learning procedure).

TREAD warnings

- **Information to ascertain (TREAD Lamp):**

- Was puncture repair fluid used (it should not be)?
  - This can cause the sensor pressure port to block and incorrect warning to occur.
- What temperature were tires last inflated at?
  At what temperature did warnings occur?
  - Pressure change is approx. 1.5psi / 10°C increase.
- Have the tires been checked / inflated since the lamp first came on?

- **If the TREAD Lamp is on:**
  - Check for short circuits.
  - Enter Diagnostics and read TREAD Warnings Local Identifier Data.
  - Check to see if warning type is under inflation or leak.
  - If the warning is for under inflation, then:
    a. Re-inflate the wheel with the matching sensor ID to it's desired Placard pressure.
    b. Check to make sure that the TREAD lamp turns off (this may take up to 4 minutes if the tire is not rapidly re-inflated).
  - If the warning is for a leak, then:
    a. Fix any puncture and re-inflate the tire to the desired Placard pressure.
    b. Wait up to 4 minutes and make sure that the TREAD lamp turns off and the lamp does not turn on again.
    c. If lamp comes on again:
    d. Re-check pressure for signs of a puncture and Re-Check TREAD Warnings Local Identifier Data.
- **If the Placard pressure is OK and the TREAD lamp still does not turn off:**
  - Turn wheel a quarter turn and again wait 4 minutes (the sensor may be in an RF null).
  - If the lamp still does not turn off:
    check for loose receiver wiring and replace the receiver with a known good one if necessary (follow configuration & learning procedure).
    - If the problem still exists, replace sensor.
    - Ensure that all tires are inflated to their correct Placard pressures.
    - Clear TREAD warnings.
    - Test drive the vehicle and ensure that the TREAD lamp does not come back on.

DTC's

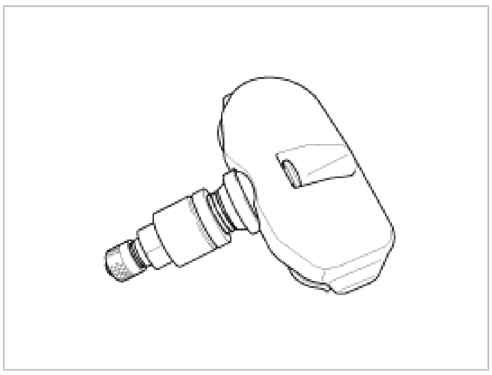
- Information to ascertain (DTC Lamp):
  - At what temperature did the DTC occur? Under certain conditions (approx.-40°C/F), a RF channel missing / hardware failure DTC may occur. This is due to the battery behavior.
- DTC's should be retrieved by using Hi-Scan diagnostic tool.
- The fault should then be diagnosed and rectified.
- DTC's should then be cleared.

DTC	Warning Type	Trouble Description	Diagnostic Lamp
C1121	Battery Level	Sensor 1 Battery Low.	Permanent during detection.
C1122		Sensor 2 Battery Low.	
C1123		Sensor 3 Battery Low.	
C1124		Sensor 4 Battery Low.	
C1126		Vehicle / TPMS receiver Battery Low.	
C1127		Vehicle / TPMS receiver Battery High.	
C1300	LF / RF External Interference	LF/RF Interference Failure.	Permanent during detection.
C1306	RF Internal Interference	Internal vehicle RF source e.g. scanner.	Permanent
C1312	Individual RF channel failure.	Sensor 1 / Front Left RF Failure.	Permanent
C1313		Sensor 2 / Front Right RF Failure.	
C1314		Sensor 3 / Rear Left RF Failure.	
C1315		Sensor 4 / Rear Right RF Failure.	
C1322	Sensor over Temperature	Sensor 1 / Front Left Sensor over 230°F(110°C).	Permanent
C1323		Sensor 2 / Front Right Sensor over	

		230°F(110°C).	
C1324		Sensor 3 / Rear Left Sensor over 230°F(110°C).	
C1325		Sensor 4 / Rear Right Sensor over 230°F(110°C).	
C1332	Sensor Failure	Sensor 1 / Front Left Sensor Fault.	Permanent
C1333		Sensor 2 / Front Right Sensor Fault.	
C1334		Sensor 3 / Rear Left Sensor Fault.	
C1335		Sensor 4 / Rear Right Sensor Fault.	
C1660	System Hardware	TPMS receiver RF circuit.	Permanent
C1661	EEPROM Failure	TPMS receiver EEPROM Failure.	Permanent
C1668	Micro controller error	Repeated Watchdog Reset / Internal failure detection.	Permanent
C2510	Lamp Short Circuit	TREAD lamp short circuit to 12 V.	Permanent
C2511		Diagnostic lamp short circuit to 12 V.	Permanent

Suspension System > Tire Pressure Monitoring System > TPMS Sensor > Description and Operation

DESCRIPTION



1. MODE
   (1) Configuration State
      A. All sensors should be in the Low Line (Base) state.
      B. In Low Line (Base) configuration, sensor transmissions occur every 3 minutes 20 seconds (nominal) and pressure is measured every 20 seconds.

   (2) Normal Fixed Base State
      A. Sensor transmissions continue at the Low Line (Base) configuration defined rates until the state is either changed by LF command or by the sensor detecting a condition that requires a temporary change to another state.
      B. The LF command to this state must contain the sensors ID.

   (3) Storage Base State:
      A. This state is a Low current consumption state.
      B. Sensors are in this state when they first arrive at the dealership (either on the vehicle or as replacement spares).
      C. In this state, the sensor does not measure pressure / temperature / battery level.
      D. The sensor will not transmit in this state unless requested to do so by the initiate command.

   (4) Alert State:
      A. The sensor automatically enters this state if the measured temperature exceeds 230 °F(110 °C) and over temperature shutdown is likely.
      B. In this state, pressure is measured every 4 seconds and RF data transmitted every 4 seconds.
      C. The state lasts for 1 minute if it is pressure triggered.
      D. After state is alse entered when a 3 psi change in pressure from the last RF transmission occurs.

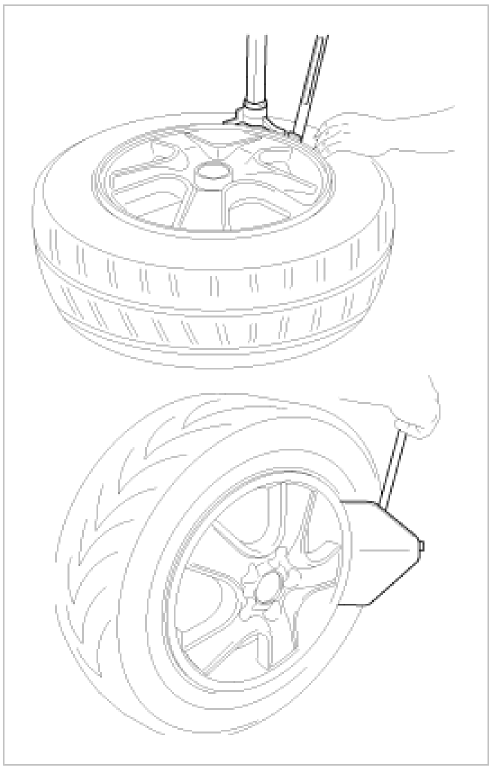
REMOVAL

Tire Removal

1. Deflate tire & remove balance weights.

CAUTION

- The tire bead should be broken approx. 90° from the valve side of the wheel. The bead breaker should not be set too deep.
- Avoid tire/tool contact with the valve on dismount.
- Dismount should end near the valve.

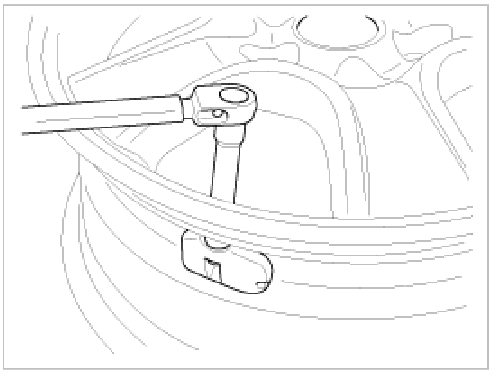


Sensor Removal

CAUTION

Handle the sensor with care.

1. Remove the valve nut.



CAUTION

The valve nut should not be re-used.

2. Discard the valve assembly.

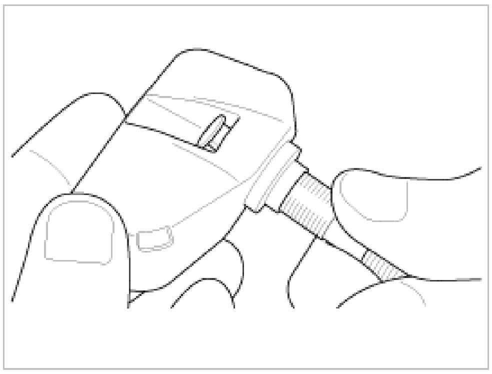
INSTALLATION

Sensor Fit

CAUTION

- Handle the sensor with care.
- Avoid lubricant contact if possible.

1. Assemble valve to sensor and turn valve 3 times with the square part of the screw in the slot.



CAUTION

- The fit should not be tight i.e. it should still be possible to easily adjust valve angle.
- Ensure that the wheel to be fitted is designed for sensor mount. There should normally be a mark to indicate this.
- Ensure that the valve hole and mating face of the wheel are clean.

2. Mount assembly to wheel.

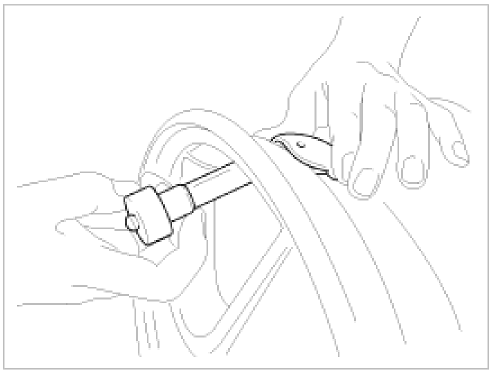
CAUTION

Ensure sensor feet are against the wheel throughout the remainder of the assembly process.

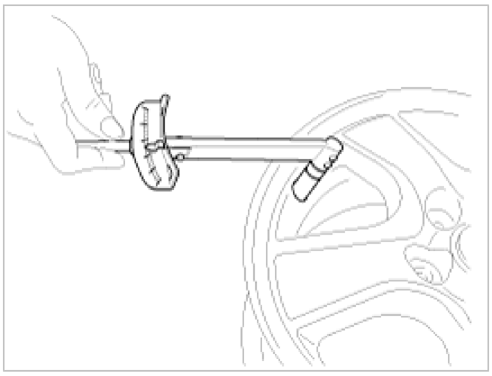
3. Tighten washer and nut by hand until the valve thread meets the nut built-in calibrated stop.

CAUTION

Ensure that the grommet remains in contact with the wheel.



4. Using a torque wrench, tighten the nut to 2.95±0.37 lb-ft (4.0±0.5 Nm) It is normal to feel a break as the 1.7 lb-ft (2.3Nm) calibrated stop in the nut snaps and the torque falls.



CAUTION

- Increase torque smoothly in order to achieve a clean break of the stop.
- Do not exceed allowed torque.
- Do not use electric or pneumatic tools.

