
T1 : within 4 ± 1sec,
T2 : 0.5 ± 0.1sec.

7. AUTO DOOR LOCK (USER OPTION)

(1) This does not activate when vehicle speed is less than 5km/h.

(2) Lock signal is output if vehicle speed is 5km/h or more for at least 1s under ALT"L" ON, IGN SW = ON. But, lock signal is not output if all doors are locked or all doors are fail in advance.

(3) Lock signal is output 3 times as Max ((2) is ignored) if either one door is unlocked after lock signal output in (2).(1s cycle) But, door, which is locked from unlock state during 3-time output, is ignored.

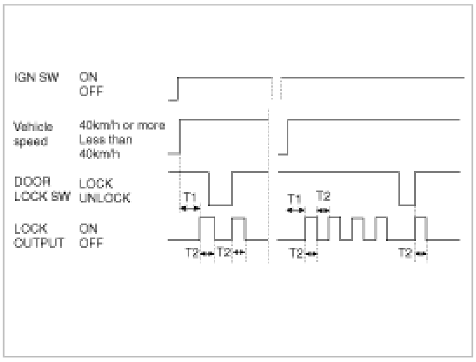
(4) Relevant door is fail if the state is unlock after 3-time output.

(5) Lock signal is output once if the fail door is unlocked again after the door is locked.

(6) Lock signal is output once if locked doors, which are lock state after lock signal output in (2),are unlocked again. But, lock signal is output once for the relevant door even when unlock state continues after lock signal output.

(7) Fail door is cleared at IGN SW = OFF.

(8) Auto door lock function is not performed when crash unlock condition is met.



T1 : 1 ± 0.1sec,
T2 : 0.5 ± 0.1sec.

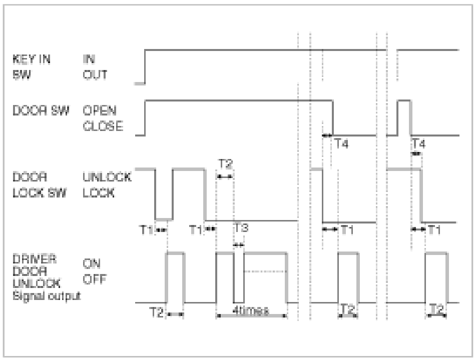
8. IGNITION KEY REMINDER

(1) This function is not performed when vehicle speed is 3km/h or more.

(2) DRIVER UNLOCK signal is output for 1s after 0.5s from when the state becomes KEY IN SW = IN & DRIVER DOOR = OPEN & DRIVER DOOR LOCK SW = LOCK.

(3) ALL DOOR UNLOCK signals are output for 1s after 0.5s from when the state becomes KEY IN SW = IN & ASSIST DOOR = OPEN & ASSIST DOOR LOCK SW = LOCK.

(4) UNLOCK signal is output 3times as Max (1s-output is excluded) in case LOCK state is held even when UNLOCK signal is output for 1s in (2),(3). (1s cycle: 0.5s ON/OFF)

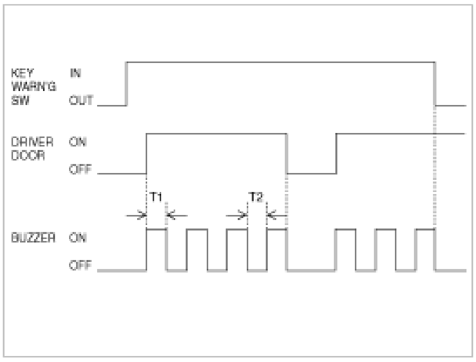


T1 : 0.5 ± 0.1 sec.
T2 : 1.0 ± 0.1 sec.
T3 : 0.5 ± 0.1 sec.
T4 : 0.5 sec.

9. KEY OPERATED WARNING

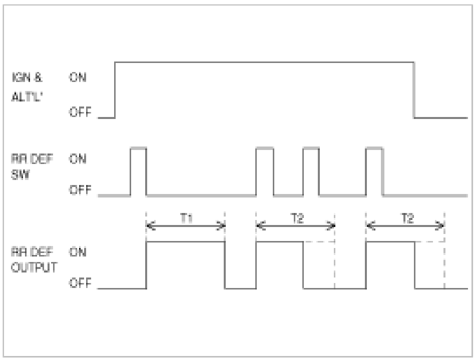
(1) If the key is in the key cylinder and the driver door is opened, the buzzer is sounded (period: 0.7 sec., duty rate: 50%).

(2) If the ignition key is removed, or the door is closed, the buzzer is switched OFF immediately.



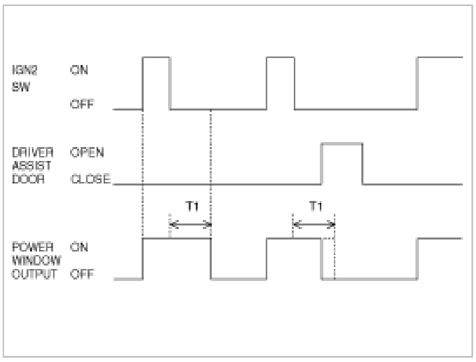
T1, T2 : 0.35 ± 0.1sec.

10. WINDSHIELD DEICER & DEFOGGER TIMER
    (1) Once ALT "L" is ON, if the defogger is switched ON, the defogger will stay ON for 20 minutes duration.
    (2) If defogger switch is pressed again (see Step 1), or if ignition is switched OFF, the defogger will shut OFF.



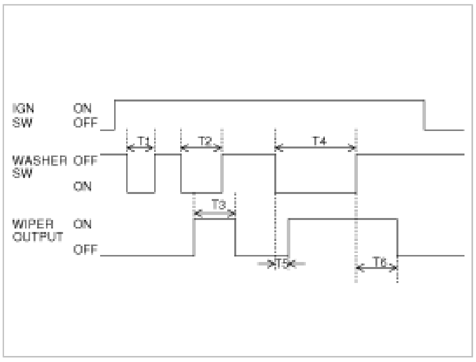
T1 : 20 ± 1 min.
T2 : MAX 20 ± 1 min.

11. POWER WINDOW TIMER
    (1) When the ignition is switched OFF, power window output remains ON for 30 seconds and then turns OFF.
    (2) Related to Step 1), if the driver's door or assist door is opened, window power output is turned OFF immediately.
    (3) When the driver's door or assist door is opened, the power window relay output is turned OFF immediately.



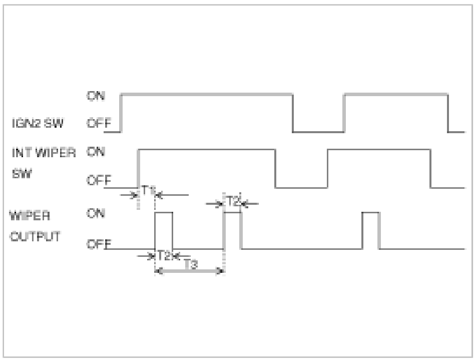
T1 : 30 ± 3 sec.

12. WIPER RELATED TO WASHER
    (1) When the ignition switch is turned ON :
        A. If washer switch is turned on, wiper output is ON after 0.3 sec. (T5)
        B. If washer switch is turned OFF, wiper output is OFF after 3.8 sec. (T6)
    (2) If the washer switch is turned OFF within 0.6 sec. (T2), the wiper will remain ON for up to 0.7 sec. (T3) from the moment that washer switch is turned OFF.



T1 : Less than 0.2 sec.
T2 : 0.2 ~0.6 sec. (MIST Function)
T3 : 0.7 ± 0.1sec.
T4 : More than 0.6 sec.
T5 : 0.3 sec.
T6 : 2.5 ~3.8 sec.

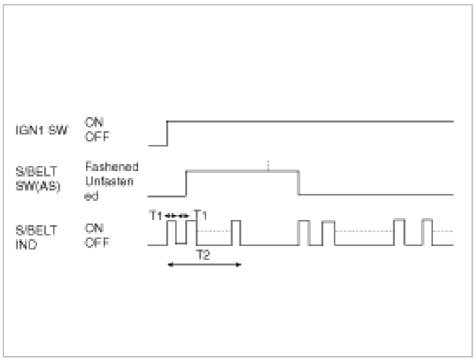
13. VARIABLE INTERMITTENT WIPER (WINDSHIELD WIPER)
    (1) With the ignition switch ON, if the intermittent wiper switch is turned on, wiper output is ON according to the setting.
    (2) When the intermittent wiper switch is ON, if the ignition switch is turned ON, wiper output is ON.



T1 : MAX 0.5 sec.
T2 : 0.7 ± 0.1sec.
T3 : 2.6 ± 0.7 sec. (FAST),
T3 : 18.0 ± 1.0sec. (SLOW) vehicle speed 0 km/h

14. SEAT BELT REMINDER FUNCTION (DRIVER)
    (1) Warning lamp lights every 0.6sec and buzzer sounds every 1sec for 6sec when IGN is ON under unfastened seat belt. (Warning lamp continues to light for 6sec if seat belt is fastened within 6sec) 30sec- time count starts at ALT"L" ON under this state. (30sec- time count starts after 6sec. if ALT"L" is ON within initial 6sec)
    (2) Buzzer stops and the warning lamp is turned OFF when IGN is turned OFF within 6sec-output.
    (3) Buzzer stops and the warning lamp is turned OFF and 30sec- time count also stops when seat belt is fastened after IGN ON.
    (4) If unfastened seat belt state continues after 60sec- time count from ALT"L"ON, the warning lamp flashes and buzzer sounds 11 times in 30sec-cycle (6sec ON/ 24sec OFF) after 30sec from ALT"L" ON.
    (5) Warning lamp & buzzer are turned OFF when IGN is OFF or seat belt is fastened during (4).
    (6) Operation in (1) is performed when seat belt is unfastened again under ALT"L" ON and fastened seat belt.
    (7) Operation in (4) is performed when ALT "L" is turned ON again after turning OFF under unfastened seat belt.

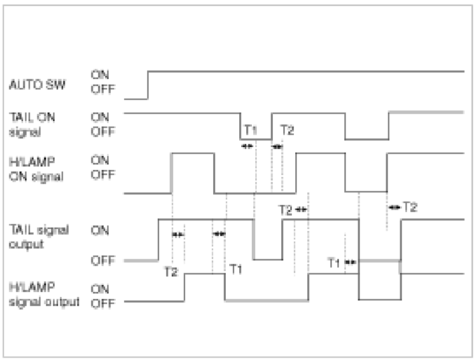
15. SEAT BELT REMINDER FUNCTION(ASSIST)
    (1) Warning lamp lights continuously every 0.6sec when IGN is turned ON under unfastened seat belt.
    (2) Warning lamp is turned OFF when IGN is turned OFF within 0.6sec.
    (3) When IGN is ON under unfastened seat belt, the warning lamp lights. The lamp continues to light for remaining time of 6sec when seat belt is fastened within 6sec. The lamp is OFF if seat belt is fastened after 6sec.
    (4) After 6 sec from IGN ON, warning lamp contintues to flash when S/BELT is unfastened and stop immediately when S/BELT is fastended.



T1 : 0.3 ± 0.1sec,
T2 : 6 ± 1sec.

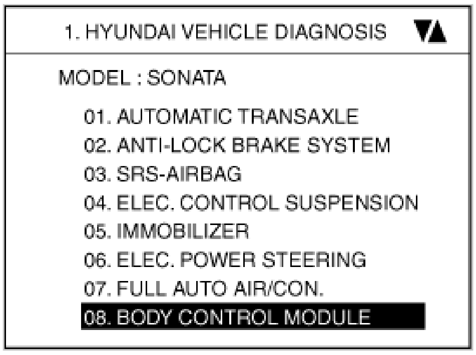
16. AUTO LIGHT CONTROL
   (1) Auto light sensor value is always read at IGN ON.
   (2) Light is turned ON after 2sec±0.2sec when auto light sensor value is same as light ON input value.
   (3) Light is turned OFF after 2sec±0.2sec when sensor value is same as light OFF input value.
   (4) Tail lamp and head lamp are turned ON when sensor value is same as tail lamp ON input value.
   (5) Light ON value of sensor is based on the below table.
   (6) Head lamp signal is output when head lamp switch is ON.
   (7) After head lamp is turned OFF, head lamp signal output is kept if head lamp ON luminance condition is met at auto light switch ON.
   (8) After head lamp is turned OFF, head lamp signal output is immediately stopped if head lamp OFF luminance condition is met at auto light switch ON.
   (9) After head lamp is turned OFF, head lamp signal output is immediately stopped at tail switch signal input.
   (10) After head lamp is turned OFF, head lamp signal output is stopped after 0.7s if there is no input of auto light switch or tail switch. (Shall be no flashing of head lamp)
   (11) Head lamp signal output is stopped when switch position is changed from AUTO to head lamp switch during head lamp ON with auto light. (Shall be no flashing of head lamp)
   (12) The condition of head lamp ON/OFF is same as the one of tail lamp ON/OFF at auto light switch ON. Light ON value of the input sensor is based on the table.

	TAIL LAMP	HEAD LAMP
ON	0.81V+/-0.08V	Same as tail sensor value
OFF	1.41V+/-0.10V	Same as tail sensor value

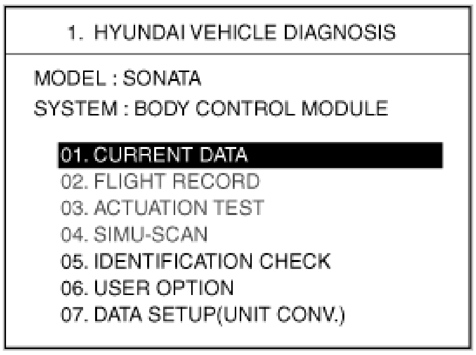


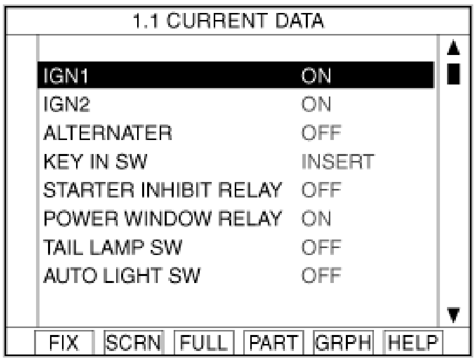
TROUBLE DIAGNOSTICS WHEN USING DIAGNOSIS TOOL

1. The body control module can diagnose by using the diagnosis tool more quickly.
   The BCM communicates with the diagnosis tool and then reads the input/output value and drives the actuator.
2. To diagnose the BCM function, select the menu of model and body control module.

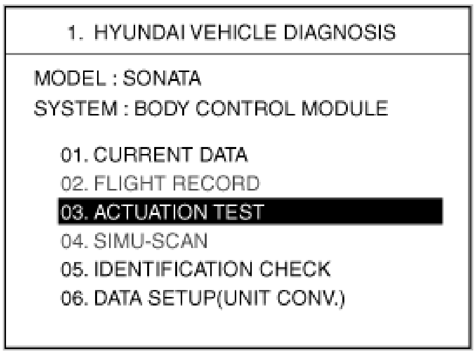


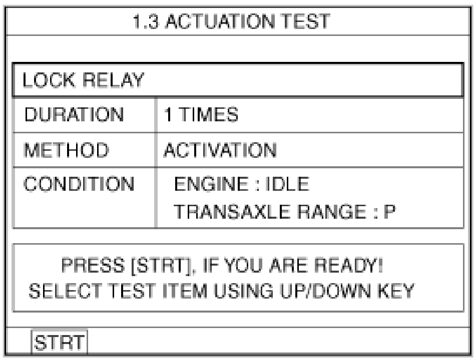
3. To consult the present input/out value of BCM, "02. INPUT/OUTPUT MONITORING". It provides information of BCM input/output conditions of power supply, turn signal/brake lamp, headlamp, door, locks, outside mirror, wiper, auto-light and transmitters etc.





4. To perform compulsory operation on BCM input factors, select "03. ACTUATION TEST"



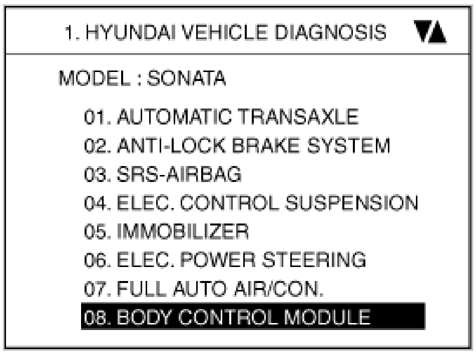


USER OPTION MODE

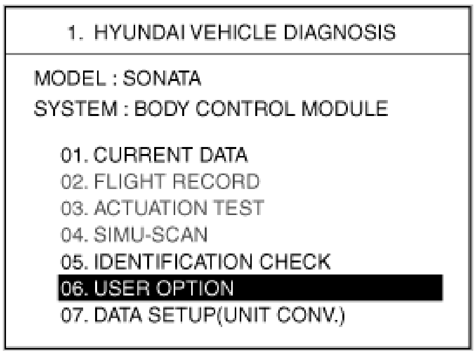
The BCM offers 3 items user option mode for a user convenience (Auto door lock, door key burglar alarm, door lock state inform horn)

- It is able to set up the enable or disable of AUTO DOOR LOCK function or AUTO DOOR LOCK operation vehicle speed when using it.
- It is able to set up the enable or disable of enter the burglar alarm mode when using door lock by the key.
- It is able to set up the enable or disable of horn inform function when using door lock by the key or RKE.

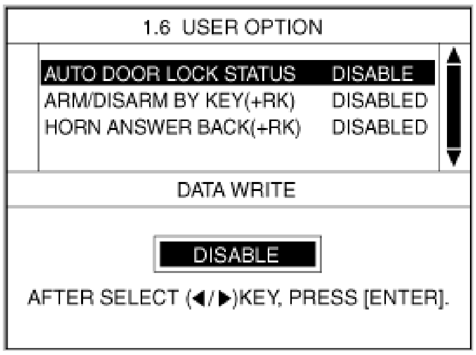
1. Select option "SONATA(NF)" and press ENTER.
2. Select option "BODY CONTROL MODULE" and press ENTER.



3. Select option "USER OPTION" and press ENTER.



4. Select option "AUTO DOOR LOCK STATUS by using the direction button(▲ / ▼).
5. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
   (Disable / 5km/h / 10km/h / 15km/h / 20km/h / 25km/h /30km/h / 35km/h / 40km/h)



6. Select option "ARM/DISARM BY KEY(+RKE)" by using the direction button(▲ / ▼).
7. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
   (Disable / Enable)
8. Select option "HORN ANSWER BACK (+RK)" by using the direction button(▲ / ▼).
9. Select the parameter by using the direction button(◂ / ▸) and press ENTER to save it.
   (Disable / Enable)

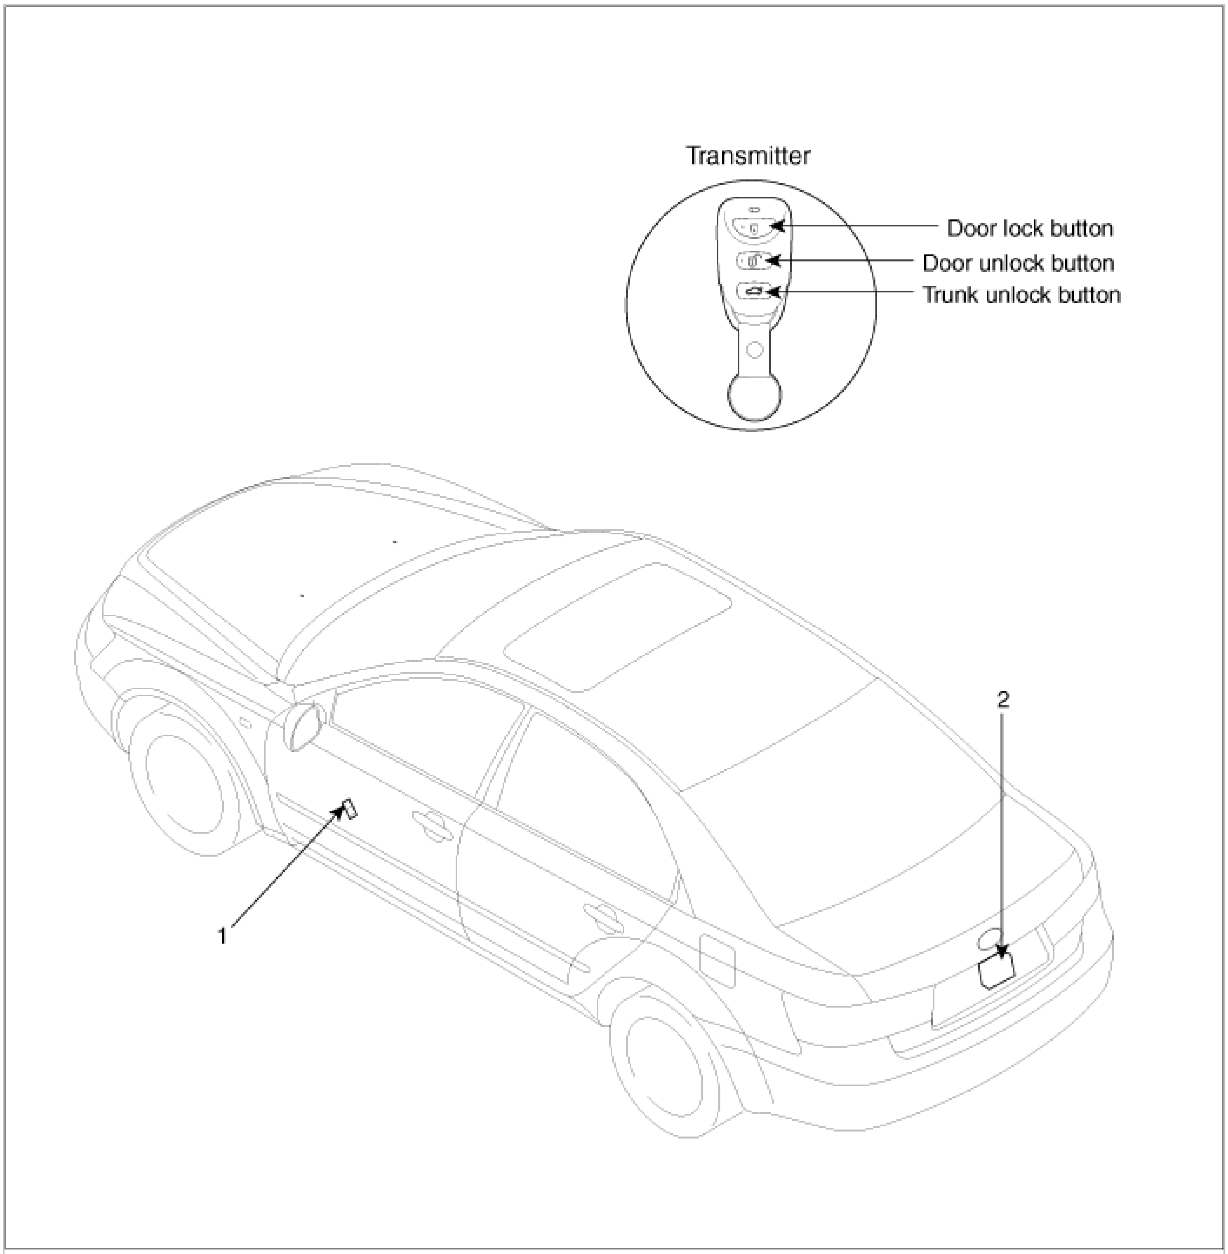
Body Electrical System > Trunk lid > Components and Components Location

COMPONENT LOCATION

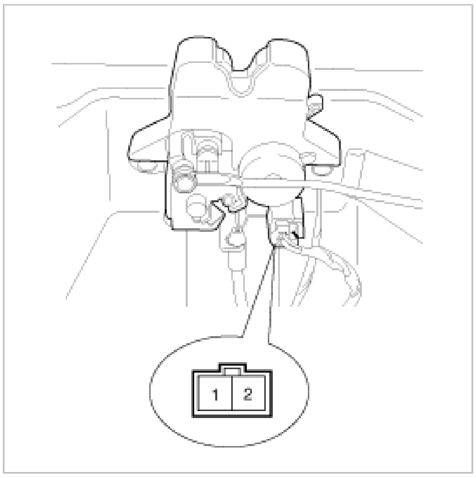


1. Trunk lid open switch
2. Trunk lid release actuator

Body Electrical System > Trunk lid > Trunk Lid Release Actuator > Repair procedures

INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group-trunk lid)
2. Disconnect the 2P connector from the actuator.



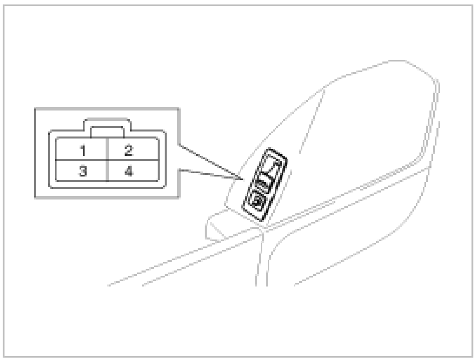
3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	2	Chassis ground
Open	⊕	⊖

Body Electrical System > Trunk lid > Trunk Lid Open Switch > Repair procedures

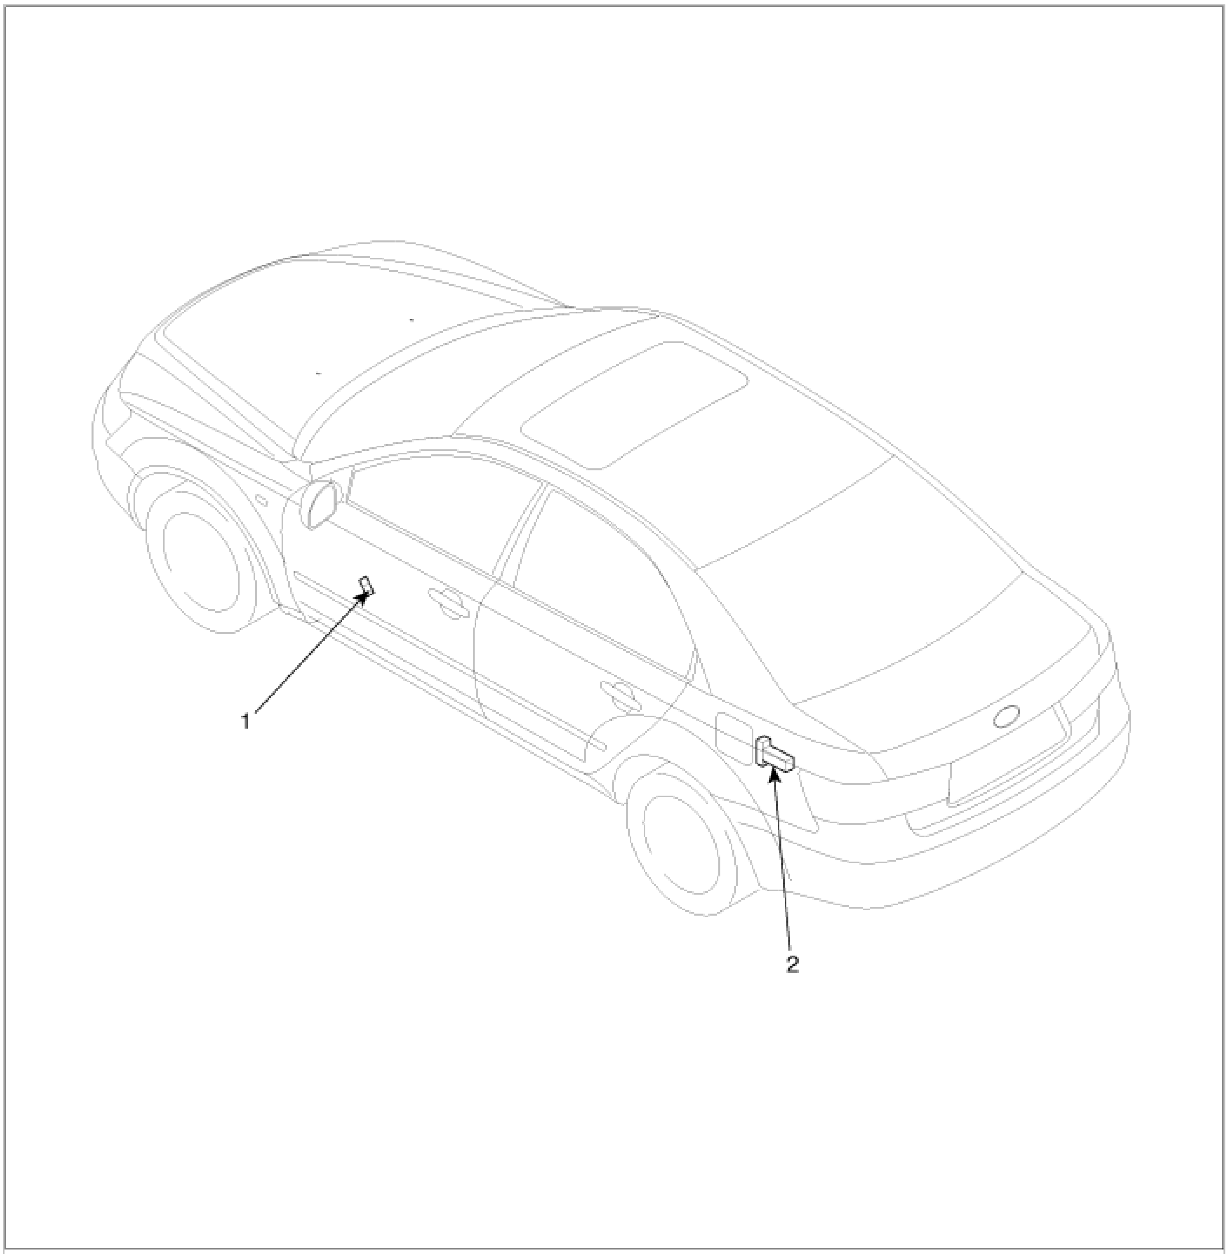
INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Check the switch for continuity between the No. 3 and No. 4 terminals.
3. If the continuity is not as specified, replace the switch.



Body Electrical System > Fuel Filler Door > Components and Components Location

COMPONENT LOCATION

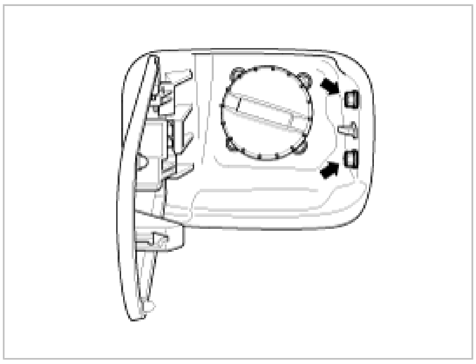


1. Fuel filler door open switch
2. Fuel filler door release actuator

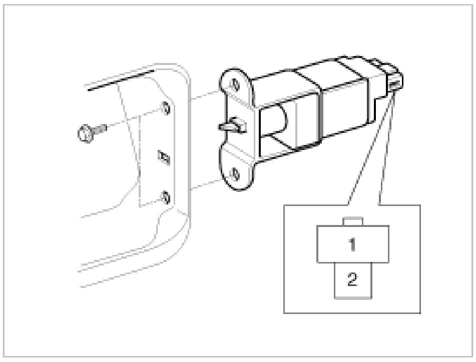
Body Electrical System > Fuel Filler Door > Fuel Filler Door Release Actuator > Repair procedures

INSPECTION

1. Remove the trunk room left trim.
2. Open the fuel filler door and remove the fuel filler door release actuator.



3. Check for continuity between terminal No. 1 and No. 2. If there is no continuity replace the fuel filler door opener.



Body Electrical System > Fuel Filler Door > Fuel Filler Door Open Switch > Repair procedures

INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Check the switch for continuity between the No. 1 and No. 2 terminals.
3. If the continuity is not as specified, replace the switch.

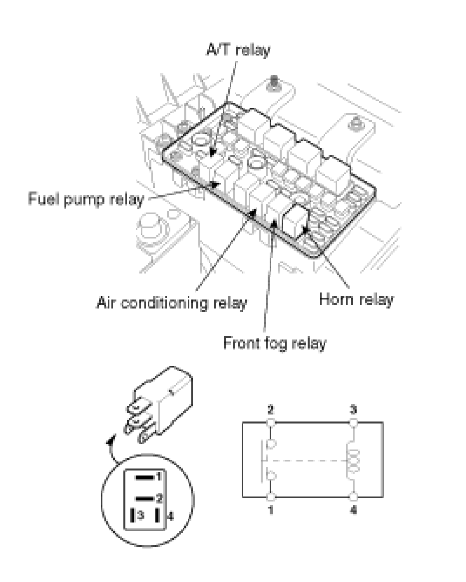
INSPECTION

POWER RELAY TEST (TYPE A)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.4 terminals.
2. There should be no continuity between the No.1 and No.2 terminals when power is disconnected.

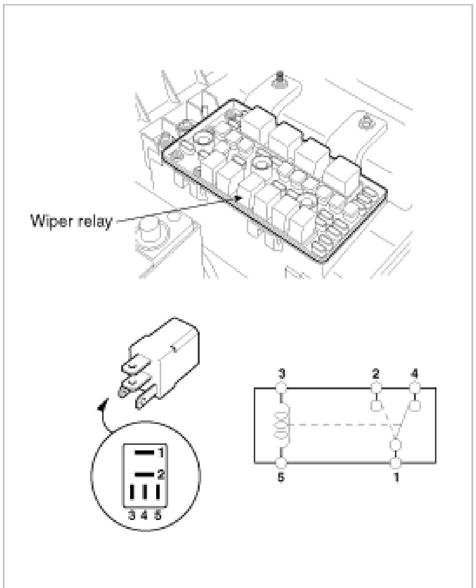


Terminal / Power (No.3-No.4)	1	2	3	4
Disconnected			○	○
Connected	○	○	⊖	⊕

POWER RELAY TEST (TYPE B)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.5 terminals.
2. There should be continuity between the No.1 and No.4 terminals when power is disconnected.

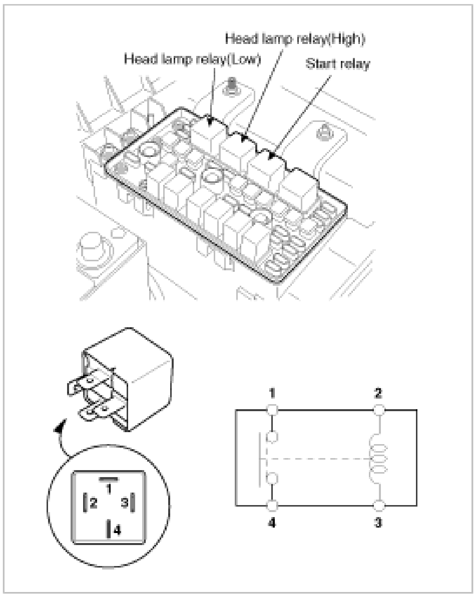


Terminal / Power (No.3-No.5)	3	5	1	2	4
Disconnected			○		○
Connected	⊖	⊕	○	○	

POWER RELAY TEST (TYPE C)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
2. There should be no continuity between the No.1 and No.4 terminals when power is disconnected.

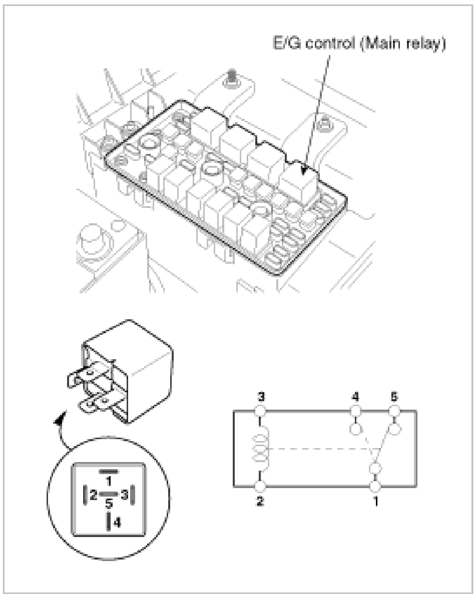


Terminal / Power (No.2-No.3)	2	3	1	4
Disconnected	○	○		
Connected	⊖	⊕	○	○

POWER RELAY TEST (TYPE D)

Check for continuity between the terminals.

1. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
2. There should be continuity between the No.1 and No.5 terminals when power is disconnected.



Terminal / Power (No.2-No.3)	2	3	1	4	5
Disconnected			○		○
Connected	⊖	⊕	○	○	

FUSE INSPECTION

1. Be sure there is no play in the fuse holders, and that the fuses are held securely.
2. Are the fuse capacities for each circuit correct?
3. Are there any blown fuses?
   If a fuse is to be replaced, be sure to use a new fuse of the same capacity. Always determine why the fuse blew first and

completely eliminate the problem before installing a new fuse.

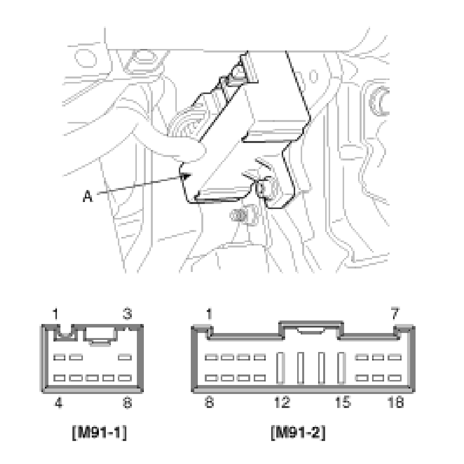
FUSE INSPECTION

1. Be sure there is no play in the fuse holders, and that the fuses are held securely.
2. Are the fuse capacities for each circuit correct?
3. Are there any blown fuses?
   If a fuse is to be replaced, be sure to use a new fuse of the same capacity. Always determine why the fuse blew first and completely eliminate the problem before installing a new fuse.

Body Electrical System > Fuses And Relays > ICM (Integrated Circuit Module) Relay Box > Description and Operation

DESCRIPTION

The ICM is united with many kinds of relays and installed below the relay box (passenger compartment).



Body Electrical System > Fuses And Relays > ICM (Integrated Circuit Module) Relay Box > Repair procedures

INSPECTION

HAZARD LAMP

Check for continuity between the terminals.

1. There should be continuity between the No.12 and No.13 terminals when power and ground are connected to the No.13 and No.3 in the M91-2 terminals.
2. There should be no continuity between the No12 and No.13 terminals when power is disconnected.

BURGLAR ALARM HORN

Check for continuity between the terminals.

1. There should be continuity between the No.8 and No.9 terminals when power and ground are connected to the No.1 and No.8 in the M91-2 terminals.
2. There should be no continuity between the No.8 and No.9 terminals when power is disconnected.

BURGLAR ALARM

Check for continuity between the terminals.

1. There should be no continuity between the No.11 and No.10 terminals when power and ground are connected to the No.11 and No.4 in the M91-2 terminals.
2. There should be continuity between the No.11 and No.10 terminals when power is disconnected.

ADJUST PEDAL

Check for continuity between the terminals.

1. There should be continuity between the No.15 and No.5 terminals when power and ground are connected to the No.15 and No.2 in the M91-2 terminals.
2. There should be no continuity between the No.15 and No.5 terminals when power is disconnected.

DRIVER DOOR TWO TURN UNLOCK

Check for continuity between the terminals.

1. There should be continuity between the No.7 and No.4 terminals when power and ground are connected to the No.6 and No.4 in the M91-1 terminals.
2. There should be continuity between the No.7 and No.5 terminals when power and ground are disconnected.

3. Vehicle speed sensor
4. Engine coolant temperature sender
5. Oil pressure switch
6. Brake fluid level warning switch
7. Parking brake switch
8. Door switch
9. Fuel gauge sender
10. Trunk lid open actuator

Body Electrical System > Indicators And Gauges > Troubleshooting

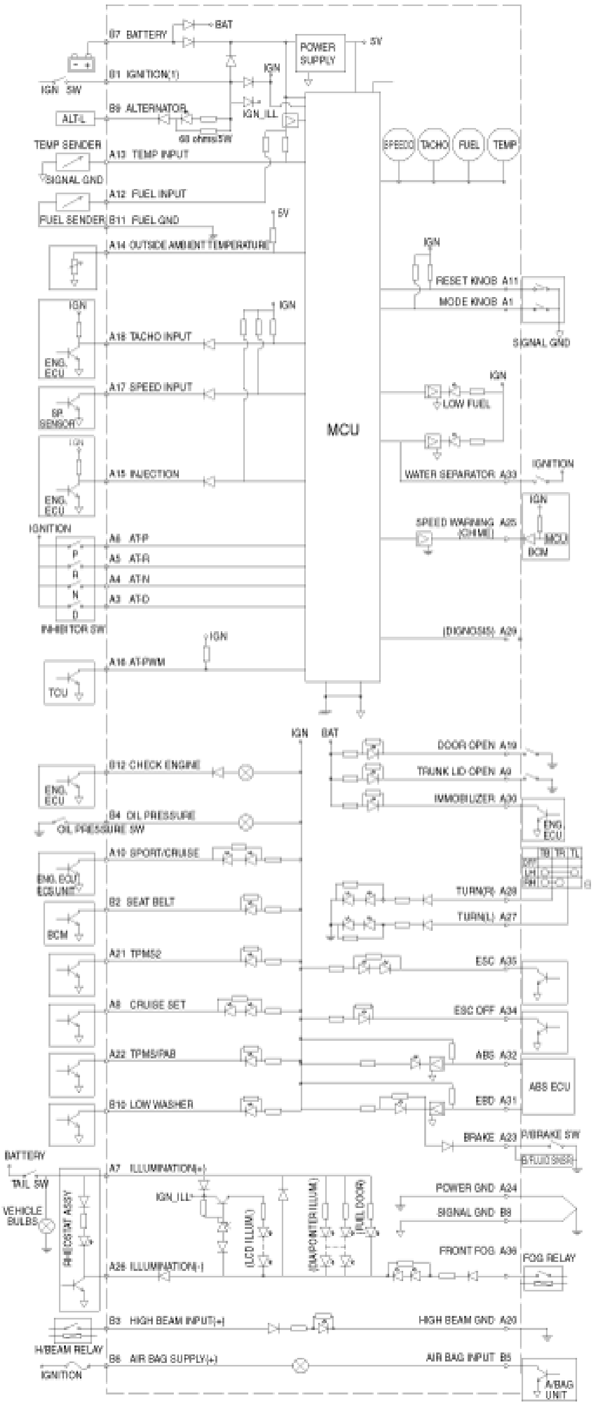
TROUBLESHOOTING

Symptom Poss	ible cause	Remedy
Speedometer does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Speedometer faulty	Check speedometer
	Vehicle speed sensor faulty	Check vehicle speed sensor
	Wiring or ground faulty	Repair if necessary
Tachometer does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Tachometer faulty	Check tachometer
	Wiring or ground faulty	Repair if necessary
Fuel gauge does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Fuel gauge faulty	Check gauge
	Fuel sender faulty	Check fuel sender

	Wiring or ground faulty	Repair if necessary
Low fuel warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Fuel sender faulty	Check fuel sender
	Wiring or ground faulty	Repair if necessary
Water temperature gauge does not operate	Cluster fuse (10A) blown	Check for short and replace fuse
	Water temperature gauge faulty	Check gauge
	Water temperature sender faulty	Check sender
	Wiring or ground faulty	Repair if necessary
Oil pressure warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Oil pressure switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Parking brake warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Brake fluid level warning switch faulty	Check switch
	Parking brake switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Open door warning lamp and trunk lid warning lamp do not light up	Memory fuse (15A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Door switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Seat belt warning lamp does not light up	Cluster fuse (10A) blown	Check for short and replace fuse
	Bulb burned out	Replace bulb
	Seat belt switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary

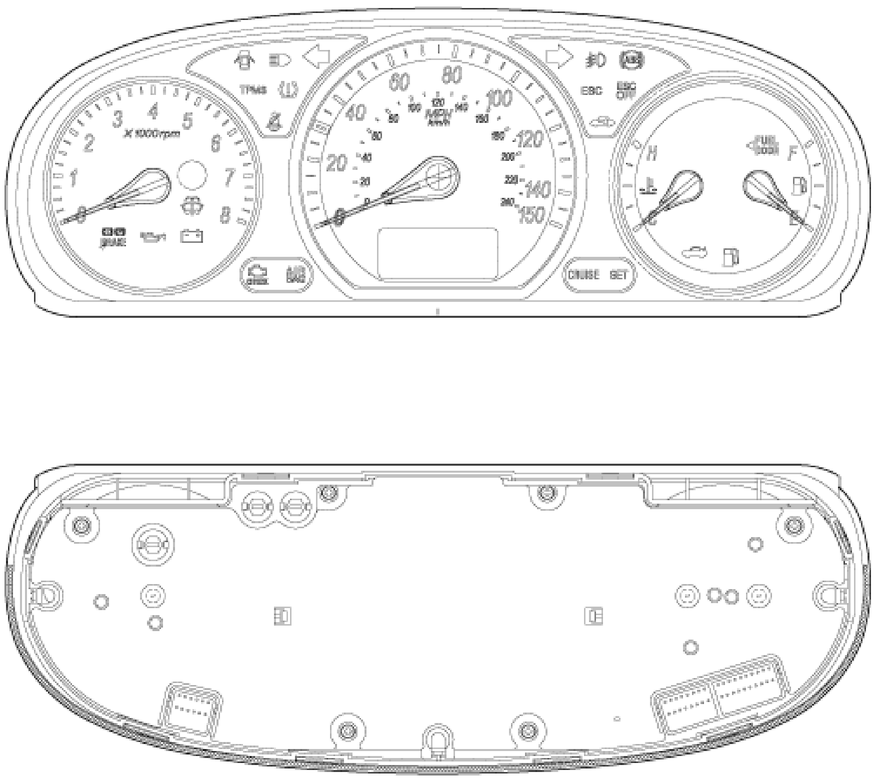
Body Electrical System > Indicators And Gauges > Instrument Cluster > Schematic Diagrams

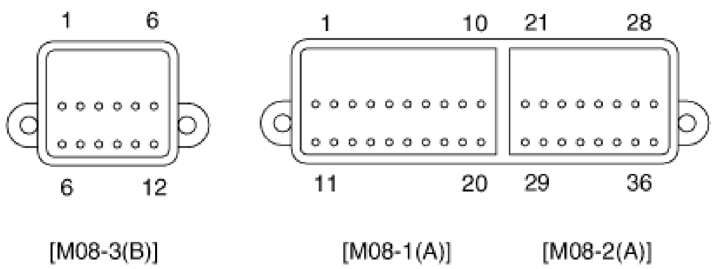
CIRCUIT DIAGRAM



Body Electrical System > Indicators And Gauges > Instrument Cluster > Components and Components Location

COMPONENTS

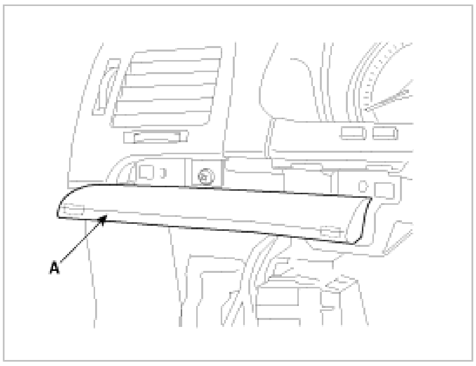




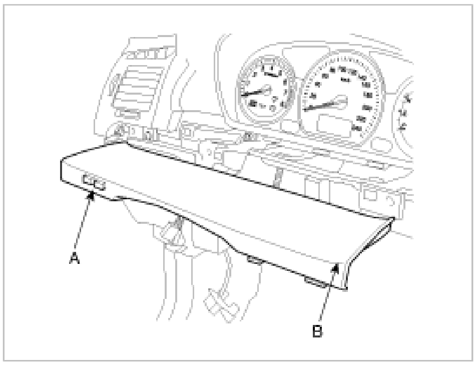
Body Electrical System > Indicators And Gauges > Instrument Cluster > Repair procedures

REPLACEMENT

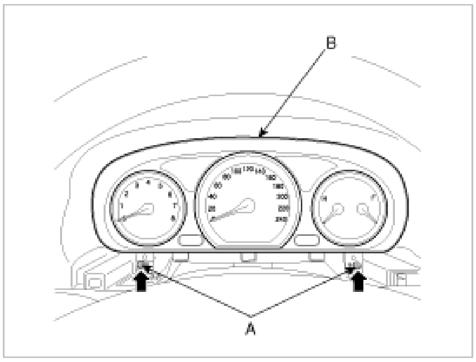
1. Disconnect the negative (-) battery terminal.
2. Remove the center garnish (A) (Refer to Body group-crash pad)



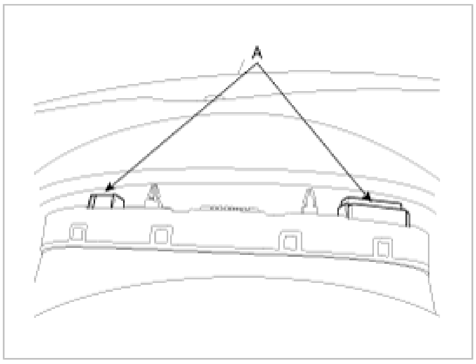
3. Remove the cluster facia panel (B) after disconnecting the connector of trip switch (A).



4. Remove the cluster from the housing (B) after removing 2 screws (A).



5. Disconnect the cluster connecter (A) and then remove the cluster.



6. Installation is the reverse of removal.

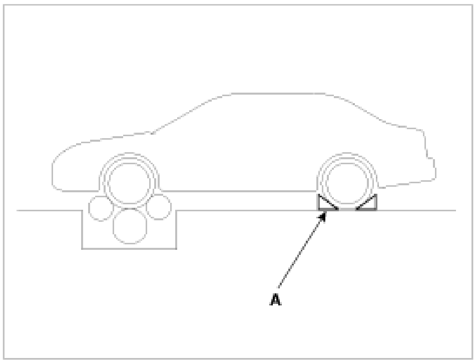
INSPECTION

SPEEDOMETER

1. Adjust the pressure of the tires to the specified level.
2. Drive the vehicle onto a speedometer tester. Use wheel chocks as appropriate.
3. Check if the speedometer indicator range is within the standard values.

> **CAUTION**
>
> Do not operate the clutch suddenly or increase/ decrease speed rapidly while testing.

> **NOTE**
>
> Tire wear and tire over or under inflation will increase the indication error.



[CANADA - km/h]

Velocity (km/h)	20	40	60	80	100	120
Tolerance (km/h)	+5.0 +0.2	+5.0 +0.2	+5.8 +0.2	+6.5 +0.5	+7.0 +1.5	+8.5 +1.5
Velocity (km/h)	140	160	180	200	220	240
Tolerance (km/h)	+10 +1.5	+11 +2.0	+12 +2.5	+13 +2.5	+14 +2.5	+15 +2.5

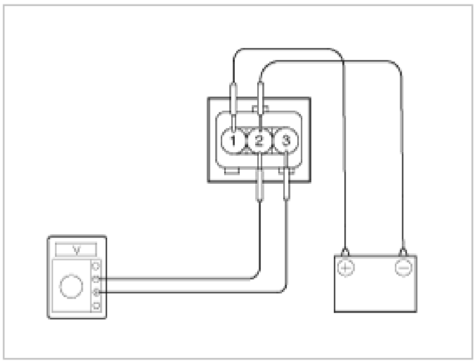
Tolerance (MPH)	+5.0 -1.0	+6.0 -1.0	+6.5 -1.0	+7.0 -1.0	-

VEHICLE SPEED SENSOR

1. Connect the positive (+) lead from battery to terminal 1 and negative (-) lead to terminal 2.
2. Connect the positive (+) lead from tester to terminal 3 and the negative (-) lead to terminal 2.
3. Rotate the shaft.
4. Check that there is voltage change from approx. 0V to 11V or more between terminals 3 and 2.
5. The voltage change should be 4 times for every revolution of the speed sensor shaft.
   If operation is not as specified, replace the sensor.



TACHOMETER

1. Connect the scan tool to the diagnostic link connector or install a tachometer.
2. With the engine started, compare the readings of the tester with that of the tachometer. Replace the tachometer if the tolerance is exceeded.

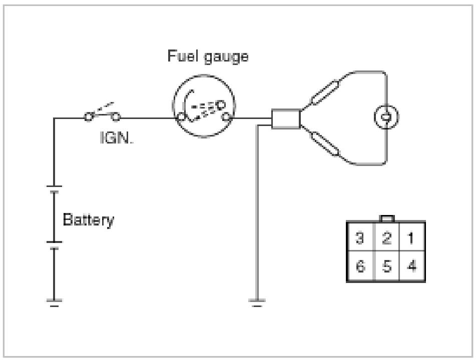
CAUTION

1. Reversing the connections of the tachometer will damage the transistor and diodes inside.
2. When removing or installing the tachometer, be careful not to drop it or subject it to severe shock.

Revolution(rpm)	1,000	2,000	3,000
Tolerance(rpm)	±120	±140	±170
Revolution(rpm)	4,000	5,000	6,000
Tolerance(rpm)	±170	±200	±200

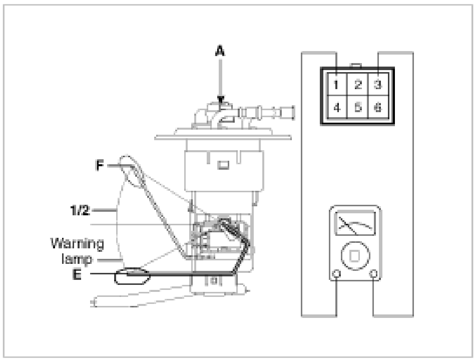
FUEL GAUGE

1. Disconnect the fuel sender connector from the fuel sender.
2. Connect a 3.4 watt, 12V test bulb to terminals 1 and 3 on the wire harness side connector.
3. Turn the ignition switch to the ON, and then check that the bulb lights up and the fuel gauge needle moves to full.



MAIN FUEL GAUGE SENDER

1. Using an ohmmeter, measure the resistance between terminals 1 and 3 of sender connector (A) at each float level.



2. Also check that the resistance changes smoothly when the float is moved from "E" to "F"

Position	Resistance(Ω)
Sender (E)	184 ± 2
Warning lamp	170 ± 2
1/2	66 ± 2
Sender (F)	15 ± 2

3. If the height resistance is unsatisfactory, replace the fuel sender as an assembly.

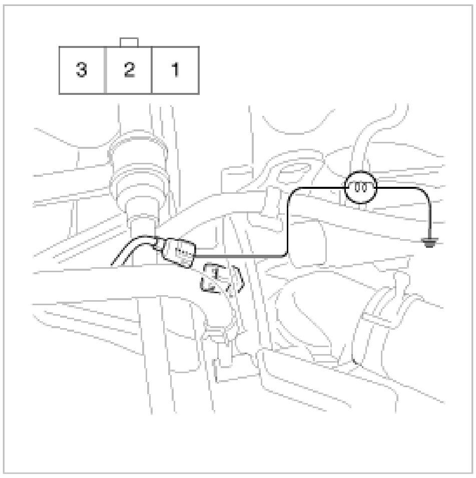
CAUTION

After completing this test, wipe the sender dry and reinstall it in the fuel tank.

ENGINE COOLANT TEMPERATURE GAUGE

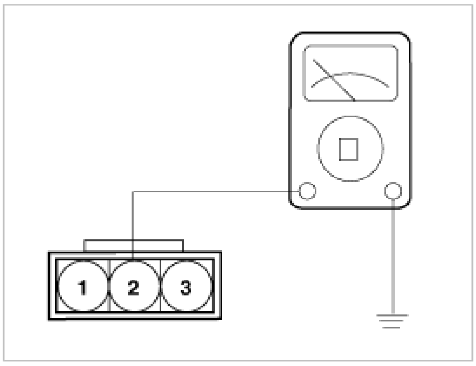
1. Disconnect the wiring connector (A) from the engine coolant temperature sender in the engine compartment.
2. Turn the ignition switch ON. Check that the gauge needle indicates cool. Turn the ignition switch OFF.

3. Connect a 12V, 3.4 wattages test bulb between the harness side connector and ground.
4. Turn the ignition switch ON.
5. Verify that the test bulb flashes and that the indicator moves to HOT.
   If operation is not as specified, replace the engine coolant temperature gauge. Then recheck the system.



ENGINE COOLANT TEMPERATURE SENDER

1. Using an ohmmeter, measure the resistance between the terminal 2 and ground.

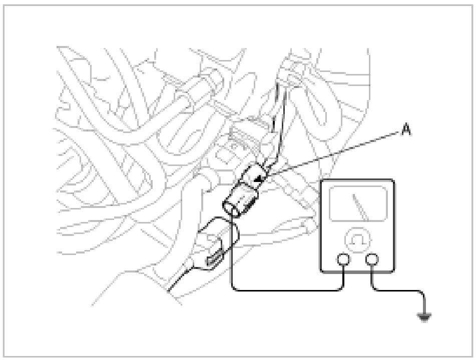


2. If the resistance value is not as shown in the table, replace the temperature sender.

Temperature [°F(°C)]	140(60)	185(85)	230(110)	257(125)
Gauge angle (°)	0	33	33	75
Resistance (Ω)	142±1	58±1	26±1	17.5±1

OIL PRESSURE SWITCH

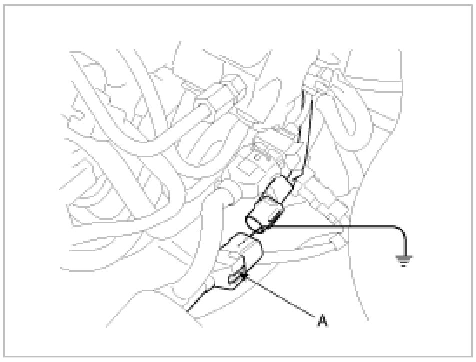
1. Check that there is continuity between the oil press switch terminal (A) and ground with the engine off.
2. Check that there is no continuity between the terminal and ground with the engine running.
3. If operation is not as specified, replace the switch.



OIL PRESSURE WARNING LAMP

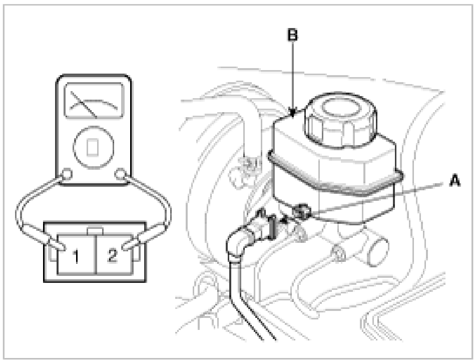
1. Disconnect the connector (A) from the warning switch and ground the terminal on the wire harness side connector.

2. Turn the ignition switch ON. Check that the warning lamp lights up. If the warning lamp doesn't light, test the bulb or inspect the wire harness.



BRAKE FLUID LEVEL WARNING SWITCH

1. Remove the connector(A) from the switch located at the brake fluid reservoir(B).
2. Verify that continuity exists between switch terminals 1 and 2 while pressing the switch (float) down with a rod.



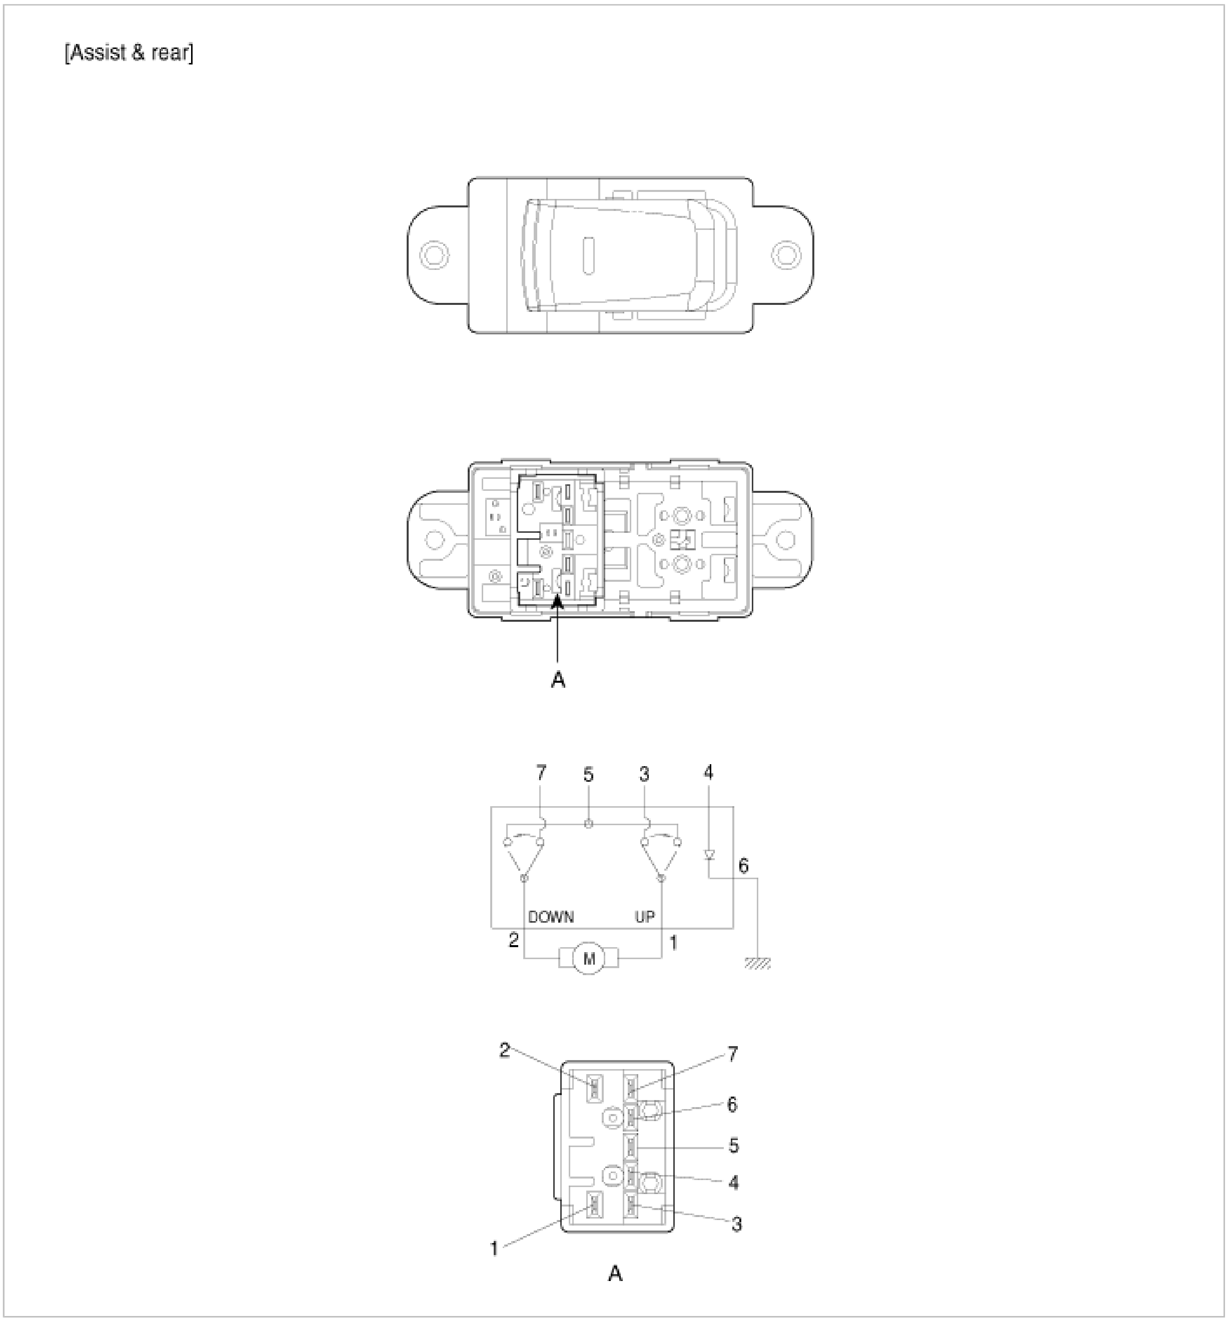
BRAKE FLUID LEVEL WARNING LAMP

1. Ignition "ON"
2. Release the parking brake.
3. Remove the connector from the brake fluid level warning switch.
4. Ground the connector at the harness side.
5. Verify that the warning lamp lights.

PARKING BRAKE SWITCH

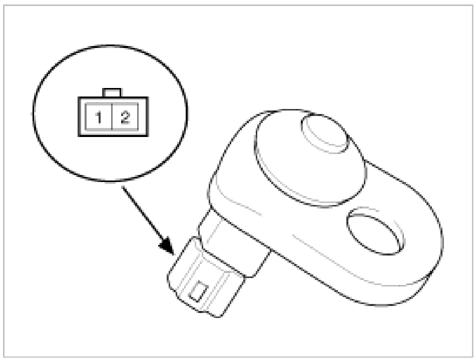
The parking brake switch (A) is a pulling type. It is located under the parking brake lever. To adjust, move the switch mount up and down with the parking brake lever released all the way.

1. Check that there is continuity between the terminal and switch body with the switch ON (Lever is pulled).
2. Check that there is no continuity between the terminal and switch body with the switch OFF (Lever is released).
   If continuity is not as specified, replace the switch or inspect its ground connection.



DOOR SWITCH

Remove the door switch and check for continuity between the terminals.



[FRONT DOOR SWITCH]

Terminal / Position	1	2	Body (Ground)
Free(Door open)	○	○	○
Push(Door close)			

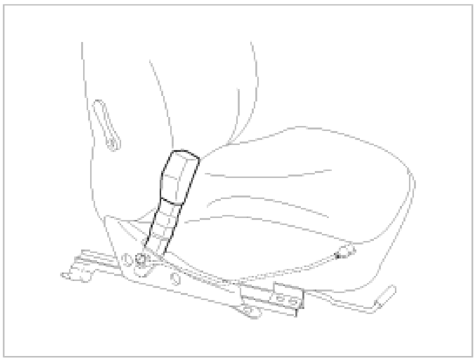
[REAR DOOR SWITCH]

Terminal / Position	1	Ground
Free(Door open)	○	○
Push(Door close)		

SEAT BELT SWITCH

1. Remove the connector from the switch.
2. Check for continuity between terminals.

Seat belt condition	Continuity
Fastened	Non-conductive (∞Ω)
Not fastened	Conductive (Ω)



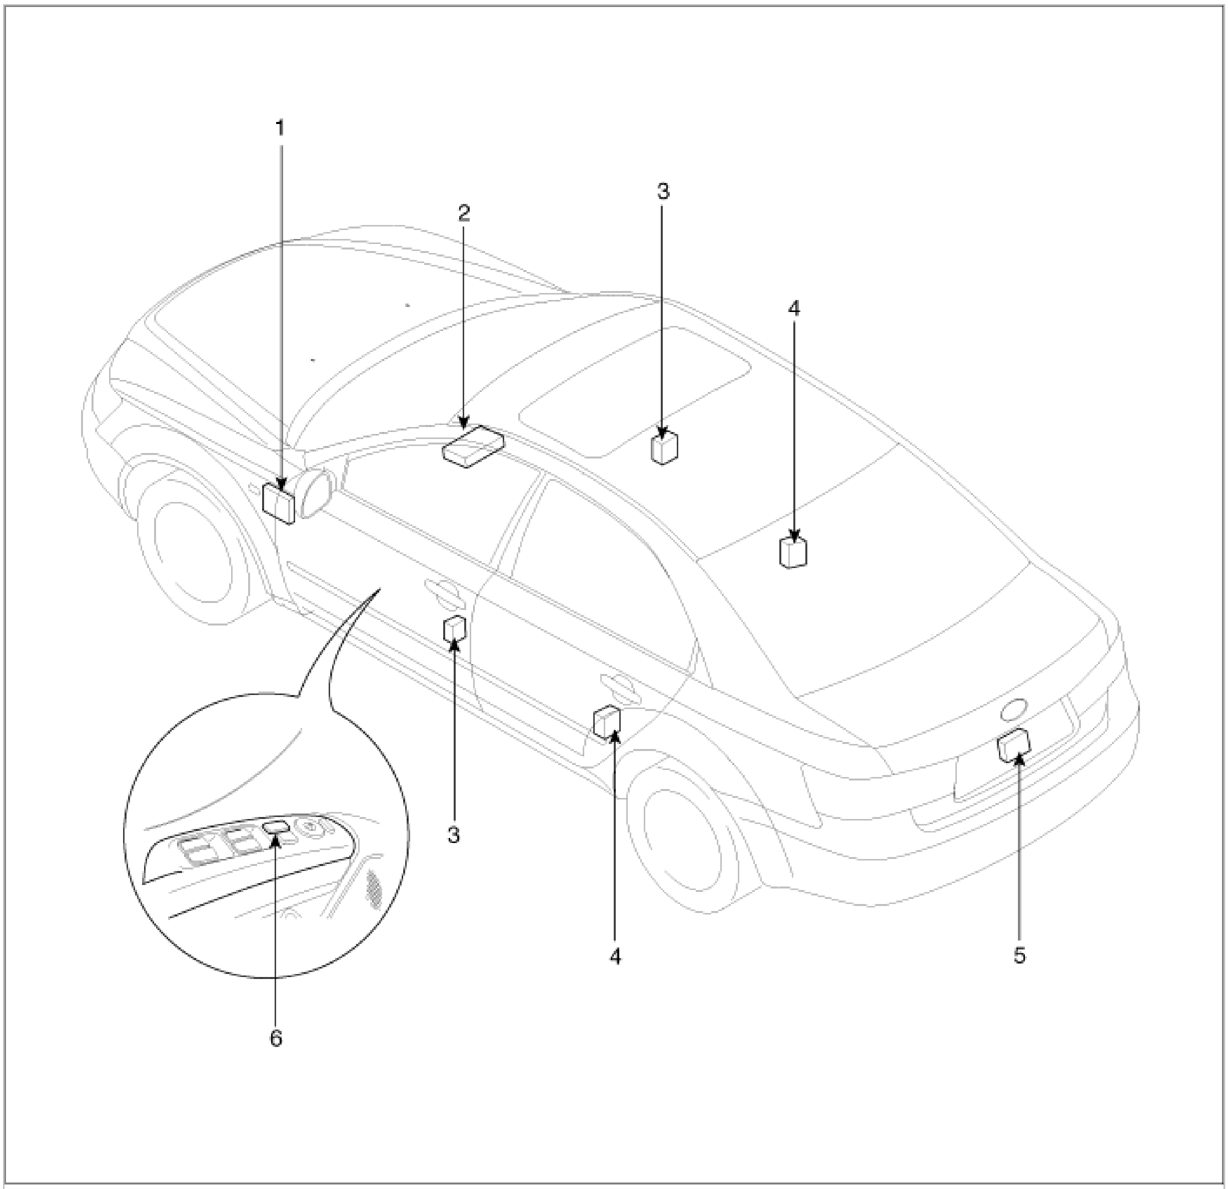
SEAT BELT WARNING LAMP

With the ignition switch turned ON, verify that the lamp glows.

Seat belt condition	Warning lamp
Fastened	OFF
Not fastened	ON

Body Electrical System > Power Door Locks > Components and Components Location

COMPONENT LOCATION

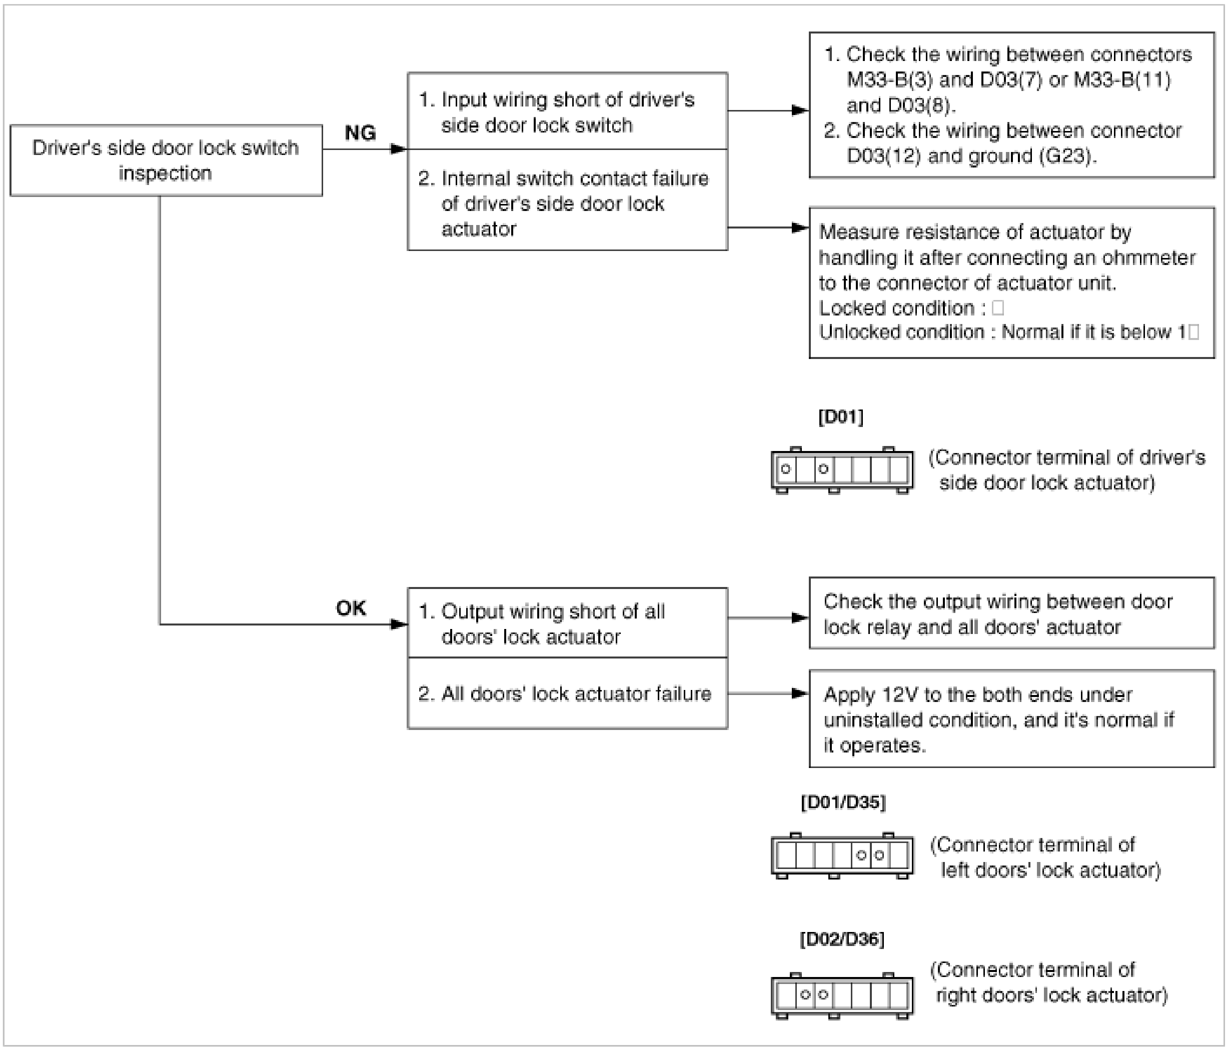


1. Junction box (Door lock/unlock relay)
2. Body control box
3. Front door lock actuator & switch
4. Rear door lock actuator & switch
5. Trunk lid release actuator
6. Door lock switch

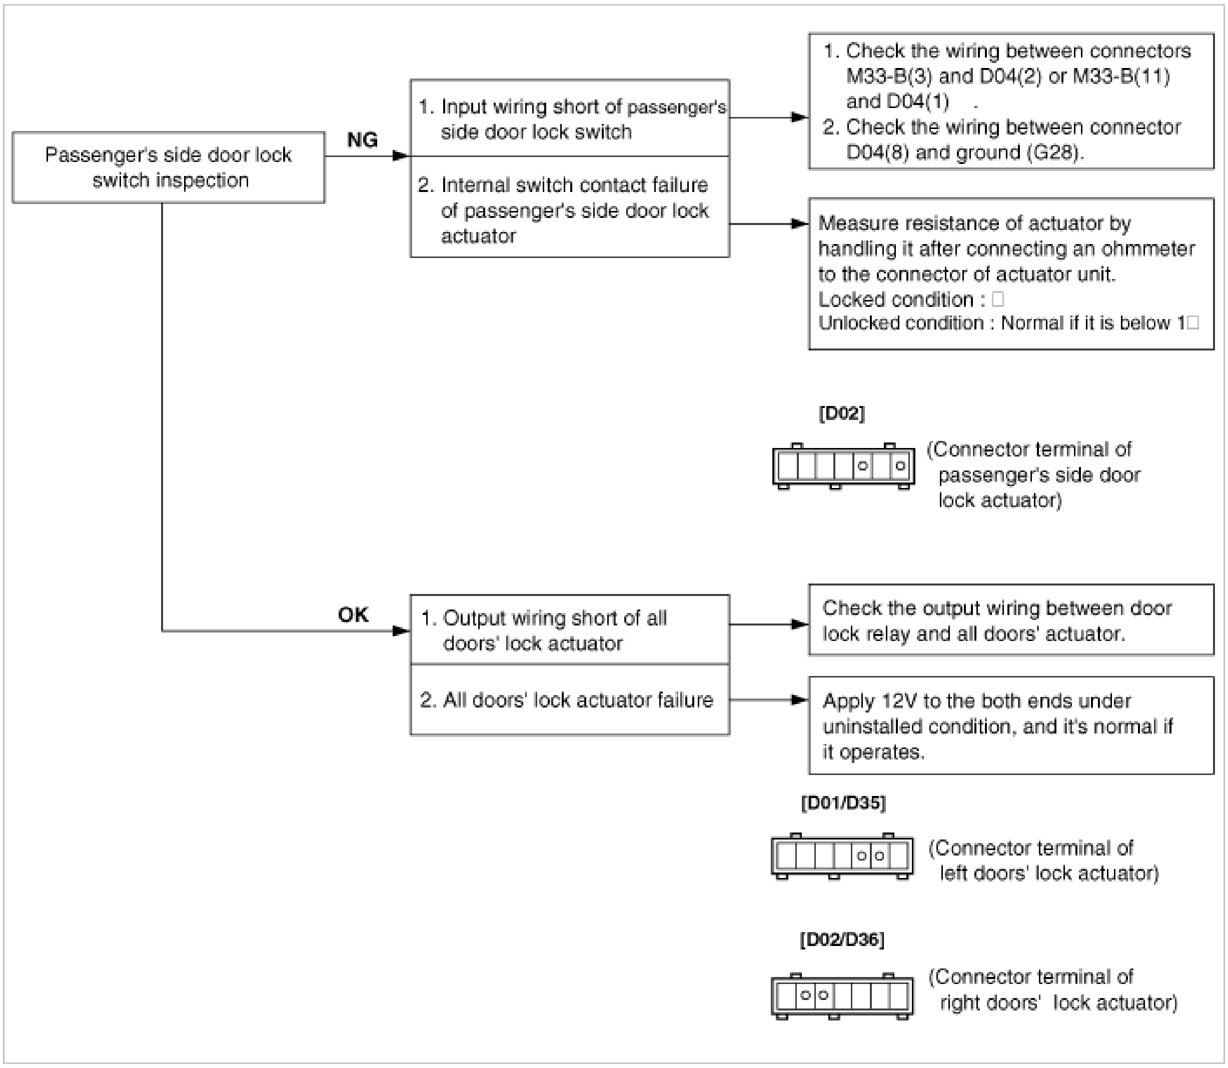
Body Electrical System > Power Door Locks > Troubleshooting

TROUBLESHOOTING

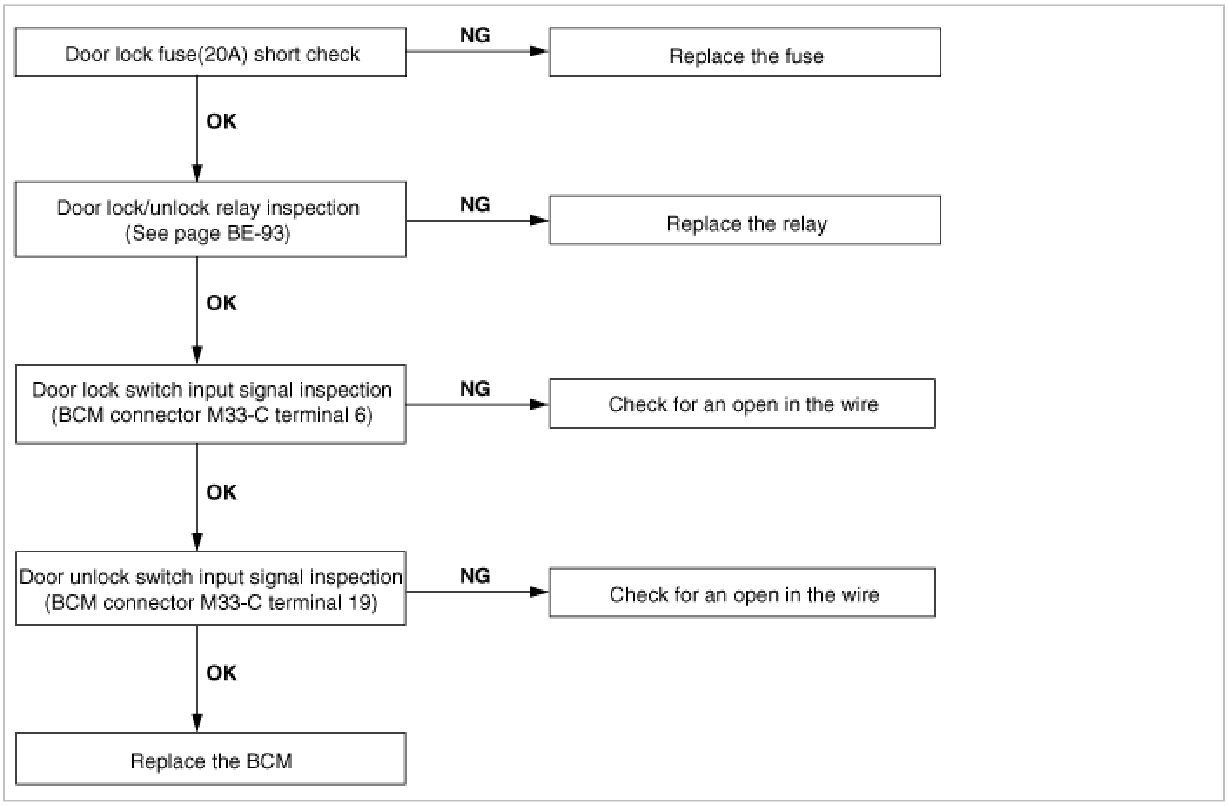
1. Lock function works but unlock function does not work. → Since door unlock relay is malfunction, replace the door unlock relay.
2. Unlock function works but lock function does not work. → Since door lock relay is malfunction, replace the door lock relay.
3. When passenger side knob is controlled, all doors locks, but when driver side knob is controlled, all doors do not lock.



4. When driver side knob is controlled. All doors lock. But when the passenger side knob is controlled, all doors do not lock.



5. Both sides do not lock either.

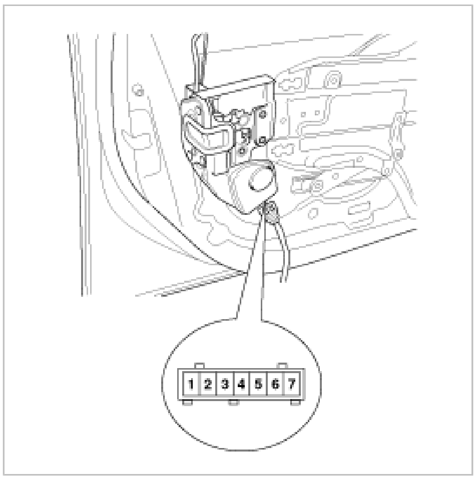


Body Electrical System > Power Door Locks > Power Door Lock Actuators > Repair procedures

INSPECTION

FRONT DOOR LOCK ACTUATOR INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

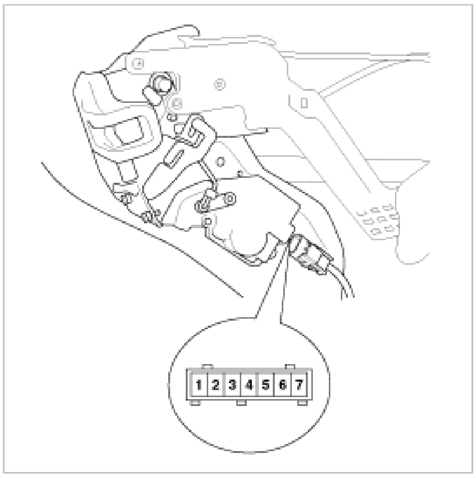


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Front left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Front right	Lock		⊕		⊖
	Unlock		⊖		⊕

REAR DOOR LOCK ACTUATOR INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

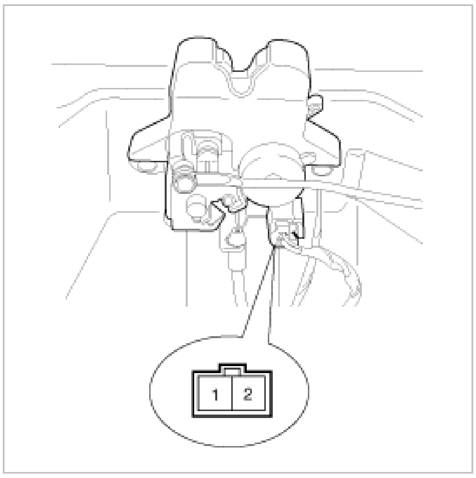


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal		5	3	6	2
Rear left	Lock	⊕		⊖	
	Unlock	⊖		⊕	
Rear right	Lock		⊕		⊖
	Unlock		⊖		⊕

TRUNK LID RELEASE ACTUATOR INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
2. Disconnect the 2P connector from the actuator.

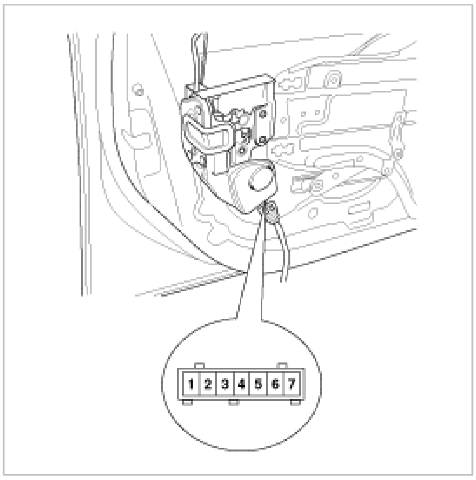


3. Check actuator operation by connecting power and ground according to the table. To prevent damage to the actuator, apply battery voltage only momentarily.

Position \ Terminal	2	Chassis ground
Open	⊕	⊖

FRONT DOOR LOCK SWITCH INSPECTION

1. Remove the front door trim panel. (Refer to the Body group - front door)
2. Disconnect the 7P connector from the actuator.

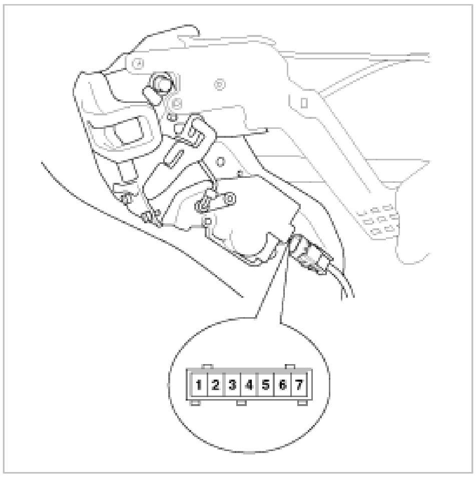


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Front left	Lock				
	Unlock	○	―	○	
Front right	Lock				
	Unlock		○	―	○

REAR DOOR LOCK SWITCH INSPECTION

1. Remove the rear door trim panel. (Refer to the Body group - rear door)
2. Disconnect the 7P connector from the actuator.

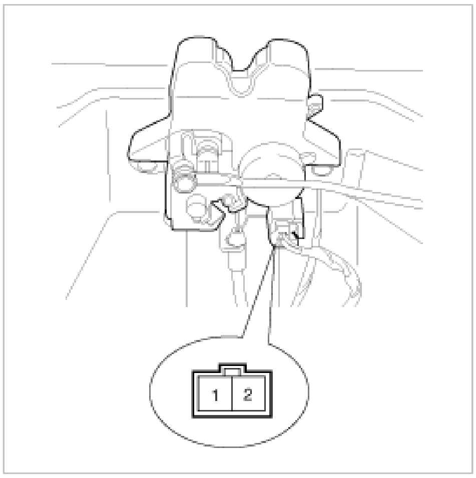


3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal		1	5	3	7
Rear left	Lock				
	Unlock	○		○	
Rear right	Lock				
	Unlock		○		○

TRANK LID OPEN SWITCH INSPECTION

1. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
2. Disconnect the 2P connector from the actuator.



3. Check for continuity between the terminals in each switch position according to the table.

Position \ Terminal	1	Chassis ground
Open	⊕	⊖

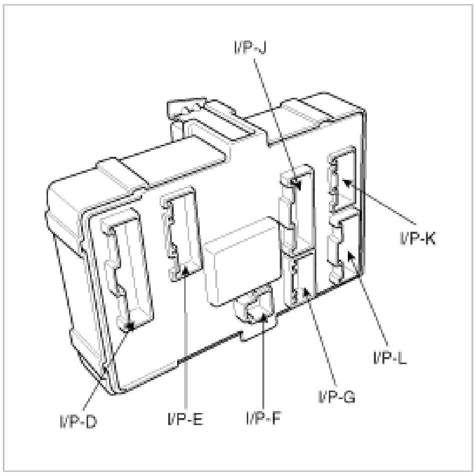
Body Electrical System > Power Door Locks > Power Door Lock Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.

DOOR LOCK

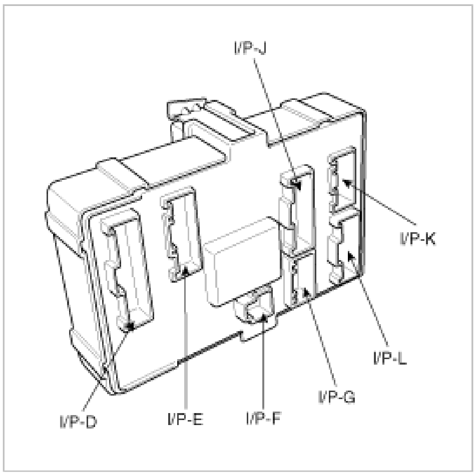
1. There should be continuity between the No.12 and No.9 terminals in the I/P-D when power and ground are connected to the No.12 terminal in the I/P-E and No.9 terminal in the I/P-D.
2. There should be no continuity between the No.12 terminal in the I/P-E and No.9 terminal in the I/P-D when power is disconnected.



Position \ Terminal	I/P-K (9)	I/P-A (15)	I/P-D (16)	I/P-B (13)
Disconnected			○	○
Connected	○	○	⊖	⊕

DOOR UNLOCK

1. There should be continuity between the No.3 terminal in the I/P-E and No.9 terminal in the I/P-D when power and ground are connected to the No.11 terminal in the I/P-E and No.9 terminal in the I/P-D.
2. There should be no continuity between the No.11 terminal in the I/P-E and No.9 terminal in the I/P-D when power is disconnected.



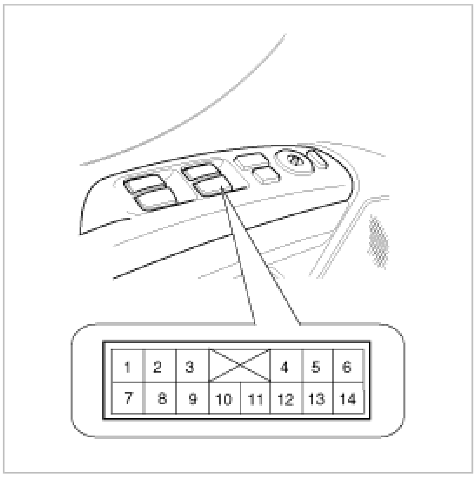
Power \ Terminal	I/P-D (9)	I/P-E (11)	I/P-E (3)	I/P-D (9)
Disconnected			○	○
Connected	○	○	⊖	⊕

Body Electrical System > Power Door Locks > Power Door Lock Switch > Repair procedures

INSPECTION

DRIVER DOOR LOCK SWITCH INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the front door trim panel. (Refer to the Body group - front door)
3. Disconnect the 14P connector from the switch.

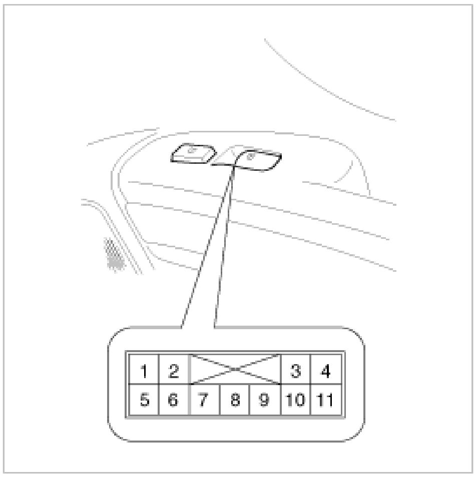


4. Check for continuity between the terminals in each switch position according to the table.

Terminal / Position	8	12	7
Lock		O	O
Unlock	O	O	

ASSIST DOOR LOCK SWITCH INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the front door trim panel. (Refer to the Body group - front door)
3. Disconnect the 11P connector from the switch.



4. Check for continuity between the terminals in each switch position according to the table.

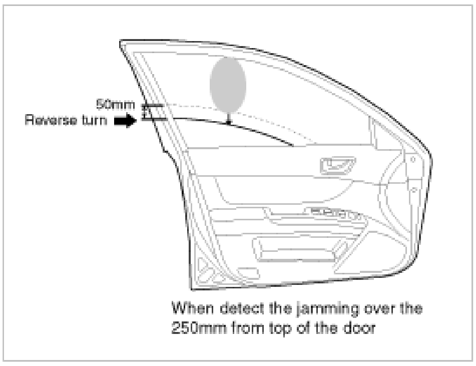
Body Electrical System > Power Windows > Description and Operation

FUNCTION OF SAFETY POWER WINDOW

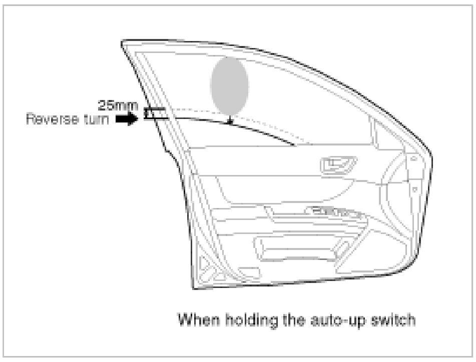
When driver door power window auto-up switch is operated, safety function is activated.

1. Safety function condition
   When detect the force of 100N during the window rising, window is reversed.
2. Length of window reversing (except holding the auto-up switch)
   A. When detect the jamming during the 4mm ~ 250mm from top of the door.
      → Window is reversed until 300mm from top of the door.

   B. When detect the jamming over the 250mm from top of the door.
      → Window is reversed until 50mm from jamming position.



3. Length of window reversing (holding the auto-up switch)
   A. When detect the jamming during holding the auto-up switch.
      → Window is reversed until 25mm from jamming position.
   B. Auto-up function is not available during the 5 seconds from above condition.
      → When holding the auto-up switch, window is operated as a manual-up function. (Safety function is not activated.)
   C. When holding the auto-up switch after 5 seconds from above condition.
      → Window is reverse until 25mm from jamming position.



4. Safety function is not available area
   Safety function is not available during the 4mm from top of the door.

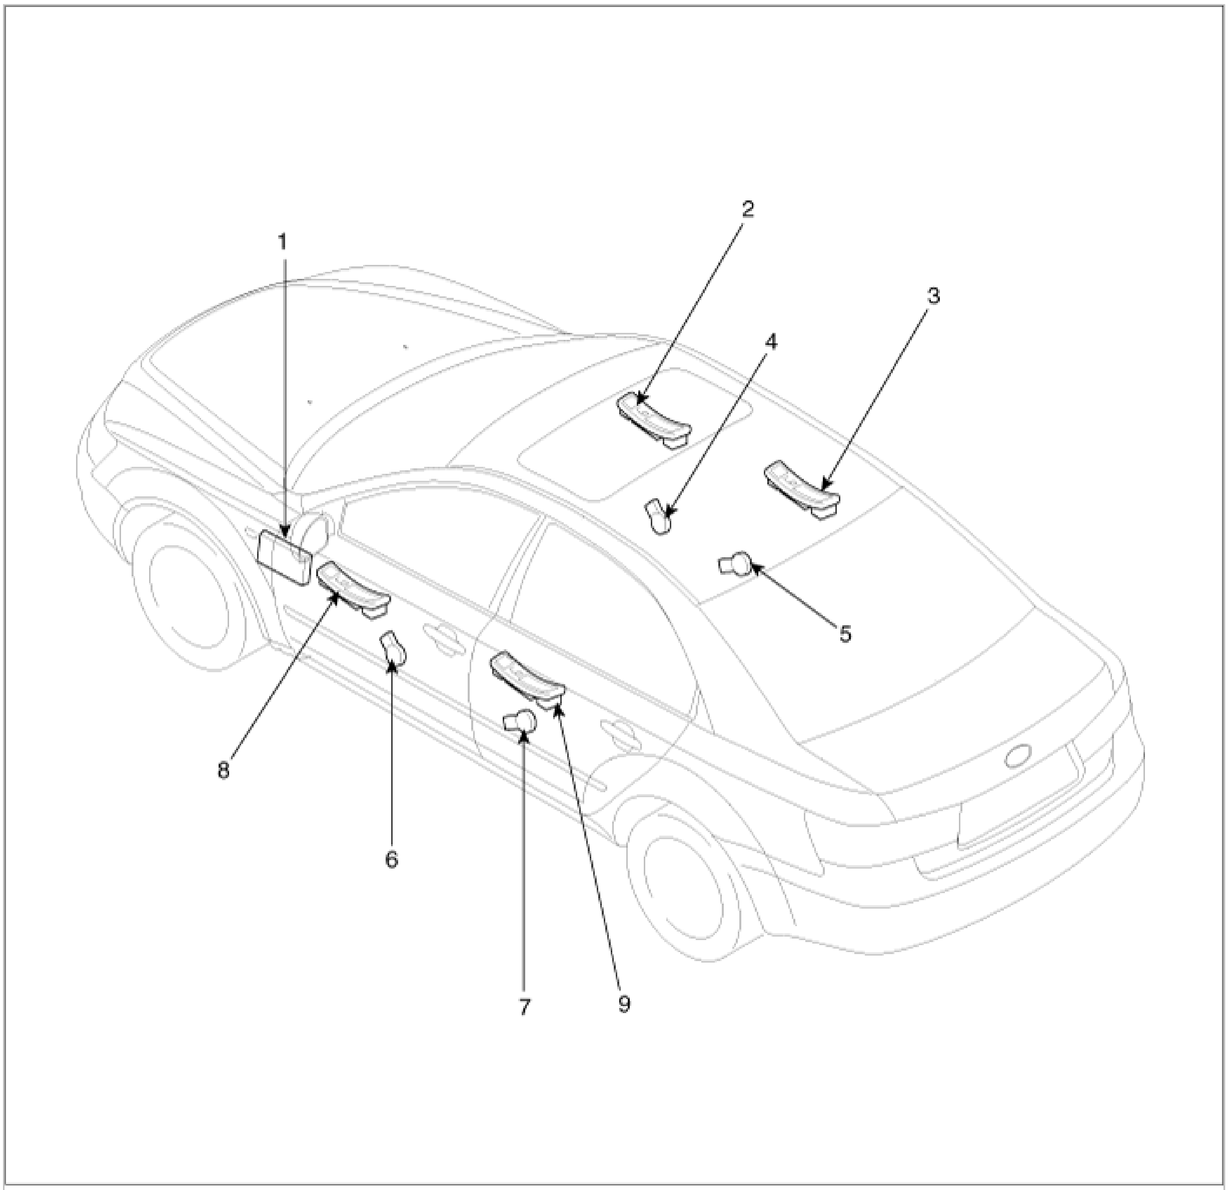
INITIALIZING METHOD OF THE SAFETY POWER WINDOW

1. Initializing of Battery Connection
   When the battery is not connected the vehicle over the 5 minutes, safety power window switch need the initializing.
   (1) Power window operation before initializing
      A. Manual-Up/Down function is available
      B. Auto-Up function is not available
         (When holding the auto-up/down switch, window is operated as a manual-up/down.)
   (2) Initializing method
      Close the window in window open position, and holding the switch in window full close position over the 0.2 second.
      (If start the closing the window in window full close position, initializing could be failed.)
   (3) If initialize the safety power window in jamming status, could occur below conditions.
      A. Safety function is not available

2. Initializing of fail safe mode
   (1) If the window moved by compulsion and motor have a problem, power window switch could be entering the fail safe mode for user's safety.
   (2) Power window operation in fail mode
      A. Auto/Manual-Down function is available
      B. Auto/Manual-Up function is not available
         (When auto/manual-up is operated, window is rising 20mm and is stopped the moving.)

Body Electrical System > Power Windows > Components and Components Location

COMPONENT LOCATION

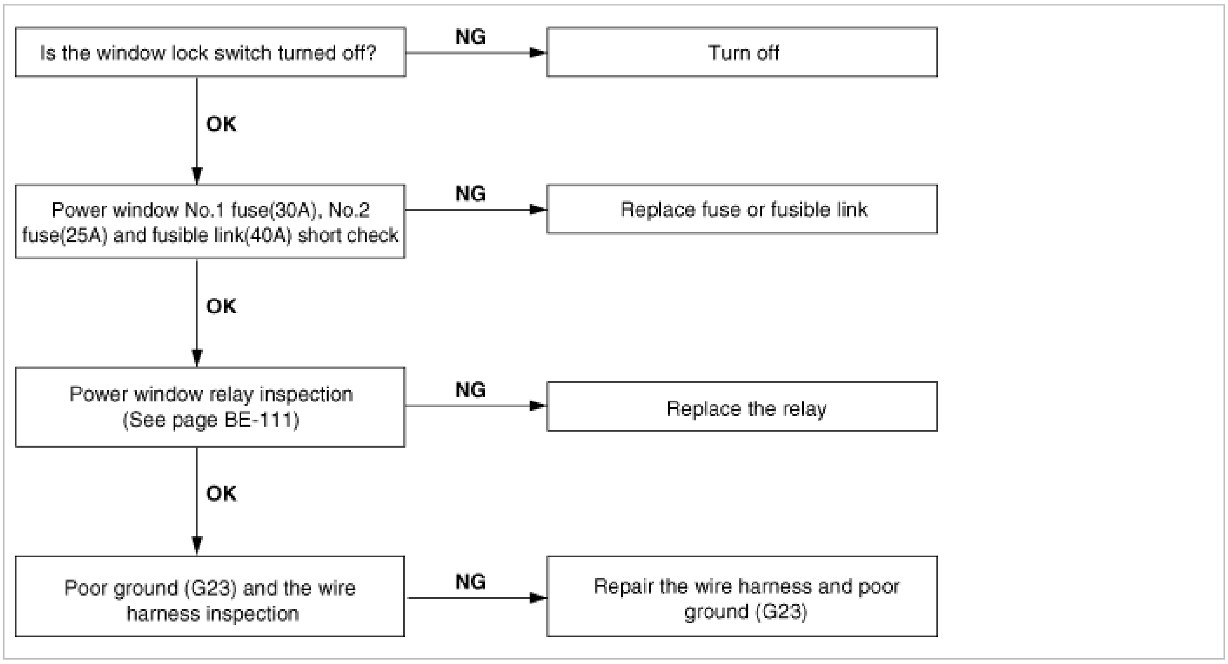


1. Passenger compartment junction box (Power window relay)	5. Rear window motor
2. Assist window switch	6. Front window motor (Safety window)
3. Rear window switch	7. Rear window motor
4. Front window motor	8. Driver window main switch
	9. Rear window switch

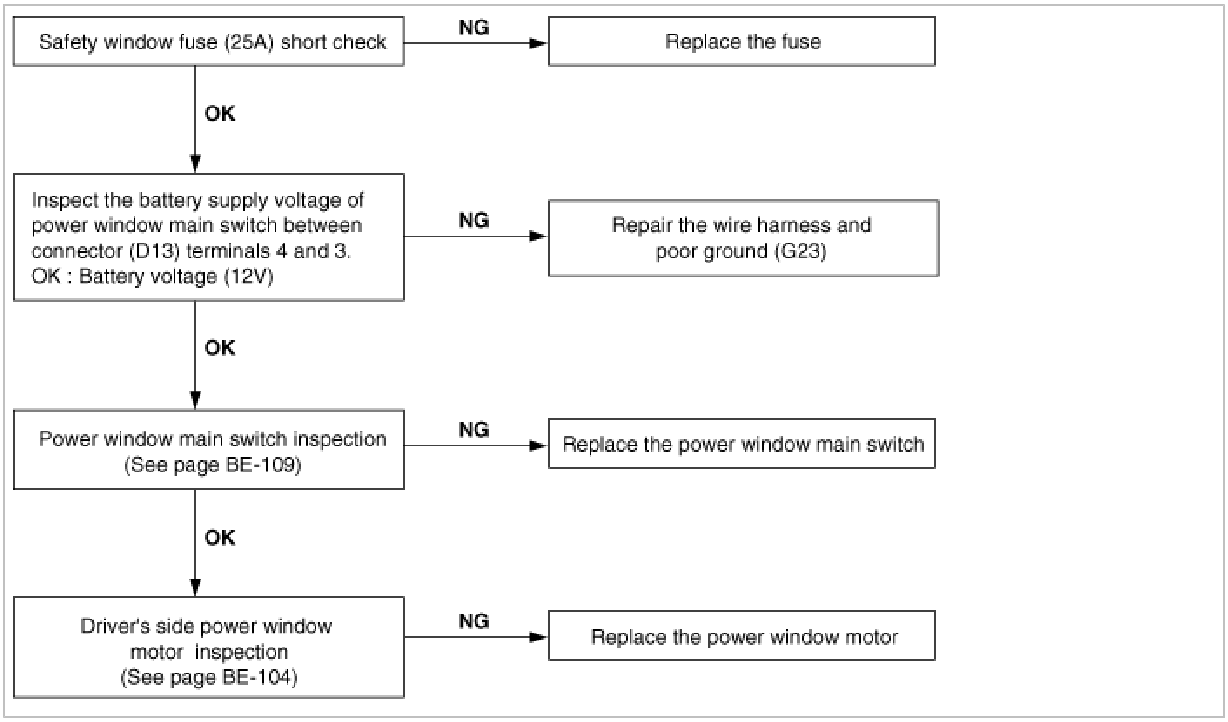
Body Electrical System > Power Windows > Troubleshooting

TROUBLESHOOTING

1. No windows operate from the main switch on the driver's door.



2. Driver's side window does not operate.



3. Passenger's side window does not operate.

Inspect the battery supply voltage of passenger's side power window switch between connector (D04) terminal 4 and 10/6.
OK : Battery voltage (12V)
→ NG → Repair the wire harness and poor ground (G23)

↓ OK

Passenger's side power window switch inspection (See page BE-109)
→ NG → Replace the power window switch

↓ OK

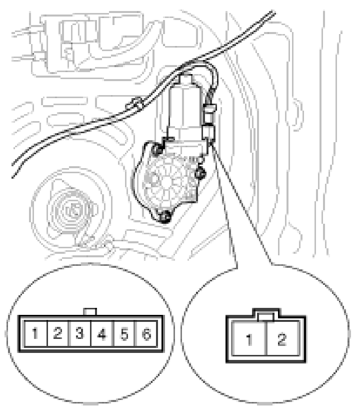
Passenger's side power window motor inspection (See page BE-104)
→ NG → Replace the power window motor

Body Electrical System > Power Windows > Power Window Motor > Repair procedures

INSPECTION

FRONT POWER WINDOW MOTOR INSPECTION

1. Remove the front door trim panel. (Refer to the Body group-front door)
2. Disconnect the connector from the motor.



[Safety power window]

3. Connect the motor terminals directly to battery voltage (12V) and check that the motor operates smoothly. Next, reverse the polarity and check that the motor operates smoothly in the reverse direction. If the operation is abnormal, replace the motor.

Position \ Terminal			1	2
LH	UP	Clockwise	⊖	⊕
	DOWN	Counter-clockwise	⊕	⊖
RH	DOWN	Clockwise	⊕	⊖
	UP	Counter-clockwise	⊖	⊕

[With driver's side safety window]

Disconnected			○	○
Connected	○	○	⊖	⊕

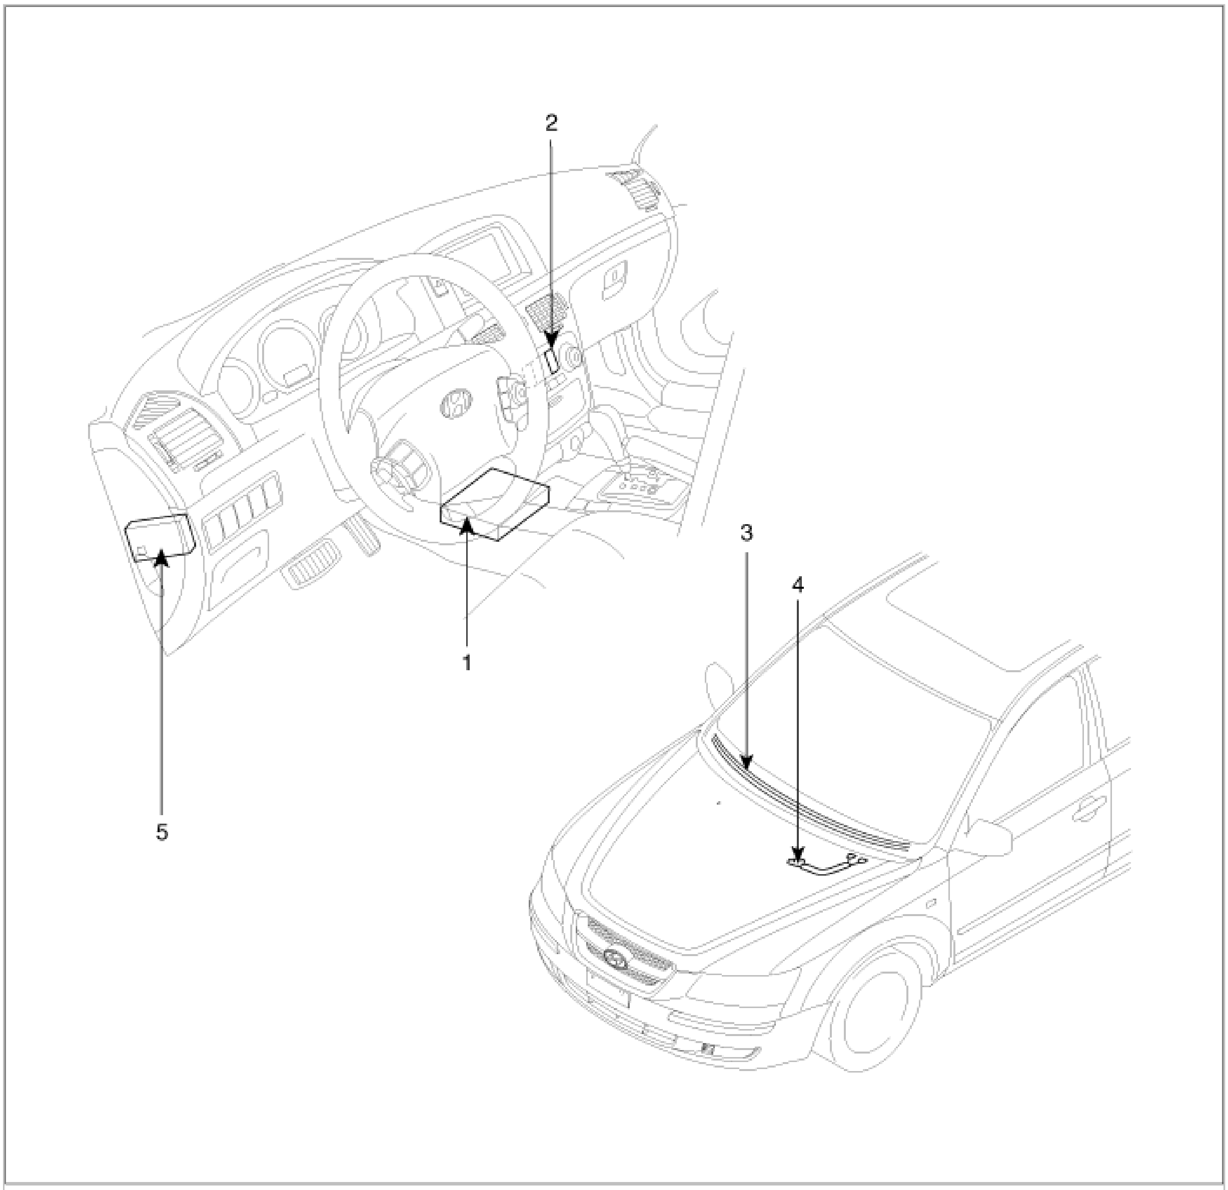
Body Electrical System > Windshield Deicer > Description and Operation

DESCRIPTION

Windshield deicer system prevent windshield wiper from freezing in the winter season. It consists of deicer in the lower part of windshield, switch and relay. Body control module receives an input signal from the deicer switch, then controls relay. Operating condition is the same that of rear window defogger system.
Since the generator "L" is switched ON, if the deicer switch is ON, then deicer output is ON for 20 minutes.

Body Electrical System > Windshield Deicer > Components and Components Location

COMPONENT LOCATION

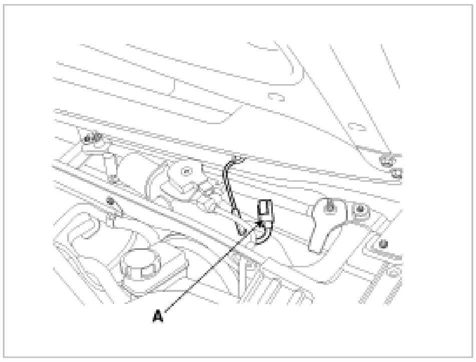


1. Body control module
2. Windshield deicer switch
3. Windshield deicer
4. Deicer connector
5. Windshield deicer relay (Built-in junction box)

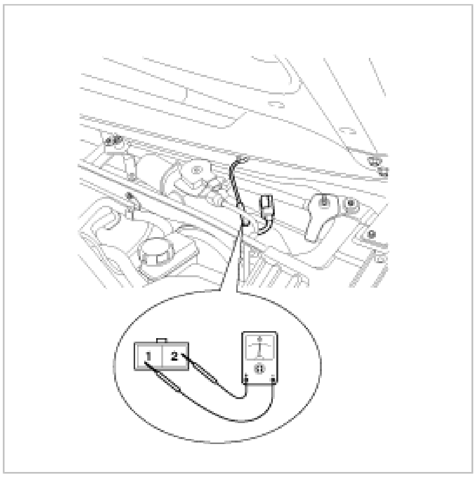
Body Electrical System > Windshield Deicer > Windshield Deicer > Repair procedures

INSPECTION

1. Remove the cowl top cover.(Refer to the wiper)
2. Disconnect the windshield deicer connector (A) from the wiper motor linkage.

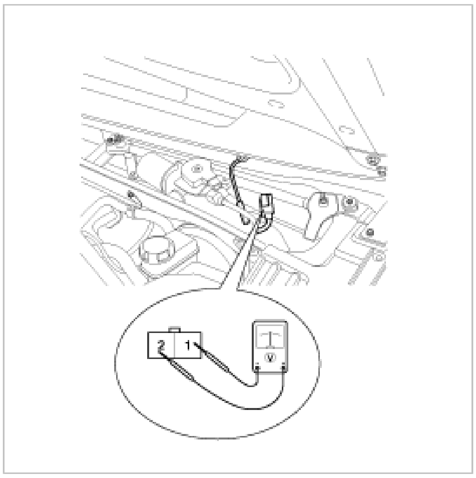


3. Check for continuity between the terminals of deicer lines.



4. Turn the ignition switch ON and the windshield deicer switch ON, then measure the voltage between the terminals of harness side deicer connector.

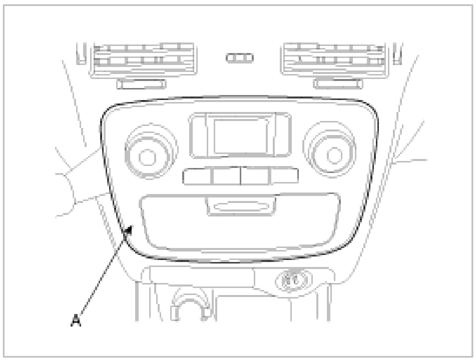
OK: approx. Battery voltage



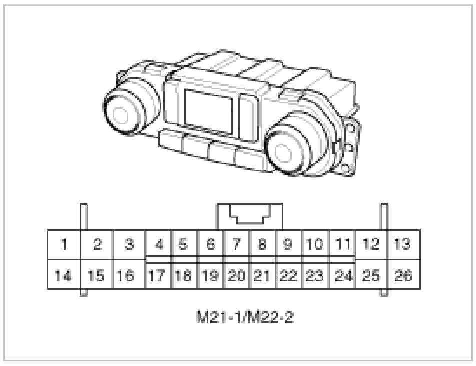
Body Electrical System > Windshield Deicer > Windshield Deicer Switch > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the center facia panel(A) by using a scraper (B). Take care of fixing clip.



3. Disconnect the connectors.
4. Using an ohmmeter, inspection the continuity between the terminals after removing to the switch connector.



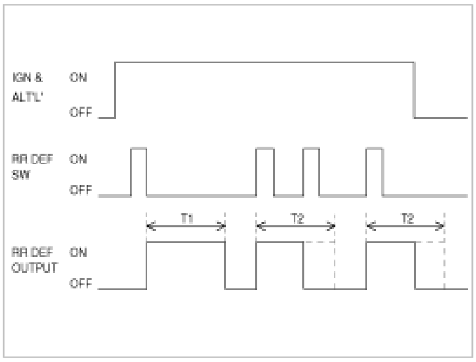
Position \ Terminal	M22-2 (23)	M22-2 (26)	M21-1 (26)	M21-1 (10)
ON (Manual)	O	O		
ON (Auto)			O	O
OFF				

Body Electrical System > Windshield Deicer > Windshield Deicer Timer > Repair procedures

INSPECTION

While operating the components, check whether the operations are normal as shown in the timing chart.

1. Once ALT "L" is ON, if the defogger is switched ON, the defogger will stay ON for 20 minutes duration.
2. If defogger switch is pressed again (see Step 1), or if ignition is switched OFF, the defogger will shut OFF.

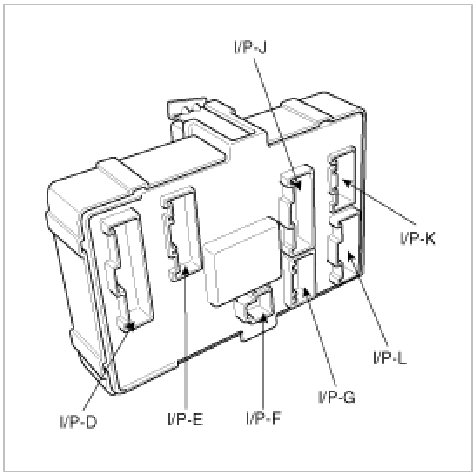


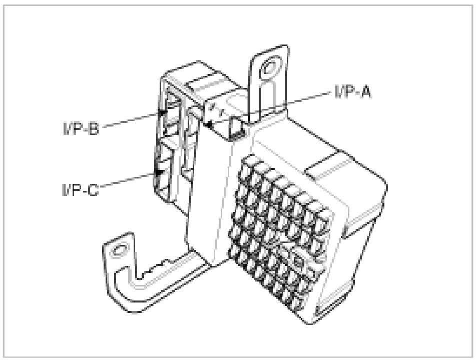
T1 : 20 ± 1 min.
T2 : MAX 20 ± 1 min.

Body Electrical System > Windshield Deicer > Windshield Deicer Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.
4. There should be continuity between the No.2 in the I/P-G and No.8 terminal in the I/P-K when power and ground are connected to the No.2 terminal in the I/P-G and No.8 terminal in the I/P-C.
5. There should be no continuity between the No.2 terminal in the I/P-G and No.8 terminal in the I/P-K when power is disconnected.

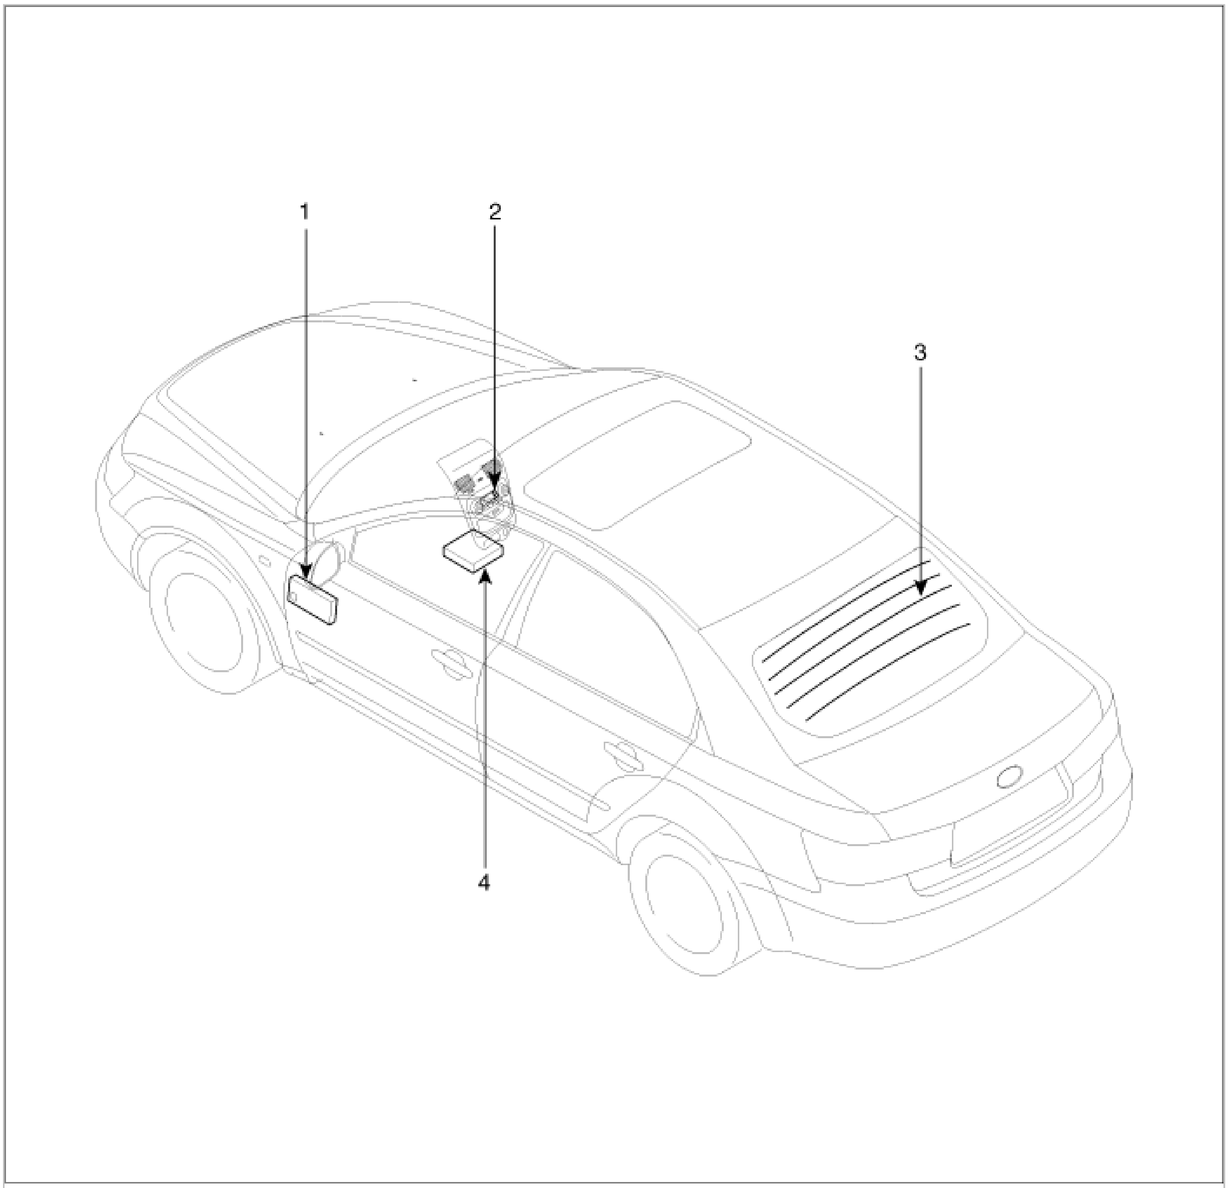




Power \ Terminal	I/P-K (8)	I/P-G (2)	I/P-C (8)	I/P-G (2)
Disconnected			○	○
Connected	○	○	⊖	⊕

Body Electrical System > Rear Window Defogger > Components and Components Location

COMPONENT LOCATION



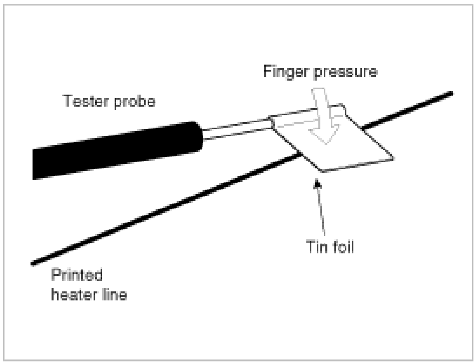
1. Junction box (Rear window defogger)	3. Rear window defogger
2. Rear window defogger switch (A/C controller)	4. Body control module

Body Electrical System > Rear Window Defogger > Rear Window Defogger Printed Heater > Repair procedures

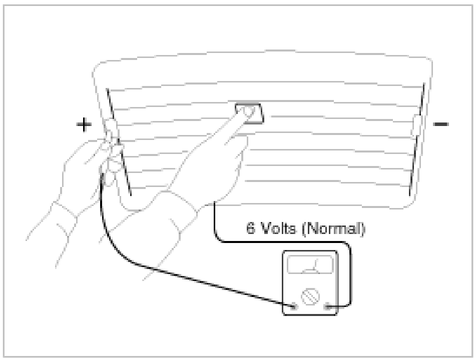
INSPECTION

CAUTION

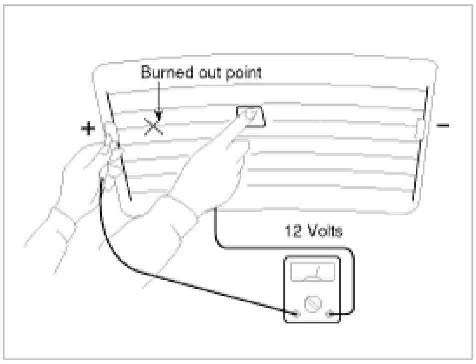
Wrap tin foil around the end of the voltmeter test lead to prevent damaging the heater line. Apply finger pressure on the tin foil, moving the tin foil along the grid line to check for open circuits.



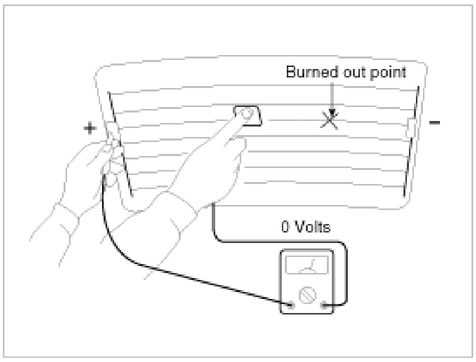
1. Turn on the defogger switch and use a voltmeter to measure the voltage of each heater line at the glass center point. If a voltage of approximately 6V is indicated by the voltmeter, the heater line of the rear window is considered satisfactory.



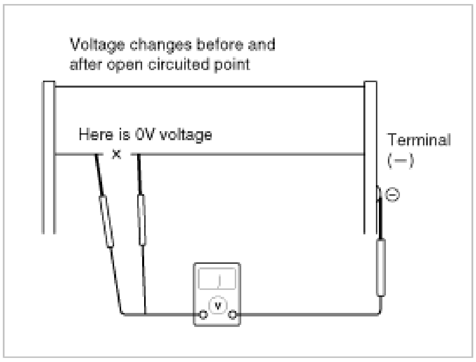
2. If a heater line is burned out between the center point and (+) terminal, the voltmeter will indicate 12V.



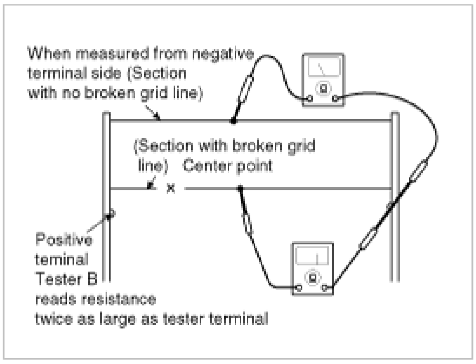
3. If a heater line is burned out between the center point and (-) terminal, the voltmeter will indicate 0V.



4. To check for open circuits, slowly move the test lead in the direction that the open circuit seems to exist. Try to find a point where a voltage is generated or changes to 0V. The point where the voltage has changed is the open-circuit point.



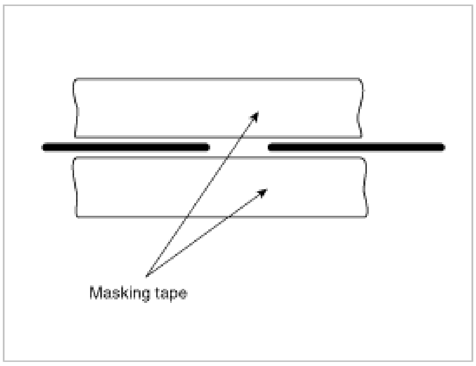
5. Use an ohmmeter to measure the resistance of each heater line between a terminal and the center of a grid line, and between the same terminal and the center of one adjacent heater line. The section with a broken heater line will have a resistance twice as that in other sections. In the affected section, move the test lead to a position where the resistance sharply changes.



REPAIR OF BROKEN HEATER LINE

Prepare the following items:

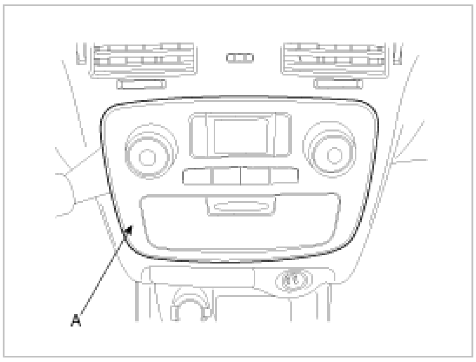
1. Conductive paint.
2. Paint thinner.
3. Masking tape.
4. Silicone remover.
5. Using a thin brush:
   Wipe the glass adjacent to the broken heater line, clean with silicone remover and attach the masking tape as shown. Shake the conductive paint container well, and apply three coats with a brush at intervals of about 15 minutes apart. Remove the tape and allow sufficient time for drying before applying power. For a better finish, scrape away excess deposits with a knife after the paint has completely dried. (Allow 24 hours).



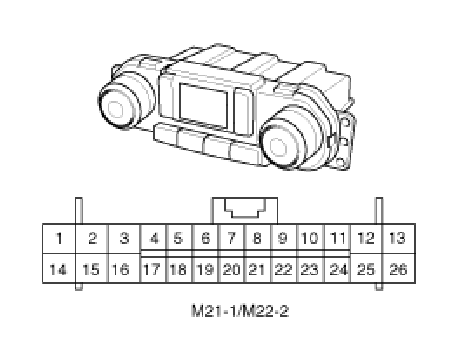
Body Electrical System > Rear Window Defogger > Rear Window Defogger Switch > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the center facia panel(A) by using a scraper (B). Take care of fixing clip.



3. Disconnect the connectors.
4. Using an ohmmeter, inspection the continuity between the terminals after removing to the switch connector.

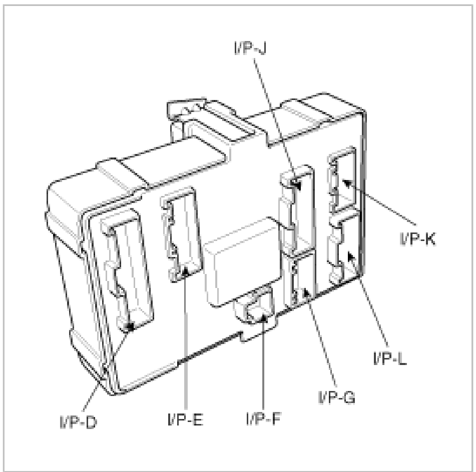


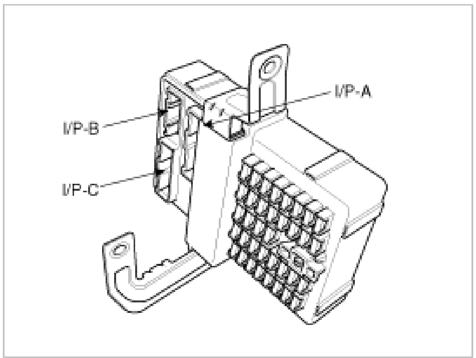
Terminal / Position	M22-2 (23)	M22-2 (26)	M21-1 (26)	M21-1 (10)
ON (Manual)	O	O		
ON (Auto)			O	O
OFF				

Body Electrical System > Rear Window Defogger > Rear Window Defogger Relay > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Remove the junction box.
3. Check for continuity between the terminals.
4. There should be continuity between the No.2 in the I/P-G and No.7 terminal in the I/P-C when power and ground are connected to the No.2 terminal in the I/P-G and No.8 terminal in the I/P-C.
5. There should be no continuity between the No.2 terminal in the I/P-G and No.7 terminal in the I/P-C when power is disconnected.





Terminal / Power	I/P-C (7)	I/P-G (2)	I/P-C (8)	I/P-G (2)
Disconnected			○	○

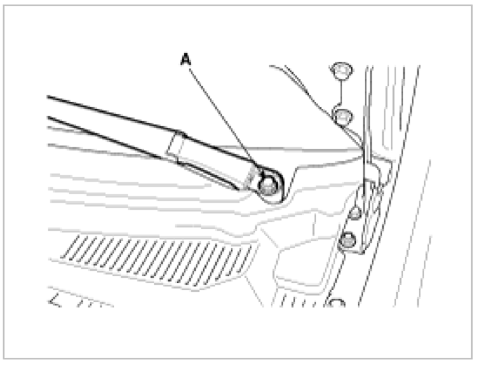
Body Electrical System > Windshield Wiper/Washer > Front Wiper Motor > Repair procedures

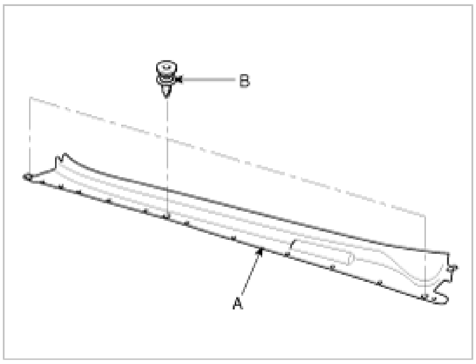
REMOVAL

1. Remove the windshield wiper arm and blade after removing a nut (A).

TORQUE: 28~32 Nm (2.8~3.2 kgf.m, 20~23.1 lbf.ft)

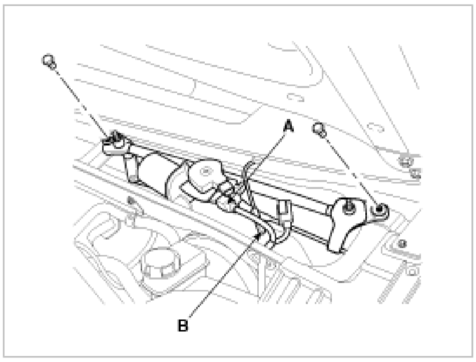


2. Remove the weather strip then remove the cowl top cover (A) after removing 3 clips (B).



3. Remove the windshield wiper motor and linkage assembly after removing 2 bolts. Disconnect the wiper motor connector (A) and windshield deicer connector (B) from the wiper motor & linkage assembly.

TORQUE: 7-11Nm (0.7-1.1, kgf.m, 5.0-7.9 lbf.ft)

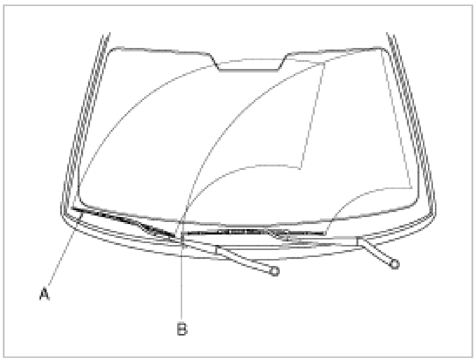


4. Installation is the reverse of removal.

INSTALLATION

1. Install the wiper arm and blade to the specified position.

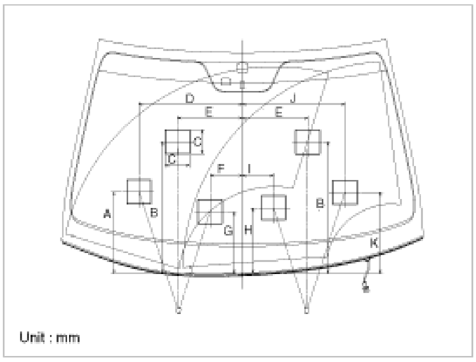
Specified position	A	B
Distance [in (mm)]	1.26+0.2/0 (32+5/0)	0.98+0.2/0 (25+5/0)



2. Set the washer nozzle on the specified spray position.

Specified position	Distance [in (mm)]
A	13.3 (337.5)
B	21.5 (545)
C	3.9 (100)
D	16.9 (429.5)
E	10.6 (270)
F	5.3 (134)

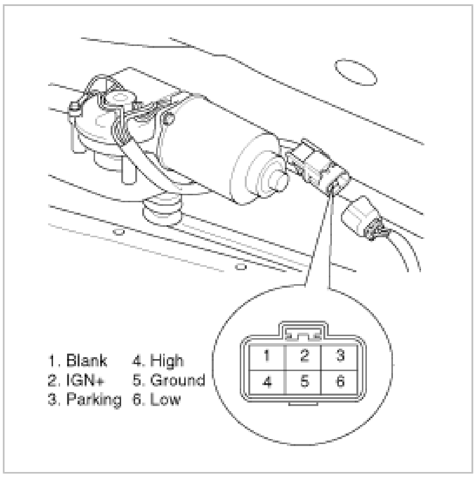
G	10.1(255.5)
H	10.7(271.5)
I	5.0(128)
J	16.7(424)
K	13.2(335.5)



INSPECTION

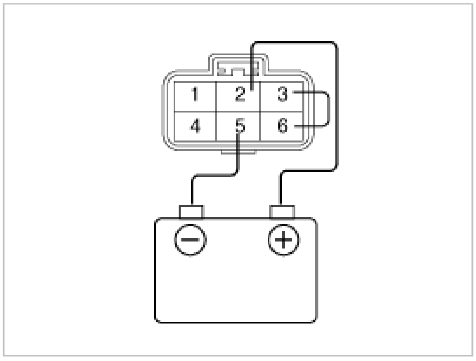
SPEED OPERATION CHECK

1. Remove the connector from the wiper motor.
2. Attach the positive (+) lead from the battery to terminal 6 and the negative (-) lead to terminal 5.
3. Check that the motor operates at low speed.
4. Connect the positive (+) lead from the battery to terminal 4 and the negative (-) lead to terminal 5.
5. Check that the motor operates at high speed.



AUTOMATIC STOP OPERATION CHECK

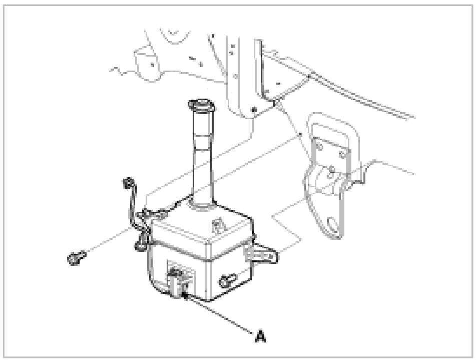
1. Operate the motor at low speed using the stalk control.
2. Stop the motor operation anywhere except at the off position by disconnecting terminal 6.
3. Connect terminals 3 and 6.
4. Connect the positive (+) lead from the battery to terminal 2 and the negative (-) lead to terminal 5.
5. Check that the motor stops running at the off position.



Body Electrical System > Windshield Wiper/Washer > Front Washer Motor > Repair procedures

REPLACEMENT

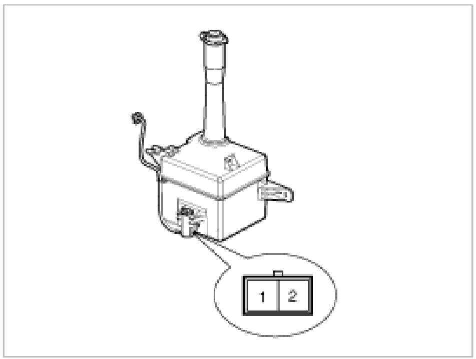
1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper cover. (Refer to Body group-Front bumper)
3. Remove the washer hose and the washer motor connector (A).
4. Remove the washer reservoir after removing 3 bolts.

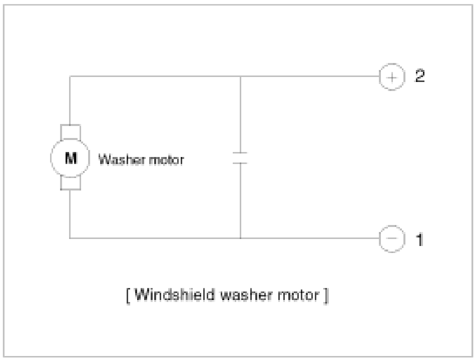


5. Installation is the reverse of removal.

INSPECTION

1. With the washer motor connected to the reservoir tank, fill the reservoir tank with water.
2. Connect positive (+) battery cables to terminal 2 and negative (-) battery cables to terminal 1 respectively.
3. Check that the motor operates normally and the washer motor runs and water sprays from the front nozzles.
4. If they are abnormal, replace the washer motor.

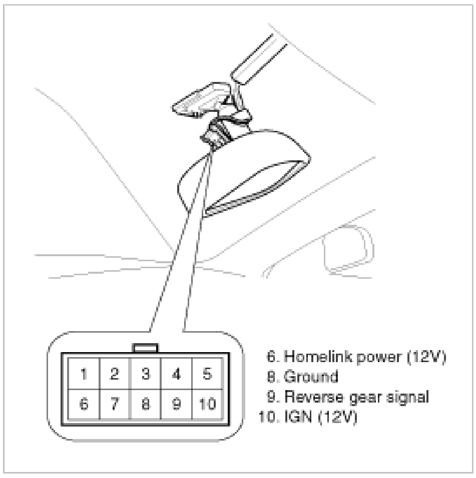




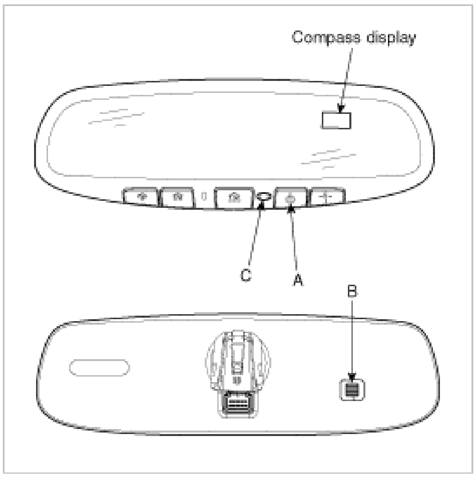
Body Electrical System > Electro chromic Inside > Electro chromic Inside Rear View Mirror > Description and Operation

DESCRIPTION

The ECM (Electro Chromic inside rear view Mirror) is for dimming the reflecting light from a vehicle behind at night, in order the user not to be dazzled by the light. The front looking sensor detects brightness of the surroundings, while the rearward looking sensor the strength of the reflecting light so that adjusts the reflexibility of the mirror in the range of 10~70%. But, when the reverse gear is engaged, it stops functioning.



1. The front looking sensor sees if the brightness of the surroundings is low enough for the mirror to operate its function.
2. The rearward looking sensor detects glaring of the reflecting light from a vehicle behind.
3. The ECM is darkened to the level as determined by the rearward looking sensor. When the glaring is no longer detected, the mirror stops functioning.



Body Electrical System > Electro chromic Inside > Electro chromic Inside Rear View Mirror > Repair procedures

INSPECTION

Check it by the procedure below to see if the function of the ECM is normal.

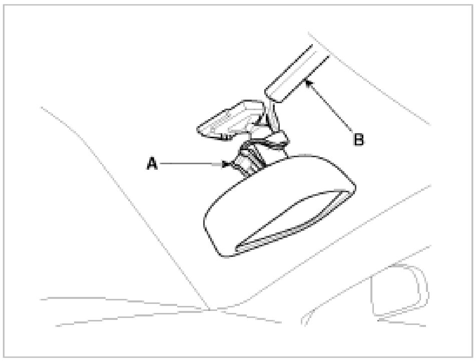
1. Turn the ignition key to the "ON" position.
2. Press the A button to turn the automatic dimming function ON/OFF.
3. Cover the front looking sensor (B) to stop functioning.
4. Head a light to the rearward looking sensor(C).
5. The ECM should be darkened as soon as the rearward looking sensor detects the light.

> NOTE
>
> If this test is performed in daytime, the ECM may be darkened as soon as the front looking sensor is covered.

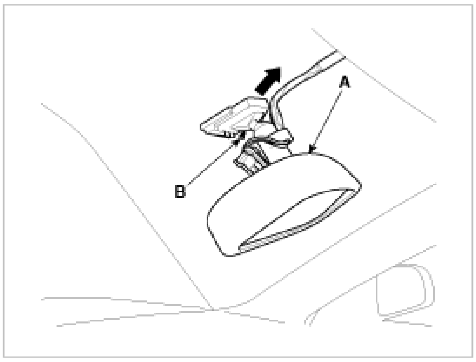
6. When the reverse gear is engaged, the ECM should not be darkened.
7. When heading lights to both the front looking and rearward looking sensors, the ECM should not be darkened.

REPLACEMENT

1. Remove the connector(A) and honelink cover (B).



2. Push the ECM base up to remove the ECM assembly (A) after loosening the mounting screw (B).



3. Installation is the reverse of removal.

Body Electrical System > Electro chromic Inside > Compass Mirror > Description and Operation

FUNCTION

1. Push the A button lower of the rear view mirror to turn on the function of the compass mirror so that displays a sign of a direction on the small board in the upper-right side of the mirror.
2. Push the A button again to turn off its function.

Body Electrical System > Electro chromic Inside > Compass Mirror > Repair procedures

CALIBRATION PROCEDURE

If the compass has been calibrated or set to variance zone number incorrectly, or you are driving in specific places (tunnel, parking lot in building, underground parking lot, near transformer substation, etc.), some phenomenon is occur as follows:

- The display read "C".
- The compass headings become inaccurate.
- The compass heading is not changed.
- Some compass headings are not displayed.

- The compass headings are inaccurate in long distance driving.

This compass automatically calibrates itself while the vehicle is driven as your route takes you in complete circles.
If the vehicle's compass headings become inaccurate continuously, the compass should be manually calibrated as follows:

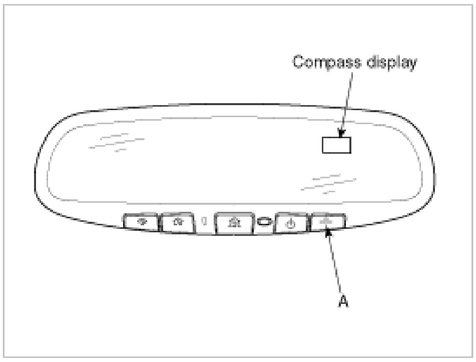
1. Move the vehicle from the large steel structure or electric power supply cable.
2. Turn on the compass by pressing the A button.
3. Check the zone number by pressing the A button for more than 4 seconds until the current zone number appears in the display.
   To re-calibrate, hold the A button for 3 seconds until C is displayed. If the zone number is different for your country, set the correct zone number referring to "Setting the compass zone" and do the "calibration procedure" again.
4. Drive your vehicle in at least 2 circles at less than 5 miles per hour (8 km/h) until the compass heading appears. Driving in a circle in right-handed direction and opposite direction is possible and if possible, stops the wiper operation.
5. If the vehicle's compass headings become inaccurate as before, do the following procedure again.

> NOTE
>
> If new vehicle is first driven or if the battery has been disconnected, do the calibration procedure as above.

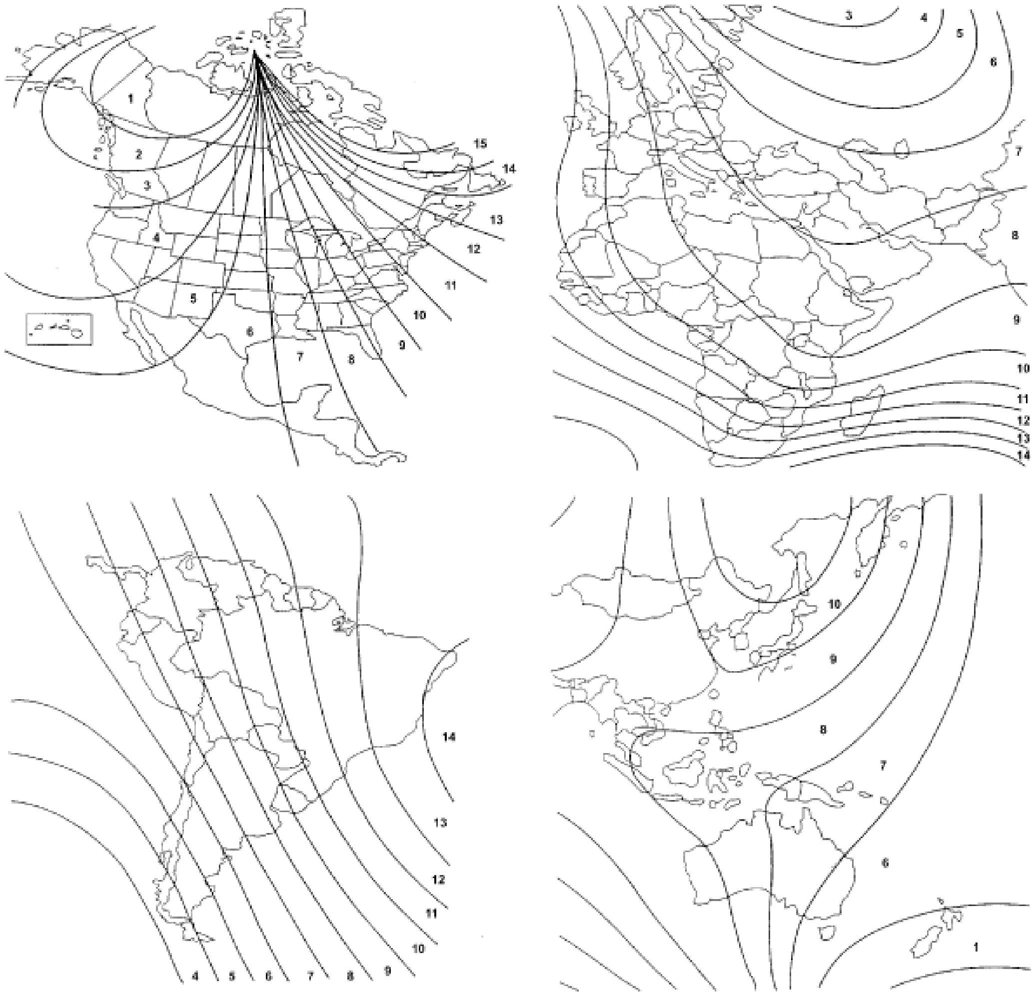
SETTING THE COMPASS ZONE

This compass must be set to compensate for the variation between true north and magnetic north. To set variation:

1. Find your current location and variance zone number on the zone map.
2. Press the A button for more than 4 seconds. The current zone number will appear in the display.
3. Release and press the A button until the new zone number appears in the display. After you stop pressing the button in, the display will show a compass direction within a few seconds.



ZONE MAP

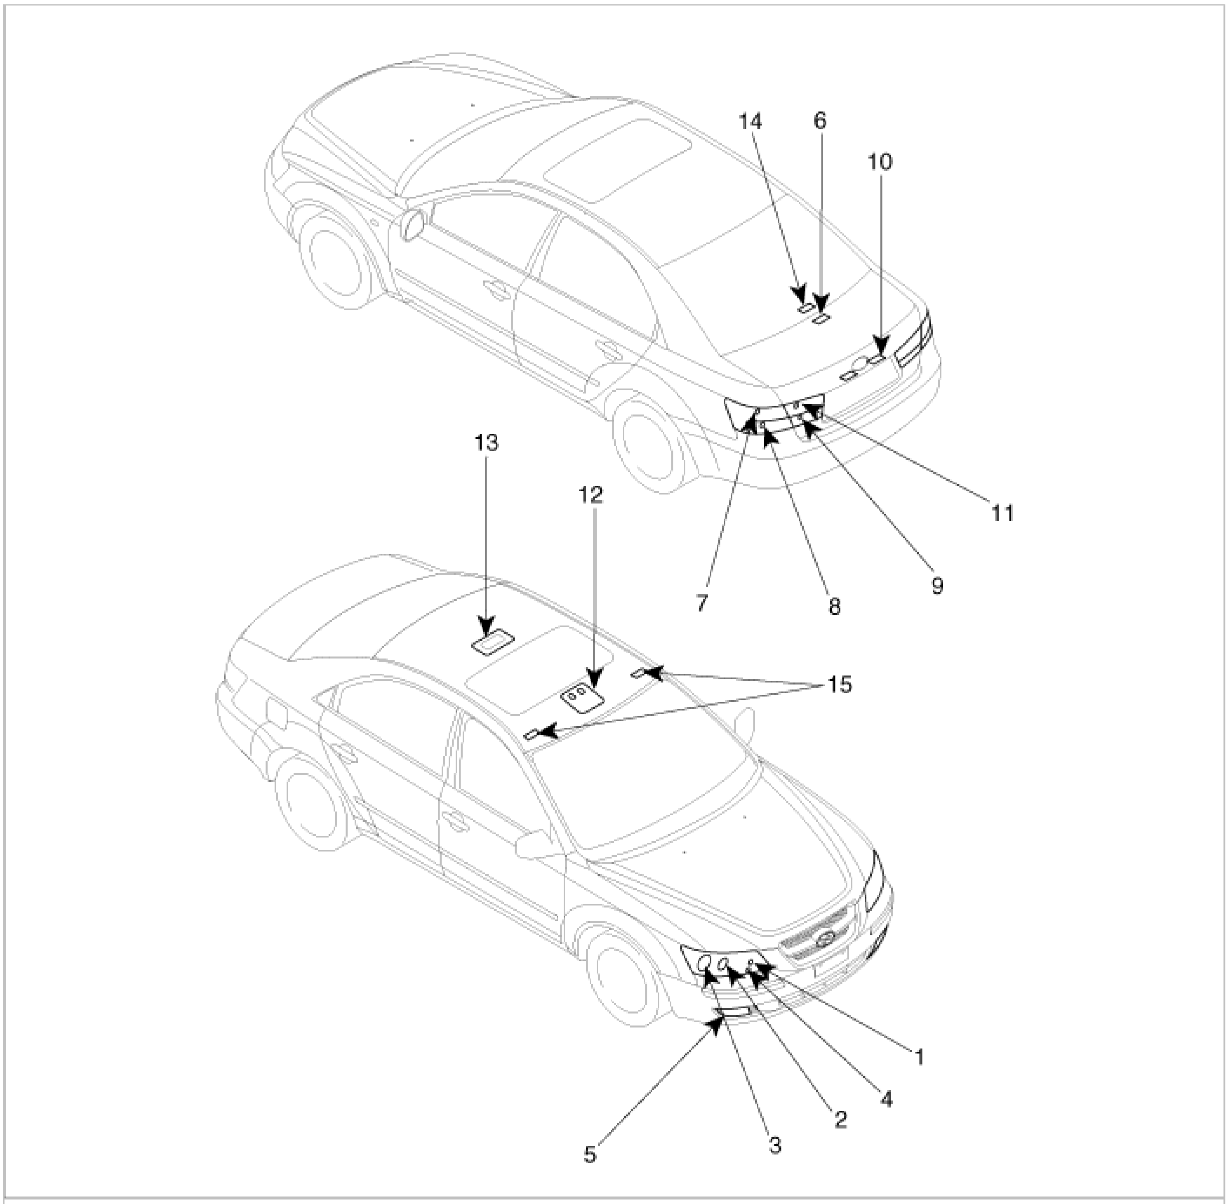


WARNING

1. Do not install the ski rack, antenna, etc. which are attached to the vehicle by means of a magnet. They affect the operation of the compass.
2. If the compass deviates from the correct indication soon after repeated adjustment, have the compass checked at an authorized dealer.
3. The compass may not indicate the correct compass point in tunnels or while driving up or down a steep hill. (The compass returns to the correct compass point when the vehicle moves to an area where the geomagnetism is stabilized.)

Body Electrical System > Lighting System > Components and Components Location

COMPONENT LOCATION



1. Head lamp (High)

Body Electrical System > Lighting System > Troubleshooting

TROUBLESHOOTING

Symptom Poss	ible cause	Remedy
One lamp does not light (all exterior)	Bulb burned out	Replace bulb
	Socket, wiring or ground faulty	Repair if necessary
Head lamps do not light	Bulb burned out	Replace bulb
	Ignition fuse (LOW:20A, HIGH:20A) blown	Check for short and replace fuse
	Head lamp fuse (10A) blown	Check for short and replace fuse
	Head lamp relay faulty	Check relay
	Lighting switch faulty	Check switch

	Wiring or ground faulty	Repair if necessary
Tail lamps and license plate lamps do not light	Bulb burned out	Replace bulb
	Tail lamp fuse (20A) blown	Check for short and replace fuse
	Tail lamp relay faulty	Check relay
	Lighting switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Stop lamps do not light	Bulb burned out	Replace bulb
	Stop lamp fuse (15A) blown	Check for short and replace fuse
	Stop lamp switch faulty	Adjust or replace switch
	Wiring or ground faulty	Repair if necessary
Stop lamps do not turn off	Stop lamp switch faulty	Repair or replace switch
Instrument lamps do not light (Tail lamps light)	Rheostat faulty	Check rheostat
	Wiring or ground faulty	Repair if necessary
Turn signal lamp does not flash on one side	Bulb burned out	Replace bulb
	Turn signal switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Turn signal lamps do not light	Bulb burned out	Replace bulb
	Turn signal lamp fuse (10A) blown	Check for short and replace fuse
	Flasher unit faulty	Check flasher unit
	Turn signal switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Hazard warning lamps do not light	Bulb burned out	Replace bulb
	Hazard warning lamp fuse (10A) blown	Check for short and replace fuse
	Flasher unit faulty	Check flasher unit
	Hazard switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Flasher rate too slow or too fast	Lamps' wattages are smaller or larger than specified	Replace lamps
	Flasher unit faulty	Check flasher unit
Back up lamps do not light	Bulb burned out	Replace bulb
	Back up lamp fuse (10A) blown	Check for short and replace fuse
	Back up lamp switch (M/T) faulty	Check switch
	Transaxle range switch (A/T) faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Room lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (15A) blown	Check for short and replace fuse
	Room lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Front fog lamps do not light	Bulb burned out	Replace bulb
	Front fog lamp fuse (15A) blown	Check for short and replace fuse
	Front fog lamp relay faulty	Check relay
	Front fog lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary
Map lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (10A) blown	Check for short and replace fuse
	Map lamp switch faulty	Check switch

	Wiring or ground faulty	Repair if necessary
Trunk room lamp does not light	Bulb burned out	Replace bulb
	Room lamp fuse (10A) blown	Check for short and replace fuse
	Trunk room lamp switch faulty	Check switch
	Wiring or ground faulty	Repair if necessary

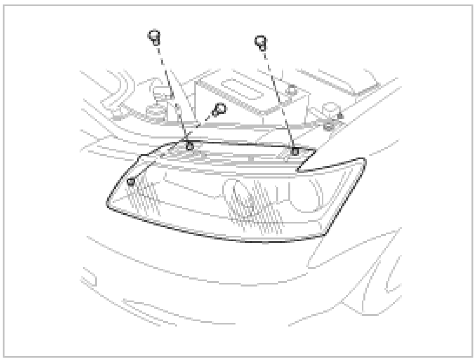
Body Electrical System > Lighting System > Head Lamps > Repair procedures

REPLACEMENT

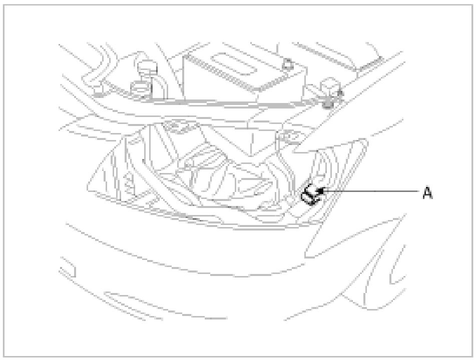
1. Disconnect the negative (-) battery terminal.
2. Loose the mounting bolts (3EA) of head lamp.



3. Remove the head lamp assembly after disconnecting the lamp connectors.

NOTE

Take care that holding clip (A) is not to be damaged.



4. Installation is the reverse of removal.

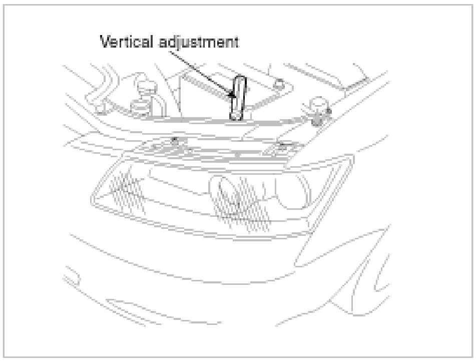
HEAD LAMP AIMING INSTRUCTIONS

The head lamps should be aimed with the proper beam-setting equipment, and in accordance with the equipment manufacturer's instructions.

> NOTE
>
> If there are any regulations pertinent to the aiming of head lamps in the area where the vehicle is to be used, adjust so as to meet those requirements.

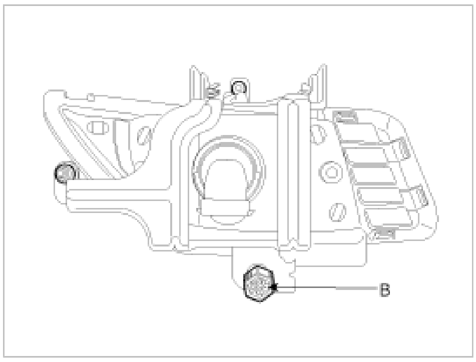
Alternately turn the adjusting gear to adjust the head lamp aiming. If beam-setting equipment is not available, proceed as follows:

1. Inflate the tires to the specified pressure and remove any loads from the vehicle except the driver, spare tire, and tools.
2. The vehicle should be placed on a flat floor.
3. Draw vertical lines (Vertical lines passing through respective head lamp centers) and a horizontal line (Horizontal line passing through center of head lamps) on the screen.
4. With the head lamp and battery in normal condition, aim the head lamps so the brightest portion falls on the horizontal and vertical lines.
   Make vertical adjustment to the lower beam using the adjusting wheel.

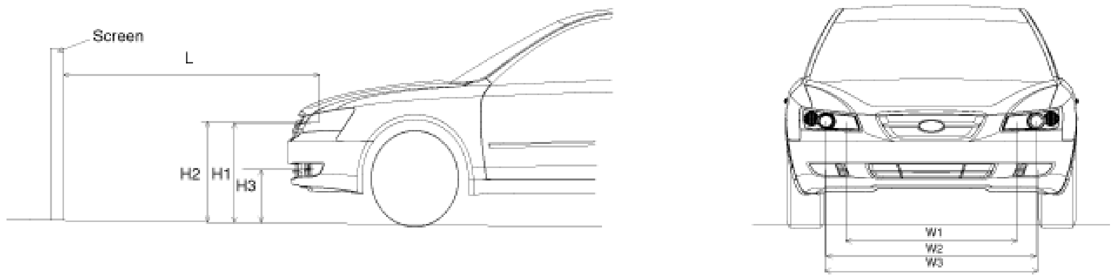


FRONT FOG LAMP AIMING

The front fog lamps should be aimed as the same manner of the head lamps aiming.
With the front fog lamps and battery normal condition, aim the front fog lamps by turning the adjusting gear.



HEAD LAMP AND FOG LAMP AIMING POINT

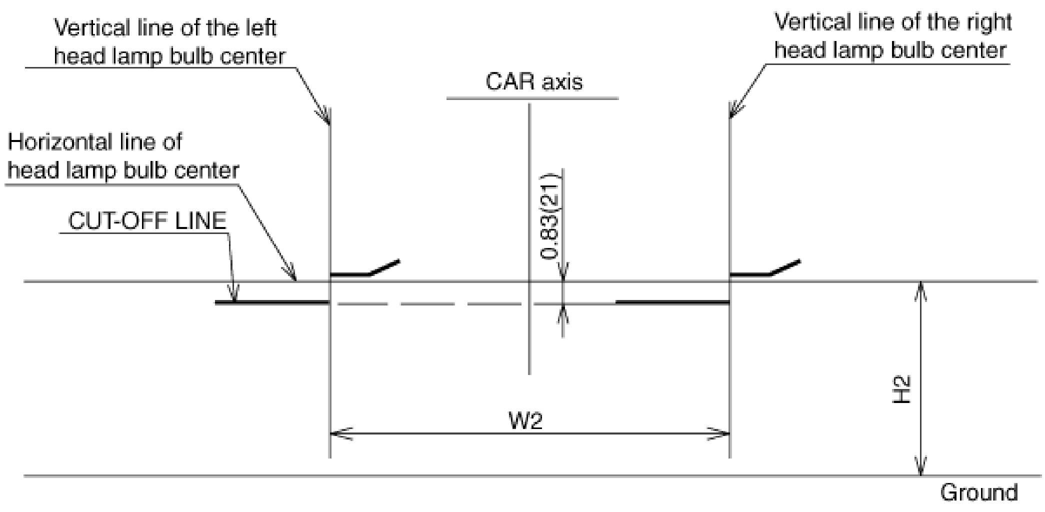


H1 : Height between the head lamp bulb center and ground (High beam)
H2 : Height between the head lamp bulb center and ground (Low beam)
H3 : Height between the fog lamp bulb center and ground
W1 : Distance between the two head lamp bulbs centers (High beam)
W2 : Distance between the two head lamp bulbs centers (Low beam)
W3 : Distance between the two fog lamp bulbs centers
L : Distance between the head lamp bulb center and screen

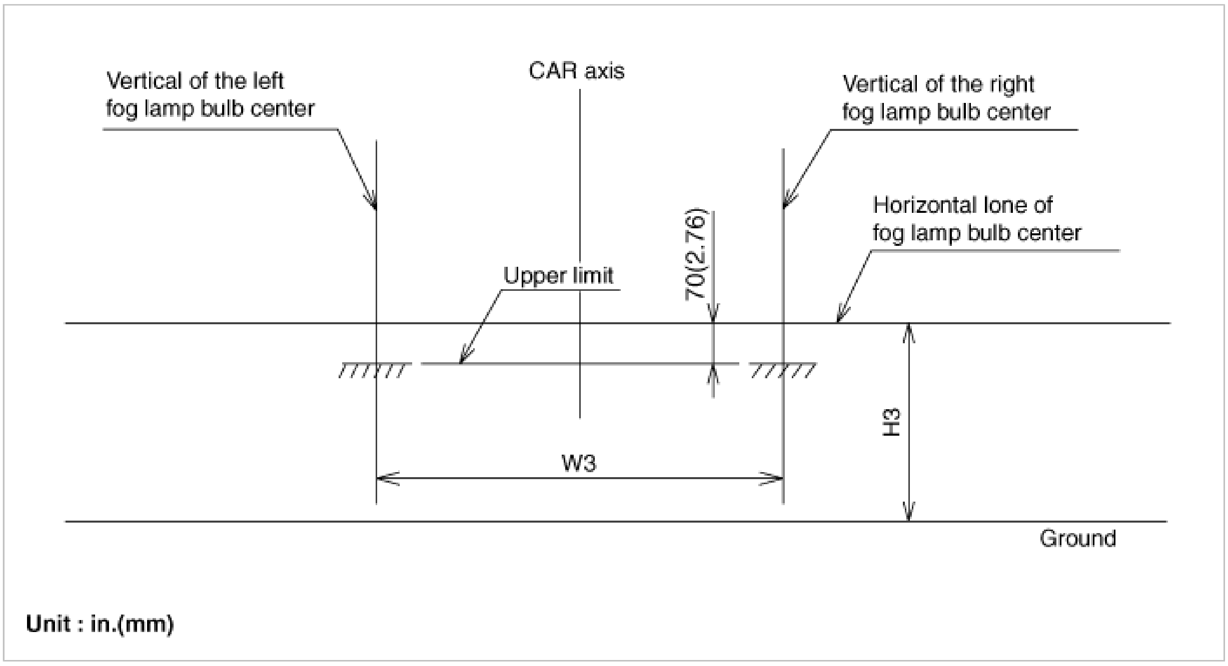
Unit : in(mm)

Vehicle condition	H1	H2	H2	W1	W2	W3	L
Without driver	26.7(679)	27.0(686)	14.3(362)	42.0(1,066)	51.4(1,306)	52.1(1,324)	118.1(3,000)
With driver	26.5(672)	26.7(679)	14.0(355)				

1. Turn the low beam on without driver aboard.
   The cut-off line should be projected in the allowable range (shaded region).

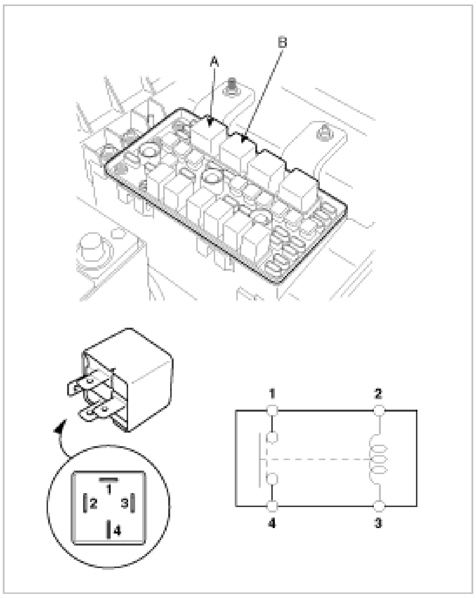


2. Turn the front fog lamp on without the driver aboard.
   The cut-off line should be projected in the allowable range (shaded region)



HEAD LAMP RELAY INSPECTION

1. Pull out the head lamp relay (Low) (A) and head lamp relay (High) (B) from the engine compartment relay box.



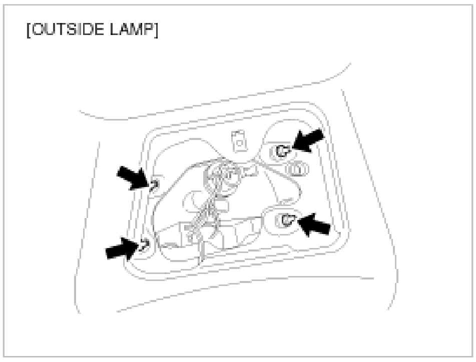
2. Check for continuity between terminals. There should be continuity between the No.1 and No.4 terminals when power and ground are connected to the No.2 and No.3 terminals.
3. There should be no continuity between the No.1 and No.4 terminals when power is disconnected.

Terminal / Power (No.2-No.3)	2	3	1	4
Disconnected	O	O		
Connected	⊖	⊕	O	O

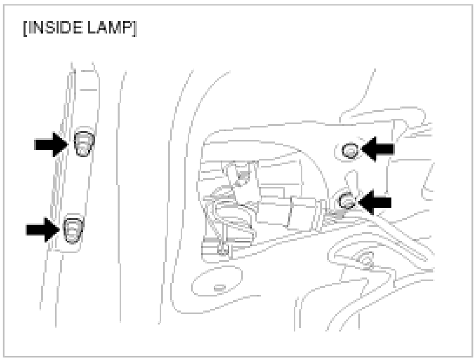
Body Electrical System > Lighting System > Turn Signal Lamp > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Loose the nuts holding the rear combination lamp then disconnect the 4P connector then remove the outside rear combination lamp.



3. Loose the nuts holding the rear combination lamp then disconnect the 4P connector then remove the inner rear combination lamp.

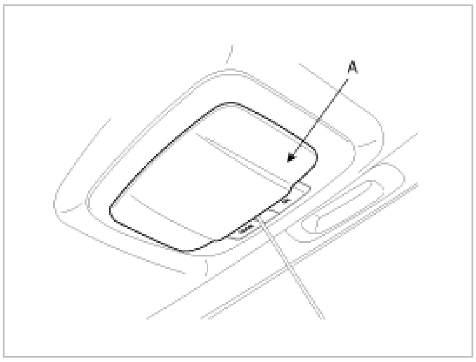


4. Installation is the reverse of removal.

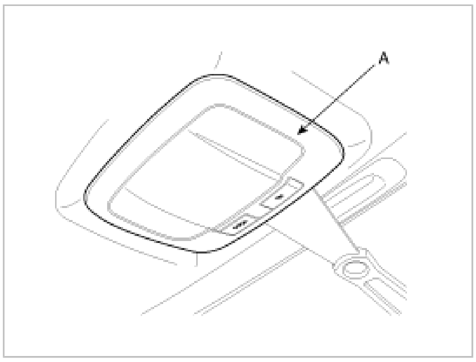
Body Electrical System > Lighting System > Room Lamp > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Detach the lamp lens (A) from the room lamp with a flat-tip screwdriver then replace the bulb (B).



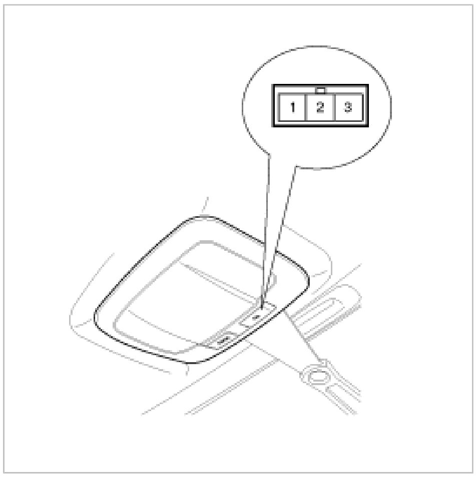
3. Remove the room lamp assembly after removing 2 screws and disconnecting the 3P connector (Standard type).
   Remove the room lamp assembly by using the scraper and then disconnect the 3P connector (Sunroof type).



4. Installation is the reverse of removal.

INSPECTION

Remove the room lamp assembly then check for continuity between terminals.

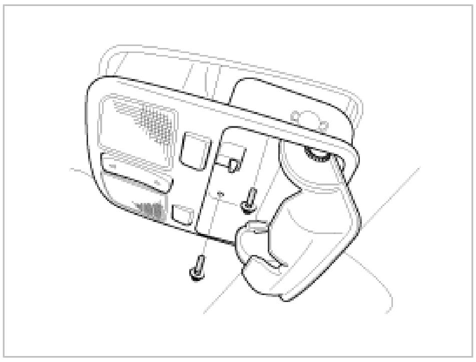


Position \ Terminal	1	2	3
ON		O	O
DOOR	O	O	
OFF			

Body Electrical System > Lighting System > Overhead Console Lamp > Repair procedures

REPLACEMENT

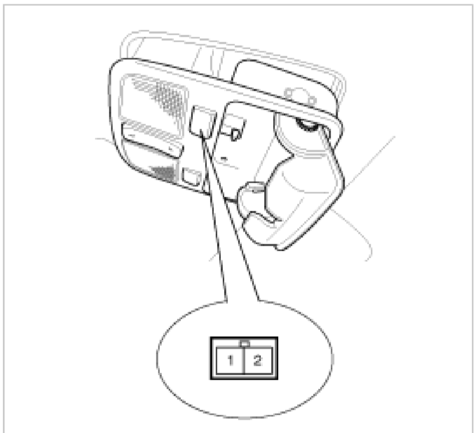
1. Disconnect the negative (-) battery terminal.
2. Open the sunglass case cover then remove the 2 screws holding the overhead console.



3. Disconnect the connector (4P) of sunroof switch and the connector (2P) of map lamp then remove the overhead console lamp assembly from the headliner.
4. Installation is the reverse of removal.

INSPECTION

Remove the overhead console lamp assembly then check for continuity between terminals. If the continuity is not as specified, replace the map lamp switch.



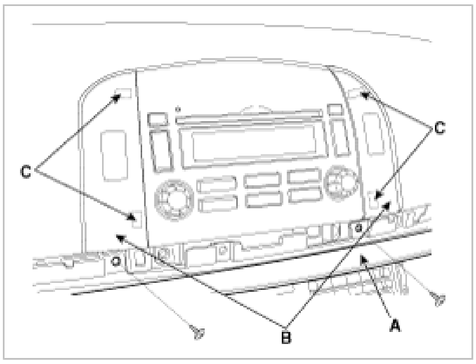
[Switch side connector]

Body Electrical System > Lighting System > Hazard Lamp Switch > Repair procedures

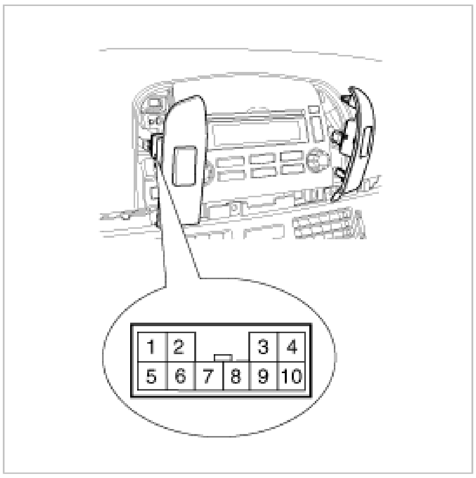
INSPECTION

HAZARD LAMP SWITCH

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad garnish (A) after pulling it by using regular screw driver (-). Take care of fixing clips(C).
3. Remove the center facia panel (B) after loosening the screws.



4. Disconnect the connectors(A).
5. Remove the hazard lamp switch from the center facia panel.



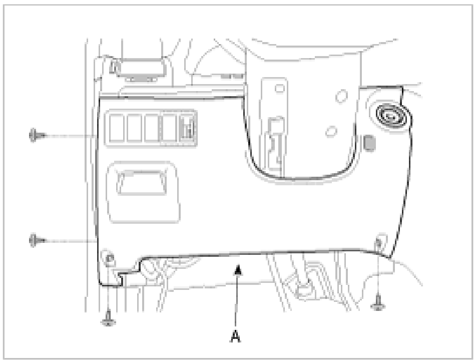
6. Operate the switch and check for continuity between terminals with an ohmmeter.

Terminal / Position	2	3	6	9	10	5	7	8
OFF	O	O				O	—	O
ON	Illumination	Illumination	O	O	O		O	O

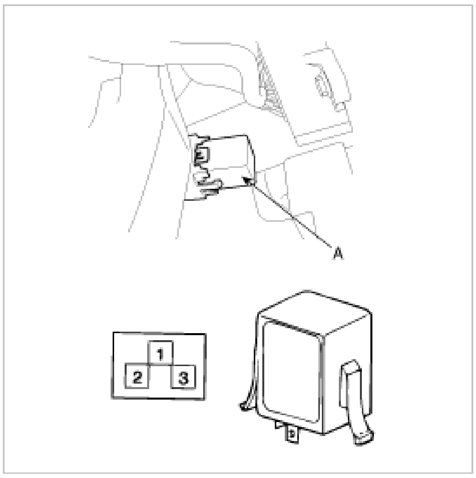
Body Electrical System > Lighting System > Flasher Unit > Repair procedures

INSPECTION

1. Disconnect the negative (-) battery terminal.
2. Disconnect the hood release cable from the hood release handle.
3. Remove the crash pad side cover (A).



4. Remove the flasher unit (A) after loosening the nut and disconnecting the connector.



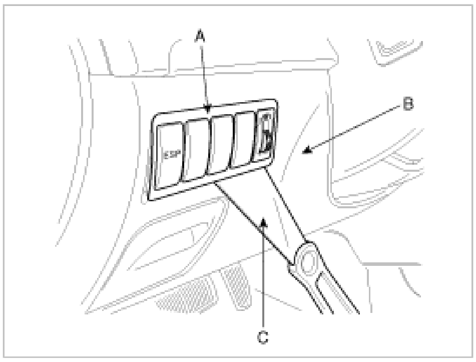
5. Connect the positive (+) lead from the battery to terminal 2 and the negative (-) lead to terminal 3.
6. Connect the two turn signal lamps in parallel to terminals 1 and 3. Check that the bulbs turn on and off.

> **NOTE**
>
> The turn signal lamps should flash 60 to 120 times per minute. If one of the front or rear turn signal lamps has an open circuit, the number of flashes will be more than 120 per minute. If operation is not as specified, replace the flasher unit.

