Automatic Transaxle System > General Information > Specifications

SPECIFICATION

Automatic transaxle type		A5HF1
Recommanded transaxle oil		Diamond ATF SP III or SK ATF SP III
Oil quantity		10.9 Liter (Only for the reference)
Oil inspection and supplement		Every one year or every 24,000 km
Replacement	Private use (Normal use)	No service required
	Private use (Severe use)	Every 48,000 Km in severe use(1~4)
	Business use	1. Driving on rough road(bumpy road, gravel road, snowy road, unpaved road etc.) 2. Driving on mountain road, ascent/descent 3. Repetition of short distance driving 4. More than 50% operation in heavy city traffic during hot weather above 32°C 5. Police, Taxi. Commercial type operation
Engine type		3.3 DOHC
Gear ratio	1st	3.789
	2nd	2.064
	3rd	1.421
	4th	1.034
	5th	0.728
	Reverse	3.808
	Final reduction gear ratio	3.333

SERVICE STANDARD

ITEM	VALUE (mm/inch)
Input shaft end play	0.7~1.45 / 0.0276~0.0571
Low & Reverse brake pressure plate end play	1.65~2.11 / 0.0650~0.0831
Reaction plate snap end play	0~0.16 / 0~0.0063
2ND brake pressure plate end play	1.09~1.55 / 0.0429~0.0610
Underdrive sun gear end play	0.25~0.45 / 0.0098~0.0177
Differential bearing spacer end play	0.045~0.105 / 0.0018~0.0041
Underdrive clutch snap ring end play	1.6~1.8 / 0.0630~0.0709
Direct clutch reaction plate snap ring end play	0.6~0.8 / 0.0236~0.0315
Reverse clutch snap ring end play	0~0.09 / 0~0.0035
Overdrive clutch snap ring end play	1.0~1.2 / 0.0394~0.0472
Reverse clutch reaction plate snap ring end play	1.5~1.7 / 0.0591~0.0669

TIGHTENING TORQUE

ITEM	Nm	Kgf.cm	lb-ft
Transfer drive gear	31.4~36.3	320.0~370.0	23.1~26.8
Rear cover	19.6~25.5	200.0~260.0	14.5~18.8
Anchor plug	83.4~112.8	850.0~1150.0	61.5~83.2
Oil pump pipe	9.8~11.8	100.0~120.0	7.2~8.7
Oil pump	19.6~25.5	200.0~260.0	14.5~18.8
Torque converter housing	42.0~54.0	428.0~551.0	31.0~39.9

Valve body	9.8~11.8	100.0~120.0	7.2~8.7
VFS reservoir	9.8~11.8	100.0~120.0	7.2~8.7
Detent spring	4.9~6.9	50.0~70.0	3.6~5.1
Valve body cover	9.8~11.8	100.0~120.0	7.2~8.7
Vehicle speed sensor	3.9~5.9	40.0~60.0	2.9~4.3
Inhibiter switch	9.8~11.8	100.0~120.0	7.2~8.7
Manual control lever	17.7~24.5	180.0~250.0	13.0~18.1
Input/Output speed sensors	9.8~11.8	100.0~120.0	7.2~8.7
Reduction brake piston rod fixing nut	14.7~24.5	150.0~250.0	10.8~18.1
Sub frame bracket	88.3~107.9	900.0~1100.0	65.1~79.6
Valve body inside seperating plate	4.9~6.9	50.0~70.0	3.6~5.1
Valve body cover seperating plate	9.8~11.8	100.0~120.0	7.2~8.7
Direct planetary carrier lock nut	156.9~176.5	1600.0~1800.0	115.7~130.2

SEALANTS

Rear cover liquid gasket	Specified sealant
Rear cover liquid gasket	Threebond 1281B or LOCTITE FMD-546
Torque converter housing liquid gasket	
Valve body liquid gasket	

Snap rings, spacers, thrust washers&races and pressure plates for adjusting

Part name	Part No.	Thickness[mm(inch)]	Identification
Thrust washer (for input shaft end play)	45544-39180	1.8 (0.0709)	
	45544-39200	2.0 (0.0787)	
	45544-39220	2.2 (0.0866)

Automatic Transaxle System > General Information > Special Service Tools

SPECIAL TOOLS

Tool (Number and name)	Illustration	Use
09453-3A110 Spring compressor		- Removal and installation of one way clutch inner race snap ring
09431-39000 Oil seal installer		- Installation of differential bearing output race
09456-39100 Clearance dummy plate		- Installation of brake pressure plate
09454-3A110 Reduction socket		- Adjustment of reduction brake piston rod
09452-21200 Oil pump oil seal installer		- Installation of oil seal in a oil pump

09453-24000 Snap ring compressor		- Removal and installation of under drive clutch snap ring
09453-4C400 Spring compressor		- Removal and installation of direct clutch snap ring - Removal and installation of reverse&over drive clutch spring retainer snap ring
09215-3C000 Oil fan remover		- Removal of valve body cover
09455-21100 Bearing installer		- Installation of the ball bearing and the transfer drive gear
09457-22000 Removing plate		- Removal of the differential bearing, the transfer shaft bearing and drive gear bearing

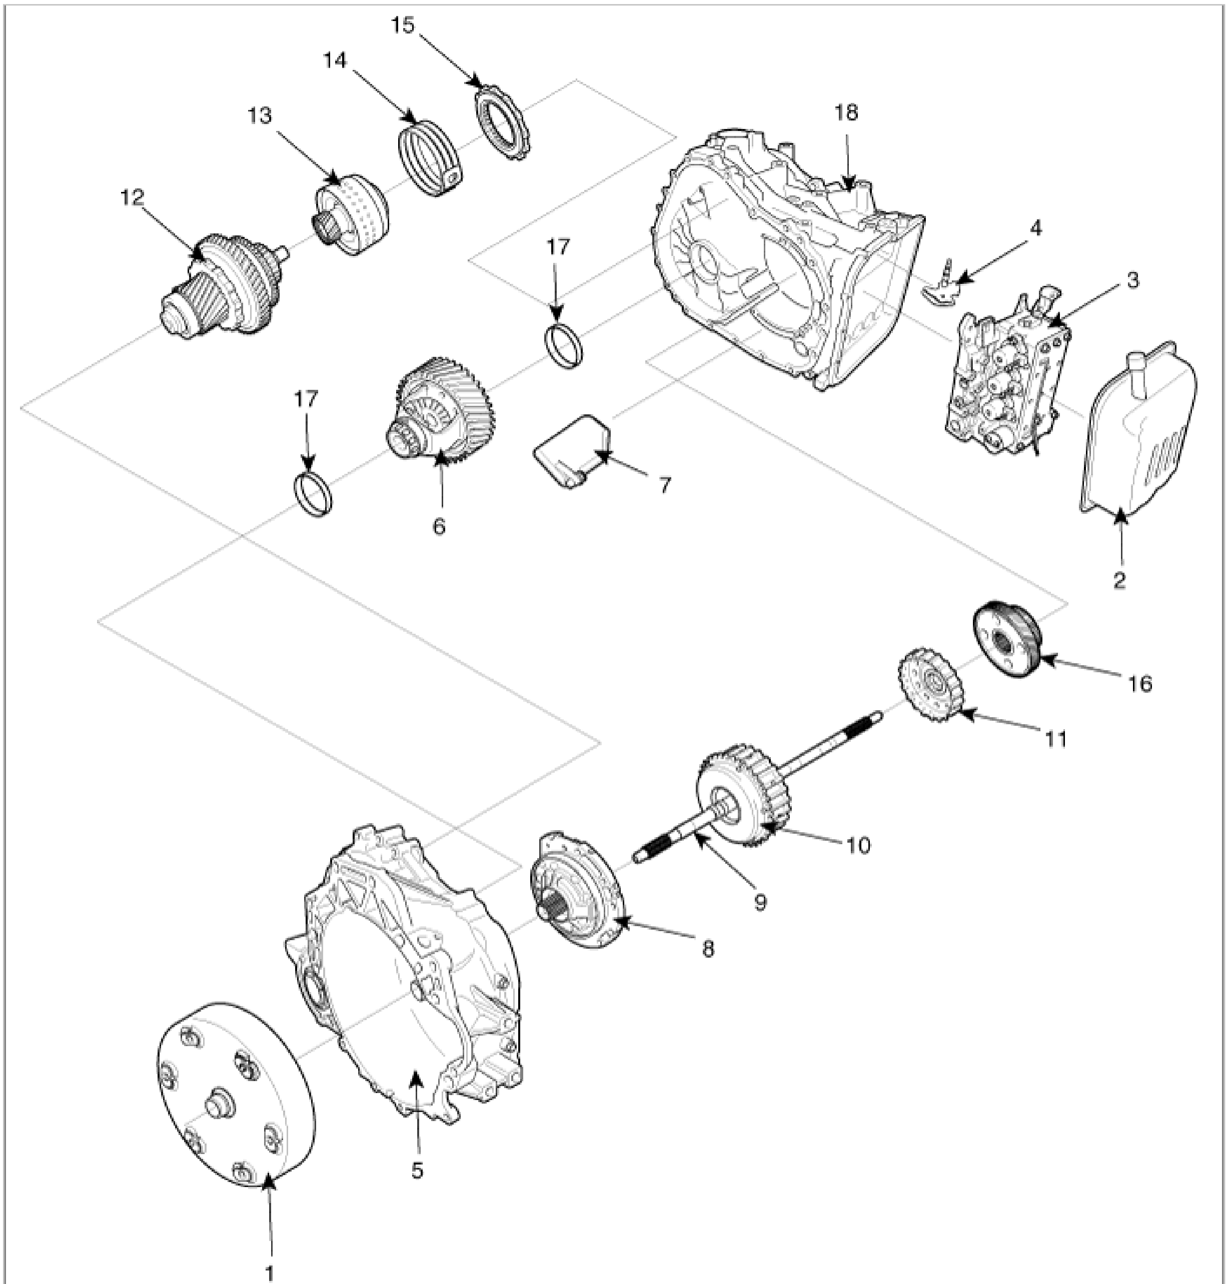
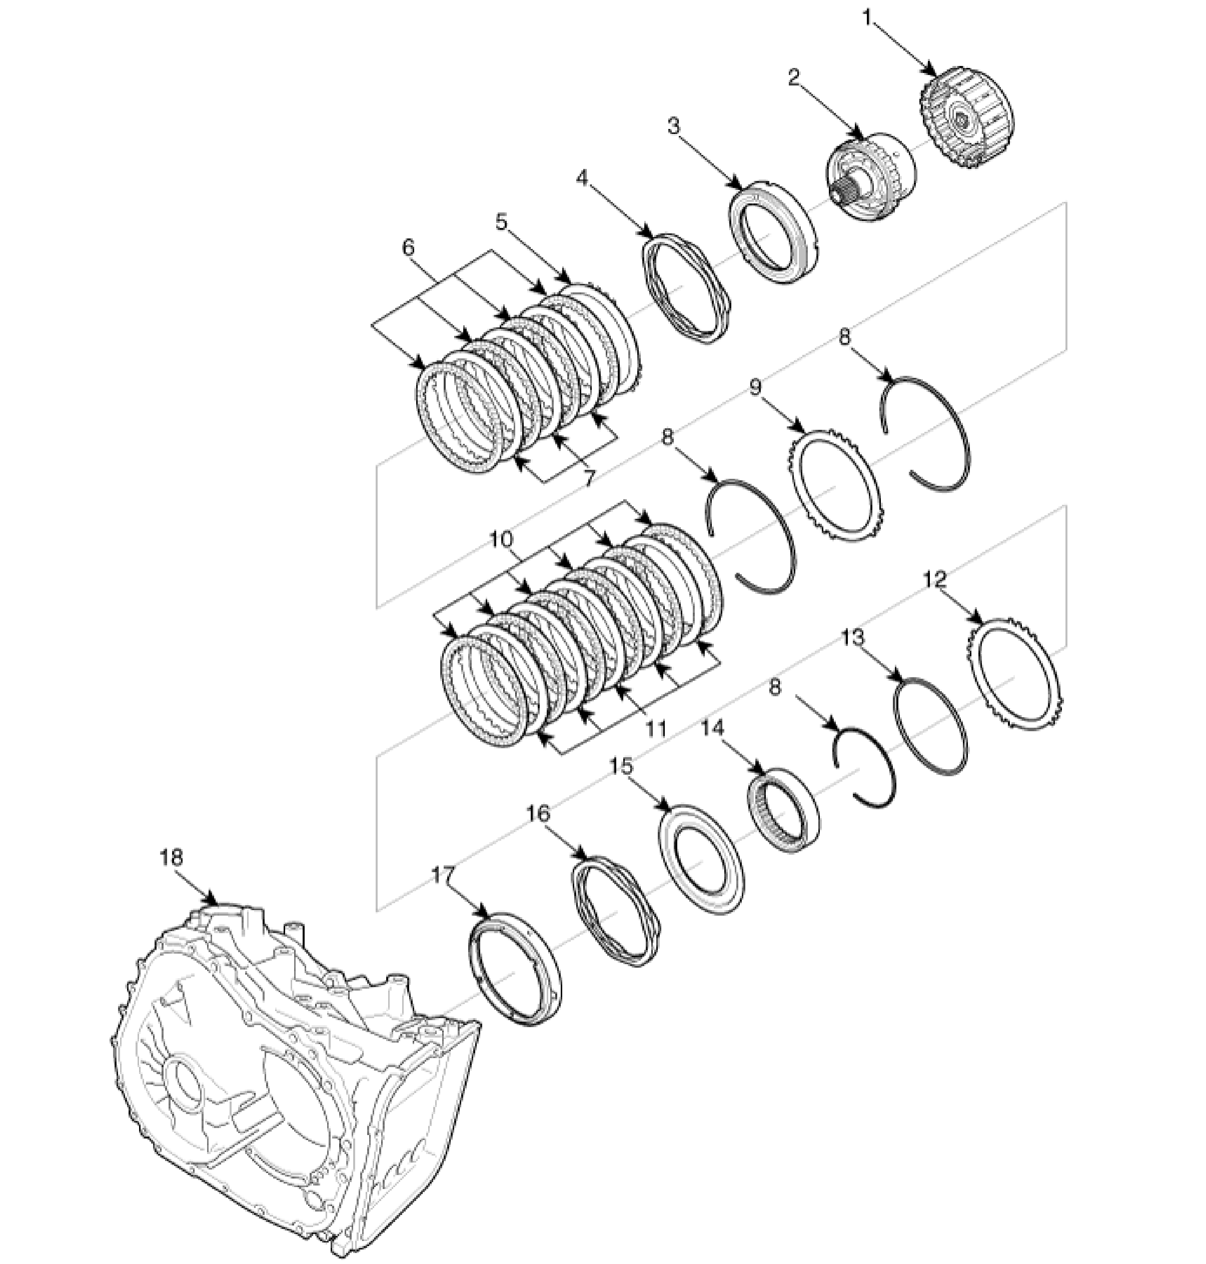
COMPONENTS(1)



1. Torque converter
2. Valve body cover
3. Valve body assembly
4. Manual control shaft assembly
5. Converter housing
6. Differential assembly
7. Main oil filter
8. Oil pump
9. Input shaft
10. Underdrive clutch assembly
11. Underdrive clutch hub
12. Direct planetary carrier assembly
13. Direct clutch assembly
14. Reduction brake bend
15. One way clutch
16. Transfer drive gear
17. Differential bearing race
18. Transaxle case

COMPONENTS(2)



1. Reverse sun gear	7. 2nd brake plates	13. Wave spring
2. Planetary gear assembly	8. Snap ring	14. Oneway clutch inner race
3. 2nd brake retainer	9. Brake reaction plate	15. Brake spring retainer
4. 2nd brake return spring	10. Brake discs	16. Low&Reverse brake return spring
5. 2nd brake pressure plate	11. Brake plates	17. Low&Reverse brake piston
6. 2nd brake discs	12. Low&Reverse brake pressure plate	18. Transaxle case

Automatic Transaxle System > Automatic Transaxle System > Automatic Transaxle > Repair procedures

REMOVAL

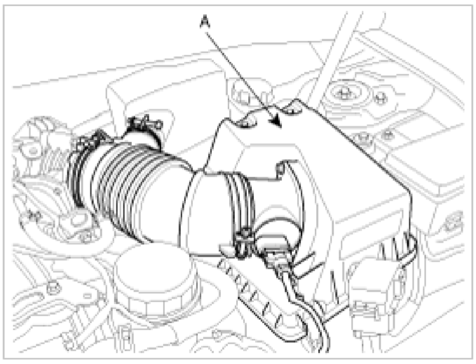
CAUTION

- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

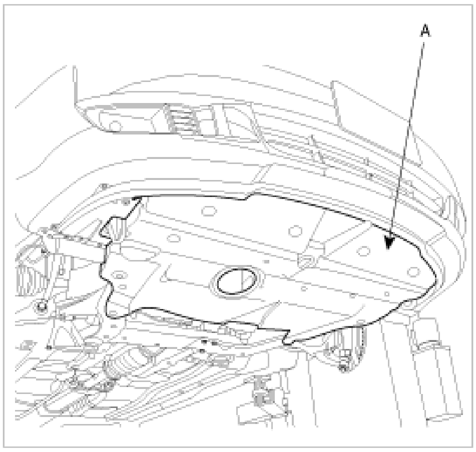
NOTE

- Mark all wiring and hoses to avoid misconnection.
- Turn the crankshaft pulley so that the No.1 piston is at top dead center. (See "EM" group)

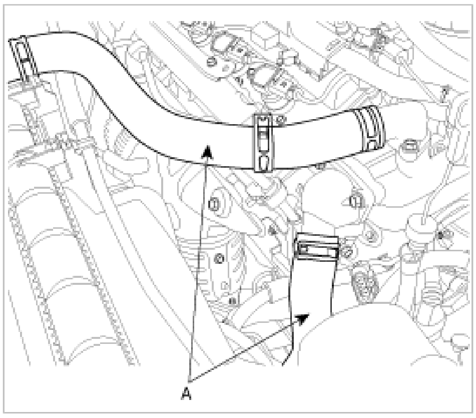
1. Disconnect the negative terminal from the battery.
2. Remove the engine cover.
3. Remove the air duct.
4. Remove the intake air hose and air cleaner assembly.
   (1) Disconnect the AFS connector.
   (2) Disconnect the breather hose from air cleaner hose.
   (3) Disconnect the PCM connectors. (See FL group)
   (4) Remove the intake air hose and air cleaner (A).



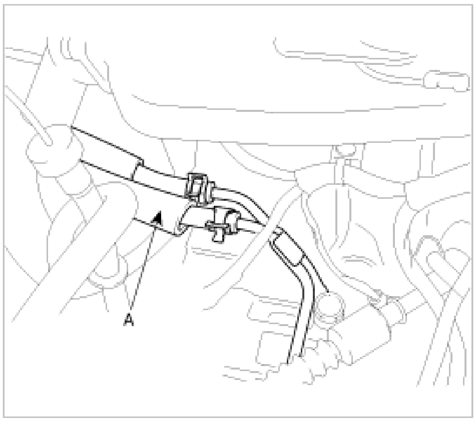
5. Remove the front wheels.
6. Remove the under cover(A).



7. Drain the engine coolant and remove the radiator cap to speed up draining.
8. Remove the upper radiator hose and the lower radiator hose(A).



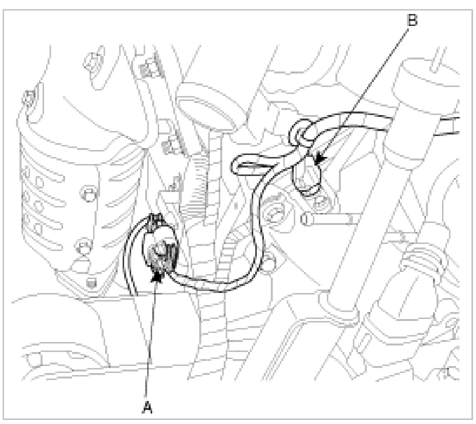
9. Remove transaxle oil cooler hose(A).



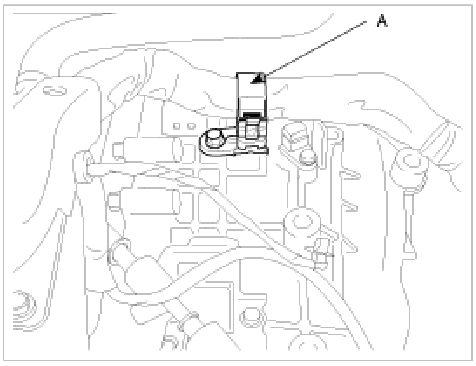
10. Remove engine wiring.
    (1) Disconnect RH oxygen sensor connector(A).

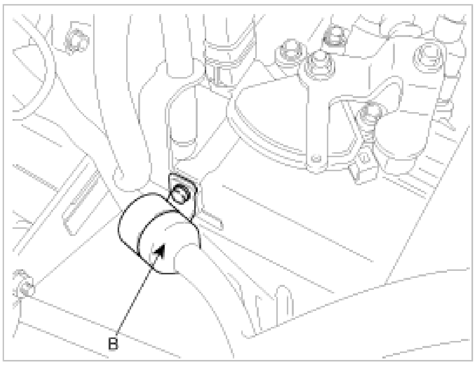
    (2) Disconnect LH front oxygen sensor connector(A).

    (3) Disconnect LH rear oxygen sensor connector(A) and CPS connector(B).

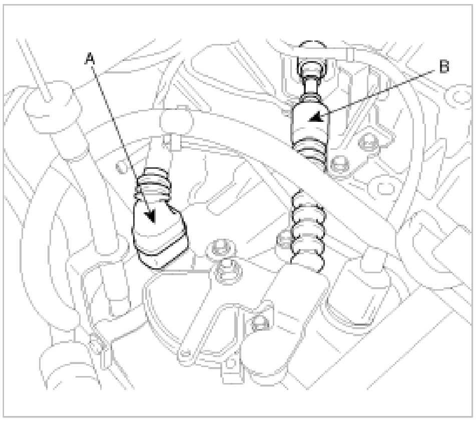


11. Disconnect the transaxle wire harness connector and remove transaxle control cable.
    (1) Remove the wiring brackets(A, B).

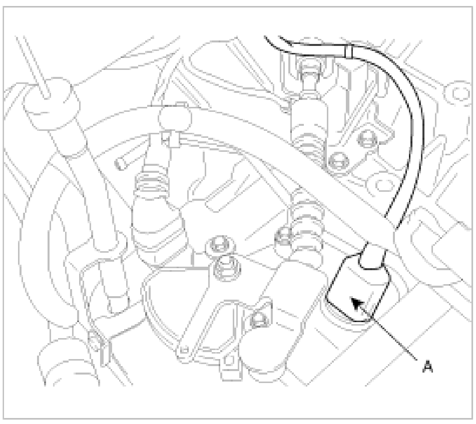




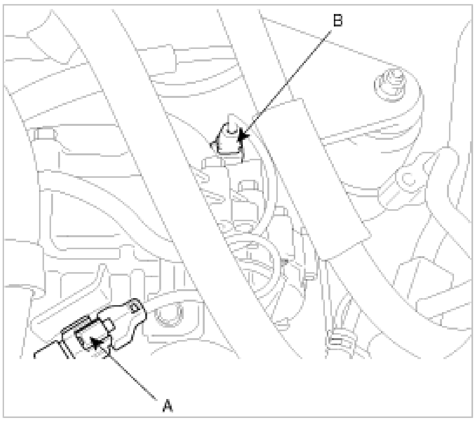
(2) Remove the inhibiter switch connector(A) and shift cable(B).



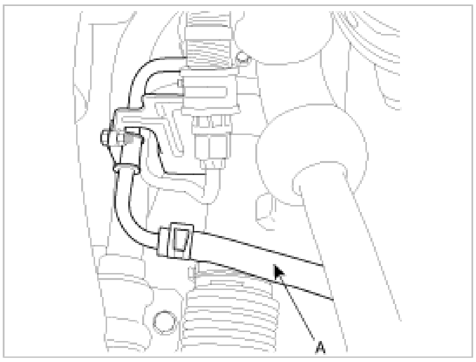
(3) Remove the solenoid valve connector(A).



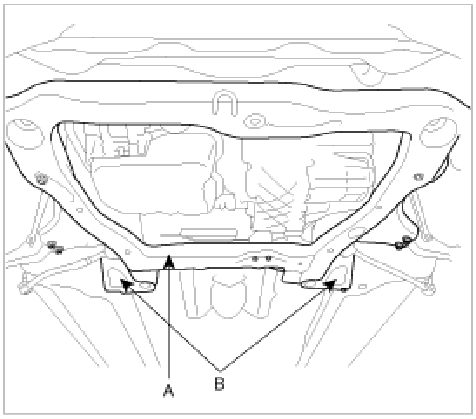
(4) Remove the input speed sensor, output speed sensor(A) and vehicle speed sensor connector(B).



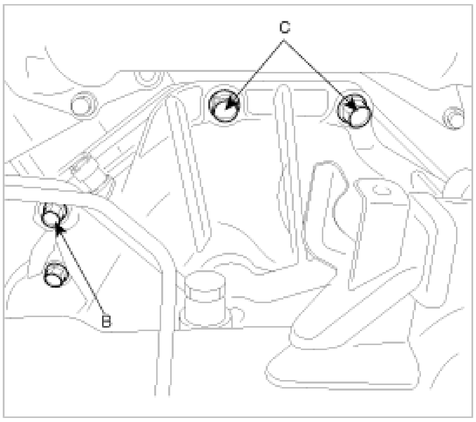
12. Disconnect EPS connector.
13. Remove power steering pump hose(A).

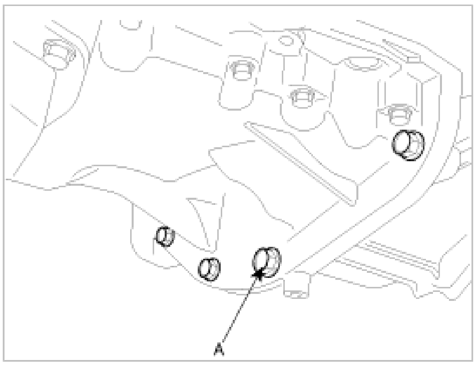


14. Using the SST(09200-38001), hold the engine and transaxle assembly safely.
15. Drain transaxle oil.
16. Remove lower arm ball joint. (See 'DS' group)
17. Remove tie rod end ball joint. (See 'DS' group)
18. Remove stabilizer bar link. (See 'SS' group)
19. After removing a split pin and nut from the steering bar tie rod, disconnect it. (Refer to 'ST'-group)
20. Remove front roll stopper mounting bolt.
21. Remove rear roll stopper mounting bolt.
22. Remove steering u-joint mounting (See 'ST' group)
23. Remove front exhaust pipe.
24. Supporting the cross member(A) with a jack, remove the stays(B) with the mounting bolts.



25. Remove the cross member.
26. Remove drive shaft from transaxle. (See 'DS' group)
27. Install a jack for supporting the transaxle assembly.
28. Remove the transaxle mounting bolts(A, B, C).





29. Lower the vehicle and remove the transaxle mounting bracket.
30. Jack up the vehicle and disassemble the transaxle assembly.

INSTALLATION

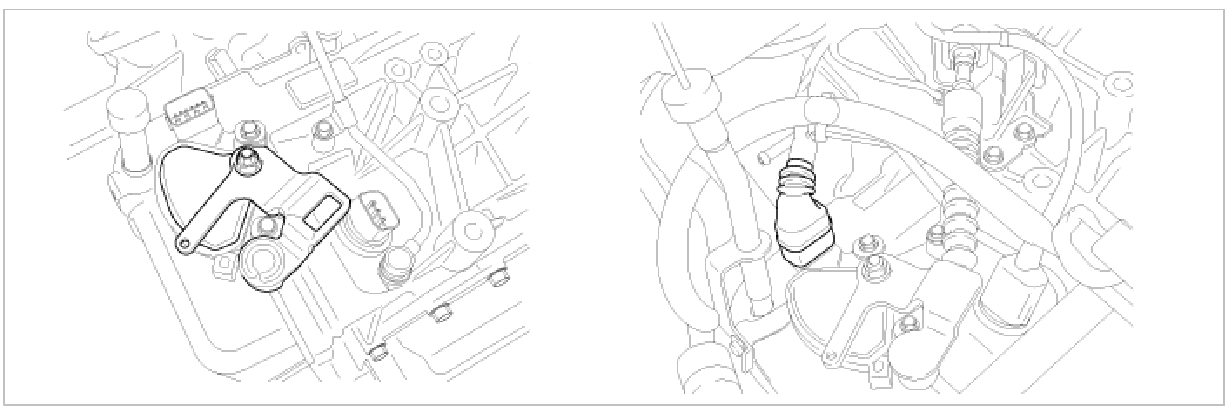
Installation is in the reverse order of removal.
Perform the following :

- Adjust the shift cable.
- Adjust the throttle cable.
- Refill the engine with engine oil.
- Refill the transaxle with fluid.
- Refill the radiator with engine coolant.
- Bleed air from the cooling system with the heater valve open.
- Clean the battery posts and cable terminals with sandpaper, assemble them, and apply grease to prevent corrosion.
- Inspect for fuel leakage.

After assembling the fuel line, turn on the ignition switch (do not operate the starter) so that the fuel pump runs for approximately two seconds and fuel line pressurizes.
Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.

Automatic Transaxle System > Troubleshooting > P0707

COMPONENT LOCATION



GENERAL DESCRIPTION

Transaxle range switch sends information of the shift lever position to the PCM by using 12V(the battery voltage). By detecting the position of the transaxle range, to start the engine is possible only when the gear position is in the parking or neutral position and the back up lamp is on only in reverse position.

DTC DESCRIPTION

The PCM sets this code when the transaxle range switch has no output signal for more than 30 seconds.

DTC DETECTING CONDITION

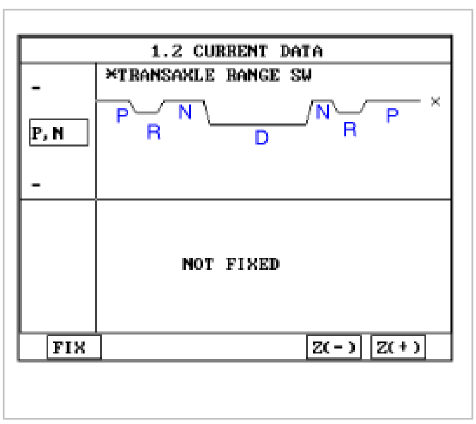
Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check for no signal	• Open or short in circuit • Faulty TRANSAXLE RANGE SWITCH • Faulty PCM
Enable Conditions	• Engine state=Run • PRNDL Diag disabling fault present flag=FALSE • Battery Voltage>11V and<16 V • Throttle position≥ 3%	
Threshold value	• No signal detected	
Diagnostic Time	• More than 30sec	
Fail Safe	• If there are no or multiple signals from the transaxle range switch, the PCM will continue to control with the signal which is detected just before DTC occurs.	

SPECIFICATION

Inspection condition		Reference value
* IG KEY : ON or Engine stall	Shift lever : P	P,N
	Shift lever : R	R
	Shift lever : N	P,N
	Shift lever : D	D

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Ignition "ON" & Engine "OFF".
3. Monitor the "TRANSAXLE RANGE SWITCH" parameter on the scantool.
4. Move selector lever from "P" range to other range.



5. Does "TRANSAXLE RANGE SWITCH" follow the reference data?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification vehicle Repair" procedure.

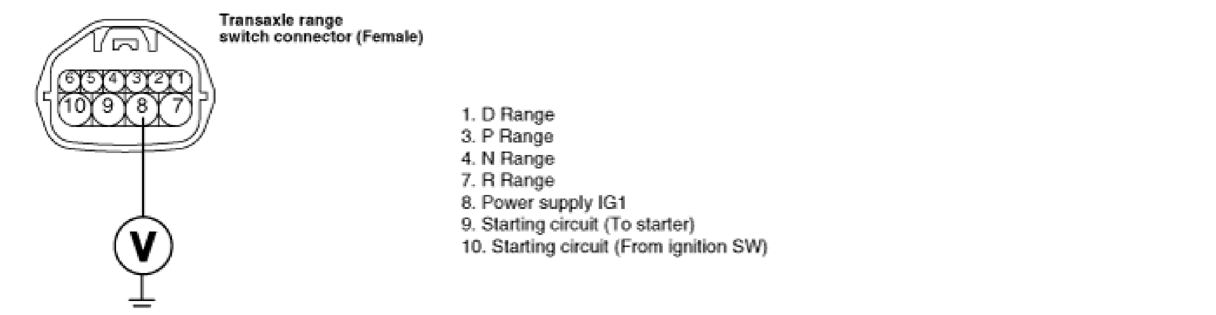
NO

▸ Go to "Power supply circuit inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. CHECK POWER TO RANGE SWITCH
   (1) Disconnect "TRANSAXLE RANGE SWITCH" connector.
   (2) Ignition "ON" & Engine "OFF".
   (3) Measure voltage between teminal "8" of the sensor harness connector and chassis ground.

Specification : approx. B+



(4) Is voltage within specifications?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

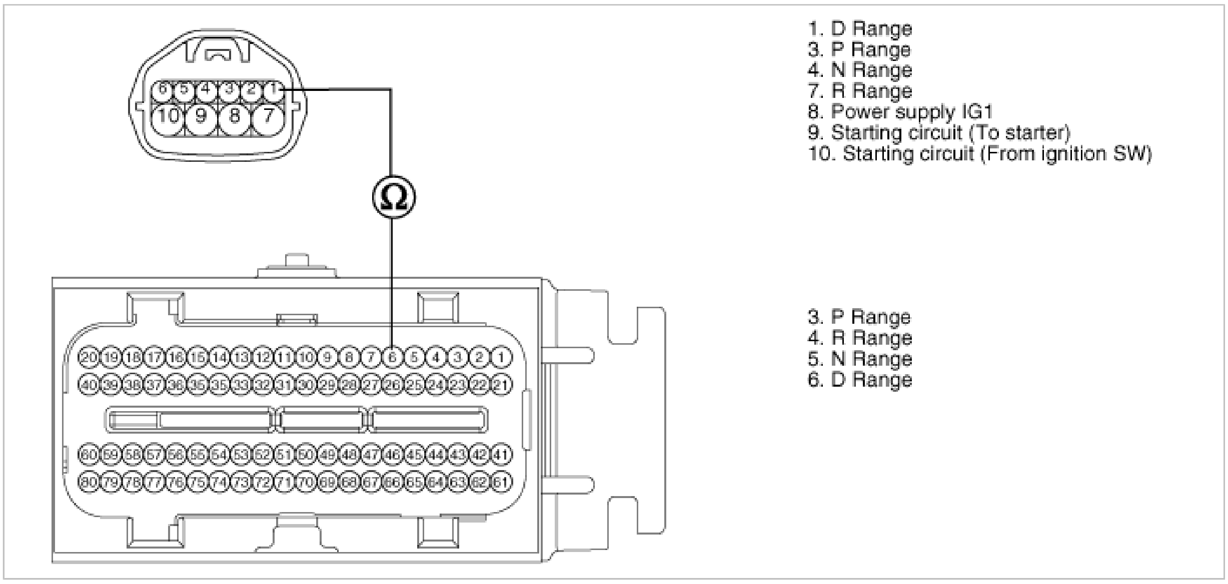
▸ Check that Fuse 10A is installed or not blown.
▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect "TRANSAXLE RANGE SWITCH" and "PCM" connector.
3. Measure resistance between each teminal of the sensor harness connector and PCM harness connector as below.

Specification : Shown below

Pin No of "TRANSAXLE RANGE SWITCH"	No.1	No.3	No.4	No.7
Pin No of "PCM" harness	A-No.6	A-No.3	A-No.5	A-No.4
Specification	0Ω	0Ω	0Ω	0Ω



4. Is resistance within specifications?

YES

▸ Go to "Component inspection" procedure.

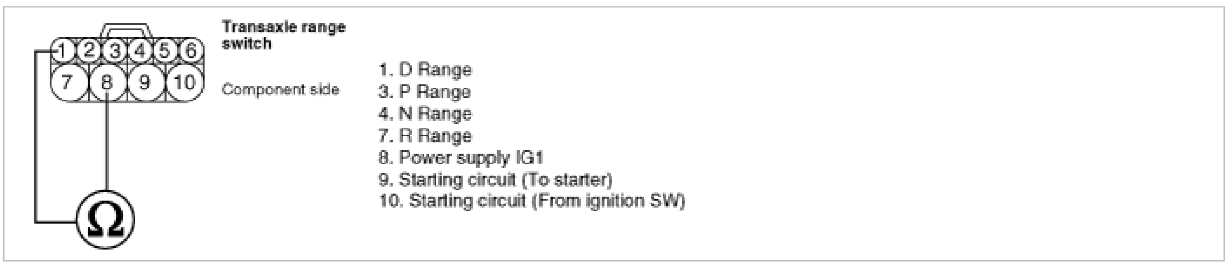
NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Remove "TRANSAXLE RANGE SWITCH".
3. Measure the resistance between each terminal of the sensor.

Specification : approx. 0 Ω



Range	Terminal Number									
	1	2	3	4	5	6	7	8	9	10
P			○					○	○	○
R							○	○		
N				○				○	○	○
D	○							○		

[RANGE SWITCH continuity check table]

4. Is resistance within specifications?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Replace "TRANSAXLE RANGE SWITCH" as necessary and go to "Verification vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present?

YES

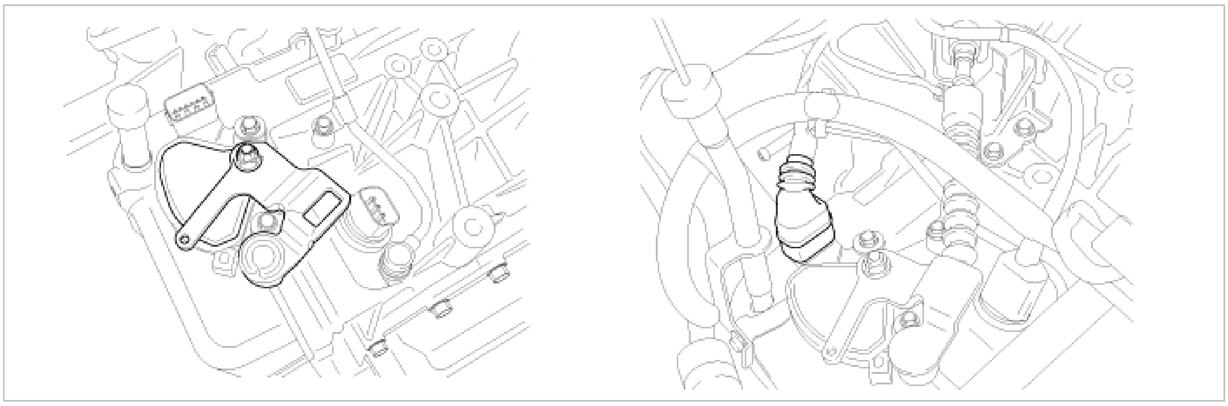
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0708

COMPONENT LOCATION



GENERAL DESCRIPTION

Transaxle range switch sends information of the shift lever position to the PCM by using 12V(the battery voltage). By detecting the position of the transaxle range, to start the engine is possible only when the gear position is in the parking or neutral position and the back up lamp is on only in reverse position.

DTC DESCRIPTION

The PCM sets this code when the transaxle range switch has two or more output signals for more than 30 seconds.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check for No signal	• Open or short in TRANSAXLE RANGE SWITCH • Faulty TRANSAXLE RANGE SWITCH • Faulty PCM
Enable Conditions	• Engine state=Run • Battery Voltage>11V and<16 V	
Threshold value	• Multiple signal	
Diagnostic Time	• More than 30sec	
Fail Safe	• If there are no or multiple signals from the transaxle range switch, the PCM will continue to control with the signal which is detected just before DTC occurs.	

SPECIFICATION

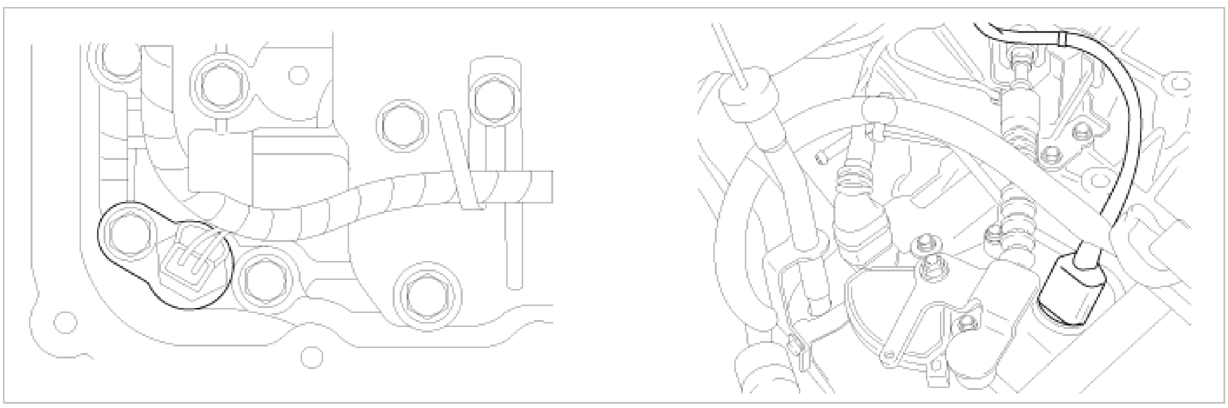
Automatic Transaxle System > Troubleshooting > P0711

COMPONENT LOCATION



GENERAL DESCRIPTION

The oil temperature sensor is installed in the valve body and uses a thermistor that resistance changes by temperature change. PCM offers 5V as a reference voltage and the output voltage changes according to the ATF's temperature. The oil temperature sensor signal is important information in detecting torque converter clutch operation or non-operation area, the oil temperature sensor's variable controlling and oil pressure's controlling at shifting.

DTC DESCRIPTION

PCM displays this code if it detects the condition below for more than 1 second. PCM regards that the ATF's oil temperature is 85°C(185°F) since this code is sensed.

DTC DETECTING CONDITION

Item		Detecting Condition & Fail Safe	Possible cause
DTC Strategy		• Check rationality	• Sensor signal circuit is short to ground • Faulty sensor • Faulty PCM
Enable Conditions	**Case 1**	• Intake air temperature(IAT)>-25°C(-13°F) • Engine state=Run • No errors in relative sensors • Engine should be cool enough	
	Case 2	• Intake air temperature(IAT)>-25°C(-13°F) • Engine state=Run • No errors in relative sensors • Engine should be cool enough	
Threshold value	**Case 1**	• Temperature difference between TM oil temp and coolant temp >20°C(68°F) • TM oil temp >coolant temp	
	Case 2	• Temperature difference between TM oil temp and coolant temp >20°C(68°F) • TM oil temp >coolant temp • Absolute value of temperature difference between minimum IAT and coolant temp at key on< 10°C(50°F) • Absolute value of temperature difference between maximum IAT and coolant temp at key on< 10°C(50°F)	
Diagnostic Time		• 1 second	
Fail Safe		• Fluid temperature is regarded as 85°C(185°F)	

SPECIFICATION

Temp.[°C(°F)]	Resistance(kΩ)	Temp.[°C(°F)]	Resistance(kΩ)
-40(-40)	139.5	80(176)	1.08
-20(-4)	47.7	100(212)	0.63
0(32)	18.6	120(248)	0.38
20(68)	8.1	140(284)	0.25
40(104)	3.8	160(320)	0.16
60(140)	1.98		

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   ▸ Repair as necessary and go to "Verification vehicle repair" procedure.

   NO

   ▸ Go to "Component inspection" procedure.

COMPONENT INSPECTION

1. CHECK "TRANSAXLE FLUID TEMPERATURE SENSOR"

   (1) Ignition "OFF".

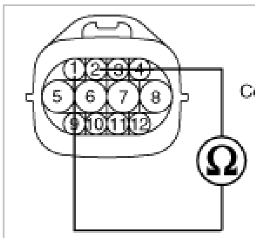
   (2) Disconnect the "TRANSAXLE FLUID TEMPERATURE SENSOR" connector.

(3) Measure the resistance between terminals "1" and "2" of the "TRANSMISSION FLUID TEMPERATURE SENSOR".

Specification : Refer to "Reference data"

[REFERENCE DATA]

Temp.[°C(°F)]	Resistance(kΩ)	Temp.[°C(°F)]	Resistance(kΩ)
-40(-40)	139.5	80(176)	1.08
-20(-4)	47.7	100(212)	0.63
0(32)	18.6	120(248)	0.38
20(68)	8.1	140(284)	0.25
40(104)	3.8	160(320)	0.16
60(140)	1.98		



(4) Is resistance within specifications?

YES

▸ Go to "CHECK PCM" as below.

NO

▸ Replace "TRANSAXLE FLUID TEMPERATURE SENSOR" as necessary and go to "Verification vehicle repair" procedure.

2. CHECK PCM

(1) Ignition "ON" & Engine "OFF".

(2) Connect "TRANSAXLE FLUID TEMPERATURE SENSOR" connector.

(3) Install scantool and select a SIMU-SCAN.

(4) Simulate voltage (0→5V) to "TRANSMISSION FLUID TEMPERATURE SENSOR" signal circuit.

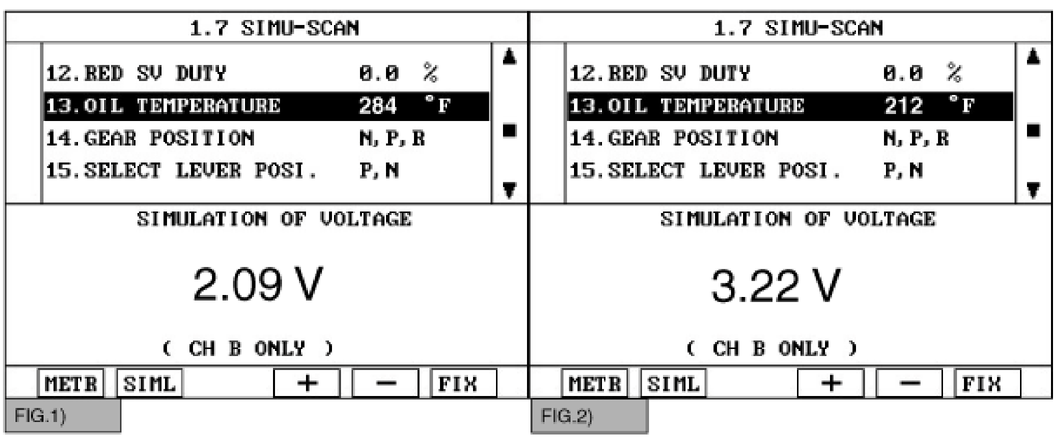


FIG.1) INPUT 2.09V → 140°C(284°F)
FIG.2) INPUT 3.22V → 100°C(212°F)

※ The values are subject to change according to vehicle model

(5) Is FLUID TEMP. SENSOR signal value changed according to simulation voltage?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM as necessary and then go to "Verification of vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

NO

▸ System performing to specification at this time.

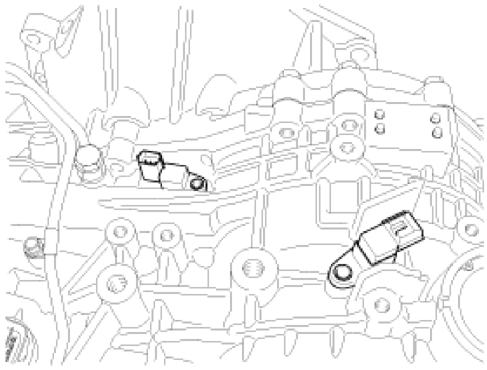
Automatic Transaxle System > Troubleshooting > P0717

COMPONENT LOCATION



GENERAL DESCRIPTION

The input(turbine) speed sensor outputs pulse-signals according to the revolutions of the input shaft of the transmission. The PCM determines the input shaft speed by counting the frequency of the pulses. This value is mainly used to control the optimum fluid pressure during shifting.

DTC DESCRIPTION

The PCM sets this code if an output pulse-signal is not detected from the input speed sensor, when the vehicle is running faster than 30 km/h. The Fail-Safe function will be set by the PCM if this code is detected.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Speed rationality check	• Signal circuit is open or short • Sensor power circuit is open • Sensor ground circuit is open • Faulty INPUT SPEED SENSOR • Faulty PCM
Enable Conditions	• Engine state=Run • Vehicle Speed >30km/h • Engine RPM at current gear 1 or 2 or Non conditional VRPM when gear is not 1 or 2 >1000rpm • Battery voltage >11V and <16 V • AT oil temp. ≥ -23°C(-9.4°F) • No error in speed sensors	
Threshold value	• No signal	
Diagnostic Time	• More than 1sec	
Fail Safe	• The gear shift position is recognized as follows. 'P' range → realization as 'N' range1 'R' range → realization as 'R' range1 'N' range → realization as 'N' range 'D' range → realization as 3 range SPT mode → CAN shift 2~3 range	

SIGNAL WAVEFORM

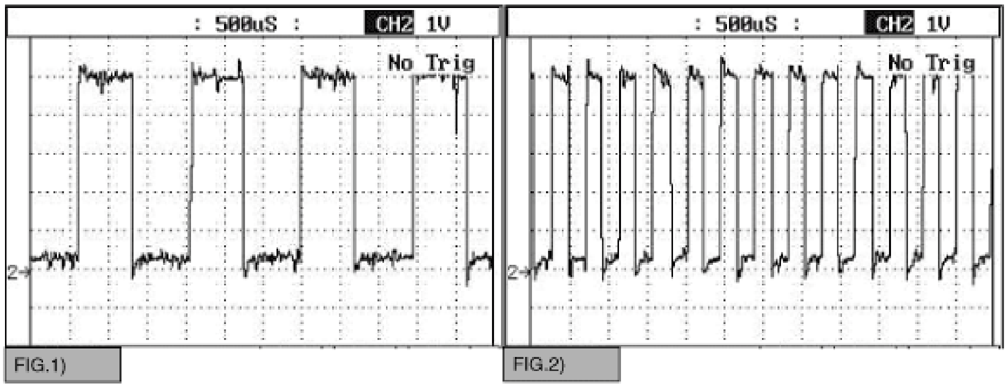


FIG.1) Idling
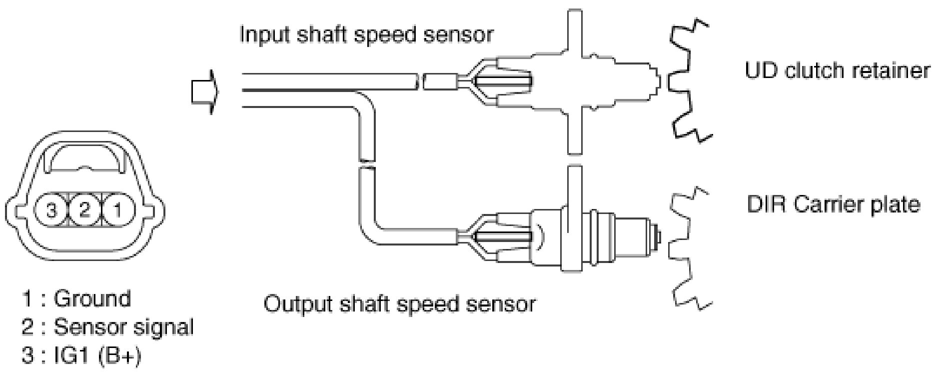
FIG.2) Accelerating

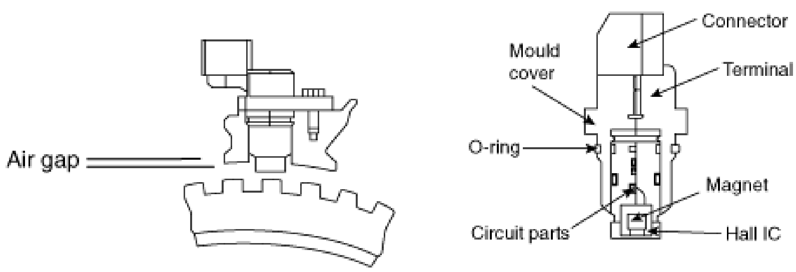
SPECIFICATION

Input shaft & Output shaft speed sensor

- Type : Hall sensor
- Current consumption : 22mA(MAX)
- Sensor body and sensor connector have been unified as one.



Air gap (mm)	Input shaft speed sensor	1.3
	Output shaft speed sensor	0.85
Insulation Resistance	Input shaft speed sensor	over 1MΩ
	Output shaft speed sensor	over 1MΩ
Peak-Peak Voltage	High	more than 4.8V
	Low	less than 0.8V



MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON" .
3. Monitor the "INPUT SPEED SENSOR" parameter on the scantool
4. Driving at speed of over 30 Km/h(19 mph).

Specification : Increasing Gradually

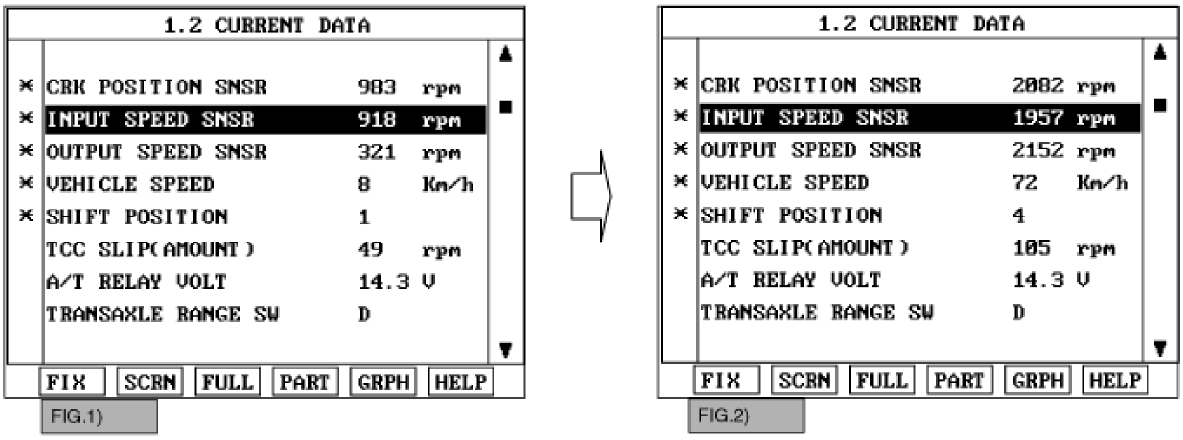


FIG.1) Idling
FIG.2) Accelerating

5. Does "input speed sensor " follow the reference data?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system may be caused from poor harness and terminals. These faults can be caused by interference from other electrical systems and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification vehicle repair" procedure.

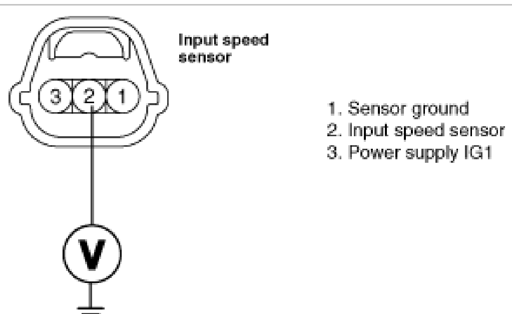
NO

▸ Go to "Signal circuit inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "INPUT SPEED SENSOR" connector.
3. Measure voltage between terminal "2" of the INPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. 5V



4. Is voltage within specification?

YES

▸ Go to "Power supply circuit inspection" procedure.

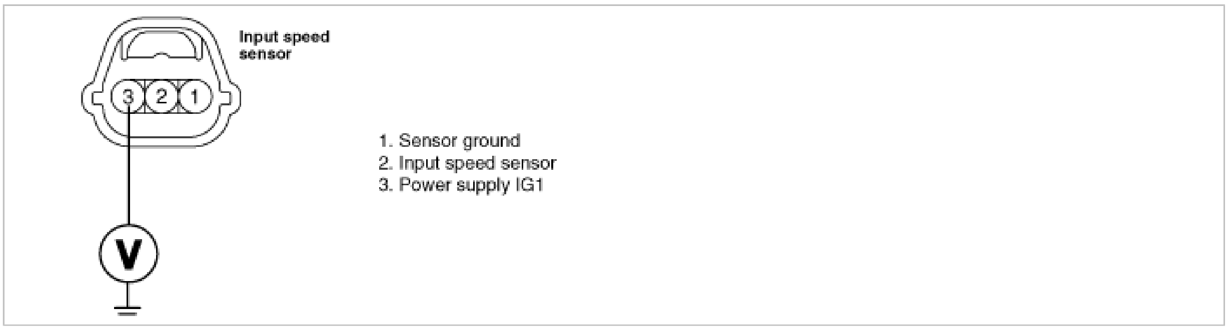
NO

- Check for open or short in harness. Repair as necessary and Go to "Verification vehicle repair" procedure.
- If signal circuit in harness is OK, go to "Check PCM" of the "Component inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "INPUT SPEED SENSOR" connector.
3. Measure voltage between terminal "3" of the INPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. B+



4. Is voltage within specification ?

YES

- Go to "Ground circuit inspection" procedure.

NO

- Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "INPUT SPEED SENSOR" connector.
3. Measure resistance between terminal "1" of the INPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. 0 Ω

4. Is resistance within specification ?

YES

- Go to "Component inspection" procedure.

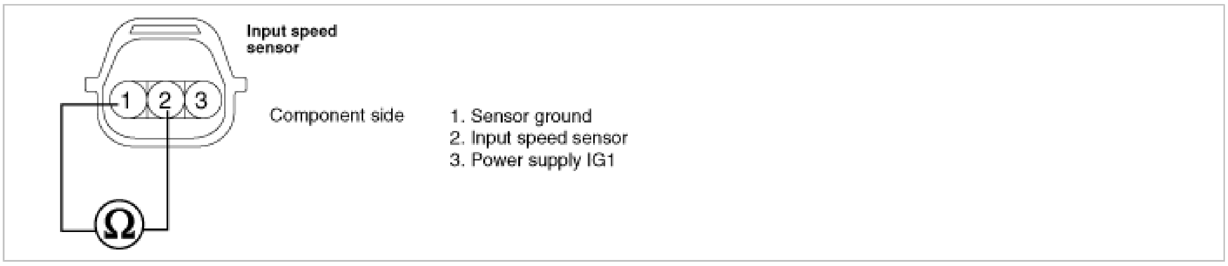
NO

- Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.
- If ground circuit in harness is OK, go to "Check PCM" of the "Component inspection" procedure.

COMPONENT INSPECTION

1. Check "INPUT SPEED SENSOR"
   (1) Ignition "OFF".
   (2) Disconnect the "INPUT SPEED SENSOR" connector.
   (3) Measure resistance between terminal "1","2" and "2","3" and "1","3" of the "INPUT SPEED SENSOR" connector.

Specification : Refer to "Reference data"



(4) Is resistance within specifications?

[REFERENCE DATA]

Air gap (mm)	Input shaft speed sensor	1.3
	Output shaft speed sensor	0.85
Insulation Resistance	Input shaft speed sensor	over 1MΩ
	Output shaft speed sensor	over 1MΩ
Peak-Peak Voltage	High	more than 4.8V
	Low	less than 0.8V

YES

▸ Go to "CHECK PCM" as below.

NO

▸ Replace "INPUT SPEED SENSOR" as necessary and go to "Verification vehicle repair" procedure.

2. CHECK PCM

(1) Ignition "ON" & Engine "OFF".

(2) Connect "INPUT SPEED SENSOR" connector.

(3) Install scantool and select a SIMU-SCAN.

(4) Simulate frequency to INPUT SPEED SENSOR signal circuit.

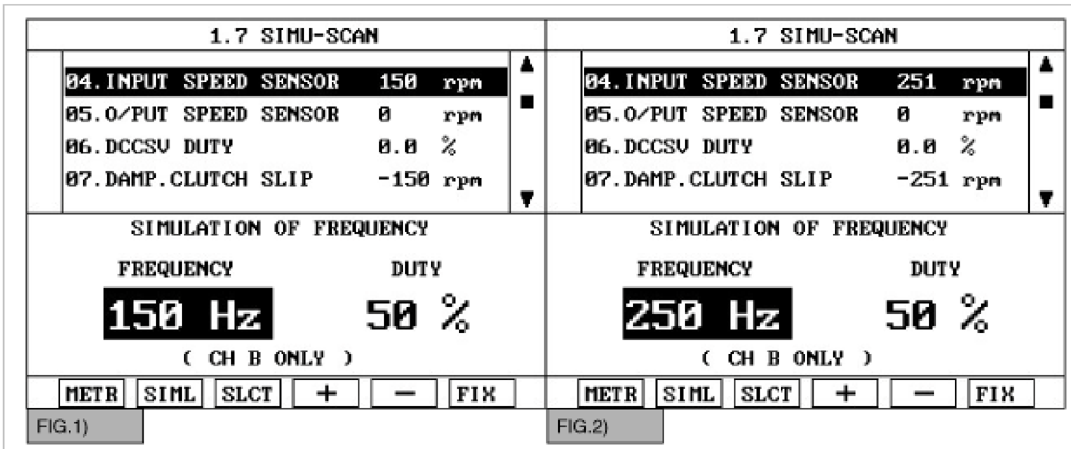


FIG.1) INPUT 150Hz → 150rpm
FIG.2) INPUT 250Hz → 251rpm

(5) Is "INPUT SPEED SENSOR" signal value changed according to simulation frequency?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM as necessary and then go to "Verification of vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Is resistance within specification ?

YES

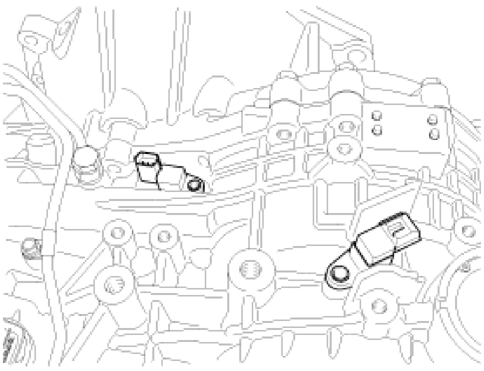
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0722

COMPONENT LOCATION



GENERAL DESCRIPTION

The output speed sensor calculates the number of rotations of the transfer drive gear, which means that the sensor calculates the frequency of electric signal that is occurred at the transfer drive gear's rotating. The signal is inputted to the PCM and is used as the main signal which decides the optimum gear position with TPS signal.

DTC DESCRIPTION

The PCM sets this code if the calculated value of the pulse-signal from the output speed sensor is noticeably different from the calculated value from vehicle speed sensor, when the vehicle is running faster than 30 km/h. The PCM will initiate the fail safe function if this code is detected.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Speed rationality check	• Signal circuit is open or short • Sensor power circuit is open • Sensor ground circuit is open • Faulty OUTPUT SPEED SENSOR • Faulty PCM
Enable Conditions	• Engine state=Run • Vehicle Speed >30km/h • Engine RPM at current gear 1 or 2 or Non conditional VRPM when gear is not 1 or 2 >1000rpm • Battery voltage >11V and< 16 V • AT oil temp. ≥ -23°C(-9.4°F) • No error in speed sensors	
Threshold value	• Vehicle speed caliculated from TM output speed sensor ≤ 50% × the vehicle speed from vehicle speed sensor	
Diagnostic Time	• More than 1sec	
Fail Safe	• Not in shifting process: The output speed sensor value have been received by calculation from the input speed sensor signal. • In shifting process: Instead of the output speed sensor signal, the vehicle speed sensor signal is used.	

SIGNAL WAVEFORM

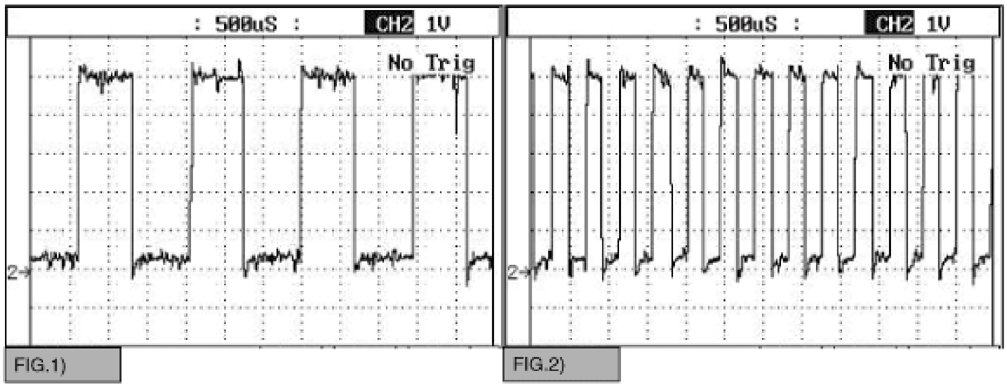


FIG.1) Idling
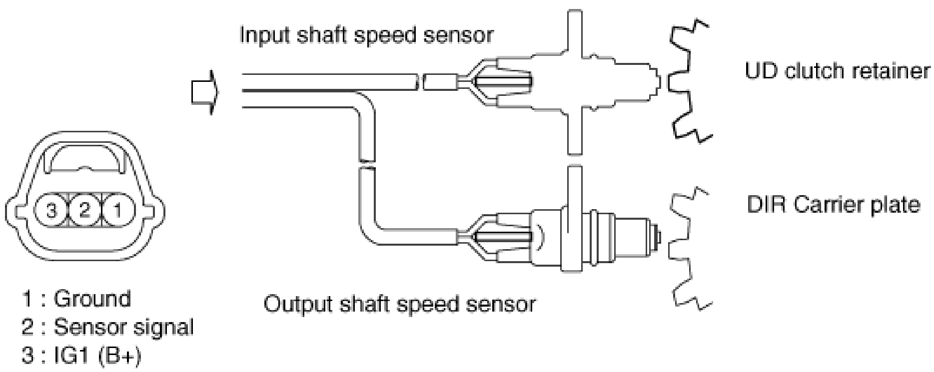
FIG.2) Accelerating

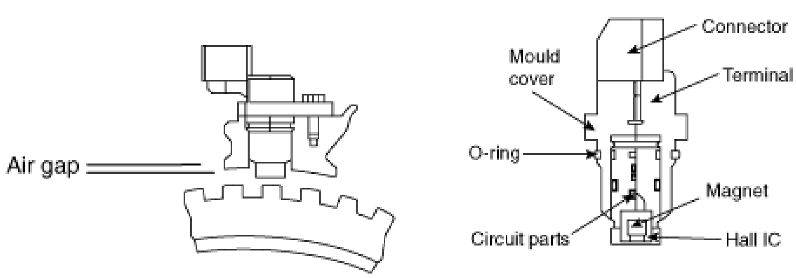
SPECIFICATION

Input shaft & Output shaft speed sensor

- Type : Hall sensor
- Current consumption : 22mA(MAX)
- Sensor body and sensor connector have been unified as one.



Air gap (mm)	Input shaft speed sensor	1.3
	Output shaft speed sensor	0.85
Insulation Resistance	Input shaft speed sensor	over 1MΩ
	Output shaft speed sensor	over 1MΩ
Peak-Peak Voltage	High	more than 4.8V
	Low	less than 0.8V



MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Monitor the "OUTPUT SPEED SENSOR" parameter on the scantool.

4. Driving at speed of over 30 Km/h(19 mph).

Specification : Increasing Gradually

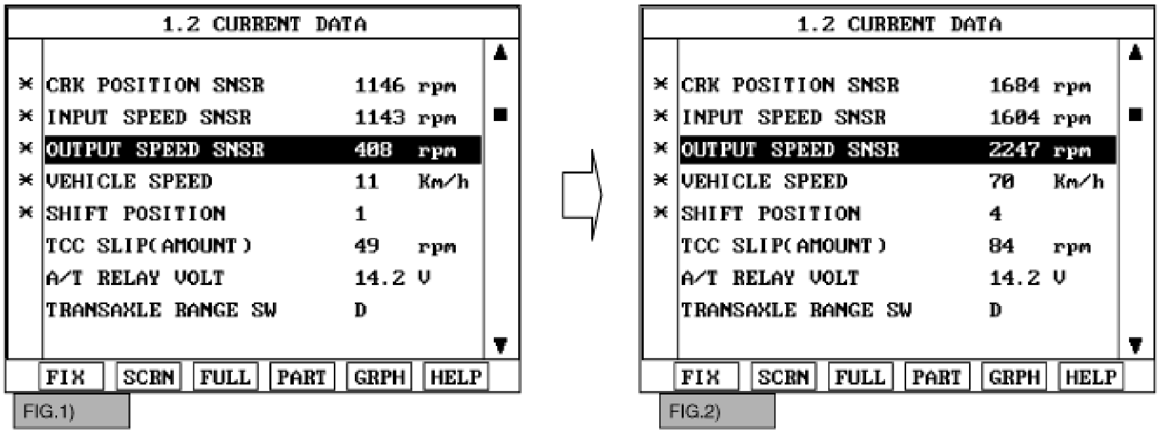


FIG.1) Low-speed
FIG.2) High-speed

5. Does "Output speed sensor" follow the reference data?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system may be caused from poor harness and terminals. These faults can be caused by interference from other electrical systems and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification vehicle Repair" procedure.

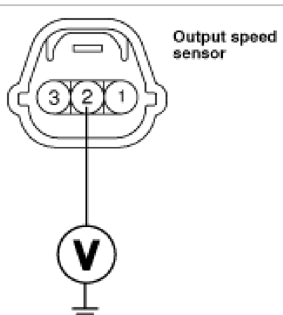
NO

▸ Go to "Signal circuit inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "OUTPUT SPEED SENSOR" connector.
3. Measure voltage between terminal "2" of the OUTPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. 5V



1. Sensor ground
2. Output speed sensor
3. Power supply IG1

4. Is voltage within specification?

YES

▸ Go to "Power supply circuit inspection" procedure.

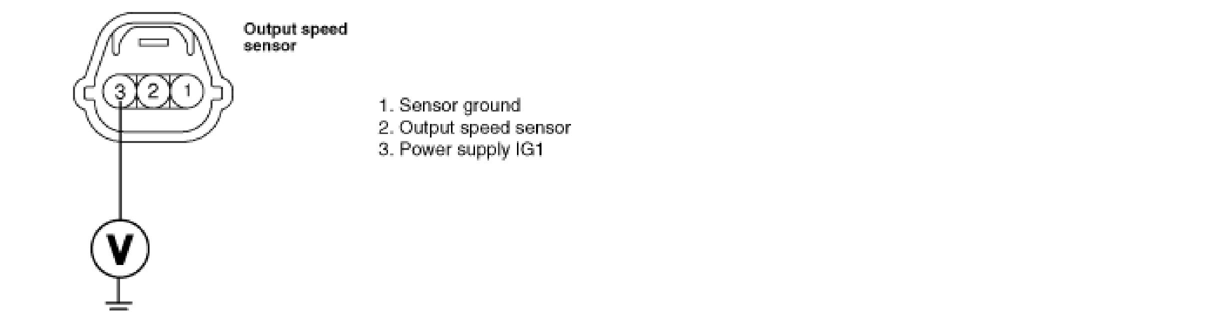
NO

▸ Check for open or short in harness. Repair as necessary and go to "Verification vehicle repair" procedure.
▸ If signal circuit in harness is OK, go to "Check PCM" of the "Component inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "OUTPUT SPEED SENSOR" connector.
3. Measure voltage between terminal "3" of the OUTPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. B+



4. Is voltage within specification?

YES

▸ Go to "Ground circuit inspection" procedure.

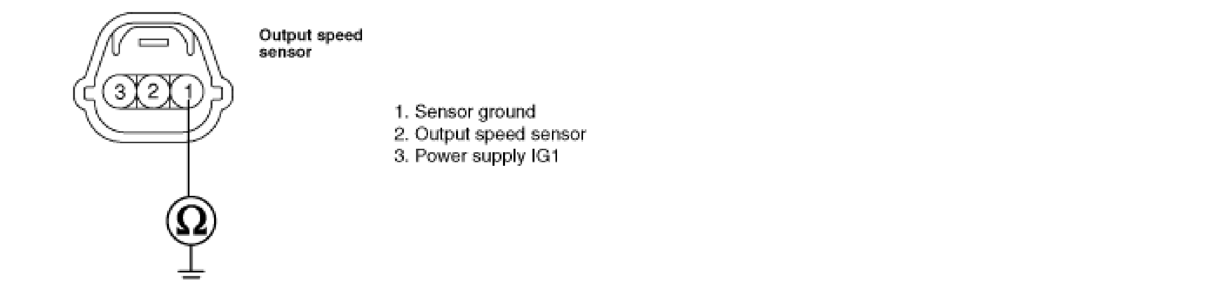
NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "OUTPUT SPEED SENSOR" connector.
3. Measure resistance between terminal "1" of the OUTPUT SPEED SENSOR harness connector and chassis ground.

Specification : approx. 0 Ω



4. Is resistance within specification?

YES

▸ Go to "Component inspection" procedure.

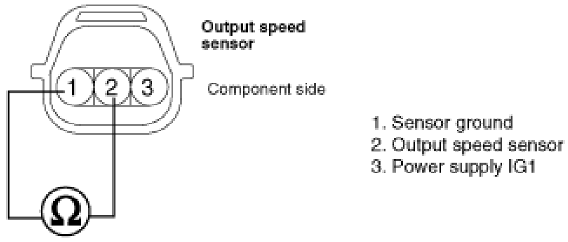
NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.
▸ If ground circuit in harness is OK, go to "Check PCM" of the "Component inspection" procedure.

COMPONENT INSPECTION

1. Check "OUTPUT SPEED SENSOR"
   (1) Ignition "OFF".
   (2) Disconnect the "OUTPUT SPEED SENSOR" connector.
   (3) Measure resistance between terminal "1","2" and "2","3" and "1","3" of the "OUTPUT SPEED SENSOR" connector.

Specification : Refer to "Reference data"



(4) Is resistance within specifications?

[REFERENCE DATA]

Air gap (mm)	Input shaft speed sensor	1.3
	Output shaft speed sensor	0.85
Insulation Resistance	Input shaft speed sensor	over 1MΩ
	Output shaft speed sensor	over 1MΩ
Peak-Peak Voltage	High	more than 4.8V
	Low	less than 0.8V

YES

▸ Go to "CHECK PCM" as below.

NO

▸ Replace "OUTPUT SPEED SENSOR" as necessary and go to "Verification vehicle repair" procedure.

2. CHECK PCM

(1) Ignition "ON" & Engine "OFF".

(2) Connect "OUTPUT SPEED SENSOR" connector.

(3) Install scantool and select a SIMU-SCAN.

(4) Simulate frequency to OUTPUT SPEED SENSOR signal circuit.

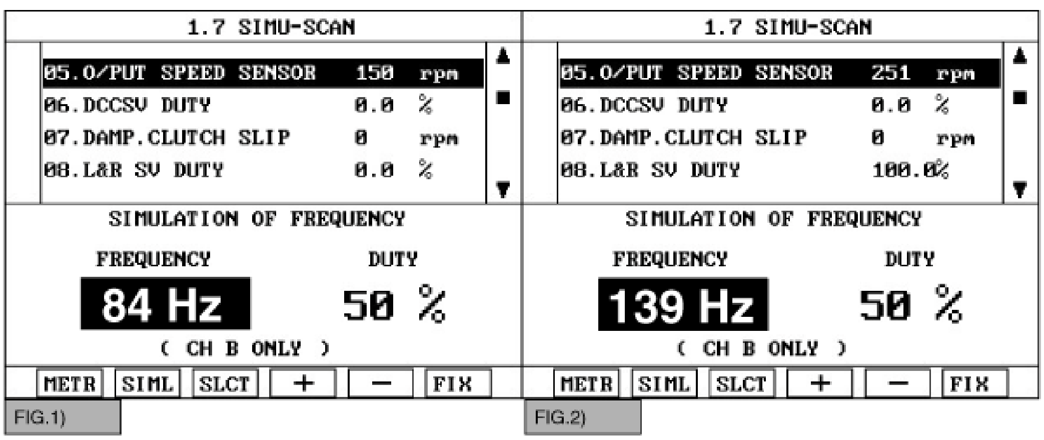


FIG.1) OUTPUT 84Hz → 150rpm
FIG.2) OUTPUT 139Hz → 251rpm

(5) Is "OUTPUT SPEED SENSOR" signal value changed according to simulation frequency?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM as necessary and then go to "Verification of vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Is resistance within specification ?

YES

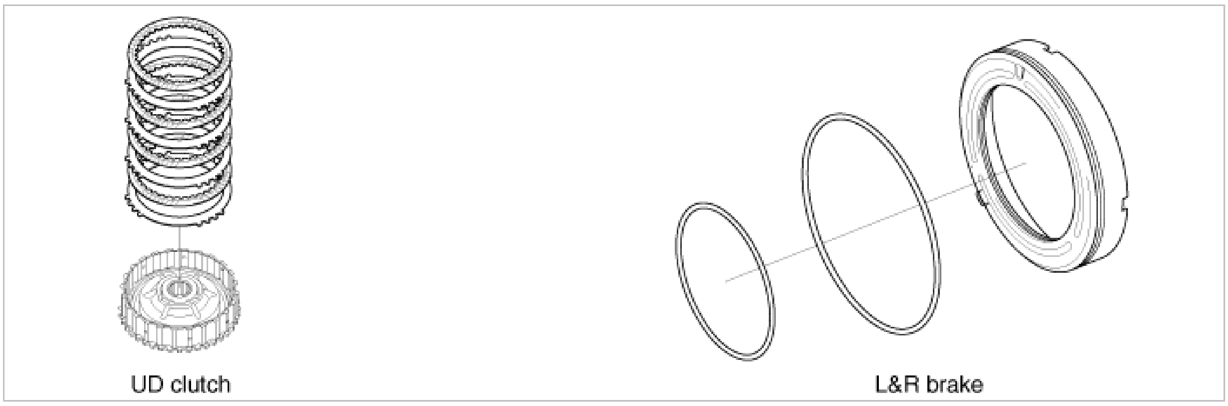
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0731

COMPONENT LOCATION



GENERAL DESCRIPTION

The input shaft speed in gear 1 range should be the similar to the value that is what the gear 1 ratio and the output shaft speed are multipled. For example, if the output shaft speed is 1,000 rpm and the gear 1 ratio is 3.789, the input shaft speed may be about 3,789 rpm.

DTC DESCRIPTION

This code is displayed if the input shaft speed does not conform with the value which is what the output shaft speed and the gear 1 ratio are multipled. This is more probably caused by a mechanical defect of adherence of control valves or a breakdown of solenoid controlled valves etc. than a electrical defect.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• 1st gear incorrect ratio	• Faulty input speed sensor • Faulty output speed sensor • Faulty UD clutch or LR brake or Oneway clutch
Enable Conditions	• Engine state=Run • Battery Voltage >11V and< 16 V • TM oil temperature >-23°C(-9.4°F) • Engine speed >450rpm • TM output speed >150rpm • TM Input speed≠ 0rpm • Current gear= 1st • Gear shifting is completed • No PRNDL fail • No error in speed sensors	
Threshold value	• │Measured input speed - calculated input speed│ >200 rpm	
Diagnostic Time	• More than 1sec	
Fail Safe	• Locked into 3rd gear.	

SIGNAL WAVEFORM

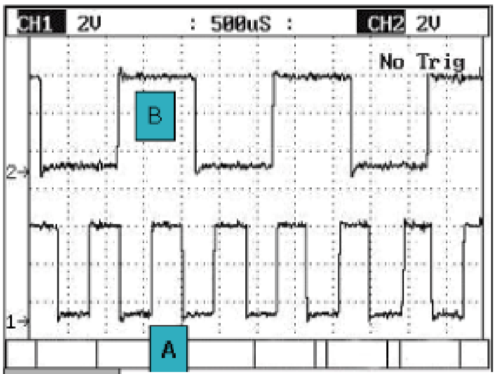


FIG.1)

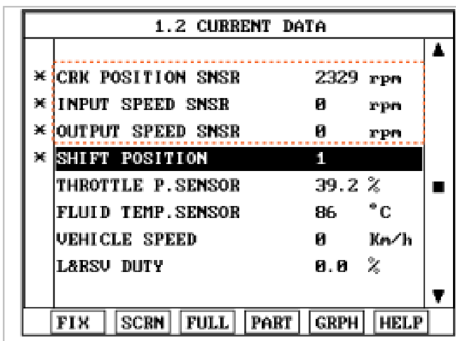
A : INPUT SPEED SENSOR
B : OUTPUT SPEED SENSOR

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Monitor the "ENGINE SPEED, INPUT SPEED SENSOR, OUTPUT SPEED SENSOR, GEAR POSITION" parameter on the scantool.
4. Perform the "STALL TEST" with gear position "1"

Specification : 2700~2900 engine rpm



OPERATING ELEMENT OF EACH SHIFTING RANGE

Range		UD clutch	OD clutch	2ND brake	LR brake	REV clutch	RED clutch	DIR clutch	OWC	OWC1
P		-	-	-	O	-	O	-	-	-

OD/C : Overdrive clutch
2ND/B : 2ND brake
LR/B : Low&Reverse brake
REV/C: Reverse clutch
RED/B: Reduction brake
DIR/C: Direct clutch

OWC : One way clutch for sub gear shifting
OWC1 : One way clutch for main gear shifting
Stall test procedure in D1 and reason
Procedure

A. Warm up the engine
B. After positioning the select lever in "D", depress the foot brake pedal fully. After that, depress the accelerator pedal to the maximum
   * The slippage of 1st gear operating parts can be detected by stall test in D.

Reason for stall test

A. If there is no mechanical defaults in A/T, all slippage occurs in torque converter.
B. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.
C. If 1st gear operating part has faults, input speed revolution will be out of specification.
D. If output speed revolution is output. It means that the foot brake force is not applied fully. Remeasuring is required.

5. Is "STALL TEST " within specification?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

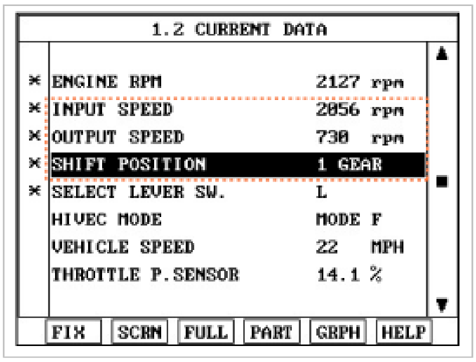
▸ Go to "Component inspection" procedure.

> CAUTION
>
> ● Do not let anybody stand in front of or behind the vehicle while this test is being carried out.
> ● Check the A/T fluid level and temperature and the engine coolant temperature.
>   - Fluid level : At the hot mark on the oil level gauge.
>   - Fluid temperature : 80~100°C(176°F~ 212°F).
>   - Engine coolant temperature : 80~100°C(176°F~ 212°F).
> ● Check both rear wheel(left and right).
> ● Pull the parking brake lever on with the brake pedal fully depressed.
> ● The throttle should not be left fully open for more than eight second.
> ● If carrying out the stall test two or more time, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent.

SIGNAL CIRCUIT INSPECTION

1. Connect Scantool.
2. Engine "ON".
3. Monitor the "INPUT&OUTPUT SPEED SENSOR" parameter on the scantool.
4. Accelerate the Engine speed until about 2000 rpm in the 1st gear.

Specification : INPUT SPEED - (OUTPUT SPEED × GEAR RATIO) ≤ 200 RPM



5. Are "INPUT & OUTPUT SPEED SENSOR" within specifications?

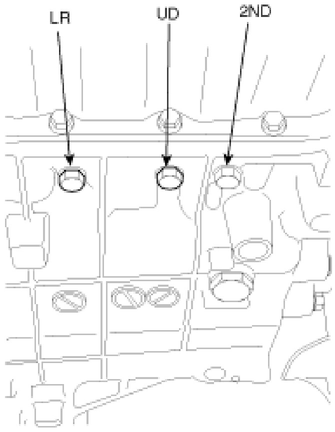
YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for electrical niose of circuit in INPUT & OUTPUT SPEED SENSOR or Replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and Go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION



1. Connect oil pressure gauge to "UD" and "L/R" ports.
2. Engine "ON".
3. Drive a car with gear position 1 in "SPORTS MODE".
4. Compare it with referance data as below.

Specification : shown below

*1 Each case of increasing and decreasing speed.
* 2 Only for 5 speed A/T.

※ Each case of increasing and decreasing of DCC solenoid duty rate to be satisfied.

● The values are subject to change according to vehicle model or condition.

5. Is oil pressure value within specification?

YES

▸ Repair AUTO TRANSAXLE(Clutch or brake) as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and go to "Verification vehicle repair " procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

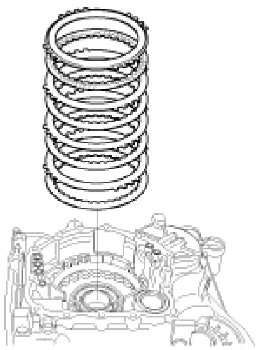
▸ Go to the applicable troubleshooting procedure.

NO

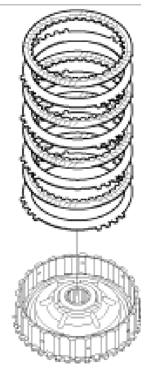
▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0732

COMPONENT LOCATION



2ND brake



UD clutch

GENERAL DESCRIPTION

The input shaft speed in gear 2 range should be the similar to the value that is what the gear 2 ratio and the output shaft speed are multipled. For example, if the output shaft speed is 1,000 rpm and the gear 2 ratio is 2.064, the input shaft speed may be about 2,064 rpm.

DTC DESCRIPTION

This code is displayed if the input shaft speed does not conform with the value which is what the output shaft speed and the gear 2 ratio are multipled. This is mainer caused by a mechanical defect of adherence of control valves or a breakdown of solenoid controlled valves etc. than a electrical defect.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• 2nd gear incorrect ratio	• Faulty input speed sensor • Faulty output speed sensor • Faulty UD clutch or 2nd brake
Enable Conditions	• Engine state= Run • Battery Voltage >11V and< 16 V • TM oil temperature >-23°C(-9.4°F) • Engine speed >450rpm • TM output speed >300rpm • TM Input speed ≠ 0rpm • Current gear= 2nd • Gear shifting is completed • No PRNDL fail • No error in speed sensors	
Threshold value	• │Measured input speed - calculated input speed│>200 rpm	
Diagnostic Time	• More than 1sec	
Fail Safe	• Locked into 3 rd gear.	

SIGNAL WAVEFORM

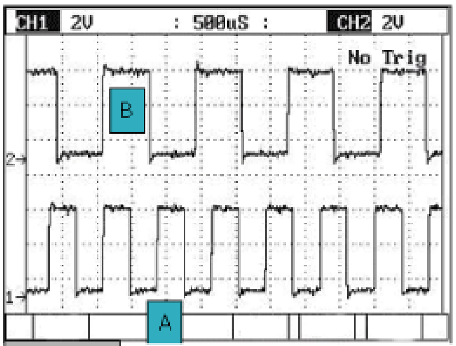


FIG.1)

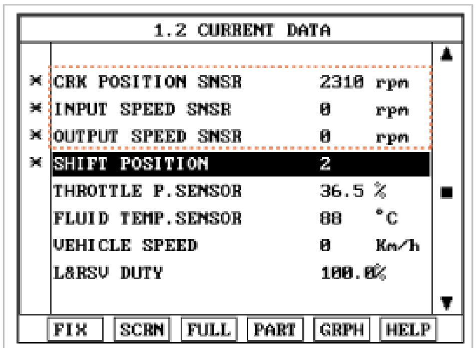
A : INPUT SPEED SENSOR
B : OUTPUT SPEED SENSOR

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Monitor the "ENGINE SPEED, INPUT SPEED SENSOR, OUTPUT SPEED SENSOR, GEAR POSITION" parameter on the scantool.
4. Perform the "STALL TEST" with gear position "2".

Specification : 2700~2900 engine rpm



OPERATING ELEMENT OF EACH SHIFTING RANGE

OWC : One way clutch for sub gear shifting
OWC1 : One way clutch for main gear shifting
Stall test procedure in D2 and reason
Procedure

A. Warm up the engine
B. After positioning the select lever in "D", depress the foot brake pedal fully after that, depress the accelerator pedal to the maximum
  * The slippage of 1st gear operating parts can be detected by stall test in D2

Reason for stall test

A. If there is are mechanical defaults in A/T, all slippage occurs in the torque converter.
B. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.
C. If 2nd brake system(2nd gear operating part) has faults, input speed revolution will be out of specification.
D. If wheels pin occurs, the applied brake force is not adequate. Retry using more brake force.

5. Is "STALL TEST " within specification?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

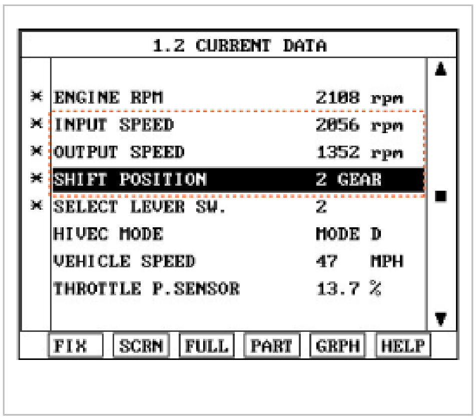
▸ Go to "Component inspection" procedure.

> **CAUTION**
>
> ● Do not let anybody stand in front of or behind the vehicle while this test is being carried out.
> ● Check the A/T fluid level and temperature and the engine coolant temperature.
>   - Fluid level : At the hot mark on the oil level gauge.
>   - Fluid temperature : 80~100°C(176°F~ 212°F).
>   - Engine coolant temperature : 80~100°C(176°F~ 212°F).
> ● Check both rear wheel(left and right).
> ● Pull the parking brake lever on with the brake pedal fully depressed.
> ● The throttle should not be left fully open for more than eight second.
> ● If carrying out the stall test two or more time, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent.

SIGNAL CIRCUIT INSPECTION

1. Connect Scantool.
2. Engine "ON".
3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the scantool.
4. Accelerate the Engine speed until about 2000 rpm in the 2nd gear.

Specification : INPUT SPEED - (OUTPUT SPEED × GEAR RATIO) ≤ 200 RPM



5. Are "INPUT &OUTPUT SPEED SENSOR" within specifications?

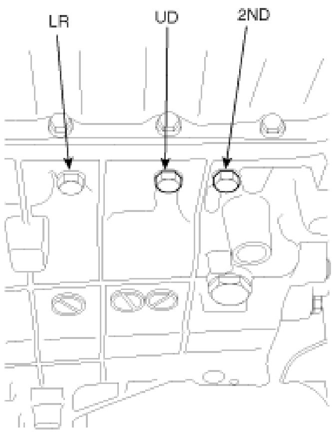
YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for electrical niose of circuit in INPUT & OUTPUT SPEED SENSOR or replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION



1. Connect oil pressure gauge to "UD" and "2nd" ports.
2. Engine "ON".
3. Drive a car with gear position 2 in "SPORTS MODE".
4. Compare it with referance data as below.

Specification : shown below

*1 Each case of increasing and decreasing speed.
* 2 Only for 5 speed A/T.

※ Each case of increasing and decreasing of DCC solenoid duty rate to be satisfied.

● The values are subject to change according to vehicle model or condition.

5. Is oil pressure value within specification?

YES

▸ Repair AUTO TRANSAXLE(Clutch or brake) as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and go to "Verification vehicle repair " procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

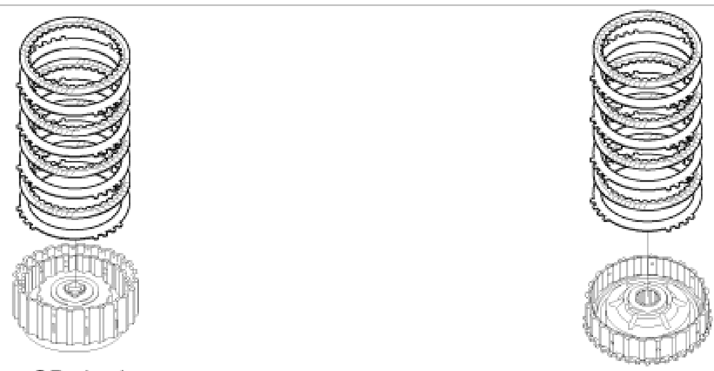
▶ Go to the applicable troubleshooting procedure.

NO

▶ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0733

COMPONENT LOCATION



GENERAL DESCRIPTION

The input shaft speed in gear 3 range should be the similar to the value that is what the gear 3 ratio and the output shaft speed are multipled. For example, if the output shaft speed is 1,000 rpm and the gear 3 ratio is 1.421, the input shaft speed will be about 1,421 rpm.

DTC DESCRIPTION

This code is displayed if the input shaft speed does not conform with the value which is what the output shaft speed and the gear 3 ratio are multipled. This is most likely caused by a mechanical defect of adherence of control valves or a breakdown of solenoid controlled valves etc. than a electrical defect.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• 3rd gear incorrect ratio	• Faulty Input speed sensor • Faulty output speed sensor • Faulty UD clutch or OD clutch
Enable Conditions	• Engine state=Run • Battery Voltage >11V and< 16 V • TM oil temperature >-23°C(-9.4°F) • Engine speed >450rpm • TM output speed >300rpm • TM Input speed≠ 0rpm • Current gear=3rd • Gear shifting is completed • No PRNDL fail • No error in speed sensors	
Threshold value	• │Measured input speed - calculated input speed│>200 rpm	
Diagnostic Time	• More than 1sec	

Fail Safe	• Locked into 3rd gear.	

SIGNAL WAVEFORM

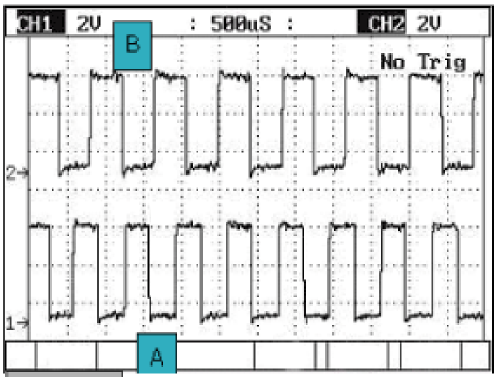


FIG.1)

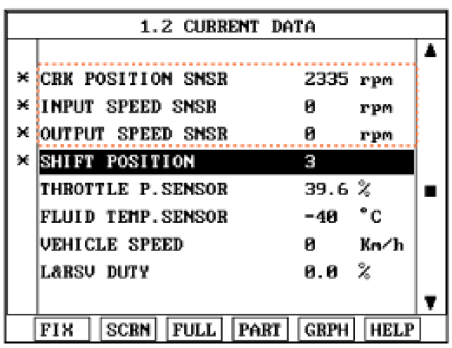
A : INPUT SPEED SENSOR
B : OUTPUT SPEED SENSOR

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Monitor the "ENGINE SPEED, INPUT SPEED SENSOR, OUTPUT SPEED SENSOR, GEAR POSITION" parameter on the scantool.
4. Disconnect the solenoide valve connector and perform the "STALL TEST".

Specification : 2700~2900 engine rpm



OPERATING ELEMENT OF EACH SHIFTING RANGE

Range		UD clutch	OD clutch	2ND brake	LR brake	REV clutch	RED clutch	DIR clutch	OWC	OWC1
P		-	-	-	O	-	O	-	-	-

	5th	-	O	O	-	-	-	O	-	-

UD/C : Underdrive clutch

OD/C : Overdrive clutch
2ND/B : 2ND brake
LR/B : Low&Reverse brake
REV/C: Reverse clutch
RED/B: Reduction brake
DIR/C: Direct clutch
OWC : One way clutch for sub gear shifting
OWC1 : One way clutch for main gear shifting

Stall test procedure in D3 and reason

Procedure

A. Warm up the engine
B. Set 3rd gear hold by disconnecting the solenoid valve connector. Fully depress the brake pedal, then place the transaxle gear lever into "D" range. Press and hold the accelerator pedal to the floor for no more than eight seconds while observing the engine, input speed,
and output speed RPM values.
* The slippage of 3rd gear operating parts can be detected by stall test in D3.

Reason for stall test

A. If there are no mechanical defaults in A/T, all slippage occurs in torque converter.
B. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.
C. If OD clutch system(3rd gear operating part) has faults, input speed revolution will be out of specification.
D. If output speed revolution is output. It means that the foot brake force is not applied fully. Retesting using greater braking force is required.

5. Is "STALL TEST " within specification?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Go to "Component inspection" procedure.

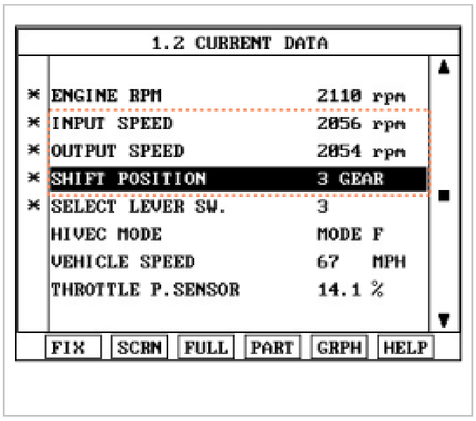
CAUTION

● Do not let anybody stand in front of or behind the vehicle while this test is being carried out.
● Check the A/T fluid level and temperature and the engine coolant temperature.
- Fluid level : At the hot mark on the oil level gauge.
- Fluid temperature : 80~100°C(176°F~ 212°F).
- Engine coolant temperature : 80~100°C(176°F~ 212°F).
● Check both rear wheel(left and right).
● Pull the parking brake lever on with the brake pedal fully depressed.
● The throttle should not be left fully open for more than eight seconds.
● If carrying out the stall test two or more times, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent tests.

SIGNAL CIRCUIT INSPECTION

1. Connect Scantool.
2. Engine "ON".
3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the scantool.
4. Accelerate the Engine speed until about 2000 rpm in the 3rd gear.

Specification : INPUT SPEED - (OUTPUT SPEED × GEAR RATIO) ≤ 200 RPM



5. Are "INPUT & OUTPUT SPEED SENSOR" within specifications?

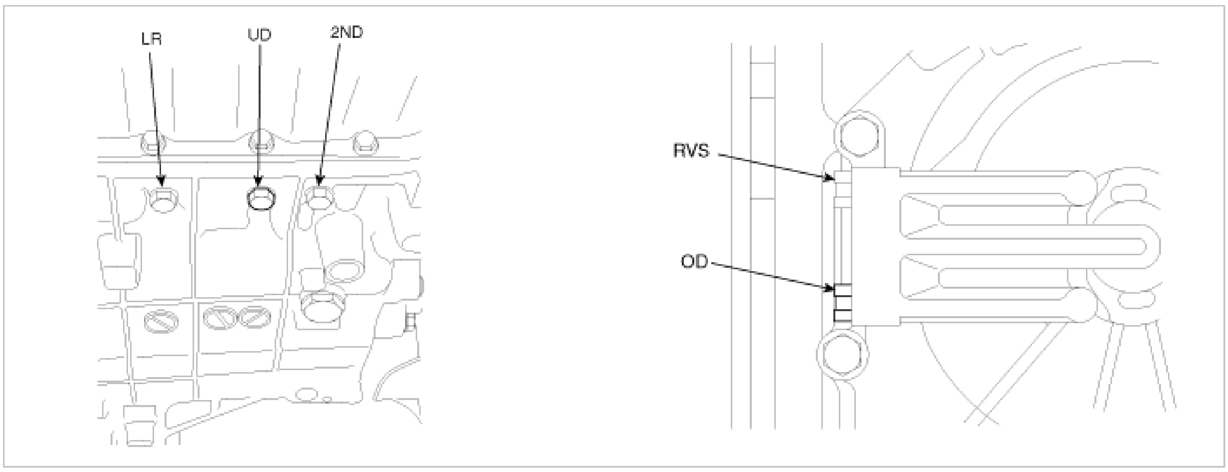
YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for electrical niose of circuit in INPUT & OUTPUT SPEED SENSOR or replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION



1. Connect Oil pressure gauge to "UD" and "OD" ports.
2. Engine "ON".
3. Drive a car with gear position 3 in "SPORTS MODE".
4. Compare it with referance data as below.

Specification : shown below

*1 Each case of increasing and decreasing speed.
* 2 Only for 5 speed A/T.

● The values are subject to change according to vehicle model or condition.

5. Is oil pressure value within specification?

YES

▸ Repair AUTO TRANSAXLE(Clutch or brake) as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and go to "Verification vehicle repair " procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

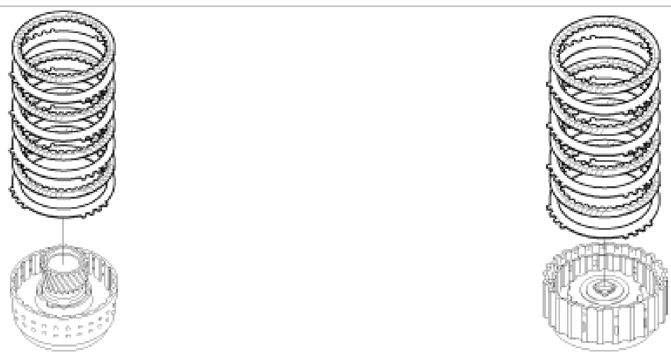
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0734

COMPONENT LOCATION



Direct clutch   OD clutch

GENERAL DESCRIPTION

The input shaft speed in gear 4 range should be the similar to the value that is what the gear 4 ratio and the output shaft speed are multipled. For example, if the output shaft speed is 1,000 rpm and the gear 4 ratio is 1.034, the input shaft speed may be about 1,034 rpm.

DTC DESCRIPTION

This code is displayed if the input shaft speed does not conform with the value which is what the output shaft speed and the gear 4 ratio are multipled. This is most likely caused by a mechanical defect of adherence of control valves or a breakdown of solenoid controlled valves etc. than a electrical defect.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• 4th gear incorrect ratio	• Faulty input speed sensor • Faulty output speed sensor • Faulty direct clutch or OD clutch

OWC : One way clutch for sub gear shifting
OWC1 : One way clutch for main gear shifting

SIGNAL CIRCUIT INSPECTION

1. Connect Scantool.
2. Engine "ON".
3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the scantool.
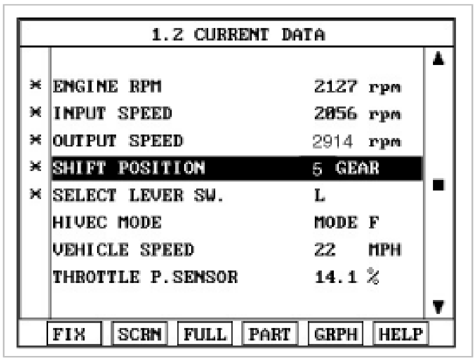
4. Accelerate the Engine speed until about 2000 rpm in the 5th gear while driving the vehicle on a level road.

Specification : INPUT SPEED - (OUTPUT SPEED × GEAR RATIO) ≤ 200 RPM



5. Are "INPUT & OUTPUT SPEED SENSOR" within specifications?

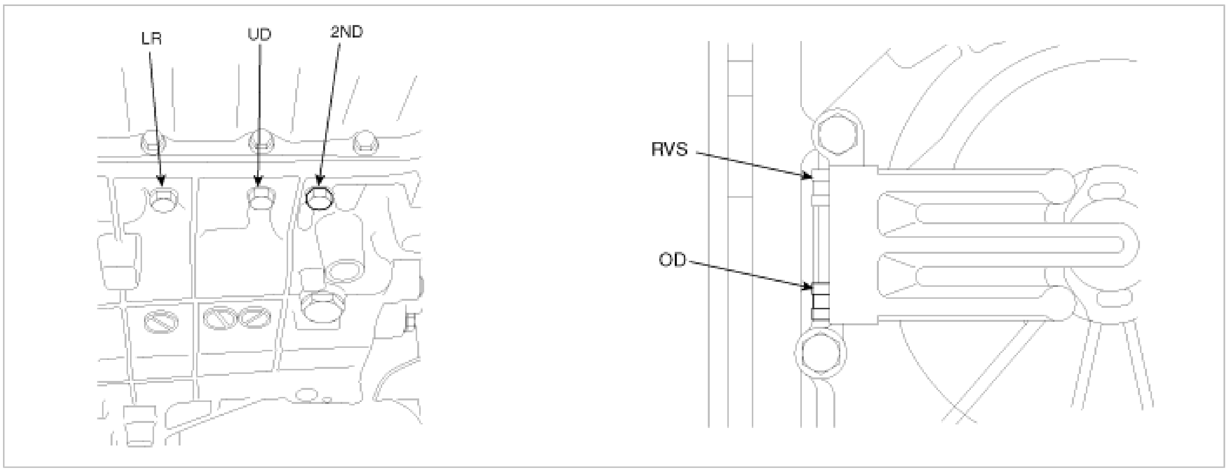
YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for electrical niose of circuit in INPUT & OUTPUT SPEED SENSOR or Replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and Go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION



1. Connect oil pressure gauge to "2nd" and "OD" ports.
2. Engine "ON".
3. Drive a car with gear position "5".
4. Compare it with referance data as below.

Specification : shown below

*1 Each case of increasing and decreasing speed.
* 2 Only for 5 speed A/T.

Manual valve position	VFS current [mA]	RPM	Operation (Duty rate %)						Oil pressure MPa {kgf/cm²}	
			LR	2ND	UD	OD	DCC	RED*²	UD CLUTCH	LR BRAKE
D	200	2500	0	100	0	100	0	0	1.03±0.02 {10.5±0.2}	1.03±0.02 {10.5±0.2}

			↑	↑	↑	↑	100	↑	MIN. 0.29	0

※ Each case of increasing and decreasing of DCC solenoid duty rate to be satisfied.
● The values are subject to change according to vehicle model or condition.

5. Is oil pressure value within specification?

YES

▸ Repair AUTO TRANSAXLE(Clutch or brake) as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and go to "Verification vehicle repair " procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

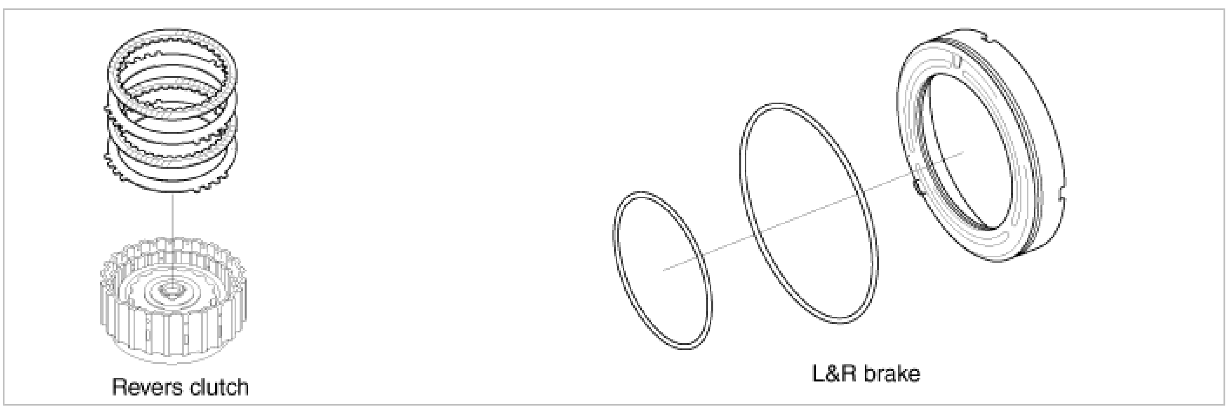
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0736

COMPONENT LOCATION



GENERAL DESCRIPTION

The input shaft speed in gear reverse range should be the similar to the value that is what the gear reverse ratio and the output shaft speed are multipled. For example, if the output shaft speed is 1,000 rpm and the gear reverse ratio is 3.808, the input shaft speed may be about 3,808 rpm.

DTC DESCRIPTION

This code is displayed if the input shaft speed does not conform with the value which is what the output shaft speed and the gear reverse ratio are multipled. This is most likely caused by a mechanical defect of adherence of control valves or a breakdown of solenoid controlled valves etc. than a electrical defect.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Reverse gear incorrect ratio	• Faulty input speed sensor • Faulty output speed sensor • Faulty RVS clutch or L/R brake
Enable Conditions	• Engine state=Run • Battery Voltage >11V and< 16 V • TM oil temperature>-23°C(-9.4°F) • Engine speed >450rpm • TM output speed >100rpm • TM Input speed≠0rpm • Current gear=reverse • Gear shifting is completed • No PRNDL fail • No error in speed sensors	
Threshold value	• │Measured input speed - calculated input speed│>200 rpm	
Diagnostic Time	• More than 1sec	
Fail Safe	• Locked into 3rd gear.	

SIGNAL WAVEFORM

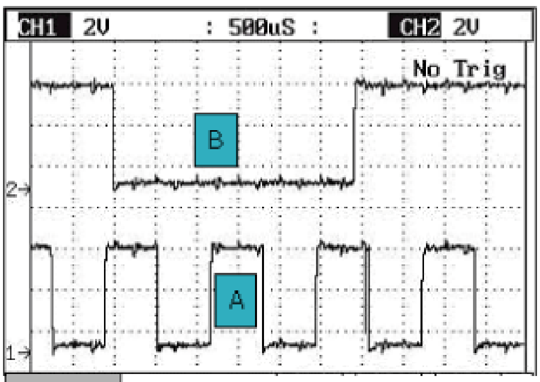


FIG.1)

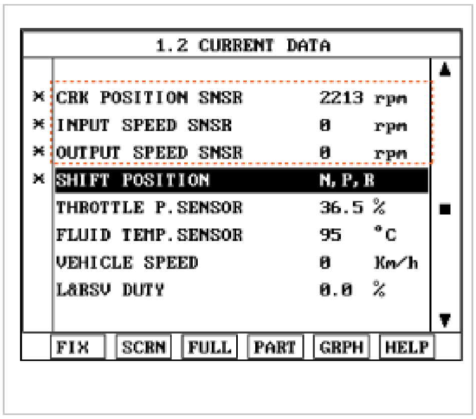
A : INPUT SPEED SENSOR
B : OUTPUT SPEED SENSOR

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Monitor the "ENGINE SPEED, INPUT SPEED SENSOR, OUTPUT SPEED SENSOR, GEAR POSITION" parameter on the scantool.
4. Perform the "STALL TEST" with gear position "R".

Specification : 2700~2900 engine rpm



OPERATING ELEMENT OF EACH SHIFTING RANGE

Range		UD clutch	OD clutch	2ND brake	LR brake	REV clutch	RED clutch	DIR clutch	OWC	OWC1
P		-	-	-	O	-	O	-	-	-

REV/C: Reverse clutch
RED/B: Reduction brake
DIR/C: Direct clutch
OWC : One way clutch for sub gear shifting
OWC1 : One way clutch for main gear shifting

Stall test procedure in Reverse and reason

Procedure

A. Warm up the engine
B. Fully depress the brake pedal, then place the transaxle gear lever into "R" range. Press and hold the accelerator pedal to the floor for no more than eight seconds while observing the engine, input speed, and output speed RPM values.
   * The slippage of REVERSE clutch and L/R brake can be detected by stall test in R range.

Reason for stall test

A. If there is no mechanical defaults in A/T, all slippage occurs in the torque converter.
B. Therfore, engine revolution is output, but input and output speed revolution must be "zero" due to wheel's lock.
C. If reverse clutch and L/R brake system(reverse gear operating parts) has faults, input speed revolution will be out of specification.
D. If output speed revolution is output. It means that the foot brake force is not applied fully. Remeasuring is required.

5. Is "STALL TEST " within specification?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Go to "Component inspection" procedure.

CAUTION

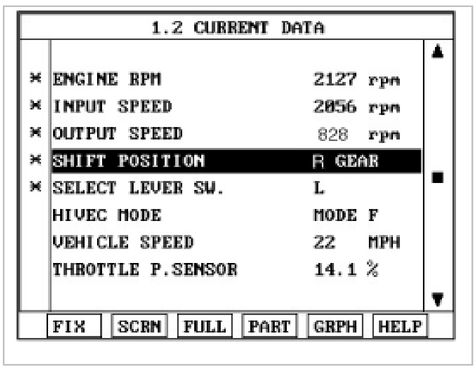
- Do not let anybody stand in front of or behind the vehicle while this test is being carried out.
- Check the A/T fluid level and temperature and the engine coolant temperature.
  - Fluid level : At the hot mark on the oil level gauge.
  - Fluid temperature : 80~100°C (176~212°F).

- Engine coolant temperature : 80~100°C (176~212°F).
● Check both rear wheel(left and right).
● Pull the parking brake lever on with the brake pedal fully depressed.
● The throttle should not be left fully open for more than eight seconds.
● If carrying out the stall test two or more time, move the select lever to the "N" position and run the engine at 1,000 rpm to let the A/T fluid cool down before carrying out subsequent tests.

SIGNAL CIRCUIT INSPECTION

1. Connect Scantool.
2. Engine "ON".
3. Monitor the "INPUT & OUTPUT SPEED SENSOR" parameter on the scantool.
4. Accelerate the Engine speed until about 2000 rpm in the "R" gear.

Specification : INPUT SPEED - (OUTPUT SPEED × GEAR RATIO) ≤ 200 RPM



5. Are "INPUT&OUTPUT SPEED SENSOR" within specifications?

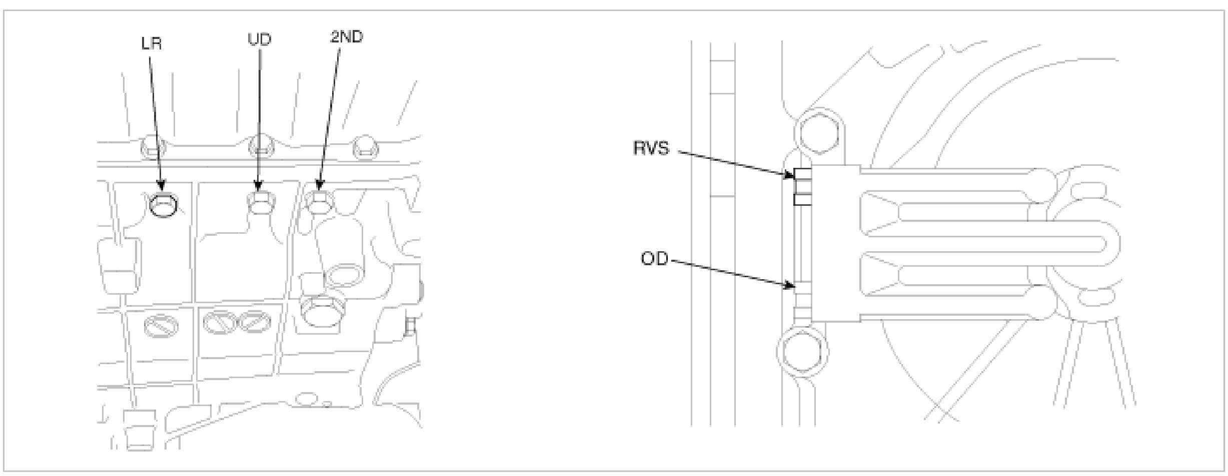
YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for electrical niose of circuit in INPUT & OUTPUT SPEED SENSOR or replace INPUT & OUTPUT SPEED SENSOR. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION



1. Connect oil pressure gauge to "RVS" and "L/R" ports.
2. Engine "ON".
3. Drive a car with gear position R.
4. Compare it with referance data as below.

Specification : shown below

*1 Each case of increasing and decreasing speed.

* 2 Only for 5 speed A/T.

● The values are subject to change according to vehicle model or condition.

5. Is oil pressure value within specification?

YES

▸ Repair AUTO TRANSAXLE(Clutch or brake) as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Replace AUTO TRANSAXLE (BODY CONTROL VALVE faulty) as necessary and go to "Verification vehicle repair " procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0741

GENERAL DESCRIPTION

The PCM controls the locking or unlocking of the Torque Converter Clutch (or Damper Clutch) by appling hydraulic pressure. The main purpose of the TCC control is to save fuel by decreasing the hydraulic load inside the torque converter. The PCM outputs duty pulses to control the torque converter clutch control solenoid valve and hydraulic pressure is applied to the torque converter according to the torque converter clutch duty ratio value. When the duty ratio is high, high pressure is applied and the torque converter clutch is locked. The normal operating range of the torque converter clutch control duty ratio value is from 30% (unlocked) to 85%(locked).

DTC DESCRIPTION

The PCM increases the duty ratio to engage the torque converter clutch, monitoring the slip rpms (difference beteween engine speed and turbine speed). To decrease the slip of the torque converter clutch, the PCM applies more hydraulic pressure by increasing the duty ratio. When the slip rpm does not drop down below the specification with 100% duty ratio, the PCM determines that the torque converter clutch is stuck OFF and sets this code.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Stuck "OFF"	※ TORQUE CONVERTER (DAMPER) CLUTCH : TCC • Faulty TCC or oil pressure system • Faulty TCC solenoid valve • Faulty body control valve • Faulty PCM
Enable Conditions	• TCC Duty cycle≠0 or TCC Abnormal slip counters ≥ 4	
Threshold value	• TCC slip counter ≥4 counts	
Diagnostic Time	• 1 second	
Fail Safe	• Stop the torque converter clutch control	

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Sellect "D RANGE" and drive vehicle.
4. Monitor the "TORQUE CONVERTER(DAMPER) CLUTCH" parameter on the scantool.

Specification : TCC SLIP<160RPM(In condition that TCC SOL. DUTY > 80%)

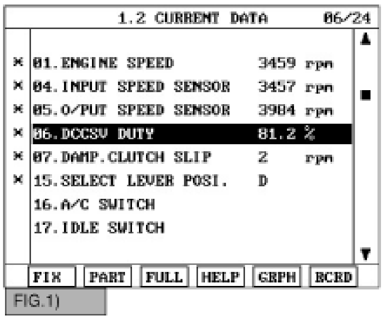

FIG.1) : Normal status

5. Are "TCC SOLENOID DUTY and TCC SLIP" within specifications?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Throughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Component inspection" procedure.

COMPONENT INSPECTION

1. CHECK TORQUE CONVERTER CLUTCH SOLENOID VALVE
   (1) Connect scantool to data link connector(DLC).
   (2) Ignition "ON" & Engine "OFF".
   (3) Select A/T solenoid valve actuator test and operate actuator test.
   (4) Can you hear operating tone for using TCC SOLENOID VALVE actuator testing function?

   YES

   ▸ Go to "CHECK OIL PRESSURE" as below.

   NO

   ▸ Replace "TCC SOLENOID VALVE" as necessary and go to "Verification vehicle repair" procedure.

2. CHECK OIL PRESSURE

(1) Connect oil pressure gauge to "DA" and "DR" ports.

(2) Ignition "ON" & Engine "OFF".

(3) After connecting Scantool and monitor the "TCC SOLENIOD VALVE DUTY" parameter on the scantool data list.

(4) Select the "D" range and accelerate engine speed to 2500 rpm.

(5) Measure oil pressure.

Specification :

Manual valve position	VFS current (mA)	RPM	Operation (Duty rate %)						Damper Apply Pressure※ (MPa)	Damper Release Pressure (MPa)
			LR	2ND	UD	OD	DCC	RED*		
D	200	2500	100	100	0	0	0	0	0.25~0.45	0.50~0.70
			↑	↑	↑	↑	50	↑	0.20~0.45	0

			↑	↑	↑	↑	100	↑	MIN. 0.29	0

※ Each case of increasing and decreasing of DCC solenoid duty rate to be satisfied.

(6) Is oil pressure value within specification?

YES

▸ Repair TORQUE CONVERTER CLUTCH(REPLACE Torque Converter) as necessary and go to "Verification vehicle repair " procedure.

NO

▸ Replace A/T assembly (or valve body assembly) as necessary and go to "Verification vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0742

GENERAL DESCRIPTION

The PCM controls the locking or unlocking of the Torque Converter Clutch (or Damper Clutch) by appling hydraulic pressure. The main purpose of the TCC control is to save fuel by decreasing the hydraulic load inside the torque converter. The PCM outputs duty pulses to control the torque converter clutch control solenoid valve and hydraulic pressure is applied to the torque converter according to the torque converter clutch duty ratio value. When the duty ratio is high, high pressure is applied and the torque converter clutch is locked. The normal operating range of the torque converter clutch control duty ratio value is from 30% (unlocked) to 85%(locked).

DTC DESCRIPTION

The PCM sets this code when the absolute value of RPM difference between engine speed and input shaft speed is less than 20 RPM.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Stuck "ON"	※ TORQUE CONVERTER (DAMPER) CLUTCH : TCC • Faulty TCC or oil pressure system • Faulty TCC solenoid valve • Faulty body control valve • Faulty PCM
Enable Conditions	• Engine state=Run • Throttle position sensor value ≥ 20% • TM output speed ≥ 500 rpm • Manifold air pressure >60 kPa • Current gear = 1 or 2 or 3 or 4 or 5	
Threshold value	• Absolute value of RPM difference between engine and TM input speed≤ 20 rpm	
Diagnostic Time	• 1 second	
Fail Safe	• Stop the torque converter clutch control	

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Engine "ON".
3. Sellect "D RANGE" and drive vehicle.
4. Monitor the "TORQUE CONVERTER(DAMPER) CLUTCH" parameter on the scantool.

			↑	↑	↑	↑	100	↑	MIN. 0.29	0

※ Each case of increasing and decreasing of DCC solenoid duty rate to be satisfied.

(6) Is oil pressure value within specification?

YES

▸ Repair TORQUE CONVERTER CLUTCH(REPLACE Torque Converter) as necessary and go to "Verification vehicle repair " procedure.

NO

▸ Replace A/T assembly (or valve body assembly) as necessary and go to "Verification vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

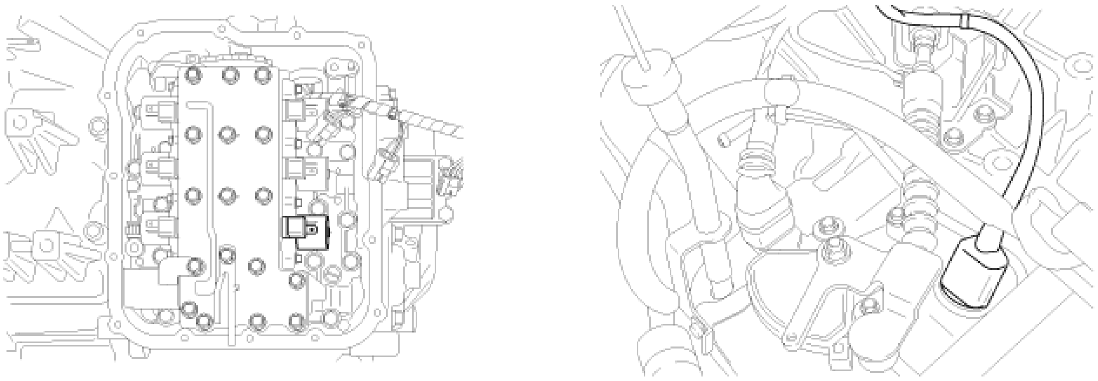
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0743

COMPONENT LOCATION



GENERAL DESCRIPTION

The PCM controls the locking or unlocking of the Torque Converter Clutch (or Damper Clutch) by appling hydraulic pressure. The main purpose of the TCC control is to save fuel by decreasing the hydraulic load inside the torque converter. The PCM outputs duty pulses to control the torque converter clutch control solenoid valve and hydraulic pressure is applied to the torque converter according to the torque converter clutch duty ratio value. When the duty ratio is high, high pressure is applied and the torque converter clutch is locked. The normal operating range of the torque converter clutch control duty ratio value is from 30% (unlocked) to 85%(locked).

DTC DESCRIPTION

The PCM checks the torque converter clutch control signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored (for example, high voltage is detected when low voltage is expected, or low voltage is detected when high voltage is expected), the PCM judges that the torque converter clutch solenoid valve circuit is malfunctioning and sets this code.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	※ TORQUE CONVERTER (DAMPER) CLUTCH : TCC • Open or short in circuit • Faulty TCC SOLENOID VALVE • Faulty PCM
Enable Conditions	• Engine state=Run • Engine runtime >0.5 secs • Battery voltage >11V and 16 V • Transmission relay state : Relay on • Gear shifting is completed	
Threshold value	• When the PCM detects electric or electronic abnormalness such as short circuit or out of range voltage.	
Diagnostic Time	• More than 5 seconds	
Fail Safe	• Locked in 3rd gear.(Control relay off)	

SPECIFICATION

Solenoid Valve for Pressure Control

- Sensor type : Normal open 3-way
- Operating temperature : -22~266°F(-30°C~130°C)
- Frequency :

- LR, 2ND, UD, OD, RED : 61.27Hz (at the ATF temp. -20°C above)
- DCC : 30.64Hz
- VFS : 600 ± 20Hzs

• Internal resistance :

- 2.6~3.4Ω(68°F or 20°C) - LR, 2ND, UD, OD, RED, DCC
- 4.0~4.7Ω(68°F or 20°C) - VFS

• Surge voltage : 56 V(except VFS)

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC)
2. Engine "ON".
3. Monitor the "TCC SOL. VALVE" parameter on the scantool
4. Sellect "D RANGE" and Operate "TCC SOLENOID DUTY" more than 85%

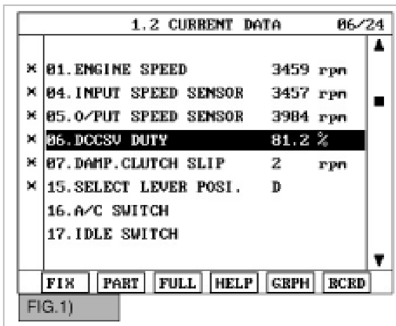


FIG.1) : Normal status

1. Does "TCC SOLENOID DUTY " follow the reference data?

YES

▶ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▶ Go to "Terminal&connector inspection " procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▶ Repair as necessary and then go to "Verification of vehicle repair" procedure.

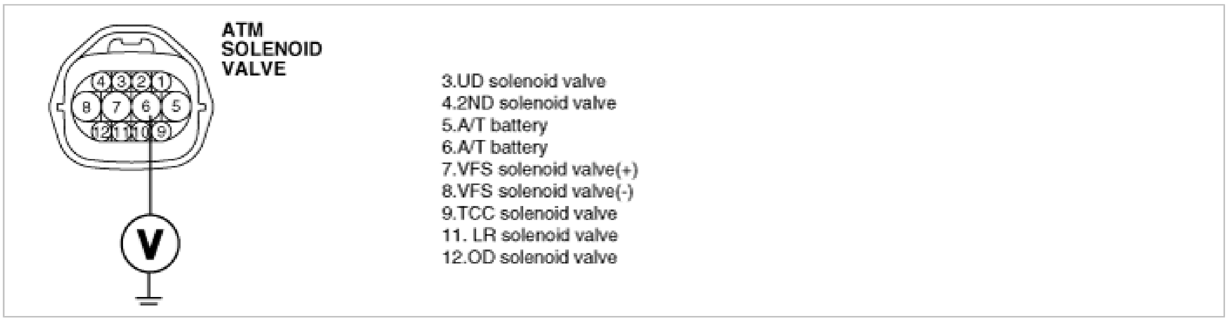
NO

▶ Go to "Power supply circuit inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Disconnect "A/T SOLENOID VALVE" connector.
2. Measure voltage between teminal "6" of the sensor harness connector and chassis ground.
3. Turn ignition switch OFF → ON

Specification: 12V is measured only for approx. 0.5sec



4. Is voltage within specifications?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Check that A/T-20A fuse in engine room junction is installed or not blown.
▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check signal circuit open inspection.
   (1) Ignition "OFF".
   (2) Disconnect "A/T SOLENOID VALVE" connector and "PCM" connector.
   (3) Measure resistance between terminal "9" of the ATM SOLENOID VALVE harness connector and terminal "43" of the PCM harness connector B.

Specification: approx. 0 Ω

   (4) Is resistance within specifications?

YES

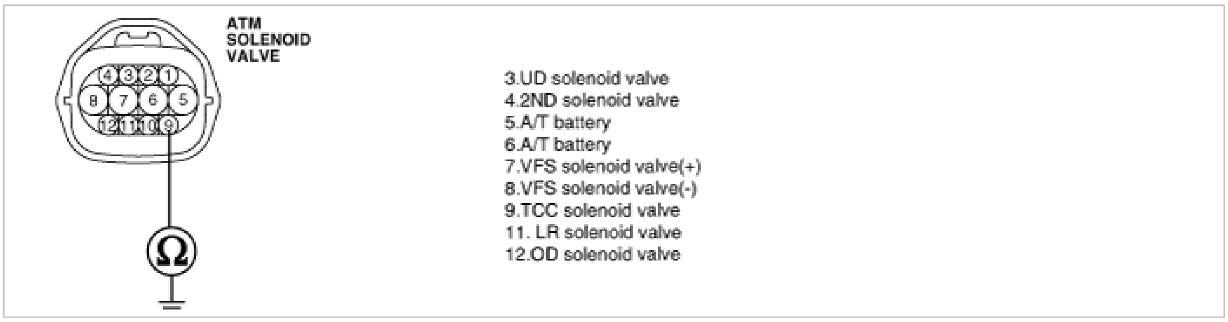
▸ Go to "Check signal circuit short inspection" procedure.

NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

2. Check signal circuit short inspection
   (1) Ignition "OFF".
   (2) Disconnect "A/T SOLENOID VALVE" connector and "PCM" connector.
   (3) Measure resistance between terminal "9" of the ATM SOLENOID VALVE harness and chassis ground.

Specification: Infinite



(4) Is resistance within specifications?

YES

▸ Go to "Component inspection" procedure.

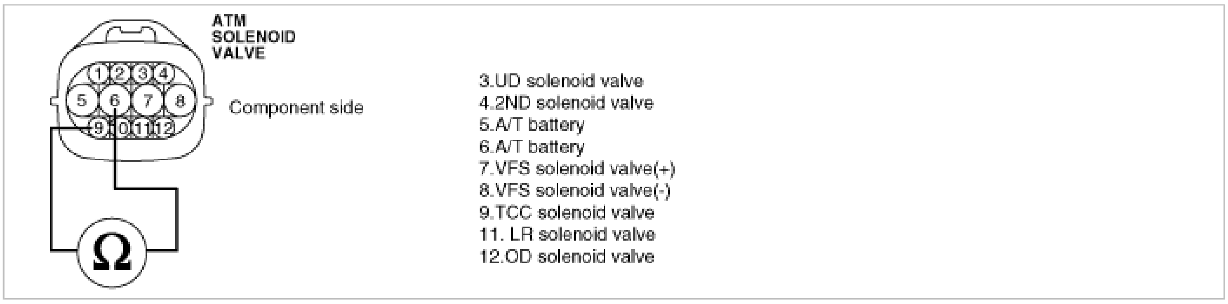
NO

▸ Check for short to ground in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION

1. CHECK SOLENOID VELVE
   (1) Ignition "OFF".
   (2) Disconnect "A/T SOLENOID VALVE" connector.
   (3) Measure resistance between terminal "9" and terminal "6" of the ATM SOLENOID VALVE harness connector.

Specification: Approximately 2.6~3.4 Ω [20°C(68°F)]



(4) Is resistance within specification?

YES

▸ Go to "CHECK PCM" as below.

NO

▸ Replace TCC SOLENOID VALVE as necessary and go to "Verification vehicle repair" procedure.

2. CHECK PCM
   (1) Connect scantool to data link connector(DLC).
   (2) Ignition "ON" & Engine "OFF".
   (3) Select A/T solenoid valve actuator test and operate actuator test.
   (4) Can you hear operating sound for TCC SOLENOID VALVE actuator testing function?

YES

▸ Go to "Verification vehicle repair" procedure.

NO

▸ Replace PCM as necessary and go to "Verification vehicle repair" procedure.

ACTUATOR TEST CONDITION

A. IG SWITCH ON
B. TRANSAXLE RANGE SWITCH is normal
C. P RANGE
D. Vehicle Speed 0km/h
E. Throttle position sensor< 1V
F. IDLE SWITCH ON

G. ENGINE RPM 0

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present?

YES

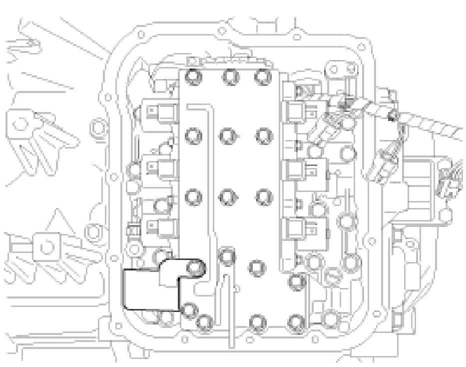
▸ Go to the applicable troubleshooting procedure.

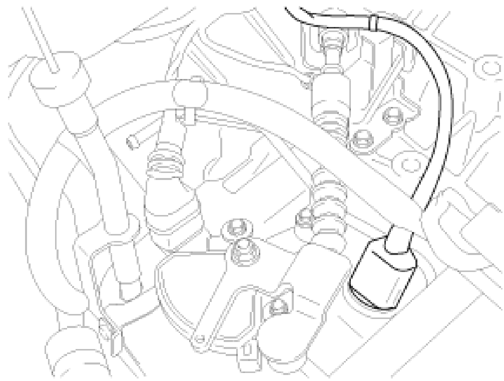
NO

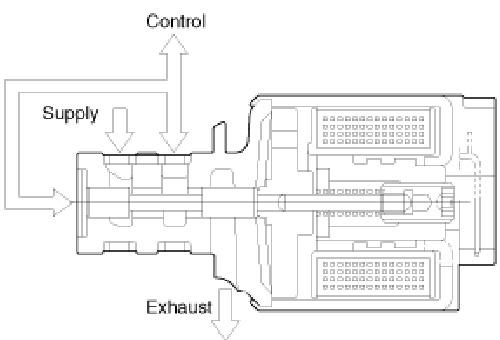
▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0746

COMPONENT LOCATION







GENERAL DESCRIPTION

In order to control the optimum line pressure and improve the efficiency of power according to the maximum efficiency of an oil pump, VFS (Variable Force Solenoid) valve has been added in the valve body hydraulic circuit.
VFS(Variable Force Solenoid): It can be said as a linear solenoid and makes detailed spool contorl available with the closer duty (600 ± 20Hz) than PWM(Pulse Width Modulation-60Hz). PWM repeats ON/OFF signals and decides the operation flux according to the 'ON' time. But, VFS decides the operation flux according to the degree that the spool jams water course.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check oil pressure and feedback current value	• Open or short in circuit • Faulty VFS SOLENOID VALVE • Faulty PCM
Enable Conditions	• Engine state=Run • VFS is enabled	
Threshold value	• Current operating state of VFS : Locked off until reset	
Diagnostic Time	• More than 1 second	

Fail Safe	• Stop the VFS control	

SPECIFICATION

Solenoid Valve for Pressure Control

- Sensor type : Normal open 3-way
- Operating temperature : -22~266°F(-30°C~130°C)

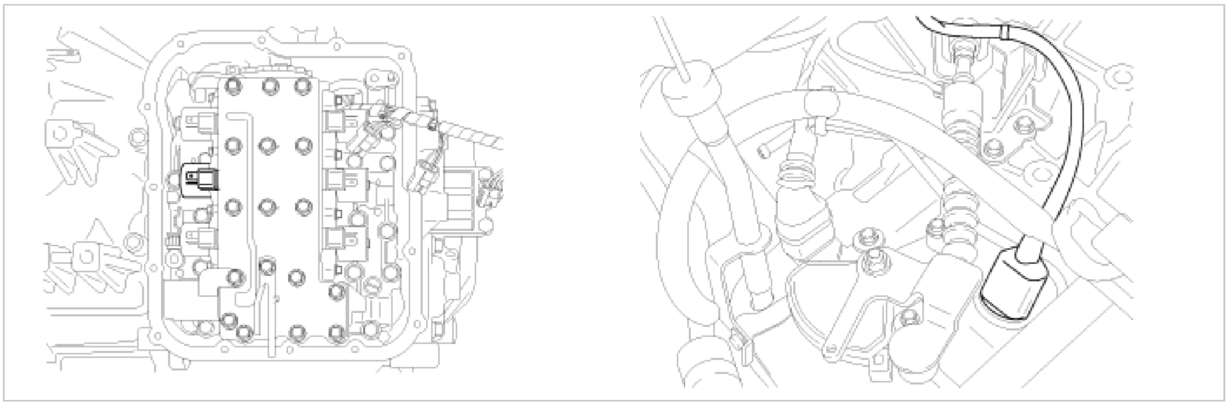
Automatic Transaxle System > Troubleshooting > P0750

COMPONENT LOCATION



GENERAL DESCRIPTION

The Automatic transmission changes the gear position of the transmission by utilizing a combination of clutches and brakes, which are controlled by solenoid valves. This automatic transmission consists of a: LR (Low and Reverse Brake), 2ND (2nd Brake), UD (Under Drive Clutch), OD (Over Drive Clutch), REV (Reverse Clutch), and a RED (Reduction Brake, only for 5 speed transmissions). The LR brake is engaged in the 1st gear and P/R/N gear positions.

DTC DESCRIPTION

The PCM checks the low and reverse control signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored (for example, high voltage is detected when low voltage is expected, or low voltage is detected when high voltage is expected), the PCM judges that the low and reverse control solenoid circuit is malfunctioning and sets this code.

DTC DETECTING CONDITION

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

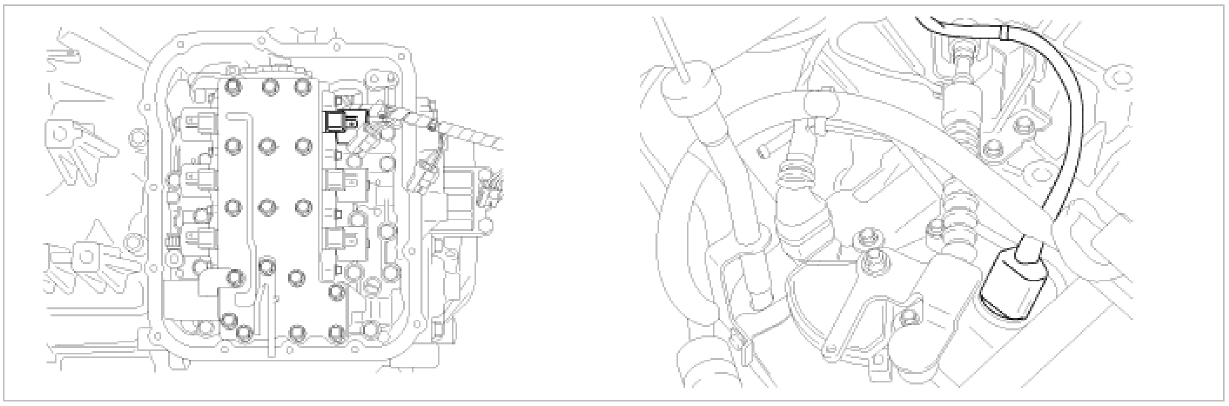
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0755

COMPONENT LOCATION



GENERAL DESCRIPTION

The Automatic transmission changes the gear position of the transmission by utilizing a combination of clutches and brakes, which are controlled by solenoid valves. This automatic transmission consists of a: LR (Low and Reverse Brake), 2ND (2nd Brake), UD (Under Drive Clutch), OD (Over Drive Clutch), REV (Reverse Clutch), and a RED (Reduction Brake, only for 5 speed transmissions).
The UD clutch is engaged in the 1st/2nd/3rd/4th gear positions.

DTC DESCRIPTION

The PCM checks the UD clutch control signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored (for example, high voltage is detected when low voltage is expected, or low voltage is detected when high voltage is expected), the PCM judges that the UD clutch control solenoid circuit is malfunctioning and sets this code.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	• Open or short in circuit • Faulty UD SOLENOID VALVE • Faulty PCM
Enable Conditions	• Engine state=Run • Engine runtime >0.5 secs • Battery voltage >11V and 16 V • Transmission relay state : Relay on • Gear shifting is completed	
Threshold value	• When the PCM detects electric or electronic abnormalness such as short circuit or out of range voltage.	
Diagnostic Time	• More than 5 seconds	
Fail Safe	• Locked in 3rd gear.(Control relay off)	

SPECIFICATION

Solenoid Valve for Pressure Control

- Sensor type : Normal open 3-way
- Operating temperature : -22~266°F(-30°C~130°C)
- Frequency :
  - LR, 2ND, UD, OD, RED : 61.27Hz (at the ATF temp. -20°C above)
  - DCC : 30.64Hz
  - VFS : 600 ± 20Hzs
- Internal resistance :
  - 2.6~3.4Ω(68°F or 20°C) - LR, 2ND, UD, OD, RED, DCC
  - 4.0~4.7Ω(68°F or 20°C) - VFS
- Surge voltage : 56 V(except VFS)

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC)
2. Engine "ON".
3. Monitor the "UD SOL. VALVE" parameter on the scantool.
4. Shift gear position "N" to "D".

Specification: P/N → 100%, D → 0.0%

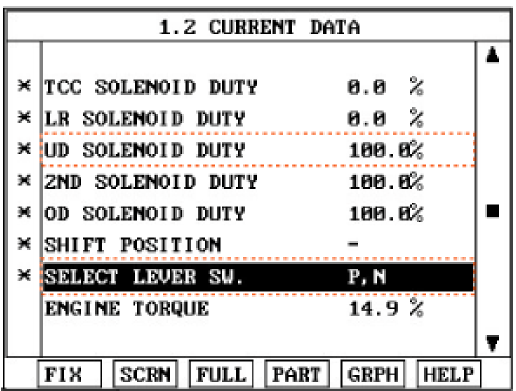


FIG.1)

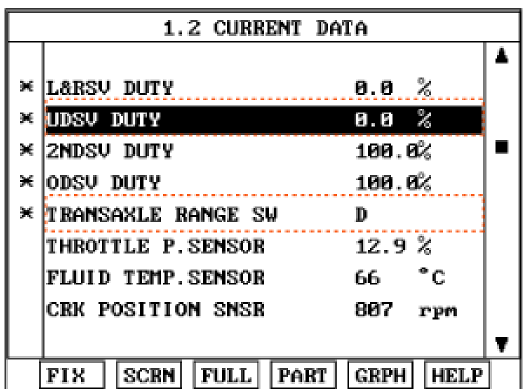

FIG.2)

FIG. 1) P/N Range
FIG. 2) D Range

5. Does "UD SOLENOID DUTY " follow the reference data?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of vehicle repair" procedure.

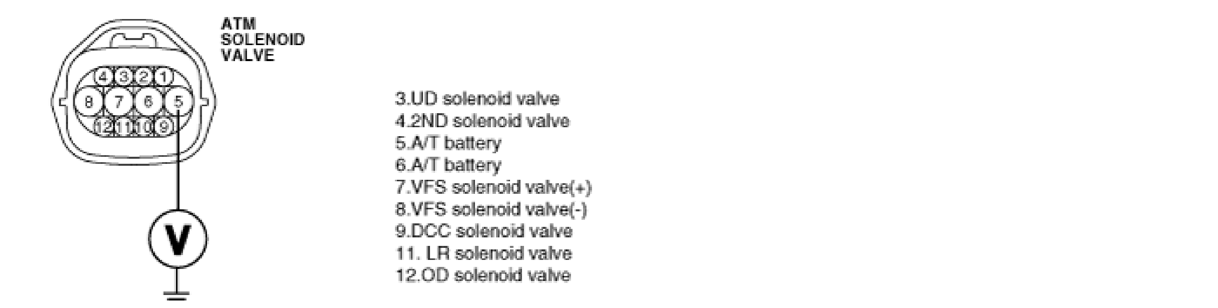
NO

▸ Go to "Power supply circuit inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Disconnect "ATM SOLENOID VALVE" connector.
2. Measure voltage between terminal "5" of the sensor harness connector and chassis ground.
3. Turn ignition switch OFF → ON.

Specification: 12V is measured only for approx. 0.5sec



4. Is voltage within specifications?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Check that A/T-20A fuse in engine room junction is installed or not blown.
▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check signal circuit open inspection
   (1) Ignition "OFF".
   (2) Disconnect "ATM SOLENOID VALVE" connector and "PCM" connector.
   (3) Measure resistance between terminal "3" of the ATM SOLENOID VALVE harness connector and terminal "3" of the PCM harness connector B.

   Specification: approx. 0 Ω

   (4) Is resistance within specifications?

YES

▸ Go to "Check signal circuit short inspection" procedure.

NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

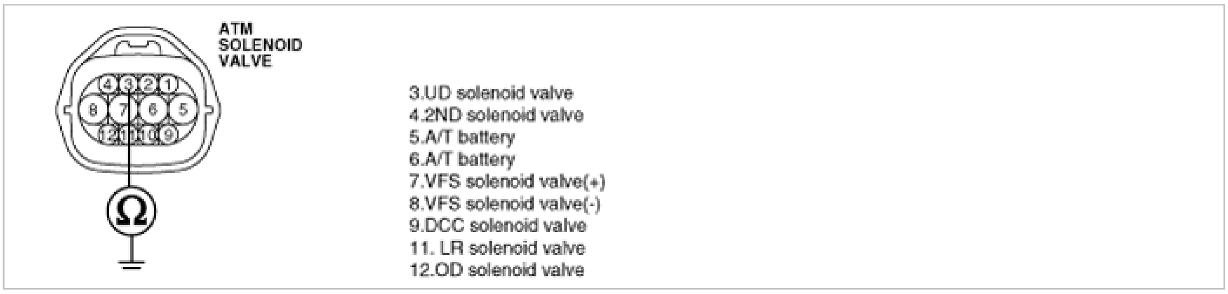
2. Check signal circuit short inspection

(1) Ignition "OFF".

(2) Disconnect "ATM SOLENOID VALVE" connector and "PCM" connector.

(3) Measure resistance between terminal "3" of the ATM SOLENOID VALVE harness and chassis ground.

Specification: Infinite



(4) Is resistance within specifications?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Check for short to ground in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION

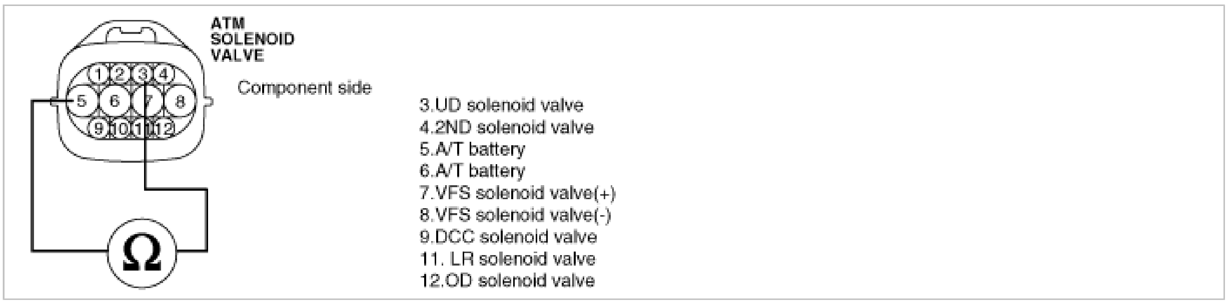
1. CHECK SOLENOID VELVE

(1) Ignition "OFF".

(2) Disconnect "ATM SOLENOID VALVE" connector.

(3) Measure resistance between terminal "3" and terminal "5" of the ATM SOLENOID VALVE harness connector.

Specification: Approximately 2.6~3.4 Ω [20°C(68°F)]



(4) Is resistance within specification?

YES

▸ Go to "CHECK PCM" as below.

NO

▸ Replace UD SOLENOID VALVE as necessary and go to "Verification vehicle repair" procedure.

2. CHECK PCM

(1) Connect scantool to data link connector(DLC).

(2) Ignition "ON" & Engine "OFF".

(3) Select ATM solenoid valve actuator test and operate actuator test.

(4) Can you hear operating sound for UD SOLENOID VALVE actuator testing function?

YES

▸ Go to "Verification vehicle repair" procedure.

NO

▸ Replace PCM as necessary and go to "Verification vehicle repair" procedure.

ACTUATOR TEST CONDITION

A. IG SWITCH ON

B. TRANSAXLE RANGE SWITCH is normal
C. P RANGE
D. Vehicle Speed 0km/h
E. Throttle position sensor < 1V
F. IDLE SWITCH ON
G. ENGINE RPM 0

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

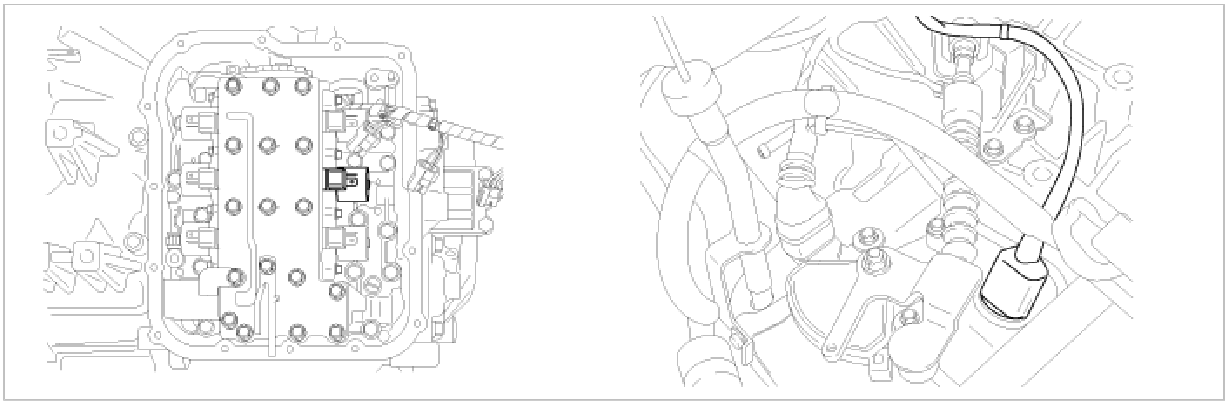
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0760

COMPONENT LOCATION



GENERAL DESCRIPTION

The Automatic transmission changes the gear position of the transmission by utilizing a combination of clutches and brakes, which are controlled by solenoid valves. This automatic transmission consists of a: LR (Low and Reverse Brake), 2ND (2nd Brake), UD (Under Drive Clutch), OD (Over Drive Clutch), REV (Reverse Clutch), and a RED (Reduction Brake, only for 5 speed transmissions).
The 2ND brake is engaged in the 2nd and 5th gear positions.

DTC DESCRIPTION

The PCM checks the 2ND brake control signal by monitoring the feedback signal from the solenoid valve drive circuit. If an unexpected signal is monitored (for example, high voltage is detected when low voltage is expected, or low voltage is detected when high voltage is expected), the PCM judges that the 2ND brake control solenoid circuit is malfunctioning and sets this code.

DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	• Open or short in circuit • Faulty 2nd SOLENOID VALVE • Faulty PCM
Enable Conditions	• Engine state=Run • Engine runtime >0.5 secs • Battery voltage >11V and 16 V • Transmission relay state : Relay on • Gear shifting is completed

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

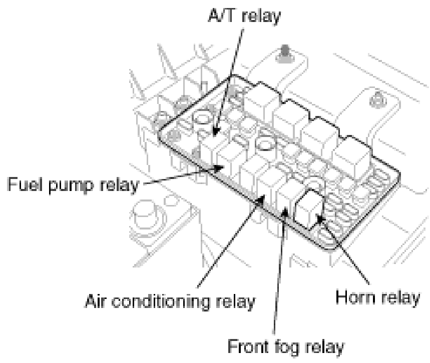
Automatic Transaxle System > Troubleshooting > P0885

COMPONENT LOCATION



GENERAL DESCRIPTION

The automatic transmission supplies power to the solenoid valves by way of a control relay. When the PCM sets the relay to ON, the relay operates and the battery power is supplied to all the sonenoid valves. When the PCM sets the relay to OFF, all solenoid valve power is shut off and the transmission is held in the 3rd gear position. (Fail Safe Mode)

DTC DESCRIPTION

The PCM checks the A/T control relay signal by monitoring the control signal. If, after the iginiton key is turned on, an unexpected voltage value, which is quite a bit lower than battery voltage, is detected, the PCM sets this code.
This code can also be set when the battery power fuse in the ignition switch has been shorted.

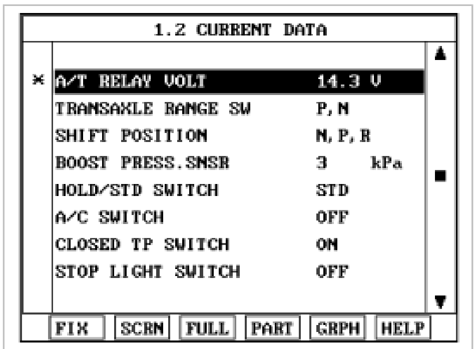
DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	• Open or short in circuit • Faulty A/T control relay • Faulty PCM
Enable Conditions	• Engine state=Run • Engine runtime >0.5 secs • Battery voltage >11V and 16 V • Transmission relay state : Relay on • Gear shifting is completed	
Threshold value	• PCM detects abnormally low voltage	
Diagnostic Time	• 2.375 second	
Fail Safe	• Locked in 3rd gear.(Control relay off)	

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Ignition "ON" & Engine "OFF".
3. Monitor the "A/T CON. RELAY VOLT" parameter on the scantool.

Specification : Approx. B+



4. Is A/T RELAY VOLT within specifications?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Replace the PCM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

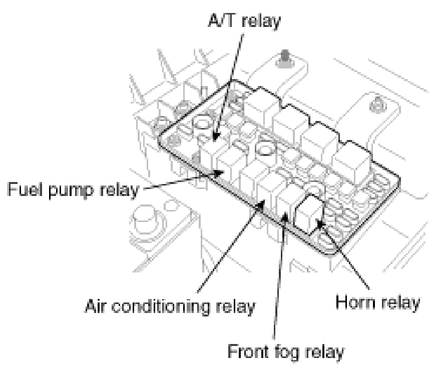
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0890

COMPONENT LOCATION



GENERAL DESCRIPTION

The automatic transmission supplies power to the solenoid valves by way of a control relay. When the PCM sets the relay to ON, the relay operates and the battery power is supplied to all the sonenoid valves. When the PCM sets the relay to OFF, all solenoid valve power is shut off and the transmission is held in the 3rd gear position. (Fail Safe Mode)

DTC DESCRIPTION

The PCM checks the A/T control relay signal by monitoring the control signal. If, the voltage applied to A/T solenoids is lower than 0.5V, the PCM sets this code.

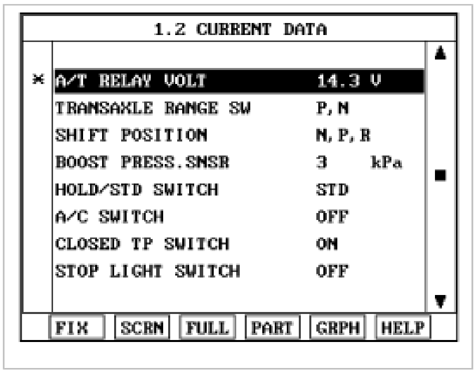
DTC DETECTING CONDITION

Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	• Open or short in circuit • Faulty A/T control relay • Faulty PCM
Enable Conditions	• Engine state≠Power off relay or engine shutdown process • Battery voltage>11V and<16V • A/T power relay is enabled • No TCM power relay diag fail	
Threshold value	• Voltage applied to A/T solenoids<= 0.5 V	
Diagnostic Time	• 2 seconds	
Fail Safe	• Locked in 3rd gear.(Control relay off)	

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Ignition "ON" & Engine "OFF".
3. Monitor the "A/T CON. RELAY VOLT" parameter on the scantool.

Specification : Approx. B+



4. Is A/T RELAY VOLT within specifications?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of vehicle repair" procedure.

NO

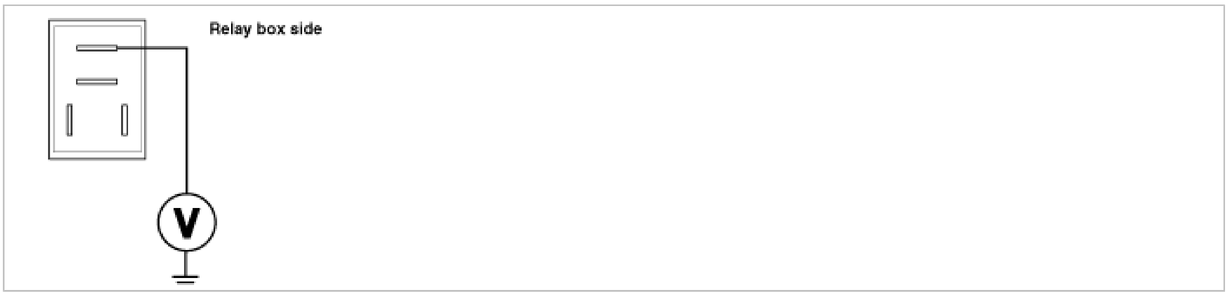
▸ Go to "Power supply circuit inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "A/T CONTROL RELAY" connector.
3. Measure the voltage between the power terminal of the "A/T CONTROL RELAY" in the engine room relay box and chassis

ground.

Specification : Approx. B+



4. Is voltage within specifications?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Check that A/T-20A fuse in engine room junction is installed or not blown.
▸ Check for Open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. CHECK A/T control relay harness
   (1) Ignition "OFF".
   (2) Disconnect the "ATM CONTROL RELAY" connector.
   (3) Measure the voltage between terminal "60" of the "PCM" harness connector A and chassis ground.
   (4) Turn ignition switch OFF → ON.

   Specification: 12V is measured only for approx. 0.5sec

   (5) Is voltage within specifications?

   YES

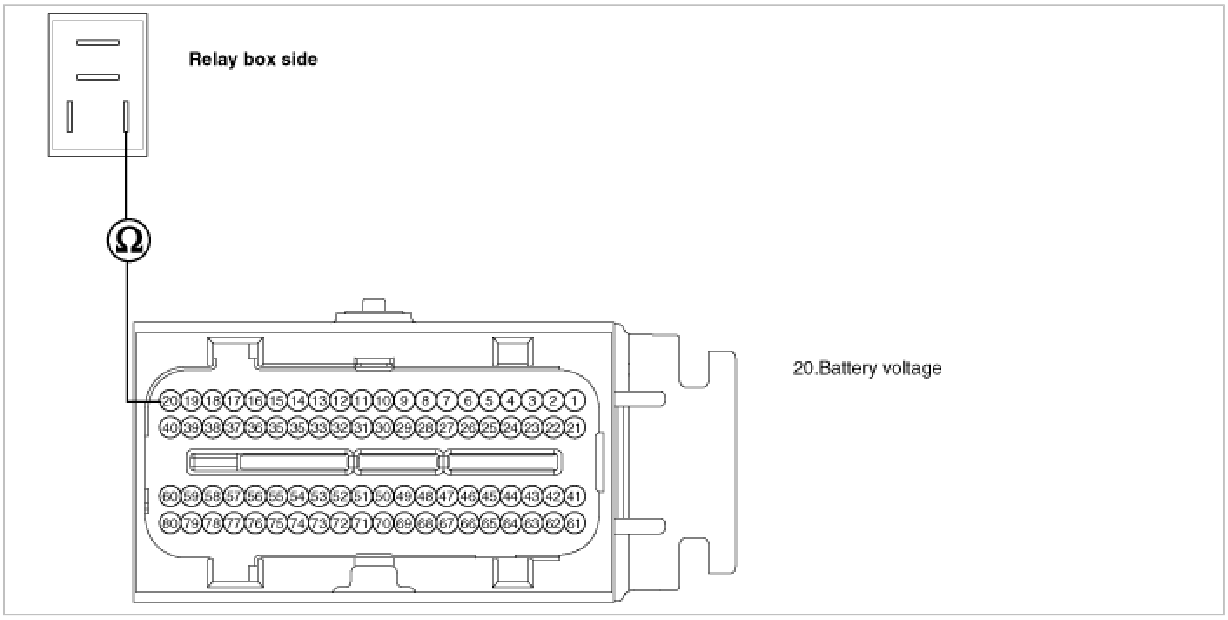
   ▸ Go to "Check supplying power to solenoid valve" procedure.

   NO

   ▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure
   ▸ If signal circuit is OK, Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM and then go to "Verification of vehicle repair" procedure.

2. CHECK supplying power to solenoid valve harness
   (1) Ignition "OFF".
   (2) Disonnect the "ATM CONTROL RELAY" and PCM connector.
   (3) Measure the resistance between the terminal shown below of the "A/T CONTROL RELAY" in the engine room relay box and terminal "20" of the PCM harness connector A.

   Specification : Approx. 0 Ω



(4) Is resistance within specifications?

YES

▸ Go to "Ground circuit inspection" procedure.

NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect the "A/T CONTROL RELAY" connector.
3. Measure the resistance between the terminal shown below of the "A/T CONTROL RELAY" in the engine room relay box and chassis ground.

Specification : Approx. 0 Ω

4. Is resistance within specifications?

YES

▸ Go to "Component inspection" procedure.

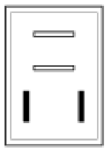
NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Remove "A/T CONTROL RELAY"
3. Measure the resistance between each terminal of the sensor.

Specification: ∞ except between those two terminals below



4. Is resistance with in specification?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Replace ATM CONTROL RELAY and then go to "Verification of vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

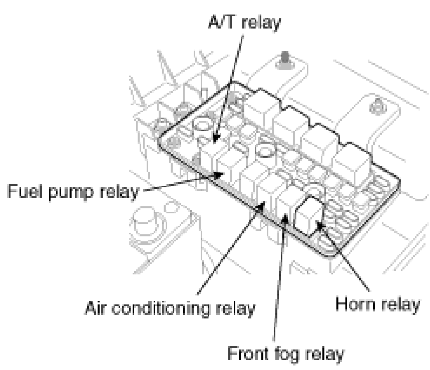
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Automatic Transaxle System > Troubleshooting > P0891

COMPONENT LOCATION



GENERAL DESCRIPTION

The automatic transmission supplies power to the solenoid valves by way of a control relay. When the PCM sets the relay to ON, the relay operates and the battery power is supplied to all the sonenoid valves. When the PCM sets the relay to OFF, all solenoid valve power is shut off and the transmission is held in the 3rd gear position. (Fail Safe Mode)

DTC DESCRIPTION

The PCM checks the A/T control relay signal by monitoring the control signal. If, the voltage applied to A/T solenoids is higher than 20V, the PCM sets this code.

DTC DETECTING CONDITION

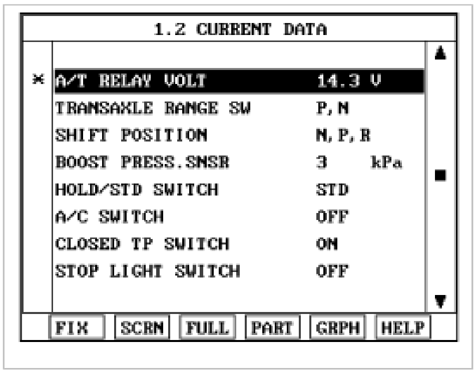
Item	Detecting Condition & Fail Safe	Possible cause
DTC Strategy	• Check voltage range	• Open or short in circuit • Faulty A/T control relay • Faulty PCM
	• Engine state≠Power off relay or engine shutdown process	

Enable Conditions	• Engine runtime >0.5 secs • Battery voltage >11V and 16 V • Transmission relay state : Relay on • Gear shifting is completed	
Threshold value	• Voltage applied to A/T solenoids>= 20 V	
Diagnostic Time	• 2 seconds	
Fail Safe	• Locked in 3rd gear.(Control relay off)	

MONITOR SCANTOOL DATA

1. Connect scantool to data link connector(DLC).
2. Ignition "ON" & Engine "OFF".
3. Monitor the "A/T CON. RELAY VOLT" parameter on the scantool.

Specification : Approx. B+



4. Is A/T RELAY VOLT within specifications?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration or damage. Repair or replace as necessary and go to "Verification vehicle repair" procedure.

NO

▸ Go to "Terminal&connector inspection" procedure.

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Go to "Power supply circuit inspection" procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Disconnect the "A/T CONTROL RELAY" connector.
3. Measure the voltage between the power terminal of the "A/T CONTROL RELAY" in the engine room relay box and chassis ground.

Specification : Approx. B+

4. Is voltage within specifications?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Check that A/T-20A fuse in engine room junction is installed or not blown.
▸ Check for Open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. CHECK A/T control relay harness
   (1) Ignition "OFF".
   (2) Disconnect the "ATM CONTROL RELAY" connector.
   (3) Measure the voltage between terminal "60" of the "PCM" harness connector A and chassis ground.
   (4) Turn ignition switch OFF → ON.

   Specification: 12V is measured only for approx. 0.5sec

   (5) Is voltage within specifications?

   YES

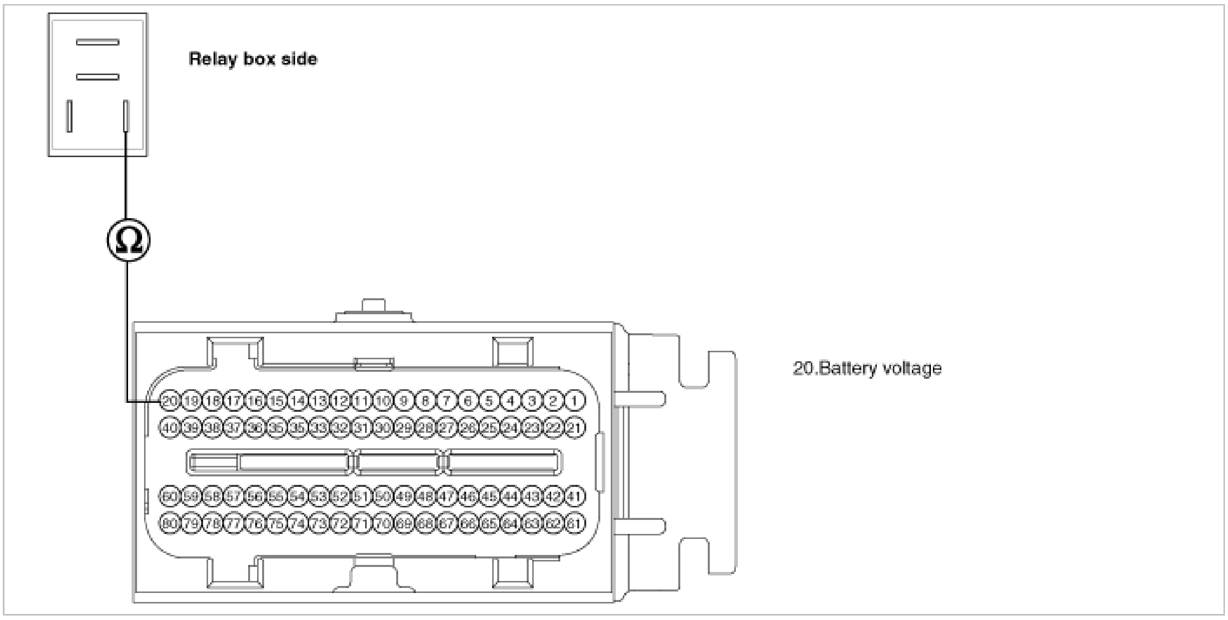
   ▸ Go to "Check supplying power to solenoid valve" procedure.

   NO

   ▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure
   ▸ If signal circuit is OK, Substitute with a known-good PCM and check for proper operation. If the problem is corrected, replace PCM and then go to "Verification of vehicle repair" procedure.

2. CHECK supplying power to solenoid valve harness
   (1) Ignition "OFF".
   (2) Disonnect the "ATM CONTROL RELAY" and PCM connector.
   (3) Measure the resistance between the terminal shown below of the "A/T CONTROL RELAY" in the engine room relay box and terminal "20" of the PCM harness connector A.

   Specification : Approx. 0 Ω



(4) Is resistance within specifications?

YES

▸ Go to "Ground circuit inspection" procedure.

NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect the "A/T CONTROL RELAY" connector.
3. Measure the resistance between the terminal shown below of the "A/T CONTROL RELAY" in the engine room relay box and chassis ground.

Specification : Approx. 0 Ω

4. Is resistance within specifications?

YES

▸ Go to "Component inspection" procedure.

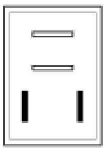
NO

▸ Check for open in harness. Repair as necessary and go to "Verification vehicle repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Remove "A/T CONTROL RELAY"
3. Measure the resistance between each terminal of the sensor.

Specification: ∞ except between those two terminals below



AT relay component side

4. Is resistance with in specification?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of vehicle repair" procedure.

NO

▸ Replace ATM CONTROL RELAY and then go to "Verification of vehicle repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Enable conditions in General information.
4. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

SPECIAL TOOLS

Tool (Number and name)	Illustration	Use
09793-21000 Door hinge adjusting wrench		Adjustment, removal and installationOf the door hinge
09800-21000 Ornament remover		Trim removal
09853-31000 Headliner clip remover		Removal of the headliner clips
09861-31100 Sealant cut-out tool		Cutting the sealant of the windshield (Use with 09861-31200)
09861-31200 Sealant cutting blade		Cutting the sealant of the windshield (Use with 09861-31100)
09861-31300 Sealant gun		Application of the sealant to the windshield
09861-31400 Glass holder		Removal and installation of the windshield
09861-31000 Windshield moulding remover		Removal of the windshield moulding
09880-4F000 Hogring clip installer		Installation of the hogring clip

Body (Interior and Exterior) > General Information > Troubleshooting

TROUBLESHOOTING

Symptom	Suspect Area	Remedy
Water leaks from sunroof	Dirt accumulated in drain tube	Clear dirt inside of drain
	Clogged drain tube	Blow air into drain to remove dirt
	Broken or dislocated drain tube, defectiveOr cracked clip	Check tube installation and Flange contact
	Deteriorated roof lid weatherstrip	Replace
	Excessive roof lid-to-body clearance and Improperly fitted weatherstrip	Adjust
Wind noise around sunroof	Loose or deformed deflector, gaps In body work	Retighten adjust or replace
Sunroof lid makes a noise when move	Foreign particles lodged in guide rail	Check drive cable and guide Rails for foreign particles
	Loose guide rails and lid	Retighten
Motor runs but sunroof Does not move or moves only partially	Foreign particles lodged in guide rail	Check drive cable and guide Rails for foreign particles
	Incorrect engagement of motor pinion With drive cable	Check for loose motor installation And damaged pinion
	Decrease in motor`s clutch slipping force	Adjust
	Increased sunroof sliding resistance Or interference of sunroof with drive Cables, weatherstrip, etc. due to Maladjustment of sunroof	Adjust or replace
Noise in motor clutch slipping Noise from motor when sunroof Is fully opened or closed is not An unusual noise	Incorrect engagement of motor pinion With drive cable	Check pinion installation and Retighten motor
	Worn out or damaged motor pinion bearing	Replace motor assembly
	Worn out or deformed drive cable	Replace
Door glass fails to operate Up and down	Incorrect window glass installation	Adjust position
	Damaged or faulty regulator arm or regulator	Correct or replace
Door does not open or close completely	Incorrect door installation	Adjust position
	Defective door check assembly	Correct or replace
	Door hinge requires grease	Apply grease
Hood does not open or close completely	Striker and latch not properly aligned	Adjust
	Incorrectly installed hood	Adjust
	Incorrect hood bumper height	Adjust
Water leak through windshield end rear window	Defective seal	Fill with sealant
	Defective flange	Correct

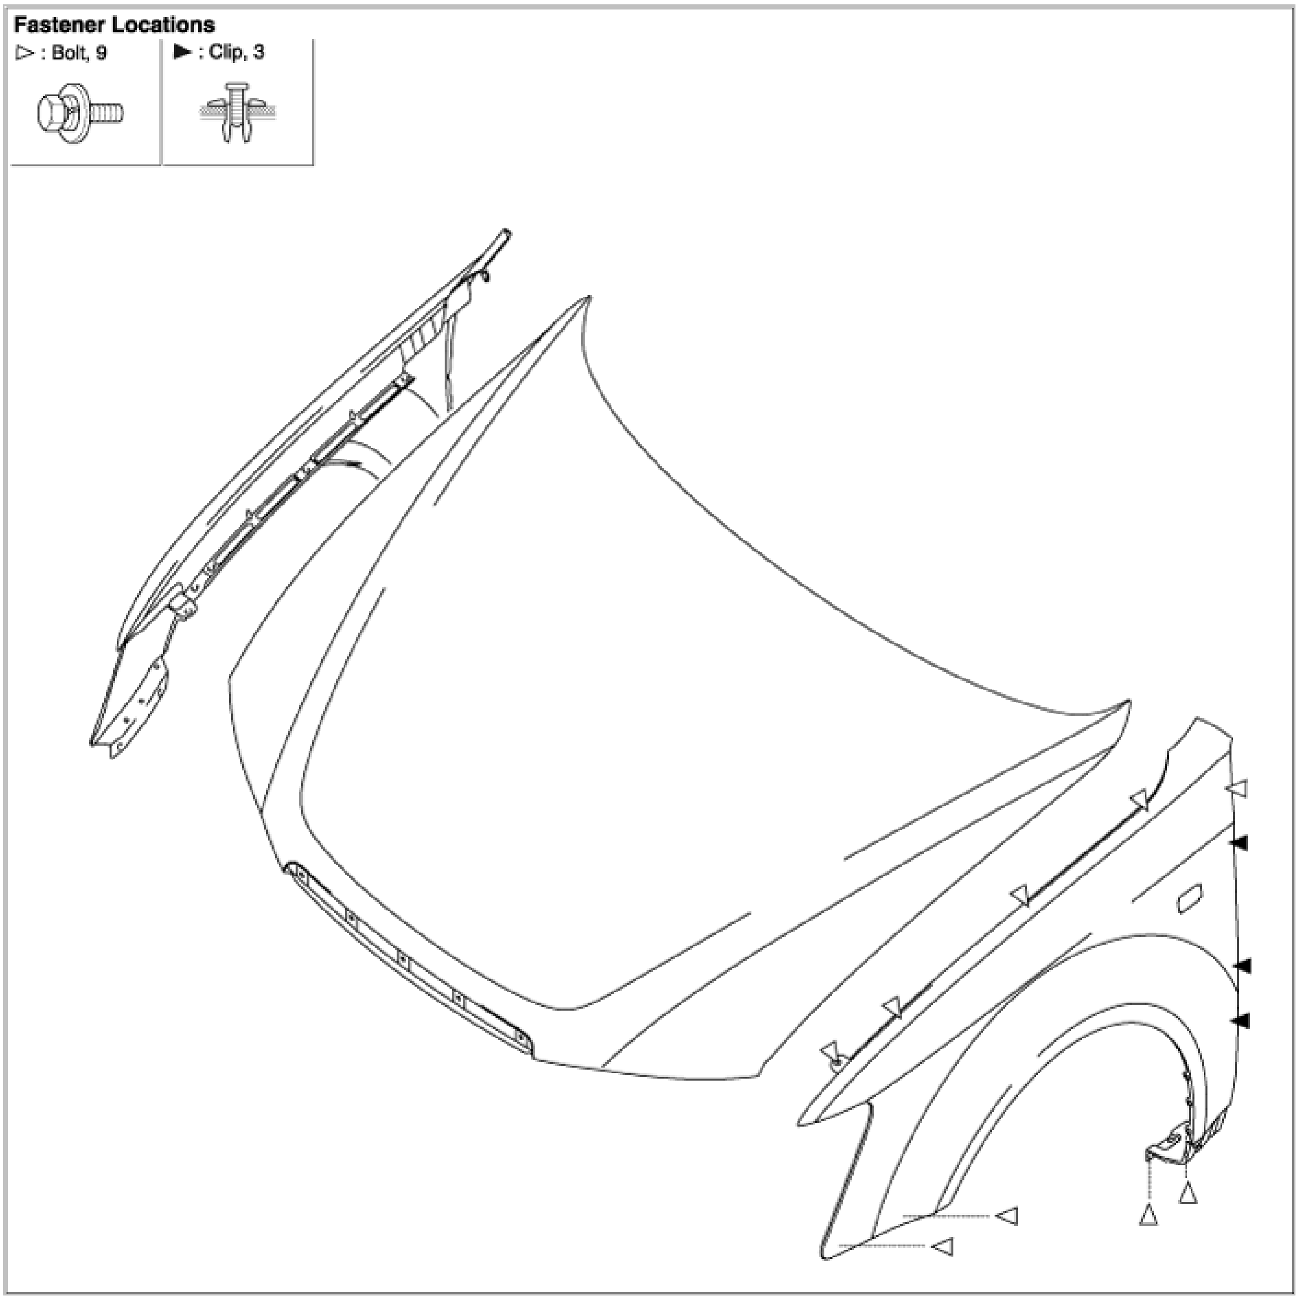
REPLACEMENT

NOTE

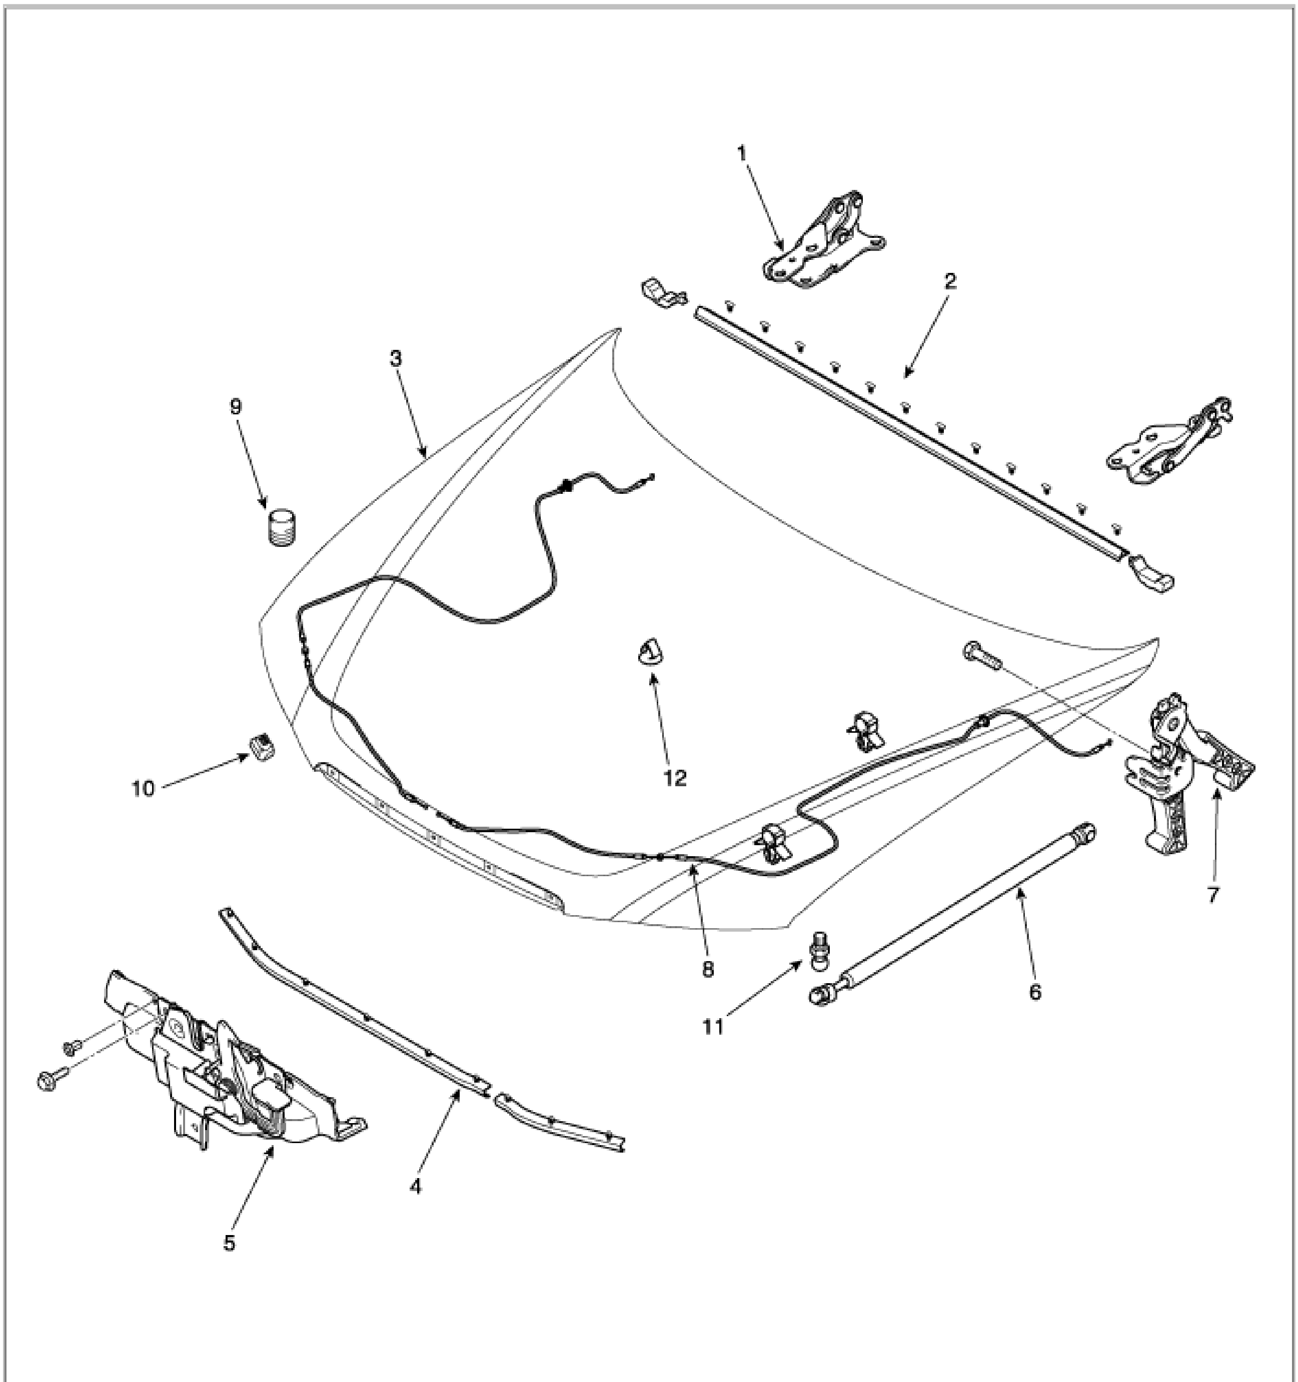
- When prying with a flat-tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.
- Take care not to scratch the body surface.

1. Remove the following items.
   A. Side garnish.
   B. Front bumper.
   C. Wheel guard.
   D. Headlamp.
2. Installation is the reverse of removal.



Body (Interior and Exterior) > Exterior > hood > Components and Components Location

COMPONENTS



1. Hood hinge	5. Hood latch	9. Hood overslam bumper
2. Hood weatherstrip	6. Hood lift	10. Hood stop bumper
3. Hood	7. Hood release handle	11. Bal l joint
4. Hood seal weatherstrip	8. Hood release cable	12. Mounting clip

Body (Interior and Exterior) > Exterior > hood > Repair procedures

REPLACEMENTS

HOOD ASSEMBLY REPLACEMENT

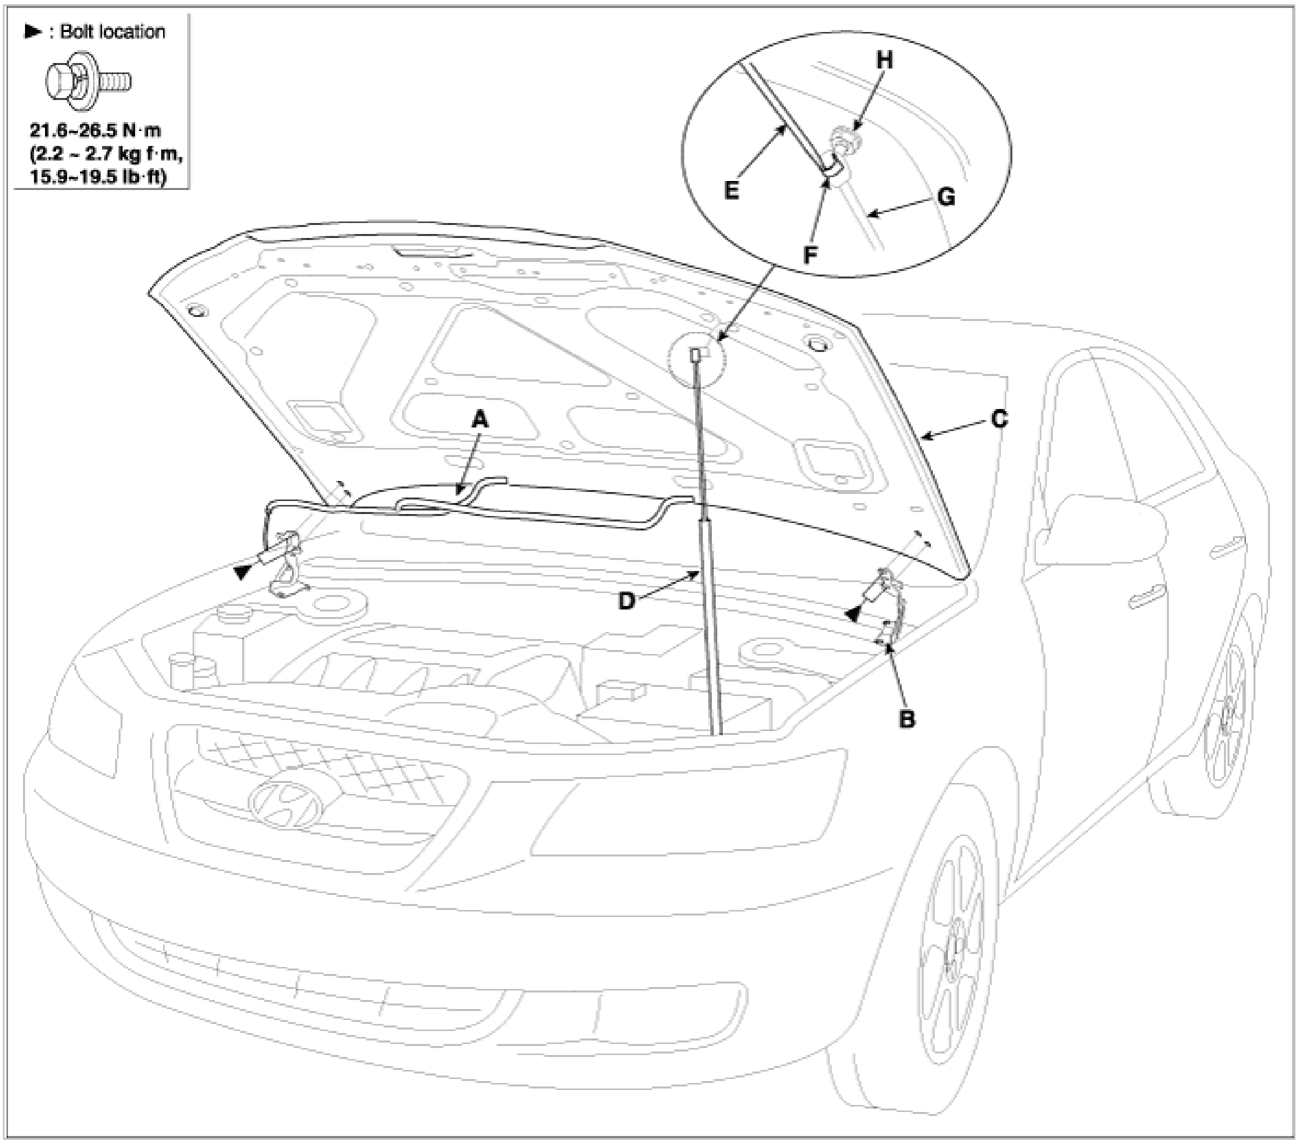
NOTE

- When removing and installing the hood, an assistant is necessary.
- Take care not to damage the hood and body.
- When removing the clips, use a clip remover.

1. Disconnect the windshield washer nozzle connecting tube (A).
2. After loose the hood hinge (B) mounting bolts, remove the hood (C).
3. Using a screwdriver (E), lift up slightly the socket clips (F) of both ends on the lifer (G), and then remove the lifter from the bracket (H).
4. Installation is the reverse of removal.

NOTE

- Make sure the hood opens properly and locks securely.
- Adjust the hood alignment.

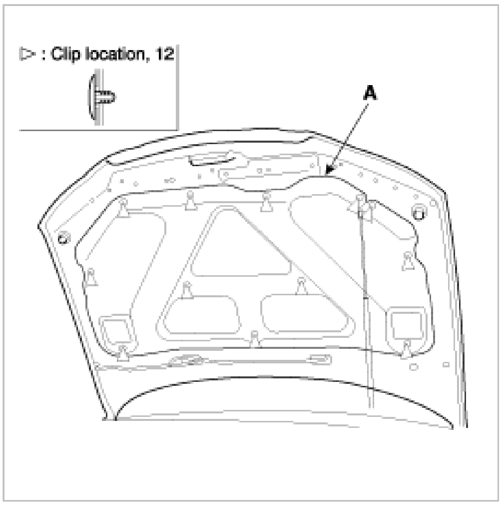


HOOD INSULATOR REPLACEMENT

1. Using a clip remover, detach the clips, and remove the hood insulator (A).

NOTE

- Take care not to scratch the hood panel.



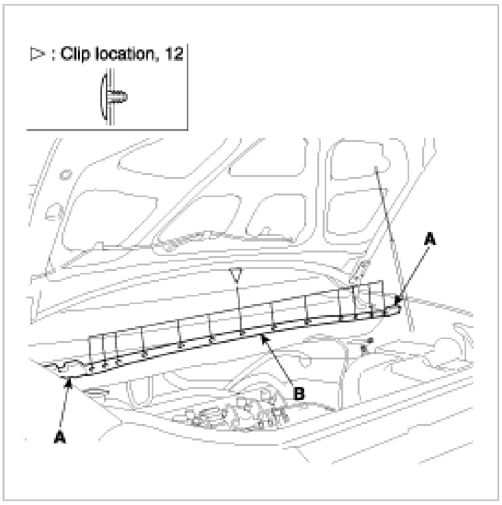
2. Installation is the reverse of removal.

NOTE

- Replace any damaged clips.

HOOD SEAL WEATHERSTRIP REPLACEMENT

1. Detach the clips, then remove the hood weatherstrip(A).
   Take care not to scratch the hood.



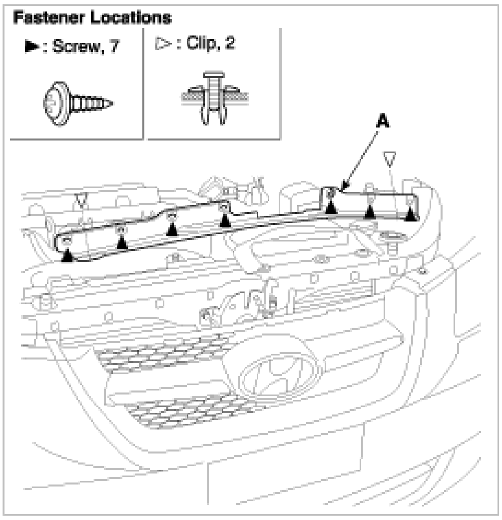
2. Installation is the reverse of removal.

NOTE

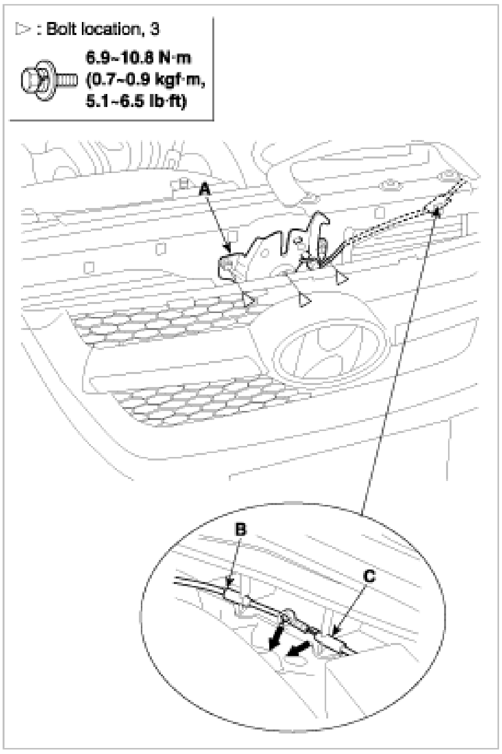
- Replace any damaged clips.

HOOD LATCH REPLACEMENT

1. Remove the radiator guard (A).



2. Remove the hood latch (A) mounting bolts.
3. Disconnect the hood latch cable (B) and release cable (C).

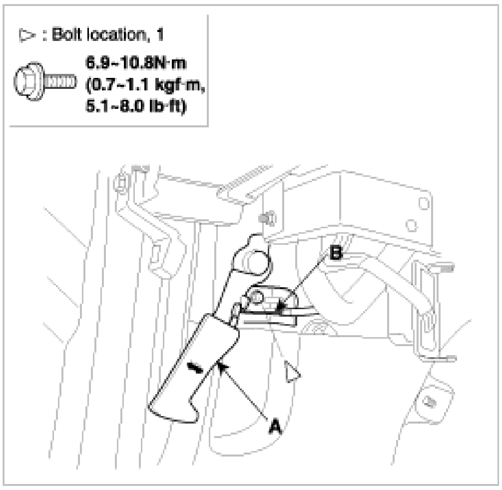


4. Installation is the reverse of removal.

> NOTE
>
> - Make sure the hood latch cable is connected properly.
> - Make sure the hood locks securely.

HOOD RELEASE HANDLE REPLACEMENT

1. Remove the mounting bolt, then remove the hood release handle (A).
2. Disconnect the hood latch cable (B) from the hood release handle. Take care not to bend the cable.



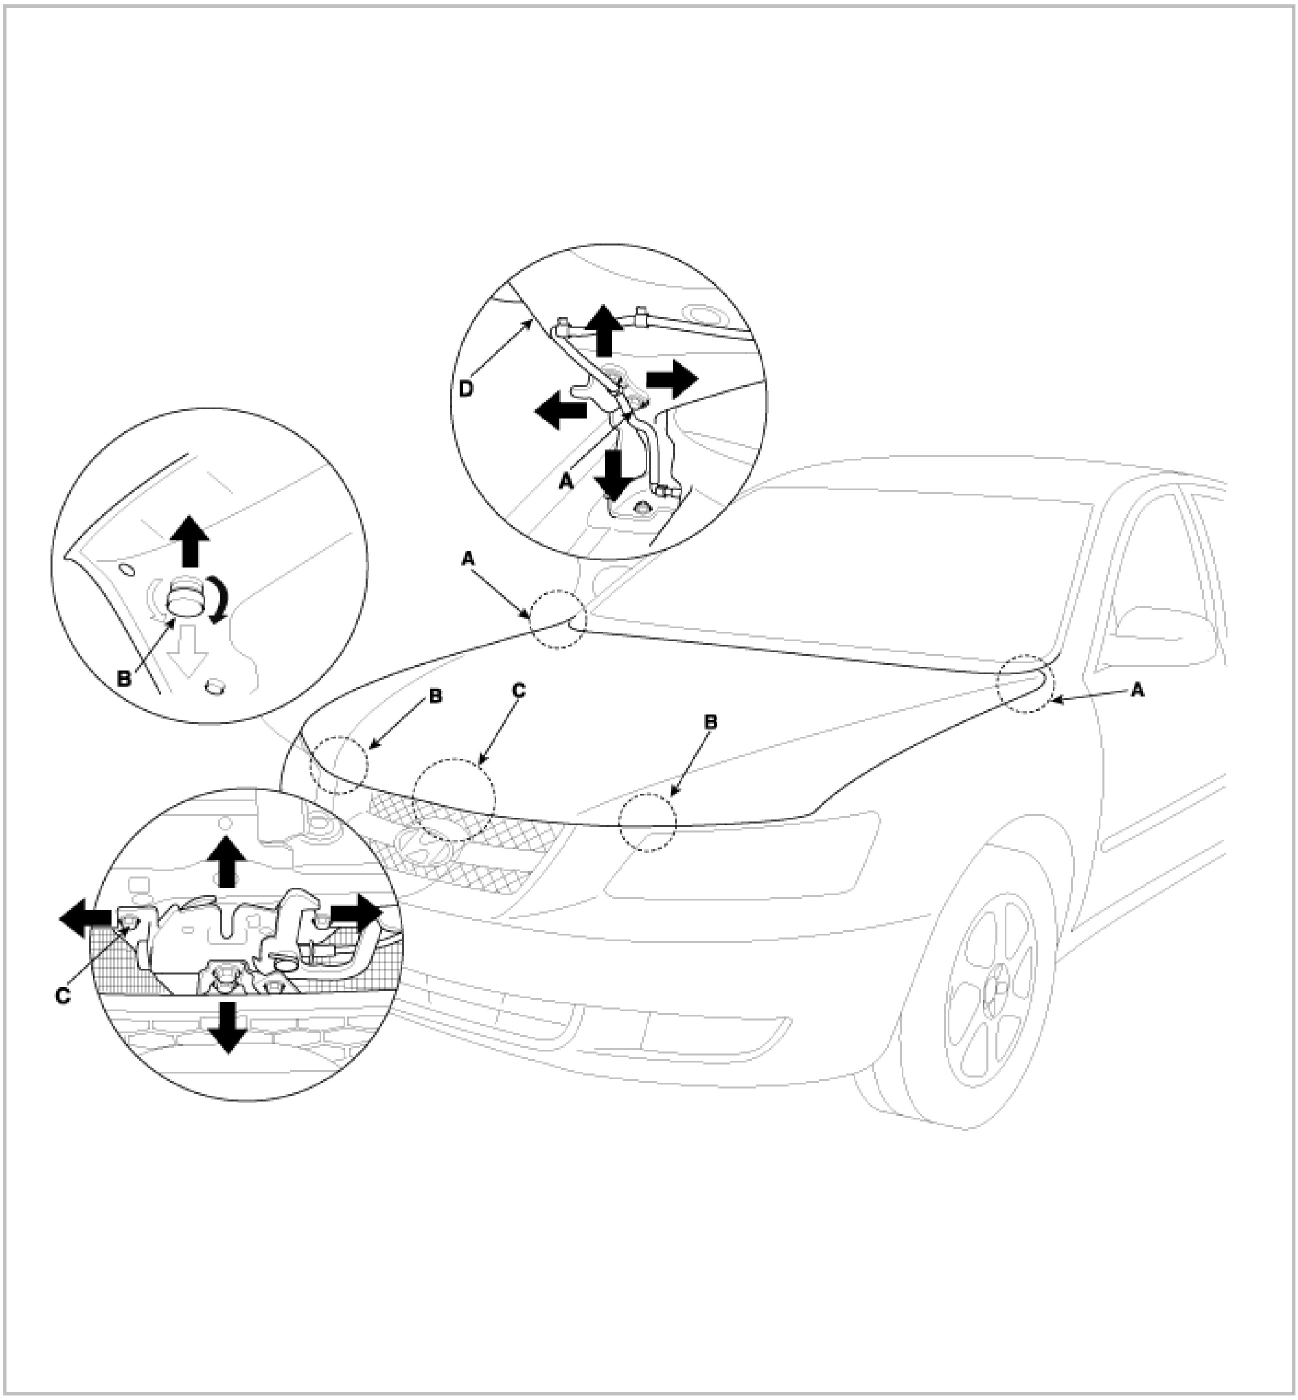
3. Installation is the reverse of removal.

> **NOTE**
>
> - Make sure the hood latch cable is connected properly.
> - Make sure the hood locks securely.

ADJUSTMENT

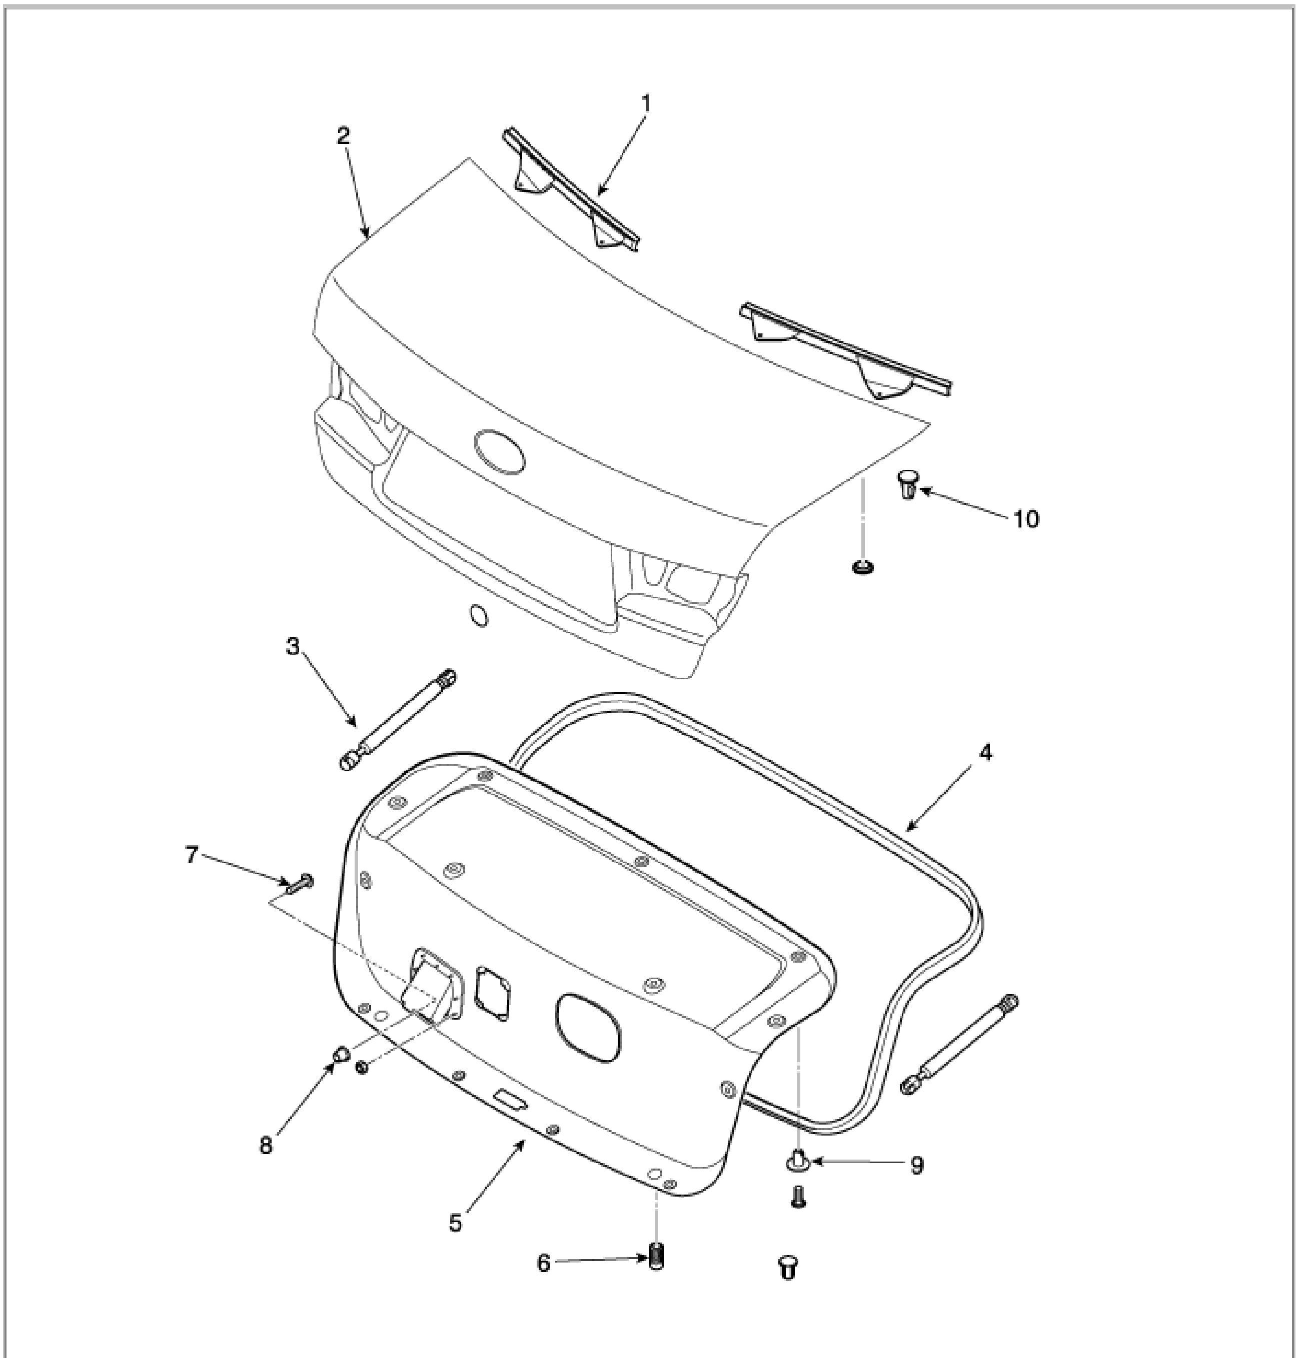
ADJUST HOOD

1. After loosening the hinge (A) mounting bolt, adjust the hood (D) by moving it up or down, or right or left.
2. Adjust the hood height by turning the hood overslam bumpers (B).
3. After loosening the hood latch (C) mounting bolts, adjust the latch by moving it up or down, or right or left.



Body (Interior and Exterior) > Exterior > trunk lid > Components and Components Location

COMPONENTS



1. Trunk seal	4. Trunk lid weatherstrip	7. Screw
2. Trunk lid	5. Trunk lid trim	8. Screw glow bet
3. Lift	6. Overslam bumper	9. Bumper cover mounting retainer
		10. Trunk lid hinge stop clip

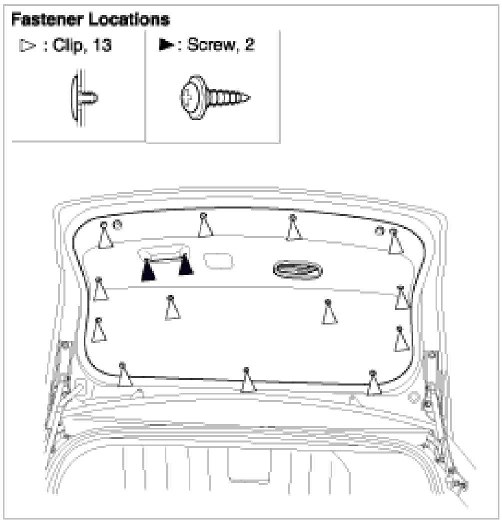
Body (Interior and Exterior) > Exterior > trunk lid > Repair procedures

REPLACEMENT

TRUNK LID TRIM REPLACEMENT

NOTE

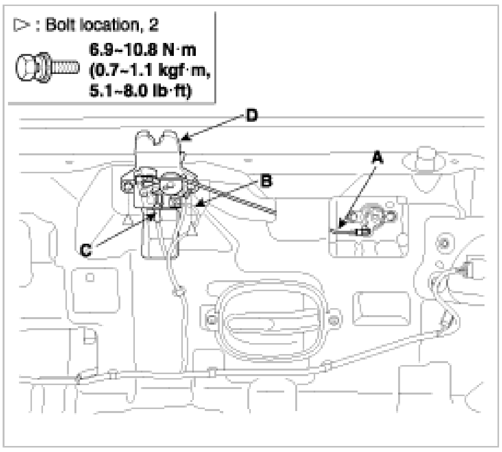
- When removing and installing the trunk lid, an assistant is necessary.
- Wear gloves to protect hands from injury.



1. Installation is the reverse of removal.

TRUNK LID LATCH REPLACEMENT

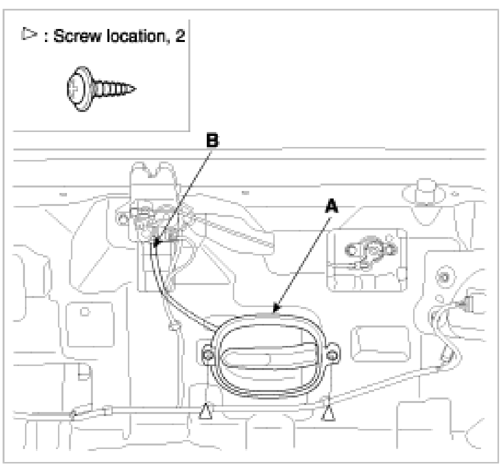
1. Remove the trunk lid trim.
2. Disconnect the key cylinder (A), connector (B) and cable (C).
3. After loosening the mounting bolt, then remove the latch assembly (D).



4. Installation is the reverse of removal.

TRUNK LID INSIDE HANDLE

1. Disconnect the inside handle cable (B).
2. After loosening the inside handle mounting screws, then remove the inside handle (A).



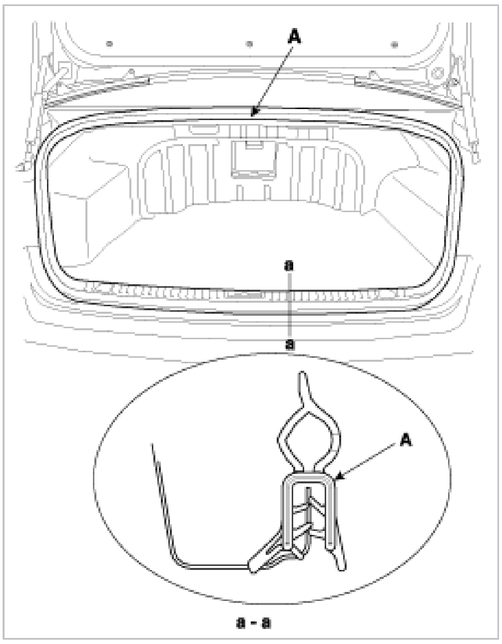
3. Installation is the reverse of removal.

NOTE

- Make sure the trunk lid latch cable is connected properly.
- Make sure the trunk lid opens properly and locks securely.

TRUNK LID WEATHERSTRIP REPLACEMENT

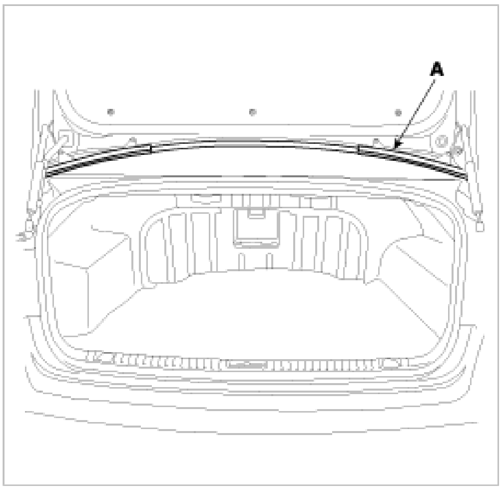
1. Remove the trunk lid weatherstrip (A).



2. Installation is the reverse of removal.

TRUNK LID SEAL WEATHERSTRIP REPLACEMENT

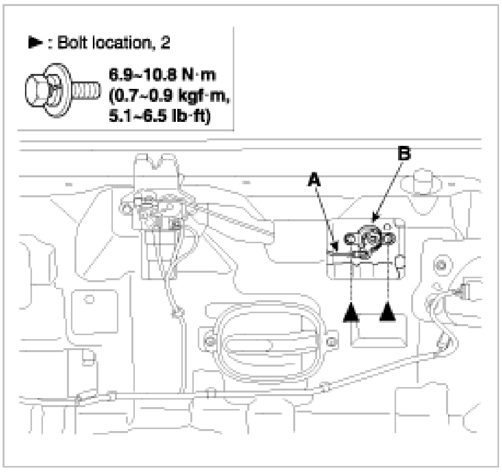
1. Detach the clips, then remove the trunk lid weatherstrip (A).



2. Installation is the reverse of removal.

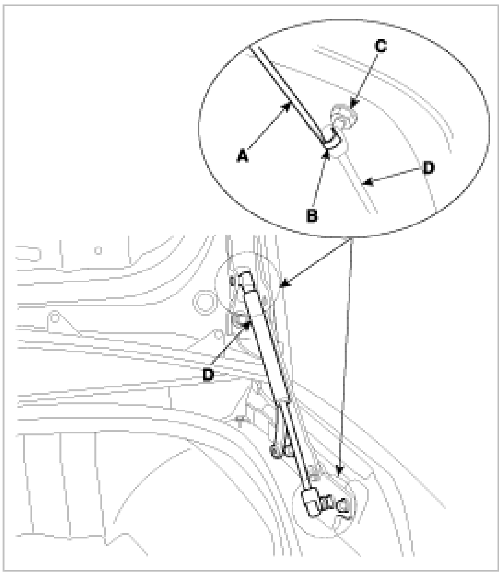
KEY HOLDER REPLACEMENT

1. Remove the trunk lid trim.
2. After loosening the mounting bolts, disconnect the connector (A).
3. Remove key holder (B).



TRUNK LID LIFT REPLACEMENT

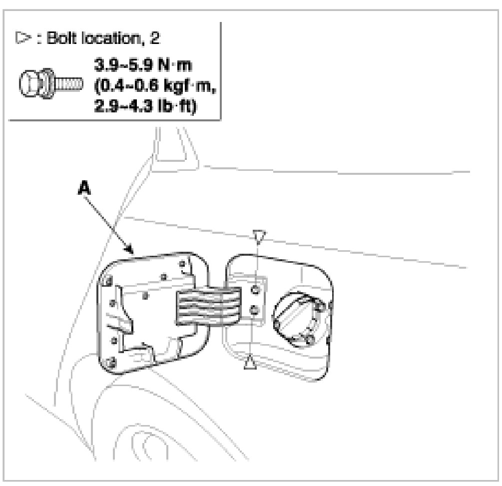
1. Using a screwdriver (A), lift up slightly the socket clips (B) of both ends on the lifter (C), and then remove the lifter from the bracket (D).



2. Push the socket of the lifter into the bracket for installation.

FUEL FILL DOOR REPLACEMENT

1. Loosen the bolts, then remove the fuel filler door (A).

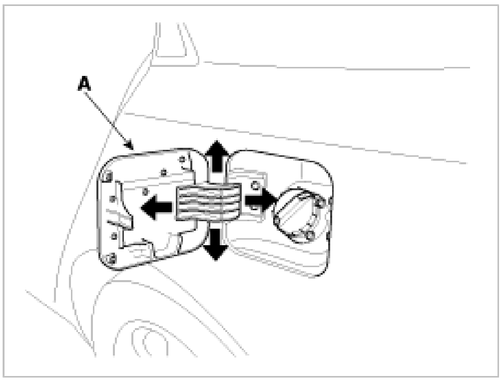


2. Installation is the reverse of removal.

NOTE

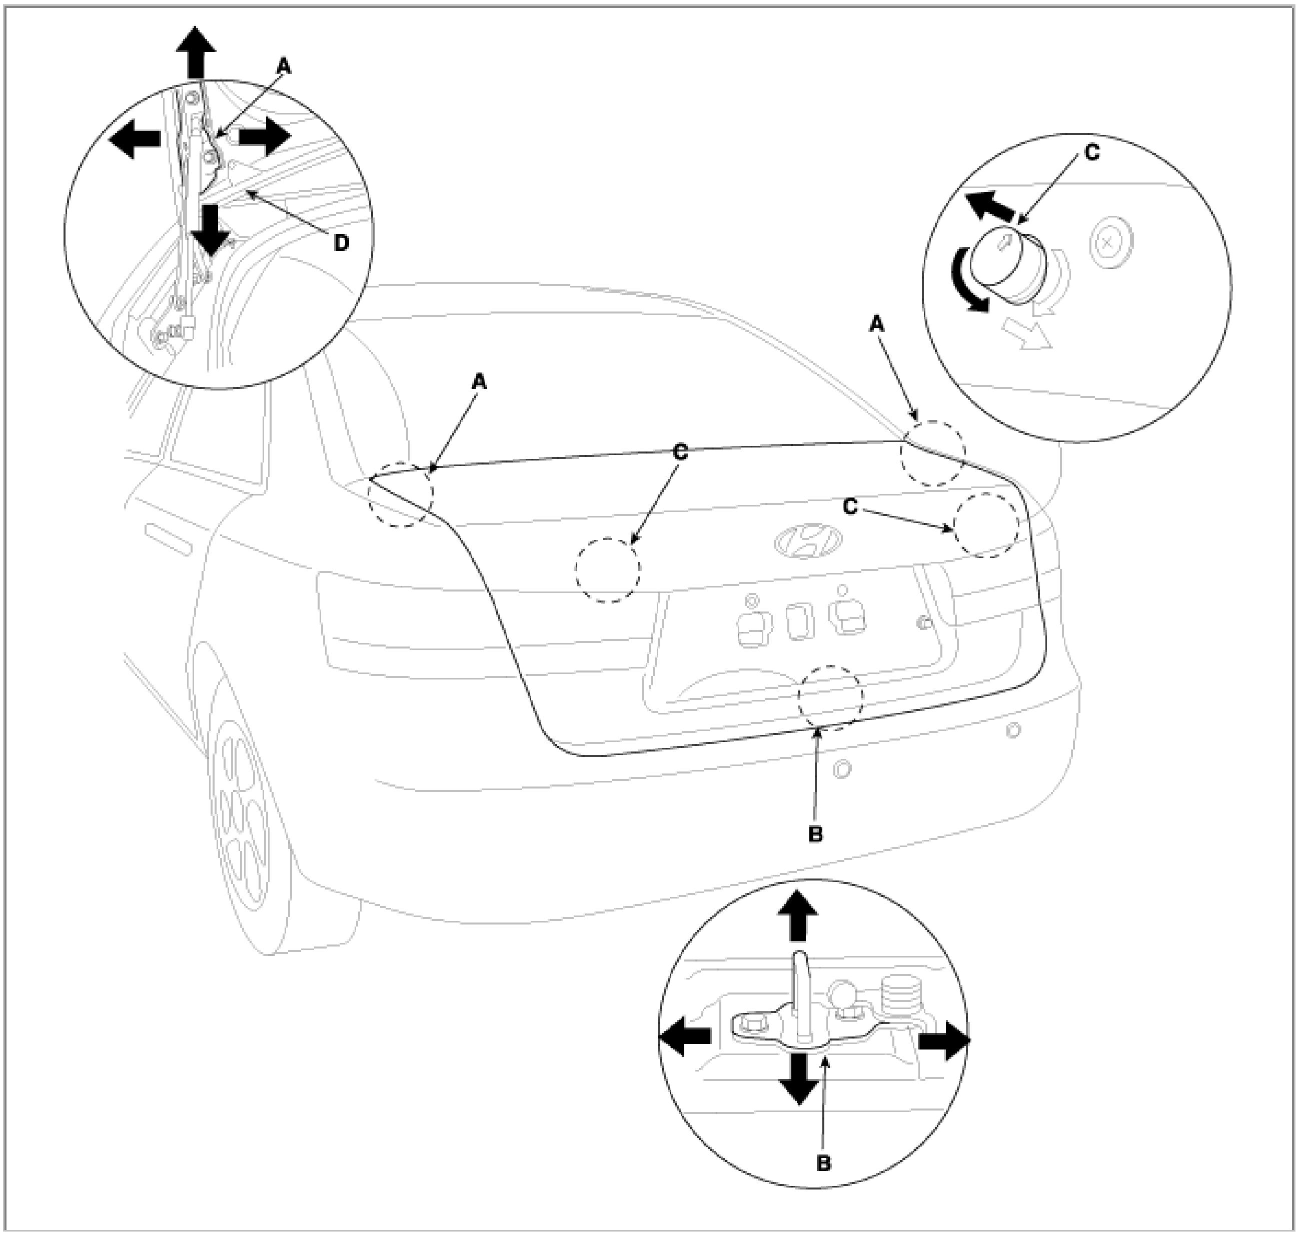
- Make sure the fuel fill door opens properly and locks securely.

3. Check that the fuel fill door (A) fits flush against the body.
   If necessary, adjust it.



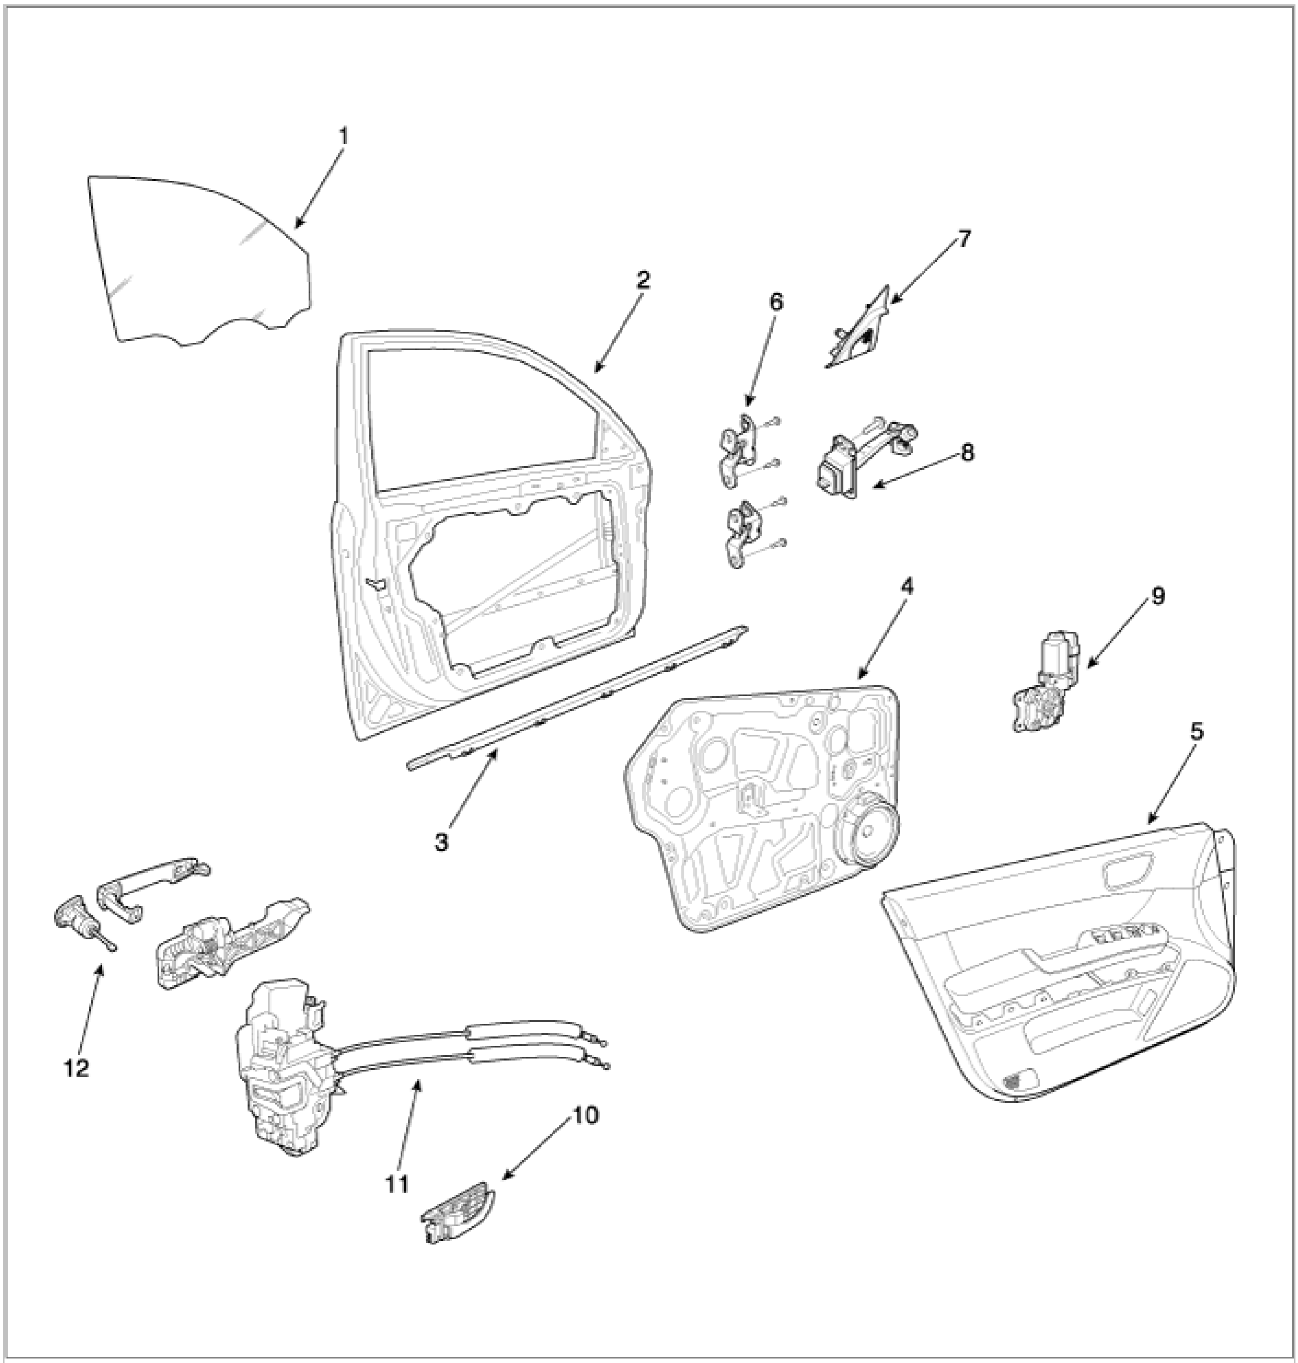
ADJUSTMENT

1. After loosening the trunk lid hinge (A) mounting bolt, adjust the hood (D) by moving it up or down, or right or left.
2. Adjust the trunk lid height by turning the trunk lid overslam bumpers (C).
3. After loosening the trunk lid latch (B) mounting bolts, adjust the trunk lid latch by moving it up or down, or right or left.



Body (Interior and Exterior) > Exterior > front door > Components and Components Location

COMPONENTS



1. Front door glass	5. Front door trim	9. Power window motor
2. Front door panel	6. Door hinge	10. Inside handle
3. Door belt weatherstrip	7. Quadrant inner cover	11. Latch assemble
4. Front door module	8. Front door checker	12. Key cylinder

Body (Interior and Exterior) > Exterior > front door > Repair procedures

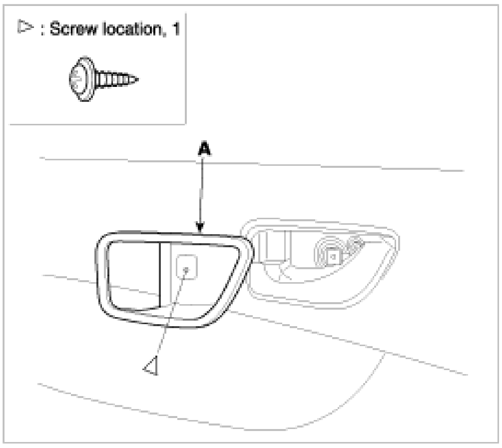
REPLACEMENT

FRONT DOOR TRIM REPLACEMENT

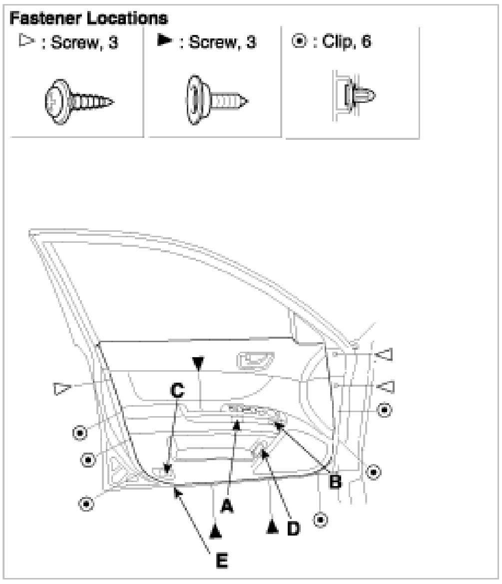
NOTE

- Take care not to scratch the door trim and other parts.
- Put on gloves to protect your hands.

1. Remove the quadrant inner cover.
2. Remove the inside handle cover (A).



3. Loosen the door trim (E) mounting screws. Release the clips that hold the door trim, then remove the door trim by pulling it upward. Disconnect the power window switch connector(A), power mirror connector (B), and door courtesy lamp connector(C), trunk lid connector (D).



4. Installation is the reverse of removal.

NOTE

- Make sure of connectors is plugged in properly and each rod is connected securely.
- Make sure the door lock and opens properly.

GLASS REPLACEMENT

NOTE

- Put on gloves to protect your hands.

1. Remove the front door trim.

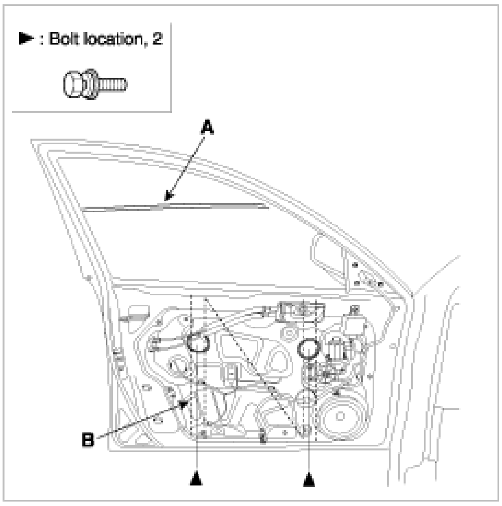
NOTE

- Use the door switch to align the mounting hole with the hole on the door glass.
- If it is impossible, align the hole with hands after removing the motor.

2. Carefully move the glass (A) until you can see the bolts, then loosen them. Separate the glass from the glass run and carefully pull the glass out through the window slot (B).

CAUTION

- Take care not to drop to glass and scratch the glass surface.

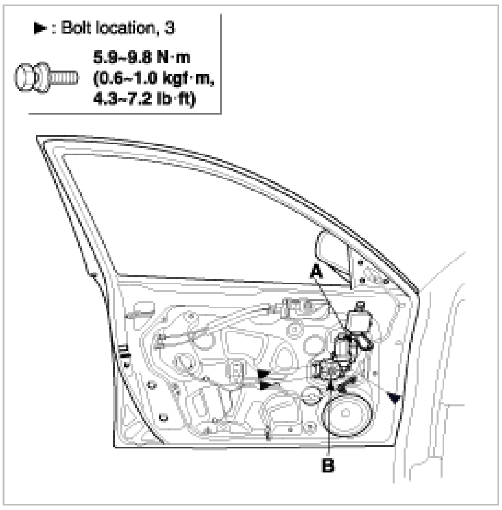


3. Installation is the reverse of removal.

> NOTE
>
> - Roll the glass up down to see if it move freely without binding.
> - Adjust the position of the glass as necessary.

POWER WINDOW MOTOR REPLACEMENT

1. Remove the front door trim.
2. After disconnecting the connector (A), remove the power window motor (B).

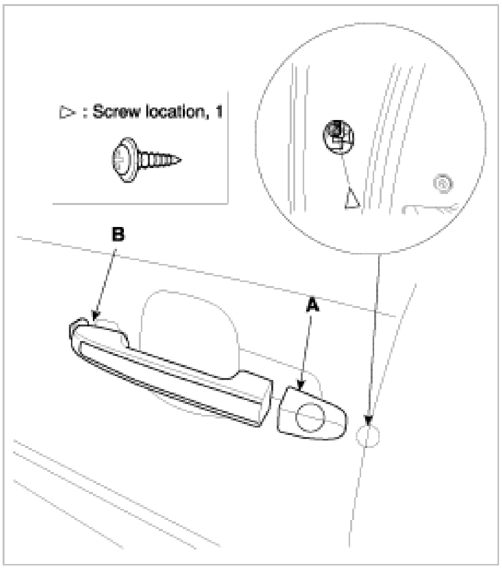


3. Installation is the reverse of removal.

> NOTE
>
> - Roll the glass up down to see if it move freely without binding.

OUT SIDE HANDLE REPLACEMENT

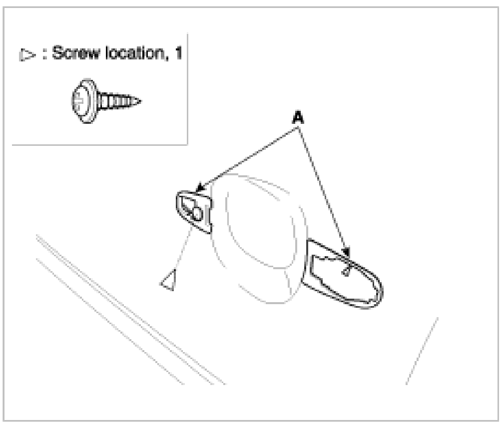
1. Remove the following parts.
   A. Remove the front door trim.
   B. Remove the glass.
   C. Remove inside handle.
2. After disconnecting the cover (A), remove the outside handle base (B).



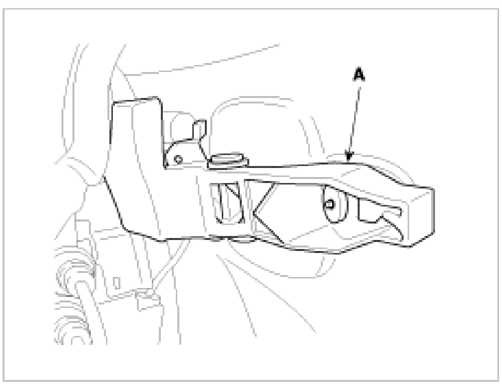
3. Remove door module.
4. Installation is the reverse of removal.

FRONT DOOR LATCH REPLACEMENT

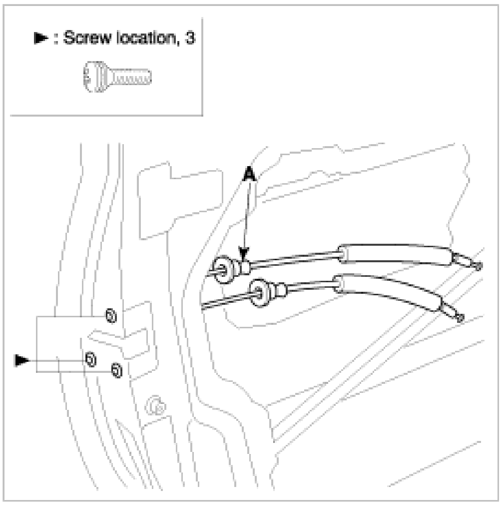
1. Remove the following parts.
   A. Remove the front door trim.
   B. Remove the glass.
   C. Remove the inside handle.
   D. Remove the door module.
2. Remove the outside handle.
3. Remove the outside handle pad (A).



4. Remove the outside handle base (A).



5. After loose the latch mounting bolts, remove the front door latch (A).

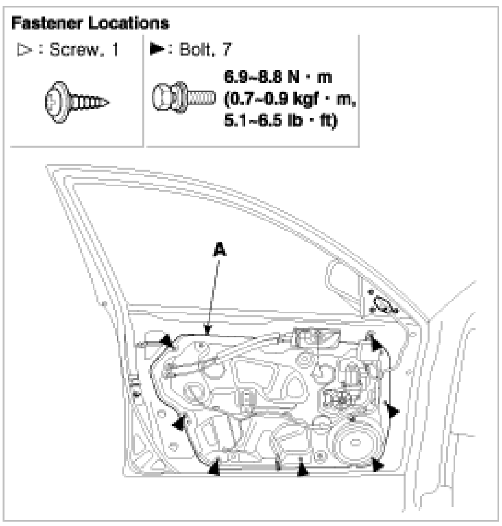


6. Installation is the reverse the removal.

> NOTE
>
> - Make sure the door locks and opens properly.

FRONT DOOR MODULE

1. Remove the front door trim.
2. Remove the glass.
3. Remove the inside handle.
4. Remove the outside handle.
5. After loose the door module mounting bolts, remove the door module (A).

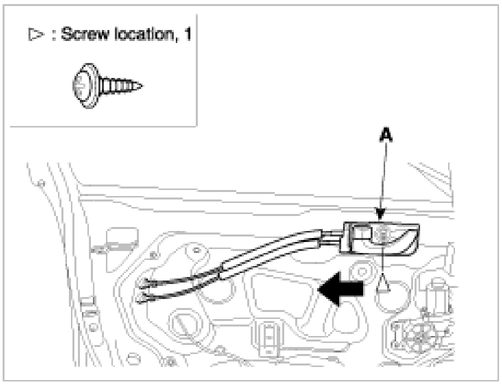


6. Installation is the reverse of removal.

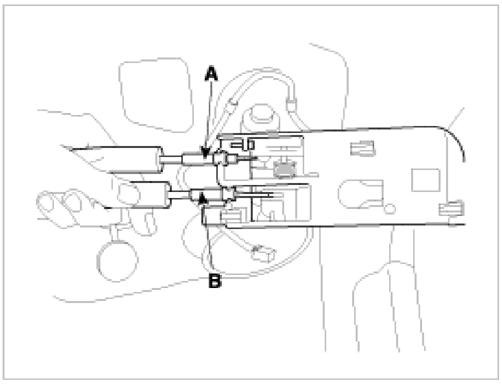
> NOTE
>
> - Make sure the connector is plugged in properly and each rod is connected securely.
> - Make sure the door lock and open properly.

INSIDE HANDLE REPLACEMENT

1. Remove the front door trim.
2. Loose the inside handle (A) mounting screw.
   Push the inside handle rearward to disconnect from the door module.



3. Disconnect the lock cable and (A) inside connect cable (B).

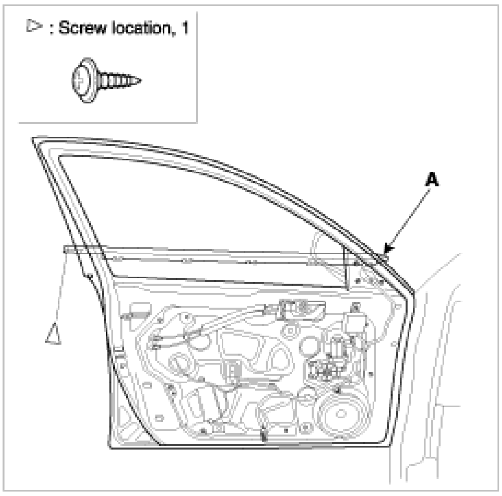


4. Installation is the reverse of removal.

> NOTE
>
> - Make sure the door lock and open properly.

DOOR BELT WEATHERSTRIP REPLACEMENT

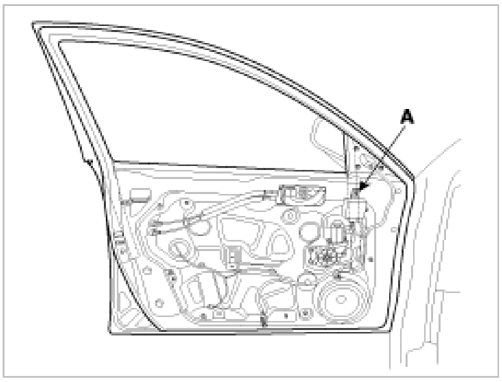
1. Remove the front door trim.
2. Release the hook (A), and then remove the door belt weatherstrip (B).



3. Installation is the reverse of removal.

GLASS RUN REPLACEMENT

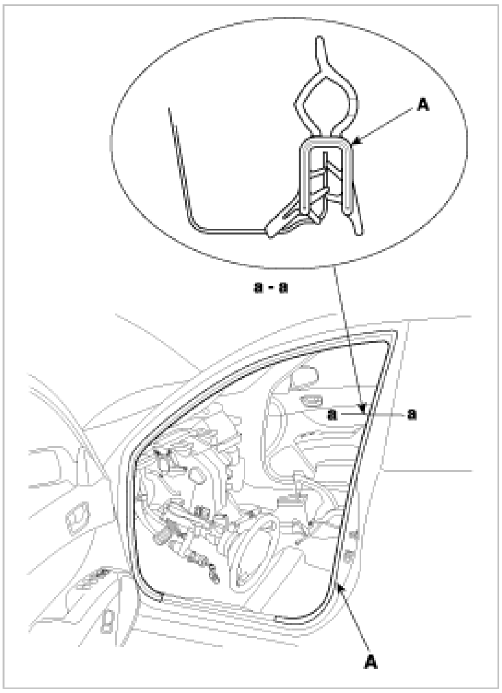
1. Remove the front door trim.
2. Remove the glass.
3. Remove the glass run channel (A) front the lower part.



4. Installation is the reverse of removal.

BODY WEATHHERSTRIP REPLACEMENT

1. Release the clips then remove the body weatherstrip(A).



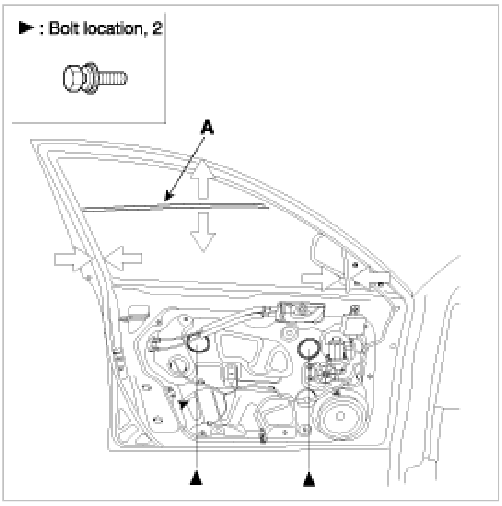
2. Installation is the reverse the removal.

ADJUSTMENT

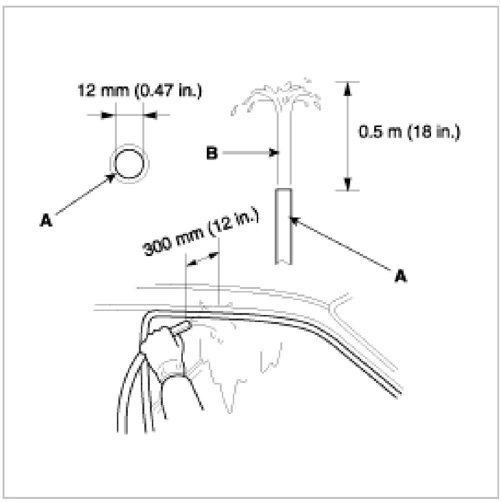
GLASS ADJUSTMENT

> NOTE
>
> - Check the glass run channel for damage or deterioration, and replace them necessary.

1. Remove the following parts.
   A. Quadrant cover.
   B. Door trim.
2. Carefully move the glass (A) until you can see the glass mounting bolts(B), then loosen them.



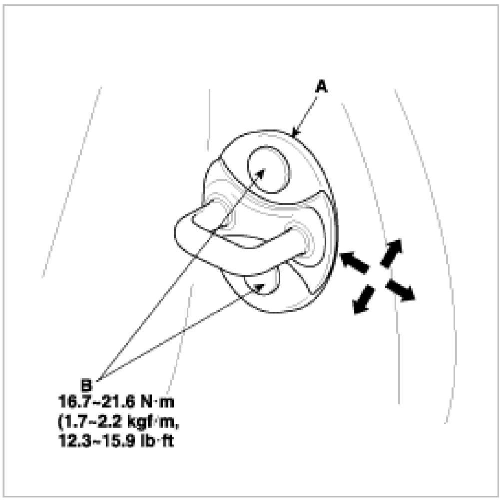
3. Push the glass (A) against the channel (C), then tighten the glass mounting bolts.
4. Check that the glass moves smoothly.
5. Raise the glass fully, and check for gaps.
   Check that the glass contacts the glass run channel evenly.
6. Check for water leaks. Run water over the roof and on the sealing area as shown, and note these items:
   A. Use a 12mm (1/2Iin.) diameter hose (A).
   B. Adjust the rate of water flow as shown (B).
   C. Do not use a nozzle.
   D. Hold the hose about 300mm(12in.) away from the door (C).



DOOR STRIKER ADJUSTMENT

Make sure the door latches securely without slamming it. If necessary, adjust the striker (A): The strike nuts are fixed. The strike can be fine adjusted up or down, and in or out.

1. Loosen the screws (B), then insert a shop towel between the body and striker.



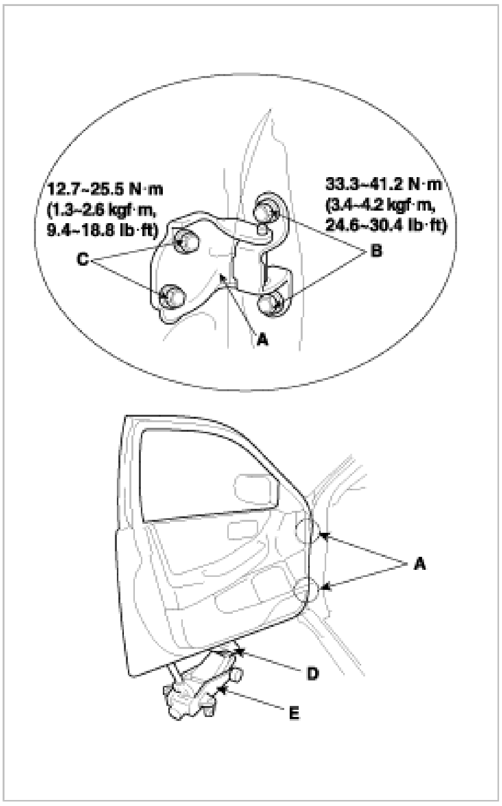
2. Lightly tighten the screws.
3. Wrap the striker with a shop towel, then adjust the striker by tapping it with a plastic hammer.
   Do not tap the striker too hard.
4. Loosen the screws and remove the shop towel.
5. Lightly tighten the screws.
6. Hold the outer handle out, and push the door against the body to be sure the striker allows a flush fit. If the door latches properly, tighten the screwsand recheck.

DOOR POSITION ADJUSTMENT

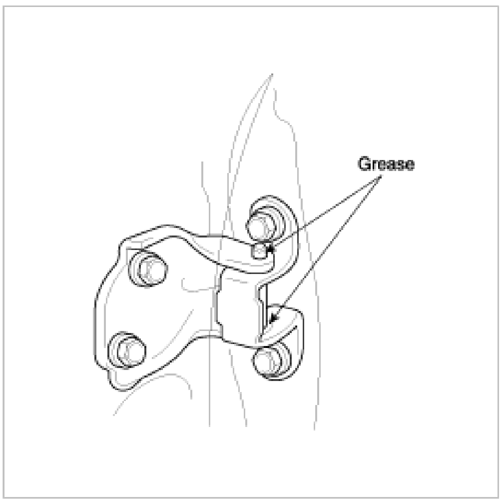
NOTE

After installing the door, check for a flush fit with the Body, then check for equal gaps between the front, rear, and bottom, door edges and the body. Check that the door and body edges are parallel. before adjusting, replace the mounting bolts.

1. Place the vehicle on a firm, level surface when adjusting the doors.
2. Adjust at the hinges (A):
   A. Loosen the door mounting bolts (B) slightly, and move the door IN or OUT until it aligns flush with the body.
   B. Loosen the hinge mounting bolts (C) slightly, and move the door BACKWARD or FORWARD, UP or DOWN as necessary to equalize the gaps.
   C. Place a shop towel (D) on the jack (E) to prevent damage to the door when adjusting the door.
3. Check that the door and body edges are parallel.



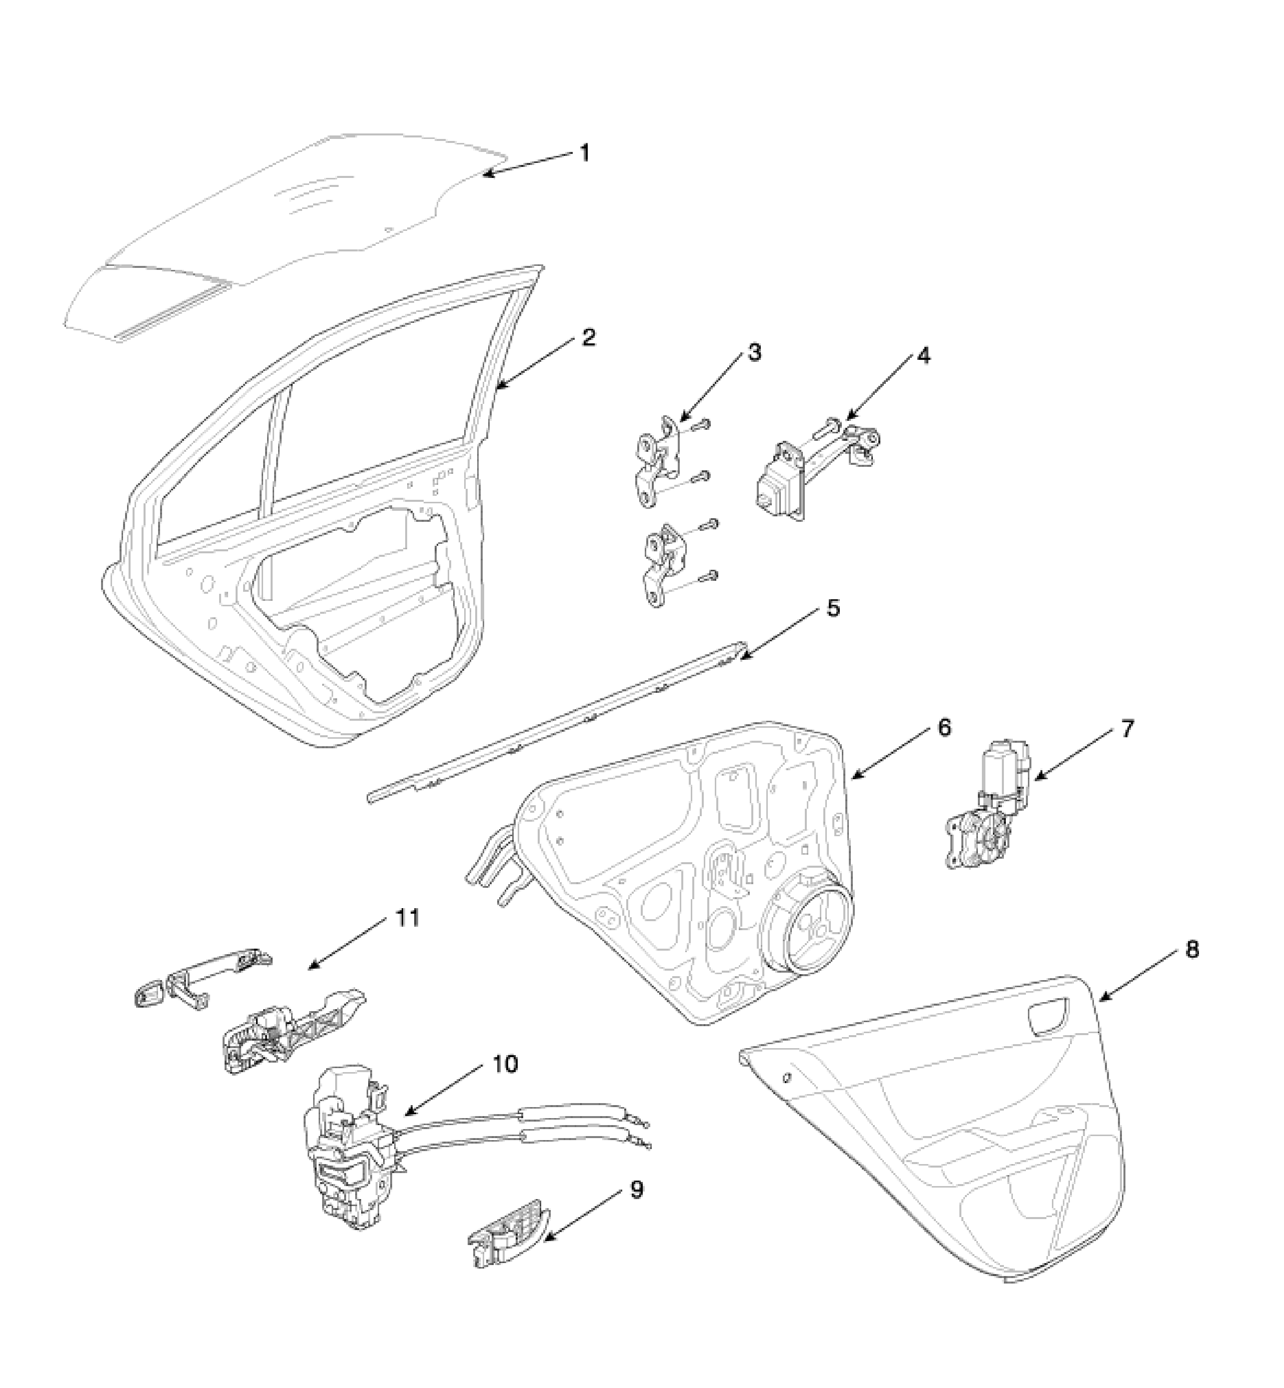
4. Grease the pivot portions of the hinges indicated by the arrows.



5. Check for water leaks.

Body (Interior and Exterior) > Exterior > rear door > Components and Components Location

COMPONENTS



1. Door grass	5. Door belt weatherstrip	9. Inside handle
2. Rear door panel	6. Door module	10. Latch assemble
3. Door hinge	7. Power window motor	11. Out side handle
4. Door checker	8. Door trim	

Body (Interior and Exterior) > Exterior > rear door > Repair procedures

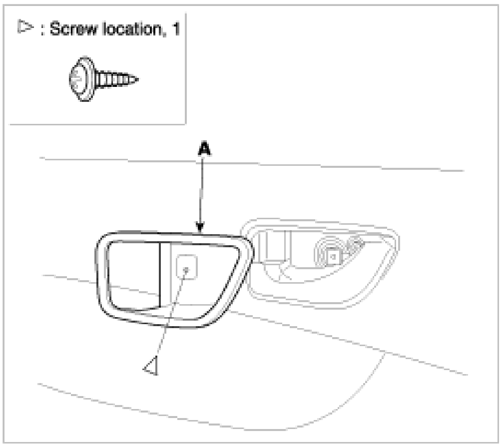
REPLACEMENT

REAR DOOR TRIM REPLACEMENT

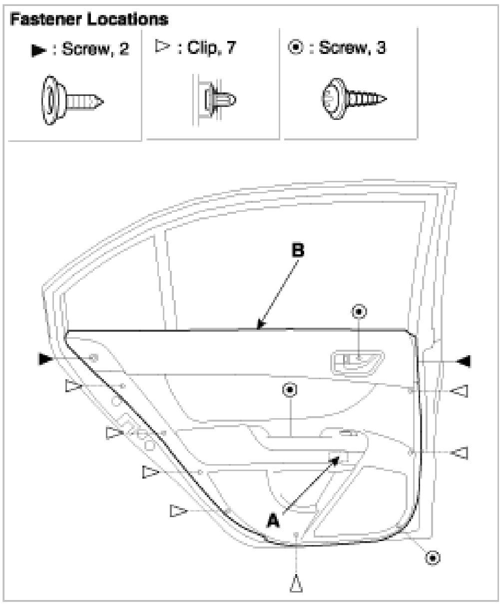
NOTE

- Take care not to scratch the door trim and other parts.
- Put on gloves to protect your hands.