Tire Fit

CAUTION

Only use wheels designed to accommodate the TPMS sensor.

1. Lubricate the tire bead not the rim. Excessive lubrication should not be applied.
2. Start tire mounting approx. 5.9 in(15 cm) from valve.
3. Move the mounting tool away from the valve.

   CAUTION

   Avoid tire / tool contact with the valve.

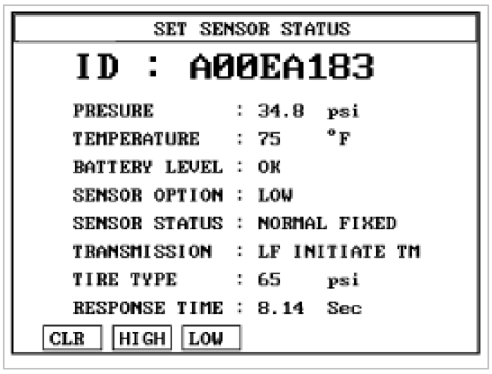
4. Finish with mounting tool near to valve.
5. Carry out inflation / pressure correction and then fit valve cap.

Sensor Initiating Procedure

NOTE

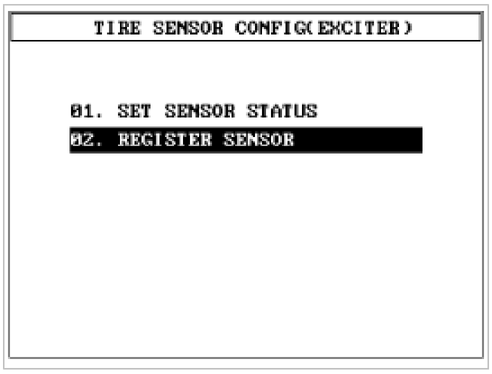
The sensor's default state will be Storage Auto (High Line).

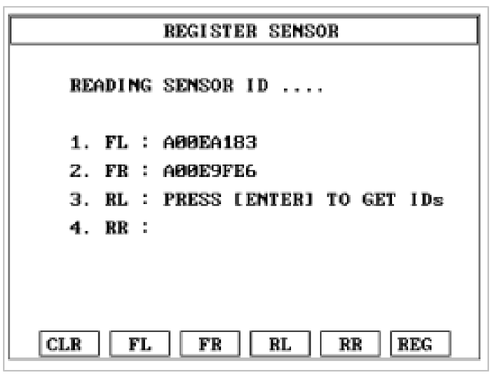
1. Change the sensor mode to Normal Fixed Base(Low Line) with the 'TPMS exciter'.



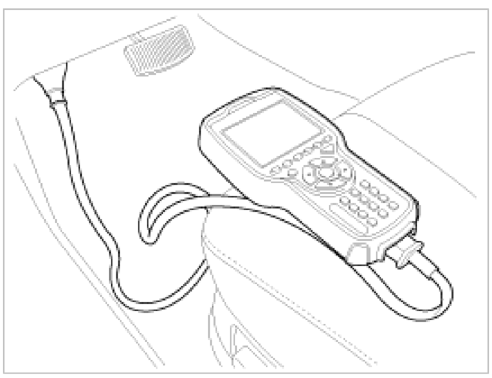
2. Read the four sensor's ids starting with sensor 1 (1 normally front left, 2 front right, 3 rear left, 4 rear right).

> **NOTE**
>
> Note that sensors which were already configured as Base (Low Line) will take longer to read.

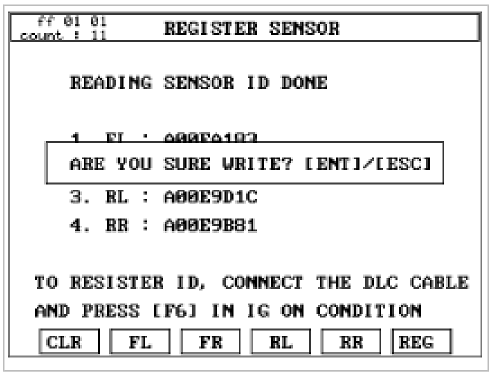


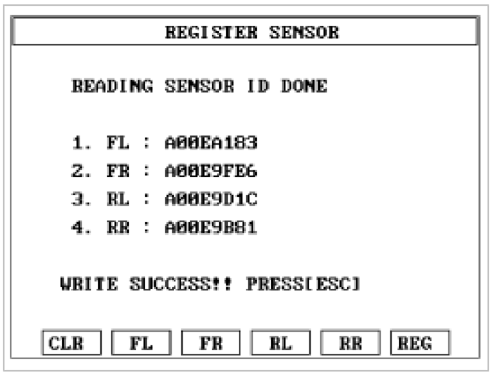


3. Connect 'TPMS exciter' to the diagnostic connector.



4. Register the four sensor's ids to the receiver.

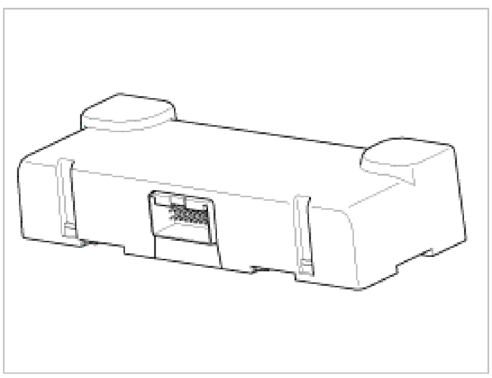




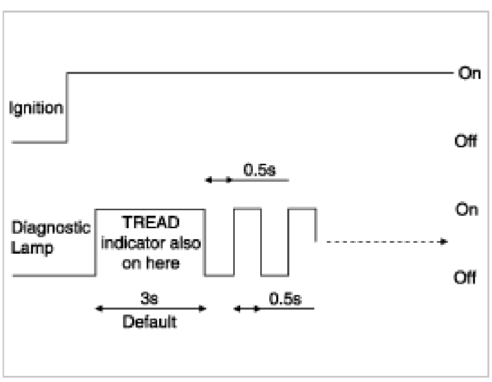
5. Cycle Ignition, wait 4 minutes and check that Normal Receiver State is now indicated (see SS-).

Suspension System > Tire Pressure Monitoring System > TPMS Receiver > Description and Operation

DESCRIPTION



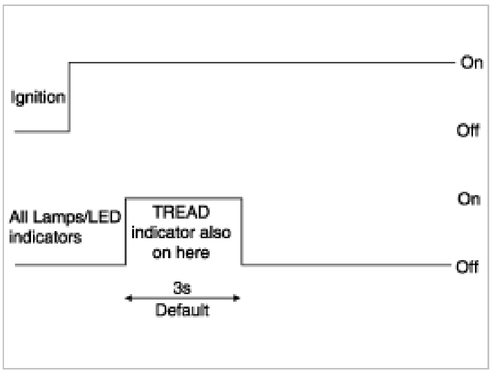
1. **Mode**
   (1) Virgin State
      A. The receiver as a sole part is shipped in this state. Replacement parts should therefore arrive in this state.
      B. In this state, there is no sensor monitoring and no DTC monitoring.
      C. The state indicates that platform specific parameters must be written to the receiver and that sensors are un-learned.



(2) Normal State

A. In order for tire inflation state and DTC monitoring to occur, the receiver must be in this state.

B. In this state, automatic sensor learning is enabled.



2. **Overview**
   A. Receives RF data from sensor.
   B. Uses sensor data to decide whether to turn on TREAD Lamp.
   C. Uses sensor information, distance traveled, background noise levels, Auto-learn status, short circuit output status, vehicle battery level, internal receiver states to determine if there is a system or a vehicle fault.

OPERATION

1. General Function
   A. Auto-learn takes place only once per Ignition cycle.
   B. On successful completion, 4 road wheel sensor ID's are latched into memory for monitoring.
   C. Until Auto-learn completes, previously learned sensors are monitored for under inflation / leak warnings.
2. General Conditions to Learn New Sensors:
   A. Receiver must determine that it is confident that sensor is not temporary:
      1) Uses vehicle speed.
      2) Uses confidence reduction of previously learned sensors.
   B. Typical time at driving over 12.4 mph(20 kph) to learn a new sensor is up to 20 minutes.
3. General Conditions to Un-Learn a sensor that is removed:
   A. It takes less than 20 minutes at 12.4~18.6 mph(20~30kph).
   B. Confidence reduction is dependent on vehicle speed greater than or equal to 12.4 mph(12 kph).

Suspension System > Tire Pressure Monitoring System > TPMS Receiver > Repair procedures

REPLACEMENT

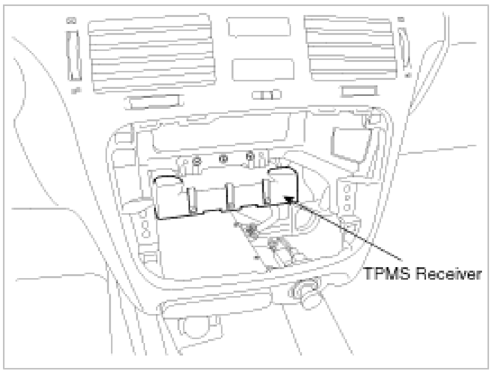
NOTE

When the receiver first arrives for replacement:
1) It will be in Virgin State.
2) It will not be configured for any specific platform.
3) It will not have any sensor ID's memorized.

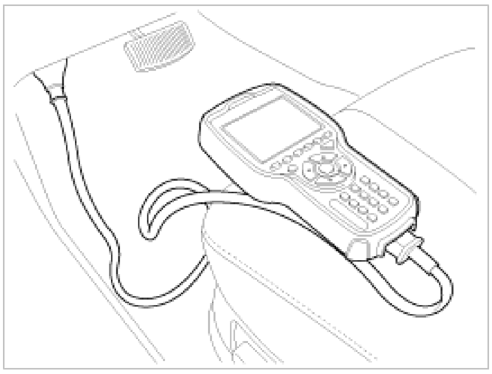
CAUTION

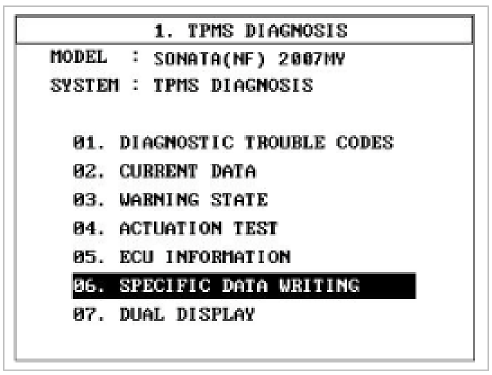
It is important to make sure that the correct receiver is used to replace the faulty part i.e. it must be Low Line (PN 95800-2E500) and not High Line (PN 95800-26000) in order to have the correct inflation warning thresholds set.