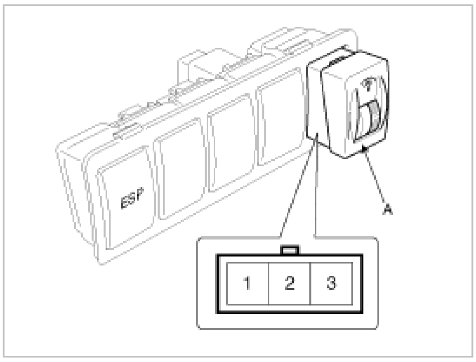
Body Electrical System > Lighting System > Rheostat > Repair procedures

INSPECTION

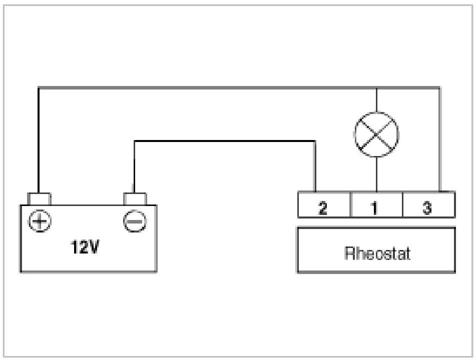
1. Disconnect the negative (-) battery terminal.
2. Remove the lower crash pad switch (A) from the side crash pad cover (B) by using the scraper (C) and then disconnect the connectors.



3. Remove the rheostat (A) from lower crash pad switch.



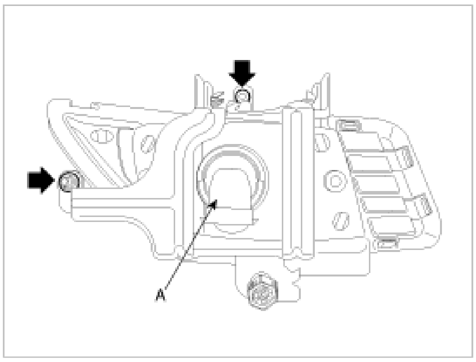
4. Check for intensity. If the light intensity of the lamps changes smoothly without any flickering when the rheostat is turned, it can be assumed that the rheostat is normal.



Body Electrical System > Lighting System > Front Fog Lamps > Repair procedures

REPLACEMENT

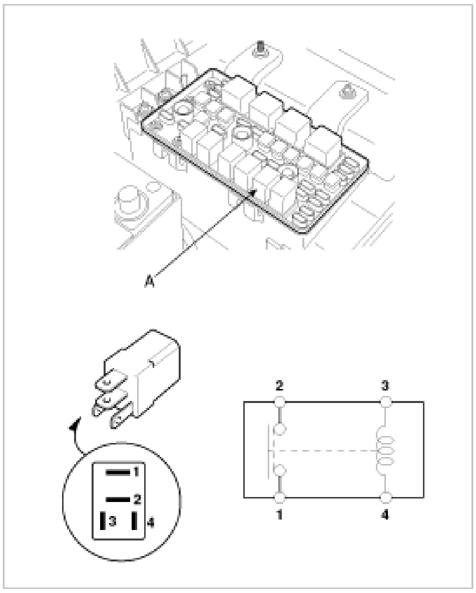
1. Disconnect the negative (-) battery terminal.
2. Remove the front bumper. (Refer to the BD group - front bumper).
3. Remove the front fog lamp (A) after loosening the screws and disconnecting the fog lamp connector.



4. Installation is the reverse of removal.

FRONT FOG LAMP RELAY INSPECTION

1. Pull out the front fog lamp (A) relay from the engine compartment relay box.
2. Check for continuity between terminals. There should be continuity between the No.1 and No.2 terminals when power and ground are connected to the No.3 and No.4 terminals.
3. There should be no continuity between the No.1 and No.2 terminals when power is disconnected.

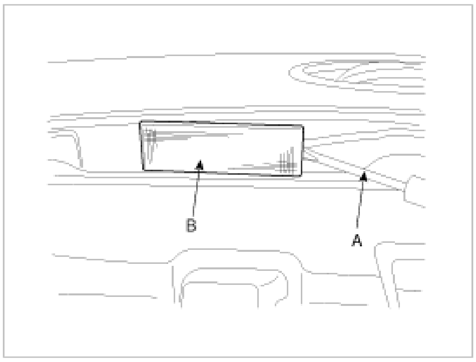


Terminal / Power (No.3-No.4)	1	2	3	4
Disconnected			○	○
Connected	○	○	⊖	⊕

Body Electrical System > Lighting System > License Lamps > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Detach the lamp lens (A) from the room lamp with a flat-tip screwdriver (B).



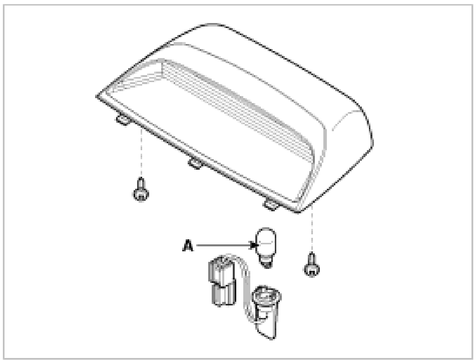
3. Replace the bulb.
4. Installation is the reverse of removal.

Body Electrical System > Lighting System > High Mounted stop lamp > Repair procedures

REPLACEMENT

HIGH MOUNTED STOP LAMP

1. Disconnect the negative(-) battery terminal.
2. Open the trunk lid and then disconnect the connector of high mounted stop lamp.
3. Remove the package tray (Refer to the Body group-package tray).
4. Replace the bulb(A) from the package tray.

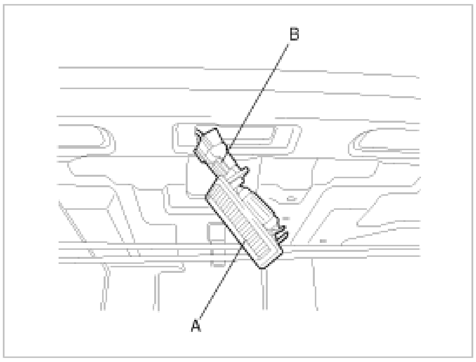


5. Installation is the reverse of removal.

Body Electrical System > Lighting System > Trunk Lamps > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Open the trunk lid, then remove the trunk room lamp (A) with a flat-tip screwdriver and disconnect the 2P connector (B).



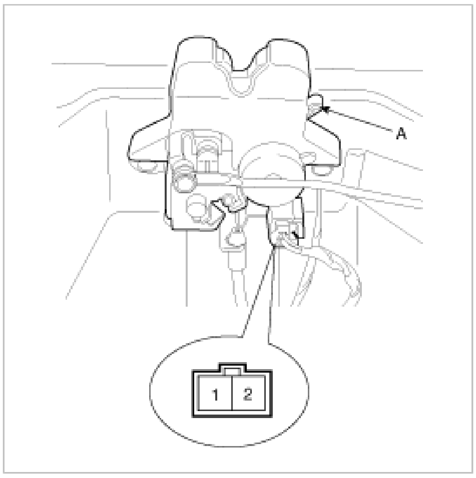
3. Replace the bulb.
4. Installation is the reverse of removal.

INSPECTION

TRUNK ROOM LAMP SWITCH

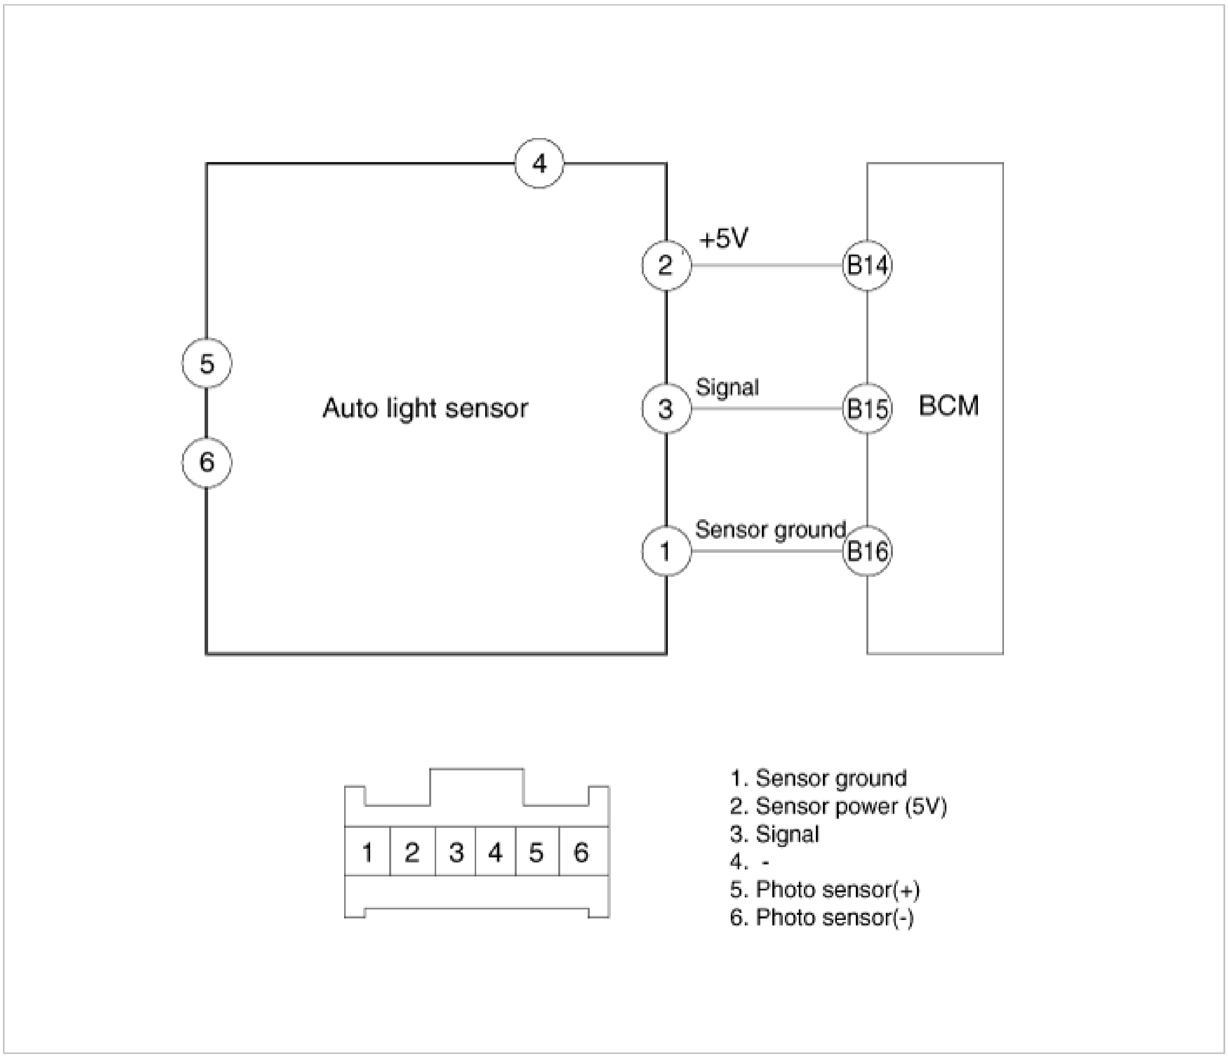
1. Disconnect the negative (-) battery terminal.
2. Remove the trunk lid trim panel. (Refer to the Body group - trunk lid)
3. Disconnect the 2P connector from the actuator.
4. Check for continuity between the terminal No. 1 and body while pushing the rod (A).

Switch rod condition	Continuity
Pushed (OFF)	Non-conductive (∞Ω)
Released (ON)	Conductive (0Ω)



Body Electrical System > Auto Lighting Control System > Schematic Diagrams

CIRCUIT DIAGRAM



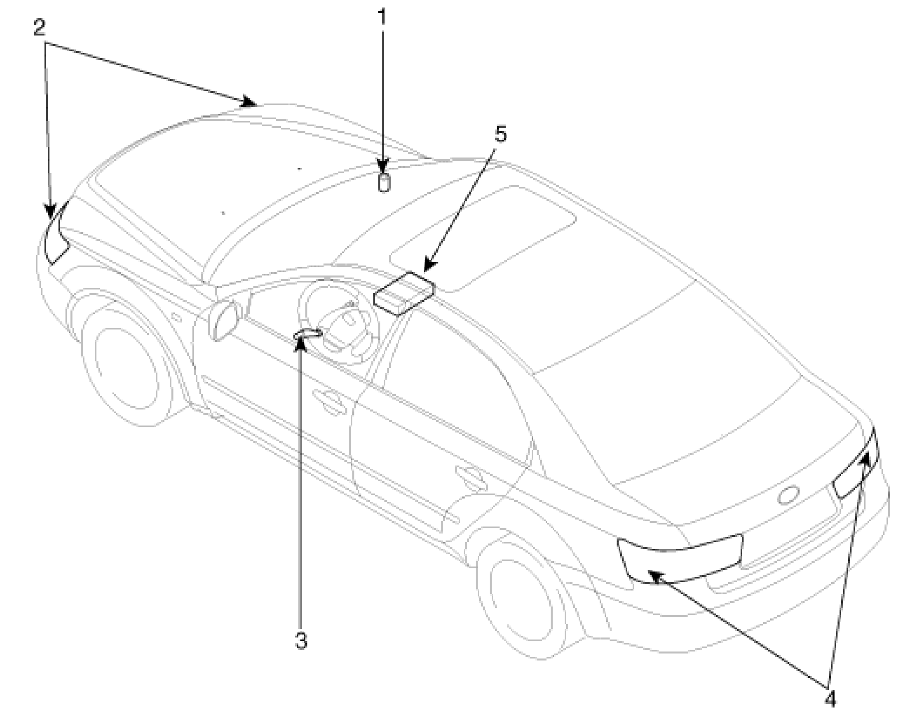
Body Electrical System > Auto Lighting Control System > Description and Operation

DESCRIPTION

The auto light control system operates by using the auto light switch.
If you set the multi-function switch to "AUTO" position, the tail lamp and head lamp will be turned automatically on or off according to external illumination.

Body Electrical System > Auto Lighting Control System > Components and Components Location

COMPONENT LOCATION



1. Auto light sensor	4. Tail lamps
2. Head lamps	5. Body control module
3. Lighting switch (Auto)	

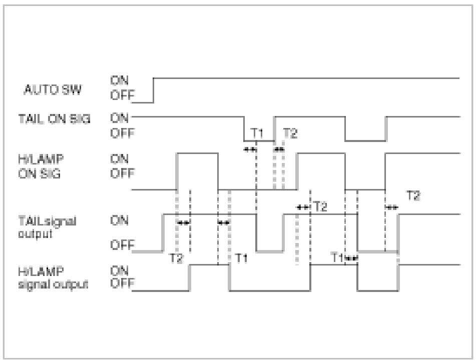
Body Electrical System > Auto Lighting Control System > Repair procedures

INSPECTION

1. While operating the auto light switch, check if the operations are normal as shown in the timing chart.
2. If operations are abnormal, check the body control module.
   (1) Auto light sensor value is always read at IGN ON.
   (2) Light is turned ON after 2sec±0.2sec when auto light sensor value is same as light ON input value.
   (3) Light is turned OFF after 2sec±0.2sec when sensor value is same as light OFF input value.
   (4) Tail lamp and head lamp are turned ON when sensor value is same as tail lamp ON input value.
   (5) Light ON value of sensor is based on the below table.
   (6) Head lamp signal is output when head lamp switch is ON.
   (7) After head lamp is turned OFF, head lamp signal output is kept if head lamp ON luminance condition is met at auto light switch ON.
   (8) After head lamp is turned OFF, head lamp signal output is immediately stopped if head lamp OFF luminance condition is met at auto light switch ON.
   (9) After head lamp is turned OFF, head lamp signal output is immediately stopped at tail switch signal input.
   (10) After head lamp is turned OFF, head lamp signal output is stopped after 0.7s if there is no input of auto light switch or tail switch. (Shall be no flashing of head lamp)
   (11) Head lamp signal output is stopped when switch position is changed from AUTO to head lamp switch during head lamp ON with auto light. (Shall be no flashing of head lamp)

(12) The condition of head lamp ON/OFF is same as the one of tail lamp ON/OFF at auto light switch ON. Light ON value of the input sensor is based on the table.

	TAIL LAMP	HEAD LAMP
ON	0.81V±0.08V	Same as tail sensor value
OFF	1.41V±0.10V	Same as tail sensor value



T1/T2 : 2.0 ± 0.2sec.

Body Electrical System > Auto Lighting Control System > Specifications

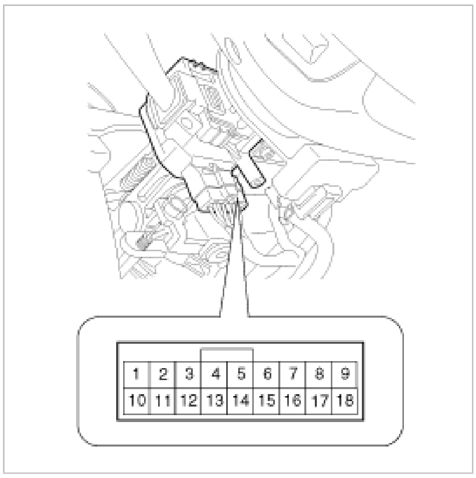
SPECIFICATIONS

Items	Specifications
Rated voltage	12V
Load	Max. 1mA
Detection illuminations Tail lamp / Head lamp	ON : 24 ± 5.2 (Lux), 0.81 ±0.08 (V) OFF : 48 ± 10.5 (Lux), 1.41 ±0.10 (V)

Body Electrical System > Auto Lighting Control System > Auto Light Switch > Repair procedures

INSPECTION

Operate the auto light switch, then check for continuity between terminals of 18P multi-function switch connector.

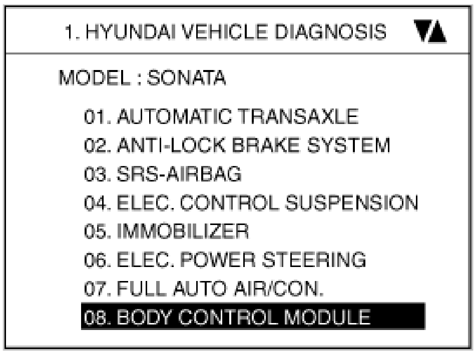


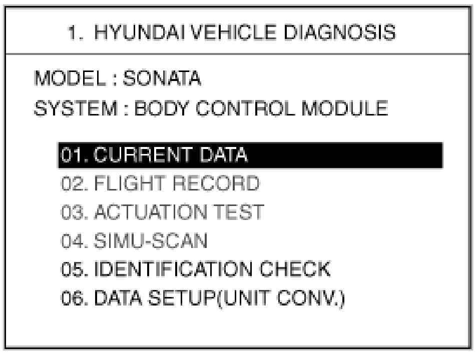
Terminal / Position	14	15	16	17
OFF				
I	O			O
II	O	O		O
AUTO			O	O

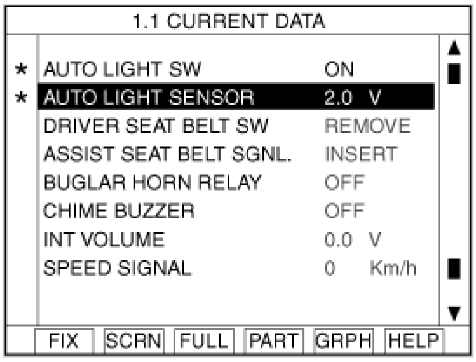
Body Electrical System > Auto Lighting Control System > Auto Light Sensor > Repair procedures

INSPECTION

1. Ignition "ON"
2. Using the scan tool.
3. Emit intensive light toward auto light sensor using sunshine, and check the output voltage change.
4. The voltage will rise with higher intensive light and reduce with lower intensive light.

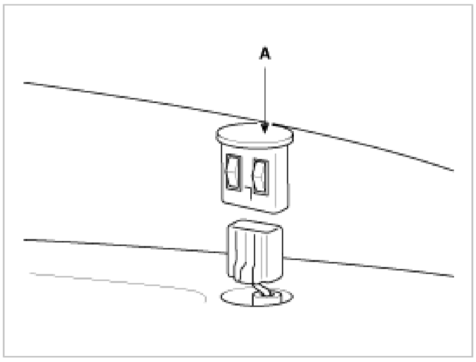






> **NOTE**
>
> When checking auto light sensor, select a place where sun shines directly on it.

5. If the measured resistance is not specification, substitute with a known-good auto light sensor and check for proper operation.
6. If the problem is corrected, replace the auto light sensor.
7. Remove the photo & auto light sensor (A) from the upper crash pad.



8. Disconnect the 6P connector from the auto light sensor then inspect the connector on the wire harness side, as shown in the chart.

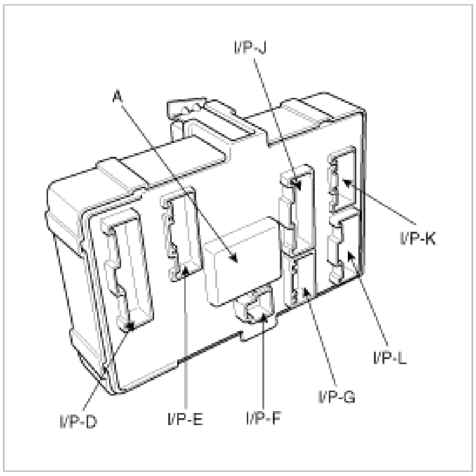
Tester connection	Condition	Specified condition
1-Ground	Auto light switch ON	Continuity
2-Ground	Sensor power	5V

9. If the circuit is not as specified, inspect the circuits connected to other parts.

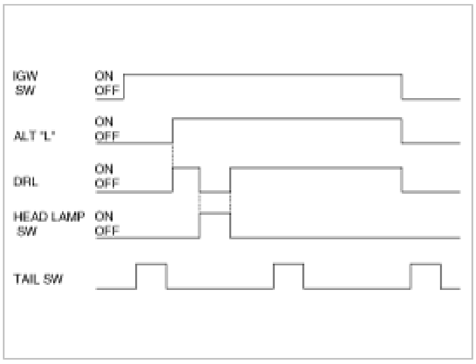
Body Electrical System > Daytime Running Lights > DRL Control Module > Repair procedures

INSPECTION

1. The daytime running light unit (A) is integrated in the junction box.



2. Check that the light operate according to the following timing chart.

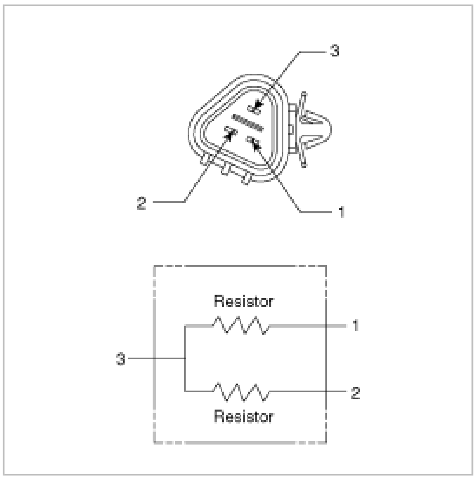


3. If the daytime running light is not operated well, inspect the connector and terminals to be sure they are all making good contact.
If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
If the terminals look OK, go to step 4.
4. Make these input tests at the connector
If any test indicates a problem, find and by using ETM correct the cause, then recheck the system.
If all the input tests prove OK, the junction box must be faulty; replace it.

INSPECTION

1. Check for continuity and measure the resistance between No.1 and NO.3 terminals.

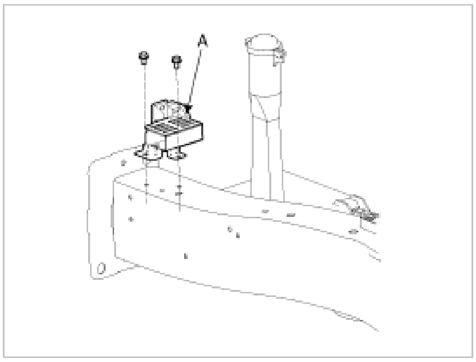
Standard value : 2.5Ω ± 5%



2. If resistance is not as specified, replace the DRL resistor.

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the right head lamp assembly (Refer to the head lamp).
3. Disconnect the connector and then remove the DRL resistor (A) under the right head lamp after loosening the bolts (2EA).



4. Installation is the reverse of removal procedure.

Body Electrical System > Immobilizer System > Description and Operation

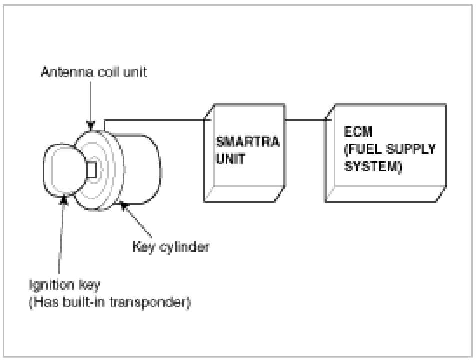
DESCRIPTION

The immobilizer system will disable the vehicle unless the proper ignition key is used, in addition to the currently available anti-theft systems such as car alarms, the immobilizer system aims to drastically reduce the rate of auto theft.

1. SMARTRA type immobilizer
   A. The SMARTRA system consists of a transponder located in the ignition key, an antenna coil, a SMARTRA unit, an indicator light and the ECM.
   B. The SMARTRA communicates to the ECM (Engine Control Module) via a dedicated communications line. Since the vehicle engine management system is able to control engine mobilization, it is the most suitable unit to control the SMARTRA.
   C. When the key is inserted in the ignition and turned to the ON position, the antenna coil sends power to the transponder in the ignition key. The transponder then sends a coded signal back through the SMARTRA unit to the ECM.
   D. If the proper key has been used, the ECM will energize the fuel supply system. The immobilizer indicator light in the cluster will simultaneously come on for more than five seconds, indicating that the SMARTRA unit has recognized the code sent by

the transponder.

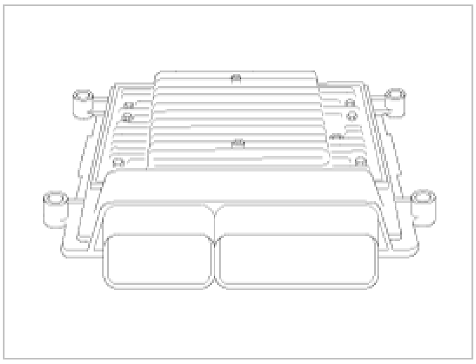
E. If the wrong key has been used and the code was not received or recognized by the ECM the indicator light will continue blinking for about five seconds until the ignition switch is turned OFF.
F. If it is necessary to rewrite the ECM to learn a new key, the dealer needs the customer's vehicle, all its keys and the Hi-scan (pro) equipped with an immobilizer program card. Any key that is not learned during rewriting will no longer start the engine.
G. The immobilizer system can store up to four key codes.
H. If the customer has lost his key, and cannot start the engine, contact HMC motor service station.



COMPONENTS OPERATIONS

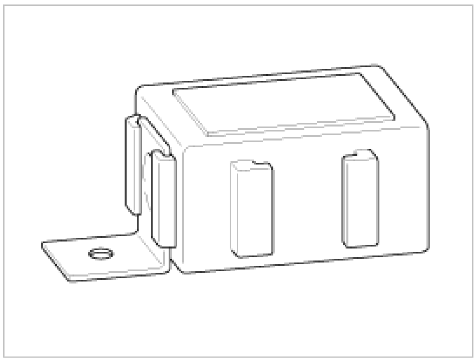
ECM (Engine Control Module)

1. The ECM carries out a check of the ignition key using a special encryption algorithm, which is programmed into the transponder as well as the ECM simultaneously. Only if the results are equal, the engine can be started. The data of all transponders, which are valid for the vehicle, are stored in the ECM.



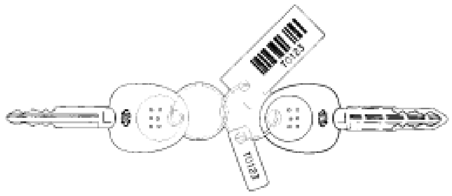
SMARTRA unit

The SMARTRA carries out communication with the built-in transponder in the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted behind of the crush pad under panel close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder, received by the antenna coil, is converted into messages for serial communication by the SMARTRA device. And, the received messages from the ECM are converted into an RF signal, which is transmitted to the transponder by the antenna.
The SMARTRA does not carry out the validity check of the transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to the ECM and vice versa.



TRANSPONDER (Built-in keys)

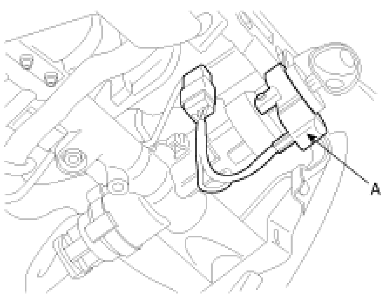
The transponder has an advanced encryption algorithm. During the key teaching procedure, the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is once only; therefore, the contents of the transponder can never be modified or changed.



Antenna coil

The antenna coil (A) has the following functions.

- The antenna coil supplies energy to the transponder.
- The antenna coil receives signal from the transponder.
- The antenna coil sends transponder signal to the SMARTRA.
  It is located directly in front of the steering handle lock.



Body Electrical System > Immobilizer System > Troubleshooting

DIAGNOSIS OF IMMOBILIZER FAULTS

- Communication between the ECM and the SMARTRA.
- Function of the SMARTRA and the transponder.
- Data (stored in the ECM related to the immobilizer function.

The following table shows the assignment of immobilizer related faults to each type:

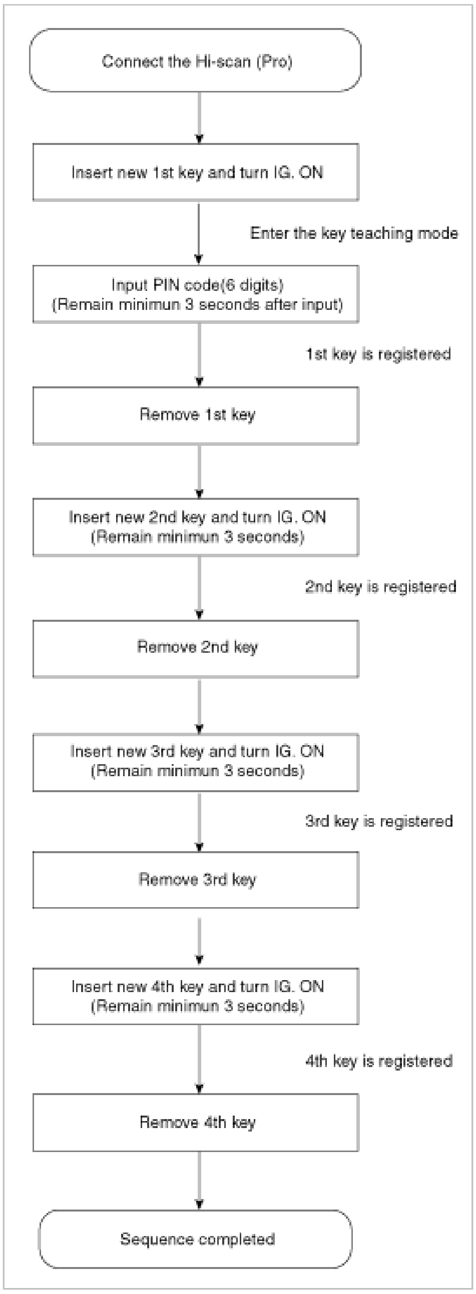
Immobilizer Related Faults	Fault types	Diagnostic codes
Transponder key fault	1. Transponder not in password mode. 2. Transponder transport data has been changed.	P1674 (Transponder status error)
Transponder key fault	1. Transponder programining error	P1675 (Transponder programming error)
SMARTRA fault	1. Invalid message from SMARTRA to ECM.	P1676 (SMARTRA message error)
SMARTRA fault	1. No response from SMARTRA (Communication Line Error - Open or Short etc.)	P1690 (SMARTRA no response)
Antenna coil fault	1. Antenna coil open/short circuit	P1691 (Antenna coil error)
Transponder key fault	1. Corrupted data from transponder 2. More than one transponder in the magnetic field (Antenna coil) 3. No transponder (Key without transponder) in the magnetic field (Antenna coil)	P1693 (Transponder no response error/invalid response)

ECM fault	1. Request from ECM is invalid (Protocol layer violation- Invalid request, check sum error etc.)	P1694 (ECM message error)
ECM internal permanent memory (EEPROM) fault	1. ECM internal permanent memory (EEPROM) fault 2. Invalid write operation to permanent memory (EEPROM)	P1695 (ECM memory error)
Invalid key fault	1. Virgin transponder at ECM status "Learnt" 2. Learnt (Invalid) Transponder at ECM status "Learnt"(Authentication fail)	P1696 (Authentication fail)
Locked by timer	1. Exceeding the maximum limit of Twice IGN ON (⊇ 32 times)	P1699 (Twice IG ON over trial)

Body Electrical System > Immobilizer System > Repair procedures

TEACHING PROCEDURES

1. Key Teaching Procedure
   Key teaching must be done after replacing a defective ECM or when providing additional keys to the vehicle owner.
   The procedure starts with an ECM request for vehicle specific data (PIN code: 6digits) from the tester. The "virgin" ECM stores the vehicle specific data and the key teaching can be started. The "learnt" ECM compares the vehicle specific data from the tester with the stored data. If the data are correct, the teaching can proceed.
   If incorrect vehicle specific data have been sent to the ECM three times, the ECM will reject the request of key teaching for one hour. This time cannot be reduced by disconnecting the battery or any other manipulation. After reconnecting the battery, the timer starts again for one hour.
   The key teaching is done by ignition on with the key and additional tester commands. The ECM stores the relevant data in the EEPROM and in the transponder. Then the ECM runs the authentication required for confirmation of the teaching process. The successful programming is then confirmed by a message to the tester.
   If the key is already known to the ECM from a previous teaching, the authentication will be accepted and the EEPROM data are updated. There is no changed transponder content (this is impossible for a learnt transponder).
   The attempt to repeatedly teach a key, which has been taught already during the same teaching cycle, is recognized by the ECM. This rejects the key and a message is sent to the tester.
   The ECM rejects invalid keys, which are presented for teaching. A message is sent to the tester. The key can be invalid due to faults in the transponder or other reasons, which result from unsuccessful programming of data. If the ECM detects different authenticators of a transponder and an ECM, the key is considered to be invalid.
   The maximum number of taught keys is 4
   If an error occurs during the Immobilizer Service Menu, the ECM status remains unchanged and a specific fault code is stored.
   If the ECM status and the key status do not match for teaching of keys, the tester procedure will be stopped and a specific fault code will be stored at ECM.



(1) ECM learnt status.

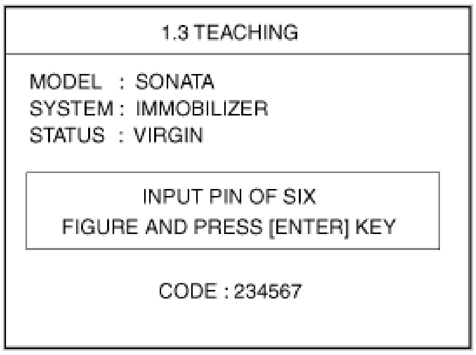
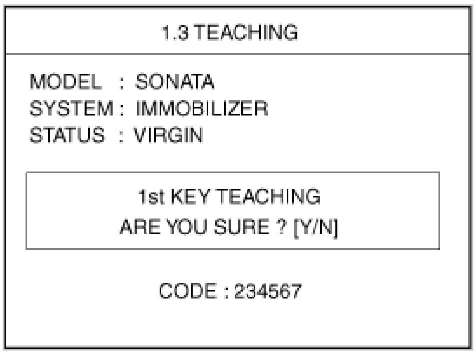
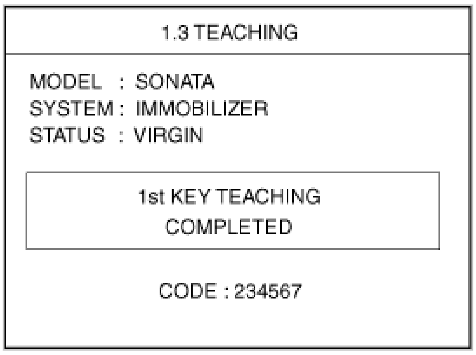
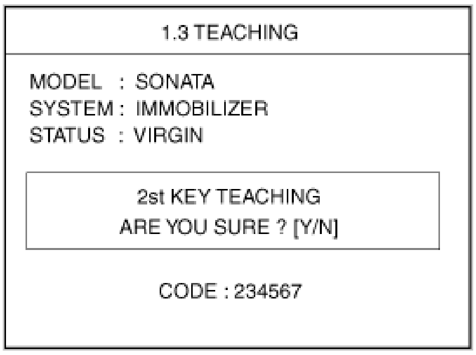
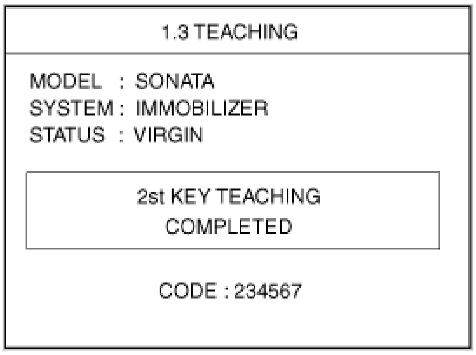
(2) ECM virgin status.
After replacing new "ECM" scantool displays that ECM is virgin status in Key Teaching mode.
"VIRGIN" status means that ECM has not matched any PIN code before.











2. User Password Teaching Procedure
   The user password for limp home is taught at the service station. The owner of the vehicle can select a number with four digits. User password teaching is only accepted by a "learnt" ECM. Before first teaching of user password to an ECM, the status of the password is "virgin" No limp home function is possible.
   The teaching is started by ignition on, with a valid key and sending the user password by tester. After successful teaching, the status of the user password changes from "virgin" to "learnt"
   The learnt user password can also be changed. This can be done if the user password status is "learnt" and the tester sends authorization of access, either the old user password or the vehicle specific data. After correct authorization, the ECM requests the new user password. The status remains "learnt" and the new user password will be valid for the next limp home mode.
   If incorrect user passwords or wrong vehicle specific data have been sent to the ECM three times, the ECM will reject the request to change the password for one hour. This time cannot be reduced by disconnecting the battery or any other actions. After reconnecting the battery, the timer starts again for one hour.

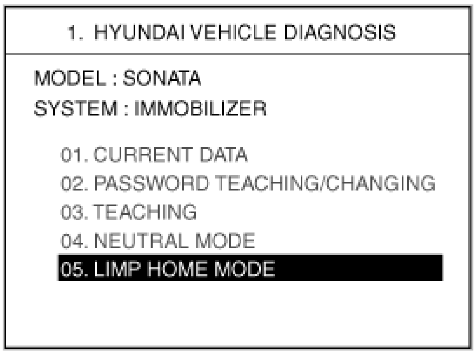
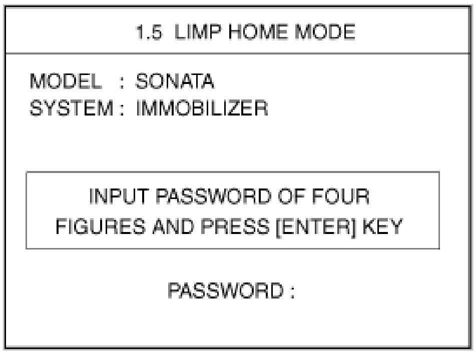
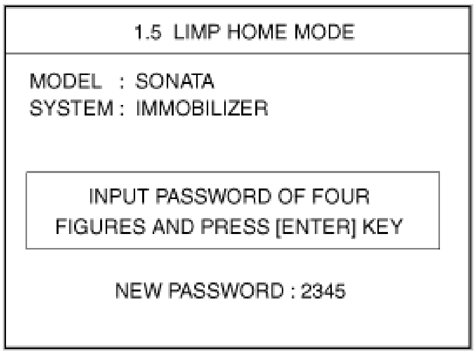
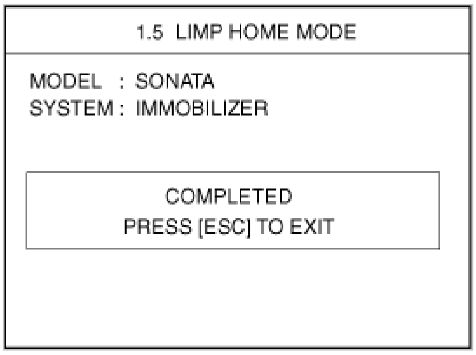
LIMP HOME FUNCTION

1. LIMP HOME BY TESTER
   If the ECM detects the fault of the SMARTRA or transponder, the ECM will allow limp home function of the immobilizer. Limp home is only possible if the user password (4 digits) has been given to the ECM before. This password can be selected by the vehicle owner and is programmed at the service station.
   The user password can be sent to the ECM via the special tester menu.
   Only if the ECM is in status "learnt" and the user password status is "learnt" and the user password is correct, the ECM will be unlocked for a period of time (30 sec.). The engine can only be started during this time. After the time has elapsed, engine start is not possible.
   If the wrong user password is sent, the ECM will reject the request of limp home for one hour. Disconnecting the battery or any other action cannot reduce this time. After connecting the battery to the ECM, the timer starts again for one hour.

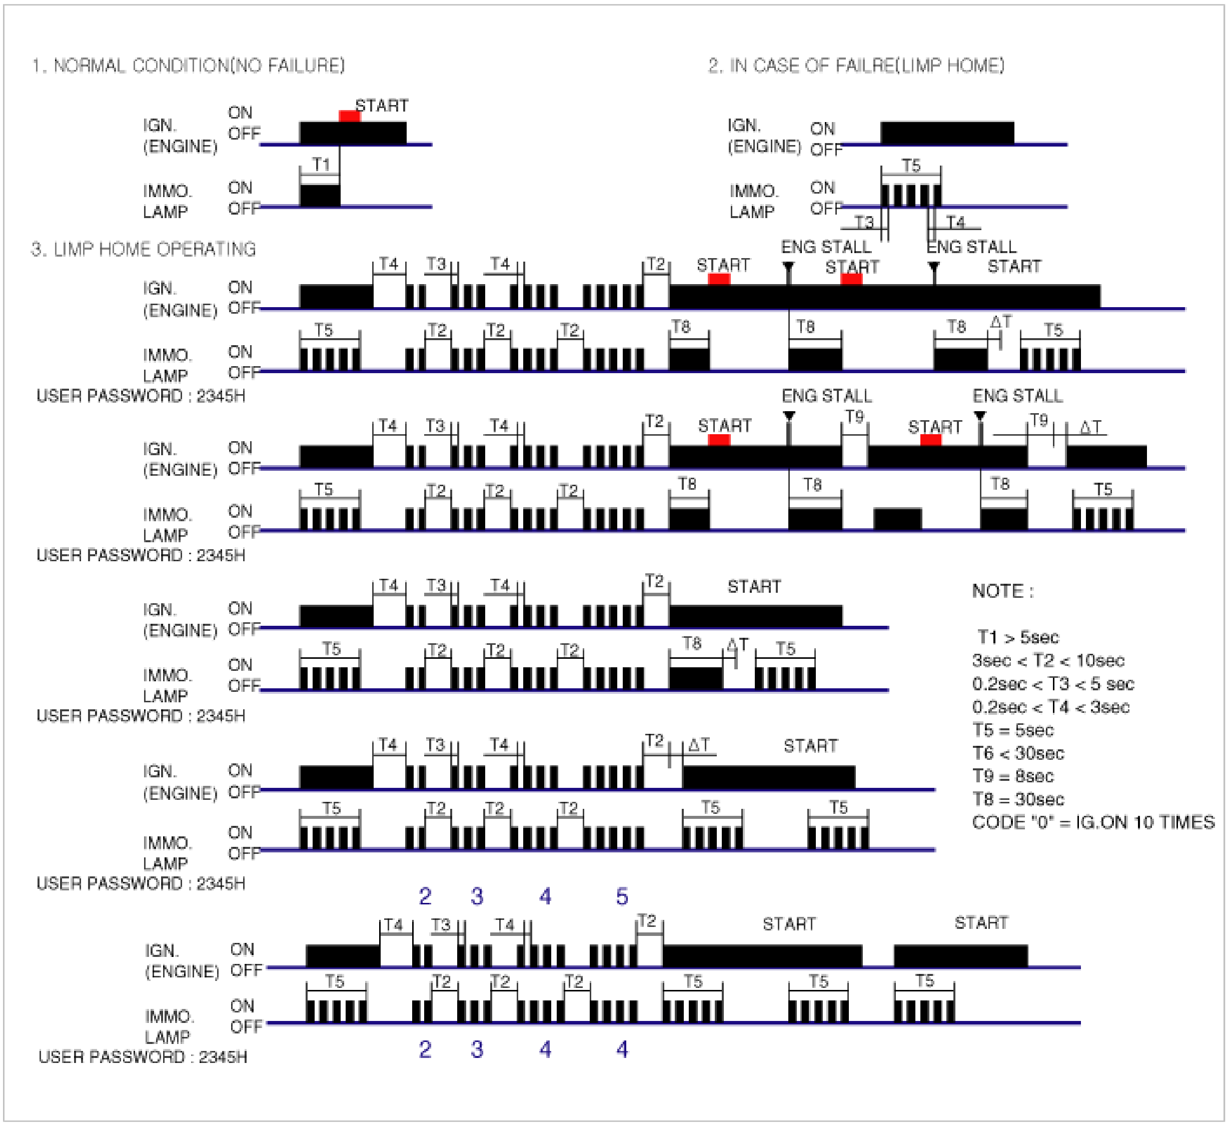








2. LIMP HOME BY IGNITION KEY
   The limp home can be activated also by the ignition key. The user password can be input to the ECM by a special sequence of ignition on/off.
   Only if the ECM is in status "learnt" and the user password status is "learnt" and the user password is correct, the ECM will be unlocked for a period of time (30 sec.). The engine can be started during this time. After the time has elapsed, engine start is not possible. After a new password has been input, the timer (30 sec.) will start again.
   After ignition off, the ECM is locked if the timer has elapsed 8 seconds. For the next start, the input of the user password is requested again.



PROBLEMS AND REPLACEMENT PARTS:

Problem	Part set	Scan tool required?
All keys have been lost	Blank key (4)	YES
Antenna coil unit does not work	Antenna coil unit	NO
ECM does not work	ECM	YES
Ignition switch does not work	Ignition switch with Antenna coil unit	YES
Unidentified vehicle specific data occurs	Key, ECM	YES
SMARTRA unit does not work	SMARTRA unit	NO

REPLACEMENT OF ECM AND SMARTRA

In case of a defective ECM, the unit has to be replaced with a "virgin" or "neutral" ECM. All keys have to be taught to the new ECM. Keys, which are not taught to the ECM, are invalid for the new ECM (Refer to key teaching procedure). The vehicle specific data have to be left unchanged due to the unique programming of transponder.

In case of a defective SMARTRA, there is no special procedure required. A new SMARTRA device simply replaces the old one. There are no transponder-related data stored in this device.

1. Things to remember before a replacement (ECM)

When installing ECM of car "A" on car "B"
※ All non-virgin ECM's need to be neutralized before installing on the other vehicles.

↓

Neutralize the ECM of car "A"

↓

Installing the ECM of car "A" on car "B"

↓

Register the keys with the PIN code of car "B"

↓

Register additional keys (Maximum of keys)
※ All phases of key registration should be completed in under 10 seconds

↓

Registration completed

2. Things to remember before a replacement (Keys & Additional registration)

Replace keys & additional registration
※ You must know the PIN code before executing this procedure

↓

Turn the key to the IG ON position

↓

Initialize the ECM (Under the Neutral Mode)

↓

Insert the key you want to register and turn it to the IG ON position

↓

Register the key (Under the Teaching Mode)

↓

Register additional keys (Maximum of 4 keys)
※ All phases of key registration should be completed in under 10 seconds

↓

Registration completed

NOTE

1. When there is only one key registered and you wish to register another key, you need to re-register the key which was already registered.
2. When the key #1 is registered and key #2 is not registered, Put the key #1 in the IG/ON or the start position and remove it. The engine can be started with the unregistered key #2.
   (Note that key #2 must be used within 10 seconds of removing key #1)
3. When the key #1 is registered and key #2 is not registered, put the unregistered master key #2 in the IG/ON or the start position.
   The engine cannot be started even with the registered key #1.
   (Note that key #1 must be used within 10 seconds of removing key #2)
4. When you inspect the immobilizer system, refer to the above paragraphs 1, 2 and 3.
   Always remember the 10 seconds zone.
5. If the pin code & password are entered incorrectly on three consecutive inputs, the system will be locked for one hour.
6. Be cautious not to overlap the transponder areas.
7. Problems can occur at key registration or vehicle starting if the transponders should overlap.

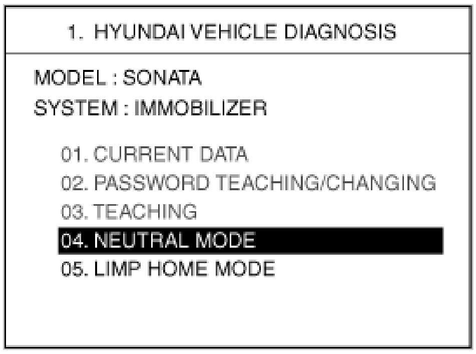
NEUTRALISING OF ECM

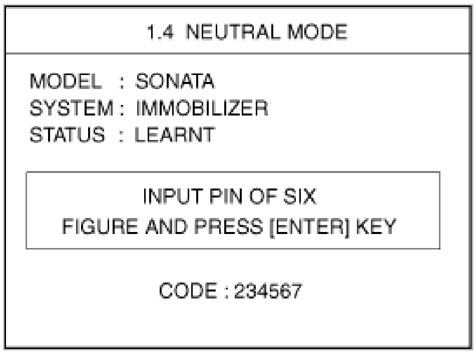
The ECM can be set to the "neutral" status by a tester.
A valid ignition key is inserted and after ignition on is recorded, the ECM requests the vehicle specific data from the tester. The communication messages are described at "Neutral Mode" After successfully receiving the data, the ECM is neutralized.
The ECM remains locked. Neither the limp home mode nor the "twice ignition on" function, is accepted by the ECM.
The teaching of keys follows the procedure described for the virgin ECM. The vehicle specific data have to be unchanged due to the unique programming of the transponder. If data should be changed, new keys with a virgin transponder are requested.
This function is for neutralizing the ECM. Ex) when lost key, Neutralize the ECM then teach keys.
(Refer to the Things to do when Key & PIN Code the ECM can be set to the "neutral" status by a scanner. A valid ignition key is inserted and after ignition on is recorded, the ECM requests the vehicle specific data from the scanner. The communication messages are described at" Neutral Mode". After successfully receiving the data, the ECM is neutralized.

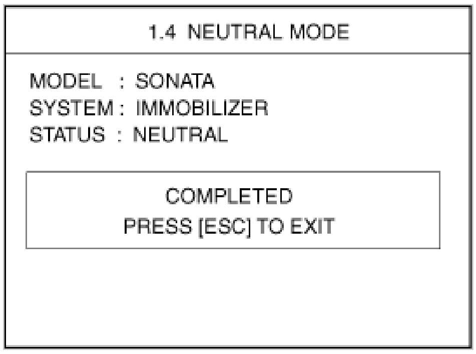
The ECM remains locked. Neither the limp home mode nor the "twice ignition on" function is accepted by ECM.
The teaching of keys follows the procedure described for virgin ECM. The vehicle specific data have to be unchanged due to the unique programming of transponder. If data should be changed, new keys with virgin transponder are requested.

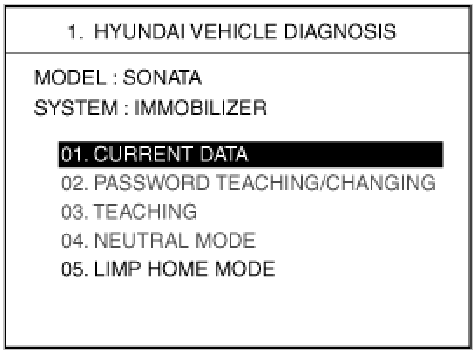
NOTE

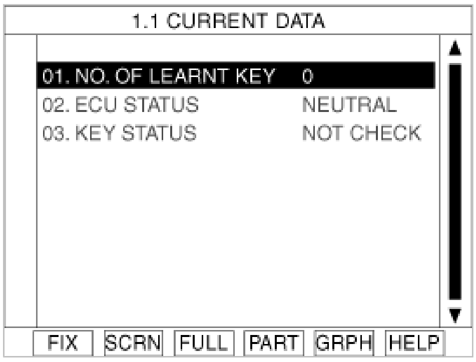
- Neutralizing setting condition
  - In case of ECM status "Learnt" regardless of user password "Virgin or Learnt"
  - Input correct PIN code by scanner.
  - Neutralizing meaning .
    : PIN code (6) & user password (4) deletion.
    : Locking of ECM (except key teaching permission)











Body Electrical System > Immobilizer System > P1674

GENERAL DESCRIPTION

During the key teaching procedure the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is unique; therefore the content of transponder can never be modified or changed. The data are a string of 9 bytes defined by vehicle manufacturer.
The transponder memory is split into two strings called authenticator and key password after this programming the transponder memory is locked and the data (PIN code) cannot be read or changed respectively. The transponder status changes from "virgin" to "learnt" Additionally every transponder includes a unique IDE (Identifier number) of 32 bit. Unique means that the IDE of all transponder is different from each other. The IDE is programmed by the transponder manufacturer and is a read-only value. The authenticator and the key password are not transferred from ECM to transponder or vice versa. Only the results from the encryption algorithm are transferred. It is almost impossible to calculate the vehicle specific data from the encryption result.
For teaching of keys and special purposes the ECM is connected to the tester device.
When IG is ON, the coil supplies energy to the transponder which in turn accumulates energy in the condenser.
Once the energy supply from the coil has stopped, using the stored energy in the condenser, the transponder transmits the ID CODE (stored within the ASIC).

DTC DESCRIPTION

This DTC is defined as TP not in password mode, or Transponder transport data has been changed.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Transponder Key
Detecting Factors	• Password mode invalid	
Detecting Window	• During Transponder Write or Read EEPROM Page	
Detecting Criteria	• TP not in password mode, or Transponder transport data has been changed	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

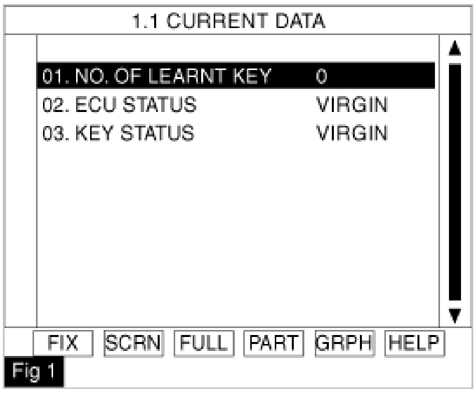


Fig 1

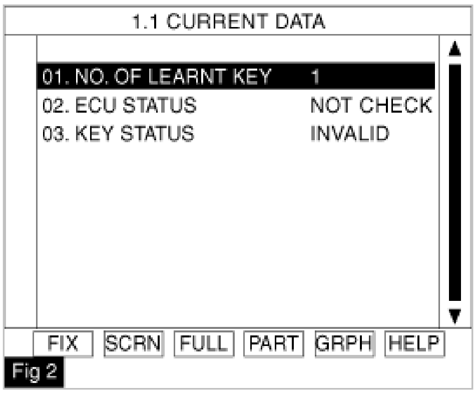

Fig 2

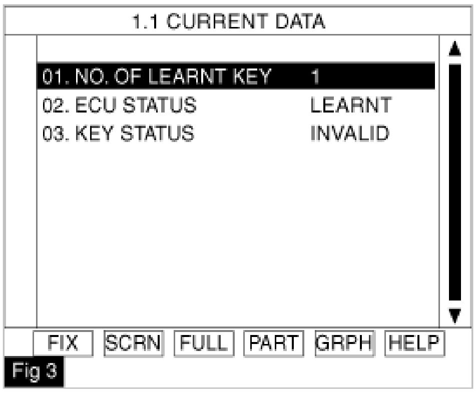

Fig 3

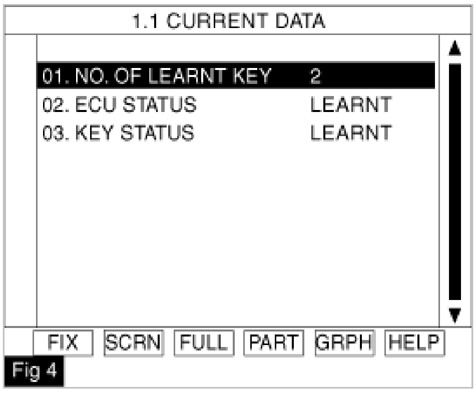

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing.
   (Refer to "Reference Data in General Information")

   NOTE

   Be sure that PIN code is prepared before performing neutral mode.

   (3) Is the neutral, teaching and password teaching/changing mode possible?

   YES

   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
   Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
   If the key status is displayed as "Virgin", replace Transponder.
   Perform key teaching mode in " Reference Data"
   Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

   YES

   Go to the applicable troubleshooting procedure.

   NO

   System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1675

   (Refer to "Reference Data in General Information")

   > NOTE
   >
   > Be sure that PIN code is prepared before performing neutral mode.

   (3) Is the neutral, teaching and password teaching/changing mode possible?

   YES

   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
   Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
   If the key status is displayed as "Virgin", replace Transponder.
   Perform key teaching mode in " Reference Data"
   Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1676

GENERAL DESCRIPTION

The SMARTRA carries out communication with the built-in transponder of the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the ECM are converted into an RF signal, which is transmitted, to the transponder by the antenna. The SMARTRA does not carry out the validity check of transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to ECM and vice versa.
SMARTRA : SMARt TRansponder Antenna

DTC DESCRIPTION

This DTC defines Invalid message from SMARTRA to ECM.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or Short in SMARTRA Circuit • Faulty SMARTRA
Detecting Criteria	• No response from SMARTRA Invalid message from SMARTRA to ECM	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

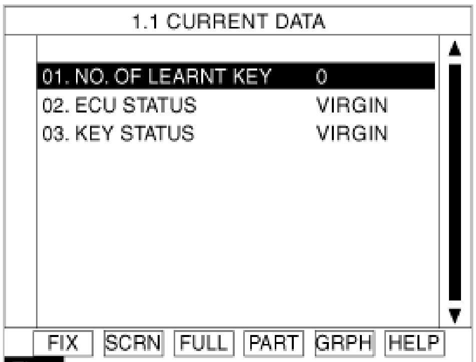

Fig 1

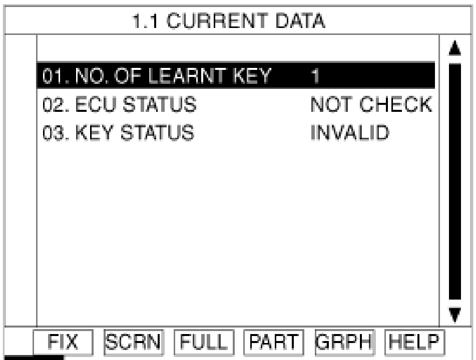

Fig 2

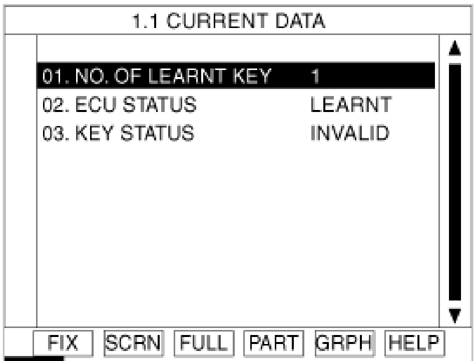

Fig 3

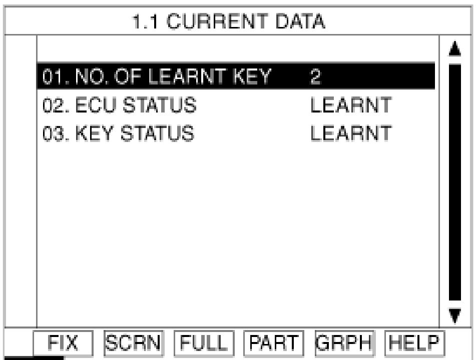

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

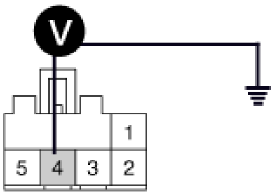
NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+



5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and SMARTRA is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

Specification : Approx. 10.2V

   (5) Is the measured voltage within specifications?

YES

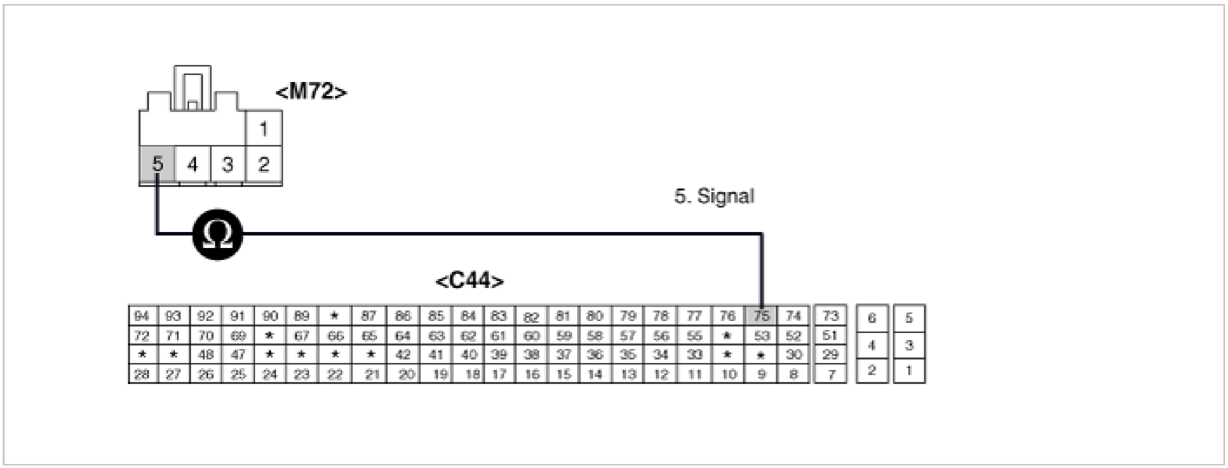
Go to "Check for open in harness" as below.

NO

Check short in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75 of ECM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

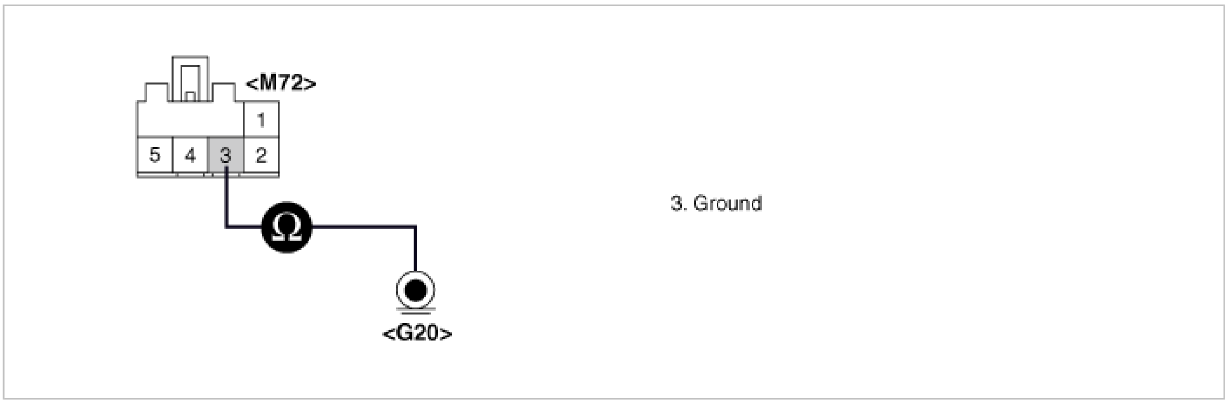
NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Check for open in harness between SMARTRA and Chassis ground.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check SMARTRA
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.

NOTE

Be sure that PIN code is prepared before performing neutral mode.

(3) Is Key teaching completed?

YES

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and go to "Go to "Verification of Vehicle Repair" procedure.

NOTE

In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1690

GENERAL DESCRIPTION

The SMARTRA carries out communication with the built-in transponder of the ignition key. This wireless communication runs on RF (Radio frequency of 125 kHz). The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving.
The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the ECM are converted into an RF signal, which is transmitted, to the transponder by the antenna. The SMARTRA does not carry out the validity check of transponder or the calculation of encryption algorithm. This device is only an advanced interface, which converts the RF data flow of the transponder into serial communication to ECM and vice versa.
SMARTRA : SMARt TRansponder Antenna

DTC DESCRIPTION

This DTC is defined as No answer from SMARTRA because of communication line error(Open or short etc.)

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or Short in SMARTRA Circuit • Faulty SMARTRA
Detecting Criteria	• No response from SMARTRA (Communication Line Error - Open or Short etc.)	

SIGNAL WAVEFORM

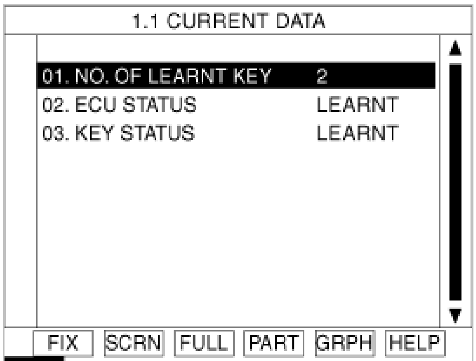


Fig 1

EMS Status	Engine start with valid key	Engine start by limp home	Teaching of key	Teaching or changing of user password	Twice ignition of function
Not yet checked	No	No	No	No	No
Virgin	No	No	Yes	No	Yes, with virgin key
Learnt	Yes	Yes, with learnt user password	Yes	Yes	No
Neutral	No	No	Yes	No	No
Locked by timer	No	No	No	No	No

Fig 2

1. ECM :
   (1) Virgin(This is status at the end of ECM production line before delivery to customer)

   (2) Neutral (This is a status that is erased all data regarding immobilizer by special command from scanner)

   (3) Not Check (The status is stored in permanent memory (EEPROM or Flash etc.)
   In case of not plausible data from this circuit the ECM cannot check the status.

   (4) Locked by timer (After a certain number of incorrect user Password(4) or PIN Code(6) the ECM is locked for one hour and no inputs are accepted during this time)

2. KEY :
   (1) Virgin (It means the key in the key cylinder has not matched with ECM yet)

   (2) Invalid (It means that data is mismatched between ECM and transponder)

   (3) Not Checked (It means that ECM cannot check the transponder data in the key cylinder)
      A. ECM cannot check the transponder data because of SMARTRA error or antenna coil error.
      B. ECM cannot check the transponder data because of communication circuit problem between ECM and SMARTRA.
      C. Key with NO Transponder
      D. More than 1(One) Transponder in the magnetic field
      E. No Transponder in the magnetic field
      F. TP data blocked
      G. TP data does not exist
      H. TP data changed
      I. TP Teaching error
      J. Multiple TP data input

Current Data from Immobilizer will show the numbers of Key learnt, ECM status, and Key status as
Fig 1. The current data provides an indication of the probable cause.
Fig 2. shows possibility of Engine start, Teaching or changing of user password according to ECM status.

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

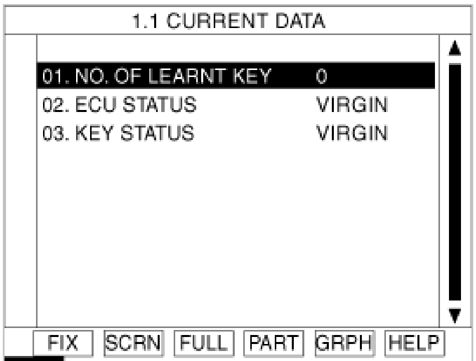

Fig 1

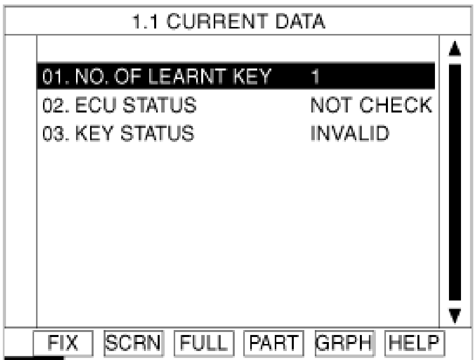

Fig 2

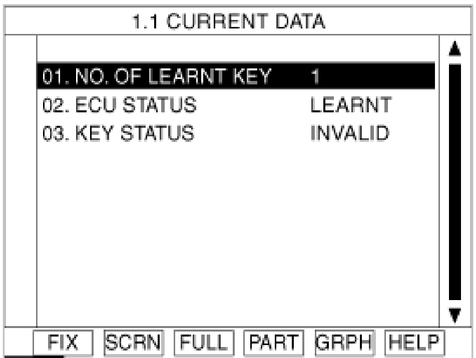

Fig 3

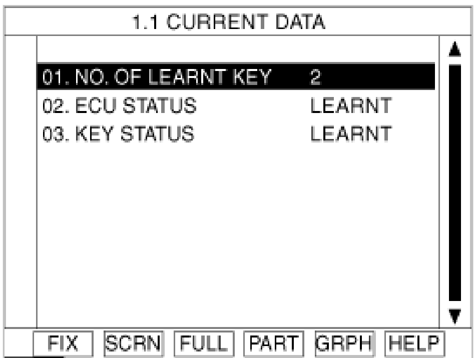

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+

5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

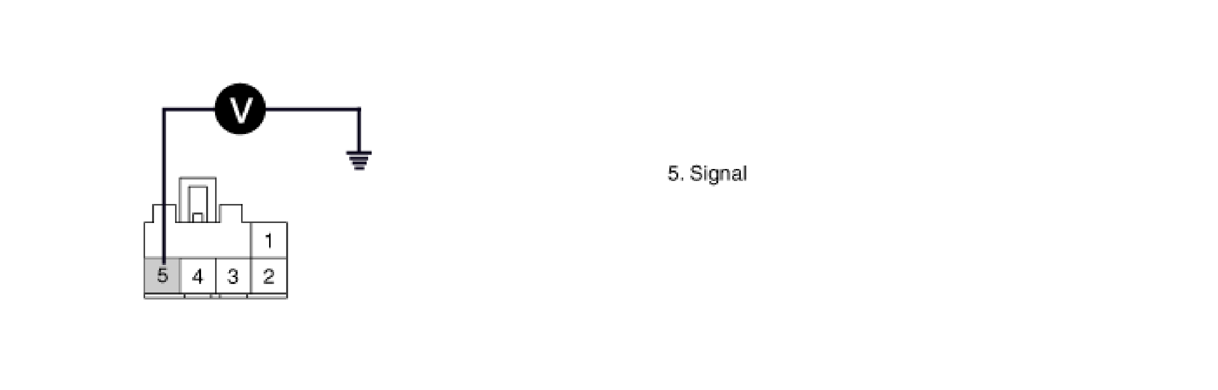
NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and Smartra is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

   Specification : Approx. 10.2V



(5) Is the measured voltage within specifications?

YES

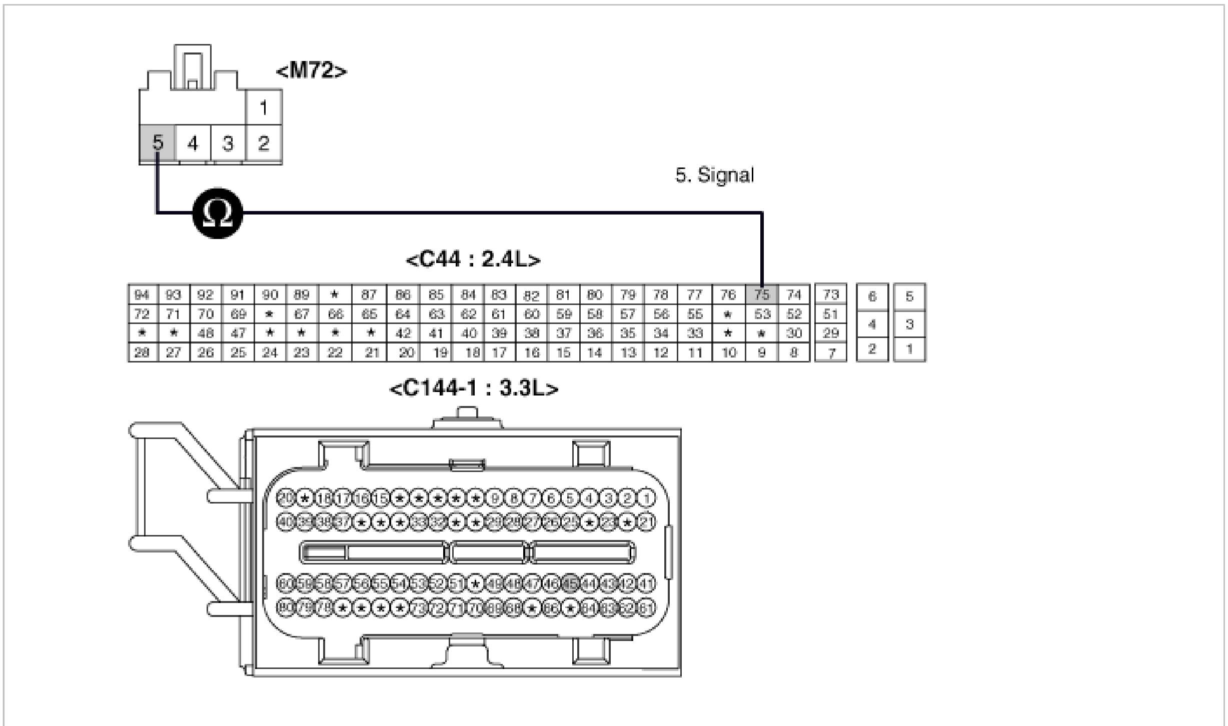
Go to "Check for open in harness" as below.

NO

Check short in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75(2.4L), 45(3.3L) of ECM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

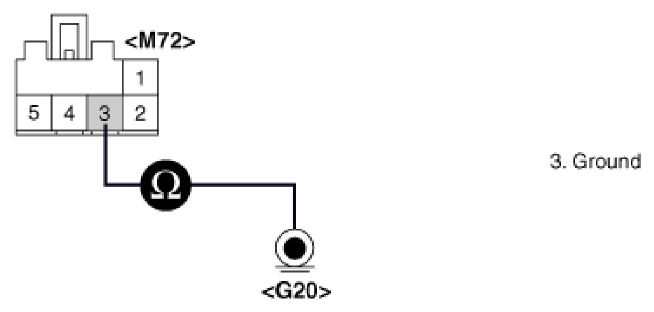
1. Check for open in harness between SMARTRA and Chassis ground.

(1) Ignition "OFF".

(2) Disconnect SMARTRA connector.

(3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check SMARTRA
   (1) Ignition " ON" & Engine "OFF".

   (2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.

   NOTE

   Be sure that PIN code is prepared before performing neutral mode.

   (3) Is Key teaching completed?

   YES

   Fault is intermittent caused by poor contact in the SMARTRA and/or EMC's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and go to "Go to "Verification of Vehicle Repair" procedure.

   NOTE

   In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

   YES

   Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1691

GENERAL DESCRIPTION

This wireless communication runs on RF . The SMARTRA is mounted at the ignition lock close to the antenna coil for RF transmission and receiving. The RF signal from the transponder received by the antenna coil is converted into messages for serial communication by the SMARTRA device. And the received messages from the EMS are converted into an RF signal, which is transmitted, to the transponder by the antenna.

DTC DESCRIPTION

This DTC is defined as Antenna coil open or short circuit.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Open or short in coil circuit • Faulty Antenna Coil • Faulty SMARTRA
Detecting factors	• Antenna signal error	
Detecting Window	• Before transponder communications	
Detecting Criteria	• Antenna open/short circuit	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

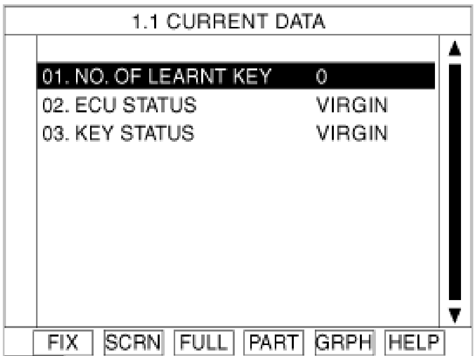


Fig 1

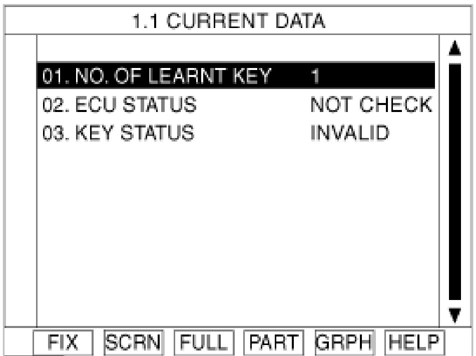

Fig 2

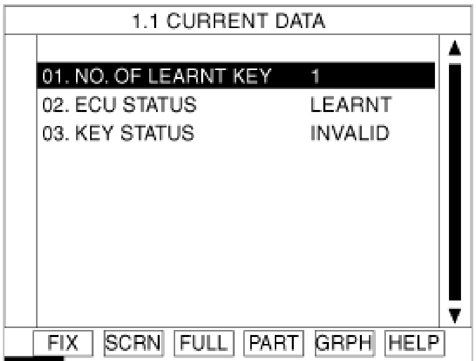

Fig 3

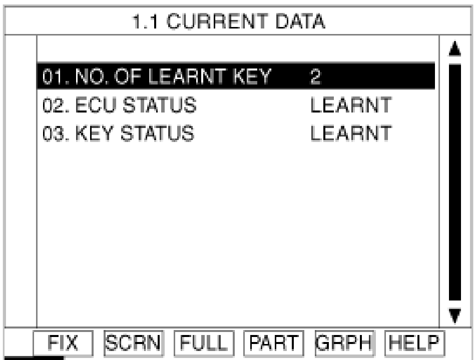

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

Repair as necessary and go to "Verification of Vehicle Repair" procedure.

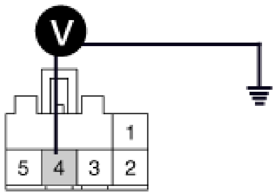
NO

Go to " Power Circuit Inspection " procedure.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect SMARTRA connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal 4 of the SMARTRA harness connector and chassis ground.

Specification : B+



5. Is the measured voltage within specifications?

YES

Go to "Signal Circuit Inspection" procedure.

NO

Check open or short in power harness.
Check that 15A SENSOR fuse located between Main relay and Smartra is open or blown off.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check for short in harness.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Ignition "ON" & Engine "OFF".
   (4) Measure voltage between terminal 5 of the SMARTRA harness connector and chassis ground.

   Specification : Approx. 10.2V

   (5) Is the measured voltage within specifications?

   YES

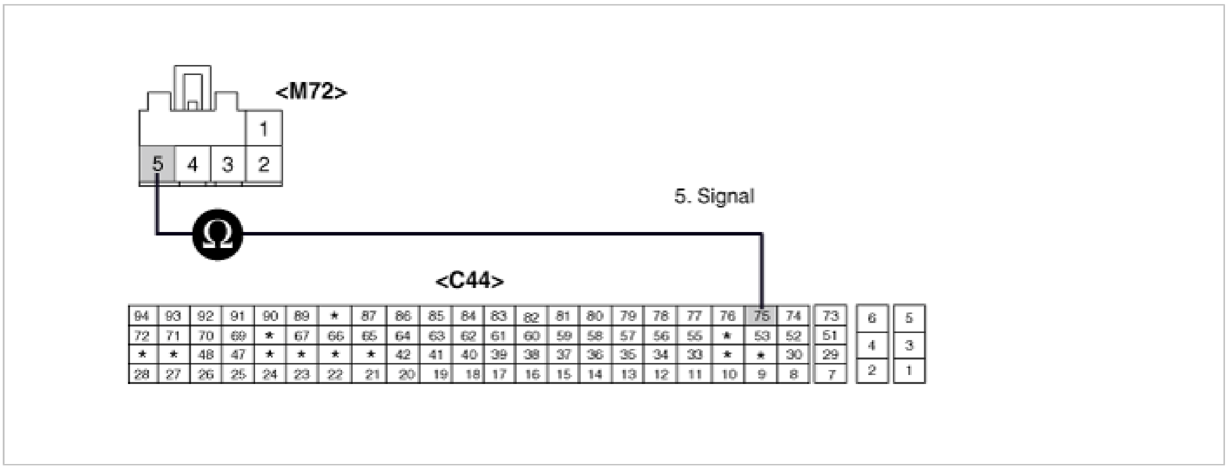
   Go to "Check for open in harness" as below.

   NO

   Check short in signal harness.
   Repair as necessary and go to "Verification of Vehicle repair" procedure.

2. Check for open in harness
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 5 of the SMARTRA harness connector and terminal 75 of ECM harness connector.

   Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Ground Circuit Inspection" procedure.

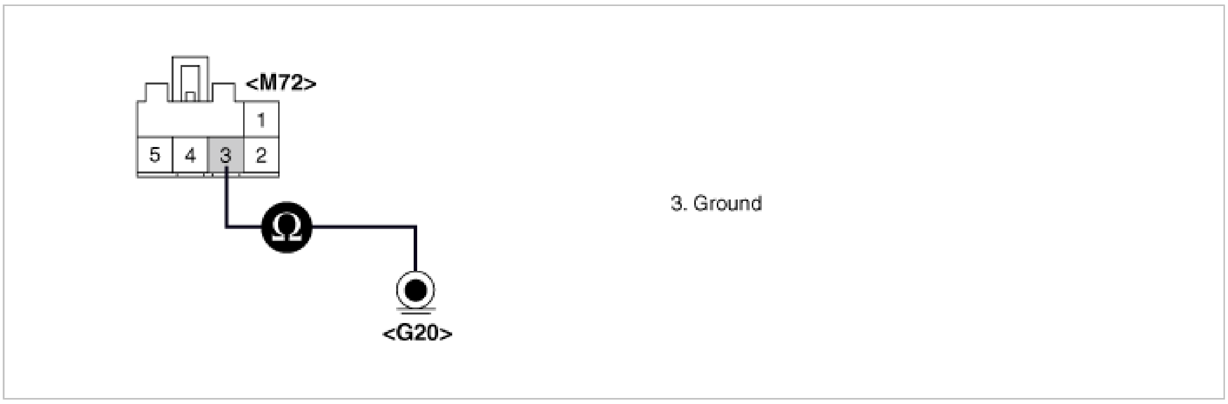
NO

Check for open in signal harness.
Repair as necessary and go to "Verification of Vehicle repair" procedure.

GROUND CIRCUIT INSPECTION

1. Check for open in harness between SMARTRA and Chassis ground.
   (1) Ignition "OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 3 of the SMARTRA harness connector and Chassis ground(G20).

Specification : Approx. below 1Ω



(4) Is the measured resistance within specifications?

YES

Go to "Component Inspection" procedure.

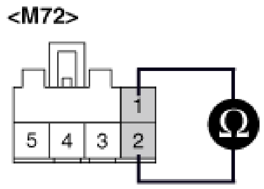
NO

Check for open in ground harness.
Make sure that Chassis ground G20 is firmly tightened properly.
Repair as necessary and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Antenna Coil
   (1) Ignition " OFF".
   (2) Disconnect SMARTRA connector.
   (3) Measure resistance between terminal 1 and 2 of the SMARTRA connector (Component side)

Specification : Approx. 9Ω



(4) Is the measured resistance within specifications?

YES

Go to " Check SMARTRA" as below.

NO

Check for open in harness between SMARTRA and Antenna coil, repair or replace as necessary.
Substitute with a known-good Antenna Coil and check for proper operation. If the problem is corrected, replace Antenna Coil. And then, go to "Verification of Vehicle Repair" procedure.

2. Check SMARTRA
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching/changing and password teaching according to description in "System inspection" procedure.

> NOTE
>
> Be sure that PIN code is prepared before performing neutral mode.

   (3) Is Key teaching completed?

YES

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good SMARTRA and check for proper operation. If the problem is corrected, replace SMARTRA and Go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> In case of faulty SMARTRA, there are no special procedures required. A new SMARTRA device simply replaces the old one. (There are no transponder-related data stored in this device.)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1693

GENERAL DESCRIPTION

During the key teaching procedure the transponder will be programmed with vehicle specific data. The vehicle specific data are written into the transponder memory. The write procedure is unique; therefore the content of transponder can never be modified or

changed. The data are a string of 9 bytes defined by vehicle manufacturer.
The transponder memory is split into two strings called authenticator and key password after this programming the transponder memory is locked and the data(PIN code) cannot be read or changed respectively. The transponder status changes from "virgin" to "learnt". Additionally every transponder includes a unique IDE (Identifier number) of 32 bit. Unique means that the IDE of all transponder is different from each other. The IDE is programmed by the transponder manufacturer and is a read-only value. The authenticator and the key password are not transferred from ECM to transponder or vice versa. Only the results from the encryption algorithm are transferred. It is almost impossible to calculate the vehicle specific data from the encryption result.
For teaching of keys and special purposes the ECM is connected to the tester device.
When IG is ON, the coil supplies energy to the transponder which in turn accumulates energy in the condenser.
Once the energy supply from the coil has stopped, using the stored energy in the condenser, the transponder transmits the ID CODE (stored within the ASIC).

DTC DESCRIPTION

This DTC is defined as Invalid Transponder Data.

DTC DESCRIPTION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Transponder Key
Detecting factors	• Invalid Transponder Data	
Detecting Window	• During Transponder IDE • During Transponder Authentication requests • During Transponder Write EEPROM page requests • During Transponder Read EEPROM page requests	
Detecting Criteria	• Corrupted data form Transponder (Tp), or more than one TP in the field, or no TP in the magnetic field.	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

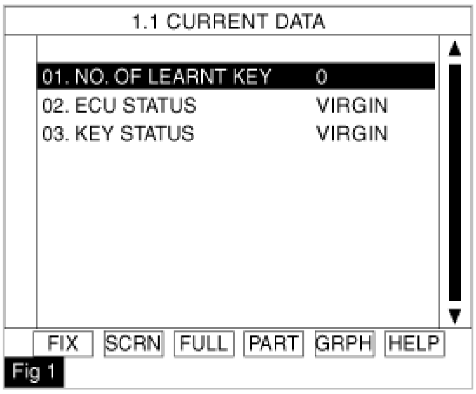


Fig 1

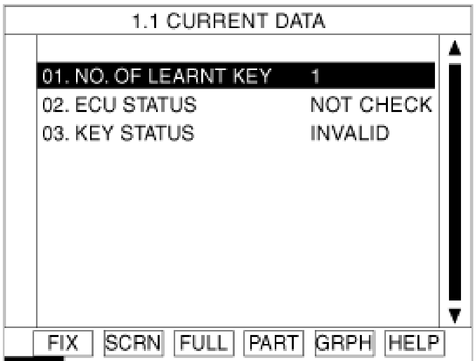

Fig 2

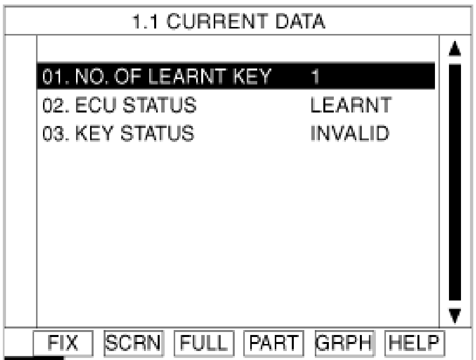

Fig 3

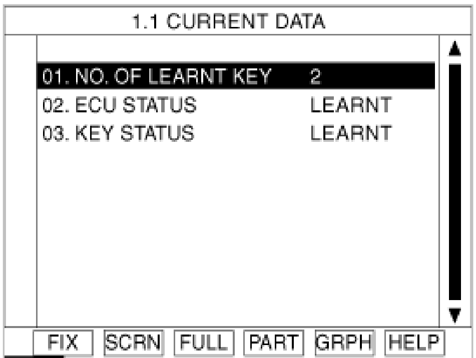

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing according to "3. ECM Neutralization, 2. Key Teaching Procedure,4. Password Teaching in Reference Data" described in General Information.

> **NOTE**
>
> Be sure that PIN code is prepared before performing neutral mode.

(3) Is the neutral, teaching and password teaching/changing mode completed?

YES

Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

NO

Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
If the key status is displayed as "Virgin", replace Transponder.
Perform key teaching mode according to "2.Key Teaching Procedure belongs to Reference Data" described in General Information.
Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1694

GENERAL DESCRIPTION

The ECM and the SMARTRA communicate by dedicated line. During this communication of ECM and SMARTRA the K line of ECM cannot be used for communication. The ECM controls the communication either to SMARTRA or to other devices(e.g. scanner) on K line by switching of a multiplexer and specific communication procedures. The multiplexer is a part of ECM hard ware.

DTC DESCRIPTION

This DTC is defined as invalid request from ECM or corrupted data.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty ECM
Detecting factors	• Request from Control unit is invalid	
Detecting Window	• End of ECM request message	
Detecting Criteria	• Protocol layer violation - Invalid request, Invalid check sum.)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

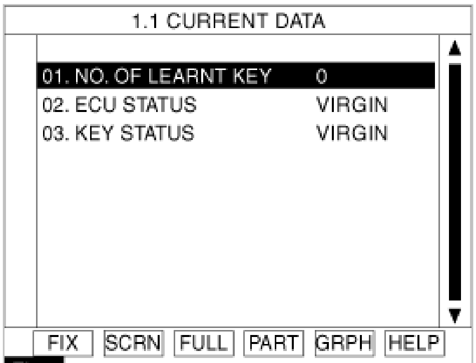

Fig 1

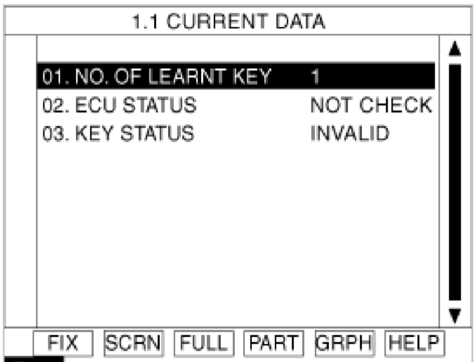

Fig 2

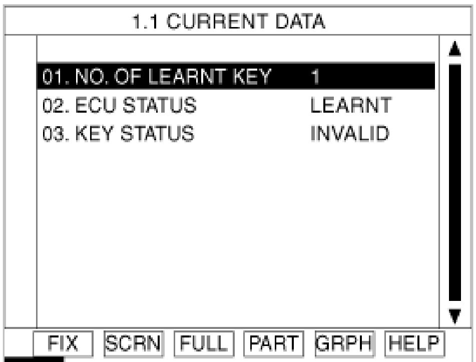

Fig 3

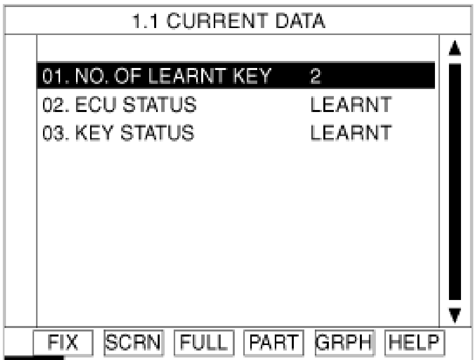

Fig 4

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECM
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform Key Teaching Procedure in "Reference Data" described in General Information.
   (3) Is the Key teaching completed?

   YES
   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

   NO
   Substitute with a known-good ECM and check for proper operation. If the problem is corrected, replace ECM and then go to " Verification of Vehicle repair" procedure.

> **NOTE**
>
> 1. Don't forget to prepare for the PIN of the vehicle before removing ECM from the vehicle.
> 2. Remember that substituting with a known-good ECM should be followed "The things to remember before repair(1)" in "Reference Data in General Information".
>   (In case of faulty ECM, it has to be replaced with "VIRGIN" or " NEUTRAL" ECM.)
> 3. Ensure that the correct PIN is entered when replacing a new ECM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES
Go to the applicable troubleshooting procedure.

NO
System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1695

GENERAL DESCRIPTION

The relevant data for the immobilizer function are stored at permanent memory (EEPROM or Flash etc.).
The immobilizer data are stored by three independent entries.
The data from EEPROM are evaluated by "2 of 3 decision". That means all three entries are read and the content is compared before authentication process.
If the contents of all entries are equal, the authentication will run without additional measures.
If only the contents of two entries are equal, the authentication will run and fault code "EEPROM defective“ is stored at ECM.
If the contents of all three entries are different from each other, no authentication will be possible and the fault code "EEPROM defective“ will be stored. The limp home function cannot be activated. The ECM shall be replaced if the EEPROM related fault occurs again after new teaching of all keys.

DTC DESCRIPTION

This DTC is defined as not only ECM have inconsistent data of EEPROM for number of keys taught, user password state and invalid write operation to EEPROM but ECM can not recognize the unique PIN code during Key Authentication.

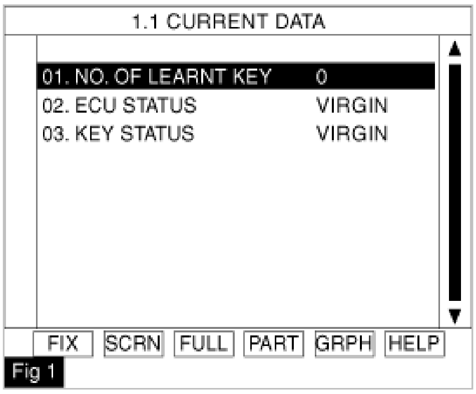
DTC DETECTING CONDITION

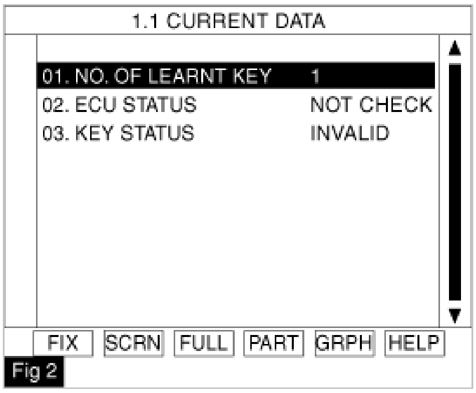
Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty ECM
Detecting Criteria	• ECM internal permanent memory (EEPROM or Flash etc.) fault. • Invalid write operation to permanent	

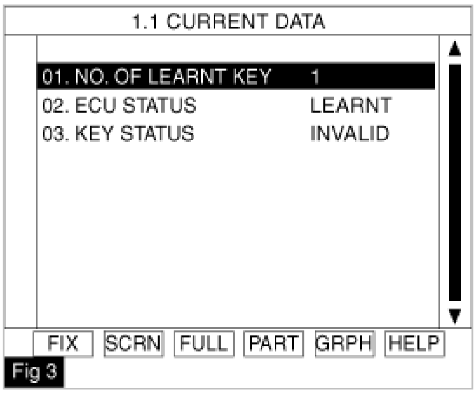
	memory(EEPROM or Flash etc.) fault.	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.







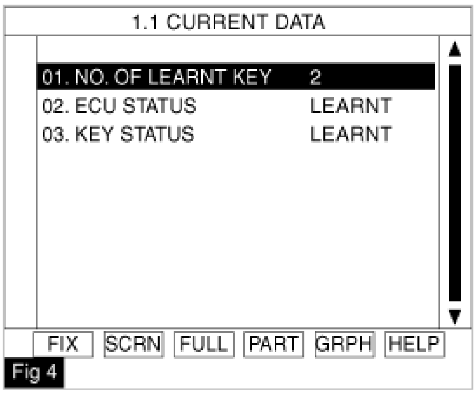


Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.

Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECM
   (1) Ignition " ON" & Engine "OFF".
   (2) Perform the Neutral, Teaching, and Password teaching/ changing mode according to 2. ECM neutralization, 3.Key Teaching Procedure, 4. Password teaching/Changing in "Reference Data" described in General Information.
   (3) Are both neutral and teaching mode completed?

   YES

   Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good ECM and check for proper operation. If the problem is corrected, replace ECM and then go to " Verification of Vehicle repair" procedure.

> NOTE
>
> 1. Don't forget to prepare for the PIN of the vehicle before removing ECM from the vehicle.
> 2. Remember that substituting with a known-good ECM should be followed "The things to remember before repair(1) in "Reference Data in General Information" (In case of faulty ECM, it has to be replaced with "VIRGIN" or " NEUTRAL" ECM.)
> 3. Ensure that the correct PIN is entered when replacing a new ECM.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1696

GENERAL DESCRIPTION

The relevant data for the immobilizer function are stored at permanent memory (EEPROM or Flash etc.).
The immobilizer data are stored by three independent entries.
The data from EEPROM are evaluated by "2 of 3 decision". That means all three entries are read and the content is compared before authentication process.
If the contents of all entries are equal, the authentication will run without additional measures.
If only the contents of two entries are equal, the authentication will run and fault code "EEPROM defective“ is stored at ECM.
If the contents of all three entries are different from each other, no authentication will be possible and the fault code "EEPROM defective“ will be stored. The limp home function cannot be activated. The ECM shall be replaced if the EEPROM related fault occurs again after new teaching of all keys.

DTC DESCRIPTION

This DTC is defined as Virgin TP or Invalid TP with “Learnt” ECM status (Authentication fail).

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Faulty TP(Virgin or Invalid)
Detecting Criteria	• Virgin TP at EMS STATUS "Learnt" • Learnt(Invalid) TP at EMS status "Learnt"(Authentication fail)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. If the DTCs are retrieved again, monitor "CURRENT DATA" to check No. of Learnt key, ECM and KEY status.

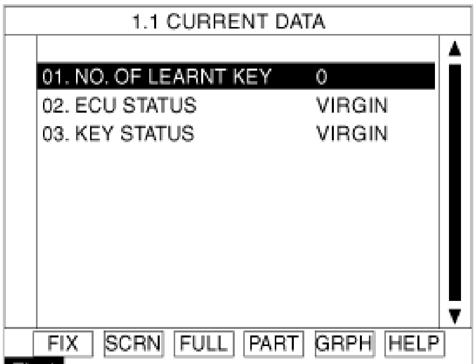

Fig 1

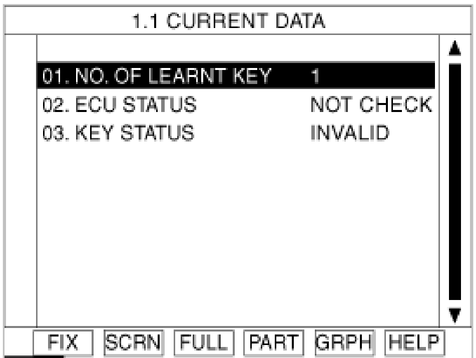

Fig 2

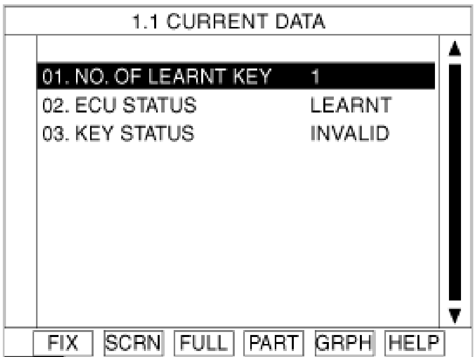

Fig 3

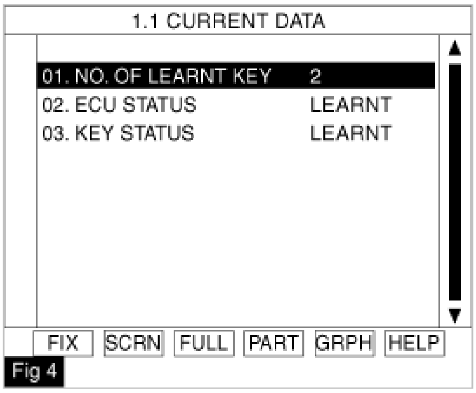

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

4. Are both Key and ECM status learnt?

YES

Fault is intermittent caused by poor contact in the SMARTRA's and/or ECM's connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Transponder
   (1) Ignition "ON" & Engine "OFF".
   (2) Perform neutral mode, key teaching and password teaching/changing.
   (Refer to "Reference Data in General Information")

   > **NOTE**
   >
   > Be sure that PIN code is prepared before performing neutral mode.

   (3) Is the neutral, teaching and password teaching/changing mode possible?

   YES

   In case that key status is "Invalid", Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary, and then go to " Verification of Vehicle Repair" procedure.
   In case that key status is "Learnt", go to "Verification of Vehicle Repair" procedure.

   NO

   Substitute with a known-good virgin Transponder and monitor CURRENT DATA.
   If the key status is displayed as "Virgin", replace Transponder.
   Perform key teaching mode in " Reference Data"
   Go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

NO

System is performing to specification at this time.

Body Electrical System > Immobilizer System > P1699

GENERAL DESCRIPTION

This is a special function for engine start by vehicle manufacturer. The engine can be started for moving from the production line to an area where the key teaching is proceeded.

DTC DESCRIPTION

This DTC is defined as exceeding the maximum limit of twice ignition On.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
Enable Condition	• IG ON	• Locked by timer
Detecting Criteria	• Exceeding the maximum limit of Twice IGN ON ($\supseteq$ 32 times)	

MONITOR SCANTOOL DATA

1. Ignition "ON" & Engine "OFF".
2. Connect Scan tool and clear the DTCs.
3. Monitor Current Data for Immobilizer System.
4. Retry to communication from the vehicle selection menu although once communication is failed.

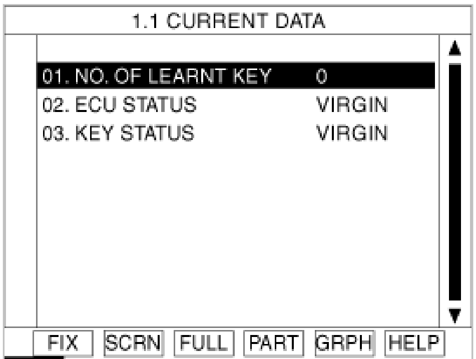

Fig 1

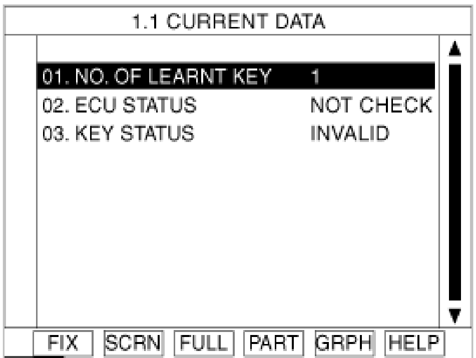

Fig 2

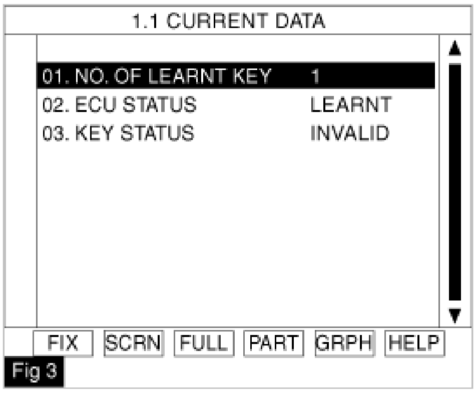

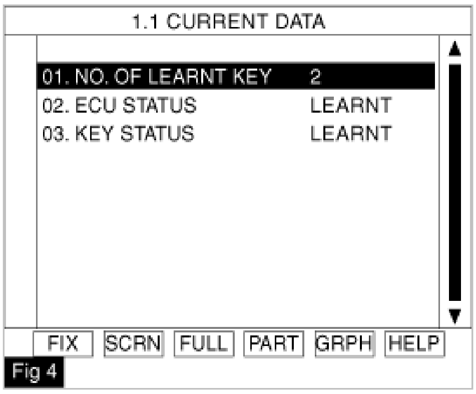

Fig 1 : ECM has not matched with any Key yet.
Fig 2 : ECM Internal Failure.
Fig 3 : IG On with unmatched key.
Fig 4 : 2(two) Keys have been matched with ECM.

5. Is the communication possible between scan tool and Immobilizer system?

YES

Wait for one hour with IG Key On. Be sure that the battery is fully enough to stay for an hour with IG ON.
Disconnecting battery or others manipulation can not reduce this time. After connecting the battery the timer starts again for one hour.
And then, reperform key teaching procedure(Refer to "Reference Data" in General Information")
Go to " Verification of Vehicle Repair" procedure

NO

Fault is intermittent caused by poor contact in the SMARTRA and/or ECM connector or was repaired and ECM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination. deterioration, or damage.
Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scan tool and monitor CURRENT DATA to check No. of Learnt key, ECM and KEY status.
2. Select Diagnostic Trouble Codes(DTCs)" mode and Clear the DTCs.
3. Are any DTCs present?

YES

Go to the applicable troubleshooting procedure.

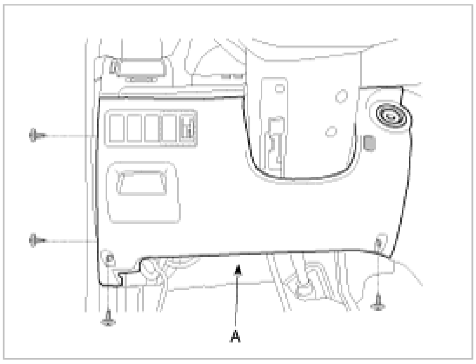
NO

System is performing to specification at this time.

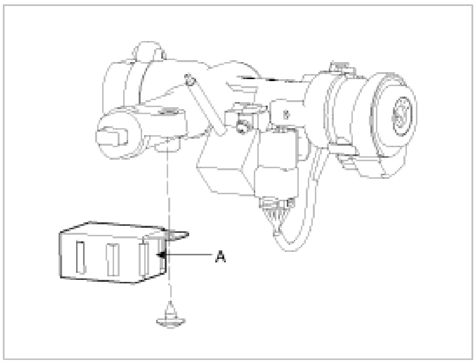
Body Electrical System > Immobilizer System > Immobilizer Control Unit > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



3. Remove the steering column shaft (Refer to the ST group).
4. Disconnect the 5P connector of the SMARTRA unit and then remove the SMARTRA unit (A) after loosening the screw.

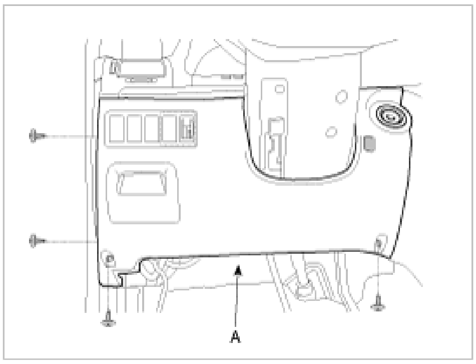


5. Installation is the reverse of removal procedure.

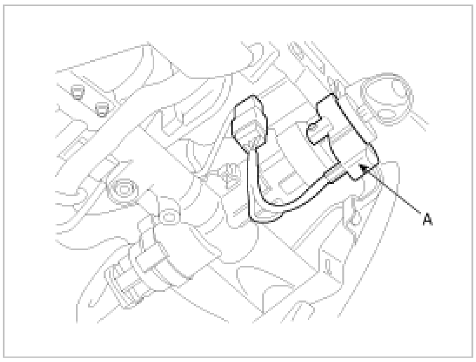
Body Electrical System > Immobilizer System > Coil Antenna > Repair procedures

REPLACEMENT

1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



3. Remove the steering column shaft (Refer to the ST group).
4. Disconnect the 6P connector of the coil antenna and then remove the coil antenna (A) after loosening the screw.

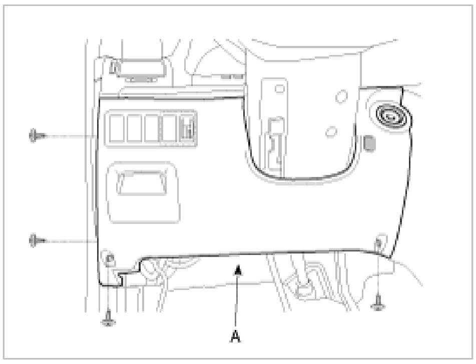


5. Installation is the reverse of removal procedure.

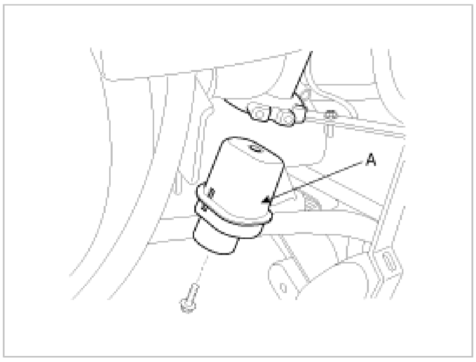
Body Electrical System > Ignition System > Ignition Switch > Repair procedures

REPLACEMENT

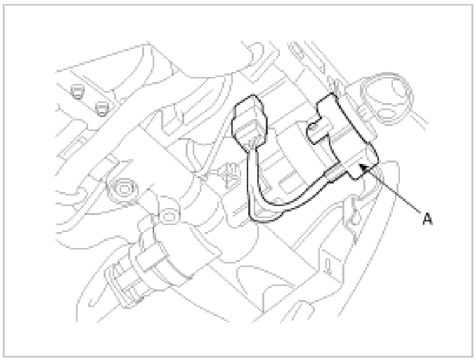
1. Disconnect the negative (-) battery terminal.
2. Remove the crash pad side cover (A).



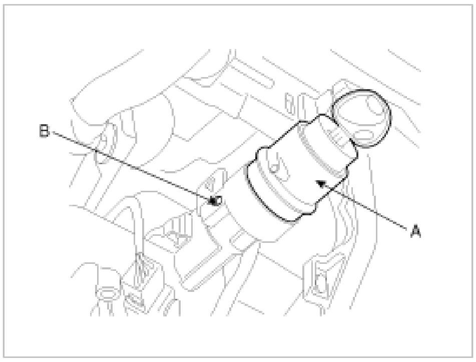
3. Remove the ignition switch (A) after loosening the screw and disconnecting the 6P connector.



4. Remove the steering column shaft (Refer to the ST group).
5. Remove the key warning switch and key illumination lamp (A) after loosening the screws and disconnecting the 6P connector.

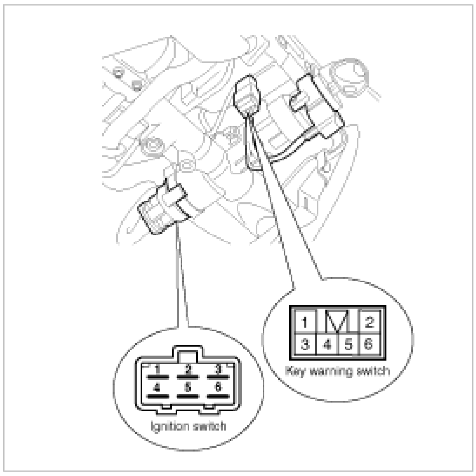


6. If it is necessary to remove the key lock cylinder (A), Remove the key lock cylinder (A) after pushing lock pin (B) with key ON.



7. Installation is the reverse of removal procedure.

INSPECTION



1. Disconnect the ignition switch connector and key warning switch connector from under the steering column.
2. Check for continuity between the terminals.
3. If continuity is not specified, replace the switch.

POSITION \ KEY \ TERMINAL		IGNITION SWITCH						STEERING		KEY WARNING SWITCH		KEY HOLE ILLUMINATION

Brake Chatter	Brake chatter is usually caused by loose or worn components, or glazed or burnt linings. Rotors with hard spots can also contribute to brake chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

Brake System > Brake System > Description and Operation

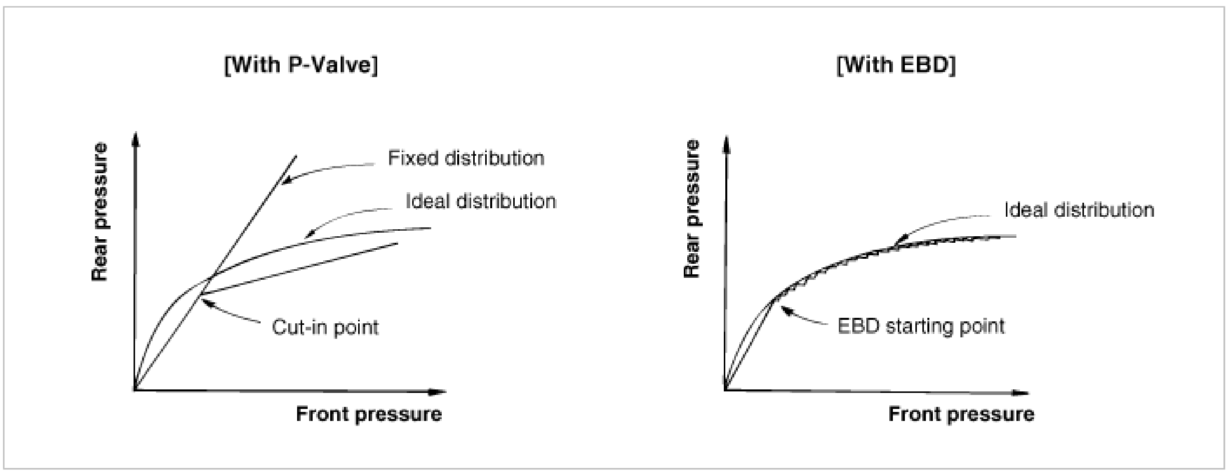
DESCRIPTION

The EBD system (Electronic Brake force Distribution) as a sub-system of the ABS system is to control the effective adhesion utilization by the rear wheels.
It further utilizes the efficiency of highly developed ABS equipment by controlling the slip of the rear wheels in the partial braking range.
The brake force is moved even closer to the optimum and controlled electronically, thus dispensing with the need for the proportioning valve.
The proportioning valve, because of a mechanical device, has limitations to achieve an ideal brake force distribution tothe rear wheels as well as to carry out the flexible brake force distribution proportioning to the vehicle load or weight increasing. And in the event of malfunctioning, driver cannot notice whether it fails or not.
EBD controlled by the ABS Control Module, calculates the slip ratio of each wheel at all times and controls the brake pressure of the rear wheels not to exceed that of the front wheels.
If the EBD fails, the EBD warning lamp (Parking brake lamp) lights up.

ADVANTAGES

- Function improvement of the base-brake system.
- Compensation for the different friction coefficients.
- Elimination of the proportioning valve.
- Failure recognition by the warning lamp.

Comparison between Proportioning valve and EBD



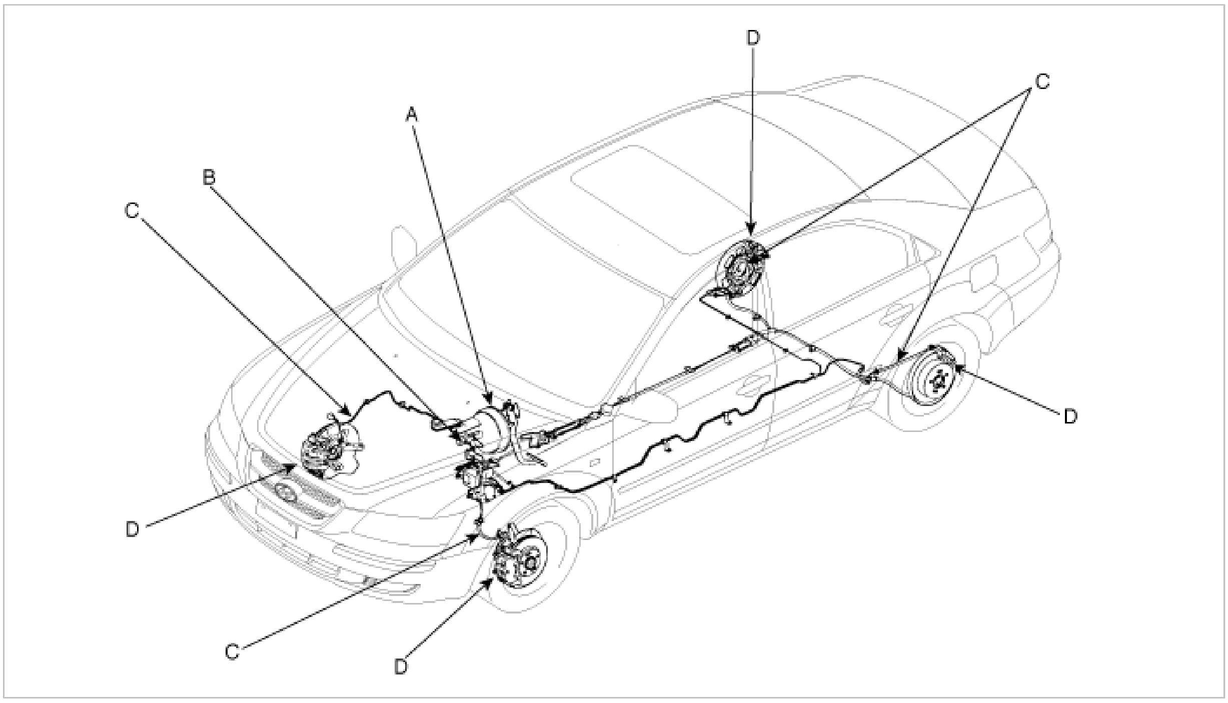
Brake System > Brake System > Repair procedures

Operation and Leakage Check

Check all of the following items:

Component	Procedure
Brake Booster (A)	Check brake operation by applying the brakes during a test drive. If the brakes do not work properly, check the brake booster. Replace the brake booster as an assembly if it does not work properly or if there are signs of leakage.
Piston cup and pressure cup inspection (B)	• Check brake operation by applying the brakes. Look for damage or signs of fluid leakage. Replace the master cylinder as an assembly if the pedal does not work properly or if there is damage or signs of fluid leakage. • Check for a difference in brake pedal stroke between quick and slow brake applications. Replace the master cylinder if there is a difference in pedal stroke.
Brake hoses (C)	Look for damage or signs of fluid leakage. Replace the brake hose with a new one if it is damaged or leaking.

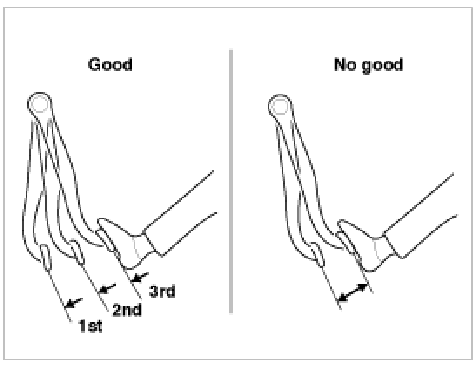
Caliper piston seal and piston boots (D)	Check brake operation by applying the brakes. Look for damage or signs of fluid leakage. If the pedal does not work properly, the brakes drag, or there is damage or signs of fluid leakage, disassemble and inspect the brake caliper. Replace the boots and seals with new ones whenever thebrake caliper is disassembled.



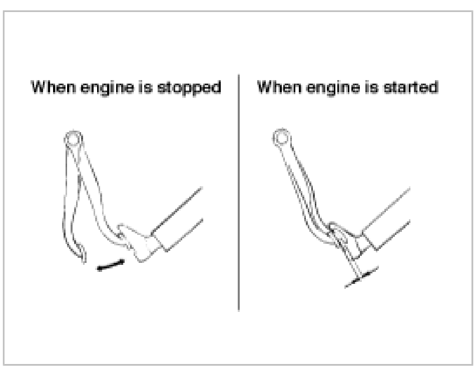
BRAKE BOOSTER OPERATING TEST

For simple checking of the brake booster operation, carry out the following tests

1. Run the engine for one or two minutes, and then stop it. If the pedal depresses fully the first time but gradually becomes higher when depressed succeeding times, the booster is operating properly, if the pedal height remains unchanged, thebooster is defective.

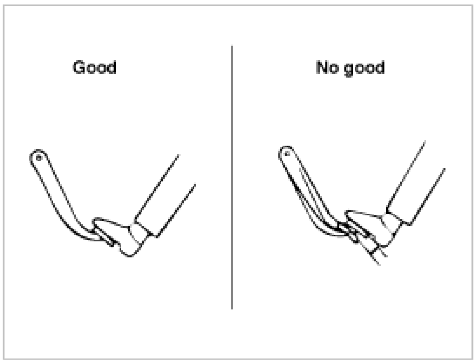


2. With the engine stopped, step on the brake pedal several times.
   Then step on the brake pedal and start the engine. If the pedal moves downward slightly, the booster is in good condition. If there is no change, the booster is defective.



3. With the engine running, step on the brake pedal and then stop the engine.
   Hold the pedal depressed for 30 seconds. If the pedal height does not change, the booster is in good condition, if the pedal

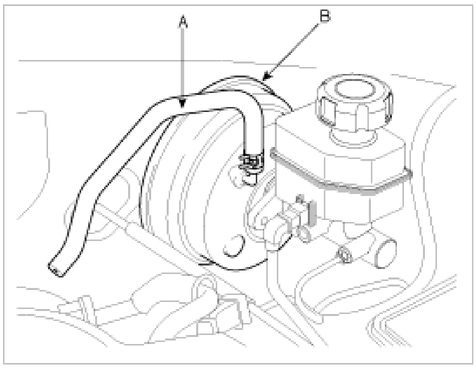
rises, the booster is defective.
If the above three tests are okay, the booster performance can be determined as good.
Even if one of the above three tests is not okay, check the check valve, vacuum hose and booster for defect.



VACUUM HOSE (CHECK VALVE)

INSPECTION

1. Disconnect the brake booster vacuum hose (check valve built in) (A) at the booster (B).
2. Start the engine and let it idle. There should be vacuum available. If no vacuum is available, the check valve is not working properly. Replace the brake booster vacuum hose and check valve and retest.

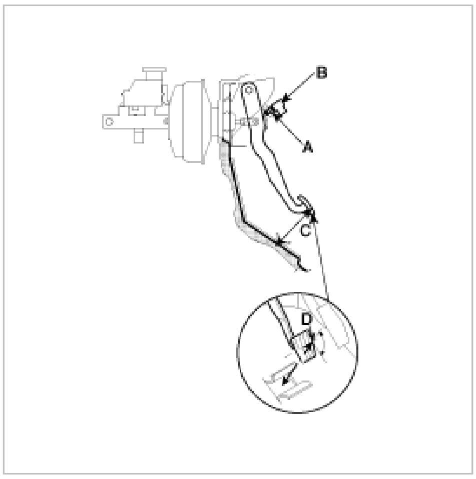


BRAKE PEDAL BRAKE SWITCH ADJUSTMENT

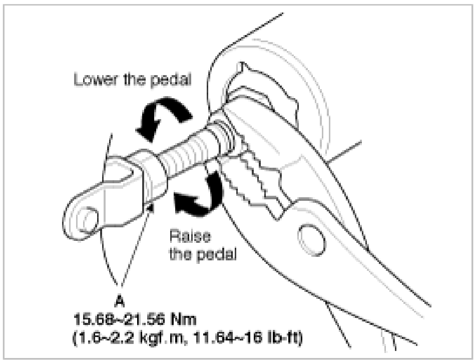
PEDAL HEIGHET

1. Disconnect the brake switch connector, loosen the brake switch locknut (A), and brake off the brake switch (B) until it is no longer touching the brake pedal.
2. Lift up the carpet. At the insulator cutout, measure the pedal height (C) from the middle of the left-side center of the pedal pad (D).

Standard pedal height(with carpet removed): 184.5mm(7.26 in.)

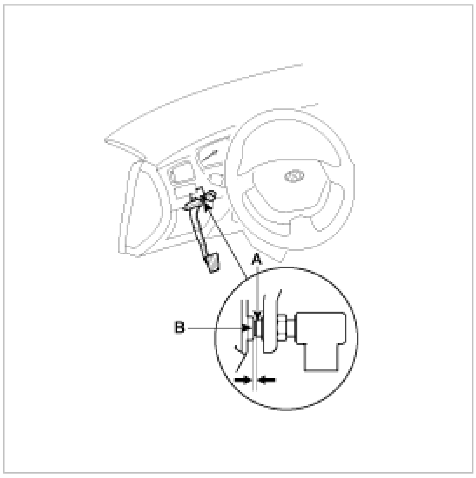


3. Loosen the pushrod locknut (A), and screw the pushrod in or out with pliers until the standard pedal height from the floor is reached. After adjustment, tighten the locknut firmly. Do not adjust the pedal height with the pushrod depressed.



BRAKE SWITCH CLEARANCE

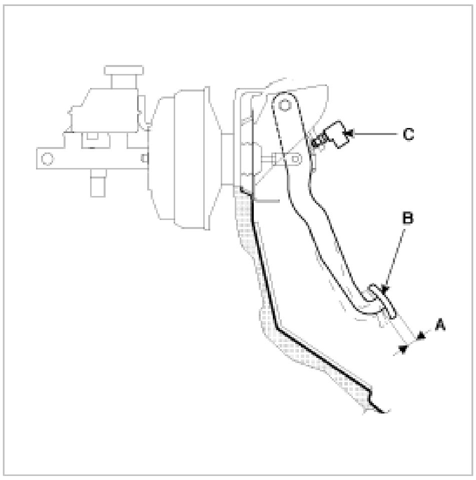
Screw in the brake switch until its plunger is fully depressed (threded end (A) touching the pad (B) on the pedal arm) then brake off the switch 3/4 turn to make 1 ~ 2 mm (0.04 ~ 0.08 in.) of clearance between the brake switch connector. Make sure that the brake lights go off when the pedal is released.



PEDAL FREE PLAY

1. With the engine off, inspect the pedal free play (A) on the pedal pad (B) by pushing the pedal by hand.

   Free play: 3 ~ 8 mm (0.12 ~ 0.31 in.)

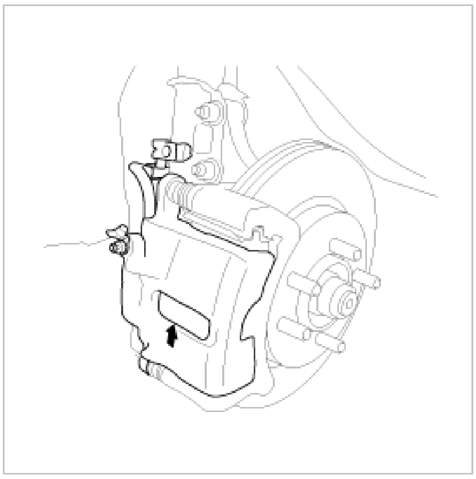


2. If the pedal free play is out of specification, adjust the brake switch (C). If the pedal free play is insufficient, it may result in brake drag.

INSPECTION OF FRONT DISC BRAKE PAD

1. Check the brake pad thickness through the caliper body inspection hole.

   Pad thickness
   Standard value : 11.0 mm (0.43 in.)
   Service limit : 3 ~ 4 mm (0.12 ~ 0.16 in.)



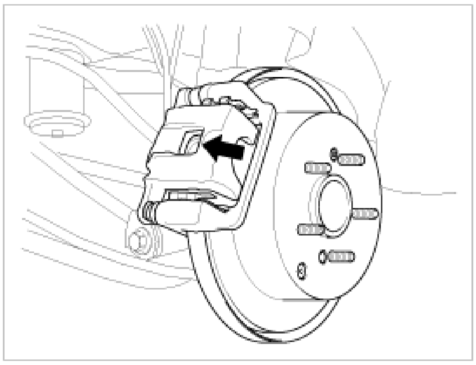
CAUTION

- If the pad lining thickness is out of specilfication, left and right pads must be replaced as a complete set.
- When the thickness difference between the left pad and right pad is large, check the sliding condition of the piston and the guide rod.

INSPECTION OF REAR DISC BRAKE PAD

1. Check the rear disk brake pad thickness through the caliper body inspection hole.

Pad thickness
Standard value : 10.0 mm (0.39 in.)
Service limit : 3.0 mm (0.12 in.)

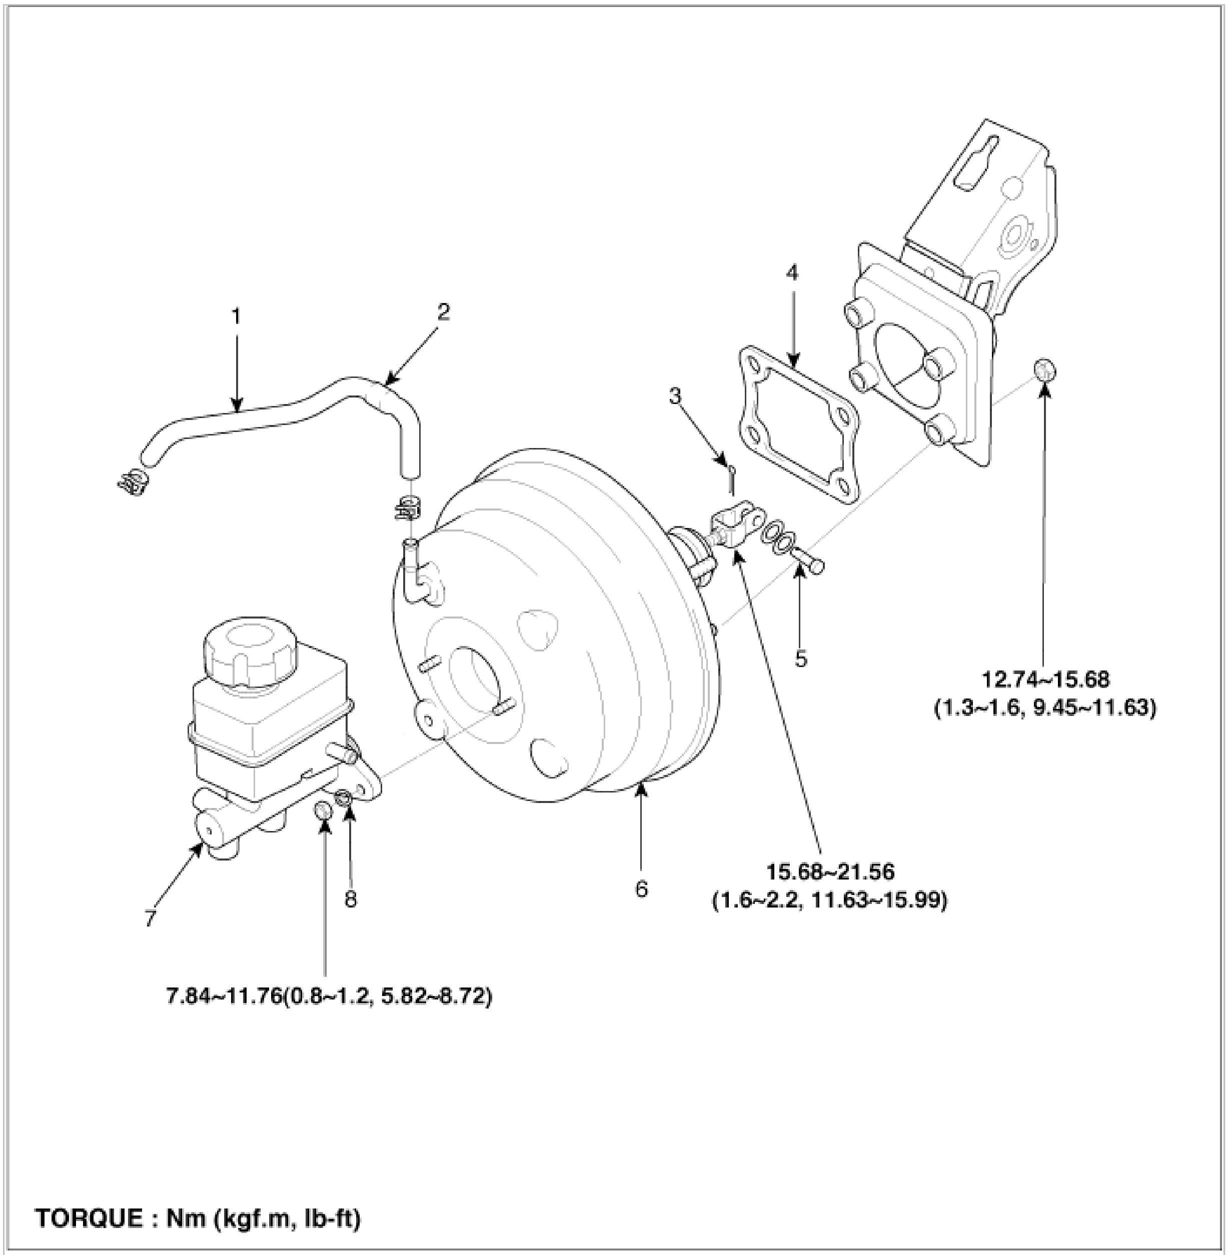


CAUTION

- If the pad thickness is out of specification, left and right pads must be replaced as a complete set.
- When the thickness difference between the left pad and right pad is large, check the sliding condition of the piston and the guide rod.

Brake System > Brake System > Brake Booster > Components and Components Location

COMPONENTS

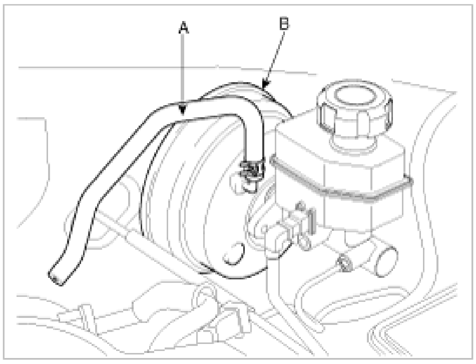


1. Vacuum hose
2. Check valve
3. Snap pin
4. Seal
5. Clevis pin
6. Brake booster
7. Master cylinder
8. Washer

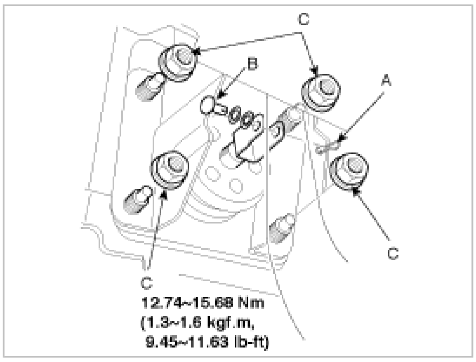
Brake System > Brake System > Brake Booster > Repair procedures

Removal

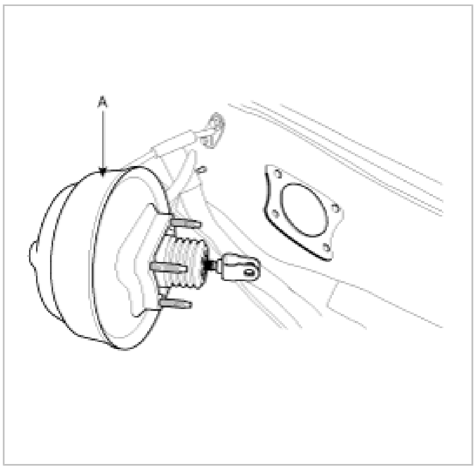
1. Remove the master cylinder.
2. Disconnect the vacuum hose (A) from the brake booster (B).



3. Remove the snap pin (A) and clevis pin (B).



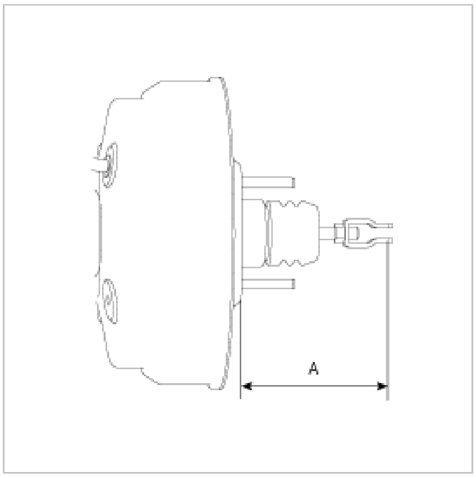
4. Remove the four booster mounting nuts (C).
5. Remove the brake booster (A).



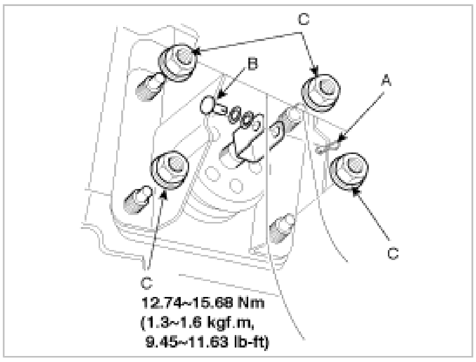
INSTALLATION

1. Adjust push rod length of the booster, and then install the seal on the booster assembly.

Standard length (A): 108± 0.5 mm (4.25 ± 0.019 in.)



2. Insert the booster and tighten the nuts (C).



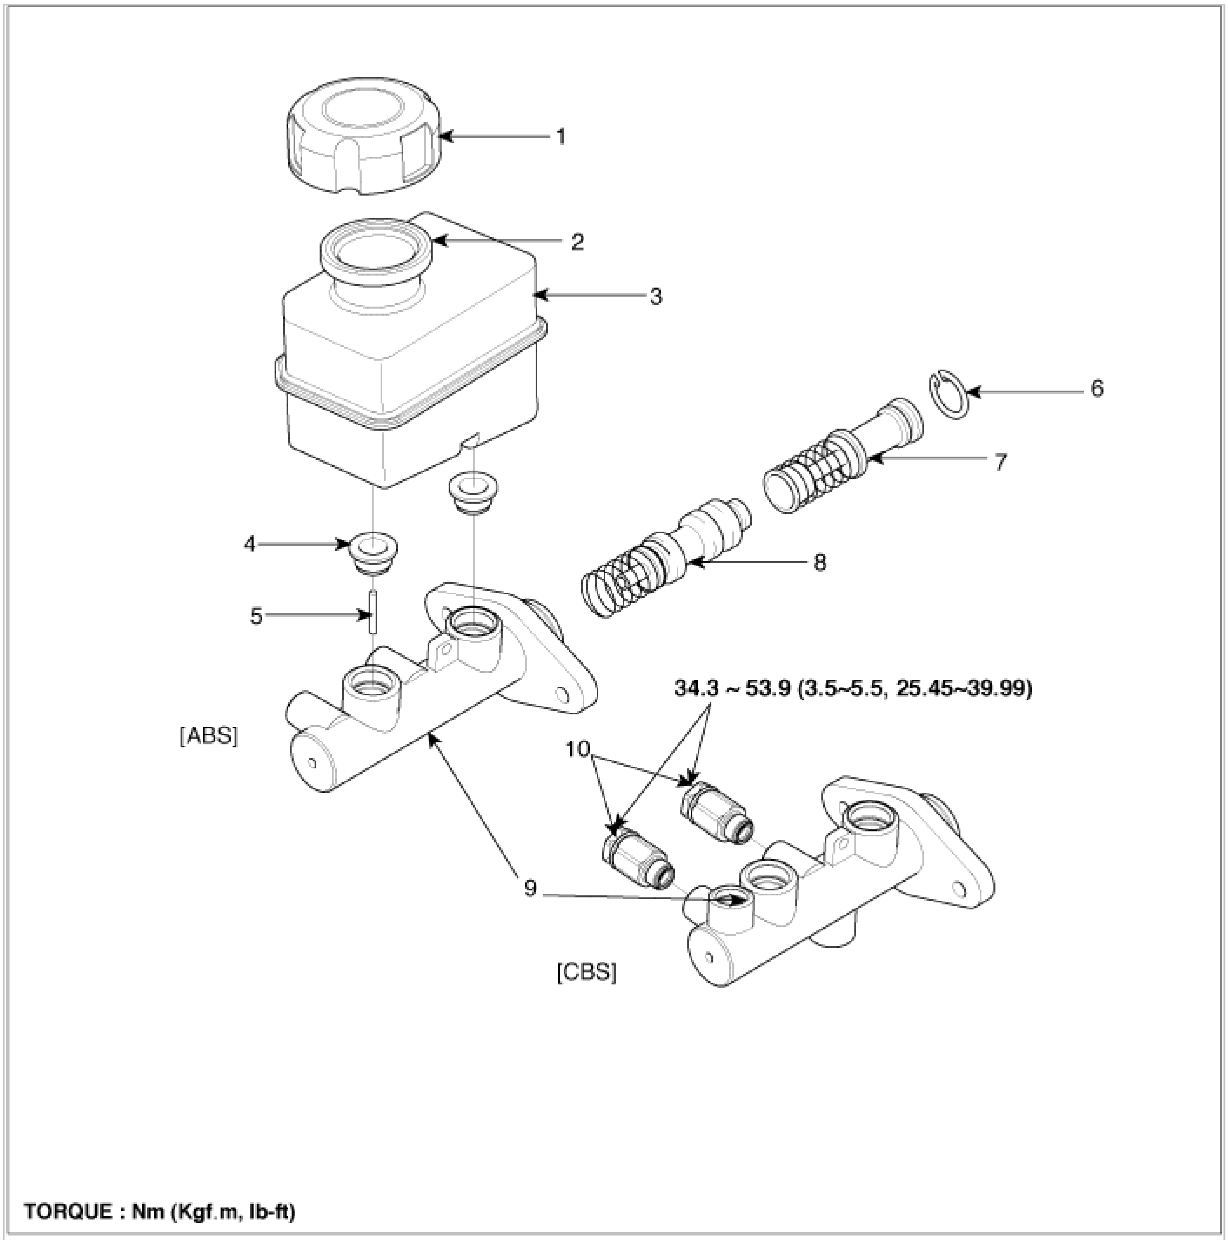
3. Connect the booster push rod and brake pedal with a pin (B) and install a snap clevis pin (A) to the clevis pin (B).

> CAUTION
>
> Grease the pin before installing the snap pin.
> Always use a new snap pin.

4. Install the master cylinder.
5. Connect the vacuum hose to the brake booster.
6. After filling the brake reservoir with brake fluid, bleed the system.
7. Check for fluid leakage.
8. Check and adjust the brake pedal for proper operation.

Brake System > Brake System > Master Cylinder > Components and Components Location

COMPONENTS



1. Reservoir cap
2. Brake fluid filter
3. Reservoir
4. Grommet
5. Cylinder pin
6. Retainer
7. Primary piston assembly
8. Secondary piston assembly
9. Master cylinder body
10. Proportioning valve

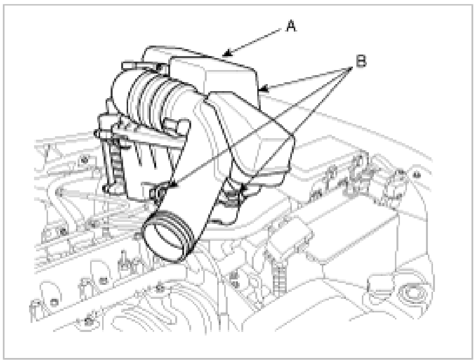
Brake System > Brake System > Master Cylinder > Repair procedures

REMOVAL

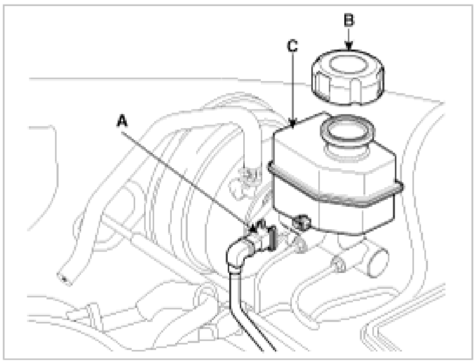
NOTE

Do not spill brake fluid on the vehicle; it may damage the paint; if brake fluid does contact the paint, wash it off immediately with water.

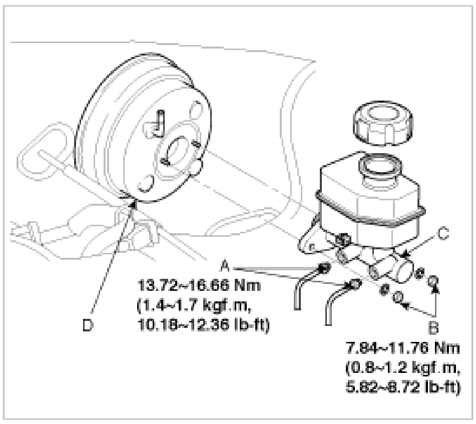
1. Remove air cleaner mounting bolts (B) from the air cleaner mounting bracket and air cleaner body (A).



2. Disconnect the brake fluid level switch connector (A), and remove the reservoir cap (B).



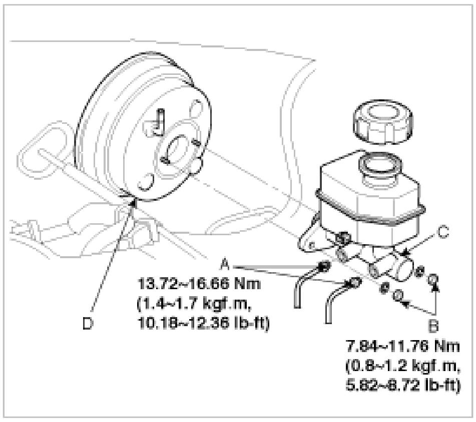
3. Remove the brake fluid from the master cylinder reservoir (C) with a syringe.
4. Disconnect the brake lines (A) from the master cylinder. To prevent spills, cover the hose joints with rags or shop towels.



5. Remove the master cylinder mounting nuts (B) and washers.
6. Remove the master cylinder(C) from the brake booster (D). Be careful not to bend or damage the brake lines when removing the master cylinder.

INSTALLATION

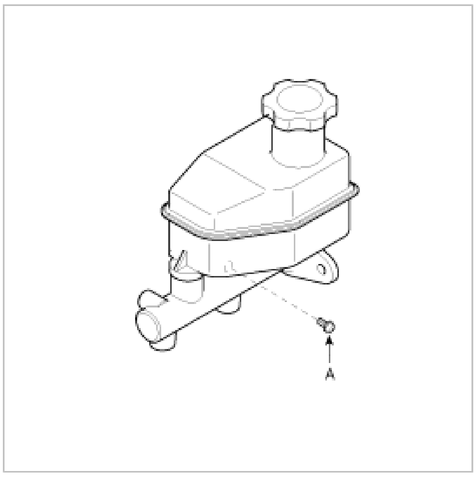
1. Install the master cylinder on the brake booster with 2 nuts.
2. Connect 2 brake tubes and the brake fluid level sensor connector.



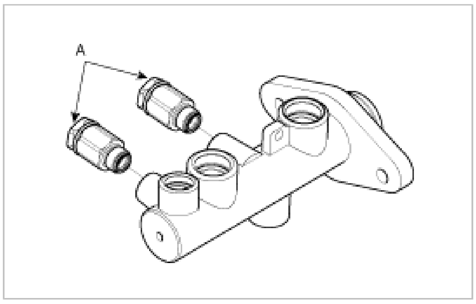
3. Fill the brake reservoir with the brake fluid and bleed the brake system.

DISASSEMBLY

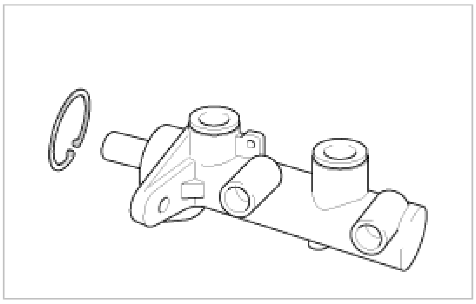
1. Remove the reservoir cap and drain the brake fluid into a suitable container.
2. Remove the fluid level sensor.
3. Remove the reservoir from the master cylinder, after remove mounting screw (A).



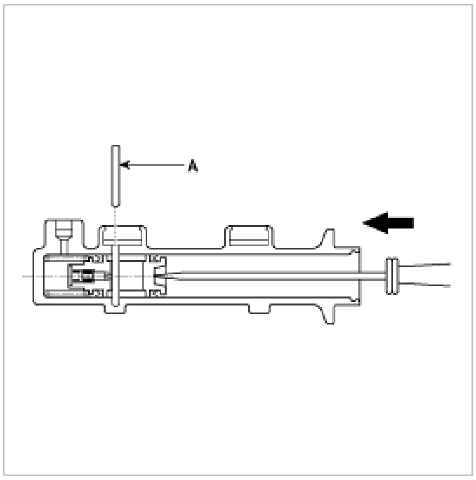
4. Remove the proportioning valves (A) - CBS only.



5. Remove the retainer ring by using the snap ring pliers then remove the primary piston assembly.



6. Remove the pin with the secondary piston pushed completely using a screwdriver. Remove the secondary piston assembly.



NOTE

Do not disassemble the primary and secondary piston assembly.

INSPECTION

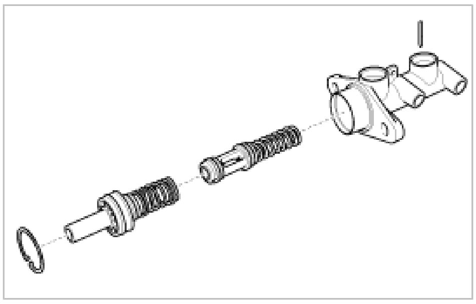
1. Check the master cylinder bore for rust or scratching.
2. Check the master cylinder for wear or damage. If necessary, clean or replace the cylinder.

CAUTION

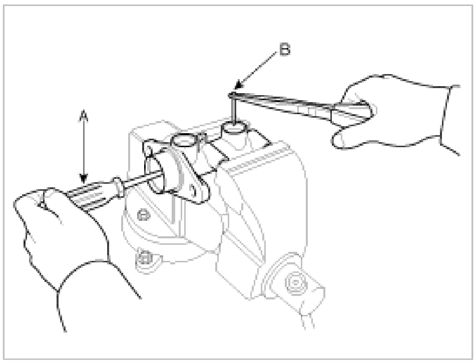
- If the cylinder bore is damaged, replace the master cylinder assembly.
- Wash the contaminated parts in alcohol.

REASSEMBLY

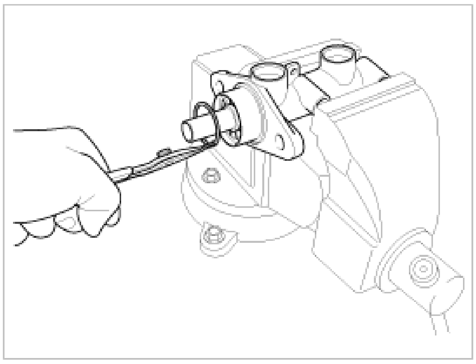
1. Apply genuine brake fluid to the rubber parts of the cylinder kit and grommets.
2. Carefully insert the springs and pistons in the proper direction.



3. Press the piston with a screwdriver(A) and install the cylinder pin(B).



4. Press the piston with a screwdriver and install the retainer ring.



5. Mount two grommets.
6. Install the reservoir on the cylinder.

Brake System > Brake System > Proportioning Valve > Description and Operation

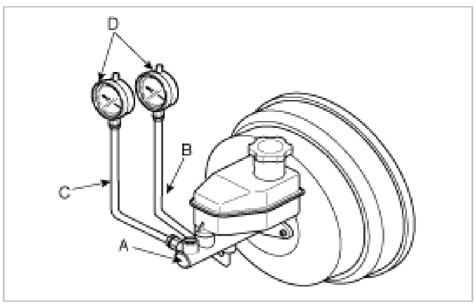
DESCRIPTION

Do not disassemble the proportioning valve. The proportioning valve makes the ideal distribution of fluid pressure to the front and rear brakes to prevent the brakes from skidding in the event of rear wheel lock up and to obtain a higher brake efficiency within the range of service brake application.

Brake System > Brake System > Proportioning Valve > Repair procedures

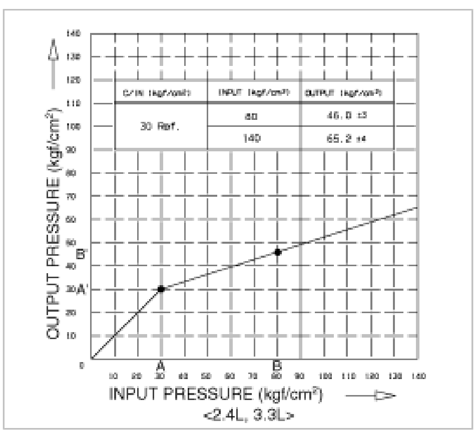
INSPECTION

1. Remove the front brake tube (B) and rear brake tube (C) from the master cylinder (A).
2. Connect two pressure gauges (D); one to the output valve of the front (B) and rear (C) brake.



> **NOTE**
>
> Be sure to bleed the system after connecting the pressure gauges.

3. With the brake applied, measure the front pressure and the rear pressure.
   If the measured pressures are within the specified range as illustrated, the proportioning valve is good.



4. Reconnect the brake lines in their original positions and bleed the system.

> **NOTE**

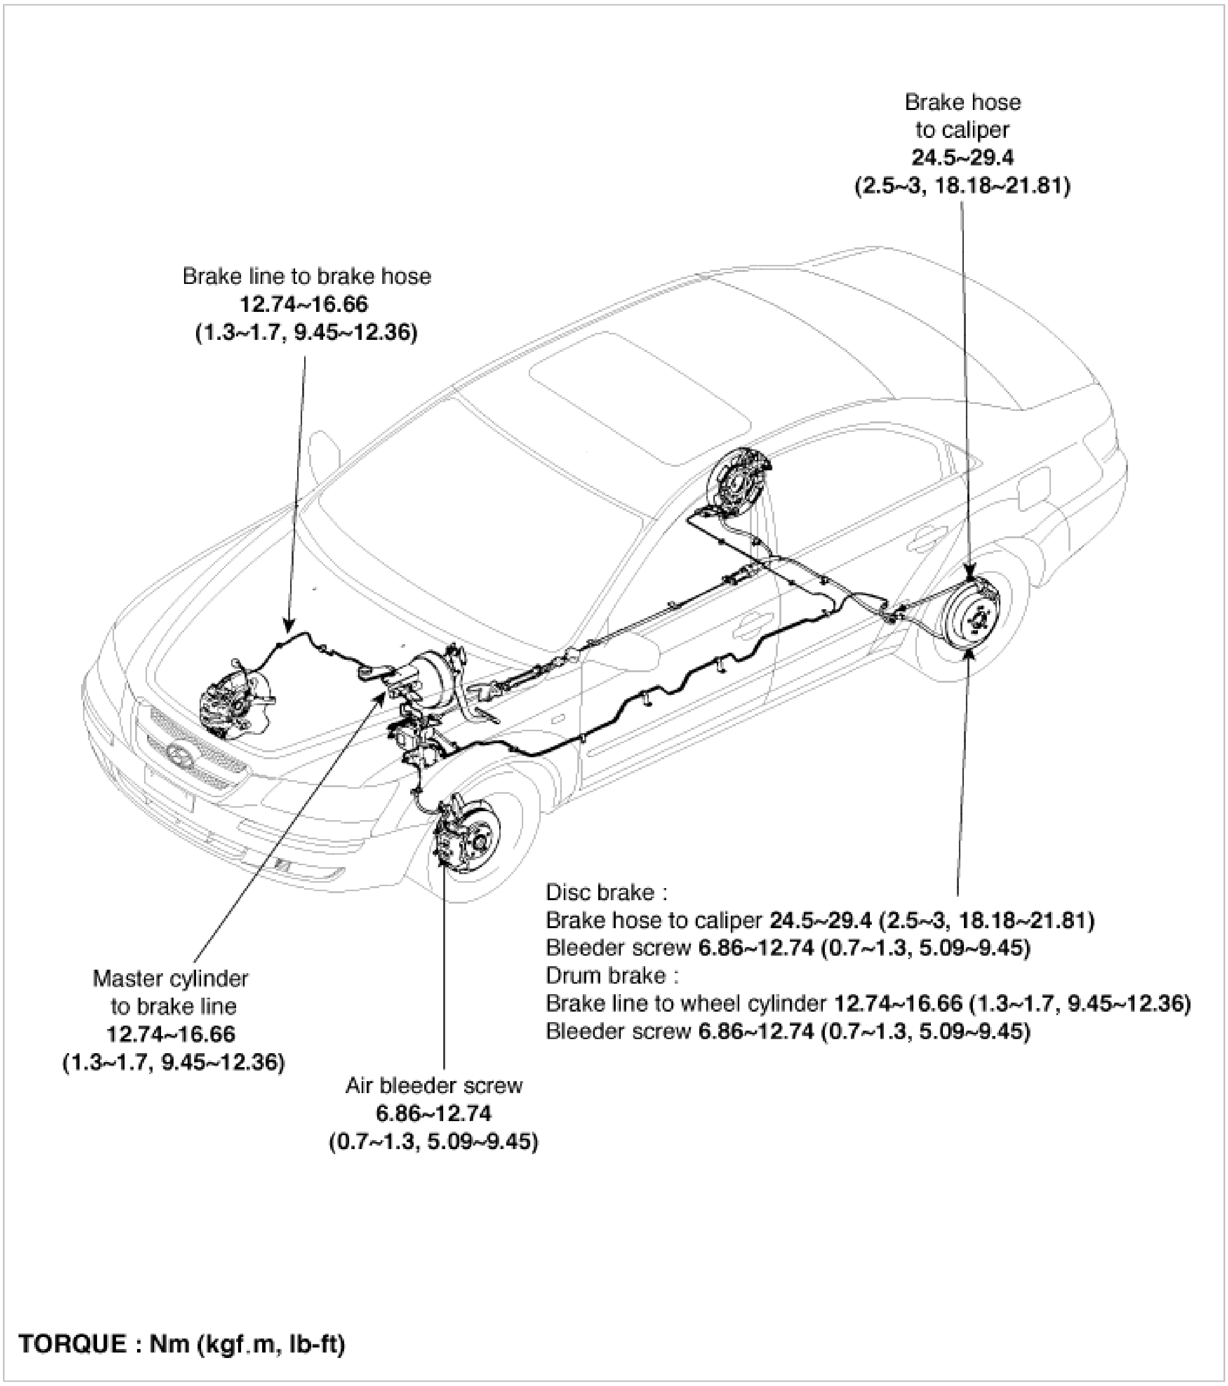
This table shows characteristics of the proportioning valve as the pressure increases.

<2.4L, 3.3L>

Input Pressure	Output Pressure
A : 30 kg/cm²	A' : 30 kg/cm²
B : 80 kg/cm²	B' : 46 kg/cm²

Brake System > Brake System > Brake Line > Components and Components Location

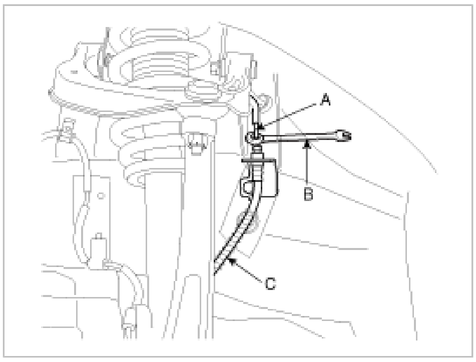
COMPONENT



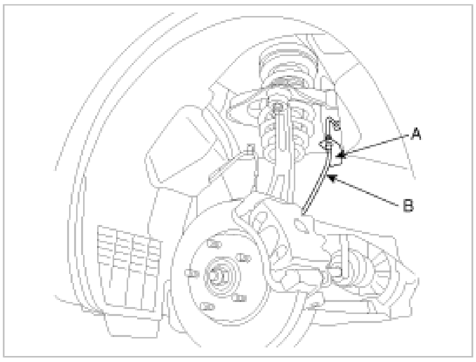
Brake System > Brake System > Brake Line > Repair procedures

REMOVAL

1. Disconnect the brake hose(C) from the brake line(A) using a flare-nut wrench(B).



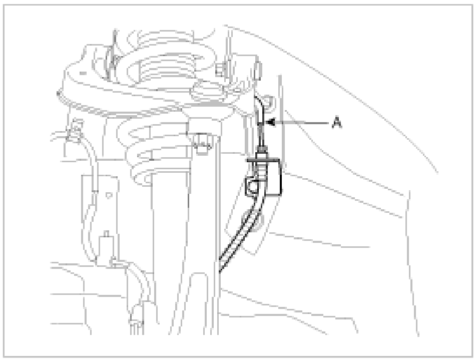
2. Remove the bracket mounting bolt(A), and then remove the brake hose(B).



3. Remove the connector bolt from the caliper, and disconnect the brake hose from the caliper.

INSTALLATION

1. Install a brake hose on the caliper with tightening brake hose bolt.
2. Install the bracket and the brake hose mounting bolt.



3. Connect the brake hose(A) to the brake line.
4. After installing the brake hose, bleed the brake system.

INSPECTION

• Check the brake tubes for cracks, crimps and corrosion.
• Check the brake hoses for cracks, damaged and oil leakage.
• Check the brake tube flare nuts for damage and oil leakage.

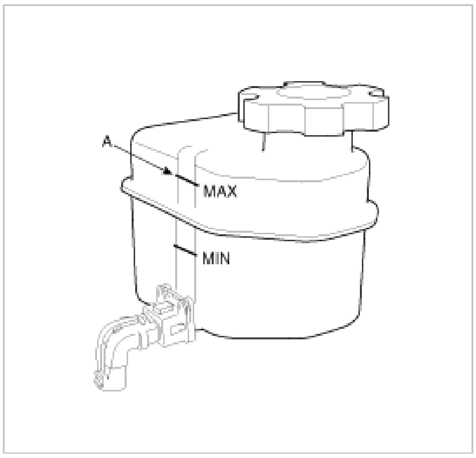
BRAKE SYSTEM BLEEDING

NOTE

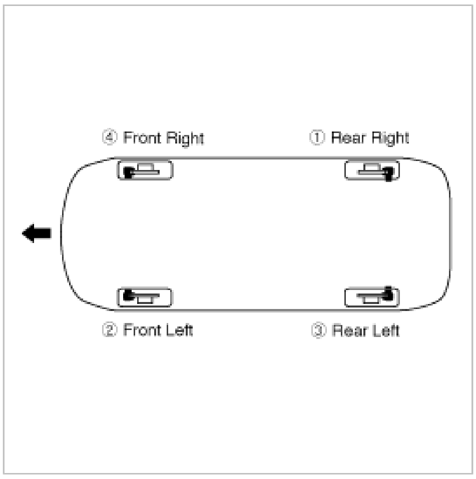
• Do not reuse the drained fluid.
• Always use Genuine DOT3 or DOT 4 Brake Fluid. Using a non-Genuine DOT or 4 brake fluid can cause corrosion and decrease the life of the system.
• Make sure no dirt of other foreign matter is allowed to contaminate the brake fluid.
• Do not spill brake fluid on the vehicle, it may damage the paint; if brake fluid does contact the paint, wash it off

immediately with water.
- The reservoir on the master cylinder must be at the MAX (upper) level mark at the start of bleeding procedure and checked after bleeding each brake caliper. Add fluid as required.

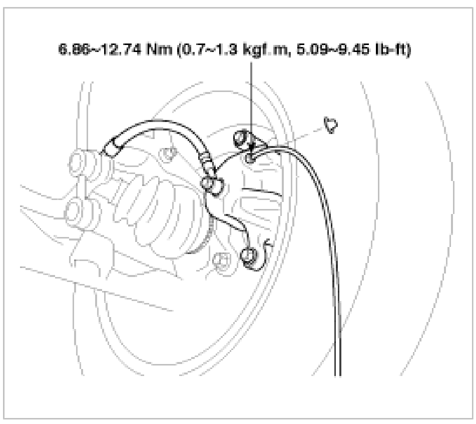
1. Make sure the brake fluid in the reservoir is at the MAX (upper) level line (A).



2. Have someone slowly pump the brake pedal several times, then apply pressure.
3. Lossen the right-rear brake bleed screw to allow air to escape from the system. Then tighten the bleed screw securely.
4. Repeat the procedure for wheel in the sequence shown below unit air bubbles no longer appear in the fluid.
5. Refill the master cylinder reservoir to MAX(upper) level line.

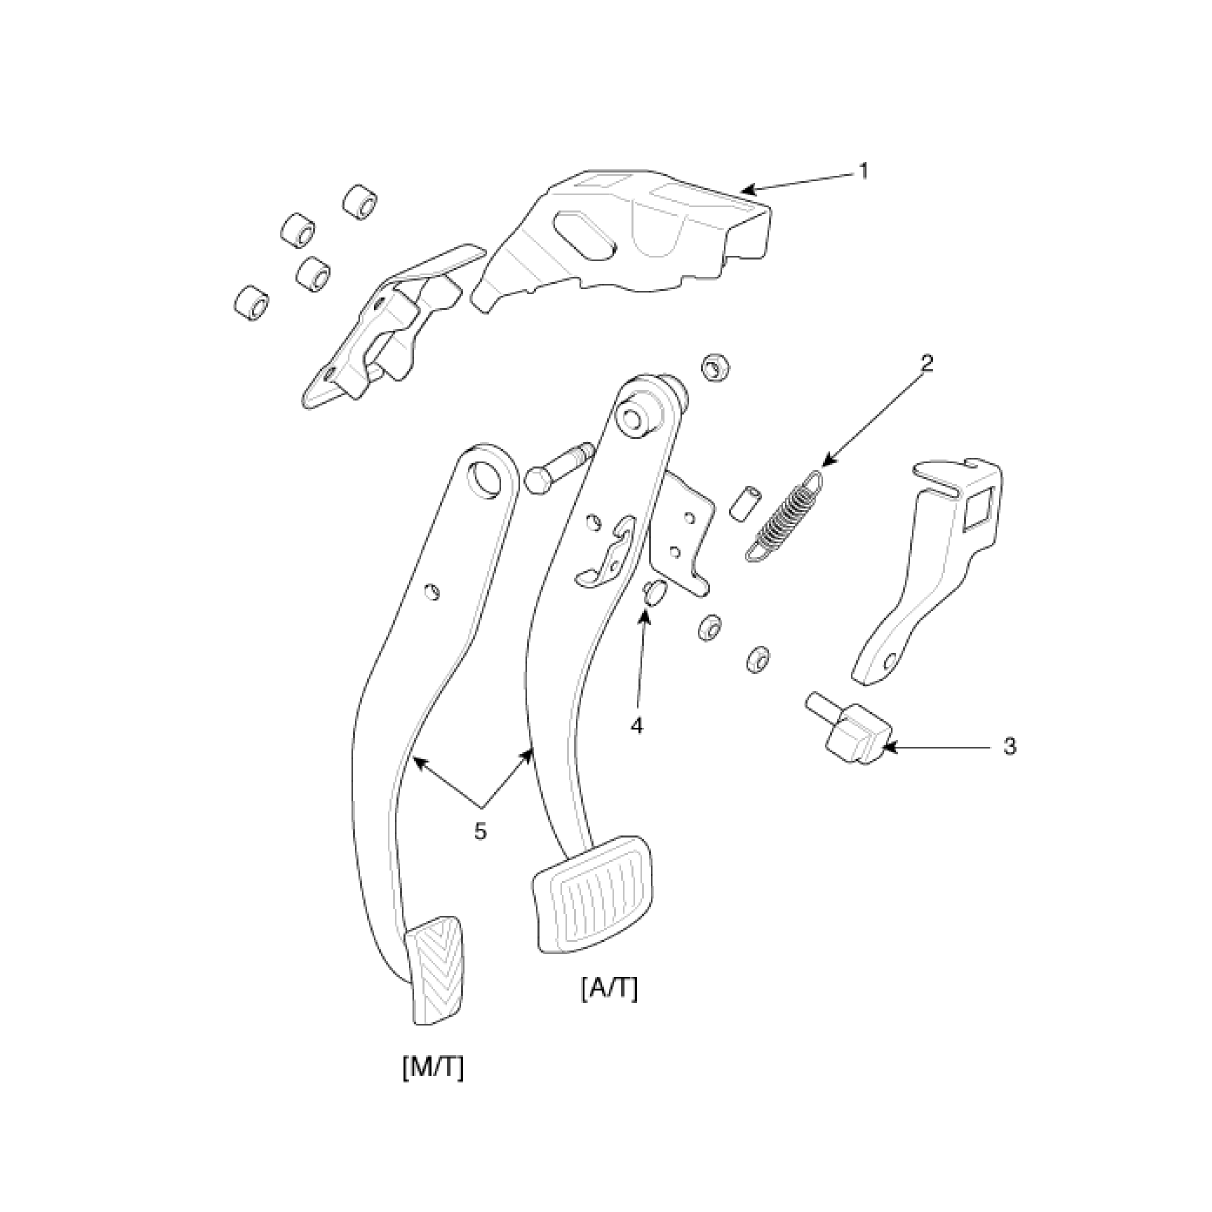


FRONT DISC BRAKE



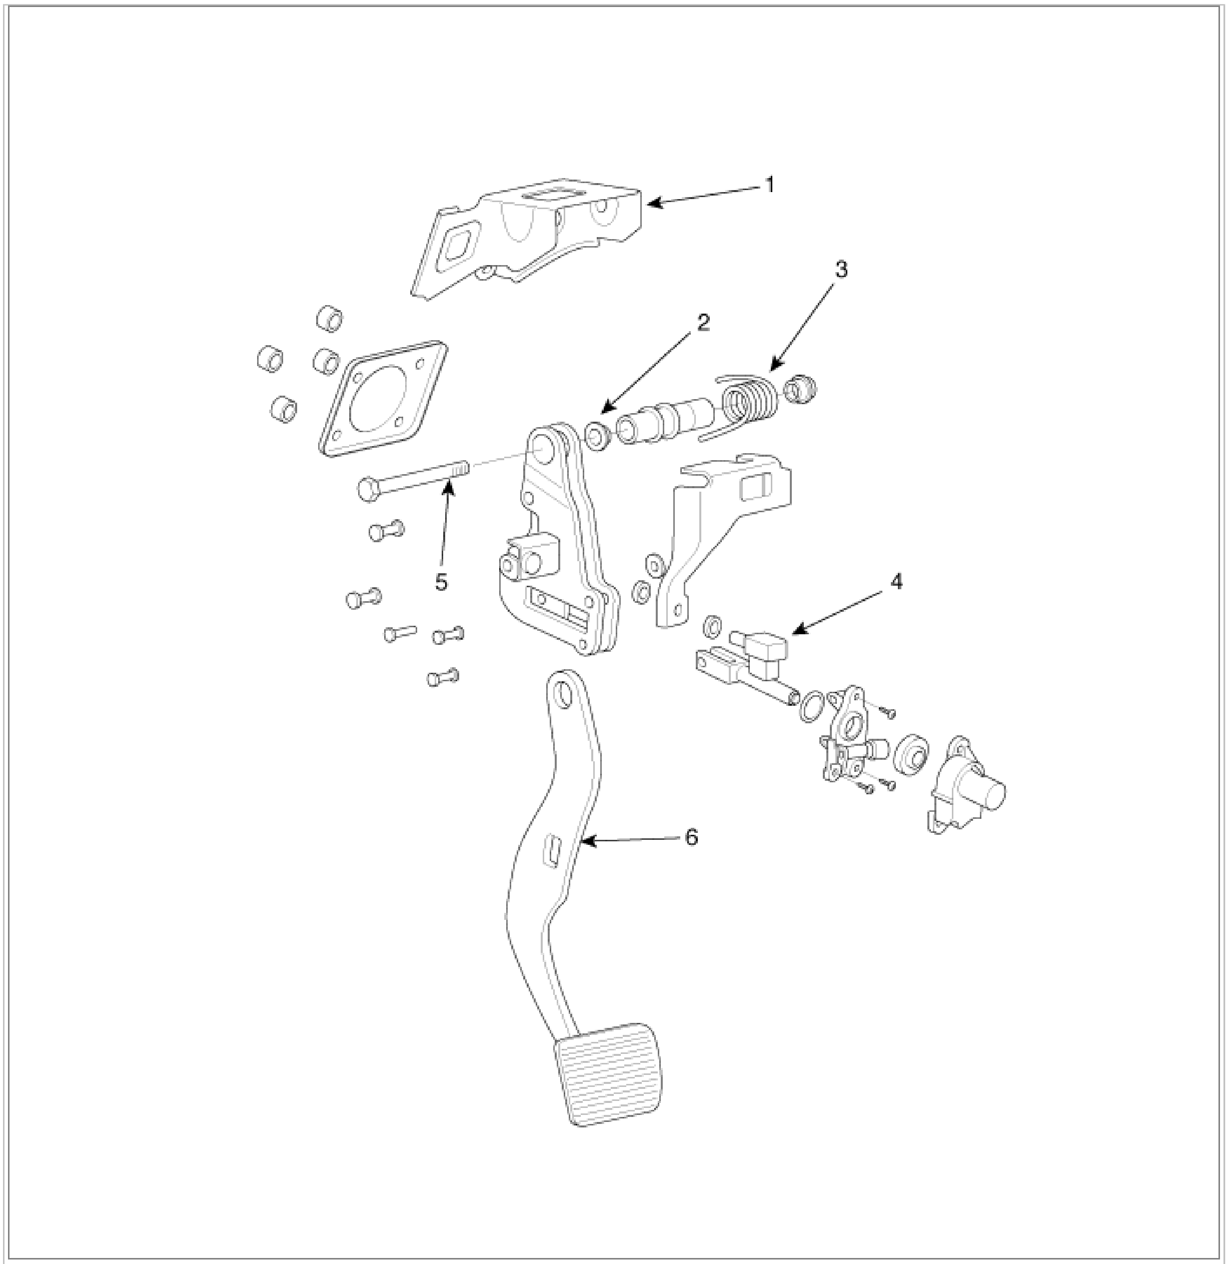
Brake System > Brake System > Brake Pedal > Components and Components Location

COMPONENTS



1. Member assembly bracket 2. Return spring 3. Stop lamp switch	4. Bushing 5. Brake pedal

COMPONENTS (ADJUSTABLE PEDAL)



1. Member assembly bracket
2. Bushing
3. Return spring
4. Stop lamp switch
5. Shaft bolt
6. Brake pedal

Brake System > Brake System > Brake Pedal > Repair procedures

REMOVAL

1. Remove the lower crash pad.(Refer to BD-"crash pad")
2. Pull down steering column shaft after removing 4 bolts.
3. Remove the stop lamp switch connector (A).
4. Remove the shift lock cable (A/T).

5. Remove the pin and snap pin.
6. Loosen the brake pedal member assembly mounting nuts and then remove the brake pedal assembly.

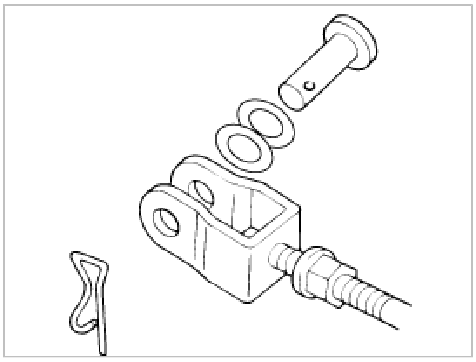
INSTALLATION

1. Installation is the reverse of removal.

> CAUTION
>
> Coat the inner surface of the bushings with the specified grease.

Specified grease : SAE J310

2. Before inserting the pin, apply the specified grease to the joint pin.



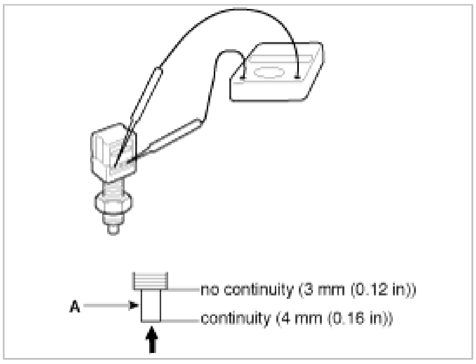
3. Install the snap pin.
4. Install the nuts with specified torque, when installing the brake pedal.

TORQUE : Nm(kgf·m,lb-ft); 12.74~15.68(1.3~1.6, 9.45~11.63)

5. Adjust the brake pedal height and free play.
6. Install the stop lamp switch.

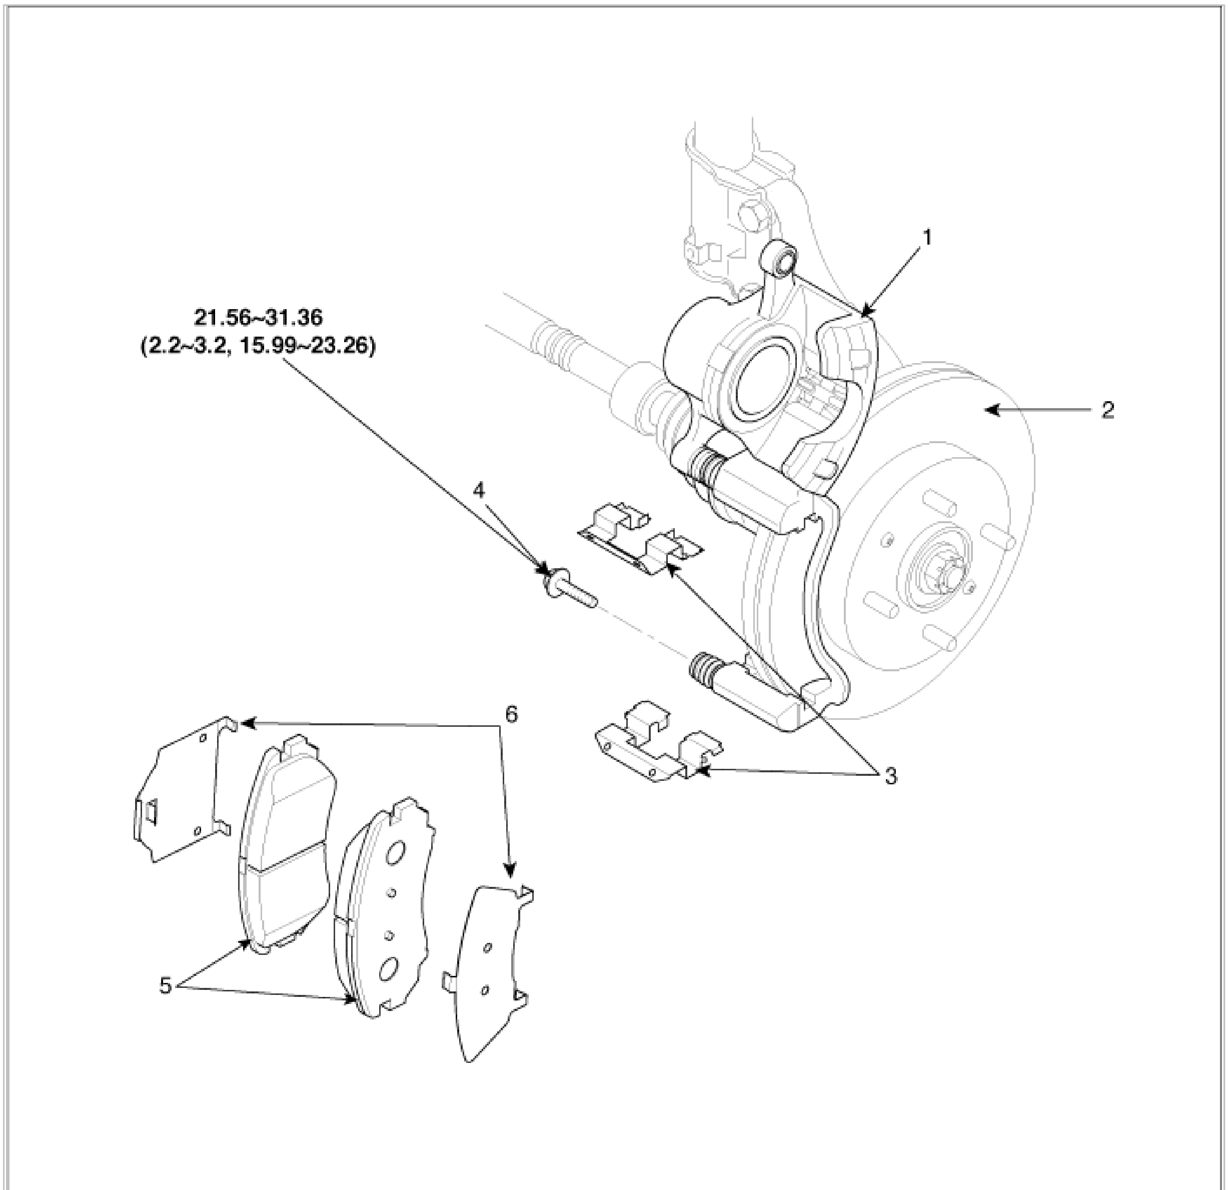
INSPECTION

1. Check the bushing for wear.
2. Check the brake pedal for bending or twisting.
3. Check the brake pedal return spring for damage.
4. Check the stop lamp switch.
   (1) Connect a circuit tester to the connector of stop lamp switch, and check whether or not there is continuity when the plunger of the stop lamp switch is pushed in and when it is released.
   (2) The stop lamp switch is in good condition if there is no continuity when plunger(A) is pushed.



Brake System > Brake System > Front Disc Brake > Components and Components Location

COMPONENTS



TORQUE: Nm (kgf.m, lb-ft)

1. Brake caliper
2. Brake disc
3. Pad retainers

5. Caliper mounting bolt
6. Washer
7. Caliper bracket
8. Caliper body
9. Piston seal
10. Piston
11. Piston boot
12. Inner shim
13. Brake pad
14. Pad retainer
15. Outer shim

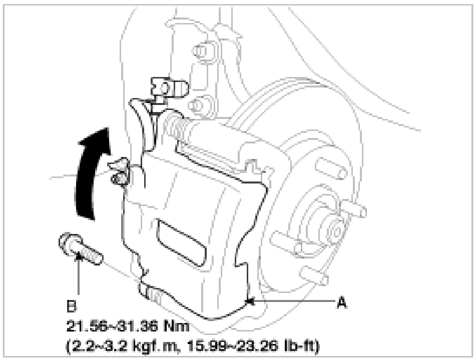
Brake System > Brake System > Front Disc Brake > Repair procedures

REMOVAL

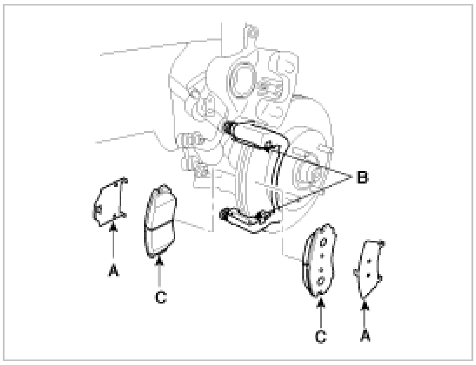
CAUTION

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.
- Avoid breathing dust particles.
- Never use on air hose or brush to clean brake assemblies.