1. Remove the inside handle cover (A).



2. Loosen the door trim (B) mounting screws. Release the clips that hold the door trim, then remove the door trim by pulling it upward. Disconnect the power window switch connector(A).



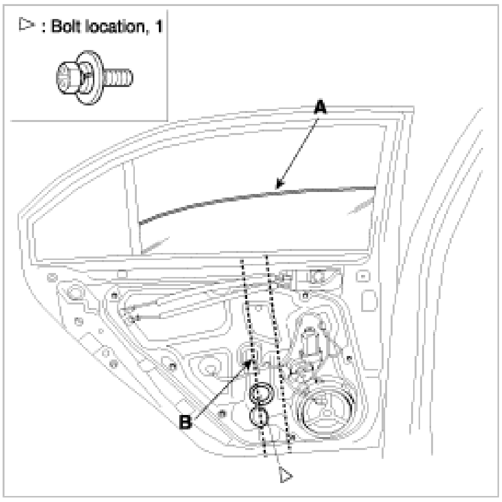
3. Installation is the reverse of removal.

> NOTE
>
> - Make sure of connectors is plugged in properly and each rod is connected securely.
> - Make sure the door lock and opens properly.

GLASS REPLACEMENT

> NOTE
>
> - Put on gloves to protect your hands.

1. Remove the rear door trim.
2. Carefully move the glass (A) until you can see the bolts, then loosen them. Separate the glass from the glass run and carefully pull the glass out through the window slot (B).



CAUTION

Take care not to drop to glass and scratch the glass surface.

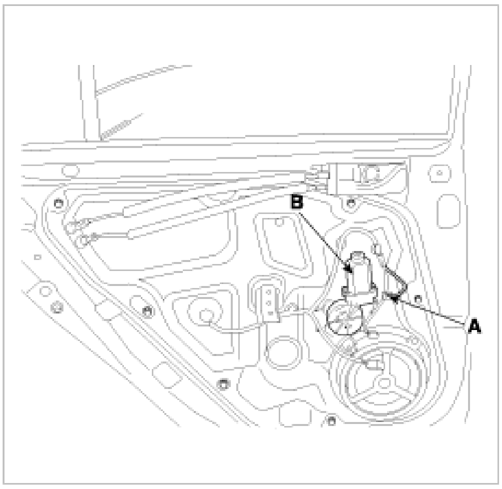
3. Installation is the reverse of removal.

NOTE

- Roll the glass up down to see if it move freely without binding.
- Adjust the position of the glass as necessary.

POWER WINDOW MOTOR REPLACEMENT

1. Remove the rear door trim.
2. After disconnecting the connector (A), remove the power window motor(B).



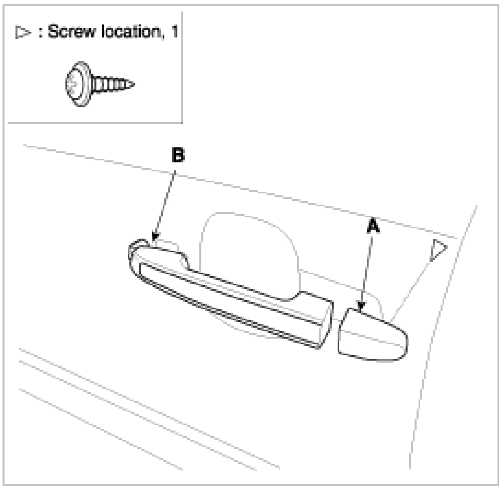
3. Installation is the reverse of removal.

NOTE

- Roll the glass up down to see if it move freely without binding.

OUT SIDE HANDLE REPLACEMENT

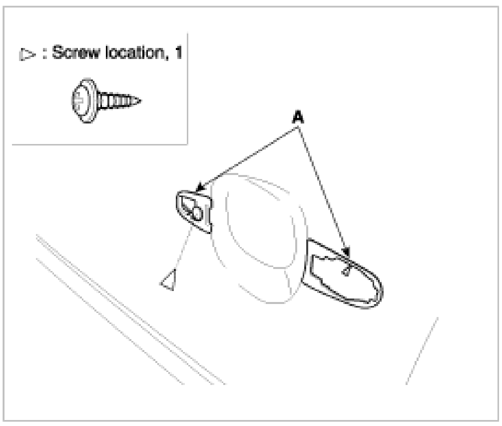
1. Remove the rear door trim.
2. Remove the glass.
3. Remove inside handle.
4. After disconnecting the cover (A), remove the outside handle base(B).



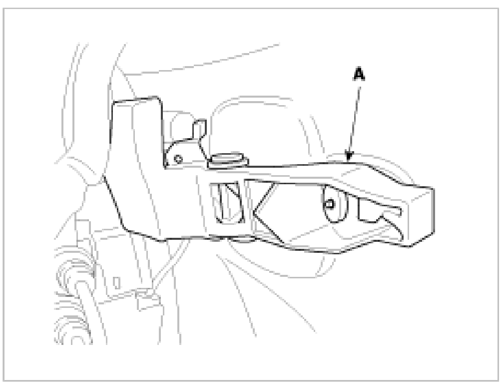
5. Remove rear door module.
6. Installation is the reverse of removal.

REAR DOOR LATCH REPLACEMENT

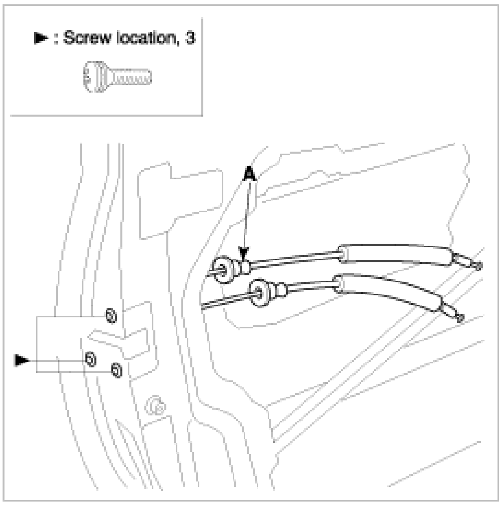
1. Remove the rear door trim.
2. Remove the glass.
3. Remove the inside handle.
4. Remove the door module.
5. Remove the out side handle.
6. Remove the out side handle pad (A).



7. Remove the out side handle base (A).



8. After loose the latch mounting bolts, remove the rear door latch(A).



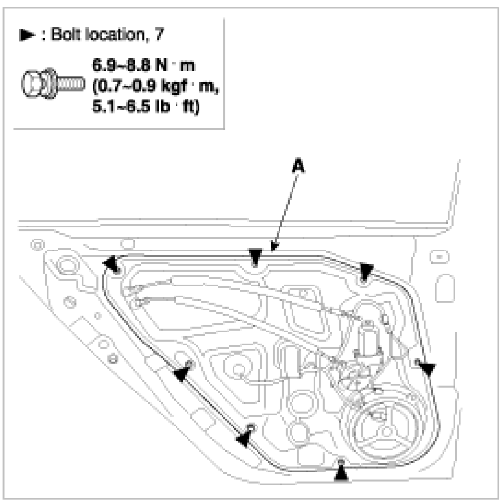
9. Installation is the reverse the removal.

NOTE

- Make sure the door lock and opens properly.

REAR DOOR MODULE REPLACEMENT

1. Remove the rear door trim.
2. Remove the glass.
3. Remove the inside handle.
4. Remove the out side handle.
5. After loose the door module mounting bolts, remove the door module (A).



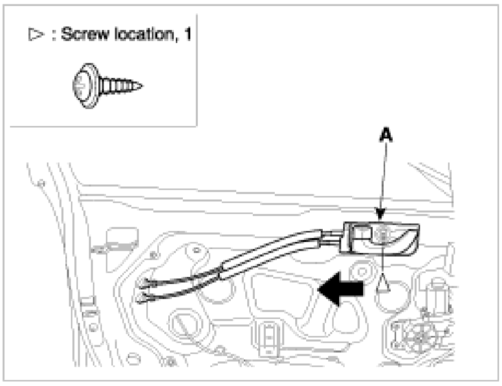
6. Installation is the reverse of removal.

NOTE

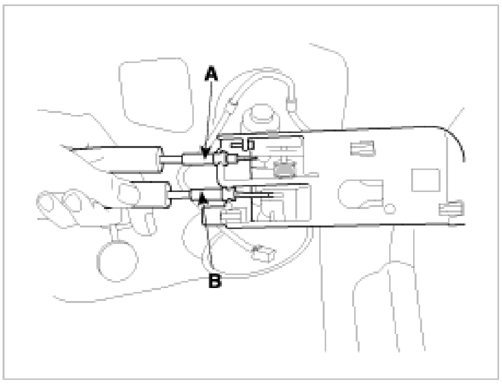
- Make sure the connector is plugged in properly and each rod is connected securely.
- Make sure the door locks and opens properly.

INSIDE HANDLE REPLACEMENT

1. Remove the rear door trim.
2. Loose the inside handle (A) mounting screw.
   Push the inside handle rearward to disconnect from the door module.



3. Disconnect the lock cable and (A) inside connect cable (B).



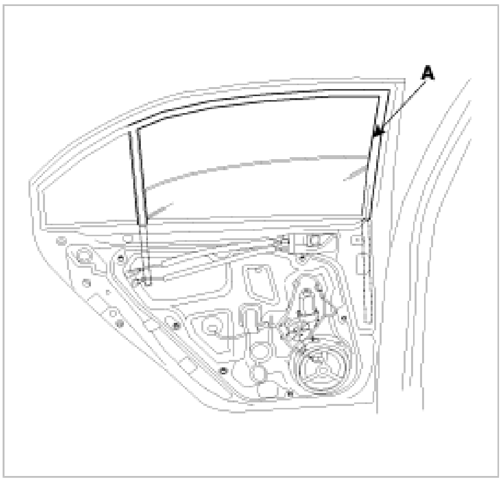
4. Installation is the reverse of removal.

> NOTE
>
> - Make sure the door lock and open properly.

DOOR BELT WEATHERSTRIP REPLACEMENT

GLASS RUN REPLACEMENT

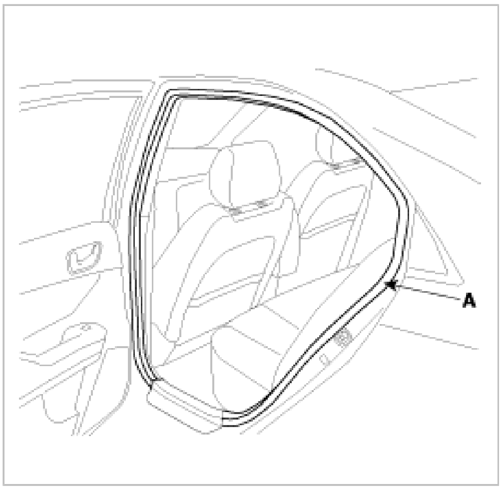
1. Remove the rear door trim.
2. Remove the glass.
3. Remove the glass run channel (A) front the lower part.



4. Installation is the reverse of removal.

BODY WEATHHERSTRIP REPLACEMENT

1. Release the clips then remove the body weatherstrip (A).



2. Installation is the reverse the removal.

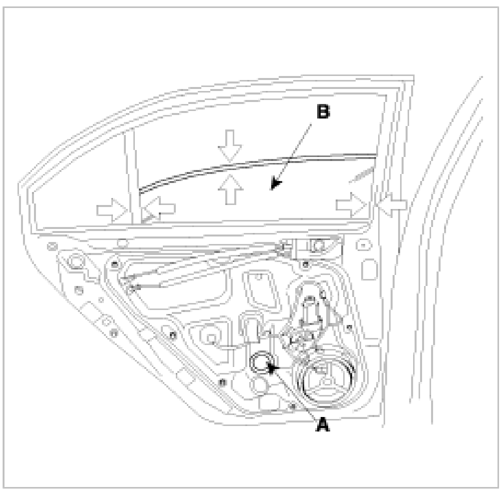
ADJUSTMENT

GLASS ADJUSTMENT

NOTE

- Check the glass run channel for damage or deterioration, and replace them necessary.

1. Remove the following parts.
   A. Door trim.
2. Carefully move the glass (A) until you can see the glass mounting bolts(B), then loosen them.

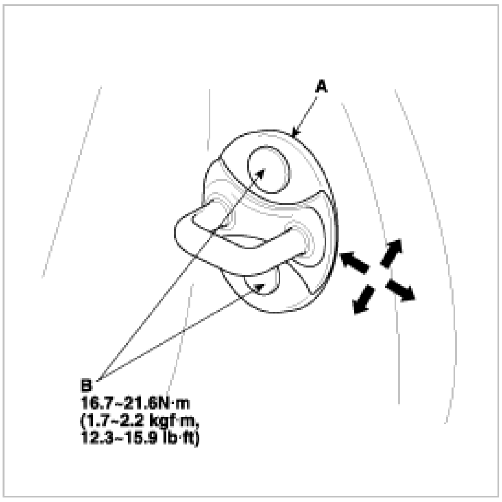


3. Push the glass (A) against the channel (C), then tighten the glass mounting bolts.
4. Check that the glass moves smoothly.
5. Raise the glass fully, and check for gaps.
   Check that the glass contacts the glass run channel evenly.
6. Check for water leaks. Run water over the roof and on the sealing area as shown, and note these items:
   A. Use a 12mm (1/2Iin.) diameter hose (A).
   B. Adjust the rate of water flow as shown (B).
   C. Do not use a nozzle.
   D. Hold the hose about 300mm(12in.) away from The door (C).

DOOR STRIKER ADJUSTMENT

Make sure the door latches securely without slamming It. If necessary, adjust the striker (A): The strike nuts are fixed. The strike can be fine adjusted up or down, and in or out.

1. Loosen the screws (B), then insert a shop towel between the body and striker.



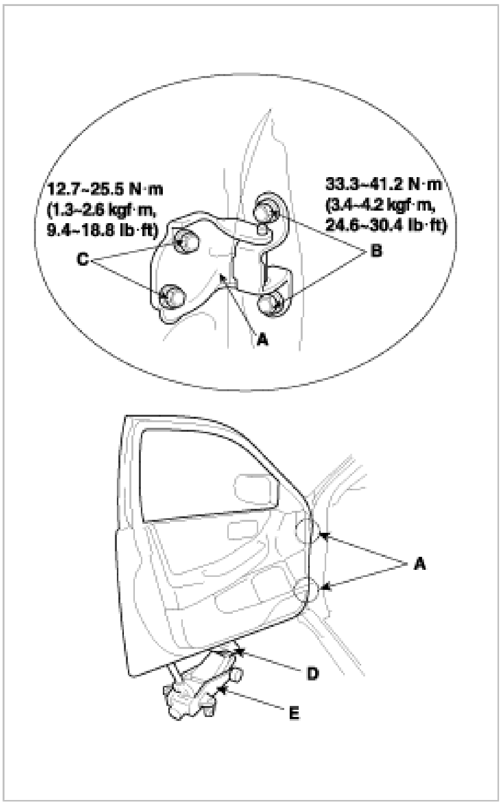
2. Lightly tighten the screws.
3. Wrap the striker with a shop towel, then adjust the striker by tapping it with a plastic hammer.
   Do not tap the striker too hard.
4. Loosen the screws and remove the shop towel.
5. Lightly tighten the screws.
6. Hold the outer handle out, and push the door against the body to be sure the striker allows a flush fit. If the door latches properly, tighten the screws and recheck.

DOOR POSITION ADJUSTMENT

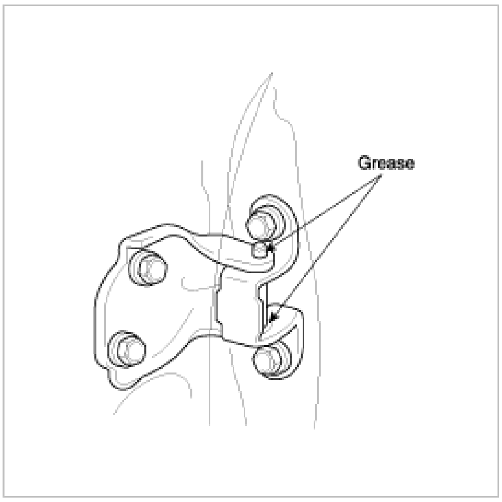
NOTE

After installing the door, check for a flush fit with the body, then check for equal gaps between the front, rear, and bottom, door edges and the body. Check that the door and body edges are parallel. before a djusting, replace the mounting bolts.

1. Place the vehicle on a firm, level surface when adjusting the doors.
2. Adjust at the hinges (A):
   A. Loosen the door mounting bolts (B) slightly, and move the door IN or OUT until it aligns flush with the body.
   B. Loosen the hinge mounting bolts (C) slightly, and move the door BACKWARD or FORWARD, UP or DOWN as necessary to equalize the gaps.
   C. Place a shop towel (D) on the jack (E) to prevent damage to the door when adjusting the door.
3. Check that the door and body edges are parallel.



4. Grease the pivot portions of the hinges indicated by the arrows.



5. Check for water leaks.

Body (Interior and Exterior) > Exterior > body side moldings > Repair procedures

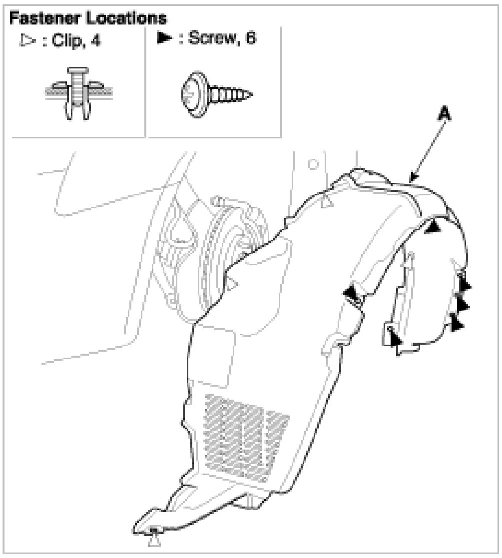
REPLACEMENT

FRONT MUD GUARD AND WHEEL GUARD

NOTE

- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.
- Take care not to scratch the body surface.

1. Remove the wheel guard (A).



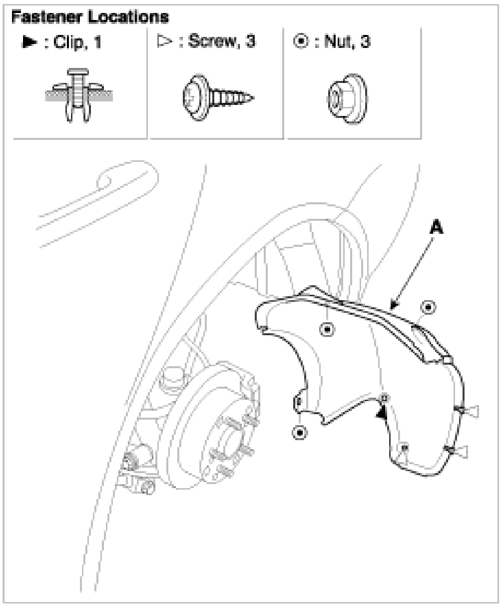
2. Installation is the reverse of removal.

REAR MUD GUARD AND WHEEL GUARD

NOTE

- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.
- Take care not to scratch the body surface.

1. Remove the wheel guard (A).

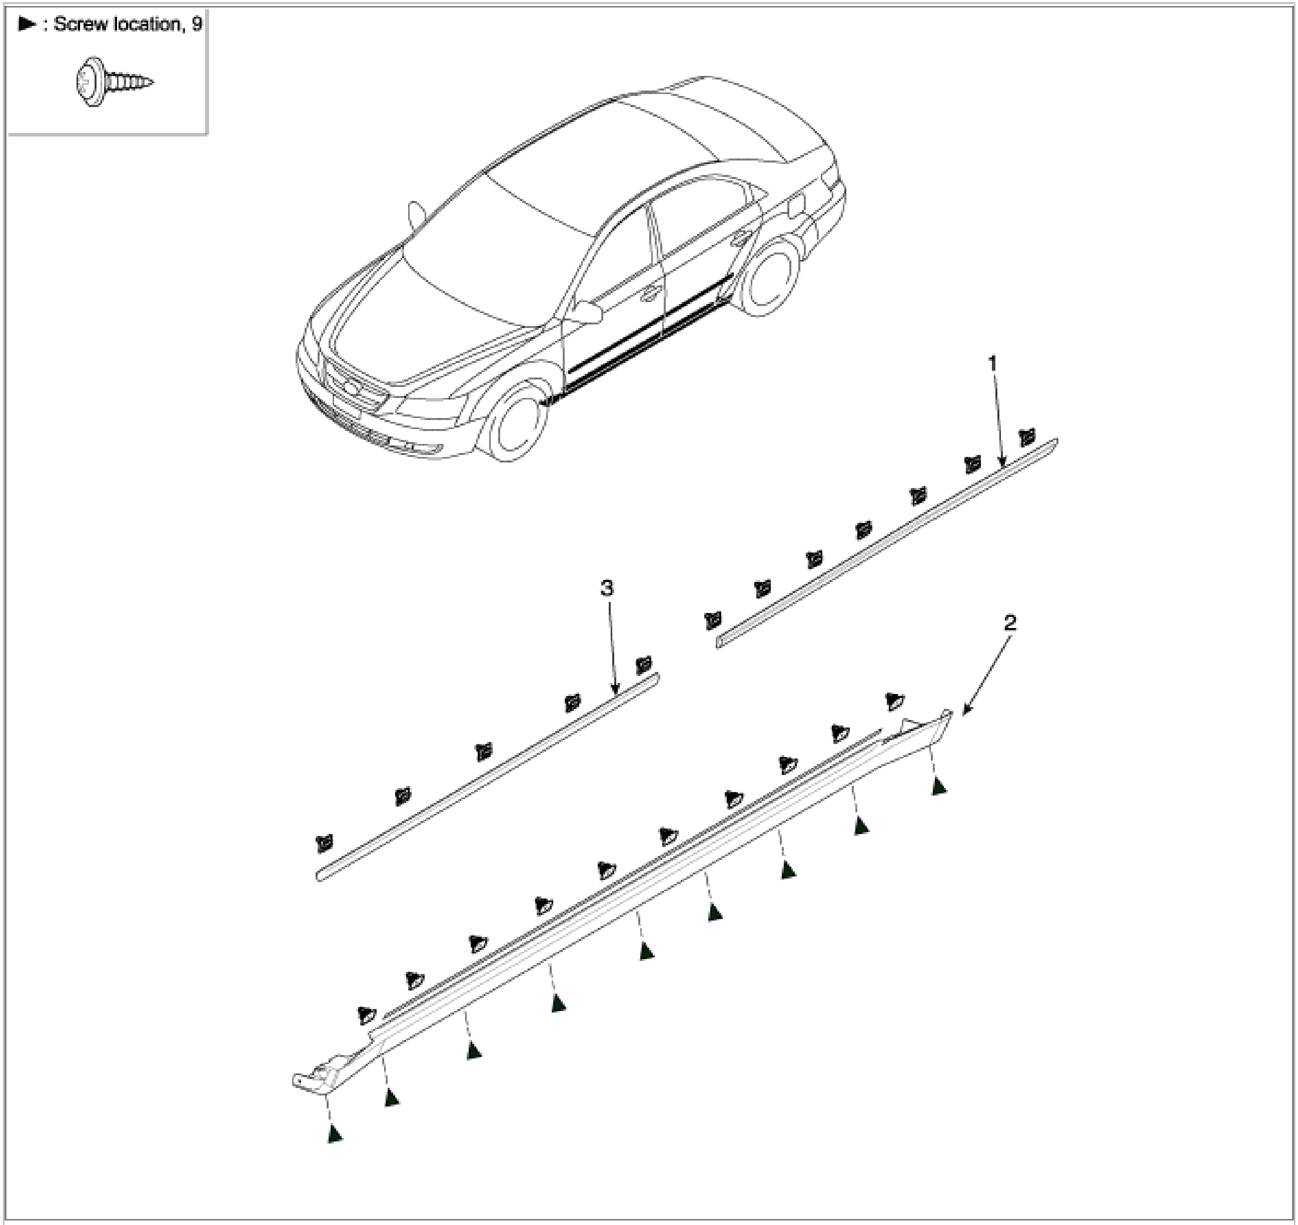


2. Installation is the reverse of removal.

SIDE GARNISH AND SIDE SILL REPLACEMENT

NOTE

- When prying with a flat-tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.
- Take care not to scratch the body surface.



1. Rear door molding
2. Side seal molding
3. Front door molding

3. Decoration cover	8. Defector	13. Glass
4. Sunshade	9. Frame	
5. Drive unit	10. Set bracket	

Body (Interior and Exterior) > Sun Roof > sun roof assembly > Repair procedures

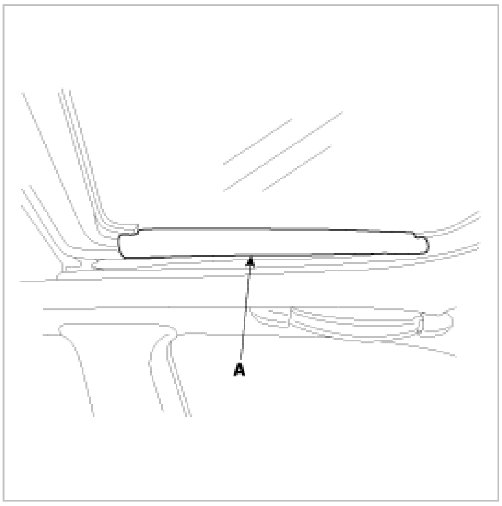
REPLACEMENT

GLASS REPLACEMENT

NOTE

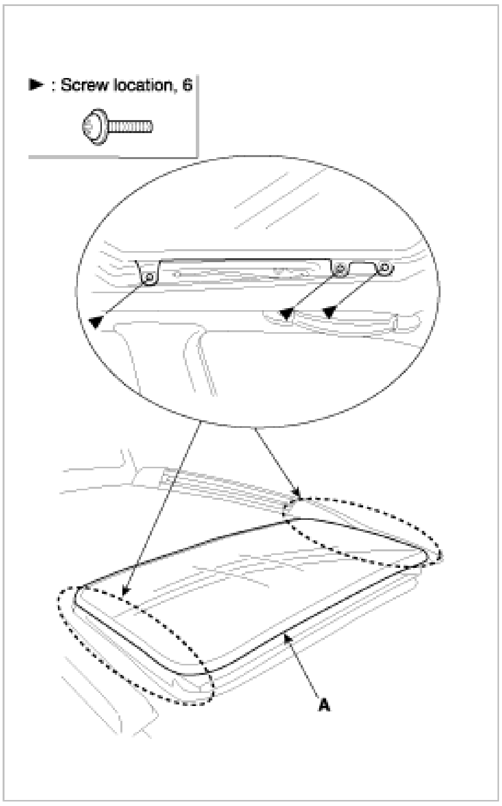
- Put on glove to protect your hands.

1. Remove both decoration cover (A).



2. Remove the glass (A) by lifting it up.

> NOTE
>
> - Do not damage the roof panel



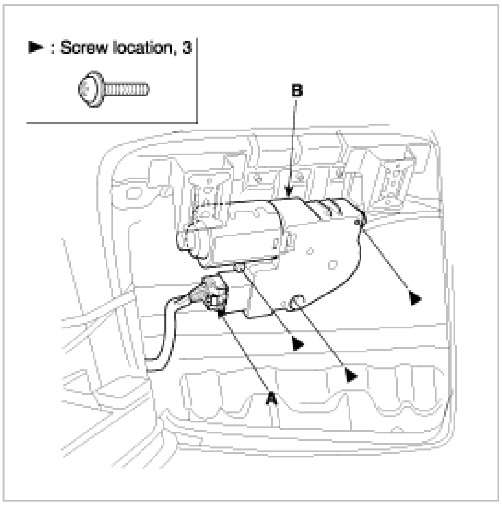
3. Installation is the reverse of removal.

MOTOR REPLACEMENT

1. Remove the over head console.

> NOTE
>
> - Confirm the position of guide whether it is closed or not when you remove the motor.

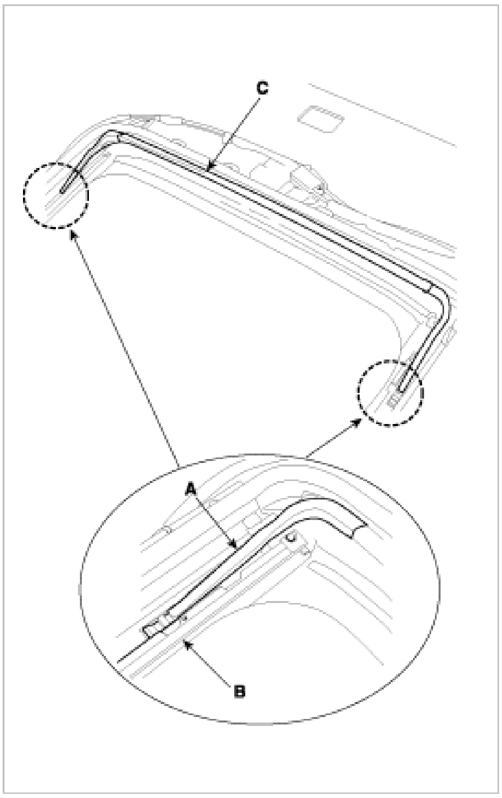
2. Disconnect the motor connector (A), remove the screws and then remove the motor (B).



3. Installation is the reverse of removal.

DEFLECTOR REPLACEMENT

1. Open the glass fully.
2. Disconnect the deflector link (A) from the frame (B), and then remove the deflector (C).



3. Installation is the reverse of removal.

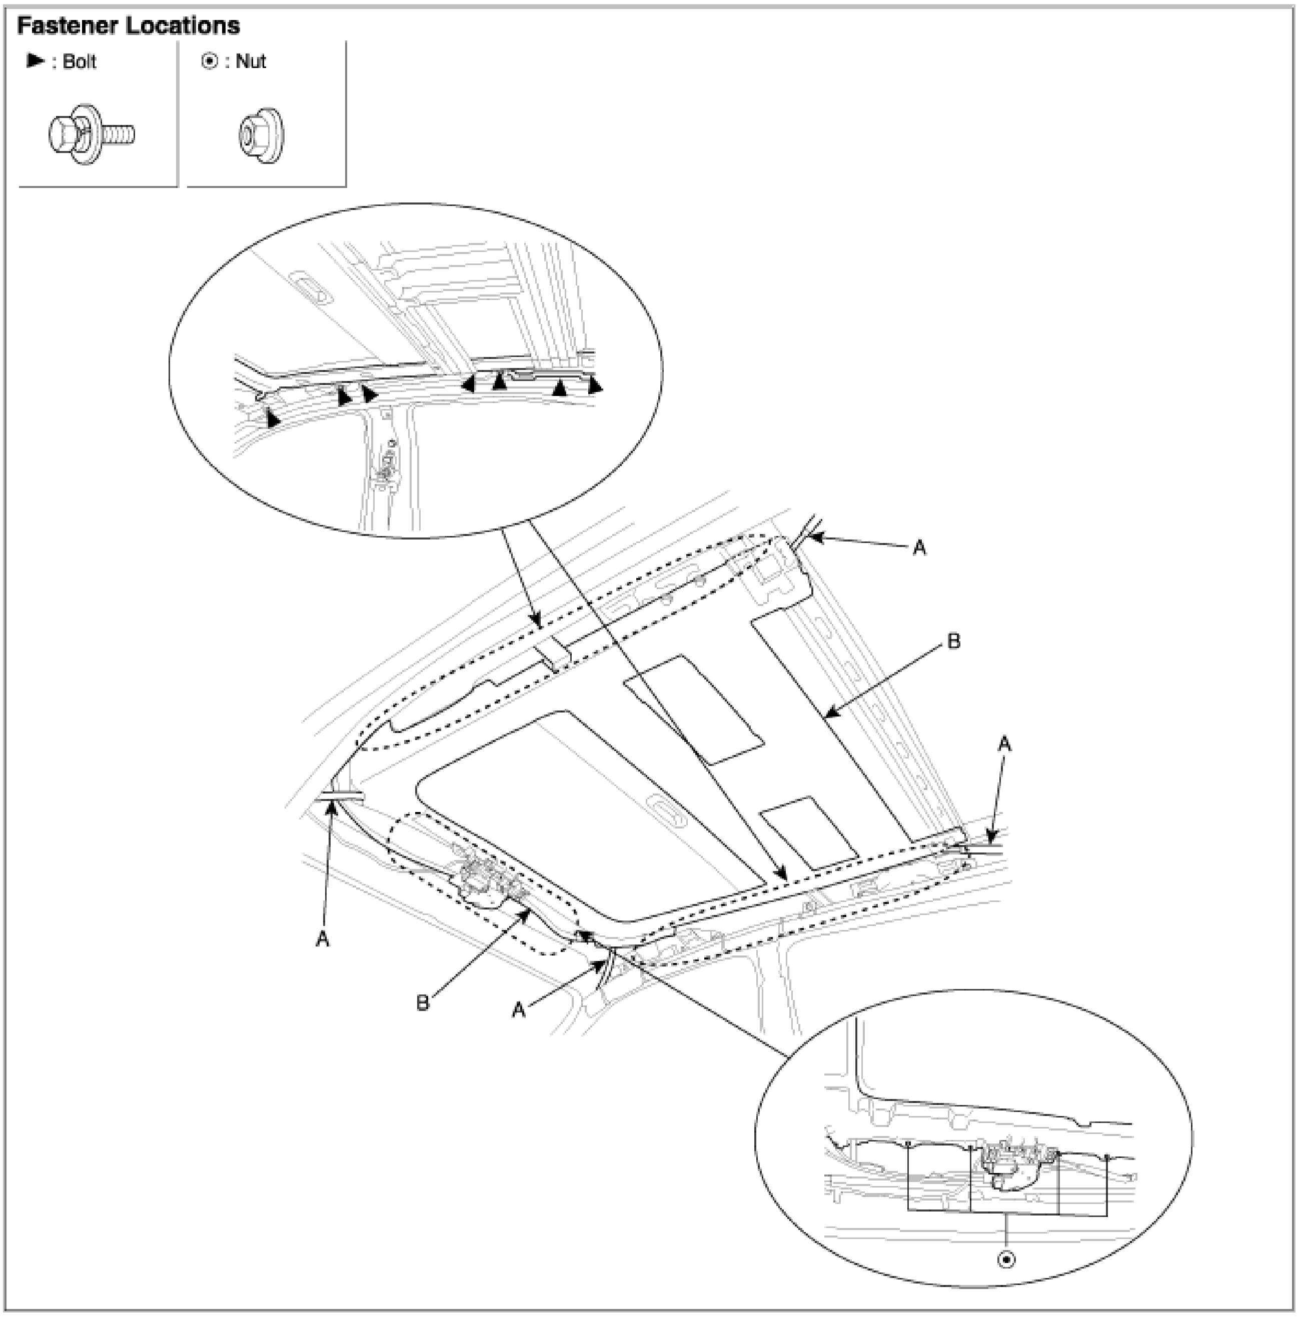
SUNROOF ASSEMBLY REPLACEMENT

1. Remove the follows parts.
   A. Front and door scuff trim.
   B. Front, center and rear pillar trim.
   C. Headlining.
   D. Sunroof glass.
2. Disconnect the drain tubes (A).
3. After loosening the mounding bolts and nuts, remove the sunroof assembly (B).

NOTE

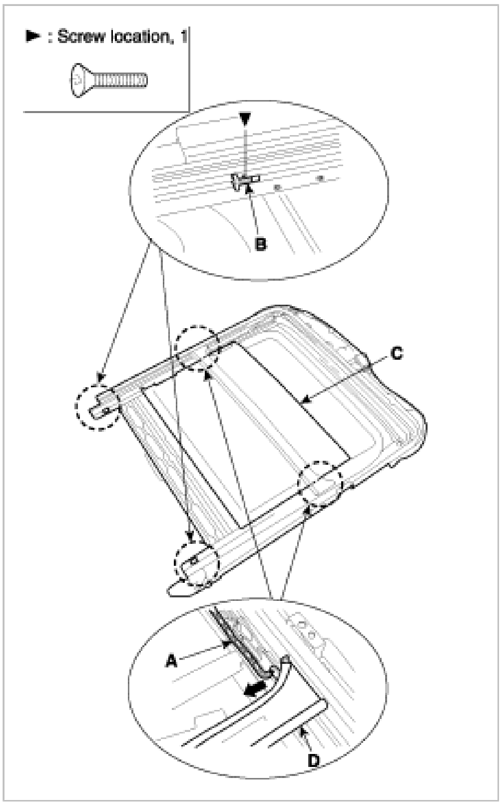
- Take care not to scratch the interior trims and other parts.

4. Installation is the reverse of removal.



SUNSHADE AND DRIP RAIL REPLACEMENT

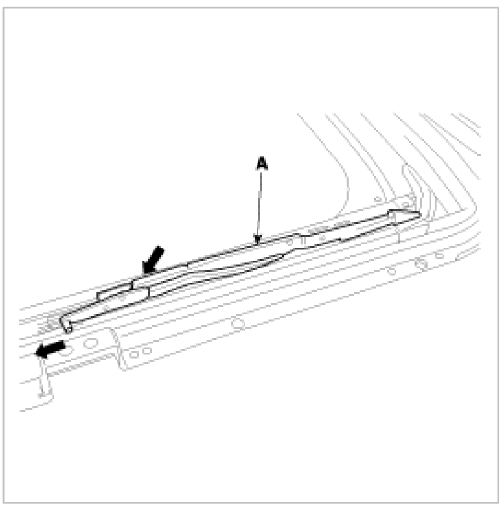
1. Remove the sunroof assembly.
2. Remove the drip link (A) and sunshade stopper (B).
3. Remove the sunshade (C) and drip rail (D).



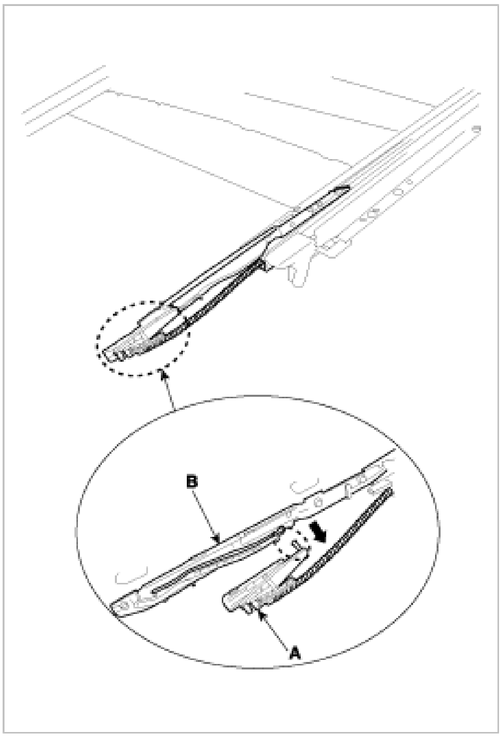
4. Installation is the reverse of removal.

GUIDE ASSEMBLY REPLACEMENT

1. Remove the sunroof assembly.
2. Remove a guide assembly (A) after lowering a guide thoroughly by pushing a slide (B) to rear.



3. Remove the guide (A) and slide (B).



4. Installation is the reverse of removal.

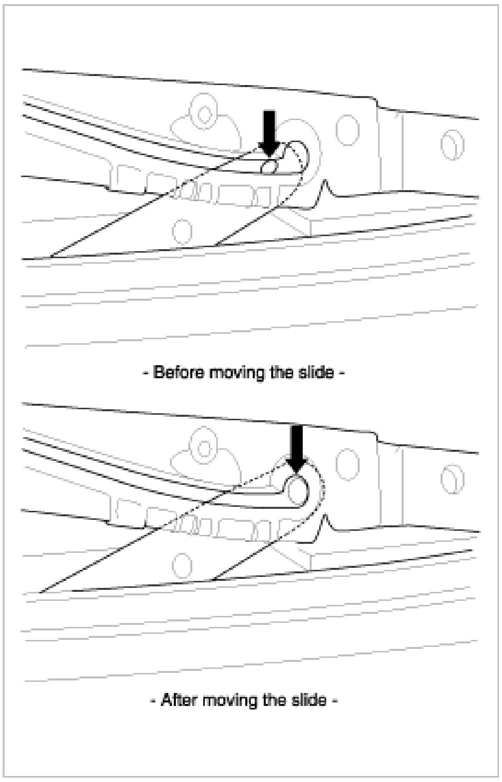
NOTE

- Make sure to align the slide with the center of “A” and “B”
- Make sure to initialize the motor.

ADJUSTMENT

HOW TO INITIALIZE

1. Check that the glass has been installed.
   A. Finished height adjustment.
2. Push the up switch. (Keep on pushing the switch)
   A. The slide moved 5mm forward after 15 seconds.



3. After moving the slide 5mm forward, turn OFF the switch and push the UP switch (Keeping on pushing the switch with continuous operation).
   A. If the operation above is normal condition, the sunroof once and closes.
4. When the sunroof is closed completely, turn OFF the UP switch initialize the motor completely.

WHEN TO INITIALIZE THE MOTOR

1. First operation the vehicle after manufacture it.
2. Initial value is erased or damaged because of short power electric discharge during operation.
3. After using the manual handle.

OPERATING THE SUNROOF EMERGENCY HANDLE

1. Use the sunroof emergency handle to close and open the sunroof manually for the following case only.
   A. To close the sunroof before driving a vehicle in a rainy day or on the highway if the sunroof cannot be closed due to failure of the sunroof motor or controller.
2. Operating method.
   A. Remove the overhead console.
   B. Push the emergency handle up into the hexagonal drive (A) of the sunroof motor. You must push hard enough to disengage the motor clutch; otherwise the emergency handle will slip due to incomplete fit in the motor.
   C. Carefully turn the emergency handle clockwise to close the sunroof.
   D. After closing the sunroof, wiggle the handle back and forth as you remove the tool from the motor, to ensure the motor clutch reengages.
   E. A 5mm hex socket may be used in place of the emergency handle, with a" Speeder" type handle.

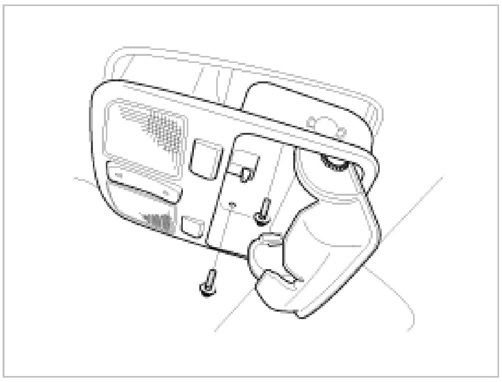
> **CAUTION**
>
> Do not use power tools to operate the sunroof.
> Damage to the components may occur.

Body (Interior and Exterior) > Sun Roof > sun roof switch > Repair procedures

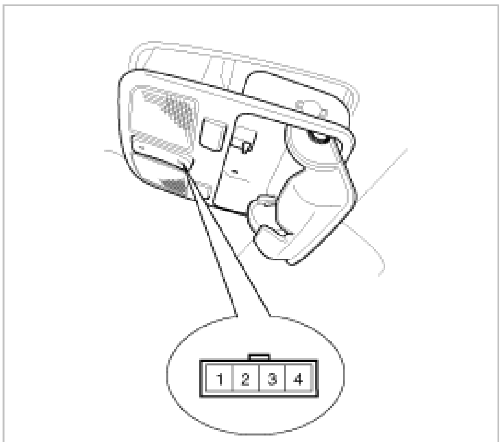
INSPECTION

1. Disconnect the negative (-) battery terminal.

2. Open the sunglass case cover from the overhead console then remove the 2 screws (B) holding the overhead console.



3. Disconnect the connector then remove the overhead console lamp assembly from the headliner. Check for continuity between the terminals. If the continuity is not as specified, replace the sunroof switch.



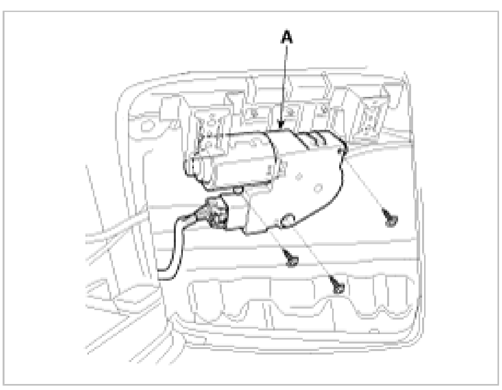
[Switch side connector]

Terminal / position	1	3	4
Slide open	O	—	O
Tilt down	O	—	O
Tilt up	O	O	

Body (Interior and Exterior) > Sun Roof > sun roof moter > Repair procedures

REPLACEMENT

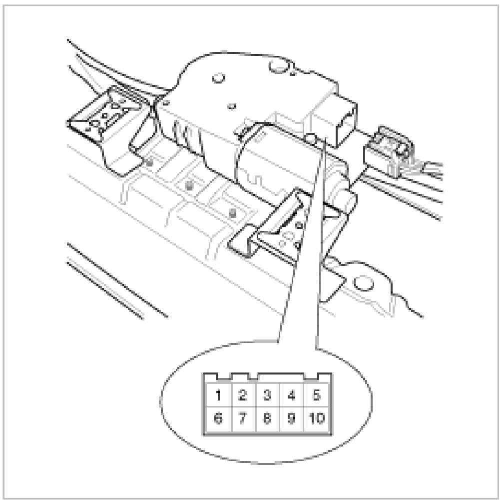
1. Disconnect the negative (-) battery terminal.
2. Open the sunglass case cover from the overhead console then remove the 2 screws holding the overhead console. Disconnect the connector then remove the overhead console lamp assembly from the headliner.
3. Remove the head lining. (Refer to Body group - sunroof)
4. Remove the sunroof motor (A) after removing 3 screws and disconnect.



5. Installation is the reverse of removal.

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Apply the battery voltage to terminal 3, 6 and ground the terminal 1.



3. Ground the terminals as below table, and check that the sunroof unit operates as below table.

Terminal / position	3	4	5	10
Slide close/Tilt up	⊕			⊖
Slide open/Tilt down	⊕		⊖	

4. Make these input tests at the connector
   If any test indicates a problem, find and correct the cause, then recheck the system.
   If all the input tests prove OK, the sunroof motor must be faulty; replace it.

Terminal	Test condition	Test: Desired result
3	IG2 ON	Check for voltage to ground: There should be battery voltage.
1	Under all conditions	Check for continuity to ground: There should be continuity.
6	Under all conditions	Check for voltage to ground: There should be battery voltage.

RESETTING THE SUNROOF

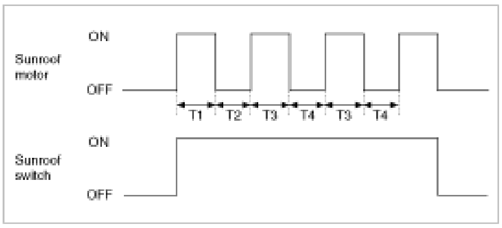
Whenever the vehicle battery is disconnected or discharged, or you use the emergency handle to operate the sunroof, you have to reset your sunroof system as follows:.

1. Turn the ignition key to the ON position.
2. According to the position of the sunroof, do as follows.
   (1) In case that the sunroof has closed completely or been tilted :
   Press the TILT UP button until the sunroof has tilted upward completely.
   (2) In case that the sunroof has slide-opened:
   Press and hold the CLOSE button for more than 5 seconds until the sunroof has closed completely.
   Press and hold the CLOSE button for more than 5 seconds after the sunroof has closed completely. Press the TILT UP button until the sunroof has tilted upward completely.
3. Release the TILT UP button.
4. Press and hold the TILT UP button once again until the sunroof has returned to the original position of TILT UP after it is raised a little higher than the maximum TILT UP position.
   When this is complete, the sunroof system is reset.

PROTECTING THE OVERHEATED MOTOR

In order to protect the overheated sunroof motor by continuous motor operation, the sunroof ECU controls the Run-time and Cool-time of motor as followings;

1. The Sunroof ECU detects the Run- time of motor
2. Motor can be operated continuously for the 1st Run-time(120 ± 10sec.).
3. The continuously operated motor stops operating after the 1st Run-time(120 ± 10sec.).
4. And then Motor is not operated for the 1st Cool-time(18 ± 2sec.).
5. Motor is operated for the 2nd Run-time(10 ± 2sec.) at the continued motor operation after 1st Cool-time(18 ± 2sec.)
6. The continuously operated motor stops operating after the 2st Run-time(120 ± 10sec.)
7. Motor is not operated for the 2st Cool-time(18 ± 2sec.).
8. Motor repeats the 2nd Run-time and 2nd Cool-time at the continued motor operation.
   A. In case that motor is not operated continuously, the Run-time which is limited for protecting the overheated motor is increased.
   B. The Run-Time of motor is initialized to "0" if the battery or fuse is reconnected after being disconnected, discharged or blown.



T1 : 120 ± 10 sec., T2 : 18 ± 2 sec.,
T3 : 10 ± 2 sec., T4 : 18 ± 2 sec.

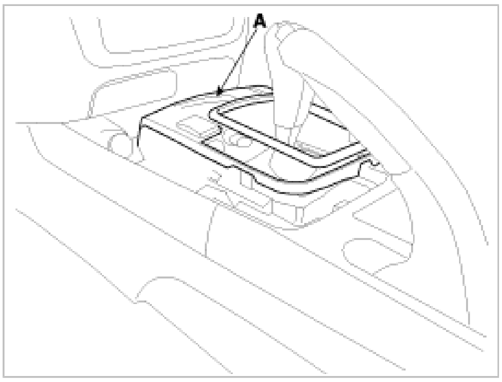
REPLACEMENT

FLOOR CONSOLE REPLACEMENT

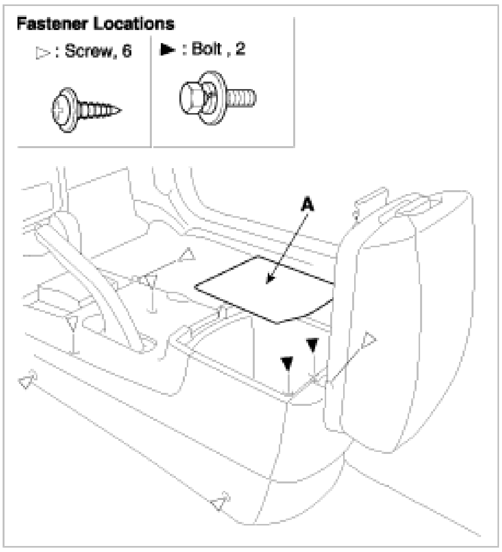
NOTE

- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.

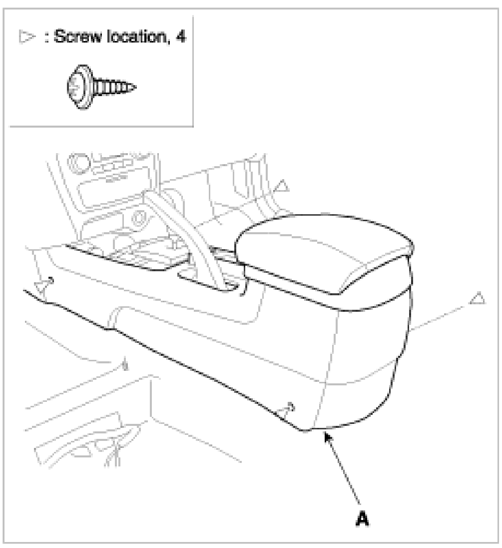
1. Remove the front seat.
2. After remove the center cover (A), disconnect the connector (B).



3. Remove the floor console pad (A).



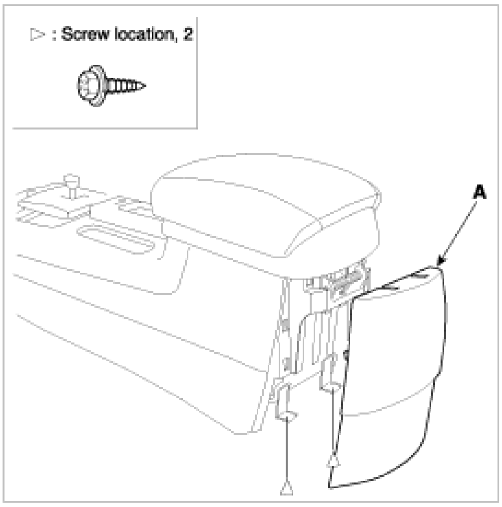
4. After loosening the console mounting screw, remove the floor console assembly(A).



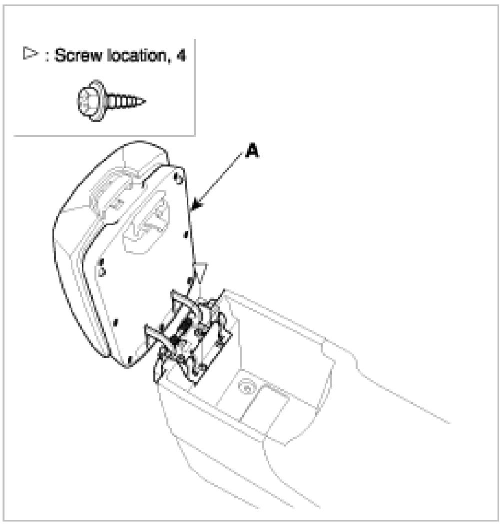
5. Installation is the reverse of removal.

ARMREST REPLACEMENT

1. Remove the console assembly.
2. Remove rear cover (A).



3. After loosening the armrest mounting screw, remove the armrest (A).



4. Installation is the reverse of removal.

Body (Interior and Exterior) > Interior > crash pad > Components and Components Location

CONPONENTS

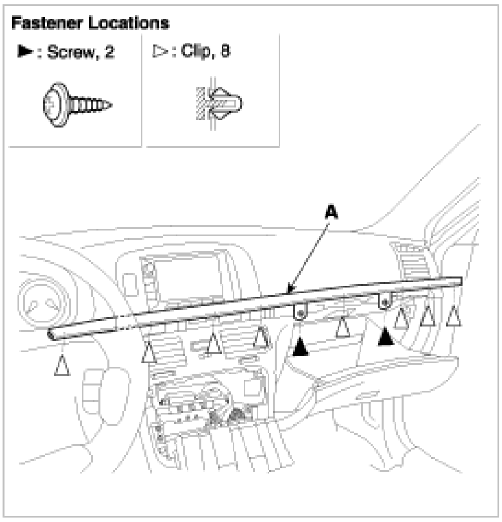
4. Center	9. Center facia	14. Digtal clock	19. Glove box
5. Main crash pad	10. Center facia lower panel	15. Air vent	20. Side cover
			21. hanger

Body (Interior and Exterior) > Interior > crash pad > Repair procedures

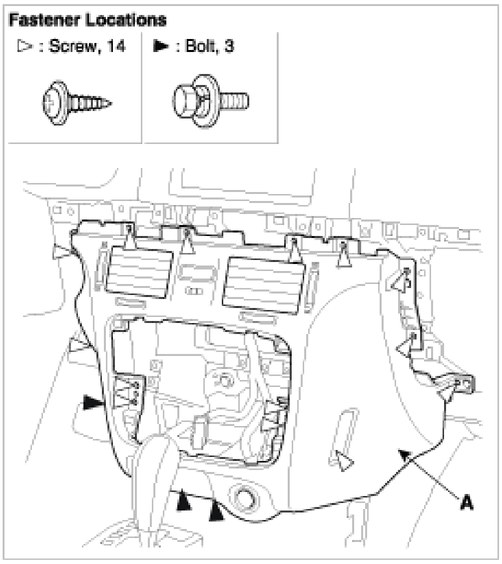
REPLACEMENT

CRASH PAD CENTER PANEL REPLACEMENT

1. Remove floor console assembly.
2. Remove the center garnish (A).
3. Remove the glove box.
4. Remove the center facia upper panel.



5. After loosening the crash pad lower panel mounting screw, then crash pad lower panel (A).

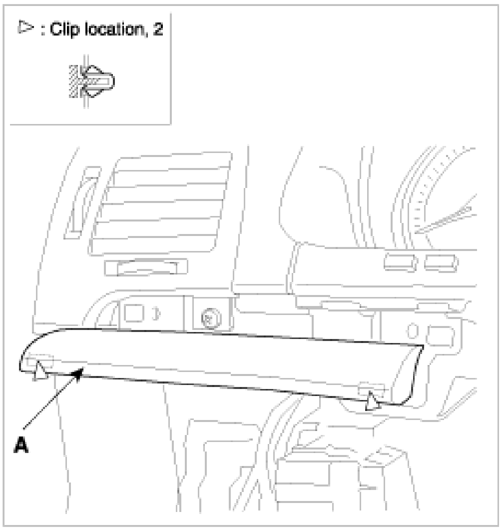


6. Installation is the reverse of removal.

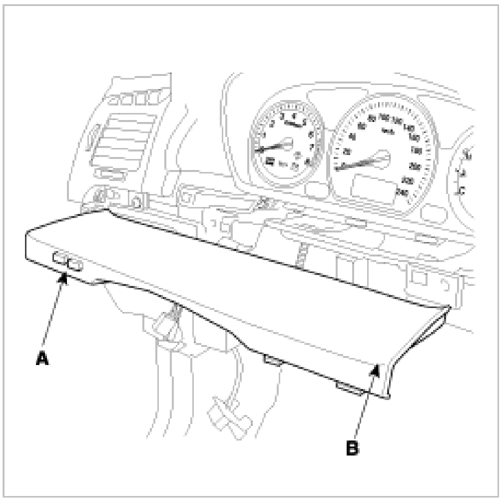
CLUSTER FACIA PANEL REPLACEMENT

> **NOTE**
>
> - When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
> - Put on gloves to protect your hands.

1. Tilt the steering column down.
2. Remove the center garnish (A).



3. After disconnecting the trip sensor connector (A), remove the cluster facia panel (B).



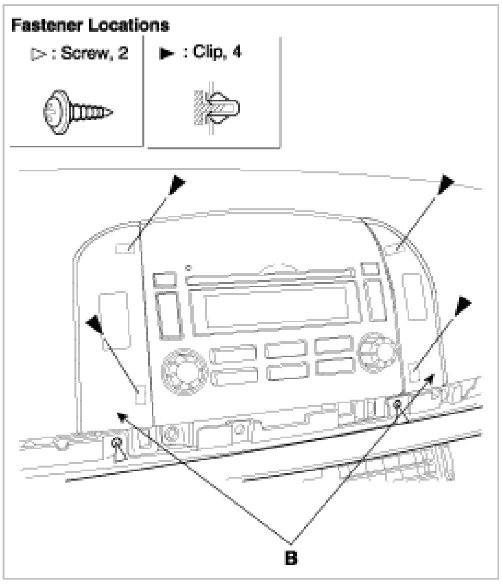
4. Installation is the reverse of removal.

> NOTE
>
> - Make sure the connector is plugged in properly.

CENTER FACIA PANEL REPLACEMENT

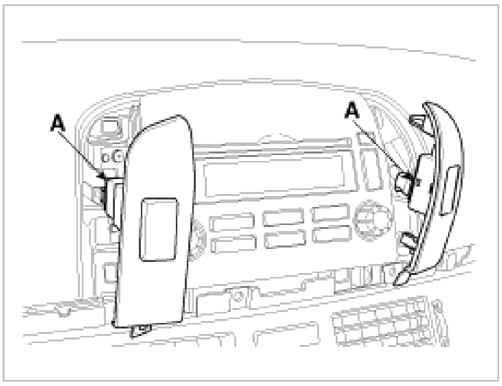
1. After disconnecting the connector (A), remove the center facia panel (B).

> NOTE
>
> - When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
> - Put on gloves to protect your hands.



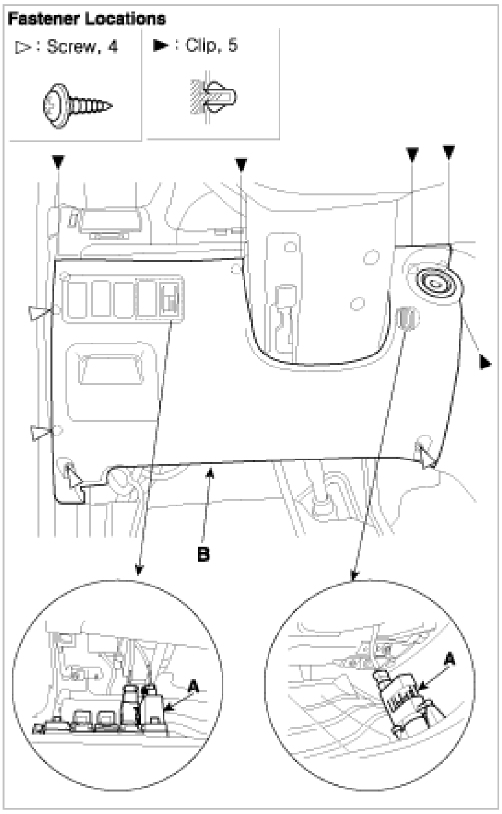
2. Installation is the reverse of removal.

> **NOTE**
>
> - Make sure the connector is plugged in properly.



LOWER CRASH PAD PANEL REPLACEMENT

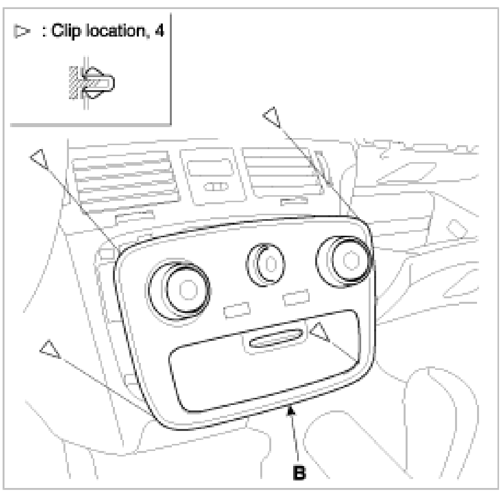
1. Remove the center garnish.
2. Loosening the crash pad lower panel mounting screw.
3. After Disconnecting the connector(A), remove lower panel (B).

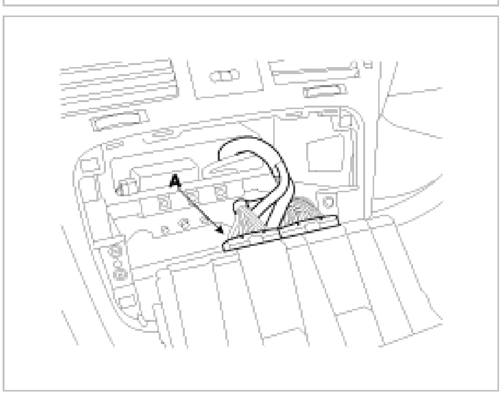


4. Installation is the reverse of removal.

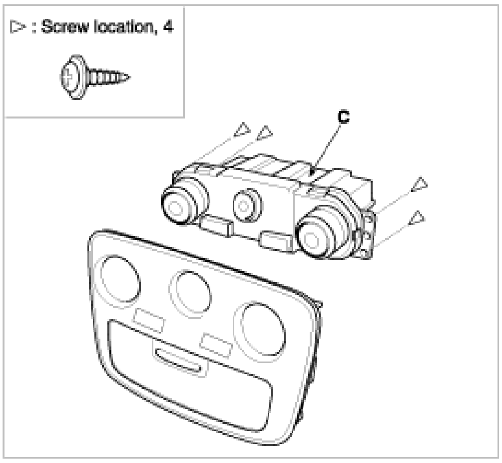
HEATER CONTROL UNIT REPLACEMENT

1. After disconnecting the connector (A), remove the center facia lower panel (B).





2. Loosening the heater control mounting screw, remove heater control unit (C).

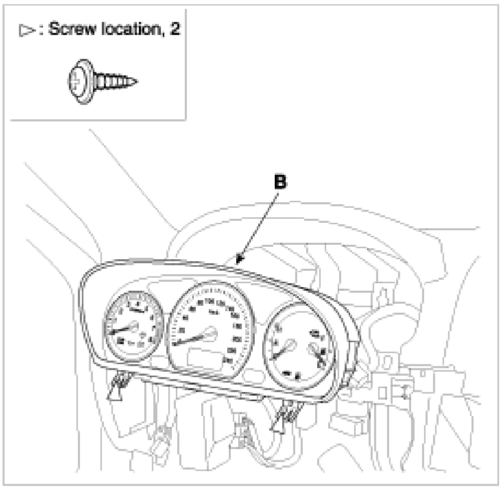


3. Installation is the reverse of removal.

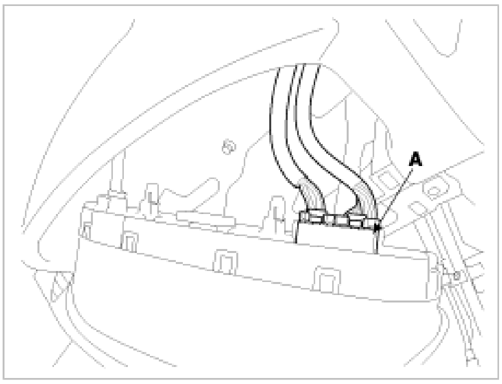
> NOTE
>
> - Make sure the connector is plugged in properly.

CLUSTER REPLACEMENT

1. Remove the cluster facia panel.
2. Loosen the screws.



3. Disconnect the cluster connector (A), then remove the cluster (B).

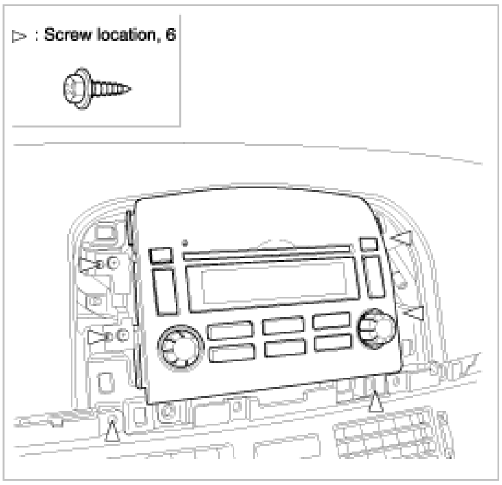


4. Installation is the reverse of removal.

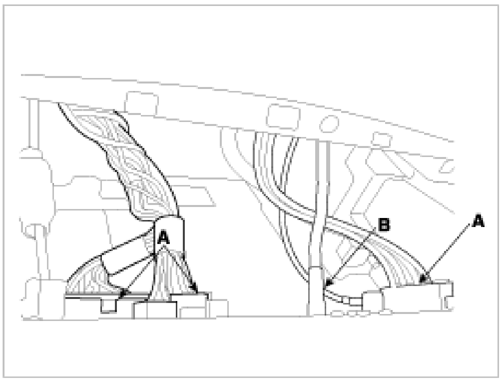
> NOTE
>
> - Make sure the connector is plugged in properly.

AUDIO ASSEMBLY REPLACEMENT

1. Remove the center facia panel.
2. Loosen the screws.



3. Disconnect the audio connector (A) and antenna cable (B), then remove the audio assembly (C).

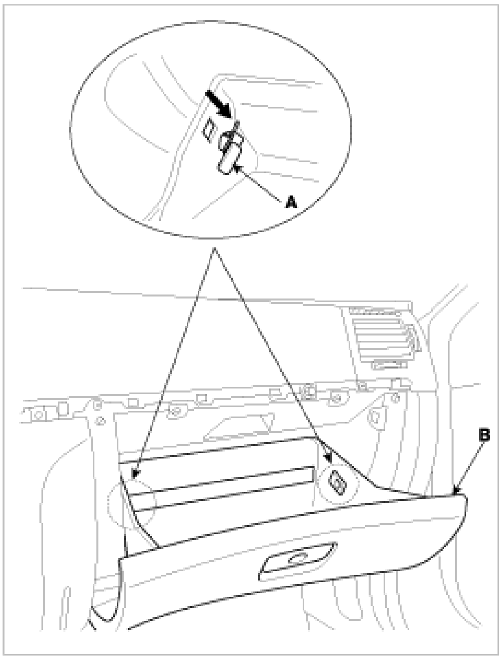


4. Installation is the reverse of removal.

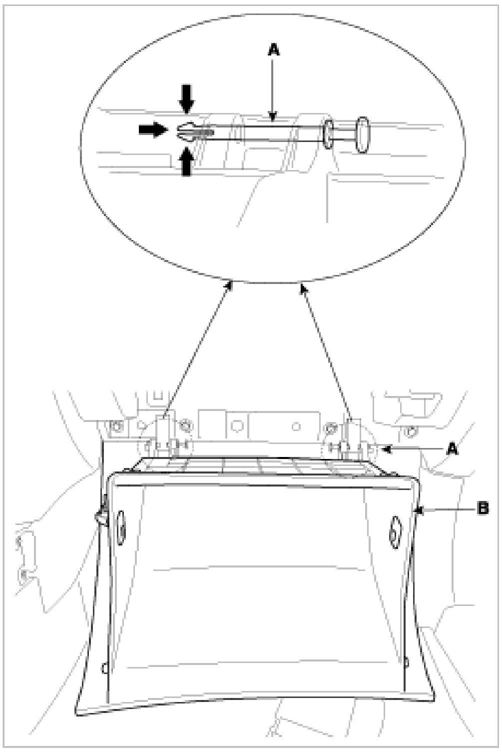
> NOTE
>
> - Make sure the connector is plugged in properly.

GLOVE BOX REPLACEMENT

1. Disconnect the damper (A) from the glove box (B).



2. Disconnect the pine (A), then remove the glove box (C).



3. Installation is the reverse of removal.

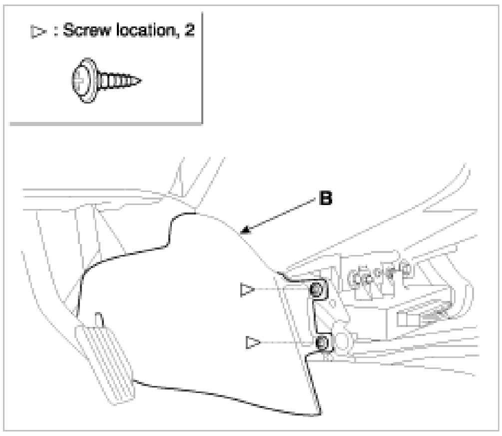
COVER REPLACEMENT

NOTE

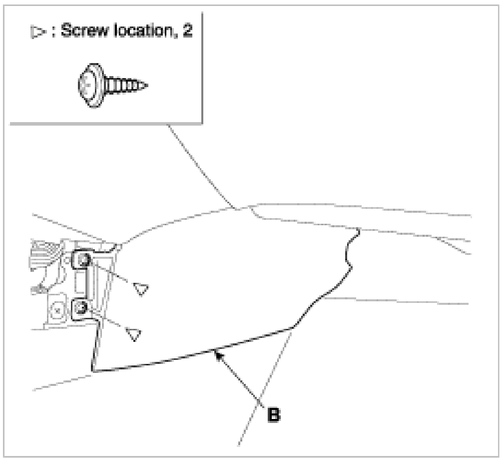
- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.

1. Remove the crash pad side cover (A), crash pad center under cover (B).
   A. Crash pad side cover.

   B. Front crash pad center under cover, LH
      - Remove the console assembly.



C. Front crash pad center under cover, RH
- Remove the console assembly.

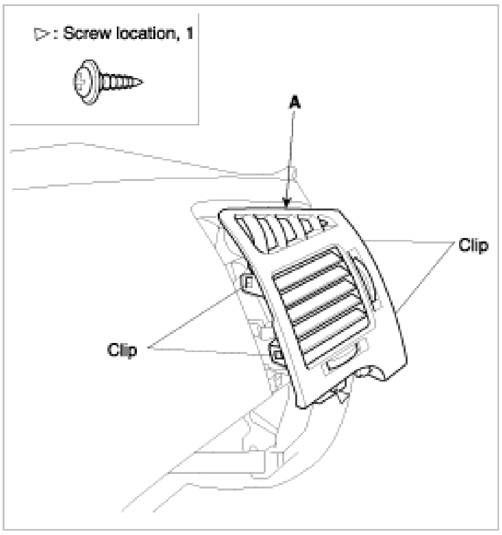


AIR VENT REPLACEMENT

NOTE

- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.

1. Remove the air vent (A) by detaching the clips.



2. Installation is the reverse of removal.

CRASH PAD REPLACEMENT

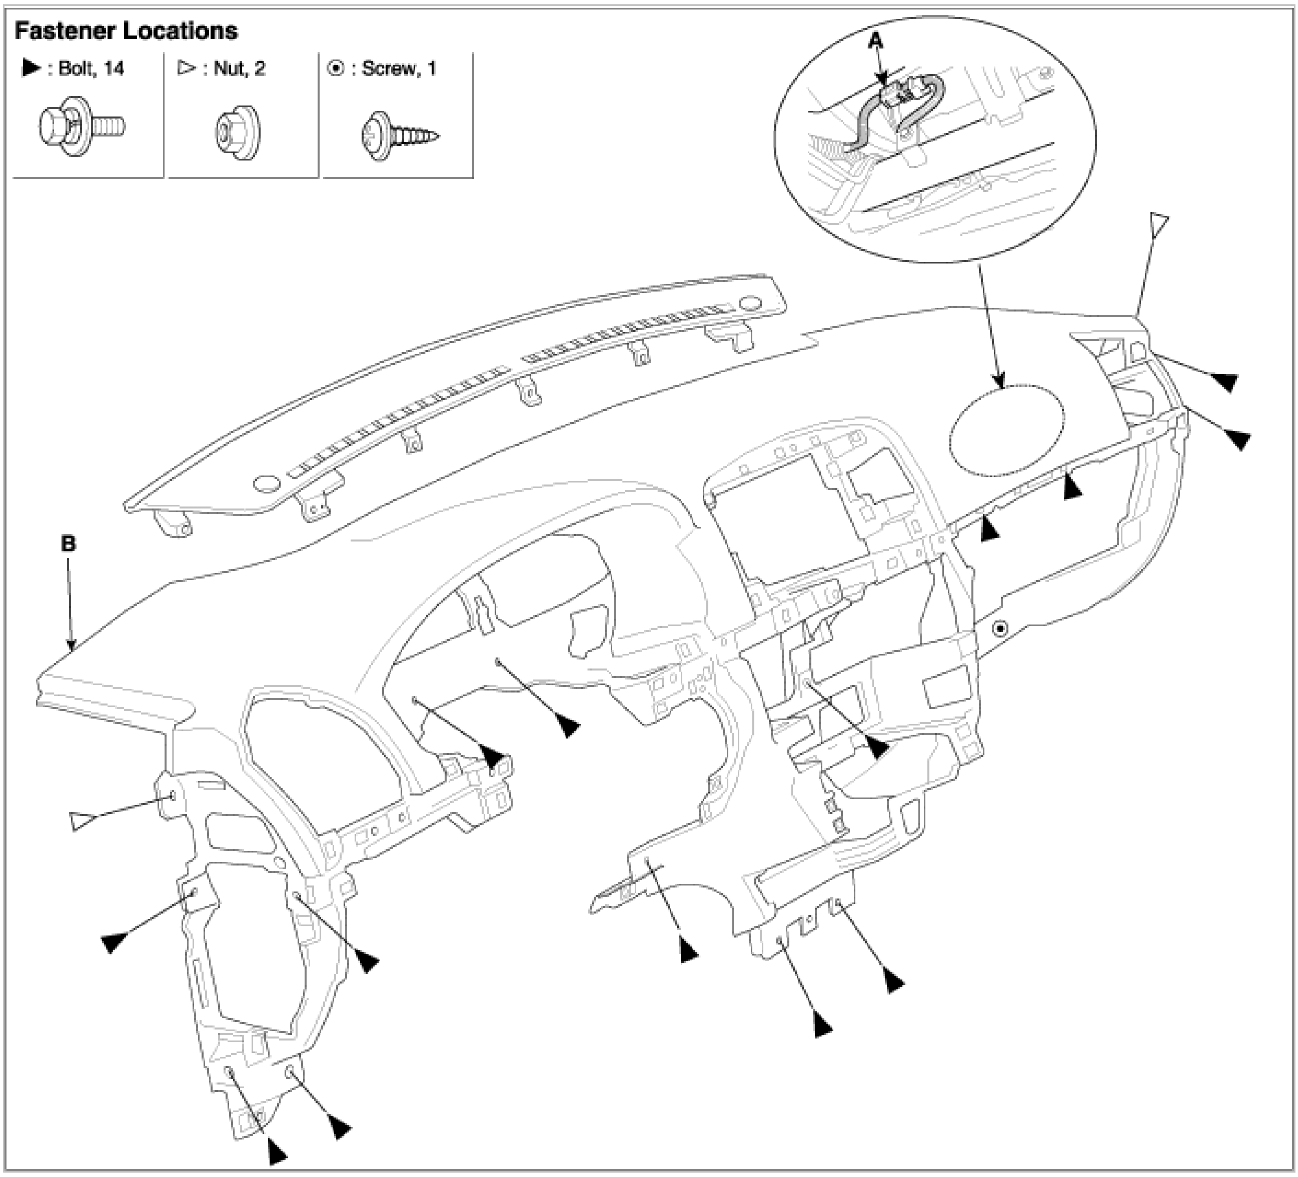
NOTE

- When prying with tip screwdriver, wrap it with protective tape, and apply protective tape around the related parts, to prevent damage.
- Put on gloves to protect your hands.

1. Remove the following items.
   A. Front seat.
   B. Cluster facia panel, cluster.
   C. Audio assembly.
   D. Glove box.
   E. Side cover, center under cover.
   F. Front pillar trim.
2. Disconnect the passenger`s air bag connector (A).
   Loosen the bolt and nut, then remove the crash pad (B).
3. Installation is the reverse of removal.

NOTE

- Make sure the crash pad fits onto the guide pins correctly.
- Before tightening the bolts, make sure the crash pad wire harnesses are not pinched.
- Make sure the connectors are plugged in properly, and the antenna lead is connected properly,
- Enter the anti- theft code for the radio, then enter the customer`s radio station presets.



Body (Interior and Exterior) > Interior > interior trim > Repair procedures

REPLACEMENT

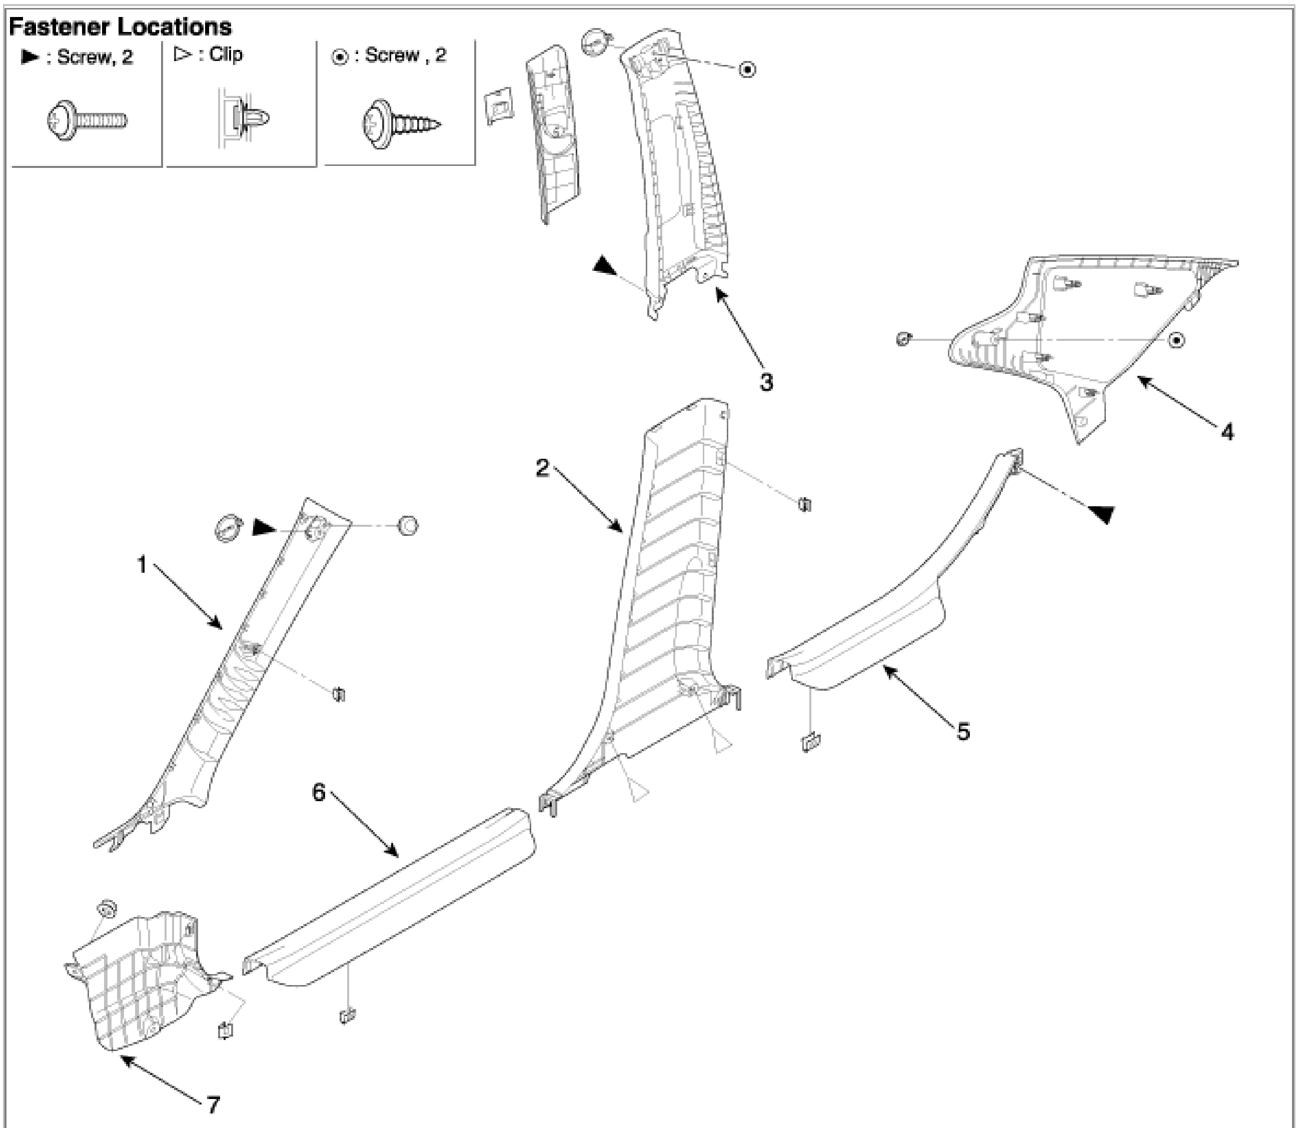
FLOOR AND SIDE TRIM

1. Remove the trim.

> NOTE
>
> - Put on gloves to protect your hands.
> - When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
> - Take care not to bend or scratch the trim and panels.

2. Installation is the reverse of removal.

> NOTE
>
> - Replace any damage clips.



1. Front pillar
2. Center lower pillar trim
3. Center upper pillar trim
4. Rear pillar trim
5. Rear door scuff trim
6. Front door scuff trim
7. Cowl side trim

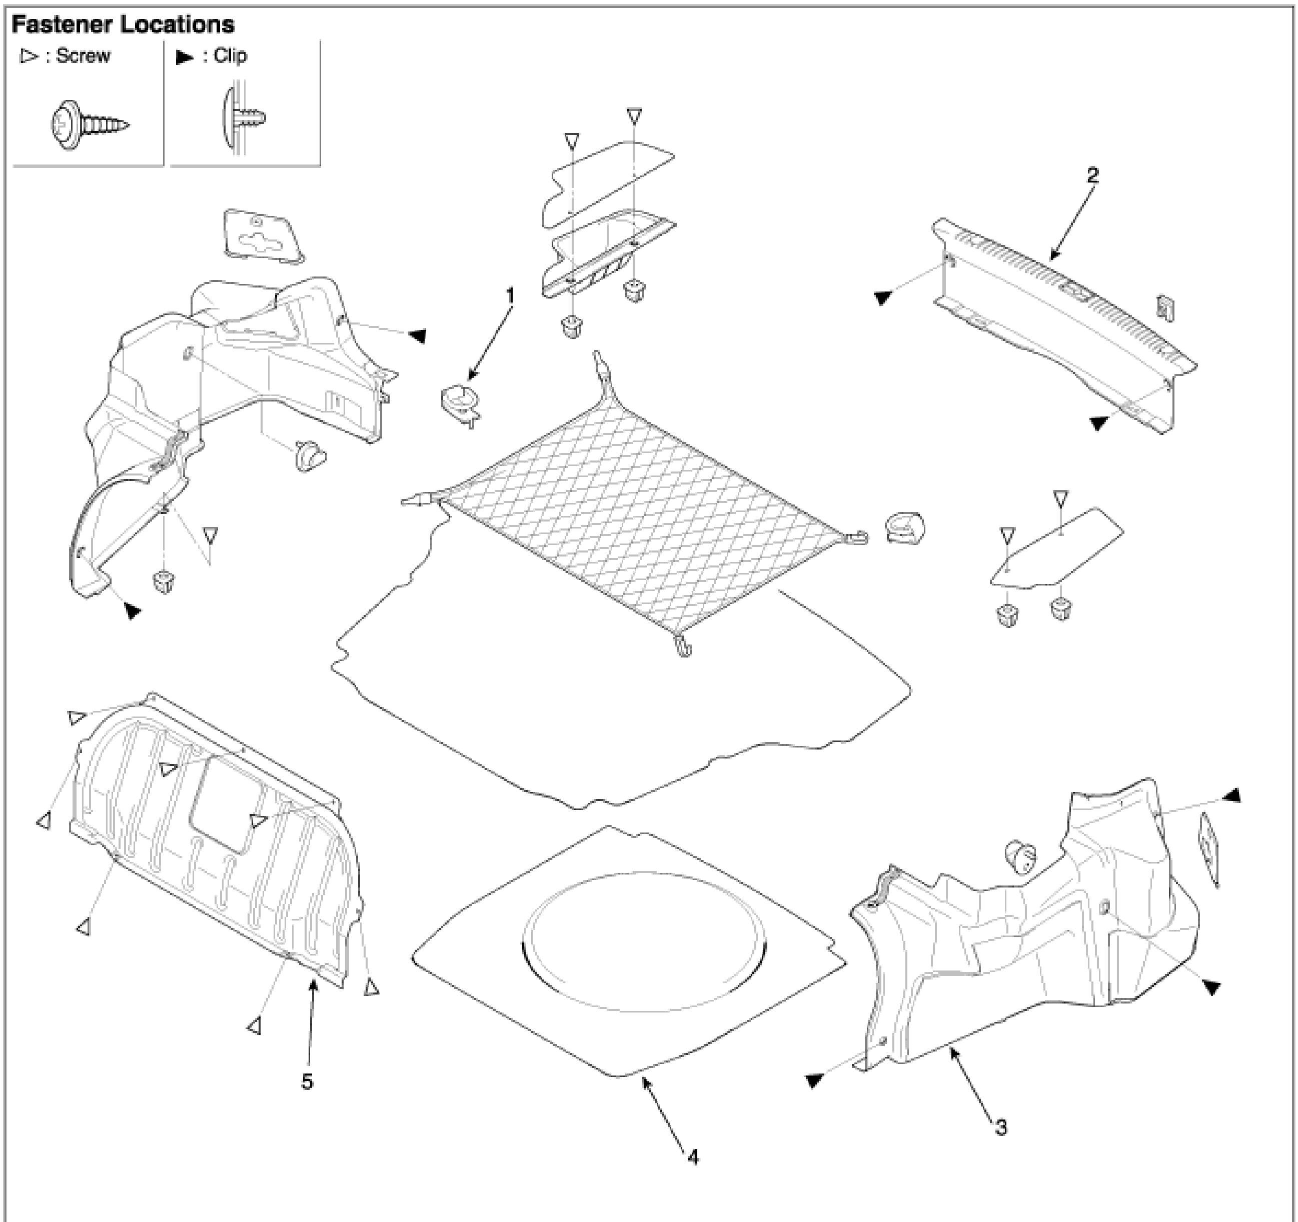
TRUNK TRIM

1. Remove the trim.

> **NOTE**
>
> - Put on gloves to protect your hands.
> - When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
> - Take care not to bend or scratch the trim and panels.

2. Installation is the reverse of removal.

> **NOTE**
>
> - Replace any damage clips.



1. Luggage flower hook
2. Rear transverse trim
3. Luggage side trim
4. Luggage cover met
5. Luggage partition trim

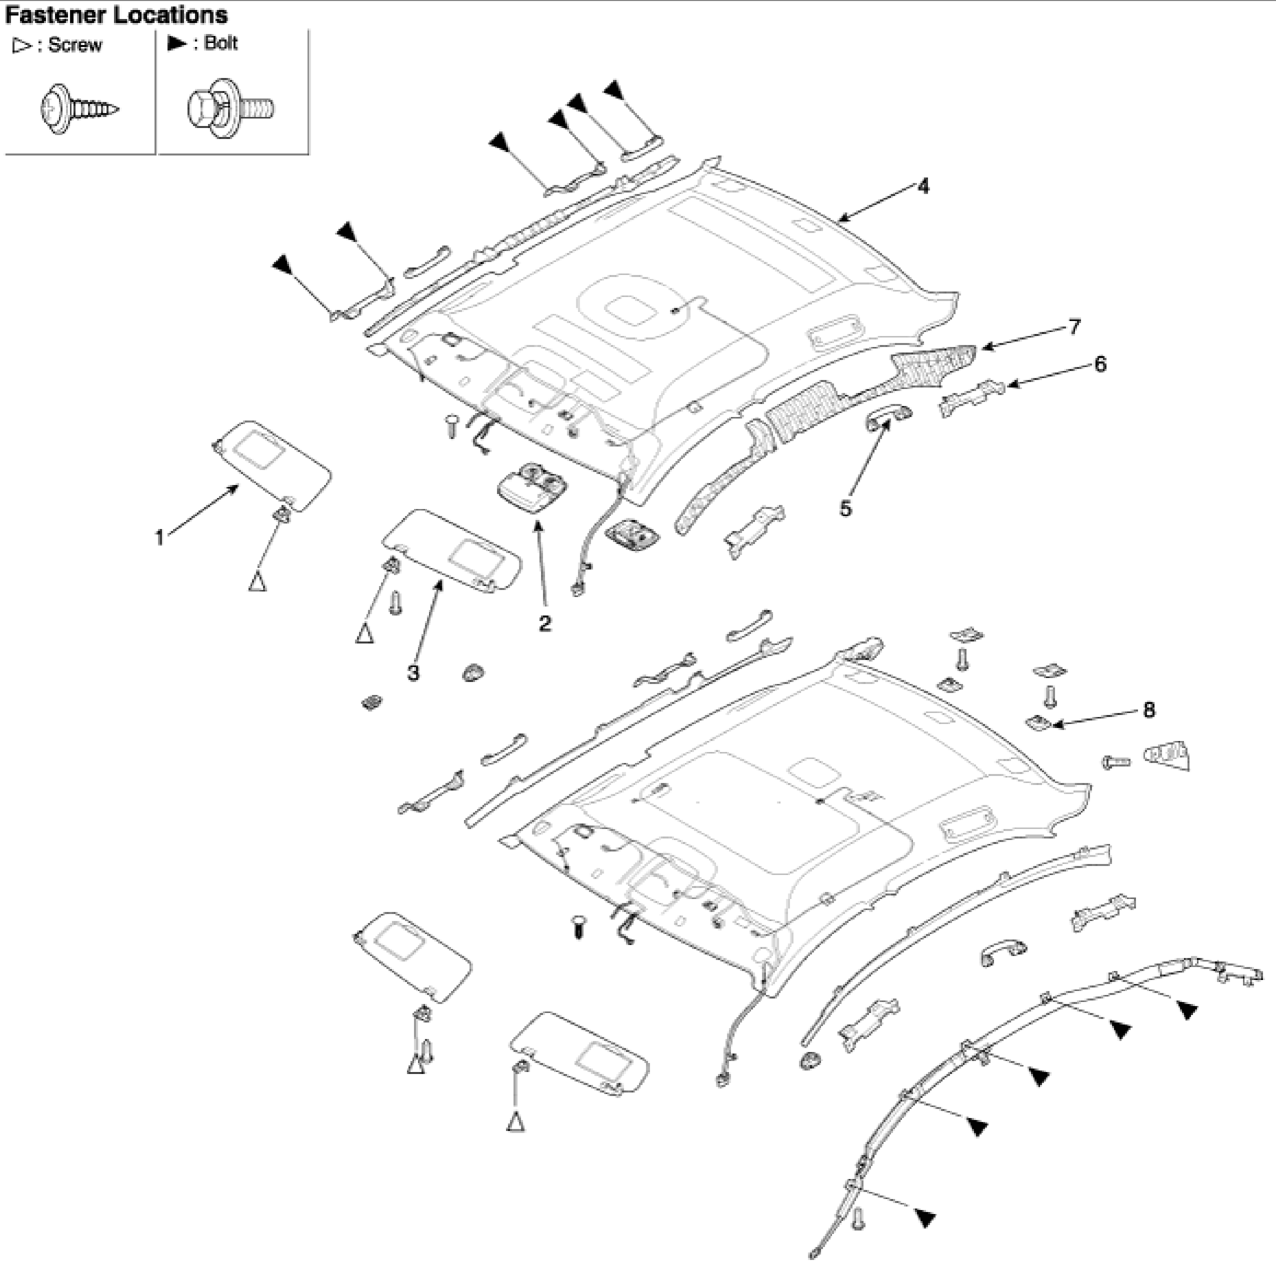
ROOF TRIM

1. Remove the trim.

> **NOTE**
>
> - Put on gloves to protect your hands.
> - When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
> - Take care not to bend or scratch the trim and panels.

2. Installation is the reverse of removal.

> **NOTE**
>
> - Replace any damage clips.



1. Sunvisor	5. Assist handle
2. Over head console lamp	6. Assist handle bracket
3. Sunvisor retainer	7. Roof absorber
4. Head lining	8. Coat hook

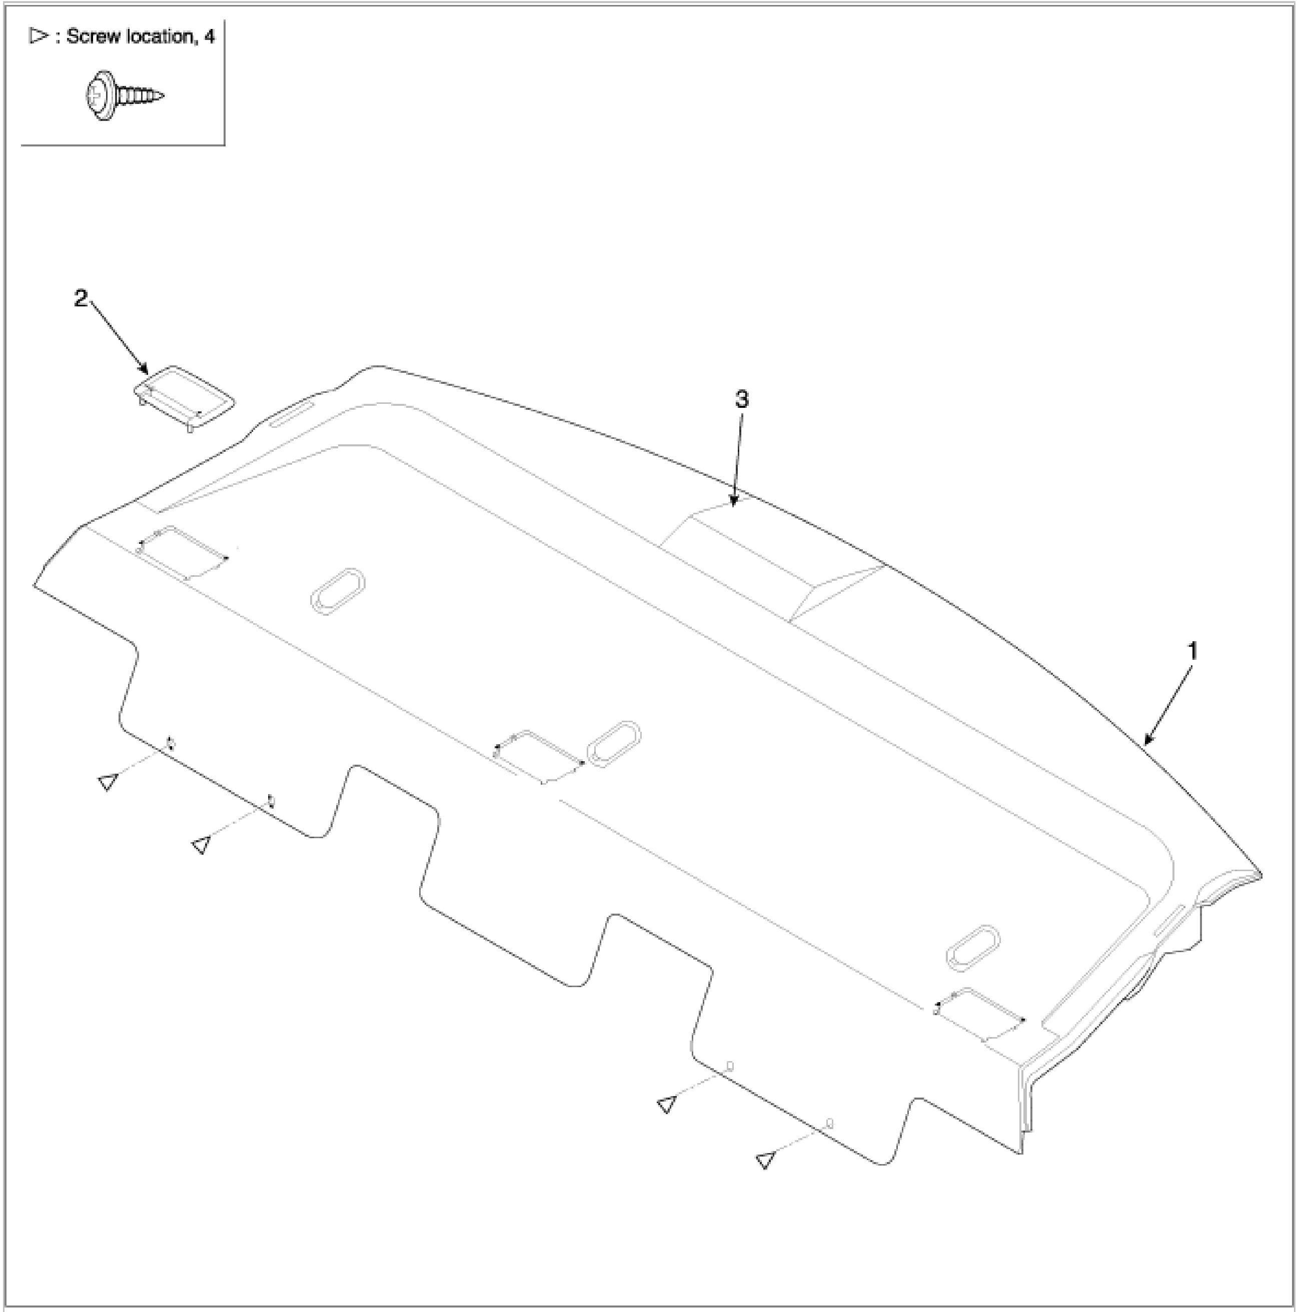
PACKAGE TRAY

1. Remove the trim.

> NOTE
>
> - Put on gloves to protect your hands.
> - When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage.
> - Take care not to bend or scratch the trim and panels.

2. Installation is the reverse of removal.

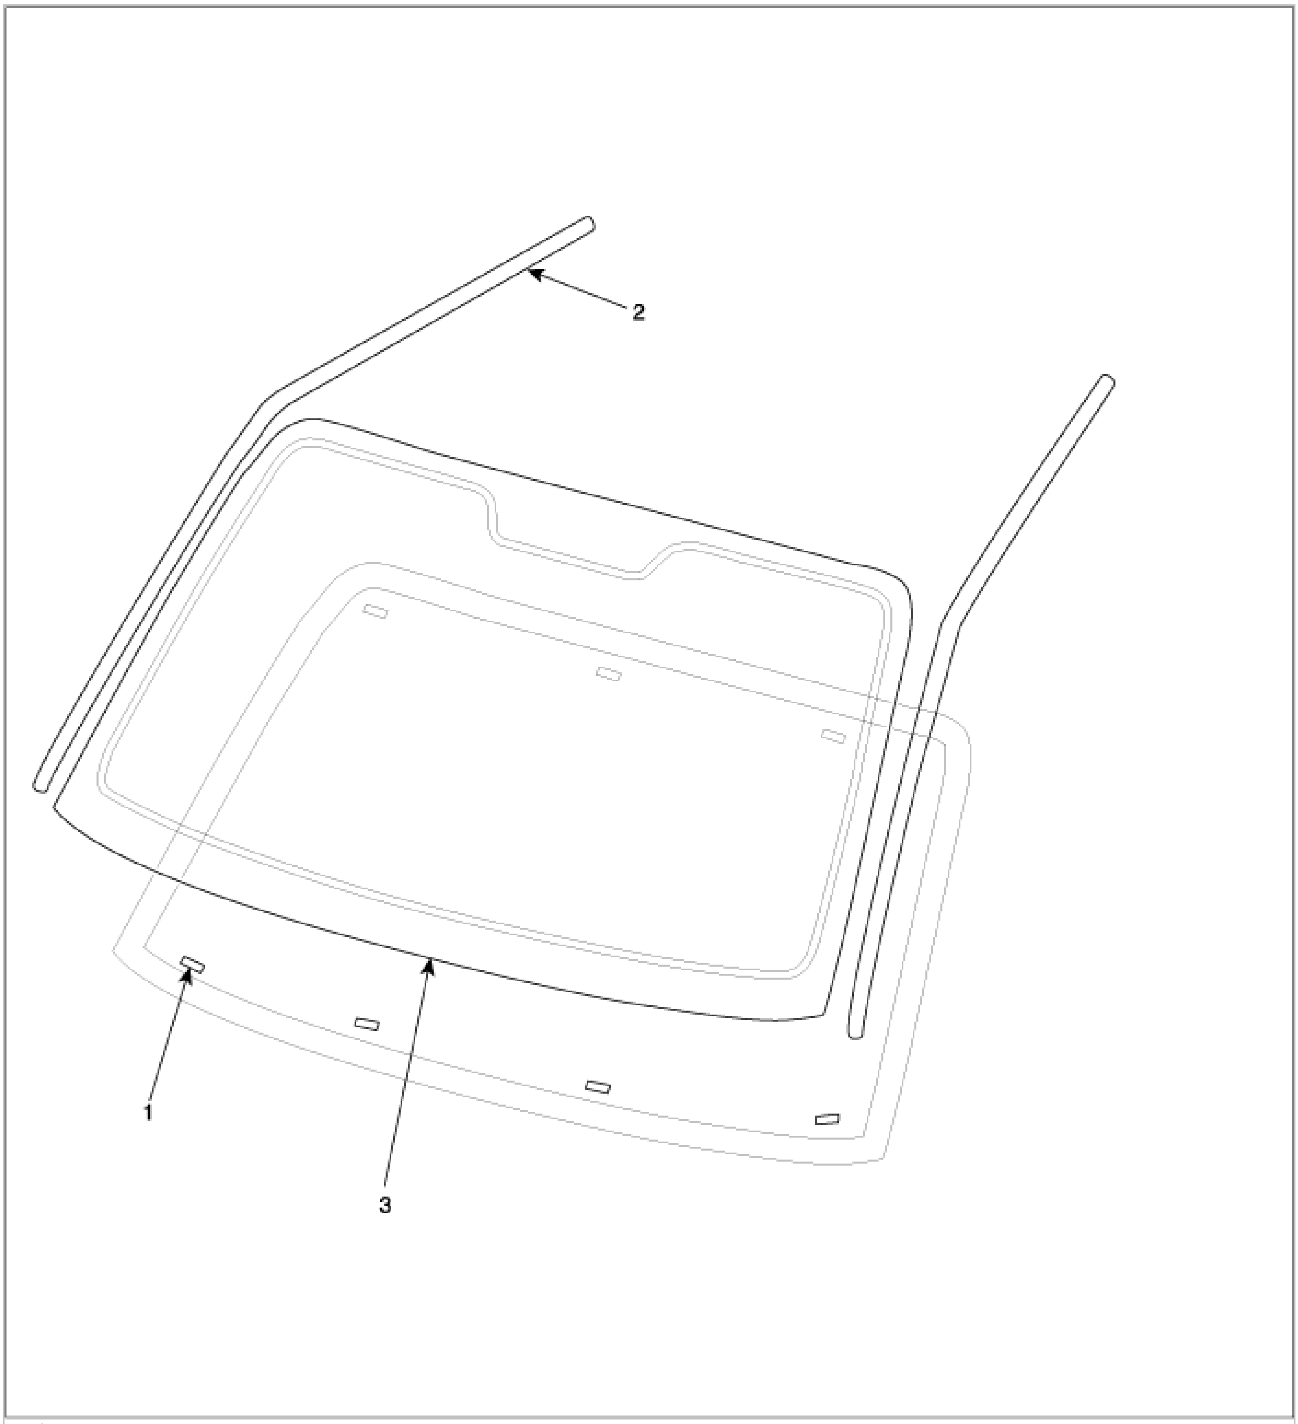
> NOTE
>
> - Replace any damage clips.



1. Package tray
2. Rear seat belt guide
3. High mount stop lamp

Body (Interior and Exterior) > Interior > windshield glass > Components and Components Location

COMPONENTS



1. Glass pad 2. Wind shield molding	3. Wind shield glass

Body (Interior and Exterior) > Interior > windshield glass > Repair procedures

REPLACEMENT

REMOVAL

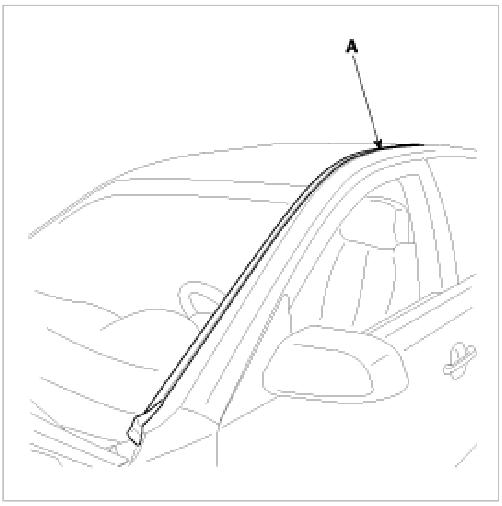
NOTE

- Put on gloves to protect your hands.
- Use seat covers to avoid damaging any surfaces.

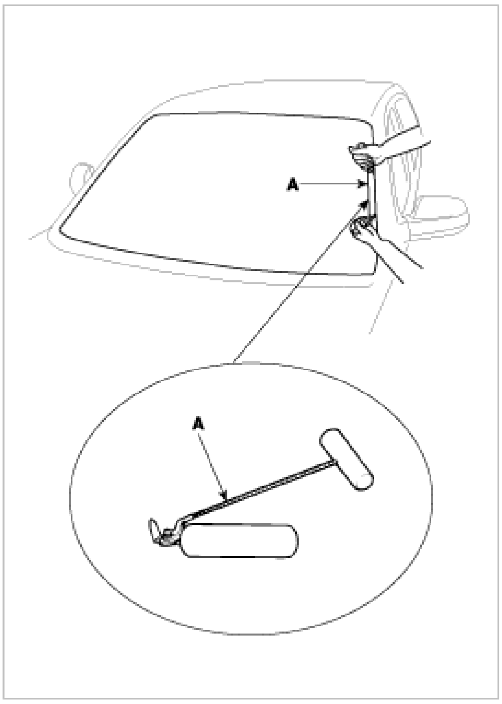
1. Remove the following items.
   A. Inside rear view mirror.
   B. Sun visors and holders, both side, overhead console, grab handles, both sides.

C. Front pillar trim, both sides.
D. Windshield wiper arms and cowl cover.

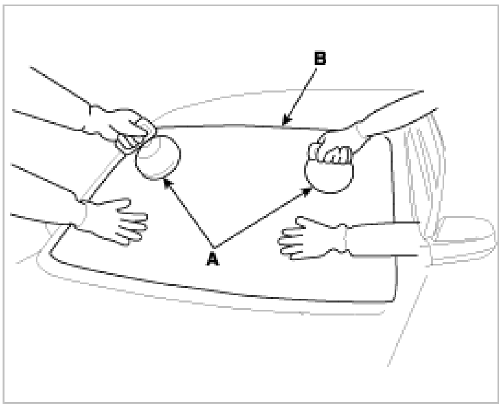
2. Remove the windshield glass side molding (A).



3. Pull down the front portion of the headliner. Take care not to bend the headliner excessively, or you may crease or break it.
4. Cut out the sealant using the sealant cutting tooln (A)(09861-31100).

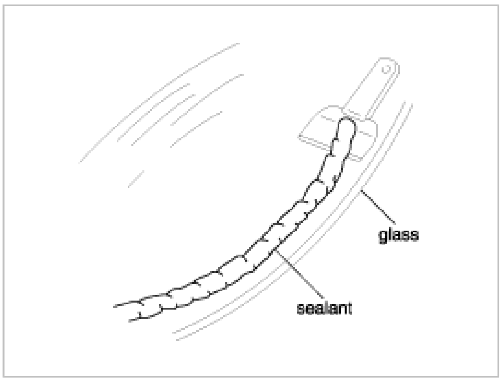


5. Remove the windshield (A) carefully using the glassholder (B)(09861-31100).

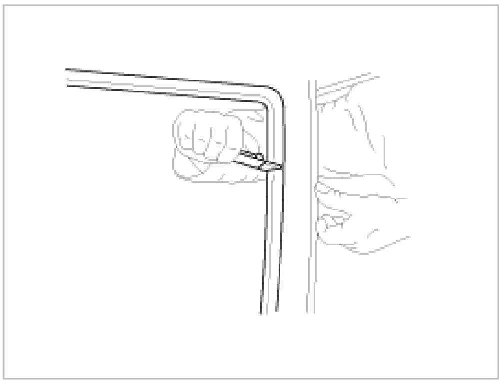


INSTALLTION

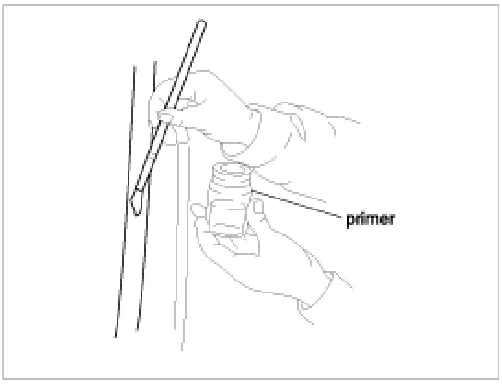
1. Remove the excess sealant from the glass with a window scraper.



2. Remove the excess sealant and foam dam from the body with a knife.



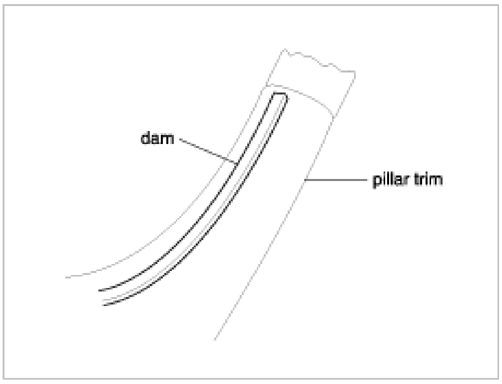
3. Clean the inside of the glass with commercial glass cleaner and a lint-free cloth.
4. Prime an area approximately 20 mm(3/4 inch) wide around the complete perimerter of the glass.
5. Prime the contact area on the body.



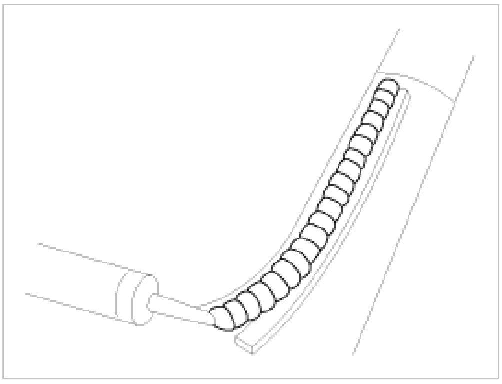
6. Reprime the same area on the inside surface of the glass.

> CAUTION
>
> Do not permit any primed surface to becom contaminated with dirt, water, oil, etc.
> Do not touch primed surfaces with your hands.
> Contamination will affect adhesion.

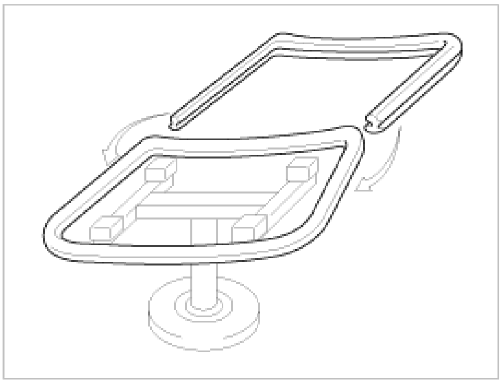
7. Install the self-adhesive foam dam to the body where the original dam had been.



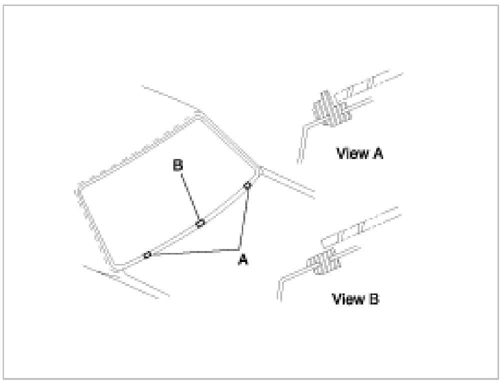
8. Apply the sealant bead to the body just outside the dam. The bead should be slightly higher than the dam.



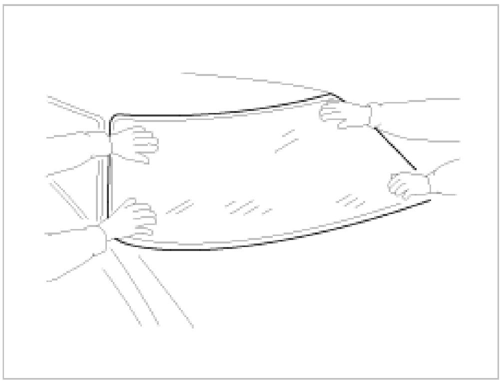
9. Install molding on the glass.

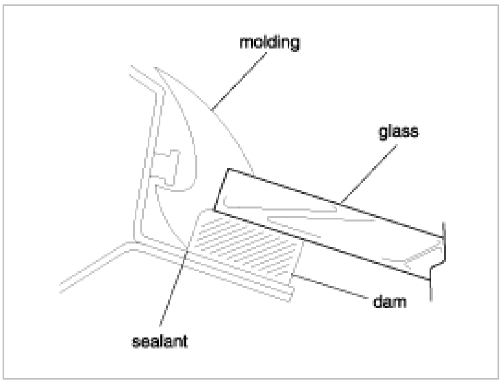


10. Install the glass into the body making sure the glass rests upon the two spacers at the bottom of the windshield.



11. Press glass firmly into place.





CAUTION

Lower both front door windows and leave them in that condition until the vehicle can be put back into service. If the vehicle were completelyclosed, quickly closing a door could break the seal.

12. Remove excess sealant, if any.
13. Press molding molding firmly into place.
14. Perform water leak test immediately.
15. Clean the outside of the windshield.
16. Install both of the front pillar trim.
17. Install the inside rearview mirror.
18. Install the cowl top cover with three fasteners.
19. Install both wiper arm assemblies with one nut eatch.

Body (Interior and Exterior) > Bumper > front bumper > Repair procedures

REPLACEMENT

1. Remove the radiator upper cover.
2. Remove the headlamp.

NOTE

- Put on gloves to protect your hands.
- When prying with tip screwdriver, wrap it with protective tape to prevent damage.

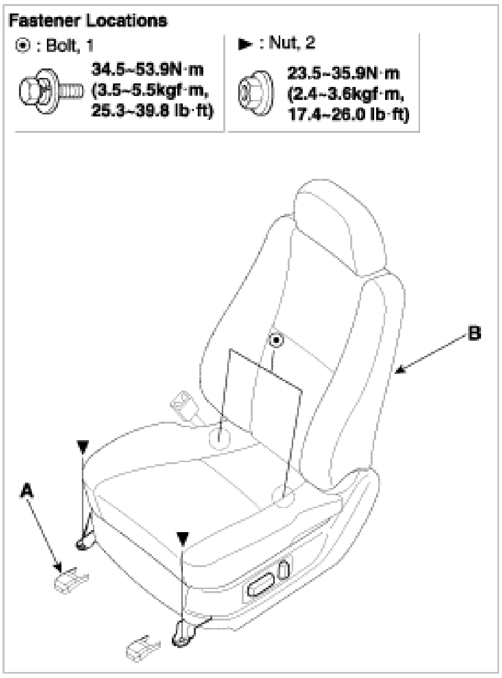
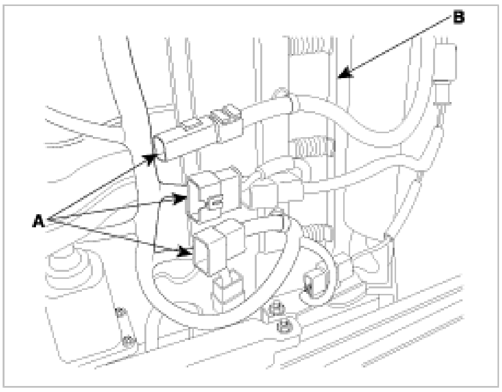
REPLACCEMENT

SEAT ASSEMBLY REPLACEMENT

1. Remove the seat assembly mounting cover (A).
2. After loosening the seat assembly mounting bolt and nut, remove the seat assembly (B).



3. Disconnect the connector (A), and remove the seat assembly.

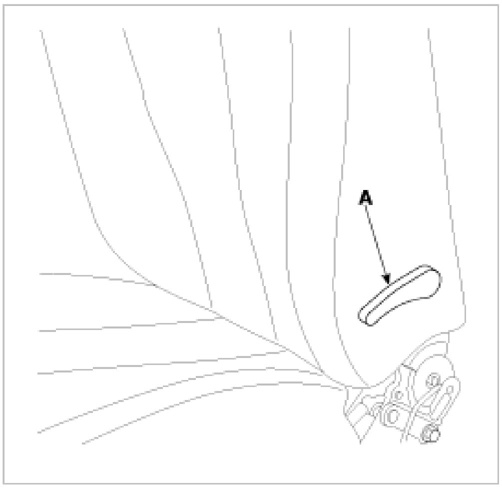


4. Installation is the reverse of removal.

> **CAUTION**
>
> SEAT MOUNTING BOLT INSTALLATION PROCEDURE
>
> - Set the into the most rearward position.
>   Check then each slide is locked, and then tighten the front mounting bolt temporarily.
> - Set the seat into most forward position.
>   Check that each slide is locked, and then Tighten the rear mounting bolt completely.
> - Set the seat into the most rearward position.
>   Check the front mounting bolt completely.
> - Check that the seat operates to and fro smoothy and the locking portion locks properly.

LUMBER SUPPORT LEVER REPLACEMENT

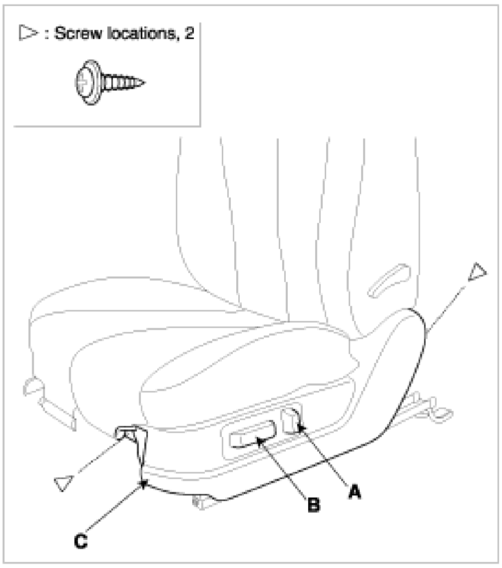
1. Remove the lumbar support lever (A).



2. Installation is the reverse of removal.

RECLINER LEVER AND HEIGHT KNOB REPLACEMENT

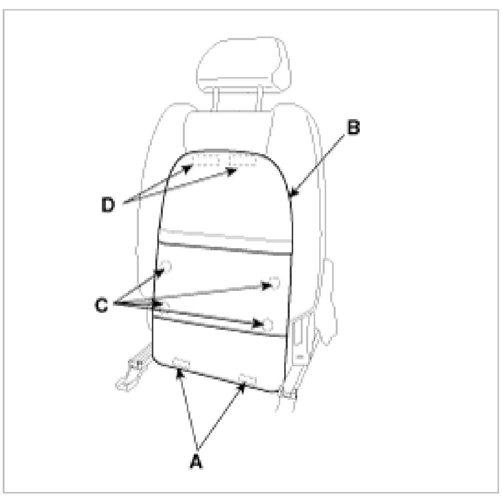
1. Remove the height adjuster knob (A) and recliner lever (B).
2. Loosen the recliner mounting screw and clip, then remove the recliner cover(C).



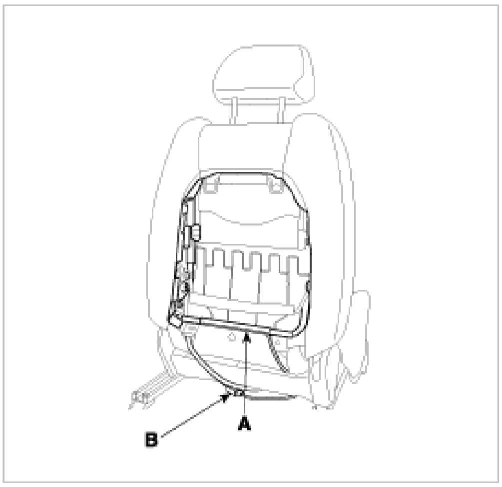
3. Installation is the reverse of removal.

SEAT BACK COVER REPLACEMENT

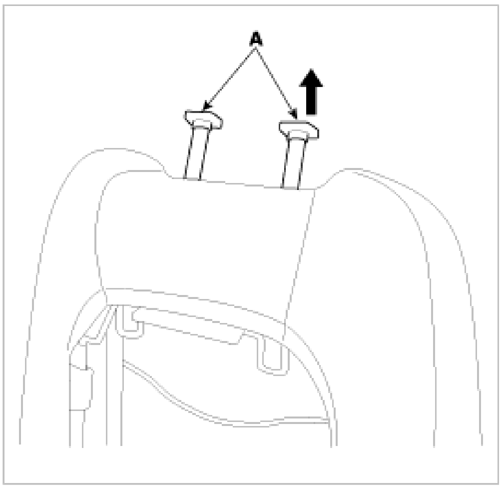
1. Remove the lumbar sport lever.
2. After disconnecting the scuff band (A), remove the seat back panel (B).



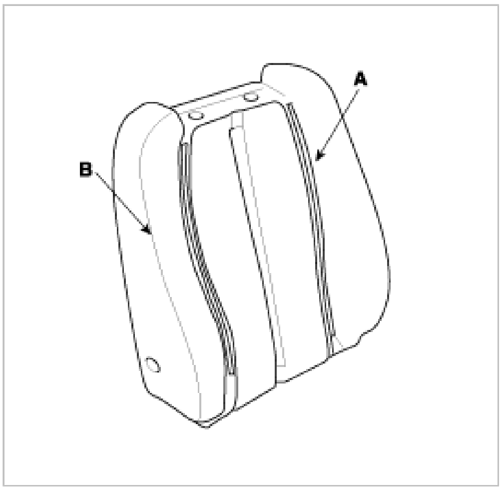
3. After disconnect the protector (A) from the back frame, then disconnect the connector (B).



4. Remove the headrest and headrest guide (A).



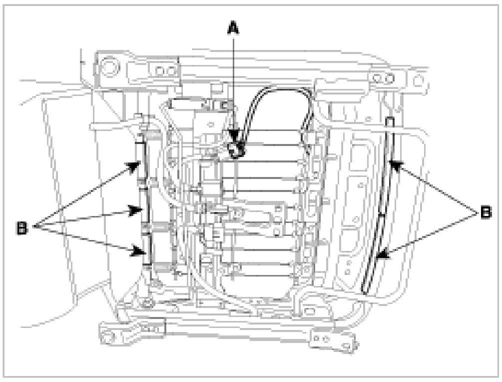
5. After removing the hogring clips (A) on the front of seat back remove the seat back cover (B).



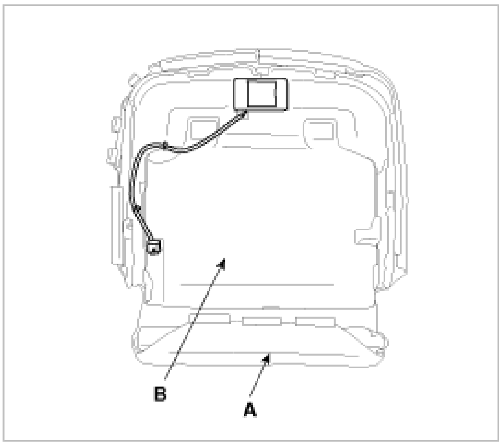
6. Installation is the reverse of removal.

SEAT CUSHION COVER REPLACEMENT

1. Remove front seat assembly.
2. Remove the scuff band.
3. After disconnect the protector (B)from the back frame, then disconnect the connector (A).

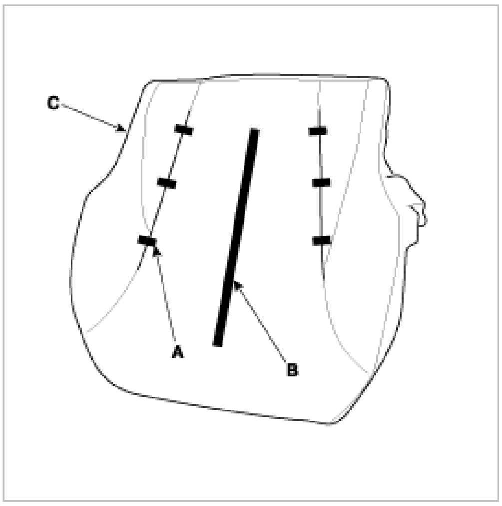


4. Remove the seat cushion(A).



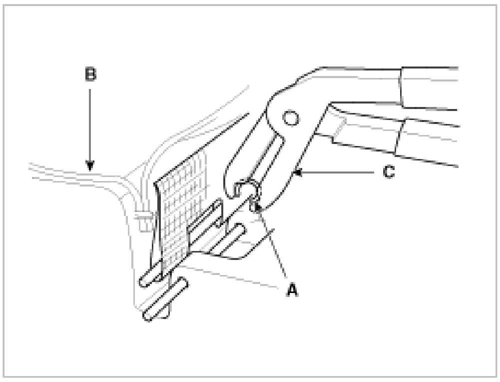
5. After removing the hogring clip (A) on the front of seat cushion and remove the seat cushion cover (C).

> CAUTION
>
> When removing the hogring clip, remove the hogring clip while pressing the wire so as not to separate the wire from the sponge.



6. Installation is the reverse of removal.

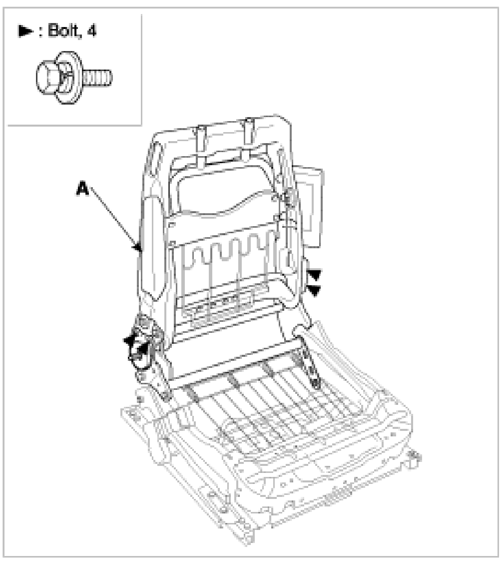
> NOTE
>
> - To prevent wrinkles, make sure the material is stretched evenly over the cover (B) before securing the hogring clips (A).
> - Replace the hogring clips with new ones using special tool (C).



SEAT BACK FRAME REPLACEMENT

1. Remove the lumbar support.
2. Remove the seat back panel.
3. Remove the headrest guide.
4. Remove the seat back cover and pad from frame.
5. Loosen the mounting bolts, then remove the seat back frame (A).

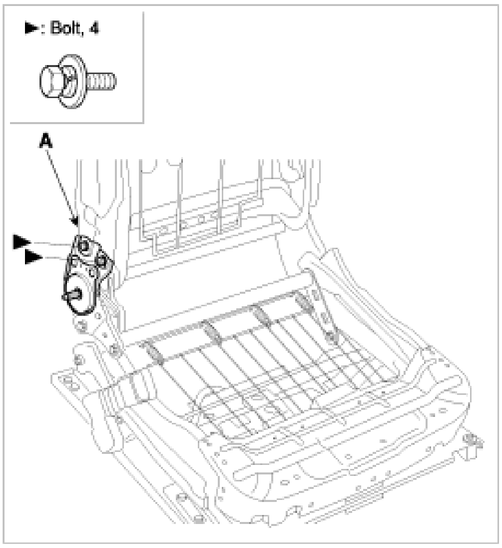
> NOTE
>
> - Remove the side air bag for replacing side air bag installation seat.
> - Be fore service, be fully aware of precautions and service procedure relevant to air bag (See page RT-Airbag).



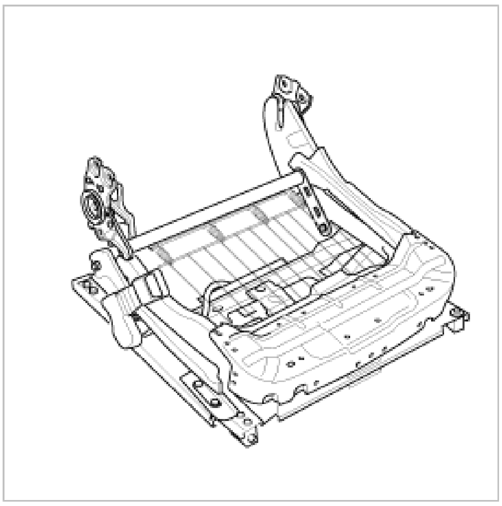
6. Installation is the reverse of removal.

SEAT TRACK REPLACEMENT

1. After removing the seat back panel, disconnect the protector.
2. Remove the recliner cover, knob and height knob.
3. Remove the seat assembly (A).



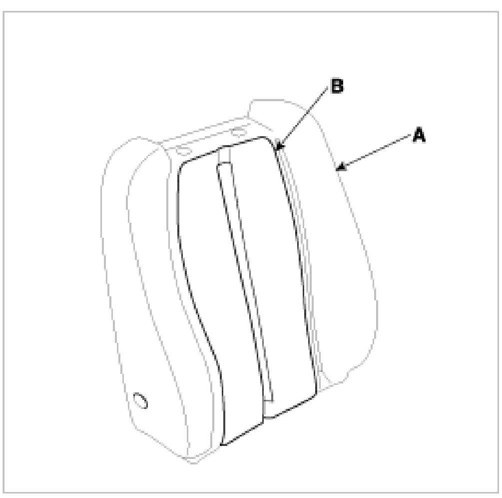
4. Remove the seat cushion.
5. Remove the seat track (A).



6. Installation is the reverse of removal.

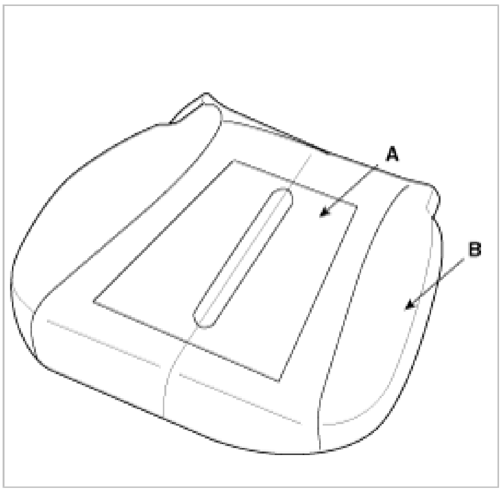
SEAT BACK HEATER REPLACEMENT

1. Remove the seat back cover.
2. Cut the heater (A)attached to the pad (B), as shown in the picture.
3. Take off the paper from the backside of the heater assembly.
4. Attach the heater to the main part of pad.
5. Install the seat back cover.



SEAT CUSHION HEATER REPLACEMENT

1. Remove the seat back cover.
2. Cut the heater (A)attached to the pad (B), as shown in the picture.
3. Take off the paper from the backside of the heater assembly.
4. Attach the heater to the main part of pad.
5. Install the seat back cover.

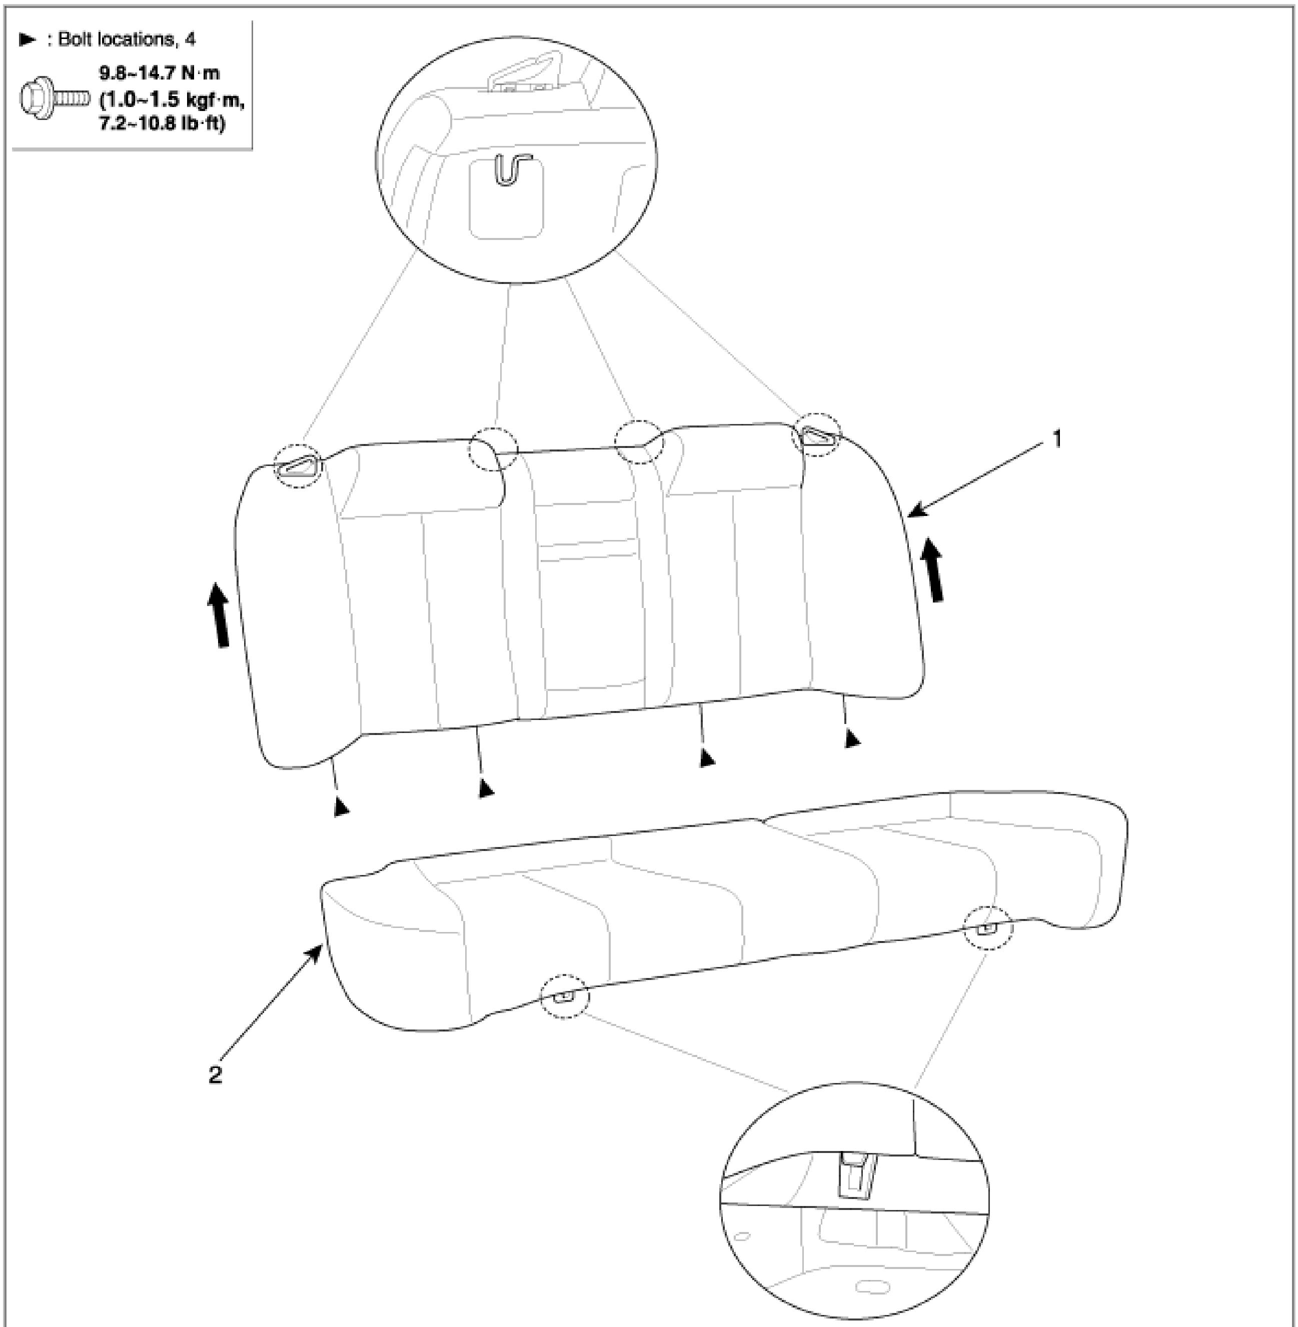


Body (Interior and Exterior) > Seat & Power Seat > rear seat > Repair procedures

REPLACEMENT

SEAT ASSEMBLY REPLACEMENT

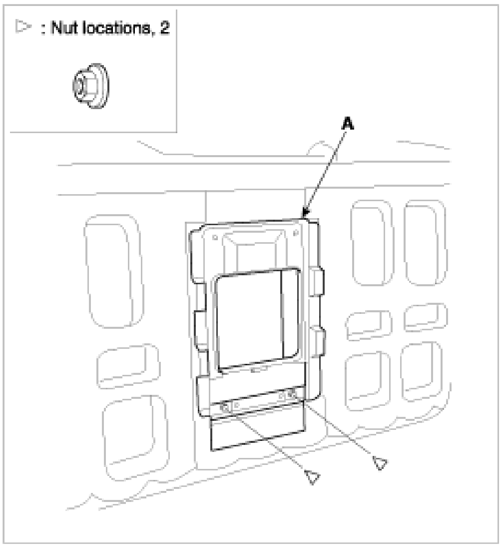
1. Remove the rear seat cushion.
2. Remove the rear seat back.
3. Installation is the reverse of removal.

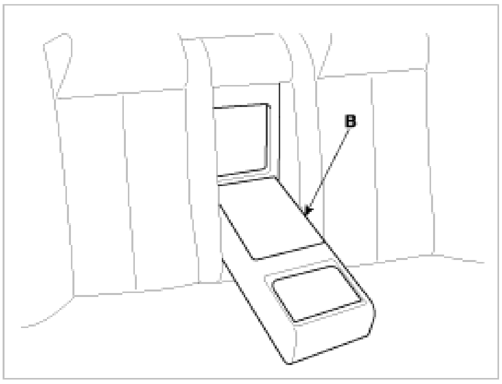


1. Seat back 2. Seat cushion

ARMREST REPLACEMENT

1. Loosening the armrest cover mounting screw.
2. After disconnecting the armrest cover (A), remove the armrest (B).

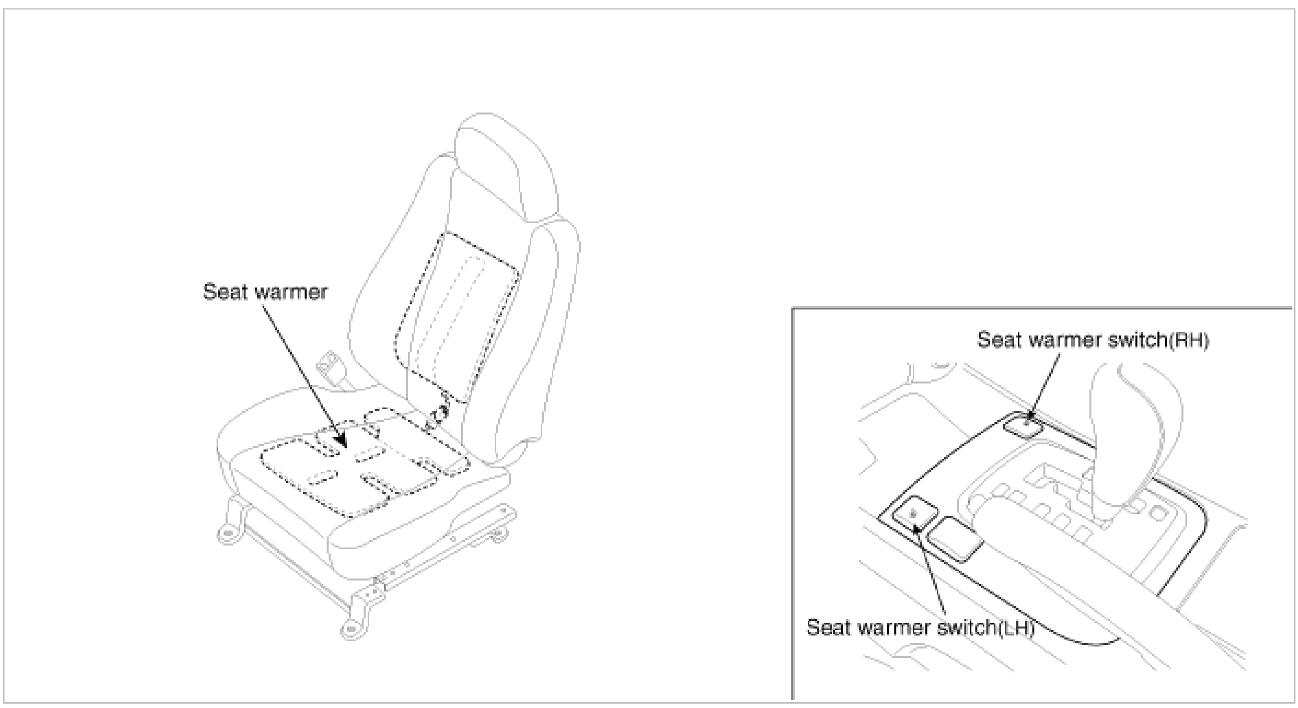




3. Installation is the reverse of removal.

Body (Interior and Exterior) > Seat Heater > Components and Components Location

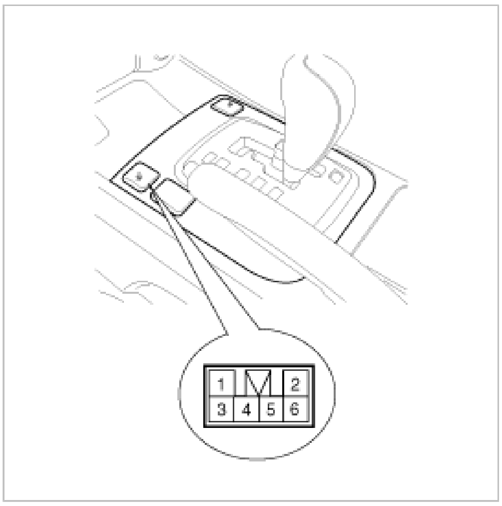
COMPONENT LOCATION



Body (Interior and Exterior) > Seat Heater > Seat Heater switch > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the seat warmer switch from the floor console upper cover with scraper.



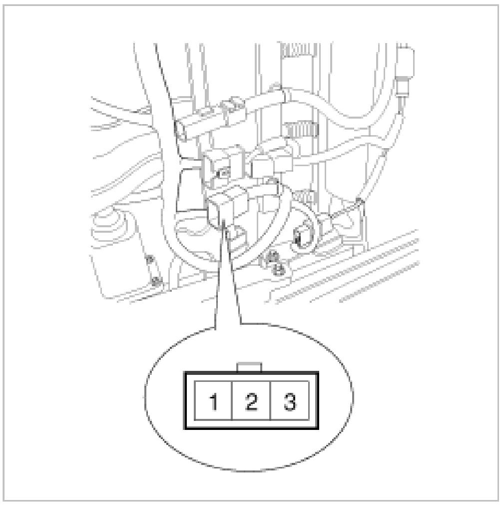
3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal	2	6	3	4	1
ON	O	O	O	O (IND.)	O
OFF		Illumination			

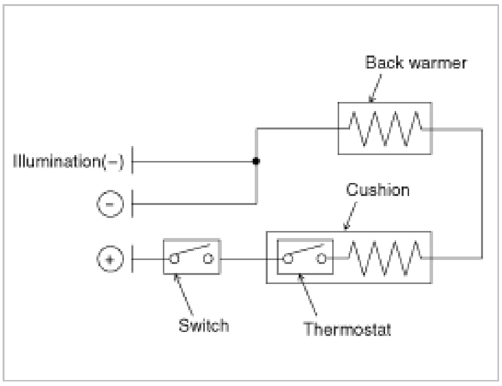
Body (Interior and Exterior) > Seat Heater > Seat heater > Repair procedures

INSPECTION

1. Check for continuity and measure the resistance between No.1 and NO.3 terminals.



Standard value: 2.45Ω ± 10%
(Cushion: 1.2Ω ± 10%, Back: 1.2Ω ± 10%)

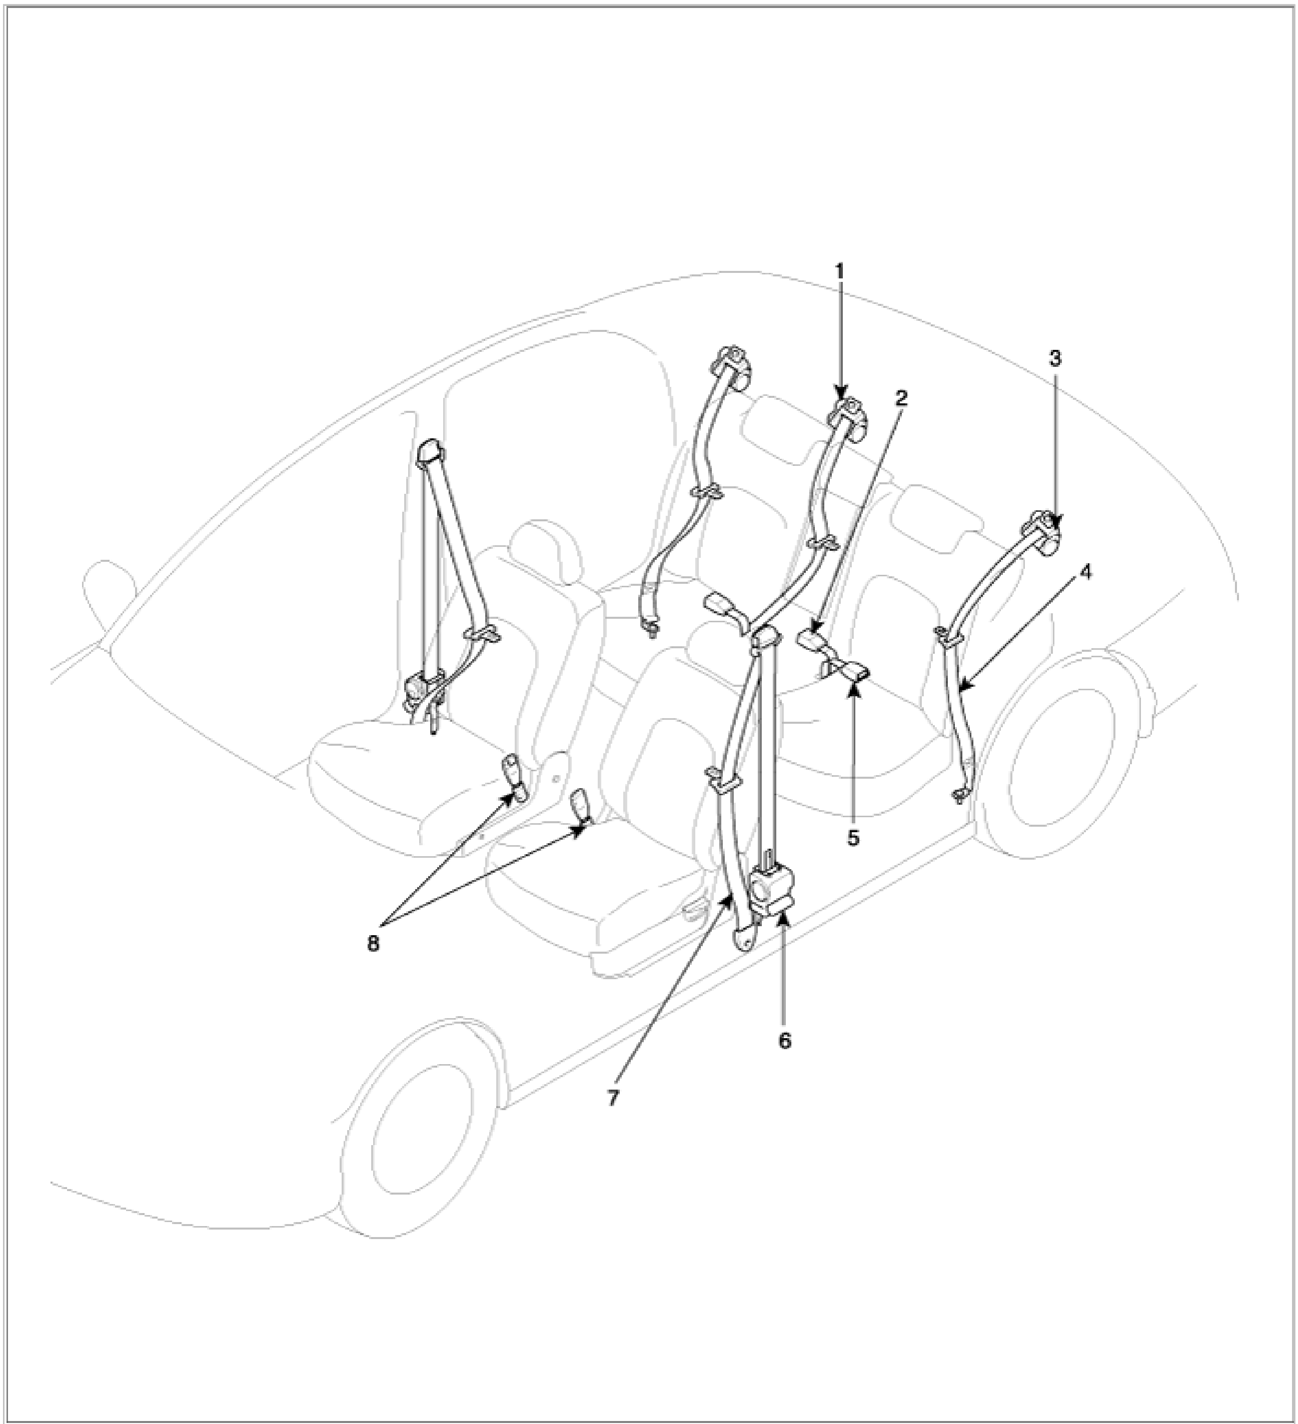


2. Operate the seat warmer after connecting the 3P connector, and then check the thermostat by measuring the temperature of seat surface.
3. Check for continuity between the terminals after disconnecting the 3P connector.

Standard value :
28 ± 3.5°C(Continuity), 37 ± 3.0°C(Short)

Body (Interior and Exterior) > Seat Belt > front seat belt > Components and Components Location

COMPONENTS



1. Rear center seat belt	4. Rear seat belt	7. Front seat belt
2. Rear center seat buckle	5. Rear seat buckle	8. Front seat buckle
3. Rear seat belt retractor	6. Front seat belt retractor	

Body (Interior and Exterior) > Seat Belt > front seat belt > Repair procedures

REPLACEMENT

FRONT SEAT BELT REPLACEMENT

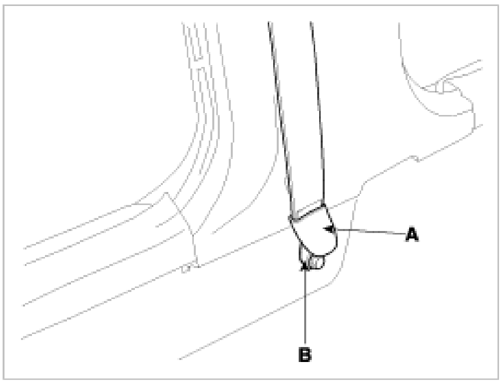
CAUTION

When installing the belt, make sure not to damage the pretensioner.

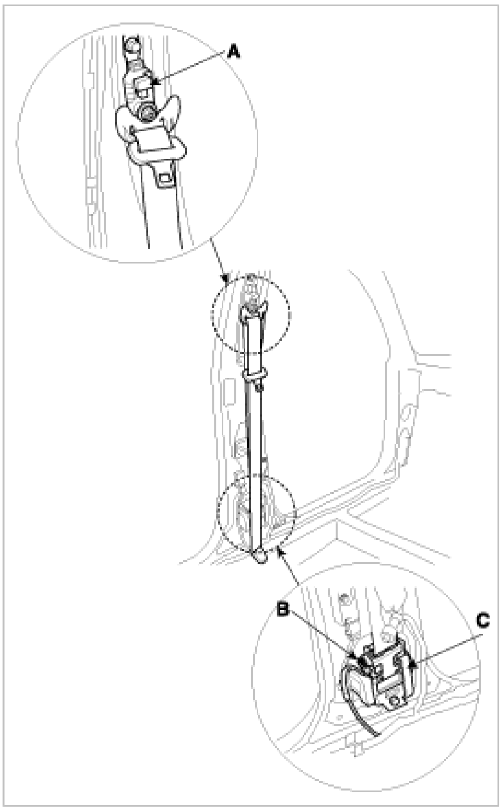
1. Remove the following items fist.

A. Front seat assembly.
B. Front and rear door scuff trim.

2. After raise the lower anchor cover (A), loosen the lower anchor mounting bolt (B).



3. Remove the center pillar lower trim.
4. Remove the center pillar upper trim.
5. Remove the upper anchor (A).



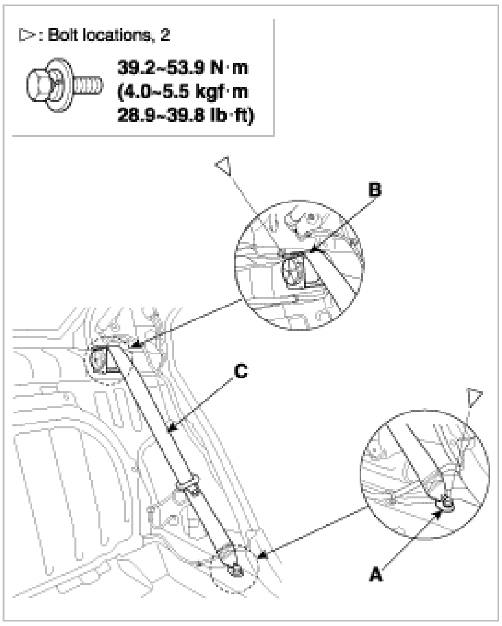
6. After disconnecting the pretensioner connector lock pin, remove the connector(B), Loosen the mounting bolt, then remove the pretensioner (C).

REAR SEAT BELT RELACEMENT

> CAUTION
>
> When installing the belt, make sure not to damage the pretensioner.

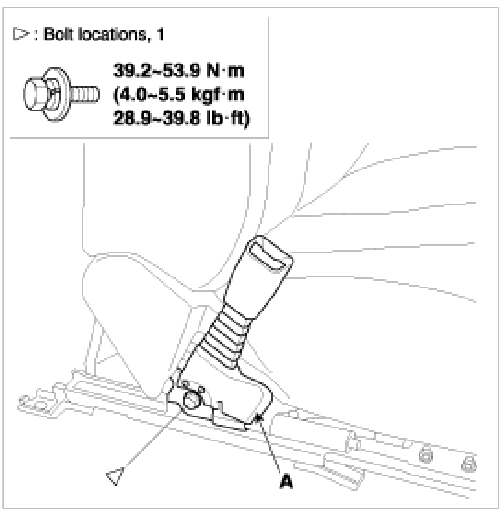
1. Remove the following items first.
   A. Rear seat assembly.
   B. Front and rear door scuff trim.
   C. Rear filler trim.
2. Remove the lower anchor (A).
3. Remove the package tray trim.

4. After loosening the retractor (B) mounting bolt, remove the rear seat belt (C).



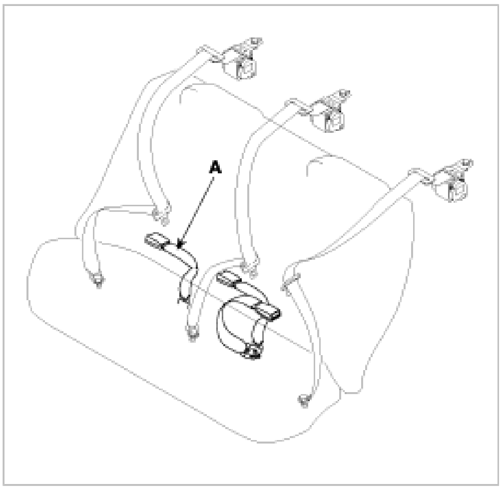
FRONT SEAT BELT BUCKLE REPLACEMENT

1. Remove the following items first.
   A. Front seat assembly.
2. Remove the wire harness of buckle from seat.
3. Remove the seat belt buckle (A).
4. Installation is the reverse of removal.



REAR SEAT BELT BUCKLE REPLACEMENT

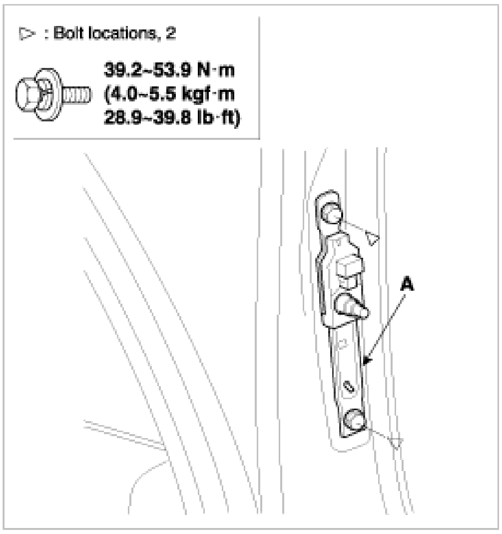
1. After cushion frame hinge mounting bolt, fold the cushion.
2. Remove the seat belt buckle (A).



3. Installation is the reverse of removal.

HIGHT ADJUSTER REPLACEMENT

1. Remove the following items first.
   A. Front seat assembly.
   B. Front and rear door scuff trim.
   C. Front seat belt upper and lower anchor.
   D. Center pillar lower and upper trim.
2. Loosen the mounting bolt, then remove the height adjuster (A).



3. Installation is the reverse of removal.

GENERAL TROUBLESHOOTING INFORMATION

BEFORE TROUBLESHOOTING

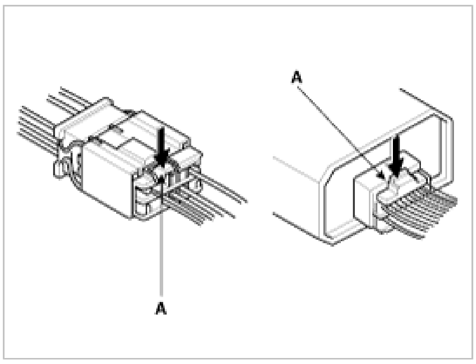
1. Check applicable fuses in the appropriate fuse/relay box.
2. Check the battery for damage, state of charge, and clean and tight connections.

> NOTE
>
> - Do not quick-charge a battery unless the battery ground cable has been disconnected, otherwise you will damage the alternator diodes.
> - Do not attempt to crank the engine with the battery ground cable loosely connected or you will severely damage the wiring.

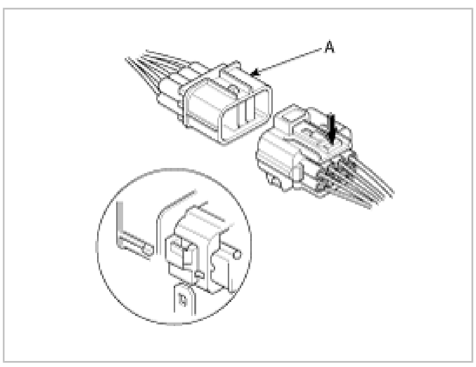
3. Check the alternator belt tension.

HANDLING CONNECTORS

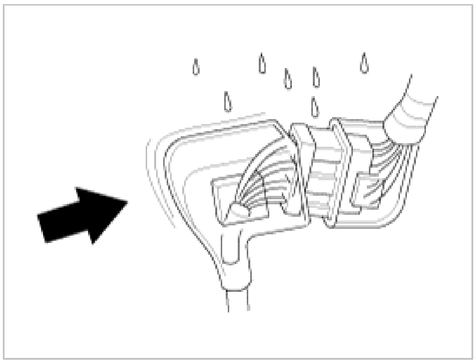
1. Make sure the connectors are clean and have no loose wire terminals.
2. Make sure multiple cavity connectors are packed with grease (except watertight connectors).
3. All connectors have push-down release type locks (A).



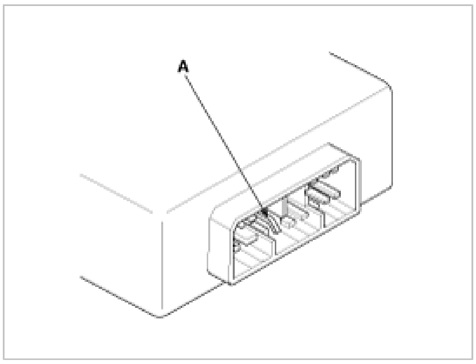
4. Some connectors have a clip on their side used to attach them to a mount bracket on the body or on another component. This clip has a pull type lock.
5. Some mounted connectors cannot be disconnected unless you first release the lock and remove the connector from its mount bracket (A).



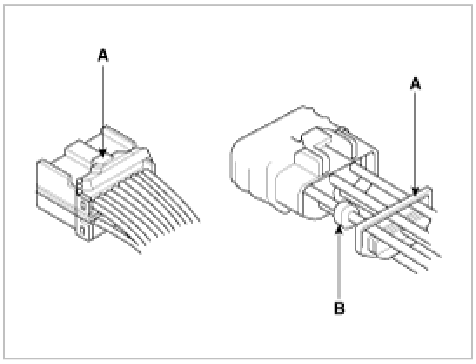
6. Never try to disconnect connectors by pulling on their wires; pull on the connector halves instead.
7. Always reinstall plastic covers.



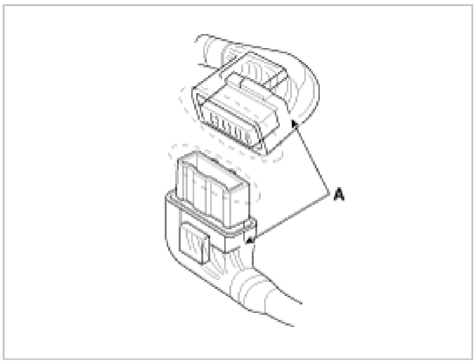
8. Before connecting connectors, make sure the terminals (A) are in place and not bent.



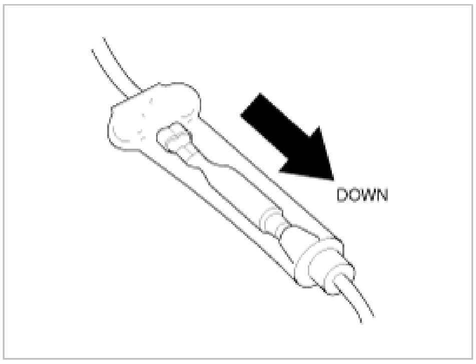
9. Check for loose retainer (A) and rubber seals (B).



10. The backs of some connectors are packed with grease. Add grease if necessary. If the grease (A) is contaminated, replace it.

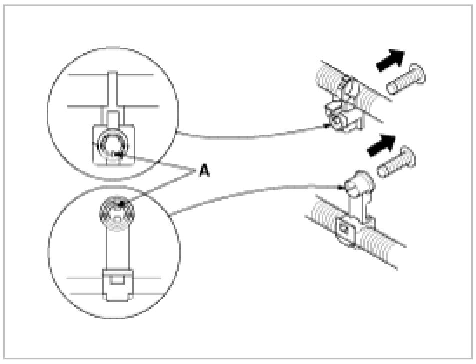


11. Insert the connector all the way and make sure it is securely locked.
12. Position wires so that the open end of the cover faces down.

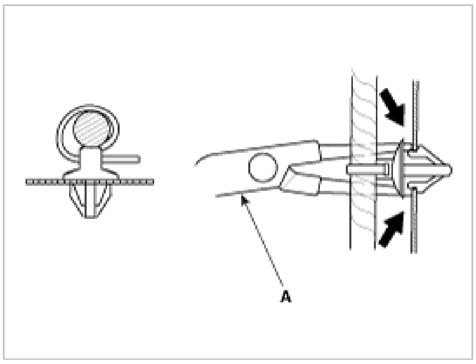


HANDLING WIRES AND HARNESSES

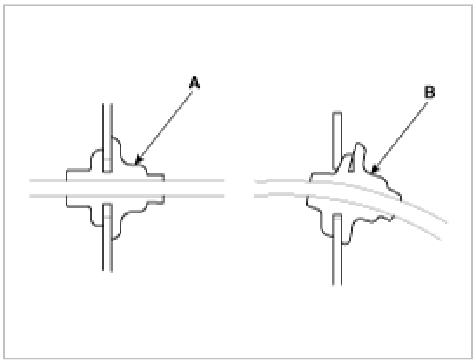
1. Secure wires and wire harnesses to the frame with their respective wire ties at the designated locations.
2. Remove clips carefully; don't damage their locks (A).



3. Slip pliers (A) under the clip base and through the hole at an angle, and then squeeze the expansion tabs to release the clip.



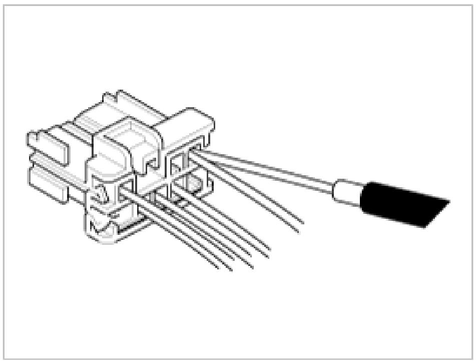
4. After installing harness clips, make sure the harness doesn't interfere with any moving parts.
5. Keep wire harnesses away from exhaust pipes and other hot parts, from sharp edges of brackets and holes, and from exposed screws and bolts.
6. Seat grommets in their grooves properly (A). Do not leave grommets distorted (B).



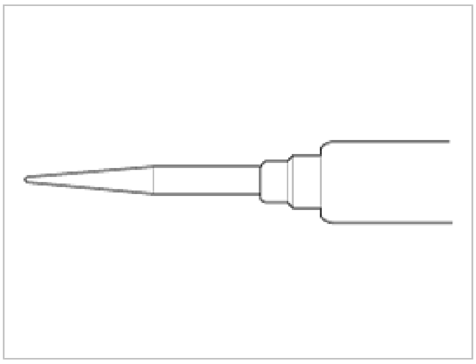
TESTING AND REPAIRS

1. Do not use wires or harnesses with broken insulation.
   Replace them or repair them by wrapping the break with electrical tape.
2. After installing parts, make sure that no wires are pinched under them.

3. When using electrical test equipment, follow the manufacturer's instructions and those described in this manual.
4. If possible, insert the probe of the tester from the wire side (except waterproof connector).



5. Use a probe with a tapered tip.

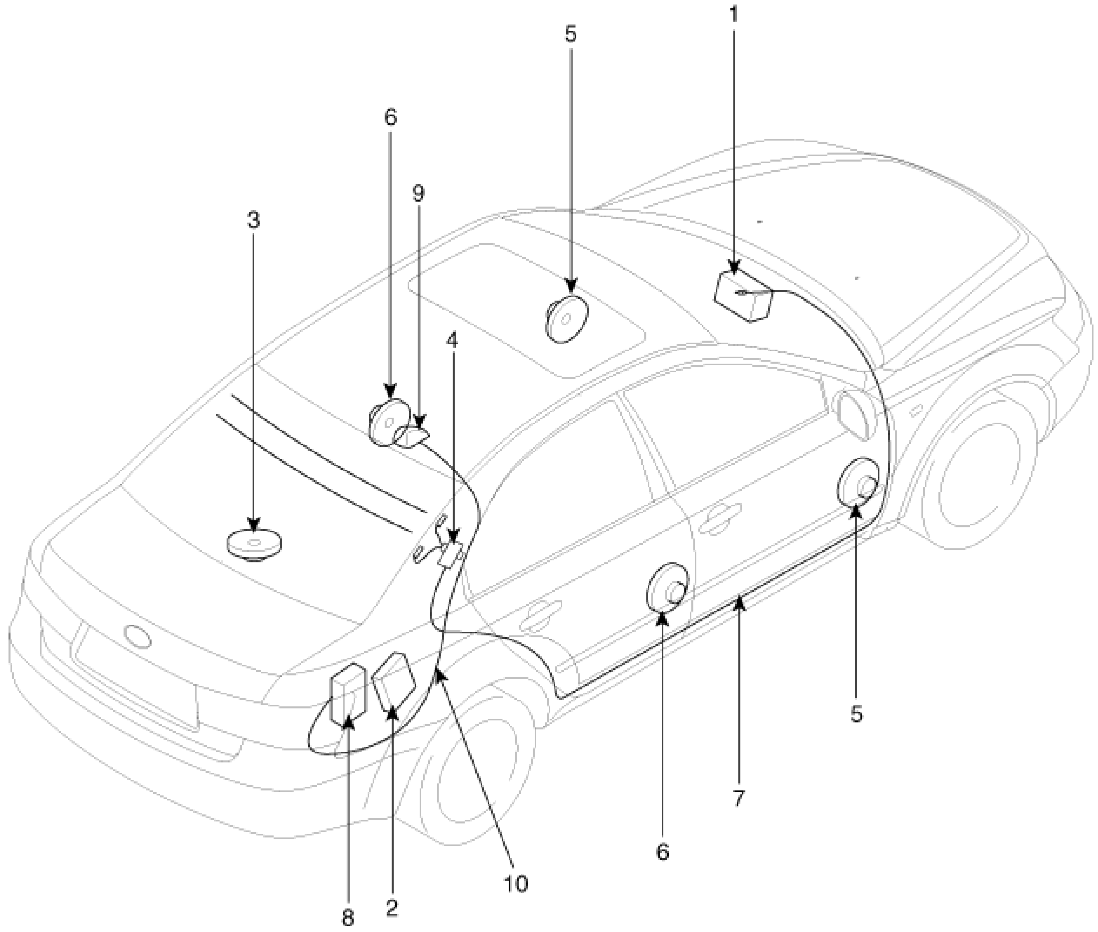


FIVE-STEP TROUBLESHOOTING

1. Verify the complaint
   Turn on all the components in the problem circuit to verify the customer complaint. Note the symptoms. Do not begin disassembly or testing until you have narrowed down the problem area.
2. Analyze the schematic
   Look up the schematic for the problem circuit.
   Determine how the circuit is supposed to work by tracing the current paths from the power feed through the circuit components to ground. If several circuits fail at the same time, the fuse or ground is a likely cause.
   Based on the symptoms and your understanding of the circuit operation, identify one or more possible causes of the problem.
3. Isolate the problem by testing the circuit.
   Make circuit tests to check the diagnosis you made in step 2. Keep in mind that a logical, simple procedure is the key to efficient troubleshooting.
   Test for the most likely cause of failure first. Try to make tests at points that are easily accessible.
4. Fix the problem
   Once the specific problem is identified, make the repair. Be sure to use proper tools and safe procedures.
5. Make sure the circuit works
   Turn on all components in the repaired circuit in all modes to make sure you've fixed the entire problem. If the problem was a blown fuse, be sure to test all of the circuits on the fuse. Make sure no new problems turn up and the original problem does not recur.

Body Electrical System > Audio > Components and Components Location

COMPONENT LOCATION



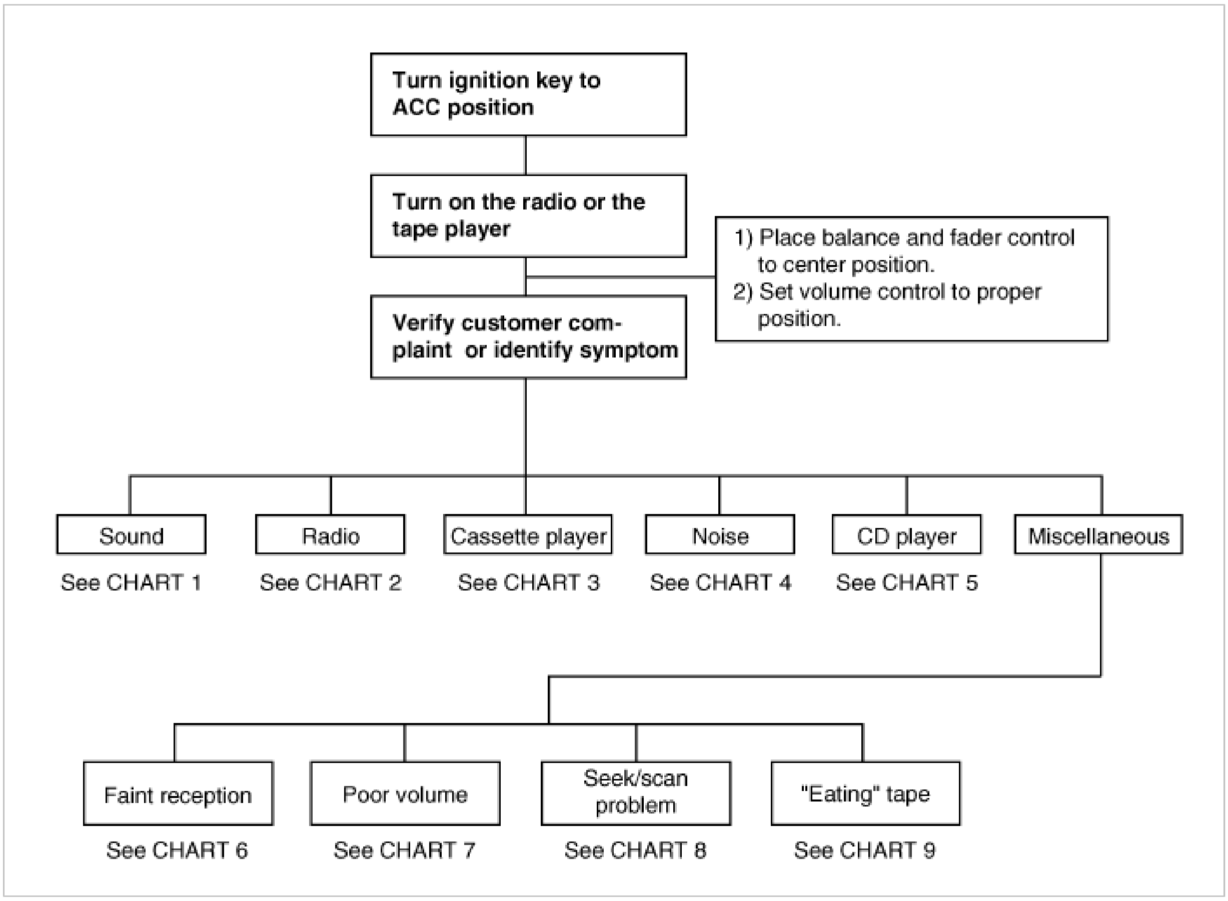
* SDARS : Satellite Digital Audio Radio Service

1. Audio unit	6. Rear door speaker
2. External amp	7. Antenna feeder cable
3. Woofer speaker	8. Set top box (SDARS)
4. Glass antenna	9. SDARS roof antenna
5. Front door speaker	10. SDARS roof antenna cable

Body Electrical System > Audio > Troubleshooting

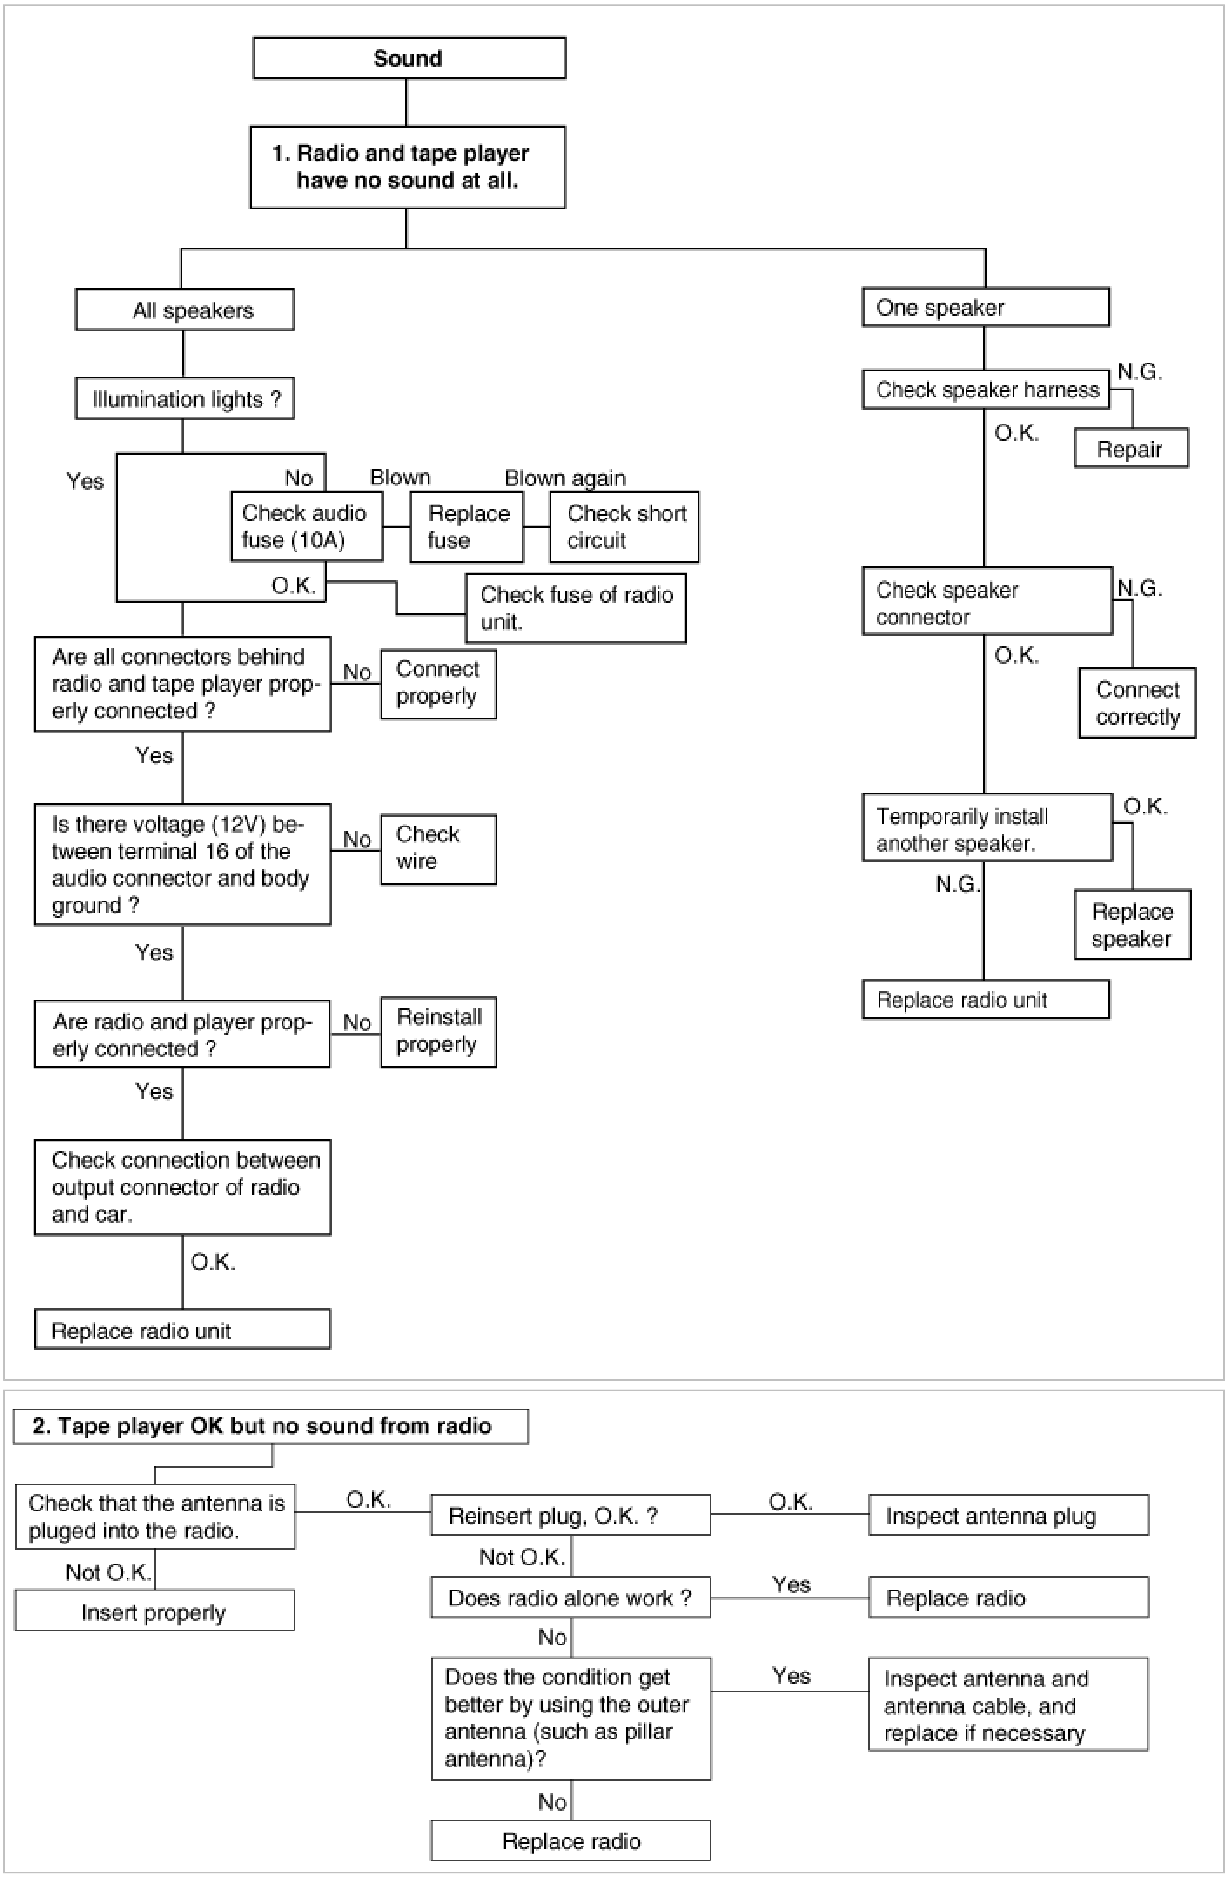
TROUBLESHOOTING

There are six areas where a problem can occur: wiring harness, the radio, the cassette tape deck, the CD player, and speaker. Troubleshooting enables you to confine the problem to a particular area.



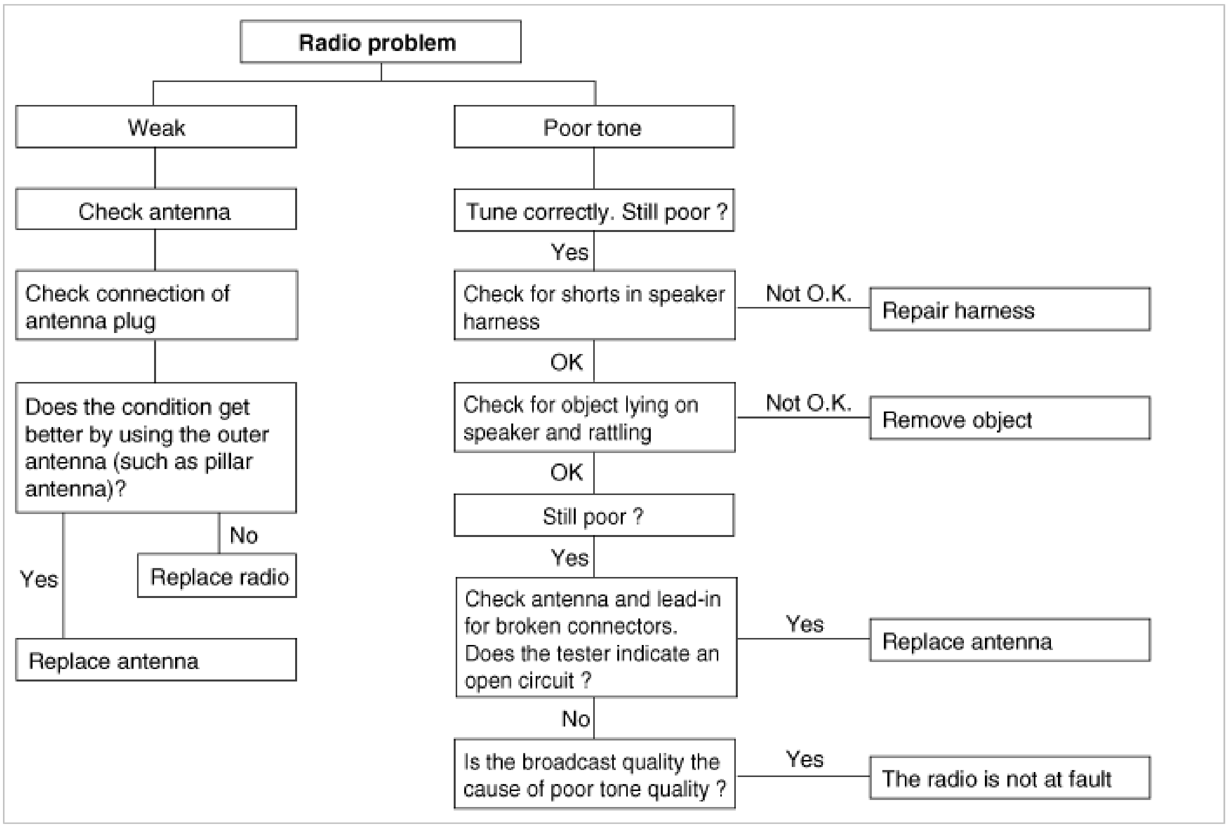
Turn ignition key to ACC position
Turn on the radio or the tape player
1) Place balance and fader control to center position.
2) Set volume control to proper position.
Verify customer com- plaint or identify symptom
Sound
See CHART 1
Radio
See CHART 2
Cassette player
See CHART 3
Noise
See CHART 4
CD player
See CHART 5
Miscellaneous
Faint reception
See CHART 6
Poor volume
See CHART 7
Seek/scan problem
See CHART 8
"Eating" tape
See CHART 9

CHART 1



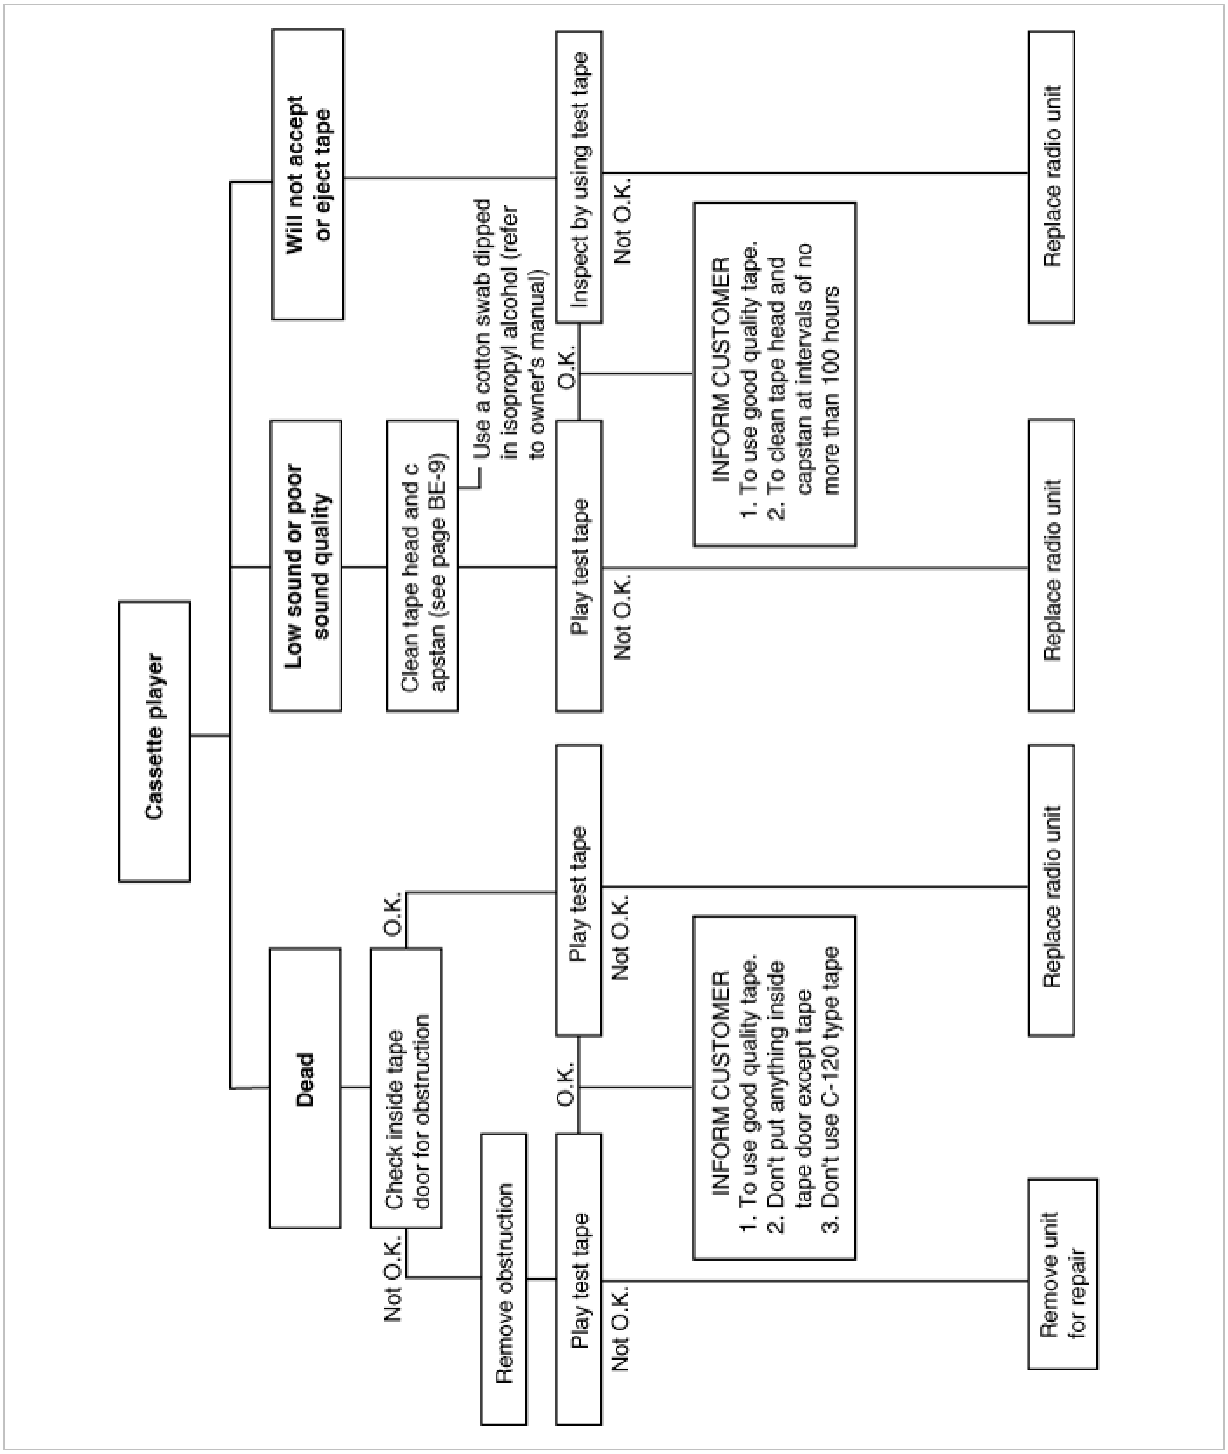
Sound
1. Radio and tape player have no sound at all.
All speakers
Illumination lights ?
Yes
No
Check audio fuse (10A)
Blown
Replace fuse
Blown again
Check short circuit
O.K.
Check fuse of radio unit.
Are all connectors behind radio and tape player properly connected ?
No
Connect properly
Yes
Is there voltage (12V) between terminal 16 of the audio connector and body ground ?
No
Check wire
Yes
Are radio and player properly connected ?
No
Reinstall properly
Yes
Check connection between output connector of radio and car.
O.K.
Replace radio unit
One speaker
Check speaker harness
N.G.
Repair
O.K.
Check speaker connector
N.G.
Connect correctly
O.K.
Temporarily install another speaker.
O.K.
Replace speaker
N.G.
Replace radio unit
2. Tape player OK but no sound from radio
Check that the antenna is pluged into the radio.
Not O.K.
Insert properly
O.K.
Reinsert plug, O.K. ?
O.K.
Inspect antenna plug
Not O.K.
Does radio alone work ?
Yes
Replace radio
No
Does the condition get better by using the outer antenna (such as pillar antenna)?
Yes
Inspect antenna and antenna cable, and replace if necessary
No
Replace radio

CHART 2



Radio problem
Weak
Check antenna
Check connection of antenna plug
Does the condition get better by using the outer antenna (such as pillar antenna)?
No
Replace radio
Yes
Replace antenna
Poor tone
Tune correctly. Still poor ?
Yes
Check for shorts in speaker harness
Not O.K.
Repair harness
OK
Check for object lying on speaker and rattling
Not O.K.
Remove object
OK
Still poor ?
Yes
Check antenna and lead-in for broken connectors. Does the tester indicate an open circuit ?
Yes
Replace antenna
No
Is the broadcast quality the cause of poor tone quality ?
Yes
The radio is not at fault

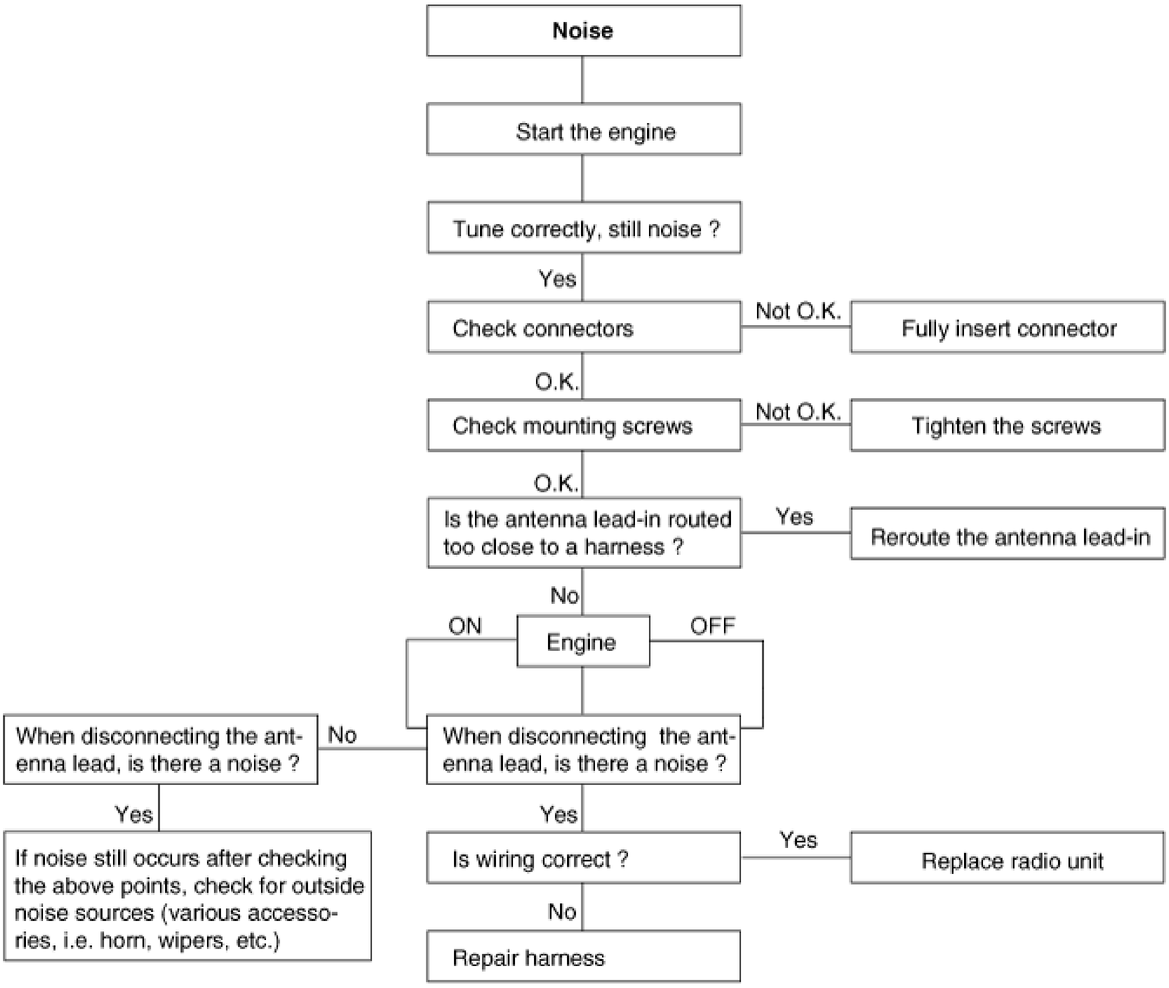
CHART 3



Cassette player
Dead
Low sound or poor sound quality
Will not accept or eject tape
Check inside tape door for obstruction
O.K.
Not O.K.
Remove obstruction
Play test tape
O.K.
Not O.K.
Play test tape
O.K.
Not O.K.
INFORM CUSTOMER
1. To use good quality tape.
2. Don't put anything inside tape door except tape
3. Don't use C-120 type tape
Replace radio unit
Remove unit for repair
Clean tape head and c apstan (see page BE-9)
Use a cotton swab dipped in isopropyl alcohol (refer to owner's manual)
Play test tape
O.K.
Not O.K.
INFORM CUSTOMER
1. To use good quality tape.
2. To clean tape head and capstan at intervals of no more than 100 hours
Replace radio unit
Inspect by using test tape
Not O.K.
Replace radio unit

CHART 4

1. RADIO



2. TAPE

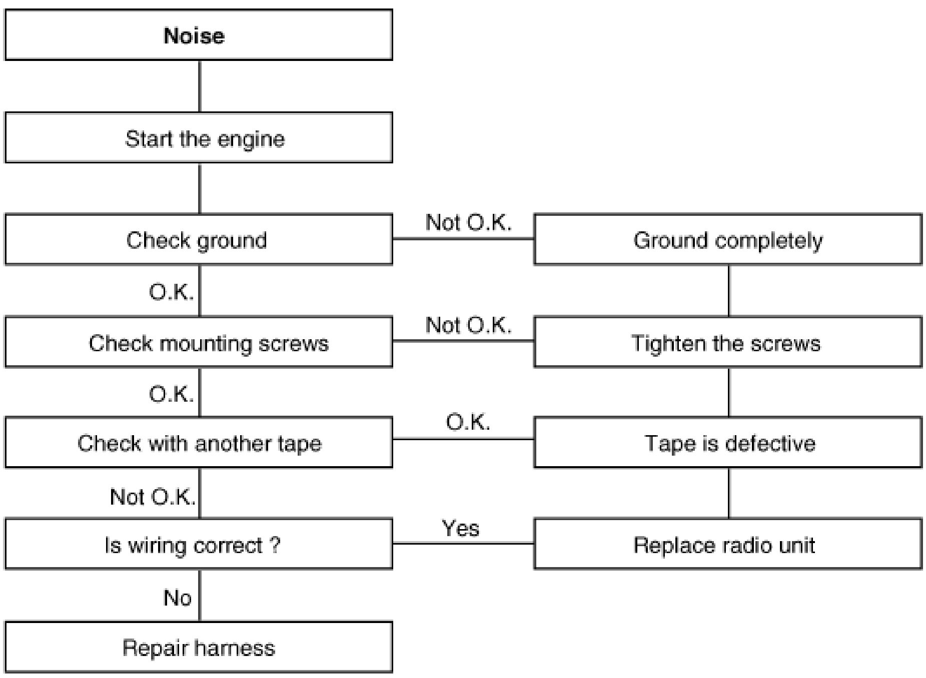


CHART 5

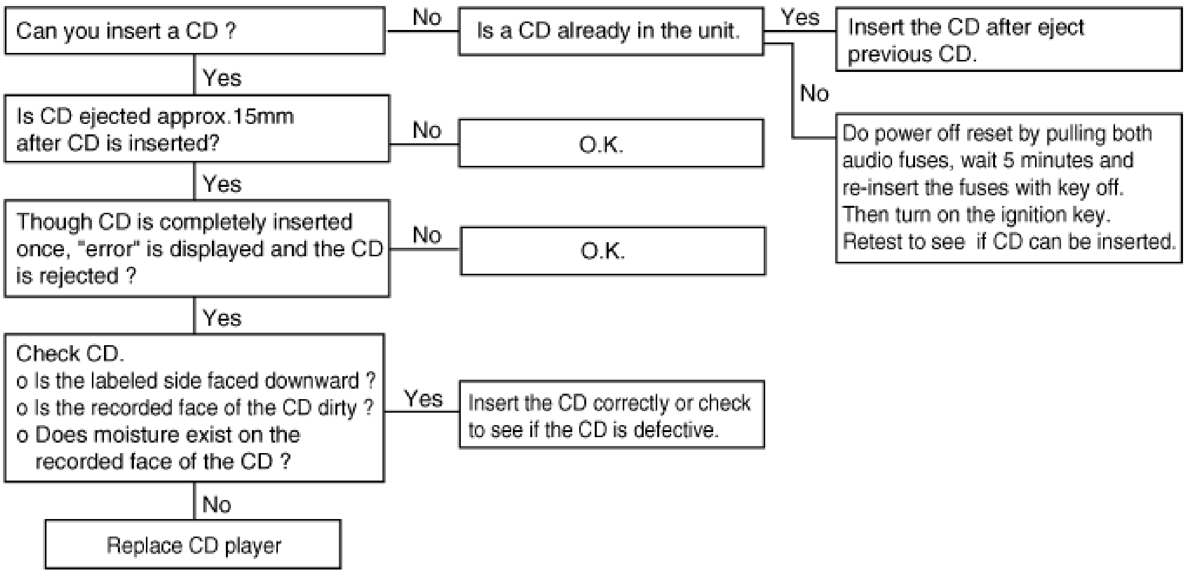
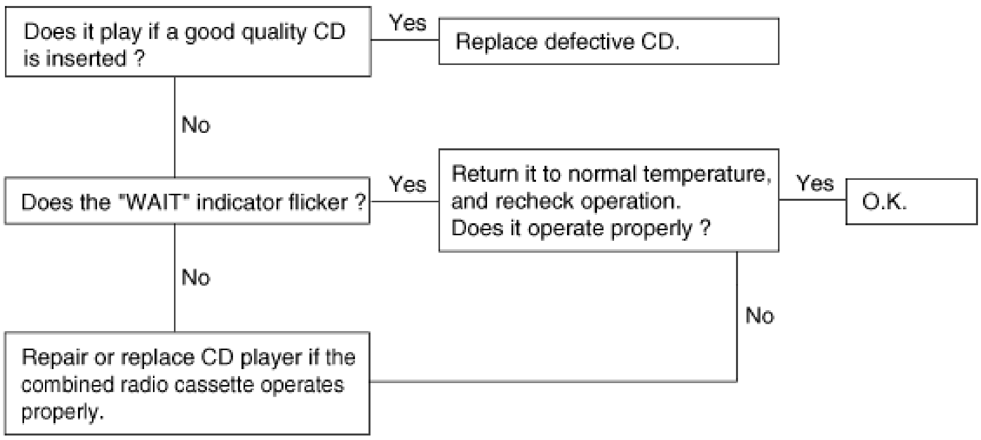
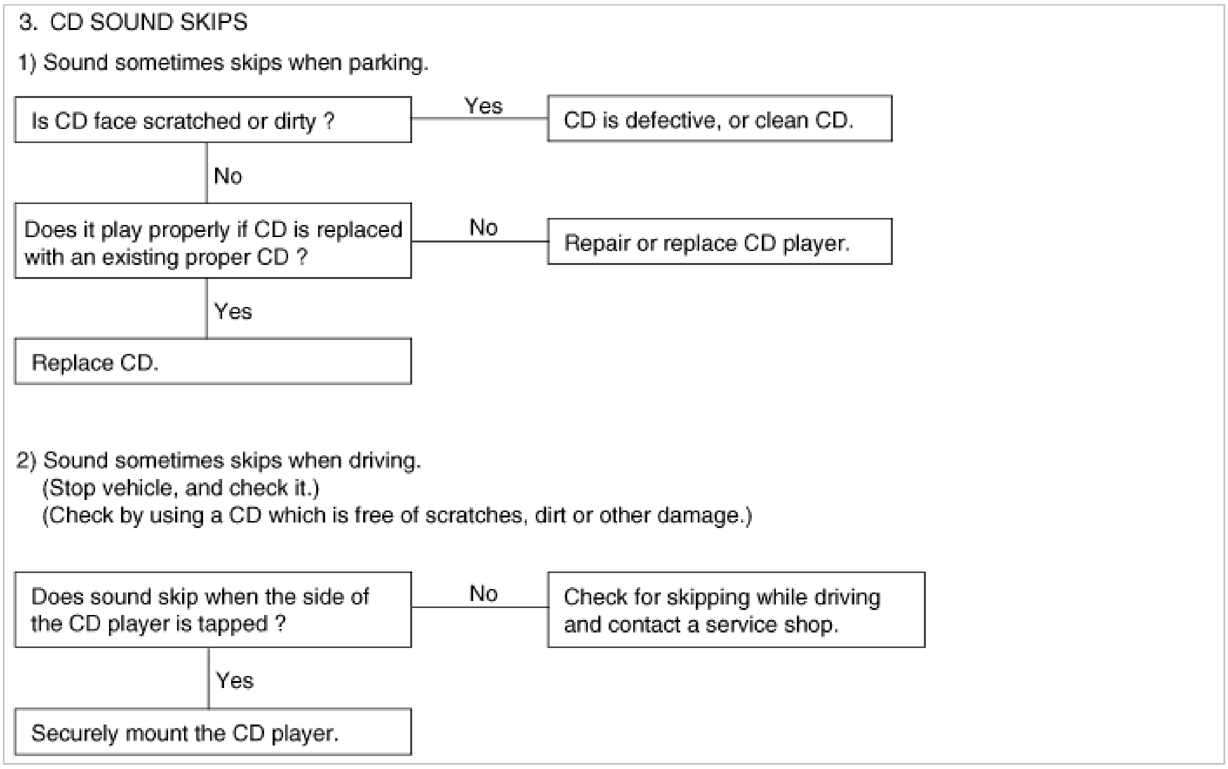
1. CD WILL NOT BE ACCEPTED

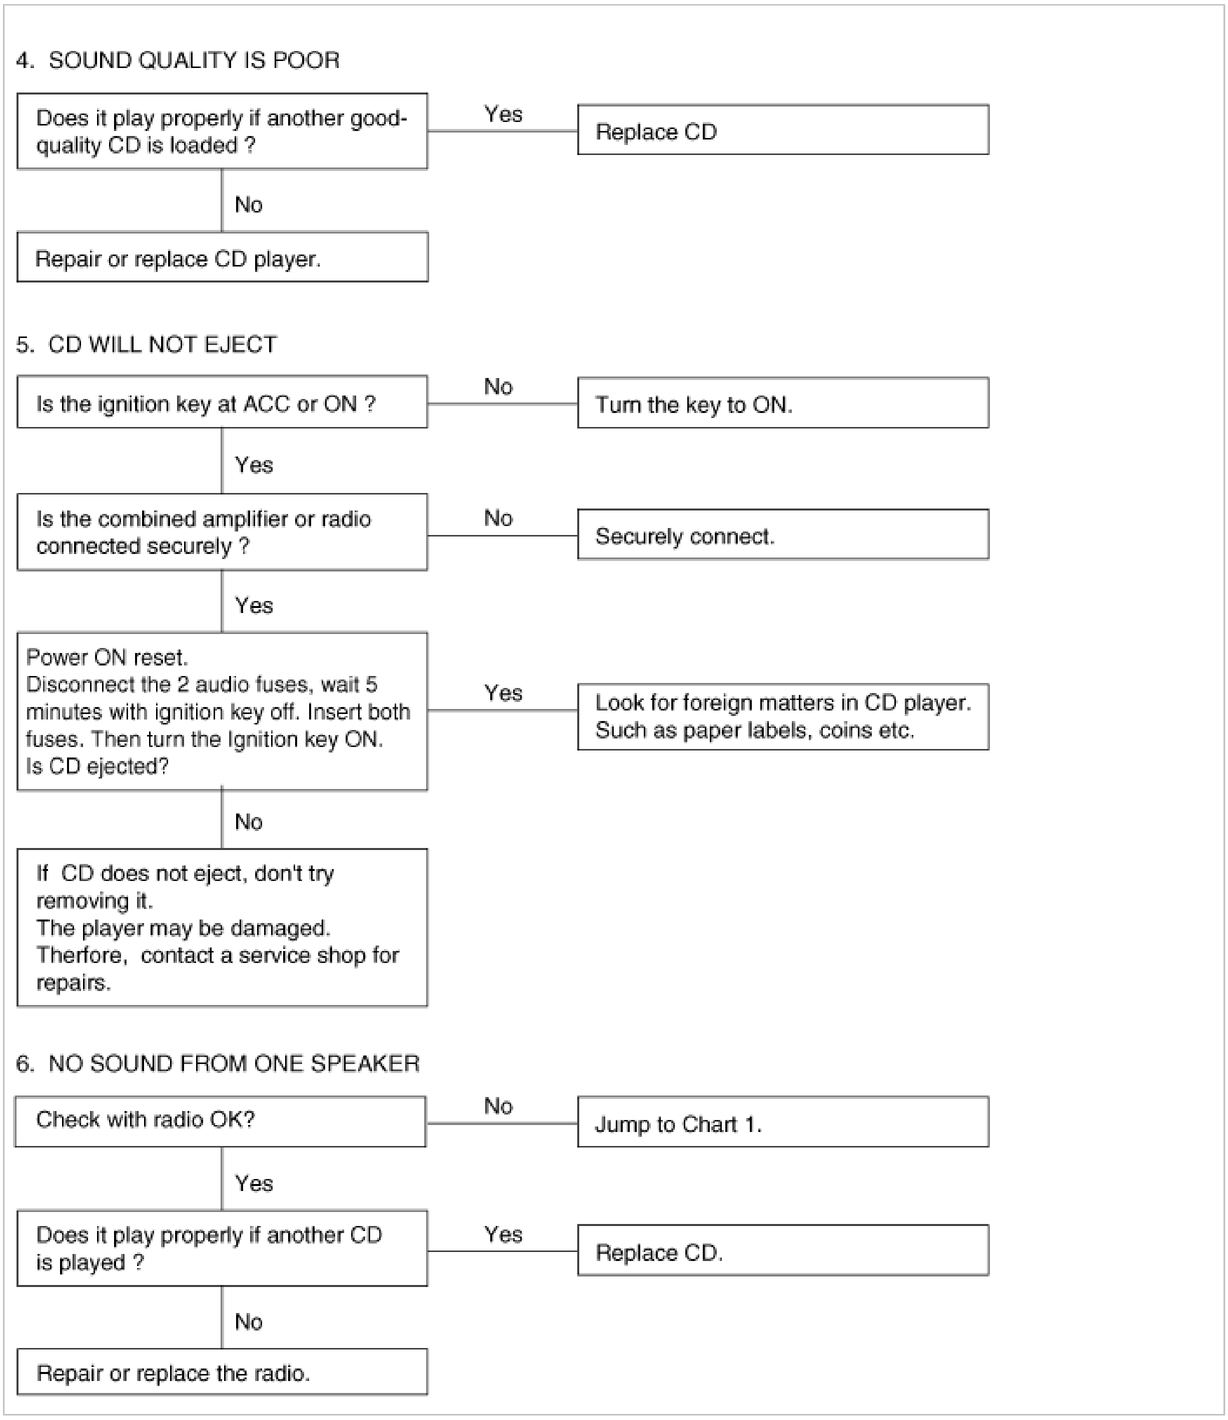


2. NO SOUND





3. CD SOUND SKIPS
1) Sound sometimes skips when parking.
Is CD face scratched or dirty ?
Yes
CD is defective, or clean CD.
No
Does it play properly if CD is replaced with an existing proper CD ?
No
Repair or replace CD player.
Yes
Replace CD.
2) Sound sometimes skips when driving.
(Stop vehicle, and check it.)
(Check by using a CD which is free of scratches, dirt or other damage.)
Does sound skip when the side of the CD player is tapped ?
No
Check for skipping while driving and contact a service shop.
Yes
Securely mount the CD player.



4. SOUND QUALITY IS POOR
Does it play properly if another good-quality CD is loaded ?
Yes
Replace CD
No
Repair or replace CD player.
5. CD WILL NOT EJECT
Is the ignition key at ACC or ON ?
No
Turn the key to ON.
Yes
Is the combined amplifier or radio connected securely ?
No
Securely connect.
Yes
Power ON reset.
Disconnect the 2 audio fuses, wait 5 minutes with ignition key off. Insert both fuses. Then turn the Ignition key ON.
Is CD ejected?
Yes
Look for foreign matters in CD player. Such as paper labels, coins etc.
No
If CD does not eject, don't try removing it.
The player may be damaged.
Therfore, contact a service shop for repairs.
6. NO SOUND FROM ONE SPEAKER
Check with radio OK?
No
Jump to Chart 1.
Yes
Does it play properly if another CD is played ?
Yes
Replace CD.
No
Repair or replace the radio.

CHART 6

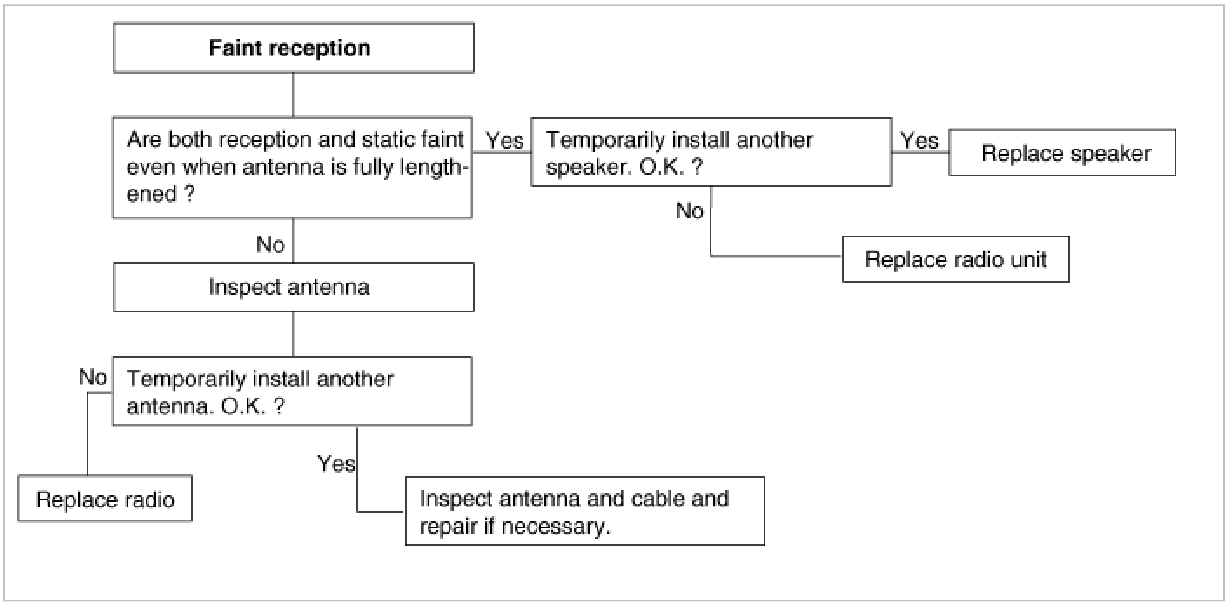


CHART 7

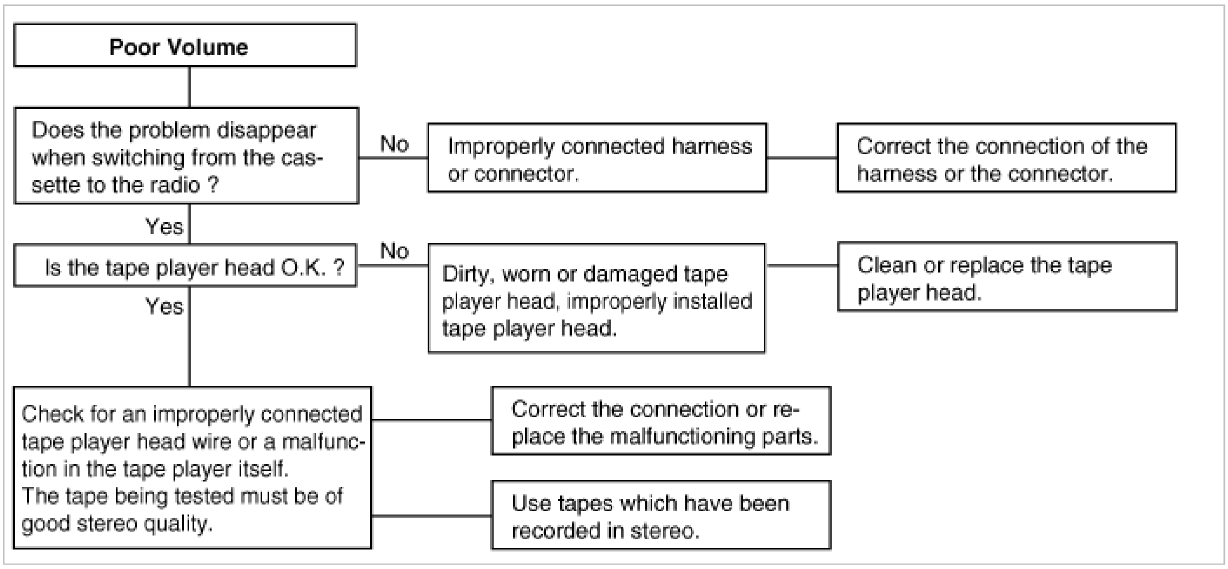

CHART 8

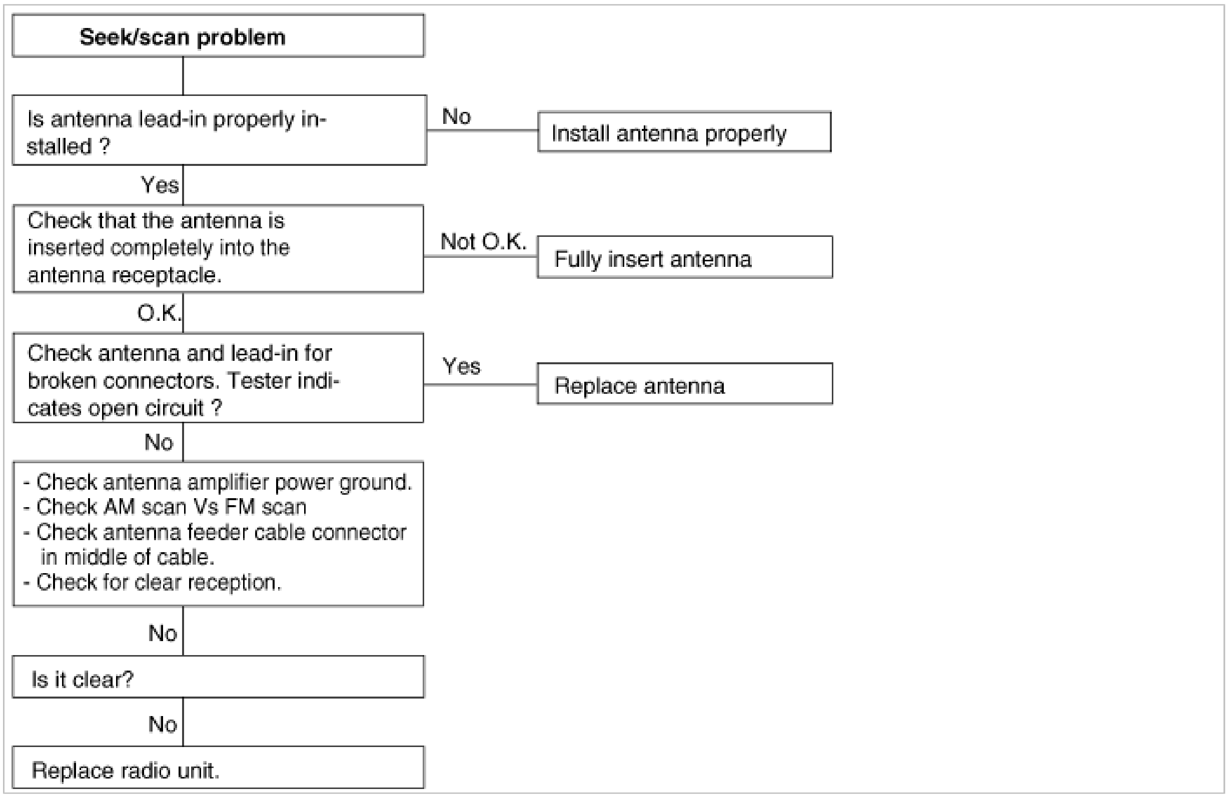

CHART 9

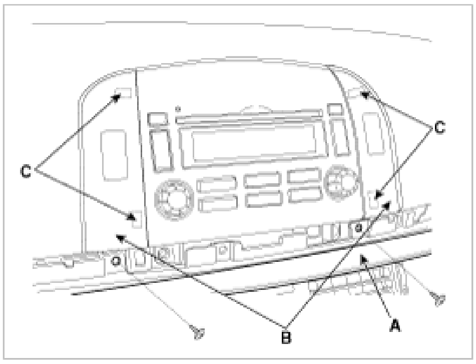
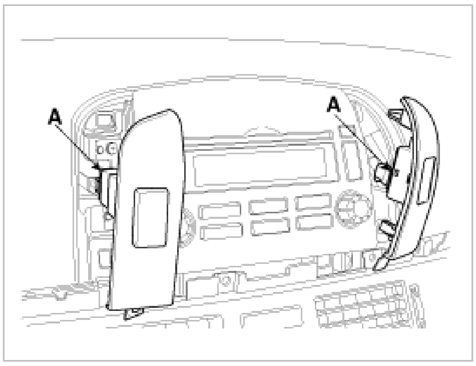
Body Electrical System > Audio > Audio Unit > Repair procedures

REPLACEMENT

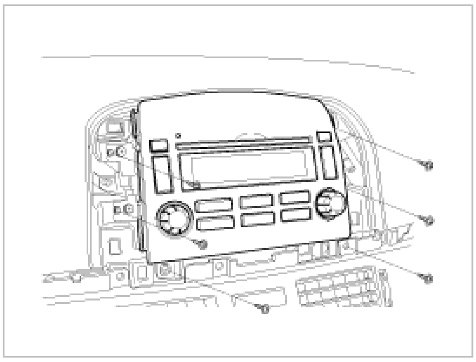
1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad garnish (A) after pulling it by using regular screw driver (-). Take care of fixing clips(C).
3. Remove the center facia panel (B) after loosening the screws.



4. Remove the connectors(A).



5. Remove the mounting screws then remove the audio unit (A).

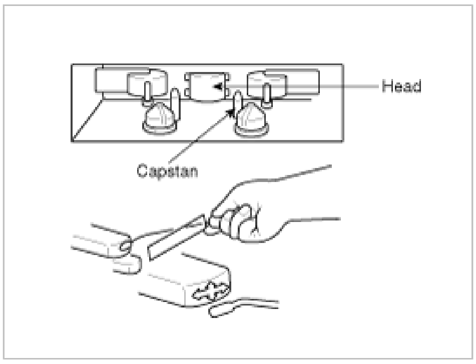


6. Installation is the reverse of removal.

INSPECTION

TAPE HEAD AND CAPSTAN CLEANING

1. To obtain optimum performance clean the head, and capstan as often as necessary, depending on frequency of use and tape cleanness.
2. To clean the tape head and capstan, use a cotton swab dipped in ordinary rubbing an alcohol. Wipe the head and capstan.

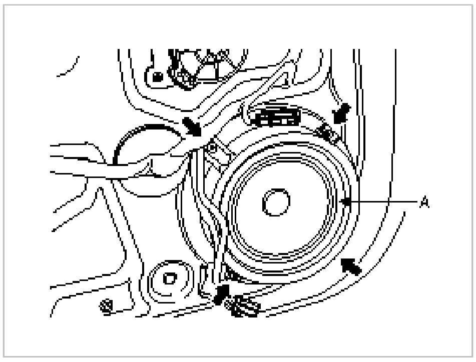


Body Electrical System > Audio > Speakers > Repair procedures

REPLACEMENT

FRONT SPEAKER

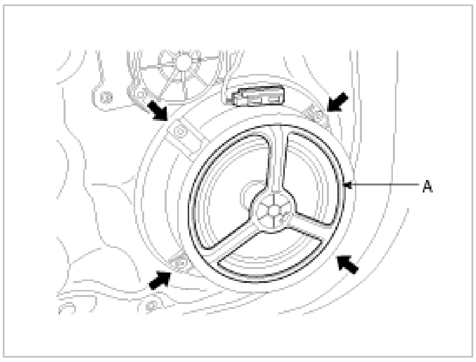
1. Remove the front door trim panel (Refer to the Body group - front door).
2. Remove the front speaker (A) after removing 4 rivets.



3. Installation is the reverse of removal.

REAR SPEAKER

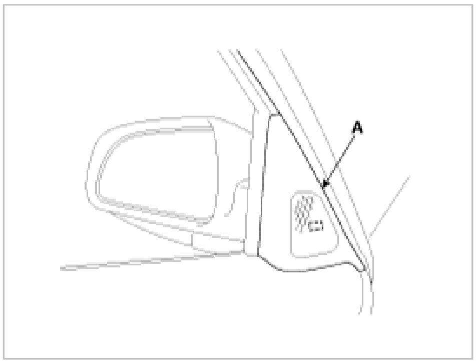
1. Remove the rear door trim panel (Refer to the Body group - rear door).
2. Remove the rear speaker (A) after removing 4 rivets.



3. Installation is the reverse of removal.

TWEETER SPEAKER

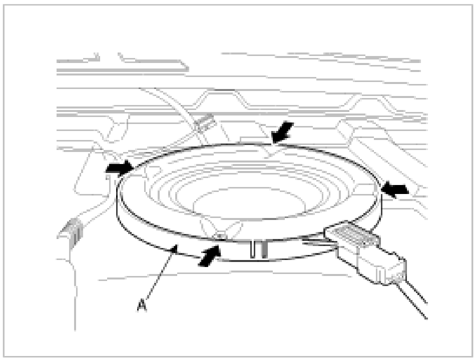
1. Remove the front door quadrant inner cover (A) (Refer to the Body group - front door).
2. Remove the tweeter speaker after disconnecting the connector.



3. Installation is the reverse of removal.

WOOFER SPEAKER

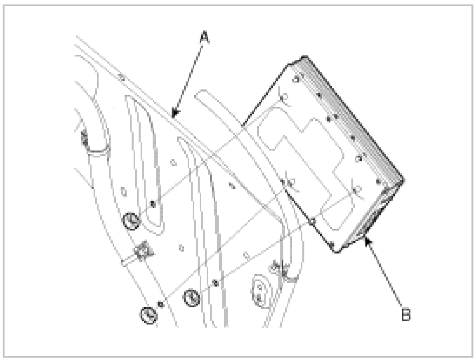
1. Remove the rear seat. (Refer to the Body group - rear seats)
2. Remove the rear package tray. (Refer to the Body group - package tray)
3. Remove the woofer speaker (A) after removing 4 bolts.



4. Installation is the reverse of removal.

EXTERNAL AMP

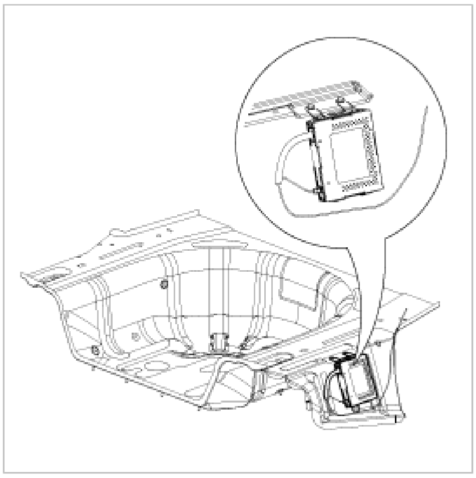
1. Remove the luggage side trim.
2. Remove the external amp (B) from the quarter inner panel (A) after removing 3 nuts.



3. Installation is the reverse of removal.

SET TOP BOX (FOR SDARS)

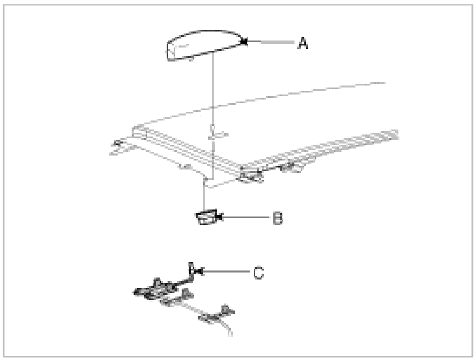
1. Remove the right lugguage side trim.
   (Refer to the Body Group - Trunk trim)
2. Remove the set top box(A) after loosening 2 bolts and disconnecting the cable and connector.



3. Installation is the reverse of removal.
4. Installation is the reverse of removal.

SDARS ROOF ANTENNA

1. Remove the rear headlining.
2. Remove the SDARS roof antenna(A) from the roof inner panel after loosening the mounting nut(B) and disconnecting the cable (C).

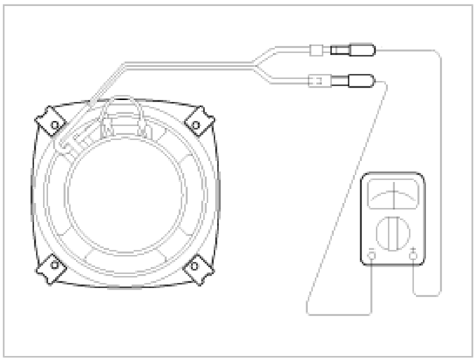


3. Installation is the reverse of removal.

INSPECTION

1. Check the speaker with an ohmmeter. If an ohmmeter indicates the correct impedance of the speaker when checking between the speaker (+) and speaker (-) of the same channel, the speaker is OK.

Specified impedance : 2 ~ 4Ω

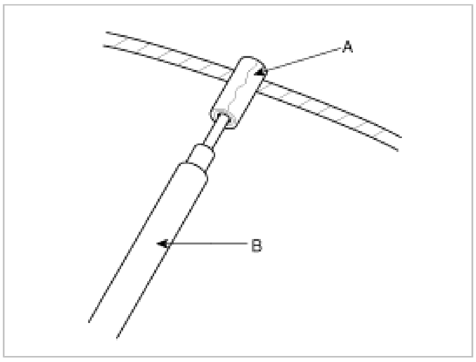


Body Electrical System > Audio > Antenna > Repair procedures

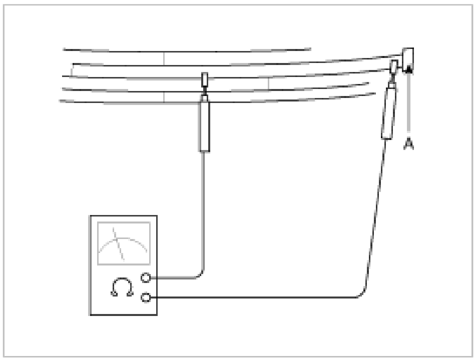
INSPECTION

GLASS ANTENNA TEST

1. Wrap aluminum foil (A) around the tip of the tester probe (B) as shown.



2. Touch one tester probe to the glass antenna terminal (A) hear, and move the other tester probe along the antenna wires to check that continuity exists.

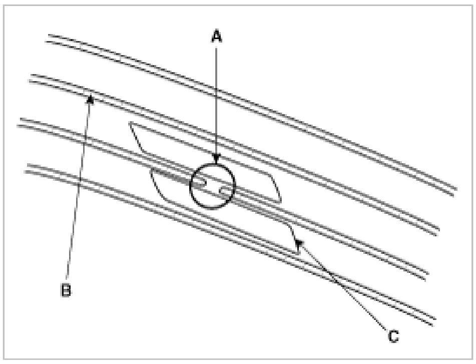


GLASS ANTENNA REPAIR

NOTE

To make an effective repair, the broken section must be no longer than one inch.

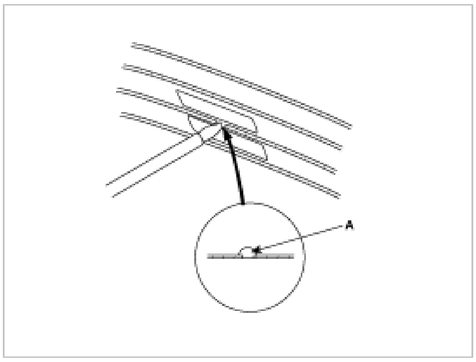
1. Lightly rub the area around the broken section (A) with fine steel wool, and then clean it with alcohol.



2. Carefully mask above and below the broken portion of the glass antenna wire (B) with cellophane tape (C).
3. Using a small brush, apply a heavy coat of silver conductive paint (A) extending about 1/8″on both sides of the break. Allow 30 minutes to dry.

NOTE

Thoroughly mix the paint before use.

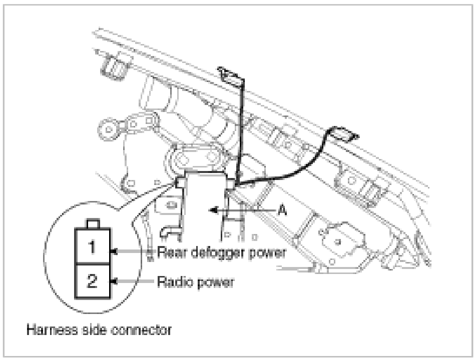


4. Check for continuity in the repaired wire.
5. Apply a second coat of paint in the same way. Let it dry three hours before removing the tape.

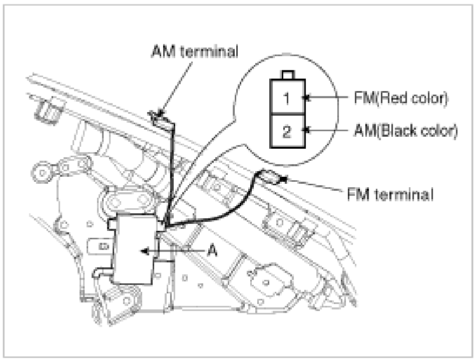
GLASS ANTENNA CIRCUIT INSPECTION

1. Remove the right side rear pillar trim. Then disconnect the 2P power connector from the glass antenna amp (A).
2. Turn the radio ON.
   Measure the voltage between terminal 2 of the harness side power connector (A) and body ground.

OK : approximately 12V (ACC+)



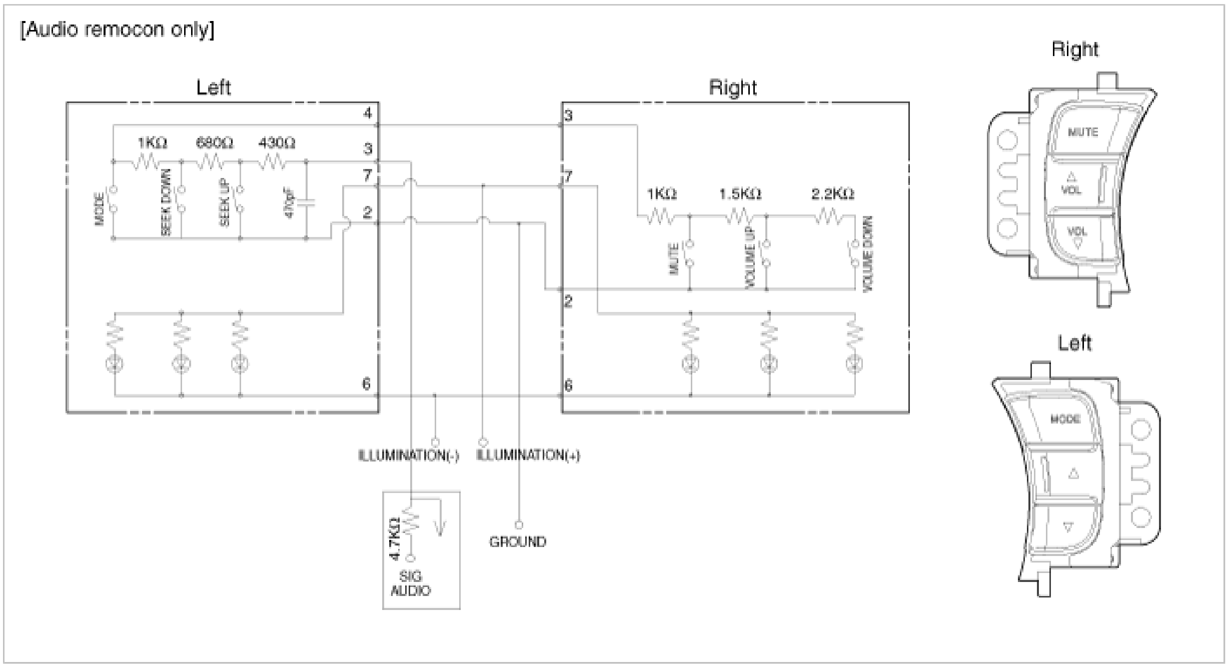
3. Disconnect the 2P connector of radio wiring from the glass antenna amp (A).
4. Check for continuity between terminals of harness side connector and antenna grid terminals (AM, FM).

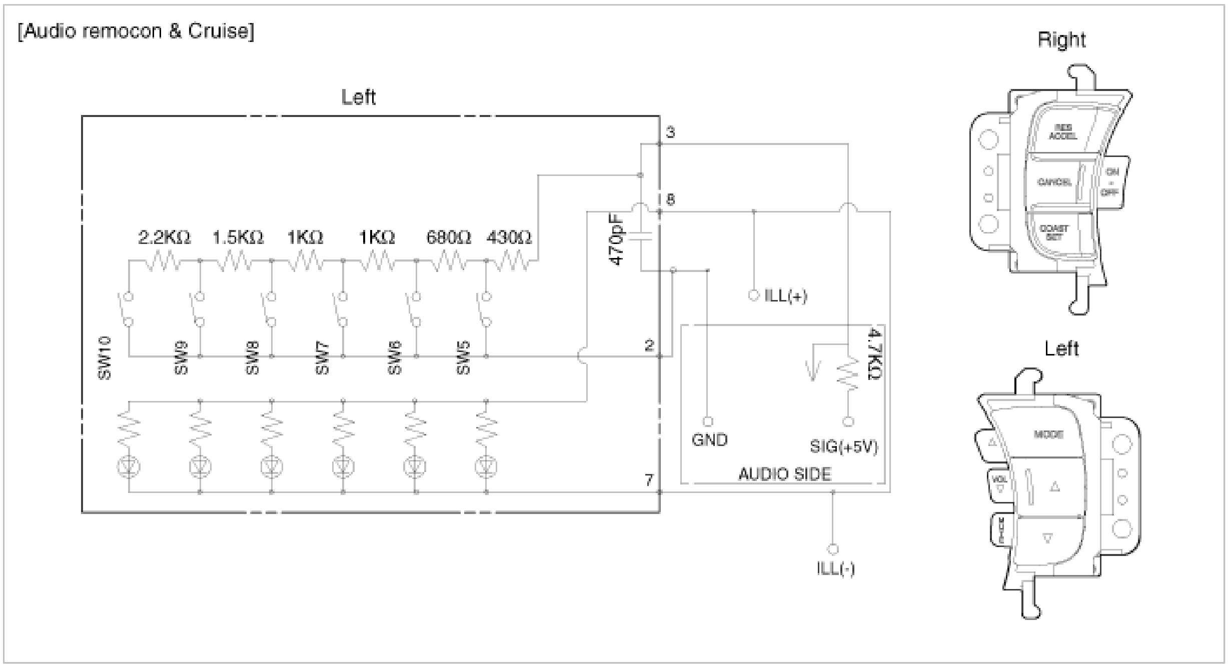


5. Check the grid lines that continuity exists.
6. When a poor radio reception is not repaired through the above inspection methods, replace the amp.
   If the radio reception is still poor, check the radio cable for short and radio head unit for failure.

Body Electrical System > Audio > Audio Remote control > Schematic Diagrams

CIRCUIT DIAGRAM

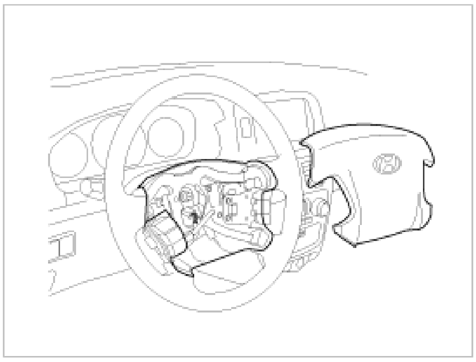




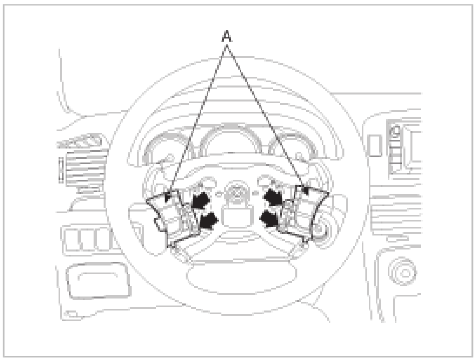
Body Electrical System > Audio > Audio Remote control > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the driver airbag module(A). (Refer to the airbag group)



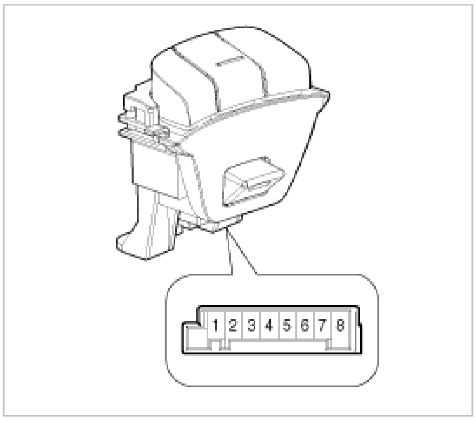
3. Remove the audio remote control switch (A) after remove the steering wheel remote control switch connector and 2 screws.



4. Installation is the reverse of removal.

INSPECTION

1. Check for resistance between No.2 and No.3 terminals in each switch position.



[Audio Remocon Only]

Switch	Connector terminal	Resistance (±5%)
VOLUME DOWN	2 - 3 (Right)	6.81 kΩ
VOLUME UP	2 - 3 (Right)	4.61 kΩ
SEEK UP	2 - 3 (Left)	430 Ω
SEEK DOWN	2 - 3 (Left)	1.11 kΩ
MODE	2 - 3 (Left)	2.11 kΩ
MUTE	2 - 3 (Right)	3..11 kΩ

[Audio Remocon & Cruise]

Switch	Connector terminal	Resistance (±5%)
VOLUME DOWN (SW 10)	2 - 3 (Left)	6.81 kΩ
VOLUME UP (SW 9)	2 - 3 (Left)	4.61 kΩ
MUTE (SW 8)	2 - 3 (Left)	3.11 kΩ
MODE (SW 7)	2 - 3 (Left)	2.11 kΩ
SEEK DOWN (SW 6)	2 - 3 (Left)	1.11 kΩ
SEEK UP (SW 5)	2 - 3 (Left)	430 Ω

	18	-		14	Intermittent wiper ground

Body Electrical System > Multifunction switch > Specifications

SPECIFICATIONS

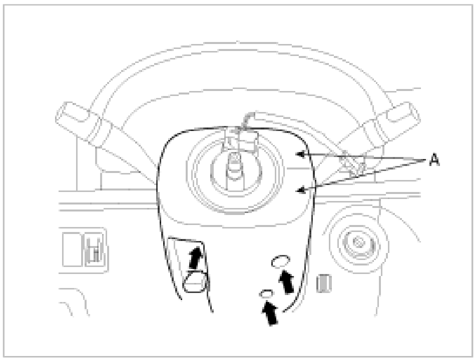
Items	Specifications
Rated voltage	DC 12 V
Operating temperature range	-30°C ~ +80°C (-22 ~ +176°F)
Rated load Dimmer & passing switch Lighting switch Turn signal & lane change switch Front fog lamp switch	 High : 1A (Relay load) Low : 1A (Relay load) Passing : 1A (Relay load) Lighting : 1A (Relay load) 6.6±0.5A (Lamp load) 1A (Relay load)

Wiper & mist switch	Low, High : 4.5A (Motor load) Intermittent : 0.22±0.05A (Relay load) Lock : Max. 28A (Motor load) Mist: 4A (Motor load)
Washer switch	4A (Motor load)
Variable intermittent volume switch	Max. 25mA

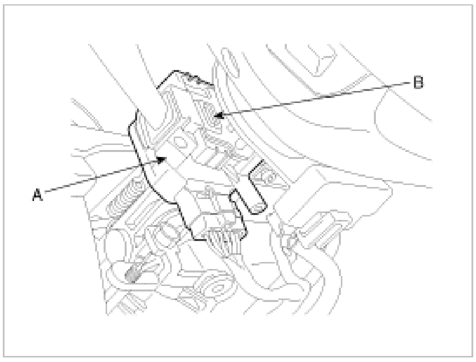
Body Electrical System > Multifunction switch > Multi Function Switch > Repair procedures

REPLACEMENT

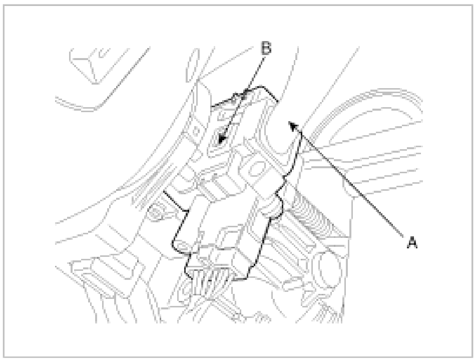
1. Disconnect the negative (-) battery terminal.
2. Remove the steering column upper and lower shrouds (A) after removing 3 screws.



3. Remove the light switch (A) by pushing the lock pin (B) after disconnecting the connector.



4. Remove the wiper switch (A) by pushing the lock pin (B) after disconnecting the connector.

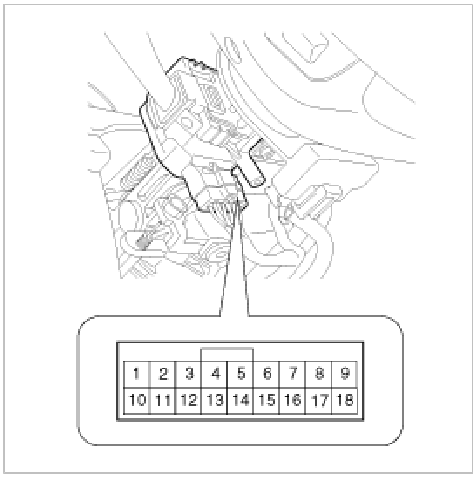


5. Installation is the reverse of removal.

INSPECTION

LIGHTING SWITCH INSPECTION

With the multi function switch in each position, make sure that continuity exists between the terminals below. If continuity is not as specified, replace the multi-function switch.



LIGHTING SWITCH (AUTO LIGHT)

Position \ Terminal	14	15	16	17
OFF				
I	○	—	—	○
II	○	○	—	○
AUTO			○	○

LIGHTING SWITCH

Position \ Terminal	14	15	16	17
OFF				
I	○	—	—	○
II	○	○	○	○

DIMMER AND PASSING SWITCH

Position \ Terminal	1	2	10	11
HU		○	—	○
HL			○	○
P	○	○	—	○

HU : Head lamp high beam
HL : Head lamp low beam
P : Head lamp passing switch

TURN SIGNAL SWITCH

ON	○	○

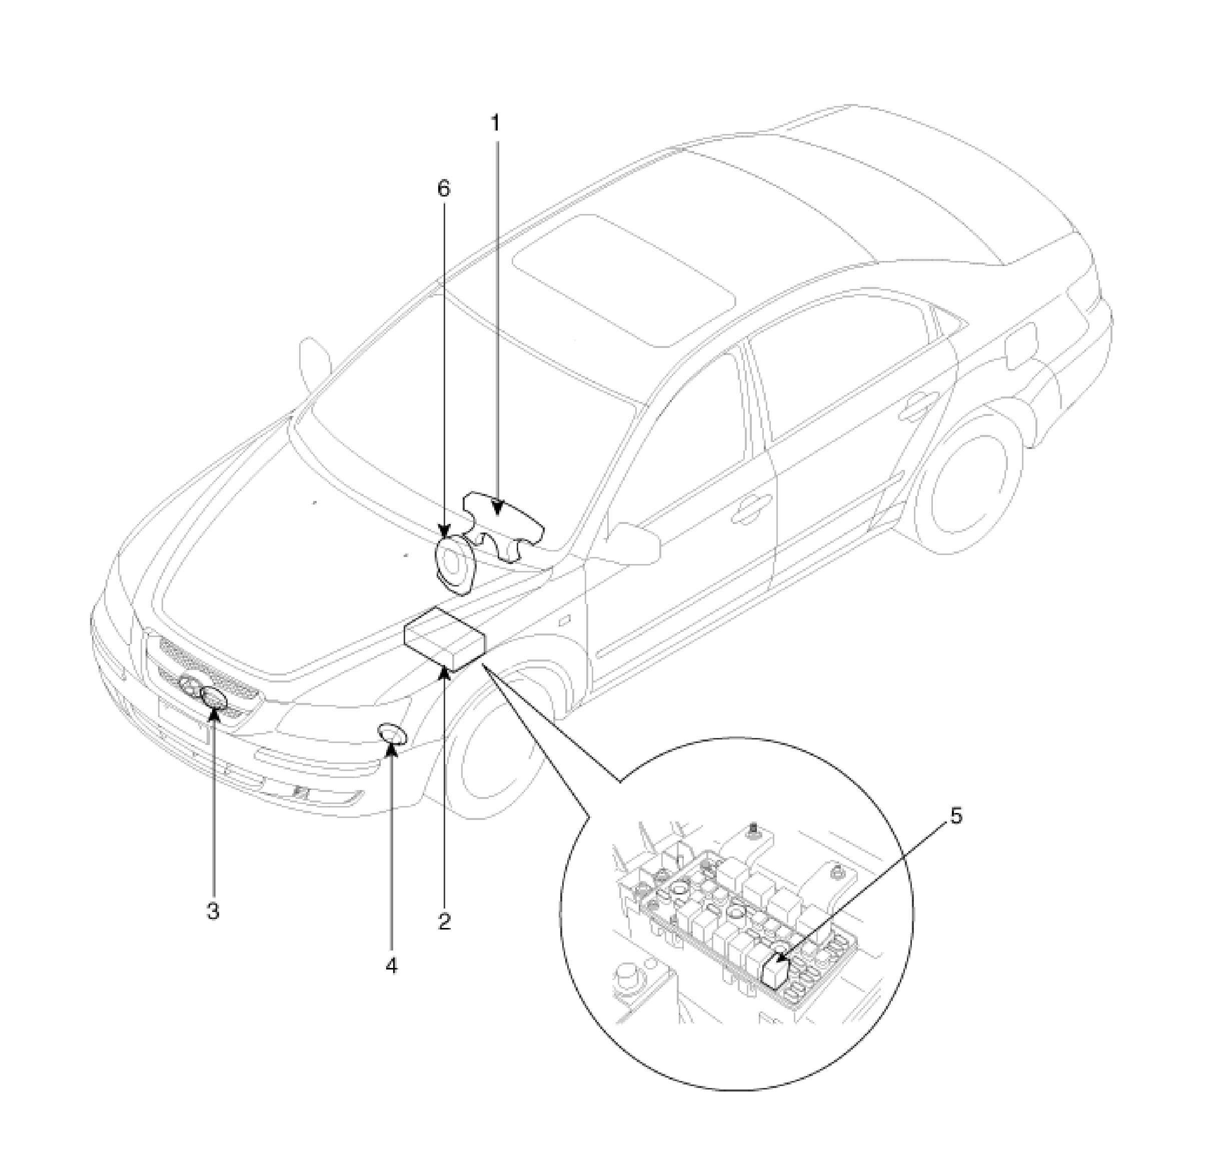
Body Electrical System > Horn > Components and Components Location

COMPONENT LOCATION

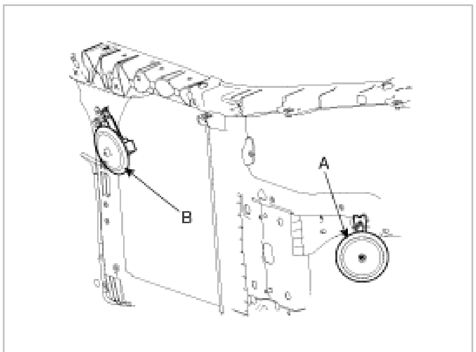


1. Horn switch	4. Horn (High pitch)
2. Relay box (Engine room compartment)	5. Horn relay
3. Horn (Low pitch)	6. Clock spring

Body Electrical System > Horn > Repair procedures

REPLACEMENT

1. Remove the front bumper. (Refer to the Body group - front bumper).
2. Remove the bolt and disconnect the horn connector, then remove the high pitch horn (A) and low pitch horn (B).