1. Disconnect vehicle battery.
2. Remove faulty part and fit bracket assembly to new part.

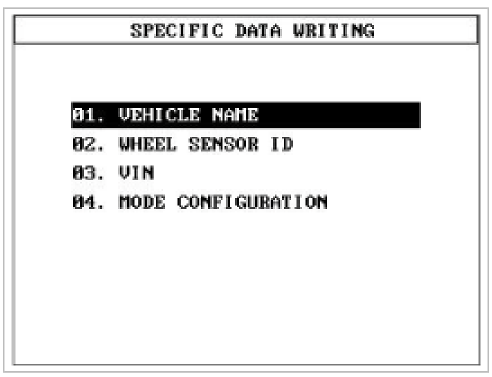


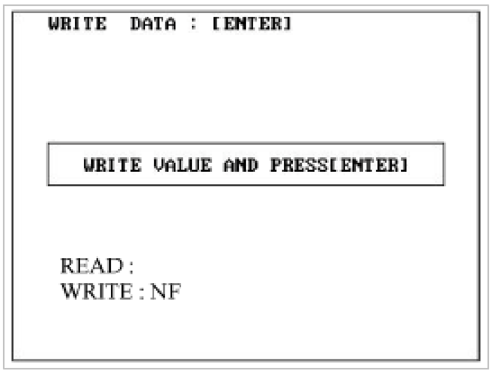
3. Secure new part to vehicle and fit connector.
4. Re-connect battery and turn Ignition on.
5. Check that DTC flash rate matches Virgin State indication (see SS-).
6. Connect 'TPMS exciter' to the diagnostic connector.



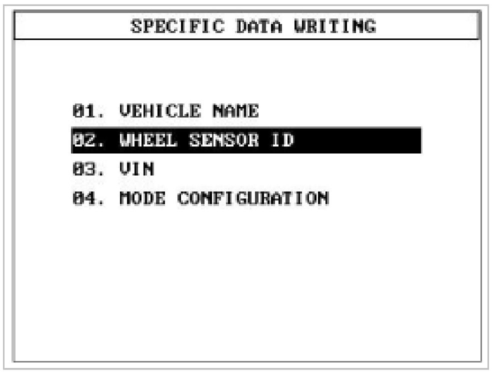


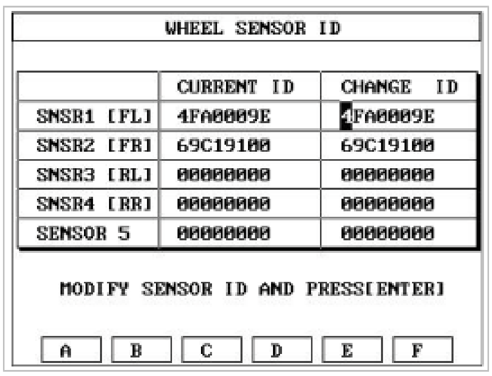
7. Write vehicle name to receiver. receiver will now automatically update monitoring parameters.



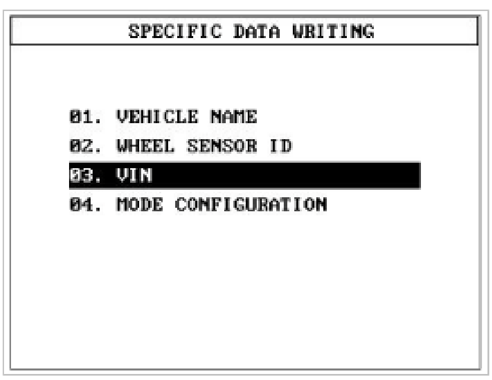


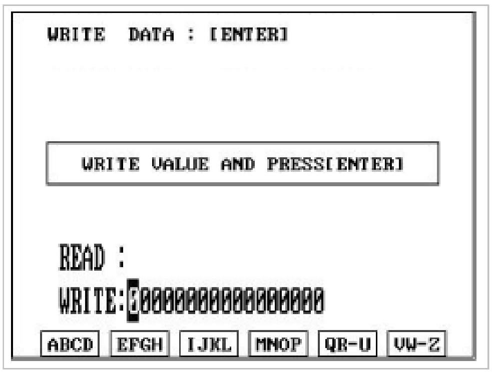
8. Read sensor's ids with the 'TPMS exciter'.
   (Refer to 'SENSOR INITIATING PROCEDURE')
9. Register sensor's ids to receiver.



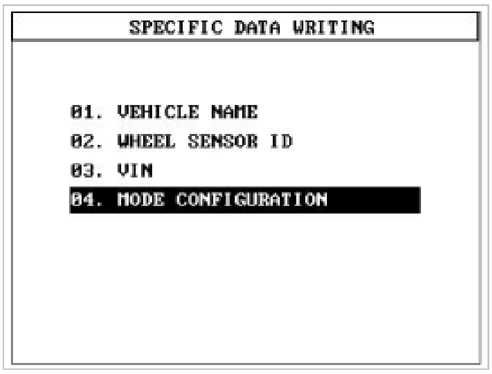


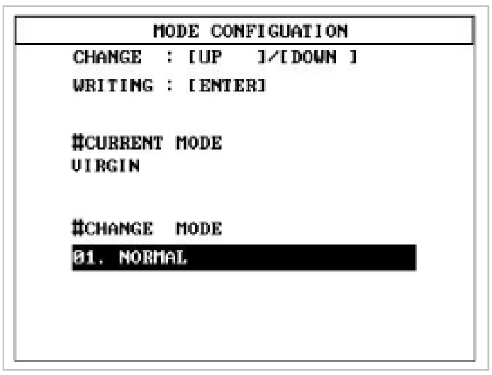
10. Register VIN number of the vehicle.(17 digits)





11. Change receiver state from Virgin to Normal.

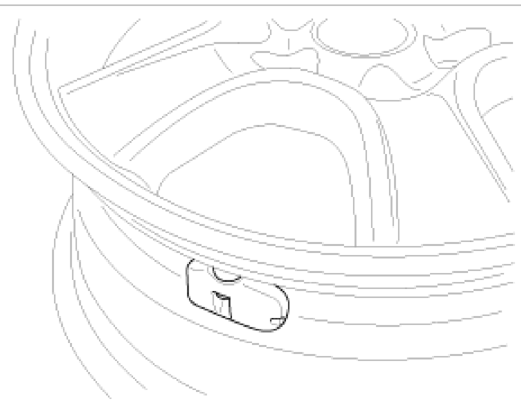




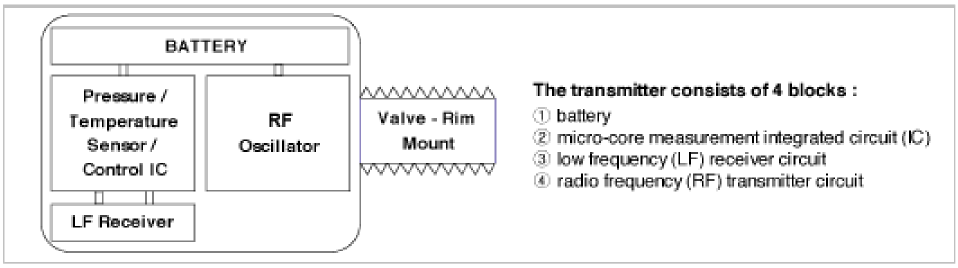
12. Disconnect diagnostic link.
13. Turn ignition off for approximately 10 seconds then turn it back on and check that Normal State is now indicated (see SS-).

Suspension System > Troubleshooting > C1121

Component Location



General Description



This transmitter is a transmitter device with tire valve, which is mounted in the valve hole of the wheel rim and transmits the pressure and temperature inside the tire, the battery voltage of the transmitter, and the tire identification code (ID) at normal and abnormal condition with the radio wave (RF) that conforms to the used area. Also this device has a countermeasure function such as the random delay of transmission time so that the RF signal from each tire will not interfere due to transmission. Wheel sensors shall support usage on steel or aluminum rims.
Sensor transmissions continue when sensor status is 'Normal Fixed State'. Sensor transmissions stop when sensor status is 'Storage State' or the sensor battery runs out. The transmitter should transmit data at vehicle speeds between 0 mph (0 kph) and 186 mph (300 kph). Operating Temperature Range is -40 to 248 °F(40 to 120 °C). Transmitter shall enter thermal shutdown once the measured temperature is greater than or equal to 257 °F(125 °C). The accuracy of the sensor is 23 to 44.6 °F(-5 to 7 °C)at this temperature. The sensor shall exit thermal shutdown once the temperature is less than or equal to 212 °F(100 °C). The transmitter shall have the capability to measure the internal battery voltage as an indicator of the end of life of the sensor. Since the unit is sealed, this parameter cannot be verified with a production unit..

【Tire Pressure Monitoring】

When 4 sensors have been learned as road wheels, it shall not be possible to learn new road wheel sensors on the same Ignition cycle. In normal mode low line, tire pressure and temperature shall be transmitted every 3 minutes 20 s nominally independent of vehicle operation. Monitoring shall be every 20 s. If sensor detects rapid deflation, then RF messages will be transmitted every 4 s for 1 minute duration. Communication from wheel sensors shall be via RF at a frequency of 315 MHz, 5 kBaud. Tire pressure measurement tolerance shall be ±7 kPa from 32 to 122 °F(0 to 50 °C) and ±17.5 kPa from -40 to 248 °F (-40 to 120°C) with a range of 100 to 450 kPa. Tire temperature measurement tolerance shall be ±37.4 °F(±3 °C) from -4 to 158 °F(-20 to 70 °C) and to ±41 °F(±5 °C) from -40 to 248 °F(40 to 120 °C)..

DTC Description

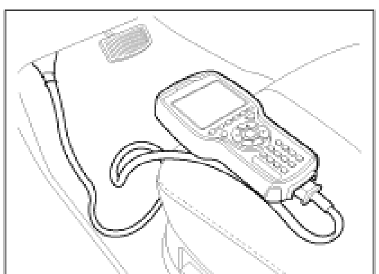
This DTC indicates that the sensor battery voltage level is Low. The most likely cause is battery passing it's expected life / excessively Low temperatures / sensor failure.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Sensor battery check	• Sensor temperature low • Sensor battery low • Faulty TPMS sensor
Enable conditions	• Latest Lowest sensor Temp. > -4 °F(-20 °C) • Distance travelled during 12 min. > 4 km	
Threshold value	• Sensor voltage <2.2 V	
Diagnosis time	• 12 ~13 minutes	

Monitor Scantool Data

1. Park the vehicle on a level surface.
2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mod of "CURRENT DATA" function.
5. Monitor the parameter of SENSOR 1 on the 'TPMS exciter' or scantool after 13 minutes.

Specification : 'Sensor Temp.' is more than -68 °F(-20 °C)and 'Sensor battery value' is 'Normal'.

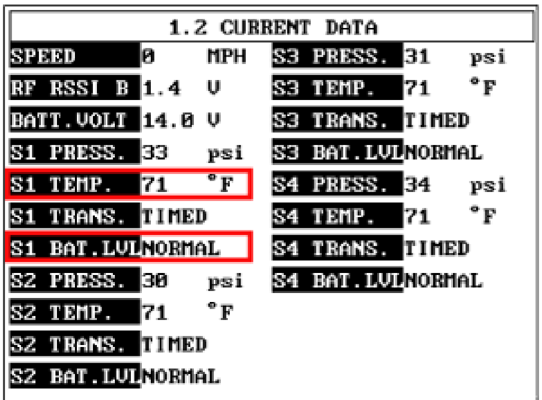


Fig 1 Sensor current data (normal)

6. Is parameter within specifications?

YES

▸ Fault is intermittent. It has been repaired and TPMS receiver module memory is not cleared yet.
▸ Go to "Verification of vehicle Repair" procedure.