1. Lossen the front wheel nuts slightly. Raise the front of the vehicle, and make sure it is securely supported. Remove the front wheels.
2. Remove the guide rod bolt(B), After raise the caliper assembly(A), support it with a wire.

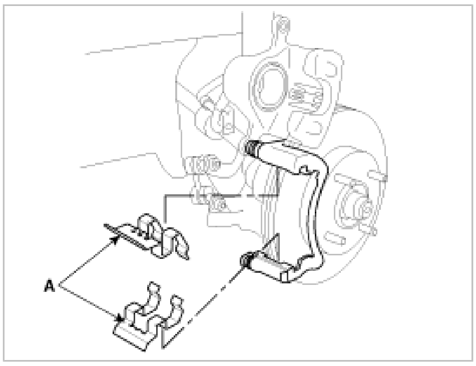


3. Remove pad shim(A), pad retainer(B) and pad assembly(C) in the caliper bracket.

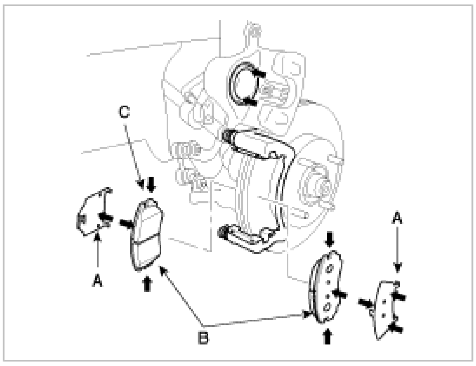


INSTALLATION

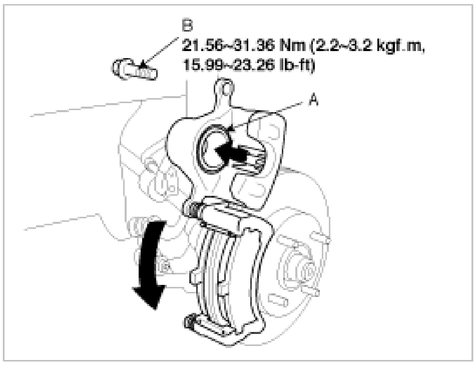
1. Install the pad retainers (A) on the caliper bracket.



2. Check the foreign material at the pad shims (A) and the back of the pads (B).
   Contaminated brake discs or pads reduce stopping ability. Keep grease off the discs and pads.

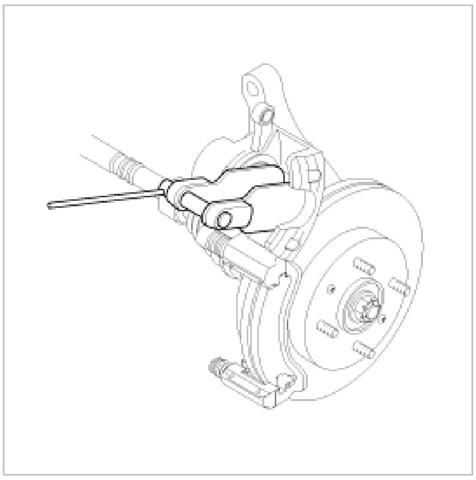


3. Install the brake pads (B) and pad shims (A) correctly. Install the pad with the wear indicator (C) on the inside.
   If you are reusing the pads, always reinstall the brake pads in their original positions to prevent a momentary loss of braking efficiency.
4. Push in the piston (A) so that the caliper will fit over the pads. Make sure that the piston boot is in position to prevent damaging it when pivoting the caliper down.
5. Pivot the caliper down into position. Being careful not to damage the pin boot, install the guide rod bolt (B) and torque it to proper specification.



NOTE

Insert the piston in the cylinder using the special tool (09581-11000).



6. Depress the brake pedal several times to make sure the brakes work, then test-drive.

NOTE

Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set.Several applications of the brake will restore the normal pedal stroke.
Be sure to do this before driving the vehicle.

7. After installation, check for leaks at hose and line joints or connections, and retighten if necessary.

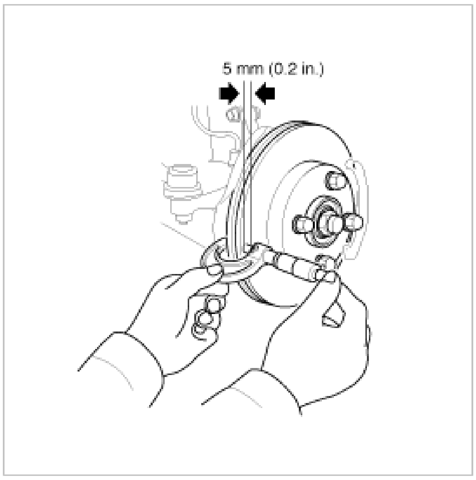
INSPECTION

FRONT BRAKE DISC THICKNESS CHECK

1. Remove all rust and contramination from the surface, and measure the disc thickness at 12 points, at least, of same distance (5mm) front the brake disc outer circle.

Front brake disc thickness
Standard value :
26.0 mm(1.024 in) - 2.4 L
28.0 mm(1.10 in) - 3.3 L
Limit :
24.4 mm(0.961 in) - 2.4 L
26.4 mm(1.04 in) - 3.3 L

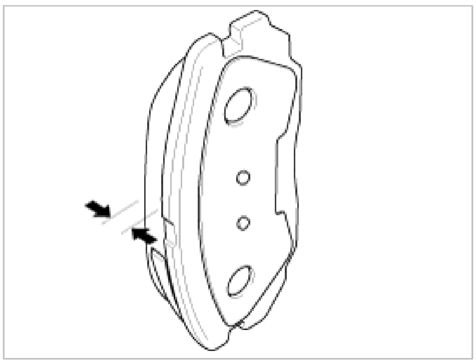
2. Thickness variation should not exceed 0.005mm (0.0002 in) (circumference) and 0.01 mm (0.0004 in)(radius) at any directions.
3. If wear exceeds the limit, replace the discs and pad assembly left and right of the vehicle.



FRONT BRAKE PAD CHECK

1. Check the pad wear. Measure the pad thickness and replace it, if it is less than the specified value.

Pad thickness
Standard value : 11 mm (0.43 in.)
Service limit : 3 ~ 4 mm (0.12 ~ 0.16 in.)



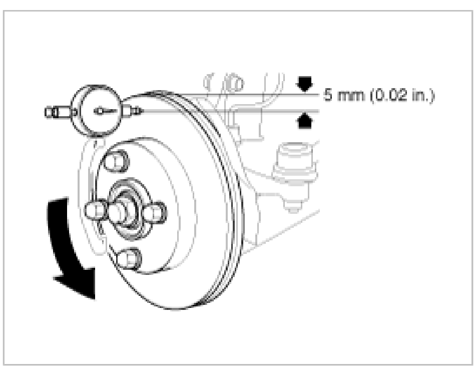
2. Check that grease is applied, to sliding contact points and the pad and backing metal for damage.

FRONT BRAKE DISC RUN OUT CHECK

1. Place a dial gauge about 5mm (0.2 in.) from the outer circumference of the brake disc, and measure the run out of the disc.

Brake disc run out
Limit : 0.04 mm (0.0016 in.) or less (new one)

2. If the run out of the brake disc exceeds the limit specification, replace the disc, and then measure the run out again.
3. If the run out does not exceed the limit specification, install the brake disc after turning it 180° and then check the run out of the brake disc again.
4. If the run out cannot be corrected by changing the position of the brake disc, replace the brake disc.



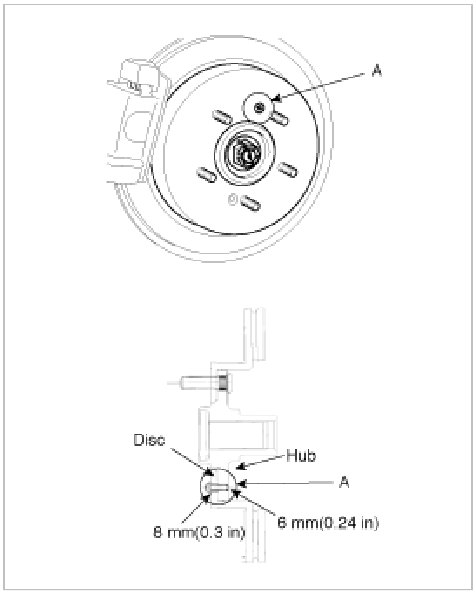
Seizing of Front brake disc

1. Remove the brake disc from hub using an M8 screw(A) if the brake disc has been seized with the hub due to corrosion or

overheating.

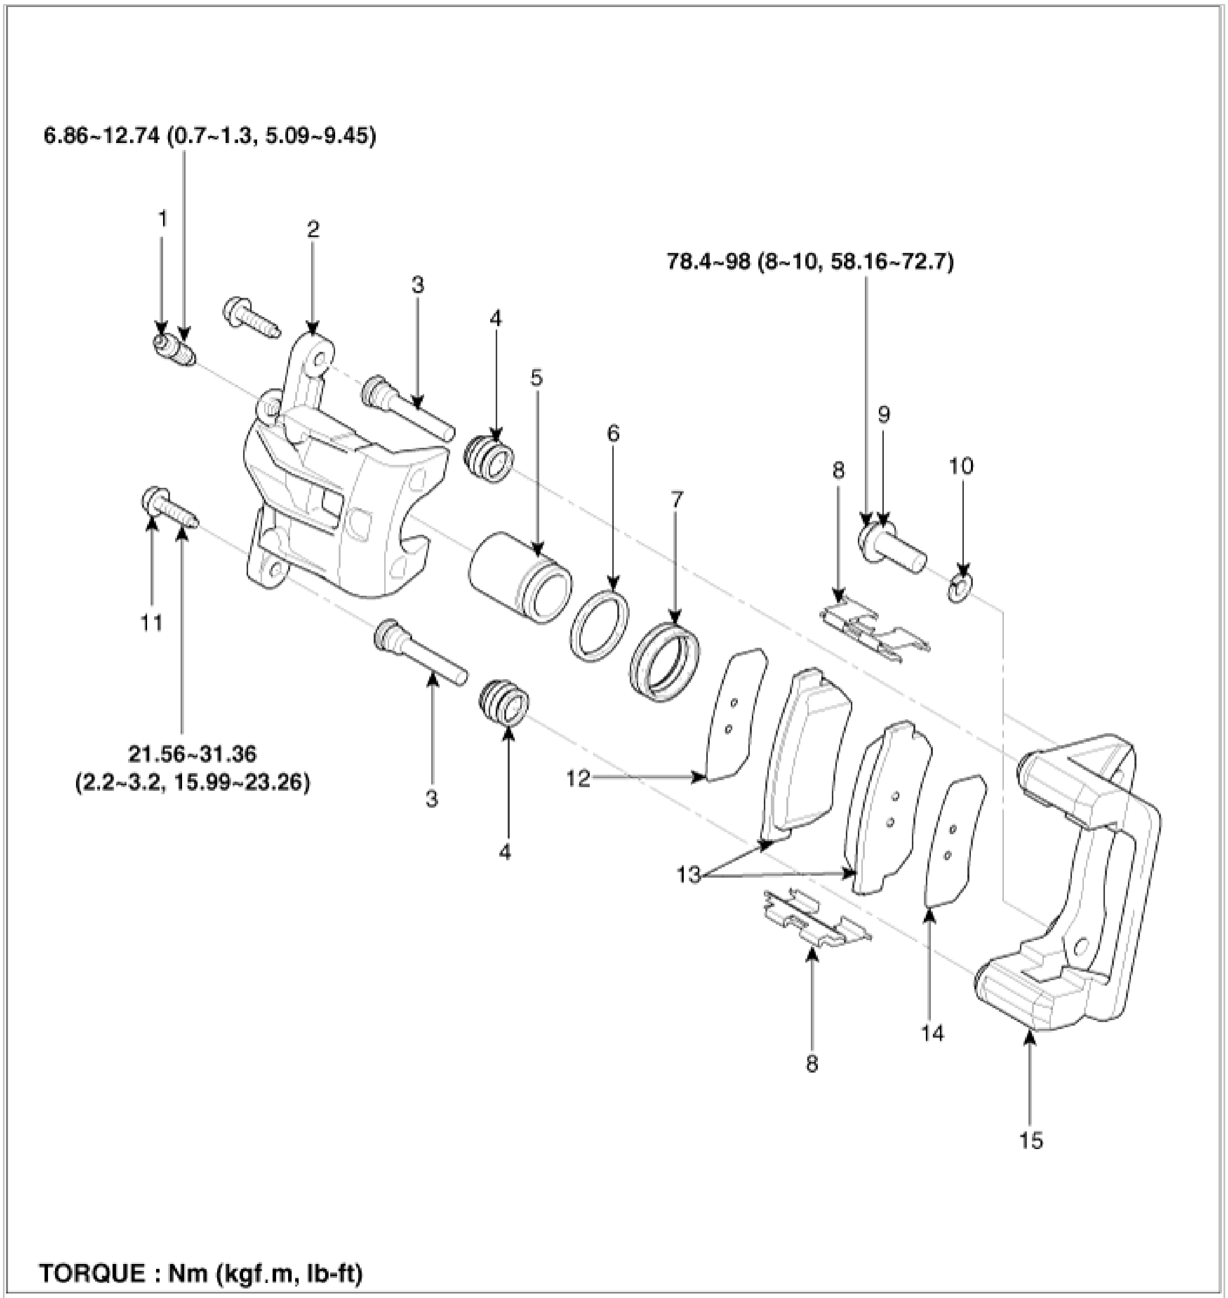
NOTE

Be careful not to use a hammer. The disc can be damaged if you remove the disc from the hub by hammering.



Brake System > Brake System > Rear Disc Brake > Components and Components Location

COMPONENTS

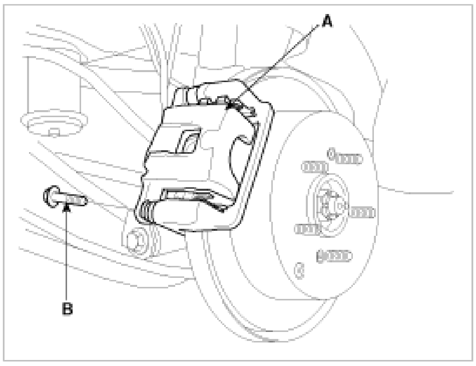


1. Bleeder screw	6. Piston seal	11. Guide rod bolt
2. Caliper body	7. Piston boot	12. Inner shim
3. Guide rod	8. Pad retainer	13. Brake Pad
4. Boot	9. Caliper mounting bolt	14. Outer shim
5. Piston	10. Washer	15. Caliper bracket

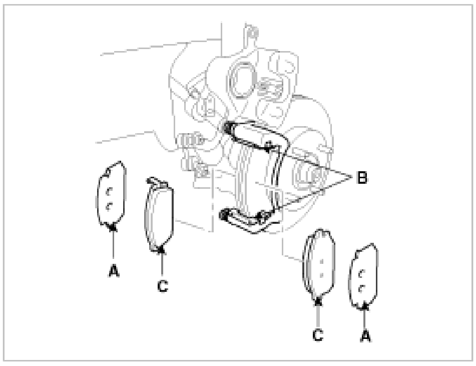
Brake System > Brake System > Rear Disc Brake > Repair procedures

REMOVAL

1. Raise the rear of the vehicle and make sure it is securely supported. Remove the rear wheel.
2. Remove the guide rod bolt(B), After raising the caliper assembly(A), support it with a wire.

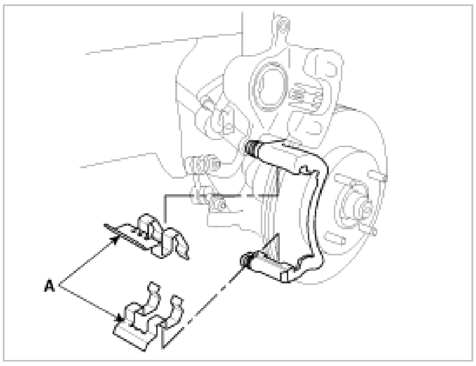


3. Remove pad shim(A), pad retainer(B) and pad assembly(C) in the caliper bracket.

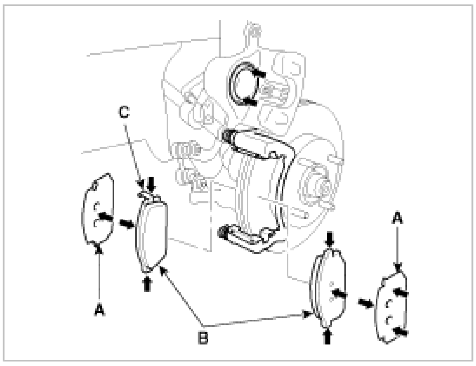


INSTALLATION

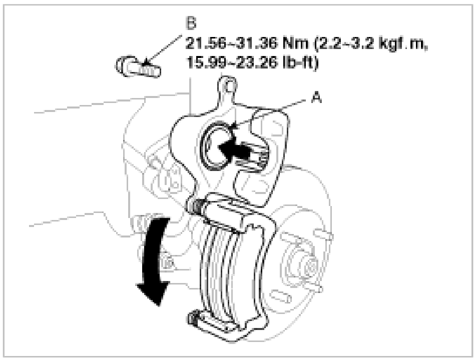
1. Install the pad retainers(A) on the caliper bracket.



2. Check for foreign material between the pad shim (A) and the back of the pads (B).

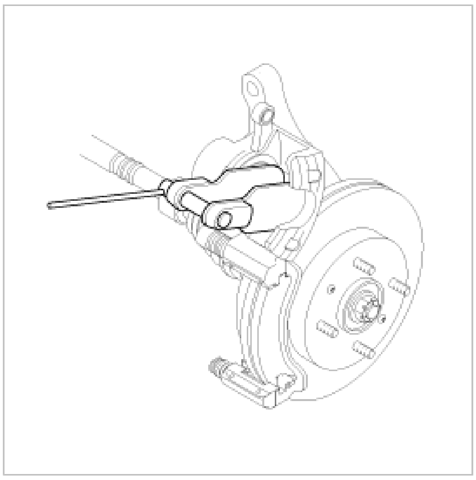


3. Contaminated brake discs or pads reduce stopping ability. Keep grease off the discs and pads.
4. Install the brake pads (B) and pad shims (A) correctly. Install the pad with the wear indicator (C) on the inside.
   If you are reusing the pads, always reinstall the brake pads in their original position to prevent a momentary loss of braking efficiency.
5. Push in the piston (A) so that the caliper will fit over the pads. Make sure that the piston boot is in position to prevent damaging it when pivoting the caliper down.
6. Pivot caliper down into position. Being careful not to damage the pin boot, install the guide rod bolt (B) and torque it to proper specification



NOTE

Insert the piston in the cylinder using the special tool(09581-11000).



7. Depress the brake pedal several time to make sure the brakes work, then test-drive.

NOTE

Engagement of the brake may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake will restore the normal pedal stroke.

8. After installaion, check for leaks at hose and line joints or connections, and retighten if necessary.

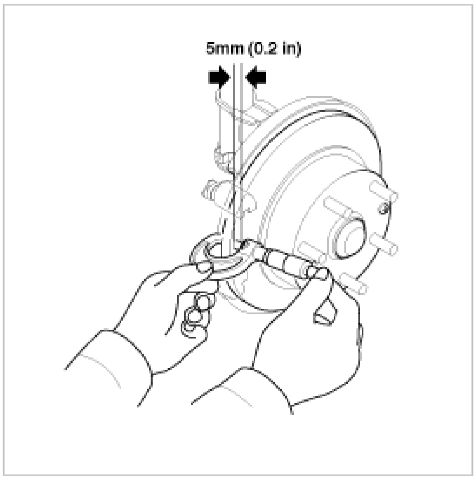
INSPECTION

REAR BRAKE DISC THICKNESS CHECK

1. Remove all rust and contamination from the disc surface, and then measure the disc thickness at 8 points, al least, of the same distance (5 mm(0.12 in)) from the brake disk outer circle.

Rear brake disc thickness
Standard value : 10.0 mm (0.39 in)
Limit : 8.4 mm (0.33 in)

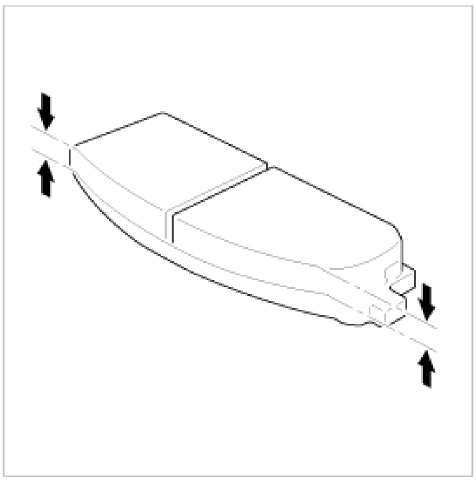
2. Thickness variation should not exceed 0.01 mm(0.0004 in) (circumference) and 0.01 mm(0.0004 in) (radius) at any directions.
3. If wear exceeds the limit, replace the discs and pad assembly for left and right of the vehicle.



REAR BRAKE PAD CHECK

1. Check the pad wear. Measure the pad thickness and replace it, if it is less than the specified value.

Pad thickness
Standard value :
10.0 mm (0.39 in) - 2.4 L
15.0 mm (0.59 in) - 3.3 L
Service limit : 3.0 mm (0.12 in)

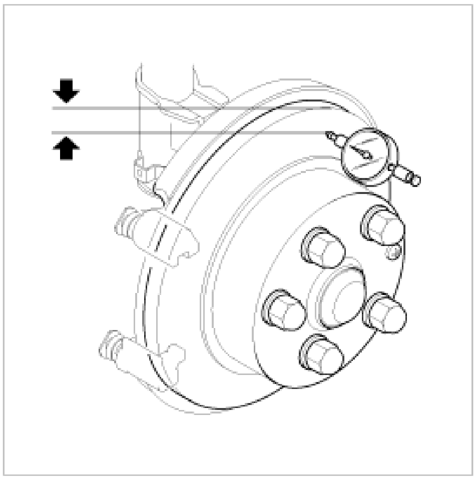


2. Check that grease is applied, and the pad and backing metal for damage.

REAR BRAKE DISC RUN OUT CHECK

1. Place a dial gauge about 5 mm (0.2 in) from the outer circumference of the brake disc, and measure the run out of the disc.

Brake disc run out
Limit : 0.05 mm (0.002 in) or less (new one)

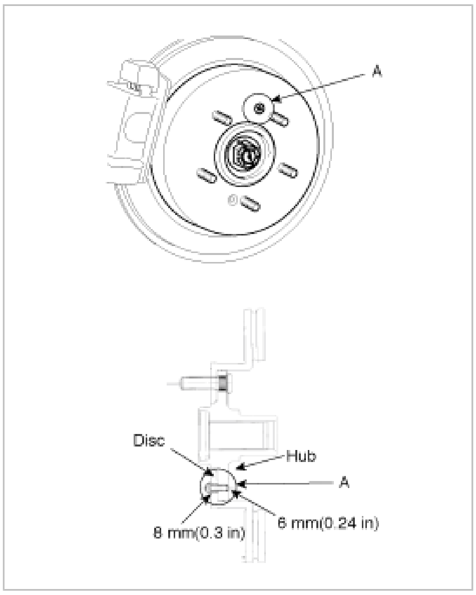


2. If the run out of the brake disc exceeds the limit specification, replace the disc, and then measure the run out again.
3. If the run out does not exceed the limit specification, install the brake disc after turning it 180° and then check the run out of the brake disc again.
4. If the run out cannot be corrected by changing the position of the brake disc, replace the brake disc.

Seizing of Rear brake disc

1. Remove the brake disc from hub using an M8 screw(A) if the brake disc has been seized with the hub due to corrosion or overheating.

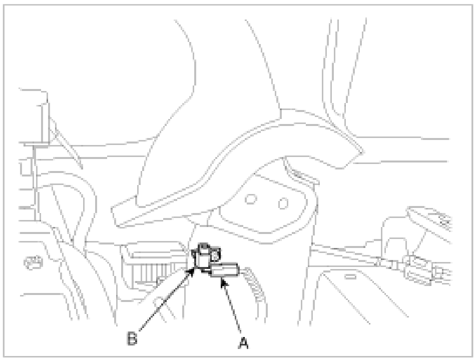
> **NOTE**
>
> Be careful not to use a hammer. The disc can be damaged if you remove the disc from the hub by hammering.



Brake System > Parking Brake System > Parking Brake Switch > Repair procedures

INSPECTION

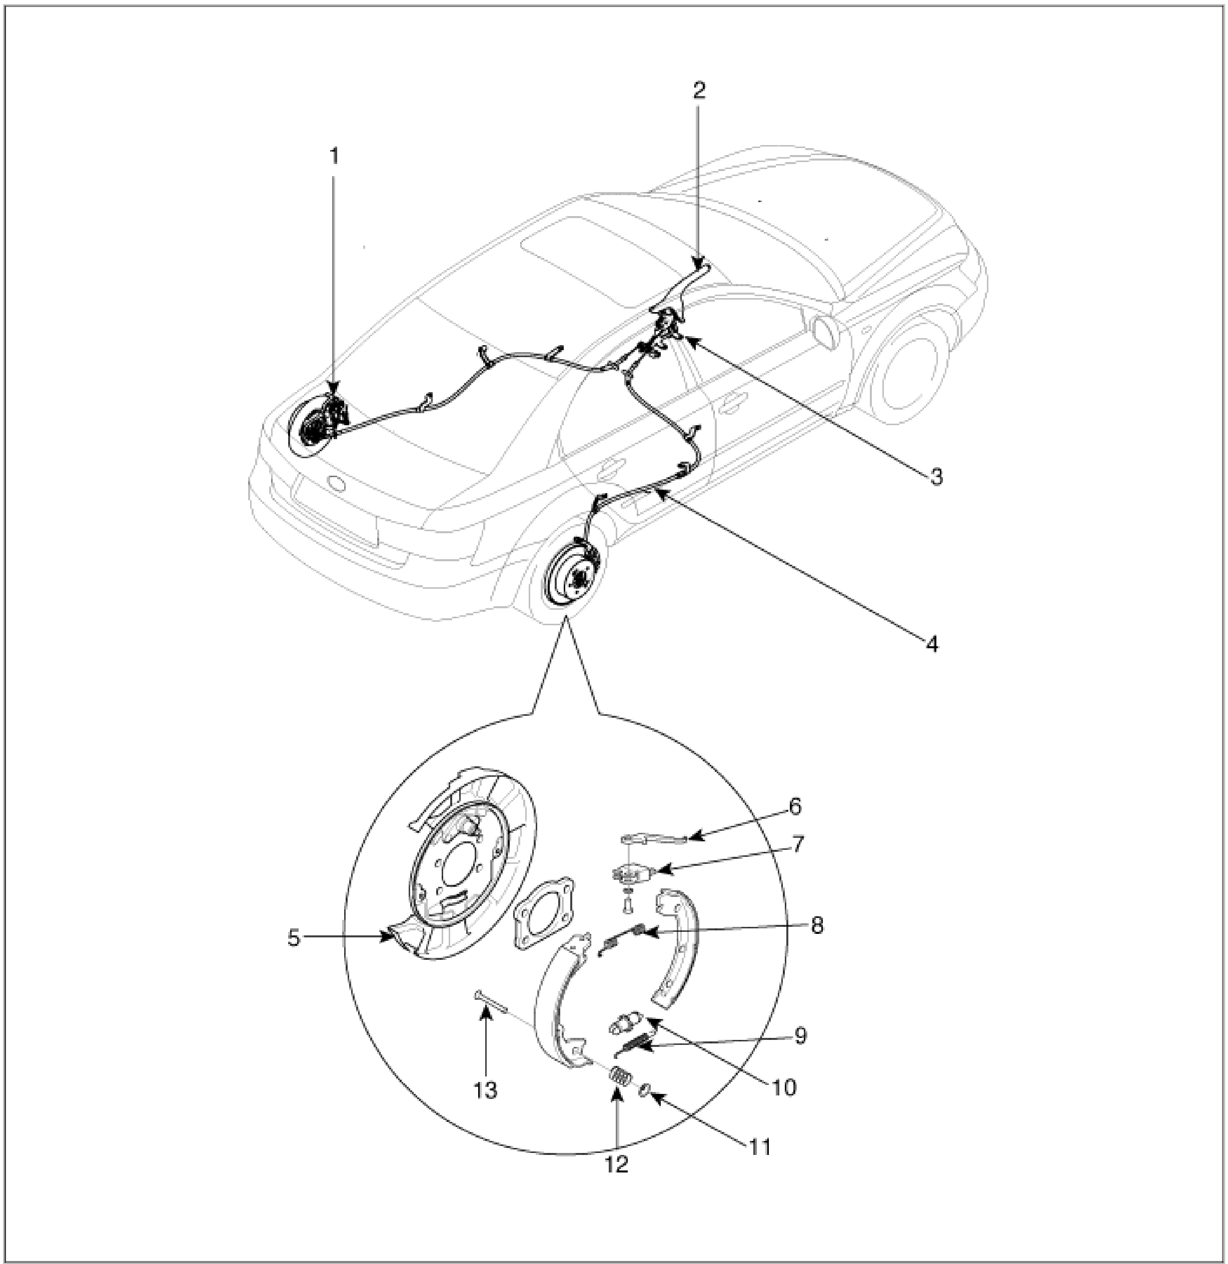
1. Remove the floor console and the connector(B) from the switch(A).



2. Inspect the continuity between (-) terminal and the ground.
   A. When the brake lever is pulled, there should be the continuity between them.
   B. When the brake lever is released, there should be no continuity between them.

Brake System > Parking Brake System > Parking Brake Assembly > Components and Components Location

COMPONENTS



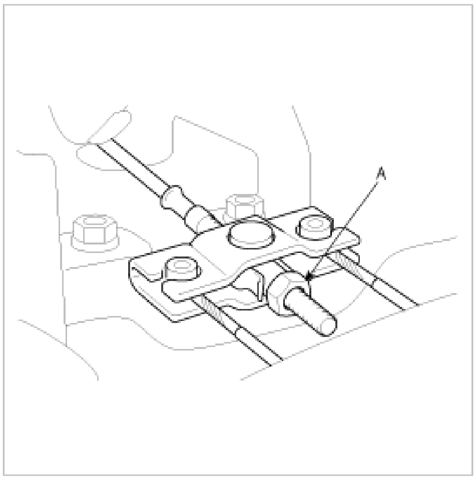
1. Rear brake caliper	6. Operating lever	11. Cup washer
2. Parking brake lever	7. Strut	12. Shoe hold down spring
3. Parking brake switch	8. Upper spring	13. Shoe hold down pin
4. Parking brake cable	9. Lower spring	
5. Backing plate	10. Adjuster	

Brake System > Parking Brake System > Parking Brake Assembly > Repair procedures

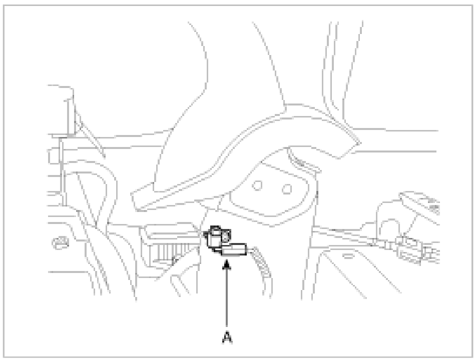
REMOVAL

> NOTE
>
> The parking brake cables must not be bent or distorted.
> This will lead to stiff operation and premature failure.

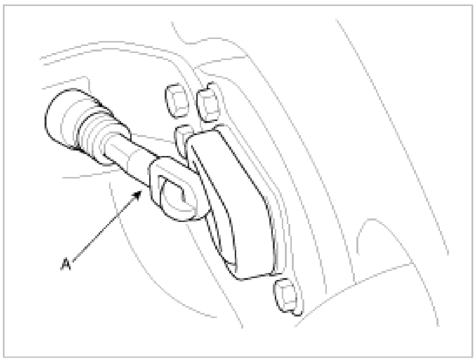
1. Remove the floor console.
2. Loosen the adjusting nut (A) and remove the parking brake cables.



3. Disconnect the connector(A) of the parking brake switch connector.



4. Remove the bolts and parking brake lever assembly(A).
5. Remove the wheel and tire.
6. Remove the brake disc and the brake shoe (Refer to the rear disc brake).
7. Remove the parking brake hook(A).



8. Remove the parking brake cable assembly.

INSTALLATION

1. Install the removed parts in the reverse order of removal.
2. Apply the specified grease to each sliding parts of the ratchet plate or the ratchet pawl.

Specified grease :
Multi purpose grease SAE J310, NLGI No.2

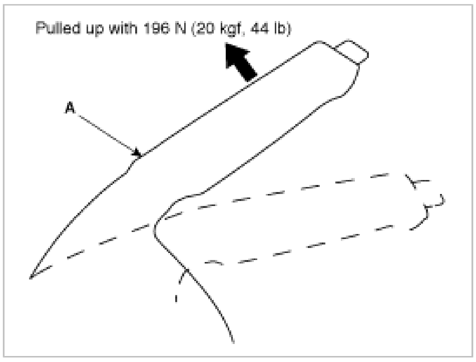
3. After installing the parking brake cable adjuster, adjust the parking brake lever stroke (Refer to the parking brake check and adjustment).

Parking brake check and adjustment

INSPECTION

1. Pull the parking brake lever (A) with 196 N (20 kgf, 44 lbf) force to fully apply the parking brake. The parking brake lever should be locked within the specified number of clicks.

   Lever locked clicks : 8

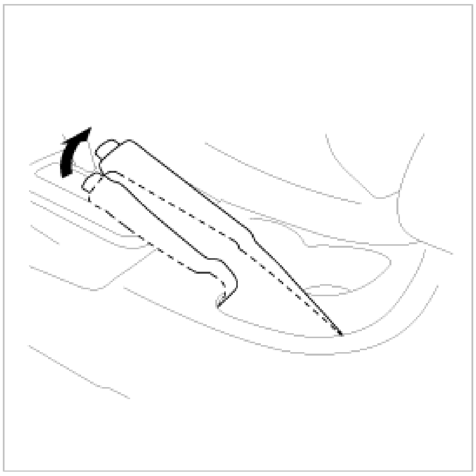
   


2. Adjust the parking brake if the lever clicks are out of specification.

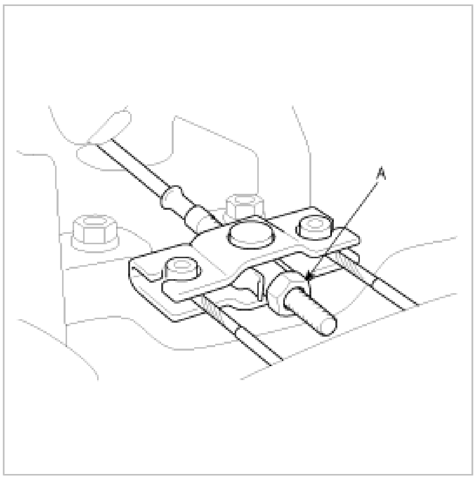
ADJUSTMENT

> **NOTE**
>
> After rear brake caliper servicing, loosen the parking brake adjusting nut, start the engine and depress the brake pedal several times to set the self-adjusting brake before adjusting the parking brake.

1. Block the front wheels, then raise the rear of the vehicle and make sure it is securely supported.
2. Pull the parking brake lever up one click.

3. Remove the floor console.
4. Tighten the adjusting nut (A) until the parking brakes are dragged slightly when the rear wheels are turned.

5. Release the parking brake lever completely, and check if parking brakes are not dragged when the rear wheels are turned.

Readjust if necessary.

6. Make sure that the parking brakes are fully applied when the parking brake lever is pulled up completly.
7. Reinstall the floor console.

Brake System > ABS(Anti-Lock Brake System) > Description and Operation

DESCRIPTION

This specification applies to HCU(Hydraulic Control Unit) and ECU(Electronic Control Unit) of the HECU.(Hydraulic and Electronic Control Unit)
This specification is for the wiring design and installation of ABS/TCS/ESC ECU.
This unit has the functions as follows.

- Input of signal from Pressure sensor, Steering angle sensor, Yaw & Lateral G sensor, the wheel speed sensors attached to each wheel.
- Control of braking force / traction force/ yaw moment.
- Failsafe function.
- Self diagnosis function.
- Interface with the external diagnosis tester.

Installation position : engine compartment

- Brake tube length from Master cylinder port to HECU inlet port should be max. 1m
- The position should not be close to the engine block and not lower than the wheel.

OPERATION

The ECU shall be put into operation by switching on the operating voltage (IGN).
On completion of the initialization phase, the ECU shall be ready for operation.
In the operating condition, the ECU shall be ready, within the specified limits (voltage and temperature), to process the signals offered by the various sensors and switches in accordance with the control algorithm defined by the software and to control the hydraulic and electrical actuators.

Wheel Sensor signal processing

The ECU shall receive wheel speed signal from the four active wheel sensors.
The wheel signals are converted to voltage signal by the signal conditioning circuit after receiving current signal from active wheel sensors and given as input to the MCU.

Solenoid Valve Control

When one side of the valve coil is connected to the positive voltage that is provided through the valve relay and the other side is connected to the ground by the semiconductor circuit, the solenoid valve goes into operation.
The electrical function of the coils are always monitored by the valve test pulse under normal operation conditions.

Voltage limits

- Overvoltage
  When overvoltage is detected(above 16V), the ECU switches off the valve relay and shuts down the system.
  When voltage is returned to operating range, the system goes back to the normal condition after the initialization phase.
- Undervoltage
  In the event of undervoltage(below 10V), ABS control shall be inhibited and the warning lamp shall be turned on.
  When voltage is returned to operating range, the warning lamp is switched off and ECU returns to normal operating mode.

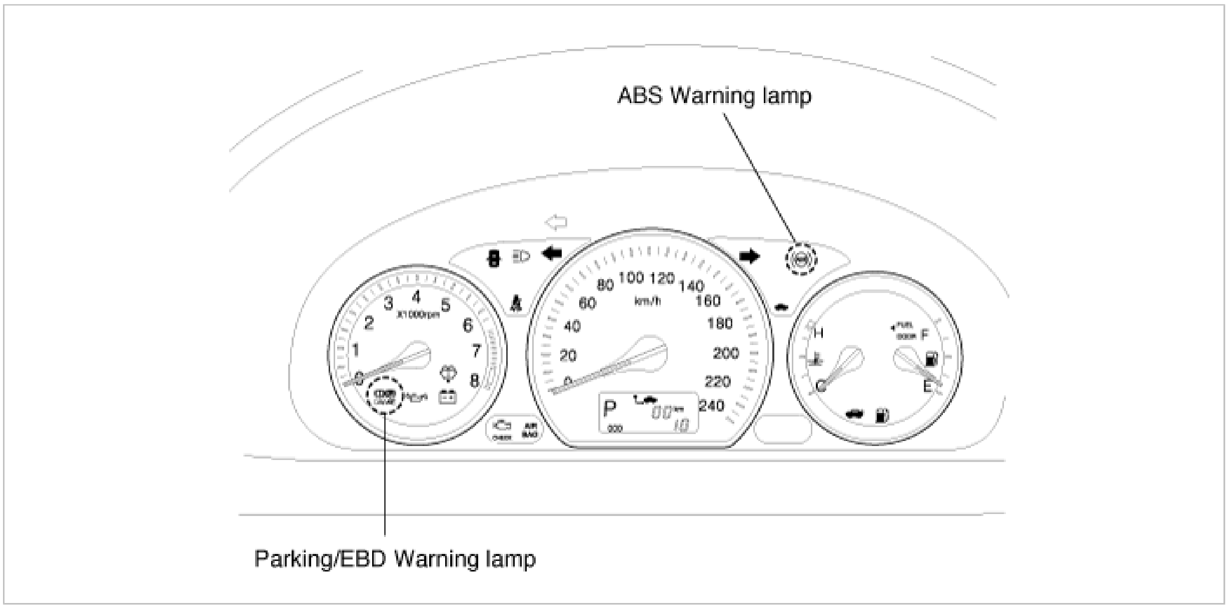
Pump Motor Checking

The ECU performs a pump motor test at a speed of 15km/h once after IGN is switched on.

Diagnostic Interface

Failures detected by the ECU are encoded on the ECU, stored in a EEPROM and read out by diagnostic equipment when the ignition switch is turned on.
The diagnosis interface can also be used for testing the ECU during production of the ECU and for actuating the HCU in the test line of manufactories (Air-bleeding line or Roll and Brake Test line).

Warning Lamp module

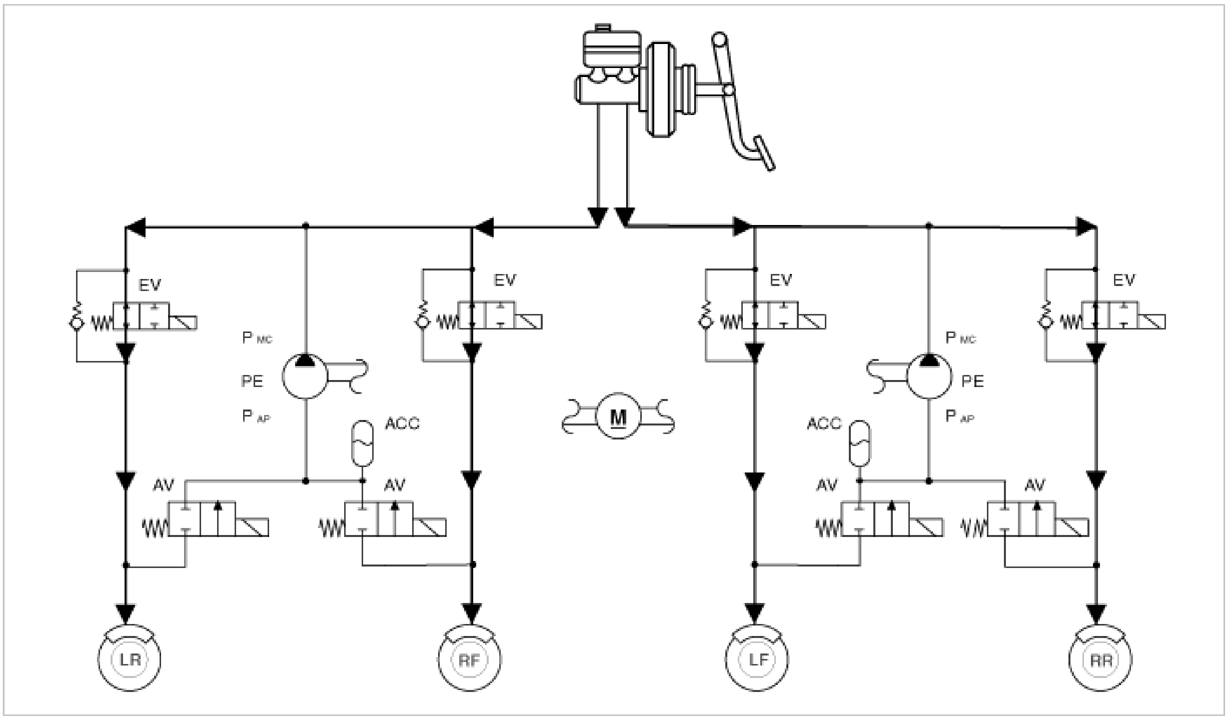


1. ABS WARNING LAMP MODULE
   The active ABS warning lamp module indicates the selftest and failure status of the ABS.The ABS warning lamp shall be on:
   A. During the initialization phase after IGN ON. (continuously 3 seconds).
   B. In the event of inhibition of ABS functions by failure.
   C. During diagnostic mode.
   D. When the ECU Connector is seperated from ECU.
2. PARKING/EBD WARNING LAMP MODULE
   The active EBD warning lamp module indicates the selftest and failure status of the EBD.However, in case the Parking Brake Switch is turned on, the EBD warning lamp is always turned on regardless of EBD functions.The EBD warning lamp shall be on:
   A. During the initialization phase after IGN ON. (continuously 3 seconds).
   B. When the Parking Brake Switch is ON or brake fluid level is low.
   C. When the EBD function is out of order.
   D. During diagnostic mode.
   E. When the ECU Connector is seperated from ECU.

ABS CONTROL

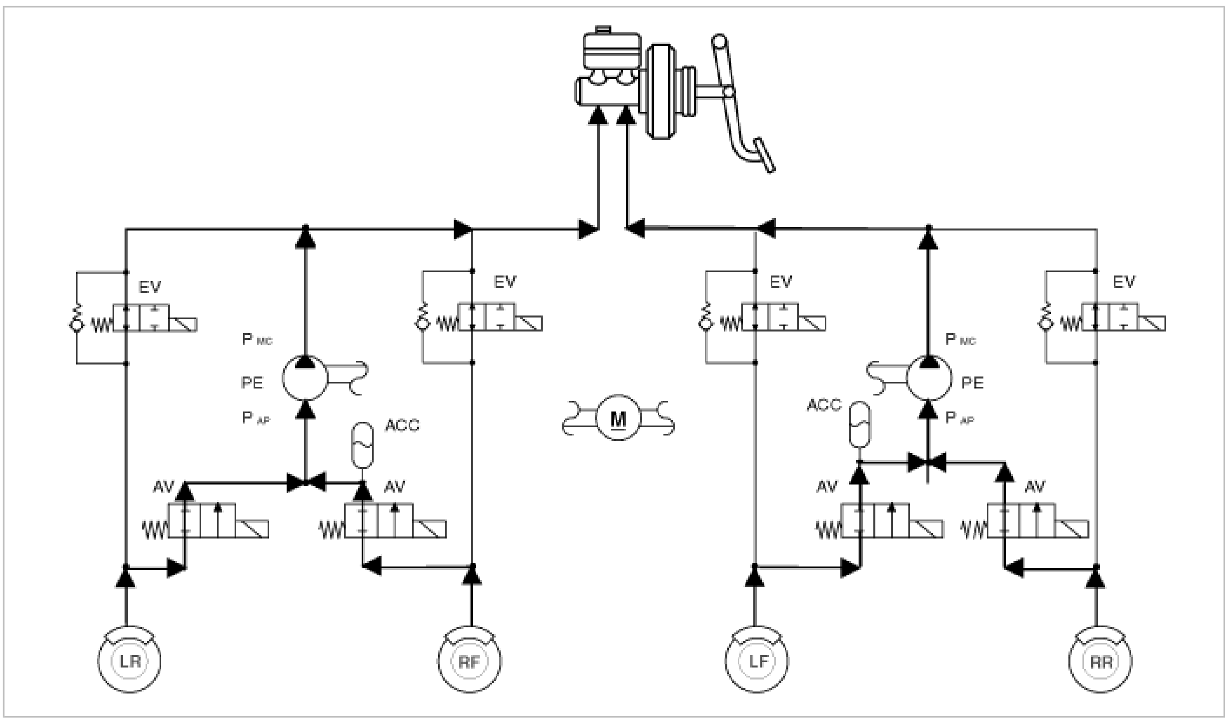
1. NORMAL BRAKING without ABS

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Open	Close	OFF



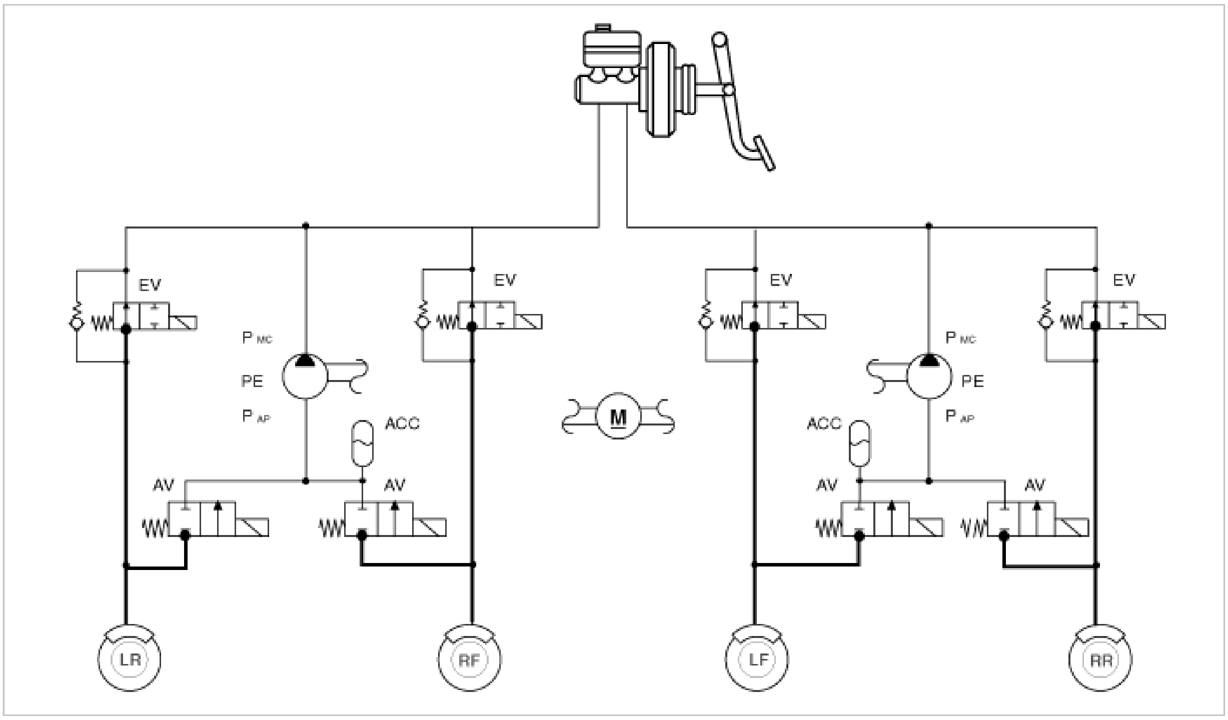
2. DECREASE MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Close	Open	ON(Motor speed control)



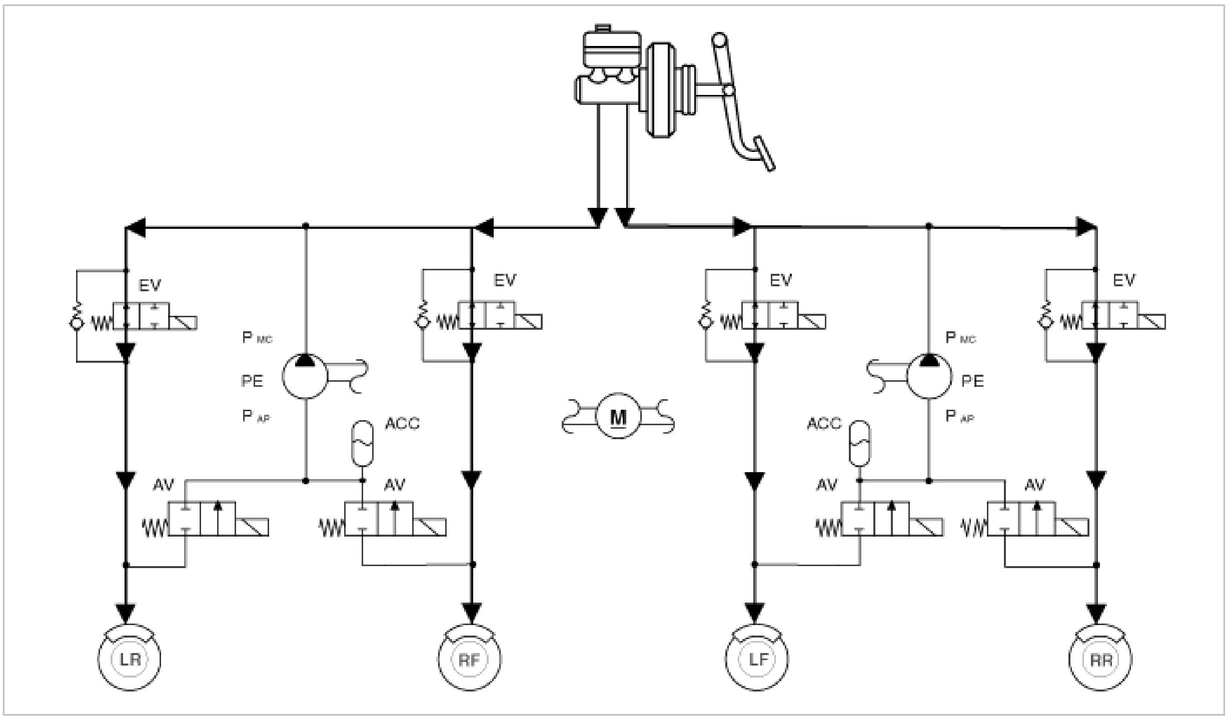
3. HOLD MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Close	Close	OFF



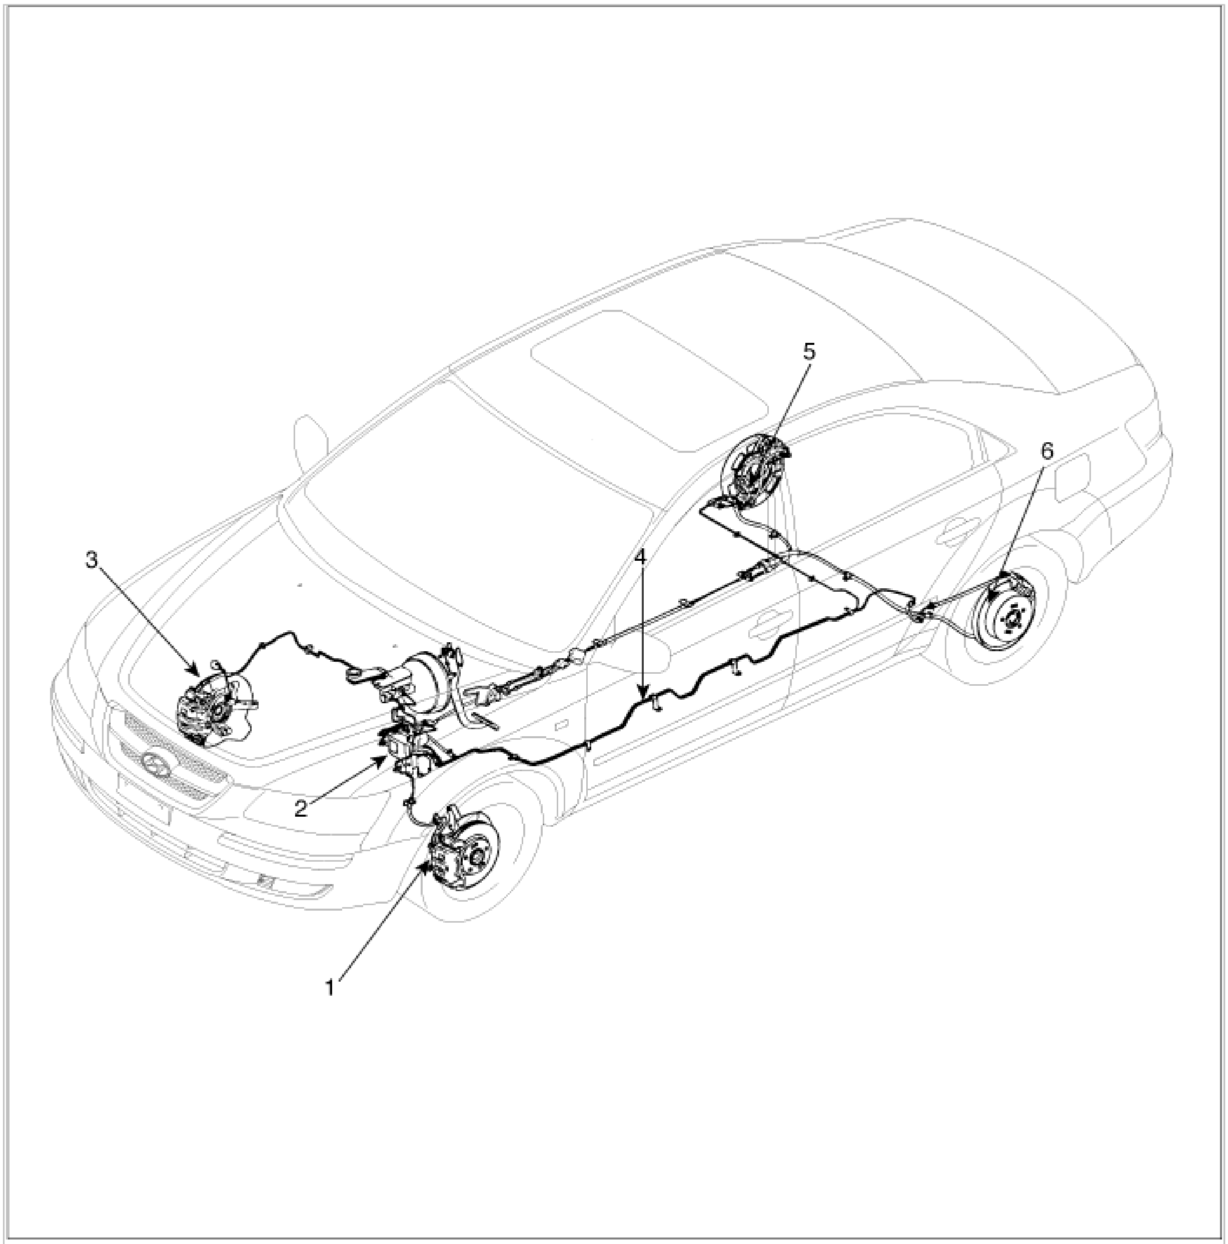
4. INCREASE MODE

	Inlet valve(EV)	Outlet valve(AV)	Pump motor
Operation	Open	Close	OFF



Brake System > ABS(Anti-Lock Brake System) > Components and Components Location

COMPONENTS

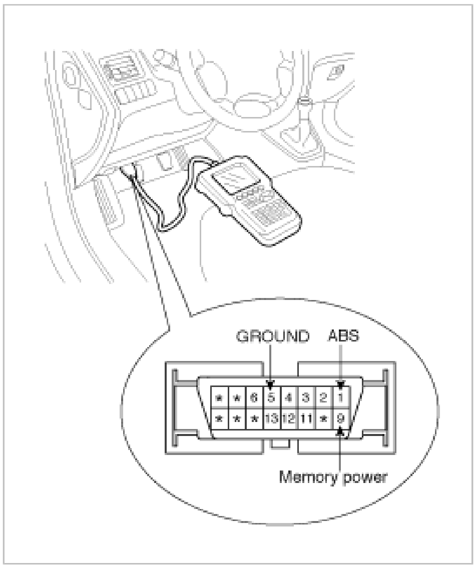


1. Front left wheel speed sensor
2. ABS control module(HECU)
3. Front right wheel speed sensor
4. Hydrauric line
5. Rear right wheel speed sensor
6. Rear left wheel speed sensor

Brake System > ABS(Anti-Lock Brake System) > Troubleshooting

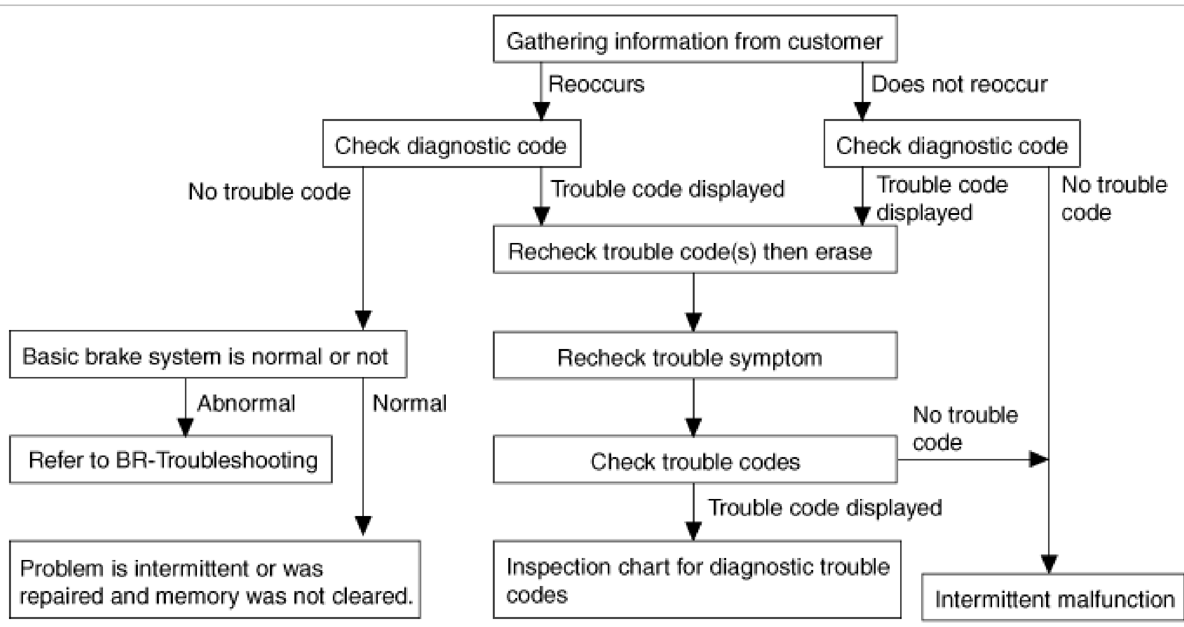
HI-SCAN (PRO) CHECK

1. Turn the ignition switch OFF.
2. Connector the Hi-scan(pro) to the 16P data link connector located the driver's side kick panel.



3. Turn the ignition switch ON.
4. Check for diagnostic trouble using the Hi-scan(pro)
5. After completion trouble of the repair or correction of the problem, erase the stored fault codes the clear key on the Hi-scan (pro).
6. Disconnect the Hi-scan(pro) from the 16P data link connector.

STANDARD FLOW OF DIAGNOSTIC TROUBLESHOOTING



*** Using the customer problem analysis check sheet for reference, ask the customer as much detail as possible about the problem.**

NOTES WITH REGARD TO DIAGNOSIS

The phenomena listed in the following table are not abnormal.

Phenomenon	Explanation
System check sound	When starting the engine, a thudding sound can sometimes be heard coming from inside the engine compartment. This is because the system operation check is being performed.
ABS operation sound	1. Sound of the motor inside the ABS hydraulic unit operation (whine). 2. Sound is generated along with vibration of the brake pedal (scraping). 3. When ABS operates, sound is generated from the vehicle chassis due to repeated brake application and release (Thump : suspension; squeak: tires)

ABS operation (Long braking distance)	For road surfaces such as snow-covered and gravel roads, the braking distance for vehicles with ABS can sometimes be longer than that for other vehicles. Accordingly, advise the customer to drive safely on such roads by lowering the vehicle speed.
Diagnosis detection conditions can vary depending on the diagnosis code. When checking the trouble symptom after the diagnosis code has been erased, ensure that the requirements listed in "Comment" are met.	

ABS CHECK SHEET

ABS Check Sheet

Inspector's Name

Customer's Name		Registration No.	
		Registration Year	/ /
		VIN.	
Date Vehicle Brought In	/ /	Odometer	Km Miles

Date the Problem First Occurred	/ /
Frequency of Occurence of Problem	☐ Continuous ☐ Intermittent (times a day)

Symptoms	☐ ABS does not operate.	
	☐ ABS does not operate efficiently.	☐ Intermittent (times a day)
	ABS Warning Light Abnormal	☐ Remains ON ☐ Does not light up

Diagnostic Trouble Code Check	1st Time	☐ Normal Code	☐ Malfunction Code (Code)
	2nd Time	☐ Normal Code	☐ Malfunction Code (Code)

PROBLEM SYMPTOMS TABLE

Symptom	Suspect Area	See page
ABS does not operate.	Only when 1. -4. are all normal and the problem is still occurring, replace the HECU. 1. Check the DTC reconfirming that the normal code is output. 2. Power source circuit. 3. Speed sensor circuit. 4. Check the hydraulic circuit for leakage.	BR - 75
ABS does not operate intermittently.	Only when 1. -4. are all normal and the problem is still occurring, replace the ABS actuator assembly. 1. Check the DTC reconfirming that the normal code is output. 2. Wheel speed sensor circuit. 3. Stop lamp switch circuit.	BR - 77

	4. Check the hydraulic circuit for leakage.	
Communication with Hi-scan (pro) is not possible. (Communication with any system is not possible)	1. Power source circuit 2. Diagnosis line	BR - 79
Communication with Hi-scan (pro) is not possible. (Communication with ABS only is not possible)	1. Power source circuit 2. Diagnosis line 3. HECU	BR - 80
When ignition key is turned ON (engine OFF), the ABS warning lamp does not light up.	1. ABS warning lamp circuit 2. HECU	BR - 81
Even after the engine is started, the ABS warning lamp remains ON.	1. ABS warning lamp circuit 2. HECU	BR - 82

CAUTION

During ABS operation, the brake pedal may vibrate or may not be able to be depressed. Such phenomena are due to intermittent changes in hydraulic pressure inside the brake line to prevent the wheels from locking and is not an abnormality.

ABS Does Not Operate

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Brake operation varies depending on driving conditions and road surface conditions, so diagnosis can be difficult.However if a normal DTC is displayed, check the following probable cause. When the problem is still occurring, replace the ABS control module.	- Faulty power source circuit - Faulty wheel speed sensor circuit - Faulty hydraulic circuit for leakage - Faulty HECU

INSPECTION PROCEDURES

DTC INSPECTION

1. Connect the Hi-Scan (pro) with the data link connector and turn the ignition switch ON.
2. Verify that the normal code is output.
   Is the normal code output?

   NO

   ▸ Check the power source circuit.

   YES

   ▸ Erase the DTC and recheck using Hi-Scan (pro).

CHECK THE POWER SOURCE CIRCUIT.

1. Disconnect the connector from the ABS control module.
2. Turn the ignition switch ON, measure the voltage between terminal 18 of the ABS control module harness side connector and body ground.

   Specification: approximately B+

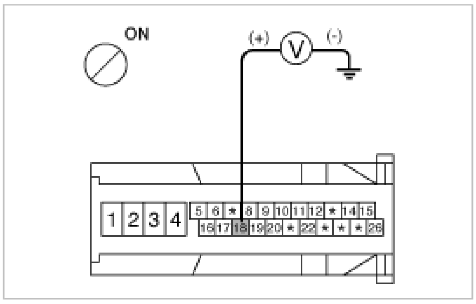
   Is the voltage within specification?

   YES

   ▸ Check the ground circuit.

   NO

   ▸ Check the harness or connector between the fuse (10A) in the engine compartment junction block and the ABS control module. Repair if necessary.



CHECK THE GROUND CIRCUIT.

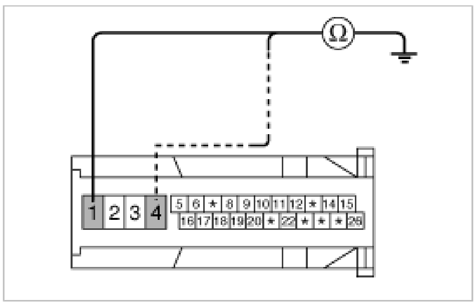
1. Disconnect the connector from the ABS control module.
2. Check for continuity between terminals 1,4 of the ABS control module harness side connector and ground point.
   Is there continuity?

YES

▸ Check the wheel speed sensor circuit.

NO

▸ Repair an open in the wire and ground point.



CHECK THE WHEEL SPEED SENSOR CIRCUIT.

Refer to the DTC troubleshooting procedures.
Is it normal?

YES

▸ Check the hydraulic circuit for leakage.

NO

▸ Repair or replace the wheel speed sensor.

CHECK THE HYDRAULIC CIRCUIT FOR LEAKAGE.

Refer to the hydraulic lines.
Inspect leakage of the hydraulic lines.
Is it normal?

YES

▸ The problem is still occurring, replace the ABS control module.

NO

▸ Repair the hydraulic lines for leakage.

ABS Does Not Operate Intermittently.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Brake operation varies depending on driving conditions and road surface conditions, so diagnosis can be difficult.However if a normal DTC is displayed, check the following probable cause. When the problem is still occurring, replace the ABS control module.	- Faulty power source circuit - Faulty wheel speed sensor circuit - Faulty hydraulic circuit for leakage - Faulty HECU

INSPECTION PROCEDURES

DTC INSPECTION

1. Connect the Hi-Scan (pro) with the data link connector and turn the ignition switch ON.
2. Verify that the normal code is output.

Is the normal code output?

NO

▸ Check the wheel speed sensor circuit.

YES

▸ Erase the DTC and recheck using Hi-Scan (pro).

CHECK THE WHEEL SPEED SENSOR CIRCUIT.

Refer to the DTC troubleshooting procedures.
Is it normal?

YES

▸ Check the stop lamp switch circuit.

NO

▸ Repair or replace the wheel speed sensor.

CHECK THE STOP LAMP SWITCH CIRCUIT.

1. Check that stop lamp lights up when brake pedal is depressed and turns off when brake pedal is released.
2. Measure the voltage between terminal 20 of the ABS control module harness side connector and body ground when brake pedal is depressed.

Specification: approximately B+

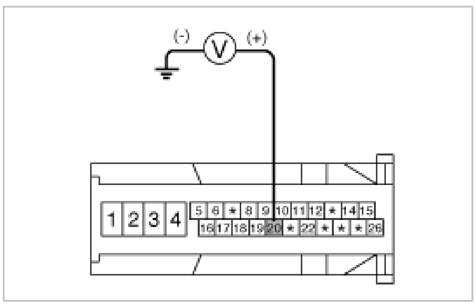
Is the voltage within specification?

YES

▸ Check the hydraulic circuit for leakage.

NO

▸ Repair the stop lamp switch. Repair an open in the wire between the ABS control module and the stop lamp switch.



CHECK THE HYDRAULIC CIRCUIT FOR LEAKAGE.

Refer to the hydraulic lines.
Inspect leakage of the hydraulic lines.
Is it normal?

YES

▸ The problem is still occurring, replace the ABS control module.

NO

▸ Repair the hydraulic lines for leakage.

Communication With Hi-Scan (pro) Is Not Possible. (Communication With Any System Is Not Possible)

DETECTING CONDITION

Trouble Symptoms	Possible Cause
Possible defect in the power supply system (including ground) for the diagnosis line.	- An open in the wire - Poor ground - Faulty power source circuit

INSPECTION PROCEDURES

CHECK THE POWER SUPPLY CIRCUIT FOR THE DIAGNOSIS

Measure the voltage between terminal 9 of the data link connector and body ground.

Specification: approximately B+

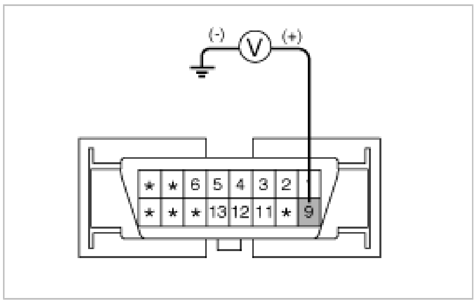
Is voltage within specification?

YES

▸ Check the ground circuit for the diagnosis.

NO

▸ Repair an open in the wire. Check and replace fuse (15A) from the engine compartment junction block.

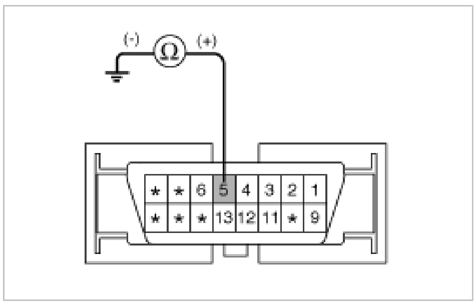


CHECK THE GROUND CIRCUIT FOR THE DIAGNOSIS

Check for continuity between terminal 5 of the data link connector and body ground.
Is there continuity?

NO

▸ Repair an open in the wire between terminal 5 of the data link connector and ground point.



Communication With Hi-Scan (pro) Is Not Possible. (Communication With ABS Only Is Not Possible)

DETECTING CONDITION

Trouble Symptoms	Possible Cause
When communication with Hi-Scan (pro) is not possible, the cause may be probably an open in the HECU power circuit or an open in the diagnosis output circuit.	- An open in the wire - Faulty HECU - Faulty power source circuit

INSPECTION PROCEDURES

CHECK FOR CONTINUITY IN THE DIAGNOSIS LINE

1. Disconnect the connector from the ABS control module.
2. Check for continuity between terminals 11 of the ABS control module connector and 1 of the data link connector.
   Is there continuity?

   YES

   ▸ Check the power source of ABS control module.

   NO

   ▸ Repair an open in the wire.

CHECK THE POWER SOURCE OF ABS CONTROL MODULE

1. Disconnect the connector from the ABS control module.
2. Turn the ignition switch ON, measure the voltage between terminal 18 of the ABS control module harness side connector and body ground.

   Specification: approximately B+

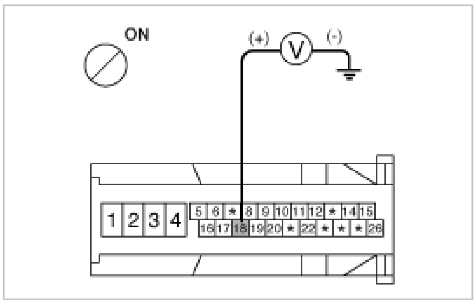
   Is voltage within specification?

YES

▸ Check for poor ground.

NO

▸ Check the harness or connector between the fuse (10A) in the engine compartment junction block and the ABS control module.Repair if necessary.



CHECK FOR POOR GROUND

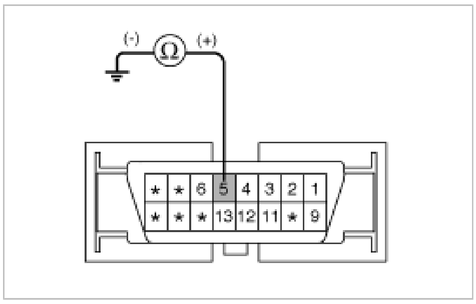
Check for continuity between terminal 5 of the data link connector and ground point.

YES

▸ Replace the ABS control module and recheck.

NO

▸ Repair an open in the wire or poor ground.



When Ignition Key Is Turned ON (Engine OFF), The ABS Warning Lamp Does Not Light Up.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
When current flows in the HECU the ABS warning lamp turns from ON to OFF as the initial check.Therefore if the lamp does not light up, the cause may be an open in the lamp power supply circuit, a blown bulb, an open in the both circuits between the ABS warning lamp and the HECU, and the faulty HECU.	- Faulty ABS warning lamp bulb - Blown No.2 fuse (10A) in the engine compartment junction block - Faulty ABS warning lamp module - Faulty HECU

INSPECTION PROCEDURES

PROBLEM VERIFICATION

Disconnect the connector from the ABS control module and turn the ignition switch ON.
Does the ABS warning lamp light up?

YES

▸ It is normal. Recheck the ABS control module.

NO

▸ Check the power source for the ABS warning lamp.

CHECK THE POWER SOURCE FOR THE ABS WARNING LAMP

1. Disconnect the instrument cluster connector and turn the ignition switch ON.
2. Measure the voltage between terminal 5 of the cluster harness side connector and body ground.

Specification: approximately B+

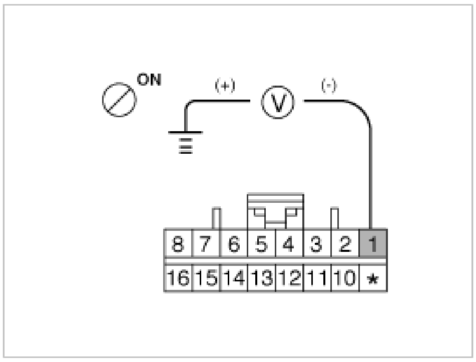
Is voltage within specification?

YES

▸ Repair bulb or instrument cluster assembly.

NO

▸ Check for blown fuse.



CHECK FOR BLOWN FUSE

Check continuity of fuse (10A) from the engine compartment junction block.
Is there continuity?

YES

▸ Repair an open in the wire between ABS fuse and 1 of cluster connector.

NO

▸ Replace the blown fuse.

Even After The Engine Is Started, The ABS Warning Lamp Remains ON.

DETECTING CONDITION

Trouble Symptoms	Possible Cause
If the HECU detects trouble, it lights the ABS warning lamp while at the same time prohibiting ABS control. At this time, the HECU records a DTC in memory.Even though the normal code is output, the ABS warning lamp remains ON, then the cause may be probably an open or short in the ABS warning lamp circuit.	- An open in the wire - Faulty instrument cluster assembly - Faulty ABS warning lamp module - Faulty HECU

INSPECTION PROCEDURES

CHECK DTC OUTPUT.

1. Connect the Hi-Scan (pro) to the 16P data link connector located behind the driver's side kick panel.
2. Check the DTC output using Hi-Scan (pro).
   Is DTC output?

   YES

   ▸ Repair circuit indicated by code output.

   NO

   ▸ Check instrument cluster.

CHECK INSTRUMENT CLUSTER

Disconnect the cluster connector and turn the ignition switch ON.
Does the ABS warning lamp remains ON?

YES

▸ Replace the instrument cluster.

NO

▸ Check for open the wire.

CHECK FOR OPEN IN THE WIRE

Check for continuity in the wire between cluster and ABS control module.
Is there continuity?

YES

▸ Replace the ABS control module and recheck.

NO

▸ Repair an open in the wire between cluster and ABS control module.

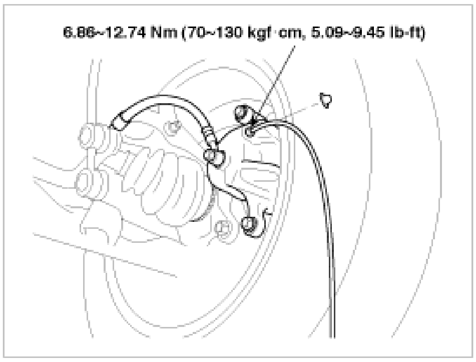
BLEEDING OF BRAKE SYSTEM

1. Remove the reservoir cap and fill the brake reservoir with brake fluid.

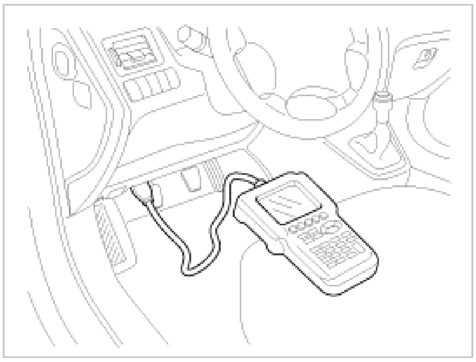
> **CAUTION**
>
> If there is any brake fluid on any painted surface, wash it off immediately.

> **NOTE**
>
> When pressure bleeding, do not depress the brake pedal.
> Recommended fluid........ DOT3 or DOT4

2. Connect a clear plastic tube to the wheel cylinder bleeder plug and insert the other end of the tube into a half filled clear plastic bottle.



3. Connect the hi-scan (pro) to the data link connector located underneath the dash panel.



4. Select and operate according to the instructions on the hi-scan (Pro) screen.

> **CAUTION**
>
> You must obey the maximum operating time of the ABS motor with the hi-scan (Pro) to prevent the motor pump from burning.

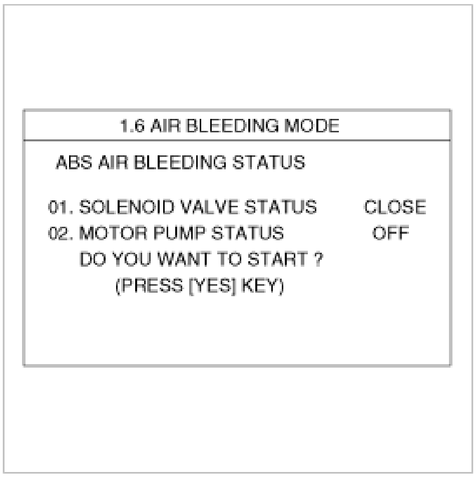
(1) Select hyundai vehicle diagnosis.

(2) Select vehicle name.

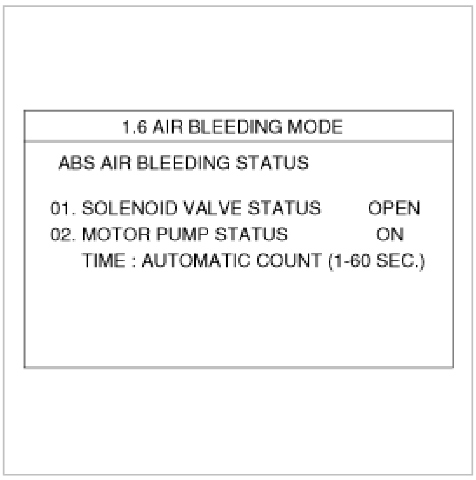
(3) Select Anti-Lock Brake system.

(4) Select air bleeding mode.

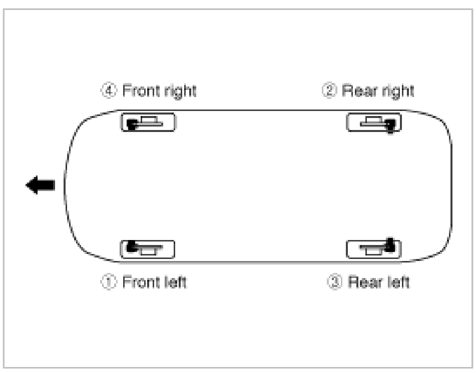
(5) Press "YES" to operate motor pump and solenoid valve.



(6) Wait 60 sec. before operating the air bleeding. (If not, you may damage the motor.)



5. Pump the brake pedal several times, and then loosen the bleeder screw until fluid starts to run out without bubbles. Then close the bleeder screw.
6. Repeat step 5 until there are no more bubbles in the fluid for each wheel.



7. Tighten the bleeder screw.

Bleed screw tightening torque:
6.86~12.74 Nm (70 ~130 kgf·cm, 5.09 ~ 9.45 lb-ft)

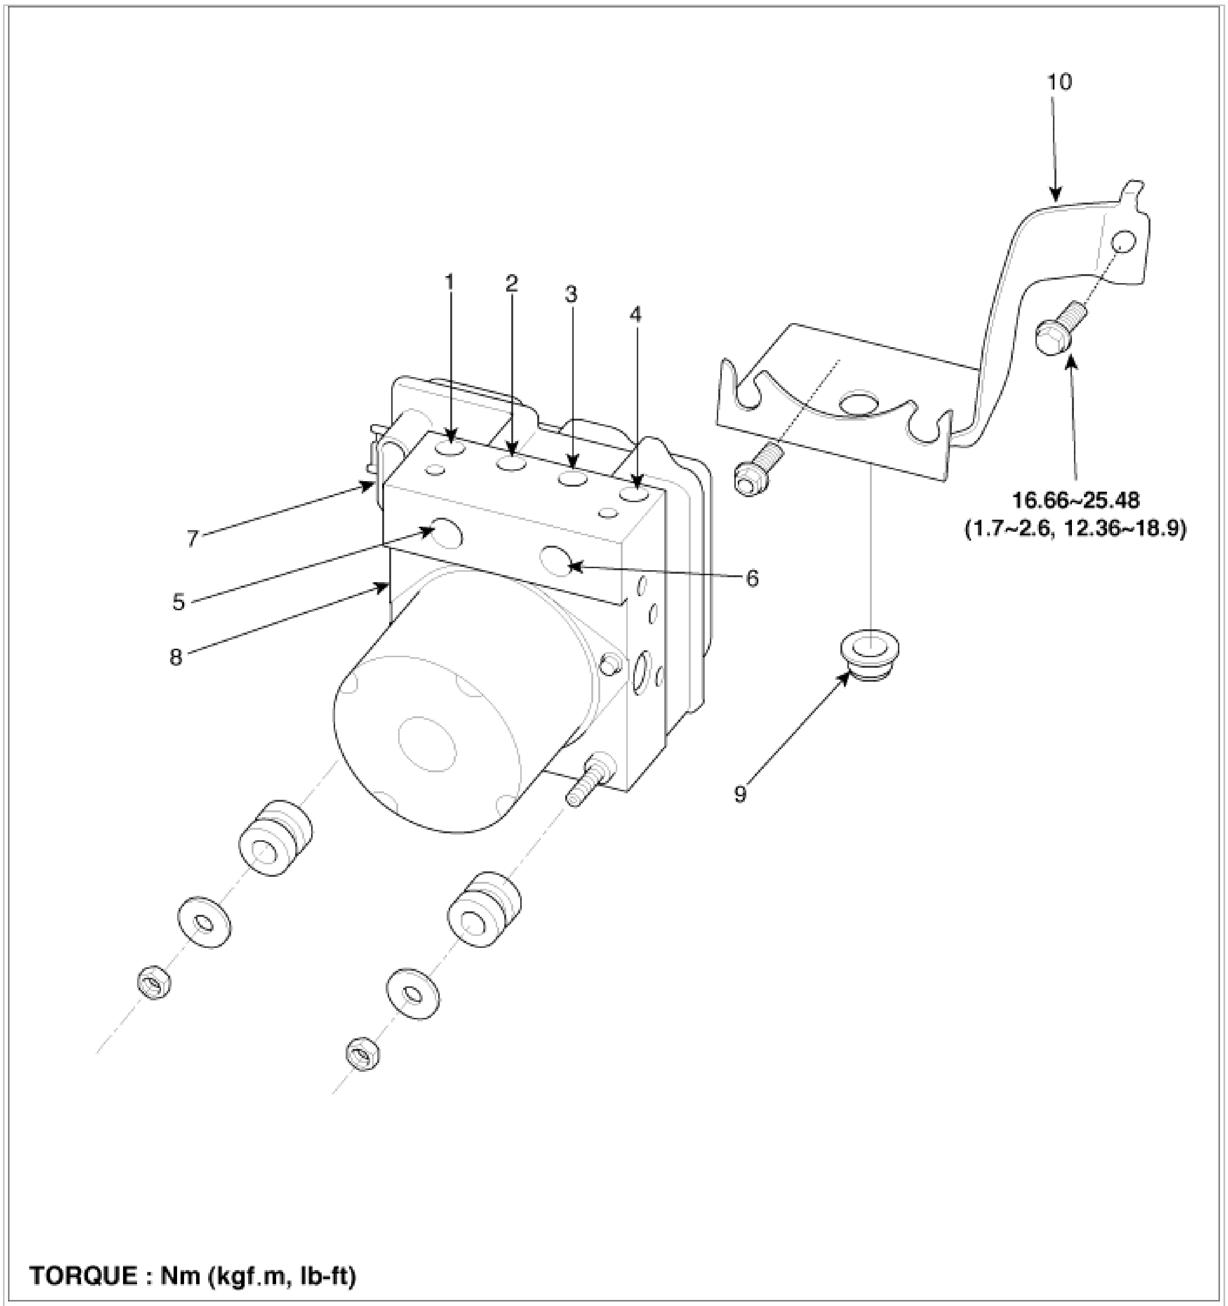
Brake System > ABS(Anti-Lock Brake System) > ABS Control Module > Components and Components Location

COMPONENTS

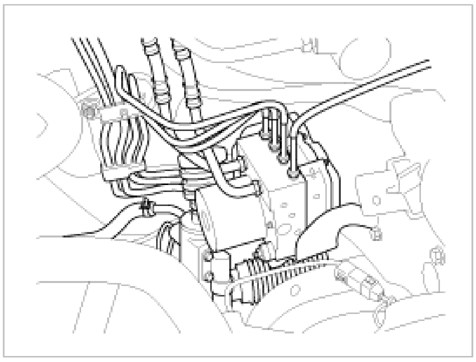


1. Front-right tube	6. MC1
2. Rear-left tube	7. ABS control module connector(26P)
3. Rear-right tube	8. ABS control module(HECU)
4. Front-left tube	9. Damper
5. MC2	10. Bracket

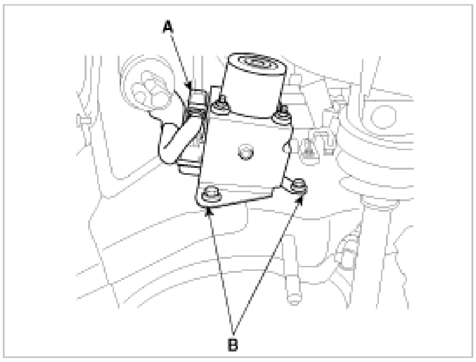
Brake System > ABS(Anti-Lock Brake System) > ABS Control Module > Repair procedures

REMOVAL

1. Disconnect the brake tube from the HECU by unlocking the nuts counterclockwise with a spanner.



2. Lift up the vehicle.
3. Disconnect the connector(A) from the HECU.



4. Remove the two HECU brake mounting bolts(B) , and then disassemble the HECU with the bracket.

> CAUTION
>
> 1. Never attempt to disassemble the HECU.
> 2. The HECU must be transported and stored in
> 3. Never shock to the HECU.

5. Remove the two HECU mounting nuts and washer, and then remove the bracket.

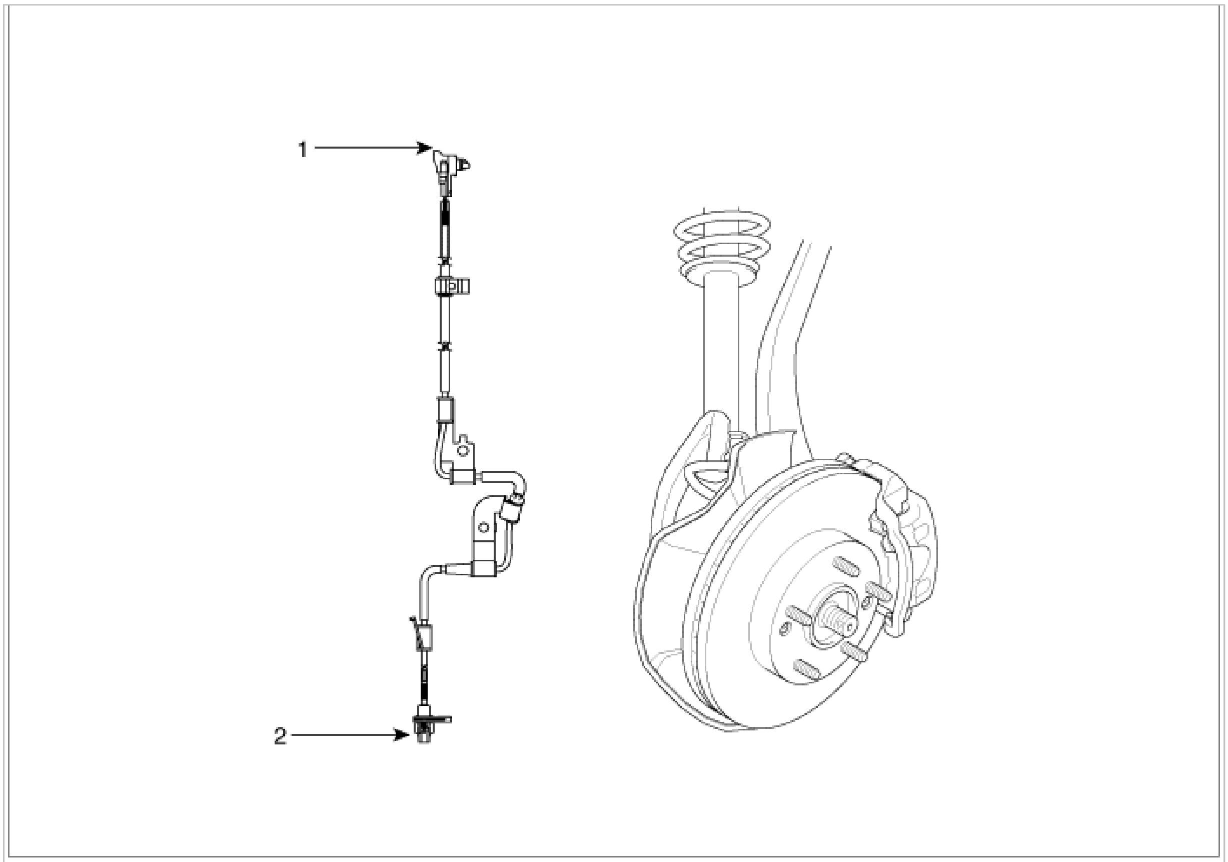
INSTALLATION

1. Installation is the reverse of removal.
2. Tighten the HECU mounting bolts and brake tube nuts to the specified torque.

Tighterning torque
HECU mounting nut :
5.88~9.8 Nm (0.6~1 kgf·m, 4.36~7.27 lb-ft)
HECU bracket mounting bolt:
16.66~25.48 Nm (1.7~2.6 kgf·m, 12.36~18.9 lb-ft)

Brake System > ABS(Anti-Lock Brake System) > Front Wheel Speed Sensor > Components and Components Location

COMPONENTS

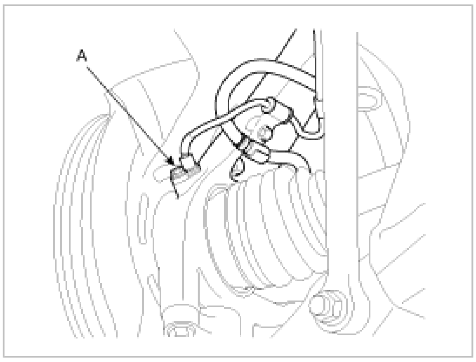


1. Front wheel speed sensor connector
2. Front wheel speed sensor

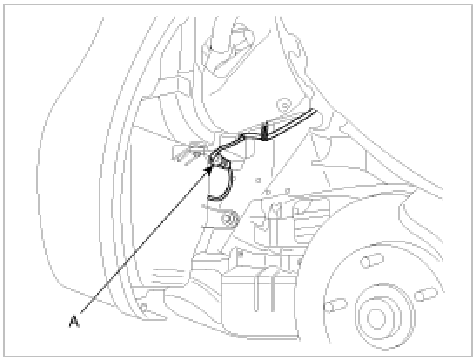
Brake System > ABS(Anti-Lock Brake System) > Front Wheel Speed Sensor > Repair procedures

REMOVAL

1. Remove the front wheel speed sensor mounting bolt(A).



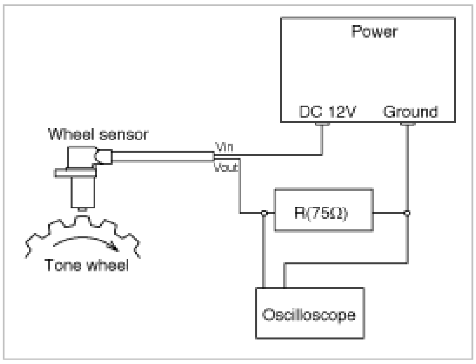
2. Remove the front wheel guard.
3. Remove the front wheel speed sensor after disconnecting the wheel speed sensor connector(A).



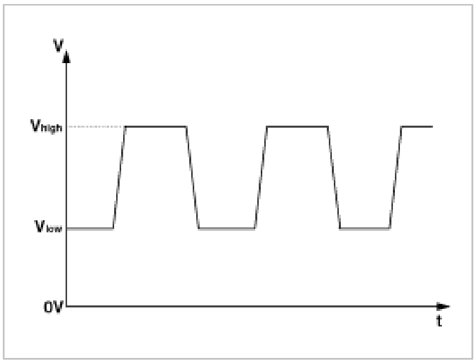
INSPECTION

1. Measure the output voltage between the terminal of the wheel speed sensor and the body ground.

> **CAUTION**
>
> In order to protect the wheel speed sensor, when measuring output voltage, a 75Ω resistor must be used as shown.



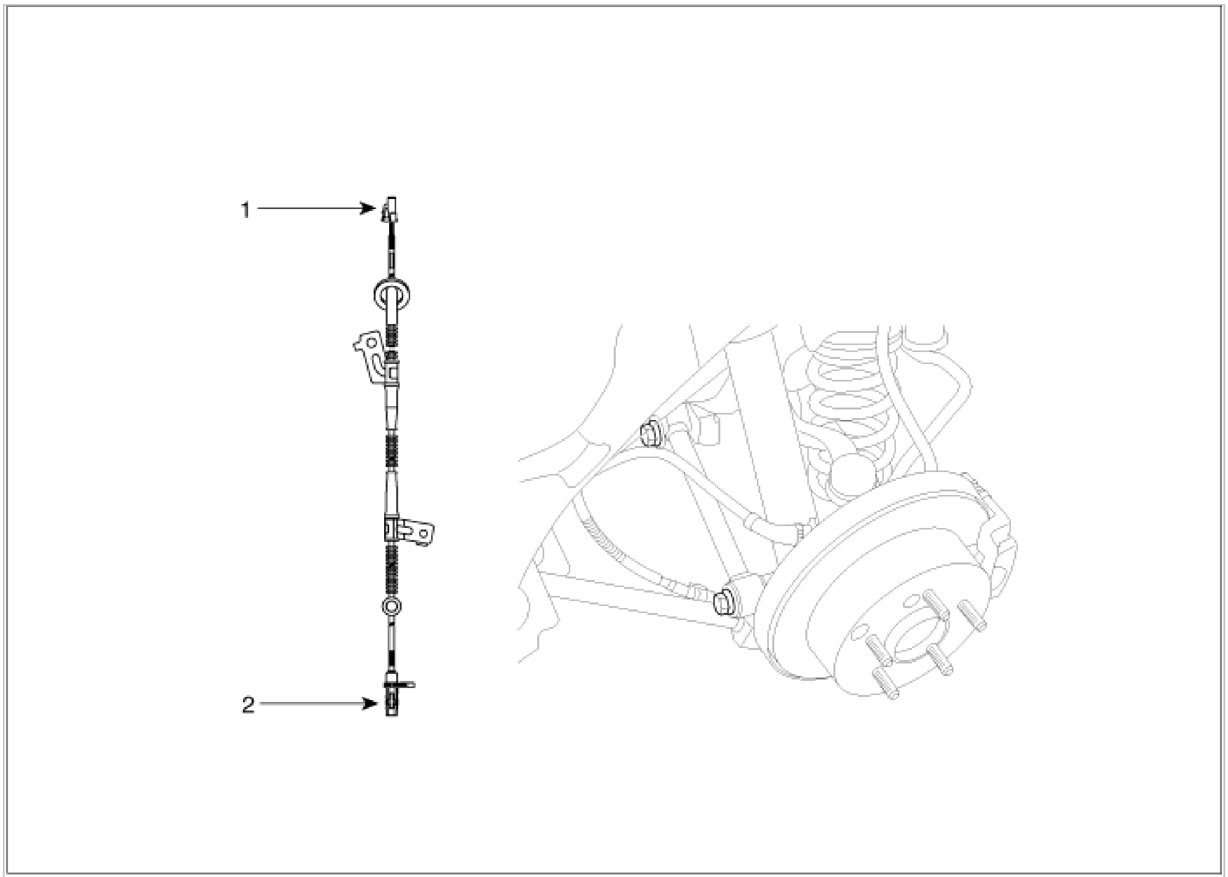
2. Compare the change of the output voltage of the wheel speed sensor to the normal change of the output voltage as shown below.



A. V_low : 0.44 V ~ 0.63 V
B. V_high : 0.885 V ~ 1.26 V
C. Frequency range : 1~2,500 Hz

Brake System > ABS(Anti-Lock Brake System) > Rear Wheel Speed Sensor > Components and Components Location

COMPONENTS

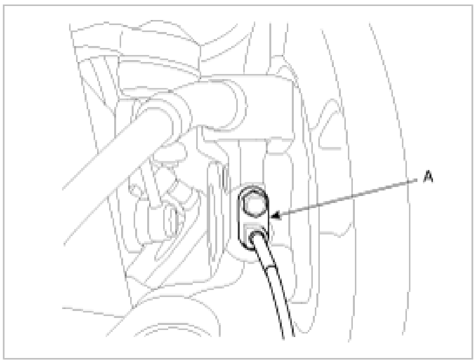


1. Rear wheel speed sensor connector
2. Rear wheel speed sensor

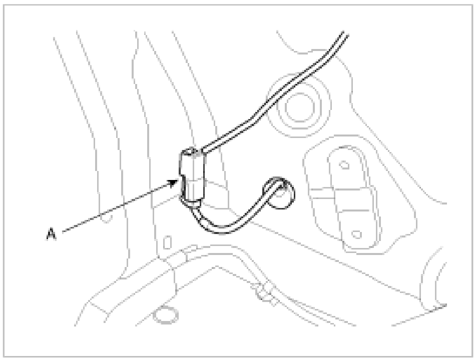
Brake System > ABS(Anti-Lock Brake System) > Rear Wheel Speed Sensor > Repair procedures

REMOVAL

1. Remove the rear wheel speed sensor mounting bolt(A).



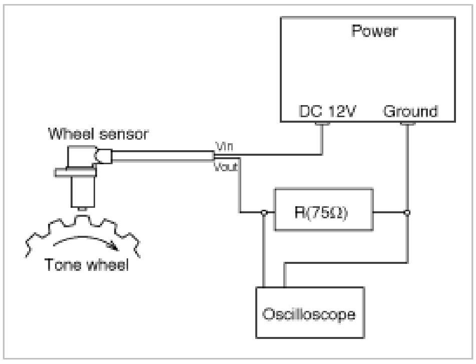
2. Remove the rear seat side pad then disconnect the rear wheel speed sensor connector(A).



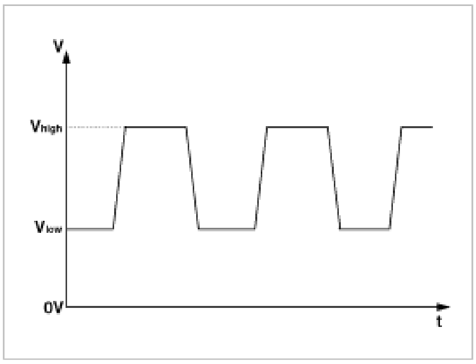
INSPECTION

1. Measure the output voltage between the terminal of the wheel speed sensor and the body ground.

> CAUTION
>
> In order to protect the wheel speed sensor, when measuring output voltage, a 75Ω resistor must be used as shown.



2. Compare the change of the output voltage of the wheel speed sensor to the normal change of the output voltage as shown below.



A. V_low : 0.44 V ~ 0.63 V
B. V_high : 0.885 V ~ 1.26 V
C. Frequency range : 1~2,500 Hz

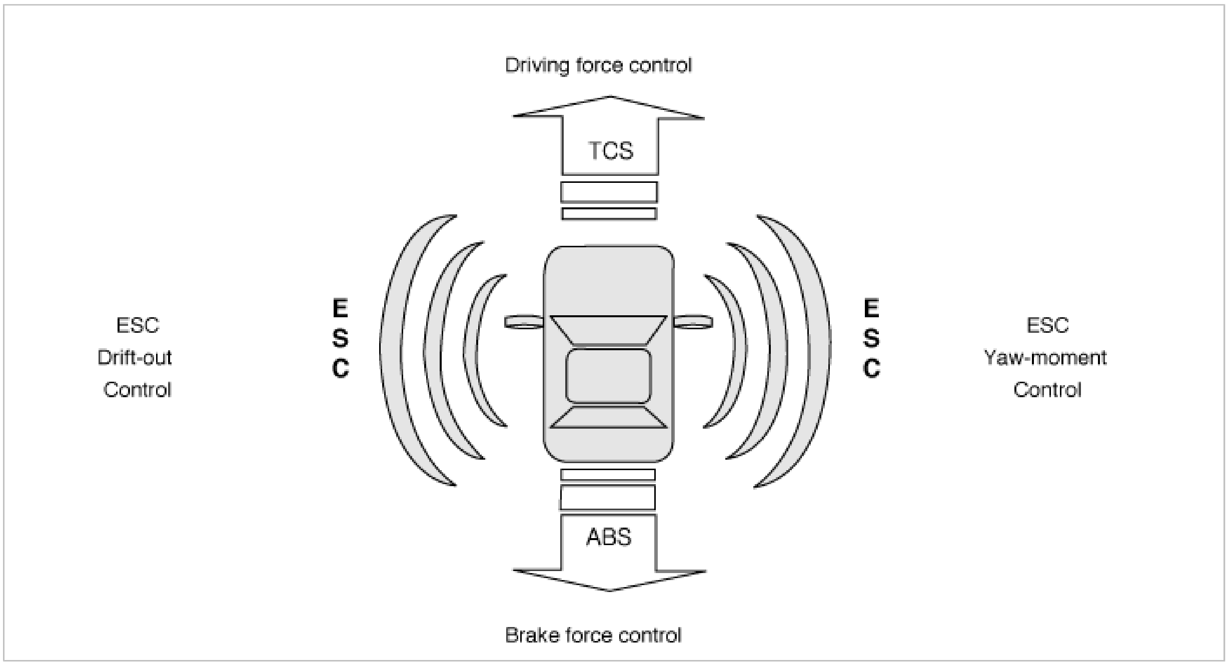
Brake System > ESP(Electronic Stability Program) System > Description and Operation

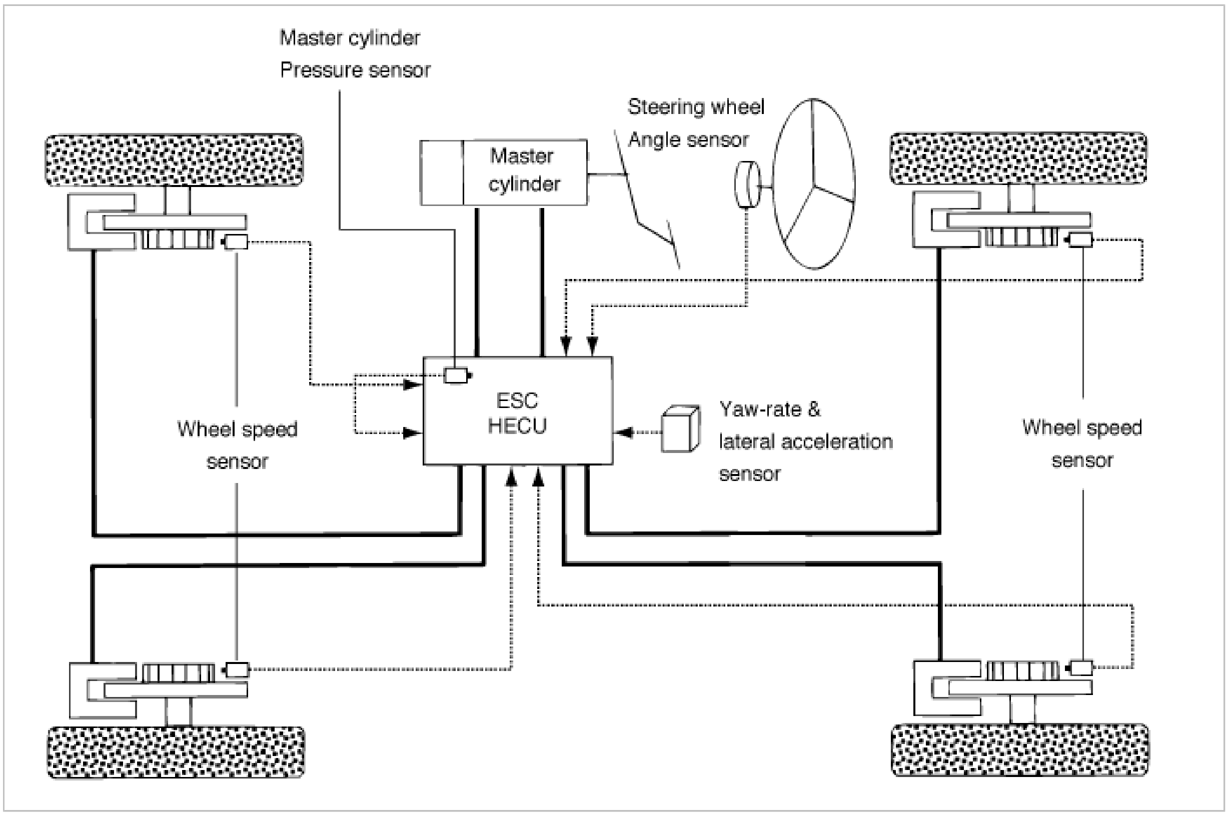
description of ESC

Optimum driving safety now has a name : ESC, the Electronic Stability Control.
ESC recognizes critical driving conditions, such as panic reactions in dangerous situations, and stabilizes the vehicle by wheel-individual braking and engine control intervention with no needfor actuating the brake or the gas pedal.
ESC adds a further function known as Active Yaw Control (AYC) to the ABS, TCS, EBD and ESC functions. Whereas the ABS/TCS function controls wheel slip during braking and acceleration and, thus, mainly intervenes in the longitudinal dynamics of the vehicle, active yaw control stabilizes the vehicle about its vertical axis.
This is achieved by wheel individual brake intervention and adaptation of the momentary engine torque with no need for any action to be taken by the driver.
ESC essentially consists of three assemblies : the sensors, the electronic control unit and the actuators.
Of course, the stability control feature works under all driving and operating conditions. Under certain driving conditions, the ABS/TCS function can be activated simultaneously with the ESC function in response to a command by the driver.
In the event of a failure of the stability control function, the basic safety function, ABS, is still maintained.



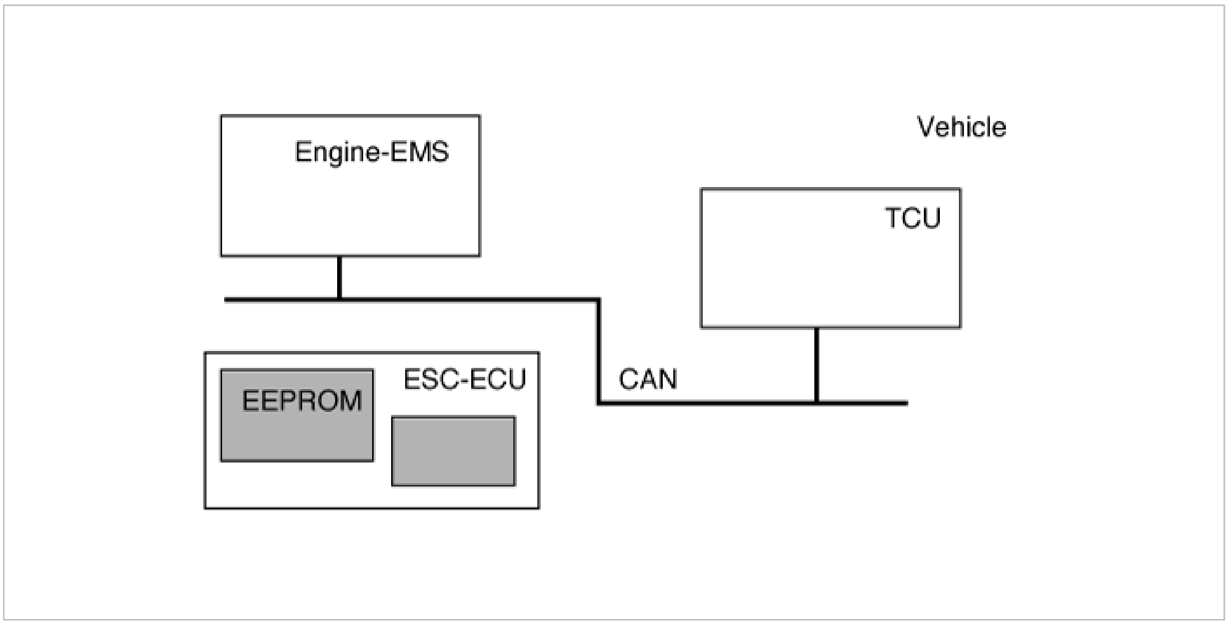
DESCRIPTION OF ESP CONTROL

ESP system includes ABS/EBD, TCS and AYC function.
ABS/EBD function The ECU changes the active sensor signal (current shift) coming from the four wheel sensors to the square wave.By using the input of above signals, the ECU calculates the vehicle speed and the acceleration & deceleration of the four wheels.And, the ECU judges whether the ABS/EBD should be actuated or not.
TCS function prevents the wheel slip of drive direction by adding the brake pressure and engine torque reduction via CAN communication.TCS function uses the wheel speed sensor signal to determine the wheel slip as far as ABS function.
AYC function prevents unstable maneuver of the vehicle. To determine the vehicle maneuver, AYC function uses the maneuver sensor signals(Yaw Rate Sensor, Lateral Acceleration Sensor, Steering Wheel Angle Sensor).If vehicle maneuver is unstable (Over Steer or Under Steer), AYC function applies the brake pressure on certain wheel, and send engine torque reduction signal by CAN.
After the key-on, the ECU continually diagnoses the system failure. (self-diagnosis)If the system failure is detected, the ECU informs driver of the system failure through the BRAKE/ABS/ESC warning lamp. (fail-safe warning)



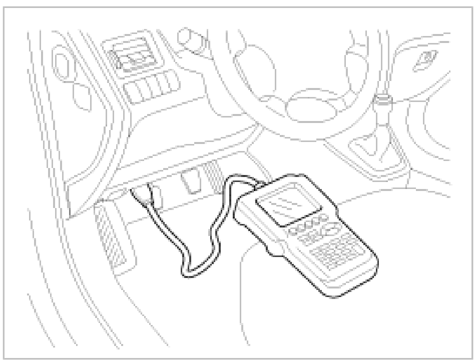
VARIANT CODING

A hardware difference of ECU does not exist according to the specification of the vehicle, but a software changes according to deference of vehicle parameter. The ESC stores variant code (data of engine, displacement volume , T/M) at the ECU memory. Since then an ESC uses the stored data.

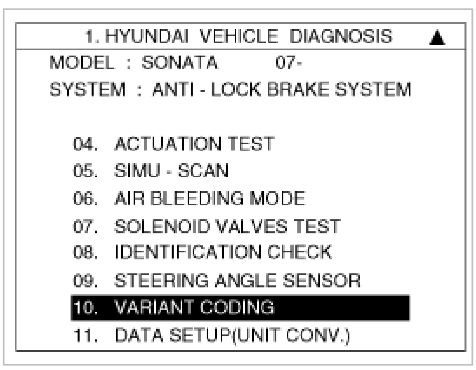


***PROCEDURE**

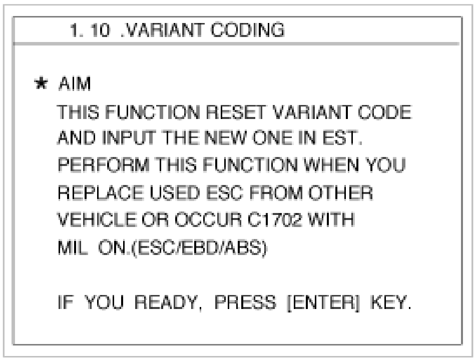
1. Install a EMS/TCU/ESC normally.
2. Connect the hi-scan (pro) to the data link connector located underneath the dash panel.



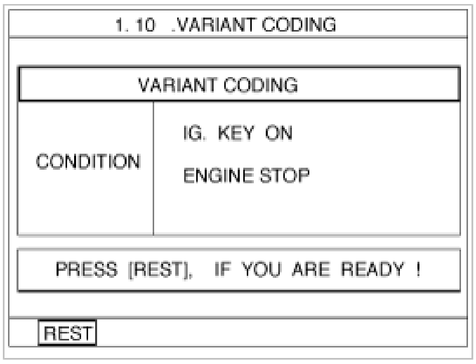
3. Select vehicle name.
4. Select ANTI-LOCK BRAKE SYSTEM.
5. Select the variant coding.



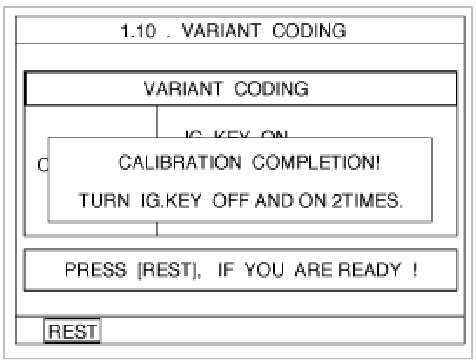
6. Follow the next procedure according to the comment .



7. Confirm the condition , and then push the "REST".



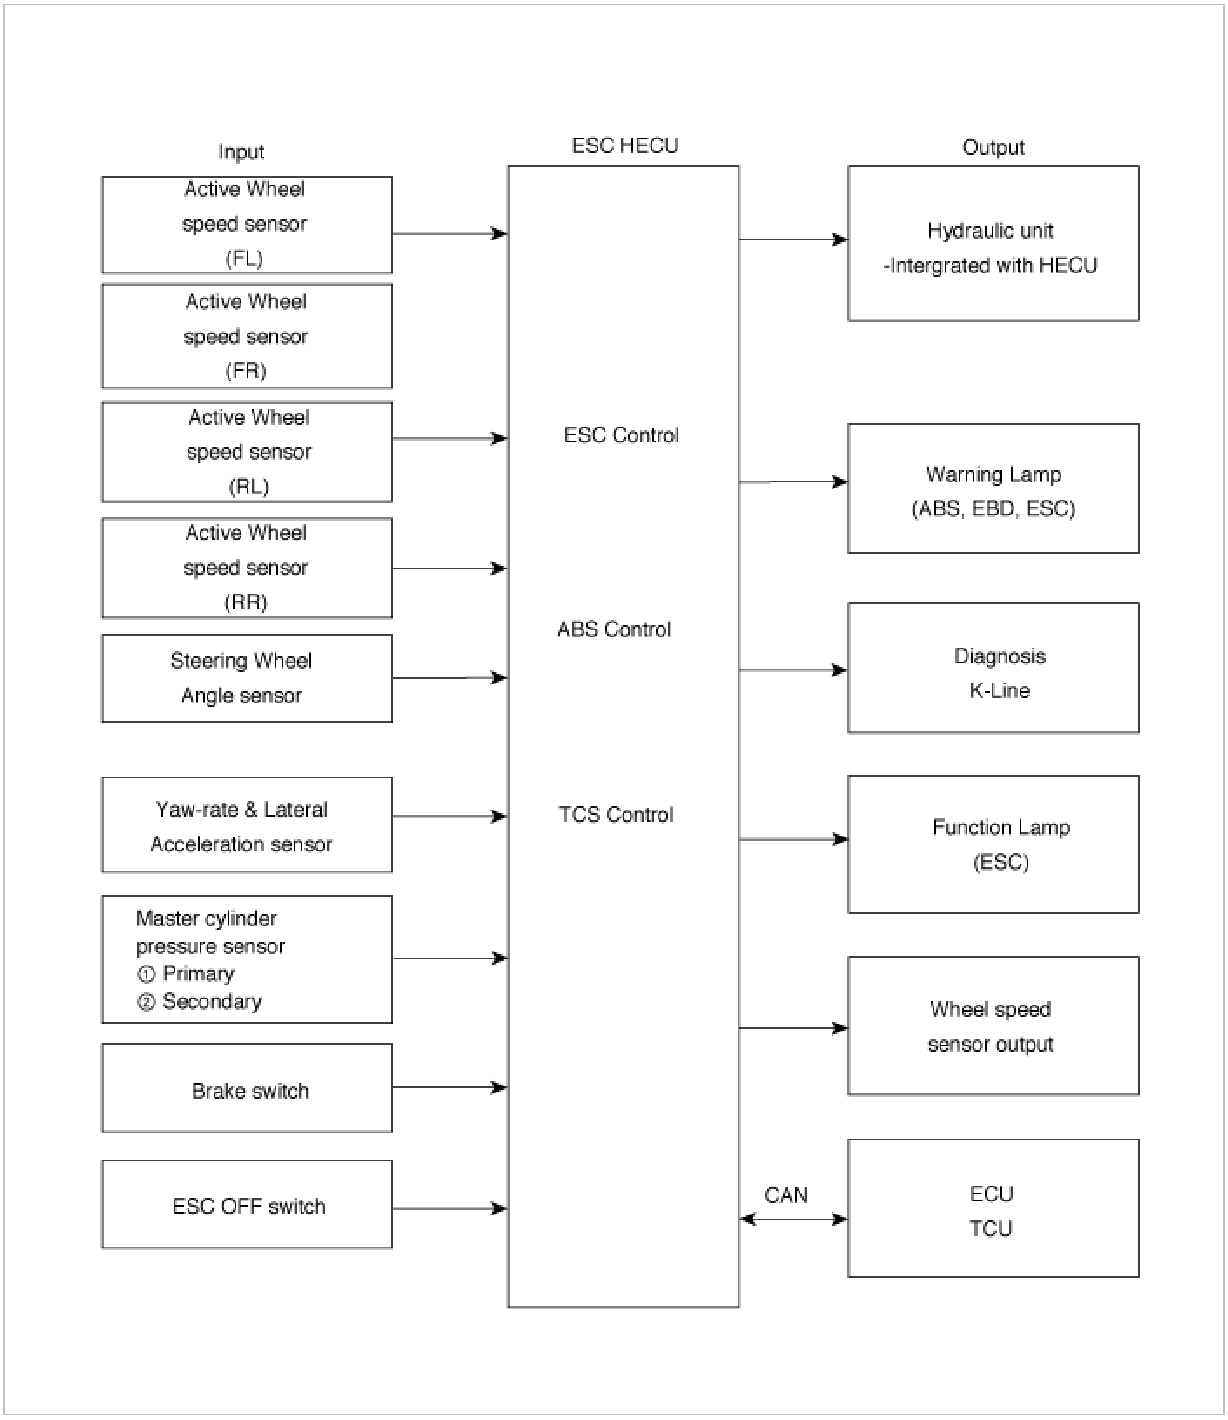
8. If the procedure is finished , the below screen is displayed .



9. IGN off.
10. IGN on.
11. The variant coding is completed.

> CAUTION
>
> If the warning lamp(ESC, EBD, ABS) is lighted up, follow the "Variant coding" again.

INPUT AND OUTPUT DIAGRAM



ESC OPERATION MODE

1. STEP 1
   The ESC analyzes the intention of the driver.

Position of steering wheel + Vehicle speed + Acceleration pedal →	ECU decides the intention of the driver.

2. STEP 2
   It analyzes the movement of the ESC vehicle.

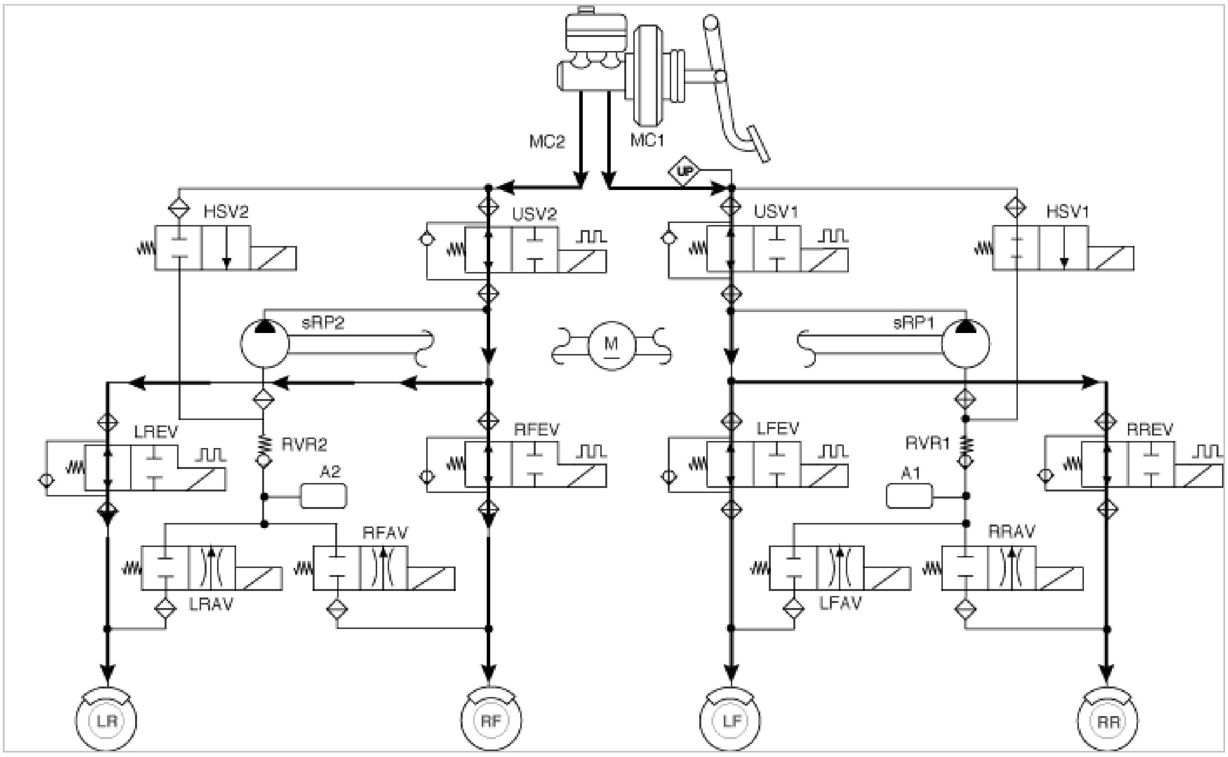
Vehicle rotation speed + Operated power to the side →	ECU decides movement of the ESC vehicle.

3. STEP 3
   It controls a vehicle posture control through the ESC braking power.
   A. The ECU calculates the needed countermeasure.
   B. The hydraulic unit controls Independently the braking power of each wheel.
   C. The ESC adjusts engine output through an engine and communication line to be connected.

ESC OPERATION MODE

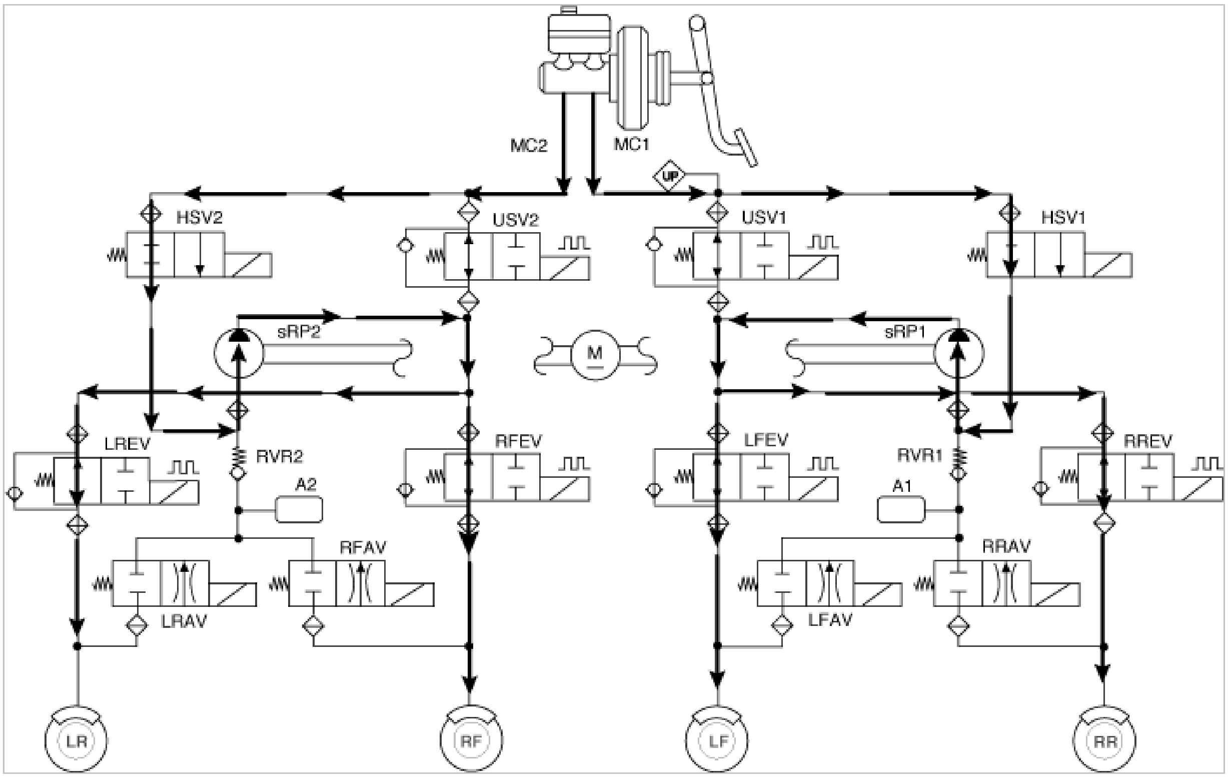
1. ESC Non-operation-Normal braking.

	Inlet valve(EV)	Outlet valve(AV)	Pilot valve(USV)	High pressure switch valve(HSV)	Pump motor
Normal braking	Open	Close	Open	Close	OFF



2. ESC INCREASE MODE

	Inlet valve(EV)	Outlet valve(AV)	Pilot valve(USV)	High pressure switch valve(HSV)	Pump motor
Normal braking	Open	Close	Close(Partial)	Open	ON(Motor speed control)



3. ESC HOLD MODE (FR is only controlled.)

	Inlet valve(EV)	Outlet valve(AV)	Pilot valve(USV)	High pressure switch valve(HSV)	Pump motor

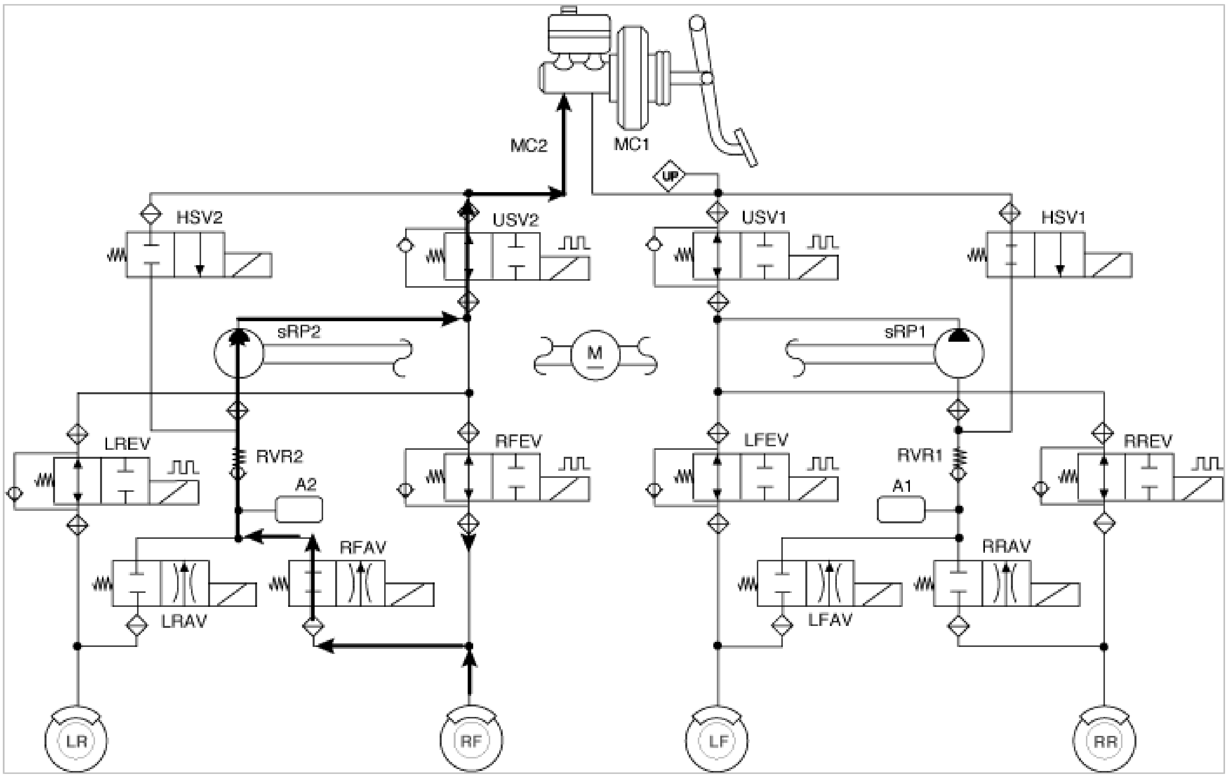
4. ESC DECREASE MODE (FR is only controlled)

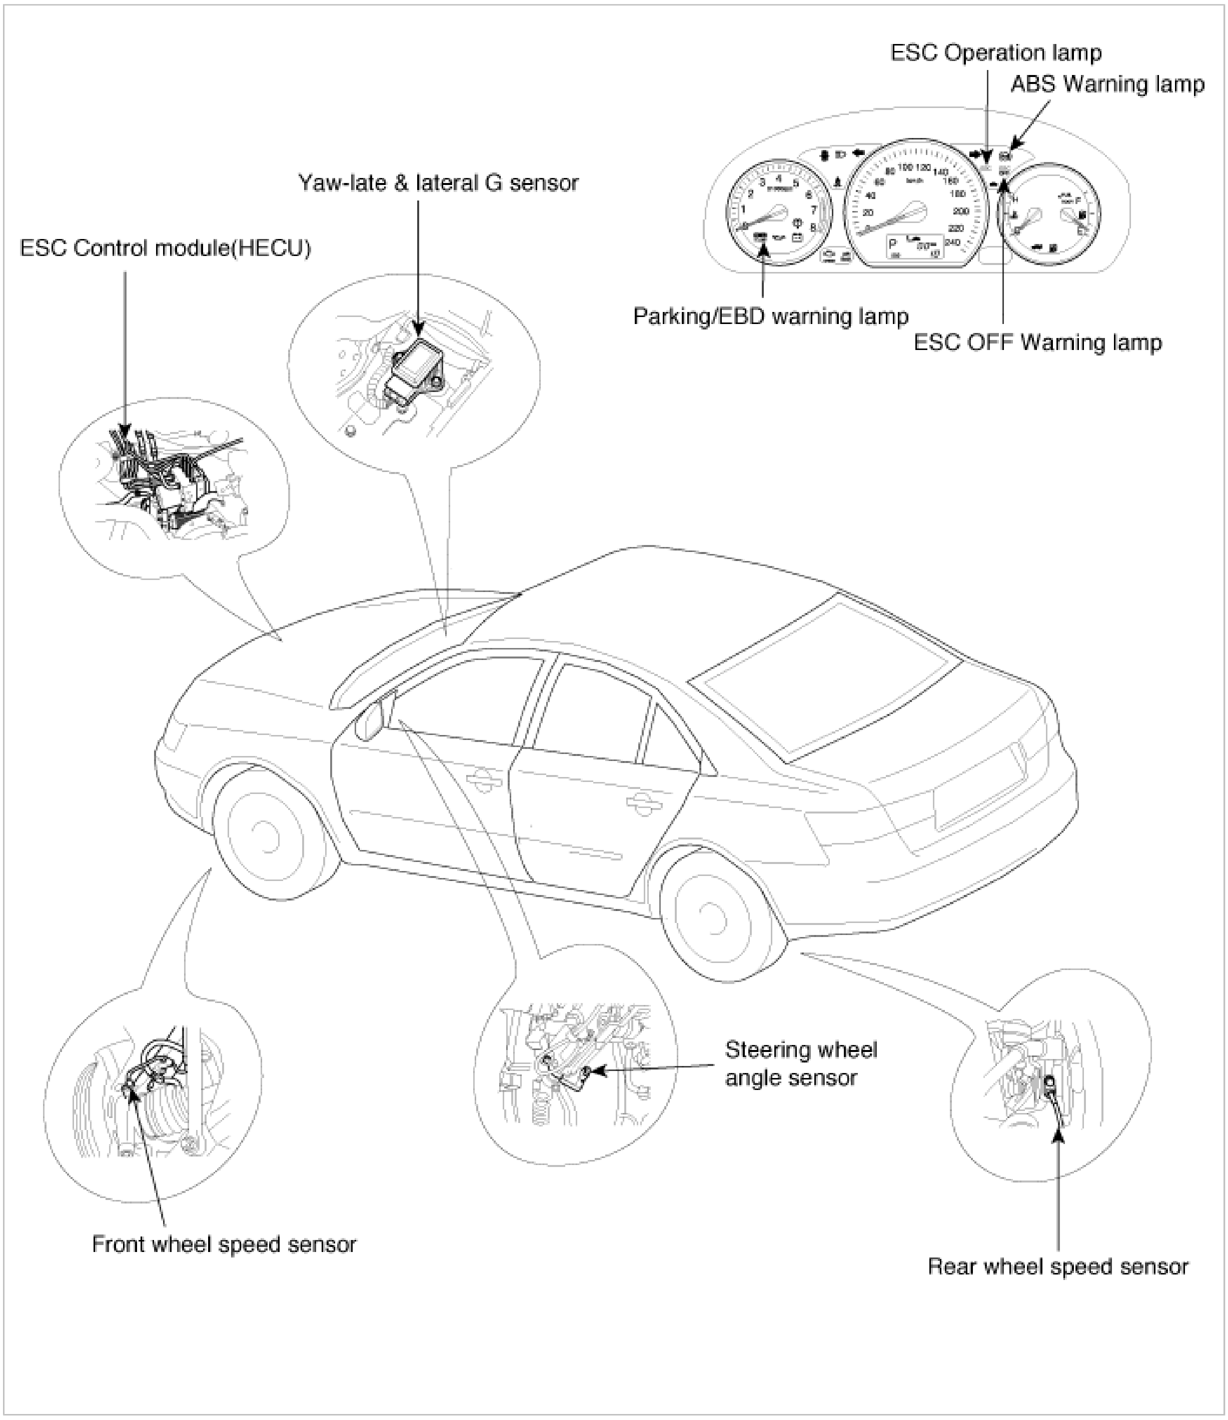
	Inlet valve(EV)	Outlet valve(AV)	Pilot valve(USV)	High pressure switch valve(HSV)	Pump motor

Normal braking	Close	Open	Close(Partial)	Open	ON(Motor speed low control)



Brake System > ESP(Electronic Stability Program) System > Components and Components Location

COMPONENTS



Brake System > ESP(Electronic Stability Program) System > Troubleshooting

FAILURE DIAGNOSIS

1. In principle, ESC and TCS controls are prohibited in case of ABS failure.
2. When ESC or TCS fails, only the failed system control is prohibited.
3. However, when the solenoid valve relay should be turned off in case of ESC failure, refer to the ABS fail-safe.
4. Information on ABS fail-safe is identical to the fail-safe in systems where ESC is not installed.

MEMORY OF FAIL CODE

1. It keeps the code as far as the backup lamp power is connected. (O)
2. It keeps the code as far as the HCU power is on. (X)

FAILURE CHECKUP

1. Initial checkup is performed immediately after the HECU power on.

2. Valve relay checkup is performed immediately after the IG2 ON.
3. It executes the checkup all the time while the IG2 power is on.
4. Initial checkup is made in the following cases.
   (1) When the failure is not detected now
   (2) When ABS and ESC are not in control.
   (3) Initial checkup is not made after ECU power on.
   (4) If the vehicle speed is over 5 mph(8 km/h) when the brake lamp switch is off.
   (5) When the vehicle speed is over 24.8 mph(40 km/h).
5. Though, it keeps on checkup even if the brake lamp switch is on.
6. When performing ABS or ESC control before the initial checkup, stop the initial checkup and wait for the HECU power input again.
7. Judge failure in the following cases.
   (1) When the power is normal.
   (2) From the point in which the vehicle speed reaches 4.9 mph(8 km/h) after HECU power on.

COUNTERMEASURES IN FAIL

1. Turn the system down and perform the following actions and wait for HECU power OFF.
2. Turn the valve relay off.
3. Stop the control during the operation and do not execute any until the normal condition recovers.

WARNING LAMP ON

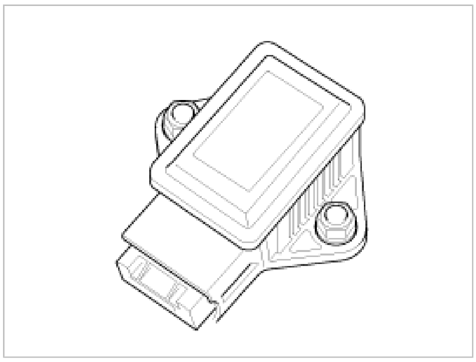
1. ABS warning lamp turns on when ABS is fail.
2. ESC operation lamp turns on when ESC is fail.

When power voltage and valve relay voltage are abnormal, input/output related failure judgment is not made.

Brake System > ESP(Electronic Stability Program) System > Yaw-rate Sensor > Description and Operation

DESCRIPTION

1. The yaw-rate & lateral G sensor is applied for the ESC system.
2. The yaw-rate is the angular velocity, when a vehicle turns a corner, and the lateral G is the acceleration to move a vehicle out of the way when cornering.
3. The sensor is located in the crash pad lower floor on vehicle.



SPECIFICATION

DESCRIPTION			SPECIFICATION	REMARK
Nominal supply voltage			11.5 ~ 12.5 V	
Supply voltage range			8 ~ 16 V	
Supply current			Max. 120 mA	Typ. 75 mA
Reference Voltage Output			2.464 ~ 2.536 V	Typ. 2.5 V
Operating temperature range			-40 ~ 85°C	
Yaw-late sensor	Measurement	+w direction, left turn	Min.100 °/s	Typ. 111 °/S

	range	-w direction, right turn	Min.100 °/s	Typ. 111 °/S
	Non-linearity		-1 ~ 1 %	
	Offset (within life,within operating temperature)		3.75 °/S	
	Upper cut-off frequency		Min. 45 Hz	Typ. 60 Hz
Lateral G sensor	Measurement range	+y direction, left turn	Min.1.8 g	Typ. 2 g
		-y direction, right turn	Min. -1.8 g	Typ. 2 g
	Non-linearity		-4 ~ 4 %

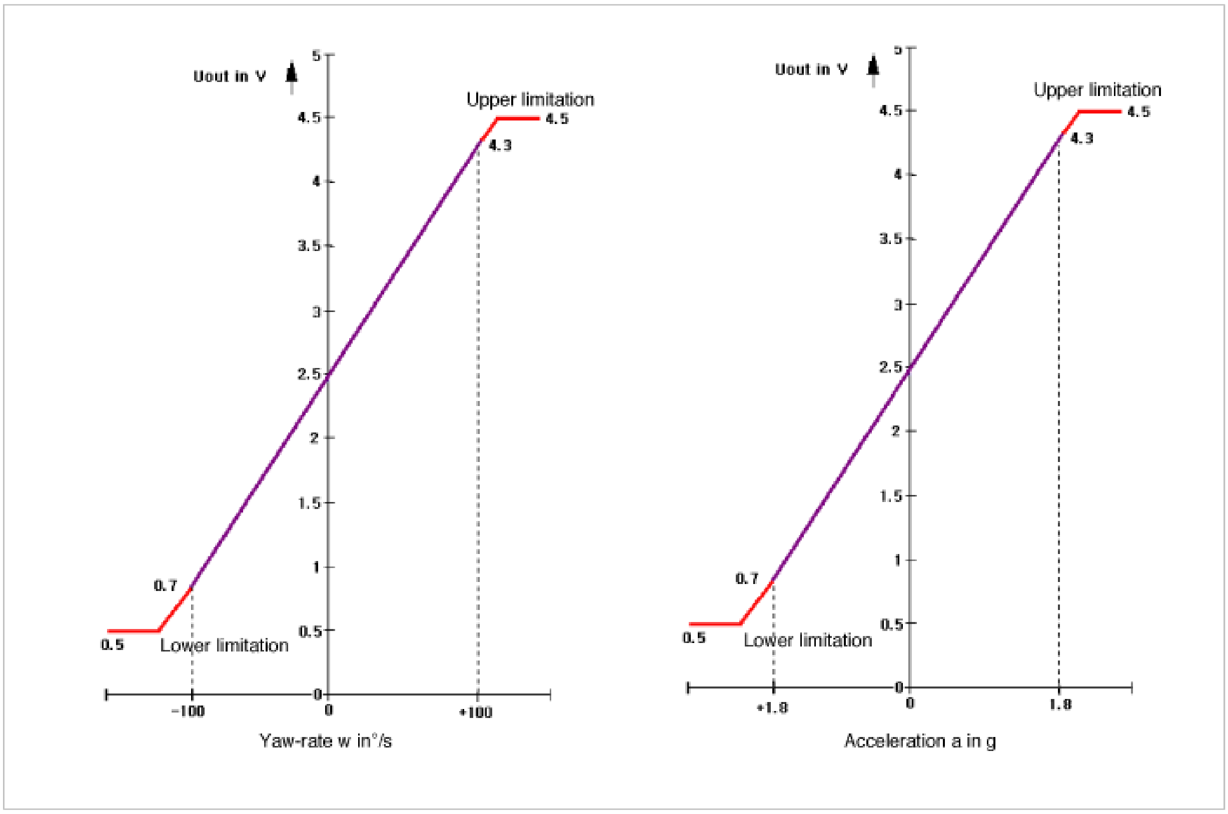
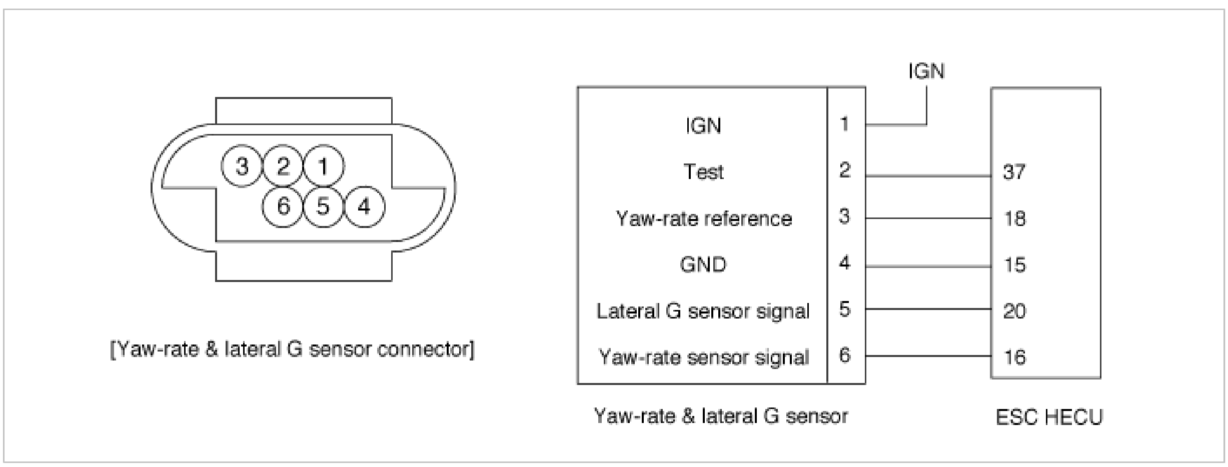
	Upper cut-off frequency		Min. 20 Hz	Typ. 40 Hz

OUTPUT CHARACTERISTIC



CIRCUIT DIAGRAM (YAW-RATE & LATERAL G SENSOR)



Brake System > ESP(Electronic Stability Program) System > ESP OFF Switch > Description and

Operation

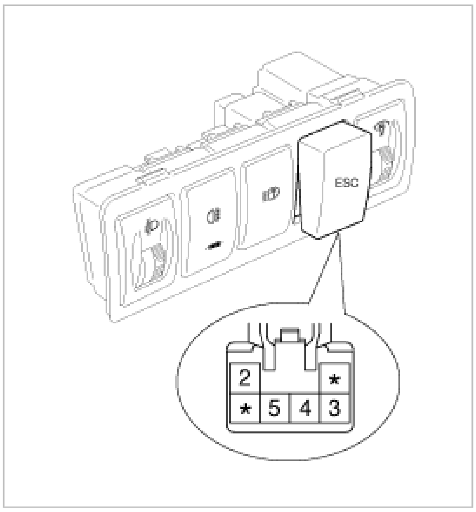
DESCRIPTION

1. The ESC OFF switch is for the user to turn off the ESC system.
2. The ESC OFF lamp is on when ESC OFF switch is engaged.

Brake System > ESP(Electronic Stability Program) System > ESP OFF Switch > Repair procedures

INSPECTION

1. Remove the ESC OFF switch from the switch panel on the crashpad of the driver's side.



2. Check the continuity between the switch terminals as the ESC OFF switch is engaged.

Position \ Terminal	2	5	3	4
ON	○	○	○	○
OFF				

Brake System > ESP(Electronic Stability Program) System > Steering Angle Position Sensor > Description and Operation

DESCRIPTION

GENERAL DATA

The steering angle speed sensor detects the angle of the steering wheel in order to which direction a user chooses.The sensor is detached on the MFS(Mutil-Function Switch) under the steering wheel.

MEASUREING PRINCIPLE

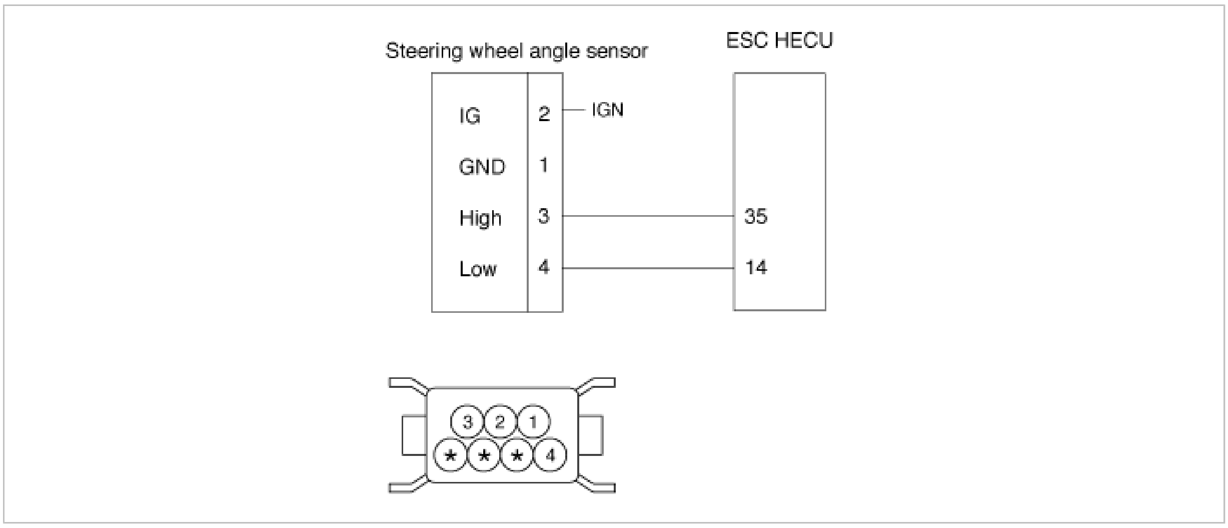
A non contact, analog angle sensor carrying out absolute measuring by the use of the Anisotropic-Magneto-Resistive effect (AMR).Measuring of the absolute angle by means of a toothed measuring gear with magnetic properties in combination with different ratios. Corresponding AMR elements that change their electrical resistance according to the magnetic field direction detect the angle position of the measuring gears.A micro-controller decodes the measured voltage signals after A/D converting with the help of a mathematical function. Output of the digital angle value and velocity via CAN-interface.

SPECIFICATION

DESCRIPTION	SPECIFICATION
Operating voltage	8~16 V
Operating temperature	-40 ~ 85 °C
Current consumption	Max.150 mA
Steering angle velocity	Max. ±2000 °/sec

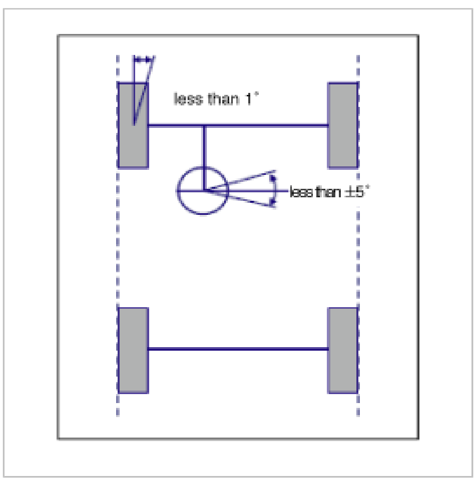
Connection delay time		t < 200 ms
Reverse voltage		-13.5 V
Measuring range	Angle	-780 ° ~ 779 °
	Angular velocity	0~ 1016 °/s
Nonlinearity angle		-2.5 ° ~ +2.5 °
Hysteresis angle		0 ° ~ 5 °
Rotational friction torque measuring		10 °/s

CIRCUIT DIAGRAM(STEERING WHEEL SPEED ANGLE SENSOR)



STEERING ANGLE SENSOR (SAS) calibration

1. PURPOSE OF calibration
    A. On vehicle control, an ESC analyzes the intention of the driver.
    B. An ESC recognizes a steering angle which a driver rotates through the steering angle sensor.
    C. A steering angle sensor used in ESC8 adjusts 0° setting of steering wheel through K-line or CAN communication.
2. STEERING ANGLE SENSOR (SAS) CALIBRATION METHOD

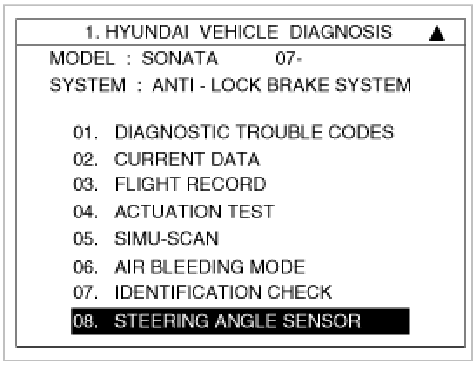


(1) Align the wheel to the straight line. (steering wheel < ± 5°)
ex) Perform the wheel alignment first.
Align the wheel to the straight line.
A driver moves the vehicle to the front and back about 5 meters twice or three times.

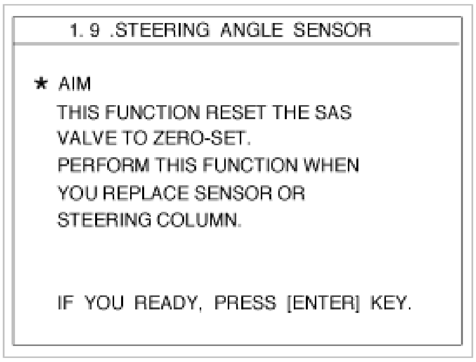
(2) Connect Hi-scan to the vehicle.

(3) Select Brake system.

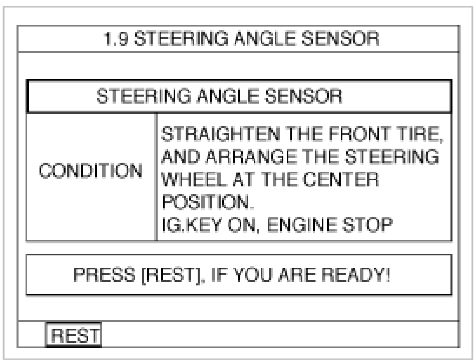
(4) Select Steering angle sensor(SAS) calibration.



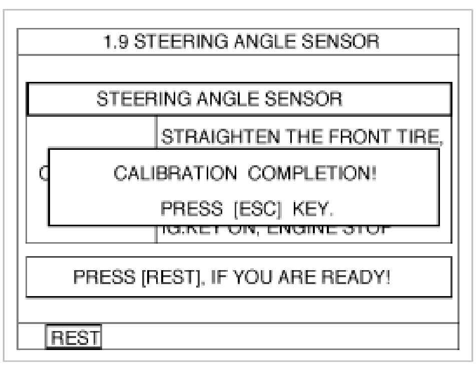
(5) Perform the Steering angle sensor(SAS) calibration.



(6) Perform the procedure continuously.



(7) The procedure is finished. Push the "ESC" key.



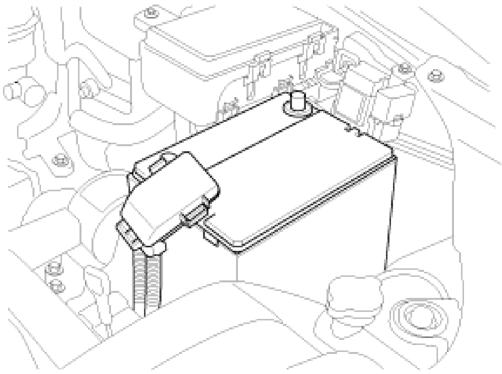
(8) Scanner OFF.

(9) Remove the scanner from the vehicle.

(10) Confirm the Steering angle sensor(SAS) calibration as driving the vehicle.(turn left once, turn right once)

Brake System > Troubleshooting > C1101

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU(Electronic Control Unit) checks the battery voltage to determine, as a safety issue, whether the ABS system can operate normally or not. The normal battery voltage range is essential for controlling the ABS system as intended.

DTC DESCRIPTION

The ABS ECU monitors battery voltage by reading the value of voltage.

1. When the voltage is higher than the expected normal value, this code is set, and the ABS/EBD/TCS/ESC functions are prohibited. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operation as well.
2. When the voltage is lower than the expected normal value, this code is set. The ABS/TCS/ESC functions are prohibited and the EBD function is allowed on LOW VOLTAGE CONDITION 1, the ABS/EBD/TCS/ESC functions are prohibited on UNDER VOLTAGE CONDITION.
3. If the voltage recovers, to within normal operating ranges, then the controller returns to normal operations as well.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring		• Poor connection in power supply circuit (IGN+) • Faulty Alternator • Faulty HECU
Enable Conditions	C1101	High voltage problem will be monitored if filtered Ignition Voltage is > 16.8 V. It will be reset if filtered Ignition Voltage < 16.7 V.	
	C1102	1. Ignition Voltage is monitored for a level of filtered Ignition Voltage < 9.3 V outside control, or a level of filtered Ignition Voltage < 9.2 V during control. 2. Hard under voltage due to low voltage glitches is detected if unfiltered Ignition Voltage < = 8.2 V for t >= 20 ms. 3. A hard under voltage problem will be detected if the filtered UZ < 7.7 V. The system remains in this condition until filtered UZ > 7.8 V. NOTE All under voltage failures will only be saved in EEPROM if vehicle speed is > 6 km/h(3 MPH). This prevents false failure entries due to a bad battery at ignition on.	
Monitoring period	Continuous. Under voltage faults are only entered in the EEPROM if the vehicle speed is v > 6 km/h (3 MPH). Over voltage faults will be always stored.		
Effect	The proper function of valves and return pump is not guaranteed.		
Fail Safe	• System down. The ABS/EBD/TCS/ESC functions are inhibited. - The valve relay and all solenoids are prevented from being switched on. • The ABS/EBD/ESC warning lamps are activated.		

SPECIFICATION

Voltage : 9.3 ≤ V ≤ 16.8 V

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to the next step.

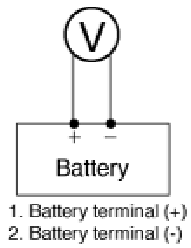
POWER SUPPLY CIRCUIT INSPECTION

1. ALTERNATOR OUTPUT VOLTAGE INSPECTION

(1) Engine "ON".

(2) Measure voltage between the battery terminal(+) and the battery terminal(-).

Specification : Approx. 14.4 ± 0.3 V (20 °C)



Voltage regulator ambient temperature(°C)	Regulating voltage
-30	14.1 ~ 15.2
20	14.1 ~ 14.7
120	13.3 ~ 14.7

Is the measured voltage within specifications?

YES

▸ Go to "Power Circuit Inspection" procedure.

NO

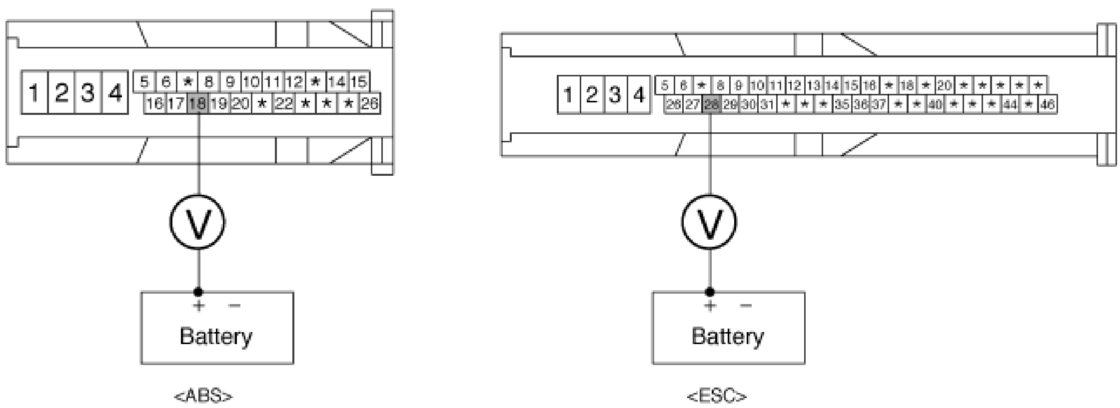
▸ Check for damaged harness and poor connection between alternator and battery. If OK , repair or replace alternator and then go to "Verification of vehicle Repair" procedure.

2. POWER CIRCUIT INSPECTION

(1) Engine "ON".

(2) Measure voltage between the battery terminal(+) and terminal "18(28:ESC)" of the HECU harness connector.

Specification : Approx. below 0.2 V



Is the measured voltage within specifications?

YES

▸Go to "Ground Circuit Inspection" procedure.

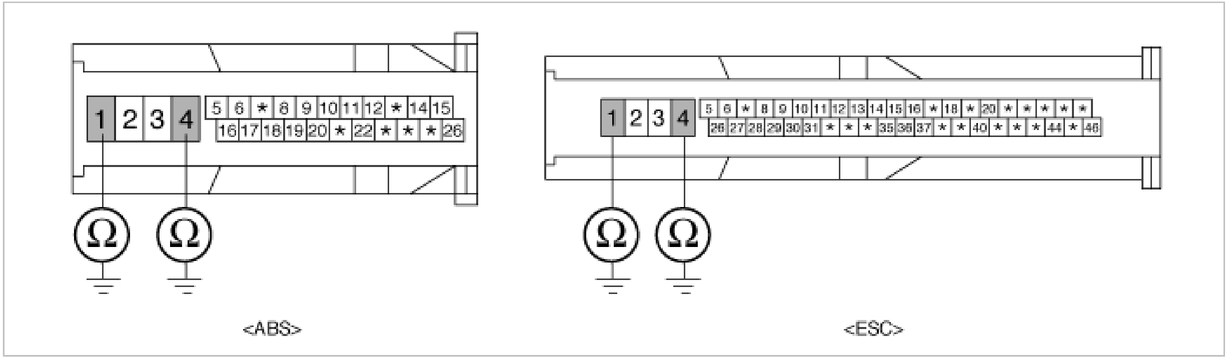
NO

▸ Check for damaged harness and poor connection between the battery terminal(+) and terminal "18(28:ESC)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1,4" of the HECU harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

NO

▸ Check for damaged harness and poor connection between terminal "1,4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

YES

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by poor connection in power harness (IGN+), faulty Alternator and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

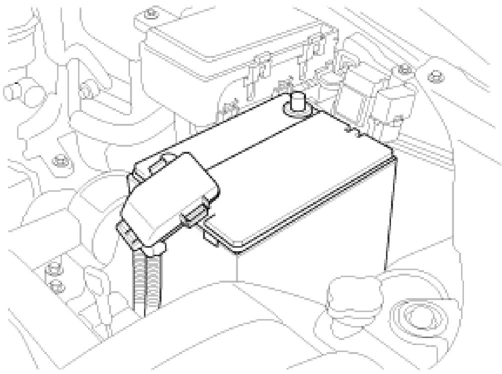
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1102

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU(Electronic Control Unit) checks the battery voltage to determine, as a safety issue, whether the ABS system can operate normally or not. The normal battery voltage range is essential for controlling the ABS system as intended.

</table>

SPECIFICATION

Voltage : 9.3 ≤ V ≤ 16.8 V

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

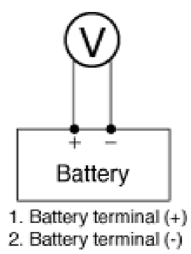
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. ALTERNATOR OUTPUT VOLTAGE INSPECTION
   (1) Engine "ON".
   (2) Measure voltage between the battery terminal(+) and the battery terminal(-).

Specification : Approx. 14.4 ± 0.3 V (20 °C)



Voltage regulator ambient temperature(°C)	Regulating voltage
-30	14.1 ~ 15.2
20	14.1 ~ 14.7
120	13.3 ~ 14.7

Is the measured voltage within specifications?

YES

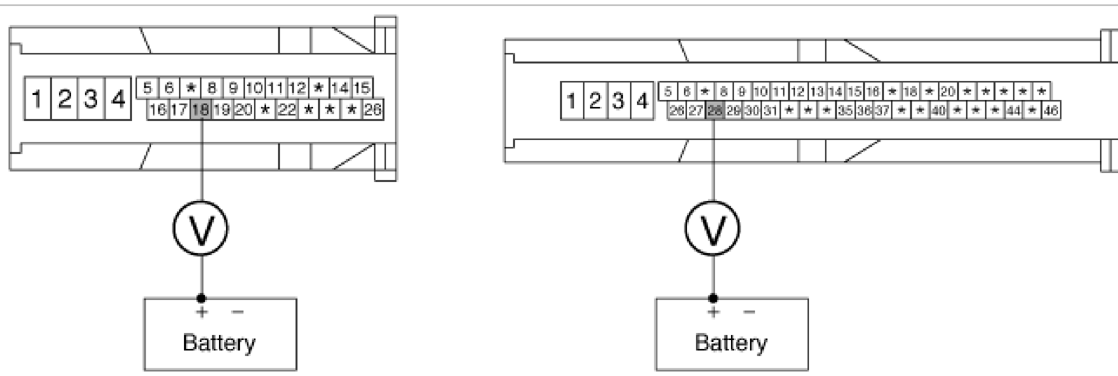
▸ Go to "Power Circuit Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between alternator and battery. If OK , repair or replace alternator and then go to "Verification of vehicle Repair" procedure.

2. POWER CIRCUIT INSPECTION
   (1) Engine "ON".
   (2) Measure voltage between the battery terminal(+) and terminal "18(28:ESP)" of the HECU harness connector.

Specification : Approx. below 0.2 V



<ABS> <ESC>

Is the measured voltage within specifications?

YES

▸Go to "Ground Circuit Inspection" procedure.

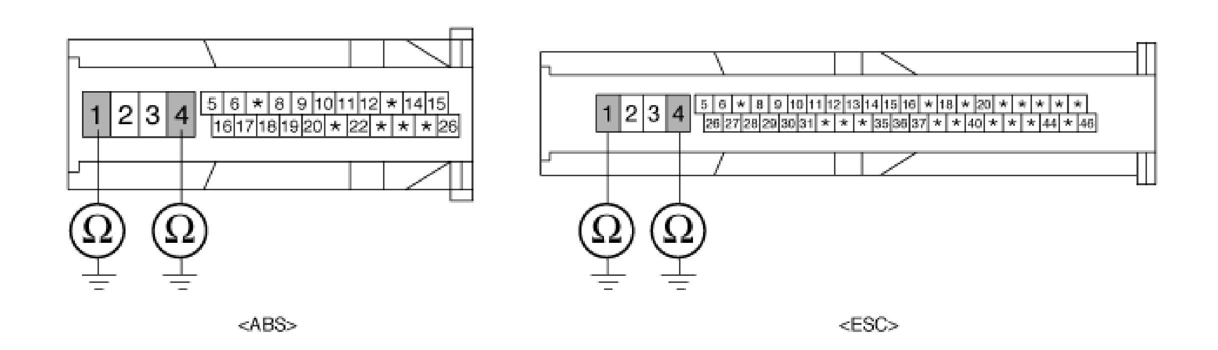
NO

▸ Check for damaged harness and poor connection between the battery terminal(+) and terminal "18(28:ESP)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1,4" of the HECU harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

NO

▸ Check for damaged harness and poor connection between terminal "1,4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

YES

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by poor connection in power harness (IGN+), faulty Alternator and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

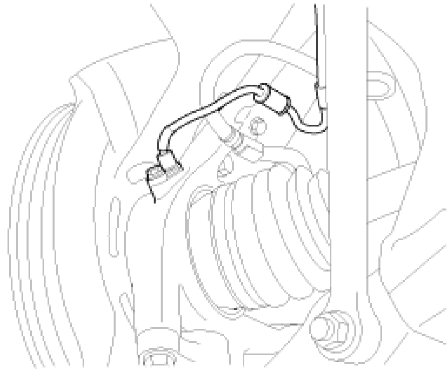
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1200

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor circuit continuously. If the sensor signal current is continuously out of the specified range for 200msec, then the HECU determines that the circuit is open/short, and sets this code. Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 10 Km/h(6 MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• Open or short of Wheel speed sensor circuit • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	Once after power up.	
	Enable Conditions	Wheel speed sensor test starts immediate after power. Especially shorts between WSS(Wheel speed sensor) lines and shorts to UZ(ECU voltage supply) can be detected by switching single WSS channels in sequence. After end of test only the channels with no fault are switched on.	
CASE 2	Monitoring period	Continuous	
	Enable Conditions	The sensor circuitry has two current levels I = 7 mA and I= 14mA. If the sensor line is broken, shorted to ground or shorted to supply voltage a faulty current level will be detected.WSS line faults are detected, if the fault condition exists uninterrupted for t >= 200 ms.	
Effect	No correct WSS Signal can be generated. Control of the corresponding wheel is no longer possible. If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased (until switch off).		

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

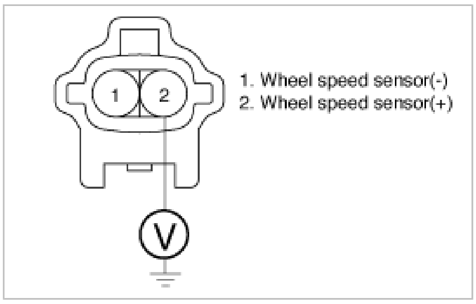
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "2" of the wheel speed sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

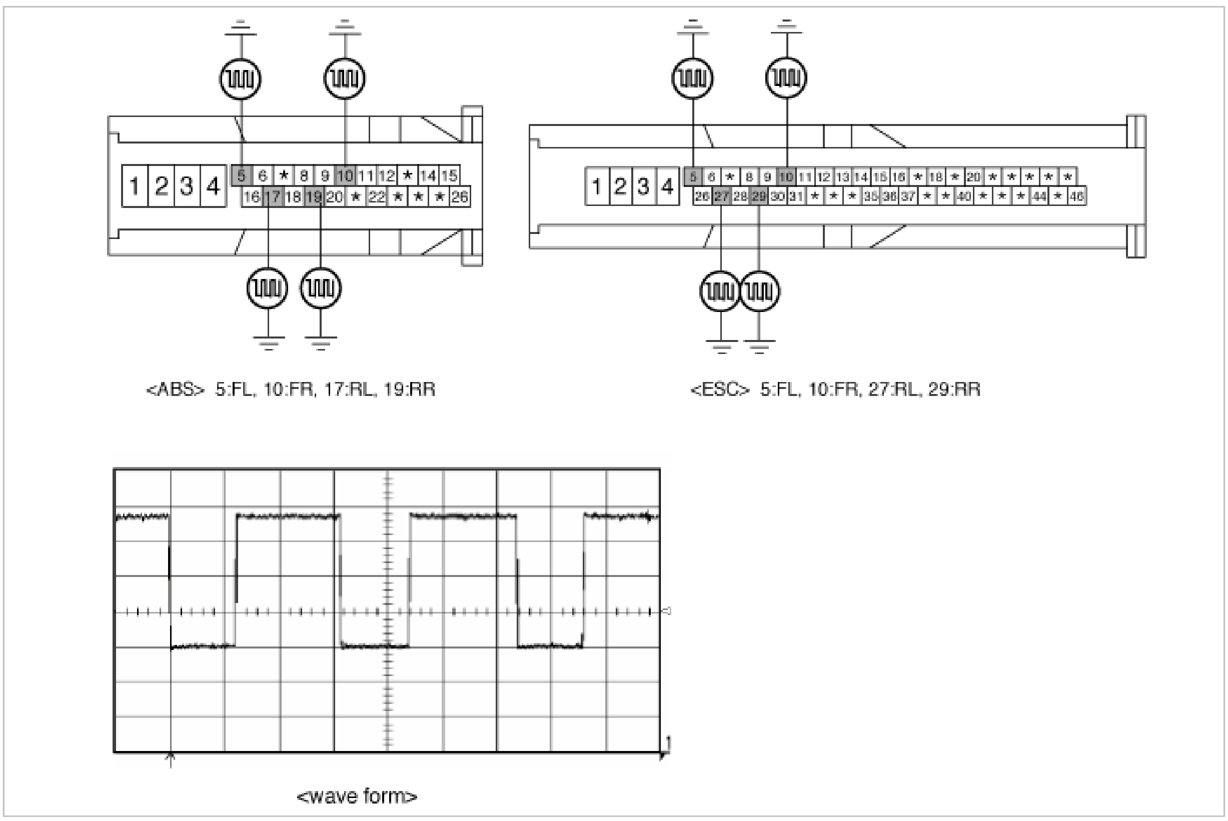
NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "16(ESC:26),9,6,8" of the HECU harness connector and terminal "2" of the Wheel speed sensor harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. By turning the wheel with hand.
3. Measure voltage between terminal "5,10,17(ESC:27),19(ESC:29)" of the HECU harness connector and chassis ground.

Specification : High : 0.89 ~ 1.26 V , Low : 0.44 ~ 0.63 V



Is the measured voltage within specifications?

YES

▸Go to "Component Inspection" procedure.

NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "1" of the wheel speed sensor harness connector and terminal "5,10,17(ESC:27),19(ESC:29)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10km/h or more(6mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected,replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more))
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

</table>

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC).

2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more) Monitor the "Wheel speed sensor" parameter on the Scantool.

   Specification : Approx. 50 km/h or more(31 mph or more)

   Is it normal?

   YES

   ▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

   NO

   (1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50 km/h or more(31 mph or more).
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more)).
   Are any DTCs present ?

   YES

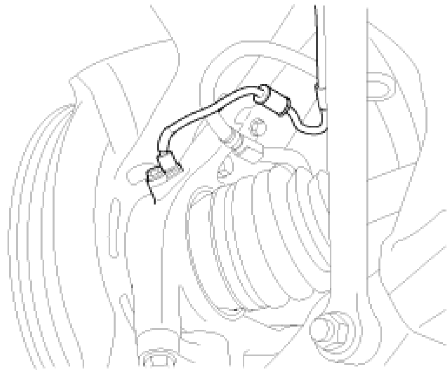
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ A system performs normally at this time.

Brake System > Troubleshooting > C1206

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor circuit continuously. If the sensor signal current is continuously out of the specified range for 200msec, then the HECU determines that the circuit is open/short, and sets this code. Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 10 Km/h(6 MPH).

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Current Monitoring		• Open or short of Wheel speed sensor circuit • Faulty Wheel speed sensor • Faulty HECU
CASE 1	Monitoring period	Once after power up.	
	Enable Conditions	Wheel speed sensor test starts immediate after power. Especially shorts between WSS(Wheel speed sensor) lines and shorts to UZ(ECU voltage supply) can be detected by switching single WSS channels in sequence. After end of test only the channels with no fault are switched on.	
CASE 2	Monitoring period	Continuous	
	Enable Conditions	The sensor circuitry has two current levels I = 7 mA and I= 14mA. If the sensor line is broken, shorted to ground or shorted to supply voltage a faulty current level will be detected.WSS line faults are detected, if the fault condition exists uninterrupted for t >= 200 ms.	
Effect	No correct WSS Signal can be generated. Control of the corresponding wheel is no longer possible. If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased (until switch off).		

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

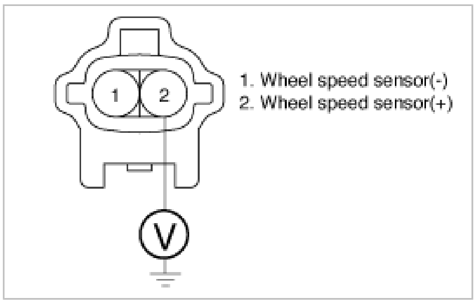
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "2" of the wheel speed sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

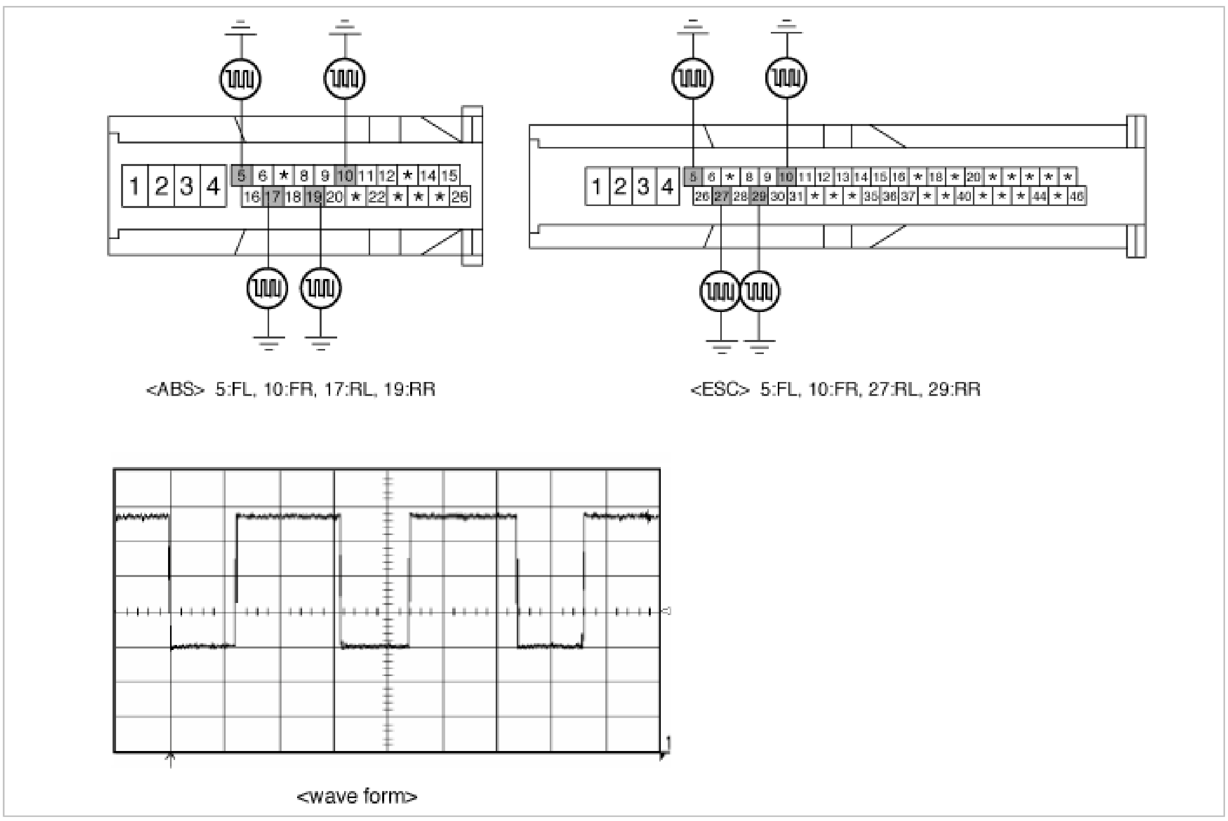
NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "16(ESP:26),9,6,8" of the HECU harness connector and terminal "2" of the Wheel speed sensor harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. By turning the wheel with hand.
3. Measure voltage between terminal "5,10,17(ESP:27),19(ESP:29)" of the HECU harness connector and chassis ground.

Specification : High : 0.89 ~ 1.26 V , Low : 0.44 ~ 0.63 V



Is the measured voltage within specifications?

YES

▸Go to "Component Inspection" procedure.

NO

▸ Check for open or short to GND in wheel speed sensor harness between terminal "1" of the wheel speed sensor harness connector and terminal "5,10,17(ESP:27),19(ESP:29)" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10km/h or more(6mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected,replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more))
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

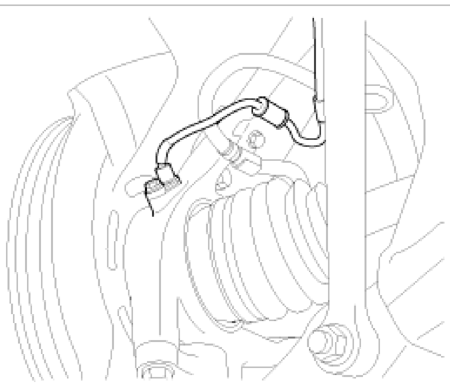
COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. This code is set when the sensor air gap is out of specified range or when No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 43.2 km/h(26 MPH) . Warning lamp is turned OFF if the detected fault is not more than when the IG KEY is turned to ON again, and wheel speeds are more than 12 Km/h (7MPH)

DTC DETECTING CONDITION

Item	Detecting Condition		Possible cause
DTC Strategy	Signal monitoring		
CASE 1	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	The test detects a failure if one (or two) wheel are at Vmin(2.75 km/h ;1.7 MPH) and the other wheels are above 12 km/h for longer than 1s.A fault could also be set during driving, if the vehicle accelerates 18 km/h after a particular wheel speed gets to vmin(2.75 km/h ;1.7 MPH) and stays there. This monitoring	

		could only detect singular faults.	
CASE 2	Monitoring period	Continuous except no under voltage is detected.	
	Enable Conditions	No wheel speed signals within 10 ms to 20 ms at a vehicle speed > 12 m/s (43,2 km/h). If the dynamic sensor monitor responses, the failures will be stored into failure memory immediately after a waiting period of 60 ms.	
CASE 3	Monitoring period	• The main monitor (λ5) needs additional information of the ESP-sensors and is active for a velocity > 20 km/h(12 MPH) and no under voltage(9.2 V) is detected. • The backup monitor (λ6) manages with the wheel speeds alone.	• Improper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
	Enable Conditions	• The main monitor (λ5): If the maximum difference of wheel speeds related to maximum wheel speed exceeds 5% a wheel specific wheel speed sensor fault is set. - the above conditions apply for 20s for 1 defective WSS. - the above conditions apply for 40s for 2 defective WSS. • The backup monitor (λ6):If the velocity is higher than 50 km/h(31 MPH), the deviation between the fastest and the slowest wheel must exceeds 6% related to the fastest wheel. If the velocity is below 50 km/h(31 MPH), the deviation must exceed an absolute value of 3 km/h(1.8 MPH) . - detection filter time : normally 20s	
Effect	Due to faulty wheel speed information the control of the corresponding wheel is no longer possible. reaction of the controller: If a sensor fault occurs on a front wheel, pressure is increased; on a rear wheel, pressure is decreased

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 50 km/h or more(31 mph or more).
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 50km/h or more(31mph or more)).
   Are any DTCs present ?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

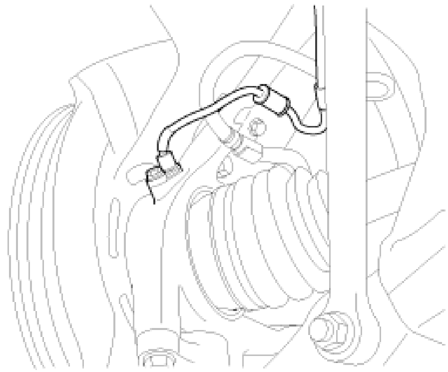
Brake System > Troubleshooting > C1213

COMPONENT LOCATION



GENERAL DESCRIPTION

The wheel speed sensor is the essential component the ABS ECU uses to calculate vehicle speed and to determine whether wheel lock occurs. For example, rear wheel speed signal is used as a reference value, for vehicle speed, in front wheel drive vehicles, and if a difference between front and rear wheel speed occurs, then ABS control is performed. Wheel speed sensor is an active hall-sensor type and good at temperature and noise charicteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and HECU calculate vehicle speed by this frequency.