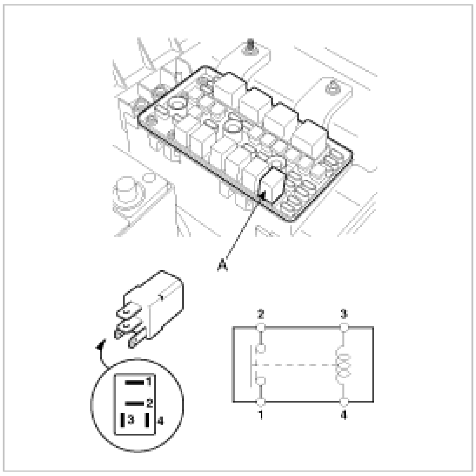
3. Installation is the reverse of removal.

INSPECTION

Test the horn by connecting battery voltage to the 1 terminal and ground the 2 terminal.
The horn should make a sound. If the horn fails to make a sound, replace it.

HORN RELAY INSPECTION

1. Remove the horn relay (A) from the engine room relay box.
2. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.4 terminals.
3. There should be no continuity between the No.1 and No.2 terminals when power is disconnected.



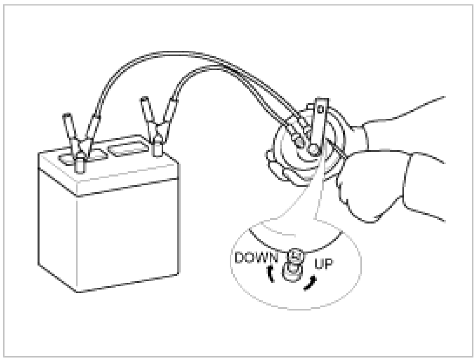
Terminal / Power (No.3-No.4)	1	2	3	4
Disconnected			○	○
Connected	○	○	⊖	⊕

ADJUSTMENT

Operate the horn, and adjust the tone to a suitable level by turning the adjusting screw.

NOTE

After adjustment, apply a small amount of paint around the screw head to keep it from loosening.



Body Electrical System > Keyless Entry And > Description and Operation

DESCRIPTION

BURGLAR ALARM SYSTEM

The burglar alarm system is armed automatically after the doors, hood, and trunk lid are closed and locked.
The system is set off when any of these things occur:

- A door is forced open.
- A door is unlocked without using the transmitter & key.
- The trunk lid is opened without using the key.
- The hood is opened.
- The engine starter circuit and battery circuit are bypassed by breaking the ignition switch.

When the system is set off, the alarm (horn) sounds and the hazard lamp flash for about two minutes or until the system is disarmed by unlocking the transmitter.
For the system to arm, the ignition switch must be off and the key removed. Then, the body control module must receive signals that the doors, hood, and trunk lid are closed and locked. When everything is closed and locked, none of the control unit inputs are grounded.
The door switches, hood switch and trunk lid switch are all close and lock the doors with the remote transmitter and then the system arms immediately.
If anything is opened or improperly unlocked after the system is armed, the body control module gets a ground signal from that switch, and the system is set off.
If one of the switches is misadjusted or there is a short in the system, the system will not arm. As long as the body control module continues to get a ground signal, it thinks the vehicle is not closed and locked and will not arm.
The receiver is integrated in the body control module.

KEYLESS ENTRY SYSTEM

The burglar alarm system is integrated with the keyless entry system. The keyless entry system allows you to lock and unlock the vehicle with the remote transmitter. When you push the LOCK button, all doors lock. When you push the UNLOCK button, driver door unlock. If the unlock button is pressed a second time right away, the remain doors unlock.
The room lamp, if its switch is in the center position, will come on when you press the UNLOCK button. If you do not open a door, the light will go off in about 30 seconds, the doors will automatically relock, and the burglar alarm system will rearm. If you relock the doors with the remote transmitter within 30 seconds, the light will go off immediately.
You cannot lock or unlock the doors with the remote transmitter if the key is in the ignition switch.
The system will signal you when the doors lock and unlock by flashing the hazard lamp once when they lock, and twice when they unlock.

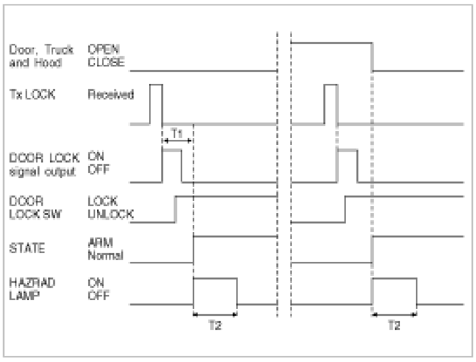
PANIC MODE

The panic mode causes the BCM to sound the alarm with the remote transmitter in order to attract attention. When the PANIC button is pressed and held for 2 seconds, the alarm will sound and exterior lights will flash for about 30 seconds.
The panic mode can be canceled at any time by pressing any button on the remote transmitter or by turning the ignition switch ON. The panic mode will not function if the key in.
The panic mode can be canceled by lock or unlock with the key.

FUNCTIONS

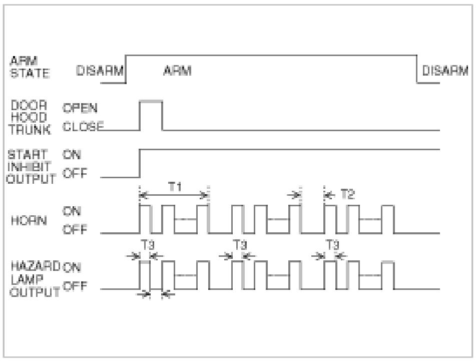
ANTI-THEFT FUNCTION

1. ARM Function
   (1) When using LOCK on the RKE (Remote Keyless Entry) or DOOR KEY the doors will lock, the hazard lamp will blink once within 0.6 seconds and the Anti-Theft System will ARM, if the following conditions have been met.
      A. The ignition key is removed from the ignition switch.
      B. All entry points are closed (doors, trunk, and hood)
      ※ Hazard lamp will not blink when driver door key lock switch transits to ARM mode by OFF→ON.
   (2) If either the door or trunk or hood is open when activating LOCK using the RKE, the doors will lock, however the hazard lamp will not flash and the Anti-Theft System will not arm.
   (3) In Step 2) if the opened entry points are subsequently closed… the door will lock, the hazard lamp will blink once and the Anti-Theft System will ARM.
   (4) If the UNLOCK signal is sent by the RKE or DOOR KEY, and either the ignition key is not inserted or entry (door, trunk, hood) to the vehicle is not made within 30 seconds, the LOCK mode will be automatically reset, the hazard lamps will blink, and the Anti-Theft System will rearm. (Key IN = Key Insertion)
   (Provided that there is no automatic lock function at a period of 30 seconds, when the UNLOCK is done by the RKE with an entry being open).



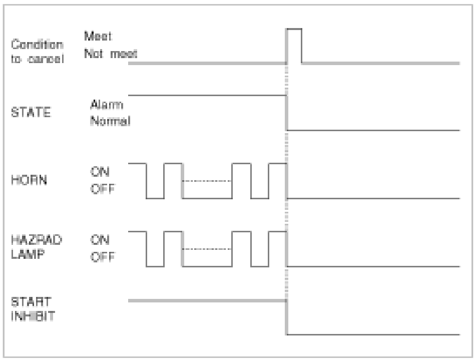
T1 : 0.6 sec,
T2 : 1.0 ±0.2 sec

2. ALARM Function
   (1) When a point of entry is opened without RKE or DOOR KEY unlock signal without RKE or DOOR KEY unlock signal while the Anti-Theft System is in the ARM mode, the hazard lamp and horn alarm will activate (ON/OFF 3 times each) for a period of 27 seconds.
   (2) Output intervals for the horn alarm and hazard lamps are identical.
   (3) The alarm sequence, when activated will continue for the duration of the alarm period even when the entry point is closed. (The alarm will reactivate if entry port is reopened after the initial alarm sequence completes.)



T1 : 27 ± 2 sec,
T2 : 10 ± 1 sec,
T3 : 0.45 ± 0.1 sec.

3. ALARM CLEARANCE
   (1) UNLOCK signal is output for 0.5s, alarm and start inhibit signal output become OFF when RKE UNLOCK signal is received or DOOR KEY UNLOCK signal is received.
   (2) LOCK signal is output for 0.5s, and alarm and start inhibit signal output become OFF when RKE LOCK signal is received or DOOR KEY LOCK signal is received.
   (3) Alarm and start inhibit signal output become OFF and the state becomes DISARM if "KEY IN SW=ON & IGN1 SW=ON & IGN2 SW=ON" is continued for 30s.
   In ARM mode, the state becomes DISARM in case of "KEY IN SW=ON & IGN1 SW=ON & IGN2 SW=ON".
   (4) In ARM mode, the state becomes DISARM at FRONT DOOR KEY UNLOCK ON and the state becomes Alarm Hold state at TRUNK KEY UNLOCK ON.
   (5) Under ALARM, FRONT DOOR or TRUNK KEY UNLOCK is turned ON, start inhibit signal output becomes OFF, then the state becomes DISARM.
   (6) If trunk is not opened after TRUNK UNLOCK signal is received with RKE or KEY, the mode enters into ARM mode 30s later after that.
   (7) If trunk is opened and closed again after TRUNK UNLOCK signal is received with RKE or KEY, the mode enters into ARM mode 30s later after that.



4. Battery Separation
   (1) When the battery is reconnected after having been disconnected/removed while in ARM mode. ARM mode continues.
   (2) When the battery is reconnected after having been disconnected/removed, and after the alarm completes, the alarm will restart.
   (3) When battery is reconnected after having been disconnected/ removed during an active alarm, the alarm sequence will restart from the beginning.

5. SECURITY INDICATOR
   (1) Security indicator: 0.3s ON, 2s OFF under key off.

(2) After entering to ARM, security indicator: 0.3s ON, 0.5s OFF in first 8s.

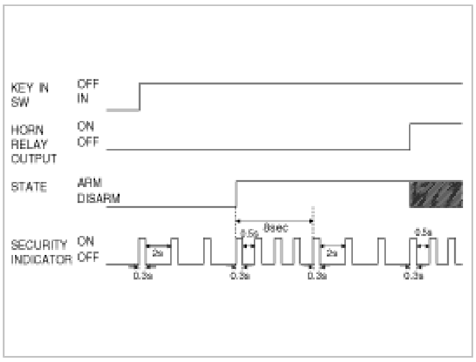
(3) After entering to ARM, the first 8s-TIMER is not reset when receiving RKE LOCK or KEY LOCK signal during the cycle: 0.3s ON, 0.5s OFF in the first 8s.

(4) 0.3s ON, 2s OFF if ARM is canceled during the cycle 0.3s ON, 0.5s OFF in the first 8s after entering to ARM.

(5) After entering to ARM, 0.3s ON, 2s OFF after the first 8s.

(6) Security indicator is OFF under key insert to key cylinder.

(7) 0.3s ON 0, 5s OFF during ALARM mode and PANIC mode.



6. DOOR UNLOCK BY P/WINDOW AND TRUNK OPEN INHIBITION FUNCTIONS

(1) Unlock signal output with door unlock switch by P/window and trunk switch is prohibited in case of RKE LOCK under ignition key off.

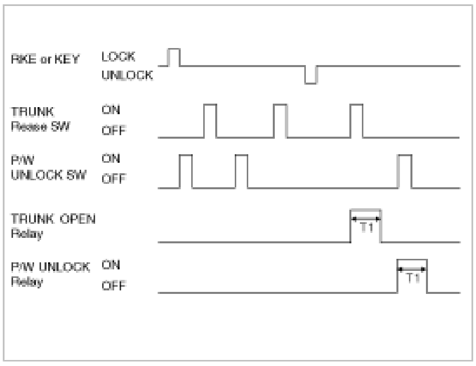
(2) Unlock signal output with door unlock switch and trunk switch by P/window is inhibited in case of door lock with door key under ignition key off.

(3) Unlock inhibition function is cancelled in case of RKE UNLOCK while door unlock inhibition function activates.

(4) Unlock inhibition function by P/window is cancelled in case of door unlock with door key while door unlock inhibition function activates.

(5) Unlock inhibition function by P/window is cancelled at ignition key in & on.

(6) In ARM mode, unlock signal by by P/window input is not output.



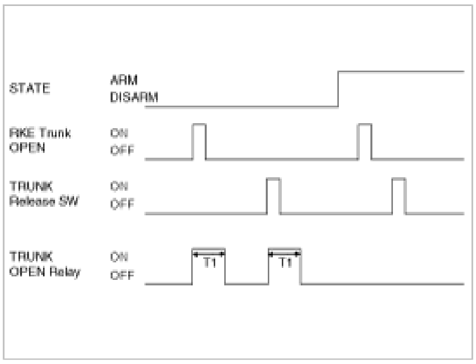
T1 : 0.5 ± 0.1 sec.

7. TRUNK OPEN WITH RKE

(1) Trunk release relay is turned ON for 0.5s if trunk signal of RKE is received. (Hold mode under ARM)

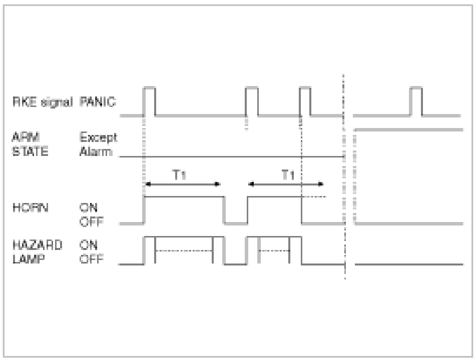
(2) Trunk release relay is turned ON for 0.5s in case of Trunk release switch OFF→ON.

(3) In ARM mode, signal by Trunk release switch input is not output.



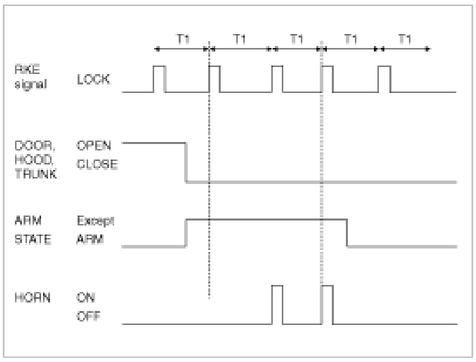
T1 : 0.5 ± 0.1 sec.

8. PANIC ALARM
   (1) PANIC alarm is turned ON for T1 by using horn and hazard if RKE PANIC signal is received.
   (2) PANIC alarm is turned OFF if (RKE LOCK/UNLOCK/PANIC/TRUNK UNLOCK /KEY IN /DOOR KEY LOCK/DOOR KEY UNLOCK / TRUNK KEY UNLOCK) signals are received during PANIC alarm.
   (3) PANIC signal output is immediately turned OFF and the state becomes ARM state if the condition for ARM is met during PANIC alarm.
   (4) The below is about antitheft alarm.
      A. Antitheft alarm does not stop even when PANIC signal of RKE is received during the alarm. (PANIC signal reception is ignored)
      B. Antitheft alarm signal is output when the condition for antitheft is met during PANIC alarm. (PANIC signal output : OFF)
      C. PANIC alarm is turned ON with continuing antitheft function when PANIC signal is received in ARM stand-by / ARM / Alarm end / RELOCK stand-by mode.



T1 : 30 ± 3 sec

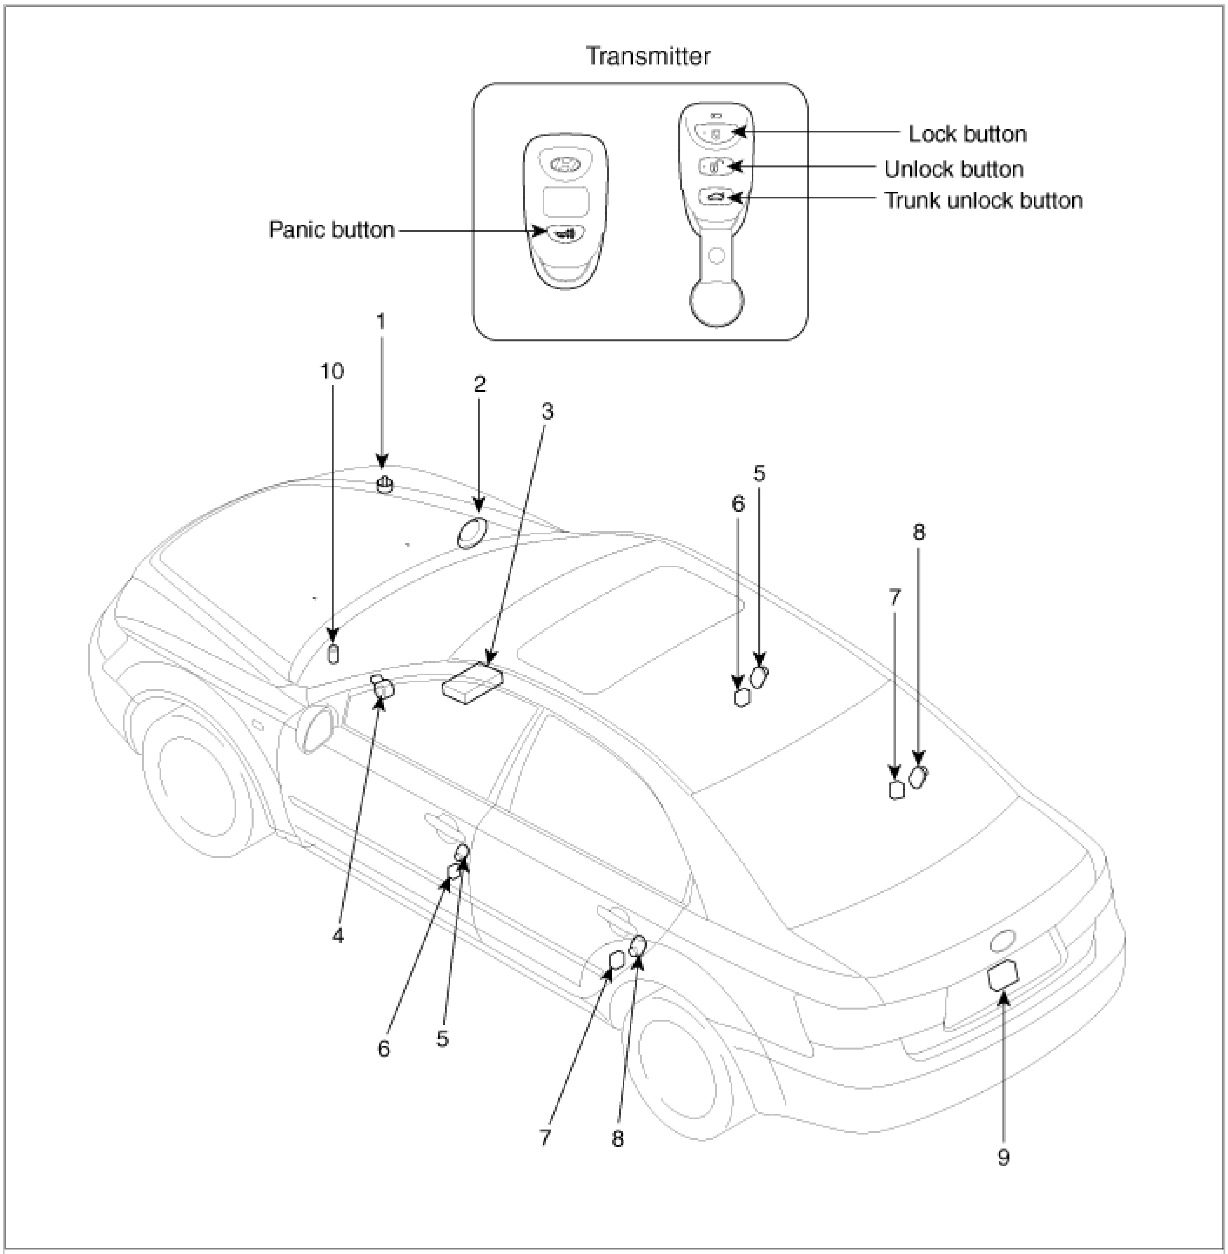
9. HORN ANSWER BACK
   (1) Under DOOR, TRUNK or HOOD: closed, horn and hazard(1s-output) signals are output if RKE LOCK signal is received again within T1 from the moment when the mode transits to ARM mode by RKE LOCK operation and ARM mode is kept.
   (2) Horn and hazard signals are not output if ARM mode is cancelled for T1.
   (3) Horn and hazard signal are output even when other LOCK signals of RKE, registered during T1, are received.



T1 : within 4sec

Body Electrical System > Keyless Entry And > Components and Components Location

COMPONENT LOCATION

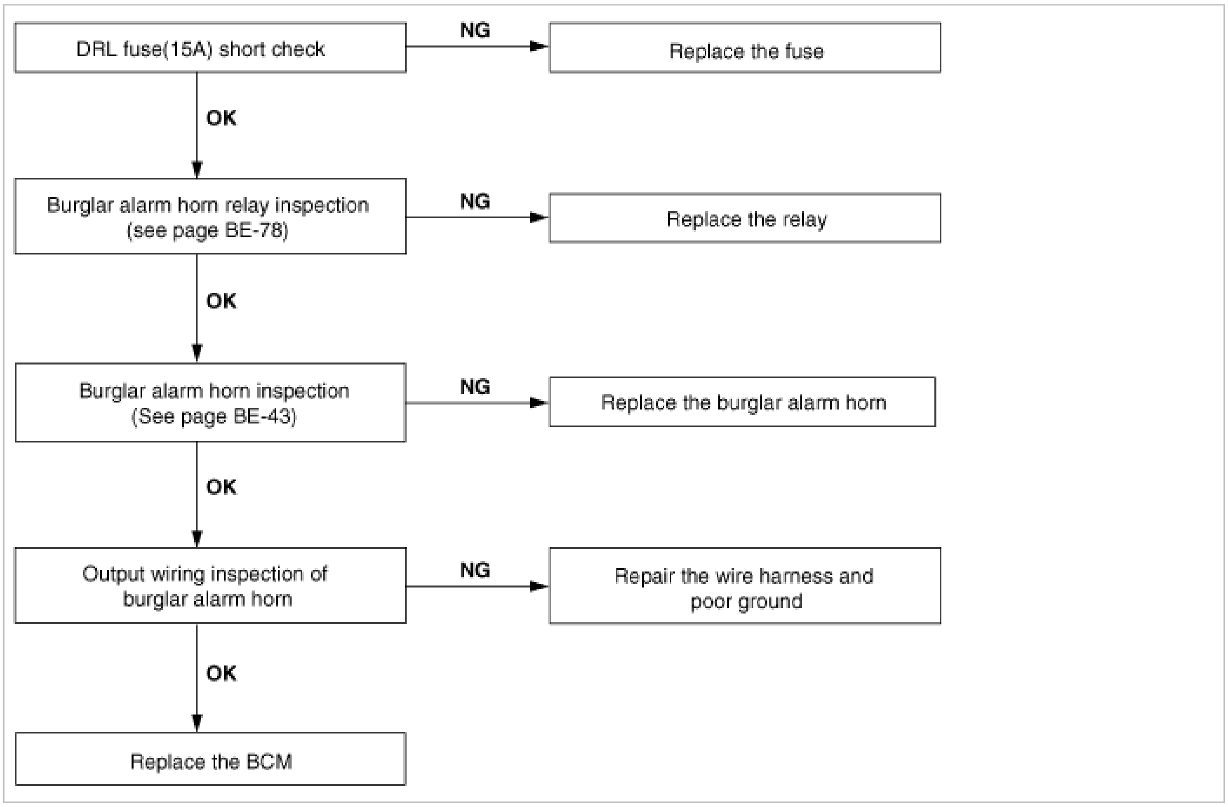


1. Hood switch	6. Front door lock actuator & switch
2. Burglar horn	7. Rear door lock actuator & switch
3. Body control module	8. Rear door switch
4. Key warning switch	9. Trunk lid lock actuator
5. Front door switch	10. Security indicator

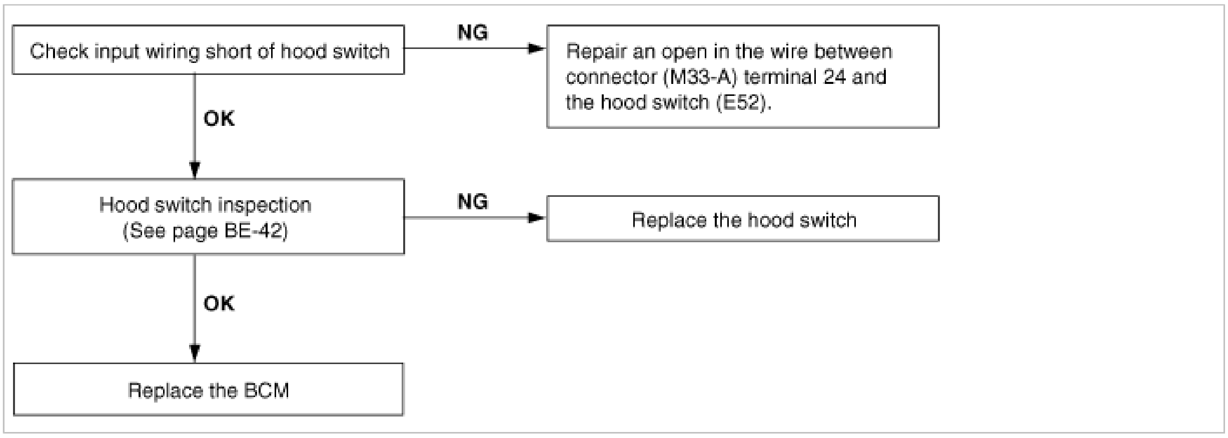
Body Electrical System > Keyless Entry And > Troubleshooting

TROUBLESHOOTING

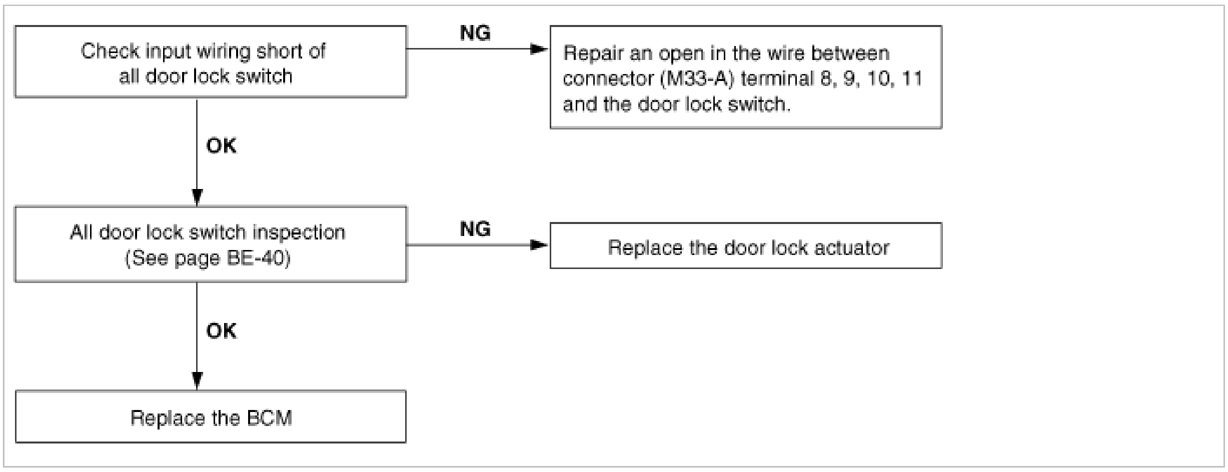
1. Alarm does not work. (Hazard lamps work)



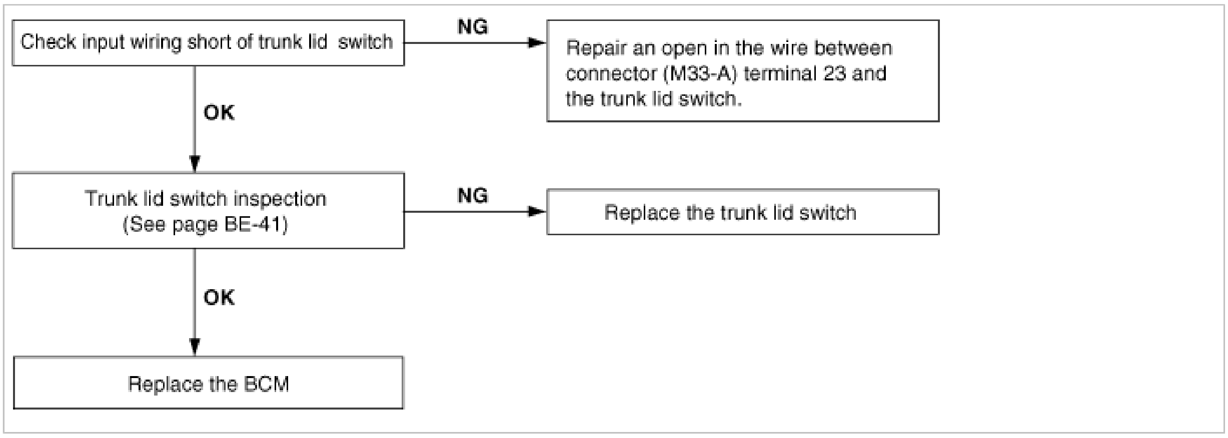
2. When hood is opened inside the car, burglar horn does not work.



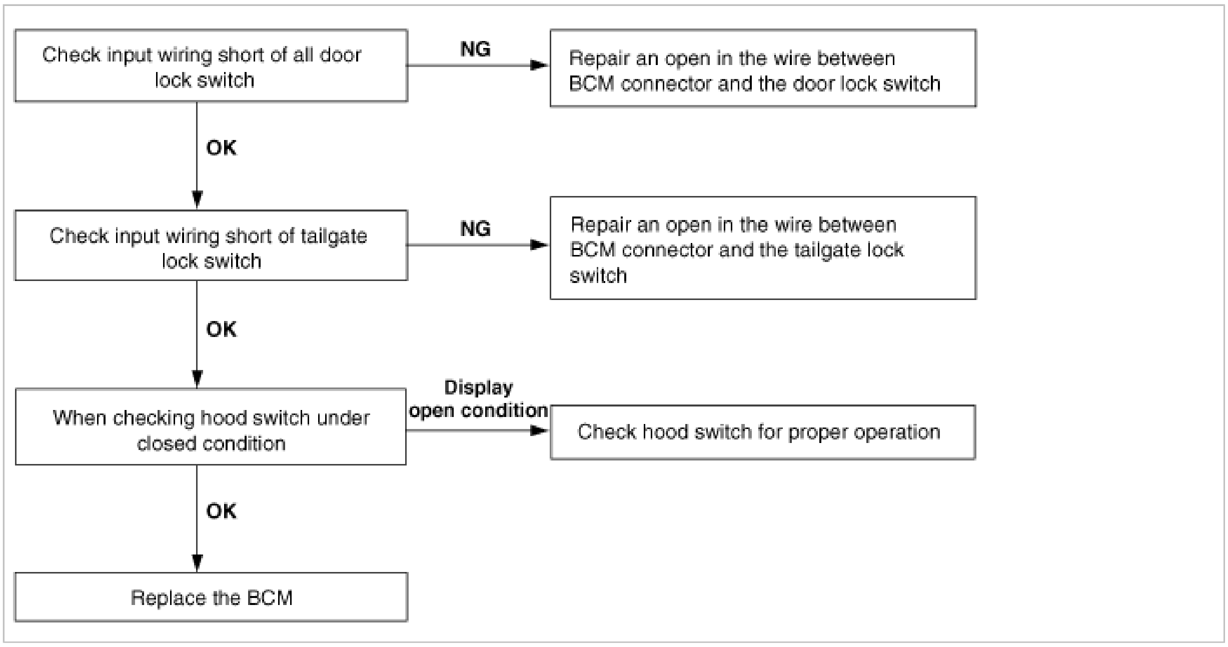
3. When door is opened inside the car, burglar horn does not work (If tailgate and hood is opened, alarm works)



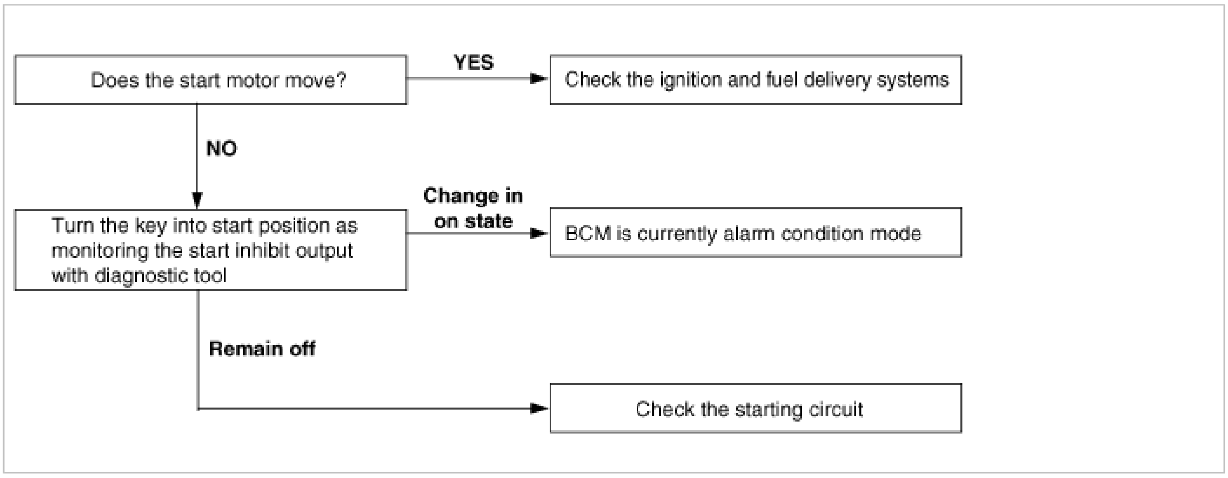
4. When trunk lid is opened inside the car, siren does not work.



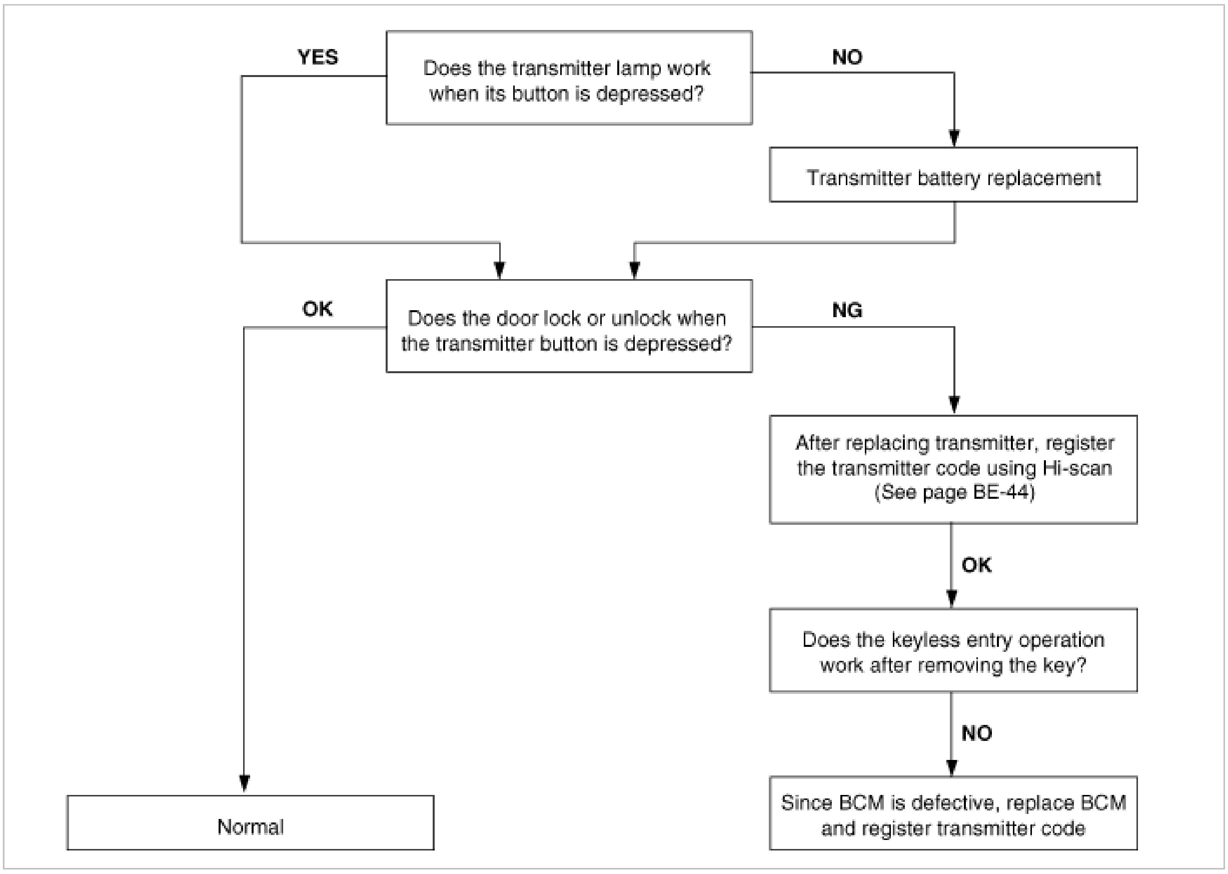
5. When the vehicle is locked by the transmitter, central door lock function works but hazard lamp doesn't blink.



6. Engine does not start, even when the alarm is disarmed.



7. Central door lock function works, but keyless entry system does not work.

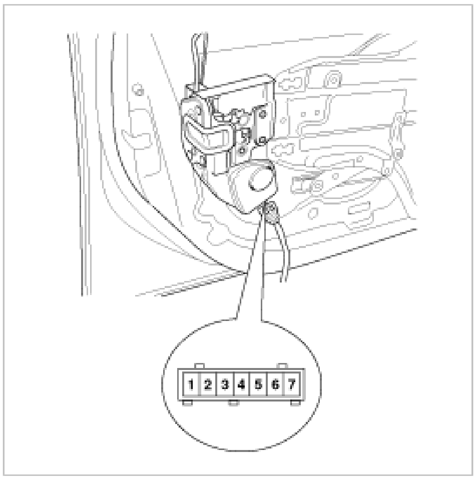


Body Electrical System > Keyless Entry And > Repair procedures

INSPECTION

FRONT DOOR LOCK ACTUATOR INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

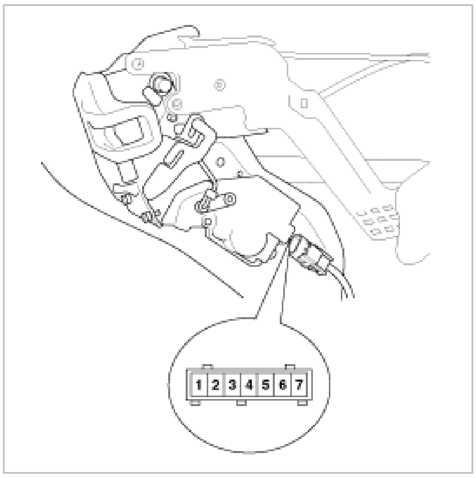


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Front left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Front right	Lock		⊕		⊖
	Unlock		⊖		⊕

REAR DOOR LOCK ACTUATOR INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

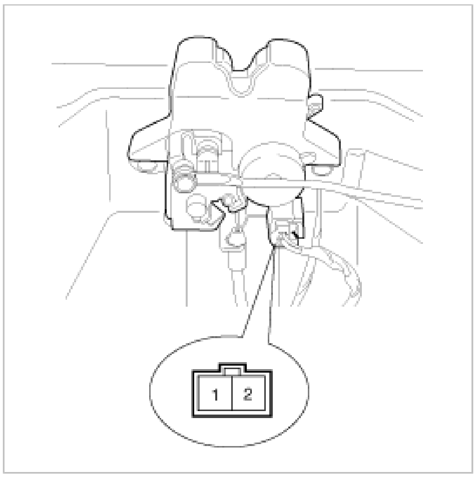


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Rear left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Rear right	Lock		⊕		⊖
	Unlock		⊖		⊕

TRUNK LID RELEASE ACTUATOR INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group-trunk lid)
2. Disconnect the 2P connector from the actuator.

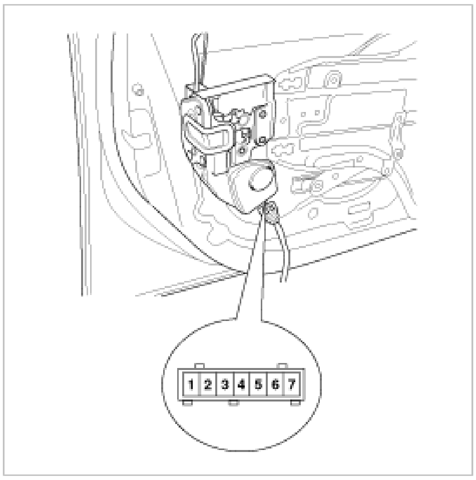


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	2	Chassis ground
Open	⊕	⊖

FRONT DOOR LOCK SWITCH INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

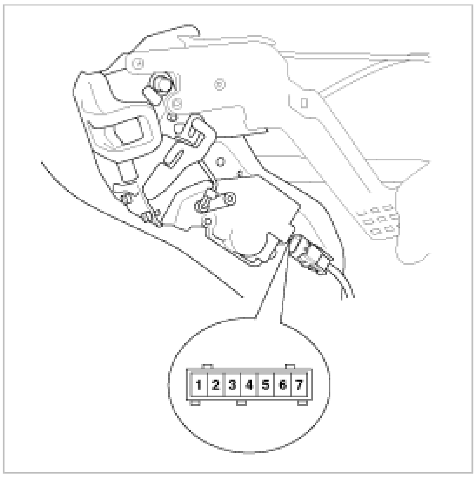


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Front left	Lock				
	Unlock	O		O	
Front right	Lock				
	Unlock		O		O

REAR DOOR LOCK SWITCH INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

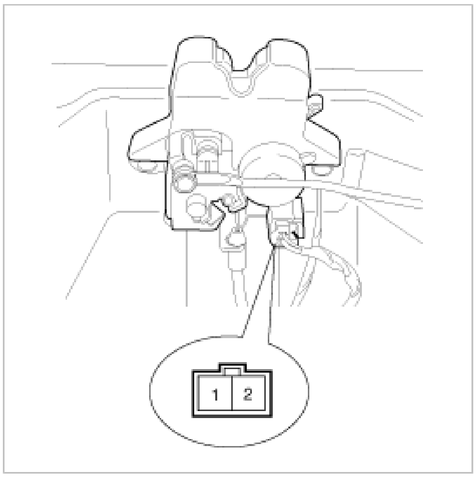


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Rear left	Lock				
	Unlock	O		O	
Rear right	Lock				
	Unlock		O		O

TRUNK LID OPEN SWITCH INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group-trunk lid)
2. Disconnect the 2P connector from the actuator.

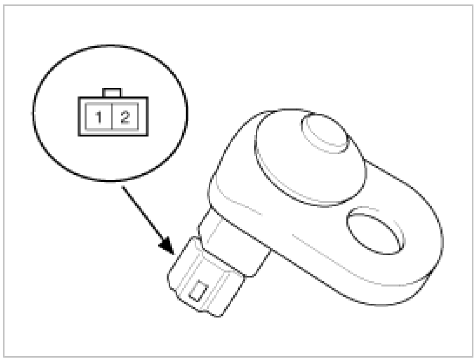


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal	1	Chassis ground
Open	⊕	⊖

DOOR SWITCH INSPECTION

Remove the door switch and check for continuity between the terminals.



[FRONT DOOR SWITCH]

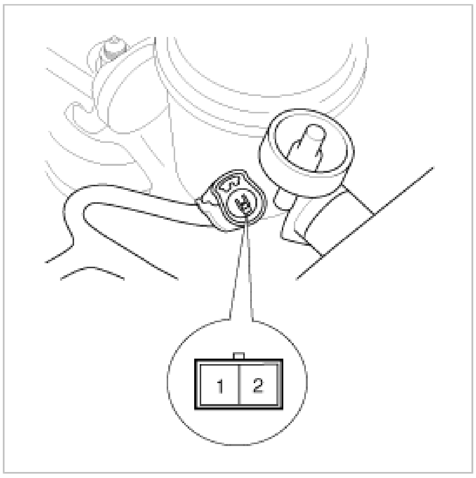
Position \ Terminal	1	2	Body (Ground)
Free(Door open)	○	○	○
Push(Door close)			

[REAR DOOR SWITCH]

Position \ Terminal	1	Ground
Free(Door open)	○	○
Push(Door close)		

HOOD SWITCH INSPECTION

1. Disconnect the 2P connector from the hood switch.

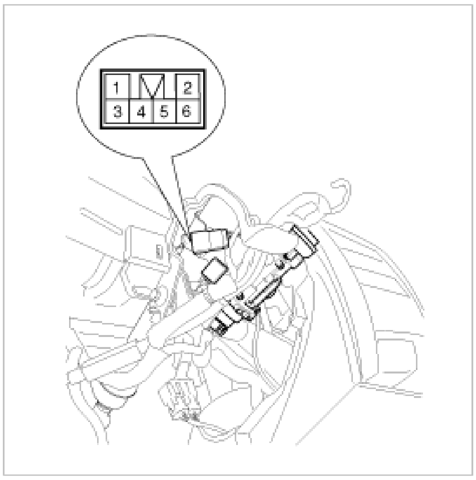


2. Check for continuity between the terminals and ground according to the table.

Position \ Terminal	1	2
Hood open (Free)	O	O
Hood close (Push)		

KEY WARNING SWITCH INSPECTION

1. Remove the driver's crash pad lower panel. (see Body group-crash pad)
2. Disconnect the 6P connector from the door warning switch.

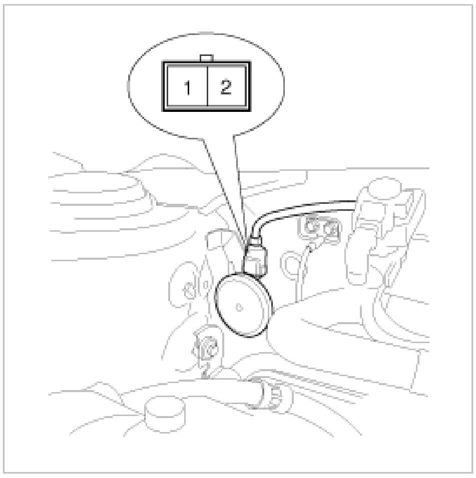


3. Check for continuity between the terminals in each position according to the table.

Key position \ Terminal	5	6
Insert	O	O
Removal		

BURGLAR HORN INSPECTION

1. Remove the burglar horn after removing 2 bolts and disconnect the 2P connector from the burglar horn.
2. Test the burglar horn by connecting battery power to the terminal 1 and ground the terminal 2.



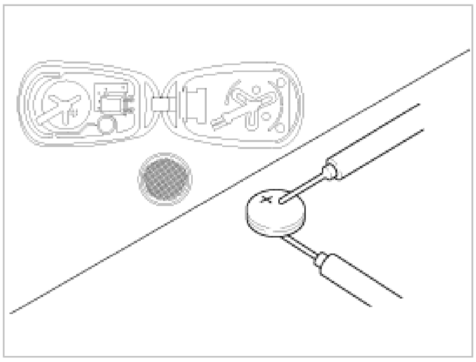
3. The burglar horn should make a sound. If the burglar horn fails to make a sound replace it.

Body Electrical System > Keyless Entry And > Transmitter > Repair procedures

INSPECTION

1. Check that the red light flickers when the door lock or unlock button is pressed on the transmitter.
2. Remove the battery and check voltage if the red light doesn't flicker.

Standard voltage : 3V



3. Replace the transmitter battery with a new one, if voltage is below 3V then try to lock and unlock the doors with the transmitter by pressing the lock or unlock button five or six times.
4. If the doors lock and unlock, the transmitter is O.K, but if the doors don't lock and unlock, register the transmitter code, then try to lock and unlock the doors.
5. If the doors lock and unlock, the transmitter is O.K, but if the doors don't lock and unlock, replace the transmitter.

TRANSMITTER CODE REGISTRATION

1. Connect the DLC cable of hi-scan to the data link connector (16 pins) in driver side crash pad lower panel, turn the power on hi-scan.

2. Select the vehicle model and then do "CODE SAVING"

```
1. HYUNDAI VEHICLE DIAGNOSIS

MODEL   :                    ALL

02. ENGINE
03. AUTOMATIC TRANSAXLE
04. ANTI-LOCK BRAKE SYSTEM
            :
            :
            :
07. CODE SAVING
```

3. After selecting "CODE SAVING" menu, push "ENTER" key, then the screen will be shown as below.

```
TRANSMITTER CODE SAVE

REMOVE THE IG. KEY FROM THE KEY
CYLINDER. CONNECT THE DLC CABLE
AND 16 PIN CONNECTOR OF THE VEHICLE.

PRESS [ENTER], IF YOU ARE READY!
```

4. After removing the ignition key from key cylinder, push "ENTER" key to proceed to the next mode for code saving. Follow steps 1 to 4 and then code saving is completed.

```
TRANSMITTER CODE SAVE

1ST. TRANSMITTER SAVE
PRESS THE TRANSMITTER [LOCK] BUTTON
OR [UNLOCK] BUTTON FOR 1 SECOND.

* NO. OF CODED KEY : 0 EA
```

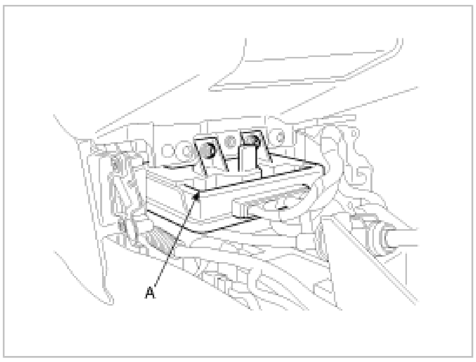
Body Electrical System > ETACS (Electronic Time > Body Control Module > Description and Operation

DESCRIPTION

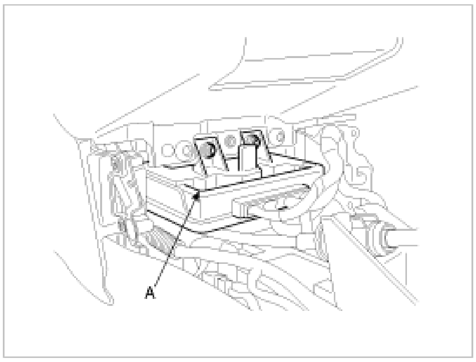
Body control module (A) receives various input switch signals controlling time and alarm functions for the intermittent wiper timer, washer timer, rear defogger timer, seat belt reminder, delayed out room lamp, central door lock, ignition key reminder, power window timer, door warning, tail lamp auto cut, crash door unlock, auto door lock, 2-Turn unlock, ignition key hole illumination control and keyless entry & burglar alarm.



Body Electrical System > ETACS (Electronic Time > Body Control Module > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the floor console (Refer to the Body group-console).
3. Remove the keyless antenna cable and body control module (A) after loosening 2 nuts.

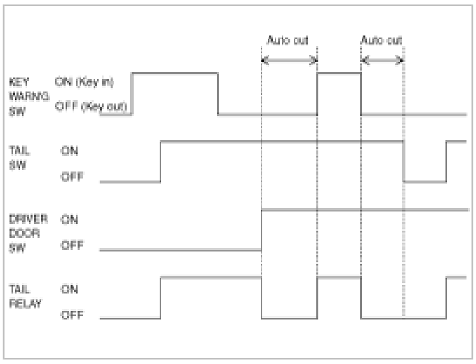


4. Installation is the reverse of removal.

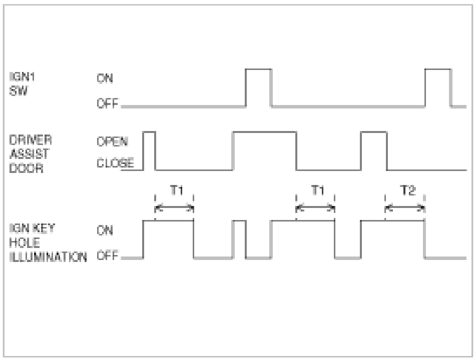
INSPECTION

Verify each components operation using related timing charts.

1. TAIL LAMP AUTO CUT
   (1) With the tail lamp switched ON, if the ignition
   Is switched OFF and the driver's door opened, the tail lamp should be automatically turned OFF.
   (2) With the ignition switch ON, if the driver's door is opened and the ignition is switched to OFF, the tail lamp should be automatically turned OFF.
   (3) When the tail lamp is cut automatically and the tail lamp switch is turned OFF and ON, the tail lamp illuminates and auto cut function is cancelled.
   (4) When the tail lamp is cut automatically and the ignition key is inserted, the tail lamp illuminates and auto cut function is canceled.

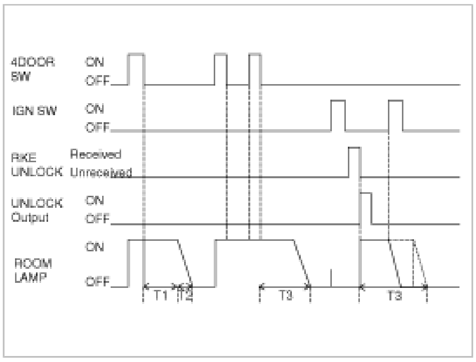


2. IGNITION KEYHOLE ILLUMINATION
   (1) Ignition keyhole illumination is turned ON when the driver or passenger door is opened.
   (2) The "ON" state for ignition keyhole illumination is delayed 10 seconds when the door is closed as in Step 1).
   (3) Ignition keyhole illumination is turned off if the ignition switch is turned ON as in Step 1) & 2).
   (4) Ignition keyhole illumination is turned off if ARM state is entered. See Steps 1) & 2).



T1 : 10 ± 1 sec.
T2 : 0 ~ 10 sec.

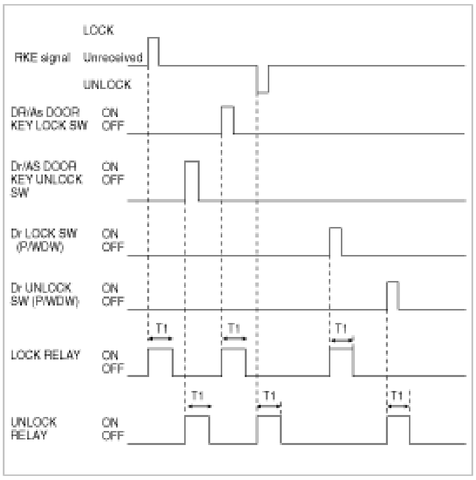
3. DELAYED ROOM LAMP
   (1) When the first door (driver, or assist or 4doors) is opened, room lamp is turned on.
   (2) When the door is closed, the room lamp is faded out for 2 seconds after there is on for 30 seconds.
   (3) Regardless of ignition ON/OFF in door open state, room lamp output is ON.
   (4) When remote control unlock is received, room lamp is turned on for 30 seconds.
   (5) While room lamp is on due to Remote control unlock, if another remote control unlock is received, then room lamp is again on for 30 sec.



T1 : 30 ± 3 sec.,
T2 : 2 ± 0.2 sec.,
T3 : 32 ± 3.2sec.

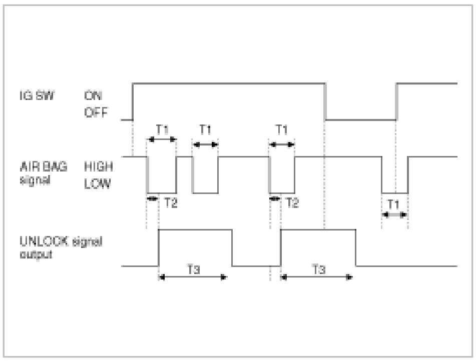
4. CENTRAL DOOR LOCK/UNLOCK
   (1) Central door lock/unlock

Function	Option	Centeral door Lock	Transmitter (RKE)
Door key UNLOCK	Driver	2-Turn unlock	2-Turn unlock
	Assist	2-Turn unlock	2-Turn unlock
Door key LOCK	Driver	All lock	All lock
	Assist	All lock	All lock
Transmitter (RKE)	Lock	–	All lock
	Unlock	–	2-Turn unlock
Driver's knob	Lock	Driver lock	Driver lock
	Unlock	Driver unlock	Driver unlock
Assist knob	Lock	Assist lock	Assist lock
	Unlock	Assist unlock	Assist unlock
Door Lock switch	Lock	All lock	All lock
	Unlock	All unlock	All unlock



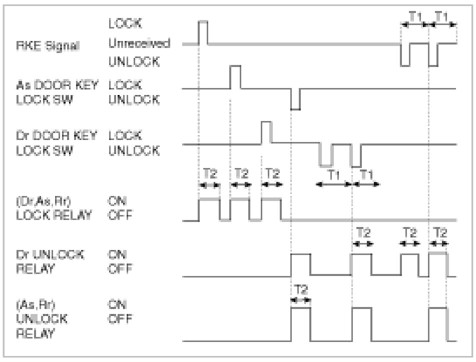
T1 : 0.5 ±0.1 sec.

5. CRASH DOOR UNLOCK
   (1) UNLOCK signal is always output when AIR BAG signal is input under IG SW = ON.
   (2) UNLOCK signal is output for the remaining time even when IG SW ON is turned to OFF during UNLOCK output.
   (3) UNLOCK signal is not output when IG SW OFF is turned to ON after AIR BAG signal is input in advance.
   (4) UNLOCK signal is output for T3 when driver, Assist or rear DOOR LOCK SW is locked from UNLOCK after UNLOCK signal is output.
   (5) AUTO DOOR LOCK function is not performed when CRASH UNLOCK condition is met.
   (6) CENTRAL DOOR LOCK function is not performed during or after CRASH UNLOCK signal output.
   But, CENTRAL DOOR LOCK function is performed normally if CRASH UNLOCK function is reset after IG OFF.



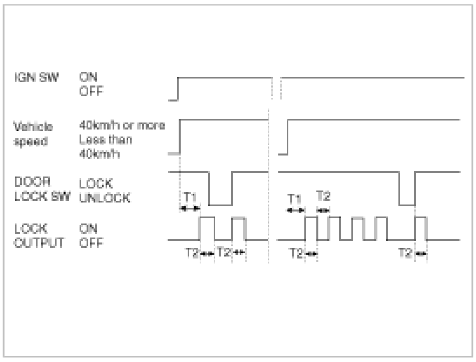
T1 : 0.2 ± 0.02 sec.,
T2 : 0.04 sec.,
T3 : 5 ± 0.5 sec.

6. 2-TURN UNLOCK
   (1) All door unlock signals are output for T2 if driver door key unlock switch is turned ON within T1 after changing driver door key unlock switch from OFF to ON(mechanically, driver door key unlock switch is unlocked and BCM signal is not output). (All door unlock signals are output even within T1 after RKE UNLOCK signal is received.)
   (2) Driver door unlock signal is output for T2 when RKE UNLOCK signal is received. But, all door unlock signals are output for T2 if RKE UNLOCK signal is received within T1.



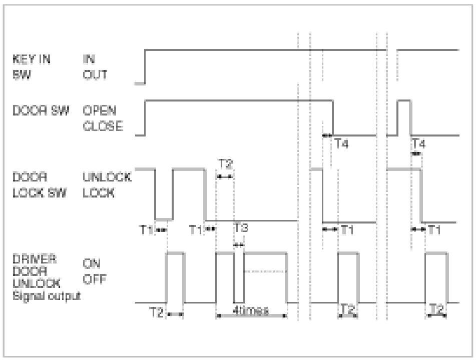
T1 : within 4 ± 1sec,
T2 : 0.5 ± 0.1sec.

7. AUTO DOOR LOCK (USER OPTION)
   (1) This does not activate when vehicle speed is less than 5km/h.
   (2) Lock signal is output if vehicle speed is 5km/h or more for at least 1s under ALT"L" ON, IGN SW = ON. But, lock signal is not output if all doors are locked or all doors are fail in advance.
   (3) Lock signal is output 3 times as Max ((2) is ignored) if either one door is unlocked after lock signal output in (2).(1s cycle) But, door, which is locked from unlock state during 3-time output, is ignored.
   (4) Relevant door is fail if the state is unlock after 3-time output.
   (5) Lock signal is output once if the fail door is unlocked again after the door is locked.
   (6) Lock signal is output once if locked doors, which are lock state after lock signal output in (2),are unlocked again. But, lock signal is output once for the relevant door even when unlock state continues after lock signal output.
   (7) Fail door is cleared at IGN SW = OFF.
   (8) Auto door lock function is not performed when crash unlock condition is met.



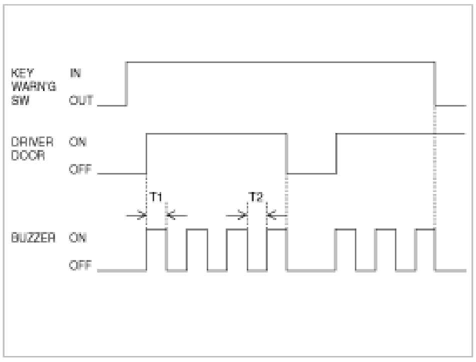
T1 : 1 ± 0.1sec,
T2 : 0.5 ± 0.1sec.

8. IGNITION KEY REMINDER
   (1) This function is not performed when vehicle speed is 3km/h or more.
   (2) DRIVER UNLOCK signal is output for 1s after 0.5s from when the state becomes KEY IN SW = IN & DRIVER DOOR = OPEN & DRIVER DOOR LOCK SW = LOCK.
   (3) ALL DOOR UNLOCK signals are output for 1s after 0.5s from when the state becomes KEY IN SW = IN & ASSIST DOOR = OPEN & ASSIST DOOR LOCK SW = LOCK.
   (4) UNLOCK signal is output 3times as Max (1s-output is excluded) in case LOCK state is held even when UNLOCK signal is output for 1s in (2),(3). (1s cycle: 0.5s ON/OFF)



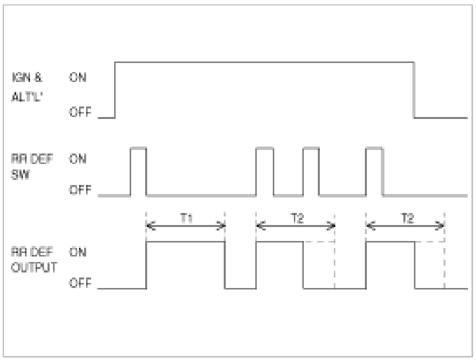
T1 : 0.5 ± 0.1 sec.
T2 : 1.0 ± 0.1 sec.
T3 : 0.5 ± 0.1 sec.
T4 : 0.5 sec.

9. KEY OPERATED WARNING
   (1) If the key is in the key cylinder and the driver door is opened, the buzzer is sounded (period: 0.7 sec., duty rate: 50%).
   (2) If the ignition key is removed, or the door is closed, the buzzer is switched OFF immediately.



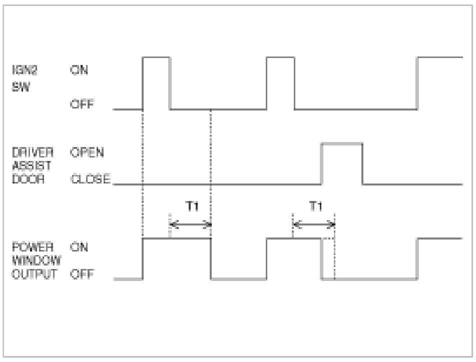
T1, T2 : 0.35 ± 0.1sec.

10. WINDSHIELD DEICER & DEFOGGER TIMER
    (1) Once ALT "L" is ON, if the defogger is switched ON, the defogger will stay ON for 20 minutes duration.
    (2) If defogger switch is pressed again (see Step 1), or if ignition is switched OFF, the defogger will shut OFF.



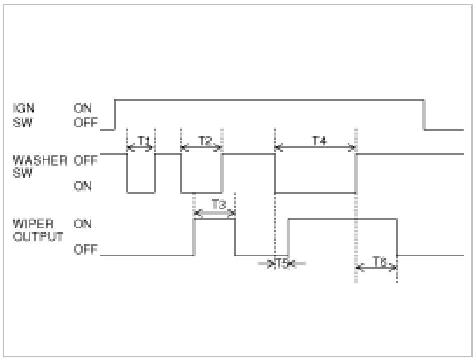
T1 : 20 ± 1 min.
T2 : MAX 20 ± 1 min.

11. POWER WINDOW TIMER
    (1) When the ignition is switched OFF, power window output remains ON for 30 seconds and then turns OFF.
    (2) Related to Step 1), if the driver’s door or assist door is opened, window power output is turned OFF immediately.
    (3) When the driver's door or assist door is opened, the power window relay output is turned OFF immediately.



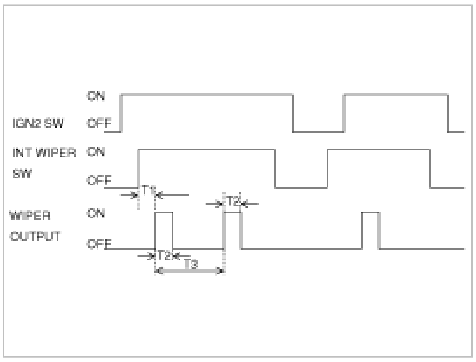
T1 : 30 ± 3 sec.

12. WIPER RELATED TO WASHER
    (1) When the ignition switch is turned ON :
        A. If washer switch is turned on, wiper output is ON after 0.3 sec. (T5)
        B. If washer switch is turned OFF, wiper output is OFF after 3.8 sec. (T6)
    (2) If the washer switch is turned OFF within 0.6 sec. (T2), the wiper will remain ON for up to 0.7 sec. (T3) from the moment that washer switch is turned OFF.



T1 : Less than 0.2 sec.
T2 : 0.2 ~0.6 sec. (MIST Function)
T3 : 0.7 ± 0.1sec.
T4 : More than 0.6 sec.
T5 : 0.3 sec.
T6 : 2.5 ~3.8 sec.

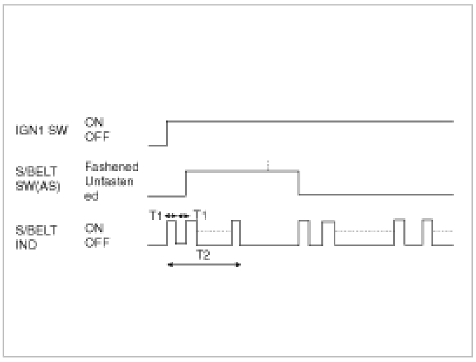
13. VARIABLE INTERMITTENT WIPER (WINDSHIELD WIPER)
    (1) With the ignition switch ON, if the intermittent wiper switch is turned on, wiper output is ON according to the setting.
    (2) When the intermittent wiper switch is ON, if the ignition switch is turned ON, wiper output is ON.



T1 : MAX 0.5 sec.
T2 : 0.7 ± 0.1sec.
T3 : 2.6 ± 0.7 sec. (FAST),
T3 : 18.0 ± 1.0sec. (SLOW) vehicle speed 0 km/h

14. SEAT BELT REMINDER FUNCTION (DRIVER)
    (1) Warning lamp lights every 0.6sec and buzzer sounds every 1sec for 6sec when IGN is ON under unfastened seat belt.
    (Warning lamp continues to light for 6sec if seat belt is fastened within 6sec)
    30sec- time count starts at ALT"L" ON under this state.
    (30sec- time count starts after 6sec. if ALT"L" is ON within initial 6sec)
    (2) Buzzer stops and the warning lamp is turned OFF when IGN is turned OFF within 6sec-output.
    (3) Buzzer stops and the warning lamp is turned OFF and 30sec- time count also stops when seat belt is fastened after IGN ON.
    (4) If unfastened seat belt state continues after 60sec- time count from ALT"L"ON, the warning lamp flashes and buzzer sounds 11 times in 30sec-cycle (6sec ON/ 24sec OFF) after 30sec from ALT"L" ON.
    (5) Warning lamp & buzzer are turned OFF when IGN is OFF or seat belt is fastened during (4).
    (6) Operation in (1) is performed when seat belt is unfastened again under ALT"L" ON and fastened seat belt.
    (7) Operation in (4) is performed when ALT "L" is turned ON again after turning OFF under unfastened seat belt.

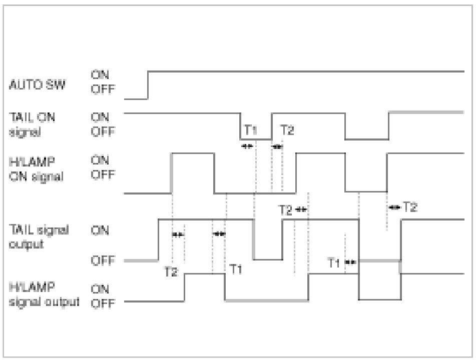
15. SEAT BELT REMINDER FUNCTION(ASSIST)
    (1) Warning lamp lights continuously every 0.6sec when IGN is turned ON under unfastened seat belt.
    (2) Warning lamp is turned OFF when IGN is turned OFF within 0.6sec.
    (3) When IGN is ON under unfastened seat belt, the warning lamp lights. The lamp continues to light for remaining time of 6sec when seat belt is fastened within 6sec. The lamp is OFF if seat belt is fastened after 6sec.
    (4) After 6 sec from IGN ON, warning lamp contitutes to flash when S/BELT is unfastened and stop immediately when S/BELT is fastended.



T1 : 0.3 ± 0.1sec,
T2 : 6 ± 1sec.

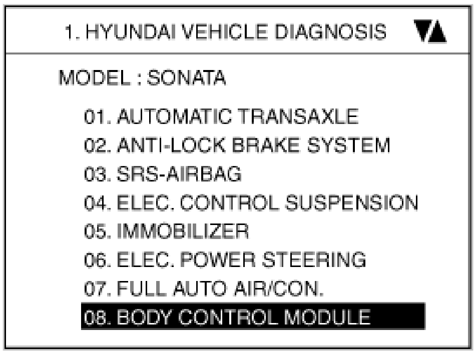
16. AUTO LIGHT CONTROL
    (1) Auto light sensor value is always read at IGN ON.
    (2) Light is turned ON after 2sec±0.2sec when auto light sensor value is same as light ON input value.
    (3) Light is turned OFF after 2sec±0.2sec when sensor value is same as light OFF input value.
    (4) Tail lamp and head lamp are turned ON when sensor value is same as tail lamp ON input value.
    (5) Light ON value of sensor is based on the below table.
    (6) Head lamp signal is output when head lamp switch is ON.
    (7) After head lamp is turned OFF, head lamp signal output is kept if head lamp ON luminance condition is met at auto light switch ON.
    (8) After head lamp is turned OFF, head lamp signal output is immediately stopped if head lamp OFF luminance condition is met at auto light switch ON.
    (9) After head lamp is turned OFF, head lamp signal output is immediately stopped at tail switch signal input.
    (10) After head lamp is turned OFF, head lamp signal output is stopped after 0.7s if there is no input of auto light switch or tail switch. (Shall be no flashing of head lamp)
    (11) Head lamp signal output is stopped when switch position is changed from AUTO to head lamp switch during head lamp ON with auto light. (Shall be no flashing of head lamp)
    (12) The condition of head lamp ON/OFF is same as the one of tail lamp ON/OFF at auto light switch ON. Light ON value of the input sensor is based on the table.

	TAIL LAMP	HEAD LAMP
ON	0.81V+/-0.08V	Same as tail sensor value
OFF	1.41V+/-0.10V	Same as tail sensor value

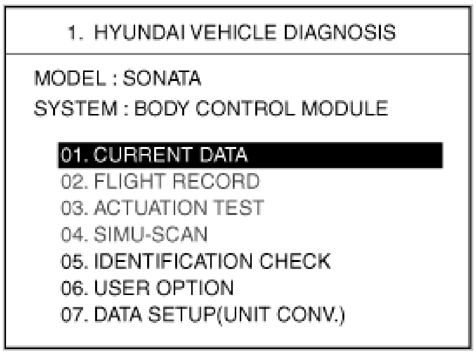


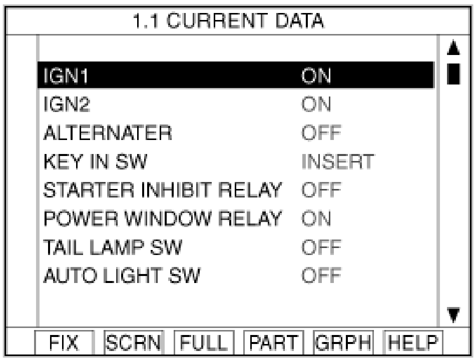
TROUBLE DIAGNOSTICS WHEN USING DIAGNOSIS TOOL

1. The body control module can diagnose by using the diagnosis tool more quickly.
   The BCM communicates with the diagnosis tool and then reads the input/output value and drives the actuator.
2. To diagnose the BCM function, select the menu of model and body control module.

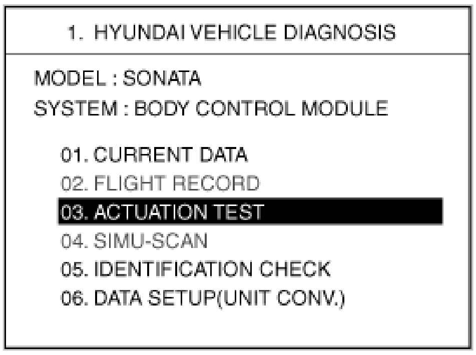


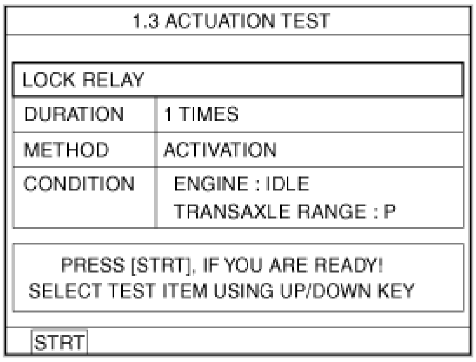
3. To consult the present input/out value of BCM, "02. INPUT/OUTPUT MONITORING". It provides information of BCM input/output conditions of power supply, turn signal/brake lamp, headlamp, door, locks, outside mirror, wiper, auto-light and transmitters etc.





4. To perform compulsory operation on BCM input factors, select "03. ACTUATION TEST"



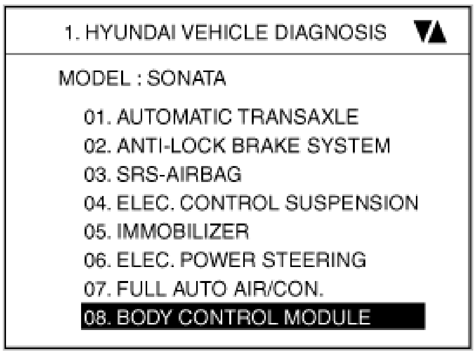


USER OPTION MODE

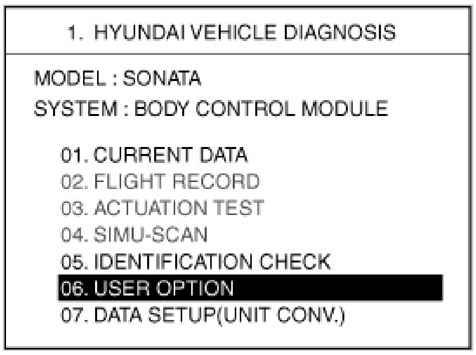
The BCM offers 3 items user option mode for a user convenience (Auto door lock, door key burglar alarm, door lock state inform horn)

- It is able to set up the enable or disable of AUTO DOOR LOCK function or AUTO DOOR LOCK operation vehicle speed when using it.
- It is able to set up the enable or disable of enter the burglar alarm mode when using door lock by the key.
- It is able to set up the enable or disable of horn inform function when using door lock by the key or RKE.

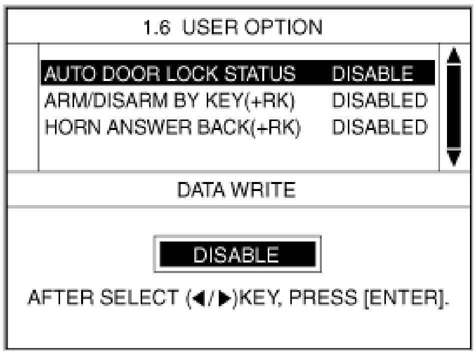
1. Select option "SONATA(NF)" and press ENTER.
2. Select option "BODY CONTROL MODULE" and press ENTER.



3. Select option "USER OPTION" and press ENTER.



4. Select option "AUTO DOOR LOCK STATUS by using the direction button(▲ / ▼).
5. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
(Disable / 5km/h / 10km/h / 15km/h / 20km/h / 25km/h /30km/h / 35km/h / 40km/h)



6. Select option "ARM/DISARM BY KEY(+RKE)" by using the direction button(▲ / ▼).
7. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
(Disable / Enable)
8. Select option "HORN ANSWER BACK (+RK)" by using the direction button(▲ / ▼).
9. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
(Disable / Enable)

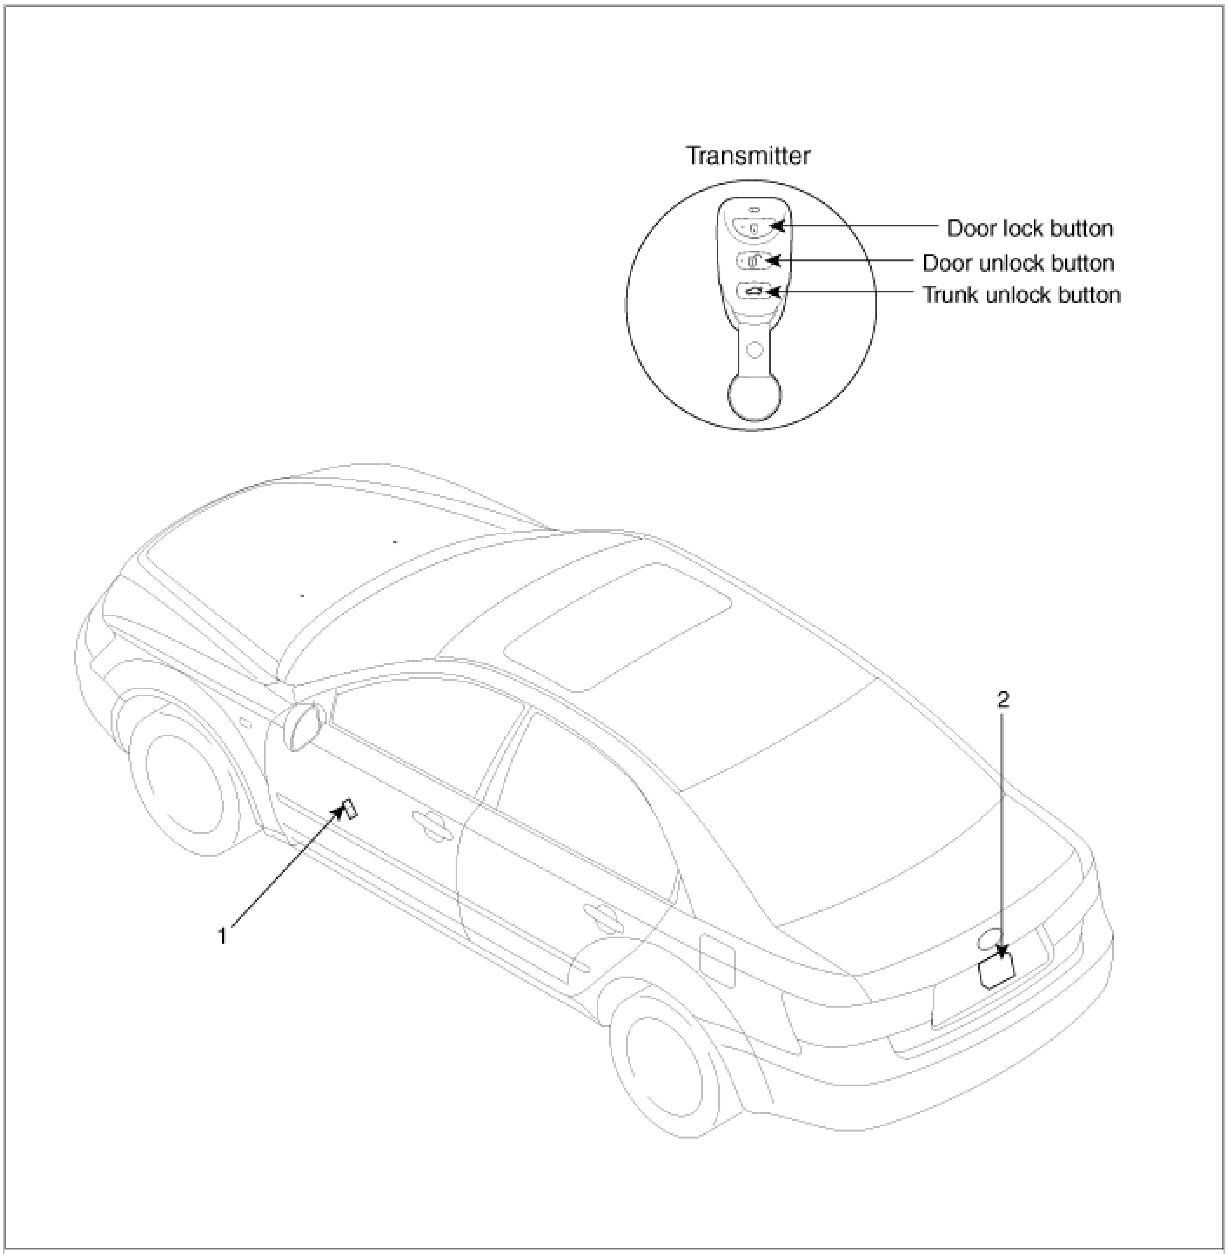
Body Electrical System > Trunk lid > Components and Components Location

COMPONENT LOCATION

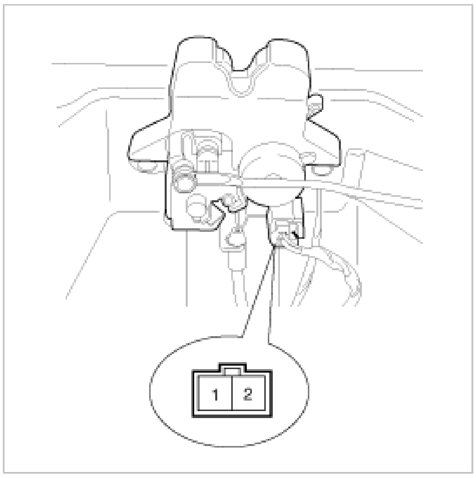


1. Trunk lid open switch 2. Trunk lid release actuator

Body Electrical System > Trunk lid > Trunk Lid Release Actuator > Repair procedures

INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group-trunk lid)
2. Disconnect the 2P connector from the actuator.



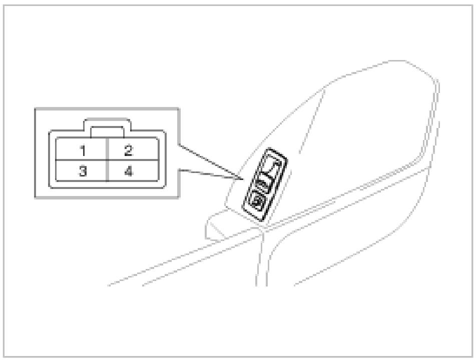
3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	2	Chassis ground
Open	⊕	⊖

Body Electrical System > Trunk lid > Trunk Lid Open Switch > Repair procedures

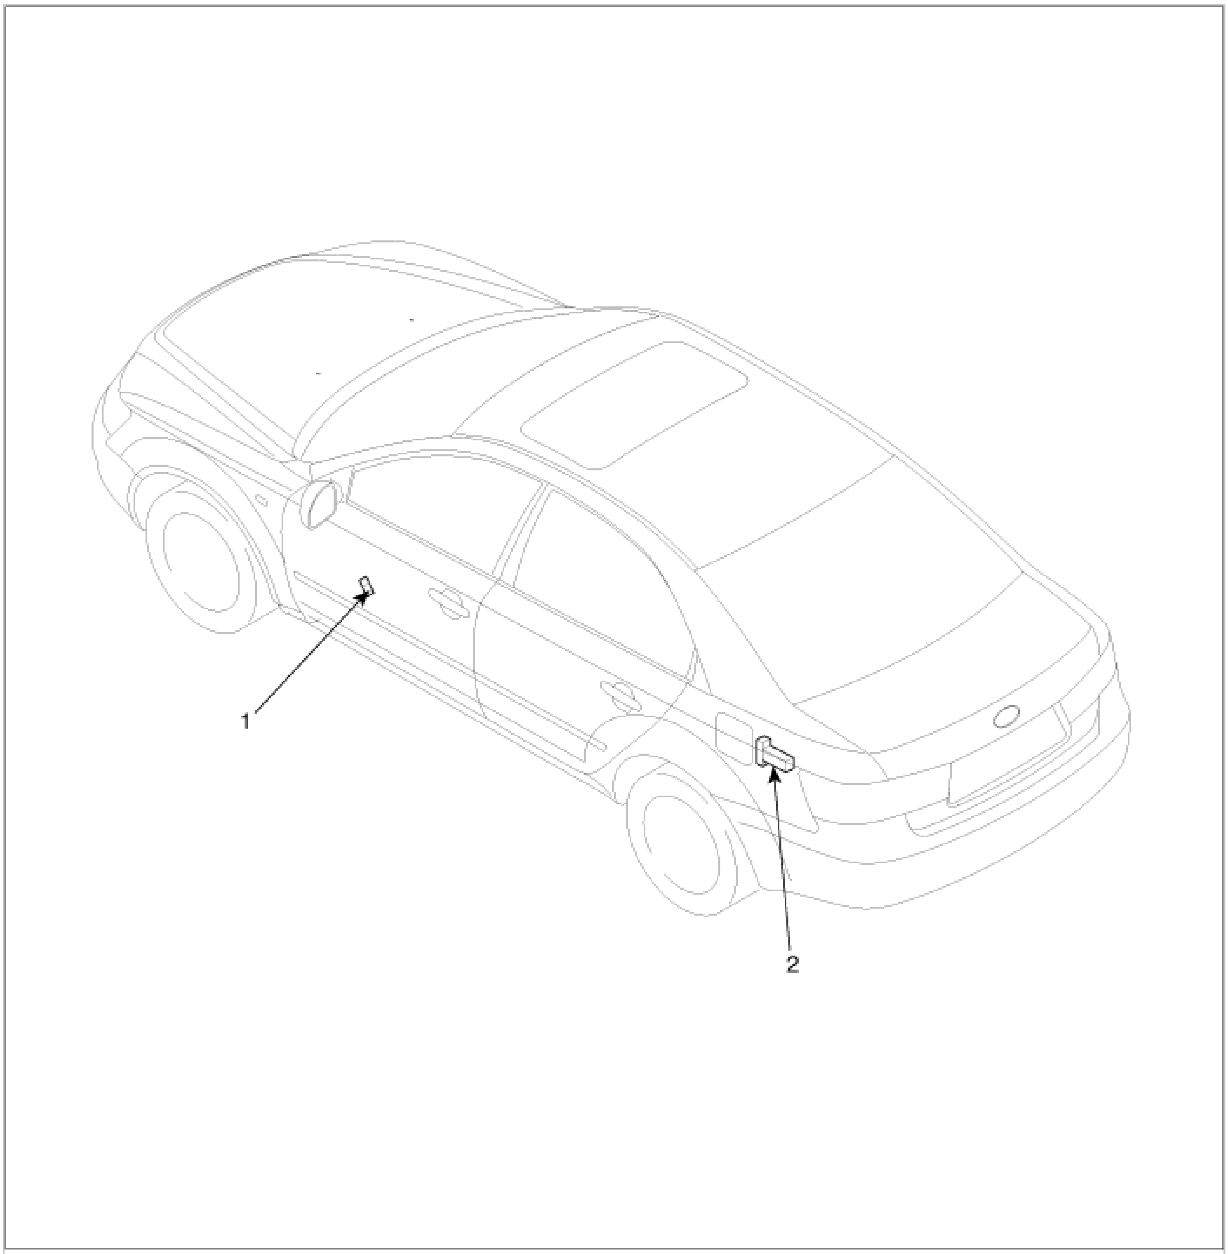
INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Check the switch for continuity between the No. 3 and No. 4 terminals.
3. If the continuity is not as specified, replace the switch.



Body Electrical System > Fuel Filler Door > Components and Components Location

COMPONENT LOCATION

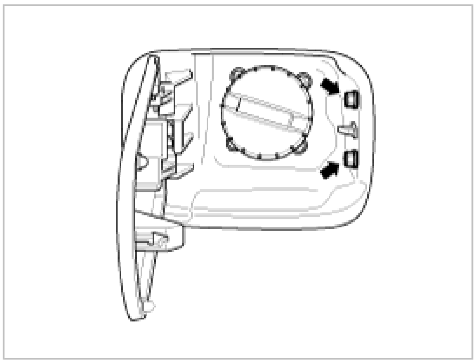


1. Fuel filler door open switch 2. Fuel filler door release actuator

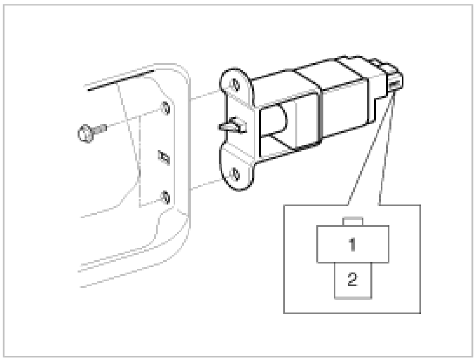
Body Electrical System > Fuel Filler Door > Fuel Filler Door Release Actuator > Repair procedures

INSPECTION

1. Remove the trunk room left trim.
2. Open the fuel filler door and remove the fuel filler door release actuator.



3. Check for continuity between terminal No. 1 and No. 2. If there is no continuity replace the fuel filler door opener.



Body Electrical System > Fuel Filler Door > Fuel Filler Door Open Switch > Repair procedures

INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Check the switch for continuity between the No. 1 and No. 2 terminals.
3. If the continuity is not as specified, replace the switch.

※ USE THE DESIGNATED FUSE ONLY

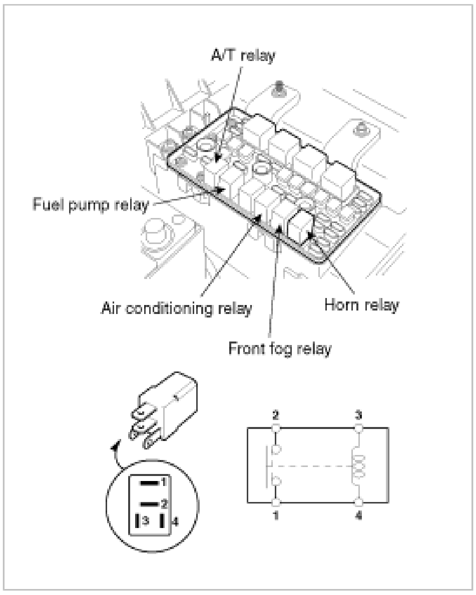
Body Electrical System > Fuses And Relays > Relay Box (Engine Compartment) > Repair procedures

INSPECTION

POWER RELAY TEST (TYPE A)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.4 terminals.
2. There should be no continuity between the No.1 and No.2 terminals when power is disconnected.

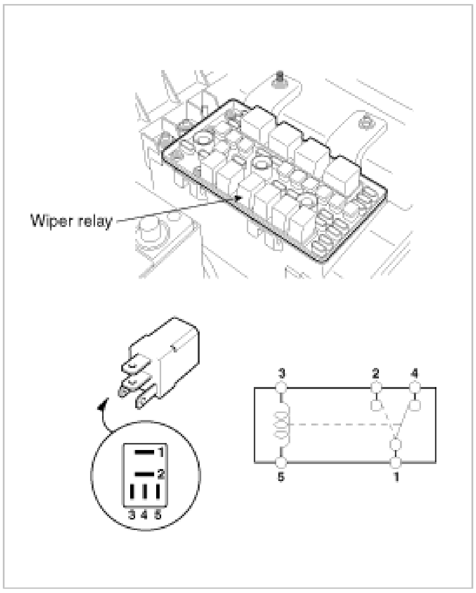


Terminal / Power (No.3-No.4)	1	2	3	4
Disconnected			O	O
Connected	O	O	⊖	⊕

POWER RELAY TEST (TYPE B)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.5 terminals.
2. There should be continuity between the No.1 and No.4 terminals when power is disconnected.

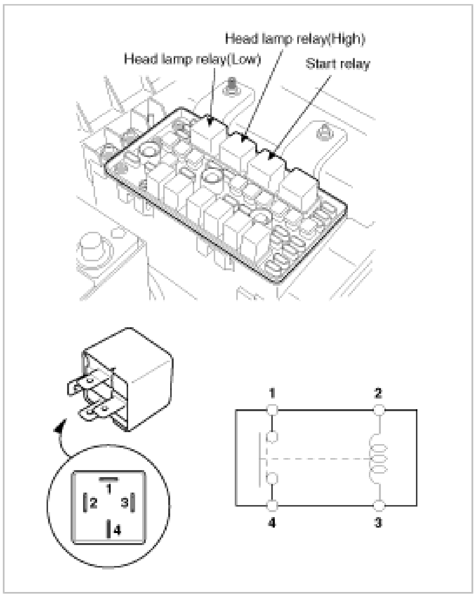


Terminal / Power (No.3-No.5)	3	5	1	2	4
Disconnected			O		O
Connected	⊖	⊕	O	O	

POWER RELAY TEST (TYPE C)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
2. There should be no continuity between the No.1 and No.4 terminals when power is disconnected.

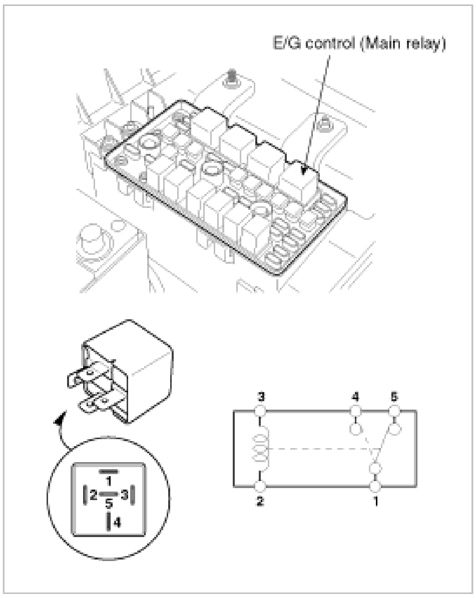


Terminal / Power (No.2-No.3)	2	3	1	4
Disconnected	○	○		
Connected	⊖	⊕	○	○

POWER RELAY TEST (TYPE D)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
2. There should be continuity between the No.1 and No.5 terminals when power is disconnected.



Terminal / Power (No.2-No.3)	2	3	1	4	5
Disconnected			○		○
Connected	⊖	⊕	○	○	

FUSE INSPECTION

1. Be sure there is no play in the fuse holders, and that the fuses are held securely.
2. Are the fuse capacities for each circuit correct?
3. Are there any blown fuses?
   If a fuse is to be replaced, be sure to use a new fuse of the same capacity. Always determine why the fuse blew first and

completely eliminate the problem before installing a new fuse.

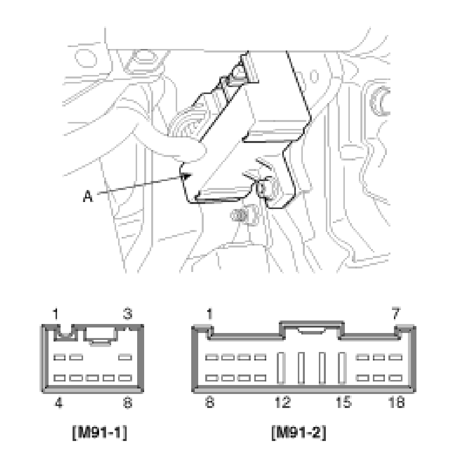
1. Be sure there is no play in the fuse holders, and that the fuses are held securely.
2. Are the fuse capacities for each circuit correct?
3. Are there any blown fuses?
   If a fuse is to be replaced, be sure to use a new fuse of the same capacity. Always determine why the fuse blew first and completely eliminate the problem before installing a new fuse.

Body Electrical System > Fuses And Relays > ICM (Integrated Circuit Module) Relay Box > Description and Operation

DESCRIPTION

The ICM is united with many kinds of relays and installed below the relay box (passenger compartment).



Body Electrical System > Fuses And Relays > ICM (Integrated Circuit Module) Relay Box > Repair procedures

INSPECTION

HAZARD LAMP

Check for continuity between the terminals.

1. There should be continuity between the No.12 and No.13 terminals when power and ground are connected to the No.13 and No.3 in the M91-2 terminals.
2. There should be no continuity between the No12 and No.13 terminals when power is disconnected.

BURGLAR ALARM HORN

Check for continuity between the terminals.

1. There should be continuity between the No.8 and No.9 terminals when power and ground are connected to the No.1 and No.8 in the M91-2 terminals.
2. There should be no continuity between the No.8 and No.9 terminals when power is disconnected.

BURGLAR ALARM

Check for continuity between the terminals.

1. There should be no continuity between the No.11 and No.10 terminals when power and ground are connected to the No.11 and No.4 in the M91-2 terminals.
2. There should be continuity between the No.11 and No.10 terminals when power is disconnected.

ADJUST PEDAL

Check for continuity between the terminals.

1. There should be continuity between the No.15 and No.5 terminals when power and ground are connected to the No.15 and No.2 in the M91-2 terminals.
2. There should be no continuity between the No.15 and No.5 terminals when power is disconnected.

DRIVER DOOR TWO TURN UNLOCK

Check for continuity between the terminals.

1. There should be continuity between the No.7 and No.4 terminals when power and ground are connected to the No.6 and No.4 in the M91-1 terminals.
2. There should be continuity between the No.7 and No.5 terminals when power and ground are disconnected.

2. Seat belt switch	7. Parking brake switch
3. Vehicle speed sensor	8. Door switch
4. Engine coolant temperature sender	9. Fuel gauge sender
5. Oil pressure switch	10. Trunk lid open actuator

Body Electrical System > Indicators And Gauges > Troubleshooting

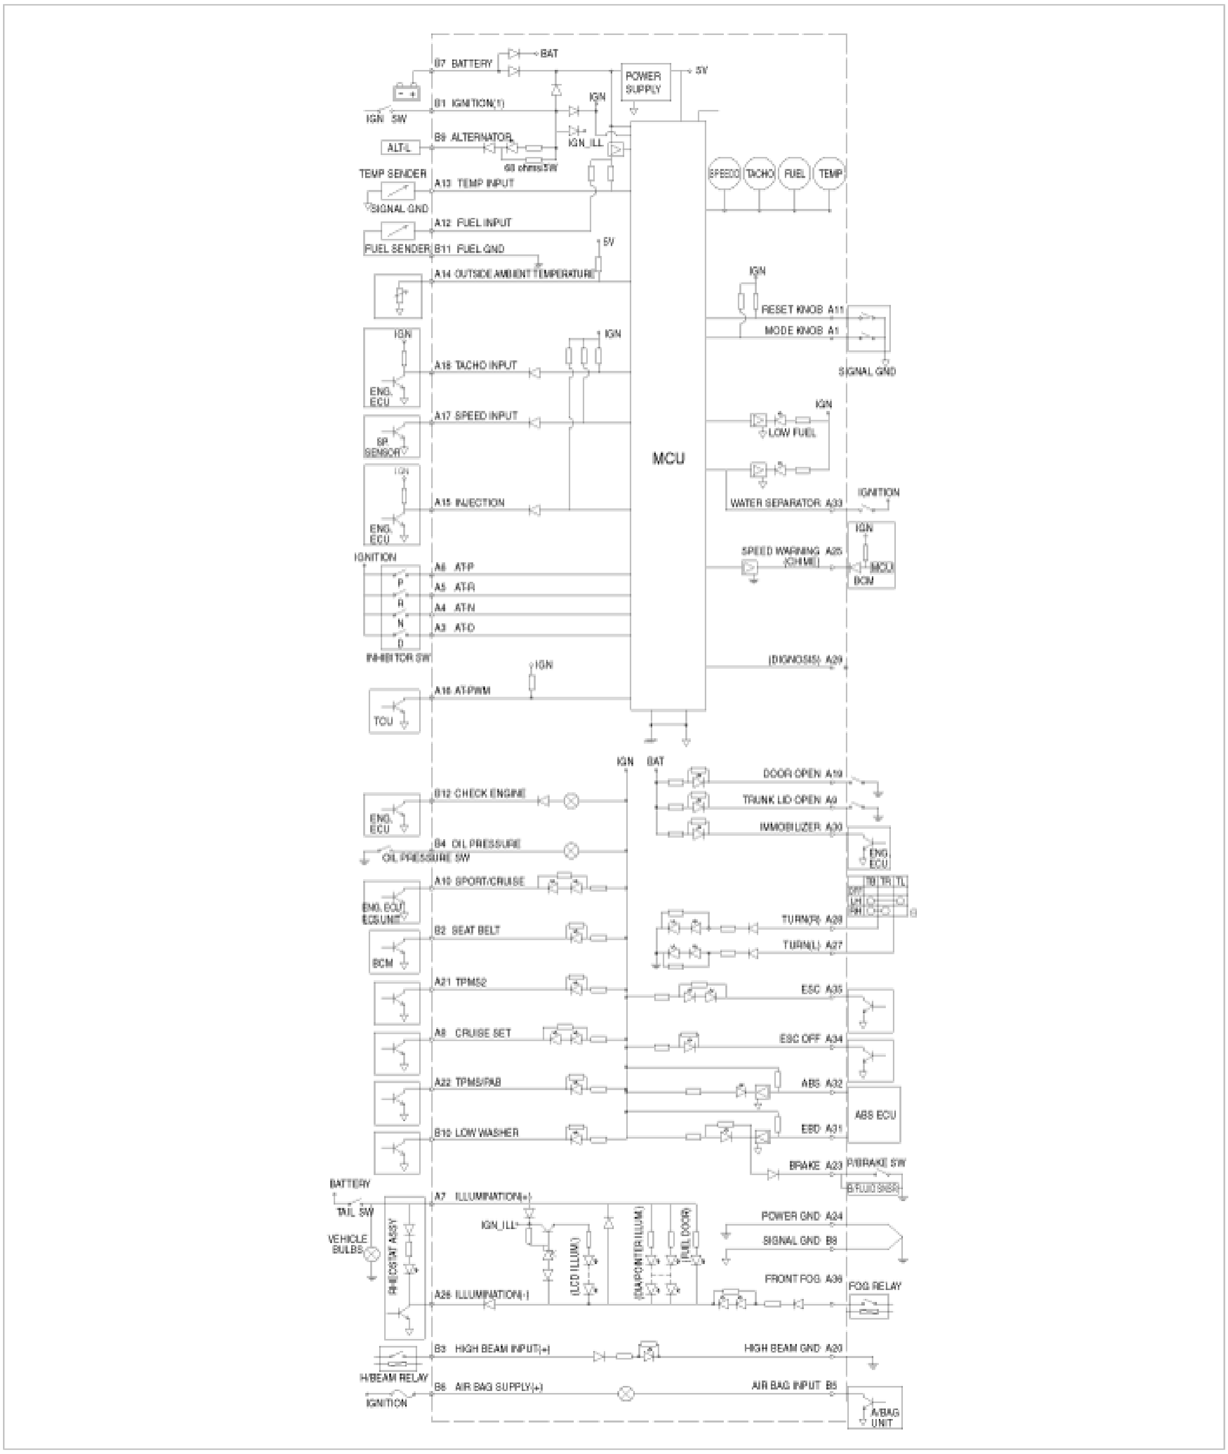
TROUBLESHOOTING

Symptom Poss	ible cause	Remedy
Speedometer does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Speedometer faulty	Check speedometer
	Vehicle speed sensor faulty	Check vehicle speed sensor
	Wiring or ground faulty	Repair if necessary
Tachometer does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Tachometer faulty	Check tachometer
	Wiring or ground faulty	Repair if necessary
Fuel gauge does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Fuel gauge faulty	Check gauge
	Fuel sender faulty	Check fuel sender

	Wiring or ground faulty	Repair if necessary
Low fuel warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Fuel sender faulty	Check fuel sender
	Wiring or ground faulty	Repair if necessary
Water temperature gauge does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Water temperature gauge faulty	Check gauge
	Water temperature sender faulty	Check sender
	Wiring or ground faulty	Repair if necessary
Oil pressure warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Oil pressure switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Parking brake warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Brake fluid level warning switch faulty	Check switch
	Parking brake switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Open door warning lamp and trunk lid warning lamp do not light up	Memory fuse (15A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Door switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Seat belt warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Seat belt switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary

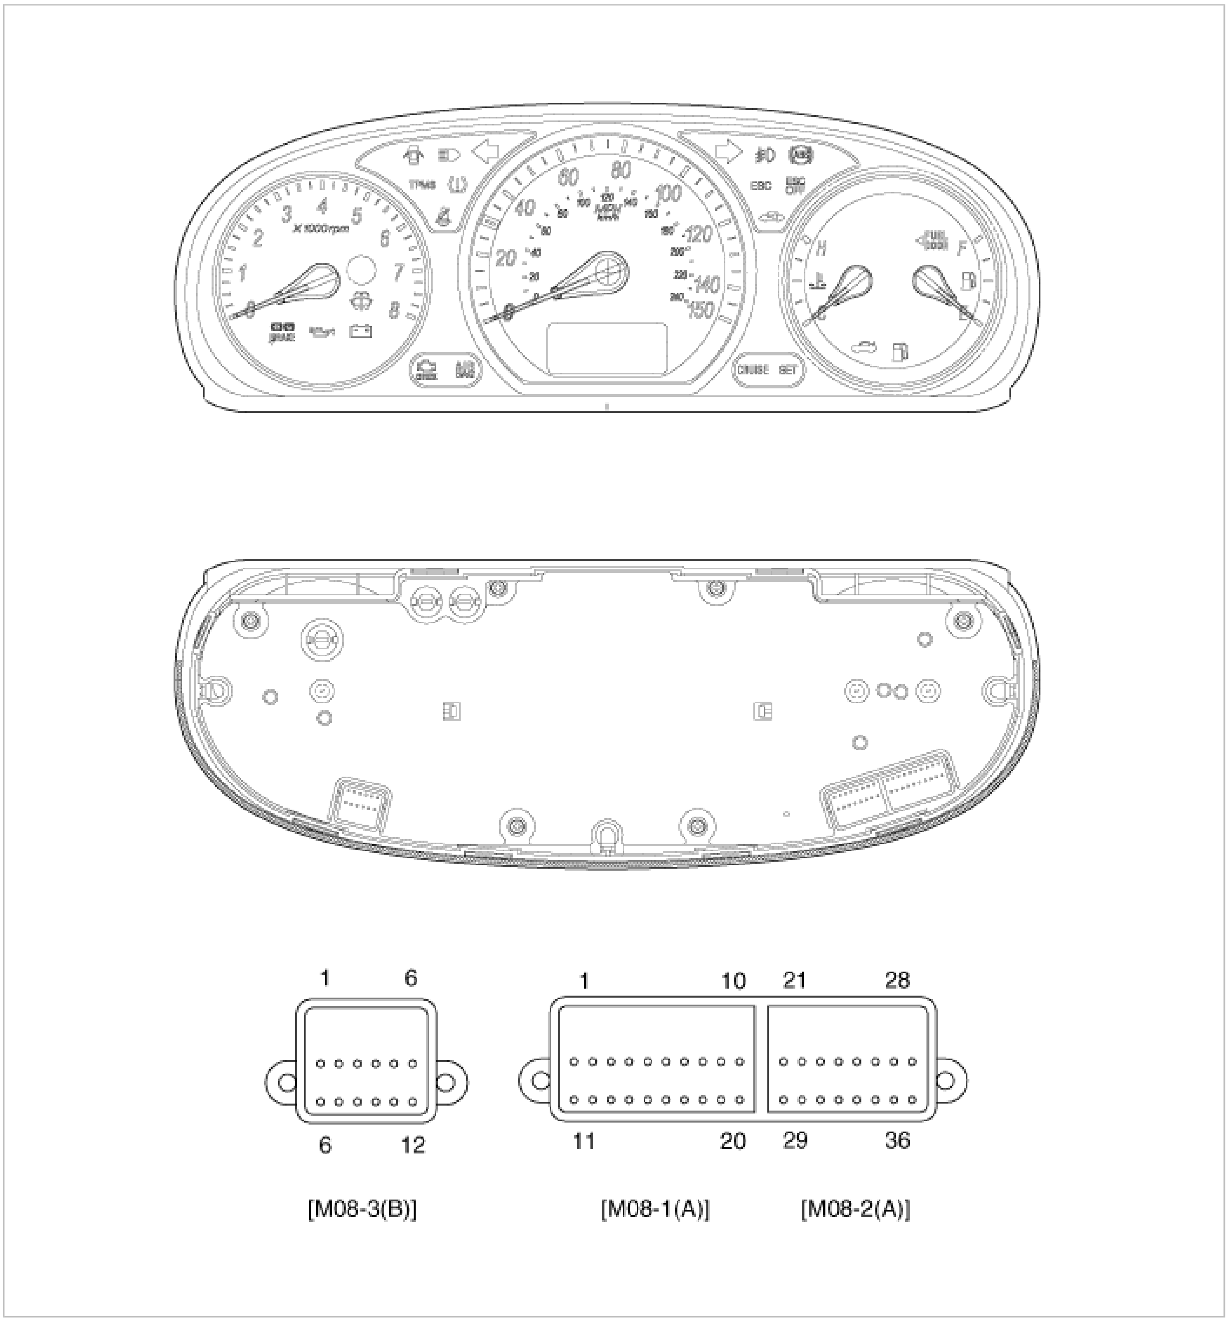
Body Electrical System > Indicators And Gauges > Instrument Cluster > Schematic Diagrams

CIRCUIT DIAGRAM



Body Electrical System > Indicators And Gauges > Instrument Cluster > Components and Components Location

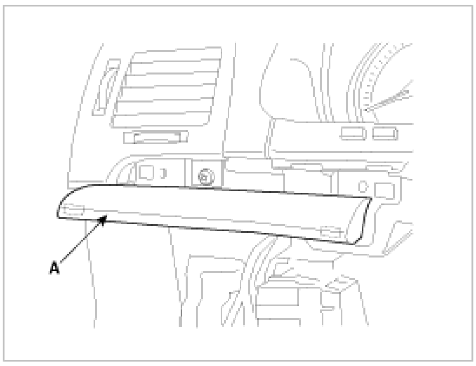
COMPONENTS



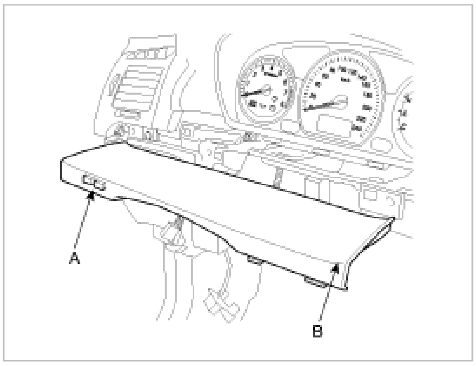
Body Electrical System > Indicators And Gauges > Instrument Cluster > Repair procedures

REPLACEMENT

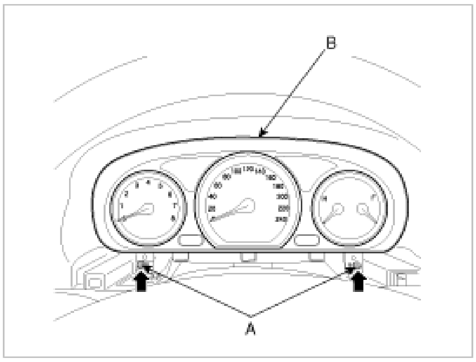
1. Disconnect the negative (-) battery terminal.
2. Remove the center garnish (A) (Refer to Body group-crash pad)



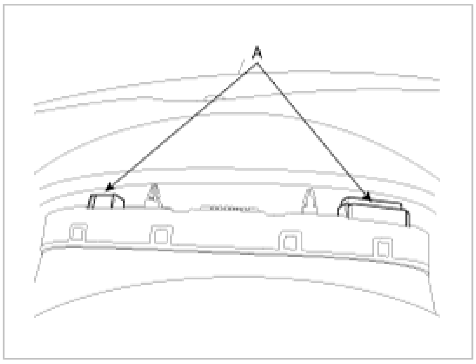
3. Remove the cluster facia panel (B) after disconnecting the connector of trip switch (A).



4. Remove the cluster from the housing (B) after removing 2 screws (A).



5. Disconnect the cluster connecter (A) and then remove the cluster.



6. Installation is the reverse of removal.

INSPECTION

SPEEDOMETER

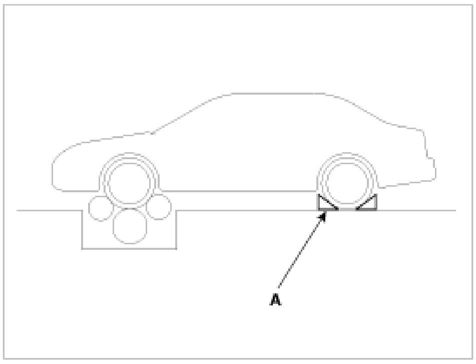
1. Adjust the pressure of the tires to the specified level.
2. Drive the vehicle onto a speedometer tester. Use wheel chocks as appropriate.
3. Check if the speedometer indicator range is within the standard values.

CAUTION

Do not operate the clutch suddenly or increase/ decrease speed rapidly while testing.

NOTE

Tire wear and tire over or under inflation will increase the indication error.



[CANADA - km/h]

Velocity (km/h)	20	40	60	80	100	120

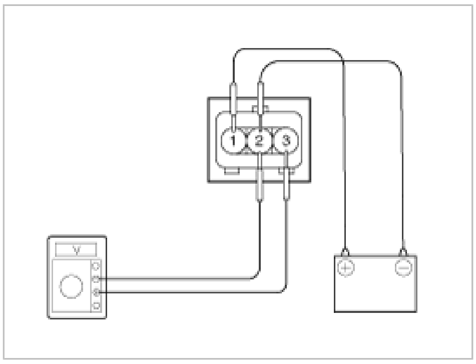
VEHICLE SPEED SENSOR

1. Connect the positive (+) lead from battery to terminal 1 and negative (-) lead to terminal 2.
2. Connect the positive (+) lead from tester to terminal 3 and the negative (-) lead to terminal 2.
3. Rotate the shaft.
4. Check that there is voltage change from approx. 0V to 11V or more between terminals 3 and 2.
5. The voltage change should be 4 times for every revolution of the speed sensor shaft.
   If operation is not as specified, replace the sensor.



TACHOMETER

1. Connect the scan tool to the diagnostic link connector or install a tachometer.
2. With the engine started, compare the readings of the tester with that of the tachometer. Replace the tachometer if the tolerance is exceeded.

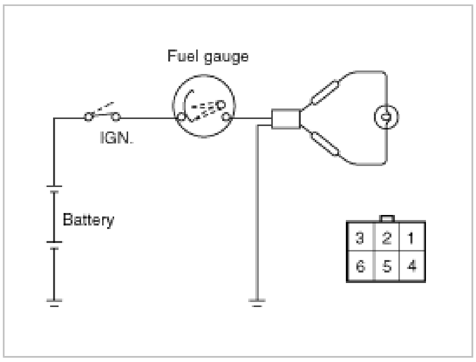
CAUTION

1. Reversing the connections of the tachometer will damage the transistor and diodes inside.
2. When removing or installing the tachometer, be careful not to drop it or subject it to severe shock.

Revolution(rpm)	1,000	2,000	3,000
Tolerance(rpm)	±120	±140	±170
Revolution(rpm)	4,000	5,000	6,000
Tolerance(rpm)	±170	±200	±200

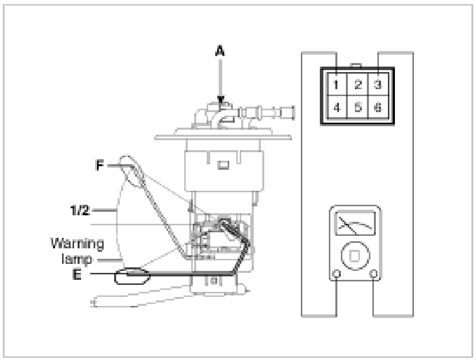
FUEL GAUGE

1. Disconnect the fuel sender connector from the fuel sender.
2. Connect a 3.4 watt, 12V test bulb to terminals 1 and 3 on the wire harness side connector.
3. Turn the ignition switch to the ON, and then check that the bulb lights up and the fuel gauge needle moves to full.



MAIN FUEL GAUGE SENDER

1. Using an ohmmeter, measure the resistance between terminals 1 and 3 of sender connector (A) at each float level.



2. Also check that the resistance changes smoothly when the float is moved from "E" to "F"

Position	Resistance(Ω)
Sender (E)	184 ± 2
Warning lamp	170 ± 2
1/2	66 ± 2
Sender (F)	15 ± 2

3. If the height resistance is unsatisfactory, replace the fuel sender as an assembly.

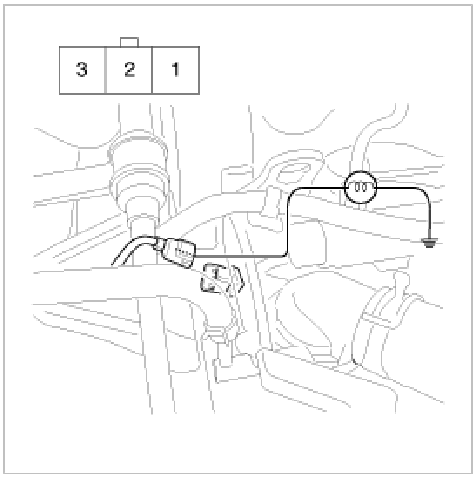
CAUTION

After completing this test, wipe the sender dry and reinstall it in the fuel tank.

ENGINE COOLANT TEMPERATURE GAUGE

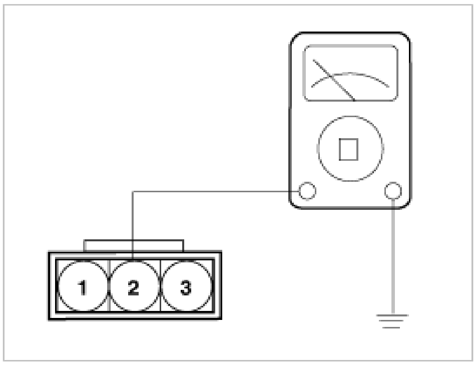
1. Disconnect the wiring connector (A) from the engine coolant temperature sender in the engine compartment.
2. Turn the ignition switch ON. Check that the gauge needle indicates cool. Turn the ignition switch OFF.

3. Connect a 12V, 3.4 wattages test bulb between the harness side connector and ground.
4. Turn the ignition switch ON.
5. Verify that the test bulb flashes and that the indicator moves to HOT.
   If operation is not as specified, replace the engine coolant temperature gauge. Then recheck the system.



ENGINE COOLANT TEMPERATURE SENDER

1. Using an ohmmeter, measure the resistance between the terminal 2 and ground.

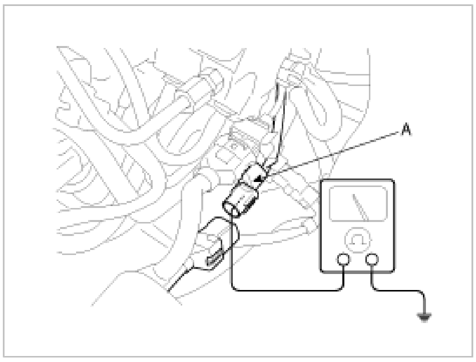


2. If the resistance value is not as shown in the table, replace the temperature sender.

Temperature [°F(°C)]	140(60)	185(85)	230(110)	257(125)
Gauge angle (°)	0	33	33	75
Resistance (Ω)	142±1	58±1	26±1	17.5±1

OIL PRESSURE SWITCH

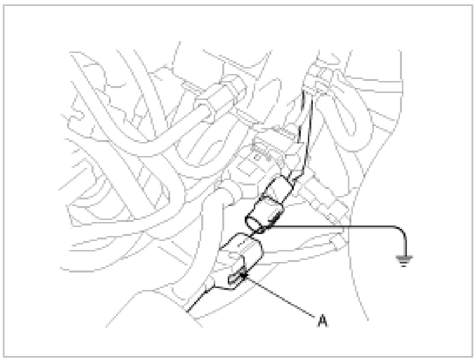
1. Check that there is continuity between the oil press switch terminal (A) and ground with the engine off.
2. Check that there is no continuity between the terminal and ground with the engine running.
3. If operation is not as specified, replace the switch.



OIL PRESSURE WARNING LAMP

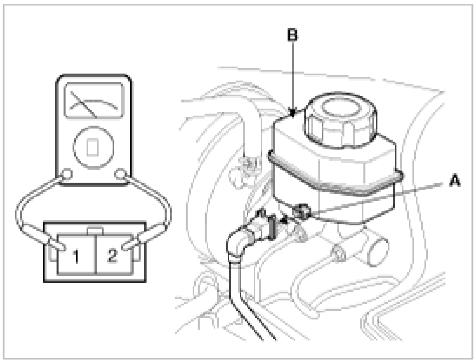
1. Disconnect the connector (A) from the warning switch and ground the terminal on the wire harness side connector.

2. Turn the ignition switch ON. Check that the warning lamp lights up. If the warning lamp doesn't light, test the bulb or inspect the wire harness.



BRAKE FLUID LEVEL WARNING SWITCH

1. Remove the connector(A) from the switch located at the brake fluid reservoir(B).
2. Verify that continuity exists between switch terminals 1 and 2 while pressing the switch (float) down with a rod.



BRAKE FLUID LEVEL WARNING LAMP

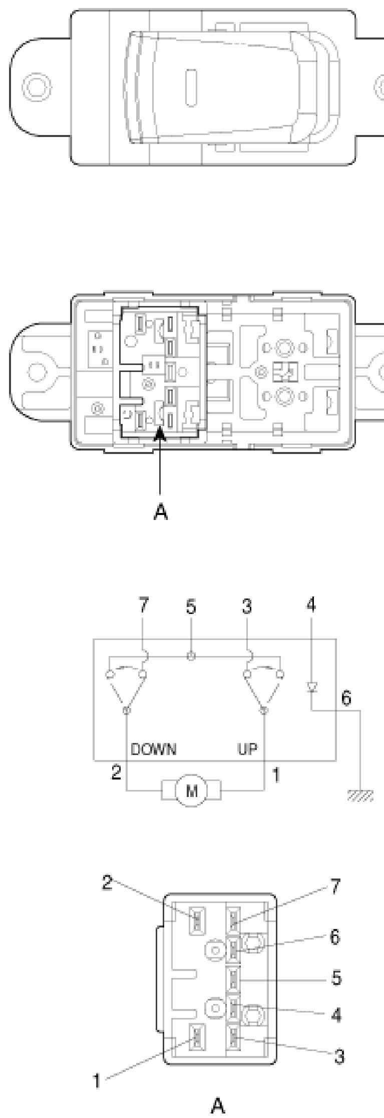
1. Ignition "ON"
2. Release the parking brake.
3. Remove the connector from the brake fluid level warning switch.
4. Ground the connector at the harness side.
5. Verify that the warning lamp lights.

PARKING BRAKE SWITCH

The parking brake switch (A) is a pulling type. It is located under the parking brake lever. To adjust, move the switch mount up and down with the parking brake lever released all the way.

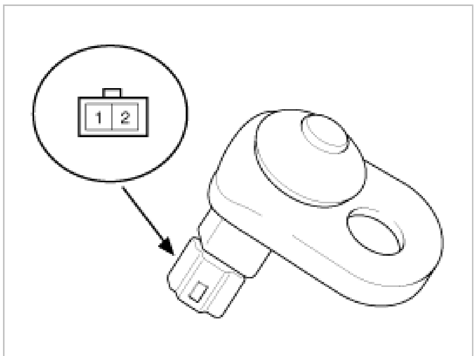
1. Check that there is continuity between the terminal and switch body with the switch ON (Lever is pulled).
2. Check that there is no continuity between the terminal and switch body with the switch OFF (Lever is released).
   If continuity is not as specified, replace the switch or inspect its ground connection.

[Assist & rear]



DOOR SWITCH

Remove the door switch and check for continuity between the terminals.



[FRONT DOOR SWITCH]

Position \ Terminal	1	2	Body (Ground)
Free(Door open)	○	○	○
Push(Door close)			

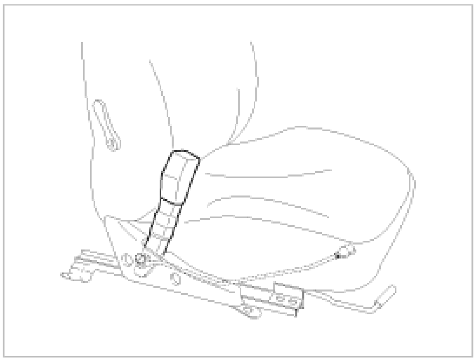
[REAR DOOR SWITCH]

Position \ Terminal	1	Ground
Free(Door open)	○	○
Push(Door close)		

SEAT BELT SWITCH

1. Remove the connector from the switch.
2. Check for continuity between terminals.

Seat belt condition	Continuity
Fastened	Non-conductive (∞Ω)
Not fastened	Conductive (Ω)



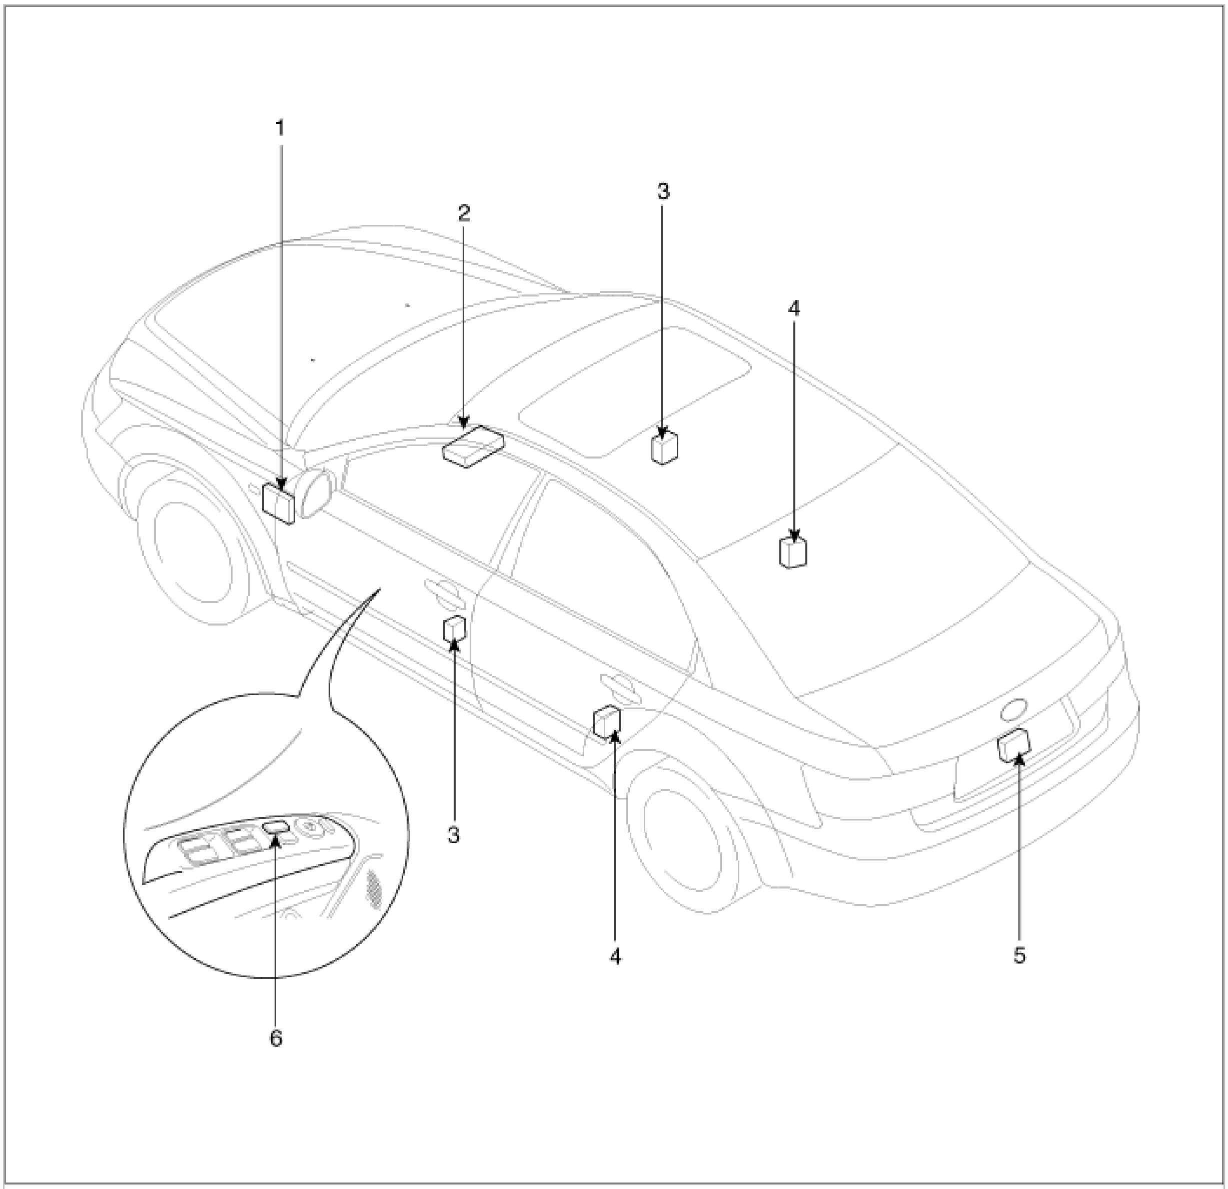
SEAT BELT WARNING LAMP

With the ignition switch turned ON, verify that the lamp glows.

Seat belt condition	Warning lamp
Fastened	OFF
Not fastened	ON

Body Electrical System > Power Door Locks > Components and Components Location

COMPONENT LOCATION

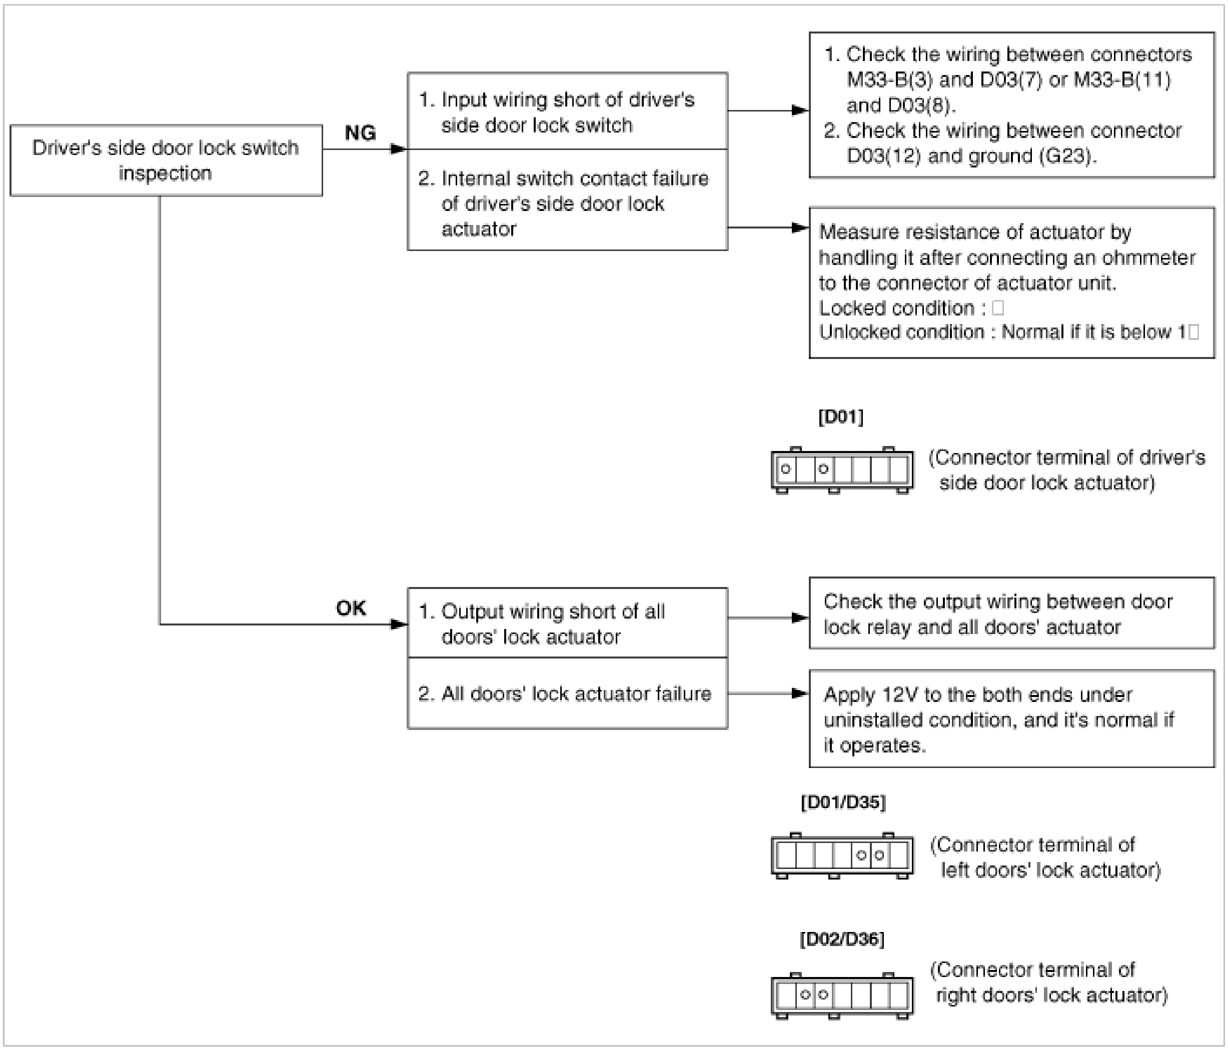


1. Junction box (Door lock/unlock relay)
2. Body control box
3. Front door lock actuator & switch
4. Rear door lock actuator & switch
5. Trunk lid release actuator
6. Door lock switch

Body Electrical System > Power Door Locks > Troubleshooting

TROUBLESHOOTING

1. Lock function works but unlock function does not work. → Since door unlock relay is malfunction, replace the door unlock relay.
2. Unlock function works but lock function does not work. → Since door lock relay is malfunction, replace the door lock relay.
3. When passenger side knob is controlled, all doors locks, but when driver side knob is controlled, all doors do not lock.



4. When driver side knob is controlled. All doors lock. But when the passenger side knob is controlled, all doors do not lock.

Passenger's side door lock switch inspection

- **NG** →
  - 1. Input wiring short of passenger's side door lock switch → 1. Check the wiring between connectors M33-B(3) and D04(2) or M33-B(11) and D04(1) . 2. Check the wiring between connector D04(8) and ground (G28).
  - 2. Internal switch contact failure of passenger's side door lock actuator → Measure resistance of actuator by handling it after connecting an ohmmeter to the connector of actuator unit. Locked condition : □ Unlocked condition : Normal if it is below 1□

[D02]

(Connector terminal of passenger's side door lock actuator)

- **OK** →
  - 1. Output wiring short of all doors' lock actuator → Check the output wiring between door lock relay and all doors' actuator.
  - 2. All doors' lock actuator failure → Apply 12V to the both ends under uninstalled condition, and it's normal if it operates.

[D01/D35]

(Connector terminal of left doors' lock actuator)

[D02/D36]

(Connector terminal of right doors' lock actuator)

5. Both sides do not lock either.

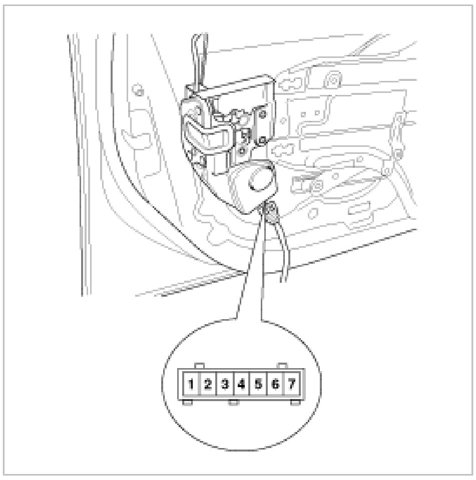
- Door lock fuse(20A) short check — **NG** → Replace the fuse
- **OK** ↓
- Door lock/unlock relay inspection (See page BE-93) — **NG** → Replace the relay
- **OK** ↓
- Door lock switch input signal inspection (BCM connector M33-C terminal 6) — **NG** → Check for an open in the wire
- **OK** ↓
- Door unlock switch input signal inspection (BCM connector M33-C terminal 19) — **NG** → Check for an open in the wire
- **OK** ↓
- Replace the BCM

Body Electrical System > Power Door Locks > Power Door Lock Actuators > Repair procedures

INSPECTION

FRONT DOOR LOCK ACTUATOR INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

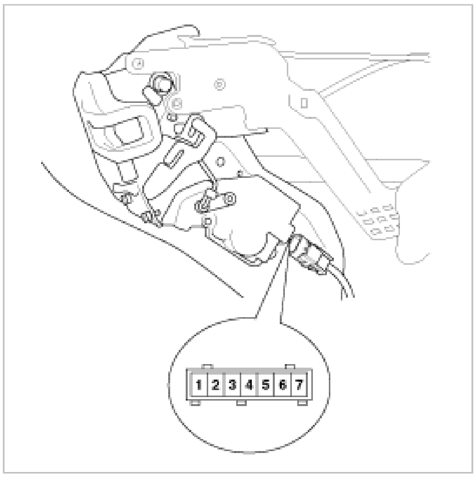


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Front left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Front right	Lock		⊕		⊖
	Unlock		⊖		⊕

REAR DOOR LOCK ACTUATOR INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

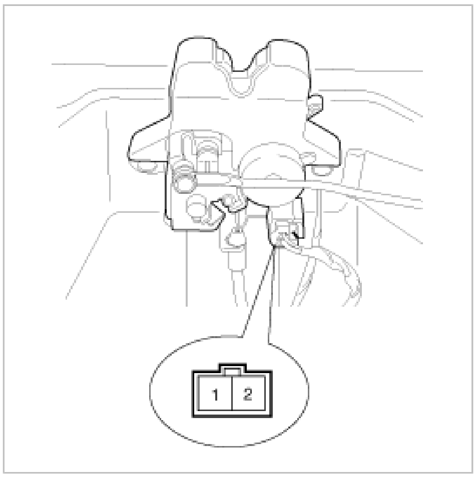


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Rear left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Rear right	Lock		⊕		⊖
	Unlock		⊖		⊕

TRUNK LID RELEASE ACTUATOR INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
2. Disconnect the 2P connector from the actuator.

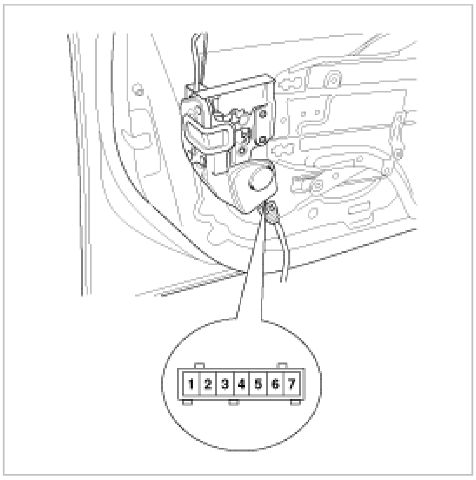


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	2	Chassis ground
Open	⊕	⊖

FRONT DOOR LOCK SWITCH INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

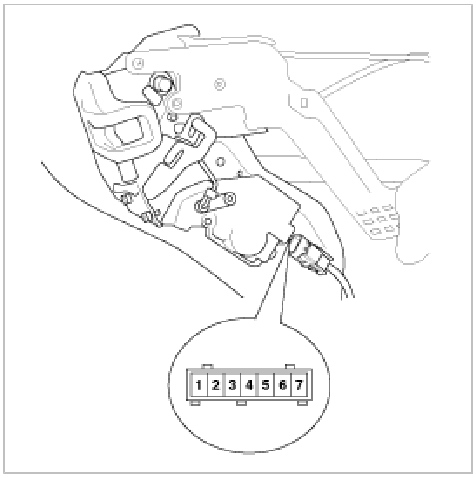


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Front left	Lock				
	Unlock	○		○	
Front right	Lock				
	Unlock		○		○

REAR DOOR LOCK SWITCH INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

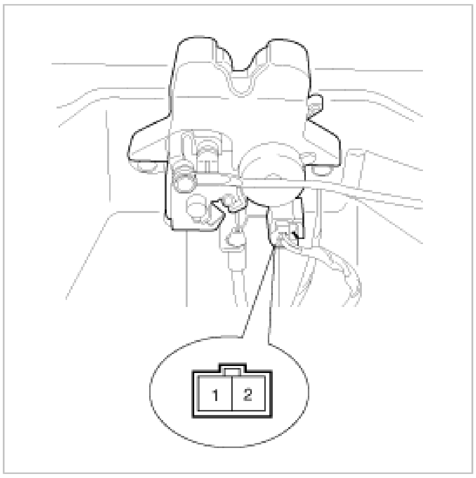


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Rear left	Lock				
	Unlock	O	—	O	
Rear right	Lock				
	Unlock		O	—	O

TRANK LID OPEN SWITCH INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
2. Disconnect the 2P connector from the actuator.



3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal	1	Chassis ground
Open	⊕	⊖

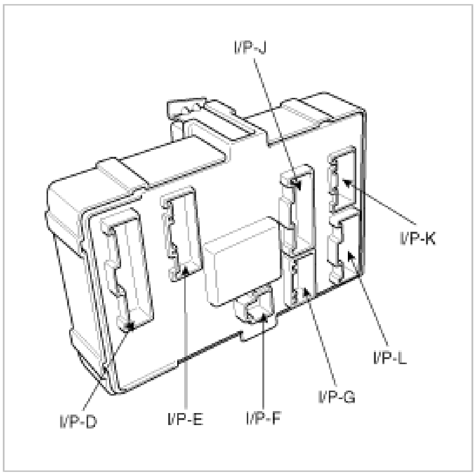
Body Electrical System > Power Door Locks > Power Door Lock Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.

DOOR LOCK

1. There should be continuity between the No.12 and No.9 terminals in the I/P-D when power and ground are connected to the No.12 terminal in the I/P-E and No.9 terminal in the I/P-D.
2. There should be no continuity between the No.12 terminal in the I/P-E and No.9 terminal in the I/P-D when power is disconnected.



Terminal / Position	I/P-K (9)	I/P-A (15)	I/P-D (16)	I/P-B (13)

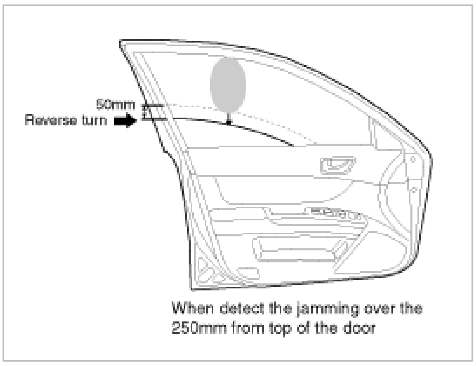
Body Electrical System > Power Windows > Description and Operation

FUNCTION OF SAFETY POWER WINDOW

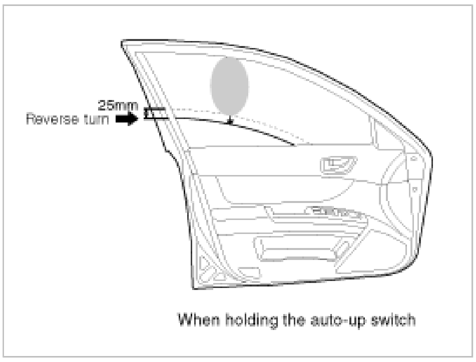
When driver door power window auto-up switch is operated, safety function is activated.

1. Safety function condition
   When detect the force of 100N during the window rising, window is reversed.
2. Length of window reversing (except holding the auto-up switch)
   A. When detect the jamming during the 4mm ~ 250mm from top of the door.
   → Window is reversed until 300mm from top of the door.

   B. When detect the jamming over the 250mm from top of the door.
   → Window is reversed until 50mm from jamming position.



3. Length of window reversing (holding the auto-up switch)
   A. When detect the jamming during holding the auto-up switch.
      → Window is reversed until 25mm from jamming position.
   B. Auto-up function is not available during the 5 seconds from above condition.
      → When holding the auto-up switch, window is operated as a manual-up function. (Safety function is not activated.)
   C. When holding the auto-up switch after 5 seconds from above condition.
      → Window is reverse until 25mm from jamming position.



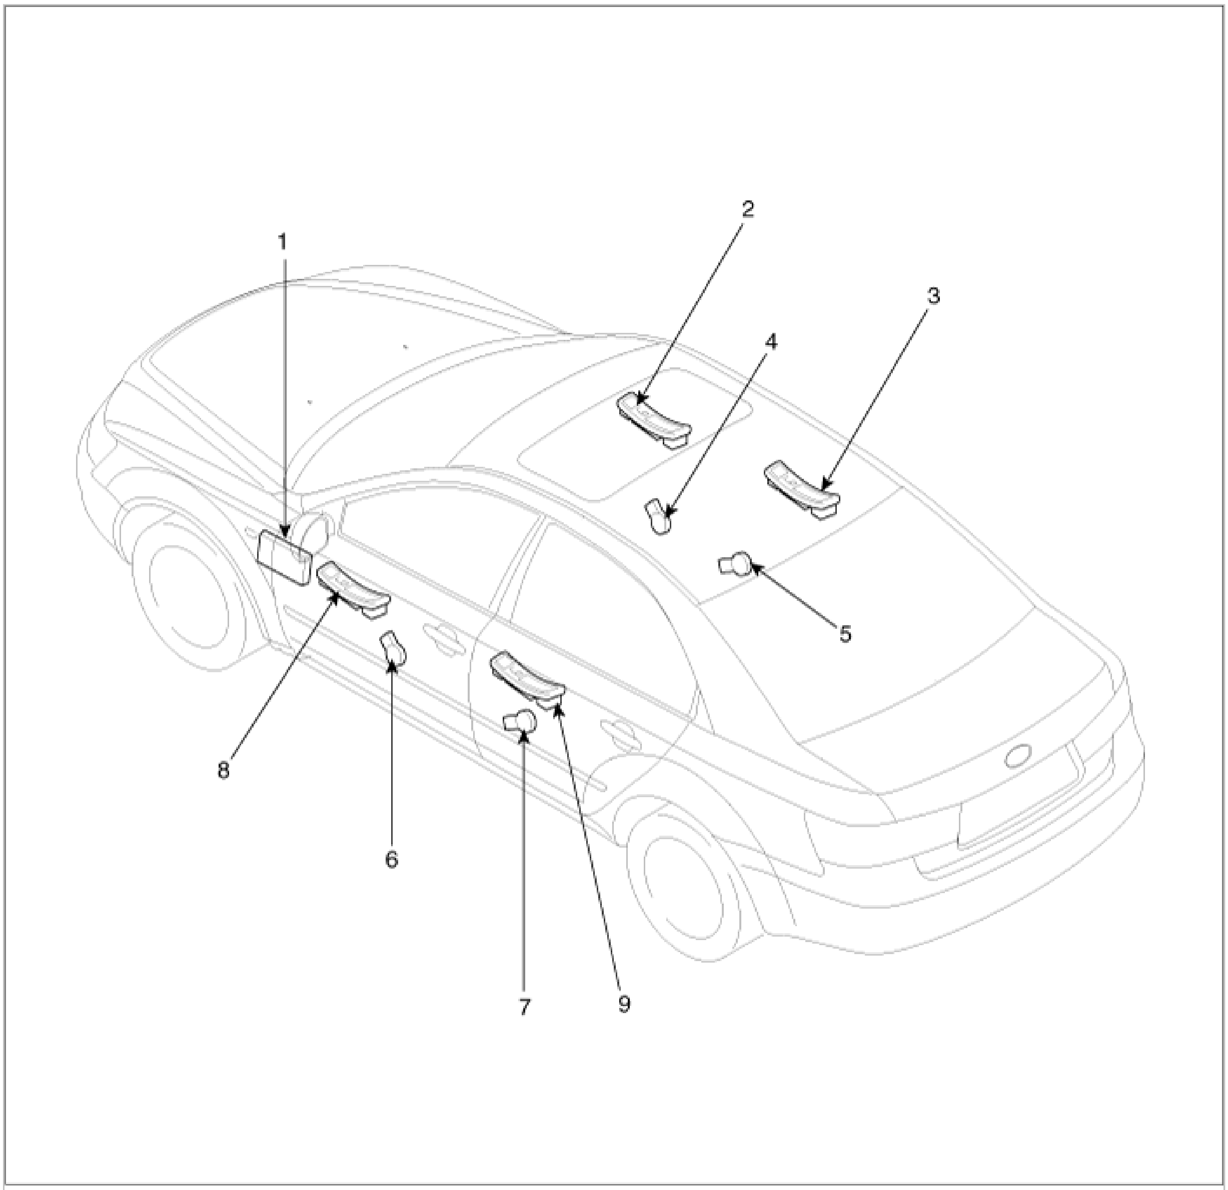
4. Safety function is not available area
   Safety function is not available during the 4mm from top of the door.

INITIALIZING METHOD OF THE SAFETY POWER WINDOW

1. Initializing of Battery Connection
   When the battery is not connected the vehicle over the 5 minutes, safety power window switch need the initializing.
   (1) Power window operation before initializing
      A. Manual-Up/Down function is available
      B. Auto-Up function is not available
         (When holding the auto-up/down switch, window is operated as a manual-up/down.)
   (2) Initializing method
      Close the window in window open position, and holding the switch in window full close position over the 0.2 second.
      (If start the closing the window in window full close position, initializing could be failed.)
   (3) If initialize the safety power window in jamming status, could occur below conditions.
      A. Safety function is not available
2. Initializing of fail safe mode
   (1) If the window moved by compulsion and motor have a problem, power window switch could be entering the fail safe mode for user's safety.
   (2) Power window operation in fail mode
      A. Auto/Manual-Down function is available
      B. Auto/Manual-Up function is not available
         (When auto/manual-up is operated, window is rising 20mm and is stopped the moving.)

Body Electrical System > Power Windows > Components and Components Location

COMPONENT LOCATION

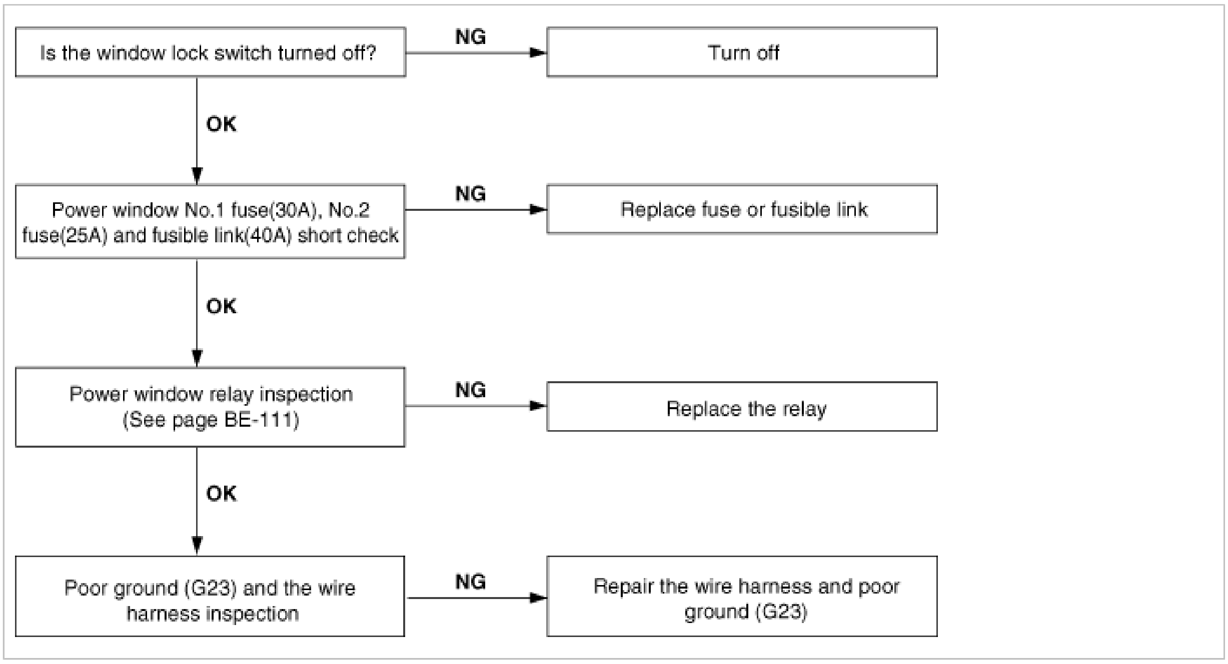


1. Passenger compartment junction box (Power window relay)
2. Assist window switch
3. Rear window switch
4. Front window motor
5. Rear window motor
6. Front window motor (Safety window)
7. Rear window motor
8. Driver window main switch
9. Rear window switch

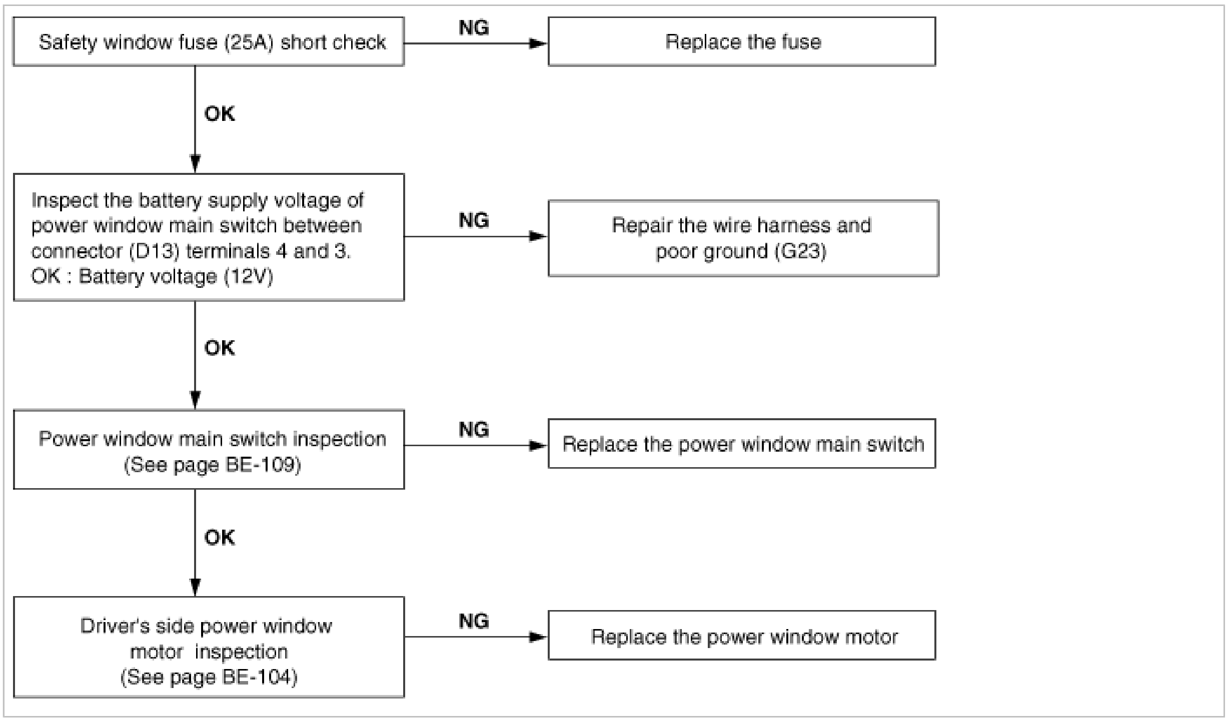
Body Electrical System > Power Windows > Troubleshooting

TROUBLESHOOTING

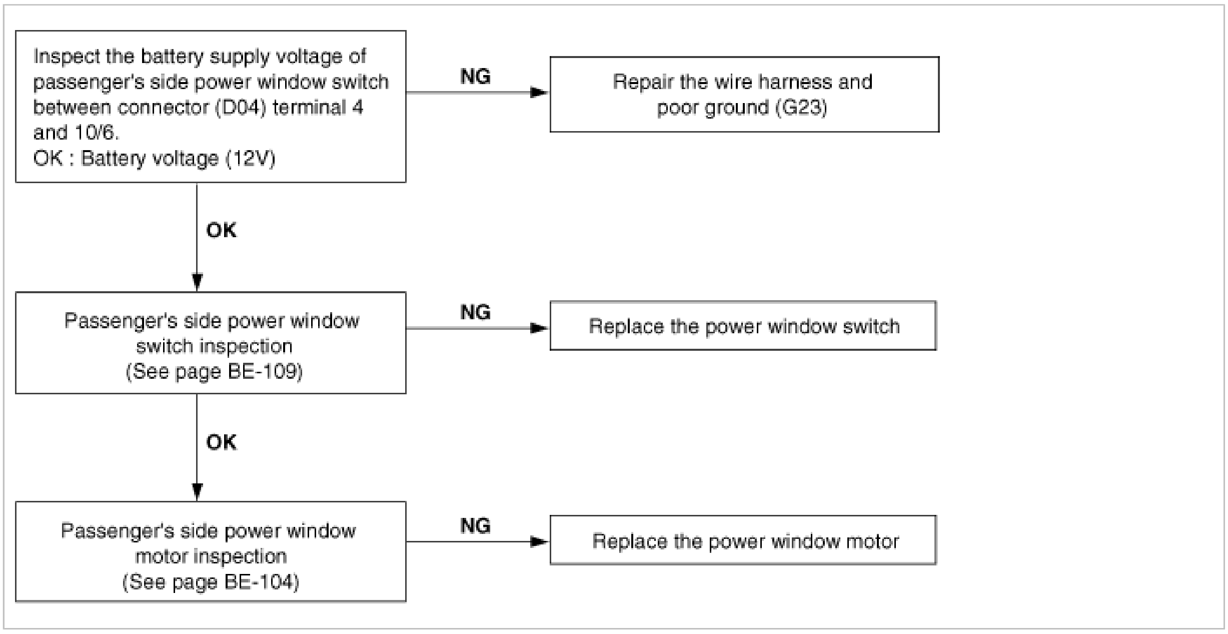
1. No windows operate from the main switch on the driver's door.



2. Driver's side window does not operate.



3. Passenger's side window does not operate.

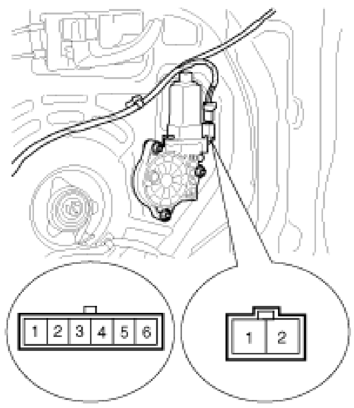


Body Electrical System > Power Windows > Power Window Motor > Repair procedures

INSPECTION

FRONT POWER WINDOW MOTOR INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Disconnect the connector from the motor.



[Safety power window]

3. Connect the motor terminals directly to battery voltage (12V) and check that the motor operates smoothly. Next, reverse the polarity and check that the motor operates smoothly in the reverse direction. If the operation is abnormal, replace the motor.

Position \ Terminal			1	2
LH	UP	Clockwise	⊖	⊕
	DOWN	Counter-clockwise	⊕	⊖
RH	DOWN	Clockwise	⊕	⊖

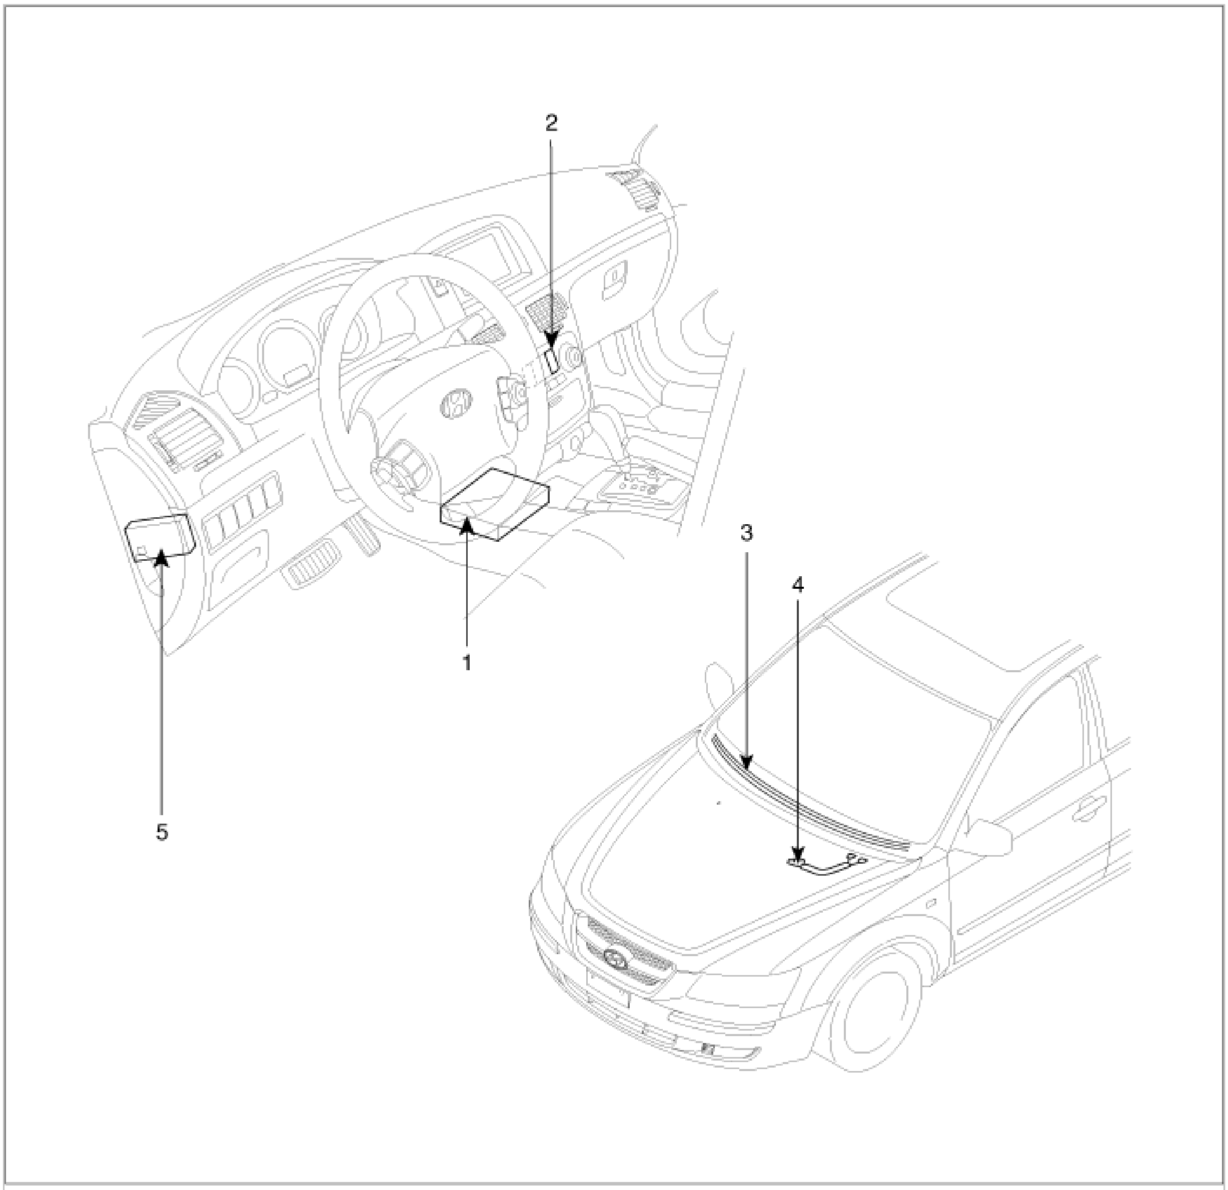
Body Electrical System > Windshield Deicer > Description and Operation

DESCRIPTION

Windshield deicer system prevent windshield wiper from freezing in the winter season. It consists of deicer in the lower part of windshield, switch and relay. Body control module receives an input signal from the deicer switch, then controls relay. Operating condition is the same that of rear window defogger system.
Since the generator "L" is switched ON, if the deicer switch is ON, then deicer output is ON for 20 minutes.

Body Electrical System > Windshield Deicer > Components and Components Location

COMPONENT LOCATION

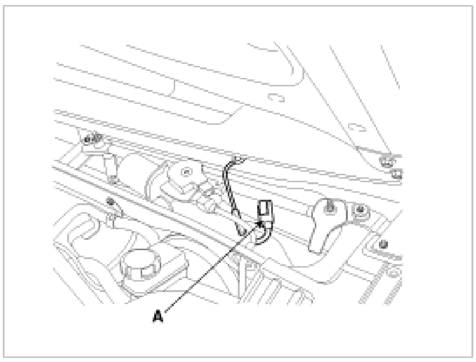


1. Body control module
2. Windshield deicer switch
3. Windshield deicer
4. Deicer connector
5. Windshield deicer relay (Built-in junction box)

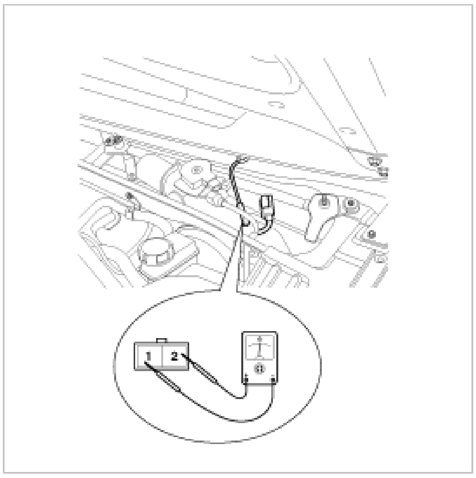
Body Electrical System > Windshield Deicer > Windshield Deicer > Repair procedures

INSPECTION

1. Remove the cowl top cover.(Refer to the wiper)
2. Disconnect the windshield deicer connector (A) from the wiper motor linkage.

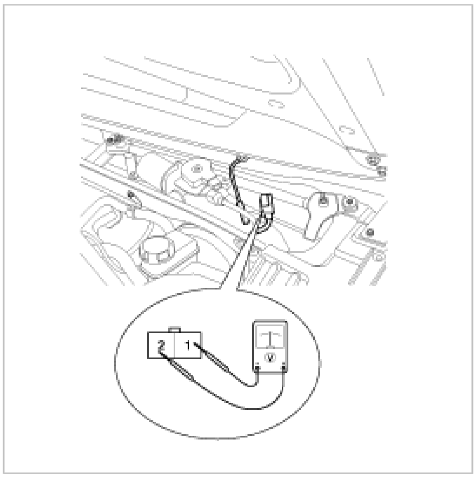


3. Check for continuity between the terminals of deicer lines.



4. Turn the ignition switch ON and the windshield deicer switch ON, then measure the voltage between the terminals of harness side deicer connector.

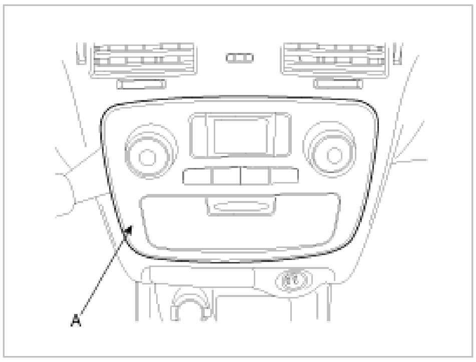
OK: approx. Battery voltage



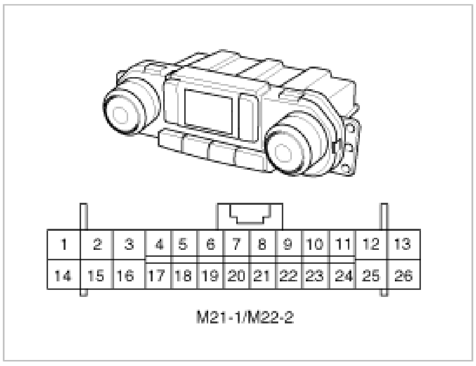
Body Electrical System > Windshield Deicer > Windshield Deicer Switch > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the center facia panel(A) by using a scraper (B). Take care of fixing clip.



3. Disconnect the connectors.
4. Using an ohmmeter, inspection the continuity between the terminals after removing to the switch connector.



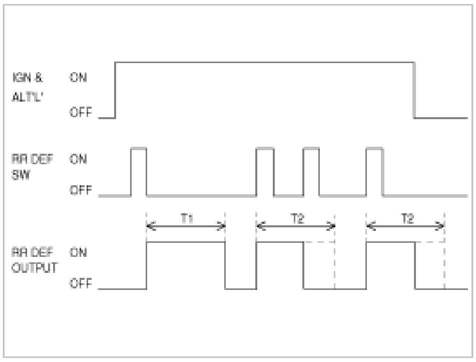
Terminal / Position	M22-2 (23)	M22-2 (26)	M21-1 (26)	M21-1 (10)
ON (Manual)	O	O		
ON (Auto)			O	O
OFF				

Body Electrical System > Windshield Deicer > Windshield Deicer Timer > Repair procedures

INSPECTION

While operating the components, check whether the operations are normal as shown in the timing chart.

1. Once ALT "L" is ON, if the defogger is switched ON, the defogger will stay ON for 20 minutes duration.
2. If defogger switch is pressed again (see Step 1), or if ignition is switched OFF, the defogger will shut OFF.

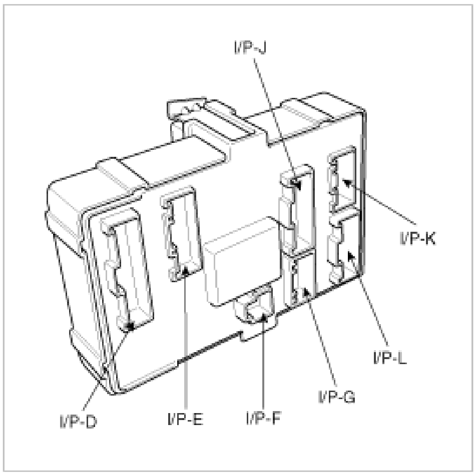


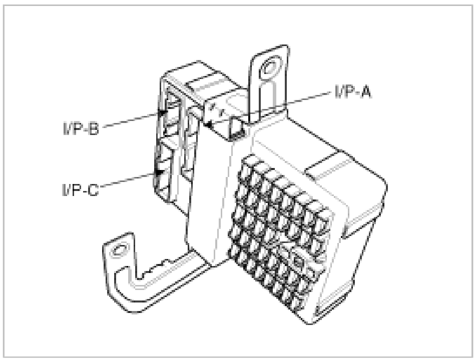
T1 : 20 ± 1 min.
T2 : MAX 20 ± 1 min.

Body Electrical System > Windshield Deicer > Windshield Deicer Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.
4. There should be continuity between the No.2 in the I/P-G and No.8 terminal in the I/P-K when power and ground are connected to the No.2 terminal in the I/P-G and No.8 terminal in the I/P-C.
5. There should be no continuity between the No.2 terminal in the I/P-G and No.8 terminal in the I/P-K when power is disconnected.

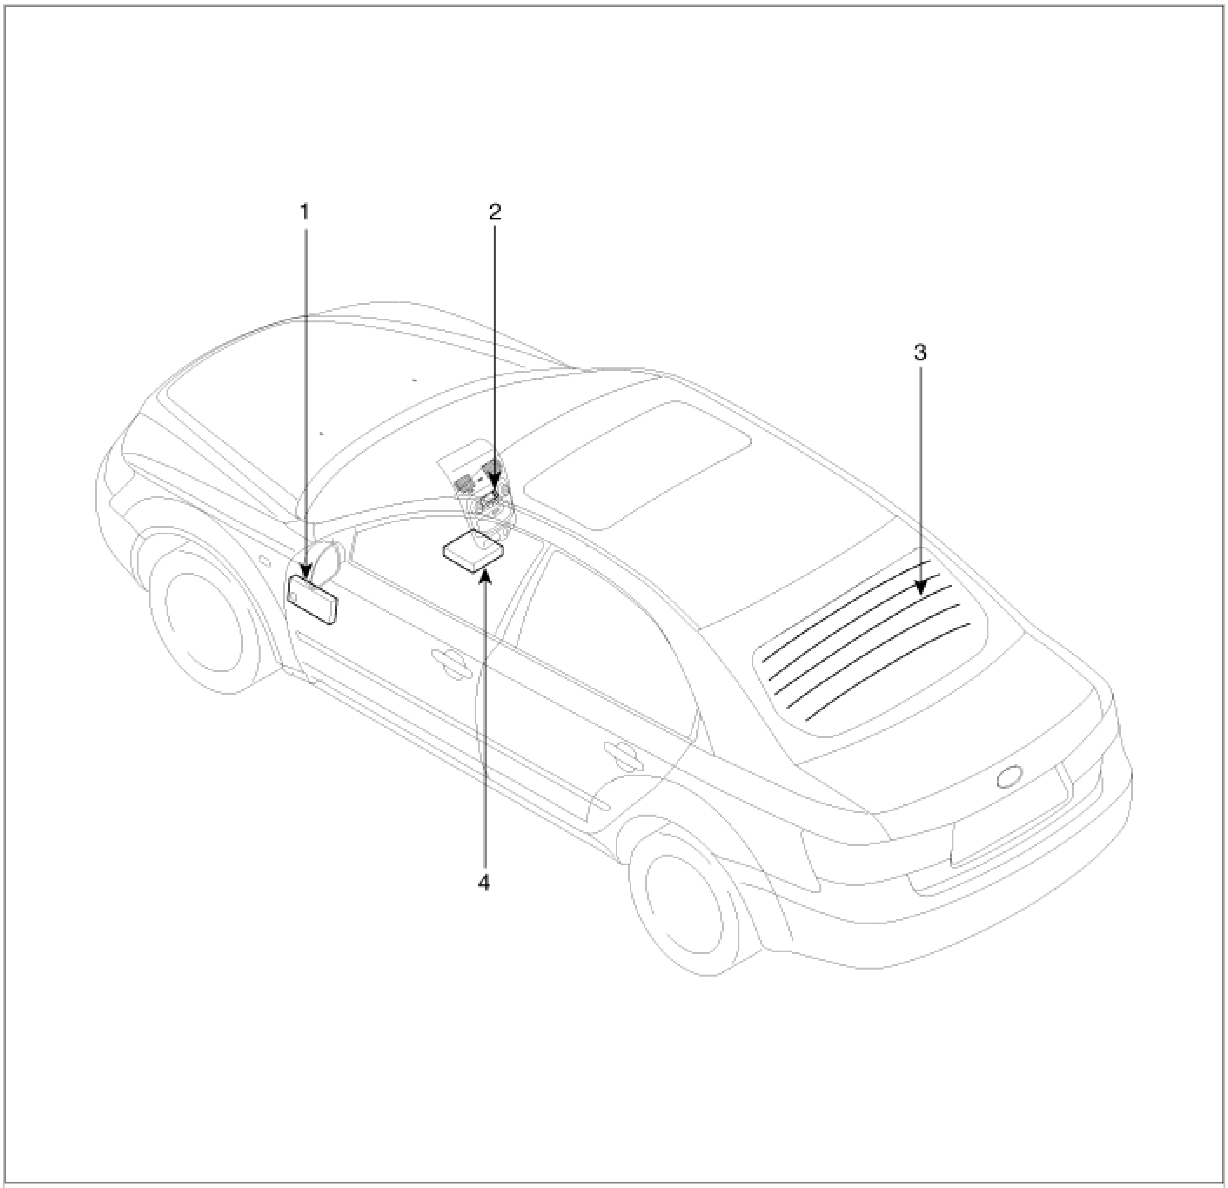




Terminal / Power	I/P-K (8)	I/P-G (2)	I/P-C (8)	I/P-G (2)
Disconnected			○	○
Connected	○	○	⊖	⊕

Body Electrical System > Rear Window Defogger > Components and Components Location

COMPONENT LOCATION



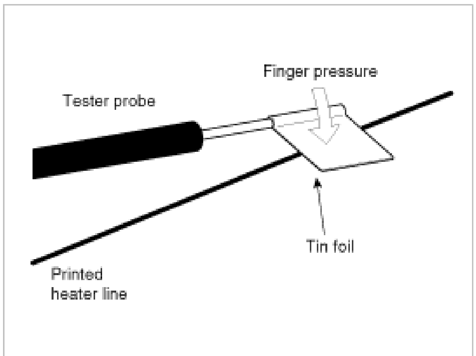
1. Junction box (Rear window defogger)
2. Rear window defogger switch (A/C controller)
3. Rear window defogger
4. Body control module

Body Electrical System > Rear Window Defogger > Rear Window Defogger Printed Heater > Repair procedures

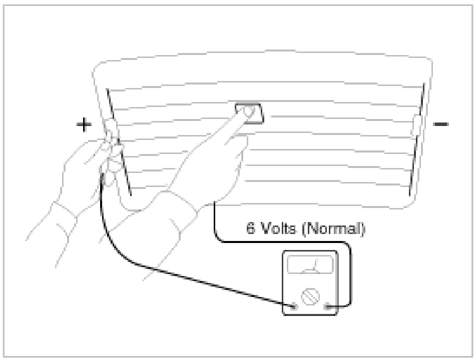
INSPECTION

CAUTION

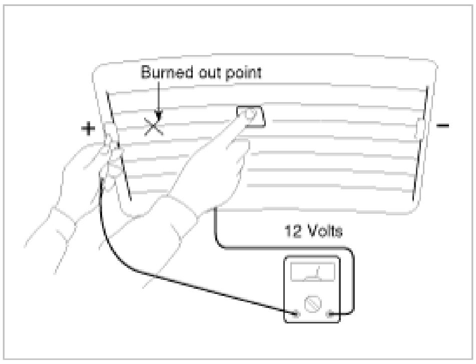
Wrap tin foil around the end of the voltmeter test lead to prevent damaging the heater line. Apply finger pressure on the tin foil, moving the tin foil along the grid line to check for open circuits.



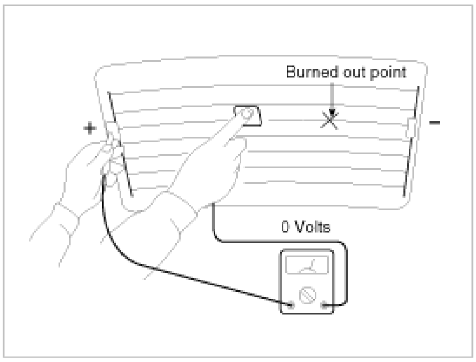
1. Turn on the defogger switch and use a voltmeter to measure the voltage of each heater line at the glass center point. If a voltage of approximately 6V is indicated by the voltmeter, the heater line of the rear window is considered satisfactory.



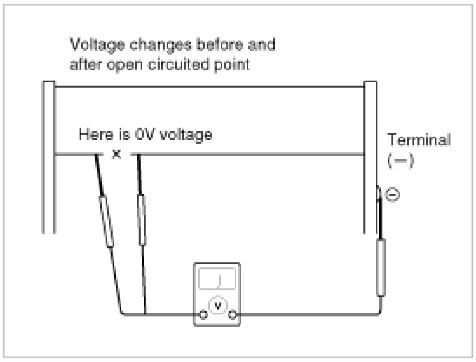
2. If a heater line is burned out between the center point and (+) terminal, the voltmeter will indicate 12V.



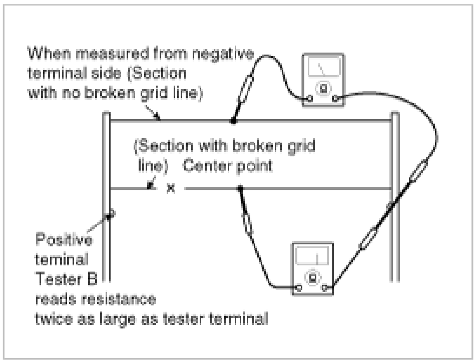
3. If a heater line is burned out between the center point and (-) terminal, the voltmeter will indicate 0V.



4. To check for open circuits, slowly move the test lead in the direction that the open circuit seems to exist. Try to find a point where a voltage is generated or changes to 0V. The point where the voltage has changed is the open-circuit point.



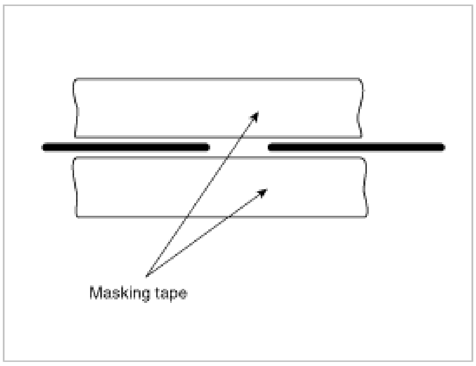
5. Use an ohmmeter to measure the resistance of each heater line between a terminal and the center of a grid line, and between the same terminal and the center of one adjacent heater line. The section with a broken heater line will have a resistance twice as that in other sections. In the affected section, move the test lead to a position where the resistance sharply changes.



REPAIR OF BROKEN HEATER LINE

Prepare the following items:

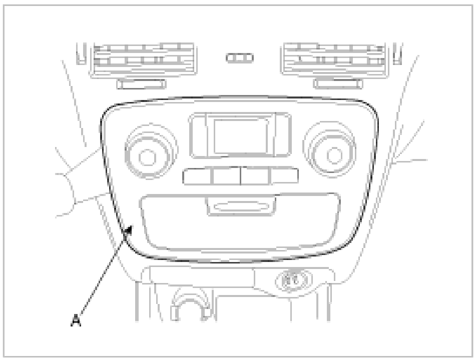
1. Conductive paint.
2. Paint thinner.
3. Masking tape.
4. Silicone remover.
5. Using a thin brush:
   Wipe the glass adjacent to the broken heater line, clean with silicone remover and attach the masking tape as shown. Shake the conductive paint container well, and apply three coats with a brush at intervals of about 15 minutes apart. Remove the tape and allow sufficient time for drying before applying power. For a better finish, scrape away excess deposits with a knife after the paint has completely dried. (Allow 24 hours).



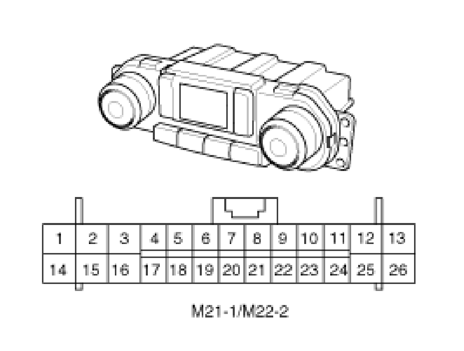
Body Electrical System > Rear Window Defogger > Rear Window Defogger Switch > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the center facia panel(A) by using a scraper (B). Take care of fixing clip.



3. Disconnect the connectors.
4. Using an ohmmeter, inspection the continuity between the terminals after removing to the switch connector.

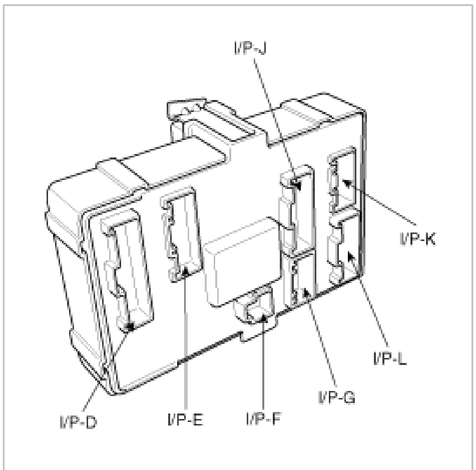


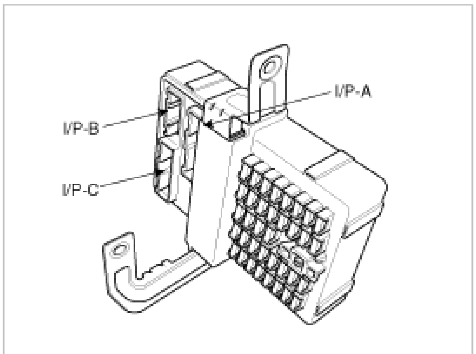
Position \ Terminal	M22-2 (23)	M22-2 (26)	M21-1 (26)	M21-1 (10)
ON (Manual)	O	O		
ON (Auto)			O	O
OFF				

Body Electrical System > Rear Window Defogger > Rear Window Defogger Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.
4. There should be continuity between the No.2 in the I/P-G and No.7 terminal in the I/P-C when power and ground are connected to the No.2 terminal in the I/P-G and No.8 terminal in the I/P-C.
5. There should be no continuity between the No.2 terminal in the I/P-G and No.7 terminal in the I/P-C when power is disconnected.





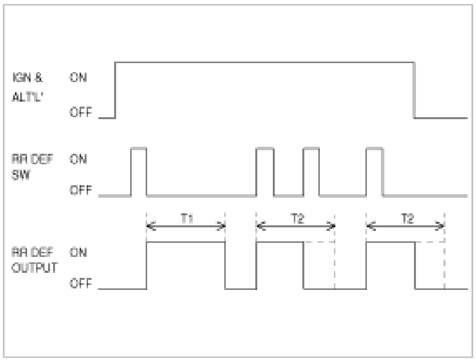
Power \ Terminal	I/P-C (7)	I/P-G (2)	I/P-C (8)	I/P-G (2)
Disconnected			○—	—○
Connected	○—	—○	⊖—	—⊕

Body Electrical System > Rear Window Defogger > Rear Window Defogger Timer > Repair procedures

INSPECTION

While operating the components, check whether the operations are normal as shown in the timing chart.

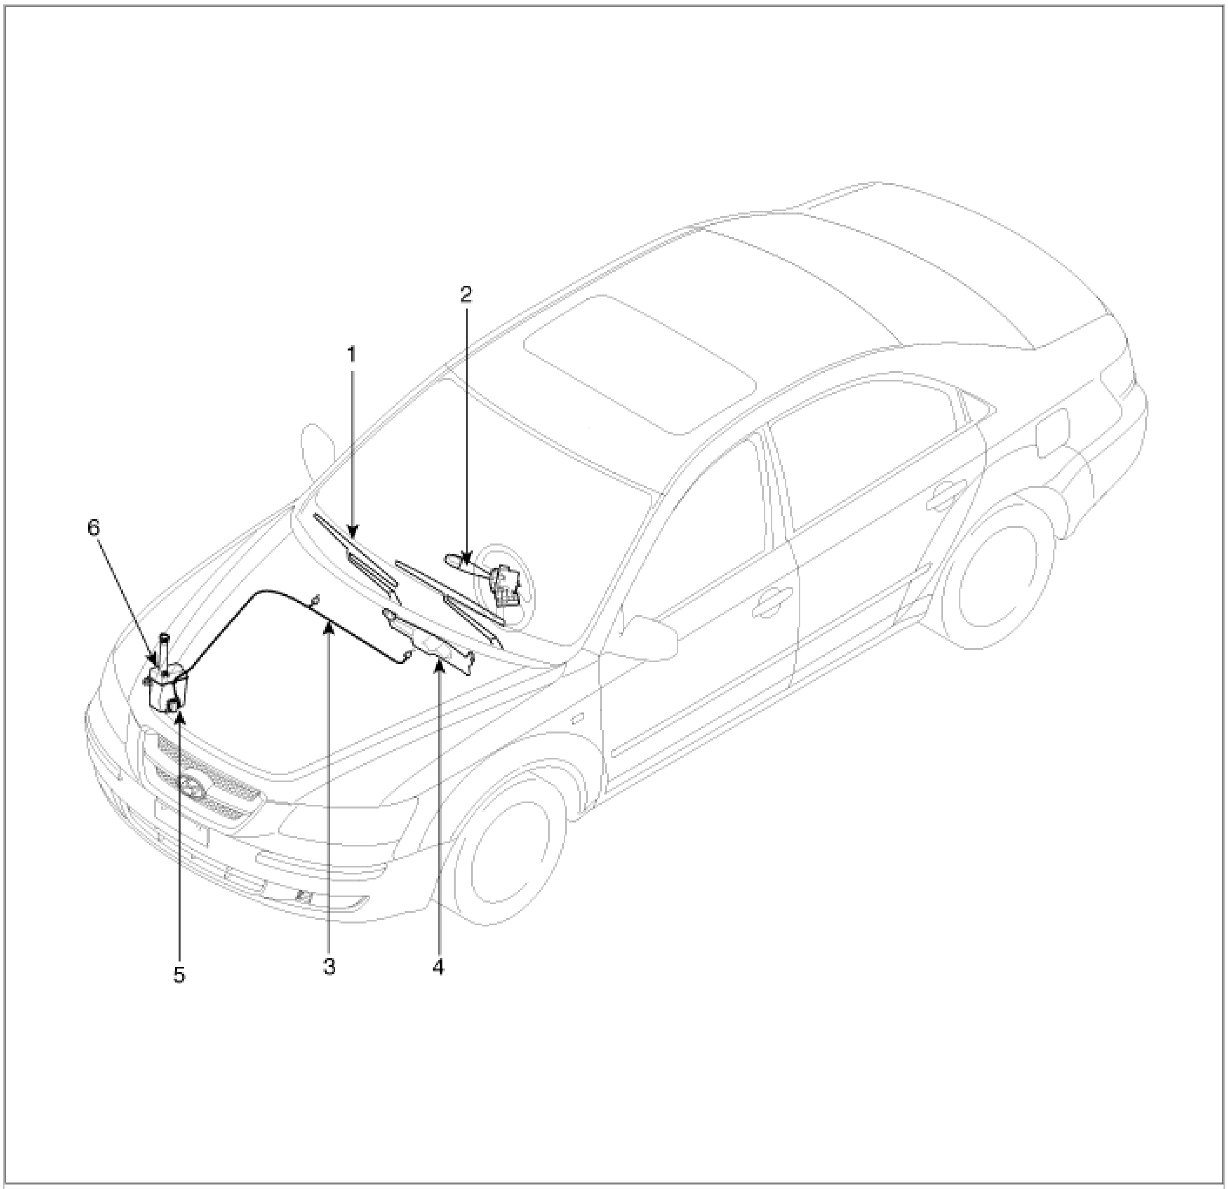
1. Once ALT "L" is ON, if the defogger is switched ON, the defogger will stay ON for 20 minutes duration.
2. If defogger switch is pressed again (see Step 1), or if ignition is switched OFF, the defogger will shut OFF.



T1 : 20 ± 1 min.
T2 : MAX 20 ± 1 min.

Body Electrical System > Windshield Wiper/Washer > Components and Components Location

COMPONENT LOCATION

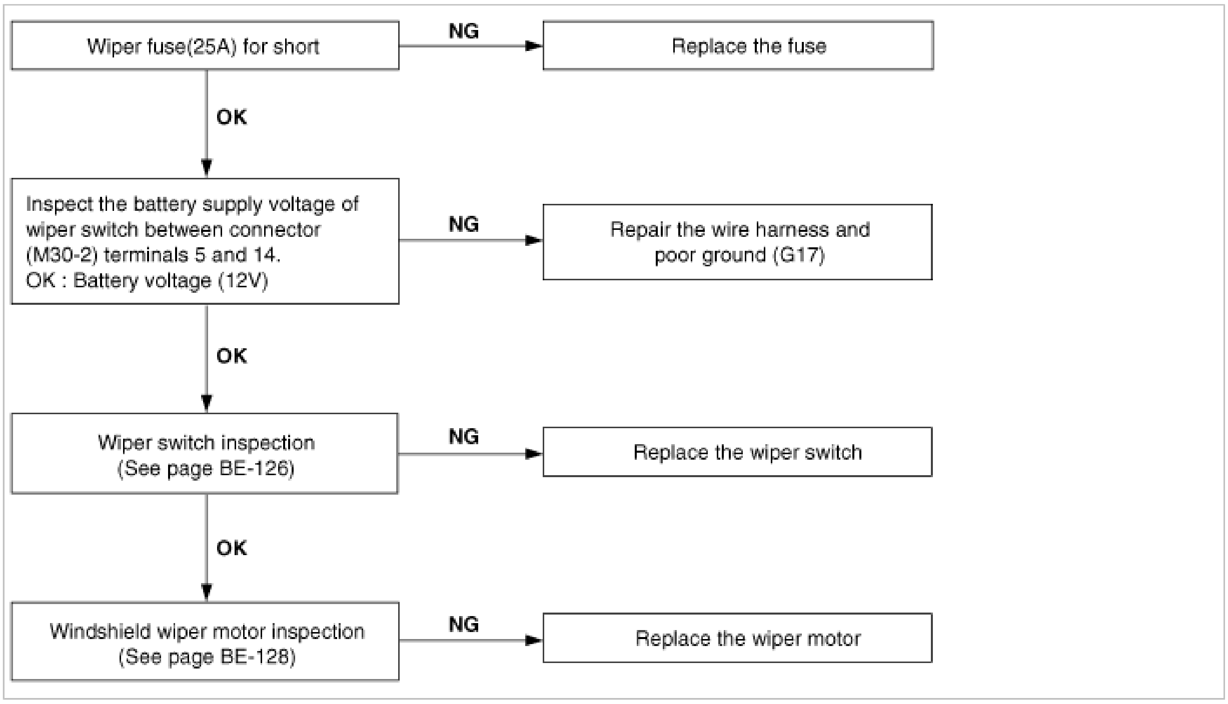


1. Windshield wiper arm & blade
2. Wiper & washer switch
3. Windshield washer hose
4. Windshield wiper motor & linkage
5. Washer motor
6. Washer reservoir

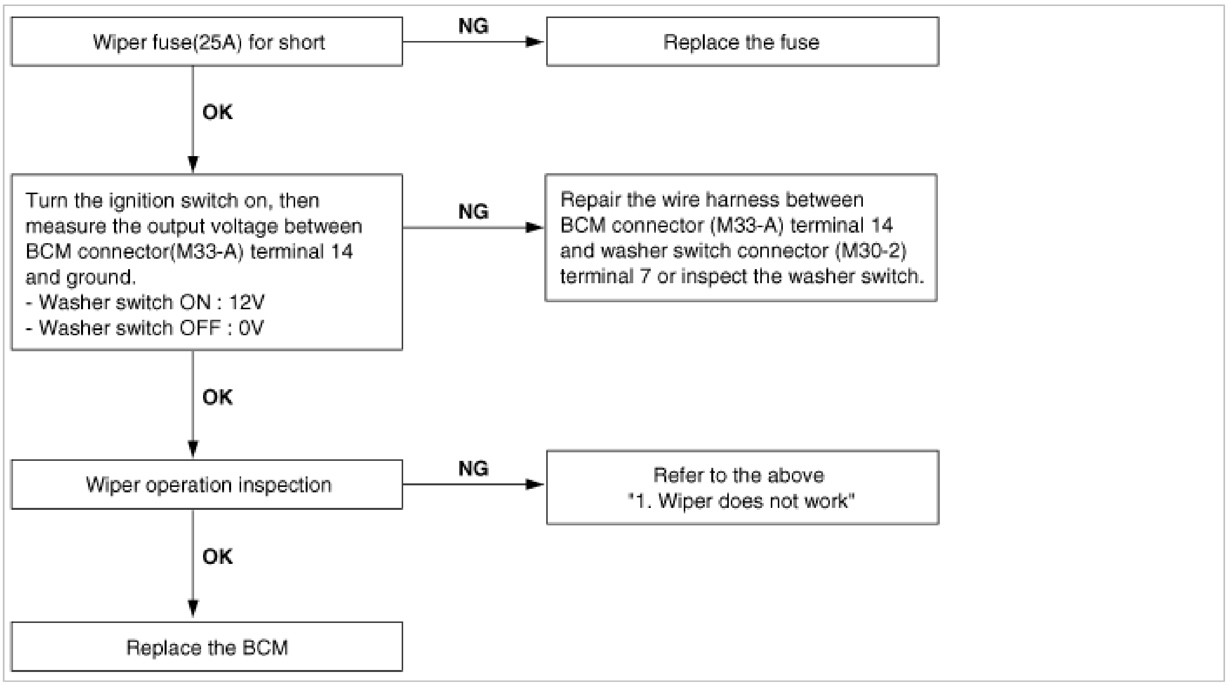
Body Electrical System > Windshield Wiper/Washer > Troubleshooting

TROUBLESHOOTING

1. Wiper low and wiper high do not work.



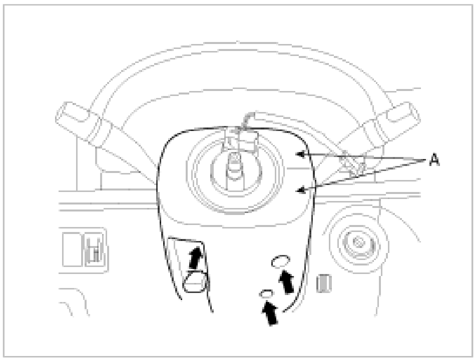
2. When washer switch is on, wiper does not work.



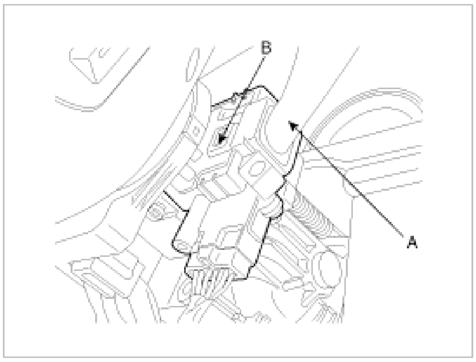
Body Electrical System > Windshield Wiper/Washer > Windshield Wiper/Washer Switch > Repair procedures

REPLACEMENT

1. Remove the steering column upper and lower shrouds (A) after removing 3 screws.



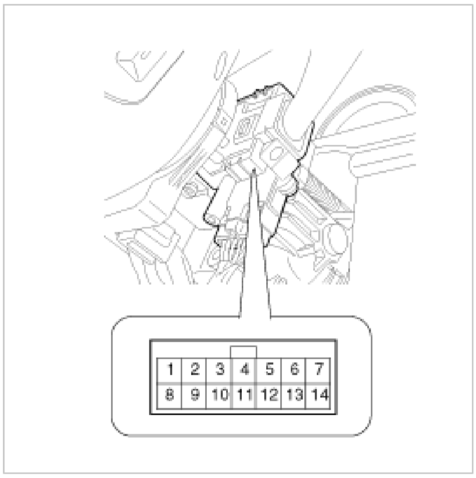
2. Remove the wiper switch (A) by pushing the lock pin (B) after disconnecting the connector.



3. Installation is the reverse of removal.

INSPECTION

Check for continuity between the terminals while operating the wiper and washer switch. If it is not normal condition, replace wiper and wiper switch.



WIPER SWITCH

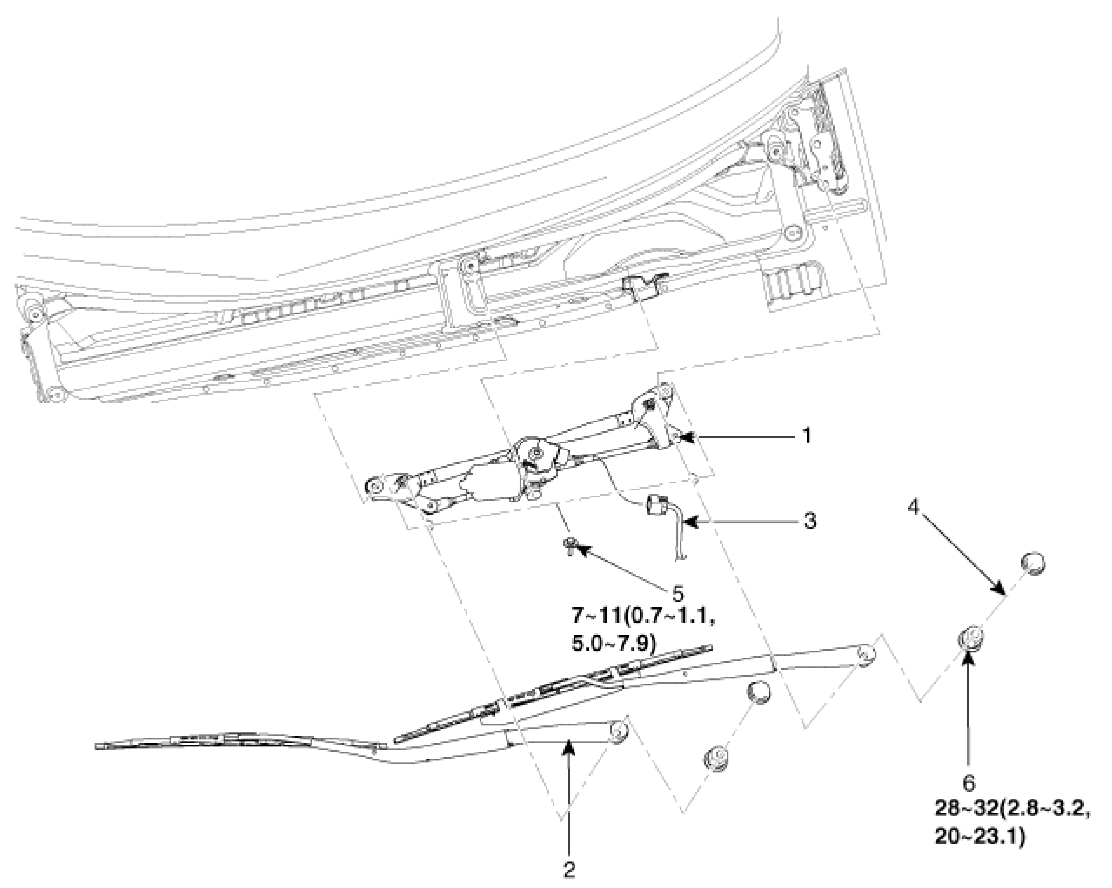
Position \ Terminal	1	2	3	4	5	6	13	14
MIST				O	O			
OFF		O	O					
INT		O	O		O	O	O	O
LOW		O			O			
HI	O				O			

WASHER SWITCH

Position \ Terminal	5	7
OFF		
ON	O	O

Body Electrical System > Windshield Wiper/Washer > Front Wiper Motor > Components and Components Location

COMPONENT LOCATION



TORQUE : Nm(kgf.m, lbf.ft)

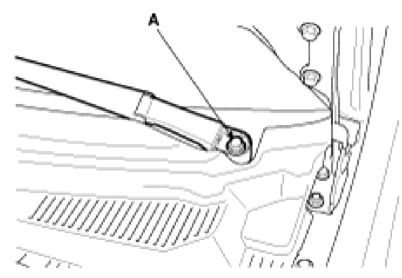
1. Wiper motor & linkage assembly	4. Cap
2. Wiper arm & blade	5. Bolt
3. Wiper motor connector	6. Nut

Body Electrical System > Windshield Wiper/Washer > Front Wiper Motor > Repair procedures

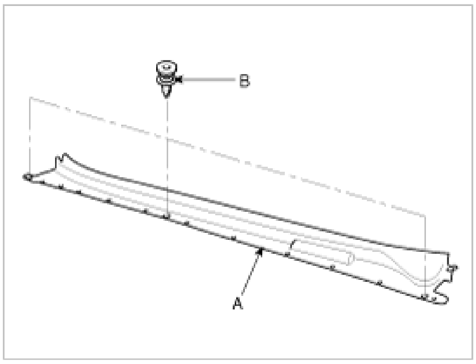
REMOVAL

1. Remove the windshield wiper arm and blade after removing a nut (A).

TORQUE: 28~32 Nm (2.8~3.2 kgf.m, 20~23.1 lbf.ft)

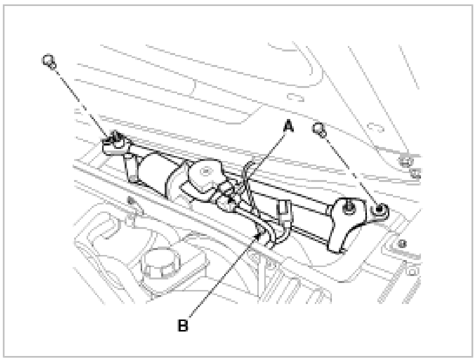


2. Remove the weather strip then remove the cowl top cover (A) after removing 3 clips (B).



3. Remove the windshield wiper motor and linkage assembly after removing 2 bolts. Disconnect the wiper motor connector (A) and windshield deicer connector (B) from the wiper motor & linkage assembly.

TORQUE: 7-11Nm (0.7-1.1, kgf.m, 5.0-7.9 lbf.ft)

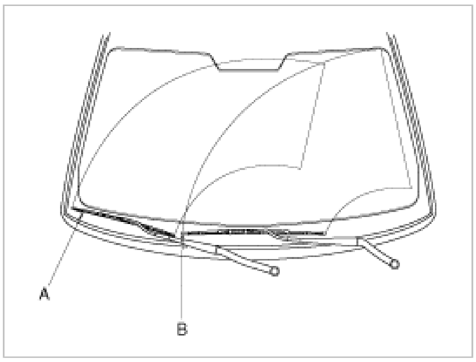


4. Installation is the reverse of removal.

INSTALLATION

1. Install the wiper arm and blade to the specified position.

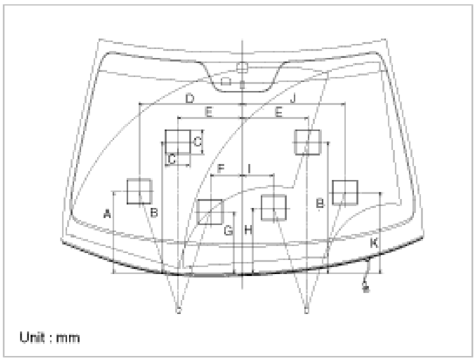
Specified position	A	B
Distance [in (mm)]	1.26+0.2/0 (32+5/0)	0.98+0.2/0 (25+5/0)



2. Set the washer nozzle on the specified spray position.

Specified position	**Distance [in (mm)]**
A	13.3 (337.5)
B	21.5 (545)
C	3.9 (100)
D	16.9 (429.5)
E	10.6 (270)
F	5.3 (134)

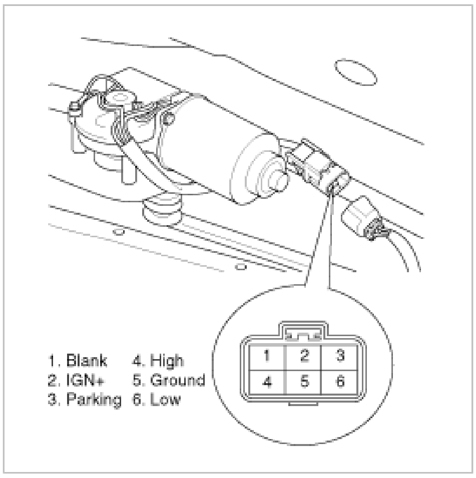
G	10.1(255.5)
H	10.7(271.5)
I	5.0(128)
J	16.7(424)
K	13.2(335.5)



INSPECTION

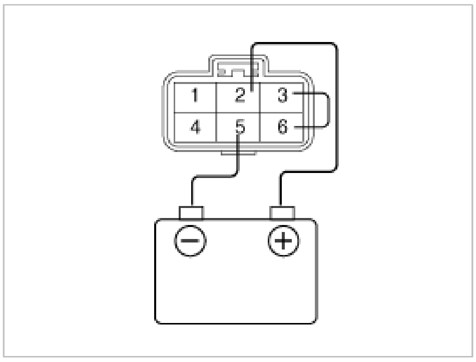
SPEED OPERATION CHECK

1. Remove the connector from the wiper motor.
2. Attach the positive (+) lead from the battery to terminal 6 and the negative (-) lead to terminal 5.
3. Check that the motor operates at low speed.
4. Connect the positive (+) lead from the battery to terminal 4 and the negative (-) lead to terminal 5.
5. Check that the motor operates at high speed.



AUTOMATIC STOP OPERATION CHECK

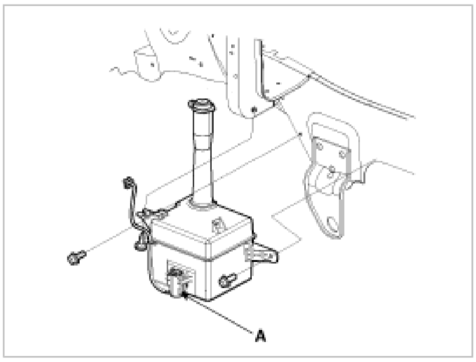
1. Operate the motor at low speed using the stalk control.
2. Stop the motor operation anywhere except at the off position by disconnecting terminal 6.
3. Connect terminals 3 and 6.
4. Connect the positive (+) lead from the battery to terminal 2 and the negative (-) lead to terminal 5.
5. Check that the motor stops running at the off position.



Body Electrical System > Windshield Wiper/Washer > Front Washer Motor > Repair procedures

REPLACEMENT

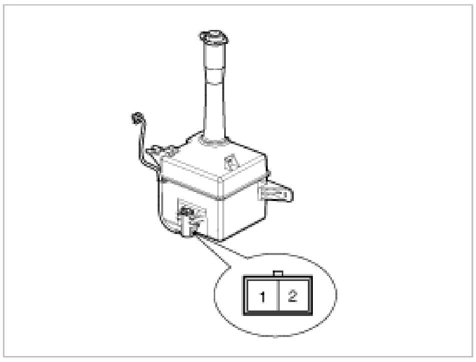
1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper cover. (Refer to Body group-Front bumper)
3. Remove the washer hose and the washer motor connector (A).
4. Remove the washer reservoir after removing 3 bolts.

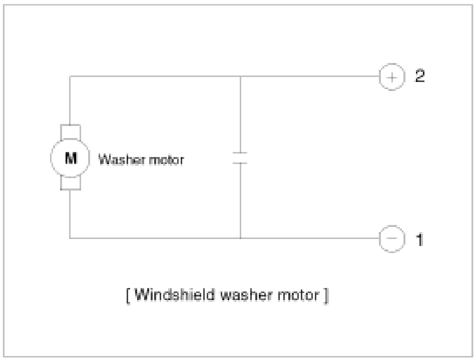


5. Installation is the reverse of removal.

INSPECTION

1. With the washer motor connected to the reservoir tank, fill the reservoir tank with water.
2. Connect positive (+) battery cables to terminal 2 and negative (-) battery cables to terminal 1 respectively.
3. Check that the motor operates normally and the washer motor runs and water sprays from the front nozzles.
4. If they are abnormal, replace the washer motor.

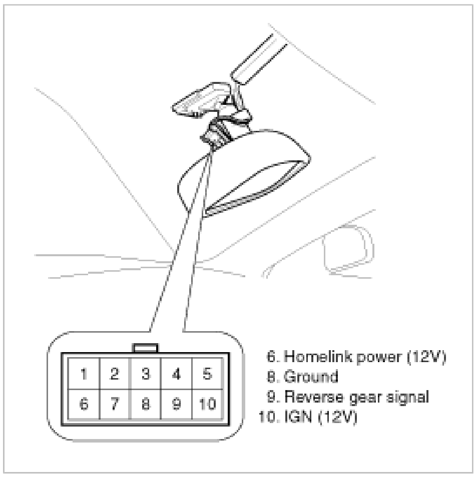




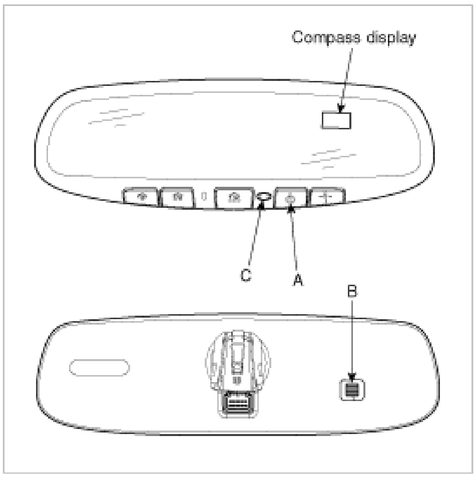
Body Electrical System > Electro chromic Inside > Electro chromic Inside Rear View Mirror > Description and Operation

DESCRIPTION

The ECM (Electro Chromic inside rear view Mirror) is for dimming the reflecting light from a vehicle behind at night, in order the user not to be dazzled by the light. The front looking sensor detects brightness of the surroundings, while the rearward looking sensor the strength of the reflecting light so that adjusts the reflexibility of the mirror in the range of 10~70%. But, when the reverse gear is engaged, it stops functioning.



1. The front looking sensor sees if the brightness of the surroundings is low enough for the mirror to operate its function.
2. The rearward looking sensor detects glaring of the reflecting light from a vehicle behind.
3. The ECM is darkened to the level as determined by the rearward looking sensor. When the glaring is no longer detected, the mirror stops functioning.



Body Electrical System > Electro chromic Inside > Electro chromic Inside Rear View Mirror > Repair procedures

INSPECTION

Check it by the procedure below to see if the function of the ECM is normal.

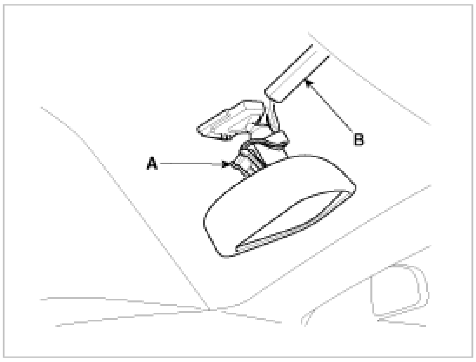
1. Turn the ignition key to the "ON" position.
2. Press the A button to turn the automatic dimming function ON/OFF.
3. Cover the front looking sensor (B) to stop functioning.
4. Head a light to the rearward looking sensor(C).
5. The ECM should be darkened as soon as the rearward looking sensor detects the light.

> NOTE
>
> If this test is performed in daytime, the ECM may be darkened as soon as the front looking sensor is covered.

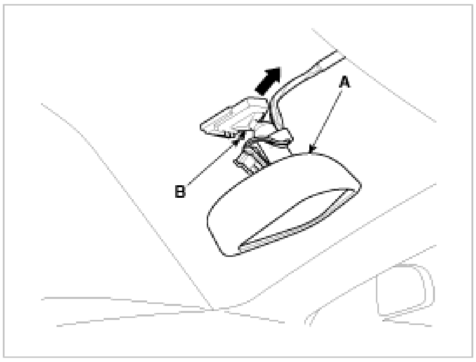
6. When the reverse gear is engaged, the ECM should not be darkened.
7. When heading lights to both the front looking and rearward looking sensors, the ECM should not be darkened.

REPLACEMENT

1. Remove the connector(A) and honelink cover (B).



2. Push the ECM base up to remove the ECM assembly (A) after loosening the mounting screw (B).



3. Installation is the reverse of removal.

Body Electrical System > Electro chromic Inside > Compass Mirror > Description and Operation

FUNCTION

1. Push the A button lower of the rear view mirror to turn on the function of the compass mirror so that displays a sign of a direction on the small board in the upper-right side of the mirror.
2. Push the A button again to turn off its function.

Body Electrical System > Electro chromic Inside > Compass Mirror > Repair procedures

CALIBRATION PROCEDURE

If the compass has been calibrated or set to variance zone number incorrectly, or you are driving in specific places (tunnel, parking lot in building, underground parking lot, near transformer substation, etc.), some phenomenon is occur as follows:

- The display read "C".
- The compass headings become inaccurate.
- The compass heading is not changed.
- Some compass headings are not displayed.

• The compass headings are inaccurate in long distance driving.

This compass automatically calibrates itself while the vehicle is driven as your route takes you in complete circles.

If the vehicle's compass headings become inaccurate continuously, the compass should be manually calibrated as follows:

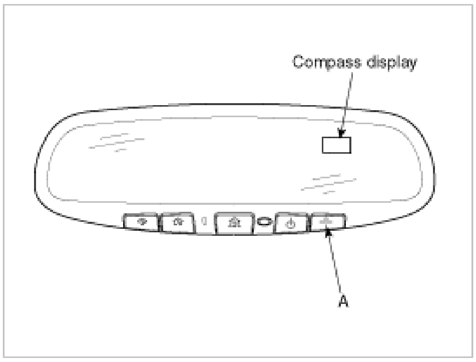
1. Move the vehicle from the large steel structure or electric power supply cable.
2. Turn on the compass by pressing the A button.
3. Check the zone number by pressing the A button for more than 4 seconds until the current zone number appears in the display.
   To re-calibrate, hold the A button for 3 seconds until C is displayed. If the zone number is different for your country, set the correct zone number referring to "Setting the compass zone" and do the "calibration procedure" again.
4. Drive your vehicle in at least 2 circles at less than 5 miles per hour (8 km/h) until the compass heading appears. Driving in a circle in right-handed direction and opposite direction is possible and if possible, stops the wiper operation.
5. If the vehicle's compass headings become inaccurate as before, do the following procedure again.

> NOTE
>
> If new vehicle is first driven or if the battery has been disconnected, do the calibration procedure as above.

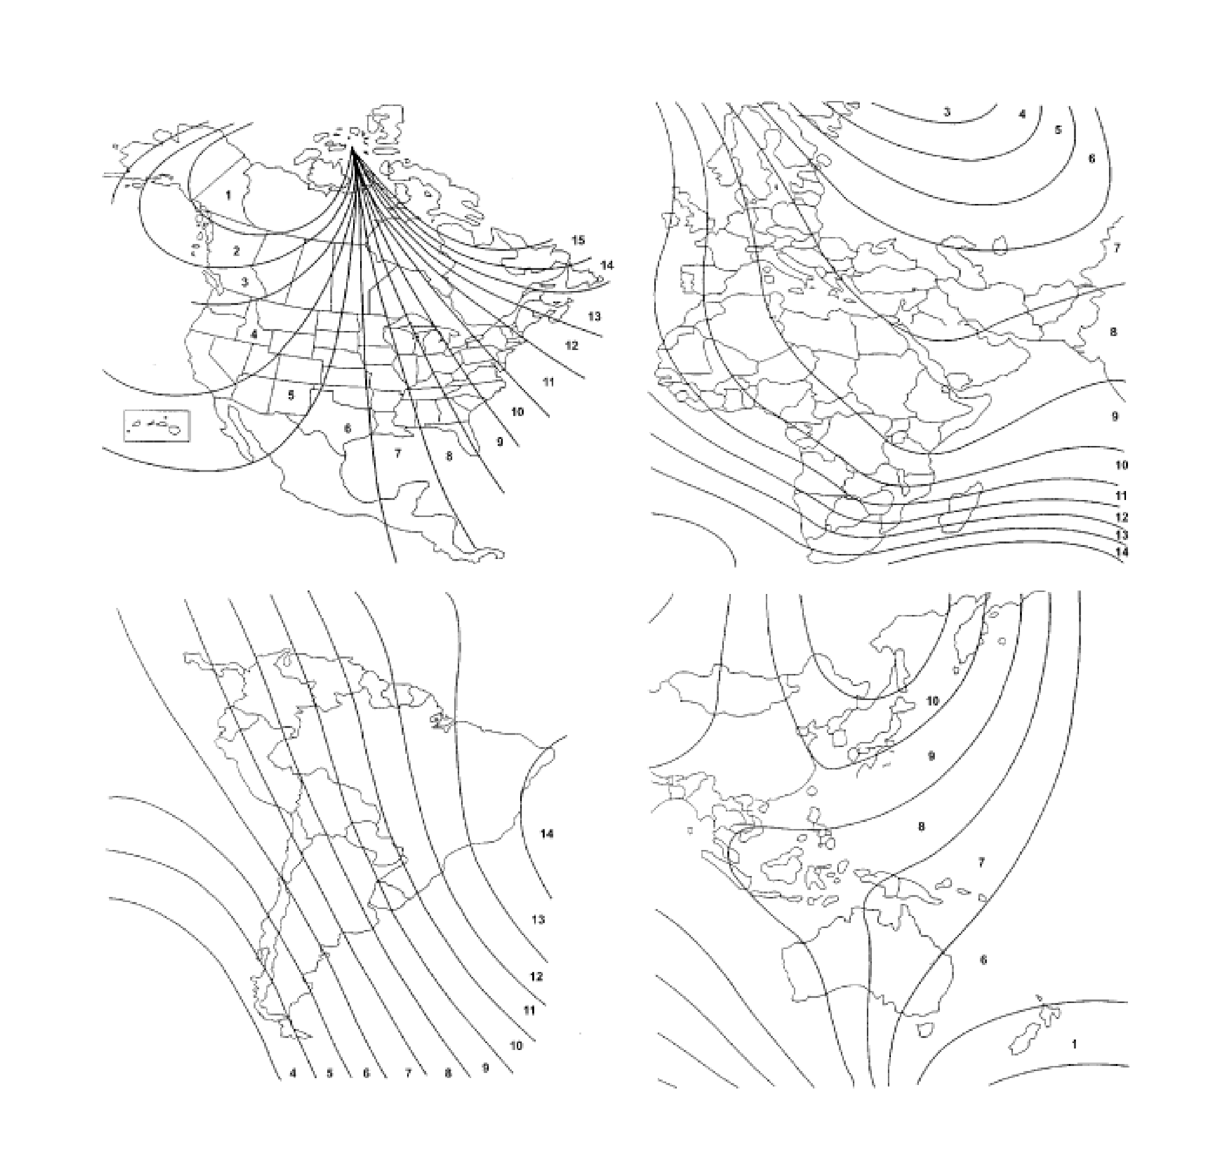
SETTING THE COMPASS ZONE

This compass must be set to compensate for the variation between true north and magnetic north. To set variation:

1. Find your current location and variance zone number on the zone map.
2. Press the A button for more than 4 seconds. The current zone number will appear in the display.
3. Release and press the A button until the new zone number appears in the display. After you stop pressing the button in, the display will show a compass direction within a few seconds.



ZONE MAP

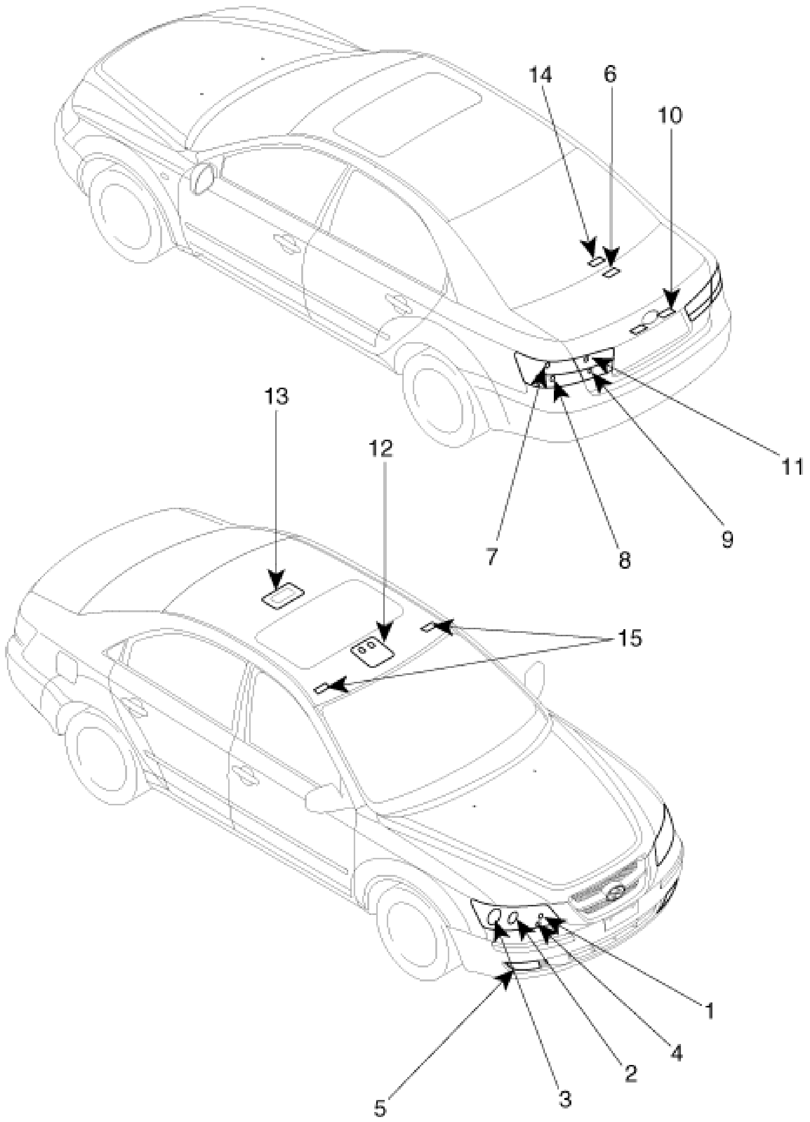


WARNING

1. Do not install the ski rack, antenna, etc. which are attached to the vehicle by means of a magnet. They affect the operation of the compass.
2. If the compass deviates from the correct indication soon after repeated adjustment, have the compass checked at an authorized dealer.
3. The compass may not indicate the correct compass point in tunnels or while driving up or down a steep hill. (The compass returns to the correct compass point when the vehicle moves to an area where the geomagnetism is stabilized.)

Body Electrical System > Lighting System > Components and Components Location

COMPONENT LOCATION



1. Head lamp (High)	9. Back up lamp
2. Head lamp (Low)	10. License plate lamp

Body Electrical System > Lighting System > Troubleshooting

TROUBLESHOOTING

Symptom Poss	ible cause	Remedy
One lamp does not light (all exterior)	Bulb burned out	Replace bulb
	Socket, wiring or ground faulty	Repair if necessary
Head lamps do not light	Bulb burned out	Replace bulb
	Ignition fuse (LOW:20A, HIGH:20A) blown	Check for short and replace fuse
	Head lamp fuse (10A) blown	Check for short and replace fuse
	Head lamp relay faulty	Check relay
	Lighting switch faulty	Check switch

	Wiring or ground faulty	Repair if necessary
Tail lamps and license plate lamps do not light	Bulb burned out	Replace bulb
	Tail lamp fuse (20A) blown	Check for short and replace fuse
	Tail lamp relay faulty	Check relay
	Lighting switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Stop lamps do not light	Bulb burned out	Replace bulb
	Stop lamp fuse (15A) blown	Check for short and replace fuse
	Stop lamp switch faulty	Adjust or replace switch
	Wiring or ground faulty	Repair if necessary
Stop lamps do not turn off	Stop lamp switch faulty	Repair or replace switch
Instrument lamps do not light (Tail lamps light)	Rheostat faulty	Check rheostat
	Wiring or ground faulty	Repair if necessary
Turn signal lamp does not flash on one side	Bulb burned out	Replace bulb
	Turn signal switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Turn signal lamps do not light	Bulb burned out	Replace bulb
	Turn signal lamp fuse (10A) blown	Check for short and replace fuse
	Flasher unit faulty	Check flasher unit
	Turn signal switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Hazard warning lamps do not light	Bulb burned out	Replace bulb
	Hazard warning lamp fuse (10A) blown	Check for short and replace fuse
	Flasher unit faulty	Check flasher unit
	Hazard switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Flasher rate too slow or too fast	Lamps' wattages are smaller or larger than specified	Replace lamps
	Flasher unit faulty	Check flasher unit
Back up lamps do not light	Bulb burned out	Replace bulb
	Back up lamp fuse (10A) blown	Check for short and replace fuse
	Back up lamp switch (M/T) faulty	Check switch
	Transaxle range switch (A/T) faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Room lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (15A) blown	Check for short and replace fuse
	Room lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Front fog lamps do not light	Bulb burned out	Replace bulb
	Front fog lamp fuse (15A) blown	Check for short and replace fuse
	Front fog lamp relay faulty	Check relay
	Front fog lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Map lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (10A) blown	Check for short and replace fuse
	Map lamp switch faulty	Check switch

	Wiring or ground faulty	Repair if necessary
Trunk room lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (10A) blown	Check for short and replace fuse
	Trunk room lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary

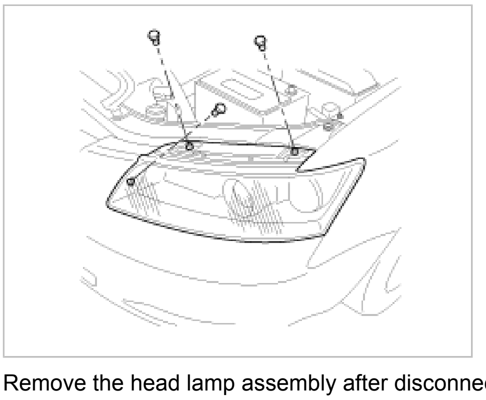
Body Electrical System > Lighting System > Head Lamps > Repair procedures

REPLACEMENT

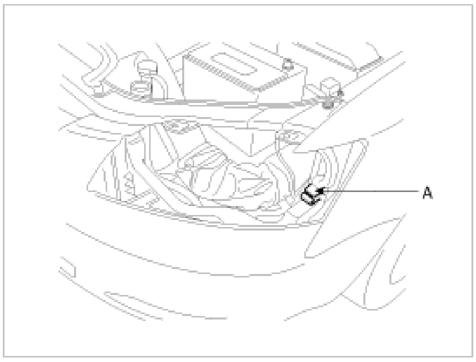
1. Disconnect the negative (-) battery terminal.
2. Loose the mounting bolts (3EA) of head lamp.



3. Remove the head lamp assembly after disconnecting the lamp connectors.

NOTE

Take care that holding clip (A) is not to be damaged.



4. Installation is the reverse of removal.

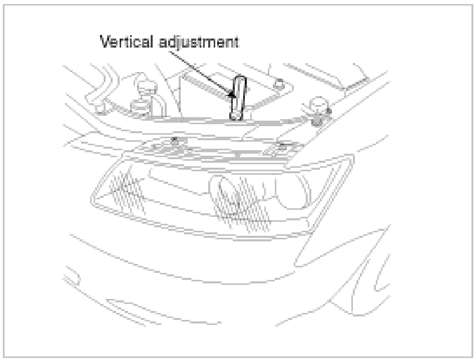
HEAD LAMP AIMING INSTRUCTIONS

The head lamps should be aimed with the proper beam-setting equipment, and in accordance with the equipment manufacturer's instructions.

> NOTE
>
> If there are any regulations pertinent to the aiming of head lamps in the area where the vehicle is to be used, adjust so as to meet those requirements.

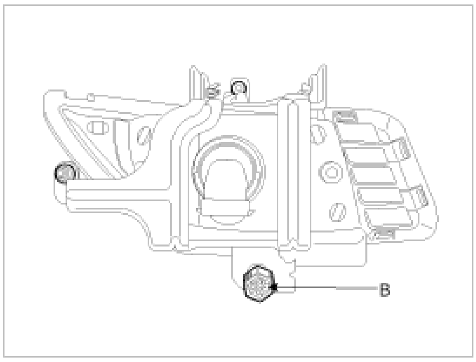
Alternately turn the adjusting gear to adjust the head lamp aiming. If beam-setting equipment is not available, proceed as follows:

1. Inflate the tires to the specified pressure and remove any loads from the vehicle except the driver, spare tire, and tools.
2. The vehicle should be placed on a flat floor.
3. Draw vertical lines (Vertical lines passing through respective head lamp centers) and a horizontal line (Horizontal line passing through center of head lamps) on the screen.
4. With the head lamp and battery in normal condition, aim the head lamps so the brightest portion falls on the horizontal and vertical lines.
   Make vertical adjustment to the lower beam using the adjusting wheel.

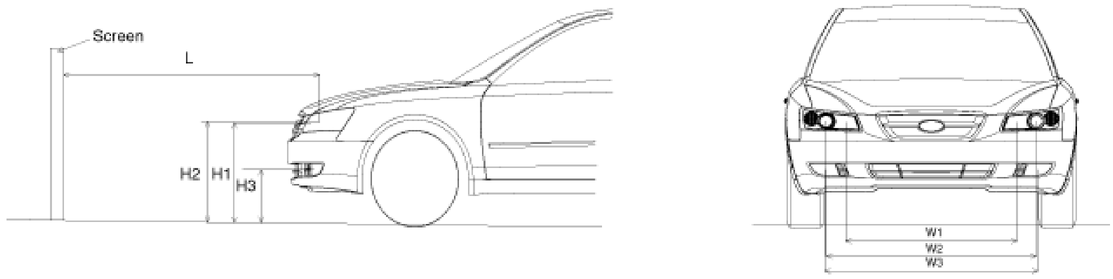


FRONT FOG LAMP AIMING

The front fog lamps should be aimed as the same manner of the head lamps aiming.
With the front fog lamps and battery normal condition, aim the front fog lamps by turning the adjusting gear.



HEAD LAMP AND FOG LAMP AIMING POINT

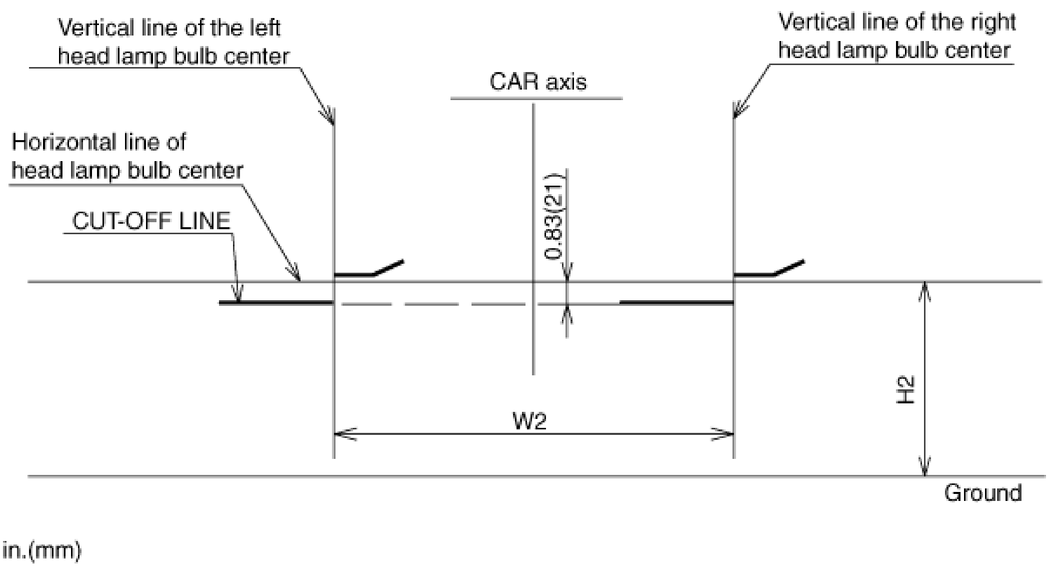


H1 : Height between the head lamp bulb center and ground (High beam)
H2 : Height between the head lamp bulb center and ground (Low beam)
H3 : Height between the fog lamp bulb center and ground
W1 : Distance between the two head lamp bulbs centers (High beam)
W2 : Distance between the two head lamp bulbs centers (Low beam)
W3 : Distance between the two fog lamp bulbs centers
L : Distance between the head lamp bulb center and screen

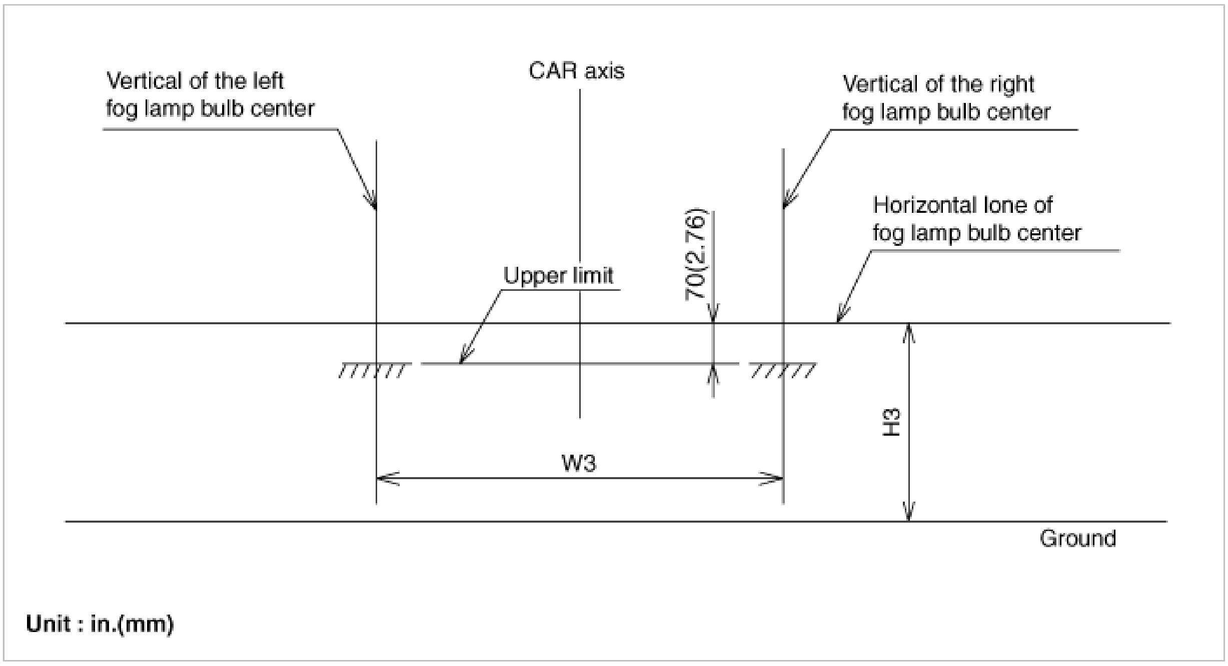
Unit : in(mm)

Vehicle condition	H1	H2	H2	W1	W2	W3	L
Without driver	26.7(679)	27.0(686)	14.3(362)	42.0(1,066)	51.4(1,306)	52.1(1,324)	118.1(3,000)
With driver	26.5(672)	26.7(679)	14.0(355)				

1. Turn the low beam on without driver aboard.
   The cut-off line should be projected in the allowable range (shaded region).

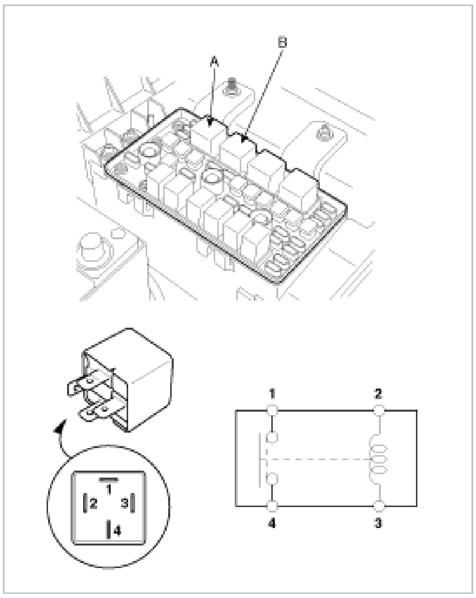


2. Turn the front fog lamp on without the driver aboard.
   The cut-off line should be projected in the allowable range (shaded region)



HEAD LAMP RELAY INSPECTION

1. Pull out the head lamp relay (Low) (A) and head lamp relay (High) (B) from the engine compartment relay box.



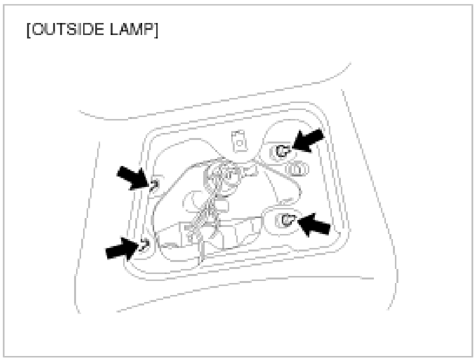
2. Check for continuity between terminals. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
3. There should be no continuity between the No.1 and No.4 terminals when power is disconnected.

Terminal / Power (No.2-No.3)	2	3	1	4
Disconnected	○	○		
Connected	⊖	⊕	○	○

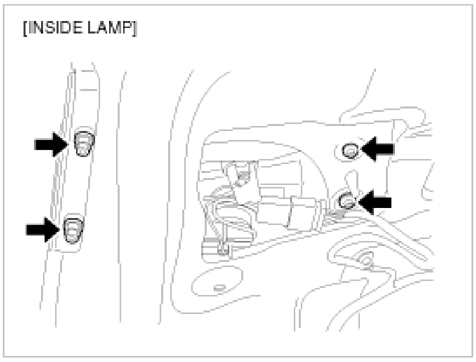
Body Electrical System > Lighting System > Turn Signal Lamp > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Loose the nuts holding the rear combination lamp then disconnect the 4P connector then remove the outside rear combination lamp.



3. Loose the nuts holding the rear combination lamp then disconnect the 4P connector then remove the inner rear combination lamp.

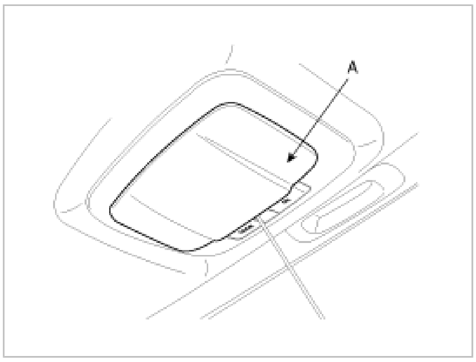


4. Installation is the reverse of removal.

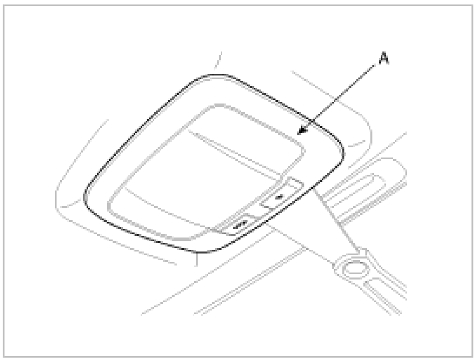
Body Electrical System > Lighting System > Room Lamp > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Detach the lamp lens (A) from the room lamp with a flat-tip screwdriver then replace the bulb (B).



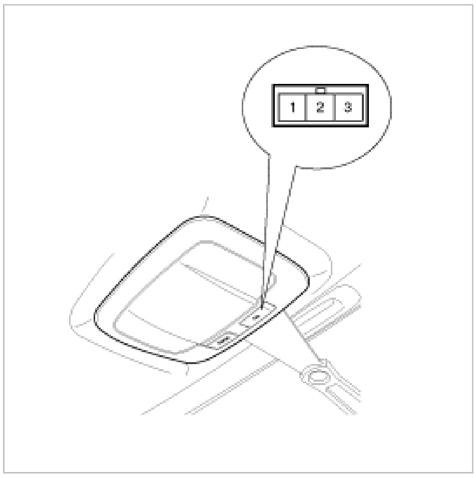
3. Remove the room lamp assembly after removing 2 screws and disconnecting the 3P connector (Standard type).
Remove the room lamp assembly by using the scraper and then disconnect the 3P connector (Sunroof type).



4. Installation is the reverse of removal.

INSPECTION

Remove the room lamp assembly then check for continuity between terminals.

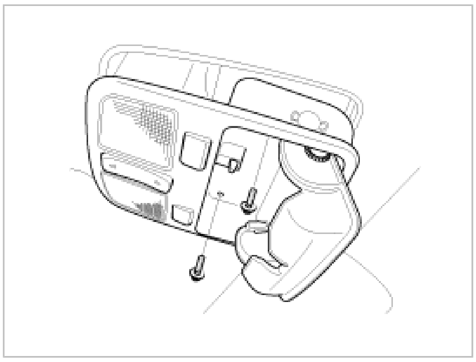


Position \ Terminal	1	2	3
ON		O—SW—	—O
DOOR	O—SW—	—O	
OFF			

Body Electrical System > Lighting System > Overhead Console Lamp > Repair procedures

REPLACEMENT

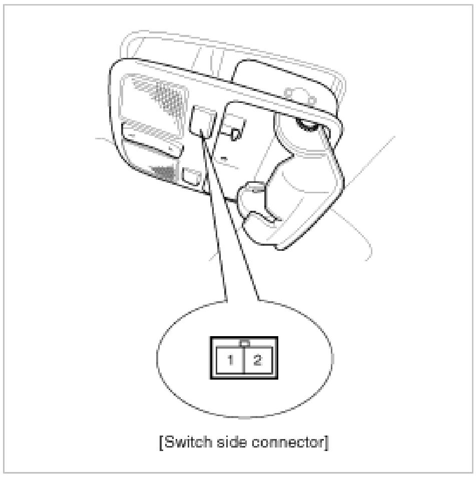
1. Disconnect the negative (-) battery terminal.
2. Open the sunglass case cover then remove the 2 screws holding the overhead console.



3. Disconnect the connector (4P) of sunroof switch and the connector (2P) of map lamp then remove the overhead console lamp assembly from the headliner.
4. Installation is the reverse of removal.

INSPECTION

Remove the overhead console lamp assembly then check for continuity between terminals. If the continuity is not as specified, replace the map lamp switch.



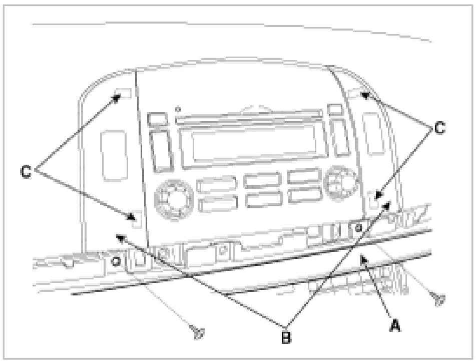
[Switch side connector]

Body Electrical System > Lighting System > Hazard Lamp Switch > Repair procedures

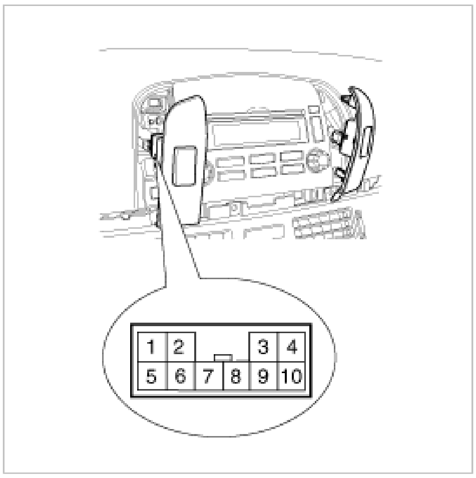
INSPECTION

HAZARD LAMP SWITCH

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad garnish (A) after pulling it by using regular screw driver (-). Take care of fixing clips(C).
3. Remove the center facia panel (B) after loosening the screws.



4. Disconnect the connectors(A).
5. Remove the hazard lamp switch from the center facia panel.



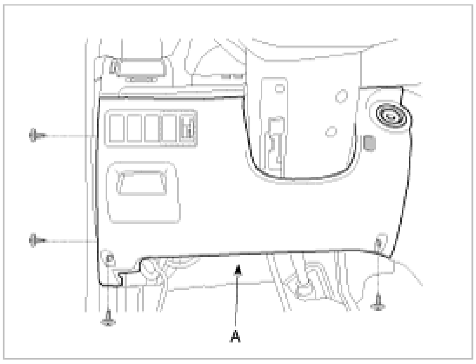
6. Operate the switch and check for continuity between terminals with an ohmmeter.

Position \ Terminal	2	3	6	9	10	5	7	8
OFF	○	○				○	—	○
ON	Illumination		○	○	○		○	○

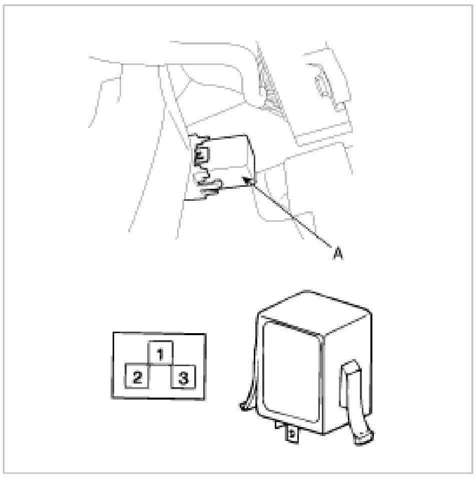
Body Electrical System > Lighting System > Flasher Unit > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Disconnect the hood release cable from the hood release handle.
3. Remove the crash pad side cover (A).



4. Remove the flasher unit (A) after loosening the nut and disconnecting the connector.



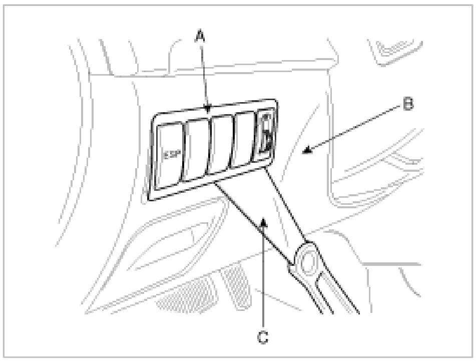
5. Connect the positive (+) lead from the battery to terminal 2 and the negative (-) lead to terminal 3.
6. Connect the two turn signal lamps in parallel to terminals 1 and 3. Check that the bulbs turn on and off.

> NOTE
>
> The turn signal lamps should flash 60 to 120 times per minute. If one of the front or rear turn signal lamps has an open circuit, the number of flashes will be more than 120 per minute. If operation is not as specified, replace the flasher unit.

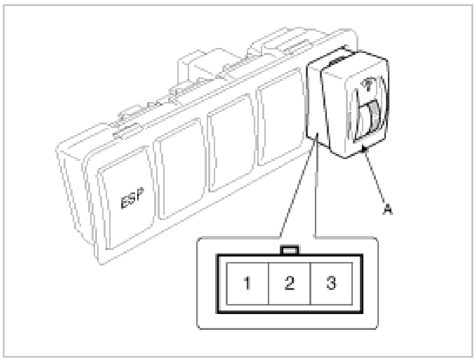
Body Electrical System > Lighting System > Rheostat > Repair procedures

INSPECTION

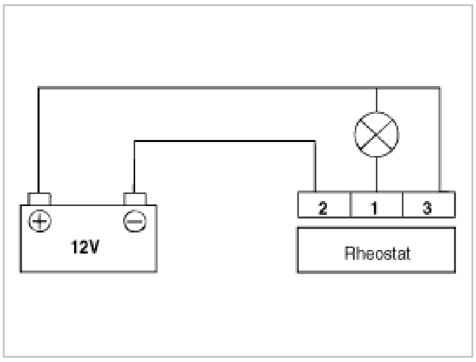
1. Disconnect the negative (-) battery terminal.
2. Remove the lower crash pad switch (A) from the side crash pad cover (B) by using the scraper (C) and then disconnect the connectors.



3. Remove the rheostat (A) from lower crash pad switch.



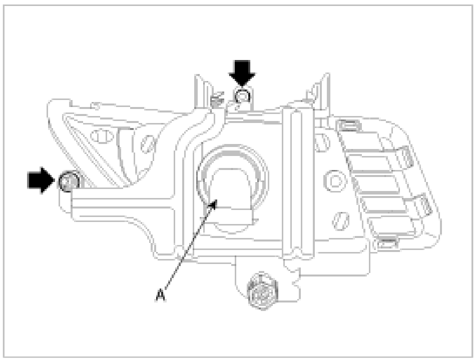
4. Check for intensity. If the light intensity of the lamps changes smoothly without any flickering when the rheostat is turned, it can be assumed that the rheostat is normal.



Body Electrical System > Lighting System > Front Fog Lamps > Repair procedures

REPLACEMENT

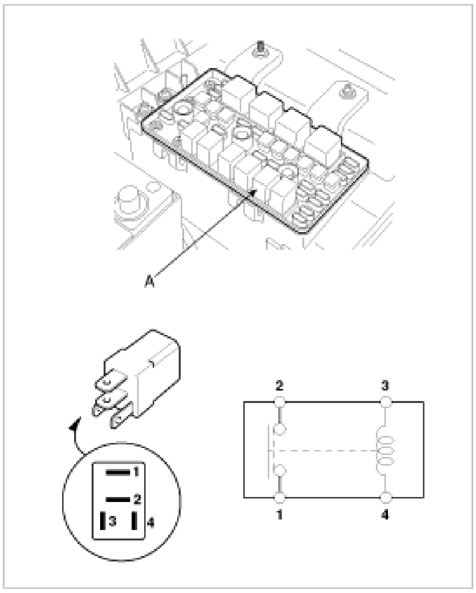
1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper. (Refer to the BD group - front bumper).
3. Remove the front fog lamp (A) after loosening the screws and disconnecting the fog lamp connector.