NO

▸ Go to "Component Inspection" procedure.

Component Inspection

1. Turn ON 'TPMS exciter'.
2. Select "TIRE SNSR CONFIG(EXCITER)" mode.
3. Execute "SET SENSOR STATUS" of each wheel.

Specification : 'Sensor battery value' is 'Normal' and 'Sensor Temp.' is more than -68 °F(-20 °C).

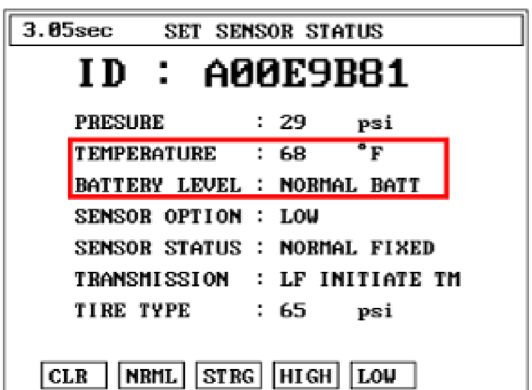

Fig 1 Sensor status (normal)

Executing "SET SENSOR STATUS"

4. Is any sensor data outside specification?

YES

▸ The sensor which displays data above the specification is SENSOR 1.
▸ Check wheel / tire where abnormal sensor data was detected. Check for tire / wheel damage and overheated brake condition.
▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure.
▸ If it is OK, go to "Check wheel / tire" as follows.

NO

▸ Check for sensor if unable to retrieve data with 'TPMS exciter'.
▸ Replace TPMS sensor if necessary and register sensor ID with 'TPMS exciter'.
▸ Go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C1122

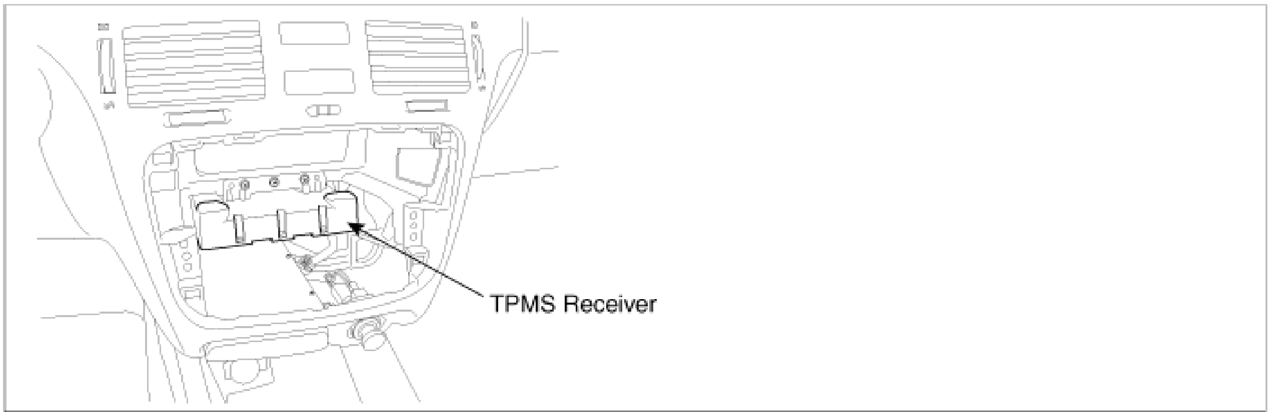
Suspension System > Troubleshooting > C1126

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the console. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

This indicates that the receiver battery level is Low. The most likely cause is battery / harness / receiver input / A-D failure.

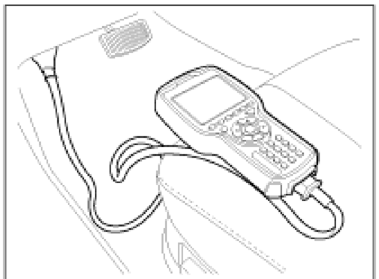
DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Battery level check	• Faulty charging system • Vehicle battery low • Faulty TPMS Receiver
Enable conditions	• Battery voltage level low	
Threshold value	• Battery voltage < 9V	
Diagnosis time	• 2 sec.	

Monitor Scantool Data

1. Start engine and turn headight and rear defroster.

2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mode of "CURRENT DATA" function.
5. Maintaining ENG. RPM at 2,500RPM(idle) over 2 minutes.
6. Monitor the parameter of BATT. VOLT on the 'TPMS exciter' or scantool

Specification : 'BATT. VOLT' is more than 10 V

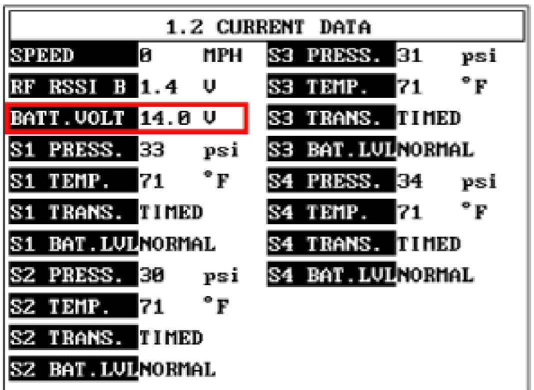


Fig 1 Sensor current data (normal)

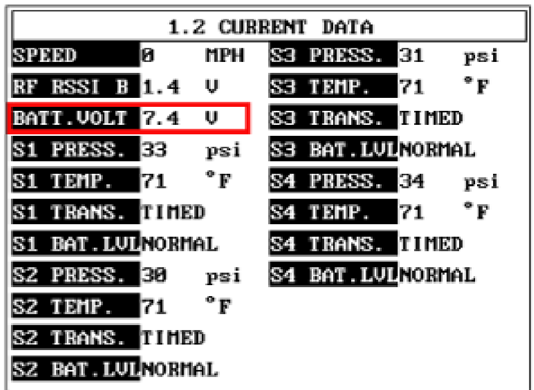

Fig 2 BATT. VOLT low

7. Is parameter normal?

YES

- Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
- Go to "Verification of vehicle Repair" procedure.

NO

- Go to "Inspection/Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminal condition. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check all connectors (and connections) for looseness, bending, corrosion, contamination, deterioration, and/or damage.
3. Has a problem been found?

YES

- Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

NO

- Go to "Charging System Inspection" procedure.

Charging System Inspection

1. Engine "ON".
2. headight and rear defroster "ON".

3. Measure voltage between terminal (+) and (-) of battery maintaining ENG. RPM at 2,500 RPM(idle) over 2 minutes.

Specification : more than 10 V

4. Is the measured voltage within specifications?

YES

▸ Substitute with a known-good TPM receiver and check for proper operation.
▸ If the problem is corrected, replace TPM receiver and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Check for fault in charging system and check for tension of generator drive belt, ENG.idle rpm or open/short in harness from battery to generator.
▸ Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

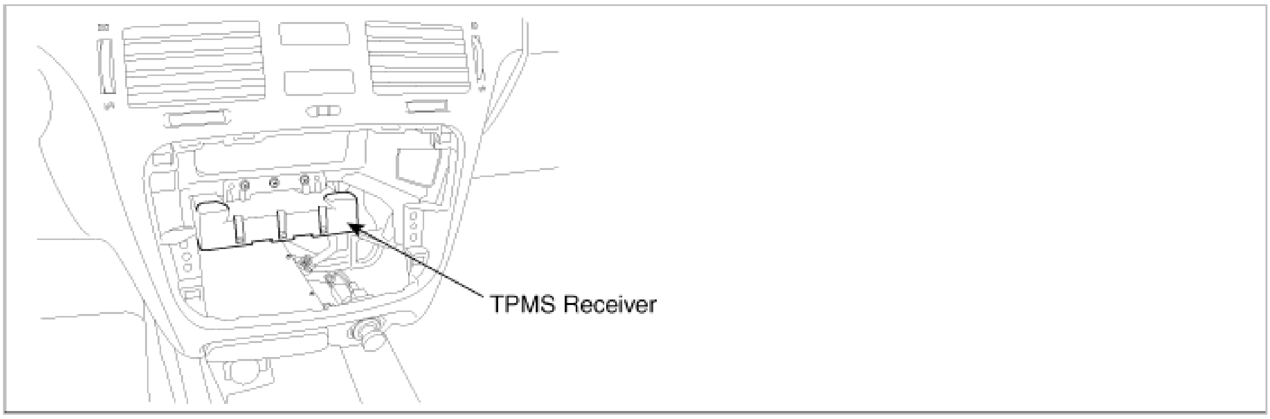
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C1127

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

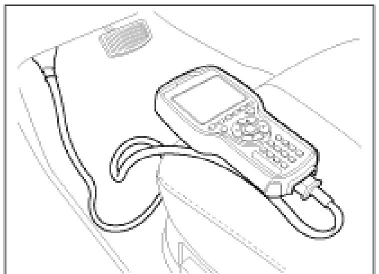
This indicates that the receiver battery level is High. The most likely cause is receiver input / A-D failure.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Battery level check	• Faulty charging system • Vehicle battery high • Faulty TPMS Receiver
Enable conditions	• Battery voltage level high	
Threshold value	• Battery voltage > 17.5 V	
Diagnosis time	• 2 sec.	

Monitor Scantool Data

1. Start engine and turn headight and heatwire on.
2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mode of "CURRENT DATA" function.
5. Maintaining ENG. RPM at 2,500RPM(idle) over 2 minutes.
6. Monitor the parameter of BATT. VOLT on the 'TPMS exciter' or scantool.

Specification : 'BATT. VOLT' is less than 16.5 V

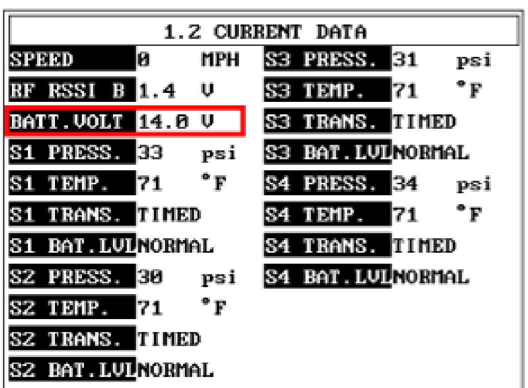


Fig 1 Sensor current data (normal)

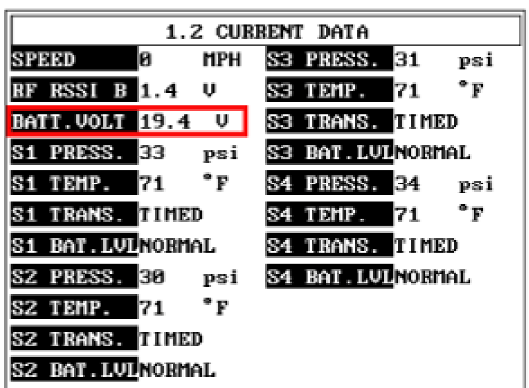

Fig 2 BATT. VOLT high

7. Is parameter normal?

YES

▸ Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
▸ Go to "Verification of vehicle Repair" procedure.

NO

▸ Go to "Inspection/Repair" procedure.

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminal condition. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.