DTC DESCRIPTION

The ABS ECU monitors the wheel speed sensor signal continuously. The monitoring reports a failure if the ABS target slip breaks out.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Improper installation of wheel speed sensor • Abnormal Rotor and wheel bearing • Faulty Wheel speed sensor • Faulty HECU
Enable Conditions	The monitoring reports a failure if the ABS target slip is exceeded for a time period >= 10 s at one or more wheels. If the driver brakes or the velocity is lower than 50 km/h(31 MPH) the detection time is enlarged to 60s.	
Monitoring period	Continuous	
Effect	Reduced function of the ESC system.	

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector(DLC).
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more). Monitor the "Wheel speed sensor" parameter on the Scantool.

   Specification : Approx.10 km/h or more(6 mph or more)

   Is it normal?

   YES

   ▸ Fault is intermittent caused by faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Repair or replace as necessary and then go to "Component Inspection" procedure.

   NO

   (1) Check for improper installation of wheel speed sensor. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (2) Check for damage of rotor teeth or wheel bearing. If NG, repair as necessary and then go to "Verification of vehicle Repair" procedure.

   (3) Substitute with a known-good Wheel speed sensor and check for proper operation. If problem is corrected, replace Wheel speed sensor and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more).
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by open or short of wheel speed sensor harness, faulty wheel speed sensor and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 10 km/h or more(6 mph or more))
   Are any DTCs present?

   YES

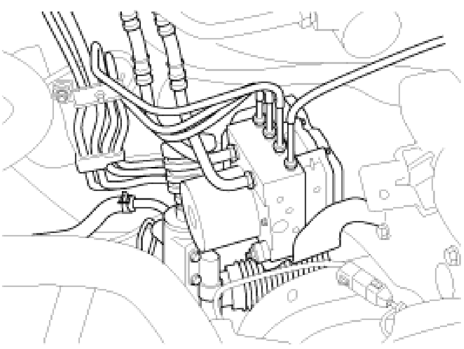
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1235

COMPONENT LOCATION



GENERAL DESCRIPTION

The pressure sensor senses the brake oil pressure to judge driver's brake intention when ESC is operating.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		Signal monitoring	
		1. Sensor supply voltage is continuous monitored (except power on). A sensor supply failure is detected if Sensor Supply Voltage > 5.3 V OR Sensor Supply Voltage < 4.7 V for t ≥ 60 ms. 2. Pressure signal 1 (DSO: original pressure value) is continuous monitored (except power on). Line faults like open, short to GND or short to UZ are detected. A Fault is

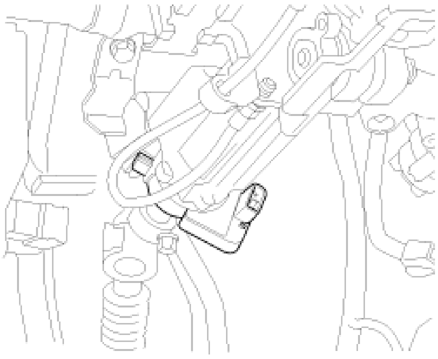
Brake System > Troubleshooting > C1260

COMPONENT LOCATION



DTC DESCRIPTION

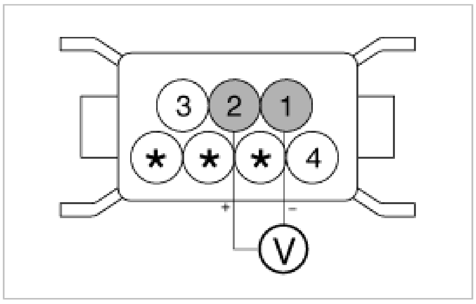
The Steering wheel angle sensor determines the direction of the rotation.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Faulty steering wheel sensor
Enable Conditions	1. LWS(steering angle sensor) offset monitoring : If the offset value exceeds a threshold of approximately 15 deg a LWS-fault is determined. 2. LWS Gradient monitoring : - signal gradient (steering angle velocity) from one 20 ms-cycle to another is higher than 40° or - change of this gradient (steering angle acceleration) is higher than 15° 3. LWS range monitoring : If value is higher than possible range for more than 300 ms a fault is determined. 4. LWS Plausibility monitoring : Dependent on the driving conditions failures in size of [10 + 60 m/s / FZREF(reference speed] deg at steering angle are recognized within 400 .. 4800 ms . 5. LWS Constant Signal Monitoring : If there is no change in the signal, but a right AND left cornering has been recognized, a fault is determined. (lateral acceleration > 2 m/s^2 in combination with a yaw rate > 6 °/s in both directions). 6. LWS Wrong Sign Monitoring : If the signals don't fit and forwards driving is detected, a fault is determined. 7. LWS Message counter monitoring : If the message counter shows an increase higher than 3 or lower than 1 in one 20 ms-cyle, a fault is stored after 160 ms.	
Monitoring period	1. Continuous during driving. 2. no under voltage and at least one LWS-message was sent in the current 20 ms-cycle. 3. After initialization and no under voltage detected. 4. Continuous during driving. 5. Initialization once in every ignition cycle. 6,7. Continuous during driving.	
Effect	Reduced controller function caused by faulty LWS signal.	

POWER SUPPLY CIRCUIT INSPECTION

1. Measure the voltage between terminal 1 and 2 of the steering angle sensor connector.



Is the voltage within 8~16V?

YES

▸ Clear the DTC, and then drive a vehicle over 40 Km/h(24 MPH) .If ESC warning lamp is turned on, replace the steering wheel sensor. Then go to "Verification of Vehicle Repair" procedure.

NO

▸ Check harness and connector between the HECU and the steering angle sensor. If NG ,replace the steering wheel sensor.

COMPONENT INSPECTION

1. CHECK INSTALLATION OF STEERING ANGLE SENSOR
   Check if the steering angle sensor is properly installed.
   Is the installation proper?

YES

▸ Check power of steering angle sensor.

NO

▸ Reinstall the steering angle sensor properly.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and practice the steering angle sensor calibration.(See page BR-161).
2. Select "Diagnostic Trouble Codes(DTCs)" mode.
3. Using a scantool, Clear DTC.
4. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1261

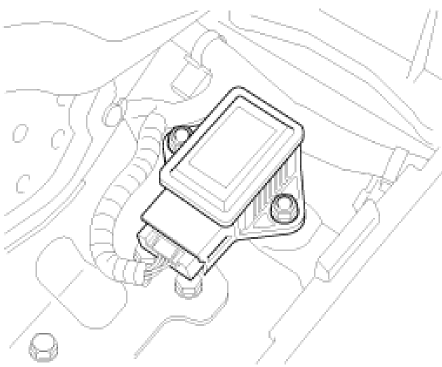
▸ A system performs normally at this time.

Brake System > Troubleshooting > C1282

COMPONENT LOCATION



GENERAL DESCRIPTION

The yaw-rate & Lateral G sensor are used for the stability of a vehicle. The yaw-rate is used to measure angular velocity while the Lateral G is to measure the force that moves the vehicle away from the center, when a vehicle is cornering.

DTC DESCRIPTION

This code sets when there is an open or short in the circuit of the yaw-rate & lateral G sensor.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Open or short of Yaw Rate & Lateral G sensor circuit • Faulty Yaw Rate & Lateral G sensor • Faulty HECU
Enable Conditions	1. The AY(Acceleration Sensor) sensor voltage is monitored for a is out of range value. A line fault is detected if AY < 0.3 V OR AY > 4.7 V for a time t >= 100 ms.. 2. Open line, short to GND and short to UZ are detected. The DRS sensor voltage is monitored for a is out of range value. A line fault is detected, if - DRSS < 0.225 V OR DRSS > 4.774 V for a time t >= 100 ms. - DRSR < 2.1 V OR DRSR > 2.9 V for a time t > 200 ms. ※DRSS (Yaw sensor reference), DRS(yaw sensor), DRSR(Yaw sensor signal)	
Monitoring period	Continuous	
Effect	Reduced controller function caused by faulty DRS and AY signal.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

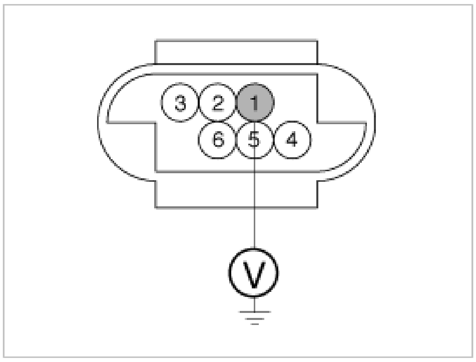
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Measure voltage between terminal "1" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

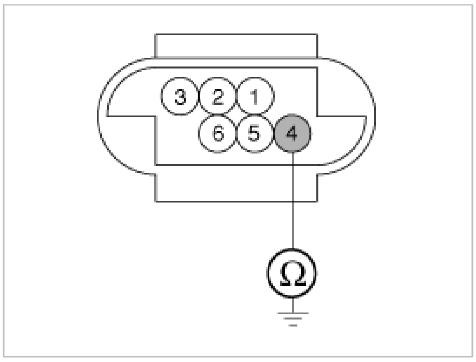
NO

▸ Check for open or short to GND in the Yaw Rate & Lateral G sensor harness between terminal "3" of the Yaw Rate & Lateral G sensor harness connector and terminal "16,20" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect Yaw Rate & Lateral G sensor connector
3. Measure resistance between terminal "4" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. below 1 Ω



Is the measured resistance within specifications?

YES

▸ Go to "Signal Circuit Inspection" procedure.

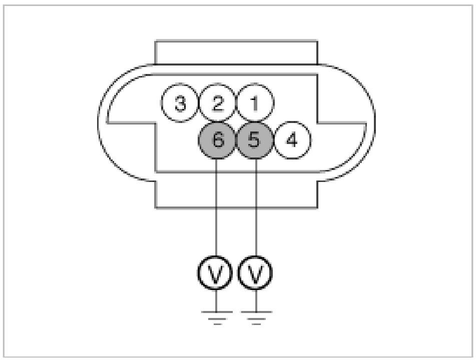
NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "4" of the Yaw Rate & Lateral G sensor harness connector and terminal "15" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON".
2. Measure voltage between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. 2.5 V



Is the measured voltage within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and terminal "16, 20" of the HECU harness connector. Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

YES

▸ Substitute with a known-good Yaw Rate & Lateral G sensor and check for proper operation. If problem is corrected, replace Yaw Rate & Lateral G sensor and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of Yaw Rate & Lateral G sensor harness and/or faulty Yaw Rate & Lateral G sensor or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

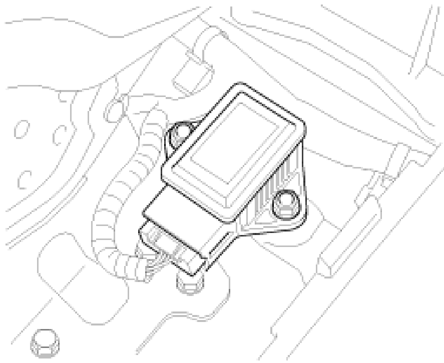
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1283

COMPONENT LOCATION



GENERAL DESCRIPTION

The yaw-rate & Lateral G sensor are used for the stability of a vehicle. The yaw-rate is used to measure angular velocity while the Lateral G is to measure the force that moves the vehicle away from the center, when a vehicle is cornering.

DTC DESCRIPTION

This code sets when there is an open or short in the circuit of the yaw-rate & lateral G sensor.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Signal monitoring	• Faulty Lateral Acceleration Sensor • Faulty Yaw Rate Sensor • Faulty HECU
EnableConditions	This test detects internal AY(Acceleration sensor) sensor malfunctions. 1. During the POS measure window (t = 100 ms) the AY signal must be for at least t = 60 ms between 0.2 V < AY < 0.8 V 2. If during stable vehicle behavior an AY-Failure larger than approximately 2.5 m/s occurs, the ESP controller will disregard the AY sensor information so that a false ESP intervention is prevented. A fault is recognized after 1.6 s during model validity. 3. If the offset value exceeds a threshold of approximately 2.25 m/s² an AY fault is determined. 4. During standstill the plausible range of |AY| is below 7 m/s². If the filtered value of |AY| is larger than 7 m/s² for more than 400 m/s a fault is set. 5. If the lateral acceleration is higher than 15 m/s² for more than 800 ms a suspected failure bit is set. After 1,6 s a fault is detected. 6. Standstill compensation: Failure threshold 5.25 °/s.Fast compensation (during driving if no standstill compensation could be completed): Failure threshold is 7,5 °/s.Long-term ("normal") compensation (during driving after succeeded standstill or fast offset compensation): Failure threshold is 7,5 °/s. 7. The fault criteria is approx. 25 % sensitivity failure. 8. If the measured yaw rate deviates more than 2.5 °/s plus a dynamicthreshold from the reference yaw rate during model validity, a failure isrecognized after 1.6 s. The dynamic threshold is between 2.5 °/s and more than 5 °/s. A typical value is 3 °/s. 9. The measured yaw rate and the model yaw rates, calculated from theWSS and LWS are compared. If the signals doesn.t fit and forward driving is recognized, a fault is determined. 10. In case of a YRS-failure, the YRS will send an abnormal yaw rate signal.	
Monitoring period	1. Once after power up and no low voltage. 2,3,8. Continuous during stable driving. 4. Continuous during standstill. 5. Continuous, if no under voltage is detected. 6. Continuous, dependent on driving situation. 7. During stable cornering after completed offset compensation. 9. After every standstill 10. Continuous	

Effect	Reduced controller function caused by faulty DRS(yaw sensor) signal.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

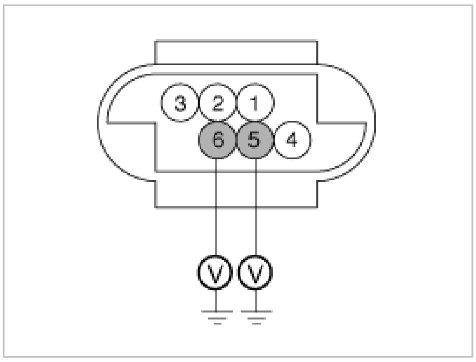
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON".
2. Measure voltage between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and chassis ground.

Specification : Approx. 2.5 V



Is the measured voltage within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for open or short in the Yaw Rate & Lateral G sensor harness between terminal "5, 6" of the Yaw Rate & Lateral G sensor harness connector and terminal "16, 20" of the HECU harness connector. Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 20 km/h or more(12 mph or more)
   Does warning lamp remain On?

YES

▸ Substitute with a known-good Yaw Rate & Lateral G sensor and check for proper operation. If problem is corrected, replace Yaw Rate & Lateral G sensor and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of Yaw Rate & Lateral G sensor harness and/or faulty Yaw Rate & Lateral G sensor or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.(Start and drive vehicle in gear and maintain vehicle speed is approx. 20 km/h or more(12 mph or more))

Are any DTCs present?

YES

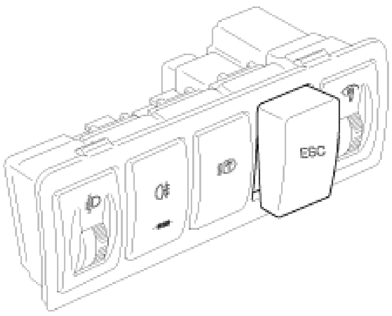
▸ Go to the applicable troubleshooting procedure.

NO

▸ A system performs normally at this time.

Brake System > Troubleshooting > C1503

COMPONENT LOCATION



GENERAL DESCRIPTION

Driver can inhibit the ESC control by ESC switch. When switch signal send into HECU, ESC warning lamp go ON and ESC control is stopped and if next switch signal is inputted again, ESC control is ready. This function is used for sporty driving or vehicle inspection.

DTC DESCRIPTION

Trouble code is set when the condition that the level of ESC switch is high is continued for 60sec.When the ESC switch failure is set there is no signal in the warning lamp and HECU inhibit the ESC control and allow the ABS/EBD control.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Short circuit monitoring	• Open or short ESC switch
Enable Conditions	Trouble code is set when the condition that the level of ESC switch is high is continued for 60 sec.	
Monitoring period	Continuous	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

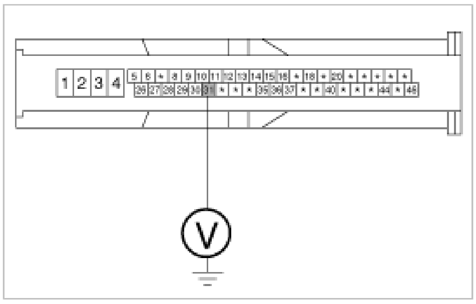
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF" & ESC Switch"ON".
2. Measure voltage between terminal "31" of the HECU harness connector and chassis ground.

Specification : Approx B+



Is the measured voltage within specifications?

YES

▸ Fault is intermittent caused by open or short in ESC switch line, faulty ESC switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

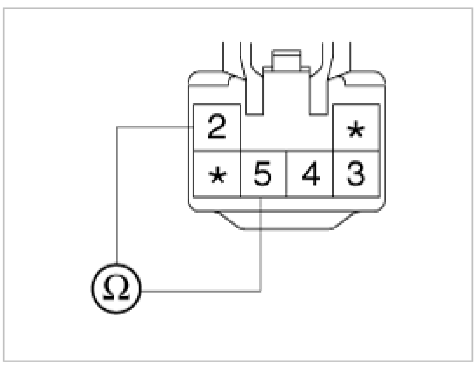
NO

▸ Check for damaged harness and poor connection in the power harness between the battery terminal(+) and the terminal "31" of the HECU harness connector . Check for open or blown 10A fuse referring to "Circuit Diagram" . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Disconnect ESC switch connector.
3. Press the ESC switch.
4. Measure resistance between terminal "2" of the ESC switch harness connector and terminal "5" of the ESC switch harness connector.

Specification : Approx below 1 Ω



Is the measured resistance within specifications?

YES

▸ Fault is intermittent caused by faulty ESC switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Substitute with a known-good ESC switch and check for proper operation. If problem is corrected, replace ESC switch and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

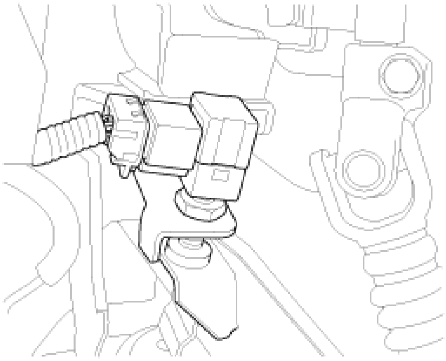
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1513

COMPONENT LOCATION



GENERAL DESCRIPTION

The brake light switch indicates brake pedal status to the ABS control unit. The switch is turned on when brake is depressed. The brake light switch is a normally-open contact which runs to battery voltage when active (brake depressed). When passive (brake not depressed), the cable is grounded via the break light bulbs.

DTC DESCRIPTION

The brake light signal is a reference to judge driver's will for braking. ABS ECU monitor open circuit of brake light switch for normal ABS control.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open circuit monitoring	• Open circuit in brake switch line • Faulty brake light switch • Faulty input stage in HECU
Enable Conditions	If the BLS-signals is high for 60 s, while the gas pedal is stepped, with vehicle speed > 3 m/s, offset compensated pVor < 5 bar and no control is active, a fault is set.	
Monitoring period	Continuous, if no under voltage is detected.	
Effect	Reduced function caused by a faulty brake light switch.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

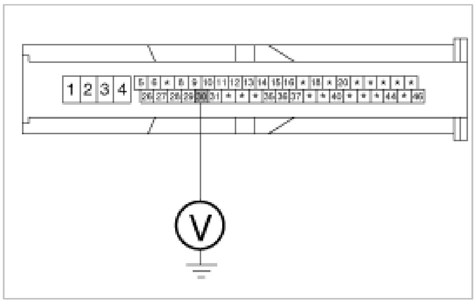
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "ON" & Engine "OFF".
2. Press the brake pedal.
3. Measure voltage between the terminal "30" of the HECU harness connector and chassis ground.

Specification : Brake Light Switch - Approx. B+



Is the measured voltage within specifications?

YES

▸ Fault is intermittent caused by open harness in brake lamp switch and brake switch line, faulty brake lamp switch was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Check for damaged harness and poor connection in the power harness between the battery terminal(+) and the terminal "30" of the HECU harness connector . Check for open or blown 15A STOP fuse. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Connect a ohmmeter to the connector of brake light switch, and check whether or not there is continuity when the plunger of the brake light switch is pushed in and when it is released.
   The switch is in good condition if there is no continuity when the plunger is pushed.
2. Is there no continuity when the plunger is pushed?

YES

▸ Fault is intermittent caused by open harness in brake light switch line, faulty brake lamp switch or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Substitute with a known-good brake lamp switch and check for proper operation. If problem is corrected, replace brake lamp switch and then go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

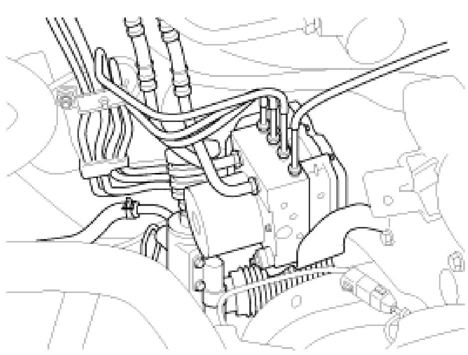
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1604

COMPONENT LOCATION



GENERAL DESCRIPTION

The HECU is composed of a ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit) , so the HECU hardware includes all solenoid valves inside the unit as well as the ECU.

DTC DESCRIPTION

The HECU monitors the operation of the IC components such as memory, register, A/D converter and so on. The HECU sets this code when the EEPROM data read by the master processor is different than prior data writed, or when the master/slave processor detects abnormal operation in RAM, Status Register, Interrupt, Timer, A/D converter or cycle time.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Internal monitoring	• Faulty HECU
EnableConditions	1. Internal control unit failures of the Micro controller and peripheral integrated circuits will be continuous monitored for proper function. 2. After EEPROM-values have been read from EEPROM, the values are monitored for corrupt data. Failure is set if: 1) Checksum not correct or 2) PSW-EEPROM-Handler reported unknown failure during EEPROM-value reading. 3. Evaluate EEPROM reading sequence. If EEPROM reading sequence take longer then 3 s, a failure is set.	
Monitoring period	1.Continuos 2,3.directly after ignition on, during reading of EEPROM-values.	
Effect	No control is available.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

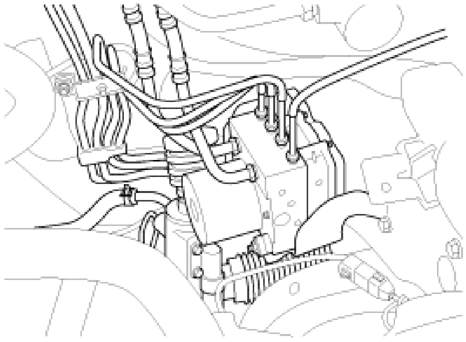
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1605

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

This code shows in case that there is an error on the CAN hardware. In this case, replace the HECU and check.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	CAN RAM monitoring	• Faulty HECU
Enable Conditions	1. Monitoring whether the initialization software has write access to the configuration registers of the CAN-controller module.Faults are detected immediately. 2. Monitoring includes line short to ground, line short to supply voltage and mutual line short. Line interruptions are detected by CAN message monitor.After detecting a BUSOFF failure the transmission is reinitialized. A BUSOFF fault is established if re-initialization is tried for 15 times in sequence without success.	
Monitoring period	1. immediate during start up. 2. Continuous	
Effect	1. CAN-Controller is not initialized correctly. Possibly no reception or transmission of messages. 2. CAN messages can not be processed. BLS is not controlled.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by short harness in CAN line and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.

3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

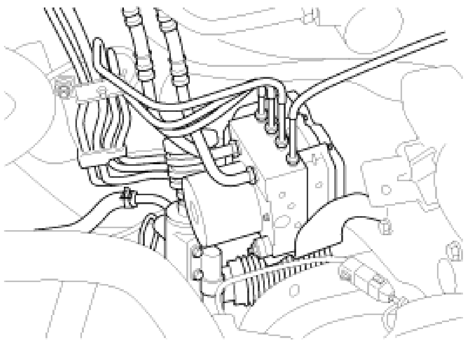
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1611

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

This code shows in case that there is an error on the CAN hardware. In this case, replace the HECU and check.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	CAN RAM monitoring	• Faulty HECU • Faulty ECM • Faulty TCU • Faulty Steering angle sensor
Enable Conditions	1. Purpose is to monitor if received message was not received by CAN controller of ABS8/ESC8 ECU.Faults are detected after filtering. Filtering has to be customized. 2. Purpose is to monitor if transmitted message has the expected data length.Actually the monitoring is reduced the check for too short messages.A message with oversized data length causes no fault. Faults are detected immediate.	
Monitoring period	Continuous	
Effect	1. CAN messages are not correct erceived. 2. CAN messages are not according to what was expected at compile time of the software.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and check for proper operation. If problem is corrected, replace ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and then go to "Verification of Vehicle Repair" procedure. If NG, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by faulty ECM(C1611)[TCU(C1612)/Steering angle sensor(C1623)] and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1612

COMPONENT LOCATION

YES

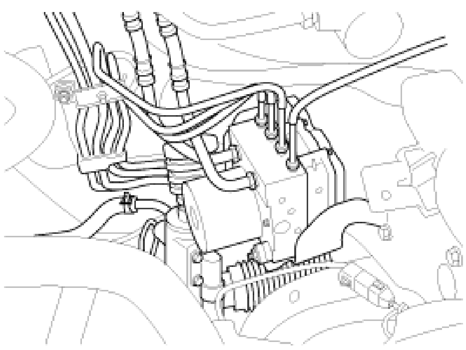
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1616

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DESCRIPTION

The HECU checks the CAN communication lines for normal TCS control, and sets this code if CAN BUS OFF status is detected for more than 100 ms.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open or short circuit monitoring	• Open or short circuit in CAN line
Enable Conditions	Monitoring includes line short to ground, line short to supply voltage and mutual line short. Line interruptions are detected by CAN message monitor. After detecting a BUSOFF failure the transmission is reinitialized. A BUSOFF fault is established if re-initialization is tried for 15 times in sequence without success.	

Monitoring period	Continuous	
Effect	CAN messages can not be processed. BLS(Brake light switch) is not controlled.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

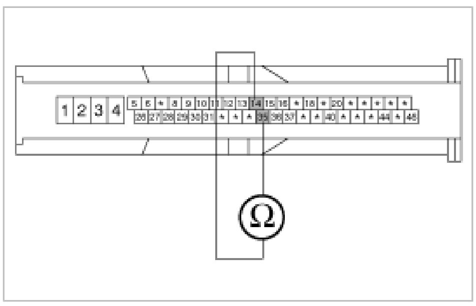
NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Ignition "OFF".
2. Measure resistance between terminal "35" of the HECU harness connector and terminal "14" of the HECU harness connector.

Specification : Approx. 60 Ω



Is the measured resistance within specifications?

YES

▸ Fault is intermittent caused by open or short in CAN signal harnessor was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

NO

▸ Check for open or short in CAN signal harness between terminal "35" of the HECU harness connector and terminal "14" of the HECU harness connector. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

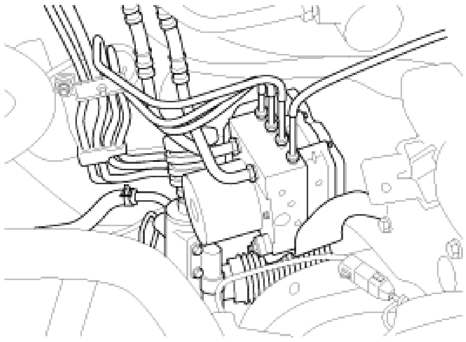
Brake System > Troubleshooting > C1625

COMPONENT LOCATION



GENERAL DESCRIPTION

The CAN is for sending and receiving the information for TCS(ESC) control, between the HECU and EMS/TCU.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Open or short circuit monitoring	• Open or short circuit in CAN line • Faulty HECU
Enable Conditions	Purpose is to monitor if transmitted message was not transmitted on time by the CAN controller of ABS8/ESC8 ECU. Faults are detected after filtering.	
Monitoring period	Continuous	
Effect	CAN messages are not transmitted on time.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to the next step.

SIGNAL CIRCUIT INSPECTION

1. Check for open or short in CAN signal harness between terminal "35" of the HECU harness connector and PCM harness connector.
2. Check for open or short in CAN signal harness between terminal "14" of the HECU harness connector and PCM harness connector.
   Is it normal?

YES

▸ Replace the HECU. Then go to "Verification of vehicle Repair" procedure.

NO

▸ Repair or replace harness and connector.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

   YES

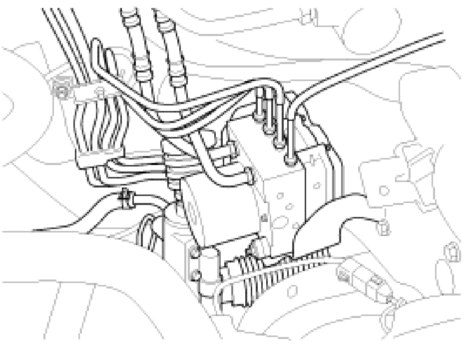
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C1626

COMPONENT LOCATION



DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Internal error	• Faulty HECU
Enable Conditions	1. Under normal conditions, the inlet valves of all four wheels are not closed during control for longer than 1.28 s. If the controller requests pressure-hold or pressure-decrease for longer than 1.28 s, a fault is stored. 2. The monitoring reports a failure if continuous ESC control occurs for a time period >= 10 s. A continuous ESC control for longer than 10 s is not possible under normal conditions.	
Monitoring period	1. Continuous 2. detected under voltage and a fault is not already detected.	
Effect	1. Reduced function as all wheel valves will remain in pressure build-up position. 2. Reduced function of the ESC system, no more ESC, no more ABS.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
   Does warning lamp remain On?

   YES

   ▸ Replace the HECU. Then go to "Verification of vehicle Repair" procedure.

   NO

▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
   Are any DTCs present?

YES

▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C1702

GENERAL DESCRIPTION

A hardware difference of ECU does not exist according to the specification of the vehicle, but a software changes according to deference of vehicle parameter. The ESC stores variant code (data of engine, displacement volume , T/M) at the ECU memory. Since then a ESC uses the stored data.

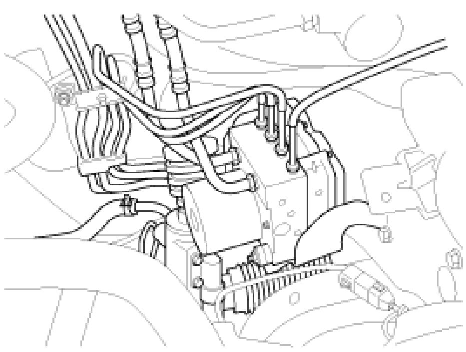
COMPONENT INSPECTION

*Variant Coding (See page BR - 142)

1. Install a EMS/TCU/ESC normally.
2. Connect a scanner to the vehicle.
3. IGN On
4. Scanner On
5. Select a brake mode.
6. Push the Variant Coding button.
7. Scanner Off
8. IGN Off
9. Remove the scanner.
10. IGN On
11. Finish the Variant Coding.

Brake System > Troubleshooting > C2112

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU supplies battery power to all solenoid valves by way of a valve relay which is controlled by the Electronic Control UNIT(ECU). The valve relay and all solenoid valves are installed inside the HECU (Hydraulic and Electronic Control Unit).

DTC DESCRIPTION

ABS ECU monitors voltage of the valve relay to check if ABS ECU can perform ABS control normally. When the valve relay is switched to ON, the HECU will set this code if the solenoid drive voltage is below permissible voltage ranges for a period of time. When the valve relay is switched to OFF, the HECU sets this code if the solenoid drive voltage is over the permissible voltage range for a period of time.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Open or short of power supply circuit • Faulty HECU • Faulty of the valve relay fuse(20 A)
Enable Conditions	1. Watchdog and VR(valve relay) function is tested during startup.FSA test(Fail Save Circuit test) detects if the VR/Enable remains in off position when it is turned on and vice versa. Reason could be short to GND or UZ(ECU voltage supply), interrupted lines or a defective output stage etc. 2. A Fault is detected if UVR(valve relay voltage) < 0.8 * UZ for a time t > 500 ms. 3. This test evaluates the function of the VR (valve relay) periodically. The VR is switched off and back on. VR malfunction and UVR short to UZ or UBVR (supply solenoid valves) and medium or high ohmic short of UVR (or a valve) to UZ, UBVR(supply solenoid valves) or GND are detected.	
Monitoring period	1.Once during startup. 2,3.Continuous	
Effect	No valve actuation possible.	

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

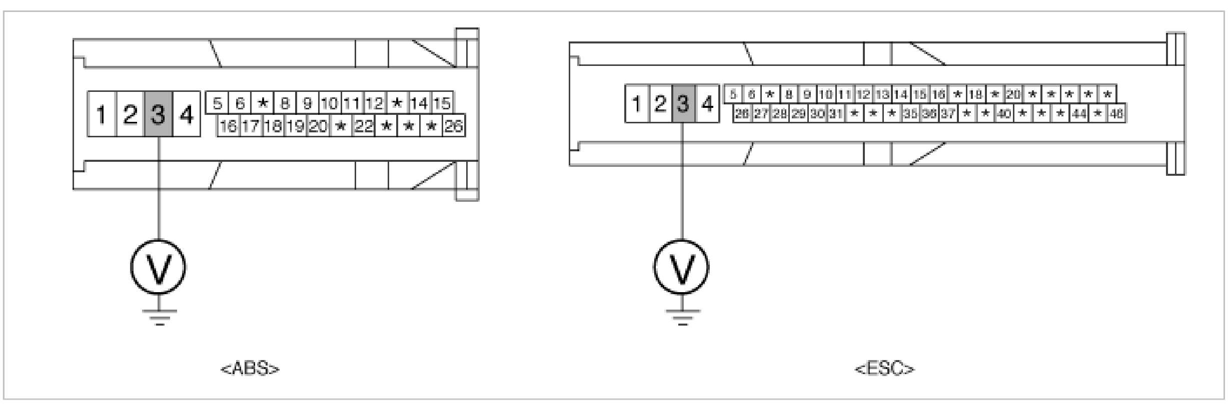
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF"
2. Disconnect HECU connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal "3" of the HECU harness connector and chassis ground.

Specification :Approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

NO

▸ Check for open or short in power harness between battery terminal(+) and terminal "3" of the HECU harness connector. Check for open or blown 20A fuse . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "4" of the HECU harness connector and chassis ground.

Specification :Approx.below 1 Ω

Is the measured resistance within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between terminal "4" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by open or short of power harness and/or faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information.
Are any DTCs present?

YES

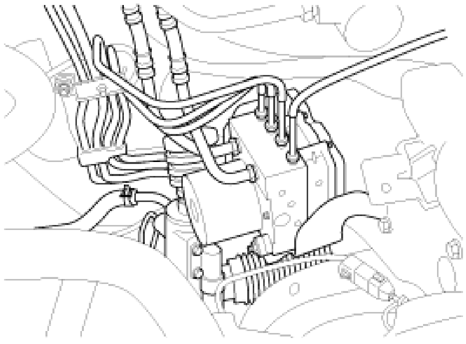
▸ Go to the applicable troubleshooting procedure.

NO

▸ System performing to specification at this time.

Brake System > Troubleshooting > C2308

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS HECU is composed of an ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit), so the HECU hardware includes all solenoid valves inside the unit as well as the ECU. Solenoid valves are switched to ON, OFF by HECU when the ABS is activated. Solenoid valves function is to increase, decrease or maintain the hydraulic pressure supplied to a wheel cylinder.

DTC DESCRIPTION

The HECU monitors the operation of the valves by checking the drive circuit of the solenoid valves, and then sets this code when the unexpcted drive voltage is detected. For example, the HECU sets the DTC if an unexpected high drive voltage is detected when the valve relay is switched to OFF.

DTC DETECTING CONDITION

<table>
<tr><th>Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>
<tr><td>DTC Strategy</td><td>Battery Voltage Monitoring</td><td rowspan="4">• Faulty HECU</td></tr>
<tr><td>Enable Conditions</td><td>1. The electrical feedback signal does not match the actuation signal for the corresponding valve:
Actuation Signal != Feedback Signal
Fault filter time is t = 30 ms
(for current controlled valves and under voltage conditions: t =80 ms)
2. Cyclic Valve and Relay Test (CVRT):
• A Fault is found if UVR(Valve relay voltage) is not within 0.1 * UZ(Ignition voltage) < UVR < 0.8 * UZ
• A Fault is found if UVR is not UVR < 0.2 * UZ and the Valve Feedback is not act. Valve = = FALSE, not act. Valve = = TRUE
At least VR is switched on again.
3. The valve and pump motor test detects electrical actuation malfunction of ABS valves. The test actuates all valves in series (to detect short cuts or shunts between the valve lines). Faults are detected by monitoring the valve response signals.</td></tr>
<tr><td>Monitoring period</td><td>1. Continuous
2. CVRT is executed immediately after power on and then periodic every t =20 s. The Test is canceled if any control/valve actuation takes place or if the Vehicle is in motion and the BLS is on.
3. The Valve and Pump motor Test is performed once after ignition on if vehicle speed is >= 15 km/h(9 MPH).</td></tr>
<tr><td>Effect</td><td>Valve cannot be actuated or valve is incorrectly actuated.
This may result in locked wheels or wheels without pressure.</td></tr>
</table>

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

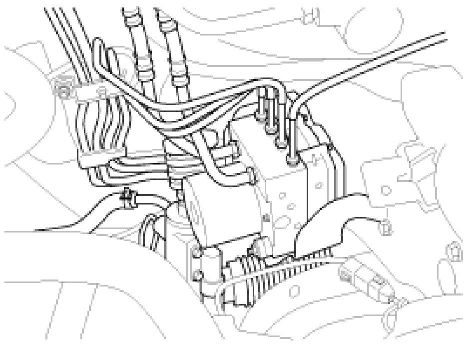
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

Brake System > Troubleshooting > C2312

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS HECU is composed of an ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit), so the HECU hardware includes all solenoid valves inside the unit as well as the ECU. Solenoid valves are switched to ON, OFF by HECU when the ABS is activated. Solenoid valves function is to increase, decrease or maintain the hydraulic pressure supplied to a wheel cylinder.

DTC DESCRIPTION

The HECU monitors the operation of the valves by checking the drive circuit of the solenoid valves, and then sets this code when the unexpcted drive voltage is detected. For example, the HECU sets the DTC if an unexpected high drive voltage is detected when the valve relay is switched to OFF.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Faulty HECU

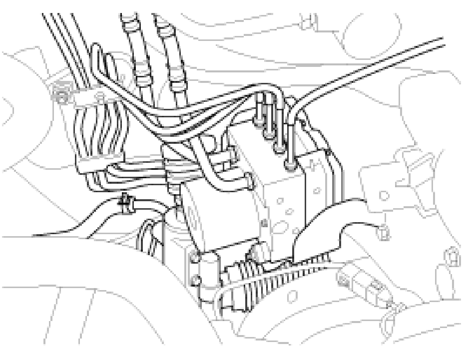
Brake System > Troubleshooting > C2316

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS HECU is composed of an ECU (Electronic Control Unit) and a HCU(Hydraulic Control Unit), so the HECU hardware includes all solenoid valves inside the unit as well as the ECU. Solenoid valves are switched to ON, OFF by HECU when the ABS is activated. Solenoid valves function is to increase, decrease or maintain the hydraulic pressure supplied to a wheel cylinder.

DTC DESCRIPTION

The HECU monitors the operation of the valves by checking the drive circuit of the solenoid valves, and then sets this code when the unexpcted drive voltage is detected. For example, the HECU sets the DTC if an unexpected high drive voltage is detected when the valve relay is switched to OFF.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	Battery Voltage Monitoring	• Faulty HECU
Enable Conditions	1. The electrical feedback signal does not match the actuation signal for the corresponding valve: Actuation Signal != Feedback Signal Fault filter time is t = 30 ms (for current controlled valves and under voltage conditions: t =80 ms) 2. Cyclic Valve and Relay Test (CVRT): • A Fault is found if UVR(Valve relay voltage) is not within 0.1 * UZ(Ignition voltage) < UVR < 0.8 * UZ • A Fault is found if UVR is not UVR < 0.2 * UZ and the Valve Feedback is not act. Valve = = FALSE, not act. Valve = = TRUE At least VR is switched on again. 3. The valve and pump motor test detects electrical actuation malfunction of ABS valves. The test actuates all valves in series (to detect short cuts or shunts between the valve lines). Faults are detected by monitoring the valve response signals.	
Monitoring period	1. Continuous 2. CVRT is executed immediately after power on and then periodic every t =20 s. The Test is canceled if any control/valve actuation takes place or if the Vehicle is in motion and the BLS is on. 3. The Valve and Pump motor Test is performed once after ignition on if vehicle speed is >= 15 km/h(9 MPH).	
Effect	Valve cannot be actuated or valve is incorrectly actuated. This may result in locked wheels or wheels without pressure.	

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

   YES

   ▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.
2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

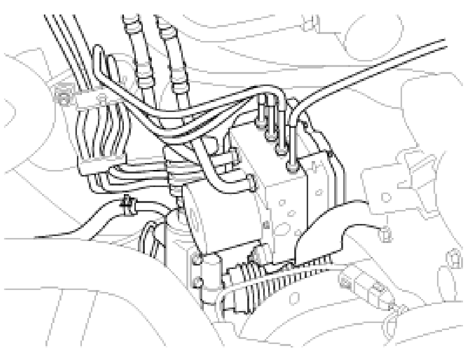
Brake System > Troubleshooting > C2402

COMPONENT LOCATION



GENERAL DESCRIPTION

The ABS ECU supplies battery power to the electric motor by way of a motor relay which is controlled by the Electronic Control Unit(ECU). The electric motor pump supplies hydraulic pressure to all wheel brake calipers by operating the piston inside the pump.

DTC DESCRIPTION

The ABS/ESC ECU monitors the pump motor relay or fuse open, open or short in motor or motor lock and then sets this code if a malfunction is detected.

DTC DETECTING CONDITION

<table>
<tr><th>Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>
<tr><td>DTC Strategy</td><td>Battery Voltage Monitoring</td><td rowspan="4">• Open or short of power supply circuit
• Faulty HECU
• Faulty of the pump motor fuse(40A)</td></tr>
<tr><td>Enable Conditions</td><td>1. A failure is detected if the voltage UM (Pump motor voltage) > 2.0 V for a time t >= 1 s.
2. A failure is detected if the voltage UM (Pump motor voltage) < (UZ(battery voltage) - 4.0 V) for a time t >= 100 ms.
3. After the end of the actuation of the motor relay has, the pump motor is still in motion and is generating a Voltage during it.s slowdown. The generated UM is monitored for a certain time on high level. The time depends on the supply voltage and is in the range of t = 30 ms to t = 125 ms.If the slow down condition isn.t met, the pump is activated again (see actuation times below) and the slowdown time is measured again. This is repeated for maximum n = 3 times. If, after the last pump activation, the pump motor slowdown time is still to short, a failure is detected.Actuation times:
1st actuation: 200 ms
2nd actuation: 1000 ms
3rd actuation: 3000 ms</td></tr>
<tr><td>Monitoring period</td><td>1. Stop monitor is active if the pump is off i.e. not actuation and no Slowdown.
2. The monitor is active if the pump is switched on .
3. Monitor is always active in the transition "pump on -> pump off".</td></tr>
<tr><td>Effect</td><td>1. The return pump does not work correct.
2. Pressure decrease (outlet valve) is no longer possible (wheels block).
3. Pressure decrease (outlet valve) is no longer possible (wheels lock).</td></tr>
</table>

TERMINAL & CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness(es) and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and then go to "Verification of Vehicle Repair" procedure.

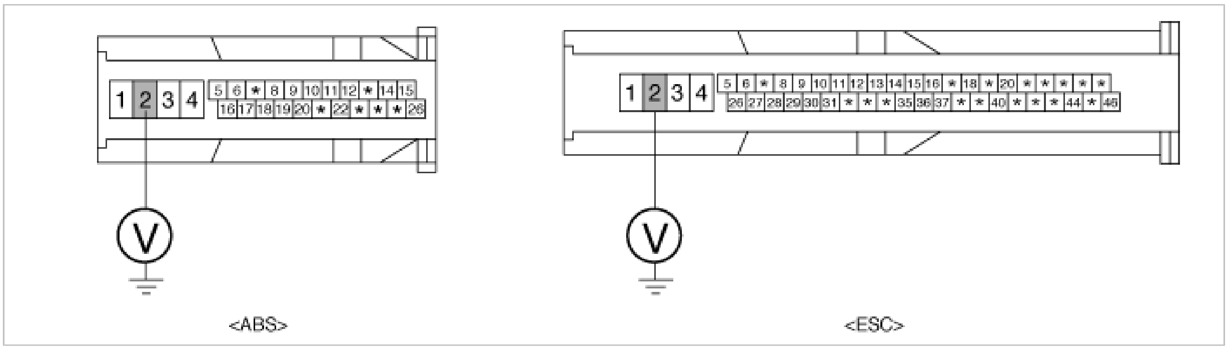
NO

▸ Go to the next step.

POWER SUPPLY CIRCUIT INSPECTION

1. Ignition "OFF"
2. Disconnect HECU connector.
3. Ignition "ON" & Engine "OFF".
4. Measure voltage between terminal "2" of the HECU harness connector and chassis ground.

Specification :Approx. B+



Is the measured voltage within specifications?

YES

▸ Go to "Ground Circuit Inspection" procedure.

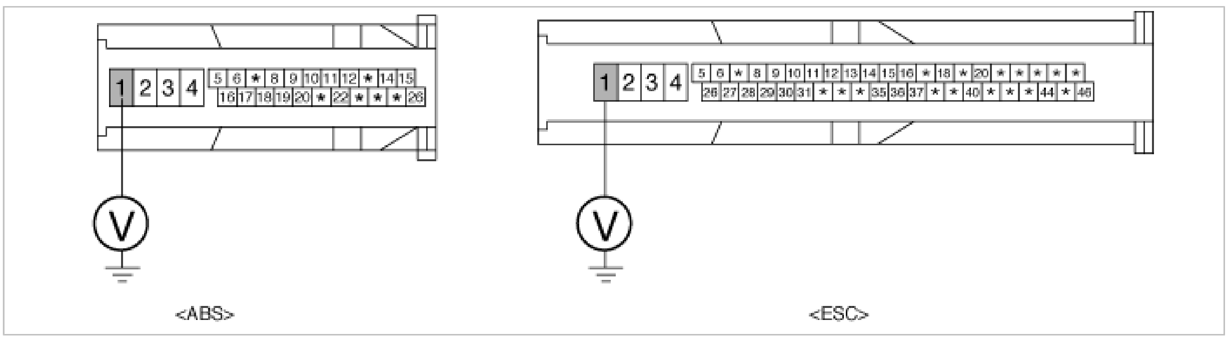
NO

▸ Check for open or short in power harness between battery terminal(+) and terminal "2" of the HECU harness connector. Check for open or blown 40A fuse . Repair as necessary and then go to "Verification of vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Ignition "OFF".
2. Disconnect HECU connector.
3. Measure resistance between terminal "1" of the HECU harness connector and chassis ground.

Specification :Approx.below 1 Ω



Is the measured resistance within specifications?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Check for damaged harness and poor connection between terminal "1" of the HECU harness connector and chassis ground. Repair as necessary and then go to "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Ignition "OFF".
2. Engine "ON".
3. Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more)
   Does warning lamp remain On?

YES

▸ Substitute with a known-good HECU and check for proper operation. If problem is corrected, replace HECU and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Fault is intermittent caused by faulty HECU or was repaired and HECU memory was not cleared. Go to the applicable troubleshooting procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected..

1. Connect scantool and select "Diagnostic Trouble Codes(DTCs)" mode.

2. Using a scantool, Clear DTC.
3. Operate the vehicle within DTC Detecting Condition in General Information. (Start and drive vehicle in gear and maintain vehicle speed is approx. 15 km/h or more(9 mph or more))
   Are any DTCs present?

   YES

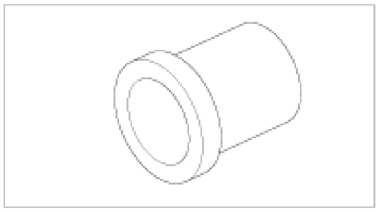
   ▸ Go to the applicable troubleshooting procedure.

   NO

   ▸ System performing to specification at this time.

SPECIAL TOOLS

Tool (Number and Name)	Illustration	Use
09568-4A000 Ball joint remover		Removal of the front lower arm and tie rod end ball joint
09517-21500 Front hub remover and installer		Measurement of wheel bearing preload
09432-11000 Bearing and gear puller		Removal of the bearing inner race from the front hub
09532-11600 Preload socket		Measurement of the wheel bearing preload (use with torque wrench)
09216-21100 Mount bushing remover and installer		• Removal of the center bearing • Press-fitting of the front wheel bearing outer race (Use with 09495-33100, 09216-21600)
09495-33000 Mainshaft bearing puller		Removal of the tone wheel
09216-21600 Mount bushing remover and installer		Removal of the wheel bearing outer race
09545-21100 Ball joint dust cover installer		Press-fitting of the front hub to the knuckle

09545-34100 Lower arm bushing remover and installer		Removal of the bearing inner race from the front hub
09453-33000B Snap ring installer		Removal and installation of the rear axle carrier bushing (Use with 09552-38200)
09216-22100 Mount bushing removerand installation base		Removal of the wheel bearing outer race (Use with 09216-21600)

Driveshaft and axle > General Information > Troubleshooting

TROUBLESHOOTING

Symptom Pos	sible cause	Remedy
Vehicle pulls to one side	Scoring of driveshaft ball joint Wear, rattle or scoring of wheel bearing Defective front suspension and steering	Replace Replace Adjust or replace
Vibration	Wear, damage or bending of driveshaft Driveshaft rattle and worn hub splines Wear, rattle or scratching of wheel bearing	Replace Replace Replace
Shimmy I	mproper wheel balance Bent wheel Defective front suspension and steering	Adjust or replace Replace Adjust or replace
Excessive noise	Wear, damage or bending of driveshaft Driveshaft rattle and worn hub splines Driveshaft rattle and worn side gear splines Wear, rattle or galling of wheel bearing Loose hub nut Defective front suspension and steering	Replace Replace Replace Replace Adjust or replace Adjust or replace
Bent cage	Cage damaged by improper handling or tool usage	Replace bearing
Galling	Metal smears on roller end due to overheating, incorrect lubricant or overloading	Replace bearing Check seals, check for proper lubrication
Cracked inner race	Race cracked due to improper fit, cocking or poor bearing seats	Replace bearing
Etching	Bearing surfaces appear gray or grayish black	Replace bearing

	in color accompanied by material etched away usually at roller spacing	Check seals, check for proper lubrication
Brinelling Surface	indentations on race surface caused by rollers being under impact loading or vibration while the bearing is not rotating	Replace bearing
Heat discoloration	Heat discoloration is dark blue resulting from overload or no lubricant (Yellow or brown color is normal)	Replace bearing Check seals and other parts
Fatigue spalling	Flaking of surface metal resulting from fatigue	Replace bearing Clean all related parts

Driveshaft and axle > General Information > Specifications

SPECIFICATIONS

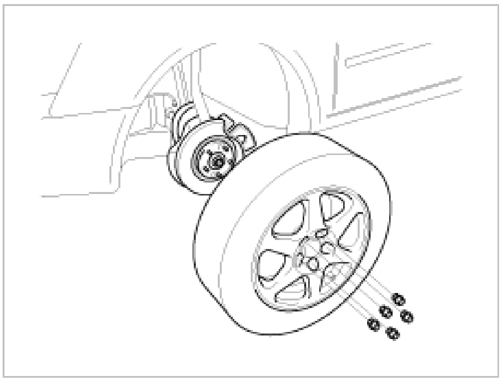
10. BJ boot
11. Snap ring
12. BJ inner race and ball
13. BJ assembly

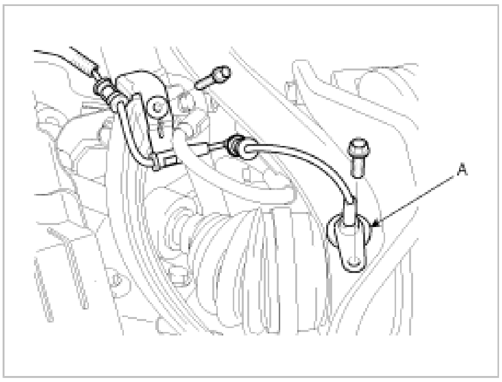
Driveshaft and axle > Driveshaft Assembly > Front Driveshaft > Repair procedures

REMOVAL

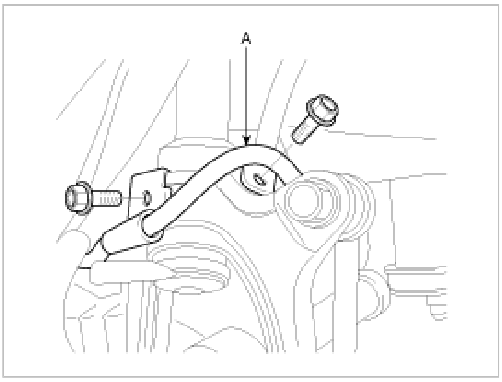
1. Remove the wheel and tire.



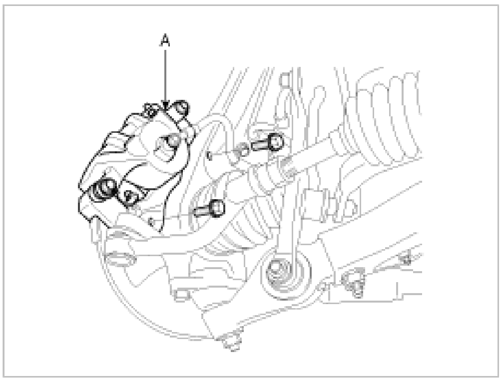
2. Disconnect the wheel speed sensor(A) from the knuckle.

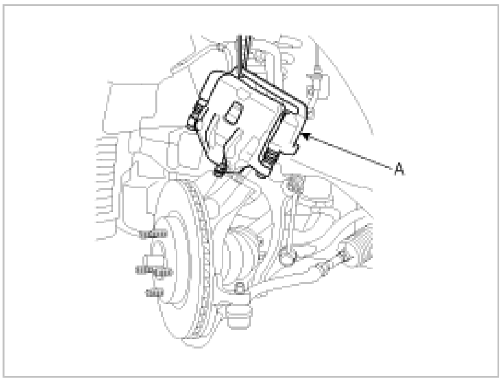


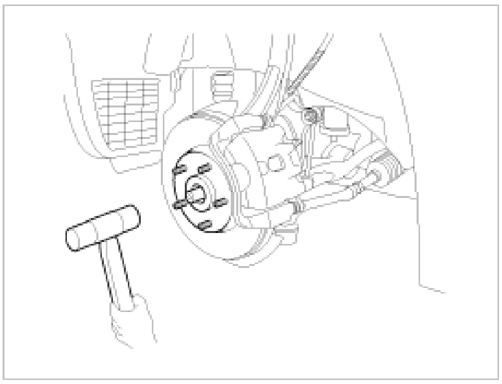
3. Disconnect the brake hose(A) from the knuckle.



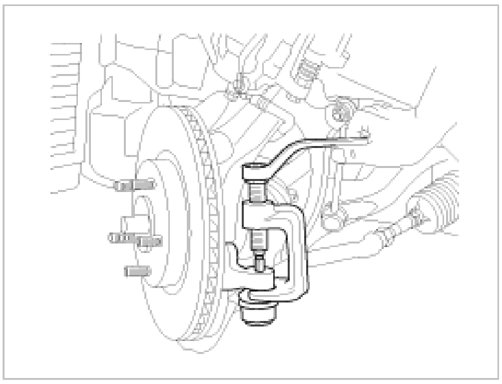
4. Remove the caliper assembly(A) and suspend it with wire.



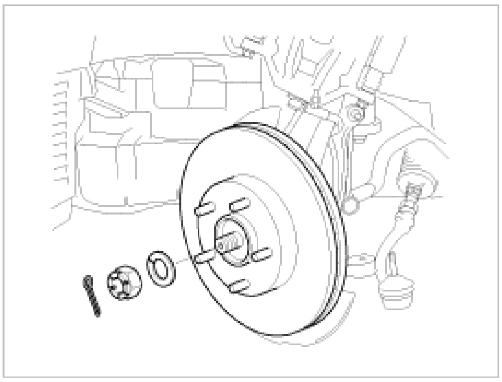




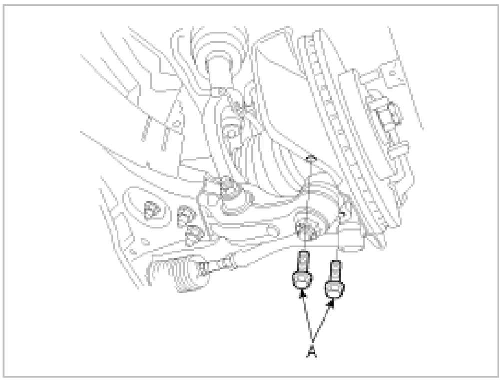
5. Using the special tool (09568-4A000), disconnect the tie rod end from the knuckle.



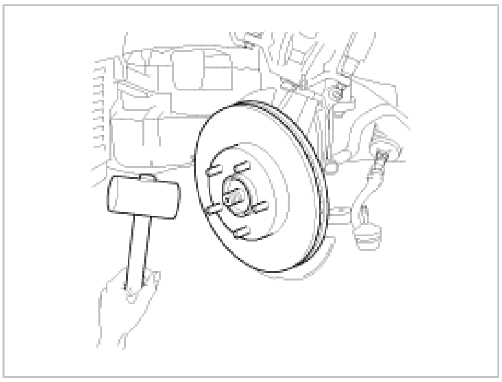
6. Remove the spilt pin and driveshaft castle nut and washer from the front hub.



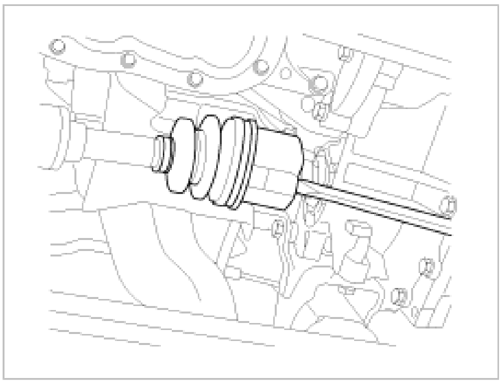
7. Remove the 2 bolts(A) and disconnect the ball joint from the knuckle.



8. Using a plastic hammer, disconnect the driveshaft from the axle hub.

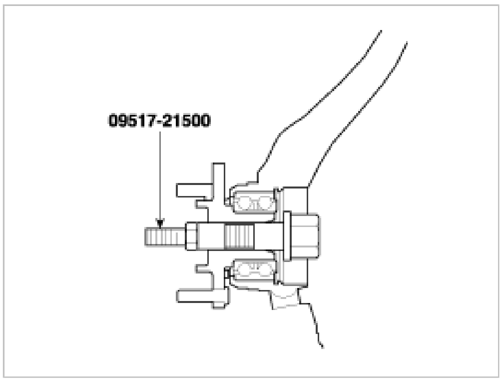


9. Removing the driveshaft from the transaxle by using a pry bar as shown below.



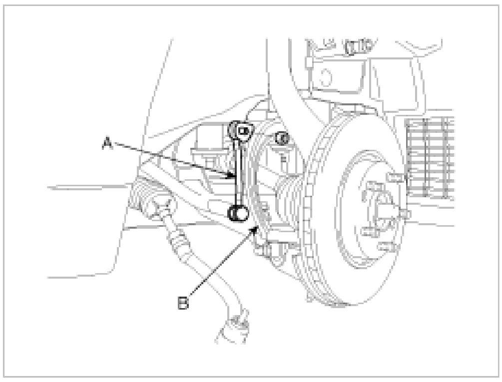
CAUTION

- Use a pry bar so you do not damage the joint.
- If you pull the driveshaft by excessive force, components inside the joint can be displaced causing the boot to be torn and the bearing to be damaged.
- Plug the transaxle case opening with an oil seal cap in order to avoid contamination.
- Support the driveshaft properly.
- Replace the retainer ring each time the driveshaft is removed from the transaxle case.
- While loosening the driveshaft nut, do not allow vehicle weight to be concentrated on the wheel bearing. If the vehicle moves, hold the wheel bearing using the special tool.

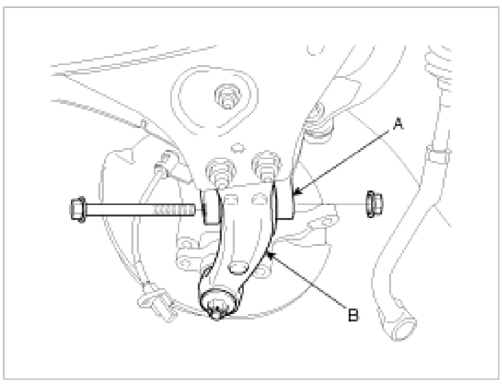


[RH3.3]

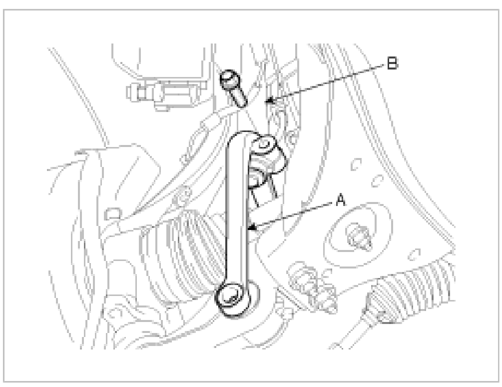
A. Remove the stabilzer link(A) from the fork(B).



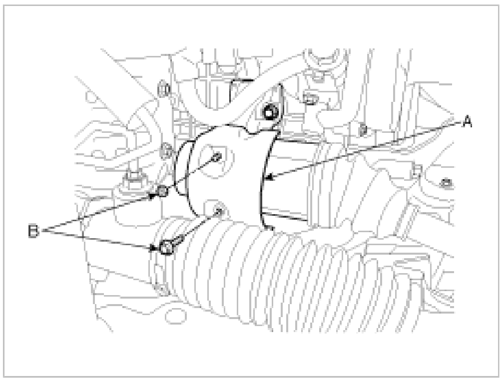
B. Remove the fork(A) from the front lower arm(B).



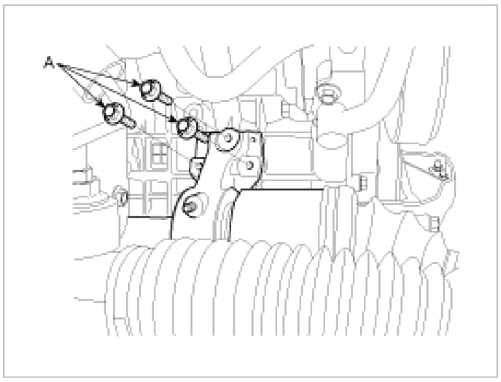
C. Remove the fork(A) from the front strut assembly(B).



D. Remove the inner shaft cover(A) from the inner shaft bracket(B).

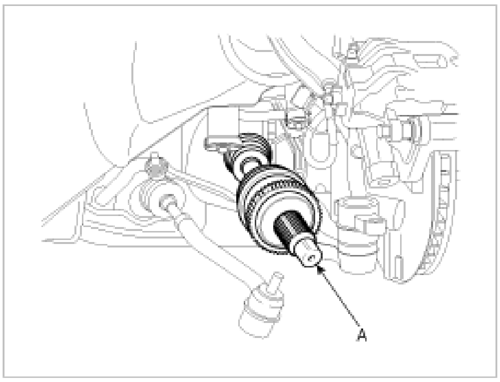


E. Remove the inner shaft bracket mounting bolt(A).

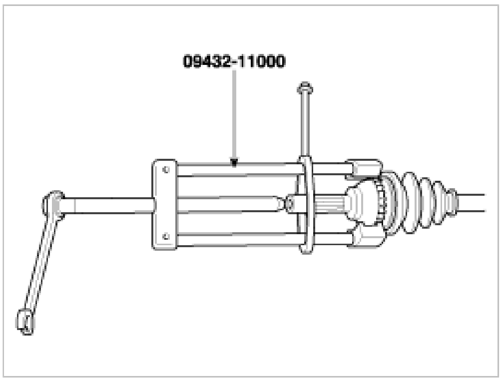


F. Remove the front driveshaft assembly(A) with the inner shaft from the transaxle.

> **CAUTION**
>
> Do not try to disconnect the inner shaft from the driveshaft. Because they can not be disconnected once assembled.
> Do not reuse the driveshaft which is disassembled from the innershaft.



10. Using the special tool (09432-11000), remove the tone wheel.

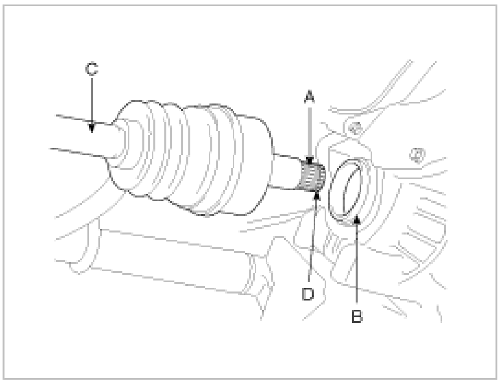


INSTALLATION

CAUTION

Replace the circlip with new ones after removal.

1. Apply gear oil on the drive shaft spliness(A) and the contacting surface of differential case oil seal(B).
2. Before installing the drive shaft(C), set the opening side of the clip(D) facing downward.



3. After installation, check if the drive shaft cannot be removed.
4. Install the drive shaft into the knuckle.

CAUTION

Be careful not to damage the boot.

5. Install the knuckle in the lower arm assembly.

Tightening Torque Nm(kgf·m, lb-ft) :
100~120 (10~12, 74~88)

6. Install the tie rod end in the knuckle.

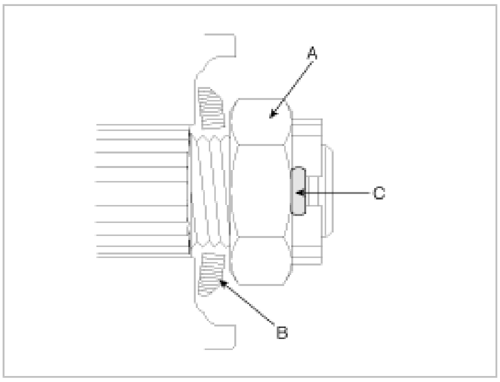
Tightening Torque Nm(kgf·m, lb-ft) :
24~34 (2.4~3.4, 18~25)

7. Install the wheel speed sensor in the knuckle.

Tightening Torque Nm(kgf·m, lb-ft) :
8~10 (0.8~1, 5.8~7.2)

8. After installing the washer(B) with convex surface outward, install the lock nut(A) and the spilt pin(C)

Tightening Torque Nm(kgf·m, lb-ft) :
200~280 (20~28, 148~207)

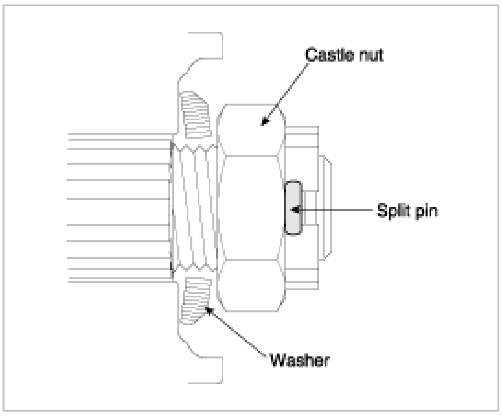


9. Install the wheel and tire.

INSTALLATION

1. Tighten the components with the tightening torque.

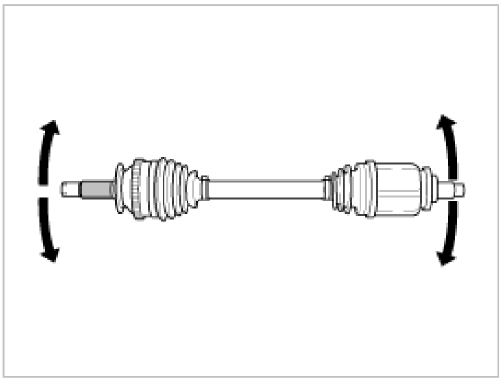
Item T	orque (kg·m)
Driveshaft nut	20 ~ 28
Lower arm and ball joint	10 ~ 12
Shock absorber lower mounting bolts	14 ~ 16
Tie rod end and knuckle	2.4 ~ 3.4



2. Replace the retainer ring every time the driveshaft is removed from the transaxle case.
3. Install the washer on driveshaft and tighten the nut as illustrated.
4. Install the split pin.

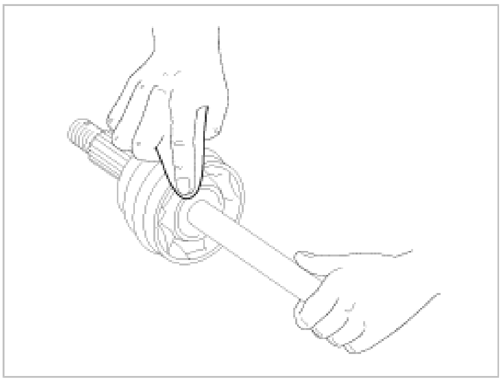
INSPECTION

1. Check the driveshaft boots for damage and deterioration.
2. Check the splines for wear and damage.
3. Check the ball joints for wear and operating condition.



INSPECTION

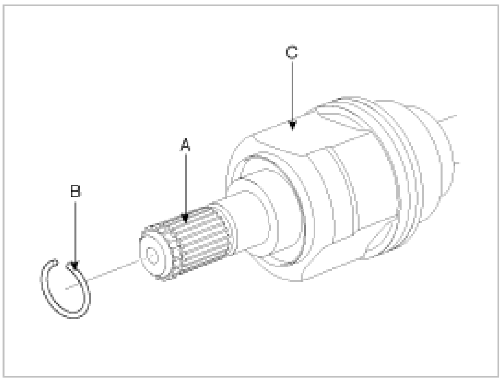
1. Check the driveshaft spline part for wear.
2. Check for entry of water and foreign material into boot.
3. Check the spider ring for revolution and wear.
4. Check the SFJ case inside wear and rust.



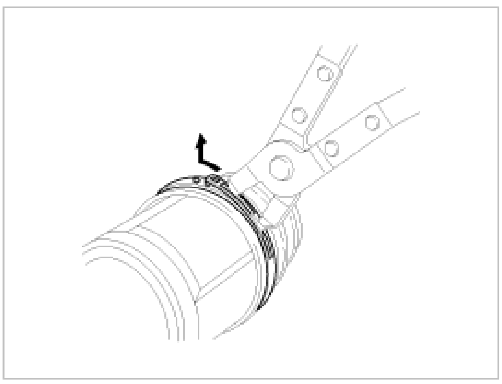
DISASSEMBLY

> **NOTE**
>
> - Do not disassemble the BJ assembly.
> - Special grease must be applied to the drive shaft joint. Do not substitute with another type of grease.
> - The boot band should be replaced with a new one.

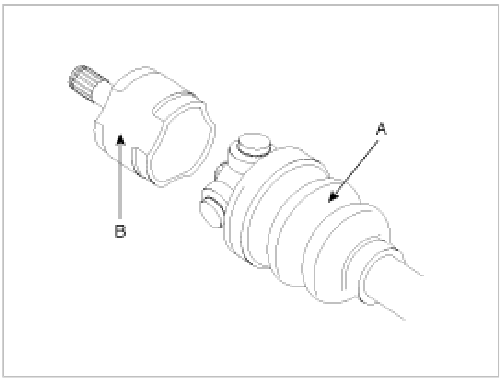
1. Remove the clip(B) from drive shaft splines(A) of the transaxle side TJ case(C).



2. Remove both boot bands from the transaxle side TJ case.

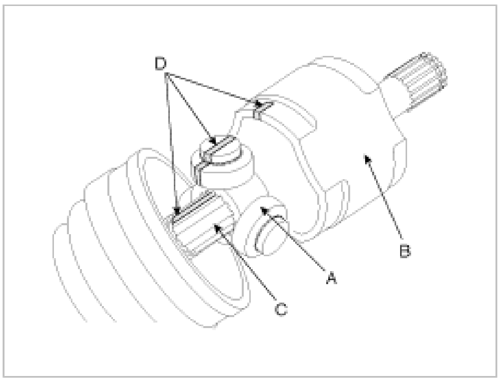


3. Pull out the boot from the transaxle side joint(TJ).
4. When separating the joint and boot(A), remove the grease from the TJ case(B).

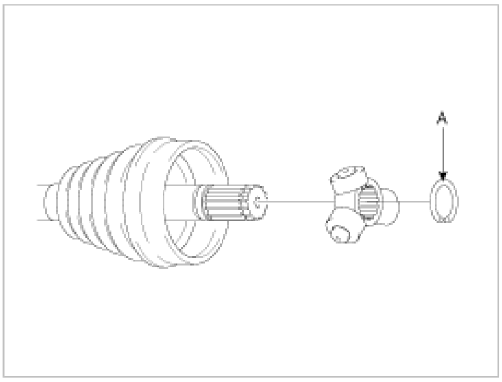


CAUTION

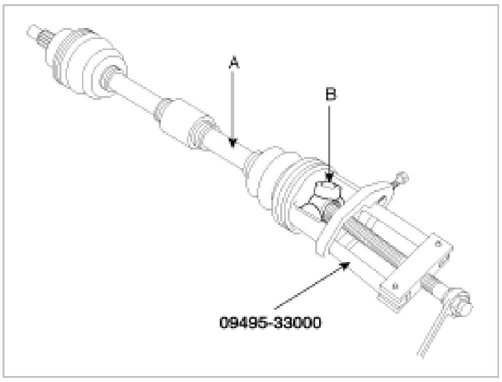
- Be careful not to damage the boot.
- Make alignment marks on spider roller assembly(A), TJ case(B), and shaft splines(C) to aid reassembly.



5. Using a plier or flat-tipped (-) screwdriver, remove the snap ring(A).



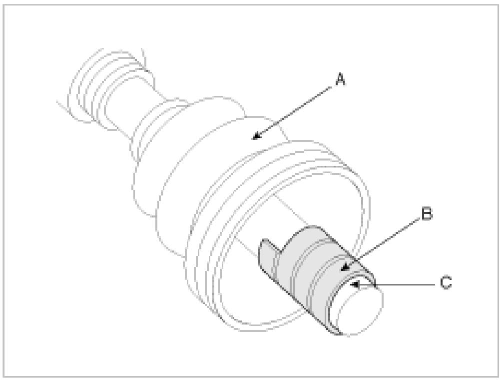
6. Remove the spider assembly(B) from drive shaft(A) by using the Special Tool(09495-33000).



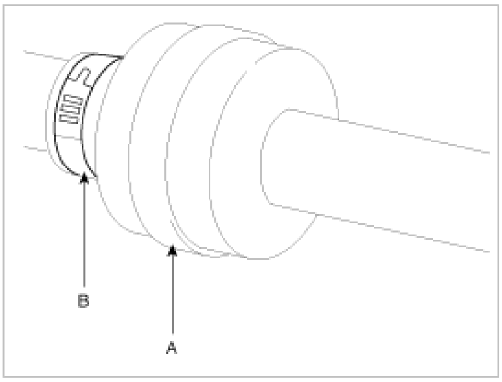
7. Clean the spider assembly.
8. Remove the boot(A), of the transaxle side joint(TJ).

CAUTION

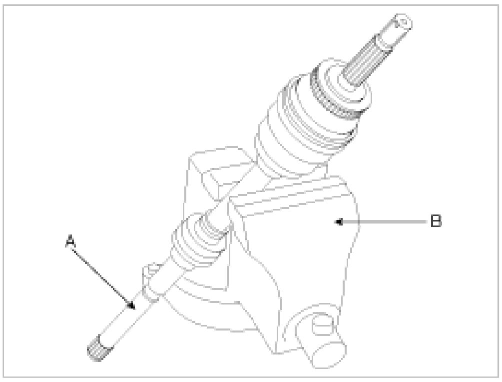
Wrap tape(B) around the driveshaft splines(C) to protect the boot(A).



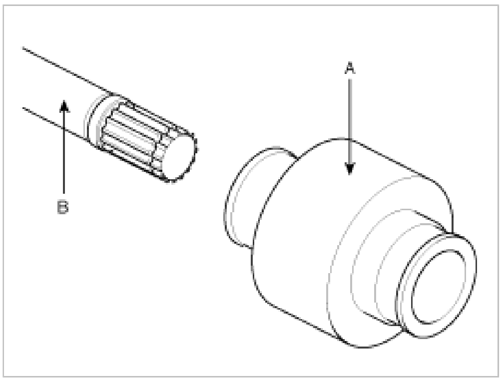
9. Remove both side of bands(B,C) of the dynamic damper(A).



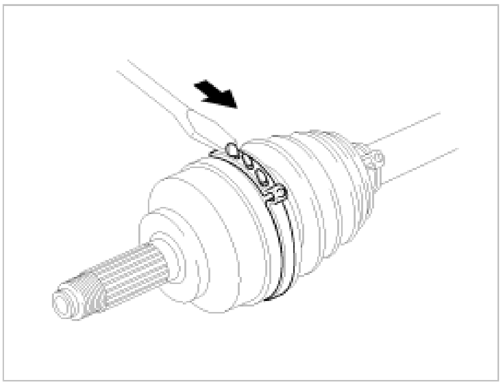
10. Fix the drive shaft(A) with a vice(B) as illustrated.



11. Apply soapy water to the shaft to prevent being damaged between the shaft spline and the dynamic damper when the dynamic damper is removed.
12. Separate dynamic damper(A) from the shaft(B) carefully.



13. Remove both bands on the side of wheel.



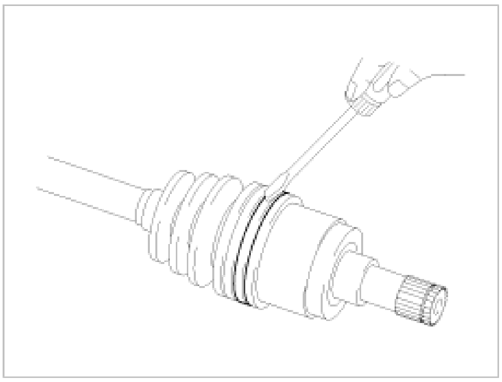
14. Pull out the joint(BJ) boot on the side of wheel into the transaxle direction.
 Be carefull not to damage the boot.

DISASSEMBLY

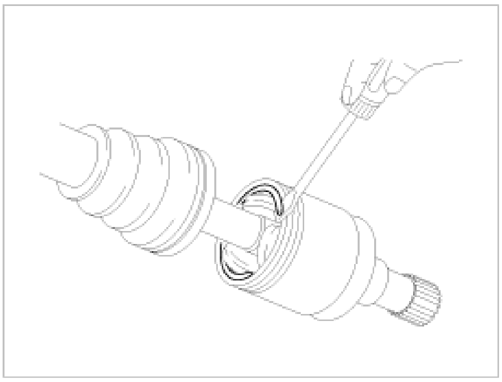
> **NOTE**
>
> - Do not disassemble the BJ assembly.
> - The Driveshaft joint uses special grease. Do not subtitute with another type of grease.
> - The Boot band should be replaced with a new one.

1. Remove the SFJ boot band and pull the boot from SFJ outer race.

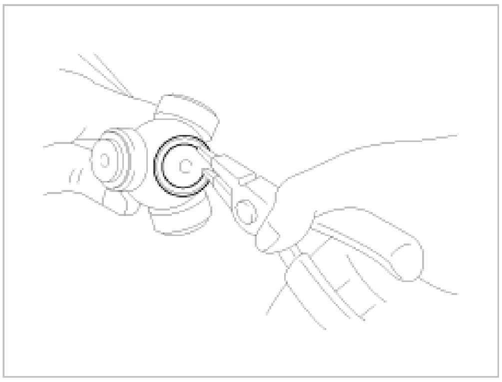
> **NOTE**
>
> Be careful not to damage it.



2. Remove the circlip using a screwdriver.
 (ASAN) KOREA



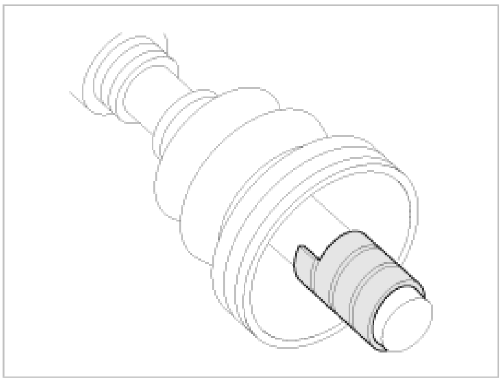
3. Remove the driveshaft from SFJ outer race.



4. Remove the snap ring and disassemble the spider assembly from the shaft.
5. Clean the spider assembly.
6. Remove the BJ boot band and removal of the SFJ boot and the BJ boot.

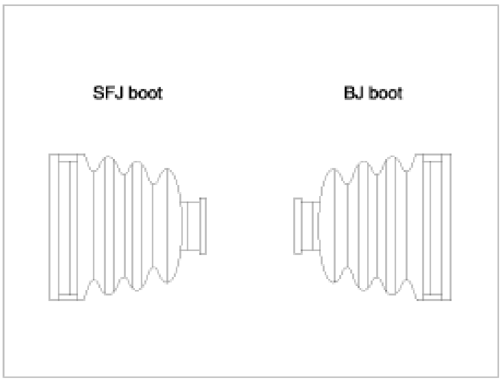
CAUTION

If the boot is reused, wrap a tape around the driveshaft splines to protect the boot.



REASSEMBLY

1. Wrap a tape around the driveshaft spline(SFJ side) to avoid boot damage.



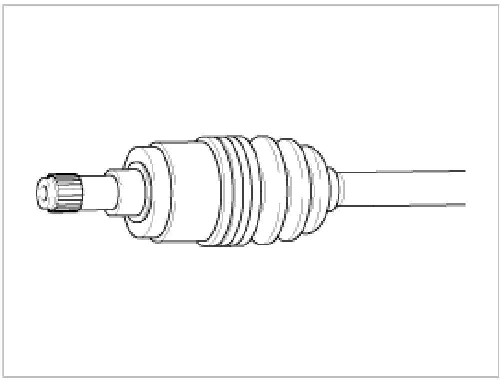
2. Apply specified grease at the driveshaft and install the boot.

Item 3.3		L
Grease filling quantity	BJ boot	Joint 140g ± 5g, Boot 60g ± 5g
	SFJ boot	Joint 100g ± 5g, Boot 45g ± 5g

3. Add the specified grease in the amount wiped away at the of inspection.
4. Tighten the boot band.

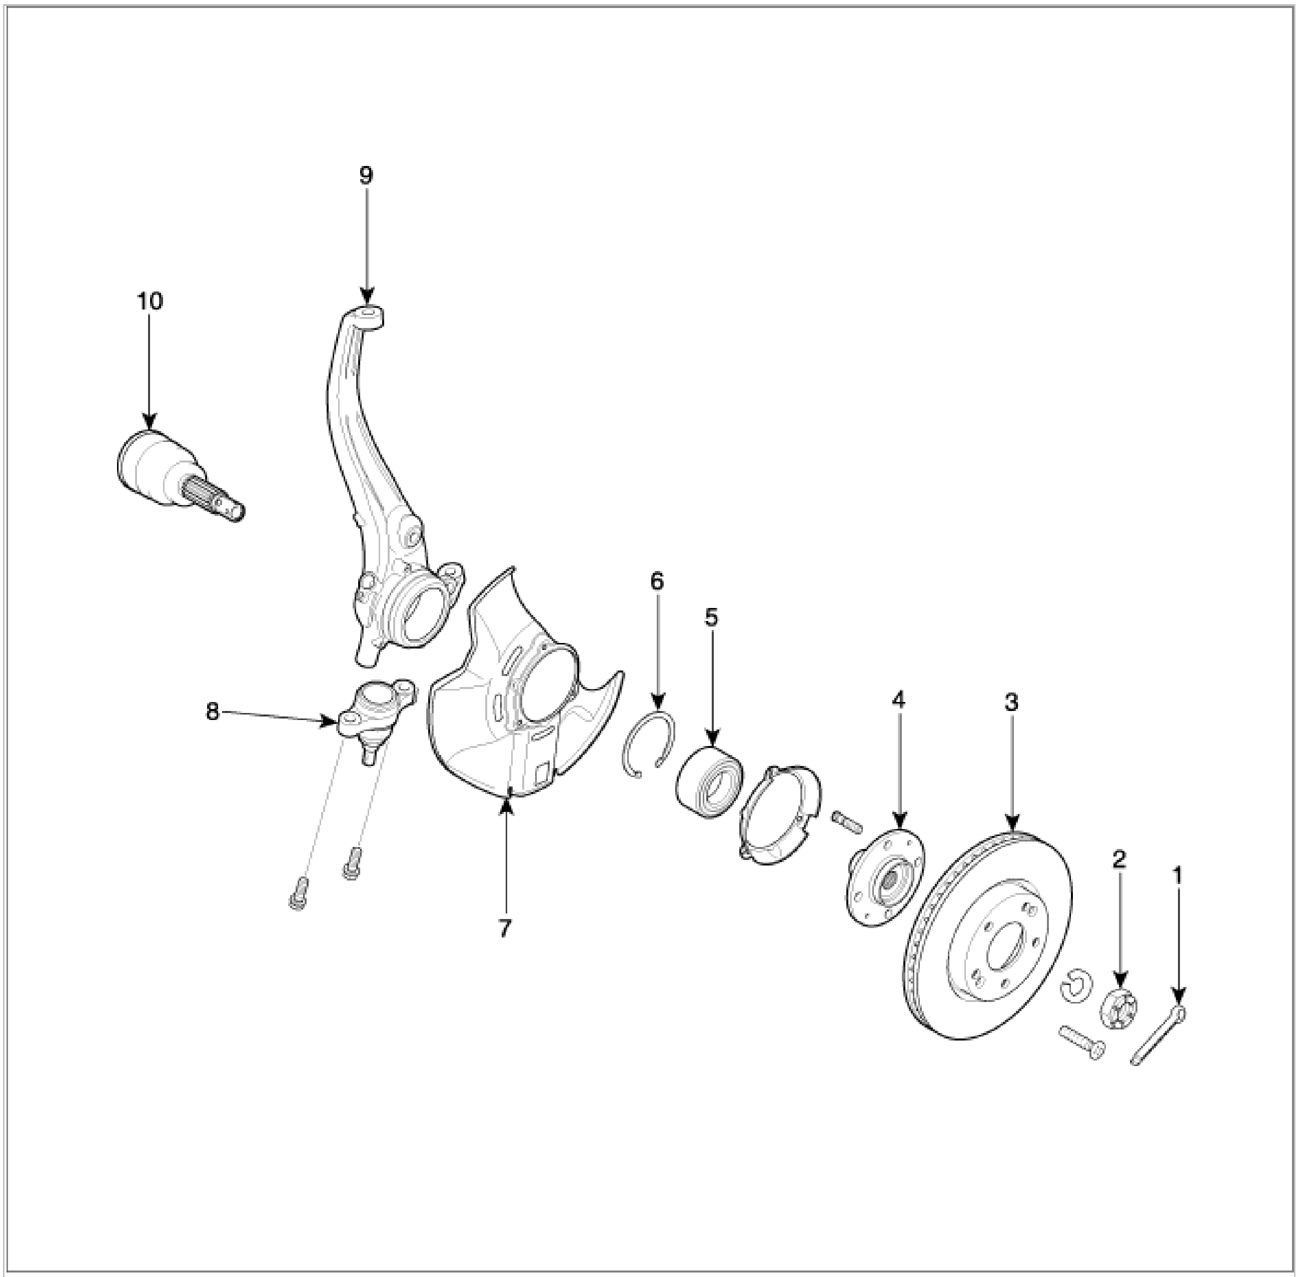
CAUTION

Adjust the distance between boot bands within the specification range when tightening the boot band to adjust air in the boot.



Driveshaft and axle > Front Axle Assembly > Front Hub / Axle > Components and Components Location

COMPONENTS

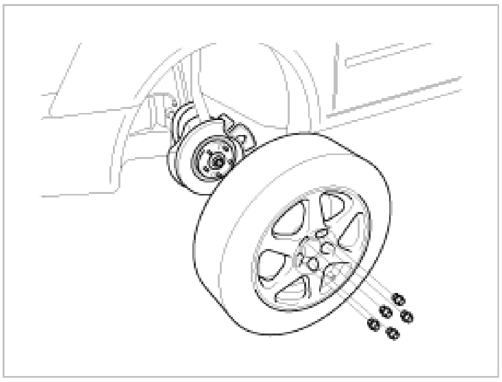


1. Split pin
2. Driveshaft nut
3. Brake disc
4. Hub
5. Wheel bearing
6. Snap ring
7. Dust cover
8. Lower arm ball joint
9. Knuckle
10. Driveshaft

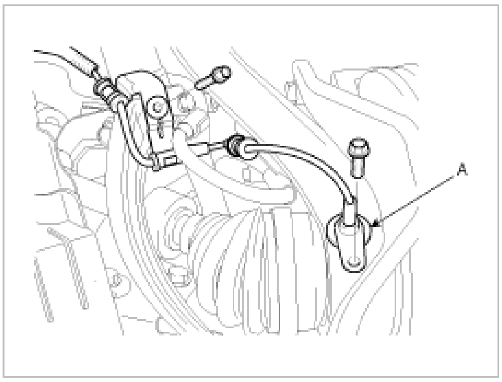
Driveshaft and axle > Front Axle Assembly > Front Hub / Axle > Repair procedures

REMOVAL

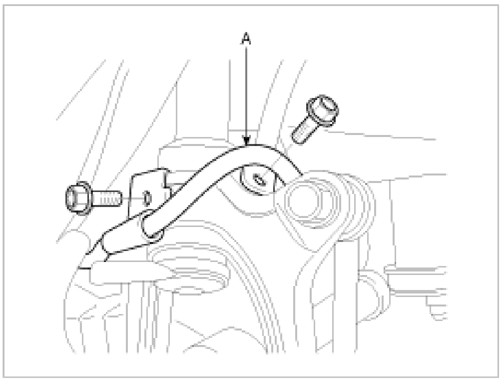
1. Remove the wheel and tire.



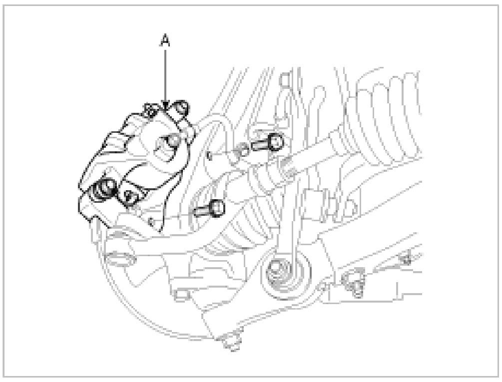
2. Disconnect the wheel speed sensor(A) from the knuckle.

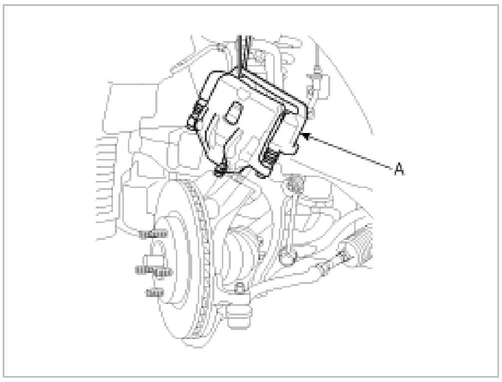


3. Disconnect the brake hose(A) from the knuckle.

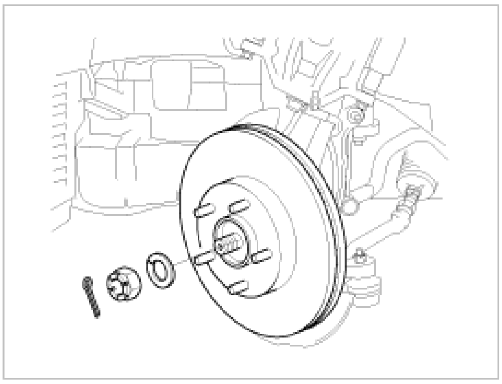


4. Remove the caliper assembly(A) and suspend it with wire.

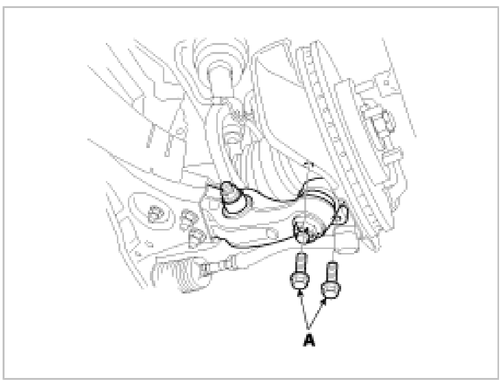




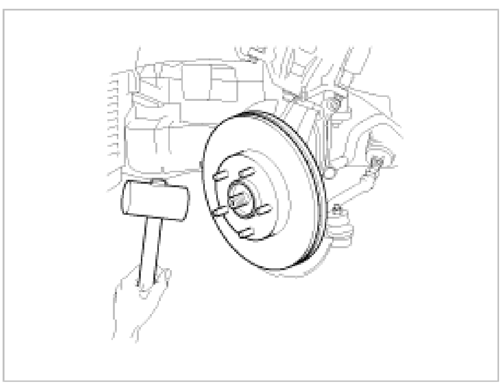
5. Remove the split pin and driveshaft castle nut from the front hub.



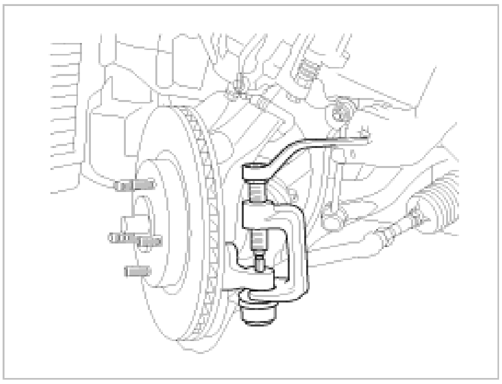
6. Remove the 2 bolts(A) and disconnect the ball joint from the knuckle.



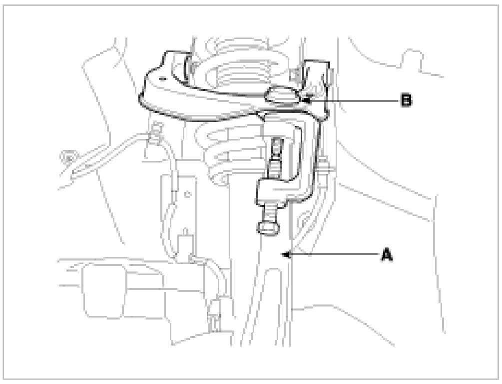
7. Using a plastic hammer, disconnect the driveshaft from the axle hub.



8. Using the special tool (09568-4A000), disconnect the tie rod end from the knuckle.



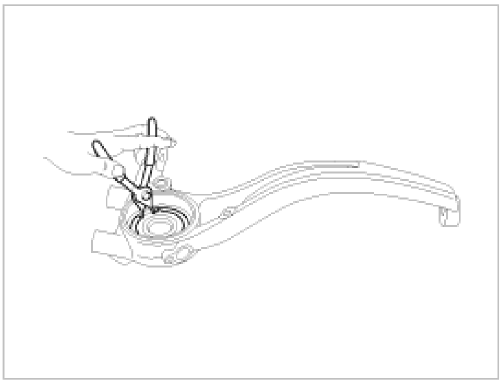
9. Loosen the upper armmounting nut but do not remove it.
10. Using the special tool (09568-4A000), disconnect the upper arm from the knuckle.



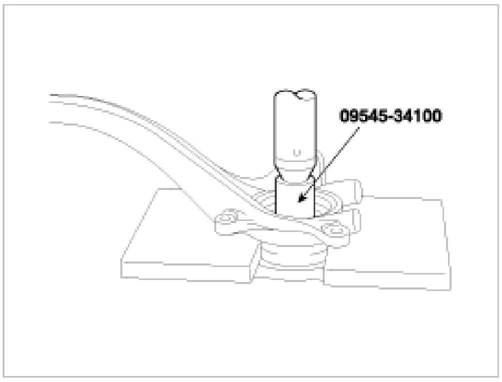
11. Remove the front axle and knuckle together.
12. Installation is the reverse of removal.

DISASSEMBLY

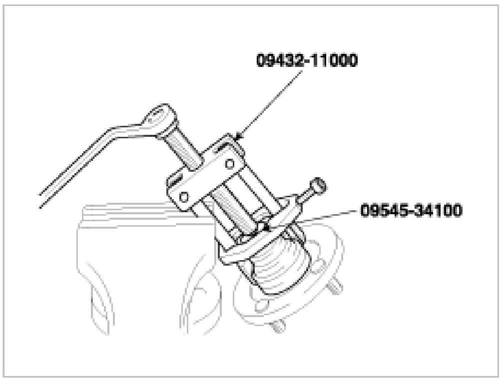
1. Remove the brake disc from the hub.
2. Remove the snap ring.



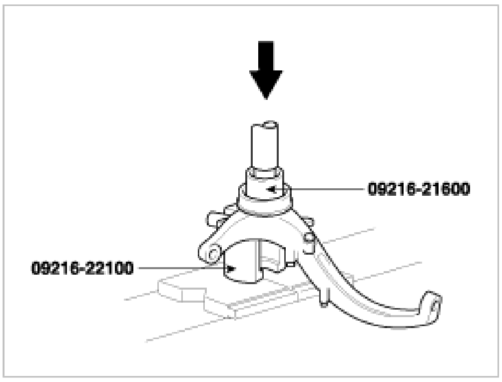
3. Using the special tool (09545-34100), disconnect the hub from the knuckle.



4. Using the special tools (09432-11000, 09545-34100), remove the wheel bearing inner race from the hub.



5. Using the special tools (09216-21600, 09216-22100), remove the wheel bearing outer race from the knuckle.



INSPECTION

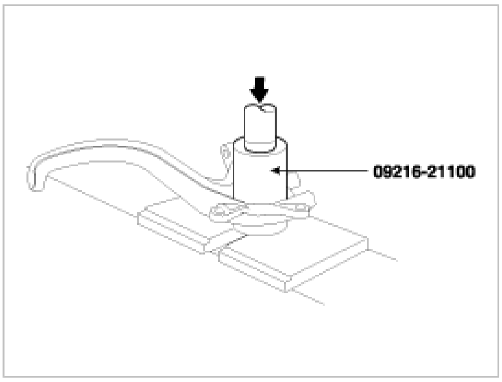
1. Check the hub for cracks and splines for wear.
2. Check the snap ring for cracks or damage.
3. Check the knuckle inner surface for scoring and cracks.

REASSEMBLY

1. Apply a thin coat of multi-purpose grease to the knuckle and bearing contact surface.
2. Using the special tool (09216-21100), press-in the bearing to the knuckle.

NOTE

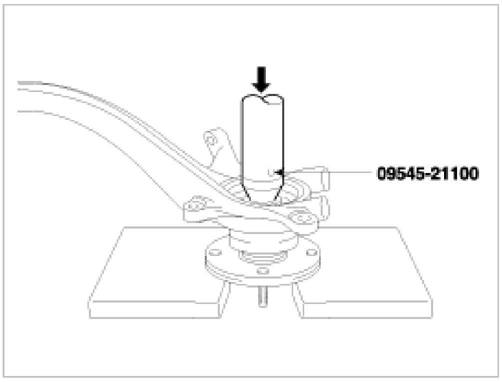
- Do not press against the inner race of the wheel bearing because that can cause damage to the bearing assembly.
- Always use a new bearing assembly.



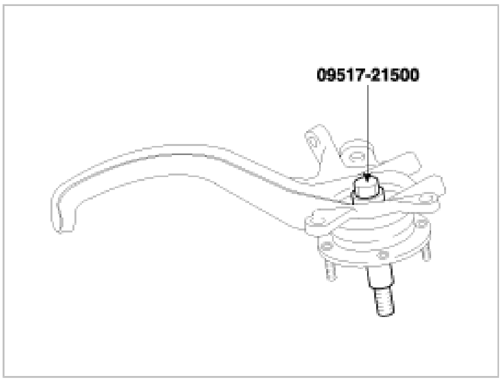
3. Install the snap ring into the groove of the knuckle.
4. Using the special tool (09545-21100), press the hub on to the knuckle.

NOTE

Do not press against the outer race of the wheel bearing because that can cause damage to the bearing assembly.

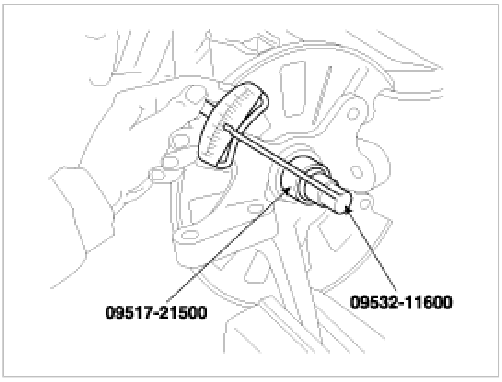


5. Tighten the hub to the knuckle to 200 Nm (20 kgf·m, 148 lb-ft) with the special tool (09517-21500).



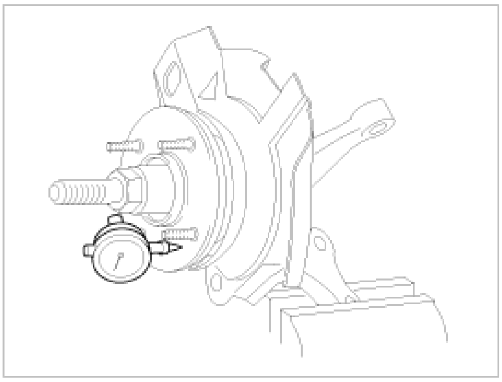
6. Rotate the hub to seat the bearing.
7. Measure the wheel bearing starting torque.

Standard value
Starting torque : 1.8 Nm (0.18 kgf·m, 16 lb-ft) or less



Fix a dial gauge and measure the hub end play. Check that it is within the standard value.

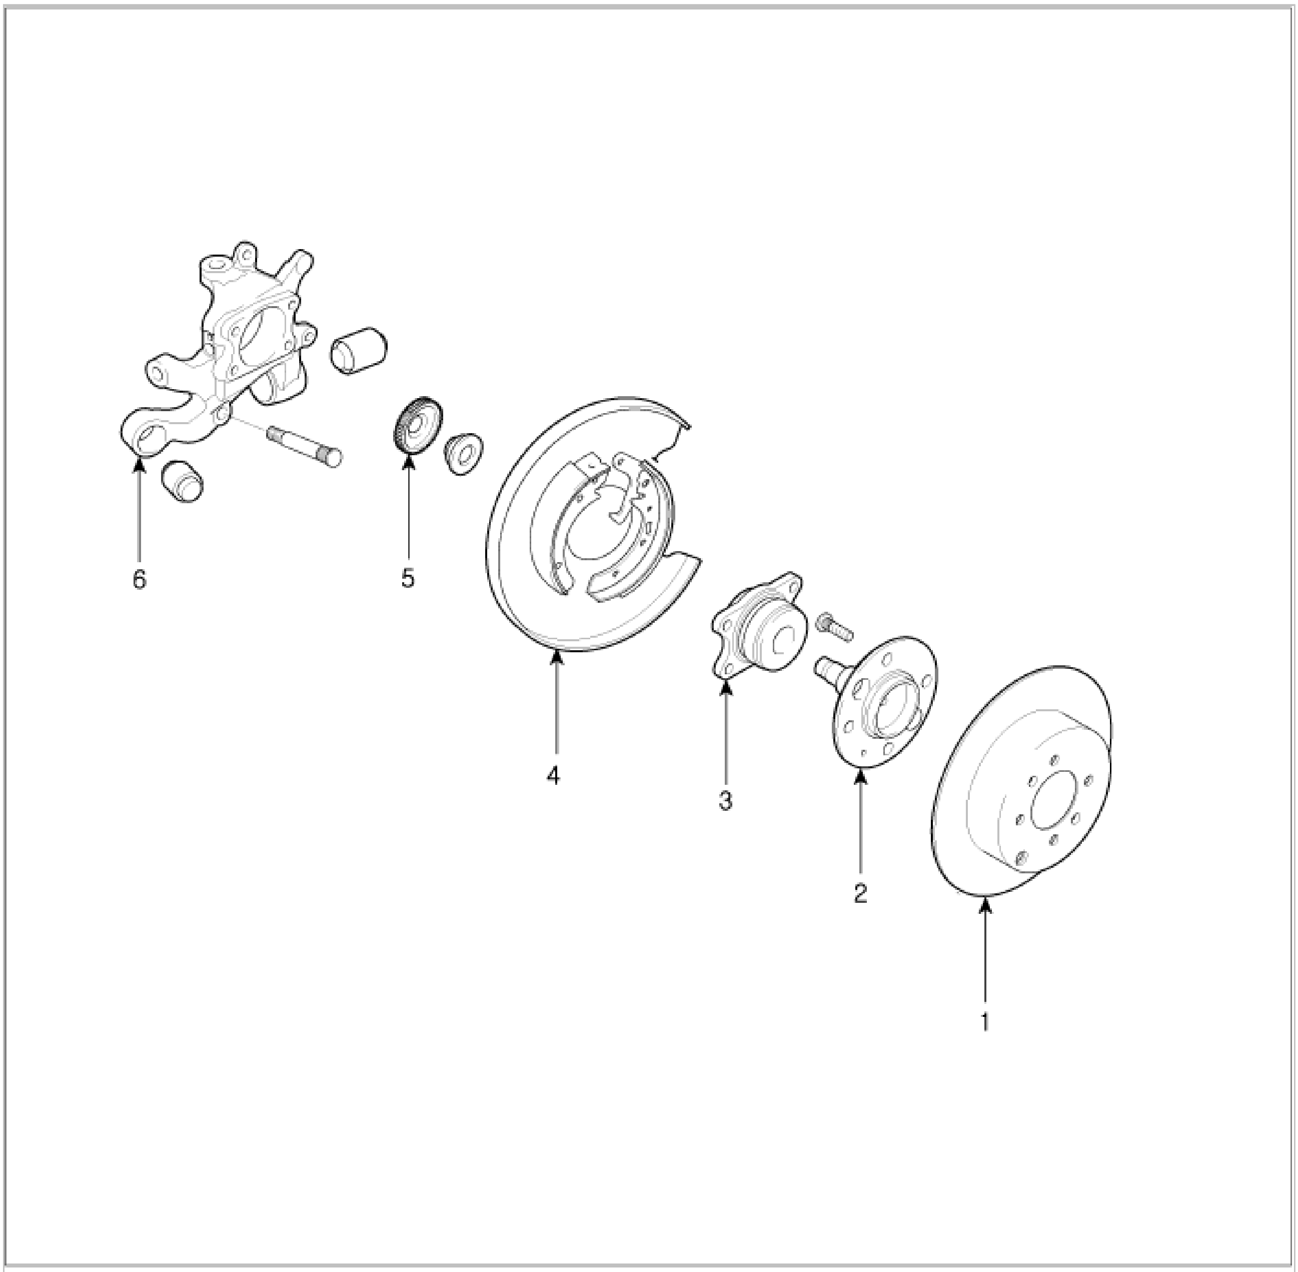
Standard value
Hub end play : 0.008 mm (0.0003 in) or less



8. Remove the special tool.
9. Install the disc to the hub.

Driveshaft and axle > Rear Axle Assembly > Rear Hub / Axle > Components and Components Location

COMPONENTS

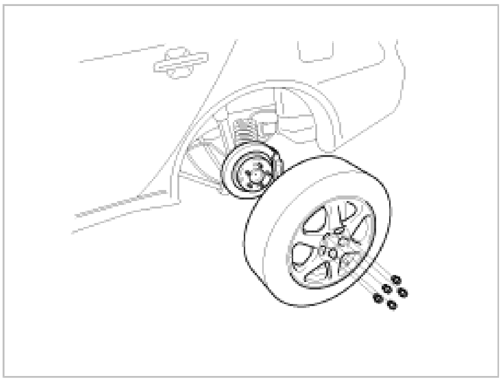


1. Brake disc	4. Brake assembly
2. Hub	5. Tone wheel (ABS System)
3. Hub bearing	6. Carrier assembly

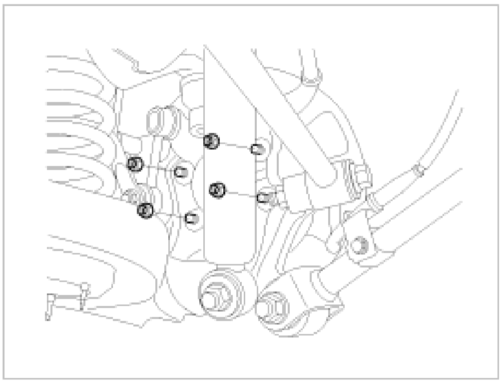
Driveshaft and axle > Rear Axle Assembly > Rear Hub / Axle > Repair procedures

REMOVAL

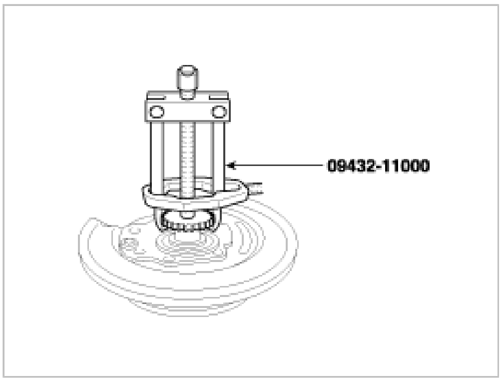
1. Release the parking brake.
2. Remove the wheel and tire.



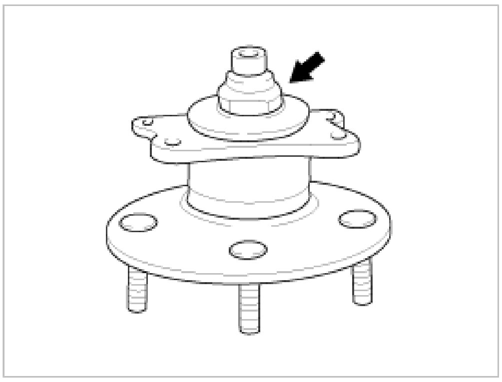
3. Remove the ABS sensor from the carrier.
4. Remove the caliper assembly from the carrier and suspend it with wire.
5. Remove the brake disc.
6. Remove the rear axle hub mounting bolts (4).



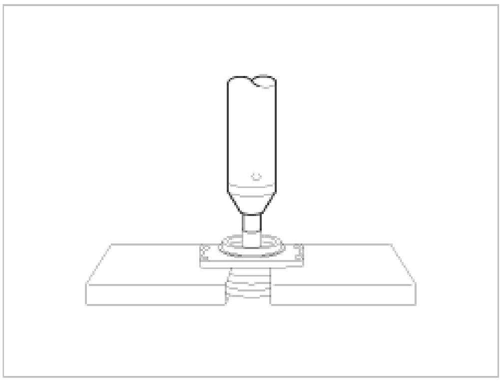
7. Using the special tool (09432-11000), remove the tone wheel.



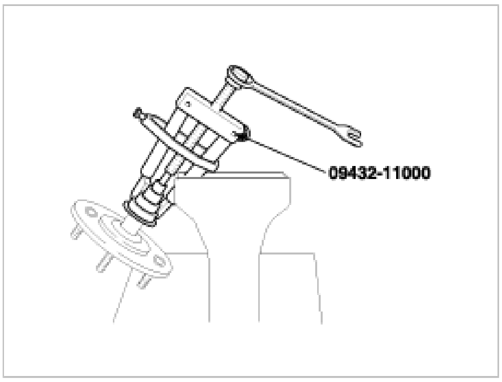
8. Remove the carrier assembly.
9. After unstaking the flange nut, remove the nut.



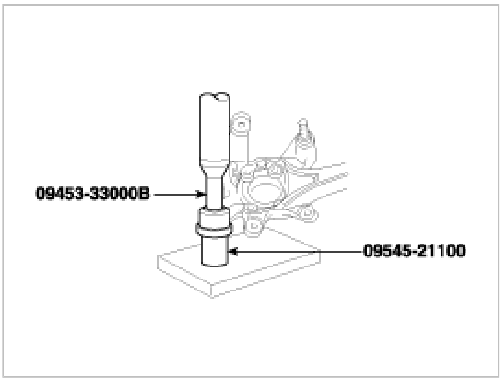
10. While supporting the flange area of the bearing outer race, press out the rear axle hub.



11. Using the special tool (09432-11000), remove the bearing inner race from the axle hub.

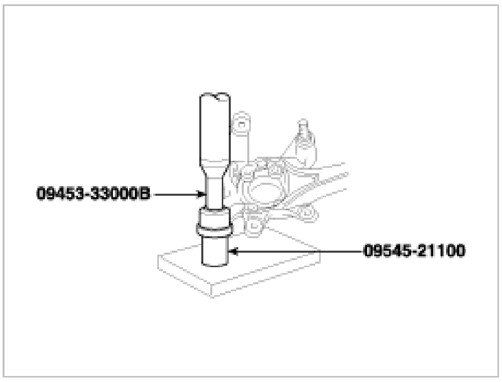


12. Using the special tools (09453-33000B, 09545-21100), remove the 2 bushings from the carrier.

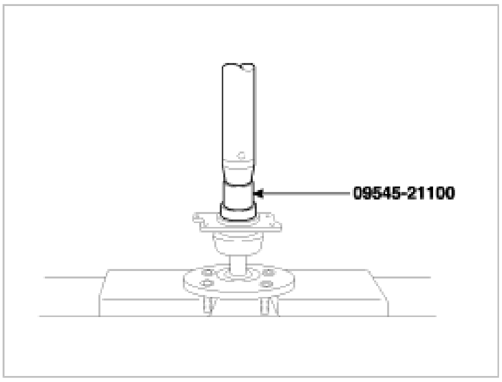


INSTALLATION

1. Using the special tools (09453-33000B, 09545-21100) press-in the 2 bushings to the carrier.



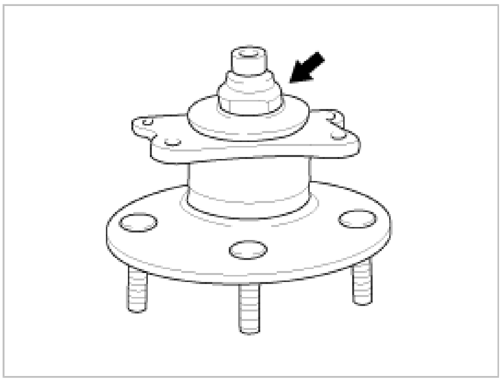
2. Apply a thin coat of multi-purpose grease to the hub and bearing contact surface.
3. Using the special tool (09545-21100), press-in the bearing to the hub.



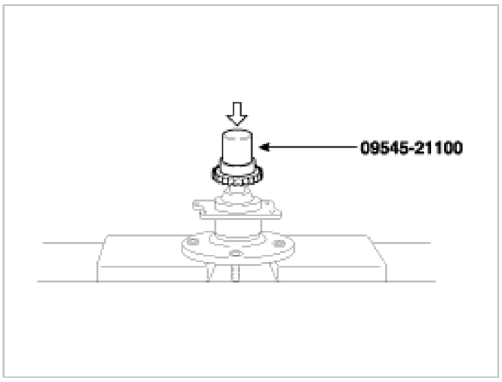
NOTE

- Do not press against the outer race of the bearing because that can cause the damage to the bearing assembly.
- Always use a new bearing assembly.

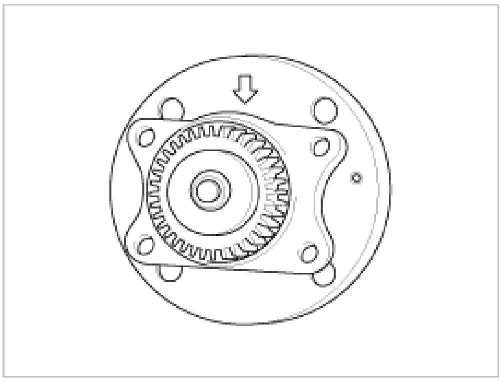
4. After tightening the flange nut, stake the nut to meet the concave portion of the spindle.



5. Using the special tool (09221-21000), press-in the tone wheel.

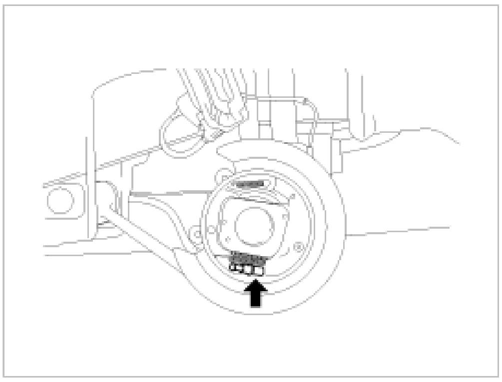


6. Fix the hub and bearing assembly to the brake backing plate so that the rounded area of the bearing outer race is placed facing upward.

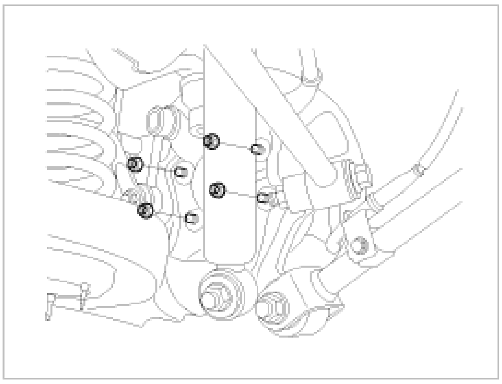


NOTE

If it is difficult to fix, adjust the parking brake adjusting nut in clockwise direction to enlarge the space between the shoe and lining assembly.

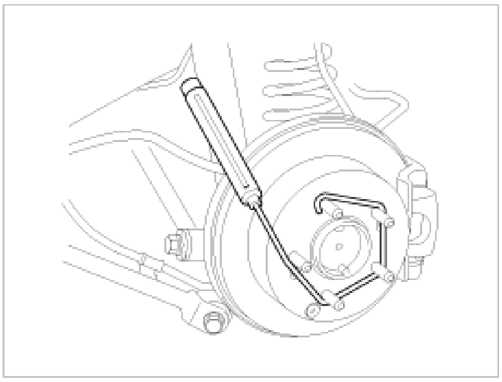


7. Tighten the 4 bolts to the specified torque.



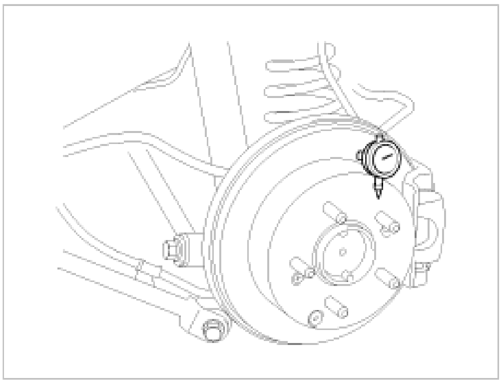
8. Rotate the hub to seat the bearing.
9. Using a spring balance, measure the wheel bearing starting torque.

Standard value
Starting torque : 1.76 Nm (0.18 kgf·m, 15.6 lb-in) or less



10. Fix a dial gauge andmeasure the hub end play. Check that it is within the standard value.

Standard value
Hub end play : 0.008 mm (0.0003 in) or less



INSPECTION

1. Check the rear hub bearing for wear or damage.
2. Check the rear tone wheel for chipped teeth.
3. Check the hub inner surface for scoring.
4. Check the carrier for crack.

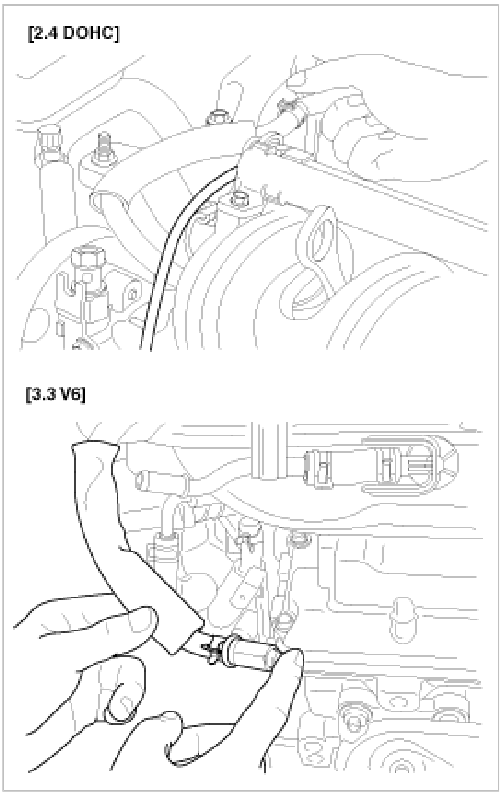
Emission Control System > Crankcase Emission Control System > Positive Crankcase Ventilation (PCV) Valve > Repair procedures

REMOVAL

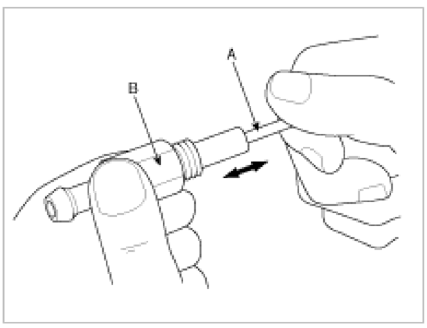
1. Disconnect the ventilation hose from the positive crankcase ventilation (PCV) valve. Remove the PCV valve from the rocker cover and reconnect it to the ventilation hose.
2. Run the engine at idle and put a finger on the open end of the PCV valve and make sure that intake manifold vacuum can be felt.

> NOTE
>
> The plunger inside the PCV valve will move back and forth.



INSPECTION

1. Remove the PCV valve.
2. Insert a thin stick(A) into the PCV valve(B) from the threaded side to check that the plunger moves.
3. If the plunger does not move, the PCV valve is clogged. Clean it or replace.



INSTALLATION

Install the PCV valve and tighten to the specified torque.

PCV valve : 0.8~1.2 kgf·m

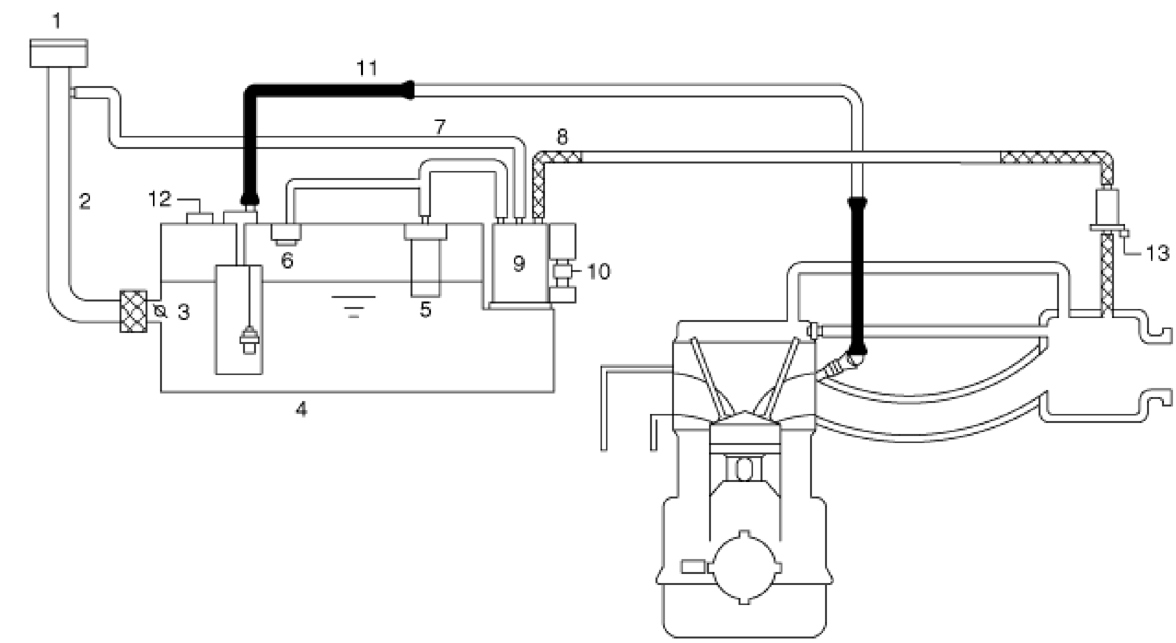
Emission Control System > Evaporative Emission Control System > Description and Operation

DESCRIPTION

This system consists of a fill vent valve, fuel shut-off valve, fuel cut valve (for roll over), two way valve (pressure/vacuum relief), fuel liquid/vapor separator which is installed beside the filler pipe, charcoal canister which is mounted under the rear floor LH side member and protector, tubes and miscellaneous connections.
While refueling, ambient air is drawn into the filler pipe so as not to emit fuel vapors in the air. The fuel vapor in the tank is then forced to flow into the canister via the fill vent valve. The fuel liquid/vapor separator isolates liquid fuel and passes the pure vapor to the charcoal canister.
While the engine is operating, the trapped vapor in the canister is drawn into the intake manifold and then into the engine

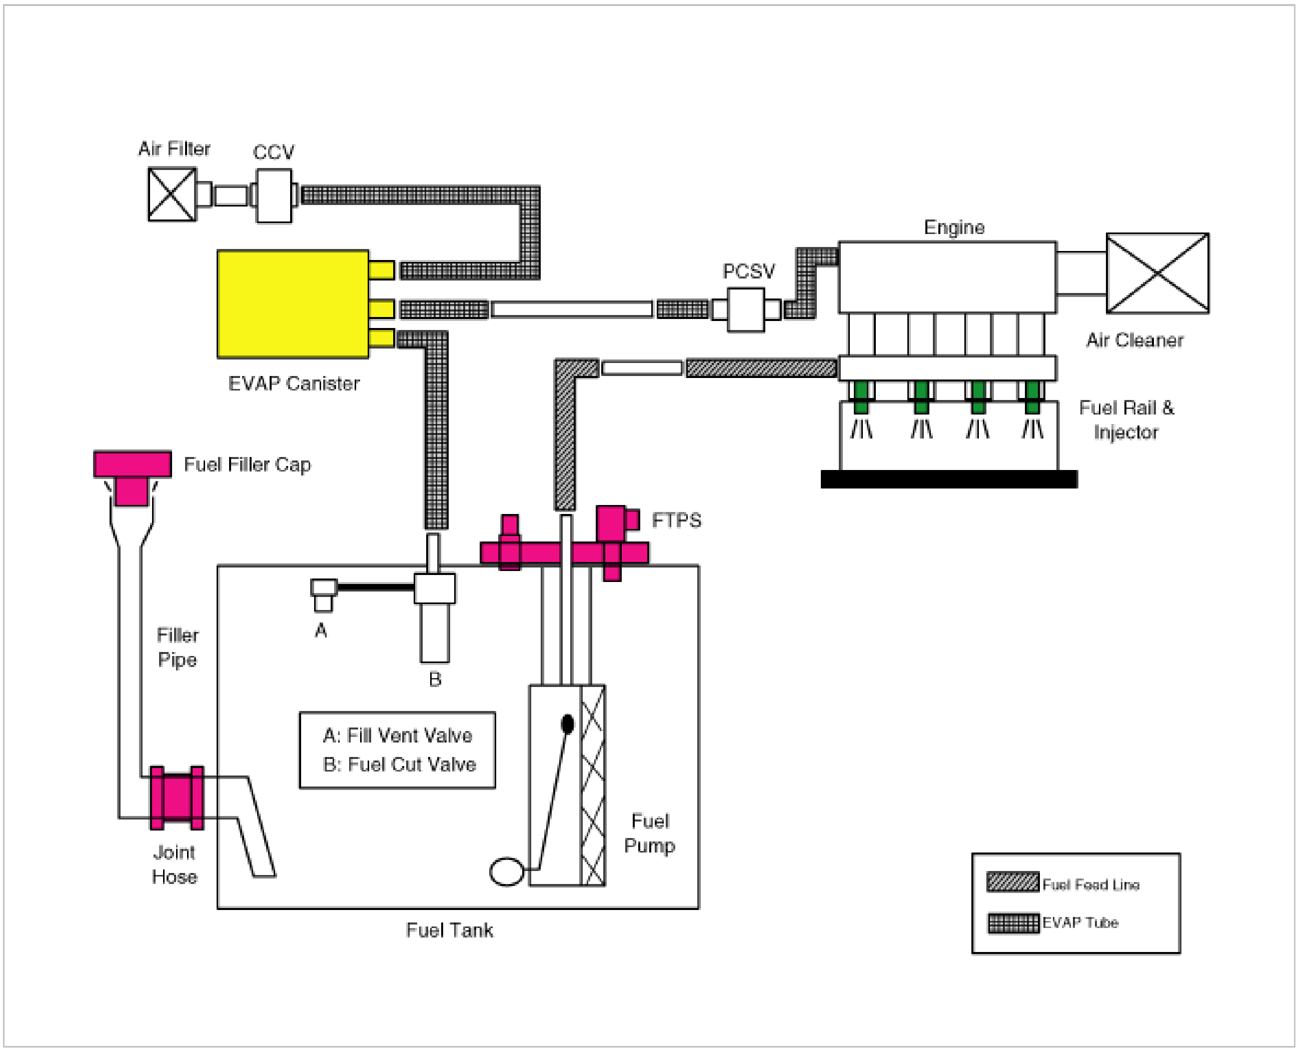
combustion chamber. According to this purge process, the charcoal canister is purged and recovers its absorbing capability.

COMPONENTS

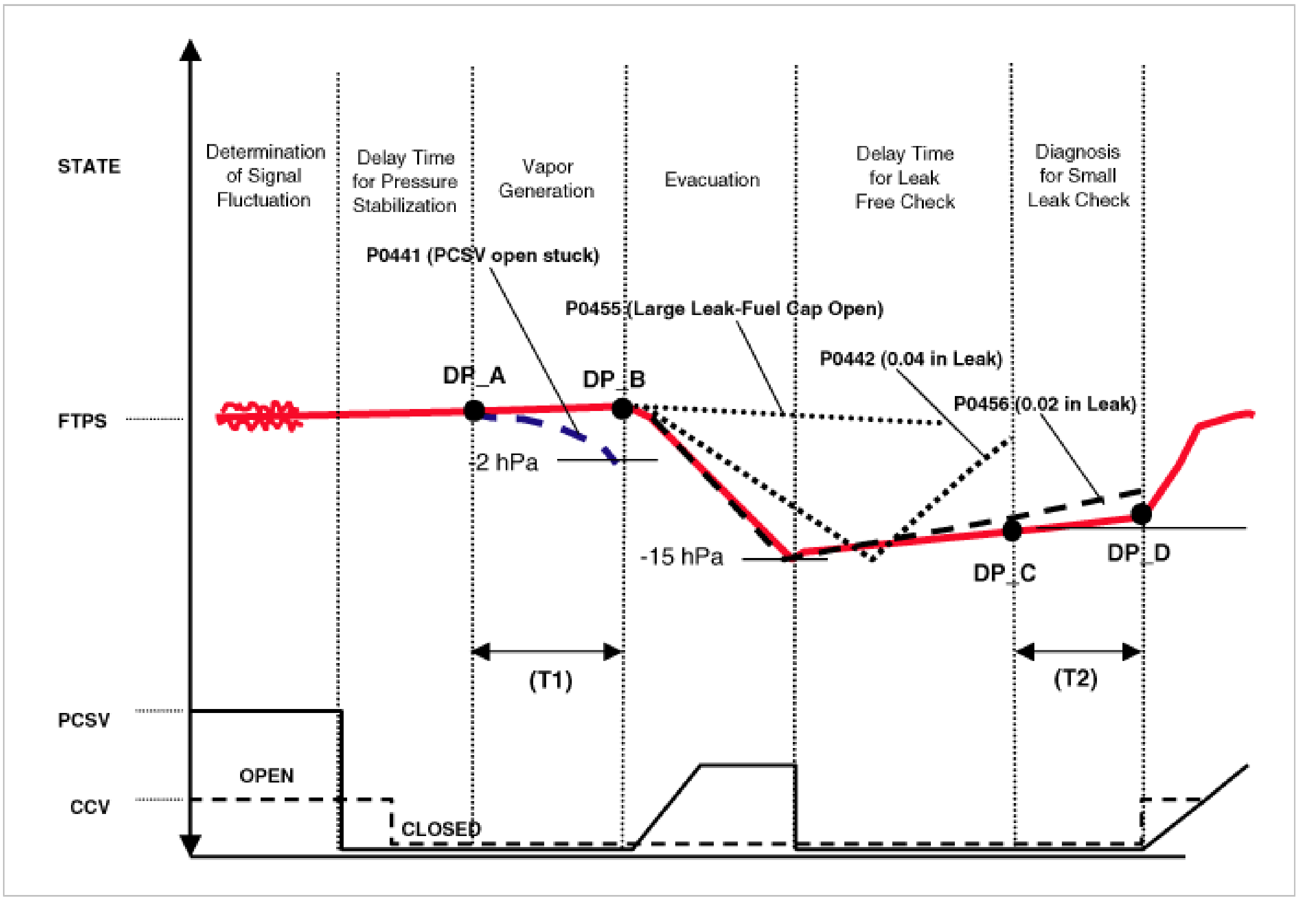


1. Filler cap
2. Fuel filler pipe
3. Check valve
4. Fuel tank
5. ORVR control valve
6. Vapor valve
7. EVAP. Hose
8. EVAP. Hose
9. Canister
10. Canister Close Valve (CCV)
11. Fuel feed line
12. Fuel Tank Pressure Sensor (FTPS)
13. Purge Control Solenoid Valve (PCSV)

DESCRIPTION



EVAP. SYSTEM MONITORING



Emission Control System > Evaporative Emission Control System > Repair procedures

INSPECTION

1. Disconnect the vacuum hose from the throttle body, and connect a vacuum pump to the vacuum hose.
2. Check the following points when the engine is cold [engine coolant temperature 60°C(140°F) or below] and when it is warm [engine coolant temperature 80°C(176°F) or higher].

WHEN ENGINE IS COLD

Engine operating condition	Applied vacuum	Result
Idling	50 kPa (7.3 psi)	Vacuum is held
3,000 rpm		

WHEN ENGINE IS WARM

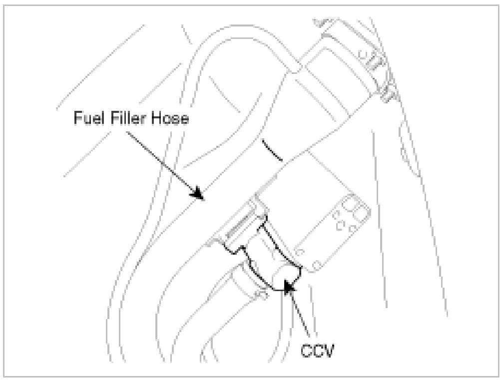
Engine operating condition	Applied vacuum	Result
Idling	50 kPa (7.3 psi)	Vacuum is held
Within 3 minutes after engine start at 3,000 rpm	Try to apply vacuum	Vacuum is released
After 3 minutes have passed after engine start at 3,000 rpm	50 kPa (7.3 psi)	Vacuum will be held momentarily, after which, it will be released

Emission Control System > Evaporative Emission Control System > Canister > Description and Operation

DESCRIPTION

The evaporative emission control system prevents hydrocarbon (HC) vapors from the fuel tank from escaping into the atmosphere where they could form photochemical smog. Gasoline vapors are collected in the charcoal canister. The

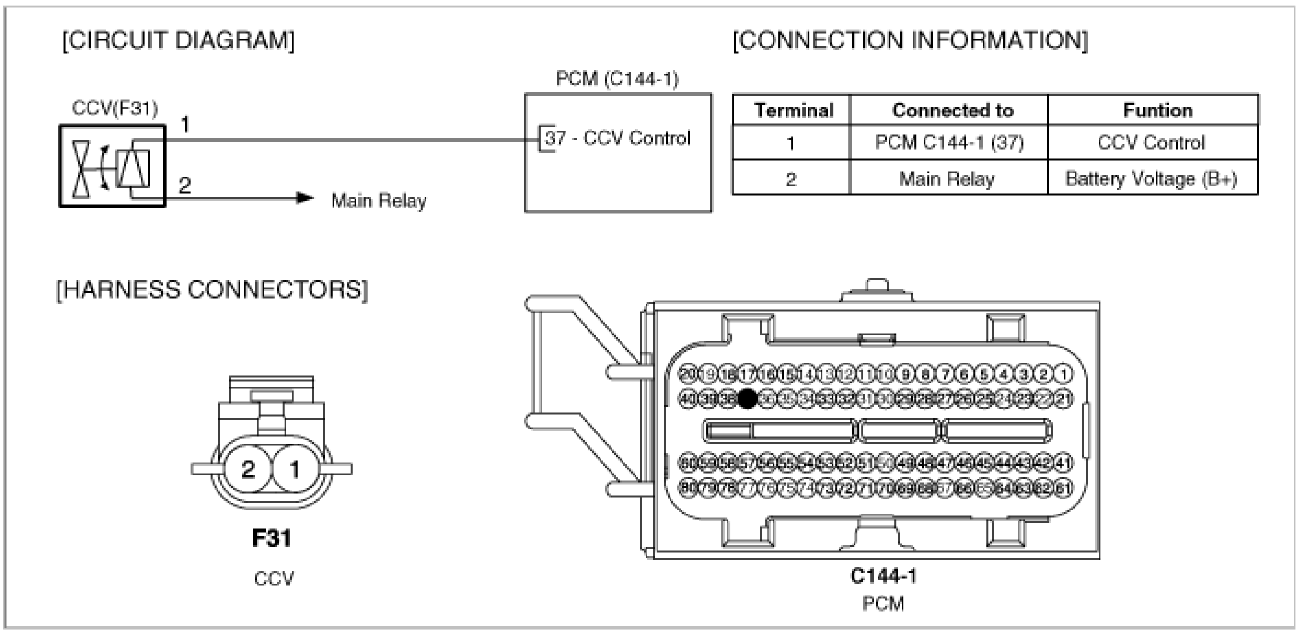
Canister Close Valve (CCV) closes off the air inlet into the canister for leak detection of the evaporative emission system. The CCV also prevents fuel vapors from escaping from the canister. When the engine purges the HC vapors from the canister, the clean air comes into the canister through the canister air-filter and the CCV.



SPECIFICATION

Item Spec	ification
Coil Resistance (Ω)	19.8 ~ 21.8Ω at 20°C (68°F)

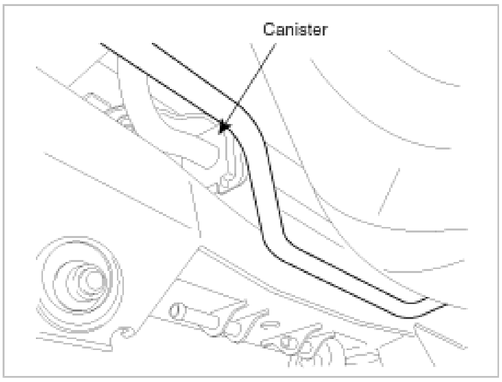
SCHEMATIC DIAGRAM



Emission Control System > Evaporative Emission Control System > Canister > Repair procedures

REMOVAL

1. Remove the fuel tank. (Refer to "Fuel System" group)
2. Disconnect hoses connecting to the canister.
3. Unfasten two mounting bolts and remove the canister.



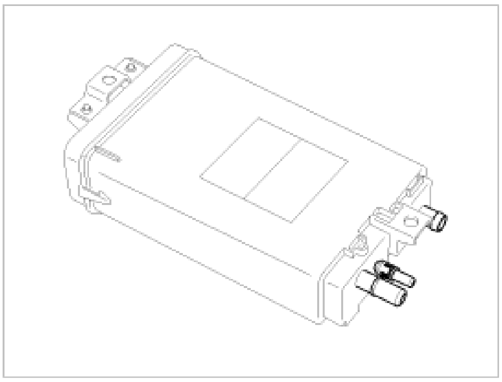
INSTALLATION

Installation is in reverse order of removal.

Torque : 1.7 ~ 2.6kgf·m (16.7 ~ 25.5N·m, 12.3 ~ 18.8lbf·ft)

INSPECTION

1. Lock for loose connections, sharp bends or damage to the fuel vapor lines.
2. Look for distortion, cracks or fuel damage.
3. After removing the canister, inspect for cracks or damage.



Emission Control System > Evaporative Emission Control System > Purge Control Solenoid Valve (PCSV) > Description and Operation

DESCRIPTION

Purge Control Solenoid Valve (PCSV) is installed on the surge tank and controls the passage between the canister and the intake manifold. It is a solenoid valve and is open when the PCM grounds the valve control line. When the passage is open (PCSV ON), fuel stored in the canister is transferred to the intake manifold.

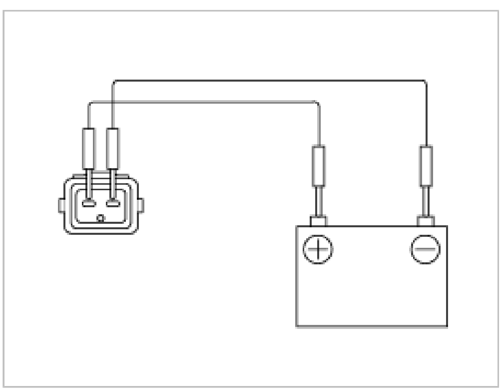
Emission Control System > Evaporative Emission Control System > Purge Control Solenoid Valve (PCSV) > Repair procedures

INSPECTION

> **NOTE**
>
> When disconnecting the vacuum hose, make an identification mark on it so that it can be reconnected to its original position.

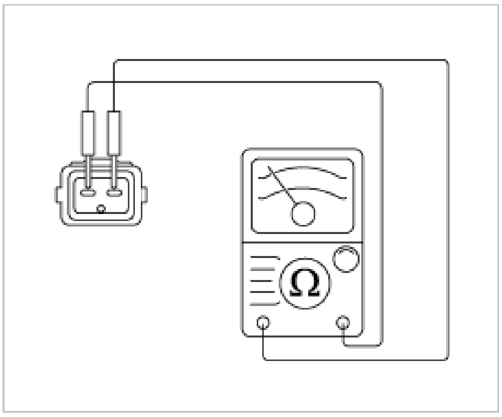
1. Disconnect the vacuum hose from the solenoid valve.
2. Detach the harness connector.
3. Connect a vacuum pump to the nipple to which the red-striped vacuum hose was connected.
4. Apply vacuum and check when voltage is applied to the PCSV and when the voltage is discontinued.

Battery voltage	Normal condition
When applied	Vacuum is released
When discontinued	Vacuum is maintained



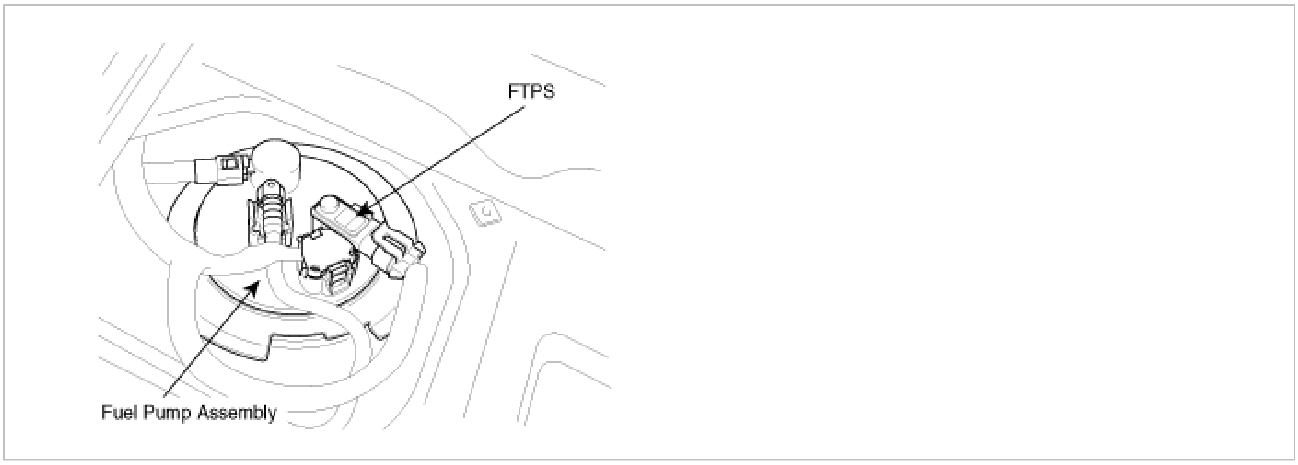
5. Measure the resistance between the terminals of the solenoid valve.

PCSV coil resistance(Ω) :
19 ~ 22Ω at 20°C (68°F)



Emission Control System > Evaporative Emission Control System > Fuel Tank Pressure Sensor (FTPS) > Description and Operation

DESCRIPTION



The evaporative emission control system prevents hydrocarbon vapors from escaping from the fuel tank into the atmosphere where they could form photochemical smog. Gasoline vapors are collected in the charcoal canister. The Fuel Tank Pressure Sensor (FTPS) is installed on fuel pump assembly and is an integral part of the evaporative monitoring system. The PCM monitors the FTPS signal to detect vacuum decay and excess vacuum. The FTPS measures the difference between the air pressure inside the fuel tank and outside air pressure to check the purge control solenoid valve operation and for leak detection in the evaporative emission control system by monitoring pressure and vacuum levels in the fuel tank during the purge control solenoid valve operating cycles.

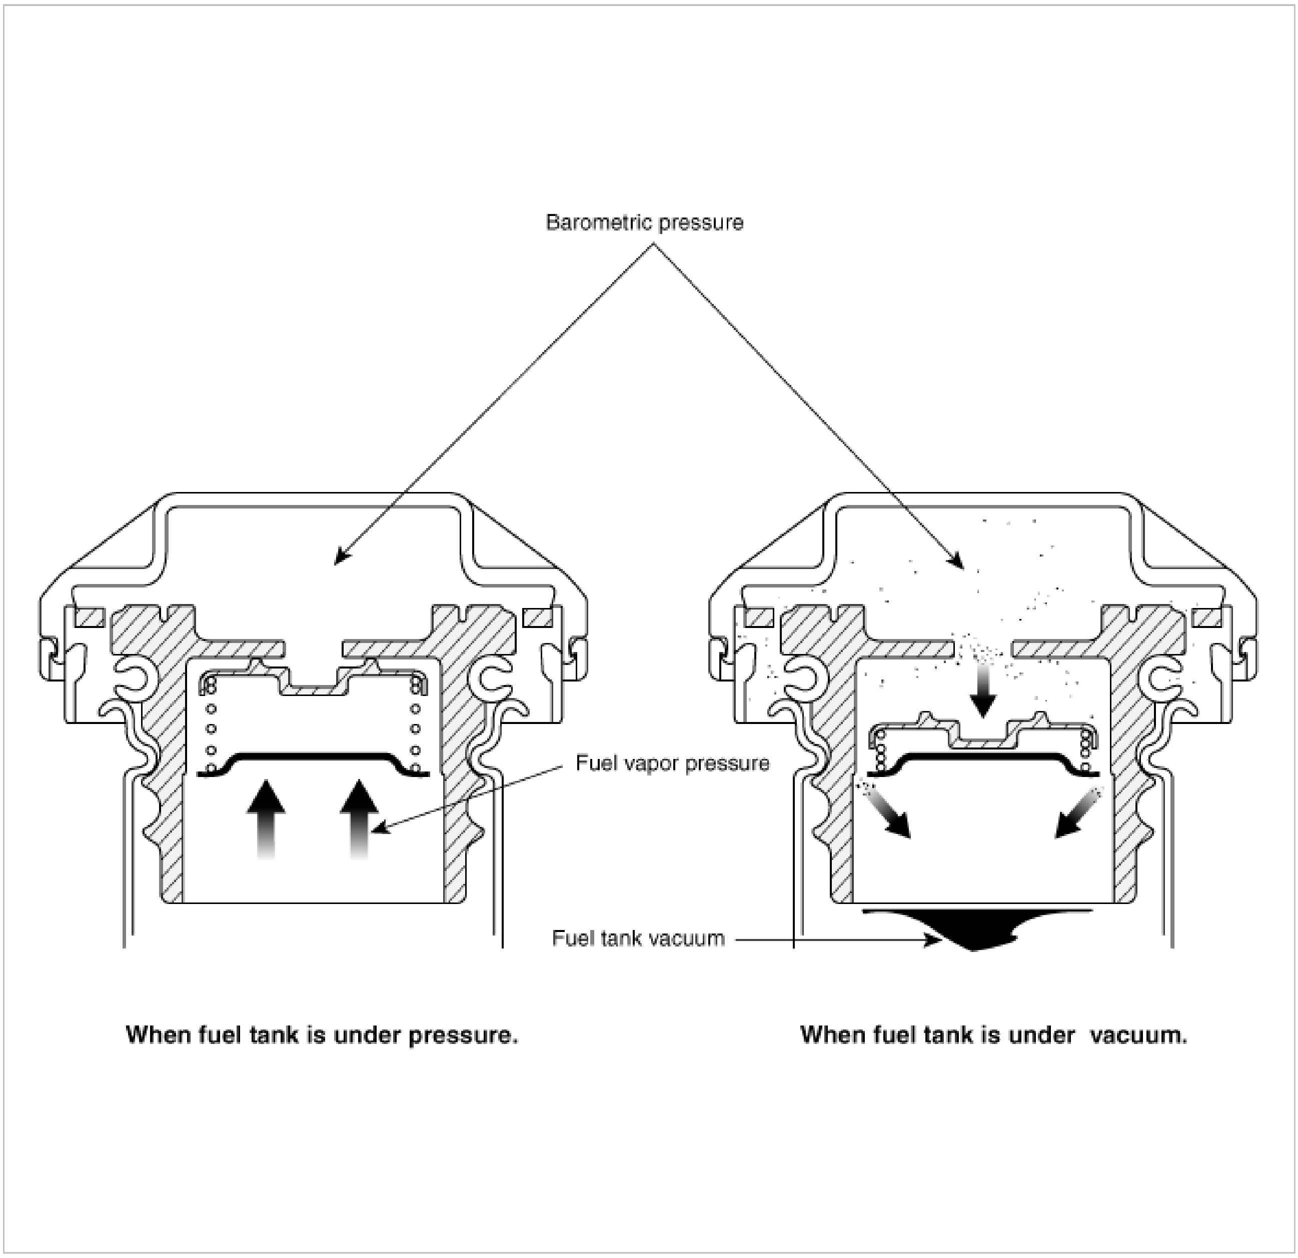
Emission Control System > Evaporative Emission Control System > Fuel Filler Cap > Description and Operation

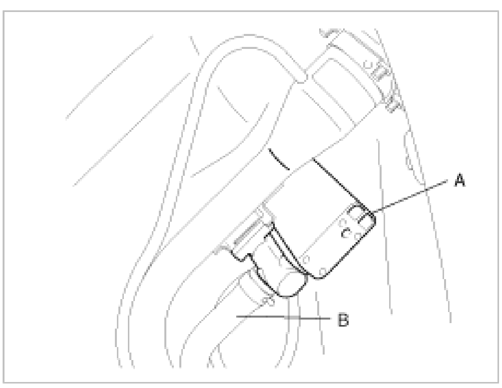
DESCRIPTION



Emission Control System > Evaporative Emission Control System > Fuel Tank Air Filter > Repair procedures

REPLACE

1. Remove the rear left wheel house.
   (Refer to "BD" group)
2. Disconnect the canister close valve wiring connector and the vapor hose to canister (B).



3. Remove the fuel tank air filter(A).
4. Install a new fuel tank air filter.

Emission Control System > Exhaust Emission Control System > Description and Operation

DESCRIPTION

Modifications to the combustion chamber, intake manifold, camshaft and ignition system form the basic control system. These items have been integrated into a highly effective system which controls exhaust emissions while maintaining good driveability and fuel economy.

AIR/FUEL MIXTURE CONTROL SYSTEM [MULTIPORT FUEL INJECTION (MFI) SYSTEM]

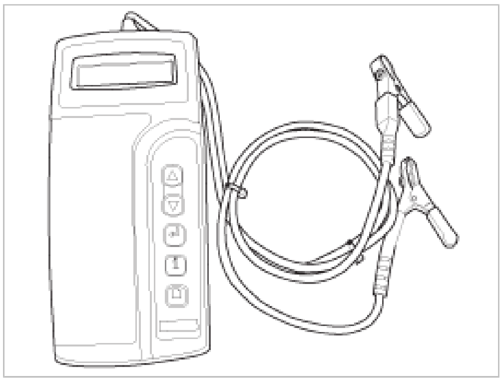
This in turn allows the engine to produce exhaust gases of the proper composition to permit the use of a three way catalyst. The three way catalyst is designed to convert the three pollutants (1) hydrocarbons (HC), (2) carbon monoxide (CO), and (3) oxides of nitrogen (NOx) into harmless substances. There are two operating modes in the MFI system.

1. Open Loop air/fuel ratio is controlled by information programmed into the ECM.
2. Closed Loop air/fuel ratio is adjusted by the ECM based on information supplied by the oxygen sensor.

THE MICRO 570 ANALYZER

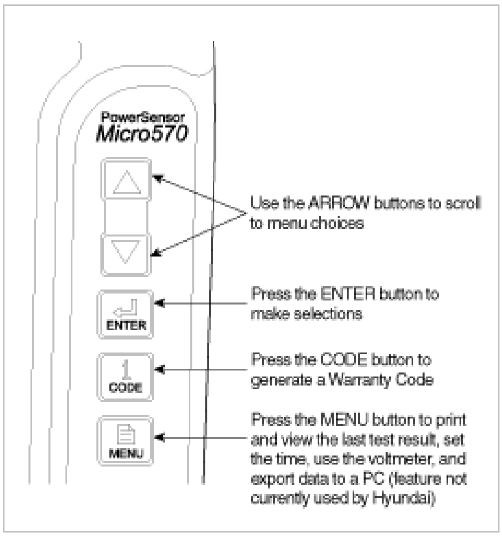
The MICRO 570 Analyzer provides the ability to test the charging and starting systems, including the battery, starter and alternator.

> **CAUTION**
>
> Because of the possibility of personal injury, always use extreme caution and appropriate eye protection when working with batteries.



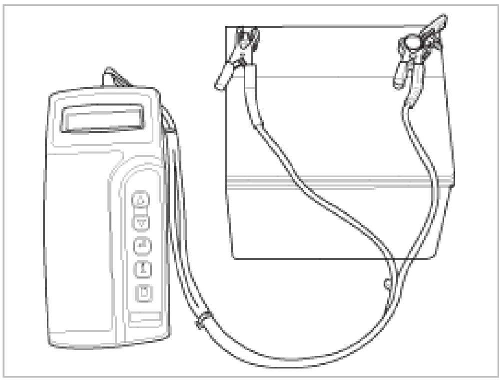
KEYPAD

The MICRO570 button on the key pad provides the following functions :



BATTERY TEST PROCEDURE

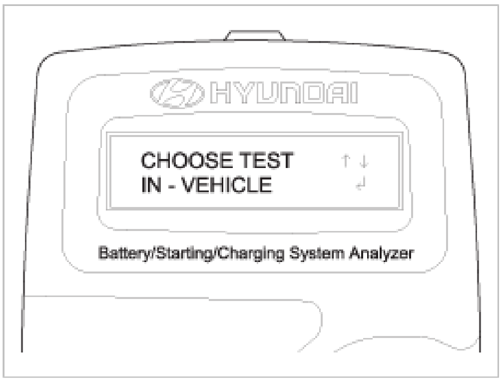
1. Connect the tester to the battery.
    A. Red clamp to battery positive (+) terminal.
    B. Black clamp to battery negative (-) terminal.



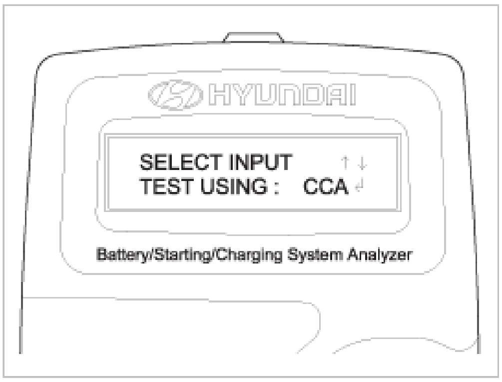
CAUTION

Connect clamps securely. If "CHECK CONNECTION" message is displayed on the screen, reconnect clamps securely.

2. The tester will ask if the battery is connected "IN A VEHICLE" or "OUT OF A VEHICLE". Make your selection by pressing the arrow buttons; then press ENTER.



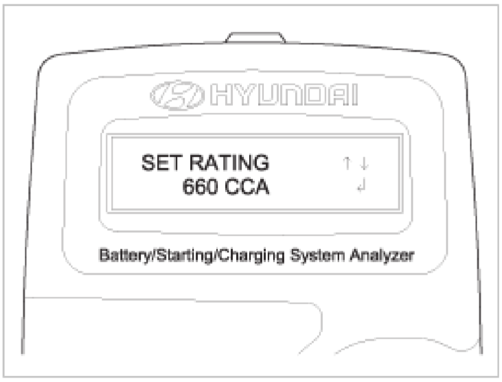
3. Choose either CCA or CCP and press the ENTER button.



NOTE

- CCA : Cold cranking amps, is an SAE specification for cranking batteries at -18°C (0°F).
- CCP : Cold cranking amps, is an SAE specification for korean manufacturer's for cranking batteries at -18°C (0° F).

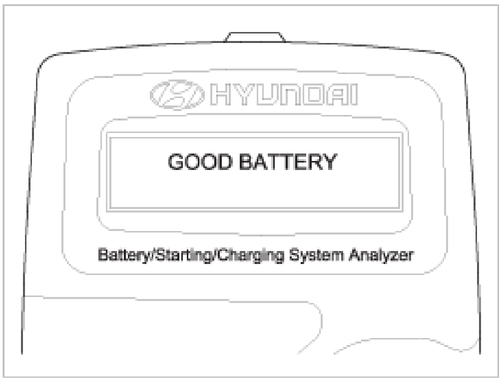
4. Set the CCA value displayed on the screen to the CCA value marked on the battery label by pressing up and down buttons and press ENTER.



NOTE

The battery ratings(CCA) displayed on the tester must be identical to the ratings marked on battery label.

5. The tester (Micro570) displays battery test results including voltage and battery ratings.
   A relevant action must be given according to the test results by referring to the battery test results as shown in the table below.



NOTE

The battery ratings (CCA) displayed on the tester must be identical to the ratings marked on battery label.

6. To conduct starter test, continuously, press ENTER.

BATTERY TEST RESULTS

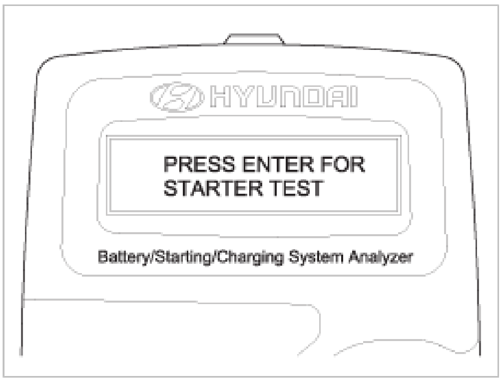
RESULT ON PRINTER	REMEDY
Good battery	No action is required
Good recharge	Battery is in a good state Recharge the battery and use
Charge & Retest	Battery is not charged properly => Charge and test the battery again (Failure to charge the battery fully may read incorrect measurement value)
Replace battery	=> Replace battery and recheck the charging system. (Improper connection between battery and vehicle cables may cause "REPLACE BATTERY", retest the battery after removing cables and connecting the tester to the battery terminal directly prior to replacing the battery)
Bad cell-replace	=> Charge and retest the battery. And then, test results may cause "REPLACE BATTERY", replace battery and recheck the charging system

WARNING

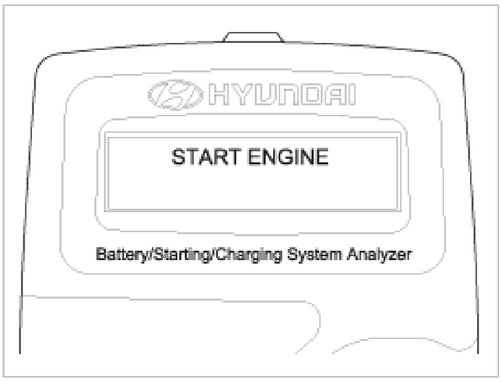
Whenever filing a claim for battery, the print out of the battery test results must be attached.

STARTER TEST PROCEDURE

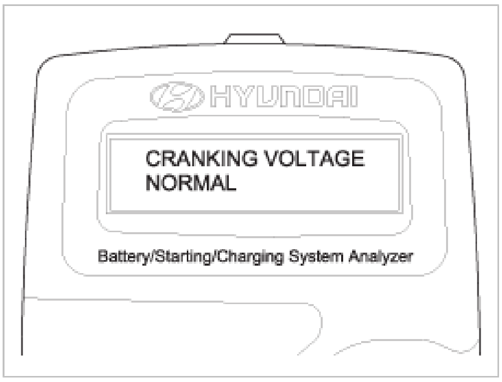
1. After the battery test, press ENTER immediately for the starter test.



2. After pressing ENTER key, start the engine.



3. Cranking voltage and starter test results will be displayed on the screen.
   Take a relevant action according to the test results by referring to the starter test results as given below.



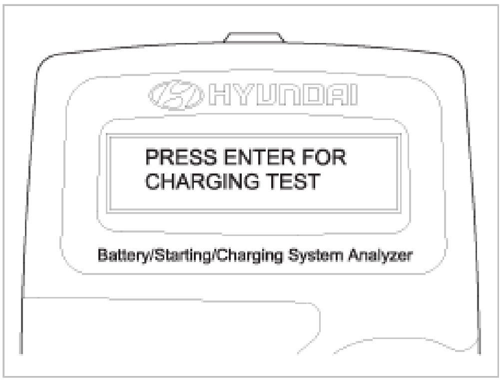
4. To continue charging system test, press ENTER.

STARTER TEST RESULTS

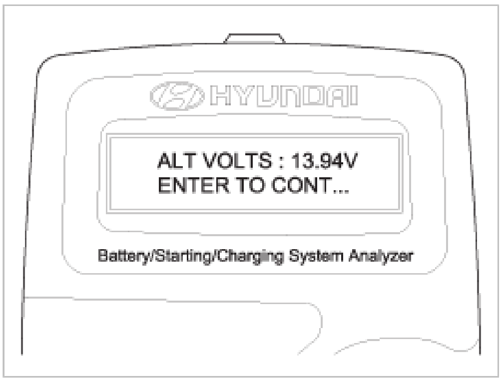
RESULT ON PRINTER	REMEDY
Cranking voltage normal	System shows a normal starter draw
Cranking voltage low	Cranking voltage is lower than normal level => Check starter
Charge battery	The state of battery charge is too low to test => Charge the battery and retest
Replace battery	=> Replace battery => If the vehicle is not started though the battery condition of "Good and fully charged" is displayed. => Check wiring for open circuit, battery cable connection, starter and repair or replace as necessary. => If the engine does crank, check fuel system.

CHARGING SYSTEM TEST PROCEDURE

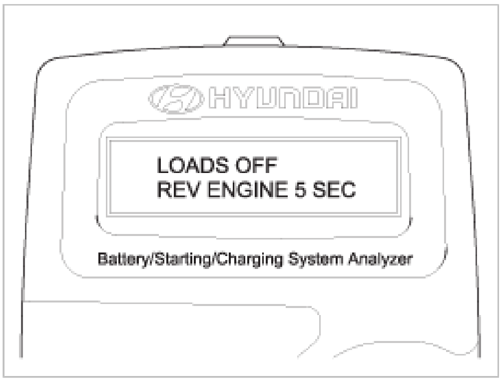
1. Press ENTER to begin charging system test.



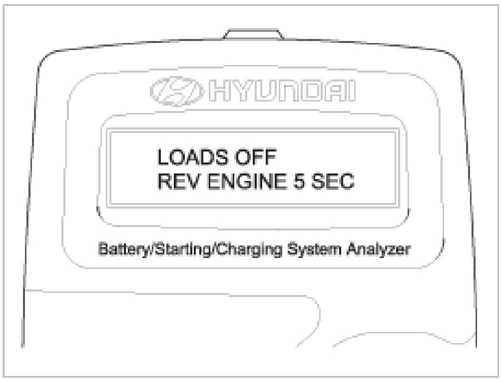
2. ENTER button is pressed, the tester displays the actual voltage of alternator.
   Press ENTER to test the charging system.



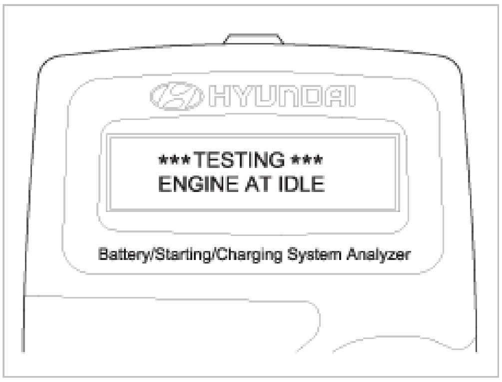
3. Turn off all electrical load and rev engine for 5 seconds by pressing the accelerator pedal.



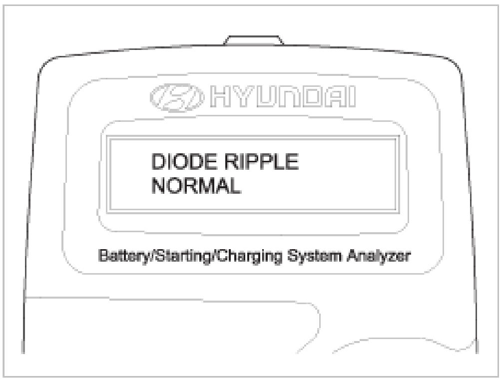
4. Press ENTER.



5. The MICRO 570 analyzer charging system output at idle for comparison to other readings.



6. Take a relevant action according to the test results by referring to the table below after shutting off the engine and disconnect the tester clamps from the battery.



CHARGING SYSTEM TEST RESULTS

RESULT ON PRINTER	REMEDY
Charging system normal/Diode ripple normal	Charging system is normal
No charging voltage	Alternator does not supply charging current to battery => Check belts, connection between alternator and battery Replace belts or cable or alternator as necessary
Low charging voltage	Alternator does not supply charging current to battery and electrical load to system fully => Check belts and alternator and replace as necessary
High charging voltage	The voltage from alternator to battery is higher than normal limit during voltage regulating. => Check connection and ground and replace regulator as necessary => Check electrolyte level in the battery
Excess ripple detected	One or more diodes in the alternator is not functioning properly => Check alternator mounting and belts and replace as necessary

Cancel speed range	15 ± 2Km/h
Maximum memorized speed	160 ± 2Km/h
Pulling force	127N(13Kgf)
Main switch serial resistance value	3.9kΩ ± 1%
Command switch serial resistance value	SET switch : 220Ω ± 1%
	RESUME switch : 910Ω ± 1%

Engine Electrical System > Ignition System > Description and Operation

DESCRITION

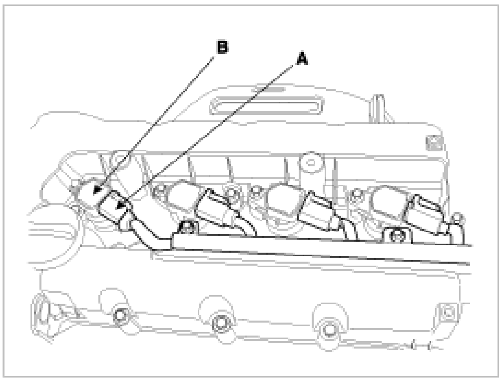
Ignition timing is controlled by the electronic control ignition timing system. The standard reference ignition timing data for the engine operating conditions are preprogrammed in the memory of the ECM (Engine Control Module).
The engine operating conditions (speed, load, warm-up condition, etc.) are detected by the various sensors. Based on these sensor signals and the ignition timing data, signals to interrupt the primary current are sent to the ECM. The ignition coil is activated, and timing is controlled.

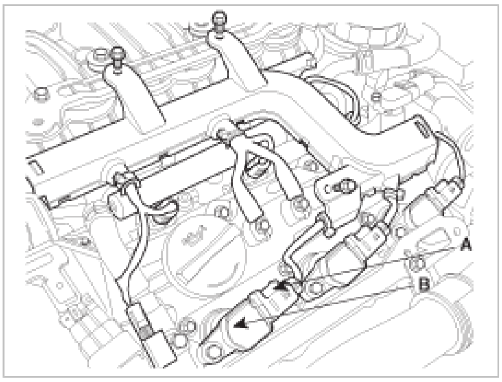
Engine Electrical System > Ignition System > Repair procedures

REMOVAL

IGNITION COIL

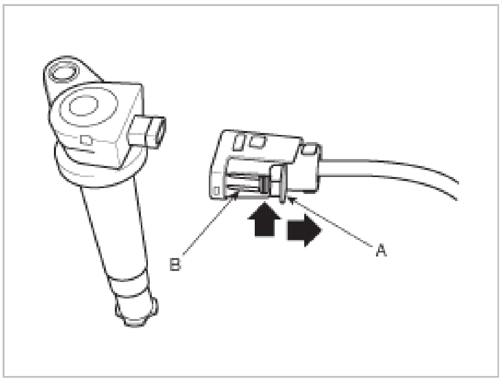
1. Remove the engine cover.
2. Disconnect the ignition coil connector(A).





NOTE

When removing the ignition coil connector, pull the lock pin(A) and push the clip(B).

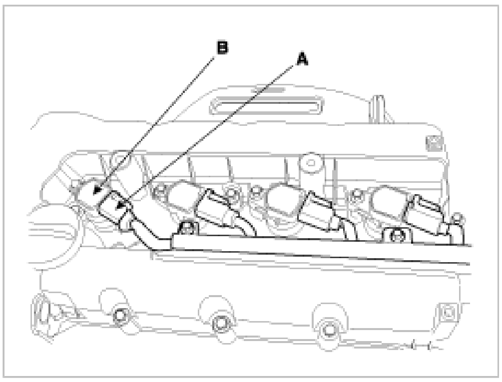


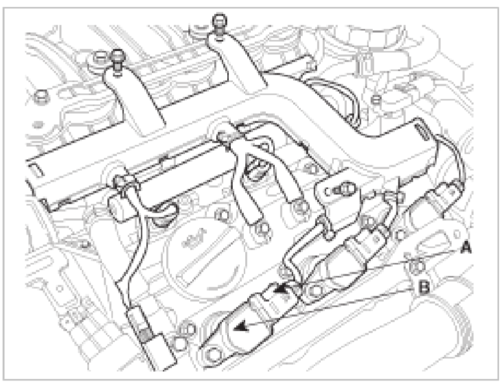
3. Remove the ignition coil (B).
4. Installation is the reverse of removal.

ON-VEHICLE INSPECTION

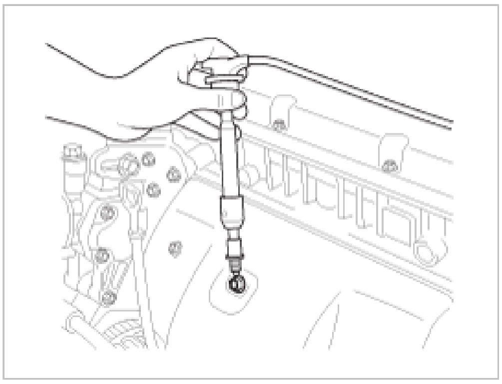
SPARK TEST

1. Remove the ignition coil connector(A).



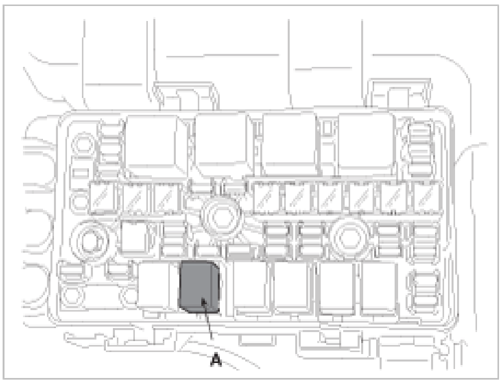


2. Remove the ignition coil(B).
3. Using a spark plug socket, remove the spark plug.
4. Install the spark plug to the ignition coil.
5. Ground the spark plug to the engine.

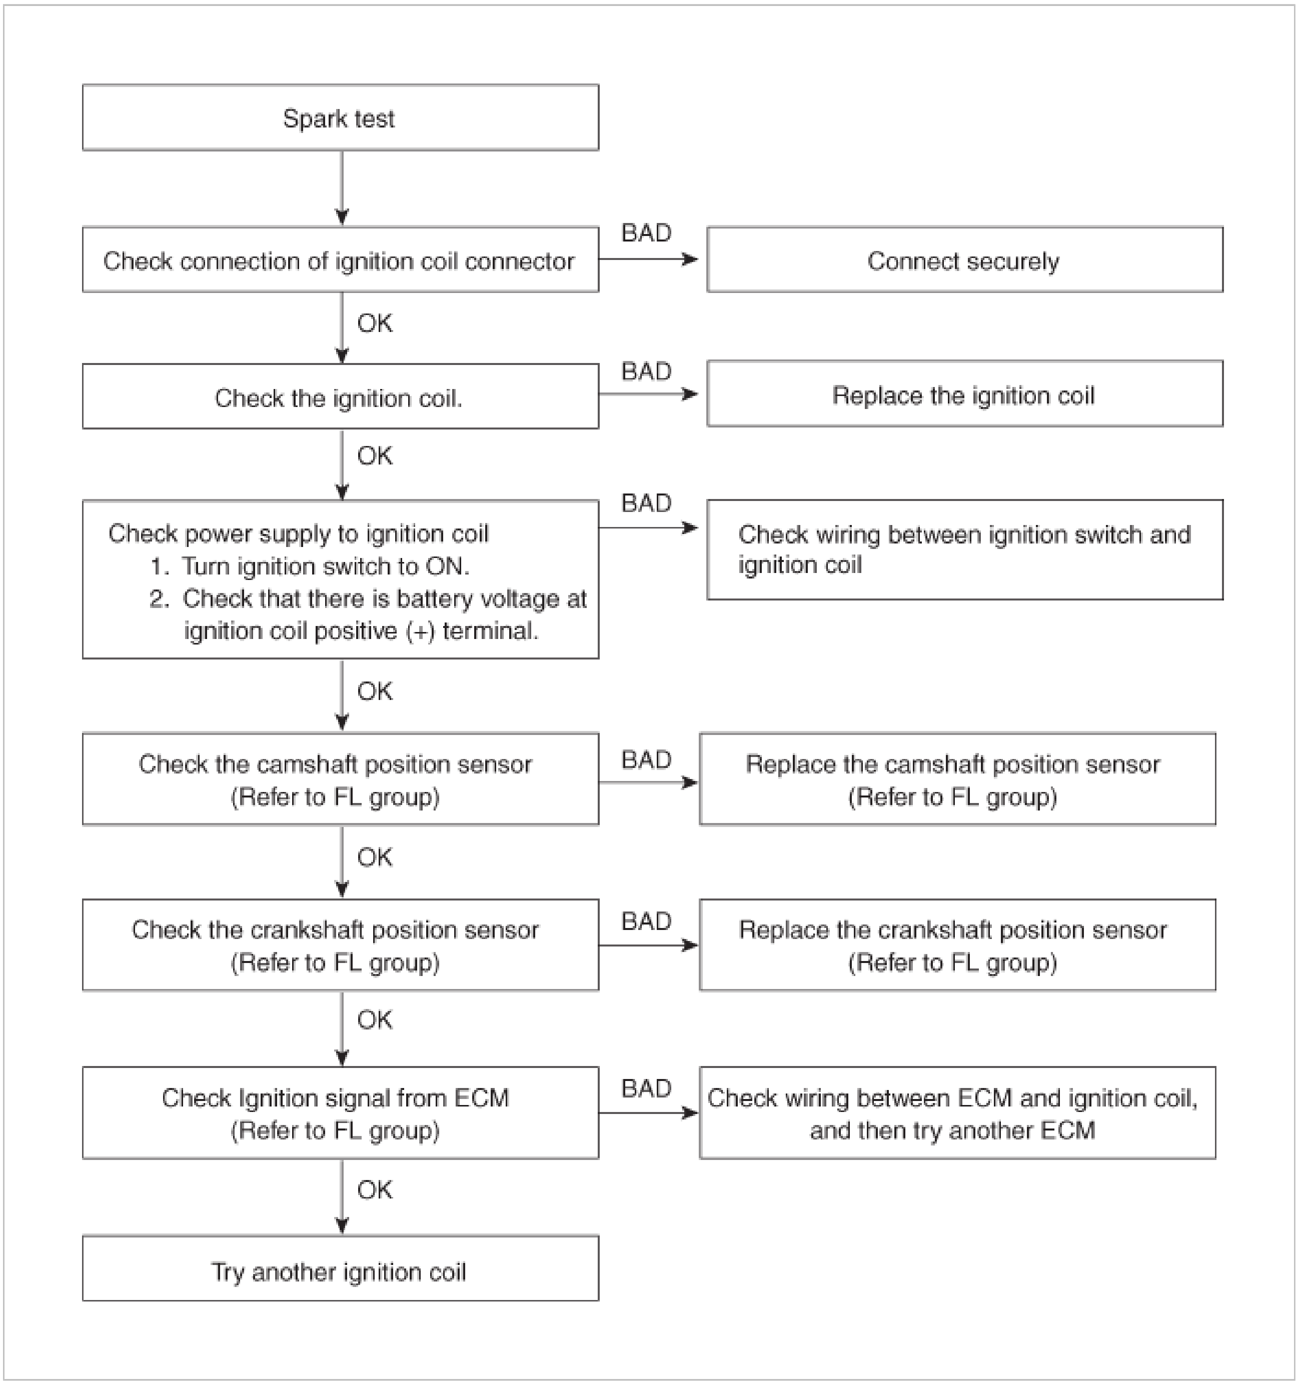


6. Check if spark occurs while engine is being cranked.

> NOTE
>
> To prevent fuel being injected from injectors while the engine is being cranked, remove the fuel pump(A) relay from the fuse box.
> Crank the engine for no more than 5 ~ 10 seconds.

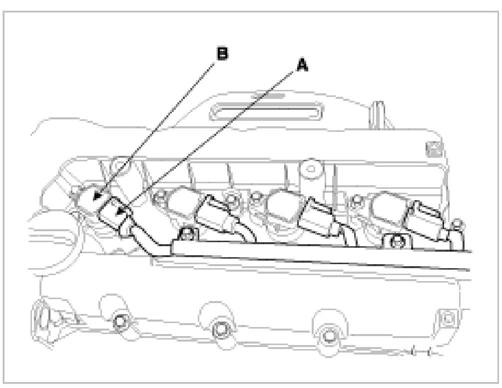


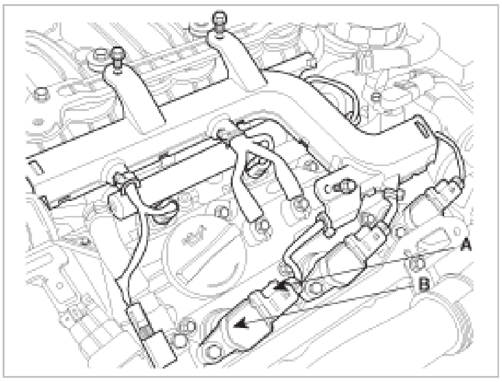
7. Inspect all the spark plugs.
8. Using a spark plug socket, install the spark plug.
9. Install the ignition coil.
10. Reconnect the ignition coil connector.