4. Installation is the reverse of removal.

FRONT FOG LAMP RELAY INSPECTION

1. Pull out the front fog lamp (A) relay from the engine compartment relay box.
2. Check for continuity between terminals. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.4 terminals.
3. There should be no continuity between the No.1 and No.2 terminals when power is disconnected.

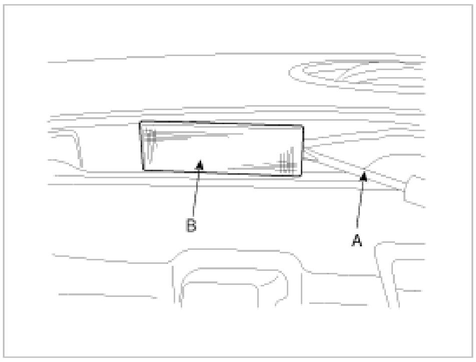


Terminal / Power (No.3-No.4)	1	2	3	4
Disconnected			○	○
Connected	○	○	⊖	⊕

Body Electrical System > Lighting System > License Lamps > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Detach the lamp lens (A) from the room lamp with a flat-tip screwdriver (B).



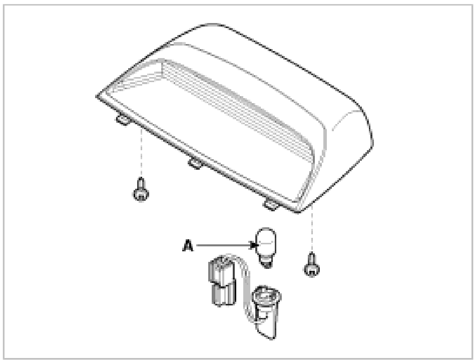
3. Replace the bulb.
4. Installation is the reverse of removal.

Body Electrical System > Lighting System > High Mounted stop lamp > Repair procedures

REPLACEMENT

HIGH MOUNTED STOP LAMP

1. Disconnect the negative(-) battery terminal.
2. Open the trunk lid and then disconnect the connector of high mounted stop lamp.
3. Remove the package tray (Refer to the Body group-package tray).
4. Replace the bulb(A) from the package tray.

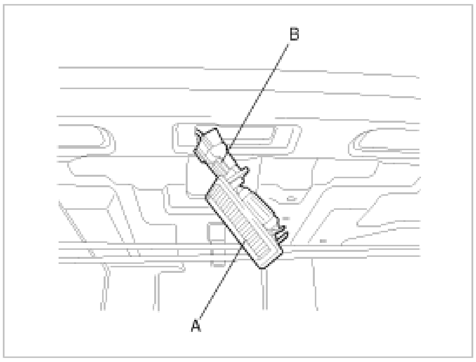


5. Installation is the reverse of removal.

Body Electrical System > Lighting System > Trunk Lamps > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Open the trunk lid, then remove the trunk room lamp (A) with a flat-tip screwdriver and disconnect the 2P connector (B).



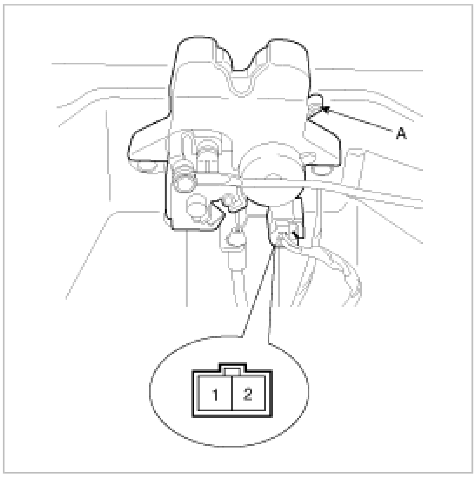
3. Replace the bulb.
4. Installation is the reverse of removal.

INSPECTION

TRUNK ROOM LAMP SWITCH

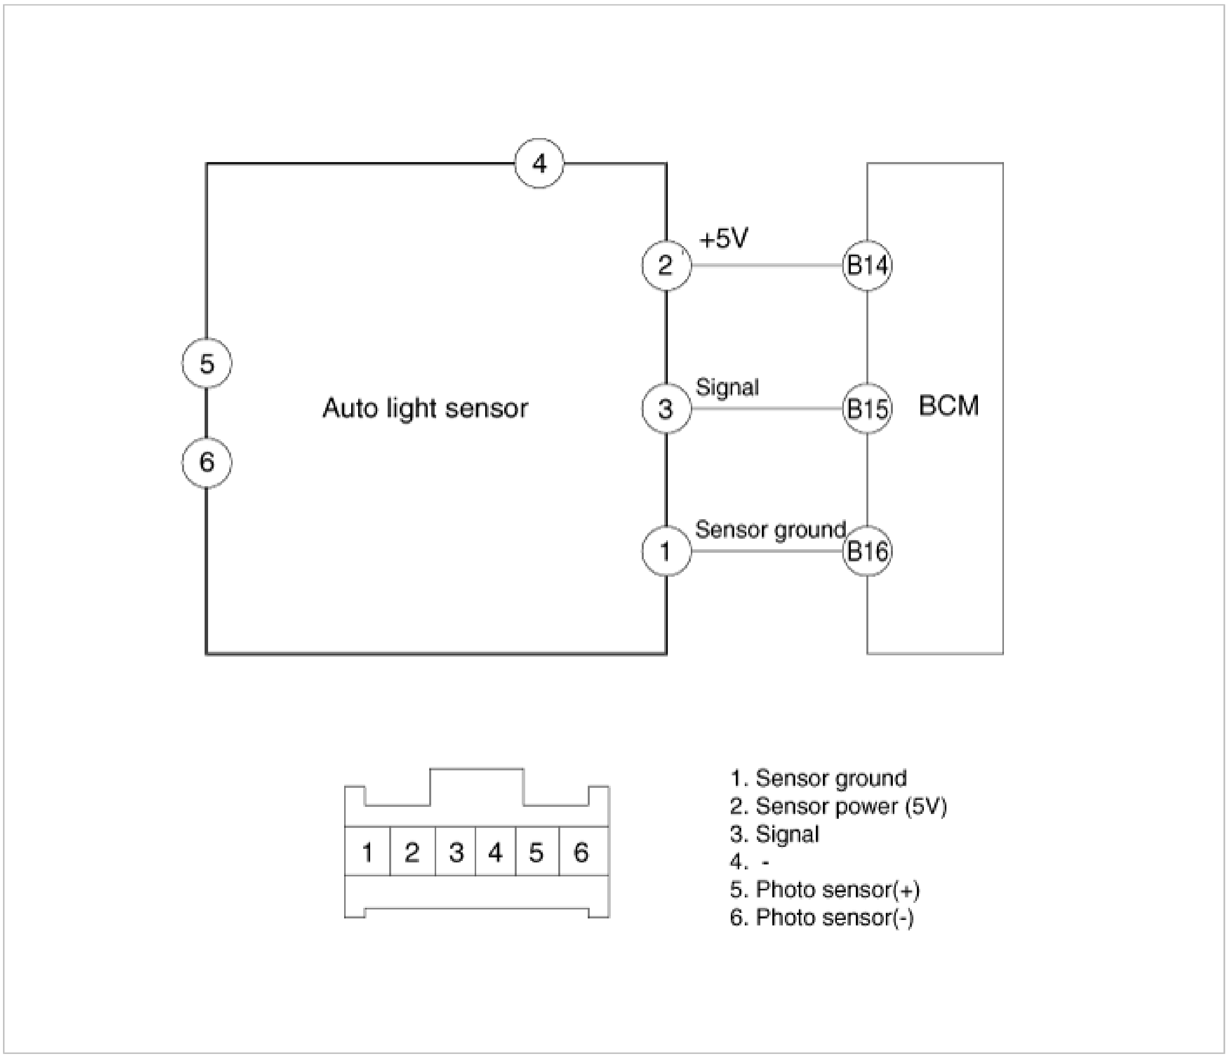
1. Disconnect the negative (-) battery terminal.
2. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
3. Disconnect the 2P connector from the actuator.
4. Check for continuity between the terminal No. 1 and body while pushing the rod (A).

Switch rod condition	Continuity
Pushed (OFF)	Non-conductive (∞Ω)
Released (ON)	Conductive (0Ω)



Body Electrical System > Auto Lighting Control System > Schematic Diagrams

CIRCUIT DIAGRAM



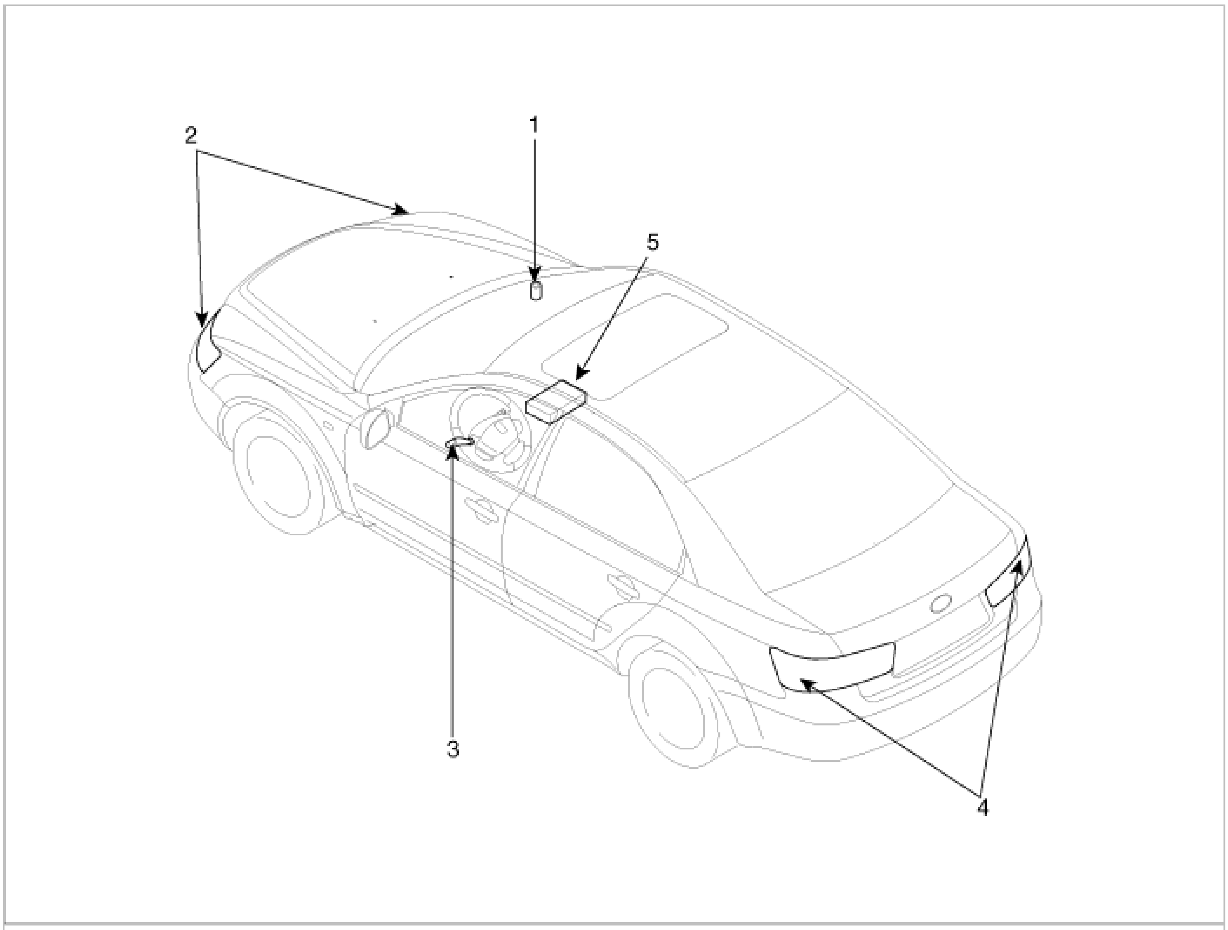
Body Electrical System > Auto Lighting Control System > Description and Operation

DESCRIPTION

The auto light control system operates by using the auto light switch.
If you set the multi-function switch to "AUTO" position, the tail lamp and head lamp will be turned automatically on or off according to external illumination.

Body Electrical System > Auto Lighting Control System > Components and Components Location

COMPONENT LOCATION



1. Auto light sensor	4. Tail lamps
2. Head lamps	5. Body control module
3. Lighting switch (Auto)	

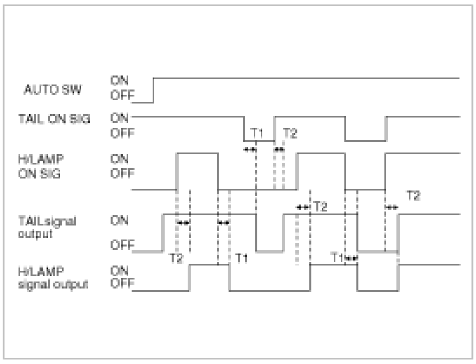
Body Electrical System > Auto Lighting Control System > Repair procedures

INSPECTION

1. While operating the auto light switch, check if the operations are normal as shown in the timing chart.
2. If operations are abnormal, check the body control module.
   (1) Auto light sensor value is always read at IGN ON.
   (2) Light is turned ON after 2sec±0.2sec when auto light sensor value is same as light ON input value.
   (3) Light is turned OFF after 2sec±0.2sec when sensor value is same as light OFF input value.
   (4) Tail lamp and head lamp are turned ON when sensor value is same as tail lamp ON input value.
   (5) Light ON value of sensor is based on the below table.
   (6) Head lamp signal is output when head lamp switch is ON.
   (7) After head lamp is turned OFF, head lamp signal output is kept if head lamp ON luminance condition is met at auto light switch ON.
   (8) After head lamp is turned OFF, head lamp signal output is immediately stopped if head lamp OFF luminance condition is met at auto light switch ON.
   (9) After head lamp is turned OFF, head lamp signal output is immediately stopped at tail switch signal input.
   (10) After head lamp is turned OFF, head lamp signal output is stopped after 0.7s if there is no input of auto light switch or tail switch. (Shall be no flashing of head lamp)
   (11) Head lamp signal output is stopped when switch position is changed from AUTO to head lamp switch during head lamp ON with auto light. (Shall be no flashing of head lamp)

(12) The condition of head lamp ON/OFF is same as the one of tail lamp ON/OFF at auto light switch ON. Light ON value of the input sensor is based on the table.

	TAIL LAMP	HEAD LAMP
ON	0.81V±0.08V	Same as tail sensor value
OFF	1.41V±0.10V	Same as tail sensor value



T1/T2 : 2.0 ± 0.2sec.

Body Electrical System > Auto Lighting Control System > Specifications

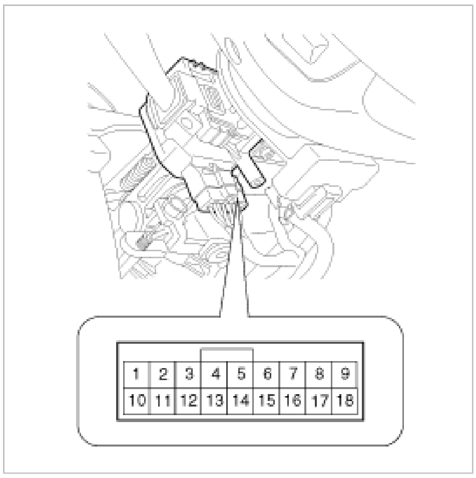
SPECIFICATIONS

Items	Specifications
Rated voltage	12V
Load	Max. 1mA
Detection illuminations Tail lamp / Head lamp	ON : 24 ± 5.2 (Lux), 0.81 ±0.08 (V) OFF : 48 ± 10.5 (Lux), 1.41 ±0.10 (V)

Body Electrical System > Auto Lighting Control System > Auto Light Switch > Repair procedures

INSPECTION

Operate the auto light switch, then check for continuity between terminals of 18P multi-function switch connector.

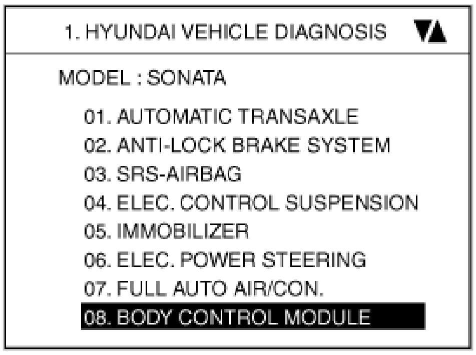


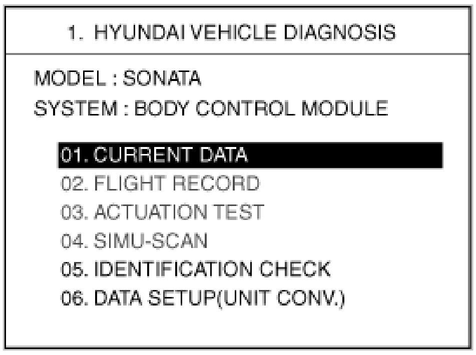
Position \ Terminal	14	15	16	17
OFF				
I	○			○
II	○	○		○
AUTO			○	○

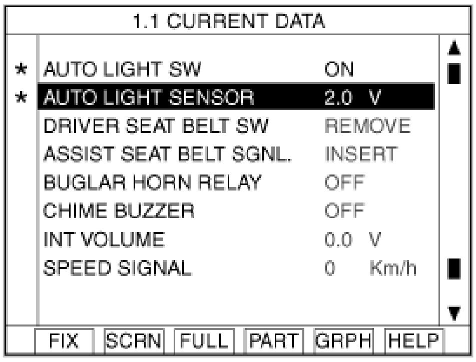
Body Electrical System > Auto Lighting Control System > Auto Light Sensor > Repair procedures

INSPECTION

1. Ignition "ON"
2. Using the scan tool.
3. Emit intensive light toward auto light sensor using sunshine, and check the output voltage change.
4. The voltage will rise with higher intensive light and reduce with lower intensive light.

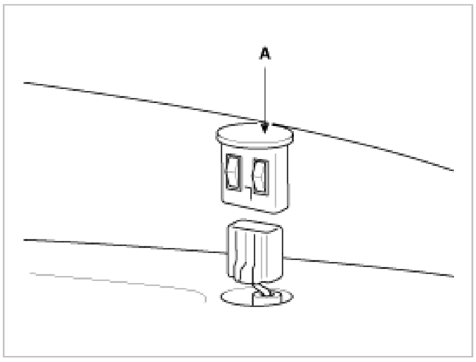






> **NOTE**
>
> When checking auto light sensor, select a place where sun shines directly on it.

5. If the measured resistance is not specification, substitute with a known-good auto light sensor and check for proper operation.
6. If the problem is corrected, replace the auto light sensor.
7. Remove the photo & auto light sensor (A) from the upper crash pad.



8. Disconnect the 6P connector from the auto light sensor then inspect the connector on the wire harness side, as shown in the chart.

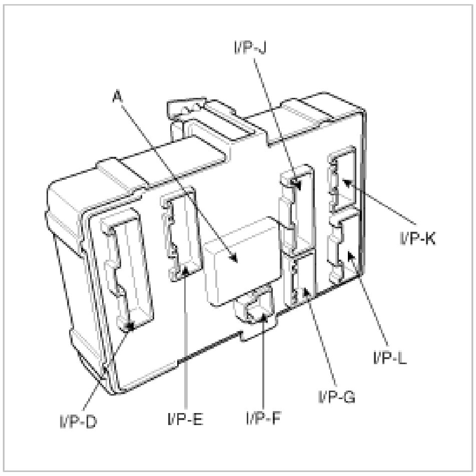
Tester connection	Condition	Specified condition
1-Ground	Auto light switch ON	Continuity
2-Ground	Sensor power	5V

9. If the circuit is not as specified, inspect the circuits connected to other parts.

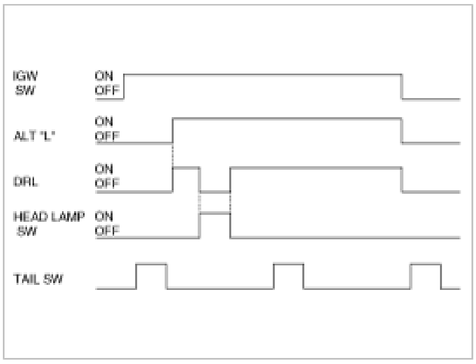
Body Electrical System > Daytime Running Lights > DRL Control Module > Repair procedures

INSPECTION

1. The daytime running light unit (A) is integrated in the junction box.



2. Check that the light operate according to the following timing chart.

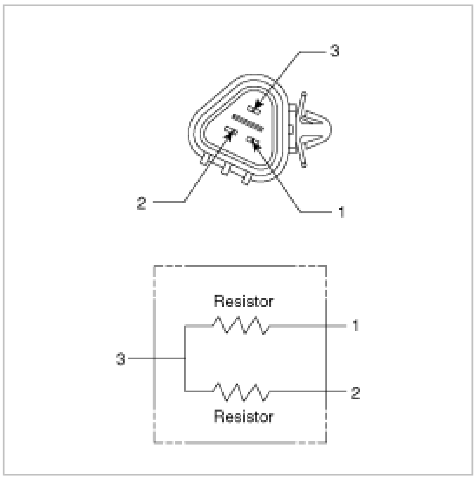


3. If the daytime running light is not operated well, inspect the connector and terminals to be sure they are all making good contact.
   If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
   If the terminals look OK, go to step 4.
4. Make these input tests at the connector
   If any test indicates a problem, find and by using ETM correct the cause, then recheck the system.
   If all the input tests prove OK, the junction box must be faulty; replace it.

INSPECTION

1. Check for continuity and measure the resistance between No.1 and NO.3 terminals.

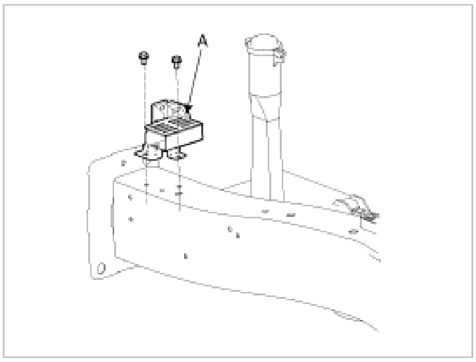
Standard value : 2.5Ω ± 5%



2. If resistance is not as specified, replace the DRL resistor.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the right head lamp assembly (Refer to the head lamp).
3. Disconnect the connector and then remove the DRL resistor (A) under the right head lamp after loosening the bolts (2EA).



4. Installation is the reverse of removal procedure.

Body Electrical System > Immobilizer System > Description and Operation

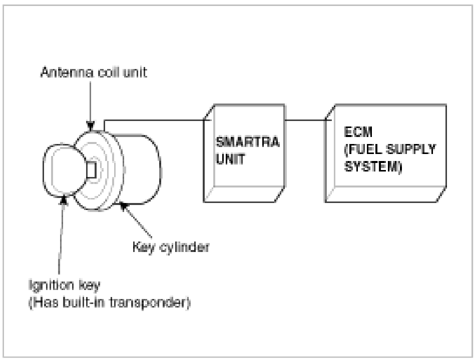
DESCRIPTION

The immobilizer system will disable the vehicle unless the proper ignition key is used, in addition to the currently available anti-theft systems such as car alarms, the immobilizer system aims to drastically reduce the rate of auto theft.

1. SMARTRA type immobilizer
   A. The SMARTRA system consists of a transponder located in the ignition key, an antenna coil, a SMARTRA unit, an indicator light and the ECM.
   B. The SMARTRA communicates to the ECM (Engine Control Module) via a dedicated communications line. Since the vehicle engine management system is able to control engine mobilization, it is the most suitable unit to control the SMARTRA.
   C. When the key is inserted in the ignition and turned to the ON position, the antenna coil sends power to the transponder in the ignition key. The transponder then sends a coded signal back through the SMARTRA unit to the ECM.
   D. If the proper key has been used, the ECM will energize the fuel supply system. The immobilizer indicator light in the cluster will simultaneously come on for more than five seconds, indicating that the SMARTRA unit has recognized the code sent by

the transponder.

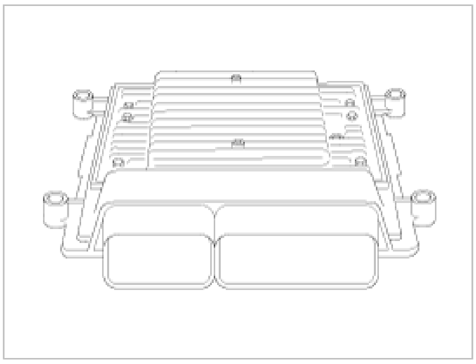
E. If the wrong key has been used and the code was not received or recognized by the ECM the indicator light will continue blinking for about five seconds until the ignition switch is turned OFF.
F. If it is necessary to rewrite the ECM to learn a new key, the dealer needs the customer's vehicle, all its keys and the Hi-scan (pro) equipped with an immobilizer program card. Any key that is not learned during rewriting will no longer start the engine.
G. The immobilizer system can store up to four key codes.
H. If the customer has lost his key, and cannot start the engine, contact HMC motor service station.



COMPONENTS OPERATIONS

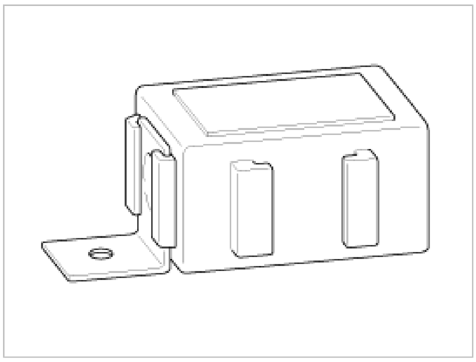
ECM (Engine Control Module)

1. The ECM carries out a check of the ignition key using a special encryption algorithm, which is programmed into the transponder as well as the ECM simultaneously. Only if the results are equal, the engine can be started. The data of all transponders, which are valid for the vehicle, are stored in the ECM.



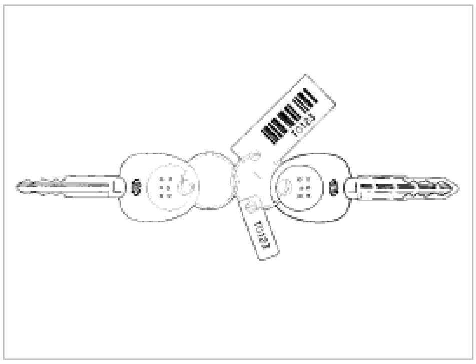
SMARTRA unit

The SMARTRA carries out communication with the built-in transponder in the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted behind of the crush pad under panel close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder, received by the antenna coil, is converted into messages for serial communication by the SMARTRA device. And, the received messages from the ECM are converted into an RF signal, which is transmitted to the transponder by the antenna.
The SMARTRA does not carry out the validity check of the transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to the ECM and vice versa.



TRANSPONDER (Built-in keys)

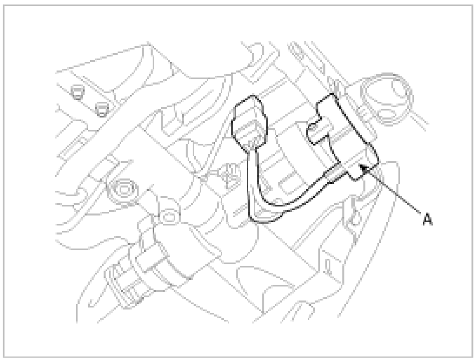
The transponder has an advanced encryption algorithm. During the key teaching procedure, the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is once only; therefore, the contents of the transponder can never be modified or changed.



Antenna coil

The antenna coil (A) has the following functions.

- The antenna coil supplies energy to the transponder.
- The antenna coil receives signal from the transponder.
- The antenna coil sends transponder signal to the SMARTRA.
  It is located directly in front of the steering handle lock.



Body Electrical System > Immobilizer System > Troubleshooting

DIAGNOSIS OF IMMOBILIZER FAULTS

- Communication between the ECM and the SMARTRA.
- Function of the SMARTRA and the transponder.
- Data (stored in the ECM related to the immobilizer function.

The following table shows the assignment of immobilizer related faults to each type:

Immobilizer Related Faults	Fault types	Diagnostic codes
Transponder key fault	1. Transponder not in password mode. 2. Transponder transport data has been changed.	P1674 (Transponder status error)
Transponder key fault	1. Transponder programining error	P1675 (Transponder programming error)
SMARTRA fault	1. Invalid message from SMARTRA to ECM.	P1676 (SMARTRA message error)
SMARTRA fault	1. No response from SMARTRA (Communication Line Error - Open or Short etc.)	P1690 (SMARTRA no response)
Antenna coil fault	1. Antenna coil open/short circuit	P1691 (Antenna coil error)
Transponder key fault	1. Corrupted data from transponder 2. More than one transponder in the magnetic field (Antenna coil) 3. No transponder (Key without transponder) in the magnetic field (Antenna coil)	P1693 (Transponder no response error/invalid response)

ECM fault	1. Request from ECM is invalid (Protocol layer violation- Invalid request, check sum error etc.)	P1694 (ECM message error)
ECM internal permanent memory (EEPROM) fault	1. ECM internal permanent memory (EEPROM) fault 2. Invalid write operation to permanent memory (EEPROM)	P1695 (ECM memory error)
Invalid key fault	1. Virgin transponder at ECM status "Learnt" 2. Learnt (Invalid) Transponder at ECM status "Learnt"(Authentication fail)	P1696 (Authentication fail)
Locked by timer	1. Exceeding the maximum limit of Twice IGN ON (⊇ 32 times)	P1699 (Twice IG ON over trial)

Body Electrical System > Immobilizer System > Repair procedures

TEACHING PROCEDURES

1. Key Teaching Procedure
   Key teaching must be done after replacing a defective ECM or when providing additional keys to the vehicle owner.
   The procedure starts with an ECM request for vehicle specific data (PIN code: 6digits) from the tester. The "virgin" ECM stores the vehicle specific data and the key teaching can be started. The "learnt" ECM compares the vehicle specific data from the tester with the stored data. If the data are correct, the teaching can proceed.
   If incorrect vehicle specific data have been sent to the ECM three times, the ECM will reject the request of key teaching for one hour. This time cannot be reduced by disconnecting the battery or any other manipulation. After reconnecting the battery, the timer starts again for one hour.
   The key teaching is done by ignition on with the key and additional tester commands. The ECM stores the relevant data in the EEPROM and in the transponder. Then the ECM runs the authentication required for confirmation of the teaching process. The successful programming is then confirmed by a message to the tester.
   If the key is already known to the ECM from a previous teaching, the authentication will be accepted and the EEPROM data are updated. There is no changed transponder content (this is impossible for a learnt transponder).
   The attempt to repeatedly teach a key, which has been taught already during the same teaching cycle, is recognized by the ECM. This rejects the key and a message is sent to the tester.
   The ECM rejects invalid keys, which are presented for teaching. A message is sent to the tester. The key can be invalid due to faults in the transponder or other reasons, which result from unsuccessful programming of data. If the ECM detects different authenticators of a transponder and an ECM, the key is considered to be invalid.
   The maximum number of taught keys is 4
   If an error occurs during the Immobilizer Service Menu, the ECM status remains unchanged and a specific fault code is stored.
   If the ECM status and the key status do not match for teaching of keys, the tester procedure will be stopped and a specific fault code will be stored at ECM.

2. User Password Teaching Procedure
   The user password for limp home is taught at the service station. The owner of the vehicle can select a number with four digits. User password teaching is only accepted by a "learnt" ECM. Before first teaching of user password to an ECM, the status of the password is "virgin" No limp home function is possible.
   The teaching is started by ignition on, with a valid key and sending the user password by tester. After successful teaching, the status of the user password changes from "virgin" to "learnt"
   The learnt user password can also be changed. This can be done if the user password status is "learnt" and the tester sends authorization of access, either the old user password or the vehicle specific data. After correct authorization, the ECM requests the new user password. The status remains "learnt" and the new user password will be valid for the next limp home mode.
   If incorrect user passwords or wrong vehicle specific data have been sent to the ECM three times, the ECM will reject the request to change the password for one hour. This time cannot be reduced by disconnecting the battery or any other actions. After reconnecting the battery, the timer starts again for one hour.

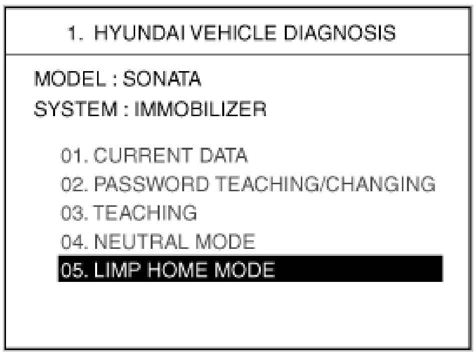
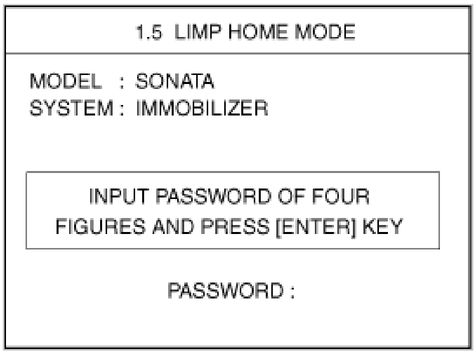
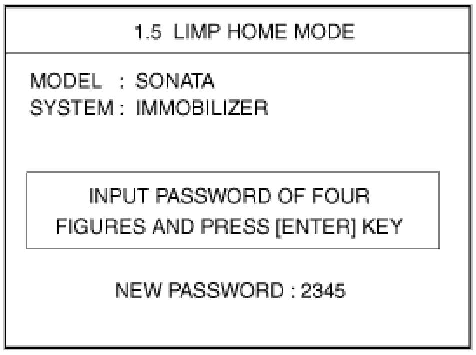
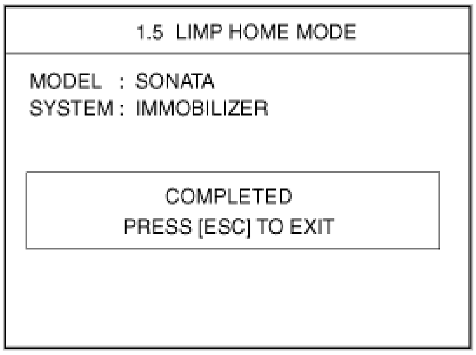
LIMP HOME FUNCTION

1. LIMP HOME BY TESTER
   If the ECM detects the fault of the SMARTRA or transponder, the ECM will allow limp home function of the immobilizer. Limp home is only possible if the user password (4 digits) has been given to the ECM before. This password can be selected by the vehicle owner and is programmed at the service station.
   The user password can be sent to the ECM via the special tester menu.
   Only if the ECM is in status "learnt" and the user password status is "learnt" and the user password is correct, the ECM will be unlocked for a period of time (30 sec.). The engine can only be started during this time. After the time has elapsed, engine start is not possible.
   If the wrong user password is sent, the ECM will reject the request of limp home for one hour. Disconnecting the battery or any other action cannot reduce this time. After connecting the battery to the ECM, the timer starts again for one hour.

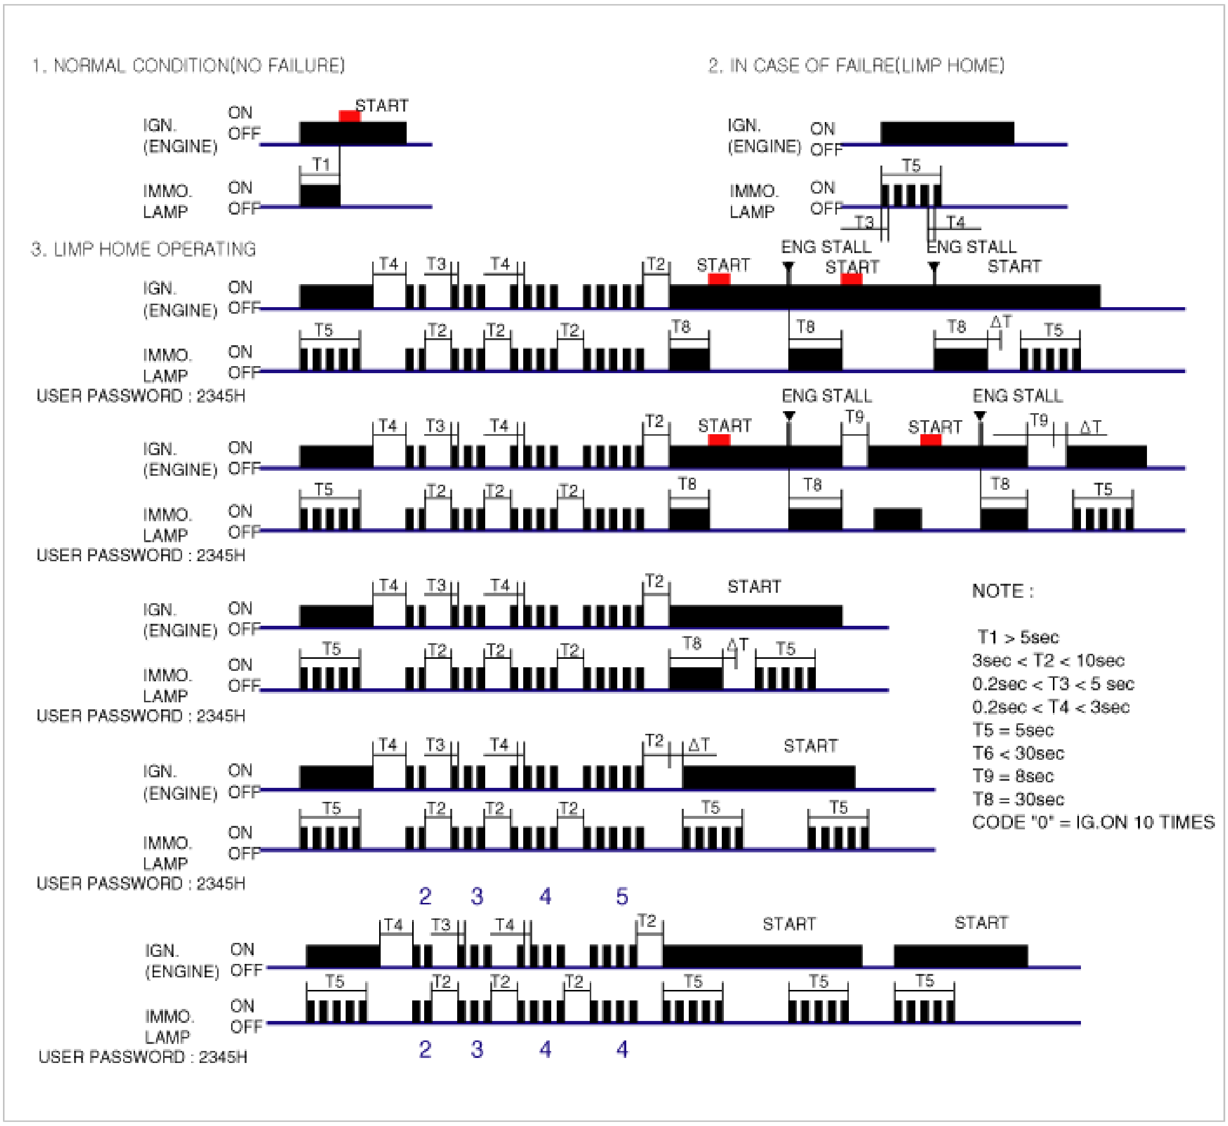








2. LIMP HOME BY IGNITION KEY
   The limp home can be activated also by the ignition key. The user password can be input to the ECM by a special sequence of ignition on/off.
   Only if the ECM is in status "learnt" and the user password status is "learnt" and the user password is correct, the ECM will be unlocked for a period of time (30 sec.). The engine can be started during this time. After the time has elapsed, engine start is not possible. After a new password has been input, the timer (30 sec.) will start again.
   After ignition off, the ECM is locked if the timer has elapsed 8 seconds. For the next start, the input of the user password is requested again.



PROBLEMS AND REPLACEMENT PARTS:

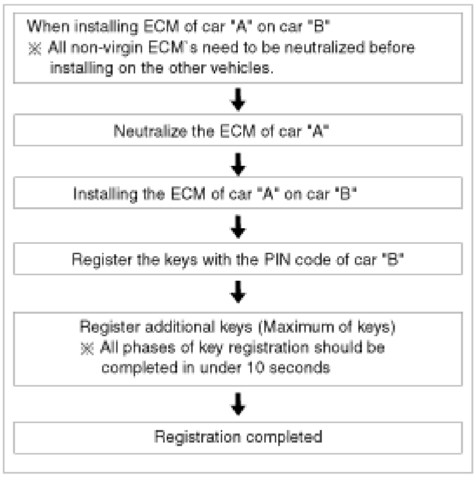
Problem	Part set	Scan tool required?
All keys have been lost	Blank key (4)	YES
Antenna coil unit does not work	Antenna coil unit	NO
ECM does not work	ECM	YES
Ignition switch does not work	Ignition switch with Antenna coil unit	YES
Unidentified vehicle specific data occurs	Key, ECM	YES
SMARTRA unit does not work	SMARTRA unit	NO

REPLACEMENT OF ECM AND SMARTRA

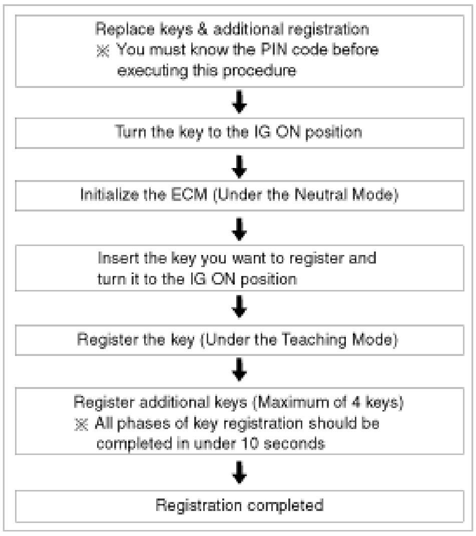
In case of a defective ECM, the unit has to be replaced with a "virgin" or "neutral" ECM. All keys have to be taught to the new ECM. Keys, which are not taught to the ECM, are invalid for the new ECM (Refer to key teaching procedure). The vehicle specific data have to be left unchanged due to the unique programming of transponder.

In case of a defective SMARTRA, there is no special procedure required. A new SMARTRA device simply replaces the old one. There are no transponder-related data stored in this device.

1. Things to remember before a replacement (ECM)



2. Things to remember before a replacement (Keys & Additional registration)



NOTE

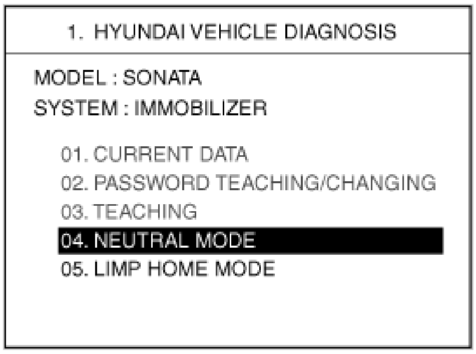
1. When there is only one key registered and you wish to register another key, you need to re-register the key which was already registered.
2. When the key #1 is registered and key #2 is not registered, Put the key #1 in the IG/ON or the start position and remove it. The engine can be started with the unregistered key #2.
   (Note that key #2 must be used within 10 seconds of removing key #1)
3. When the key #1 is registered and key #2 is not registered, put the unregistered master key #2 in the IG/ON or the start position.
   The engine cannot be started even with the registered key #1.
   (Note that key #1 must be used within 10 seconds of removing key #2)
4. When you inspect the immobilizer system, refer to the above paragraphs 1, 2 and 3.
   Always remember the 10 seconds zone.
5. If the pin code & password are entered incorrectly on three consecutive inputs, the system will be locked for one hour.
6. Be cautious not to overlap the transponder areas.
7. Problems can occur at key registration or vehicle starting if the transponders should overlap.

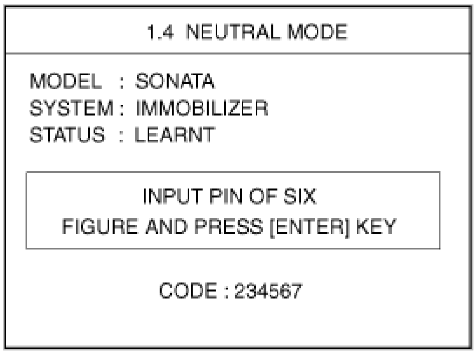
NEUTRALISING OF ECM

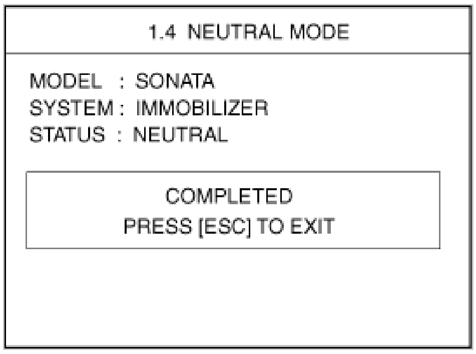
The ECM can be set to the "neutral" status by a tester.
A valid ignition key is inserted and after ignition on is recorded, the ECM requests the vehicle specific data from the tester. The communication messages are described at "Neutral Mode" After successfully receiving the data, the ECM is neutralized.
The ECM remains locked. Neither the limp home mode nor the "twice ignition on" function, is accepted by the ECM.
The teaching of keys follows the procedure described for the virgin ECM. The vehicle specific data have to be unchanged due to the unique programming of the transponder. If data should be changed, new keys with a virgin transponder are requested.
This function is for neutralizing the ECM. Ex) when lost key, Neutralize the ECM then teach keys.
(Refer to the Things to do when Key & PIN Code the ECM can be set to the "neutral" status by a scanner. A valid ignition key is inserted and after ignition on is recorded, the ECM requests the vehicle specific data from the scanner. The communication messages are described at" Neutral Mode". After successfully receiving the data, the ECM is neutralized.

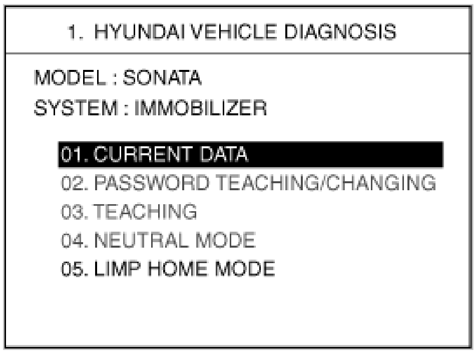
The ECM remains locked. Neither the limp home mode nor the "twice ignition on" function is accepted by ECM.
The teaching of keys follows the procedure described for virgin ECM. The vehicle specific data have to be unchanged due to the unique programming of transponder. If data should be changed, new keys with virgin transponder are requested.

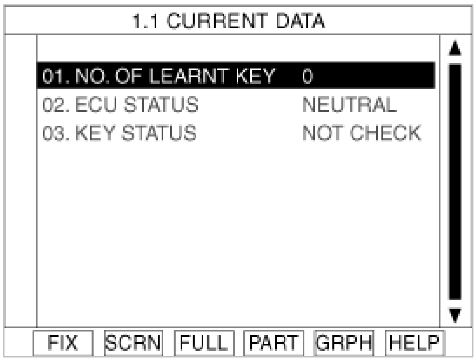
> **NOTE**
>
> - Neutralizing setting condition
>   - In case of ECM status "Learnt" regardless of user password "Virgin or Learnt"
>   - Input correct PIN code by scanner.
>   - Neutralizing meaning .
>   : PIN code (6) & user password (4) deletion.
>   : Locking of ECM (except key teaching permission)











Body Electrical System > Immobilizer System > P1674

GENERAL DESCRIPTION

During the key teaching procedure the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is unique; therefore the content of transponder can never be modified or changed. The data are a string of 9 bytes defined by vehicle manufacturer.
The transponder memory is split into two strings called authenticator and key password after this programming the transponder memory is locked and the data (PIN code) cannot be read or changed respectively. The transponder status changes from "virgin" to "learnt" Additionally every transponder includes a unique IDE (Identifier number) of 32 bit. Unique means that the IDE of all transponder is different from each other. The IDE is programmed by the transponder manufacturer and is a read-only value. The authenticator and the key password are not transferred from ECM to transponder or vice versa. Only the results from the encryption algorithm are transferred. It is almost impossible to calculate the vehicle specific data from the encryption result.
For teaching of keys and special purposes the ECM is connected to the tester device.
When IG is ON, the coil supplies energy to the transponder which in turn accumulates energy in the condenser.
Once the energy supply from the coil has stopped, using the stored energy in the condenser, the transponder transmits the ID CODE (stored within the ASIC).

DTC DESCRIPTION

This DTC is defined as TP not in password mode, or Transponder transport data has been changed.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Transponder Key
Detecting Factors	• Password mode invalid	
Detecting Window	• During Transponder Write or Read EEPROM Page	
Detecting Criteria	• TP not in password mode, or Transponder transport data has been changed	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

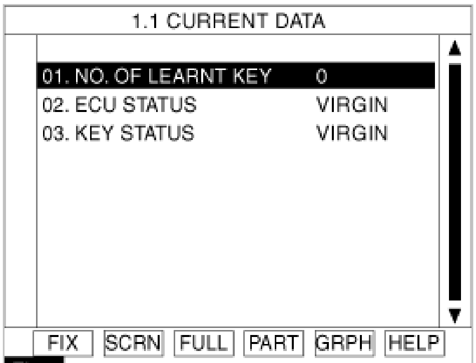


Fig 1

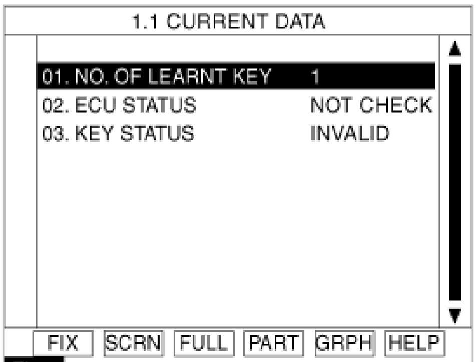

Fig 2

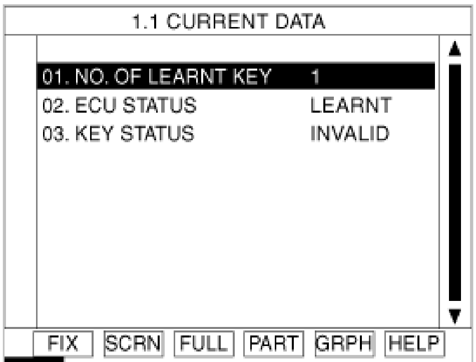

Fig 3

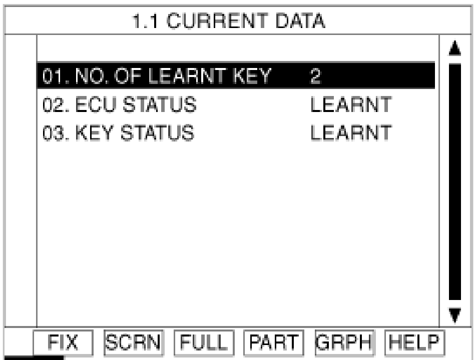

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing.
   (Refer to "Reference Data in General Information")

   NOTE
   Be sure that PIN code is prepared before performing neutral mode.

   (3) Is the neutral, teaching and password teaching/changing mode possible?

   YES
   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
   Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

   NO
   Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
   If the key status is displayed as "Virgin", replace Transponder.
   Perform key teaching mode in " Reference Data"
   Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES
Go to the applicable troubleshooting procedure.

NO
System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1675

GENERAL DESCRIPTION

The SMARTRA carries out communication with the built-in transponder of the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the ECM are converted into an RF signal, which is transmitted, to the transponder by the antenna. The SMARTRA does not carry out the validity check of transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to ECM and vice versa.
SMARTRA : SMARt TRansponder Antenna

DTC DESCRIPTION

This DTC defines Invalid message from SMARTRA to ECM.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or Short in SMARTRA Circuit • Faulty SMARTRA
Detecting Criteria	• No response from SMARTRA Invalid message from SMARTRA to ECM	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

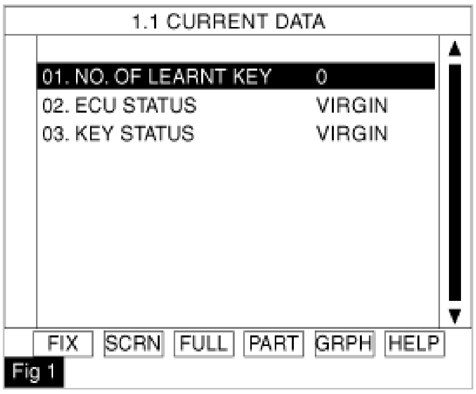

Fig 1

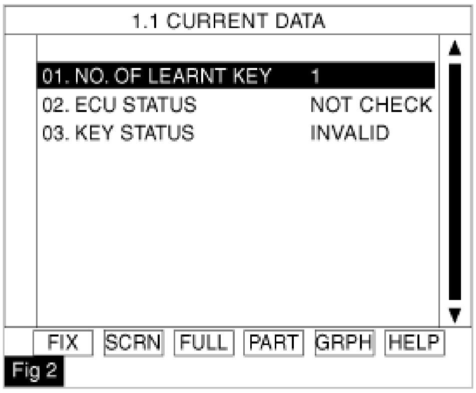

Fig 2

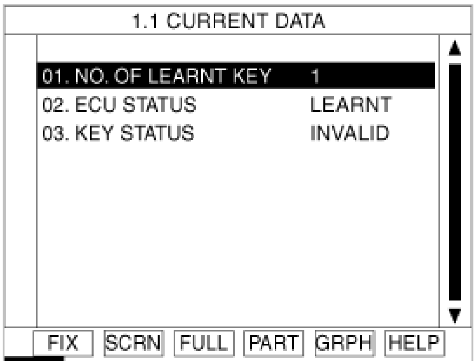

Fig 3

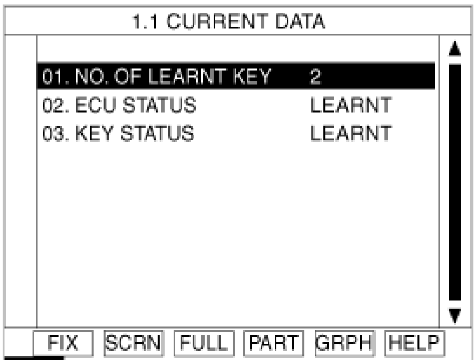

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+

5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and SMARTRA is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

   Specification : Approx. 10.2V

   (5) Is the measured voltage within specifications?

   YES

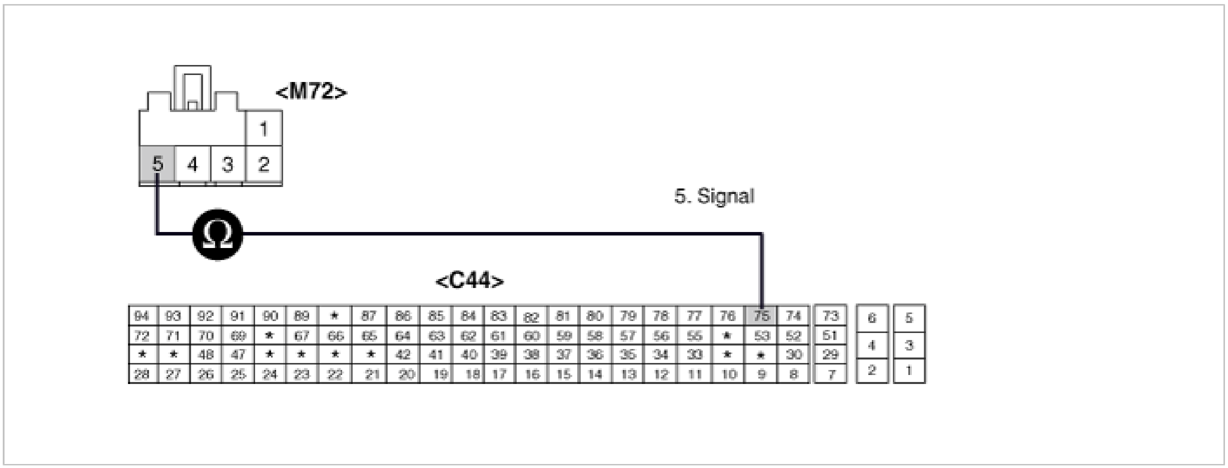
   Go to "Check for open in harness" as below.

   NO

   Check short in signal harness.
   Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75 of ECM harness connector.

   Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

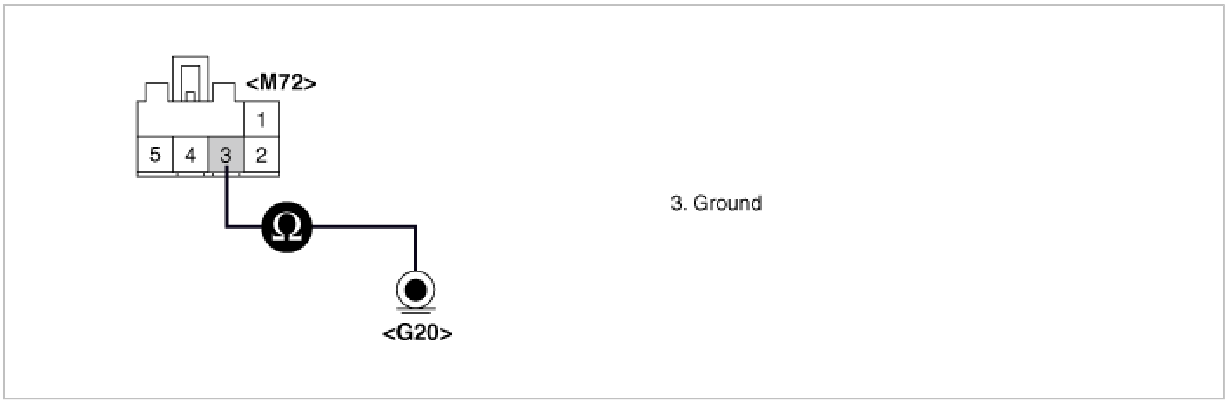
GROUND CIRCUIT INSPECTION

1. Check for open in harness between SMARTRA and Chassis ground.
   (1) Ignition "OFF".

   (2) Disconnect SMARTRA connector.

   (3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check SMARTRA
   (1) Ignition " ON" & Engine "OFF".

   (2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.

NOTE

Be sure that PIN code is prepared before performing neutral mode.

(3) Is Key teaching completed?

YES

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and go to "Go to "Verification of Vehicle Repair" procedure.

NOTE

In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1690

GENERAL DESCRIPTION

The SMARTRA carries out communication with the built-in transponder of the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the ECM are converted into an RF signal, which is transmitted, to the transponder by the antenna. The SMARTRA does not carry out the validity check of transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to ECM and vice versa.
SMARTRA : SMARt TRansponder Antenna

DTC DESCRIPTION

This DTC is defined as No answer from SMARTRA because of communication line error(Open or short etc.)

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or Short in SMARTRA Circuit • Faulty SMARTRA
Detecting Criteria	• No response from SMARTRA (Communication Line Error - Open or Short etc.)	

SIGNAL WAVEFORM

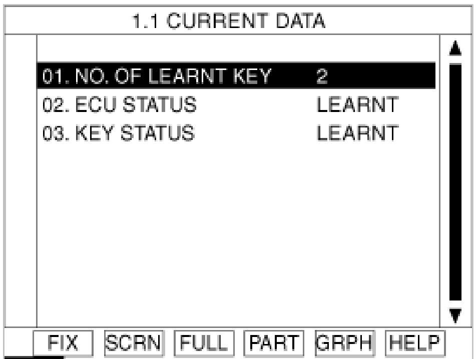


Fig 1

EMS Status	Engine start with valid key	Engine start by limp home	Teaching of key	Teaching or changing of user password	Twice ignition of function
Not yet checked	No	No	No	No	No
Virgin	No	No	Yes	No	Yes, with virgin key
Learnt	Yes	Yes, with learnt user password	Yes	Yes	No
Neutral	No	No	Yes	No	No
Locked by timer	No	No	No	No	No

Fig 2

1. ECM :
   (1) Virgin(This is status at the end of ECM production line before delivery to customer)

   (2) Neutral (This is a status that is erased all data regarding immobilizer by special command from scanner)

   (3) Not Check (The status is stored in permanent memory (EEPROM or Flash etc.)
   In case of not plausible data from this circuit the ECM cannot check the status.

   (4) Locked by timer (After a certain number of incorrect user Password(4) or PIN Code(6) the ECM is locked for one hour and no inputs are accepted during this time)

2. KEY :
   (1) Virgin (It means the key in the key cylinder has not matched with ECM yet)

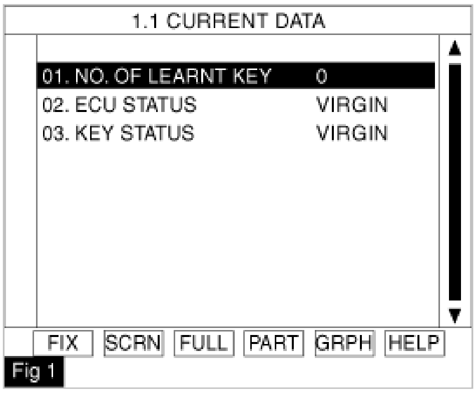
   (2) Invalid (It means that data is mismatched between ECM and transponder)

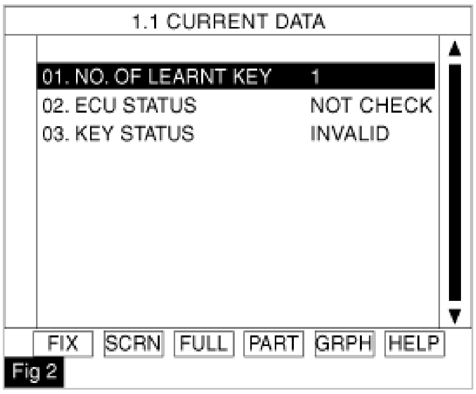
   (3) Not Checked (It means that ECM cannot check the transponder data in the key cylinder)
   A. ECM cannot check the transponder data because of SMARTRA error or antenna coil error.
   B. ECM cannot check the transponder data because of communication circuit problem between ECM and SMARTRA.
   C. Key with NO Transponder
   D. More than 1(One) Transponder in the magnetic field
   E. No Transponder in the magnetic field
   F. TP data blocked
   G. TP data does not exist
   H. TP data changed
   I. TP Teaching error
   J. Multiple TP data input

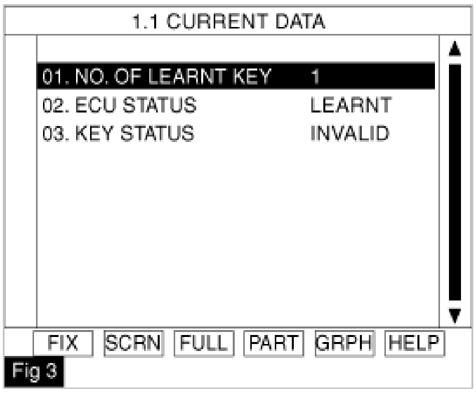
Current Data from Immobilizer will show the numbers of Key learnt, ECM status, and Key status as
Fig 1. The current data provides an indication of the probable cause.
Fig 2. shows possibility of Engine start, Teaching or changing of user password according to ECM status.

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.







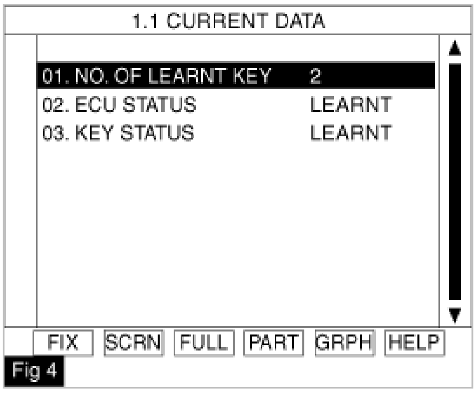


Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

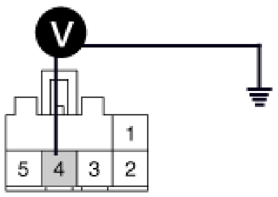
NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+



5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

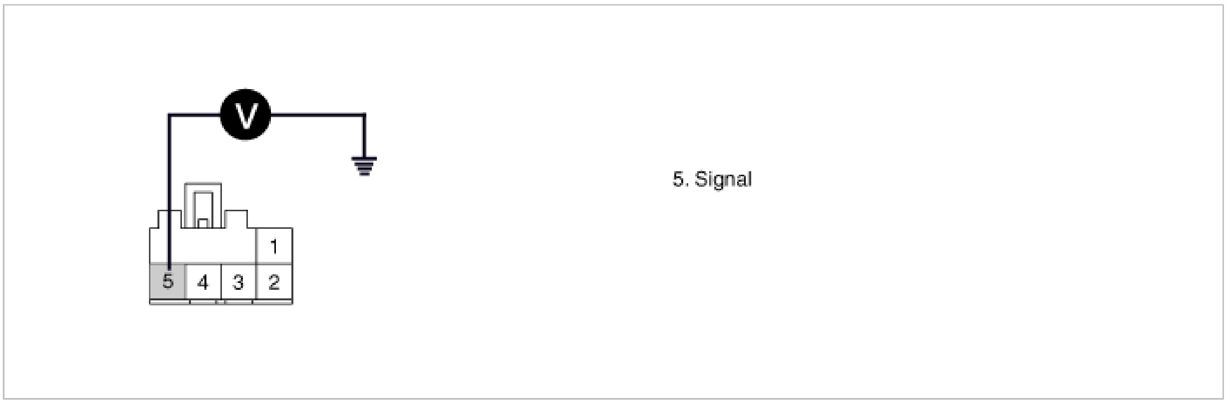
NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and Smartra is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

   Specification : Approx. 10.2V



(5) Is the measured voltage within specifications?

YES

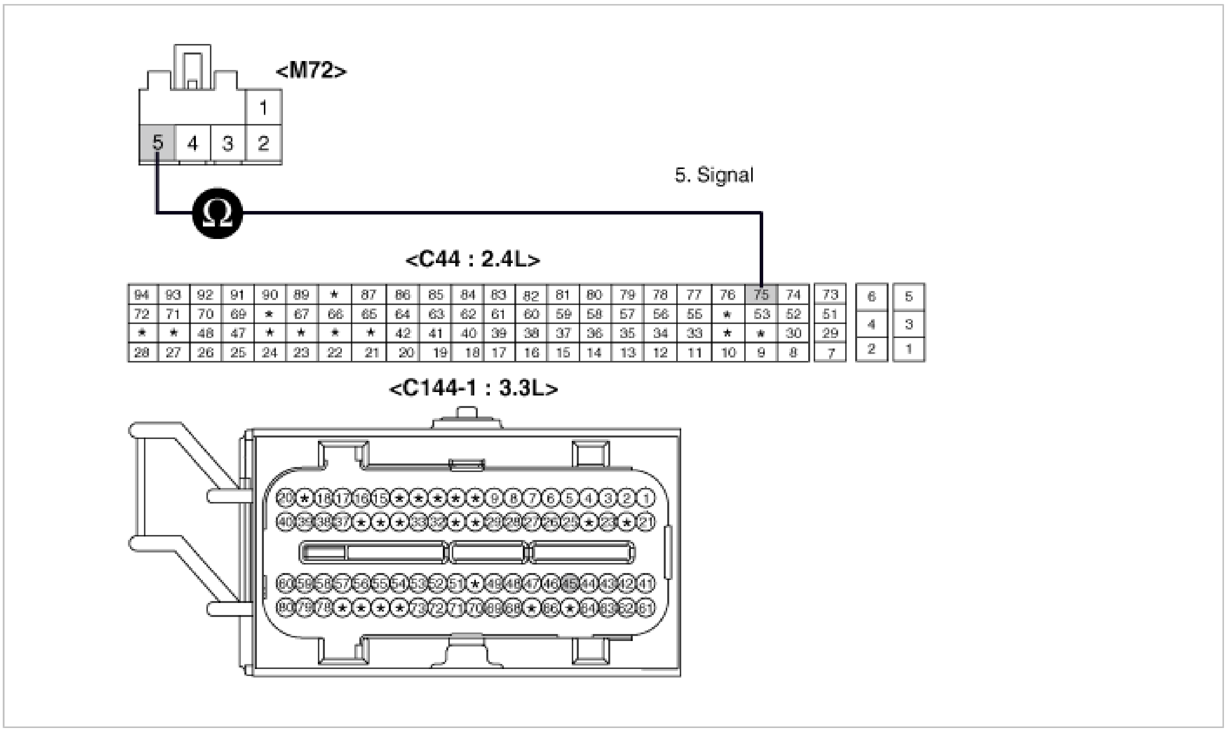
Go to "Check for open in harness" as below.

NO

Check short in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75(2.4L), 45(3.3L) of ECM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

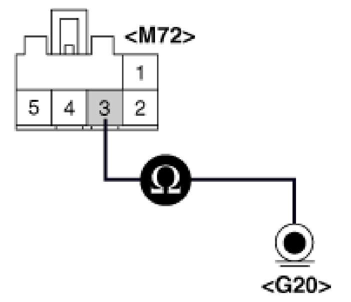
1. Check for open in harness between SMARTRA and Chassis ground.

(1) Ignition "OFF".

(2) Disconnect SMARTRA connector.

(3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check SMARTRA

(1) Ignition " ON" & Engine "OFF".

(2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.

> **NOTE**
>
> Be sure that PIN code is prepared before performing neutral mode.

(3) Is Key teaching completed?

YES

Fault is intermittent caused by poor contact in the SMARTRA and/or EMC's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and go to "Go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1691

GENERAL DESCRIPTION

This wireless communication runs on RF . The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving. The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the EMS are converted into an RF signal, which is transmitted, to the transponder by the antenna.

DTC DESCRIPTION

This DTC is defined as Antenna coil open or short circuit.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or short in coil circuit • Faulty Antenna Coil • Faulty SMARTRA
Detecting factors	• Antenna signal error	
Detecting Window	• Before transponder communications	
Detecting Criteria	• Antenna open/short circuit	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

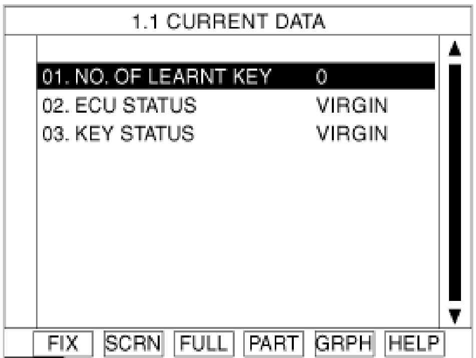


Fig 1

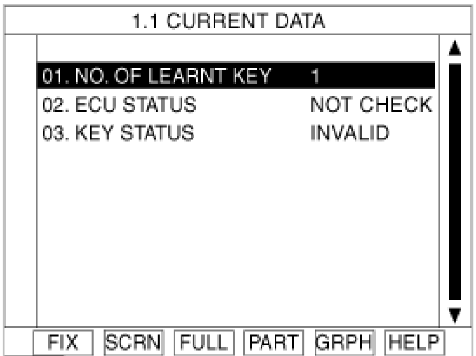

Fig 2

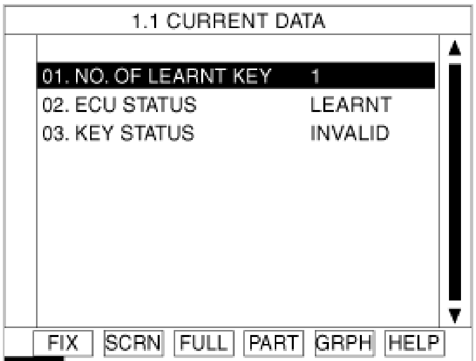

Fig 3

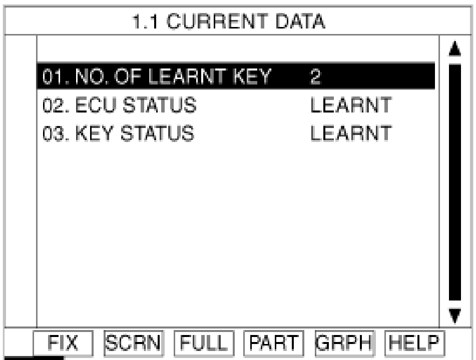

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

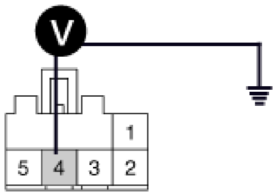
NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+



5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and Smartra is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

   Specification : Approx. 10.2V

   (5) Is the measured voltage within specifications?

   YES

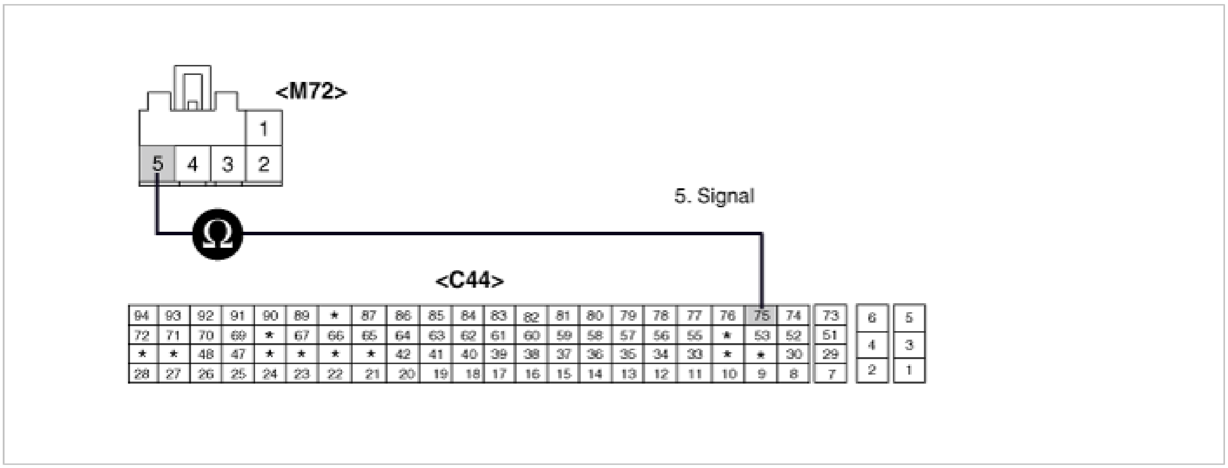
   Go to "Check for open in harness" as below.

   NO

   Check short in signal harness.
   Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75 of ECM harness connector.

   Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

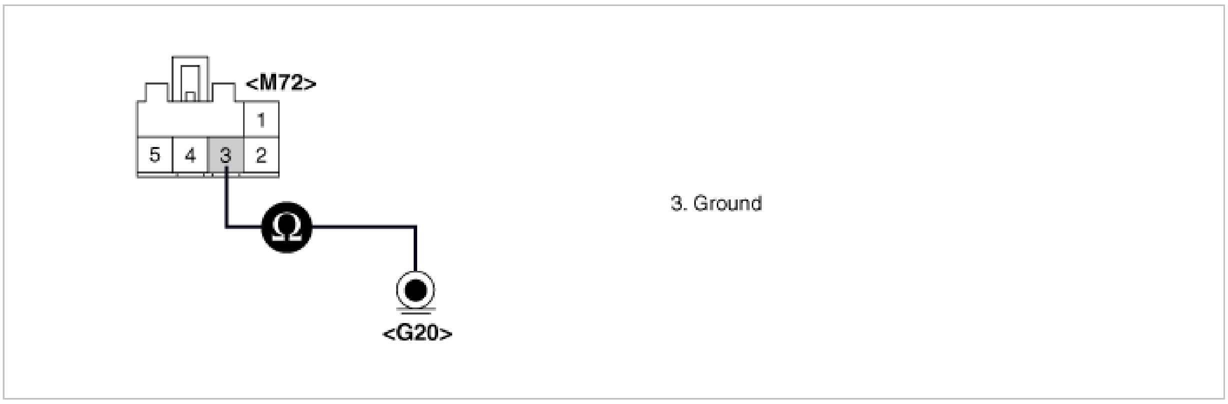
NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Check for open in harness between SMARTRA and Chassis ground.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground(G20).

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

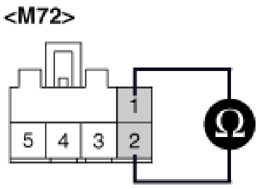
NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Antenna Coil
   (1) Ignition " OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 1 and 2 of the SMARTRA connector (Component side)

Specification : Approx. 9Ω



(4) Is the measured resistance within specifications?

YES

Go to " Check SMARTRA" as below.

NO

Check for open in harness between SMARTRA and Antenna coil, repair or replace as necessary.
Substitute with a known-good Antenna Coil and check for proper operation. If the problem is corrected, replace Antenna Coil. And then, go to "Verification of Vehicle Repair" procedure.

2. Check SMARTRA
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching/changing and password teaching according to description in "System inspection" procedure.

> NOTE
>
> Be sure that PIN code is prepared before performing neutral mode.

   (3) Is Key teaching completed?

YES

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and Go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1693

GENERAL DESCRIPTION

During the key teaching procedure the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is unique; therefore the content of transponder can never be modified or

changed. The data are a string of 9 bytes defined by vehicle manufacturer.
The transponder memory is split into two strings called authenticator and key password after this programming the transponder memory is locked and the data(PIN code) cannot be read or changed respectively. The transponder status changes from "virgin" to "learnt". Additionally every transponder includes a unique IDE (Identifier number) of 32 bit. Unique means that the IDE of all transponder is different from each other. The IDE is programmed by the transponder manufacturer and is a read-only value. The authenticator and the key password are not transferred from ECM to transponder or vice versa. Only the results from the encryption algorithm are transferred. It is almost impossible to calculate the vehicle specific data from the encryption result.
For teaching of keys and special purposes the ECM is connected to the tester device.
When IG is ON, the coil supplies energy to the transponder which in turn accumulates energy in the condenser.
Once the energy supply from the coil has stopped, using the stored energy in the condenser, the transponder transmits the ID CODE (stored within the ASIC).

DTC DESCRIPTION

This DTC is defined as Invalid Transponder Data.

DTC DESCRIPTION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Transponder Key
Detecting factors	• Invalid Transponder Data	
Detecting Window	• During Transponder IDE • During Transponder Authentication requests • During Transponder Write EEPROM page requests • During Transponder Read EEPROM page requests	
Detecting Criteria	• Corrupted data form Transponder (Tp), or more than one TP in the field, or no TP in the magnetic field.	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

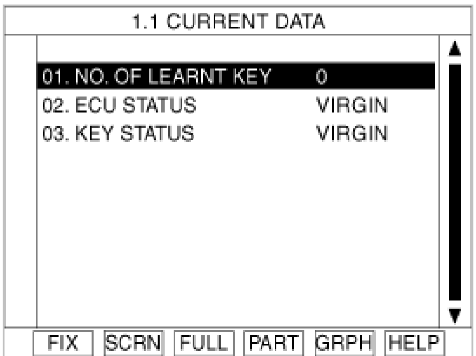


Fig 1

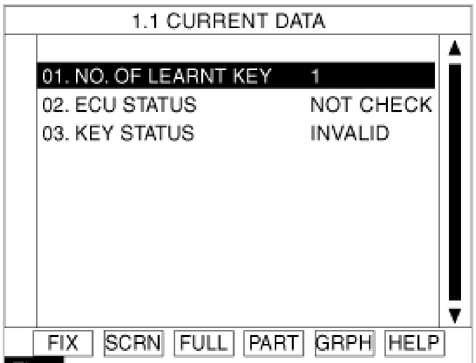

Fig 2

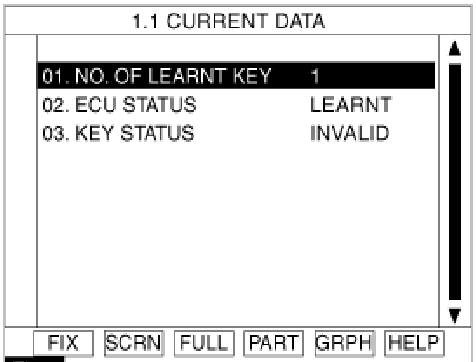

Fig 3

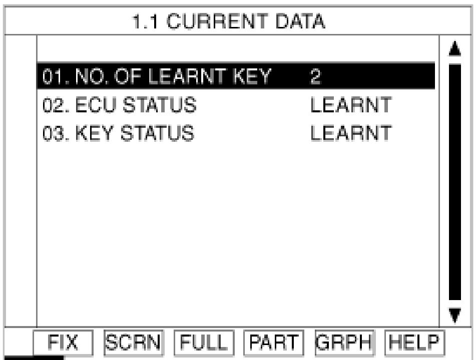

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing according to "3. ECM Neutralization, 2. Key Teaching Procedure,4. Password Teaching in Reference Data" described in General Information.

> **NOTE**
>
> Be sure that PIN code is prepared before performing neutral mode.

(3) Is the neutral, teaching and password teaching/changing mode completed?

YES

Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
If the key status is displayed as "Virgin", replace Transponder.
Perform key teaching mode according to "2.Key Teaching Procedure belongs to Reference Data" described in General Information.
Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1694

GENERAL DESCRIPTION

The ECM and the SMARTRA communicate by dedicated line. During this communication of ECM and SMARTRA the K line of ECM cannot be used for communication. The ECM controls the communication either to SMARTRA or to other devices(e.g. scanner) on K line by switching of a multiplexer and specific communication procedures. The multiplexer is a part of ECM hard ware.

DTC DESCRIPTION

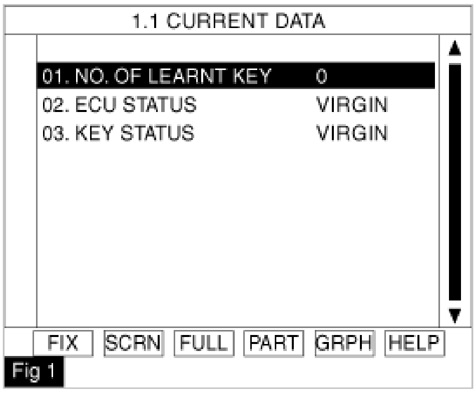
This DTC is defined as invalid request from ECM or corrupted data.

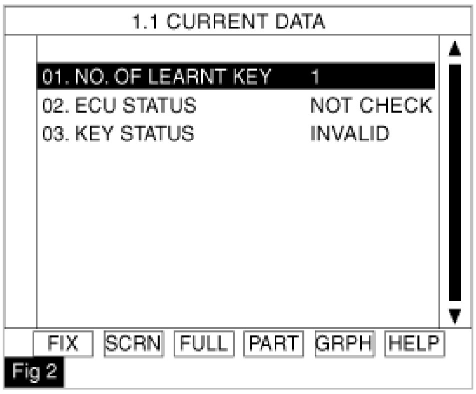
DTC DETECTING CONDITION

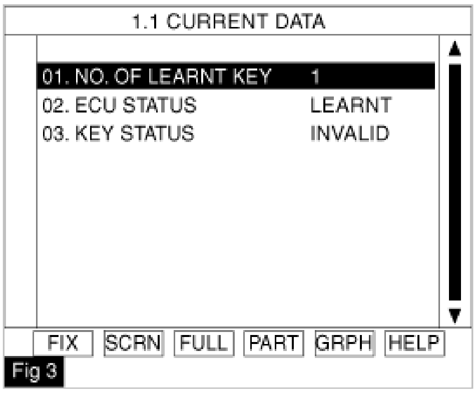
Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty ECM
Detecting factors	• Request from Control unit is invalid	
Detecting Window	• End of ECM request message	
Detecting Criteria	• Protocol layer violation - Invalid request, Invalid check sum.)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.







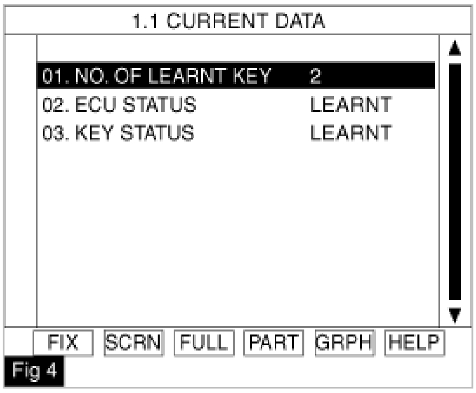


Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECM
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform Key Teaching Procedure in "Reference Data" described in General Information.
   (3) Is the Key teaching completed?

YES

Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good ECM and check for proper operation. If the problem is corrected, replace ECM and then go to " Verification of Vehicle repair" procedure.

> NOTE
>
> 1. Don't forget to prepare for the PIN of the vehicle before removing ECM from the vehicle.
> 2. Remember that substituting with a known-good ECM should be followed "The things to remember before repair(1)" in "Reference Data in General Information".
>   (In case of faulty ECM, it has to be replaced with "VIRGIN" or " NEUTRAL" ECM.)
> 3. Ensure that the correct PIN is entered when replacing a new ECM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1695

GENERAL DESCRIPTION

The relevant data for the immobilizer function are stored at permanent memory (EEPROM or Flash etc.).
The immobilizer data are stored by three independent entries.
The data from EEPROM are evaluated by "2 of 3 decision". That means all three entries are read and the content is compared before authentication process.
If the contents of all entries are equal, the authentication will run without additional measures.
If only the contents of two entries are equal, the authentication will run and fault code "EEPROM defective“ is stored at ECM.
If the contents of all three entries are different from each other, no authentication will be possible and the fault code "EEPROM defective“ will be stored. The limp home function cannot be activated. The ECM shall be replaced if the EEPROM related fault occurs again after new teaching of all keys.

DTC DESCRIPTION

This DTC is defined as not only ECM have inconsistent data of EEPROM for number of keys taught, user password state and invalid write operation to EEPROM but ECM can not recognize the unique PIN code during Key Authentication.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty ECM
Detecting Criteria	• ECM internal permanent memory (EEPROM or Flash etc.) fault. • Invalid write operation to permanent	

	memory(EEPROM or Flash etc.) fault.	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

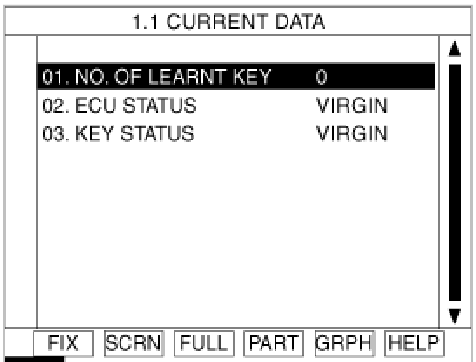

Fig 1

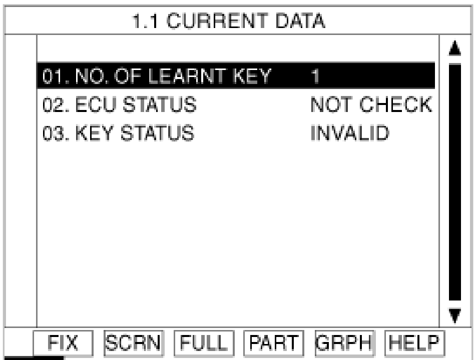

Fig 2

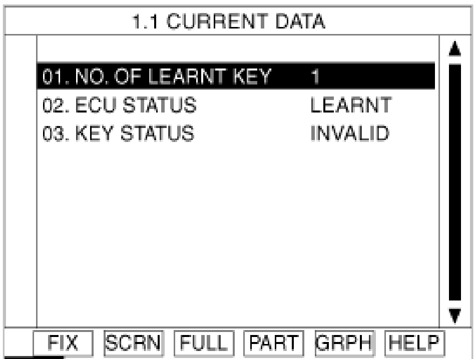

Fig 3

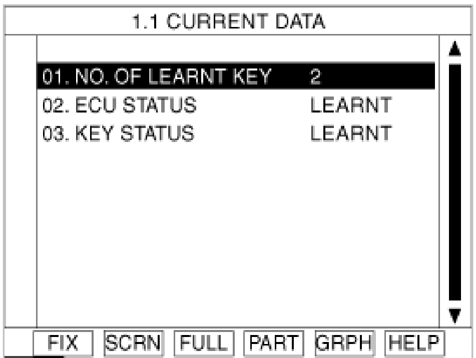

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.

Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECM
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.
   (3) Are both neutral and teaching mode completed?

   YES

   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
   Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good ECM and check for proper operation. If the problem is corrected, replace ECM and then go to " Verification of Vehicle repair" procedure.

   NOTE

   1. Don't forget to prepare for the PIN of the vehicle before removing ECM from the vehicle.
   2. Remember that substituting with a known-good ECM should be followed "The things to remember before repair(1) in "Reference Data in General Information" (In case of faulty ECM, it has to be replaced with "VIRGIN" or " NEUTRAL" ECM.)
   3. Ensure that the correct PIN is entered when replacing a new ECM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1696

GENERAL DESCRIPTION

The relevant data for the immobilizer function are stored at permanent memory (EEPROM or Flash etc.).
The immobilizer data are stored by three independent entries.
The data from EEPROM are evaluated by "2 of 3 decision". That means all three entries are read and the content is compared before authentication process.
If the contents of all entries are equal, the authentication will run without additional measures.
If only the contents of two entries are equal, the authentication will run and fault code "EEPROM defective“ is stored at ECM.
If the contents of all three entries are different from each other, no authentication will be possible and the fault code "EEPROM defective“ will be stored. The limp home function cannot be activated. The ECM shall be replaced if the EEPROM related fault occurs again after new teaching of all keys.

DTC DESCRIPTION

This DTC is defined as Virgin TP or Invalid TP with “Learnt” ECM status (Authentication fail).

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty TP(Virgin or Invalid)
Detecting Criteria	• Virgin TP at EMS STATUS "Learnt" • Learnt(Invalid) TP at EMS status "Learnt"(Authentication fail)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

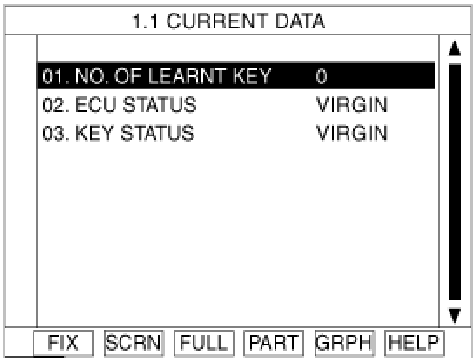

Fig 1

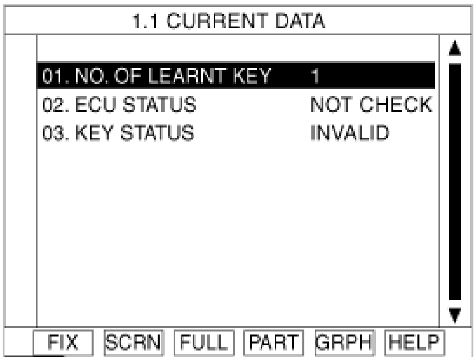

Fig 2

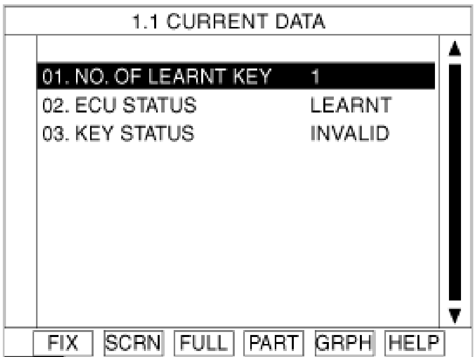

Fig 3

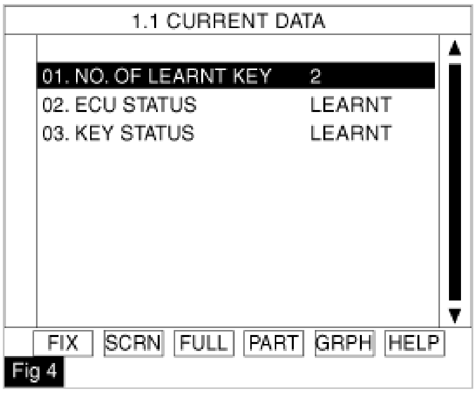

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing.
   (Refer to "Reference Data in General Information")

   > **NOTE**
   >
   > Be sure that PIN code is prepared before performing neutral mode.

   (3) Is the neutral, teaching and password teaching/changing mode possible?

   YES

   In case that key status is "Invalid", Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary, and then go to " Verification of Vehicle Repair" procedure.
   In case that key status is "Learnt", go to "Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
   If the key status is displayed as "Virgin", replace Transponder.
   Perform key teaching mode in " Reference Data"
   Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1699

GENERAL DESCRIPTION

This is a special function for engine start by vehicle manufacturer. The engine can be started for moving from the production line to an area where the key teaching is proceeded.

DTC DESCRIPTION

This DTC is defined as exceeding the maximum limit of twice ignition On.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Locked by timer
Detecting Criteria	• Exceeding the maximum limit of Twice IGN ON (⊇ 32 times)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. Monitor Current Data for Immobilizer System.
4. Retry to communication from the vehicle selection menu although once communication is failed.

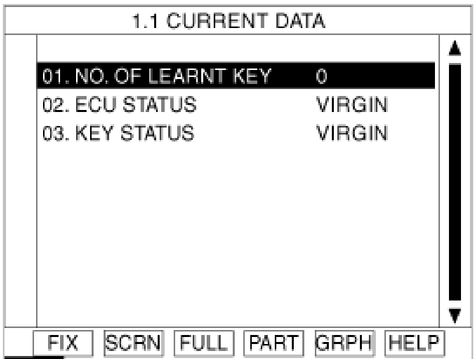

Fig 1

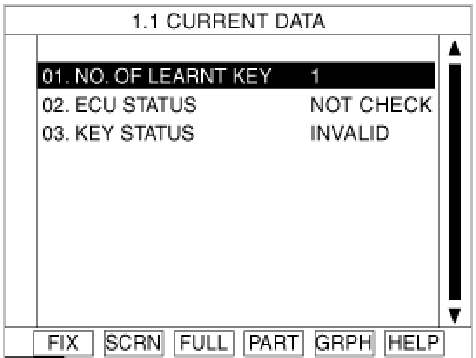

Fig 2

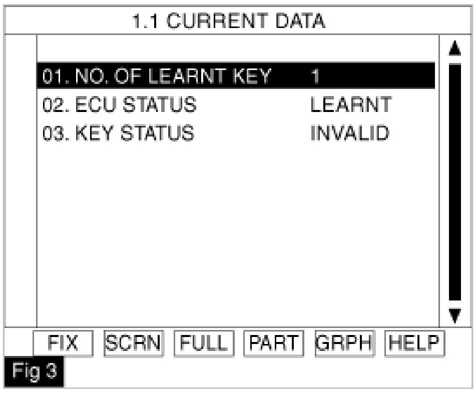

Fig 3

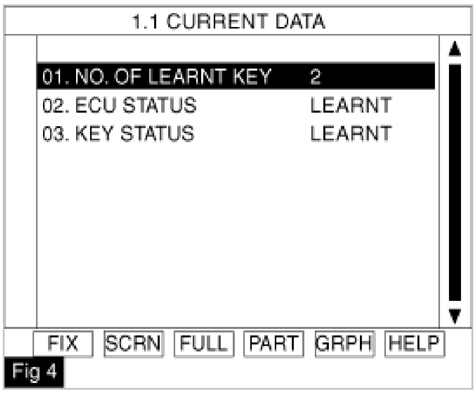

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

5. Is the communication possible between scan tool and Immobilizer system?

YES

Wait for one hour with IG Key On. Be sure that the battery is fully enough to stay for an hour with IG ON.
Disconnecting battery or others manipulation can not reduce this time. After connecting the battery the timer starts again for one hour.
And then, reperform key teaching procedure(Refer to "Reference Data" in General Information")
Go to " Verification of Vehicle Repair" procedure

NO

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination. deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

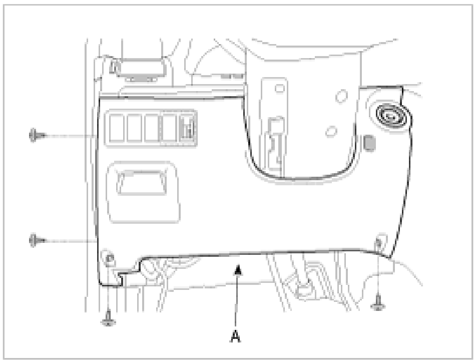
NO

System is performing to specification at this time.

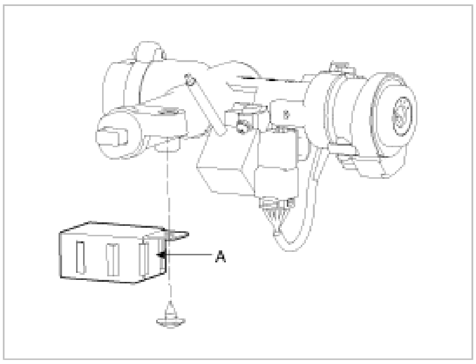
Body Electrical System > Immobilizer System > Immobilizer Control Unit > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



3. Remove the steering column shaft (Refer to the ST group).
4. Disconnect the 5P connector of the SMARTRA unit and then remove the SMARTRA unit (A) after loosening the screw.

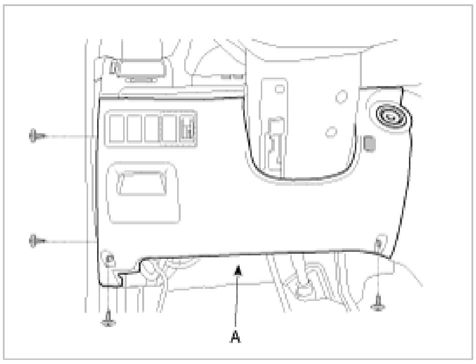


5. Installation is the reverse of removal procedure.

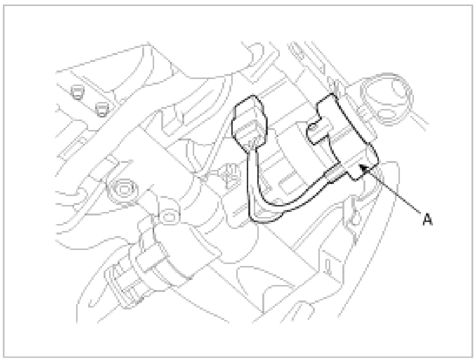
Body Electrical System > Immobilizer System > Coil Antenna > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



3. Remove the steering column shaft (Refer to the ST group).
4. Disconnect the 6P connector of the coil antenna and then remove the coil antenna (A) after loosening the screw.

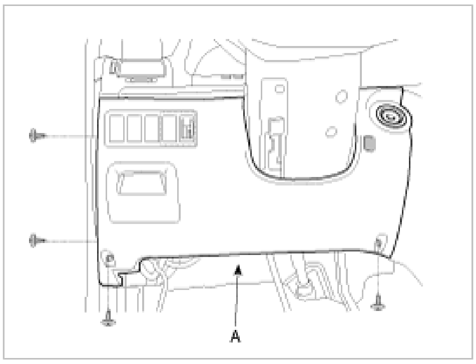


5. Installation is the reverse of removal procedure.

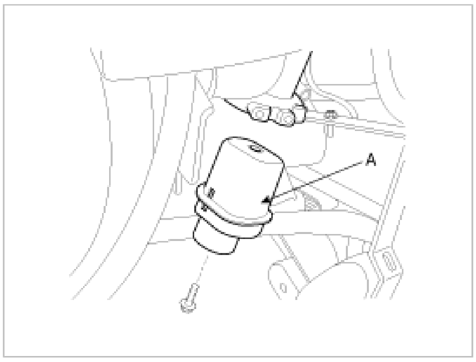
Body Electrical System > Ignition System > Ignition Switch > Repair procedures

REPLACEMENT

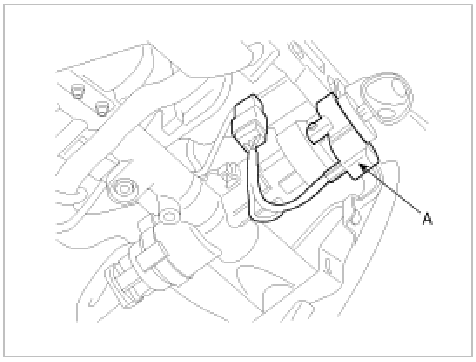
1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



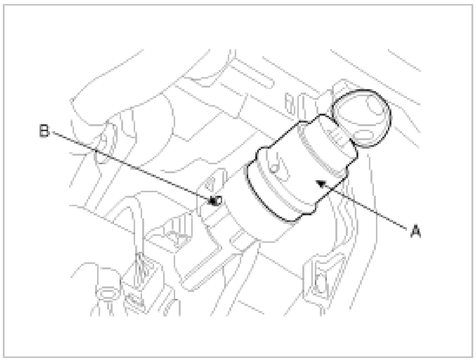
3. Remove the ignition switch (A) after loosening the screw and disconnecting the 6P connector.



4. Remove the steering column shaft (Refer to the ST group).
5. Remove the key warning switch and key illumination lamp (A) after loosening the screws and disconnecting the 6P connector.

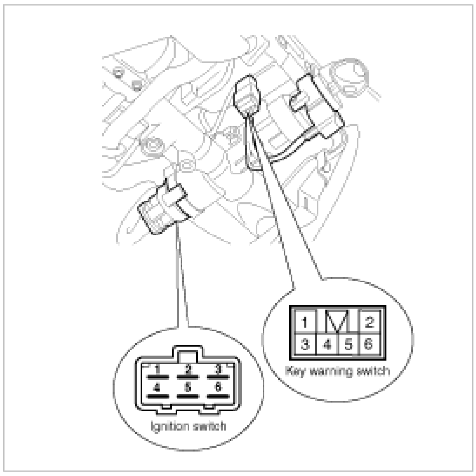


6. If it is necessary to remove the key lock cylinder (A), Remove the key lock cylinder (A) after pushing lock pin (B) with key ON.



7. Installation is the reverse of removal procedure.

INSPECTION



1. Disconnect the ignition switch connector and key warning switch connector from under the steering column.
2. Check for continuity between the terminals.
3. If continuity is not specified, replace the switch.

PROBLEM SYMPTOMS TABLE

Symptom	Suspect Area	Reference
Lower pedal or spongy pedal	1. Brake system (Fluid leaks) 2. Brake system (Air in) 3. Piston seals (Worn or damaged) 4. Rear brake shoe clearance(Out of adjustment) 5. Master cylinder (Faulty)	repair air·bleed replace adjust replace
Brake drag	1. Brake pedal freeplay (Minimum) 2. Parking brake lever travel (Out of adjustment) 3. Parking brake wire (Sticking) 4. Rear brake shoe clearance(Out of adjustment) 5. Pad or lining (Cracked or distorted) 6. Piston (Stuck) 7. Piston (Frozen) 8. Anchor or Return spring (Faulty) 9. Booster system (Vacuum leaks) 10. Master cylinder (Faulty)	adjust adjust repair adjust replace replace replace replace repair replace
Brake pull	1. Piston (Sticking) 2. Pad or lining (Oily) 3. Piston (Frozen) 4. Disc (Scored) 5. Pad or lining (Cracked or distorted)	replace replace replace replace replace
Hard pedal but brake inefficient	1. Brake system (Fluid leaks) 2. Brake system (Air in) 3. Pad or lining (Worn) 4. Pad or lining (Cracked or distorted) 5. Rear brake shoe clearance(Out of adjustment) 6. Pad or lining (Oily) 7. Pad or lining (Glazed) 8. Disc (Scored) 9. Booster system (Vacuum leaks)	repair air·bleed replace replace adjust adjust replace replace repair
Noise from brake	1. Pad or lining (Cracked or distorted) 2. Installation bolt (Loosen) 3. Disc (Scored) 4. Sliding pin (Worn) 5. Pad or lining (Dirty) 6. Pad or lining (Glazed) 7. Anchor or Return spring (Faulty) 8. Brake pad shim (Damage)	replace adjust replace replace clean replace replace replace

	9. Shoe hold-down spring (Damage)	replace
Brake fades	1. master cylinder	replace
Brake vibration, pulsation	1. brake booster 2. pedal free play 3. master cylinder 4. caliper 5. master cylinder cap seal 6. damaged brake lines	replace adjust replace replace replace replace
Brake Chatter	Brake chatter is usually caused by loose or worn components, or glazed or burnt linings. Rotors with hard spots can also contribute to brake chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

Brake System > Brake System > Description and Operation

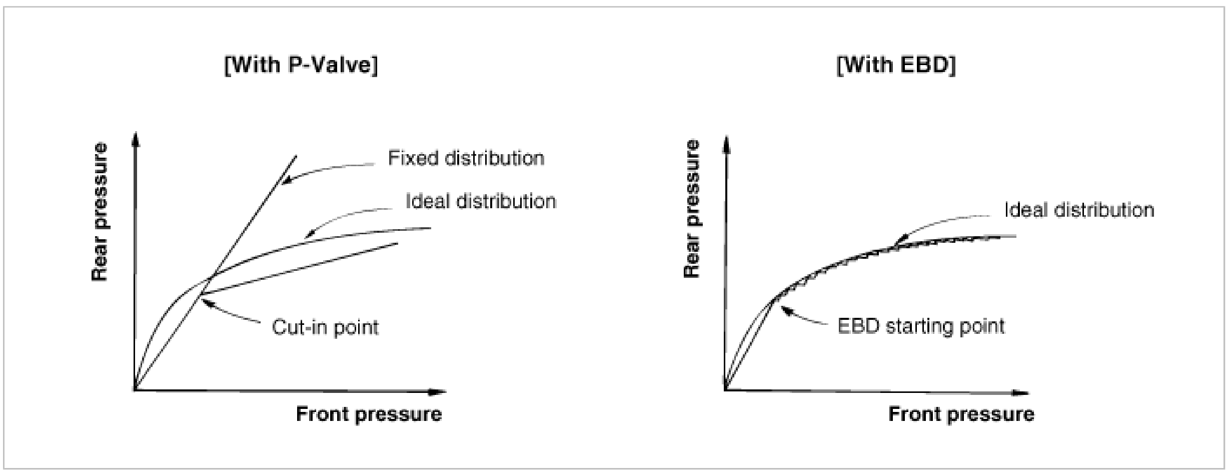
DESCRIPTION

The EBD system (Electronic Brake force Distribution) as a sub-system of the ABS system is to control the effective adhesion utilization by the rear wheels.
It further utilizes the efficiency of highly developed ABS equipment by controlling the slip of the rear wheels in the partial braking range.
The brake force is moved even closer to the optimum and controlled electronically, thus dispensing with the need for the proportioning valve.
The proportioning valve, because of a mechanical device, has limitations to achieve an ideal brake force distribution tothe rear wheels as well as to carry out the flexible brake force distribution proportioning to the vehicle load or weight increasing. And in the event of malfunctioning, driver cannot notice whether it fails or not.
EBD controlled by the ABS Control Module, calculates the slip ratio of each wheel at all times and controls the brake pressure of the rear wheels not to exceed that of the front wheels.
If the EBD fails, the EBD warning lamp (Parking brake lamp) lights up.

ADVANTAGES

- Function improvement of the base-brake system.
- Compensation for the different friction coefficients.
- Elimination of the proportioning valve.
- Failure recognition by the warning lamp.

Comparison between Proportioning valve and EBD



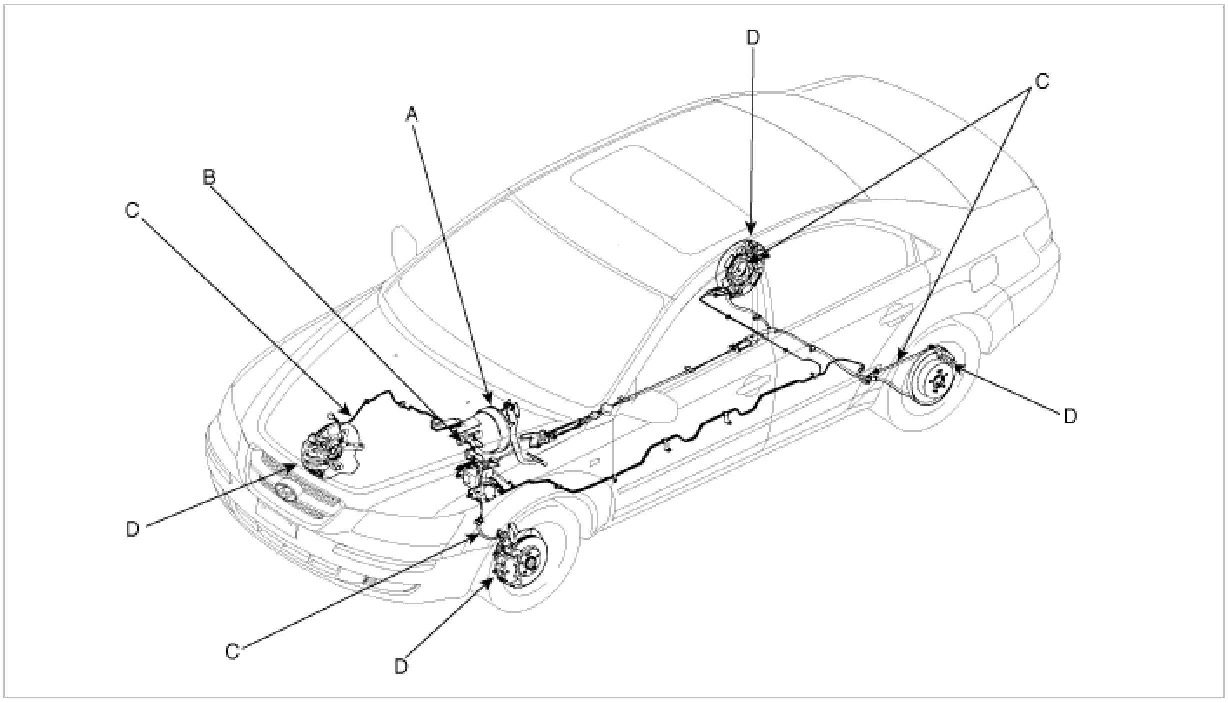
Brake System > Brake System > Repair procedures

Operation and Leakage Check

Check all of the following items:

Component	Procedure
Brake Booster (A)	Check brake operation by applying the brakes during a test drive. If the brakes do not work properly, check the brake booster. Replace the brake booster as an assembly if it does not work properly or if there are signs of leakage.
Piston cup and pressure cup inspection (B)	• Check brake operation by applying the brakes. Look for damage or signs of fluid leakage. Replace the master cylinder as an assembly if the pedal does not work properly or if there is damage or signs of fluid leakage. • Check for a difference in brake pedal stroke between quick and slow brake applications. Replace the master cylinder if there is a difference in pedal stroke.
Brake hoses (C)	Look for damage or signs of fluid leakage. Replace the brake hose with a new one if it is damaged or leaking.

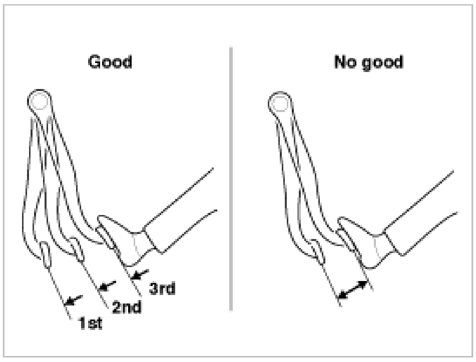
Caliper piston seal and piston boots (D)	Check brake operation by applying the brakes. Look for damage or signs of fluid leakage. If the pedal does not work properly, the brakes drag, or there is damage or signs of fluid leakage, disassemble and inspect the brake caliper. Replace the boots and seals with new ones whenever thebrake caliper is disassembled.



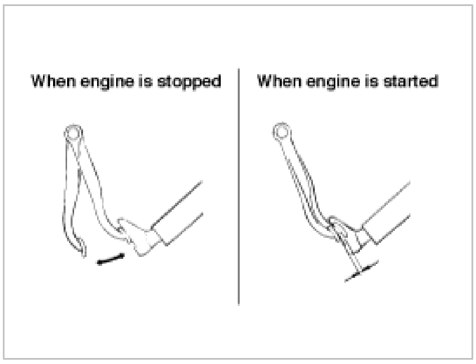
BRAKE BOOSTER OPERATING TEST

For simple checking of the brake booster operation, carry out the following tests

1. Run the engine for one or two minutes, and then stop it. If the pedal depresses fully the first time but gradually becomes higher when depressed succeeding times, the booster is operating properly, if the pedal height remains unchanged, thebooster is defective.

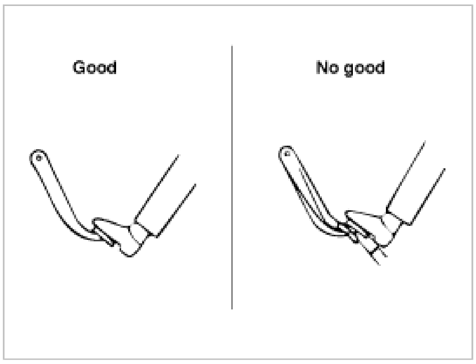


2. With the engine stopped, step on the brake pedal several times.
Then step on the brake pedal and start the engine. If the pedal moves downward slightly, the booster is in good condition. If there is no change, the booster is defective.



3. With the engine running, step on the brake pedal and then stop the engine.
Hold the pedal depressed for 30 seconds. If the pedal height does not change, the booster is in good condition, if the pedal

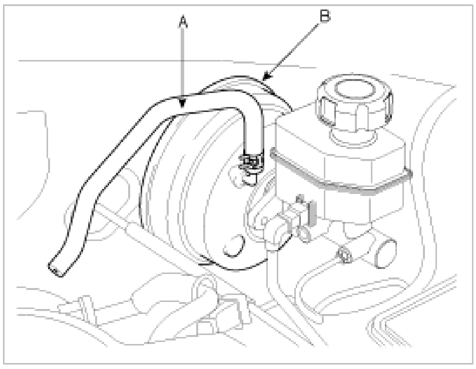
rises, the booster is defective.
If the above three tests are okay, the booster performance can be determined as good.
Even if one of the above three tests is not okay, check the check valve, vacuum hose and booster for defect.



VACUUM HOSE (CHECK VALVE)

INSPECTION

1. Disconnect the brake booster vacuum hose (check valve built in) (A) at the booster (B).
2. Start the engine and let it idle. There should be vacuum available. If no vacuum is available, the check valve is not working properly. Replace the brake booster vacuum hose and check valve and retest.

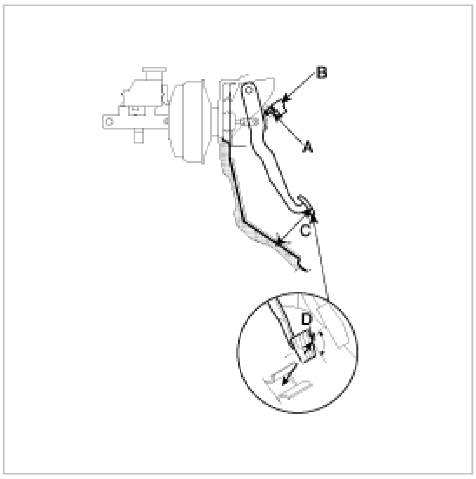


BRAKE PEDAL BRAKE SWITCH ADJUSTMENT

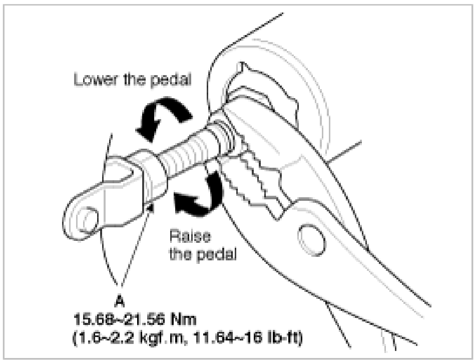
PEDAL HEIGHET

1. Disconnect the brake switch connector, loosen the brake switch locknut (A), and brake off the brake switch (B) until it is no longer touching the brake pedal.
2. Lift up the carpet. At the insulator cutout, measure the pedal height (C) from the middle of the left-side center of the pedal pad (D).

Standard pedal height(with carpet removed): 184.5mm(7.26 in.)

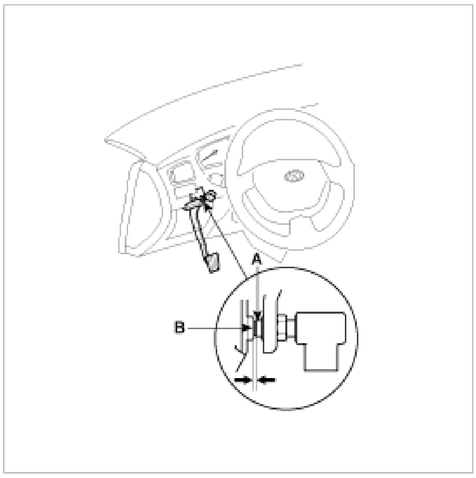


3. Loosen the pushrod locknut (A), and screw the pushrod in or out with pliers until the standard pedal height from the floor is reached. After adjustment, tighten the locknut firmly. Do not adjust the pedal height with the pushrod depressed.



BRAKE SWITCH CLEARANCE

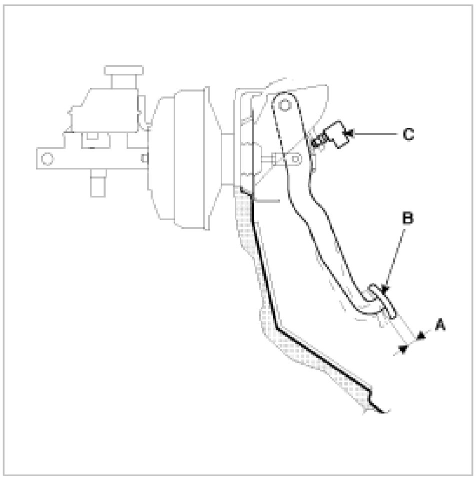
Screw in the brake switch until its plunger is fully depressed (threded end (A) touching the pad (B) on the pedal arm) then brake off the switch 3/4 turn to make 1 ~ 2 mm (0.04 ~ 0.08 in.) of clearance between the brake switch connector. Make sure that the brake lights go off when the pedal is released.



PEDAL FREE PLAY

1. With the engine off, inspect the pedal free play (A) on the pedal pad (B) by pushing the pedal by hand.

   Free play: 3 ~ 8 mm (0.12 ~ 0.31 in.)

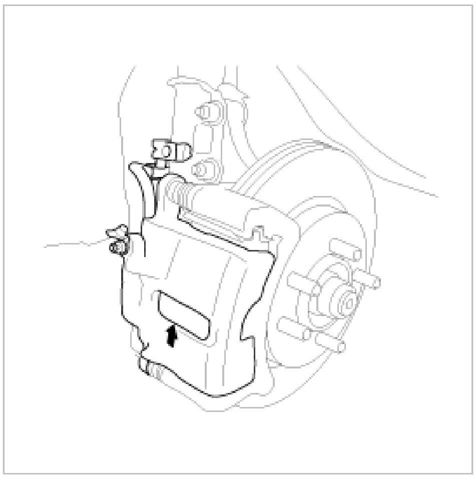


2. If the pedal free play is out of specification, adjust the brake switch (C). If the pedal free play is insufficient, it may result in brake drag.

INSPECTION OF FRONT DISC BRAKE PAD

1. Check the brake pad thickness through the caliper body inspection hole.

   Pad thickness
   Standard value : 11.0 mm (0.43 in.)
   Service limit : 3 ~ 4 mm (0.12 ~ 0.16 in.)



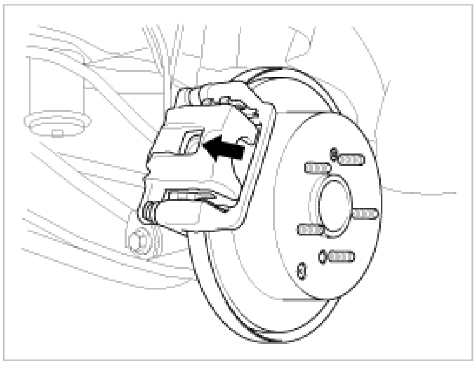
CAUTION

- If the pad lining thickness is out of specilfication, left and right pads must be replaced as a complete set.
- When the thickness difference between the left pad and right pad is large, check the sliding condition of the piston and the guide rod.

INSPECTION OF REAR DISC BRAKE PAD

1. Check the rear disk brake pad thickness through the caliper body inspection hole.

Pad thickness
Standard value : 10.0 mm (0.39 in.)
Service limit : 3.0 mm (0.12 in.)

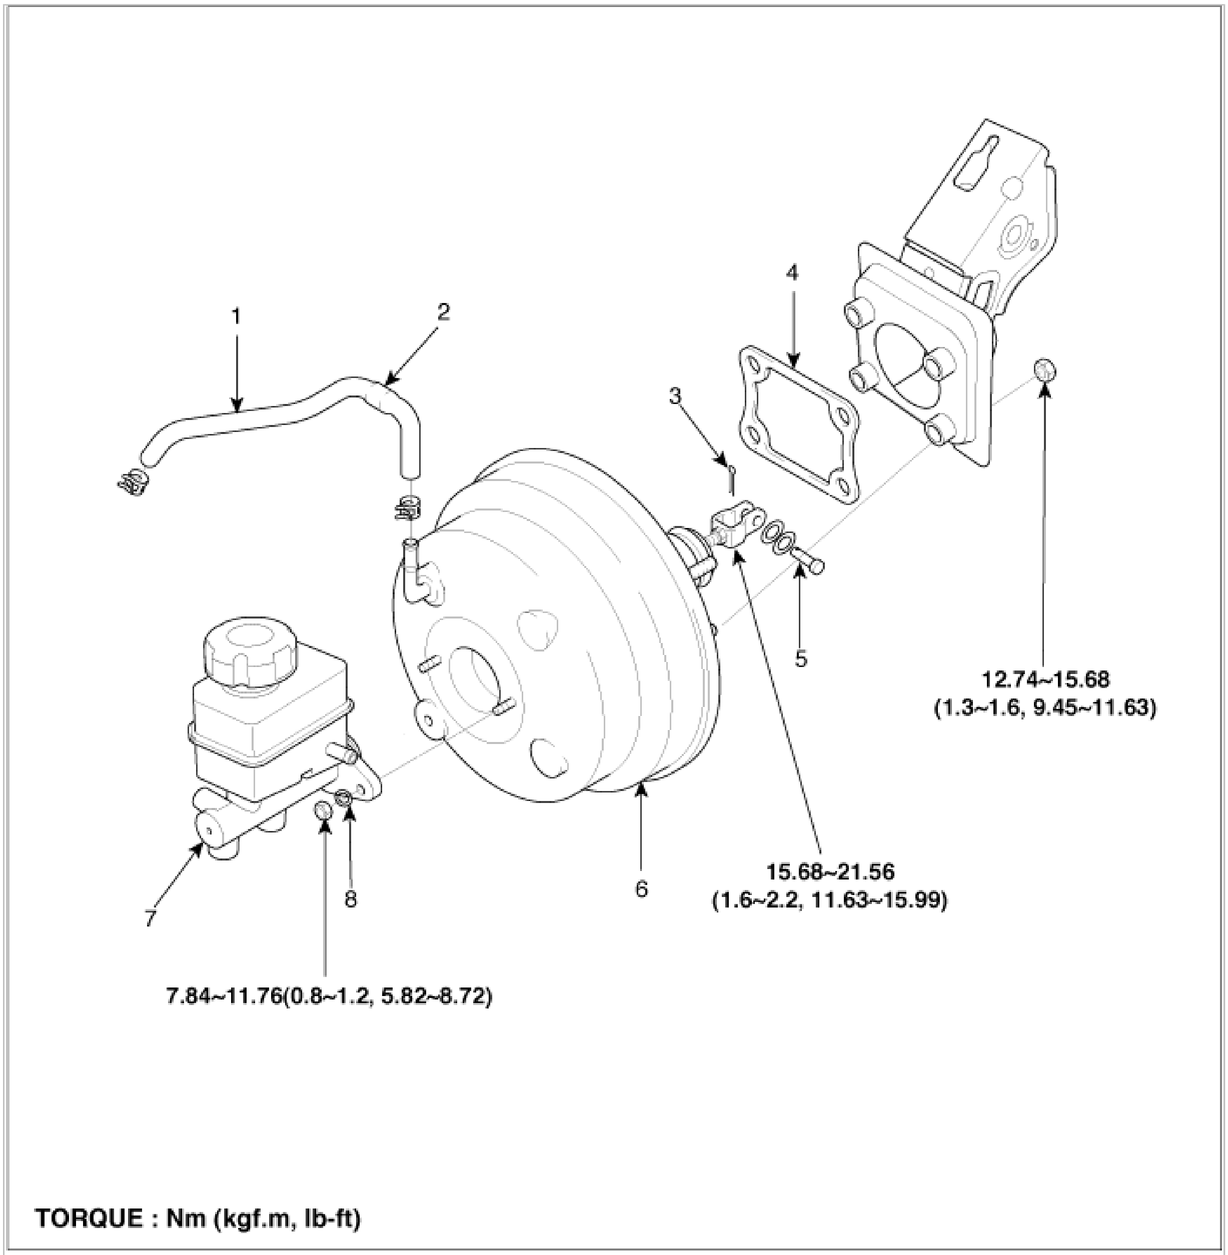


CAUTION

- If the pad thickness is out of specification, left and right pads must be replaced as a complete set.
- When the thickness difference between the left pad and right pad is large, check the sliding condition of the piston and the guide rod.

Brake System > Brake System > Brake Booster > Components and Components Location

COMPONENTS

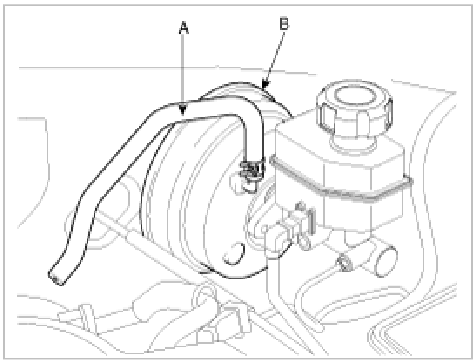


1. Vacuum hose	5. Clevis pin
2. Check valve	6. Brake booster
3. Snap pin	7. Master cylinder
4. Seal	8. Washer

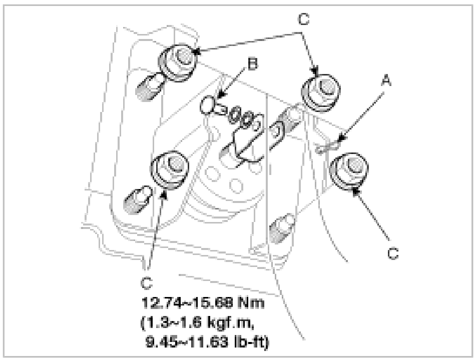
Brake System > Brake System > Brake Booster > Repair procedures

Removal

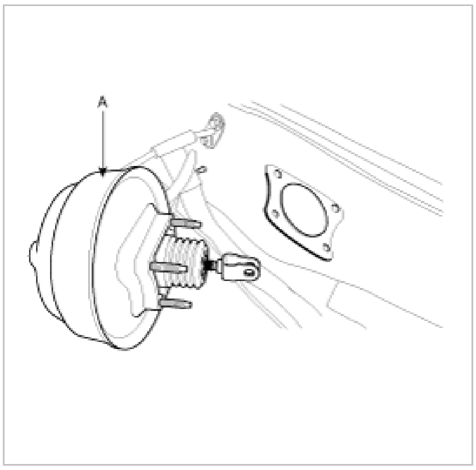
1. Remove the master cylinder.
2. Disconnect the vacuum hose (A) from the brake booster (B).



3. Remove the snap pin (A) and clevis pin (B).



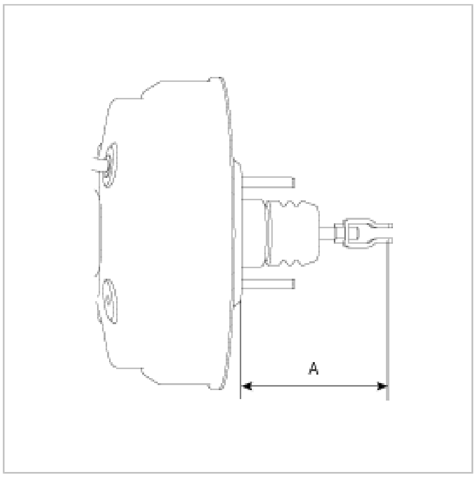
4. Remove the four booster mounting nuts (C).
5. Remove the brake booster (A).



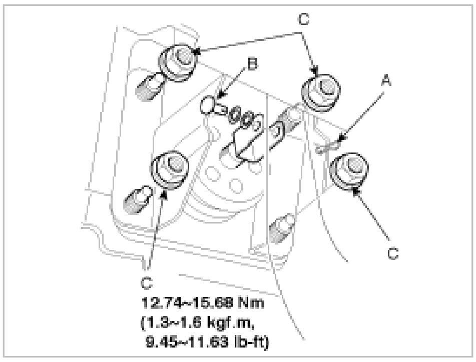
INSTALLATION

1. Adjust push rod length of the booster, and then install the seal on the booster assembly.

Standard length (A): 108± 0.5 mm (4.25 ± 0.019 in.)



2. Insert the booster and tighten the nuts (C).



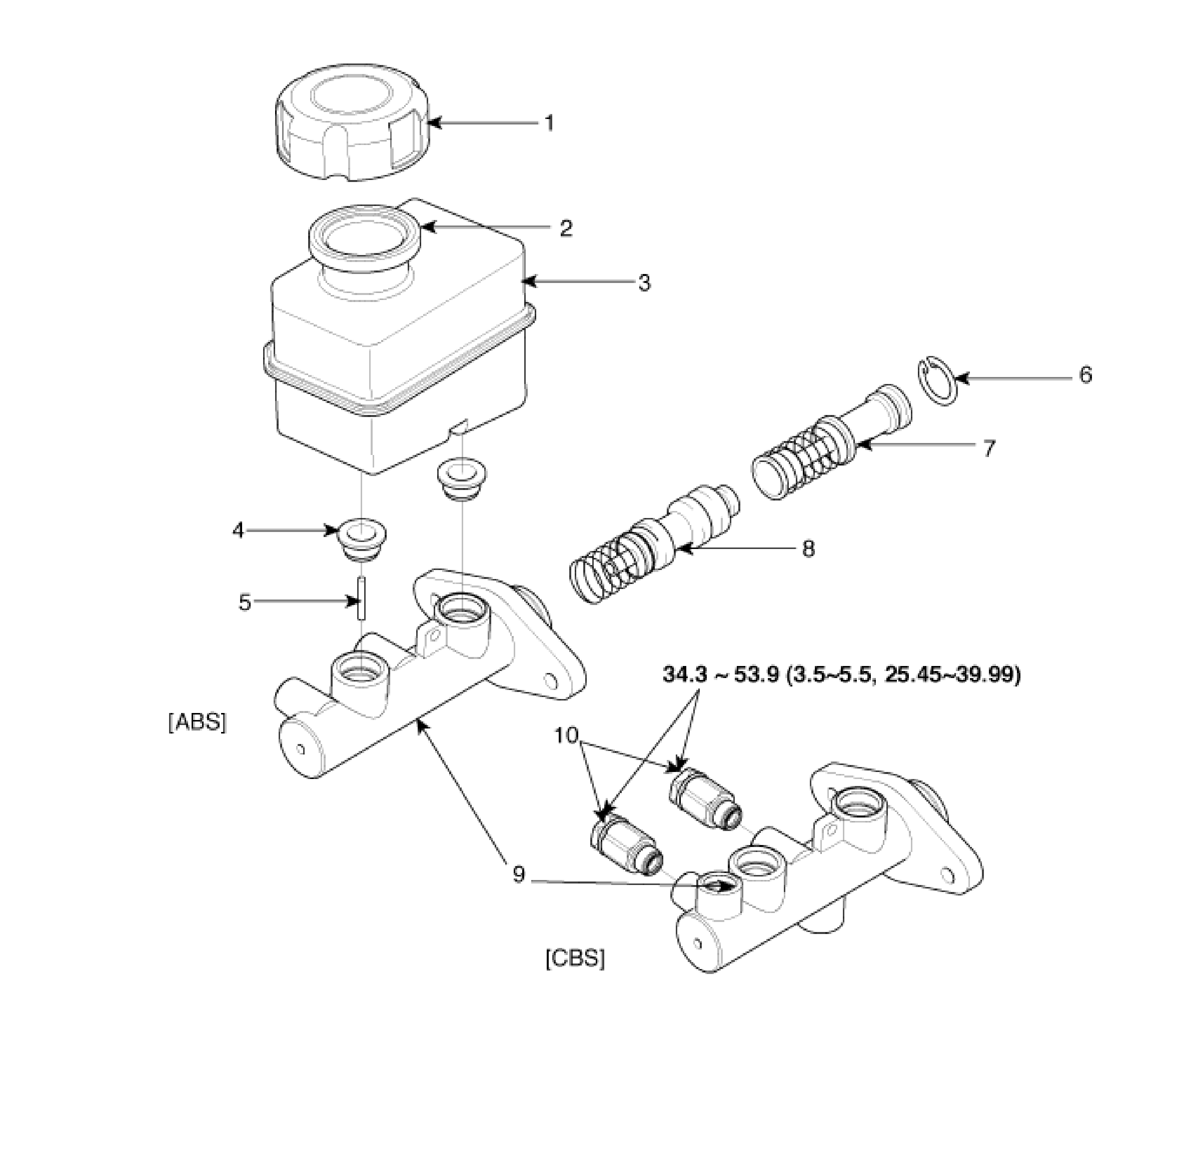
3. Connect the booster push rod and brake pedal with a pin (B) and install a snap clevis pin (A) to the clevis pin (B).

> **CAUTION**
>
> Grease the pin before installing the snap pin.
> Always use a new snap pin.

4. Install the master cylinder.
5. Connect the vacuum hose to the brake booster.
6. After filling the brake reservoir with brake fluid, bleed the system.
7. Check for fluid leakage.
8. Check and adjust the brake pedal for proper operation.

Brake System > Brake System > Master Cylinder > Components and Components Location

COMPONENTS



1. Reservoir cap	6. Retainer
2. Brake fluid filter	7. Primary piston assembly
3. Reservoir	8. Secondary piston assembly
4. Grommet	9. Master cylinder body
5. Cylinder pin	10. Proportioning valve

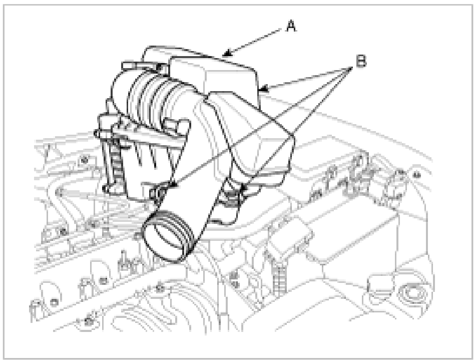
Brake System > Brake System > Master Cylinder > Repair procedures

REMOVAL

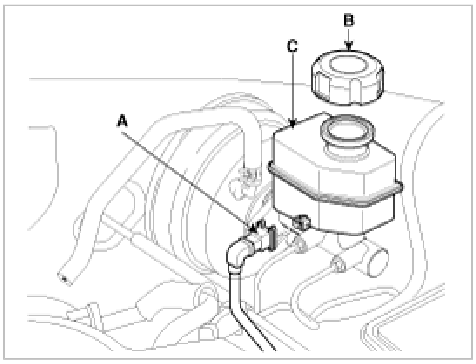
NOTE

Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

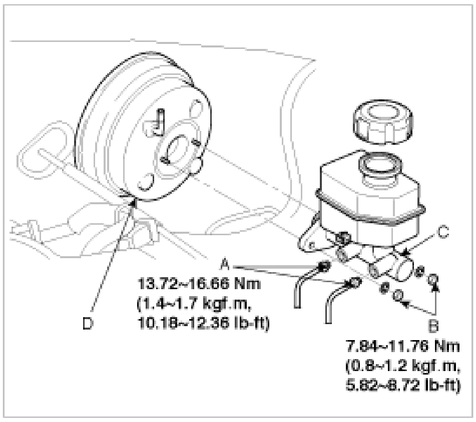
1. Remove air cleaner mounting bolts (B) from the air cleaner mounting bracket and air cleaner body (A).



2. Disconnect the brake fluid level switch connector (A), and remove the reservoir cap (B).



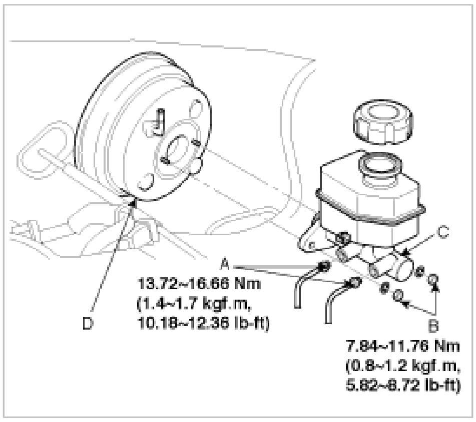
3. Remove the brake fluid from the master cylinder reservoir (C) with a syringe.
4. Disconnect the brake lines (A) from the master cylinder. To prevent spills, cover the hose joints with rags or shop towels.



5. Remove the master cylinder mounting nuts (B) and washers.
6. Remove the master cylinder(C) from the brake booster (D). Be careful not to bend or damage the brake lines when removing the master cylinder.

INSTALLATION

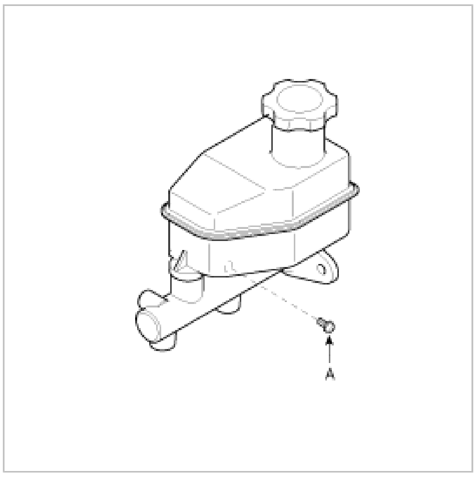
1. Install the master cylinder on the brake booster with 2 nuts.
2. Connect 2 brake tubes and the brake fluid level sensor connector.



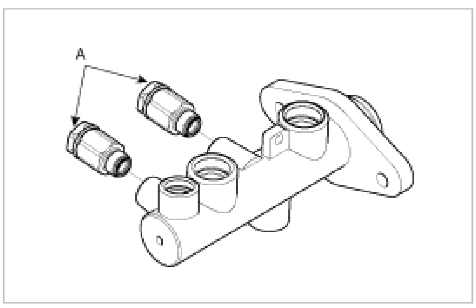
3. Fill the brake reservoir with the brake fluid and bleed the brake system.

DISASSEMBLY

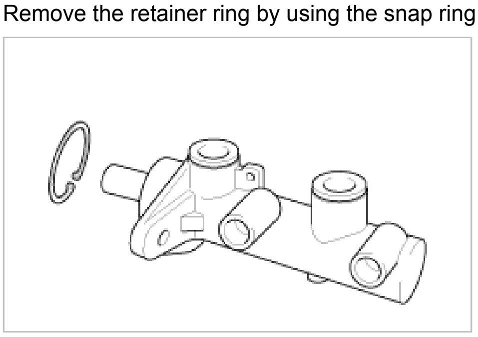
1. Remove the reservoir cap and drain the brake fluid into a suitable container.
2. Remove the fluid level sensor.
3. Remove the reservoir from the master cylinder, after remove mounting screw (A).



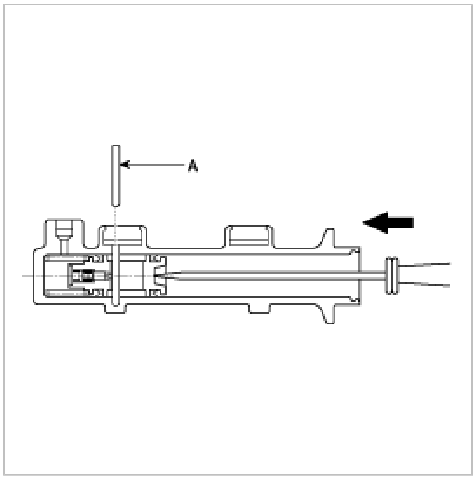
4. Remove the proportioning valves (A) - CBS only.



5. Remove the retainer ring by using the snap ring pliers then remove the primary piston assembly.



6. Remove the pin with the secondary piston pushed completely using a screwdriver. Remove the secondary piston assembly.



NOTE

Do not disassemble the primary and secondary piston assembly.

INSPECTION

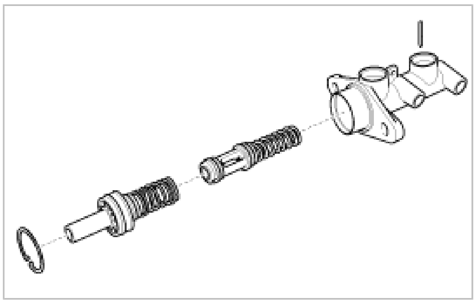
1. Check the master cylinder bore for rust or scratching.
2. Check the master cylinder for wear or damage. If necessary, clean or replace the cylinder.

CAUTION

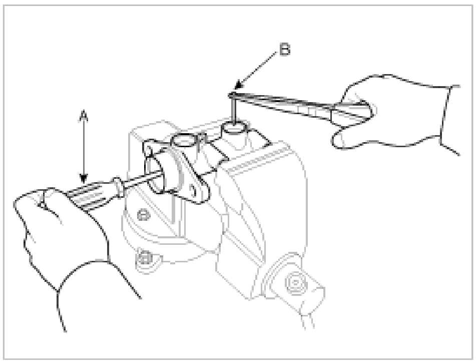
- If the cylinder bore is damaged, replace the master cylinder assembly.
- Wash the contaminated parts in alcohol.

REASSEMBLY

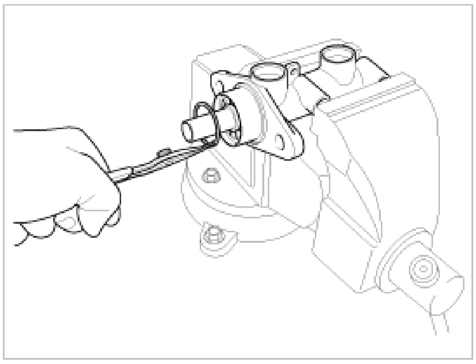
1. Apply genuine brake fluid to the rubber parts of the cylinder kit and grommets.
2. Carefully insert the springs and pistons in the proper direction.



3. Press the piston with a screwdriver(A) and install the cylinder pin(B).



4. Press the piston with a screwdriver and install the retainer ring.



5. Mount two grommets.
6. Install the reservoir on the cylinder.

Brake System > Brake System > Proportioning Valve > Description and Operation

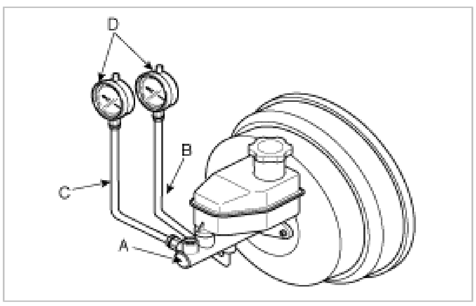
DESCRIPTION

Do not disassemble the proportioning valve. The proportioning valve makes the ideal distribution of fluid pressure to the front and rear brakes to prevent the brakes from skidding in the event of rear wheel lock up and to obtain a higher brake efficiency within the range of service brake application.

Brake System > Brake System > Proportioning Valve > Repair procedures

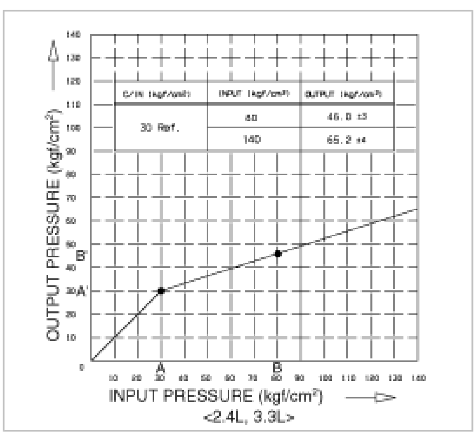
INSPECTION

1. Remove the front brake tube (B) and rear brake tube (C) from the master cylinder (A).
2. Connect two pressure gauges (D); one to the output valve of the front (B) and rear (C) brake.



> **NOTE**
>
> Be sure to bleed the system after connecting the pressure gauges.

3. With the brake applied, measure the front pressure and the rear pressure.
   If the measured pressures are within the specified range as illustrated, the proportioning valve is good.



4. Reconnect the brake lines in their original positions and bleed the system.

> **NOTE**

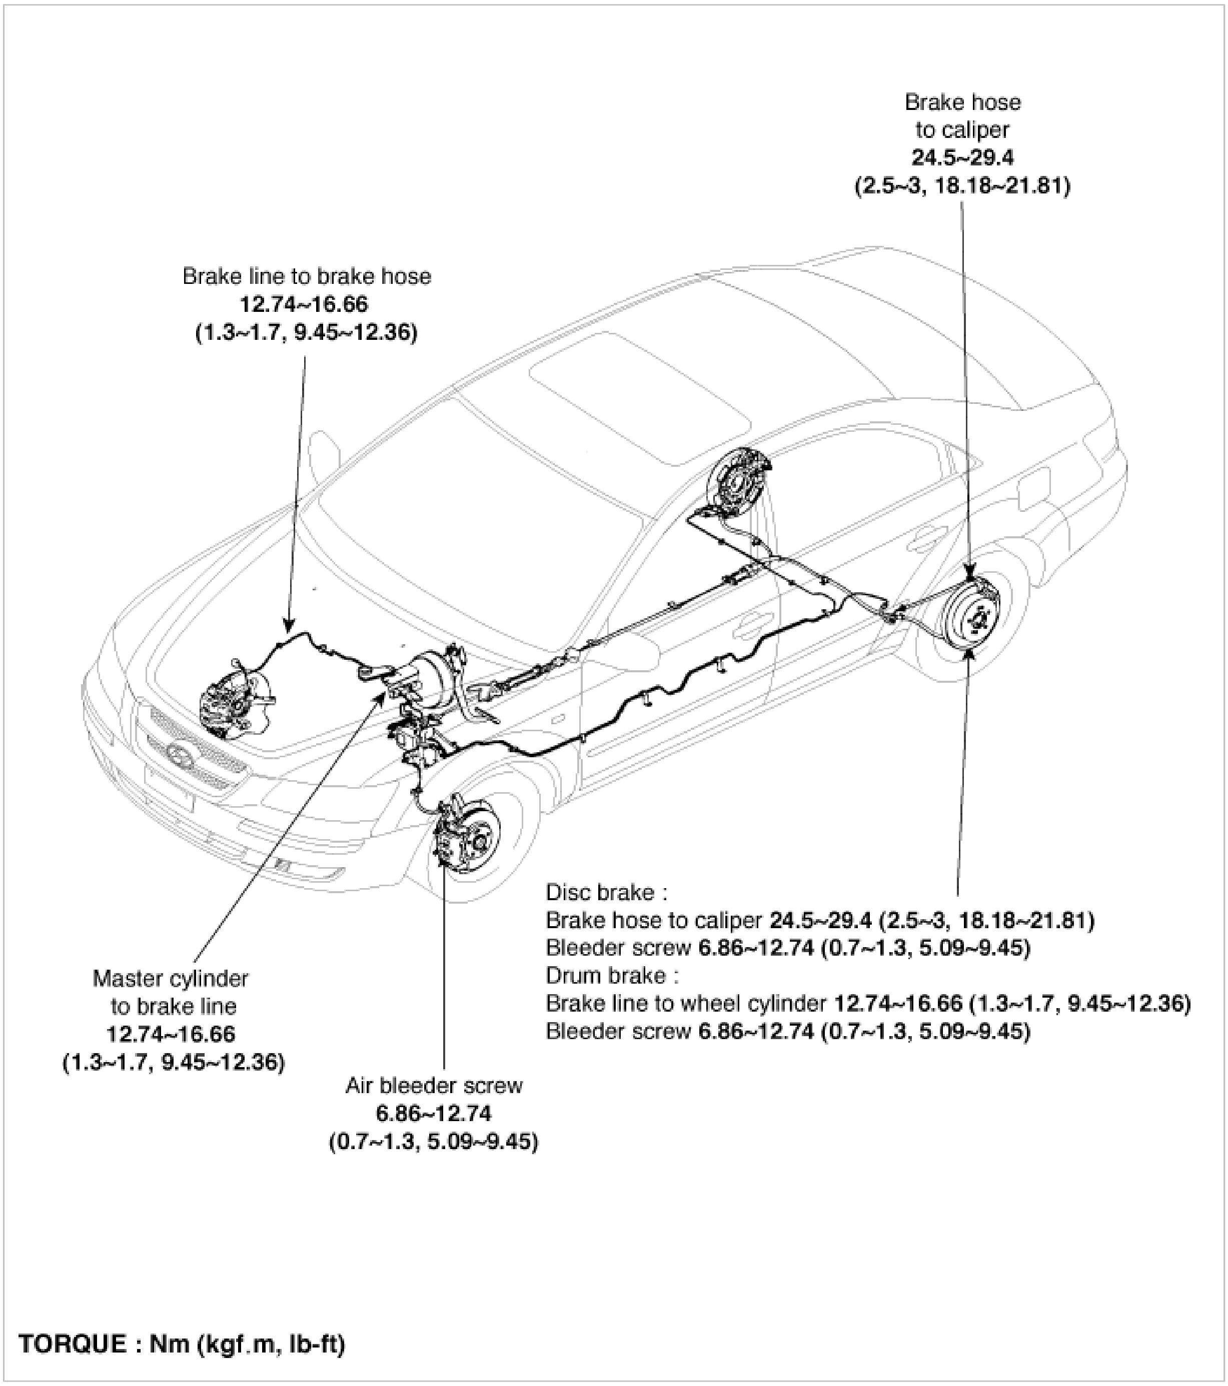
This table shows characteristics of the proportioning valve as the pressure increases.

<2.4L, 3.3L>

Input Pressure	Output Pressure
A : 30 kg/cm²	A' : 30 kg/cm²
B : 80 kg/cm²	B' : 46 kg/cm²

Brake System > Brake System > Brake Line > Components and Components Location

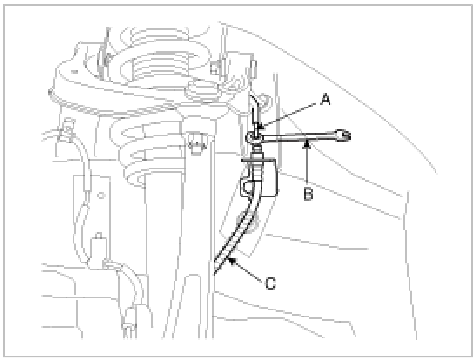
COMPONENT



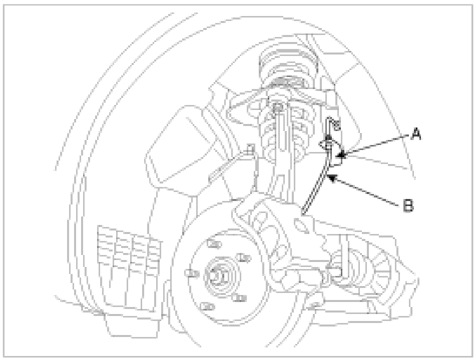
Brake System > Brake System > Brake Line > Repair procedures

REMOVAL

1. Disconnect the brake hose(C) from the brake line(A) using a flare-nut wrench(B).



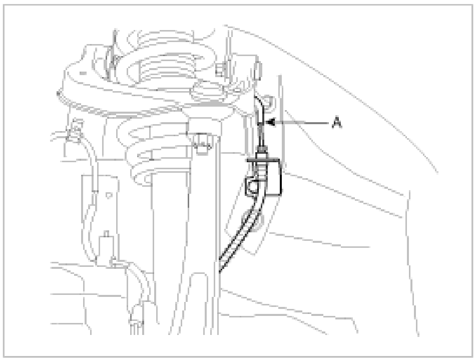
2. Remove the bracket mounting bolt(A), and then remove the brake hose(B).



3. Remove the connector bolt from the caliper, and disconnect the brake hose from the caliper.

INSTALLATION

1. Install a brake hose on the caliper with tightening brake hose bolt.
2. Install the bracket and the brake hose mounting bolt.



3. Connect the brake hose(A) to the brake line.
4. After installing the brake hose, bleed the brake system.

INSPECTION

- Check the brake tubes for cracks, crimps and corrosion.
- Check the brake hoses for cracks, damaged and oil leakage.
- Check the brake tube flare nuts for damage and oil leakage.

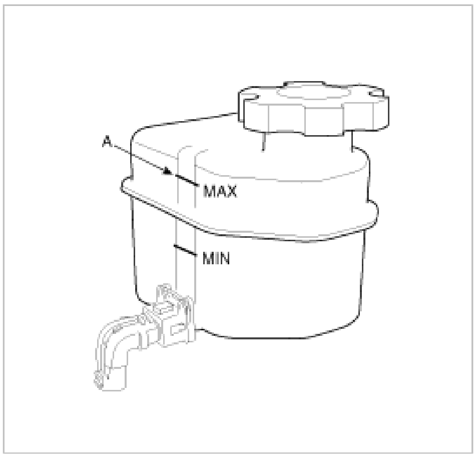
BRAKE SYSTEM BLEEDING

NOTE

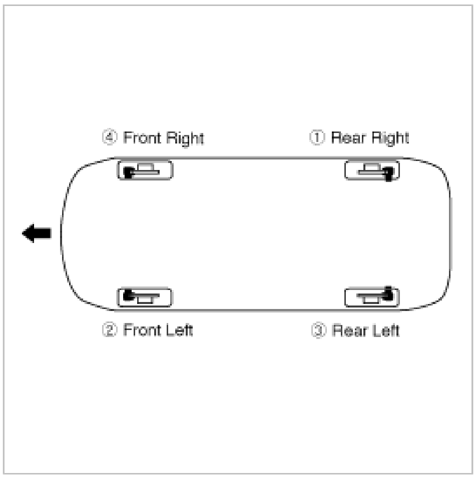
- Do not reuse the drained fluid.
- Always use Genuine DOT3 or DOT 4 Brake Fluid. Using a non-Genuine DOT or 4 brake fluid can cause corrosion and decrease the life of the system.
- Make sure no dirt of other foreign matter is allowed to contaminate the brake fluid.
- Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off

immediately with water.
- The reservoir on the master cylinder must be at the MAX (upper) level mark at the start of bleeding procedure and checked after bleeding each brake caliper. Add fluid as required.

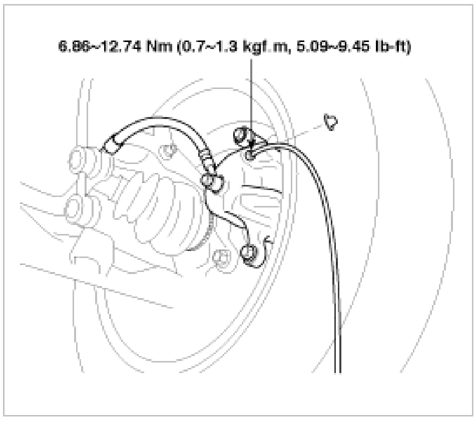
1. Make sure the brake fluid in the reservoir is at the MAX (upper) level line (A).



2. Have someone slowly pump the brake pedal several times, then apply pressure.
3. Lossen the right-rear brake bleed screw to allow air to escape from the system. Then tighten the bleed screw securely.
4. Repeat the procedure for wheel in the sequence shown below unit air bubbles no longer appear in the fluid.
5. Refill the master cylinder reservoir to MAX(upper) level line.

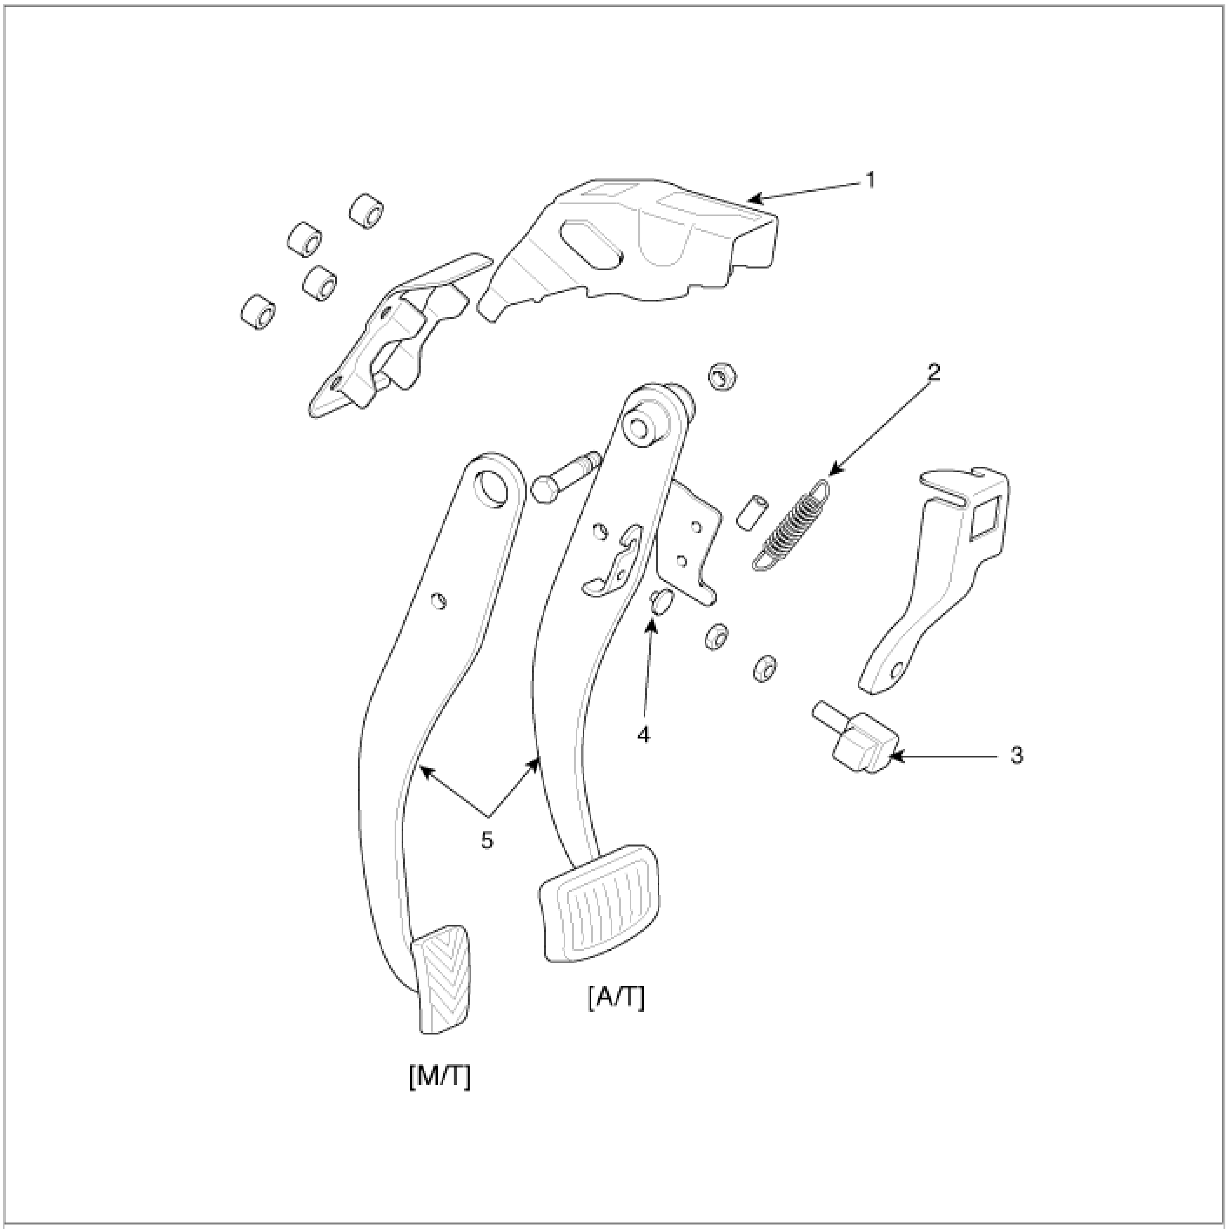


FRONT DISC BRAKE



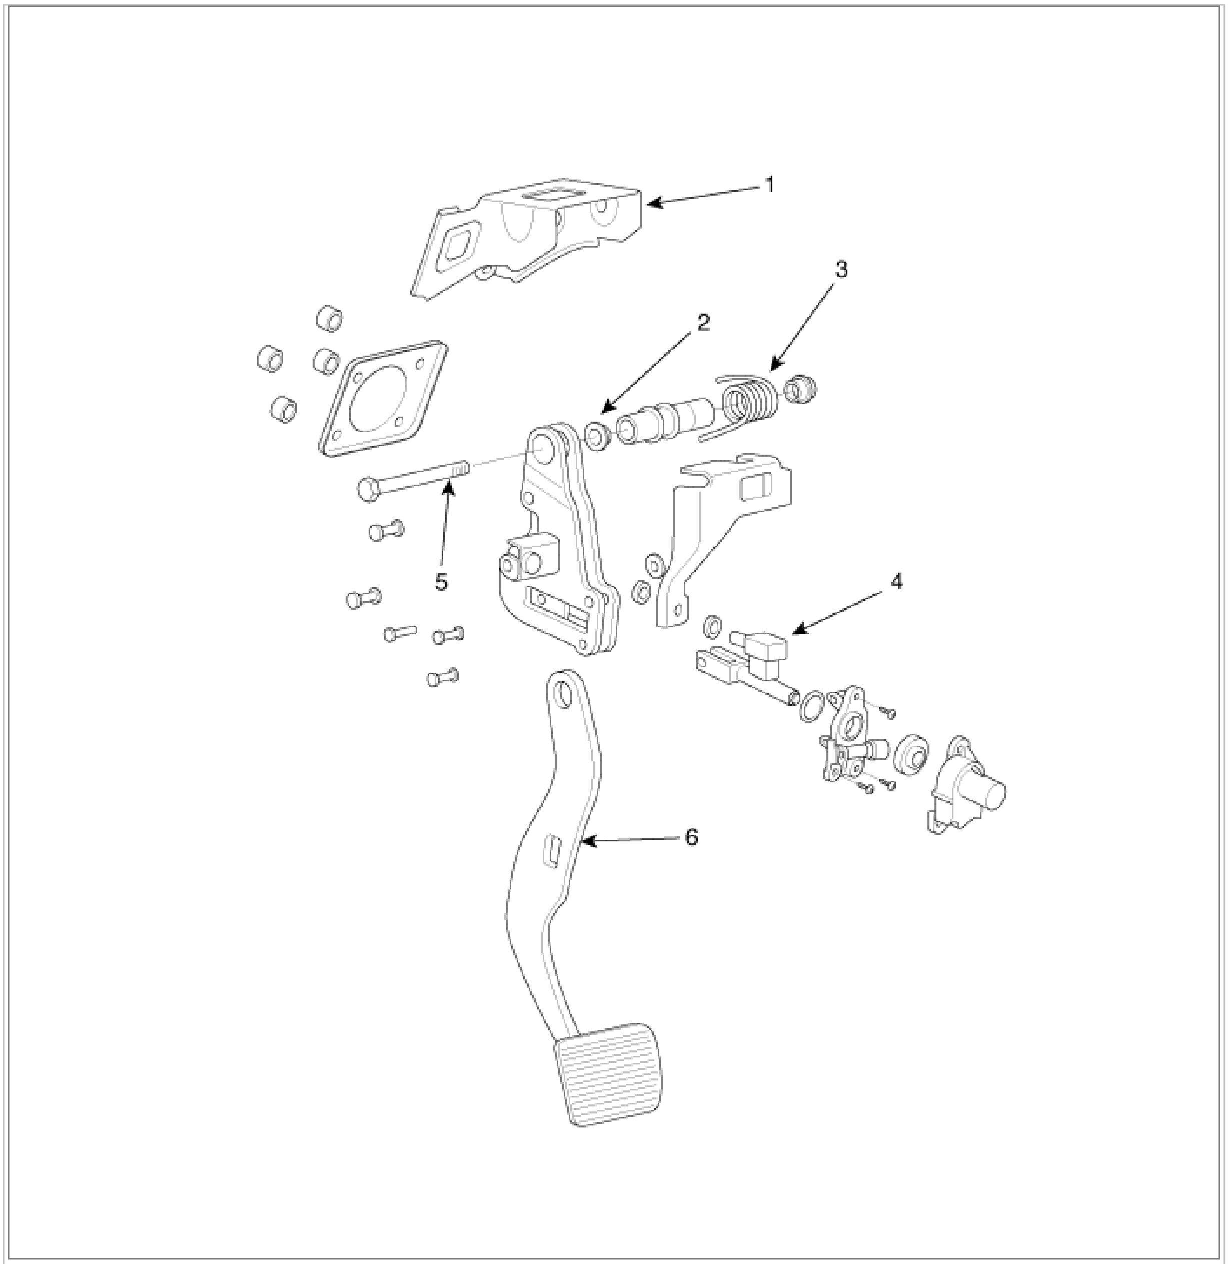
Brake System > Brake System > Brake Pedal > Components and Components Location

COMPONENTS



1. Member assembly bracket
2. Return spring
3. Stop lamp switch
4. Bushing
5. Brake pedal

COMPONENTS (ADJUSTABLE PEDAL)



1. Member assembly bracket
2. Bushing
3. Return spring
4. Stop lamp switch
5. Shaft bolt
6. Brake pedal

Brake System > Brake System > Brake Pedal > Repair procedures

REMOVAL

1. Remove the lower crash pad.(Refer to BD-"crash pad")
2. Pull down steering column shaft after removing 4 bolts.
3. Remove the stop lamp switch connector (A).
4. Remove the shift lock cable (A/T).

5. Remove the pin and snap pin.
6. Loosen the brake pedal member assembly mounting nuts and then remove the brake pedal assembly.

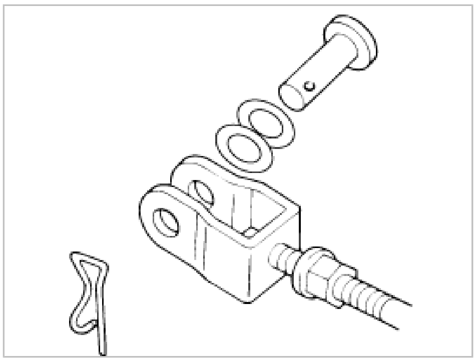
INSTALLATION

1. Installation is the reverse of removal.

> CAUTION
>
> Coat the inner surface of the bushings with the specified grease.

Specified grease : SAE J310

2. Before inserting the pin, apply the specified grease to the joint pin.



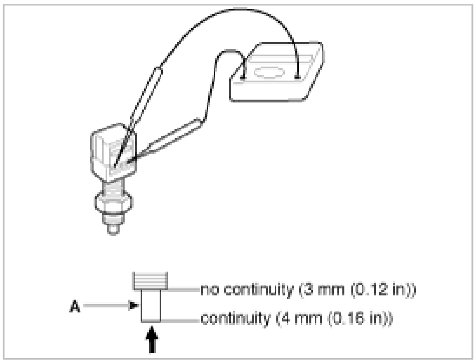
3. Install the snap pin.
4. Install the nuts with specified torque, when installing the brake pedal.

TORQUE : Nm(kgf·m,lb-ft); 12.74~15.68(1.3~1.6, 9.45~11.63)

5. Adjust the brake pedal height and free play.
6. Install the stop lamp switch.

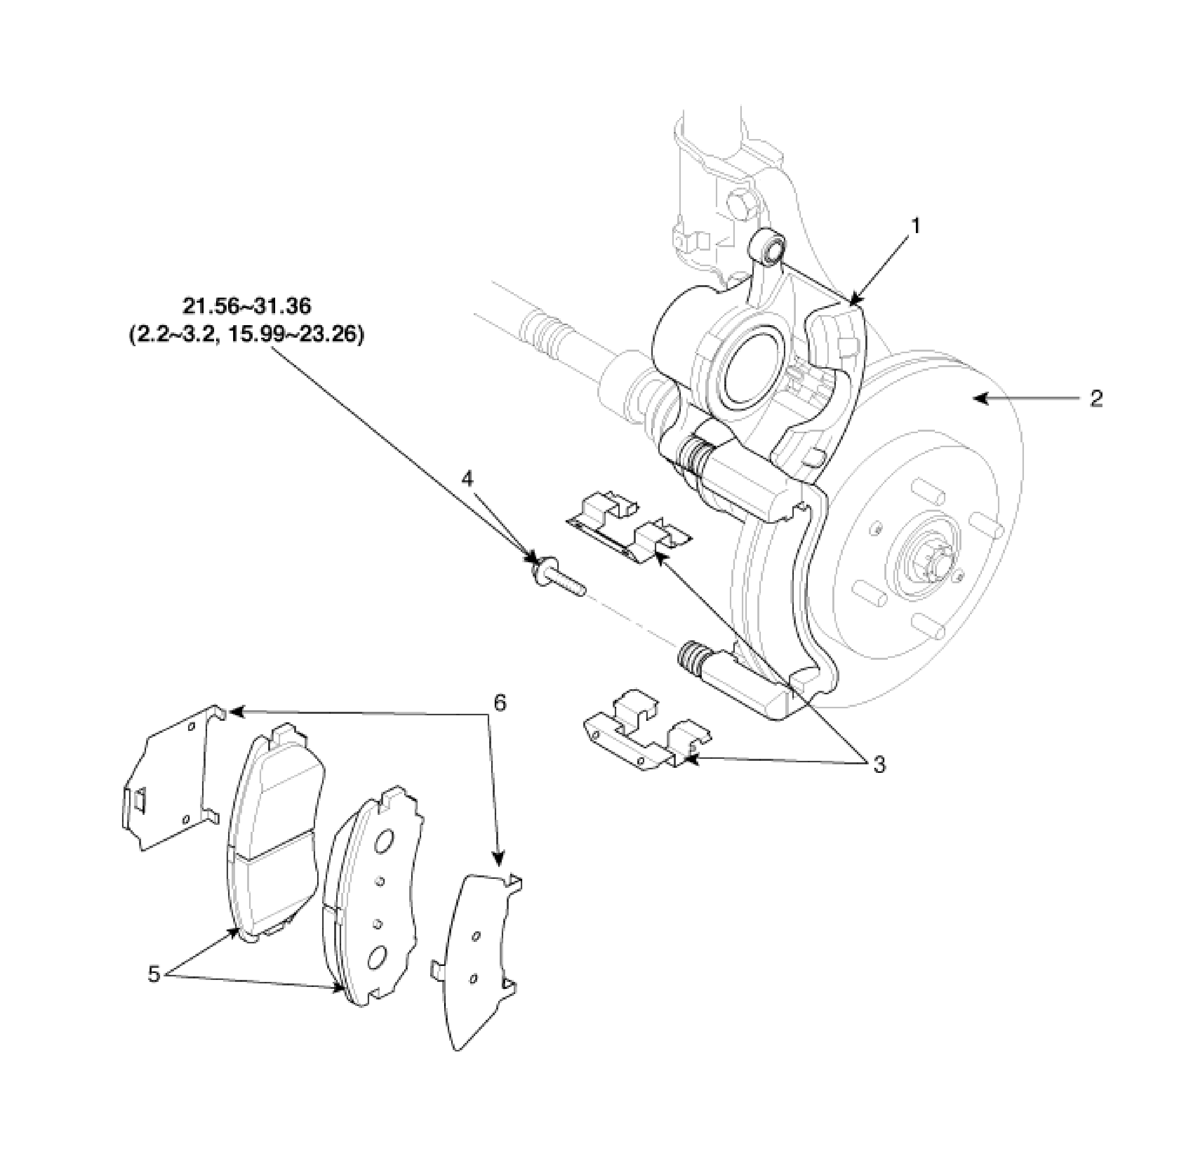
INSPECTION

1. Check the bushing for wear.
2. Check the brake pedal for bending or twisting.
3. Check the brake pedal return spring for damage.
4. Check the stop lamp switch.
   (1) Connect a circuit tester to the connector of stop lamp switch, and check whether or not there is continuity when the plunger of the stop lamp switch is pushed in and when it is released.
   (2) The stop lamp switch is in good condition if there is no continuity when plunger(A) is pushed.



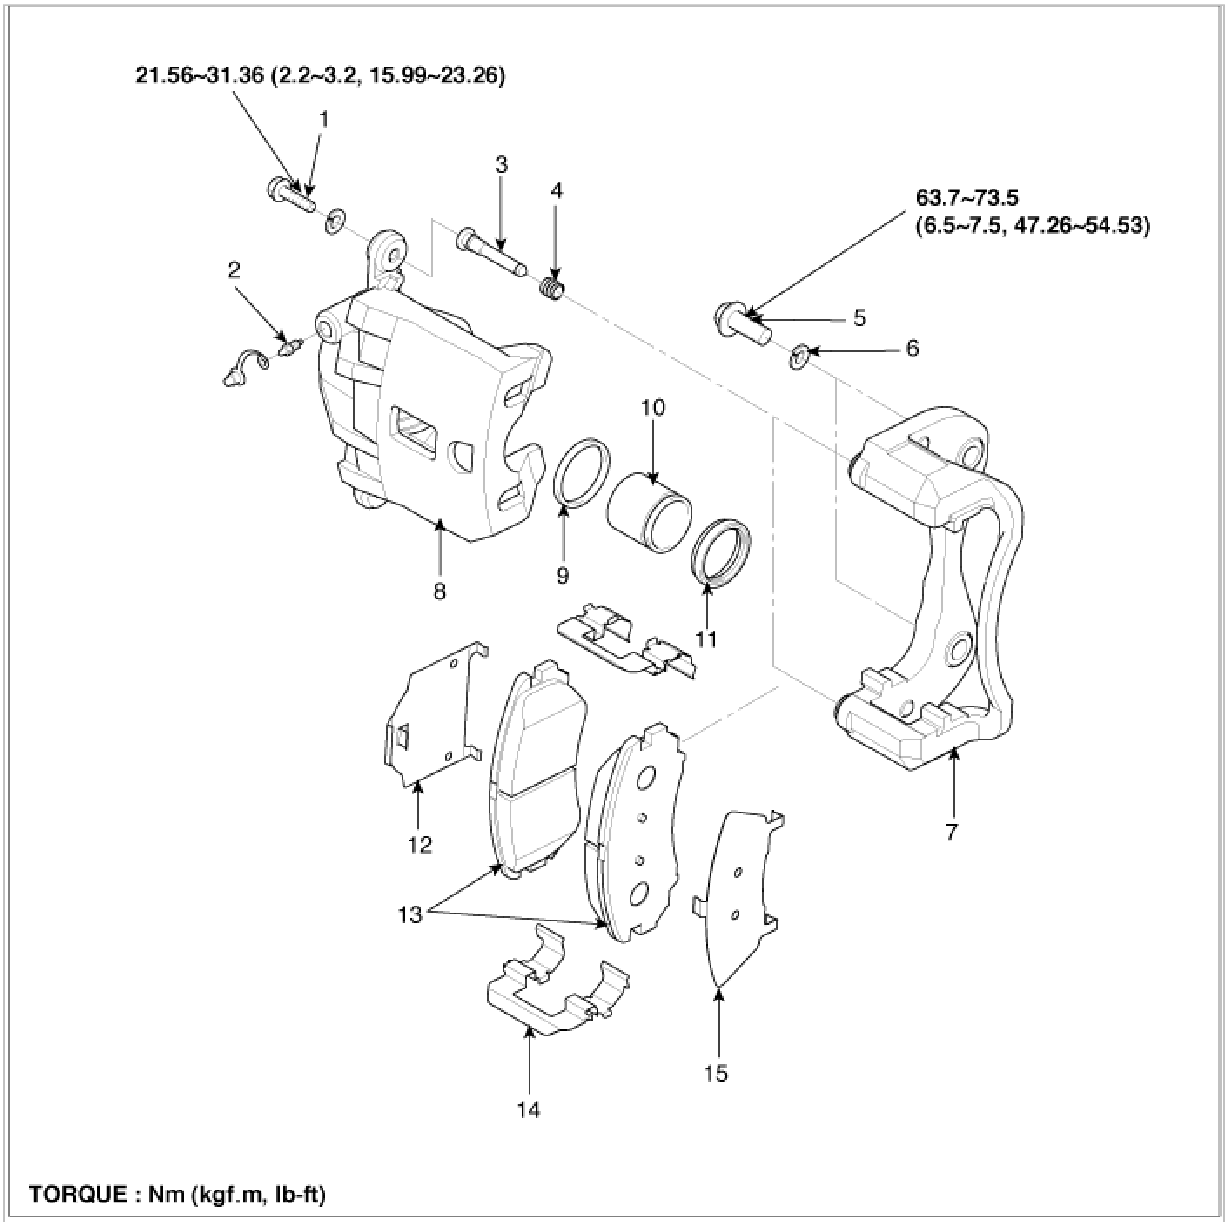
Brake System > Brake System > Front Disc Brake > Components and Components Location

COMPONENTS



TORQUE: Nm (kgf.m, lb-ft)

1. Brake caliper
2. Brake disc
3. Pad retainers
4. Guide rod bolt
5. Brake pads
6. Brake pad shims



1. Guide rod bolt	6. Washer	11. Piston boot
2. Bleeder screw	7. Caliper bracket	12. Inner shim
3. Guide rod	8. Caliper body	13. Brake pad
4. Boot	9. Piston seal	14. Pad retainer
5. Caliper mounting bolt	10. Piston	15. Outer shim

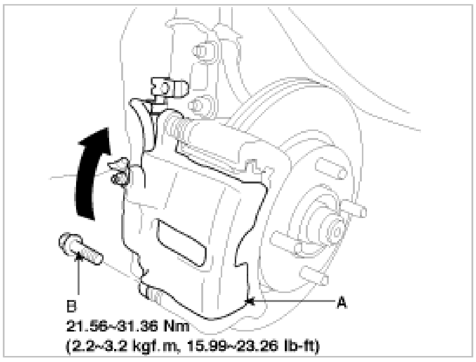
Brake System > Brake System > Front Disc Brake > Repair procedures

REMOVAL

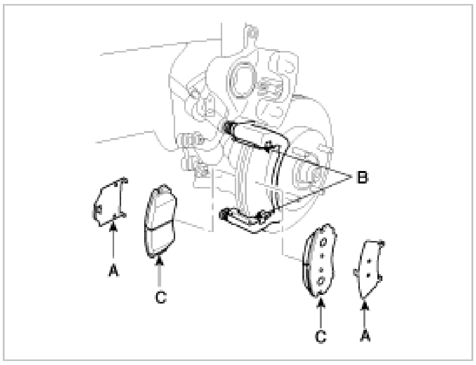
CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use on air hose or brush to clean brake assemblies.

1. Lossen the front wheel nuts slightly. Raise the front of the vehicle, and make sure it is securely supported. Remove the front wheels.
2. Remove the guide rod bolt(B), After raise the caliper assembly(A), support it with a wire.

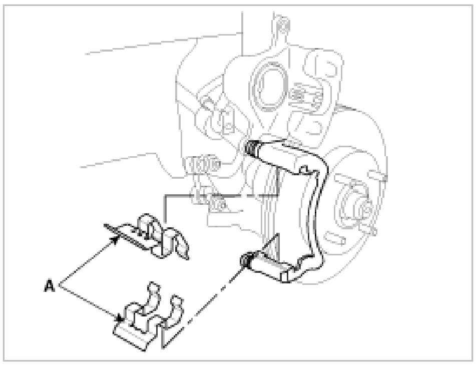


3. Remove pad shim(A), pad retainer(B) and pad assembly(C) in the caliper bracket.

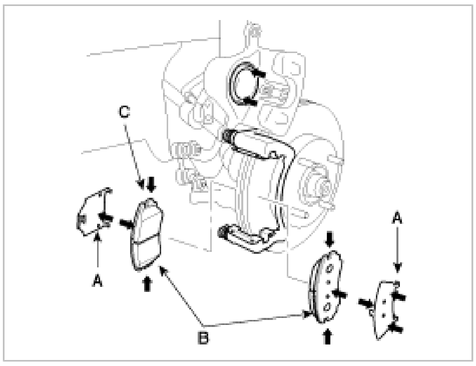


INSTALLATION

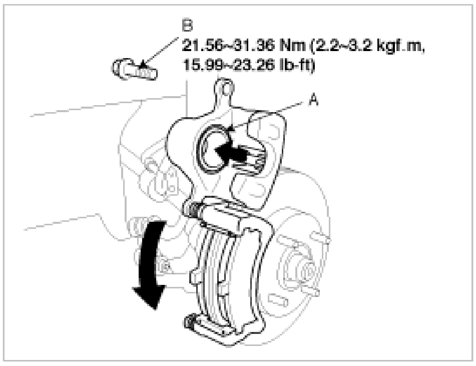
1. Install the pad retainers (A) on the caliper bracket.



2. Check the foreign material at the pad shims (A) and the back of the pads (B).
   Contaminated brake discs or pads reduce stopping ability. Keep grease off the discs and pads.

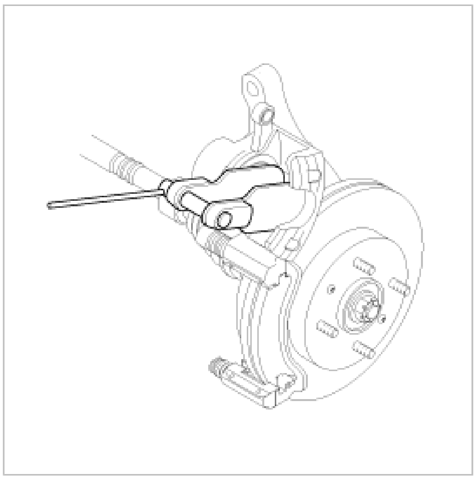


3. Install the brake pads (B) and pad shims (A) correctly. Install the pad with the wear indicator (C) on the inside.
   If you are reusing the pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.
4. Push in the piston (A) so that the caliper will fit over the pads. Make sure that the piston boot is in position to prevent damaging it when pivoting the caliper down.
5. Pivot the caliper down into position. Being careful not to damage the pin boot, install the guide rod bolt (B) and torque it to proper specification.



NOTE

Insert the piston in the cylinder using the special tool (09581-11000).



6. Depress the brake pedal several times to make sure the brakes work, then test-drive.

NOTE

Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set.Several applications of the brake will restore the normal pedal stroke.
Be sure to do this before driving the vehicle.

7. After installation, check for leaks at hose and line joints or connections, and retighten if necessary.

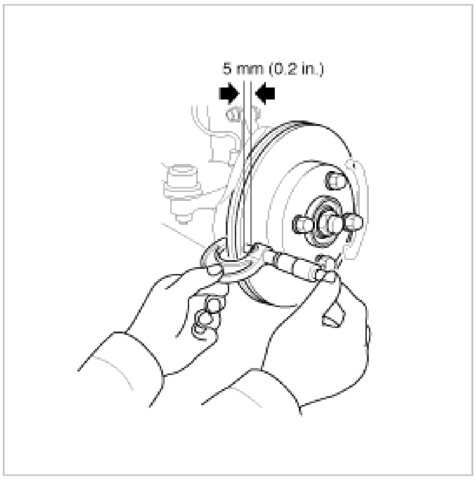
INSPECTION

FRONT BRAKE DISC THICKNESS CHECK

1. Remove all rust and contramination from the surface, and measure the disc thickness at 12 points, at least, of same distance (5mm) front the brake disc outer circle.

Front brake disc thickness
Standard value :
26.0 mm(1.024 in) - 2.4 L
28.0 mm(1.10 in) - 3.3 L
Limit :
24.4 mm(0.961 in) - 2.4 L
26.4 mm(1.04 in) - 3.3 L

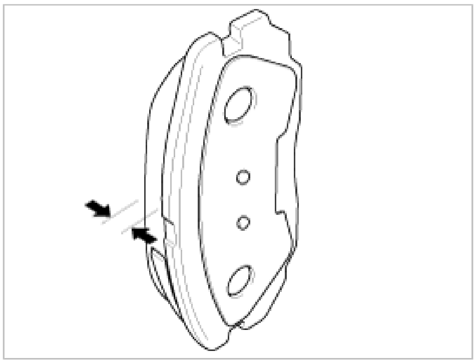
2. Thickness variation should not exceed 0.005mm (0.0002 in) (circumference) and 0.01 mm (0.0004 in)(radius) at any directions.
3. If wear exceeds the limit, replace the discs and pad assembly left and right of the vehicle.



FRONT BRAKE PAD CHECK

1. Check the pad wear. Measure the pad thickness and replace it, if it is less than the specified value.

Pad thickness
Standard value : 11 mm (0.43 in.)
Service limit : 3 ~ 4 mm (0.12 ~ 0.16 in.)



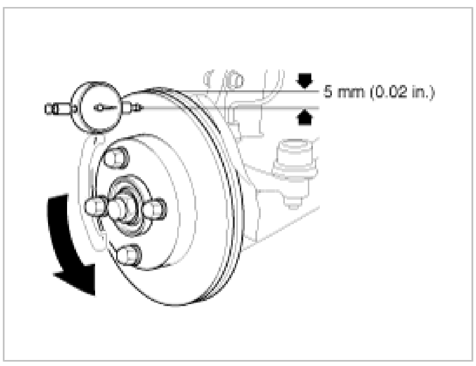
2. Check that grease is applied, to sliding contact points and the pad and backing metal for damage.

FRONT BRAKE DISC RUN OUT CHECK

1. Place a dial gauge about 5mm (0.2 in.) from the outer circumference of the brake disc, and measure the run out of the disc.

Brake disc run out
Limit : 0.04 mm (0.0016 in.) or less (new one)

2. If the run out of the brake disc exceeds the limit specification, replace the disc, and then measure the run out again.
3. If the run out does not exceed the limit specification, install the brake disc after turning it 180° and then check the run out of the brake disc again.
4. If the run out cannot be corrected by changing the position of the brake disc, replace the brake disc.



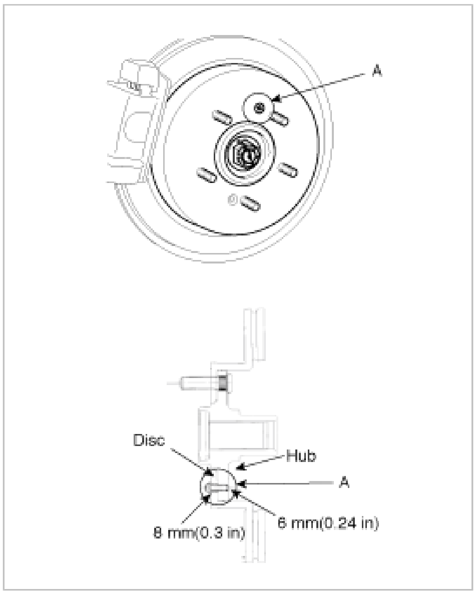
Seizing of Front brake disc

1. Remove the brake disc from hub using an M8 screw(A) if the brake disc has been seized with the hub due to corrosion or

overheating.

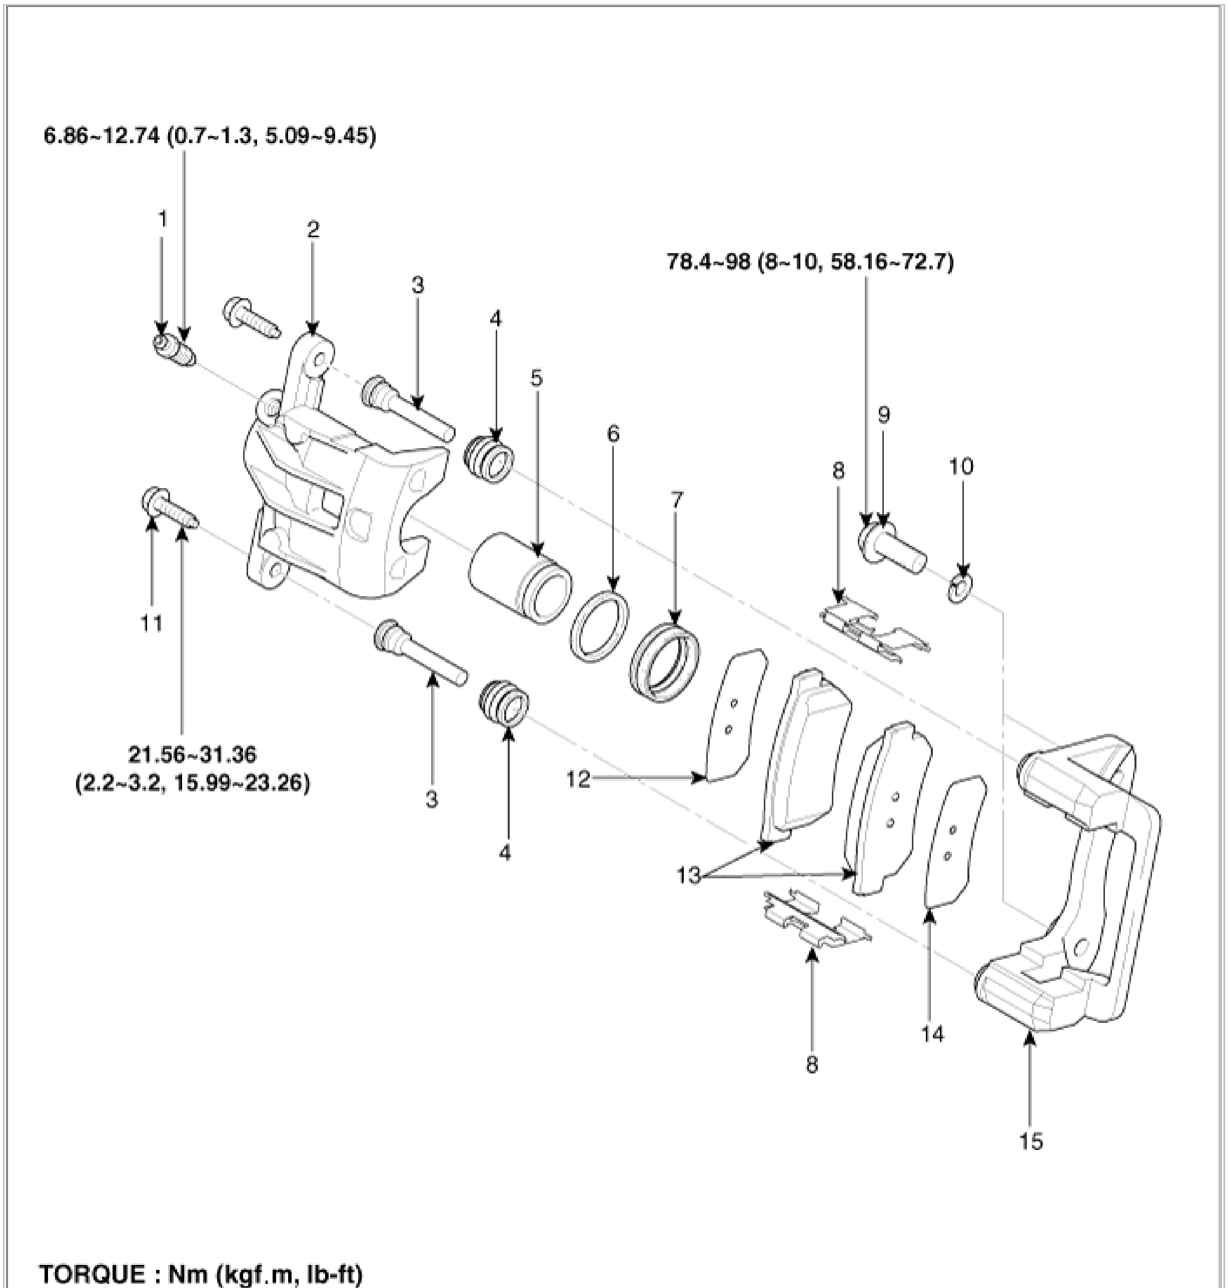
NOTE

Be careful not to use a hammer. The disc can be damaged if you remove the disc from the hub by hammering.



Brake System > Brake System > Rear Disc Brake > Components and Components Location

COMPONENTS

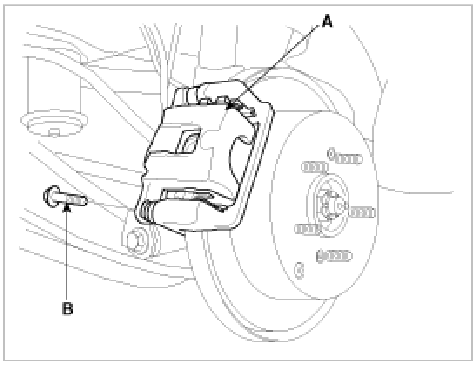


1. Bleeder screw	6. Piston seal	11. Guide rod bolt
2. Caliper body	7. Piston boot	12. Inner shim
3. Guide rod	8. Pad retainer	13. Brake Pad
4. Boot	9. Caliper mounting bolt	14. Outer shim
5. Piston	10. Washer	15. Caliper bracket

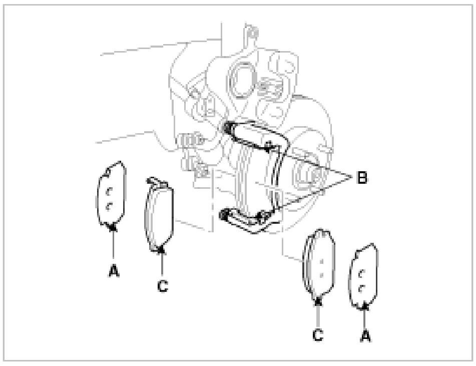
Brake System > Brake System > Rear Disc Brake > Repair procedures

REMOVAL

1. Raise the rear of the vehicle and make sure it is securely supported. Remove the rear wheel.
2. Remove the guide rod bolt(B), After raising the caliper assembly(A), support it with a wire.

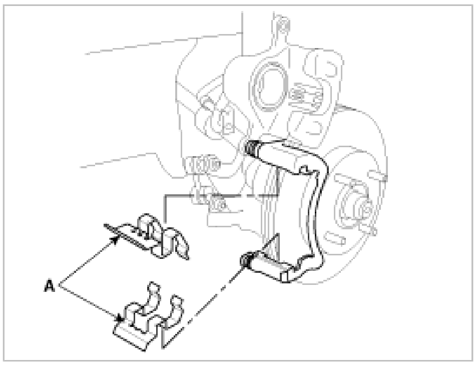


3. Remove pad shim(A), pad retainer(B) and pad assembly(C) in the caliper bracket.

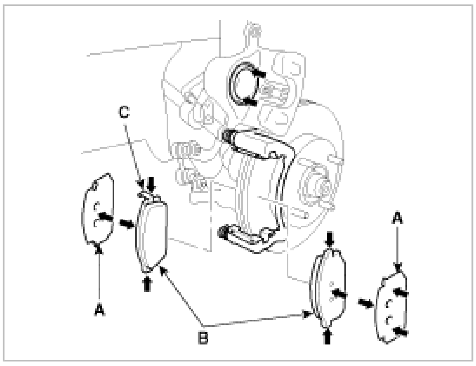


INSTALLATION

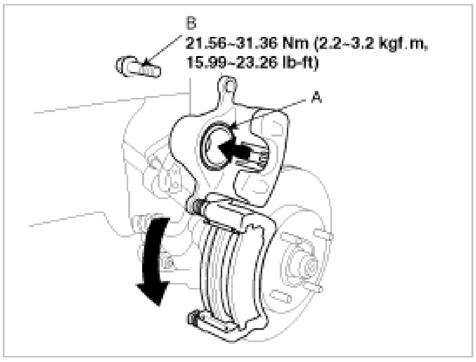
1. Install the pad retainers(A) on the caliper bracket.



2. Check for foreign material between the pad shim (A) and the back of the pads (B).

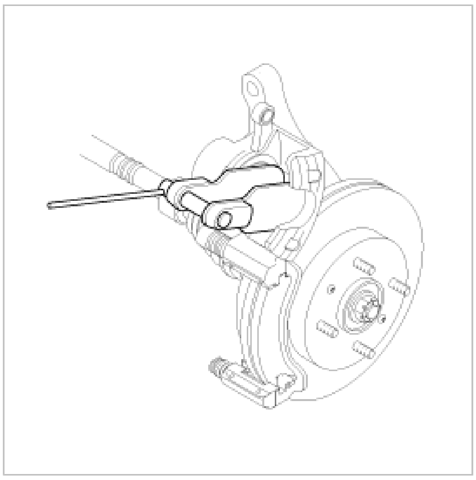


3. Contaminated brake discs or pads reduce stopping ability. Keep grease off the discs and pads.
4. Install the brake pads (B) and pad shims (A) correctly. Install the pad with the wear indicator (C) on the inside.
   If you are reusing the pads, always reinstall the brake pads in their original position to prevent a momentary loss of braking efficiency.
5. Push in the piston (A) so that the caliper will fit over the pads. Make sure that the piston boot is in position to prevent damaging it when pivoting the caliper down.
6. Pivot caliper down into position. Being careful not to damage the pin boot, install the guide rod bolt (B) and torque it to proper specification



NOTE

Insert the piston in the cylinder using the special tool(09581-11000).



7. Depress the brake pedal several time to make sure the brakes work, then test-drive.

NOTE

Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake will restore the normal pedal stroke.

8. After installaion, check for leaks at hose and line joints or connections, and retighten if necessary.

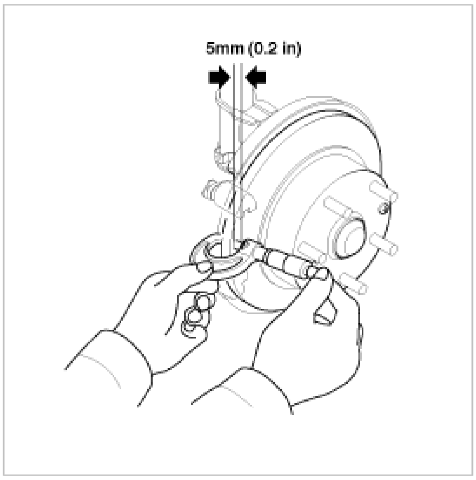
INSPECTION

REAR BRAKE DISC THICKNESS CHECK

1. Remove all rust and contamination from the disc surface, and then measure the disc thickness at 8 points, al least, of the same distance (5 mm(0.12 in)) from the brake disk outer circle.

   Rear brake disc thickness
   Standard value : 10.0 mm (0.39 in)
   Limit : 8.4 mm (0.33 in)

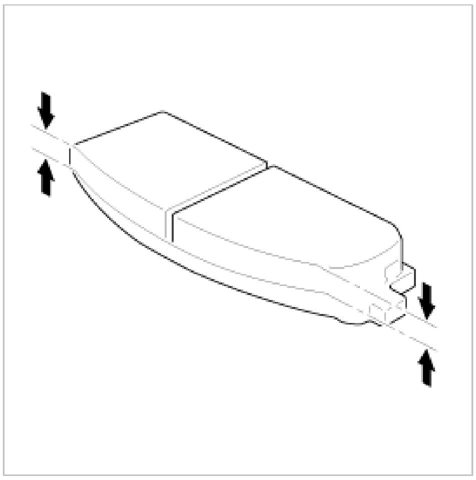
2. Thickness variation should not exceed 0.01 mm(0.0004 in) (circumference) and 0.01 mm(0.0004 in) (radius) at any directions.
3. If wear exceeds the limit, replace the discs and pad assembly for left and right of the vehicle.



REAR BRAKE PAD CHECK

1. Check the pad wear. Measure the pad thickness and replace it, if it is less than the specified value.

Pad thickness
Standard value :
10.0 mm (0.39 in) - 2.4 L
15.0 mm (0.59 in) - 3.3 L
Service limit : 3.0 mm (0.12 in)

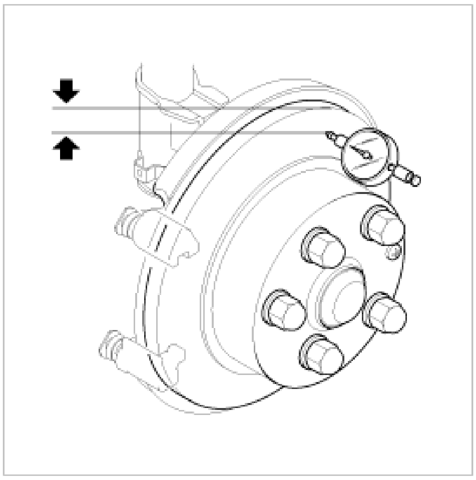


2. Check that grease is applied, and the pad and backing metal for damage.

REAR BRAKE DISC RUN OUT CHECK

1. Place a dial gauge about 5 mm (0.2 in) from the outer circumference of the brake disc, and measure the run out of the disc.

Brake disc run out
Limit : 0.05 mm (0.002 in) or less (new one)

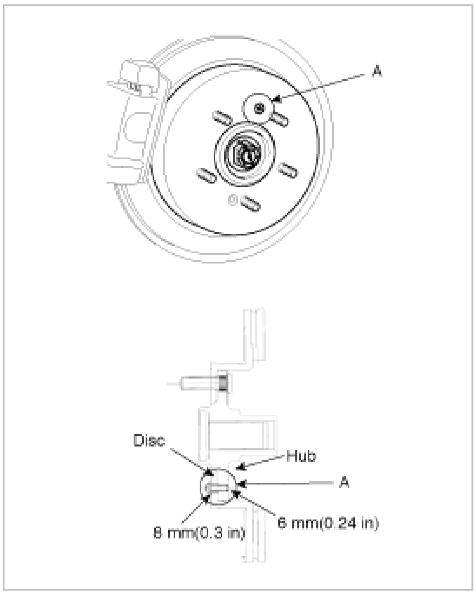


2. If the run out of the brake disc exceeds the limit specification, replace the disc, and then measure the run out again.
3. If the run out does not exceed the limit specification, install the brake disc after turning it 180° and then check the run out of the brake disc again.
4. If the run out cannot be corrected by changing the position of the brake disc, replace the brake disc.

Seizing of Rear brake disc

1. Remove the brake disc from hub using an M8 screw(A) if the brake disc has been seized with the hub due to corrosion or overheating.

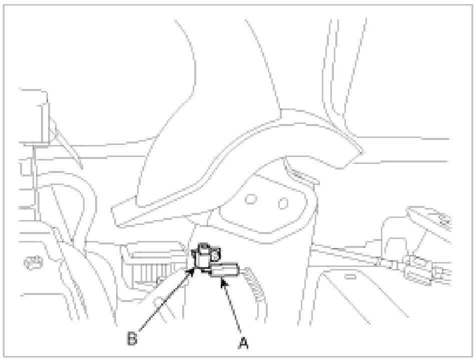
> NOTE
>
> Be careful not to use a hammer. The disc can be damaged if you remove the disc from the hub by hammering.



Brake System > Parking Brake System > Parking Brake Switch > Repair procedures

INSPECTION

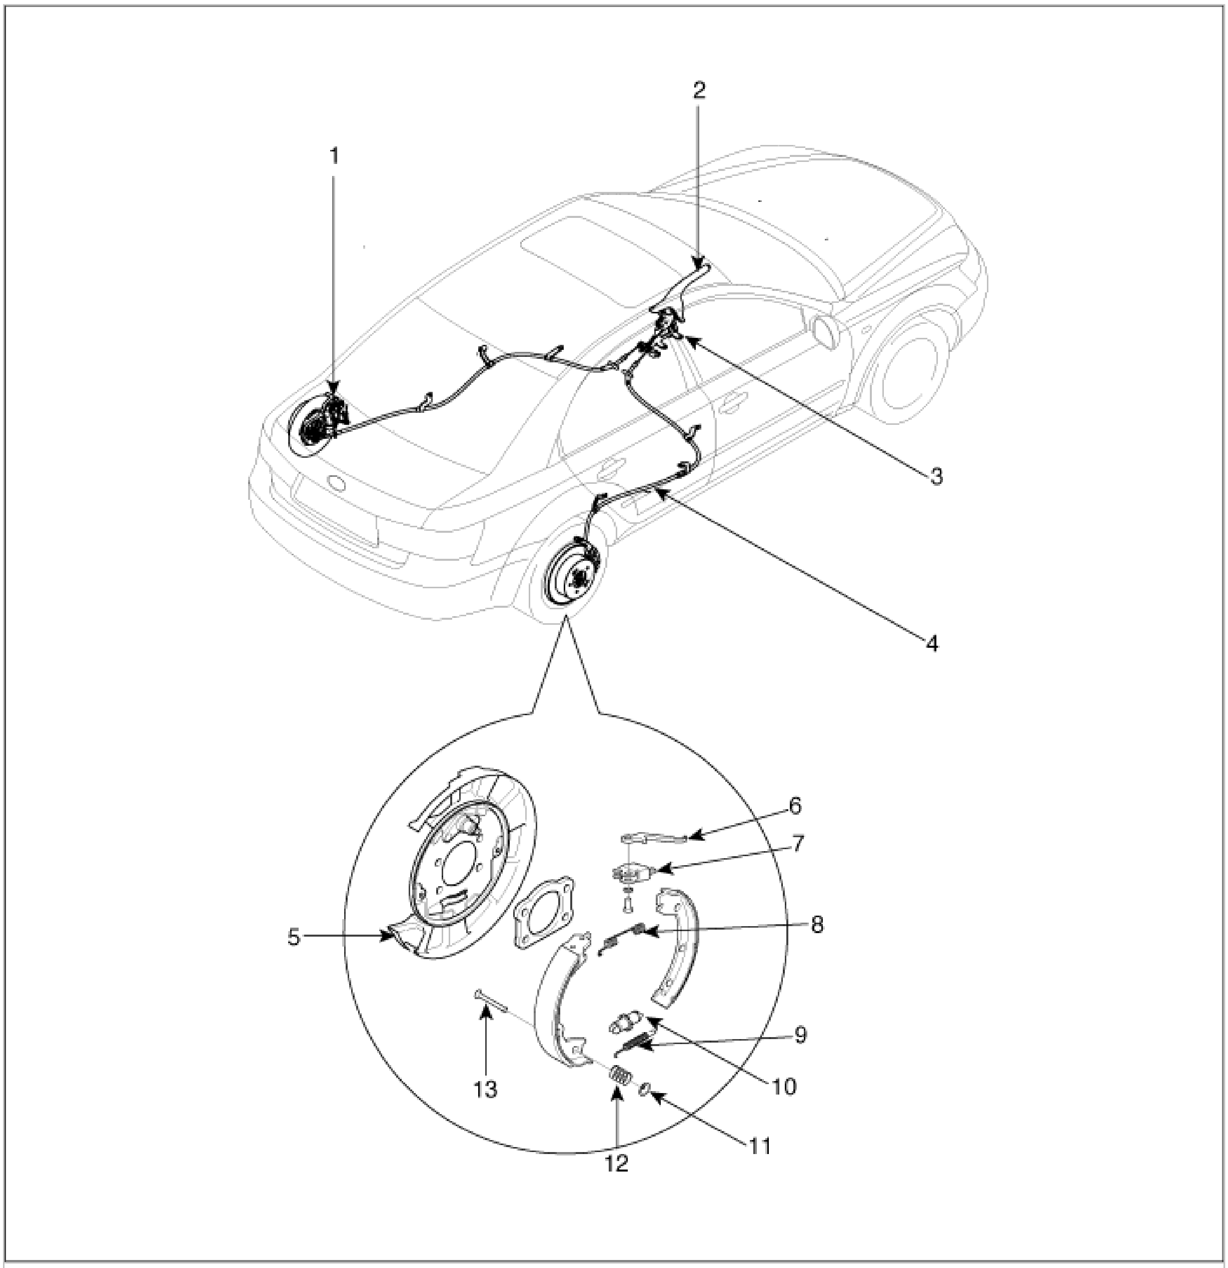
1. Remove the floor console and the connector(B) from the switch(A).



2. Inspect the continuity between (-) terminal and the ground.
   A. When the brake lever is pulled, there should be the continuity between them.
   B. When the brake lever is released, there should be no continuity between them.

Brake System > Parking Brake System > Parking Brake Assembly > Components and Components Location

COMPONENTS



1. Rear brake caliper	6. Operating lever	11. Cup washer
2. Parking brake lever	7. Strut	12. Shoe hold down spring
3. Parking brake switch	8. Upper spring	13. Shoe hold down pin
4. Parking brake cable	9. Lower spring	
5. Backing plate	10. Adjuster	

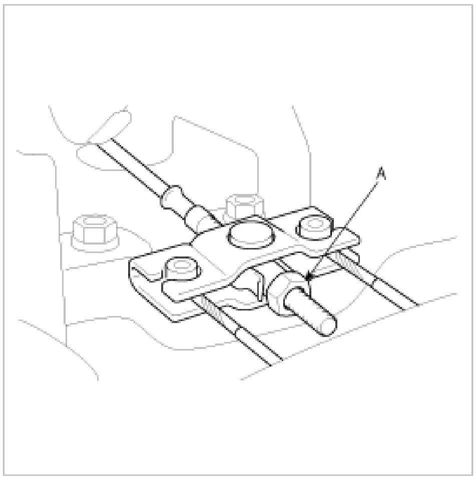
Brake System > Parking Brake System > Parking Brake Assembly > Repair procedures

REMOVAL

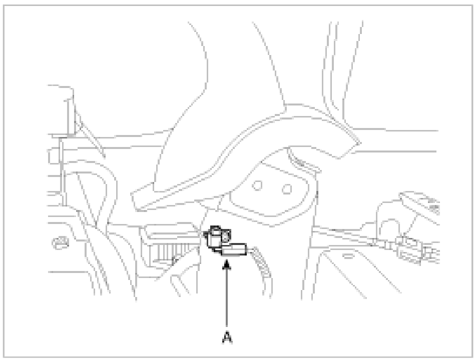
NOTE

The parking brake cables must not be bent or distorted.
This will lead to stiff operation and premature failure.

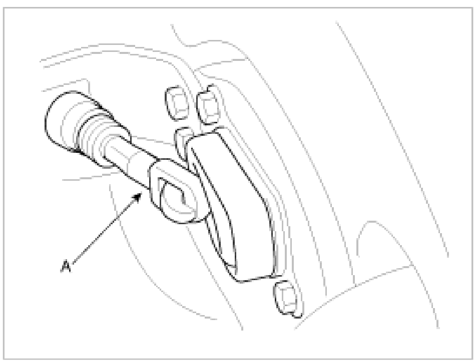
1. Remove the floor console.
2. Loosen the adjusting nut (A) and remove the parking brake cables.



3. Disconnect the connector(A) of the parking brake switch connector.



4. Remove the bolts and parking brake lever assembly(A).
5. Remove the wheel and tire.
6. Remove the brake disc and the brake shoe (Refer to the rear disc brake).
7. Remove the parking brake hook(A).



8. Remove the parking brake cable assembly.

INSTALLATION

1. Install the removed parts in the reverse order of removal.
2. Apply the specified grease to each sliding parts of the ratchet plate or the ratchet pawl.

Specified grease :
Multi purpose grease SAE J310, NLGI No.2

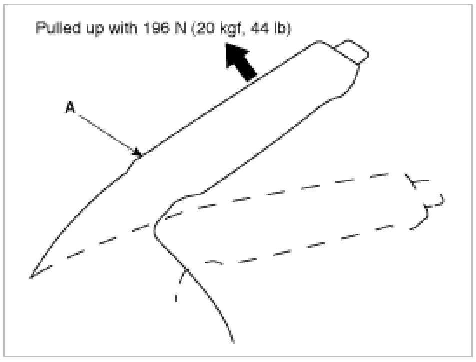
3. After installing the parking brake cable adjuster, adjust the parking brake lever stroke (Refer to the parking brake check and adjustment).

Parking brake check and adjustment

INSPECTION

1. Pull the parking brake lever (A) with 196 N (20 kgf, 44 lbf) force to fully apply the parking brake. The parking brake lever should be locked within the specified number of clicks.

Lever locked clicks : 8



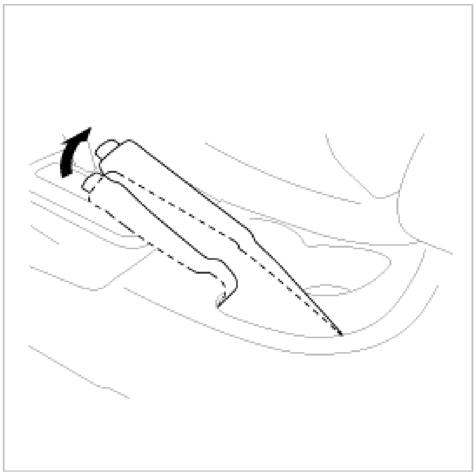
2. Adjust the parking brake if the lever clicks are out of specification.

ADJUSTMENT

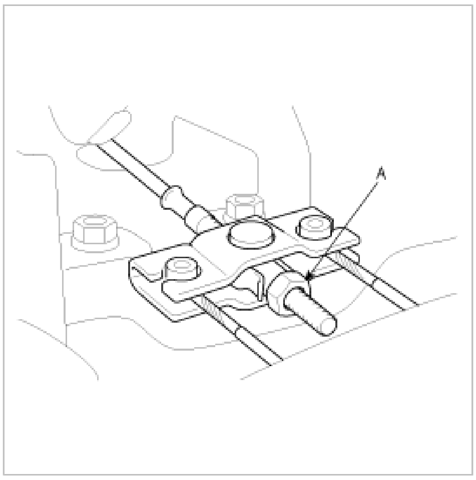
NOTE

After rear brake caliper servicing, loosen the parking brake adjusting nut, start the engine and depress the brake pedal several times to set the self-adjusting brake before adjusting the parking brake.

1. Block the front wheels, then raise the rear of the vehicle and make sure it is securely supported.
2. Pull the parking brake lever up one click.



3. Remove the floor console.
4. Tighten the adjusting nut (A) until the parking brakes are dragged slightly when the rear wheels are turned.



5. Release the parking brake lever completely, and check if parking brakes are not dragged when the rear wheels are turned.

Readjust if necessary.

6. Make sure that the parking brakes are fully applied when the parking brake lever is pulled up completly.
7. Reinstall the floor console.

Brake System > ABS(Anti-Lock Brake System) > Description and Operation

DESCRIPTION

This specification applies to HCU(Hydraulic Control Unit) and ECU(Electronic Control Unit) of the HECU.(Hydraulic and Electronic Control Unit)
This specification is for the wiring design and installation of ABS/TCS/ESC ECU.
This unit has the functions as follows.

- Input of signal from Pressure sensor, Steering angle sensor, Yaw & Lateral G sensor, the wheel speed sensors attached to each wheel.
- Control of braking force / traction force/ yaw moment.
- Failsafe function.
- Self diagnosis function.
- Interface with the external diagnosis tester.

Installation position : engine compartment

- Brake tube length from Master cylinder port to HECU inlet port should be max. 1m
- The position should not be close to the engine block and not lower than the wheel.

OPERATION

The ECU shall be put into operation by switching on the operating voltage (IGN).
On completion of the initialization phase, the ECU shall be ready for operation.
In the operating condition, the ECU shall be ready, within the specified limits (voltage and temperature), to process the signals offered by the various sensors and switches in accordance with the control algorithm defined by the software and to control the hydraulic and electrical actuators.

Wheel Sensor signal processing

The ECU shall receive wheel speed signal from the four active wheel sensors.
The wheel signals are converted to voltage signal by the signal conditioning circuit after receiving current signal from active wheel sensors and given as input to the MCU.

Solenoid Valve Control

When one side of the valve coil is connected to the positive voltage that is provided through the valve relay and the other side is connected to the ground by the semiconductor circuit, the solenoid valve goes into operation.
The electrical function of the coils are always monitored by the valve test pulse under normal operation conditions.

Voltage limits

- Overvoltage
  When overvoltage is detected(above 16V), the ECU switches off the valve relay and shuts down the system.
  When voltage is returned to operating range, the system goes back to the normal condition after the initialization phase.
- Undervoltage
  In the event of undervoltage(below 10V), ABS control shall be inhibited and the warning lamp shall be turned on.
  When voltage is returned to operating range, the warning lamp is switched off and ECU returns to normal operating mode.

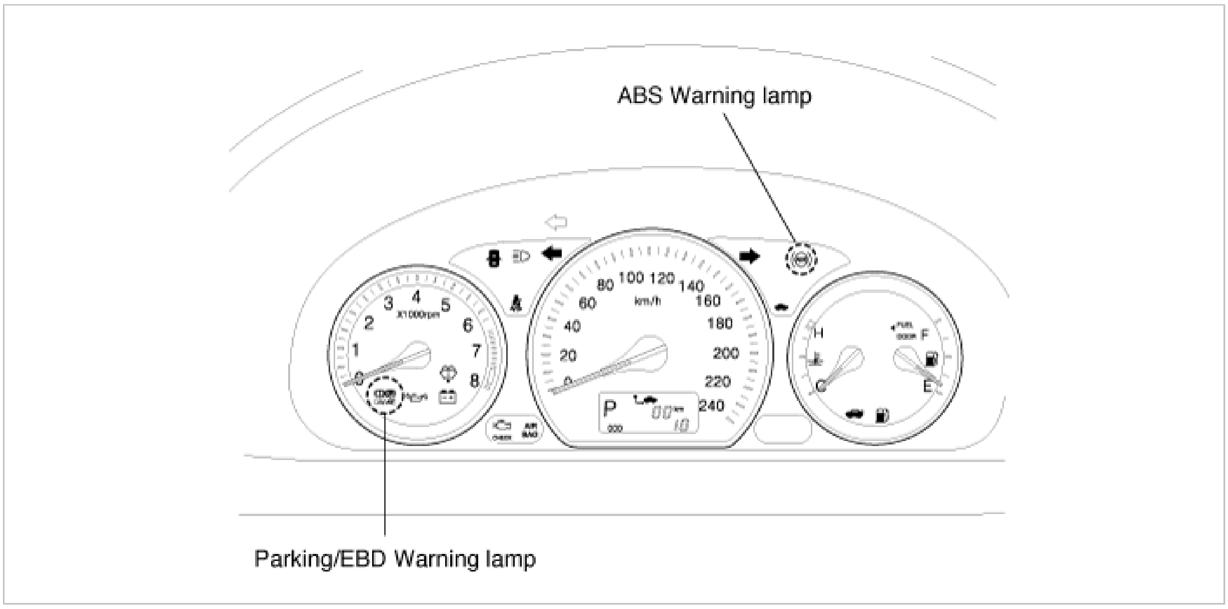
Pump Motor Checking

The ECU performs a pump motor test at a speed of 15km/h once after IGN is switched on.

Diagnostic Interface

Failures detected by the ECU are encoded on the ECU, stored in a EEPROM and read out by diagnostic equipment when the ignition switch is turned on.
The diagnosis interface can also be used for testing the ECU during production of the ECU and for actuating the HCU in the test line of manufactories (Air-bleeding line or Roll and Brake Test line).

Warning Lamp module

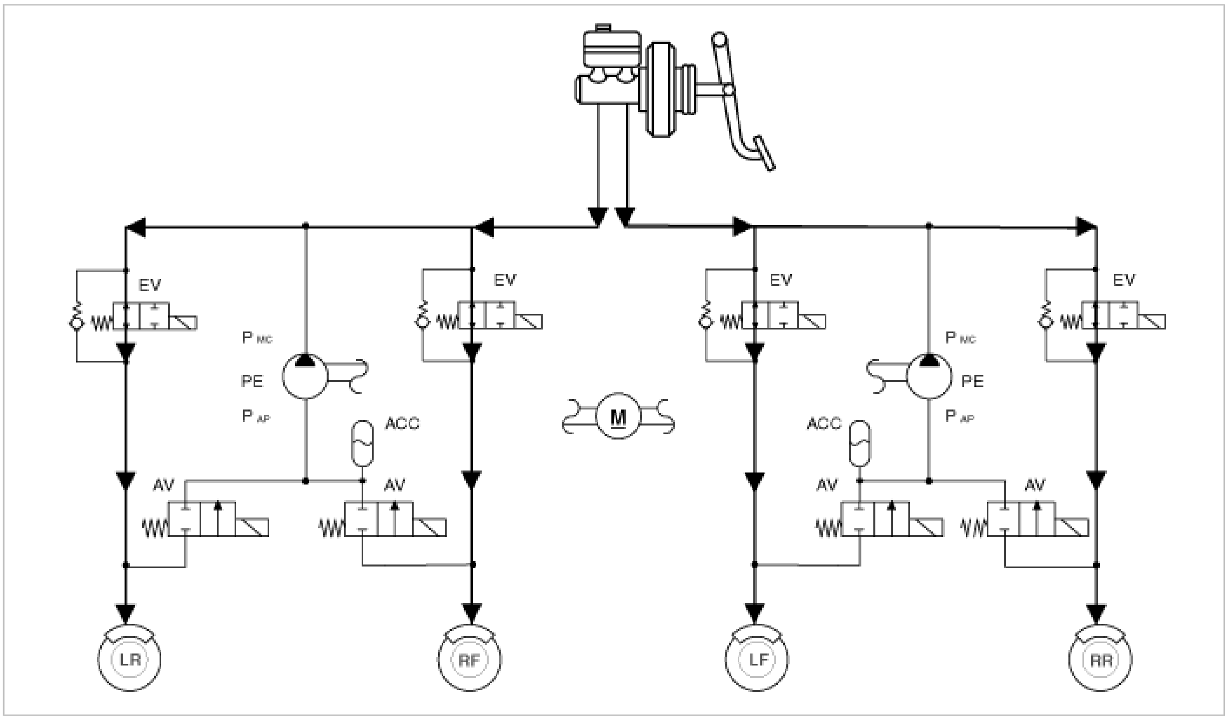


1. ABS WARNING LAMP MODULE
   The active ABS warning lamp module indicates the selftest and failure status of the ABS.The ABS warning lamp shall be on:
   A. During the initialization phase after IGN ON. (continuously 3 seconds).
   B. In the event of inhibition of ABS functions by failure.
   C. During diagnostic mode.
   D. When the ECU Connector is seperated from ECU.
2. PARKING/EBD WARNING LAMP MODULE
   The active EBD warning lamp module indicates the selftest and failure status of the EBD.However, in case the Parking Brake Switch is turned on, the EBD warning lamp is always turned on regardless of EBD functions.The EBD warning lamp shall be on:
   A. During the initialization phase after IGN ON. (continuously 3 seconds).
   B. When the Parking Brake Switch is ON or brake fluid level is low.
   C. When the EBD function is out of order.
   D. During diagnostic mode.
   E. When the ECU Connector is seperated from ECU.

ABS CONTROL

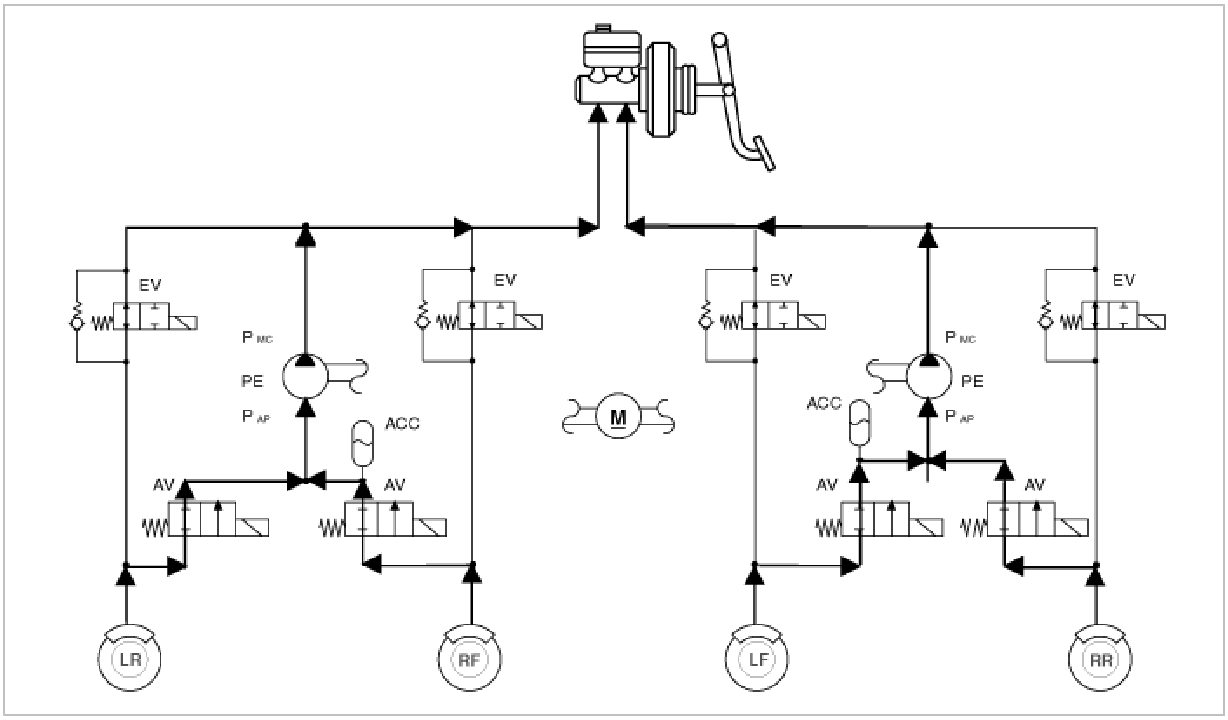
1. NORMAL BRAKING without ABS

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Open	Close	OFF



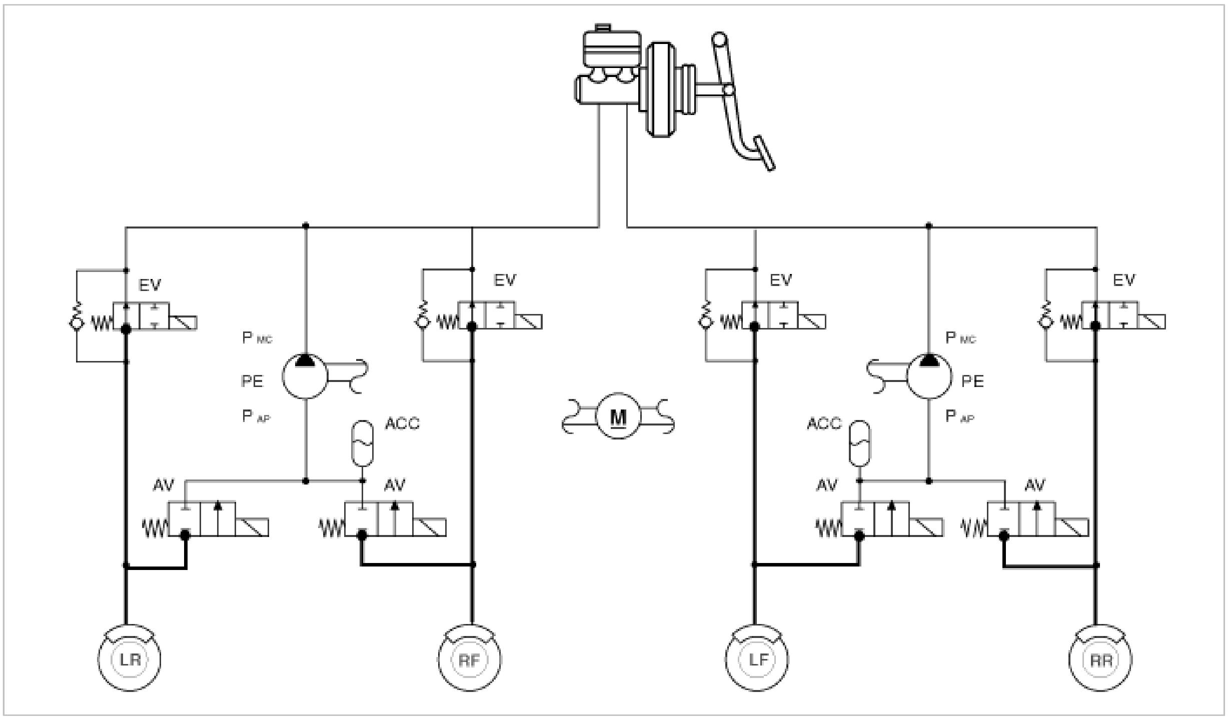
2. DECREASE MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Close	Open	ON(Motor speed control)



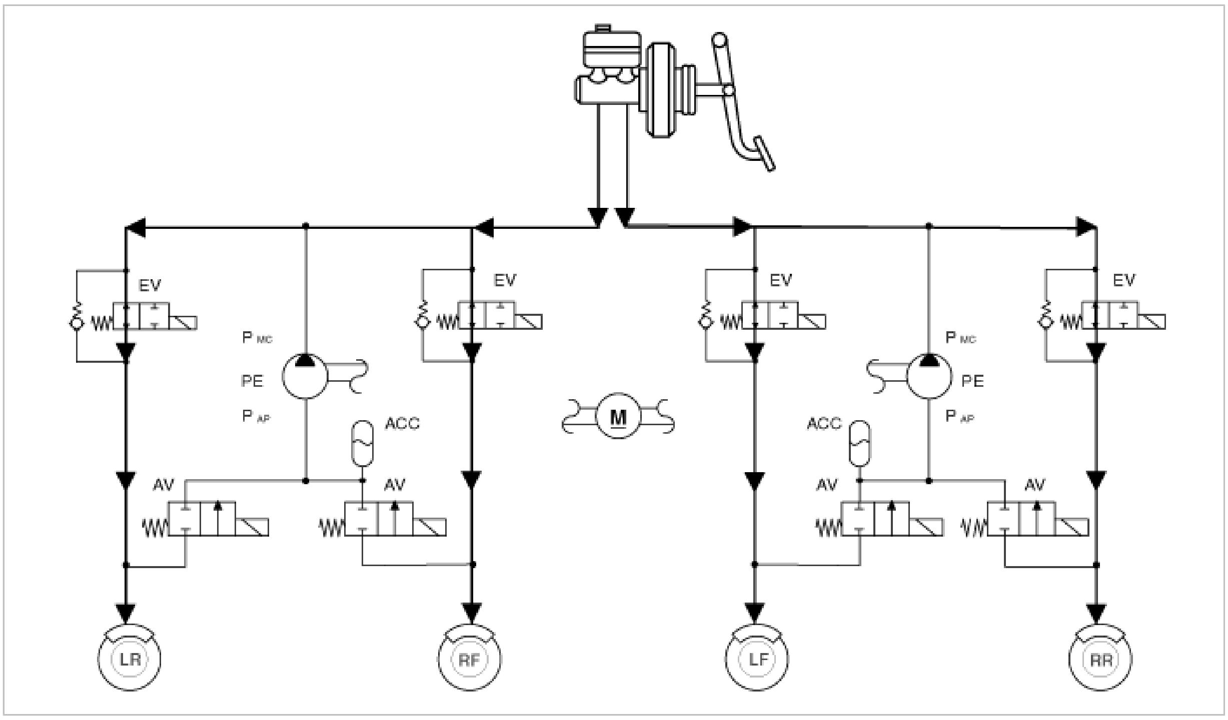
3. HOLD MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Close	Close	OFF



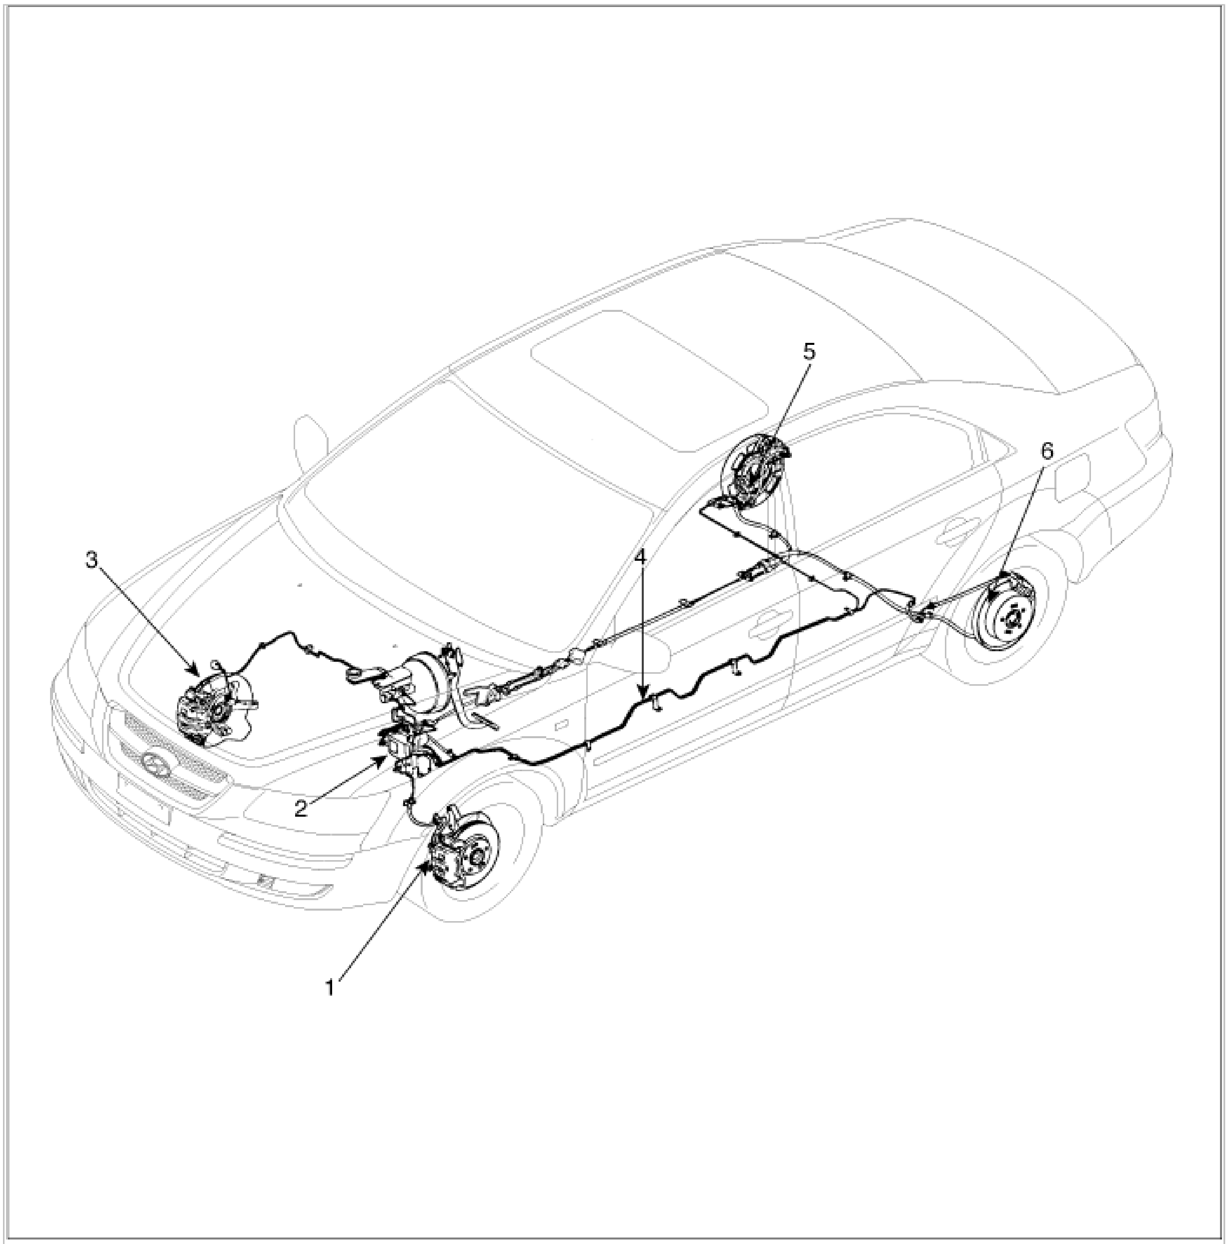
4. INCREASE MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Open	Close	OFF



Brake System > ABS(Anti-Lock Brake System) > Components and Components Location

COMPONENTS

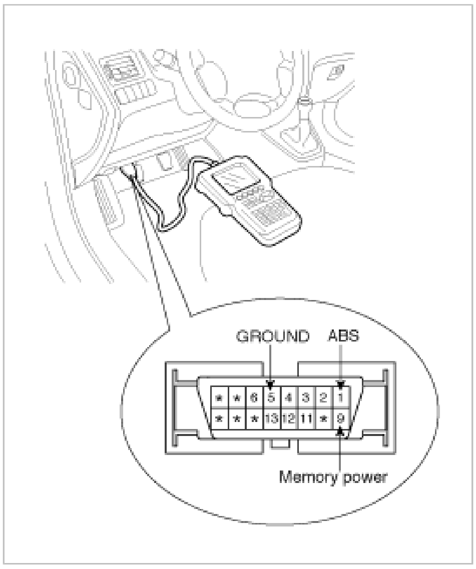


1. Front left wheel speed sensor
2. ABS control module(HECU)
3. Front right wheel speed sensor
4. Hydrauric line
5. Rear right wheel speed sensor
6. Rear left wheel speed sensor

Brake System > ABS(Anti-Lock Brake System) > Troubleshooting

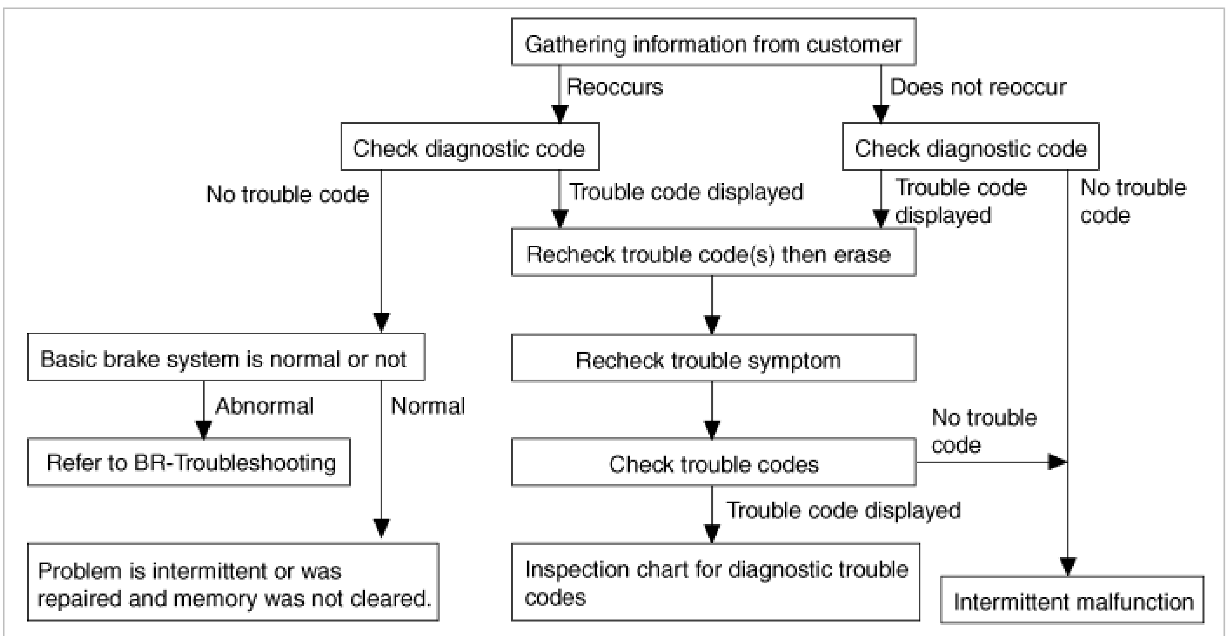
HI-SCAN (PRO) CHECK

1. Turn the ignition switch OFF.
2. Connector the Hi-scan(pro) to the 16P data link connector located the driver's side kick panel.



3. Turn the ignition switch ON.
4. Check for diagnostic trouble using the Hi-scan(pro)
5. After completion trouble of the repair or correction of the problem, erase the stored fault codes the clear key on the Hi-scan (pro).
6. Disconnect the Hi-scan(pro) from the 16P data link connector.

STANDARD FLOW OF DIAGNOSTIC TROUBLESHOOTING



*** Using the customer problem analysis check sheet for reference, ask the customer as much detail as possible about the problem.**

NOTES WITH REGARD TO DIAGNOSIS

The phenomena listed in the following table are not abnormal.

Phenomenon	Explanation
System check sound	When starting the engine, a thudding sound can sometimes be heard coming from inside the engine compartment. This is because the system operation check is being performed.
ABS operation sound	1. Sound of the motor inside the ABS hydraulic unit operation (whine). 2. Sound is generated along with vibration of the brake pedal (scraping). 3. When ABS operates, sound is generated from the vehicle chassis due to repeated brake application and release (Thump : suspension; squeak: tires)

ABS operation (Long braking distance)	For road surfaces such as snow-covered and gravel roads, the braking distance for vehicles with ABS can sometimes be longer than that for other vehicles. Accordingly, advise the customer to drive safely on such roads by lowering the vehicle speed.
Diagnosis detection conditions can vary depending on the diagnosis code. When checking the trouble symptom after the diagnosis code has been erased, ensure that the requirements listed in "Comment" are met.	

ABS CHECK SHEET

ABS Check Sheet

Inspector's Name ________

Customer's Name		**Registration No.**	
		Registration Year	/ /
		VIN.	
Date Vehicle Brought In	/ /	**Odometer**	Km Miles

Date the Problem First Occurred	/ /
Frequency of Occurence of Problem	☐ Continuous ☐ Intermittent (times a day)

Symptoms	☐ ABS does not operate.		
	☐ ABS does not operate efficiently.		☐ Intermittent (times a day)
	ABS Warning Light Abnormal	☐ Remains ON	☐ Does not light up

Diagnostic Trouble Code Check	**1st Time**	☐ Normal Code	☐ Malfunction Code (Code)
	2nd Time	☐ Normal Code	☐ Malfunction Code (Code)

PROBLEM SYMPTOMS TABLE

Symptom	Suspect Area	See page
ABS does not operate.	Only when 1. -4. are all normal and the problem is still occurring, replace the HECU. 1. Check the DTC reconfirming that the normal code is output. 2. Power source circuit. 3. Speed sensor circuit. 4. Check the hydraulic circuit for leakage.	BR - 75
ABS does not operate intermittently.	Only when 1. -4. are all normal and the problem is still occurring, replace the ABS actuator assembly. 1. Check the DTC reconfirming that the normal code is output. 2. Wheel speed sensor circuit. 3. Stop lamp switch circuit.	BR - 77

	4. Check the hydraulic circuit for leakage.	
Communication with Hi-scan (pro) is not possible. (Communication with any system is not possible)	1. Power source circuit 2. Diagnosis line	BR - 79
Communication with Hi-scan (pro) is not possible. (Communication with ABS only is not possible)	1. Power source circuit 2. Diagnosis line 3. HECU	BR - 80
When ignition key is turned ON (engine OFF), the ABS warning lamp does not light up.	1. ABS warning lamp circuit 2. HECU	BR - 81
Even after the engine is started, the ABS warning lamp remains ON.	1. ABS warning lamp circuit 2. HECU	BR - 82

CAUTION

During ABS operation, the brake pedal may vibrate or may not be able to be depressed. Such phenomena are due to intermittent changes in hydraulic pressure inside the brake line to prevent the wheels from locking and is not an abnormality.

ABS Does Not Operate

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Brake operation varies depending on driving conditions and road surface conditions, so diagnosis can be difficult.However if a normal DTC is displayed, check the following probable cause. When the problem is still occurring, replace the ABS control module.	- Faulty power source circuit - Faulty wheel speed sensor circuit - Faulty hydraulic circuit for leakage - Faulty HECU

INSPECTION PROCEDURES

DTC INSPECTION

1. Connect the Hi-Scan (pro) with the data link connector and turn the ignition switch ON.
2. Verify that the normal code is output.
   Is the normal code output?

   NO

   ▸ Check the power source circuit.

   YES

   ▸ Erase the DTC and recheck using Hi-Scan (pro).

CHECK THE POWER SOURCE CIRCUIT.

1. Disconnect the connector from the ABS control module.
2. Turn the ignition switch ON, measure the voltage between terminal 18 of the ABS control module harness side connector and body ground.

   Specification: approximately B+

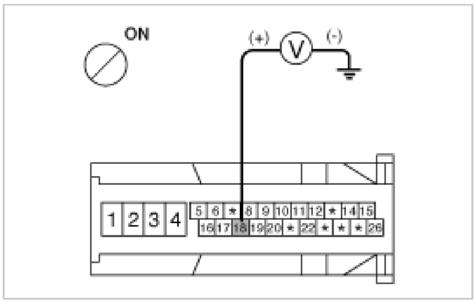
   Is the voltage within specification?

   YES

   ▸ Check the ground circuit.

   NO

   ▸ Check the harness or connector between the fuse (10A) in the engine compartment junction block and the ABS control module. Repair if necessary.



CHECK THE GROUND CIRCUIT.

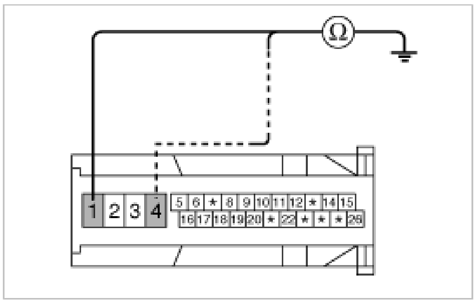
1. Disconnect the connector from the ABS control module.
2. Check for continuity between terminals 1,4 of the ABS control module harness side connector and ground point.
   Is there continuity?

YES

▸ Check the wheel speed sensor circuit.

NO

▸ Repair an open in the wire and ground point.



CHECK THE WHEEL SPEED SENSOR CIRCUIT.

Refer to the DTC troubleshooting procedures.
Is it normal?

YES

▸ Check the hydraulic circuit for leakage.

NO

▸ Repair or replace the wheel speed sensor.

CHECK THE HYDRAULIC CIRCUIT FOR LEAKAGE.

Refer to the hydraulic lines.
Inspect leakage of the hydraulic lines.
Is it normal?

YES

▸ The problem is still occurring, replace the ABS control module.

NO

▸ Repair the hydraulic lines for leakage.

ABS Does Not Operate Intermittently.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Brake operation varies depending on driving conditions and road surface conditions, so diagnosis can be difficult.However if a normal DTC is displayed, check the following probable cause. When the problem is still occurring, replace the ABS control module.	- Faulty power source circuit - Faulty wheel speed sensor circuit - Faulty hydraulic circuit for leakage - Faulty HECU

INSPECTION PROCEDURES

DTC INSPECTION

1. Connect the Hi-Scan (pro) with the data link connector and turn the ignition switch ON.
2. Verify that the normal code is output.

Is the normal code output?

NO

▸ Check the wheel speed sensor circuit.

YES

▸ Erase the DTC and recheck using Hi-Scan (pro).

CHECK THE WHEEL SPEED SENSOR CIRCUIT.

Refer to the DTC troubleshooting procedures.
Is it normal?

YES

▸ Check the stop lamp switch circuit.

NO

▸ Repair or replace the wheel speed sensor.

CHECK THE STOP LAMP SWITCH CIRCUIT.

1. Check that stop lamp lights up when brake pedal is depressed and turns off when brake pedal is released.
2. Measure the voltage between terminal 20 of the ABS control module harness side connector and body ground when brake pedal is depressed.

Specification: approximately B+

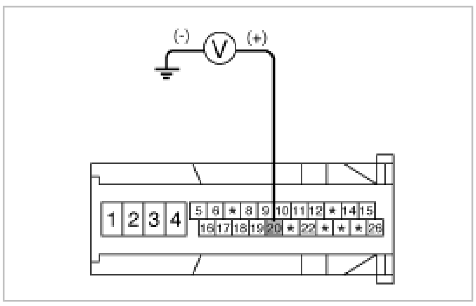
Is the voltage within specification?

YES

▸ Check the hydraulic circuit for leakage.

NO

▸ Repair the stop lamp switch. Repair an open in the wire between the ABS control module and the stop lamp switch.



CHECK THE HYDRAULIC CIRCUIT FOR LEAKAGE.

Refer to the hydraulic lines.
Inspect leakage of the hydraulic lines.
Is it normal?

YES

▸ The problem is still occurring, replace the ABS control module.

NO

▸ Repair the hydraulic lines for leakage.

Communication With Hi-Scan (pro) Is Not Possible. (Communication With Any System Is Not Possible)

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Possible defect in the power supply system (including ground) for the diagnosis line.	- An open in the wire - Poor ground - Faulty power source circuit

INSPECTION PROCEDURES

CHECK THE POWER SUPPLY CIRCUIT FOR THE DIAGNOSIS

Measure the voltage between terminal 9 of the data link connector and body ground.

Specification: approximately B+

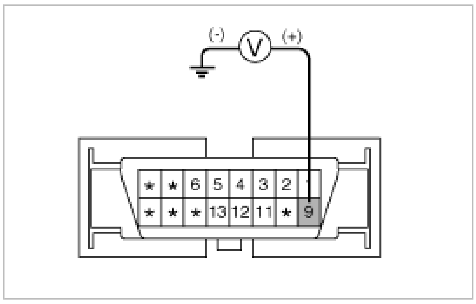
Is voltage within specification?

YES

▸ Check the ground circuit for the diagnosis.

NO

▸ Repair an open in the wire. Check and replace fuse (15A) from the engine compartment junction block.

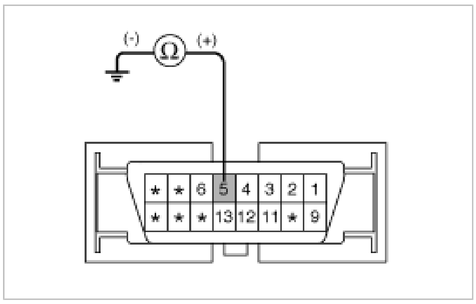


CHECK THE GROUND CIRCUIT FOR THE DIAGNOSIS

Check for continuity between terminal 5 of the data link connector and body ground.
Is there continuity?

NO

▸ Repair an open in the wire between terminal 5 of the data link connector and ground point.



Communication With Hi-Scan (pro) Is Not Possible. (Communication With ABS Only Is Not Possible)

DETECTING CONDITION

Trouble Symptoms	Possible Cause
When communication with Hi-Scan (pro) is not possible, the cause may be probably an open in the HECU power circuit or an open in the diagnosis output circuit.	- An open in the wire - Faulty HECU - Faulty power source circuit

INSPECTION PROCEDURES

CHECK FOR CONTINUITY IN THE DIAGNOSIS LINE

1. Disconnect the connector from the ABS control module.
2. Check for continuity between terminals 11 of the ABS control module connector and 1 of the data link connector.
   Is there continuity?

   YES

   ▸ Check the power source of ABS control module.

   NO

   ▸ Repair an open in the wire.

CHECK THE POWER SOURCE OF ABS CONTROL MODULE

1. Disconnect the connector from the ABS control module.
2. Turn the ignition switch ON, measure the voltage between terminal 18 of the ABS control module harness side connector and body ground.

   Specification: approximately B+

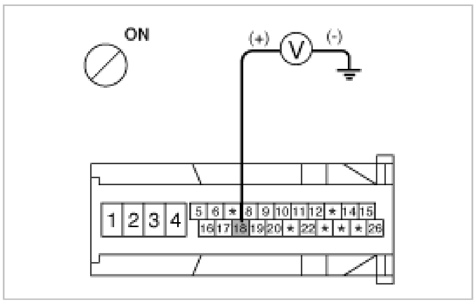
   Is voltage within specification?

YES

▸ Check for poor ground.

NO

▸ Check the harness or connector between the fuse (10A) in the engine compartment junction block and the ABS control module.Repair if necessary.



CHECK FOR POOR GROUND

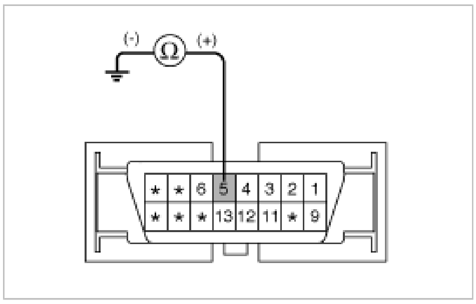
Check for continuity between terminal 5 of the data link connector and ground point.

YES

▸ Replace the ABS control module and recheck.

NO

▸ Repair an open in the wire or poor ground.



When Ignition Key Is Turned ON (Engine OFF), The ABS Warning Lamp Does Not Light Up.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
When current flows in the HECU the ABS warning lamp turns from ON to OFF as the initial check.Therefore if the lamp does not light up, the cause may be an open in the lamp power supply circuit, a blown bulb, an open in the both circuits between the ABS warning lamp and the HECU, and the faulty HECU.	- Faulty ABS warning lamp bulb - Blown No.2 fuse (10A) in the engine compartment junction block - Faulty ABS warning lamp module - Faulty HECU

INSPECTION PROCEDURES

PROBLEM VERIFICATION

Disconnect the connector from the ABS control module and turn the ignition switch ON.
Does the ABS warning lamp light up?

YES

▸ It is normal. Recheck the ABS control module.

NO

▸ Check the power source for the ABS warning lamp.

CHECK THE POWER SOURCE FOR THE ABS WARNING LAMP

1. Disconnect the instrument cluster connector and turn the ignition switch ON.
2. Measure the voltage between terminal 5 of the cluster harness side connector and body ground.

Specification: approximately B+

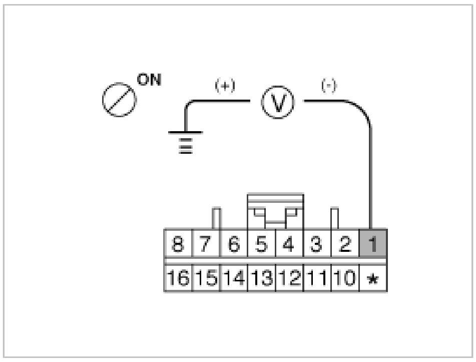
Is voltage within specification?

YES

▸ Repair bulb or instrument cluster assembly.

NO

▸ Check for blown fuse.