YES

▸ Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

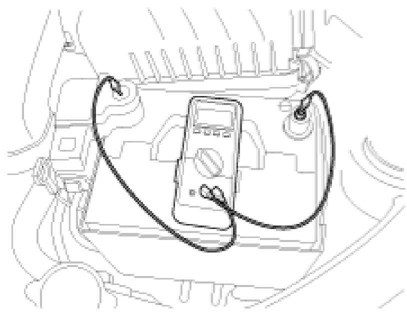
NO

▸ Go to "Charging System Inspection" procedure.

Charging System Inspection

1. Engine "ON".
2. headight and rear defroster "ON".
3. Measure voltage between terminal (+) and (-) of battery maintaining ENG. RPM at 2,500 RPM(idle) over 2 minutes.

Specification : less than 16.5 V



4. Is the measured voltage within specifications?

YES

▸ Substitute with a known-good TPM receiver and check for proper operation.
▸ If the problem is corrected, replace TPM receiver and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Check for fault in charging system and thoroughly check all connectors (and connections) for looseness, bending, corrosion, contamination, deterioration, and/or damage.
Repair or replace if necessary and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

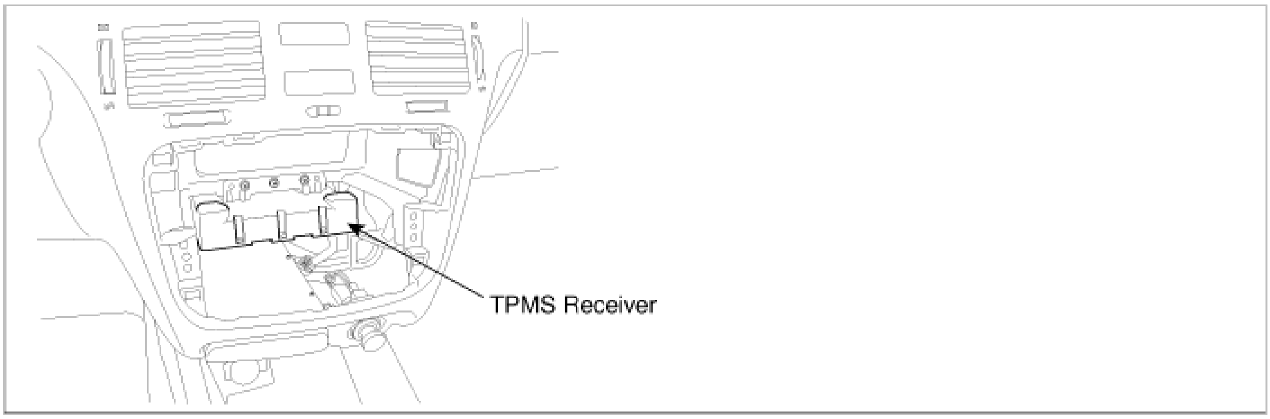
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C1300

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

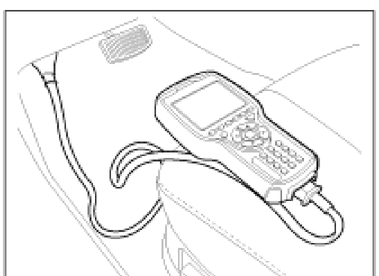
This DTC indicates that system is not functioning due to High interference levels from external sources.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• LF/RF check	• LF/RF Interference from external sources(unless C1306 also exists as historic. If this is the case then interference source is likely to be internal to the vehicle)
Enable conditions	• System not functioning due to High RF interference levels	
Threshold value	• No valid RF data for 8 min from any sensor • Distance travelled during 8 minutes ≤ 1.68 mile(2.7 km)	
Diagnosis time	• 8 - 9 minutes	

Monitor Scantool Data

1. Park the vehicle on a level surface.
2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mode of "CURRENT DATA" function.
5. Monitor the parameter of RF RSSI background on the 'TPMS exciter' or scantool after 9 minutes.

Specification : "RSSI background" is less than 1.9 V

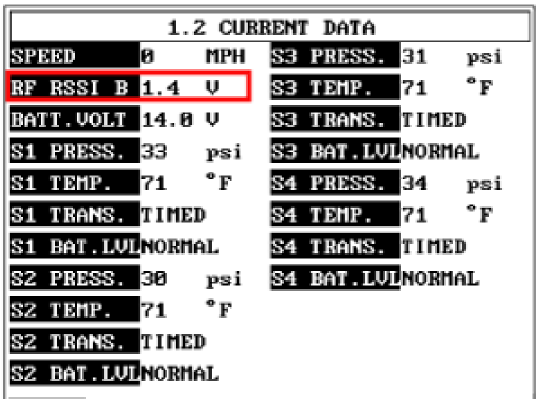


Fig 1 Sensor current data (normal)

6. Is parameter within specifications?

YES

- Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
- Go to "Verification of vehicle Repair" procedure.

NO

- Substitute with a known-good TPM receiver module and check for proper operation.
- If the problem is corrected, replace TPM receiver module and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

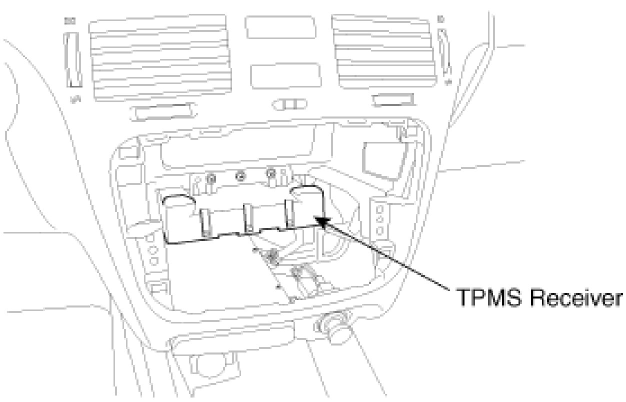
- Go to the applicable troubleshooting procedure.

NO

- System performing to specification at this time.

Suspension System > Troubleshooting > C1306

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

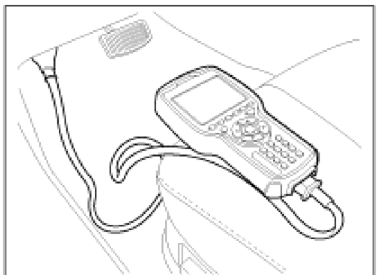
This DTC indicates that system is not functioning due to High interference levels, which are most likely being generated in the vehicle.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• LF/RF check	• Internal vehicle noise source
Enable conditions	• System not functioning due to High RF interference (Internal) levels	
Threshold value	• No valid RF data for 8 min from any sensor • Distance travelled during 8 minutes > 1.68 mile(2.7 km)	
Diagnosis time	• 8 - 9 minutes	

Monitor Scantool Data

1. Park the vehicle on a level surface.
2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mode of "CURRENT DATA" function.
5. Monitor the parameter of RF RSSI background on the 'TPMS exciter' or scantool after 9 minutes..

Specification : "RSSI background" is less than 1.9V

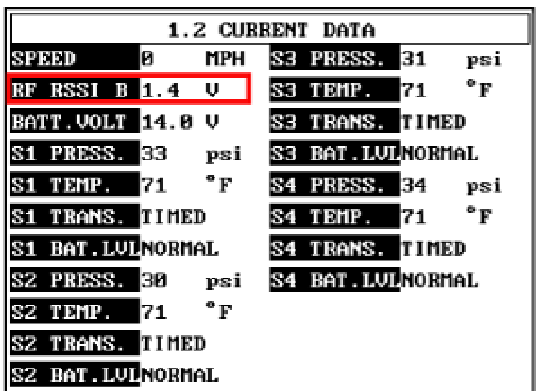


Fig 1 Sensor current data (normal)

6. Is parameter within specifications?

YES

▸ Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
▸ Go to "Verification of vehicle Repair" procedure.

NO

▸ Substitute with a known-good TPM receiver module and check for proper operation.
▸ If the problem is corrected, replace TPM receiver module and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

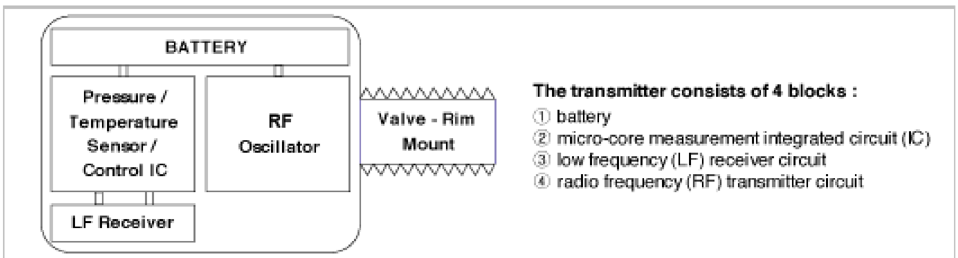
NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C1312

Component Location

General Description



This transmitter is a transmitter device with tire valve, which is mounted in the valve hole of the wheel rim and transmits the pressure and temperature inside the tire, the battery voltage of the transmitter, and the tire identification code (ID) at normal and abnormal condition with the radio wave (RF) that conforms to the used area. Also this device has a countermeasure function such as the random delay of transmission time so that the RF signal from each tire will not interfere such as due to the simultaneous transmission. Wheel sensors shall support usage on steel or aluminum rims.
Sensor transmissions continue when sensor status is 'Normal Fixed State'. Sensor transmissions stop when sensor status is 'Storage State' or the sensor battery runs out. The transmitter should transmit data at vehicle speeds between 0 mph (0 kph) and 186 mph (300 kph). Operating Temperature Range is -40 to 120 °C. Transmitter shall enter thermal shutdown once the measured temperature is greater than or equal to 125 °C. The accuracy of the sensor is ± 5°C at this temperature. The sensor shall exit thermal shutdown once the temperature is less than or equal to 100 °C. The transmitter shall have the capability to measure the internal battery voltage as an indicator of the end of life of the sensor. Since the unit is sealed, this parameter cannot be verified with a production unit.

【Tire Pressure Monitoring】

When 4 sensors have been learned as road wheels, it shall not be possible to learn new road wheel sensors on the same Ignition cycle. In normal mode low line, tire pressure and temperature shall be transmitted every 3 minutes 20 s nominally independent of vehicle operation. Monitoring shall be every 20 s. If sensor detects rapid deflation, then RF messages will be transmitted every 4 s for 1 minute duration. Communication from wheel sensors shall be via RF at a frequency of 315 MHz, 5 kBaud. Tire pressure measurement tolerance shall be ±7 kPa from 0 to 50 °C and ±17.5 kPa from -40 to 120°C with a range of 100 to 450 kPa. Tire temperature measurement tolerance shall be ±3 °C from -20 to 70 °C and to ±5 °C from -40 to 120 °C.

DTC Description

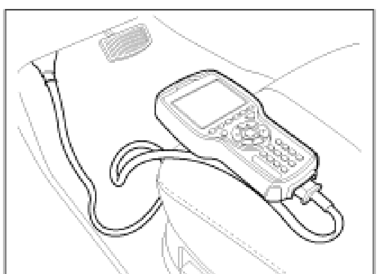
This DTC indicates that the sensor has either failed to learn OR has successfully learned and the receiver did not receive messages from the learned sensor for 12 minutes.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• RF message from sensor1 check	• Incorrectly configured TPMS sensor e.g.Low Line vehicle with High Line sensors. • Low Line vehicle sensors in storage state. • Wrong receiver type fitted e.g. Low Line receiver to a High Line vehicle. • Shielding in vehicle. • Un-approved wheels/tires i.e. a vehicle set up that has not been approved for good RF performance. • Incorrectly fitted sensor / receiver. • Faulty TPMS sensor
Enable conditions	• 2.48 mile < Distance travelled during 12 min. < 24.85 mile	
Threshold value	• Failure to Learn Sensors1 Correctly. • No RF message received from sensor1 over 12 min.	
Diagnosis time	• 12 ~ 20 minutes.	