INSPECT SPARK PLUG

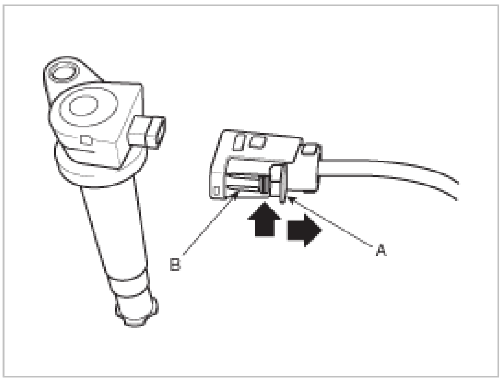
1. Remove the ignition coil connector(A).





NOTE

When removing the ignition coil connector, pull the lock pin(A) and push the clip(B).

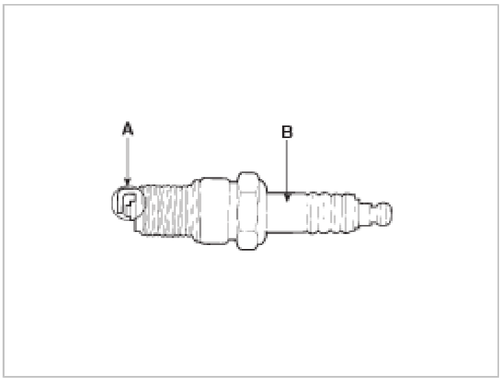


2. Remove the ignition coil(B).
3. Using a spark plug socket, remove the spark plug.

CAUTION

Be careful that no contaminates enter through the spark plug holes.

4. Inspect the electrodes (A) and ceramic insulator (B).

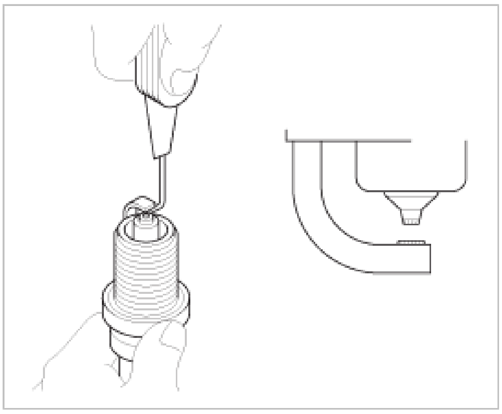


INSPECTION OF ELECTRODES

Condition	Dark deposits	White deposits
Description	- Fuel mixture too rich - Low air intake	- Fuel mixture too lean - Advanced ignition timing - Insufficient plug tightening torque

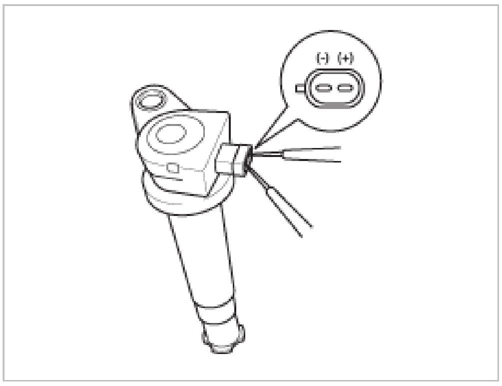
5. Check the electrode gap (A).

Standard :
Unleaded : 1.0 ~ 1.1 mm (0.0394 ~ 0.0433 in.)



INSPECT IGNITION COIL

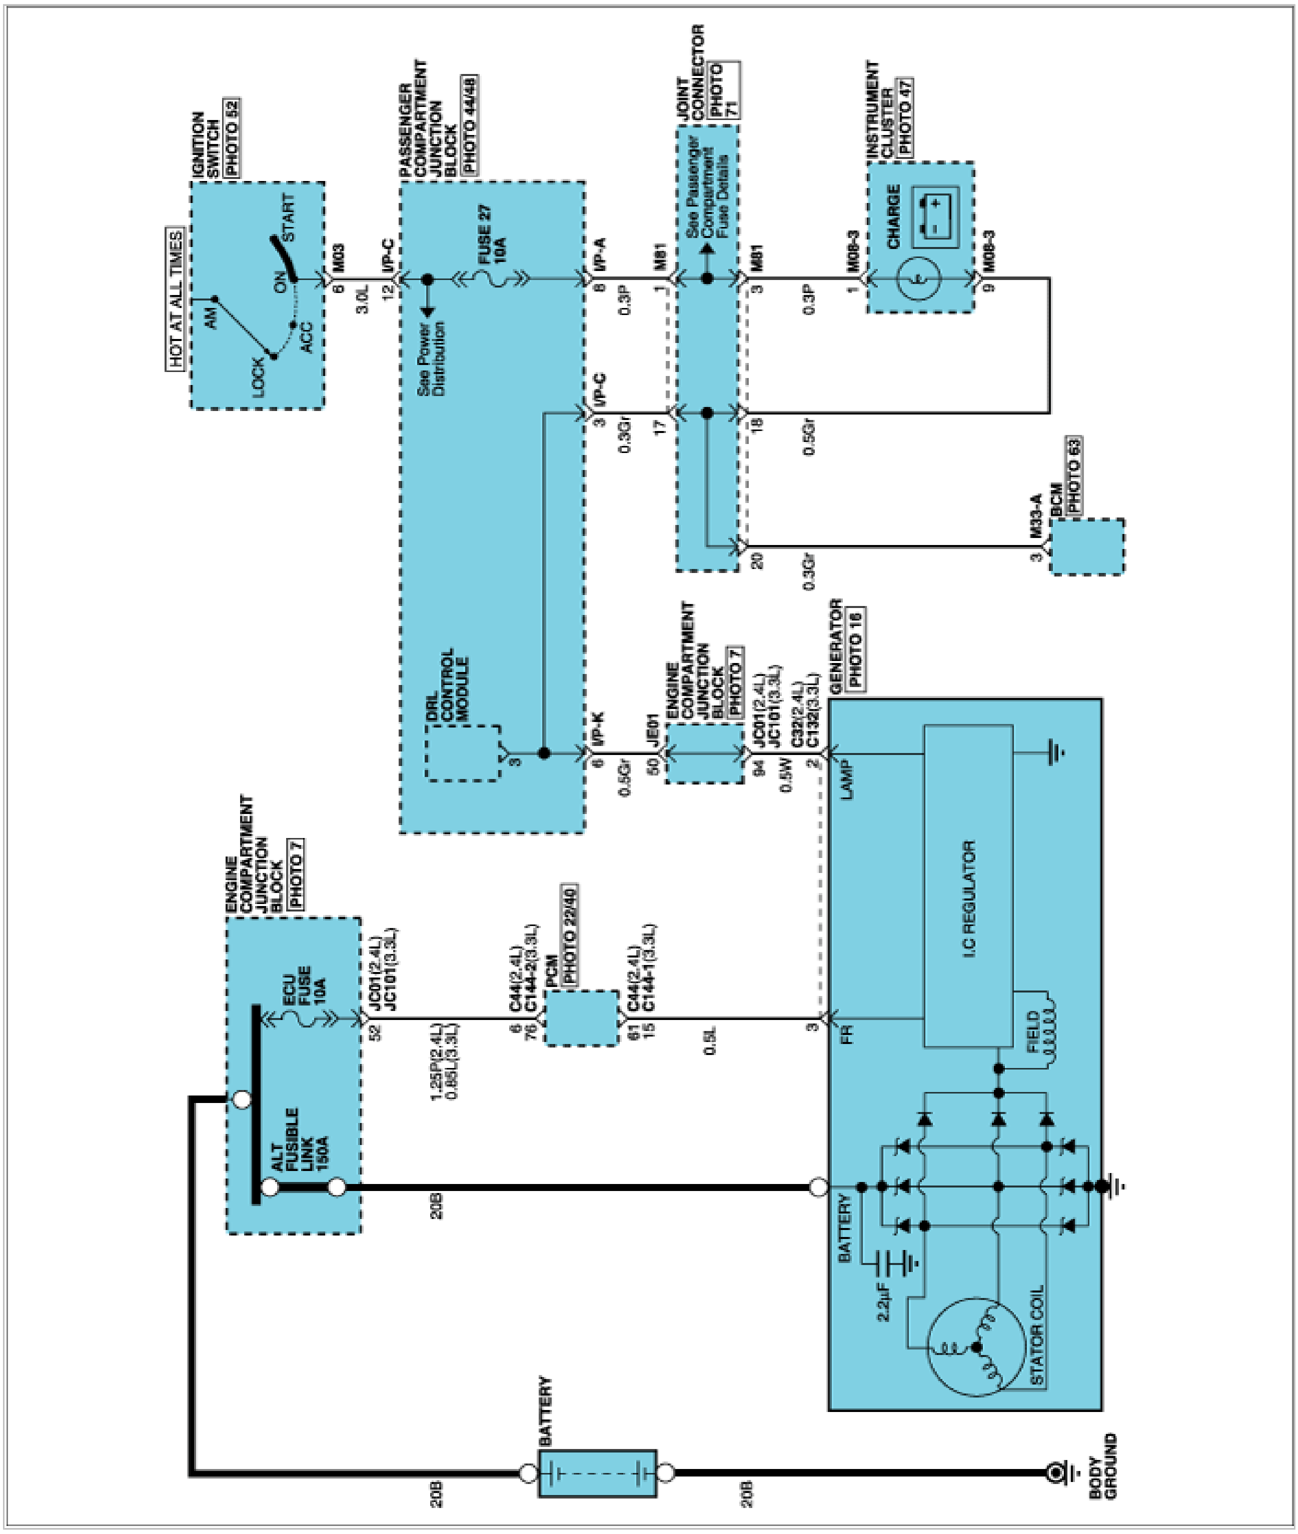
1. Measure the primary coil resistance between terminals (+) and (-).



Standard value: 0.62Ω ± 10%

Engine Electrical System > Charging System > Schematic Diagrams

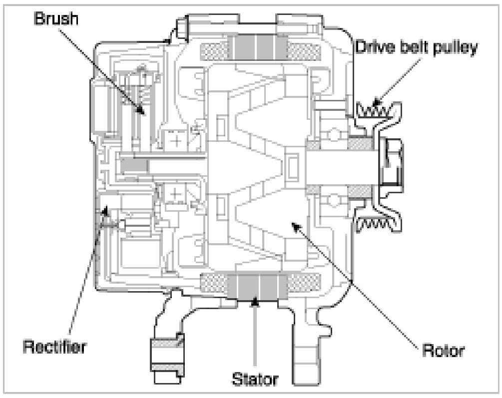
CIRCUIT DIAGRAM FOR CHARGING SYSTEM



Engine Electrical System > Charging System > Description and Operation

DESCRIPTION

The charging system includes a battery, an alternator with a built-in regulator, and the charging indicator light and wire.
The Alternator has built-in diodes, each rectifying AC current to DC current.
Therefore, DC current appears at alternator "B" terminal.
In addition, the charging voltage of this alternator is regulated by the battery voltage detection system.
The main components of the alternator are the rotor, stator, rectifier, capacitor brushes, bearings and V-ribbed belt pulley.
The brush holder contains a built-in electronic voltage regulator.



Engine Electrical System > Charging System > Repair procedures

ON-VEHICLE INSPECTION

CAUTION

- Check that the battery cables are connected to the correct terminals.
- Disconnect the battery cables when the battery is given a quick charge.
- Never disconnect the battery while the engine is running.

CHECK BATTERY VOLTAGE

1. If 20 minutes have not passed since the engine was stopped, turn the ignition switch ON and turn on the electrical system (headlamp, blower motor, rear defogger etc.) for 60 seconds to remove the surface charge.
2. Turn the ignition switch OFF and turn off the electrical systems.
3. Measure the battery voltage between the negative (-) and positive (+) terminals of the battery.

   Standard voltage : 12.5 ~ 12.9V at 20°C(68°F)

   If the voltage is less than specification, charge the battery.

CHECK THE BATTERY TERMINALS AND FUSES

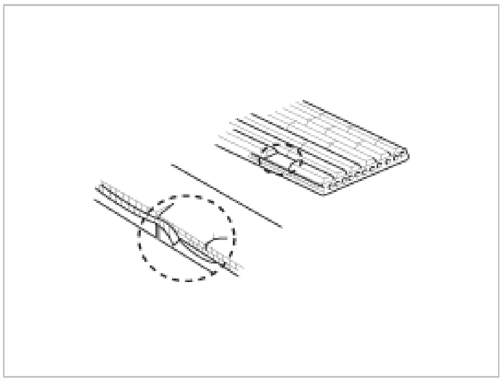
1. Check that the battery terminals are not loose or corroded.
2. Check the fuses for continuity.

INSPECT DRIVE BELT

Visually check the belt for excessive wear, frayed cords etc.
If any defect has been found, replace the drive belt.

NOTE

Cracks on the rib side of a belt are considered acceptable. If the belt has chunks missing from the ribs, it should be replaced.



VISUALLY CHECK ALTERNATOR WIRING AND LISTEN FOR ABNORMAL NOISES

1. Check that the wiring is in good condition.
2. Check that there is no abnormal noise from the alternator while the engine is running.

CHECK DISCHARGE WARNING LIGHT CIRCUIT

1. Warm up the engine and then turn it off.
2. Turn off all accessories.
3. Turn the ignition switch "ON". Check that the discharge warning light is lit.
4. Start the engine. Check that the light is lit.
   If the light does not go off as specified, troubleshoot the discharge light circuit.

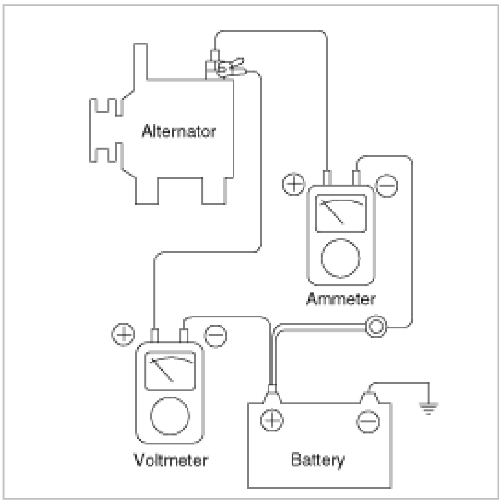
INSPECT CHARGING SYSTEM

VOLTAGE ;DROP ;TEST ;OF ;ALTERNATOR ;OUTPUT ;WIRE

This test determines whether or not the wiring between the alternator "B" terminal and the battery (+) terminal is good by the voltage drop method.

PREPARATION

1. Turn the ignition switch to "OFF".
2. Disconnect the output wire from the alternator "B" terminal. Connect the (+) lead wire of ammeter to the "B" terminal of alternator and the (-) lead wire of ammeter to the output wire. Connect the (+) lead wire of voltmeter to the "B" terminal of alternator and the (-) lead wire of voltmeter to the (+) terminal of battery.



TEST

1. Start the engine.
2. Turn on the headlamps and blower motor, and set the engine speed until the ammeter indicates 20A.
   And then, read the voltmeter at this time.

RESULT

1. The voltmeter may indicate the standard value.

   Standard value: 0.2V max

2. If the value of the voltmeter is higher than expected (above 0.2V max.), poor wiring is suspected. In this case check the wiring from the alternator "B" terminal to the battery (+) terminal. Check for loose connections, color change due to an over-heated harness, etc. Correct them before testing again.
3. Upon completion of the test, set the engine speed at idle.
   Turn off the headlamps, blower motor and the ignition switch.

OUTPUT CURRENT TEST

This test determines whether or not the alternator gives an output current that is equivalent to the normal output.

PREPARATION

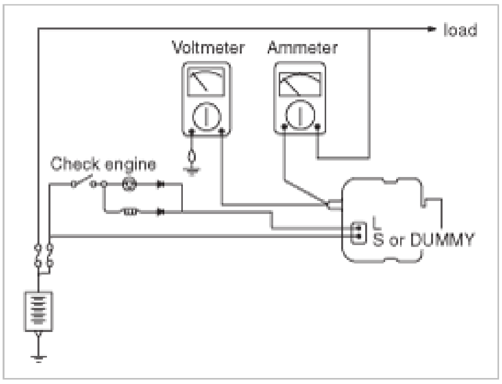
1. Prior to the test, check the following items and correct as necessary.

Check the battery installed in the vehicle to ensure that it is in good condition. The battery checking method is described in the section "Battery".
The battery that is used to test the output current should be one that has been partially discharged. With a fully charged battery, the test may not be conducted correctly due to an insufficient load.
Check the tension of the alternator drive belt. The belt tension check method is described in the section "Inspect drive belt".

2. Turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Disconnect the alternator output wire from the alternator "B" terminal.
5. Connect a DC ammeter (0 to 150A) in series between the "B" terminal and the disconnected output wire. Be sure to connect the (-) lead wire of the ammeter to the disconnected output wire.

> NOTE
>
> Tighten each connection securely, as a heavy current will flow. Do not rely on clips.

6. Connect a voltmeter (0 to 20V) between the "B" terminal and ground. Connect the (+) lead wire to the alternator "B" terminal and (-) lead wire to a good ground.
7. Attach an engine tachometer and connect the battery ground cable.
8. Leave the engine hood open.



TEST

1. Check to see that the voltmeter reads as the same value as the battery voltage. If the voltmeter reads 0V, and the open circuit in the wire between alternator "B" terminal and battery (-) terminal or poor grounding is suspected.
2. Start the engine and turn on the headlamps.
3. Set the headlamps to high beam and the heater blower switch to HIGH, quickly increase the engine speed to 2,500 rpm and read the maximum output current value indicated by the ammeter.

> NOTE
>
> After the engine start up, the charging current quickly drops.
> Therefore, the above operation must be done quickly to read the maximum current value correctly.

RESULT

1. The ammeter reading must be higher than the limit value. If it is lower but the alternator output wire is in good condition, remove the alternator from the vehicle and test it.

Limit value : 77A min.(110A alternator)
91A min.(130A alternator)

> NOTE
>
> - The nominal output current value is shown on the nameplate affixed to the alternator body.
> - The output current value changes with the electrical load and the temperature of the alternator itself. Therefore, the nominal output current may not be obtained. If such is the case, keep the headlamps on the cause discharge of the battery, or use the lights of another vehicle to increase the electrical load.

The nominal output current may not be obtained if the temperature of the alternator itself or ambient temperature is too high.
In such a case, reduce the temperature before testing again.

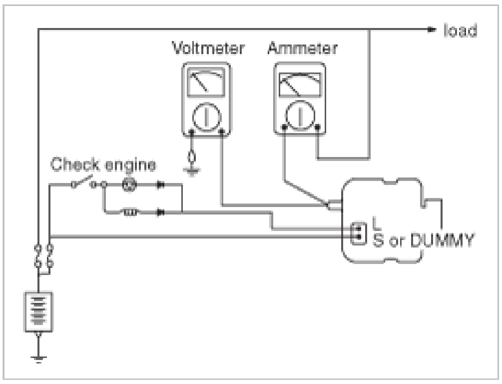
2. Upon completion of the output current test, lower the engine speed to idle and turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Remove the ammeter and voltmeter and the engine tachometer.
5. Connect the alternator output wire to the alternator "B" terminal.
6. Connect the battery ground cable.

REGULATED VOLTAGE TEST

The purpose of this test is to check that the electronic voltage regulator controls voltage correctly.

PREPARATION

1. Prior to the test, check the following items and correct if necessary.
   Check that the battery installed on the vehicle is fully charged. The battery checking method is described in the section "Battery".
   Check the alternator drive belt tension. The belt tension check method is described in the section "Inspect drive belt".
2. Turn ignition switch to "OFF".
3. Disconnect the battery ground cable.
4. Connect a digital voltmeter between the "B" terminal of the alternator and ground. Connect the (+) lead of the voltmeter to the "B" terminal of the alternator. Connect the (-) lead to good ground or the battery (-) terminal.
5. Disconnect the alternator output wire from the alternator "B" terminal.
6. Connect a DC ammeter (0 to 150A) in series between the "B" terminal and the disconnected output wire.
   Connect the (-) lead wire of the ammeter to the disconnected output wire.
7. Attach the engine tachometer and connect the battery ground cable.



TEST

1. Turn on the ignition switch and check to see that the voltmeter indicates the following value.

   Voltage: Battery voltage

   If it reads 0V, there is an open circuit in the wire between the alternator "B" terminal and the battery and the battery (-) terminal.
2. Start the engine. Keep all lights and accessories off.
3. Run the engine at a speed of about 2,500 rpm and read the voltmeter when the alternator output current drops to 10A or less

RESULT

1. If the voltmeter reading agrees with the value listed in the regulating voltage table below, the voltage regulator is functioning correctly. If the reading is other than the standard value, the voltage regulator or the alternator is faulty.
   REGULATING VOLTAGE TABLE

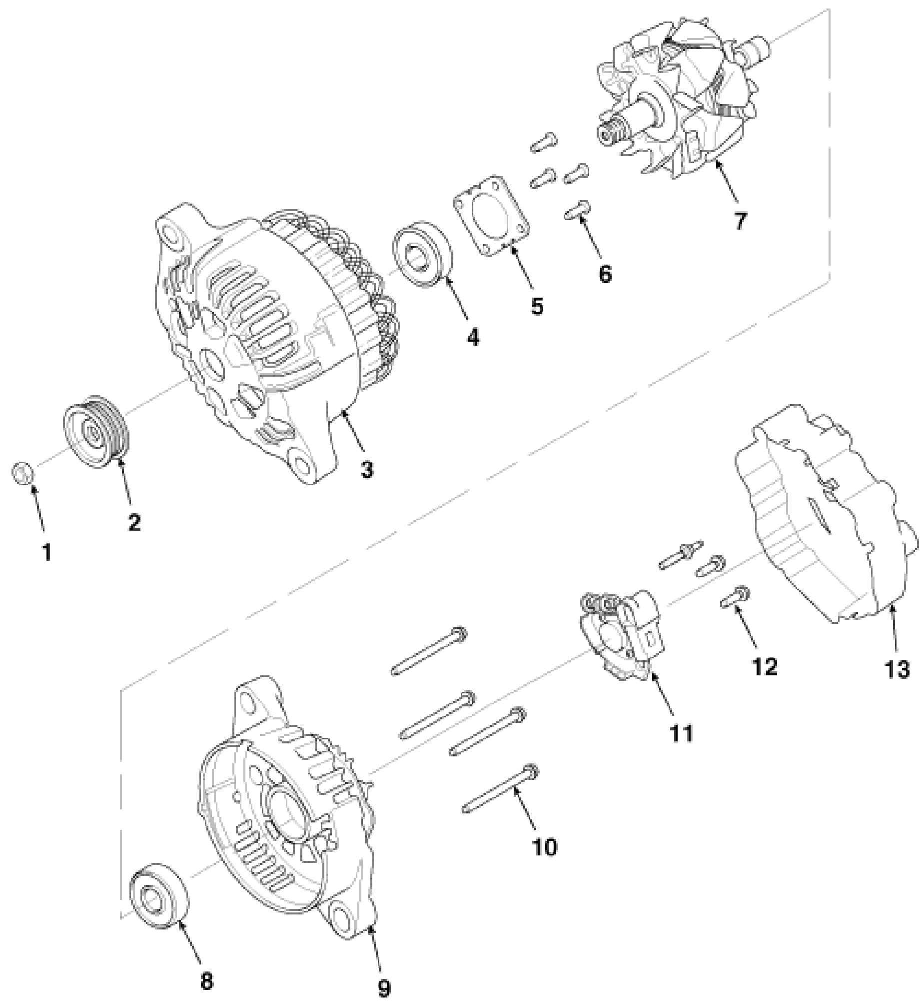
Voltage regulator ambient temperature °C (°F)	Regulating voltage (V)
-30 (-22)	14.2 ~ 15.3

25 (77) 135 (275)	14.2 ~ 14.8 13.3 ~ 14.8

2. Upon completion of the test, reduce the engine speed to idle, and turn off the ignition switch.
3. Disconnect the battery ground cable.
4. Remove the voltmeter and ammeter and the engine tachometer.
5. Connect the alternator output wire to the alternator "B" terminal.
6. Connect the battery ground cable.

Engine Electrical System > Charging System > Alternator > Components and Components Location

COMPONENT

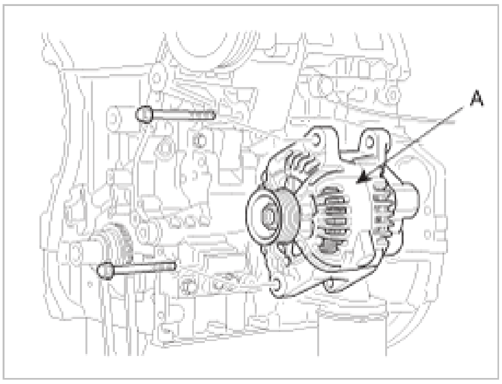


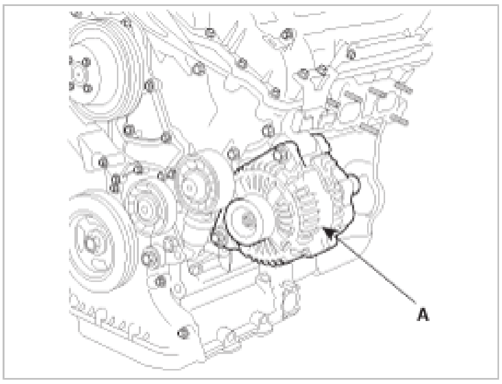
1. Nut
2. Pulley
3. Front bracket
4. Front bearing
5. Bearing cover
6. Bearing cover bolt
7. Rotor coil
8. Rear bearing
9. Rear bracket
10. Through bolt
11. Brush holder assembly
12. Brush holder bolt
13. Rear cover

Engine Electrical System > Charging System > Alternator > Repair procedures

REMOVAL

1. Disconnect the battery negative terminal first, then the positive terminal.
2. Disconnect the alternator connector, and remove the cable from alternator "B" terminal.
3. Remove the drive belt.
4. Pull out the through bolt and then remove the alternator(A).

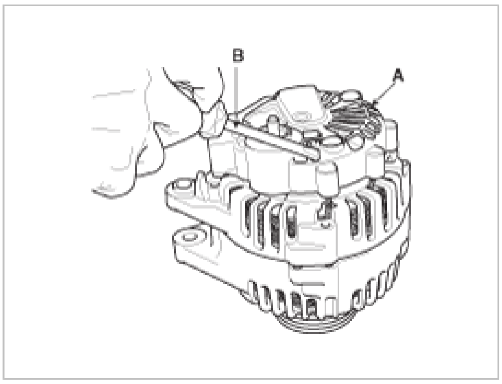




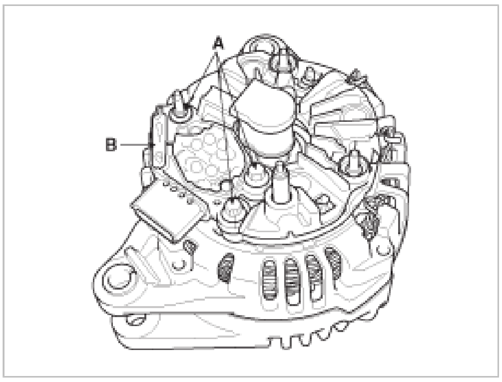
5. Installation is the reverse of removal.

DISASSEMBLY

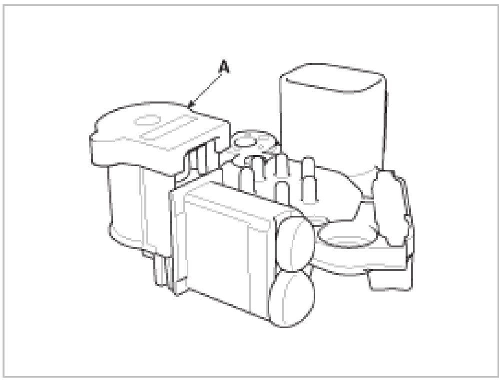
1. Remove the alternator cover(A) using a screw driver(B).



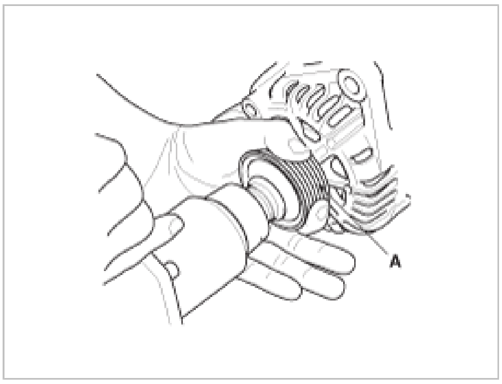
2. Loosen the mounting bolts(A) and disconnect the brush holder assembly(B).



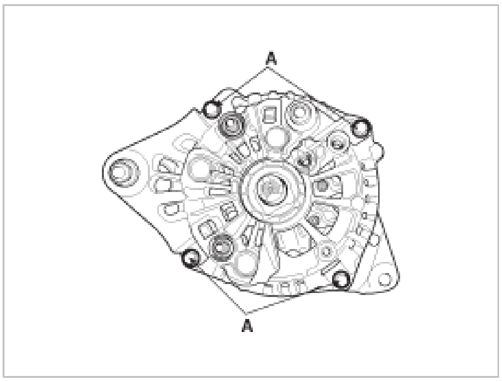
3. Remove the slip ring guide(A).



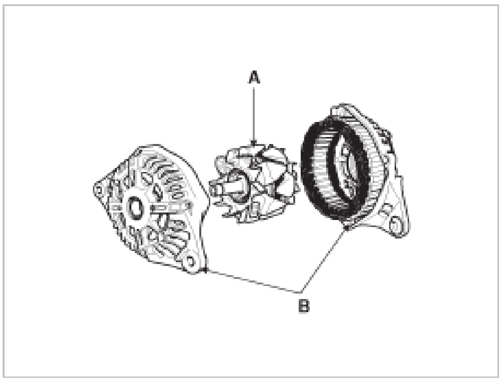
4. Remove the nut, pulley(A) and spacer.



5. Loosen the 4 through bolts(A).



6. Disconnect the rotor(A) and cover(B).

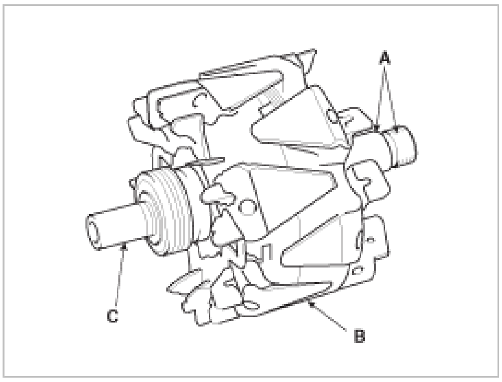


7. Reassembly is the reverse order of disassembly.

INSPECTION

INSPECT ROTOR

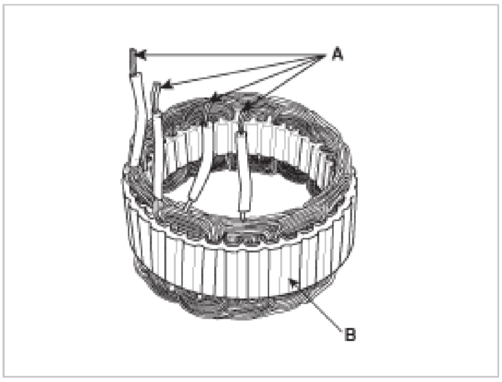
1. Check that there is continuity between the slip rings (A).



2. Check that there is no continuity between the slip rings and the rotor (B) or rotor shaft (C).
3. If the rotor fails either continuity check, replace the alternator.

INSPECT STATOR

1. Check that there is continuity between each pair of leads (A).

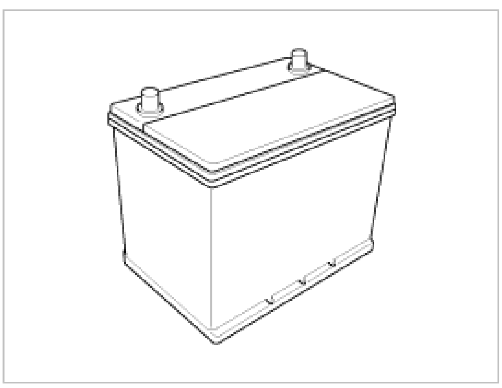


2. Check that there is no continuity between each lead and the coil core.
3. If the coil fails either continuity check, replace the alternator.

Engine Electrical System > Charging System > Battery > Description and Operation

DESCRIPTION

1. The maintenance-free battery is, as the name implies, totally maintenance free and has no removable battery cell caps.
2. Water never needs to be added to the maintenance-free battery.
3. The battery is completely sealed, except for small vent holes in the cover.

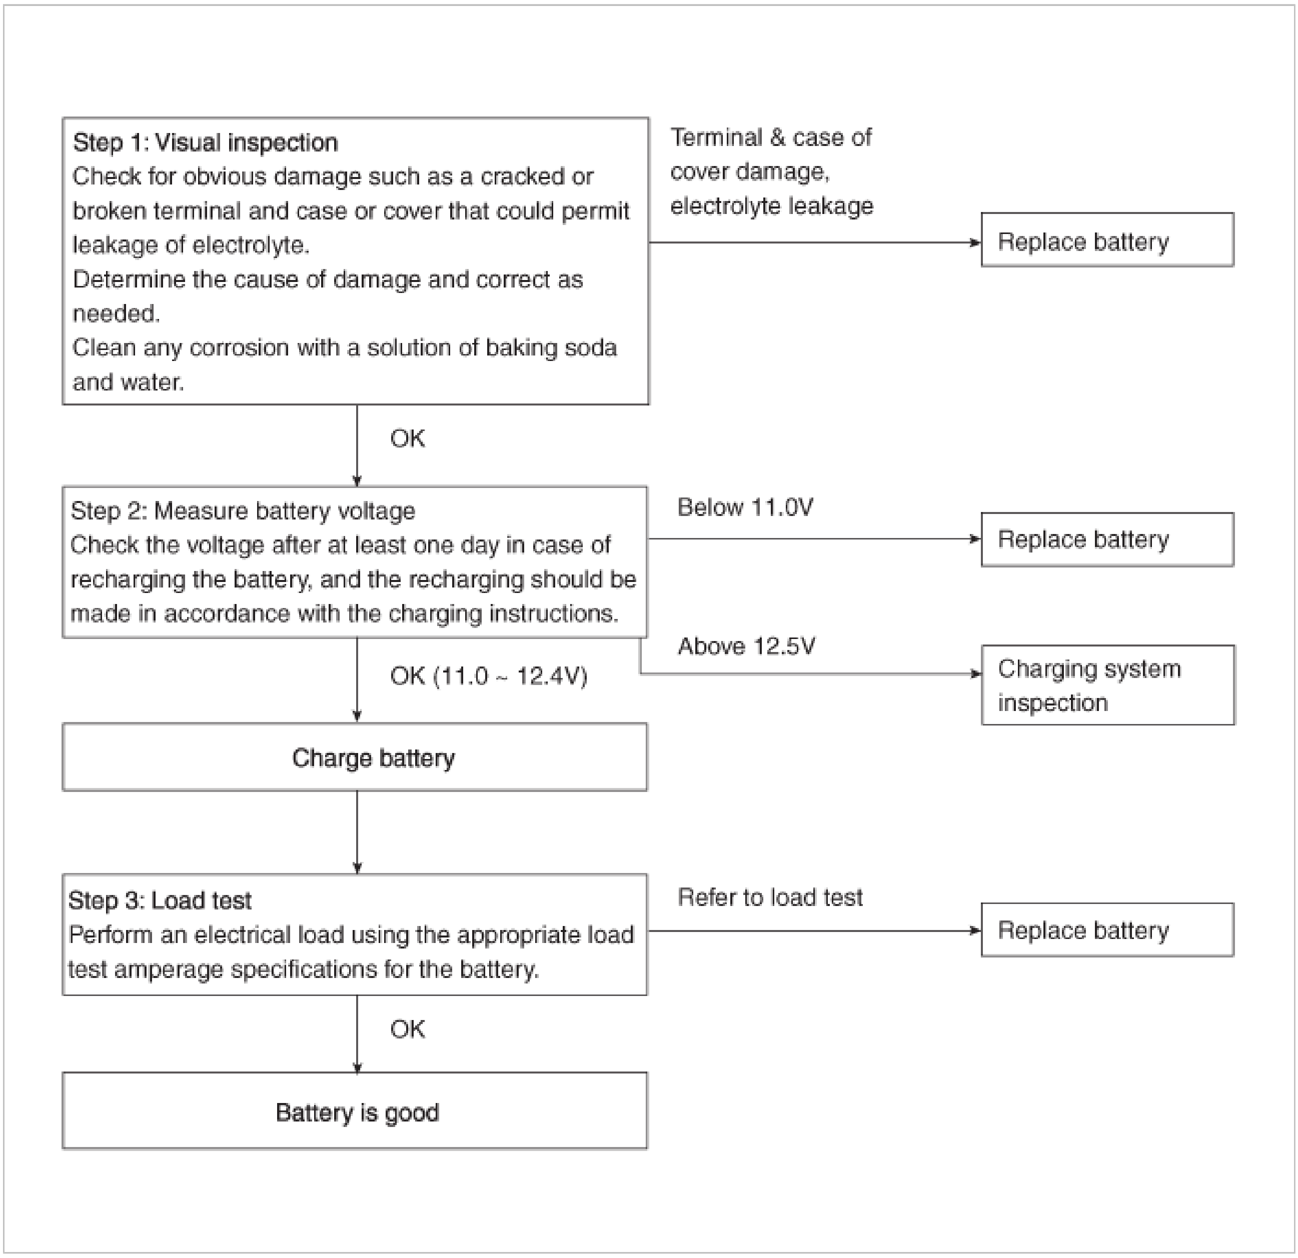


Engine Electrical System > Charging System > Battery > Repair procedures

INSPECTION

BATTERY DIAGNOSTIC TEST (1)

CHECKING FLOW



LOAD TEST

1. Perform the following steps to complete the load test procedure for maintenance free batteries.
2. Connect the load tester clamps to the terminals and proceed with the test as follow:
   (1) If the battery has been on charge, remove the surface charge by connecting a 300ampere load for 15 seconds.
   (2) Connect the voltmeter and apply the specified load.
   (3) Read the voltage after the load has been applied for 15 seconds.
   (4) Disconnect the load.
   (5) Compare the voltage reading with the minimum and replace the battery if battery test voltage is below that shown in the voltage table.

Voltage	Temperature
9.6V	20°C (68.0°F) and above
9.5V	16°C (60.8°F)
9.4V	10°C (50.0°F)
9.3V	4°C (39.2°F)
9.1V	-1°C (30.2°F)

8.9V	-7°C (19.4°F)
8.7V	-12°C (10.4°F)
8.5V	-18°C (-0.4°F)

NOTE

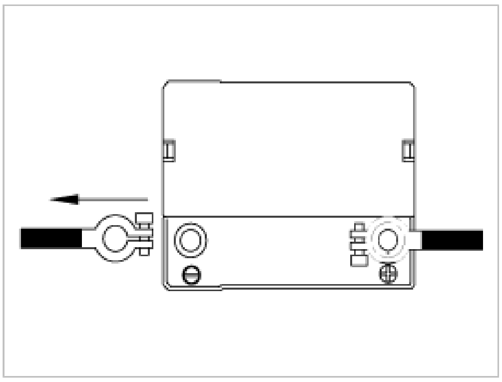
- If the voltage is greater than shown in the table, the battery is good.
- If the voltage is less than shown in the table, replace the battery.

BATTERY DIAGNOSTIC TEST (2)

1. Make sure the ignition switch and all accessories are in the OFF position.
2. Disconnect the battery cables (negative first).
3. Remove the battery from the vehicle.

CAUTION

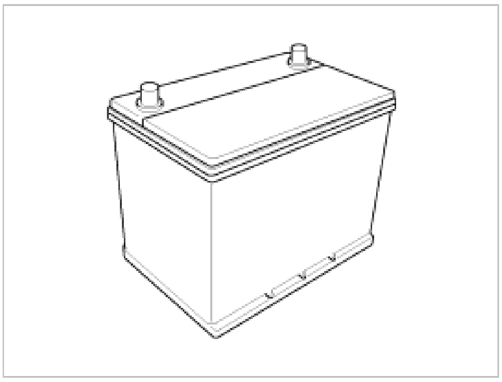
Care should be taken in the event the battery case is cracked or leaking, to protect your skin from the electrolyte. Heavy rubber gloves (not the household type) should be wore when removing the battery.



4. Inspect the battery tray for damage caused by the loss of electrolyte. If acid damage is present, it will be necessary to clean the area with a solution of clean warm water and baking soda. Scrub the area with a stiff brush and wipe off with a cloth moistened with baking soda and water.
5. Clean the top of the battery with the same solution as described above.
6. Inspect the battery case and cover for cracks. If cracks are present, the battery must be replaced.
7. Clean the battery posts with a suitable battery post tool.
8. Clean the inside surface of the terminal clamps with a suitable battery cleaning tool. Replace damaged or frayed cables and broken terminal clamps.
9. Install the battery in the vehicle.
10. Connect the cable terminals to the battery post, making sure tops of the terminals are flush with the tops of the posts.
11. Tighten the terminal nuts securely.
12. Coat all connections with light mineral grease after tightening.

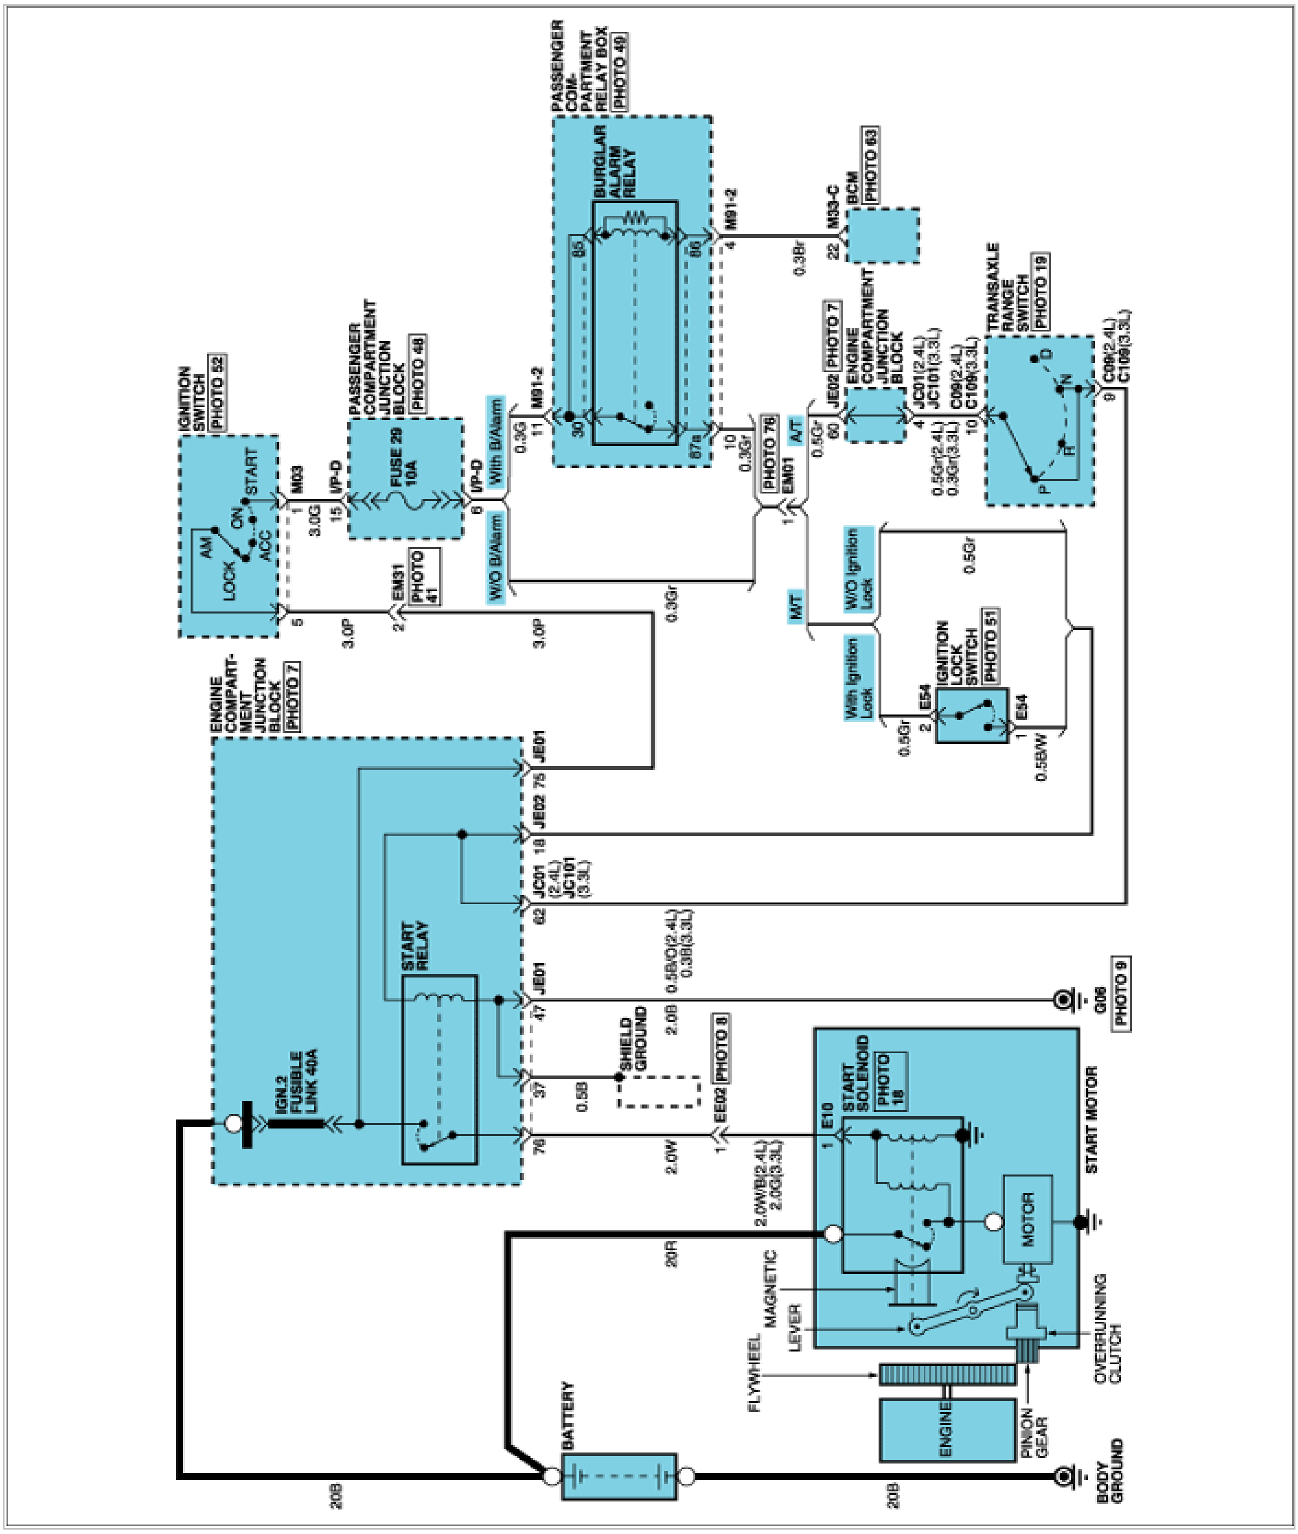
CAUTION

When batteries are being charged, an explosive gas forms beneath the cover of each cell. Do not smoke near batteries being charged or which have recently been charged. Do not break live circuit at the terminals of batteries being charged.
A spark will occur when the circuit is broken. Keep open flames away from battery.



Engine Electrical System > Starting System > Schematic Diagrams

CIRCUIT DIAGRAM OF STARTING SYSTEM



Engine Electrical System > Starting System > Description and Operation

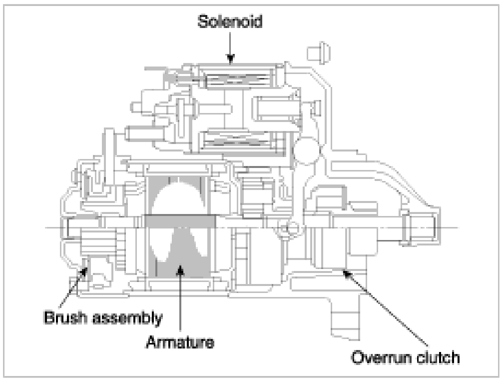
DESCRIPTION

The starting system includes the battery, starter, solenoid switch, ignition switch, inhibitor switch (A/T), ignition lock switch, connection wires and the battery cable.

When the ignition key is turned to the start position, current flows and energizes the starter motor's solenoid coil.

The solenoid plunger and clutch shift lever are activated, and the clutch pinion engages the ring gear.

The contacts close and the starter motor cranks. In order to prevent damage caused by excessive rotation of the starter armature when the engine starts, the clutch pinion gear overruns.



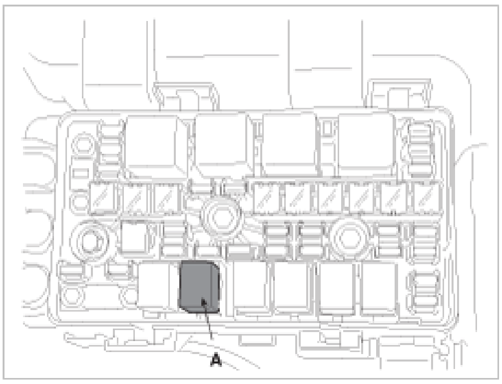
Engine Electrical System > Starting System > Repair procedures

STARTER CIRCUIT TROUBLESHOOTING

NOTE

The battery must be in good condition and fully charged.

1. Remove the fuel pump relay(A) from the fuse box.

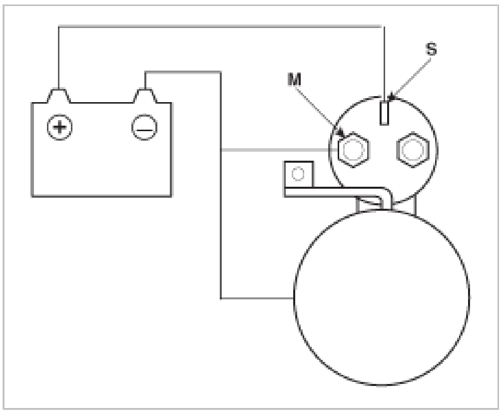


2. With the shift lever in N or P (A/T) or clutch pedal pressed (M/T), turn the ignition switch to "START"
   If the starter normally cranks the engine, starting system is OK. If the starter will not crank the engine at all, go to next step.
   If it won't disengage from the ring gear when you release key, check for the following until you find the cause.
   A. Solenoid plunger and switch malfunction.
   B. Dirty pinion gear or damaged overrunning clutch.
3. Check the battery condition. Check electrical connections at the battery, battery negative cable connected to the body, engine ground cables, and the starter for looseness and corrosion. Then try starting the engine again.
   If the starter cranks normally the engine, repairing the loose connection repaired the problem. The starting system is now OK.
   If the starter still does not crank the engine, go to next step.
4. Disconnect the connector from the S-terminal of solenoid. Connect a jumper wire from the B-terminal of solenoid to the S-terminal of solenoid.
   If the starter cranks the engine, go to next step.
   If the starter still does not crank the engine, remove the starter, and repair or replace as necessary.
5. Check the following items in the order listed until you find the open circuit.
   A. Check the wire and connectors between the driver's under-dash fuse/relay box and the ignition switch, and between the driver's under-dash fuse/relay box and the starter.
   B. Check the ignition switch (Refer to BE group - ignition system)
   C. Check the transaxle range switch connector or ignition lock switch connector.
   D. Inspect the starter relay.

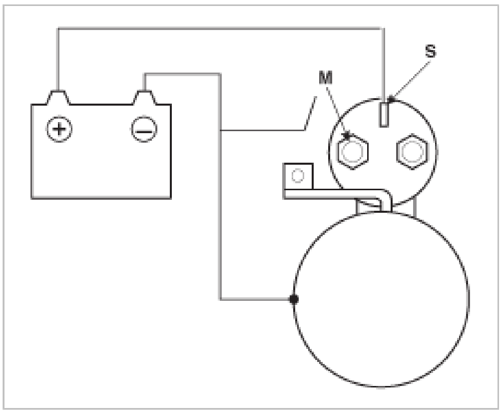
STARTER SOLENOID TEST

1. Disconnect the field coil wire from the M-terminal of solenoid switch.
2. Connect the battery as shown. If the starter pinion pops out, it is working properly. To avoid damaging the starter, do not

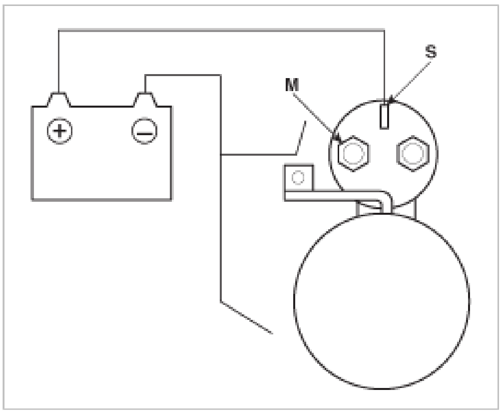
leave the battery connected for more than 10 seconds.



3. Disconnect the battery from the M terminal.
   If the pinion does not retract, the hold-in coil is working properly. To avoid damaging the starter, do not leave the battery connected for more than 10 seconds.

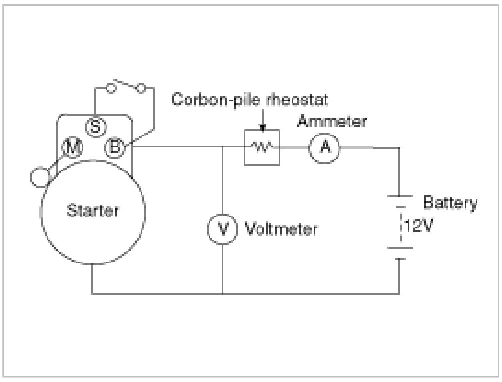


4. Disconnect the battery also from the body. If the pinion retracts immediately, it is working properly. To avoid damaging the starter, do not leave the battery connected for more than 10 seconds.



FREE RUNNING TEST

1. Place the starter motor in a vise equipped with soft jaws and connect a fully-charged 12-volt battery to starter motor as follows.
2. Connect a test ammeter (100-ampere scale) and carbon pile rheostats as shown in the illustration.
3. Connect a voltmeter (15-volt scale) across starter motor.



4. Rotate carbon pile to the off position.
5. Connect the battery cable from battery's negative post to the starter motor body.
6. Adjust until battery voltage shown on the voltmeter reads 11volts.
7. Confirm that the maximum amperage is within the specifications and that the starter motor turns smoothly and freely.

Current : 90A max (2.4L), 85A MAX (3.3L)
Speed : 2,600 rpm

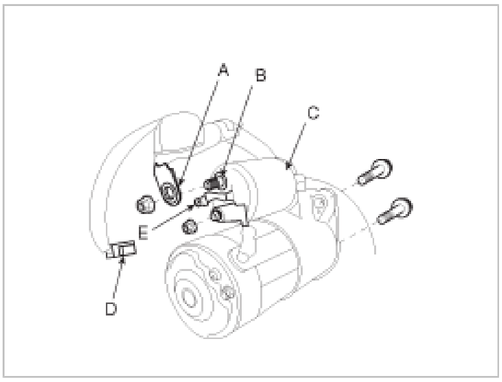
8. Magnet switch assembly
9. Planet shaft assembly
10. Planetary gear assembly
11. Packing
12. Shield
13. Armature assembly
14. Yoke assembly
15. Brush holder assembly
16. Through bolt

Engine Electrical System > Starting System > Starter > Repair procedures

STARTER

REMOVAL

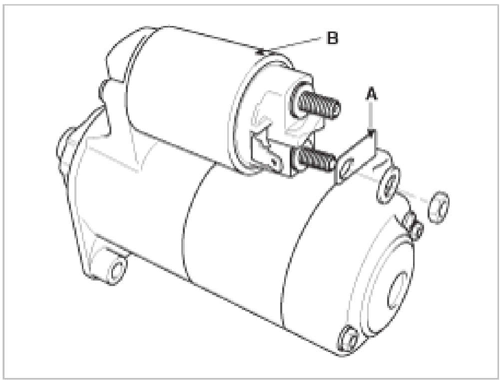
1. Disconnect the battery negative cable.
2. Disconnect the starter cable (A) from the B terminal (B) on the solenoid (C), then disconnect the connector (D) from the S terminal (E).



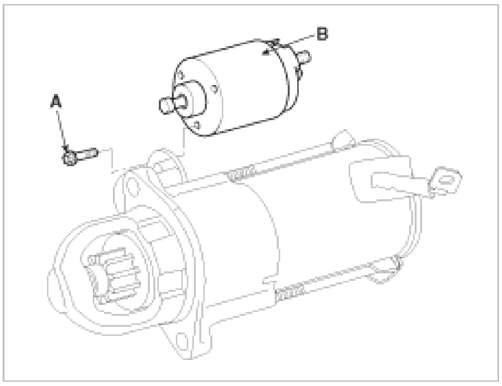
3. Remove the 2 bolts holding the starter, then remove the starter.
4. Installation is the reverse of removal.
5. Connect the battery negative cable to the battery.

DISASSEMBLY

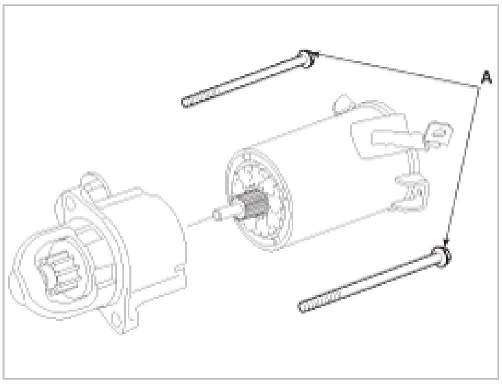
1. Disconnect the M-terminal (A) on the magnet switch assembly (B).



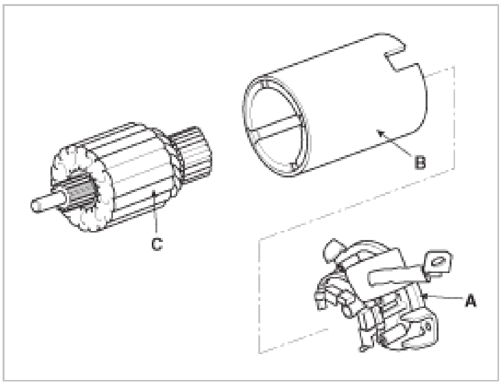
2. After loosening the 3 screws (A), detach the magnet switch assembly (B).



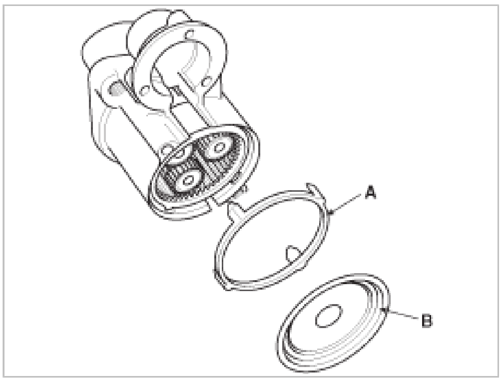
3. Loosen the through bolts (A).



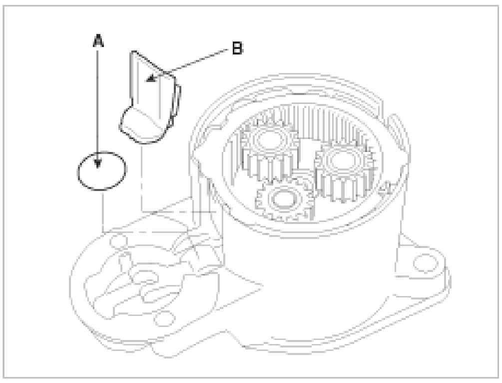
4. Remove the brush holder assembly (A), yoke (b) and armature (C).



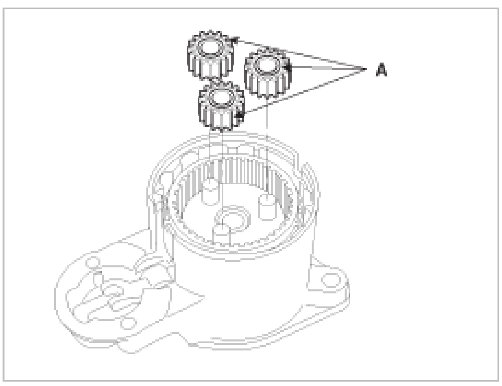
5. Remove the shield (A) and packing (B).



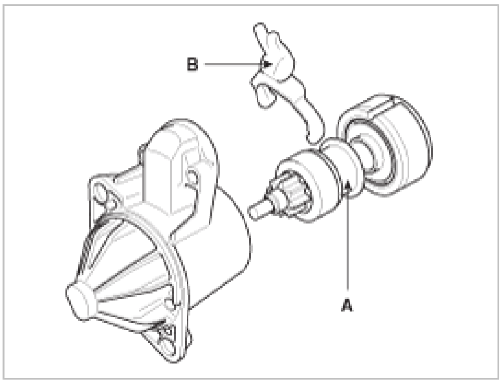
6. Remove the lever plate (A) and lever packing (B).



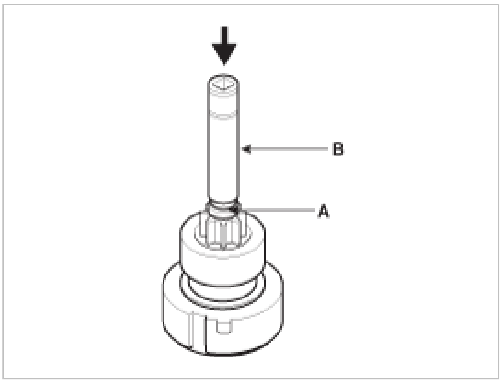
7. Disconnect the planet gear (A).



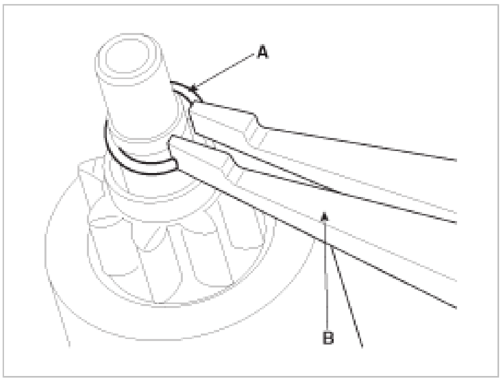
8. Disconnect the planet shaft assembly (A) and lever (B).



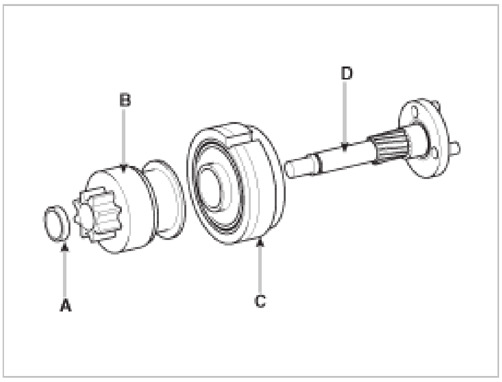
9. Press the stop ring (A) using a socket (B).



10. After removing the stopper (A) using stopper pliers (B).

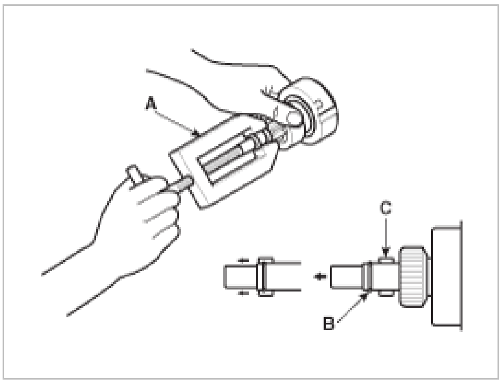


11. Disconnect the stop ring (A), overrunning clutch (B), internal gear (C) and planet shaft (D).



12. Reassembly is the reverse of disassembly.

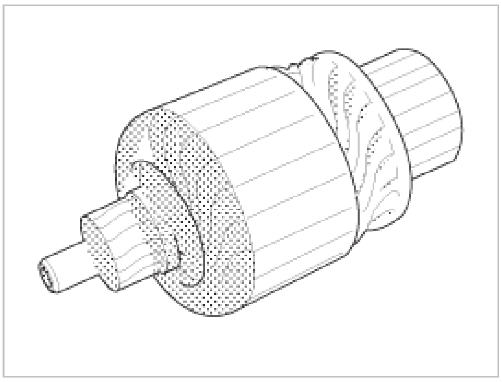
NOTE
Using a suitable pulling tool (A), pull the overrunning clutch stop ring (B) over the stopper (C).



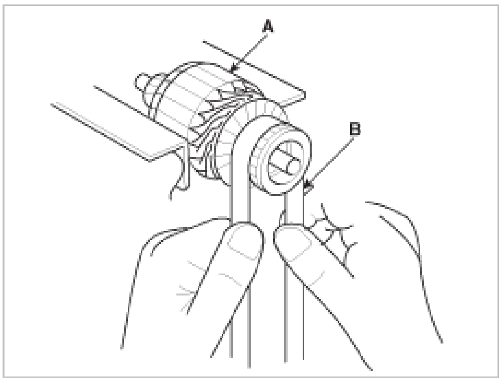
INSPECTION

ARMATURE INSPECTION AND TEST

1. Remove the starter.
2. Disassemble the starter as shown at the beginning of this procedure.
3. Inspect the armature for wear or damage from contact with the permanent magnet. If there is wear or damage, replace the armature.

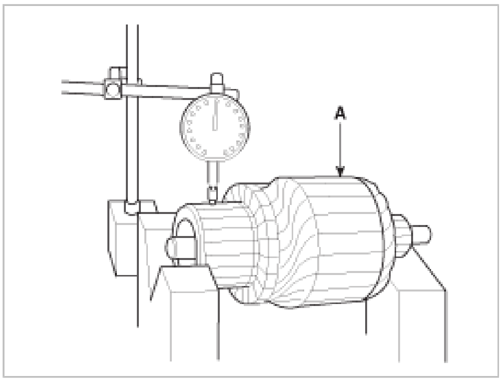


4. Check the commutator (A) surface. If the surface is dirty or burnt, resurface with emery cloth or a lathe within the following specifications, or recondition with #500 or #600 sandpaper (B).



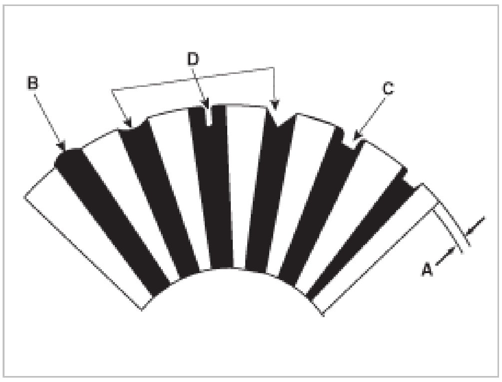
5. Measure the commutator (A) runout.
   A. If the commutator runout is within the service limit, check the commutator for carbon dust or brass chips between the segments.
   B. If the commutator run out is not within the service limit, replace the armature.

Commutator runout
Standard (New): 0.02mm (0.0008in.) max
Service limit: 0.05mm (0.0020in.)

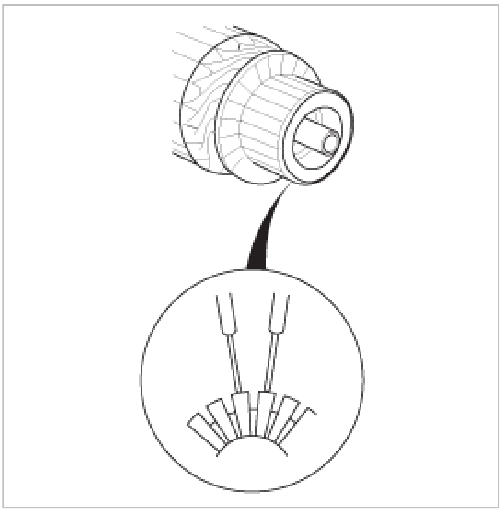


6. Check the mica depth (A). If the mica is too high (B), undercut the mica with a hacksaw blade to the proper depth. Cut away all the mica (C) between the commutator segments. The undercut should not be too shallow, too narrow, or v-shaped (D).

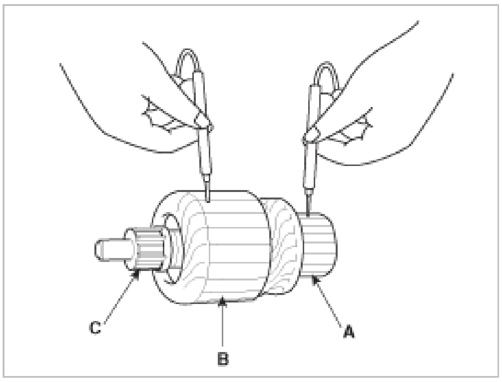
Commutator mica depth
Standard (New) : 0.5 mm (0.0197 in.)
Limit : 0.2mm (0.0079 in.)



7. Check for continuity between the segments of the commutator. If an open circuit exists between any segments, replace the armature.

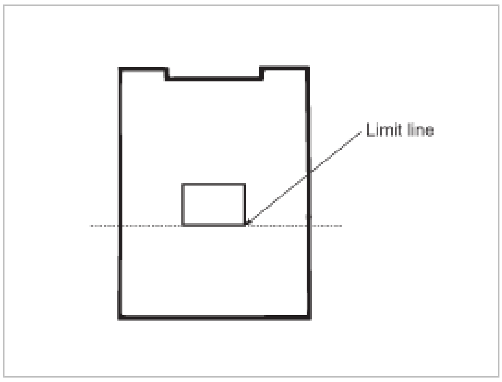


8. Check with an ohmmeter that no continuity exists between the commutator (A) and armature coil core (B), and between the commutator and armature shaft (C). If continuity exists, replace the armature.



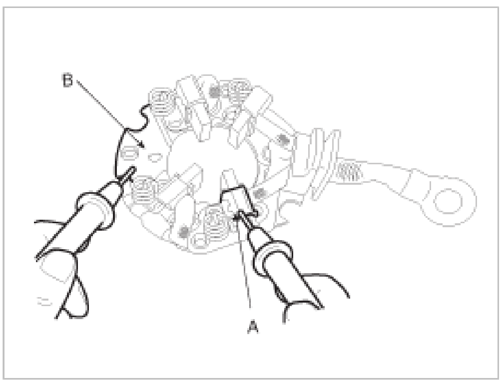
INSPECT STARTER BRUSH

Brushes that are worm out, or oil-soaked, should be replaced.

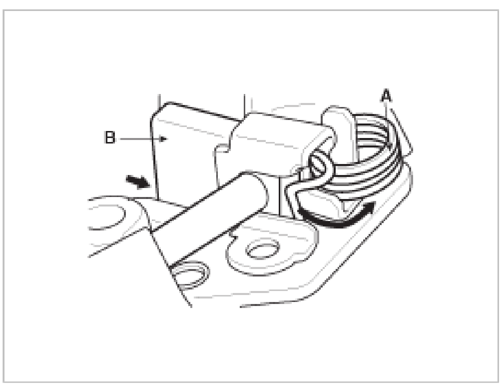


STARTER BRUSH HOLDER TEST

1. Check that there is no continuity between the (+) brush holder (A) and (-) brush holder (B). If there is no continuity, replace the brush holder assembly.



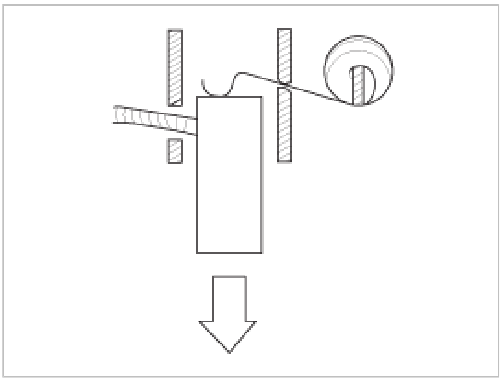
2. Pry back each brush spring (A) with a screwdriver, then position the brush (B) about halfway out of its holder, and release the spring to hold it there.



3. Install the armature in the housing, and install the brush holder. Next, pry back each brush spring again, and push the brush down until it seats against the commutator, then release the spring against the end of the brush.

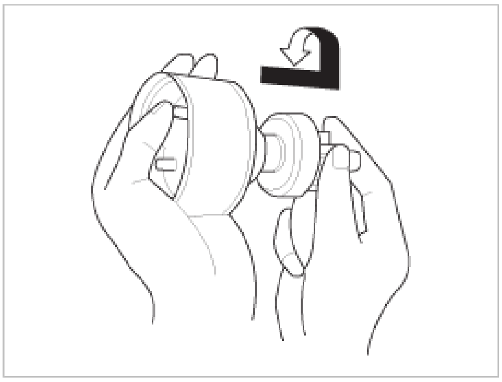
NOTE

To seat new brushes, slip a strip of #500 or #600 sandpaper, with the grit side up, between the commutator and each brush, and smoothly rotate the armature. The contact surface of the brushes will be sanded to the same contour as the commutator.



INSPECT OVERRUNNING CLUTCH

1. Slide the overrunning clutch along the shaft.
   Replace it if does not slide smoothly.
2. Rotate the overrunning clutch both ways.
   Does it lock in one direction and rotate smoothly in reverse? If it does not lock in either direction or it locks in both directions, replace it.



3. If the starter drive gear is worn or damaged, replace the overrunning clutch assembly. (the gear is not available separately).
   Check the condition of the flywheel or torque converter ring gear if the starter drive gear teeth are damaged.

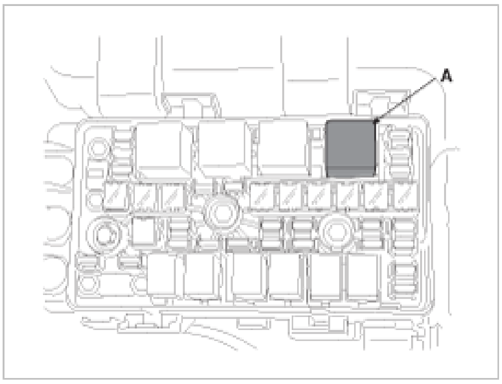
CLEANING

1. Do not immerse parts in cleaning solvent. Immersing the yoke assembly and/or armature will damage the insulation. Wipe these parts with a cloth only.
2. Do not immerse the drive unit in cleaning solvent. The overrun clutch is pre-lubricated at the factory and solvent will wash lubrication from the clutch.
3. The drive unit may be cleaned with a brush moistened with cleaning solvent and wiped dry with a cloth.

Engine Electrical System > Starting System > Starter Relay > Repair procedures

INSPECTION

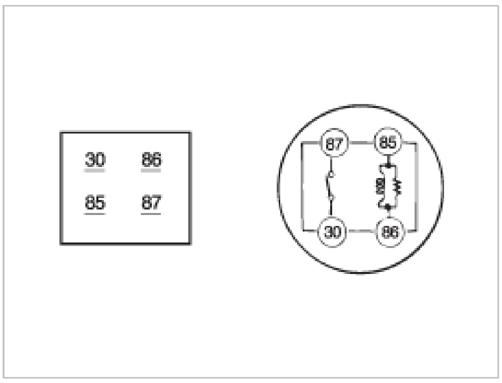
1. Remove the fuse box cover.
2. Remove the starter relay (A).



3. Using an ohmmeter, check that there is continuity between each terminal.

Terminal	Continuity
30 - 87	NO
85 - 86	YES

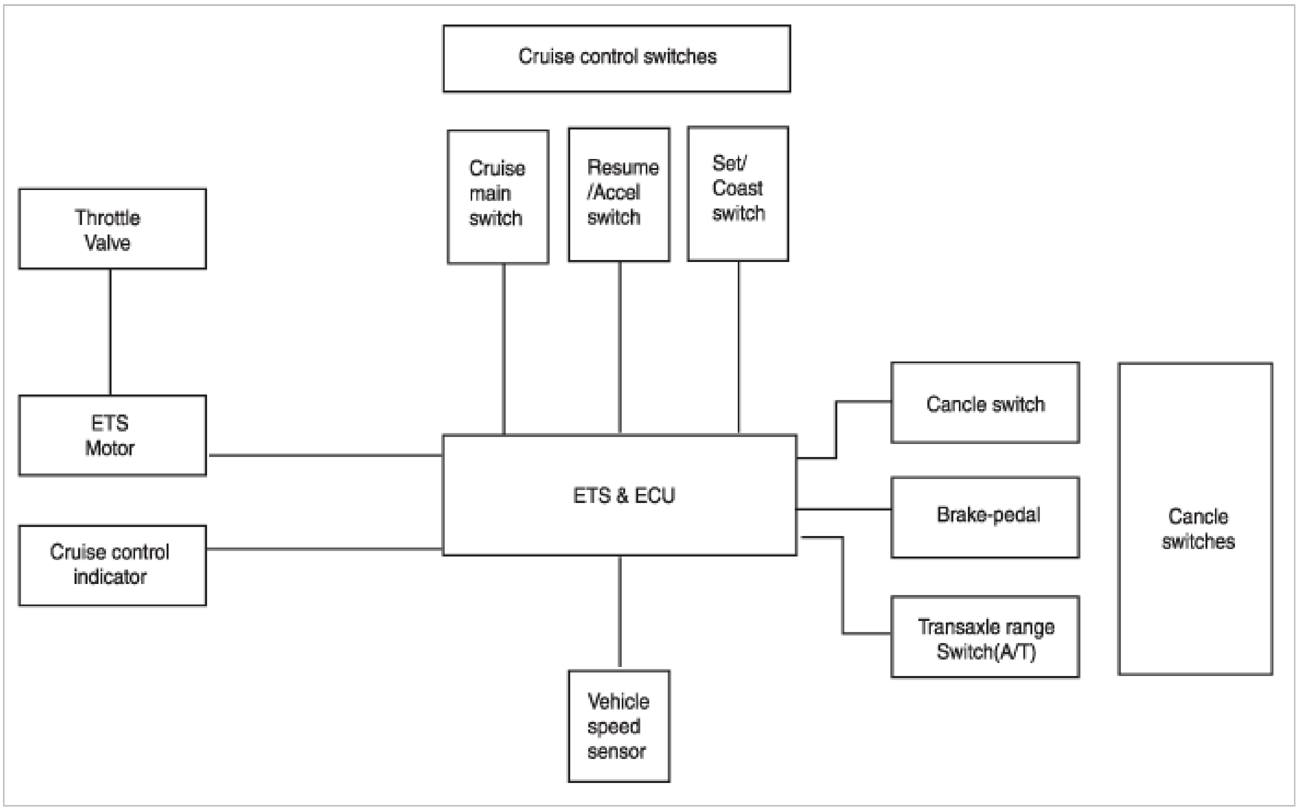
4. Apply 12V to terminal 85 and ground to terminal 86.
   Check for continuity between terminals 30 and 87.



5. If there is no continuity, replace the starter relay.
6. Install the starter relay.
7. Install the fuse box cover.

Engine Electrical System > Cruise Control System > Description and Operation

SYSTEM BLOCK DIAGRAM



COMPONENT PARTS AND FUNCTION OUTLINE

Component part		Function
Vehicle-speed sensor		Converts vehicle speed to pulse.
Engine control module (ECM)		Receives signals from sensor and control switches;
Cruise control indicator		Illuminate when CRUISE main switch is ON (Built into cluster)
Cruise Control switches	CRUISE main switch	Switch for automatic speed control power supply.
	Resume/Accel switch	Controls automatic speed control functions by Resume/Accel switch (Set/Coast switch)
	Set/Coast switch	
Cancel switch	Cancel switch	Sends cancel signals to ECM
	Brake-pedal switch	
	Transaxle range switch (A/T) Clutch switch (M/T)	
ETS motor		Regulates the throttle valve to the set opening by ECM.

* ETS : Electronic Throttle System

CRUISE CONTROL

Cruise control system is engaged by "ON. OFF" main switch located on right of steering wheel column. System has the capability to cruise, coast, resume speed, and accelerate, and raise "tap-up" or lower "tap-down" set speed.
It also has a safety interrupt, engaged upon depressing brake or shifting select lever.
ECM is a speed control system that maintains a required vehicle speed at normal driving conditions.
The main components of cruise control system are mode control switches, transaxle range switch, brake switch, vehicle speed sensor, ECM and ETS motor that connect throttle body.
ECM contains a low speed limit which will prevent system engagement below a minimum speed of 40km/h (25mph).
The operation of the controller is controlled by mode control switches located on steering wheel.
Transaxle range switch and brake switch are provided to disengage the cruise control system. The switches are on brake pedal bracket and transaxle. When the brake pedal is depressed or select lever shifted, the cruise control system is electrically disengaged and the throttle is returned to the idle position.

Cruise main switch

Cruise control system is engaged by pressing "ON. OFF" push button. Releasing "ON.OFF" push button release throttle, clears cruise memory speed, and puts vehicle in a non-cruise mode.

Coast/Set switch

COAST.SET switch located on right of steering wheel column has two positions - "Normal" and "Depressed". The set position - With COAST.SET switch depressed and then released the cruise speed will be set at the speed the vehicle was going when COAST.SET switch was released. The coast position - With COAST.SET switch fully depressed, driver can lower cruise speed. To decrease cruise speed, COAST.SET switch is held in, disengaging cruise control system. When vehicle has slowed to required cruise speed, releasing COAST.SET switch will re-engage speed at new selected speed. The tap down - To lower vehicle speed, cruise must be engaged and operating. Tap down is done by quickly pressing and releasing COAST.SET switch. Do not hold COAST.SET switch in depressed position.
Tap down is a function in which cruise speed car be decreased by 1mph (1.6km/h)

Resume/Accel switch

RES.ACCEL switch located on right of steering wheel column has two positions - "Normal" and "Depressed".
The resume position - With RES.ACCEL switch depressed and then release, this switch also returns cruise control operation to last speed (Which is temporarily disengaged by Cancel switch or Brake pedal), setting when momentarily operating RES.ACCEL switch by constant acceleration.
The accel position - With RES.ACCEL switch depressed and held in, disengaging cruise control system, when vehicle has accelerated to required cruise speed, releasing RES.ACCEL switch will re-engage speed at new selected speed.
The tap up - To increase vehicle speed, the cruise must be engaged and operating.
Tap up is done by quickly pressing and releasing RES.ACCEL switch less than 0.5 second. Do not hold RES.ACCEL switch in depressed position. Tap up is a function in which cruise speed can be increased by 1mph (1.6km/h).

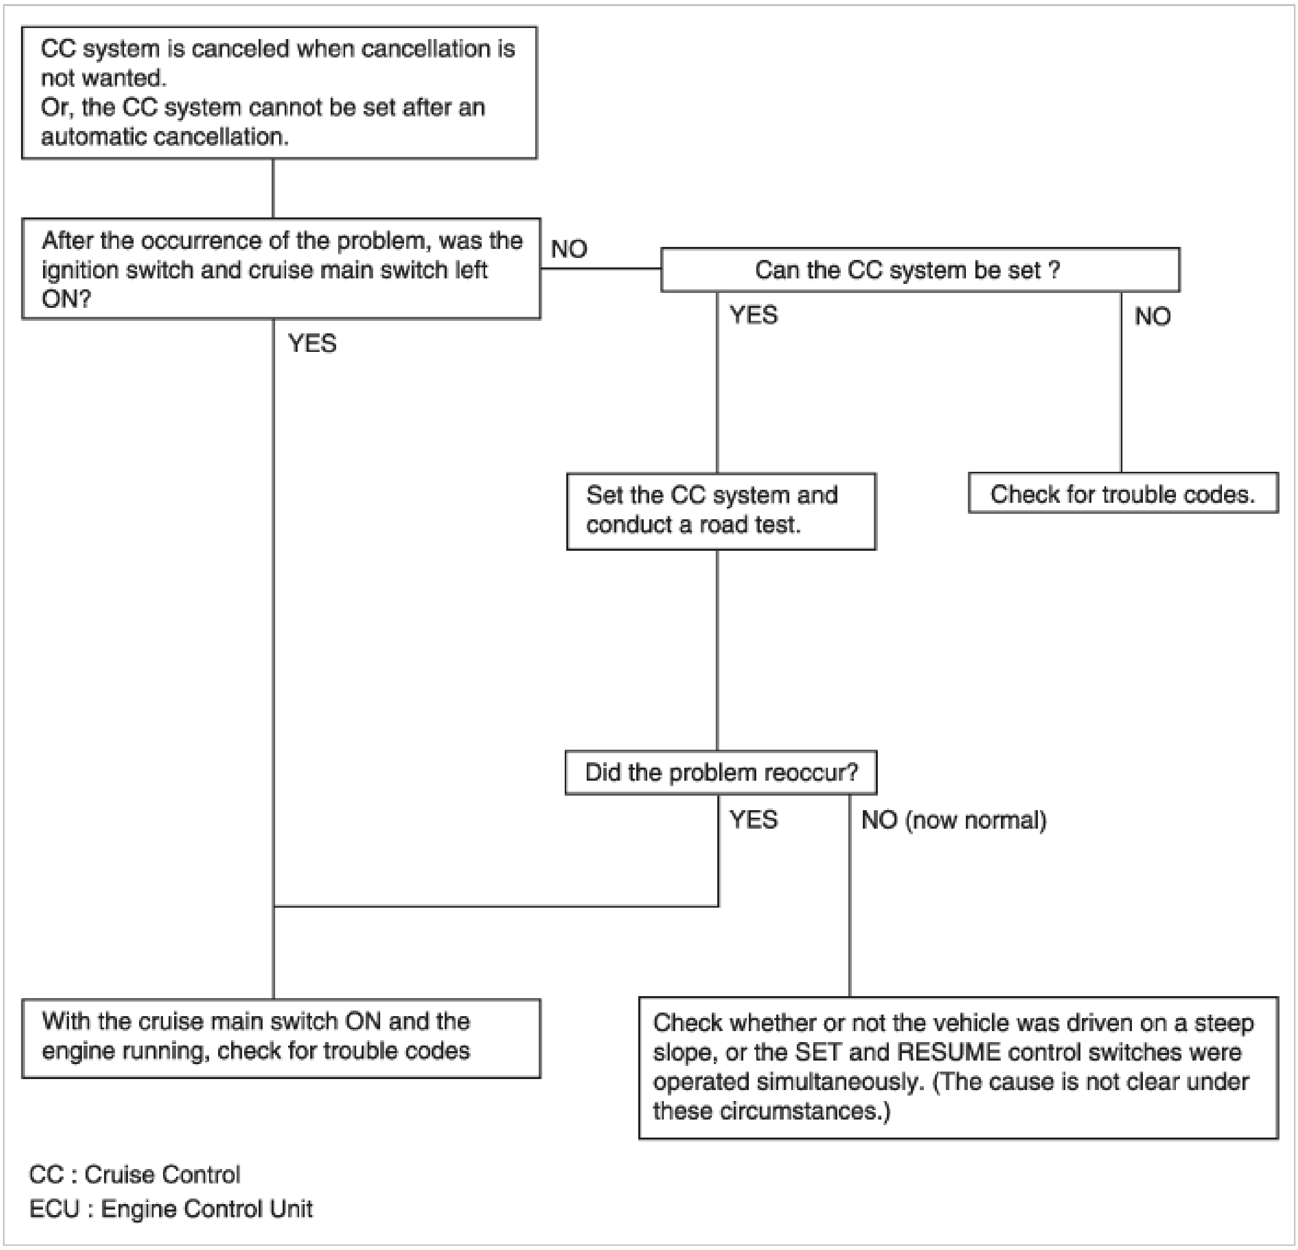
Cancel switch

Cruise control system is temporarily disengaged by pressing "CANCEL" switch.
Cruise speed canceled by this switch will be recovered by RES.ACCEL switch

Engine Electrical System > Cruise Control System > Troubleshooting

TROUBLE SYMPTOM CHARTS

TROUBLE SYMPTOM 1



TROUBLE SYMPTOM 2

Trouble symptom	Probable cause	Remedy
The set vehicle speed varies greatly upward or downward "Surging" (repeated alternating acceleration and deceleration) occurs after setting	Malfunction of the vehicle speed sensor circuit	Repair the vehicle speed sensor system, or replace the part
	Malfunction of ECM	Replace the ECM

TROUBLE SYMPTOM 3

Trouble symptom	Probable cause	Remedy
The CC system is not canceled when the brake pedal is depressed	Damaged or disconnected wiring of the brake pedal switch	Repair the harness or replace the brake pedal switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 4

Trouble symptom	Probable cause	Remedy
The CC system is not canceled when	Damaged or disconnected wiring of inhibitor switch input circuit	Repair the harness or repair or replace

the shift lever is moved to the "N" position (It is canceled, however, when the brake pedal is depressed	Improper adjustment of inhibitor switch	the inhibitor switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 5

Trouble symptom	Probable cause	Remedy
Cannot decelerate (coast) by using the SET switch	Temporary damaged or disconnected wiring of SET switch input circuit	Repair the harness or replace the SET switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 6

Trouble symptom	Probable cause	Remedy
Cannot accelerate or resume speed by using the RESUME switch	Damaged or disconnected wiring, or short circuit, or RESUME switch input circuit	Repair the harness or replace the RESUME switch
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 7

Trouble symptom	Probable cause	Remedy
CC system can be set while driving at a vehicle speed of less than 40km/h (25mph), or there is no automatic cancellation at that speed	Malfunction of the vehicle-speed sensor circuit	Repair the vehicle speed sensor system, or replace the part
	Malfunction of the ECM	Replace the ECM

TROUBLE SYMPTOM 8

Trouble symptom	Probable cause	Remedy
The cruise main switch indicator lamp does not illuminate (But CC system is normal)	Damaged or disconnected bulb of cruise main switch indicator lamp	Repair the harness or replace the part.
	Harness damaged or disconnected

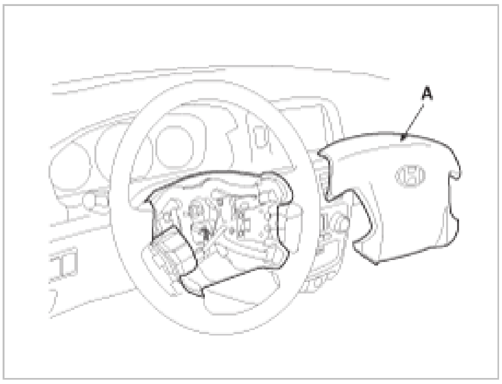
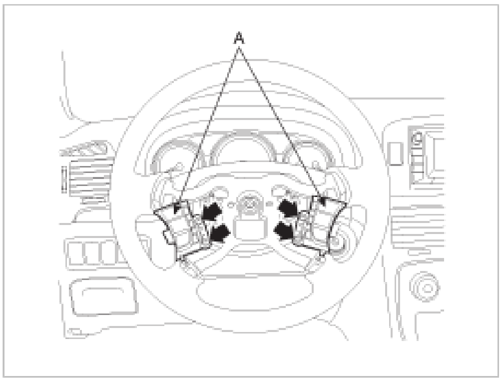
Engine Electrical System > Cruise Control System > Cruise Control Switch > Repair procedures

REMOVAL

1. Disconnect the battery (-) terminal.
2. Remove the driver side air bag module(A). (Refer to RT GR.)



3. Disconnect the cruise control switch connector and then remove the cruise control switch(A) with two screws.

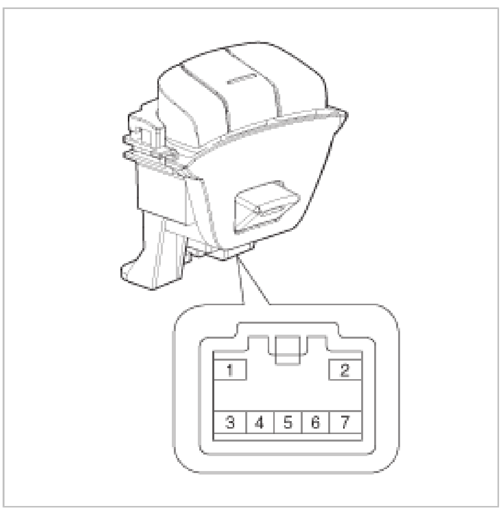


4. Installation is the reverse of removal.

INSPECTION

MEASURING RESISTANCE

1. Disconnect the cruise control switch connector from the control switch.



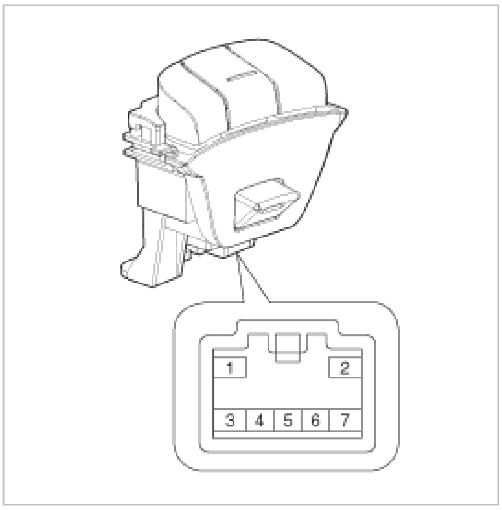
2. Measure resistance between terminals on the control switch when each function switch is ON (switch is depressed).

Function switch	Terminal	Resistance
Cruise Main	RH 1-2	3.9kΩ ± 1%
Cancel	RH 1-3	0Ω ± 1%
Set/Coast	RH 1-3	220Ω ± 1%
Resume/Accel	RH 1-3	910Ω ± 1%

3. If not within specification, replace switch.

MEASURING VOLTAGE

1. Connect the cruise control switch connector to the control switch.



2. Measure voltage between terminals on the harness side connector when each function switch is ON (switch is depressed).

Function switch	Terminal	Voltage
Cruise Main	RH 1-2	-
Cancel	RH 1-3	0.0V ± 0.22V
Set/Coast	RH 1-3	1.5V ± 0.22V
Resume/Accel	RH 1-3	3.0V ± 0.22V

3. If not within specification, replace switch.

	Fully openedtemperature	95°C (203°F)	
	Full lift	10mm (0.3937in.)	
Radiator cap	Main valve opening pressure	93.16 ~ 122.58kpa (0.95 ~ 1.25kg/cm², 13.51 ~ 17.78psi)	
	Vacuum valve opening pressure	0.98 ~ 4.90 kpa (0.01 ~ 0.05kg/cm², 0.14 ~ 0.71 psi)	
Water temperature sensor			
Type		Thermister type	
Resistance	20°C (68°F)	2.31 ~ 2.59KΩ	
	80°C(176°F)	0.3222 KΩ	

TIGHTENING TORQUE

Item Q	uantity	Nm	kgf.m	lbf.ft
Crankshaft pulley bolt	1	284.2 ~ 303.8	29.0 ~ 31.0	209.76 ~ 224.22
Timing chain cover bolt B	17	18.62 ~ 21.56	1.9 ~ 2.2	13.74 ~ 15.91
Timing chain cover bolt C	4	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain cover bolt D	1	58.80 ~ 68.80	6.0 ~ 7.0	43.40 ~ 50.63
Timing chain cover bolt E	1	58.80 ~ 68.80	6.0 ~ 7.0	43.40 ~ 50.63
Timing chain cover bolt F	2	24.50 ~ 26.46	2.5 ~ 2.7	18.08 ~ 19.53
Timing chain cover bolt G	4	21.56 ~ 23.52	2.2 ~ 2.4	15.91 ~ 17.36
Timing chain cover bolt H	1	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain cover bolt I	1	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain cover bolt J	1	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Cam to cam guide bolt	4	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain auto tensioner bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain auto tensioner nut	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Timing chain guide bolt	4	19.60 ~ 24.50	2.0 ~ 2.5	14.17 ~ 18.08
Oil pump chain cover bolt	3	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Oil pump chain tensioner bolt	1	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Oil pump chain guide bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Oil pump chain sprocket bolt	1	18.62 ~ 21.56	1.9 ~ 2.2	13.74 ~ 15.91
Lower oil pan bolt	13	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Drive belt auto tensioner bolt(M12)	1	96.04 ~ 99.96	9.8 ~ 10.2	70.88 ~ 73.78
Drive belt auto tensioner bolt(M8)	1	17.64 ~ 21.56	1.8 ~ 2.2	13.02 ~ 15.91
Drive belt idler bolt	1	53.90 ~ 57.82	5.5 ~ 5.9	39.78 ~ 42.67
OCV(oil control valve) bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Cylinder head bolt	16	(37.3~41.2) + (118~122°) + (88~92°)	(3.8~4.2) + (118~122°) + (88~92°)	(27.5~30.4) + (118~122°) + (88~92°)
Cylinder head bolt	1	18.62 ~ 23.52	1.9 ~ 2.4	13.74 ~ 17.36
CVVT & exhaust cam sprocket bolt	4	64.68 ~ 76.44	6.6 ~ 7.8	47.74 ~ 56.42
Camshaft bearing cap bolt	32	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68

Cylinder head cover bolt	38	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Connecting rod bearing bolt	12	(17.7~21.6) + (88~92°)	(1.8~2.2) + (88~92°)	(13.0~15.9) + (88~92°)
Main bearing cap inner bolt(M11)	8	49.00 + 90°	5.0 + 90°	36.16 + 90°
Main bearing cap outer bolt(M8)	8	19.60 + 120°	2.0 + 120°	14.46 + 120°
Main bearing cap side bolt(M8)	6	29.40 ~ 31.36	3.0 ~ 3.2	21.70 ~ 23.14
Oil drain cover bolt	6	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Rear oil seal case bolt	6	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Baffle plate bolt	12	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Upper oil pan bolt	16	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Knock sensor bolt	2	15.68 ~ 23.52	1.6 ~ 2.4	11.57 ~ 17.36
Drive plate bolt	8	71.54 ~ 75.46	7.3 ~ 7.7	52.80 ~ 55.69
Oil filter cap	1	24.50	2.5	18.08
Oil drain bolt	1	34.30 ~ 44.10	3.5 ~ 4.5	25.31 ~ 32.55
Oil pump bolt	3	19.60 ~ 23.52	2.0 ~ 2.4	14.47 ~ 17.36
Oil filter body bolt	10	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Oil filter body cover bolt	11	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Water vent hose bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Water pump bolt(Timing chain cover bolt L)	1	21.56 ~ 26.46	2.2 ~ 2.7	15.91 ~ 19.53
Water pump bolt(Timing chain cover bolt K)	4	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Water pump pulley bolt	4	7.84 ~ 9.80	0.8 ~ 1.0	5.78 ~ 7.23
Water temp. control nut	4	18.62 ~ 23.52	1.9 ~ 2.4	13.74 ~ 17.36
Water temp. control bolt	2	18.62 ~ 23.52	1.9 ~ 2.4	13.74 ~ 17.36
Water inlet pipe bolt	3	16.66 ~ 19.60	1.7 ~ 2.0	12.30 ~ 14.47
Air vent pipe bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Intake manifold bolt	6	18.62 ~ 23.52	1.9 ~ 2.4	13.74 ~ 17.36
Intake manifold nut	2	18.62 ~ 23.52	1.9 ~ 2.4	13.74 ~ 17.36
Surge tank bolt	5	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Surge tank nut	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Breather pipe bolt	2	9.80 ~ 11.76	1.0 ~ 1.2	7.23 ~ 8.68
Surge tank bracket bolt	2	27.44 ~ 31.36	2.8 ~ 3.2	20.25 ~ 23.14
ETC bracket bolt	2	15.68 ~ 25.48	1.6 ~ 2.6	11.57 ~ 18.80
Exhaust manifold nut	16	39.20 ~ 44.10	4.0 ~ 4.5	28.93 ~ 32.55
Heat protector bolt	8	16.66 ~ 21.56	1.7 ~ 2.2	12.30 ~ 15.91
Front muffler	2	39.20 ~ 58.80	4.0 ~ 6.0	28.93 ~ 43.40

COMPRESSION

NOTE

If the there is lack of power, excessive oil consumption or poor fuel economy, measure the compression pressure.

1. Warm up and stop engine.
   Allow the engine to warm up to normal operating temperature.
2. Remove ignition coils. (See EE group - ignition)
3. Remove spark plugs.
   Using a 16mm plug wrench, remove the 6 spark plugs.

4. Check cylinder compression pressure.
   A. Insert a compression gauge into the spark plug hole.
   B. Fully open the throttle.
   C. After 7times of cranking the engine, measure the compression pressure.

> NOTE
>
> Always use a fully charged battery to obtain engine speed of 200 rpm or more.

   D. Repeat steps (a) through (c) for each cylinder.

> NOTE
>
> This measurement must be done in as short a time as possible.

Compression pressure :
1,225kPa (12.5kgf/cm², 177psi) - 200 ~ 250rpm
Minimum pressure :
1,078kPa (11.0kgf/cm², 156psi)

   E. If the cylinder compression in 1 or more cylinders is low, pour a small amount of engine oil into the cylinder through the spark plug hole and repeat steps (a) through (c) for cylinders with low compression.
      - If adding oil helps the compression, it is likely that the piston rings and/or cylinder bore are worn or damaged.
      - If pressure stays low, a valve may be sticking or seating is improper, or there may be leakage past the gasket.

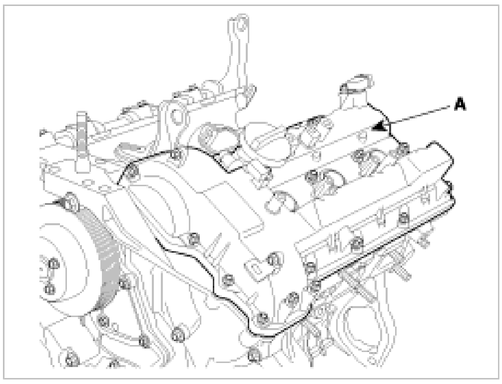
5. Reinstall spark plugs.
6. Install ignition coils. (See EE group - ignition)

VALVE CLEARANCE INSPECTION AND ADJUSTMENT

> NOTE
>
> Inspect and adjust the valve clearance when the engine is cold (Engine coolant temperature : 20°C) and cylinder head is installed on the cylinder block.

1. Remove the engine cover.
2. Remove air cleaner assembly.
3. Remove the surge tank.
4. Remove the cylinder head cover.
   A. Disconnect the ignition coil connector and remove the ignition coil.
   B. Disconnect the breather hose(A) from the cylinder head cover.

   C. Loosen the cylinder head cover bolts and then remove the cover(A) and gasket.

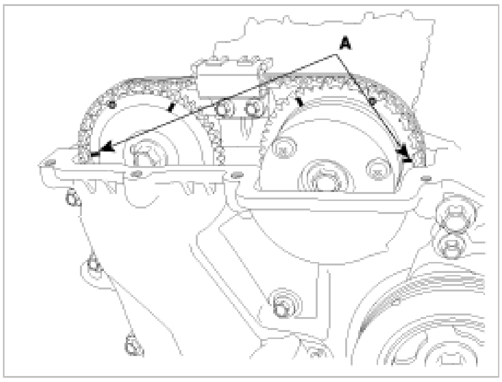


5. Set No.1 cylinder to TDC/compression.
   A. Turn the crankshaft pulley and align its groove with the timing mark "T" of the lower timing chain cover.

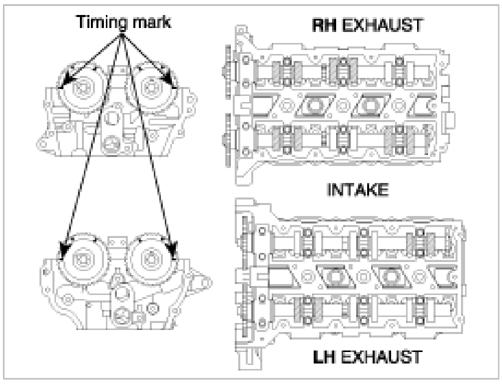
   B. Check that the mark(A) of the camshaft timing sprockets are in straight line on the cylinder head surface as shown in the illustration.
      If not, turn the crankshaft one revolution (360°)

NOTE

Do not rotate engine counterclockwise



6. Inspect the valve clearance.
   A. Check only the valve indicated as shown. [No. 1 cylinder : TDC/Compression] measure the valve clearance.



· Using a thickness gauge, measure the clearance between the tappet and the base circle of camshaft.

· Record the out-of-specification valve clearance measurements. They will be used later to determine the required replacement adjusting tappet.

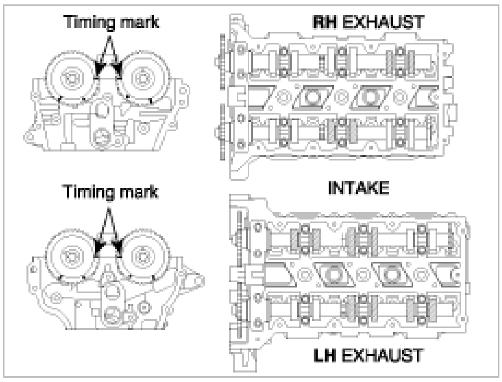
Valve clearance
Specification
Engine coolant temperature : 20°C [68°F]
Limit
Intake : 0.10 ~ 0.30mm (0.0039 ~ 0.0118in.)
Exhaust : 0.20 ~ 0.40mm (0.0079 ~ 0.0157in.)

B. Turn the crankshaft pulley one revolution (360°) and align the groove with timing mark "T" of the lower timing chain cover.

NOTE

Do not rotate engine counterclockwise

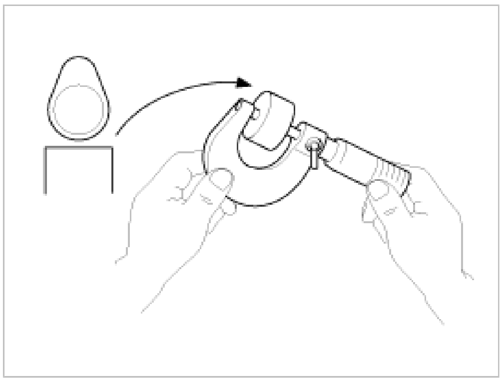
C. Check only valves indicated as shown. [NO. 4 cylinder : TDC/compression]. Measure the valve clearance.



7. Adjust the intake and exhaust valve clearance.
   A. Set the No.1 cylinder to the TDC/compression.
   B. Remove the timing chain.
   C. Remove the camshaft bearing caps(A).

   D. Remove the camshaft assembly(A).

   E. Remove MLAs.
   F. Measure the thickness of the removed tappet using a micrometer.



G. Calculate the thickness of a new tappet so that the valve clearance comes within the specified value.

Valve clearance(Engine coolant temperature: 20°C[68°F])
T : Thickness of removed tappet
A : Measured valve clearance
N : Thickness of new tappet
Intake : N = T + [A - 0.20mm(0.0079in.)]
Exhaust : N = T + [A - 0.30mm (0.0118in.)]

H. Select a new tappet with a thickness as close as possible to the calculated value.

NOTE

Shims are available in 41size increments of 0.015mm (0.0006in.) from 3.00mm (0.118in.) to 3.600mm (0.1417in.)

I. Place a new tappet on the cylinder head.

NOTE

Appling engine oil at the selected tappet on the periphery and top surface.

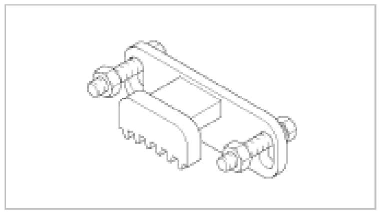
J. Install the intake and exhaust camshaft.
K. Install the bearing caps.
L. Install the timing chain.
M. Turn the crankshaft two turns in the operating direction(clockwise) and realign crankshaft sprocket and camshaft sprocket timing marks.
N. Recheck the valve clearance.

Valve clearance (Engine coolant temperature: 20°C[68°F])
[Specification]
Intake : 0.17 ~ 0.23mm (0.0067 ~ 0.0090in.)
Exhaust : 0.27 ~ 0.33mm (0.0106 ~ 0.0129in.)

Engine Mechanical System > General Information > Special Service Tools

SPECIAL TOOLS

Tool (Number and name)	Illustration	Use
Crankshaft front oil seal installer (09231-3C100)		Installation of the front oil seal
Flywheel stopper (09231-3C300)		Removal and installation of the flywheel and crankshaft pulley.

Torque angle adapter (09221-4A000)		Installation of bolts & nuts needing an angular method
Valve stem seal remover (09222-29000)		Remover of the valve stem seal
Valve stem seal remover (09222-3C100)		Installation of the valve stem seal
Valve spring compressor & holder (09222-3K000) (09222-3C300)		Removal and installation of the intake or exhaust valve A : 09222-3K000 B : 09222-3C300 (holder)
Crankshaft rear oil seal installer (09231-3C200) (09231-H1100)		Installation of the crankshaft rear oil seal A : 09231-3C200 B : 09231-H1100
Oil pan remover (09215-3C000)		Removal of oil pan
Oil filter wrench (09263-3C100)		Removal and installation of the oil filter

Engine Mechanical System > General Information > Troubleshooting

TROUBLESHOOTING

Symptom S	uspect area	Remedy
Engine misfire with abnormal internal lower engine noises.	Worn crankshaft bearings. Loose or improperly engine drive plate.	Replace the crankshaft and bearings as required. Repair or replace the drive plate as required.
	Worn piston rings. (Oil consumption may or may not cause the engine to misfire.)	Inspect the cylinder for a loss of compression. Repair or replace as required.
	Worn crankshaft thrust bearings	Replace the crankshaft and bearings as required.
Engine misfire with abnormal valve train noise.	Stuck valves. (Carbon buildup on the valve stem)	Repair or replace as required.
	Excessive worn or mis-aligned timing chain.	Replace the timing chain and sprocket as required.
	Worn camshaft lobes.	Replace the camshaft and valve lifters.
Engine misfire with coolant consumption.	• Faulty cylinder head gasket and/or cranking or other damage to the cylinder head and engine block cooling system. • Coolant consumption may or may not cause the engine to overheat.	• Inspect the cylinder head and engine block for damage to the coolant passages and/or a faulty head gasket. • Repair or replace as required.
Engine misfire with excessive oil consumption.	Worn valves, guides and/or valve stem oil seals.	Repair or replace as required.
	Worn piston rings. (Oil consumption may or may not cause the engine to misfire)	• Inspect the cylinder for a loss of compression. • Repair or replace as required.
Engine noise on start-up, but only lasting a few seconds.	Incorrect oil viscosity.	• Drain the oil. • Install the correct viscosity oil.
	Worn crankshaft thrust bearing.	• Inspect the thrust bearing and crankshaft. • Repair or replace as required.
Upper engine noise,regardless of engine speed.	Low oil pressure.	Repair or replace as required.
	Broken valve spring.	Replace the valve spring.
	Worn or dirty valve lifters.	Replace the valve lifters.
	Stretched or broken timing chain and/or damaged sprocket teeth.	Replace the timing chain and sprockets.
	Worn timing chain tensioner, if applicable.	Replace the timing chain tensioner as required.
	Worn camshaft lobes.	• Inspect the camshaft lobes. • Replace the timing camshaft and valve lifters as required.
	Worn valve guides or valve stems.	Inspect the valves and valve guides,then repair as required.
	Stuck valves. (Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect the valves and valve guides, then repair as required.
	Worn drive belt, idler, tensioner and bearing.	Replace as required.
Lower engine noise,regardless of engine speed.	Low oil pressure.	Repair or required.
	Loose or damaged drive plate.	Repair or replace the drive plate.
	Damaged oil pan, contacting the oil pump screen.	• Inspect the oil pan. • Inspect the oil pump screen. • Repair or replace as required.
	Oil pump screen loose, damaged or restricted.	• Inspect the oil pump screen.

		• Repair or replace as required.
	Excessive piston-to-cylinder bore clearance.	• Inspect the piston, piston pin and cylinder bore. • Repair as required.
	Excessive piston pin-to-piston clearance.	• Inspect the piston, piston pin and the connecting rod. • Repair or replace as required.
	Excessive connecting rod bearing clearance	Inspect the following components and repair as required. • The connecting rod bearings. • The connecting rods. • The crankshaft pin journals.
	Excessive crankshaft bearing clearance.	Inspect the following components, and repair as required. • The crankshaft bearings. • The crankshaft main journals. • The cylinder block.
	Incorrect piston, piston pin and connecting rod installation	• Verify the piston pins and connecting rods are installed correctly. • Repair as required.
Engine noise under load.	Low oil pressure	Repair or replace as required.
	Excessive connecting rod bearing clearance .	Inspect the following components andrepair as required : • The connecting rod bearings. • The connecting rods. • The crankshaft.
	Excessive crankshaft bearing clearance.	Inspect the following components, andrepair as required. • The crankshaft bearings. • The crankshaft main journals. • The cylinder block.
Engine will not crank-crankshaft will not rotate.	Hydraulically locked cylinder. • Coolant/antifreeze in cylinder. • Oil in cylinder. • Fuel in cylinder.	1. Remove spark plugs and check for fluid. 2. Inspect for broken head gasket. 3. Inspect for cracked engine block or cylinder head. 4. Inspect for a sticking fuel injector and/or leaking fuel regulator.
	Broken timing chain and/or timing chain and/or timing chain gears.	1. Inspect timing chain and gears. 2. Repair as required.
	Material in cylinder. • Broken valve • Piston material • Foreign material	1. Inspect cylinder for damaged components and/or foreign materials. 2. Repair or replace as required.
	Seized crankshaft or connecting rod bearings.	1. Inspect crankshaft and connecting rod bearing. 2. Repair as required.
	Bent or broken connecting rod.	1. Inspect connecting rods. 2. Repair as required.
	Broken crankshaft.	1. Inspect crankshaft. 2. Repair as required.

Removal

CAUTION

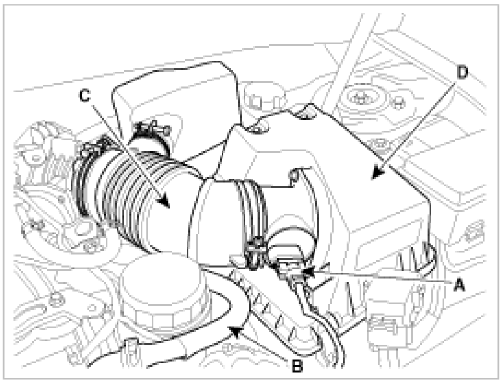
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

NOTE

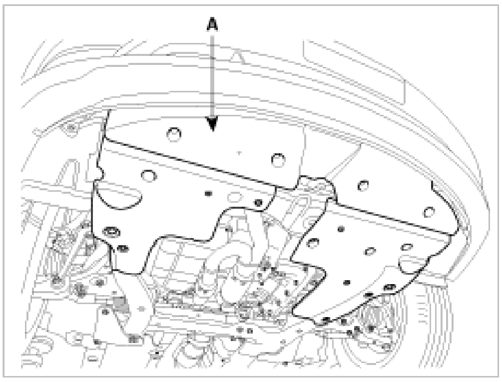
- Mark all wiring and hoses to avoid misconnection.

• Turn the crankshaft pulley so that the No.1 piston is at top dead center.

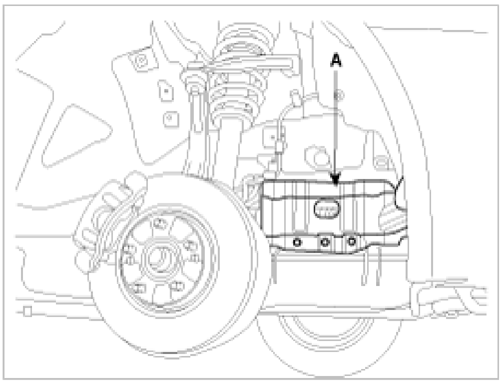
1. Disconnect the negative terminal from the battery.
2. Remove the engine cover.
3. Remove the air duct.
4. Remove the intake air hose and air cleaner assembly.
   (1) Disconnect the AFS connector(A).
   (2) Disconnect the breather hose(B) from air cleaner hose.
   (3) Disconnect the ECM connector. (Refer to FL group)
   (4) Remove the intake air hose(C) and air cleaner(D).



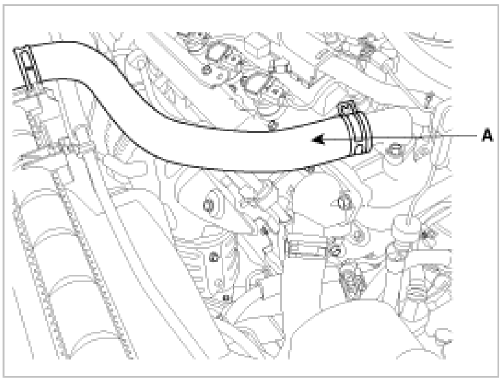
5. Remove the front wheels.
6. Remove the under cover(A).



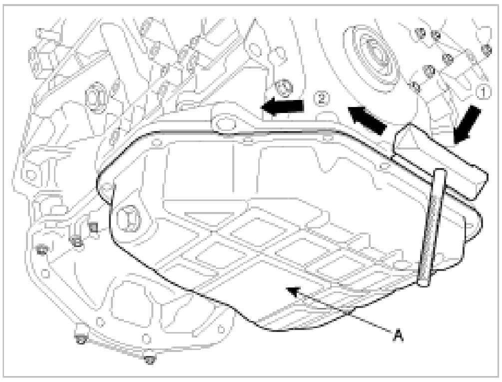
7. Remove the side cover(A).



8. Drain the engine coolant.
   Remove the radiator cap to speed draining.
9. Remove the upper radiator hose(A).



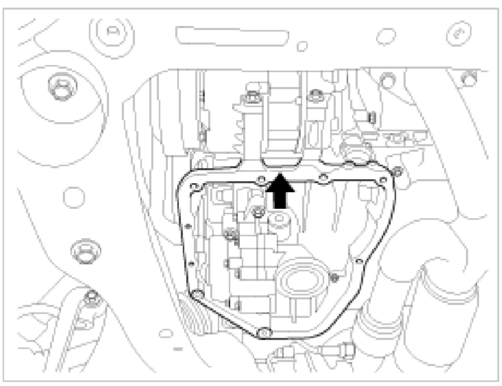
10. Drain the engine oil.
11. Remove the lower oil pan(A).
    Insert the blade of SST(09215-3C000) between the upper oil pan and lower oil pan, and cut off applied sealer and removed lower oil pan.



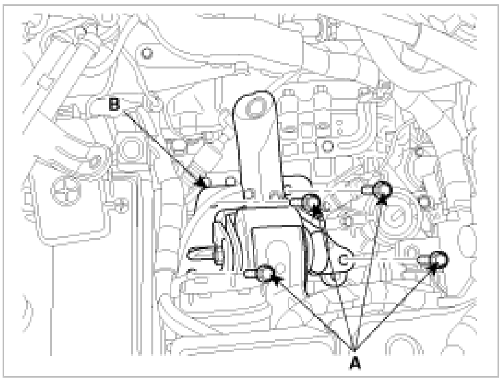
NOTE

- Insert the SST between the oil pan and the ladder frame by tapping it with a plastic hammer in the direction of arrow.
- After tapping the SST with a plastic hammer along the direction of arrow around more than 2/3 edge of the oil pan, remove it from the ladder frame.
- Do not turn over the SST abruptly without tapping. It be result in damage of the SST.
- Be careful not to damage the contact surfaces of Upper oil pan and lower oil pan.

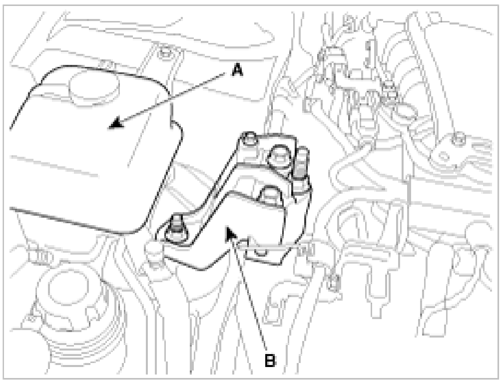
12. Install the jack to the upper oil pan.



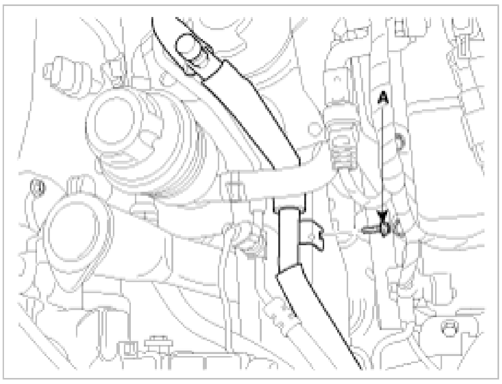
13. Just loosen the transaxle mounting bolts(A) without removing the transaxle mounting(B).



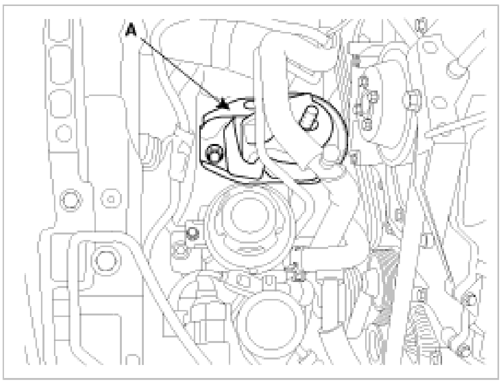
14. Remove the engine coolant reservoir tank (A).
15. Remove the engine mounting bracket (B).



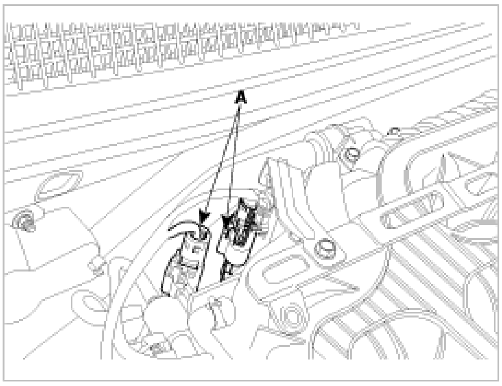
16. Loosen the A/C pipe bracket mounting bolt (A).



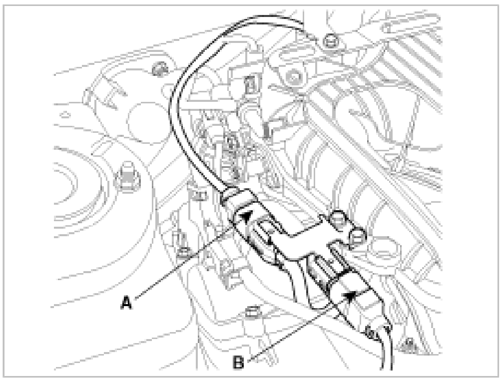
17. Remove the no.1 engine mounting (A) through the lower position of A/C pipe line.



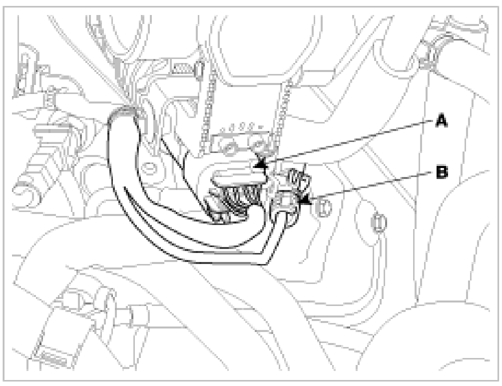
18. Remove the surge tank.
    (1) Disconnect the RH oxygen sensor connector(A).



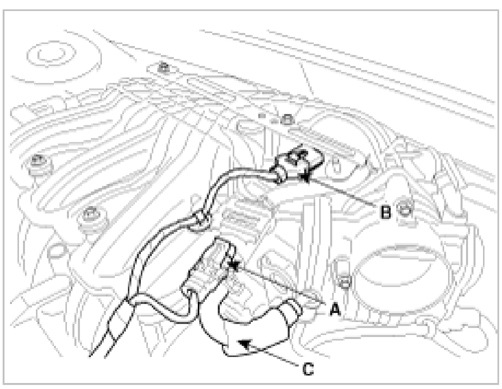
(2) Disconnect the RH injector connector(A) and the ignition coil connector(B).



(3) Disconnect the ETC connector(A) and the knock sensor connector(B).



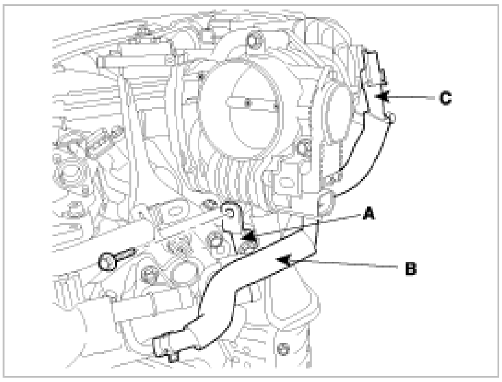
(4) Disconnect the PCSV connector(A), the MAP sensor connector(B) and the PCSV hose(C).



(5) Remove the ETC bracket(A).

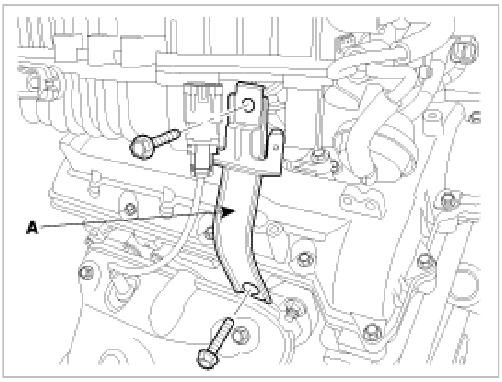
(6) Disconnect the water hoses(B) from the ETC.

(7) Disconnect the PCV(C) hose.

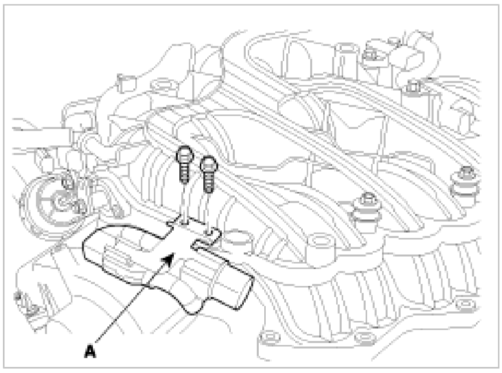


(8) Disconnect the brake vacuum hose.

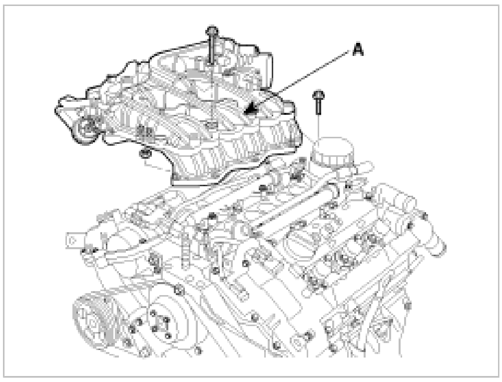
(9) Remove the surge tank stay(A).



(10) Remove the connector bracket(A) from the surge tank.



(11) Remove the surge tank(A).

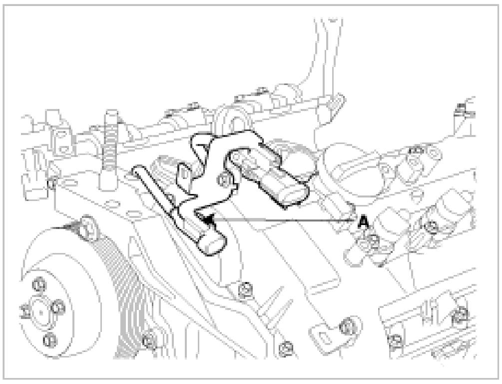


NOTE

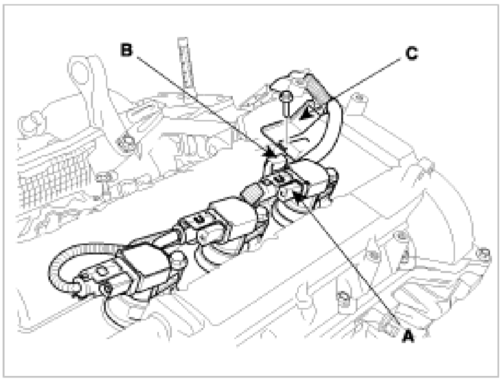
- Cover the inlet of intake manifold with a clean woven stuff or vinyl cover to prevent foreign materials from entering.

19. Remove the cylinder head cover.

(1) Remove the connector bracket (A) from the LH cylinder head cover.

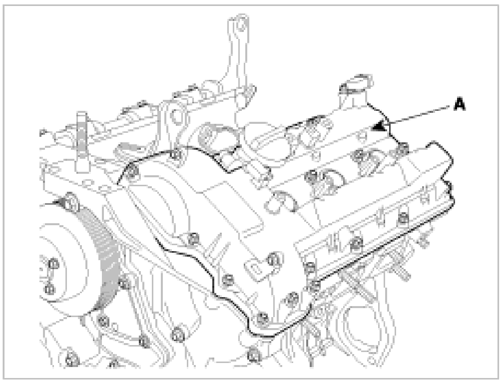


(2) Disconnect the RH ignition coil connector(A), the condenser connector (B) and remove the wiring bracket(C).



(3) Remove the LH,RH ignition coil.

(4) Remove the LH,RH cylinder head cover(A).



NOTE

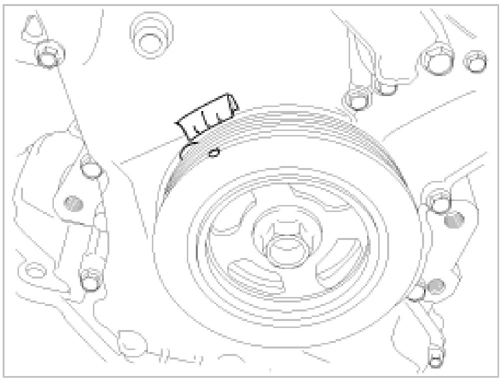
- Cover the upside of engine head with a clean woven stuff or vinyl cover to prevent foreign materials from entering.

20. Set No.1 cylinder to TDC/compression.

(1) Turn the crankshaft pulley and align its groove with the timing mark "T" of the lower timing chain cover.

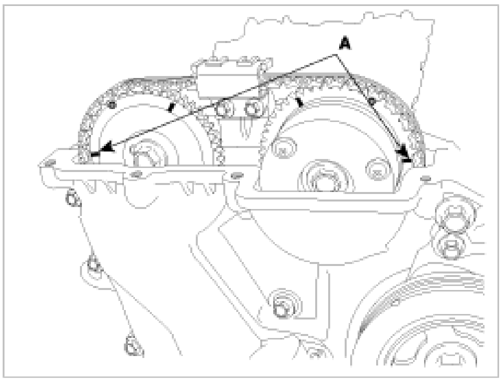
NOTE

Do not rotate engine counterclockwise.



(2) Check that the mark (A) of the camshaft timing sprockets are in straight line on the cylinder head surface as shown in the illustration.

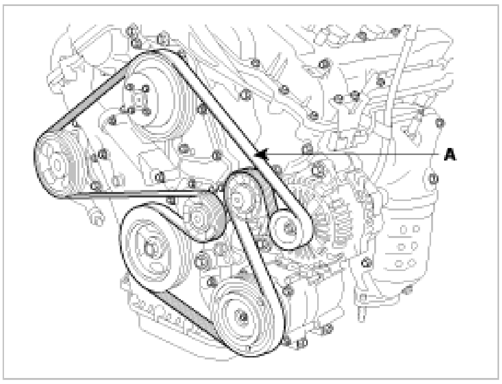
If not, turn the crankshaft one revolution (360°).



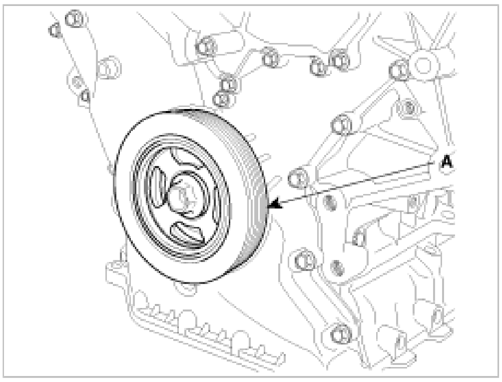
NOTE

Do not rotate engine counterclockwise.

21. Remove the drive belt(A).

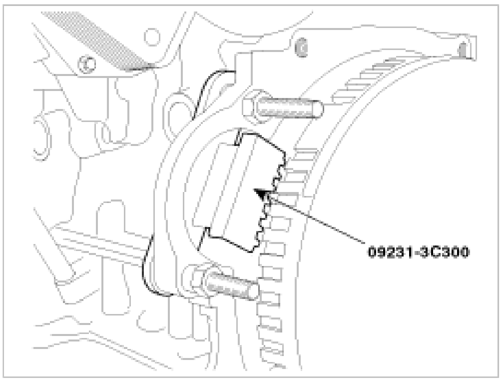


22. Remove the crankshaft damper pulley(A).

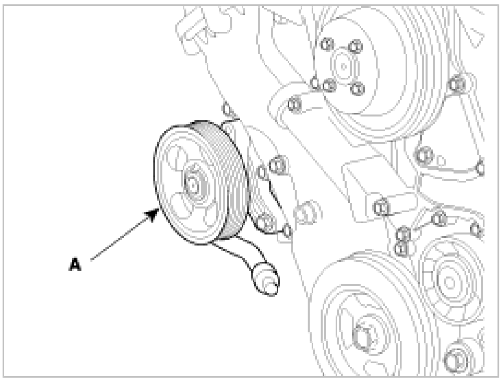


NOTE

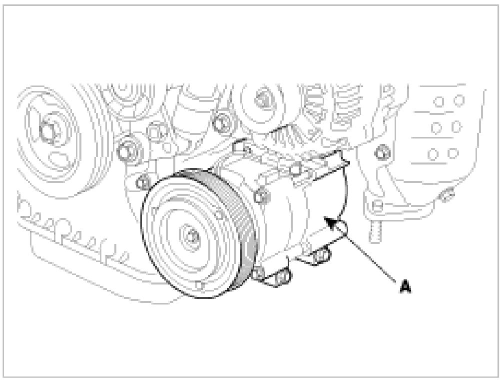
• Use the SST(flywheel stopper, 09231-3C300) to remove the crankshaft pulley bolt, after remove the starter.



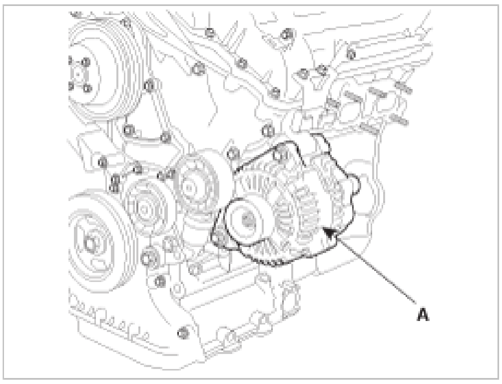
23. Lift up the engine assembly by using the jack.
24. Remove the power steering pump(A).



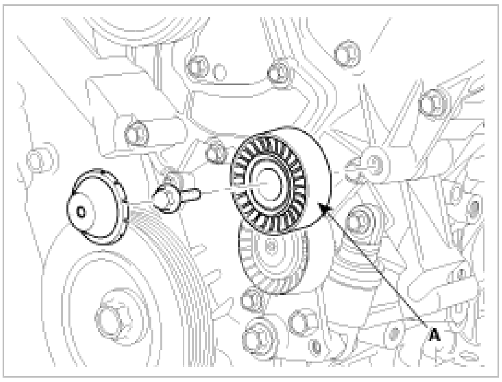
25. Remove the air conditioner compressor(A).



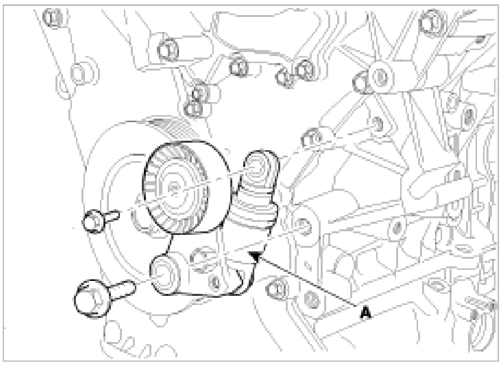
26. Remove the alternator(A).



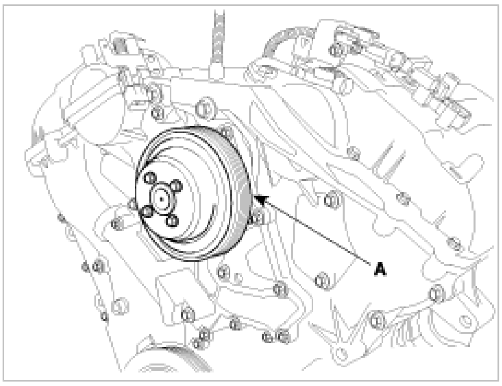
27. Remove the drive belt idler(A).



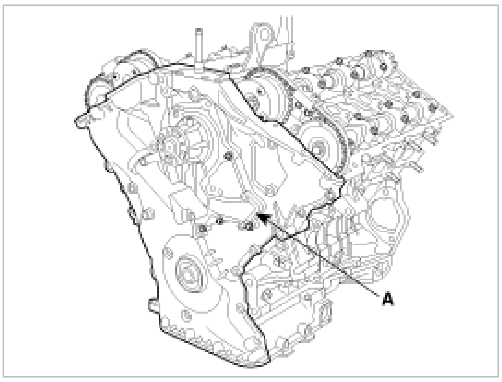
28. Remove the drive belt auto tensioner(A).



29. Remove water pump pulley(A).



30. Remove the timing chain cover(A).

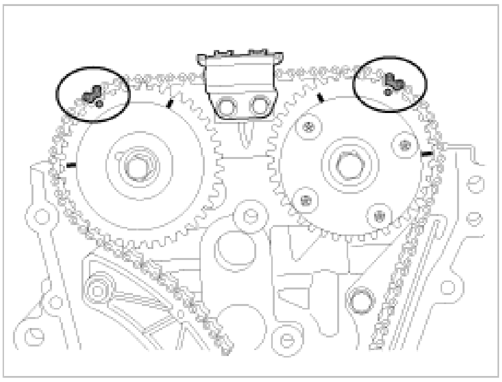


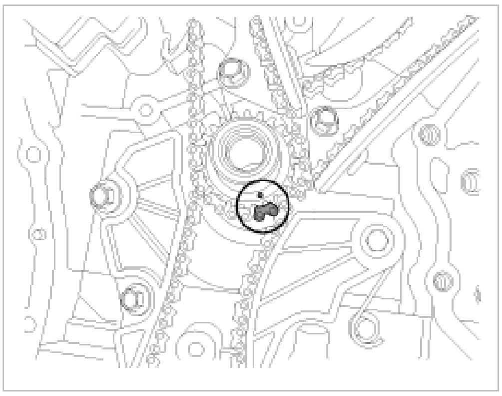
CAUTION

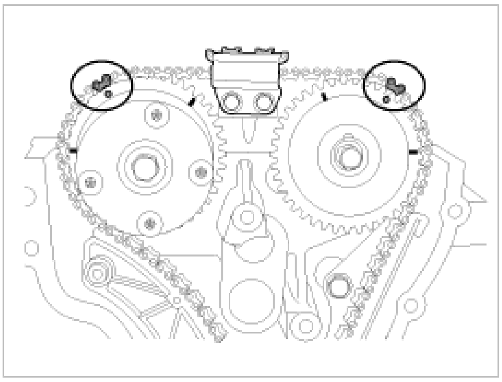
- Be careful not to damage the contact surfaces of cylinder block, cylinder head and timing chain cover.

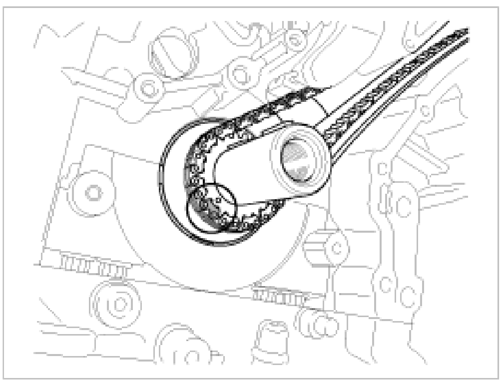
NOTE

- Before removing the timing chain, mark the RH/LH timing chain with an identification based on the location of the sprocket because the identification mark on the chain for TDC (Top Dead Center) can be erased.

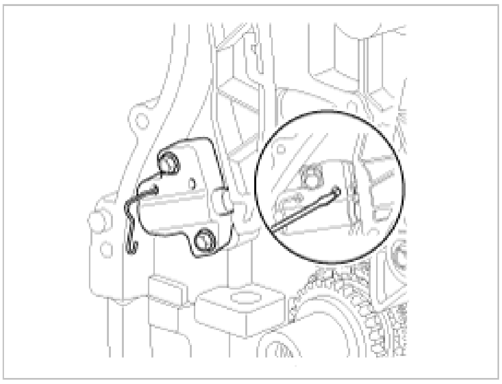




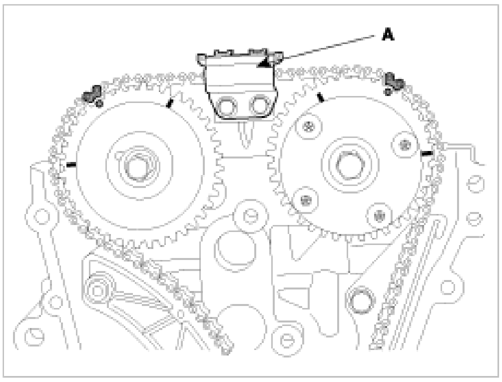




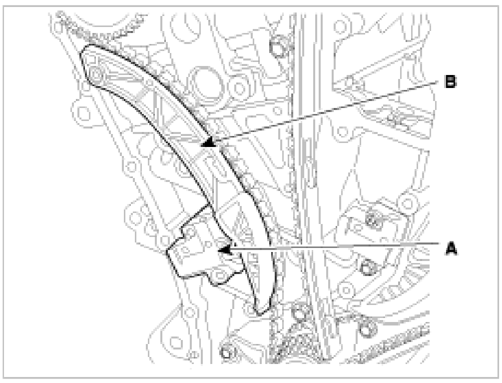
31. Install a set pin after compressing the RH timing chain tensioner.



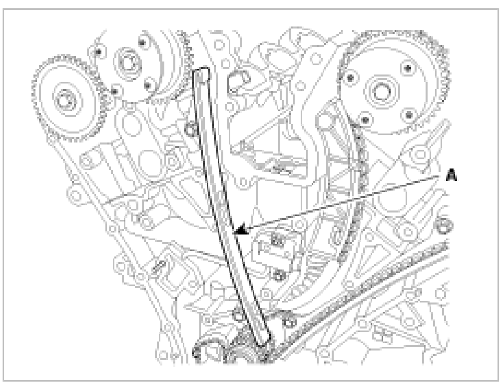
32. Remove the RH cam-to-cam guide(A).



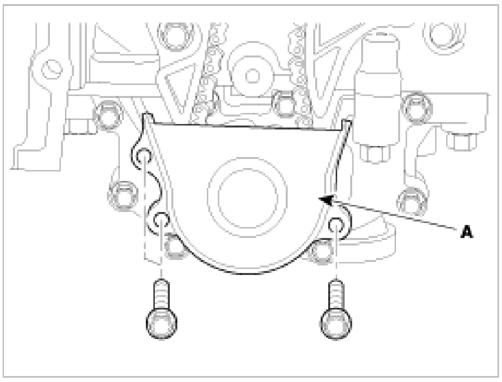
33. Remove the RH timing chain auto tensioner (A) and the RH timing chain tensioner arm(B).



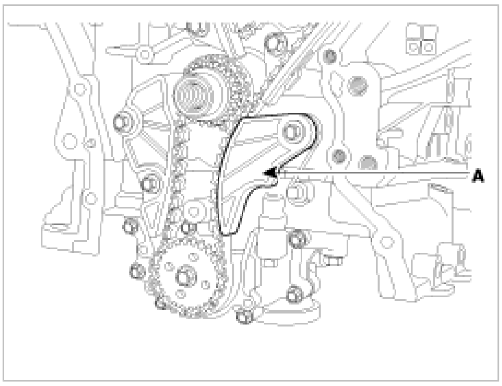
34. Remove the RH timing chain.
35. Remove the RH timing chain guide(A).



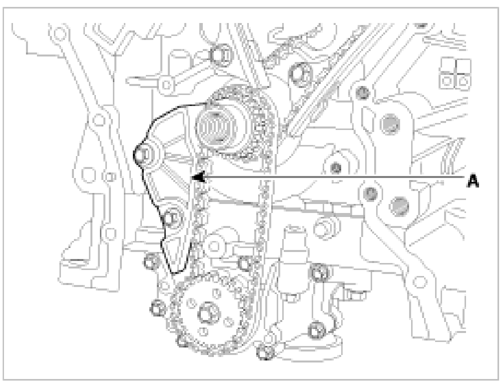
36. Remove the oil pump chain cover(A).



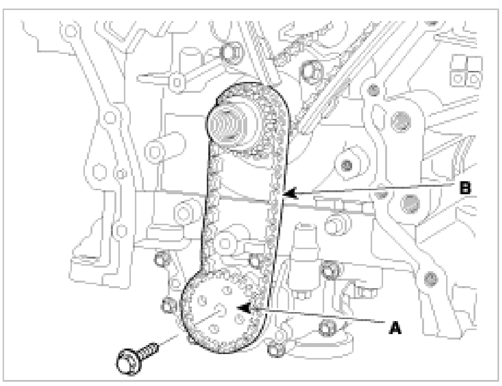
37. Remove the oil pump chain tensioner assembly(A).



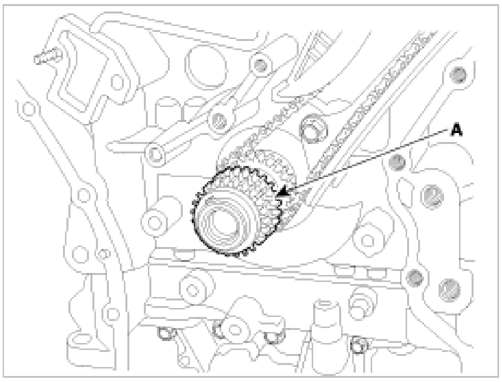
38. Remove the oil pump chain guide(A).



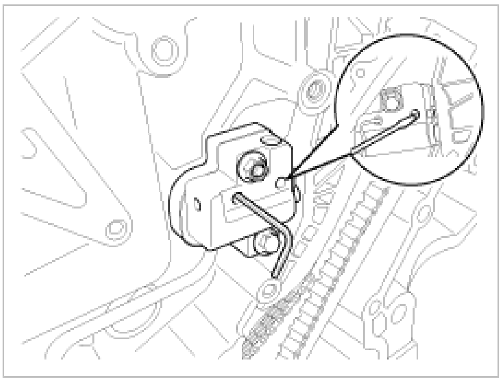
39. Remove the oil pump chain sprocket(A) and oil pump chain(B).



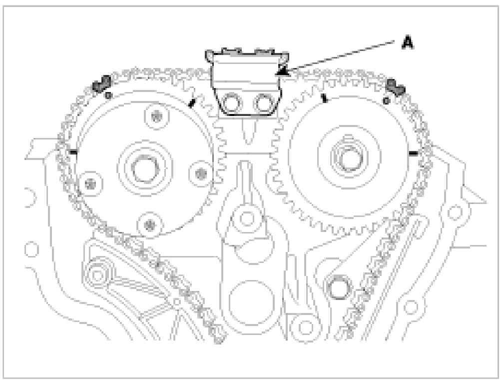
40. Remove the crankshaft sprocket(A) (O/P & RH camshaft drive).



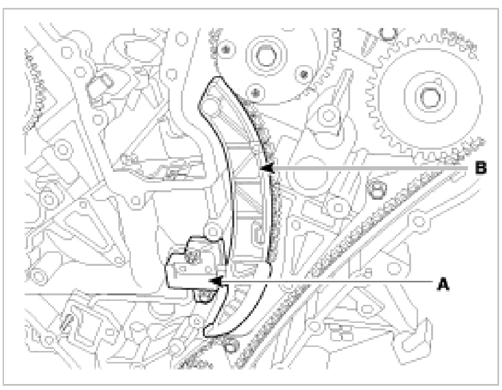
41. Install a set pin after compressing the LH timing chain tensioner.



42. Remove the LH cam-to-cam guide(A).

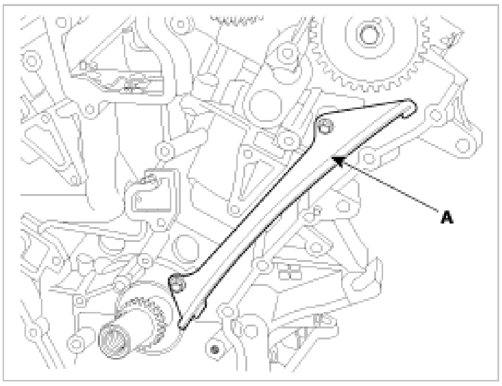


43. Remove the LH timing chain auto tensioner (A) and LH timing chain tensioner arm(B).

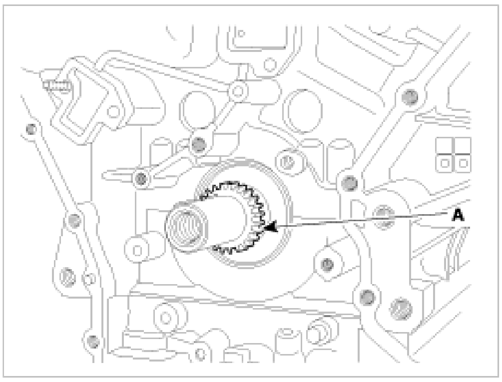


44. Remove the LH timing chain.

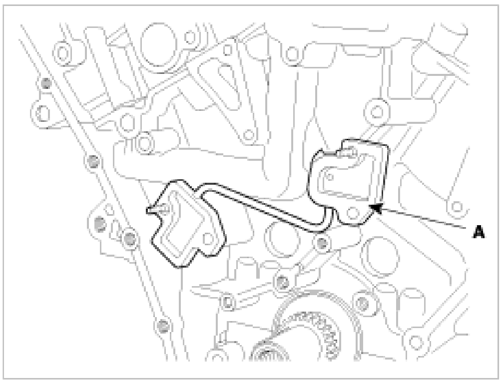
45. Remove the LH timing chain guide(A).



46. Remove the crankshaft sprocket(A) (LH camshaft drive).



47. Remove the tensioner adapter assembly(A).



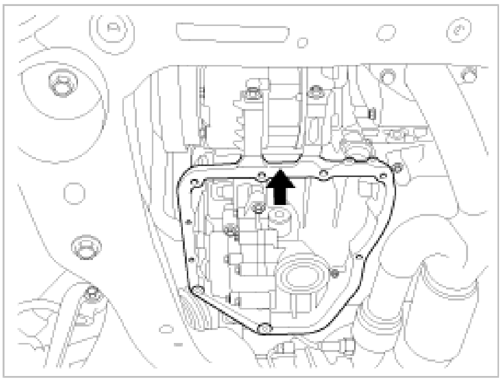
Inspection

Sprockets, Chain Tensioner, Chain Guide, Chain Tensioner Arm

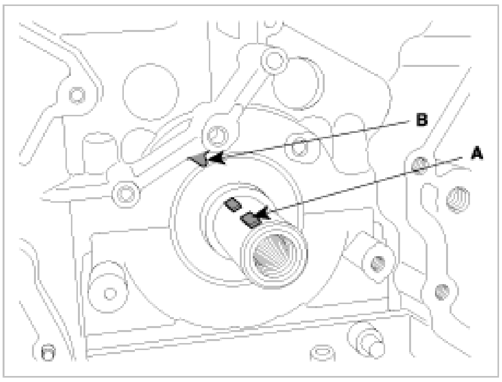
1. Check the camshaft sprocket and crankshaft sprocket for abnormal wear, cracks, or damage. Replace as necessary.
2. Inspect the tensioner arm and chain guide for abnormal wear, cracks, or damage. Replace as necessary.
3. Check that the tensioner piston moves smoothly when the ratchet pawl is released with thin rod.

Installation

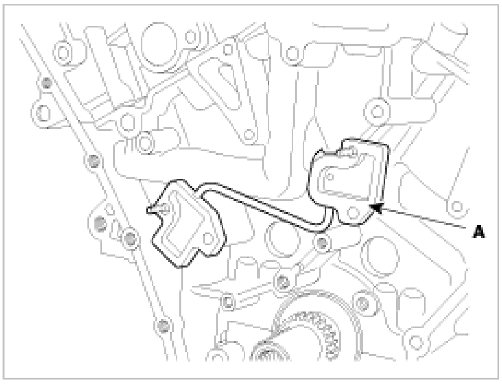
1. Install the jack to the upper oil pan.



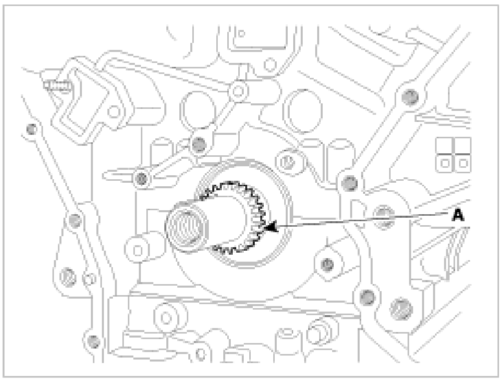
2. The key (A) of crankshaft should be aligned with the timing mark (B) of timing chain cover. As a result of this, the piston of No.1 cylinder is placed at the top dead center on compression stroke.



3. Install the tensioner adapter assembly(A).

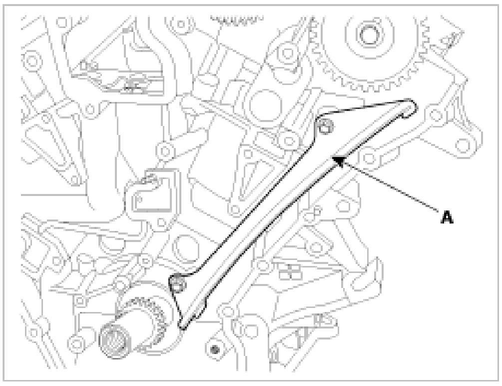


4. Install the crankshaft sprocket(A) (LH camshaft drive).

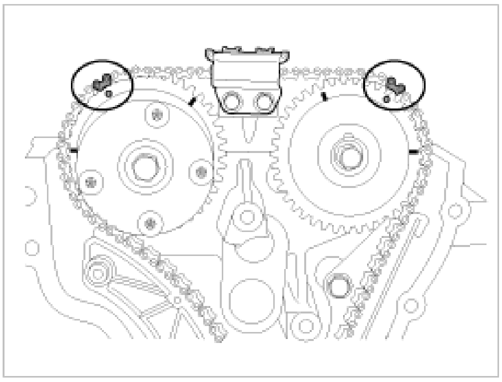


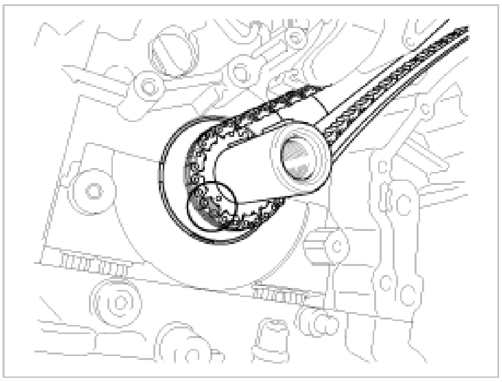
5. Install the LH timing chain guide(A).

Tightening torque
19.60 ~ 24.50N.m (2.0 ~ 2.5kgf.m, 14.17 ~ 18.08lb-ft)



6. Install the LH timing chain.
   To install the timing chain with no slack between each shaft (cam, crank), follow the below procedure.
   Crankshaft sprocket → Timing chain guide → Exhaust camshaft sprocket → Intake camshaft sprocket.
   The timing mark of each sprockets should be matched with timing mark (color link) of timing chain at installing timing chain.





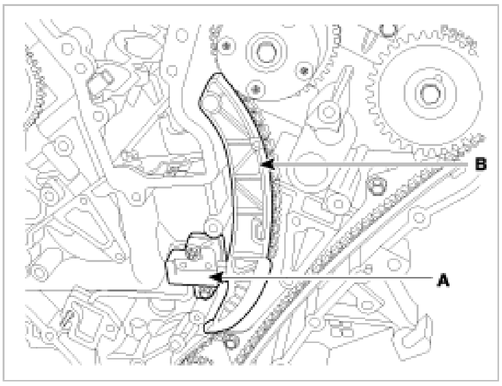
7. Install the LH timing chain tensioner arm(B).

Tightening torque
18.62 ~ 21.56N.m (1.9 ~ 2.2kgf.m, 13.74 ~ 15.91lb-ft)

---

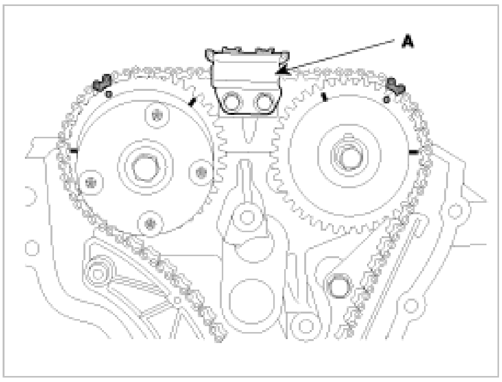
8. Install the chain tensioner(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)

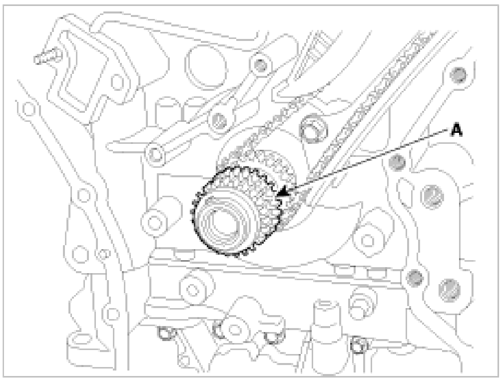


9. Install the LH cam-to-cam guide(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)

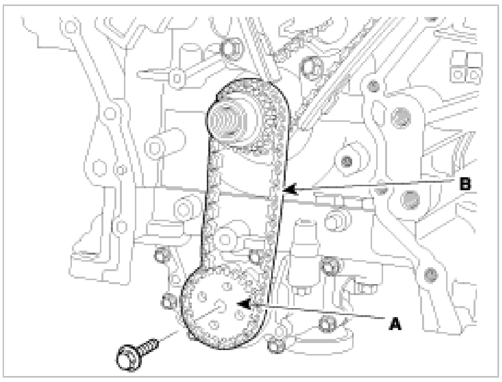


10. Install the crankshaft sprocket(A) (O/P & RH camshaft drive).



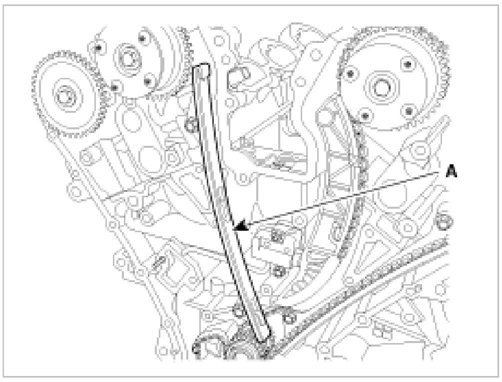
11. Install the oil pump chain(B) and the oil pump sprocket(A).

Tightening torque
18.62 ~ 21.56N.m (1.9 ~ 2.2kgf.m, 13.74 ~ 15.91lb-ft)

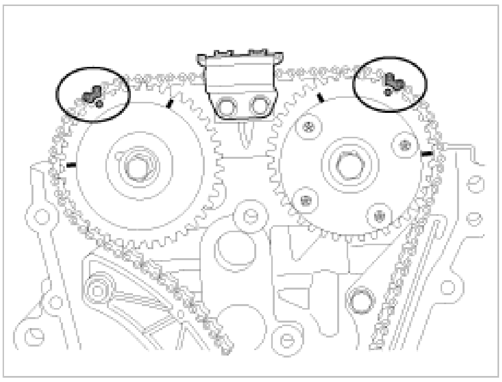


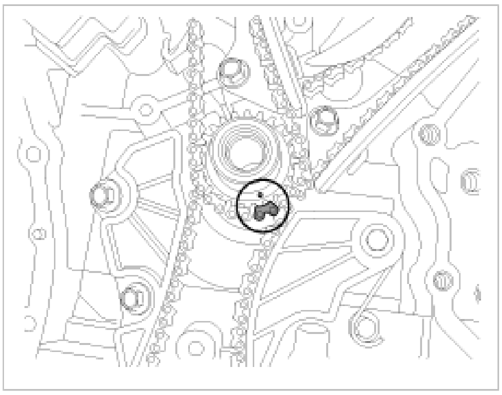
12. Install the RH timing chain guide(A).

Tightening torque
19.60 ~ 24.50N.m (2.0 ~ 2.5kgf.m, 14.17 ~ 18.08lb-ft)



13. Install the RH timing chain.
To install the timing chain with no slack between each shaft (cam, crank), follow the below procedure.
Crankshaft sprocket → Intake camshaft sprocket → Exhaust camshaft sprocket.
The timing mark of each sprockets should be matched with timing mark (color link) of timing chain at installing timing chain.



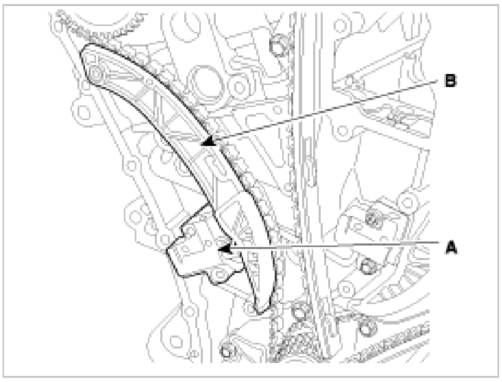


14. Install the RH timing chain tensioner arm(B).

Tightening torque
18.62 ~ 21.56N.m (1.9 ~ 2.2kgf.m, 13.74 ~ 15.91lb-ft)

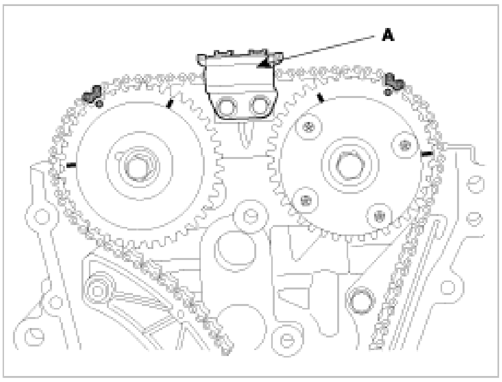
15. Install the RH timing chain auto tensioner(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



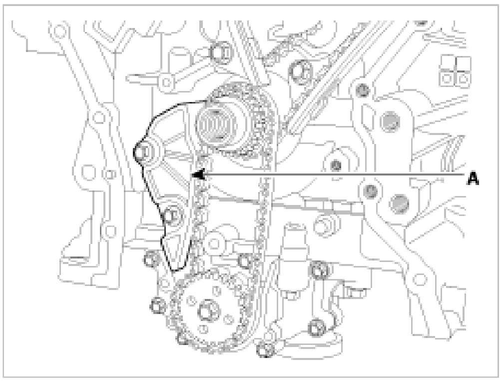
16. Install the RH cam-to-cam guide(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



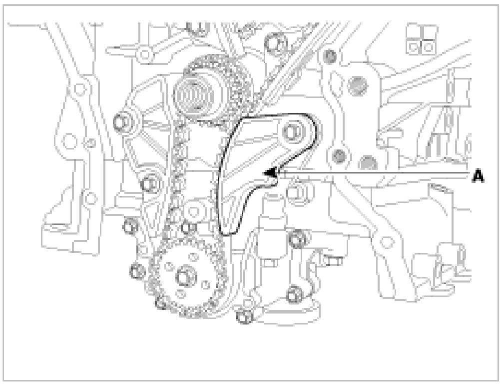
17. Install the oil pump chain guide(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)

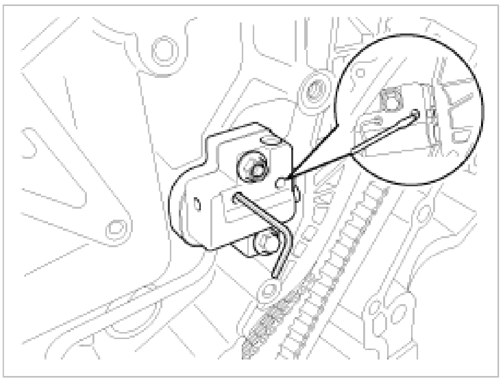


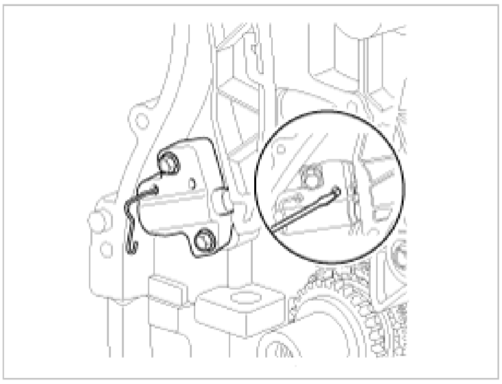
18. Install the oil pump chain tensioner assembly(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



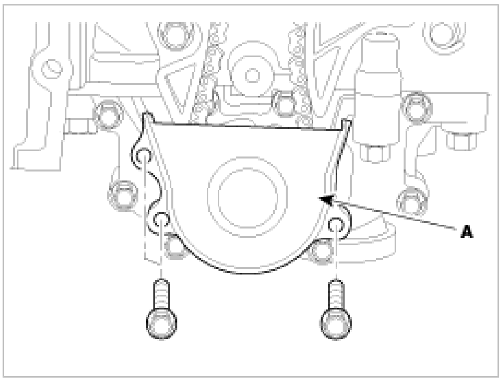
19. Pull out the pins of hydraulic tensioner (LH & RH).





20. Install the oil pump chain cover(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



21. After rotating the crankshaft 2 revolutions in regular direction (clockwise viewed from front), confirm the timing mark.

NOTE

Always turn the crankshaft clockwise.

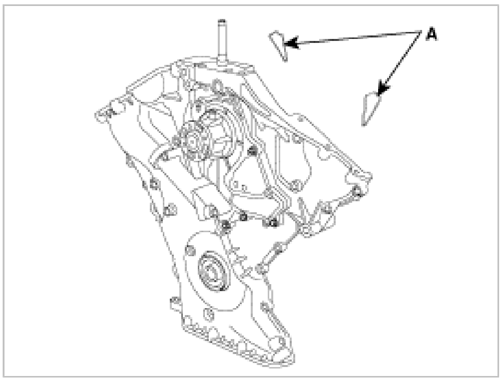
22. Install the timing chain cover.
   (1) The sealant locations on chain cover and on counter parts (cylinder head, cylinder block, and lower oil pan) must be free of engine oil and etc.
   (2) Before assembling the timing chain cover, the liquid sealant TB 1217H should be applied on the gap between cylinder head and cylinder block.
   The part must be assembled within 5 minutes after sealant was applied.

Bead width : 2.5mm(0.1in.)

   (3) After applying liquid sealant TB1217H on timing chain cover.
   The part must be assembled within 5 minutes after sealant was applied.
   Selant should be applied without discontinuity.

Bead width : 2.5mm(0.1in.)

   (4) Install the new gasket(A) to the timing chain cover.

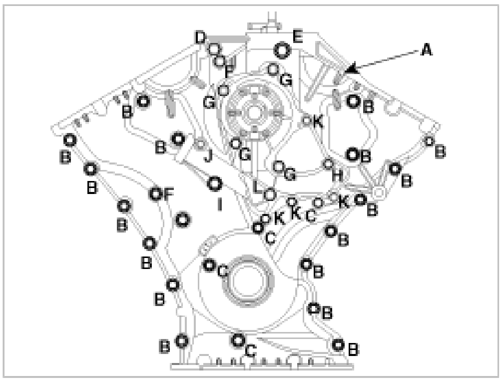


NOTE

During timing cover installation, care not to take off applied sealant on the timing cover by contact with other parts.

   (5) The dowel pins on the cylinder block and holes on the timing chain cover should be used as a reference in order to assemble the timing chain cover to be in exact position.

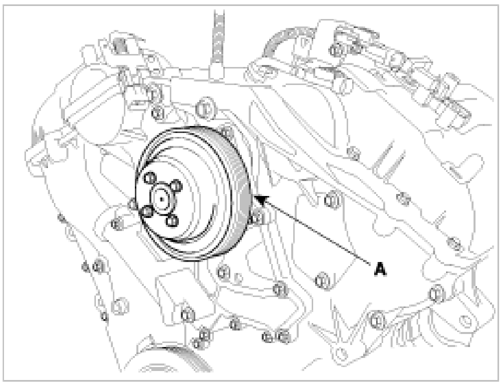
Tightening torque
B(17) :
18.62 ~ 21.56N.m (1.9 ~ 2.2kgf.m, 13.74 ~ 15.91lb-ft)
C(4) :
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)
D(1) :
58.80 ~ 68.80N.m (6.0 ~ 7.0kgf.m, 43.40 ~ 50.63lb-ft)
E(1) :
58.80 ~ 68.80N.m (6.0 ~ 7.0kgf.m, 43.40 ~ 50.63lb-ft)
F(2) :
24.50 ~ 26.46N.m (2.5 ~ 2.7kgf.m, 18.08 ~ 19.53lb-ft)
G(4) :
21.56 ~ 23.52N.m (2.2 ~ 2.4kgf.m, 15.91 ~ 17.36lb-ft)
H(1) :
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)
I(1) :
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)
J(1) :
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)
K(4) :
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)
L(1):
21.56 ~ 26.46N.m (2.2 ~ 2.7kgf.m, 15.91 ~ 19.53lb-ft)
- New bolt



(6) The firing and/or blow out test should not be performed within 30 minutes after the timing chain cover was assembled.

23. Install the water pump pulley(A).

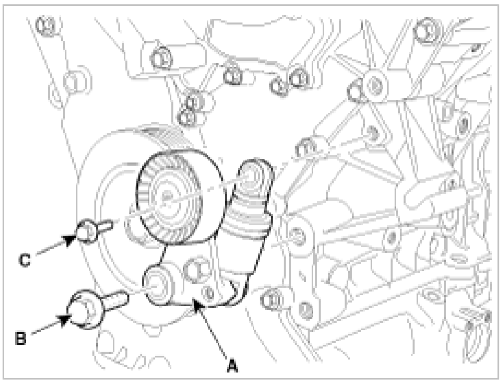
Tightening torque
7.84 ~ 9.80N.m (0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lb-ft)



24. Install the drive belt auto tensioner(A).

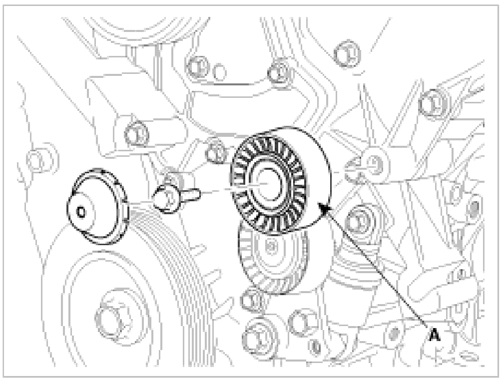
Tightening torque

Bolt(B) :
81.39 ~ 85.32N.m (8.3 ~ 8.7kgf.m, 60.03 ~ 62.93lb-ft)
Bolt(C) :
17.64 ~ 21.56N.m (1.8 ~ 2.2kgf.m, 13.02 ~ 15.91lb-ft)



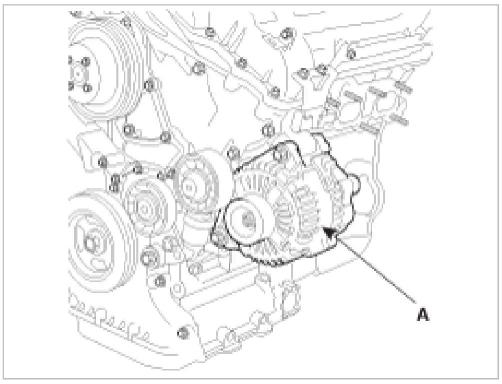
25. Install the drive belt idler(A).

Tightening torque
52.92 ~ 57.82N.m (5.4 ~ 5.9kgf.m, 39.06 ~ 42.67lb-ft)

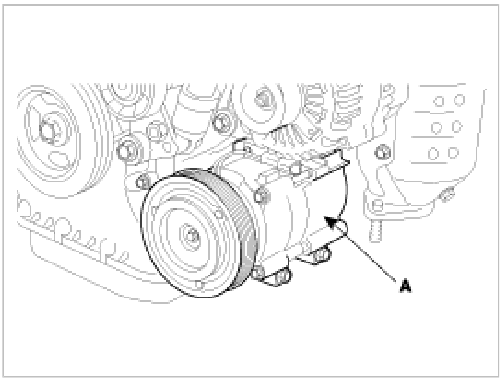


26. Install the alternator(A).

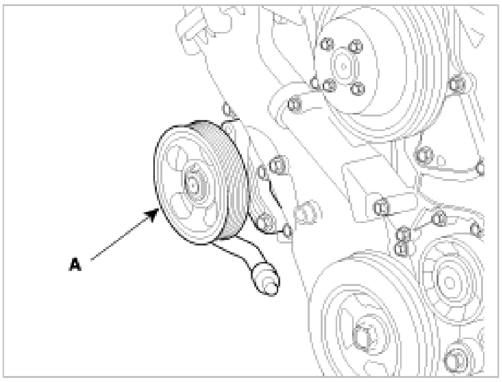
Tightening torque
26.48 ~ 33.34N.m (2.7 ~ 3.4kgf.m, 19.53 ~ 24.59lb-ft)



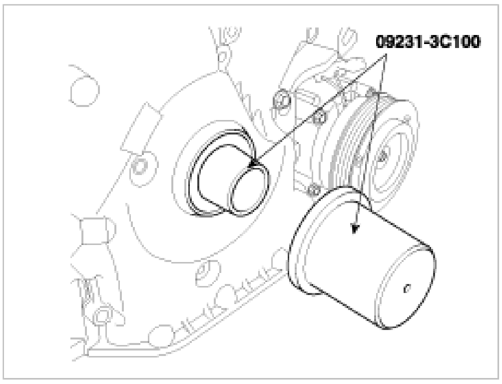
27. Install the air conditioner compressor(A). (Refer to HA group)



28. Install the power steering pump(A). (Refer to ST group)

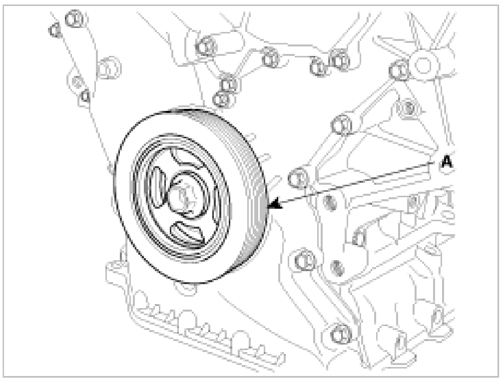


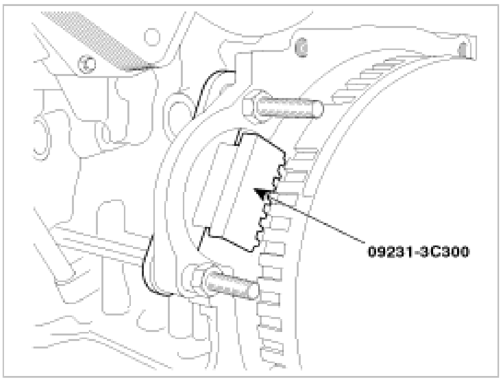
29. Lower the engine assembly by using the jack.
30. Using SST(09231-3C100), install timing chain cover oil seal.



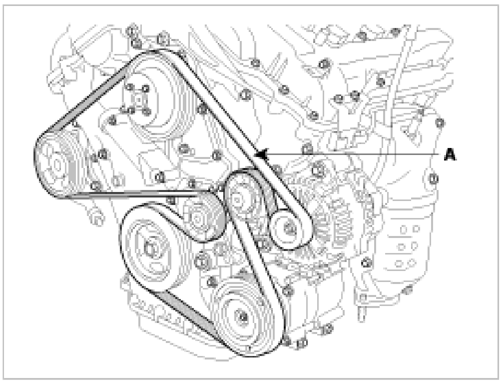
31. Using SST(09231-3C300) install the crankshaft damper pulley(A).

Tightening torque
284.2~303.8N.m (29.0~31.0kgf.m, 209.76~224.22lb-ft)



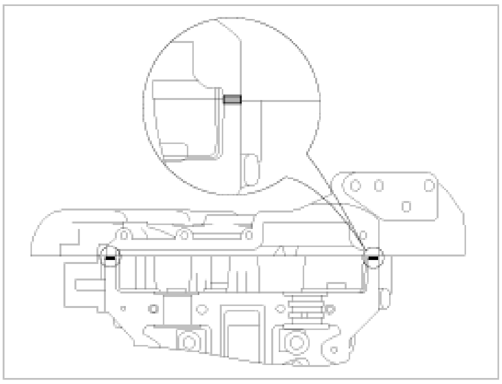


32. Install the drive belt(A).
    Crankshaft pulley → A/C pulley → idler pulley → alternator pulley → water pump pulley → P/S pump pulley→ tensioner pulley.
    Rotate auto tensioner arm in the counterclockwise moving auto tensioner pulley bolt with wrench.
    After putting belt on auto tensioner pulley, release the auto tensioner pulley slowly.



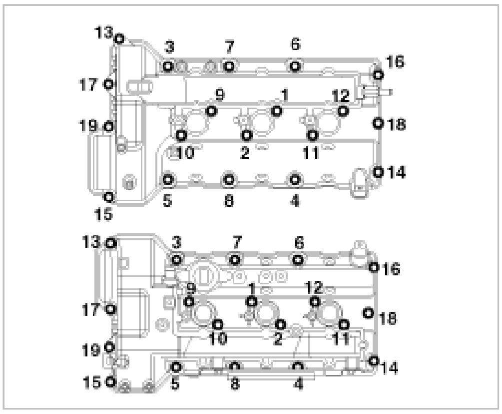
33. Install the cylinder head cover.
    (1) The hardening sealant located on the upper area between timing chain cover and cylinder head should be removed before assembling cylinder head cover.
    (2) After applying sealant(TB1217H), it should be assembled within 5 minutes.

Bead width : 2.5mm (0.1in.)



(3) The firing and/or blow out test should not be performed within 30 minutes after the cylinder head cover was assembled.
(4) Install the cylinder head cover bolts as following method.

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)

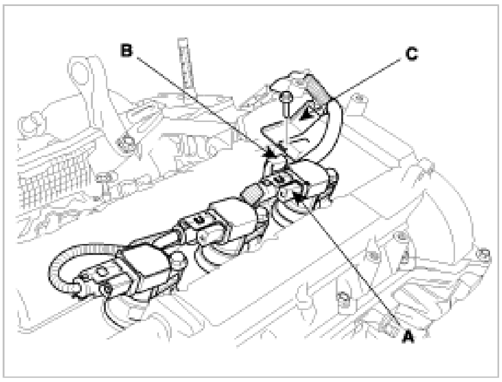


CAUTION

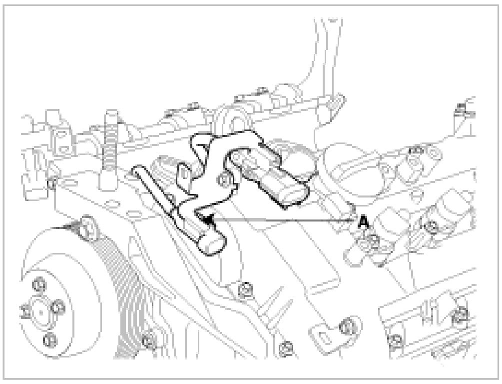
Do not reuse cylinder head cover gasket.

(5) Install the ignition coil.

(6) Connect the RH ignition coil connector(A), the condenser connector(B) and install the wiring bracket(C).



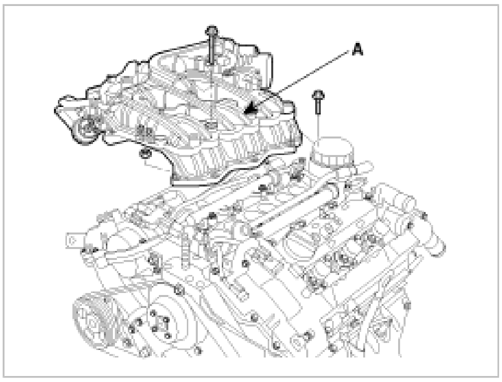
(7) Install the connector bracket(A) from the LH cylinder head cover.



34. Install the surge tank.

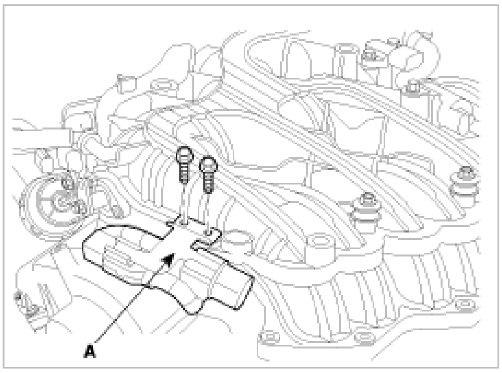
(1) Install the surge tank(A).

Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



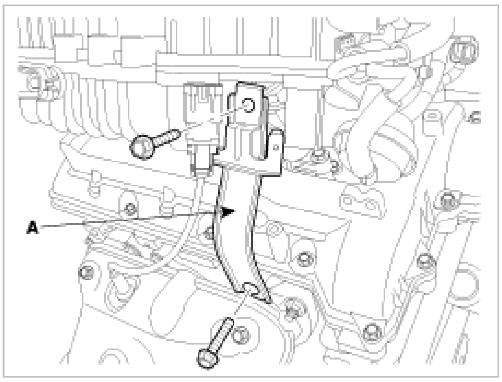
(2) Install the connector bracket(A) on the surge tank.

Tightening torque
6.86 ~ 10.78N.m (0.7 ~ 1.1kgf.m, 5.06 ~ 7.96lb-ft)



(3) Install the surge tank stay.

Tightening torque
27.44 ~ 31.36N.m (2.8 ~ 3.2kgf.m, 20.25 ~ 23.14lb-ft)



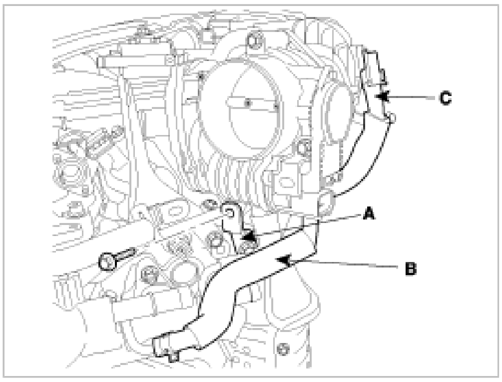
(4) Connect the brake vacuum hose.

(5) Connect the PCV hose(C).

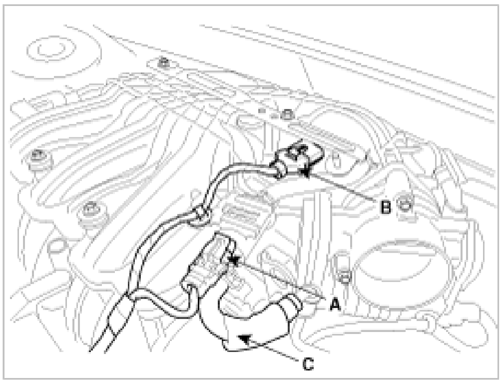
(6) Connect the water hoses(B) to the ETC.

(7) Install the ETC bracket(A).

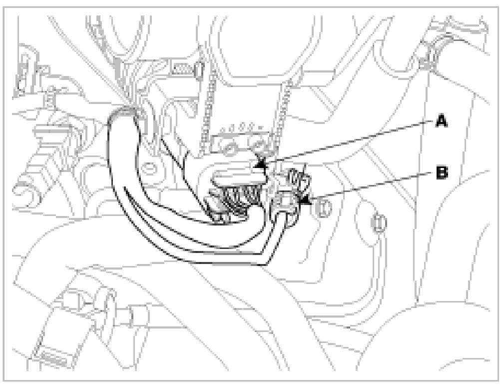
Tightening torque
15.68 ~ 25.48N.m (1.6 ~ 2.6kgf.m, 11.57 ~ 18.80lb-ft)



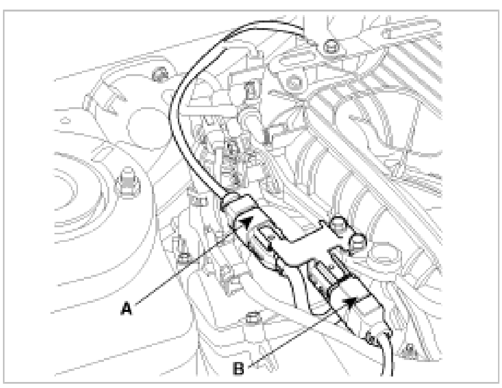
(8) Connect the PCSV connector(A), the MAP sensor connector(B) and the PCSV hose(C).



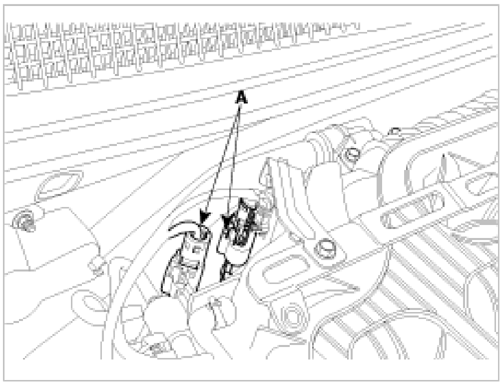
(9) Connect the ETC connector(A) and the knock sensor connector(B).



(10) Connect the RH injector connector (A) and the ignition coil connector(B).

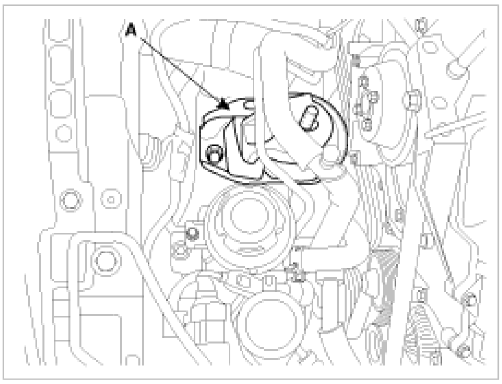


(11) Connect the RH oxygen sensor connector(A).

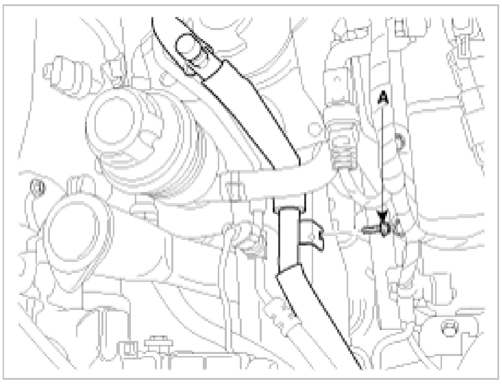


35. Install the no.1 engine mounting (A) through the lower position of A/C pipe line.

Tightening torque
49.03 ~ 63.74N.m (5.0 ~ 6.5kgf.m, 36.17 ~ 47.01lb-ft)

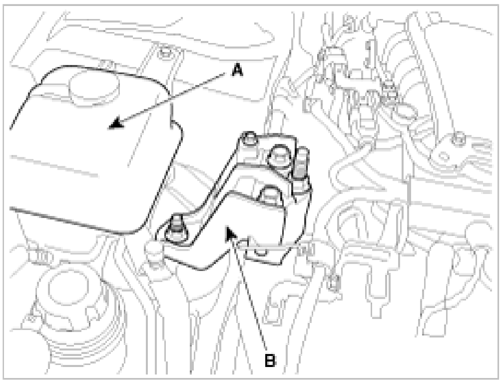


36. Install the A/C pipe bracket mounting bolt (A).



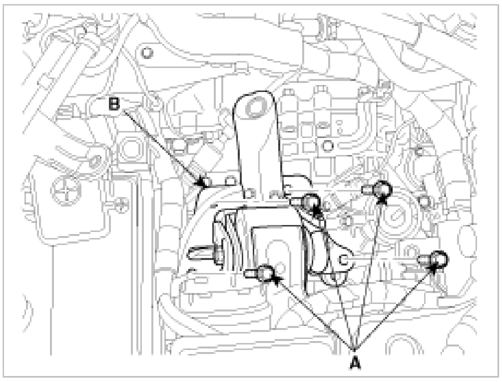
37. Install the engine coolant reservoir tank (A).
38. Install the engine mounting bracket (B).

Tightening torque
63.74 ~ 83.36N.m (6.5 ~ 8.5kgf.m, 47.01 ~ 61.48lb-ft)

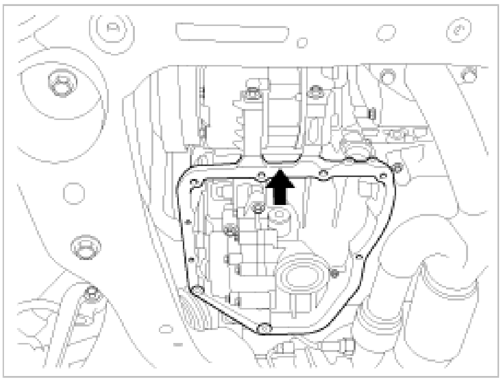


39. Install the transaxle mounting bolts(A).

Tightening torque
49.03 ~ 63.74N.m (5.0 ~ 6.5kgf.m, 36.17 ~ 47.01lb-ft)

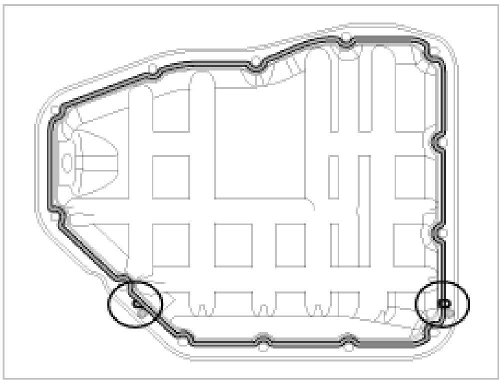


40. Remove the jack from the upper oil pan.



41. Install the lower oil pan.
    (1) Using a gasket scraper, remove all the old packing material from the gasket surfaces.
    (2) Before assembling the oil pan, the liquid sealant TB 1217H should be applied on oil pan.
    The part must be assembled within 5 minutes after the sealant was applied.

Bead width : 2.5mm(0.1in.).
But marked area(*) to be 5.0mm(0.2in.)

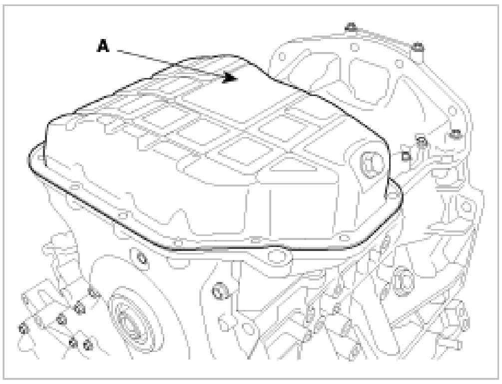


CAUTION

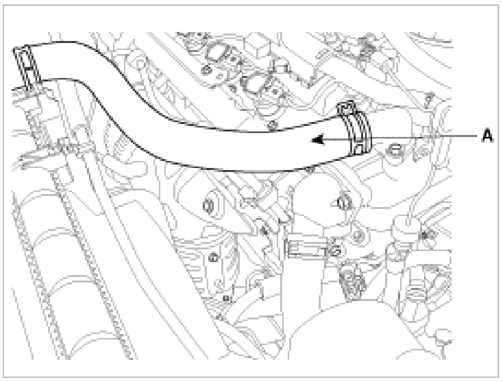
- Make clean the sealing face before assembling two parts.
- Remove harmful foreign matters on the sealing face before applying sealant.
- When applying sealant gasket, sealant must not be protruded into the inside of oil pan.
- To prevent leakage of oil, apply sealant gasket to the inner threads of the bolt holes.

(3) Install the oil pan(A).
Uniformly tighten the bolts in several passes.

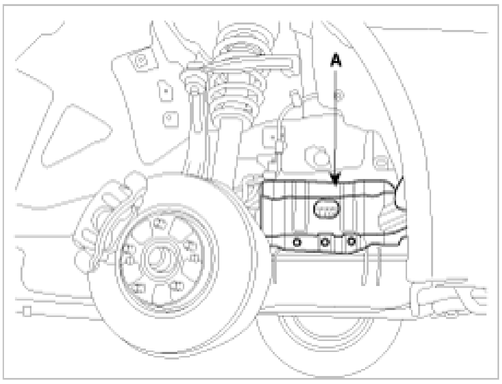
Tightening torque
9.80 ~ 11.76N.m (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lb-ft)



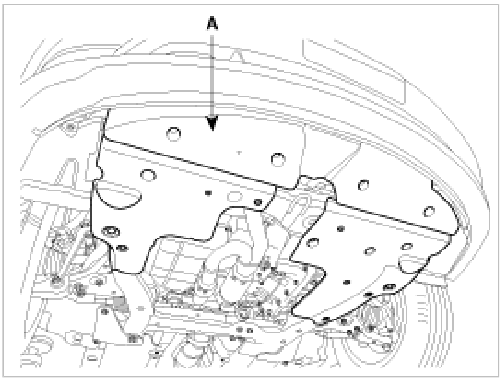
42. Install the upper radiator hose(A).



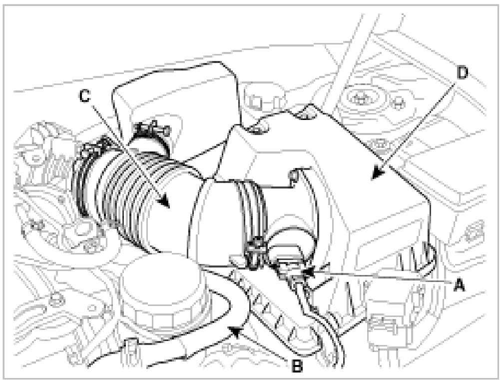
43. Install the side cover(A).



44. Install the under cover(A).



45. Install the front wheels.
46. Install the intake air hose and air cleaner assembly.
    (1) Install the intake air hose(C) and air cleaner(D).
    (2) Connect the ECM connector. (Refer to FL group)
    (3) Connect the breather hose(B) from air cleaner hose.
    (4) Connect the AFS connector(A).

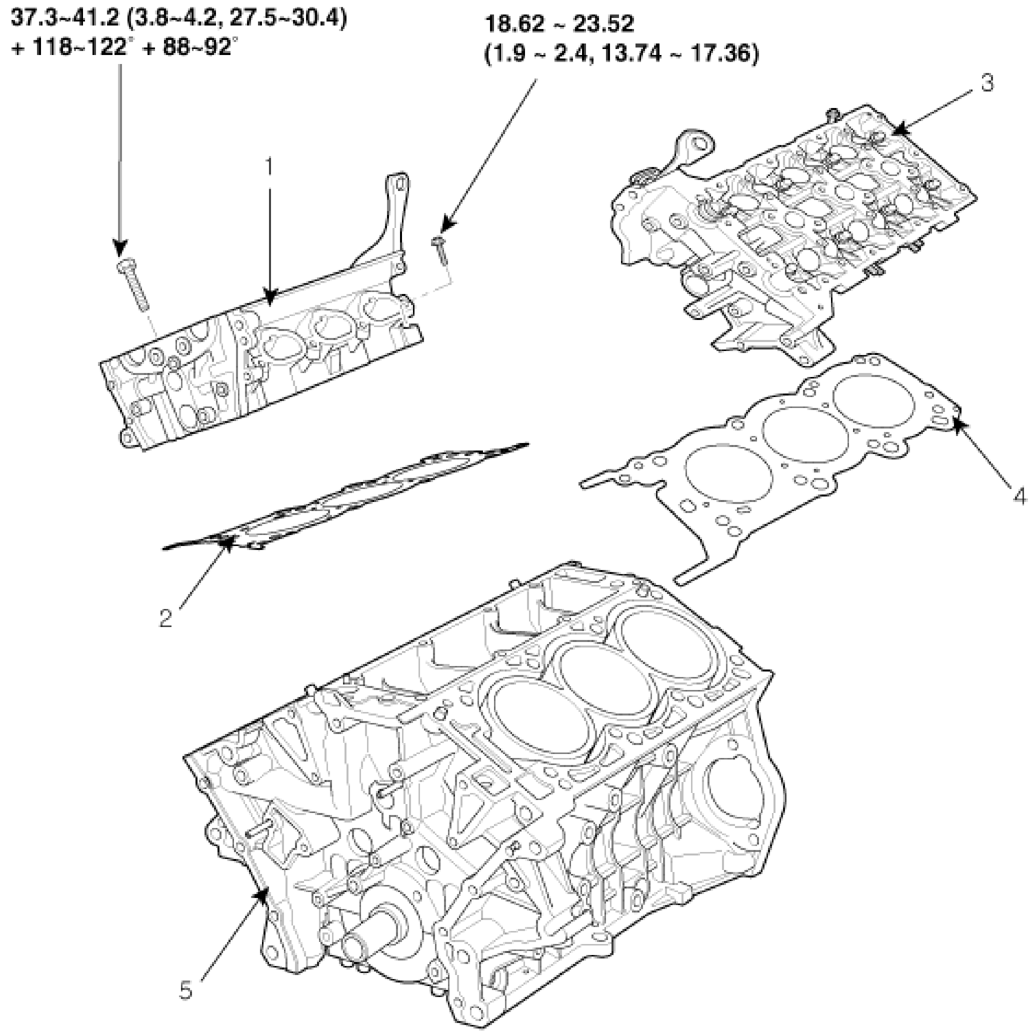


47. Install the air duct.
48. Install the engine cover.
49. Connect the negative terminal from the battery.

NOTE

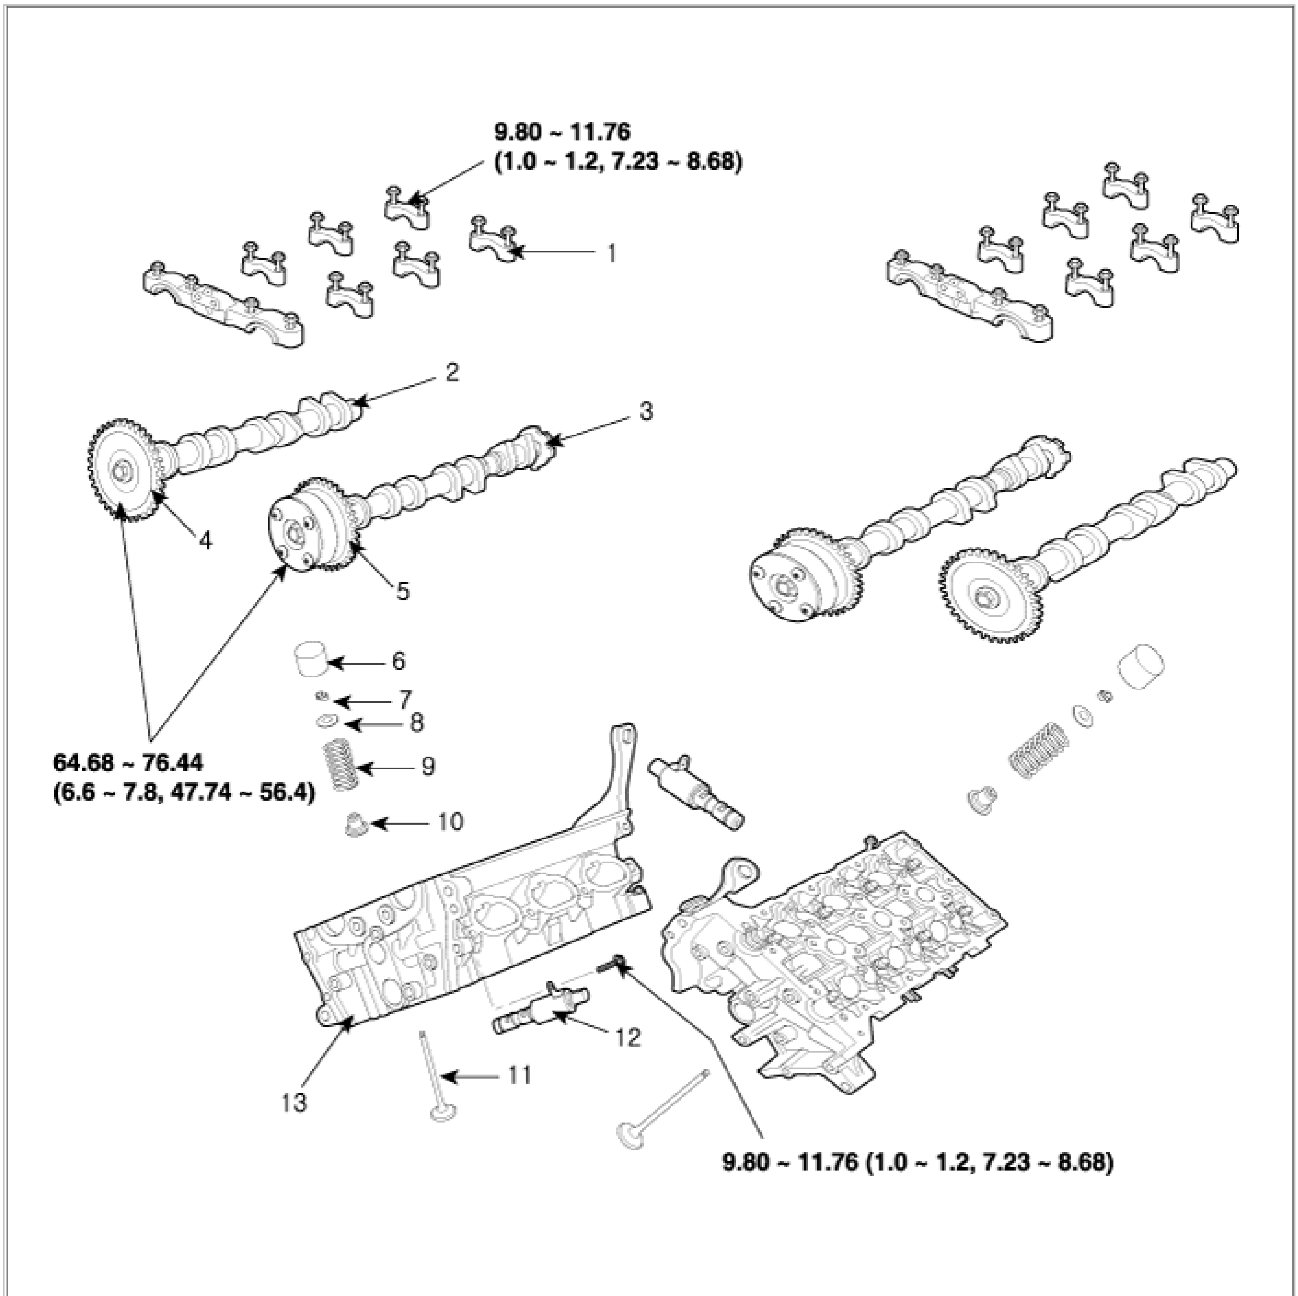
- Refill engine with engine oil.
- Refill radiator and reservoir tank with engine coolant.
- Bleed air from the cooling system.
- Start engine and let it run until it warms up. (until the radiator fan operates 3 or 4 times.)
- Turn Off the engine. Check the level in the radiator, add coolant if needed. This will allow trapped air to be removed from the cooling system.
- Put radiator cap on tightly, then run the engine again and check for leaks.

COMPONENTS



TORQUE : N.m (kgf.m, lbf.ft)

1. RH cylinder head
2. RH cylinder head gasket
3. LH cylinder head
4. LH cylinder head gasket
5. Cylinder block



1. Camshaft bearing cap
2. Exhaust camshaft
3. Intake camshaft
4. Exhaust camshaft sprocket
5. CVVT assembly
6. MLA
7. Retainer lock
8. Retainer
9. Valve spring
10. Valve stem seal
11. Valve
12. OCV
13. Cylinder head

Engine Mechanical System > Cylinder Head Assembly > Repair procedures

REMOVAL

CAUTION

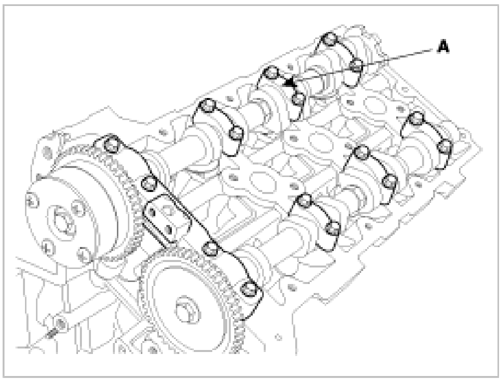
- Use fender covers to avoid damaging painted surfaces.
- To avoid damaging the cylinder head, wait until the engine coolant temperature drops below normal temperature before removing it.
- When handling a metal gasket, take care not to fold the gasket or damage the contact surface of the gasket.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

NOTE

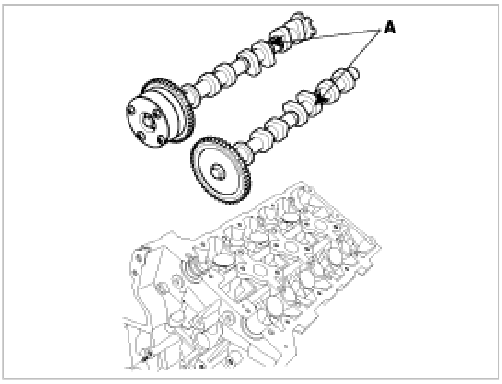
- Mark all wiring and hoses to avoid misconnection.
- Turn the crankshaft pulley so that the No. 1 piston is at top dead center.

Engine removal is required for this procedure.

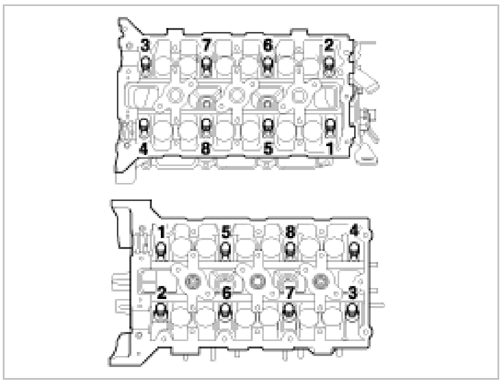
1. Remove exhaust manifold.
2. Remove intake manifold.
3. Remove timing chain.
4. Remove water temperature control assembly.
5. Remove camshaft bearing cap(A).



6. Remove camshaft assembly(A).



7. Remove cylinder head bolts, then remove cylinder head.
   (1) Uniformly loosen and remove the 16 cylinder head bolts, in several passes, in the sequence shown. Remove the 16 cylinder head bolts and plate washers.



CAUTION

Head warpage or cracking could result from removing bolts in an incorrect order.

   (2) Lift the cylinder head from the dowels on the cylinder block and place the cylinder head on wooden blocks on a bench.

CAUTION

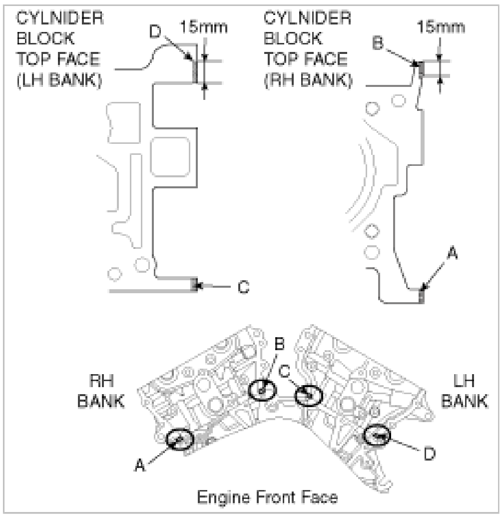
Be careful not to damage the contact surfaces of the cylinder head and cylinder block.

INSTALLATION

NOTE

- Thoroughly clean all parts to be assembled.
- Always use a new head and manifold gasket.
- The cylinder head gasket is a metal gasket. Take care not to bend it.
- Rotate the crankshaft, set theNo.1 piston at TDC.

1. Install the cylinder head.
   A. The sealant locations on cylinder head and cylinder block must be free of engine oil and ETC.
   B. Apply sealant on cylinder block top face before assembling cylinder head gaskets.
   The part must be assembled within 5 minutes after sealant was applied.

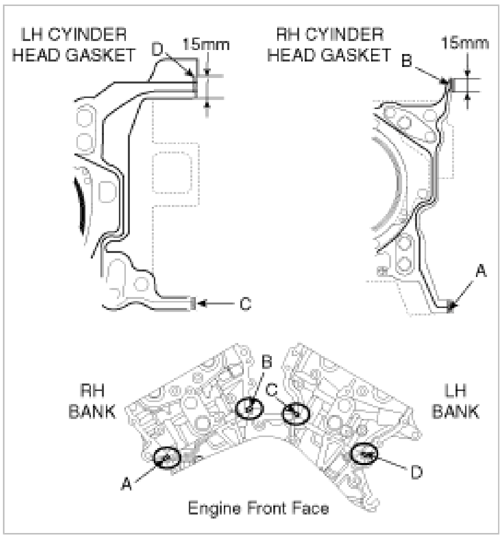


NOTE

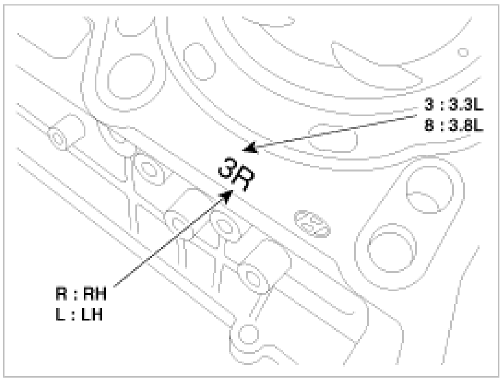
Refer to below illustration to apply the sealant.

Bead width : 2.0~3.0 mm
Sealant locations : 1.0~1.5mm from block surface
Recommended sealant :Liquid sealant TB1217H

   C. Apply sealant on cylinder head gaskets after assembling cylinder head gaskets on cylinder block.
   The part must be assembled within 5 minutes after sealant was applied.

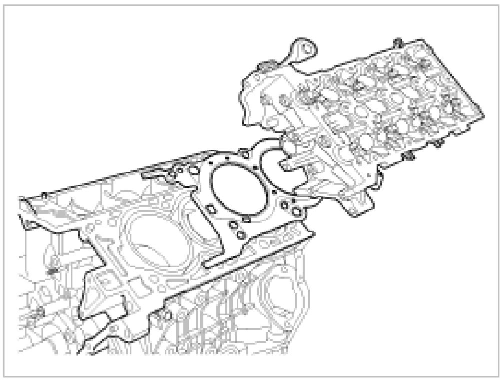


> **NOTE**
>
> Be careful of the installation direction.



D. Install the cylinder head.

> **NOTE**
>
> Remove the extruded sealant after assembling cylinder heads.

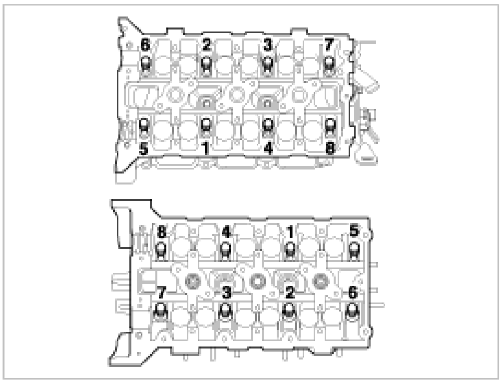


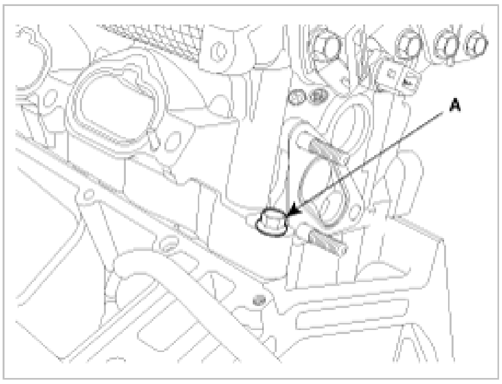
2. Place the cylinder head carefully in order not to damage the gasket with the bottom part of the end.
3. Install cylinder head bolts.
   (1) Do not apply engine oil on the threads and under the heads of the cylinder head bolts.
   (2) Using SST(09221-4A000), install and tighten the cylinder head bolts and plate washers, in several passes, in the sequence shown.

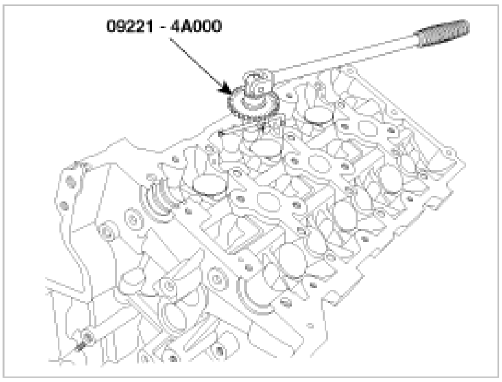
Tightening torque
Head bolt : 37.3~41.2Nm (3.8~4.2kgf.m, 27.5~30.4lb-ft) + 118~122° + 88~92°
Bolt (A) : 18.62 ~ 23.52Nm(1.9 ~ 2.4kgf.m, 13.74 ~ 17.36lbf.ft)

NOTE

Always use new cylinder head bolt.

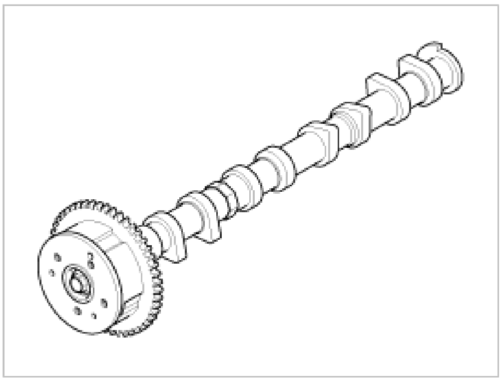






4. Install the CVVT and camshaft sprocket.

Tightening torque
64.68 ~ 76.44Nm(6.6 ~ 7.8 kgf.m, 47.74 ~ 56.4lbf.ft)



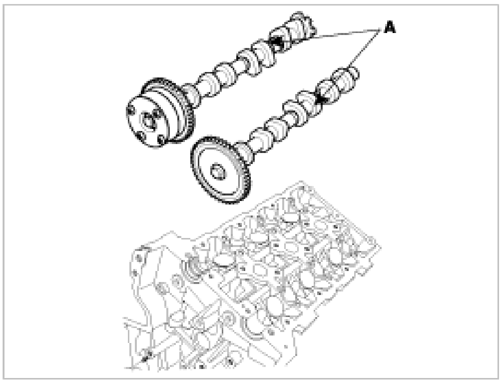
NOTE

- Install camshaft-inlet to dowel pin of CVVT assembly .
  At this time, attend not to be installed to oil hole of camshaft-inlet.
- Hold the hexagonal head wrench portion of the camshaft with a vise, and install the bolt and CVVT assembly.
- Do not rotate CVVT assembly when camshaft is installed to dowel pin of CVVT assembly.

5. Install camshafts(A).

NOTE

- Apply a light coat of engine oil on camshaft journals.
- Assemble the key groove of camshaft rear side to the same level of head top surface.
- Be careful the right, left bank, intake, exhaust side before assembling.



Intake camshaft

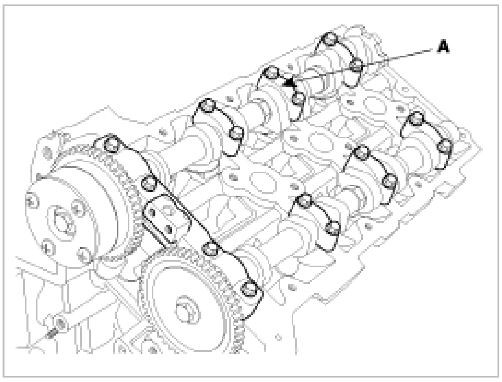
	LH	RH
3.3L	A: 27mm(1.0630in.) B: 27mm(1.0630in.)	A: 30mm(1.1811in.) B: 30mm(1.1811in.)

Exhaust camshaft

	LH	RH
3.3L	A: 27mm(1.0630in.)	A: 30mm(1.1811in.)

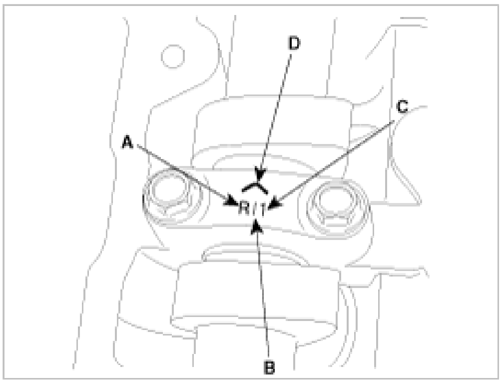
6. Install camshaft bearing caps.

Tightening torque
9.80 ~ 11.76Nm(1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)



NOTE

Be careful the right, left bank, intake, exhaust side before assembling.



A : L(LH),R(RH)
B : I(Intake),None(Exhaust)
C : Journal number
D : Front mark

CAUTION

Rotate the crankshaft not to contact the valves to the pistons by making the pistons below 10mm(0.3937in.) from the top of cylinder block.

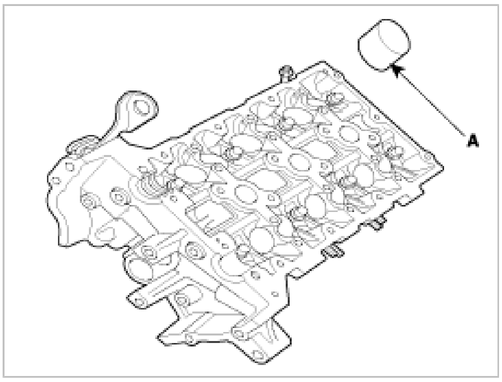
7. Install water temperature control assembly.
8. Install timing chain.
9. Check and adjust valve clearance.
10. Install the exhaust manifold.
11. Install the intake manifold.

DISASSEMBLY

NOTE

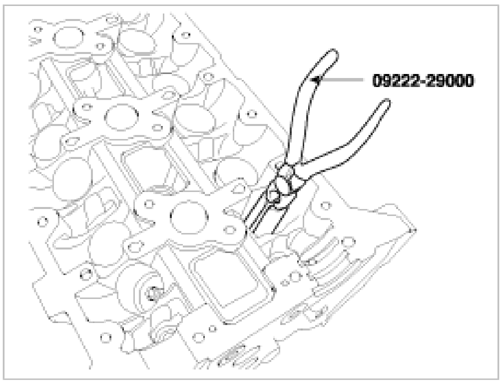
Identify MLA, valves and valve springs as they are removed so that each item can be reinstalled in its original position.

1. Remove MLAs(A).



2. Remove valves.
   (1) Using SST(09222-3K000, 09222-3C300), compress the valve spring and remove retainer lock.

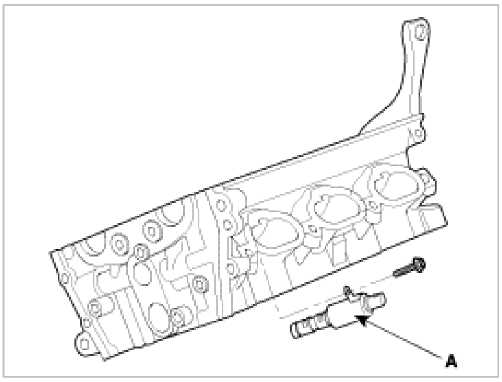
   (2) Remove the spring retainer.
   (3) Remove the valve spring.
   (4) Remove the valve.
   (5) Using SST(09222-29000), remove the valve stem seal.



NOTE

Do not reuse old valve stem seals.

3. Remove OCV(A).

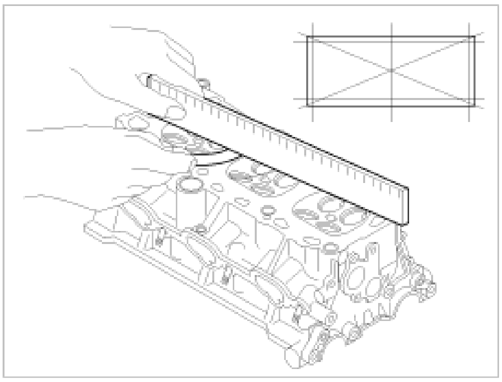


INSPECTION

CYLINDER HEAD

1. Inspect for flatness.
   Using a precision straight edge and feeler gauge, measure the surface the contacting the cylinder block and the manifolds for warpage.

Flatness of cylinder head gasket surface
Standard : Less than 0.05mm(0.002in.)[Less than 0.02mm(0.0008in.)/150x150]
Flatness of manifold gasket surface
Standard : Less than 0.03mm(0.001in)/110x110

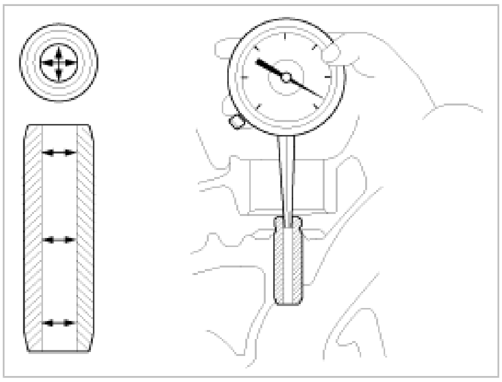


2. Inspect for cracks.
   Check the combustion chamber, intake ports, exhaust ports and cylinder block surface for cracks. If cracked, replace the cylinder head.

VALVE AND VALVE SPRING

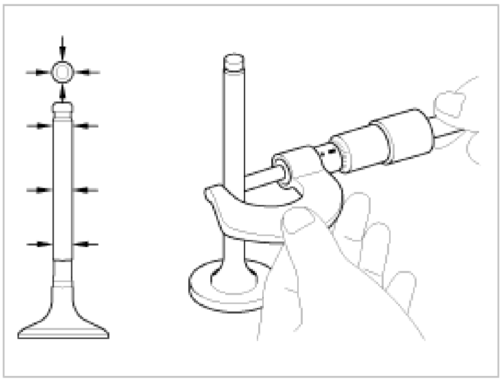
1. Inspect valve stems and valve guides.
   (1) Using a caliper gauge, measure the inside diameter of the valve guide.

Valve guide I.D.
Intake / Exhaust : 5.500 ~ 5.512mm (0.216 ~ 0.217in.)



(2) Using a micrometer, measure the diameter of the valve stem.

Valve stem O.D.
Intake : 5.465 ~ 5.480mm (0.2151 ~ 0.2157in.)
Exhaust : 5.458 ~ 5.470mm (0.2149 ~ 0.2153in.)

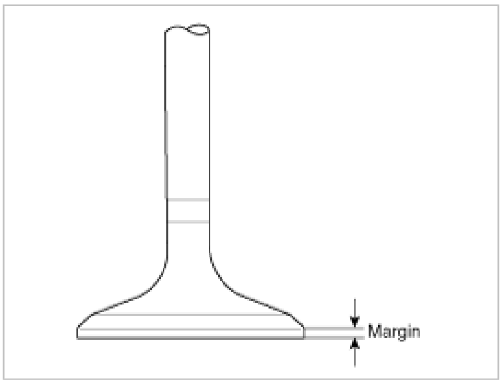


(3) Subtract the valve stem diameter measurement from the valve guide inside diameter measurement.

Valve stem-to-guide clearance
[Standard]
Intake : 0.020 ~ 0.047mm (0.0008 ~ 0.0018in.)
Exhaust : 0.030 ~ 0.054mm (0.0012 ~ 0.0021in.)
[Limit]
Intake : 0.07mm (0.0027in.)
Exhaust : 0.09mm (0.0035in.)

2. Inspect valves.
(1) Check the valve is ground to the correct valve face angle.
(2) Check that the surface of the valve for wear.
If the valve face is worn, replace the valve.
(3) Check the valve head margin thickness.
If the margin thickness is less than minimum, replace the valve.

Margin
[Standard]
Intake : 1.56 ~ 1.86mm(0.06142 ~ 0.07323in.)
Exhaust : 1.73 ~ 2.03mm(0.06811 ~ 0.07992in.)



(4) Check the valve length.

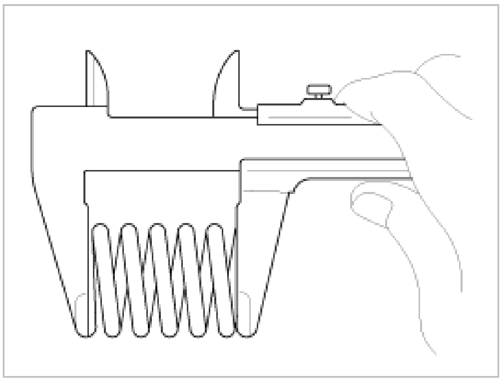
Length
Intake : 105.27mm (4.1445in)
Exhaust : 105.50mm (4.1535in)

(5) Check the surface of the valve stem tip for wear.

If the valve stem tip is worn, replace the valve.

3. Inspect valve seats
   Check the valve seat for evidence of overheating and improper contact with the valve face.
   If the valve seat is worn, replace cylinder head.
   Before reconditioning the seat, check the valve guide for wear. If the valve guide is worn, replace cylinder head.
   Recondition the valve seat with a valve seat grinder or cutter. The valve seat contact width should be within specifications and centered on the valve face.
4. Inspect valve springs.
   (1) Using a steel square, measure the out-of-square of the valve spring.
   (2) Using a vernier calipers, measure the free length of the valve spring.

Valve spring
[Standard]
Free height : 43.86mm (1.7267in.)
Out-of-square : 1.5°



MLA

1. Inspect MLA.
   Using a micrometer, measure the MLA outside diameter.

MLA O.D.
Intake/Exhaust : 34.964 ~ 34.980mm(1.3765 ~ 1.3771in.)

2. Using a caliper gauge, measure MLA tappet bore inner diameter of cylinder head.

Tappet bore I.D.
Intake/Exhaust : 35.000 ~ 35.025mm(1.3779 ~ 1.3789in.)

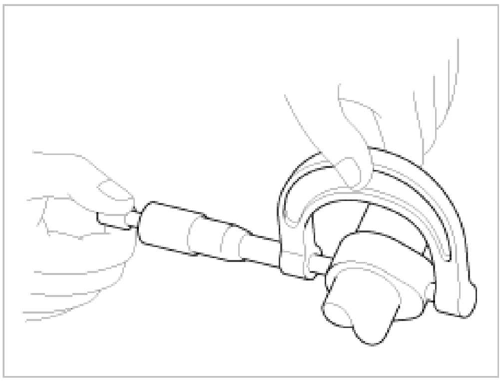
3. Subtract MLA outside diameter measurement from tappet bore inside diameter measurement.

MLA to tappet bore clearance
[Standard]
Intake/Exhaust : 0.020 ~ 0.061mm(0.0008 ~ 0.0024in.)
[Limit]
Intake/Exhaust : 0.07mm(0.0027in.)

CAMSHAFT

1. Inspect cam lobes.
   Using a micrometer, measure the cam lobe height.

Cam height
[Standard value]
Intake : 46.3mm (1.8228in.)
Exhaust : 45.8mm (1.8031in.)



If the cam lobe height is less than standard, replace the camshaft.

2. Inspect camshaft journal clearance.
   (1) Clean the bearing caps and camshaft journals.
   (2) Place the camshafts on the cylinder head.
   (3) Lay a strip of plastigage across each of the camshaft journal.

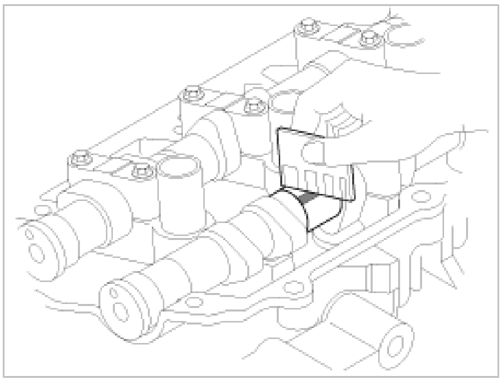
   (4) Install the bearing caps.

CAUTION

Do not turn the camshaft.

   (5) Remove the bearing caps.
   (6) Measure the plastigage at its widest point.

Bearing oil clearance
[Standard value]
Intake
No.1 journal : 0.020 ~ 0.057mm (0.0008 ~ 0.0022in.)
No.2,3,4,, journal : 0.030 ~ 0.067mm (0.0012 ~ 0.0026in.)
Exhaust
No.1 journal : 0.020 ~ 0.057mm (0.0008 ~ 0.0022in.)
No.2,3,4,, journal : 0.030 ~ 0.067mm (0.0012 ~ 0.0026in.)



If the oil clearance is greater than maximum, replace the camshaft. If necessary, replace cylinder head.

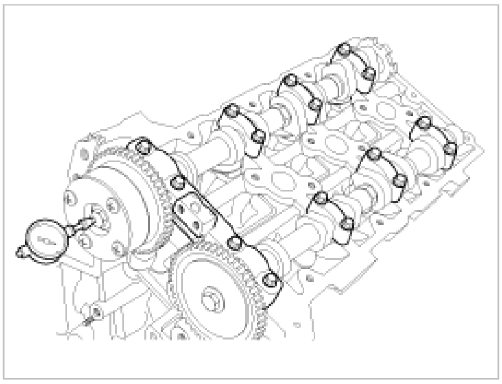
(7) Completely remove the plastigage.

(8) Remove the camshafts.

3. Inspect camshaft end play.
   (1) Install the camshafts.

   (2) Using a dial indicator, measure the end play while moving the camshaft back and forth.

Camshaft end play
[Standard value] : 0.056 ~ 0.064mm(0.0022 ~ 0.0025in.)



If the end play is greater than maximum, replace the camshaft. If necessary, replace cylinder head.

   (3) Remove the camshafts.

CVVT ASSEMBLY

1. Inspect CVVT assembly.
   (1) Check that the CVVT assembly will not turn.

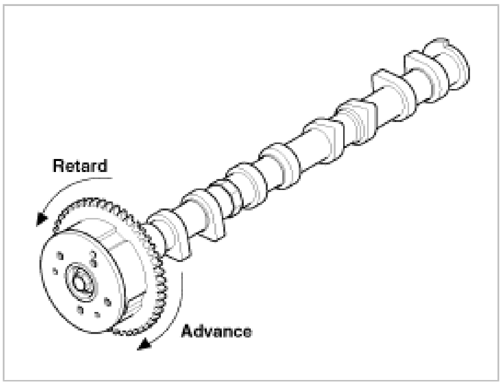
   (2) Apply vinyl tape to the retard hole except the one indicated by the arrow in the illustration.

   (3) Wind tape around the tip of the air gun and apply air of approx. 150kpa(1.5kgf/cm², 21psi) to the port of the camshaft.
   (Perform this order to release the lock pin for the maximum delay angle locking.)

NOTE

When the oil splashes, wipe it off with a shop rag.

   (4) Under the condition of (3), turn the CVVT assembly to the advance angle side (the arrow marked direction in the illustration) with your hand.
   Depending on the air pressure, the CVVT assembly will turn to the advance side without applying force by hand. Also, under the condition that the pressure can be hardly applied because of the air leakage from the port, there may be the casethat the lock pin could be hardly released.



(5) Except the position where the lock pin meets at the maximum delay angle, let the CVVT assembly turn back and forth and check the movable range and that there is no disturbance.

Standard: Movable smoothly in the range about 22.5°

(6) Turn the CVVT assembly with your hand and lock it at the maximum delay angle position (counter clockwise).

REASSEMBLY

NOTE

Thoroughly clean all parts to be assembled.
Before installing the parts, apply fresh engine oil to all sliding and rotating surfaces.
Replace oil seals with new ones.

1. Install valves.
   (1) Using SST(09222-3C100), push in a new oil seal.

   NOTE

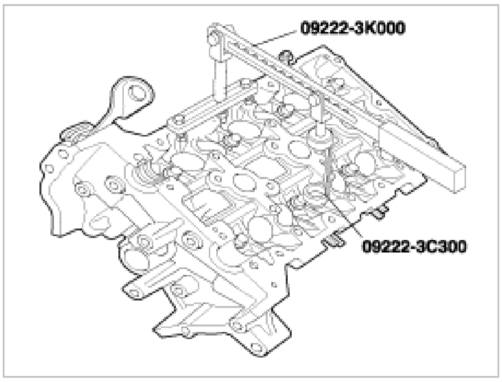
   Do not reuse old valve stem seals.
   Incorrect installation of the seal could result in oil leakage past the valve guides.

   (2) Install the valve, valve spring and spring retainer.

   NOTE

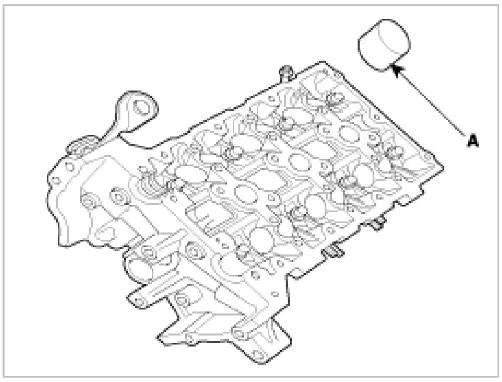
   Place valve springs so that the side coated with enamel faces toward the valve spring retainer and then installs the retainer.

   (3) Using the SST(09222 - 3K000, 09222-3C300), compress the spring and install the retainer locks. After installing the valves, ensure that the retainer locks are correctly in place before releasing the valve spring compressor.



(4) Lightly tap the end of each valve stem two or three times with the wooden handle of a hammer to ensure proper seating of the valve and retainer lock.

2. Install MLAs.
Check that the MLA rotates smoothly by hand.

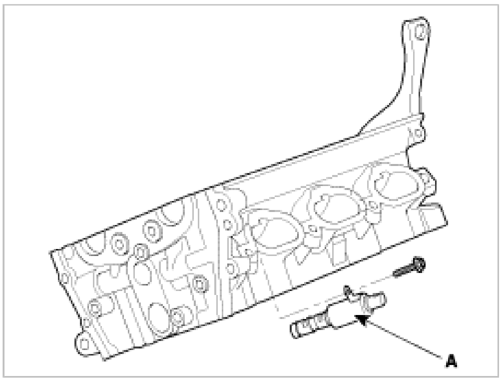


NOTE

MLA can be reinstalled in its original position.

3. Install OCV(A).

Tightening torque
9.80 ~ 11.76Nm(1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)



NOTE

- To install OCV with gray colored connector into RH bank.
- To install OCV with black colored connector into LH bank.

CAUTION

- Do not reuse the OCV when dropped.
- Keep clean the OCV.

• Do not hold the OCV sleeve during servicing.
• When the OCV is installed on the engine, do not move the engine with holding the OCV yoke.

Engine Mechanical System > Engine And Transaxle Assembly > Repair procedures

REMOVAL

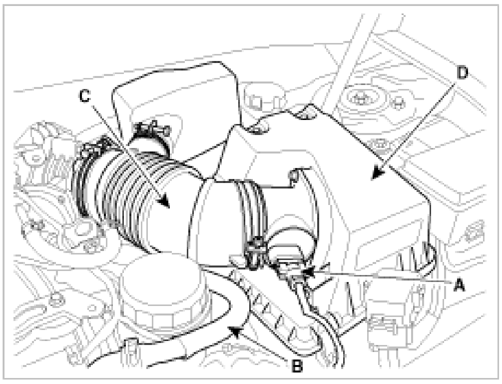
CAUTION

• Use fender covers to avoid damaging paintedsurfaces.
• To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

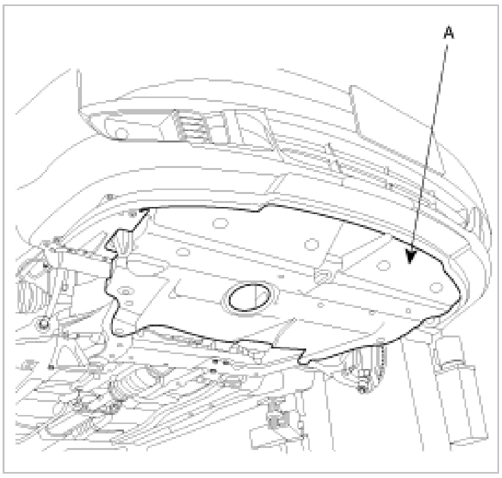
NOTE

• Mark all wiring and hoses to avoid misconnection.
• Turn the crankshaft pulley so that the No.1 piston is at top dead center.

1. Disconnect the neagative terminal from the battery.
2. Remove the engine cover.
3. Remove the air duct.
4. Remove the intake air hose and air cleaner assembly.
   (1) Disconnect the AFS connector(A).
   (2) Disconnect the breather hose(B) from air cleanerhose.
   (3) Disconnect the ECM connector. (See FL group)
   (4) Remove the intake air hose(C) and air cleaner(D).

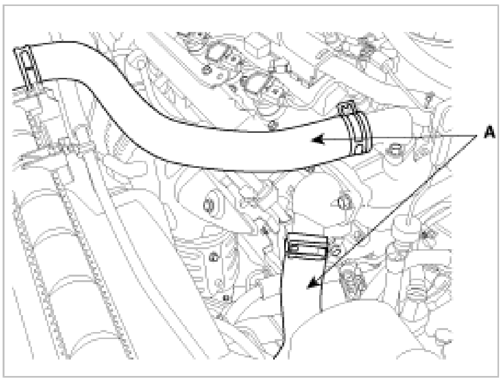


5. Remove front wheels.
6. Remove under cover(A).

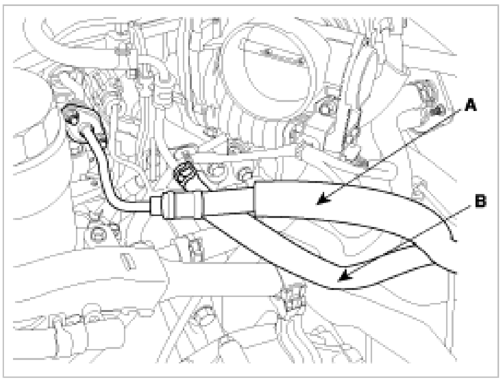


7. Drain the engine coolant.
   Remove the radiator cap to speed draining.

8. Remove the upper radiator hose and lower radiator hose(A).



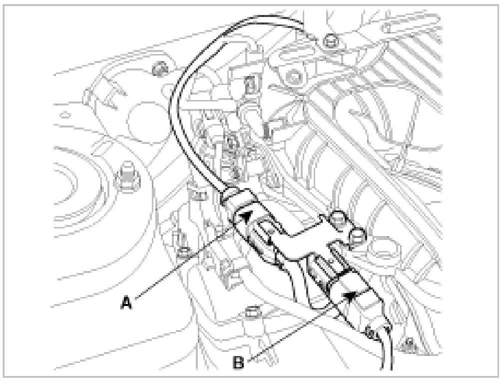
9. Remove transaxle oil cooler hose.
10. Remove fuel hose(A) and PCSV(B) hose.



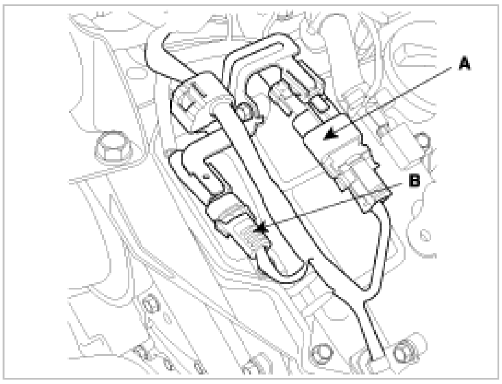
11. Remove engine wiring.
    (1) Disconnect RH oxygen sensor connector(A).

    (2) Disconnect power steering oil pressure sensor connector(A).

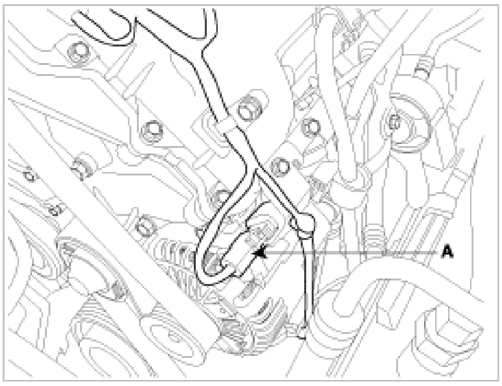
    (3) Disconnect RH injector connector(A) and ignition coil connector(B).



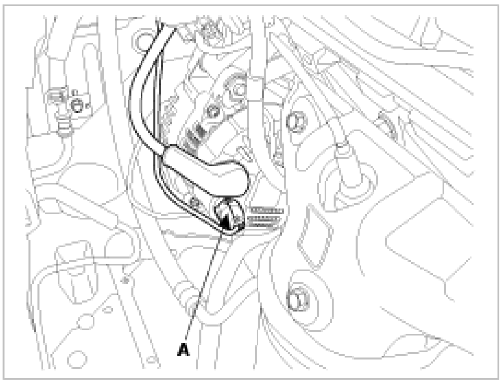
(4) Disconnect OCV connector(A) and knock sensor connector(B).



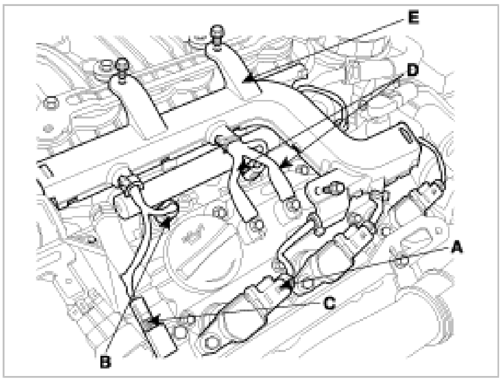
(5) Disconnect LH front oxygen sensor connector(A).



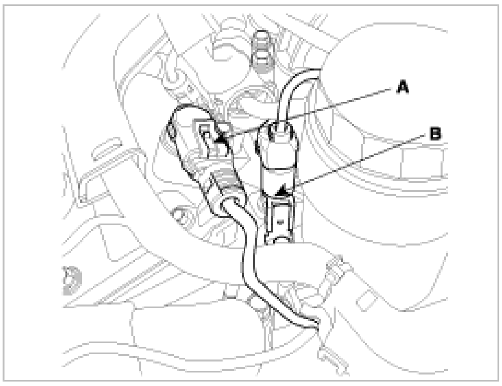
(6) Disconnect alternator connector(A).



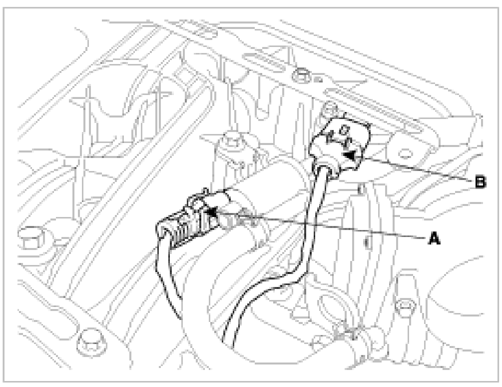
(7) Disconnect LH ignition coil connector(A), injector connector(B), condenser connector(C) and ground(D), and remove wiring harness protector(E).



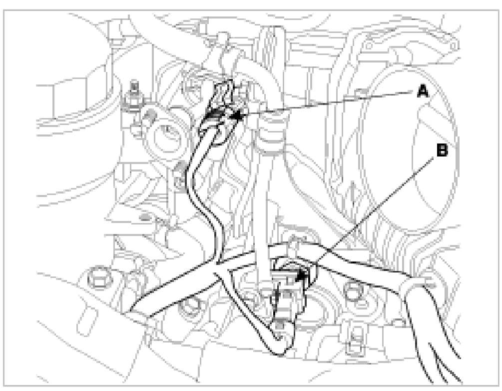
(8) Disconnect LH CMPS(A) and oil pressure switch connector(B).



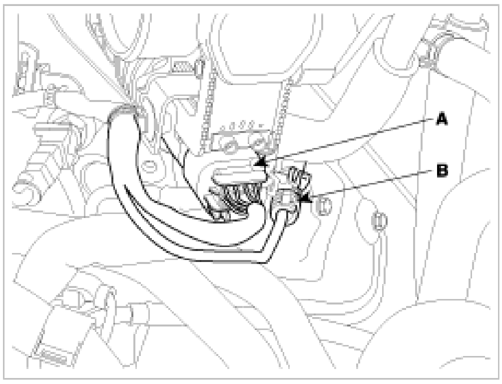
(9) Disconnect PCSV connector(A) and MAP sensor connector(B).



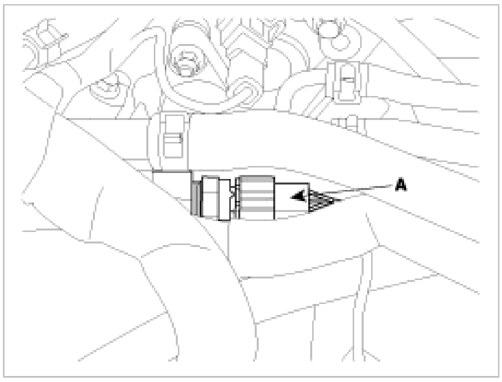
(10) Disconnect RH CMPS(A) and OTS connector(B).



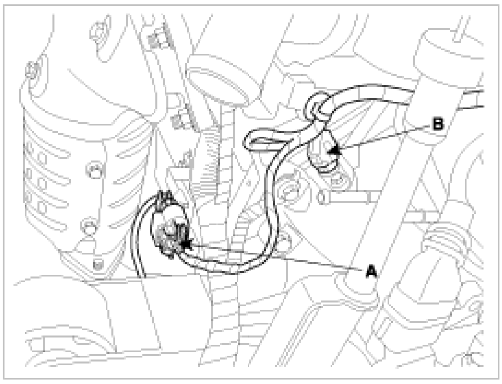
(11) Disconnect ETC connector(A) and knock sensor connector(B).



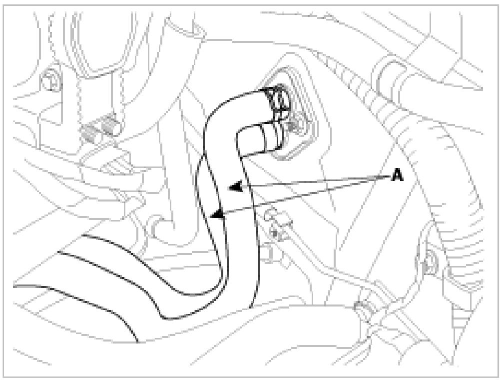
(12) Disconnect WTS connector(A).



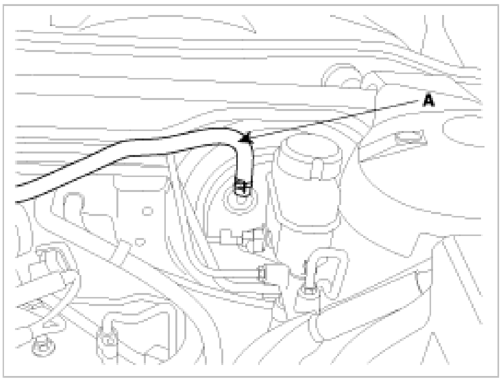
(13) Disconnect LH rear oxygen sensor connector(A) and CPS connector(B).



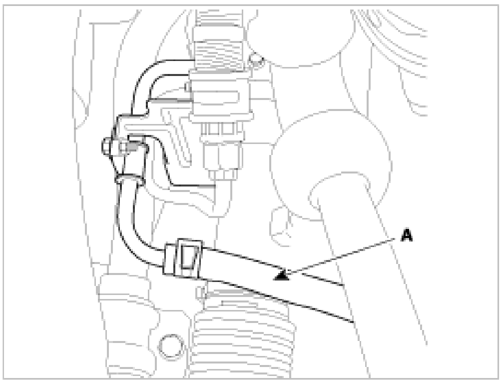
12. Disconnect the transaxle wire harness connector and remove the transaxle control cable.(See TR group)
13. Disconnect EPS connector.
14. Remove heater hose(A).



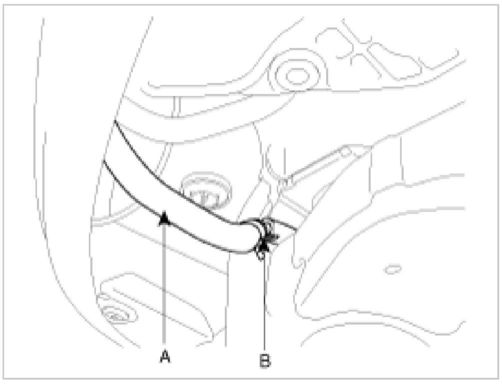
15. Remove brake vacuum hose(A).



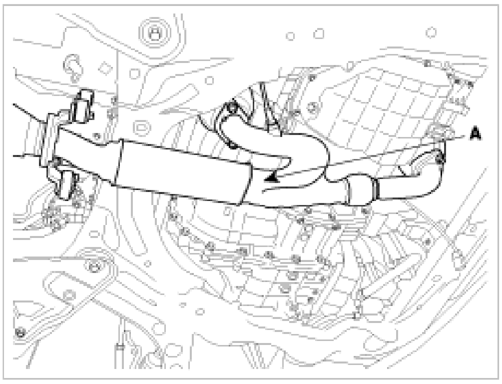
16. Remove power steering pump hose(A).



17. Remove A/C compressor hose.
18. Drain transaxle oil.
19. Remove lower arm ball joint. (SeeDS group)
20. Remove tile rod end ball joint. (See DS group)
21. Remove stabilizer link. (See SS group)
22. After removing a split pin and nut from the steering bar tie rod, disconnect it. (See ST group)
23. Remove power steering return hose(A) and drain power steering oil.

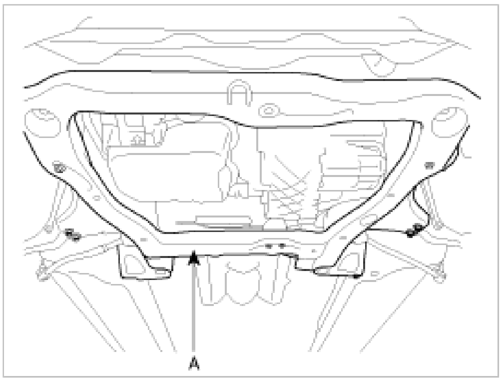


24. Remove front roll stopper mounting bolt.
25. Remove rear roll stopper mounting bolt.
26. Remove steering u-joint mounting (See ST group)
27. Remove front exhaust pipe(A).

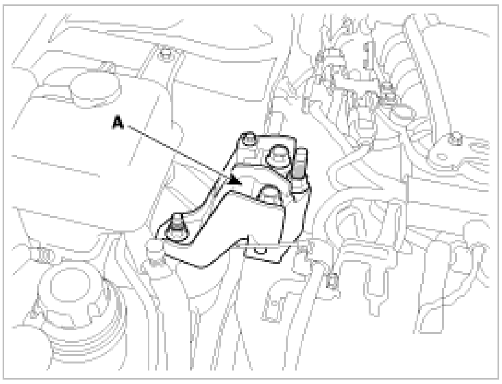


28. Supporting the cross member(A) with a jack, remove the stay with the mounting bolts.

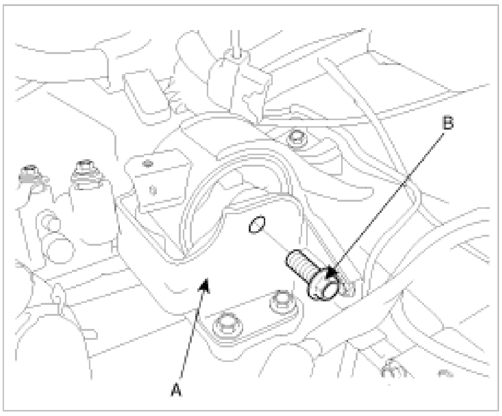
Tightening torque :
137.3~156.9Nm (14.0~16.0kgf.m, 101.3~115.7lb-ft)



29. Remove drive shaft from transaxle.(See DS group)
30. Install jack for supporting engine and transaxle assembly.
31. Remove the engine mounting bracket(A).



32. Remove the transaxle mounting bracket(A).



33. Jack up the vehicle.

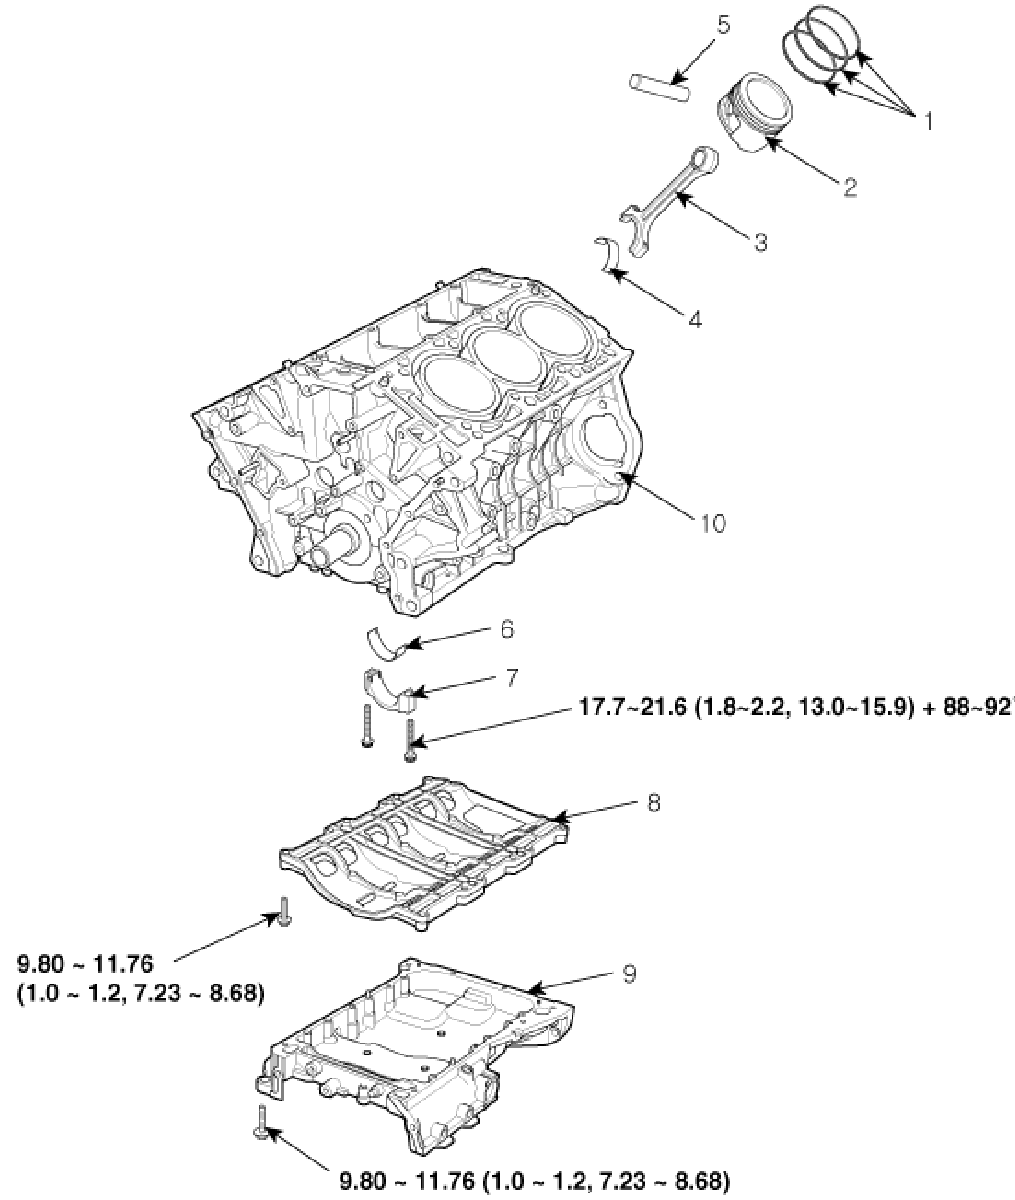
INSTALLATION

Installation is in the reverse order of removal.
Perform the following :

- Adjust the shift cable.
- Refill the engine with engine oil.
- Refill the transaxle with fluid.
- Refill the radiator with engine coolant.
- Bleed air from the cooling system with the heater valve open.
- Clean the battery posts and cable terminals with sandpaper assemble them, then apply grease to prevent corrosion.
- Inspect for fuel leakage.
  After assembling the fuel line, turn on the ignition switch (do not operate the starter) so that the fuel pump runs for approximately two seconds and fuel line pressurizes.
  Repeat this operation two or three times, then check for fuel leakage at any point in the fuel line.

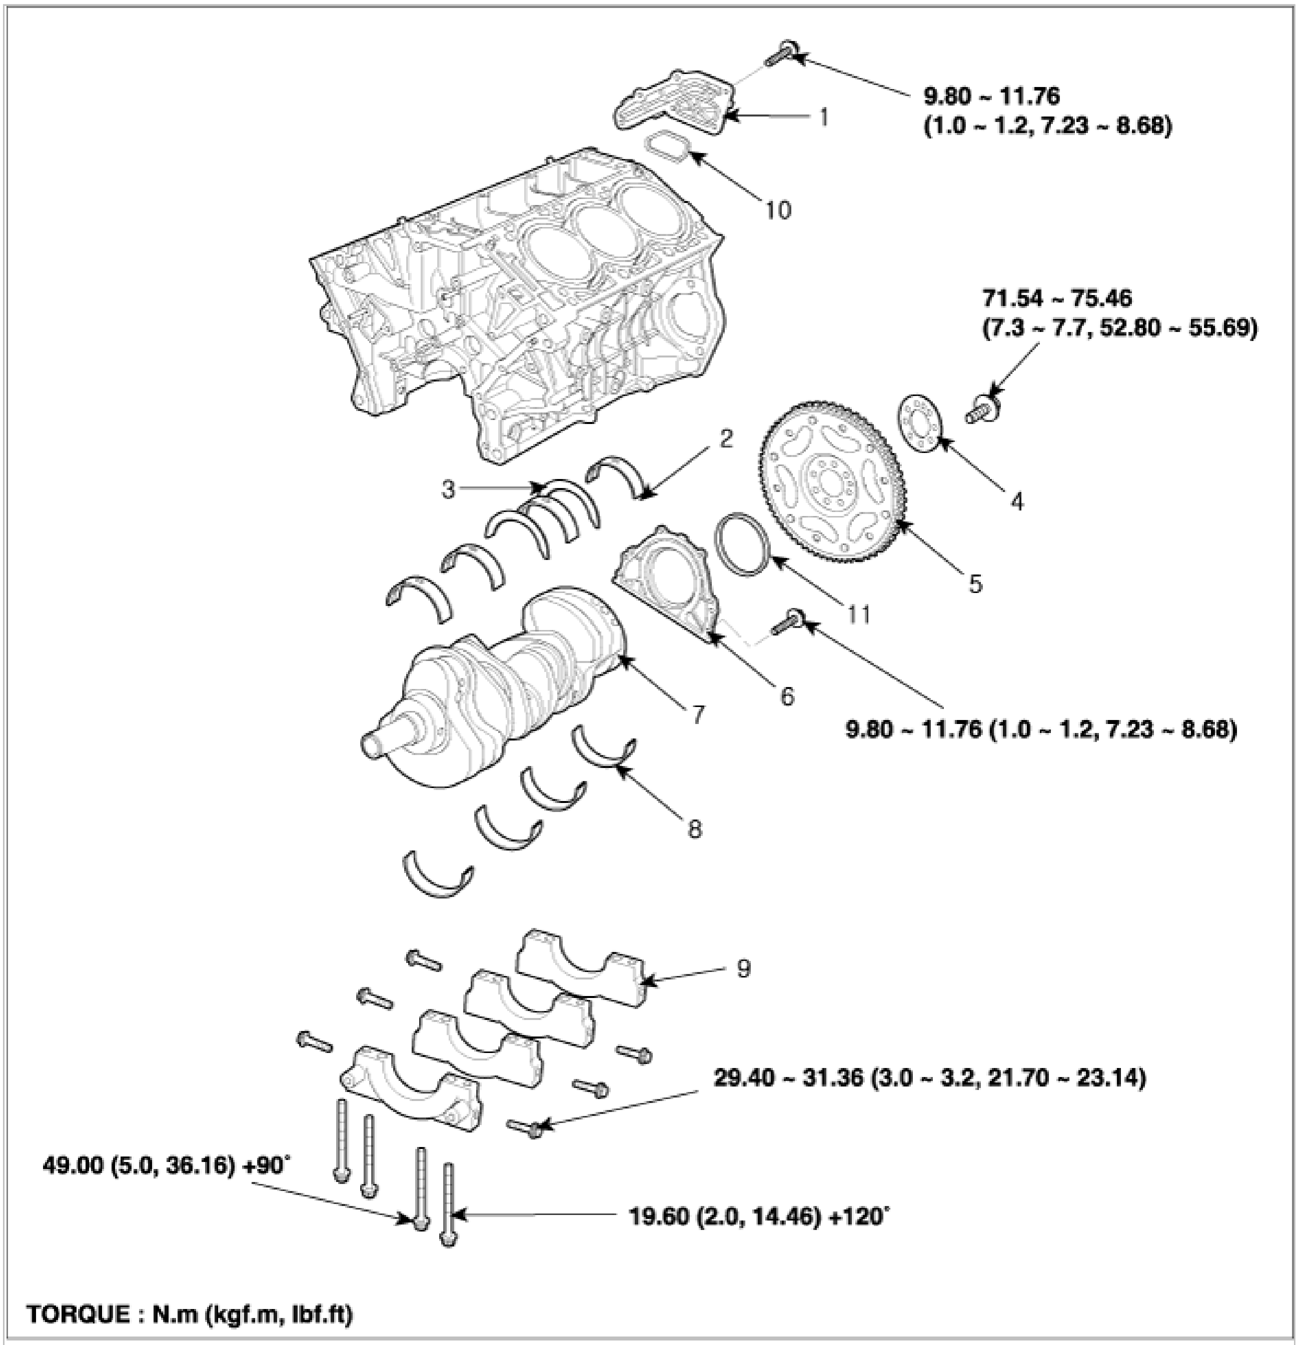
Engine Mechanical System > Cylinder Block > Components and Components Location

COMPONENTS



TORQUE : N.m (kgf.m, lbf.ft)

1. Piston ring
2. Piston
3. Connecting rod
4. Connecting rod upper bearing
5. Piston pin
6. Connecting rod lower bearing
7. Connecting rod bearing cap
8. Baffle plate
9. Upper oil pan
10. Cylinder block



1. Oil drain cover
2. Crankshaft upper bearing
3. Thrust bearing
4. Plate adapter
5. Drive plate
6. Rear oil seal case
7. Crankshaft
8. Crankshaft lower bearing
9. Main bearing cap
10. Oil drain cover gasket
11. Rear oil seal

Engine Mechanical System > Cylinder Block > Repair procedures

REMOVAL

CAUTION

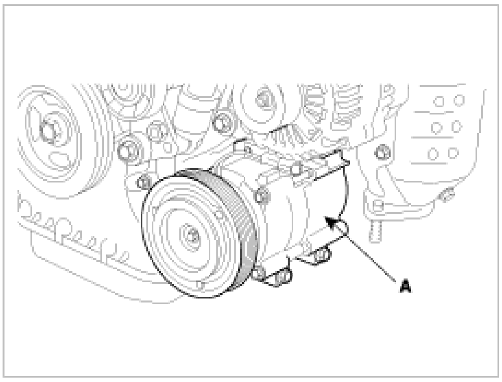
- Use fender covers to avoid damaging painted surfaces.
- To avoid damage, unplug the wiring connectors carefully while holding the connector portion.

NOTE

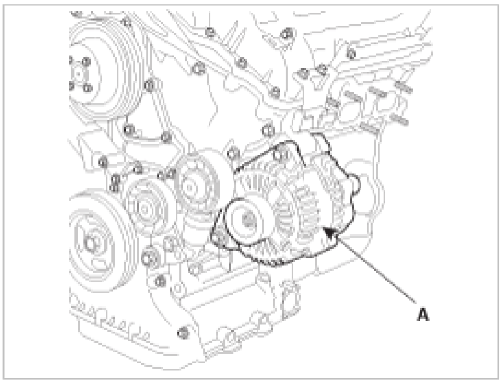
- Mark all wiring and hoses to avoid misconnection.

• Inspection the timing belt before removing the cylinder head.
• Turn the crankshaft pulley so that the No.1 piston is at top dead center.

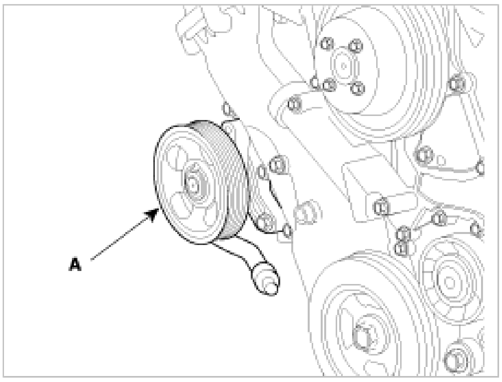
1. Remove exhaust manifold.
2. Remove intake manifold.
3. Remove timing chain.
4. Remove water temperature control assembly.
5. Remove cylinder head.
6. Remove oil pump.
7. Remove oil filter assembly.
8. Remove A/C compressor(A) from engine.



9. Remove alternator(A) from engine.



10. Remove power steering pump(A) from engine.



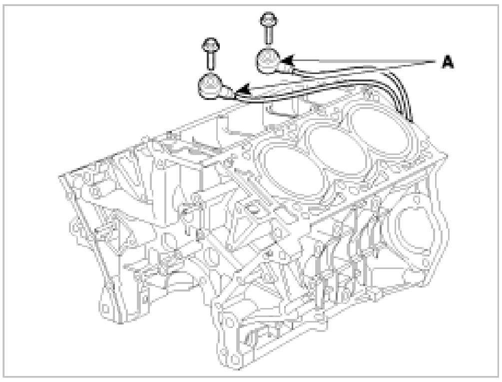
INSTALLATION

1. Install power steering pump.
2. Install alternator.
3. Install air compressor
4. Install oil filter assembly.

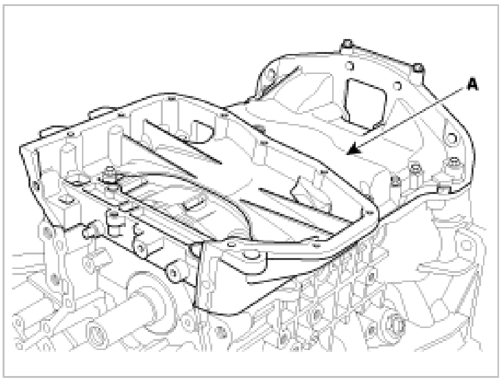
5. Install oil pump.
6. Install cylinder head.
7. Install water temperature control assembly.
8. Install timing chain.
9. Install intake manifold.
10. Install exhaust manifold.

DISASSEMBLY

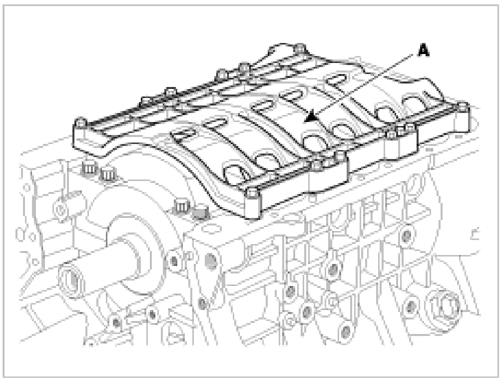
1. Remove drive plate.
2. Remove knock sensor(A).



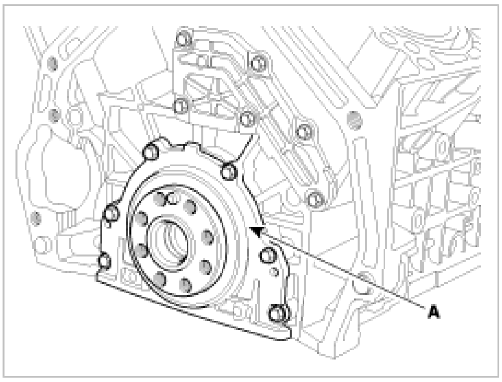
3. Remove upper oil pan(A).



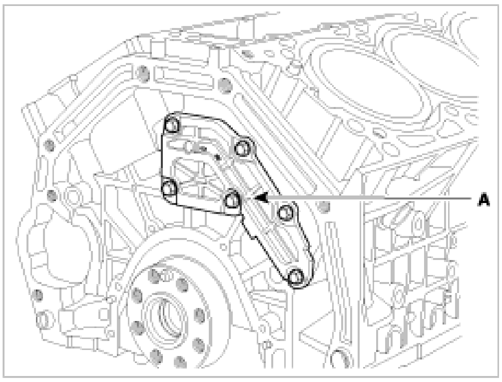
4. Remove baffle plate(A).



5. Remove rear oil seal case(A).



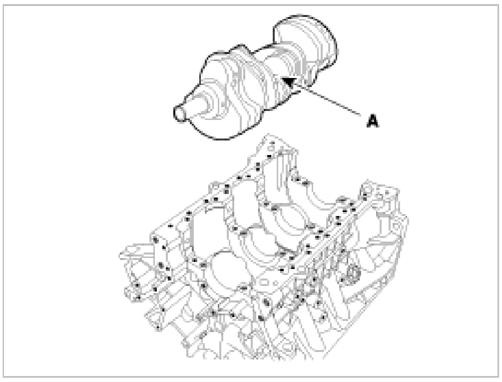
6. Remove oil drain cover(A).



7. Check the connecting rod end play.
8. Check the connecting rod oil clearance.
9. Remove piston and connecting rod assemblies.
   (1) Using a ridge reamer, remove all the carbon from the top of the cylinder.
   (2) Push the piston, connecting rod assembly and upper bearing through the top of the cylinder block.

> NOTE
>
> - Keep the bearings, connecting rod and cap together.
> - Arrange the piston and connecting rod assemblies in the correct order.

10. Remove crankshaft main bearing cap and check oil clearance.
11. Check the crankshaft end play.
12. Lift the crankshaft(A) out of engine, being careful not to damage journals.



> NOTE
>
> Arrange the main bearings and thrust bearings in the correct order.

13. Check fit between piston and piston pin.
    Try to move the piston back and forth on the piston pin. If any movement is felt, replace piston and piston pin as a set.
14. Remove piston rings.

(1) Using a piston ring expender, remove the 2 compression rings.

(2) Remove 2 side rails and the spacer by hand.

> NOTE
>
> Arrange the piston rings in the correct order only.

15. Disconnect connecting rod from piston.

INSPECTION

CONNECTING ROD AND CRANKSHAFT

1. Check the connecting rod end play.
   Using a feeler gauge, measure the end play while moving the connecting rod back and forth.

   Standard end play : 0.1~ 0.25mm(0.004 ~ 0.010in.)

   A. If out-of-tolerance, install a new connecting rod.
   B. If still out-of-tolerance, replace the crankshaft.

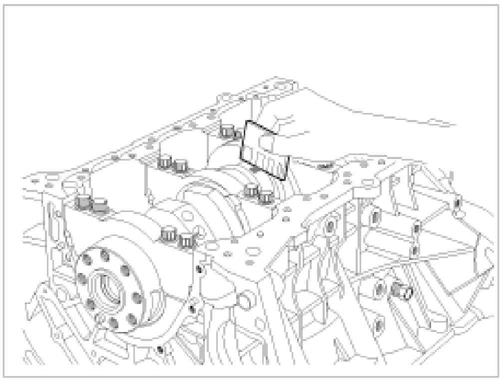
2. Check the connecting rod bearing oil clearance.
   (1) Check the matchmarks on the connecting rod and cap are aligned to ensure correct reassembly.
   (2) Remove 2 connecting rod cap bolts.
   (3) Remove the connecting rod cap and bearing half.
   (4) Clean the crank pin and bearing.
   (5) Place plastigage across the crank pin.
   (6) Reinstall the bearing half and cap, and torque the bolts.

   Tightening torque
   17.7~21.6Nm (1.8~2.2kgf.m, 13.0~15.9lb-ft) + 88~92°

   > NOTE
   >
   > Do not turn the crankshaft.

   (7) Remove 2 bolts, connecting rod cap and bearinghalf.
   (8) Measure the plastigage at its widest point.

   Standard oil clearance
   0.030 ~ 0.048mm(0.0012 ~ 0.0019in.)



(9) If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color mark (select the color as shown in the next column), and recheck the clearance.

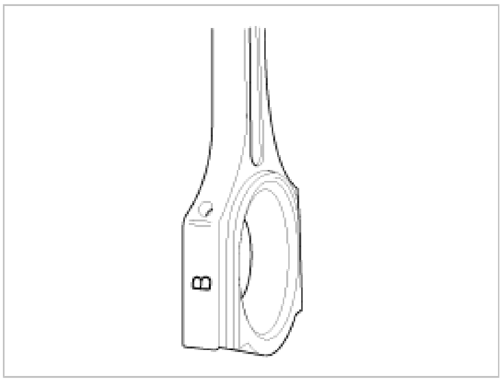
> CAUTION
>
> Do not file, shim, or scrape the bearings or the caps to adjust clearance.

(10) If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check clearance again.

> NOTE
>
> If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

> CAUTION
>
> If the marks are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

CONNECTING ROD MARK LOCATION

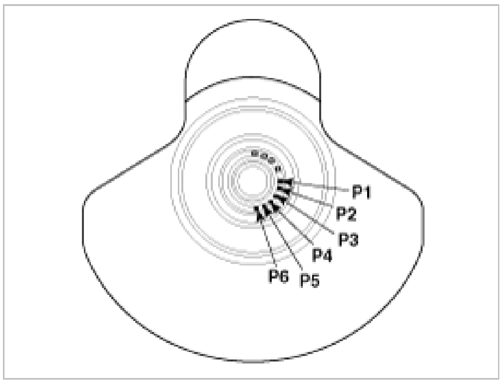


DISCRIMINATION OF CONNECTING ROD

CLASS	MARK	INSIDE DIAMETER
0	a	58.000 ~ 58.006mm (2.2834 ~ 2.2837in.)
1	b	58.006 ~ 58.012mm (2.2837 ~ 2.2839in.)
2	c	58.012 ~ 58.018mm (2.2839 ~ 2.2842in.)

CRANKSHAFT PIN MARK LOCATION

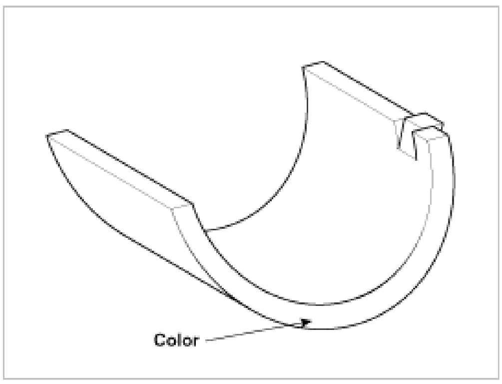
DISCRIMINATION OF CRANKSHAFT



DISCRIMINATION OF CRANKSHAFT

CLASS	MARK	OUTSIDE DIAMETER OF PIN
I	A	54.966 ~ 54.972mm (2.1640 ~ 2.1642in.)
II	B	54.960 ~ 54.966mm (2.1638 ~ 2.1640in.)
III	C	54.954 ~ 54.960mm (2.1635 ~ 2.1638in.)

PLACE OF IDENTIFICATION MARK (CONNECTING ROD BEARING)



DISCRIMINATION OF CONNECTING ROD BEARING

CLASS	MARK	THICKNESS OF BEARING
E	BLUE	1.514 ~ 1.517mm (0.0596 ~ 0.0597in.)
D	BLACK	1.511 ~ 1.514mm (0.0595 ~ 0.0596in.)
C	BROWN	1.508 ~ 1.511mm (0.0594 ~ 0.0595in.)
B	GREEN	1.505 ~ 1.508mm (0.0593 ~ 0.0594in.)
A	YELLOW	1.502 ~ 1.505mm (0.0591 ~ 0.0593in)

(11) Selection

		CONNECTING ROD IDENTIFICATION MARK		
		0(a)	1(b)	2(c)
CRANKSHAFT	I(A)	A (YELLOW)	B (GREEN)	C (BROWN)
	II(B)	B	C	D

INDENTIFICATION MARK		(GREEN)	(BROWN)	(BLACK)
	III(C)	C (BROWN)	D (BLACK)	E (BLUE)

3. Check the crankshaft bearing oil clearance.
   (1) To check main bearing-to-journal oil clearance, remove the main bearing caps and bearing halves.
   (2) Clean each main journal and bearing half with a clean shop tower.
   (3) Place one strip of plastigage across each main journal.
   (4) Reinstall the bearings and caps, then torque the bolts.

Tightening torque
49.00Nm(5.0 kgf.m, 36.16lbf.ft) + 90°
19.60 Nm(2.0 kgf.m, 14.46lbf.ft)+ 120°
29.40 ~ 31.36Nm(3.0 ~ 3.2 kgf.m, 21.70 ~ 23.14lbf.ft)

NOTE

Do not turn the crankshaft.

   (5) Remove the cap and bearing again, and measure the widest part of the plastigage.

Standard oil clearance
0.022 ~ 0.040mm (0.0009 ~ 0.0016in.)

   (6) If the plastigage measures too wide or too narrow, remove the upper half of the bearing, install a new, complete bearing with the same color mark (select the color as shown in the next column), and recheck the clearance.

CAUTION

Do not file, shim, or scrape the bearings or the caps to adjust clearance.

   (7) If the plastigage shows the clearance is still incorrect, try the next larger or smaller bearing (the color listed above or below that one), and check clearance again.

NOTE

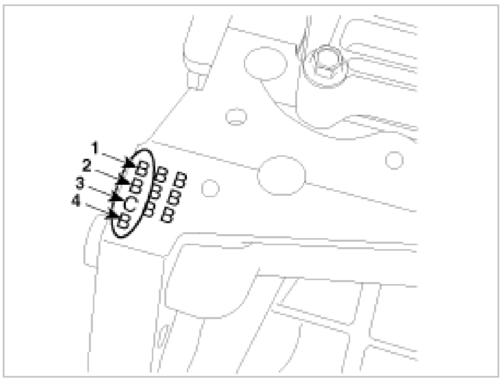
If the proper clearance cannot be obtained by using the appropriate larger or smaller bearings, replace the crankshaft and start over.

CAUTION

If the marks are indecipherable because of an accumulation of dirt and dust, do not scrub them with a wire brush or scraper. Clean them only with solvent or detergent.

Crankshaft bore mark location
Letters have been stamped on the block as a mark for the size of each of the 5 main journal bores.
Use them, and the numbers or bar stamped on the crank (marks for main journal size), to choose the correct

bearings.

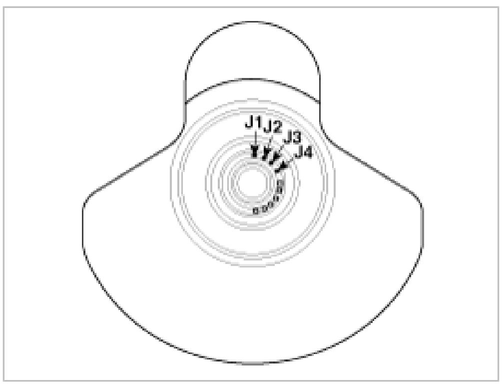


DISCRIMINATION OF CYLINDER BLOCK

CLASS	MARK	INSIDE DIAMETER
a	A	73.500 ~ 73.506mm (2.8937 ~ 2.8939in.)
b	B	73.506 ~ 73.512mm (2.8939 ~ 2.8942in.)
c	C	73.512 ~ 73.518mm (2.8942 ~ 2.8944in.)

CRANKSHAFT JOURNAL MARK LOCATION

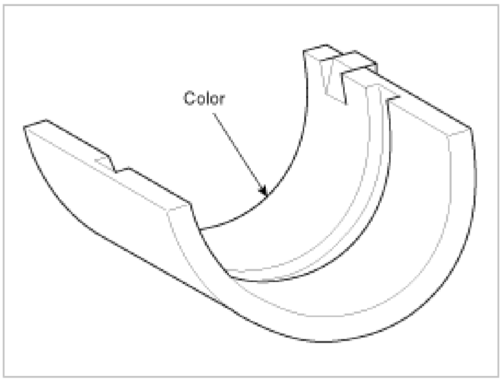
DISCRIMINATION OF CRANKSHAFT



DISCRIMINATION OF CRANKSHAFT

CLASS	MARK	OUTSIDE DIAMETER OF JOURNAL
I	A	68.954 ~ 68.960mm (2.7147 ~ 2.7150in.)
II	B	68.948 ~ 68.954mm (2.7145 ~ 2.7147in.)
III	C	68.942 ~ 68.948mm (2.7142 ~ 2.7145in.)

PLACE OF IDENTIFICATION MARK (CRANKSHAFT BEARING)



DISCRIMINATION OF CRANKSHAFT BEARING

CLASS	MARK	THICKNESS OF BEARING
E	BLUE	2.277 ~ 2.280mm (0.0896 ~ 0.0897in.)
D	BLACK	2.274 ~ 2.277mm (0.0895 ~ 0.0896in.)
C	BROWN	2.271 ~ 2.274mm (0.0894 ~ 0.0895in.)
B	GREEN	2.268 ~ 2.271mm (0.0893 ~ 0.0894in.)
A	YELLOW	2.265 ~ 2.268mm (0.0892 ~ 0.0893in.)

SELECTION

		CRANKSHAFT BORE IDENTIFICATION MARK		
		a(A)	b(B)	c(C)
CRANKSHAFT IDENTIFICATION MARK	I(A)	A (YELLOW)	B (GREEN)	C (BROWN)
	II(B)	B (GREEN)	C (BROWN)	D (BLACK)
	III(C)	C (BROWN)	D (BLACK)	E (BLUE)

4. Check crankshaft end play.
   Using a dial indicator, measure the thrust clearance while prying the crankshaft back and forth with a screwdriver.

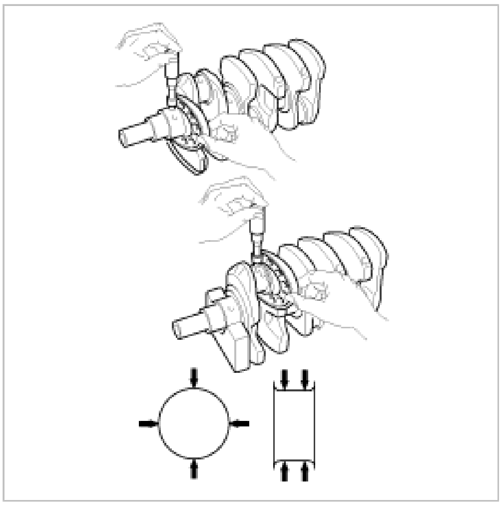
   Standard end play
   0.10 ~ 0.28mm (0.0039 ~ 0.0110in.)

   
   If the end play is greater than maximum, replace the thrust bearings as a set.

   Thrust bearing thickness
   2.41 ~ 2.45mm(0.0949 ~ 0.0964in.)

5. Inspect main journals and crank pins
   Using a micrometer, measure the diameter of each main journal and crank pin.

   Main journal diameter : 68.942 ~ 68.960mm (2.7142 ~ 2.7149in.)
   Crank pin diameter : 54.954 ~ 54.972mm (2.1635 ~ 2.1642in.)



CONNECTING RODS

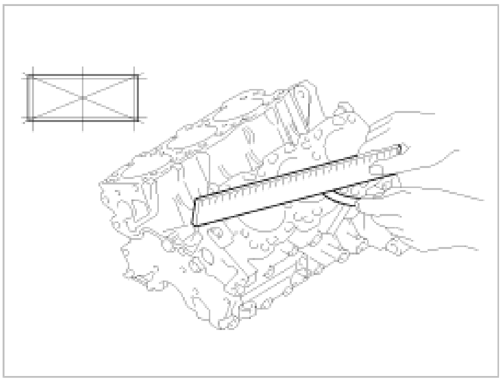
1. When reinstalling, make sure that cylinder numbers put on the connecting rod and cap at disassembly match. When a new connecting rod is installed, make sure that the notches for holding the bearing in place are on the same side.
2. Replace the connecting rod if it is damaged on the thrust faces at either end. Also if step wear or a severely rough surface of the inside diameter of the small end is apparent, the rod must be replaced as well.
3. Using a connecting rod aligning tool, check the rod for bend and twist. If the measured value is close to the repair limit, correct the rod by a press. Any connecting rod that has been severely bent or distorted should be replaced.

   Allowable bend of connecting rod :
   0.05mm / 100mm (0.0020 in./3.94 in.) or less
   Allowable twist of connecting rod :
   0.1mm / 100mm (0.0039 in./3.94 in.) or less

CYLINDER BLOCK

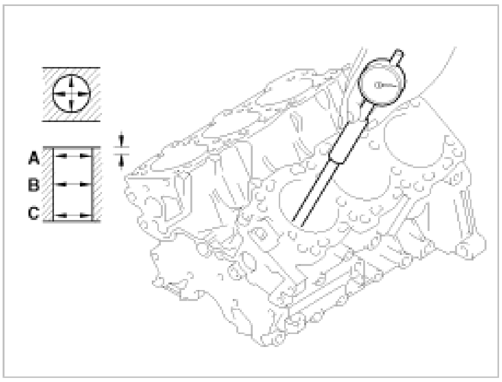
1. Remove gasket material.
   Using a gasket scraper, remove all the gasketmaterial from the top surface of the cylinder block.
2. Clean cylinder block
   Using a soft brush and solvent, thoroughly clean the cylinder block.
3. Inspect top surface of cylinder block for flatness.
   Using a precision straight edge and feeler gauge, measure the surface contacting the cylinder head gasket for warpage.

   Flatness of cylinder block gasket surface
   Standard : Less than 0.05mm(0.0020 in.),Less than 0.02mm(0.0008in.) / 150 x 150

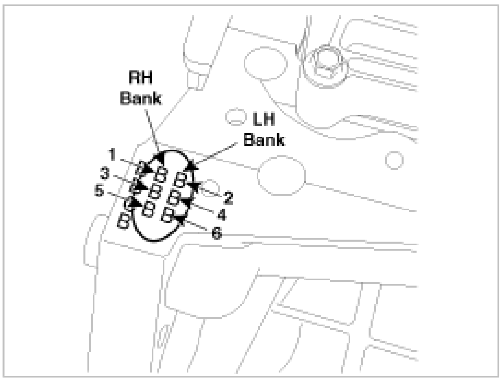


4. Inspect cylinder bore diameter
   Visually check the cylinder for vertical scratchs.
   If deep scratches are present, replace the cylinder block.
5. Inspect cylinder bore diameter
   Using a cylinder bore gauge, measure the cylinder bore diameter at position in the thrust and axial directions.

Standard diameter
92.00 ~ 92.03mm (3.6220 ~ 3.6232in.)

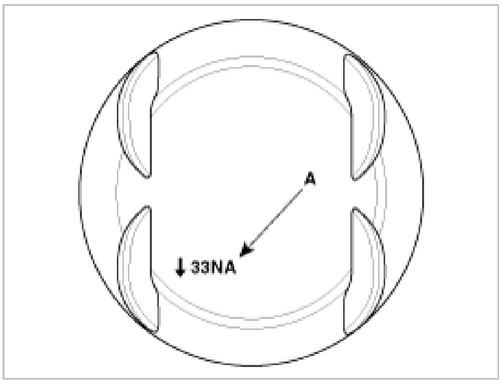


6. Check the cylinder bore size code on the cylinder block.



Class	Size code	Cylinder bore inner diameter
A	A	92.00~92.01mm (3.6220 ~ 3.6224in.)
B	B	92.01~92.02mm (3.6224 ~ 3.6228in.)
C	C	92.02~92.03mm (3.6228 ~ 3.6232in.)

7. Check the piston size code on the piston top face.



Class	Size code	Piston outer diameter
A	A	91.97~91.98mm (3.6209 ~ 3.6212in.)
B	B	91.98~91.99mm (3.6212 ~ 3.6216in.)
C	C	91.99~92.00mm (3.6216 ~ 3.6220in.)

8. Select the piston related to cylinder bore class.

Clearance : 0.02 ~ 0.04mm(0.0008 ~ 0.0016in.)

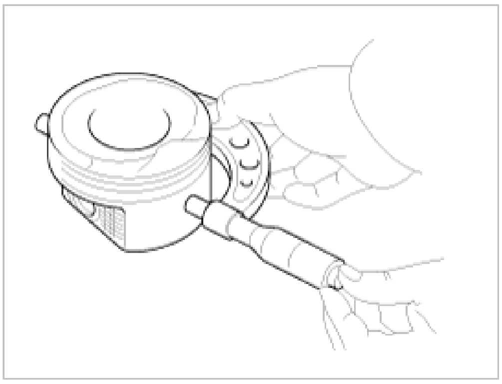
PISTON AND RINGS

1. Clean piston
   (1) Using a gasket scraper, remove the carbon from the piston top.
   (2) Using a groove cleaning tool or broken ring, clean the piston ring grooves.
   (3) Using solvent and a brush, thoroughly clean the piston.

   NOTE
   Do not use a wire brush.

2. The standard measurement of the piston outside diameter is taken 14 mm (0.5512 in.) from the bottom of the piston.

Standard diameter
91.97 ~ 92.00mm (3.6209~ 3.6220in.)



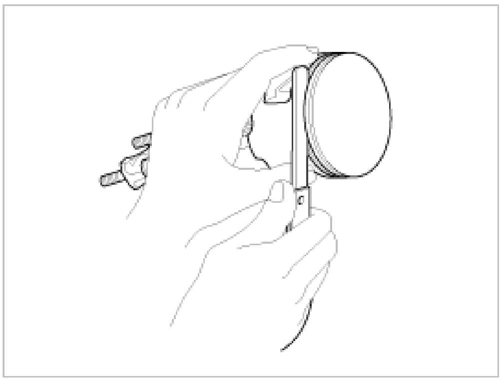
3. Calculate the difference between the cylinder bore diameter and the piston diameter.

Piston-to-cylinder clearance
0.02 ~ 0.04mm(0.0008 ~ 0.0016in.)

4. Inspect the piston ring side clearance.

Using a feeler gauge, measure the clearance between new piston ring and the wall of the ring groove.

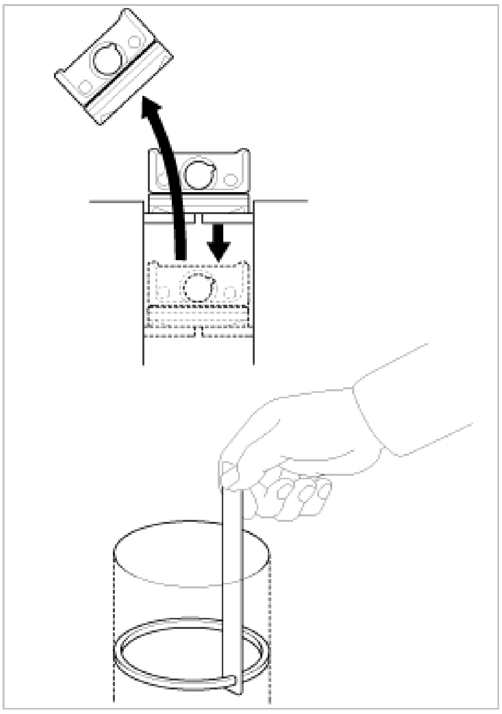
Piston ring side clearance
Standard
No.1 : 0.04 ~ 0.078mm (0.0016 ~ 0.0031in.)
No.2 : 0.03 ~ 0.07mm (0.0012 ~ 0.0027in.)
Oil ring : 0.06 ~ 0.15mm (0.0024 ~ 0.0059in.)
Limit
No.1 : 0.1mm (0.004in.)
No.2 : 0.1mm (0.004in.)
Oil ring : 0.2mm (0.008in.)



If the clearance is greater than maximum, replace the piston.

5. Inspect piston ring end gap.
To measure the piston ring end gap, insert a piston ring into the cylinder bore. Position the ring at right angles to the cylinder wall by gently pressing it down with a piston. Measure the gap with a feeler gauge. If the gap exceeds the service limit, replace the piston ring. If the gap is too large, recheck the cylinder bore diameter against the wear limits. If the bore is over the service limit, the cylinder block must be replaced.

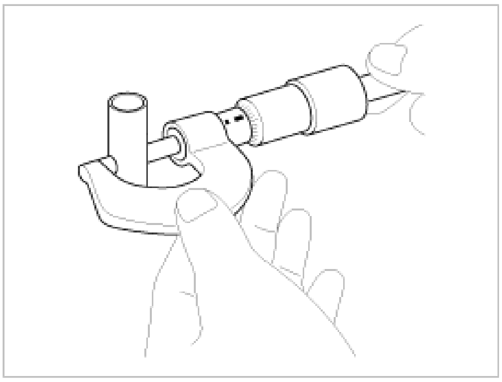
Piston ring end gap
Standard
No.1 : 0.17 ~ 0.32mm (0.0067 ~ 0.0126in.)
No.2 : 0.32 ~ 0.47m (0.0126 ~ 0.0185in.)
Oil ring : 0.20 ~ 0.70mm (0.0079 ~ 0.0275in.)
Limit
No.1 : 0.6mm (0.0236in.)
No.2 : 0.7mm (0.0275in.)
Oil ring : 0.8mm (0.0315in.)



PISTON PINS

1. Measure the diameter of the piston pin.

Piston pin diameter
23.002 ~ 23.006mm (0.9056 ~ 0.9057in.)



2. Measure the piston pin-to-piston clearance.

Piston pin-to-piston clearance
0.009 ~ 0.017mm (0.0004 ~ 0.0007in.)

3. Check the difference between the piston pin diameter and the connecting rod small end diameter.

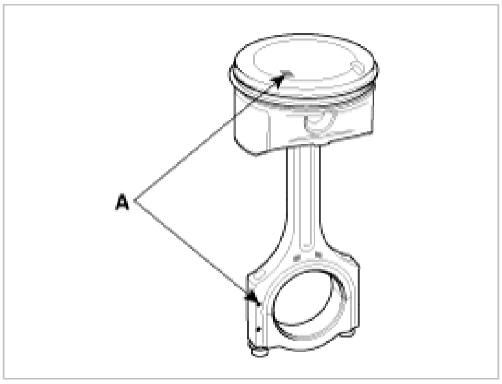
Piston pin-to-connecting rod interference
0.017 ~ 0.032mm (0.0007 ~ 0.0013in.)

REASSEMBLY

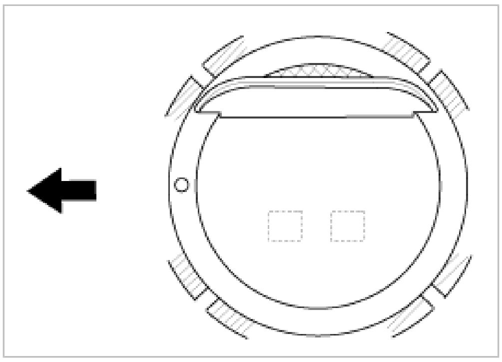
NOTE

- Thoroughly clean all parts to assembled.
- Before installing the parts, apply fresh engine oil to all sliding and rotating surfaces.
- Replace all gaskets, O-rings and oil seals with new parts.

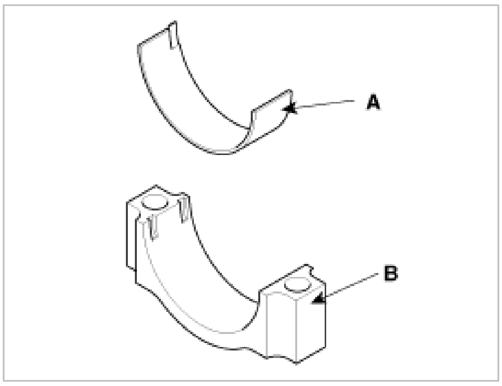
1. Assemble piston and connecting rod.
   (1) Use a hydraulic press for installation.
   (2) The piston front mark and the connecting rod front mark must face the timing belt side of the engine.



2. Install piston rings.
   (1) Install the oil ring spacer and 2 side rails by hand.
   (2) Using a piston ring expander, install the 2 compression rings with the code mark facing upward.
   (3) Position the piston rings so that the ring ends are as shown.



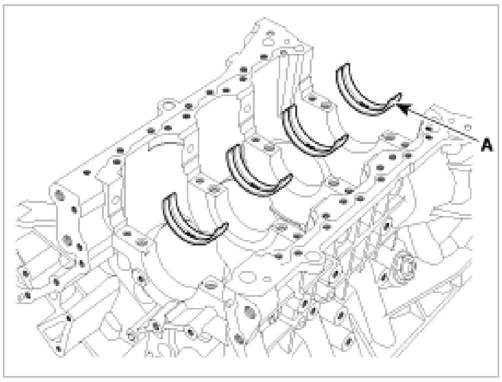
3. Install connecting rod bearings.
   (1) Align the bearing claw with the groove of the connecting rod or connecting rod cap.
   (2) Install the bearings(A) in the connecting rod and connecting rod cap(B).



4. Install main bearings.

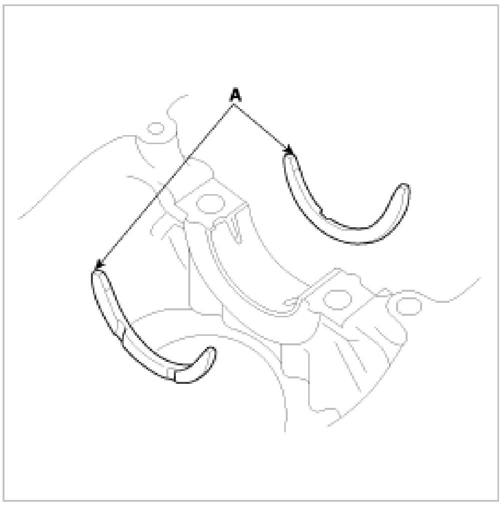
> **NOTE**
>
> Upper bearings have an oil groove of oil holes; Lower bearings do not.

   (1) Align the bearing claw with the claw groove of the cylinder block, push in the 4 upper bearings(A).

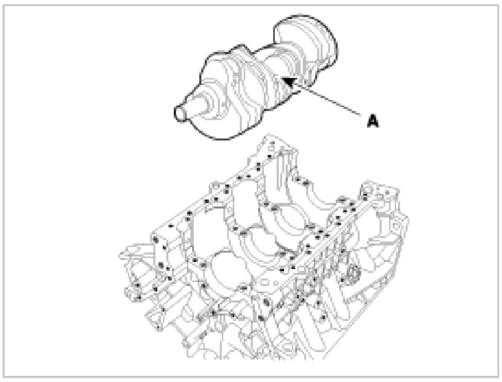


(2) Align the bearing claw with the claw groove of the main bearing cap, and push in the 4 lowerbearings.

5. Install thrust bearings.
   Install the 2 thrust bearings(A) under the No.3 journal position of the cylinder block with the oil grooves facing outward.



6. Place crankshaft on the cylinder block.

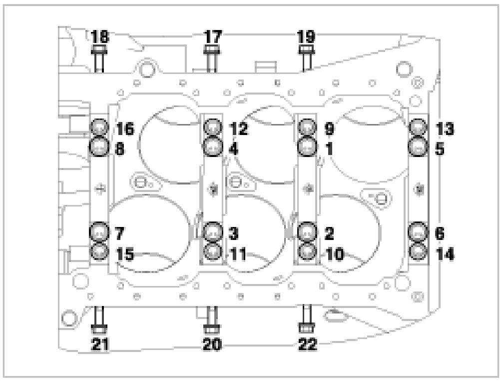


7. Place main bearing caps on cylinder block.
8. Install main bearing cap bolts.
   (1) Install and uniformly tighten the bearing cap bolts, in several passes, in the sequence shown.

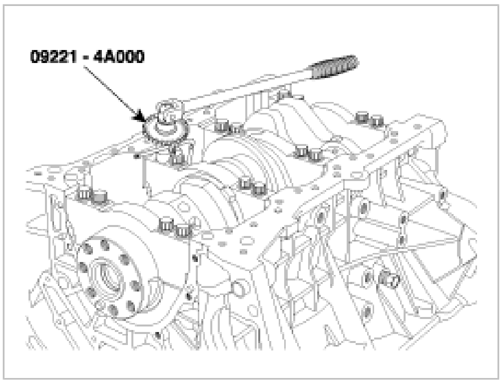
Tightening torque
Main bearing cap bolt
49.00Nm(5.0 kgf.m, 36.16lbf.ft) + 90° (1 ~ 8)
19.60 Nm(2.0 kgf.m, 14.46lbf.ft)+ 120° (9 ~ 16)
29.40 ~ 31.36Nm(3.0 ~ 3.2 kgf.m, 21.70 ~ 23.14lbf.ft) (17 ~ 22)

NOTE

- Always use new main bearing cap bolt.
- If any of the bearing cap bolts in broken or deformed, replace it.



Use SST(09221-4A000), install main bearing cap bolts.



(2) Check that the crankshaft turns smoothly.

9. Check crankshaft end play.
10. Install piston and connecting rod assemblies.

> **NOTE**
>
> Before installing the pistons, apply a coat of engine oil to the ring grooves and cylinder bores.

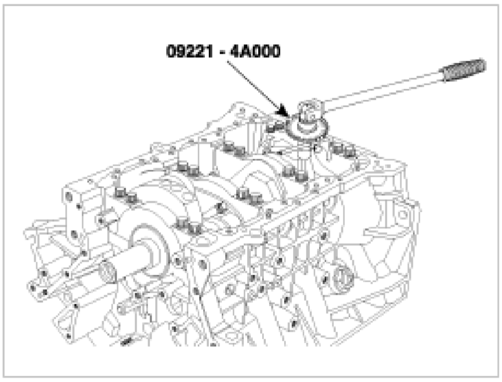
(1) Install the ring compressor, check that the bearing is securely in place, then position the piston in the cylinder, and tap it in using the wooden handle of a hammer.

(2) Stop after the ring compressor pops free, and check the connecting rod-to-check journal alignment before pushing the piston into place.

(3) Apply engine oil to the bolt threads. Install the rod caps with bearings, and torque the bolts.

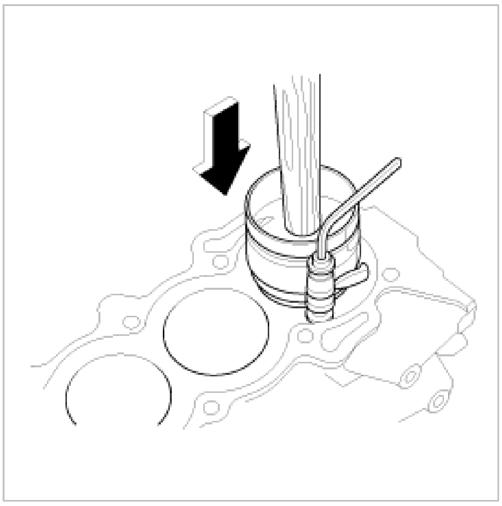
Tightening torque
17.7~21.6Nm (1.8~2.2kgf.m, 13.0~15.9lb-ft) + 88~92°

Use SST(09221-4A000), install connecting rod bearing cap bolts.



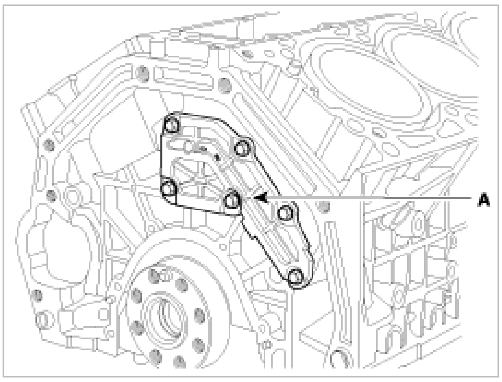
> **NOTE**
>
> • Always use new connecting rod bearing cap bolt.

• Maintain downward force on the ring compressor to prevent the rings from expanding before entering the cylinder bore.



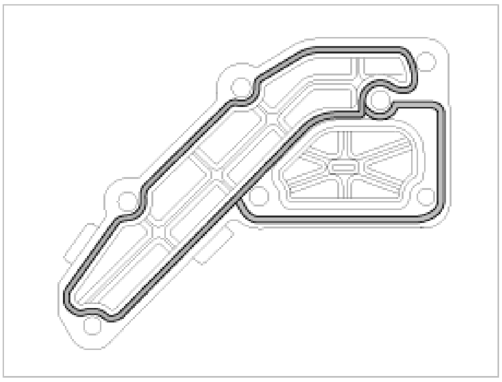
11. Check the connecting rod end play.
12. Install oil drain cover.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)



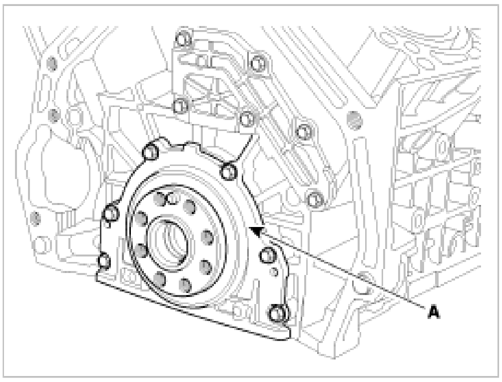
NOTE

• Make clean the sealing face before assembling two parts.
• Remove harmful foreign matters on the sealing face before applying sealant
• Be assembling oil drain cover, the liquid sealant TB1217H should be applied oil drain cover.
• The part must be assembled within 5 minutes after sealant was applied.
• Apply sealant to the inner threads of the bolt holes.



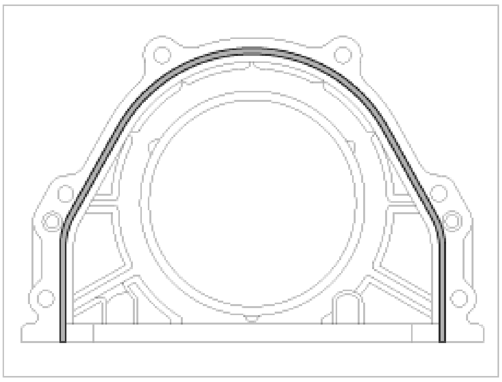
13. Install rear oil seal case.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.67lbf.ft)

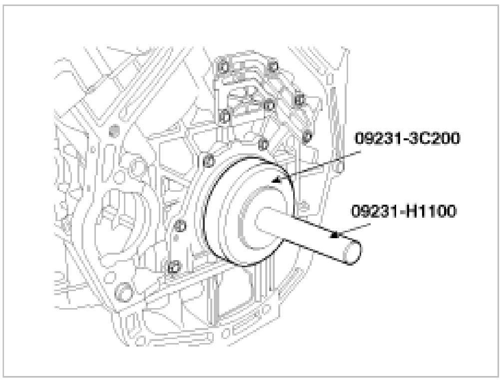


NOTE

- Make clean the sealing face before assembling two parts.
- Remove harmful foreign matters on the sealing face before applying sealant
- Be assembling rear oil seal case, the liquid sealant TB1217H should be applied rear oil seal case.
- The part must be assembled within 5 minutes after sealant was applied.
- Apply sealant to the inner threads of the bolt holes.

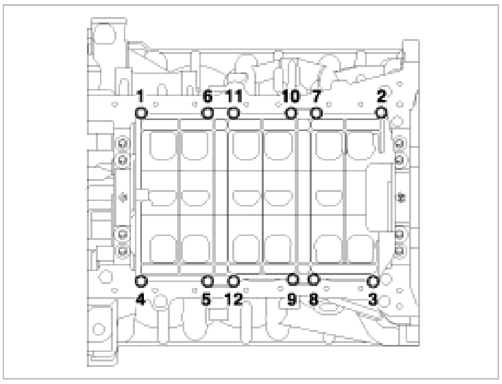


14. Using SST(09231-3C200, 09231-H1100), install rear oil seal.



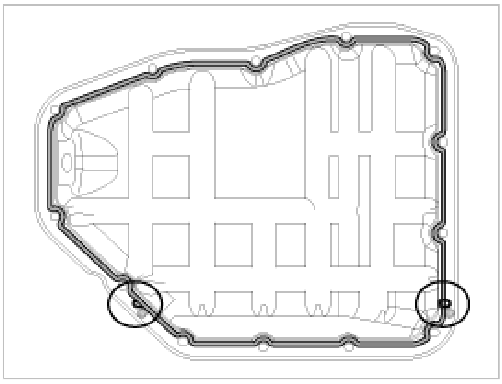
15. Install baffle plate.
    Install and uniformly tighten the baffle plate bolts, in several passes, in the sequence shown.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)



16. Install upper oil pan.
    A. Using a gasket scraper, remove all the old packing material from the gasket surfaces.
    B. Before assebling the oil pan, the liquid sealant TB1217H should be applied on upper oil pan. The part must be assembled within 5 minutes after the sealant was applied.

    Bead width : 2.5mm(0.1in.)



CAUTION

- Make clean the sealing face before assembling two parts.
- Remove harmful foreign matters on the sealing face before applying sealant
- When applying sealant gasket, sealant must not be protruded into the inside of oil pan.
- To prevent leakage of oil, apply sealant gasket ot the inner threads of the bolt holes.

    C. Install oil pan.
    Uniformly tighten the bolts in several passes.

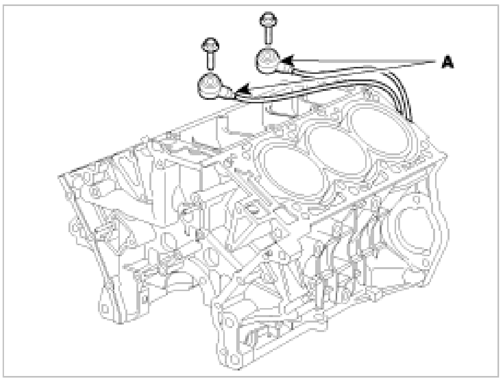
    Tightening torque
    9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

    D. After assembly, wait at least 30 minutes before filling the engine with oil.

17. Install knock sensor.

Tightening torque

15.68 ~ 23.52Nm (1.6 ~ 2.4kgf.m, 11.57 ~ 17.36lbf.ft)



18. Install drive plate.

Tightening torque
71.54 ~ 75.46Nm (7.3 ~ 7.7kgf.m, 52.80 ~ 55.69lbf.ft)

Engine Mechanical System > Cooling System > Description and Operation

ENGINE COOLANT REFILLING AND BLEEDING

WARNING

Never remove the radiator cap when the engine is hot. Serious scalding could be caused by hot fluid under high pressure escaping from the radiator.

CAUTION

When pouring engine coolant, be sure to shut the relay box lid and not to let coolant spill on the electrical parts or the paint. If any coolant spills, rinse it off immediately.

1. Make sure the engine and radiator are cool to the touch.
2. Remove radiator cap.
3. Loosen the drain plug, and drain the coolant.
4. Tighten the radiator drain plug securely.
5. Remove, drain and reinstall the reservoir. Fill the tank halfway to the MAX mark with water, then up to the MAX mark with antifreeze.
6. Fill fluid mixture with coolant and water(4 : 6) slowly through the radiator cap. Push the upper/lower hoses of the radiator so as bleed air easily.

NOTE

- Use only genuine antifreeze/coolant.
- For best corrosion protection, the coolant concentration must be maintained year-round at 50% minimum. Coolant concentrations less than 50% may not provide sufficient protection against corrosion or freezing.
- Coolant concentrations greater then 60% will impair cooling efficiency and are not recommended.

CAUTION

- Do not mix different brands of antifreeze/coolants.
- Do not use additional rust inhibitors or antirust products; they may not be compatible with the coolant.

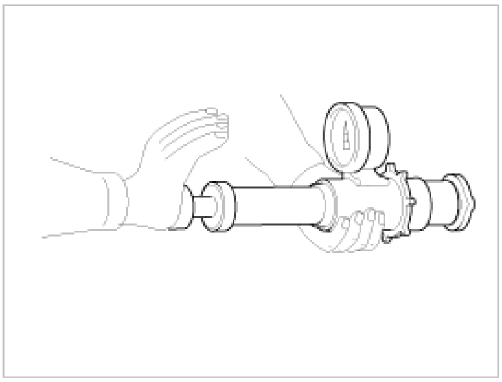
7. Start the engine and run coolant circulates.
When the cooling fan operates and coolant circulates, refill coolant through the radiator cap.
8. Repeat 7 until the cooling fan 3 ~ 5times and bleed air sufficiently out of the cooling system.
9. Install the radiator cap and fill the reservoir tank to the "MAX" line with coolant.

10. Run the vehicle under idle until the cooling fan operates 2 ~ 3 times.
11. Stop the engine and wait coolant gets cool.
12. Repeat 6 to 11 until the coolant level doesn't fall any more, bleed air out of the cooling system.

> **NOTE**
>
> As it is to bleed air out to the cooling system and refill coolant when coolant gets cool completely, recheck the coolant level in the reservoir tank for 2 ~ 3 days after replacing coolant.

CAP TESTING

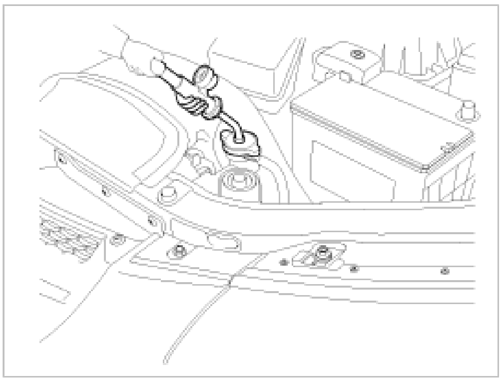
1. Remove the radiator cap, wet its seal with engine coolant, then install it no pressure tester.



2. Apply a pressure of 93 ~ 123kPa (0.95 ~ 1.25kgf/cm², 14 ~ 19psi)
3. Check for a drop in pressure.
4. If the pressure drops, replace the cap.

TESTING

1. Wait until engine is cool, then carefully remove the radiator cap and fill the radiator with engine coolant, then install it on the pressure tester.

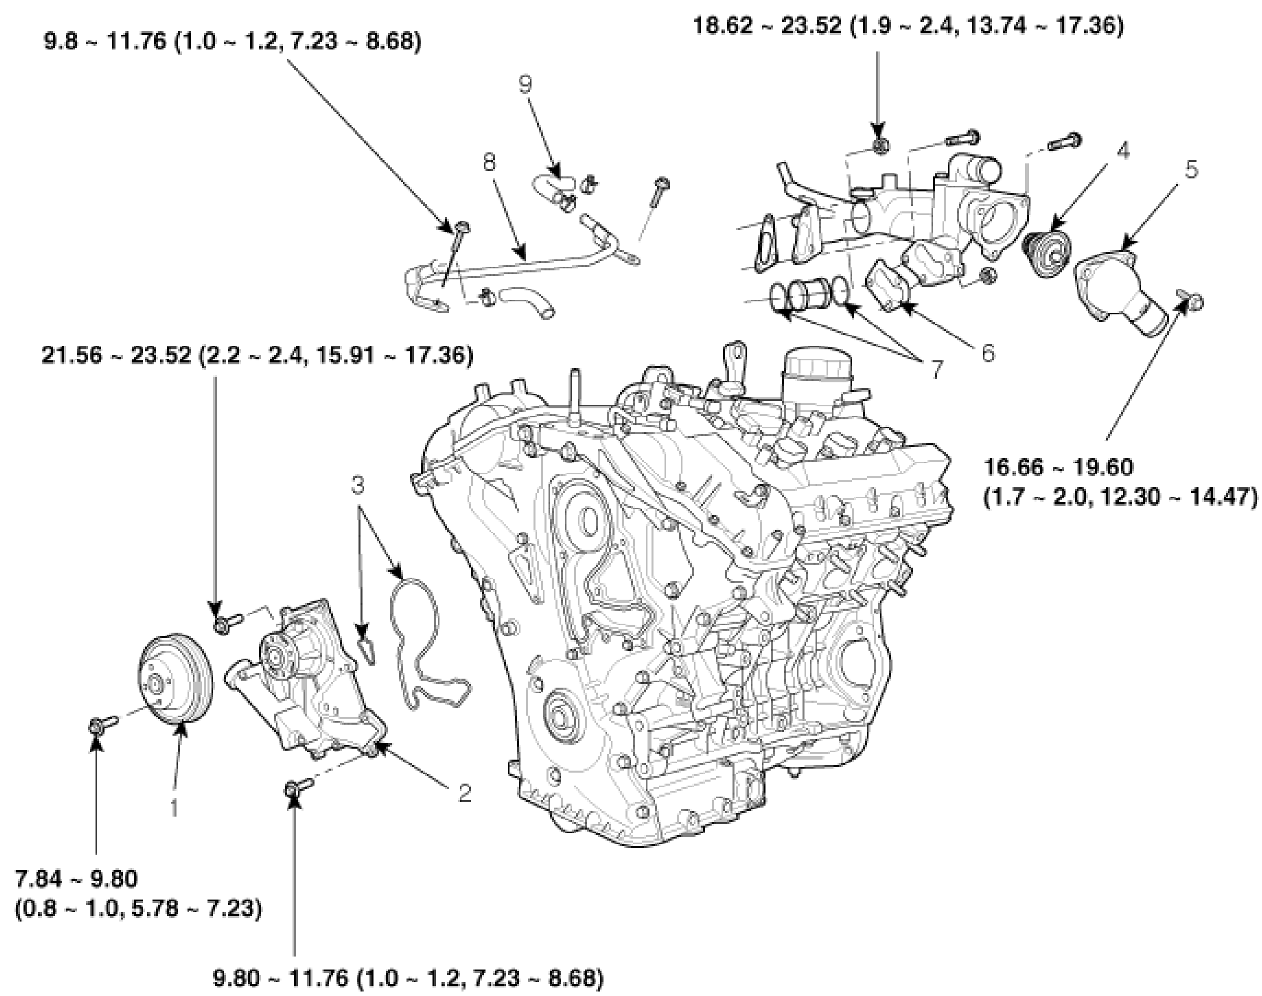


2. Apply a pressure tester to the radiator and apply a pressure of 93 ~ 123kPa (0.95 ~ 1.25kgf/cm² 14 ~18psi).
3. Inspect for engine coolant leaks and a drop in pressure.
4. Remove the tester and reinstall the radiator cap.

> **NOTE**
>
> Check for engine oil in the coolant and/or coolant in the engine oil.

Engine Mechanical System > Cooling System > Components and Components Location

COMPONENT



TORQUE : N.m (kgf.m, lb-ft)

1. Water pump pulley
2. Water pump
3. Water pump gasket
4. Thermostat
5. Water inlet pipe
6. Gasket
7. O - ring
8. Air vent pipe
9. Hose

Engine Mechanical System > Cooling System > Repair procedures

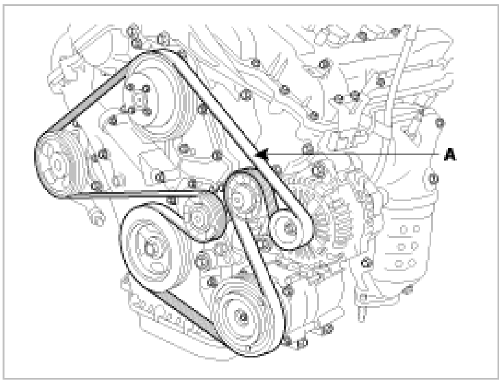
REMOVAL

WATER PUMP

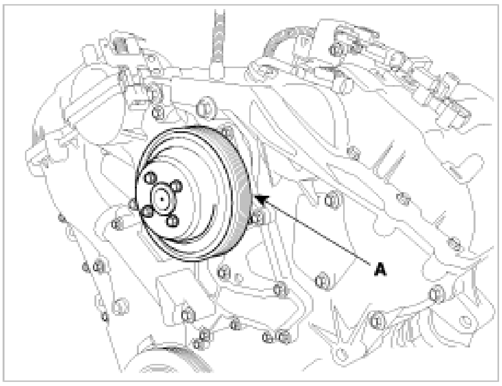
1. Drain the engine coolant.

> WARNING
>
> System is under high pressure when the engine is hot. To avoid danger of releasing scalding engine coolant, remove the cap only when the engine is cool.

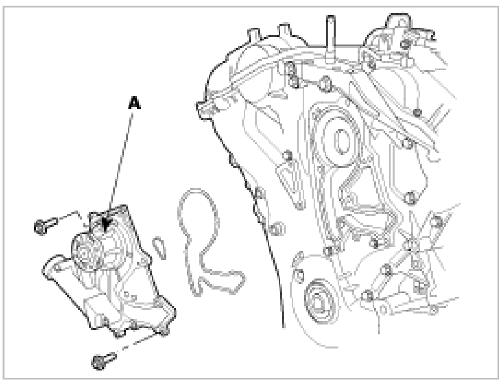
2. Remove drive belt(A).



3. Remove the 4 bolts and pump pulley(A).

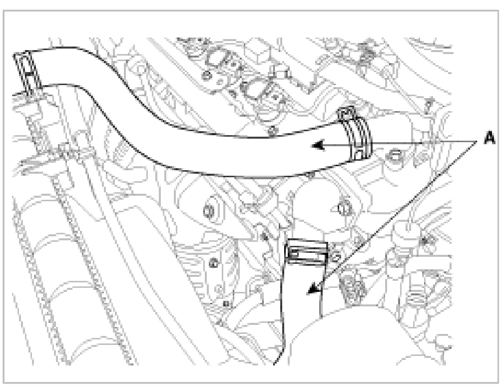


4. Remove the water pump(A) and gasket.



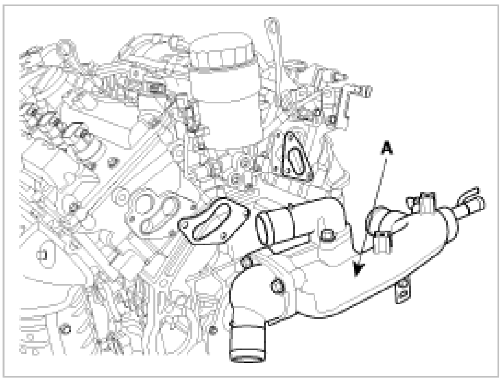
WATER TEMPERATURE CONTROL ASSEMBLY

1. Drain the engine coolant.
2. Remove air cleaner assembly.
3. Disconnect radiator upper and lower hose(A).



4. Disconnect WTS connector.
5. Disconnect heater hose, water vent hose and water hose from water temperature control assembly.
6. Remove wiring protector.

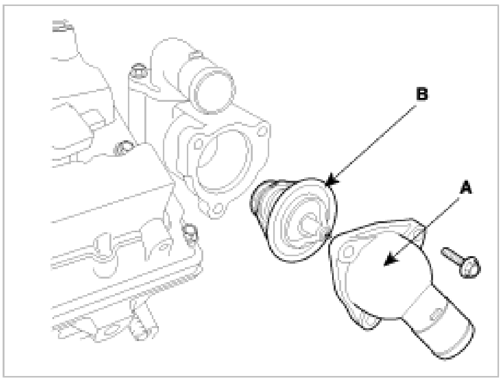
7. Remove water temperature control assembly(A).



THERMOSTAT

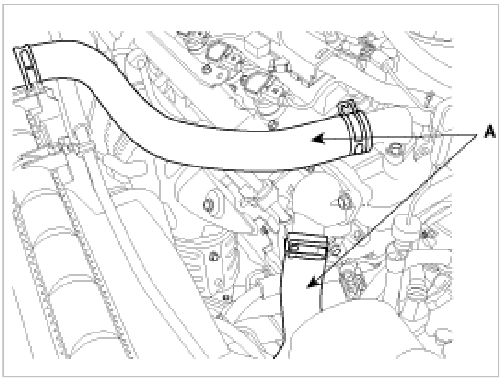
> **NOTE**
>
> Removal of the thermostat would have an adverse effect, causing a lowering of cooling efficiency. Do not remove the thermostat, even if the engine tends to overheat.

1. Drain engine coolant so its level is below thermostat.
2. Remove water inlet(A) and thermostat(B).



RADIATOR

1. Drain the engine coolant.
2. Disconnect radiator upper and lower hoses(A).



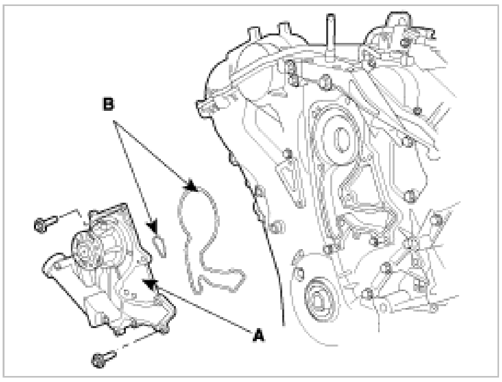
3. Disconnect transaxle oil cooler hoses.(See TR group)
4. Remove radiator bracket.
5. Remove radiator assembly.

INSTALLATION

WATER PUMP

1. Install the water pump(A) and a new gasket(B) with 12 bolts.

Tightening torque
21.56 ~ 23.52Nm (2.2 ~ 2.4kgf.m, 15.91 ~ 17.36lbf.ft)
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

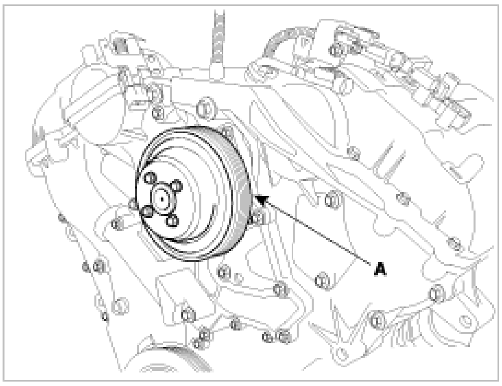


NOTE

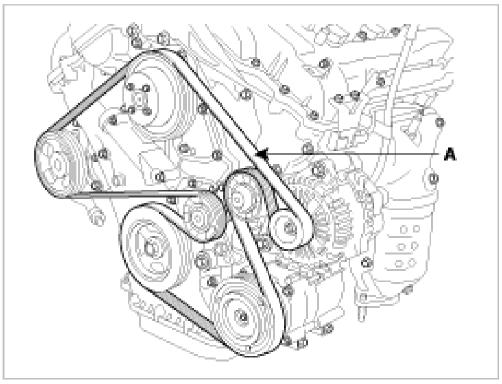
Make clean the contact face before assembly.

2. Install the 4 bolts and pump pulley(A).

Tightening torque
7.84 ~ 9.80Nm (0.8 ~ 1.0kgf.m, 5.78 ~ 7.23lbf.ft)



3. Install drive belt(A).



4. Fill with engine coolant.
5. Start engine and check for leaks.
6. Recheck engine coolant level.

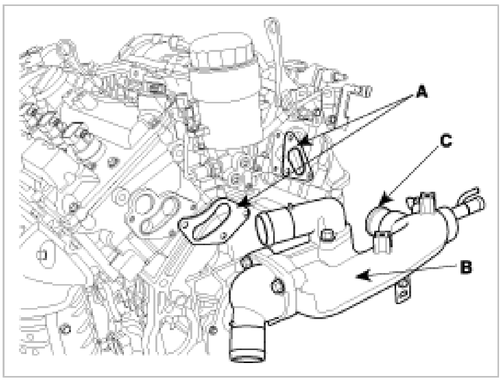
WATER TEMPERATURE CONTROL ASSEMBLY

NOTE

Make clean the contact face before assembly.

1. Install water temperature control assembly(B) and new gasket(A).

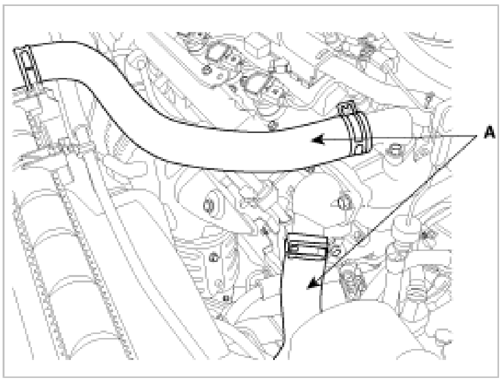
Tightening torque
18.62 ~ 23.52Nm (1.9 ~ 2.4kgf.m, 13.74 ~ 17.36lbf.ft)



NOTE

Use new O-rings(C) when reassembling.

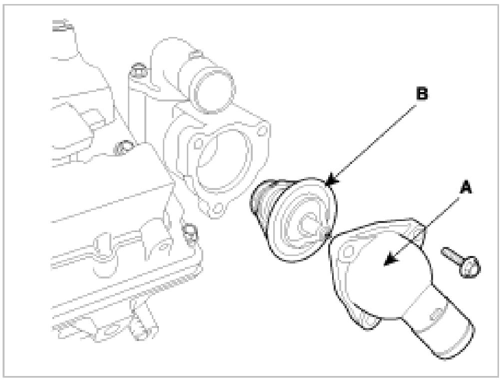
2. Connect water hoses to the water temperature control assembly.
3. Install wiring protector.
4. Connect WTS connector.
5. Connect radiator upper and lower hose(A).



6. Install air cleaner assembly.
7. Fill with engine coolant.
8. Start engine and check for leaks.
9. Recheck engine coolant level.

THERMOSTAT

1. Place thermostat in thermostat housing.
   (1) Install the thermostat with the jiggle valve upward.
   (2) Install a new thermostat(B).



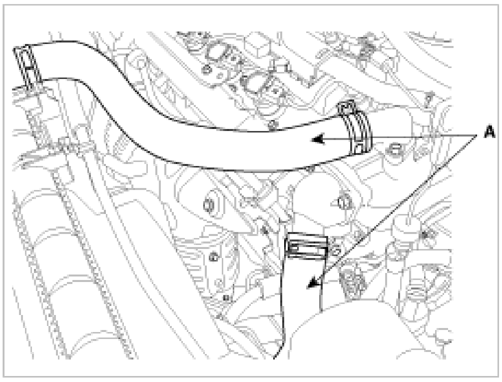
2. Install water inlet(A).

Tightening torque
16.66 ~ 19.60Nm (1.7 ~ 2.0kgf.m, 12.30 ~ 14.47lbf.ft)

3. Fill with engine coolant.
4. Start engine and check for leaks.

RADIATOR

1. Install radiator assembly.
2. Install radiator upper bracket.
3. Connect transaxle oil cooler hoses.(See TR group)
4. Connect radiator upper and lower hoses(A).



5. Fill with engine coolant.
6. Start engine and check for leaks.
7. Recheck engine coolant level.

INSPECTION

WATER PUMP

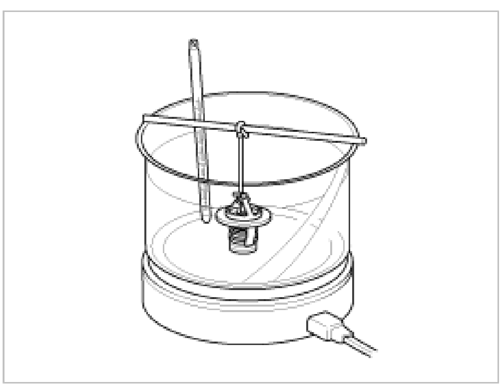
1. Check each part for cracks, damage or wear, and replace the coolant pump assembly if necessary.
2. Check the bearing for damage, abnormal noise and sluggish rotation, and replace the coolant pump assembly if necessary.
3. Check for coolant leakage. If coolant leaks from hole, the seal is defective. Replace the coolant pump assembly.

NOTE

A small amount of "weeping" from the bleed hole is normal.

THERMOSTAT

1. Immerse the thermostat in water and gradually heatthe water.



2. Check the valve opening temperature.
Valve opening temperature : 82°C (177°F)

Full opening temperature : 95°C (205°F)
If the valve opening temperature is not as specified, replace the thermostat.

3. Check the valve lift.
   Valve lift : Min. 10mm (0.4in.) at 95°C (205°F)
   If the valve lift is not as specified, replace the thermostat.

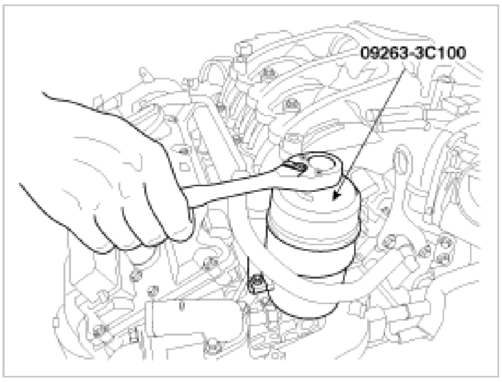
Engine Mechanical System > Lubrication System > Description and Operation

OIL AND FILTER

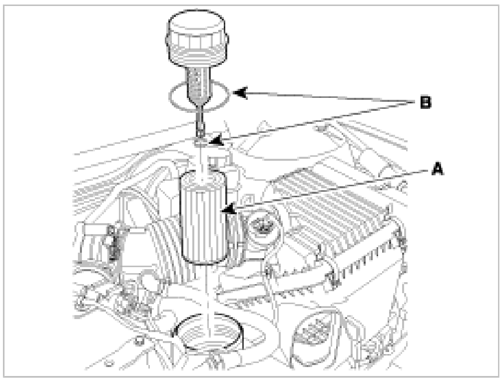
CAUTION

- Prolonged and repeated contact with mineral oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.
- Exercise caution in order to minimize the length and frequency of contact of your skin to used oil. Wear protective clothing and gloves. Wash your skin thoroughly with soap and water, or use water-less hand cleaner, to remove any used engine oil. Do not use gasoline, thinners, or solvents.
- In order to preserve the environment, used oil and used oil filter must be disposed of only at designated disposal sites.

1. Park the car on level ground.
   Start the engine and let it warm up.
2. Turn the engine off and open the hood.
   Remove the engine cover.
3. Wait for 5minutes after loosening the oil filter cap by turning it counterclockwise with SST(09263-3C100) to drain well the oil in the oil filter.



4. Drain the engine oil.
   A. Remove the oil filler cap.
   B. After lifting the car, remove the oil drain plug and drain the oil into a container.
5. Replace oil filter.
   A. Disconnect the oil filter cap from oil filter body.
   B. Remove the oil filter element.
   C. Check and clean the oil filter installation surface.
   D. Check the part number of the new oil filter is as same as old one.
   E. Install new oil filter element(A) and two new O-rings(B).



F. Apply clean engine oil to the new O-rings.
   Lightly screw the oil filter cap into place, and tighten it until the O-ring contacts the seat.
G. Finally tighten it again by specified tightening torque.

Tightening torque
24.50Nm (2.5kgf.m, 18.08lbf.ft)

6. Refill with engine oil.
   A. Install the oil drain plug with a new gasket.

   Tightening torque
   34.3 ~ 44.1Nm (3.5 ~ 4.5kgf.m, 25.3 ~ 32.5lbf.ft)

   B. Fill with fresh engine oil, after remove the engine oil level gauge.

   Capacity
   Total : 6.4L(6.76U.S.qus,5.63lmp.qts)
   Oil pan : 5.5L(5.81U.S.qus,4.84lmp.qts)
   Oil filter : 0.4L(0.42U.S.qus,0.35lmp.qts)
   Drain and refill : 5.2L(5.49U.S.qus,4.58lmp.qts)

   C. Install the oil filler cap and oil level gauge.
7. Start the engine and check to be sure no oil is leaking from the drain plug or oil filter.
8. Recheck engine oil level.

INSPECTION

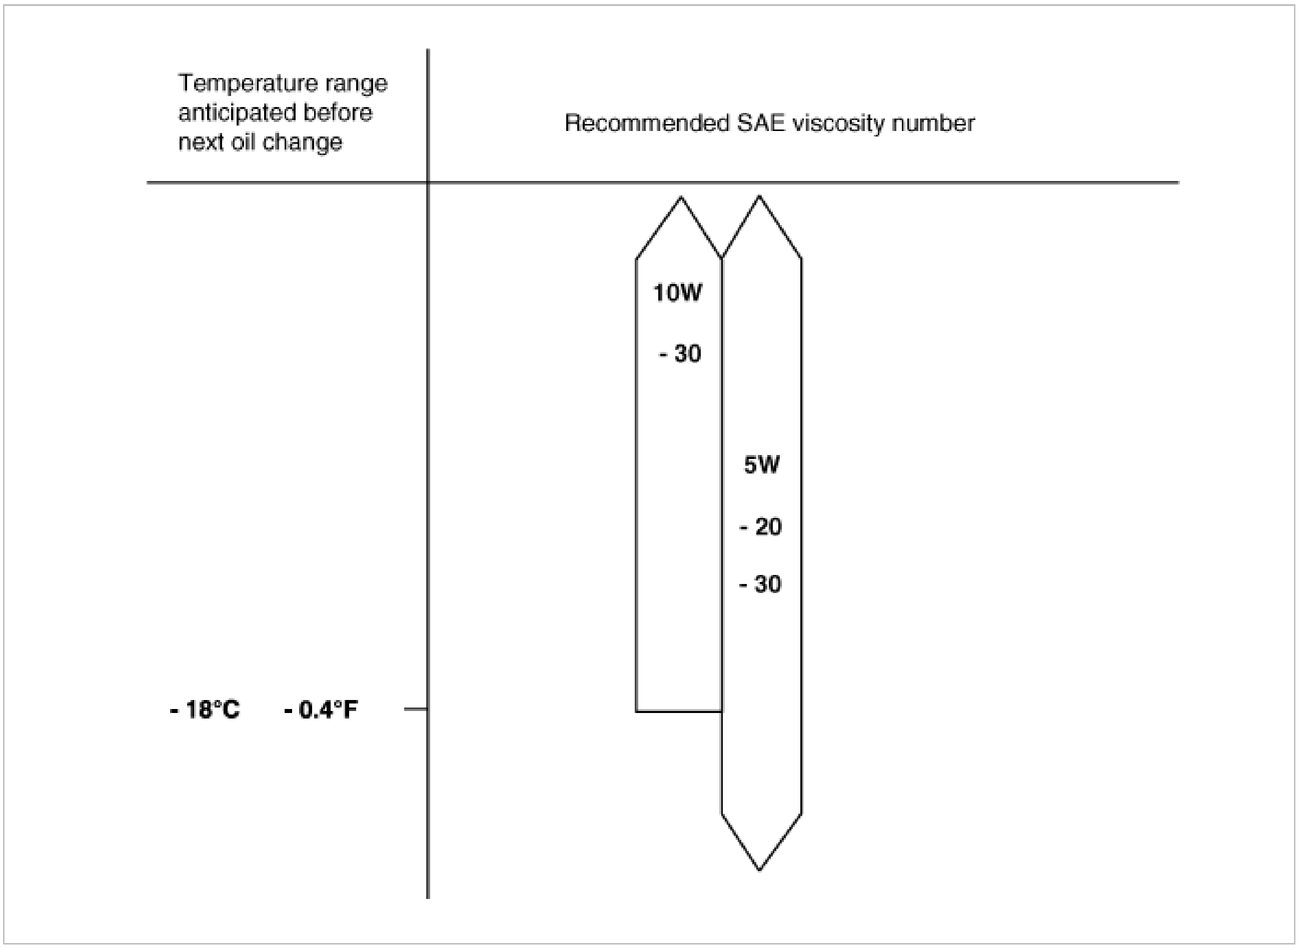
1. Check engine oil quality.
   Check the oil for deterioration, entry of water, discoloring or thinning.
   If the quality is visibly poor, replace the oil.
2. Check engine oil level.
   After warming up the engine and then 5 minutes after the engine stop, oil level should be between the "L" and "F" marks on the dipstick.
   If low, check for leakage and add oil up to the "F" mark.

NOTE

Do not fill with engine oil above the "F" mark.

SELECTION OF ENGINE OIL

Recommended API classification : Above SJ or SL
Recommended SAE viscosity grades : 5W-20
If 5W-20 engine oil is not available, 5W-30 or secondary recommanded engine oil for carrespanding temperature range can be used.



NOTE

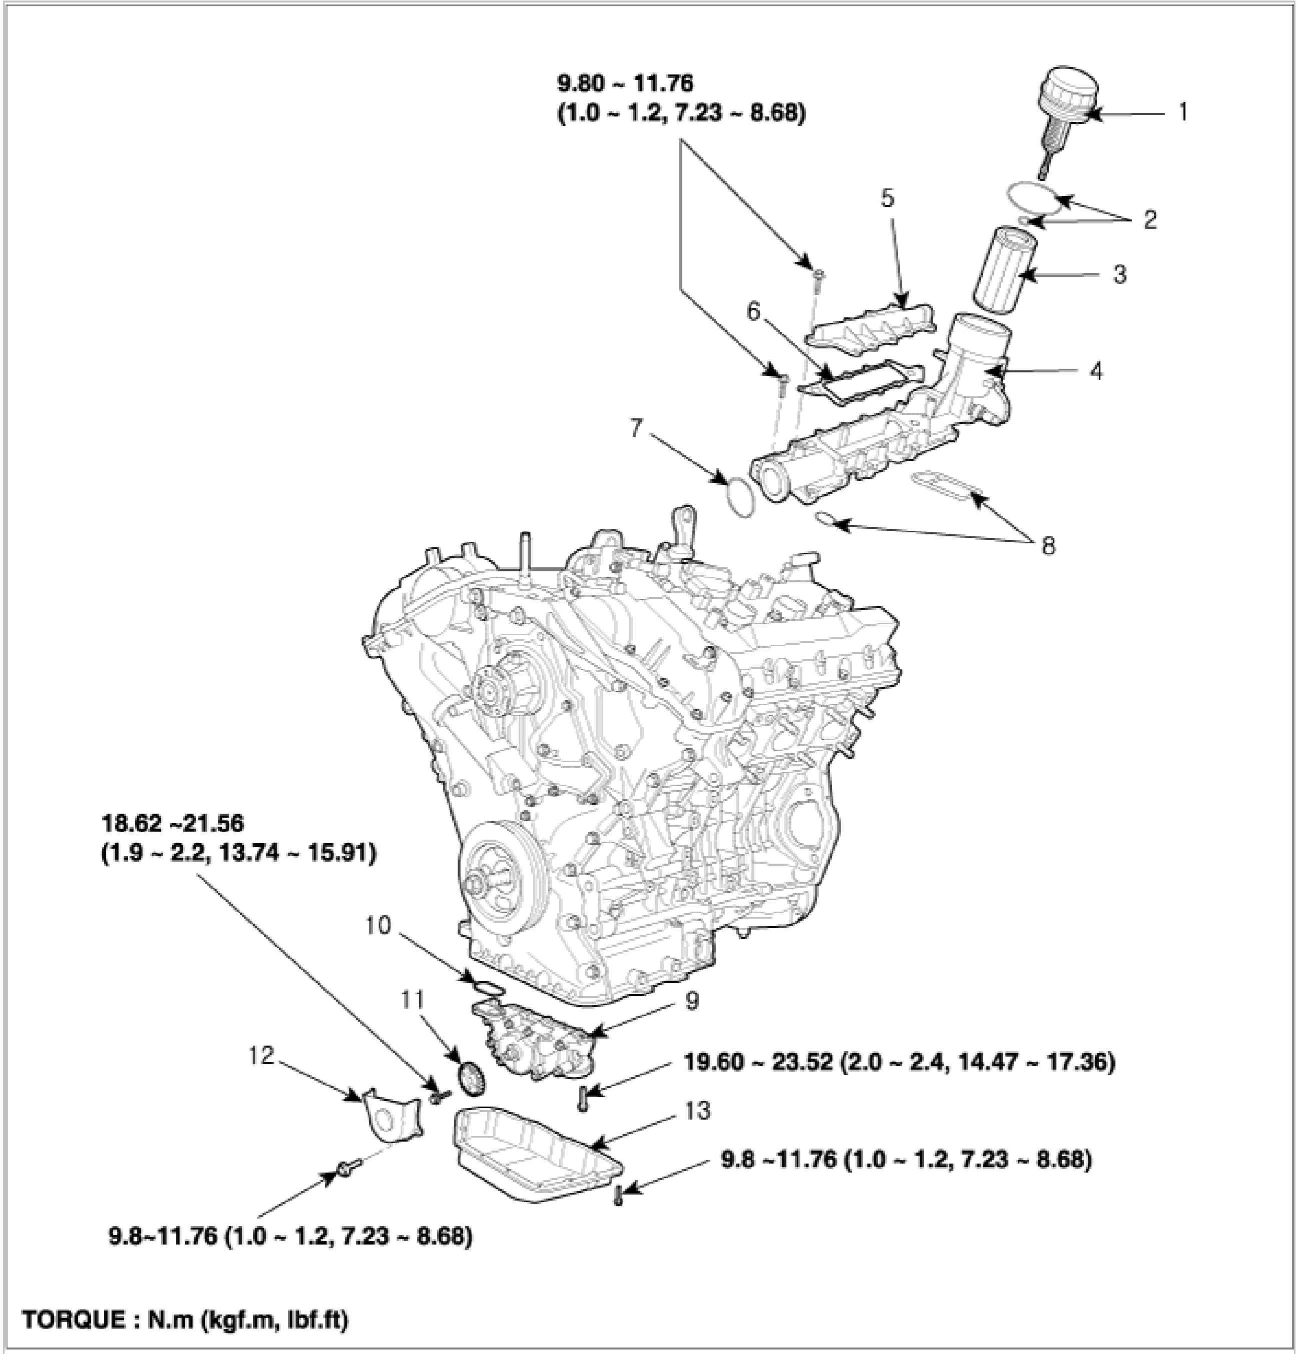
For best performance and maximum protection of all types of operation, select only those lubricants which :

- Satisfy the requirement of the API classification.
- Have proper SAE grade number for expected ambient temperature range.

Lubricants that do not have both an SAE grade number and API service classification on the container should not be used.

Engine Mechanical System > Lubrication System > Components and Components Location

COMPONENT



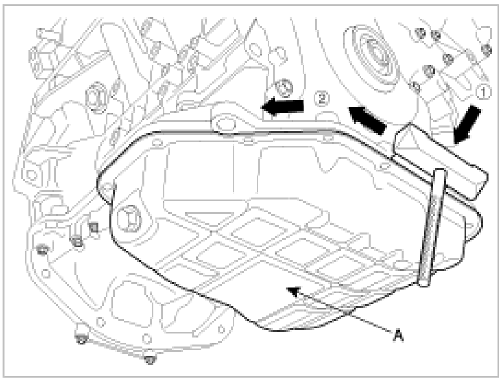
1. Oil filter cap
2. O - ring
3. Oil filter element
4. Oil filter body
5. Oil filter body cover
6. Gasket
7. O - ring
8. Gasket
9. Oil pump
10. Gasket
11. Oil pump sprocket
12. Oil pump chain cover
13. Lower oil paon

Engine Mechanical System > Lubrication System > Repair procedures

REMOVAL

Oil pump

1. Drain engine oil.
2. Using SST(09215-3C000) remove lower oil pan(A).

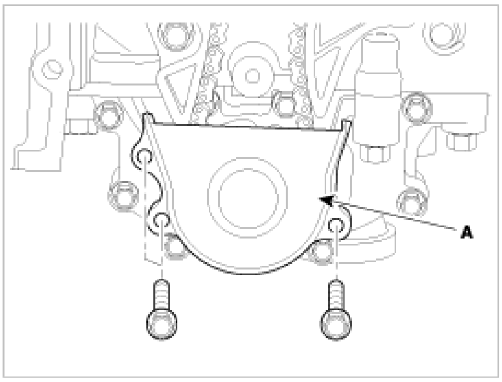


CAUTION

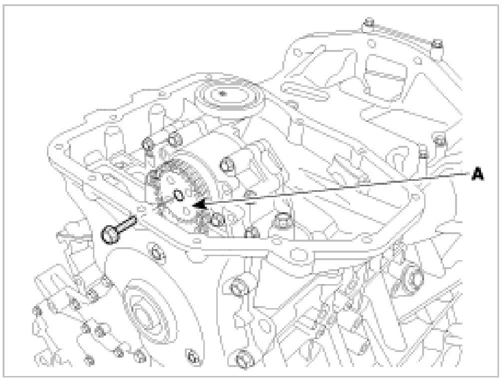
- Insert the SST between the oil pan and the ladder frame by tapping it with a plastic hammer in the direction of ① arrow.
- After tapping the SST with a plastic hammer along the direction of ② arrow around more than 2/3 edge of the oil pan, remove it from the ladder frame.
- Do not turn over the SST abruptly without tapping. It be result in damage of the SST.

Be careful not to damage the contact surfaces of upper oil pan and lower oil pan.

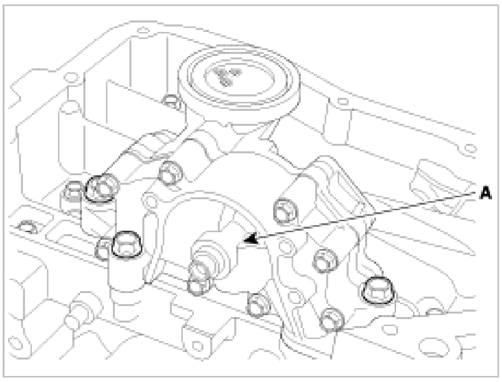
3. Remove oil pump chain cover(A).



4. Remove oil pump chain sprocket(A).

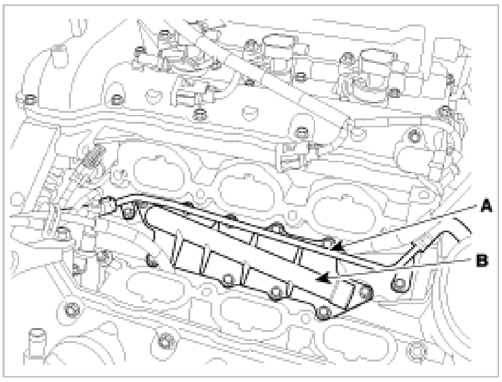


5. Remove oil pump(A).

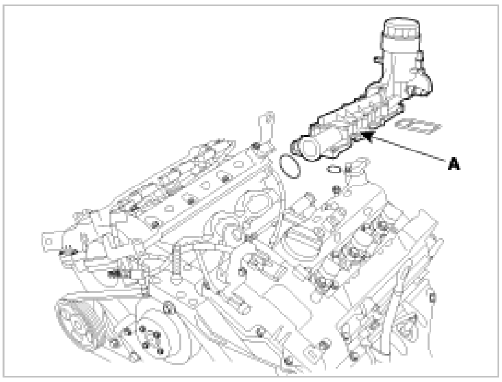


Oil filter assembly

1. Loosen the oil filter cap by turning it counterclockwise to drain well the oil in the oil filter.
2. Remove surge tank and intake manifold.
3. Disconnect oil pressure switch connector.
4. Drain the engine coolant.
5. Disconnect water hoses from ETC.
6. Remove water temperature control assembly.
7. Disconnect water vent hose(A).
8. Remove oil filter body cover(B).



9. Remove oil filter body.(A).



> NOTE
>
> Be careful of the knock sensor connector.

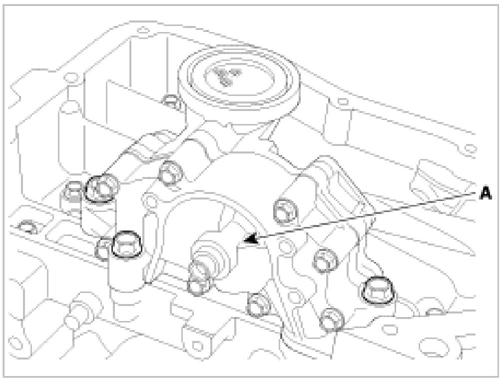
INSTALLATION

Oil pump

1. Install oil pump(A).

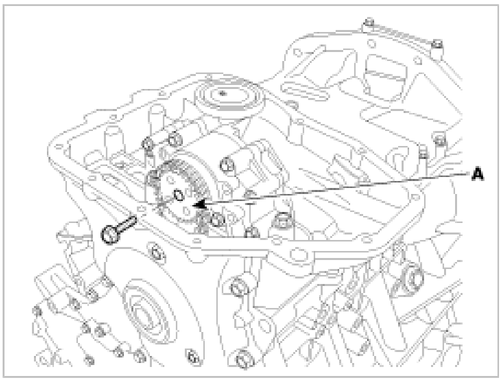
Tightening torque
19.60 ~ 23.52Nm (2.0 ~ 2.4kgf.m, 14.47 ~ 17.36lbf.ft)

> NOTE
>
> Always use a new O-ring.



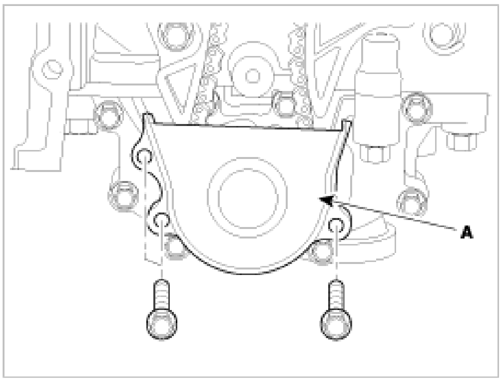
2. Install oil pump sprocket(A)and oil pump chain on the oil pump.

Tightening torque
18.62 ~ 21.56Nm (1.9 ~ 2.2kgf.m, 13.74 ~ 15.91lbf.ft)



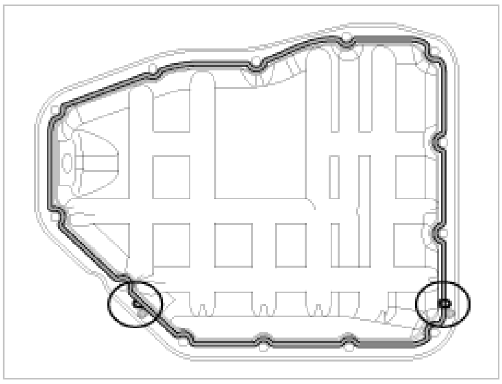
3. Install oil pump chain cover(A).

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)



4. Install upper oil pan.
   A. Using a gasket scraper, remove all the old packing material from the gasket surfaces.
   B. Before assembling the oil pan, the liquid sealant TB1217H should be applied on upper oil pan. The part must be assembled within 5 minutes after the sealant was applied.

   Bead width : 2.5mm(0.1in.)

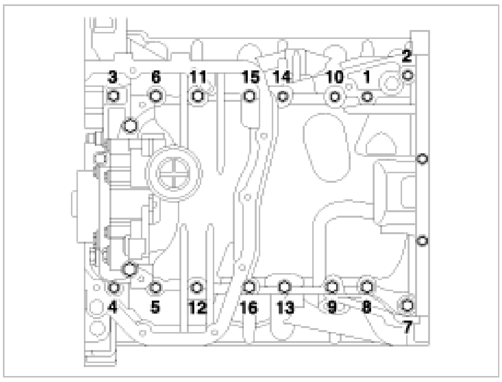


CAUTION

- Make clean the sealing face before assembling two parts.
- Remove harmful foreign matters on the sealing face before applying sealant
- When applying sealant gasket, sealant must not be protruded into the inside of oil pan.
- To prevent leakage of oil, apply sealant gasket ot the inner threads of the bolt holes.

C. Install upper oil pan.
   Uniformly tighten the bolts in several passes.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

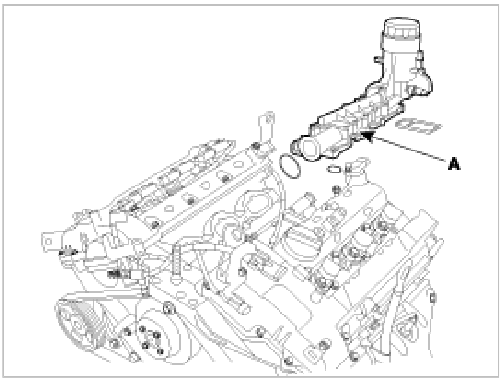


D. After assembly, wait at least 30 minutes before filling the engine with oil.

OIL FILTER ASSEMBLY

1. Install oil filter body(A) and new O-rings.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

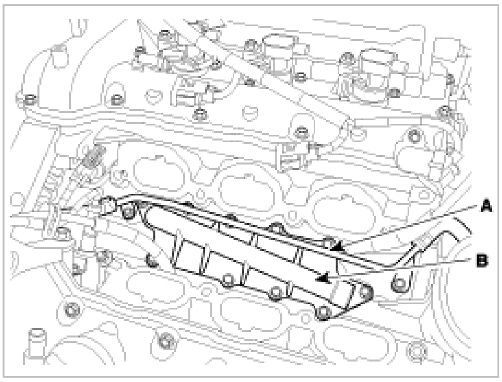


NOTE

• All rubber gasket must be no damaged by assembling parts.
• Be careful of the knock sensor connector.
• Always use a new O-ring

2. Install oil filter body cover(B) and new gasket on the oil filter body.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)



3. Connect water vent hose.

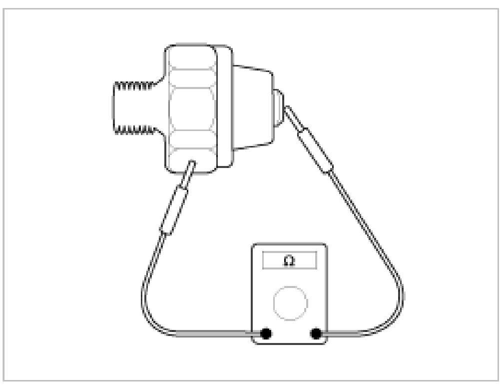
Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

4. Install water temperature control assembly.
5. Connect water hoses on the ETC.
6. Connect oil pressure switch connector.
7. Install intake manifold and surge tank.
8. Fill with engine coolant.
9. Start engine and check for leaks.
10. Recheck engine coolant level.

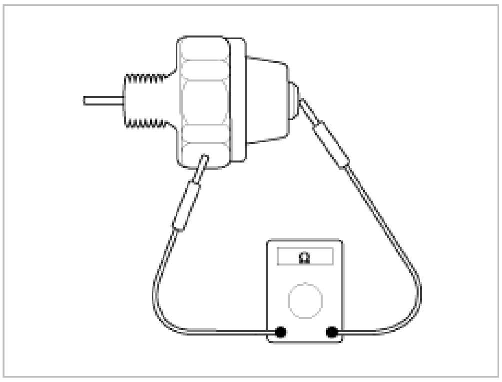
INSPECTION

OIL PRESSURE SWITCH

1. Check the continuity between the terminal and the body with an ohmmeter.
   If there is no continuity, replace the oil pressure switch.



2. Check the continuity between the terminal and the body when the fine wire is pushed. If there is continuity even when the fine wire is pushed, replace the switch.
3. If there is no continuity when a 50kpa (7psi) is applied throgh the oil hole, the switch is operaing properly.
   Check for air leakage. If air leaks, the diaphragm is broken. Replace it.