CHECK FOR BLOWN FUSE

Check continuity of fuse (10A) from the engine compartment junction block.
Is there continuity?

YES

▸ Repair an open in the wire between ABS fuse and 1 of cluster connector.

NO

▸ Replace the blown fuse.

Even After The Engine Is Started, The ABS Warning Lamp Remains ON.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
If the HECU detects trouble, it lights the ABS warning lamp while at the same time prohibiting ABS control. At this time, the HECU records a DTC in memory.Even though the normal code is output, the ABS warning lamp remains ON, then the cause may be probably an open or short in the ABS warning lamp circuit.	- An open in the wire - Faulty instrument cluster assembly - Faulty ABS warning lamp module - Faulty HECU

INSPECTION PROCEDURES

CHECK DTC OUTPUT.

1. Connect the Hi-Scan (pro) to the 16P data link connector located behind the driver's side kick panel.
2. Check the DTC output using Hi-Scan (pro).
   Is DTC output?

   YES

   ▸ Repair circuit indicated by code output.

   NO

   ▸ Check instrument cluster.

CHECK INSTRUMENT CLUSTER

Disconnect the cluster connector and turn the ignition switch ON.
Does the ABS warning lamp remains ON?

YES

▸ Replace the instrument cluster.

NO

▸ Check for open the wire.

CHECK FOR OPEN IN THE WIRE

Check for continuity in the wire between cluster and ABS control module.
Is there continuity?

YES

▸ Replace the ABS control module and recheck.

NO

▸ Repair an open in the wire between cluster and ABS control module.

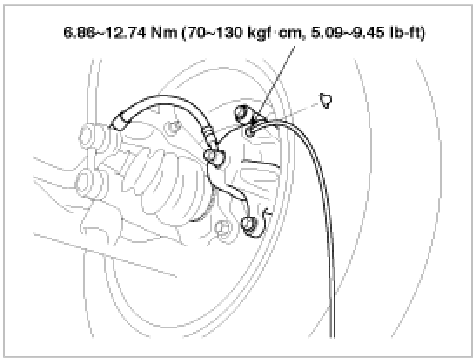
BLEEDING OF BRAKE SYSTEM

1. Remove the reservoir cap and fill the brake reservoir with brake fluid.

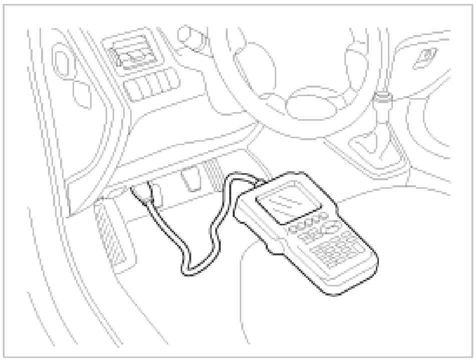
> **CAUTION**
>
> If there is any brake fluid on any painted surface, wash it off immediately.

> **NOTE**
>
> When pressure bleeding, do not depress the brake pedal.
> Recommended fluid........ DOT3 or DOT4

2. Connect a clear plastic tube to the wheel cylinder bleeder plug and insert the other end of the tube into a half filled clear plastic bottle.



3. Connect the hi-scan (pro) to the data link connector located underneath the dash panel.



4. Select and operate according to the instructions on the hi-scan (Pro) screen.

> **CAUTION**
>
> You must obey the maximum operating time of the ABS motor with the hi-scan (Pro) to prevent the motor pump from burning.

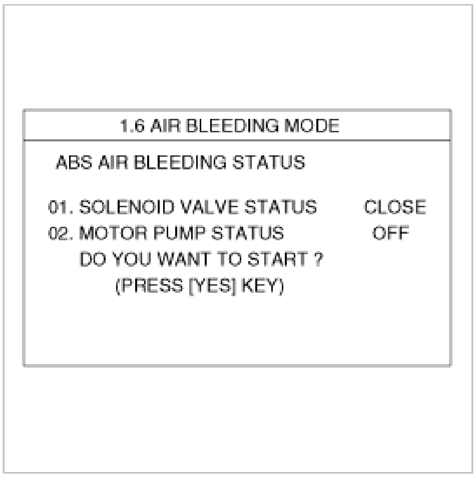
(1) Select hyundai vehicle diagnosis.

(2) Select vehicle name.

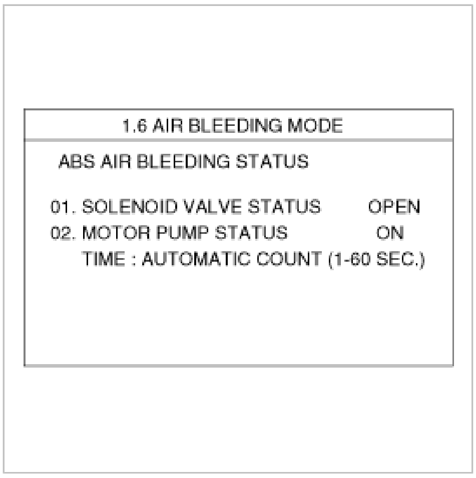
(3) Select Anti-Lock Brake system.

(4) Select air bleeding mode.

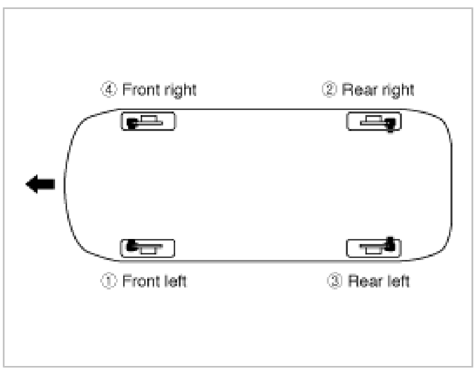
(5) Press "YES" to operate motor pump and solenoid valve.



(6) Wait 60 sec. before operating the air bleeding. (If not, you may damage the motor.)



5. Pump the brake pedal several times, and then loosen the bleeder screw until fluid starts to run out without bubbles. Then close the bleeder screw.
6. Repeat step 5 until there are no more bubbles in the fluid for each wheel.



7. Tighten the bleeder screw.

Bleed screw tightening torque:
6.86~12.74 Nm (70 ~130 kgf·cm, 5.09 ~ 9.45 lb-ft)

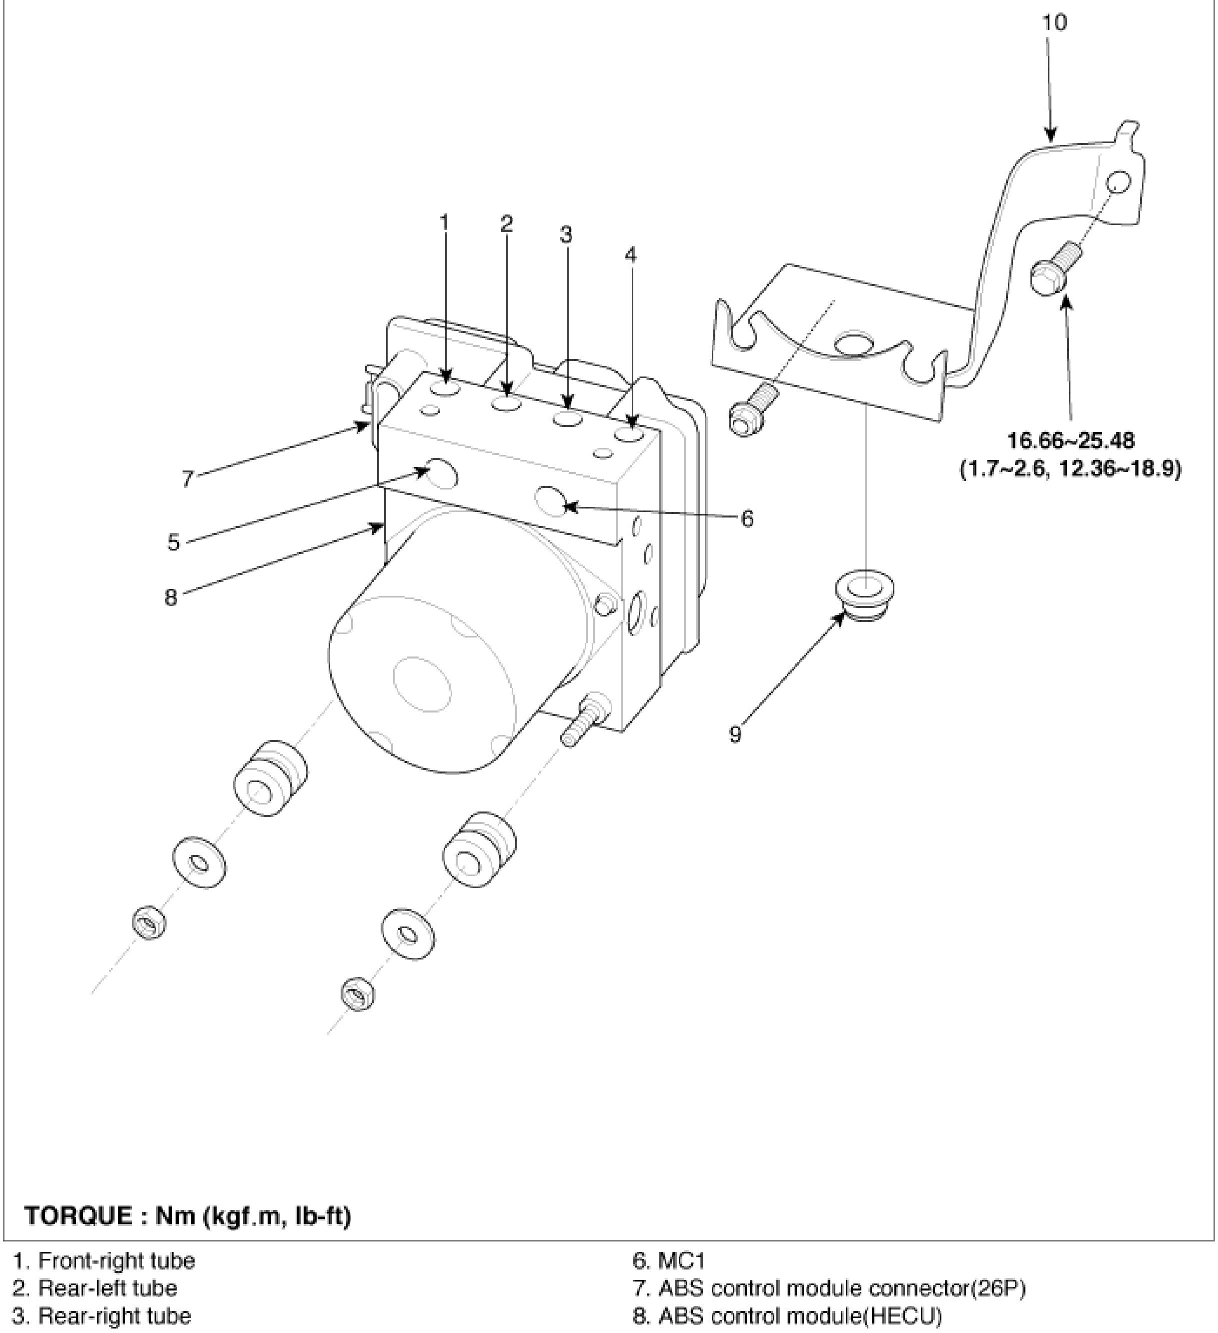
Brake System > ABS(Anti-Lock Brake System) > ABS Control Module > Components and Components Location

COMPONENTS



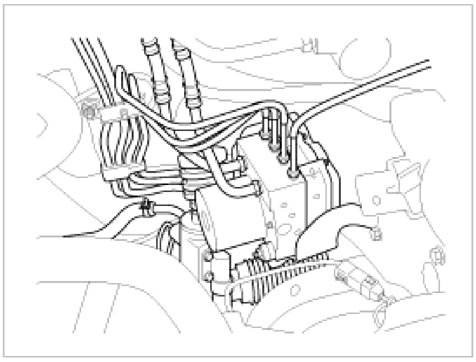
TORQUE : Nm (kgf.m, lb-ft)

1. Front-right tube
2. Rear-left tube
3. Rear-right tube
4. Front-left tube
5. MC2
6. MC1
7. ABS control module connector(26P)
8. ABS control module(HECU)
9. Damper
10. Bracket

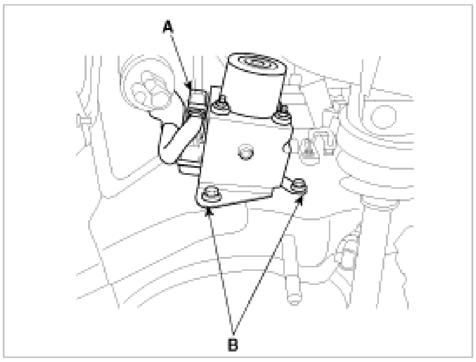
Brake System > ABS(Anti-Lock Brake System) > ABS Control Module > Repair procedures

REMOVAL

1. Disconnect the brake tube from the HECU by unlocking the nuts counterclockwise with a spanner.



2. Lift up the vehicle.
3. Disconnect the connector(A) from the HECU.



4. Remove the two HECU brake mounting bolts(B) , and then disassemble the HECU with the bracket.

> CAUTION
>
> 1. Never attempt to disassemble the HECU.
> 2. The HECU must be transported and stored in
> 3. Never shock to the HECU.

5. Remove the two HECU mounting nuts and washer, and then remove the bracket.

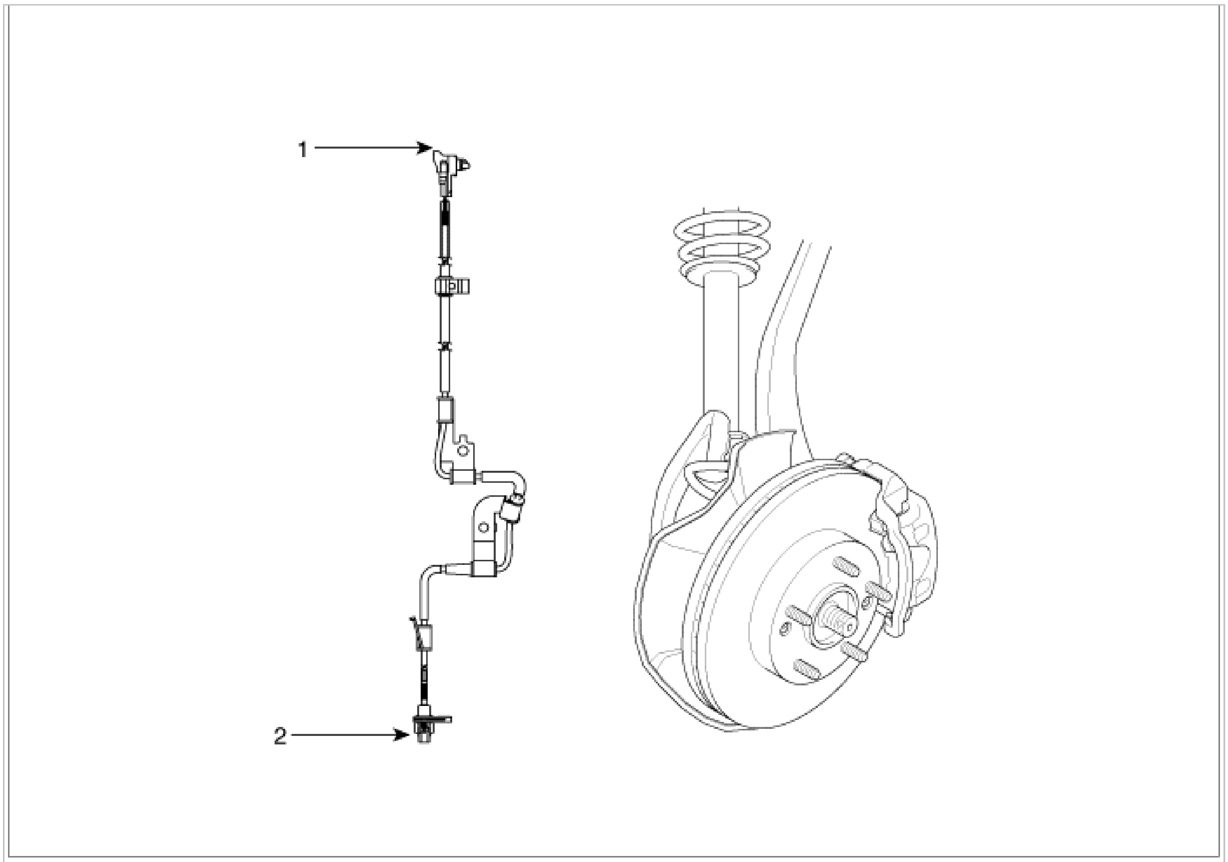
INSTALLATION

1. Installation is the reverse of removal.
2. Tighten the HECU mounting bolts and brake tube nuts to the specified torque.

Tighterning torque
HECU mounting nut :
5.88~9.8 Nm (0.6~1 kgf·m, 4.36~7.27 lb-ft)
HECU bracket mounting bolt:
16.66~25.48 Nm (1.7~2.6 kgf·m, 12.36~18.9 lb-ft)

Brake System > ABS(Anti-Lock Brake System) > Front Wheel Speed Sensor > Components and Components Location

COMPONENTS

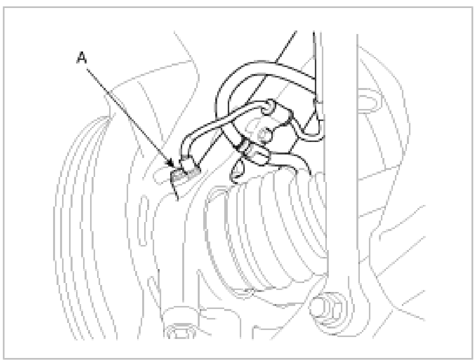


1. Front wheel speed sensor connector
2. Front wheel speed sensor

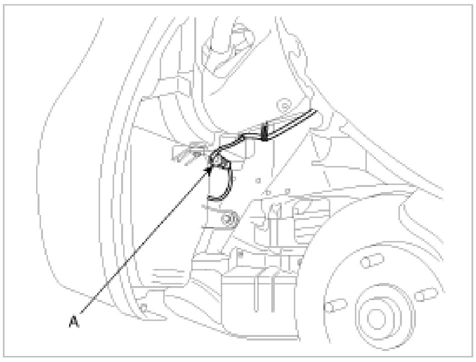
Brake System > ABS(Anti-Lock Brake System) > Front Wheel Speed Sensor > Repair procedures

REMOVAL

1. Remove the front wheel speed sensor mounting bolt(A).



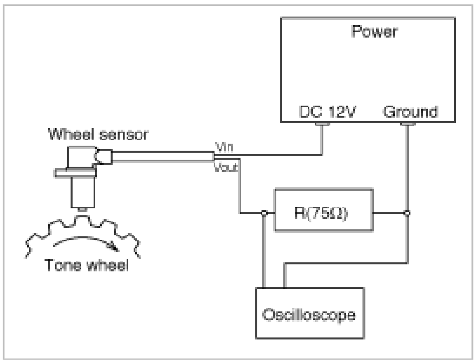
2. Remove the front wheel guard.
3. Remove the front wheel speed sensor after disconnecting the wheel speed sensor connector(A).



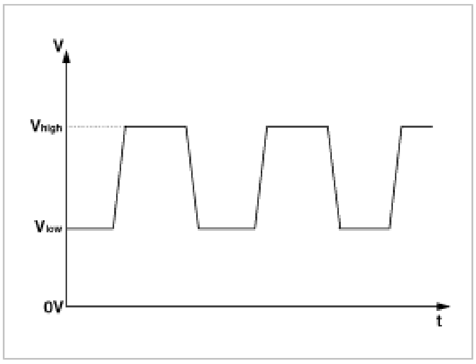
INSPECTION

1. Measure the output voltage between the terminal of the wheel speed sensor and the body ground.

> CAUTION
>
> In order to protect the wheel speed sensor, when measuring output voltage, a 75Ω resistor must be used as shown.



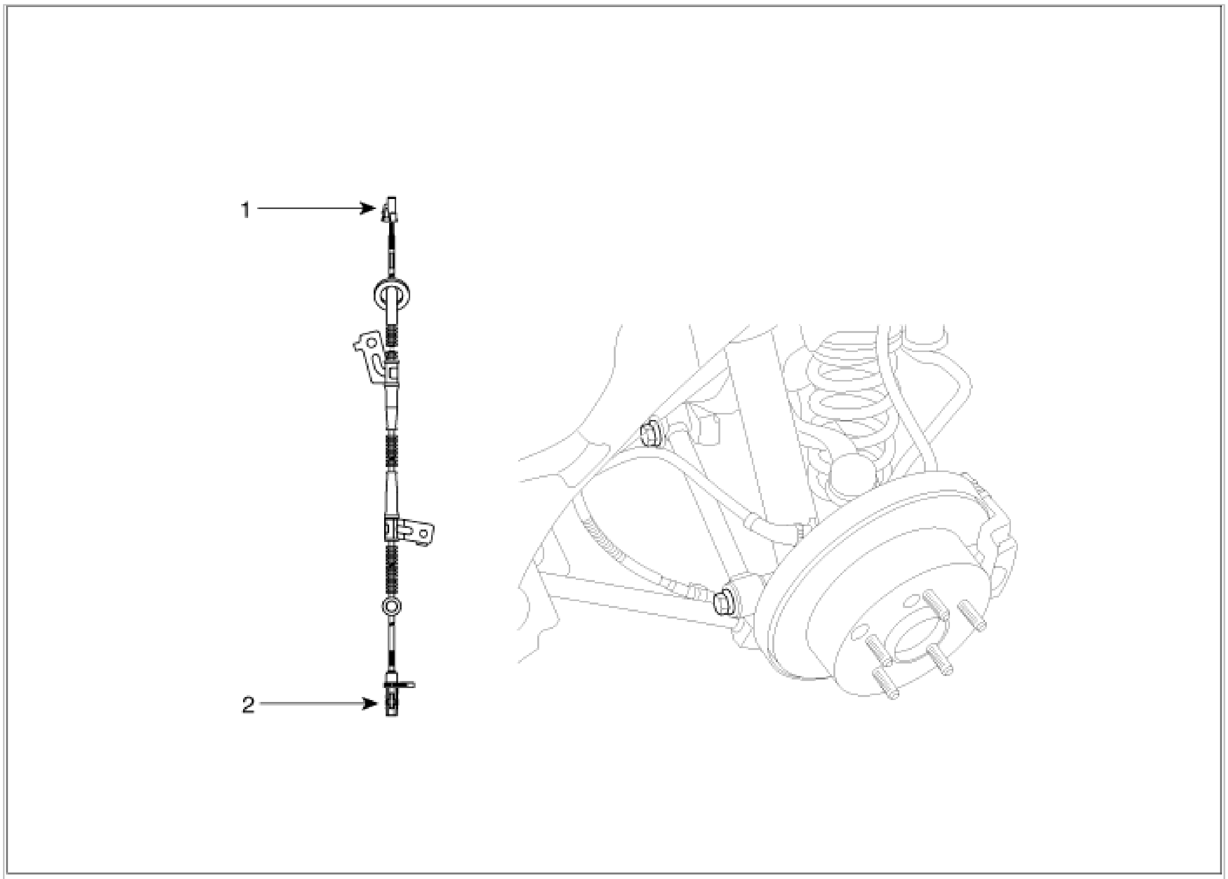
2. Compare the change of the output voltage of the wheel speed sensor to the normal change of the output voltage as shown below.



A. V_low : 0.44 V ~ 0.63 V
B. V_high : 0.885 V ~ 1.26 V
C. Frequency range : 1~2,500 Hz

Brake System > ABS(Anti-Lock Brake System) > Rear Wheel Speed Sensor > Components and Components Location

COMPONENTS

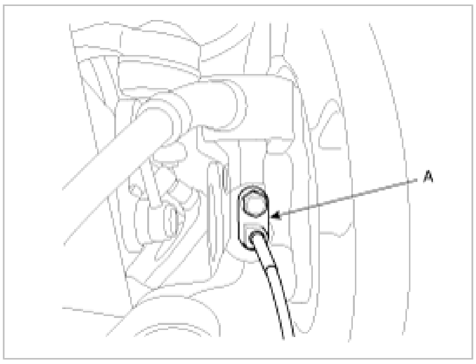


1. Rear wheel speed sensor connector
2. Rear wheel speed sensor

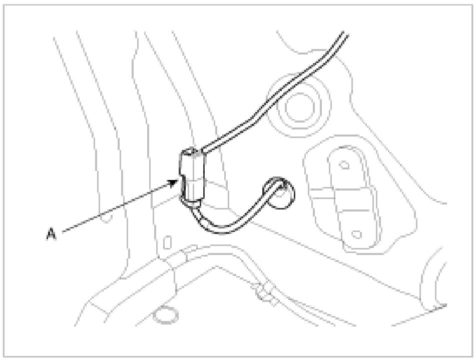
Brake System > ABS(Anti-Lock Brake System) > Rear Wheel Speed Sensor > Repair procedures

REMOVAL

1. Remove the rear wheel speed sensor mounting bolt(A).



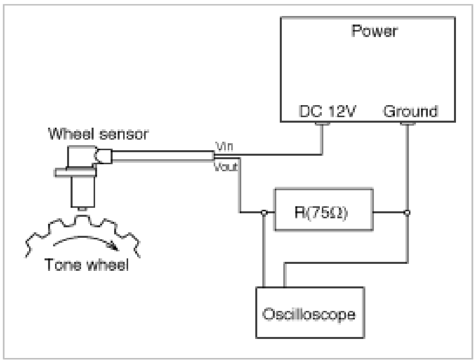
2. Remove the rear seat side pad then disconnect the rear wheel speed sensor connector(A).



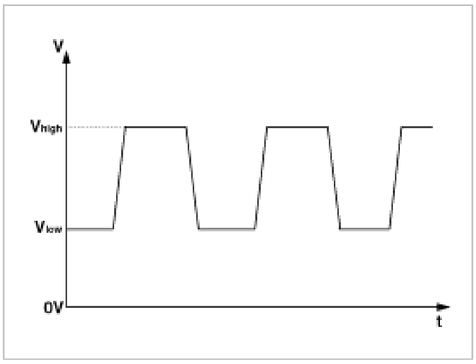
INSPECTION

1. Measure the output voltage between the terminal of the wheel speed sensor and the body ground.

> **CAUTION**
>
> In order to protect the wheel speed sensor, when measuring output voltage, a 75Ω resistor must be used as shown.



2. Compare the change of the output voltage of the wheel speed sensor to the normal change of the output voltage as shown below.



A. V_low : 0.44 V ~ 0.63 V
B. V_high : 0.885 V ~ 1.26 V
C. Frequency range : 1~2,500 Hz

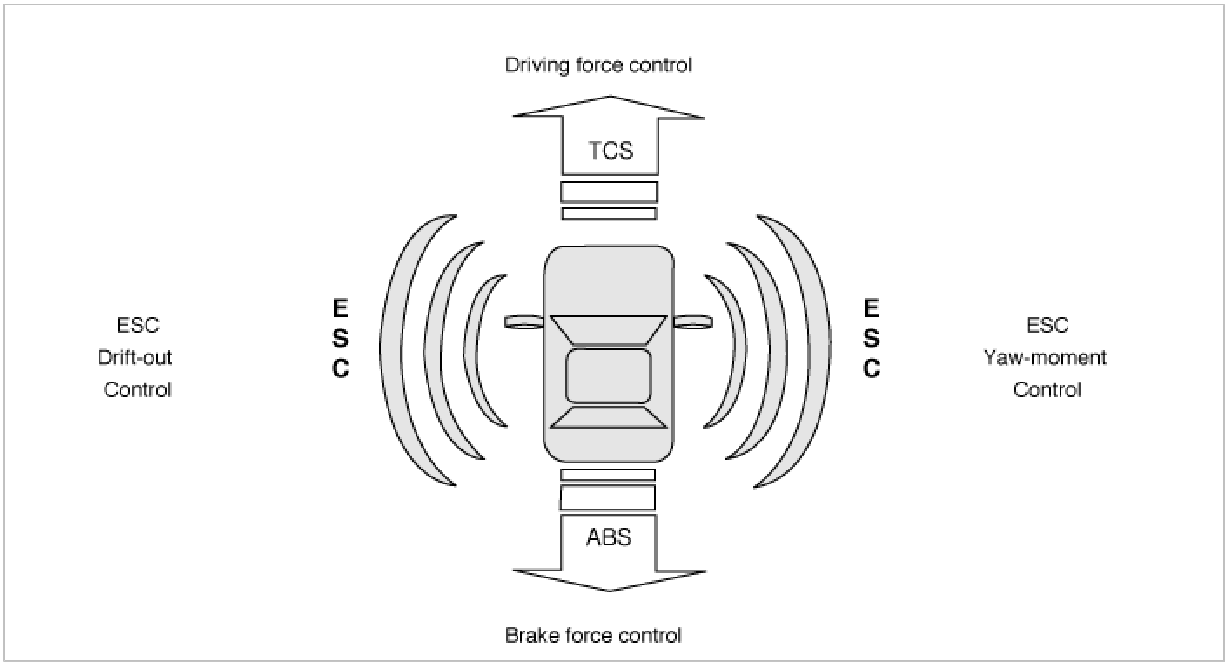
Brake System > ESP(Electronic Stability Program) System > Description and Operation

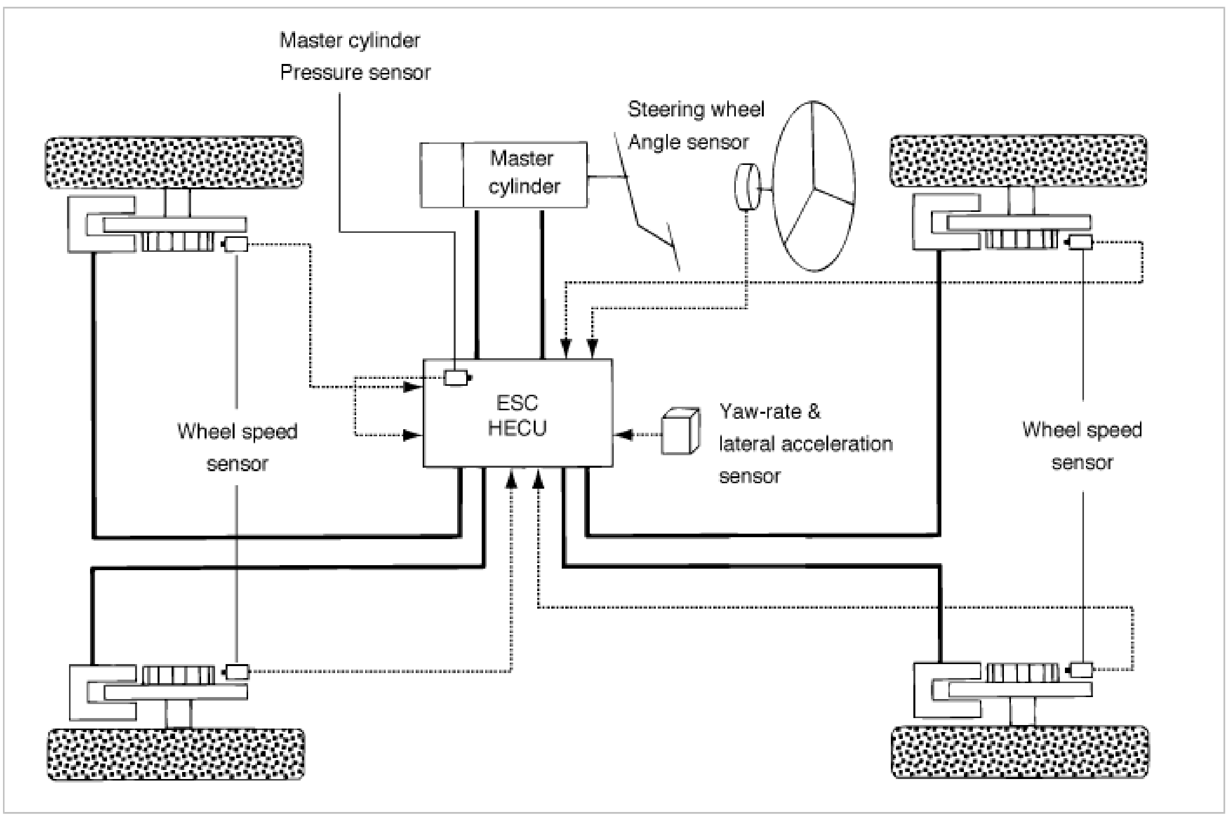
description of ESC

Optimum driving safety now has a name : ESC, the Electronic Stability Control.
ESC recognizes critical driving conditions, such as panic reactions in dangerous situations, and stabilizes the vehicle by wheel-individual braking and engine control intervention with no needfor actuating the brake or the gas pedal.
ESC adds a further function known as Active Yaw Control (AYC) to the ABS, TCS, EBD and ESC functions. Whereas the ABS/TCS function controls wheel slip during braking and acceleration and, thus, mainly intervenes in the longitudinal dynamics of the vehicle, active yaw control stabilizes the vehicle about its vertical axis.
This is achieved by wheel individual brake intervention and adaptation of the momentary engine torque with no need for any action to be taken by the driver.
ESC essentially consists of three assemblies : the sensors, the electronic control unit and the actuators.
Of course, the stability control feature works under all driving and operating conditions. Under certain driving conditions, the ABS/TCS function can be activated simultaneously with the ESC function in response to a command by the driver.
In the event of a failure of the stability control function, the basic safety function, ABS, is still maintained.



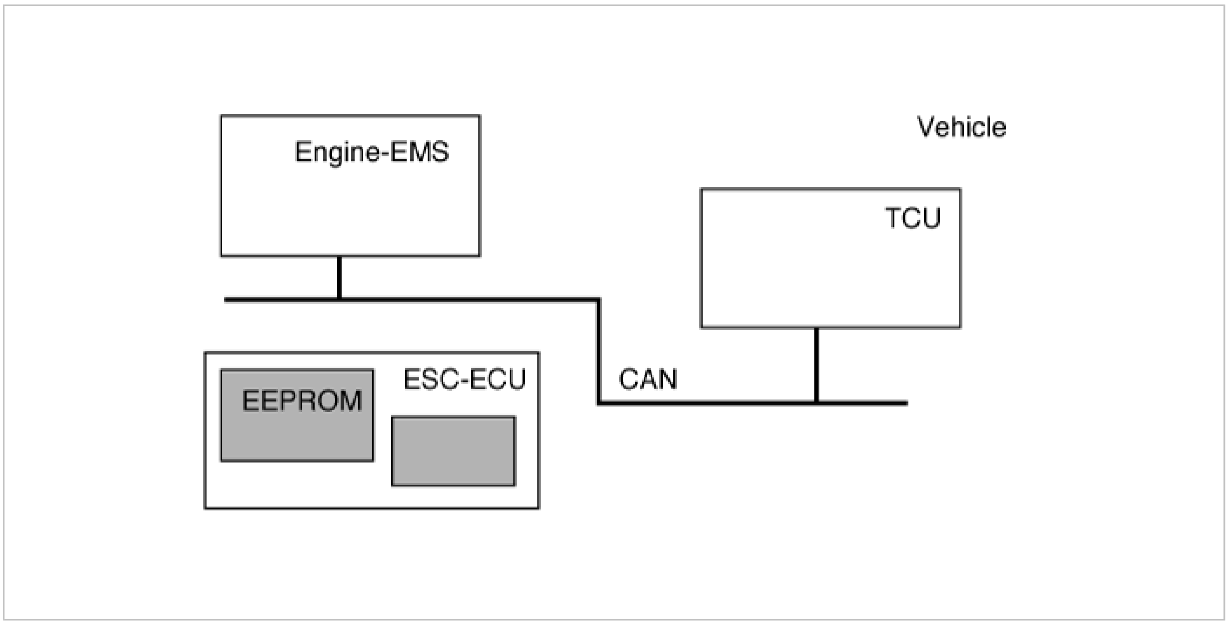
DESCRIPTION OF ESP CONTROL

ESP system includes ABS/EBD, TCS and AYC function.
ABS/EBD function The ECU changes the active sensor signal (current shift) coming from the four wheel sensors to the square wave.By using the input of above signals, the ECU calculates the vehicle speed and the acceleration & deceleration of the four wheels.And, the ECU judges whether the ABS/EBD should be actuated or not.
TCS function prevents the wheel slip of drive direction by adding the brake pressure and engine torque reduction via CAN communication.TCS function uses the wheel speed sensor signal to determine the wheel slip as far as ABS function.
AYC function prevents unstable maneuver of the vehicle. To determine the vehicle maneuver, AYC function uses the maneuver sensor signals(Yaw Rate Sensor, Lateral Acceleration Sensor, Steering Wheel Angle Sensor).If vehicle maneuver is unstable (Over Steer or Under Steer), AYC function applies the brake pressure on certain wheel, and send engine torque reduction signal by CAN.
After the key-on, the ECU continually diagnoses the system failure. (self-diagnosis)If the system failure is detected, the ECU informs driver of the system failure through the BRAKE/ABS/ESC warning lamp. (fail-safe warning)



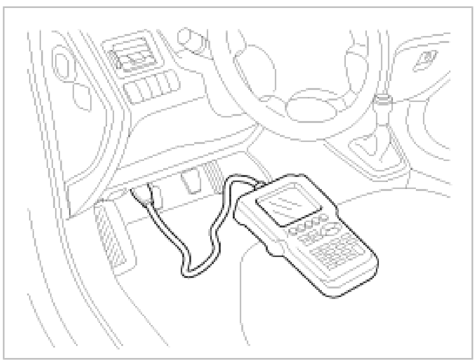
VARIANT CODING

A hardware difference of ECU does not exist according to the specification of the vehicle, but a software changes according to deference of vehicle parameter. The ESC stores variant code (data of engine, displacement volume , T/M) at the ECU memory. Since then an ESC uses the stored data.

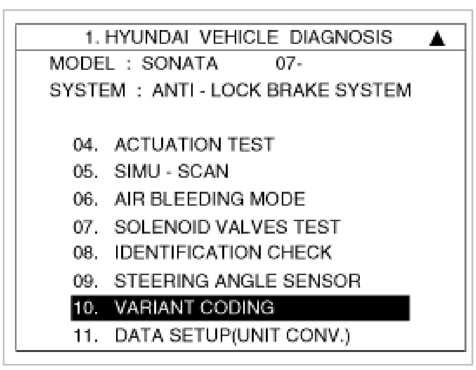


***PROCEDURE**

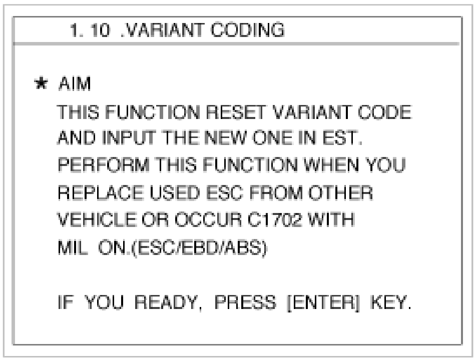
1. Install a EMS/TCU/ESC normally.
2. Connect the hi-scan (pro) to the data link connector located underneath the dash panel.



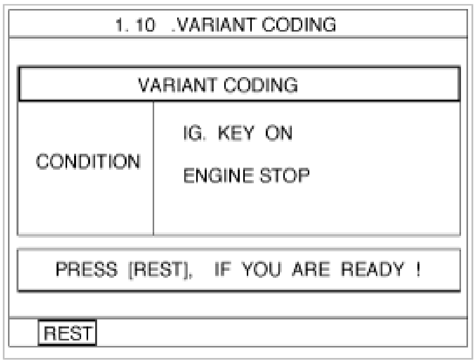
3. Select vehicle name.
4. Select ANTI-LOCK BRAKE SYSTEM.
5. Select the variant coding.



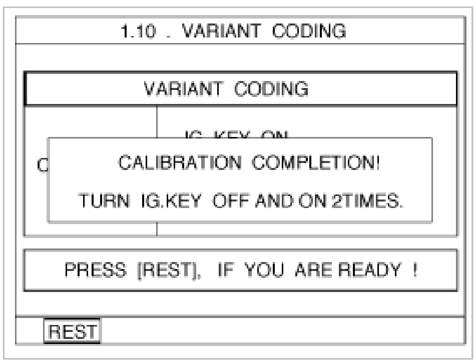
6. Follow the next procedure according to the comment .



7. Confirm the condition , and then push the "REST".



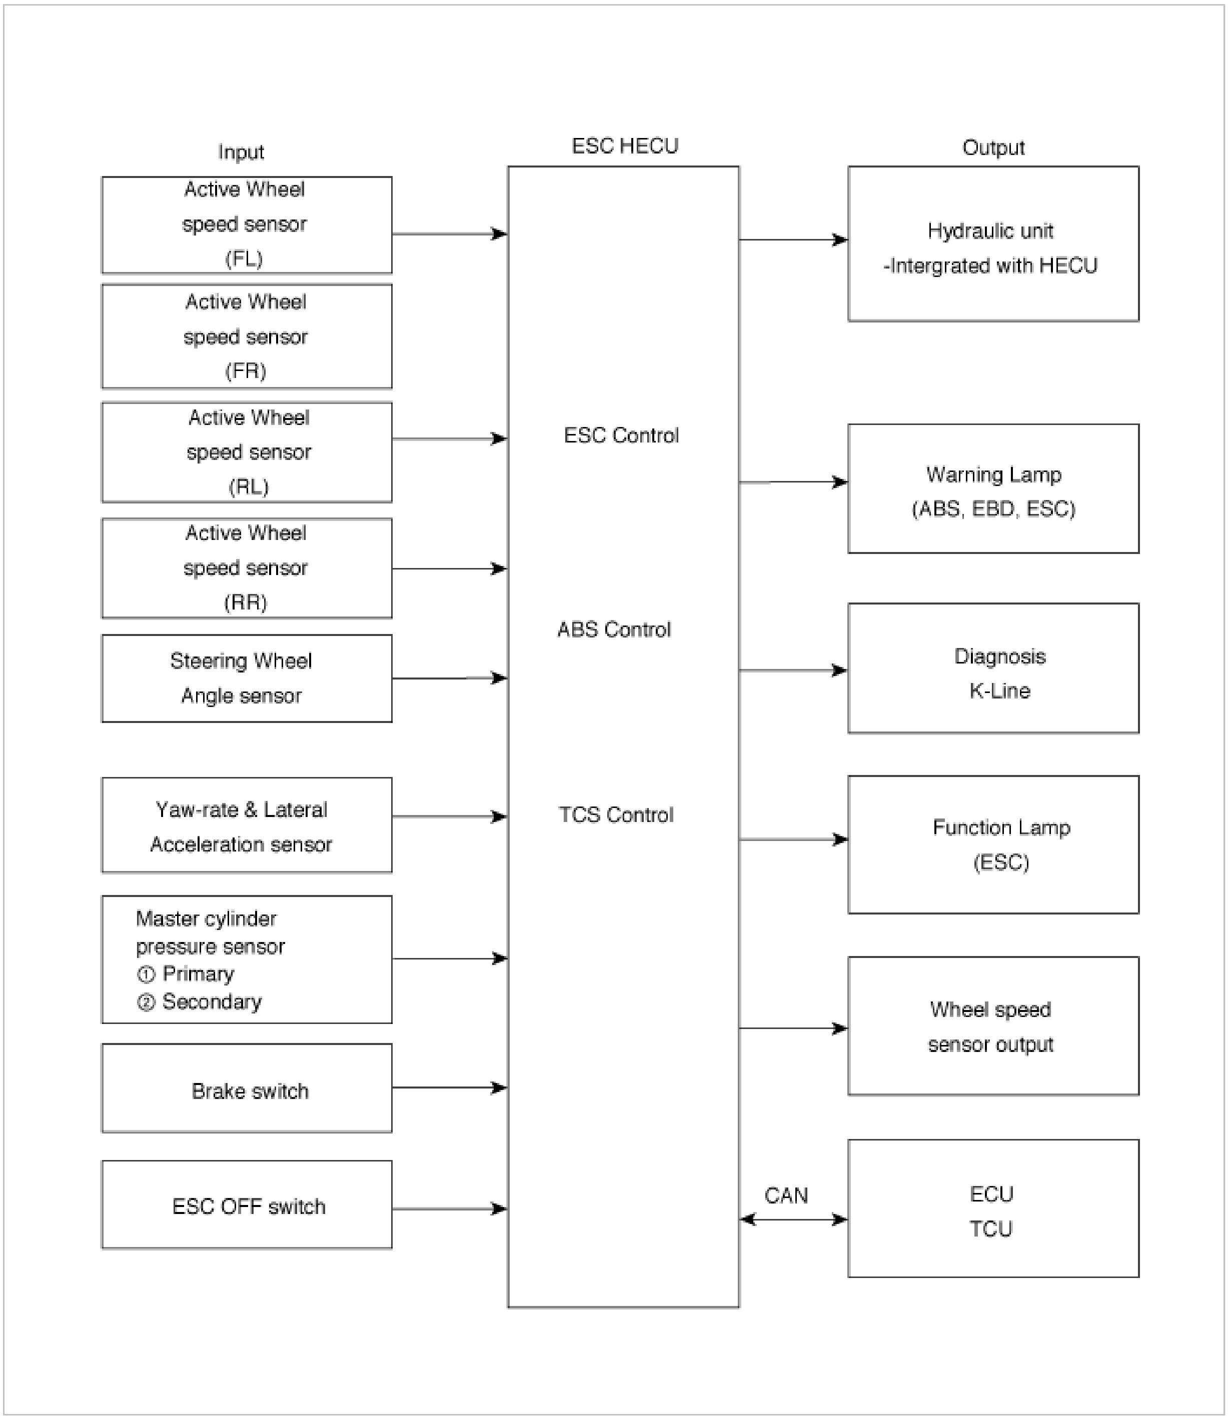
8. If the procedure is finished , the below screen is displayed .



9. IGN off.
10. IGN on.
11. The variant coding is completed.

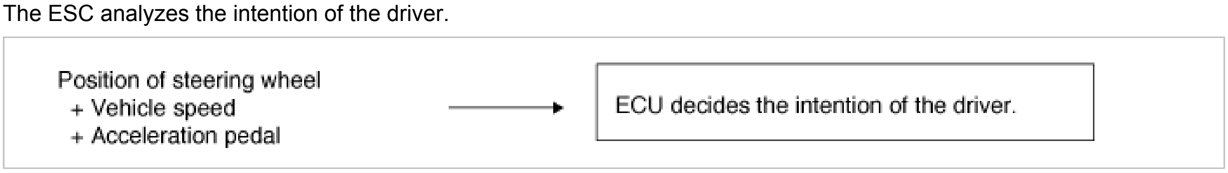
> CAUTION
>
> If the warning lamp(ESC, EBD, ABS) is lighted up, follow the "Variant coding" again.

INPUT AND OUTPUT DIAGRAM

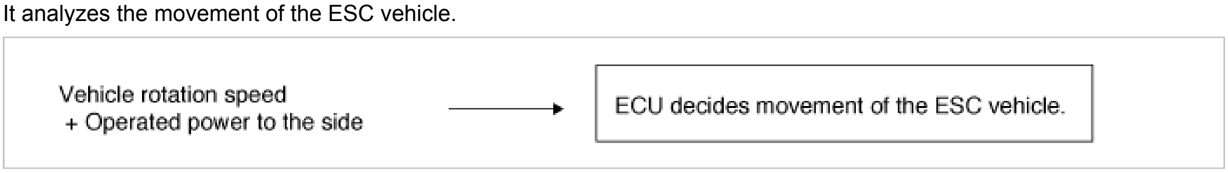


ESC OPERATION MODE

1. STEP 1
   The ESC analyzes the intention of the driver.



2. STEP 2
   It analyzes the movement of the ESC vehicle.

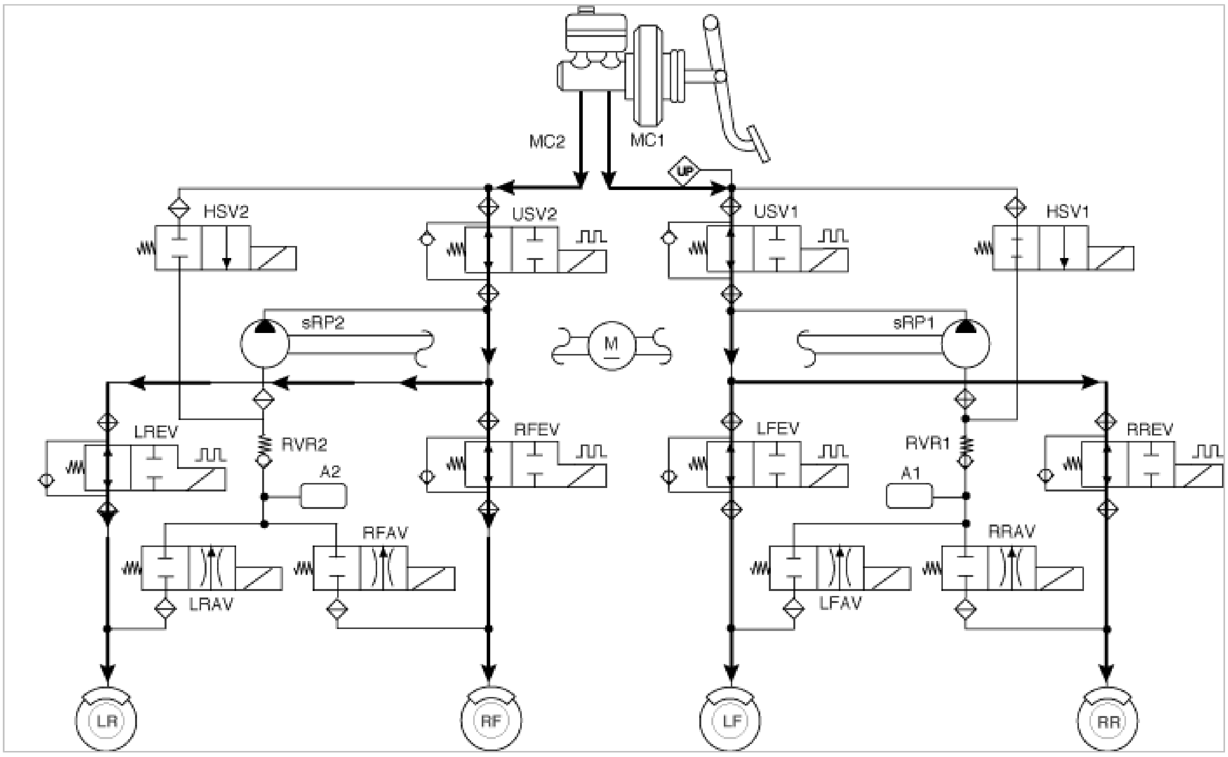


3. STEP 3
   It controls a vehicle posture control through the ESC braking power.
   A. The ECU calculates the needed countermeasure.
   B. The hydraulic unit controls Independently the braking power of each wheel.
   C. The ESC adjusts engine output through an engine and communication line to be connected.

ESC OPERATION MODE

1. ESC Non-operation-Normal braking.

	Inlet valve(EV)	Outlet valve(AV)	Pilot valve(USV)	High pressure switch valve(HSV)	Pump motor
Normal braking	Open	Close	Open	Close	OFF



2. ESC INCREASE MODE

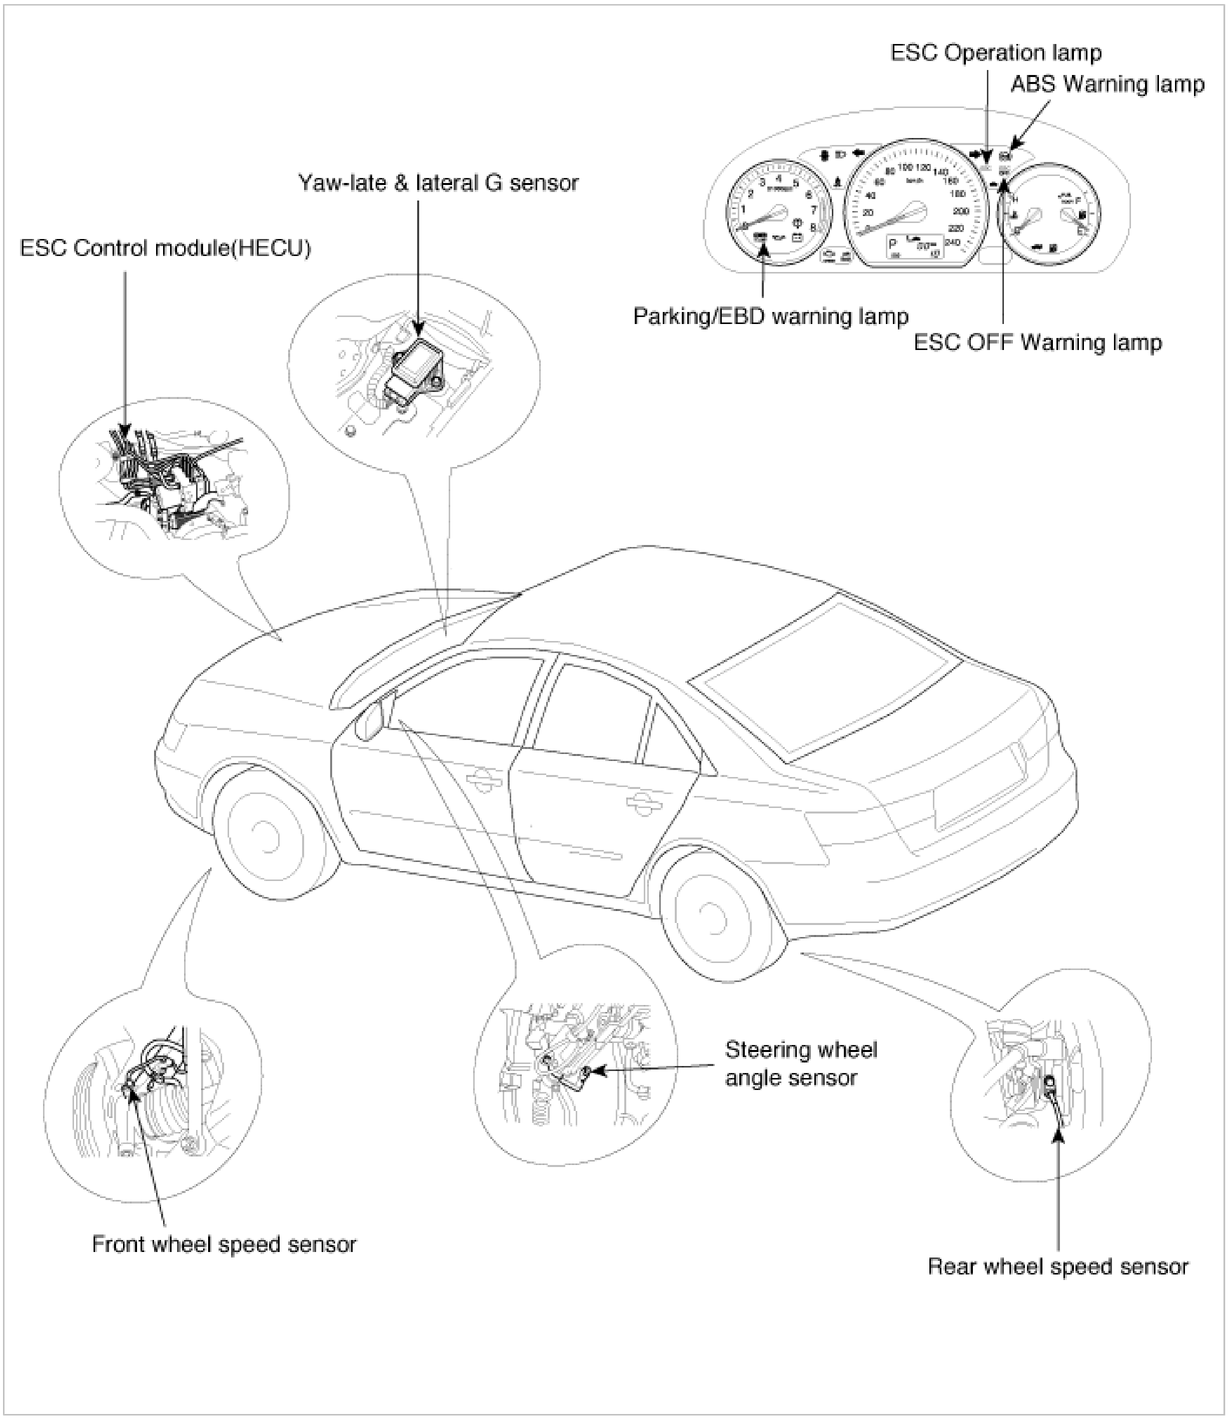
Brake System > ESP(Electronic Stability Program) System > Components and Components Location

COMPONENTS



Brake System > ESP(Electronic Stability Program) System > Troubleshooting

FAILURE DIAGNOSIS

1. In principle, ESC and TCS controls are prohibited in case of ABS failure.
2. When ESC or TCS fails, only the failed system control is prohibited.
3. However, when the solenoid valve relay should be turned off in case of ESC failure, refer to the ABS fail-safe.
4. Information on ABS fail-safe is identical to the fail-safe in systems where ESC is not installed.

MEMORY OF FAIL CODE

1. It keeps the code as far as the backup lamp power is connected. (O)
2. It keeps the code as far as the HCU power is on. (X)

FAILURE CHECKUP

1. Initial checkup is performed immediately after the HECU power on.

2. Valve relay checkup is performed immediately after the IG2 ON.
3. It executes the checkup all the time while the IG2 power is on.
4. Initial checkup is made in the following cases.
   (1) When the failure is not detected now
   (2) When ABS and ESC are not in control.
   (3) Initial checkup is not made after ECU power on.
   (4) If the vehicle speed is over 5 mph(8 km/h) when the brake lamp switch is off.
   (5) When the vehicle speed is over 24.8 mph(40 km/h).
5. Though, it keeps on checkup even if the brake lamp switch is on.
6. When performing ABS or ESC control before the initial checkup, stop the initial checkup and wait for the HECU power input again.
7. Judge failure in the following cases.
   (1) When the power is normal.
   (2) From the point in which the vehicle speed reaches 4.9 mph(8 km/h) after HECU power on.

COUNTERMEASURES IN FAIL

1. Turn the system down and perform the following actions and wait for HECU power OFF.
2. Turn the valve relay off.
3. Stop the control during the operation and do not execute any until the normal condition recovers.

WARNING LAMP ON

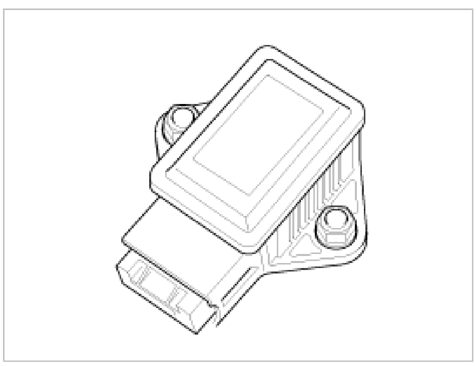
1. ABS warning lamp turns on when ABS is fail.
2. ESC operation lamp turns on when ESC is fail.

When power voltage and valve relay voltage are abnormal, input/output related failure judgment is not made.

Brake System > ESP(Electronic Stability Program) System > Yaw-rate Sensor > Description and Operation

DESCRIPTION

1. The yaw-rate & lateral G sensor is applied for the ESC system.
2. The yaw-rate is the angular velocity, when a vehicle turns a corner, and the lateral G is the acceleration to move a vehicle out of the way when cornering.
3. The sensor is located in the crash pad lower floor on vehicle.



SPECIFICATION

DESCRIPTION			SPECIFICATION	REMARK
Nominal supply voltage			11.5 ~ 12.5 V	
Supply voltage range			8 ~ 16 V	
Supply current			Max. 120 mA	Typ. 75 mA
Reference Voltage Output			2.464 ~ 2.536 V	Typ. 2.5 V

Brake System > ESP(Electronic Stability Program) System > ESP OFF Switch > Description and

Operation

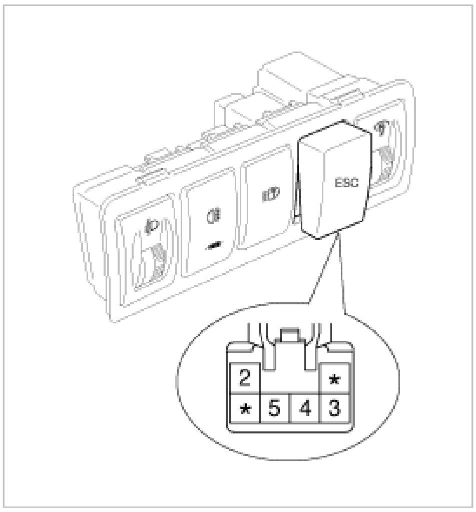
DESCRIPTION

1. The ESC OFF switch is for the user to turn off the ESC system.
2. The ESC OFF lamp is on when ESC OFF switch is engaged.

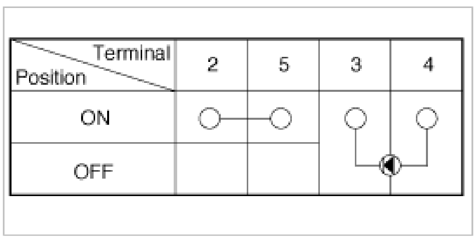
Brake System > ESP(Electronic Stability Program) System > ESP OFF Switch > Repair procedures

INSPECTION

1. Remove the ESC OFF switch from the switch panel on the crashpad of the driver's side.



2. Check the continuity between the switch terminals as the ESC OFF switch is engaged.



Position \ Terminal	2	5	3	4
ON	○	○	○	○
OFF				

Brake System > ESP(Electronic Stability Program) System > Steering Angle Position Sensor > Description and Operation

DESCRIPTION

GENERAL DATA

The steering angle speed sensor detects the angle of the steering wheel in order to which direction a user chooses.The sensor is detached on the MFS(Mutil-Function Switch) under the steering wheel.

MEASUREING PRINCIPLE

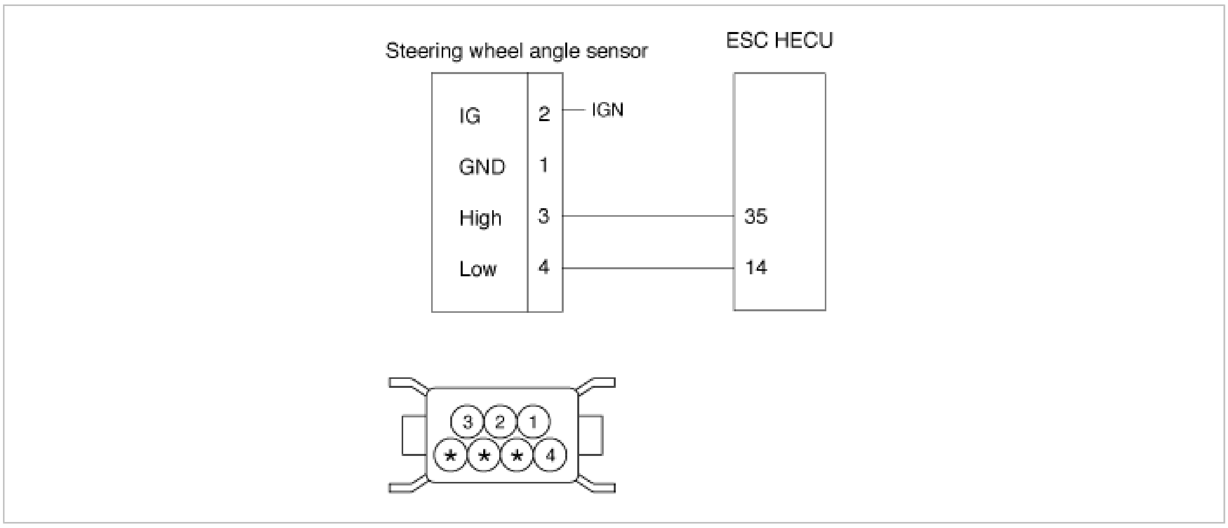
A non contact, analog angle sensor carrying out absolute measuring by the use of the Anisotropic-Magneto-Resistive effect (AMR).Measuring of the absolute angle by means of a toothed measuring gear with magnetic properties in combination with different ratios. Corresponding AMR elements that change their electrical resistance according to the magnetic field direction detect the angle position of the measuring gears.A micro-controller decodes the measured voltage signals after A/D converting with the help of a mathematical function. Output of the digital angle value and velocity via CAN-interface.

SPECIFICATION

DESCRIPTION	SPECIFICATION
Operating voltage	8~16 V
Operating temperature	-40 ~ 85 °C
Current consumption	Max.150 mA
Steering angle velocity	Max. ±2000 °/sec

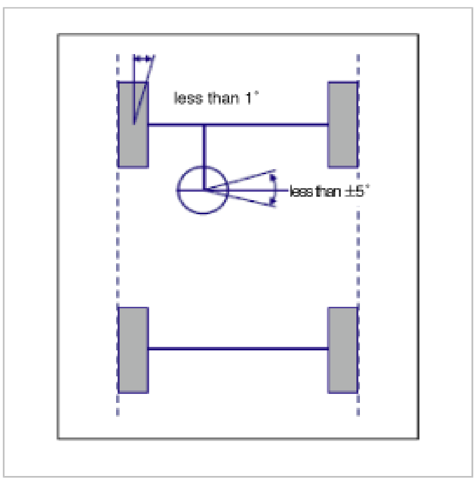
Connection delay time		t < 200 ms
Reverse voltage		-13.5 V
Measuring range	Angle	-780 ° ~ 779 °
	Angular velocity	0~ 1016 °/s
Nonlinearity angle		-2.5 ° ~ +2.5 °
Hysteresis angle		0 ° ~ 5 °
Rotational friction torque measuring		10 °/s

CIRCUIT DIAGRAM(STEERING WHEEL SPEED ANGLE SENSOR)



STEERING ANGLE SENSOR (SAS) calibration

1. PURPOSE OF calibration
   A. On vehicle control, an ESC analyzes the intention of the driver.
   B. An ESC recognizes a steering angle which a driver rotates through the steering angle sensor.
   C. A steering angle sensor used in ESC8 adjusts 0° setting of steering wheel through K-line or CAN communication.
2. STEERING ANGLE SENSOR (SAS) CALIBRATION METHOD

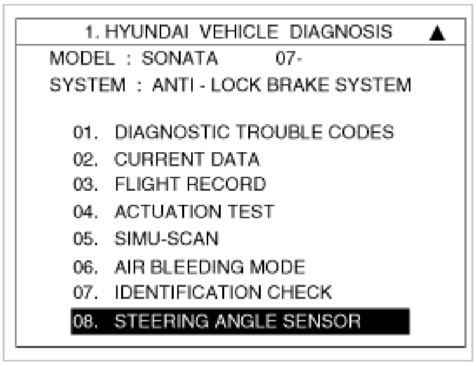


(1) Align the wheel to the straight line. (steering wheel < ± 5°)
ex) Perform the wheel alignment first.
Align the wheel to the straight line.
A driver moves the vehicle to the front and back about 5 meters twice or three times.

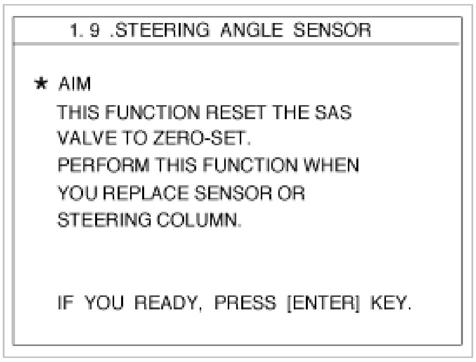
(2) Connect Hi-scan to the vehicle.

(3) Select Brake system.

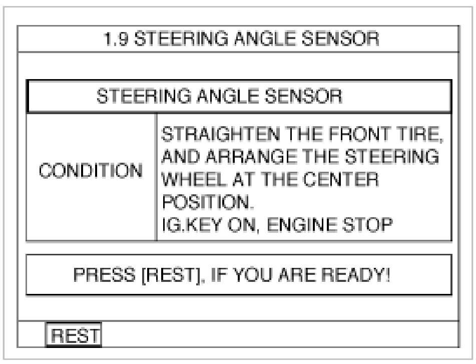
(4) Select Steering angle sensor(SAS) calibration.



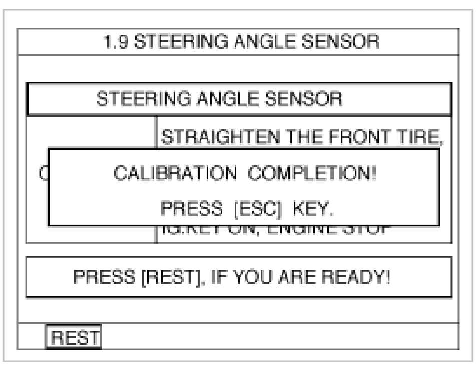
(5) Perform the Steering angle sensor(SAS) calibration.



(6) Perform the procedure continuously.



(7) The procedure is finished. Push the "ESC" key.



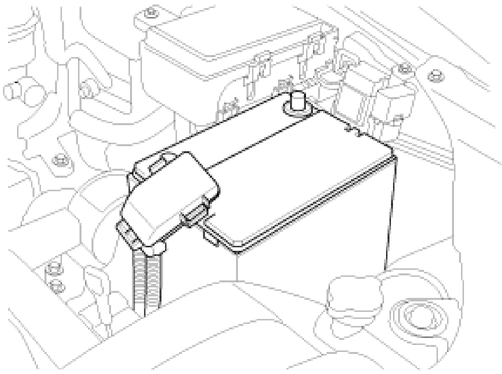
(8) Scanner OFF.

(9) Remove the scanner from the vehicle.

(10) Confirm the Steering angle sensor(SAS) calibration as driving the vehicle.(turn left once, turn right once)

Brake System > Troubleshooting > C1101

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU(Electronic Control Unit) checks the battery voltage to determine, as a safety issue, whether the ABS system can operate normally or not. The normal battery voltage range is essential for controlling the ABS system as intended.

DTC DESCRIPTION

The ABS ECU monitors battery voltage by reading the value of voltage.

1. When the voltage is higher than the expected normal value, this code is set, and the ABS/EBD/TCS/ESC functions are prohibited. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operation as well.
2. When the voltage is lower than the expected normal value, this code is set. The ABS/TCS/ESC functions are prohibited and the EBD function is allowed on LOW VOLTAGE CONDITION 1, the ABS/EBD/TCS/ESC functions are prohibited on UNDER VOLTAGE CONDITION.
3. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operations as well.

DTC DETECTING CONDITION

• The ABS/EBD/ESC warning lamps are activated.</td></tr>
</table>

SPECIFICATION

Voltage : 9.3 ≤ V ≤ 16.8 V

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to the next step.

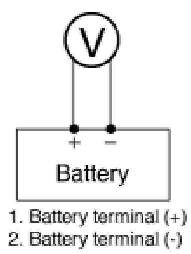
POWER SUPPLY CIRCUIT INSPECTION

1. ALTERNATOR OUTPUT VOLTAGE INSPECTION

(1) Engine "ON".

(2) Measure voltage between the battery terminal(+) and the battery terminal(-).

Specification : Approx. 14.4 ± 0.3 V (20 °C)



Voltage regulator ambient temperature(°C)	Regulating voltage
-30	14.1 ~ 15.2
20	14.1 ~ 14.7
120	13.3 ~ 14.7

Is the measured voltage within specifications?

YES

▸ Go to "Power Circuit Inspection" procedure.

NO

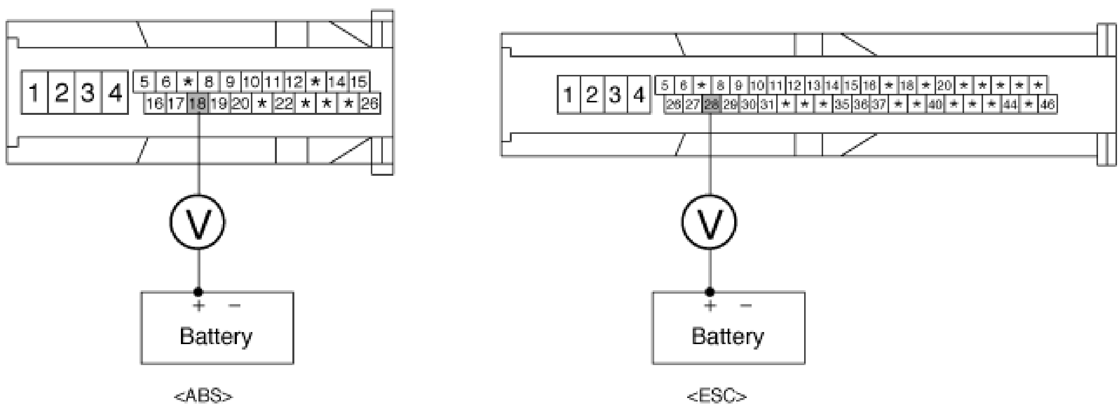
▸ Check for damaged harness and poor connection between alternator and battery. If OK , repair or replace alternator and then go to "Verification of vehicle Repair" procedure.

2. POWER CIRCUIT INSPECTION

(1) Engine "ON".

(2) Measure voltage between the battery terminal(+) and terminal "18(28:ESC)" of the HECU harness connector.

Specification : Approx. below 0.2 V



Is the measured voltage within specifications?

YES

▸Go to "Ground Circuit Inspection" procedure.

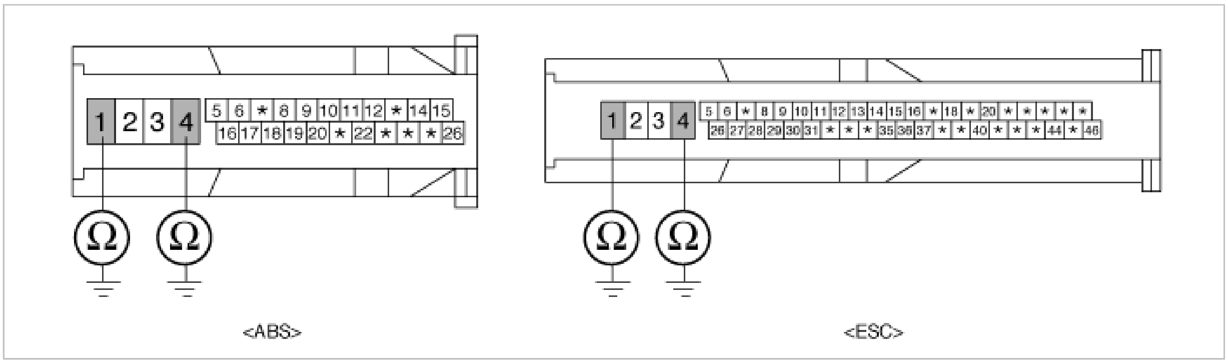
NO

▸ Check for damaged harness and poor connection between the battery terminal(+) and terminal "18(28:ESC)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1,4" of the HECU harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

NO

▸ Check for damaged harness and poor connection between terminal "1,4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

YES

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by poor connection in power harness (IGN+), faulty Alternator and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

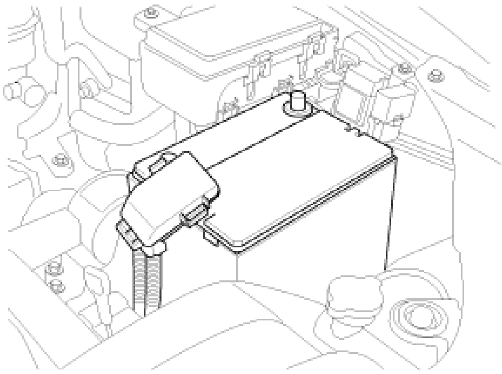
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1102

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU(Electronic Control Unit) checks the battery voltage to determine, as a safety issue, whether the ABS system can operate normally or not. The normal battery voltage range is essential for controlling the ABS system as intended.

DTC DESCRIPTION

The ABS ECU monitors battery voltage by reading the value of voltage.

1. When the voltage is higher than the expected normal value, this code is set, and the ABS/EBD/TCS/ESP functions are prohibited. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operation as well.
2. When the voltage is lower than the expected normal value, this code is set. The ABS/TCS/ESP functions are prohibited and the EBD function is allowed on LOW VOLTAGE CONDITION 1, the ABS/EBD/TCS/ESP functions are prohibited on UNDER VOLTAGE CONDITION.
3. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operations as well.

SPECIFICATION

Voltage : 9.3 ≤ V ≤ 16.8 V

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

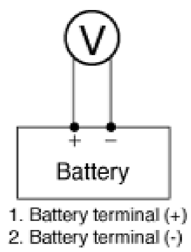
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. ALTERNATOR OUTPUT VOLTAGE INSPECTION
   (1) Engine "ON".
   (2) Measure voltage between the battery terminal(+) and the battery terminal(-).

   Specification : Approx. 14.4 ± 0.3 V (20 °C)



Voltage regulator ambient temperature(°C)	Regulating voltage
-30	14.1 ~ 15.2
20	14.1 ~ 14.7
120	13.3 ~ 14.7

Is the measured voltage within specifications?

YES

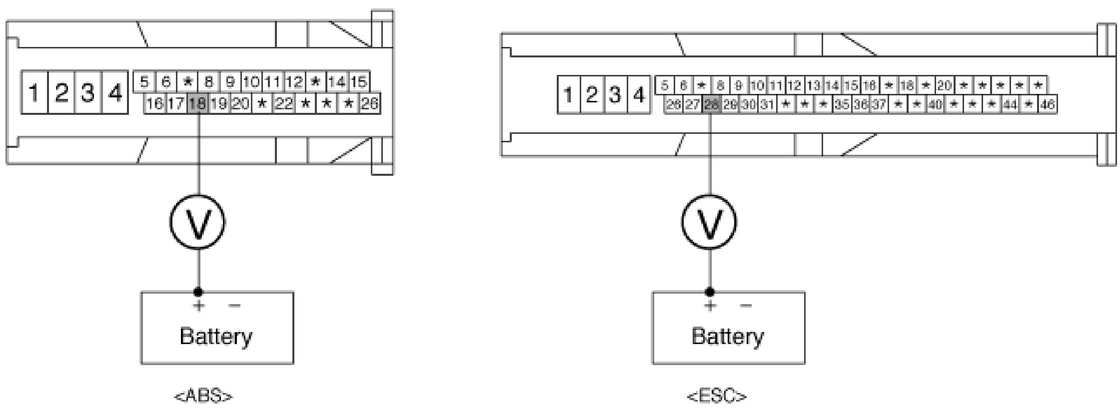
▸ Go to "Power Circuit Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between alternator and battery. If OK , repair or replace alternator and then go to "Verification of vehicle Repair" procedure.

2. POWER CIRCUIT INSPECTION
   (1) Engine "ON".
   (2) Measure voltage between the battery terminal(+) and terminal "18(28:ESP)" of the HECU harness connector.

   Specification : Approx. below 0.2 V



Is the measured voltage within specifications?

YES

▸Go to "Ground Circuit Inspection" procedure.

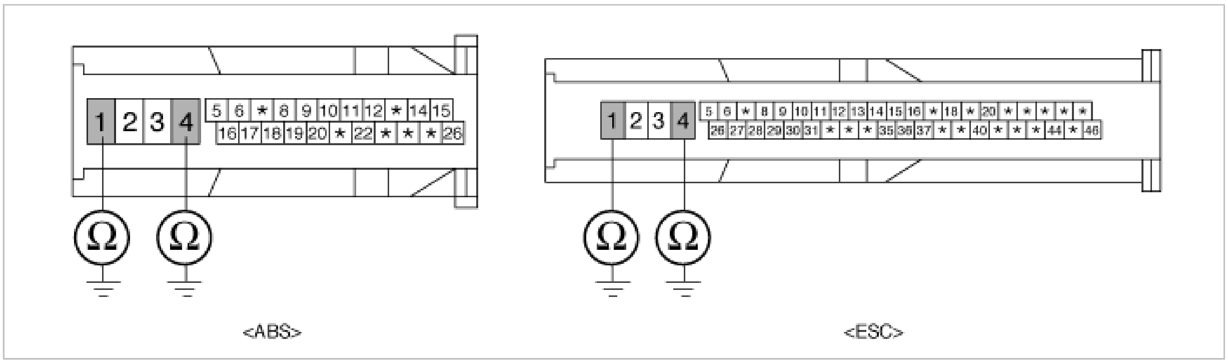
NO

▸ Check for damaged harness and poor connection between the battery terminal(+) and terminal "18(28:ESP)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1,4" of the HECU harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

NO

▸ Check for damaged harness and poor connection between terminal "1,4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

YES

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by poor connection in power harness (IGN+), faulty Alternator and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

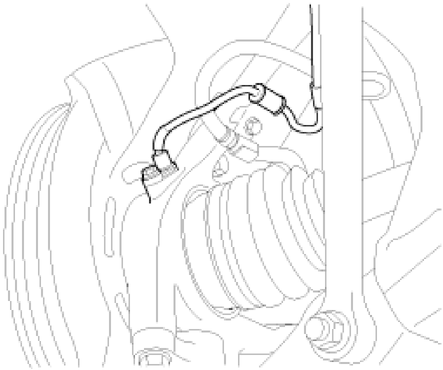
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1200

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor circuit continuously. If the sensor signal current is continuously out of the specified range for 200msec, then the HECU determines that the circuit is open/short, and sets this code. Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 10 Km/h(6 MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• Open or short of Wheel speed sensor circuit • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	Once after power up.	
	Enable Conditions	Wheel speed sensor test starts immediate after power. Especially shorts between WSS(Wheel speed sensor) lines and shorts to UZ(ECU voltage supply) can be detected by switching single WSS channels in sequence. After end of test only the channels with no fault are switched on.	
CASE 2	Monitoring period	Continuous	
	Enable Conditions	The sensor circuitry has two current levels I = 7 mA and I= 14mA. If the sensor line is broken, shorted to ground or shorted to supply voltage a faulty current level will be detected.WSS line faults are detected, if the fault condition exists uninterrupted for t >= 200 ms.	
Effect	No correct WSS Signal can be generated. Control of the corresponding wheel is no longer possible. If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased (until switch off).		

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

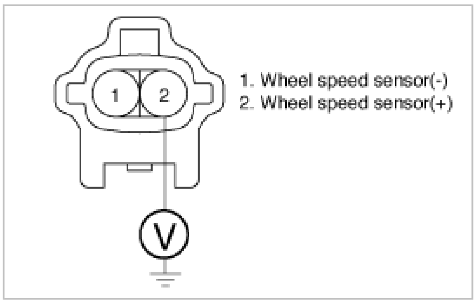
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "2" of the wheel speed sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

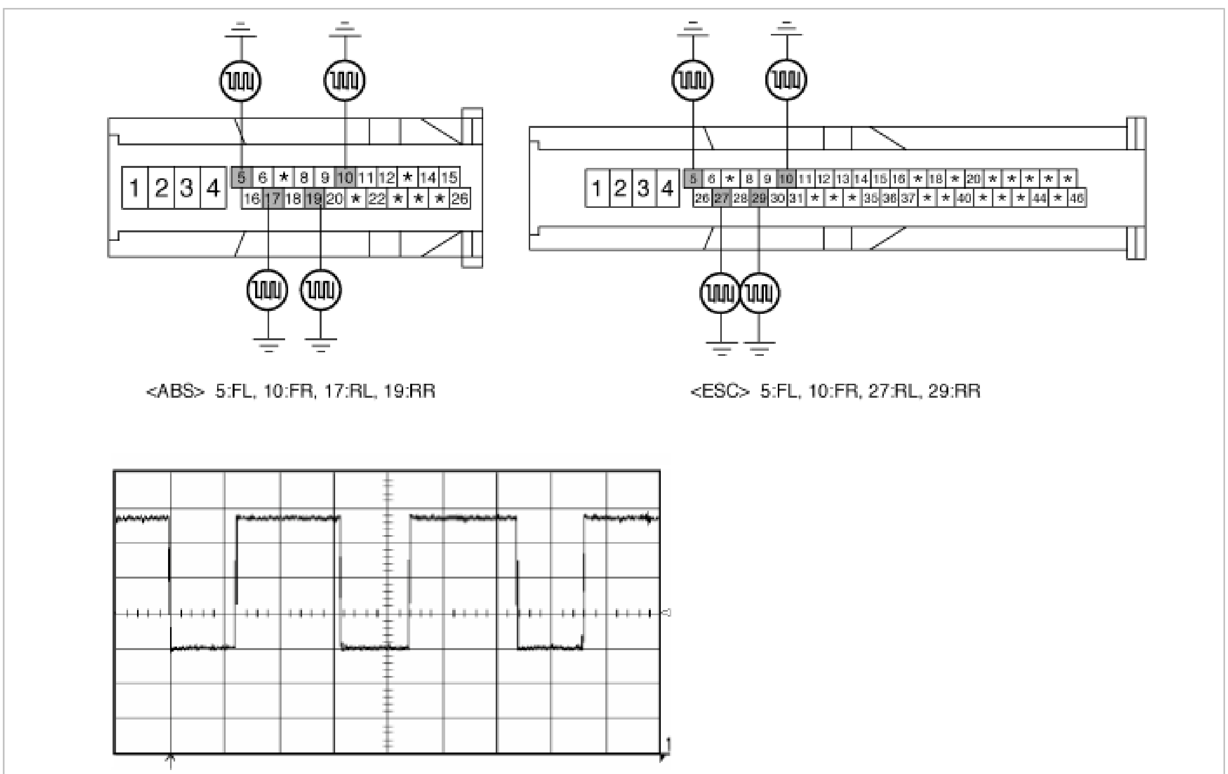
NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "16(ESC:26),9,6,8" of the HECU harness connector and terminal "2" of the Wheel speed sensor harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. By turning the wheel with hand.
3. Measure voltage between terminal "5,10,17(ESC:27),19(ESC:29)" of the HECU harness connector and chassis ground.

Specification : High : 0.89 ~ 1.26 V , Low : 0.44 ~ 0.63 V



<wave form>

Is the measured voltage within specifications?

YES

▶Go to "Component Inspection" procedure.

NO

▶ Check for open or short to GND in wheel speed sensor harness between terminal "1" of the wheel speed sensor harness connector and terminal "5,10,17(ESC:27),19(ESC:29)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10km/h or more(6mph or more).
   Does warning lamp remain On?

YES

▶ Substitute with a known-good HECU and check for proper operation. If problem is corrected,replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▶ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more))

COMPONENT LOCATION

GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. This code is set if an abnormal speed change ratio is detected while the vehicle speed is 10~80 Km/h(6~50 MPH). Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 12 Km/h(7MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• mproper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	The monitoring is active from 10 km/h to 80km/h(6~50 MPH) and if no ABS-control is active at a front wheel and a rear wheel.	
	Enable Conditions	Every time, if a gap in the wheel speed sensor signal occurs cyclically with one wheel rotation, a fault counter is increased by one. If the fault counter exceeds its limit of 10, a wheel specific fault is stored in the EEPROM.	
CASE 2	Monitoring period	Continuous if V_Vehicle > 12 m/s	
	EnableConditions	No wheel speed signals within 10 ms to 20 ms at a vehicle speed> 12 m/s (43.2 km/h, 27MPH). If the dynamic sensor monitor responses, the failures will be stored into failure memory immediately after a waiting period of 60ms.	
Effect	Due to faulty wheel speed information the control of the corresponding wheel is no longer possible. reaction of the controller: If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased.		

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC)
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 40 km/h or more(24 mph or more) Monitor the "Wheel speed sensor" parameter on the Scantool.

Specification : Approx. 12 km/h or more(7 mph or more)

Is it normal?

YES

▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

NO

(1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 12 km/h or more(7 mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 12 km/h or more(7 mph or more))
   Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

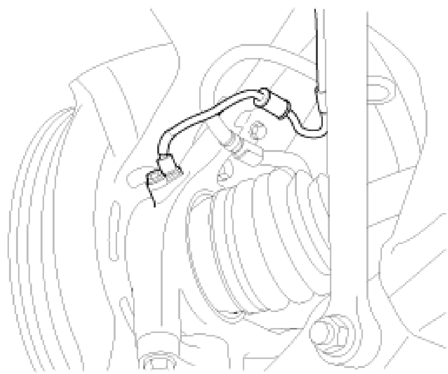
COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. This code is set when the sensor air gap is out of specified range or when No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 43.2 km/h(26 MPH) . Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 12 Km/h (7MPH)

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Signal monitoring		
CASE 1	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	The test detects a failure if one (or two) wheel are at Vmin(2.75 km/h ;1.7 MPH) and the other wheels are above 12 km/h for longer than 1s.A fault could also be set during driving, if the vehicle accelerates 18 km/h after a particular wheel speed gets to vmin(2.75 km/h ;1.7 MPH) and stays there. This monitoring	

		could only detect singular faults.	
CASE 2	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 12 m/s (43,2 km/h). If the dynamic sensor monitor responses, the failures will be stored into failure memory immediately after a waiting period of 60 ms.	
CASE 3	Monitoring period	• The main monitor (λ5) needs additional information of the ESC-sensors and is active for a velocity > 20 km/h(12 MPH) and no under voltage(9.2 V) is detected. • The backup monitor (λ6) manages with the wheel speeds alone.	• Improper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
	Enable Conditions	• The main monitor (λ5): If the maximum difference of wheel speeds related to maximum wheel speed exceeds 5% a wheel specific wheel speed sensor fault is set. - the above conditions apply for 20s for 1 defective WSS. - the above conditions apply for 40s for 2 defective WSS. • The backup monitor (λ6):If the velocity is higher than 50 km/h(31 MPH), the deviation between the fastest and the slowest wheel must exceeds 6% related to the fastest wheel. If the velocity is below 50 km/h(31 MPH), the deviation must exceed an absolute value of 3 km/h(1.8 MPH) . - detection filter time : normally 20s	
Effect	Due to faulty wheel speed information the control of the corresponding wheel is no longer possible. reaction of the controller: If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased		

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more) Monitor the "Wheel speed sensor" parameter on the Scantool.

Specification : Approx. 50 km/h or more(31 mph or more)

Is it normal?

YES

▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

NO

(1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50 km/h or more(31 mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC).

2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more) Monitor the "Wheel speed sensor" parameter on the Scantool.

Specification : Approx. 50 km/h or more(31 mph or more)

Is it normal?

YES

▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

NO

(1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50 km/h or more(31 mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more)).
   Are any DTCs present ?

YES

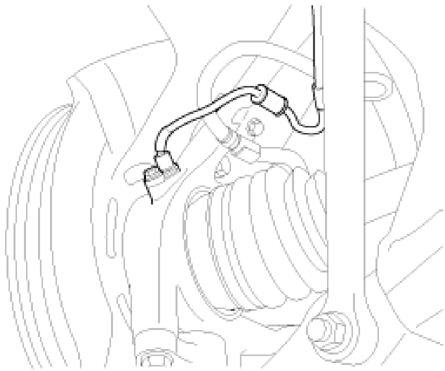
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1206

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor circuit continuously. If the sensor signal current is continuously out of the specified range for 200msec, then the HECU determines that the circuit is open/short, and sets this code. Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 10 Km/h(6 MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• Open or short of Wheel speed sensor circuit • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	Once after power up.	
	Enable Conditions	Wheel speed sensor test starts immediate after power. Especially shorts between WSS(Wheel speed sensor) lines and shorts to UZ(ECU voltage supply) can be detected by switching single WSS channels in sequence. After end of test only the channels with no fault are switched on.	
CASE 2	Monitoring period	Continuous	
	Enable Conditions	The sensor circuitry has two current levels I = 7 mA and I= 14mA. If the sensor line is broken, shorted to ground or shorted to supply voltage a faulty current level will be detected.WSS line faults are detected, if the fault condition exists uninterrupted for t >= 200 ms.	
Effect	No correct WSS Signal can be generated. Control of the corresponding wheel is no longer possible. If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased (until switch off).		

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

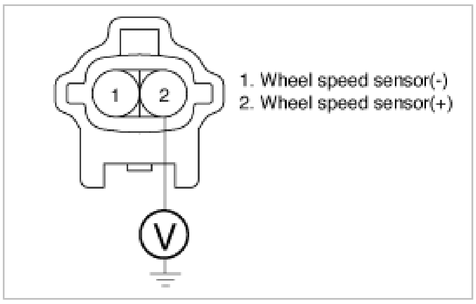
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "2" of the wheel speed sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

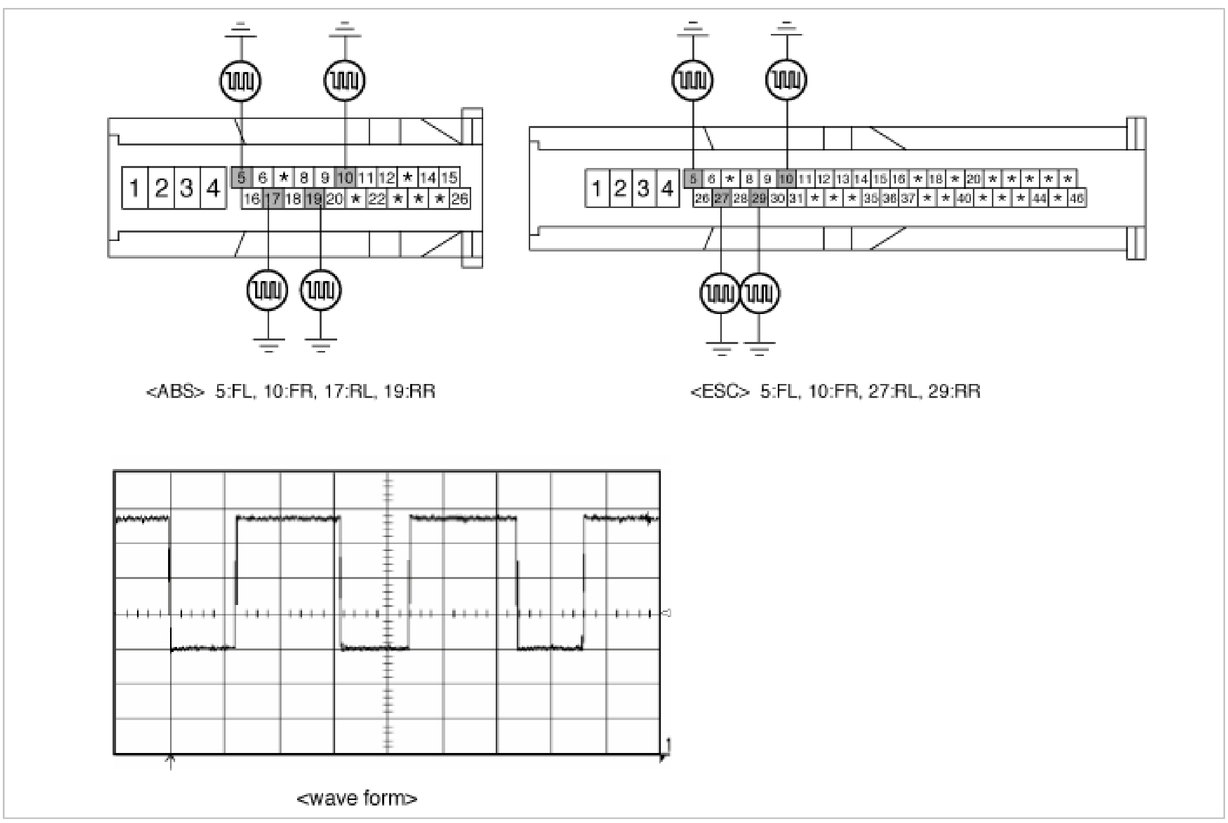
NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "16(ESP:26),9,6,8" of the HECU harness connector and terminal "2" of the Wheel speed sensor harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. By turning the wheel with hand.
3. Measure voltage between terminal "5,10,17(ESP:27),19(ESP:29)" of the HECU harness connector and chassis ground.

Specification : High : 0.89 ~ 1.26 V , Low : 0.44 ~ 0.63 V



Is the measured voltage within specifications?

YES

▸Go to "Component Inspection" procedure.

NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "1" of the wheel speed sensor harness connector and terminal "5,10,17(ESP:27),19(ESP:29)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10km/h or more(6mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected,replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

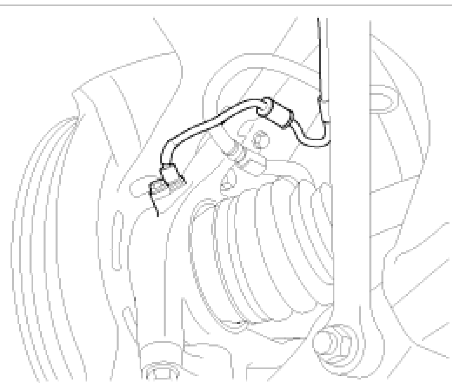
COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. This code is set if an abnormal speed change ratio is detected while the vehicle speed is 10~80 Km/h(6~50 MPH). Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 12 Km/h(7MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• mproper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	The monitoring is active from 10 km/h to 80km/h(6~50 MPH) and if no ABS-control is active at a front wheel and a rear wheel.	
	Enable Conditions	Every time, if a gap in the wheel speed sensor signal occurs cyclically with one wheel rotation, a fault counter is increased by one. If the fault counter exceeds its limit of 10, a wheel specific fault is stored in the EEPROM.	
CASE 2	Monitoring period	Continuous if V_Vehicle > 12 m/s	
	EnableConditions	No wheel speed signals within 10 ms to 20 ms at a vehicle speed> 12 m/s (43.2 km/h, 27MPH). If the dynamic sensor monitor responses, the failures will be stored into failure memory immediately after a waiting period of 60ms.	
Effect	Due to faulty wheel speed information the control of the corresponding wheel is no longer possible. reaction of the controller: If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased.		

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC)
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 40 km/h or more(24 mph or more) Monitor the "Wheel speed sensor" parameter on the Scantool.

   Specification : Approx. 12 km/h or more(7 mph or more)

   Is it normal?

   YES

   ▶ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

   NO

   (1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 12 km/h or more(7 mph or more).
   Does warning lamp remain On?

   YES

   ▶ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

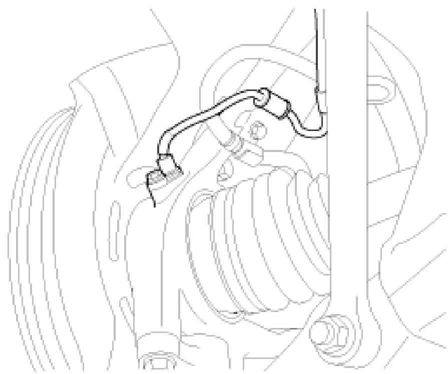
COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. This code is set when the sensor air gap is out of specified range or when No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 43.2 km/h(26 MPH) . Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 12 Km/h (7MPH)

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Signal monitoring		
CASE 1	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	The test detects a failure if one (or two) wheel are at Vmin(2.75 km/h ;1.7 MPH) and the other wheels are above 12 km/h for longer than 1s.A fault could also be set during driving, if the vehicle accelerates 18 km/h after a particular wheel speed gets to vmin(2.75 km/h ;1.7 MPH) and stays there. This monitoring	

		could only detect singular faults.	
CASE 2	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 12 m/s (43,2 km/h). If the dynamic sensor monitor responses, the failures will be stored into failure memory immediately after a waiting period of 60 ms.	
CASE 3	Monitoring period	• The main monitor (λ5) needs additional information of the ESP-sensors and is active for a velocity > 20 km/h(12 MPH) and no under voltage(9.2 V) is detected. • The backup monitor (λ6) manages with the wheel speeds alone.	• Improper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
	Enable Conditions	• The main monitor (λ5): If the maximum difference of wheel speeds related to maximum wheel speed exceeds 5% a wheel specific wheel speed sensor fault is set. - the above conditions apply for 20s for 1 defective WSS. - the above conditions apply for 40s for 2 defective WSS. • The backup monitor (λ6):If the velocity is higher than 50 km/h(31 MPH), the deviation between the fastest and the slowest wheel must exceeds 6% related to the fastest wheel. If the velocity is below 50 km/h(31 MPH), the deviation must exceed an absolute value of 3 km/h(1.8 MPH) . - detection filter time : normally 20s	
Effect	Due to faulty wheel speed information the control of the corresponding wheel is no longer possible. reaction of the controller: If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased		

MONITOR SCANTOOL DATA

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more)).
   Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

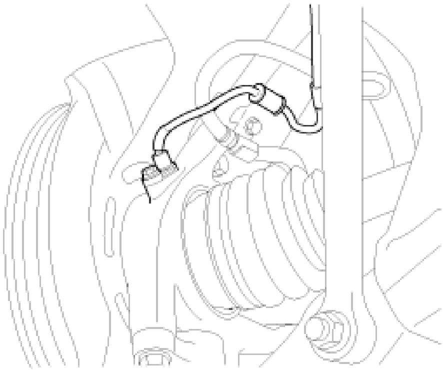
Brake System > Troubleshooting > C1213

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. The monitoring reports a failure if the ABS target slip breaks out.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Improper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
Enable Conditions	The monitoring reports a failure if the ABS target slip is exceeded for a time period >= 10 s at one or more wheels. If the driver brakes or the velocity is lower than 50 km/h(31 MPH) the detection time is enlarged to 60s.	
Monitoring period	Continuous	
Effect	Reduced function of the ESC system.	

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more). Monitor the "Wheel speed sensor" parameter on the Scantool.

Specification : Approx.10 km/h or more(6 mph or more)

Is it normal?

YES

▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

NO

(1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

(3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more).
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more))
   Are any DTCs present?

   YES

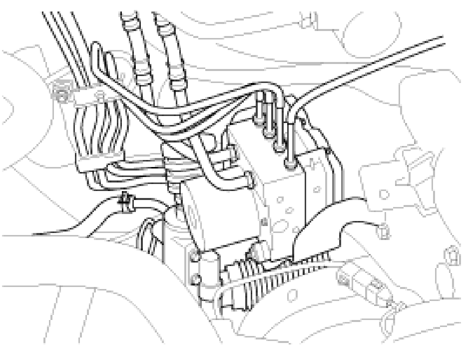
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1235

COMPONENT LOCATION



GENERAL DESCRIPTION

The pressure sensor senses the brake oil pressure to judge driver's brake intention when ESC is operating.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		Signal monitoring	
		1. Sensor supply voltage is continuous monitored (except power on). A sensor supply failure is detected if Sensor Supply Voltage > 5.3 V OR Sensor Supply Voltage < 4.7 V for t ≥ 60 ms. 2. Pressure signal 1 (DSO: original pressure value) is continuous monitored (except power on). Line faults like open, short to GND or short to UZ are detected. A Fault is

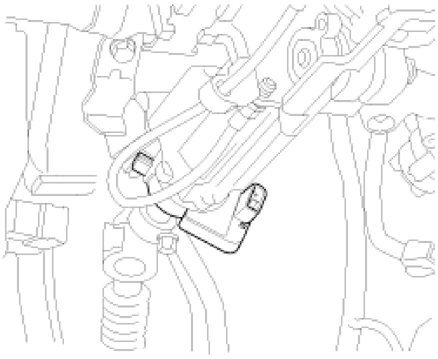
Brake System > Troubleshooting > C1260

COMPONENT LOCATION



DTC DESCRIPTION

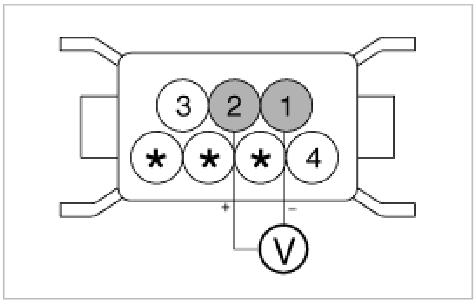
The Steering wheel angle sensor determines the direction of the rotation.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Faulty steering wheel sensor
Enable Conditions	1. LWS(steering angle sensor) offset monitoring : If the offset value exceeds a threshold of approximately 15 deg a LWS-fault is determined. 2. LWS Gradient monitoring : - signal gradient (steering angle velocity) from one 20 ms-cycle to another is higher than 40° or - change of this gradient (steering angle acceleration) is higher than 15° 3. LWS range monitoring : If value is higher than possible range for more than 300 ms a fault is determined. 4. LWS Plausibility monitoring : Dependent on the driving conditions failures in size of [10 + 60 m/s / FZREF(reference speed] deg at steering angle are recognized within 400 .. 4800 ms . 5. LWS Constant Signal Monitoring : If there is no change in the signal, but a right AND left cornering has been recognized, a fault is determined. (lateral acceleration > 2 m/s^2 in combination with a yaw rate > 6 °/s in both directions). 6. LWS Wrong Sign Monitoring : If the signals don't fit and forwards driving is detected, a fault is determined. 7. LWS Message counter monitoring : If the message counter shows an increase higher than 3 or lower than 1 in one 20 ms-cyle, a fault is stored after 160 ms.	
Monitoring period	1. Continuous during driving. 2. no under voltage and at least one LWS-message was sent in the current 20 ms-cycle. 3. After initialization and no under voltage detected. 4. Continuous during driving. 5. Initialization once in every ignition cycle. 6,7. Continuous during driving.	
Effect	Reduced controller function caused by faulty LWS signal.	

POWER SUPPLY CIRCUIT INSPECTION

1. Measure the voltage between terminal 1 and 2 of the steering angle sensor connector.



Is the voltage within 8~16V?

YES

▸ Clear the DTC, and then drive a vehicle over 40 Km/h(24 MPH) .If ESC warning lamp is turned on, replace the steering wheel sensor. Then go to "Verification of Vehicle Repair" procedure.

NO

▸ Check harness and connector between the HECU and the steering angle sensor. If NG ,replace the steering wheel sensor.

COMPONENT INSPECTION

1. CHECK INSTALLATION OF STEERING ANGLE SENSOR
   Check if the steering angle sensor is properly installed.
   Is the installation proper?

YES

▸ Check power of steering angle sensor.

NO

▸ Reinstall the steering angle sensor properly.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and practice the steering angle sensor calibration.(See page BR-161).
2. Select "Diagnostic Trouble Codes(DTCs)" mode.
3. Using a scantool, Clear DTC.
4. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1261

YES

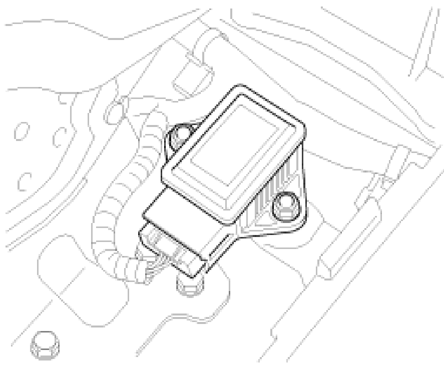
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1282

COMPONENT LOCATION



GENERAL DESCRIPTION

The yaw-rate & Lateral G sensor are used for the stability of a vehicle. The yaw-rate is used to measure angular velocity while the Lateral G is to measure the force that moves the vehicle away from the center, when a vehicle is cornering.

DTC DESCRIPTION

This code sets when there is an open or short in the circuit of the yaw-rate & lateral G sensor.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Open or short of Yaw Rate & Lateral G sensor circuit • Faulty Yaw Rate & Lateral G sensor • Faulty HECU
Enable Conditions	1. The AY(Acceleration Sensor) sensor voltage is monitored for a is out of range value. A line fault is detected if AY < 0.3 V OR AY > 4.7 V for a time t >= 100 ms.. 2. Open line, short to GND and short to UZ are detected. The DRS sensor voltage is monitored for a is out of range value. A line fault is detected, if - DRSS < 0.225 V OR DRSS > 4.774 V for a time t >= 100 ms. - DRSR < 2.1 V OR DRSR > 2.9 V for a time t > 200 ms. ※DRSS (Yaw sensor reference), DRS(yaw sensor), DRSR(Yaw sensor signal)	
Monitoring period	Continuous	
Effect	Reduced controller function caused by faulty DRS and AY signal.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

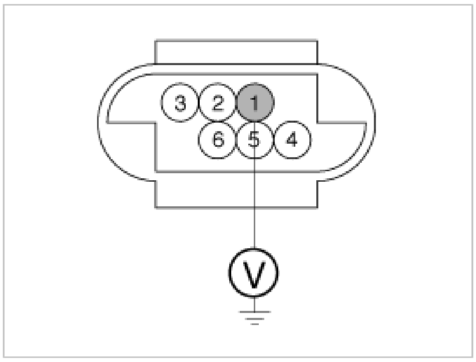
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "1" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

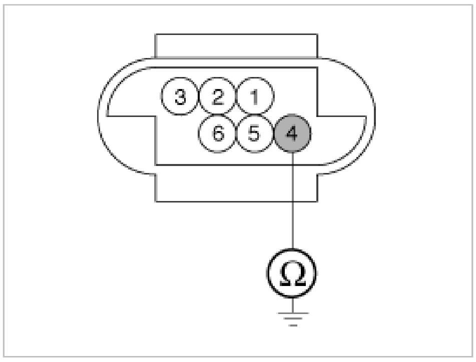
NO

▸ Check for open or short to GND in the Yaw Rate & Lateral G sensor harness between terminal "3" of the Yaw Rate & Lateral G sensor harness connector and terminal "16,20" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect Yaw Rate & Lateral G sensor connector
3. Measure resistance between terminal "4" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

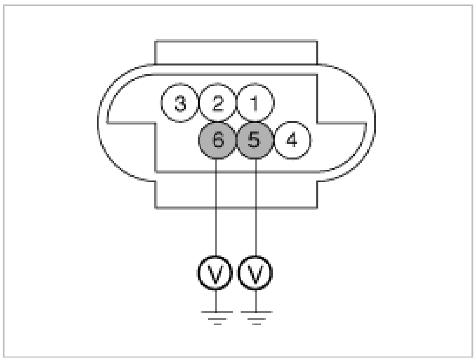
NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "4" of the Yaw Rate & Lateral G sensor harness connector and terminal "15" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON".
2. Measure voltage between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. 2.5 V



Is the measured voltage within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and terminal "16, 20" of the HECU harness connector. Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good Yaw Rate & Lateral G sensor and check for proper operation. If problem is corrected, replace Yaw Rate & Lateral G sensor and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of Yaw Rate & Lateral G sensor harness and/or faulty Yaw Rate & Lateral G sensor or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

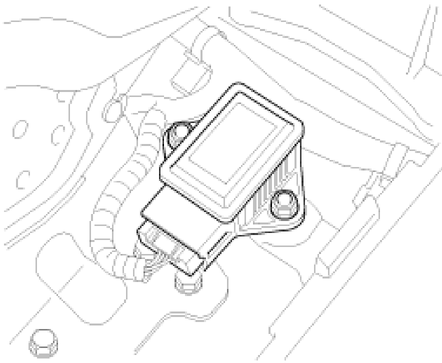
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1283

COMPONENT LOCATION



GENERAL DESCRIPTION

The yaw-rate & Lateral G sensor are used for the stability of a vehicle. The yaw-rate is used to measure angular velocity while the Lateral G is to measure the force that moves the vehicle away from the center, when a vehicle is cornering.

DTC DESCRIPTION

This code sets when there is an open or short in the circuit of the yaw-rate & lateral G sensor.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Faulty Lateral Acceleration Sensor • Faulty Yaw Rate Sensor • Faulty HECU
EnableConditions	This test detects internal AY(Acceleration sensor) sensor malfunctions. 1. During the POS measure window (t = 100 ms) the AY signal must be for at least t = 60 ms between 0.2 V < AY < 0.8 V 2. If during stable vehicle behavior an AY-Failure larger than approximately 2.5 m/s occurs, the ESP controller will disregard the AY sensor information so that a false ESP intervention is prevented. A fault is recognized after 1.6 s during model validity. 3. If the offset value exceeds a threshold of approximately 2.25 m/s^2 an AY fault is determined. 4. During standstill the plausible range of |AY| is below 7 m/s^2. If the filtered value of |AY| is larger than 7 m/s^2 for more than 400 m/s a fault is set. 5. If the lateral acceleration is higher than 15 m/s^2 for more than 800 ms a suspected failure bit is set. After 1,6 s a fault is detected. 6. Standstill compensation: Failure threshold 5.25 °/s.Fast compensation (during driving if no standstill compensation could be completed): Failure threshold is 7,5 °/s.Long-term ("normal") compensation (during driving after succeeded standstill or fast offset compensation): Failure threshold is 7,5 °/s. 7. The fault criteria is approx. 25 % sensitivity failure. 8. If the measured yaw rate deviates more than 2.5 °/s plus a dynamicthreshold from the reference yaw rate during model validity, a failure isrecognized after 1.6 s. The dynamic threshold is between 2.5 °/s and more than 5 °/s. A typical value is 3 °/s. 9. The measured yaw rate and the model yaw rates, calculated from theWSS and LWS are compared. If the signals doesn.t fit and forward driving is recognized, a fault is determined. 10. In case of a YRS-failure, the YRS will send an abnormal yaw rate signal.	
Monitoring period	1. Once after power up and no low voltage. 2,3,8. Continuous during stable driving. 4. Continuous during standstill. 5. Continuous, if no under voltage is detected. 6. Continuous, dependent on driving situation. 7. During stable cornering after completed offset compensation. 9. After every standstill 10. Continuous	

Effect	Reduced controller function caused by faulty DRS(yaw sensor) signal.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

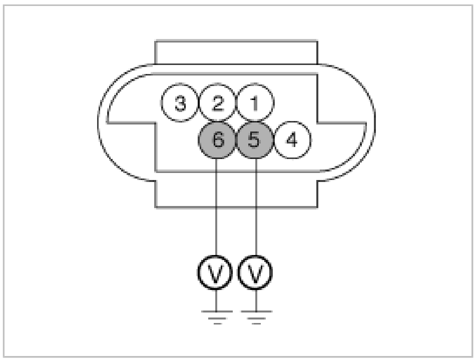
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON".
2. Measure voltage between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. 2.5 V



Is the measured voltage within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and terminal "16, 20" of the HECU harness connector. Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 20 km/h or more(12 mph or more)
   Does warning lamp remain On?

YES

▸ Substitute with a known-good Yaw Rate & Lateral G sensor and check for proper operation. If problem is corrected, replace Yaw Rate & Lateral G sensor and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of Yaw Rate & Lateral G sensor harness and/or faulty Yaw Rate & Lateral G sensor or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 20 km/h or more(12 mph or more))

Are any DTCs present?

YES

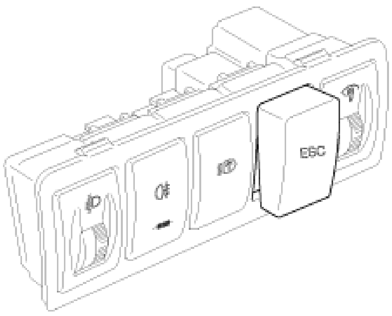
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1503

COMPONENT LOCATION



GENERAL DESCRIPTION

Driver can inhibit the ESC control by ESC switch. When switch signal send into HECU, ESC warning lamp go ON and ESC control is stopped and if next switch signal is inputted again, ESC control is ready. This function is used for sporty driving or vehicle inspection.

DTC DESCRIPTION

Trouble code is set when the condition that the level of ESC switch is high is continued for 60sec.When the ESC switch failure is set there is no signal in the warning lamp and HECU inhibit the ESC control and allow the ABS/EBD control.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Short circuit monitoring	• Open or short ESC switch
Enable Conditions	Trouble code is set when the condition that the level of ESC switch is high is continued for 60 sec.	
Monitoring period	Continuous	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

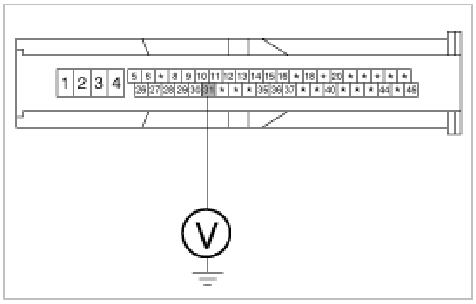
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF" & ESC Switch"ON".
2. Measure voltage between terminal "31" of the HECU harness connector and chassis ground.

Specification : Approx B+



Is the measured voltage within specifications?

YES

▸ Fault is intermittent caused by open or short in ESC switch line, faulty ESC switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

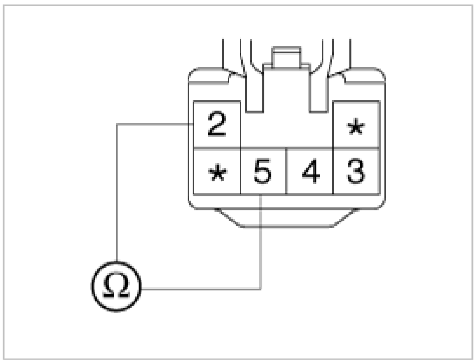
NO

▸ Check for damaged harness and poor connection in the power harness between the battery terminal(+) and the terminal "31" of the HECU harness connector . Check for open or blown 10A fuse referring to "Circuit Diagram" . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Disconnect ESC switch connector.
3. Press the ESC switch.
4. Measure resistance between terminal "2" of the ESC switch harness connector and terminal "5" of the ESC switch harness connector.

Specification : Approx below 1 Ω



Is the measured resistance within specifications?

YES

▸ Fault is intermittent caused by faulty ESC switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Substitute with a known-good ESC switch and check for proper operation. If problem is corrected, replace ESC switch and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

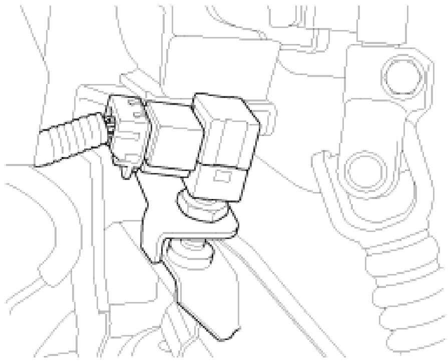
COMPONENT LOCATION



GENERAL DESCRIPTION

The brake light switch indicates brake pedal status to the ABS control unit. The switch is turned on when brake is depressed. The brake light switch is a normally-open contact which runs to battery voltage when active (brake depressed). When passive (brake not depressed), the cable is grounded via the break light bulbs.

DTC DESCRIPTION

The brake light signal is a reference to judge driver's will for braking. ABS ECU monitor open circuit of brake light switch for normal ABS control.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open circuit monitoring	• Open circuit in brake switch line • Faulty brake light switch • Faulty input stage in HECU
Enable Conditions	If the BLS-signals is high for 60 s, while the gas pedal is stepped, with vehicle speed > 3 m/s, offset compensated pVor < 5 bar and no control is active, a fault is set.	
Monitoring period	Continuous, if no under voltage is detected.	
Effect	Reduced function caused by a faulty brake light switch.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

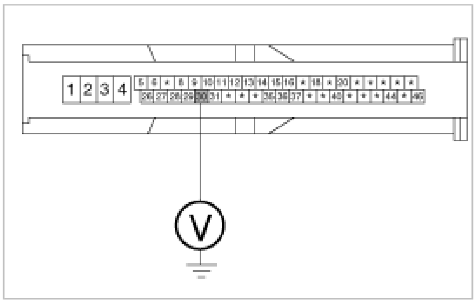
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Press the brake pedal.
3. Measure voltage between the terminal "30" of the HECU harness connector and chassis ground.

Specification : Brake Light Switch - Approx. B+



Is the measured voltage within specifications?

YES

▸ Fault is intermittent caused by open harness in brake lamp switch and brake switch line, faulty brake lamp switch was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Check for damaged harness and poor connection in the power harness between the battery terminal(+) and the terminal "30" of the HECU harness connector . Check for open or blown 15A STOP fuse. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Connect a ohmmeter to the connector of brake light switch, and check whether or not there is continuity when the plunger of the brake light switch is pushed in and when it is released.
   The switch is in good condition if there is no continuity when the plunger is pushed.
2. Is there no continuity when the plunger is pushed?

YES

▸ Fault is intermittent caused by open harness in brake light switch line, faulty brake lamp switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Substitute with a known-good brake lamp switch and check for proper operation. If problem is corrected, replace brake lamp switch and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

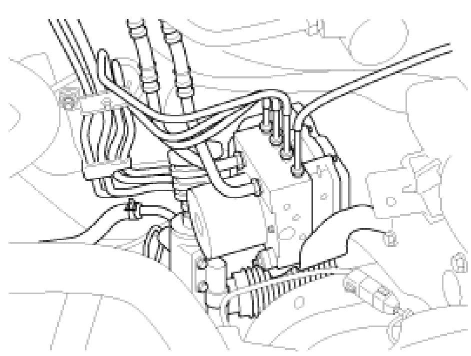
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1604

COMPONENT LOCATION



GENERAL DESCRIPTION

The HECU is composed of a ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit) , so the HECU hardware includes all solenoid valves inside the unit as well as the ECU.

DTC DESCRIPTION

The HECU monitors the operation of the IC components such as memory, register, A/D converter and so on. The HECU sets this code when the EEPROM data read by the master processor is different than prior data writed, or when the master/slave processor detects abnormal operation in RAM, Status Register, Interrupt, Timer, A/D converter or cycle time.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Internal monitoring	• Faulty HECU
EnableConditions	1. Internal control unit failures of the Micro controller and peripheral integrated circuits will be continuous monitored for proper function. 2. After EEPROM-values have been read from EEPROM, the values are monitored for corrupt data. Failure is set if: 1) Checksum not correct or 2) PSW-EEPROM-Handler reported unknown failure during EEPROM-value reading. 3. Evaluate EEPROM reading sequence. If EEPROM reading sequence take longer then 3 s, a failure is set.	
Monitoring period	1.Continuos 2,3.directly after ignition on, during reading of EEPROM-values.	
Effect	No control is available.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

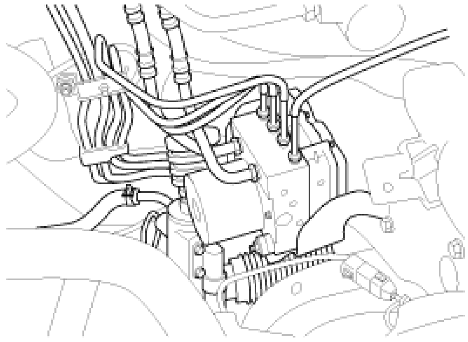
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1605

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

This code shows in case that there is an error on the CAN hardware. In this case, replace the HECU and check.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	CAN RAM monitoring	• Faulty HECU
Enable Conditions	1. Monitoring whether the initialization software has write access to the configuration registers of the CAN-controller module.Faults are detected immediately. 2. Monitoring includes line short to ground, line short to supply voltage and mutual line short. Line interruptions are detected by CAN message monitor.After detecting a BUSOFF failure the transmission is reinitialized. A BUSOFF fault is established if re-initialization is tried for 15 times in sequence without success.	
Monitoring period	1. immediate during start up. 2. Continuous	
Effect	1. CAN-Controller is not initialized correctly. Possibly no reception or transmission of messages. 2. CAN messages can not be processed. BLS is not controlled.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by short harness in CAN line and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.

3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

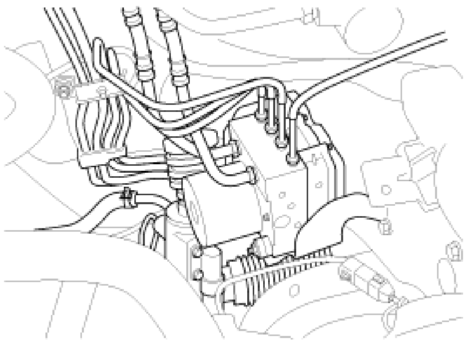
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1611

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

This code shows in case that there is an error on the CAN hardware. In this case, replace the HECU and check.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	CAN RAM monitoring	• Faulty HECU • Faulty ECM • Faulty TCU • Faulty Steering angle sensor
Enable Conditions	1. Purpose is to monitor if received message was not received by CAN controller of ABS8/ESC8 ECU.Faults are detected after filtering. Filtering has to be customized. 2. Purpose is to monitor if transmitted message has the expected data length.Actually the monitoring is reduced the check for too short messages.A message with oversized data length causes no fault. Faults are detected immediate.	
Monitoring period	Continuous	
Effect	1. CAN messages are not correct erceived. 2. CAN messages are not according to what was expected at compile time of the software.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and check for proper operation. If problem is corrected, replace ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and then go to "Verification of Vehicle Repair" procedure. If NG, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by faulty ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1612

COMPONENT LOCATION

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

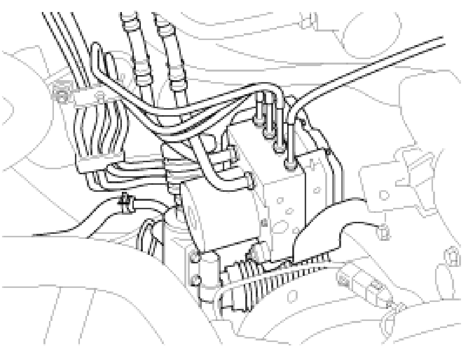
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1616

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

The HECU checks the CAN communication lines for normal TCS control, and sets this code if CAN BUS OFF status is detected for more than 100 ms.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open or short circuit monitoring	• Open or short circuit in CAN line
Enable Conditions	Monitoring includes line short to ground, line short to supply voltage and mutual line short. Line interruptions are detected by CAN message monitor. After detecting a BUSOFF failure the transmission is reinitialized. A BUSOFF fault is established if re-initialization is tried for 15 times in sequence without success.	

Monitoring period	Continuous	
Effect	CAN messages can not be processed. BLS(Brake light switch) is not controlled.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

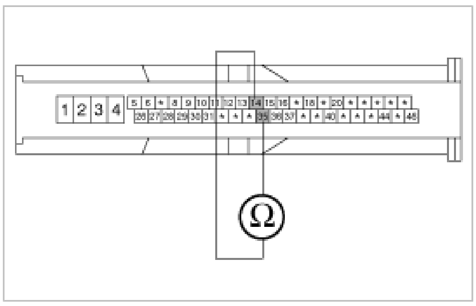
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "OFF".
2. Measure resistance between terminal "35" of the HECU harness connector and terminal "14" of the HECU harness connector.

Specification : Approx. 60 Ω



Is the measured resistance within specifications?

YES

▸ Fault is intermittent caused by open or short in CAN signal harnessor was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Check for open or short in CAN signal harness between terminal "35" of the HECU harness connector and terminal "14" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

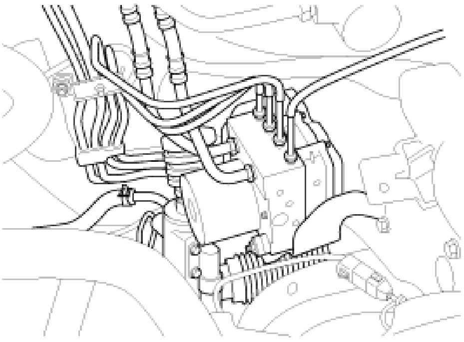
Brake System > Troubleshooting > C1625

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open or short circuit monitoring	• Open or short circuit in CAN line • Faulty HECU
Enable Conditions	Purpose is to monitor if transmitted message was not transmitted on time by the CAN controller of ABS8/ESC8 ECU. Faults are detected after filtering.	
Monitoring period	Continuous	
Effect	CAN messages are not transmitted on time.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Check for open or short in CAN signal harness between terminal "35" of the HECU harness connector and PCM harness connector.
2. Check for open or short in CAN signal harness between terminal "14" of the HECU harness connector and PCM harness connector.
   Is it normal?

YES

▸ Replace the HECU. Then go to "Verification of vehicle Repair" procedure.

NO

▸ Repair or replace harness and connector.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

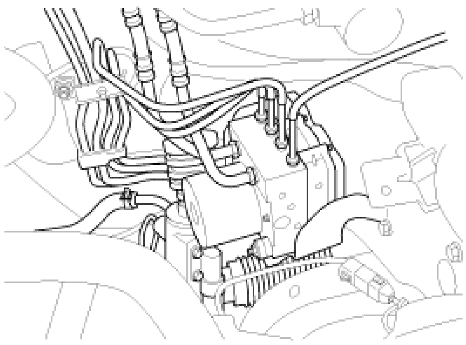
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1626

COMPONENT LOCATION



DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Internal error	• Faulty HECU
Enable Conditions	1. Under normal conditions, the inlet valves of all four wheels are not closed during control for longer than 1.28 s. If the controller requests pressure-hold or pressure-decrease for longer than 1.28 s, a fault is stored. 2. The monitoring reports a failure if continuous ESC control occurs for a time period >= 10 s. A continuous ESC control for longer than 10 s is not possible under normal conditions.	
Monitoring period	1. Continuous 2. detected under voltage and a fault is not already detected.	
Effect	1. Reduced function as all wheel valves will remain in pressure build-up position. 2. Reduced function of the ESC system, no more ESC, no more ABS.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Replace the HECU. Then go to "Verification of vehicle Repair" procedure.

   NO

▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1702

GENERAL DESCRIPTION

A hardware difference of ECU does not exist according to the specification of the vehicle, but a software changes according to deference of vehicle parameter. The ESC stores variant code (data of engine, displacement volume , T/M) at the ECU memory. Since then a ESC uses the stored data.

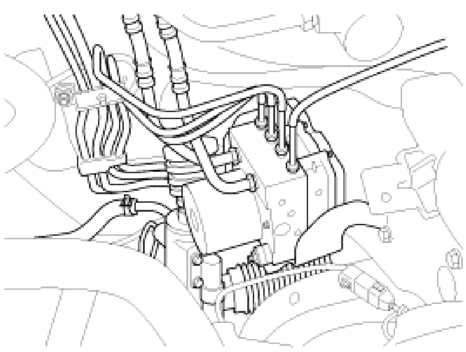
COMPONENT INSPECTION

*Variant Coding (See page BR - 142)

1. Install a EMS/TCU/ESC normally.
2. Connect a scanner to the vehicle.
3. IGN On
4. Scanner On
5. Select a brake mode.
6. Push the Variant Coding button.
7. Scanner Off
8. IGN Off
9. Remove the scanner.
10. IGN On
11. Finish the Variant Coding.

Brake System > Troubleshooting > C2112

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU supplies battery power to all solenoid valves by way of a valve relay which is controlled by the Electronic Control UNIT(ECU). The valve relay and all solenoid valves are installed inside the HECU (Hydraulic and Electronic Control Unit).

DTC DESCRIPTION

ABS ECU monitors voltage of the valve relay to check if ABS ECU can perform ABS control normally. When the valve relay is switched to ON, the HECU will set this code if the solenoid drive voltage is below permissible voltage ranges for a period of time. When the valve relay is switched to OFF, the HECU sets this code if the solenoid drive voltage is over the permissible voltage range for a period of time.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Open or short of power supply circuit • Faulty HECU • Faulty of the valve relay fuse(20 A)
Enable Conditions	1. Watchdog and VR(valve relay) function is tested during startup.FSA test(Fail Save Circuit test) detects if the VR/Enable remains in off position when it is turned on and vice versa. Reason could be short to GND or UZ(ECU voltage supply), interrupted lines or a defective output stage etc. 2. A Fault is detected if UVR(valve relay voltage) < 0.8 * UZ for a time t > 500 ms. 3. This test evaluates the function of the VR (valve relay) periodically. The VR is switched off and back on. VR malfunction and UVR short to UZ or UBVR (supply solenoid valves) and medium or high ohmic short of UVR (or a valve) to UZ, UBVR(supply solenoid valves) or GND are detected.	
Monitoring period	1.Once during startup. 2,3.Continuous	
Effect	No valve actuation possible.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

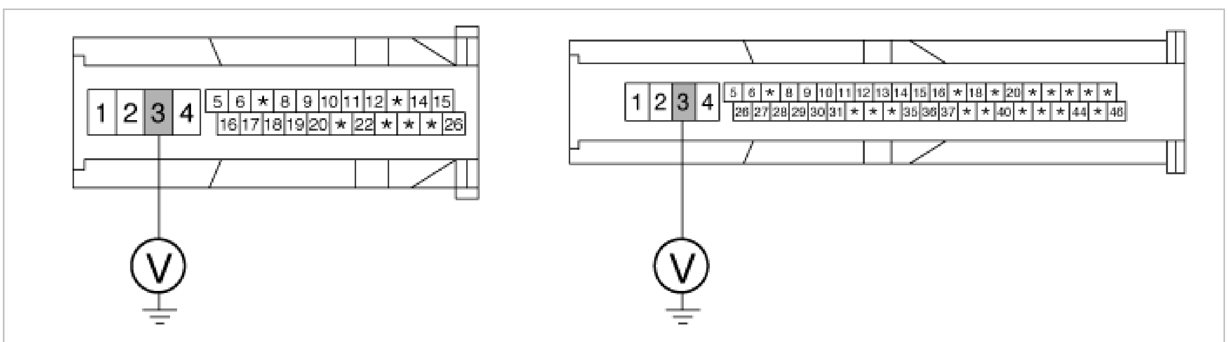
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF"
2. Disconnect HECU connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal "3" of the HECU harness connector and chassis ground.

Specification :Approx. B+



<ABS> <ESC>

Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

NO

▸ Check for open or short in power harness between battery terminal(+) and terminal "3" of the HECU harness connector. Check for open or blown 20A fuse . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "4" of the HECU harness connector and chassis ground.

Specification :Approx.below 1 Ω

Is the measured resistance within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between terminal "4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of power harness and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

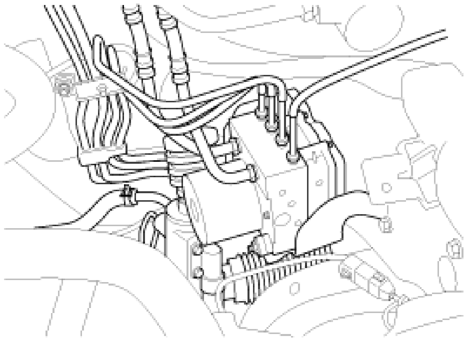
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C2308

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS HECU is composed of an ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit), so the HECU hardware includes all solenoid valves inside the unit as well as the ECU. Solenoid valves are switched to ON, OFF by HECU when the ABS is activated. Solenoid valves function is to increase, decrease or maintain the hydraulic pressure supplied to a wheel cylinder.

DTC DESCRIPTION

The HECU monitors the operation of the valves by checking the drive circuit of the solenoid valves, and then sets this code when the unexpcted drive voltage is detected. For example, the HECU sets the DTC if an unexpected high drive voltage is detected when the valve relay is switched to OFF.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Faulty HECU
Enable Conditions	1. The electrical feedback signal does not match the actuation signal for the corresponding valve: Actuation Signal != Feedback Signal Fault filter time is t = 30 ms (for current controlled valves and under voltage conditions: t =80 ms) 2. Cyclic Valve and Relay Test (CVRT): • A Fault is found if UVR(Valve relay voltage) is not within 0.1 * UZ(Ignition voltage) < UVR < 0.8 * UZ • A Fault is found if UVR is not UVR < 0.2 * UZ and the Valve Feedback is not act. Valve = = FALSE, not act. Valve = = TRUE At least VR is switched on again. 3. The valve and pump motor test detects electrical actuation malfunction of ABS valves. The test actuates all valves in series (to detect short cuts or shunts between the valve lines). Faults are detected by monitoring the valve response signals.	
Monitoring period	1. Continuous 2. CVRT is executed immediately after power on and then periodic every t =20 s. The Test is canceled if any control/valve actuation takes place or if the Vehicle is in motion and the BLS is on. 3. The Valve and Pump motor Test is performed once after ignition on if vehicle speed is >= 15 km/h(9 MPH).	
Effect	Valve cannot be actuated or valve is incorrectly actuated. This may result in locked wheels or wheels without pressure.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

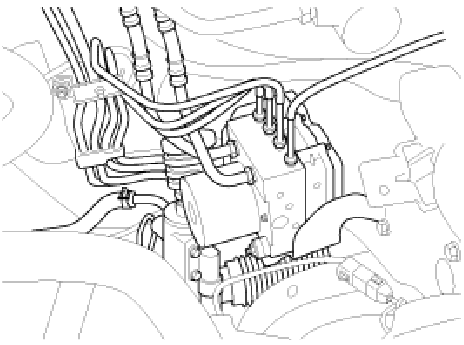
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C2312

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS HECU is composed of an ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit), so the HECU hardware includes all solenoid valves inside the unit as well as the ECU. Solenoid valves are switched to ON, OFF by HECU when the ABS is activated. Solenoid valves function is to increase, decrease or maintain the hydraulic pressure supplied to a wheel cylinder.

DTC DESCRIPTION

The HECU monitors the operation of the valves by checking the drive circuit of the solenoid valves, and then sets this code when the unexpcted drive voltage is detected. For example, the HECU sets the DTC if an unexpected high drive voltage is detected when the valve relay is switched to OFF.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Faulty HECU
Enable Conditions	1. The electrical feedback signal does not match the actuation signal for the corresponding valve: Actuation Signal != Feedback Signal Fault filter time is t = 30 ms (for current controlled valves and under voltage conditions: t =80 ms) 2. Cyclic Valve and Relay Test (CVRT): • A Fault is found if UVR(Valve relay voltage) is not within 0.1 * UZ(Ignition voltage) < UVR < 0.8 * UZ • A Fault is found if UVR is not UVR < 0.2 * UZ and the Valve Feedback is not act. Valve = = FALSE, not act. Valve = = TRUE At least VR is switched on again. 3. The valve and pump motor test detects electrical actuation malfunction of ABS valves. The test actuates all valves in series (to detect short cuts or shunts between the valve lines). Faults are detected by monitoring the valve response signals.	
Monitoring period	1. Continuous 2. CVRT is executed immediately after power on and then periodic every t =20 s. The Test is canceled if any control/valve actuation takes place or if the Vehicle is in motion and the BLS is on. 3. The Valve and Pump motor Test is performed once after ignition on if vehicle speed is >= 15 km/h(9 MPH).	
Effect	Valve cannot be actuated or valve is incorrectly actuated. This may result in locked wheels or wheels without pressure.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

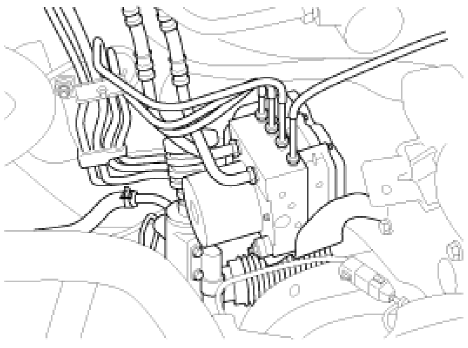
Brake System > Troubleshooting > C2402

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU supplies battery power to the electric motor by way of a motor relay which is controlled by the Electronic Control Unit(ECU). The electric motor pump supplies hydraulic pressure to all wheel brake calipers by operating the piston inside the pump.

DTC DESCRIPTION

The ABS/ESC ECU monitors the pump motor relay or fuse open, open or short in motor or motor lock and then sets this code if a malfunction is detected.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Open or short of power supply circuit • Faulty HECU • Faulty of the pump motor fuse(40A)
Enable Conditions	1. A failure is detected if the voltage UM (Pump motor voltage) > 2.0 V for a time t >= 1 s. 2. A failure is detected if the voltage UM (Pump motor voltage) < (UZ(battery voltage) - 4.0 V) for a time t >= 100 ms. 3. After the end of the actuation of the motor relay has, the pump motor is still in motion and is generating a Voltage during it.s slowdown. The generated UM is monitored for a certain time on high level. The time depends on the supply voltage and is in the range of t = 30 ms to t = 125 ms.If the slow down condition isn.t met, the pump is activated again (see actuation times below) and the slowdown time is measured again. This is repeated for maximum n = 3 times. If, after the last pump activation, the pump motor slowdown time is still to short, a failure is detected.Actuation times: 1st actuation: 200 ms 2nd actuation: 1000 ms 3rd actuation: 3000 ms	
Monitoring period	1. Stop monitor is active if the pump is off i.e. not actuation and no Slowdown. 2. The monitor is active if the pump is switched on . 3. Monitor is always active in the transition "pump on -> pump off".	
Effect	1. The return pump does not work correct. 2. Pressure decrease (outlet valve) is no longer possible (wheels block). 3. Pressure decrease (outlet valve) is no longer possible (wheels lock).	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

   YES

   ▶ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

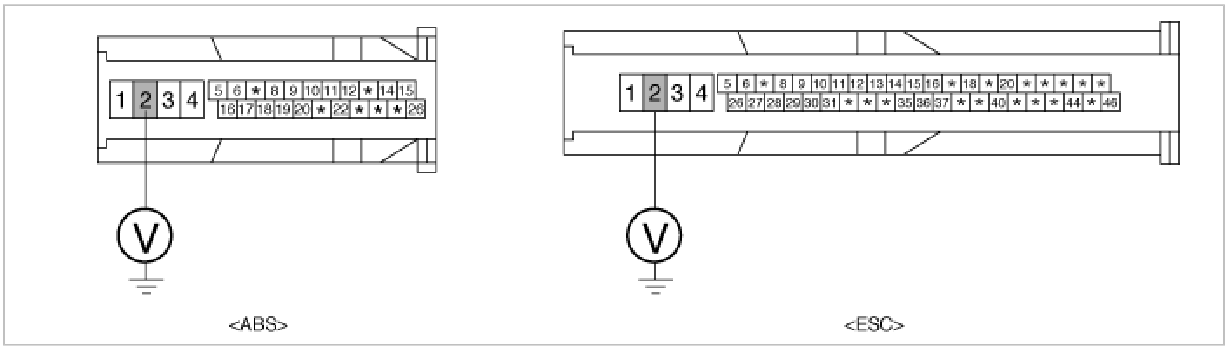
   NO

   ▶ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF"
2. Disconnect HECU connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal "2" of the HECU harness connector and chassis ground.

   Specification :Approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

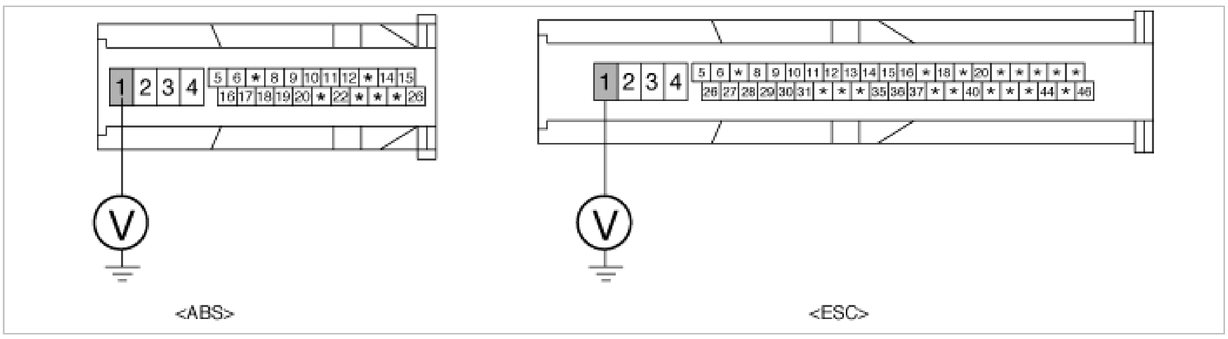
NO

▸ Check for open or short in power harness between battery terminal(+) and terminal "2" of the HECU harness connector. Check for open or blown 40A fuse . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1" of the HECU harness connector and chassis ground.

Specification :Approx.below 1 Ω



Is the measured resistance within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between terminal "1" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

   ▸ Go to the applicable troubleshooting procedure.

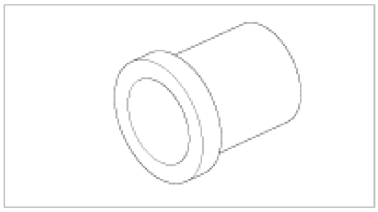
   NO

   ▸ System performing to specification at this time.

Driveshaft and axle > General Information > Special Service Tools

SPECIAL TOOLS

Tool (Number and Name)	Illustration	Use
09568-4A000 Ball joint remover		Removal of the front lower arm and tie rod end ball joint
09517-21500 Front hub remover and installer		Measurement of wheel bearing preload
09432-11000 Bearing and gear puller		Removal of the bearing inner race from the front hub
09532-11600 Preload socket		Measurement of the wheel bearing preload (use with torque wrench)
09216-21100 Mount bushing remover and installer		• Removal of the center bearing • Press-fitting of the front wheel bearing outer race (Use with 09495-33100, 09216-21600)
09495-33000 Mainshaft bearing puller		Removal of the tone wheel
09216-21600 Mount bushing remover and installer		Removal of the wheel bearing outer race
09545-21100 Ball joint dust cover installer		Press-fitting of the front hub to the knuckle

09545-34100 Lower arm bushing remover and installer		Removal of the bearing inner race from the front hub
09453-33000B Snap ring installer		Removal and installation of the rear axle carrier bushing (Use with 09552-38200)
09216-22100 Mount bushing removerand installation base		Removal of the wheel bearing outer race (Use with 09216-21600)

Driveshaft and axle > General Information > Troubleshooting

TROUBLESHOOTING

Symptom Pos	sible cause	Remedy
Vehicle pulls to one side	Scoring of driveshaft ball joint Wear, rattle or scoring of wheel bearing Defective front suspension and steering	Replace Replace Adjust or replace
Vibration	Wear, damage or bending of driveshaft Driveshaft rattle and worn hub splines Wear, rattle or scratching of wheel bearing	Replace Replace Replace
Shimmy I	mproper wheel balance Bent wheel Defective front suspension and steering	Adjust or replace Replace Adjust or replace
Excessive noise	Wear, damage or bending of driveshaft Driveshaft rattle and worn hub splines Driveshaft rattle and worn side gear splines Wear, rattle or galling of wheel bearing Loose hub nut Defective front suspension and steering	Replace Replace Replace Replace Adjust or replace Adjust or replace
Bent cage	Cage damaged by improper handling or tool usage	Replace bearing
Galling	Metal smears on roller end due to overheating, incorrect lubricant or overloading	Replace bearing Check seals, check for proper lubrication
Cracked inner race	Race cracked due to improper fit, cocking or poor bearing seats	Replace bearing
Etching	Bearing surfaces appear gray or grayish black	Replace bearing

	in color accompanied by material etched away usually at roller spacing	Check seals, check for proper lubrication
Brinelling Surface	indentations on race surface caused by rollers being under impact loading or vibration while the bearing is not rotating	Replace bearing
Heat discoloration	Heat discoloration is dark blue resulting from overload or no lubricant (Yellow or brown color is normal)	Replace bearing Check seals and other parts
Fatigue spalling	Flaking of surface metal resulting from fatigue	Replace bearing Clean all related parts

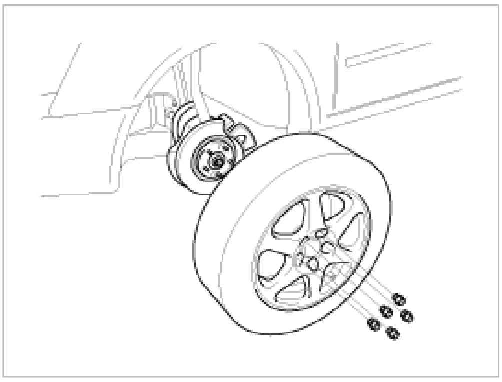
4. Spider assembly	9. BJ boot band	
5. Circle pin	10. BJ boot	

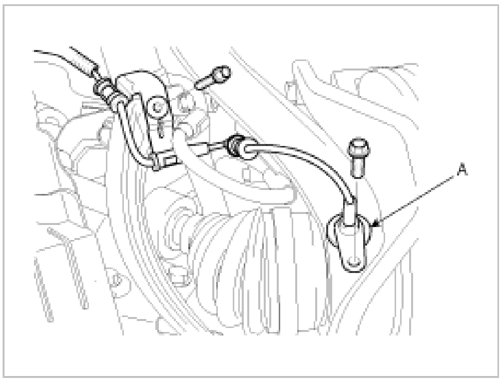
Driveshaft and axle > Driveshaft Assembly > Front Driveshaft > Repair procedures

REMOVAL

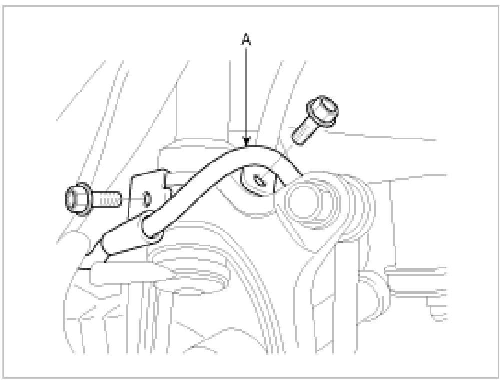
1. Remove the wheel and tire.



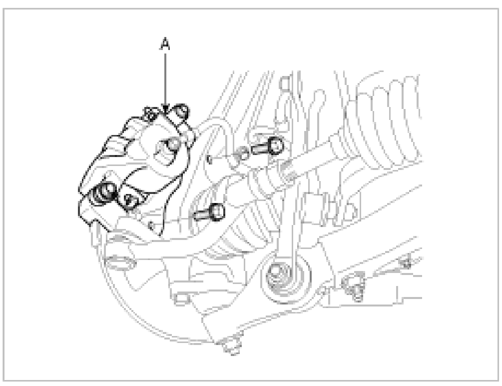
2. Disconnect the wheel speed sensor(A) from the knuckle.

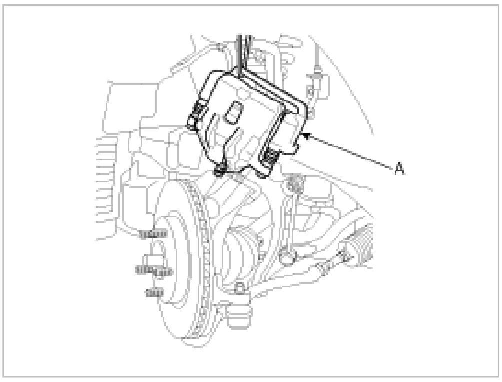


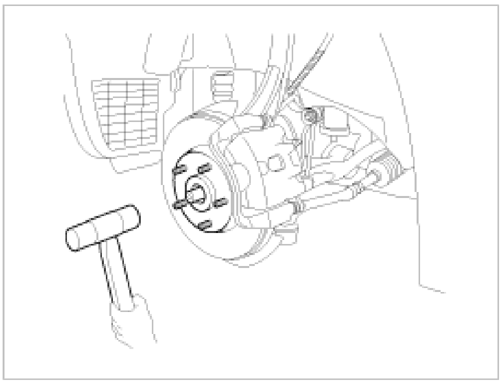
3. Disconnect the brake hose(A) from the knuckle.



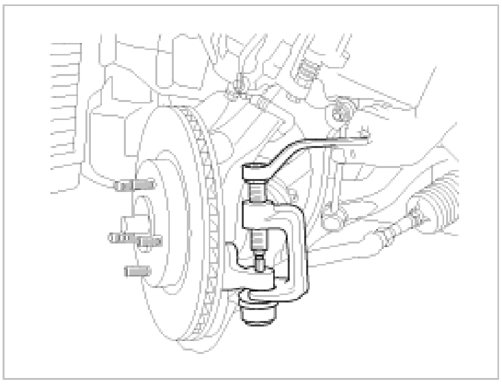
4. Remove the caliper assembly(A) and suspend it with wire.



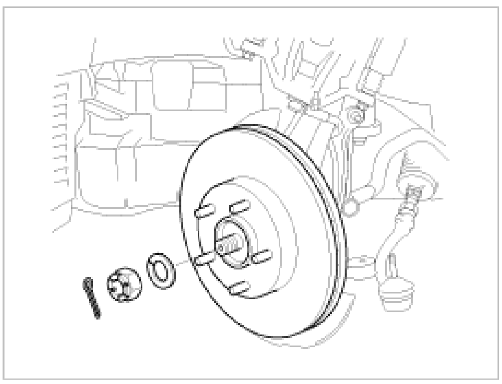




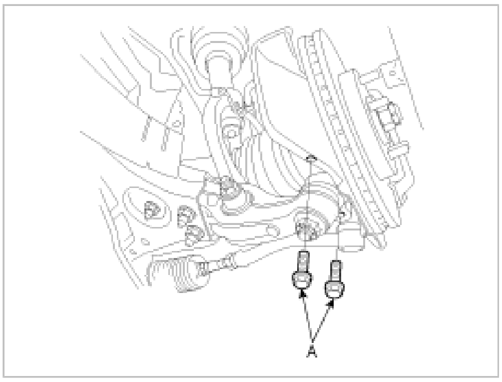
5. Using the special tool (09568-4A000), disconnect the tie rod end from the knuckle.



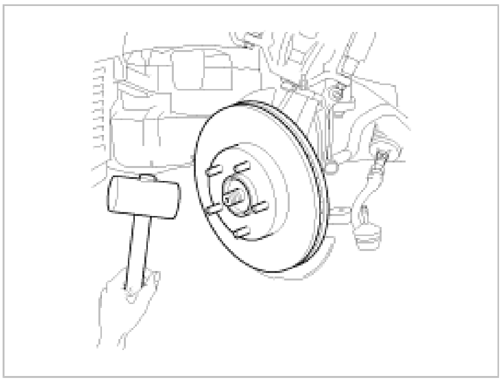
6. Remove the spilt pin and driveshaft castle nut and washer from the front hub.



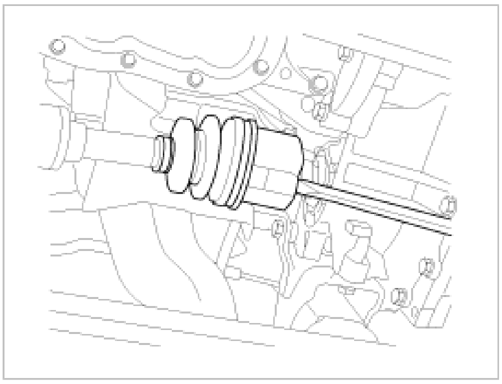
7. Remove the 2 bolts(A) and disconnect the ball joint from the knuckle.



8. Using a plastic hammer, disconnect the driveshaft from the axle hub.

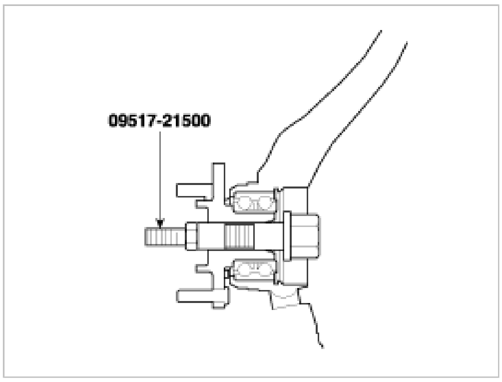


9. Removing the driveshaft from the transaxle by using a pry bar as shown below.



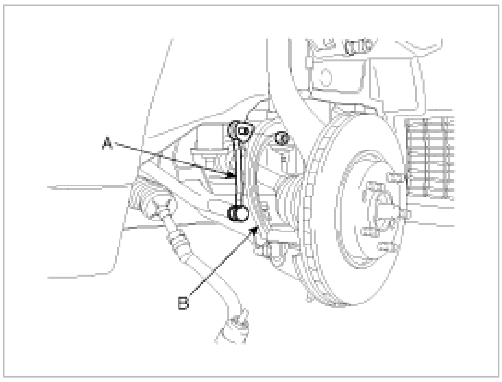
CAUTION

- Use a pry bar so you do not damage the joint.
- If you pull the driveshaft by excessive force, components inside the joint can be displaced causing the boot to be torn and the bearing to be damaged.
- Plug the transaxle case opening with an oil seal cap in order to avoid contamination.
- Support the driveshaft properly.
- Replace the retainer ring each time the driveshaft is removed from the transaxle case.
- While loosening the driveshaft nut, do not allow vehicle weight to be concentrated on the wheel bearing. If the vehicle moves, hold the wheel bearing using the special tool.

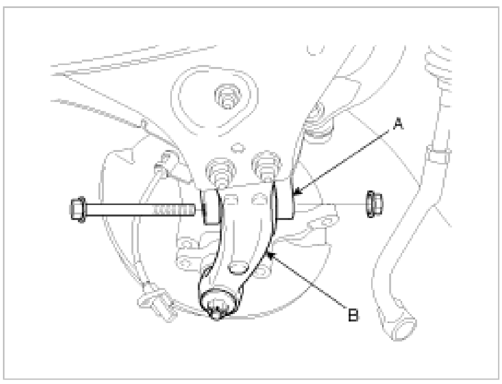


[RH3.3]

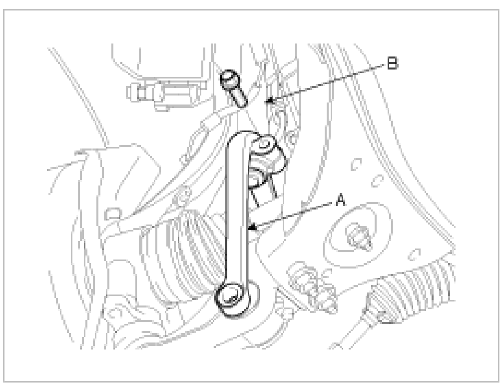
A. Remove the stabilzer link(A) from the fork(B).



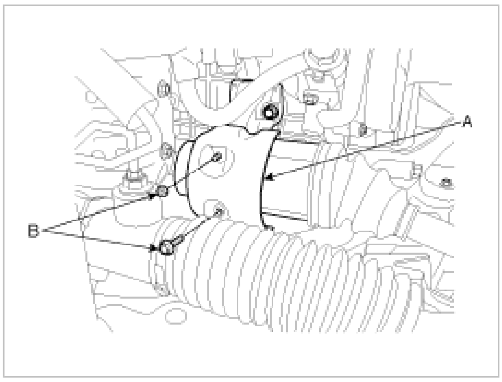
B. Remove the fork(A) from the front lower arm(B).



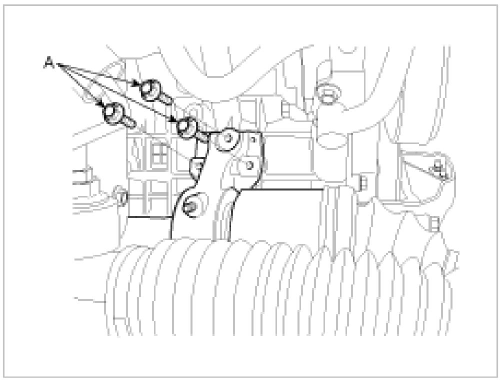
C. Remove the fork(A) from the front strut assembly(B).



D. Remove the inner shaft cover(A) from the inner shaft bracket(B).



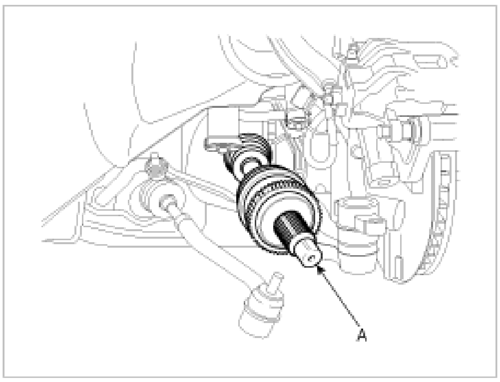
E. Remove the inner shaft bracket mounting bolt(A).



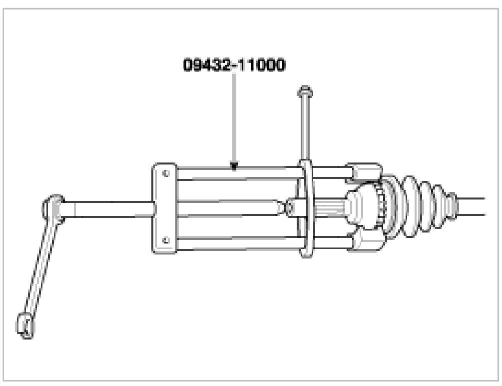
F. Remove the front driveshaft assembly(A) with the inner shaft from the transaxle.

CAUTION

Do not try to disconnect the inner shaft from the driveshaft. Because they can not be disconnected once assembled.
Do not reuse the driveshaft which is disassembled from the innershaft.



10. Using the special tool (09432-11000), remove the tone wheel.

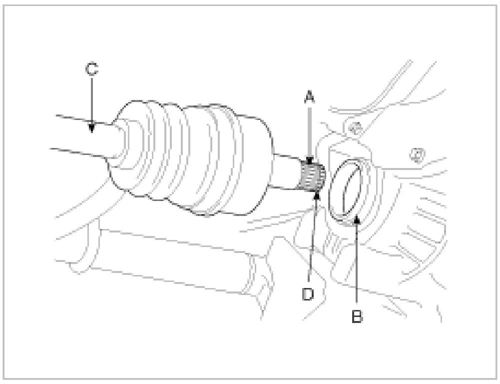


INSTALLATION

CAUTION

Replace the circlip with new ones after removal.

1. Apply gear oil on the drive shaft spliness(A) and the contacting surface of differential case oil seal(B).
2. Before installing the drive shaft(C), set the opening side of the clip(D) facing downward.



3. After installation, check if the drive shaft cannot be removed.
4. Install the drive shaft into the knuckle.

CAUTION

Be careful not to damage the boot.

5. Install the knuckle in the lower arm assembly.

Tightening Torque Nm(kgf·m, lb-ft) :
100~120 (10~12, 74~88)

6. Install the tie rod end in the knuckle.

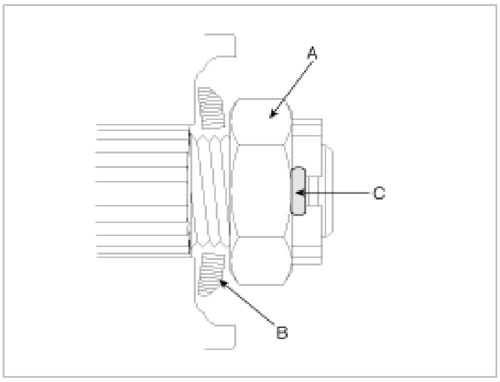
Tightening Torque Nm(kgf·m, lb-ft) :
24~34 (2.4~3.4, 18~25)

7. Install the wheel speed sensor in the knuckle.

Tightening Torque Nm(kgf·m, lb-ft) :
8~10 (0.8~1, 5.8~7.2)

8. After installing the washer(B) with convex surface outward, install the lock nut(A) and the spilt pin(C)

Tightening Torque Nm(kgf·m, lb-ft) :
200~280 (20~28, 148~207)

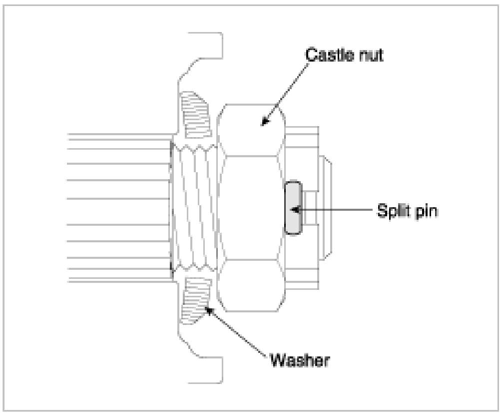


9. Install the wheel and tire.

INSTALLATION

1. Tighten the components with the tightening torque.

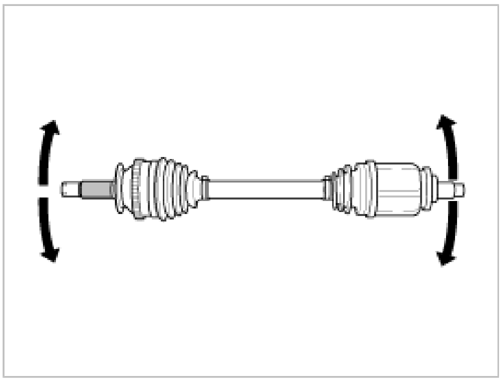
Item T	orque (kg·m)
Driveshaft nut	20 ~ 28
Lower arm and ball joint	10 ~ 12
Shock absorber lower mounting bolts	14 ~ 16
Tie rod end and knuckle	2.4 ~ 3.4



2. Replace the retainer ring every time the driveshaft is removed from the transaxle case.
3. Install the washer on driveshaft and tighten the nut as illustrated.
4. Install the split pin.

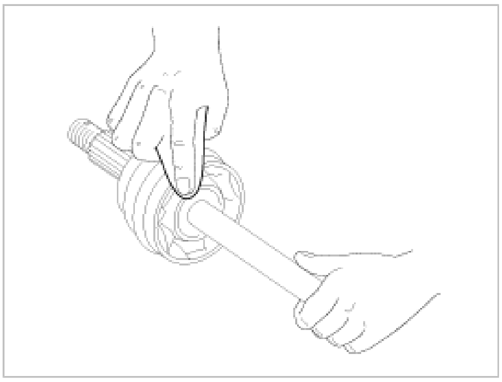
INSPECTION

1. Check the driveshaft boots for damage and deterioration.
2. Check the splines for wear and damage.
3. Check the ball joints for wear and operating condition.



INSPECTION

1. Check the driveshaft spline part for wear.
2. Check for entry of water and foreign material into boot.
3. Check the spider ring for revolution and wear.
4. Check the SFJ case inside wear and rust.

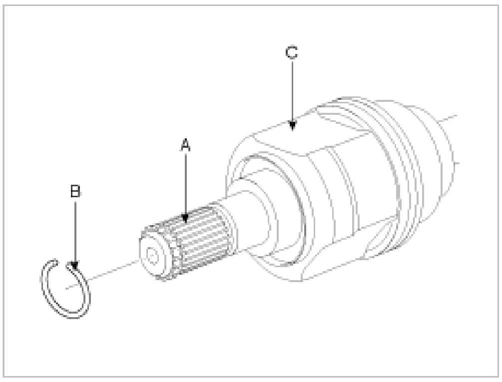


DISASSEMBLY

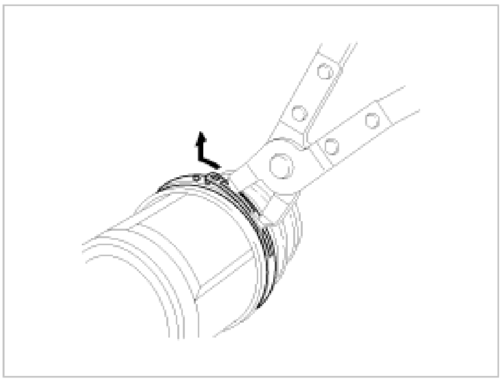
NOTE

- Do not disassemble the BJ assembly.
- Special grease must be applied to the drive shaft joint. Do not substitute with another type of grease.
- The boot band should be replaced with a new one.

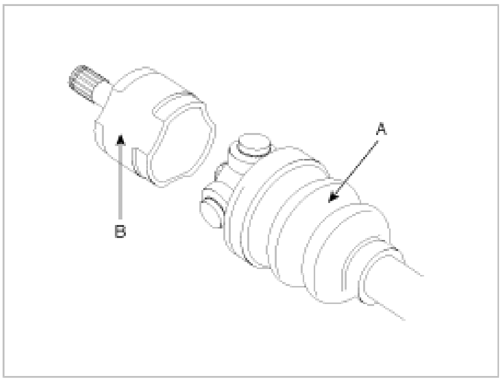
1. Remove the clip(B) from drive shaft splines(A) of the transaxle side TJ case(C).



2. Remove both boot bands from the transaxle side TJ case.

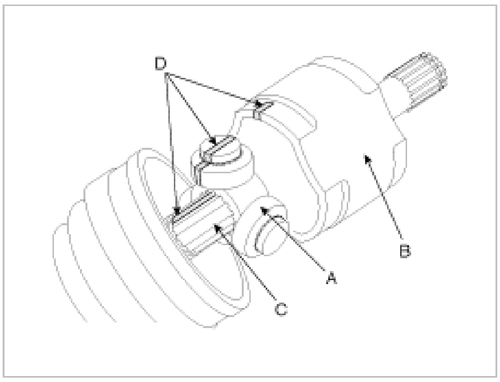


3. Pull out the boot from the transaxle side joint(TJ).
4. When separating the joint and boot(A), remove the grease from the TJ case(B).

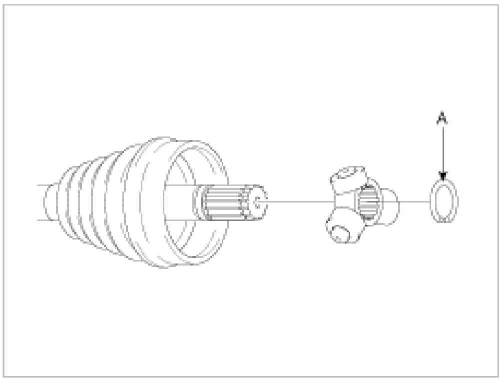


CAUTION

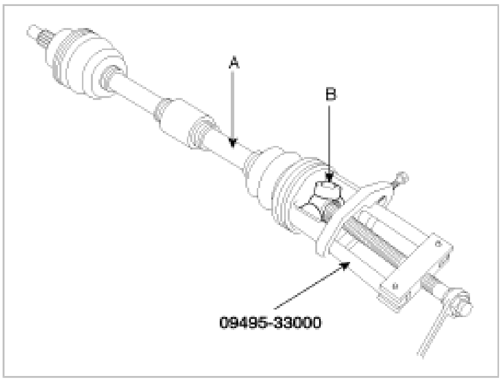
- Be careful not to damage the boot.
- Make alignment marks on spider roller assembly(A), TJ case(B), and shaft splines(C) to aid reassembly.



5. Using a plier or flat-tipped (-) screwdriver, remove the snap ring(A).



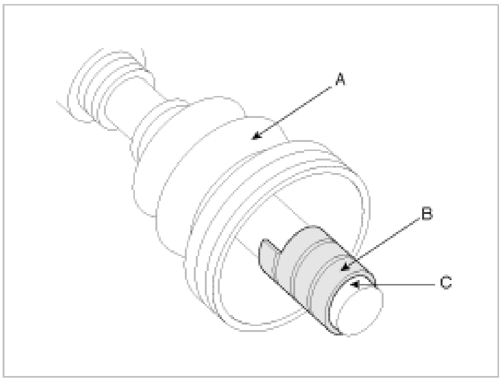
6. Remove the spider assembly(B) from drive shaft(A) by using the Special Tool(09495-33000).



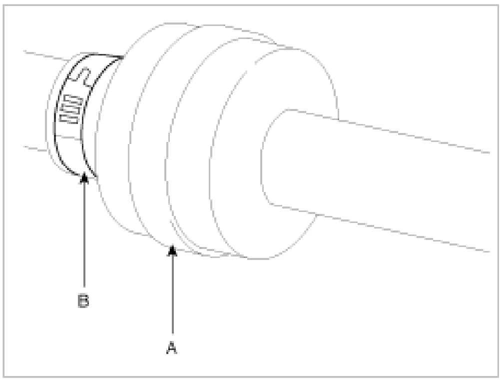
7. Clean the spider assembly.
8. Remove the boot(A), of the transaxle side joint(TJ).

CAUTION

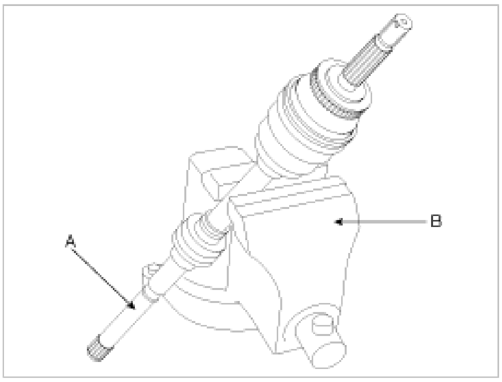
Wrap tape(B) around the driveshaft splines(C) to protect the boot(A).



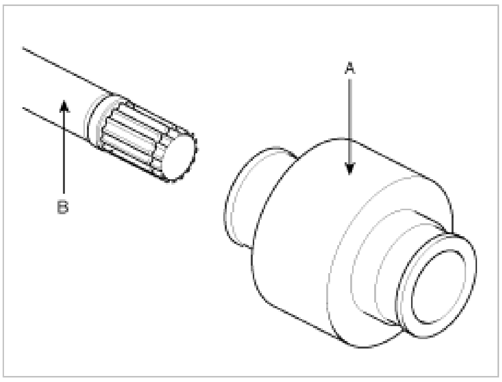
9. Remove both side of bands(B,C) of the dynamic damper(A).



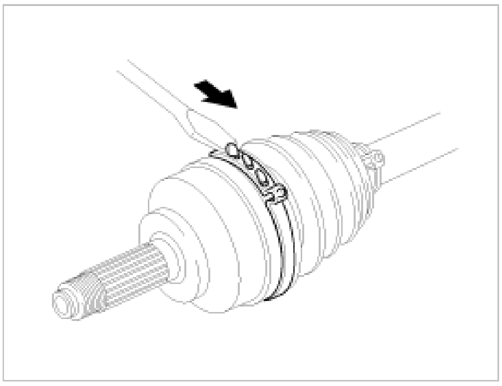
10. Fix the drive shaft(A) with a vice(B) as illustrated.



11. Apply soapy water to the shaft to prevent being damaged between the shaft spline and the dynamic damper when the dynamic damper is removed.
12. Separate dynamic damper(A) from the shaft(B) carefully.



13. Remove both bands on the side of wheel.



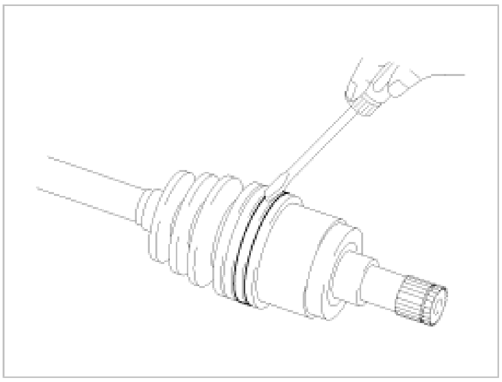
14. Pull out the joint(BJ) boot on the side of wheel into the transaxle direction.
    Be carefull not to damage the boot.

DISASSEMBLY

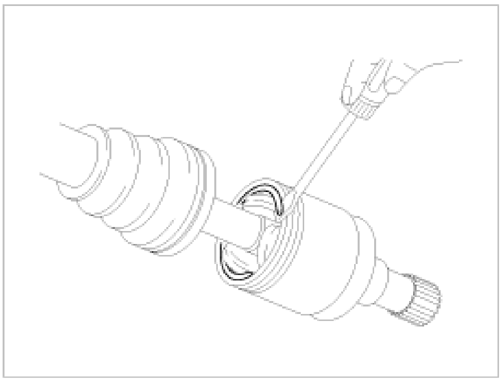
> **NOTE**
>
> - Do not disassemble the BJ assembly.
> - The Driveshaft joint uses special grease. Do not subtitute with another type of grease.
> - The Boot band should be replaced with a new one.

1. Remove the SFJ boot band and pull the boot from SFJ outer race.

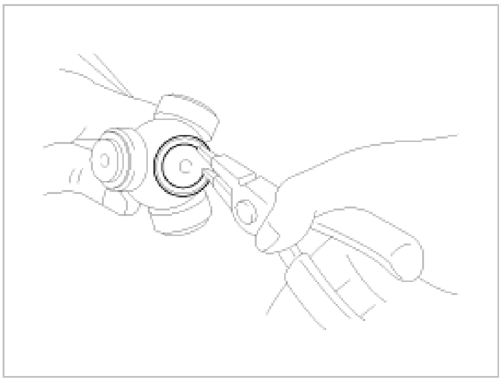
> **NOTE**
>
> Be careful not to damage it.



2. Remove the circlip using a screwdriver.
   (ASAN) KOREA



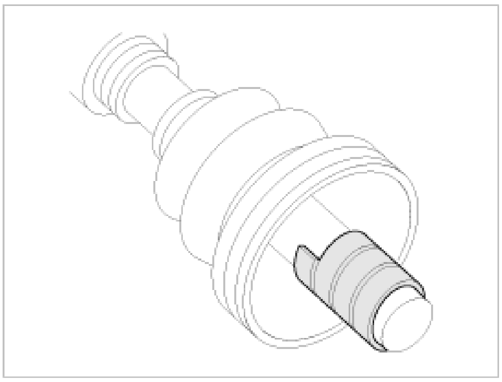
3. Remove the driveshaft from SFJ outer race.



4. Remove the snap ring and disassemble the spider assembly from the shaft.
5. Clean the spider assembly.
6. Remove the BJ boot band and removal of the SFJ boot and the BJ boot.

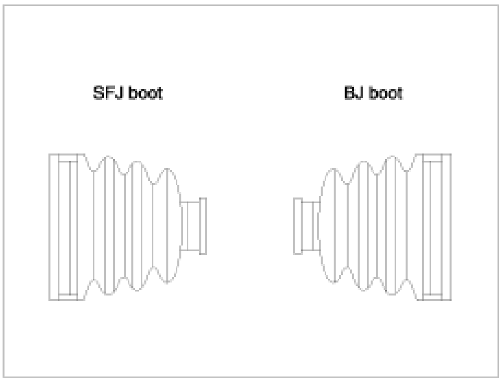
CAUTION

If the boot is reused, wrap a tape around the driveshaft splines to protect the boot.



REASSEMBLY

1. Wrap a tape around the driveshaft spline(SFJ side) to avoid boot damage.



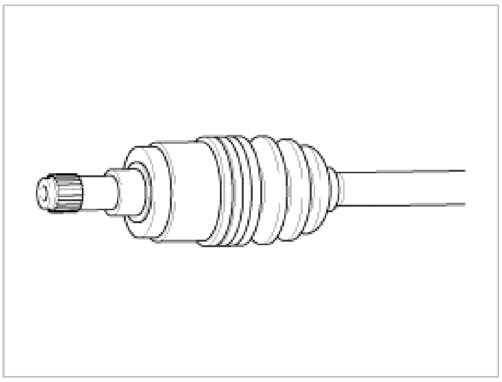
2. Apply specified grease at the driveshaft and install the boot.

Item 3.3		L
Grease filling quantity	BJ boot	Joint 140g ± 5g, Boot 60g ± 5g
	SFJ boot	Joint 100g ± 5g, Boot 45g ± 5g

3. Add the specified grease in the amount wiped away at the of inspection.
4. Tighten the boot band.

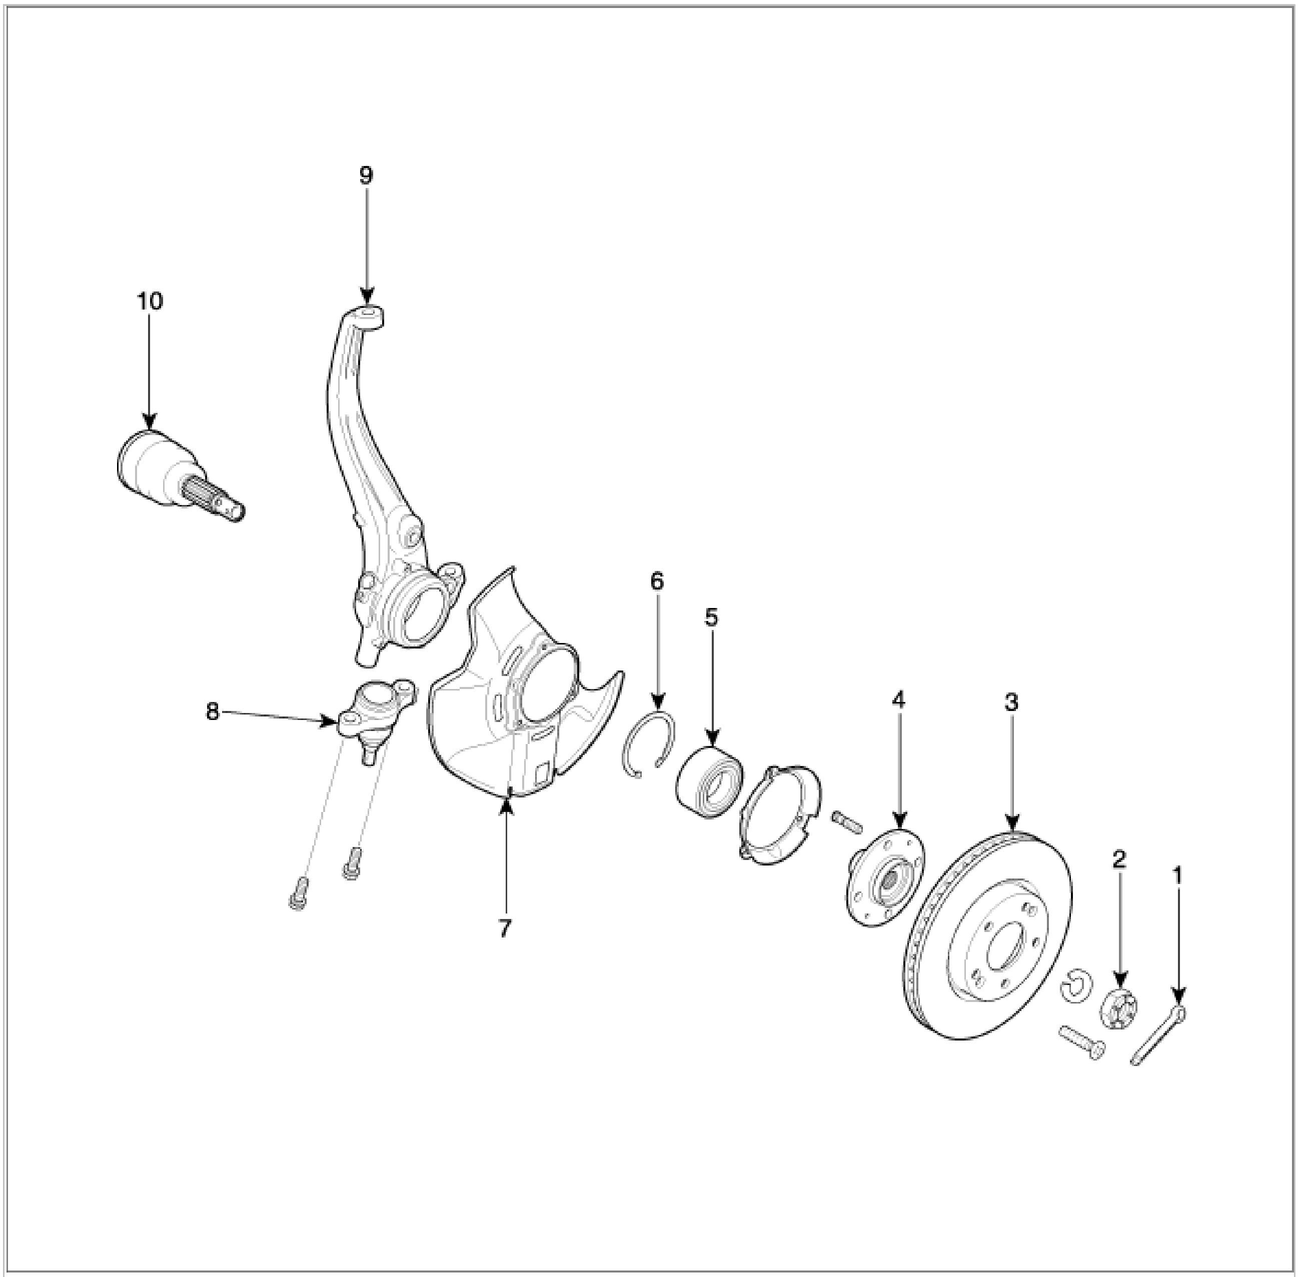
CAUTION

Adjust the distance between boot bands within the specification range when tightening the boot band to adjust air in the boot.



Driveshaft and axle > Front Axle Assembly > Front Hub / Axle > Components and Components Location

COMPONENTS

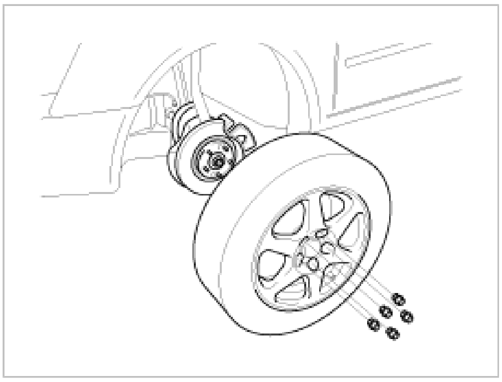


1. Split pin
2. Driveshaft nut
3. Brake disc
4. Hub
5. Wheel bearing
6. Snap ring
7. Dust cover
8. Lower arm ball joint
9. Knuckle
10. Driveshaft

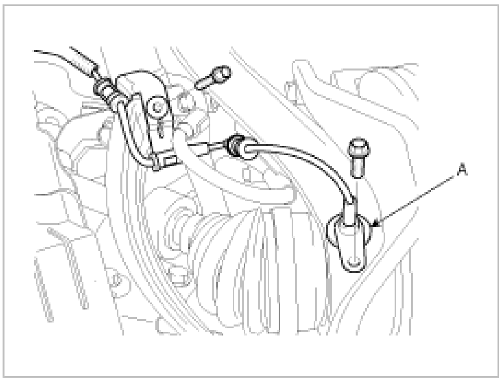
Driveshaft and axle > Front Axle Assembly > Front Hub / Axle > Repair procedures

REMOVAL

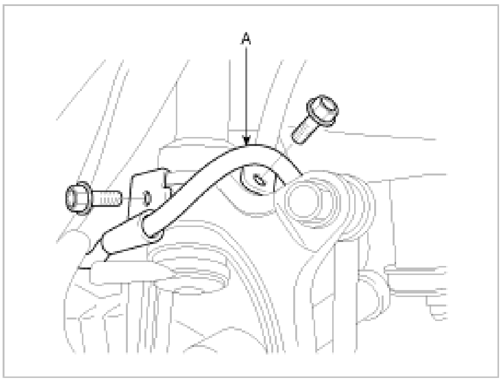
1. Remove the wheel and tire.



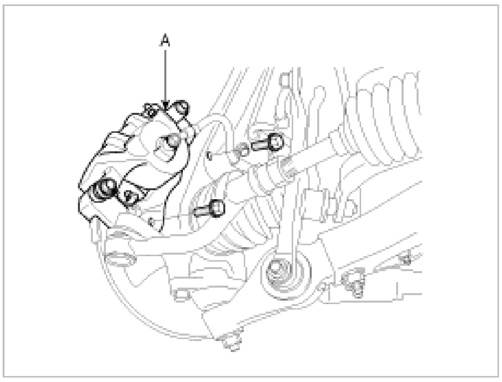
2. Disconnect the wheel speed sensor(A) from the knuckle.

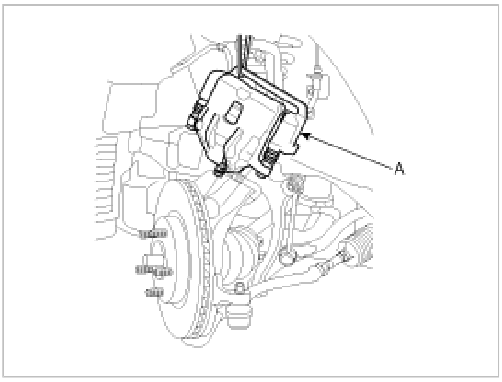


3. Disconnect the brake hose(A) from the knuckle.

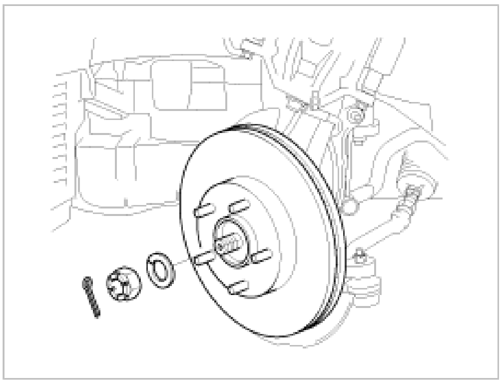


4. Remove the caliper assembly(A) and suspend it with wire.

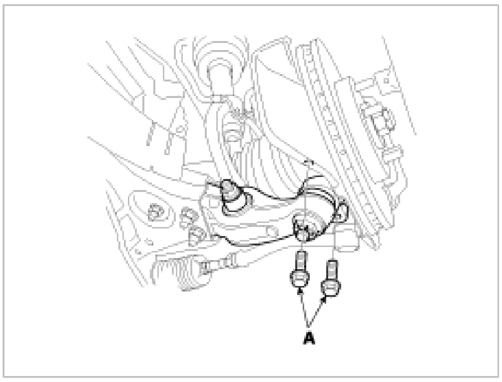




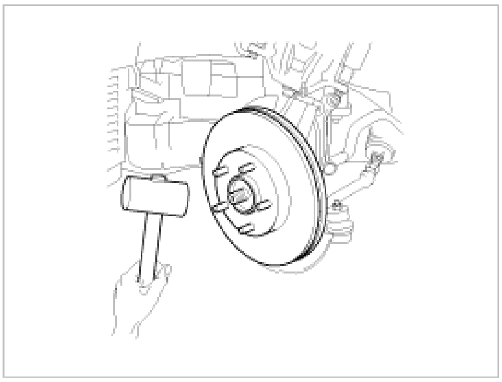
5. Remove the split pin and driveshaft castle nut from the front hub.



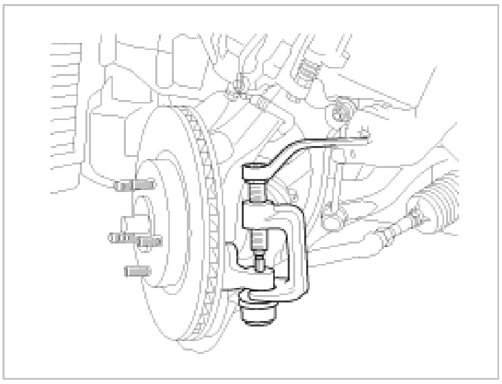
6. Remove the 2 bolts(A) and disconnect the ball joint from the knuckle.



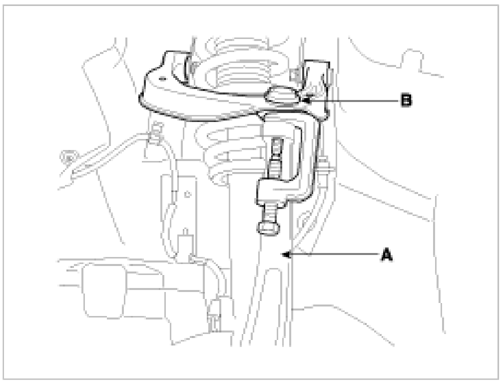
7. Using a plastic hammer, disconnect the driveshaft from the axle hub.



8. Using the special tool (09568-4A000), disconnect the tie rod end from the knuckle.



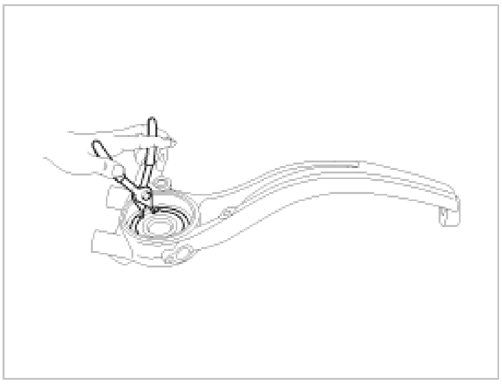
9. Loosen the upper armmounting nut but do not remove it.
10. Using the special tool (09568-4A000), disconnect the upper arm from the knuckle.



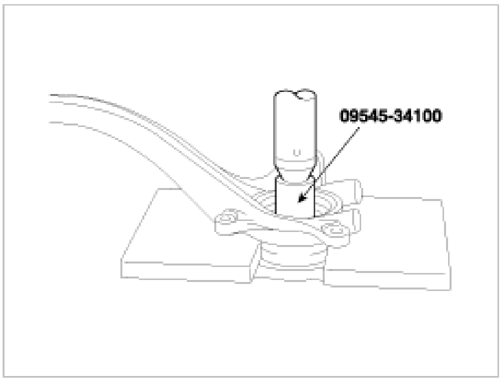
11. Remove the front axle and knuckle together.
12. Installation is the reverse of removal.

DISASSEMBLY

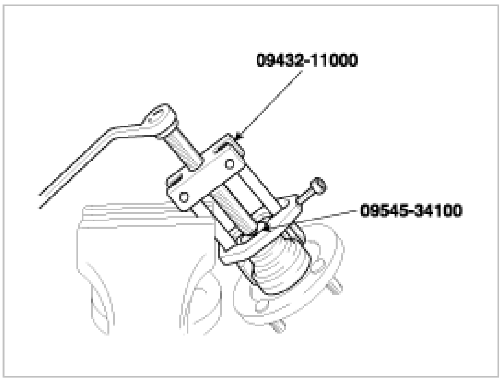
1. Remove the brake disc from the hub.
2. Remove the snap ring.



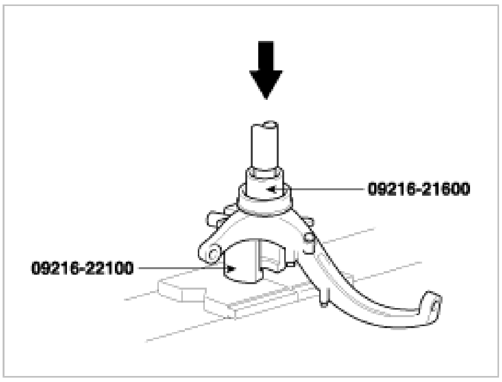
3. Using the special tool (09545-34100), disconnect the hub from the knuckle.



4. Using the special tools (09432-11000, 09545-34100), remove the wheel bearing inner race from the hub.



5. Using the special tools (09216-21600, 09216-22100), remove the wheel bearing outer race from the knuckle.



INSPECTION

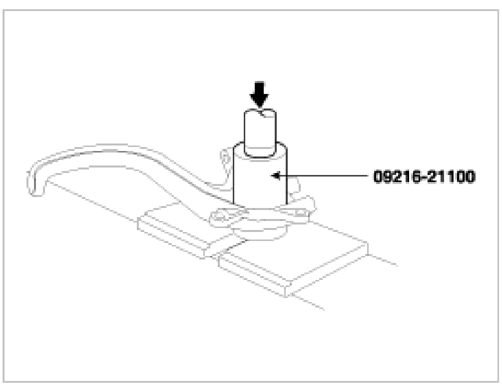
1. Check the hub for cracks and splines for wear.
2. Check the snap ring for cracks or damage.
3. Check the knuckle inner surface for scoring and cracks.

REASSEMBLY

1. Apply a thin coat of multi-purpose grease to the knuckle and bearing contact surface.
2. Using the special tool (09216-21100), press-in the bearing to the knuckle.

NOTE

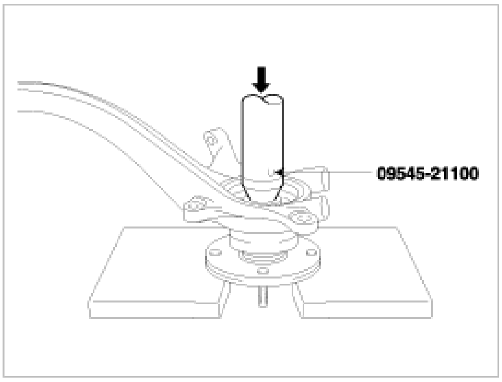
- Do not press against the inner race of the wheel bearing because that can cause damage to the bearing assembly.
- Always use a new bearing assembly.



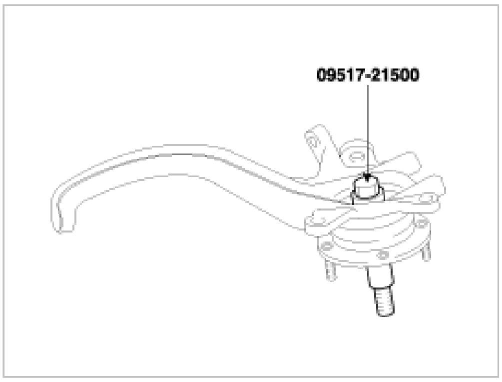
3. Install the snap ring into the groove of the knuckle.
4. Using the special tool (09545-21100), press the hub on to the knuckle.

NOTE

Do not press against the outer race of the wheel bearing because that can cause damage to the bearing assembly.

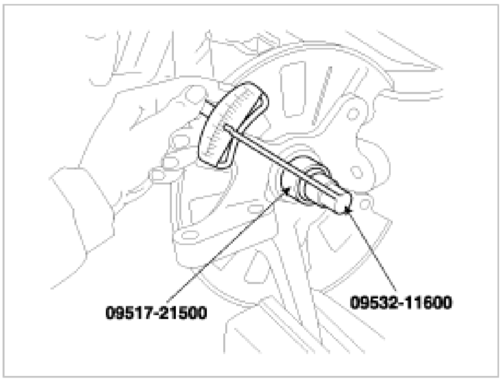


5. Tighten the hub to the knuckle to 200 Nm (20 kgf·m, 148 lb-ft) with the special tool (09517-21500).



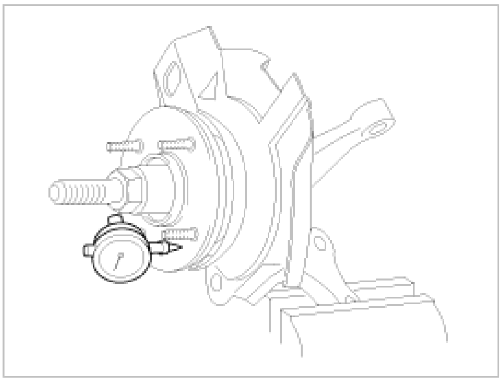
6. Rotate the hub to seat the bearing.
7. Measure the wheel bearing starting torque.

Standard value
Starting torque : 1.8 Nm (0.18 kgf·m, 16 lb-ft) or less



Fix a dial gauge and measure the hub end play. Check that it is within the standard value.

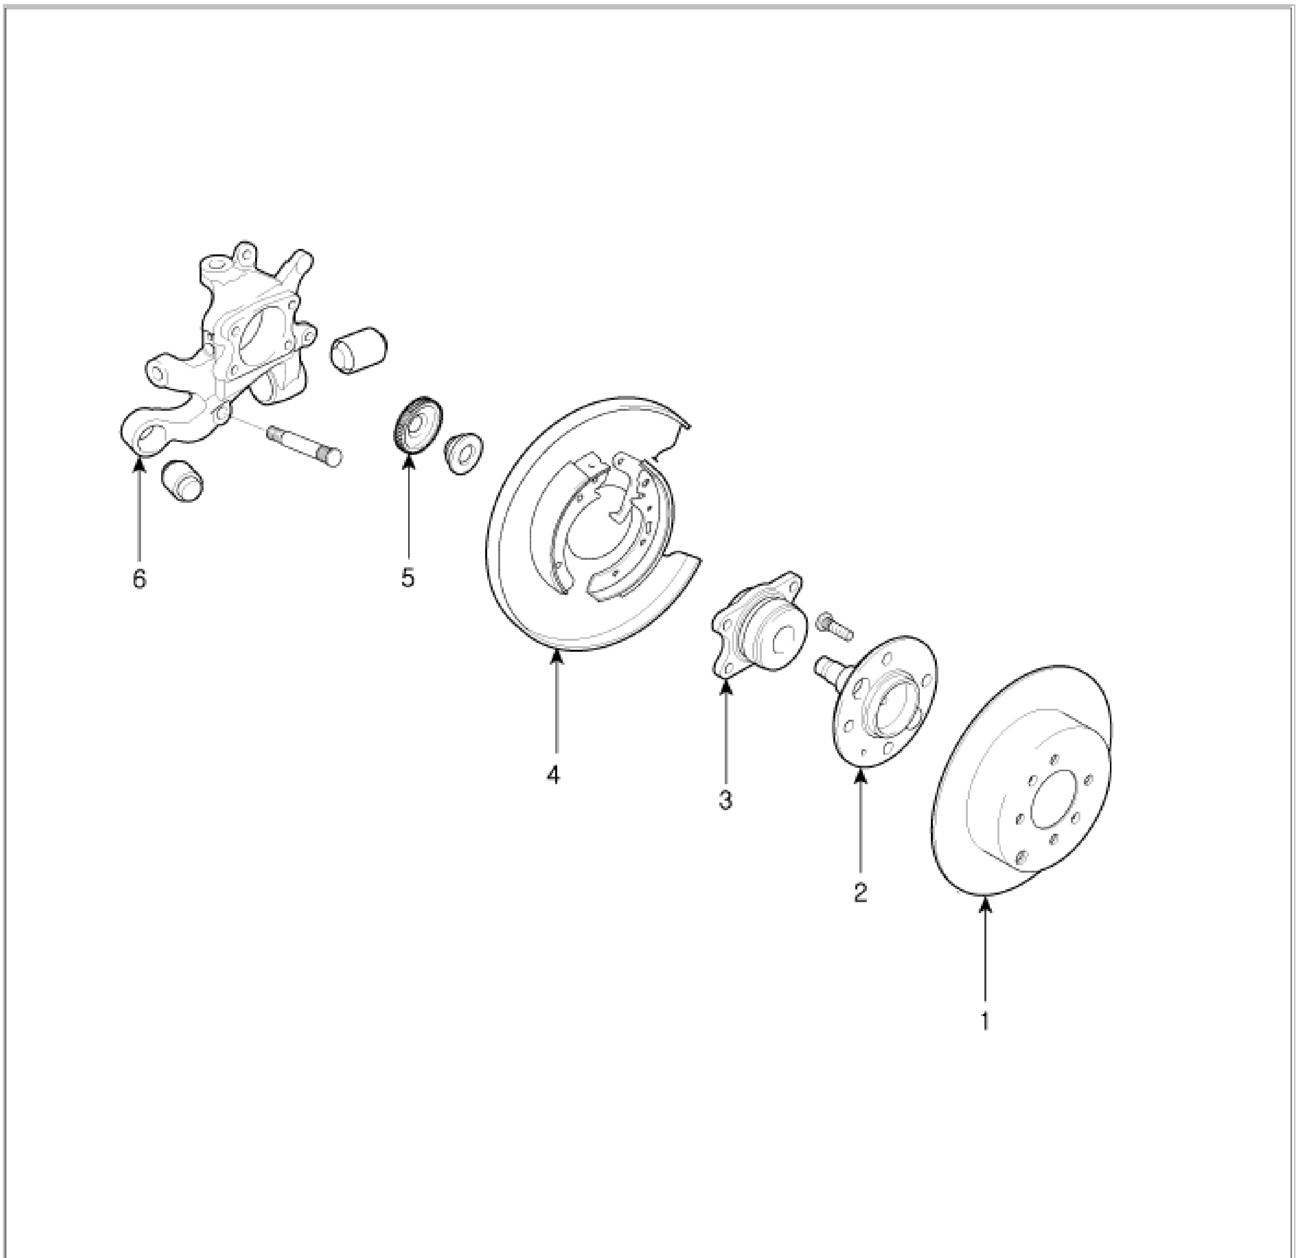
Standard value
Hub end play : 0.008 mm (0.0003 in) or less



8. Remove the special tool.
9. Install the disc to the hub.

Driveshaft and axle > Rear Axle Assembly > Rear Hub / Axle > Components and Components Location

COMPONENTS

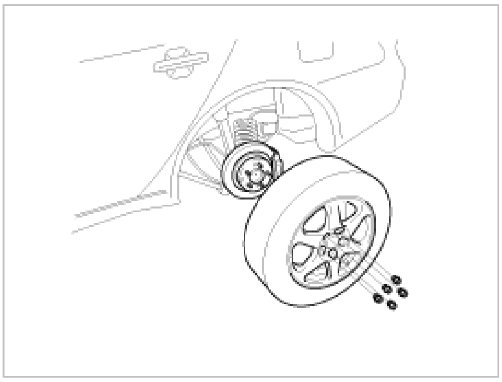


1. Brake disc	4. Brake assembly
2. Hub	5. Tone wheel (ABS System)
3. Hub bearing	6. Carrier assembly

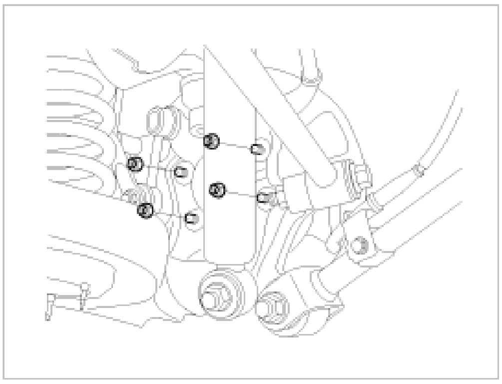
Driveshaft and axle > Rear Axle Assembly > Rear Hub / Axle > Repair procedures

REMOVAL

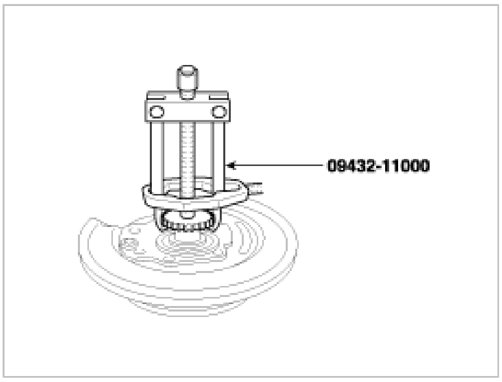
1. Release the parking brake.
2. Remove the wheel and tire.



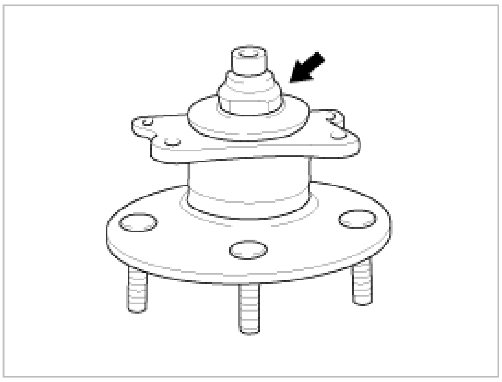
3. Remove the ABS sensor from the carrier.
4. Remove the caliper assembly from the carrier and suspend it with wire.
5. Remove the brake disc.
6. Remove the rear axle hub mounting bolts (4).



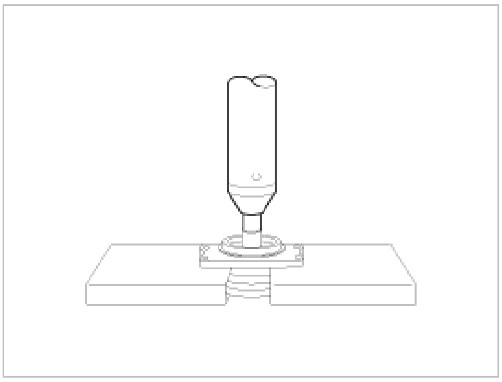
7. Using the special tool (09432-11000), remove the tone wheel.



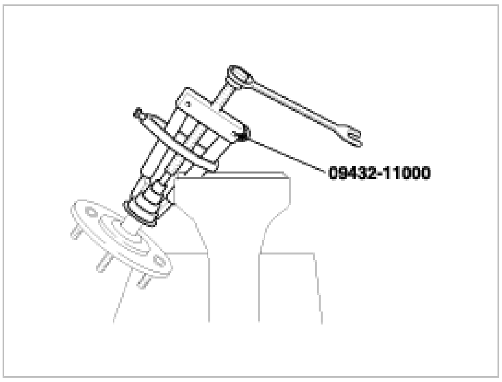
8. Remove the carrier assembly.
9. After unstaking the flange nut, remove the nut.



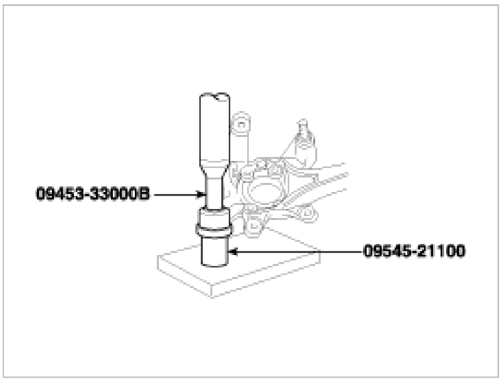
10. While supporting the flange area of the bearing outer race, press out the rear axle hub.



11. Using the special tool (09432-11000), remove the bearing inner race from the axle hub.

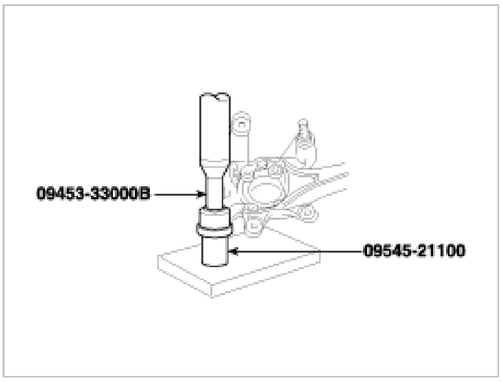


12. Using the special tools (09453-33000B, 09545-21100), remove the 2 bushings from the carrier.

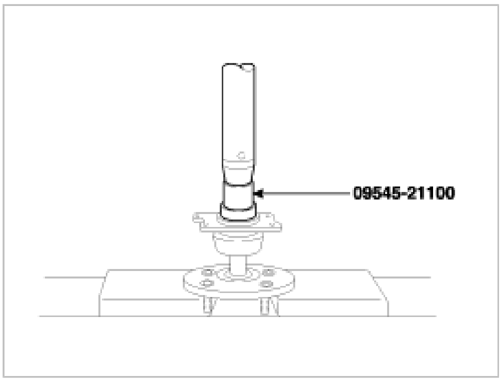


INSTALLATION

1. Using the special tools (09453-33000B, 09545-21100) press-in the 2 bushings to the carrier.



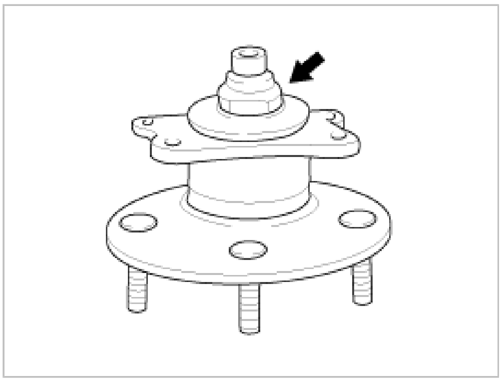
2. Apply a thin coat of multi-purpose grease to the hub and bearing contact surface.
3. Using the special tool (09545-21100), press-in the bearing to the hub.



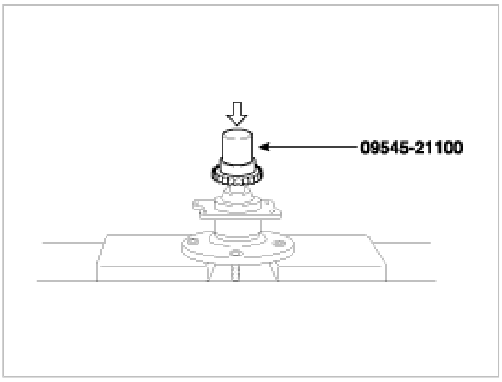
NOTE

- Do not press against the outer race of the bearing because that can cause the damage to the bearing assembly.
- Always use a new bearing assembly.

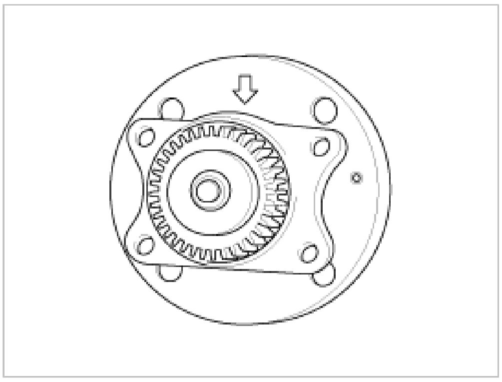
4. After tightening the flange nut, stake the nut to meet the concave portion of the spindle.



5. Using the special tool (09221-21000), press-in the tone wheel.

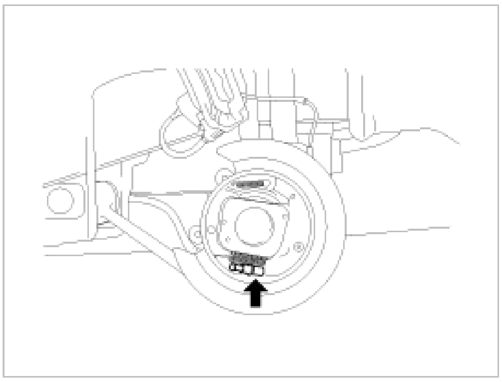


6. Fix the hub and bearing assembly to the brake backing plate so that the rounded area of the bearing outer race is placed facing upward.

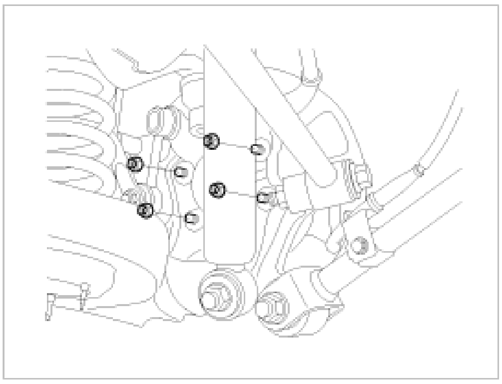


NOTE

If it is difficult to fix, adjust the parking brake adjusting nut in clockwise direction to enlarge the space between the shoe and lining assembly.

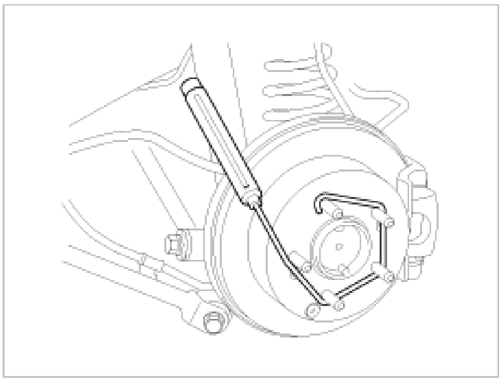


7. Tighten the 4 bolts to the specified torque.



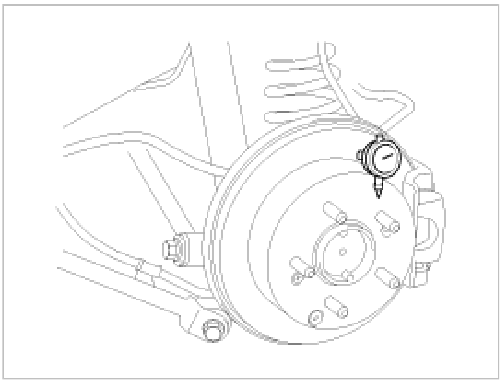
8. Rotate the hub to seat the bearing.
9. Using a spring balance, measure the wheel bearing starting torque.

Standard value
Starting torque : 1.76 Nm (0.18 kgf·m, 15.6 lb-in) or less



10. Fix a dial gauge andmeasure the hub end play. Check that it is within the standard value.

Standard value
Hub end play : 0.008 mm (0.0003 in) or less



INSPECTION

1. Check the rear hub bearing for wear or damage.
2. Check the rear tone wheel for chipped teeth.
3. Check the hub inner surface for scoring.
4. Check the carrier for crack.

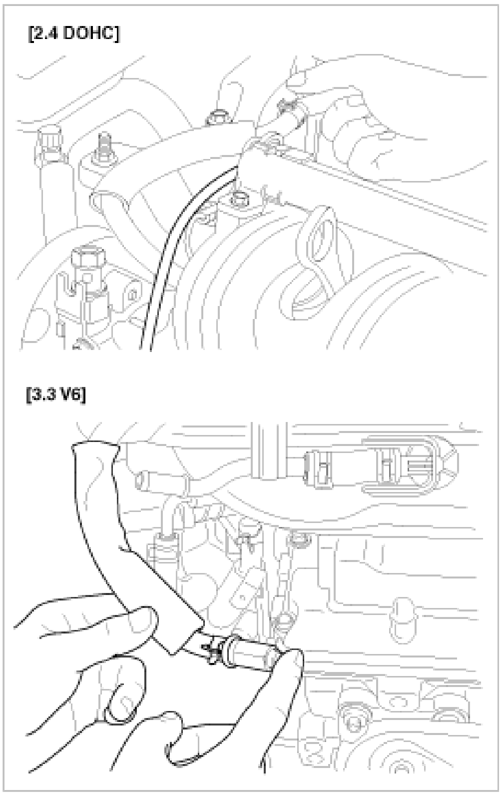
Emission Control System > Crankcase Emission Control System > Positive Crankcase Ventilation (PCV) Valve > Repair procedures

REMOVAL

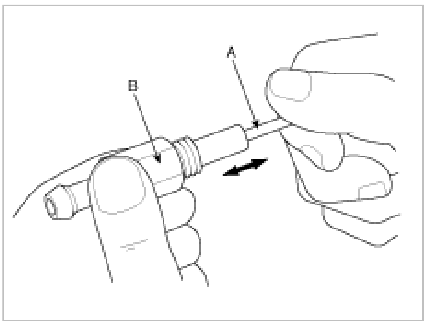
1. Disconnect the ventilation hose from the positive crankcase ventilation (PCV) valve. Remove the PCV valve from the rocker cover and reconnect it to the ventilation hose.
2. Run the engine at idle and put a finger on the open end of the PCV valve and make sure that intake manifold vacuum can be felt.

> NOTE
>
> The plunger inside the PCV valve will move back and forth.



INSPECTION

1. Remove the PCV valve.
2. Insert a thin stick(A) into the PCV valve(B) from the threaded side to check that the plunger moves.
3. If the plunger does not move, the PCV valve is clogged. Clean it or replace.



INSTALLATION

Install the PCV valve and tighten to the specified torque.

PCV valve : 0.8~1.2 kgf·m

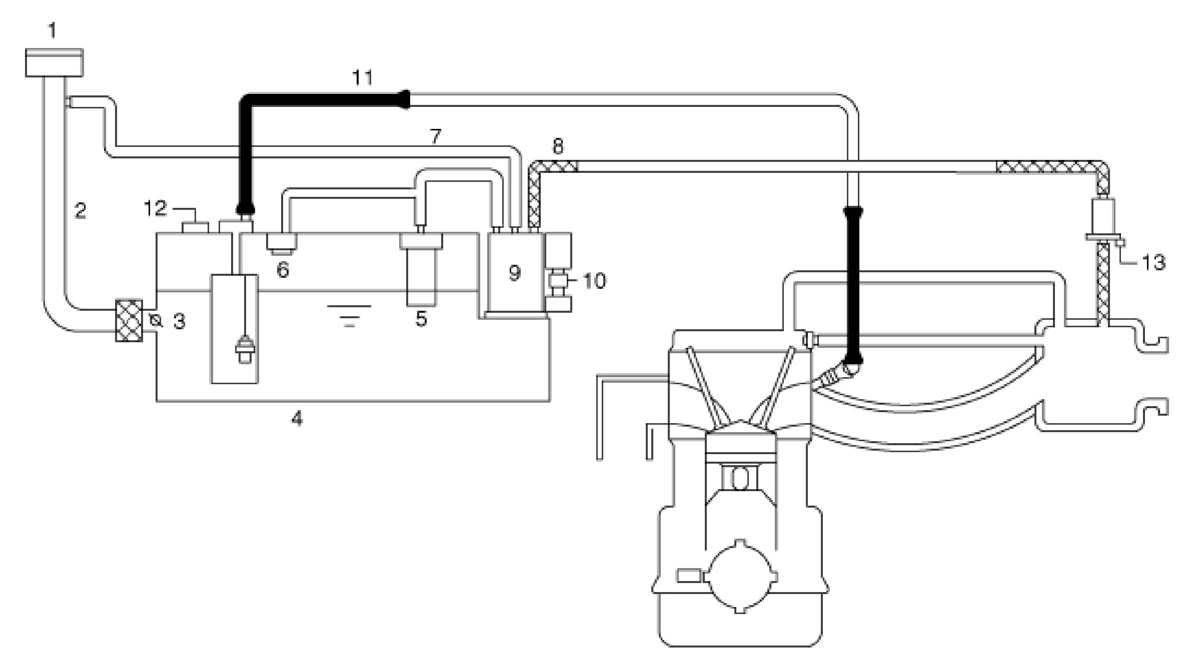
Emission Control System > Evaporative Emission Control System > Description and Operation

DESCRIPTION

This system consists of a fill vent valve, fuel shut-off valve, fuel cut valve (for roll over), two way valve (pressure/vacuum relief), fuel liquid/vapor separator which is installed beside the filler pipe, charcoal canister which is mounted under the rear floor LH side member and protector, tubes and miscellaneous connections.
While refueling, ambient air is drawn into the filler pipe so as not to emit fuel vapors in the air. The fuel vapor in the tank is then forced to flow into the canister via the fill vent valve. The fuel liquid/vapor separator isolates liquid fuel and passes the pure vapor to the charcoal canister.
While the engine is operating, the trapped vapor in the canister is drawn into the intake manifold and then into the engine

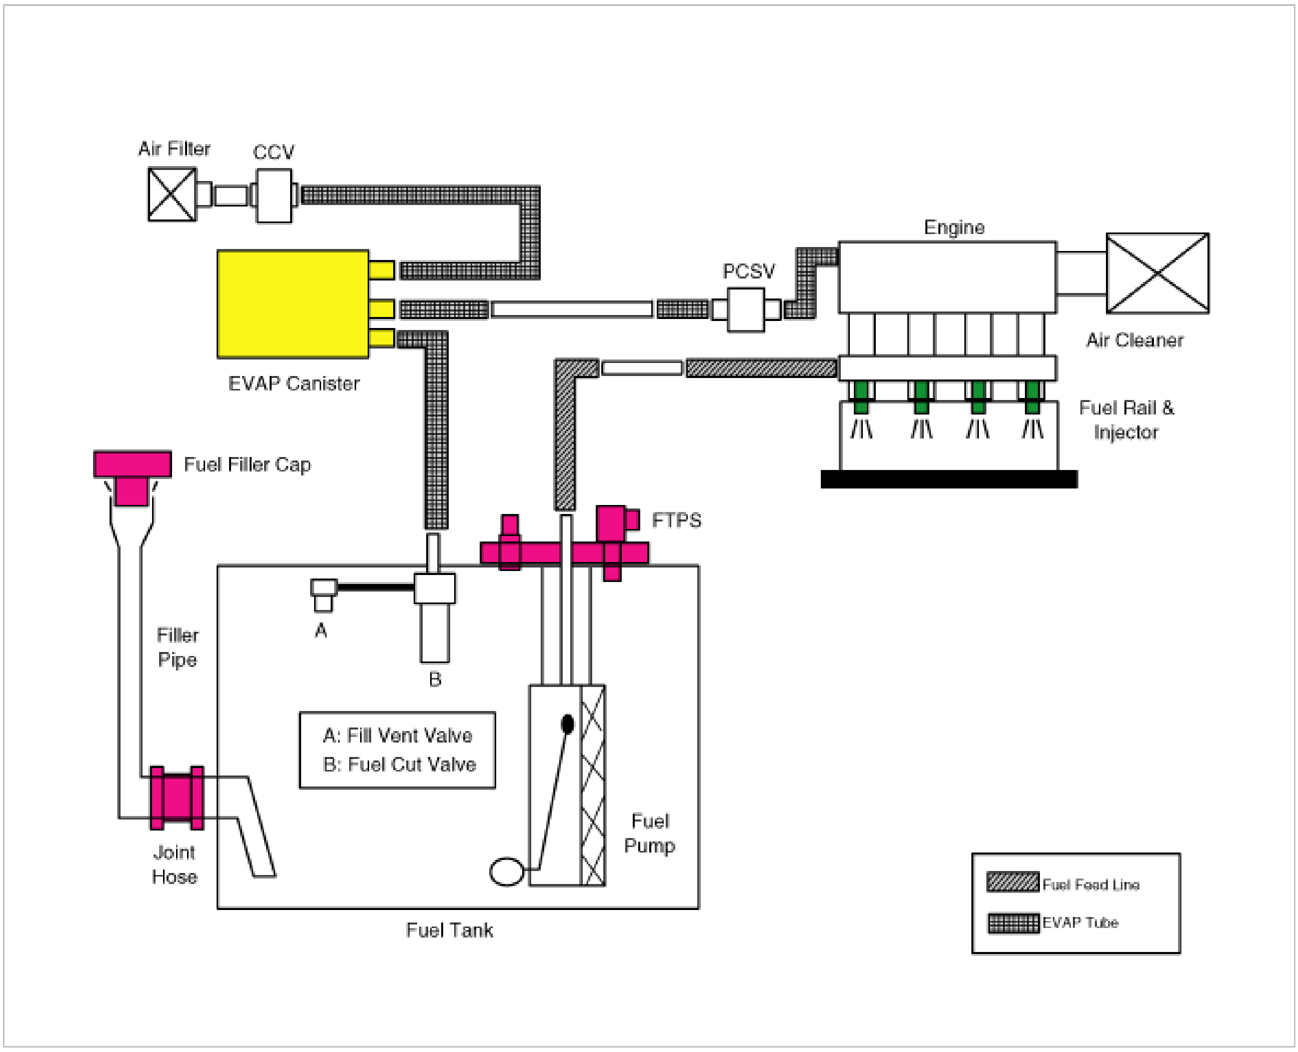
combustion chamber. According to this purge process, the charcoal canister is purged and recovers its absorbing capability.

COMPONENTS

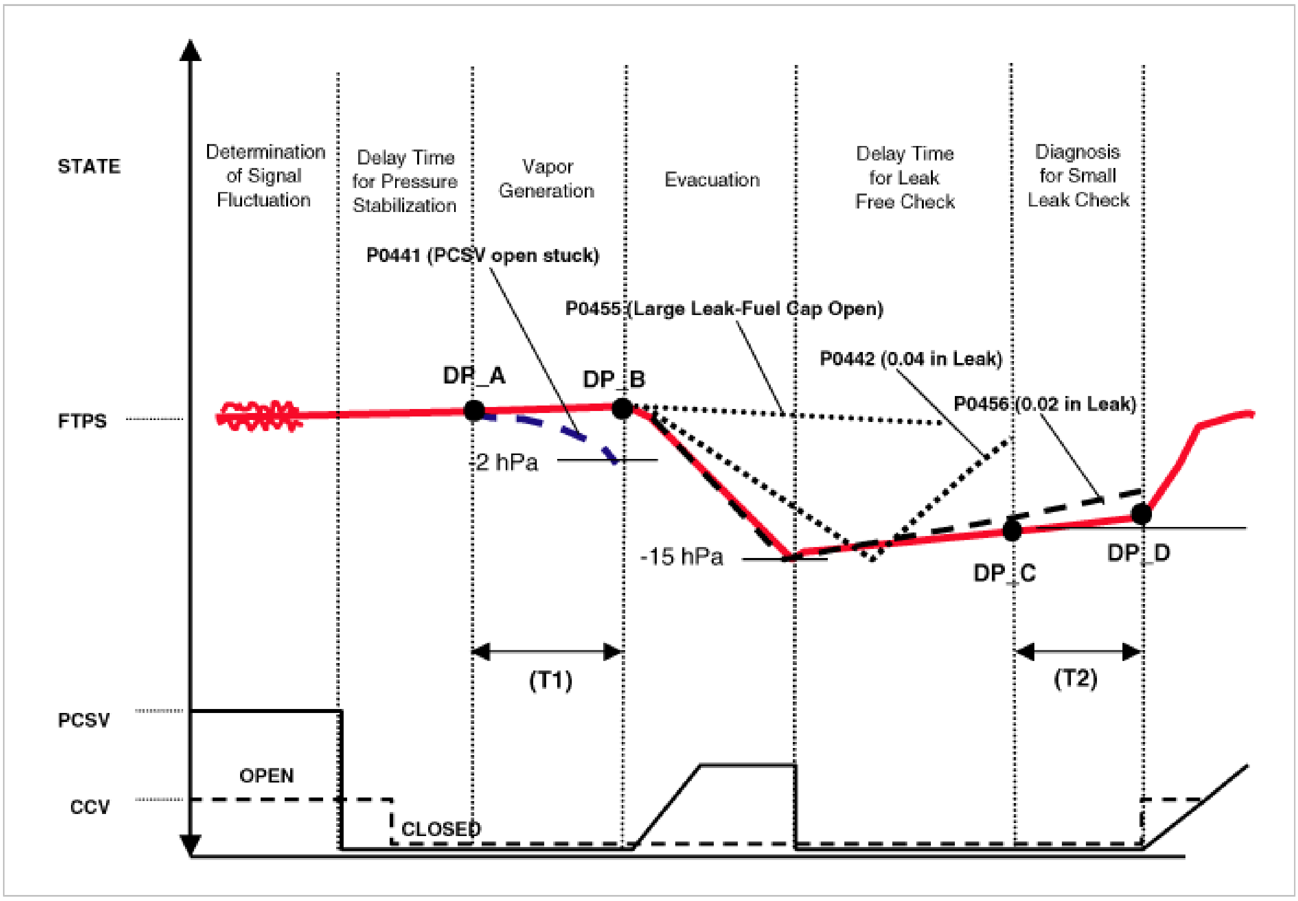


1. Filler cap	8. EVAP. Hose
2. Fuel filler pipe	9. Canister
3. Check valve	10. Canister Close Valve (CCV)
4. Fuel tank	11. Fuel feed line
5. ORVR control valve	12. Fuel Tank Pressure Sensor (FTPS)
6. Vapor valve	13. Purge Control Solenoid Valve (PCSV)
7. EVAP. Hose	

DESCRIPTION



EVAP. SYSTEM MONITORING



Emission Control System > Evaporative Emission Control System > Repair procedures

INSPECTION

1. Disconnect the vacuum hose from the throttle body, and connect a vacuum pump to the vacuum hose.
2. Check the following points when the engine is cold [engine coolant temperature 60°C(140°F) or below] and when it is warm [engine coolant temperature 80°C(176°F) or higher].

WHEN ENGINE IS COLD

Engine operating condition	Applied vacuum	Result
Idling	50 kPa (7.3 psi)	Vacuum is held
3,000 rpm		

WHEN ENGINE IS WARM

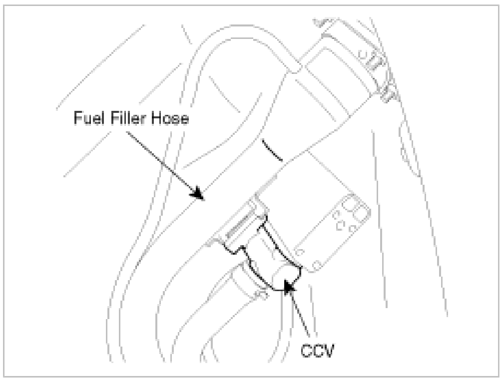
Engine operating condition	Applied vacuum	Result
Idling	50 kPa (7.3 psi)	Vacuum is held
Within 3 minutes after engine start at 3,000 rpm	Try to apply vacuum	Vacuum is released
After 3 minutes have passed after engine start at 3,000 rpm	50 kPa (7.3 psi)	Vacuum will be held momentarily, after which, it will be released

Emission Control System > Evaporative Emission Control System > Canister > Description and Operation

DESCRIPTION

The evaporative emission control system prevents hydrocarbon (HC) vapors from the fuel tank from escaping into the atmosphere where they could form photochemical smog. Gasoline vapors are collected in the charcoal canister. The

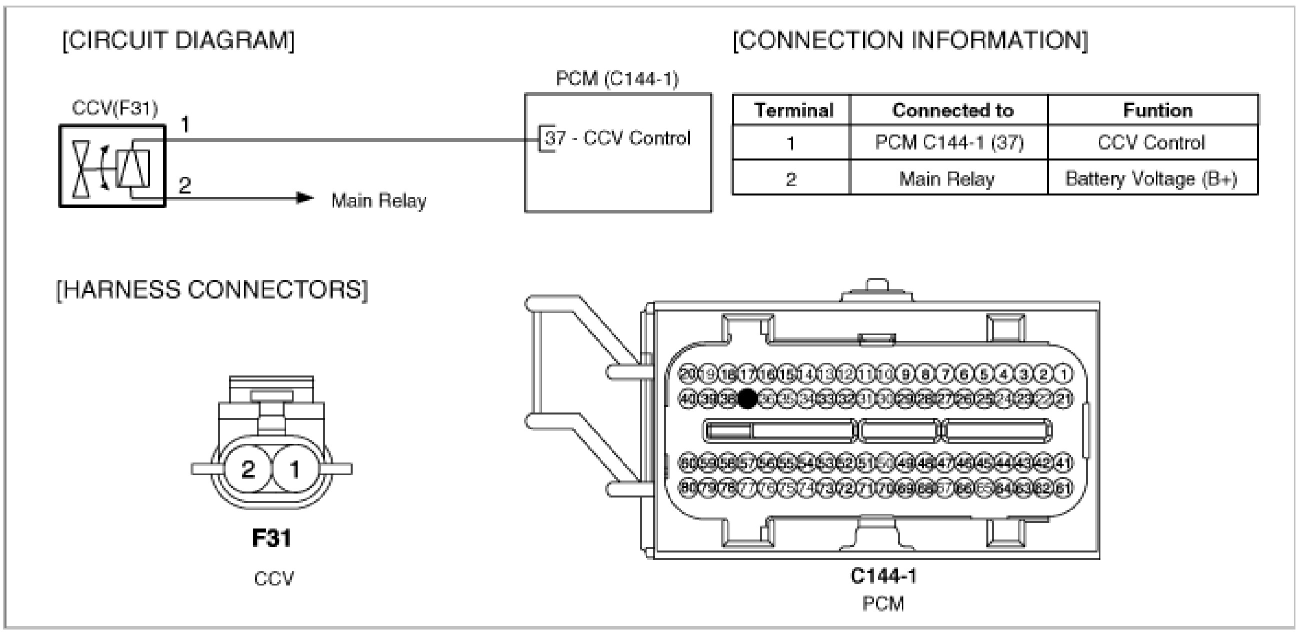
Canister Close Valve (CCV) closes off the air inlet into the canister for leak detection of the evaporative emission system. The CCV also prevents fuel vapors from escaping from the canister. When the engine purges the HC vapors from the canister, the clean air comes into the canister through the canister air-filter and the CCV.



SPECIFICATION

Item Spec	ification
Coil Resistance (Ω)	19.8 ~ 21.8Ω at 20°C (68°F)

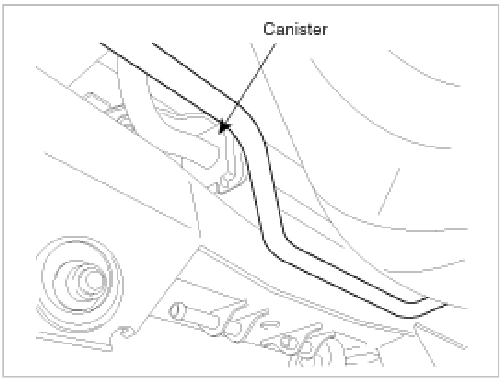
SCHEMATIC DIAGRAM



Emission Control System > Evaporative Emission Control System > Canister > Repair procedures

REMOVAL

1. Remove the fuel tank. (Refer to "Fuel System" group)
2. Disconnect hoses connecting to the canister.
3. Unfasten two mounting bolts and remove the canister.



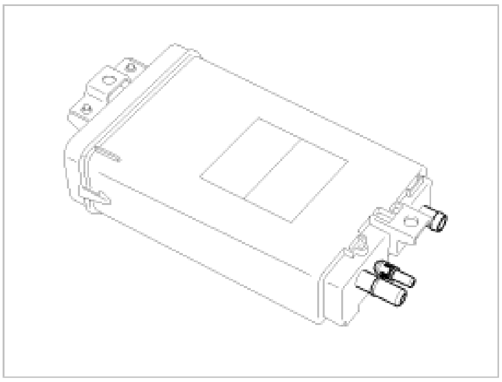
INSTALLATION

Installation is in reverse order of removal.

Torque : 1.7 ~ 2.6kgf·m (16.7 ~ 25.5N·m, 12.3 ~ 18.8lbf·ft)

INSPECTION

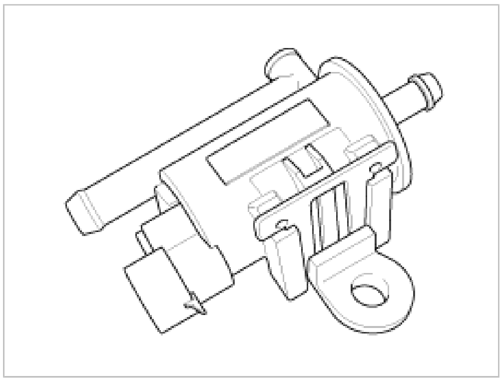
1. Lock for loose connections, sharp bends or damage to the fuel vapor lines.
2. Look for distortion, cracks or fuel damage.
3. After removing the canister, inspect for cracks or damage.



Emission Control System > Evaporative Emission Control System > Purge Control Solenoid Valve (PCSV) > Description and Operation

DESCRIPTION

Purge Control Solenoid Valve (PCSV) is installed on the surge tank and controls the passage between the canister and the intake manifold. It is a solenoid valve and is open when the PCM grounds the valve control line. When the passage is open (PCSV ON), fuel stored in the canister is transferred to the intake manifold.



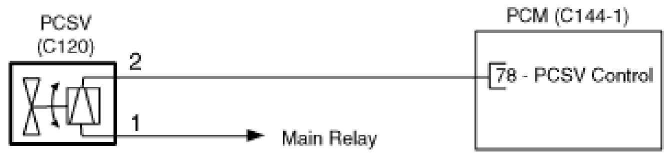
SPECIFICATION

Item	Specification

Coil Resistance (Ω)	19.0 ~ 22.0Ω at 20°C (68°F)

SCHEMATIC DIAGRAM

[CIRCUIT DIAGRAM]



[CONNECTION INFORMATION]

Terminal	Connected to	Funtion

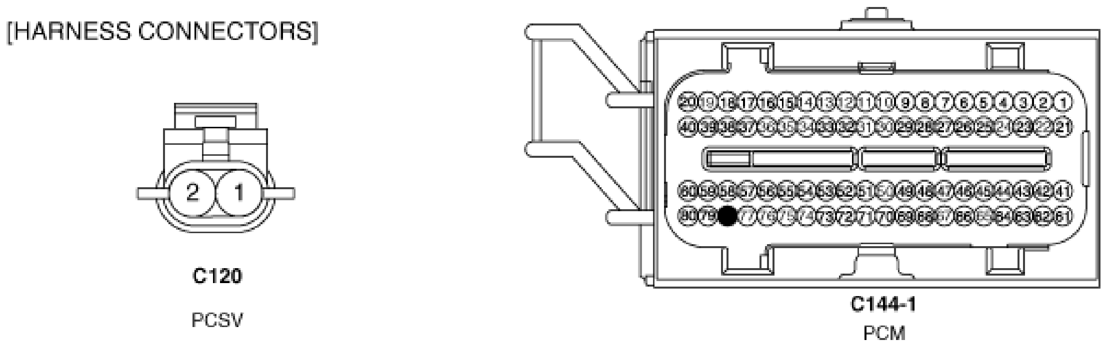
2	PCM C144-1 (78)	PCSV Control

[HARNESS CONNECTORS]



Emission Control System > Evaporative Emission Control System > Purge Control Solenoid Valve (PCSV) > Repair procedures

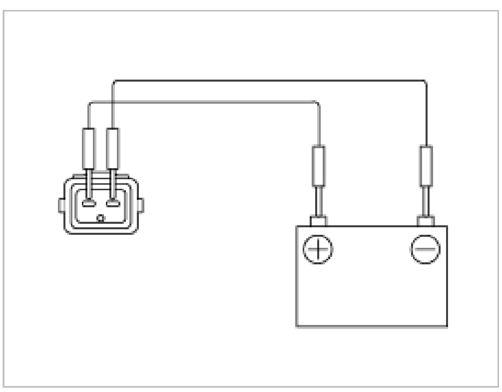
INSPECTION

NOTE

When disconnecting the vacuum hose, make an identification mark on it so that it can be reconnected to its original position.

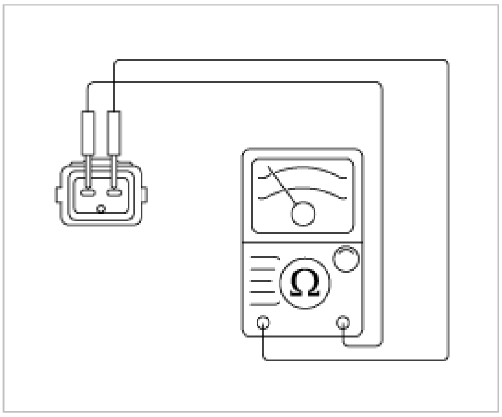
1. Disconnect the vacuum hose from the solenoid valve.
2. Detach the harness connector.
3. Connect a vacuum pump to the nipple to which the red-striped vacuum hose was connected.
4. Apply vacuum and check when voltage is applied to the PCSV and when the voltage is discontinued.

Battery voltage	Normal condition
When applied	Vacuum is released
When discontinued	Vacuum is maintained



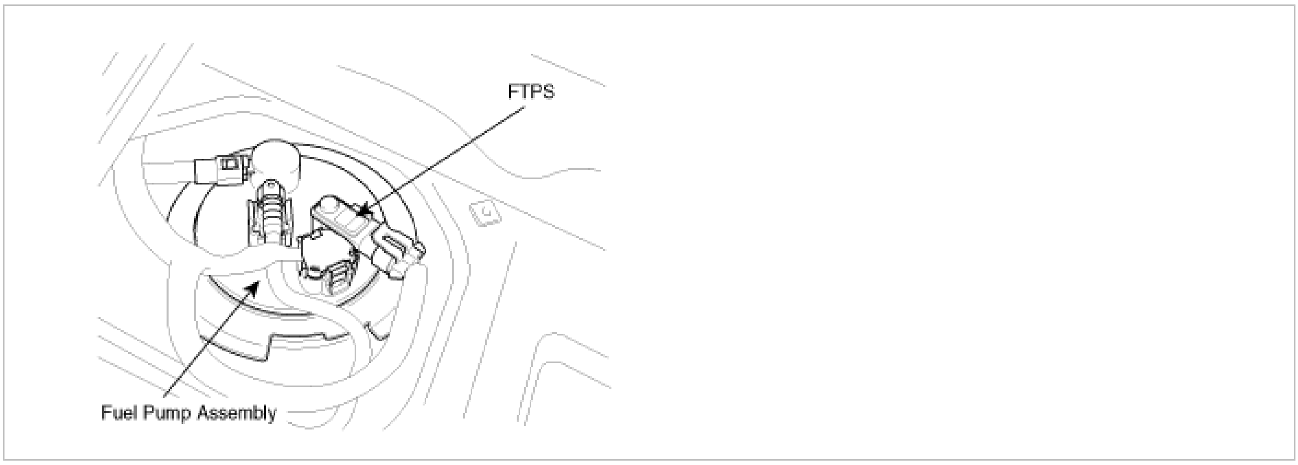
5. Measure the resistance between the terminals of the solenoid valve.

PCSV coil resistance(Ω) :
19 ~ 22Ω at 20°C (68°F)



Emission Control System > Evaporative Emission Control System > Fuel Tank Pressure Sensor (FTPS) > Description and Operation

DESCRIPTION

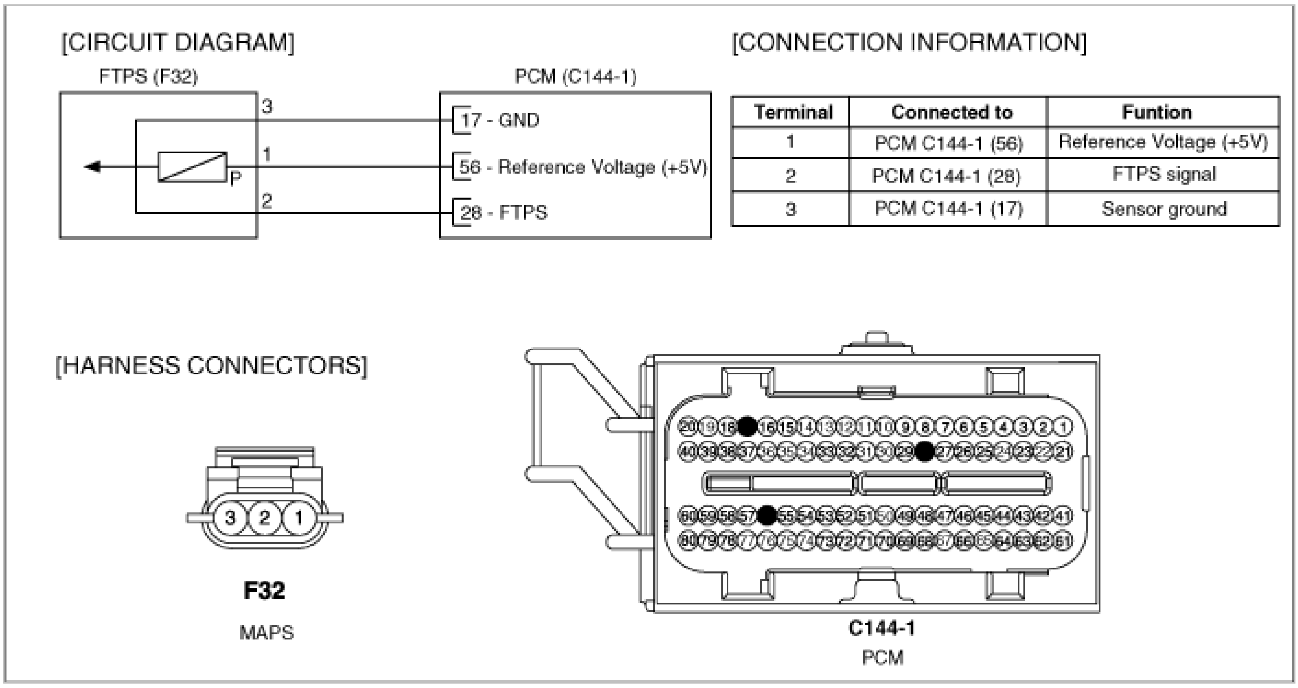


The evaporative emission control system prevents hydrocarbon vapors from escaping from the fuel tank into the atmosphere where they could form photochemical smog. Gasoline vapors are collected in the charcoal canister. The Fuel Tank Pressure Sensor (FTPS) is installed on fuel pump assembly and is an integral part of the evaporative monitoring system. The PCM monitors the FTPS signal to detect vacuum decay and excess vacuum. The FTPS measures the difference between the air pressure inside the fuel tank and outside air pressure to check the purge control solenoid valve operation and for leak detection in the evaporative emission control system by monitoring pressure and vacuum levels in the fuel tank during the purge control solenoid valve operating cycles.

SPECIFICATION

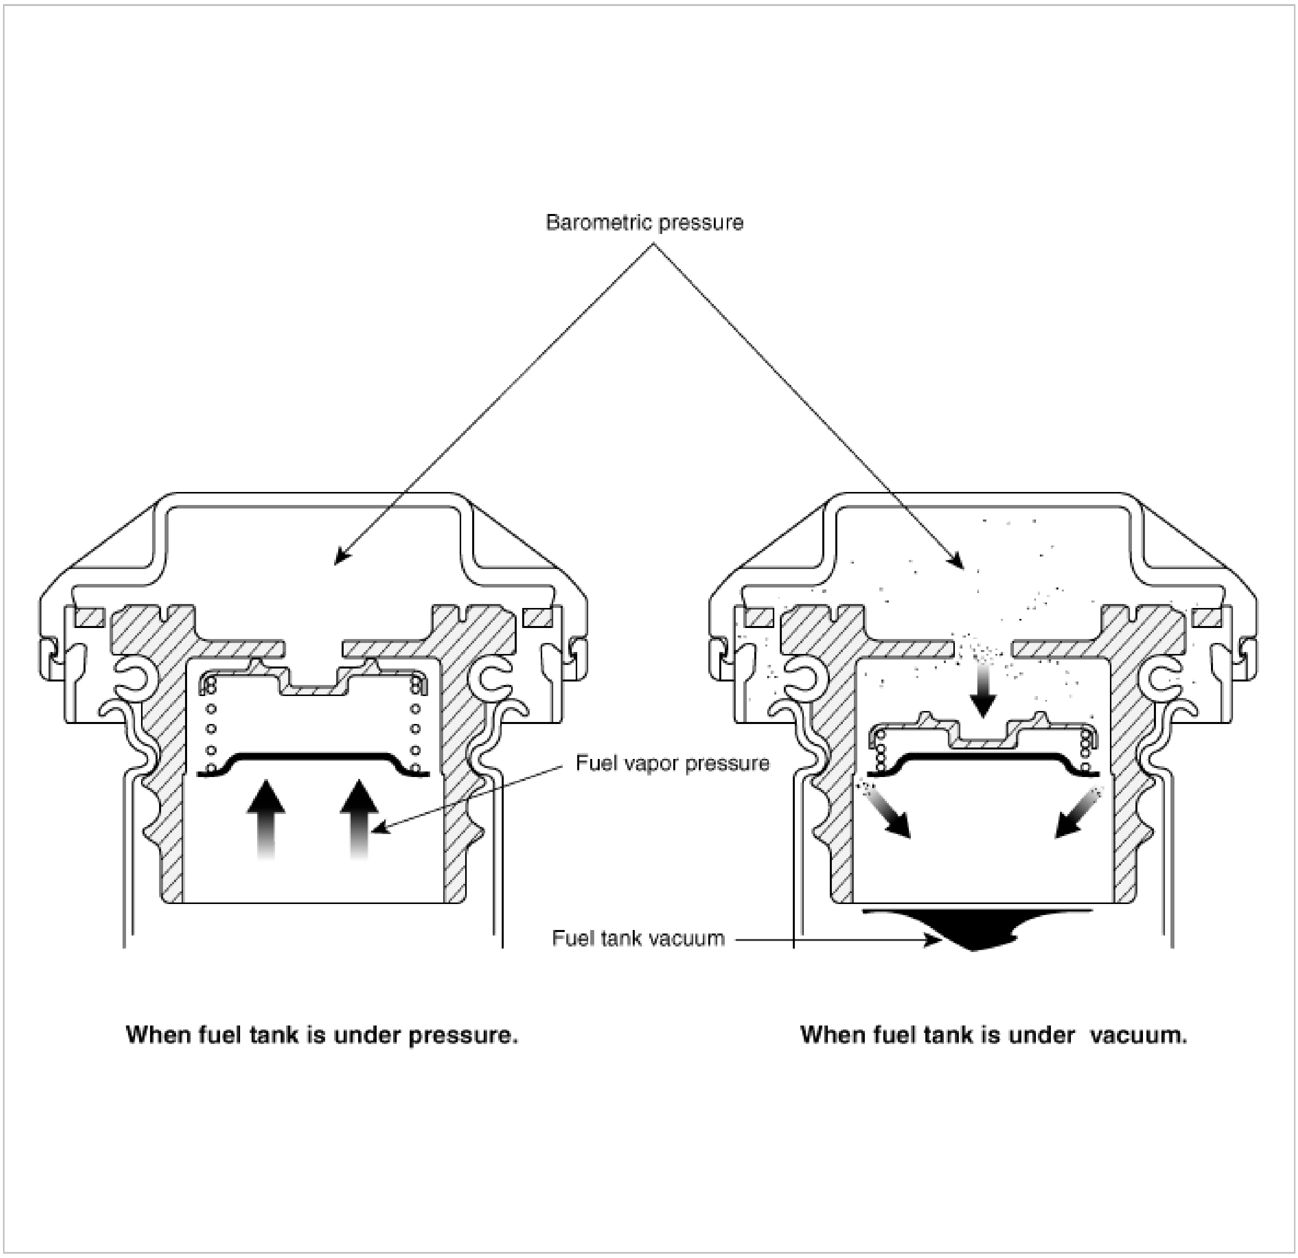
Pressure (kPa)	Output Voltage (V)
-3.75 kPa	4.5 V
0 kPa	1.5 V
1.25 kPa	0.5 V

SCHEMATIC DIAGRAM



Emission Control System > Evaporative Emission Control System > Fuel Filler Cap > Description and Operation

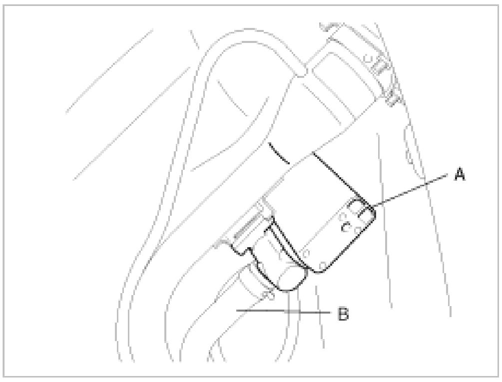
DESCRIPTION



Emission Control System > Evaporative Emission Control System > Fuel Tank Air Filter > Repair procedures

REPLACE

1. Remove the rear left wheel house.
   (Refer to "BD" group)
2. Disconnect the canister close valve wiring connector and the vapor hose to canister (B).



3. Remove the fuel tank air filter(A).
4. Install a new fuel tank air filter.

Emission Control System > Exhaust Emission Control System > Description and Operation

DESCRIPTION

Modifications to the combustion chamber, intake manifold, camshaft and ignition system form the basic control system. These items have been integrated into a highly effective system which controls exhaust emissions while maintaining good driveability and fuel economy.

AIR/FUEL MIXTURE CONTROL SYSTEM [MULTIPORT FUEL INJECTION (MFI) SYSTEM]

This in turn allows the engine to produce exhaust gases of the proper composition to permit the use of a three way catalyst. The three way catalyst is designed to convert the three pollutants (1) hydrocarbons (HC), (2) carbon monoxide (CO), and (3) oxides of nitrogen (NOx) into harmless substances. There are two operating modes in the MFI system.

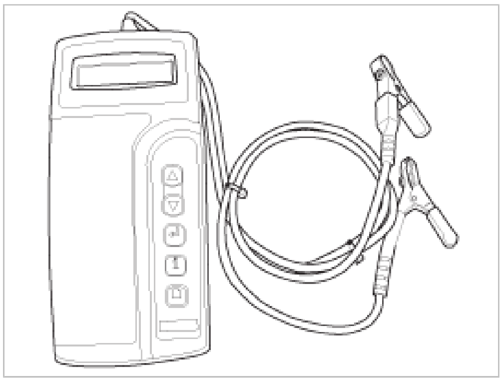
1. Open Loop air/fuel ratio is controlled by information programmed into the ECM.
2. Closed Loop air/fuel ratio is adjusted by the ECM based on information supplied by the oxygen sensor.