Monitor Scantool Data

1. Connect "TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

2. Select "TPMS DIAGNOSIS" mode.
3. Select the "FULL" mode of "CURRENT DATA" function.
4. Monitor the parameter of SENSOR 1 on the 'TPMS exciter' or scantool after 20 minutes.

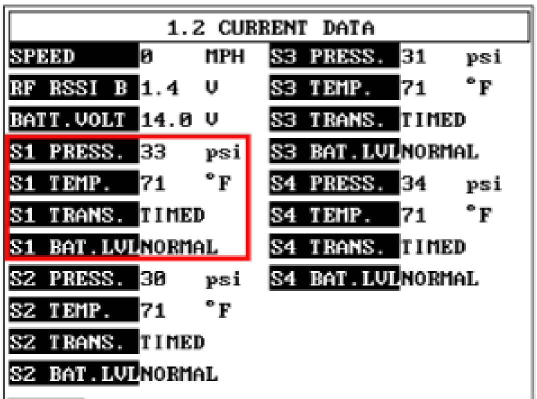


Fig 1 Sensor current data (normal)

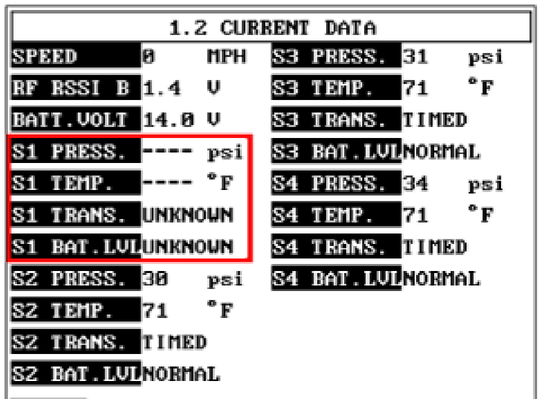

Fig 2 Sensor current data (failure)

5. Is parameter normal?

YES

- Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
- Go to "Verification of vehicle Repair" procedure.

NO

- Go to "Component Inspection" procedure.

Component Inspection

1. Turn ON 'TPMS exciter'.
2. Select "TIRE SNSR CONFIG(EXCITER)" mode.
3. Execute "SET SENSOR STATUS" of each wheel.

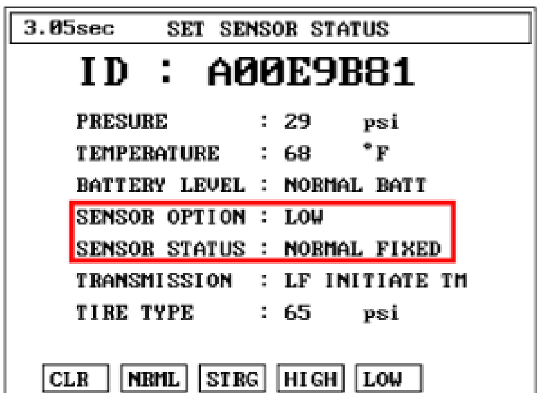

Fig 1 Sensor status (normal)

Executing "SET SENSOR STATUS"

4. Is data unable to be retrieved for any sensor?

YES

- Replace affected TPM sensor and register sensor ID with 'TPMS exciter'.
- Go to "Verification of Vehicle Repair" procedure.

NO

- Substitute with a known-good TPM receiver module and check for proper operation.
- If the problem is corrected, replace TPM receiver module and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

YES

▸ The sensor which displays data above the specification is SENSOR 1.

▸ Check wheel / tire of SENSOR 1 if Damaged tire, Excessive braking, Driving while the parking brake is on is detected.
▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure.
▸ If it is OK, go to "Check wheel / tire" as fellows.

NO

▸ Substitute with a known-good TPMS receiver module and check proper operation.
▸ If the problem is corrected, replace TPMS receiver module and go to "Verification of Vehicle Repair" procedure.

【Check wheel / tire】

1. Cool the heat of the SENSOR 1 wheel / tire.
2. IG OFF & IG ON.
3. Monitor the parameter of sensor 1 temperature on the 'TPMS exciter' or scantool after 4 minutes.

Specification : Less than 230 °F(110 °C)

YES

▸ Fault can be because of temporary overheating.
▸ Go to "Verification of vehicle Repair" procedure.

NO

▸ Replace TPMS sensor and register sensor ID with 'TPMS exciter'.
▸ Go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

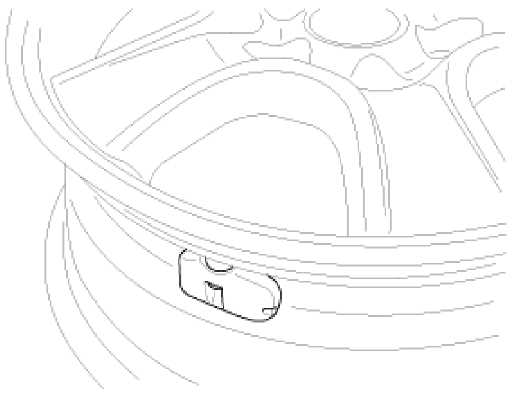
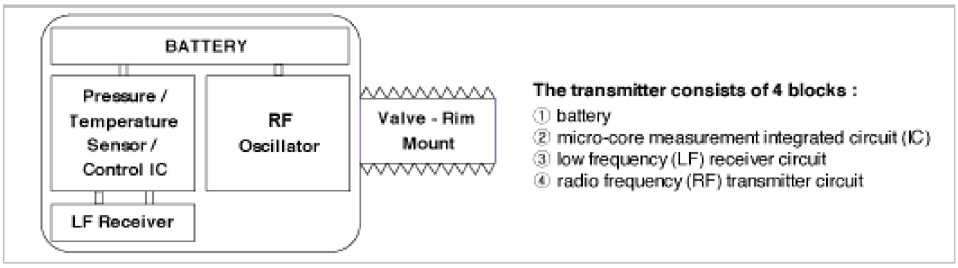
Suspension System > Troubleshooting > C1324

Component Location



General Description



This transmitter is a transmitter device with tire valve, which is mounted in the valve hole of the wheel rim and transmits the pressure and temperature inside the tire, the battery voltage of the transmitter, and the tire identification code (ID) at normal and abnormal condition with the radio wave (RF) that conforms to the used area. Also this device has a countermeasure function such as the random delay of transmission time so that the RF signal from each tire will not interfere such as due to the simultaneous transmission. Wheel sensors shall support usage on steel or aluminum rims.

Sensor transmissions continue when sensor status is 'Normal Fixed State'. Sensor transmissions stop when sensor status is 'Storage State' or the sensor battery runs out. The transmitter should transmit data at vehicle speeds between 0 mph (0 kph) and 186 mph (300 kph). Operating Temperature Range is -40 to 120 °C. Transmitter shall enter thermal shutdown once the measured temperature is greater than or equal to 125 °C. The accuracy of the sensor is ± 5°C at this temperature. The sensor shall exit thermal shutdown once the temperature is less than or equal to 100 °C. The transmitter shall have the capability to measure the internal battery voltage as an indicator of the end of life of the sensor. Since the unit is sealed, this parameter cannot be verified with a production unit.

【Tire Pressure Monitoring】

When 4 sensors have been learned as road wheels, it shall not be possible to learn new road wheel sensors on the same Ignition cycle. In normal mode low line, tire pressure and temperature shall be transmitted every 3 minutes 20 s nominally independent of vehicle operation. Monitoring shall be every 20 s. If sensor detects rapid deflation, then RF messages will be transmitted every 4 s for 1 minute duration. Communication from wheel sensors shall be via RF at a frequency of 315 MHz, 5 kBaud. Tire pressure measurement tolerance shall be ±7 kPa from 0 to 50 °C and ±17.5 kPa from -40 to 120°C with a range of 100 to 450 kPa. Tire temperature measurement tolerance shall be ±3 °C from -20 to 70 °C and to ±5 °C from -40 to 120 °C.

DTC Description

This DTC indicates that the sensor has seen a temperature in excess of 110°C. At 125°C, the sensor will shut down and the warning is therefore so that the driver knows that there is a problem with the vehicle that may affect tire performance.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Temperature of sensor check	• Damaged tire • Excessive braking • Driving while the parking brake is on.
Enable conditions	• 2 consecutive Alert State temperature > 230°F(110°C)	
Threshold value	• Sensor temperature > 230°F(110°C)	
Diagnosis time	• < 10 sec.	

Monitor Scantool Data

1. Park the vehicle on a level surface.
2. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).
3. Select "TPMS DIAGNOSIS" mode.
4. Select the "FULL" mode of "CURRENT DATA" function.
5. Monitor the parameter of SENSOR 1 temperature on the 'TPMS exciter' or scantool after 4 minutes.

Specification : Less than 230 °F(110 °C)

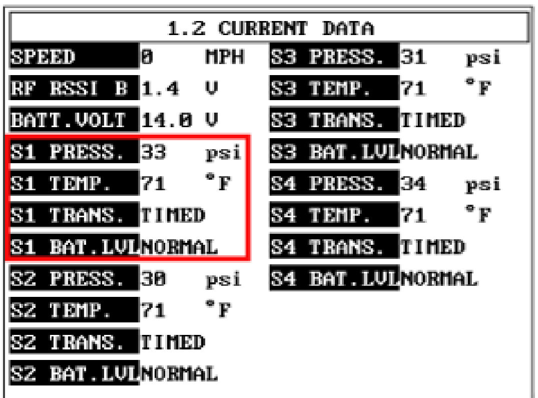


Fig 1 Sensor current data (normal)

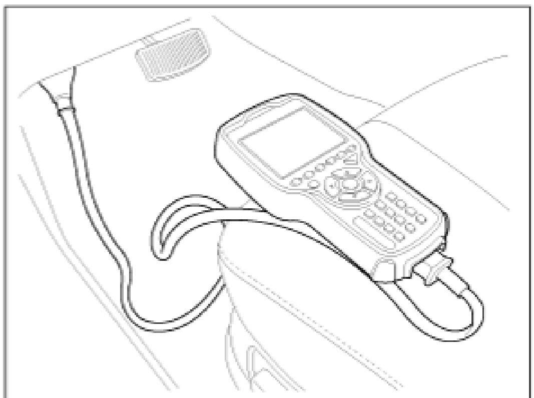

Connect the DLC for 'TPMS exciter'

6. Is parameter within specifications?

YES

▸ Fault is intermittent. It has been repaired and TPM receiver module memory is not cleared yet.
▸ Go to "Verification of vehicle Repair" procedure.

NO

▸ Go to "Component Inspection" procedure.

Component Inspection

【Check TPM SENSOR 1】

1. Turn ON 'TPMS exciter'.
2. Select "TIRE SNSR CONFIG(EXCITER)" mode.
   Execute "SET SENSOR STATUS" of each wheel.
3. Monitor the parameter of each sensor temperature on the 'TPMS exciter'.