Engine Mechanical System > Intake And Exhaust System > Components and Components Location

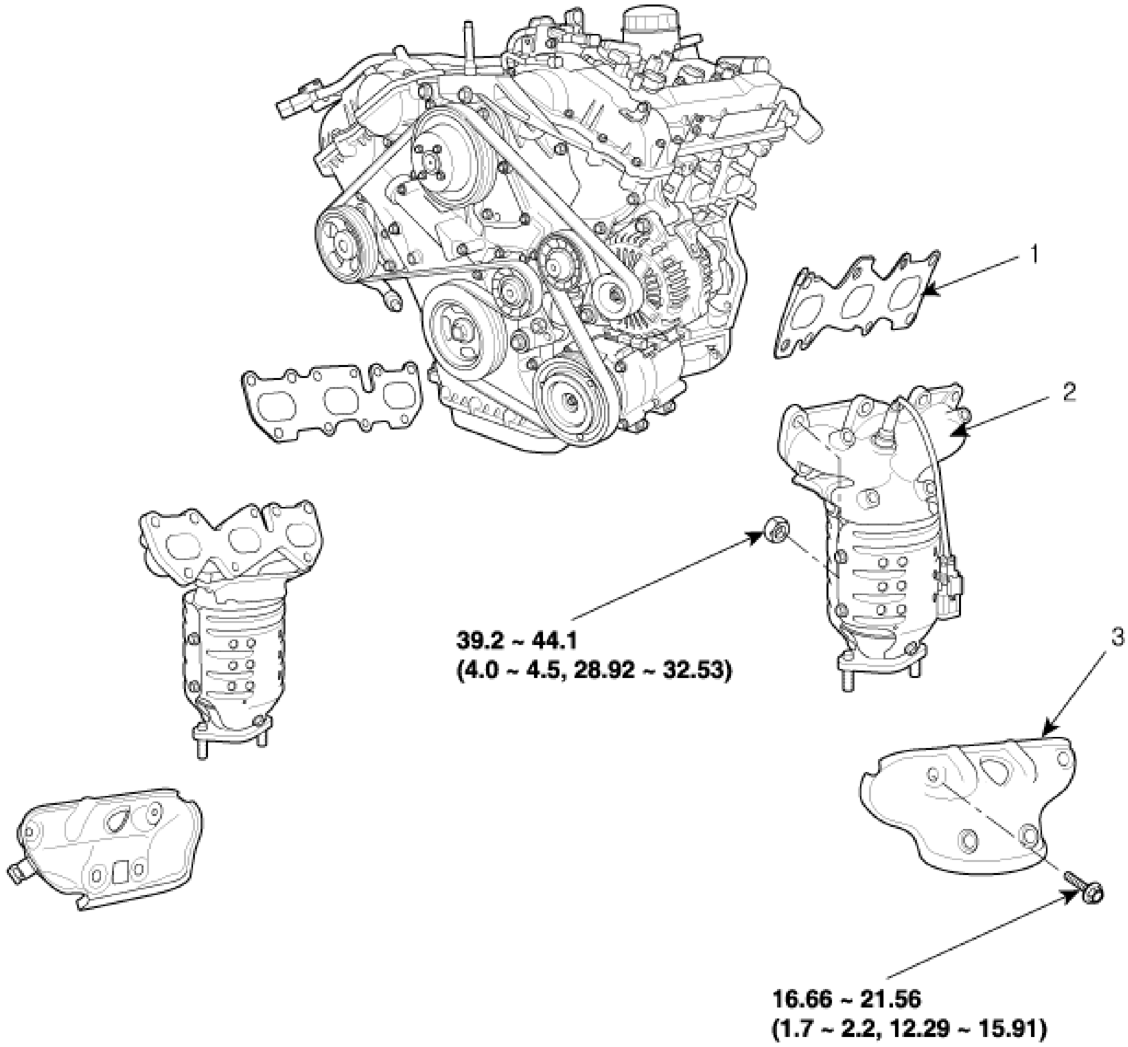
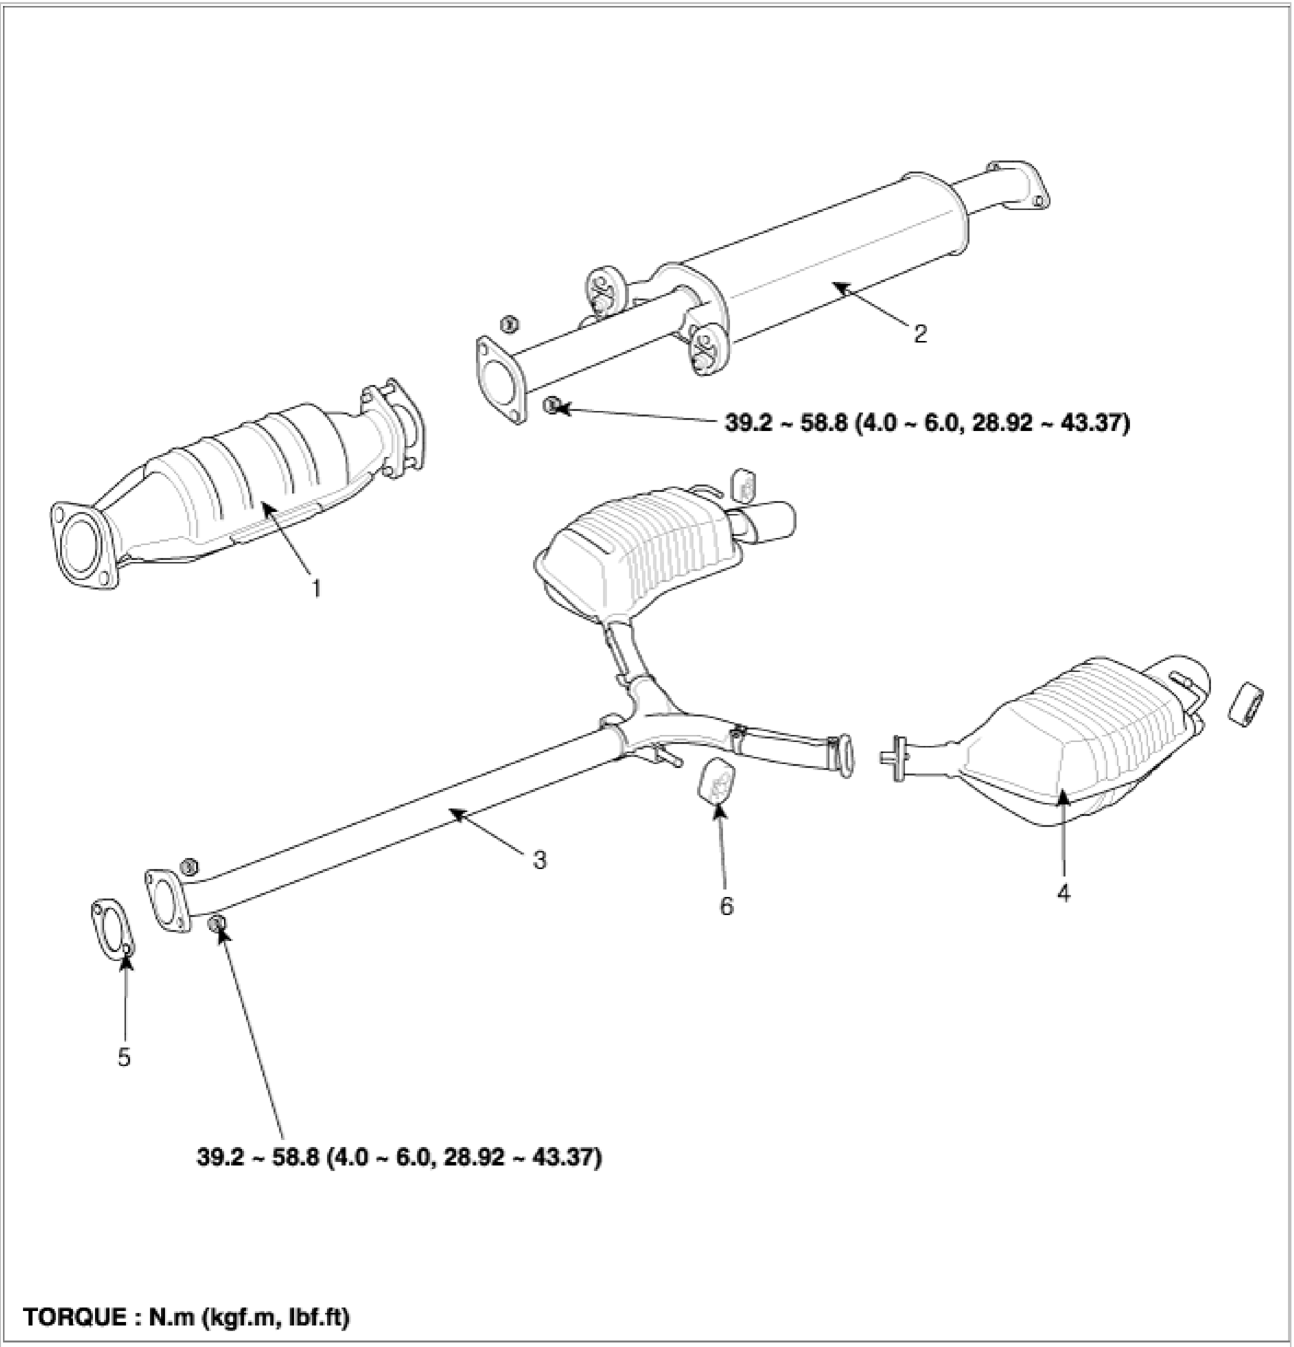
2. Delivery pipe
3. Intake manifold



TORQUE : N.m (kgf.m, lbf.ft)

1. Gasket
2. Exhaust manifold
3. Heat protector



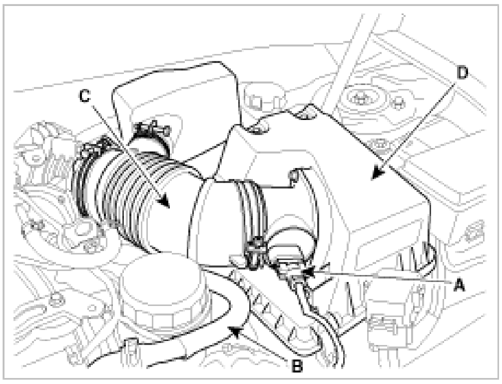
1. Catalytic converter
2. Center muffler
3. Main muffler
4. LH muffler
5. Gasket
6. Rubber hanger

Engine Mechanical System > Intake And Exhaust System > Repair procedures

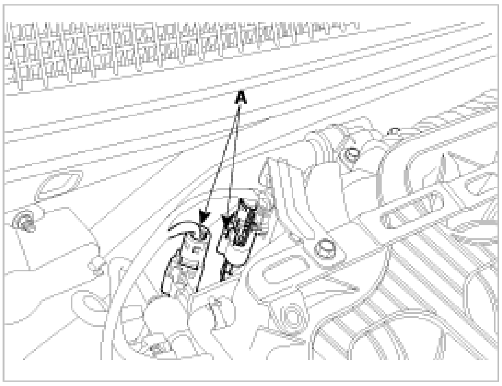
REMOVAL

INTAKE MANIFOLD

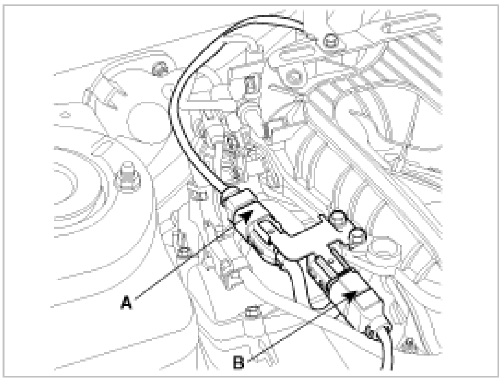
1. Disconnect AFS(A) and breather hose(B).
2. Remove air cleaner upper cover(D) and intake hose(C).



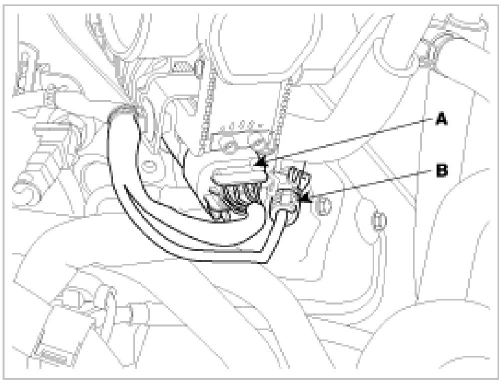
3. Disconnect RH oxygen sensor connector(A).



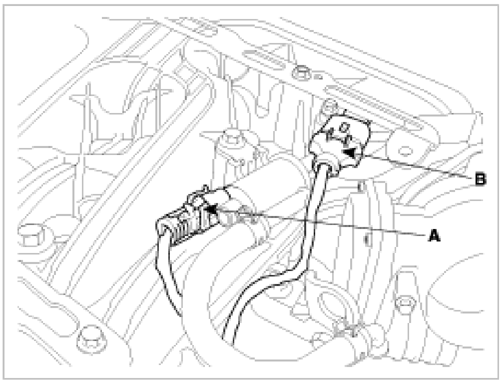
4. Disconnect RH injector connector(A) and ignition coil connector(B).



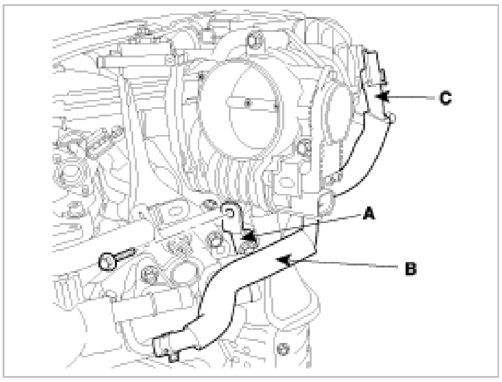
5. Disconnect ETC connector(A) and knock sensor connector(B).



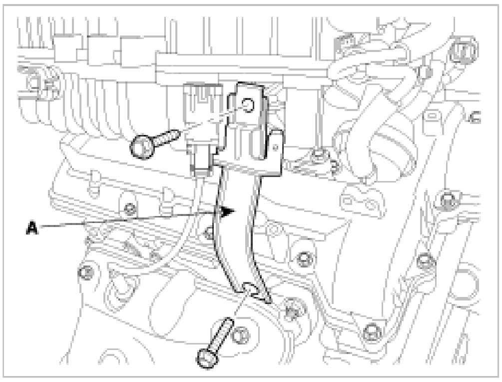
6. Disconnect PCSV connector(A), MAP sensor connector(B) and PCSV hose.



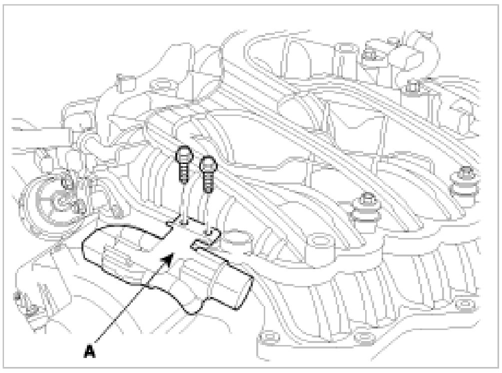
7. Remove ETC bracket(A).
8. Disconnect water hoses(B) from ETC.
9. Disconnect PCV(C) hose.



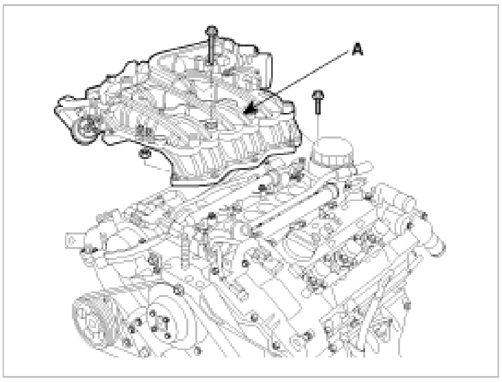
10. Disconnect brake vacuum hose.
11. Remove surge tank stay(A).



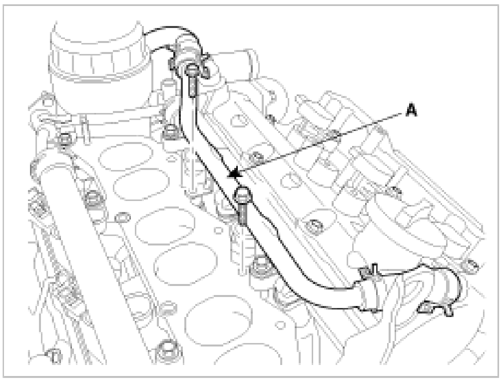
12. Remove connector bracket(A) from surge tank.



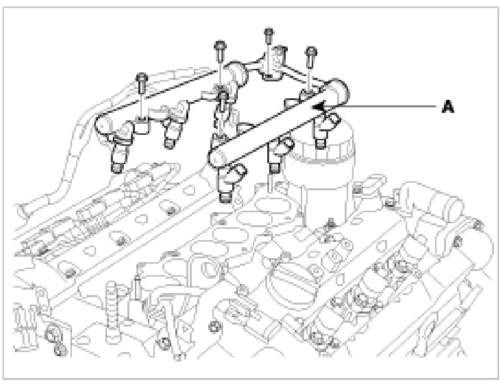
13. Remove surge tank(A).



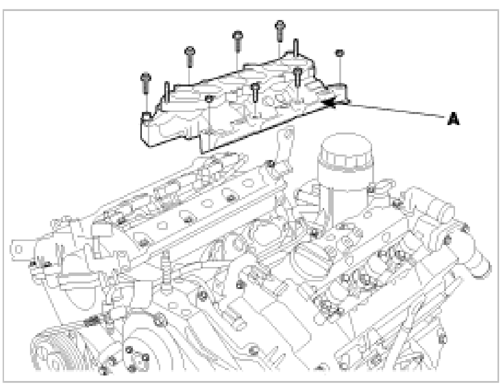
14. Disconnect breather hose(A).



15. Disconnect LH injector connector.
16. Remove delivery pipe(A).

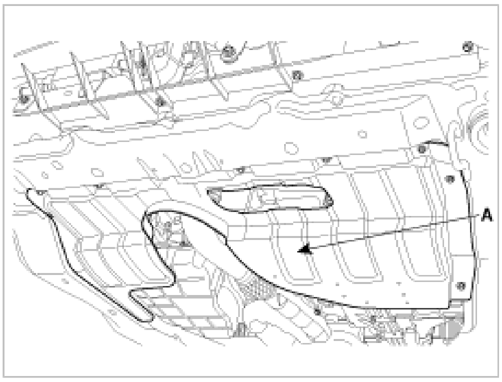


17. Remove intake manifold(A) and gasket.

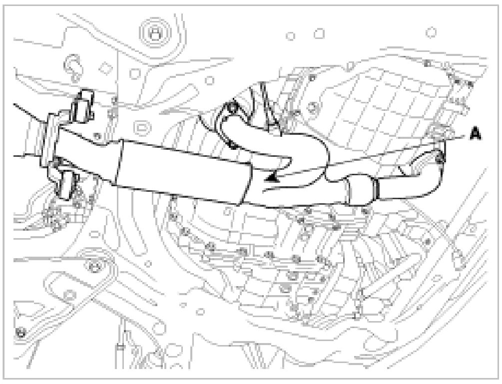


EXHAUST MANIFOLD

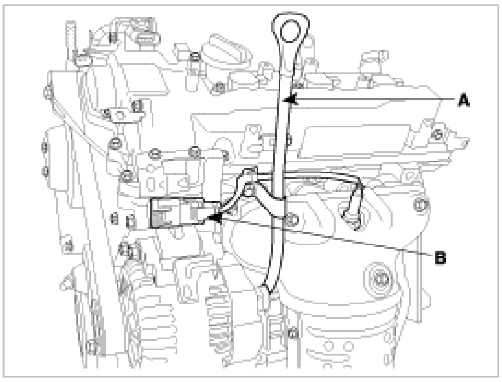
1. Remove under cover(A).



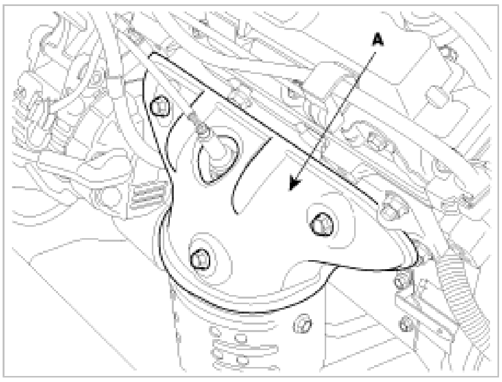
2. Disconnect LH,RH rear oxygen sensor connector from bracket.
3. Remove front muffler(A).



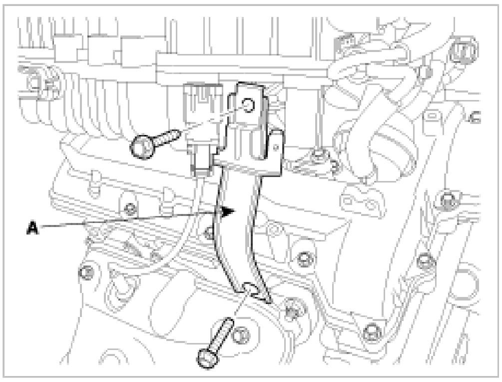
4. Remove oil level gauge(A).
5. Disconnect LH front oxygen sensor connector(B) from bracket.



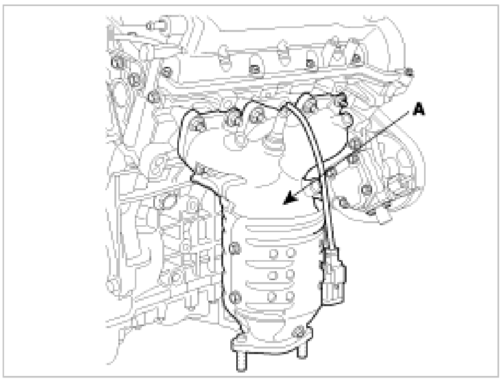
6. Remove LH heat protector.



7. Remove LH exhaust manifold.
8. Disconnect RH front oxygen sensor connector from bracket.



9. Remove RH heat protector.
10. Remove RH exhaust manifold.



INSTALLATION

INTAKE MANIFOLD

1. Install intake manifold and new gasket on the cylinder head.

Tightening torque
18.62 ~ 23.52Nm (1.9 ~ 2.4kgf.m, 13.74 ~ 17.36lbf.ft)

NOTE
Be careful of the installation direction.

2. Install delivery pipe.(See FL group)
3. Connect LH injector connector.
4. Connect breather hose.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

5. Install surge tank.

Tightening torque
9.80 ~ 11.76Nm (1.0 ~ 1.2kgf.m, 7.23 ~ 8.68lbf.ft)

6. Install connector bracket on the surge tank.

Tightening torque
6.86 ~ 10.78Nm (0.7 ~ 1.1kgf.m, 5.06 ~ 7.96lbf.ft)

7. Install surge tank stay.

Tightening torque
27.44 ~ 31.36Nm (2.8 ~ 3.2kgf.m, 20.25 ~ 23.14lbf.ft)

8. Connect brake vacuum hose.
9. Connect PCV hose.
10. Connect water hoses to ETC.
11. Install ETC bracket.

Tightening torque
15.68 ~ 25.48Nm (1.6 ~ 2.6kgf.m, 11.57 ~ 18.80lbf.ft)

12. Connect ETC connector and knoch sensor connector.
13. Connect PCSV connector, MAP sensor connector and PCSV hoe.
14. Connect RH injector connector and ignition coil connector.
15. Connect RH oxygen sensor connector.
16. Install air cleaner upper cover and in take hose.
17. Connect AFS(A) and breather hose.

EXHAUST MANIFOLD

1. Install new gasket and exhaust manifold.

Tightening torque
39.2 ~ 44.1Nm(4.0 ~ 4.5kgf.m, 28.92 ~ 32.53lbf.ft)

2. Install heat protector.

Tightening torque
16.66 ~ 21.56Nm(1.7 ~ 2.2kgf.m, 12.30 ~ 15.91lbf.ft)

3. Install front muffler.

Tightening torque
39.2 ~ 58.8N.m(4.0 ~ 6.0kgf.m, 28.92 ~ 43.37lbf.ft)

4. Connect oxygen sensor connector.
5. Install under cover.

SPECIAL SERVICE TOOLS

Tool (Number and name)	Illustration	Application
09353-24100 Fuel Pressure Gauge		Measuring the fuel line pressure
09353-38000 Fuel Pressure Gauge Adapter		Connection between the delivery pipe and fuel feed line
09353-24000 Fuel Pressure Gauge Connector		Connection between Fuel Pressure Gauge (09353-24100) and Fuel Pressure Gauge Adapter (09353-38000)
09310-3K000 Fuel Pump Locking Ring Wrench		Removing the fuel Pump assembly

BASIC TROUBLESHOOTING

BASIC TROUBLESHOOTING GUIDE

1	**Bring Vehicle to Workshop**

2	**Analyze Customer's Problem**
•	Ask the customer about the conditions and environment relative to the issue (Use CUSTOMER PROBLEM ANALYSIS SHEET).

3	**Verify Symptom, and then Check DTC and Freeze Frame Data**
•	Connect Hi-Scan (Pro) to Diagnostic Link Connector (DLC).
•	Record the DTC and freeze frame data.
	NOTE *To erase DTC and freeze frame data, refer to Step 5.*

4	**Confirm the Inspection Procedure for the System or Part**
•	Using the SYMPTOM TROUBLESHOOTING GUIDE CHART, choose the correct inspection procedure for the system or part to be checked.

5	**Erase the DTC and Freeze Frame Data**
	WARNING **NEVER erase DTC and freeze frame data before completing Step 2 MIL/DTC in "CUSTOMER PROBLEM ANALYSIS SHEET".**

6	**Inspect Vehicle Visually**
•	Go to Step 11, if you recognize the problem.

7	**Recreate (Simulate) Symptoms of the DTC**
•	Try to recreate or simulate the symptoms and conditions of the malfunction as described by customer.
•	If DTC(s) is/are displayed, simulate the condition according to troubleshooting procedure for the DTC.

8	**Confirm Symptoms of Problem**
•	If DTC(s) is/are not displayed, go to Step 9.
•	If DTC(s) is/are displayed, go to Step 11.

9	**Recreate (Simulate) Symptom**
•	Try to recreate or simulate the condition of the malfunction as described by the customer.

10	**Check the DTC**
•	If DTC(s) does(do) not occur, refer to INTERMITTENT PROBLEM PROCEDURE in BASIC INSPECTION PROCEDURE.
•	If DTC(s) occur(s), go to Step 11.

11	**Perform troubleshooting procedure for DTC**
12	**Adjust or repair the vehicle**
13	**Confirmation test**
14	**END**

CUSTOMER PROBLEM ANALYSIS SHEET

1. VEHICLE INFORMATION

(I) VIN:
(II) Production Date:
(III) Odometer Reading: (miles)

2. SYMPTOMS

□ Unable to start	□ Engine does not turn over □ Incomplete combustion □ Initial combustion does not occur
□ Difficult to start	□ Engine turns over slowly □ Other_________________
□ Poor idling	□ Rough idling □ Incorrect idling □ Unstable idling (High: ______ rpm, Low: ______rpm)

	□ Other ________________________________
□ Engine stall	□ Soon after starting □ After accelerator pedal depressed □ After accelerator pedal released □ During A/C ON □ Shifting from N to D-range □ Other ____
□ Others	□ Poor driving (Surge) □ Knocking □ Poor fuel economy □ Back fire □ After fire □ Other __________________________

3. ENVIRONMENT

Problem frequency	□ Constant □ Sometimes (________________) □ Once only □ Other ____
Weather	□ Fine □ Cloudy □ Rainy □ Snowy □ Other _________________
Outdoor temperature	Approx. _____ °C/°F
Place	□ Highway □ Suburbs □ Inner City □ Uphill □ Downhill □ Rough road □ Other _________________________________
Engine temperature	□ Cold □ Warming up □ After warming up □ Any temperature
Engine operation	□ Starting □ Just after starting (____ min) □ Idling □ Racing □ Driving □ Constant speed □ Acceleration □ Deceleration □ A/C switch ON/OFF □ Other ___________________________

4. MIL/DTC

MIL (Malfunction Indicator Lamp)		□ Remains ON □ Sometimes lights up □ Does not light
DTC	Normal check (Pre-check)	□ Normal □ DTC (____________________________________) □ Freeze Frame Data
	Check mode	□ Normal □ DTC (____________________________________) □ Freeze Frame Data

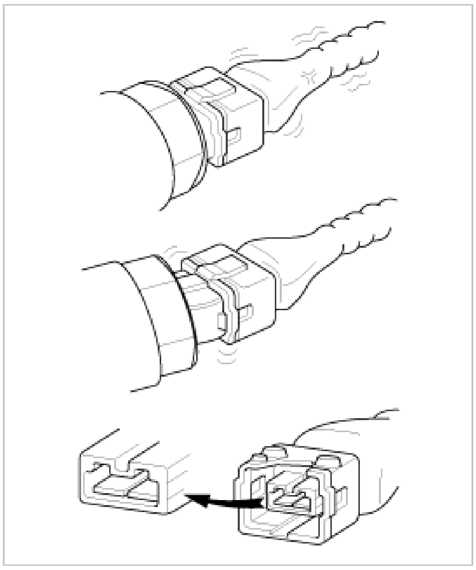
BASIC INSPECTION PROCEDURE

The measured resistance at high temperature after vehicle running may be high or low. So all resistance must be measured at ambient temperature (20°C, 68°F), unless there is any notice.

> NOTE
>
> The measured resistance in except for ambient temperature (20°C, 68°F) is reference value.

Sometimes the most difficult case in troubleshooting is when a problem symptom occurs but does not occur again during testing. An example would be if a problem appears only when the vehicle is cold but has not appeared when warm. In this case, the technician should thoroughly make out a "CUSTOMER PROBLEM ANALYSIS SHEET" and recreate (simulate) the environment and condition which occurred when the vehicle was having the issue.

1. Clear Diagnostic Trouble Code (DTC).
2. Inspect connector connection, and check terminal for poor connections, loose wires, bent, broken or corroded pins, and then verify that the connectors are always securely fastened.



3. Slightly shake the connector and wiring harness vertically and horizontally.
4. Repair or replace the component that has a problem.
5. Verify that the problem has disappeared with the road test.

● SIMULATING VIBRATION

1) Sensors and Actuators
: Slightly vibrate sensors, actuators or relays with finger.

> WARNING
>
> Strong vibration may break sensors, actuators or relays

2) Connectors and Harness
: Lightly shake the connector and wiring harness vertically and then horizontally.

● SIMULATING HEAT

1) Heat components suspected of causing the malfunction with a hair dryer or other heat sourre.

> WARNING
>
> • DO NOT heat components to the point where they may be damaged.
> • DO NOT heat the ECM directly.

● SIMULATING WATER SPRINKLING

1) Sprinkle water onto vehicle to simulate a rainy day or a high humidity condition.

> WARNING
>
> DO NOT sprinkle water directly into the engine compartment or electronic components.

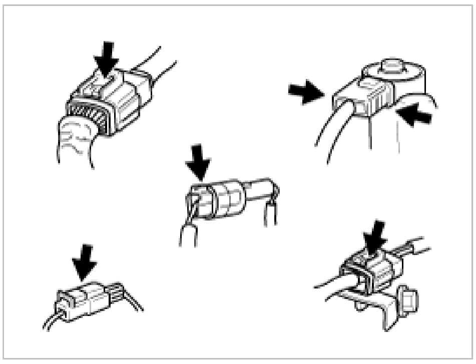
● SIMULATING ELECTRICAL LOAD

1) Turn on all electrical systems to simulate excessive electrical loads (Radios, fans, lights, etc.).

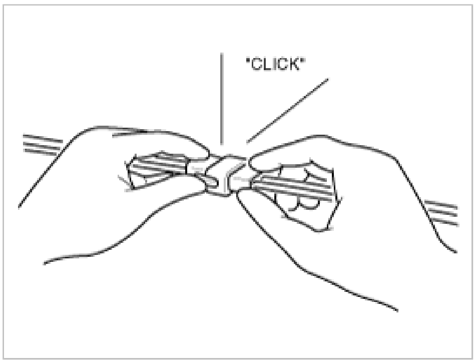
CONNECTOR INSPECTION PROCEDURE

1. Handling of Connector
   A. Never pull on the wiring harness when disconnecting connectors.

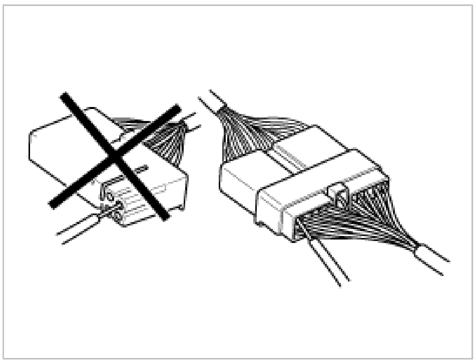
   B. When removing the connector with a lock, press or pull locking lever.



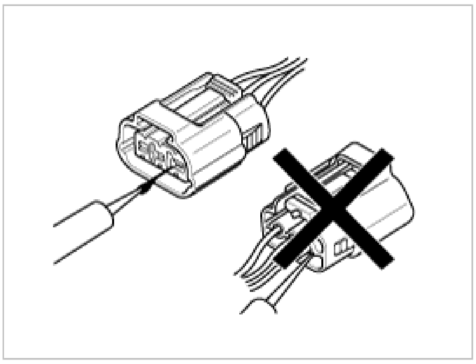
C. Listen for a click when locking connectors. This sound indicates that they are securely locked.



D. When a tester is used to check for continuity, or to measure voltage, always insert tester probe from wire harness side.



E. Check waterproof connector terminals from the connector side. Waterproof connectors cannot be accessed from harness side.



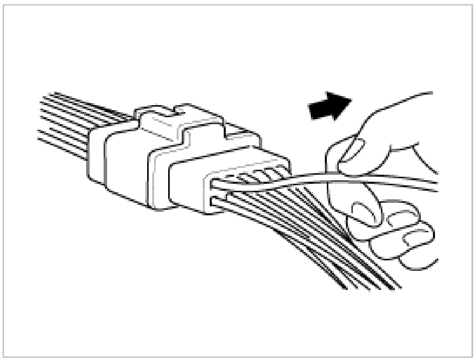
NOTE

- Use a fine wire to prevent damage to the terminal.
- Do not damage the terminal when inserting the tester lead.

2. Checking Point for Connector
   A. While the connector is connected:
      Hold the connector, check connecting condition and locking efficiency.
   B. When the connector is disconnected:
      Check missed terminal, crimped terminal or broken core wire by slightly pulling the wire harness.
      Visually check for rust, contamination, deformation and bend.

C. Check terminal tightening condition:
Insert a spare male terminal into a female terminal, and then check terminal tightening conditions.

D. Pull lightly on individual wires to ensure that each wire is secured in the terminal.



3. Repair Method of Connector Terminal
    A. Clean the contact points using air gun and/or shop rag.

    > **NOTE**
    > Never use sand paper when polishing the contact points, otherwise the contact point may be damaged.

    B. In case of abnormal contact pressure, replace the female terminal.

WIRE HARNESS INSPECTION PROCEDURE

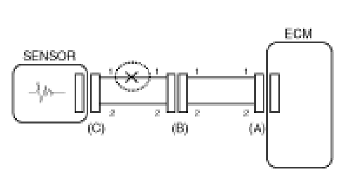
1. Before removing the wire harness, check the wire harness position and crimping in order to restore it correctly.
2. Check whether the wire harness is twisted, pulled or loosened.
3. Check whether the temperature of the wire harness is abnormally high.
4. Check whether the wire harness is rotating, moving or vibrating against the sharp edge of a part.
5. Check the connection between the wire harness and any installed part.
6. If the covering of wire harness is damaged; secure, repair or replace the harness.

ELECTRICAL CIRCUIT INSPECTION PROCEDURE

1. Procedures for Open Circuit
    A. Continuity Check
    B. Voltage Check

    If an open circuit occurs (as seen in [FIG. 1]), it can be found by performing Step 2 (Continuity Check Method) or Step 3 (Voltage Check Method) as shown below.

FIG 1



2. Continuity Check Method

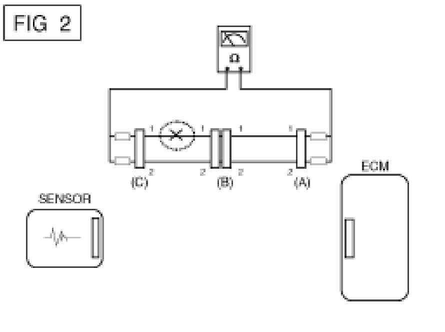
    > **NOTE**
    > When measuring for resistance, lightly shake the wire harness above and below or from side to side.

Specification (Resistance)
1Ω or less → Normal Circuit
1MΩ or Higher → Open Circuit

A. Disconnect connectors (A), (C) and measure resistance between connector (A) and (C) as shown in [FIG. 2].
In [FIG.2.] the measured resistance of line 1 and 2 is higher than 1MΩ and below 1 Ω respectively. Specifically the open

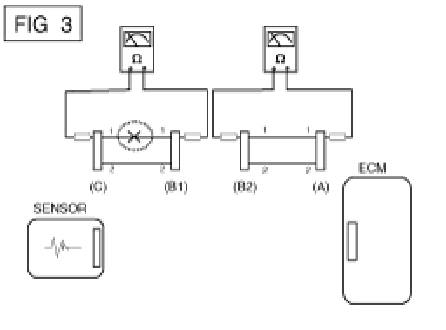
circuit is line 1 (Line 2 is normal). To find exact break point, check sub line of line 1 as described in next step.

FIG 2



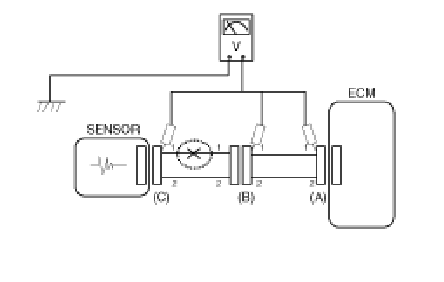
B. Disconnect connector (B), and measure for resistance between connector (C) and (B1) and between (B2) and (A) as shown in [FIG. 3].
In this case the measured resistance between connector (C) and (B1) is higher than 1MΩ and the open circuit is between terminal 1 of connector (C) and terminal 1 of connector (B1).

FIG 3



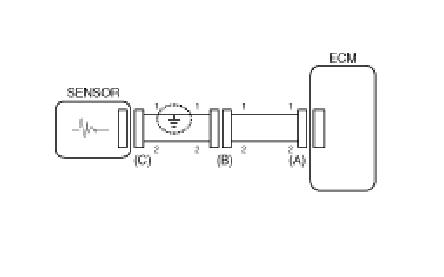
3. Voltage Check Method
A. With each connector still connected, measure the voltage between the chassis ground and terminal 1 of each connectors (A), (B) and (C) as shown in [FIG. 4].
The measured voltage of each connector is 5V, 5V and 0V respectively. So the open circuit is between connector (C) and (B).

FIG 4



4. Test Method for Short to Ground Circuit
A. Continuity Check with Chassis Ground
If short to ground circuit occurs as shown in [FIG. 5], the broken point can be found by performing below Step 2 (Continuity Check Method with Chassis Ground) as shown below.

FIG 5



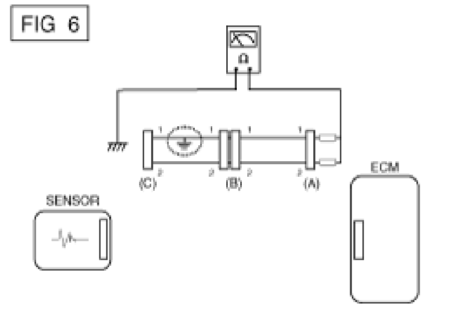
5. Continuity Check Method (with Chassis Ground)

> **NOTE**
>
> Lightly shake the wire harness above and below, or from side to side when measuring the resistance.

Specification (Resistance)
1Ω or less → Short to Ground Circuit
1MΩ or Higher → Normal Circuit

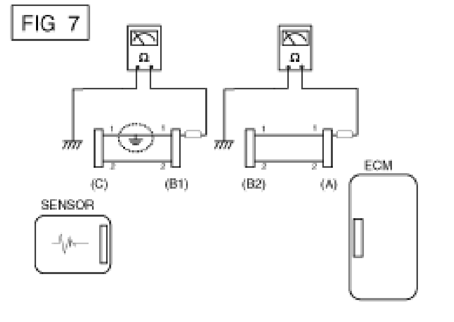
A. Disconnect connectors (A), (C) and measure for resistance between connector (A) and Chassis Ground as shown in [FIG. 6].
   The measured resistance of line 1 and 2 in this example is below 1 Ω and higher than 1MΩ respectively. Specifically the short to ground circuit is line 1 (Line 2 is normal). To find exact broken point, check the sub line of line 1 as described in the following step.

FIG 6



B. Disconnect connector (B), and measure the resistance between connector (A) and chassis ground, and between (B1) and chassis ground as shown in [FIG. 7].
   The measured resistance between connector (B1) and chassis ground is 1Ω or less. The short to ground circuit is between terminal 1 of connector (C) and terminal 1 of connector (B1).

FIG 7



SYMPTOM TROUBLESHOOTING GUIDE CHART

MAIN SYMPTOM	DIAGNOSTIC PROCEDURE	ALSO CHECK FOR
Unable to start (Engine does not turn over)	1. Test the battery 2. Test the starter 3. Inhibitor switch (A/T) or clutch start switch (M/T)	
Unable to start (Incomplete combustion)	1. Test the battery 2. Check the fuel pressure 3. Check the ignition circuit 4. Troubleshooting the immobilizer system (In case of immobilizer lamp ON)	• DTC • Low compression • Intake air leaks • Slipped or broken timing belt • Contaminated fuel
Difficult to start	1. Test the battery 2. Check the fuel pressure 3. Check the ECT sensor and circuit (Check DTC) 4. Check the ignition circuit	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
	1. Check the fuel pressure 2. Check the Injector	• DTC

Poor idling (Rough, unstable or incorrect Idle)	3. Check the long term fuel trim and short term fuel trim (Refer to CUSTOMER DATASTREAM) 4. Check the idle speed control circuit (Check DTC) 5. Inspect and test the Throttle Body 6. Check the ECT sensor and circuit (Check DTC)	• Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Engine stall	1. Test the Battery 2. Check the fuel pressure 3. Check the idle speed control circuit (Check DTC) 4. Check the ignition circuit 5. Check the CKPS Circuit (Check DTC)	• DTC • Intake air leaks • Contaminated fuel • Weak ignition spark
Poor driving (Surge)	1. Check the fuel pressure 2. Inspect and test Throttle Body 3. Check the ignition circuit 4. Check the ECT Sensor and Circuit (Check DTC) 5. Test the exhaust system for a possible restriction 6. Check the long term fuel trim and short term fuel trim (Refer to CUSTOMER DATASTREAM)	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Knocking	1. Check the fuel pressure 2. Inspect the engine coolant 3. Inspect the radiator and the electric cooling fan 4. Check the spark plugs	• DTC • Contaminated fuel
Poor fuel economy	1. Check customer's driving habits • Is A/C on full time or the defroster mode on? • Are tires at correct pressure? • Is excessively heavy load being carried? • Is acceleration too much, too often? 2. Check the fuel pressure 3. Check the injector 4. Test the exhaust system for a possible restriction 5. Check the ECT sensor and circuit	• DTC • Low compression • Intake air leaks • Contaminated fuel • Weak ignition spark
Hard to refuel (Overflow during refueling)	1. Test the canister close valve 2. Inspect the fuel filler hose/pipe • Pinched, kinked or blocked? • Filler hose is torn 3. Inspect the fuel tank vapor vent hose between the EVAP. canister and air filter 4. Check the EVAP. canister	• Malfunctioning gas station filling nozzle (If this problem occurs at a specific gas station during refueling)

SPECIFICATION

FUEL DELIVERY SYSTEM

Items	Specification	
Fuel Tank	Capacity	67ℓit. (17.7 U.S.gaℓ., 14.7 Imp. gaℓ.)
Fuel Filter (built in Fuel Pump assembly)	Type	High pressure type
Fuel Pressure Regulator (built in Fuel Pump assembly)	Regulated Fuel Pressure	375 ~ 385 kPa(3.82 ~ 3.92 kgf/cm², 54.3 ~ 55.8 psi)
Fuel Pump	Type	Electrical, in-tank type
	Driven by	Electric motor

SENSOR

MASS AIR FLOW SENSOR (MAFS)

▷ Type: Hot-film type

▷ Specification

Air Flow (kg/h)	Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz
43.2 kg/h	4,024Hz
57.6 kg/h	4,399Hz
72.0 kg/h	4,704Hz
108.0 kg/h	5,329Hz
144.0 kg/h	5,897Hz
198.0 kg/h	6,553Hz
270.0 kg/h	7,240Hz
360.0 kg/h	7,957Hz
486.0 kg/h	8,738Hz
666.0 kg/h	9,644Hz
900.0 kg/h	10,590Hz

INTAKE AIR TEMPERATURE SENSOR (IATS)
▷ Type: Thermistor type
▷ Specification

Temperature		Resistance (kΩ)
°C	°F	
-40	-40	100.87kΩ
-20	-4	28.58kΩ
0	32	9.40kΩ
10	50	5.66kΩ
20	68	3.51kΩ
40	104	1.47kΩ
60	140	0.67kΩ
80	176	0.33kΩ

MANIFOLD ABSOLUTE PRESSURE SENSOR (MAPS)
▷ Type: Piezo-resistive pressure type
▷ Specification

Pressure (kPa)	Output Voltage (V)
20.0kPa	0.79V
46.66kPa	1.84V
101.32kPa	4.00V

ENGINE COOLANT TEMPERATURE SENSOR (ECTS)
▷ Type: Thermistor type
▷ Specification

Temperature		Resistance (kΩ)
°C	°F	
-40	-40	48.14kΩ
-20	-4	14.13 ~ 16.83kΩ
0	32	5.79kΩ
20	68	2.31 ~ 2.59kΩ

40	104	1.15kΩ
60	140	0.59kΩ
80	176	0.32kΩ

THROTTLE POSITION SENSOR (TPS)
▷ Type: Variable resistor type
▷ Specification (When reference voltage = 5.0V)

Throttle Angle (°)	Output Voltage(V)	
	TPS1	TPS2
0°	0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0V

Item	Sensor Resistance (kΩ)
TPS1	4.0 ~ 6.0kΩ at 20°C (68°F)
TPS2	2.72 ~ 4.08kΩ at 20°C (68°F)

ACCELERATOR POSITION SENSOR (APS)
▷ Type: Variable resistor type
▷ Specification (When reference voltage = 5.0V)

Accelerator Position	Output Voltage (V)	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.29 ~ 0.46V
W.O.T	3.85 ~ 4.35V	1.93 ~ 2.18V

Item	Sensor Resistance (kΩ)
APS1	0.7 ~ 1.3kΩ at 20°C (68°F)
APS2	1.4 ~ 2.6kΩ at 20°C (68°F)

HEATED OXYGEN SENSOR (HO2S)
▷ Type: Zirconia (ZrO_2) type
▷ Specification

A/F Ratio	Output Voltage (V)
RICH	0.75 ~ 1.00V
LEAN	0 ~ 0.12V

Item	Resistance (Ω)
Sensor Heater	8.1 ~ 11.1Ω at 21°C (69.8°F)

CAMSHAFT POSITION SENSOR (CMPS)
▷ Type: Hall effect type

▷ Specification

Item	Specification
Output Voltage (V)	High: 5.0V
	Low: 0.7V
Air Gap (mm)	0.5 ~ 1.5mm

CRANKSHAFT POSITION SENSOR (CKPS)
▷ Type: Magnetic field sensitive type
▷ Specification

Item	Specification
Coil Resistance (Ω)	630 ~ 770Ω at 20°C (68°F)
Air Gap (mm)	0.5 ~ 1.5mm

KNOCK SENSOR (KS)
▷ Type: Piezo-electricity type
▷ Specification

Item	Specification
Capacitance (pF)	1,480 ~ 2,220pF

CVVT OIL TEMPERATURE SENSOR (OTS)
▷ Type: Thermistor type
▷ Specification

Temperature		Resistance (kΩ)
°C	°F	
-20	-4	16.52kΩ
20	68	2.45kΩ
80	176	0.29kΩ

FUEL TANK PRESSURE SENSOR (FTPS)
▷ Type: Piezo-Resistivity type
▷ Specification

Pressure (kPa)	Output Voltage (V)
-3.75 kPa	4.5 V
0 kPa	1.5 V
1.25 kPa	0.5 V

ACTUATORS

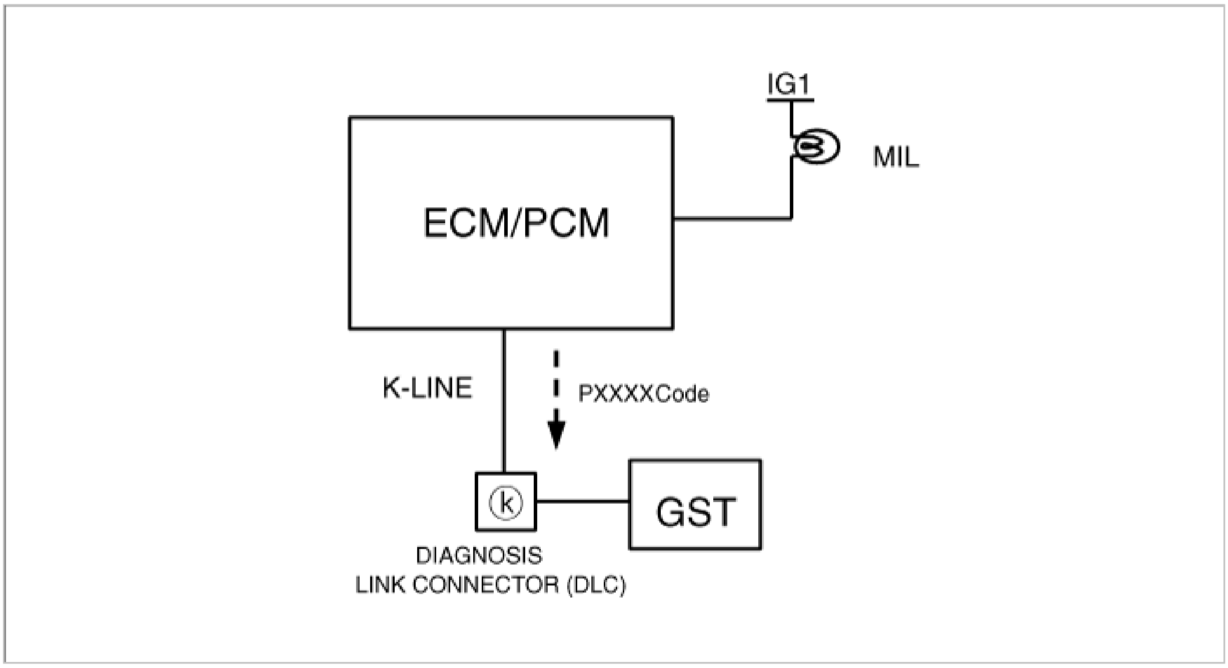
Fuel System > Engine Control System > Description and Operation

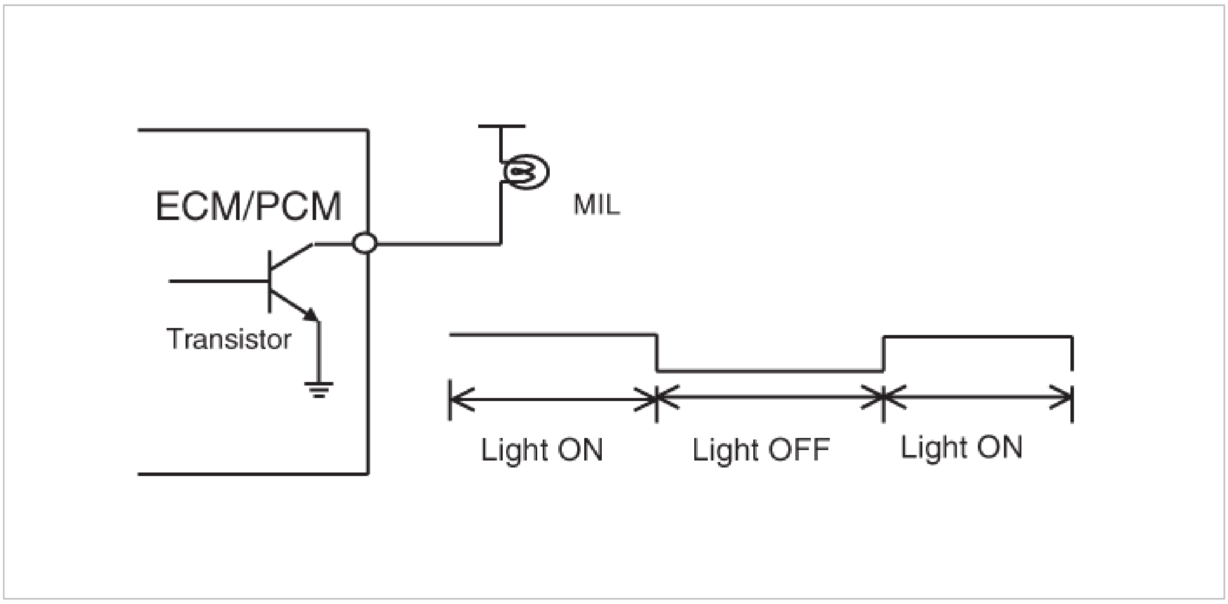
OBD-II REVIEW

1. OVERVIEW

The California Air Resources Board (CARB) began regulation of On Board Diagnostics (OBD) for vehicles sold in california beginning with the 1988 model year. The first phase, OBD-I, required monitoring of the fuel metering system, Exhust Gas Recirculation (EGR) system and additional emission related components. The Malfunction Indicator Lamp (MIL) was required to light and alert the driver of the fault and the need for repair of the emission control system. Associated with the MIL was a fault code or Diagnostic Trouble Code (DTC) idenfying the specific area of the fault.
The OBD system was proposed by CARB to improve air quality by identifying vehicle exceeding emission standards. Passage of the Federal Clean Air Act Amendments in 1990 has also prompted the Environmental Protection Agency (EPA) to develop On Board Diagnostic requirements. CARB OBD-II regulations were followed until 1999 when the federal regulations were used.
The OBD-II system meets government regulations by monitoring the emission control system. When a system or component exceeds emission threshold or a component operates outside tolerance, a DTC will be stored and the MIL illuminated.
The diagnostic executive is a computer program in the Engine Control Module (ECM) or PowertrainControl Module (PCM) that coordinates the OBD-II self-monitoring system. This program controls all the monitors and interactions, DTC and MIL operation, freeze frame data and scan tool interface.
Freeze frame data describes stored engine conditions, such as state of the engine, state of fuel control, spark, RPM, load and warm status at the point the first fault is detected. Previously stored conditions will be replaced only if a fuel or misfire fault is detected. This data is accessible with the scan tool to assist in repairing the vehicle.
The center of the OBD-II system is a microprocessor called the Engine Control Module (ECM) or Powertrain Control Module (PCM).
The ECM or PCM receives input from sensors and other electronic components (switches, relays, and others) based on information received and programmed into its memory (keep alive random access memory, and others), the ECM or PCM generates output signals to control various relays, solenoids and actuators.

2. CONFIGURATION OF HARDWARE AND RELATED TERMS





The Malfunction Indicator Lamp (MIL) is connected between ECM or PCM-terminal Malfunction Indicator Lamp and battery supply (open collector amplifier).
In most cars, the MIL will be installed in the instrument panel. The lamp amplifier can not be damaged by a short circuit.
Lamps with a power dissipation much greater than total dissipation of the MIL and lamp in the tester may cause a fault indication.
▹ At ignition ON and engine revolution (RPM)< MIN. RPM, the MIL is switched ON for an optical check by the driver.
When the ECM or PCM detects a malfunction related emission during the first driving cycle, the DTC and engine data are stored in the freeze frame memory. The MIL is illuminated only when the ECM or PCM detects the same malfunction related the DTC in two consecutive driving cycles.
● Misfire and Fuel System Malfunctions:
For misfire or fuel system malfunctions, the MIL may be eliminated if the same fault does not reoccur during monitoring in three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first detected.
● All Other Malfunctions:
For all other faults, the MIL may be extinguished after three subsequent sequential driving cycles during which the monitoring system responsible for illuminating the MIL functions without detecting the malfunction and if no other malfunction has been identified that would independently illuminate the MIL according to the requirements outlined above.
The diagnostic system may erase a fault code if the same fault is not re-registered in at least 40 engine warm-up cycles, and the MIL is not illuminated for that fault code.

- Bidirectional line
- K-Line is defined as the line which provides information in a serial digital form from ECM or PCM to the diagnostic tester. K-Line is used bidirectionally, in which case it may carry commands or data from the diagnostic tester to the ECM or PCM. K-Line is also used to initialize the serial communication.

A driving cycle consists of engine start up, and engine shut off.

A warm-up cycle means sufficient vehicle operation such that the engine coolant temperature has risen by at least 40 degrees Fahrenheit from engine starting and reaches a minimum has risen by at least 40 degrees Fahrenheit from engine starting and reaches a minimum temperature of at least 160 degrees Fahrenheit.

A trip means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system except catalyst efficiency or evaporative system monitoring when a steady-speed check is used, subject to the limitation that the manufacturer-defined trip monitoring conditions shall all be encountered at least once during the first engine start portion of the applicable FTP cycle.

- Diagnostic Trouble Code (SAE J2012)
- DTCs used in OBD-II vehicles will begin with a letter and are followed by four numbers.

The letter of the beginning of the DTC identifies the function of the monitored device that has failed. A "P" indicates a powertrain device, "C" indicates a chassis device. "B" is for body device and "U" indicates a network or data link code. The first number indicates if the code is generic (common to all manufacturers) or if it is manufacturer specific. A "0" & "2" indicates generic, "1" indicates manufacturer-specific. The second number indicates the system that is affected with a number between 1 and 7.

The following is a list showing what numbers are assigned to each system.

1) Fuel and air metering
2) Fuel and air metering(injector circuit malfunction only)
3) Ignition system or misfire
4) Auxiliary emission controls
5) Vehicle speed controls and idle control system
6) Computer output circuits
7) Transmission

The last two numbers of the DTC indicates the component or section of the system where the fault is located.

When a freeze frame event is triggered by an emission related DTC, the ECM or PCM stores various vehicle information as it existed the moment the fault ocurred. The DTC number along with the engine data can be useful in aiding a technician in locating the cause of the fault. Once the data from the 1st driving cycle DTC ocurrence is stored in the freeze frame memory, it will remain there even when the fault ocurrs again (2nd driving cycle) and the MIL is illuminated.

- Freeze Frame List
  1) Calculated Load Value
  2) Engine RPM
  3) Fuel Trim
  4) Fuel Pressure (if available)
  5) Vehicle Speed (if available)
  6) Coolant Temperature
  7) Intake Manifold Pressure (if available)
  8) Closed-or Open-loop operation
  9) Fault code

3. OBD-II SYSTEM READINESS TESTS

The catalyst efficiency monitor is a self-test strategy within the ECM or PCM that uses the downstream Heated Oxygen Sensor (HO2S) to determine when a catalyst has fallen below the minimum level of effectiveness in its ability to control exhaust emission.

Misfire is defined as the lack of proper combustion in the cylinder due to the absence of spark, poor fuel metering, or poor compression. Any combustion that does not occur within the cylinder at the proper time is also a misfire. The misfire detection monitor detects fuel, ignition or mechanically induced misfires. The intent is to protect the catalyst from permanent damage and to alert the customer of an emission failure or an inspection maintenance failure by illuminating the MIL . When a misfire is detected, special software called freeze frame data is enabled. The freeze frame data captures the operational state of the vehicle when a fault is detected from misfire detection monitor strategy.

The fuel system monitor is a self-test strategy within the ECM or PCM that monitors the adaptive fuel table The fuel control system uses the adaptive fuel table to compensate for normal variability of the fuel system components caused by wear or aging. During normal vehicle operation, if the fuel system appears biased lean or rich, the adaptive value table will shift the fuel delivery calculations to remove bias.

The cooling system monitoring is a self-test strategy within the ECM or PCM that monitors ECTS (Engine Coolant Temperature Sensor) and thermostat about circuit continuity, output range, rationality faults.

OBD-II regulations require monitoring of the upstream Heated O2 Sensor (H2OS) to detect if the deterioration of the sensor has exceeded thresholds. An additional HO2S is located downstream of the Warm-Up Three Way Catalytic Converter (WU-TWC) to determine the efficiency of the catalyst.

Although the downstream H2OS is similar to the type used for fuel control, it functions differently. The downstream HO2S is monitored to determine if a voltage is generated. That voltage is compared to a calibrated acceptable range.

The EVAP. monitoring is a self-test strategy within the ECM or PCM that tests the integrity of the EVAP. system. The complete evaporative system detects a leak or leaks that cumulatively are greater than or equal to a leak caused by a 0.040 inch and 0.020 inch diameter orifice.

The A/C system monitoring is a self-test strategy within the ECM or PCM that monitors malfunction of all A/C system component at A/C ON.

The comprehensive components monitoring is a self-test strategy within the ECM or PCM that detects fault of any electronic powertrain components or system that provides input to the ECM or PCM and is not exclusively an input to any other OBD-II monitor.

Fuel System > Engine Control System > Power train Control Module (PCM) > Repair procedures

PCM PROBLEM INSPECTION PROCEDURE

1. TEST PCM GROUND CIRCUIT: Measure resistance between PCM and chassis ground using the backside of PCM harness connector as PCM side check point. If the problem is found, repair it.

   Specification (Resistance): 1Ω or less

2. TEST PCM CONNECTOR: Disconnect the PCM connector and visually check the ground terminals on PCM side and harness side for bent pins or poor contact pressure. If the problem is found, repair it.
3. If problem is not found in Step 1 and 2, the PCM could be faulty. If so, replace the PCM with a new one, and then check the vehicle again. If the vehicle operates normally then the problem was likely with the PCM.
4. RE-TEST THE ORIGINAL PCM : Install the original PCM (may be broken) into a known-good vehicle and check the vehicle. If the problem occurs again, replace the original PCM with a new one. If problem does not occur, this is intermittent problem (Refer to INTERMITTENT PROBLEM PROCEDURE in BASIC INSPECTION PROCEDURE).

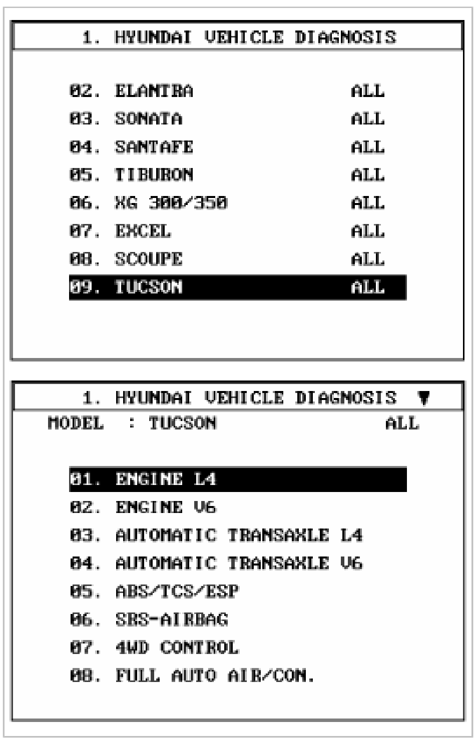
VIN PROGRAMMING PROCEDURE

VIN (Vehicle Identification Number) is a number that has the vehicle's information (Maker, Vehicle Type, Vehicle Line/Series, Body Type, Engine Type, Transmission Type, Model Year, Plant Location and so forth. For more information, please refer to the group "GI" in this SERVICE MANUAL). When replacing an PCM, the VIN must be programmed in the PCM. If there is no VIN in PCM memory, the fault code (DTC P0630) is set.

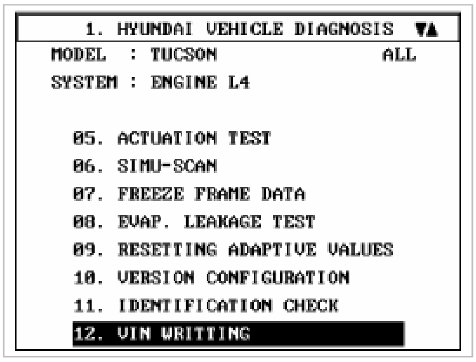
CAUTION

The programmed VIN cannot be changed. When writing the VIN, confirm the VIN carefully

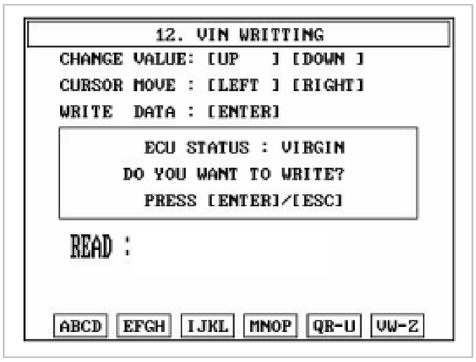
1. Select "Vehicle" and "Engine" (For example, TUCSON 2.0L L4).



2. Select "VIN WRITING".



3. Check the PCM status.



NOTE

- VIRGIN: VIN is not programmed
- LEARNT: VIN has been already programmed

Is the PCM status "VIRGIN"?

YES

▸ Go to next step 4.

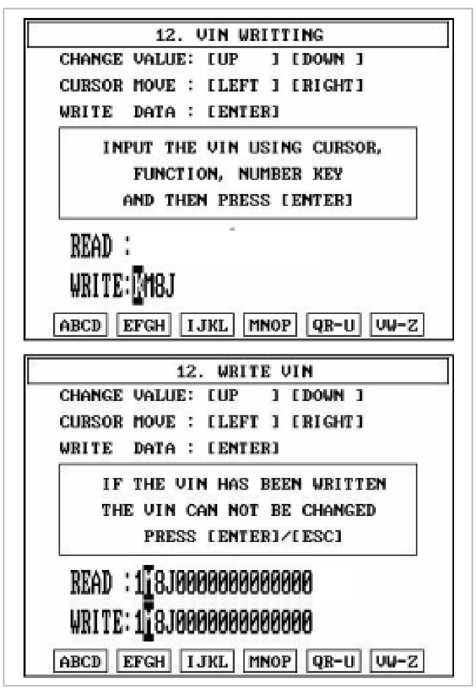
NO

▸ END

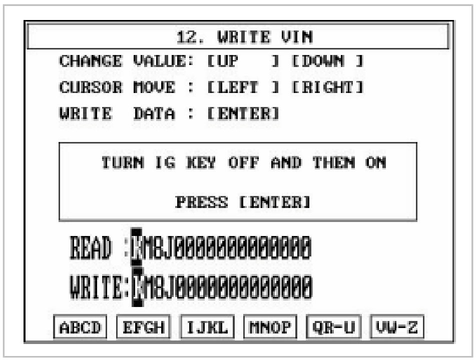
4. Write the VIN with cursor, function and number keys.

WARNING

Before pressing the "ENTER" key, confirm the VIN again because the programmed VIN cannot be changed.



5. After verifying the written VIN, press the "ENTER" key.
6. Turn the ignition switch OFF, and then turn ON.



7. Verify the programmed VIN in the PCM memory.

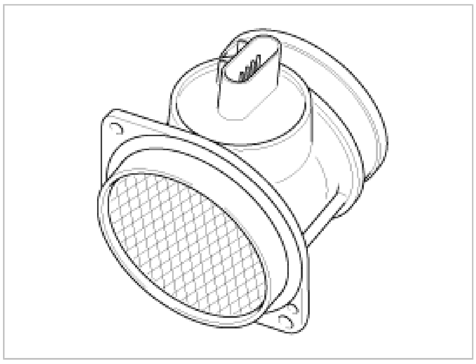
Fuel System > Engine Control System > Mass Air Flow Sensor (MAFS) > Description and Operation

DESCRIPTION

Mass Air Flow Sensor (MAFS) is a hot-film type sensor and is located in between the air cleaner and the throttle body. It consists of a tube, a sensor assembly and honey cell and detects intake air quantity flowing into the intake manifold. While the intake air coming out of the air cleaner flows by the honey cell, it becomes laminar flow, and then it passes the hot-film. At this time, heat transfer is generated by convection and this sensor loses its energy. This sensor detects the mass air flow by using the energy loss and transfers the information to the PCM by frequency. The PCM calculates fuel quantity and ignition timing.



SPECIFICATION

Air Flow (kg/h)	Output Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz
43.2 kg/h	4,024Hz
57.6 kg/h	4,399Hz
72.0 kg/h	4,704Hz
108.0 kg/h	5,329Hz
144.0 kg/h	5,897Hz
198.0 kg/h	6,553Hz
270.0 kg/h	7,240Hz
360.0 kg/h	7,957Hz
486.0 kg/h	8,738Hz
666.0 kg/h	9,644Hz
900.0 kg/h	10,590Hz

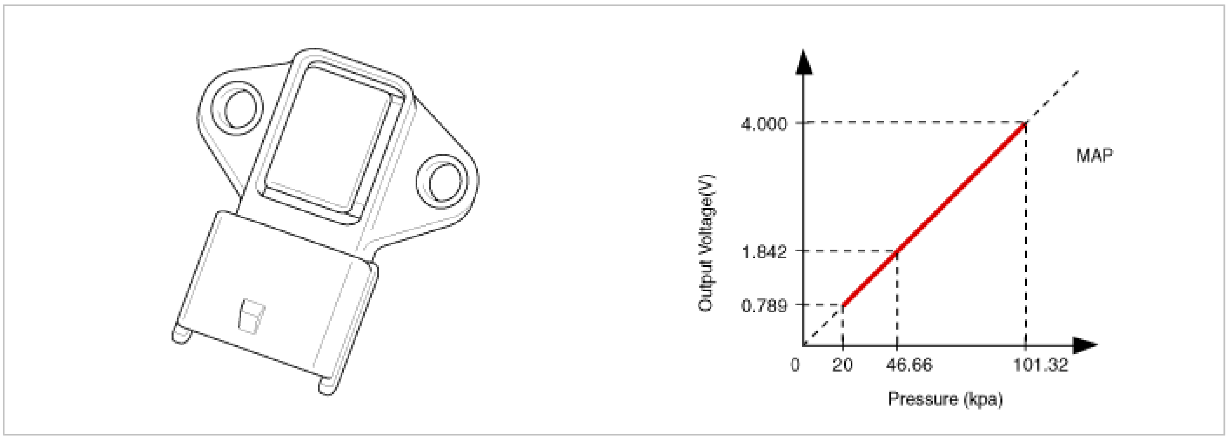
PCM

Fuel System > Engine Control System > Manifold Absolute Pressure Sensor (MAPS) > Description and Operation

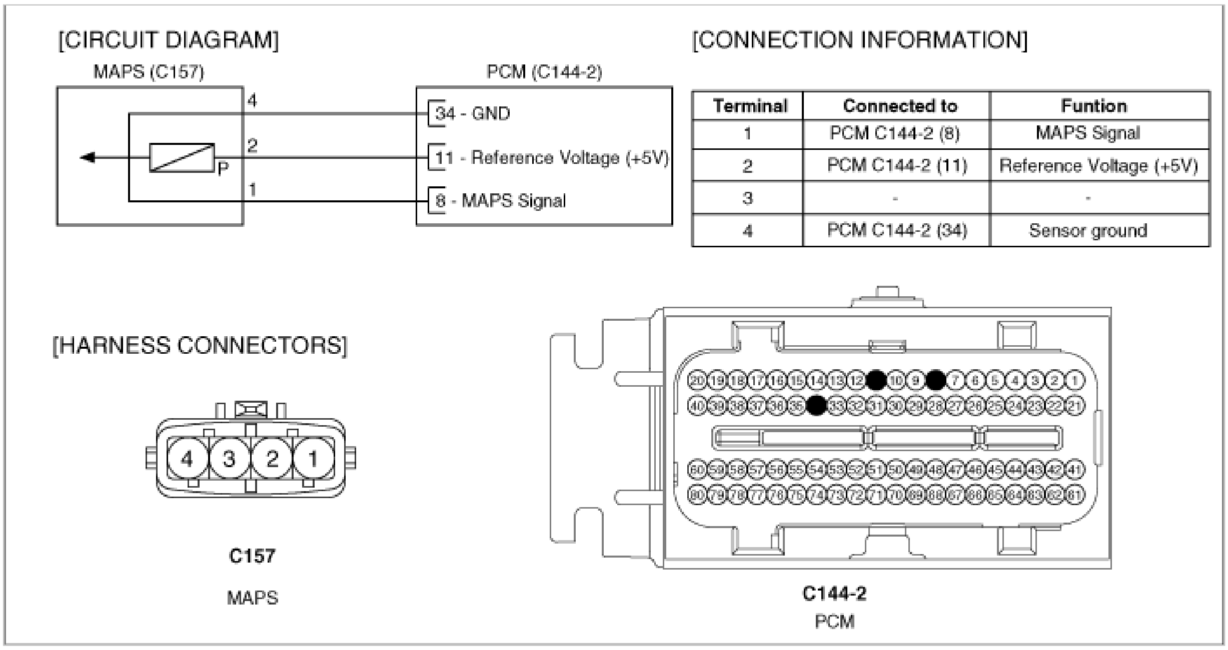
DESCRIPTION



Manifold Absolute Pressure Sensor (MAPS) is speed-density type sensor and is installed on the surge tank. This MAPS senses absolute pressure in surge tank and transfers this analog signal proportional to the pressure to the PCM. The PCM calculates the intake air quantity and engine speed based on this signal. This MAPS consists of piezo-electric element and hybrid IC that amplifies the element output signal. The element is silicon diaphragm type and adapts pressure sensitive variable resistor effect of semi-conductor. 100% vacuum and the manifold pressure applies to both sides of it respectively. That is, this sensor outputs the silicon variation proportional to pressure change by voltage.

SPECIFICATION

Pressure(kPa)	Output Voltage (V)
20.0kPa	0.79V
46.66kPa	1.84V
101.32kPa	4.00V



Terminal	Connected to	Funtion

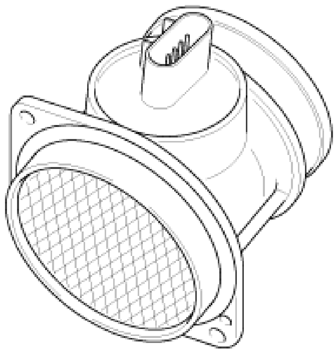
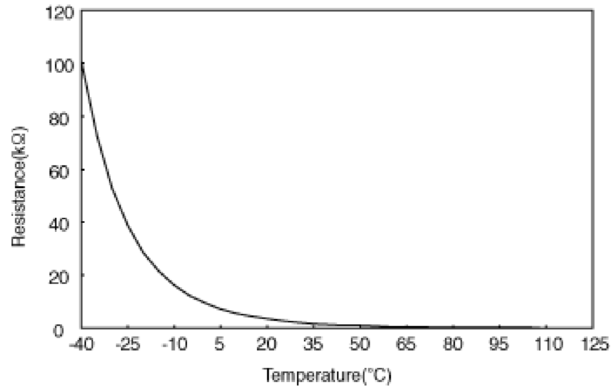
3	-	-
4	PCM C144-2 (34)	Sensor ground

Fuel System > Engine Control System > Intake Air Temperature Sensor (IATS) > Description and Operation

DESCRIPTION





Intake Air Temperature Sensor (IATS) is installed inside the Mass Air Flow Sensor (MAFS) and detects the intake air temperature. To calculate precise air quantity, correction of the air temperature is needed because air density varies according to the temperature. So the PCM uses not only MAFS signal but also IATS signal. This sensor has a Negative Temperature Coefficient (NTC) and its resistance is in inverse proportion to the temperature.

SPECIFICATION

Temperature		Resistance (kΩ)
°C	°F	
-40	-40	100.87kΩ
-20	-4	28.58kΩ
0	32	9.40kΩ
10	50	5.66kΩ
20	68	3.51kΩ
40	104	1.47kΩ

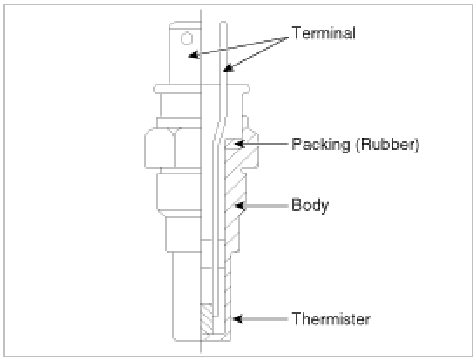
PCM

Fuel System > Engine Control System > Engine Coolant Temperature Sensor (ECTS) > Description and Operation

DESCRIPTION

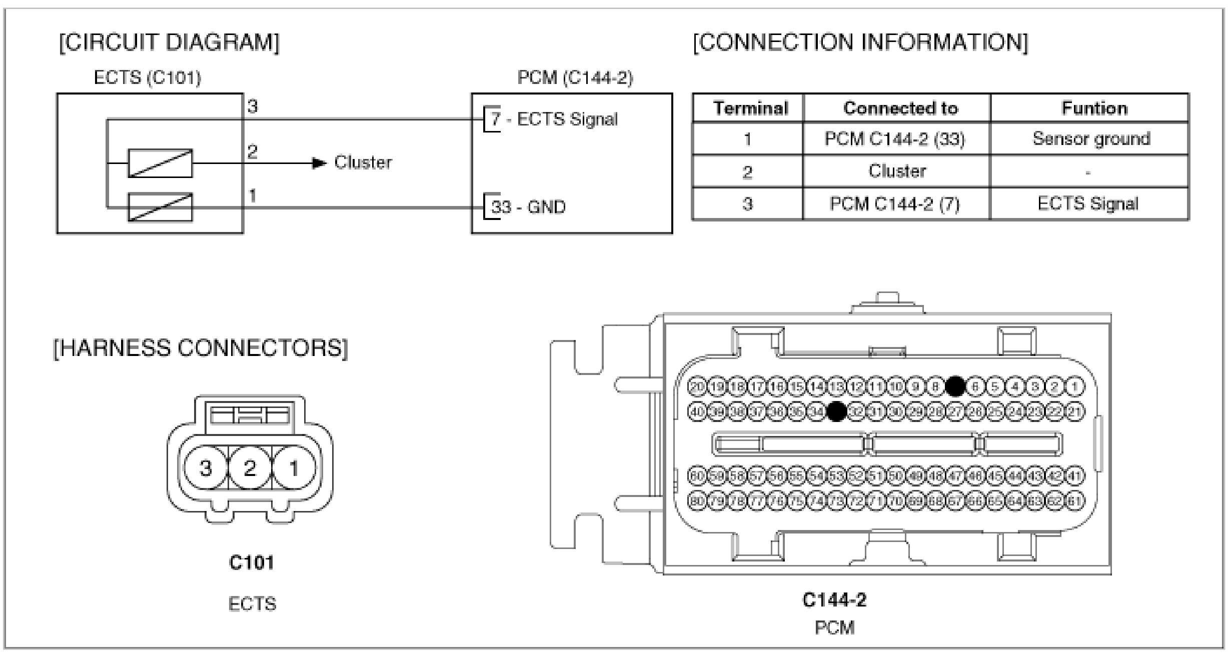
Engine Coolant Temperature Sensor (ECTS) is located in the engine coolant passage of the cylinder head for detecting the engine coolant temperature. The ECTS uses a thermistor whose resistance changes with the temperature. The electrical resistance of the ECTS decreases as the temperature increases, and increases as the temperature decreases. The reference 5 V in the PCM is supplied to the ECTS via a resistor in the PCM.That is, the resistor in the PCM and the thermistor in the ECTS are connected in series. When the resistance value of the thermistor in the ECTS changes according to the engine coolant temperature, the output voltage also changes. During cold engine operation the PCM increases the fuel injection duration and controls the ignition timing using the information of engine coolant temperature to avoid engine stalling and improve drivability.



SPECIFICATION

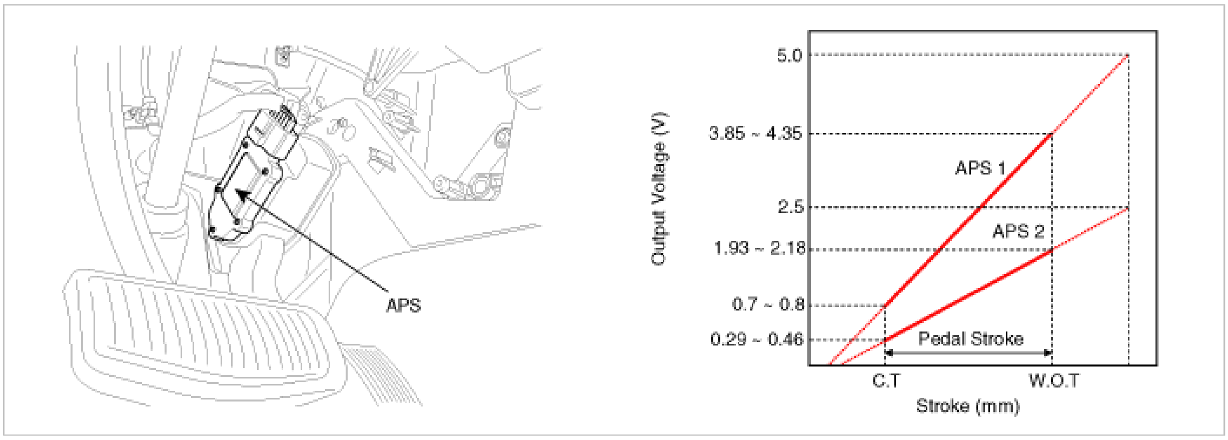
Temperature		Resistance(kΩ)
°C	°F	
-40	-40	48.14kΩ
-20	-4	14.13 ~ 16.83kΩ
0	32	5.79kΩ
20	68	2.31 ~ 2.59kΩ
40	104	1.15kΩ
60	140	0.59kΩ
80	176	0.32kΩ

SCHEMATIC DIAGRAM



Fuel System > Engine Control System > Accelerator Position Sensor (APS) > Description and Operation

DESCRIPTION



Accelerator Position Sensor (APS) is installed on the accelerator pedal module and detects the rotation angle of the accelerator pedal. The APS is one of the most important sensors in engine control system, so it consists of the two sensors which adapt individual sensor power and ground line. The second sensor monitors the first sensor and its output voltage is half of the first one. If the ratio of the sensor 1 and 2 is out of the range (approximately 1/2), the diagnostic system judges that it is abnormal.

SPECIFICATION

Pedal Position	Output Voltage (V) [Vref = 5.0V]	
	APS1	APS2
C.T	0.7 ~ 0.8V	0.29 ~ 0.46V
W.O.T	3.85 ~ 4.35V	1.93 ~ 2.18V

Item	Sensor Resistance
APS1	0.7 ~ 1.3kΩ at 20°C (68°F)
APS2	1.4 ~ 2.6kΩ at 20°C (68°F)

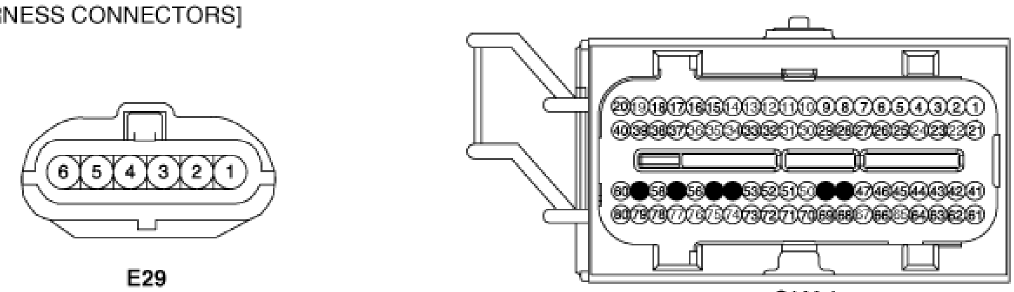
[HARNESS CONNECTORS]

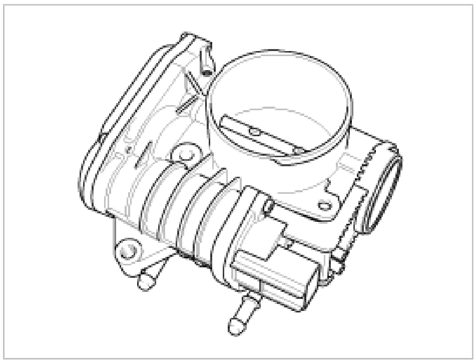


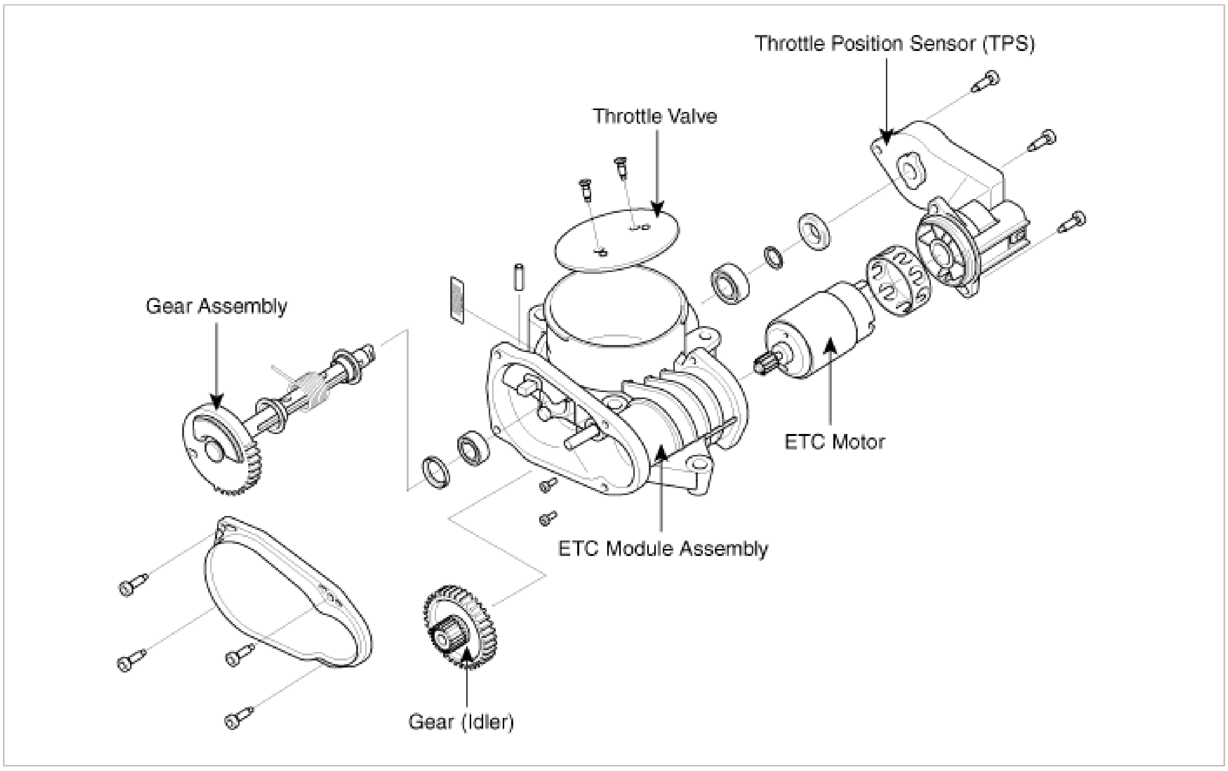
Fuel System > Engine Control System > ETC (Electric Throttle control) System > Description

and Operation

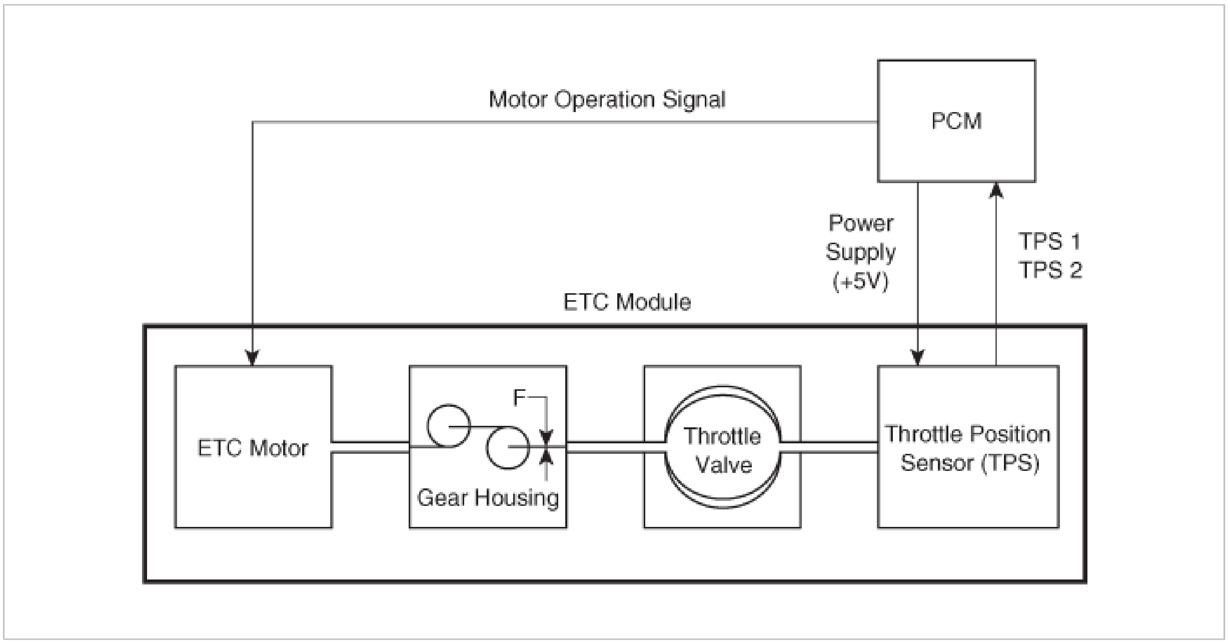
DESCRIPTION

ETC (Electronic Throttle Control) system is electronically controlled throttle device which controls the throttle valve. It consists of ETC motor, throttle body and throttle position sensor (TPS). A mechanical throttle control system receives a driver's intention via a wire cable between the accelerator and the throttle valve, while this ETC system does the signal from the Accelerator Position Sensor (APS) installed on the accelerator pedal. After the PCM receives the APS signal and calculates the throttle opening angle, it activates the throttle valve by using the ETC motor. Additionally, it can materialize cruise control function without any special devices.





COMPONENTS



SPECIFICATION

[THROTTLE POSITION SENSOR]

Throttle Angle(°)	Output Voltage(V) [Vref = 5.0V]	
	TPS1	TPS2
0°	0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V

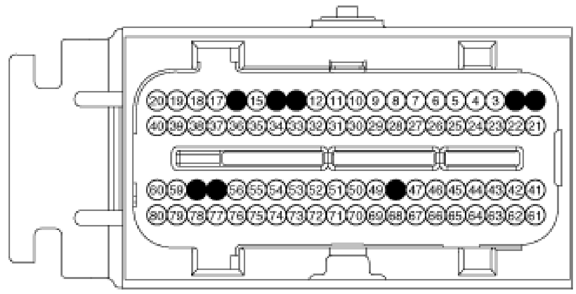
ETC MODULE



C144-2

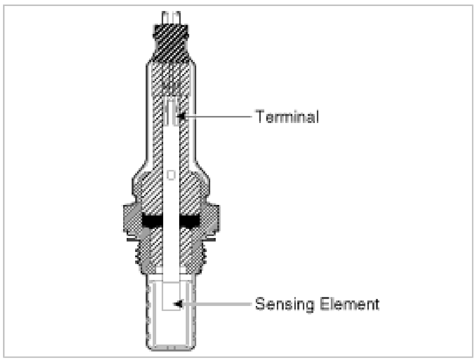
PCM

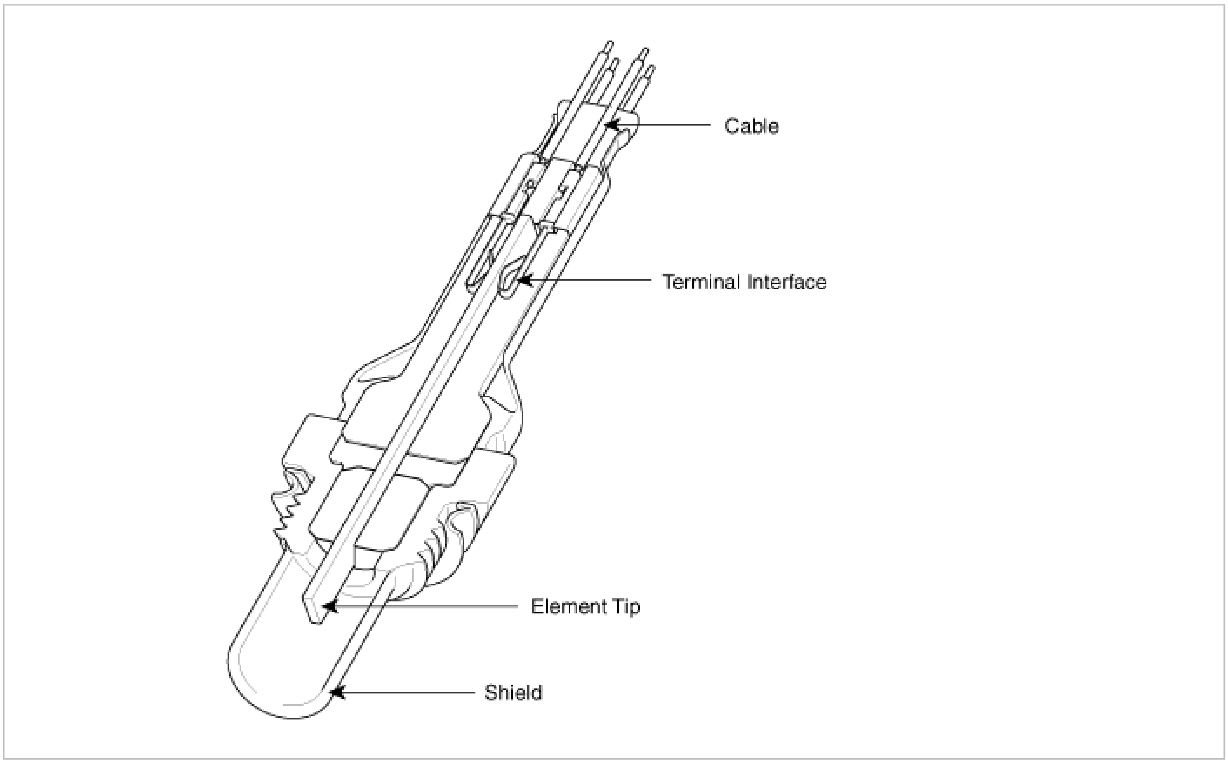
FAIL-SAFE MODE

Mode	Description	Symptom	Possible Cause
MODE 1	FORCED ENGINE SHUTDOWN	Engine stop	• ETC system can't proceed reliable algorithm procedure - Fatal PCM internal programming error - Faulty intake system or throttle body
MODE 2	FORCED IDLE & POWER MANAGEMENT	Forced idle state controlled by fuel quantity regulation and ignition timing adjustment	• ETC system can't control engine power via throttle device • Disabled throttle control or broken throttle position information
MODE 3	FORCED IDLE	Forced idle state and no response for accelerator activation	• No information about the accelerator position - Broken APS 1 and 2, faulty A/D converter or internal controller
MODE 4	LIMIT PERFORMANCE & POWER MANAGEMENT	Engine power is determined by accelerator position and idle power requirement (Limited vehicle running)	• ETC system can't securely control engine power
MODE 5	LIMIT PERFORMANCE	1. Engine power varies with accelerator position, but driver perceives lack of engine power. 2. MIL ON (Normal vehicle running)	• Not reliable accelerator position signal or bad maximum power generation - Faulty APS, ignition voltage or internal controller
MODE 6	NORMAL	Normal	

DESCRIPTION

Heated Oxygen Sensor (HO2S) consists of zirconium and alumina and is installed on upstream and downstream of the Manifold Catalyst Converter (MCC). After it compares oxygen consistency of the atmosphere with the exhaust gas, it transfers the oxygen consistency of the exhaust gas to the PCM. When A/F ratio is rich or lean, it generates approximately 1V or 0V respectively. In order that this sensor normally operates, the temperature of the sensor tip is higher than 370°C (698°F). So it has a heater which is controlled by the PCM duty signal. When the exhaust gas temperature is lower than the specified value, the heater warms the sensor tip.





SPECIFICATION

A/F Ratio	Output Voltage (V)
RICH	0.75 ~ 1.00V
LEAN	0 ~ 0.12V

Item	Specification
Heater Resistance (Ω)	8.1 ~ 11.1Ω at 21°C (69.8°F)

PCM

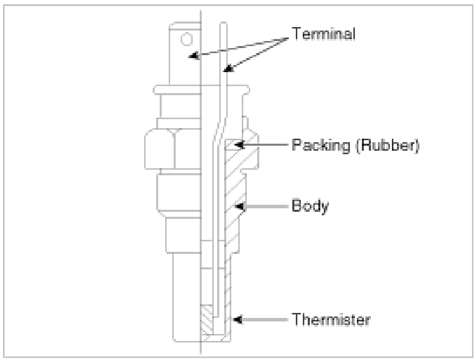
Fuel System > Engine Control System > CVVT Oil Temperature Sensor (OTS) > Description and Operation

DESCRIPTION

Continuously Variable Valve Timing (CVVT) system controls valve overlap by forcibly activating the camshaft and adjusts EGR

(Exhaust Gas Recirculation) amount. It decreases exhaust gas (NOx, HC) and improves fuel economy, idle state, torque in low speed and power in high speed. This system uses engine oil pressure and consists of the two CVVT Oil Control Valves (OCV) in each bank which supplies oil to cam phaser according to PWM (Pulse With Modulator) signal of the PCM, a CVVT Oil Temperature Sensor (OTS) which detects the oil temperature and a cam phaser which is installed on the end of the camshaft and converts camshaft phase. The oil getting out of the CVVT oil control valve flows into the cam phaser and rotates the rotor inside camphaser. At this time, the camshaft rotates with the rotor and the cam phase is changed.

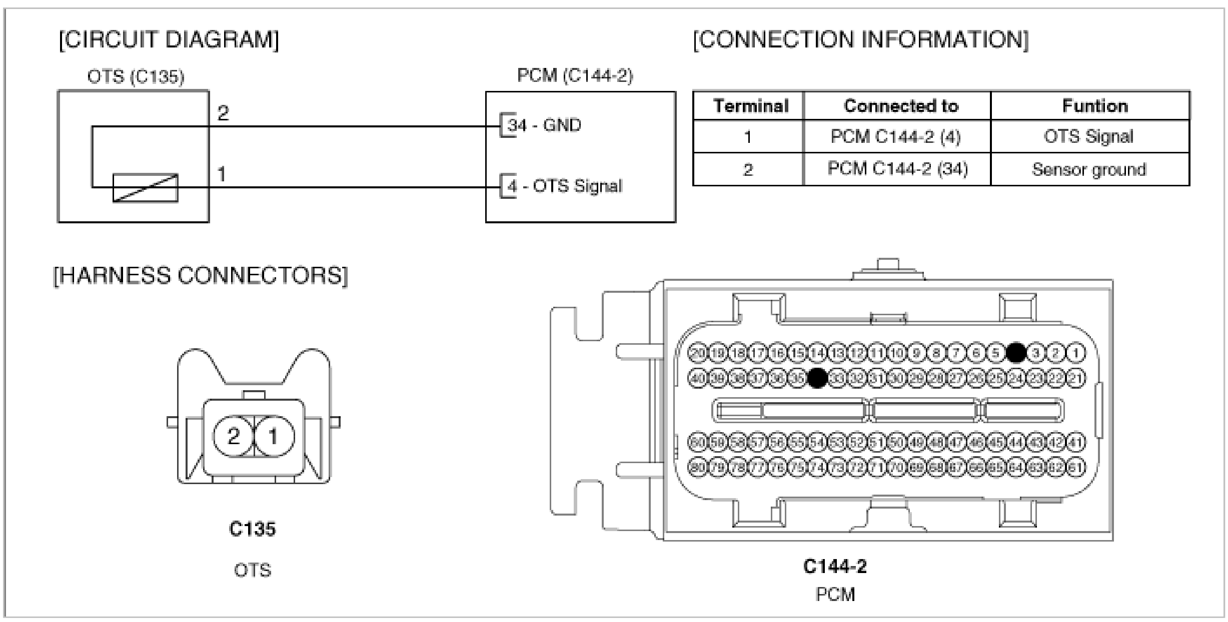
1. When camshaft rotates engine rotation-wise: Intake-Advance / Exhaust-Retard
2. When camshaft rotates counter engine rotation-wise: Intake- Retard / Exhaust- Advance



SPECIFICATION

Temperature		Resistance(kΩ)
°C	°F	
-20	-4	16.52kΩ
20	32	2.45kΩ
80	176	0.29kΩ

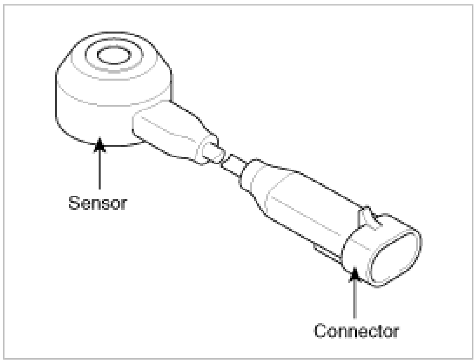
SCHEMATIC DIAGRAM

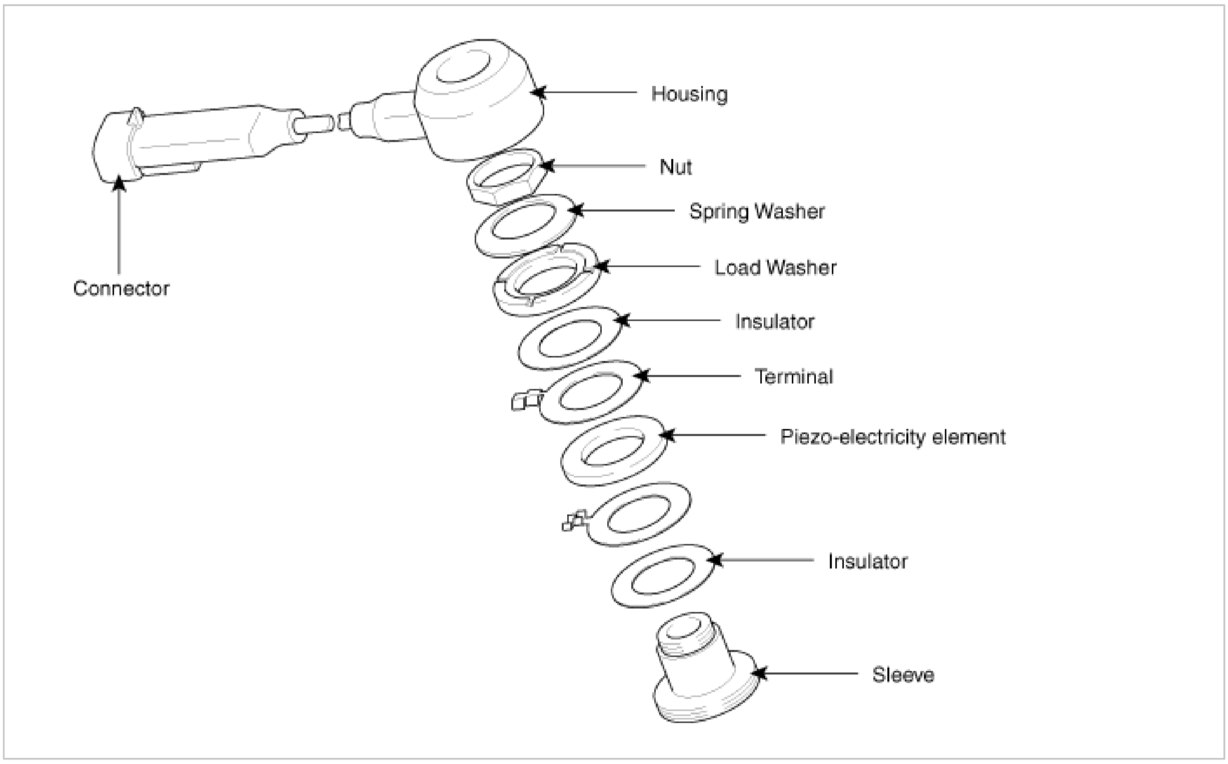


Fuel System > Engine Control System > Knock Sensor (KS) > Description and Operation

DESCRIPTION

Knocking is a phenomenon characterized by undesirable vibration and noise and can cause engine damage. Knock Sensor (KS) senses engine knocking and the two sensors are installed inside the V-valley of the cylinder block. When knocking occurs, the vibration from the cylinder block is applied as pressure to the piezoelectric element. At this time, this sensor transfers the voltage signal higher than the specified value to the PCM and the PCM retards the ignition timing. If the knocking disappears after retarding the ignition timing, the PCM will advance the ignition timing. This sequential control can improve engine power, torque and fuel economy.

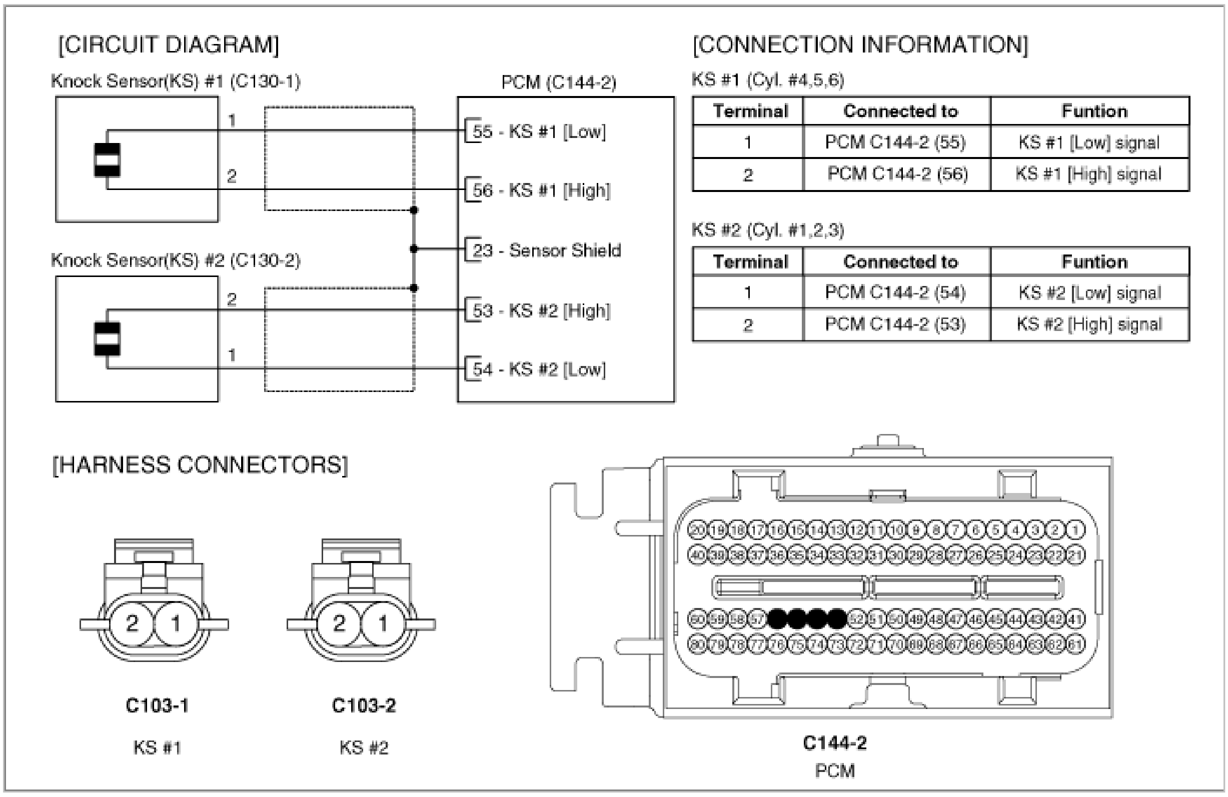




SPECIFICATION

Item	Specification
Capacitance (pF)	1,480 ~ 2,220pF

SCHEMATIC DIAGRAM



Fuel System > Engine Control System > Crankshaft Position Sensor (CKPS) > Description and Operation

DESCRIPTION

Crankshaft Position Sensor (CKPS) detects the crankshaft position and is one of the most important sensors of the engine control system. If there is no CKPS signal input, fuel is not supplied and the main relay does not operate. That is, vehicle can't run without CKPS signal. This sensor is installed on transaxle housing and generates alternating current by magnetic flux field which is made by the sensor and the target wheel when engine runs. The magnetic flux increases when the protrusion of the target wheel is getting near to the sensor and does not change in the most close position. When the protrusion becomes estranged from the sensor, magnetic flux disappears and alternating current is generated. The target wheel consists of 58 slots and 2 missing slots on 360 CA (Crank Angle).

2	PCM C144-2 (21)	CKPS [HIGH] Signal

Fuel System > Engine Control System > Camshaft Position Sensor (CMPS) > Description and Operation

DESCRIPTION

Camshaft Position Sensor (CMPS) is a hall sensor and detects the camshaft position by using a hall element. It is related with Crankshaft Position Sensor (CKPS) and detects the piston position of each cylinder which the CKPS can't detect. The two CMPS are installed on engine head cover of bank 1 and 2 and uses a target wheel installed on the camshaft. This sensor has a hall-effect IC which output voltage changes when magnetic field is made on the IC with current flow. So the sequential injection of the 6 cylinders is impossible without CMPS signal.

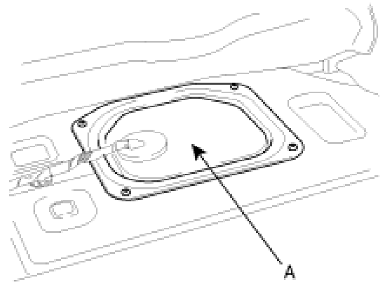
Fuel System > Fuel Delivery System > Repair procedures

FUEL PRESSURE TEST

1. PREPARING

1. Open the service cover (A) in trunk.

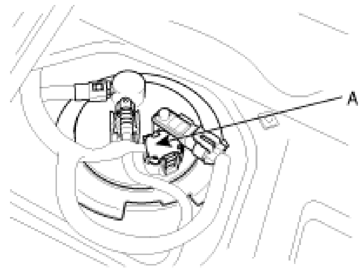


2. RELEASE THE INTERNAL PRESSURE

1. Disconnect the fuel pump connector(A).
2. Start the engine and wait until fuel in fuel line is exhausted.
3. After the engine stalls, turn the ignition switch to OFF position and disconnect the negative (-) terminal from the battery.

NOTE

Be sure to reduce the fuel pressure before disconnecting the fuel feed hose, otherwise fuel will spill out.



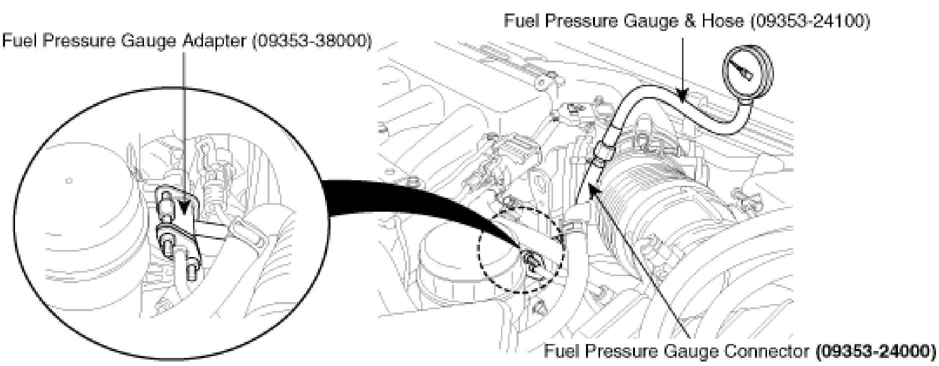
3. INSTALL THE SPECIAL SERVICE TOOL (SST) FOR MEASURING THE FUEL PRESSURE

1. Disconnect the fuel feed hose from the delivery pipe.

CAUTION

Cover the hose connection with a shop towel to prevent splashing of fuel caused by residual pressure in the fuel line.

2. Install the Fuel Pressure Gauge Adapter (09353-38000) between the delivery pipe and the fuel feed hose.
3. Connect the Fuel Pressure Gauge Connector (09353-24000) to the Fuel Pressure Gauge Adapter (09353-38000).
4. Connect the Fuel Pressure Gauge and Hose (09353-24100) to Fuel Pressure Gauge Connector (09353-24000).
5. Connect the fuel feed hose to the Fuel Pressure Gauge Adapter (09353-38000).



4. INSPECT FUEL LEAKAGE ON CONNECTION

1. Connect the battery negative (-) terminal.
2. Apply battery voltage to the fuel pump terminal and activate the fuel pump. With fuel pressure applied, check that there is no fuel leakage from the fuel pressure gauge or connection part.

5. FUEL PRESURE TEST

1. Disconnect the negative (-) terminal from the battery.
2. Connect the fuel pump connector.
3. Connect the battery negative (-) terminal.
4. Start the engine and measure the fuel pressure at idle.

Standard Value: 374 ~ 384 kpa (3.82 ~ 3.92 kgf/㎠, 54.3 ~ 55.8 psi)

- If the measured fuel pressure differs from the standard value, perform the necessary repairs using the table below.

Condition	Probable Cause	Suspected Area
Fuel Pressure too low	Clogged fuel filter	Fuel filter
	Fuel leak on the fuel-pressure regulator that is assembled on fuel pump because of poor seating of the fuel-pressure regulator.	Fuel Pressure Regulator
Fuel Pressure too High	Sticking fuel pressure regulator	Fuel Pressure Regulator

5. Stop the engine and check for a change in the fuel pressure gauge reading.

After engine stops, the gauge reading should hold for about 5 minutes

- Observing the declination of the fuel pressure when the gauge reading drops and perform the necessary repairs using the table below.

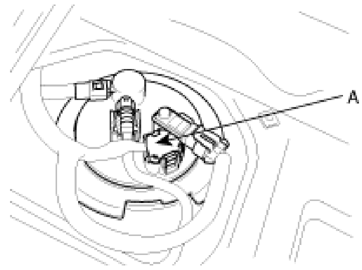
Condition	Probable Cause	Supected Area
Fuel pressure drops slowly after engine is stopped	Injector leak	Injector
Fuel pressure drops immediately after engine is stopped	The check valve within the fuel pump is open	Fuel Pump

6. RELEASE THE INTERNAL PRESSURE

1. Disconnect the fuel pump connector(A).
2. Start the engine and wait until fuel in fuel line is exhausted.
3. After the engine stalls, turn the ignition switch to OFF position and disconnect the negative (-) terminal from the battery.

NOTE

Be sure to reduce the fuel pressure before disconnecting the fuel feed hose, otherwise fuel will spill out.



7. REMOVE THE SPECIAL SERVICE TOOL (SST) AND CONNECT THE FUEL LINE

1. Disconnect the Fuel Pressure Gauge and Hose (09353-24100) from the Fuel Pressure Gauge Connector (09353-24000).
2. Disconnect the Fuel Pressure Gauge Connector (09353-24000) from the Fuel Pressure Gauge Adapter (09353-38000).
3. Disconnect the fuel feed hose from the Fuel Pressure Gauge Adapter (09353-38000).
4. Disconnect the Fuel Pressure Gauge Adapter (09353-38000) from the delivery pipe.

CAUTION

Cover the hose connection with a shop towel to prevent splashing of fuel caused by residual pressure in the fuel line.

5. Connect the fuel feed hose to the delivery pipe.

8. INSPECT FUEL LEAKAGE ON CONNECTION

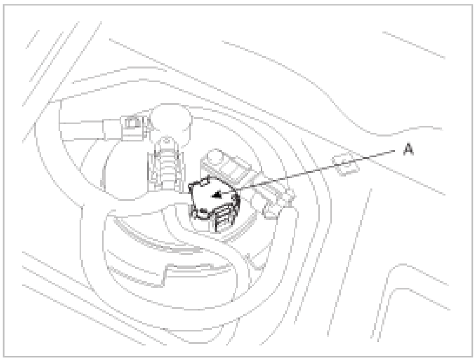
1. Connect the battery negative (-) terminal.
2. Apply battery voltage to the fuel pump terminal and activate the fuel pump. With fuel pressure applied, check that there is no fuel leakage from the fuel pressure gauge or connection part.
3. If the vehicle is normal, connect the fuel pump connector.

Fuel System > Fuel Delivery System > Fuel Tank > Repair procedures

REMOVAL

1. Preparation
   (1) Open the Service Cover (A) by unscrewing the bolts (B).

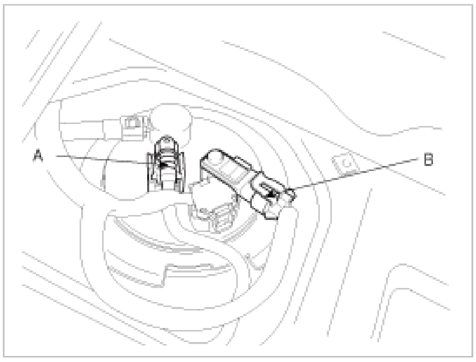
   (2) Disconnect the Fuel Pump Connector (A).



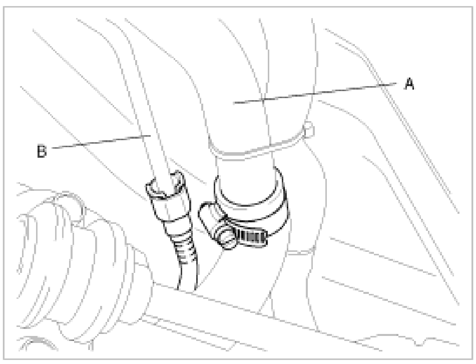
(3) Start the engine and wait until fuel in fuel line is exhausted.

(4) After the engine stalls, turn the ignition switch to OFF position.

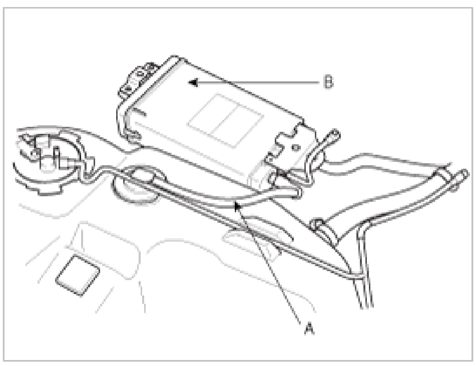
2. Disconnect the Fuel Feed Line (A) and Fuel Tank Pressure Sensor connector (B).



3. Lift the vehicle and support the fuel tank with a jack.
4. Remove the main and center muffler (Refer to the group "EM" in this SHOP MANUAL).
5. Disconnect the Fuel Filler Hose (A) and Recirculation Line (B).



6. Disconnect the Canister Hose (A) from the Canister (B).



7. Remove the fuel tank band mounting bolts (2), and then remove the Fuel Tank from the vehicle.

INSTALLATION

Install the Fuel Tank according to the reverse order of REMOVAL procedure.

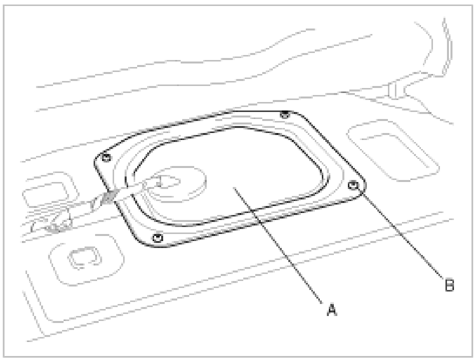
Fuel Tank Band Tightening Torques: 34.3 ~ 53.9 N·m (3.5 ~ 5.5 kgf·m, 25.3 ~ 39.8 lbf·ft)

Fuel System > Fuel Delivery System > Fuel Pump > Repair procedures

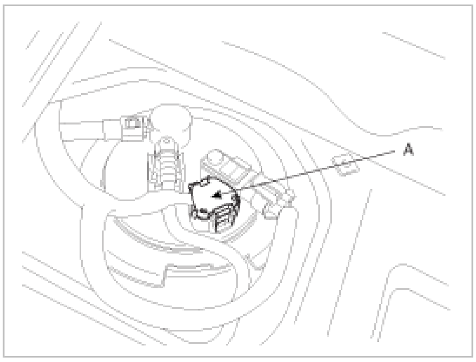
REMOVAL

1. Preparation

(1) Open the Service Cover (A) with unscrewing the bolts (B).



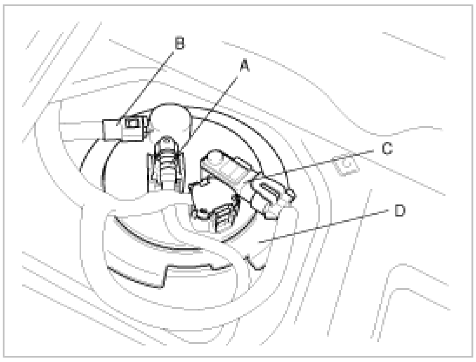
(2) Disconnect the Fuel Pump Connector (A).



(3) Start the engine and wait until fuel in fuel line is exhausted.

(4) After the engine stalls, turn the ignition switch to OFF position.

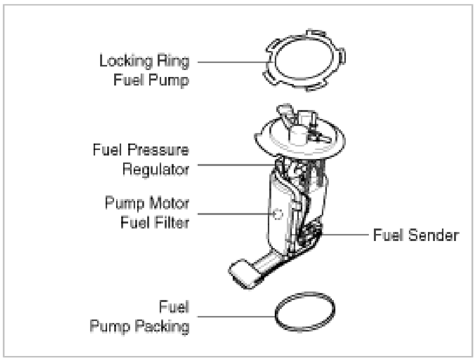
2. Disconnect the Fuel Feed Line (A), Recirculation Line (B) and Fuel Tank Pressure Sensor connector (C).



3. Unfasten the Fuel Pump Locking Ring (D) with the Special Service Tool (Refer to "SPECIAL SERVICE TOOL").

> CAUTION
>
> Be careful NOT TO damage the surface of the fuel rank.

4. Remove the Fuel Pump assembly from the Fuel Tank.



INSTALLATION

Install the Fuel Pump according to the reverse order of REMOVAL procedure.

NOTE

Replace the Fuel Pump Locking Ring and Fuel Pump Plate Packing with a new one when installing the fuel pump again.

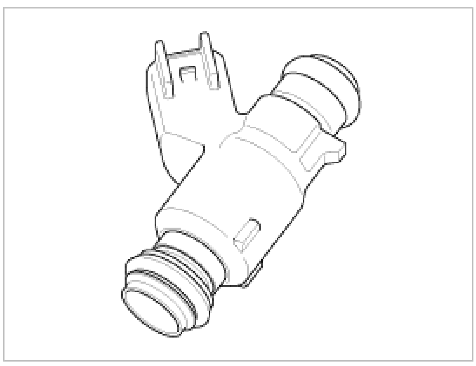
Fuel System > Fuel Delivery System > Injector > Description and Operation

DESCRIPTION

Based on information from various sensors, the PCM measures the fuel injection amount. The fuel injector is a solenoid-operated valve and the fuel injection amount is controlled by length of time that the fuel injector is held open. The PCM controls each injector by grounding the control circuit. When the PCM energizes the injector by grounding the control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak for a moment.

CAUTION

If an injector connector is disconnected for more than 46 seconds while the engine runs, the PCM will determine that the cylinder is misfired and cut fuel supply. So be careful not to exceed 46 seconds. But the engine runs normally in 10 seconds after turning the ignition key off.



SPECIFICATION

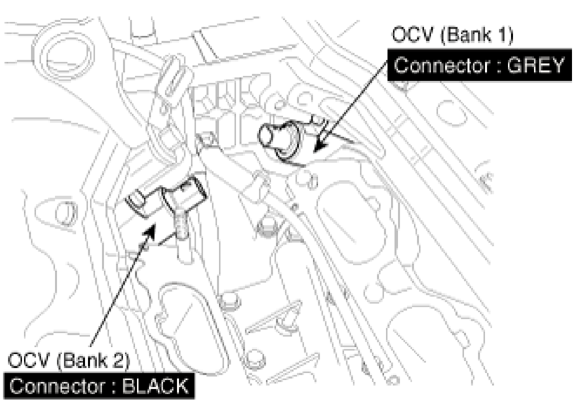
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

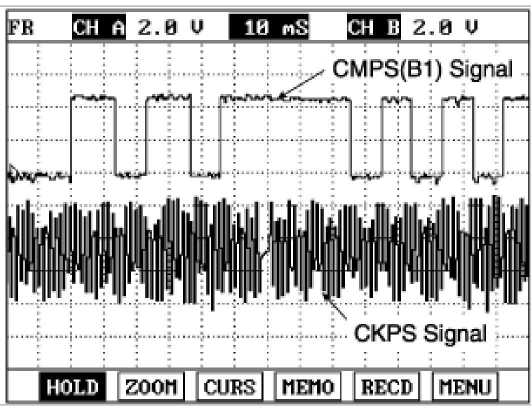
DTC DESCRIPTION

This diagnostic monitors the phasing response rate and determines whether the response rate is fast enough. A state machine is used to capture the response rate.The measured results are then compared to an allowable threshold. The threshold is a function of the oil temperature and the requested desired rate. Test of the phaser response rate requires an engine speed or engine load change.
PCM detects CAM phasing average rate while cam offset is available. If the CAM phasing rate is failure in 12 times out of 15 CAM phasing test PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if the phaser is moving at an expected rate	• Excessive phasing system leakage • Binding Oil Pressure (ex. Blockage in OCV filter) • Faulty PCM
Enable Conditions	• Cam Offset is available	
Threshold value	• Cam phasing average rate is out of threshold programmed in PCM	
Diagnosis Time	• Continuous (12 tests failure for 15 cam edge tests)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle.
If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS.
Cam phasing can be detected from offset variation.

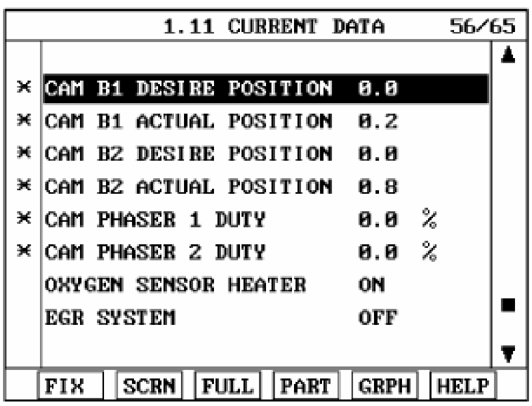
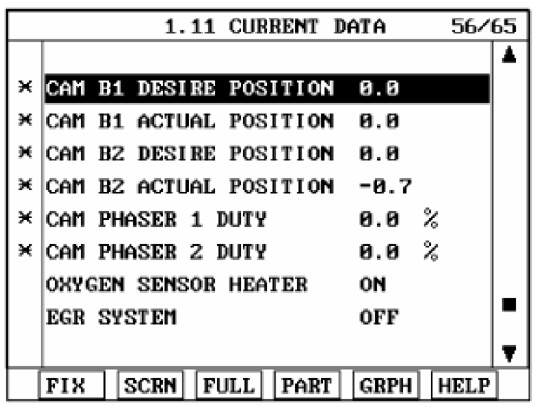
MONITOR SCANTOOL DATA

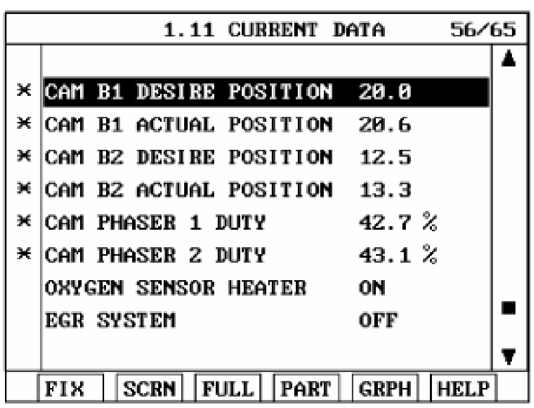
1. Connect scantool and ENG "ON".
2. Monitor "CMPS(B1)" on the service data.



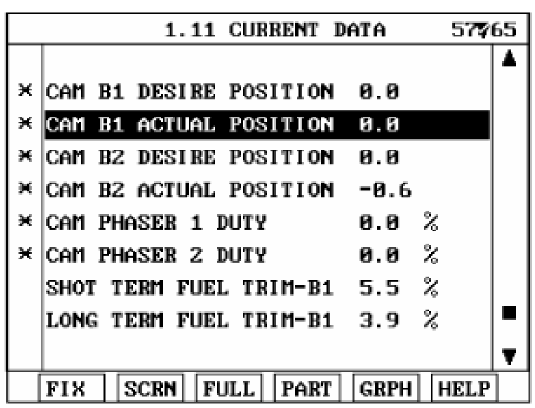
Normal data - idle



Open circuit - idle



Normal at accelleration



Open at accelleration

3. Are the "CMPS(B1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "System Inspection" procedure.

SYSTEM INSPECTION

1. Visual Inspection
   (1) Check oil level is O.K.

   (2) Check oil level is contaminated.

   (3) Check that any oil leakage or blockage is occurred on the parts related to CVVT.

   (4) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check OCV
   (1) connect scantool and IG "ON"

   (2) Select "OCV" on the Actuation Test

   (3) Activates "OCV" by pressing "STRT(F1)" key
   (should hear a faint click from Oil Control solenoid Valve)

   (4) Repeat this procedure 4 or 5 times to ensure intake valve control solenoid reliability

   (5) Has a problem been found ?

   YES

   ▸ Substitute with a known - good CVVT and check for proper operation. If the problem is corrected, replace CVVT and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

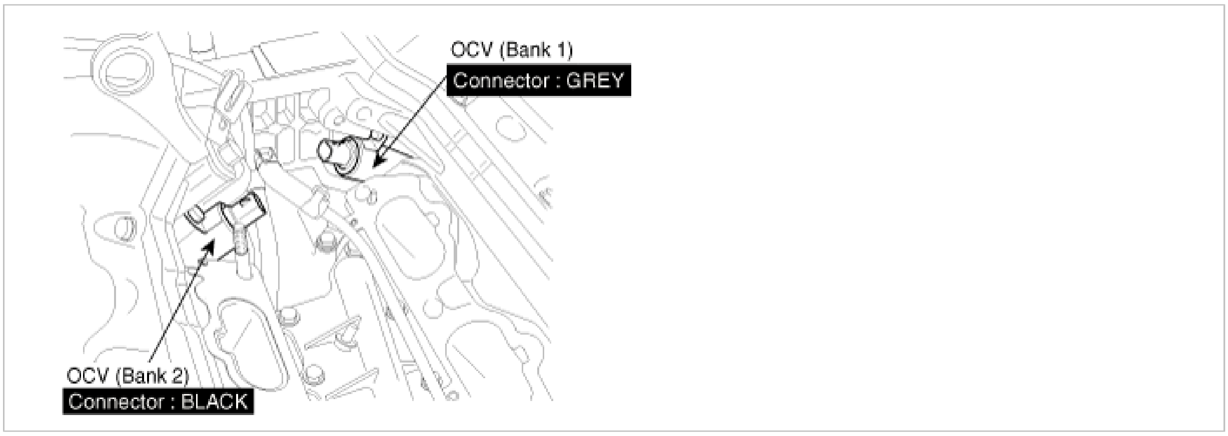
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Figure1. illustrates the method for detecting unresolved phasing steady-state error.
The figure shows two cases, case 1 to the left of the dashed line, and case 2 to the right of the dashed line. In case 1,the duty cycle command is considered high, or above a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the maximum position, but the position remains at a medium level. The range of positions considered 'medium' is defined by calibrations.
In case 2, the duty cycle command is considered low, or below a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the minimum position, but the position remains at a medium level.
Each of these cases is a phaser position error failure. Each case is also considered to be due to a phaser seizure. When either case is detected, a timing counter begins to increment. If the counter exceeds a calibration threshold memorized in PCM, the failure criteria is TRUE.
Another similar diagnostic test is performed to check steady-state error. In this test, no consideration is given to the duty cycle command versus phaser position. This test is only a check of the phasing position error. It is a test of the phaser control logic. If there has been integral windup in the PID control,this test will detect it. In the test, if the phaser error is greater than a calibration threshold memorized in PCM,a timing counter increments. If the counter exceeds the calibration threshold memorized in PCM,the failure criteria is TRUE.

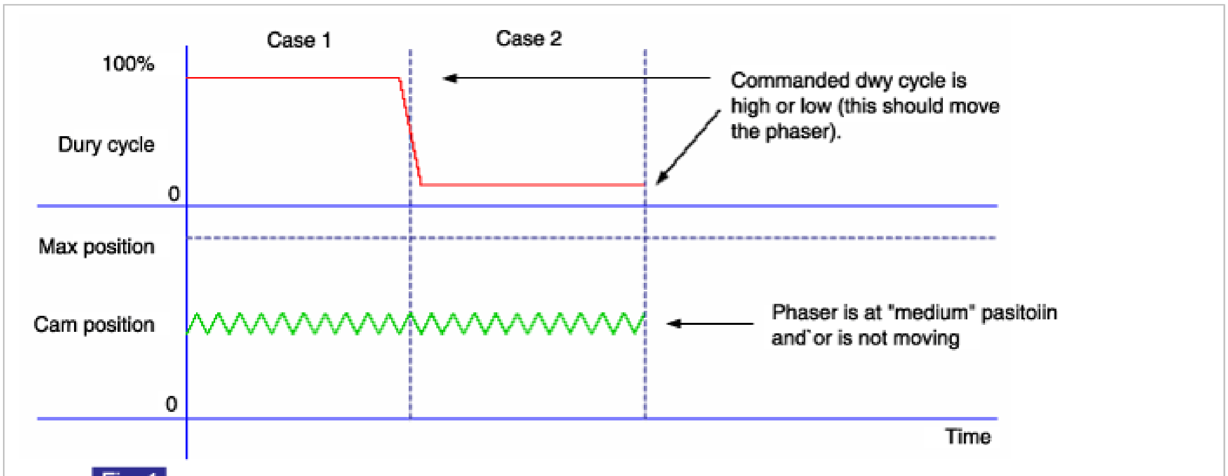


Fig. 1

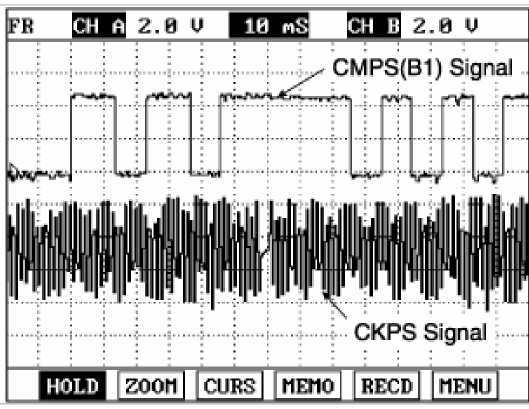
PCM monitors CAM phaser error while both cam offset is available and cam velocity is below 15CAD/s .If the CAM phaser does not move although PCM commands OCV duty cycle PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if the phaser is stuck or has steady-state error	• Engine Oil • OCV • CVVT stuck • PCM
Enable Conditions		• Offsets available • Cam velocity below threshold< 15 CAD/s	
Thresh old value	Case 1	• 5 CAD < Cam position< 50 CAD • Duty Cycle >90% • Duty Cycle< 10% • Timing Counter >80	
	Case 2	• Cam Position error >4 CAD • Timing Counter >80	
Diagnosis Time		• Continuous (More than 0.75sec. Test failure for every 90sec tests)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle. If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS. Cam phasing can be detected from offset variation.

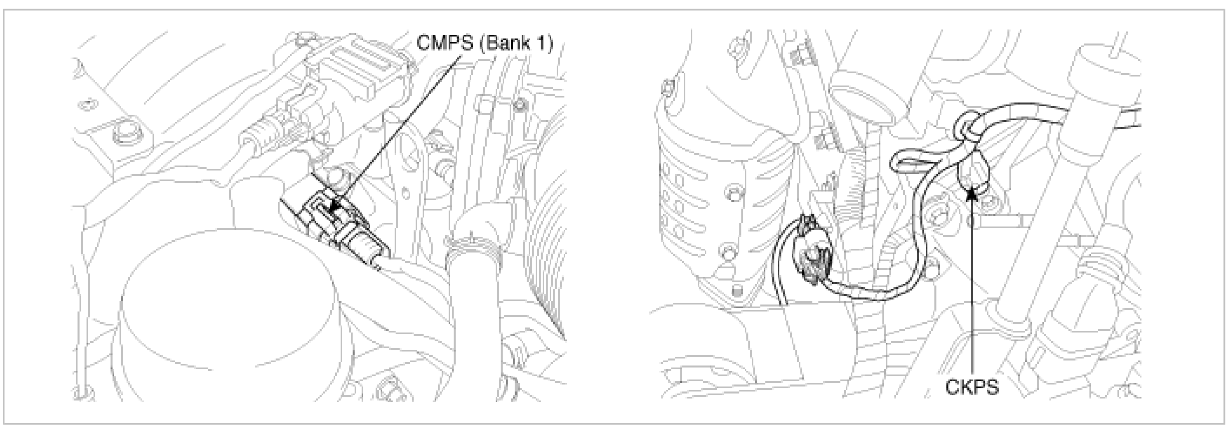
COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Tooth offsets are learned, updated, stored and initialized. For a given cam target wheel and systemcalibration, the tooth offsets should maintain relatively steady values. If the values of tooth offsets areobserved to drift outside of an established range, then a failure is present in the hardware or electronicsystem for measuring cam phasing.
This diagnosis is to verify that learned tooth offsets are within an acceptable range.
PCM monitors tooth offset while no active faults is present.If the tooth offsets is out of threshold more than 20 offset learning for 36 offset learning PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause

PCM

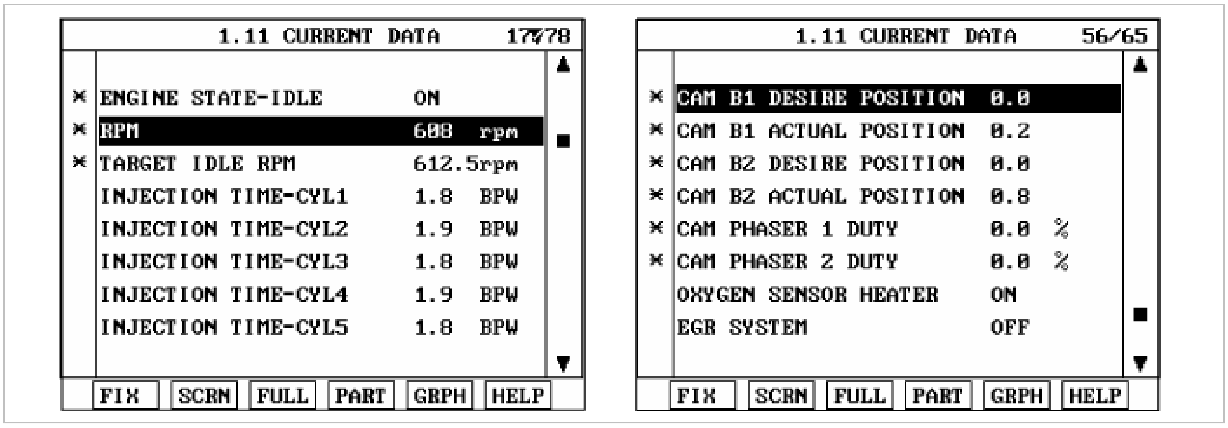
MONITOR SCANTOOL DATA

1. Connect scantool and warm -up the engine until normal operating temperature.
2. Monitor "CAM, Engine speed" on service data.



3. Are the "CMPS(B1) & Engine RPM" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Terminaal and connector inpection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Terminal and connector inspection" procedure.

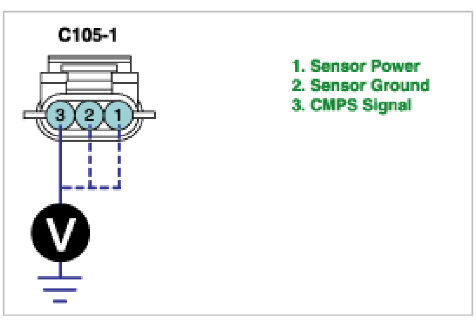
SYSTEM INSPECTION

1. Check CMPS

(1) IG "OFF" & Disconnect CMPS connector.

(2) IG "ON" & Measure voltage between terminal 1,2 & 3 of CMPS harness connector and chassis ground.

Specification :
Terminal 1. approx. 5V
Terminal 2. approx. below 1V
Terminal 3. approx. 5V



(3) Is the measured voltage within specification ?

YES

▸ Go to Check "CKPS" as follow.

NO

▸ Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

2. Check CKPS
   (1) IG "OFF" and disconnect CKPS connector.
   (2) IG "ON" & Measure voltage between terminal 1 & 2 of CKPS harness connecotor and chassis ground.

Specification : Approximately 1.4V

   (3) Is the measured voltage within specification ?

YES

▸ Go to "component Inspection" procedure.

NO

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. CMPS, CKPS Inspection
   (1) IG "OFF" and connect scantool.
   (2) ENG "ON" and Measure signal waveform at terminal 3 of CMPS.
   (3) Measure signal waveform at terminal 1 or 2 of CKPS.

Specification :

   (4) Is the measured signal waveform O.K ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

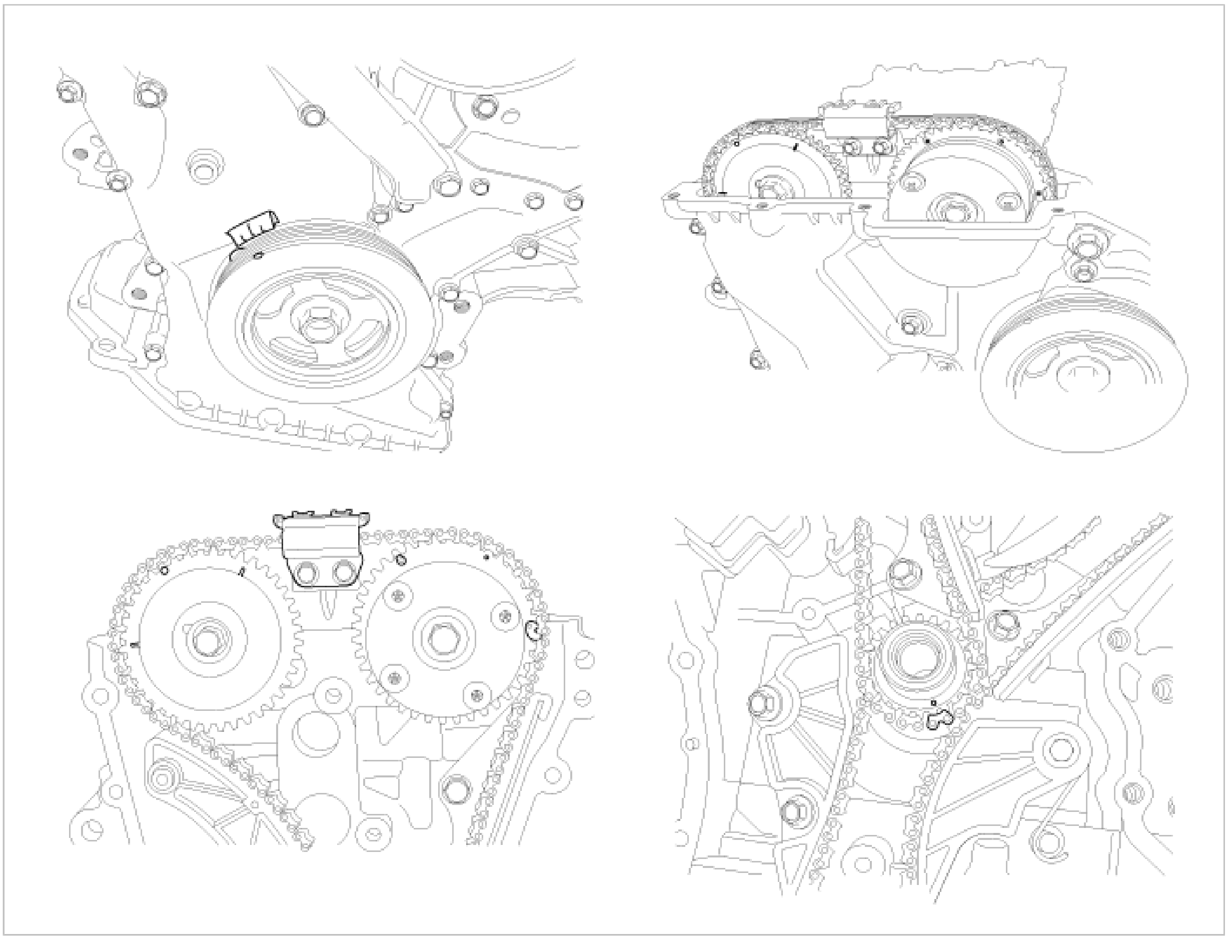
> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Go to "Timing Mark Inspection" procedure as follow.

2. Timing Mark Inspection.
   (1) IG "OFF" and check the timing mark is correctly aligned.

Reference :



(2) Is the timing mark correctly aligned ?

YES

▸ Substitute with a known - good CVVT and check for proper operation. If the problem is corrected, replace CVVT and go to "Verification of Vehicle Repair" procedure.

(3) ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

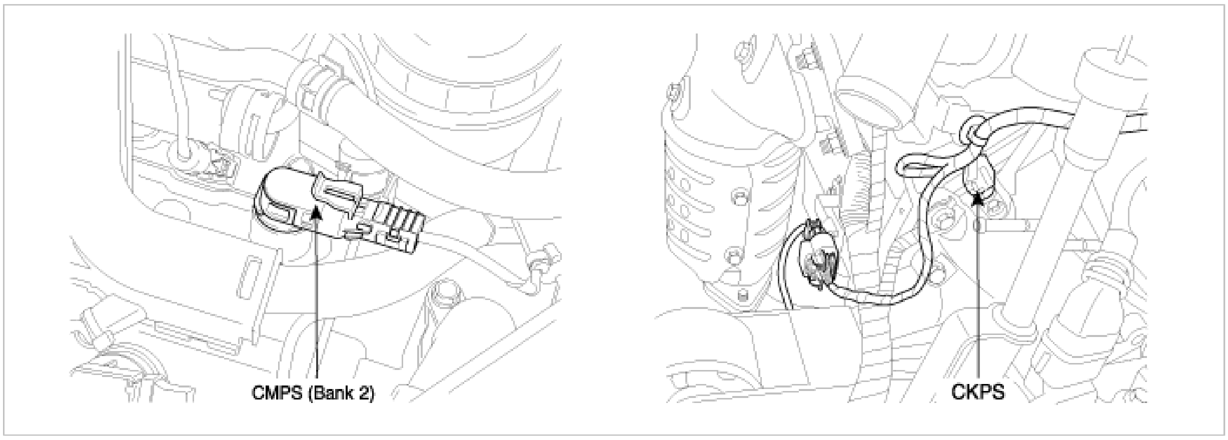
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0018

COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Tooth offsets are learned, updated, stored and initialized. For a given cam target wheel and systemcalibration, the tooth offsets should maintain relatively steady values. If the values of tooth offsets areobserved to drift outside of an established range, then a failure is present in the hardware or electronicsystem for measuring cam phasing.
This diagnosis is to verify that learned tooth offsets are within an acceptable range.
PCM monitors tooth offset while no active faults is present.If the tooth offsets is out of threshold more than 20 offset learning for 36 offset learning PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

<table>
<tr><th colspan="2">Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>

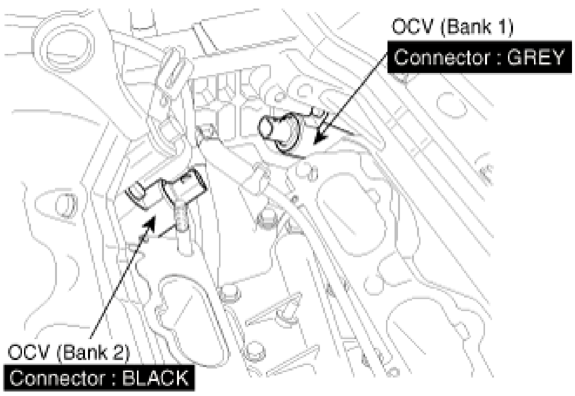
Fuel System > Troubleshooting > P0021

COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

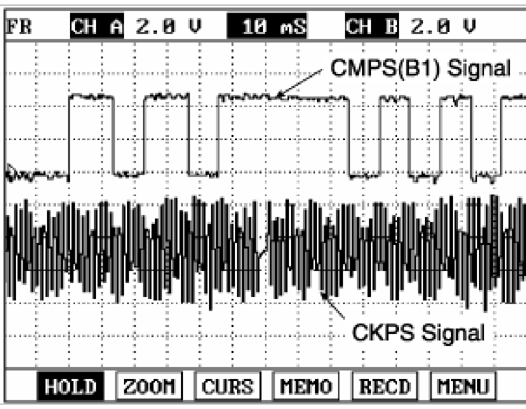
This diagnostic monitors the phasing response rate and determines whether the response rate is fast enough. A state machine is used to capture the response rate.The measured results are then compared to an allowable threshold. The threshold is a function of the oil temperature and the requested desired rate. Test of the phaser response rate requires an engine speed or engine load change.
PCM detects CAM phasing average rate while cam offset is available. If the CAM phasing rate is failure in 12 times out of 15 CAM phasing test PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if the phaser is moving at an expected rate	

Enable Conditions	• Cam Offset is available	• Excessive phasing system leakage • Binding Oil Pressure (ex. Blockage in OCV filter) • Faulty PCM
Threshold value	• Cam phasing average rate is out of threshold programmed in PCM	
Diagnosis Time	• Continuous (12 tests failure for 15 cam edge tests)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle.
If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS.
Cam phasing can be detected from offset variation.

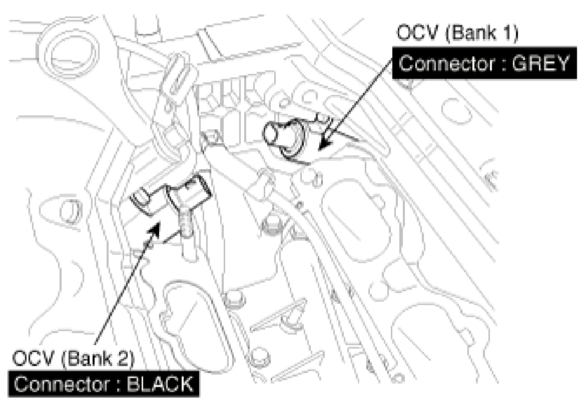
Fuel System > Troubleshooting > P0022

COMPONENT LOCATION



GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Figure1. illustrates the method for detecting unresolved phasing steady-state error.
The figure shows two cases, case 1 to the left of the dashed line, and case 2 to the right of the dashed line. In case 1,the duty cycle command is considered high, or above a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the maximum position, but the position remains at a medium level. The range of positions considered ‘medium’ is defined by calibrations.
In case 2, the duty cycle command is considered low, or below a calibration threshold memorized in PCM. This should cause the cam phaser to move toward the minimum position, but the position remains at a medium level.
Each of these cases is a phaser position error failure. Each case is also considered to be due to a phaser seizure. When either case is detected, a timing counter begins to increment. If the counter exceeds a calibration threshold memorized in PCM, the failure criteria is TRUE.
Another similar diagnostic test is performed to check steady-state error. In this test, no consideration is given to the duty cycle command versus phaser position. This test is only a check of the phasing position error. It is a test of the phaser control logic. If there has been integral windup in the PID control,this test will detect it. In the test, if the phaser error is greater than a calibration threshold memorized in PCM,a timing counter increments. If the counter exceeds the calibration threshold memorized in PCM,the failure criteria is TRUE.

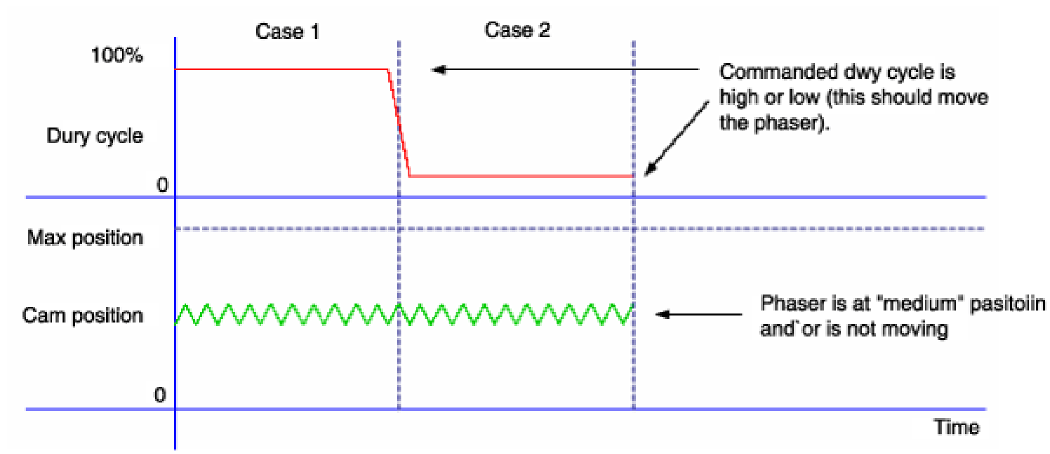


Fig. 1

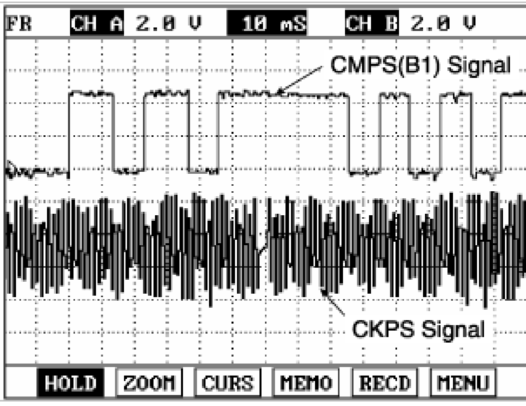
PCM monitors CAM phaser error while both cam offset is available and cam velocity is below 15CAD/s .If the CAM phaser does not move although PCM commands OCV duty cycle PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if the phaser is stuck or has steady-state error	• Engine Oil • OCV • CVVT stuck • PCM
Enable Conditions		• Offsets available • Cam velocity below threshold< 15 CAD/s	
Thresh old value	Case 1	• 5 CAD < Cam position< 50 CAD • Duty Cycle >90% • Duty Cycle< 10% • Timing Counter >80	
	Case 2	• Cam Position error >4 CAD • Timing Counter >80	
Diagnosis Time		• Continuous (More than 0.75sec. Test failure for every 90sec tests)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle. If the Cam Phasing is generated by PCM the offset of cam target wheel tooth varies against 58X reference tooth of CKPS. Cam phasing can be detected from offset variation.

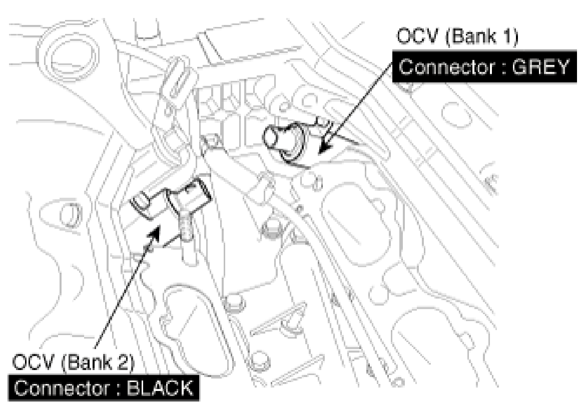
Fuel System > Troubleshooting > P0026

COMPONENT LOCATION



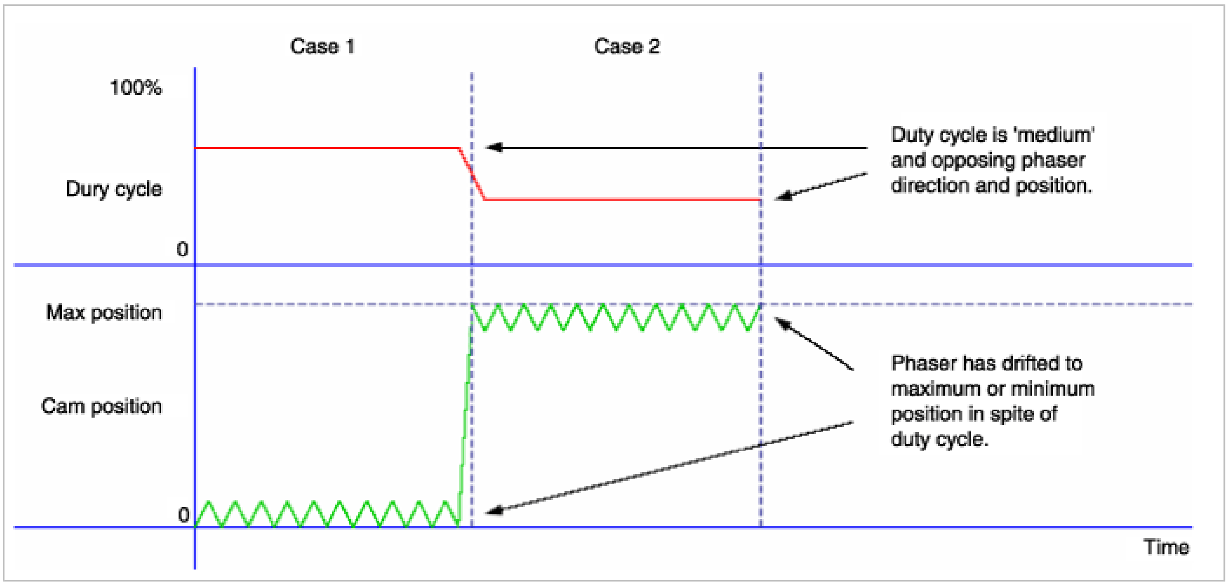
GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Small particles in the engine oil may cause the oil control valve to bind or otherwise get stuck atcertain spool positions. A test is used in this diagnostic to detect a stuck valve spool. A cleaningfunction is then used to try and free the spool. If unsuccessful, the diagnostic test is failed.

Figure 1. illustrates the principle of the valve stuck diagnostic test. As in the phaser error diagnosticillustration, there are two cases shown in the figure. The case on the left shows a case where the dutycycle is above a calibration threshold, yet the phaser position is near the minimum position. Undernormal operation, such a duty cycle command would move the phaser toward its maximum position.The case on the right shows the opposite situation. The duty cycle command is below a threshold, yetthe phaser position is near its maximum.



In the diagnostic test logic, duty cycle is not used. There are two reasons: 1) duty cycle is theparameter most closely related to result of the test, and should not be used in the test, and 2) it isdifficult to establish thresholds for duty cycle because of the variation of such thresholds. Instead ofduty cycle, position error is used. This indicates clearly the expected duty cycle behavior and allowsthresholds to be established without consideration for temperature, voltage and pressure conditions aswell as the strength or lack of strength in the gain calibration.

PCM monitors OCV stuck while cam offset is available and Valve cleaning is not in progress .If the PCM detects that CAM position angle is over 20 CAD(Crank Angle Degree) than expected cam positionthat PCM controls the OCV while cam position is in designated crank angle degree, PCM determines that a faultexists and a DTC is stored.

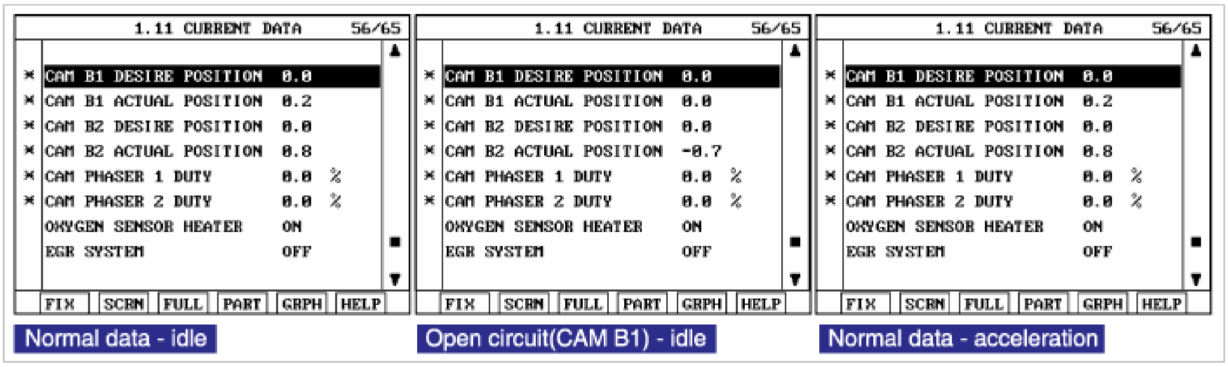
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "CAM(B1)" status on the service data.



4. Are the "CMP(B1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, ending, corrosion, contamination, deterioration, or damage. Repair or replace asnecessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

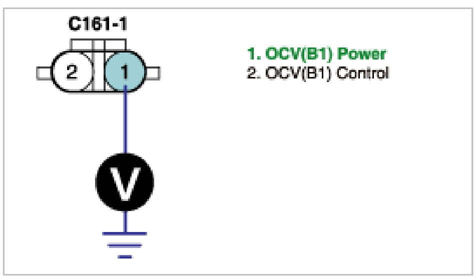
NO

▸ Go to " Power Circuit Inspection " as follow

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect OCV connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of OCV harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to " Control Circuit Inspection " procedure.

NO

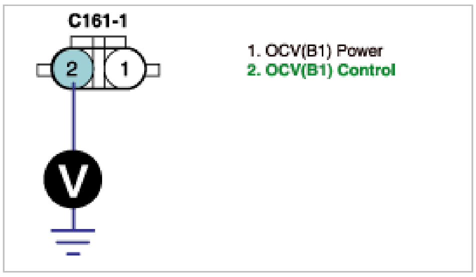
▸ Check that Fuse between Main Relay and OCV is open.
▸ Check open between main relay and OCV.
▸ Check short to ground between Main Relay and OCV.
▸ Repair or replace as necessay go to "Verification of Vehicle Repair " procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF" and disconnect OCV connector.
2. IG "ON" & ENG "OFF".

3. Measure voltage between terminal 2 of OCV harness connector and chassis ground.

Specification : Approx. below 1V



4. Is the measured voltage within specification ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

SYSTEM INSPECTION

1. Visual Inspection

(1) Check oil level is O.K.

(2) Check oil level is contaminated.

(3) Check that any oil leakage is occurred around OCV.

(4) Has a problem been found ?

YES

▸ Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

NO

▸ Go to "Component Inspection" procedure

COMPONENT INSPECTION

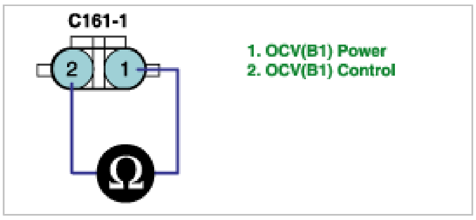
1. OCV Inspection

(1) IG "OFF" & Disconnect OCV connector.

(2) Measure resistance between terminal 1 and 2 of OCV connector (Component Side)

Specification :

Resistance (Ω)	6.7 ~ 7.7



(3) Is the measured resistance within specification?

YES

▸ Go to "Actuation Test" as follow.

NO

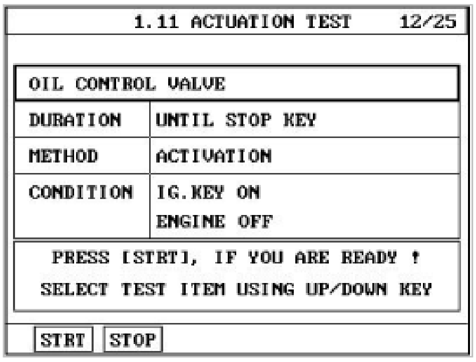
▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

2. Actuation Test

(1) IG "OFF" and connect OCV connector

(2) IG "ON" & ENG "OFF"

(3) Check that click sound can be heard when actuation operates with scantool.



(4) Does the OCV operate corectly when actuation operates ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

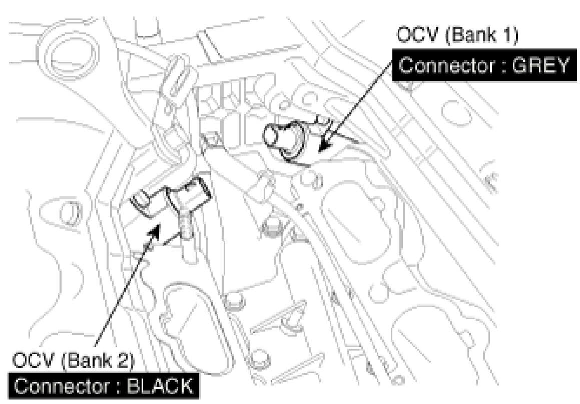
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0028

COMPONENT LOCATION

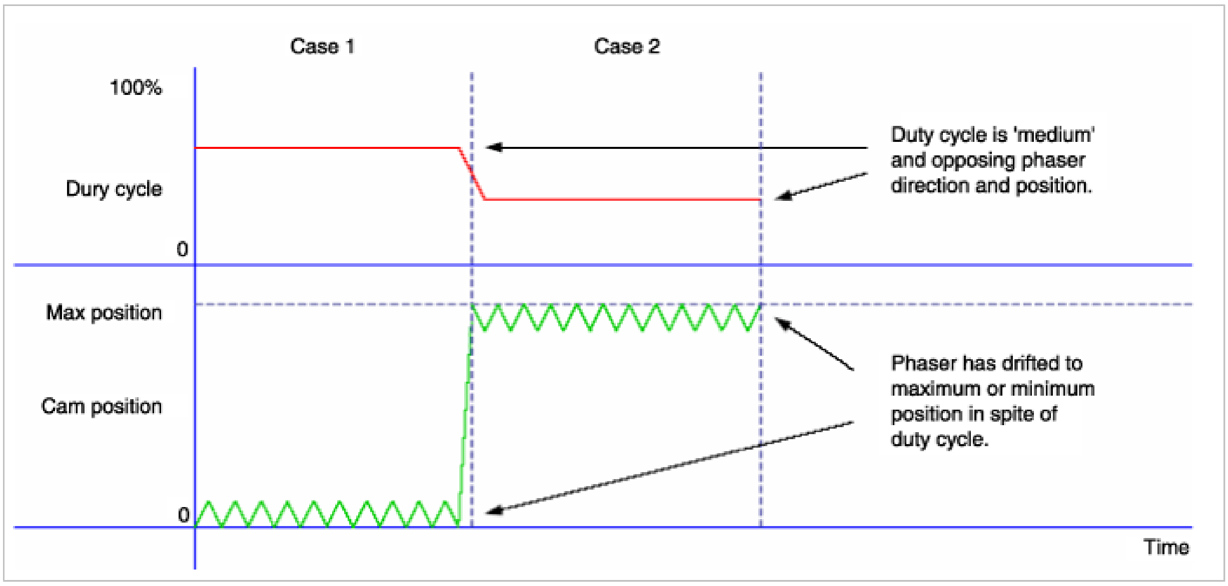


GENERAL DESCRIPTION

Different from the existing fixed cam phase angle type, CVVT(Continuously Variable Valve Timing) is the device which varies cam phase angle continuously to be optimum. And with engine oil pressure, it operates. CVVT consists of OCV(Oil Control Valve) and cam phaser. OCV, mounted on cylinder head, controlls the amount and direction of oil delivered to cam phaser by oil valve which is connected to a solenoid. Cam phaser, rotating cam phaser rotor with pressure and amount of oil produced by OCV, rotates cam shaft forcefully for or against the rotating direction and finally, cam shaft phase changes. With the appliance of CVVT, engine power,fuel efficiency and the quality of exhause gas are improved.

DTC DESCRIPTION

Small particles in the engine oil may cause the oil control valve to bind or otherwise get stuck atcertain spool positions. A test is used in this diagnostic to detect a stuck valve spool. A cleaningfunction is then used to try and free the spool. If unsuccessful, the diagnostic test is failed.
Figure 1. illustrates the principle of the valve stuck diagnostic test. As in the phaser error diagnosticillustration, there are two cases shown in the figure. The case on the left shows a case where the dutycycle is above a calibration threshold, yet the phaser position is near the minimum position. Undernormal operation, such a duty cycle command would move the phaser toward its maximum position.The case on the right shows the opposite situation. The duty cycle command is below a threshold, yetthe phaser position is near its maximum.



In the diagnostic test logic, duty cycle is not used. There are two reasons: 1) duty cycle is theparameter most closely related to result of the test, and should not be used in the test, and 2) it isdifficult to establish thresholds for duty cycle because of the variation of such thresholds. Instead ofduty cycle, position error is used. This indicates clearly the expected duty cycle behavior and allowsthresholds to be established without consideration for temperature, voltage and pressure conditions aswell as the strength or lack of strength in the gain calibration.
PCM monitors OCV stuck while cam offset is available and Valve cleaning is not in progress .If the PCM detects that CAM position angle is over 20 CAD(Crank Angle Degree) than expected cam positionthat PCM controls the OCV while cam position is in designated crank angle degree, PCM determines that a faultexists and a DTC is stored.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Determines if oil control valve is stuck	• Oil Pressure Loss • OCV(B2) seizure • PCM
Enable Conditions		• Valve cleaning not in progress • Offsets available	
Thresh old value	Case 1	• Cam position > 50 CAD • Cam position Error > 20 CAD • Timing counter >56 count	
	Case 2	• Cam position< 5 CAD • Cam position Error > 20 CAD • Timing counter >56 count	
Diagnosis Time		• Continuous (More than 0.75sec failure for every 56.25 sec. tests)	
MIL On Condition		• 2 driving Cycle

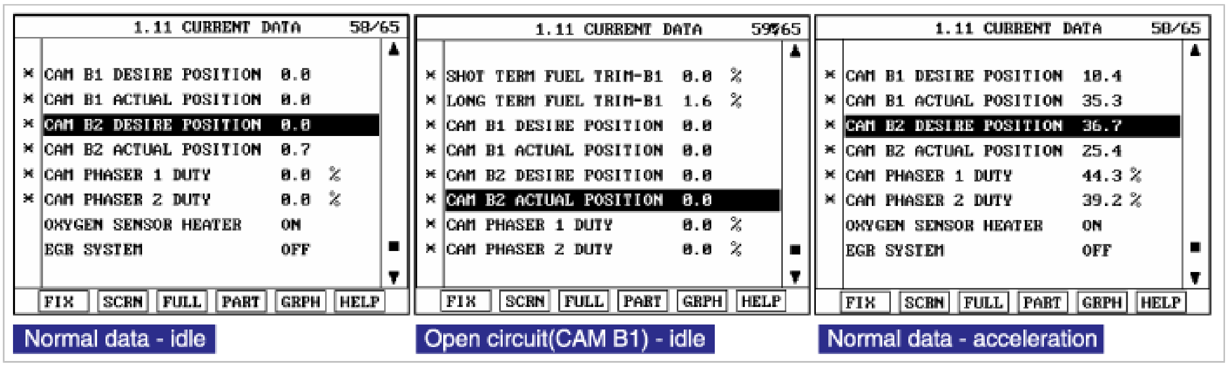
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "CAM(B2)" status on the service data.



4. Are the "CMP(B2)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, ending, corrosion, contamination, deterioration, or damage. Repair or replace asnecessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

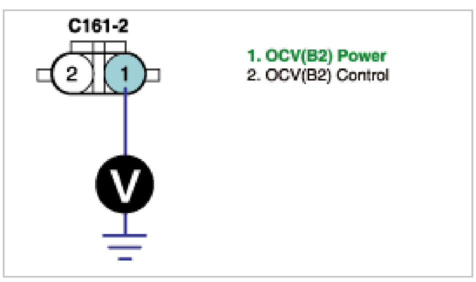
NO

▸ Go to " Power Circuit Inspection " as follow

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect OCV connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of OCV harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to " Control Circuit Inspection " procedure.

NO

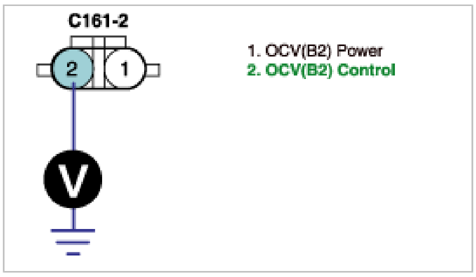
▸ Check that Fuse between Main Relay and OCV is open.
▸ Check open between main relay and OCV.
▸ Check short to ground between Main Relay and OCV.
▸ Repair or replace as necessay go to "Verification of Vehicle Repair " procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF" and disconnect OCV connector.
2. IG "ON" & ENG "OFF".

3. Measure voltage between terminal 2 of OCV harness connector and chassis ground.

Specification : Approx. below 1V



4. Is the measured voltage within specification ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

SYSTEM INSPECTION

1. Visual Inspection
   (1) Check oil level is O.K.
   (2) Check oil level is contaminated.
   (3) Check that any oil leakage is occurred around OCV.
   (4) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Component Inspection" procedure

COMPONENT INSPECTION

1. OCV Inspection
   (1) IG "OFF" & Disconnect OCV connector.
   (2) Measure resistance between terminal 1 and 2 of OCV connector (Component Side)
   Specification :

Resistance (Ω)	6.7 ~ 7.7

   (3) Is the measured resistance within specification ?

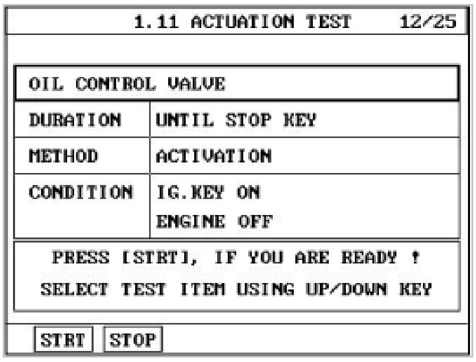
   YES

   ▸ Go to "Actuation Test" as follow.

   NO

   ▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

2. Actuation Test
   (1) IG "OFF" and connect OCV connector
   (2) IG "ON" & ENG "OFF"
   (3) Check that click sound can be heard when actuation operates with scantool.



(4) Does the OCV operate corectly when actuation operates ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

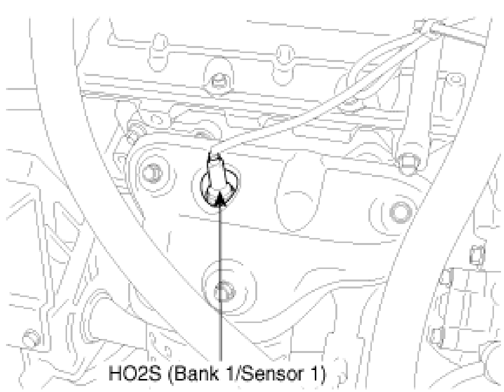
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0031

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

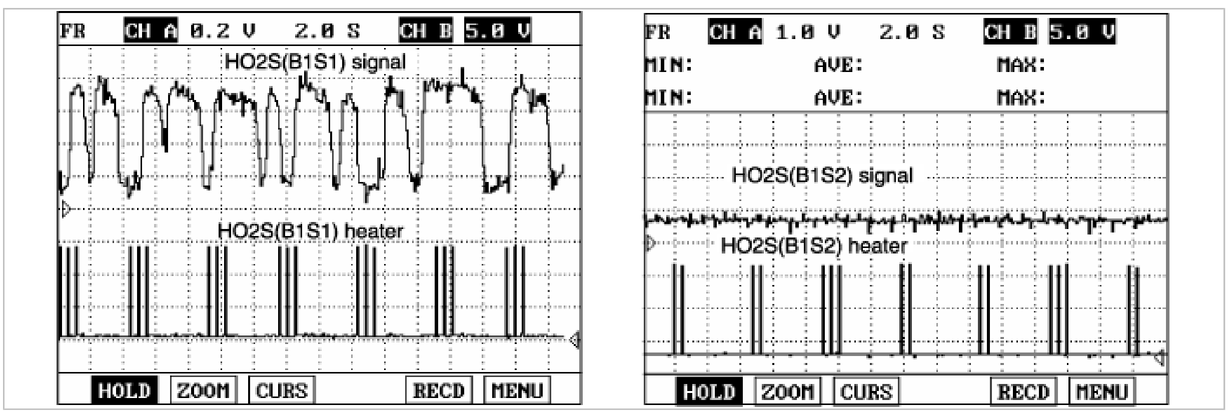
DTC DESCRIPTION

If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • Open in Power Circuit • Open or short to ground in control circuit • HO2S(B1/S1) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• short to ground or open circuit	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

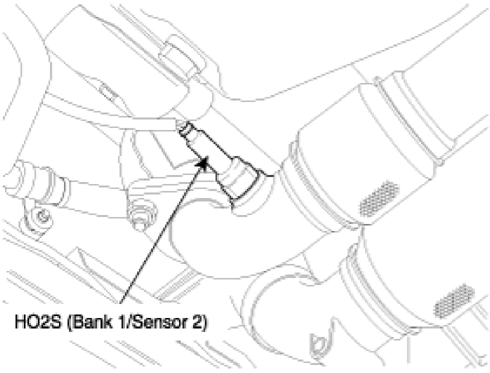
Fuel System > Troubleshooting > P0037

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B1/S2) heater "Control Circuit Inspection" procedure.

NO

▸ Repair open or short to ground in HO2S(B1/S2) Heater power circuit then, go to "Verification of Vehicle Repair" procedure.

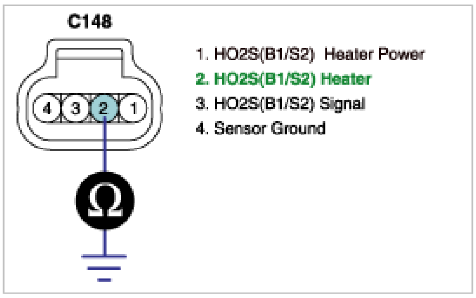
CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness.

(1) IG "OFF" and disconnect HO2S(B1/S2) connector.

(2) Measure resistance between terminal 2 of HO2S(B1/S2) harness connector and chassis ground.

Specification : Infinite



(3) Is the measured resistance within specification ?

YES

▸ Go to HO2S(B1/S2) "Check Open in harness" as follows.

NO

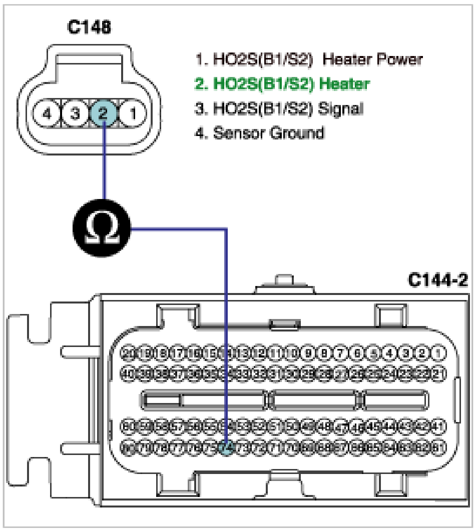
▸ Repair short to ground in HO2S (B1/S2) heater control circuit and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness

(1) IG "OFF" and disconnect HO2S(B1/S2) and PCM connector.

(2) Measure resistance between terminal 2 of HO2S(B1/S2) harness connector and terminal 74 of PCM harness connector.

Specification : Approx. below 1Ω



(3) Is the measured resistance within specification ?

YES

▸ Go to HO2S(B1/S2) "Component Inspection" procedure.

NO

▸ Repair open in HO2S(B1/S2) heater control circuit and go to "Verifiction of Vehicle Repair" procedure.

COMPONENT INSPECTION

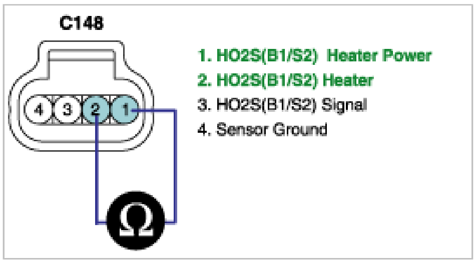
1. Check HO2S(B1/S2) Heater resistance

(1) IG "OFF" and disconnect HO2S(B1/S2) connector

(2) Measure resistance between terminal 1 and 2 of HO2S(B1/S2)(Component Side)

Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5



(3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Substitute with a known - good HO2S(B1/S2) and check for proper operation. If the problem is corrected, replace HO2S (B1/S2) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

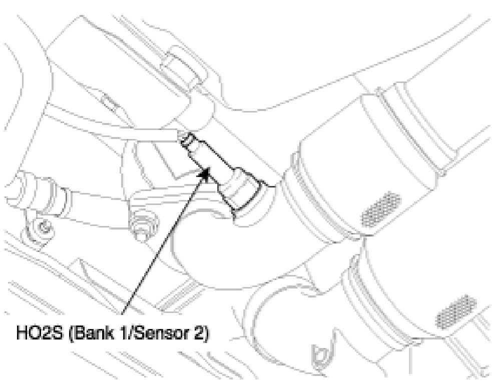
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0038

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

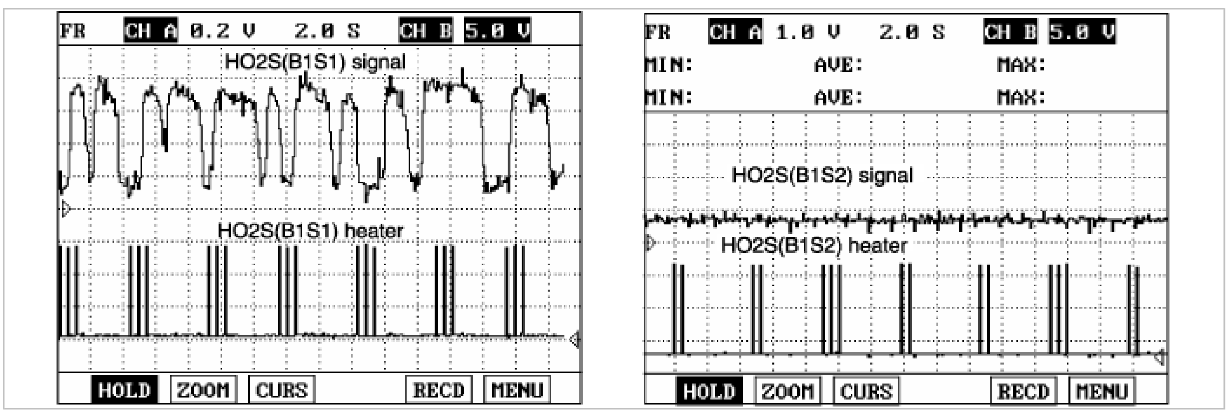
DTC DESCRIPTION

If the PCM detects heater output voltage is higher than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • short to battery in control circuit • HO2S(B1/S2) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• short to battery	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

Heater	
Resistance (Ω)	9.6 ± 1.5

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure

POWER CIRCUIT INSPECTION

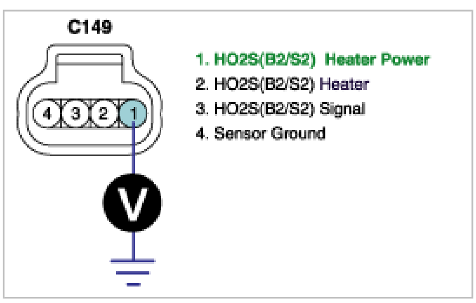
1. IG "OFF" & Disconnect HO2S(B2/S2) connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of HO2S(B2/S2) harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to HO2S(B2/S2) heater "Control Circuit Inspection" procedure.

NO

▸ Repair open or short to ground in HO2S(B2/S2) Heater power circuit then, go to "Verification of Vehicle Repair" procedure.

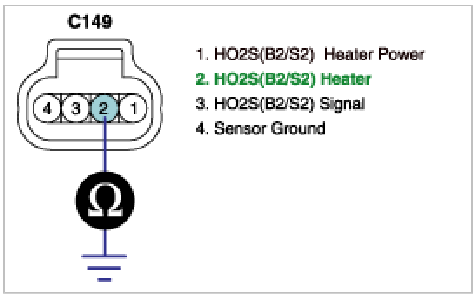
CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness.

(1) IG "OFF" and disconnect HO2S(B2/S2) connector.

(2) Measure resistance between terminal 2 of HO2S(B2/S2) harness connector and chassis ground.

Specification : Infinite



(3) Is the measured resistance within specification ?

YES

▸ Go to HO2S(B2/S2) "Check Open in harness" as follows.

NO

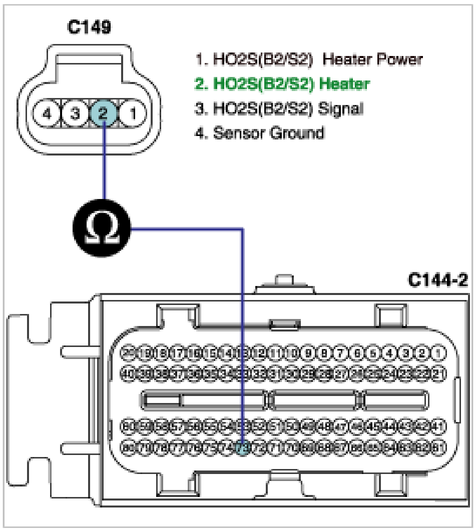
▸ Repair short to ground in HO2S (B2/S2) heater control circuit and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness

(1) IG "OFF" and disconnect HO2S(B2/S2) and PCM connector.