THE MICRO 570 ANALYZER

The MICRO 570 Analyzer provides the ability to test the charging and starting systems, including the battery, starter and alternator.

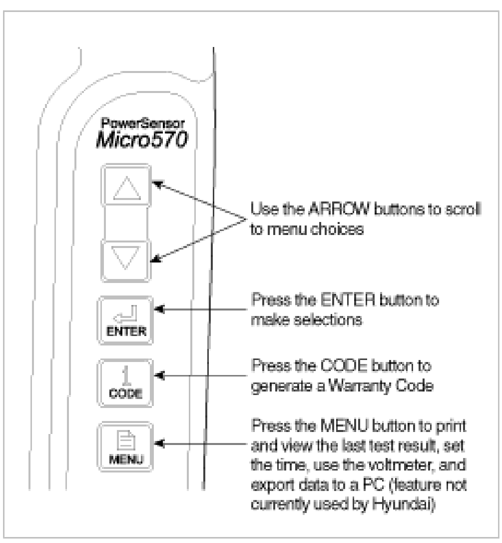
CAUTION

Because of the possibility of personal injury, always use extreme caution and appropriate eye protection when working with batteries.



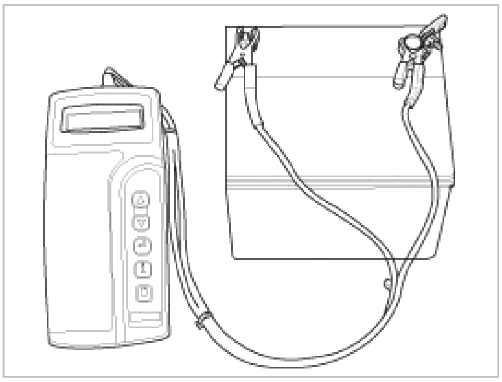
KEYPAD

The MICRO570 button on the key pad provides the following functions :



BATTERY TEST PROCEDURE

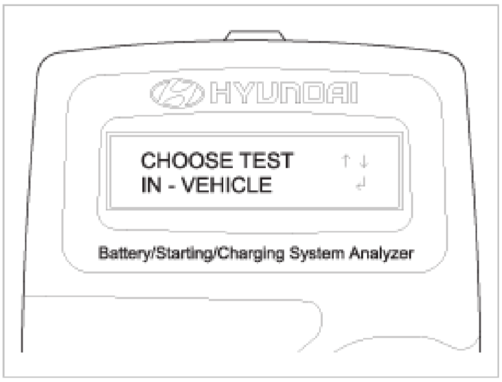
1. Connect the tester to the battery.
   A. Red clamp to battery positive (+) terminal.
   B. Black clamp to battery negative (-) terminal.



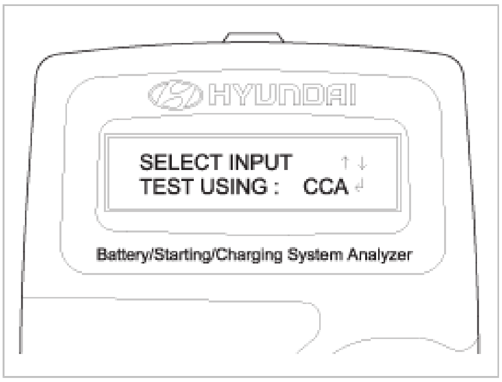
CAUTION

Connect clamps securely. If "CHECK CONNECTION" message is displayed on the screen, reconnect clamps securely.

2. The tester will ask if the battery is connected "IN A VEHICLE" or "OUT OF A VEHICLE". Make your selection by pressing the arrow buttons; then press ENTER.



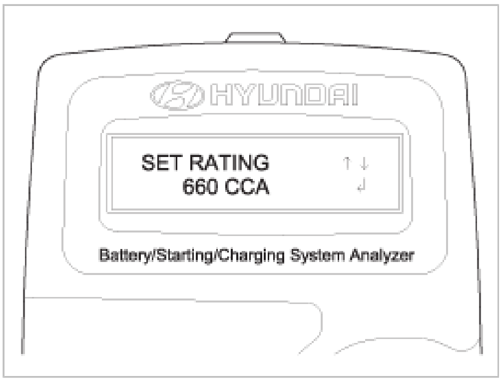
3. Choose either CCA or CCP and press the ENTER button.



NOTE

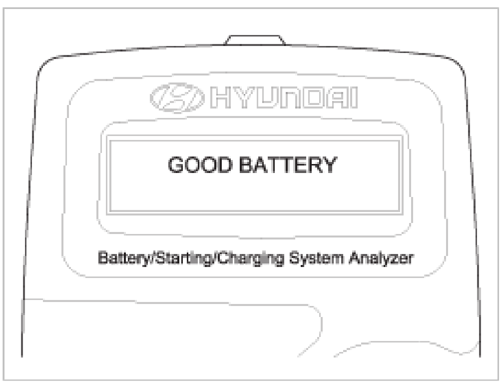
- CCA : Cold cranking amps, is an SAE specification for cranking batteries at -18°C (0°F).
- CCP : Cold cranking amps, is an SAE specification for korean manufacturer's for cranking batteries at -18°C (0°F).

4. Set the CCA value displayed on the screen to the CCA value marked on the battery label by pressing up and down buttons and press ENTER.



> **NOTE**
>
> The battery ratings(CCA) displayed on the tester must be identical to the ratings marked on battery label.

5. The tester (Micro570) displays battery test results including voltage and battery ratings.
   A relevant action must be given according to the test results by referring to the battery test results as shown in the table below.



> **NOTE**
>
> The battery ratings (CCA) displayed on the tester must be identical to the ratings marked on battery label.

6. To conduct starter test, continuously, press ENTER.

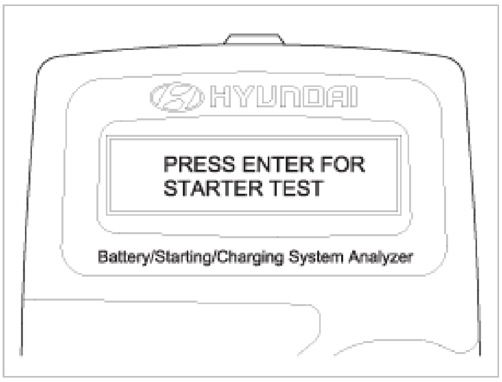
BATTERY TEST RESULTS

RESULT ON PRINTER	REMEDY
Good battery	No action is required
Good recharge	Battery is in a good state Recharge the battery and use
Charge & Retest	Battery is not charged properly => Charge and test the battery again (Failure to charge the battery fully may read incorrect measurement value)
Replace battery	=> Replace battery and recheck the charging system. (Improper connection between battery and vehicle cables may cause "REPLACE BATTERY", retest the battery after removing cables and connecting the tester to the battery terminal directly prior to replacing the battery)
Bad cell-replace	=> Charge and retest the battery. And then, test results may cause "REPLACE BATTERY", replace battery and recheck the charging system

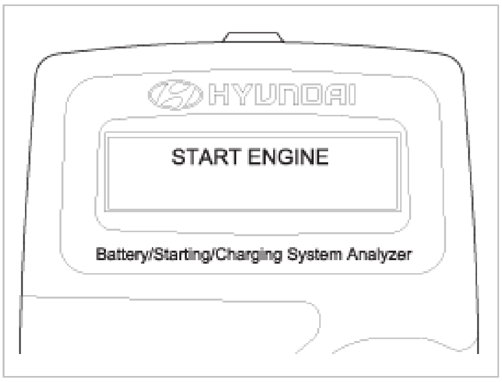
> **WARNING**
>
> Whenever filing a claim for battery, the print out of the battery test results must be attached.

STARTER TEST PROCEDURE

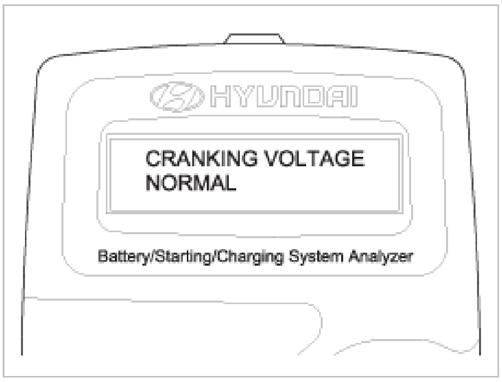
1. After the battery test, press ENTER immediately for the starter test.



2. After pressing ENTER key, start the engine.



3. Cranking voltage and starter test results will be displayed on the screen.
   Take a relevant action according to the test results by referring to the starter test results as given below.



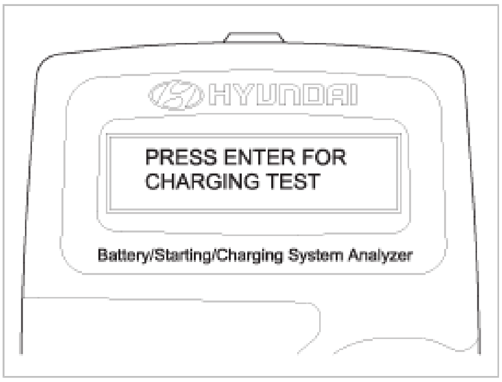
4. To continue charging system test, press ENTER.

STARTER TEST RESULTS

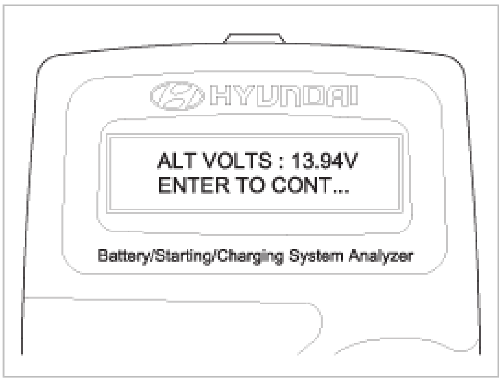
RESULT ON PRINTER	REMEDY
Cranking voltage normal	System shows a normal starter draw
Cranking voltage low	Cranking voltage is lower than normal level => Check starter
Charge battery	The state of battery charge is too low to test => Charge the battery and retest
Replace battery	=> Replace battery => If the vehicle is not started though the battery condition of "Good and fully charged" is displayed. => Check wiring for open circuit, battery cable connection, starter and repair or replace as necessary. => If the engine does crank, check fuel system.

CHARGING SYSTEM TEST PROCEDURE

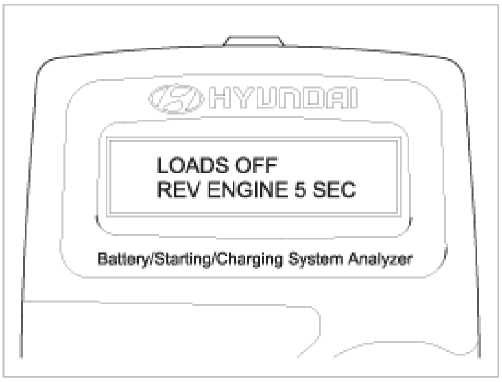
1. Press ENTER to begin charging system test.



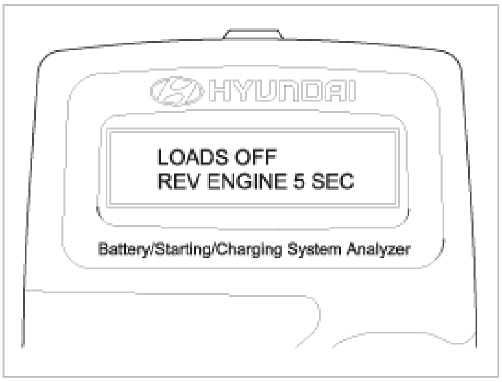
2. ENTER button is pressed, the tester displays the actual voltage of alternator.
   Press ENTER to test the charging system.



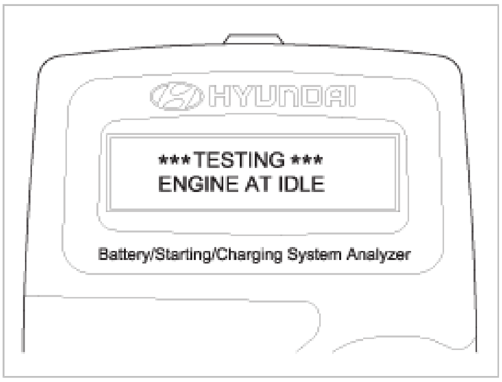
3. Turn off all electrical load and rev engine for 5 seconds by pressing the accelerator pedal.



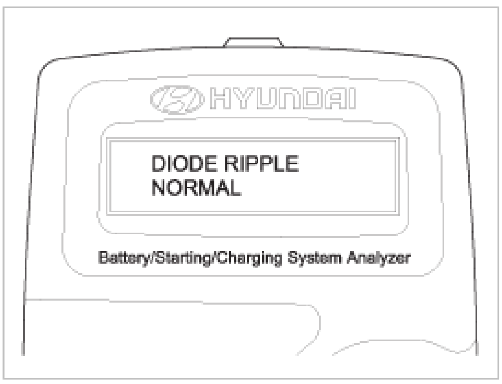
4. Press ENTER.



5. The MICRO 570 analyzer charging system output at idle for comparison to other readings.



6. Take a relevant action according to the test results by referring to the table below after shutting off the engine and disconnect the tester clamps from the battery.



CHARGING SYSTEM TEST RESULTS

RESULT ON PRINTER	REMEDY
Charging system normal/Diode ripple normal	Charging system is normal
No charging voltage	Alternator does not supply charging current to battery => Check belts, connection between alternator and battery Replace belts or cable or alternator as necessary
Low charging voltage	Alternator does not supply charging current to battery and electrical load to system fully => Check belts and alternator and replace as necessary
High charging voltage	The voltage from alternator to battery is higher than normal limit during voltage regulating. => Check connection and ground and replace regulator as necessary => Check electrolyte level in the battery
Excess ripple detected	One or more diodes in the alternator is not functioning properly => Check alternator mounting and belts and replace as necessary

Engine Electrical System > General Information > Special Service Tools

	Reserve capacity	110 min	←
	Specific gravity [at 20°C(68°F)]	1.280 ± 0.01	←

NOTE

- COLD CRANKING AMPERAGE is the amperage a battery can deliver for 30 seconds and maintain a terminal voltage of 7.2V or greater at a specified temperature.
- RESERVE CAPACITY RATING is amount of time a battery can deliver 25A and maintain a minimum terminal voltage of 10.5V at 26.7°C(80.1°F).

AUTO CRUISE CONTROL SYSTEM

Items	Specification
Setting error	Within ± 1.5Km/h on level road

Vehicle speed memory variation	No variation
Setting time	0.1sec max
Resuming time	0.1sec max.
Minimum operating speed	40 ± 2Km/h
Cancel speed range	15 ± 2Km/h
Maximum memorized speed	160 ± 2Km/h
Pulling force	127N(13Kgf)
Main switch serial resistance value	3.9kΩ ± 1%
Command switch serial resistance value	SET switch : 220Ω ± 1%
	RESUME switch : 910Ω ± 1%

Engine Electrical System > Ignition System > Description and Operation

DESCRITION

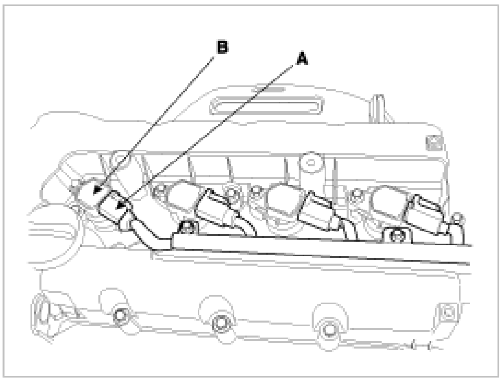
Ignition timing is controlled by the electronic control ignition timing system. The standard reference ignition timing data for the engine operating conditions are preprogrammed in the memory of the ECM (Engine Control Module).
The engine operating conditions (speed, load, warm-up condition, etc.) are detected by the various sensors. Based on these sensor signals and the ignition timing data, signals to interrupt the primary current are sent to the ECM. The ignition coil is activated, and timing is controlled.

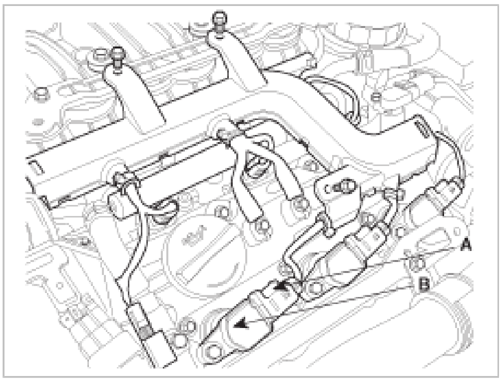
Engine Electrical System > Ignition System > Repair procedures

REMOVAL

IGNITION COIL

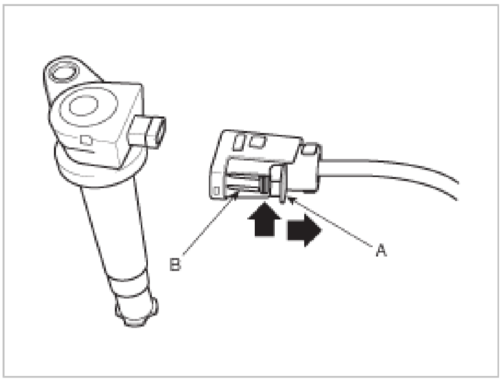
1. Remove the engine cover.
2. Disconnect the ignition coil connector(A).





NOTE

When removing the ignition coil connector, pull the lock pin(A) and push the clip(B).

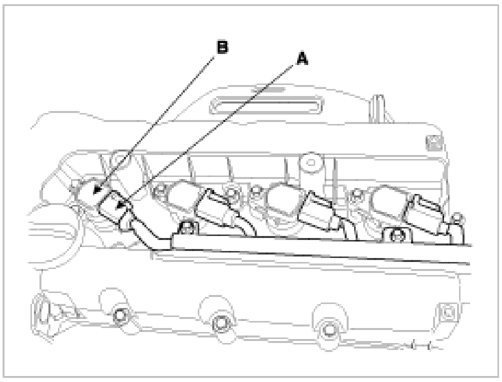


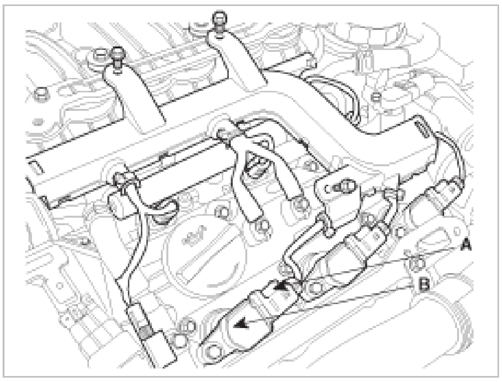
3. Remove the ignition coil (B).
4. Installation is the reverse of removal.

ON-VEHICLE INSPECTION

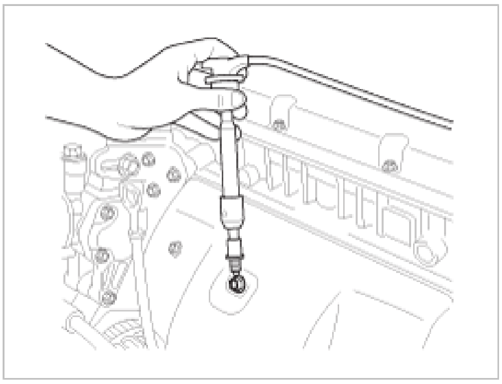
SPARK TEST

1. Remove the ignition coil connector(A).



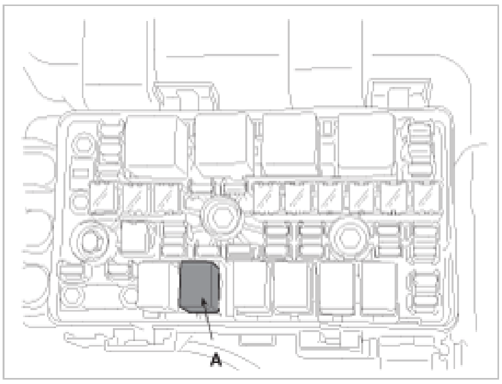


2. Remove the ignition coil(B).
3. Using a spark plug socket, remove the spark plug.
4. Install the spark plug to the ignition coil.
5. Ground the spark plug to the engine.

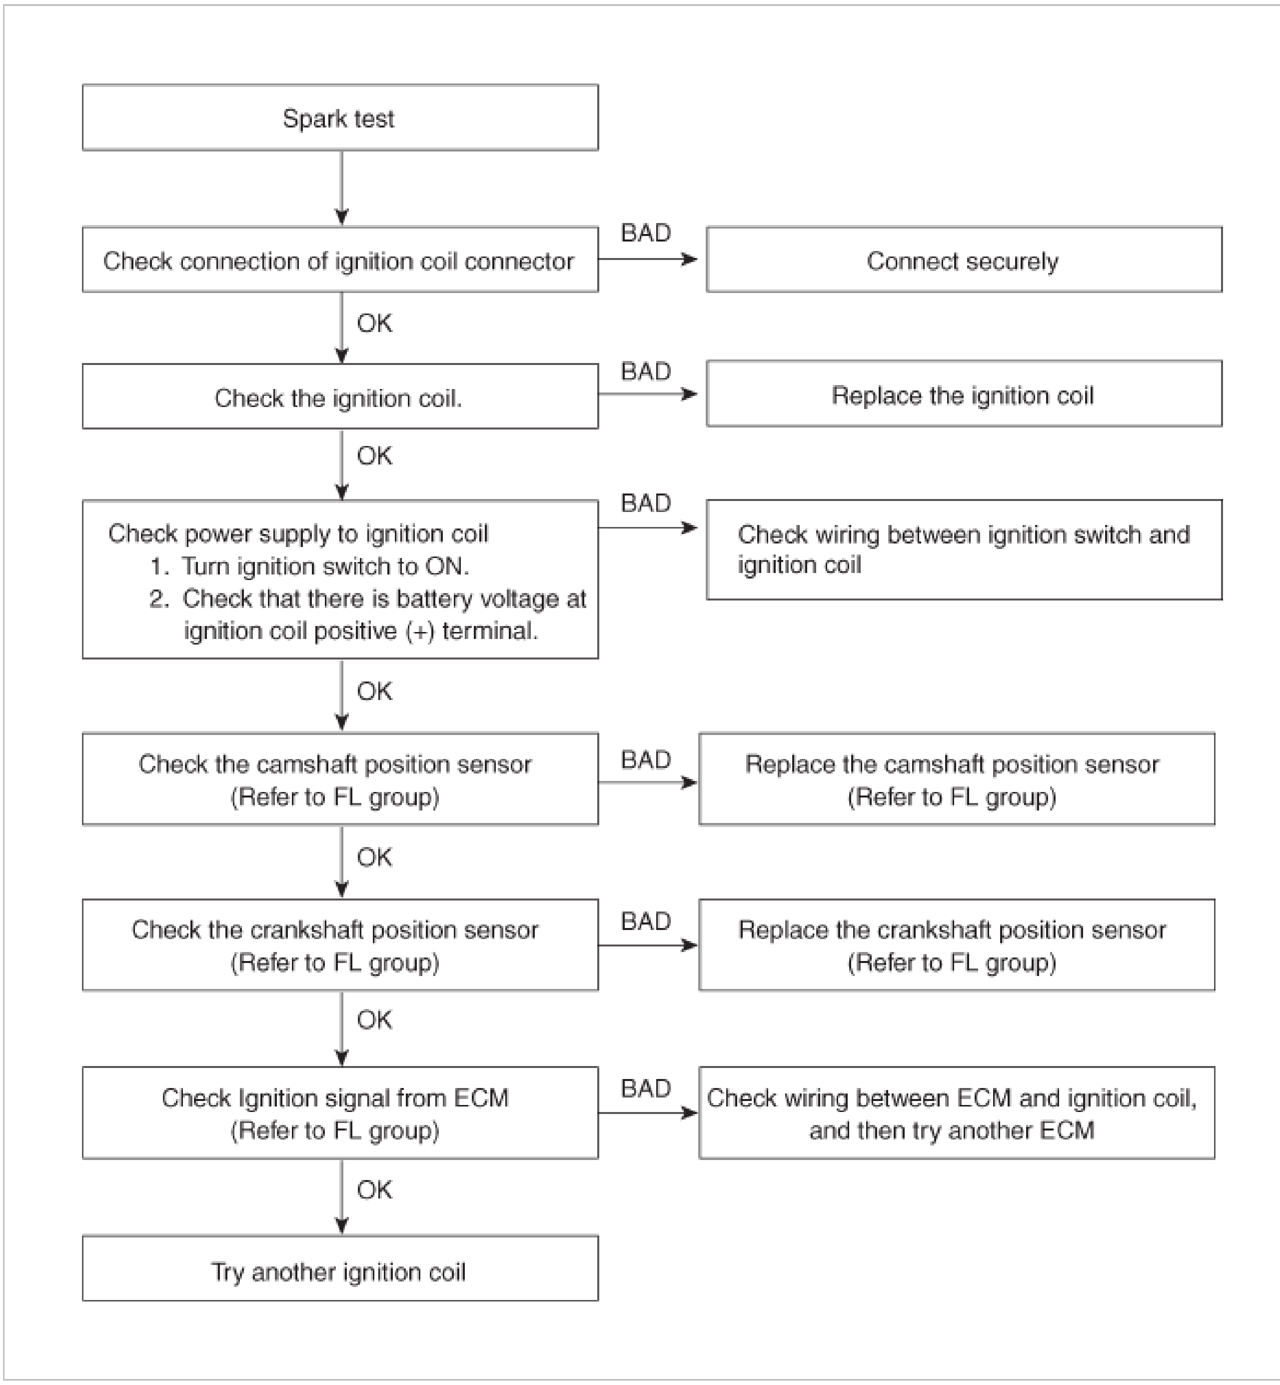


6. Check if spark occurs while engine is being cranked.

> NOTE
>
> To prevent fuel being injected from injectors while the engine is being cranked, remove the fuel pump(A) relay from the fuse box.
> Crank the engine for no more than 5 ~ 10 seconds.

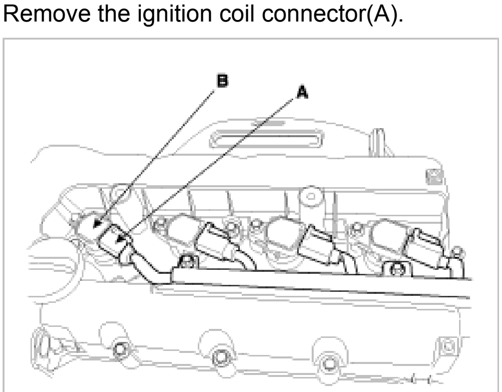


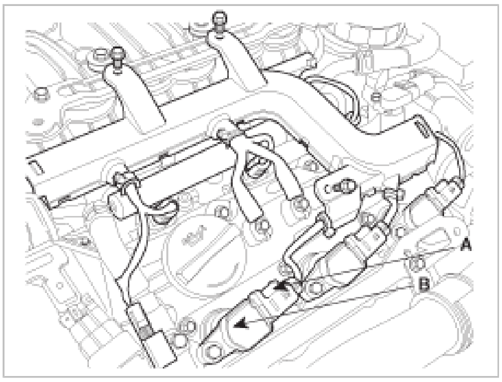
7. Inspect all the spark plugs.
8. Using a spark plug socket, install the spark plug.
9. Install the ignition coil.
10. Reconnect the ignition coil connector.



INSPECT SPARK PLUG

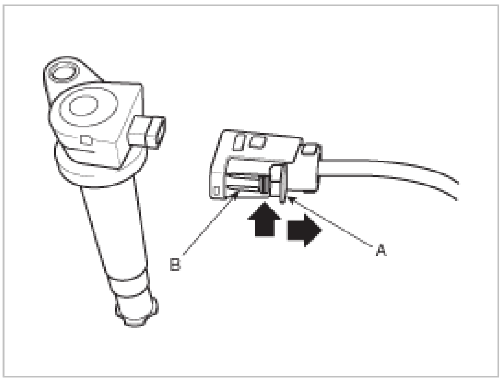
1. Remove the ignition coil connector(A).





NOTE

When removing the ignition coil connector, pull the lock pin(A) and push the clip(B).

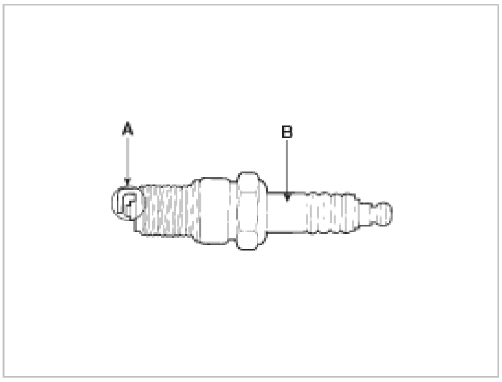


2. Remove the ignition coil(B).
3. Using a spark plug socket, remove the spark plug.

CAUTION

Be careful that no contaminates enter through the spark plug holes.

4. Inspect the electrodes (A) and ceramic insulator (B).

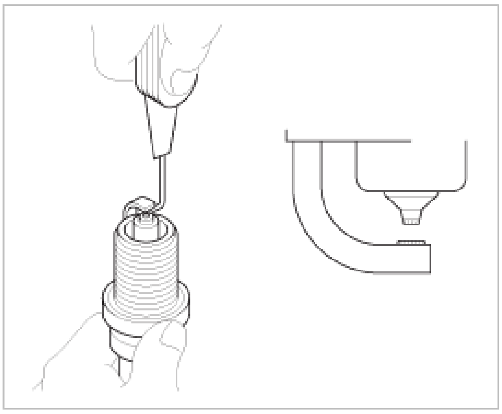


INSPECTION OF ELECTRODES

Condition	Dark deposits	White deposits
Description	- Fuel mixture too rich - Low air intake	- Fuel mixture too lean - Advanced ignition timing - Insufficient plug tightening torque

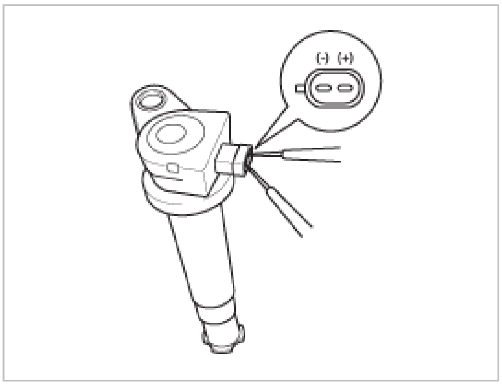
5. Check the electrode gap (A).

Standard :
Unleaded : 1.0 ~ 1.1 mm (0.0394 ~ 0.0433 in.)



INSPECT IGNITION COIL

1. Measure the primary coil resistance between terminals (+) and (-).

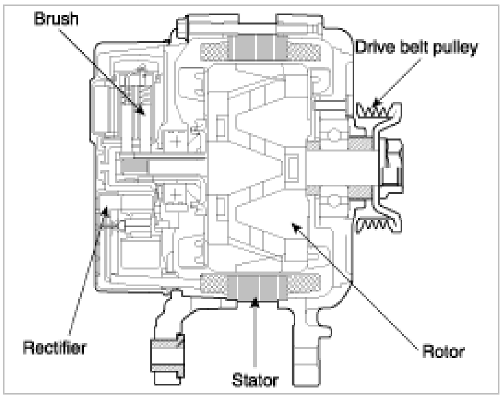


Standard value: 0.62Ω ± 10%

Engine Electrical System > Charging System > Description and Operation

DESCRIPTION

The charging system includes a battery, an alternator with a built-in regulator, and the charging indicator light and wire.
The Alternator has built-in diodes, each rectifying AC current to DC current.
Therefore, DC current appears at alternator "B" terminal.
In addition, the charging voltage of this alternator is regulated by the battery voltage detection system.
The main components of the alternator are the rotor, stator, rectifier, capacitor brushes, bearings and V-ribbed belt pulley.
The brush holder contains a built-in electronic voltage regulator.



Engine Electrical System > Charging System > Repair procedures

ON-VEHICLE INSPECTION

CAUTION

- Check that the battery cables are connected to the correct terminals.
- Disconnect the battery cables when the battery is given a quick charge.
- Never disconnect the battery while the engine is running.

CHECK THE BATTERY TERMINALS AND FUSES

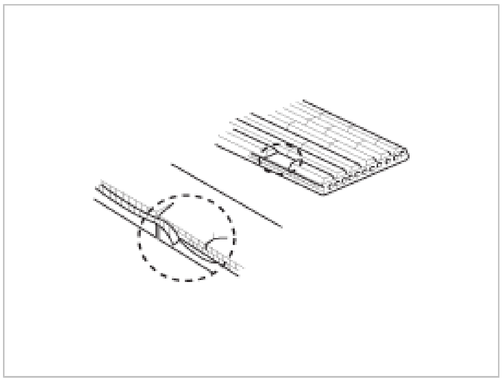
1. Check that the battery terminals are not loose or corroded.
2. Check the fuses for continuity.

INSPECT DRIVE BELT

Visually check the belt for excessive wear, frayed cords etc.
If any defect has been found, replace the drive belt.

NOTE

Cracks on the rib side of a belt are considered acceptable. If the belt has chunks missing from the ribs, it should be replaced.



VISUALLY CHECK ALTERNATOR WIRING AND LISTEN FOR ABNORMAL NOISES

1. Check that the wiring is in good condition.
2. Check that there is no abnormal noise from the alternator while the engine is running.

CHECK DISCHARGE WARNING LIGHT CIRCUIT

1. Warm up the engine and then turn it off.
2. Turn off all accessories.
3. Turn the ignition switch "ON". Check that the discharge warning light is lit.
4. Start the engine. Check that the light is lit.
   If the light does not go off as specified, troubleshoot the discharge light circuit.

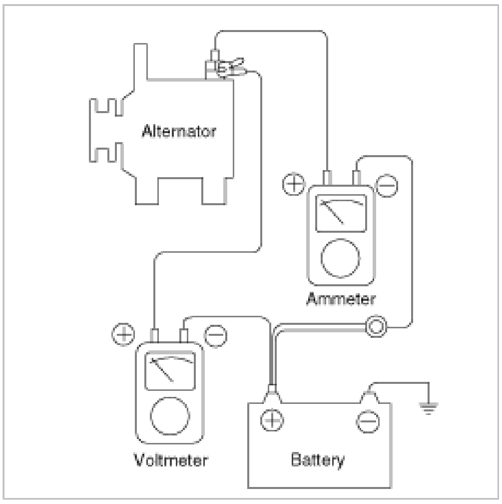
INSPECT CHARGING SYSTEM

VOLTAGE ;DROP ;TEST ;OF ;ALTERNATOR ;OUTPUT ;WIRE

This test determines whether or not the wiring between the alternator "B" terminal and the battery (+) terminal is good by the voltage drop method.

PREPARATION

1. Turn the ignition switch to "OFF".
2. Disconnect the output wire from the alternator "B" terminal. Connect the (+) lead wire of ammeter to the "B" terminal of alternator and the (-) lead wire of ammeter to the output wire. Connect the (+) lead wire of voltmeter to the "B" terminal of alternator and the (-) lead wire of voltmeter to the (+) terminal of battery.



TEST

1. Start the engine.
2. Turn on the headlamps and blower motor, and set the engine speed until the ammeter indicates 20A.
   And then, read the voltmeter at this time.

RESULT

1. The voltmeter may indicate the standard value.

   Standard value: 0.2V max

2. If the value of the voltmeter is higher than expected (above 0.2V max.), poor wiring is suspected. In this case check the wiring from the alternator "B" terminal to the battery (+) terminal. Check for loose connections, color change due to an over-heated harness, etc. Correct them before testing again.
3. Upon completion of the test, set the engine speed at idle.
   Turn off the headlamps, blower motor and the ignition switch.

OUTPUT CURRENT TEST

This test determines whether or not the alternator gives an output current that is equivalent to the normal output.

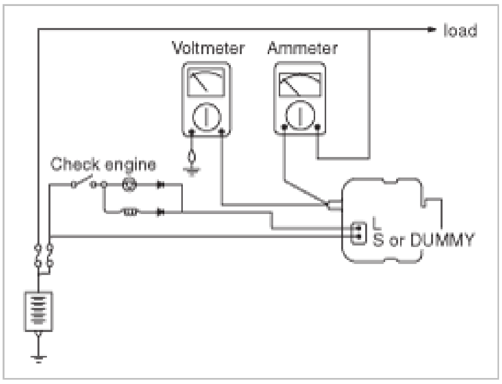
PREPARATION

1. Prior to the test, check the following items and correct as necessary.
   Check the battery installed in the vehicle to ensure that it is in good condition. The battery checking method is described in the section "Battery".
   The battery that is used to test the output current should be one that has been partially discharged. With a fully charged battery, the test may not be conducted correctly due to an insufficient load.
   Check the tension of the alternator drive belt. The belt tension check method is described in the section "Inspect drive belt".
2. Turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Disconnect the alternator output wire from the alternator "B" terminal.
5. Connect a DC ammeter (0 to 150A) in series between the "B" terminal and the disconnected output wire. Be sure to connect the (-) lead wire of the ammeter to the disconnected output wire.

   NOTE

   Tighten each connection securely, as a heavy current will flow. Do not rely on clips.

6. Connect a voltmeter (0 to 20V) between the "B" terminal and ground. Connect the (+) lead wire to the alternator "B" terminal and (-) lead wire to a good ground.
7. Attach an engine tachometer and connect the battery ground cable.
8. Leave the engine hood open.



TEST

1. Check to see that the voltmeter reads as the same value as the battery voltage. If the voltmeter reads 0V, and the open circuit in the wire between alternator "B" terminal and battery (-) terminal or poor grounding is suspected.
2. Start the engine and turn on the headlamps.
3. Set the headlamps to high beam and the heater blower switch to HIGH, quickly increase the engine speed to 2,500 rpm and read the maximum output current value indicated by the ammeter.

> NOTE
>
> After the engine start up, the charging current quickly drops.
> Therefore, the above operation must be done quickly to read the maximum current value correctly.

RESULT

1. The ammeter reading must be higher than the limit value. If it is lower but the alternator output wire is in good condition, remove the alternator from the vehicle and test it.

   Limit value : 50% of the rate voltage

> NOTE
>
> - The nominal output current value is shown on the nameplate affixed to the alternator body.
> - The output current value changes with the electrical load and the temperature of the alternator itself.
>   Therefore, the nominal output current may not be obtained. If such is the case, keep the headlamps on the cause discharge of the battery, or use the lights of another vehicle to increase the electrical load.
>   The nominal output current may not be obtained if the temperature of the alternator itself or ambient temperature is too high.
>   In such a case, reduce the temperature before testing again.

2. Upon completion of the output current test, lower the engine speed to idle and turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Remove the ammeter and voltmeter and the engine tachometer.
5. Connect the alternator output wire to the alternator "B" terminal.
6. Connect the battery ground cable.

REGULATED VOLTAGE TEST

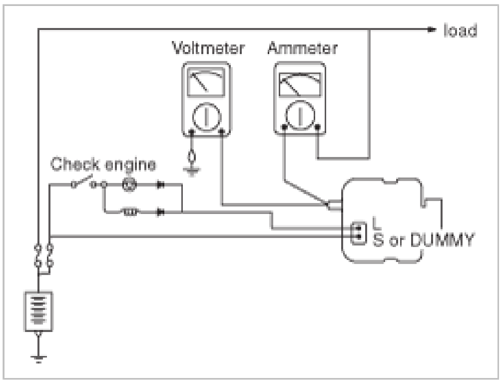
The purpose of this test is to check that the electronic voltage regulator controls voltage correctly.

PREPARATION

1. Prior to the test, check the following items and correct if necessary.
   Check that the battery installed on the vehicle is fully charged. The battery checking method is described in the section "Battery".
   Check the alternator drive belt tension. The belt tension check method is described in the section "Inspect drive belt".
2. Turn ignition switch to "OFF".
3. Disconnect the battery ground cable.
4. Connect a digital voltmeter between the "B" terminal of the alternator and ground. Connect the (+) lead of the voltmeter

to the "B" terminal of the alternator. Connect the (-) lead to good ground or the battery (-) terminal.

5. Disconnect the alternator output wire from the alternator "B" terminal.
6. Connect a DC ammeter (0 to 150A) in series between the "B" terminal and the disconnected output wire. Connect the (-) lead wire of the ammeter to the disconnected output wire.
7. Attach the engine tachometer and connect the battery ground cable.



TEST

1. Turn on the ignition switch and check to see that the voltmeter indicates the following value.

   Voltage: Battery voltage

   If it reads 0V, there is an open circuit in the wire between the alternator "B" terminal and the battery and the battery (-) terminal.
2. Start the engine. Keep all lights and accessories off.
3. Run the engine at a speed of about 2,500 rpm and read the voltmeter when the alternator output current drops to 10A or less

RESULT

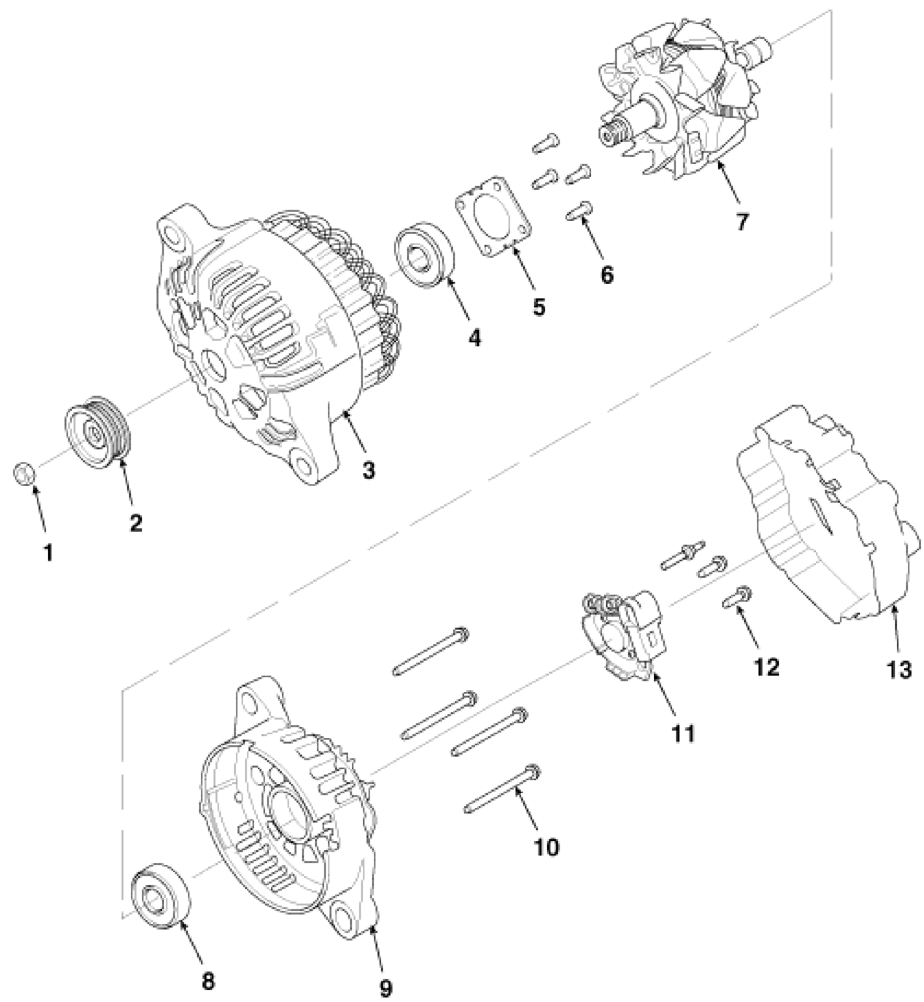
1. If the voltmeter reading agrees with the value listed in the regulating voltage table below, the voltage regulator is functioning correctly. If the reading is other than the standard value, the voltage regulator or the alternator is faulty.
   REGULATING VOLTAGE TABLE

Voltage regulator ambient temperature °C (°F)	Regulating voltage (V)
-30 (-22) 25 (77) 135 (275)	14.2 ~ 15.3 14.2 ~ 14.8 13.3 ~ 14.8

2. Upon completion of the test, reduce the engine speed to idle, and turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Remove the voltmeter and ammeter and the engine tachometer.
5. Connect the alternator output wire to the alternator "B" terminal.
6. Connect the battery ground cable.

Engine Electrical System > Charging System > Alternator > Components and Components Location

COMPONENT

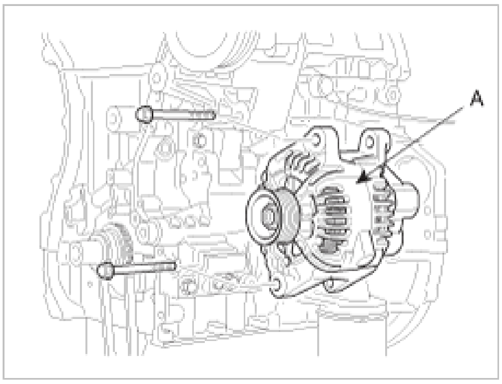


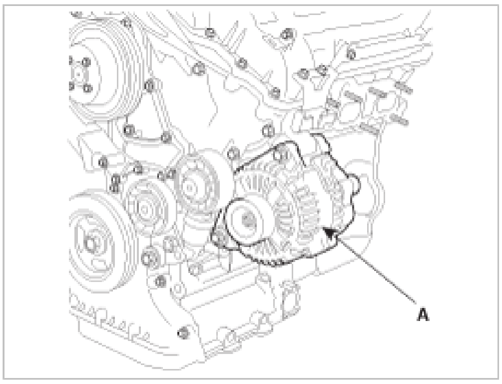
1. Nut	8. Rear bearing
2. Pulley	9. Rear bracket
3. Front bracket	10. Through bolt
4. Front bearing	11. Brush holder assembly
5. Bearing cover	12. Brush holder bolt
6. Bearing cover bolt	13. Rear cover
7. Rotor coil	

Engine Electrical System > Charging System > Alternator > Repair procedures

REMOVAL

1. Disconnect the battery negative terminal first, then the positive terminal.
2. Disconnect the alternator connector, and remove the cable from alternator "B" terminal.
3. Remove the drive belt.
4. Pull out the through bolt and then remove the alternator(A).

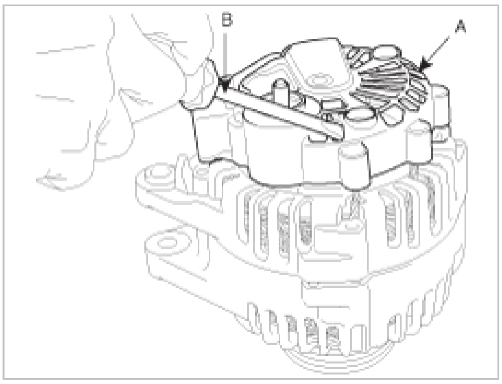




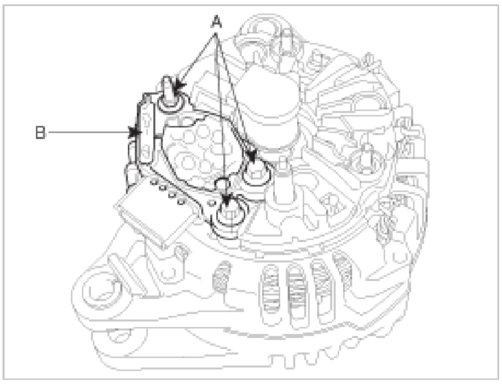
5. Installation is the reverse of removal.

DISASSEMBLY

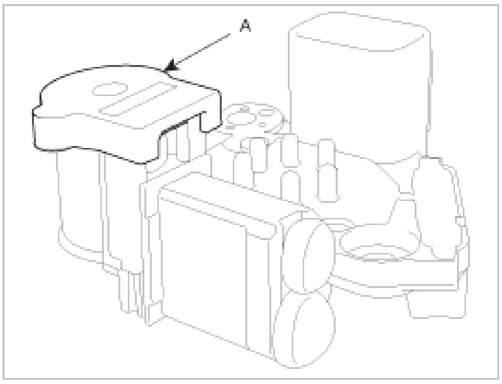
1. Remove the alternator cover(A) using a screw driver(B).



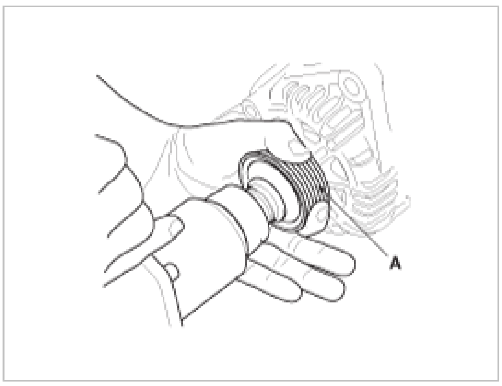
2. Loosen the mounting bolts(A) and disconnect the brush holder assembly(B).



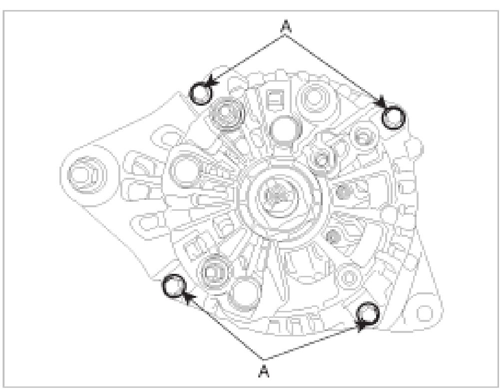
3. Remove the slip ring guide(A).



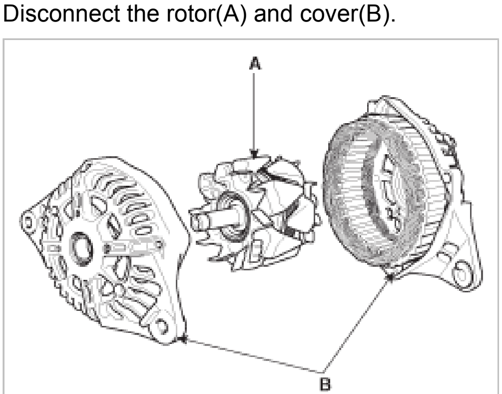
4. Remove the nut, pulley(A) and spacer.



5. Loosen the 4 through bolts(A).



6. Disconnect the rotor(A) and cover(B).

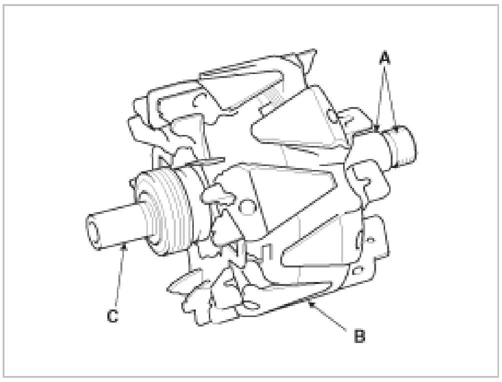


7. Reassembly is the reverse order of disassembly.

INSPECTION

INSPECT ROTOR

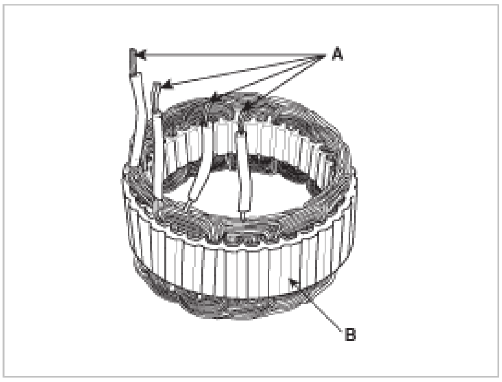
1. Check that there is continuity between the slip rings (A).



2. Check that there is no continuity between the slip rings and the rotor (B) or rotor shaft (C).
3. If the rotor fails either continuity check, replace the alternator.

INSPECT STATOR

1. Check that there is continuity between each pair of leads (A).

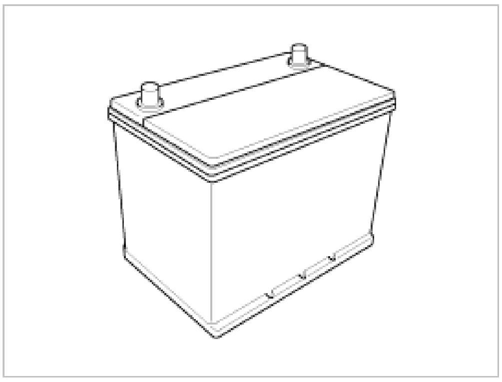


2. Check that there is no continuity between each lead and the coil core.
3. If the coil fails either continuity check, replace the alternator.

Engine Electrical System > Charging System > Battery > Description and Operation

DESCRIPTION

1. The maintenance-free battery is, as the name implies, totally maintenance free and has no removable battery cell caps.
2. Water never needs to be added to the maintenance-free battery.
3. The battery is completely sealed, except for small vent holes in the cover.

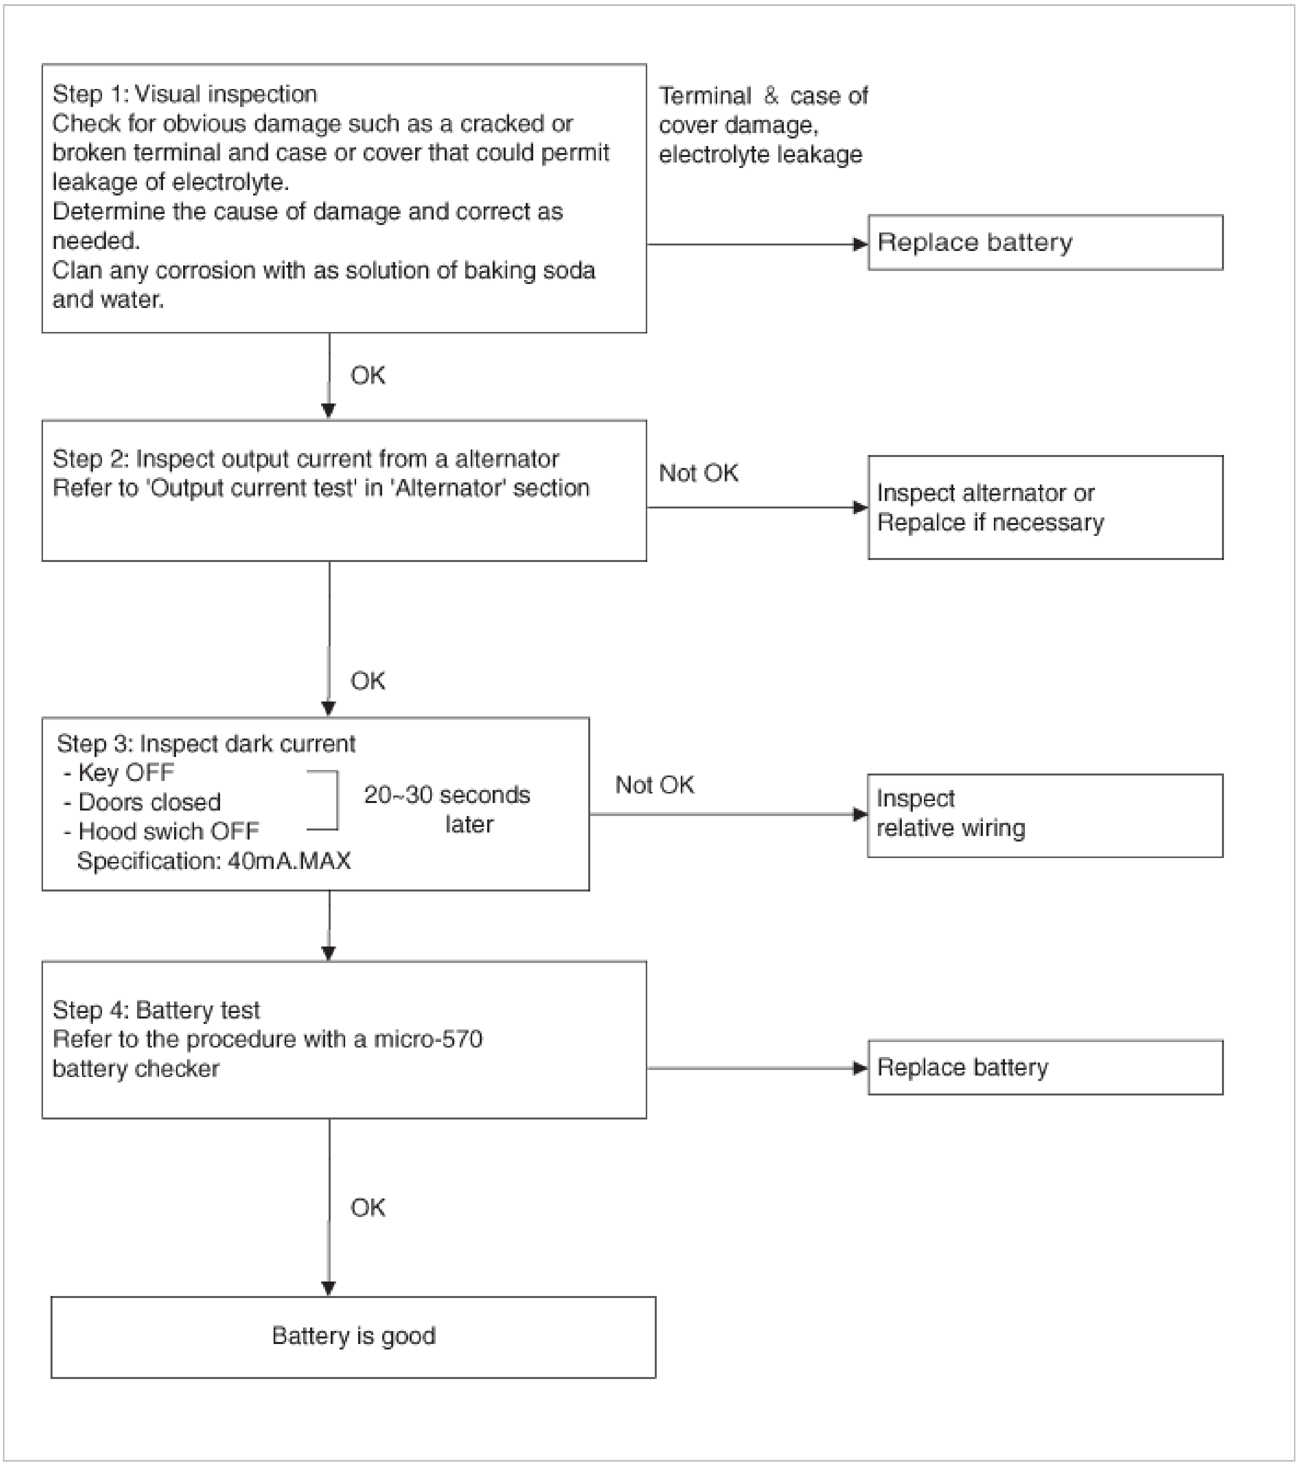


Engine Electrical System > Charging System > Battery > Repair procedures

INSPECTION

BATTERY DIAGNOSTIC TEST (1)

CHECKING FLOW



LOAD TEST

1. Perform the following steps to complete the load test procedure for maintenance free batteries.
2. Connect the load tester clamps to the terminals and proceed with the test as follow:
   (1) If the battery has been on charge, remove the surface charge by connecting a 300ampere load for 15 seconds.
   (2) Connect the voltmeter and apply the specified load.
   (3) Read the voltage after the load has been applied for 15 seconds.
   (4) Disconnect the load.
   (5) Compare the voltage reading with the minimum and replace the battery if battery test voltage is below that shown in the voltage table.

Voltage	Temperature
9.6V	20°C (68.0°F) and above

9.5V	16°C (60.8°F)
9.4V	10°C (50.0°F)
9.3V	4°C (39.2°F)
9.1V	-1°C (30.2°F)
8.9V	-7°C (19.4°F)
8.7V	-12°C (10.4°F)
8.5V	-18°C (-0.4°F)

NOTE

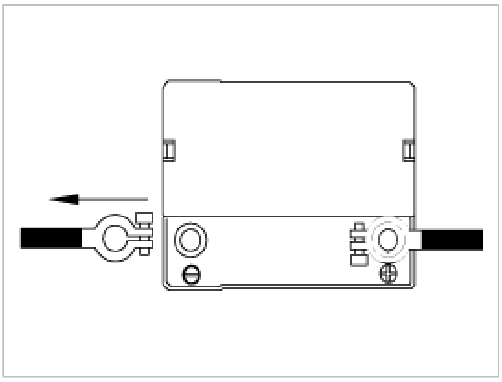
- If the voltage is greater than shown in the table, the battery is good.
- If the voltage is less than shown in the table, replace the battery.

BATTERY DIAGNOSTIC TEST (2)

1. Make sure the ignition switch and all accessories are in the OFF position.
2. Disconnect the battery cables (negative first).
3. Remove the battery from the vehicle.

CAUTION

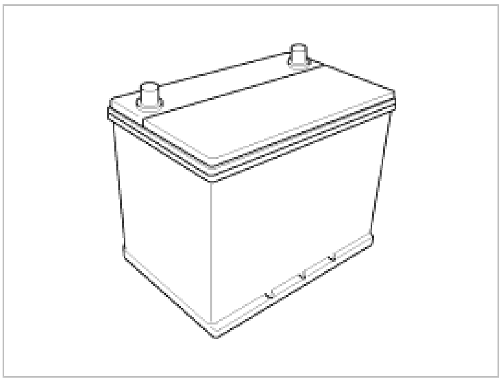
Care should be taken in the event the battery case is cracked or leaking, to protect your skin from the electrolyte. Heavy rubber gloves (not the household type) should be wore when removing the battery.



4. Inspect the battery tray for damage caused by the loss of electrolyte. If acid damage is present, it will be necessary to clean the area with a solution of clean warm water and baking soda. Scrub the area with a stiff brush and wipe off with a cloth moistened with baking soda and water.
5. Clean the top of the battery with the same solution as described above.
6. Inspect the battery case and cover for cracks. If cracks are present, the battery must be replaced.
7. Clean the battery posts with a suitable battery post tool.
8. Clean the inside surface of the terminal clamps with a suitable battery cleaning tool. Replace damaged or frayed cables and broken terminal clamps.
9. Install the battery in the vehicle.
10. Connect the cable terminals to the battery post, making sure tops of the terminals are flush with the tops of the posts.
11. Tighten the terminal nuts securely.
12. Coat all connections with light mineral grease after tightening.

CAUTION

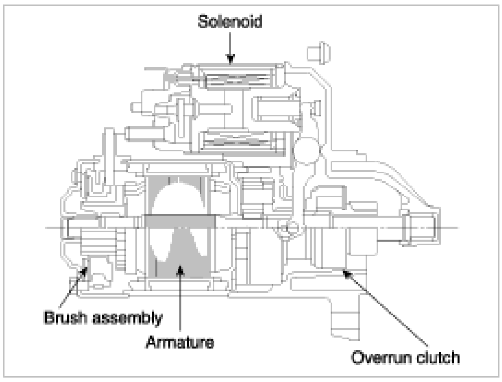
When batteries are being charged, an explosive gas forms beneath the cover of each cell. Do not smoke near batteries being charged or which have recently been charged. Do not break live circuit at the terminals of batteries being charged.
A spark will occur when the circuit is broken. Keep open flames away from battery.



Engine Electrical System > Starting System > Description and Operation

DESCRIPTION

The starting system includes the battery, starter, solenoid switch, ignition switch, inhibitor switch (A/T), ignition lock switch, connection wires and the battery cable.
When the ignition key is turned to the start position, current flows and energizes the starter motor's solenoid coil.
The solenoid plunger and clutch shift lever are activated, and the clutch pinion engages the ring gear.
The contacts close and the starter motor cranks. In order to prevent damage caused by excessive rotation of the starter armature when the engine starts, the clutch pinion gear overruns.



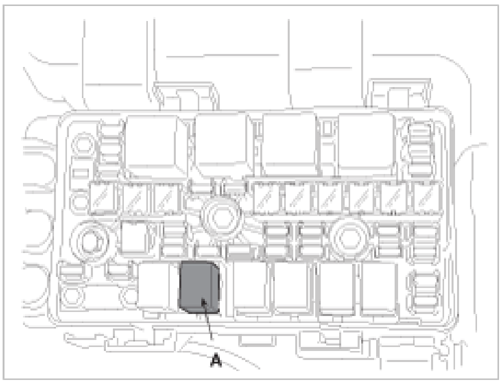
Engine Electrical System > Starting System > Repair procedures

STARTER CIRCUIT TROUBLESHOOTING

NOTE

The battery must be in good condition and fully charged.

1. Remove the fuel pump relay(A) from the fuse box.



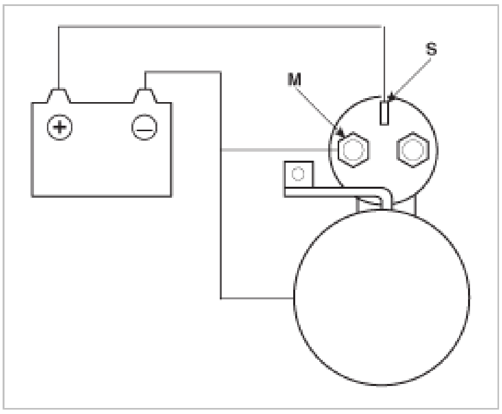
2. With the shift lever in N or P (A/T) or clutch pedal pressed (M/T), turn the ignition switch to "START"
   If the starter normally cranks the engine, starting system is OK. If the starter will not crank the engine at all, go to next step.
   If it won't disengage from the ring gear when you release key, check for the following until you find the cause.

A. Solenoid plunger and switch malfunction.
B. Dirty pinion gear or damaged overrunning clutch.

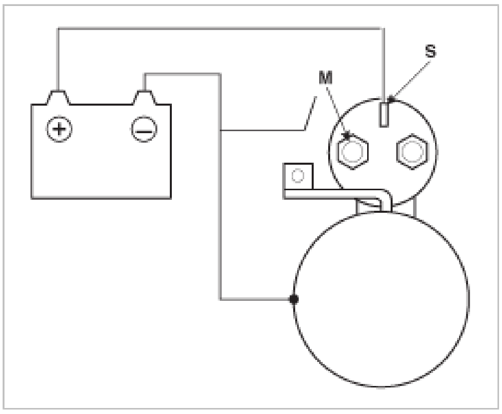
3. Check the battery condition. Check electrical connections at the battery, battery negative cable connected to the body, engine ground cables, and the starter for looseness and corrosion. Then try starting the engine again.
   If the starter cranks normally the engine, repairing the loose connection repaired the problem. The starting system is now OK.
   If the starter still does not crank the engine, go to next step.
4. Disconnect the connector from the S-terminal of solenoid. Connect a jumper wire from the B-terminal of solenoid to the S-terminal of solenoid.
   If the starter cranks the engine, go to next step.
   If the starter still does not crank the engine, remove the starter, and repair or replace as necessary.
5. Check the following items in the order listed until you find the open circuit.
   A. Check the wire and connectors between the driver's under-dash fuse/relay box and the ignition switch, and between the driver's under-dash fuse/relay box and the starter.
   B. Check the ignition switch (Refer to BE group - ignition system)
   C. Check the transaxle range switch connector or ignition lock switch connector.
   D. Inspect the starter relay.

STARTER SOLENOID TEST

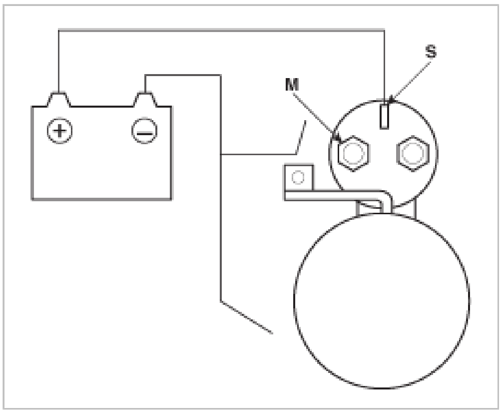
1. Disconnect the field coil wire from the M-terminal of solenoid switch.
2. Connect the battery as shown. If the starter pinion pops out, it is working properly. To avoid damaging the starter, do not leave the battery connected for more than 10 seconds.



3. Disconnect the battery from the M terminal.
   If the pinion does not retract, the hold-in coil is working properly. To avoid damaging the starter, do not leave the battery connected for more than 10 seconds.

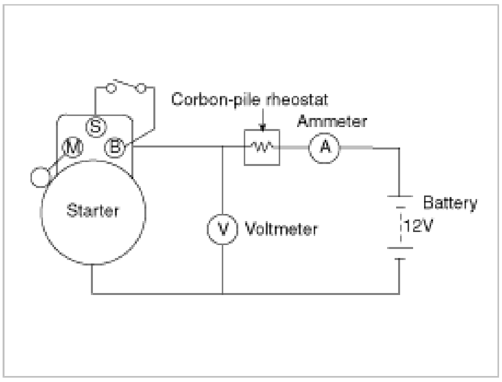


4. Disconnect the battery also from the body. If the pinion retracts immediately, it is working properly. To avoid damaging the starter, do not leave the battery connected for more than 10 seconds.



FREE RUNNING TEST

1. Place the starter motor in a vise equipped with soft jaws and connect a fully-charged 12-volt battery to starter motor as follows.
2. Connect a test ammeter (100-ampere scale) and carbon pile rheostats as shown in the illustration.
3. Connect a voltmeter (15-volt scale) across starter motor.



4. Rotate carbon pile to the off position.
5. Connect the battery cable from battery's negative post to the starter motor body.
6. Adjust until battery voltage shown on the voltmeter reads 11volts.
7. Confirm that the maximum amperage is within the specifications and that the starter motor turns smoothly and freely.

Current : 90A max (2.4L), 85A MAX (3.3L)
Speed : 2,600 rpm

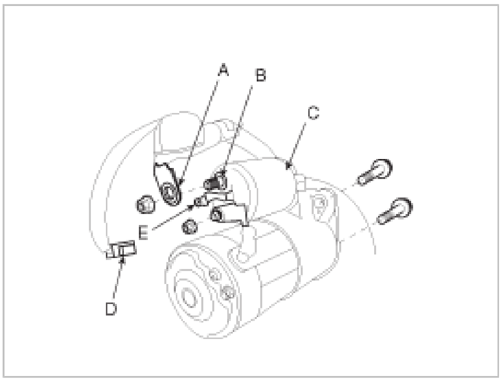
13. Armature assembly
14. Yoke assembly
15. Brush holder assembly
16. Through bolt

Engine Electrical System > Starting System > Starter > Repair procedures

STARTER

REMOVAL

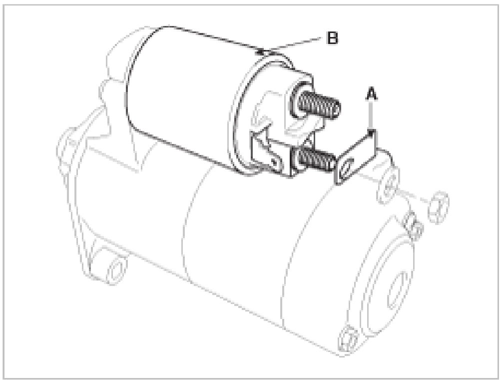
1. Disconnect the battery negative cable.
2. Disconnect the starter cable (A) from the B terminal (B) on the solenoid (C), then disconnect the connector (D) from the S terminal (E).



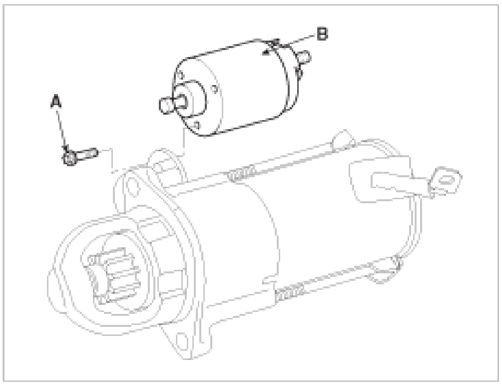
3. Remove the 2 bolts holding the starter, then remove the starter.
4. Installation is the reverse of removal.
5. Connect the battery negative cable to the battery.

DISASSEMBLY

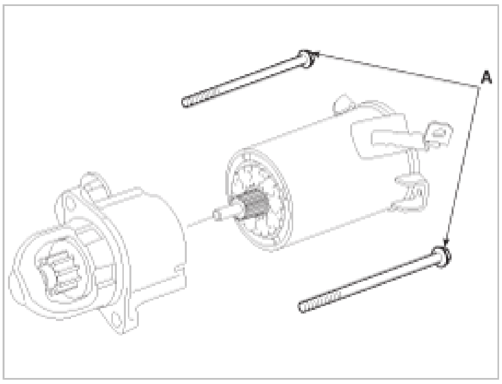
1. Disconnect the M-terminal (A) on the magnet switch assembly (B).



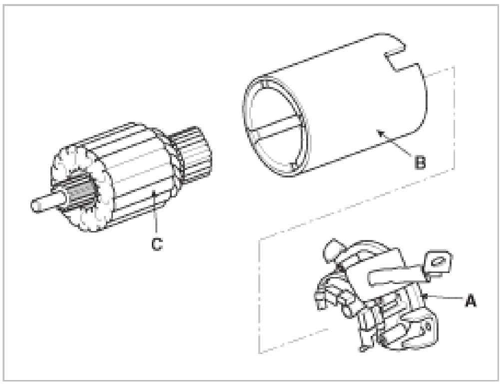
2. After loosening the 3 screws (A), detach the magnet switch assembly (B).



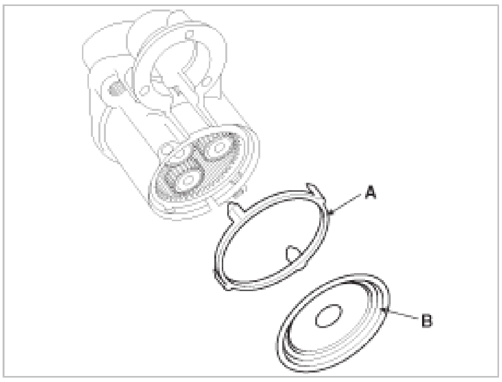
3. Loosen the through bolts (A).



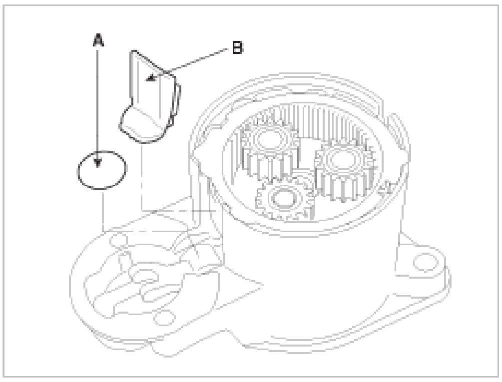
4. Remove the brush holder assembly (A), yoke (b) and armature (C).



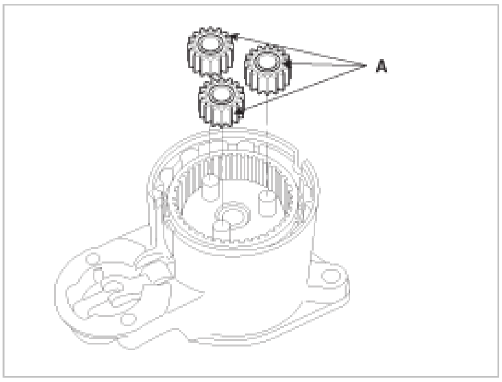
5. Remove the shield (A) and packing (B).



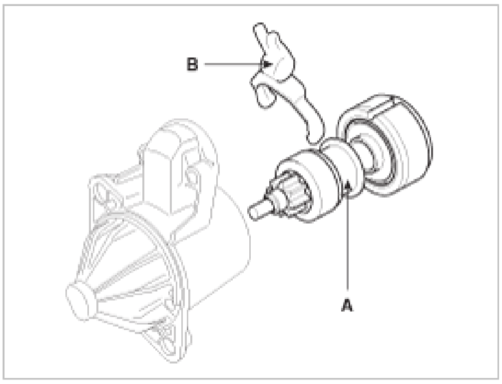
6. Remove the lever plate (A) and lever packing (B).



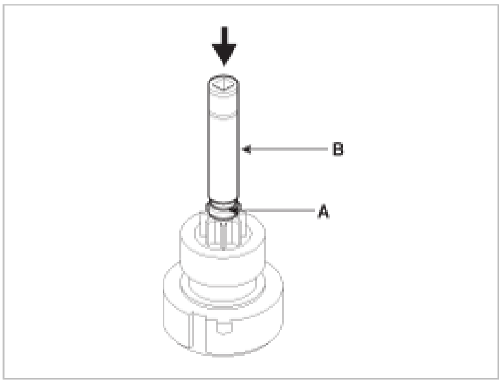
7. Disconnect the planet gear (A).



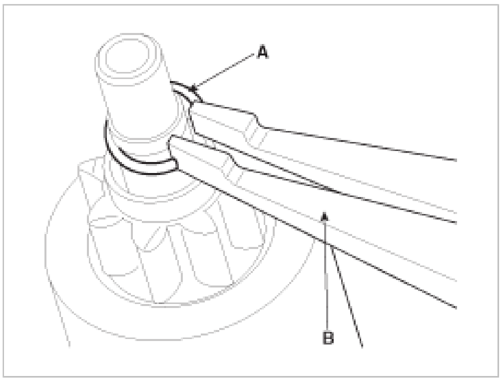
8. Disconnect the planet shaft assembly (A) and lever (B).



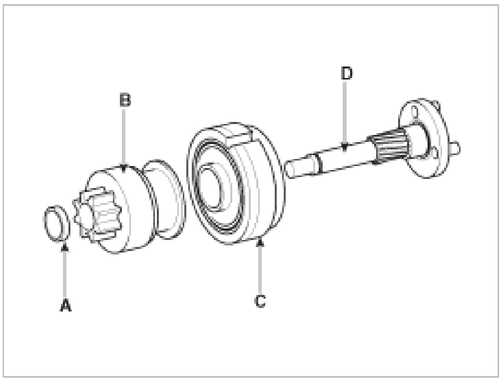
9. Press the stop ring (A) using a socket (B).



10. After removing the stopper (A) using stopper pliers (B).



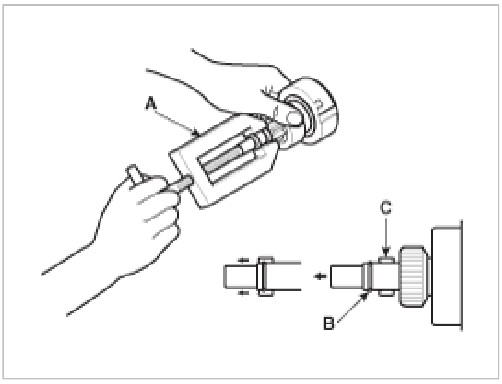
11. Disconnect the stop ring (A), overrunning clutch (B), internal gear (C) and planet shaft (D).



12. Reassembly is the reverse of disassembly.

NOTE

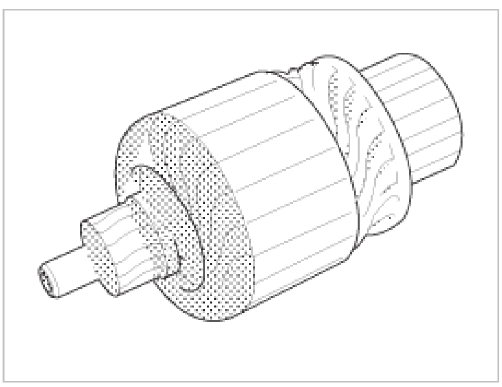
Using a suitable pulling tool (A), pull the overrunning clutch stop ring (B) over the stopper (C).



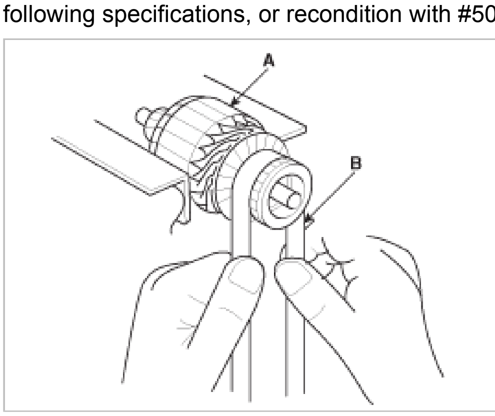
INSPECTION

ARMATURE INSPECTION AND TEST

1. Remove the starter.
2. Disassemble the starter as shown at the beginning of this procedure.
3. Inspect the armature for wear or damage from contact with the permanent magnet. If there is wear or damage, replace the armature.

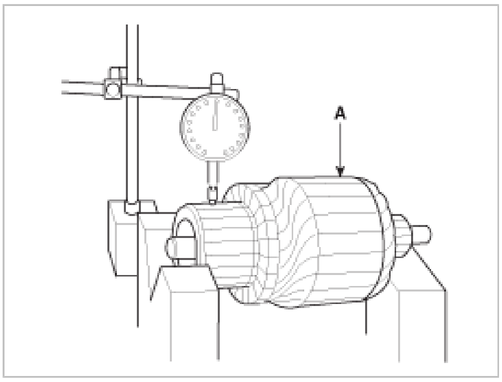


4. Check the commutator (A) surface. If the surface is dirty or burnt, resurface with emery cloth or a lathe within the following specifications, or recondition with #500 or #600 sandpaper (B).



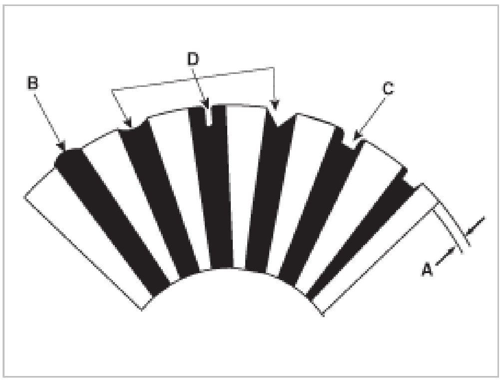
5. Measure the commutator (A) runout.
   A. If the commutator runout is within the service limit, check the commutator for carbon dust or brass chips between the segments.
   B. If the commutator run out is not within the service limit, replace the armature.

Commutator runout
Standard (New): 0.02mm (0.0008in.) max
Service limit: 0.05mm (0.0020in.)

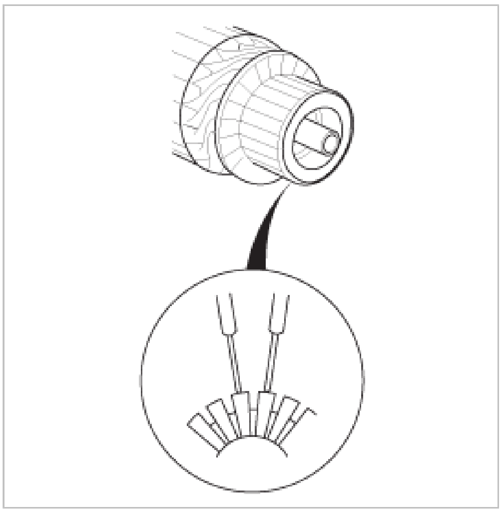


6. Check the mica depth (A). If the mica is too high (B), undercut the mica with a hacksaw blade to the proper depth. Cut away all the mica (C) between the commutator segments. The undercut should not be too shallow, too narrow, or v-shaped (D).

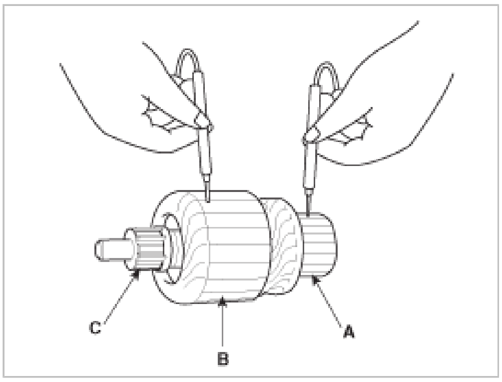
Commutator mica depth
Standard (New) : 0.5 mm (0.0197 in.)
Limit : 0.2mm (0.0079 in.)



7. Check for continuity between the segments of the commutator. If an open circuit exists between any segments, replace the armature.

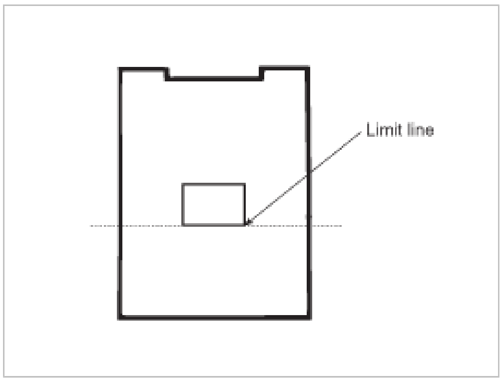


8. Check with an ohmmeter that no continuity exists between the commutator (A) and armature coil core (B), and between the commutator and armature shaft (C). If continuity exists, replace the armature.



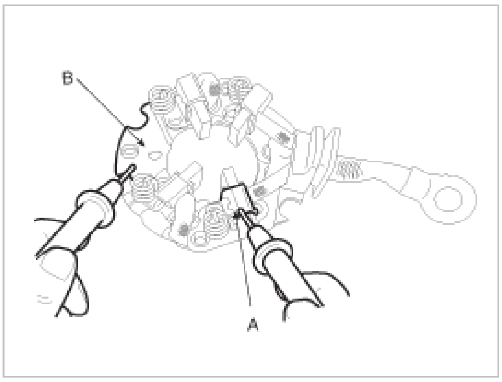
INSPECT STARTER BRUSH

Brushes that are worm out, or oil-soaked, should be replaced.

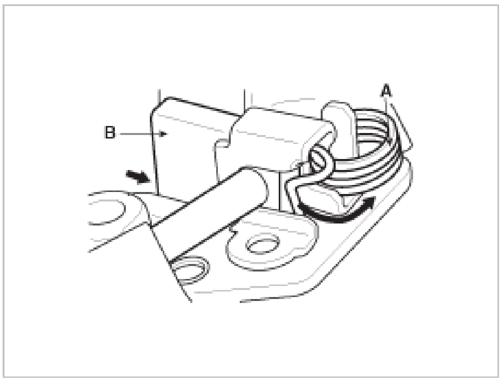


STARTER BRUSH HOLDER TEST

1. Check that there is no continuity between the (+) brush holder (A) and (-) brush holder (B). If there is no continuity, replace the brush holder assembly.



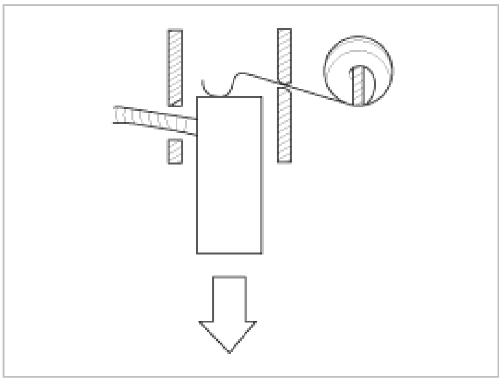
2. Pry back each brush spring (A) with a screwdriver, then position the brush (B) about halfway out of its holder, and release the spring to hold it there.



3. Install the armature in the housing, and install the brush holder. Next, pry back each brush spring again, and push the brush down until it seats against the commutator, then release the spring against the end of the brush.

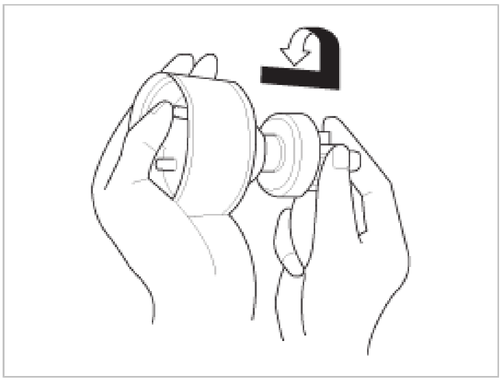
NOTE

To seat new brushes, slip a strip of #500 or #600 sandpaper, with the grit side up, between the commutator and each brush, and smoothly rotate the armature. The contact surface of the brushes will be sanded to the same contour as the commutator.



INSPECT OVERRUNNING CLUTCH

1. Slide the overrunning clutch along the shaft.
   Replace it if does not slide smoothly.
2. Rotate the overrunning clutch both ways.
   Does it lock in one direction and rotate smoothly in reverse? If it does not lock in either direction or it locks in both directions, replace it.



3. If the starter drive gear is worn or damaged, replace the overrunning clutch assembly. (the gear is not available separately).
   Check the condition of the flywheel or torque converter ring gear if the starter drive gear teeth are damaged.

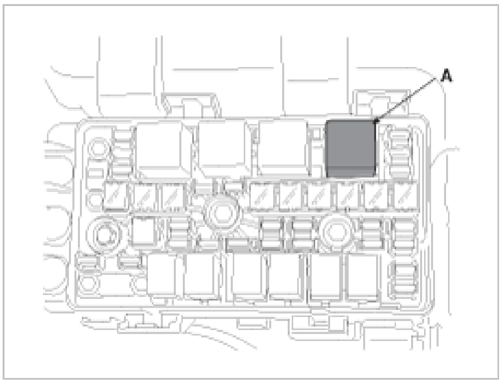
CLEANING

1. Do not immerse parts in cleaning solvent. Immersing the yoke assembly and/or armature will damage the insulation. Wipe these parts with a cloth only.
2. Do not immerse the drive unit in cleaning solvent. The overrun clutch is pre-lubricated at the factory and solvent will wash lubrication from the clutch.
3. The drive unit may be cleaned with a brush moistened with cleaning solvent and wiped dry with a cloth.

Engine Electrical System > Starting System > Starter Relay > Repair procedures

INSPECTION

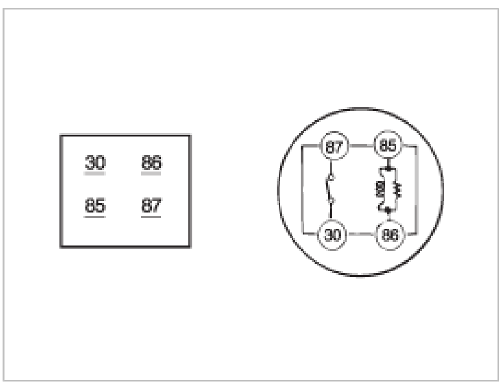
1. Remove the fuse box cover.
2. Remove the starter relay (A).



3. Using an ohmmeter, check that there is continuity between each terminal.

Terminal	Continuity
30 - 87	NO
85 - 86	YES

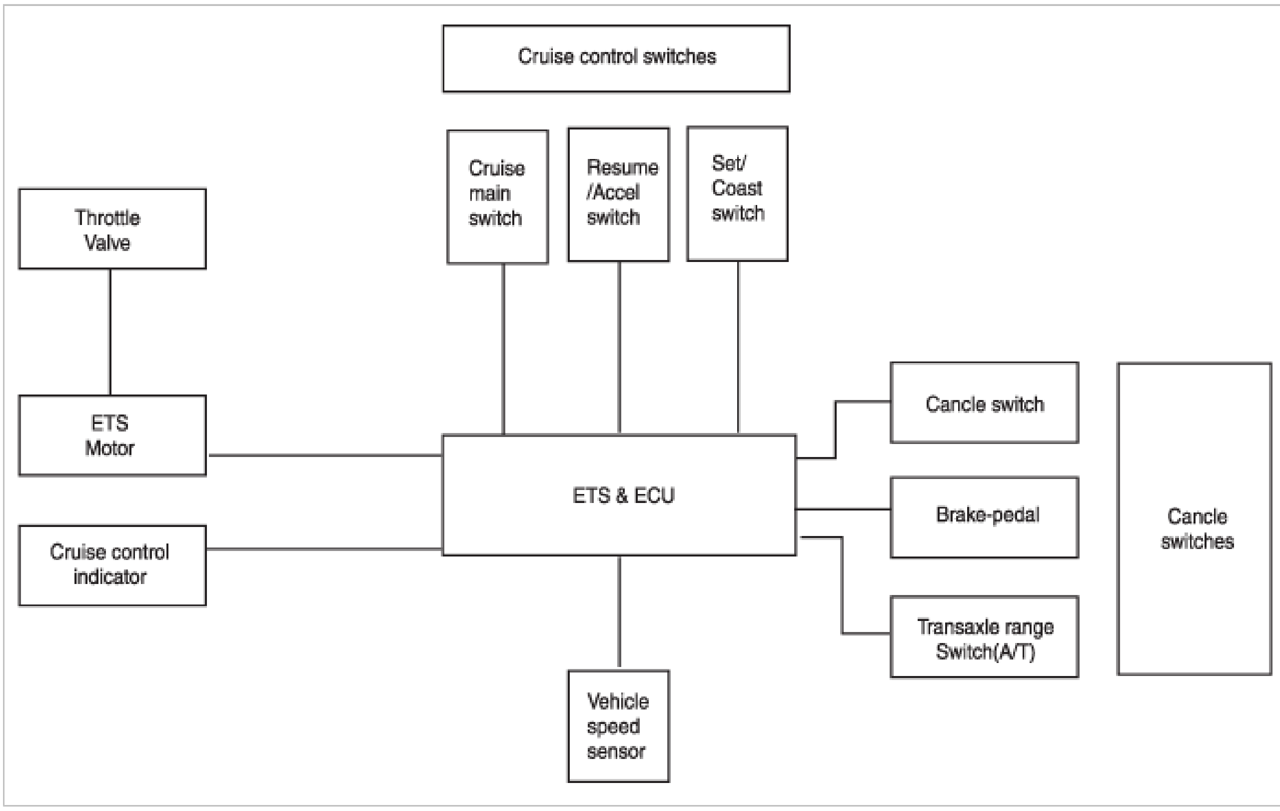
4. Apply 12V to terminal 85 and ground to terminal 86.
   Check for continuity between terminals 30 and 87.



5. If there is no continuity, replace the starter relay.
6. Install the starter relay.
7. Install the fuse box cover.

Engine Electrical System > Cruise Control System > Description and Operation

SYSTEM BLOCK DIAGRAM



COMPONENT PARTS AND FUNCTION OUTLINE

Component part		Function
Vehicle-speed sensor		Converts vehicle speed to pulse.
Engine control module (ECM)		Receives signals from sensor and control switches;
Cruise control indicator		Illuminate when CRUISE main switch is ON (Built into cluster)
Cruise Control switches	CRUISE main switch	Switch for automatic speed control power supply.
	Resume/Accel switch	Controls automatic speed control functions by Resume/Accel switch (Set/Coast switch)
	Set/Coast switch	
Cancel switch	Cancel switch	Sends cancel signals to ECM
	Brake-pedal switch	
	Transaxle range switch (A/T) Clutch switch (M/T)	
ETS motor		Regulates the throttle valve to the set opening by ECM.

* ETS : Electronic Throttle System

CRUISE CONTROL

Cruise control system is engaged by "ON. OFF" main switch located on right of steering wheel column. System has the capability to cruise, coast, resume speed, and accelerate, and raise "tap-up" or lower "tap-down" set speed.
It also has a safety interrupt, engaged upon depressing brake or shifting select lever.
ECM is a speed control system that maintains a required vehicle speed at normal driving conditions.
The main components of cruise control system are mode control switches, transaxle range switch, brake switch, vehicle speed sensor, ECM and ETS motor that connect throttle body.
ECM contains a low speed limit which will prevent system engagement below a minimum speed of 40km/h (25mph).
The operation of the controller is controlled by mode control switches located on steering wheel.
Transaxle range switch and brake switch are provided to disengage the cruise control system. The switches are on brake pedal bracket and transaxle. When the brake pedal is depressed or select lever shifted, the cruise control system is electrically disengaged and the throttle is returned to the idle position.

Cruise main switch

Cruise control system is engaged by pressing "ON. OFF" push button. Releasing "ON.OFF" push button release throttle, clears cruise memory speed, and puts vehicle in a non-cruise mode.

Coast/Set switch

COAST.SET switch located on right of steering wheel column has two positions - "Normal" and "Depressed". The set position - With COAST.SET switch depressed and then released the cruise speed will be set at the speed the vehicle was going when COAST.SET switch was released. The coast position - With COAST.SET switch fully depressed, driver can lower cruise speed. To decrease cruise speed, COAST.SET switch is held in, disengaging cruise control system. When vehicle has slowed to required cruise speed, releasing COAST.SET switch will re-engage speed at new selected speed. The tap down - To lower vehicle speed, cruise must be engaged and operating. Tap down is done by quickly pressing and releasing COAST.SET switch. Do not hold COAST.SET switch in depressed position.

Tap down is a function in which cruise speed car be decreased by 1mph (1.6km/h)

Resume/Accel switch

RES.ACCEL switch located on right of steering wheel column has two positions - "Normal" and "Depressed".

The resume position - With RES.ACCEL switch depressed and then release, this switch also returns cruise control operation to last speed (Which is temporarily disengaged by Cancel switch or Brake pedal), setting when momentarily operating RES.ACCEL switch by constant acceleration.

The accel position - With RES.ACCEL switch depressed and held in, disengaging cruise control system, when vehicle has accelerated to required cruise speed, releasing RES.ACCEL switch will re-engage speed at new selected speed.

The tap up - To increase vehicle speed, the cruise must be engaged and operating.

Tap up is done by quickly pressing and releasing RES.ACCEL switch less than 0.5 second. Do not hold RES.ACCEL switch in depressed position. Tap up is a function in which cruise speed can be increased by 1mph (1.6km/h).

Cancel switch

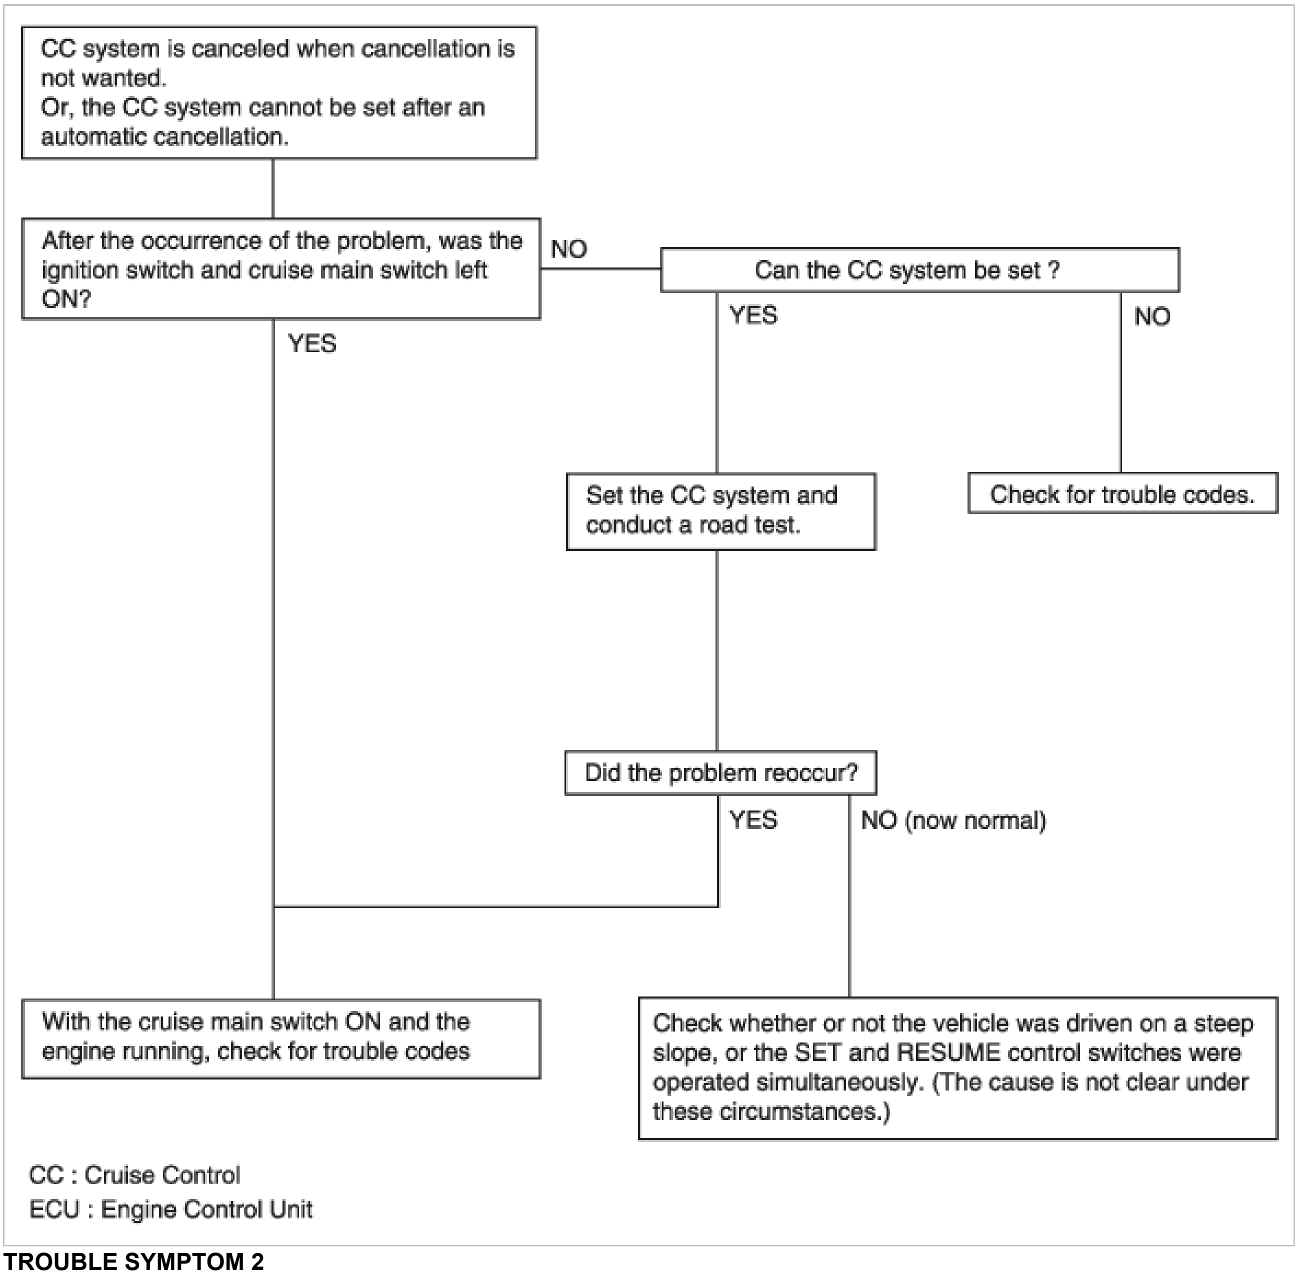
Cruise control system is temporarily disengaged by pressing "CANCEL" switch.

Cruise speed canceled by this switch will be recovered by RES.ACCEL switch

Engine Electrical System > Cruise Control System > Troubleshooting

TROUBLE SYMPTOM CHARTS

TROUBLE SYMPTOM 1



TROUBLE SYMPTOM 2

Trouble symptom	Probable cause	Remedy
The set vehicle speed varies greatly upward or downward "Surging" (repeated alternating acceleration and deceleration) occurs after setting	Malfunction of the vehicle speed sensor circuit	Repair the vehicle speed sensor system, or replace the part
	Malfunction of ECM	Replace the ECM

TROUBLE SYMPTOM 3

Trouble symptom	Probable cause	Remedy
The CC system is not canceled when the brake pedal is depressed	Damaged or disconnected wiring of the brake pedal switch	Repair the harness or replace the brake pedal switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 4

Trouble symptom	Probable cause	Remedy
The CC system is not canceled when	Damaged or disconnected wiring of inhibitor switch input circuit	Repair the harness or repair or replace

the shift lever is moved to the "N" position (It is canceled, however, when the brake pedal is depressed	Improper adjustment of inhibitor switch	the inhibitor switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 5

Trouble symptom	Probable cause	Remedy
Cannot decelerate (coast) by using the SET switch	Temporary damaged or disconnected wiring of SET switch input circuit	Repair the harness or replace the SET switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 6

Trouble symptom	Probable cause	Remedy
Cannot accelerate or resume speed by using the RESUME switch	Damaged or disconnected wiring, or short circuit, or RESUME switch input circuit	Repair the harness or replace the RESUME switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 7

Trouble symptom	Probable cause	Remedy
CC system can be set while driving at a vehicle speed of less than 40km/h (25mph), or there is no automatic cancellation at that speed	Malfunction of the vehicle-speed sensor circuit	Repair the vehicle speed sensor system, or replace the part
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 8

Trouble symptom	Probable cause	Remedy
The cruise main switch indicator lamp does not illuminate (But CC system is normal)	Damaged or disconnected bulb of cruise main switch indicator lamp	Repair the harness or replace the part.
	Harness damaged or disconnected

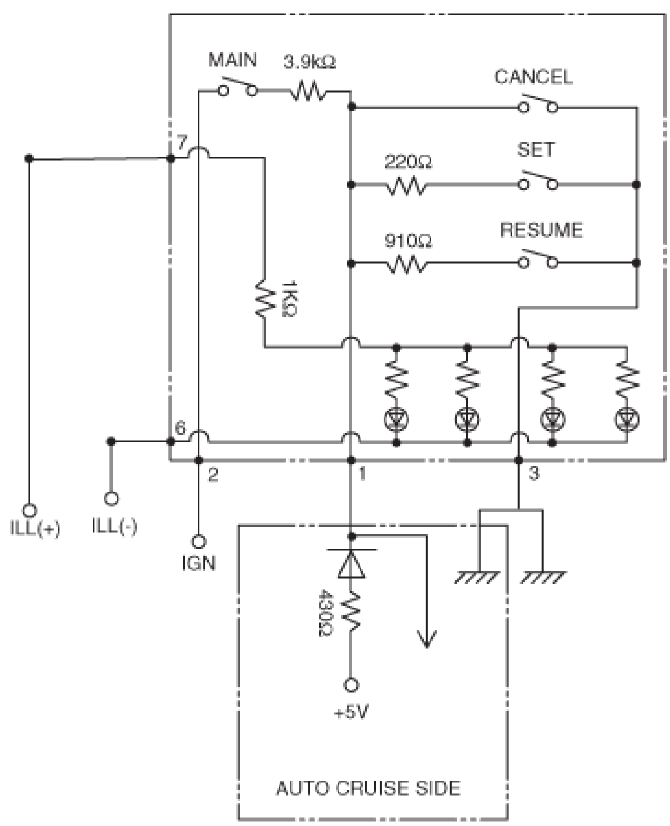
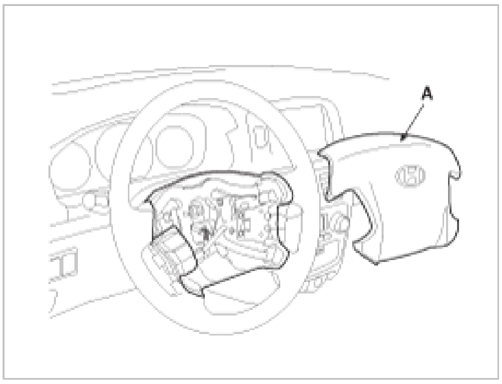
6	ILL(-)
7	ILL(+)



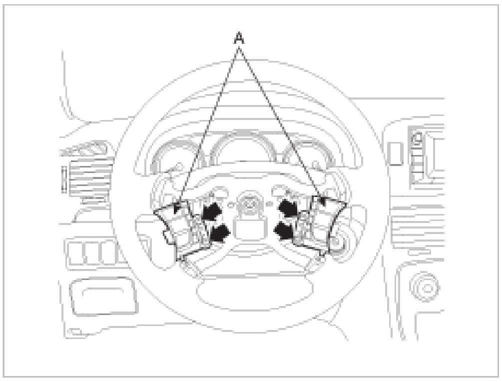
Engine Electrical System > Cruise Control System > Cruise Control Switch > Repair procedures

REMOVAL

1. Disconnect the battery (-) terminal.
2. Remove the driver side air bag module(A). (Refer to RT GR.)



3. Disconnect the cruise control switch connector and then remove the cruise control switch(A) with two screws.

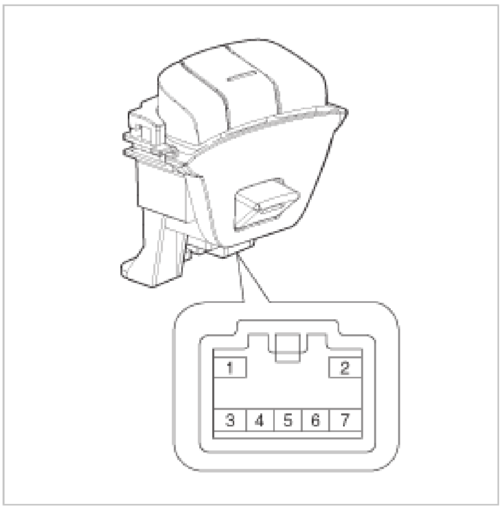


4. Installation is the reverse of removal.

INSPECTION

MEASURING RESISTANCE

1. Disconnect the cruise control switch connector from the control switch.



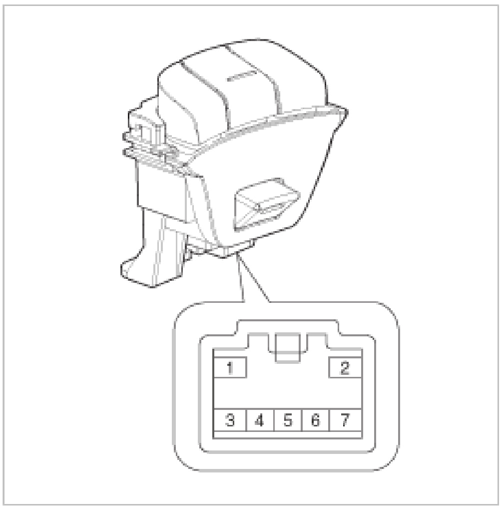
2. Measure resistance between terminals on the control switch when each function switch is ON (switch is depressed).

Function switch	Terminal	Resistance
Cruise Main	RH 1-2	3.9kΩ ± 1%
Cancel	RH 1-3	0Ω ± 1%
Set/Coast	RH 1-3	220Ω ± 1%
Resume/Accel	RH 1-3	910Ω ± 1%

3. If not within specification, replace switch.

MEASURING VOLTAGE

1. Connect the cruise control switch connector to the control switch.



2. Measure voltage between terminals on the harness side connector when each function switch is ON (switch is depressed).

Function switch	Terminal	Voltage
Cruise Main	RH 1-2	-
Cancel	RH 1-3	0.0V ± 0.22V
Set/Coast	RH 1-3	1.5V ± 0.22V
Resume/Accel	RH 1-3	3.0V ± 0.22V

3. If not within specification, replace switch.

Tensioner & idler bracket bolt	7	39.2 ~ 44.1	4.0 ~ 4.5	28.92 ~ 32.53
Water temp. control bolt	2	14.7 ~ 21.56	1.5 ~ 2.2	10.84 ~ 15.90
Water temp. control nut	1	19.6 ~ 26.46	2.0 ~ 2.7	14.46 ~ 19.52
Water inlet pipe bolt	2	19.6 ~ 26.46	2.0 ~ 2.7	14.46 ~ 19.52
Oil level gauge assembly bolt	1	7.84 ~ 11.76	0.8 ~ 1.2	5.78 ~ 8.67
Ignition coil bolt	4	3.92 ~ 5.88	0.4 ~ 0.6	2.89 ~ 4.34
Intake manifold bolt	3	18.62 ~ 27.44	1.9 ~ 2.8	13.73 ~ 20.24
Intake manifold nut	2	18.62 ~ 27.44	1.9 ~ 2.8	13.73 ~ 20.24
Intake manifold stay bolt	4	18.62 ~ 27.44	1.9 ~ 2.8	13.73 ~ 20.24
Exhaust manifold heat protector bolt	4	18.62 ~ 27.44	1.9 ~ 2.8	13.73 ~ 20.24
Exhaust manifold nut	7	39.2 ~ 44.1	4.0 ~ 4.5	28.92 ~ 32.53
Exhaust manifold stay bolt (M8)	2	18.62 ~ 27.44	1.9 ~ 2.8	13.74 ~ 20.24
Exhaust manifold stay bolt (M10)	1	51.94 ~ 57.82	5.4 ~ 5.9	38.3 ~ 42.6
Front muffler bolt	2	39.2 ~ 58.8	4.0 ~ 6.0	28.92 ~ 43.37
Engine cover nut	2	3.92 ~ 5.88	0.4 ~ 0.6	2.89 ~ 4.34
Engine cover mounting bracket bolt	2	7.84 ~ 11.76	0.8 ~ 1.2	5.78 ~ 8.67
Crankshaft position sensor bolt	1	3.92 ~ 5.88	0.4 ~ 0.6	2.89 ~ 4.34
Oxygen sensor	1	39.2 ~ 49.0	4.0 ~ 5.0	28.9 ~ 36.1
Knock sensor	1	16.66 ~ 25.48	1.7 ~ 2.6	12.29 ~ 18.79
Oil temperature sensor	1	19.6 ~ 39.2	2.0 ~ 4.0	14.46 ~ 28.92
Camshaft position sensor	1	3.92 ~ 5.88	0.4 ~ 0.6	2.89 ~ 4.34
Oil pressure switch	1	7.84 ~ 11.76	0.8 ~ 1.2	5.78 ~ 8.67
Main bearing cap bolt	10	14.7 + (27.5~31.4) + (120~125°)	1.5 + (2.8~3.2) + (120~125°)	10.8 + (20.3~23.1) + (120~125°)
Oil filter	1	11.76 ~ 15.68	1.2 ~ 1.6	8.67 ~ 11.57
Connecting rod bearing cap bolt	8	(17.7~21.6) + (88~92°)	(1.8~2.2) + (88~92°)	(13.0~15.9) + (88~92°)

Engine Mechanical System > General Information > Special Service Tools

SPECIAL TOOLS

Tool (Number and name)	Illustration	Use
Crankshaft front oil seal installer		Installation of the front oil seal

(09214-3K000) (09231-H1100)		A : 09214-3K000 B : 09231-H1100
Flywheel stopper (09231-3K000)		Removal and installation of the flywheel and crankshaft pulley.
Torque angle adapter (09221-4A000)		Installtion of bolts & nuts needing an angular method
Valve stem seal installer (09222-4A000)		Installation of the valve stem seal
Valve stem seal installer (09222-29000)		Removal of the valve stem seal
Valve spring compressor & holder (09222-3K000) (09222-3K100)		Removal and installation of the intake or exhaust valve A : 09222-3K000 B : 09222-3K100 (holder)
Crankshaft rear oil seal installer (09214-3K100) (09231-H1100)		Installation of the crankshaft rear oil seal A : 09214-3K100 B : 09231-H1100

Engine Mechanical System > General Information > Troubleshooting

TROUBLESHOOTING

Symption	Suspect area	Remedy (See page)
Engine misfire with abnormal internal lower engine noises.	Worn crankshaft bearings Loose or improperly engine filwheel	Replace the crankshaft and bearings as required. Repair or replace the flywheel as required.

	Worn piston rings (Oil consumption may or may not cause the engine to misfire.)	Inspect the cylinder for a loss of compression. Repair or replace as required.
	Worn crankshaft thrust bearings	Replace the crankshaft and bearings as required
Engine misfire with abnormal valve train noise.	Stuck valves. (Carbon buidup on the valve stem)	Repair or replace as required
	Excessive worn or mis-aligned timing chain	Replace the timing chain and sprocket as required.
	Worn camshaft lobes.	Replace the camshaft and valve lifters.
Engine misfire with coolant consumption	• Faulty cylinder head gasket and/or cranking or other damage to the cylinder head and engine block cooling system. • Coolant consumption may or may not cause the engine to overheat.	• Inspect the cylinder head and engine block for damage to the coolant passages and/or a faulty head gasket. • Repair or replace as required.
Engine misfire with excessive oil consumption	Worn valves, guides and/or valve stem oil seals.	Repair or replace as required.
	Worn piston rings. (Oil consumption may or may not cause the engine to misfire)	• Inspect the cylinder for a loss of compression. • Repair or replace as required.
Engine noise on start-up, but only lasting a few seconds.	Incorrect oil viscosity	• Drain the oil. • Install the correct viscosity oil.
	Worn crankshaft thrust bearing.	• Inspect the thrust bearing and crankshaft. • Repair or replace as required.
Upper engine noise, regardless of engine speed.	Low oil pressure	Repair or repalce as required.
	Broken valve spring.	Replace the valve spring.
	Worn or dirty valve lifters.	Replace the valve lifters.
	Stetched or broken timing chain and/or damaged sprocket teeth.	Replace the timing chain and sprockets.
	Worn timing chain tensioner, if applicable.	Replace the timing chain tensioner as required.
	Worn camshaft lobes.	• Inspect the camshaft lobes. • Replace the timing camshaft and valve lifters as required.
	Worn valve guides or valve stems.	Inspect the valves and valve guides, then repair as required.
	Stuck valves. (Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect the valves and valve guides, then repair as required.
	Worn drive belt, idler, tensioner and bearing.	Replace as required
Lower engine noise, regardless of engine speed	Low oil pressure	Repair or required.
	Loose or damaged flywheel.	Repair or replace the flywheel.
	Damaged oil pan, contacting the oil pump screen.	• Inspect the oil pan. • Inspect the oil pump screen. • Repair or replace as required.
	Oil pump screen loose, damaged or restircted.	• Inspect the oil pump screen. • Repair or replace as required.
	Excessive piston-to-cylinder bore clearance.	• Inspect the piston, piston pin and cylinder bore. • Repair as required.
	Excessive piston pin-to-piston clearance	• Inspect the piston, piston pin and the

		connecting rod. • Repair or replace as required.
	Excessive connecting rod bearing clearance	Inspect the following components and repair as required. • The connecting rod bearings. • The connecting rods. • The crankshaft pin journals.
	Excessive crankshaft bearing clearance	Inspect the following components, and repair as required. • The crankshaft bearings. • The crankshaft main journals. • The cylinder block
	Incorrect piston, piston pin and connecting rod installation	• Verify the piston pins and connecting rods are installed correctly. • Repair as required.
Engine noise under load	Low oil pressure	Repair or replace as required.
	Excessive connecting rod bearing clearance	Inspect the following components and repair as required : • The connecting rod bearings. • The connecting rods. • The crankshaft
	Excessive crankshaft bearing clearance	Inspect the following components, and repair as required. • The crankshaft bearings. • The crankshaft main journals. • The cylinder block.
Engine will not crank-crankshaft will not rotate	Hydraulically locked cylinder • Coolant/antifreeze in cylinder. • Oil in cylinder. • Fuel in cylinder	1. Remove spark plugs and check for fluid. 2. Inspect for broken head gasket. 3. Inspect for cracked engine block or cylinder head. 4. Inspect for a sticking fuel injector and/or leaking fuel regulator.
	Broken timing chain and/or timing chain and/or timing chain gears.	1. Inspect timing chain and gears. 2. Repair as required.
	Material in cylinder • Broken valve • Piston material • Foreign material	1. Inspect cylinder for damaged components and/or foreign materials. 2. Repair or replace as required.
	Seized crankshaft or connecting rod bearings.	1. Inspect crankshaft and connecting rod bearing. 2. Repair as required.
	Bent or broken connecting rod.	1. Inspect connecing rods. 2. Repair as required.
	Broken crankshaft	1. Inspect crankshaft. 2. Repair as required.

Engine Mechanical System > General Information > Repair procedures

COMPRESSION

NOTE

If the there is lack of power, excessive oil consumption or poor fuel economy, measure the compression pressure.

1. Warm up and stop engine.
   Allow the engine to warm up to normal operating temperature.
2. Remove ignition coils. (See EE group - ignition)
3. Remove spark plugs.
   Using a 16mm plug wrench, remove the 4 spark plugs.
4. Check cylinder compression pressure.
   A. Insert a compression gauge into the spark plug hole.

   B. Fully open the throttle.
   C. While cranking the engine, measure the compression pressure.

   NOTE

   Always use a fully charged battery to obtain engine speed of 200 rpm or more.

   D. Repeat steps (a) through (c) for each cylinder.

   NOTE

   This measurement must be done in as short a time as possible.

   Compression pressure :
   1,283kPa (13.0kgf/cm², 185psi)
   Minimum pressure :
   1,135kPa (11.5kgf/cm², 164psi)
   Difference between each cylinder :
   100kPa (1.0kgf/cm², 15psi) or less

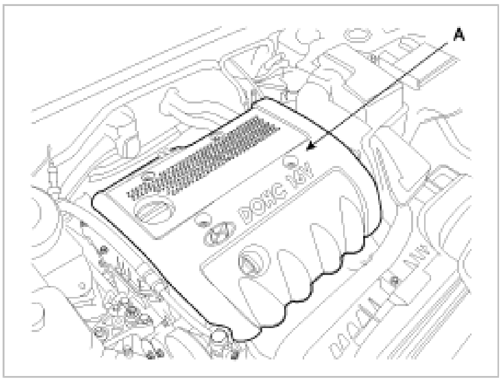
   E. If the cylinder compression in 1 or more cylinders is low, pour a small amount of engine oil into the cylinder through the spark plug hole and repeat steps (a) through (c) for cylinders with low compression.
      - If adding oil helps the compression, it is likely that the piston rings and/or cylinder bore are worn or damaged.
      - If pressure stays low, a valve may be sticking or seating is improper, or there may be leakage past the gasket.
5. Reinstall spark plugs.
6. Install ignition coils. (See EE group - ignition)

VALVE CLEARANCE INSPECTION AND ADJUSTMENT

NOTE

Inspect and adjust the valve clearance when the engine is cold (Engine coolant temperature : 20°C) and cylinder head is installed on the cylinder block.

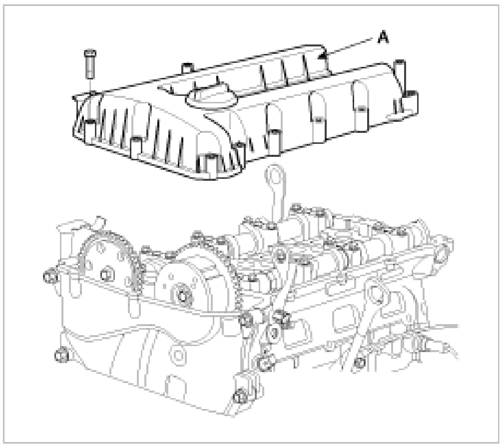
1. Remove the engine cover(A).



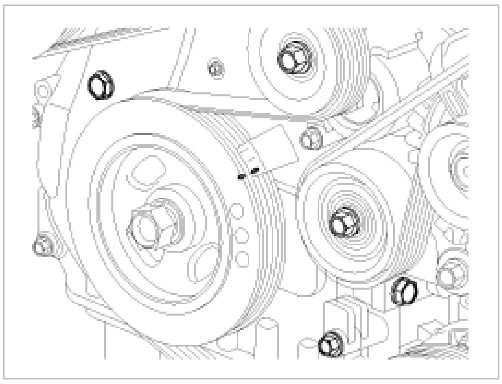
2. Remove the cylinder head cover.
   A. Disconnect the ignition coil connect(A) and remove the ignition coil.

   B. Disconnect the P.C.V hose(A) and the breather hose from the cylinder head cover.

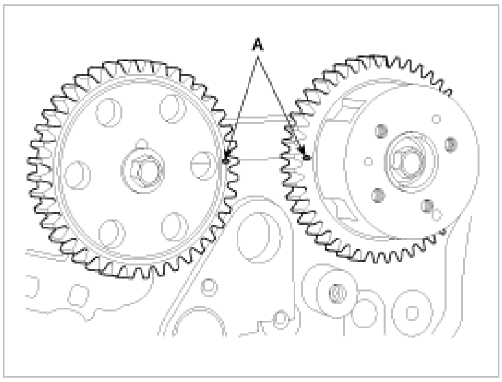
   C. Loosen the cylinder head cover bolts and then remove the cover(A) and gasket.



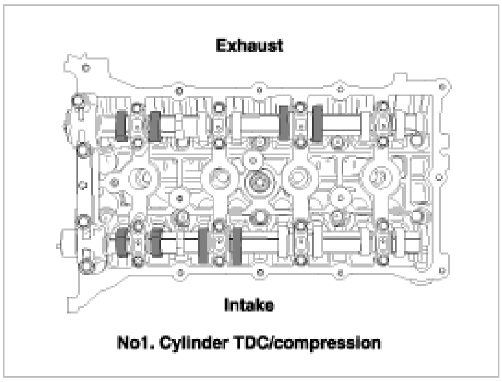
3. Set No.1 cylinder to TDC/compression.
   A. Turn the crankshaft pulley and align its groove with the timing mark "T" of the lower timing chain cover.



B. Check that the mark(A) of the camshaft timing sprockets are in straight line on the cylinder head surface as shown in the illustration.
   If not, turn the crankshaft one revolution (360°)



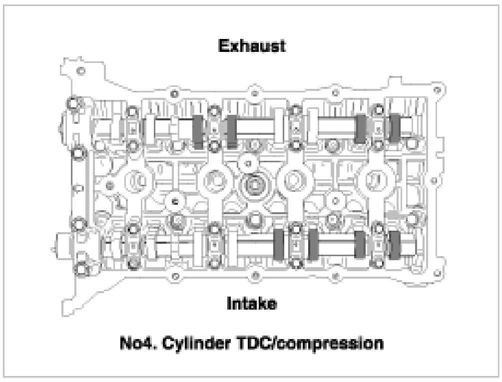
4. Inspect the valve clearance.
   A. Check only the valve indicated as shown. [No. 1 cylinder : TDC/Compression] measure the valve clearance.



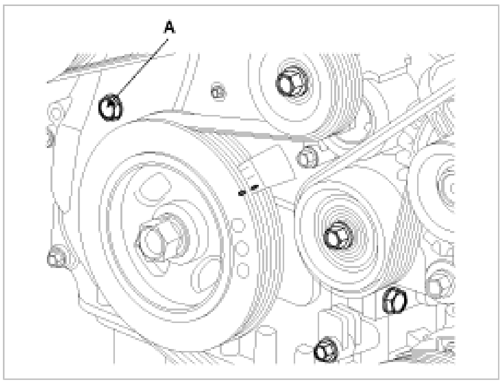
·Using a thickness gauge, measure the clearance between the tappet and the base circle of camshaft.
·Record the out-of-specification valve clearance measurements. They will be used later to determine the required replaement adjusing tappet.

Valve clearance
Specification
Engine coolant temperature : 20°C [68°F]
Limit
Intake : 0.10 ~ 0.30mm (0.0039 ~ 0.0118in.)
Exhaust : 0.20 ~ 0.40mm (0.0079 ~ 0.0157in.)

B. Turn the crankshaft pulley one revolution (360°) and align the groove with timing mark "T" of the lower timing chain cover.
C. Check only valves indicated as shown. [NO. 4 cylinder : TDC/compression]. Measure the valve clearance.



5. Adjust the intake and exhaust valve clearance.
   A. Set the No.1 cylinder to the TDC/compression.
   B. Marks on the timing chain and camshaft timing sprockets.
   C. Remove the service hole bolt(A) of the timing chain cover.



CAUTION

The bolt must not be reused once it has been assembled.

   D. Insert a thin rod in the service hole of the timing chain cover and release the ratchet.
   E. Remove the front camshaft bearing cap(A).

   F. Remove the exhaust camshaft sprocket.
   G. Remove the exhaust camshaft bearing cap and exhaust camshaft.
   H. Remove the intake camshaft bearing cap and intake camshaft.

CAUTION

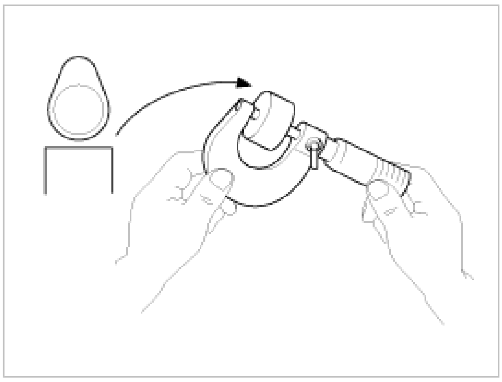
When disconnecting the timing chain from the camshaft timing sprocket, hold the timing chain.

   I. Tie a timing chain with a string.

CAUTION

Be careful not to drop anything inside timing chain cover.

   J. Measure the thickness of the removed tappet using a micrometer.



K. Calculate the thickness of a new tappet so that the valve clearance comes within the specificified value.

Valve clearance (Engine coolant temperature : 20°C)
T : Thickness of removed tappet
A : Measured valve clearance
N : Thickness of new tappet
Intake : N = T + [A - 0.20mm(0.0079in.)]
Exhaust : N = T + [A-0.30mm (0.0118in.)]

L. Select a new tappet with a thickness as close as possible to the caculated value.

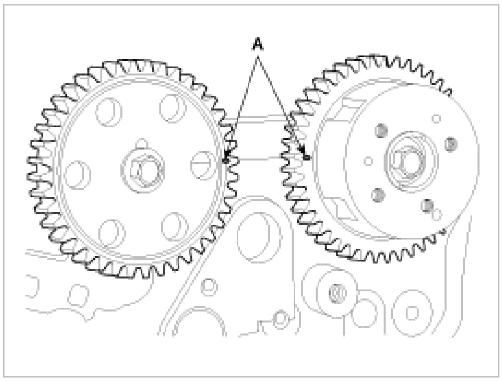
NOTE

Shims are available in 47size increments of 0.015mm (0.0006in.) from 3.00mm (0.118in.) to 3.690mm (0.1452in.)

M. Place a new tappet on the cylinder head.
N. Hold the timing chain, and place the intake camshaft and timing sprocket assembly.
O. Align the matchmarks on the timing chain and camshaft timing sprocket.
P. Install the intake and exhaust camshaft.
Q. Install the front bearing cap.
R. Install the sevice hole bolt.

Tightening torque
12 ~ 15N.m (1.2 ~ 1.5kgf.m, 8.8 ~ 11.0lbf.ft)

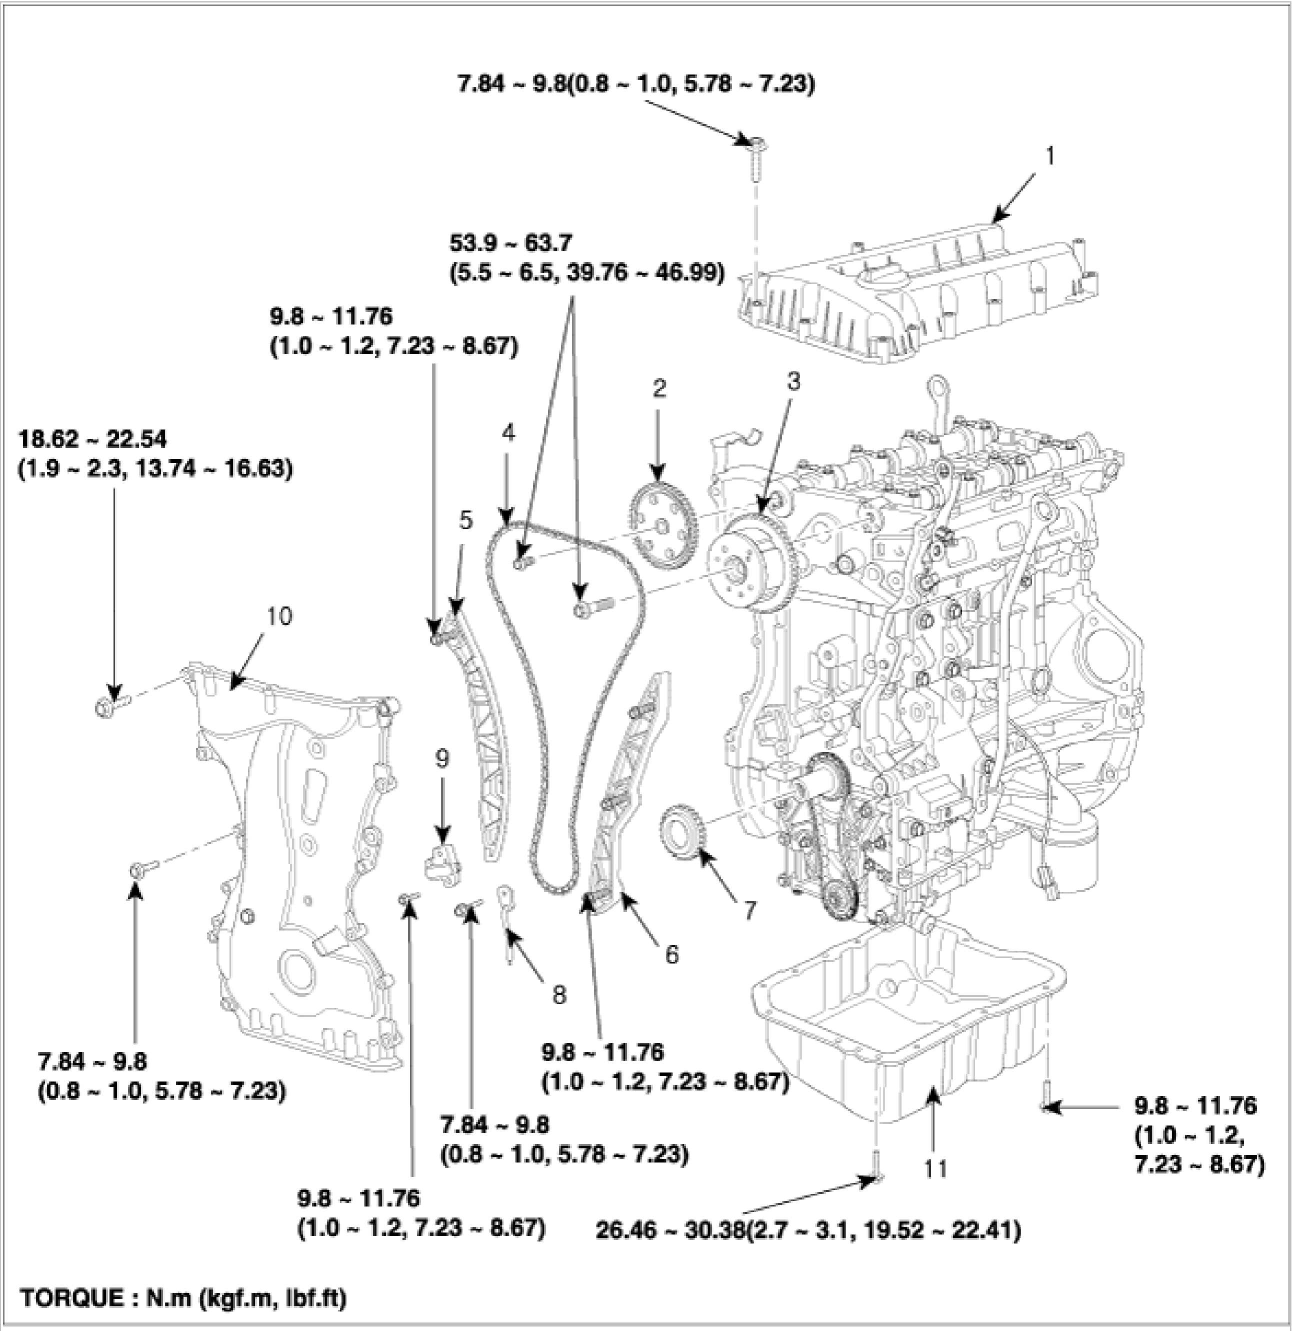
S. Turn the crankshaft two turns in the operating direction(clockwise) and realign crankshaft sprocket and camshaft sprocket timing marks.



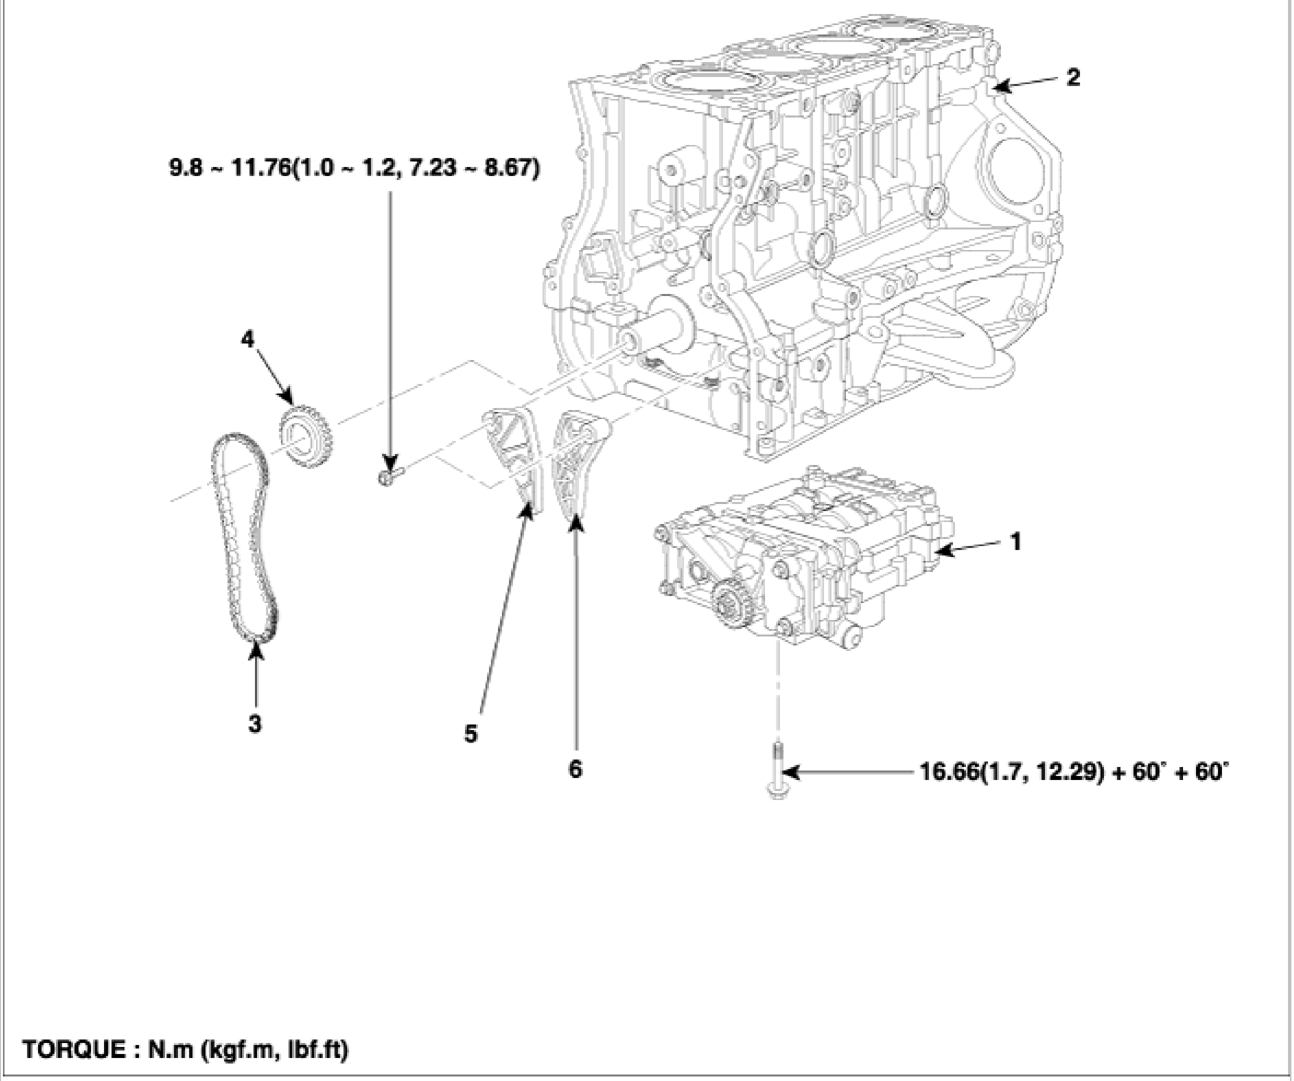
T. Recheck the valve clearance.

Valve clearance (Engine coolant temperature : 20°C)
[Specification]
Intake : 0.17 ~ 0.23mm (0.0067 ~ 0.0090in.)
Exhaust : 0.27 ~ 0.33mm (0.0106 ~ 0.0129in.)

COMPONENT



1. Cylinder head cover
2. Exhaust camshaft sprocket
3. CVVT assembly
4. Timing chain
5. Timing chain tensioner arm
6. Timing chain guide
7. Crankshafe sprocket
8. Oil jet
9. Timing chain tensioner
10. Timing chain cover
11. Oil pan



1. Balance shaft module
2. Cylinder block
3. Balance shaft chain
4. Balance shaft chain sprocket
5. Balance shaft chain guide
6. Balance shaft chain tensioner arm

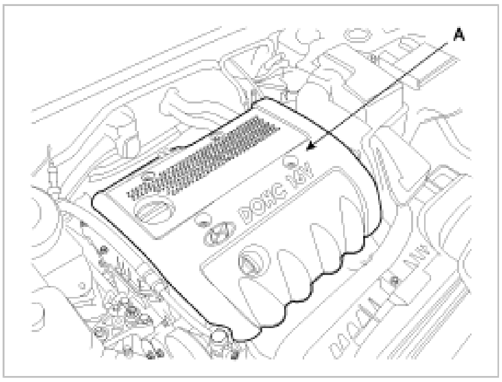
Engine Mechanical System > Timing System > Repair procedures

REMOVAL

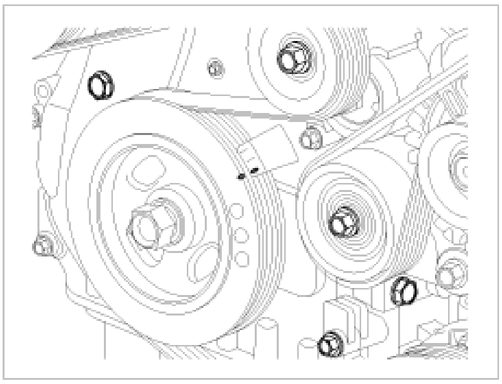
Engine removal is not required for this procedure.

Timing chain

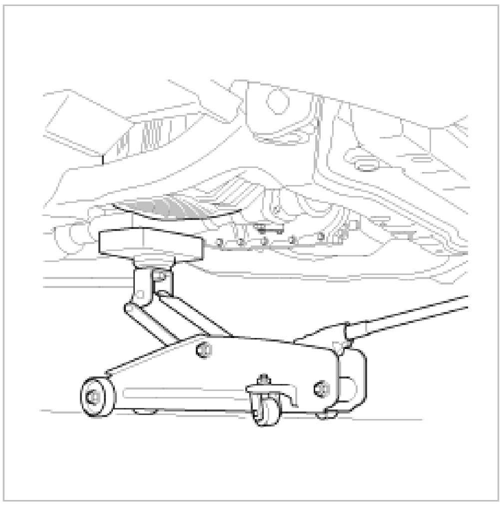
1. Remove the engine cover(A).



2. Remove RH front wheel.
3. Remove RH side cover.
4. Set No.1 cylinder to TDC/compression

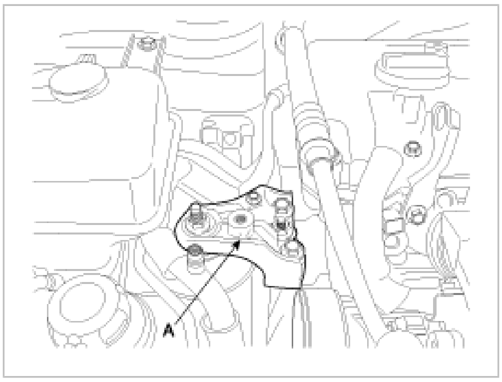


5. Remove the engine mount bracket.
   (1) Set the jack to the engine oil pan.

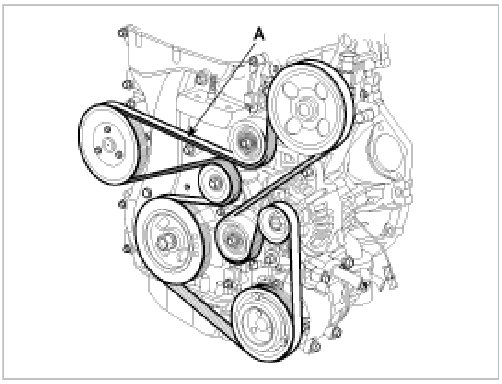


> **NOTE**
>
> Place wooden block between the jack and engine oil pan.

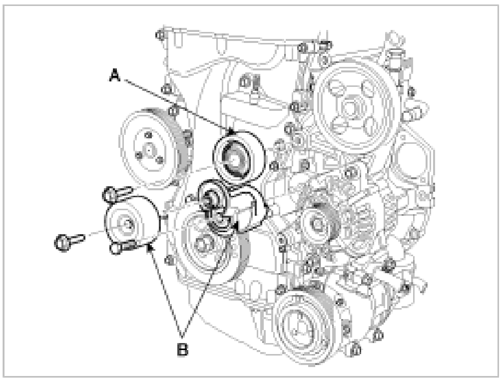
   (2) Remove the 2bolts, 2nuts and engine mount bracket(A).



6. Temporarily loosen the water pump pulley bolts.
7. Remove drive belt(A).



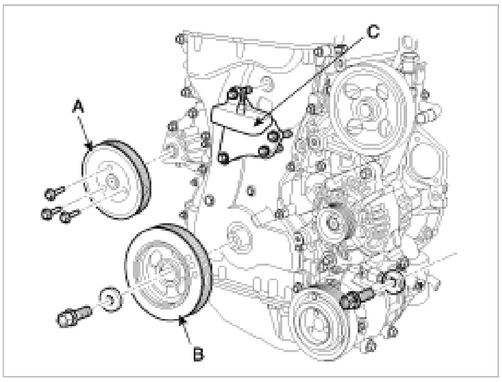
8. Remove the idler pulley(A).



9. Remove the drive belt tensioner pulley and tensioner(B).

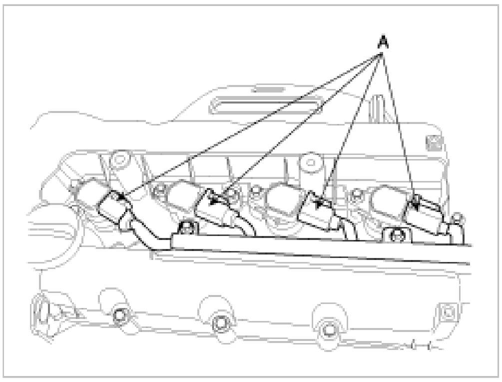
> NOTE
>
> Tensioner pulley bolt is left - handed screw.

10. Remove the water pump pulley(A).

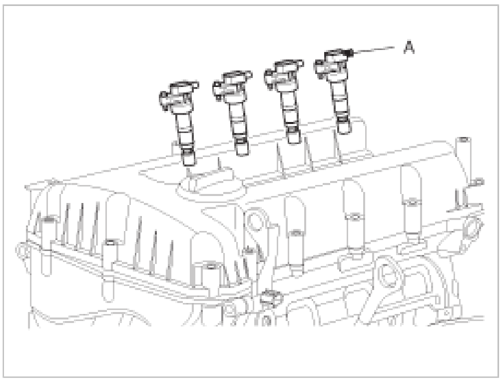


11. Remove the crankshaft pulley(B).

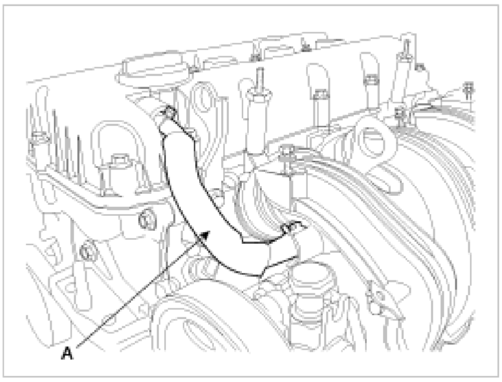
12. Remove the engine support bracket(C).
13. Disconnect the ignition coil connector(A).



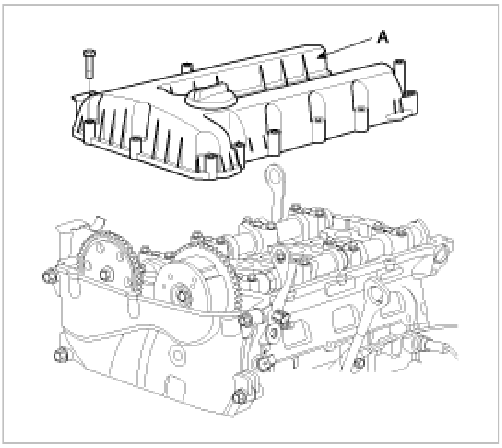
14. Remove the ignition coil(A).



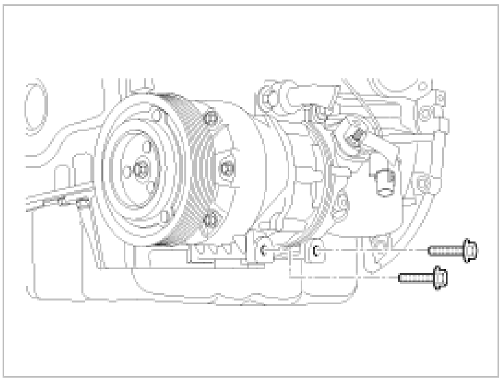
15. Remove the PCV hose(A) and breather hose from the cylinder head cover.



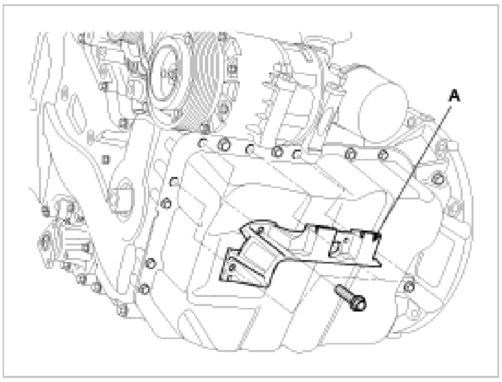
16. Loosen the cylinder head cover bolts and then remove the cylinder head cover(A) and gasket.



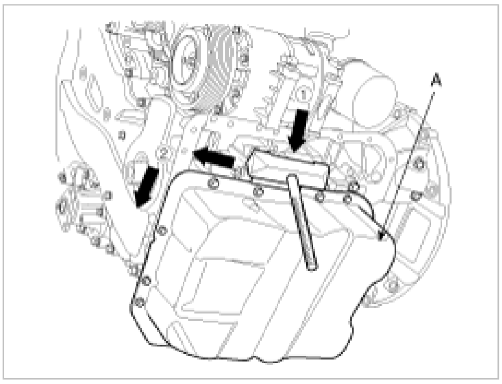
17. Remove the compressor lower bolts.



18. Remove the compressor bracket(A).

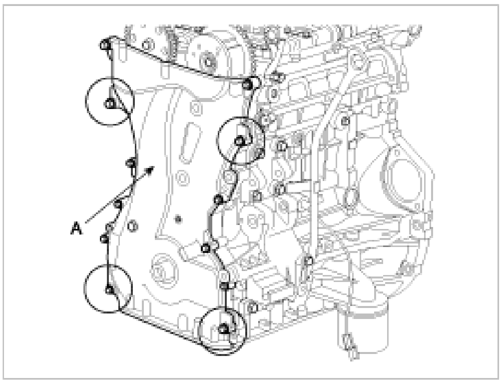


19. Drain the engine oil.
20. Remove the oil pan.



> **CAUTION**
>
> - Insert the SST between the oil pan and the ladder frame by tapping it with a plastic hammer in the direction of ① arrow.
> - After tapping the SST with a plastic hammer along the direction of ② arrow around more than 2/3 edge of the oil pan, remove it from the ladder frame.
> - Do not turn over the SST abruptly without tapping. It be result in damage of the SST.
>
> Be careful not to damage the contact surfaces of cylinder block and oil pan.

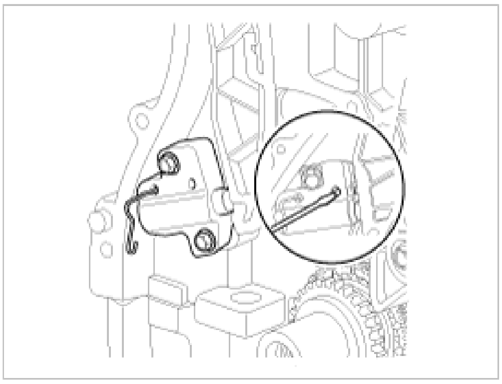
21. Remove the timing chain cover(A) by prying the portions between the cylinder head and cylinder block with a screwdriver.



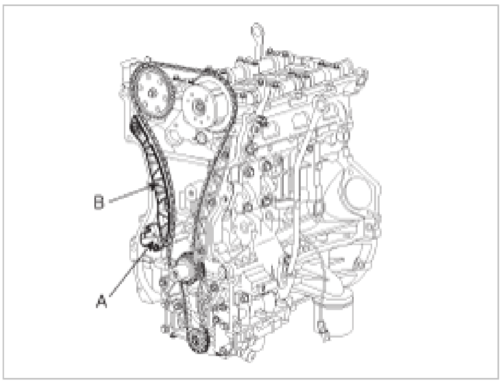
CAUTION

Be careful not to damage the contact surfaces of cylinder block, cylinder head and timing chain cover.

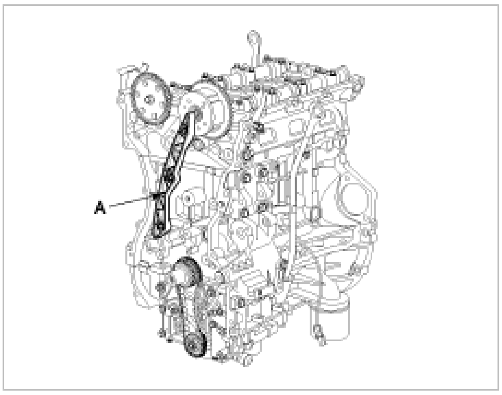
22. The key of crankshaft should be aligned with the mating face of main bearing cap. As a result of this, the piston of No.1 cylinder is placed at the top dead center on compression stroke.
23. Install a set pin after compressing the timing chain tensioner.



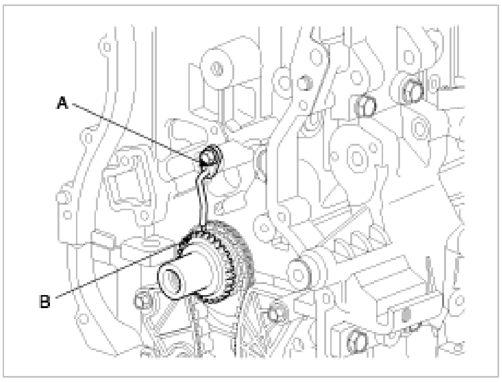
24. Remove the timing chain tensioner(A).



25. Remove the timing chain tensioner arm(B).
26. Remove the timing chain.
27. Remove the timing chain guide(A).

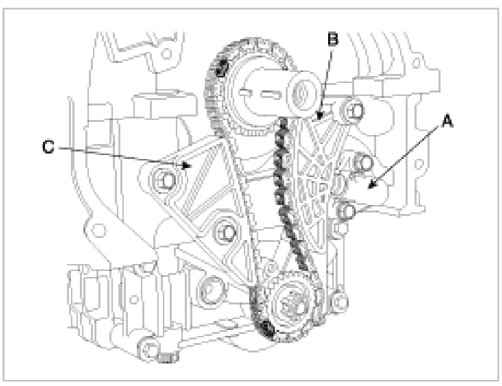


28. Remove the timing chain oil jet(A).
29. Remove the crankshaft chain sprocket(B).

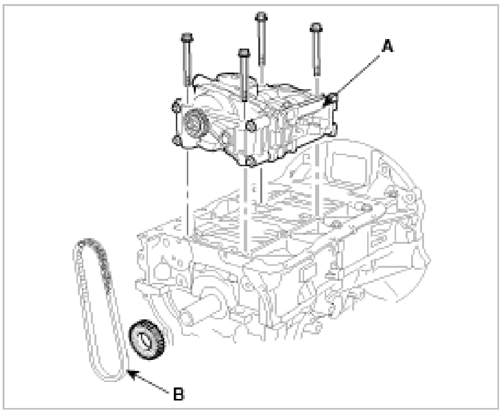


Balance shaft chain

1. Remove the timing chain.
2. Install a set pin after compressing the balance shaft chain tensioner.
3. Remove the balance shaft chain tensioner(A).



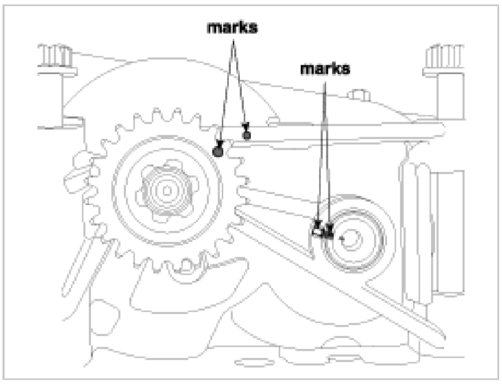
4. Remove the balance shaft chain tensioner arm(B).
5. Remove the balance shaft chain guide(C).
6. Remove the balance shaft module(A) and balance shaft chain(B).



INSTALLATION

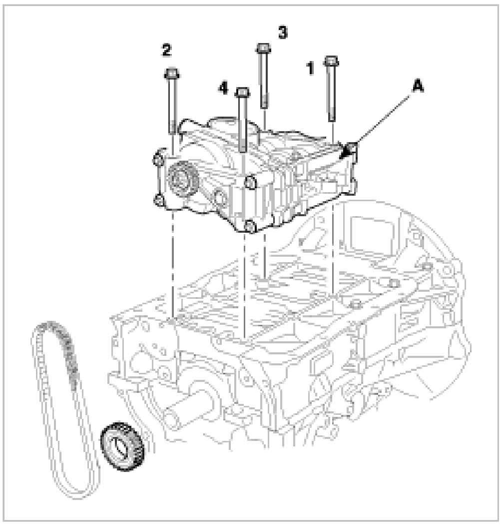
Balance shaft chain

1. The key of crankshaft should be aligned with the mating face of main bearing cap. As a result of this, the piston of No.1 cylinder is placed at the top dead center on compression stroke.
2. Confirm the balance shaft module timing mark.
   Timing marks to be visually aligned with centers of adjacent cast timing notches.



3. Install balance shaft module that the timing mark of balance shaft module sprocket should be matched with the timing mark (color link) of balance shaft chain.

Tightening torque
16.66N.m(1.7kgf.m, 12.3lbf.ft) + 60° + 60°



4. Install the balance shaft chain guide(C).

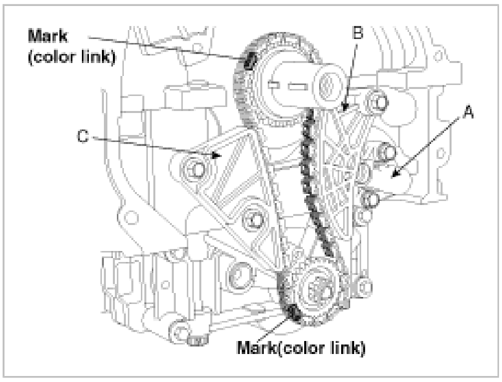
Tightening torque
9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)

5. Install the balance shaft tensioner arm(B).

Tightening torque
9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)

6. Install the balance shaft tensioner(A) and remove the set pin.

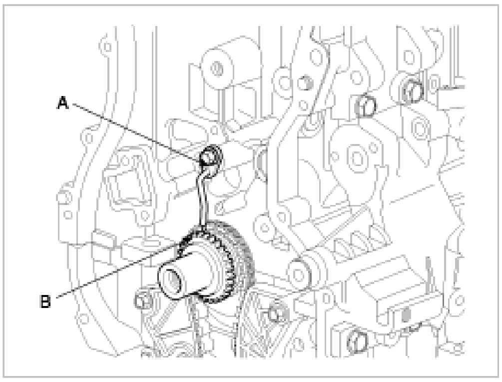
Tightening torque
9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)



7. Confirm the timing marks.

Timing chain

1. Install crankshaft chain sprocket(B).

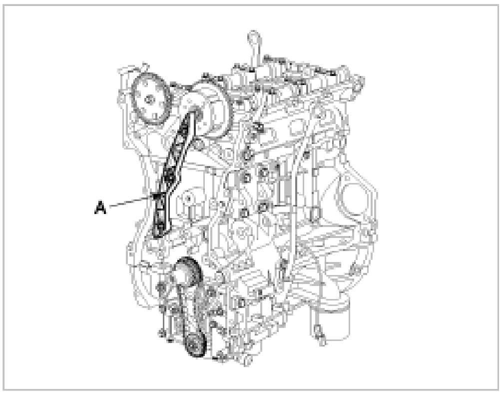


2. Install timing chain oil jet(A).

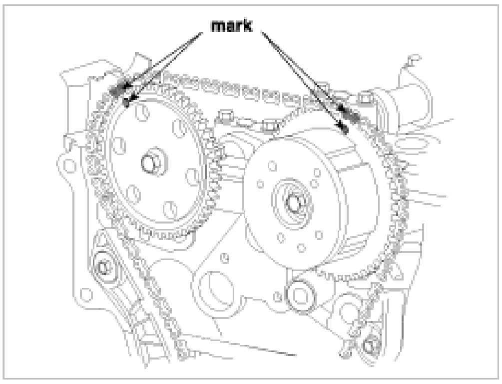
Tightening torque
7.84 ~ 9.8N.m(0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lbf.ft)

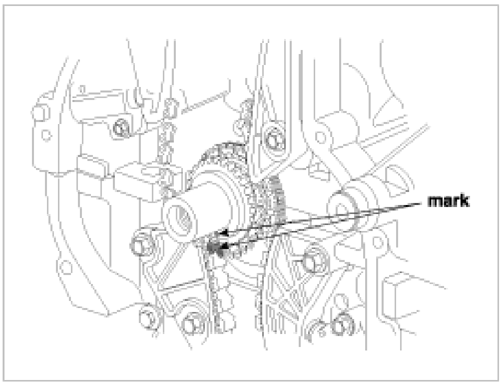
3. Set crankshaft that the key of crankshaft should be aligned with the mating surface of main bearing cap. Put the intake, exhaust camshaft assembly that the TDC mark of intake sprocket and exhast sprocket should be aligned with the top surface of cylinder head. As a result of this, place the piston on No.1 cylinder at the top dead center on compression stroke.
4. install timing chain guide(A).

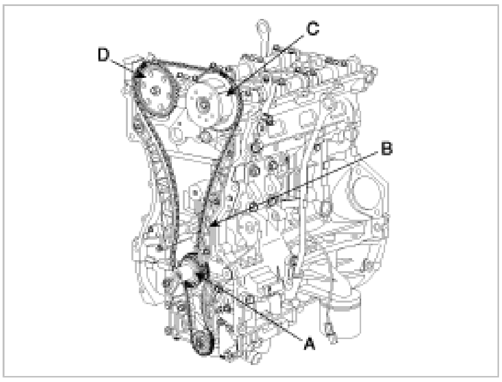
Tightening torque
9.8 ~ 11.6N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)



5. Install timing chain.
   To install the timing chain with no slack between each shaft (cam, crank), follow the below procedure.
   Crankshaft sprocket(A) → Timing chain guide(B) → Intake camshaft sprocket(C) → Exhaust camshaft sprocket(D).
   The timing mark of each sprockets should be matched with timing mark (color link) of timing chain at installing timing chain.





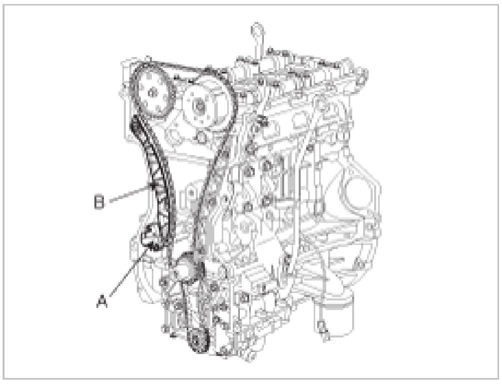


6. Install timing chain tensioner arm(B).

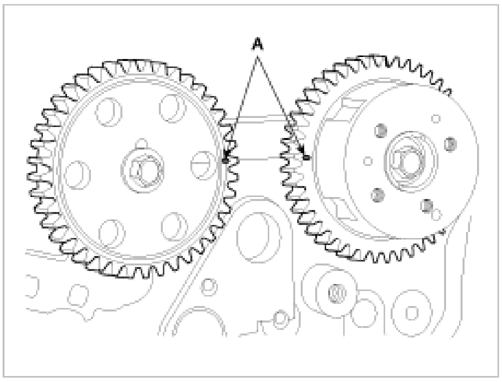
   Tightening torque
   9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)

7. Install timing chain auto tensioner(A) and remove set pin.

Tightening torque
9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)

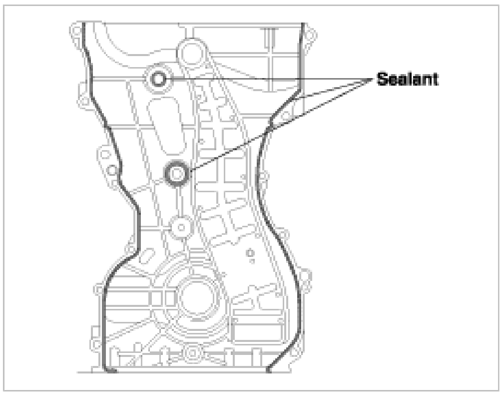


8. After rotating crankshaft 2 revolutions in regular direction (clockwise viewed from front), confirm the timing mark.



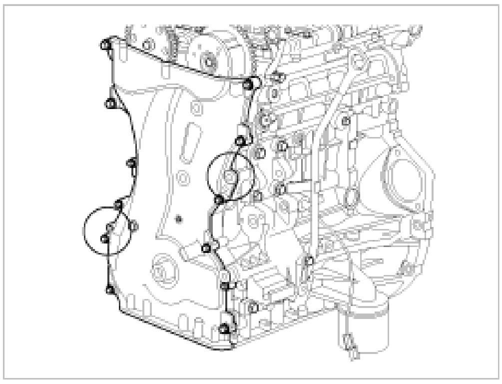
9. Install timing chain cover.
   A. The sealant locations on chain cover and on counter parts (cylinder head, cylinder block, and ladder frame) must be free of engine oil and ETC.
   B. Before assembling the timing chain cover, the liquid sealant Loctite 5900 should be applied on the gap between cylinder head and cylinder block.
      The part must be assembled within 5 minutes after sealant was applied.
      Bead width : 2.5mm(0.1in.)

   C. After applying liquid sealant Loctite 5900 on timing chain cover.
      The part must be assembled within 5 minutes after sealant was applied.
      Selant should be applied without discontinuity.
      Bead width : 2.5mm(0.1in.)



D. The dowel pins on the cylinder block and holes on the timing chain cover should be used as a reference in order to assemble the timing chain cover to be in exact position.

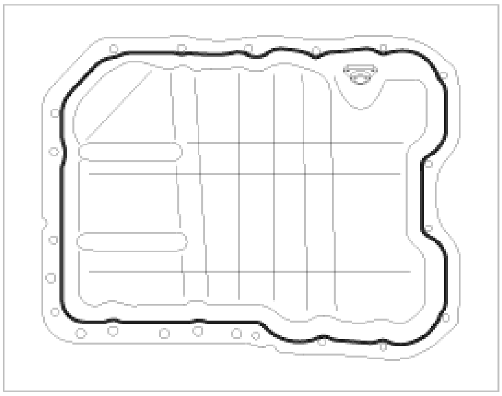
Tightening torque
M6 : 7.84 ~ 9.8N.m(0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lbf.ft)
M8 : 18.62 ~ 22.54N.m(1.9 ~ 2.3kgf.m, 13.74 ~ 16.63lbf.ft)



E. The firing and/or blow out test should not be performed within 30 minutes after the timing chain cover was assembled.

10. Install timing chain cover oil seal
    (1) Apply engine oil to a new oil seal lip.
    (2) Using SST(09214-3K000, 09231-H1100) and a hammer, tap in the oil seal.
11. Install oil pan.
    A. Using a gasket scraper, remove all the old packing material from the gasket surfaces.
    B. Before assebling the oil pan, the liquid sealant Loctite 5900 should be applied on oil pan.
    The part must be assembled within 5 minutes after the sealant was applied.

Sealant : Loctite 5900 or equivalent(MS 721-40A)

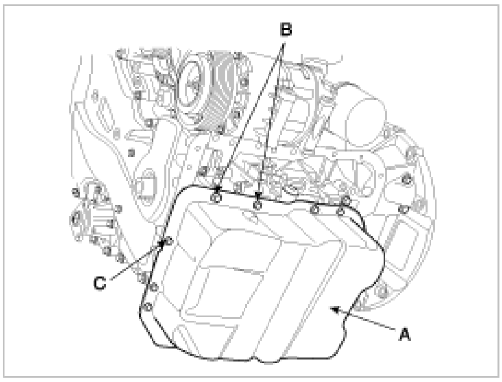


CAUTION

• When applying sealant gasket, sealant must not be protruded into the inside of oil pan.
• To prevent leakage of oil, apply sealant gasket ot the inner threads of the bolt holes.

C. Install oil pan(A).
   Uniformly tighten the bolts in several passes.

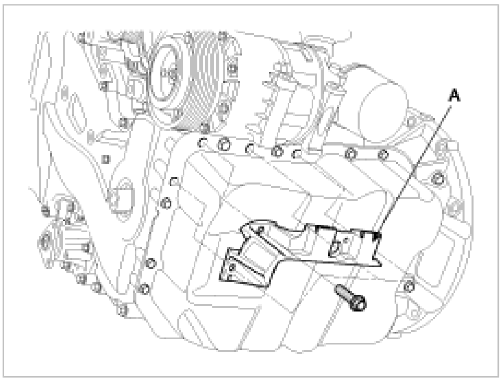
   Tightening torque
   M8(B) : 26.46 ~ 30.38N.m(2.7 ~ 3.1kgf.m, 19.52 ~ 22.41lbf.ft)
   M6(C) : 9.8 ~ 11.76N.m(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)



D. After assembly, wait at least 30 minutes before filling the engine with oil.

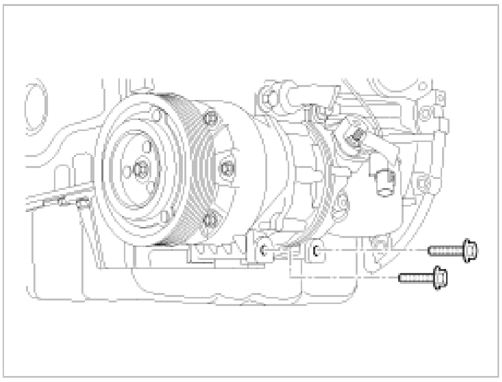
12. Install air compressor bracket(A).

Tightening torque
19.6 ~ 23.52N.m(2.0 ~ 2.4kgf.m, 14.46 ~ 17.35lbf.ft)



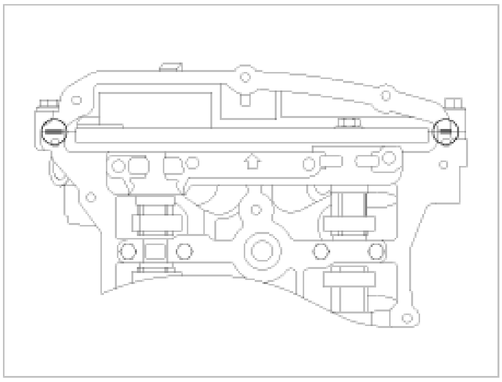
13. Install air compressor bolt

Tightening torque
19.6 ~ 24.5N.m(2.0 ~ 2.5kgf.m, 14.46 ~ 18.07lbf.ft)



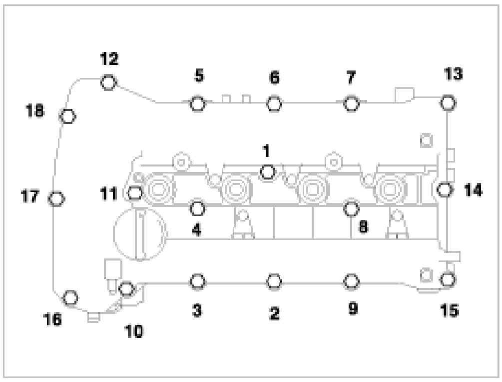
14. Install cylinder head cover.
   A. The hardening sealant located on the upper area between timing chain cover and cylinder head should be removed before assembling cylinder head cover.

B. After applying sealant, it should be assembled within 5 minutes.
Bead width : 2.5mm(0.1in.)



C. The firing and/or blow out test should not be performed within 30 minutes after the cylinder head cover was assembled.
D. Install the cylinder head coer bolts as following method.

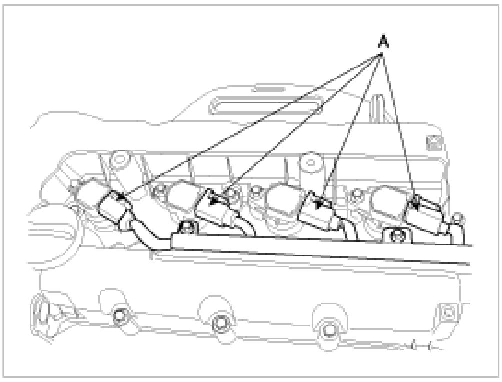
Tightening torque
1st step : 3.92 ~ 5.88N.m(0.4 ~ 0.6kgf.m, 2.89 ~ 4.34lbf.ft)
2st step : 7.84 ~ 9.8N.m(0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lbf.ft)



CAUTION

Do not reuse cylinder head cover gasket.

15. Install ignition coil (See EE group-ignition)
16. Connect ignition coil connector(A).



17. Install engine support bracket(C).

Tightening torque
M10 : 39.2 ~ 44.1N.m(4.0 ~ 4.5kgf.m, 28.92 ~ 32.53lbf.ft)
M8 : 19.6 ~ 24.5N.m(2.0 ~ 2.5kgf.m, 14.46 ~ 18.07lbf.ft)

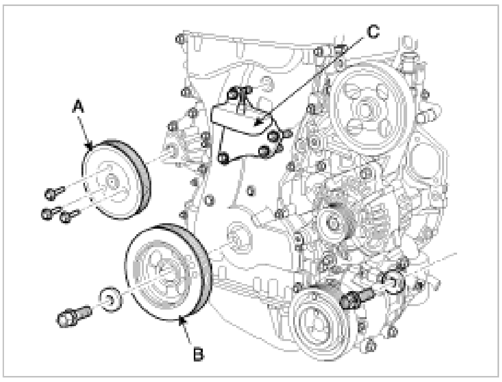
---

18. Using SST(09231-3K000), install crankshaft pulley(B).

Tightening torque
166.6 ~ 176.4N.m(17 ~ 18kgf.m, 122.9 ~ 130.13lbf.ft)

19. Install water pump pulley(A).

Tightening torque
7.84 ~ 9.8N.m(0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lbf.ft)

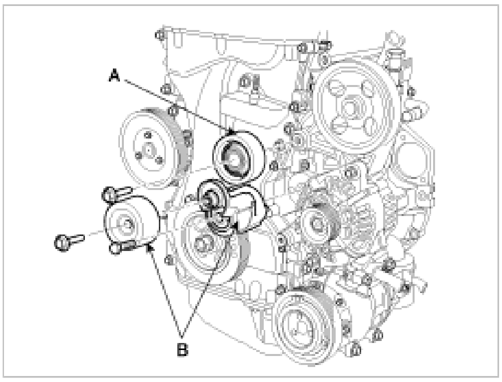


20. Install drive belt tensioner(B) and tensioner pulley.

Tightening torque
53.9 ~ 63.7N.m(5.5 ~ 6.5kgf.m, 39.7 ~ 47.0lbf.ft)

21. Install idler pulley(A)

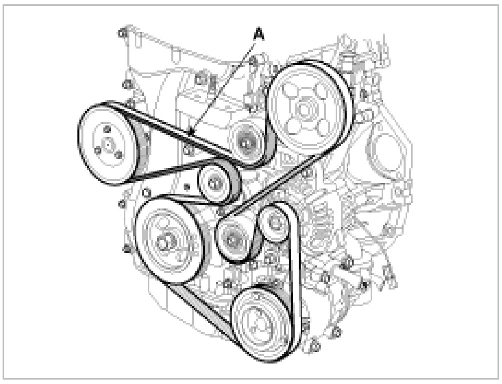
Tightening torque
53.9 ~ 63.7N.m(5.5 ~ 6.5kgf.m, 39.7 ~ 47.0lbf.ft)



NOTE

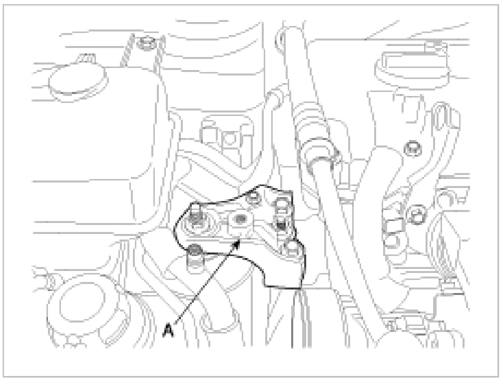
Tensioner pulley bolt is left-handed screw.

22. Install drive belt(A)
Crankshaft pulley → A/C pulley → alternator pulley → idler pulley → P/C pump pulley → idler pulley → water pump pulley → tensioner pulley.
Rotate auto tensioner arm in the counter - clockwise moving auto tensioner pulley bolt with wrench.
After putting belt on auto tensioner pulley, release the auto tensioner pulley slowly.



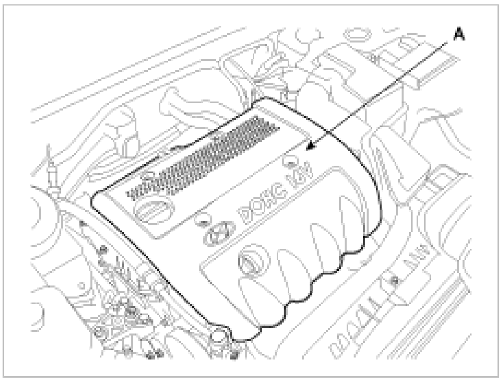
23. Install engine mounting bracket(A).

Tightening torque
63.7 ~ 83.3N.m(6.5 ~ 8.5kgf.m, 47.0 ~ 61.4lbf.ft)



24. Install RH side cover.
25. Install RH front wheel.
26. Install engine cover(A).

Tightening torque
3.92 ~ 5.88N.m(40 ~ 60kgf.cm, 2.89 ~ 4.34lbf.ft)



INSPECTION

SPOCKETS, CHAIN TENSIONER, CHAIN GUIDE, CHAIN TENSIONER ARM

1. Check the camshaft sprocket and crankshaft sprocket for abnormal wear, cracks, or damage. Replace as necessary.
2. Inspect the tensioner arm and chain guide for abnormal wear, cracks, or damage.
   Replace as necessary.
3. Check that the tensioner piston moves smoothly when the ratchet pawl is released with thin rod.

BELT, IDLER, BELT TENSIONER, PULLEY

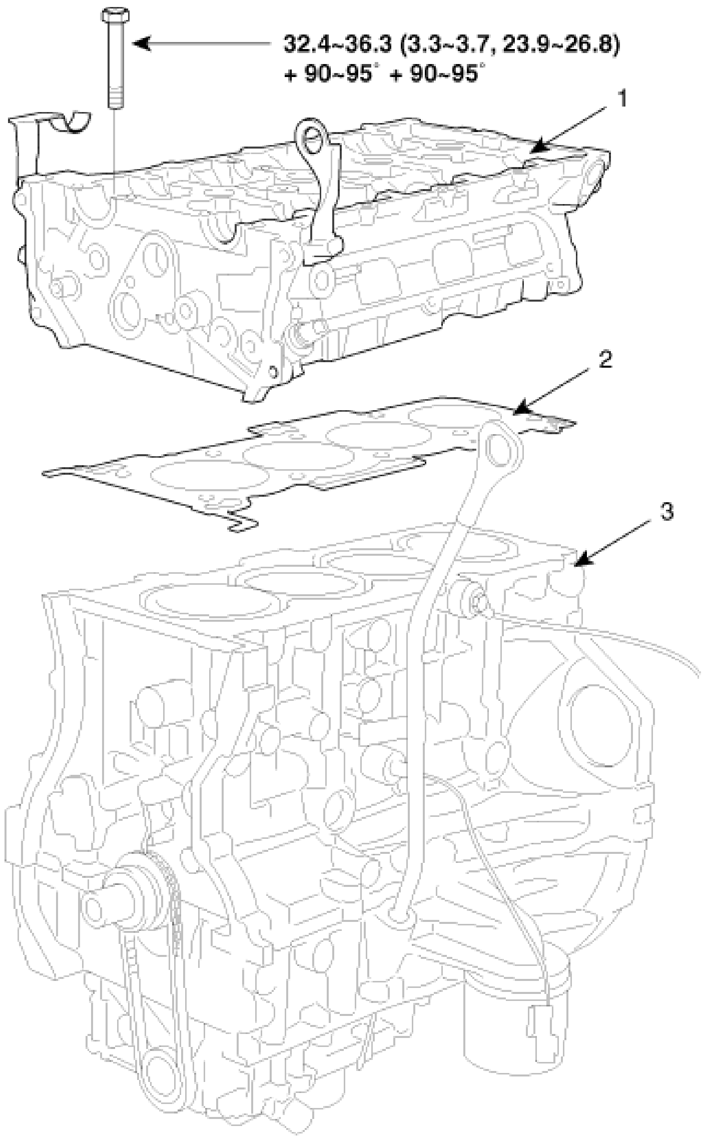
1. Check the belt for oil or dust deposits.
   Replace, if necessary.
   Small deposits should be wiped away with a dry cloth or paper. Do not clean with solvent.
2. When the engine is overhauled or belt tension adjusted, check the belt carefully. If any of the following flaws are evident, replace the belt.

> NOTE
>
> • Do not bend, twist or turn the timing belt inside out.
> • Do not allow the timing belt to come into contact with oil, water and steam.

3. Inspect the idler for easy and smooth rotation and check for play or noise.

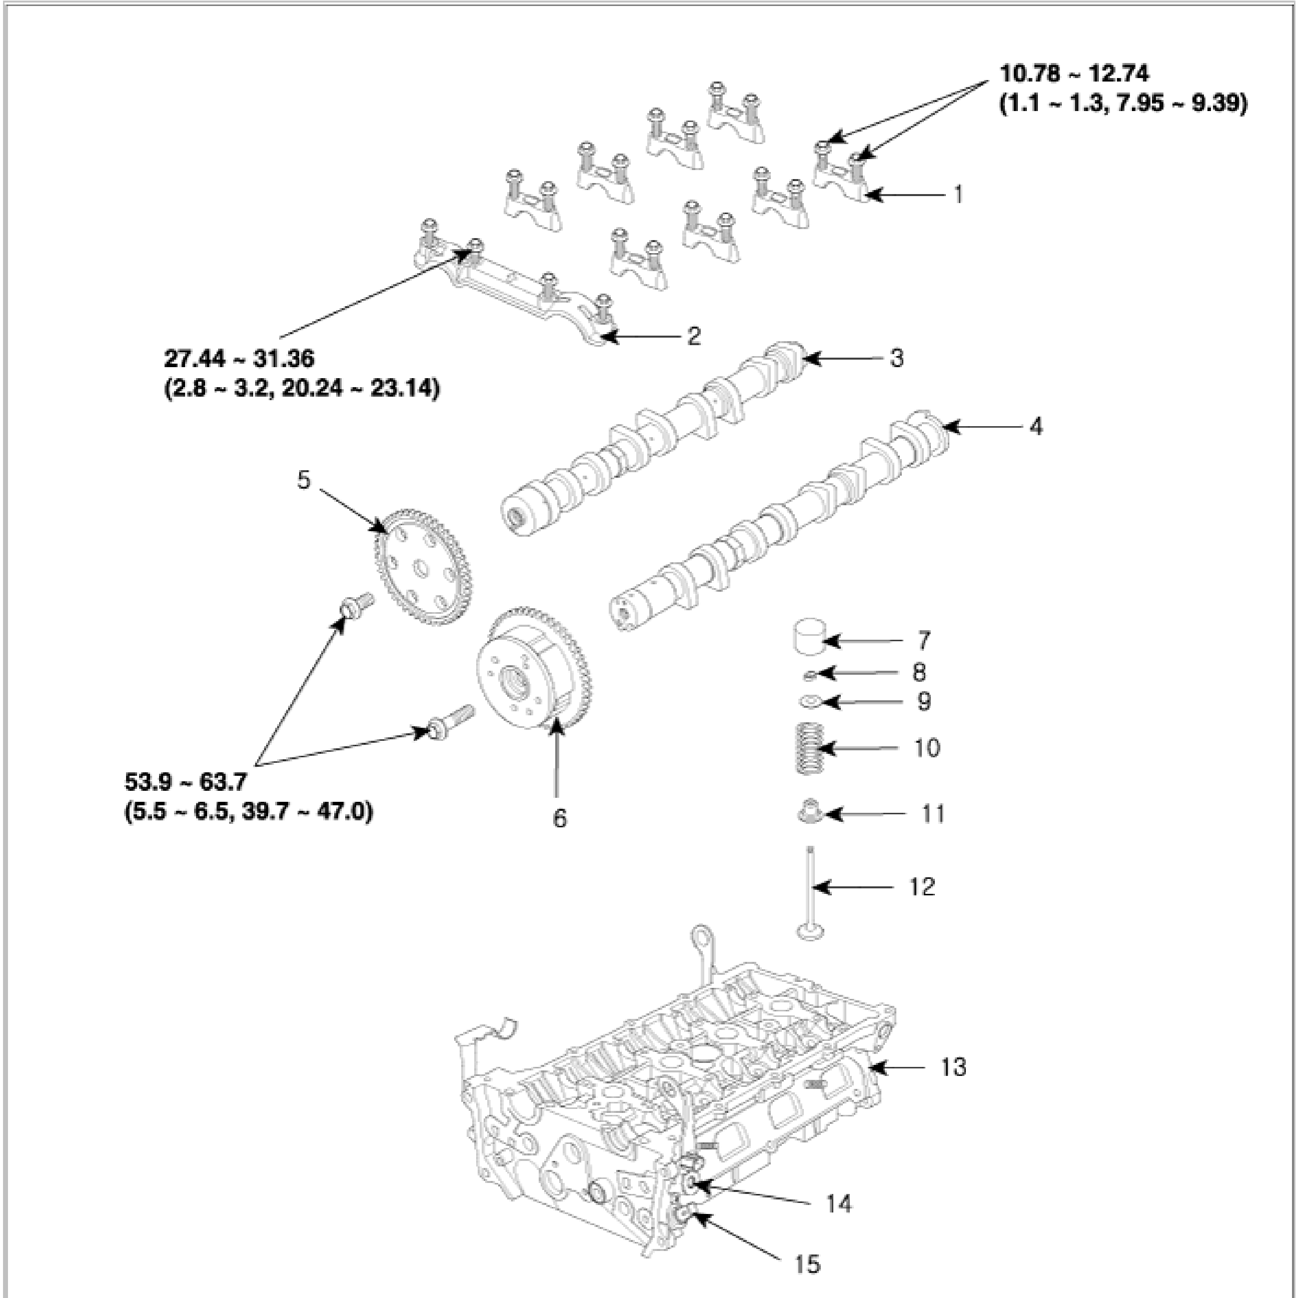
Engine Mechanical System > Cylinder Head Assembly > Components and Components Location

COMPONENTS



TORQUE : N.m (kgf.m, lbf.ft)

1. Cylinder head
2. Cylinder head gasket
3. Cylinder block



1. Camshaft bearing cap
2. Camshaft front bearing cap
3. Exhaust camshaft
4. Intake camshaft
5. Exhaust camshaft sprocket
6. CVVT assembly
7. MLA
8. Retainer lock
9. Retainer
10. Valve spring
11. Valve stem seal
12. Valve
13. Cylinder head
14. OCV
15. OTS

Engine Mechanical System > Cylinder Head Assembly > Repair procedures

REMOVAL

Engine removal is not required for this procedure.

CAUTION

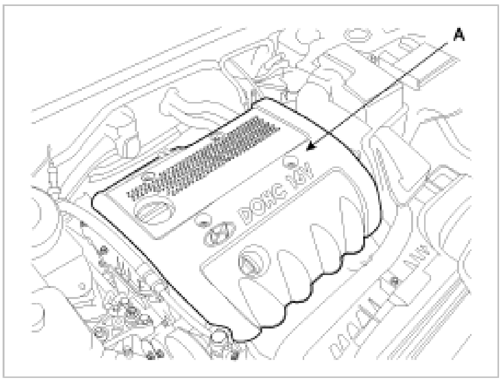
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the cylinder head, wait until the engine coolant temperature drops below normal temperature before removing it.
- When handling a metal gasket, take care not to fold the gasket or damage the contact surface of the gasket.

• To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

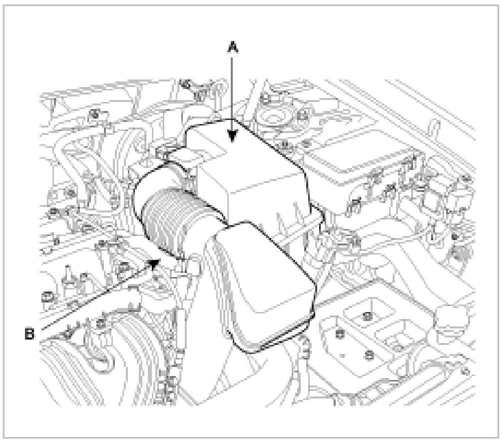
NOTE

• Mark all wiring and hoses to avoid misconnection.
• Turn the crankshaft pulley so that the No. 1 piston is at top dead center.

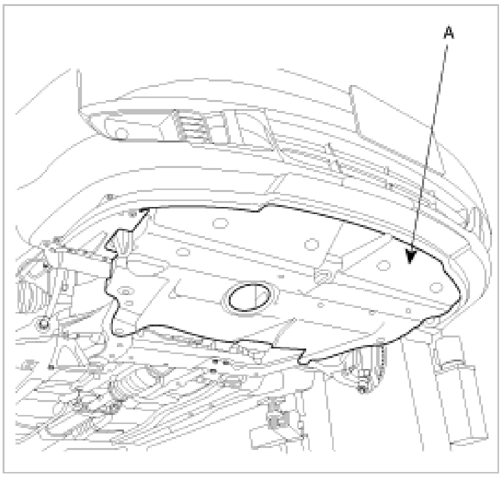
1. Disconnect the negative terminal from the battery.
2. Remove engine cover(A).



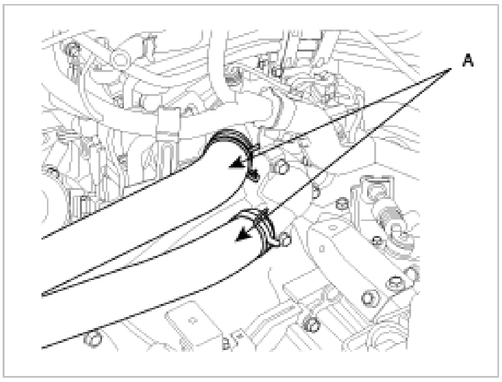
3. Remove air duct.
4. Remove the intake air hose and air cleaner assembly.
   (1) Disconnect the AFS connector.
   (2) Disconnect the breather hose(B) from air cleaner hose.
   (3) Disconnect the ECM connector. (See FL group)
   (4) Remove the intake air hose and air cleaner assembly(A).



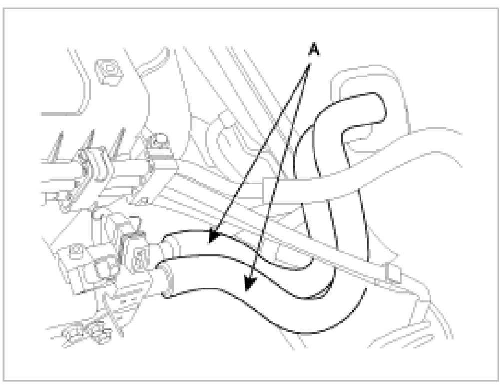
5. Remove front wheels.
6. Remove under cover(A).



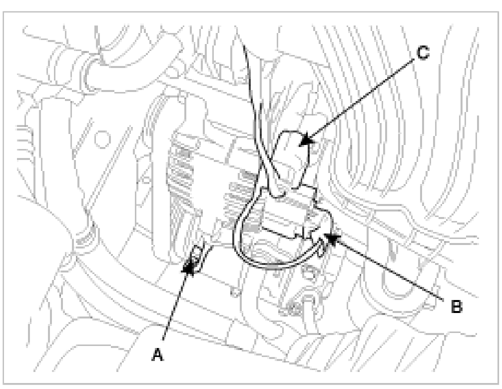
7. Drain the engine coolant.
   Remove the radiator cap to speed draining.
8. Remove the upper and lower radiator hose(A).



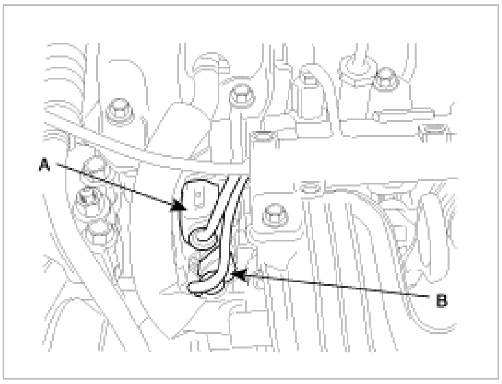
9. Remove the heater hoses(A).



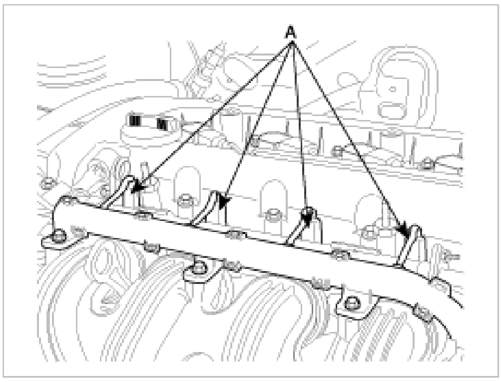
10. Disconnect A/C switch(A), alternator connector(B), and oil pressure switch(C).



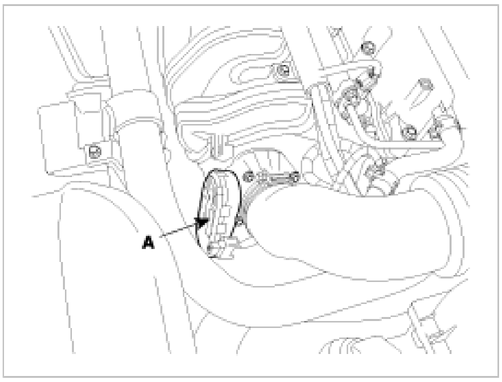
11. Disconnect OCV connector(A) and OTS connector(B).



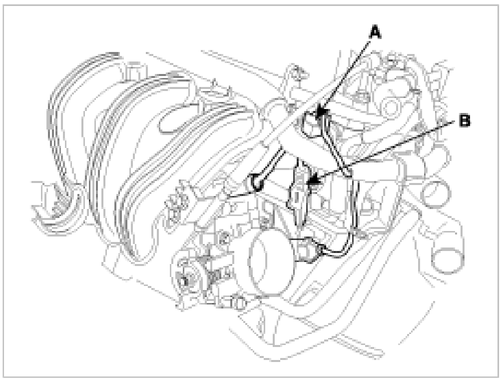
12. Disconnect injector connectors(A).



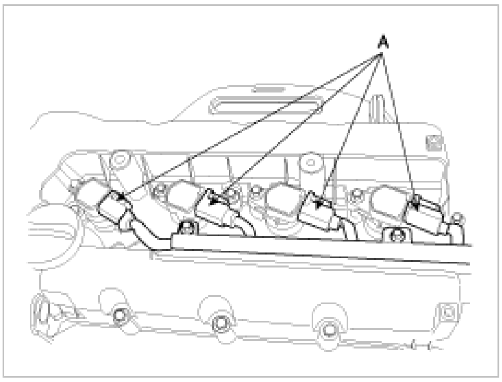
13. Disconnect ETS connector(A)



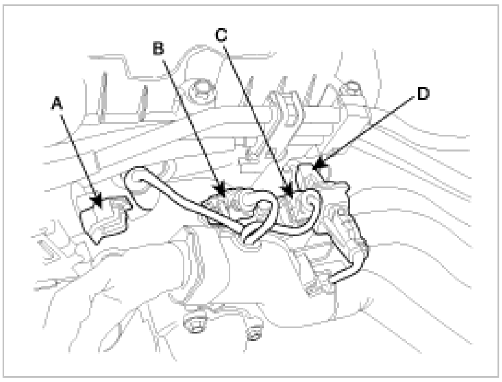
14. Disconnect CMP connector(A), and knock sensor connector(B).



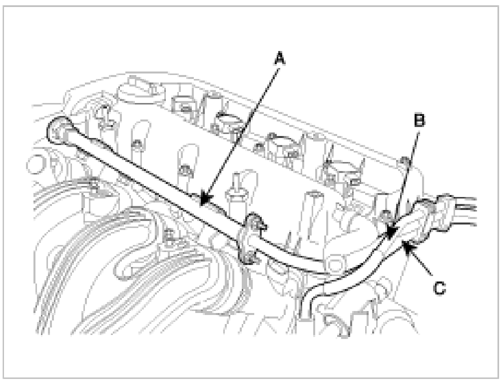
15. Disconnect ignition coil connectors(A).



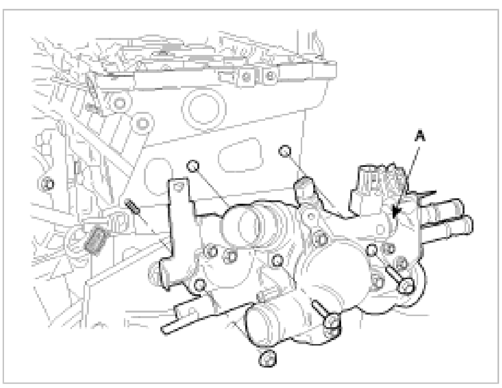
16. Disconnect PCSV connector(A), WTS connector(B), condenser connector(C), and CKP sensor connector(D).



17. Remove delivery pipe(A), brake vacuum hose(B), and PCSV hose(C).



18. Remove water temp control assembly(A).

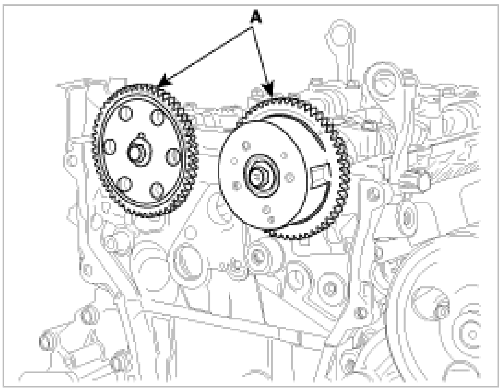


19. Remove intake manifold.

20. Remove exhaust manifold.

21. Remove timing chain.

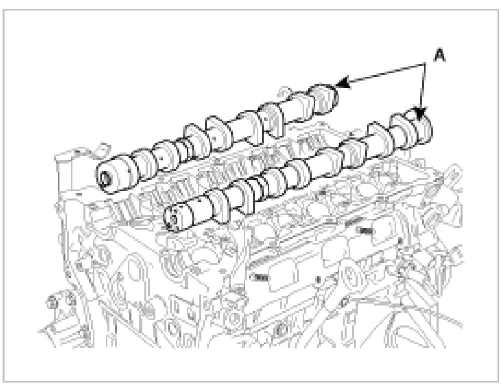
22. Remove CVVT assembly and camshaft sprocket(A).



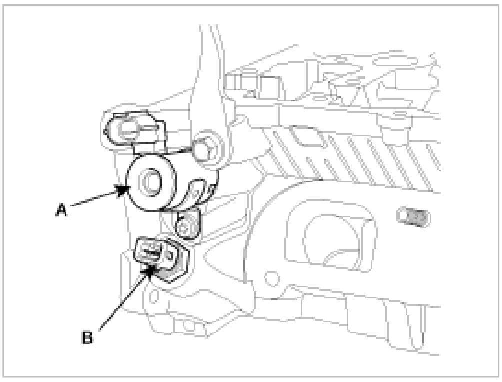
23. Remove camshaft.
    (1) Remove front camshaft bearing cap(A).

    (2) Remove camshaft bearing cap(A), in the sequence shown.

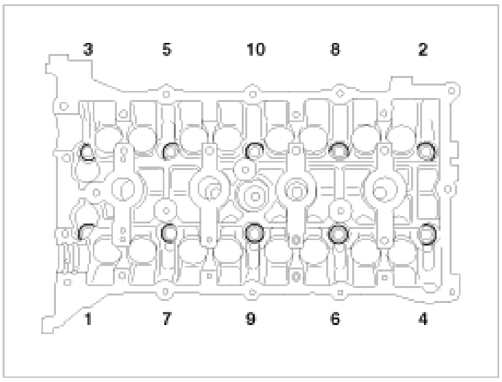
    (3) Remove camshafts(A)



24. Remove OCV(A) and OTS(B).



25. Remove the cylinder head bolts, then remove the cylinder head.
   (1) Using triple square wrench, uniformly loosen and remove the 10 cylinder head bolts, in several passes, in the sequence shown. Remove the 10 cylinder head bolts and plate washers.



> **CAUTION**
>
> Head warpage or cracking could result from removing bolts in an incorrect order.

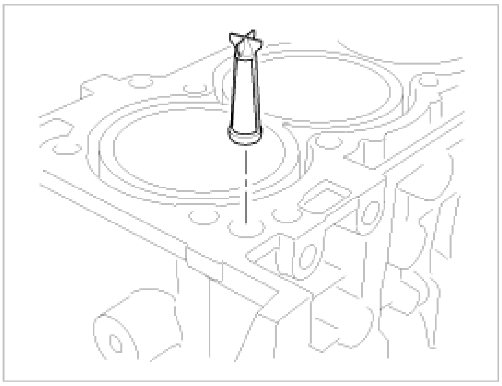
   (2) Lift the cylinder head from the dowels on the cylinder block and place the cylinder head on wooden blocks on a bench.

> **CAUTION**
>
> Be careful not to damage the contact surfaces of the cylinder head and cylinder block.

INSTALLATION

> **NOTE**
>
> - Thoroughly clean all parts to be assembled.
> - Always use a new head and manifold gasket.
> - The cylinder head gasket is a metal gasket. Take care not to bend it.
> - Rotate the crankshaft, set the No.1 piston at TDC.

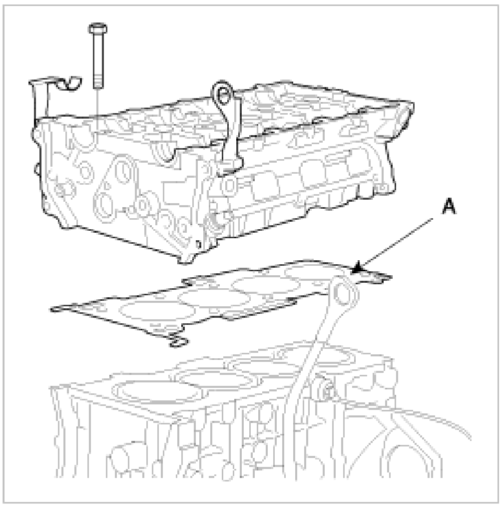
1. Install OCV filter.



NOTE

Keep clean te OCV filter.

2. Install the cylinder head gasket(A) on the cylinder block.



NOTE

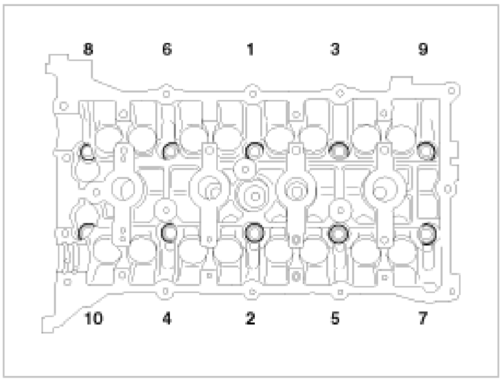
Be careful of the installation direction.

3. Place the cylinder head carefully in order not to damage the gasket with the bottom part of the end.
4. Install cylinder head bolts.
   (1) Apply a light coat if engine oil on the threads and under the heads of the cylinder head bolts.
   (2) Using wrench, install and tighten the 10 cylinder head bolts and plate washers, in several passes, in the sequence shown.

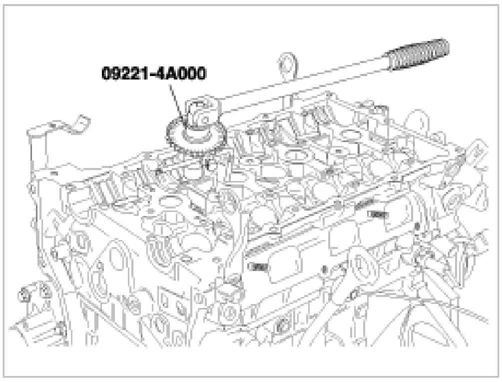
Tightening torque
32.4~36.3Nm (3.3~3.7kgf.m, 23.9~26.8lb-ft) + (90~95°) + (90~95°)

NOTE

Always use new cylinder head bolt.

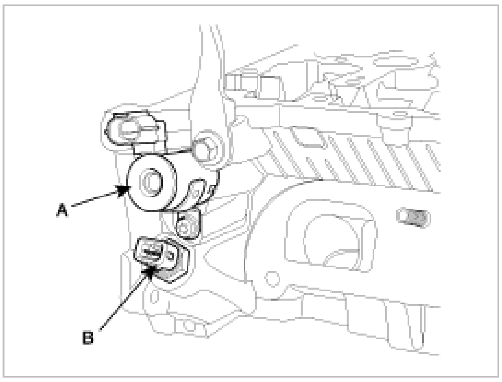


Using SST(09221-4A000), install cylinder head bolts.



5. Install OCV(A) and OTS (B).

Tightening torque
OCV : 9.8 ~ 11.76Nm(1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)
OTS : 19.6 ~ 23.52Nm(2.0 ~ 2.4kgf.m, 14.46 ~ 17.35lbf.ft)

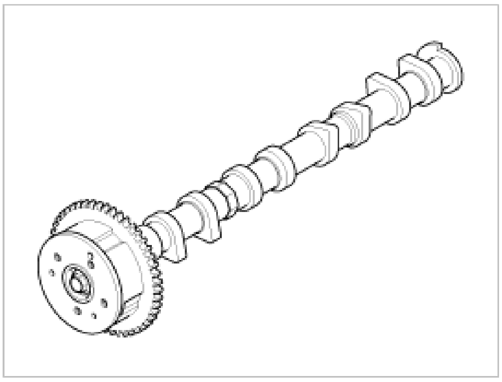


CAUTION

- Do not reuse the OCV when dropped.
- Keep clean the OCV.
- Do not hold the OCV sleeve during servicing.
- When the OCV is installed on the engine, do not move the engine with holding the OCV yoke.

6. Install the CVVT and camshaft sprocket.

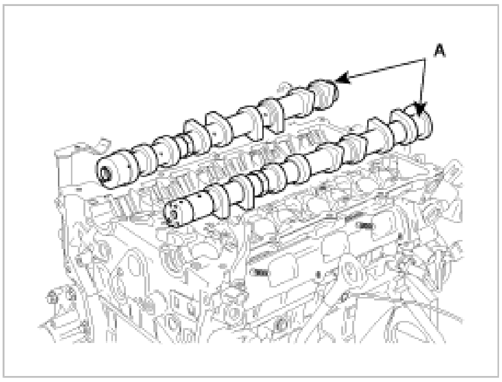
Tightening torque
53.9 ~ 63.7Nm(5.5 ~ 6.5 kgf.m, 39.7 ~ 47.0lbf.ft)



NOTE

Hold the hexagonal head wrench portion of the camshaft with a vise, and install the bolt and CVVT assembly.

7. Install camshafts (A).

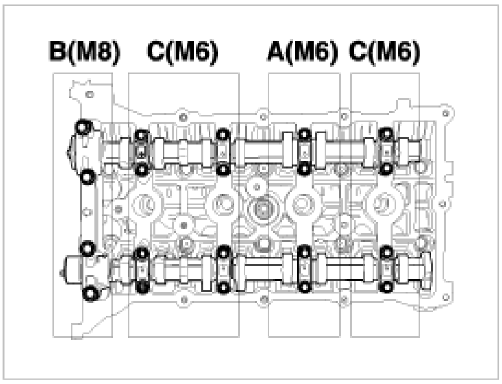


NOTE

Apply a light coat of engine oil on camshaft journals.

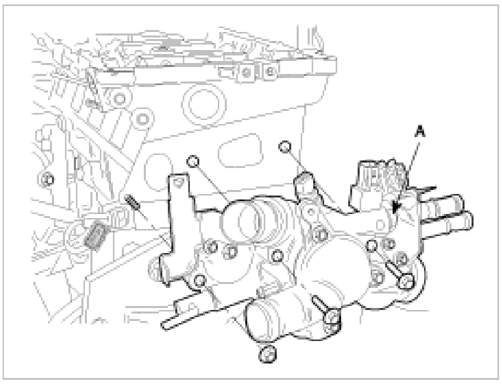
8. Install camshaft bearing caps in their proper locations.
   Tightening order.
   Group A → Group B → Group C.

   Tightening torque
   M6 : 10.78 ~ 12.74Nm(1.1 ~ 1.3kgf.m, 7.95 ~ 9.39lbf.ft)
   M8 : 27.44 ~ 31.36Nm(2.8 ~ 3.2kgf.m, 20.24 ~ 23.14 lbf.ft)



9. Install timing chain.
10. Check and adjust valve clearance.
11. Install the exhaust manifold.
12. Install the intake manifold.
13. Install water temp control assembly (A).

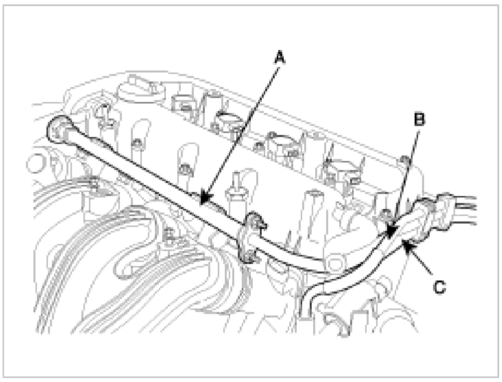
    Tightening torque
    Bolt : 14.7 ~ 21.56Nm(1.5 ~ 2.2kgf.m, 10.84 ~ 15.90lbf.ft)
    Nut : 19.6 ~ 26.46Nm(2.0 ~ 2.7kgf.m, 14.46 ~ 19.52lbf.ft)



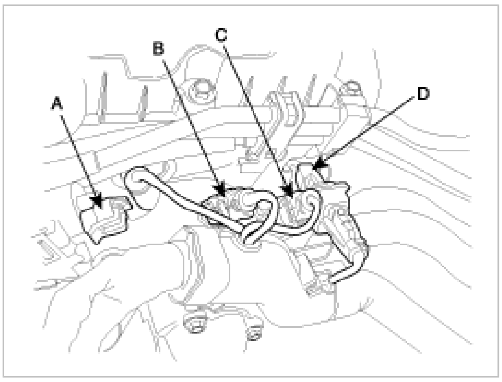
NOTE

- Assemble water temp control assembly and water inlet pipe to water pump assembly before nuts for assembling of water inlet pipe to be tightened.
- Insert after wetting O-ring or inner surface of thermostat housing.
- Always use a new O-ring.

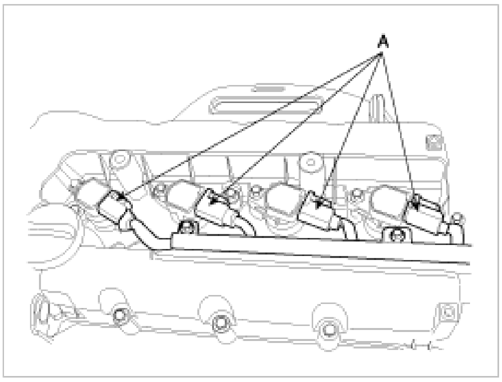
14. Install delivery pipe (A), brake hose(B), and PCSV hose (C).



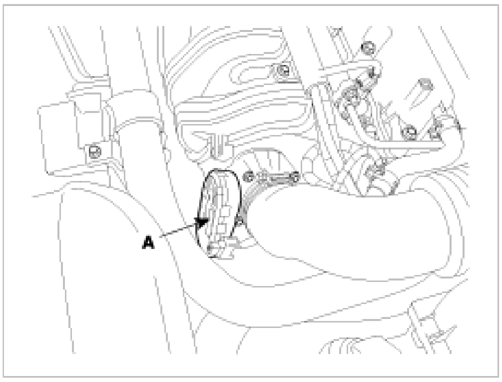
15. Connect PCSV connector (A), WTS connector (B), condenser connector (C), and CKP sensor connector (D).



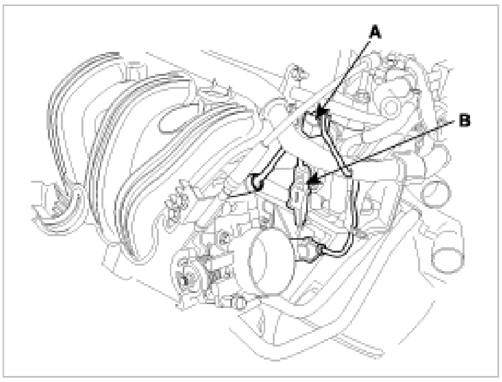
16. Install ignition coil connector (A).



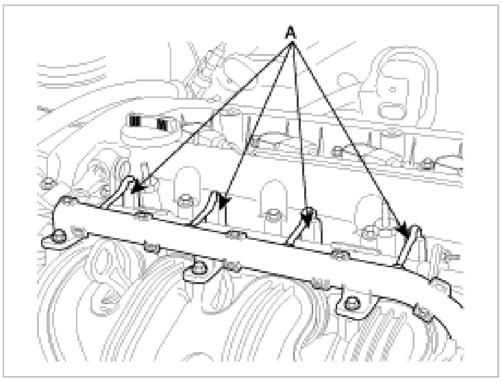
17. Connect ETS connector(A)



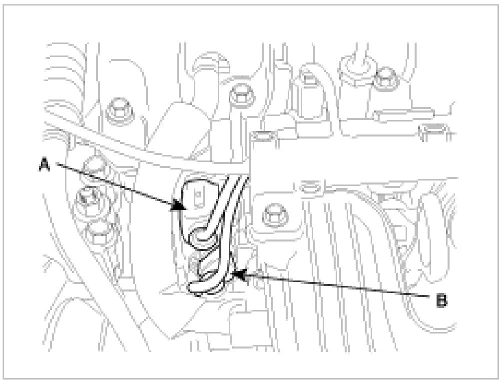
18. Connect CMP connector (A), and knock sensor connector (B).



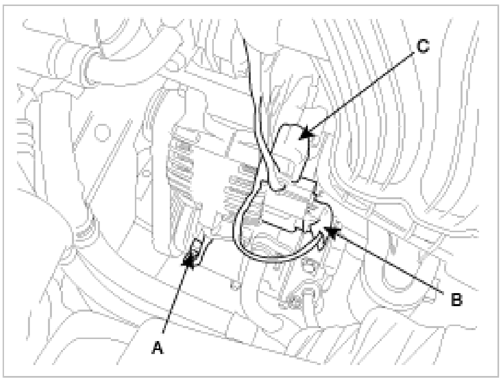
19. Connect injector connectors (A).



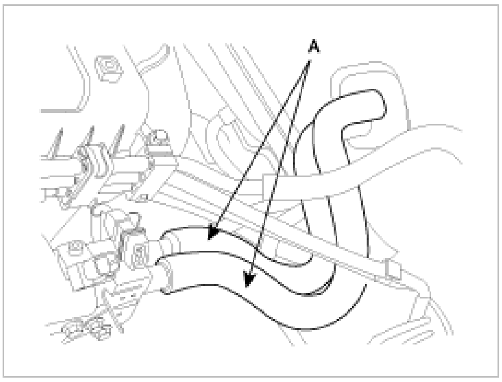
20. Connect OCV connector (A) and OTS connector (B).



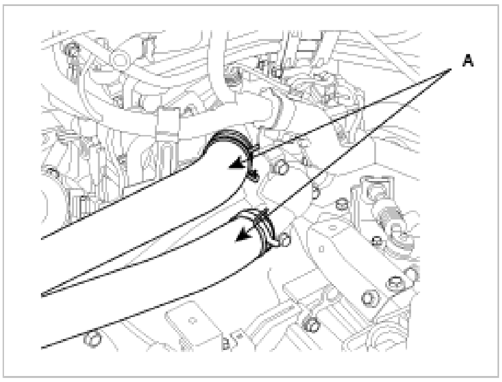
21. Connect A/C switch (A), alternator connect (B), and oil pressure switch (C).



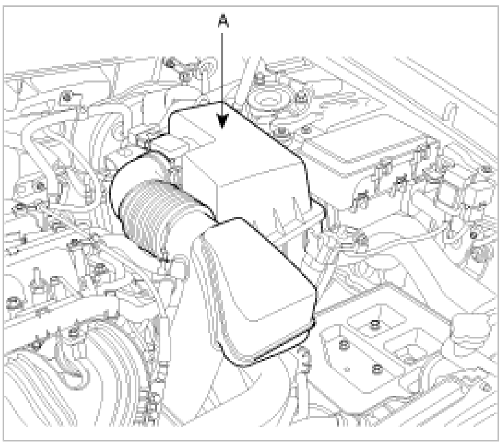
22. Install heater hoses(A).



23. Install the upper radiator hose and lower radiator hose(A).



24. Install the intake air hose and air cleaner assembly.



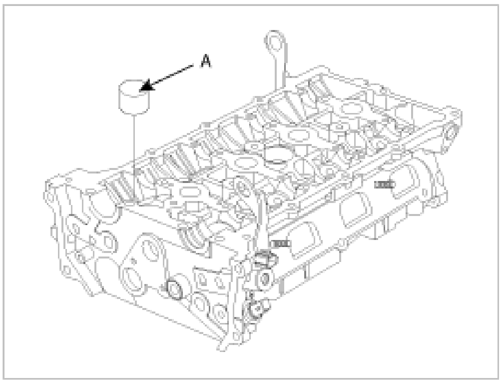
25. Install the engine cover.
26. Connect the negative terminal to the battery.
27. Filll with engine coolant.
28. Start the engine and check for leaks.
29. Recheck engine coolant level and oil level.

DISASSEMBLY

NOTE

Identify MLA(Mechanical Lash Adjuster), valves, valve springs as they are removed so that each item can be reinstalled in its original position.

1. Remove MLAs(A).



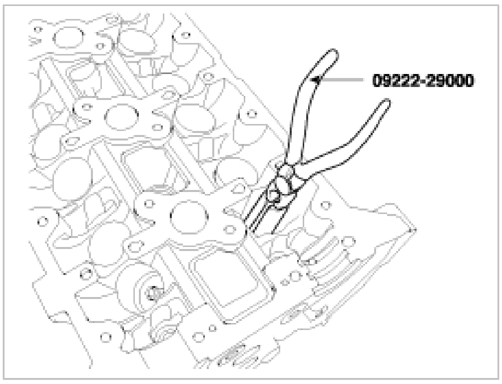
2. Remove valves.
   (1) Using SST(09222-3K000, 09222-3K100), compress the valve spring and remove retainer lock.

   (2) Remove the spring retainer.

   (3) Remove the valve spring.

   (4) Remove the valve.

   (5) Using SST(09222-29000) remove the valve stem seal.

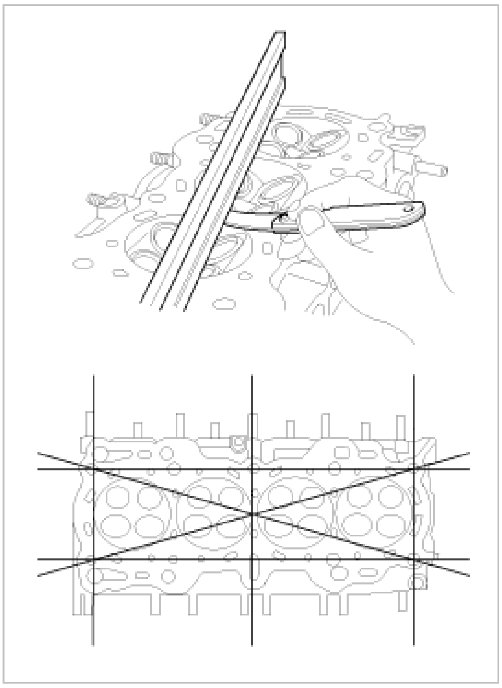


INSPECTION

CYLINDER HEAD

1. Inspect for flatness.
   Using a precision straight edge and feeler gauge, measure the surface the contacting the cylinder block and the manifolds for warpage.

Flatness of cylinder head gasket surface
Standard : Less than 0.05mm(0.002in.)



2. Inspect for cracks.
   Check the combustion chamber, intake ports, exhaust ports and cylinder block surface for cracks. If cracked, replace the cylinder head.

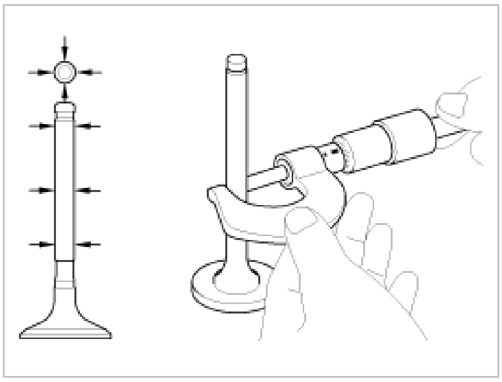
VALVE AND VALVE SPRING

1. Inspect valve stems and valve guides.
   (1) Using a caliper gauge, measure the inside diameter of the valve guide.

Valve guid I.D.
Intake / Exhaust : 5.500 ~ 5.512mm (0.216 ~ 0.217in.)

   (2) Using a micrometer, measure the diameter of the valve stem.

Valve stem O.D.
Intake : 5.465 ~ 5.480mm (0.2151 ~ 0.2157in.)
Exhaust : 5.458 ~ 5.470mm (0.2149 ~ 0.2153in.)



(3) Subtract the valve stem diameter measurement from the valve guide inside diameter measurement.

Valve stem-to-guide clearance
[Standard]
Intake : 0.020 ~ 0.047mm (0.0008 ~ 0.0018in.)
Exhaust : 0.030 ~ 0.054mm (0.0012 ~ 0.0021in.)
[Limit]
Intake : 0.07mm (0.0027in.)
Exhaust : 0.09mm (0.0035in.)

If the clearance is greater than maximum, replace the valve and valve guide.

2. Inspect valves.
   (1) Check the valve is ground to the correct valve face angle.
   (2) Check that the surface of the valve for wear.
   If the valve face is worn, replace the valve.
   (3) Check the valve head margin thickness.
   If the margin thickness is less than minimum, replace the valve.

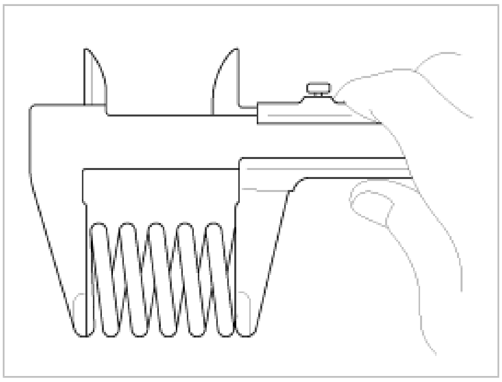
Margin
[Standard]
Intake : 1.02mm(0.0401in.)
Exhaust : 1.09mm(0.0429in.)

   (4) Check the surface of the valve stem tip for wear.
   If the valve stem tip is worn, replace the valve.

3. Inspect valve seats
   Check the valve seat for evidence of overheating and improper contact with the valve face.
   Replace the seat if necessary.
   Before reconditioning the seat, check the valve guide for wear. If the valve guide is worn, replace it, then recondition the seat. Recondition the valve seat with a valve seat grinder or cutter. The valve seat contact width should be within specifications and centered on the valve face.

4. Inspect valve springs.
   (1) Using a steel square, measure the out-of-square of the valve spring.
   (2) Using a vernier calipers, measure the free length of the valve spring.

Valve spring
[Standard]
Free height : 47.44mm (1.8677in.)
Out-of-square : 1.5°



If the free length is not as specified, replace the valve spring.

MLA

1. Inspect MLA.
   Using a micrometer, measure the MLA outside diameter.

   MLA O.D.
   Intake/Exhaust : 31.964 ~ 31.980mm(1.2584 ~ 1.2590in.)

2. Using a caliper gauge, measure MLA tappet bore inner diameter of cylinder head.

   Tappet bore I.D.
   Intake/Exhaust : 32.000 ~ 32.025mm(1.2598 ~ 1.2608in.)

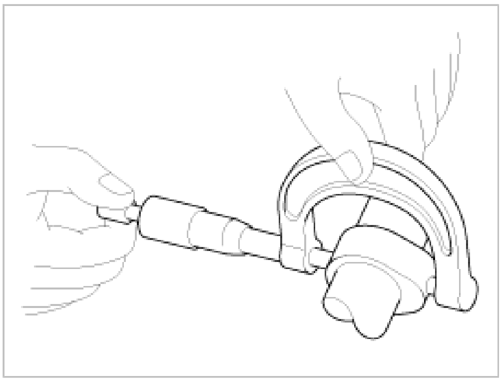
3. Subtract MLA outside diameter measurement from tappet bore inside diameter measurement.

   MLA to tappet bore clearance
   [Standard]
   Intake/Exhaust : 0.020 ~ 0.061mm(0.0008 ~ 0.0024in.)
   [Limit]
   Intake/Exhaust : 0.07mm(0.0027in.)

CAMSHAFT

1. Inspect cam lobes.
   Using a micrometer, measure the cam lobe height.

   Cam height
   [Standard value]
   Intake : 43.70 ~ 43.90mm (1.7204 ~ 1.7283in.)
   Exhaust : 44.90 ~ 45.10mm (1.7677 ~ 1.7756in.)



If the cam lobe height is less than standard, replace the camshaft.

2. Inspect camshaft journal clearance.
   (1) Clean the bearing caps and camshaft journals.
   (2) Place the camshafts on the cylinder head.
   (3) Lay a strip of plastigage across each of the camshaft journal.

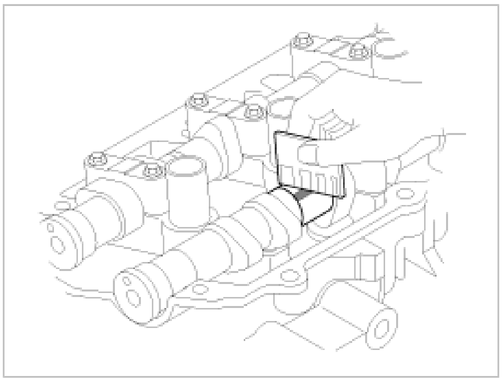
   (4) Install the bearing caps.

CAUTION

Do not turn the camshaft.

   (5) Remove the bearing caps.
   (6) Measure the plastigage at its widest point.

Bearing oil clearance
[Standard value]
Intake
No.1 journal : 0.02 ~ 0.057mm (0.0008 ~ 0.0022in.)
No.2,3,4,5, journal : 0.045 ~ 0.082mm (0.0018 ~ 0.0032in.)
Exhaust : 0.045 ~ 0.082mm (0.0018 ~ 0.0032in.)
[Limit] :
Intake
No.1 journal : 0.09mm (0.0035in.)
No.2,3,4,5 journal : 0.12mm (0.0047in.)
Exhaust : 0.12mm (0.0047in.)



If the oil clearance is greater than maximum, replace the camshaft. If necessary, replace cylinder head.

(7) Completely remove the plastigage.

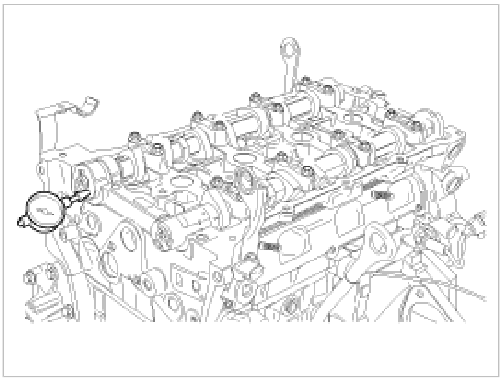
(8) Remove the camshafts.

3. Inspect camshaft end play.

(1) Install the camshafts.

(2) Using a dial indicator, measure the end play while moving the camshaft back and forth.

Camshaft end play
[Standard value] : 0.10 ~ 0.22mm(0.004 ~ 0.0087in.)
[Limit] : 0.24mm (0.0094in.)



If the end play is greater than maximum, replace the camshaft. If necessary, replace cylinder head.

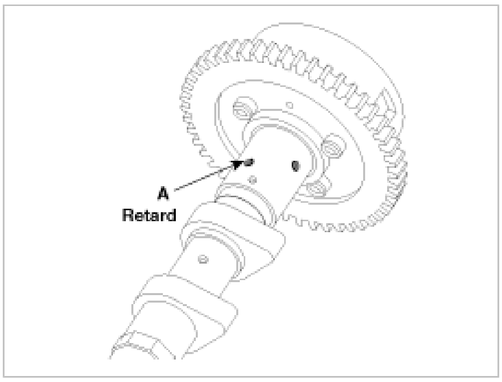
(3) Remove the camshafts.

CVVT ASSEMBLY

1. Inspect CVVT assembly.

(1) Check that the CVVT assembly will not turn.

(2) Apply vinyl tape to the retard hole except the one indicated by the arrow in the illustration.

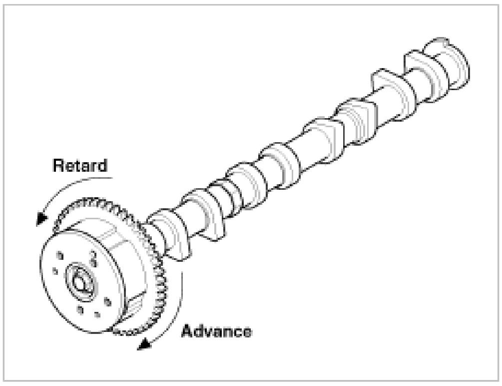


(3) Wind tape around the tip of the air gun and apply air of approx. 150kpa(1.5kgf/cm², 21psi) to the port of the camshaft.
(Perform this order to release the lock pin for the maximum delay angle locking.)

NOTE

When the oil splashes, wipe it off with a shop rag and the likes.

(4) Under the condition of (3), turn the CVVT assembly to the advance angle side (the arrow marked direction in the illustration) with your hand.
Depending on the air pressure, the CVVT assembly will turn to the advance side without applying force by hand. Also, under the condition that the pressure can be hardly applied because of the air leakage from the port, there may be the case that the lock pin could be hardly released.



(5) Except the position where the lock pin meets at the maximum delay angle, let the CVVT assembly turn back and forth and check the movable range and that there is no disturbance.

Standard: Movable smoothly in the range about 22.5°

(6) Turn the CVVT assembly with your hand and lock it at the maximum delay angle position (counter clockwise).

REASSEMBLY

NOTE

Thoroughly clean all parts to be assembled.
Before installing the parts, apply fresh engine oil to all sliding and rotating surfaces.
Replace oil seals with new ones.

1. Install valves.
   (1) Using SST(09222-4A000), push in a new oil seal.

NOTE

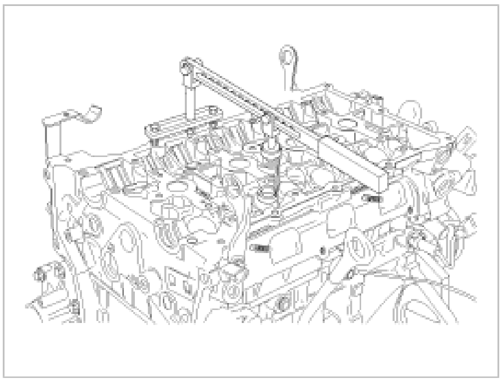
Do not reuse old valve stem seals.
Incorrect installation of the seal could result in oil leakage past the valve guides.

   (2) Install the valve, valve spring and spring retainer.

NOTE

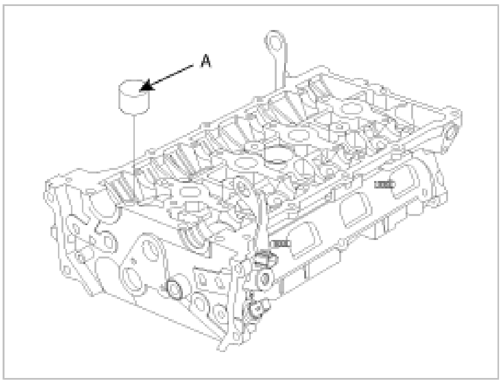
Place valve springs so that the side coated with enamel faces toward the valve spring retainer and then installs the retainer.

(3) Using the SST(09222-3K000, 09222-3K100), compress the spring and install the retainer locks. After installing the valves, ensure that the retainer locks are correctly in place before releasing the valve spring compressor.



(4) Lightly tap the end of each valve stem two or three times with the wooden handle of a hammer to ensure proper seating of the valve and retainer lock.

2. Install MLAs.
Check that the MLA rotates smoothly by hand.



NOTE

MLA can be reinstalled in its original position.

Engine Mechanical System > Engine And Transaxle Assembly > Repair procedures

REMOVAL

CAUTION

- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

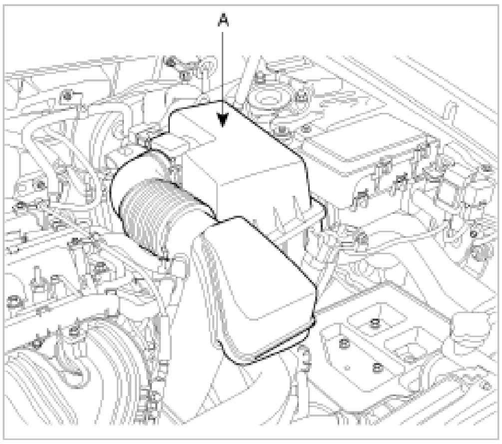
NOTE

- Mark all wiring and hoses to avoid misconnection.
- Inspection the timing belt before removing the cylinder head.
- Turn the crankshaft pulley so that the No.1 piston is at top dead center.

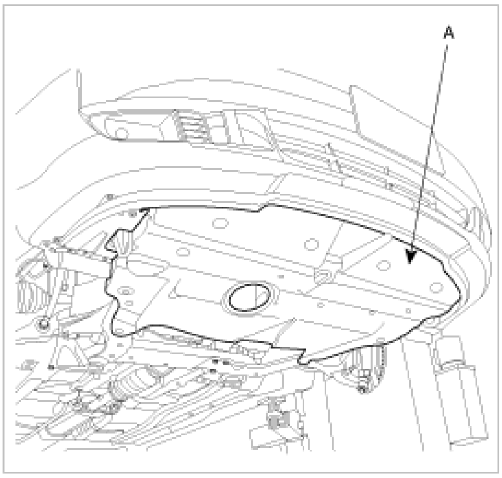
1. Disconnect the neagative terminal from the battery.
2. Remove the engine cover.
3. Remove the air duct.
4. Remove the intake air hose and air cleaner assembly.
   (1) Disconnect the AFS connector.
   (2) Disconnect the breather hose from air cleaner hose.

(3) Disconnect the ECM connector. (See FL group)

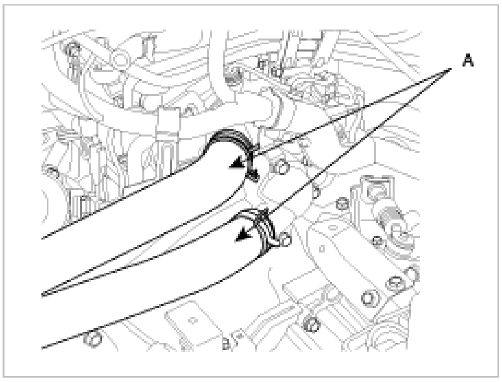
(4) Remove the intake air hose and air cleaner(A).



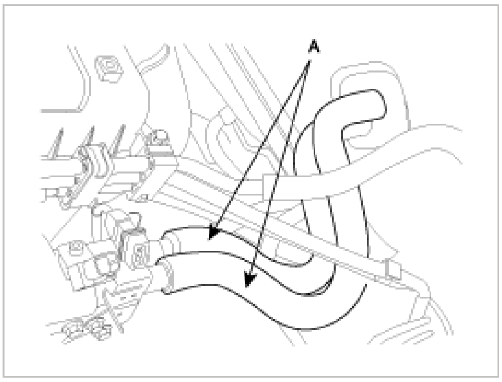
5. Remove front wheels.
6. Remove under cover(A).



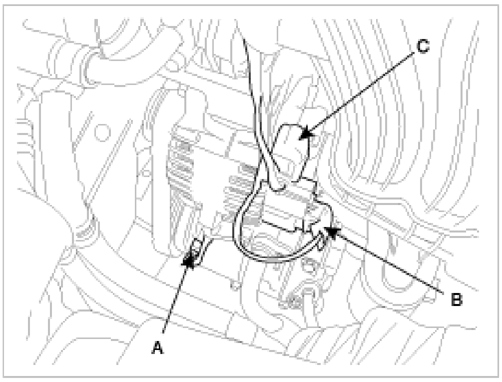
7. Drain the engine coolant.
   Remove the radiator cap to speed draining.
8. Remove the upper radiator hose and lower radiator hose(A).



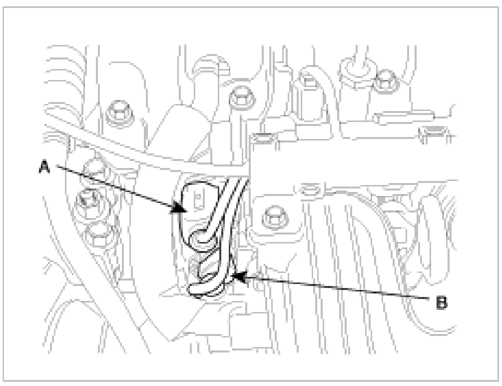
9. Remove the heater hoses(A).



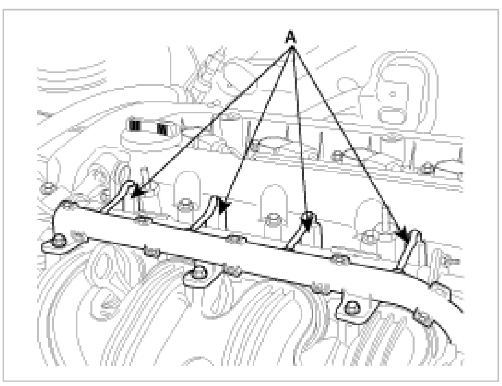
10. Disconnect A/C switch(A), alternator connector(B) and pressure switch(C).



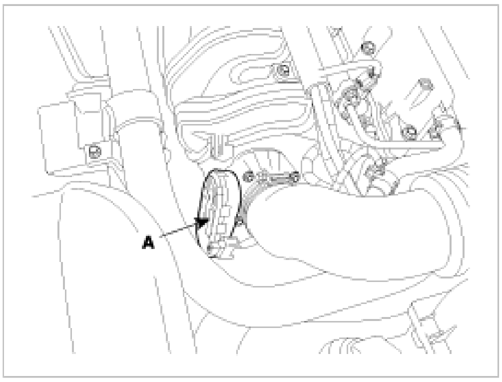
11. Disconnect OCV connector(A) and OTS connector(B).



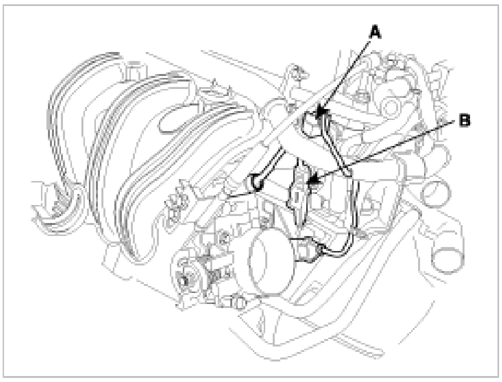
12. Disconnect injector connectors(A).



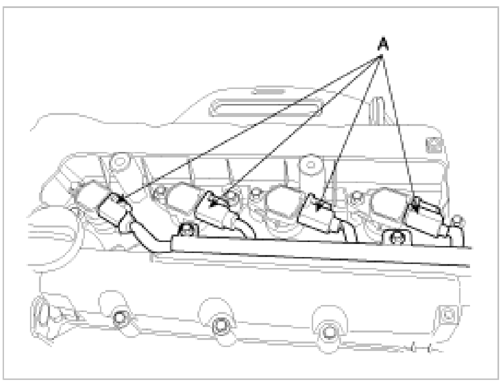
13. Disconnect ETS connector(A)



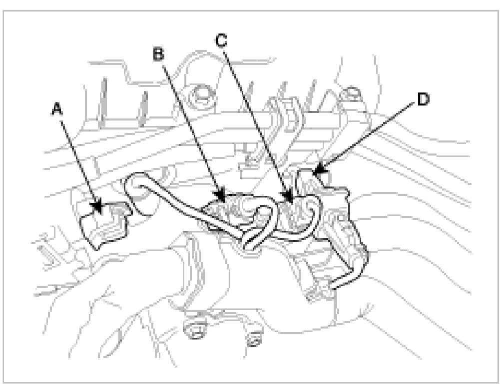
14. Disconnect CMP connector(A), and knock sensor connector(B).



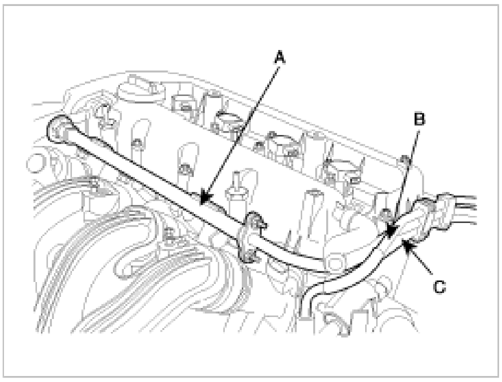
15. Disconnect ignition coil connectors(A).



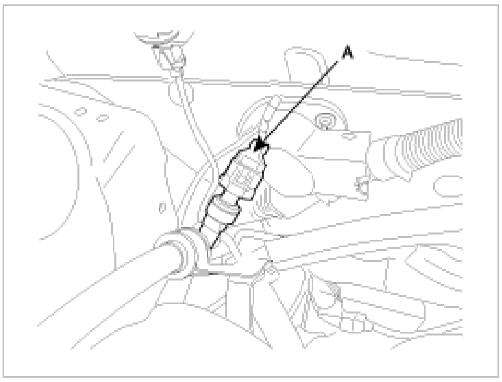
16. Disconnect PCSV connector(A), WTS connector(B), condenser connector(C), and CKP sensor connector(D).



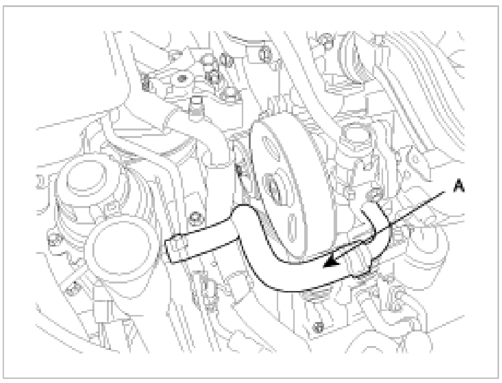
17. Remove delivery pipe(A), brake vacuum hose(B), and PCSV hose(C).



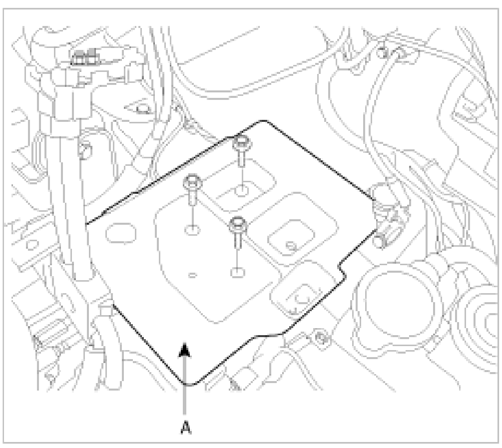
18. Disconnect P/S pump oil pressure switch connector(A).



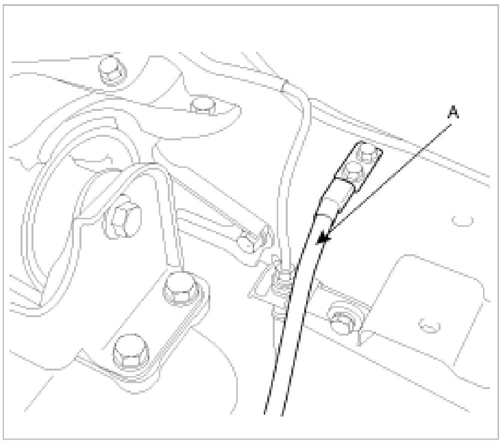
19. Remove P/S pump hose(A).



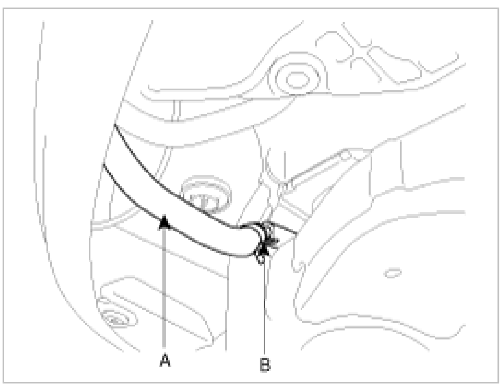
20. Remove the battery body bracket.(A).



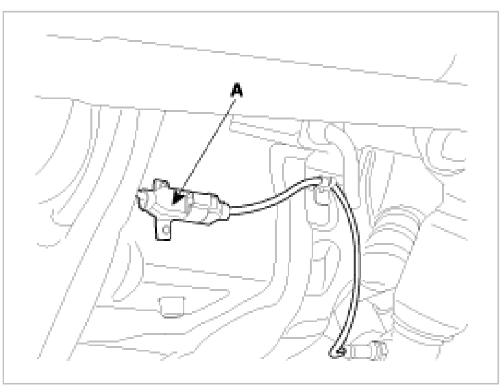
21. Disconnect the ground cable from the transaxle.



22. Disconnect the transaxle wire harness connector. (A/T).
    A. Disconnect the inhibitor switch connector.
    B. Disconnect the transaxle range connector.
    C. Disconnect the input shaft speed connector.
    D. Disconnect the output shaft speed connector.
    E. Disconnect the vehicle speed sensor connector.
    F. Remove control cable transaxle range switch.
23. Drain transaxle oil.
24. Disconnect EPS connector. (See ST group)
25. Remove lower arm ball joint. (SeeDS group)
26. Remove tile rod end ball joint. (See DS group)
27. Remove stabilizer link. (See SS group)
28. Remove power steering return hose(A) and drain power steering oil.

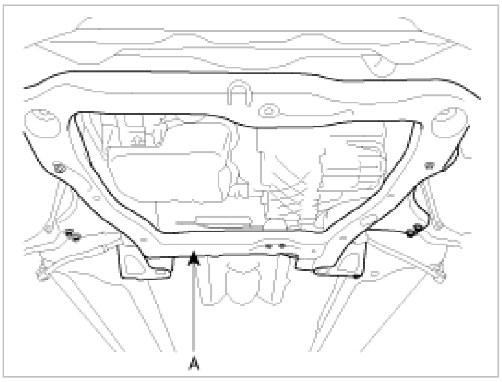


29. Remove front roll stopper mounting bolt.
30. Remove rear roll stopper mounting bolt.
31. Remove steering u-joint mounting (See ST group)
32. Disconnect oxygen sensor connetor(A).

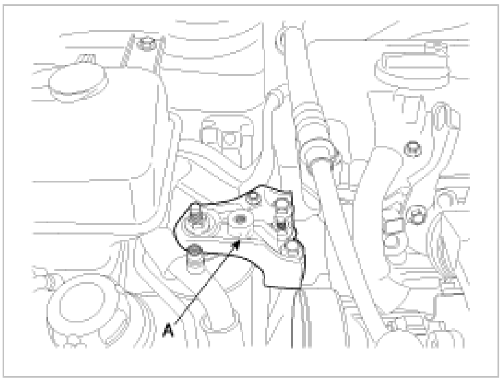


33. Remove front exhaust pipe.

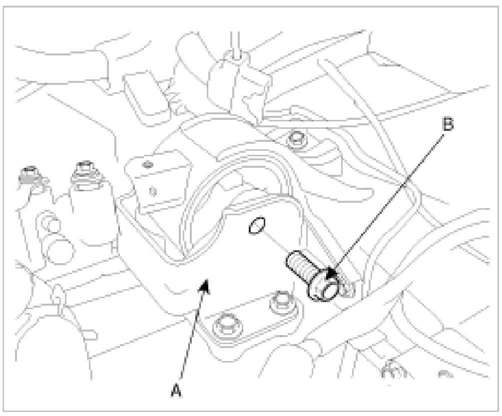
34. Install jack and remove sub-frame(A).



35. Remove drive shaft from transaxle.
36. Install jack for supporting engine and transaxle assembly.
37. Remove the engine mounting bracket(A).



38. Remove the transaxle mounting bracket(A).



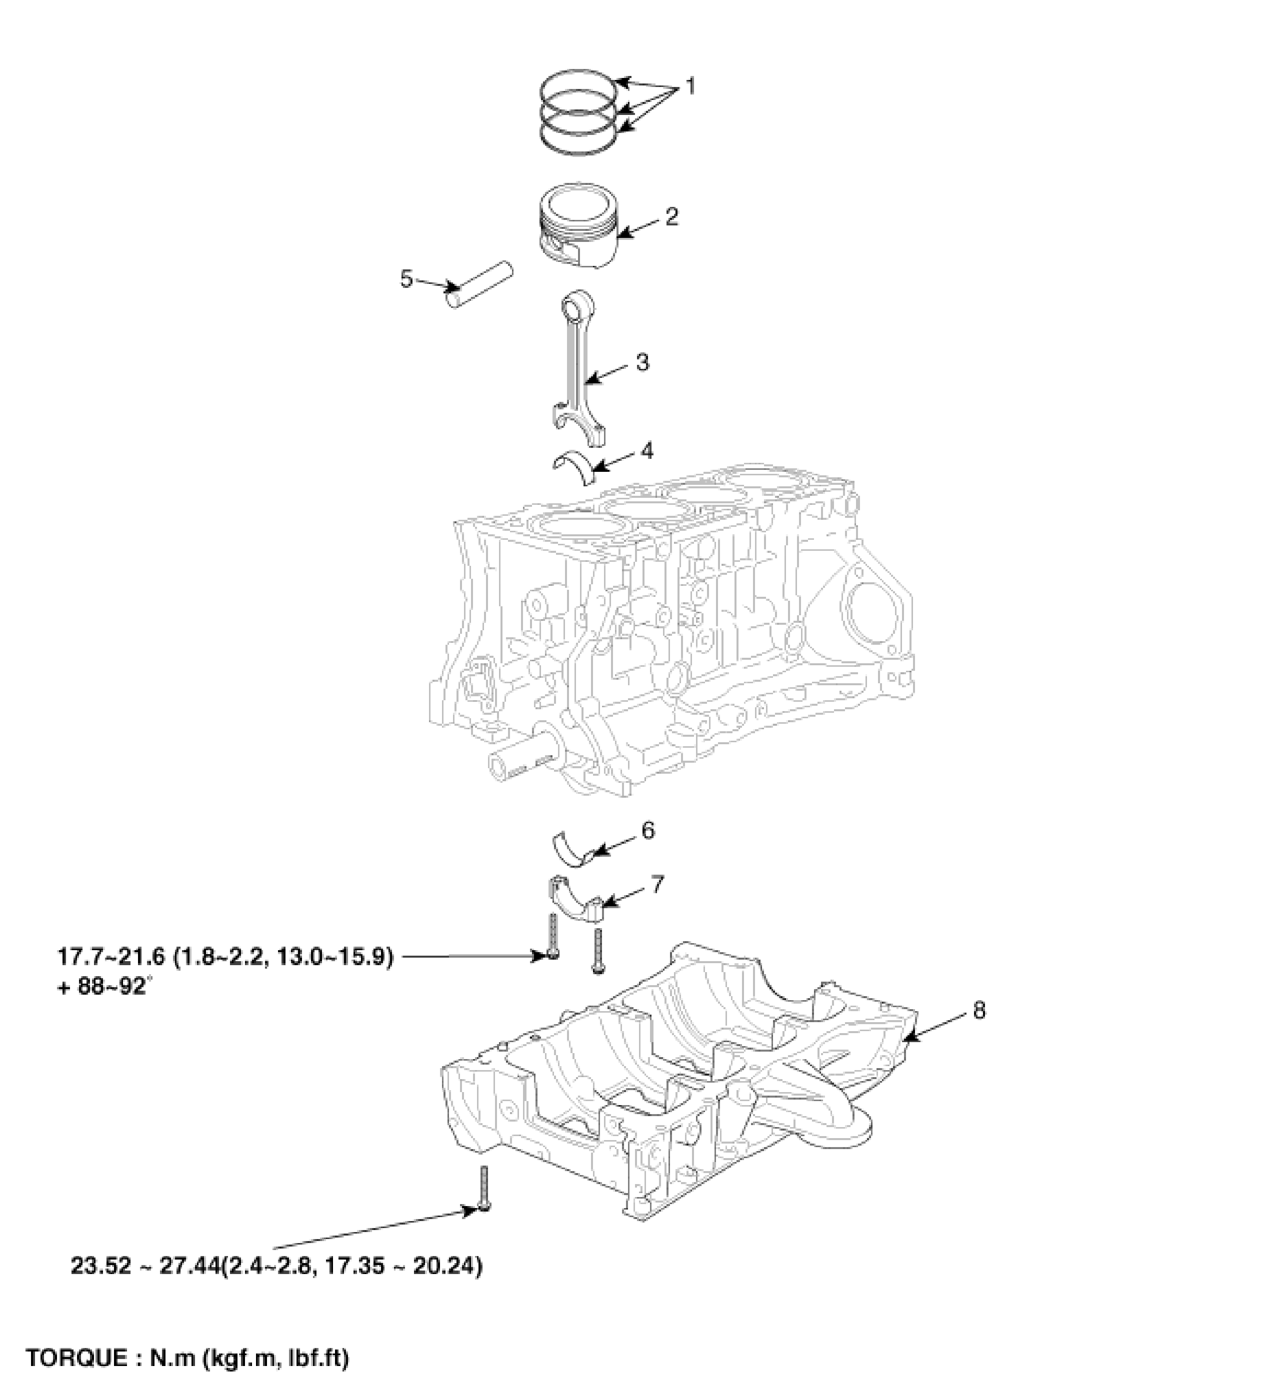
39. Jack up the vehicle.