Specification : Less than 230 °F(110 °C)

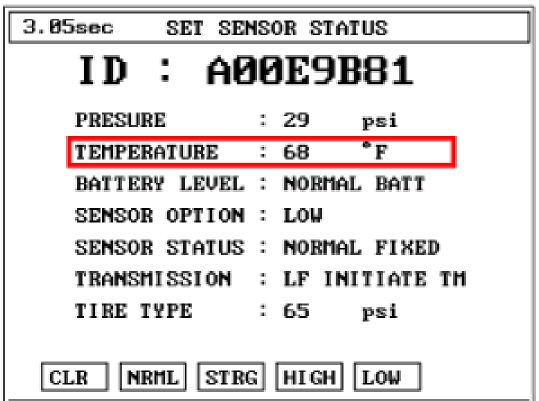

Fig 1 Sensor status (normal)

Executing "SET SENSOR STATUS"

4. Is any sensor data outside specification?

YES

▸ The sensor which displays data above the specification is SENSOR 1.
▸ Check wheel / tire of SENSOR 1 if Damaged tire, Excessive braking, Driving while the parking brake is on is detected.
▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure.

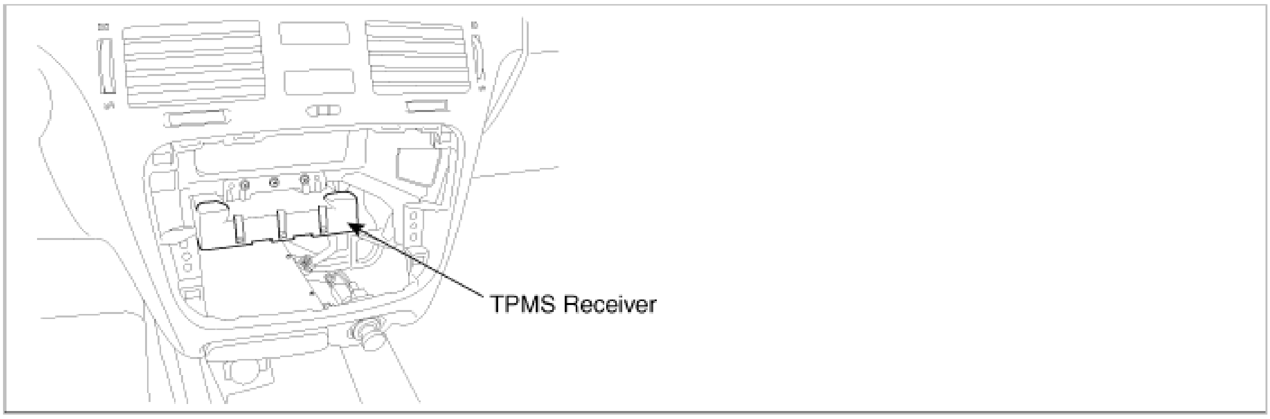
Suspension System > Troubleshooting > C1660

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

This DTC indicates that the receiver has not received any RF messages. The most likely cause is receiver RF circuit failure / RF screening.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Internal RF circuit check of Receiver module	• Low Line - all sensors in storage state and no other RF transmissions received • Low Line - receiver RF shielding • Faulty TPMS Receiver module
Enable conditions	• No valid RF data for 12 min from any sensor • RF messages and the signal levels are unexpected	
Threshold value	• Internal RF circuit fault	
Diagnosis time	• 12 ~13 minutes	

Component Inspection

【Check status of all TPM sensor】

1. Turn ON 'TPMS exciter'.
2. Select "TIRE SNSR CONFIG(EXCITER)" mode.
   Execute "SET SENSOR STATUS" of each wheel.

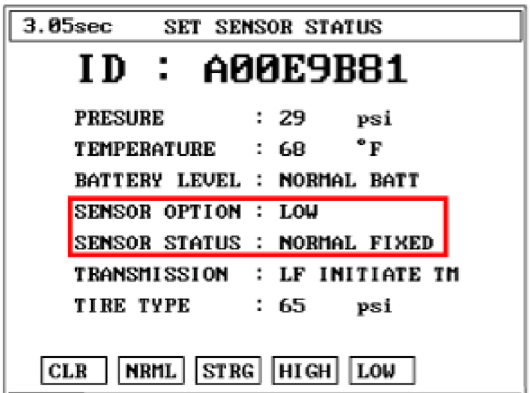


Fig 1 Sensor status (normal)

Executing "SET SENSOR STATUS"

3. Are status of all sensors "normal"?

YES

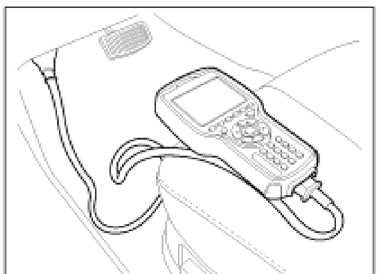
- Check TPM receiver RF shielding.
- If it is OK, go to "Check TPM receiver" as fellows.
- Repair if necessary and go to "Verification of Vehicle Repair" procedure.

NO

- Change status of all TPM sensors into "normal" status with 'TPMS exciter'.
- Go to "Verification of Vehicle Repair" procedure.

【Check TPM receiver】

1. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

2. Clear DTC.
3. IG OFF & IG ON. Wait 4 minutes.
4. Execute "Diagnostic Trouble Codes(DTCs)".
5. Is 'C1660' present ?

YES

- Substitute with a known-good TPM Receiver module and check for proper operation.
- If the problem is corrected, replace TPM Receiver module and go to "Verification of vehicle Repair" procedure.

NO

- TPM receiver complete successful Auto-Learn.
- System is OK.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

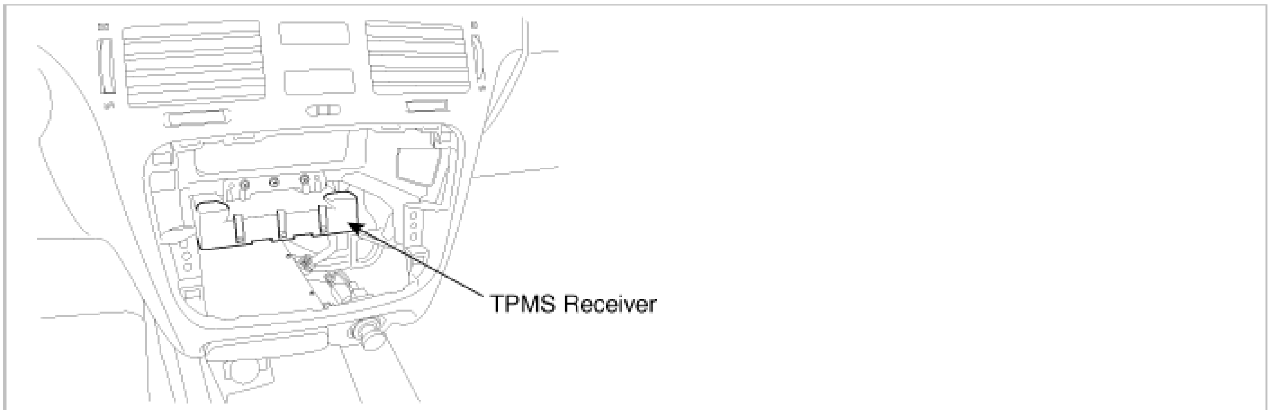
- Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C1661

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

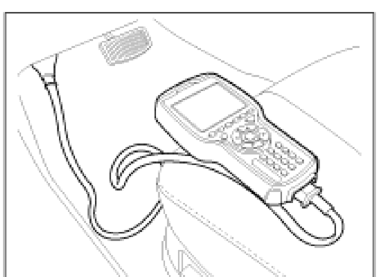
This DTC indicates that the receiver has a problem reading or writing to EEPROM.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Receiver module check	• Transient over voltage due to vehicle fault (fault would typically recover) • Faulty TPMS Receiver
Enable conditions	• Reading or writing problem to EEPROM	
Threshold value	• EEPROM in the receiver module fault	
Diagnosis time	• < 10 sec.	

Component Inspection

1. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



Connect the DLC for 'TPMS exciter'

2. Clear DTC.
3. IG OFF & IG ON. Wait 4 minutes.
4. Execute "Diagnostic Trouble Codes(DTCs)".

5. Is 'C1661' present ?

YES

▶ Substitute with a known-good TPM Receiver module and check for proper operation.
▶ If the problem is corrected, replace TPM Receiver module and go to "Verification of vehicle Repair" procedure.

NO

▶ TPM receiver complete successful Auto-Learn.
▶ System is OK.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

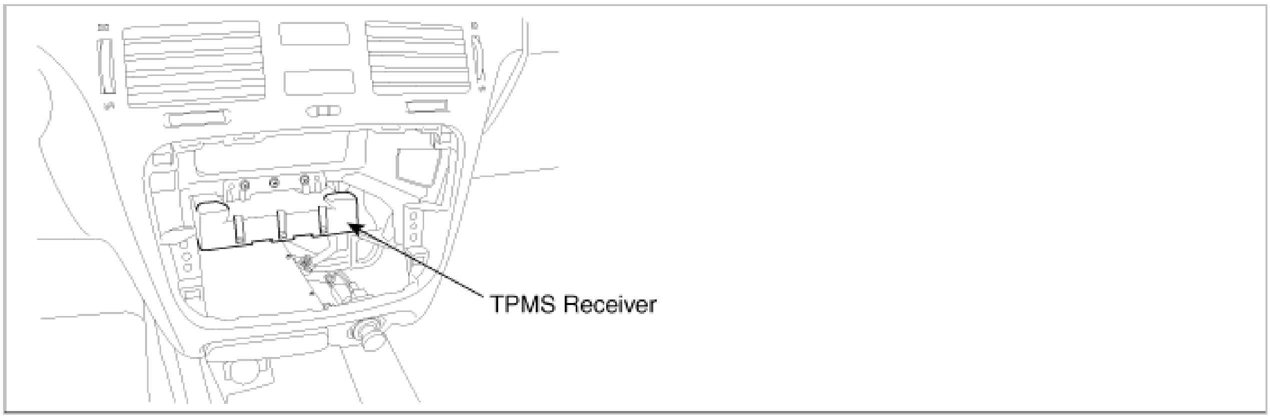
▶ Go to the applicable troubleshooting procedure.

NO

▶ System performing to specification at this time.

Suspension System > Troubleshooting > C1668

Component Location



General Description

TPM Receiver is integrated with the TPM module installed at the bottom of the steering column. The operating battery of TPM module is supplied from the vehicle battery. Data such as Tire pressure, Tire Temperature, TPM sensor battery status and TPM sensor valve ID from TPM sensors are transmitted to TPM receiver in the form of RF signal. TPM module accomplishes Tire Monitoring and Warning Logic with received data.