INSTALLATION

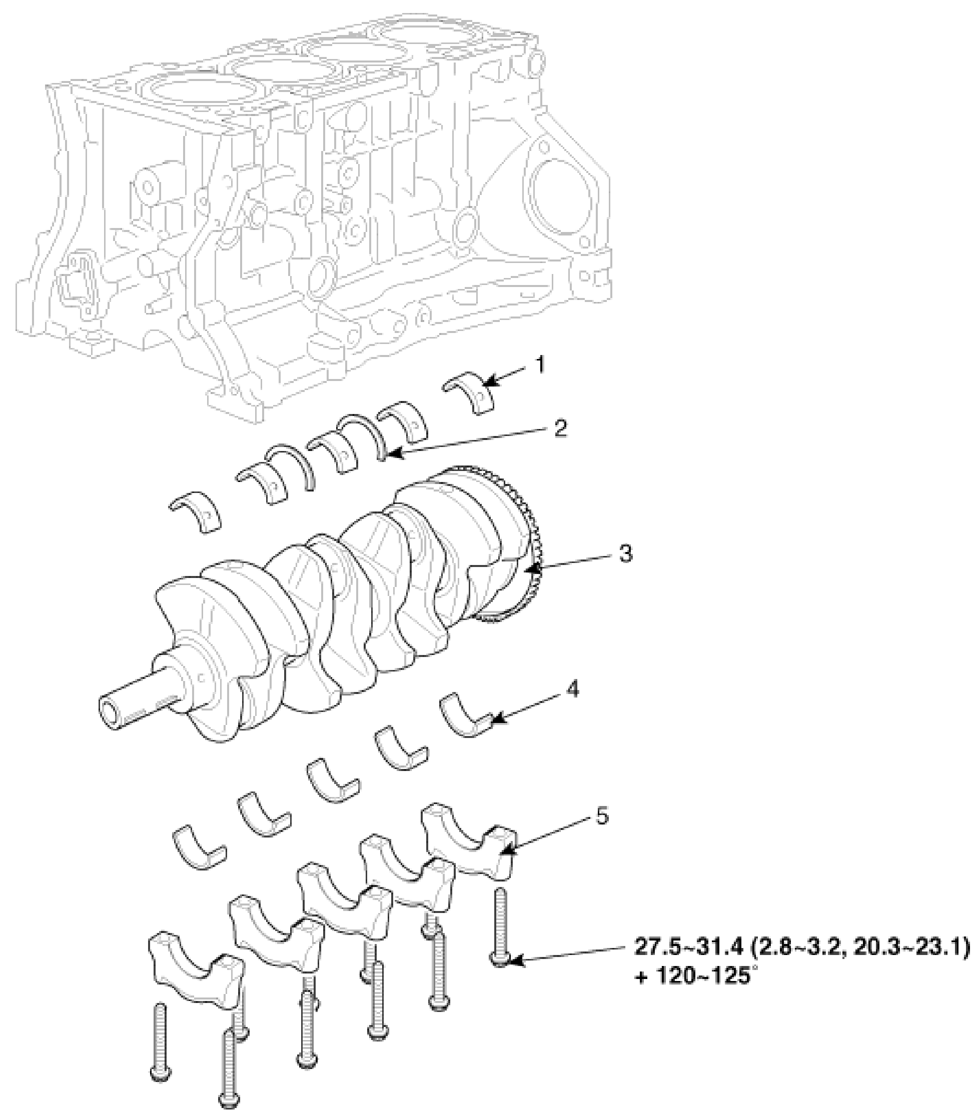
Perform the following :

- Adjust the shift cable.
- Refill the engine with engine oil.
- Refill the transaxle with fluid.
- Refill the radiator with engine coolant.
- Bleed air from the cooling system with the heater valve open.
- Clean the battery posts and cable terminals with sandpaper assemble them, then apply grease to prevent corrosion.
- Inspect for fuel leakage.
  After assembling the fuel line, turn on the ignition switch (do not operate the starter) so that the fuel pump runs for approximately two seconds and fuel line pressureizes.
  Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.

COMPONENTS



1. Piston ring
2. Piston
3. Connecting rod
4. Connecting rod upper bearing
5. Piston pin
6. Connecting rod lower bearing
7. Connecting rod bearing cap
8. Ladder frame

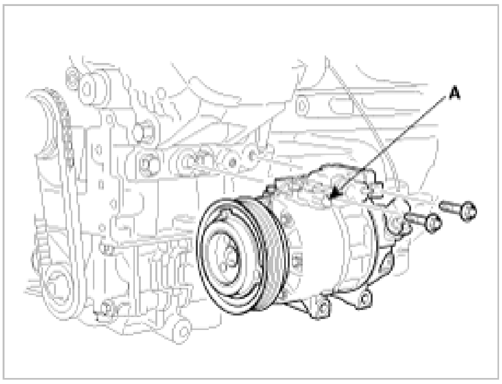


1. Crankshaft upper bearing
2. Thrust bearing
3. Crankshaft
4. Crankshaft lower bearing
5. Main bearing cap

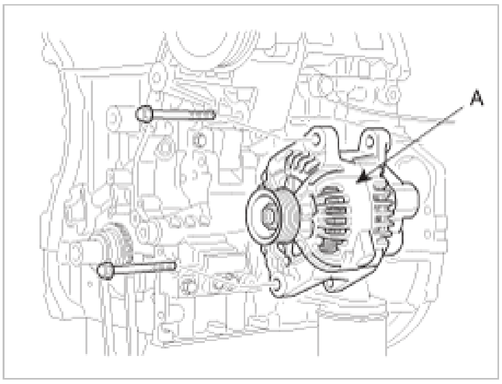
Engine Mechanical System > Cylinder Block > Repair procedures

DISASSEMBLY

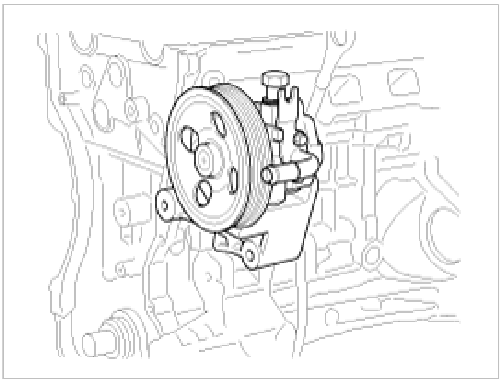
1. M/T : remove flywheel.
2. A/T : remove drive plate.
3. Install engine to engine stand for disassembly.
4. Remove timing chain.
5. Remove cylinder head.
6. Remove A/C compressor(A) from engine. (See HA group)



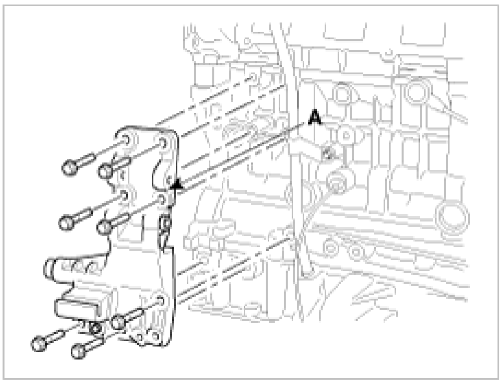
7. Remove alternator(A) from engine. (See EE group)



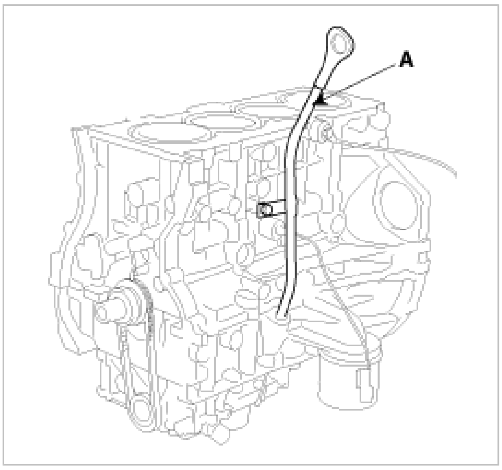
8. Remove power steering pump and bracket. (See ST group)



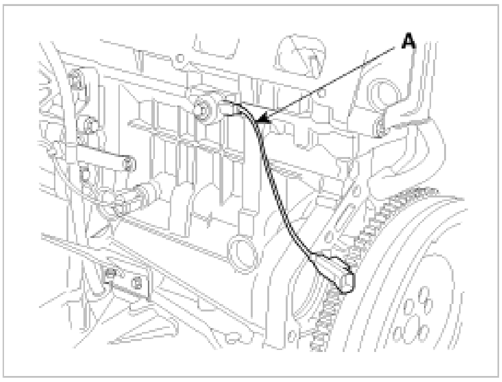
9. Remove tensioner assembly integrated bracket(A).



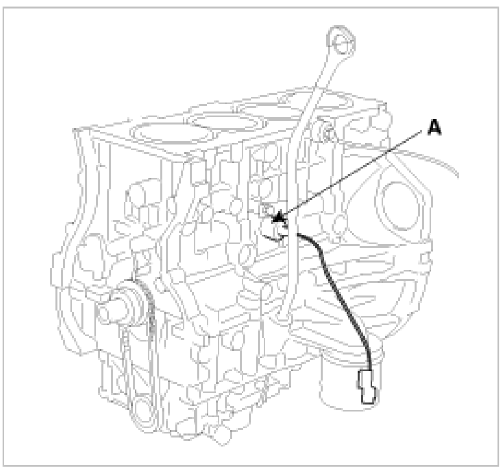
10. Remove oil level gauge assembly(A).



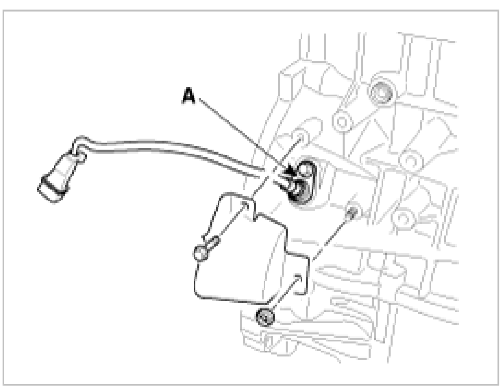
11. Remove knock sensor(A).



12. Remove oil pressure sensor(A).

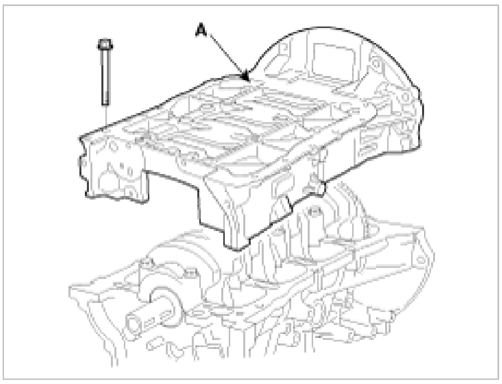


13. Remove CKP sensor(A).



14. Remove water pump.
15. Remove balance shaft module.

16. Remove ladder frame(A).



17. Check the connecting rod end play.
18. Remove the connecting rod caps and check oil clearance.
19. Remove piston and connecting rod assemblies.
    (1) Using a ridge reamer, remove all the carbon from the top of the cylinder.
    (2) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.

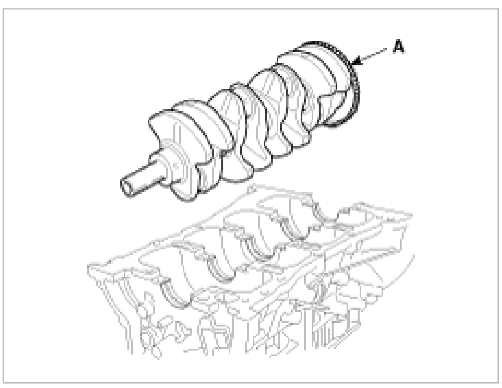
NOTE

• Keep the bearings, connecting rod and cap together.
• Arrange the piston and connecting rod assemblies in the correct order.

20. Remove crankshaft bearing cap and check oil clearance.
21. Check the crankshaft end play.
22. Lift the crankshaft(A) out of the engine, being careful not to damage journals.

NOTE

Arrange the main bearings and thrust bearings in the correct order.



23. Check fit between piston and piston pin.
    Try to move the piston back and forth on the piston pin. If any movement is felt, replace the piston and pin as a set.
24. Remove piston rings.
    (1) Using a piston ring expender, remove the 2 compression rings.
    (2) Remove 2 side rails and the spacer by hand.

NOTE

Arrange the piston rings in the correct order only.

25. Disconnect connecting rod from piston.

INSPECTION

CONNECTING ROD AND CRANKSHAFT

1. Check the connecting rod end play.
   Using a feeler gauge, measure the end play while moving the connecting rod back and forth.

   Standard end play : 0.1~ 0.25mm(0.004 ~ 0.010in.)
   Maximum end play : 0.35mm(0.0138in.)

   
   A. If out-of-tolerance, install a new connecting rod.
   B. If still out-of-tolerance, replace the crankshaft.

2. Check the connecting road bearing oil clearance.
   (1) Check the matchmarks on the connecting rod and cap are aligned to ensure correct reassembly.
   (2) Remove 2 connecting rod cap bolts.
   (3) Remove the connecting rod cap and bearing half.
   (4) Clean the crank pin and bearing.
   (5) Place plastigage across the crank pin.
   (6) Reinstall the bearing half and cap, and torque the bolts.

   Tightening torque
   17.7~21.6Nm (1.8~2.2kgf.m, 13.0~15.9lb-ft) + 88~92°

   NOTE

   Do not turn the crankshaft.

   (7) Remove 2 bolts, connecting rod cap and bearing half.
   (8) Measure the plastigage at its widest point.

   Standard oil clearance
   0.028 ~ 0.046mm(0.0011 ~ 0.0018in.)

   
   (9) If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color mark (select the color as shown in the next column), and recheck the clearance.

CAUTION

Do not file, shim, or scrape the bearings or the caps to adjust clearance.

(10) If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check clearance again.

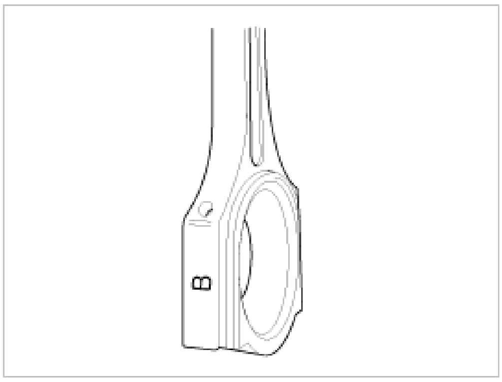
NOTE

If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

CAUTION

If the marks are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

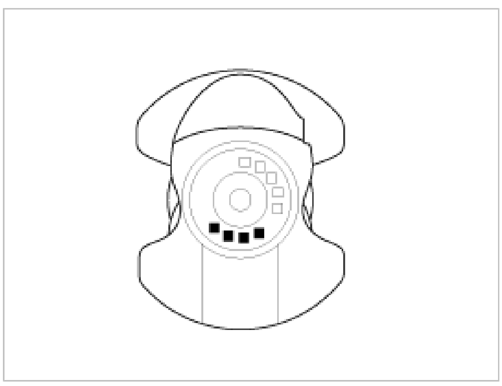
Connecting rod mark location



Discrimination of connecting rod

CLASS MA	RK	INSIDE DIAMETER
a	A	51.000 ~ 51.006mm (2.0079 ~ 2.0081in.)
b	B	51.006 ~ 51.012mm (2.0081 ~ 2.0083in.)
c	C	51.012 ~ 51.018mm (2.0083 ~ 2.0085in.)

Crankshaft pin mark location Discrimination of crankshaft

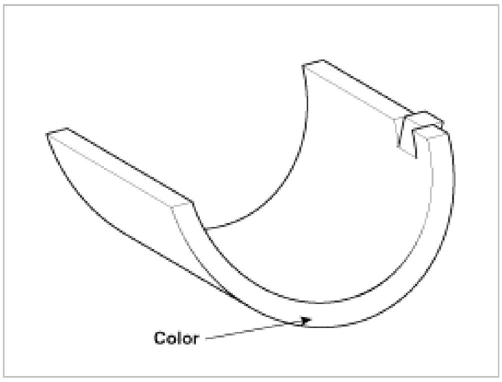


Discrimination of crankshaft

CLASS	MARK	OUTSIDE DIAMETER OF PIN
I	1	47.966 ~ 47.972mm (1.8884 ~ 1.8886in.)
II	2	47.960 ~ 47.966mm

		(1.8881 ~ 1.8884in.)
III	3	47.954 ~ 47.960mm (1.8879 ~ 1.8881in.)

Place of identification mark (Connecting rod bearing) Discrimination of connecting rod bearing



Discrimination of connecting rod bearing

CLASS	MARK	THICKNESS OF BEARING
AA	BLUE	1.514 ~ 1.517mm (0.0596 ~ 0.0597in.)
A	BLACK	1.511 ~ 1.514mm (0.0595 ~ 0.0596in.)
B	NONE	1.508 ~ 1.511mm (0.0594 ~ 0.0595in.)
C	GREEN	1.505 ~ 1.508mm (0.0593 ~ 0.0594in.)
D	YELLOW	1.502 ~ 1.505mm (0.0591 ~ 0.0593in)

(11) Selection

CRANKSHAFT INDENTIFICATION MARK	CONNECTING ROD IDENTIFICATION MARK	ASSEMBING CLASSIFICATION OF BEARING
I (1)	a (A)	D (YELLOW)
	b (B)	C (GREEN)
	c (C)	B (NONE)
II (2)	a (A)	C (GREEN)
	b (B)	B (NONE)
	c (C)	A (BLACK)
III (3)	a (A)	B (NONE)
	b (B)	A (BLACK)
	c (C)	AA (BLUE)

3. Check the crankshaft bearing oil clearance.
   (1) To check main bearing-to-journal oil clearance, remove the main caps and bearing halves.
   (2) Clean each main journal and bearing half with a clean shop tower.
   (3) Place one strip of plastigage across each main journal.
   (4) Reinstall the bearings and caps, then torque the bolts.

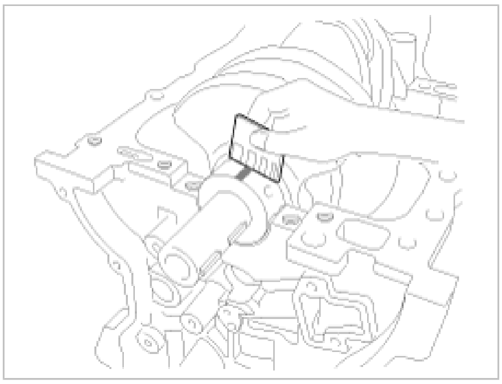
Tightening torque
14.7Nm (1.5kgf.m, 10.8lb-ft) + 27.5~31.4Nm (2.8~3.2kgf.m, 20.3~23.1lb-ft) + 120~125°

NOTE

Do not turn the crankshaft.

(5) Remove the cap and bearing again, and measure the widest part of the plastigage.

Standard oil clearance
0.026 ~ 0.048mm (0.0010 ~ 0.0019in.)



(6) If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color mark (select the color as shown in the next column), and recheck the clearance.

CAUTION

Do not file, shim, or scrape the bearings or the caps to adjust clearance.

(7) If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check clearance again.

NOTE

If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

CAUTION

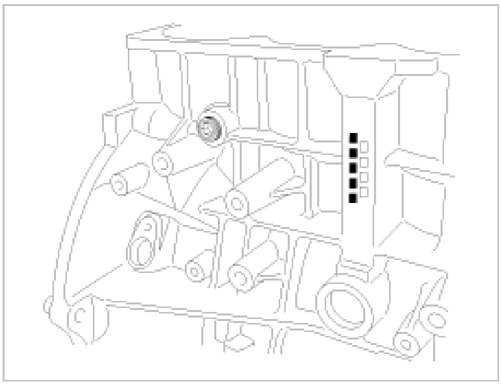
If the marks are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

Connecting rods

1. When reinstalling, make sure that cylinder numbers put on the connecting rod and cap at disassembly match. When a new connecting rod is installed, make sure that the notches for holding the bearing in place are on the same side.
2. Replace the connecting rod if it is damaged on the thrust faces at either end. Also if step wear or a severely rough surface of the inside diameter of the small end is apparent, the rod must be replaced as well.
3. Using a connecting rod aligning tool, check the rod for bend and twist. If the measured value is close to the repair limit, correct the rod by a press. Any connecting rod that has been severely bent or distorted should be replaced.

Allowable bend of connecting rod :
0.05mm / 100mm (0.0020 in./3.94 in.) or less
Allowable twist of connecting rod :
0.1mm / 100mm (0.0039 in./3.94 in.) or less

Crankshaft bore mark location
Letters have been stamped on the block as a mark for the size of each of the 5 main journal bores.
Use them, and the numbers or bar stamped on the crank (marks for main journal size), to choose the correct bearings.



Discrimination of cylinder block

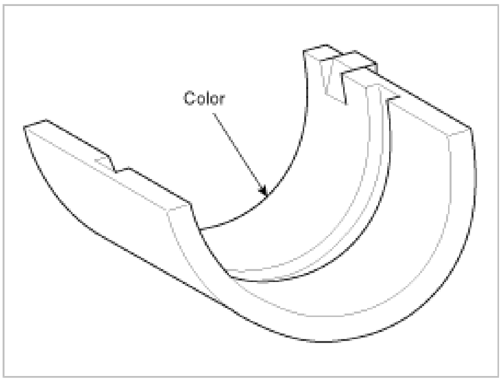
CLASS MA	RK	INSIDE DIAMETER
a	A	56.000 ~ 56.006mm (2.2047 ~ 2.2049in.)
b	B	56.006 ~ 56.012mm (2.2049 ~ 2.2052in.)
c	C	56.012 ~ 56.018mm (2.2052 ~ 2.2054in.)

Crankshaft journal mark location Discrimination of crankshaft

Discrimination of crankshaft

CLASS	MARK	OUTSIDE DIAMETER OF JOURNAL
I	1	51.954 ~ 51.960mm (2.0454 ~ 2.0456in.)
II	2	51.948 ~ 51.954mm (2.0452 ~ 2.0454.)
III	3	51.942 ~ 51.948mm (2.0449 ~ 2.0452in.)

Place of identification mark (Crankshaft bearing) Discrimination of crankshaft bearing



Discrimination of crankshaft bearing

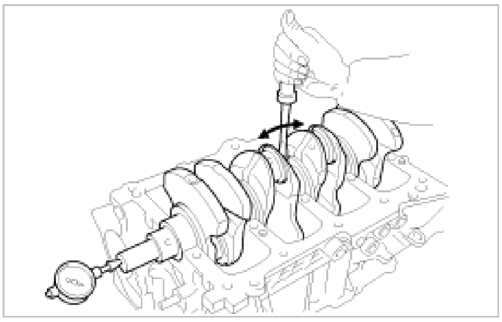
CLASS	MARK	THICKNESS OF BEARING
AA	BLUE	2.026 ~ 2.029mm (0.0797 ~ 0.0798in.)
A	BLACK	2.023 ~ 2.026mm (0.0796 ~ 0.0797in.)
B	NONE	2.020 ~ 2.023mm (0.0795 ~ 0.0796in.)
C	GREEN	2.017 ~ 2.020mm (0.0794 ~ 0.795in.)
D	YELLOW	2.014 ~ 2.017mm (0.0793 ~ 0.0794in.)

Selection

CRANKSHAFT IDENTIFICATION MARK	CRANKSHAFT BORE IDENTIFICATION MARK	ASSEMBLING CLASSIFICATION OF BEARING
I (1)	a (A)	D (YELLOW)
	b (B)	C (GREEN)
	c (C)	B (NONE)
II (2)	a (A)	C (GREEN)
	b (B)	B (NONE)
	c (C)	A (BLACK)
III (3)	a (A)	B (NONE)
	b (B)	A (BLACK)
	c (C)	AA (BLUE)

4. Check crankshaft end play.
   Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

Standard end play
0.07 ~ 0.25mm (0.0027 ~ 0.0098in.)
Limit : 0.30mm (0.0118in.)

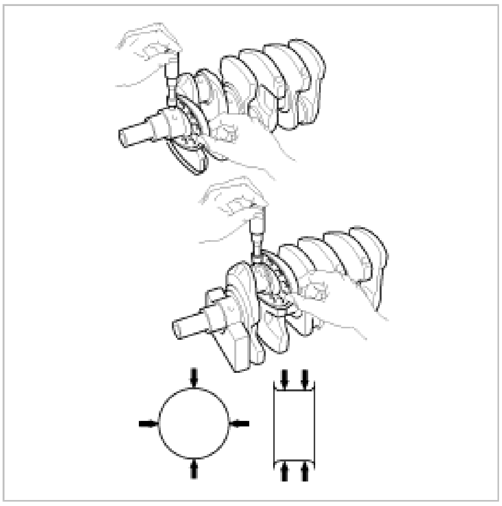


If the end play is greater than maximum, replace the thrust bearings as a set.

Thrust bearing thickness
1.925 ~ 1.965mm(0.0758 ~ 0.07736in.)

5. Inspect main journals and crank pins
   Using a micrometer, measure the diameter of each main journal and crank pin.

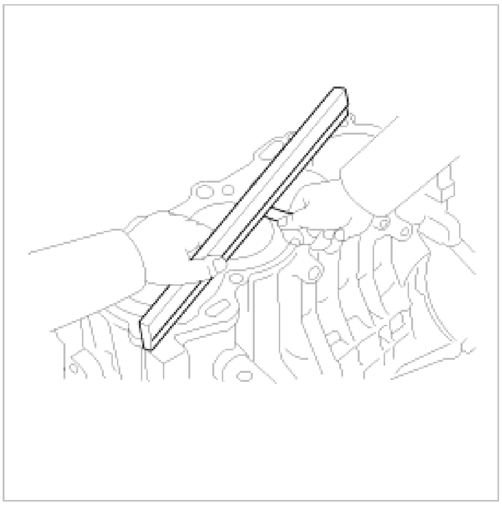
Main journal diameter : 51.942 ~ 51.960mm (2.0449 ~ 2.0456in.)
Crank pin diameter : 47.954 ~ 47.972mm (1.8879 ~ 1.8886in.)



CYLINDER BLOCK

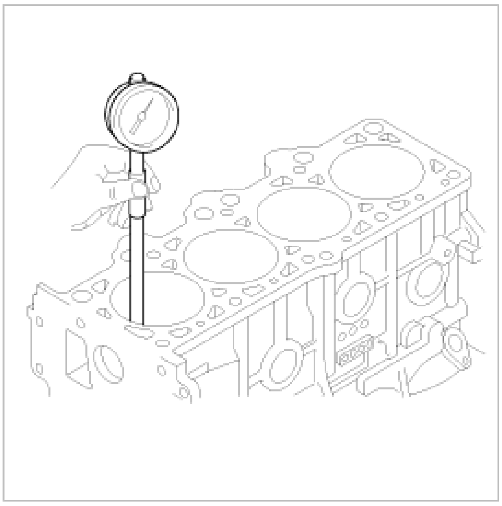
1. Remove gasket material.
   Using a gasket scraper, remove all the gasket material from the top surface of the cylinder block.
2. Clean cylinder block
   Using a soft brush and solvent, thoroughly clean the cylinder block.
3. Inspect top surface of cylinder block for flatness.
   Using a precision straight edge and feeler gauge, measure the surface contacting the cylinder head gasket for warpage.

Flatness of cylinder block gasket surface
Standard : Less than 0.05mm(0.0020 in.)



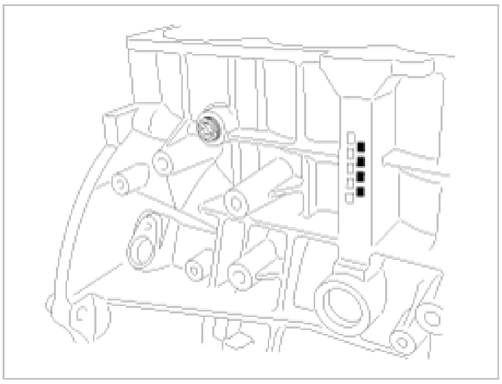
4. Inspect cylinder bore diameter
   Visually check the cylinder for vertical scratchs.
   If deep scratches are present, replace the cylinder block.
5. Inspect cylinder bore diameter
   Using a cylinder bore gauge, measure the cylinder bore diameter at position in the thrust and axial directions.

Standard diameter
88.00 ~ 88.03mm (3.4645 ~ 3.4657in.)



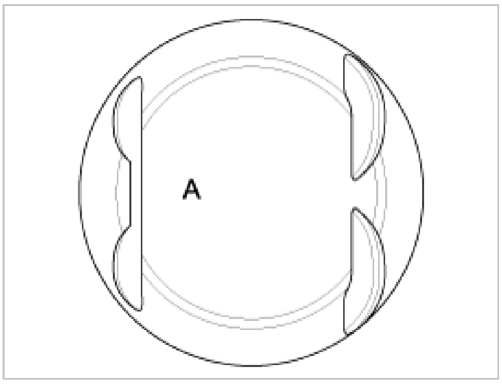
> NOTE
>
> Measure position(from the bottom of the cylinder block)
> : 110.7mm(4.3582in.)/160mm(6.2992in.)/210mm(8.2677in.)

6. Check the cylinder bore size code on the cylinder block.



Class	Cylinder bore inner diameter	Size code
A	88.00 ~ 88.01mm (3.4645~ 3.4649in.)	A
B	88.01 ~ 88.02mm (3.4649~ 3.4653in.)	B
C	88.02 ~ 88.03mm (3.4653~ 3.4657in.)	C

7. Check the piston size code on the piston top face.



> NOTE

Stamp the grade mark of basic diameter with rubber stamp.

Class	Piston outer diameter	Size code
A	87.97 ~ 87.98mm (3.4633 ~ 3.4637in.)	A
B	87.98 ~ 87.99mm (3.4637 ~ 3.4641in.)	None
C	87.99 ~ 88.00mm (3.4641 ~ 3.4645in.)	C

8. Select the piston related to cylinder bore class.

Clearance : 0.02 ~ 0.04mm (0.00078 ~ 0.00157in.)

PISTON AND RINGS

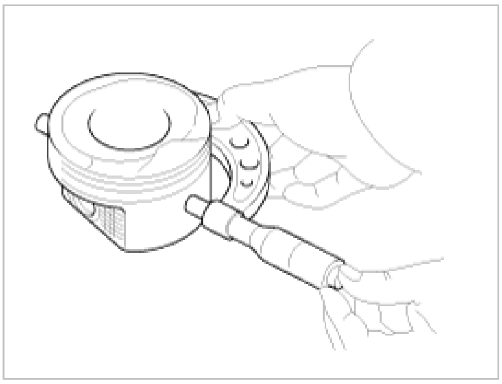
1. Clean piston
   (1) Using a gasket scraper, remove the carbon from the piston top.
   (2) Using a groove cleaning tool or broken ring, clean the piston ring grooves.
   (3) Using solvent and a brush, thoroughly clean the piston.

   NOTE

   Do not use a wire brush.

2. The standard measurement of the piston outside diameter is taken 47 mm (1.85 in.) from the top land of the piston.

Standard diameter
87.97 ~ 88.00mm (3.4633~ 3.4645in.)



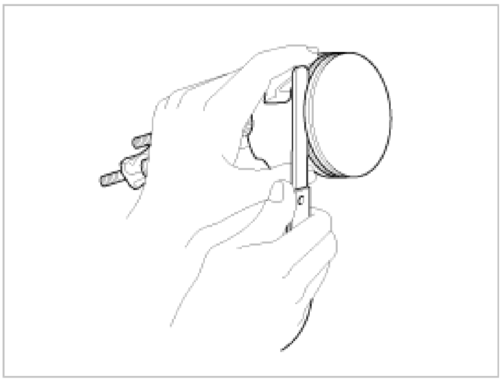
3. Calculate the difference between the cylinder bore diameter and the piston diameter.

Piston-to-cylinder clearance
0.02 ~ 0.04mm(0.0008 ~ 0.0016in.)

4. Inspect the piston ring side clearance.
   Using a feeler gauge, measure the clearance between new piston ring and the wall of the ring groove.

Piston ring side clearance
Standard
No.1 : 0.03 ~ 0.07mm (0.0012 ~ 0.0027in.)
No.2 : 0.03 ~ 0.07mm (0.0012 ~ 0.0027in.)
Oil ring : 0.06 ~ 0.15mm (0.0024 ~ 0.0059in.)
Limit
No.1 : 0.1mm (0.004in.)

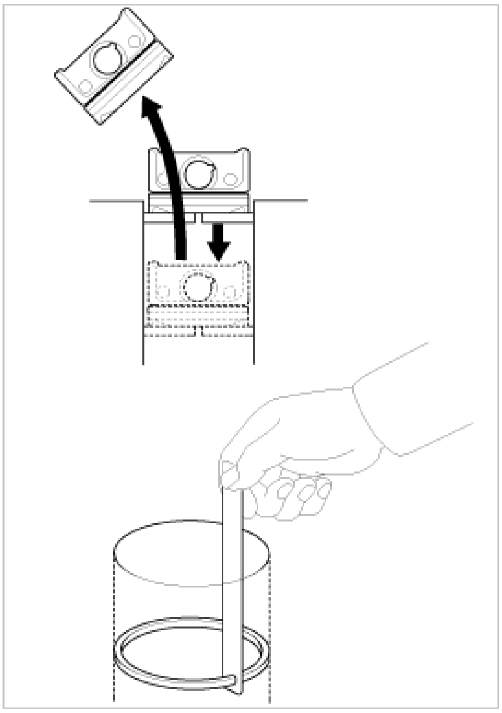
No.2 : 0.1mm (0.004in.)
Oil ring : 0.2mm (0.008in.)



If the clearance is greater than maximum, replace the piston.

5. Inspect piston ring end gap.
   To measure the piston ring end gap, insert a piston ring into the cylinder bore. Position the ring at right angles to the cylinder wall by gently pressing it down with a piston. Measure the gap with a feeler gauge. If the gap exceeds the service limit, replace the piston ring. If the gap is too large, recheck the cylinder bore diameter against the wear limits. If the bore is over the service limit, the cylinder block must be replaced.

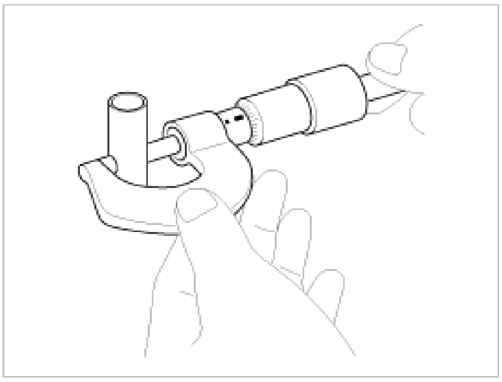
Piston ring end gap
Standard
No.1 : 0.15 ~ 0.30mm (0.0059 ~ 0.0118in.)
No.2 : 0.30 ~ 0.45m (0.0118 ~ 0.0177in.)
Oil ring : 0.20 ~ 0.70mm (0.0079 ~ 0.0275in.)
Limit
No.1 : 0.6mm (0.0236in.)
No.2 : 0.7mm (0.0275in.)
Oil ring : 0.8mm (0.0315in.)



PISTON PINS

1. Measure the diameter of the piston pin.

Piston pin diameter
21.001 ~ 21.006mm (0.8268 ~ 0.8270in.)



2. Measure the piston pin-to-piston clearance.

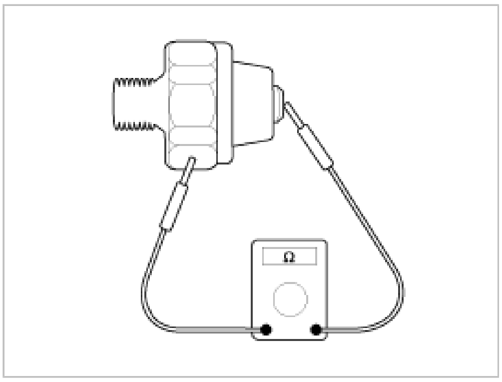
Piston pin-to-piston clearance
0.01 ~ 0.02mm (0.0004 ~ 0.0008in.)

3. Check the difference between the piston pin diameter and the connecting rod small end diameter.

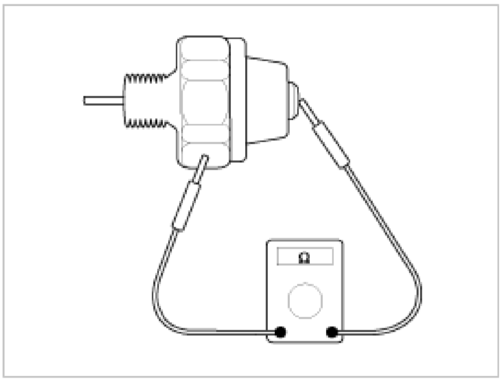
Piston pin-to-connecting rod interference
0.016 ~ 0.032mm (0.00063 ~ 0.00126in.)

OIL PRESSURE SWITCh

1. Check the continuity between the terminal and the body with an ohmmeter.
   If there is no continuity, replace the oil pressure switch.



2. Check the continuity between the terminal and the body when the fine wire is pushed. If there is continuity even when the fine wire is pushed, replace the switch.
3. If there is no continuity when a 50kpa (7psi) is applied throgh the oil hole, the switch is operaing properly.
   Check for air leakage. If air leaks, the diaphragm is broken. Replace it.

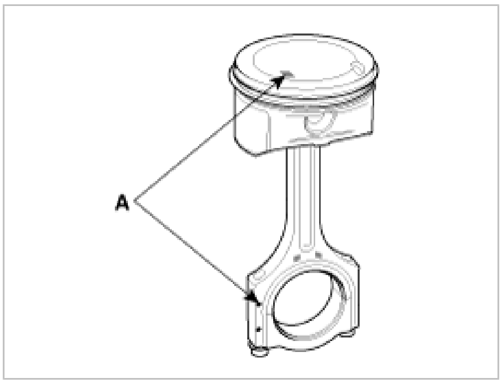


REASSEMBLY

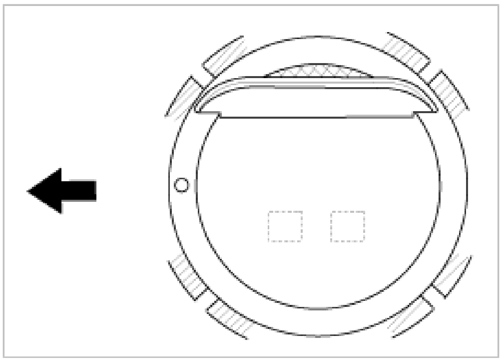
NOTE

• Thoroughly clean all parts to assembled.
• Before installing the parts, apply fresh engine oil to all sliding and rotating surfaces.
• Replace all gaskets, O-rings and oil seals with new parts.

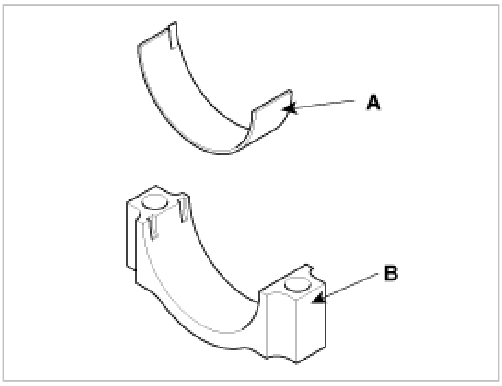
1. Assemble piston and connecting rod.
   (1) Use a hydraulic press for installation.
   (2) The piston front mark and the connecting rod front mark must face the timing belt side of the engine.



2. Install piston rings.
   (1) Install the oil ring spacer and 2 side rails by hand.
   (2) Using a piston ring expander, install the 2 compression rings with the code mark facing upward.
   (3) Position the piston rings so that the ring ends are as shown.



3. Install connecting rod bearings.
   (1) Align the bearing claw with the groove of the connecting rod or connecting rod cap.
   (2) Install the bearings(A) in the connecting rod and connecting rod cap(B).

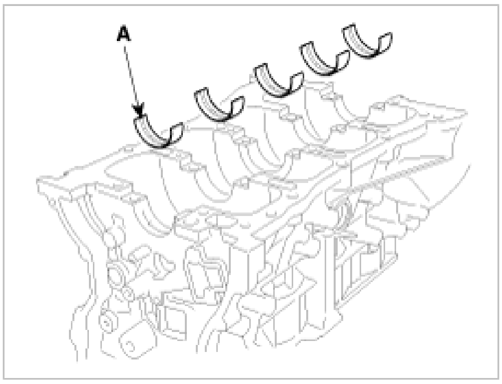


4. Install main bearings.

NOTE

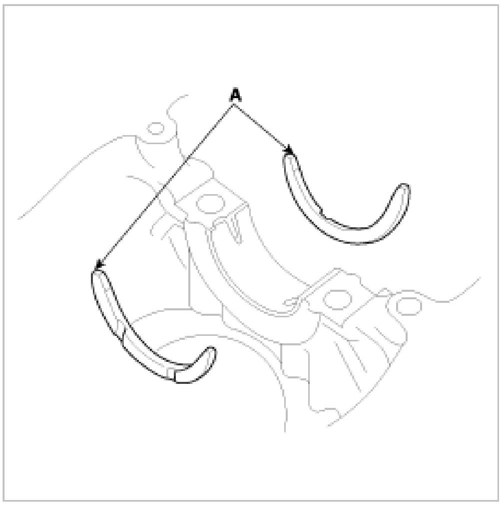
Upper bearings have an oil groove of oil holes; Lower bearings do not.

   (1) Align the bearing claw with the claw groove of the cylinder block, push in the 5 upper bearings(A).



(2) Align the bearing claw with the claw groove of the main bearing cap, and push in the 5 lower bearings.

5. Install thrust bearings.
   Install the 2 thrust bearings(A) under the No.3 journal position of the cylinder block with the oil grooves facing outward.



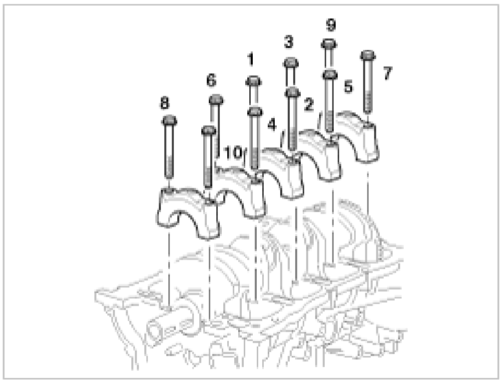
6. Place crankshaft on the cylinder block.
7. Place main bearing caps on cylinder block.
8. Install main bearing cap bolts.

> NOTE
>
> • The main bearing cap bolts are tightened in 2 progressive steps.
> • If any of the bearing cap bolts in broken or deformed, replace it.
> • Always use new main bearing cap bolt.

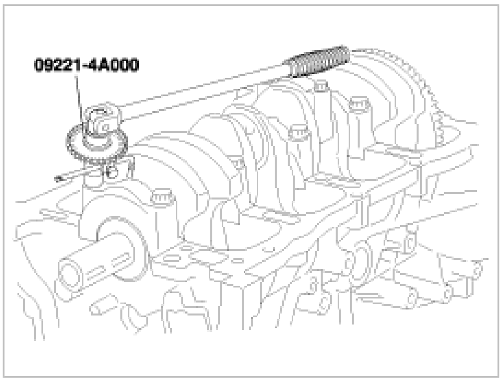
(1) Apply a light coat of engine oil on the threads and under the bearing cap bolts.

(2) Install and uniformly tighten the 10 bearing cap bolts(A), in several passes, in the sequence shown.

Tightening torque:
14.7Nm (1.5kgf.m, 10.8lb-ft) + 27.5~31.4Nm (2.8~3.2kgf.m, 20.3~23.1lb-ft) + 120~125°



(3) Retighten the bearing cap bolts by 120~125° in the numerical order shown.
Using SST(09221-4A000), install main bearing cap bolts.



(4) Check that the crankshaft turns smoothly.

9. Check crankshaft end play.
10. Install piston and connecting rod assemblies.

> **NOTE**
> Before installing the pistons, apply a coat of engine oil to the ring grooves and cylinder bores.

(1) Remove the connecting rod caps, and slip short sections of rubber hose over the threaded ends of the connecting rod bolts.

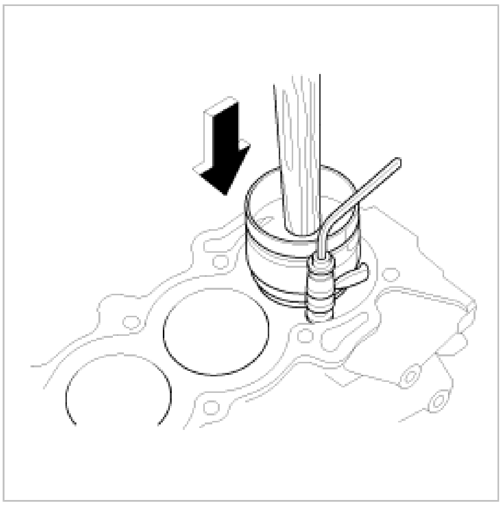
(2) Install the ring compressor, check that the bearing is securely in place, then position the piston in the cylinder, and tap it in using the wooden handle of a hammer.

(3) Stop after the ring compressor pops free, and check the connecting rod-to-check journal alignment before pushing the piston into place.

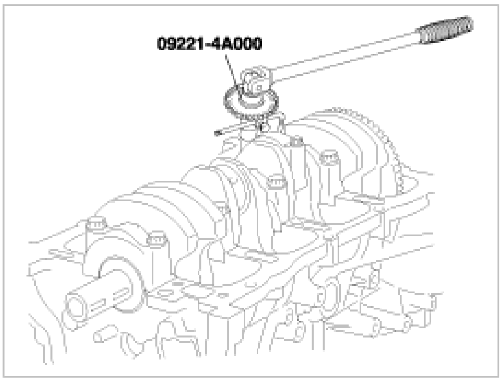
(4) Apply engine oil to the bolt threads. Install the rod caps with bearings, and torque the bolts.

Tightening torque
17.7~21.6Nm (1.8~2.2kgf.m, 13.0~15.9lb-ft) + 88~92°

> **NOTE**
> Maintain downward force on the ring compressor to prevent the rings from expanding before entering the cylinder bore.

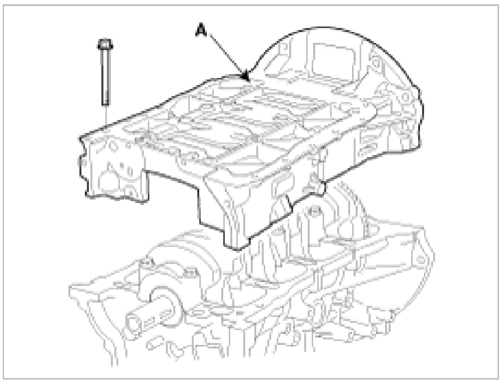


(5) Using SST(09221-4A000), install connecting rod bolts.



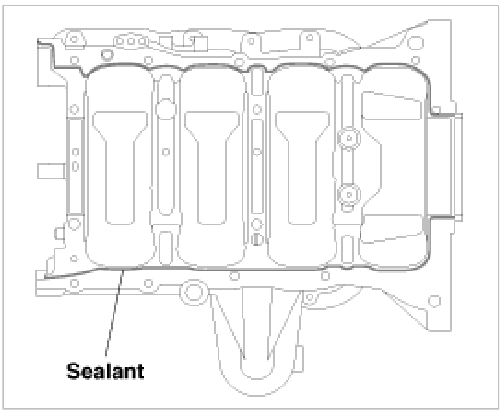
11. Install ladder frame(A) with 10 bolts.

Tightening torque
23.52 ~ 27.44Nm (2.4 ~ 2.8kgf.m, 17.35 ~ 20.24lbf.ft)



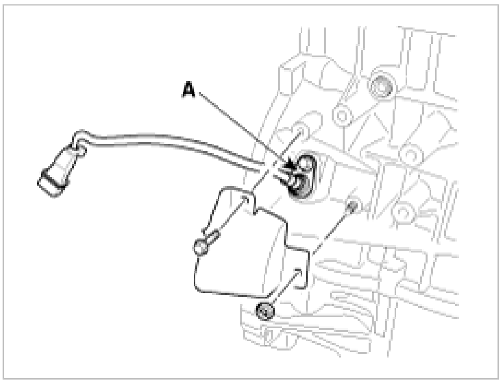
NOTE

- Be assembling ladder frame, the liquid sealant Loctite 5900 should be applied ladder frame.
- The part must be assembled within 5 minutes after sealant was applied.
- Apply sealant to the inner threads of the bolt holes.



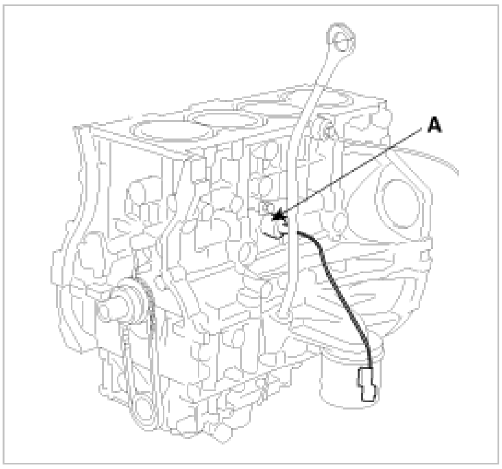
12. Install rear oil seal.
    (1) Apply engine oil to a new oil seal lip.
    (2) Using SST(09231-H1100, 09214-3K100) and a hammer, tap in the oil seal until its surface is flush with the rear oil seal retainer edge.
13. Install balance shaft module.
14. Install water pump.
15. Install CKP sensor(A) and sensor cover.

Tightening torque
3.92 ~ 5.88Nm (0.4 ~ 0.6kgf.m, 2.89 ~ 4.34lbf.ft)



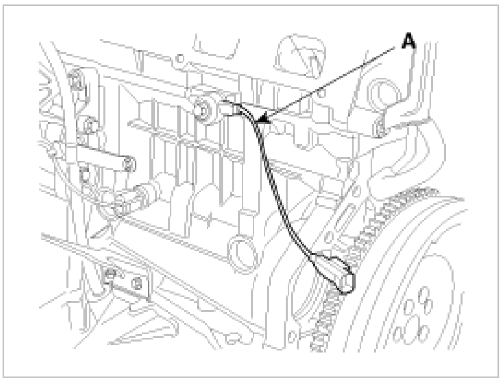
16. Install oil pressure sensor.
    (1) Apply adhesive to 2 or 3 threads.
        Adhesive : MS 721-39(B) or equivalent.
    (2) Install the oil pressure sensor (A).

Tightening torque
7.84 ~ 11.76Nm (0.8 ~ 1.2kgf.m, 5.78 ~ 8.67lbf.ft)



17. Install knock sensor(A).

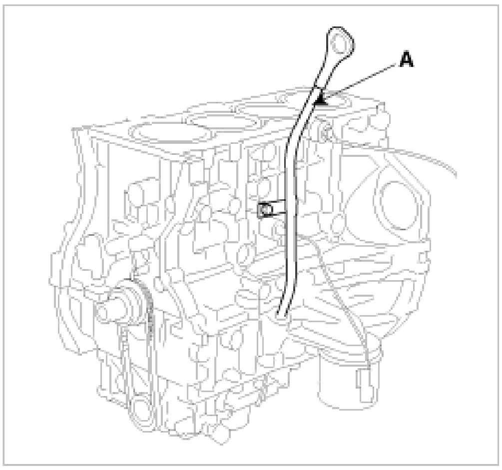
Tightening torque
16.66 ~ 25.48Nm (1.7 ~ 2.6kgf.m, 12.29 ~ 18.78lbf.ft)



18. Install oil level gauge assembly.
    (1) Install a new O-ring on the oil level gauge.
    (2) Apply engine oil on the O-ring.
    (3) Install the oil level gauge assembly(A) with the bolt.

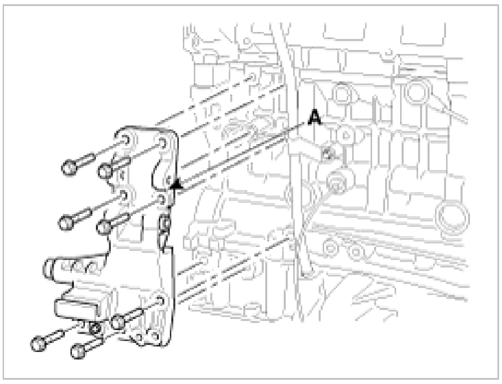
Tightening torque

7.84 ~ 11.76Nm (0.8 ~ 1.2kgf.m, 5.78 ~ 8.67lbf.ft)



19. Install tensioner assembly integrated bracket(A).

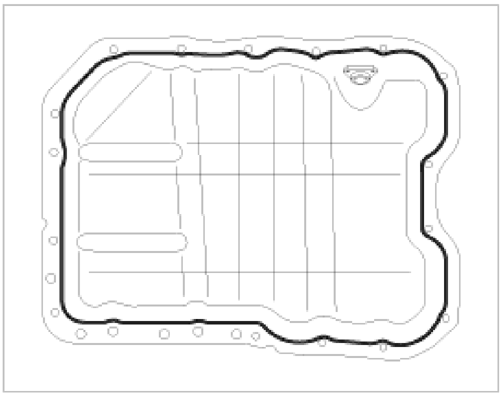
Tightening torque
39.2 ~ 44.1Nm (4.0 ~ 4.5kgf.m, 28.92 ~ 32.53lbf.ft)



20. Install power steering pomp bracket and power steering pump. (See ST group)
21. Install alternator. (See EE group)
22. Install A/C compressor. (See HA group)
23. Install cylinder head.
24. Install timing chain.
25. Install oil pan.
    (1) Using a razor blade and gasket scraper, remove all the old packing material from the gasket surfaces.

    > NOTE
    >
    > Check that the mating surfaces are clean and dry before applying liquid gasket.

    (2) Apply liquid gasket as an even bead, centered between the edges of the mating surface.
    Use liquid gasket LOCTITE5900 or equivalent(MS721-40A).

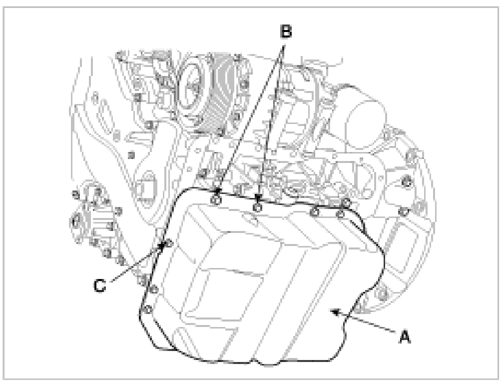


NOTE

- To prevent leakage of oil, apply liquid gasket to the inner threads of the bolt holes.
- Do not install the parts if five minutes or more have elapsed since applying the liquid gasket. Instead, reapply liquid gasket after removing the residue.
- After assembly, wait at least 30 minutes before filling the engine with oil.

(3) Install the oil pan(A).
Uniformly tighten the bolts in several passes.

Tightening torque
M8(B) : 26.46 ~ 30.38Nm (2.7 ~ 3.1kgf.m, 19.52 ~ 22.41lbf.ft)
M6(C) : 9.8 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)



26. Remove engine stand.
27. A/T : Install drive plate.

Tightening torque
117.6 ~ 127.4Nm (12 ~ 13kgf.m, 86.75 ~ 93.98lbf.ft)

28. M/T : Install flywheel.

Tightening torque
117.6 ~ 127.4Nm (12 ~ 13kgf.m, 86.75 ~ 93.98lbf.ft)

NOTE

- Always use new flywheel(drive plate) bolts.
- Install and uniformly tighten the 7 bolts, in several passes.

Engine Mechanical System > Cooling System > Description and Operation

Engine Coolant Refilling and Bleeding

WARNING

Never remove the radiator cap when the engine is hot. Serious scalding could be caused by hot fluid under high pressure escaping from the radiator.

CAUTION

When pouring engine coolant, be sure to shut the relay box lid and not to let coolant spill on the electrical parts or the paint. If any coolant spills, rinse it off immediately.

1. Make sure the engine and radiator are cool to the touch.
2. Remove radiator cap.
3. Loosen the drain plug, and drain the coolant.
4. Tighten the radiator drain plug securely.
5. Remove, drain and reinstall the reservoir. Fill the tank halfway to the MAX mark with water, then up to the MAX mark with antifreeze.
6. Fill fluid mixture with coolant and water(4 : 6) slowly through the radiator cap. Push the upper/lower hoses of the radiator so as bleed air easily.

   NOTE

   - Use only genuine antifreese/coolant.
   - For best corrosion protection, the coolant concentration must be maintained year-round at 50% minimum. Coolant concentrations less than 50% may not provide sufficient protection against corrosion or freezing.
   - Coolant concentrations greater then 60% will impair cooling efficiency and are not recommended.

   CAUTION

   - Do not mix different brands of antifreeze/coolants.
   - Do not use additional rust inhibitors or anti-rust products; they may not be compatible with the coolant.

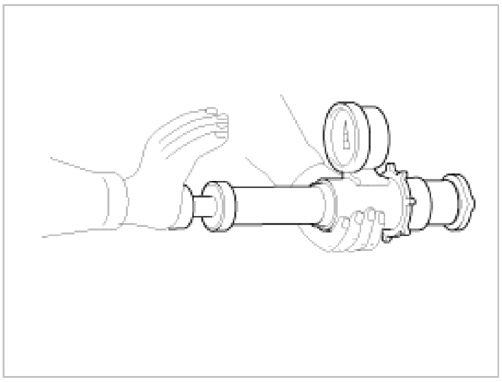
7. Start the engine and run coolant circulates.
   When the cooling fan operates and coolant curculates, refill coolant through the radiator cap.
8. Repeat 7 until the cooling fan 3 ~ 5times and bleed air sufficiently out of the cooling system.
9. Install the radiator cap and fill the reservoir tank to the "MAX" line with coolant.
10. Run the vehicle under idle until the cooling fan operates 2 ~ 3 times.
11. Stop the engine and wait coolant gets cool.
12. Repeat 6 to 11 until the coolant level doesn't fall any more, bleed air out of the cooling system.

    NOTE

    As it is to bleed air out to the cooling system and refill coolant when coolant gets cool completely, recheck the coolant level in the reservoir tank for 2 ~ 3 days after replacing coolant.

Cap Testing

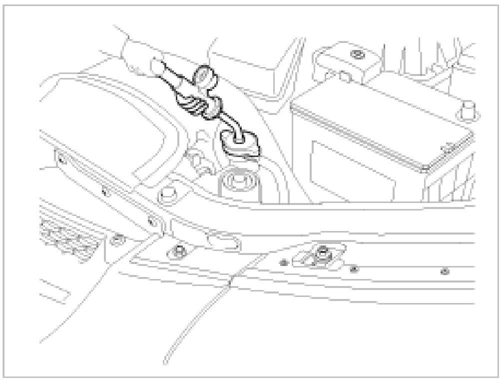
1. Remove the radiator cap, wet its seal with engine coolant, then install it no pressure tester.



2. Apply a pressure of 93 ~ 123kPa (0.95 ~ 1.25kgf/cm², 14 ~ 19psi)
3. Check for a drop in pressure.
4. If the pressure drops, replace the cap.

Testing

1. Wait until engine is cool, then carefully remove the radiator cap and fill the radiator with engine coolant, then install it on the pressure tester.

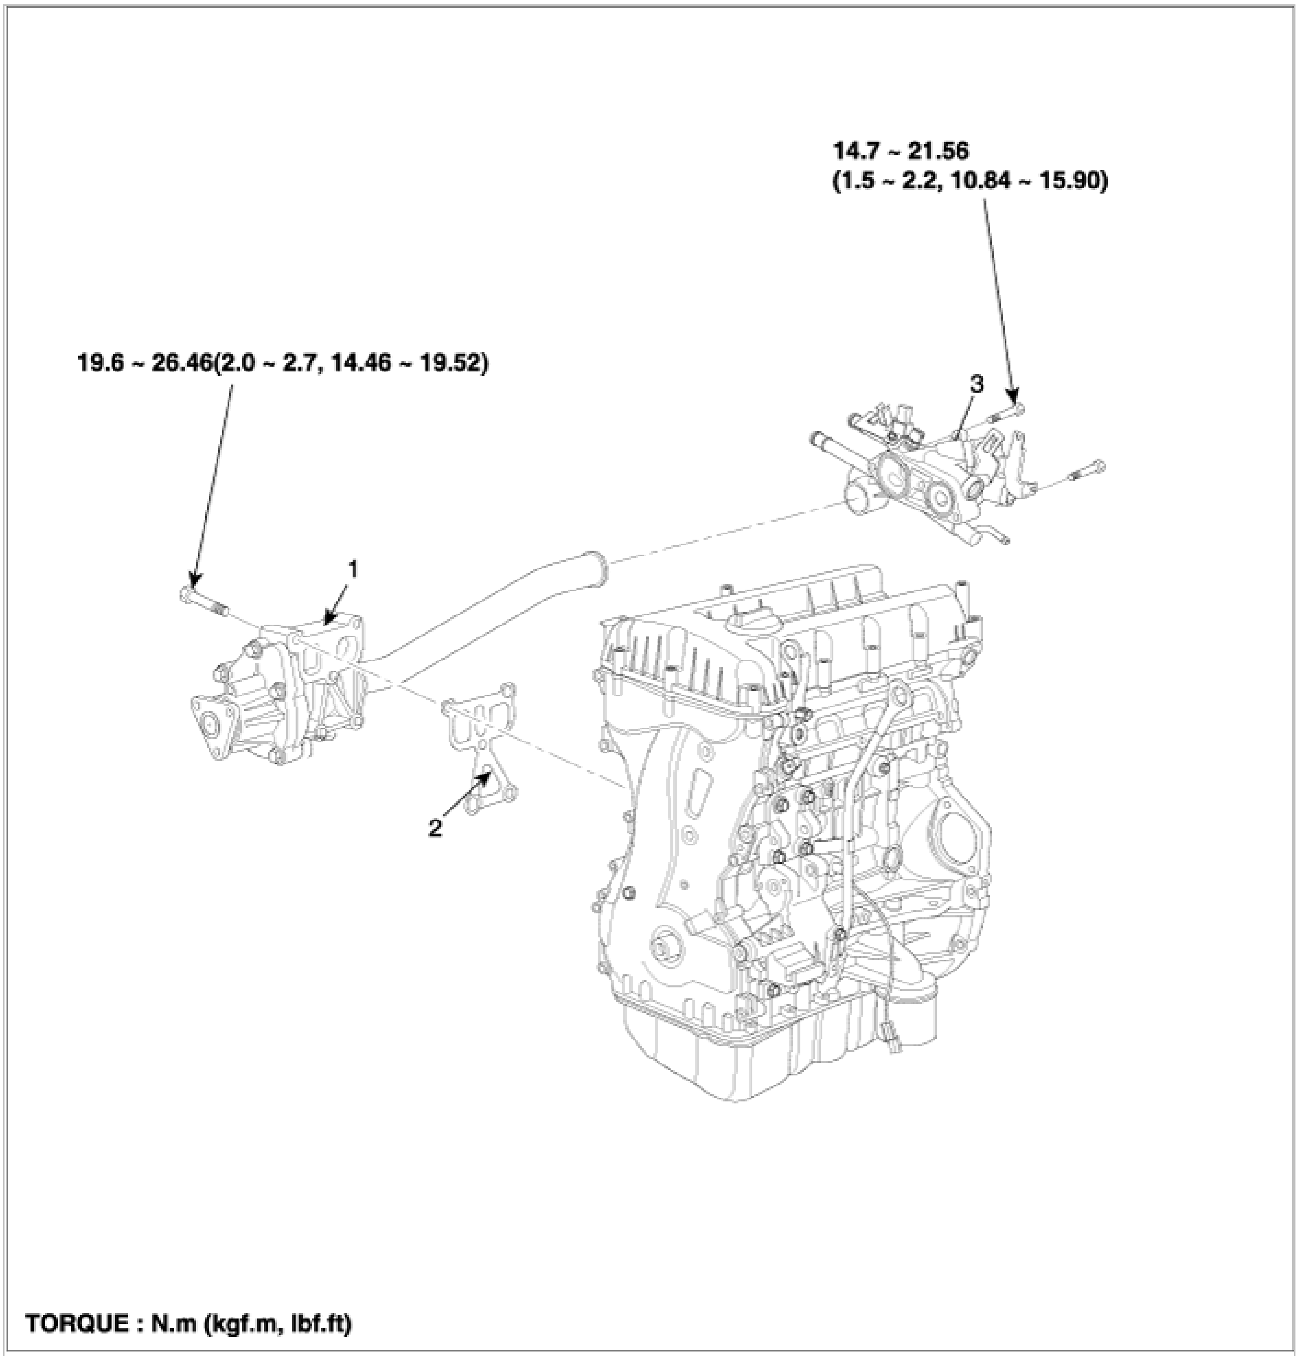


2. Apply a pressure tester to the radiator and apply a pressure of 93 ~ 123kPa (0.95 ~ 1.25kgf/cm² 14 ~ 18psi).
3. Inspect for engine coolant leaks and a drop in pressure.
4. Remove the tester and reinstall the radiator cap.

> NOTE
>
> Check for engine oil in the coolant and/or coolant in the engine oil.

Engine Mechanical System > Cooling System > Components and Components Location

COMPONENT



1. Water pump
2. Water pump gasket
3. Water temp control assembly

Engine Mechanical System > Cooling System > Repair procedures

REMOVAL

WATER PUMP

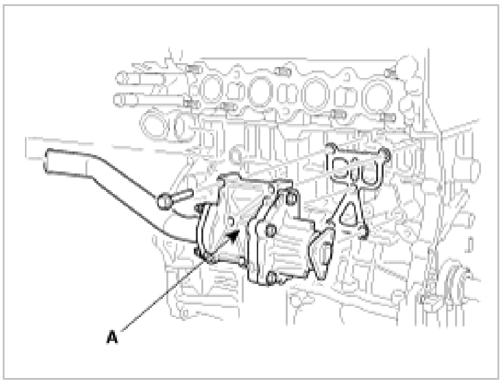
1. Drain the engine coolant.

> WARNING
>
> System is under high pressure when the engine is hot. To avoid danger of releasing scalding engine coolant, remove the cap only when the engine is cool.

2. Remove drive belt.
3. Remove exhaust manifold.
4. Remove the water pump.

(1) Remove the 4 bolts and pump pulley.

(2) Remove the water pump(B) and gasket.

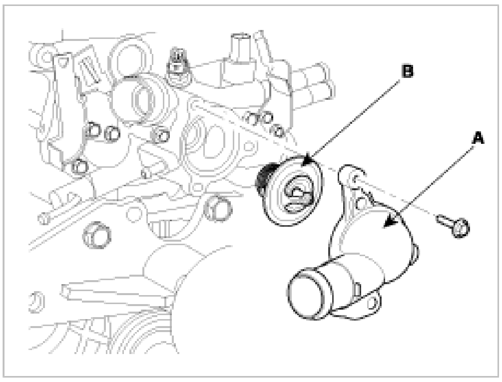


5. Remove water inlet pipe nut.

THERMOSTAT

> NOTE
>
> Removal of the thermostat would have an adverse effect, causing a lowering of cooling efficiency. Do not remove the thermostat, even if the engine tends to overheat.

1. Drain engine coolant so its level is below thermostat.
2. Remove water inlet(A) and thermostat(B).



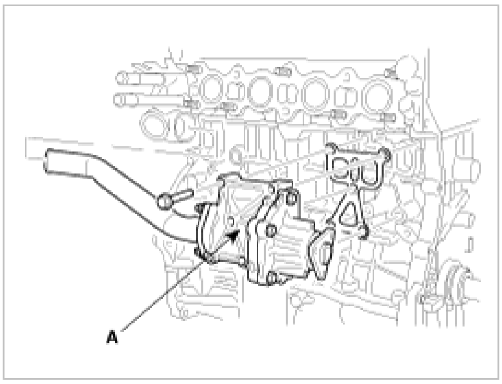
INSTALLATION

WATER PUMP

1. Install the water pump.

(1) Install the water pump(A) and a new gasket with the 5 bolts.

Tightening torque
19.6 ~ 26.46Nm (2.0 ~ 2.7kgf.m, 14.46 ~ 19.52lbf.ft)



(2) Install the 4 bolts and pump pulley.

2. Install water inlet pipe nut.

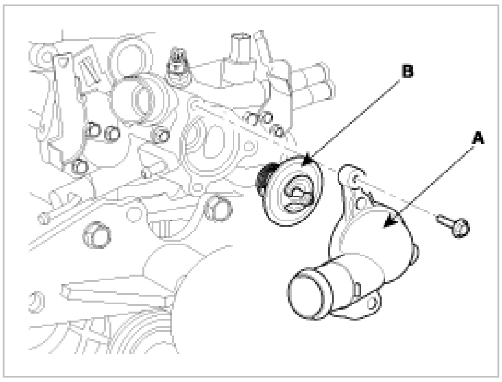
Tightening torque
19.6 ~ 26.46Nm (2.0 ~ 2.7kgf.m, 14.46 ~ 19.52lbf.ft)

3. Install exhaust manifold.
4. Install drive belt.
5. Fill with engine coolant.
6. Start engine and check for leaks.
7. Recheck engine coolant level.

THERMOSTAT

1. Place thermostat in thermostat housing.
   (1) Install the thermostat with the jiggle valve upward.

   (2) Install a new thermostat(B).



2. Install water inlet(A).

Tightening torque
14.7 ~ 21.56Nm (1.5 ~ 2.2kgf.m, 10.84 ~ 15.90lbf.ft)

3. Fill with engine coolant.
4. Start engine and check for leaks.

INSPECTION

WATER PUMP

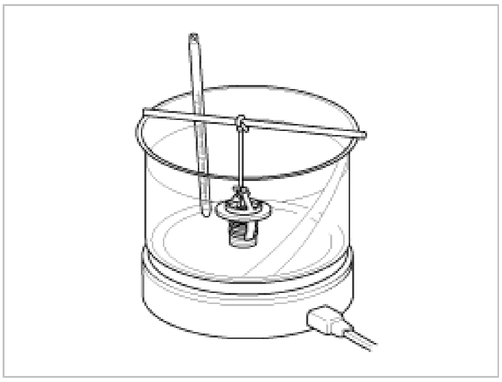
1. Check each part for cracks, damage or wear, and replace the coolant pump assembly if necessary.
2. Check the bearing for damage, abnormal noise and sluggish rotation, and replace the coolant pump assembly if necessary.
3. Check for coolant leakage. If coolant leaks from hole, the seal is defective. Replace the coolant pump assembly

NOTE

A small amount of "weeping" from the bleed hole is normal.

THERMOSTAT

1. Immerse the thermostat in water and gradually heat the water.



2. Check the valve opening temperature.

Valve opening temperature : 82°C (177°F)
Full opening temperature : 95°C (205°F)

If the valve opening temperature is not as specified, replace the thermostat.

3. Check the valve lift.

Valve lift : 8mm (0.3in.) or more at 95°C (205°F)

If the valve lift is not as specified, replace the thermostat.

Engine Mechanical System > Lubrication System > Description and Operation

OIL AND FILTER

CAUTION

- Prolonged and repeated contact with mineral oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.
- Exercise caution in order to minimize the length and frequency of contact of your skin to used oil. Wear protective clothing and gloves. Wash your skin thoroughly with soap and water, or use water-less hand cleaner, to remove any used engine oil. Do not use gasoline, thinners, or solvents.
- In order to preserve the environment, used oil and used oil filter must be disposed of only at designated disposal sites.

1. Drain engine oil.
   A. Remove the oil filter cap.
   B. Remove the oil drain plug, and drain the oil into a container.
2. Replace oil filter.
   A. Remove the oil filter.
   B. Check and clean the oil filter installation surface.
   C. Check the part number of the new oil filter is as same as old one.
   D. Apply clean engine oil to the gasket of a new oil filter.
   E. Lightly screw the oil filter into place, and tighten it until the gasket contacts the seat.

   Tightening torque
   11.76 ~ 15.68Nm (1.2 ~ 1.6kgf.m, 8.67 ~ 11.57lbf.ft)

3. Refill with engine oil filter.
   A. Clean and install the oil drain plug with a new gasket.

   Tightening torque
   34.3 ~ 44.1N.m (3.5 ~ 4.5kgf.m, 25.3 ~ 32.5lb-ft)

   B. Fill with fresh engine oil

Capacity
Drain and refill
W/Oil filter change : 4.0l (4.23U.S.qts, 3.52lmp qts)
W/O Oil filter change : 3.7l (3.90U.S.qts, 3.26lmp qts)

C. Install the oil filter cap.

4. Start engine and check for oil leaks.
5. Recheck engine oil level.

INSPECTION

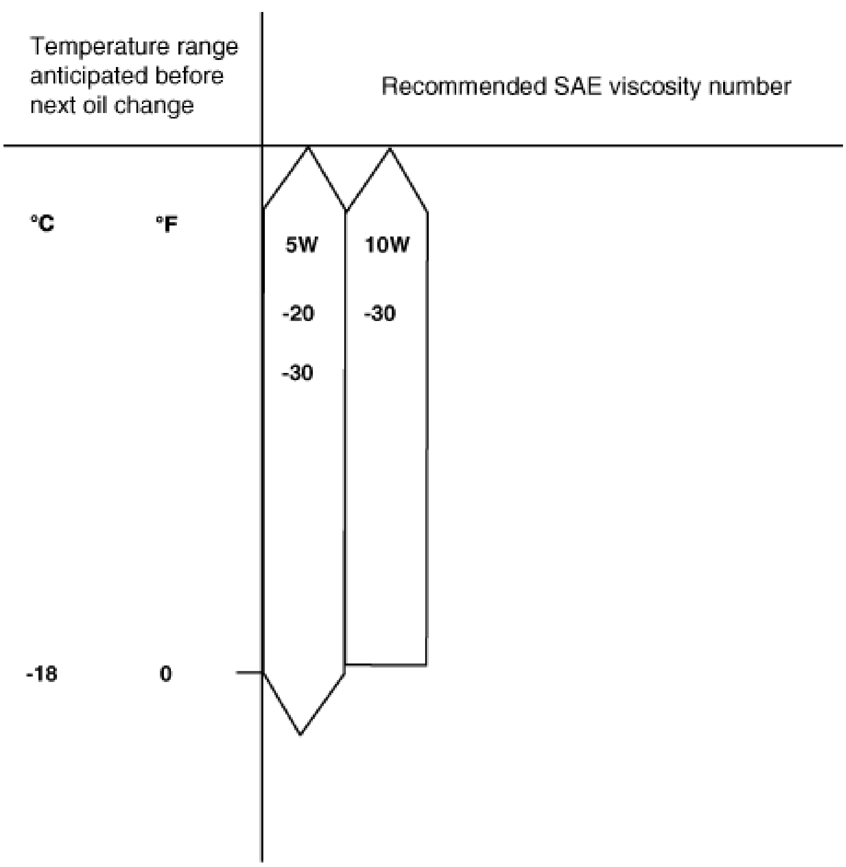
1. Check engine oil quality
   Check the oil for deterioration, entry of water, discoloring or thinning.
   If the quality is visibly poor, replace the oil.
2. Check engine oil level.
   After warming up the engine and then 5 minutes after the engine stop, oil level should be between the "L" and "F" marks on the dipstick.
   If low, check for leakage and add oil up to the "F" mark.

NOTE

Do not fill with engine oil above the "F" mark.

SELECTION OF ENGINE OIL

Recommended SAE viscosity grades : 5W-20
If 5W-20 engine oil is not available, secondary recommended engine oil can be used for corresponding temperature range.



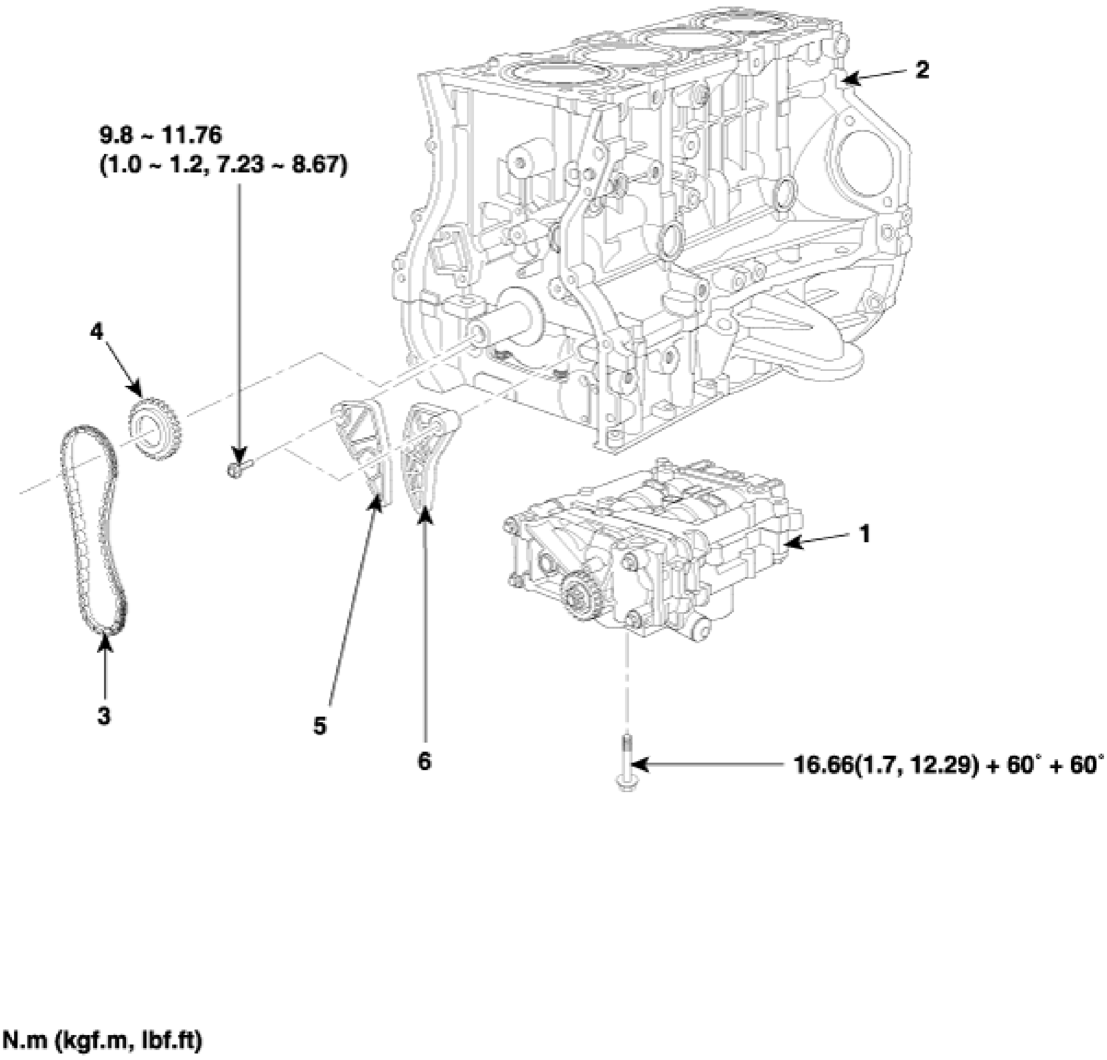
NOTE

For best performance and maximum protection of all types of operation, select only those lubricants whitch :
- Satisfy the requirement of the API classification.
- Have proper SAE grade number for expected ambient temperature range.

Lubricants that do not have both an SAE grade number and API service classification on the container should not be used.

Engine Mechanical System > Lubrication System > Components and Components Location

COMPONENT

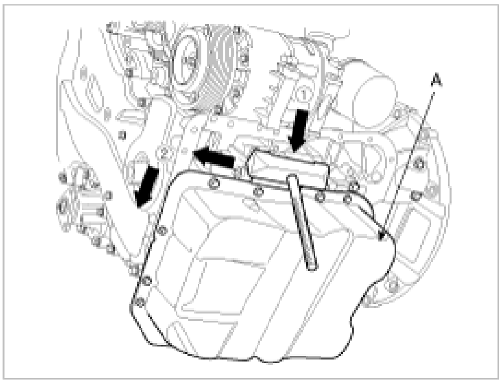


1. Balance shaft module
2. Cylinder block
3. Balance shaft chain
4. Balance shaft chain sprocket
5. Balance shaft chain guide
6. Balance shaft chain tensioner arm

Engine Mechanical System > Lubrication System > Repair procedures

REMOVAL

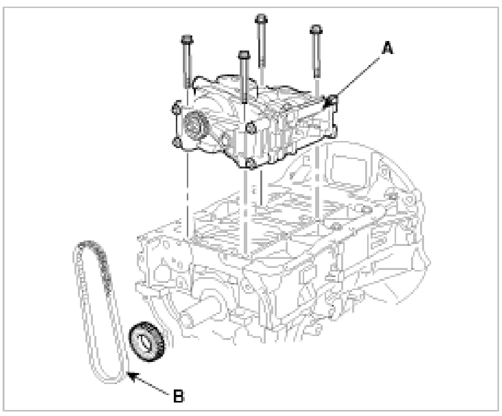
1. Drain engine oil.
2. Remove the drive belt.
3. Turn the crankshaft and align the white groove on the crankshaft pulley with the pointer on the lower cover.
4. Remove the oil pan.



CAUTION

- Insert the SST between the oil pan and the ladder frame by tapping it with a plastic hammer in the direction of ① arrow.
- After tapping the SST with a plastic hammer along the direction of ② arrow around more than 2/3 edge of the oil pan, remove it from the ladder frame.
- Do not turn over the SST abruptly without tapping. It be result in damage of the SST.

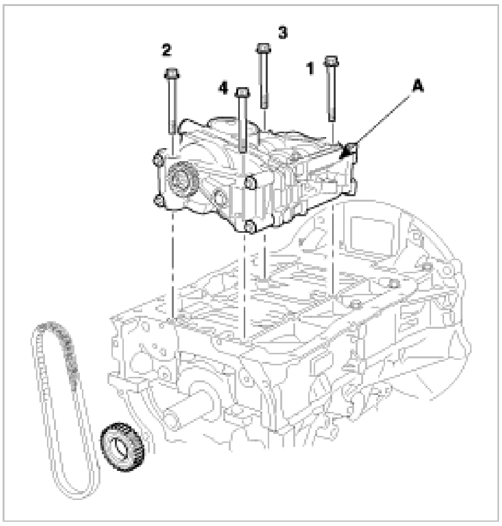
5. Remove the timing chain.
6. Remove balance shaft chain(B) and balance shaft module(A).



INSTALLATION

1. Install balance shaft chain.
2. Confirm the balance shaft module timing mark. Timing marks to be visually aligned with centers of adjacent cast timing notches.
3. Install balance shaft module that the timing mark of balance shaft module sprocket should be matched with the timing mark (color link) of balance shaft chain.

Tightenig torque
16.66Nm (1.7kgf.m, 12.3lbf.ft) + 60°+ 60°

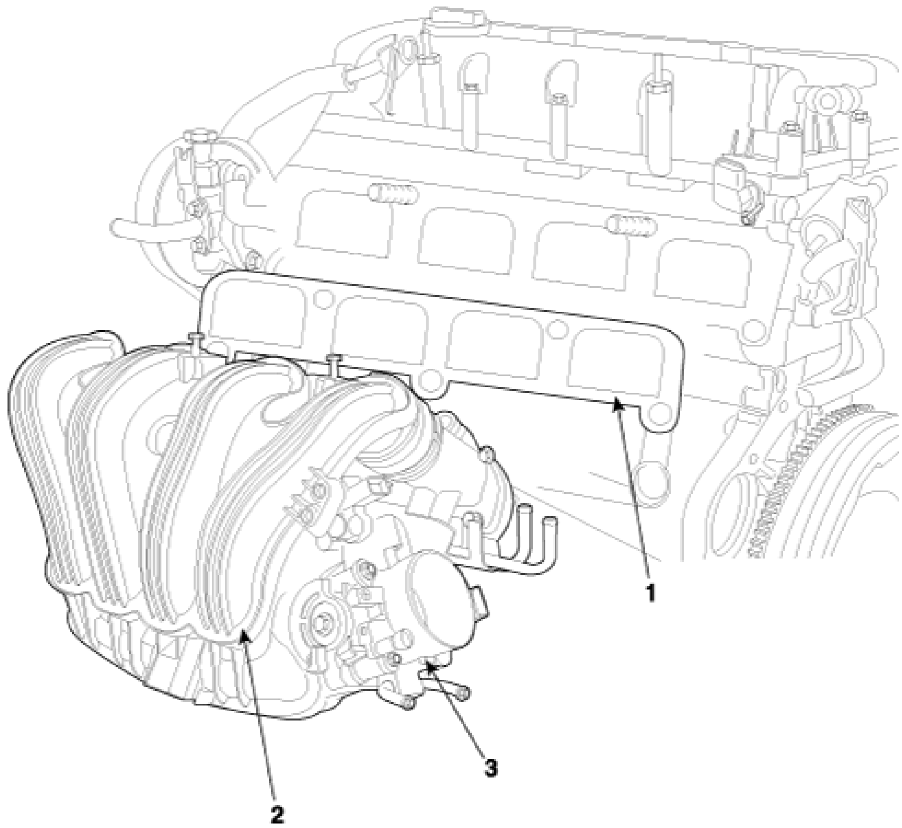


4. Install timing chain.
5. Install oil pan.
6. Fill with engine oil.
7. Start engine and check for leaks.

Engine Mechanical System > Intake And Exhaust System > Components and Components Location

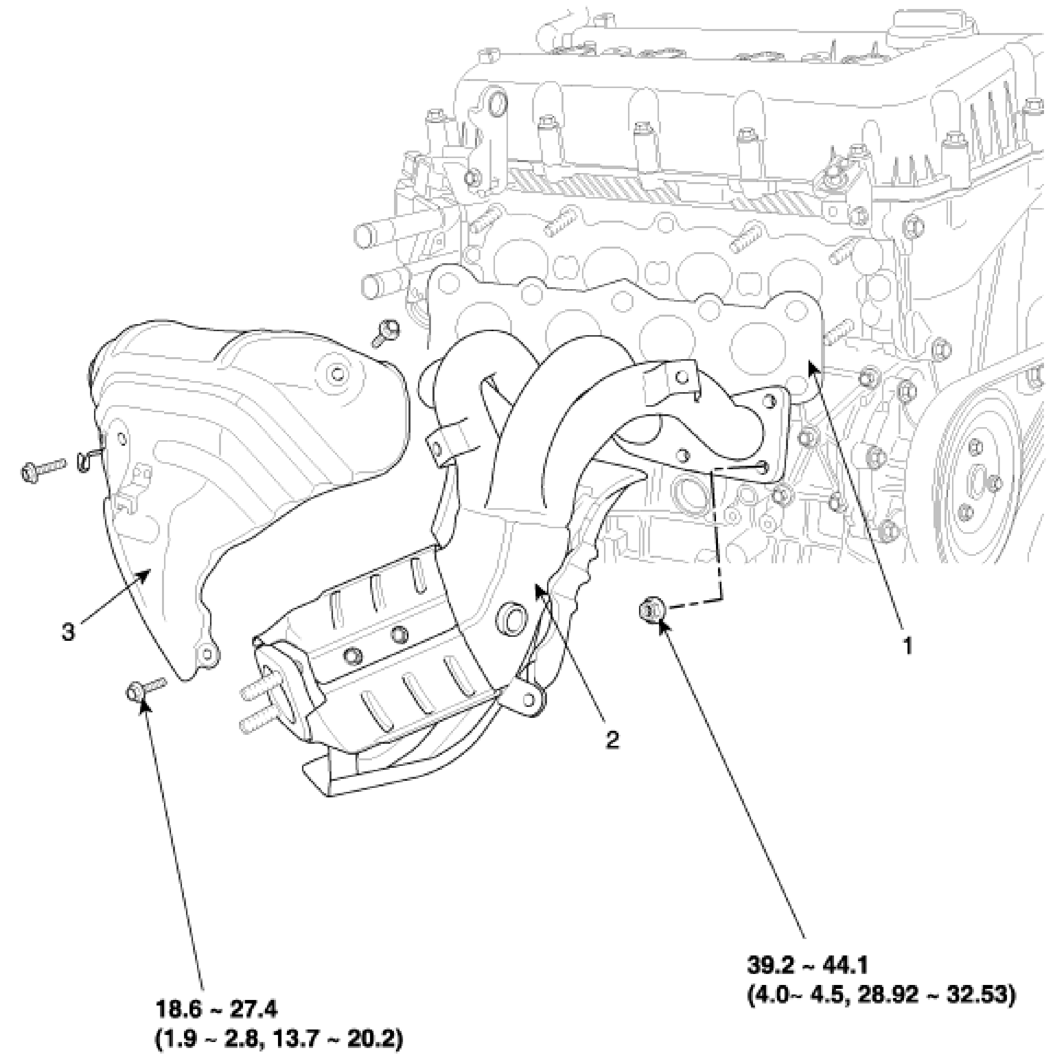
COMPONENT

INTAKE MANIFOLD



1. Intake manifold gasket
2. Intake manifold assembly
3. Throttle body

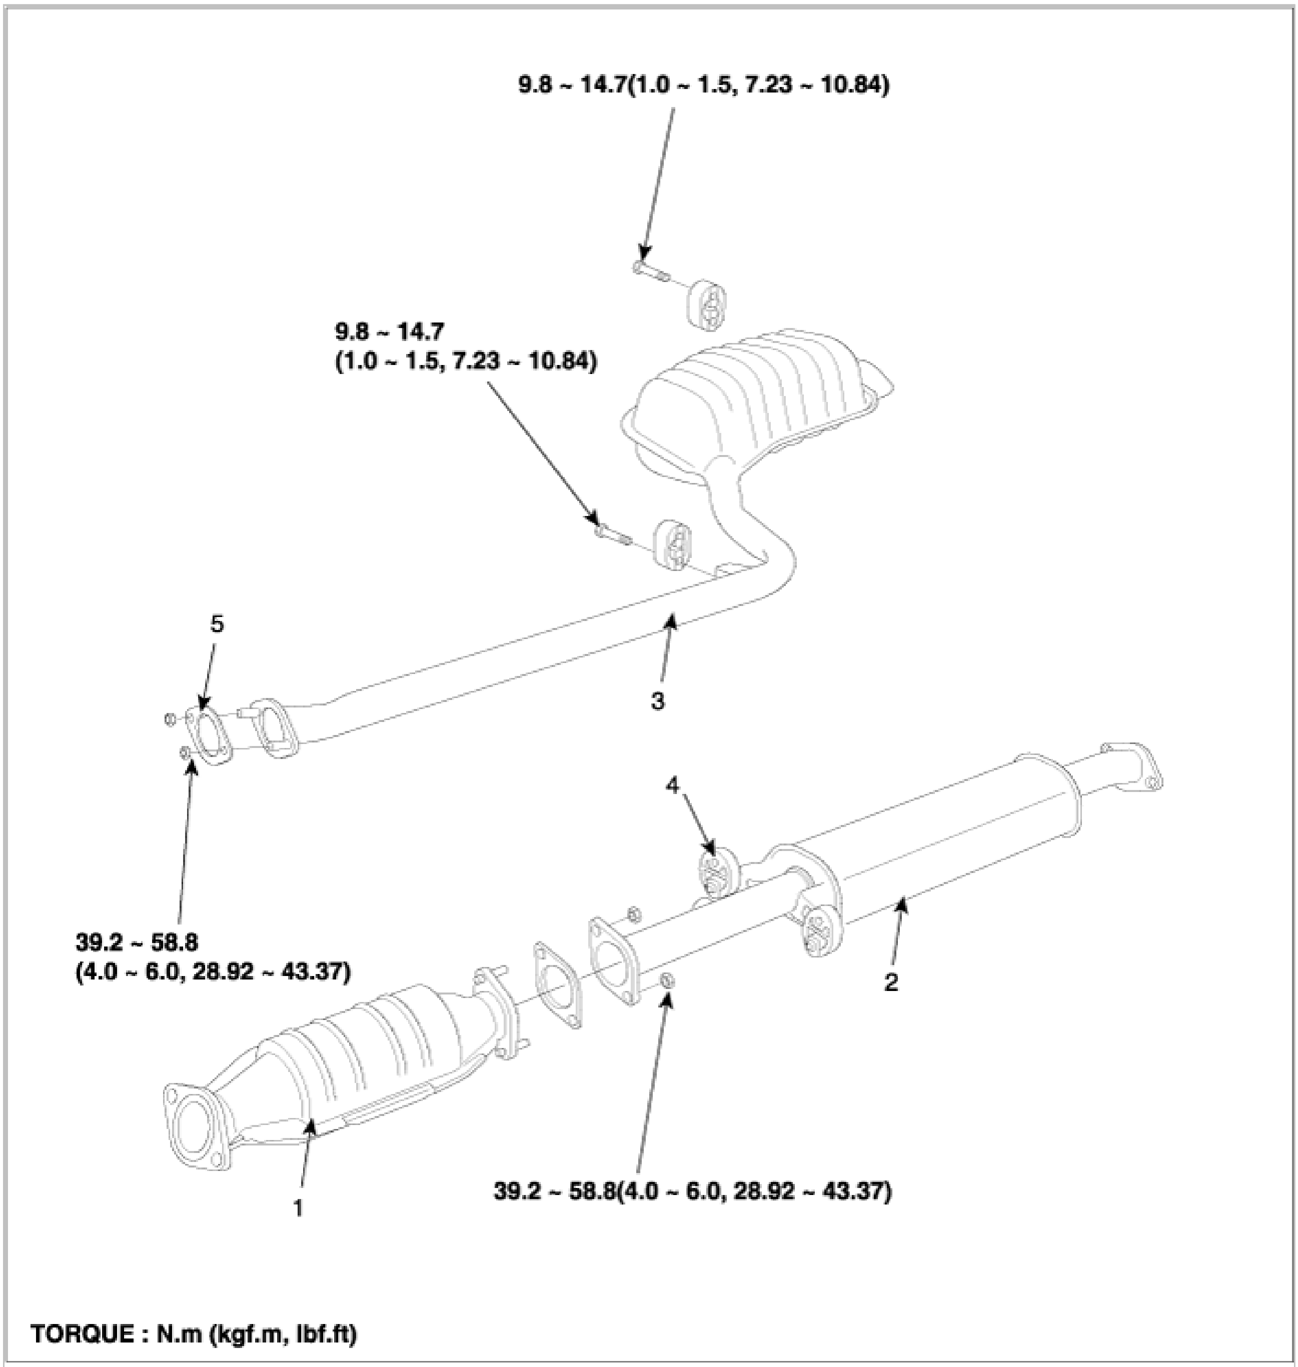
EXHAUST MANIFOLD



TORQUE : Nm (kgf.m, lbf.ft)

1. Exhaust manifold gasket
2. Exhaust manifold
3. Heat protector

MUFFLER



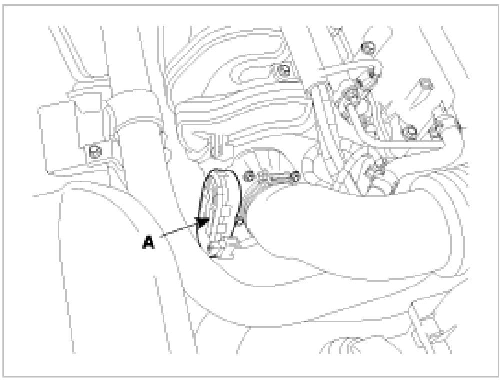
1. Catalytic converter
2. Center muffler
3. Main muffler
4. Rnbber hanger
5. Gasket

Engine Mechanical System > Intake And Exhaust System > Repair procedures

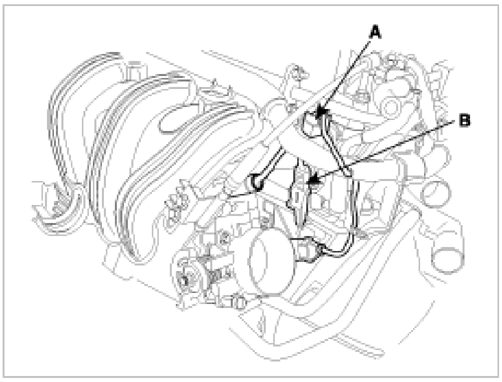
REMOVAL

INTAKE MANIFOLD

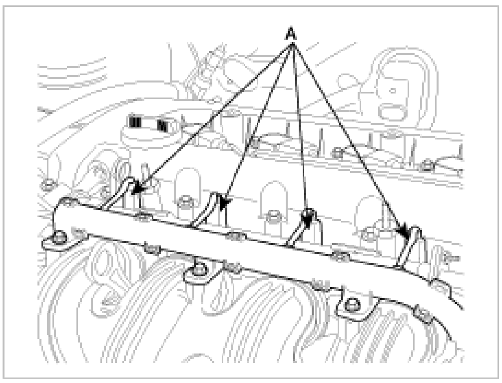
1. Remove the engine cover.
2. Disconnect ETS connector(A)



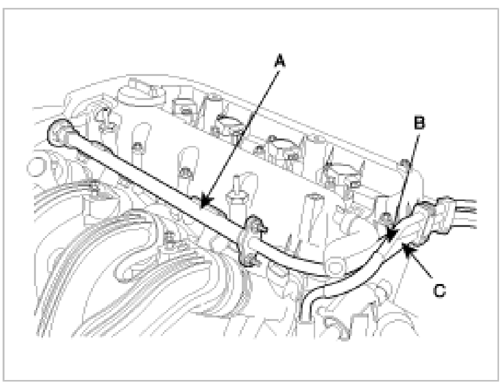
3. Disconnect CMP connector(A), and knock sensor connector(B).



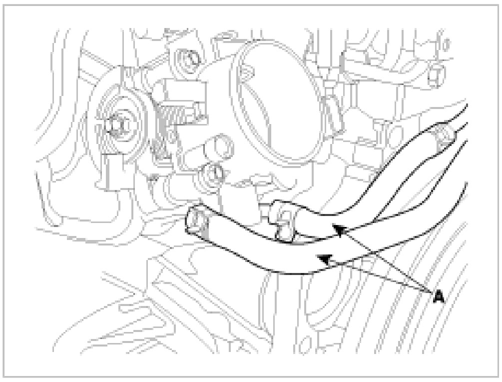
4. Disconnect injector connector(A).



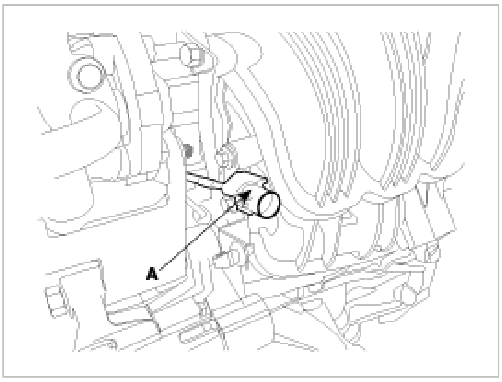
5. Remove the delivery pipe(A), brake vacuum hose(B), and PCSV hose(C).



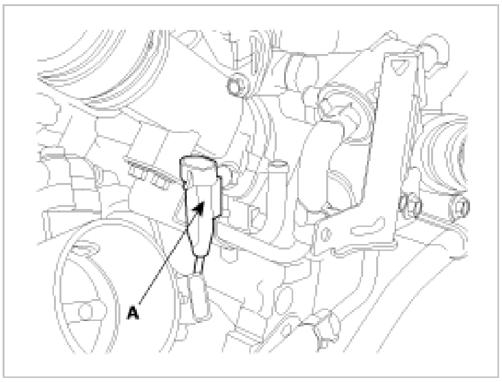
6. Remove coolant hose(A) from throttle body.



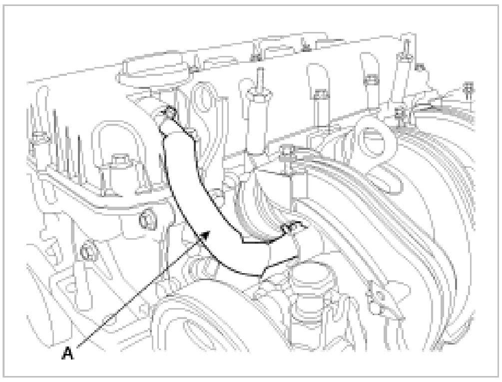
7. Remove oil pressure switch connector(A) from bracket.



8. Remove knock sensor connector(A) from bracket.

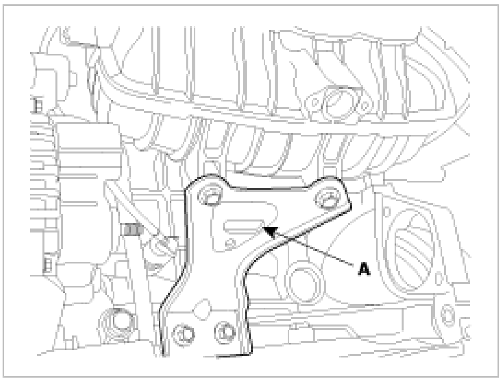


9. Remove PCV hose(A).

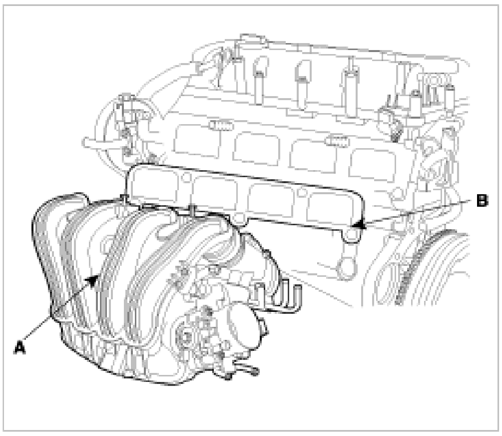


10. Remove oil level gauge.

11. Remove intake manifold stay(A).

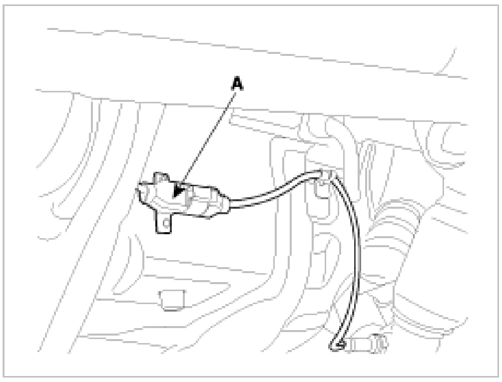


12. Remove intake manifold(A) and gasket(B).

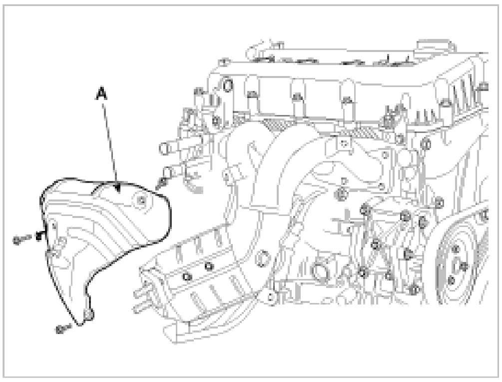


Exhaust manifold

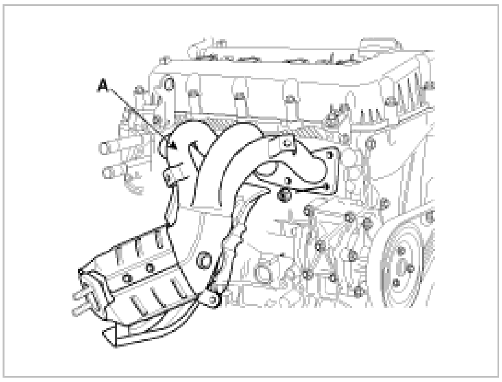
1. Remove the oxygen sensor connector.



2. Remove the front muffler.
3. Remove the heat protector(A).



4. Remove exhaust manifold stay bolt.
5. Remove exhaust manifold(A) and gasket.



INSTALLATION

EXHAUST MANIFOLD

1. Install new gasket and exhaust manifold.

Tightening torque
39.2 ~ 44.1N.m(4.0 ~ 4.5kgf.m, 28.92 ~ 32.53lbf.ft)

2. Install exhaust manifold stay bolt.

Tightening torque
51.94 ~ 57.82N.m(5.4 ~ 5.9kgf.m, 38.3 ~ 42.6lbf.ft)

3. Install heat protector.

Tightening torque
18.6 ~ 27.44N.m(1.9 ~ 2.8kgf.m, 13.7 ~ 20.2lbf.ft)

4. Install front muffler.

Tightening torque
39.2 ~ 58.8N.m(4.0 ~ 6.0kgf.m, 28.92 ~ 43.37lbf.ft)

5. Connect oxygen sensor connector.

INTAKE MANIFOLD

1. Install intake manifold.

Tightening torque
18.62 ~ 27.44N.m(1.9 ~ 2.8kgf.m, 13.7 ~ 20.2lbf.ft)

2. Install intake manifold stay.

Tightening torque
18.6 ~ 27.44N.m(1.9 ~ 2.8kgf.m, 13.7 ~ 20.2lbf.ft)

3. Install oil level gauge
4. Install PCV hose
5. Install air cleaner assembly.
6. Install engine cover.

Fuel System > General Information > Special Service Tools

SPECIAL SERVICE TOOLS

Tool (Number and name)	Illustration	Application
09353-24100 Fuel Pressure Gauge		Measuring the fuel line pressure
09353-38000 Fuel Pressure Gauge Adapter		Connection between the delivery pipe and fuel feed line
09353-24000 Fuel Pressure Gauge Connector		Connection between Fuel Pressure Gauge (09353-24100) and Fuel Pressure Gauge Adapter (09353-38000)
09310-3K000 Fuel Pump Locking Ring Wrench		Removing the fuel Pump assembly

Fuel System > General Information > Troubleshooting

BASIC TROUBLESHOOTING

BASIC TROUBLESHOOTING GUIDE

1	**Bring Vehicle to Workshop**

2	**Analyze Customer's Problem**
•	Ask the customer about the conditions and environment relative to the issue (Use CUSTOMER PROBLEM ANALYSIS SHEET).

3	**Verify Symptom, and then Check DTC and Freeze Frame Data**
•	Connect Hi-Scan (Pro) to Diagnostic Link Connector (DLC).
•	Record the DTC and freeze frame data.
	NOTE *To erase DTC and freeze frame data, refer to Step 5.*

4	**Confirm the Inspection Procedure for the System or Part**
•	Using the SYMPTOM TROUBLESHOOTING GUIDE CHART, choose the correct inspection procedure for the system or part to be checked.

5	**Erase the DTC and Freeze Frame Data**
	WARNING **NEVER erase DTC and freeze frame data before completing Step 2 MIL/DTC in "CUSTOMER PROBLEM ANALYSIS SHEET".**

6	**Inspect Vehicle Visually**
•	Go to Step 11, if you recognize the problem.

7	**Recreate (Simulate) Symptoms of the DTC**
•	Try to recreate or simulate the symptoms and conditions of the malfunction as described by customer.
•	If DTC(s) is/are displayed, simulate the condition according to troubleshooting procedure for the DTC.

8	**Confirm Symptoms of Problem**
•	If DTC(s) is/are not displayed, go to Step 9.
•	If DTC(s) is/are displayed, go to Step 11.

9	**Recreate (Simulate) Symptom**
•	Try to recreate or simulate the condition of the malfunction as described by the customer.

10	**Check the DTC**
•	If DTC(s) does(do) not occur, refer to INTERMITTENT PROBLEM PROCEDURE in BASIC INSPECTION PROCEDURE.
•	If DTC(s) occur(s), go to Step 11.

11	**Perform troubleshooting procedure for DTC**

12	**Adjust or repair the vehicle**

13	**Confirmation test**

14	**END**

CUSTOMER PROBLEM ANALYSIS SHEET

1. VEHICLE INFORMATION

(I) VIN:
(II) Production Date:
(III) Odometer Reading: (miles)

2. SYMPTOMS

□ Unable to start	□ Engine does not turn over □ Incomplete combustion □ Initial combustion does not occur
□ Difficult to start	□ Engine turns over slowly □ Other_________________
□ Poor idling	□ Rough idling □ Incorrect idling □ Unstable idling (High: ______ rpm, Low: ______rpm)

	□ Other ____________________________
□ Engine stall	□ Soon after starting □ After accelerator pedal depressed □ After accelerator pedal released □ During A/C ON □ Shifting from N to D-range □ Other ______________________________________
□ Others	□ Poor driving (Surge) □ Knocking □ Poor fuel economy □ Back fire □ After fire □ Other _______________________

3. ENVIRONMENT

Problem frequency	□ Constant □ Sometimes (______________) □ Once only □ Other ___________________________________
Weather	□ Fine □ Cloudy □ Rainy □ Snowy □ Other _______________
Outdoor temperature	Approx. _____ °C/°F
Place	□ Highway □ Suburbs □ Inner City □ Uphill □ Downhill □ Rough road □ Other ____________________________
Engine temperature	□ Cold □ Warming up □ After warming up □ Any temperature
Engine operation	□ Starting □ Just after starting (____ min) □ Idling □ Racing □ Driving □ Constant speed □ Acceleration □ Deceleration □ A/C switch ON/OFF □ Other _________________________

4. MIL/DTC

MIL (Malfunction Indicator Lamp)		□ Remains ON □ Sometimes lights up □ Does not light
DTC	Normal check (Pre-check)	□ Normal □ DTC (________________________________) □ Freeze Frame Data
	Check mode	□ Normal □ DTC (________________________________) □ Freeze Frame Data

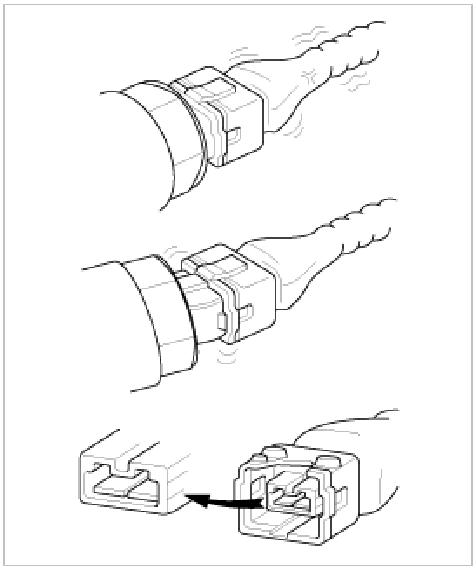
BASIC INSPECTION PROCEDURE

The measured resistance at high temperature after vehicle running may be high or low. So all resistance must be measured at ambient temperature (20°C, 68°F), unless there is any notice.

> **NOTE**
>
> The measured resistance in except for ambient temperature (20°C, 68°F) is reference value.

Sometimes the most difficult case in troubleshooting is when a problem symptom occurs but does not occur again during testing. An example would be if a problem appears only when the vehicle is cold but has not appeared when warm. In this case, the technician should thoroughly make out a "CUSTOMER PROBLEM ANALYSIS SHEET" and recreate (simulate) the environment and condition which occurred when the vehicle was having the issue.

1. Clear Diagnostic Trouble Code (DTC).
2. Inspect connector connection, and check terminal for poor connections, loose wires, bent, broken or corroded pins, and then verify that the connectors are always securely fastened.



3. Slightly shake the connector and wiring harness vertically and horizontally.
4. Repair or replace the component that has a problem.
5. Verify that the problem has disappeared with the road test.

● SIMULATING VIBRATION

1) Sensors and Actuators
 : Slightly vibrate sensors, actuators or relays with finger.

WARNING
Strong vibration may break sensors, actuators or relays

2) Connectors and Harness
 : Lightly shake the connector and wiring harness vertically and then horizontally.

● SIMULATING HEAT

1) Heat components suspected of causing the malfunction with a hair dryer or other heat sourre.

WARNING
• DO NOT heat components to the point where they may be damaged. • DO NOT heat the ECM directly.

● SIMULATING WATER SPRINKLING

1) Sprinkle water onto vehicle to simulate a rainy day or a high humidity condition.

WARNING
DO NOT sprinkle water directly into the engine compartment or electronic components.

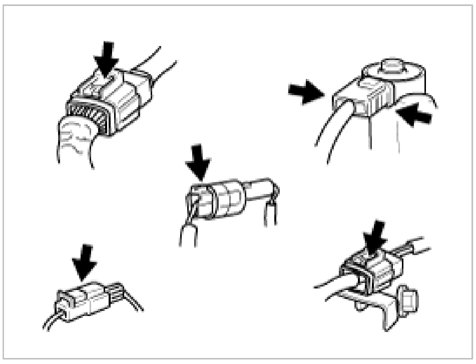
● SIMULATING ELECTRICAL LOAD

1) Turn on all electrical systems to simulate excessive electrical loads (Radios, fans, lights, etc.).

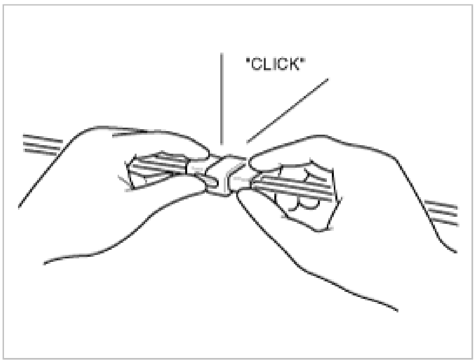
CONNECTOR INSPECTION PROCEDURE

1. Handling of Connector
   A. Never pull on the wiring harness when disconnecting connectors.

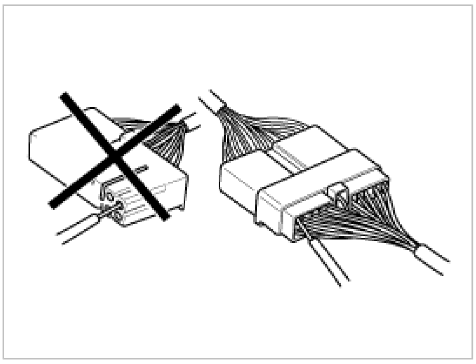
   B. When removing the connector with a lock, press or pull locking lever.



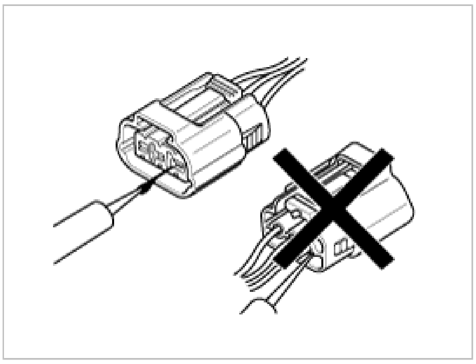
C. Listen for a click when locking connectors. This sound indicates that they are securely locked.



D. When a tester is used to check for continuity, or to measure voltage, always insert tester probe from wire harness side.



E. Check waterproof connector terminals from the connector side. Waterproof connectors cannot be accessed from harness side.



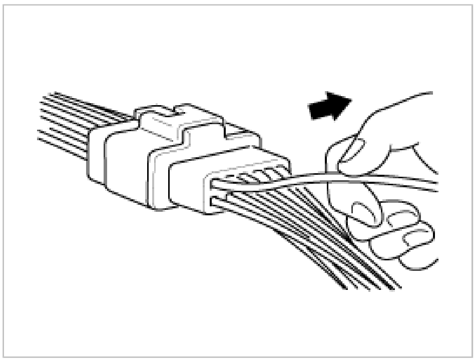
NOTE

- Use a fine wire to prevent damage to the terminal.
- Do not damage the terminal when inserting the tester lead.

2. Checking Point for Connector
   A. While the connector is connected:
      Hold the connector, check connecting condition and locking efficiency.
   B. When the connector is disconnected:
      Check missed terminal, crimped terminal or broken core wire by slightly pulling the wire harness.
      Visually check for rust, contamination, deformation and bend.

C. Check terminal tightening condition:
Insert a spare male terminal into a female terminal, and then check terminal tightening conditions.

D. Pull lightly on individual wires to ensure that each wire is secured in the terminal.



3. Repair Method of Connector Terminal
    A. Clean the contact points using air gun and/or shop rag.

    > NOTE
    > Never use sand paper when polishing the contact points, otherwise the contact point may be damaged.

    B. In case of abnormal contact pressure, replace the female terminal.

WIRE HARNESS INSPECTION PROCEDURE

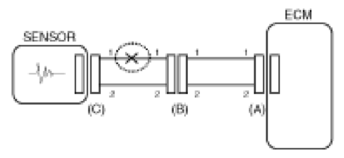
1. Before removing the wire harness, check the wire harness position and crimping in order to restore it correctly.
2. Check whether the wire harness is twisted, pulled or loosened.
3. Check whether the temperature of the wire harness is abnormally high.
4. Check whether the wire harness is rotating, moving or vibrating against the sharp edge of a part.
5. Check the connection between the wire harness and any installed part.
6. If the covering of wire harness is damaged; secure, repair or replace the harness.

ELECTRICAL CIRCUIT INSPECTION PROCEDURE

1. Procedures for Open Circuit
    A. Continuity Check
    B. Voltage Check

    If an open circuit occurs (as seen in [FIG. 1]), it can be found by performing Step 2 (Continuity Check Method) or Step 3 (Voltage Check Method) as shown below.

FIG 1



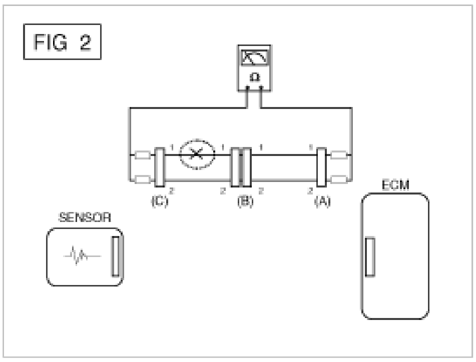
2. Continuity Check Method

    > NOTE
    > When measuring for resistance, lightly shake the wire harness above and below or from side to side.

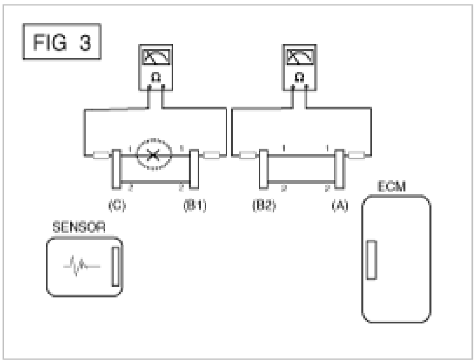
Specification (Resistance)
1Ω or less → Normal Circuit
1MΩ or Higher → Open Circuit

A. Disconnect connectors (A), (C) and measure resistance between connector (A) and (C) as shown in [FIG. 2].
In [FIG.2.] the measured resistance of line 1 and 2 is higher than 1MΩ and below 1 Ω respectively. Specifically the open

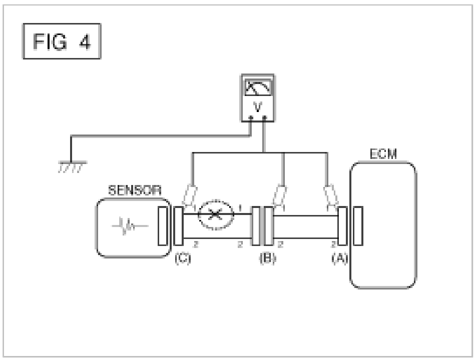
circuit is line 1 (Line 2 is normal). To find exact break point, check sub line of line 1 as described in next step.



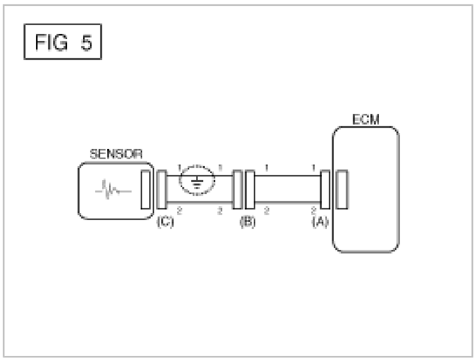
B. Disconnect connector (B), and measure for resistance between connector (C) and (B1) and between (B2) and (A) as shown in [FIG. 3].
In this case the measured resistance between connector (C) and (B1) is higher than 1MΩ and the open circuit is between terminal 1 of connector (C) and terminal 1 of connector (B1).



3. Voltage Check Method
   A. With each connector still connected, measure the voltage between the chassis ground and terminal 1 of each connectors (A), (B) and (C) as shown in [FIG. 4].
   The measured voltage of each connector is 5V, 5V and 0V respectively. So the open circuit is between connector (C) and (B).



4. Test Method for Short to Ground Circuit
   A. Continuity Check with Chassis Ground
   If short to ground circuit occurs as shown in [FIG. 5], the broken point can be found by performing below Step 2 (Continuity Check Method with Chassis Ground) as shown below.



5. Continuity Check Method (with Chassis Ground)

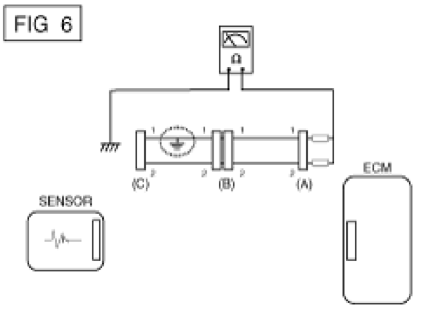
NOTE

Lightly shake the wire harness above and below, or from side to side when measuring the resistance.

Specification (Resistance)
1Ω or less → Short to Ground Circuit
1MΩ or Higher → Normal Circuit

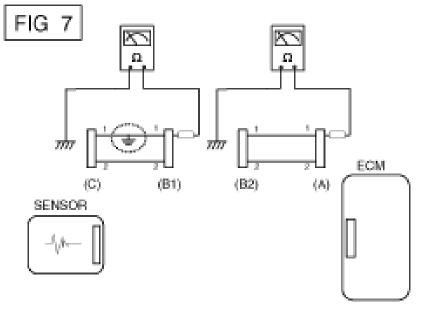
A. Disconnect connectors (A), (C) and measure for resistance between connector (A) and Chassis Ground as shown in [FIG. 6].
   The measured resistance of line 1 and 2 in this example is below 1 Ω and higher than 1MΩ respectively. Specifically the short to ground circuit is line 1 (Line 2 is normal). To find exact broken point, check the sub line of line 1 as described in the following step.

FIG 6



B. Disconnect connector (B), and measure the resistance between connector (A) and chassis ground, and between (B1) and chassis ground as shown in [FIG. 7].
   The measured resistance between connector (B1) and chassis ground is 1Ω or less. The short to ground circuit is between terminal 1 of connector (C) and terminal 1 of connector (B1).

FIG 7



SYMPTOM TROUBLESHOOTING GUIDE CHART

MAIN SYMPTOM	DIAGNOSTIC PROCEDURE	ALSO CHECK FOR
Unable to start (Engine does not turn over)	1. Test the battery 2. Test the starter 3. Inhibitor switch (A/T) or clutch start switch (M/T)	
Unable to start (Incomplete combustion)	1. Test the battery 2. Check the fuel pressure 3. Check the ignition circuit 4. Troubleshooting the immobilizer system (In case of immobilizer lamp ON)	• DTC • Low compression • Intake air leaks • Slipped or broken timing belt • Contaminated fuel
Difficult to start	1. Test the battery 2. Check the fuel pressure 3. Check the ECT sensor and circuit (Check DTC) 4. Check the ignition circuit	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
	1. Check the fuel pressure 2. Check the Injector	• DTC

Poor idling (Rough, unstable or incorrect Idle)	3. Check the long term fuel trim and short term fuel trim (Refer to CUSTOMER DATASTREAM) 4. Check the idle speed control circuit (Check DTC) 5. Inspect and test the Throttle Body 6. Check the ECT sensor and circuit (Check DTC)	• Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Engine stall	1. Test the Battery 2. Check the fuel pressure 3. Check the idle speed control circuit (Check DTC) 4. Check the ignition circuit 5. Check the CKPS Circuit (Check DTC)	• DTC • Intake air leaks • Contaminated fuel • Weak ignition spark
Poor driving (Surge)	1. Check the fuel pressure 2. Inspect and test Throttle Body 3. Check the ignition circuit 4. Check the ECT Sensor and Circuit (Check DTC) 5. Test the exhaust system for a possible restriction 6. Check the long term fuel trim and short term fuel trim (Refer to CUSTOMER DATASTREAM)	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Knocking	1. Check the fuel pressure 2. Inspect the engine coolant 3. Inspect the radiator and the electric cooling fan 4. Check the spark plugs	• DTC • Contaminated fuel
Poor fuel economy	1. Check customer's driving habits • Is A/C on full time or the defroster mode on? • Are tires at correct pressure? • Is excessively heavy load being carried? • Is acceleration too much, too often? 2. Check the fuel pressure 3. Check the injector 4. Test the exhaust system for a possible restriction 5. Check the ECT sensor and circuit	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Hard to refuel (Overflow during refueling)	1. Test the canister close valve 2. Inspect the fuel filler hose/pipe • Pinched, kinked or blocked? • Filler hose is torn 3. Inspect the fuel tank vapor vent hose between the EVAP. canister and air filter 4. Check the EVAP. canister	• Malfunctioning gas station filling nozzle (If this problem occurs at a specific gas station during refueling)

20.0kPa	0.79V
46.66kPa	1.84V
101.32kPa	4.00V

ENGINE COOLANT TEMPERATURE SENSOR (ECTS)
▷ Type: Thermistor type
▷ Specification

Temperature		Resistance (kΩ)
°C	°F	
-40	-40	48.14kΩ
-20	-4	14.13 ~ 16.83kΩ
0	32	5.79kΩ
20	68	2.31 ~ 2.59kΩ

40	104	1.15kΩ
60	140	0.59kΩ
80	176	0.32kΩ

THROTTLE POSITION SENSOR (TPS)
▷ Type: Variable resistor type
▷ Specification (When reference voltage = 5.0V)

Throttle Angle (°)	Output Voltage(V)	
	TPS1	TPS2
0°	0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0V

Item	Sensor Resistance (kΩ)
TPS1	4.0 ~ 6.0kΩ at 20°C (68°F)
TPS2	2.72 ~ 4.08kΩ at 20°C (68°F)

ACCELERATOR POSITION SENSOR (APS)
▷ Type: Variable resistor type
▷ Specification (When reference voltage = 5.0V)

Accelerator Position	Output Voltage (V)	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.29 ~ 0.46V
W.O.T	3.85 ~ 4.35V	1.93 ~ 2.18V

Item	Sensor Resistance (kΩ)
APS1	0.7 ~ 1.3kΩ at 20°C (68°F)
APS2	1.4 ~ 2.6kΩ at 20°C (68°F)

HEATED OXYGEN SENSOR (HO2S)
▷ Type: Zirconia (ZrO_2) type
▷ Specification

A/F Ratio	Output Voltage (V)
RICH	0.75 ~ 1.00V
LEAN	0 ~ 0.12V

Item	Resistance (Ω)
Sensor Heater	8.1 ~ 11.1Ω at 21°C (69.8°F)

CAMSHAFT POSITION SENSOR (CMPS)
▷ Type: Hall effect type

▷ Specification

Item	Specification
Output Voltage (V)	High: 5.0V
	Low: 0.7V
Air Gap (mm)	0.5 ~ 1.5mm

CRANKSHAFT POSITION SENSOR (CKPS)
▷ Type: Magnetic field sensitive type
▷ Specification

Item	Specification
Coil Resistance (Ω)	630 ~ 770Ω at 20°C (68°F)
Air Gap (mm)	0.5 ~ 1.5mm

KNOCK SENSOR (KS)

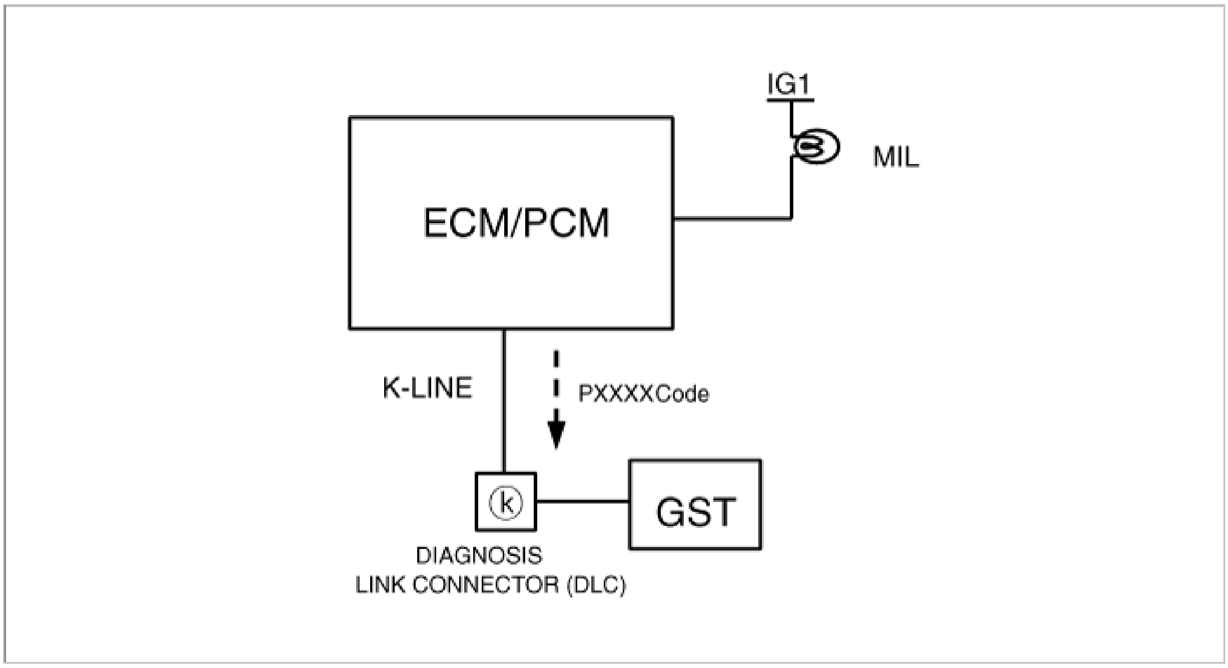
Fuel System > Engine Control System > Description and Operation

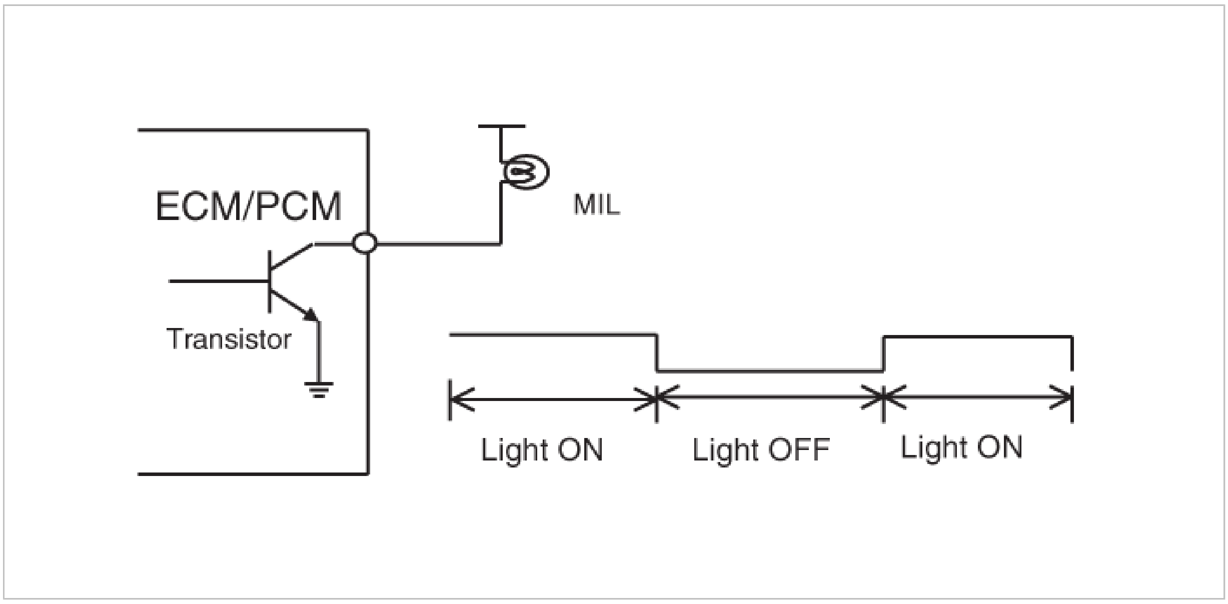
OBD-II REVIEW

1. OVERVIEW

The California Air Resources Board (CARB) began regulation of On Board Diagnostics (OBD) for vehicles sold in california beginning with the 1988 model year. The first phase, OBD-I, required monitoring of the fuel metering system, Exhust Gas Recirculation (EGR) system and additional emission related components. The Malfunction Indicator Lamp (MIL) was required to light and alert the driver of the fault and the need for repair of the emission control system. Associated with the MIL was a fault code or Diagnostic Trouble Code (DTC) idenfying the specific area of the fault.
The OBD system was proposed by CARB to improve air quality by identifying vehicle exceeding emission standards. Passage of the Federal Clean Air Act Amendments in 1990 has also prompted the Environmental Protection Agency (EPA) to develop On Board Diagnostic requirements. CARB OBD-II regulations were followed until 1999 when the federal regulations were used.
The OBD-II system meets government regulations by monitoring the emission control system. When a system or component exceeds emission threshold or a component operates outside tolerance, a DTC will be stored and the MIL illuminated.
The diagnostic executive is a computer program in the Engine Control Module (ECM) or PowertrainControl Module (PCM) that coordinates the OBD-II self-monitoring system. This program controls all the monitors and interactions, DTC and MIL operation, freeze frame data and scan tool interface.
Freeze frame data describes stored engine conditions, such as state of the engine, state of fuel control, spark, RPM, load and warm status at the point the first fault is detected. Previously stored conditions will be replaced only if a fuel or misfire fault is detected. This data is accessible with the scan tool to assist in repairing the vehicle.
The center of the OBD-II system is a microprocessor called the Engine Control Module (ECM) or Powertrain Control Module (PCM).
The ECM or PCM receives input from sensors and other electronic components (switches, relays, and others) based on information received and programmed into its memory (keep alive random access memory, and others), the ECM or PCM generates output signals to control various relays, solenoids and actuators.

2. CONFIGURATION OF HARDWARE AND RELATED TERMS





The Malfunction Indicator Lamp (MIL) is connected between ECM or PCM-terminal Malfunction Indicator Lamp and battery supply (open collector amplifier).
In most cars, the MIL will be installed in the instrument panel. The lamp amplifier can not be damaged by a short circuit.
Lamps with a power dissipation much greater than total dissipation of the MIL and lamp in the tester may cause a fault indication.
▹ At ignition ON and engine revolution (RPM)< MIN. RPM, the MIL is switched ON for an optical check by the driver.
When the ECM or PCM detects a malfunction related emission during the first driving cycle, the DTC and engine data are stored in the freeze frame memory. The MIL is illuminated only when the ECM or PCM detects the same malfunction related the DTC in two consecutive driving cycles.
● Misfire and Fuel System Malfunctions:
For misfire or fuel system malfunctions, the MIL may be eliminated if the same fault does not reoccur during monitoring in three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first detected.
● All Other Malfunctions:
For all other faults, the MIL may be extinguished after three subsequent sequential driving cycles during which the monitoring system responsible for illuminating the MIL functions without detecting the malfunction and if no other malfunction has been identified that would independently illuminate the MIL according to the requirements outlined above.
The diagnostic system may erase a fault code if the same fault is not re-registered in at least 40 engine warm-up cycles, and the MIL is not illuminated for that fault code.

- Bidirectional line
- K-Line is defined as the line which provides information in a serial digital form from ECM or PCM to the diagnostic tester. K-Line is used bidirectionally, in which case it may carry commands or data from the diagnostic tester to the ECM or PCM. K-Line is also used to initialize the serial communication.

A driving cycle consists of engine start up, and engine shut off.

A warm-up cycle means sufficient vehicle operation such that the engine coolant temperature has risen by at least 40 degrees Fahrenheit from engine starting and reaches a minimum has risen by at least 40 degrees Fahrenheit from engine starting and reaches a minimum temperature of at least 160 degrees Fahrenheit.
A trip means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system except catalyst efficiency or evaporative system monitoring when a steady-speed check is used, subject to the limitation that the manufacturer-defined trip monitoring conditions shall all be encountered at least once during the first engine start portion of the applicable FTP cycle.

- Diagnostic Trouble Code (SAE J2012)
- DTCs used in OBD-II vehicles will begin with a letter and are followed by four numbers.

The letter of the beginning of the DTC identifies the function of the monitored device that has failed. A "P" indicates a powertrain device, "C" indicates a chassis device. "B" is for body device and "U" indicates a network or data link code. The first number indicates if the code is generic (common to all manufacturers) or if it is manufacturer specific. A "0" & "2" indicates generic, "1" indicates manufacturer-specific. The second number indicates the system that is affected with a number between 1 and 7.
The following is a list showing what numbers are assigned to each system.

1) Fuel and air metering
2) Fuel and air metering(injector circuit malfunction only)
3) Ignition system or misfire
4) Auxiliary emission controls
5) Vehicle speed controls and idle control system
6) Computer output circuits
7) Transmission

The last two numbers of the DTC indicates the component or section of the system where the fault is located.
When a freeze frame event is triggered by an emission related DTC, the ECM or PCM stores various vehicle information as it existed the moment the fault ocurred. The DTC number along with the engine data can be useful in aiding a technician in locating the cause of the fault. Once the data from the 1st driving cycle DTC ocurrence is stored in the freeze frame memory, it will remain there even when the fault ocurrs again (2nd driving cycle) and the MIL is illuminated.

- Freeze Frame List
  1) Calculated Load Value
  2) Engine RPM
  3) Fuel Trim
  4) Fuel Pressure (if available)
  5) Vehicle Speed (if available)
  6) Coolant Temperature
  7) Intake Manifold Pressure (if available)
  8) Closed-or Open-loop operation
  9) Fault code

3. OBD-II SYSTEM READINESS TESTS

The catalyst efficiency monitor is a self-test strategy within the ECM or PCM that uses the downstream Heated Oxygen Sensor (HO2S) to determine when a catalyst has fallen below the minimum level of effectiveness in its ability to control exhaust emission.
Misfire is defined as the lack of proper combustion in the cylinder due to the absence of spark, poor fuel metering, or poor compression. Any combustion that does not occur within the cylinder at the proper time is also a misfire. The misfire detection monitor detects fuel, ignition or mechanically induced misfires. The intent is to protect the catalyst from permanent damage and to alert the customer of an emission failure or an inspection maintenance failure by illuminating the MIL . When a misfire is detected, special software called freeze frame data is enabled. The freeze frame data captures the operational state of the vehicle when a fault is detected from misfire detection monitor strategy.
The fuel system monitor is a self-test strategy within the ECM or PCM that monitors the adaptive fuel table The fuel control system uses the adaptive fuel table to compensate for normal variability of the fuel system components caused by wear or aging. During normal vehicle operation, if the fuel system appears biased lean or rich, the adaptive value table will shift the fuel delivery calculations to remove bias.
The cooling system monitoring is a self-test strategy within the ECM or PCM that monitors ECTS (Engine Coolant Temperature Sensor) and thermostat about circuit continuity, output range, rationality faults.
OBD-II regulations require monitoring of the upstream Heated O2 Sensor (H2OS) to detect if the deterioration of the sensor has exceeded thresholds. An additional HO2S is located downstream of the Warm-Up Three Way Catalytic Converter (WU-TWC) to determine the efficiency of the catalyst.
Although the downstream H2OS is similar to the type used for fuel control, it functions differently. The downstream HO2S is monitored to determine if a voltage is generated. That voltage is compared to a calibrated acceptable range.
The EVAP. monitoring is a self-test strategy within the ECM or PCM that tests the integrity of the EVAP. system. The complete evaporative system detects a leak or leaks that cumulatively are greater than or equal to a leak caused by a 0.040 inch and 0.020 inch diameter orifice.
The A/C system monitoring is a self-test strategy within the ECM or PCM that monitors malfunction of all A/C system component at A/C ON.
The comprehensive components monitoring is a self-test strategy within the ECM or PCM that detects fault of any electronic powertrain components or system that provides input to the ECM or PCM and is not exclusively an input to any other OBD-II

monitor.

Fuel System > Engine Control System > Power train Control Module (PCM) > Repair procedures

PCM PROBLEM INSPECTION PROCEDURE

1. TEST PCM GROUND CIRCUIT: Measure resistance between PCM and chassis ground using the backside of PCM harness connector as PCM side check point. If the problem is found, repair it.

   Specification (Resistance): 1Ω or less

2. TEST PCM CONNECTOR: Disconnect the PCM connector and visually check the ground terminals on PCM side and harness side for bent pins or poor contact pressure. If the problem is found, repair it.
3. If problem is not found in Step 1 and 2, the PCM could be faulty. If so, replace the PCM with a new one, and then check the vehicle again. If the vehicle operates normally then the problem was likely with the PCM.
4. RE-TEST THE ORIGINAL PCM : Install the original PCM (may be broken) into a known-good vehicle and check the vehicle. If the problem occurs again, replace the original PCM with a new one. If problem does not occur, this is intermittent problem (Refer to INTERMITTENT PROBLEM PROCEDURE in BASIC INSPECTION PROCEDURE).

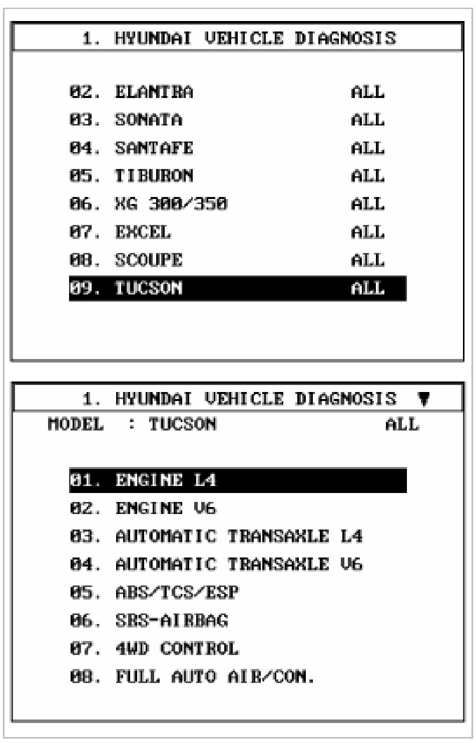
VIN PROGRAMMING PROCEDURE

VIN (Vehicle Identification Number) is a number that has the vehicle's information (Maker, Vehicle Type, Vehicle Line/Series, Body Type, Engine Type, Transmission Type, Model Year, Plant Location and so forth. For more information, please refer to the group "GI" in this SERVICE MANUAL). When replacing an PCM, the VIN must be programmed in the PCM. If there is no VIN in PCM memory, the fault code (DTC P0630) is set.

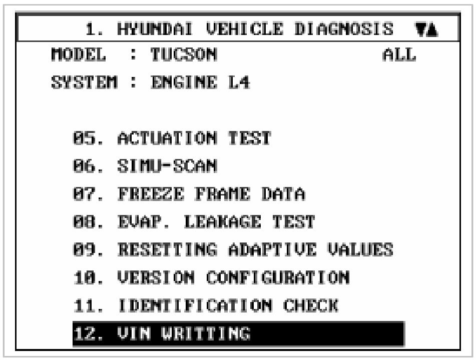
CAUTION

The programmed VIN cannot be changed. When writing the VIN, confirm the VIN carefully

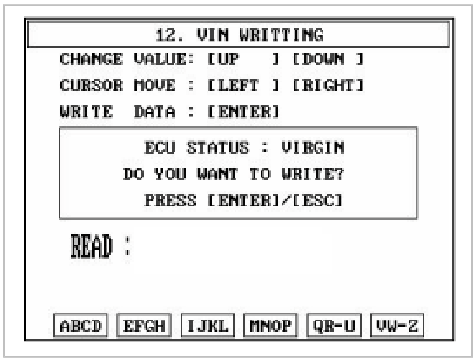
1. Select "Vehicle" and "Engine" (For example, TUCSON 2.0L L4).



2. Select "VIN WRITING".



3. Check the PCM status.



NOTE

- VIRGIN: VIN is not programmed
- LEARNT: VIN has been already programmed

Is the PCM status "VIRGIN"?

YES

▸ Go to next step 4.

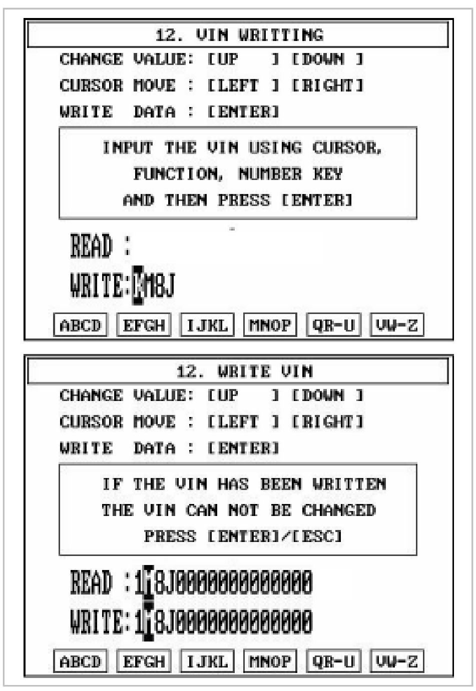
NO

▸ END

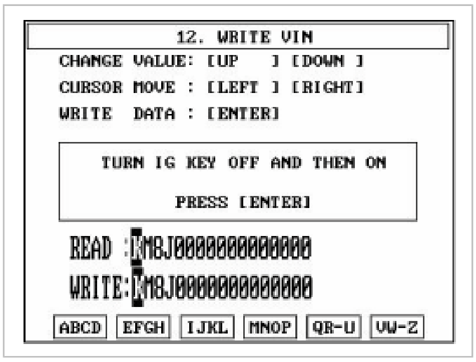
4. Write the VIN with cursor, function and number keys.

WARNING

Before pressing the "ENTER" key, confirm the VIN again because the programmed VIN cannot be changed.



5. After verifying the written VIN, press the "ENTER" key.
6. Turn the ignition switch OFF, and then turn ON.



7. Verify the programmed VIN in the PCM memory.

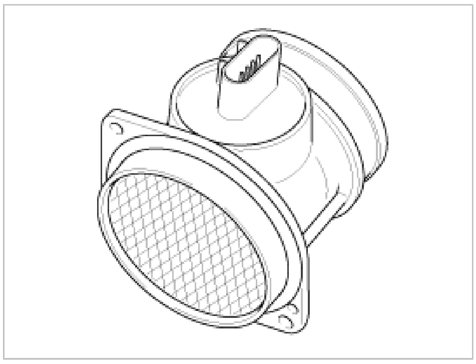
Fuel System > Engine Control System > Mass Air Flow Sensor (MAFS) > Description and Operation

DESCRIPTION

Mass Air Flow Sensor (MAFS) is a hot-film type sensor and is located in between the air cleaner and the throttle body. It consists of a tube, a sensor assembly and honey cell and detects intake air quantity flowing into the intake manifold. While the intake air coming out of the air cleaner flows by the honey cell, it becomes laminar flow, and then it passes the hot-film. At this time, heat transfer is generated by convection and this sensor loses its energy. This sensor detects the mass air flow by using the energy loss and transfers the information to the PCM by frequency. The PCM calculates fuel quantity and ignition timing.



SPECIFICATION

Air Flow (kg/h)	Output Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz
43.2 kg/h	4,024Hz
57.6 kg/h	4,399Hz
72.0 kg/h	4,704Hz
108.0 kg/h	5,329Hz
144.0 kg/h	5,897Hz
198.0 kg/h	6,553Hz
270.0 kg/h	7,240Hz

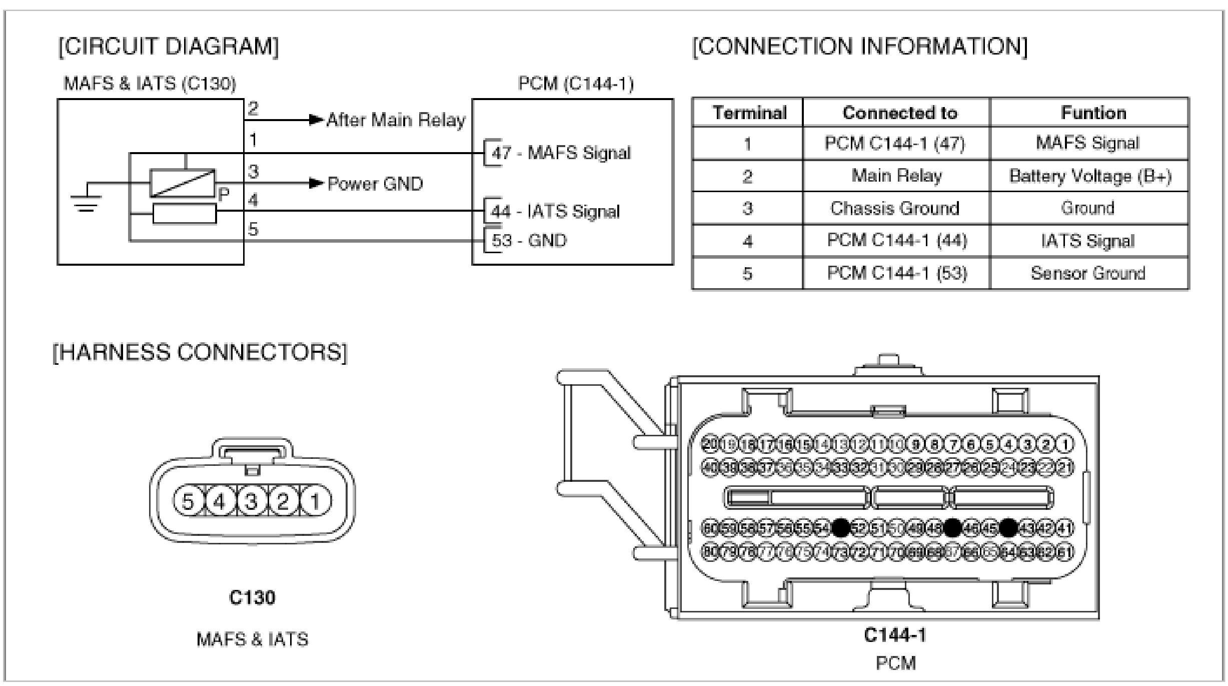
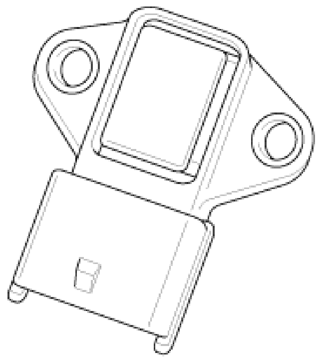
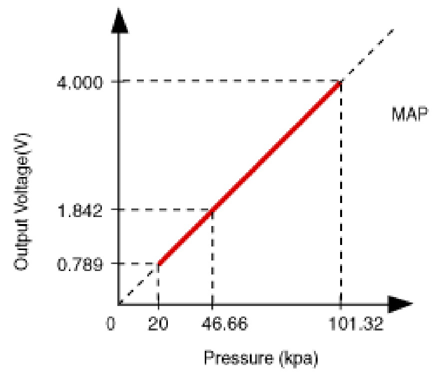
SCHEMATIC DIAGRAM



Fuel System > Engine Control System > Manifold Absolute Pressure Sensor (MAPS) > Description and Operation

DESCRIPTION

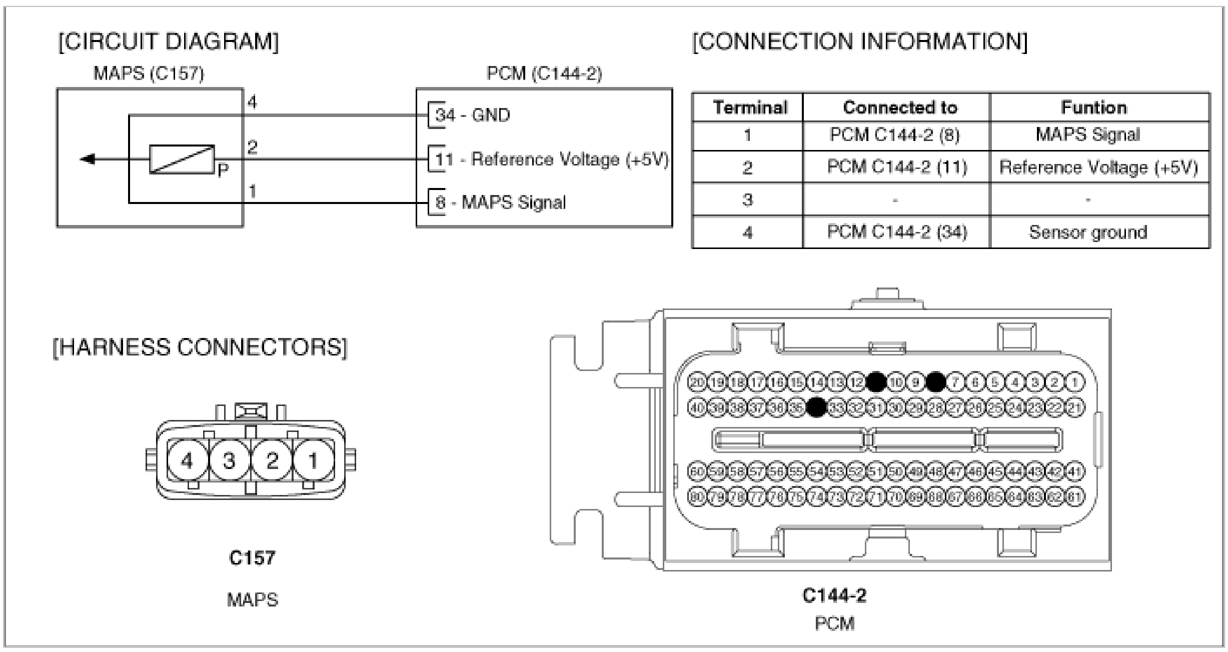




Manifold Absolute Pressure Sensor (MAPS) is speed-density type sensor and is installed on the surge tank. This MAPS senses absolute pressure in surge tank and transfers this analog signal proportional to the pressure to the PCM. The PCM calculates the intake air quantity and engine speed based on this signal. This MAPS consists of piezo-electric element and hybrid IC that amplifies the element output signal. The element is silicon diaphragm type and adapts pressure sensitive variable resistor effect of semi-conductor. 100% vacuum and the manifold pressure applies to both sides of it respectively. That is, this sensor outputs the silicon variation proportional to pressure change by voltage.

SPECIFICATION

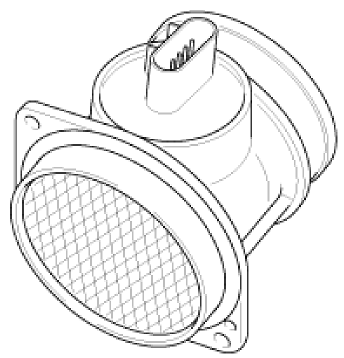
Pressure(kPa)	Output Voltage (V)
20.0kPa	0.79V
46.66kPa	1.84V
101.32kPa	4.00V

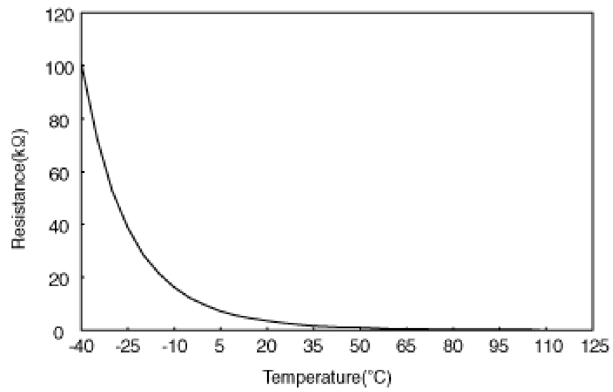


Terminal	Connected to	Funtion
1	PCM C144-2 (8)	MAPS Signal
2	PCM C144-2 (11)	Reference Voltage (+5V)
3	-	-
4	PCM C144-2 (34)	Sensor ground

Fuel System > Engine Control System > Intake Air Temperature Sensor (IATS) > Description and Operation

DESCRIPTION





Intake Air Temperature Sensor (IATS) is installed inside the Mass Air Flow Sensor (MAFS) and detects the intake air temperature. To calculate precise air quantity, correction of the air temperature is needed because air density varies according to the temperature. So the PCM uses not only MAFS signal but also IATS signal. This sensor has a Negative Temperature Coefficient (NTC) and its resistance is in inverse proportion to the temperature.

SPECIFICATION

Temperature		Resistance (kΩ)
°C	°F	
-40	-40	100.87kΩ
-20	-4	28.58kΩ
0	32	9.40kΩ
10	50	5.66kΩ
20	68	3.51kΩ
40	104	1.47kΩ

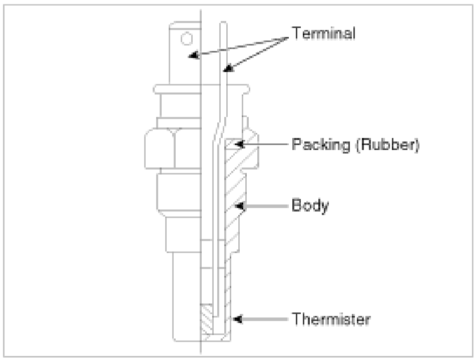
PCM

Fuel System > Engine Control System > Engine Coolant Temperature Sensor (ECTS) > Description and Operation

DESCRIPTION

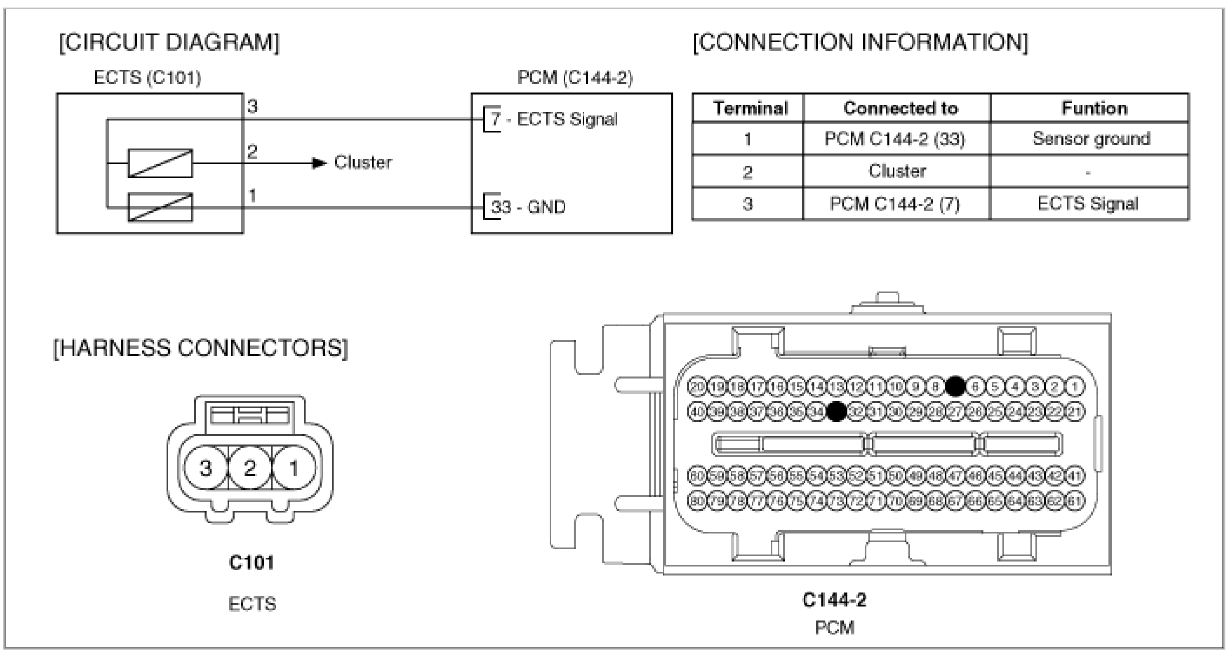
Engine Coolant Temperature Sensor (ECTS) is located in the engine coolant passage of the cylinder head for detecting the engine coolant temperature. The ECTS uses a thermistor whose resistance changes with the temperature. The electrical resistance of the ECTS decreases as the temperature increases, and increases as the temperature decreases. The reference 5 V in the PCM is supplied to the ECTS via a resistor in the PCM.That is, the resistor in the PCM and the thermistor in the ECTS are connected in series. When the resistance value of the thermistor in the ECTS changes according to the engine coolant temperature, the output voltage also changes. During cold engine operation the PCM increases the fuel injection duration and controls the ignition timing using the information of engine coolant temperature to avoid engine stalling and improve drivability.



SPECIFICATION

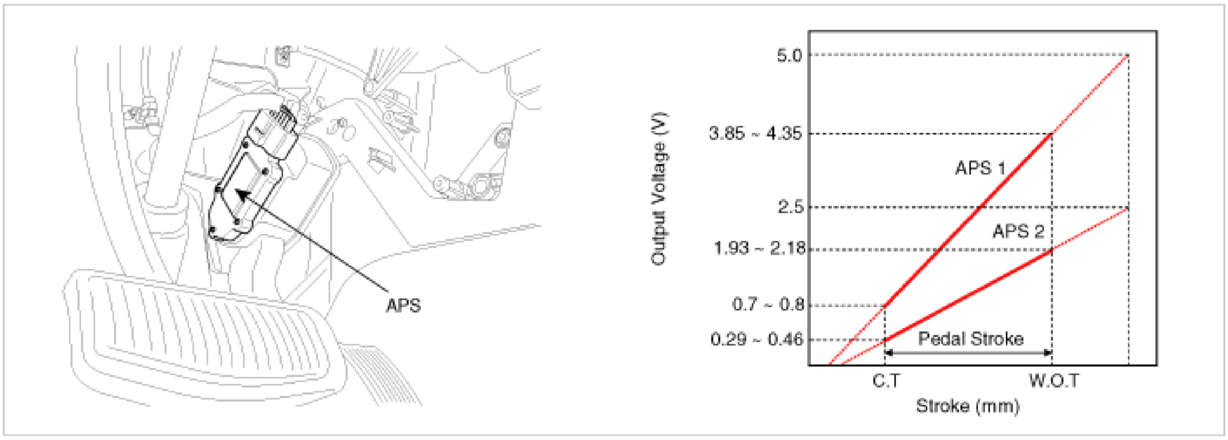
Temperature		Resistance(kΩ)
°C	°F	
-40	-40	48.14kΩ
-20	-4	14.13 ~ 16.83kΩ
0	32	5.79kΩ
20	68	2.31 ~ 2.59kΩ
40	104	1.15kΩ
60	140	0.59kΩ
80	176	0.32kΩ

SCHEMATIC DIAGRAM



Fuel System > Engine Control System > Accelerator Position Sensor (APS) > Description and Operation

DESCRIPTION



Accelerator Position Sensor (APS) is installed on the accelerator pedal module and detects the rotation angle of the accelerator pedal. The APS is one of the most important sensors in engine control system, so it consists of the two sensors which adapt individual sensor power and ground line. The second sensor monitors the first sensor and its output voltage is half of the first one. If the ratio of the sensor 1 and 2 is out of the range (approximately 1/2), the diagnostic system judges that it is abnormal.

SPECIFICATION

Pedal Position	Output Voltage (V) [Vref = 5.0V]	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.29 ~ 0.46V
W.O.T	3.85 ~ 4.35V	1.93 ~ 2.18V

Item	Sensor Resistance
APS1	0.7 ~ 1.3kΩ at 20°C (68°F)
APS2	1.4 ~ 2.6kΩ at 20°C (68°F)

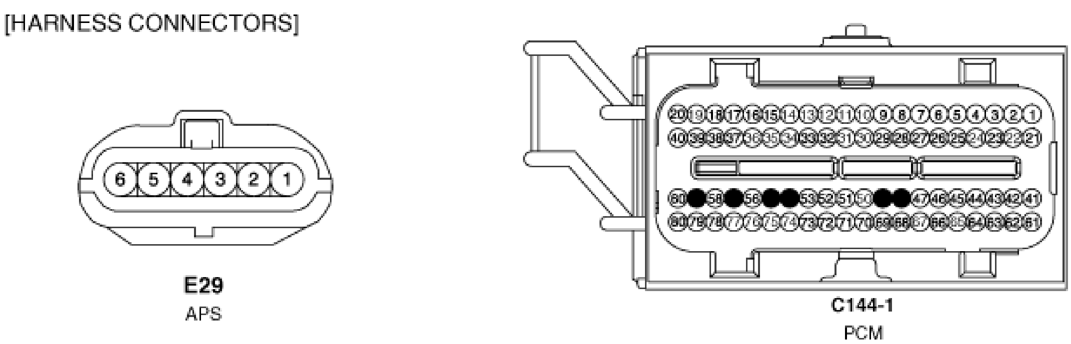
[HARNESS CONNECTORS]

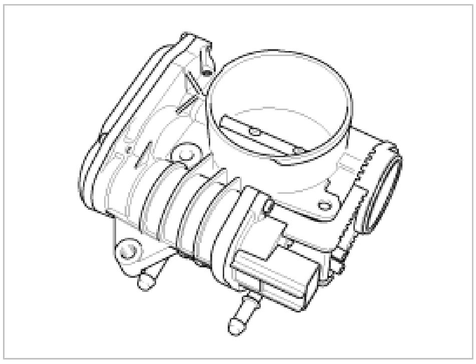


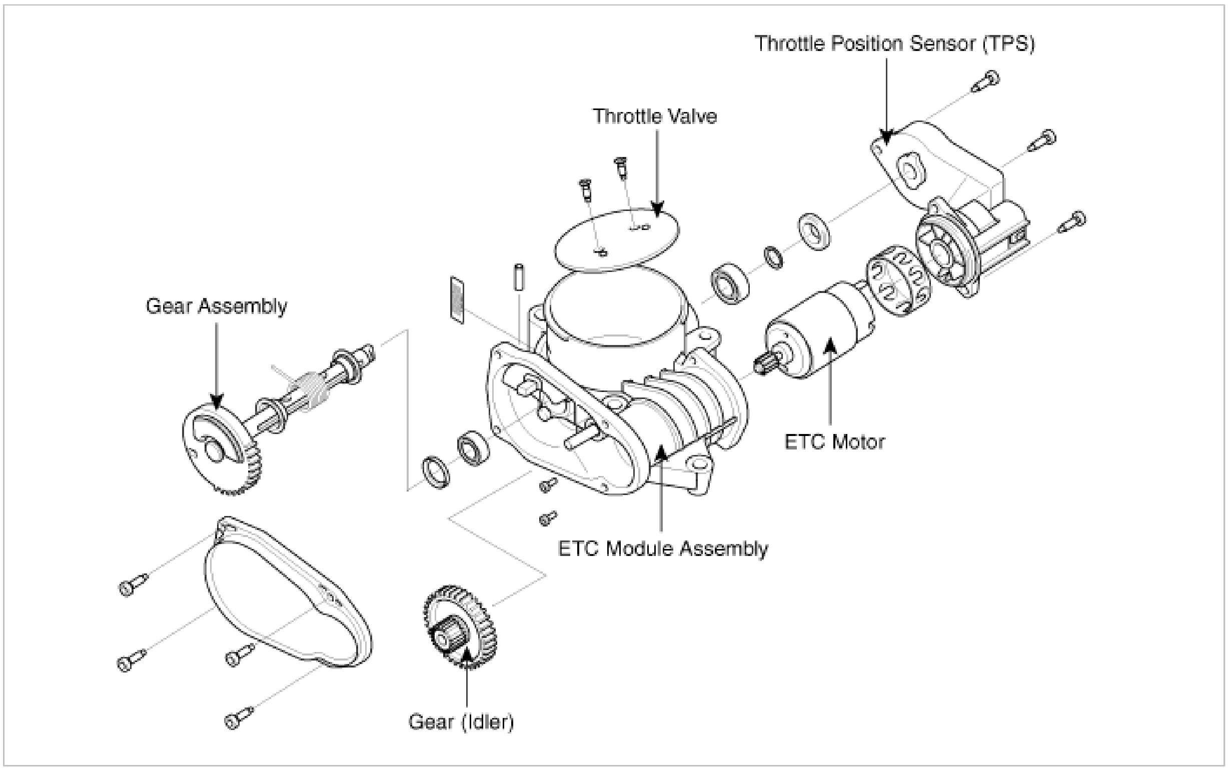
Fuel System > Engine Control System > ETC (Electric Throttle control) System > Description

and Operation

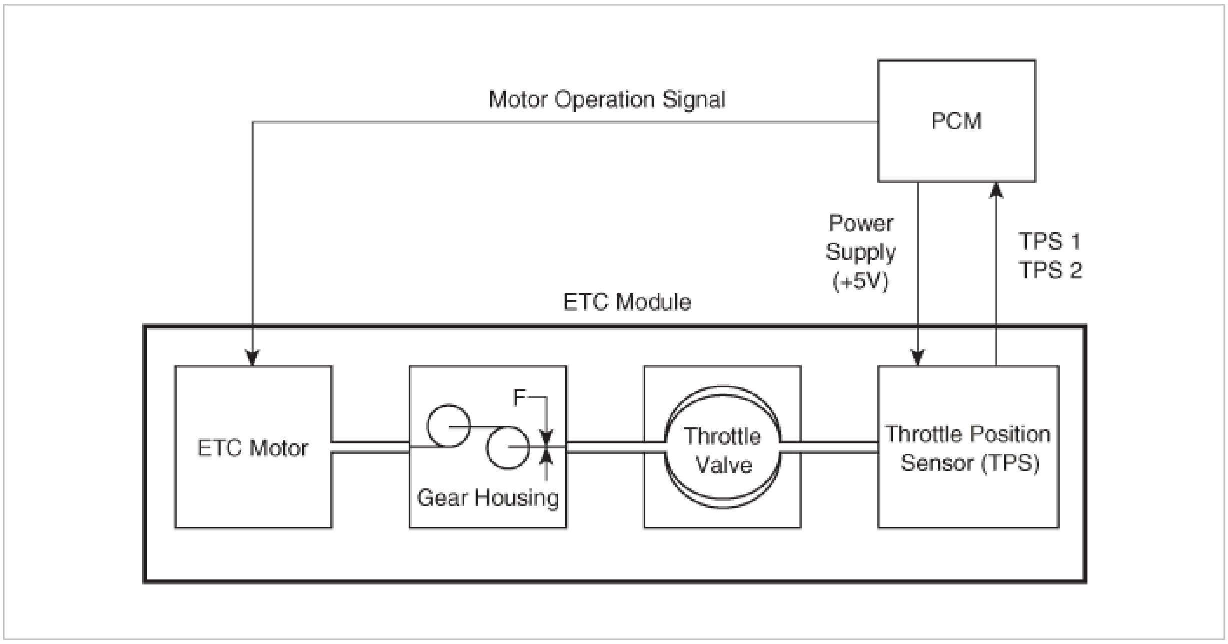
DESCRIPTION

ETC (Electronic Throttle Control) system is electronically controlled throttle device which controls the throttle valve. It consists of ETC motor, throttle body and throttle position sensor (TPS). A mechanical throttle control system receives a driver's intention via a wire cable between the accelerator and the throttle valve, while this ETC system does the signal from the Accelerator Position Sensor (APS) installed on the accelerator pedal. After the PCM receives the APS signal and calculates the throttle opening angle, it activates the throttle valve by using the ETC motor. Additionally, it can materialize cruise control function without any special devices.





COMPONENTS



SPECIFICATION

[THROTTLE POSITION SENSOR]

Throttle Angle(°)	Output Voltage(V) [Vref = 5.0V]	
	TPS1	TPS2
0°	0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0V

Item	Sensor Resistance

PCM

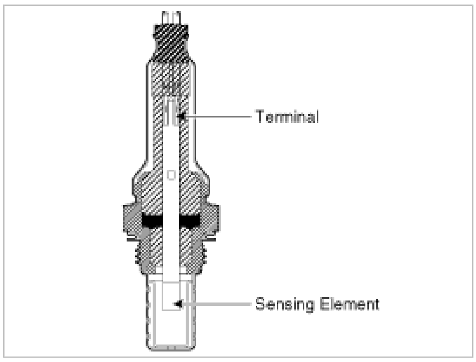
FAIL-SAFE MODE

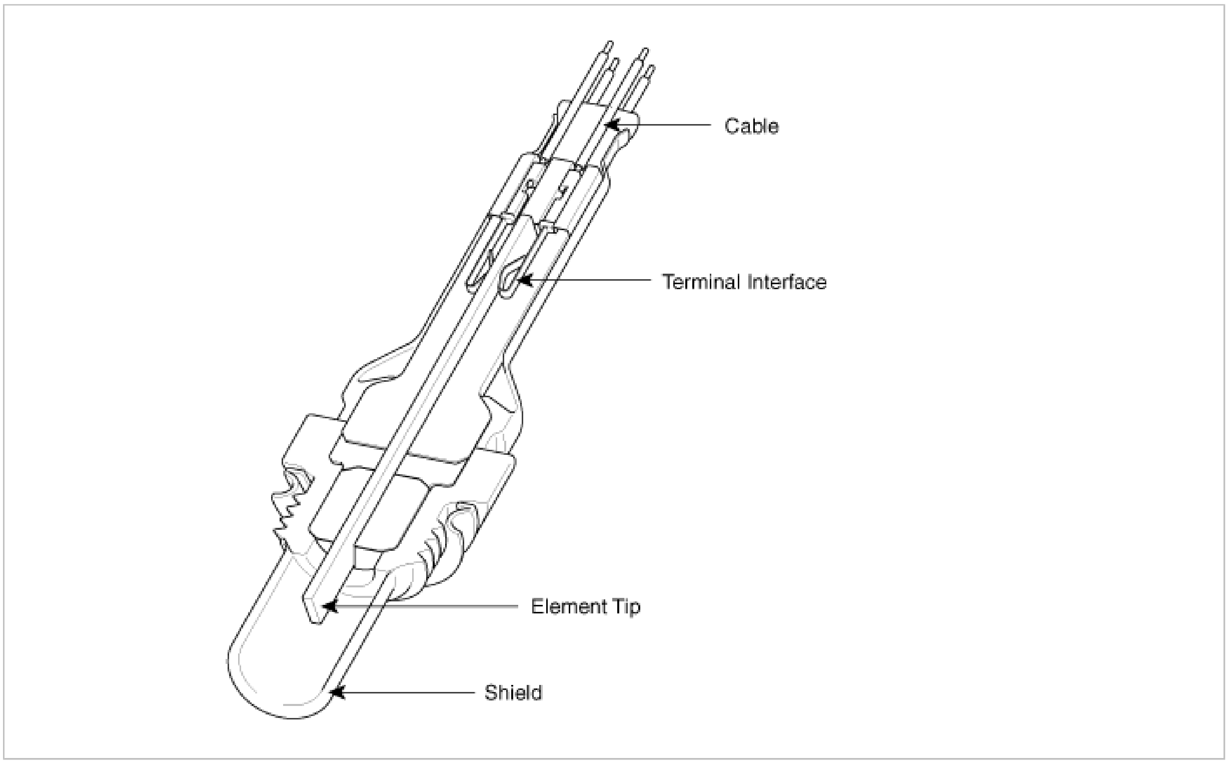
Mode	Description	Symptom	Possible Cause
MODE 1	FORCED ENGINE SHUTDOWN	Engine stop	• ETC system can't proceed reliable algorithm procedure - Fatal PCM internal programming error - Faulty intake system or throttle body
MODE 2	FORCED IDLE & POWER MANAGEMENT	Forced idle state controlled by fuel quantity regulation and ignition timing adjustment	• ETC system can't control engine power via throttle device • Disabled throttle control or broken throttle position information
MODE 3	FORCED IDLE	Forced idle state and no response for accelerator activation	• No information about the accelerator position - Broken APS 1 and 2, faulty A/D converter or internal controller
MODE 4	LIMIT PERFORMANCE & POWER MANAGEMENT	Engine power is determined by accelerator position and idle power requirement (Limited vehicle running)	• ETC system can't securely control engine power
MODE 5	LIMIT PERFORMANCE	1. Engine power varies with accelerator position, but driver perceives lack of engine power. 2. MIL ON (Normal vehicle running)	• Not reliable accelerator position signal or bad maximum power generation - Faulty APS, ignition voltage or internal controller
MODE 6	NORMAL	Normal	

Fuel System > Engine Control System > Heated Oxygen Sensor (HO2S) > Description and Operation

DESCRIPTION

Heated Oxygen Sensor (HO2S) consists of zirconium and alumina and is installed on upstream and downstream of the Manifold Catalyst Converter (MCC). After it compares oxygen consistency of the atmosphere with the exhaust gas, it transfers the oxygen consistency of the exhaust gas to the PCM. When A/F ratio is rich or lean, it generates approximately 1V or 0V respectively. In order that this sensor normally operates, the temperature of the sensor tip is higher than 370°C (698°F). So it has a heater which is controlled by the PCM duty signal. When the exhaust gas temperature is lower than the specified value, the heater warms the sensor tip.





SPECIFICATION

A/F Ratio	Output Voltage (V)
RICH	0.75 ~ 1.00V
LEAN	0 ~ 0.12V

Item	Specification
Heater Resistance (Ω)	8.1 ~ 11.1Ω at 21°C (69.8°F)

PCM

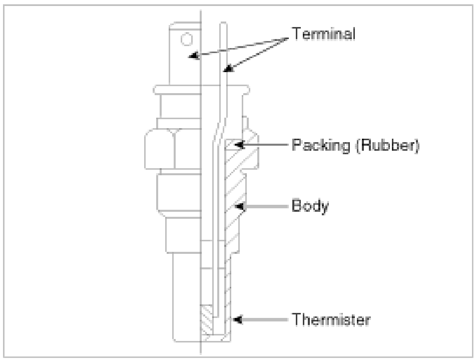
Fuel System > Engine Control System > CVVT Oil Temperature Sensor (OTS) > Description and Operation

DESCRIPTION

Continuously Variable Valve Timing (CVVT) system controls valve overlap by forcibly activating the camshaft and adjusts EGR

(Exhaust Gas Recirculation) amount. It decreases exhaust gas (NOx, HC) and improves fuel economy, idle state, torque in low speed and power in high speed. This system uses engine oil pressure and consists of the two CVVT Oil Control Valves (OCV) in each bank which supplies oil to cam phaser according to PWM (Pulse With Modulator) signal of the PCM, a CVVT Oil Temperature Sensor (OTS) which detects the oil temperature and a cam phaser which is installed on the end of the camshaft and converts camshaft phase. The oil getting out of the CVVT oil control valve flows into the cam phaser and rotates the rotor inside camphaser. At this time, the camshaft rotates with the rotor and the cam phase is changed.

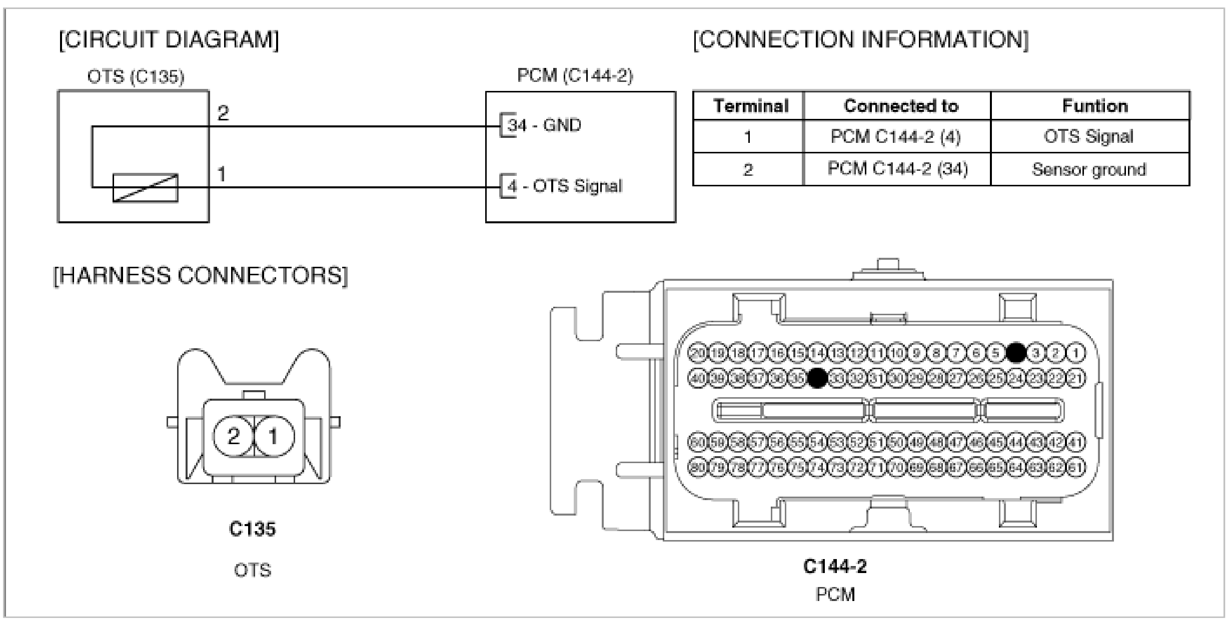
1. When camshaft rotates engine rotation-wise: Intake-Advance / Exhaust-Retard
2. When camshaft rotates counter engine rotation-wise: Intake- Retard / Exhaust- Advance



SPECIFICATION

Temperature		Resistance(kΩ)
°C	°F	
-20	-4	16.52kΩ
20	32	2.45kΩ
80	176	0.29kΩ

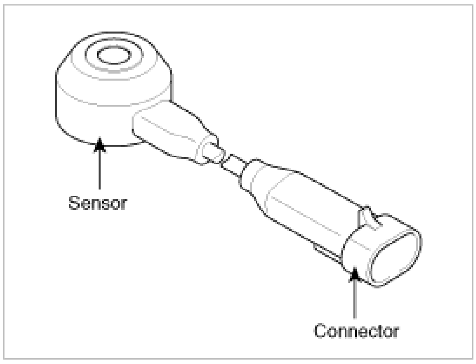
SCHEMATIC DIAGRAM

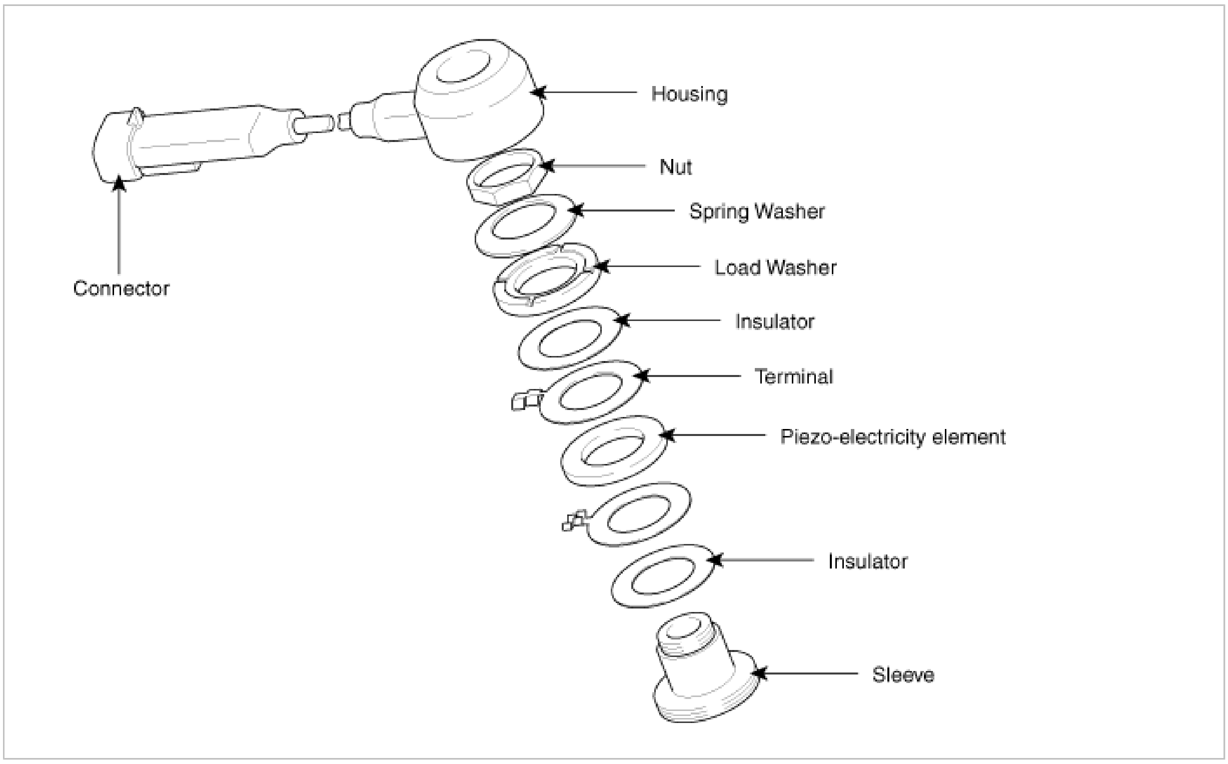


Fuel System > Engine Control System > Knock Sensor (KS) > Description and Operation

DESCRIPTION

Knocking is a phenomenon characterized by undesirable vibration and noise and can cause engine damage. Knock Sensor (KS) senses engine knocking and the two sensors are installed inside the V-valley of the cylinder block. When knocking occurs, the vibration from the cylinder block is applied as pressure to the piezoelectric element. At this time, this sensor transfers the voltage signal higher than the specified value to the PCM and the PCM retards the ignition timing. If the knocking disappears after retarding the ignition timing, the PCM will advance the ignition timing. This sequential control can improve engine power, torque and fuel economy.

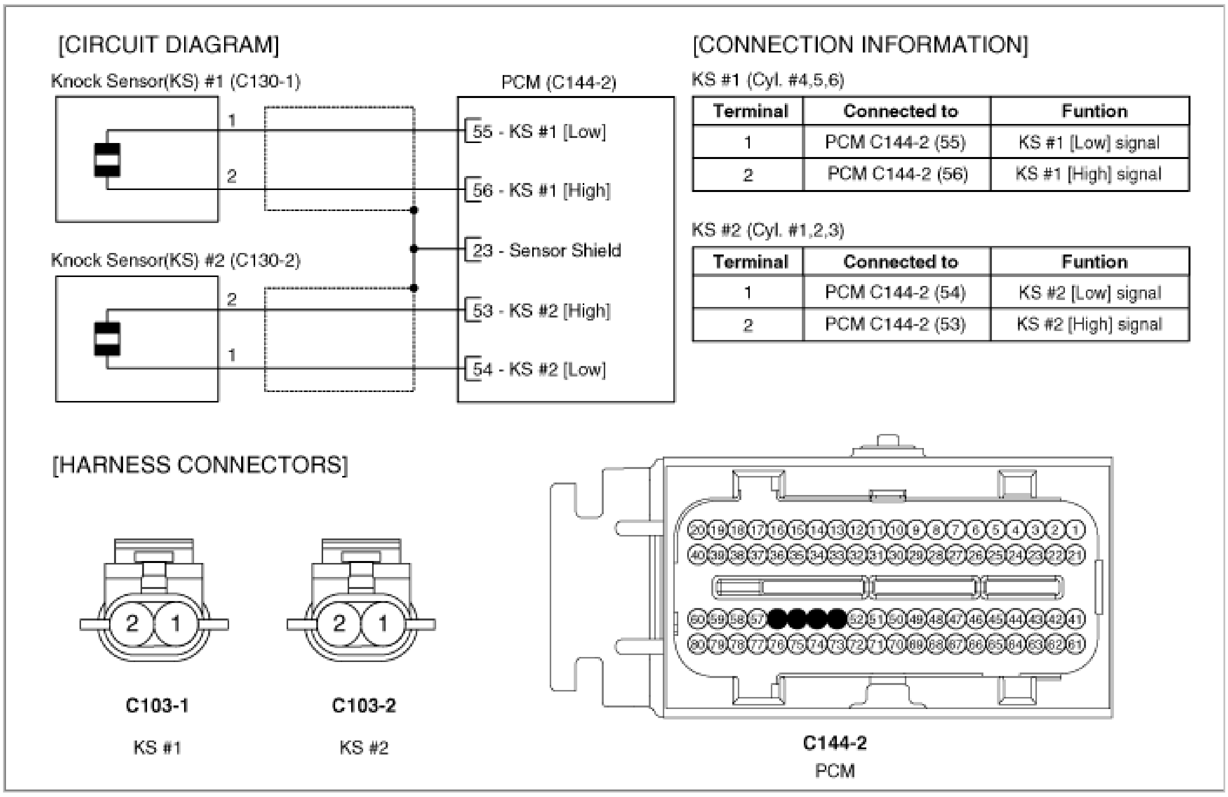




SPECIFICATION

Item	Specification
Capacitance (pF)	1,480 ~ 2,220pF

SCHEMATIC DIAGRAM



Fuel System > Engine Control System > Crankshaft Position Sensor (CKPS) > Description and Operation

DESCRIPTION

Crankshaft Position Sensor (CKPS) detects the crankshaft position and is one of the most important sensors of the engine control system. If there is no CKPS signal input, fuel is not supplied and the main relay does not operate. That is, vehicle can't run without CKPS signal. This sensor is installed on transaxle housing and generates alternating current by magnetic flux field which is made by the sensor and the target wheel when engine runs. The magnetic flux increases when the protrusion of the target wheel is getting near to the sensor and does not change in the most close position. When the protrusion becomes estranged from the sensor, magnetic flux disappears and alternating current is generated. The target wheel consists of 58 slots and 2 missing slots on 360 CA (Crank Angle).

2	PCM C144-2 (21)	CKPS [HIGH] Signal

Fuel System > Engine Control System > Camshaft Position Sensor (CMPS) > Description and Operation

DESCRIPTION

Camshaft Position Sensor (CMPS) is a hall sensor and detects the camshaft position by using a hall element. It is related with Crankshaft Position Sensor (CKPS) and detects the piston position of each cylinder which the CKPS can't detect. The two CMPS are installed on engine head cover of bank 1 and 2 and uses a target wheel installed on the camshaft. This sensor has a hall-effect IC which output voltage changes when magnetic field is made on the IC with current flow. So the sequential injection of the 6 cylinders is impossible without CMPS signal.

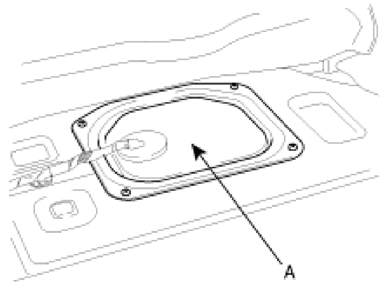
FUEL PRESSURE TEST

1. PREPARING

1. Open the service cover (A) in trunk.

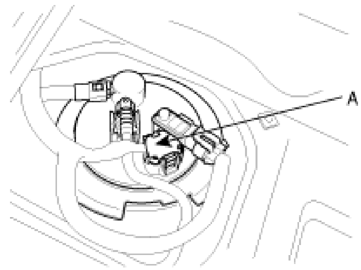


2. RELEASE THE INTERNAL PRESSURE

1. Disconnect the fuel pump connector(A).
2. Start the engine and wait until fuel in fuel line is exhausted.
3. After the engine stalls, turn the ignition switch to OFF position and disconnect the negative (-) terminal from the battery.

NOTE

Be sure to reduce the fuel pressure before disconnecting the fuel feed hose, otherwise fuel will spill out.



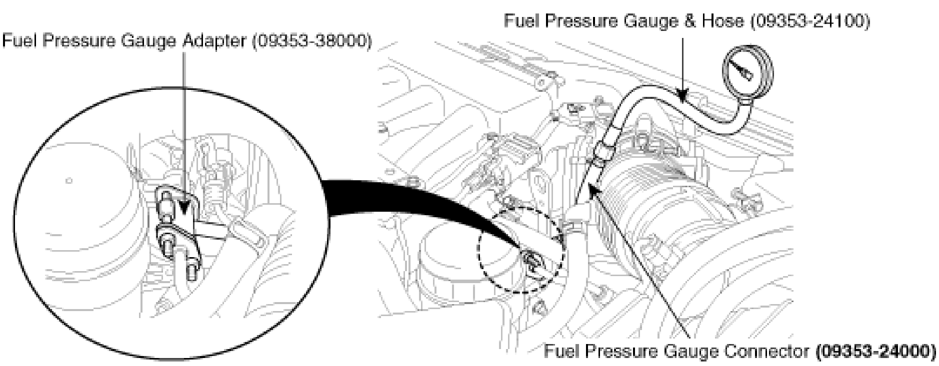
3. INSTALL THE SPECIAL SERVICE TOOL (SST) FOR MEASURING THE FUEL PRESSURE

1. Disconnect the fuel feed hose from the delivery pipe.

CAUTION

Cover the hose connection with a shop towel to prevent splashing of fuel caused by residual pressure in the fuel line.

2. Install the Fuel Pressure Gauge Adapter (09353-38000) between the delivery pipe and the fuel feed hose.
3. Connect the Fuel Pressure Gauge Connector (09353-24000) to the Fuel Pressure Gauge Adapter (09353-38000).
4. Connect the Fuel Pressure Gauge and Hose (09353-24100) to Fuel Pressure Gauge Connector (09353-24000).
5. Connect the fuel feed hose to the Fuel Pressure Gauge Adapter (09353-38000).



4. INSPECT FUEL LEAKAGE ON CONNECTION

1. Connect the battery negative (-) terminal.
2. Apply battery voltage to the fuel pump terminal and activate the fuel pump. With fuel pressure applied, check that there is no fuel leakage from the fuel pressure gauge or connection part.

5. FUEL PRESURE TEST

1. Disconnect the negative (-) terminal from the battery.
2. Connect the fuel pump connector.
3. Connect the battery negative (-) terminal.
4. Start the engine and measure the fuel pressure at idle.

Standard Value: 374 ~ 384 kpa (3.82 ~ 3.92 kgf/㎠, 54.3 ~ 55.8 psi)

- If the measured fuel pressure differs from the standard value, perform the necessary repairs using the table below.

Condition	Probable Cause	Suspected Area
Fuel Pressure too low	Clogged fuel filter	Fuel filter
	Fuel leak on the fuel-pressure regulator that is assembled on fuel pump because of poor seating of the fuel-pressure regulator.	Fuel Pressure Regulator
Fuel Pressure too High	Sticking fuel pressure regulator	Fuel Pressure Regulator

5. Stop the engine and check for a change in the fuel pressure gauge reading.

After engine stops, the gauge reading should hold for about 5 minutes

- Observing the declination of the fuel pressure when the gauge reading drops and perform the necessary repairs using the table below.

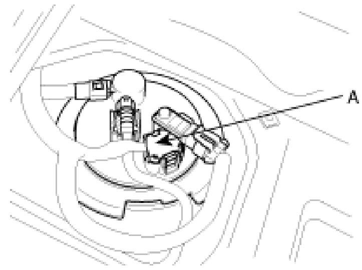
Condition	Probable Cause	Supected Area
Fuel pressure drops slowly after engine is stopped	Injector leak	Injector
Fuel pressure drops immediately after engine is stopped	The check valve within the fuel pump is open	Fuel Pump

6. RELEASE THE INTERNAL PRESSURE

1. Disconnect the fuel pump connector(A).
2. Start the engine and wait until fuel in fuel line is exhausted.
3. After the engine stalls, turn the ignition switch to OFF position and disconnect the negative (-) terminal from the battery.

NOTE

Be sure to reduce the fuel pressure before disconnecting the fuel feed hose, otherwise fuel will spill out.



7. REMOVE THE SPECIAL SERVICE TOOL (SST) AND CONNECT THE FUEL LINE

1. Disconnect the Fuel Pressure Gauge and Hose (09353-24100) from the Fuel Pressure Gauge Connector (09353-24000).
2. Disconnect the Fuel Pressure Gauge Connector (09353-24000) from the Fuel Pressure Gauge Adapter (09353-38000).
3. Disconnect the fuel feed hose from the Fuel Pressure Gauge Adapter (09353-38000).
4. Disconnect the Fuel Pressure Gauge Adapter (09353-38000) from the delivery pipe.

CAUTION

Cover the hose connection with a shop towel to prevent splashing of fuel caused by residual pressure in the fuel line.

5. Connect the fuel feed hose to the delivery pipe.

8. INSPECT FUEL LEAKAGE ON CONNECTION

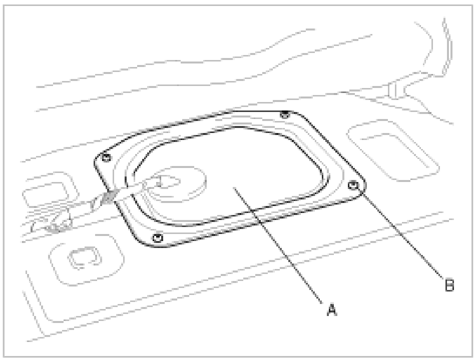
1. Connect the battery negative (-) terminal.
2. Apply battery voltage to the fuel pump terminal and activate the fuel pump. With fuel pressure applied, check that there is no fuel leakage from the fuel pressure gauge or connection part.
3. If the vehicle is normal, connect the fuel pump connector.

Fuel System > Fuel Delivery System > Fuel Tank > Repair procedures

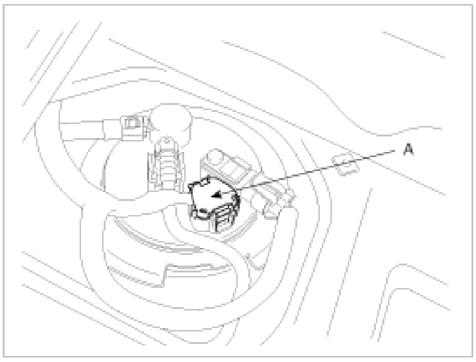
REMOVAL

1. Preparation

(1) Open the Service Cover (A) by unscrewing the bolts (B).



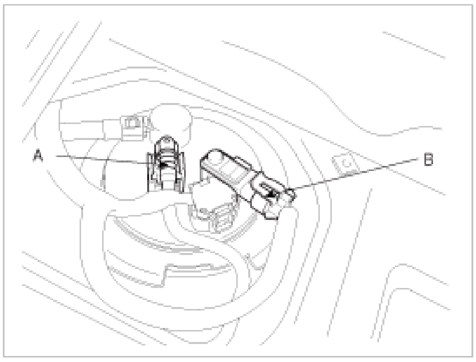
(2) Disconnect the Fuel Pump Connector (A).



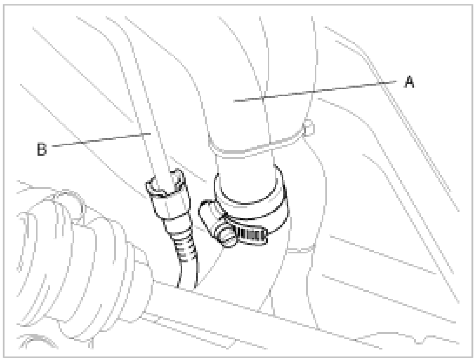
(3) Start the engine and wait until fuel in fuel line is exhausted.

(4) After the engine stalls, turn the ignition switch to OFF position.

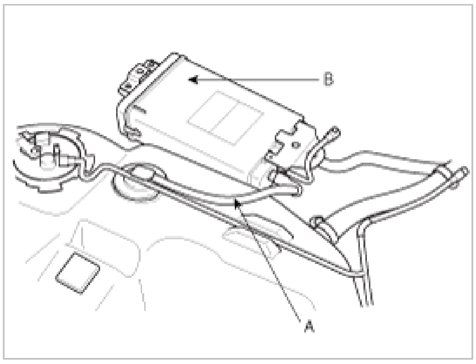
2. Disconnect the Fuel Feed Line (A) and Fuel Tank Pressure Sensor connector (B).



3. Lift the vehicle and support the fuel tank with a jack.
4. Remove the main and center muffler (Refer to the group "EM" in this SHOP MANUAL).
5. Disconnect the Fuel Filler Hose (A) and Recirculation Line (B).



6. Disconnect the Canister Hose (A) from the Canister (B).



7. Remove the fuel tank band mounting bolts (2), and then remove the Fuel Tank from the vehicle.

INSTALLATION

Install the Fuel Tank according to the reverse order of REMOVAL procedure.

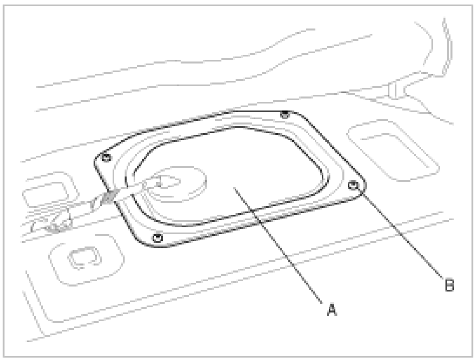
Fuel Tank Band Tightening Torques: 34.3 ~ 53.9 N·m (3.5 ~ 5.5 kgf·m, 25.3 ~ 39.8 lbf·ft)

Fuel System > Fuel Delivery System > Fuel Pump > Repair procedures

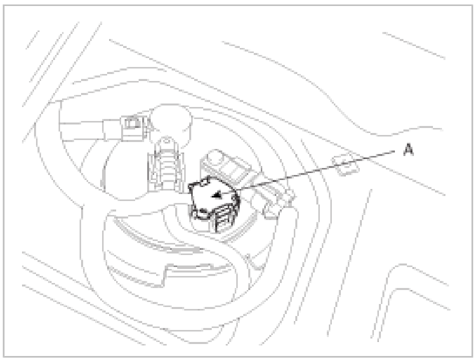
REMOVAL

1. Preparation

(1) Open the Service Cover (A) with unscrewing the bolts (B).



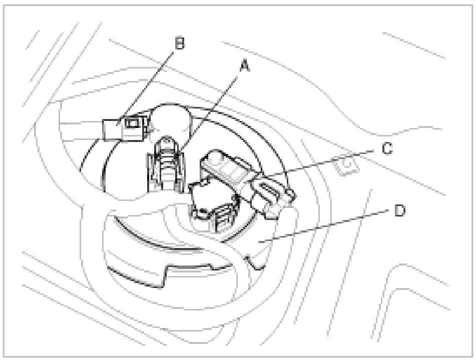
(2) Disconnect the Fuel Pump Connector (A).



(3) Start the engine and wait until fuel in fuel line is exhausted.

(4) After the engine stalls, turn the ignition switch to OFF position.

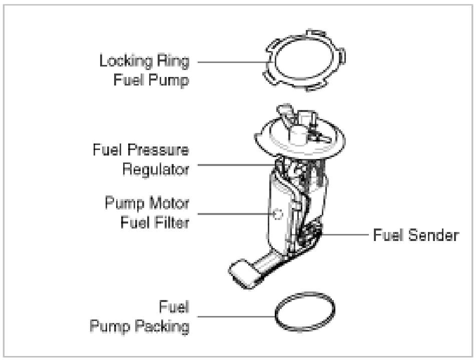
2. Disconnect the Fuel Feed Line (A), Recirculation Line (B) and Fuel Tank Pressure Sensor connector (C).



3. Unfasten the Fuel Pump Locking Ring (D) with the Special Service Tool (Refer to "SPECIAL SERVICE TOOL").

> **CAUTION**
>
> Be careful NOT TO damage the surface of the fuel rank.

4. Remove the Fuel Pump assembly from the Fuel Tank.



INSTALLATION

Install the Fuel Pump according to the reverse order of REMOVAL procedure.

NOTE

Replace the Fuel Pump Locking Ring and Fuel Pump Plate Packing with a new one when installing the fuel pump again.

Fuel System > Fuel Delivery System > Injector > Description and Operation

DESCRIPTION

Based on information from various sensors, the PCM measures the fuel injection amount. The fuel injector is a solenoid-operated valve and the fuel injection amount is controlled by length of time that the fuel injector is held open. The PCM controls each injector by grounding the control circuit. When the PCM energizes the injector by grounding the control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak for a moment.

CAUTION

If an injector connector is disconnected for more than 46 seconds while the engine runs, the PCM will determine that the cylinder is misfired and cut fuel supply. So be careful not to exceed 46 seconds. But the engine runs normally in 10 seconds after turning the ignition key off.

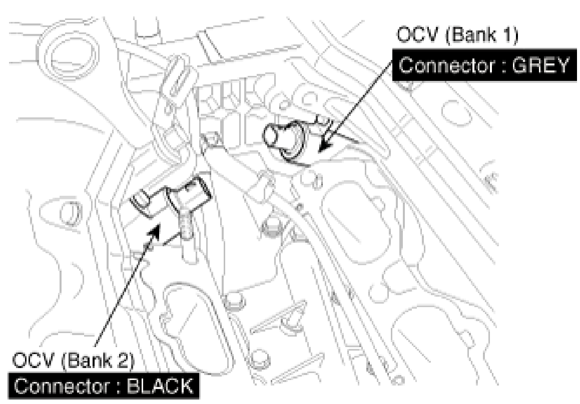
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

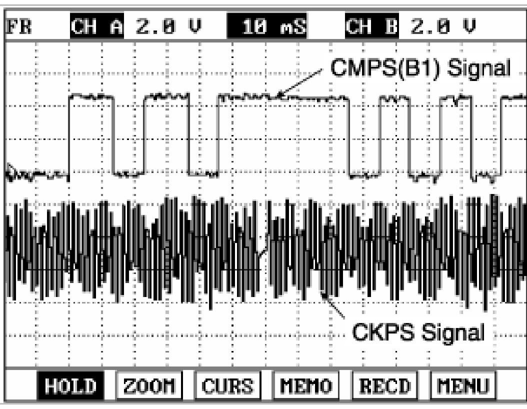
DTC DESCRIPTION

This diagnostic monitors the phasing response rate and determines whether the response rate is fast enough. A state machine is used to capture the response rate.The measured results are then compared to an allowable threshold. The threshold is a function of the oil temperature and the requested desired rate. Test of the phaser response rate requires an engine speed or engine load change.
PCM detects CAM phasing average rate while cam offset is available. If the CAM phasing rate is failure in 12 times out of 15 CAM phasing test PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if the phaser is moving at an expected rate	• Excessive phasing system leakage • Binding Oil Pressure (ex. Blockage in OCV filter) • Faulty PCM
Enable Conditions	• Cam Offset is available	
Threshold value	• Cam phasing average rate is out of threshold programmed in PCM	
Diagnosis Time	• Continuous (12 tests failure for 15 cam edge tests)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle.
If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS.
Cam phasing can be detected from offset variation.

3. Are the "CMPS(B1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "System Inspection" procedure.

SYSTEM INSPECTION

1. Visual Inspection
   (1) Check oil level is O.K.

   (2) Check oil level is contaminated.

   (3) Check that any oil leakage or blockage is occurred on the parts related to CVVT.

   (4) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check OCV
   (1) connect scantool and IG "ON"

   (2) Select "OCV" on the Actuation Test

   (3) Activates "OCV" by pressing "STRT(F1)" key
   (should hear a faint click from Oil Control solenoid Valve)

   (4) Repeat this procedure 4 or 5 times to ensure intake valve control solenoid reliability

   (5) Has a problem been found ?

   YES

   ▸ Substitute with a known - good CVVT and check for proper operation. If the problem is corrected, replace CVVT and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

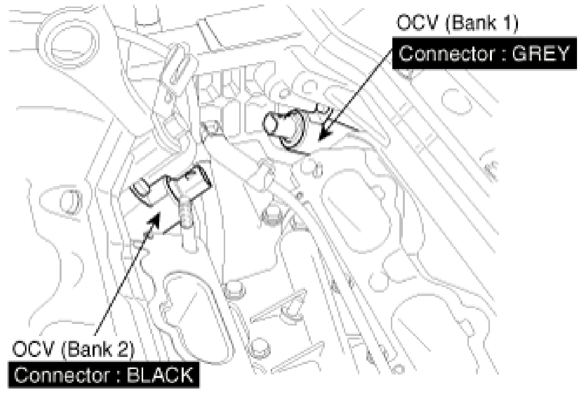
YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Figure1. illustrates the method for detecting unresolved phasing steady-state error.
The figure shows two cases, case 1 to the left of the dashed line, and case 2 to the right of the dashed line. In case 1,the duty cycle command is considered high, or above a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the maximum position, but the position remains at a medium level. The range of positions considered 'medium' is defined by calibrations.
In case 2, the duty cycle command is considered low, or below a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the minimum position, but the position remains at a medium level.
Each of these cases is a phaser position error failure. Each case is also considered to be due to a phaser seizure. When either case is detected, a timing counter begins to increment. If the counter exceeds a calibration threshold memorized in PCM, the failure criteria is TRUE.
Another similar diagnostic test is performed to check steady-state error. In this test, no consideration is given to the duty cycle command versus phaser position. This test is only a check of the phasing position error. It is a test of the phaser control logic. If there has been integral windup in the PID control,this test will detect it. In the test, if the phaser error is greater than a calibration threshold memorized in PCM,a timing counter increments. If the counter exceeds the calibration threshold memorized in PCM,the failure criteria is TRUE.

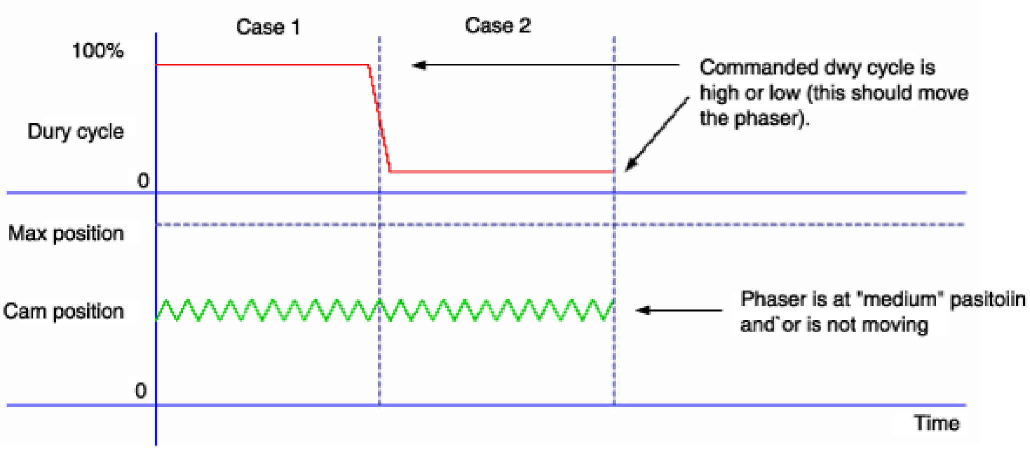


Fig. 1

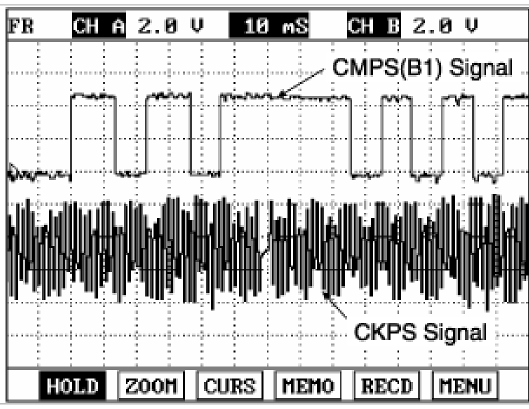
PCM monitors CAM phaser error while both cam offset is available and cam velocity is below 15CAD/s .If the CAM phaser does not move although PCM commands OCV duty cycle PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if the phaser is stuck or has steady-state error	• Engine Oil • OCV • CVVT stuck • PCM
Enable Conditions		• Offsets available • Cam velocity below threshold< 15 CAD/s	
Thresh old value	Case 1	• 5 CAD < Cam position< 50 CAD • Duty Cycle >90% • Duty Cycle< 10% • Timing Counter >80	
	Case 2	• Cam Position error >4 CAD • Timing Counter >80	
Diagnosis Time		• Continuous (More than 0.75sec. Test failure for every 90sec tests)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle.
If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS.
Cam phasing can be detected from offset variation.

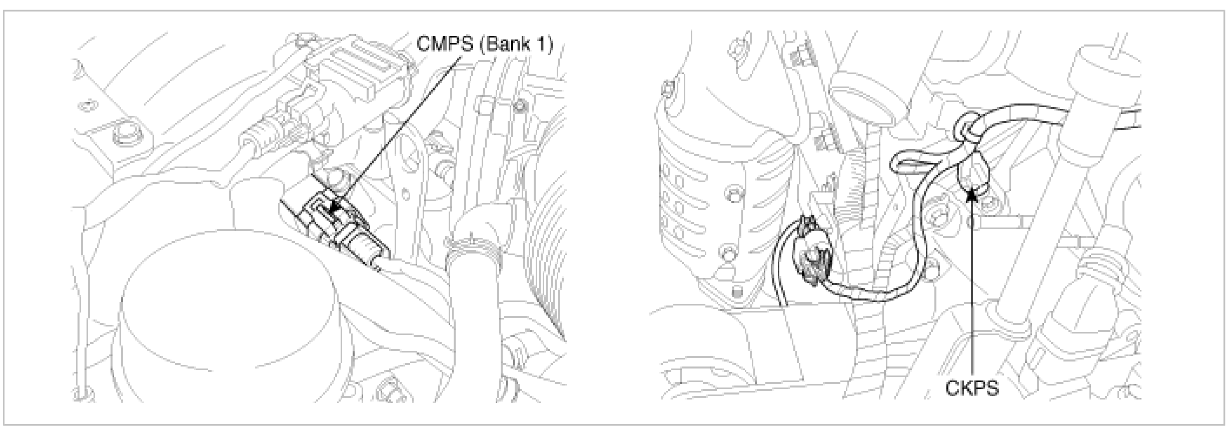
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Tooth offsets are learned, updated, stored and initialized. For a given cam target wheel and systemcalibration, the tooth offsets should maintain relatively steady values. If the values of tooth offsets areobserved to drift outside of an established range, then a failure is present in the hardware or electronicsystem for measuring cam phasing.
This diagnosis is to verify that learned tooth offsets are within an acceptable range.
PCM monitors tooth offset while no active faults is present.If the tooth offsets is out of threshold more than 20 offset learning for 36 offset learning PCM determines that a faultexists and a DTC is stored.

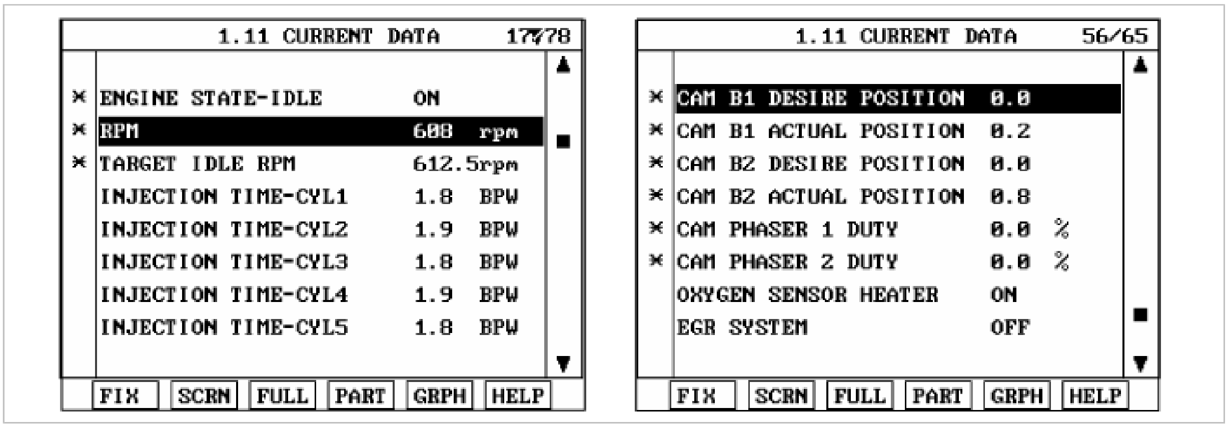
MONITOR SCANTOOL DATA

1. Connect scantool and warm -up the engine until normal operating temperature.
2. Monitor "CAM, Engine speed" on service data.



3. Are the "CMPS(B1) & Engine RPM" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Terminaal and connector inpection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

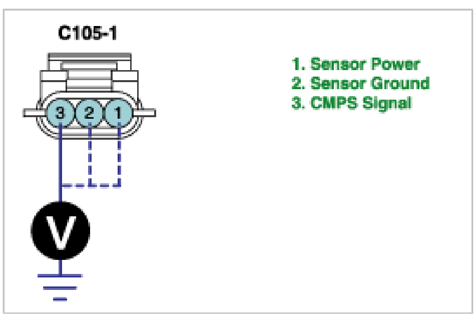
NO

▸ Go to "Terminal and connector inspection" procedure.

SYSTEM INSPECTION

1. Check CMPS
   (1) IG "OFF" & Disconnect CMPS connector.
   (2) IG "ON" & Measure voltage between terminal 1,2 & 3 of CMPS harness connector and chassis ground.

Specification :
Terminal 1. approx. 5V
Terminal 2. approx. below 1V
Terminal 3. approx. 5V



(3) Is the measured voltage within specification ?

YES

▸ Go to Check "CKPS" as follow.

NO

▸ Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

2. Check CKPS
   (1) IG "OFF" and disconnect CKPS connector.
   (2) IG "ON" & Measure voltage between terminal 1 & 2 of CKPS harness connecotor and chassis ground.

Specification : Approximately 1.4V

   (3) Is the measured voltage within specification ?

YES

▸ Go to "component Inspection" procedure.

NO

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. CMPS, CKPS Inspection
   (1) IG "OFF" and connect scantool.
   (2) ENG "ON" and Measure signal waveform at terminal 3 of CMPS.
   (3) Measure signal waveform at terminal 1 or 2 of CKPS.

Specification :

   (4) Is the measured signal waveform O.K ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

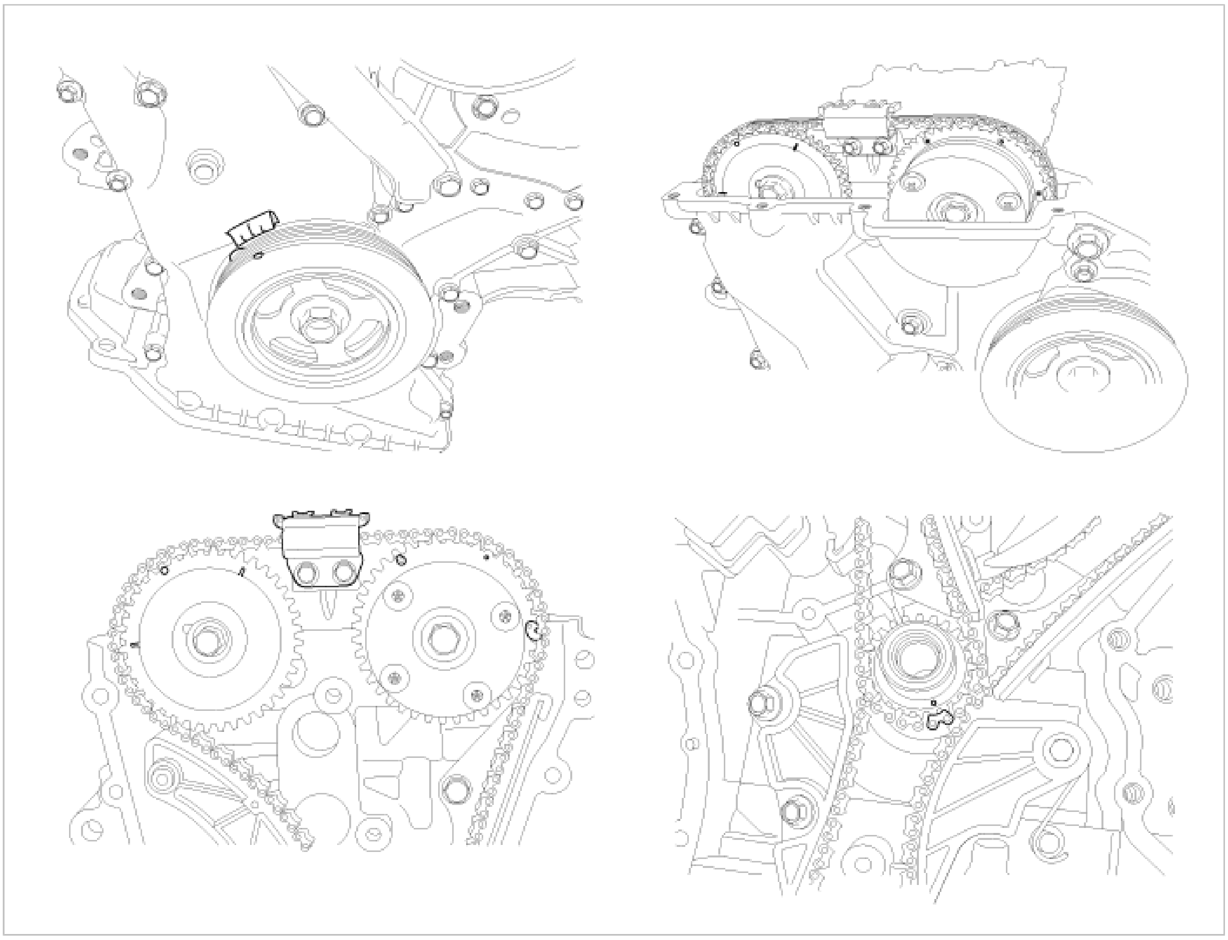
> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Go to "Timing Mark Inspection" procedure as follow.

2. Timing Mark Inspection.
   (1) IG "OFF" and check the timing mark is correctly aligned.

Reference :



(2) Is the timing mark correctly aligned ?

YES

▸ Substitute with a known - good CVVT and check for proper operation. If the problem is corrected, replace CVVT and go to "Verification of Vehicle Repair" procedure.

(3) ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

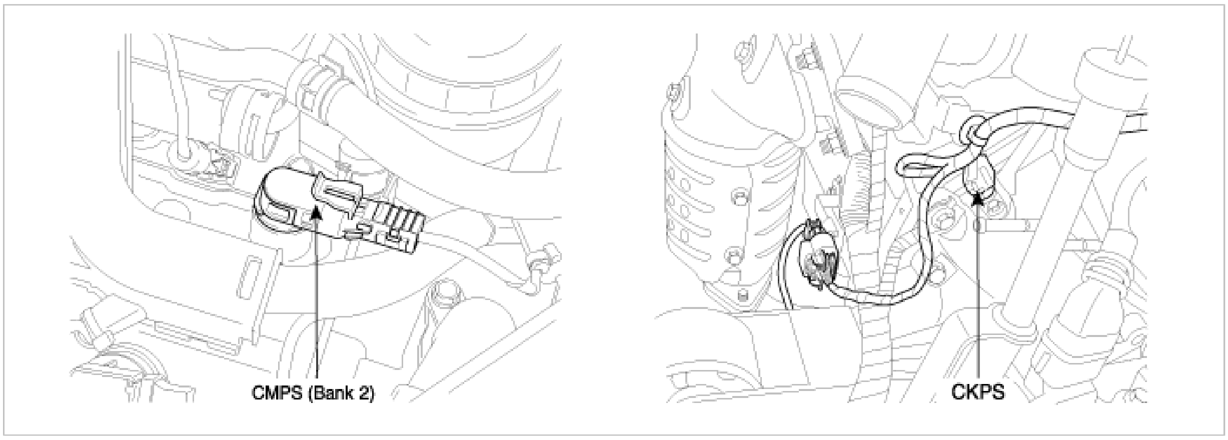
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

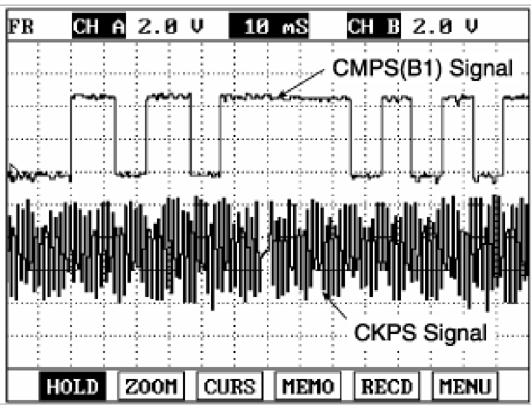
This diagnostic monitors the phasing response rate and determines whether the response rate is fast enough. A state machine is used to capture the response rate.The measured results are then compared to an allowable threshold. The threshold is a function of the oil temperature and the requested desired rate. Test of the phaser response rate requires an engine speed or engine load change.
PCM detects CAM phasing average rate while cam offset is available. If the CAM phasing rate is failure in 12 times out of 15 CAM phasing test PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if the phaser is moving at an expected rate	

Enable Conditions	• Cam Offset is available	• Excessive phasing system leakage • Binding Oil Pressure (ex. Blockage in OCV filter) • Faulty PCM
Threshold value	• Cam phasing average rate is out of threshold programmed in PCM	
Diagnosis Time	• Continuous (12 tests failure for 15 cam edge tests)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle.
If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS.
Cam phasing can be detected from offset variation.

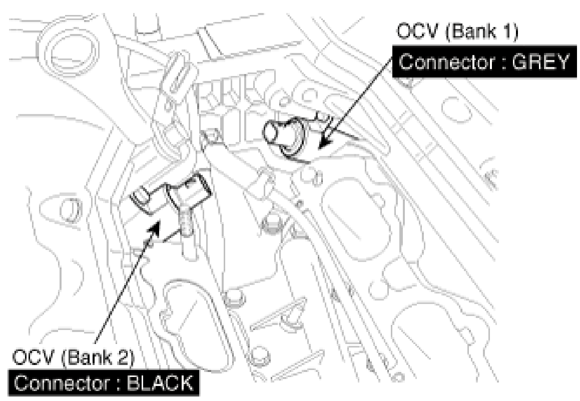
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Figure1. illustrates the method for detecting unresolved phasing steady-state error.
The figure shows two cases, case 1 to the left of the dashed line, and case 2 to the right of the dashed line. In case 1,the duty cycle command is considered high, or above a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the maximum position, but the position remains at a medium level. The range of positions considered ‘medium’ is defined by calibrations.
In case 2, the duty cycle command is considered low, or below a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the minimum position, but the position remains at a medium level.
Each of these cases is a phaser position error failure. Each case is also considered to be due to a phaser seizure. When either case is detected, a timing counter begins to increment. If the counter exceeds a calibration threshold memorized in PCM, the failure criteria is TRUE.
Another similar diagnostic test is performed to check steady-state error. In this test, no consideration is given to the duty cycle command versus phaser position. This test is only a check of the phasing position error. It is a test of the phaser control logic. If there has been integral windup in the PID control,this test will detect it. In the test, if the phaser error is greater than a calibration threshold memorized in PCM,a timing counter increments. If the counter exceeds the calibration threshold memorized in PCM,the failure criteria is TRUE.

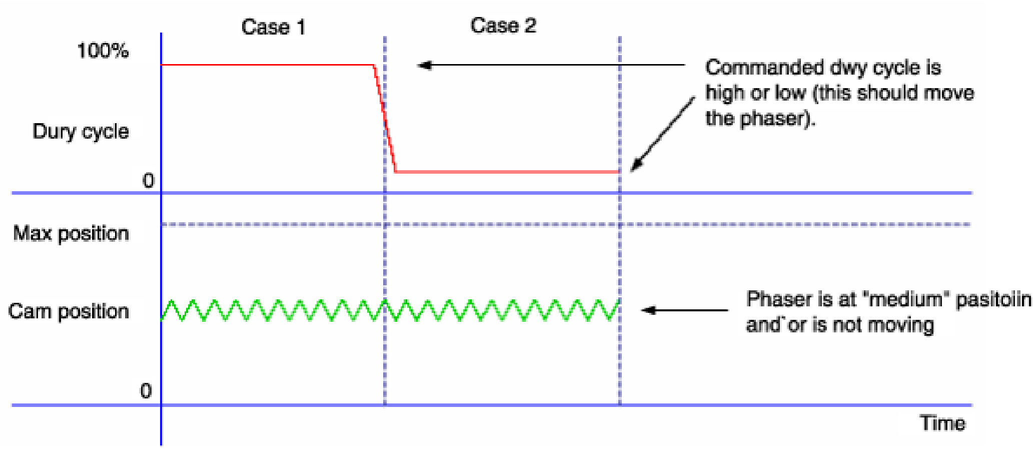


Fig. 1

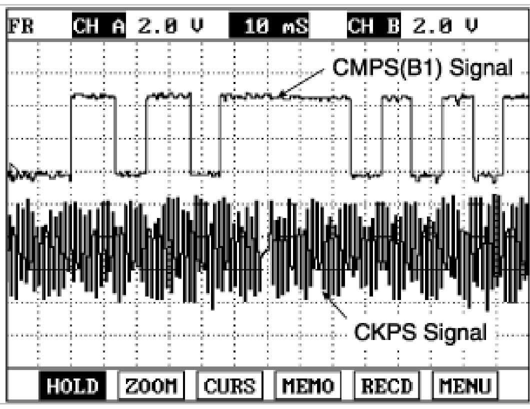
PCM monitors CAM phaser error while both cam offset is available and cam velocity is below 15CAD/s .If the CAM phaser does not move although PCM commands OCV duty cycle PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if the phaser is stuck or has steady-state error	• Engine Oil • OCV • CVVT stuck • PCM
Enable Conditions		• Offsets available • Cam velocity below threshold< 15 CAD/s	
Thresh old value	Case 1	• 5 CAD < Cam position< 50 CAD • Duty Cycle >90% • Duty Cycle< 10% • Timing Counter >80	
	Case 2	• Cam Position error >4 CAD • Timing Counter >80	
Diagnosis Time		• Continuous (More than 0.75sec. Test failure for every 90sec tests)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle. If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS. Cam phasing can be detected from offset variation.

YES

▸ Substitute with a known - good CVVT and check for proper operation. If the problem is corrected, replace CVVT and go to "Verification of Vehicle Repair" procedure.

NO

(6) ▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

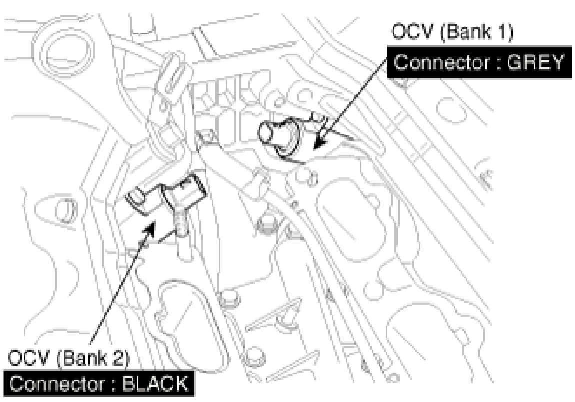
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0026

COMPONENT LOCATION

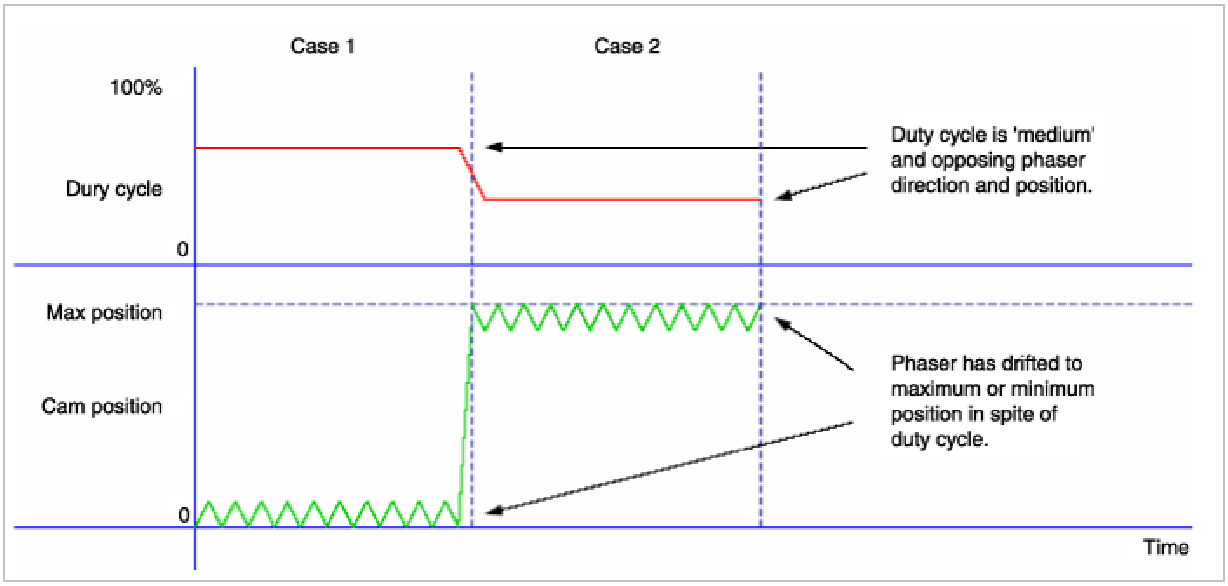


GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Small particles in the engine oil may cause the oil control valve to bind or otherwise get stuck atcertain spool positions. A test is used in this diagnostic to detect a stuck valve spool. A cleaningfunction is then used to try and free the spool. If unsuccessful, the diagnostic test is failed.
Figure 1. illustrates the principle of the valve stuck diagnostic test. As in the phaser error diagnosticillustration, there are two cases shown in the figure. The case on the left shows a case where the dutycycle is above a calibration threshold, yet the phaser position is near the minimum position. Undernormal operation, such a duty cycle command would move the phaser toward its maximum position.The case on the right shows the opposite situation. The duty cycle command is below a threshold, yetthe phaser position is near its maximum.



In the diagnostic test logic, duty cycle is not used. There are two reasons: 1) duty cycle is theparameter most closely related to result of the test, and should not be used in the test, and 2) it isdifficult to establish thresholds for duty cycle because of the variation of such thresholds. Instead ofduty cycle, position error is used. This indicates clearly the expected duty cycle behavior and allowsthresholds to be established without consideration for temperature, voltage and pressure conditions aswell as the strength or lack of strength in the gain calibration.
PCM monitors OCV stuck while cam offset is available and Valve cleaning is not in progress .If the PCM detects that CAM position angle is over 20 CAD(Crank Angle Degree) than expected cam positionthat PCM controls the OCV while cam position is in designated crank angle degree, PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if oil control valve is stuck	• Oil Pressure Loss • OCV seizure • PCM
Enable Conditions		• Valve cleaning not in progress • Offsets available	
Thresh old value	Case 1	• Cam position > 50 CAD • Cam position Error > 20 CAD • Timing counter >56 count	
	Case 2	• Cam position< 5 CAD • Cam position Error > 20 CAD • Timing counter >56 count	
Diagnosis Time		• Continuous (More than 0.75sec failure for every 56.25 sec. tests)	
MIL On Condition		• 2 driving Cycle

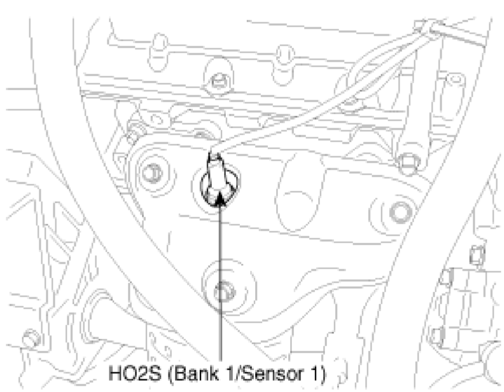
Fuel System > Troubleshooting > P0031

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

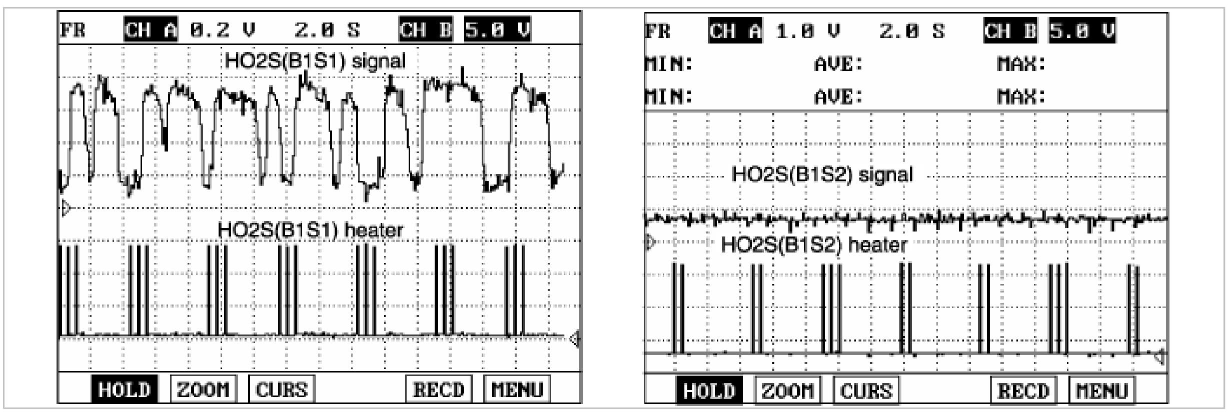
DTC DESCRIPTION

If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • Open in Power Circuit • Open or short to ground in control circuit • HO2S(B1/S1) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• short to ground or open circuit	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

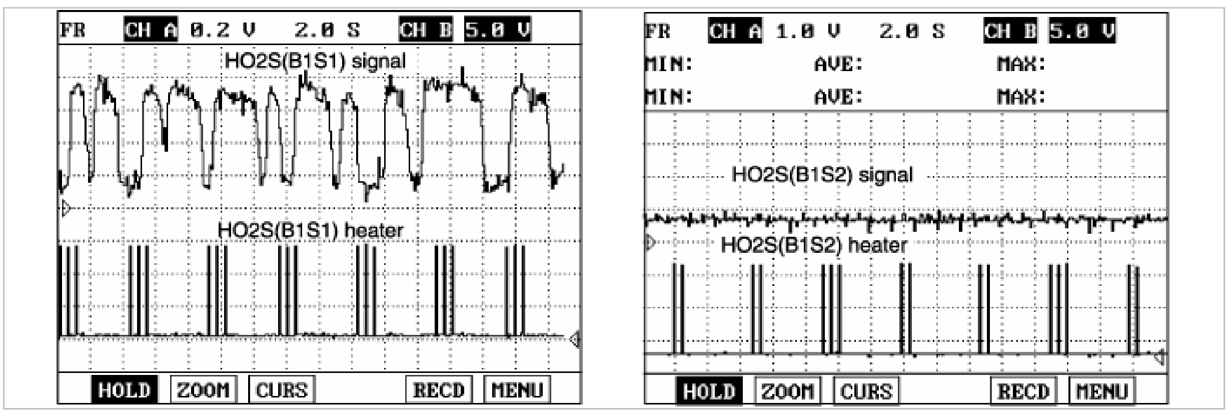
SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

Heater	
Resistance (Ω)	9.6 ± 1.5

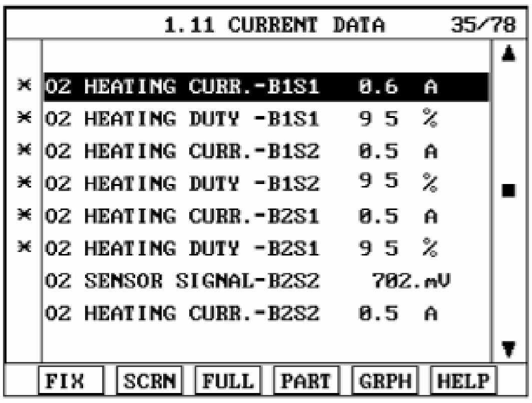
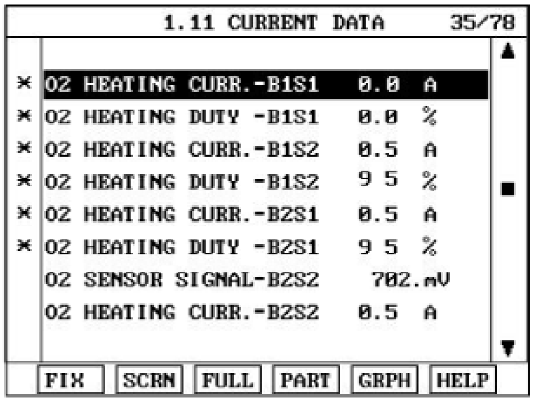
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B1/S1)" status on the service data.



Normal data - idle



Open circuit(HO2S heater-B1S1)

4. Is the "HO2S Heater(B1/S1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

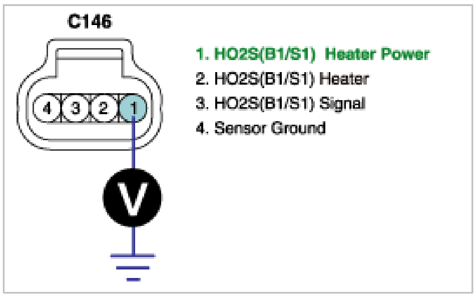
NO

▸ Go to " Power Circuit Inspection " procedure

POWER CIRCUIT INSPECTION

1. IG "OFF" & Disconnect HO2S(B1/S1) connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of HO2S(B1/S1) harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B1/S1) heater "Control Circuit Inspection" procedure.

NO

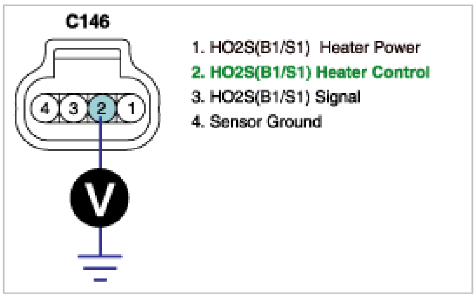
▸ Check output voltage from alternator then repair or replace as necessary. Go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF" & disconnect HO2S(B1/S1) connector.

2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 2 of HO2S(B1/S1) harness connector and chassis ground.

Specification : Approx. 0 V



4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B1/S1) "Component Inspection" procedure.

NO

▸ Repair short to battery in HO2S(B1/S1) Heater control circuit and go to "Verification of Vhicle Repair" procedure.

COMPONENT INSPECTION

1. Check HO2S(B1/S1) Heater resistance.
   (1) IG "OFF" and disconnect HO2S(B1/S1) connector.
   (2) Measure resistance between terminal 1 and 2 of HO2S(B1/S1)connector (Component Side)
   Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5

   (3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Substitute with a known - good HO2S(B1/S1) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "

5. Are any DTCs present ?

YES

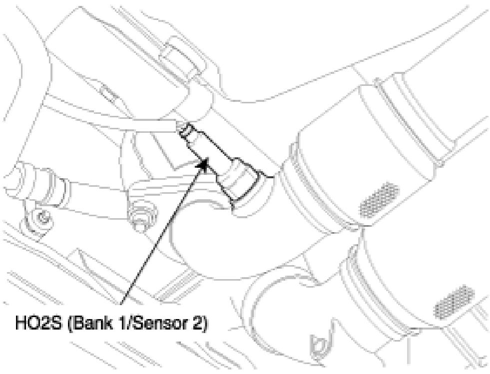
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0037

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • Open in Power Circuit • Open or short to ground in control circuit • HO2S(B1/S2) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• short to ground or open circuit

GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.The

PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

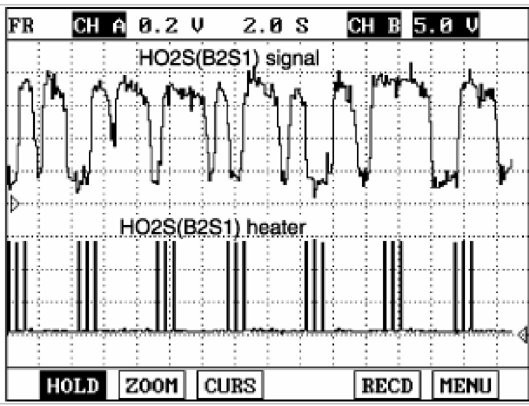
DTC DESCRIPTION

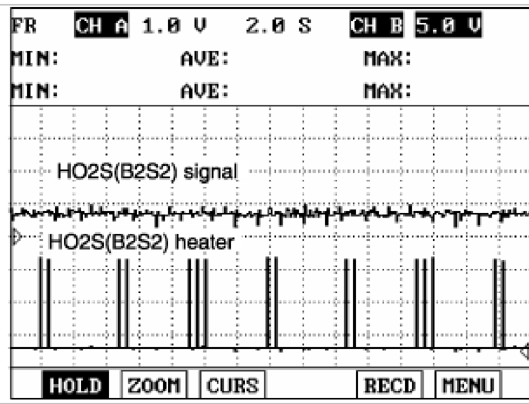
If the PCM detects heater output voltage is higher than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • Open or short to battery in control circuit • HO2S(B2/S1) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• short to battery	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA





The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

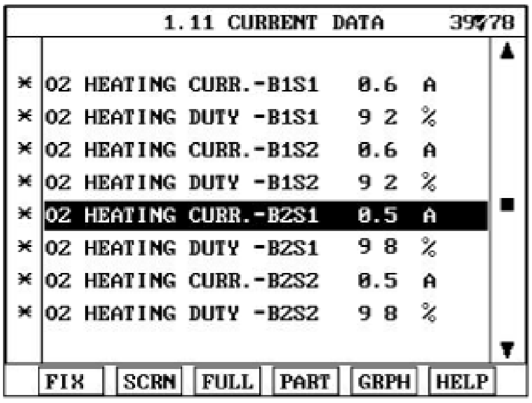
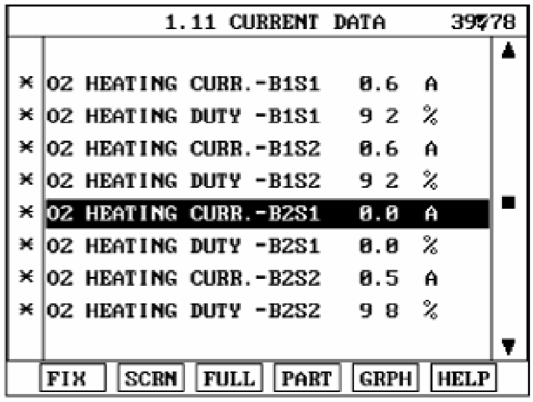
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B2/S1)" status on the service data.



Normal data - idle



Open circuit(HO2S heater-B2S1)

4. Is the "HO2S Heater(B2/S1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

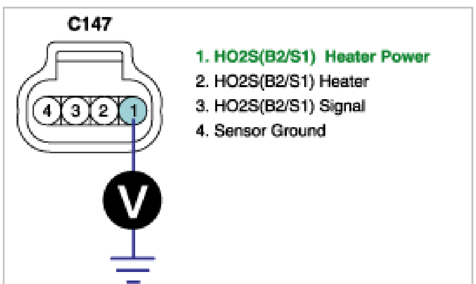
NO

▸ Go to " Power Circuit Inspection " as follows

POWER CIRCUIT INSPECTION

1. IG "OFF" & Disconnect HO2S(B2/S1) connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of HO2S(B2/S1) harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B2/S1) heater "Control Circuit Inspection" procedure.

NO

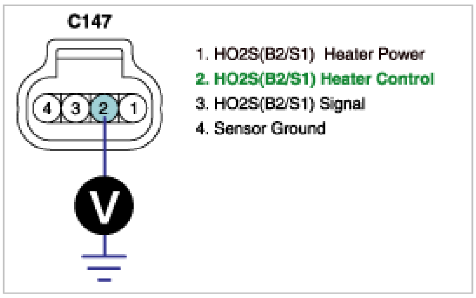
▸ Repair open or short to ground in HO2S(B2/S1) Heater power circuit then, go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF" & disconnect HO2S(B2/S1) connector.

2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 2 of HO2S(B2/S1) harness connector and chassis ground.

Specification : Approx. 0 V



4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B2/S1) "Component Inspection" procedure.

NO

▸ Repair short to battery in HO2S(B2/S1) Heater control circuit and go to "Verification of Vhicle Repair" procedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S1) Heater resistance
   (1) IG "OFF" and disconnect HO2S(B2/S1) connector
   (2) Measure resistance between terminal 1 and 2 of HO2S(B2/S1)(Component Side)
   Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5

   (3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Substitute with a known - good HO2S(B2/S1) and check for proper operation. If the problem is corrected, replace HO2S (B2/S1) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "

5. Are any DTCs present ?

YES

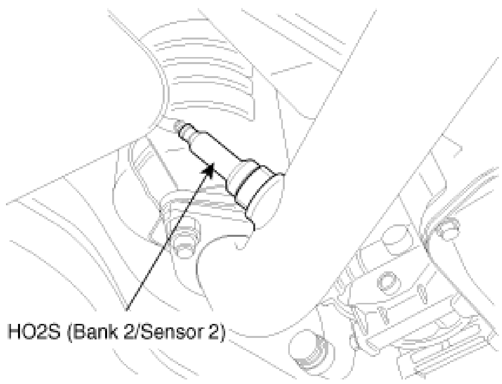
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0057

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

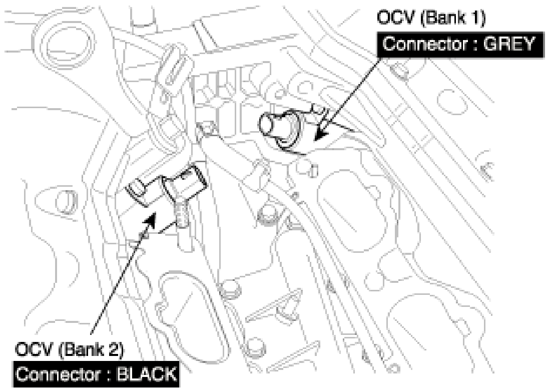
Fuel System > Troubleshooting > P0076

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM controls OCV(Oil Contol Valve) with PWM (Pulse Width Modulator) signal to change oil passages supplying oil to CVVT that makes CAM postion changes (advance or retard). OCV is integrated with oil filter and located at the nearest CVVT on the engine block.

The oil control valve is commanded by a pulse-width-modulated signal from the engine control unit. A duty cycle of zero commands the cam phaser to its default position. A duty cycle of 100% commands the phaser to its maximum phased position. When the phaser must be controlled to an intermediate position, the duty cycle is maintained in the region of the 'hold position'. This is a medium duty cycle, usually between 35% and 65%, depending on temperature and voltage conditions. As the cam phaser is advanced and retarded, its position is measured using a toothed wheel.

The wheel is attached to the camshaft, or to the cam phaser rotor. A sensor picks up the signal from the wheel and its output is read by the engine control unit. A cam signal is generated for each cam phaser on the engine. This requires a separate toothed wheel and cam sensor combination for each cam phaser. The cam signal and crankwheel signal are compared as the engine turns, and the phasing position is determined. The position is displayed in crank angle degrees, relative position from default. This position measurement is used as feedback for the position control software, which determines the required percent duty cycle commanded to the oil control valve.

DTC DESCRIPTION

When the enable condition is satisfied The PCM checks that high and low outputs (Voltage level) are observed when OCVs are commanded. When a OCV output failure is detected, the appropriate fail counter is incremented.

If the failure threshold is exceeded 5 seconds during one diagnostic test(10second), the test is failed and DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of VCPD Bank 1 Intake circuit output	• Poor Connection • Open in Power Circuit • Open or short to ground in control circuit • OCV • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay ≥ 0.5sec	
Threshold value	• Short to ground or open circuit	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles

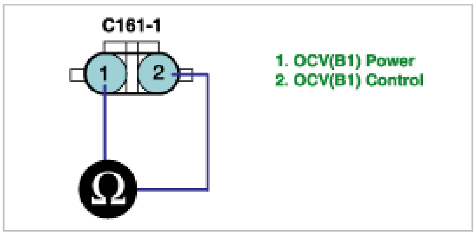
COMPONENT INSPECTION

1. Check OCV
   (1) IG "OFF" and disconnect OCV connector.
   (2) Measure resistance between terminal 1 and 2 of OCV. (Component Side)

Specification :

Resistance (Ω)	6.7 ~ 7.7



(3) Is the measured resistance within specification ?

YES

▸ Go to "OCV Actuation Test" as follows.

NO

▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

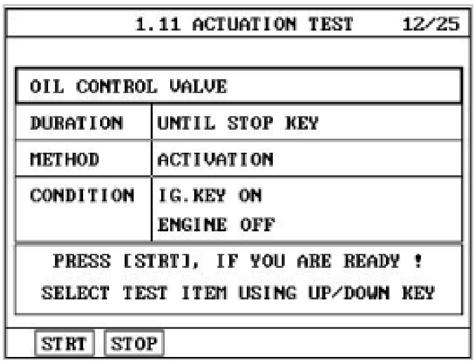
2. OCV Actuation Test

(1) Connect scantool and IG "ON".

(2) Select "OCV" on the Actuation Test.

(3) Activates "OCV" by pressing "STRT(F1)" key.
(should hear a faint click from Oil Control solenoid Valve)

(4) Repeat this procedure 4 or 5 times to ensure intake valve control solenoid reliability



(5) Does OCV generate clik sound during acutation test ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

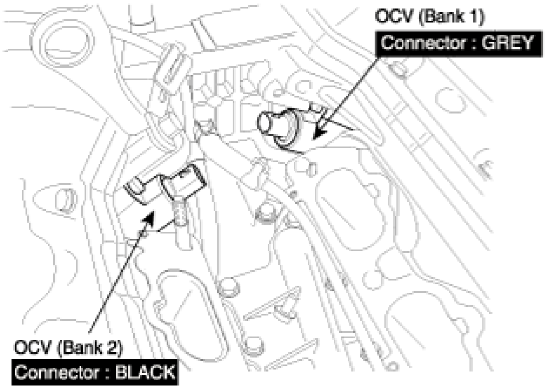
YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM controls OCV(Oil Contol Valve) with PWM (Pulse Width Modulator) signal to change oil passages supplying oil to CVVT that makes CAM postion changes (advance or retard). OCV is integrated with oil filter and located at the nearest CVVT on the engine block.
The oil control valve is commanded by a pulse-width-modulated signal from the engine control unit. A duty cycle of zero commands the cam phaser to its default position. A duty cycle of 100% commands the phaser to its maximum phased position. When the phaser must be controlled to an intermediate position, the duty cycle is maintained in the region of the 'hold position'. This is a medium duty cycle, usually between 35% and 65%, depending on temperature and voltage conditions. As the cam phaser is advanced and retarded, its position is measured using a toothed wheel.
The wheel is attached to the camshaft, or to the cam phaser rotor. A sensor picks up the signal from the wheel and its output is read by the engine control unit. A cam signal is generated for each cam phaser on the engine. This requires a separate toothed wheel and cam sensor combination for each cam phaser. The cam signal and crankwheel signal are compared as the engine turns, and the phasing position is determined. The position is displayed in crank angle degrees, relative position from default. This position measurement is used as feedback for the position control software, which determines the required percent duty cycle commanded to the oil control valve.

DTC DESCRIPTION

When the enable condition is satisfied The PCM checks that high and low outputs (Voltage level) are observed when OCVs are commanded. When a OCV output failure is detected, the appropriate fail counter is incremented.
If the failure threshold is exceeded 5 seconds during one diagnostic test(10second),the test is failed and DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to battery of VCPD Bank 1 Intake circuit output	• Poor Connection • Short to battery in Control Circuit • OCV • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay ≥ 0.5sec	
Threshold value	• Short to battery	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles

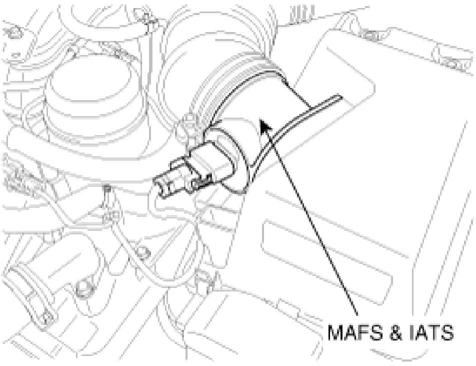
Fuel System > Troubleshooting > P0101

COMPONENT LOCATION



GENERAL DESCRIPTION

The Delphi MAF Sensor is an air mass flowmeter, which operates on the principle of hot film anemometry. A heated element is placed within the air stream, and maintained at a constant temperature above the air temperature. The amount of electrical power required to maintain the heated element at the proper temperature is a direct function of the flow rate of the air mass past the element. PCM uses this information to determine the injection duration and ignition timing for the desired air/fuel ratio.

DTC DESCRIPTION

The difference between values coming from the MAF Sensor and those are calculated is analyzed. This difference, or error, is then compared to high and low limit calibration values, which are functions of engine speed. PCM compares the difference between MAFS output and calculated flow rate value while enable condition is met.
If the acutal air flow is higher than Maximum threshold, or lower than Minimum threshold for more than 75 seconds failure for every 125 seconds test. PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The MAF Rationality Diagnostic compares the difference between MAF Sensor output and calculated flow rate value to a calibration value	• Poor connection • Open or short in harness • Clogged air cleaner • MAFS • PCM
Enable Conditions	• Barometric Pressure enable conditions criteria met • Engine Coolant Temperature ≥ 60°C • 600rpm < Engine Speed < 3000rpm • Air Conditioning Clutch not transitioning • Torque Control is not Active • Traction Control is not Active • Brake switch is not active • Current Transmission Torque Converter Clutch State same as previous • Power Steering is not Cramped • Engine Speed difference ≤ 300rpm • TPS value difference ≤ 5% • MAP value difference ≤ 7 kPa • Idle Airflow difference ≤ 10% • VCPC changes ≤ 10% • MAP TPS Rationality High Power Condition Fail Criteria Not Met • MAP TPS Rationality Low Power Condition Fail Criteria Not	

		Met • MAP TPS Rationality Decel. Condition Fail Criteria Not Met • BARO Update Enable Criteria Met • Enable Timer ≥ 1.5s
Thresh old value	Case 1	• Acutal Air Mass Value < Positive Memorized Value
	Case 2	• Acutal Air Mass Value > Negative Memorized Value
Diagnosis Time		• Continuous (More than 75 seconds failure for every 125 seconds test)

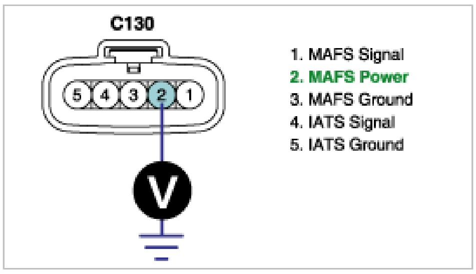
▶ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and Disconnect MAFS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 2 of MAFS harness connector and chassis ground

Specification : B+



4. Is the measured resistance within specification ?

YES

▶ Go to "Ground Circuit Inspection" proceudure.

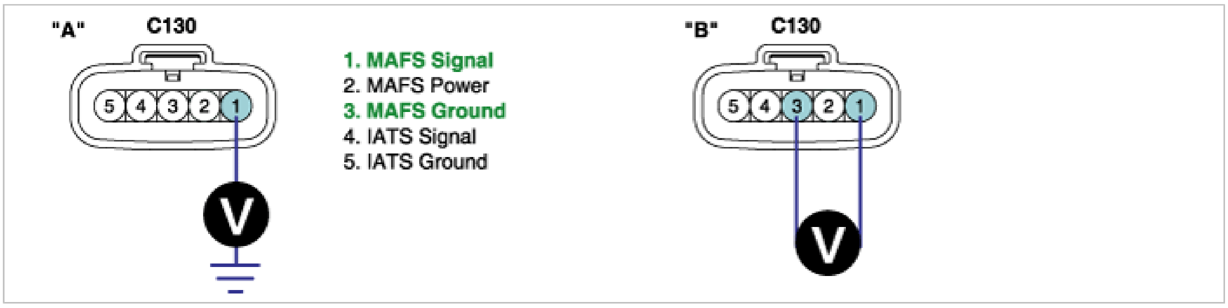
NO

▶ Check that fuse between MAFS and Main Relay is open or not installed.
▶ Check open in power circuit between MAFS and Main Relay.
▶ Go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAFS connector.
2. Measure voltage between terminal 1 of MAFS harness connector and chassis ground.
3. Measure voltage between terminal 1 and 3 of MAFS harness connector.

Specification : Voltage difference between Measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

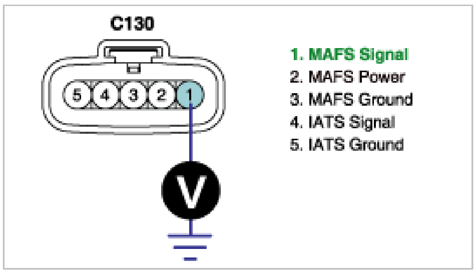
NO

▸ Repair contact resistance or open in harnesss and then go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAFS connector.
2. IG "ON' & ENG "OFF".
3. Measure voltage between terminal 1 of MAFS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection
   (1) Check that MAFS is damaged, contaminated or deformed.
   (2) Check tha air cleaner is clogged.
   (3) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check MAFS" as follows

2. Check MAFS
   (1) IG "OFF" and install a scantool
   (2) ENG "ON" and monitor "MAFS" data on the service data.
   (3) Monitor signal waveform at terminal 1 of MAFS with scantool.

   Specification :Signal waveform will be displayed as follows. (Be aware that the signal of MAFS is not voltage display but frequency display.)

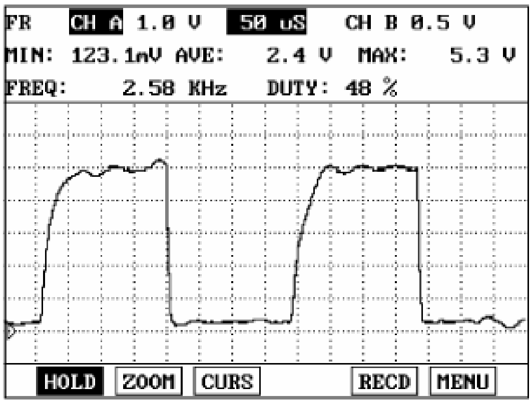


Fig. 1

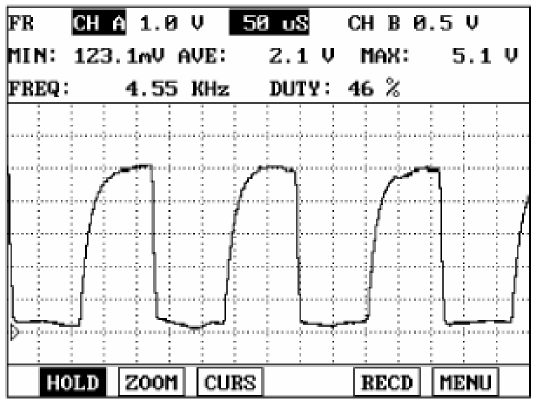

Fig. 2

Fig. 1 : Idle
Fig. 2 : Acceleration

(4) Are both service data and signalwave form dispayed correctly ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good MAFS and check for proper operation. If the problem is corrected, replace MAFS and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

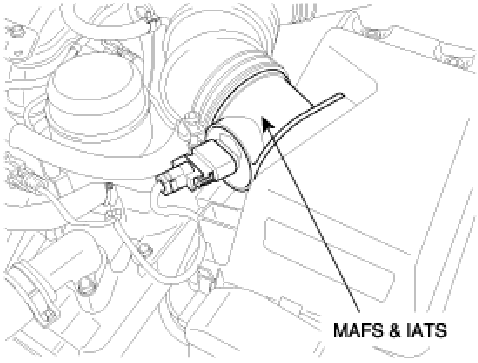
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0102

COMPONENT LOCATION



GENERAL DESCRIPTION

The Delphi MAF Sensor is an air mass flowmeter, which operates on the principle of hot film anemometry. A heated element is placed within the air stream, and maintained at a constant temperature above the air temperature. The amount of electrical power required to maintain the heated element at the proper temperature is a direct function of the flow rate of the air mass past the element. PCM uses this information to determine the injection duration and ignition timing for the desired air/fuel ratio.

DTC DESCRIPTION

The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to low and high limits. When the frequency is outside the allowable limits, the circuit is determined to be failed. When a MAF Sensor fails, it may cause the fuel control subsystem to deliver an incorrect quantity of fuel. The most probable failure modes of the MAF Sensor system are an open or short circuit, resulting in a low frequency code setting.
If PCM detects that output of MAFS is lower than 720Hz for more than 75 second failure during one dignostic test(125 second) while enable condition is met PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

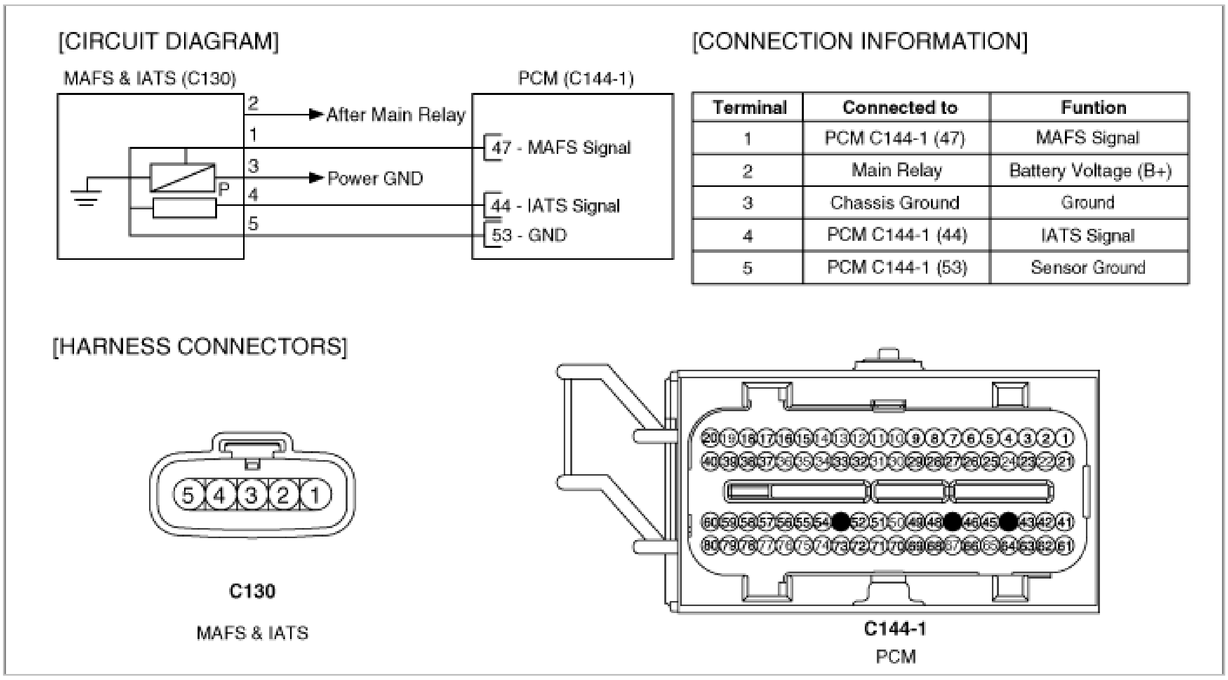
Item	Detecting Condition	Possible cause
DTC Strategy	• The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to a low limit	• Poor Connection • Open or short in harness • Clogged air cleaner • MAFS • PCM
Enable Conditions	• Engine Speed ≥ 500 rpm • Engine Running Time ≥ 5 second • Ignition Voltage ≥ 11V • Conditions met delay time ≥ 1 second	
Threshold value	• MAF frequency signal < 1000Hz	
Diagnosis Time	• Continuous (More than 75 second failure for every 125 second tests)	
MIL On Condition	• 2 Driving Cycles	

SPECIFICATION

Air Flow (kg/h)	Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz
43.2 kg/h	4,024Hz
57.6 kg/h	4,399Hz
72.0 kg/h	4,704Hz
108.0 kg/h	5,329Hz
144.0 kg/h	5,897Hz

198.0 kg/h	6,553Hz
270.0 kg/h	7,240Hz
360.0 kg/h	7,957Hz
486.0 kg/h	8,738Hz
666.0 kg/h	9,644Hz
900.0 kg/h	10,590Hz

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "Air Flow" status on the service data.
   Specification :

Air Flow (kg/h)	Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz
43.2 kg/h	4,024Hz
57.6 kg/h	4,399Hz
72.0 kg/h	4,704Hz
108.0 kg/h	5,329Hz
144.0 kg/h	5,897Hz
198.0 kg/h	6,553Hz
270.0 kg/h	7,240Hz
360.0 kg/h	7,957Hz
486.0 kg/h	8,738Hz
666.0 kg/h	9,644Hz

900.0 kg/h	10,590Hz

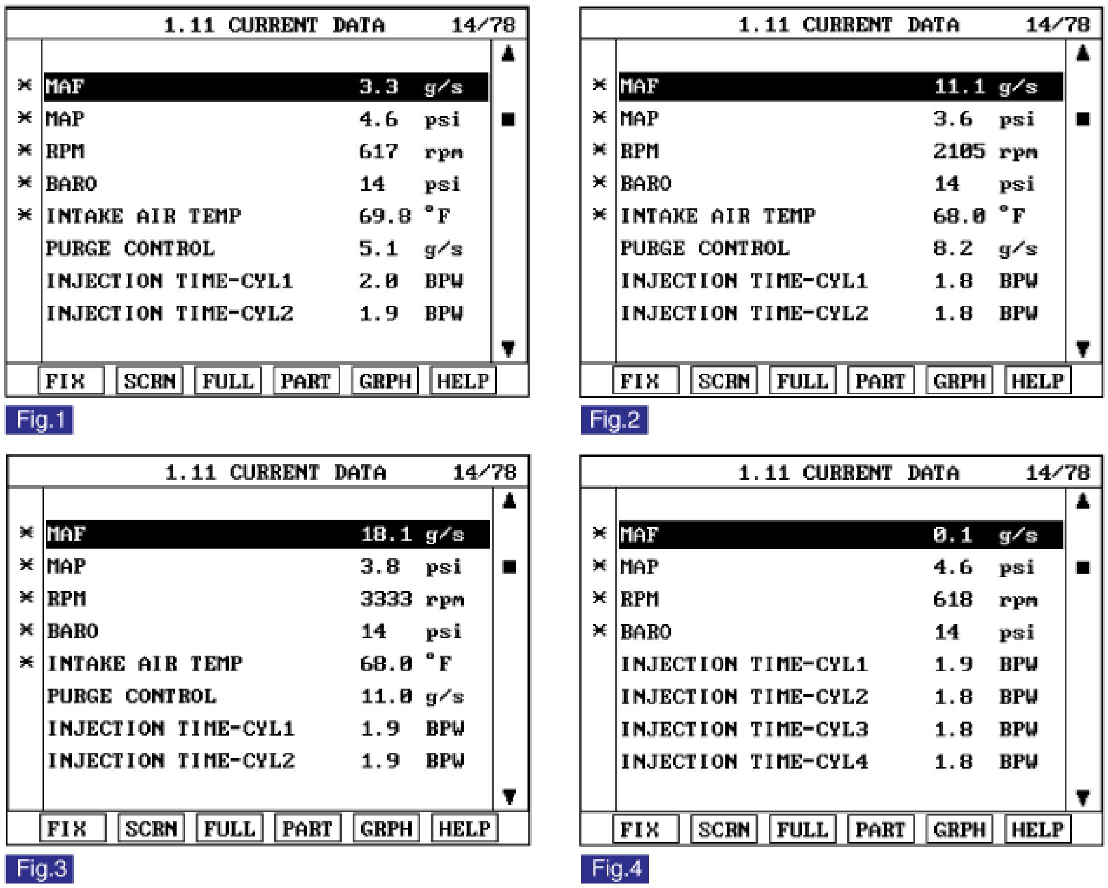


Fig.1: Idle
Fig.3: 3000 rpm

Fig.2: 2000 rpm
Fig.4: Open in signal harness

4. Are the "Air Flow" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

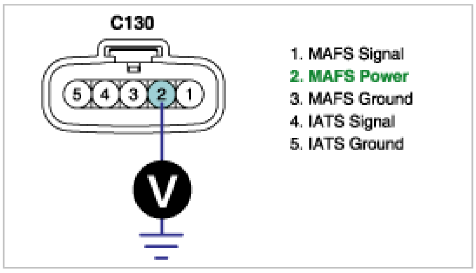
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and Disconnect MAFS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 2 of MAFS harness connector and chassis ground

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" Procedure.

NO

▸ Check fuse between MAFS and main relay is open or not installed.
▸ Repair open in power harness between MAFS and main relay and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect MAFS connector.
   (2) IG "ON' & ENG "OFF".
   (3) Measure voltage between terminal 1 of MAFS harness connector and chassis ground.

Specification : Approx. 5V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Ground circuit inspection" procedure.

NO

▸ If the measured voltage is "0", go to "Check open in harness" as follows. If the measured voltage is over "5V", go to " Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 and 2 of MAFS harness connector.
   (3) Measure resistance between terminal 1 and 4 of MAFS harness connector.

Specification : Infinite

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Check short to ground in harness" as follows.

NO

▸ Repair short to battery in harness and go to "Verification of Vehicle Repair" procedure.

3. Check short to ground in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 of MAFS harness connector and chassis ground.

Specification : Infinite

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ epair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

4. Check open in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 of MAFS harness connector and terminal 47 of PCM harness connector.

Specification : Approx. below 1Ω.

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Ground circuit Inspection" procedure.

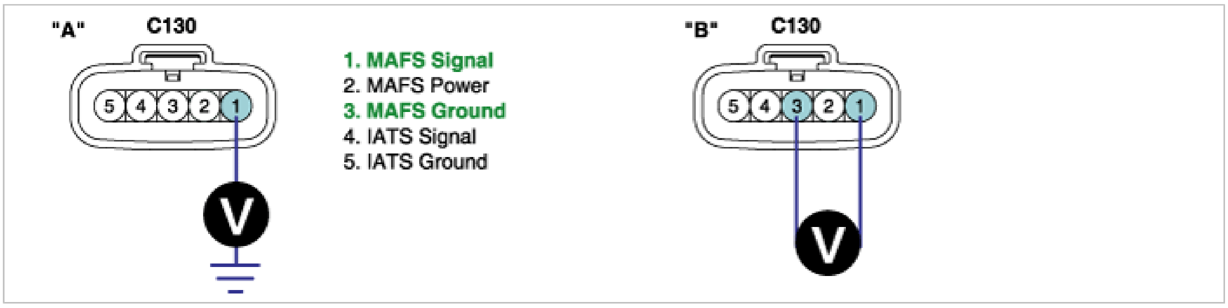
NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAFS connector.
2. Measure voltage between terminal 1 of MAFS harness connector and chassis ground.
3. Measure voltage between terminal 1 and 3 of MAFS harness connector.

Specification : Voltage difference between Measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact resistance or open in harnesss and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection
   (1) Check that MAFS is damaged, contaminated or deformed.
   (2) Check tha air cleaner is clogged.
   (3) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check MAFS" as follows

2. Check MAFS
   (1) IG "OFF" and install a scantool
   (2) ENG "ON" and monitor "MAFS" data on the service data.
   (3) Monitor signal waveform at terminal 1 of MAFS with scantool.

   Specification :Signal waveform will be displayed as follows. (Be aware that the signal of MAFS is not voltage display but frequency display.)

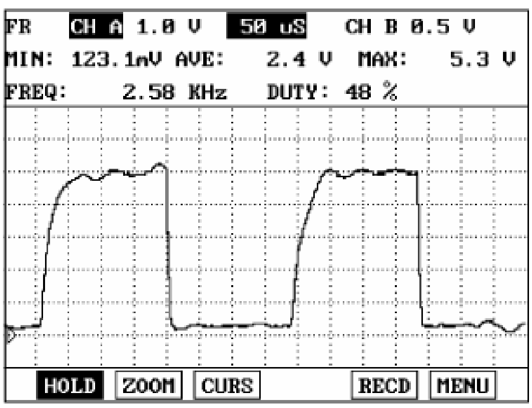


Fig. 1

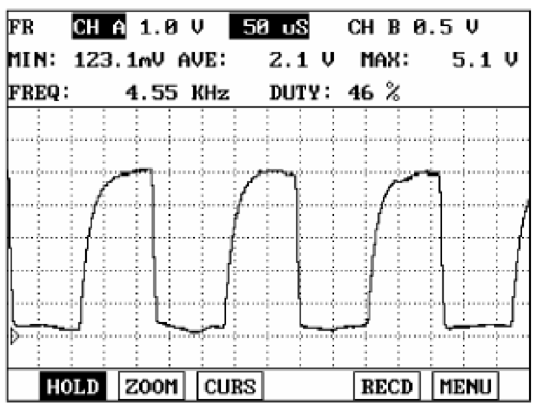

Fig. 2

Fig. 1 : Idle
Fig. 2 : Acceleration

   (4) Are both service data and signalwave form dispayed correctly ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good MAFS and check for proper operation. If the problem is corrected, replace MAFS and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

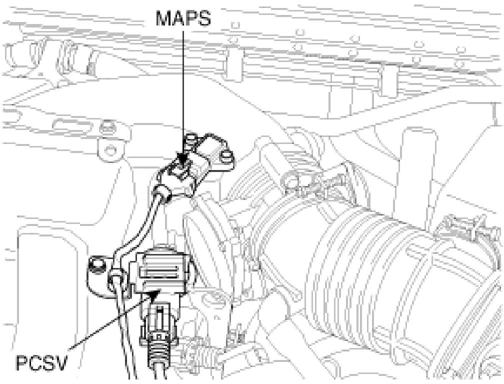
Fuel System > Troubleshooting > P0106

COMPONENT LOCATION



GENERAL DESCRIPTION

The amount of intake air flow must be inputted to PCM in order to determine the fuel injection quantity. To measure the pressure inside of intake manifold, MAFS is used at idle and MAPS is required at accelerating. MAPS(Manifold Absolute Pressure) calculates the amount of air indirectly as measuring the pressure inside of intake manifold. This mechanism is alsl called Speed-Density Type.MAPS transfers analog output signal which is proportional to the change of intake manifold pressure, then, with this signal and RPM, PCM calculates the amount of intake air flow. MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

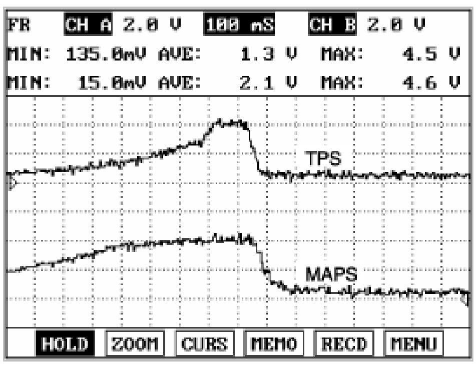
The MAP/TPS Rationality Diagnostic is comprised of two tests. A deceleration test is performedto provide a robust method for detection of an altitude compensated MAP value that is too high for the deceleration condition. The second test compares the altitude compensated MAP value to both high and low limits, dependent upon throttle position and engine speed. When the MAP value is out of the threshold range, the MAP/TPS system is determined to be failed.
When the MAP/TPS Rationality Diagnostic fails, the effects may cause the fuel control subsystem to deliver an incorrect quantity of fuel. The most probable failure modes of the MAP Sensor system are a skewed MAP or TPS sensor, resulting in a poor correlation between MAP and TPS
To ensure the vehicle is not performing in a transient maneuver, input signals and control parametersare monitored for stability for both the deceleration test and the power test. A large enough change inany of these stability parameters indicates that either the actual airflow rate or the calculated airflowrate may be misrepresented during the transient condition. Inclusion of this check for stability allowsbetter separation of passing and failing systems.
PCM compares the difference between MAPS output and calculated MAPS value while enable condition ismet. If the acutal MAP value is higher than Maximum threshold or lower than Minimum threshold for 15 secondfailure during one diagnostic test(32 second),PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• The MAP reading is compared to expected MAP high and low limits based on engine speed & Throttle Position	
	Case 1	**Decel Stable Conditions Criteria** • Engine State = Run • MAP_TPS_Rationality Fault is not present • Valid barometric pressure update • 1300rpm ≤ Engine speed ≤ 4500rpm • Idle Airflow Stable ≤ 4.9988% • -10°C< Coolant Temperature above minimum threshold	
		Power Stable Conditions Criteria • Engine State = Run • MAP_TPS_Rationality Fault is not present • Valid barometric pressure update • 1300rpm ≤ Engine speed ≤ 4000rpm	

Enable Conditions	Case 2	• HVAC Clutch not transitioning • Traction control not active • Torque fuel reduction not active • Brake Switch Not Activated • Coolant Temperature ≥ 60°C • TPS value difference ≤ 4.9988% • MAP value difference ≤ 5kPa • Idle Airflow Stable ≤ 4.9988% • Bank 1 VCPC ≤ 10 degree • Bank 2 VCPC ≤ 10 degree	• Poor connection • Open or short in harness • MAPS • PCM
	Case 3	**Decel Enable Conditions Criteria** • Decel Stable Conditions Present • Throttle position < 0.2991% • Vehicle Speed ≥ 30kph • The minimum consecutive time that the engine operating conditions must meet the enable criteria	
	Case 4	**Power Enable Conditions Criteria** • Power Stable Conditions Present • The minimum consecutive time that the engine operating conditions must meet the enable criteria > 3 second	
Threshold value	Case 1	**Power Test** • Altitude compensated MAP < Memorized min. MAP data • Altitude compensated MAP > Memorized max. MAP data	
	Case 2	**Decelleration Test** • Altitude compensated MAP < Memorized MAP data	
Diagnosis Time		• Continuous (More than 15 seconds failure for every 32 seconds test)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



It is necessary that MAPS should be checked along with TPS. Because The MAP/TPS Rationality Diagnostic is comprised of two tests. A deceleration test is performed to provide a robust method for detection of an altitude compensated MAP value that is too high for the deceleration condition. The second test compares the altitude compensated MAP value to both high and low limits, dependent upon throttle position and engine speed. When the MAP value is out of the threshold range, the MAP/TPS system is determined to be failed.

4. Are the "MAPS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

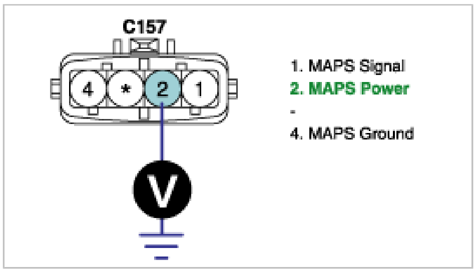
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAPS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 2 of MAPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Ground circuit inspection" procedure.

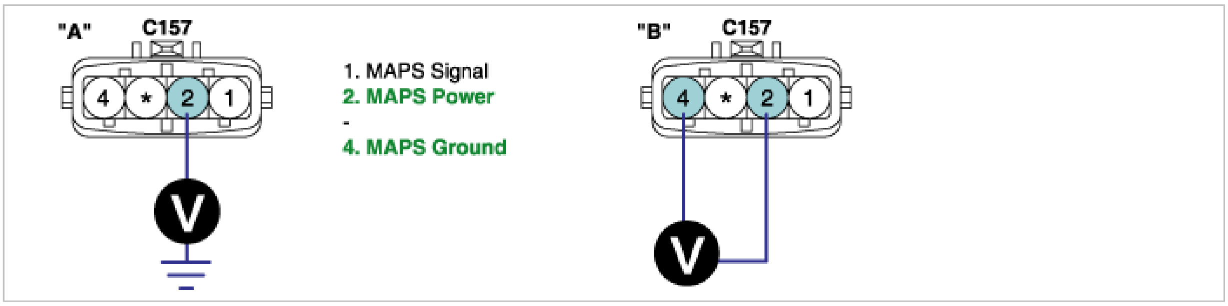
NO

▸ Repair open or short to ground in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAPS connector.
2. Measure voltage between terminal 2 of MAPS harness connector and chassis ground.
3. Measure voltage between terminal 2 and 4 of MAPS harness connector.

Specification : Voltage difference between Measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect MAPS connector.
   (2) IG "ON" & ENG "OFF"
   (3) Measure voltage between terminal 1 of MAPS harness connector and chassis ground.

Specification : Approx. 0V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnet MAPS and PCM connector.
   (2) Measure resistance between terminal 1 of MAPS harness connector and terminal 8 of PCM harness connector.

Specification : Approx. Below 1 Ω

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

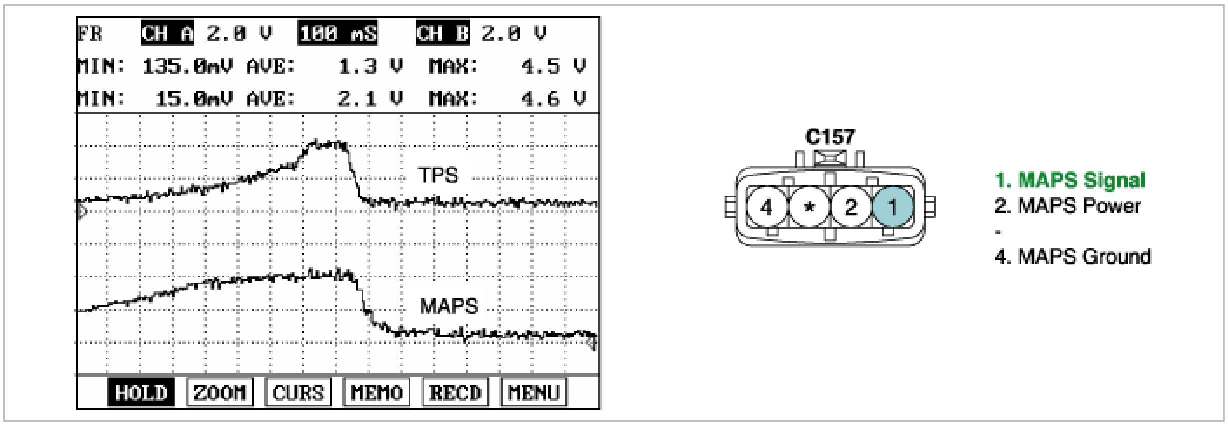
▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check MAPS Performance
   (1) IG "OFF" and install scatool.
   (2) Connect probe to MAPS and TPS to check signal waveform by using oscilloscope function.

(3) ENG "ON" and monitor signal waveform during accelleration and decelleration.
Specificaton :

Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				



(4) Is the measured signal waveform(MAP/TPS Rationality) O.K ?

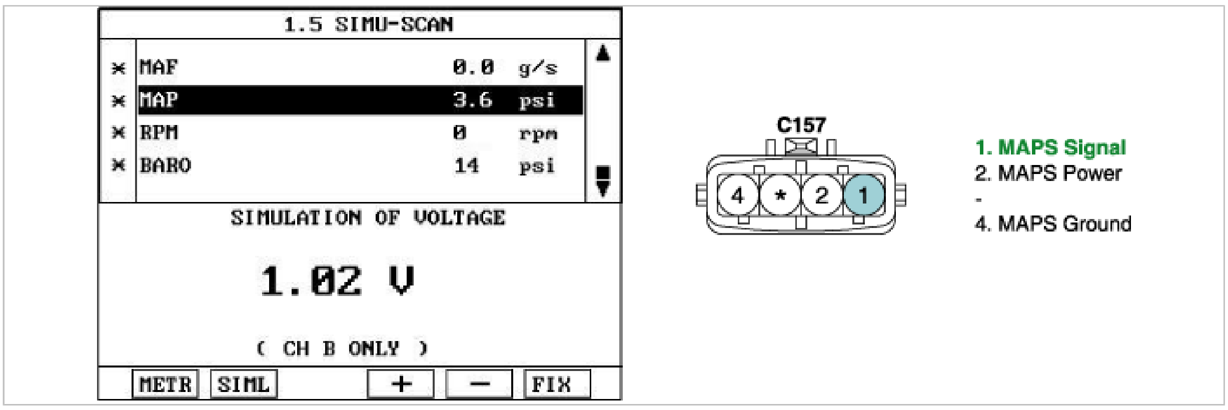
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good MAPS and check for proper operation. If the problem is corrected, replace MAPS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" disconnect MAPS connector
   (2) Connect Scantool and IG "ON" & ENG "OFF"
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal 1 of MAPS harness connector.



(5) Does the signal value of MAP sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

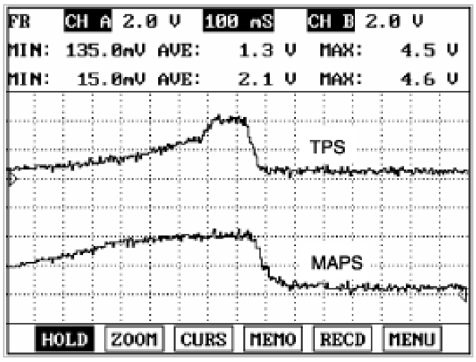
Checking output signals of MAPS every 5 sec. under detecting condition, if an output signal is below 0.25V for more than 2.5 sec., PCM sets P0107. Warning lamp turns on when the malfunction lasts till continuous 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• This code detects a continuous short to low or open in either the signal circuit or the MAP	• Connecting condition • Open or short to ground in power circuit • Open or short to ground in signal circuit • MAPS
Enable Conditions	Case 1	• No TPS Active Fault Present • Ignition Voltage ≥ 11V • Engine Speed ≤ 1000rpm • Throttle Position ≥ 0%	
	Case 2	• No TPS Active Fault Present • Ignition Voltage ≥ 11V • Engine Speed >1000rpm • Throttle Position ≥ 30%	

Threshold value	• MAP Signal < 0.25V	• PCM
Diagnosis Time	• Contineous (More than 2.5 seconds failure for every 5 seconds test)	
MIL On Condition	• 2 Driving Cycle	

SIGNAL WAVEFORM AND DATA

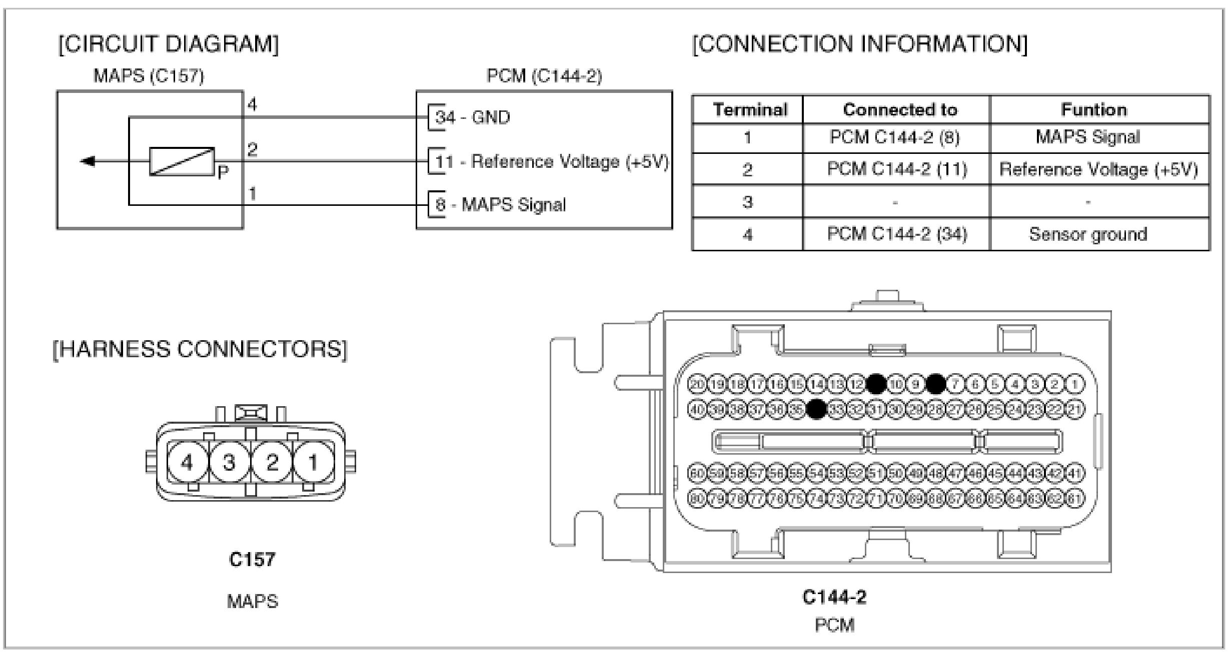


Comparing MAPS and TPS, The signals of MAPS and TPS increasess and decrease simultaneously.

SPECIFICATION

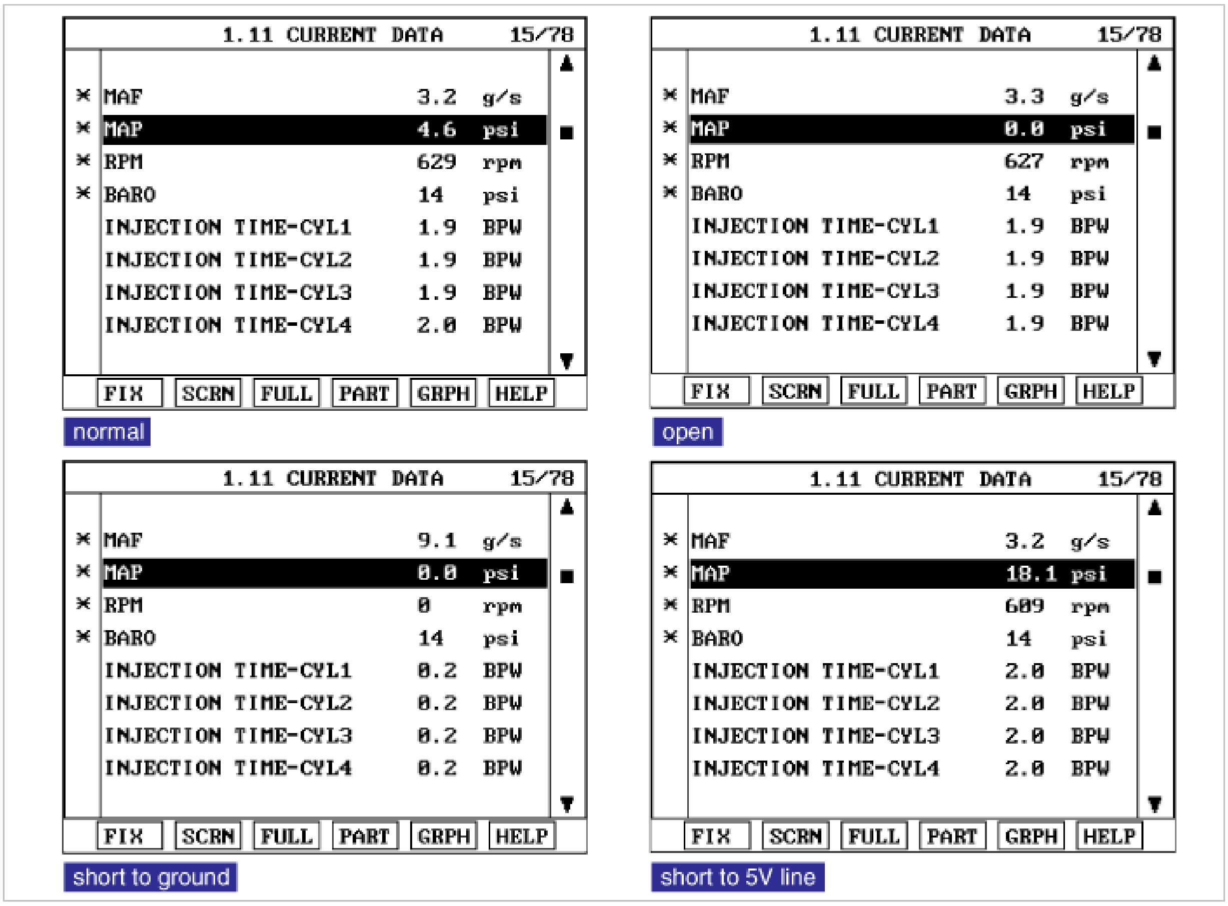
Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Cable (DLC)
2. Warm up engine to normal operating temperature
3. Monitor "MAPS" parameter on the scantool.



4. Is the current data displayed correctly ?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

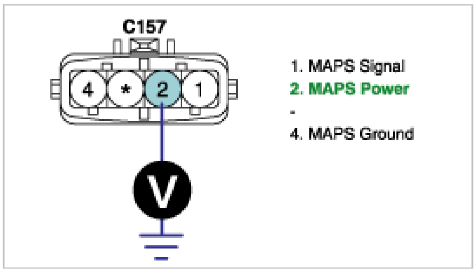
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect MAPS connector.
3. IG "ON"
4. Measure the voltage between terminal 2 of MAPS harness connector and ground.

Specification : Approx. 5V



5. Is the measured voltage within specification ?

YES

▶ Go to "Signal Circuit Inspection" of MAPS.

NO

▶ After repairing open or short to ground in circuits and go to "Verification of Vehicle Repair"

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness.
   (1) IG "OFF"
   (2) Disconnect MAPS and PCM connector.
   (3) Measure the resistance between terminal 1 of MAPS harness connector and ground.

   Specification : Infinite

   (4) Is the measured resistance within the specification?

   YES

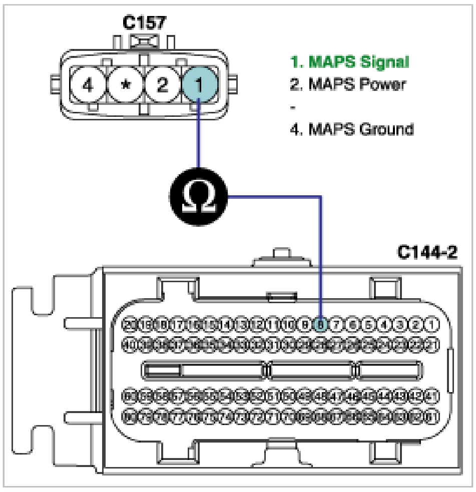
   ▶ Go to "Check open in the harness" procedure.

   NO

   ▶ After repairing short to ground in harness and go to "Verification of Vehicle Repair"

2. Check open in the harness
   (1) IG "OFF"
   (2) Disconnect MAPS and PCM connector.
   (3) Measure the resistance between terminal 1 of MAPS harness connector and terminal 8 of PCM harness connector

   Specification : Approx. below 1 Ω



(4) Is the measured resistance within the specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in the harness and go to "Verification of Vehicle Repair".

COMPONENT INSPECTION

1. MAPS performance test
   (1) IG "OFF"
   (2) Connect scantool to Data Link Connector(DLC) and selest "Oscilloscope" then, connect probes to output signal lines of MAPS and TPS.Turn engine "ON" and monitor the waveforms accelerating or decelerating
   (3) ENG "ON" and monitor signal waveform during accelleration and decelleration.
   Specificaton :

Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				

   (4) Is the waveform displayed correctly?(Compare the response time of TPS and MAPS)

YES

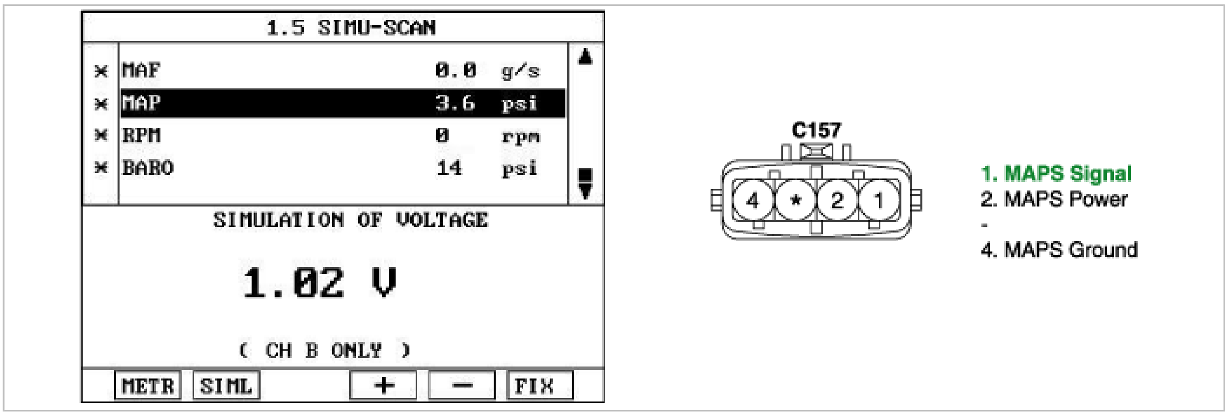
▸ Go to "Check PCM".

NO

▸ After replacing MAPS with new one, if it operates normally, replace MAPS and go to "Verification of Vehicle Repair".

2. Check PCM
   (1) IG "OFF" disconnect MAPS connector
   (2) Connect Scantool and IG "ON" & ENG "OFF"
   (3) Select simulation function on scantool.

(4) Simulate voltage at terminal 1 of MAPS harness connector.



(5) Does the output voltage response to the change of signal by simulation?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

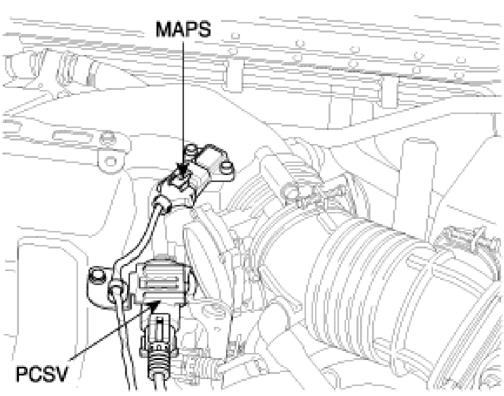
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0108

COMPONENT LOCATION



GENERAL DESCRIPTION

The amount of intake air flow must be inputted to PCM in order to determine the fuel injection quantity. To measure the pressure inside of intake manifold, MAFS is used at idle and MAPS is required at accelerating. MAPS(Manifold Absolute Pressure) calculates the amount of air indirectly as measuring the pressure inside of intake manifold. This mechanism is alsl called Speed-Density Type.
MAPS transfers analog output signal which is proportional to the change of intake manifold pressure, then, with this signal and RPM, PCM calculates the amount of intake air flow.
MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

Checking output signals of MAPS every 5 sec. under detecting condition, if an output signal is above 4.5V for more than 2.5 sec., PCM sets P0108. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

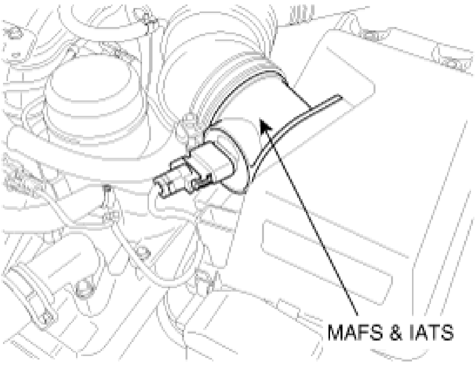
Fuel System > Troubleshooting > P0110

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

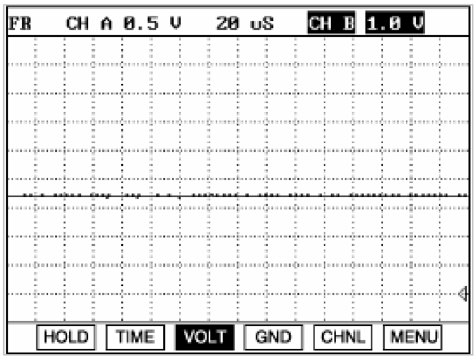
DTC DESCRIPTION

This test has two parts – the Stuck Start Test and the Stuck Drive test. The logic checks for movements in the IAT by comparing the min and max IAT values. If a sufficient difference is present, both parts of the test declare a PASS. Otherwise, the startup portion of the stuck test sets a “sensor stuck” flag and increments a counter while monitoring the min and max IAT. If the stuck condition persists, the counter eventually reaches its’ threshold and the startup test completes with the sensorstuck flag set.
If a PASS is not declared as mentioned above, the Drive portion of the stuck test also sets a “sensor stuck” flag and then checks for enough engine load to be present and if it is, it increments a counter. If the stuck condition persists and the engine continues to experience at least the minimum load, the counter eventually reaches its threshold indicating that enough engine heating as well as airflow introduction has taken place and sets a drive conditions complete flag. It then waits for the engine to return to idle. Once at idle, an idle counter is incremented until it reaches its threshold (as long as the stuck conditions persists). This completes the drive test and also the entire Stuck Test.
PCM monitors difference MAX. and MIN IATS in order to detect movement in IATS therough Start Test and Drive Test while enable condition is met. If PCM detects intake air temperature does not change PCM determines that a fault exists and a DTC is stored.
MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy	Case 1	• Start Test: Monitors the difference between max and min IAT in order to detect movement in IAT for a certain time.	• Poor connection • Open or short in harness • IATS • PCM
	Case 2	• Drive test: Performs the max and min delta check while driving under load for a length of time followed by an idle for a certain time.	
Enable Conditions		• Engine soaked time > 480min • Engine Running State • No disabling fault present • IAT stored previous trip • No IAT Tests pending	
Thresh old value	Case 1	• Max IAT - Min IAT ≤ 1°C • Start Test Counter ≥ 120	
	Case 2	• Max IAT - Min IAT ≤ 1°C • Idle Test Counter ≥ 120	
MIL On Condition		• 2 driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

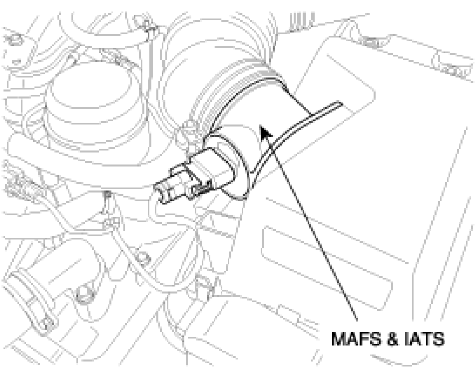
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0111

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The

PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

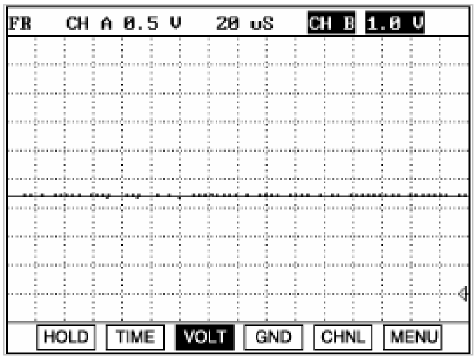
DTC DESCRIPTION

Determine if the IAT sensor reading is skewed high or low. As in the stuck test, the IAT sensor is exposed to conditions such as ample airflow introduction and engine heating that enhance the possibility of ambient temperature change. That helps the diagnostic in its' analysis
A skewed condition is suspected only if the IAT at startup differs from the coolant temperature by a minimum threshold on either the high or the low side. If it does not, the skew test declares a PASS.Otherwise, if IAT & ECT and the coolant temperature is greater than an allowed minimum, the Skew Low Test is executed. This test checks for enough engine load to be present and introduces a delay as long as the skewed condition persists. This allows sufficient airflow introduction and engine heating, and also allows time for the IAT reading to stabilize. If at any time during this delay the absolute difference between the startup and current IAT exceeds a maximum allowed value (drift check), no reporting is done and the test is disabled (case of vehicle being driven out of a heated garage in to a colder ambience, etc.). Otherwise, once the delay period is over, a fail counter isincremented and as it reaches its threshold, the low test completes and indicates a failure.On the other hand if a passing condition is not present and IAT & ECT, the Skew High Test is called. This test checks for enough engine load to be present and introduces a delay as long as the skewed condition persists. This allows sufficient airflow introduction and engine heating and also allows time for the IAT reading to stabilize. If at any time during this delay the absolute difference between the startup and current IAT exceeds a maximum allowed value (drift check), no reporting is done and the test is disabled (case of vehicle being driven out of an air conditioned garage into a warmer ambience, etc.). Once the delay period is over and the IAT is greater than a minimum threshold, a fail counter is incremented and as it reaches its threshold, the high test completes and indicates a failure. But if the IAT is less than this threshold, no reporting is done and test is disabled (again protection against case of vehicle being driven out of an air conditioned garage into a warmer ambience and setting a false MIL).
PCM monitors difference MAX. and MIN IATS in order to detect movement in IATS therough Start Test and Drive Test while enable condition is met. If PCM detects intake air temperature does not change PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detection condition	Possible cause
DTC Strategy	Case 1	• Skew Low Test: Monitors the difference between the startup coolant and IAT values	• Poor Connection • Open or short in harness • IATS • PCM
	Case 2	• Skew High Test: Monitors the difference between the startup IAT and coolant values	
EnableConditions	Case 1	• Engine soaked time ≥ 480min • Engine running state • No disabling faults present • IAT stored previous trip • IAT Skewed Test Not Complete • Startup Coolant Temperature >-20°C • Airflow >15 g/s • Vehicle speed >40kph	
	Case 2	• Engine soaked time ≥ 480min • Engine running state • No disabling faults present • IAT stored previous trip • IAT Skewed Test Not Complete • Airflow >15 g/s • Vehicle speed >40kph	
Thresh old value	Case 1	• Startup Coolant - Startup IAT ≥ 30°C	
	Case 2	• Startup IAT - Startup Coolant ≥ 20°C	
Diagnosis Time		• Continuous (More than 1.25 second failure)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. 2. IG "ON" and ENG "OFF"
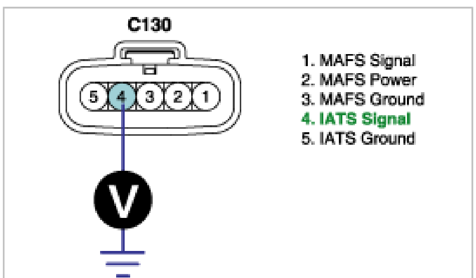
3. Measure voltage between terminal 4 of IATS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Check short to battery in harness.
▸ If O.K, go to "Ground Circuit Inspection" procedure.
▸ If N.G, repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

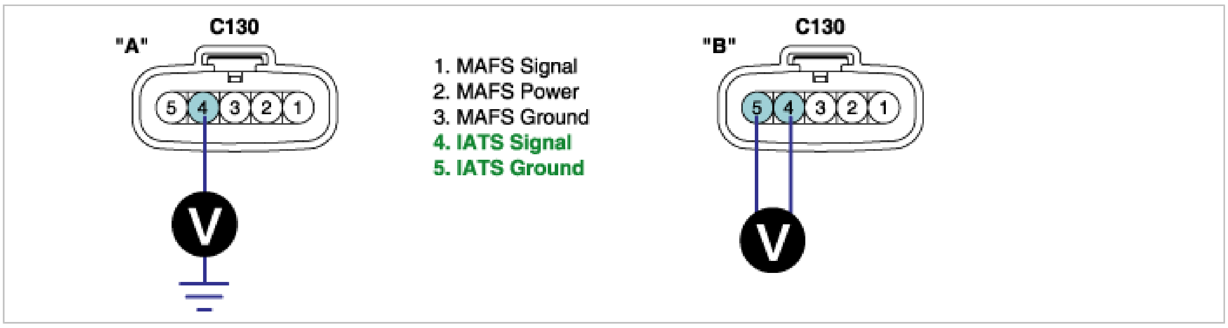
NO

▸ Repair open or short to ground in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect IATS connector.
2. Measure voltage terminal 4 of IATS harness connector and chassis ground.
3. Measure voltage terminal 4 and 5 of IATS harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact resistance or open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check resistance of IATS
   (1) IG "OFF" and disconnect IATS connector.
   (2) Measure resistance between terminal 4 and 5 of IATS connector.(Component Side)
   Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61
-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69
10(50)	5.49 ~ 5.83	80(176)	0.33 ~ 0.34

   (3) Is the measured resistance within specification ?

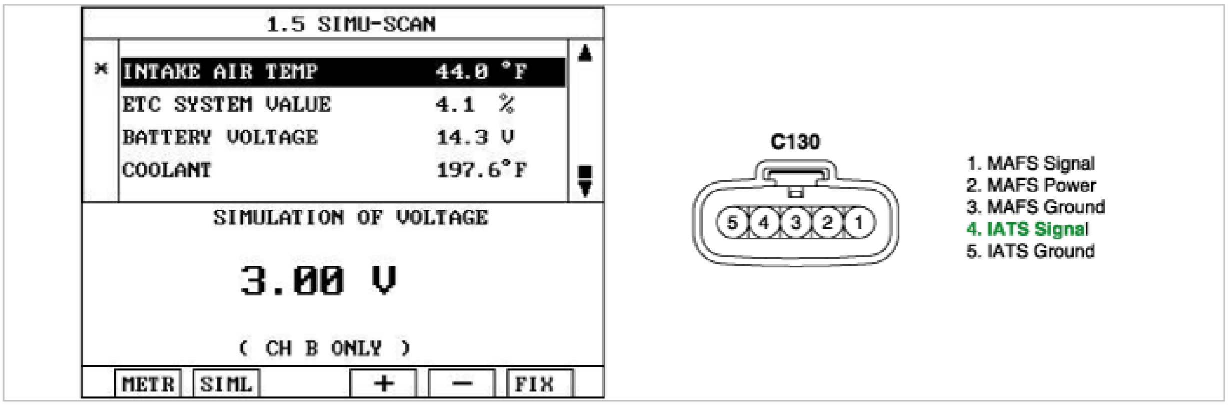
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good IATS and check for proper operation. If the problem is corrected, replace IATS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Disconnect IATS connector and connect probe to terminal 4 of IATS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 4 of IATS harness connector.



(5) Does the signal value of IAT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

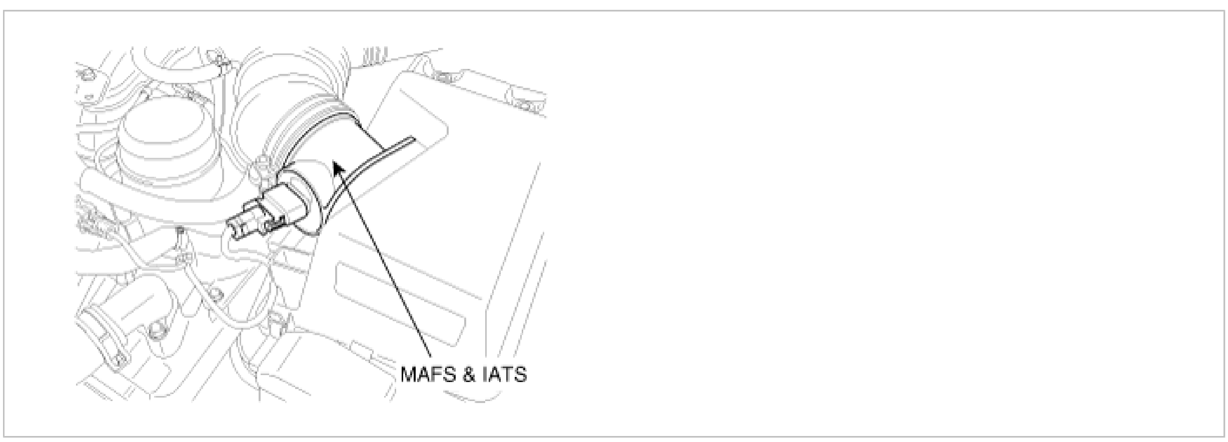
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0112

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

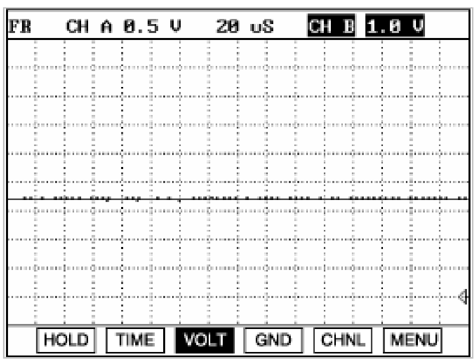
DTC DESCRIPTION

Checking output signals of IATS every 20 sec. under detecting condition, if an ouput signal is below 0.1V for more than 10 sec., PCM sets P0112. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• This code detects a continuous short to ground in either the signal circuit or the sensor	• Poor connection • Short to ground in harness • IATS • PCM
EnableConditions	Case 1	• Engine running state • No Vehicle speed sensor fault • Vehicle speed >50kph(30mph)	
	Case 2	• Engine running time >120 sec. • Time from IG "OFF" to IG "ON" >360 min.	
Threshold value		• Intake air temperature sensor's voltage< 0.1V	
Diagnosis Time		• Continuous (More than 10 seconds failure for every 20 seconds test)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61
-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69

4. Is the "IATS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect IATS connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 4 of IATS harness connector and chassis ground.

Specification : Approx. 5V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Go to " Check short to ground in harness" procedure.

2. Check short to ground in harness
   (1) IG "OFF" and disconnect IATS connector and PCM connector.
   (2) Measure resistance between terminal 4 of IATS harness connector and chassis ground.
   (3) Measure resistance between terminals 4 and 5 of IATS harness connector.
   (4) Measure resistance between terminals 4 and 3 of IATS harness connector.

Specification : Infinite

   (5) Is the measured resistance within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

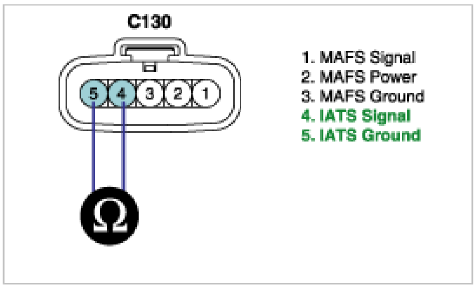
COMPONENT INSPECTION

1. Check IATS
   (1) IG "OFF" and disconnect IATS connector.
   (2) Measure resistance between teminals 4 and 5 of IATS connector.(Component side)

Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61

-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69
10(50)	5.49 ~ 5.83	80(176)	0.33 ~ 0.34



(3) Is the measured resistance within specification ?

YES

▸ Go to "Check PCM" as follows.

NO

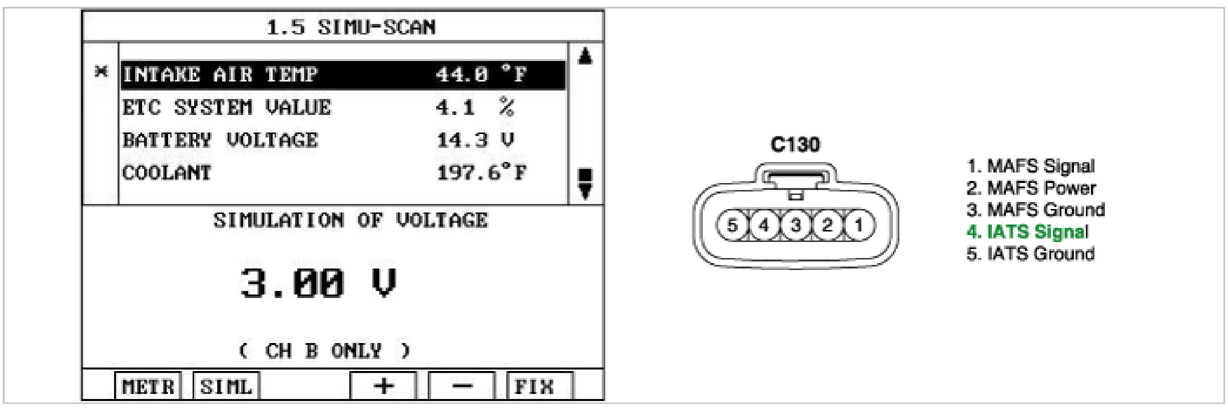
▸ Substitute with a known - good IATS and check for proper operation. If the problem is corrected, replace IATS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.

   (2) Disconnect IATS connector and connect probe to terminal 4 of IATS harness connector.

   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.

   (4) Simulate voltage at terminal 4 of IATS harness connector.



(5) Does the signal value of IAT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

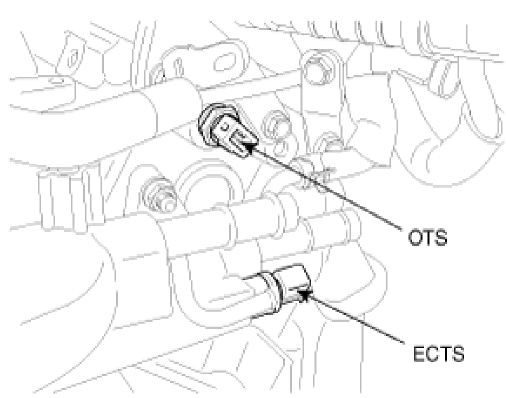
Fuel System > Troubleshooting > P0115

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature

(ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

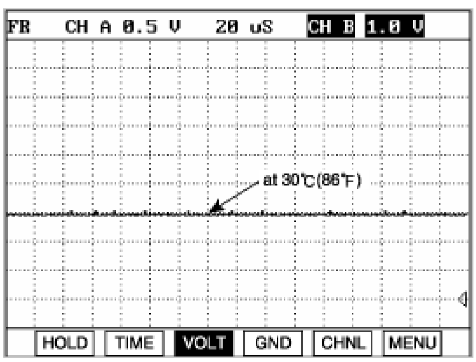
DTC DESCRIPTION

Failure mode is the coolant sensor output stuck. When this failure mode occurs, no change is observed in the ECT Sensor reading, even though the engine may be warming up from a cold start. It calculates the difference between the startup and current coolant temperatures and compares against the threshold. Insufficient change over this period of time indicates a failure.
PCM monitors difference between the startup and current coolant temperature and compares agaist the threshold while enable condition is met. If the PCM detects that the coolant temperature sensor signal change is less than 3°C for 120 second, PCM determines that a fault exists and a DTC is stored.
MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Rationality	• Poor connection • Low level of Engine Coolant • Improperly installed ECTS • Open or short in circuit • ECTS • PCM
Enable Conditions	• Engine Run state • Vehicle soak time >360min • No Disabling Faults Present	
Threshold value	• This code detects a coolant temp sensor that is stuck within an expected range of movement< 3 °C(37.4°F)	
Diagnosis Time	• Continuous (More than 120 seconds failure within 150 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 3 of ECTS harness connector.

   (5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

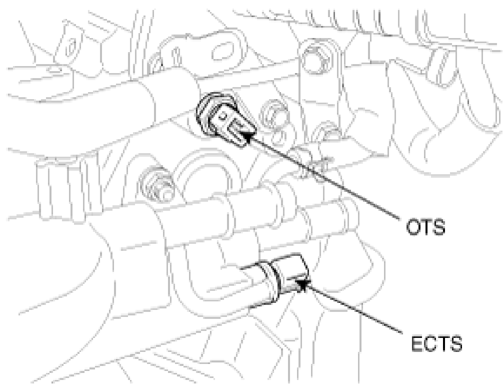
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0117

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature (ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

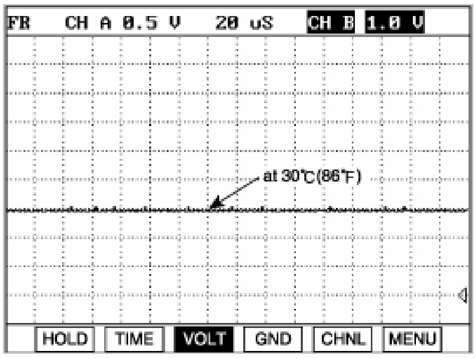
DTC DESCRIPTION

Checking output signals from ECTS every 20 sec. under detecting condition, if an output signal is below 0.1V for more than 10 sec., PCM sets P0117. Warning lamp turns on when the malfunction lasts till continuous 2 driving cycle. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Signal low	• Poor connection • Short to ground in harness • ECTS • PCM
Enable Conditions	Case 1	• Time after start-up >120 sec.	
	Case 2	• Time from IG "OFF" to IG "ON" >360 min. • Engine running state	
Threshold value		• Engine coolant temperature sensor's voltage< 0.1V	
Diagnosis Time		• Contineous (More than 10 seconds failure for every 20 second test)	
MIL On Condition		• 2 Driving Cycle	

SIGNAL WAVEFORM AND DATA

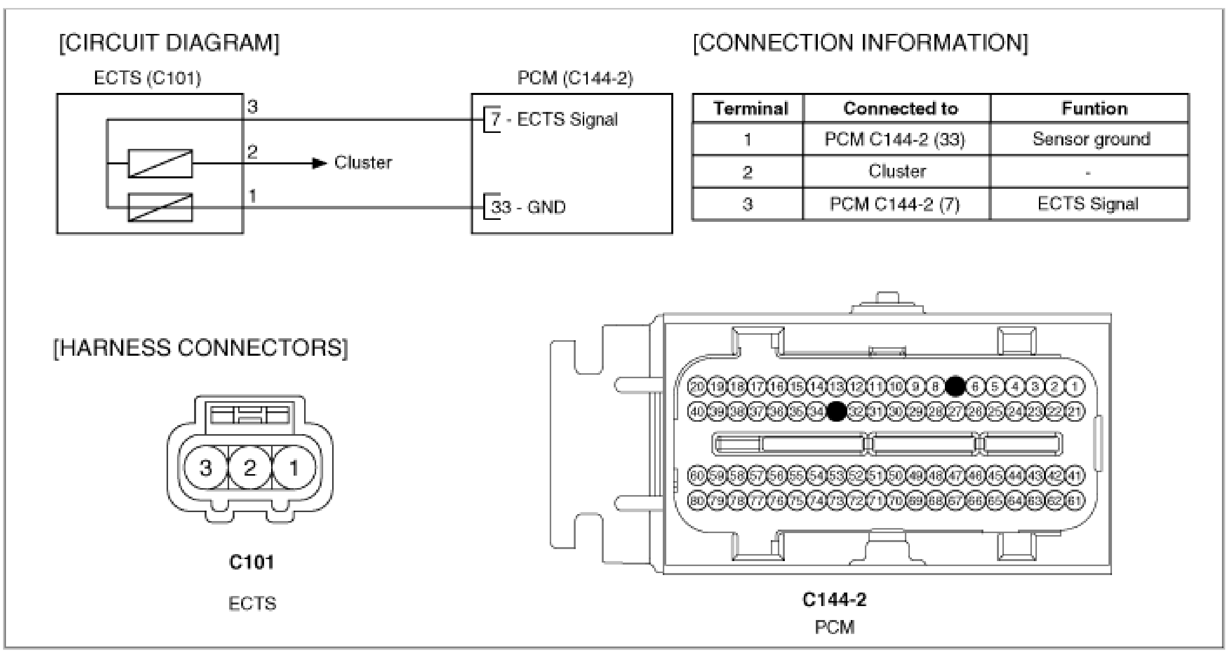


The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "Monitor "ECTS" status on the service data." item on the service data.

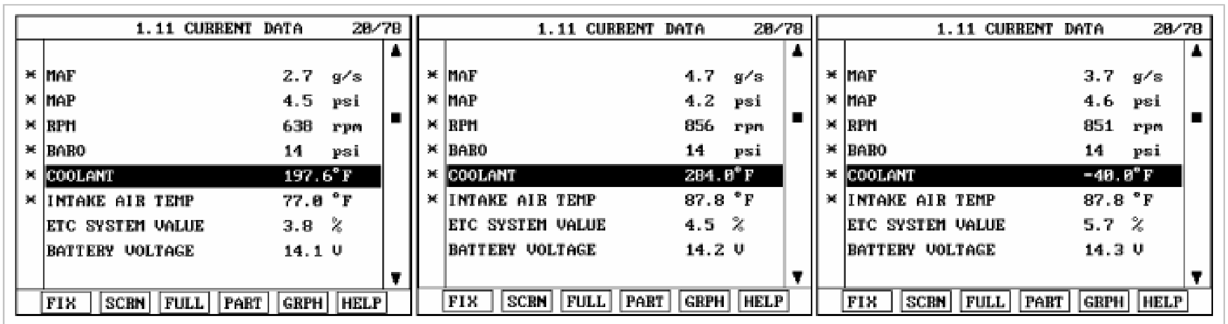


Fig. 1 Fig. 2 Fig. 3

Fig. 1 : Normal at Idle
Fig. 2 : Short to ground at idle
Fig. 3 : Open or short to battery at idle

4. Is the "ECTS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal & Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminaal and connector inspection" procedure.

SIGNAL CIRCUIT INSPECTION

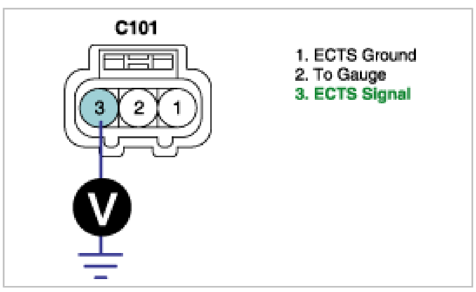
1. Check voltage

(1) IG "OFF" and disconnect ECTS connector.

(2) IG "ON" and ENG "OFF"

(3) Measure voltage between terminal 3 of ECTS harness connector and chassis ground.

Specification : Approx. 5V



(4) Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Go to "Check short to ground in harness" as follows.

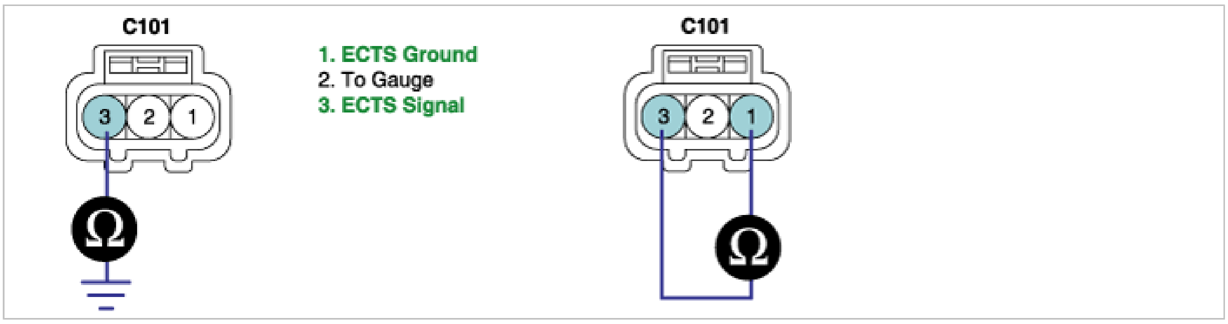
2. Check short to ground in harness

(1) IG "OFF" and disconnect ECTS connector and PCM connector.

(2) Measure resistance between terminal 3 of ECTS harness connector and chassis ground.

(3) Measure resistance between terminals 1 and 3 of ECTS harness connector.

Specification : Infinite



(4) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check ECTS

(1) IG "OFF" and disconnect ECTS connector.

(2) Measure resistance between terminals 1 and 3 of ECTS connector.(Component side)

Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

(3) Is the measured resistance within specification?

YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

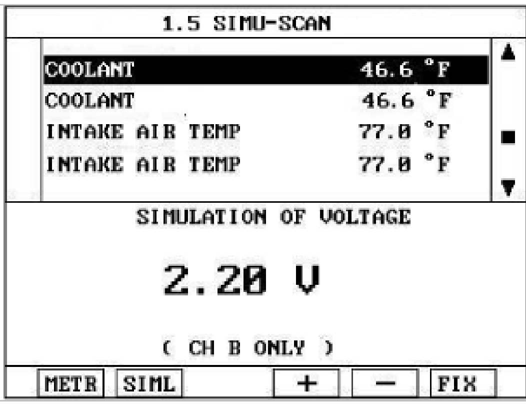
2. Check PCM

(1) IG "OFF" and connect scantool.

(2) Connect probe to terminal 3 of ECTS harness connector.

(3) IG "ON" and ENG "OFF" and simulation Function on scantool.

(4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

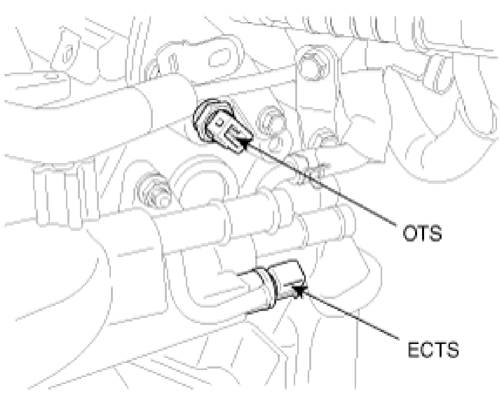
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0118

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature

(ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

DTC DESCRIPTION

Checking output signals from ECTS every 20 sec. under detecting condition, if an output signal is above 4.9V for more than 10 sec., PCM sets P0118. Warning lamp turns on when the malfunction lasts till continuous 2 driving cycle. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Open, Signal high	• Poor connection • Open or short to battery in signal harness • Open in ground harness • ECTS • PCM
Enable Conditions	Case 1	• Time after start-up >120 sec.	
	Case 2	• Time from IG "OFF" to IG "ON" > 360 min. • Intake air temperature ≥ -10°C(14°F) • Engine running state	
Threshold value		• Engine coolant temperature sensor's voltage >4.9V	
Diagnosis Time		• Contineous (More than 10 sec. failure for every 20 sec. test)	
MIL On Condition		• 2 Driving Cycle

(3) Is the measured resistance within specification?

YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

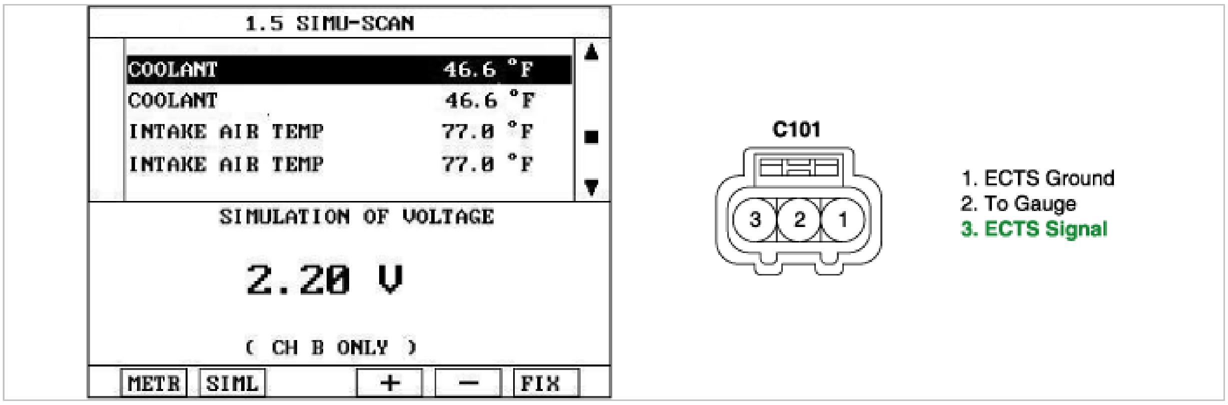
2. Check PCM

(1) IG "OFF" and connect scantool.

(2) Connect probe to terminal 3 of ECTS harness connector.

(3) IG "ON" and ENG "OFF" and simulation Function on scantool.

(4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

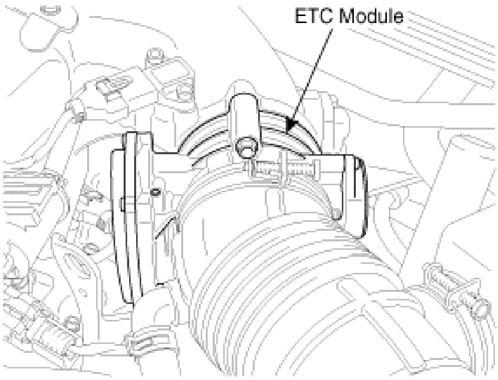
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0122

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

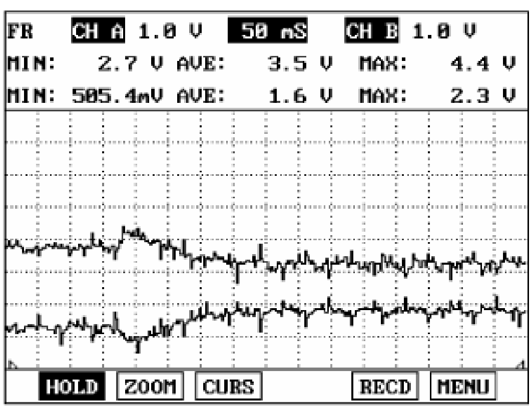
DTC DESCRIPTION

Checking output signals from TPS1 every 8.5 sec. under detecting condition, if an output signal is below 0.25V for more than 0.1 sec., PCM sets P0122. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

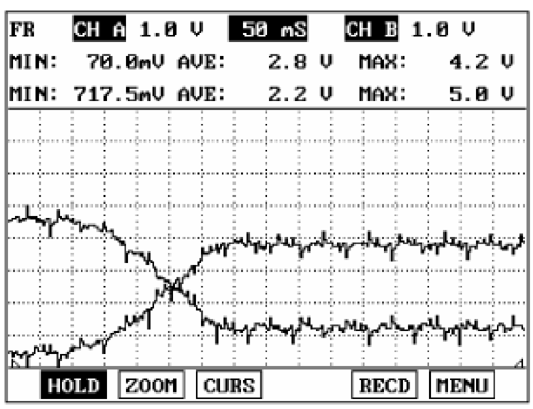
DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• signal low	• Poor connection • Open or short to ground in power harness • Short to ground in signal harness • TPS • PCM
Enable condition	• IG "ON	
threshold value	• The voltage of TPS< 0.25V	
diagnosis time	• Continuous (more than 0.1 sec. failure for every 8.5 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



Hit the accelerator at IG ON



Open the throttle valve by force at IG ON

SPECIFICATION

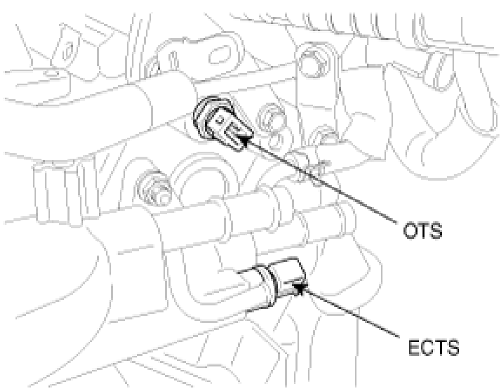
Fuel System > Troubleshooting > P0125

COMPONENT LOCATION



GENERAL DESCRIPTION

An Engine Coolant Temperature Sensor (ECTS) monitors the temperature of the coolant. This input is used by the PCM for engine control and as an enabling criteria for same diagnostics. The air flow coming into the engine is accumulated and used to determine if the engine has been driven within conditions that would allow the engine coolant to heat up normally to the thermostat regulating temperature. If the coolant temperature does not reach regulating temperature of the thermostat, diagnostics that use the engine coolant temperature as enabling criteria may not run when expected.

DTC DESCRIPTION

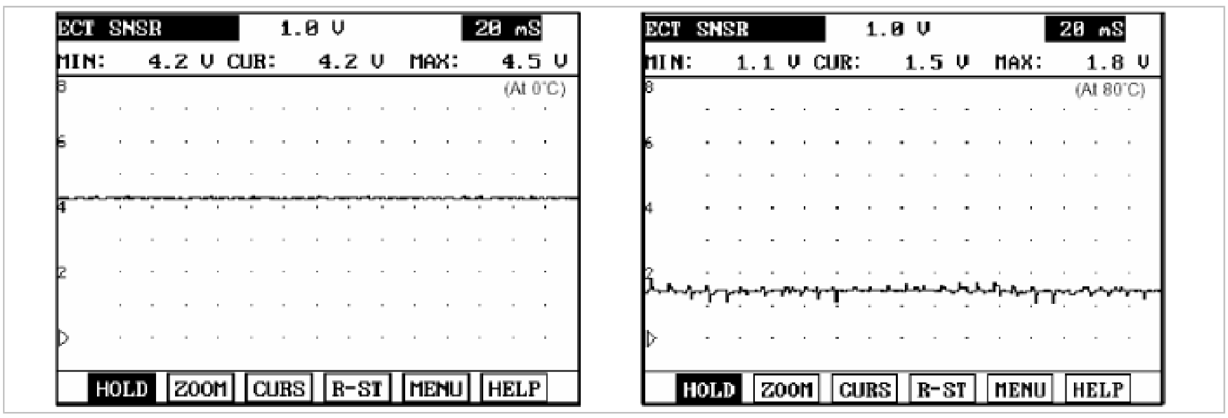
The Engine Coolant Temperature Time to Closed Loop Diagnostic monitors the time it takes the coolant to reach the temperature required for closed loop engine operation and compares it against a maximum limit dependent on the difference between the startup coolant temperature and the closed loop coolant temperature for that warm up cycle. If it takes longer than this allowed limit, a failure has occurred.

If the coolant temperature does not reach the specified value within the established time parameters, the PCM determines that a malfunction exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This diagnostic monitors the time it takes for the coolant temperature to reach the closed loop temperature and compares against a maximum threshold in order to make a PASS/FAIL determination, provided airflow and idle conditions are met.	• Poor connection • Improper coolant level • Malfunctioning Cooling System • Faulty ECTS
Enable Conditions	• No disabling faults present • Coolant sensor within range • Startup coolant temp ≤ 34°C(86 °F) • Engine running	
Threshold value	• Undefaulted coolant temperature ≥ Threshold Value(°C) • Test Time = Threshold (second)	
Diagnosis Time	• More than 5 second failure.	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

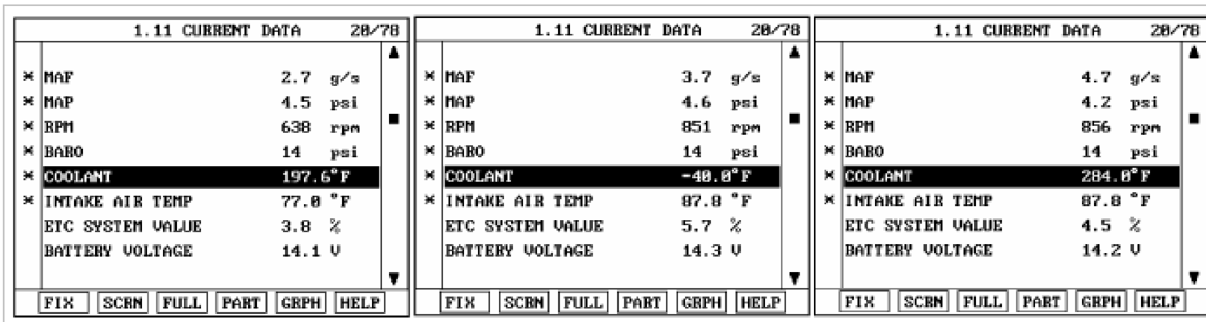

Fig. 1 Fig. 2 Fig. 3

Fig. 1 : Sensor data at normal
Fig. 2 : Sensor data at open
Fig. 3 : Sensor data at short

4. Is the measured ECTS parameter displayed within specifications ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection" procedure

SYSTEM INSPECTION

1. Check cooling system coolant level and fill if low.
2. Check that cooling fan is operating continuously.
3. Has a problem been found ?

YES

▸ Repair or repalce as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECTS.

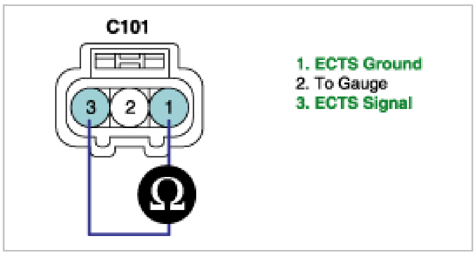
(1) Ignition "OFF"

(2) Disconnect ECTS connector

(3) Measure resistance between terminals "1" and "3" of the ECT sensor (to ECT sensor side).

Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		



(4) Is the measured resistance within specifications ?

YES

▸ Go to "Check PCM" as below.

NO

▸ Substitute with a known - good ECT sensor and check for proper operation. If the problem is corrected, replace ECT sensor and go to "Verification of Vehicle Repair" procedure.

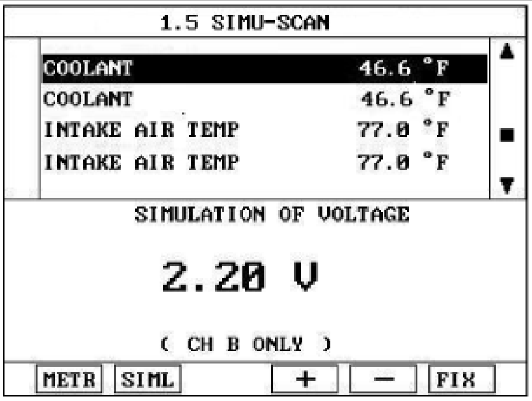
2. Check PCM

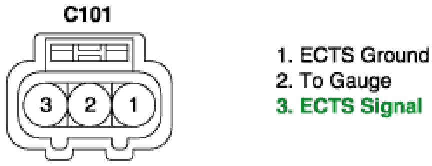
(1) Ignition "OFF".

(2) Connect Scantool and Ignition "ON" & Engine "OFF "

(3) Select simulation function on scantool.

(4) Simulate voltage at terminal "3" of ECT sensor signal connector.





(5) Does the signal value of ECT sensor changes according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

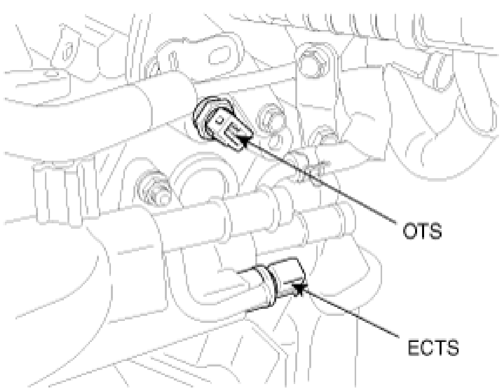
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0128

COMPONENT LOCATION



GENERAL DESCRIPTION

The Thermostat is a mechanical (thermal) device located in an engine coolant passage that allows passage of coolant into the radiator once the coolant has reached a manufacturer specified temperature called the Regulating Temperature. It has a metallic frame with a spring-loaded,centrally mounted, wax filled cylinder/piston assembly that expands and contracts with changes in temperature, thereby controlling the passage of coolant into the radiator.

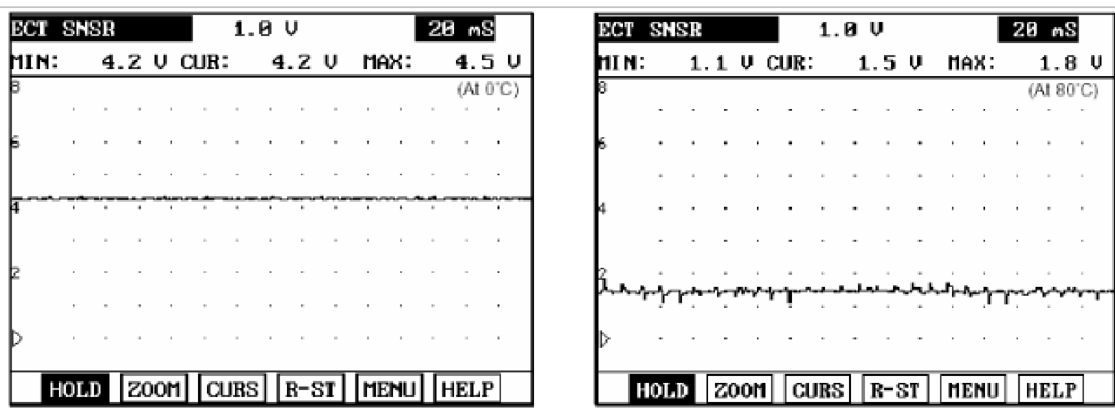
DTC DESCRIPTION

If the engine coolant temperature does not reach the specified value within the allocated period of time, the PCM determines that a malfunction exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The Thermostat Diagnostic monitors the time it takes for the coolant temperature to reach either the maximum temperature required to enable other diagnostics or the Thermostat Regulating Temperature, and compares it against a threshold in order to make a PASS/FAIL determination, provided airflow and idle conditions are met.	• Poor connection • Improper coolant level • Faulty Thermostat
Enable Conditions	• No disabling faults present • Coolant sensor within range • Thermostat target temp - Startup coolant temp ≥ 20°C(68°F) • Intake air temperature >-6.6641°C(20°F) • Engine Running	
Threshold value	• Undefaulted coolant temperature ≥ Threshold Value(°C) • Test Time = Threshold (second)	
Diagnosis Time	• Continuous (More than 5 second failure.)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

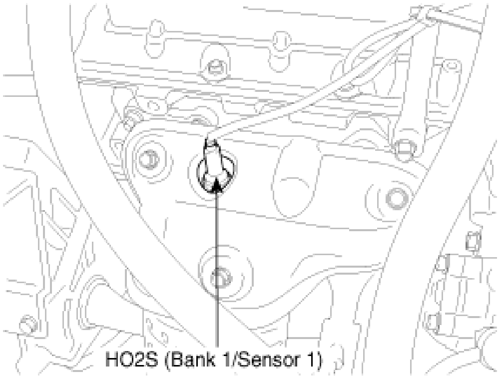
YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.04V for more than 12.5 sec., PCM sets P0131. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor Connection • Short to ground in harness • HO2S(B1/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B1/S1)< 0.04V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

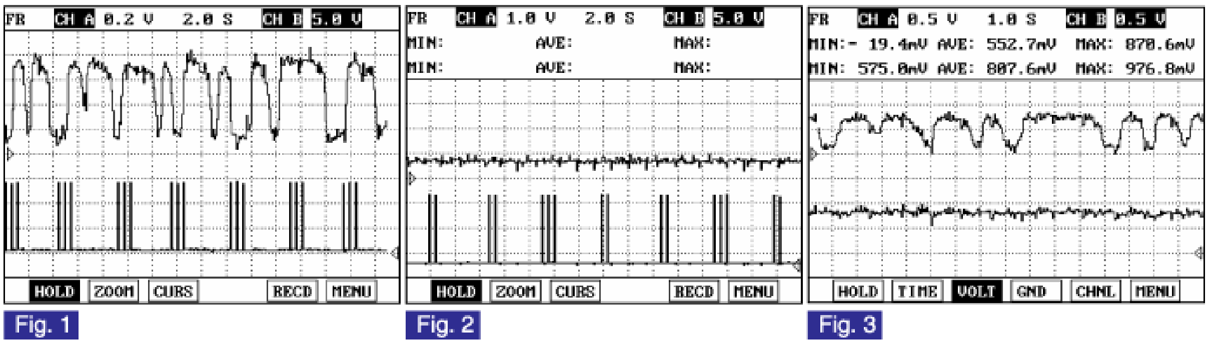


Fig. 1 : HO2S(B1S1) & Heater
Fig. 2 : HO2S(B1S2) & Heater
Fig. 3 : HO2S(B1S1) & HO2S(B1S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

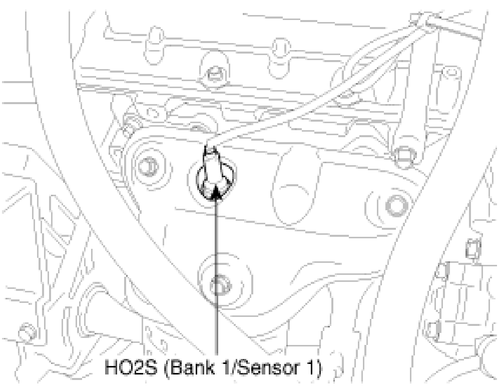
Fuel System > Troubleshooting > P0133

COMPONENT LOCATION



GENERAL DESCRIPTION

The HO2S is used to supply the PCM with information regarding the composition of the air/fuel mixture. The HO2S is positioned in the exhaust pipe ahead of the TWC. To measure the oxygen content, the HO2S requires a supply of ambient air as a reference. The HO2S produces a voltage that varies between 0.1V and 0.9V under normal operating conditions. The Powertrain Control Module (PCM) monitors this voltage and determines if the exhaust gas is lean or rich. If the voltage input at the PCM is under approx. 0.45V the exhaust is lean, and if the voltage input is over approx. 0.45V the exhaust is rich. The PCM constantly monitors the HO2S signal during closed loop operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary.
This oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to forceambient air into the sensor to maintain a more pure environment for comparison. In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture

for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.

DTC DESCRIPTION

The response time of an O2 sensor can be impacted by two factors: temperature and poisoning. Poisoning of the O2 sensor is the primary failure mode of O2 sensor response time. Poisoning can come from many sources: silicone from gaskets or even in the fuel, phosphorous from engine oil, carbon from operating in a cooler environment or lead from the fuel. Most poisoning failures have the potential to clear up after the source of the poisoning has been removed. However, sometimes the poisoning may be so severe that the damage is irreversible.
Checking output signals from HO2S under detecting condition, if an output signal is out of threshold, PCM sets P0133.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines O2 sensor functionality by checking its response rate	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• 1200 ≤ Engine RPM ≤ 4300 • 7.5g/s ≤ Air Flow ≤ 40g/s • Engine run time >60sec • Engine Coolant >70°C(158 °F) • No Decel Fuel Cut-Off Exit with Rich Bias Fueling • No torque Fuel Reduction in effect • No Disabling Faults • All of the conditions above met for more than 2 sec.	
Threshold value	• Switching counter lean to rich ≥ 13 • Switching counter rich to lean ≥ 13 • Response Lean Rich Transition Counter/Response Lean Rich Switch Counter < 29 • Response Rich Lean Transition Counter/Response Rich Lean Switch Counter < 35 • Response Rich Lean Average/Response Lean Rich Average >0.3809 • Response Rich Lean Average/Response Lean Rich Average< 3	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

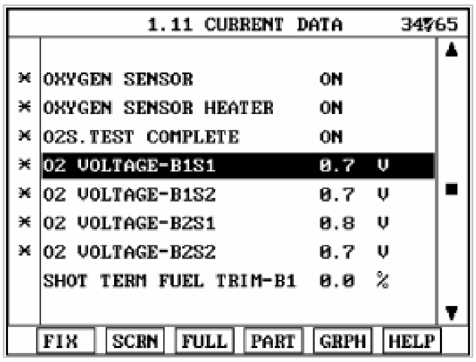
MONITOR SCANTOOL DATA

1. Connect Scantool & Engine "ON"
2. Warm up the engine to normal operating temperature.
3. Monitor HO2S voltage(B1/S1) parameter on scantool

Specification : Voltage will vary from 0.1 to 0.9 V



4. Is the HO2S parameter displayed within specifications ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Component Inspection" procedure

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   (1) Visually/physically inspect following items:
      - Inspect the front HO2S for Contaminated, deteriorated or aged Front HO2S
      - If contamination is evident on the HO2S, replace contaminated sensor

   (2) Is the HO2S visually / physically O.K ?

   YES

   ▸ Go to "Check Performance of H02S" as follows

   NO

   ▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair" procedure.

2. Check performance of HO2S
   (1) Connect scantool & Engine "ON"

   (2) Warm-up the engine to normal engine temperature.

   (3) Monitor signal waveform of HO2S with scantool.

   Specification : Response times :

HO2S	Response Time (70% Duty at 10Hz)
	lean to rich(Less than 65ms) rich to lean(Less than 80ms)

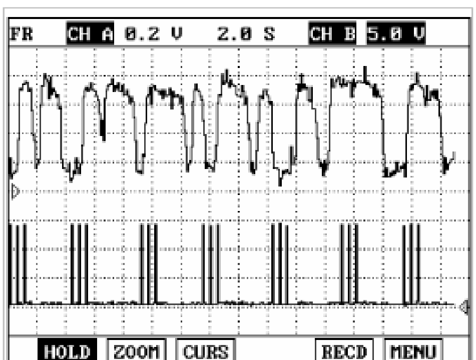


Fig. 1

Fig. 1 : HO2S(B1S1) & Heater

   (4) Is the sensor signal switching properly ?

   YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

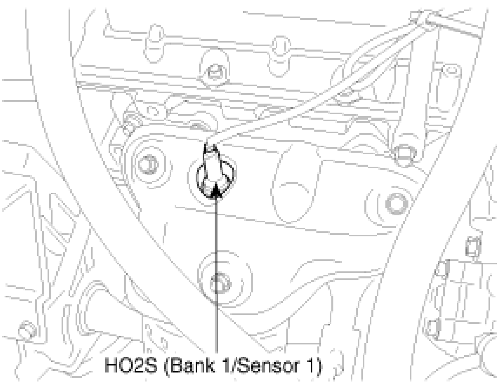
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0134

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 90 sec. under detecting condition, if an output signal indicating open in the circuit lasts for more than 76.5 sec., PCM sets P0134. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

SIGNAL WAVEFORM AND DATA

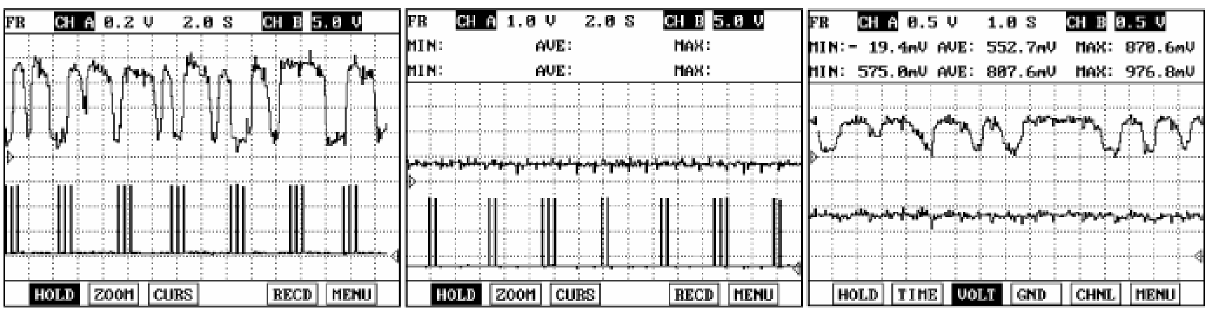

Fig. 1 Fig. 2 Fig. 3

Fig. 1 : HO2S(B1S1) & Heater
Fig. 2 : HO2S(B1S2) & Heater
Fig. 3 : HO2S(B1S1) & HO2S(B1S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

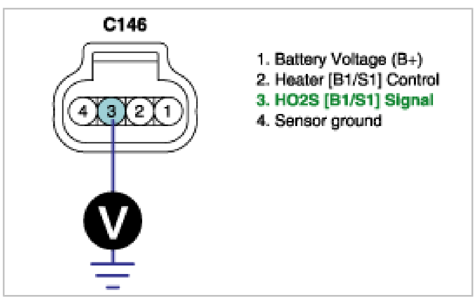
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B1/S1) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B1/S1) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Ground circuit inspection" procedure.

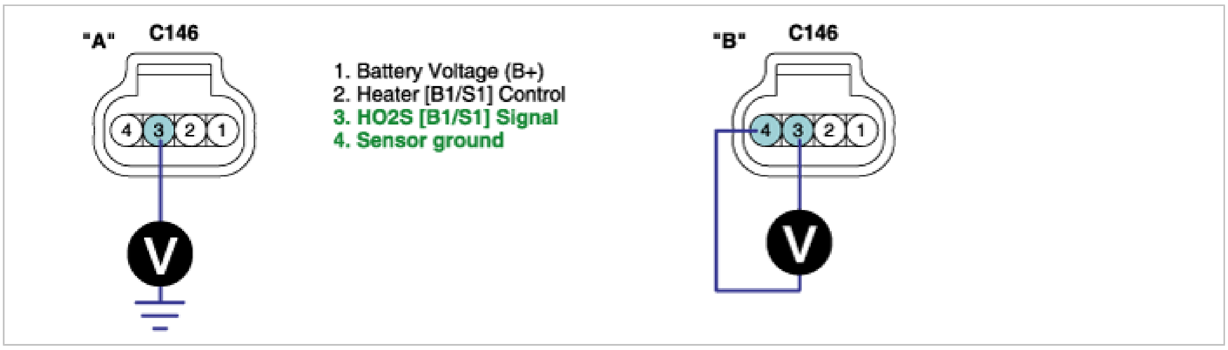
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" prcedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B1/S1) connector.
2. Measure voltage between terminal 3 of HO2S(B1/S1) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B1/S1) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" prcedure.

COMPONENT INSPECTION

1. Check HO2S(B1/S1)
   (1) IG "OFF" and disconnect HO2S(B1/S1) connector.
   (2) Check HO2S(B1/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B1/S1) normal?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good HO2S(B1/S1) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure

   > NOTE
   >

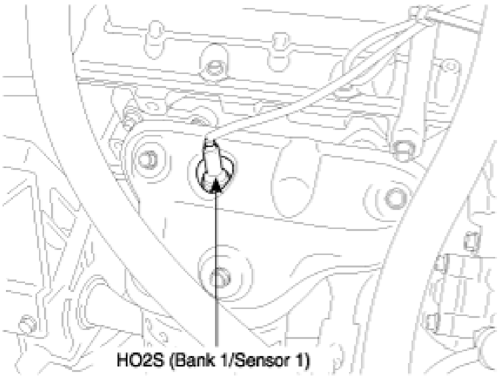
Fuel System > Troubleshooting > P0135

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

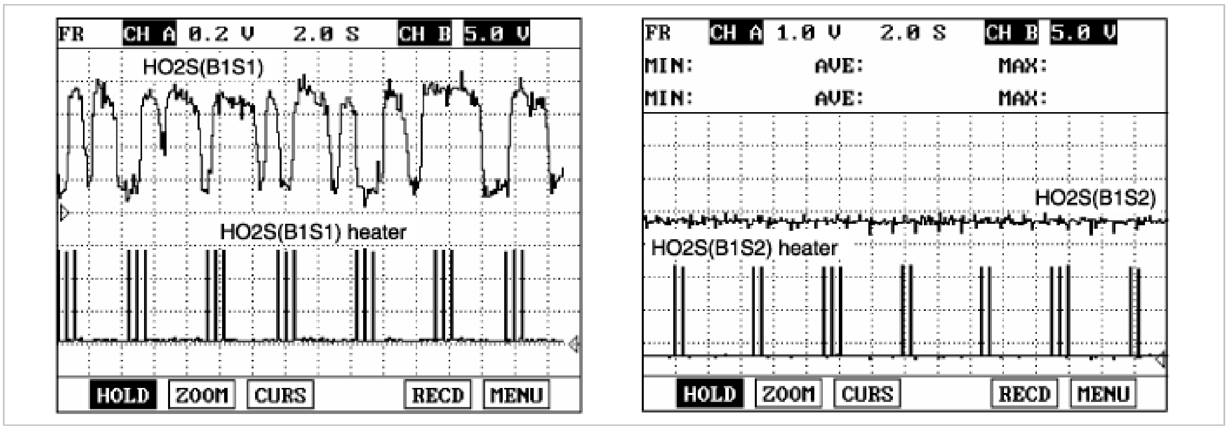
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater current is lower than threshold value for 2.5 seconds or over while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B1/S1) • PCM
Enable Conditions	• Ignition ON • Engine Running >60s • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < threshold value	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40°F), 13.5V	2.2 MAX

NO

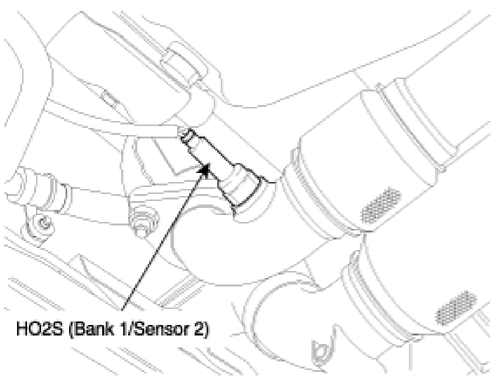
▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0137

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B1/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B1/S2), it means the poor performance of catalytic converter.

DTC DESCRIPTION

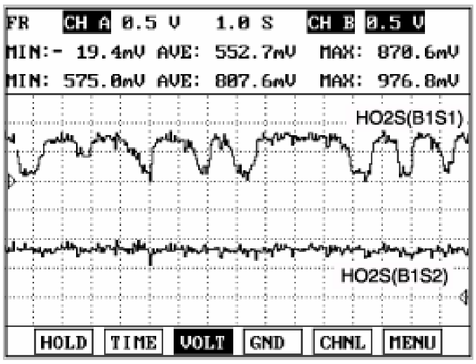
Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec. PCM sets P0137. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor Connection • Short to ground in harness • HO2S(B1/S2) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec	
Threshold value	• The voltage of HO2S(B1/S2)< 0.04V	

Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

PCM

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B1/S2)" item on the service data.

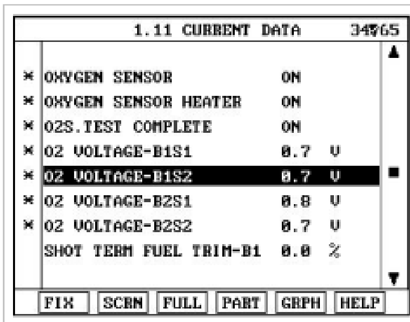

Fig. 1

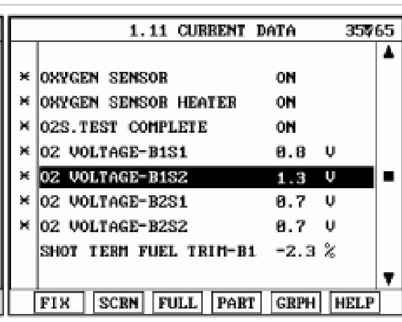

Fig. 2

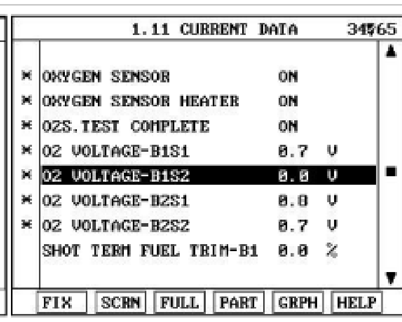

Fig. 3

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

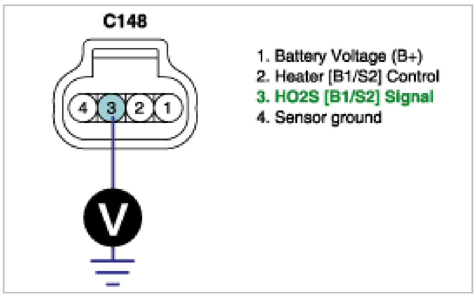
1. IG "OFF" and disconnect HO2S(B1/S2) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B1/S2) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   Visually/physically inspect following items:
   A. Inspect the Rear HO2S for Contaminated, deteriorated or aged Rear HO2S
   B. If contamination is evident on the HO2S, replace contaminated sensor
2. Is the HO2S(B1/S2) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B1/S2) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

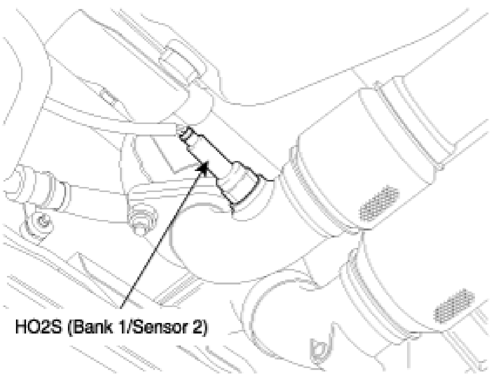
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0139

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter (warm-up catalytic converter) or in the rear exhaust pipe, which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

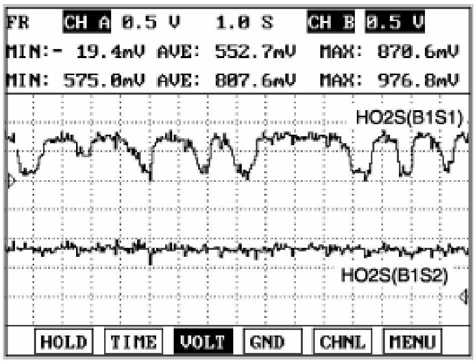
Since the Catalyst Diagnostic uses the oxygen sensors to determine the quality of the catalyst, and since an extended period of time with the rear oxygen sensor value steady is interpreted as a “good” catalyst, the Catalyst Diagnostic can be rendered inaccurate by an improperly functioning oxygen sensor. This diagnostic will extend the period of time that the Catalyst diagnostic requests a fuel shift. If the oxygen sensor still fails to respond after this extended time, then there is a fault with the sensor. Checking the Maximum time allowed between the front sensor response and the rear sensor response to the Stage1 or 2 fuel shift under detecting condition, if the fuel shift time is higher than 25sec, PCM determines a fault and sets DTC P0139. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if Rear O2 Sensor is acceptable for Idle Catalyst Monitor use	
Enable Conditions	• If Idle Catalyst Monitor Diagnostic is enabled HO2S Bank 1 Sensor 2 Response Diagnostic Enable Criteria Met	

Threshold value	• Maximum time allowed between the front sensor response and the rear sensor response to the Stage1(Forced to lean) ICMD(Idle Catalyst Monitor Diagnostic)fuel shift ≥ 25sec • Maximum time allowed between the front sensor response and the rear sensor response to the Stage 2(Forced to rich) ICMD(Idle Catalyst Monitor Diagnostic) fuel shift ≥ 25sec	• Poor connection • Faulty HO2S • Faulty PCM
Diagnosis Time	• -	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

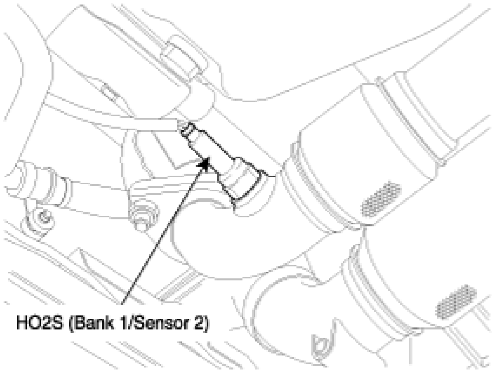
Fuel System > Troubleshooting > P0140

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B1/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B1/S2), it means the poor performance of catalytic converter.

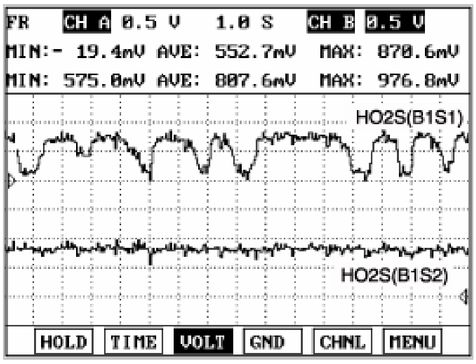
DTC DESCRIPTION

Checking output signals from HO2S every 10 sec. under detecting condition, if an output signal indicating open in the circuit lasts for more than 6.3 sec., PCM sets P0140. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Open	• Poor Connection • Open in harness • HO2S(B1/S2) • PCM
Enable Conditions		• No sensor cooled status • The minimum airflow ≥ 2g/s • The battery voltage ≥ 10V • Engine running state >30 sec. • Coolant temperature ≥ 60°C(140°F)	
Threshold value	Case 1	• At pumping current ON • 1.2V ≤ Voltage of HO2S ≤ 3.9V	
	Case 2	• At pumping current OFF • 0.415V ≤ Voltage of HO2S ≤ 0.515V	
Diagnosis Time		• Continuous (more than 6.3 sec.failure for every 10 sec.test)	
MIL On Condition		• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

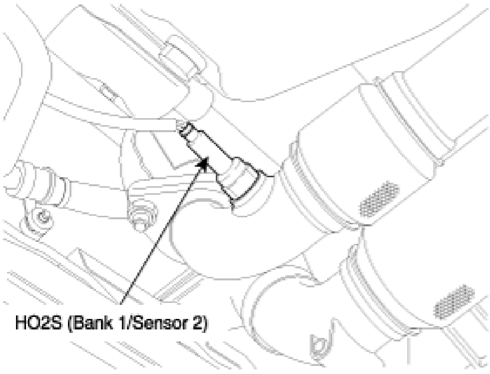
Fuel System > Troubleshooting > P0141

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B1/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B1/S2), it means the poor performance of catalytic converter.

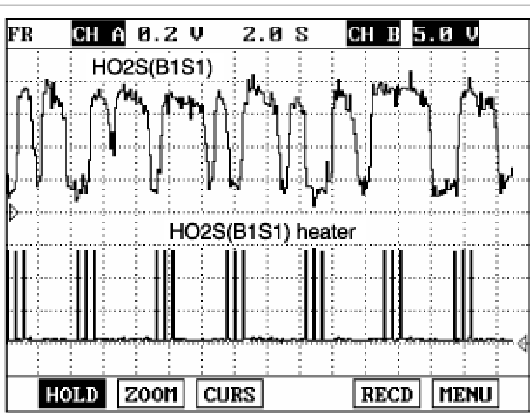
DTC DESCRIPTION

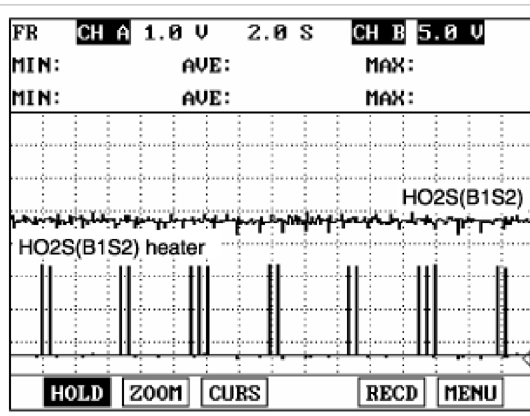
The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B1/S2) • PCM
Enable Conditions	• Ignition ON • Engine Running >60s • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < 0.02A	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA





The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after

engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX

YES

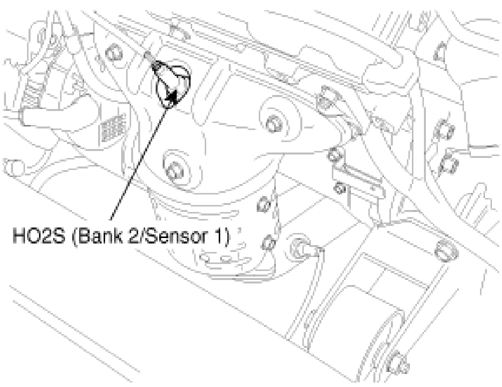
▶ Go to the applicable troubleshoooting procedure.

NO

▶ System is performing to specification at this time.

Fuel System > Troubleshooting > P0151

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec., PCM sets P0151. MI (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor connection • Short to ground in harness • HO2S(B2/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30sec • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B2/S1)< 0.04V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

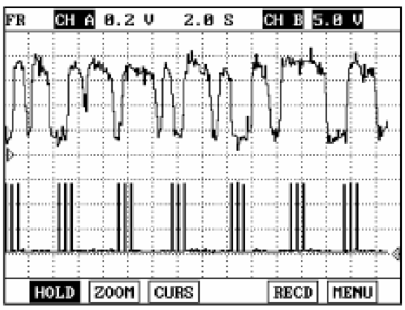


Fig. 1

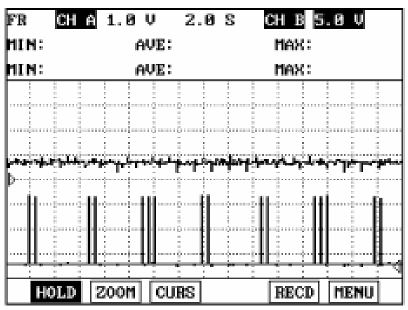

Fig. 2

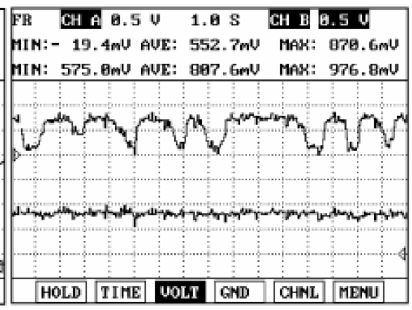

Fig. 3

Fig. 1 : HO2S(B2S1) & Heater
Fig. 2 : HO2S(B2S2) & Heater
Fig. 3 : HO2S(B2S1) & HO2S(B2S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B2/S1)" item on the service data.

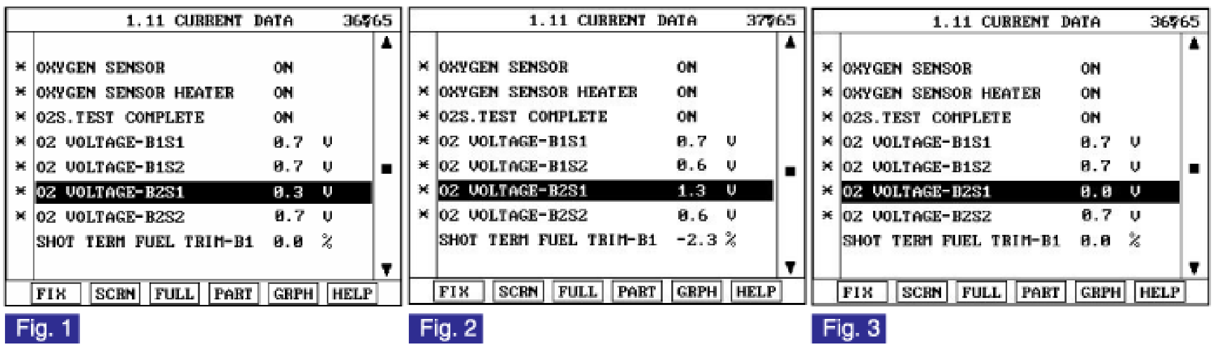

Fig. 1 : Normal data
Fig. 2 : Open or Short to battery in HO2S(B2/S1)
Fig. 3 : Short to ground in HO2S(B2/S1)

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

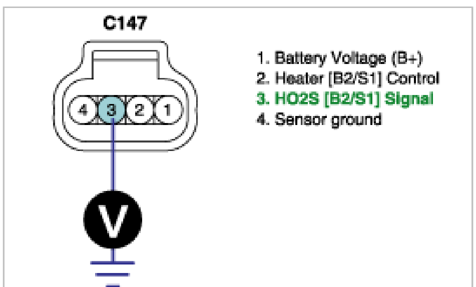
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B2/S1) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B2/S1) harness connector and chassis ground.

Specification :
Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S1)
   (1) IG "OFF" and disconnect HO2S(B2/S1) connector.
   (2) Check HO2S(B2/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B2/S1) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B2/S1) and check for proper operation. If the problem is corrected, replace HO2S (B2/S1) and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

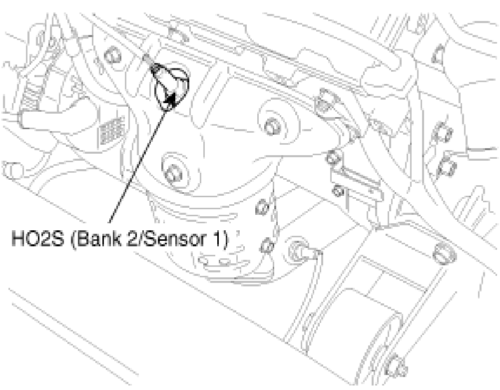
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0152

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.

The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.

The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.

Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is above 1.3V for more than 12.5 sec., PCM sets P0152. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal high	• Poor connection • Short to battery in harness • HO2S(B2/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec • The coolant temperature ≥ 60°C(140°F) • Feed-back control(Closed loop) state • No fuel-cut state • Above conditions are met >5 sec	
Threshold value	• The voltage of HO2S(B2/S1) >1.3V	
Diagnosis Time	• Continuous (more than 12.5 sec.failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

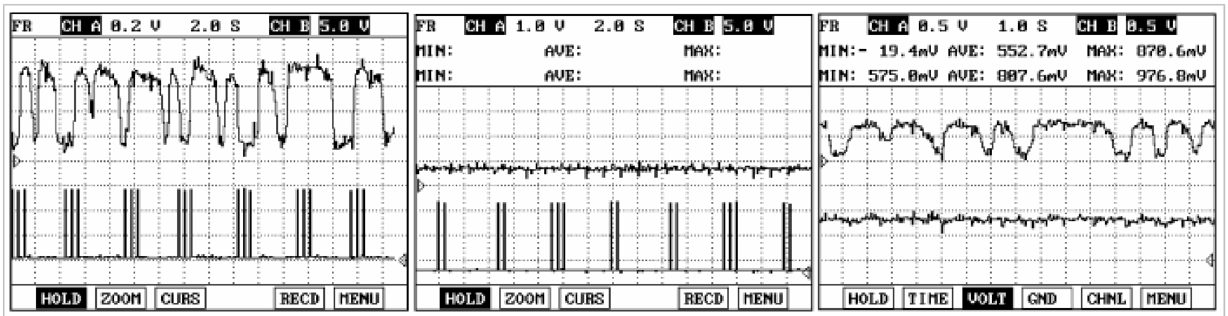


Fig. 1 Fig. 2 Fig. 3

Fig. 1 : HO2S(B2S1) & Heater
Fig. 2 : HO2S(B2S2) & Heater
Fig. 3 : HO2S(B2S1) & HO2S(B2S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

YES

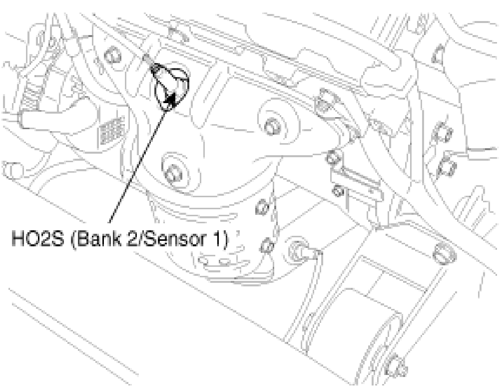
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0153

COMPONENT LOCATION



GENERAL DESCRIPTION

The HO2S is used to supply the PCM with information regarding the composition of the air/fuel mixture. The HO2S is positioned in the exhaust pipe ahead of the TWC. To measure the oxygen content, the HO2S requires a supply of ambient air as a reference. The HO2S produces a voltage that varies between 0.1V and 0.9V under normal operating conditions. The Powertrain Control Module (PCM) monitors this voltage and determines if the exhaust gas is lean or rich. If the voltage input at the PCM is under approx. 0.45V the exhaust is lean, and if the voltage input is over approx. 0.45V the exhaust is rich. The PCM constantly monitors the HO2S signal during closed loop operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary.
This oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to forceambient air into the sensor to maintain a more pure environment for comparison. In either

case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.

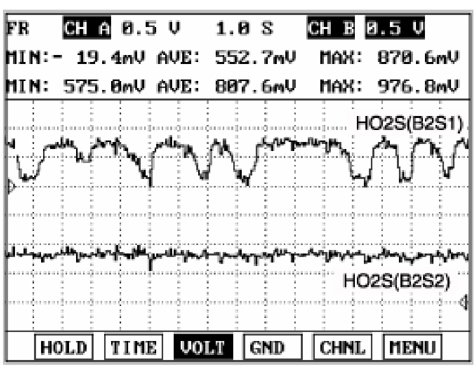
DTC DESCRIPTION

The response time of an O2 sensor can be impacted by two factors: temperature and poisoning. Poisoning of the O2 sensor is the primary failure mode of O2 sensor response time. Poisoning can come from many sources: silicone from gaskets or even in the fuel, phosphorous from engine oil, carbon from operating in a cooler environment or lead from the fuel. Most poisoning failures have the potential to clear up after the source of the poisoning has been removed. However, sometimes thepoisoning may be so severe that the damage is irreversible. Checking output signals from HO2S under detecting condition, if an output signal is out of threshold, PCM sets P0153.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines O2 sensor functionality by checking its response rate	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• 1200 ≤ Engine RPM ≤ 4300 • 40g/s ≤ Air Flow ≤ 7.5g/s • Engine run time >60sec • Engine Coolant >70°C(158 °F) • No DFCO(Decel Fuel Cut-Off) Exit with Rich Bias Fueling • No TORQ Fuel Reduction in effect • No Disabling Faults • All of the conditions above met for more than 2sec	
Threshold value	• Switching counter lean to rich ≥ 13 • Switching counter rich to lean ≥ 13 • Response Lean Rich Transition Counter/Response Lean Rich Switch Counter < 29 • Response Rich Lean Transition Counter/Response Rich Lean Switch Counter < 35 • Response Rich Lean Average/Response Lean Rich Average > 0.3809 • Response Rich Lean Average/Response Lean Rich Average < 3	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



After warming-up, Releasing accellerator pedal suddenly around 4000rpm the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off. Conversely, sudden depressing accellerator pedal HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will be switching between lean(0.12 ~ 0.74V) to rich(above 0.75V) normally.

SPECIFICATION

	Response Time (70% Duty at 10Hz)

HO2S	lean to rich(Less than 0.65sec) rich to lean(Less than 0.8sec)

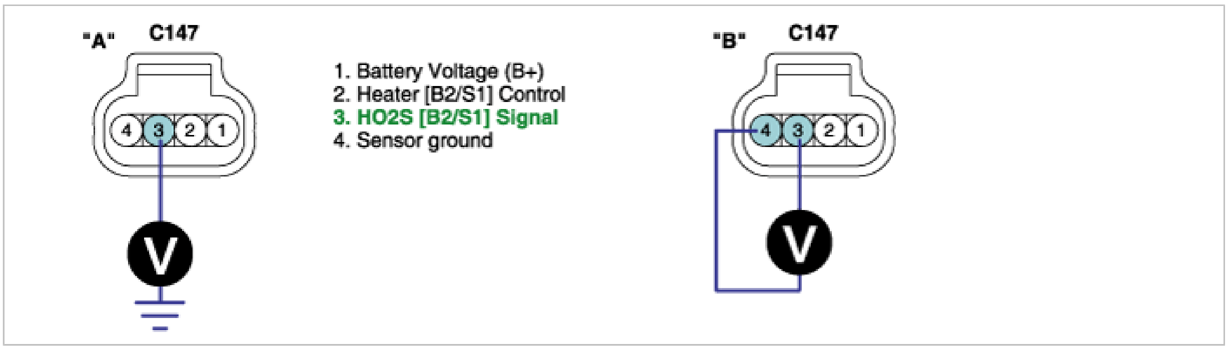
▸ Repair open in harness, and go to "Verification of Vehicle Repair" prcedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B2/S1) connector.
2. Measure voltage between terminal 3 of HO2S(B2/S1) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B2/S1) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" prcedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S1)
   (1) IG "OFF" and disconnect HO2S(B2/S1) connector.
   (2) Check HO2S(B2/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B2/S1) normal?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good HO2S(B2/S1) and check for proper operation. If the problem is corrected, replace HO2S (B2/S1) and go to "Verification of Vehicle Repair" procedure.

   NOTE

   There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

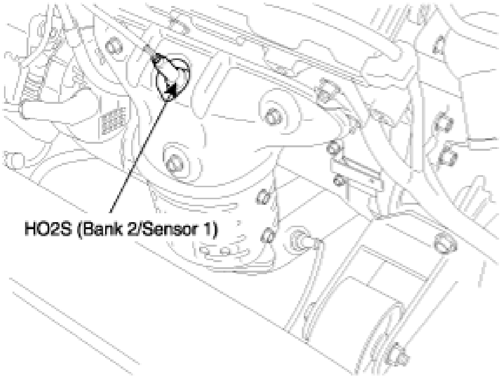
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0155

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

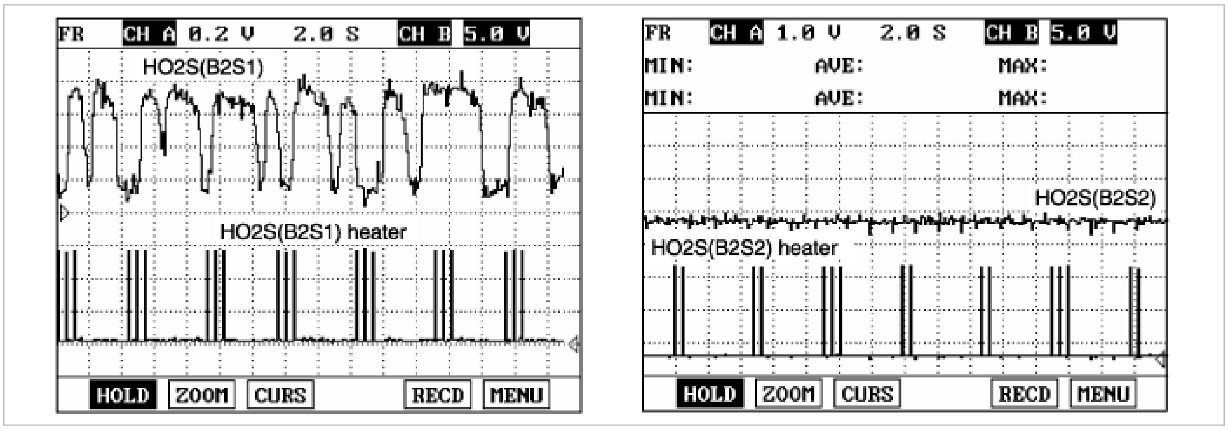
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B2/S1) • PCM
Enable Conditions	• Ignition ON • Engine Running >60sec • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5sec	
Threshold value	• Filtered O2 Heater Current< threshold value	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.25 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40 °F), 13.5V	2.2 MAX

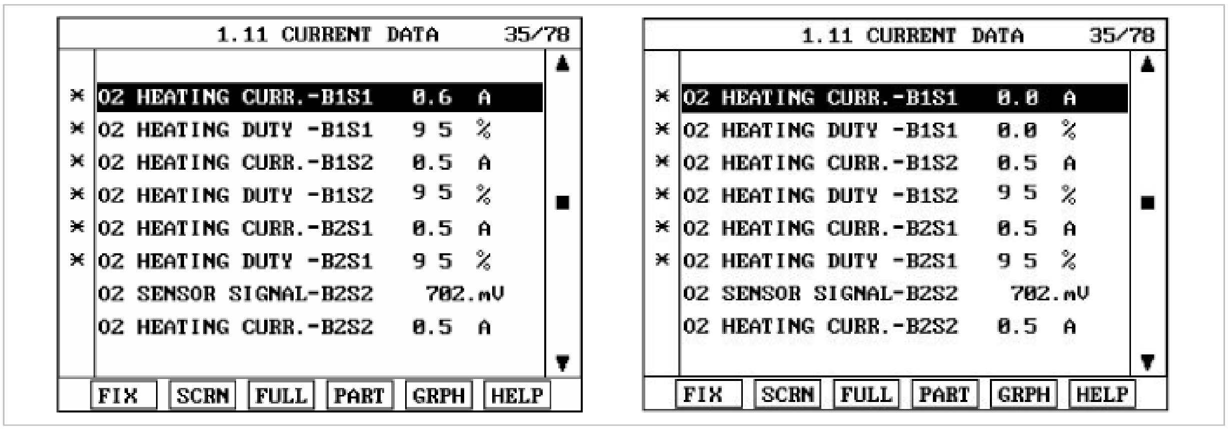
PCM

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B2/S1) Heater" status on the service data.



4. Is the "HO2S Heater(B2/S1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S1) Heater resistance
   (1) IG "OFF" and disconnect HO2S(B2/S1) connector
   (2) Measure resistance between terminal 1 and 2 of HO2S(B2/S1)(Component Side)
   Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5 at 21°C(69.8°F)

   (3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good HO2S(B2/S1) and check for proper operation. If the problem is corrected, replace HO2S (B2/S1) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

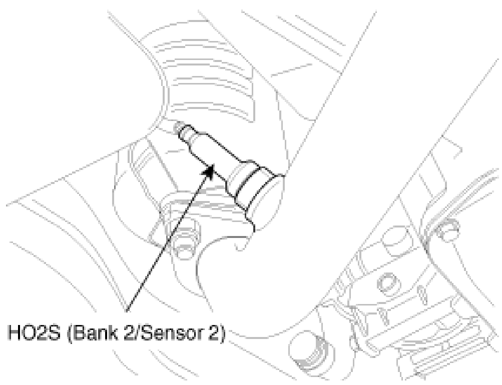
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0157

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B2/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B2/S2), it means the poor performance of catalytic converter.

DTC DESCRIPTION

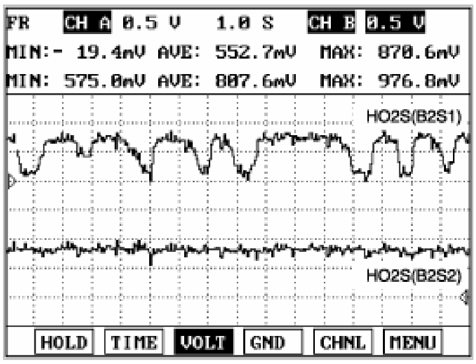
Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec., PCM sets P0157. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor connection • Short to ground in harness • HO2S(B2/S2) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B2/S2)< 0.04V	

Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

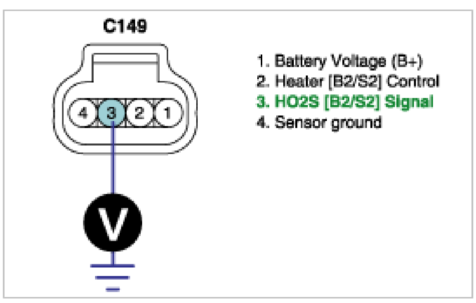
NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B2/S2)
2. IG "ON"
3. Measure voltage between terminal 3 of HO2S(B2/S2) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   Visually/physically inspect following items:
   A. Inspect the Rear HO2S for Contaminated, deteriorated or aged Rear HO2S
   B. If contamination is evident on the HO2S, replace contaminated sensor
2. Is the HO2S(B2/S2) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

> **NOTE**

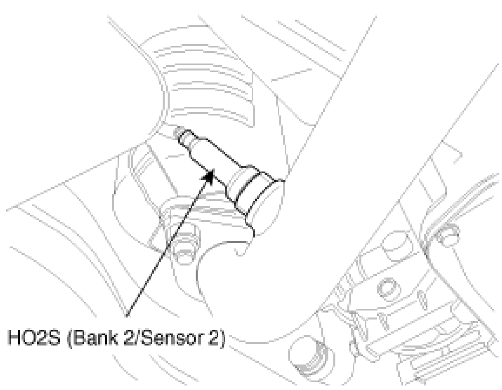
Fuel System > Troubleshooting > P0159

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter (warm-up catalytic converter) or in the rear exhaust pipe, which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

Since the Catalyst Diagnostic uses the oxygen sensors to determine the quality of the catalyst, and since an extended period of time with the rear oxygen sensor value steady is interpreted as a “good” catalyst, the Catalyst Diagnostic can be rendered inaccurate by an improperly functioning oxygen sensor. This diagnostic will extend the period of time that the Catalyst diagnostic requests a fuel shift. If the oxygen sensor still fails to respond after this extended time, then there is a fault with the sensor. Checking the Maximum time allowed between the front sensor response and the rear sensor response to the Stage1 or 2 fuel shift under detecting condition, if the fuel shift time is higher than 25sec, PCM determines a fault and sets DTC P0159. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if Rear O2 Sensor is acceptable for Idle Catalyst Monitor use	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• If Idle Catalyst Monitor Diagnostic is enabled HO2S Bank 1 Sensor 2 Response Diagnostic Enable Criteria Met	
Threshold value	• Maximum time allowed between the front sensor response and the rear sensor response to the Stage 1(Forced to rich) ICMD(Idle Catalyst Monitor Diagnostic)fuel shift ≥ 25sec • Maximum time allowed between the front sensor response and the rear sensor response to the Stage 2(Forced to lean) ICMD(Idle Catalyst Monitor Diagnostic) fuel shift ≥ 25sec	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

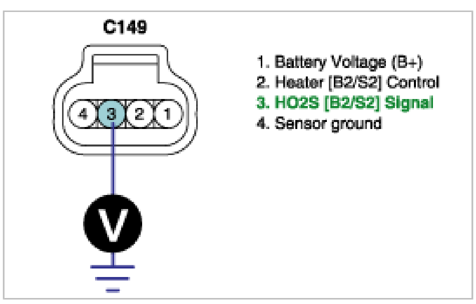
NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B2/S2) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B2/S2) harness connector and chassis ground.

Specification :
Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Ground Circuit Inspection" procedure.

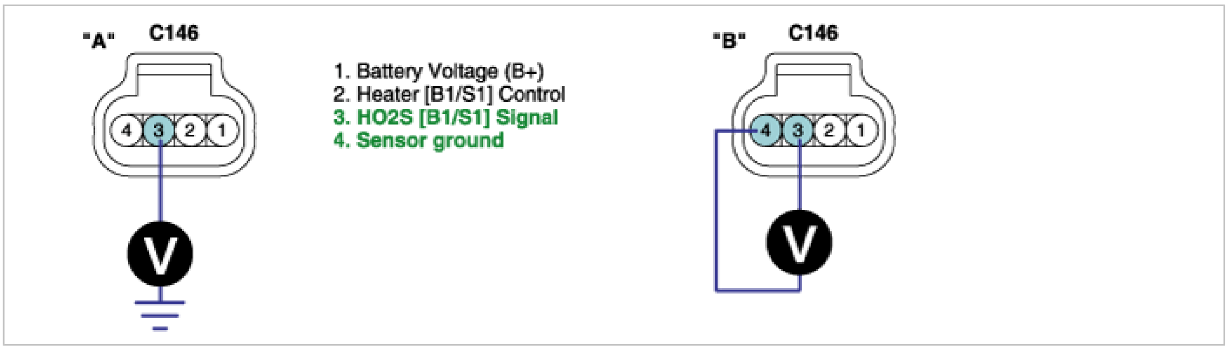
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B2/S2) connector.
2. Measure voltage between terminal 3 of HO2S(B2/S2) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B2/S2) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   Visually/physically inspect following items:
   A. Inspect the Rear HO2S for Contaminated, deteriorated or aged Rear HO2S
   B. If contamination is evident on the HO2S, replace contaminated sensor
2. Is the HO2S(B2/S2) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

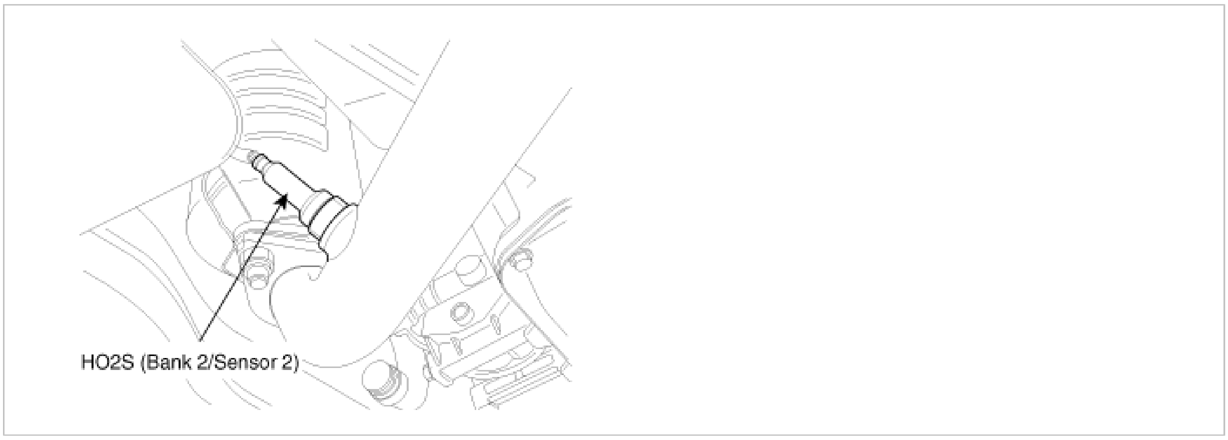
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0161

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B2/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B2/S2), it means the poor performance of catalytic converter.

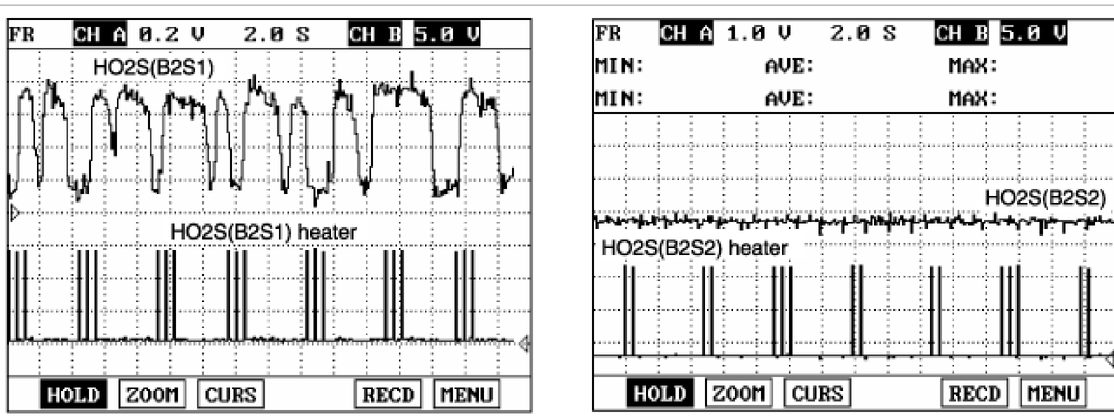
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts.If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor connection • Contact Resistance • HO2S(B2/S2) • PCM
Enable Conditions	• Ignition ON • Engine Running > 60s • Heater Duty Cycle > 0.4% • Max. Duty Cycle - Min. Duty Cycle < 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < 0.02A	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after

engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

(For reference only)

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40°F), 13.5V	2.2 MAX

3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

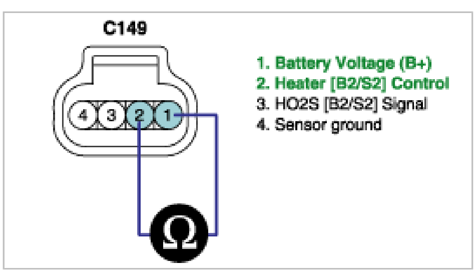
NO

▸ Go to " Component Inspection " procedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S2) Heater resistance
   (1) IG "OFF" and disconnect HO2S(B2/S2) connector
   (2) Measure resistance between terminal 1 and 2 of HO2S(B2/S2)(Component Side)
   Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5 at 21°C(69.8°F)



2. Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0171

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. The DTC relevant to fuel trim will be set when the amount reaches excessive levels because of a lean or rich condition.

DTC DESCRIPTION

Checking air-fuel ratio correction value every 0.75 sec. under detecting condition, if an value is within detecting condition for more than 0.3 sec., PCM sets P0171. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

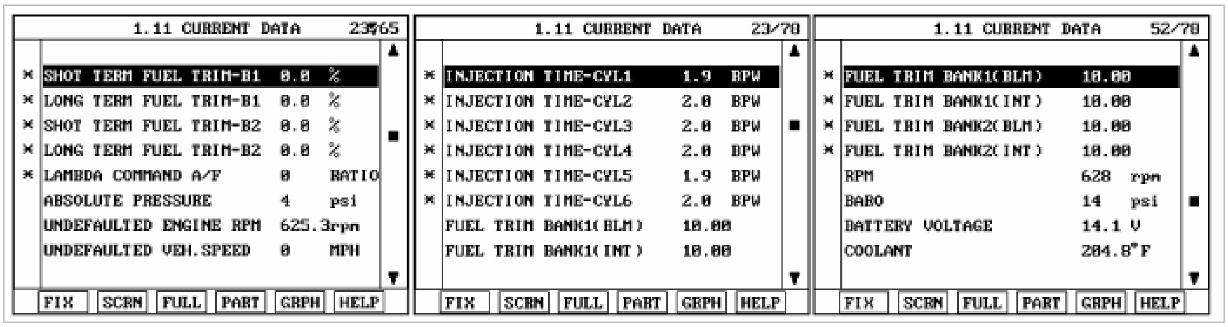
DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Fuel Trim Limits Exceeded	• Poor connection • Relevant sensor/actuator • Air leakage • PCM
Enable Conditions	• 550rpm ≤ Engine speed ≤ 4000rpm • 60°C(140°F) ≤ Engine coolant temperature ≤ 115°C(239°F) • -10°C(14°F) ≤ Intake air temperature ≤ 60°C(140°F) • 0° ≤ Throttle position ≤ 80° • 25kPa ≤ Engine load ≤ 90kPa • 1.5g/s ≤ Intake air flow ≤ 80g/s • Barometric pressure ≥ 72kPa • Vehicle speed ≤ 130km/h • System voltage ≥ 11V • Feed-back control state • No other diagnostic fault	
Threshold value	• Lean limit average < 0.8 (Average of short term fuel trim) and < 1.2(Average of long term fuel trim)	
Diagnosis Time	• Continuous (More than 0.3 second failure for every 0.75 second test)	

MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. Warm -up the engine to normal operating temperature.
3. Monitor "Sensor/actuator related to fuel system(HO2S, MAFS, MAPS, TPS, ECTS, PSCA, Injector, and so on)" items on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check air leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system for following items
   - ▸ Vacuum hoses for splits, kinks and improper connections.
   - ▸ Throttle body gasket
   - ▸ Gasket between intake manifold and cylinder head
   - ▸ Seals between intake manifold and fuel injectors
   - ▸ Exhaust system between HO2S and three way catalyst for air leakage

   (2) Has a problem found in this procedure?

   YES

   ▸ Repair or replace it which has a problem, and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check the fuel line" as follows

2. Check the fuel line
   (1) Check the fuel line for following items
   - ▸ Connector connection state
   - ▸ Damage/ connection state for vacuum hoses connected to fuel line
   - ▸ Bent/ pressed/ twisted fuel line or fuel leakage

(2) Has a problem found in this procedure?

YES

▸ Repair or replace it which has a problem, and go to " Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check fuel pressure" as follows

3. Check fuel pressure

> **NOTE**
>
> - Be cautious that Fuel is explosive and an empty fuel tank can still contain explosive gases.When working on fuel system make sure to supply adequate ventilationto the work area. Do not smoke, and keep sparks and open flames away.
> - The fuel system remains under pressure when the engine is not running. Release fuel system pressure before disconnecting any fuel line to reduce the chance of presonal injury or fire damage to vehicle components.

(1) IG "OFF" and disconnect Fuel Pump Relay in Junction Box.

(2) Start-up and wait until it stops itself.

(3) IG "OFF" and connect Fuel Pump Relay.

(4) Install the fuel pressure gauge to the delivery pipe with the fuel pressure gauge adaptor.

(5) Activate the fuel pump, and with fuel pressure applied, check that there is no fuel leakage from the pressure gauge or connection part.

(6) Disconnect the vacuum hose from the pressure regulator, and plug the hose end.

(7) Measure the fuel pressure at idle.

Specification : 374.6 ~ 384.4 kPa(3.82 ~ 3.92 kg/cm², 54.3 ~ 55.8 psi)

(8) Is the measured fuel pressure within specifications ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or replace according to the below table. And then, go to " Verification of Vehicle Repair"procedure.

Condition	Possible Cause
Fuel Pressure is too low	Fuel filter,fuel pressure regulator, in-tank fuel hose or the fuel pump
Fuel Pressure is too high	Fuel pressure regulator, hose or pipe
No different fuel pressure when vacuum hose is connected or not	The vacuum hose or the nipple

COMPONENT INSPECTION

1. Check PCV

(1) IG "OFF" and remove PCV valve from cylinder head

(2) With engine idling, block PCV valve and confirm that vacuum is felt.

(3) Insert thin stick into the screwed PCV valve and verify that the plunger is moving.

(4) Is the PCV valve normally moving?

YES

▸ Go to "Check PCSV as follows.

NO

▸ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV

(1) IG "OFF" and disconnect PCSV and vacuum hose.

(2) Connect hand-vacuum gage with PCSV and supply vacuum to it.

(3) Is the vacuum maintained ?

YES

▸ Go to " Check injector" as follows.

NO

▸ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF" and disconnect injector.
   (2) Check it for blocking caused by any foreign substance.
   (3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)
   Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω

   (4) Is the measured resistance within specification?

YES

▸ Go to "Check sensor/actuator related to fuel system" as follows

NO

▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on)
   (Refer to each DTC diagnostic procedure)
   (2) Are all of these items normal ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0172

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. Threshold value	• Lean limit average< 0.8 (Average of short term fuel trim) and< 1.2(Average of long term fuel trim)	
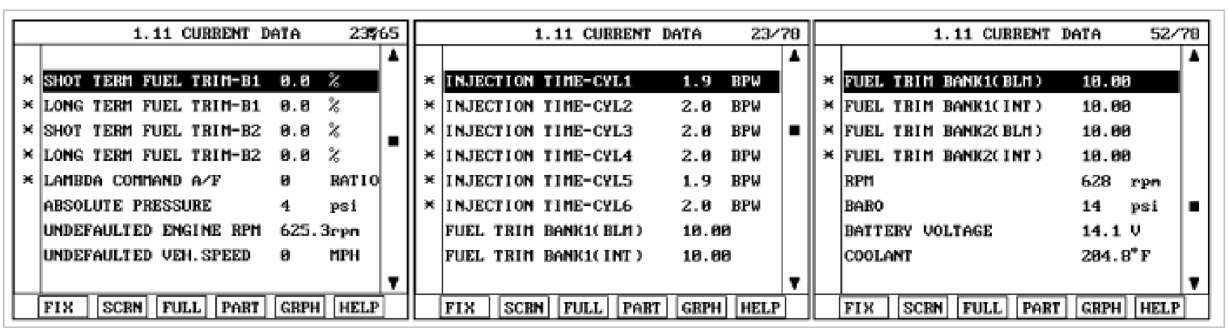
Diagnosis Time	• Continuous (More than 0.3 second failure for every 0.75 second test)	
MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. Warm -up the engine to normal operating temperature.
3. Monitor "Sensor/actuator related to fuel system(HO2S, MAFS, MAPS, TPS, ECTS, PSCA, Injector, and so on)" items on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check air leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system for following items
   - ▸ Vacuum hoses for splits, kinks and improper connections.
   - ▸ Throttle body gasket
   - ▸ Gasket between intake manifold and cylinder head
   - ▸ Seals between intake manifold and fuel injectors
   - ▸ Exhaust system between HO2S and three way catalyst for air leakage

   (2) Has a problem found in this procedure?

   YES

   ▸ Repair or replace it which has a problem, and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check the fuel line" as follows

2. Check the fuel line
   (1) Check the fuel line for following items
   - ▸ Connector connection state
   - ▸ Damage/ connection state for vacuum hoses connected to fuel line
   - ▸ Bent/ pressed/ twisted fuel line or fuel leakage

   (2) Has a problem found in this procedure?

   YES

   ▸ Repair or replace it which has a problem, and go to " Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check fuel pressure" as follows

3. Check fuel pressure

NOTE

- Be cautious that Fuel is explosive and an empty fuel tank can still contain explosive gases.When working on fuel

system make sure to supply adequate ventilationto the work area. Do not smoke, and keep sparks and open flames away.
- The fuel system remains under pressure when the engine is not running. Release fuel system pressure before disconnecting any fuel line to reduce the chance of presonal injury or fire damage to vehicle components.

(1) IG "OFF" and disconnect Fuel Pump Relay in Junction Box.

(2) Start-up and wait until it stops itself.

(3) IG "OFF" and connect Fuel Pump Relay.

(4) Install the fuel pressure gauge to the delivery pipe with the fuel pressure gauge adaptor.

(5) Activate the fuel pump, and with fuel pressure applied, check that there is no fuel leakage from the pressure gauge or connection part.

(6) Disconnect the vacuum hose from the pressure regulator, and plug the hose end.

(7) Measure the fuel pressure at idle.

Specification : 374.6 ~ 384.4 kPa(3.82 ~ 3.92 kg/cm², 54.3 ~ 55.8 psi)

(8) Is the measured fuel pressure within specifications ?

YES

▶ Go to "Component Inspection" procedure.

NO

▶ Repair or replace according to the below table. And then, go to " Verification of Vehicle Repair"procedure.

Condition	Possible Cause
Fuel Pressure is too low	Fuel filter,fuel pressure regulator, in-tank fuel hose or the fuel pump
Fuel Pressure is too high	Fuel pressure regulator, hose or pipe
No different fuel pressure when vacuum hose is connected or not	The vacuum hose or the nipple

COMPONENT INSPECTION

1. Check PCV

(1) IG "OFF" and remove PCV valve from cylinder head

(2) With engine idling, block PCV valve and confirm that vacuum is felt.

(3) Insert thin stick into the screwed PCV valve and verify that the plunger is moving.

(4) Is the PCV valve normally moving?

YES

▶ Go to "Check PCSV as follows.

NO

▶ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV

(1) IG "OFF" and disconnect PCSV and vacuum hose.

(2) Connect hand-vacuum gage with PCSV and supply vacuum to it.

(3) Is the vacuum maintained ?

YES

▶ Go to " Check injector" as follows.

NO

▶ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector

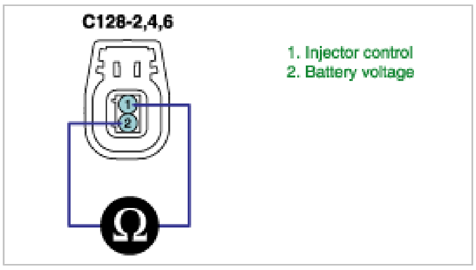
(1) IG "OFF" and disconnect injector.

(2) Check it for blocking caused by any foreign substance.

(3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)

Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω



(4) Is the measured resistance within specification?

YES

▸ Go to "Check sensor/actuator related to fuel system" as follows

NO

▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on) (Refer to each DTC diagnostic procedure)

   (2) Are all of these items normal ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0175

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. The DTC relevant to fuel trim will be set when the amount reaches excessive levels because of a lean or rich condition.

DTC DESCRIPTION

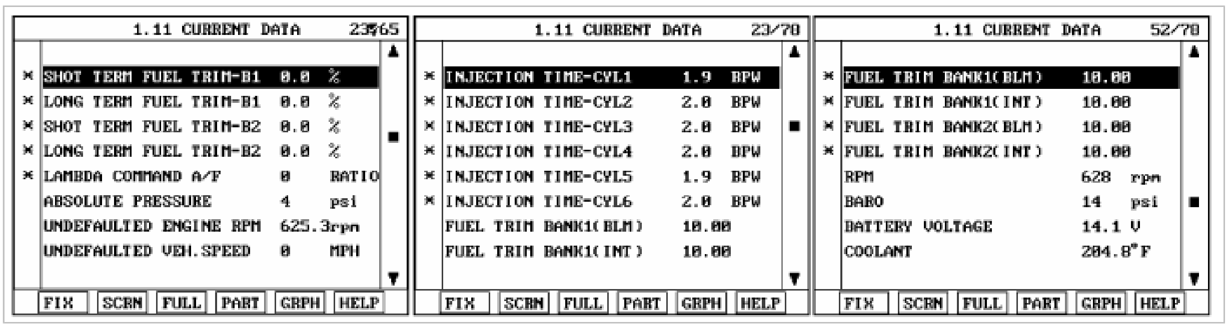
Checking air-fuel ratio correction value every 0.75 sec. under detecting condition, if an value is within detecting condition for more than 0.3 sec., PCM sets P0175. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Fuel Trim Limits Exceeded	• Poor connection • Relevant sensor/actuator • Blocking of Intake system • Fuel leakage in injector • Improper fuel line pressure • PCM
Enable Conditions	• 550rpm ≤ Engine speed ≤ 4000rpm • 60°C(140°F) ≤ Engine coolant temperature ≤ 115°C(239°F) • -10°C(14°F) ≤ Intake air temperature ≤ 60°C(140°F) • 0° ≤ Throttle position ≤ 80° • 25kPa ≤ Engine load ≤ 90kPa • 1.5g/s ≤ Intake air flow ≤ 80g/s • Barometric pressure ≥ 72kPa • Vehicle speed ≤ 130km/h • System voltage ≥ 11V • Feed-back control state • No other diagnostic fault	
Threshold value	• Lean limit average >1.2 (Average of short term fuel trim) and < 0.8(Average of long term fuel trim)	
Diagnosis Time	• Continuous (More than 0.3 second failure for every 0.75 second test)	
MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. Warm -up the engine to normal operating temperature.
3. Monitor "Sensor/actuator related to fuel system(HO2S, MAFS, MAPS, TPS, ECTS, PSCA, Injector, and so on)" items on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check blocking of intake system
   (1) Visually/physically inspect the blocking in intake system for following items
   - Throttle body gasket and damage
   - Clogging of Air cleaner
   - Blocking in intake manifold and injector caused by any foreign substance

   (2) Has a problem found?

   YES
   - Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

   NO
   - Go to " Check fuel pressure" as follows.

2. Check fuel pressure

   > **NOTE**
   >
   > - Be cautious that Fuel is explosive and an empty fuel tank can still contain explosive gases.When working on fuel system make sure to supply adequate ventilationto the work area. Do not smoke, and keep sparks and open flames away.
   > - The fuel system remains under pressure when the engine is not running. Release fuel system pressure before disconnecting any fuel line to reduce the chance of presonal injury or fire damage to vehicle components.

   (1) IG "OFF" and disconnect Fuel Pump Relay in Junction Box.

   (2) Start-up and wait until it stops itself.

   (3) IG "OFF" and connect Fuel Pump Relay.

   (4) Install the fuel pressure gauge to the delivery pipe with the fuel pressure gauge adaptor.

   (5) Activate the fuel pump, and with fuel pressure applied, check that there is no fuel leakage from the pressure gauge or connection part.

   (6) Disconnect the vacuum hose from the pressure regulator, and plug the hose end.

   (7) Measure the fuel pressure at idle.

   Specification : 374.6 ~ 384.4 kPa(3.82 ~ 3.92 kg/cm², 54.3 ~ 55.8 psi)

   (8) Is the measured fuel pressure within specifications ?

   YES
   - Go to "Component Inspection" procedure.

   NO
   - Repair or replace according to the below table. And then, go to " Verification of Vehicle Repair"procedure.

Condition	Possible Cause
Fuel Pressure is too low	Fuel filter,fuel pressure regulator, in-tank fuel hose or the fuel pump
Fuel Pressure is too high	Fuel pressure regulator, hose or pipe
No different fuel pressure when vacuum hose is connected or not	The vacuum hose or the nipple

3. Check fuel leakage in injector
   (1) IG "OFF" after checking the fuel pressure test.

   (2) Stop engine and check for a change in the fuel pressure gauge reading for 5 minutes.

   Specification : After engine stops, fuel gauge reading is maintained for 5 minutes.

   (3) Is the fuel gauge reading within specification?

   YES
   - Go to "Component Inspection" procedure.

   NO
   - There is a fuel leakage in injector. Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check PCV
   (1) IG "OFF" and remove PCV valve from cylinder head
   (2) With engine idling, block PCV valve and confirm that vacuum is felt.
   (3) Insert thin stick into the screwed PCV valve and verify that the plunger is moving.
   (4) Is the PCV valve normally moving?

   YES

   ▸ Go to "Check PCSV as follows.

   NO

   ▸ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV
   (1) IG "OFF" and disconnect PCSV and vacuum hose.
   (2) Connect hand-vacuum gage with PCSV and supply vacuum to it.
   (3) Is the vacuum maintained ?

   YES

   ▸ Go to " Check injector" as follows.

   NO

   ▸ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF" and disconnect injector.
   (2) Check it for blocking caused by any foreign substance.
   (3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)
   Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω

   (4) Is the measured resistance within specification?

   YES

   ▸ Go to "Check sensor/actuator related to fuel system" as follows

   NO

   ▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on) (Refer to each DTC diagnostic procedure)
   (2) Are all of these items normal ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

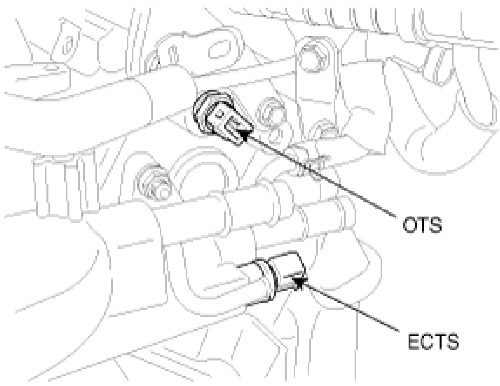
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0196

COMPONENT LOCATION



GENERAL DESCRIPTION

In CVVT system, the working fluid is engine oil. But its density varies according to temperature, PCM performs oil quantity correction based on the signal from engine oil temperature sensor over the various range of temperature. Main function of Oil Pressure Sensor is as follows.

1. intake air valve control solenoid(oil control valve) duty correction : As coil resistance varies according to oil temperature, excessive current flows at low temperture and low current at high temperature without duty correction. Therefore, PCM performs duty correction properly according to output signal from oil temperature sensor to supply constant current which is free from the change of oil temperature.
2. CVVT system operation starting temperature determination : As CVVT response gets weaker due to the friction of engine components such as valve at low temperature, PCM operates CVVT at above specific temperture based on output signal from oil temperture sensor.
3. improved CVVT controllability : CVVT response speed varies as oil temperature, PCM improves controllability throughout estimating response speed with oil temperture sensor output signal.

DTC DESCRIPTION

Checking the oil temperture , coolant temperature and intake air temperature every 25 sec. under detecting condition, if the difference in temperature at start-up exceeds threshold value, PCM sets P0196. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

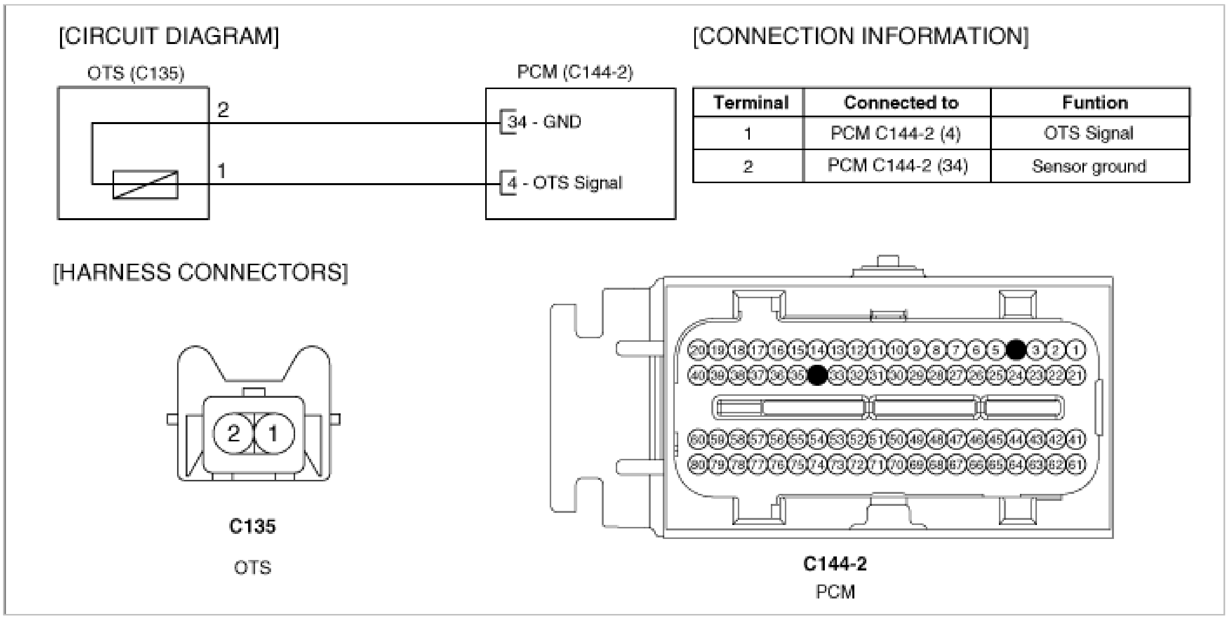
Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if the oil temperature value is rational, compared to coolant and intake air temperature.	• Poor connection • Open or short in harness • Faulty OTS
Enable Conditions	Case 1	• Engine run time after startup< 30 sec • Minimum soak period required >270 min	
	Case 2	• Minimum engine run time >800 sec	
	Case 1	• The difference in temperature between oil and coolant temperatures at startup. > 35°C(63°F)	

Threshold value	Case 2	• The difference in temperature between oil temperature and intake air temperature at startup >35°C(63°F)	• PCM
Diagnosis Time		• Continuous (More than 12.5 sec.failure for every 25 sec.test)	
MIL On Condition		• 2 Driving Cycles	

SPECIFICATION

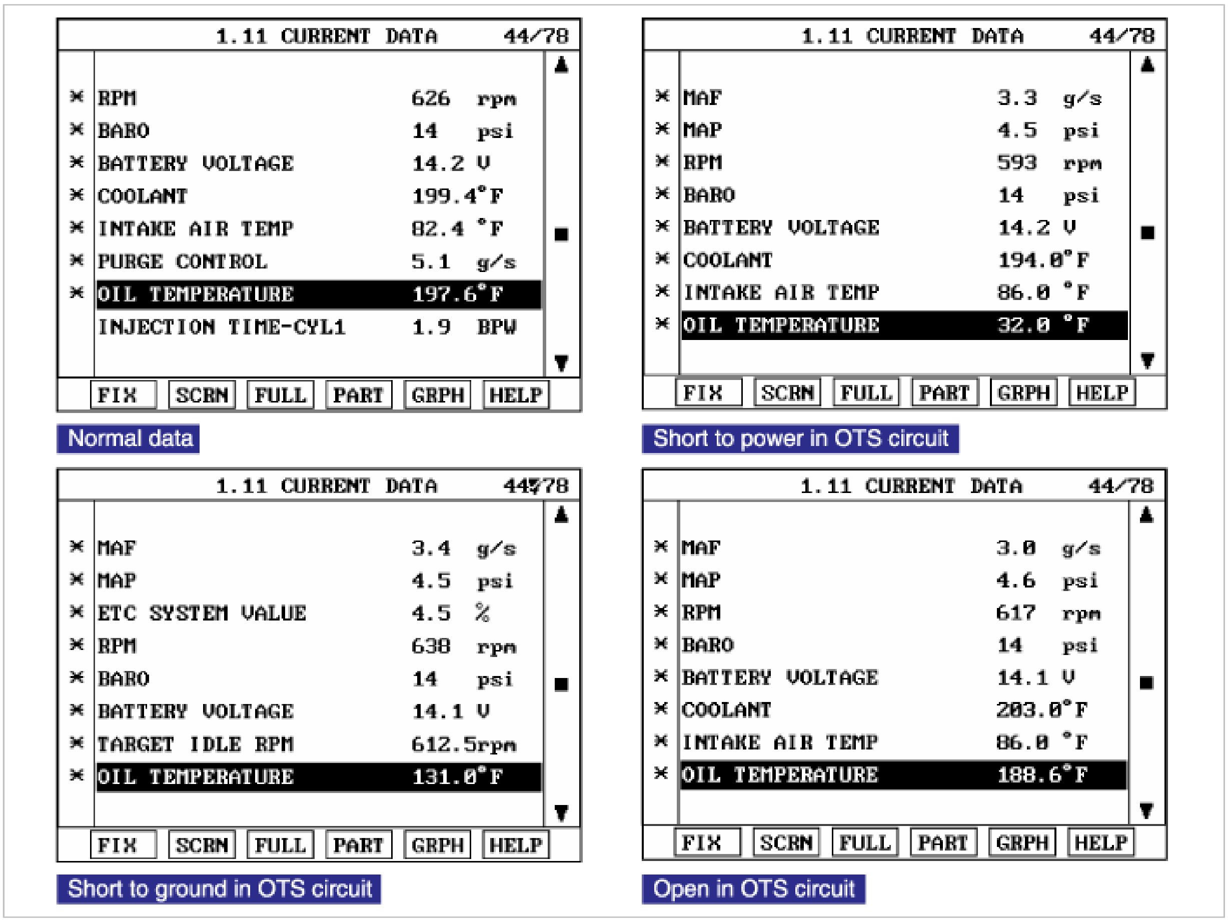
Temperature(°C/°F)	Resistance(kΩ)
-20°C/ -4°F	16.52kΩ
20°C/ 68°F	2.45kΩ
80°C/ 176°F	0.29kΩ

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector (DLC)
2. Warm up engine to normal operating temperature
3. Monitor "Oil Temperature" parameter on the scantool.



4. Is the current data displayed correctly ?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▸ Go to "Terminal and connector inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

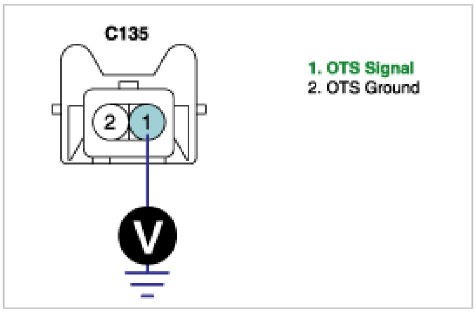
NO

▸ Go to "signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check Voltage
   (1) IG "OFF" & ENG "OFF"
   (2) Disconnect OTS connector
   (3) IG "ON" & ENG "OFF"
   (4) Measure voltage between harness terminal 1 of OTS and chassis ground.

Specification : Approx. 5V



(5) Is the measured voltage within specification ?

YES

▸ Go to "Ground Circuit Inspection" procedure.

NO

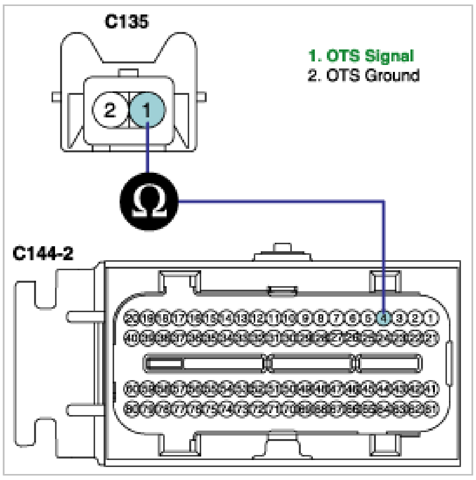
▸ Go to "Check open in harness" as follow.

2. Check open in harness
   (1) IG "OFF" & ENG "OFF"

   (2) Disconnect OTS and PCM connector.

   (3) Measure resistance between terminal 1 of OTS harness connector and terminal 4 of PCM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specification ?

YES

▸ Go to "Ground Circuit Inspection" procedure.

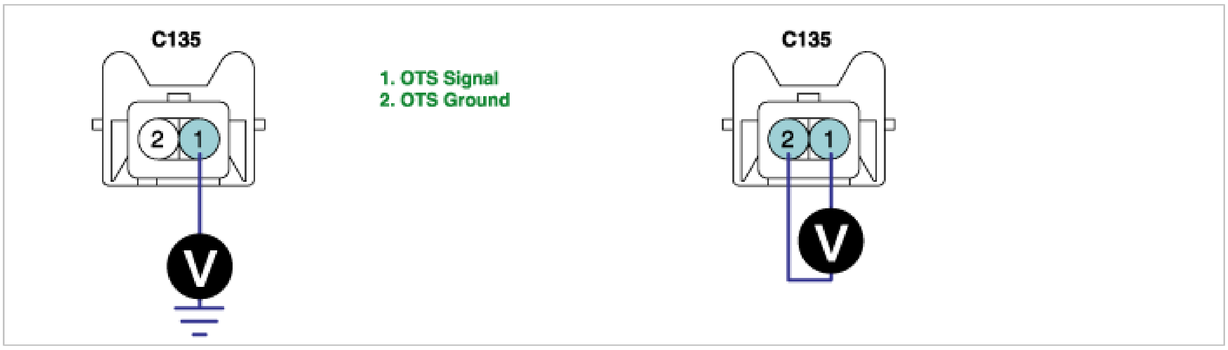
NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" & ENG "OFF"
2. Disconnect OTS connector
3. Measure voltage between terminal 1 of OTS harness connector and chassis ground.
4. Measure voltage between terminals 1 and 2 of OTS harness connector.

Specification : Measurement "A" - Measurement 'B' = Approx. below 200mV



5. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure

NO

▸ Repair or replace contact resistance or open in harness and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check resistance of OTS
   (1) IG "ON" & ENG "OFF"

   (2) Monitor Oil Temperature parameter on the scantool

   (3) IG "OFF" & ENG "OFF"

   (4) Disconnect OTS connector.

   (5) Measure resistance between terminal 1 and 2 of OTS connector(Component Side)

   Specification :

Temperature(°C/°F)	Resistance(kΩ)
-20°C/ -4°F	16.52kΩ
20°C/ 68°F	2.45kΩ
80°C/ 176°F	0.29kΩ

   (6) Is the measured resistance within specification ?

   YES

   ▸ Go to "Check PCM" as follows.

   NO

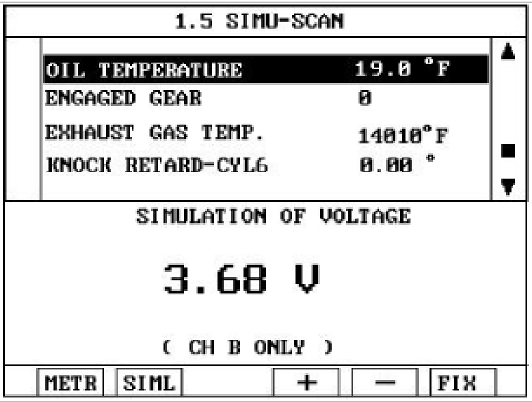
   ▸ Substitute with a known - good OTS and check for proper operation. If the problem is corrected, replace OTS and go to "Verification of Vehicle Repair" procedure.

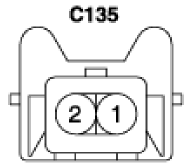
2. Check PCM
   (1) Ignition "OFF" and Connect Scantool

   (2) Ignition"ON " & Engine "OFF"

   (3) Select simulation function on scantool.

   (4) Simulate voltage at terminal "1" of OTS signal connector.





1. OTS Signal
2. OTS Ground

(5) Does the OTS signal value changes according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

▸ Go to "Component Inspection" procedure

NO

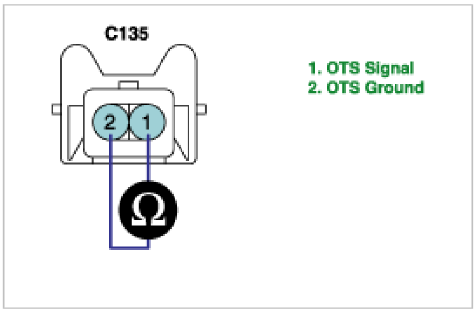
▸ Repair or replace contact resistance or open in harness and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check resistance of OTS
   (1) IG "ON" & ENG "OFF"
   (2) Monitor Oil Temperature parameter on the scantool
   (3) IG "OFF" & ENG "OFF"
   (4) Disconnect OTS connector.
   (5) Measure resistance between terminal 1 and 2 of OTS connector(Component Side)
   Specification :

Temperature(°C/°F)	Resistance(kΩ)

-20°C/ -4°F	16.52kΩ
20°C/ 68°F	2.45kΩ
80°C/ 176°F	0.29kΩ



(6) Is the measured resistance within specification ?

YES

▶ Go to "Check PCM" as follows.

NO

▶ Substitute with a known - good OTS and check for proper operation. If the problem is corrected, replace OTS and go to "Verification of Vehicle Repair" procedure.

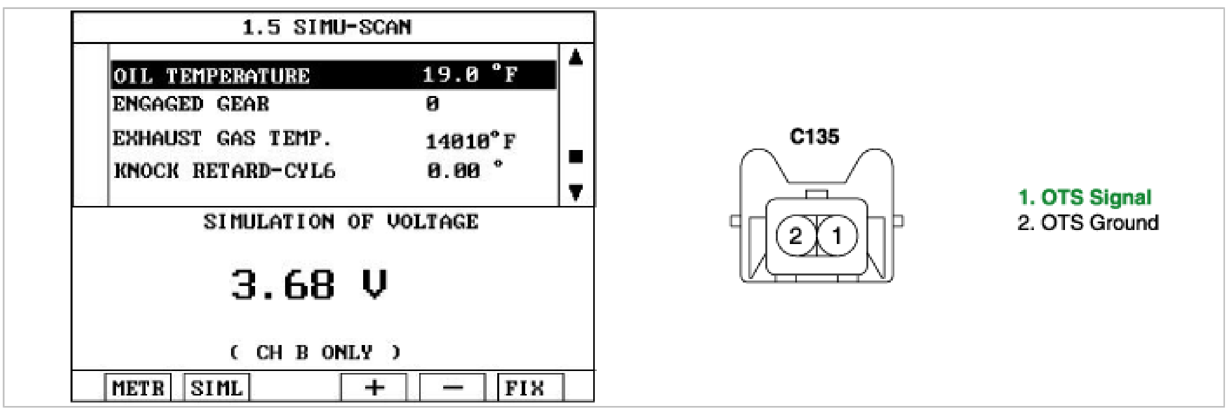
2. Check PCM

(1) Ignition "OFF" and Connect Scantool

(2) Ignition"ON " & Engine "OFF"

(3) Select simulation function on scantool.

(4) Simulate voltage at terminal "1" of OTS signal connector.



(5) Does the OTS signal value changes according to simulation voltage ?

YES

▶ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

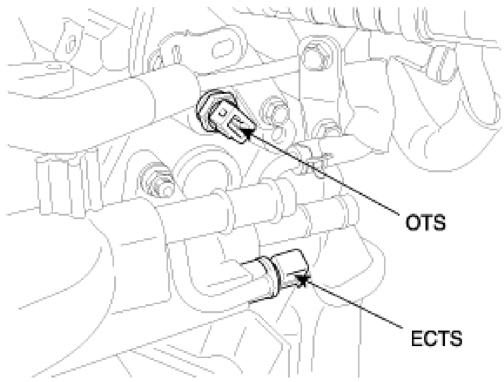
▸ Go to the applicable troubleshooooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0217

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature (ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

DTC DESCRIPTION

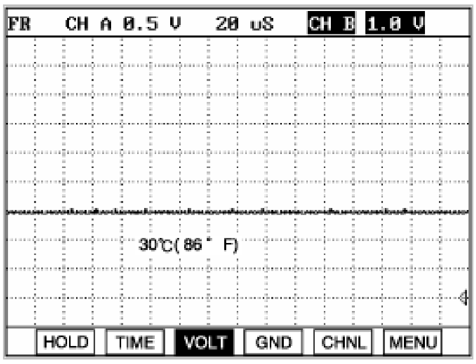
The Engine Coolant Temperature High Rationality Diagnostic checks for unusually high engine coolant temperatures under normal operating loads and if the temperature is found to be higher than a certain limit, the diagnostic declares a failure.
PCM monitors difference between the startup and current coolant temperature and compares agaist the threshold while enable condition is met. If the PCM detects that the coolant temperature exceeds the limit under normal operating condition, PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This diagnostic introduces a calibratable delay and simultaneously looks out for excessive engine loads. Once the delay period passes and excessive loads have not been experienced, the diagnostic checks whether the undefaulted coolant temperature has exceeded a maximum threshold in order to make a PASS/FAIL determination.	• Poor connection • Lack of engine coolant • Water pump • ECTS • PCM
Enable Conditions	• Engine Running status • No disabling faults present • Coolant Sensor within range • Undefaulted Coolant Temp ≥ 50°C(122 °F) • ndefaulted IAT ≥ 35°C(95 °F) • Soak time ≥ 360min or Undeafaulted Coolant temp ≤ 45°C(113 ° F)	
Thresh old	• Coolant temperature above which High Rationality fail criteria is satisfied ≥ 110°C (230 °F) (Vehicle has been under high airflow	

value	conditions that may cause the High Rationality diagnostic to false fail) - To detect a failure, Average airflow must be< 30 g/sec and EWMA Airflow must be< 50 g/sec)	
Diagnosis Time	• Continuous (More than 12.5 sec.failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

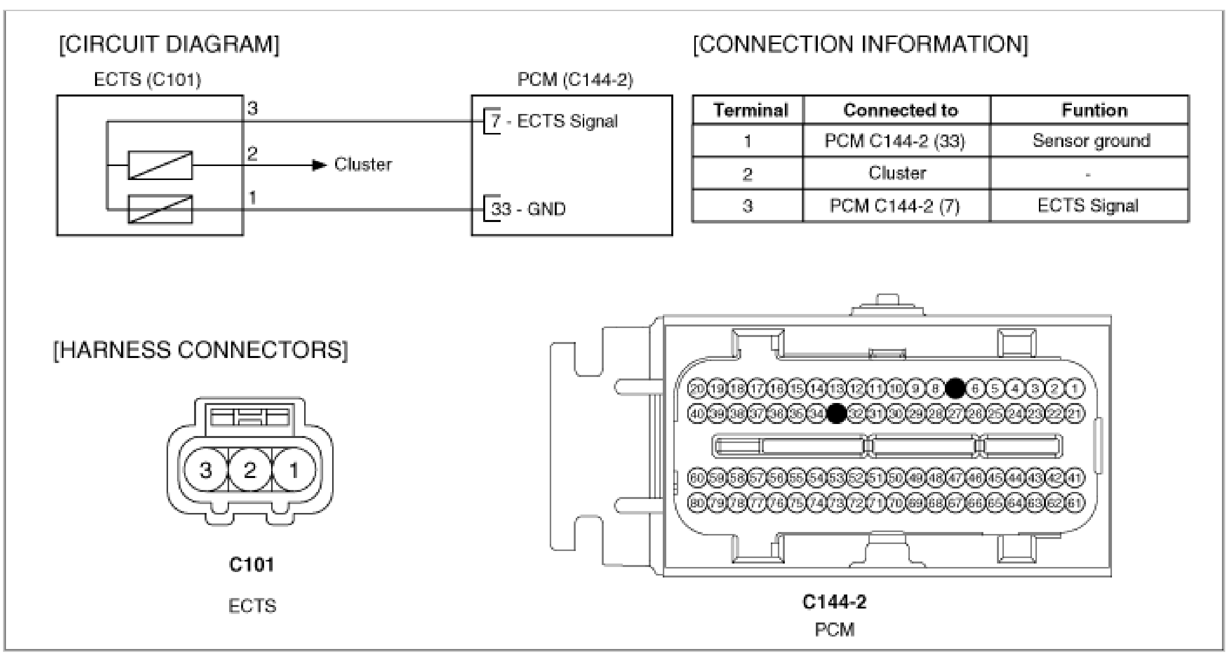


The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "ECTS" item on the service data.

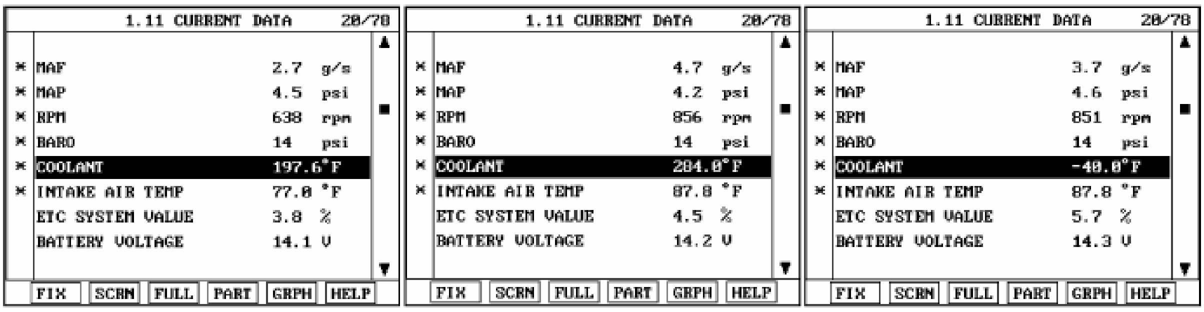


Fig. 1 Fig. 2 Fig. 3

Fig. 1 : Normal at Idle
Fig. 2 : Short to ground at idle
Fig. 3 : Open or short to battery at idle

4. Is the "ECTS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

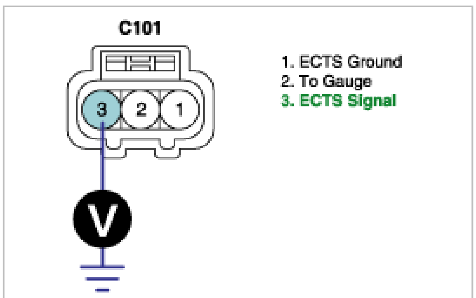
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect ECTS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 3 of ECTS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Go to "Check short to ground in harness" as follows.

5. Check short to ground in harness
   (1) IG "OFF" and disconnect ECTS connector and PCM connector.
   (2) Measure resistance between terminal 3 of ECTS harness connector and chassis ground.
   (3) Measure resistance between terminals 1 and 3 of ECTS harness connector.

Specification : Infinite

   (4) Is the measured resistance within specification?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

SYSTEM INSPECTION

1. Check if Engine coolant level is O.K
2. Check if that water pump is operating correctly.
3. Has a problem been found ?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair"procedure.

NO

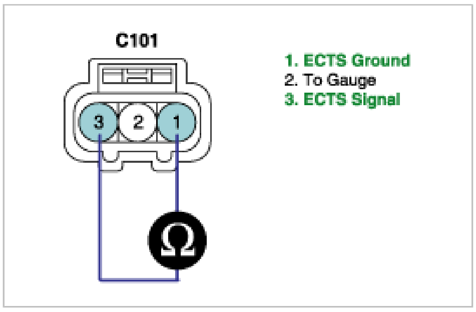
▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check resistance of ECTS
   (1) IG "OFF" and disconnect ECTS connector.
   (2) Measure resistance between terminal 1 and 3 of ECTS connector. (Component Side)

Specification :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		



(3) Is the measured resistance within specification ?

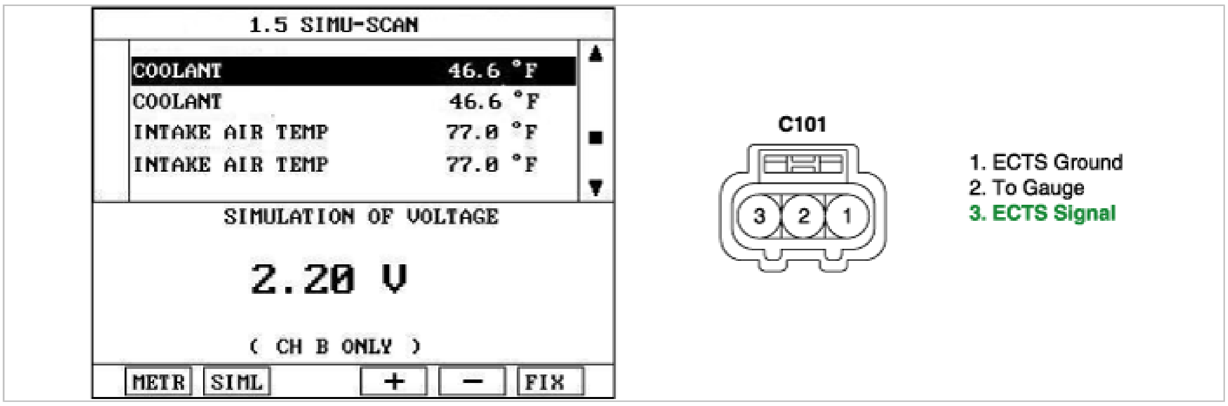
YES

▸ Go to "Check PCM" procedure.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Connect probe to terminal 3 of ECTS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

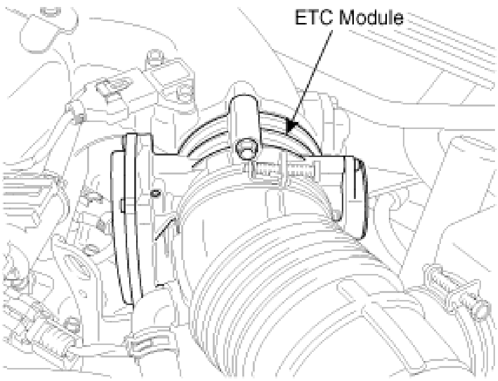
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0222

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

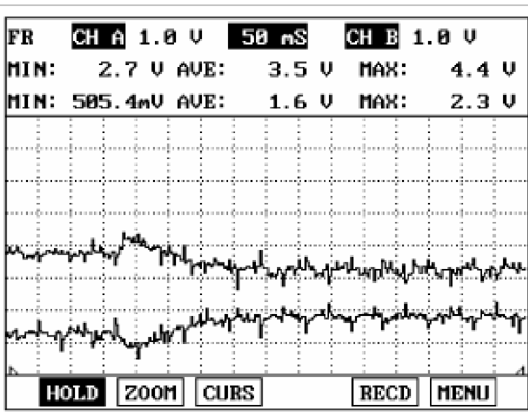
DTC DESCRIPTION

Checking output signals from TPS2 every 8.5 sec. under detecting condition, if an output signal is below 0.25V for more than 0.1 sec, PCM sets P0222. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

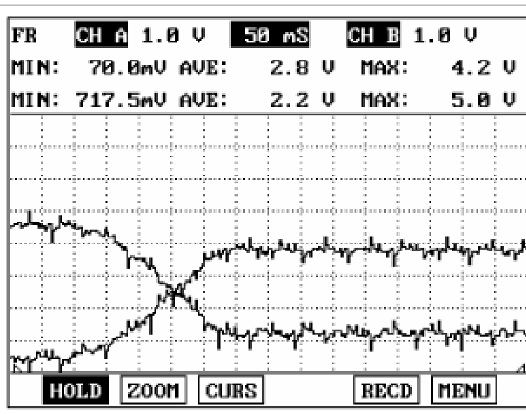
DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• signal low	• Poor connection • Open or short to ground in power harness • Open or short to ground in signal harness • TPS • PCM
Enable condition	• IG "ON"	
threshold value	• The signal voltage of TPS < 0.25V	
diagnosis time	• Continuous (more than 0.1 sec. failure for every 8.5 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



Hit the accelerator at IG ON



Open the throttle valve by force at IG ON

SPECIFICATION

Throttle opening (°)	Output voltage(V) [Vref=5.0]	
	TPS1	TPS2
0°	0.0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V

NO

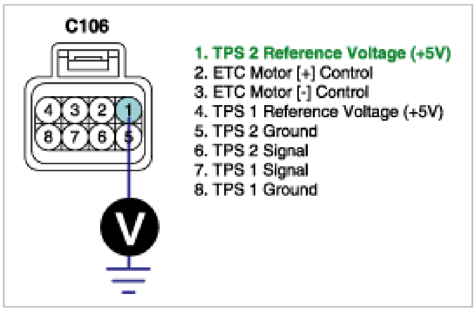
▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect TPS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of TPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Repair open or short to ground in power harness, and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.
   (2) Measure resistance between terminal 6 of TPS harness connector and chassis ground.
   (3) Measure resistance between terminals 6 and 5(8) of TPS harness connector.

   Specification : Infinite

   (4) Is the measured resistance within specification?

   YES

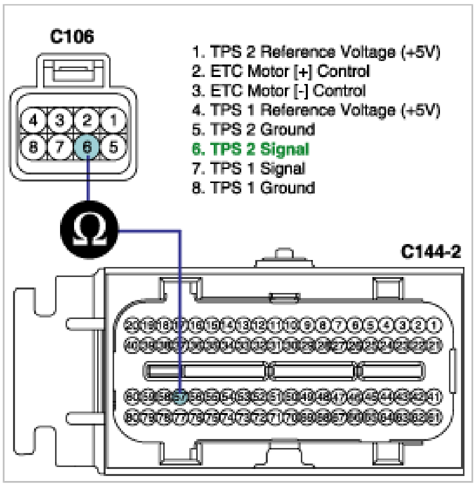
   ▸ Go to "Check open in harness" as follows

   NO

   ▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.
   (2) Measure resistance between terminal 6 of TPS harness connector and terminal 57 of PCM harness connector.

   Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to " Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Repair" procedure.

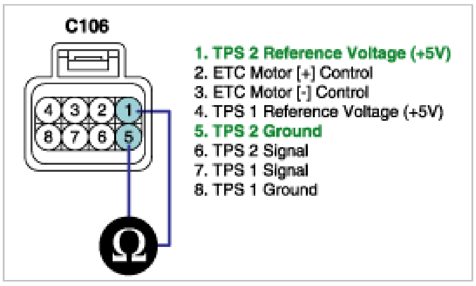
COMPONENT INSPECTION

1. Check TPS

(1) IG "OFF" and disconnect TPS connector.

(2) Measure resistance between terminals 1 and 5 of TPS connector.(Component side)

Specification : 2.7 ~ 4.1kΩ



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good TPS and check for proper operation. If the problem is corrected, replace TPS and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

> CAUTION
>
> Procedure of ETS Initialization
> 1. Erase the trouble codes on PCM
> 2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
> 3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

NO

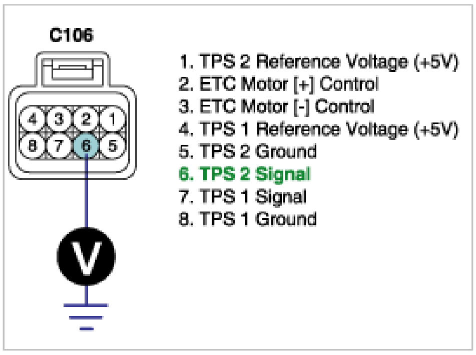
▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect TPS connector.
   (2) IG "ON and ENG "OFF"
   (3) Measure voltage between terminal 6 of TPS harness connector and chassis ground.

Specification : Approx. 0V



(4) Is the measured voltage within specification?

YES

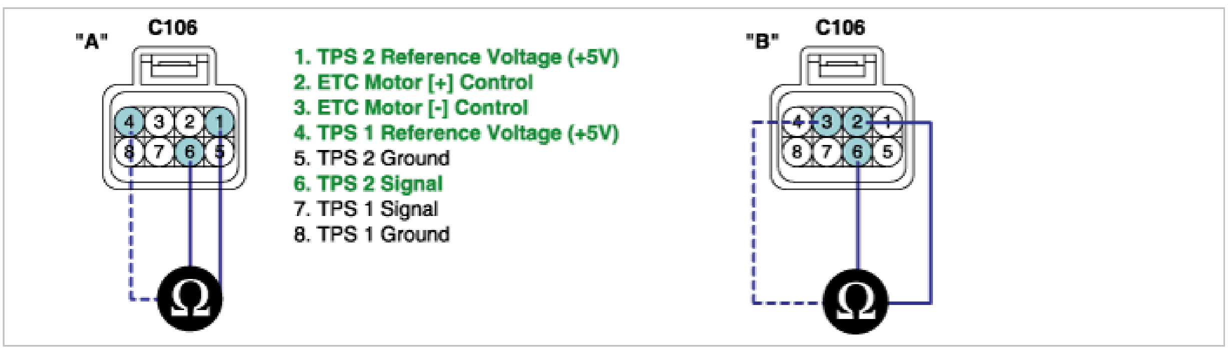
▸ Go to "Ground Circuit Inspection" procedure.

NO

▸ Go to "Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.
   (2) Measure resistance between terminals 1 and 6 of TPS harness connector.
   (3) Measure resistance between terminals 4 and 6 of TPS harness connector.
   (4) Measure resistance between terminals 2 and 6 of TPS harness connector.
   (5) Measure resistance between terminals 3 and 6 of TPS harness connector.

Specification : Infinite



(6) Is the measured resistance within specification?

YES

▸ Go to " Ground Circuit Inspection" procedure.

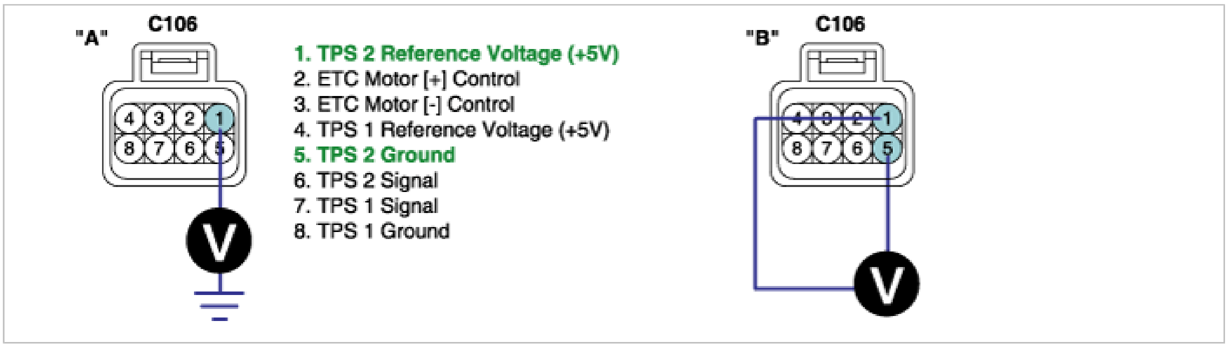
NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect TPS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of TPS harness connector and chassis ground.
4. Measure voltage between terminals 1 and 5 of TPS harness connector.

Specification : Measurement "A" - Measurement 'B' = Approx. below 200mV



5. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open or contact resistance inharness, and go to "Verification of Vehicle Repair: procedure.

COMPONENT INSPECTION

1. Check TPS
   (1) IG "OFF" and disconnect TPS connector.
   (2) Measure resistance between terminals 1 and 5 of TPS connector.(Component side)

Specification : 2.7 ~ 4.1kΩ

   (3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good TPS and check for proper operation. If the problem is corrected, replace TPS and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

CAUTION

Procedure of ETS Initialization
1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

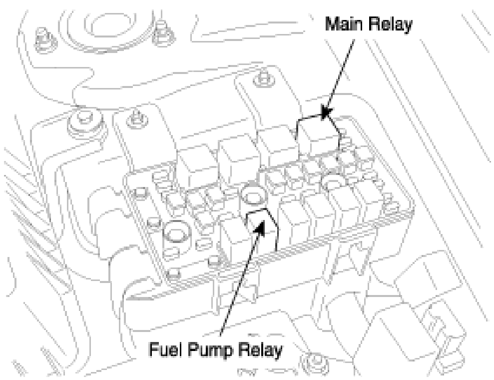
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0230

COMPONENT LOCATION



GENERAL DESCRIPTION

The PCM provides ground to one side of the coil in the fuel pump relay to control the fuel pump relay. The other side of the fuel pump relay coil is connected to fuel pump relay, which activates when the ignition switch is ON. The PCM monitors the control circuit between the fuel pump relay and the ECM. When the ignition switch is turned ON, the PCM energizes the fuel pump relay, which sends power to the fuel pump.

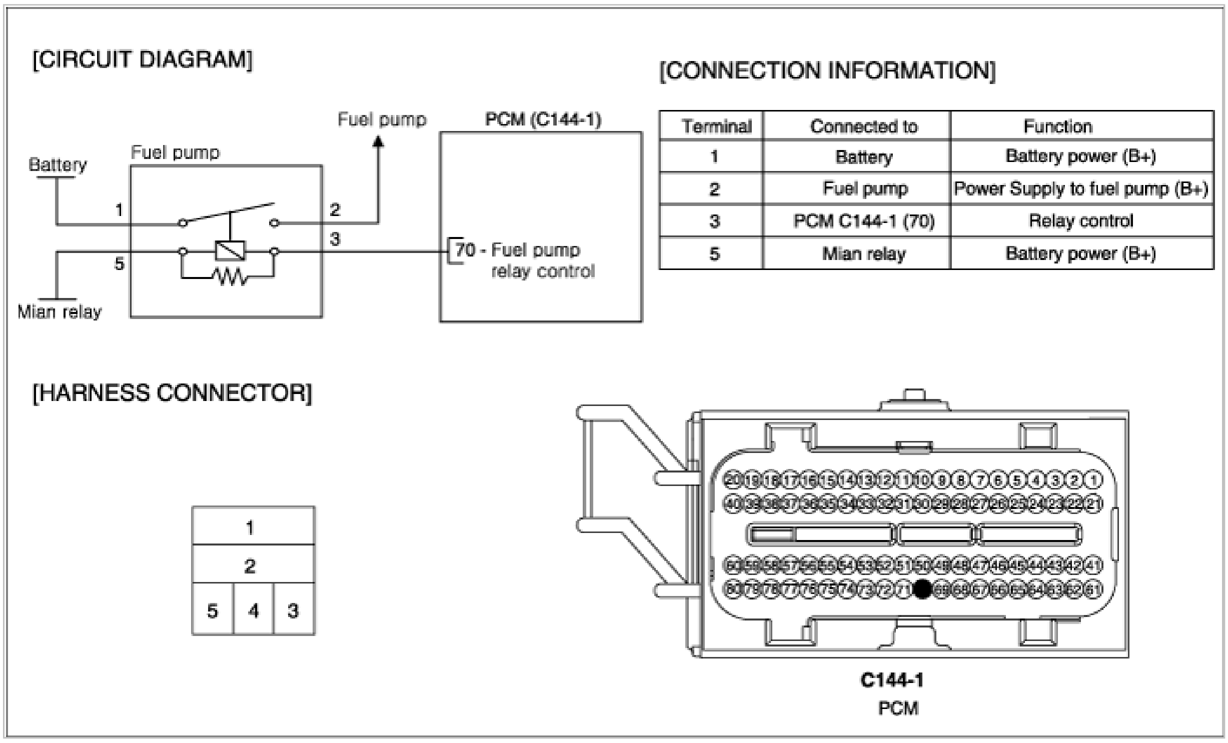
DTC DESCRIPTION

Checking fuel pump relay circuit continuously under detecting condition, if open or short in the circuit is detected PCM sets P0230.In addition, Take note that open circuit in Main Relay may cause this P0230 code.
※ In addition, Take note that open circuit in Main Relay may cause this P0230 code.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low or High	• Poor connection • Open or short in fuel pump relay circuit • Open in Main Relay circuit • Fuel Pump Relay • PCM
Enable condition	• 11V ≤ Battery Voltage ≤ 16V	
threshold value	• Open or short	
diagnosis time	• Continuous	
MIL ON condition	• NO MIL ON(DTC only)	

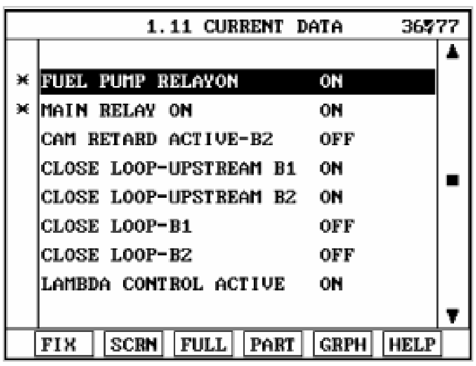
SCHEMATIC DIAGRAM



Terminal	Connected to	Function
1	Battery	Battery power (B+)
2	Fuel pump	Power Supply to fuel pump (B+)
3	PCM C144-1 (70)	Relay control
5	Mian relay	Battery power (B+)

MONITOR SCANTOOL DATA

1. Connect Scantool to Data Link Cable(DLC).
2. ENG "ON"
3. Monitor "Fuel Pump Relay" item on the scantool.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▸ Go to "Terminal and connector inspection" procedure.
▸ In case of open in Main Relay, this DTC can be set. so, check it for open before going next procedure.(Refer to DTC relating to Main relay)

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

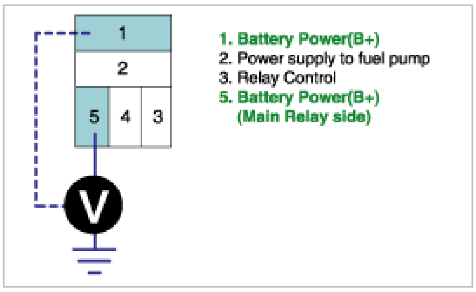
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" & ENG "OFF"
2. Disconnect fuel pump relay.
3. IG "ON" & ENG "OFF"
4. Measure voltage between harness terminal 1(5) of chassis ground.

Specification : B+



5. Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection" procedure.

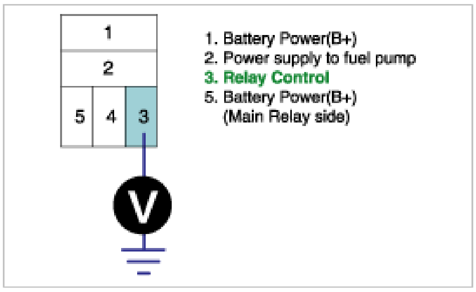
NO

▸ Check "Fuse" between fuel pump relay and main relay is not installed or blown off
▸ Check "Fuse" between fuel pump relay and battery is not installed or blown off
▸ Especially, if battery voltage at terminal 5 is not detected, replace the Main Relay.
▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect fuel pump relay.
3. IG "ON" & ENG "OFF"
4. Measure voltage between harness terminal 5 and chassis ground.

Specification : Approx. 2.5V



5. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or repalce as necessary and then, go to "Verification of Vehicle Repair" procedure.

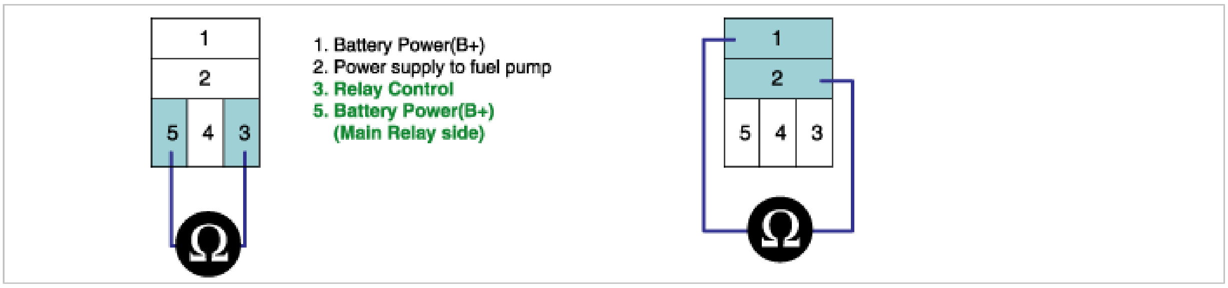
COMPONENT INSPECTION

1. Check fuel pump relay
   (1) IG "OFF"
   (2) Disconnect Fuel Pump Relay
   (3) Measure resistance between terminal 1 and 2 of Fuel Pump Relay

(4) Measure resistance between terminal 3 and 5 of Fuel Pump Relay

Specification :

Terminal	continuity
1~2	NO
3~5	YES (Approx. 70Ω ~ 120Ω)



(5) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good Fuel Pump Relay and check for proper operation.If the problem is corrected, replace Fuel Pump Relay and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

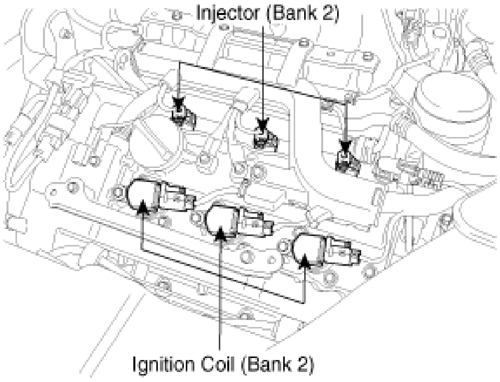
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0261

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

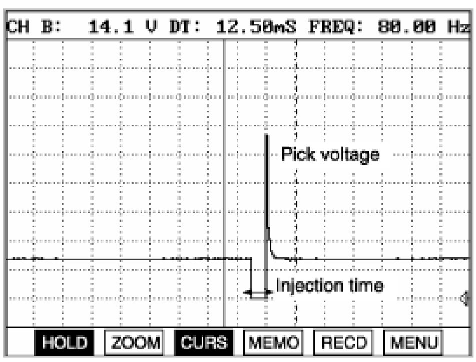
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is low for more than 5 sec., PCM sets P0261. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low	• Poor connection • Open or short to ground in power harness • Open or short to ground in control harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met > 0.5sec.	
threshold value	• Open or short to ground	
diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)

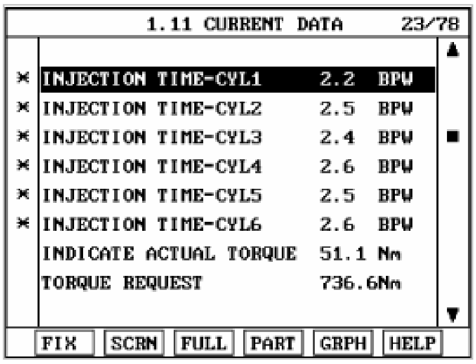
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "fuel injection time" item on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

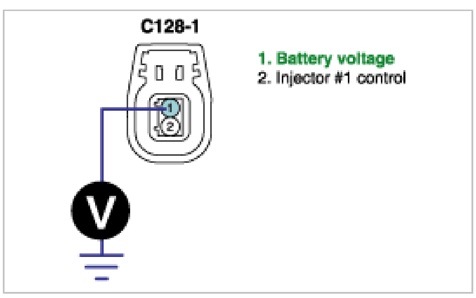
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "ON" and disconnect injector connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of injector harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification?

YES

▸ Go to "Control Circuit Inspection" procedure.

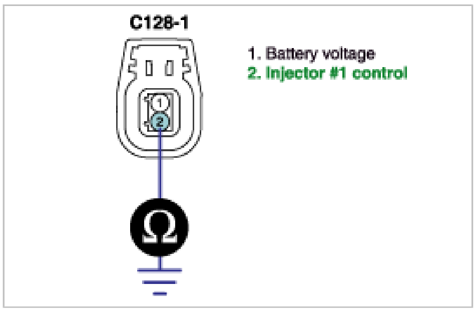
NO

▸ Check open or connection of the fuse connected to injector power supply.
▸ Repair open or short to ground in harness, and go to "Verification of Vehicle Repair' procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminal 2 of injector harness connector and chassis ground.

Specification : Infinite



(3) Is the measured resistance within specification?

YES

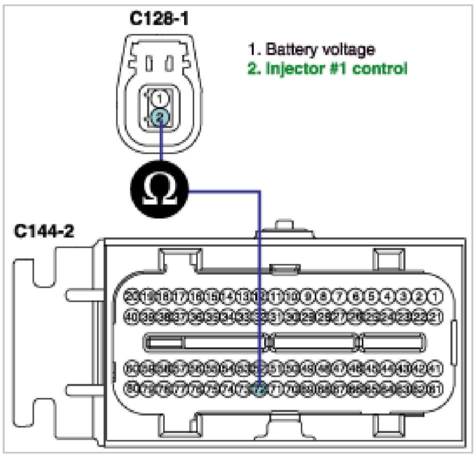
▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminal 2 of injector harness connector and 72 of PCM harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

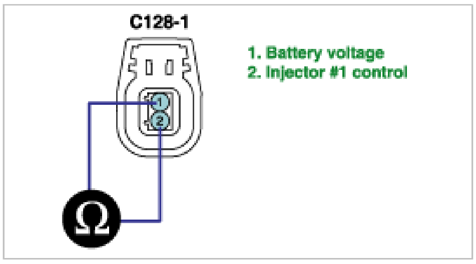
▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)

Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

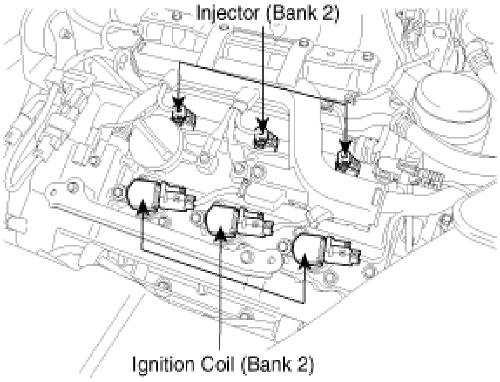
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0262

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

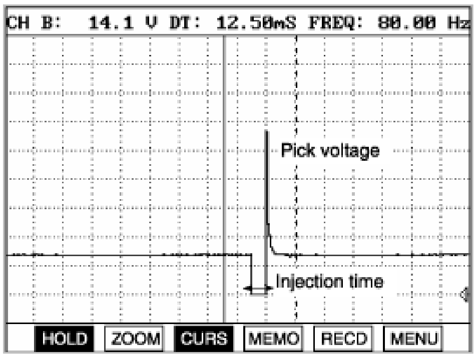
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is high for more than 5 sec., PCM sets P0262. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal High	• Poor connection • Short to battery in harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met >0.5sec.	
threshold value	• Short to battery	
diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

   (2) Measure resistance between terminal 2 of injector harness connector and 64 of PCM harness connector.

Specification : Below 1Ω

   (3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

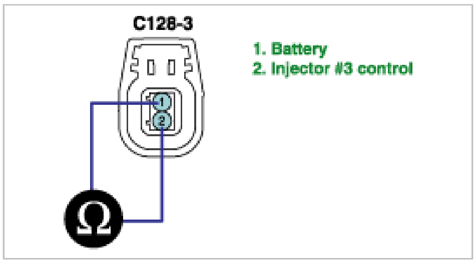
▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)

Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

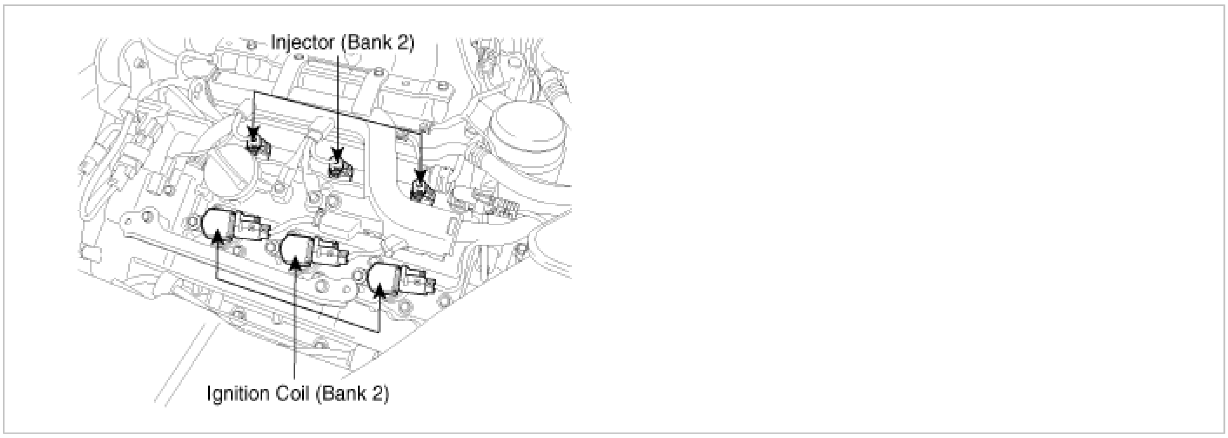
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0268

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

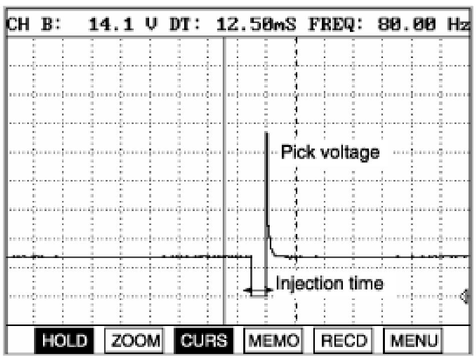
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is high for more than 5 sec., PCM sets P0268. Warning lamp turns on when the malfunction lasts till continuous 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal High	• Poor connection • Short to battery in harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met >0.5sec.	
threshold value	• Short to battery	
diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

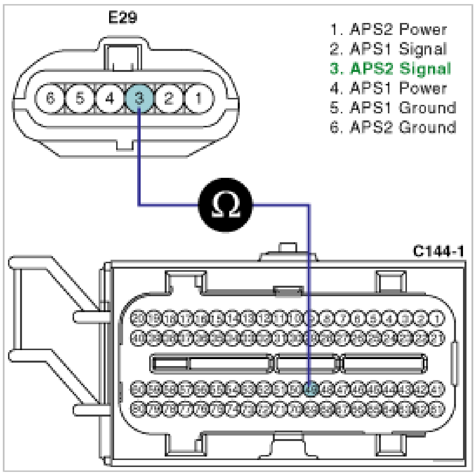
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "fuel injection time" item on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Control Circuit Inspection" procedure.

CONTROL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect injector connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 2 of injector harness connector and chassis ground.

Specification : Approx. 0V

   (4) Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

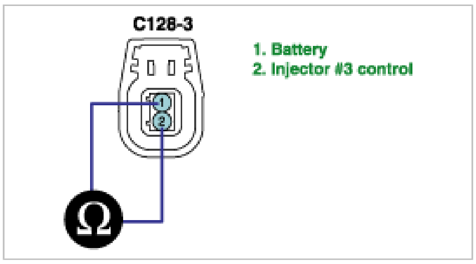
▸ Go to "Check short to battery in harness" as follows.

2. Check short to battery in harness

(1) IG "OFF" and disconnect injector connector and PCM connector.

(2) Measure resistance between terminals 1 and 2 of injector harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

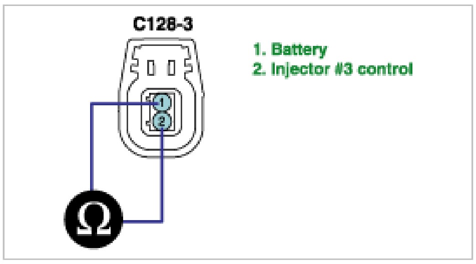
1. Check injector

(1) IG "OFF" and disconnect injector connector.

(2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)

Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Control Circuit Inspection" procedure.

CONTROL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect injector connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 2 of injector harness connector and chassis ground.

   Specification : Approx. 0V

   (4) Is the measured voltage within specification?

   YES

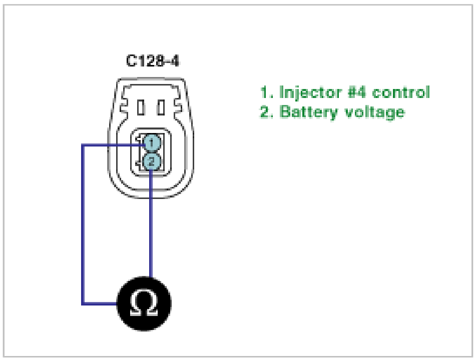
   ▸ Go to "Component Inspection" procedure.

   NO

   ▸ Go to "Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of injector harness connector.

   Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

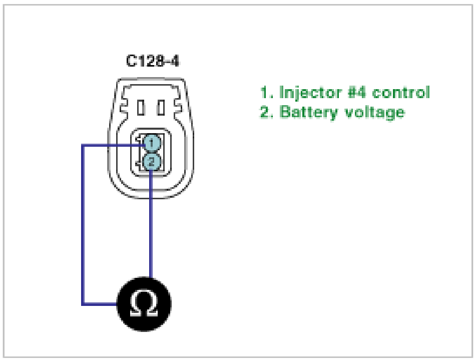
NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)
   Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "

5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshooooting procedure.

NO

▸ System is performing to specification at this time.

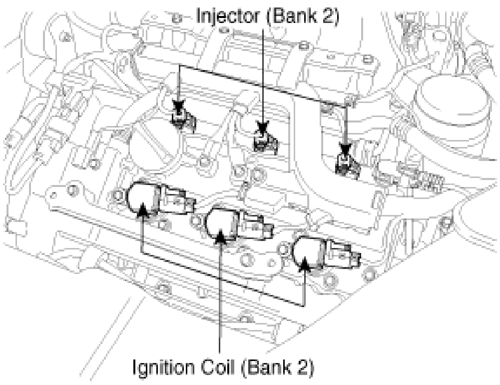
Fuel System > Troubleshooting > P0276

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

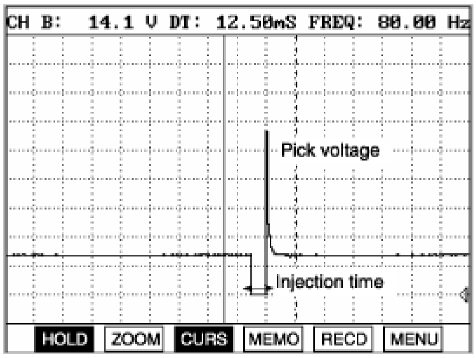
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is low for more than 5 sec., PCM sets P0276. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low	• Poor connection • Open or short to ground in power harness • Open or short to ground in control harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met > 0.5sec.	
Threshold value	• Open or short to ground	
Diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

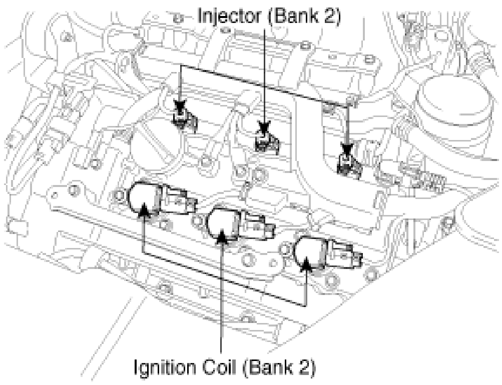
Fuel System > Troubleshooting > P0300

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0300. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• Determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misfre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold (based on vehicle speed) then the engine is considered to	

Enable condition	Case 3	be operation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥ 11 engine cycles (If negative torque load condition is detected. Negative torque is determined by load conditions less than a 'zero torque' line which is determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a cam synchronization problem is detected internal to the Misfire diagnostic >30 engine cycles If false information is received, a false misfire could be diagnosed. • Intrusive diagnostics not enabled (EGR FLOW) • Number of engine cycles to delay the misfire diagnostic if any intrusive diagnostic test that could potentially interfere with the misfire diagnostic detectability has been determined to be active • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period (31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times < 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times < 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of

		number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F) • Calculated coolant temperature with default applied > 120° C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults • P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.

▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data

(1) Ignition "OFF"

(2) Connect Scantool and Engine "ON"

(3) Monitor parameters related to "Random Misfire Detected" on CURRENT DATA

Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

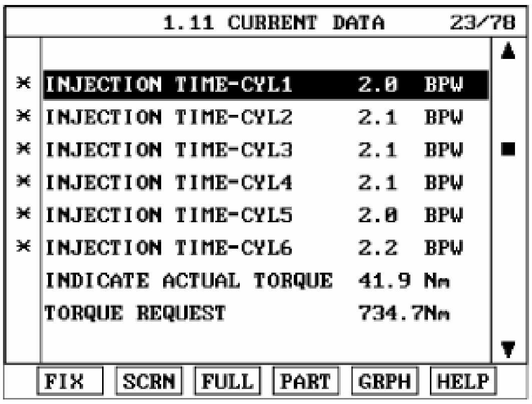


Fig. 1

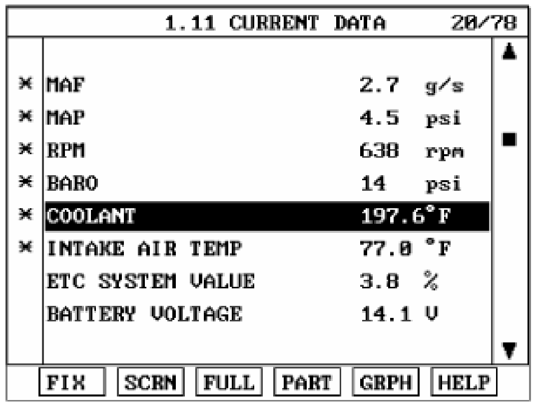

Fig. 2

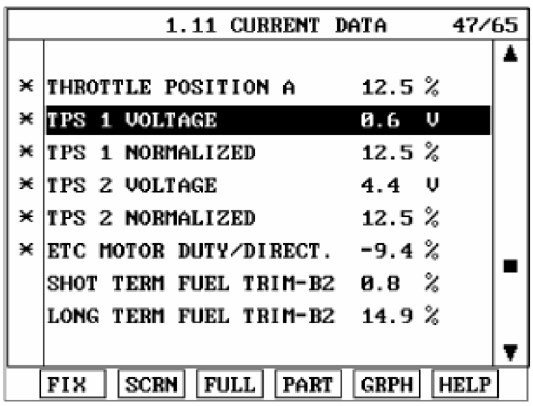

Fig. 3

(4) Are the parameters related to "Random/Multi Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg

(1) Remove cylinder's spark plugs

(2) Visually/physically inspect the following items:
- Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
- Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
- Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

(3) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
(1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
- Vacuum hoses for splits, kinks and improper connections.
- Throttle body gasket
- Gasket between intake manifold and cylinder head
- Seals between intake manifold and fuel injectors
- Exhaust system between HO2S and Three way catalyst for air leakage

(2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
(1) Remove PCV valve from cylinder head cover by puling ventilation hose

(2) With engine idling block PCV valve opening

(3) Verify that vacuum is felt

(4) Remove PCV valve

(5) Blow through valve from prot "A" and verify that air comes out of prot "B"

(6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

(7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
(1) Warm up the engine to normal operating temperature

(2) Disconnect the spark plug cables and remove the spark plugs.

(3) Crank the engine to remove any foreign material in the cylinders.

(4) Put compression pressure gauge into spark pulg hole

(5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

(6) Is compression pressure for each cylinder displayed within specifications ?

Specification : 1323kPa(13.5 kg/cm²,192 psi)

YES

▸ Go to "Check Timing " as below

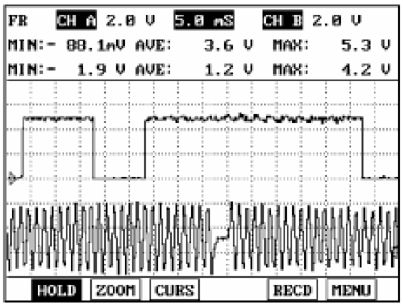
NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.
▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
(1) Ignition "OFF"

(2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

(3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment



(4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

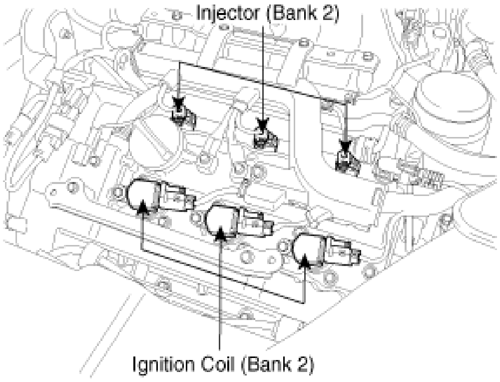
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0301

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0301. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.

MONITOR SCANTOOL DATA

1. Is the power balance test done?

   YES

   ▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.
   ▸ If power balance test is finished within 46 sec., go to next procedure.

   NO

   ▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 1 Misfire Detected" on CURRENT DATA
   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

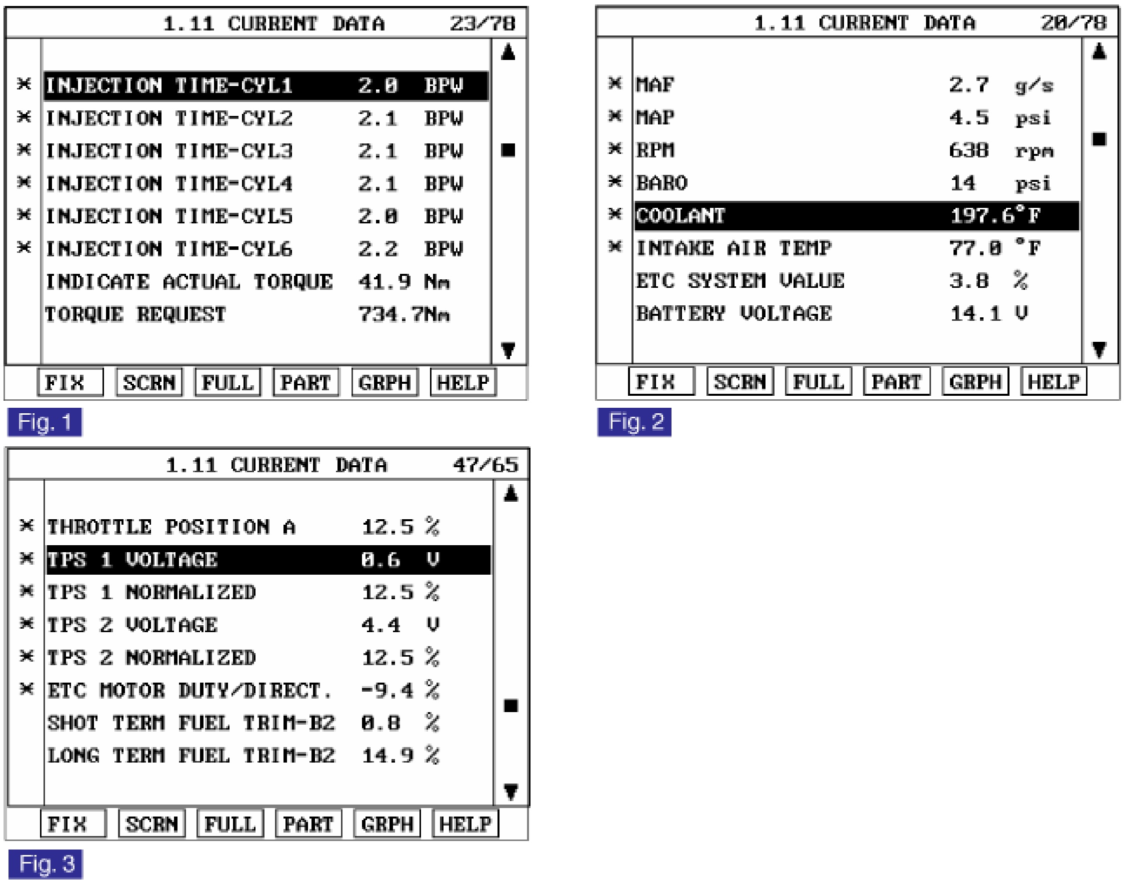

Fig. 1
Fig. 2
Fig. 3

(4) Are the parameters related to "Cylinder 1 Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg

(1) Remove cylinder's spark plugs

(2) Visually/physically inspect the following items:

- Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
- Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
- Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

(3) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Air Leakage " as below

2. Check Air Leakage

(1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
- Vacuum hoses for splits, kinks and improper connections.
- Throttle body gasket
- Gasket between intake manifold and cylinder head
- Seals between intake manifold and fuel injectors
- Exhaust system between HO2S and Three way catalyst for air leakage

(2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

(1) Remove PCV valve from cylinder head cover by puling ventilation hose

(2) With engine idling block PCV valve opening

(3) Verify that vacuum is felt

(4) Remove PCV valve

(5) Blow through valve from prot "A" and verify that air comes out of prot "B"

(6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

(7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure

(1) Warm up the engine to normal operating temperature

(2) Disconnect the spark plug cables and remove the spark plugs.

(3) Crank the engine to remove any foreign material in the cylinders.

(4) Put compression pressure gauge into spark pulg hole

(5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

(6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.

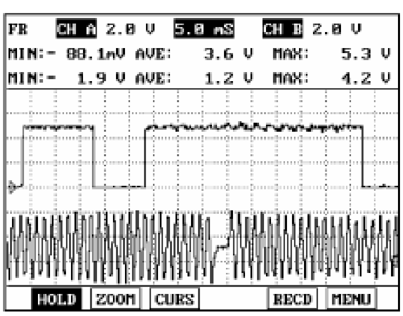
▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing

(1) Ignition "OFF"

(2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

(3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment



(4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

(5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

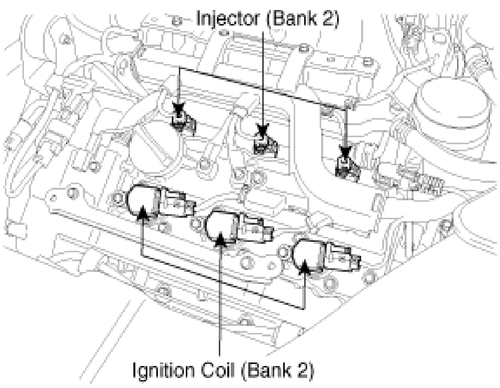
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0302

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0302. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. Negative torque isdetermined by load conditions less than a 'zero torque' line whichis determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a camsynchronization problem is detected internal to the Misfirediagnostic > 30 engine cyclesIf false information is received, a false misfire could bediagnosed. • Intrusive diagnostics not enabled (EGRFLOW) • Number of engine cycles to delay the misfire diagnostic ifany intrusive diagnostic test that could potentially interferewith the misfire diagnostic detectability has been determined to beactive • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel

   (1) Remove cylinder's spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.

▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

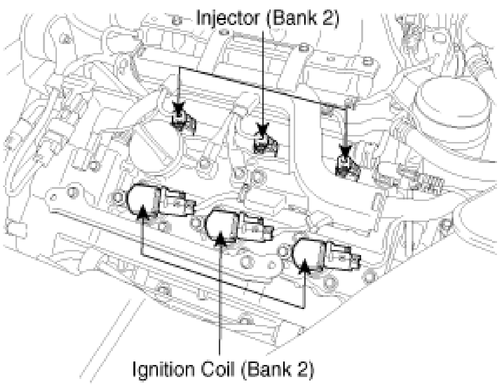
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0304

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0304. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating

and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. Negative torque isdetermined by load conditions less than a 'zero torque' line whichis determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a camsynchronization problem is detected internal to the Misfirediagnostic > 30 engine cyclesIf false information is received, a false misfire could bediagnosed. • Intrusive diagnostics not enabled (EGRFLOW) • Number of engine cycles to delay the misfire diagnostic ifany intrusive diagnostic test that could potentially interferewith the misfire diagnostic detectability has been determined to beactive • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period	

Enable condition	Case 3	(31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times< 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times< 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F) • Calculated coolant temperature with default applied > 120°C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM

		• P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.
▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 4 Misfire Detected" on CURRENT DATA
   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

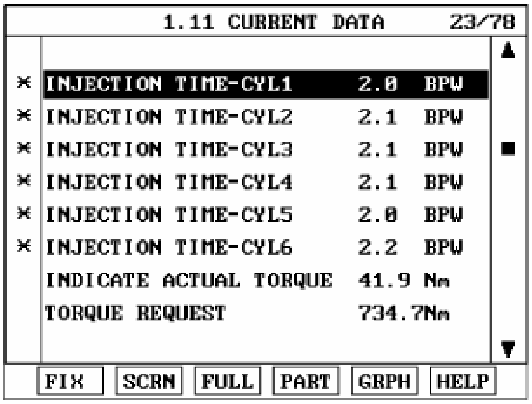


Fig. 1

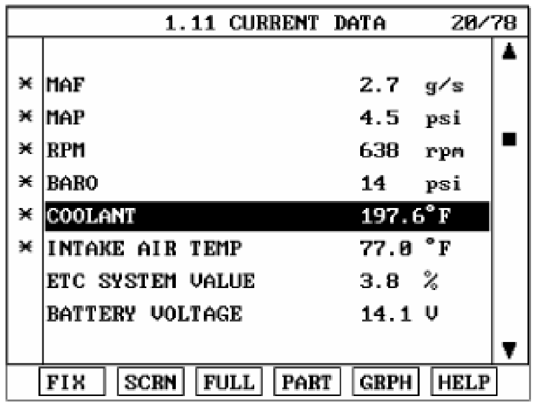

Fig. 2

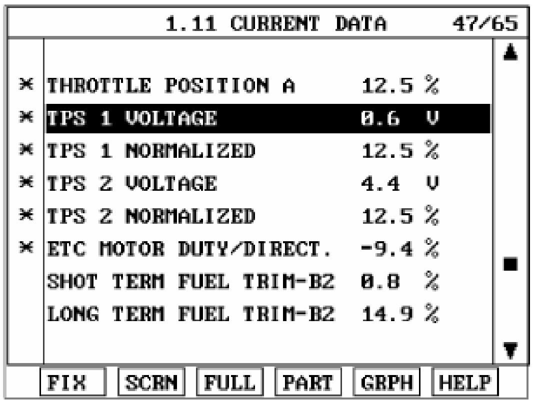

Fig. 3

(4) Are the parameters related to "Cylinder 4 Misfire Detected" displayed correctly on Current Data ?

YES

▶ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg
   (1) Remove cylinder’s spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▶ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.

▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

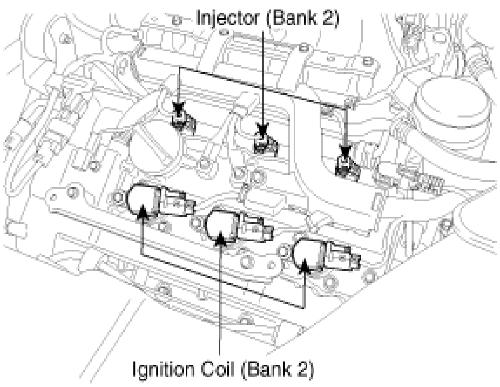
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0305

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0305. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating

and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.

NO

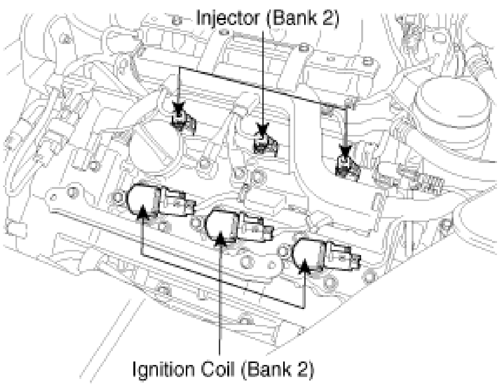
▶ System is performing to specification at this time.

Fuel System > Troubleshooting > P0306

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0306. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating

and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. Negative torque isdetermined by load conditions less than a 'zero torque' line whichis determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a camsynchronization problem is detected internal to the Misfirediagnostic > 30 engine cyclesIf false information is received, a false misfire could bediagnosed. • Intrusive diagnostics not enabled (EGRFLOW) • Number of engine cycles to delay the misfire diagnostic ifany intrusive diagnostic test that could potentially interferewith the misfire diagnostic detectability has been determined to beactive • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period	

Enable condition	Case 3	(31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times< 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times< 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F) • Calculated coolant temperature with default applied > 120° C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM

		• P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.
▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 6 Misfire Detected" on CURRENT DATA
   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

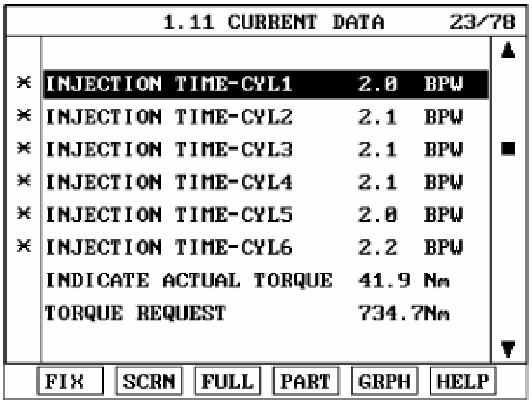


Fig. 1

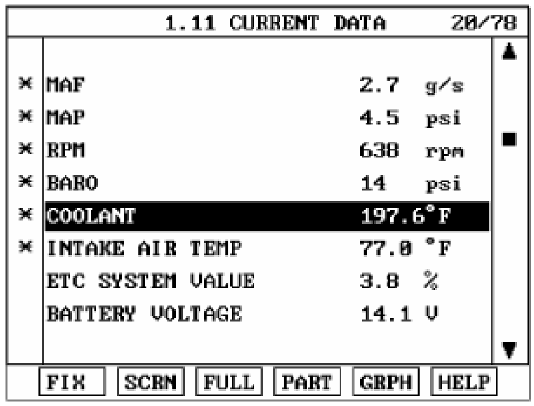

Fig. 2

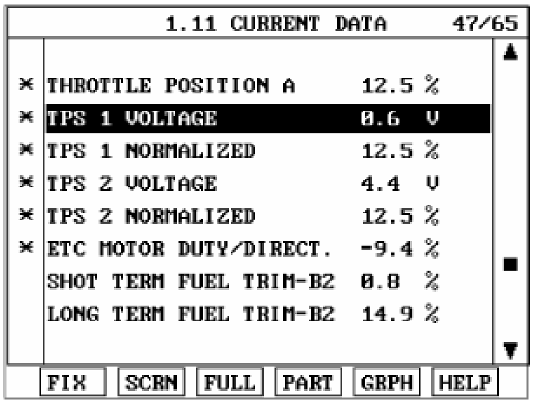

Fig. 3

(4) Are the parameters related to "Cylinder 6 Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg
   (1) Remove cylinder's spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.
▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

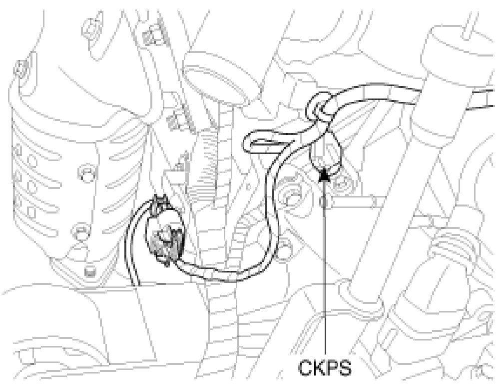
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0315

COMPONENT LOCATION



GENERAL DESCRIPTION

The Tooth Error Correction (TEC) Learn Algorithm determines engine-specific variation in crankshaft position sensing. The largest factor of variation is geometric tooth spacing although other factors, such as bearing run out, may also be present. Once TEC is learned, compensation factors are then calculated and used by the Misfire Diagnostic algorithm to improve the accuracy of engine positiondeterminations.Tooth error correction factors are normally learned only once during the life of a vehicle. However, if a vehicle controller, engine crankshaft, target wheel, or crank sensor is replaced or serviced, tooth error correction factors must be re-learned. This can be performed in a service environment with serial data commands.

DTC DESCRIPTION

It is impossible to forge or machine a perfectly proportioned crankshaft wheel. Therefore, each crankshaft wheel produced will have minor variations in the spacing and/or width of its gear teeth.These variations (tooth error), if not compensated for, can cause false misfire detection. In order to account for tooth error, the tooth error correction algorithm measures the variation in crankshaft wheel teeth and calculates a compensation factor, which is applied to the reference periods when the misfire detection algorithm runs. This compensation factor is learned once, early in the life of the vehicle, and need never be learned again unless the crank

wheel is replaced or the vehicle's PCM EEPROM or similar storage device is erased.
Checking tooth error correction under detecting condition, if the TEC is out of Threshold value, PCM sets P0315.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This DTC indicates that crankwheel tooth error has not been learned.	• CKPS • Target wheel • PCM
Enable Conditions	• 11.4932 ≤ Ignition Voltage ≤15.9907 • 10.0006 ≤ Engine load< 89.9993 • 2000 ≤ engine speed ≤ 4000 • Vehicle speed < 5kph(3.106856 mph) • Tec RPM stability timer >10sec • 0°C(32°F)< coolant temp< 110°C(230°F) • Not active disabling faults • Not key on disabling faults	
Threshold value	• Distance driven without learning tooth error ≥ 4000km (2485.484769 mile) • Maximum allowed number of tooth error correction samples taken in the On The Road(OTR)learning mode< 50 counts • Individual tooth error factors outside calibratable range = True • Sum of tooth error factors variation outside calibratable range ≥ 50 counts	
Diagnosis Time	• Continuous (More than 0.15sec failure)	
MIL On Condition	• DTC only	

COMPONENT INSPECTION

1. Visually check CKPS and target wheel
   (1) IG "OFF"
   (2) Check CKPS and target wheel for deformation or damage visually
   (3) Is the above items normal ?

   YES

   ▸ Go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   > **NOTE**
   >
   > There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

   YES

   ▸ Go to the applicable troubleshoooting procedure.

   NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0325

COMPONENT LOCATION

GENERAL DESCRIPTION

Knocking is a phenomenon characterized by undesirable vibration and noise that can cause engine damage. A knock sensor (KS) is mounted on the cylinder block and senses engine knocking. A knocking vibration from the cylinder block is applied as pressure to the piezoelectric element. A knock sensor (KS) detects vibration when RPM rises or drops and generates voltages based on this vibration. The PCM controls the ignition timing based on the amplitude and frequency of the knock sensor signal. For example, if engine knocking occurs, the ignition timing is retarded to prevent it.

DTC DESCRIPTION

Checking the range of input signal with a knock sensor under detecting condition, PCM senses open or short in knock sensor circuit or malfunction of sensor. If a knock signal or noise level is without the specified value during standard duration, PCM sets P0325. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal open	• Poor connection • Open in harness • Knock sensor • PCM
Enable Conditions	• Pressure in intake manifold is normal. • Engine speed ≤ 1600rpm	
Threshold value	• Filter coefficient < 0.8	
Diagnosis Time	• Continuous (More than 12.5 sec.failure for every 25 sec.test)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA

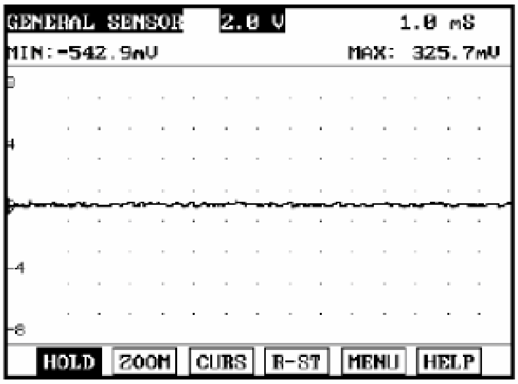


Fig. 1

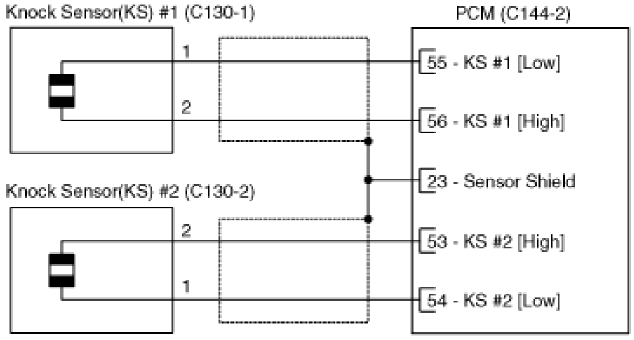
The knock sensor is installed at cycliner block to detect the vibration effectively during engine running.
The above waveform shows the signal waveform of knock sensor when knock dosen't happen. Generally, knock signal has more noise than other sensor.

SCHEMATIC DIAGRAM

[CIRCUIT DIAGRAM]



[CONNECTION INFORMATION]

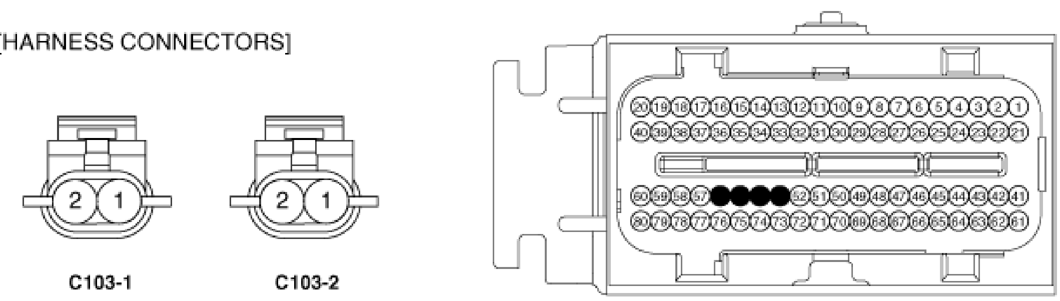
KS #1 (Cyl. #4,5,6)

Terminal	Connected to	Funtion
1	PCM C144-2 (55)	KS #1 [Low] signal
2	PCM C144-2 (56)	KS #1 [High] signal

KS #2 (Cyl. #1,2,3)

Terminal	Connected to	Funtion
1	PCM C144-2 (54)	KS #2 [Low] signal
2	PCM C144-2 (53)	KS #2 [High] signal

[HARNESS CONNECTORS]



C103-1 KS #1

C103-2 KS #2

C144-2 PCM

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor item related to knock sensor on the service data.

Normal data at idle

4. Is the service data displayed correctly ?

YES

▶ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▶ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check open in harness
   (1) IG "OFF" and disconnect knock sensor connector and PCM connector.
   (2) Measure resistance between terminal 1 of knock sensor harness connector and terminal 55 of PCM harness connector.
   (3) Measure resistance between terminal 2 of knock sensor harness connector and terminal 56 of PCM harness connector.

Specification : Below 1Ω

   (4) Is the measured resistance within specification?

YES

▸ If the problem is corrected after substituting with a known - good knock sensor, replace it. If the problem is pending, check for proper operating after substituting with a known - good PCM. and then if the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.