DTC Description

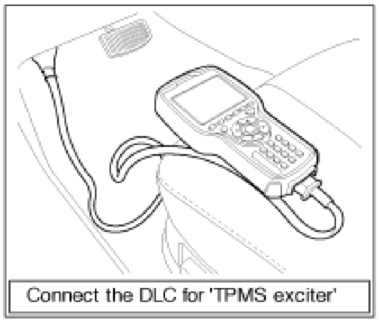
This DTC indicates that the receiver has detected an internal error.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Receiver module check	• Transient over voltage due to vehicle fault (fault would typically recover) • Faulty TPMS Receiver
Enable conditions	• An Internal error	
Threshold value	• TPMS Receiver module fault	
Diagnosis time	• < 3 sec. - Carried out once at Ignition ON	

Component Inspection

1. Connect 'TPMS exciter' or scantool to Data Link Connector(DLC).



2. Clear DTC.
3. IG OFF & IG ON. Wait 4 minutes.
4. Execute "Diagnostic Trouble Codes(DTCs)".
5. Is 'C1668' present ?

YES

▸ Substitute with a known-good TPM Receiver module and check for proper operation.
▸ If the problem is corrected, replace TPM Receiver module and go to "Verification of vehicle Repair" procedure.

NO

▸ TPM receiver complete successful Auto-Learn.
▸ System is OK.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

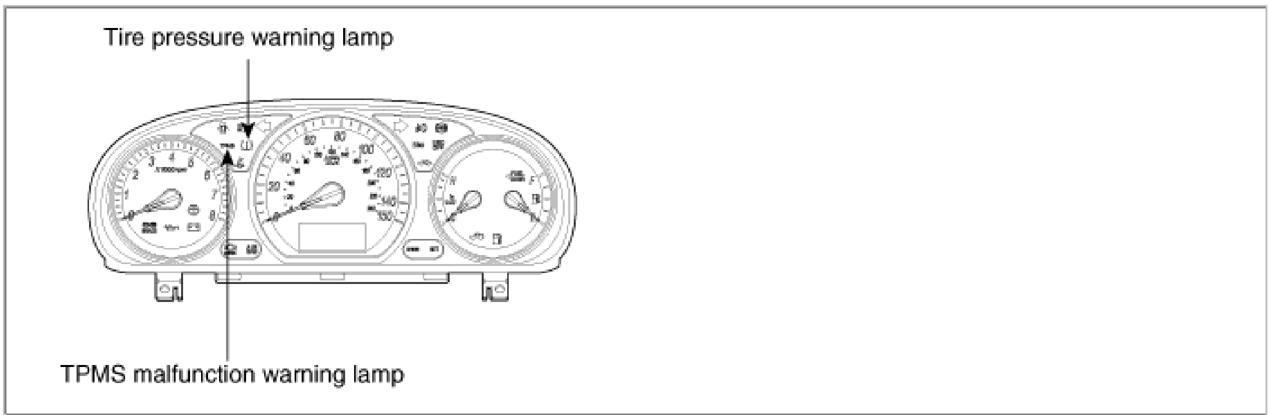
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Suspension System > Troubleshooting > C2510

Component Location



General Description

The TPMS receiver unit must provide two outputs continuously to drive the indicator lamps. One of the output turn the TREAD indicator lamp on when pressure in one or more tires associated with the TPMS receiver unit have reported a pressure below the warning level threshold. The other output turn the TPMS Warning indicator bulb on when the TPMS receiver unit has detected a system fault.

【Turn the TREAD indicator lamp on】

1. When tire pressure is below allowed threshold.
2. When rapid leak is detected by the sensor.
3. Indicates that tire needs to be re-inflated to placard pressure / repaired.

【Turn the TREAD indicator lamp off】

1. Under-inflation : When tire pressure is above (warning threshold + hysteresis).
2. Leak : When tire pressure is above (leak warning threshold) OR on Ignition cycle off to on.

DTC Description

This DTC indicates that the TREAD(Tire Under Inflation / Leak Warning) / DTC Warning lamp is short circuit and therefore cannot be turned on. The most likely failure is harness / instrument cluster / connector / receiver short circuit.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Input lamp current check	• Short circuit to 12 V between lamp and TPMS receiver
Enable conditions	• TREAD / Diagnostic lamp circuit short to 12 V	
Threshold value	• TREAD / Diagnostic lamp - 200 mA allowed each (after in rush time). 50 mA margin built in.	
Diagnosis time	• < 3s	

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminal condition. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check all connectors (and connections) for looseness, bending, corrosion, contamination, deterioration, and/or damage.
3. Has a problem been found?

YES

▸ Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

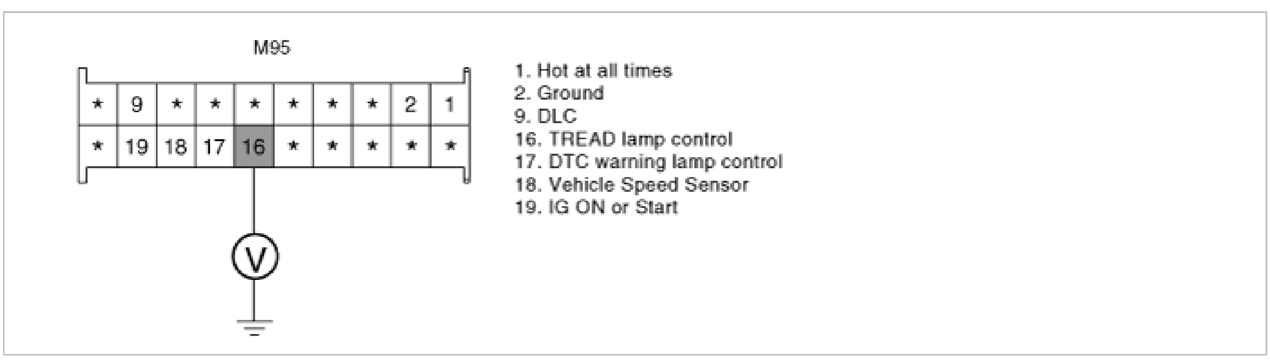
NO

▸ Go to "Control Circuit Inspection" procedure.

Control Circuit Inspection

1. Engine "OFF".
2. Disconnect instrument cluster connector and TPM receiver connector.
3. Engine "ON".
4. Measure voltage between terminal "16" of TPMS receiver harness connector and chassis ground.

Specification : 0 V



5. Is the measured voltage within specifications?

YES

- Substitute with a known-good TPM receiver and check for proper operation.
- If the problem is corrected, replace TPM receiver and then go to "Verification of Vehicle Repair" procedure.

NO

- Check for short to power in control harness.
- Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

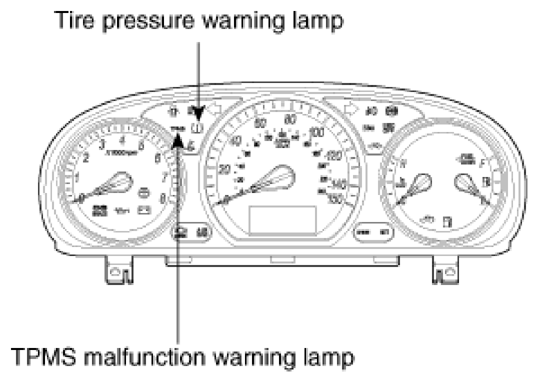
- Go to the applicable troubleshooting procedure.

NO

- System performing to specification at this time.

Suspension System > Troubleshooting > C2511

Component Location



General Description

The TPMS receiver unit must provide two outputs continuously to drive the indicator lamps. One of the output turn the TREAD indicator lamp on when pressure in one or more tires associated with the TPMS receiver unit have reported a pressure below the warning level threshold. The other output turn the TPMS Warning indicator bulb on when the TPMS receiver unit has detected a system fault.

【Turn the TPMS DTC Warning indicator lamp on】

1. When the system detects a fault that is external to the receiver / sensor.
2. When the system detects a receiver fault.
3. When the system detects a sensor fault.

【Turn the TPMS DTC Warning indicator lamp off】

1. If the fault is considered as 'critical', then the lamp is held on throughout the current Ignition cycle (even if the DTC has been demoted). This is because it is important to bring the problem to the drivers attention. On the following Ignition cycle, the demotion conditions will be re-checked. If the demotion conditions occur, the lamp will be turned off. It will be held on until DTC demotion checking is completed.
2. 'Non critical' faults are those that can occur temporarily e.g. vehicle battery under voltage. The lamp is therefore turned off when the DTC demotion condition occurs.

DTC Description

This DTC indicates that the TREAD(Tire Under Inflation / Leak Warning) / DTC Warning lamp is short circuit and therefore cannot be turned on. The most likely failure is harness / instrument cluster / connector / receiver short circuit.

DTC Detecting Condition

Item	Detecting Condition	Possible cause
DTC strategy	• Input lamp current check	• Short circuit to 12 V between lamp and TPMS receiver
Enable conditions	• TREAD / Diagnostic lamp circuit short to 12 V	
Threshold value	• TREAD / Diagnostic lamp - 200 mA allowed each (after in rush time). 50 mA margin built in.	
Diagnosis time	• < 3s	

Terminal and Connector Inspection

1. Many malfunctions in the electrical system are caused by poor harness and terminal condition. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check all connectors (and connections) for looseness, bending, corrosion, contamination, deterioration, and/or damage.
3. Has a problem been found?

YES

▶ Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

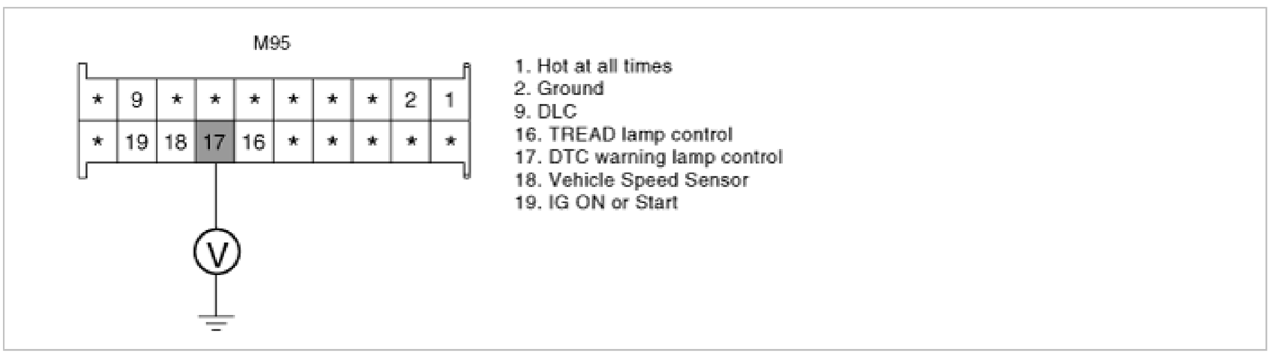
NO

▶ Go to "Control Circuit Inspection" procedure.

Control Circuit Inspection

1. Engine "OFF".
2. Disconnect instrument cluster connector and TPM receiver connector.
3. Engine "ON".
4. Measure voltage between terminal "17" of TPMS receiver harness connector and chassis ground.

Specification : 0 V



5. Is the measured voltage within specifications?

YES

▶ Substitute with a known-good TPM receiver and check for proper operation.
▶ If the problem is corrected, replace TPM receiver and then go to "Verification of Vehicle Repair" procedure.

NO

▶ Check for short to power in control harness.
▶ Repair if necessary and then go to "Verification of Vehicle Repair" procedure.

Verification of Vehicle Repair

After a repair, it is essential to verify that the fault has been corrected.

1. Connect TPMS exciter or scantool and select "Diagnostic Trouble Codes(DTCs)" mode
2. Using a TPMS exciter or scantool, Clear DTC.

3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.