(2) Measure resistance between terminal 2 of HO2S(B2/S2) harness connector and terminal 73 of PCM harness connector.

Specification : Approx. below 1Ω



(3) Is the measured resistance within specification ?

YES

▸ Go to HO2S(B2/S2) "Component Inspection" procedure.

NO

▸ Repair open in HO2S(B2/S2) heater control circuit and go to "Verifiction of Vehicle Repair" procedure.

COMPONENT INSPECTION

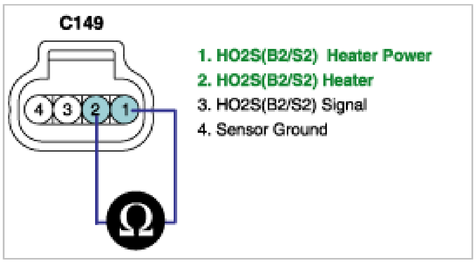
1. Check HO2S(B2/S2) Heater resistance

(1) IG "OFF" and disconnect HO2S(B2/S2) connector

(2) Measure resistance between terminal 1 and 2 of HO2S(B2/S2)(Component Side)

Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5



(3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

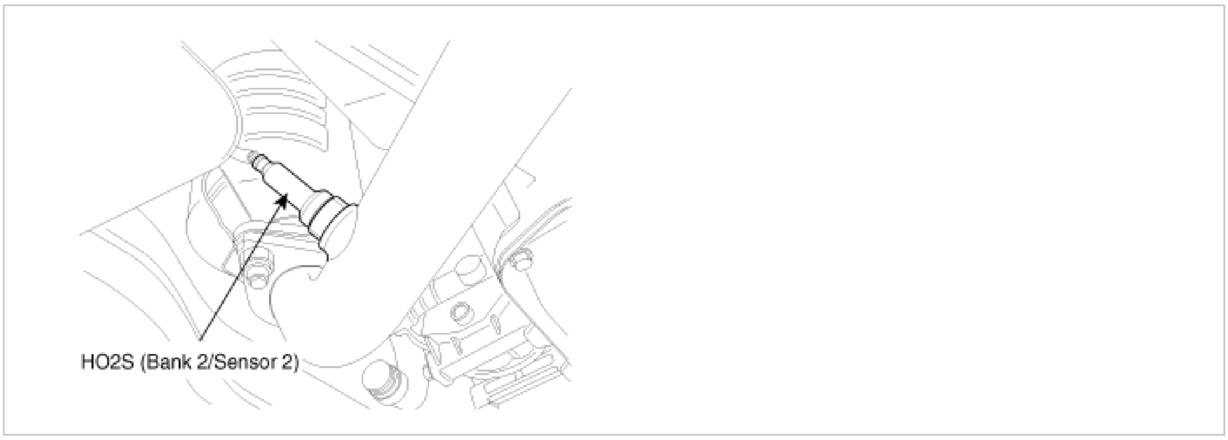
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0058

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

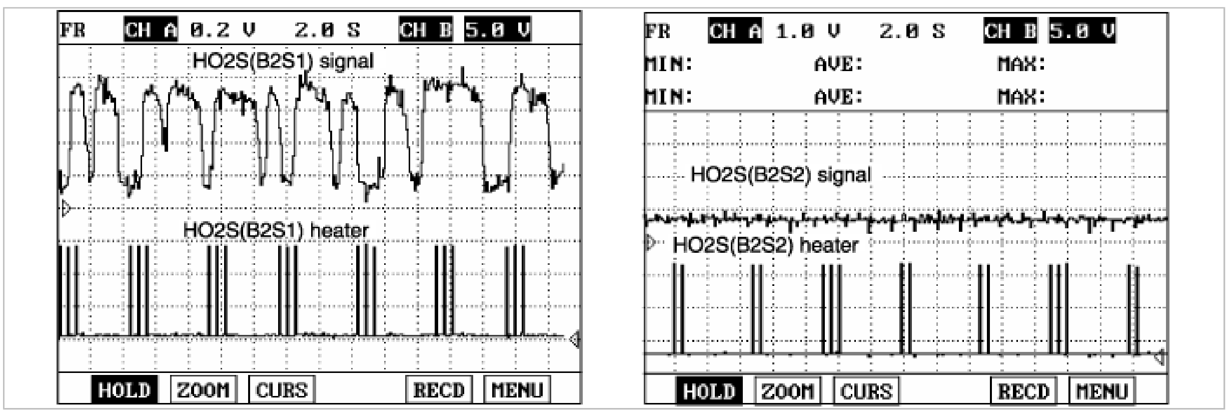
DTC DESCRIPTION

If the PCM detects heater output voltage is higher than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of O2 sensor heater circuit output	• Poor Connection • Open or short to battery in control circuit • HO2S(B2/S2) • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay < 0.5sec	
Threshold value	• Short to battery	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

Heater	
Resistance (Ω)	9.6 ± 1.5

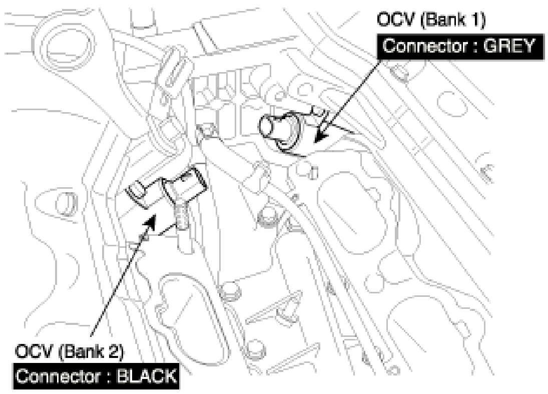
Fuel System > Troubleshooting > P0076

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM controls OCV(Oil Contol Valve) with PWM (Pulse Width Modulator) signal to change oil passages supplying oil to CVVT that makes CAM postion changes (advance or retard). OCV is integrated with oil filter and located at the nearest CVVT on the engine block.

The oil control valve is commanded by a pulse-width-modulated signal from the engine control unit. A duty cycle of zero commands the cam phaser to its default position. A duty cycle of 100% commands the phaser to its maximum phased position. When the phaser must be controlled to an intermediate position, the duty cycle is maintained in the region of the 'hold position'. This is a medium duty cycle, usually between 35% and 65%, depending on temperature and voltage conditions. As the cam phaser is advanced and retarded, its position is measured using a toothed wheel.

The wheel is attached to the camshaft, or to the cam phaser rotor. A sensor picks up the signal from the wheel and its output is read by the engine control unit. A cam signal is generated for each cam phaser on the engine. This requires a separate toothed wheel and cam sensor combination for each cam phaser. The cam signal and crankwheel signal are compared as the engine turns, and the phasing position is determined. The position is displayed in crank angle degrees, relative position from default. This position measurement is used as feedback for the position control software, which determines the required percent duty cycle commanded to the oil control valve.

DTC DESCRIPTION

When the enable condition is satisfied The PCM checks that high and low outputs (Voltage level) are observed when OCVs are commanded. When a OCV output failure is detected, the appropriate fail counter is incremented.

If the failure threshold is exceeded 5 seconds during one diagnostic test(10second), the test is failed and DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit of VCPD Bank 1 Intake circuit output	• Poor Connection • Open in Power Circuit • Open or short to ground in control circuit • OCV • PCM

4. Are the "CAM" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

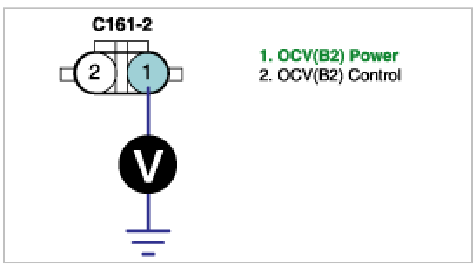
▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" & Disconnect OCV(B2) connector.
2. IG "ON" & ENG "OFF".
3. Measure voltage between terminal 1 of OCV(B2) harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection " procedure.

NO

▸ Check fuse between Main Relay and OCV is open or not installed.
▸ Check open in power circuit between Main Relay and OCV power circuit.
▸ Repair or repalce as necessary and then go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness
    (1) IG "OFF" and disconnect OCV connector.
    (2) IG "ON" & ENG "OFF".
    (3) Measure resistance between terminal 2 of OCV harness connector and chassis ground.

Specification : Infinite

    (4) Is the measured resistance within specification ?

YES

▶ Go to "Check open in harness" as follows

NO

▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
    (1) IG "OFF" and disconnect OCV and PCM connector.
    (2) Measure resistance between terminal 2 of OCV harness connector and terminal 61 of PCM harness connector.

Specification : Approx. below 1Ω

    (3) Is the measured resistance within specification ?

YES

▶ Go to "Component Inspection" procedure.

NO

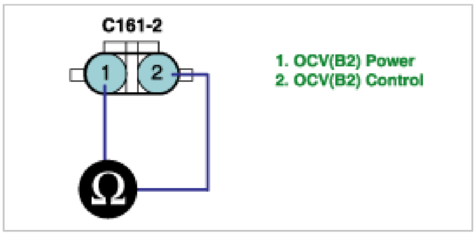
▶ Repair or replace as necessary and then go to " Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check OCV
    (1) IG "OFF" and disconnect OCV connector.
    (2) Measure resistance between terminal 1 and 2 of OCV. (Component Side)

Specification :

Resistance (Ω)	6.7 ~ 7.7



(3) Is the measured resistance within specification ?

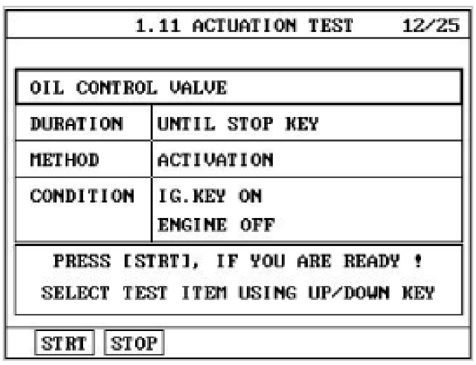
YES

(4) ▸ Go to "OCV Actuation Test" as follows.

NO

▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

2. OCV Actuation Test
   (1) Connect scantool and IG "ON"
   (2) Select "OCV" on the Actuation Test
   (3) Activates "OCV" by pressing "STRT(F1)" key
   (should hear a faint click from Oil Control solenoid Valve)
   (4) Repeat this procedure 4 or 5 times to ensure intake valve control solenoid reliability



(5) Does OCV generate clik sound during acutation test ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good OCV and check for proper operation. If the problem is corrected, replace OCV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

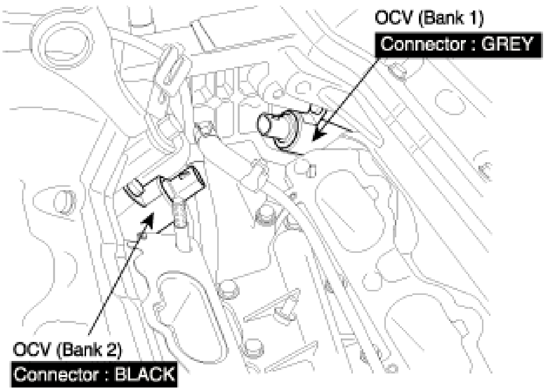
YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

COMPONENT LOCATION



GENERAL DESCRIPTION

PCM controls OCV(Oil Contol Valve) with PWM (Pulse Width Modulator) signal to change oil passages supplying oil to CVVT that makes CAM postion changes (advance or retard). OCV is integrated with oil filter and located at the nearest CVVT on the engine block.
The oil control valve is commanded by a pulse-width-modulated signal from the engine control unit. A duty cycle of zero commands the cam phaser to its default position. A duty cycle of 100% commands the phaser to its maximum phased position. When the phaser must be controlled to an intermediate position, the duty cycle is maintained in the region of the ‘hold position’. This is a medium duty cycle, usually between 35% and 65%, depending on temperature and voltage conditions. As the cam phaser is advanced and retarded, its position is measured using a toothed wheel.
The wheel is attached to the camshaft, or to the cam phaser rotor. A sensor picks up the signal from the wheel and its output is read by the engine control unit. A cam signal is generated for each cam phaser on the engine. This requires a separate toothed wheel and cam sensor combination for each cam phaser. The cam signal and crankwheel signal are compared as the engine turns, and the phasing position is determined. The position is displayed in crank angle degrees, relative position from default. This position measurement is used as feedback for the position control software, which determines the required percent duty cycle commanded to the oil control valve.

DTC DESCRIPTION

When the enable condition is satisfied The PCM checks that high and low outputs (Voltage level) are observed when OCVs are commanded. When a OCV output failure is detected, the appropriate fail counter is incremented.
If the failure threshold is exceeded 5 seconds during one diagnostic test(10second), the test is failed and DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to battery of VCPD Bank 1 Intake circuit output	• Poor Connection • Short to battery in Control Circuit • OCV • PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay ≥ 0.5sec	
Threshold value	• Short to battery	
Diagnosis Time	• Continuous (More than 5 seconds failure for every 10 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

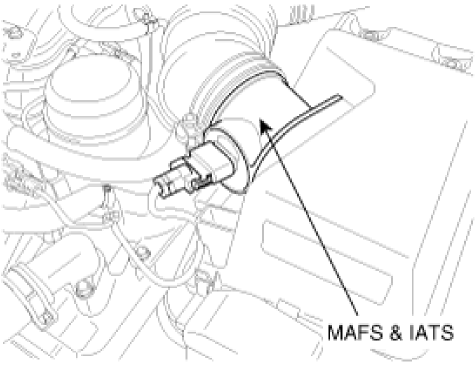
▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0101

COMPONENT LOCATION



GENERAL DESCRIPTION

The Delphi MAF Sensor is an air mass flowmeter, which operates on the principle of hot film anemometry. A heated element is placed within the air stream, and maintained at a constant temperature above the air temperature. The amount of electrical power required to maintain the heated element at the proper temperature is a direct function of the flow rate of the air mass past the element. PCM uses this information to determine the injection duration and ignition timing for the desired air/fuel ratio.

DTC DESCRIPTION

The difference between values coming from the MAF Sensor and those are calculated is analyzed. This difference, or error, is then compared to high and low limit calibration values, which are functions of engine speed. PCM compares the difference between MAFS output and calculated flow rate value while enable condition is met.
If the acutal air flow is higher than Maximum threshold, or lower than Minimum threshold for more than 75 seconds failure for every 125 seconds test. PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The MAF Rationality Diagnostic compares the difference between MAF Sensor output and calculated flow rate value to a calibration value	• Poor connection • Open or short in harness • Clogged air cleaner • MAFS • PCM
Enable Conditions	• Barometric Pressure enable conditions criteria met • Engine Coolant Temperature ≥ 60°C • 600rpm < Engine Speed < 3000rpm • Air Conditioning Clutch not transitioning • Torque Control is not Active • Traction Control is not Active • Brake switch is not active • Current Transmission Torque Converter Clutch State same as previous • Power Steering is not Cramped • Engine Speed difference ≤ 300rpm • TPS value difference ≤ 5% • MAP value difference ≤ 7 kPa • Idle Airflow difference ≤ 10% • VCPC changes ≤ 10% • MAP TPS Rationality High Power Condition Fail Criteria Not Met • MAP TPS Rationality Low Power Condition Fail Criteria Not	

		Met • MAP TPS Rationality Decel. Condition Fail Criteria Not Met • BARO Update Enable Criteria Met • Enable Timer ≥ 1.5s	
Thresh old value	Case 1	• Acutal Air Mass Value < Positive Memorized Value	
	Case 2	• Acutal Air Mass Value > Negative Memorized Value	
Diagnosis Time		• Continuous (More than 75 seconds failure for every 125 seconds test)

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

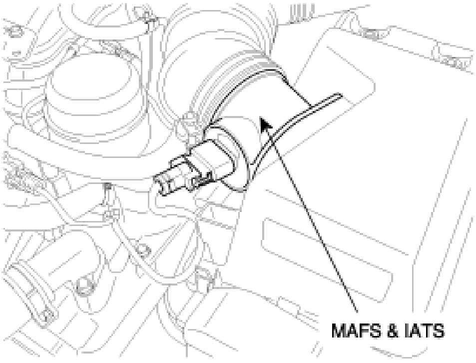
▸ Go to the applicable troubleshooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0102

COMPONENT LOCATION



GENERAL DESCRIPTION

The Delphi MAF Sensor is an air mass flowmeter, which operates on the principle of hot film anemometry. A heated element is placed within the air stream, and maintained at a constant temperature above the air temperature. The amount of electrical power required to maintain the heated element at the proper temperature is a direct function of the flow rate of the air mass past the element. PCM uses this information to determine the injection duration and ignition timing for the desired air/fuel ratio.

DTC DESCRIPTION

The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to low and high limits. When the frequency is outside the allowable limits, the circuit is determined to be failed. When a MAF Sensor fails, it may cause the fuel control subsystem to deliver an incorrect quantity of fuel. The most probable failure modes of the MAF Sensor system are an open or short circuit, resulting in a low frequency code setting.
If PCM detects that output of MAFS is lower than 720Hz for more than 75 second failure during one dignostic test(125 second) while enable condition is met PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to a low limit	• Poor Connection • Open or short in harness • Clogged air cleaner • MAFS • PCM

4. Are the "Air Flow" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

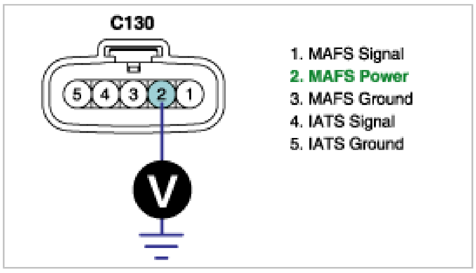
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and Disconnect MAFS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 2 of MAFS harness connector and chassis ground

Specification : B+



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" Procedure.

NO

▸ Check fuse between MAFS and main relay is open or not installed.
▸ Repair open in power harness between MAFS and main relay and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect MAFS connector.
   (2) IG "ON' & ENG "OFF".
   (3) Measure voltage between terminal 1 of MAFS harness connector and chassis ground.

Specification : Approx. 5V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Ground circuit inspection" procedure.

NO

▸ If the measured voltage is "0", go to "Check open in harness" as follows. If the measured voltage is over "5V", go to " Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 and 2 of MAFS harness connector.
   (3) Measure resistance between terminal 1 and 4 of MAFS harness connector.

Specification : Infinite

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Check short to ground in harness" as follows.

NO

▸ Repair short to battery in harness and go to "Verification of Vehicle Repair" procedure.

3. Check short to ground in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 of MAFS harness connector and chassis ground.

Specification : Infinite

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ epair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

4. Check open in harness
   (1) IG "OFF" and disconnect MAFS and PCM connector.
   (2) Measure resistance between terminal 1 of MAFS harness connector and terminal 47 of PCM harness connector.

Specification : Approx. below 1Ω.

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Ground circuit Inspection" procedure.

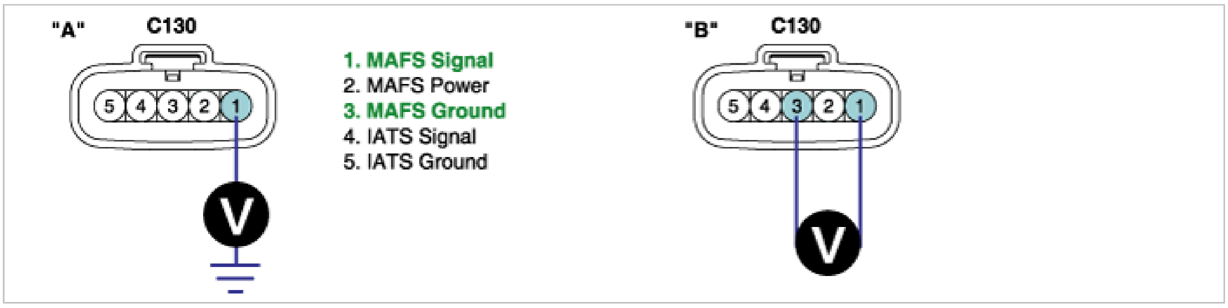
NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAFS connector.
2. Measure voltage between terminal 1 of MAFS harness connector and chassis ground.
3. Measure voltage between terminal 1 and 3 of MAFS harness connector.

Specification : Voltage difference between Measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact resistance or open in harnesss and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection
   (1) Check that MAFS is damaged, contaminated or deformed.
   (2) Check tha air cleaner is clogged.
   (3) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check MAFS" as follows

2. Check MAFS
   (1) IG "OFF" and install a scantool
   (2) ENG "ON" and monitor "MAFS" data on the service data.
   (3) Monitor signal waveform at terminal 1 of MAFS with scantool.

   Specification :Signal waveform will be displayed as follows. (Be aware that the signal of MAFS is not voltage display but frequency display.)

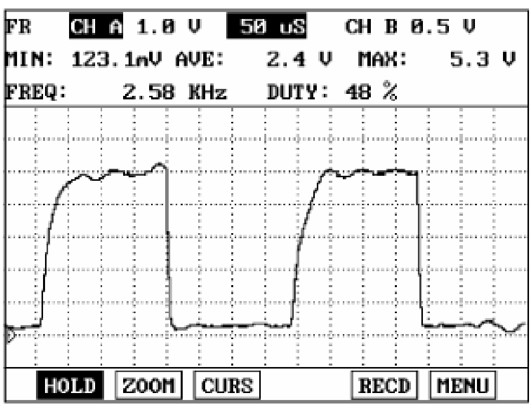


Fig. 1

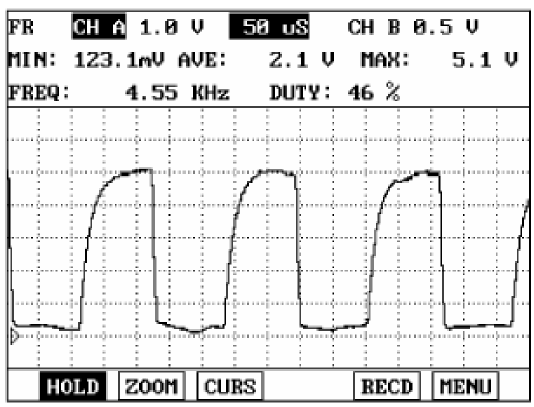

Fig. 2

Fig. 1 : Idle
Fig. 2 : Acceleration

   (4) Are both service data and signalwave form dispayed correctly ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good MAFS and check for proper operation. If the problem is corrected, replace MAFS and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

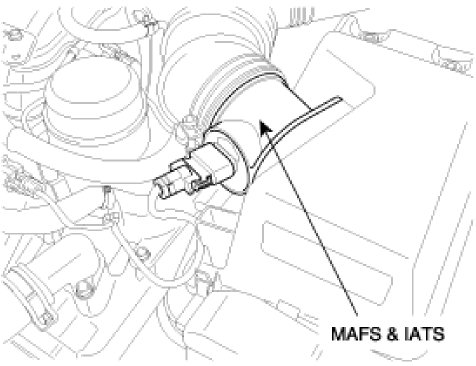
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0103

COMPONENT LOCATION



GENERAL DESCRIPTION

The Delphi MAF Sensor is an air mass flowmeter, which operates on the principle of hot filmanemometry. A heated element is placed within the air stream, and maintained at a constanttemperature above the air temperature. The amount of electrical power required to maintain theheated element at the proper temperature is a direct function of the flow rate of the air mass pastthe element. PCM uses this information to determine the injection duration and ignition timing for the desired air/fuel ratio.

DTC DESCRIPTION

The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to low and high limits. When the frequency is outside the allowable limits, the circuit is determined to be failed. When a MAF Sensor fails, it may cause the fuel control subsystem to deliver an incorrect quantity of fuel. The most probable failure modes of the MAF Sensor system are an open or short circuit, resulting in a low frequency code setting.
If PCM detects that output of MAFS is higher thatn 12000Hz for more than 75 second failure during 125 second dignostic test while enable condition is met PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The MAF Frequency Airmeter Circuit Diagnostic compares the airmeter input frequency to a high limit	

Enable Conditions	• Engine Speed ≥ 500 rpm • Engine Running Time ≥ 5 second • Ignition Voltage ≥ 11V • Conditions met delay time ≥ 1 second	• Noise • MAFS • PCM
Threshold value	• MAF frequency signal > 11900Hz	
Diagnosis Time	• Continuous (More than 75 second failure for every 125 second tests)	
MIL On Condition	• 2 Driving Cycles	

SPECIFICATION

Air Flow (kg/h)	Frequency (Hz)
12.6 kg/h	2,617Hz
18.0 kg/h	2,958Hz
23.4 kg/h	3,241Hz
32.4 kg/h	3,653Hz

Fig.4: Open in signal harness

4. Are the "Air Flow" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

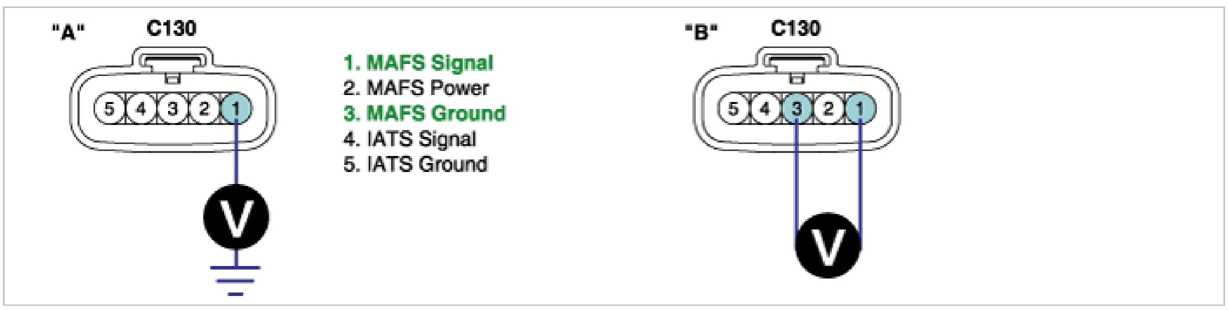
NO

▸ Go to "Ground Circuit Inspection" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnector MAFS connector.
3. Measure the voltage between terminal 1 of MAFS harness connector.
4. Measure the voltage between terminal 1 and 3 of MAFS harness connector.

Specification : Voltage difference and "A" and B" is below 200mV



5. Is the measured voltage within the specification?

YES

▸ Go to "Component Inspection".

NO

▸ After repairing or replacing contact resistance in ground circuit and open in the MAFS circuit, go to "Verification and Vehicle Repair".

COMPONENT INSPECTION

1. Visual Inspection
   (1) Check that MAFS is damaged, contaminated or deformed.
   (2) Check tha air cleaner is clogged.
   (3) Has a problem been found ?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check MAFS" as follows

2. Check MAFS
   (1) IG "OFF" and install a scantool
   (2) ENG "ON" and monitor "MAFS" data on the service data.

(3) Monitor signal waveform at terminal 1 of MAFS with scantool.

Specification :Signal waveform will be displayed as follows. (Be aware that the signal of MAFS is not voltage display but frequency display.)

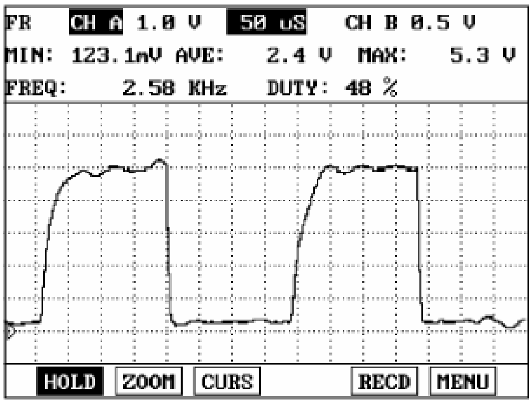


Fig. 1

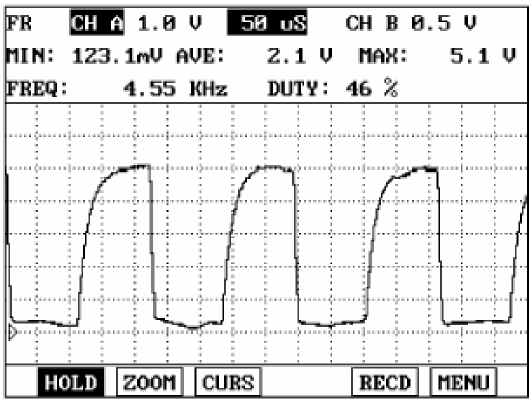

Fig. 2

Fig. 1 : Idle
Fig. 2 : Acceleration

(4) Are both service data and signalwave form dispayed correctly ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.
Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good MAFS and check for proper operation. If the problem is corrected, replace MAFS and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

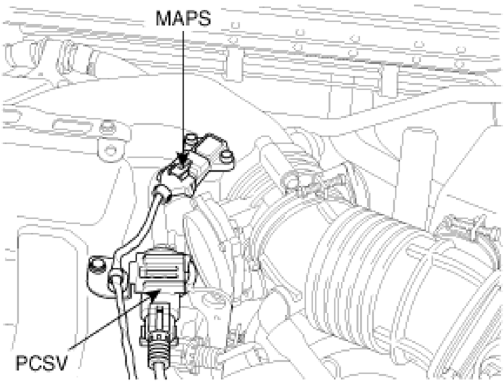
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0106

COMPONENT LOCATION



GENERAL DESCRIPTION

The amount of intake air flow must be inputted to PCM in order to determine the fuel injection quantity. To measure the pressure inside of intake manifold, MAFS is used at idle and MAPS is required at accelerating. MAPS(Manifold Absolute Pressure) calculates the amount of air indirectly as measuring the pressure inside of intake manifold. This mechanism is alsl called Speed-Density Type.MAPS transfers analog output signal which is proportional to the change of intake manifold pressure, then, with this signal and RPM, PCM calculates the amount of intake air flow. MAPS is mounted on surge tank to measure the pressure inside of intake manifold, and it consists of a piezo electric element and hybrid IC which amplifies output signal from the element. A piezo electric element is a sort of a diaphragm using piezo electric effect. One side of the diaphragm is surrounded with vacuum chamber while intake pressure is applied to the other side. Thus, signals are output by the transformation of diagphragm according to the change of pressure inside of intake manifold.

DTC DESCRIPTION

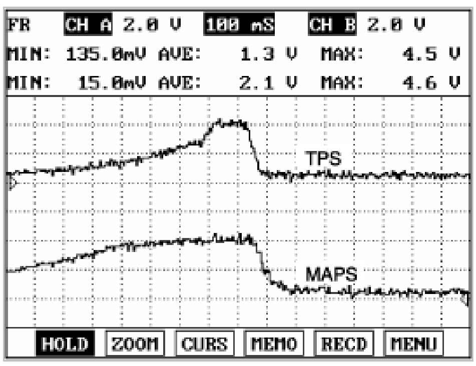
The MAP/TPS Rationality Diagnostic is comprised of two tests. A deceleration test is performedto provide a robust method for detection of an altitude compensated MAP value that is too high for the deceleration condition. The second test compares the altitude compensated MAP value to both high and low limits, dependent upon throttle position and engine speed. When the MAP value is out of the threshold range, the MAP/TPS system is determined to be failed.
When the MAP/TPS Rationality Diagnostic fails, the effects may cause the fuel control subsystem to deliver an incorrect quantity of fuel. The most probable failure modes of the MAP Sensor system are a skewed MAP or TPS sensor, resulting in a poor correlation between MAP and TPS
To ensure the vehicle is not performing in a transient maneuver, input signals and control parametersare monitored for stability for both the deceleration test and the power test. A large enough change inany of these stability parameters indicates that either the actual airflow rate or the calculated airflowrate may be misrepresented during the transient condition. Inclusion of this check for stability allowsbetter separation of passing and failing systems.
PCM compares the difference between MAPS output and calculated MAPS value while enable condition ismet. If the acutal MAP value is higher than Maximum threshold or lower than Minimum threshold for 15 secondfailure during one diagnostic test(32 second),PCM determines that a fault exists and a DTC is stored.MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• The MAP reading is compared to expected MAP high and low limits based on engine speed & Throttle Position	
	Case 1	**Decel Stable Conditions Criteria** • Engine State = Run • MAP_TPS_Rationality Fault is not present • Valid barometric pressure update • 1300rpm ≤ Engine speed ≤ 4500rpm • Idle Airflow Stable ≤ 4.9988% • -10°C< Coolant Temperature above minimum threshold	
		Power Stable Conditions Criteria • Engine State = Run • MAP_TPS_Rationality Fault is not present • Valid barometric pressure update • 1300rpm ≤ Engine speed ≤ 4000rpm	

Enable Conditions	Case 2	• HVAC Clutch not transitioning • Traction control not active • Torque fuel reduction not active • Brake Switch Not Activated • Coolant Temperature ≥ 60°C • TPS value difference ≤ 4.9988% • MAP value difference ≤ 5kPa • Idle Airflow Stable ≤ 4.9988% • Bank 1 VCPC ≤ 10 degree • Bank 2 VCPC ≤ 10 degree	
	Case 3	**Decel Enable Conditions Criteria** • Decel Stable Conditions Present • Throttle position < 0.2991% • Vehicle Speed ≥ 30kph • The minimum consecutive time that the engine operating conditions must meet the enable criteria	• Poor connection • Open or short in harness • MAPS • PCM
	Case 4	**Power Enable Conditions Criteria** • Power Stable Conditions Present • The minimum consecutive time that the engine operating conditions must meet the enable criteria > 3 second	
Threshold value	Case 1	**Power Test** • Altitude compensated MAP < Memorized min. MAP data • Altitude compensated MAP > Memorized max. MAP data	
	Case 2	**Decelleration Test** • Altitude compensated MAP < Memorized MAP data	
Diagnosis Time		• Continuous (More than 15 seconds failure for every 32 seconds test)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



It is necessary that MAPS should be checked along with TPS. Because The MAP/TPS Rationality Diagnostic is comprised of two tests. A deceleration test is performed to provide a robust method for detection of an altitude compensated MAP value that is too high for the deceleration condition. The second test compares the altitude compensated MAP value to both high and low limits, dependent upon throttle position and engine speed. When the MAP value is out of the threshold range, the MAP/TPS system is determined to be failed.

4. Are the "MAPS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

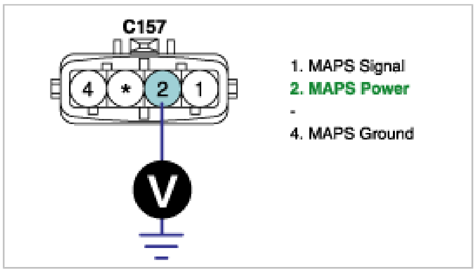
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAPS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 2 of MAPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Ground circuit inspection" procedure.

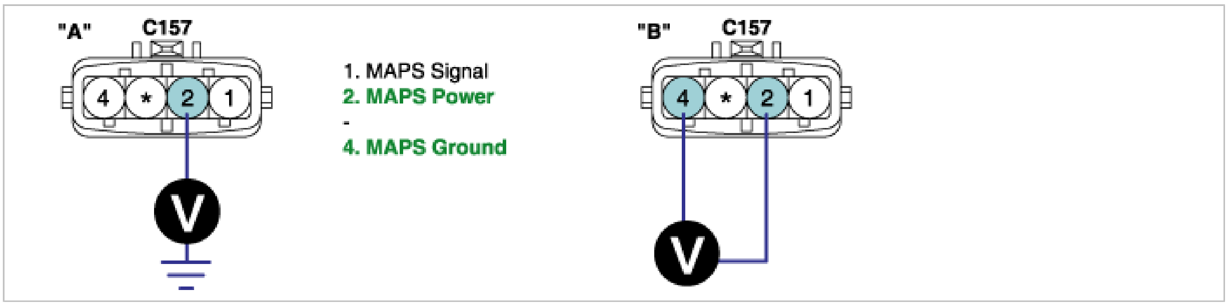
NO

▸ Repair open or short to ground in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect MAPS connector.
2. Measure voltage between terminal 2 of MAPS harness connector and chassis ground.
3. Measure voltage between terminal 2 and 4 of MAPS harness connector.

Specification : Voltage difference between Measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal Circuit Inspection" procedure.

NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect MAPS connector.
   (2) IG "ON" & ENG "OFF"
   (3) Measure voltage between terminal 1 of MAPS harness connector and chassis ground.

Specification : Approx. 0V

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnet MAPS and PCM connector.
   (2) Measure resistance between terminal 1 of MAPS harness connector and terminal 8 of PCM harness connector.

Specification : Approx. Below 1 Ω

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

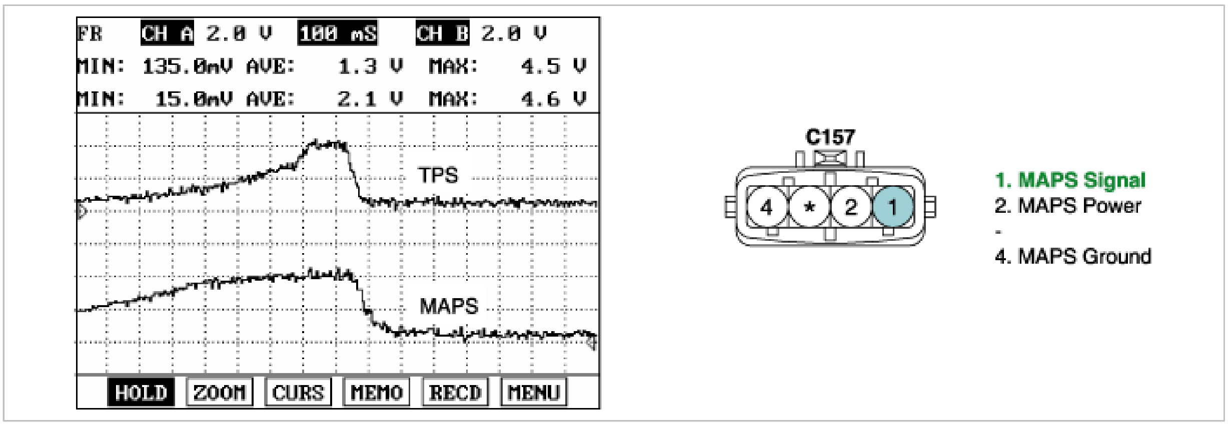
COMPONENT INSPECTION

1. Check MAPS Performance
   (1) IG "OFF" and install scatool.
   (2) Connect probe to MAPS and TPS to check signal waveform by using oscilloscope function.

(3) ENG "ON" and monitor signal waveform during accelleration and decelleration.

Specificaton :

Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				



(4) Is the measured signal waveform(MAP/TPS Rationality) O.K ?

YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good MAPS and check for proper operation. If the problem is corrected, replace MAPS and go to "Verification of Vehicle Repair" procedure.

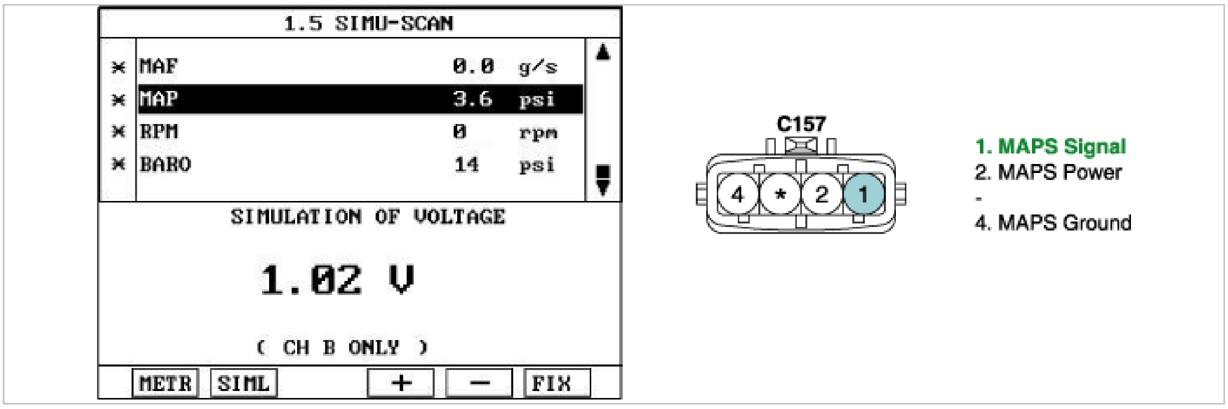
2. Check PCM

(1) IG "OFF" disconnect MAPS connector

(2) Connect Scantool and IG "ON" & ENG "OFF"

(3) Select simulation function on scantool.

(4) Simulate voltage at terminal 1 of MAPS harness connector.



(5) Does the signal value of MAP sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

▸ Go to "Signal Circuit Inspection" procedure.

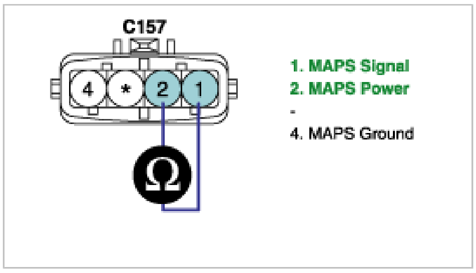
NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect MAPS and PCM connector.
3. Measure resistance between terminal 1 and 2 of MAPS harness connector.

Specification : Infinite



4. Is the measured resistance within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact reistance or open in harness and then go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. MAPS performance test
   (1) IG "OFF"
   (2) Connect scantool to Data Link Connector(DLC) and selest "Oscilloscope" then, connect probes to output signal lines of MAPS and TPS.Turn engine "ON" and monitor the waveforms accelerating or decelerating
   (3) ENG "ON" and monitor signal waveform during accelleration and decelleration.
   Specificaton :

Pressure (kPa)	20	35	60	95	101.32
Voltage (V)	0.789	1.382	2.369	3.75	4
Tolerance (V)	± 0.045				

   (4) Is the waveform displayed correctly?(Compare the response time of TPS and MAPS)

YES

▸ Go to "Check PCM".

NO

▸ After replacing MAPS with new one, if it operates normally, replace MAPS and go to "Verification of Vehicle Repair".

2. Check PCM
   (1) IG "OFF" disconnect MAPS connector
   (2) Connect Scantool and IG "ON" & ENG "OFF"
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal 1 of MAPS harness connector.

   (5) Does the output voltage response to the change of signal by simulation?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM.Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

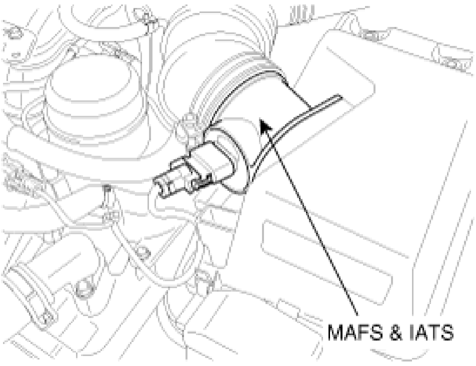
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0110

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

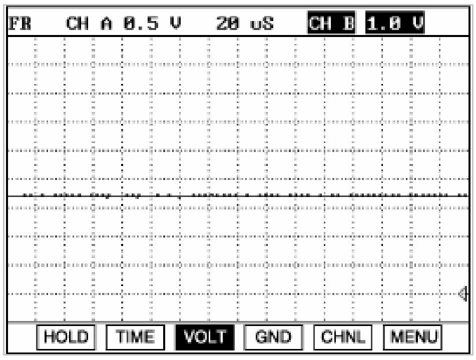
DTC DESCRIPTION

This test has two parts – the Stuck Start Test and the Stuck Drive test. The logic checks for movements in the IAT by comparing the min and max IAT values. If a sufficient difference is present, both parts of the test declare a PASS. Otherwise, the startup portion of the stuck test sets a “sensor stuck” flag and increments a counter while monitoring the min and max IAT. If the stuck condition persists, the counter eventually reaches its’ threshold and the startup test completes with the sensorstuck flag set.
If a PASS is not declared as mentioned above, the Drive portion of the stuck test also sets a “sensor stuck” flag and then checks for enough engine load to be present and if it is, it increments a counter. If the stuck condition persists and the engine continues to experience at least the minimum load, the counter eventually reaches its threshold indicating that enough engine heating as well as airflow introduction has taken place and sets a drive conditions complete flag. It then waits for the engine to return to idle. Once at idle, an idle counter is incremented until it reaches its threshold (as long as the stuck conditions persists). This completes the drive test and also the entire Stuck Test.
PCM monitors difference MAX. and MIN IATS in order to detect movement in IATS therough Start Test and Drive Test while enable condition is met. If PCM detects intake air temperature does not change PCM determines that a fault exists and a DTC is stored.
MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy	Case 1	• Start Test: Monitors the difference between max and min IAT in order to detect movement in IAT for a certain time.	• Poor connection • Open or short in harness • IATS • PCM
	Case 2	• Drive test: Performs the max and min delta check while driving under load for a length of time followed by an idle for a certain time.	
Enable Conditions		• Engine soaked time > 480min • Engine Running State • No disabling fault present • IAT stored previous trip • No IAT Tests pending	
Thresh old value	Case 1	• Max IAT - Min IAT ≤ 1°C • Start Test Counter ≥ 120	
	Case 2	• Max IAT - Min IAT ≤ 1°C • Idle Test Counter ≥ 120	
MIL On Condition		• 2 driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)

4. Is the "IATS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure.

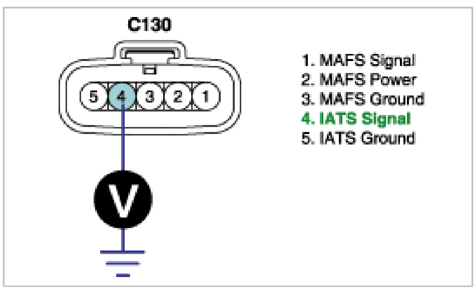
NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect IATS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 4 of IATS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Check short to battery in harness.
▸ If O.K, go to "Ground Circuit Inspection" procedure.
▸ If N.G, repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

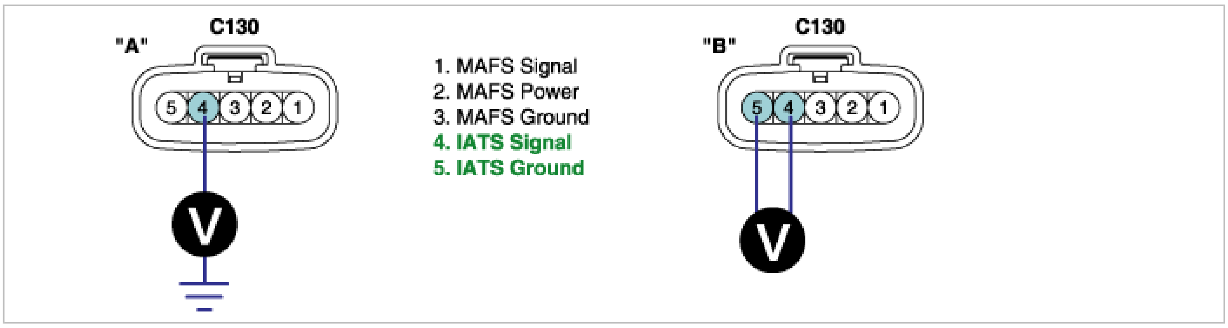
NO

▸ Repair open or short to ground in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect IATS connector.
2. Measure voltage terminal 4 of IATS harness connector and chassis ground.
3. Measure voltage terminal 4 and 5 of IATS harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact resistance or open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check resistance of IATS
   (1) IG "OFF" and disconnect IATS connector.
   (2) Measure resistance between terminal 4 and 5 of IATS connector.(Component Side)
   Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61
-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69
10(50)	5.49 ~ 5.83	80(176)	0.33 ~ 0.34

   (3) Is the measured resistance within specification ?

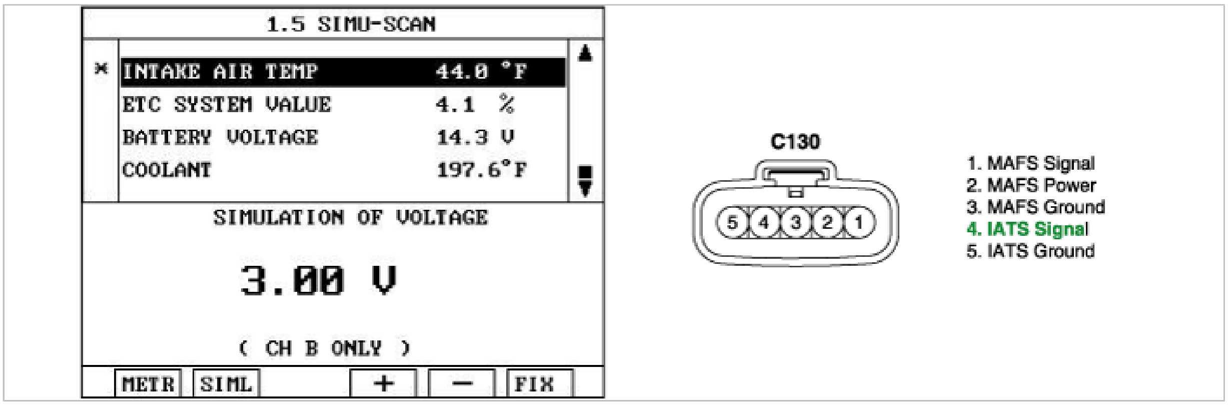
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good IATS and check for proper operation. If the problem is corrected, replace IATS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Disconnect IATS connector and connect probe to terminal 4 of IATS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 4 of IATS harness connector.



(5) Does the signal value of IAT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

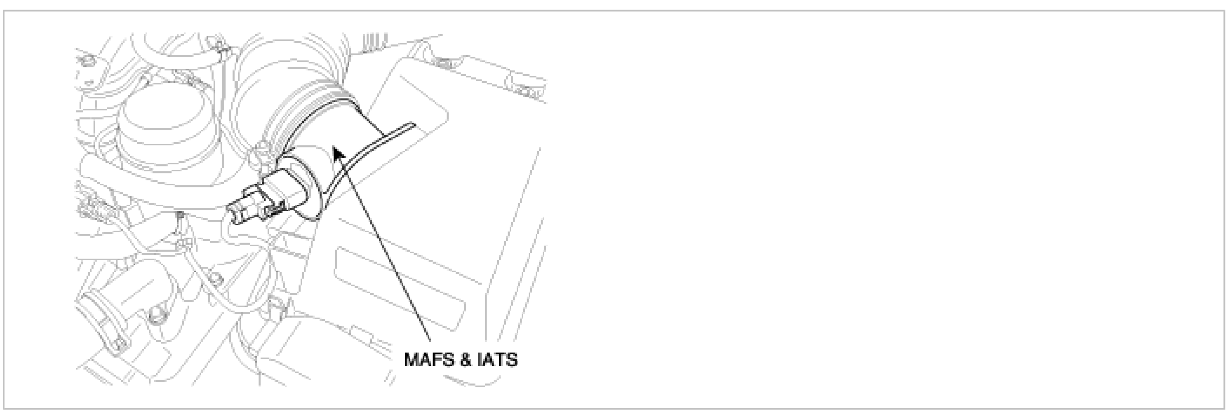
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0111

COMPONENT LOCATION



GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The

PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

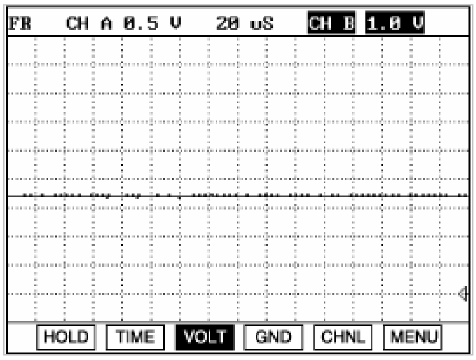
DTC DESCRIPTION

Determine if the IAT sensor reading is skewed high or low. As in the stuck test, the IAT sensor is exposed to conditions such as ample airflow introduction and engine heating that enhance the possibility of ambient temperature change. That helps the diagnostic in its' analysis
A skewed condition is suspected only if the IAT at startup differs from the coolant temperature by a minimum threshold on either the high or the low side. If it does not, the skew test declares a PASS.Otherwise, if IAT & ECT and the coolant temperature is greater than an allowed minimum, the Skew Low Test is executed. This test checks for enough engine load to be present and introduces a delay as long as the skewed condition persists. This allows sufficient airflow introduction and engine heating, and also allows time for the IAT reading to stabilize. If at any time during this delay the absolute difference between the startup and current IAT exceeds a maximum allowed value (drift check), no reporting is done and the test is disabled (case of vehicle being driven out of a heated garage in to a colder ambience, etc.). Otherwise, once the delay period is over, a fail counter isincremented and as it reaches its threshold, the low test completes and indicates a failure.On the other hand if a passing condition is not present and IAT & ECT, the Skew High Test is called. This test checks for enough engine load to be present and introduces a delay as long as the skewed condition persists. This allows sufficient airflow introduction and engine heating and also allows time for the IAT reading to stabilize. If at any time during this delay the absolute difference between the startup and current IAT exceeds a maximum allowed value (drift check), no reporting is done and the test is disabled (case of vehicle being driven out of an air conditioned garage into a warmer ambience, etc.). Once the delay period is over and the IAT is greater than a minimum threshold, a fail counter is incremented and as it reaches its threshold, the high test completes and indicates a failure. But if the IAT is less than this threshold, no reporting is done and test is disabled (again protection against case of vehicle being driven out of an air conditioned garage into a warmer ambience and setting a false MIL).
PCM monitors difference MAX. and MIN IATS in order to detect movement in IATS therough Start Test and Drive Test while enable condition is met. If PCM detects intake air temperature does not change PCM determines that a fault exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detection condition	Possible cause
DTC Strategy	Case 1	• Skew Low Test: Monitors the difference between the startup coolant and IAT values	• Poor Connection • Open or short in harness • IATS • PCM
	Case 2	• Skew High Test: Monitors the difference between the startup IAT and coolant values	
EnableConditions	Case 1	• Engine soaked time ≥ 480min • Engine running state • No disabling faults present • IAT stored previous trip • IAT Skewed Test Not Complete • Startup Coolant Temperature >-20°C • Airflow >15 g/s • Vehicle speed >40kph	
	Case 2	• Engine soaked time ≥ 480min • Engine running state • No disabling faults present • IAT stored previous trip • IAT Skewed Test Not Complete • Airflow >15 g/s • Vehicle speed >40kph	
Threshold value	Case 1	• Startup Coolant - Startup IAT ≥ 30°C	
	Case 2	• Startup IAT - Startup Coolant ≥ 20°C	
Diagnosis Time		• Continuous (More than 1.25 second failure)	
MIL On Condition		• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. COMPONENT LOCATION

GENERAL DESCRIPTION

The Intake Air Temperature (IAT) sensor measures the temperature of engine intake air. The Intake Air Temperature (IAT) sensor is a thermistor (a variable resistor that changes along with outside air temperature) in series with a fixed resistor in the PCM. The PCM applies 5volts to the IAT sensor. The PCM monitors the voltage across the IAT sensor and converts it into a temperature reading. When the outside air temperature is cold the IAT sensor resistance is high, and when the outside air temperature is warm the IAT sensor resistance is low. Therefore, when the air temperature is cold the PCM will receive a high voltage input, and when the air temperature is warm the PCM will receive a low voltage input. The signal from IAT sensor is used for injection time correction (Cold post start correction), ignition angle correction(Air temperature correction) and idle speed correction(Air-density correction).

DTC DESCRIPTION

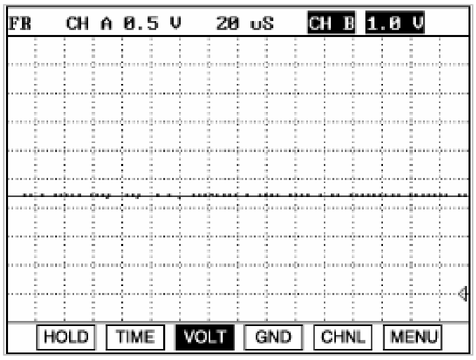
Checking output signals of IATS every 20 sec. under detecting condition, if an ouput signal is over 4.9V for more than 10 sec., PCM sets P0113. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This code detects a continuous short to high in either the signal circuit or the sensor	• Poor connection • Open or short to battery in harness • Open in ground harness • IATS • PCM
Enable Conditions	• Engine running state • No Vehicle speed sensor fault • No ECTS fault • No MAFS fault • Intake airflow< 15 g/s • Vehicle speed< 25kph(9.3mph) • Engine coolant temperature >50°C(122°F)	
Threshold value	• Intake air temperature sensor's voltage >4.9V	
Diagnosis Time	• Continuous (More than 10 seconds failure for every 20 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

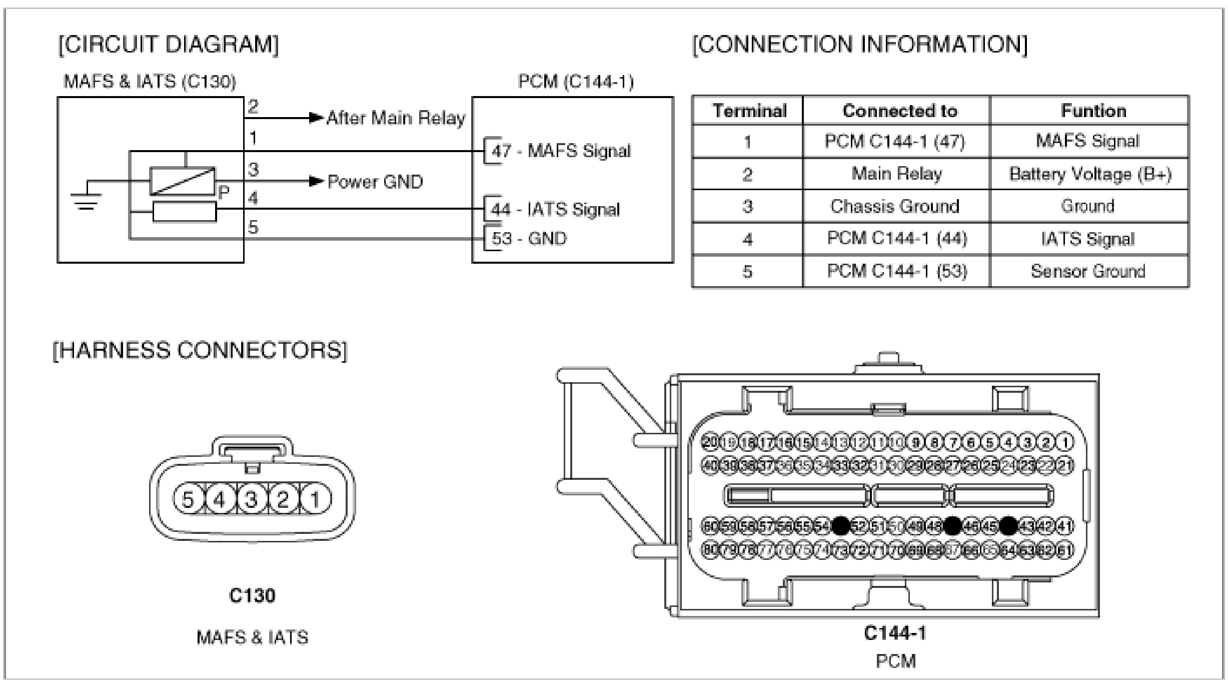


The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61
-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69
10(50)	5.49 ~ 5.83	80(176)	0.33 ~ 0.34

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "IATS" item on the service data.

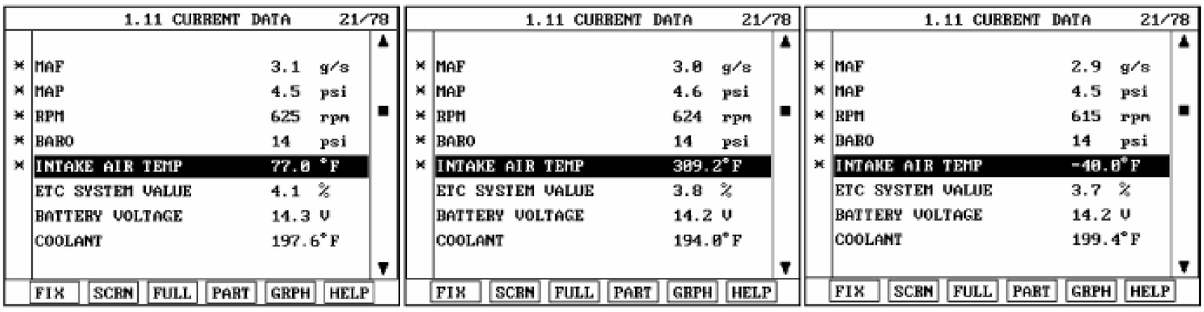


Fig. 1 Fig. 2 Fig. 3

Fig. 1 : Open at idle
Fig. 2 : Short to ground
Fig. 3 : Short to battery

4. Is the "IATS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

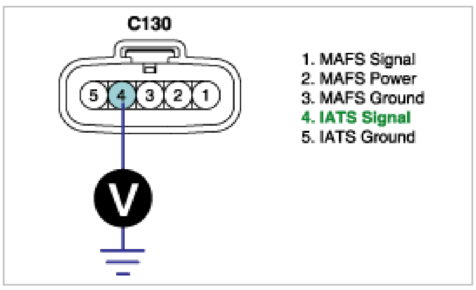
1. Check voltage

(1) IG "OFF" and disconnect IATS connector.

(2) IG "ON" and ENG "OFF"

(3) Measure voltage between terminal 4 of IATS harness connector and chassis ground.

Specification : Approx. 5V



(4) Is the measured voltage within specification ?

YES

▸ Go to "Ground Circuit Inspection" procedure.

NO

▸ If the voltage is 0V, go to "Check open in harness" as follows. If the voltage is more than 5.1V, go to "Check short to battery in harness" as follows.

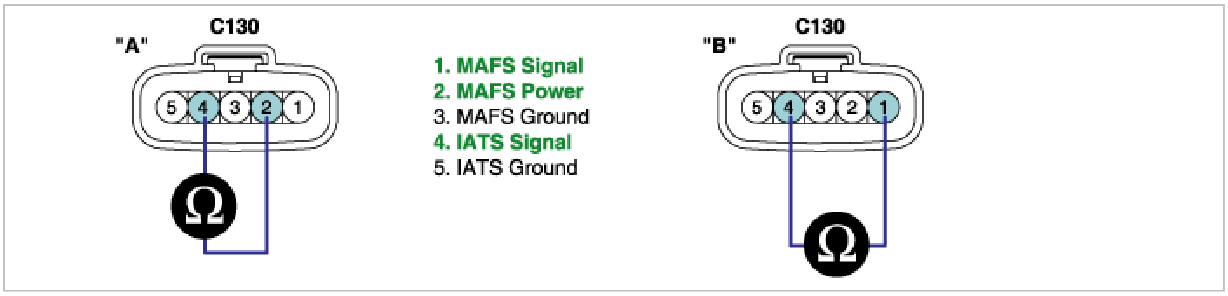
2. Check short to battery in harness

(1) IG "OFF" and disconnect IATS connector and PCM connector.

(2) Measure resistance between terminals 2 and 4 of IATS harness connector.

(3) Measure resistance between terminals 1 and 4 of IATS harness connector.

Specification : Infinite



(4) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

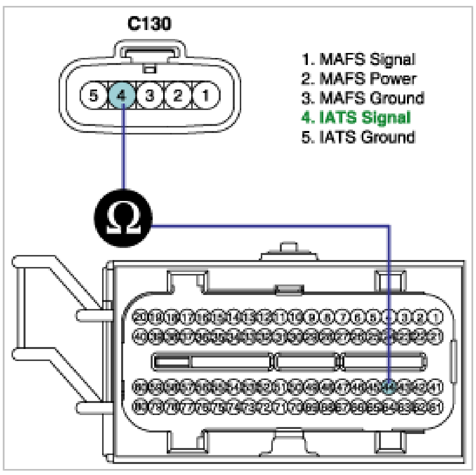
▸ Repair short to battery in harness and go to "Verification of Vehicle Repair" procedure.

3. Check open in harness

(1) IG "OFF" and disconnect IATS connector and PCM connctor.

(2) Measure resistance between terminal 4 of IATS harness connector and 44 of PCM harness connector.

Specification : below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Ground Circuit Inspection" procedure.

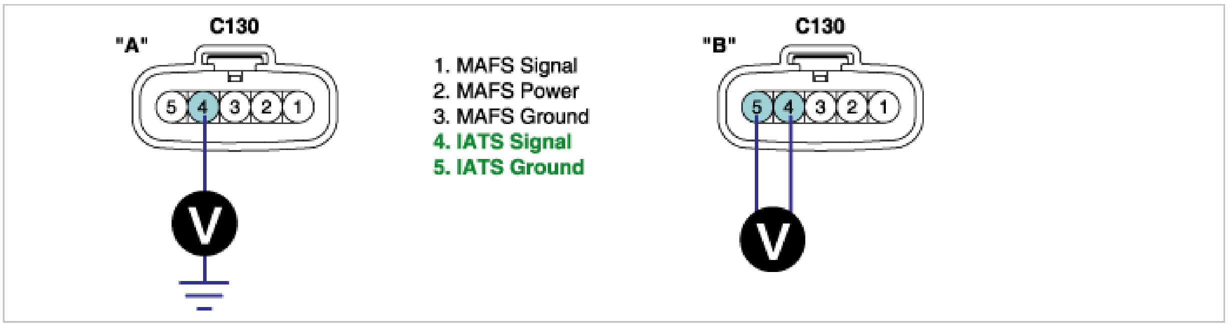
NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect IATS connector.
2. Measure voltage between terminal 4 of IATS harness connector and chassis ground.
3. Measure voltage between terminals 4 and 5 of IATS harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair contact resistance or open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check IATS
   (1) IG "OFF" and disconnect IATS connector.

   (2) Measure resistance between teminals 4 and 5 of IATS connector.(Component side)
   Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	95.95 ~ 105.78	20(68)	3.42 ~ 3.61
-20(-4)	27.4 ~ 29.77	40(104)	1.43 ~ 1.5
0(32)	9.08 ~ 9.72	60(140)	0.66 ~ 0.69
10(50)	5.49 ~ 5.83	80(176)	0.33 ~ 0.34

   (3) Is the measured resistance within specification ?

YES

▸ Go to "Check PCM" as follows.

NO

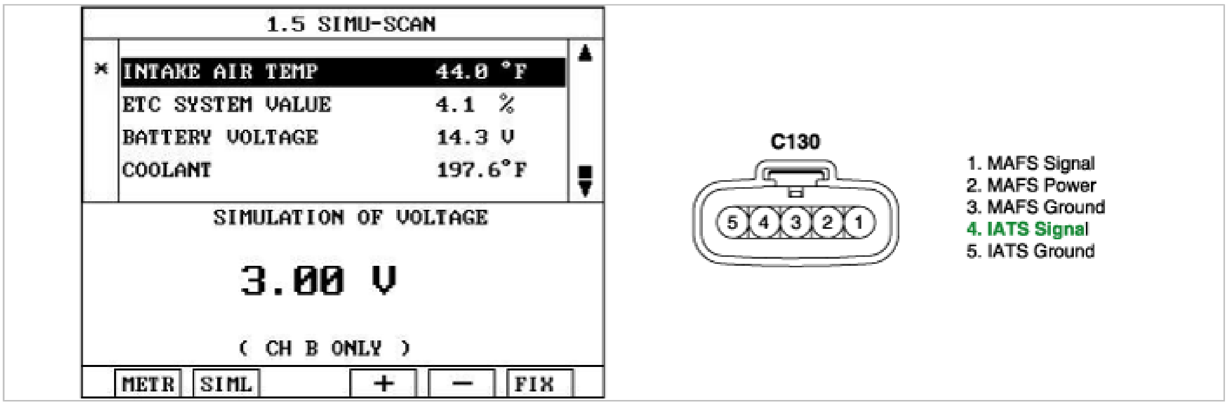
▸ Substitute with a known - good IATS and check for proper operation. If the problem is corrected, replace IATS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.

   (2) Disconnect IATS connector and connect probe to terminal 4 of IATS harness connector.

   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.

   (4) Simulate voltage at terminal 4 of IATS harness connector.



(5) Does the signal value of IAT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

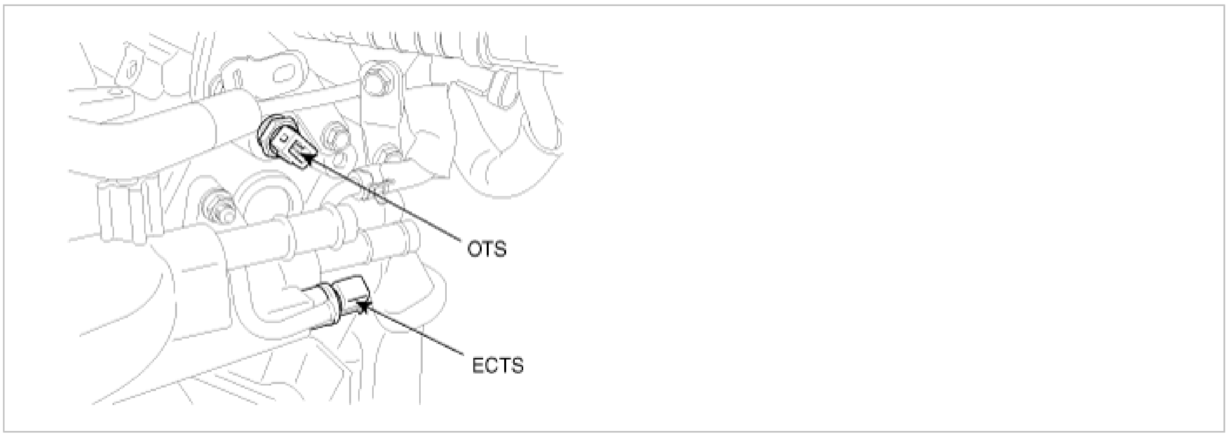
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0115

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature

(ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

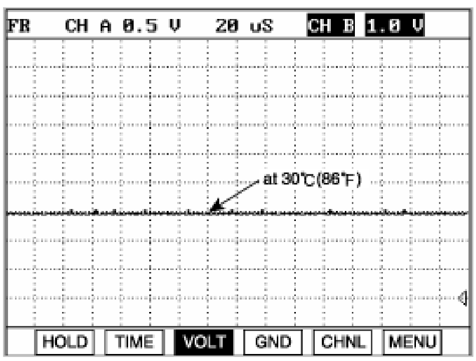
DTC DESCRIPTION

Failure mode is the coolant sensor output stuck. When this failure mode occurs, no change is observed in the ECT Sensor reading, even though the engine may be warming up from a cold start. It calculates the difference between the startup and current coolant temperatures and compares against the threshold. Insufficient change over this period of time indicates a failure.
PCM monitors difference between the startup and current coolant temperature and compares agaist the threshold while enable condition is met. If the PCM detects that the coolant temperature sensor signal change is less than 3°C for 120 second, PCM determines that a fault exists and a DTC is stored.
MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Rationality	• Poor connection • Low level of Engine Coolant • Improperly installed ECTS • Open or short in circuit • ECTS • PCM
Enable Conditions	• Engine Run state • Vehicle soak time >360min • No Disabling Faults Present	
Threshold value	• This code detects a coolant temp sensor that is stuck within an expected range of movement< 3 °C(37.4°F)	
Diagnosis Time	• Continuous (More than 120 seconds failure within 150 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

   (2) Measure resistance between terminals 1 and 3 of ECTS connector.(Component side)
   Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

(3) Is the measured resistance within specification?

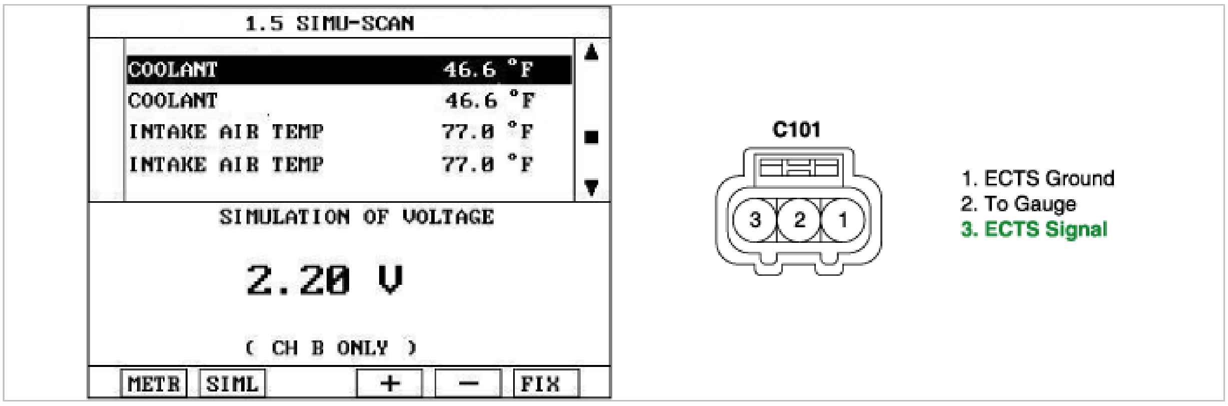
YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) IG "OFF" and connect scantool.
   (2) Connect probe to terminal 3 of ECTS harness connector.
   (3) IG "ON" and ENG "OFF" and simulation Function on scantool.
   (4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

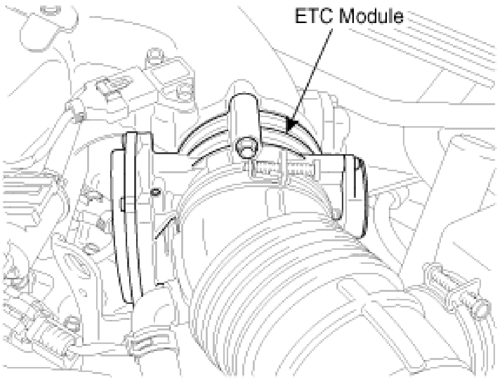
Fuel System > Troubleshooting > P0122

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

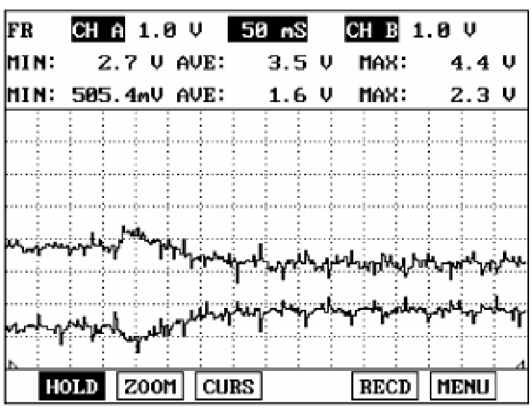
DTC DESCRIPTION

Checking output signals from TPS1 every 8.5 sec. under detecting condition, if an output signal is below 0.25V for more than 0.1 sec., PCM sets P0122. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

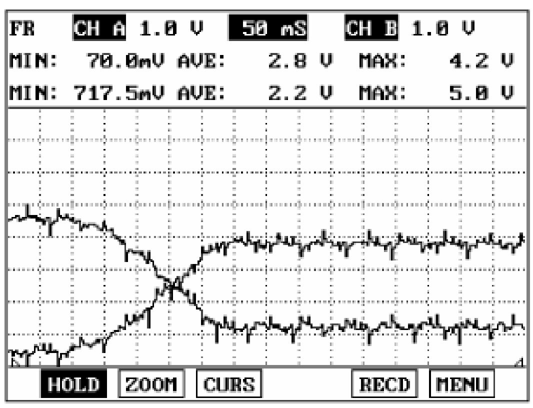
DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• signal low	• Poor connection • Open or short to ground in power harness • Short to ground in signal harness • TPS • PCM
Enable condition	• IG "ON	
threshold value	• The voltage of TPS< 0.25V	
diagnosis time	• Continuous (more than 0.1 sec. failure for every 8.5 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



Hit the accelerator at IG ON



Open the throttle valve by force at IG ON

SPECIFICATION

Throttle opening (°)	Output voltage(V) [Vref=5.0]	
	TPS1	TPS2
0°	0.0V	5.0V

10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0.0V

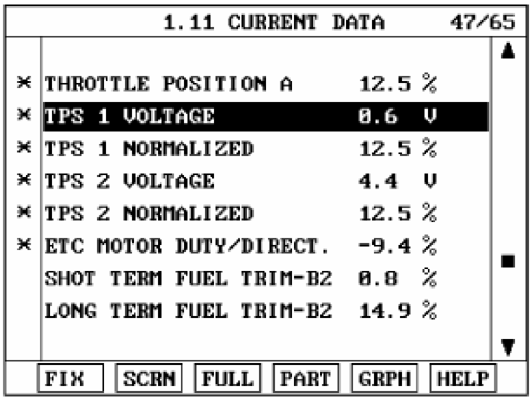
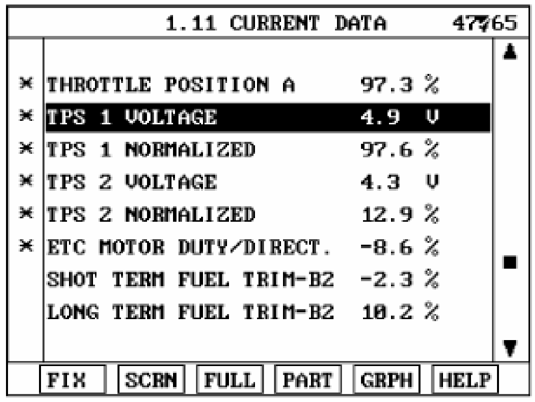
MONITOR SCANTOOL DATA

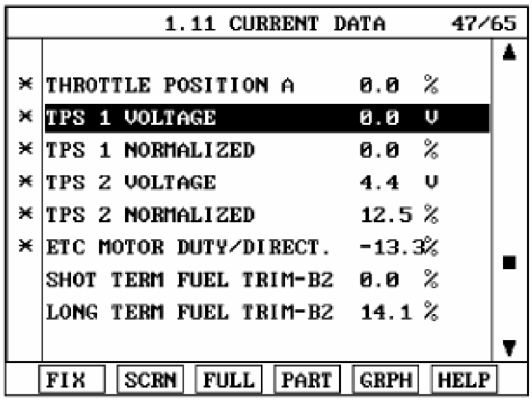
1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "TPS1" item on the service data.



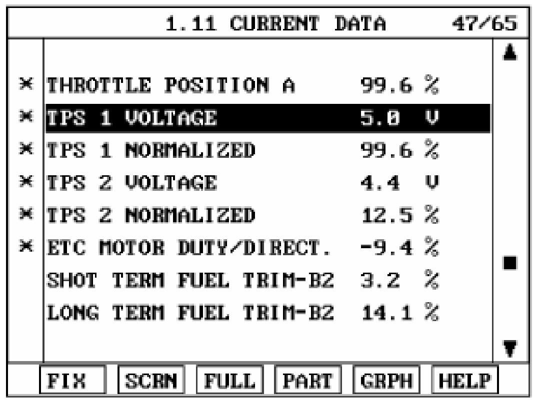
Normal data at idle



Data at open in TPS1



Data at short to ground in TPS1



Data at short to battery in TPS1

CAUTION

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

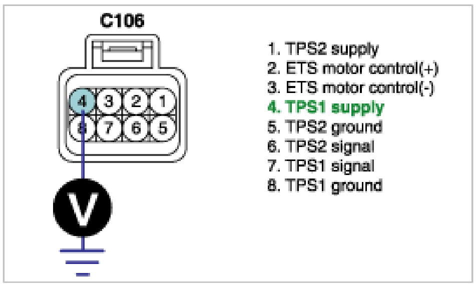
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect TPS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 4 of TPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Repair open or short to ground in power harness, and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.
   (2) Measure resistance between terminal 7 of TPS harness connector and chassis ground.
   (3) Measure resistance between terminals 7 and 5(8) of TPS harness connector.

Specification : Infinite

   (4) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

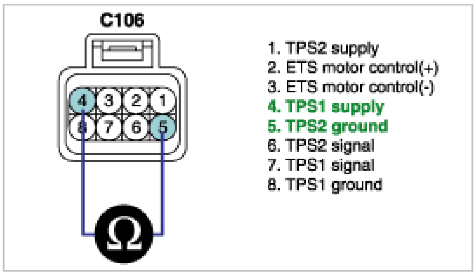
NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check TPS
   (1) IG "OFF" and disconnect TPS connector.
   (2) Measure resistance between terminals 4 and 5 of TPS connector.(component side)

Specificaton : 4 ~ 6kΩ



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good ECT motor & TPS and check for proper operation. If the problem is corrected, replace ECT motor & TPS and go to "Verification of Vehicle Repair" procedure.

CAUTION

Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

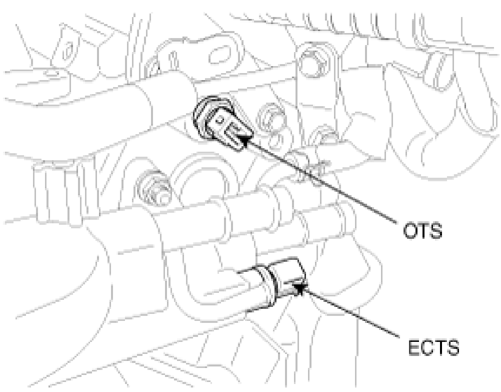
Fuel System > Troubleshooting > P0125

COMPONENT LOCATION



GENERAL DESCRIPTION

An Engine Coolant Temperature Sensor (ECTS) monitors the temperature of the coolant. This input is used by the PCM for engine control and as an enabling criteria for same diagnostics. The air flow coming into the engine is accumulated and used to determine if the engine has been driven within conditions that would allow the engine coolant to heat up normally to the thermostat regulating temperature. If the coolant temperature does not reach regulating temperature of the thermostat, diagnostics that use the engine coolant temperature as enabling criteria may not run when expected.

DTC DESCRIPTION

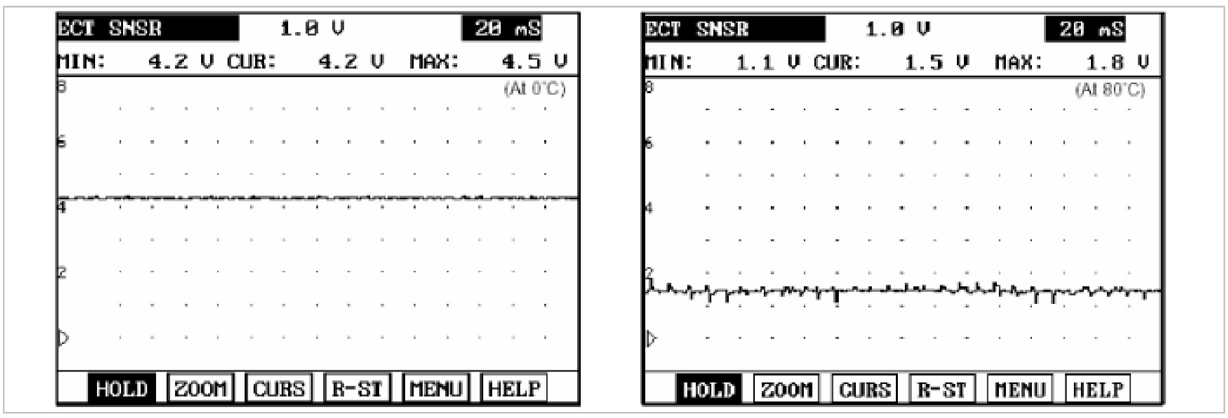
The Engine Coolant Temperature Time to Closed Loop Diagnostic monitors the time it takes the coolant to reach the temperature required for closed loop engine operation and compares it against a maximum limit dependent on the difference between the startup coolant temperature and the closed loop coolant temperature for that warm up cycle. If it takes longer than this allowed limit, a failure has occurred.

If the coolant temperature does not reach the specified value within the established time parameters, the PCM determines that a malfunction exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This diagnostic monitors the time it takes for the coolant temperature to reach the closed loop temperature and compares against a maximum threshold in order to make a PASS/FAIL determination, provided airflow and idle conditions are met.	• Poor connection • Improper coolant level • Malfunctioning Cooling System • Faulty ECTS
Enable Conditions	• No disabling faults present • Coolant sensor within range • Startup coolant temp ≤ 34°C(86 °F) • Engine running	
Threshold value	• Undefaulted coolant temperature ≥ Threshold Value(°C) • Test Time = Threshold (second)	
Diagnosis Time	• More than 5 second failure.	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection" procedure

SYSTEM INSPECTION

1. Check cooling system coolant level and fill if low.
2. Check that cooling fan is operating continuously.
3. Has a problem been found ?

YES

▸ Repair or repalce as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ECTS.
   (1) Ignition "OFF"
   (2) Disconnect ECTS connector
   (3) Measure resistance between terminals "1" and "3" of the ECT sensor (to ECT sensor side).
   Specificaton :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		

   (4) Is the measured resistance within specifications ?

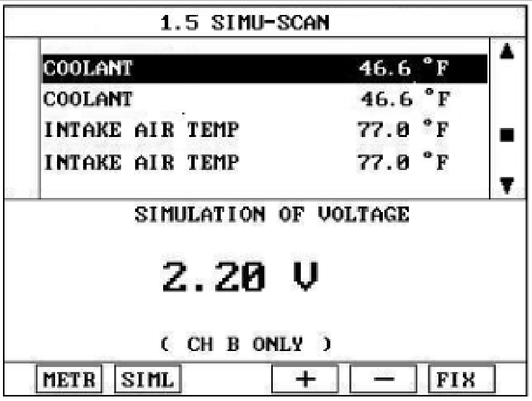
YES

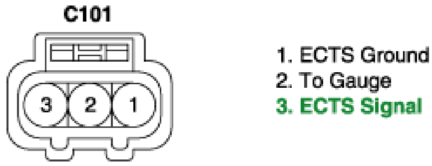
▸ Go to "Check PCM" as below.

NO

▸ Substitute with a known - good ECT sensor and check for proper operation. If the problem is corrected, replace ECT sensor and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) Ignition "OFF".
   (2) Connect Scantool and Ignition "ON" & Engine "OFF "
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal "3" of ECT sensor signal connector.





(5) Does the signal value of ECT sensor changes according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

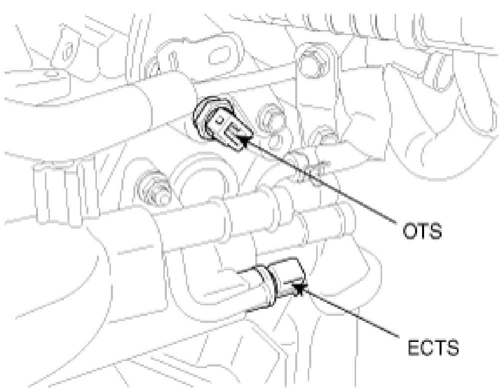
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0128

COMPONENT LOCATION



GENERAL DESCRIPTION

The Thermostat is a mechanical (thermal) device located in an engine coolant passage that allows passage of coolant into the radiator once the coolant has reached a manufacturer specified temperature called the Regulating Temperature. It has a metallic frame with a spring-loaded,centrally mounted, wax filled cylinder/piston assembly that expands and contracts with changes in temperature, thereby controlling the passage of coolant into the radiator.

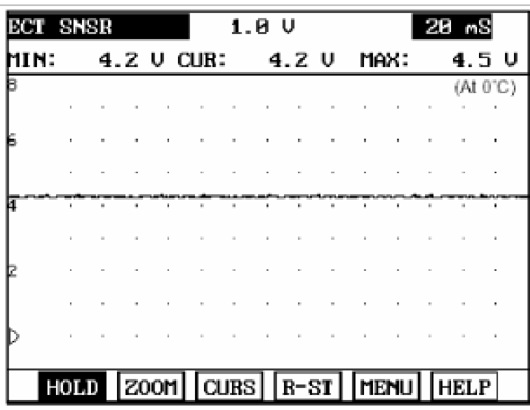
DTC DESCRIPTION

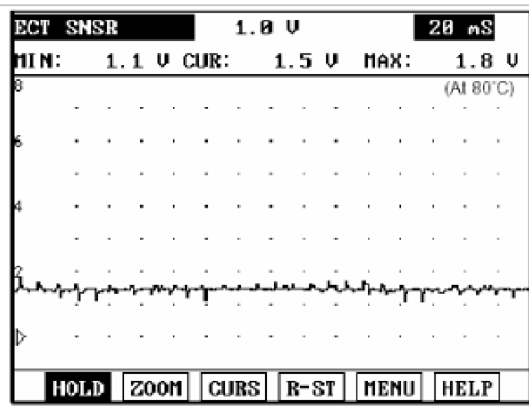
If the engine coolant temperature does not reach the specified value within the allocated period of time, the PCM determines that a malfunction exists and a DTC is stored. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The Thermostat Diagnostic monitors the time it takes for the coolant temperature to reach either the maximum temperature required to enable other diagnostics or the Thermostat Regulating Temperature, and compares it against a threshold in order to make a PASS/FAIL determination, provided airflow and idle conditions are met.	• Poor connection • Improper coolant level • Faulty Thermostat
Enable Conditions	• No disabling faults present • Coolant sensor within range • Thermostat target temp - Startup coolant temp ≥ 20°C(68°F) • Intake air temperature >-6.6641°C(20°F) • Engine Running	
Threshold value	• Undefaulted coolant temperature ≥ Threshold Value(°C) • Test Time = Threshold (second)	
Diagnosis Time	• Continuous (More than 5 second failure.)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA





The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

MONITOR SCANTOOL DATA

1. Engine "OFF"
2. Monitor Engine Coolant Temperature Sensor parameter on Current data

3. Is the measured ECTS parameter displayed within specifications ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Component Inspection" procedure

COMPONENT INSPECTION

1. Check Thermostat
   (1) Check cooling system coolant level and fill if low.
   (2) Check for a proper cooling system operation. Especially check that cooling and condenser fan working normally.
   (3) Remove the thermostat and check the following items:
      (1) Stuck or damaged
      (2) Verify the temperature at which the valve is open : 80 ~84°C(176~183.2°F)
   (4) Has a problem been found ?

   YES

   ▸ Substitute with a known - good Thermostat and check for proper operation. If the problem is corrected, replace Thermostat and go to "Verification of Vehicle Repair" proprocedure.

   NO

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   > NOTE
   >
   > There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

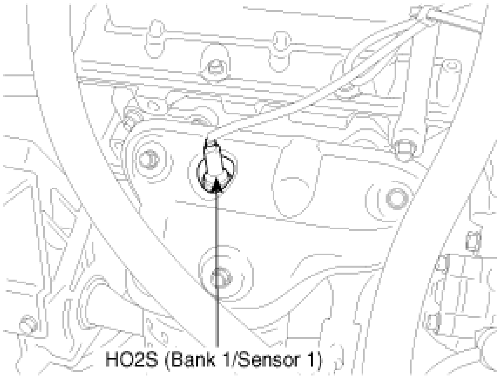
YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.04V for more than 12.5 sec., PCM sets P0131. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor Connection • Short to ground in harness • HO2S(B1/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B1/S1)< 0.04V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles

Fig. 1 : HO2S(B1S1) & Heater
Fig. 2 : HO2S(B1S2) & Heater
Fig. 3 : HO2S(B1S1) & HO2S(B1S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B1/S1)" status on the service data.

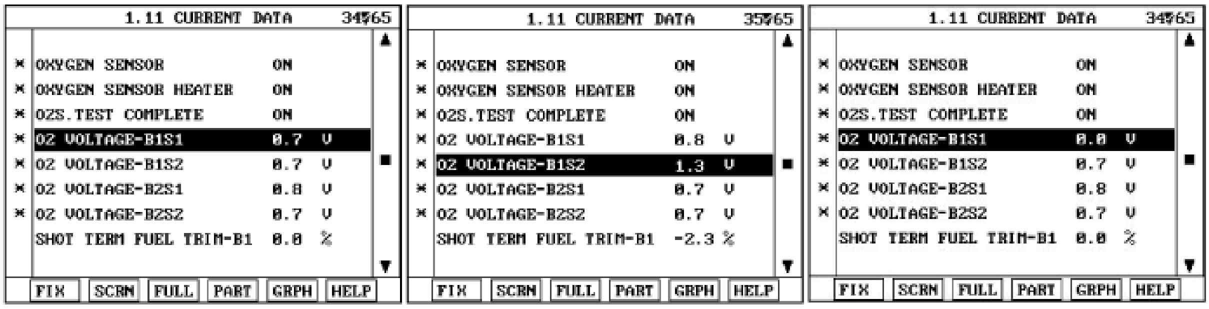

Fig. 1 Fig. 2 Fig. 3

Fig. 1 : Normal data
Fig. 2 : Open or Short to battery in HO2S(B1/S1)
Fig. 3 : Short to ground in HO2S(B1/S1)

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

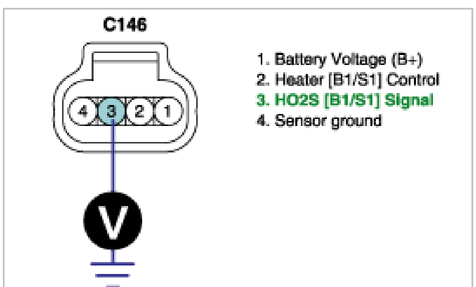
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B1/S1) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B1/S1) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check HO2S(B1/S1)
   (1) IG "OFF" and disconnect HO2S(B1/S1) connector.
   (2) Check HO2S(B1/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B1/S1) normal?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good HO2S(B1/S1) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure

   > **NOTE**
   >
   > There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

   YES

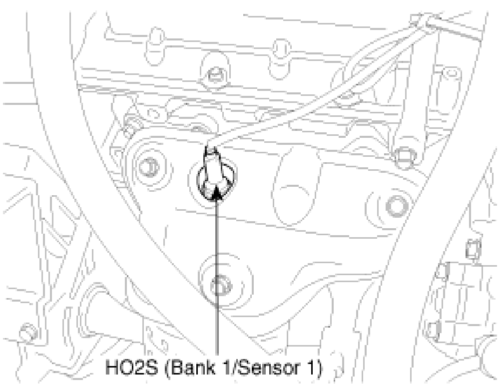
   ▸ Go to the applicable troubleshoooting procedure.

   NO

   ▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0132

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.

The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.

The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.

Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.

In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from O2 sensor every 15 sec. under detecting condition, if an output signal is below 1.3V for more than 12.5 sec., PCM sets P0132. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal high	• Poor Connection • Short to battery in harness • HO2S(B1/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B1/S1) >1.3V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles

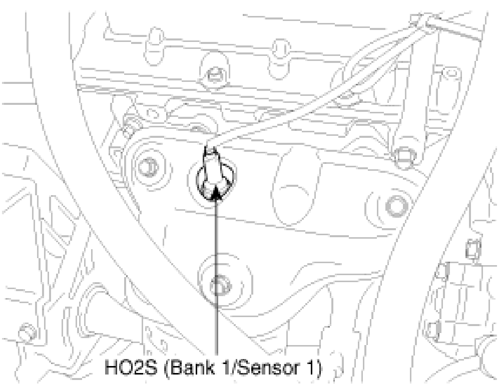
Fuel System > Troubleshooting > P0133

COMPONENT LOCATION



GENERAL DESCRIPTION

The HO2S is used to supply the PCM with information regarding the composition of the air/fuel mixture. The HO2S is positioned in the exhaust pipe ahead of the TWC. To measure the oxygen content, the HO2S requires a supply of ambient air as a reference. The HO2S produces a voltage that varies between 0.1V and 0.9V under normal operating conditions. The Powertrain Control Module (PCM) monitors this voltage and determines if the exhaust gas is lean or rich. If the voltage input at the PCM is under approx. 0.45V the exhaust is lean, and if the voltage input is over approx. 0.45V the exhaust is rich. The PCM constantly monitors the HO2S signal during closed loop operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary.
This oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to forceambient air into the sensor to maintain a more pure environment for comparison. In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture

for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.

DTC DESCRIPTION

The response time of an O2 sensor can be impacted by two factors: temperature and poisoning. Poisoning of the O2 sensor is the primary failure mode of O2 sensor response time. Poisoning can come from many sources: silicone from gaskets or even in the fuel, phosphorous from engine oil, carbon from operating in a cooler environment or lead from the fuel. Most poisoning failures have the potential to clear up after the source of the poisoning has been removed. However, sometimes the poisoning may be so severe that the damage is irreversible.
Checking output signals from HO2S under detecting condition, if an output signal is out of threshold, PCM sets P0133.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines O2 sensor functionality by checking its response rate	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• 1200 ≤ Engine RPM ≤ 4300 • 7.5g/s ≤ Air Flow ≤ 40g/s • Engine run time >60sec • Engine Coolant >70°C(158 °F) • No Decel Fuel Cut-Off Exit with Rich Bias Fueling • No torque Fuel Reduction in effect • No Disabling Faults • All of the conditions above met for more than 2 sec.	
Threshold value	• Switching counter lean to rich ≥ 13 • Switching counter rich to lean ≥ 13 • Response Lean Rich Transition Counter/Response Lean Rich Switch Counter < 29 • Response Rich Lean Transition Counter/Response Rich Lean Switch Counter < 35 • Response Rich Lean Average/Response Lean Rich Average >0.3809 • Response Rich Lean Average/Response Lean Rich Average< 3	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles

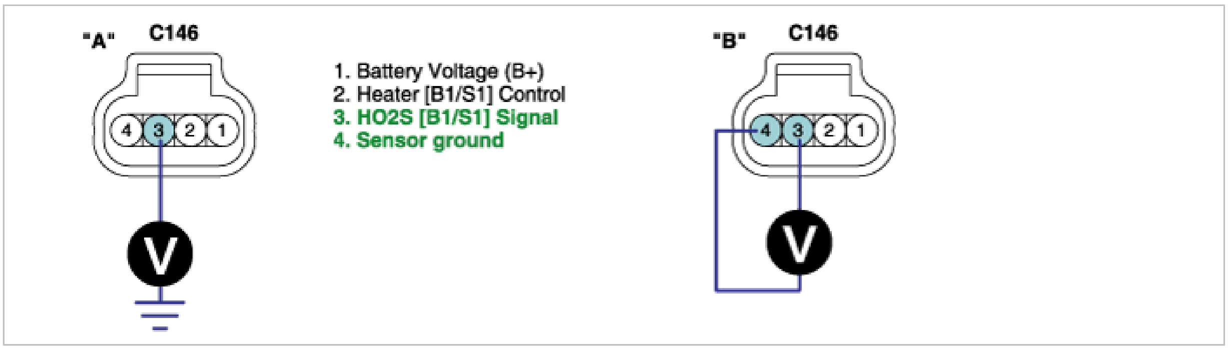
▸ Repair open in harness, and go to "Verification of Vehicle Repair" prcedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B1/S1) connector.
2. Measure voltage between terminal 3 of HO2S(B1/S1) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B1/S1) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" prcedure.

COMPONENT INSPECTION

1. Check HO2S(B1/S1)
   (1) IG "OFF" and disconnect HO2S(B1/S1) connector.
   (2) Check HO2S(B1/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B1/S1) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B1/S1) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

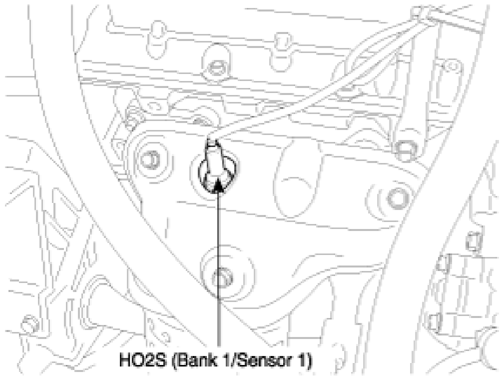
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0135

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

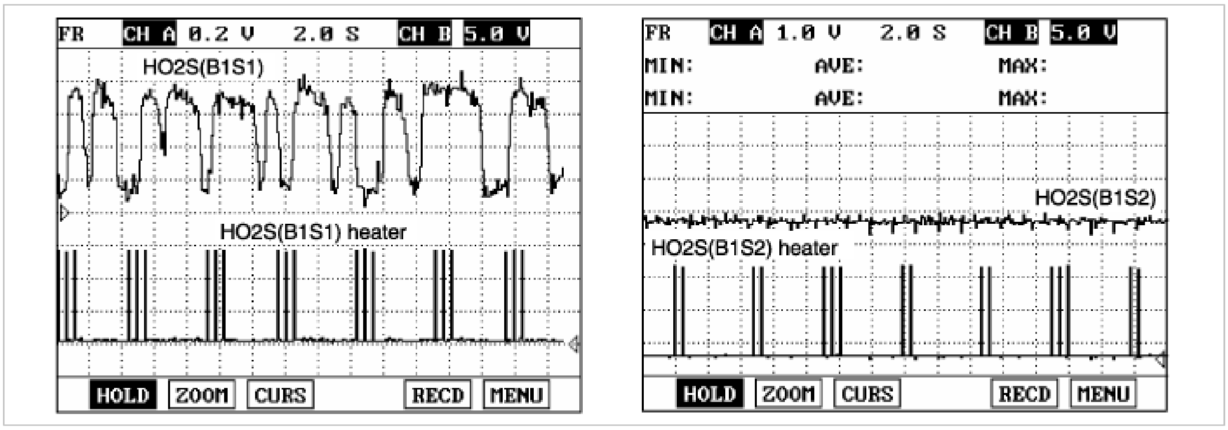
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater current is lower than threshold value for 2.5 seconds or over while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B1/S1) • PCM
Enable Conditions	• Ignition ON • Engine Running >60s • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < threshold value	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40°F), 13.5V	2.2 MAX

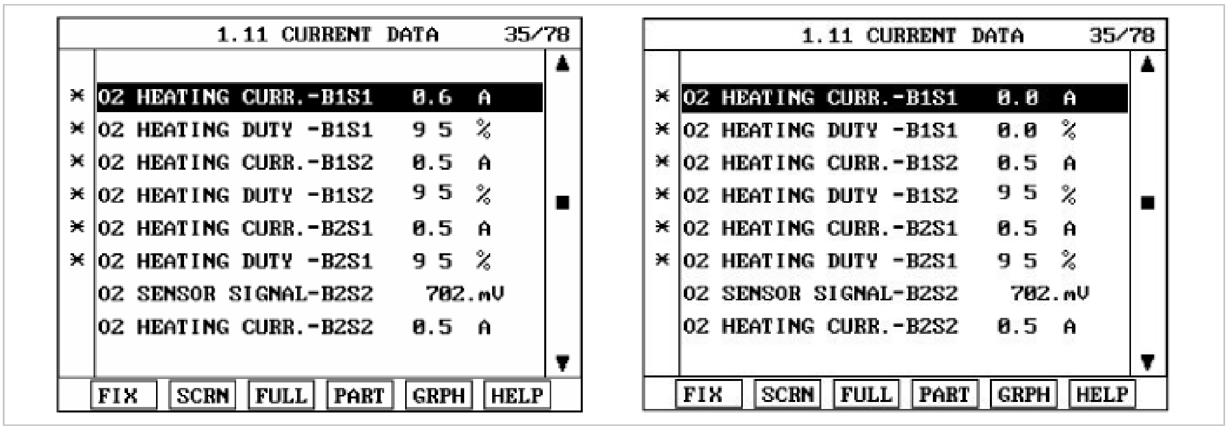
PCM

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "HO2S(B1/S1) Heater" status on the service data.



4. Is the "HO2S Heater(B1/S1)" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

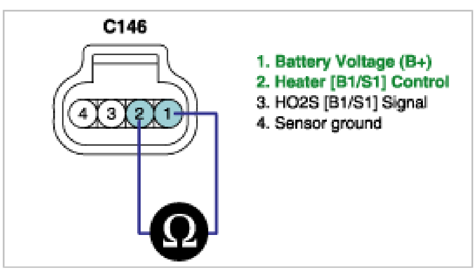
▸ Go to " Component Inspection " procedure.

COMPONENT INSPECTION

1. Check HO2S(B1/S1) Heater resistance
   (1) IG "OFF" and disconnect HO2S(B1/S1) connector
   (2) Measure resistance between terminal 1 and 2 of HO2S(B1/S1)(Component Side)

Specification :

Heater	
Resistance (Ω)	9.6 ± 1.5 at 21°C(69.8°F)



(3) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good HO2S(B1/S1) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

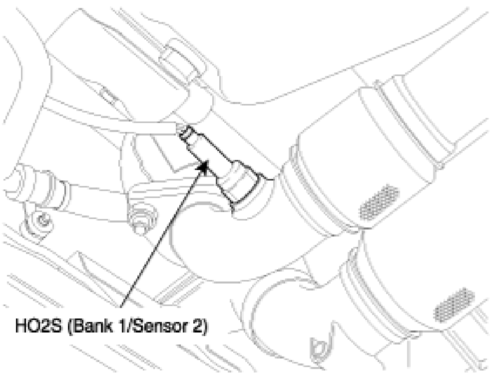
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0137

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B1/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B1/S2), it means the poor performance of catalytic converter.

DTC DESCRIPTION

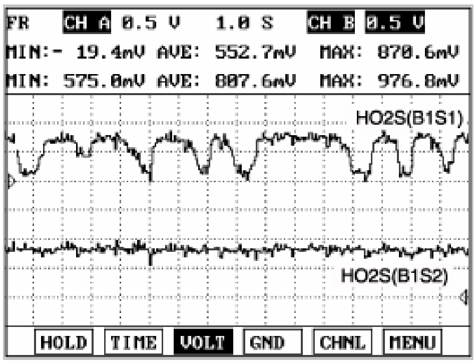
Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec. PCM sets P0137. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor Connection • Short to ground in harness • HO2S(B1/S2) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec	
Threshold value	• The voltage of HO2S(B1/S2)< 0.04V	

Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

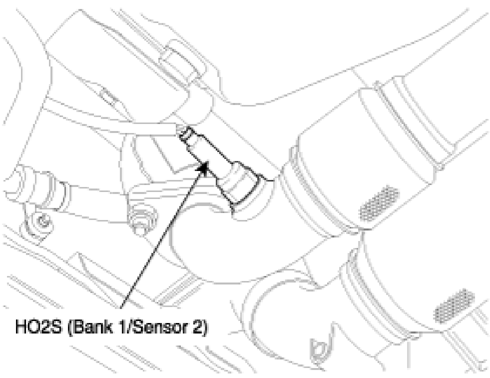
Fuel System > Troubleshooting > P0139

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter (warm-up catalytic converter) or in the rear exhaust pipe, which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

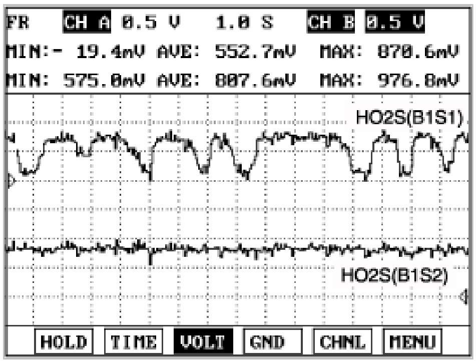
Since the Catalyst Diagnostic uses the oxygen sensors to determine the quality of the catalyst, and since an extended period of time with the rear oxygen sensor value steady is interpreted as a “good” catalyst, the Catalyst Diagnostic can be rendered inaccurate by an improperly functioning oxygen sensor. This diagnostic will extend the period of time that the Catalyst diagnostic requests a fuel shift. If the oxygen sensor still fails to respond after this extended time, then there is a fault with the sensor. Checking the Maximum time allowed between the front sensor response and the rear sensor response to the Stage1 or 2 fuel shift under detecting condition, if the fuel shift time is higher than 25sec, PCM determines a fault and sets DTC P0139. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if Rear O2 Sensor is acceptable for Idle Catalyst Monitor use	
Enable Conditions	• If Idle Catalyst Monitor Diagnostic is enabled HO2S Bank 1 Sensor 2 Response Diagnostic Enable Criteria Met	

Threshold value	• Maximum time allowed between the front sensor response and the rear sensor response to the Stage1(Forced to lean) ICMD(Idle Catalyst Monitor Diagnostic)fuel shift ≥ 25sec • Maximum time allowed between the front sensor response and the rear sensor response to the Stage 2(Forced to rich) ICMD(Idle Catalyst Monitor Diagnostic) fuel shift ≥ 25sec	• Poor connection • Faulty HO2S • Faulty PCM
Diagnosis Time	• -	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

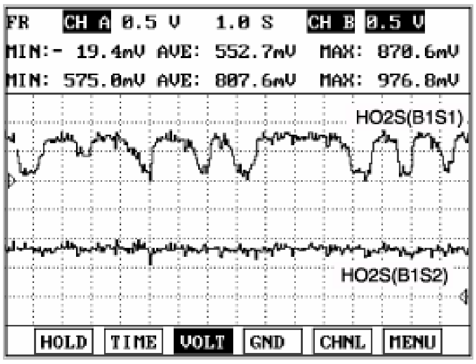
SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

3. Monitor "HO2S(B1/S2)" item on the service data.

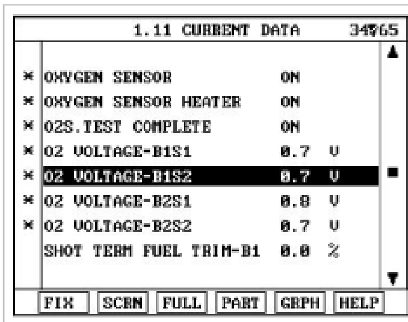

Fig. 1

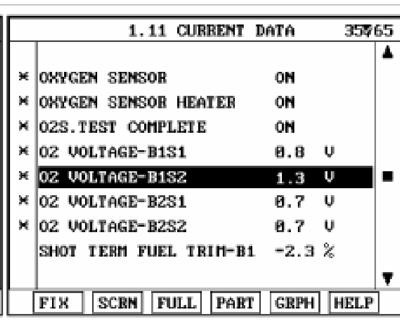

Fig. 2

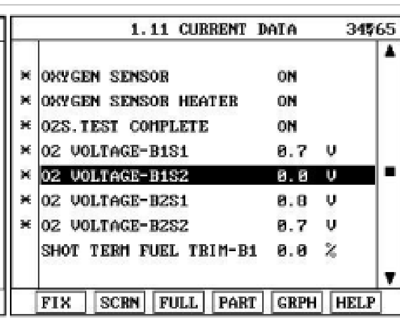

Fig. 3

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

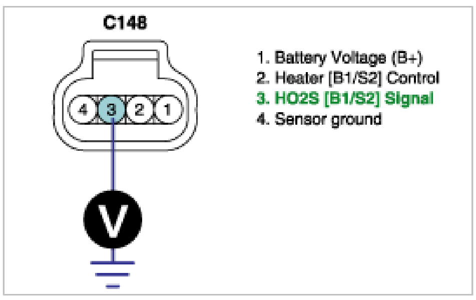
NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B1/S2) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 3 of HO2S(B1/S2) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Ground Circuit Inspection" procedure.

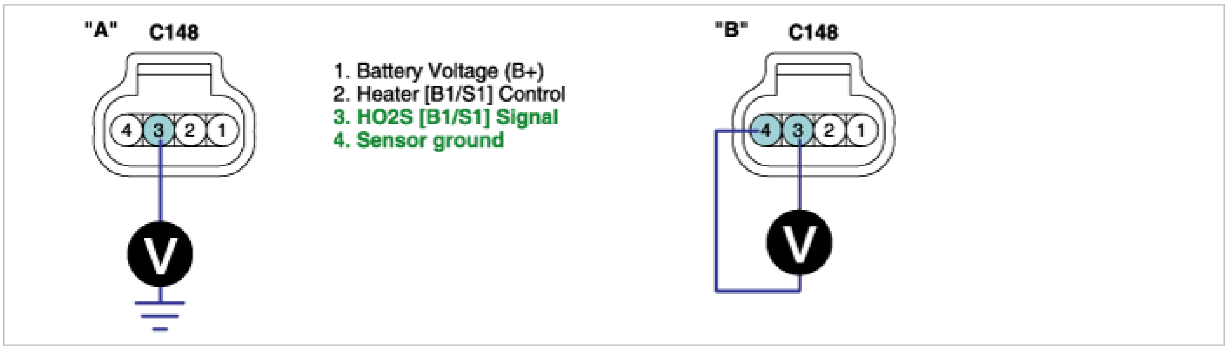
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B1/S2) connector.
2. Measure voltage between terminal 3 of HO2S(B1/S2) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B1/S2) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" prcedure.

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   Visually/physically inspect following items:
   A. Inspect the Rear HO2S for Contaminated, deteriorated or aged Rear HO2S
   B. If contamination is evident on the HO2S, replace contaminated sensor
2. Is the HO2S(B1/S2) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B1/S2) and check for proper operation. If the problem is corrected, replace HO2S (B1/S1) and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

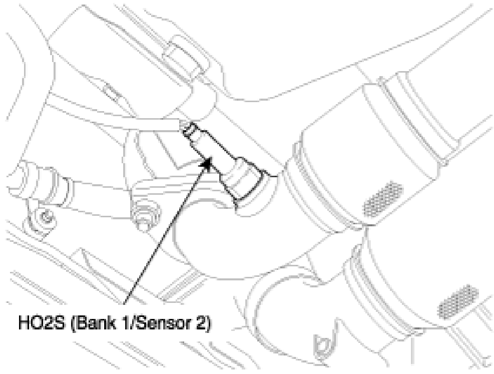
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0141

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B1/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B1/S2), it means the poor performance of catalytic converter.

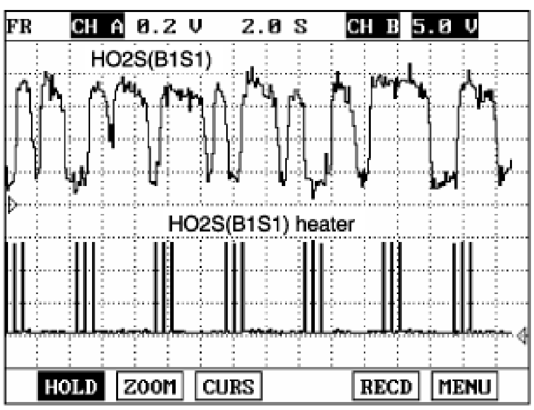
DTC DESCRIPTION

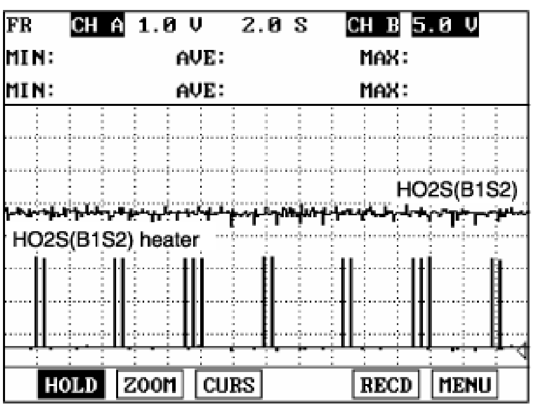
The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B1/S2) • PCM
Enable Conditions	• Ignition ON • Engine Running >60s • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < 0.02A	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA





The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after

engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40 °F), 13.5V	2.2 MAX

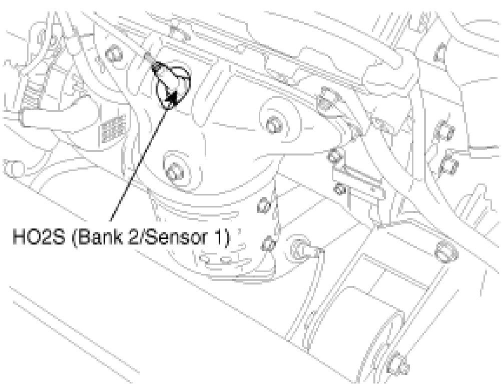
Fuel System > Troubleshooting > P0151

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec., PCM sets P0151. MI (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor connection • Short to ground in harness • HO2S(B2/S1) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30sec • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B2/S1)< 0.04V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA

Fig. 1 : HO2S(B2S1) & Heater
Fig. 2 : HO2S(B2S2) & Heater
Fig. 3 : HO2S(B2S1) & HO2S(B2S2)

After warming-up, if accelerator pedal is released suddenly around 4000rpm, the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off for the moment. Conversely, if suddenly accelerator pedal is depressed, HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will switch from lean to rich normally.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

※In case of open circuit, voltage is set to 0.45V(Pumping current OFF) or 3.5V(Pumping current ON)

5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

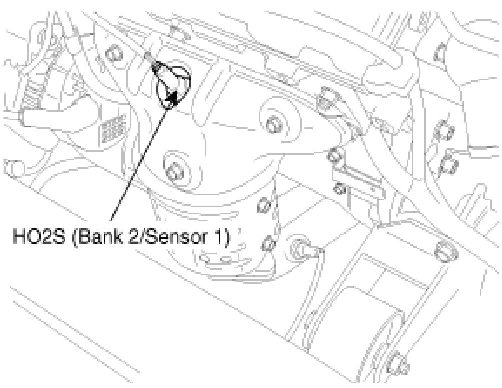
Fuel System > Troubleshooting > P0153

COMPONENT LOCATION



GENERAL DESCRIPTION

The HO2S is used to supply the PCM with information regarding the composition of the air/fuel mixture. The HO2S is positioned in the exhaust pipe ahead of the TWC. To measure the oxygen content, the HO2S requires a supply of ambient air as a reference. The HO2S produces a voltage that varies between 0.1V and 0.9V under normal operating conditions. The Powertrain Control Module (PCM) monitors this voltage and determines if the exhaust gas is lean or rich. If the voltage input at the PCM is under approx. 0.45V the exhaust is lean, and if the voltage input is over approx. 0.45V the exhaust is rich. The PCM constantly monitors the HO2S signal during closed loop operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary.
This oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to forceambient air into the sensor to maintain a more pure environment for comparison. In either

case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V. Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.

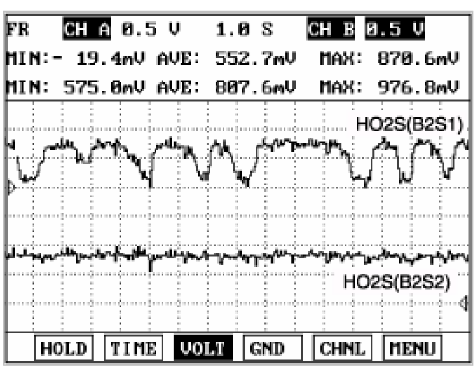
DTC DESCRIPTION

The response time of an O2 sensor can be impacted by two factors: temperature and poisoning. Poisoning of the O2 sensor is the primary failure mode of O2 sensor response time. Poisoning can come from many sources: silicone from gaskets or even in the fuel, phosphorous from engine oil, carbon from operating in a cooler environment or lead from the fuel. Most poisoning failures have the potential to clear up after the source of the poisoning has been removed. However, sometimes thepoisoning may be so severe that the damage is irreversible. Checking output signals from HO2S under detecting condition, if an output signal is out of threshold, PCM sets P0153.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines O2 sensor functionality by checking its response rate	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• 1200 ≤ Engine RPM ≤ 4300 • 40g/s ≤ Air Flow ≤ 7.5g/s • Engine run time >60sec • Engine Coolant >70°C(158 °F) • No DFCO(Decel Fuel Cut-Off) Exit with Rich Bias Fueling • No TORQ Fuel Reduction in effect • No Disabling Faults • All of the conditions above met for more than 2sec	
Threshold value	• Switching counter lean to rich ≥ 13 • Switching counter rich to lean ≥ 13 • Response Lean Rich Transition Counter/Response Lean Rich Switch Counter < 29 • Response Rich Lean Transition Counter/Response Rich Lean Switch Counter < 35 • Response Rich Lean Average/Response Lean Rich Average > 0.3809 • Response Rich Lean Average/Response Lean Rich Average < 3	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



After warming-up, Releasing accellerator pedal suddenly around 4000rpm the HO2S signal reading will be lower than 200mV resulting from Fuel cut-off. Conversely, sudden depressing accellerator pedal HO2S signal reading will be around 0.6V ~1.0V. At idle, HO2S signal will be switching between lean(0.12 ~ 0.74V) to rich(above 0.75V) normally.

SPECIFICATION

	Response Time (70% Duty at 10Hz)

HO2S	lean to rich(Less than 0.65sec) rich to lean(Less than 0.8sec)

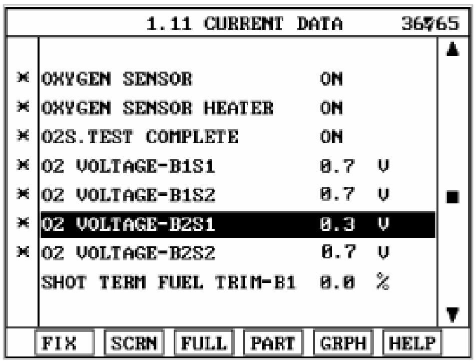
MONITOR SCANTOOL DATA

1. Connect Scantool & Engine "ON"
2. Warm up the engine to normal operating temperature.
3. Monitor HO2S voltage(B2/S1) parameter on scantool

Specification : Voltage will vary from 0.1 to 0.9 V



4. Is the HO2S parameter displayed within specifications ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Component Inspection" procedure

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   (1) Visually/physically inspect following items:
   - Inspect the front HO2S for Contaminated, deteriorated or aged Front HO2S
   - If contamination is evident on the HO2S, replace contaminated sensor

   (2) Is the HO2S visually / physically O.K ?

   YES

   ▸ Go to "Check Performance of H02S" as follows

   NO

   ▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair" procedure.

2. Check performance of HO2S
   (1) Connect scantool & Engine "ON"

   (2) Warm-up the engine to normal engine temperature.

   (3) Monitor signal waveform of HO2S with scantool

   Specification : Response times :

HO2S	Response Time (70% Duty at 10Hz)
	lean to rich(Less than 0.65sec) rich to lean(Less than 0.8sec)

   (4) Is the sensor signal switching properly ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

▸ Substitute with a known - good HO2S and check for proper operation. If the problem is corrected, replace HO2S and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

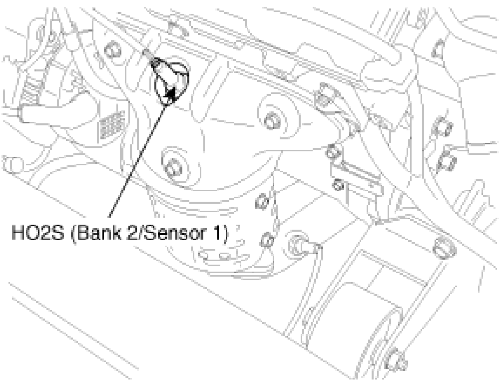
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0154

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

DTC DESCRIPTION

Checking output signals from HO2S every 90 sec. under detecting condition, if an output signal indicating open in the circuit lasts for more than 76.5 sec., PCM sets P0154. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Open	• Poor connection • Open in harness • HO2S(B2/S1) • PCM
Enable Conditions		• No sensor cooled status • The minimum airflow ≥ 2g/s • The battery voltage ≥ 10V • Engine running state >30 sec. • Coolant temperature ≥ 60°C(140°F)	
Threshold value	Case 1	• At pumping current ON • 1.2V ≤ Voltage of HO2S ≤ 3.9V	
	Case 2	• At pumping current OFF • 0.415V ≤ Voltage of HO2S ≤ 0.515V	
Diagnosis Time		• Continuous (more than 76.5 sec.failure for every 90 sec.test)	
MIL On Condition		• 2 driving cycles	

SIGNAL WAVEFORM AND DATA

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

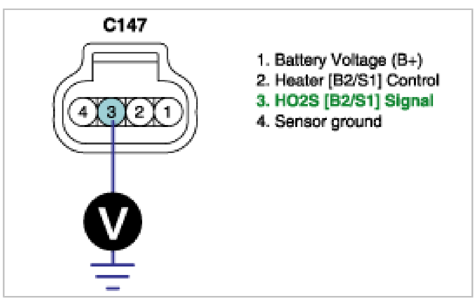
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B2/S1) connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between termianl 3 of HO2S(B2/S1) harness connector and chassis ground.

Specification :
Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Ground circuit inspection" procedure.

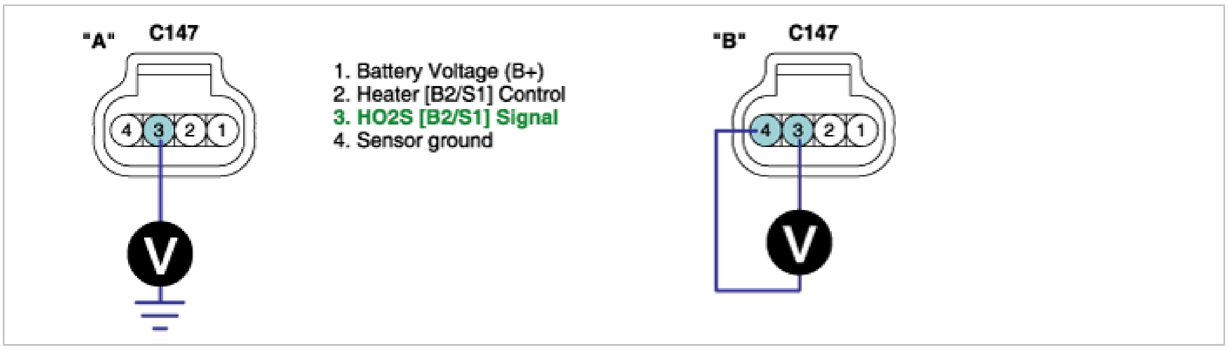
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" prcedure.

GROUND CIRCUIT INSPECTION

1. IG "ON" and disconnect HO2S(B2/S1) connector.
2. Measure voltage between terminal 3 of HO2S(B2/S1) harness connector and chassis ground.
3. Measure voltage between terminals 3 and 4 of HO2S(B2/S1) harness connector.

Specification : Voltage difference between measurement "A" and "B" is below 200mV.



4. Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" prcedure.

COMPONENT INSPECTION

1. Check HO2S(B2/S1)
   (1) IG "OFF" and disconnect HO2S(B2/S1) connector.
   (2) Check HO2S(B2/S1) for damage or contamination caused by a foreign substance.
   (3) Is the HO2S(B2/S1) normal?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good HO2S(B2/S1) and check for proper operation. If the problem is corrected, replace HO2S (B2/S1) and go to "Verification of Vehicle Repair" procedure.

   NOTE

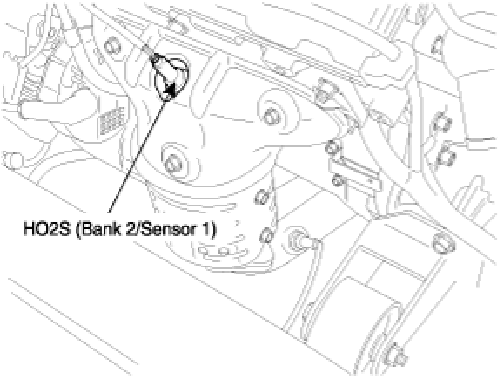
Fuel System > Troubleshooting > P0155

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to control emissions of the CO, HC and NOx components of the exhaust gas, heated oxygen sensor (HO2S), mounted on the front side and rear side of catalytic converter, detects the oxygen content in the exhaust gas. The front HO2S signal is used to control air/fuel ratio (closed loop fuel control) and the rear HO2S signal is used to monitor front HO2S and catalyst for proper operation.
The HO2S requires a minimum temperature to operate properly and provide a closed loop fuel control system. The HO2S contains the heater element to reduce its warming-up time and ensure its performance during all driving conditions.
The oxygen sensor generates a voltage that indicates the difference between the oxygen content of the exhaust stream and the oxygen content of ambient air. When the exhaust stream is “rich,” there is more oxygen in the ambient air than in the exhaust stream, so the voltage will be higher.
Some oxygen sensor varieties use a “bias” voltage to achieve better resolution of the exhaust stream signal. Some oxygen sensor varieties use a “pumping circuit” to force ambient air into the sensor to maintain a more pure environment for comparison.
In either case, a cold sensor will tend to indicate voltage values near the open circuit value. For the “pumping current” sensors, this open circuit value can be near 3.5 V.Since the Fuel control logic would incorrectly consider this reading to indicate a very rich mixture for an extended time, the fuel control logic can not use the oxygen sensor reading under such conditions.
The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

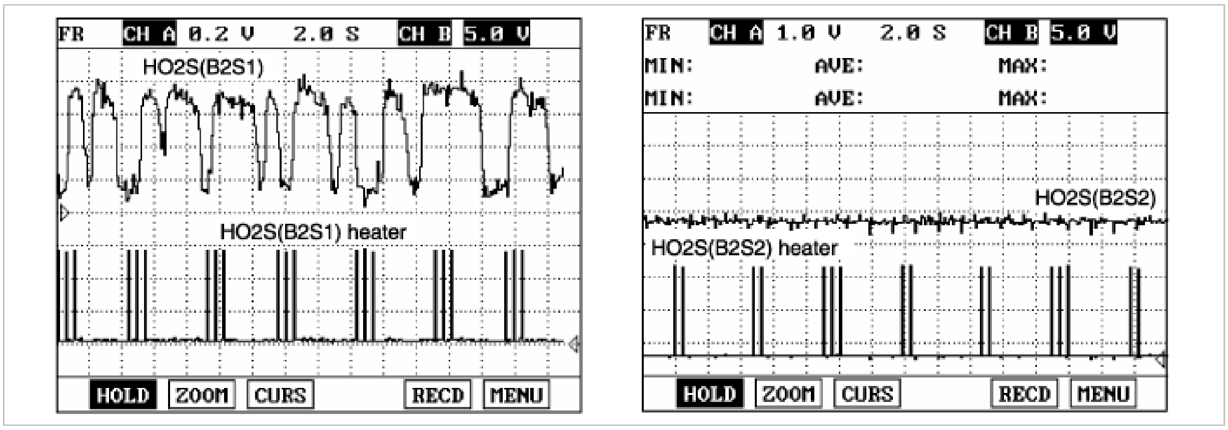
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts. If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor Connection • Contact Resistance • HO2S(B2/S1) • PCM
Enable Conditions	• Ignition ON • Engine Running >60sec • Heater Duty Cycle >0.4% • Max. Duty Cycle - Min. Duty Cycle< 0.05% • Delay Time ≥ 5sec	
Threshold value	• Filtered O2 Heater Current< threshold value	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

For reference only

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.25 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40 °F), 13.5V	2.2 MAX

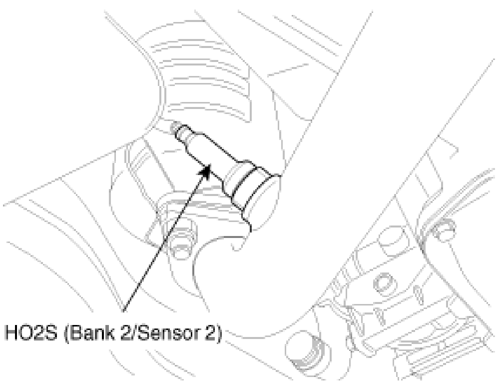
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0157

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B2/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B2/S2), it means the poor performance of catalytic converter.

DTC DESCRIPTION

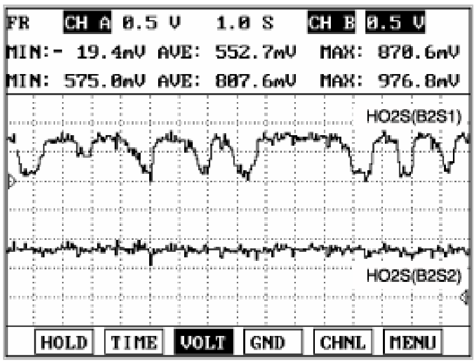
Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is below 0.05V for more than 12.5 sec., PCM sets P0157. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor connection • Short to ground in harness • HO2S(B2/S2) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B2/S2)< 0.04V	

Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

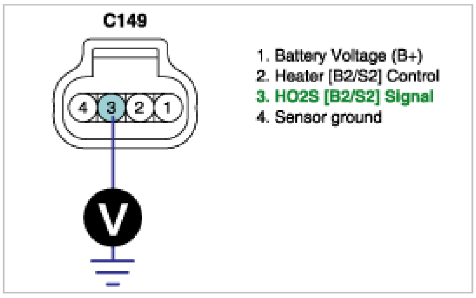
▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect HO2S(B2/S2)
2. IG "ON"
3. Measure voltage between terminal 3 of HO2S(B2/S2) harness connector and chassis ground.

Specification : Approx. 3.5V - when pumping current is ON
Approx. 0.45V - when pumping current is OFF



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visual Inspection of HO2S
   Visually/physically inspect following items:
   A. Inspect the Rear HO2S for Contaminated, deteriorated or aged Rear HO2S
   B. If contamination is evident on the HO2S, replace contaminated sensor
2. Is the HO2S(B2/S2) normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

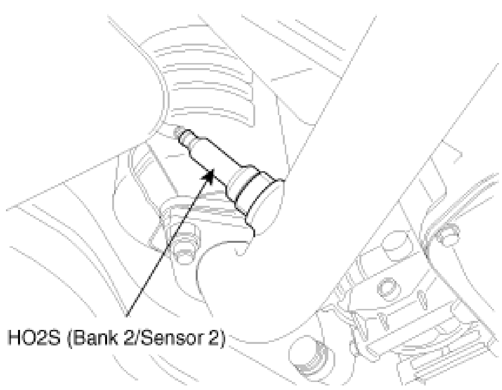
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0158

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B2/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B2/S2), it means the poor performance of catalytic converter.

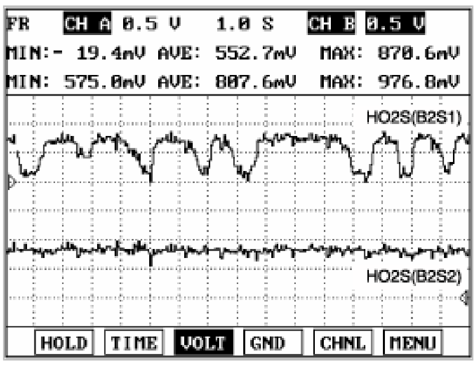
DTC DESCRIPTION

Checking output signals from HO2S every 15 sec. under detecting condition, if an output signal is above 1.3V for more than 12.5 sec, PCM sets P0158. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal low	• Poor connection • Short to battery in harness • HO2S(B2/S2) • PCM
Enable Conditions	• Battery voltage ≥ 10V • The minimum airflow ≥ 2g/s • Engine running state ≥ 30 sec. • The coolant temperature ≥ 60°C(140°F) • The feed-back control (the closed loop) state • No fuel-cut state • Above conditions are met >5 sec.	
Threshold value	• The voltage of HO2S(B2/S2) > 1.3V	
Diagnosis Time	• Continuous (more than 12.5 sec. failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The amplitude of the signal output of the rear HO2S is small compared to the front HO2S because the rear HO2S detects emission gas purified by the catalytic converter. This is the normal signal waveform of the rear HO2S at idle.

SPECIFICATION

Air/fuel mixture	Voltage(V)
Rich	0.75 ~ 1V
Lean	0 ~ 0.12V

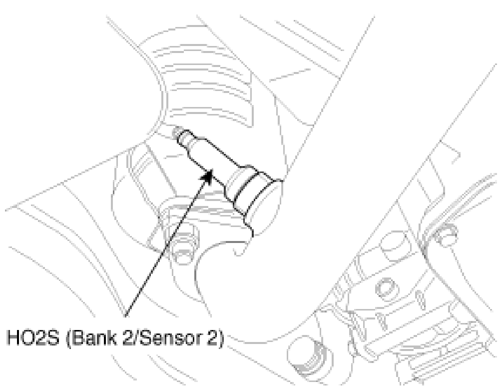
Fuel System > Troubleshooting > P0159

COMPONENT LOCATION



GENERAL DESCRIPTION

The rear heated oxygen sensor is mounted on the rear side of the Catalytic Converter (warm-up catalytic converter) or in the rear exhaust pipe, which is able to detect the catalyst efficiency. The rear heated oxygen sensor (HO2S) produces a voltage between 0V and 1V. This rear heated oxygen sensor is used to estimate the oxygen storage capability. If a catalyst has good conversion properties, the oxygen fluctuations are smoothed by the oxygen storage capacity of the catalyst. If the conversion provided by the catalyst is low due to aging, poisoning or misfiring, then the oxygen fluctuations are similar to signals from the front oxygen sensor.

DTC DESCRIPTION

Since the Catalyst Diagnostic uses the oxygen sensors to determine the quality of the catalyst, and since an extended period of time with the rear oxygen sensor value steady is interpreted as a “good” catalyst, the Catalyst Diagnostic can be rendered inaccurate by an improperly functioning oxygen sensor. This diagnostic will extend the period of time that the Catalyst diagnostic requests a fuel shift. If the oxygen sensor still fails to respond after this extended time, then there is a fault with the sensor. Checking the Maximum time allowed between the front sensor response and the rear sensor response to the Stage1 or 2 fuel shift under detecting condition, if the fuel shift time is higher than 25sec, PCM determines a fault and sets DTC P0159. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if Rear O2 Sensor is acceptable for Idle Catalyst Monitor use	• Poor connection • Faulty HO2S • Faulty PCM
Enable Conditions	• If Idle Catalyst Monitor Diagnostic is enabled HO2S Bank 1 Sensor 2 Response Diagnostic Enable Criteria Met	
Threshold value	• Maximum time allowed between the front sensor response and the rear sensor response to the Stage 1(Forced to rich) ICMD(Idle Catalyst Monitor Diagnostic)fuel shift ≥ 25sec • Maximum time allowed between the front sensor response and the rear sensor response to the Stage 2(Forced to lean) ICMD(Idle Catalyst Monitor Diagnostic) fuel shift ≥ 25sec	
Diagnosis Time	• -	
MIL On Condition	• 2 Driving Cycles

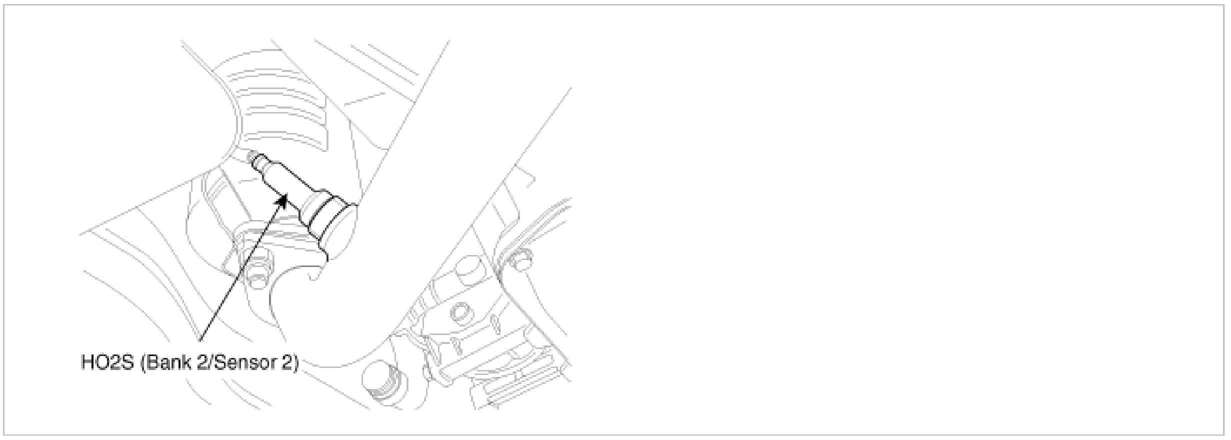
Fuel System > Troubleshooting > P0161

COMPONENT LOCATION



GENERAL DESCRIPTION

HO2S(B2/S2) is in the back of Catalytic Converter to check the proper operation of catalyst. As Exhaust gas already passed through catalyst, oxygen density in it is within specific range. If the oxygen density changes in accordance with HO2S(B2/S2), it means the poor performance of catalytic converter.

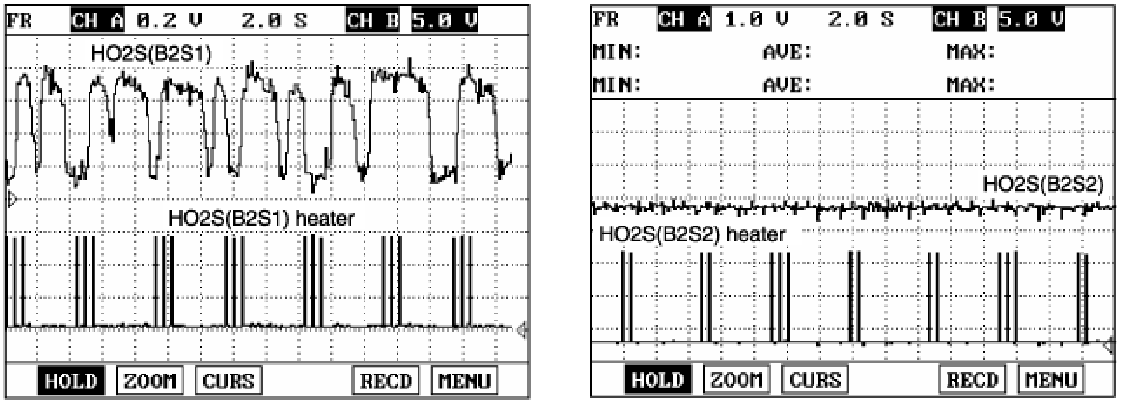
DTC DESCRIPTION

The O2 Heater diagnostic compares the current that is passing through the O2 Heater to a low limit. When the current is too low, the O2 Heater is considered failed.A failed O2 Heater will have an affect on vehicle emissions, especially on cold starts. The O2 Heater allows the O2 Sensor to work properly more quickly after the engine starts.If the PCM detects heater output voltage is lower than threshold value for 5 seconds while enable condition is met PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Compares the current that is passing through the O2 Heater to a low limit	• Poor connection • Contact Resistance • HO2S(B2/S2) • PCM
Enable Conditions	• Ignition ON • Engine Running > 60s • Heater Duty Cycle > 0.4% • Max. Duty Cycle - Min. Duty Cycle < 0.05% • Delay Time ≥ 5s	
Threshold value	• Filtered O2 Heater Current < 0.02A	
Diagnosis Time	• Continuous (More than 2.5 second failure for every 5 second test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The HO2S requires a minimum temperature to provide a closed loop fuel control system. So the HO2S contains a heater element to reduce its warm-up time and ensure its performance during all driving conditions. The HO2S heater is controlled ON after

engine start except for Cold condition and high speed accelleration. The PCM controls this heater element by duty cycle. The main relay supplies voltage to the heater and the PCM provides a ground circuit for activating the heater.

SPECIFICATION

(For reference only)

Condition	Current(A)
Heater Current at 13.5V, 450°C(842°F) Exhaust	0.52 ± 0.1
Heater In-rush Current at 21°C(69.8°F), 13.5V	1.7 MAX
Heater In-rush Current at -40°C(-40°F), 13.5V	2.2 MAX

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good HO2S(B2/S2) and check for proper operation. If the problem is corrected, replace HO2S (B2/S2) and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0171

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. The DTC relevant to fuel trim will be set when the amount reaches excessive levels because of a lean or rich condition.

DTC DESCRIPTION

Checking air-fuel ratio correction value every 0.75 sec. under detecting condition, if an value is within detecting condition for more than 0.3 sec., PCM sets P0171. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

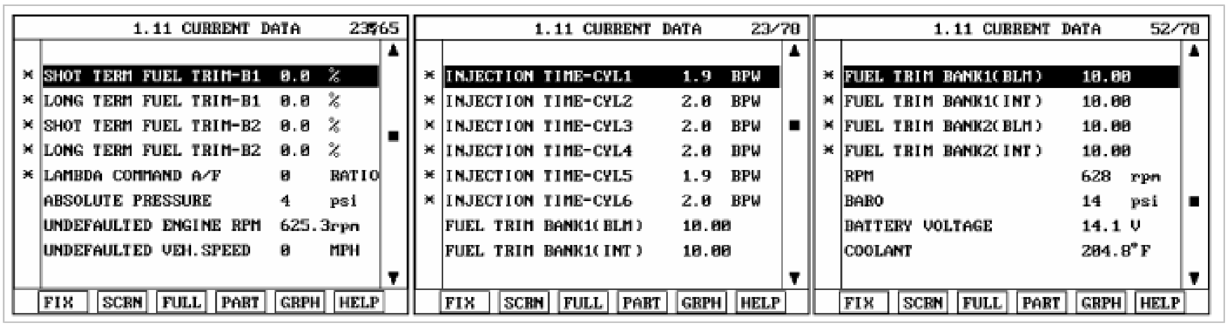
DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Fuel Trim Limits Exceeded	• Poor connection • Relevant sensor/actuator • Air leakage • PCM
Enable Conditions	• 550rpm ≤ Engine speed ≤ 4000rpm • 60°C(140°F) ≤ Engine coolant temperature ≤ 115°C(239°F) • -10°C(14°F) ≤ Intake air temperature ≤ 60°C(140°F) • 0° ≤ Throttle position ≤ 80° • 25kPa ≤ Engine load ≤ 90kPa • 1.5g/s ≤ Intake air flow ≤ 80g/s • Barometric pressure ≥ 72kPa • Vehicle speed ≤ 130km/h • System voltage ≥ 11V • Feed-back control state • No other diagnostic fault	
Threshold value	• Lean limit average < 0.8 (Average of short term fuel trim) and < 1.2(Average of long term fuel trim)	
Diagnosis Time	• Continuous (More than 0.3 second failure for every 0.75 second test)	

MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. Warm -up the engine to normal operating temperature.
3. Monitor "Sensor/actuator related to fuel system(HO2S, MAFS, MAPS, TPS, ECTS, PSCA, Injector, and so on)" items on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found ?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check air leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system for following items
   - ▸ Vacuum hoses for splits, kinks and improper connections.
   - ▸ Throttle body gasket
   - ▸ Gasket between intake manifold and cylinder head
   - ▸ Seals between intake manifold and fuel injectors
   - ▸ Exhaust system between HO2S and three way catalyst for air leakage

   (2) Has a problem found in this procedure?

   YES

   ▸ Repair or replace it which has a problem, and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check the fuel line" as follows

2. Check the fuel line
   (1) Check the fuel line for following items
   - ▸ Connector connection state
   - ▸ Damage/ connection state for vacuum hoses connected to fuel line
   - ▸ Bent/ pressed/ twisted fuel line or fuel leakage

(2) Has a problem found in this procedure?

YES

▸ Repair or replace it which has a problem, and go to " Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check fuel pressure" as follows

3. Check fuel pressure

> **NOTE**
>
> - Be cautious that Fuel is explosive and an empty fuel tank can still contain explosive gases.When working on fuel system make sure to supply adequate ventilationto the work area. Do not smoke, and keep sparks and open flames away.
> - The fuel system remains under pressure when the engine is not running. Release fuel system pressure before disconnecting any fuel line to reduce the chance of presonal injury or fire damage to vehicle components.

(1) IG "OFF" and disconnect Fuel Pump Relay in Junction Box.

(2) Start-up and wait until it stops itself.

(3) IG "OFF" and connect Fuel Pump Relay.

(4) Install the fuel pressure gauge to the delivery pipe with the fuel pressure gauge adaptor.

(5) Activate the fuel pump, and with fuel pressure applied, check that there is no fuel leakage from the pressure gauge or connection part.

(6) Disconnect the vacuum hose from the pressure regulator, and plug the hose end.

(7) Measure the fuel pressure at idle.

Specification : 374.6 ~ 384.4 kPa(3.82 ~ 3.92 kg/cm², 54.3 ~ 55.8 psi)

(8) Is the measured fuel pressure within specifications ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or replace according to the below table. And then, go to " Verification of Vehicle Repair"procedure.

Condition	Possible Cause
Fuel Pressure is too low	Fuel filter,fuel pressure regulator, in-tank fuel hose or the fuel pump
Fuel Pressure is too high	Fuel pressure regulator, hose or pipe
No different fuel pressure when vacuum hose is connected or not	The vacuum hose or the nipple

COMPONENT INSPECTION

1. Check PCV

(1) IG "OFF" and remove PCV valve from cylinder head

(2) With engine idling, block PCV valve and confirm that vacuum is felt.

(3) Insert thin stick into the screwed PCV valve and verify that the plunger is moving.

(4) Is the PCV valve normally moving?

YES

▸ Go to "Check PCSV as follows.

NO

▸ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV

(1) IG "OFF" and disconnect PCSV and vacuum hose.

(2) Connect hand-vacuum gage with PCSV and supply vacuum to it.

(3) Is the vacuum maintained ?

YES

▸ Go to " Check injector" as follows.

NO

▸ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF" and disconnect injector.

   (2) Check it for blocking caused by any foreign substance.

   (3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)
   Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω

   (4) Is the measured resistance within specification?

YES

▸ Go to "Check sensor/actuator related to fuel system" as follows

NO

▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on)
   (Refer to each DTC diagnostic procedure)

   (2) Are all of these items normal ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0172

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. The DTC relevant to fuel trim will be set when the amount reaches excessive levels because of a lean or rich condition.

DTC DESCRIPTION

Checking air-fuel ratio correction value every 0.75 sec. under detecting condition, if an value is within detecting condition for more than 0.3 sec., PCM sets P0172. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Fuel Trim Limits Exceeded	• Poor connection • Relevant sensor/actuator • Blocking of Intake system • Fuel leakage in injector • Improper fuel line pressure • PCM

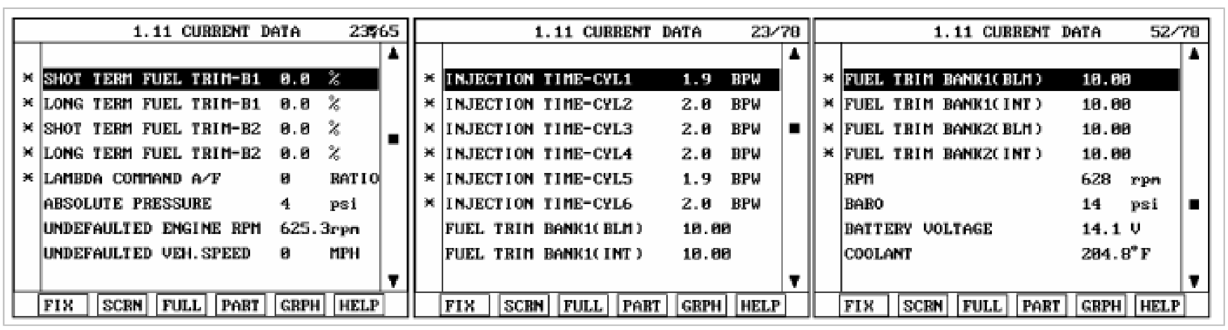
Threshold value	• Lean limit average >1.2 (Average of short term fuel trim) and< 0.8(Average of long term fuel trim)	
Diagnosis Time	• Continuous (More than 0.3 second failure for every 0.75 second test)	
MIL On Condition	• 2 Driving Cycles	

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. Warm -up the engine to normal operating temperature.
3. Monitor "Sensor/actuator related to fuel system(HO2S, MAFS, MAPS, TPS, ECTS, PSCA, Injector, and so on)" items on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by

interference from other electrical systems, and mechanical or chemical damage.

2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure.

SYSTEM INSPECTION

1. Check blocking of intake system
   (1) Visually/physically inspect the blocking in intake system for following items
   - ▸ Throttle body gasket and damage
   - ▸ Clogging of Air cleaner
   - ▸ Blocking in intake manifold and injector caused by any foreign substance

   (2) Has a problem found?

   YES

   ▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to " Check fuel pressure" as follows.

2. Check fuel pressure

> **NOTE**
>
> - Be cautious that Fuel is explosive and an empty fuel tank can still contain explosive gases.When working on fuel system make sure to supply adequate ventilationto the work area. Do not smoke, and keep sparks and open flames away.
> - The fuel system remains under pressure when the engine is not running. Release fuel systempressure before disconnecting any fuel line to reduce the chance of presonal injury orfire damage to vehicle components.

   (1) IG "OFF" and disconnect Fuel Pump Relay in Junction Box.

   (2) Start-up and wait until it stops itself.

   (3) IG "OFF" and connect Fuel Pump Relay.

   (4) Install the fuel pressure gauge to the delivery pipe with the fuel pressure gauge adaptor.

   (5) Activate the fuel pump, and with fuel pressure applied, check that there is no fuel leakage from the pressure gauge or connection part.

   (6) Disconnect the vacuum hose from the pressure regulator, and plug the hose end.

   (7) Measure the fuel pressure at idle.

   Specification : 374.6 ~ 384.4 kPa(3.82 ~ 3.92 kg/cm², 54.3 ~ 55.8 psi)

   (8) Is the measured fuel pressure within specifications ?

   YES

   ▸ Go to "Component Inspection" procedure.

   NO

   ▸ Repair or replace according to the below table. And then, go to " Verification of Vehicle Repair"procedure.

Condition	Possible Cause
Fuel Pressure is too low	Fuel filter,fuel pressure regulator, in-tank fuel hose or the fuel pump
Fuel Pressure is too high	Fuel pressure regulator, hose or pipe
No different fuel pressure when vacuum hose is connected or not	The vacuum hose or the nipple

3. Check fuel leakage in injector
   (1) IG "OFF" after checking the fuel pressure test.

   (2) Stop engine and check for a change in the fuel pressure gauge reading for 5 minutes.

Specification : After engine stops, fuel gauge reading is maintained for 5 minutes.

(3) Is the fuel gauge reading within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ There is a fuel leakage in injector. Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check PCV
   (1) IG "OFF" and remove PCV valve from cylinder head

   (2) With engine idling, block PCV valve and confirm that vacuum is felt.

   (3) Insert thin stick into the screwed PCV valve and verify that the plunger is moving.

   (4) Is the PCV valve normally moving?

   YES

   ▸ Go to "Check PCSV as follows.

   NO

   ▸ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV
   (1) IG "OFF" and disconnect PCSV and vacuum hose.

   (2) Connect hand-vacuum gage with PCSV and supply vacuum to it.

   (3) Is the vacuum maintained ?

   YES

   ▸ Go to " Check injector" as follows.

   NO

   ▸ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF" and disconnect injector.

   (2) Check it for blocking caused by any foreign substance.

   (3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)
   Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω

   (4) Is the measured resistance within specification?

   YES

   ▸ Go to "Check sensor/actuator related to fuel system" as follows

   NO

   ▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on)
   (Refer to each DTC diagnostic procedure)

   (2) Are all of these items normal ?

   YES

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0174

GENERAL DESCRIPTION

In order to provide the best possible combination of drivability, fuel economy and emission control, the PCM uses a closed loop air/fuel metering system. The PCM monitors the HO2S signal voltage and adjusts fuel delivery based it in closed loop fuel control. Changes in fuel delivery will be indicated by the long-term and the short-term fuel trim values. The ideal fuel trim value is around 0%. The PCM will add fuel when the HO2S signal is indicating a lean condition. Additional fuel is indicated by fuel trim values that are above 0%. The PCM will reduce fuel when the HO2S signal is indicating a rich condition. Reduction in fuel is indicated by fuel trim values that are below 0%. The DTC relevant to fuel trim will be set when the amount reaches excessive levels because of a lean or rich condition.

DTC DESCRIPTION

Checking air-fuel ratio correction value every 0.75 sec. under detecting condition, if an value is within detecting condition for more than 0.3 sec., PCM sets P0174. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

YES

▸ Go to "Check PCSV as follows.

NO

▸ Replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check PCSV
   (1) IG "OFF" and disconnect PCSV and vacuum hose.
   (2) Connect hand-vacuum gage with PCSV and supply vacuum to it.
   (3) Is the vacuum maintained ?

YES

▸ Go to " Check injector" as follows.

NO

▸ Repair or replace it, and go to " Verification of Vehicle Repair" procedure.

3. Check injector
   (1) IG "OFF" and disconnect injector.
   (2) Check it for blocking caused by any foreign substance.
   (3) Measure resistance between terminals 1 and 2 of Injector connector.(Component side)

Specification :

Temp	Coil's resistance
20°C(68°F)	11.4 ~ 12.6 Ω

   (4) Is the measured resistance within specification?

YES

▸ Go to "Check sensor/actuator related to fuel system" as follows

NO

▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

4. Check sensor/actuator related to fuel system
   (1) Check the signal of sensor/actuator related to fuel system(HO2S, MAFS,MAPS, TPS, ECTS, PCSV, Injector and so on) (Refer to each DTC diagnostic procedure)
   (2) Are all of these items normal ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair it, and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

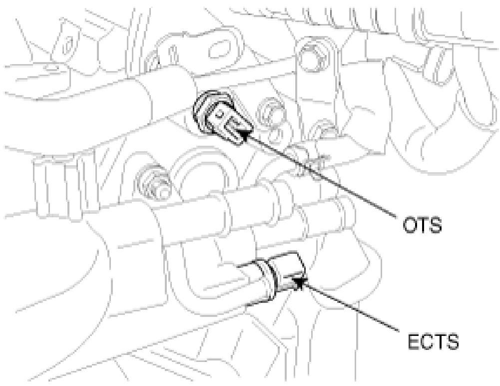
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0196

COMPONENT LOCATION



GENERAL DESCRIPTION

In CVVT system, the working fluid is engine oil. But its density varies according to temperature, PCM performs oil quantity correction based on the signal from engine oil temperature sensor over the various range of temperature. Main function of Oil Pressure Sensor is as follows.

1. intake air valve control solenoid(oil control valve) duty correction : As coil resistance varies according to oil temperature, excessive current flows at low temperture and low current at high temperature without duty correction. Therefore, PCM performs duty correction properly according to output signal from oil temperature sensor to supply constant current which is free from the change of oil temperature.
2. CVVT system operation starting temperature determination : As CVVT response gets weaker due to the friction of engine components such as valve at low temperature, PCM operates CVVT at above specific temperture based on output signal from oil temperture sensor.
3. improved CVVT controllability : CVVT response speed varies as oil temperature, PCM improves controllability throughout estimating response speed with oil temperture sensor output signal.

DTC DESCRIPTION

Checking the oil temperture , coolant temperature and intake air temperature every 25 sec. under detecting condition, if the difference in temperature at start-up exceeds threshold value, PCM sets P0196. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

<table>
<tr><th colspan="2">Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>
<tr><td colspan="2">DTC Strategy</td><td>• Determines if the oil temperature value is rational, compared to coolant and intake air temperature.</td><td rowspan="5">• Poor connection

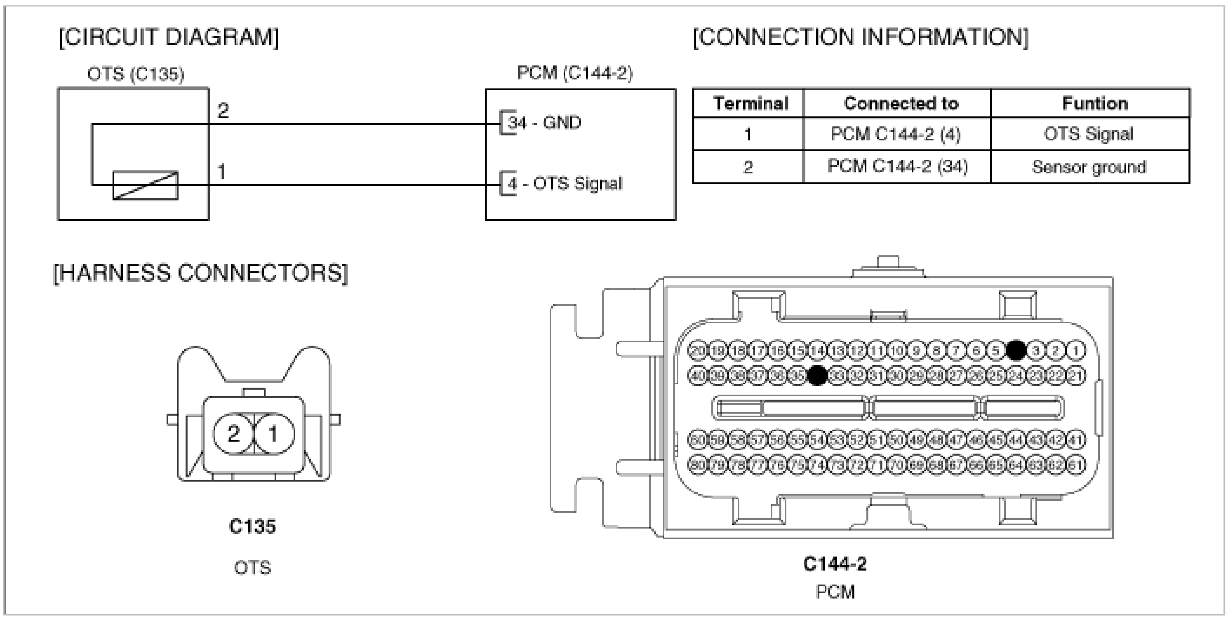
</table>

Threshold value	Case 2	• The difference in temperature between oil temperature and intake air temperature at startup >35°C(63°F)	• PCM
Diagnosis Time		• Continuous (More than 12.5 sec.failure for every 25 sec.test)	
MIL On Condition		• 2 Driving Cycles	

SPECIFICATION

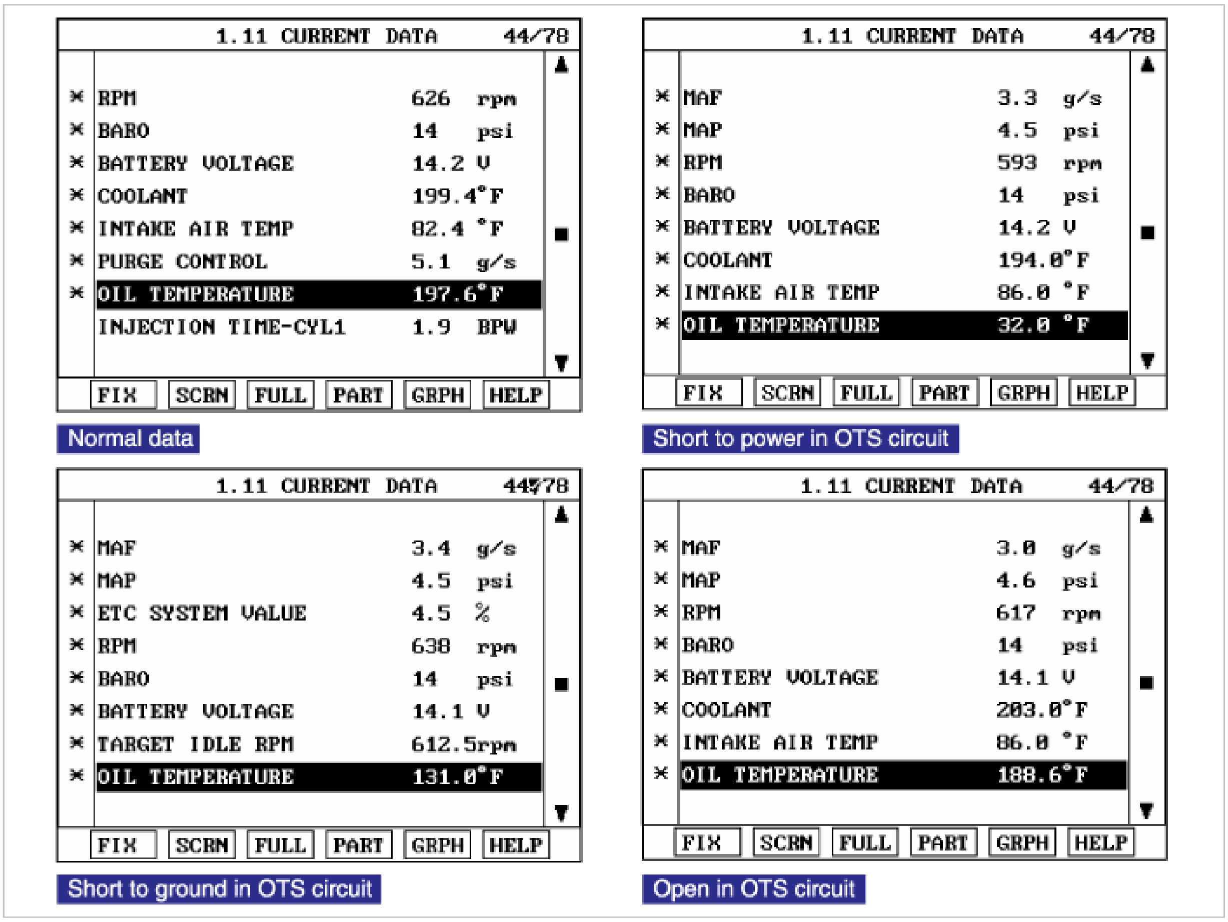
Temperature(°C/°F)	Resistance(kΩ)
-20°C/ -4°F	16.52kΩ
20°C/ 68°F	2.45kΩ
80°C/ 176°F	0.29kΩ

SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Connector (DLC)
2. Warm up engine to normal operating temperature
3. Monitor "Oil Temperature" parameter on the scantool.



Normal data / Short to power in OTS circuit / Short to ground in OTS circuit / Open in OTS circuit

4. Is the current data displayed correctly ?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▸ Go to "Terminal and connector inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

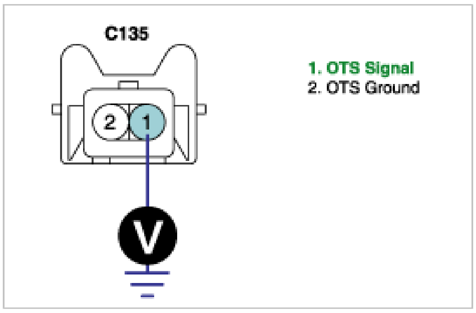
NO

▸ Go to "signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check Voltage
   (1) IG "OFF" & ENG "OFF"
   (2) Disconnect OTS connector
   (3) IG "ON" & ENG "OFF"
   (4) Measure voltage between harness terminal 1 of OTS and chassis ground.

Specification : Approx. 5V



(5) Is the measured voltage within specification ?

YES

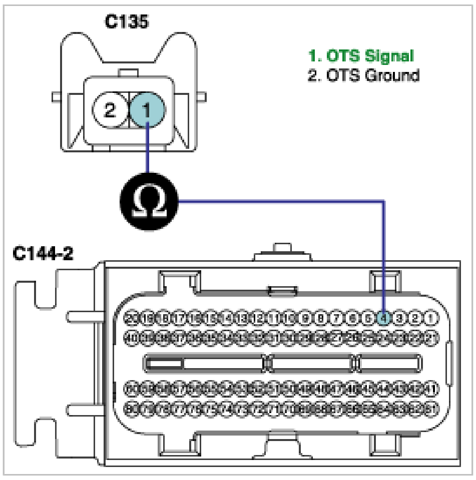
▸ Go to "Ground Circuit Inspection" procedure.

NO

▸ Go to "Check open in harness" as follow.

2. Check open in harness
   (1) IG "OFF" & ENG "OFF"
   (2) Disconnect OTS and PCM connector.
   (3) Measure resistance between terminal 1 of OTS harness connector and terminal 4 of PCM harness connector.

Specification : Approx. below 1Ω



(4) Is the measured resistance within specification ?

YES

▸ Go to "Ground Circuit Inspection" procedure.

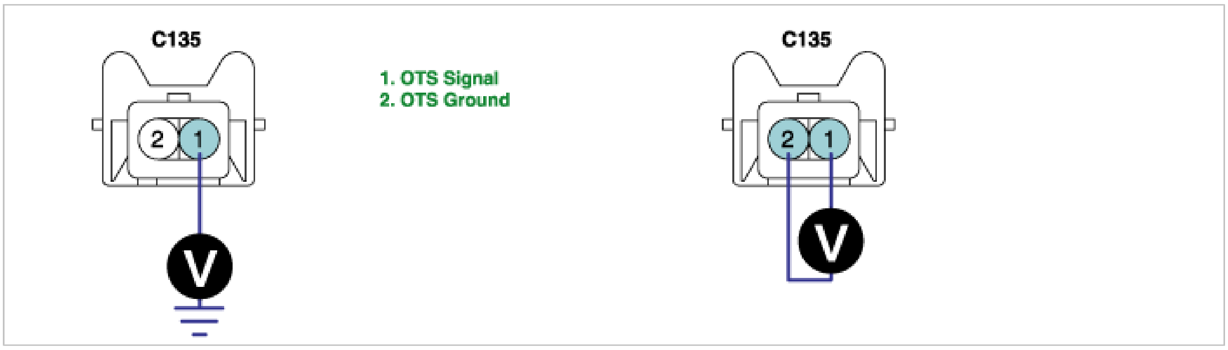
NO

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" & ENG "OFF"
2. Disconnect OTS connector
3. Measure voltage between terminal 1 of OTS harness connector and chassis ground.
4. Measure voltage between terminals 1 and 2 of OTS harness connector.

Specification : Measurement "A" - Measurement 'B' = Approx. below 200mV



5. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure

NO

▸ Repair or replace contact resistance or open in harness and then, go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check resistance of OTS
   (1) IG "ON" & ENG "OFF"
   (2) Monitor Oil Temperature parameter on the scantool
   (3) IG "OFF" & ENG "OFF"
   (4) Disconnect OTS connector.
   (5) Measure resistance between terminal 1 and 2 of OTS connector(Component Side)
   Specification :

Temperature(°C/°F)	Resistance(kΩ)
-20°C/ -4°F	16.52kΩ
20°C/ 68°F	2.45kΩ
80°C/ 176°F	0.29kΩ

   (6) Is the measured resistance within specification ?

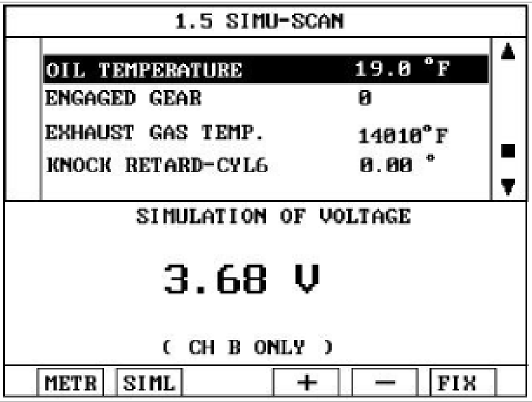
YES

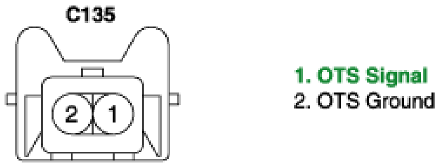
▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good OTS and check for proper operation. If the problem is corrected, replace OTS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM
   (1) Ignition "OFF" and Connect Scantool
   (2) Ignition"ON " & Engine "OFF"
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal "1" of OTS signal connector.





(5) Does the OTS signal value changes according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.

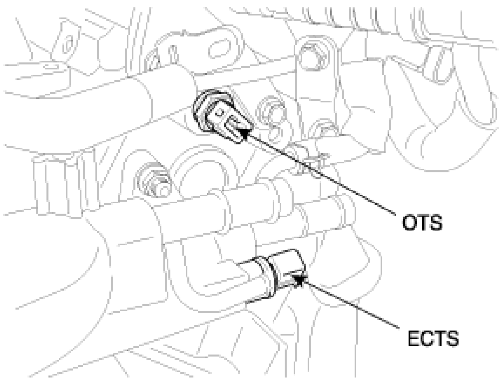
Fuel System > Troubleshooting > P0217

COMPONENT LOCATION



GENERAL DESCRIPTION

The Engine Coolant Temperature(ECT) Sensor measures the temperature of engine coolant. The Engine Coolant Temperature (ECT) Sensor is located near the thermostat housing of the cylinder head. ECT Sensor is a thermistor (A Variable Resistor that Changes Along with ECT) in series with a fixed resistor in the Engine Control Module (PCM). The PCM applies 5 volts to the ECT sensor. The PCM monitors the voltage across the ECT sensor and converts it into a temperature reading. When the engine is cold the ECT sensor resistance is high, and when the engine is warm the ECT sensor resistance is low. Therefore, when the engine is cold the PCM will receive a high voltage input, and when the engine is warm the PCM will receive a low voltage input. The signal from ECT sensor is used for Injection, ignition timing, idle speed and cooling fan control.

DTC DESCRIPTION

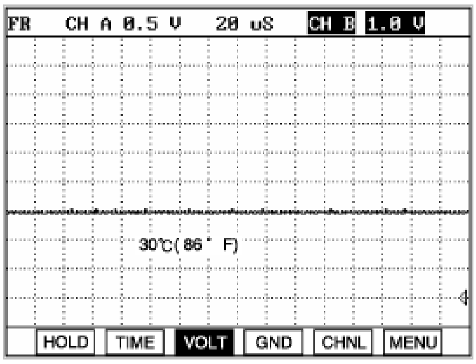
The Engine Coolant Temperature High Rationality Diagnostic checks for unusually high engine coolant temperatures under normal operating loads and if the temperature is found to be higher than a certain limit, the diagnostic declares a failure.
PCM monitors difference between the startup and current coolant temperature and compares agaist the threshold while enable condition is met. If the PCM detects that the coolant temperature exceeds the limit under normal operating condition, PCM determines that a fault exists and a DTC is stored.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This diagnostic introduces a calibratable delay and simultaneously looks out for excessive engine loads. Once the delay period passes and excessive loads have not been experienced, the diagnostic checks whether the undefaulted coolant temperature has exceeded a maximum threshold in order to make a PASS/FAIL determination.	• Poor connection • Lack of engine coolant • Water pump • ECTS • PCM
Enable Conditions	• Engine Running status • No disabling faults present • Coolant Sensor within range • Undefaulted Coolant Temp ≥ 50°C(122 °F) • ndefaulted IAT ≥ 35°C(95 °F) • Soak time ≥ 360min or Undeafaulted Coolant temp ≤ 45°C(113 °F)	
Thresh old	• Coolant temperature above which High Rationality fail criteria is satisfied ≥ 110°C (230 °F) (Vehicle has been under high airflow	

value	conditions that may cause the High Rationality diagnostic to false fail) - To detect a failure, Average airflow must be< 30 g/sec and EWMA Airflow must be< 50 g/sec)	
Diagnosis Time	• Continuous (More than 12.5 sec.failure for every 15 sec.test)	
MIL On Condition	• 2 Driving Cycles	

SIGNAL WAVEFORM AND DATA



The output signals of IATS & ECTS change smoothly without any rapid changes. Those have almost same characteristic signal during the early period after start. It means that the temperatures of intake air and engine coolant are depended on the temperature of atmosphere. Meanwhile, during the warming up, the output signal of ECTS is going up increasingly. but, the output signal of IATS changes a little bit. even it may not change almost. It means that the heat of engine does not affect on the temperature of intake air.

SPECIFICATION

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

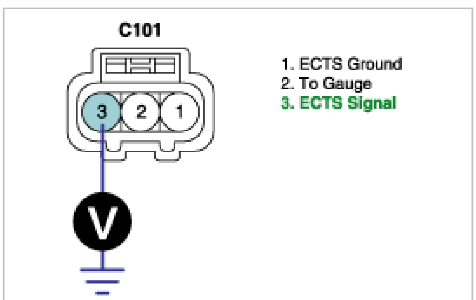
NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. IG "OFF" and disconnect ECTS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 3 of ECTS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Go to "Check short to ground in harness" as follows.

5. Check short to ground in harness
   (1) IG "OFF" and disconnect ECTS connector and PCM connector.
   (2) Measure resistance between terminal 3 of ECTS harness connector and chassis ground.
   (3) Measure resistance between terminals 1 and 3 of ECTS harness connector.

Specification : Infinite

   (4) Is the measured resistance within specification?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

SYSTEM INSPECTION

1. Check if Engine coolant level is O.K
2. Check if that water pump is operating correctly.
3. Has a problem been found ?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair"procedure.

NO

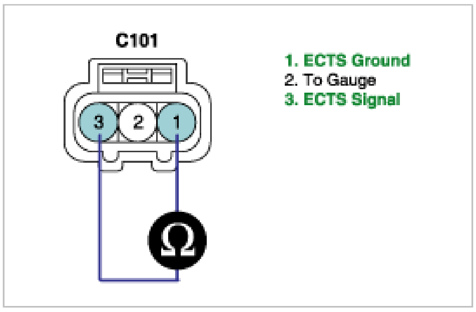
▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check resistance of ECTS
   (1) IG "OFF" and disconnect ECTS connector.
   (2) Measure resistance between terminal 1 and 3 of ECTS connector. (Component Side)

Specification :

Temp. (°C/°F)	Resistance (kΩ)	Temp. (°C/°F)	Resistance (kΩ)
-40(-40)	48.14	40(104)	1.15
-20(-4)	14.13 ~ 16.83	60(140)	0.59
0(32)	5.79	80(176)	0.32
20(68)	2.31 ~ 2.59		



(3) Is the measured resistance within specification ?

YES

▶ Go to "Check PCM" procedure.

NO

▶ Substitute with a known - good ECTS and check for proper operation. If the problem is corrected, replace ECTS and go to "Verification of Vehicle Repair" procedure.

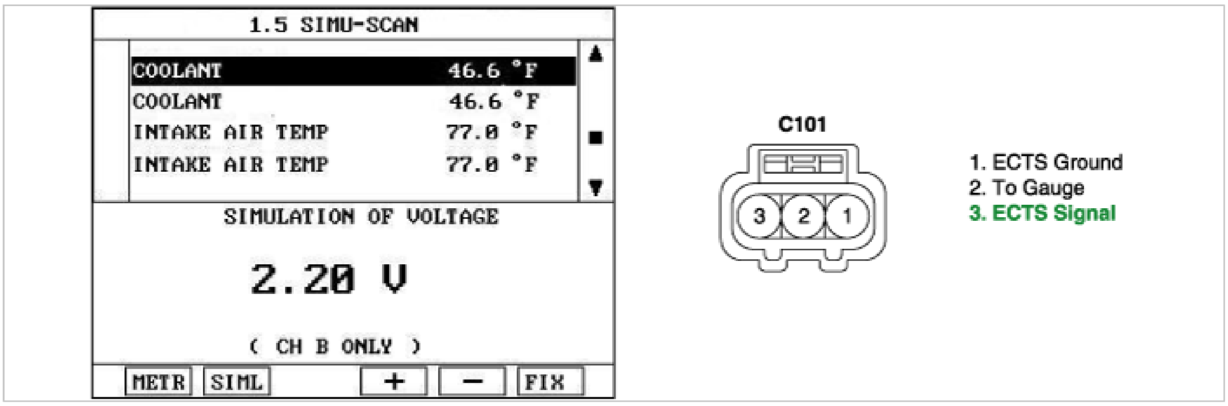
2. Check PCM

(1) IG "OFF" and connect scantool.

(2) Connect probe to terminal 3 of ECTS harness connector.

(3) IG "ON" and ENG "OFF" and simulation Function on scantool.

(4) Simulate voltage at terminal 3 of ECTS harness connector.



(5) Does the signal value of ECT sensor change according to simulation voltage ?

YES

▶ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▶ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▶ Go to the applicable troubleshoooting procedure.

NO

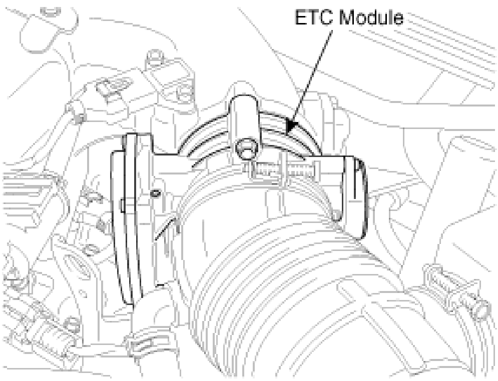
Fuel System > Troubleshooting > P0222

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

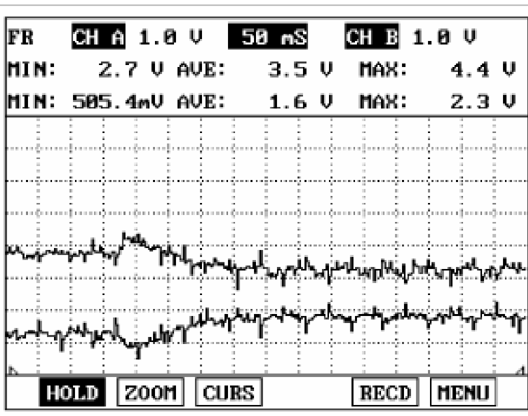
DTC DESCRIPTION

Checking output signals from TPS2 every 8.5 sec. under detecting condition, if an output signal is below 0.25V for more than 0.1 sec, PCM sets P0222. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

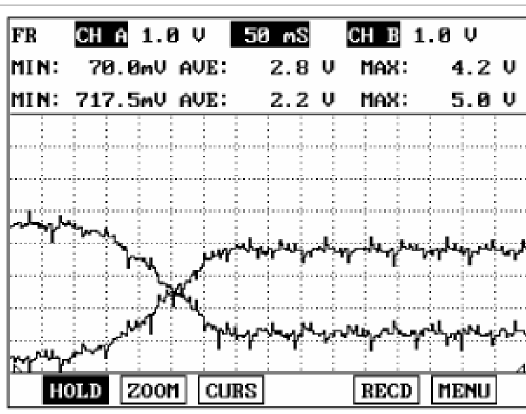
DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• signal low	• Poor connection • Open or short to ground in power harness • Open or short to ground in signal harness • TPS • PCM
Enable condition	• IG "ON"	
threshold value	• The signal voltage of TPS < 0.25V	
diagnosis time	• Continuous (more than 0.1 sec. failure for every 8.5 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA



Hit the accelerator at IG ON



Open the throttle valve by force at IG ON

SPECIFICATION

Throttle opening (°)	Output voltage(V) [Vref=5.0]	
	TPS1	TPS2
0°	0.0V	5.0V
10°	0.5V	4.5V
20°	0.9V	4.1V
30°	1.4V	3.6V
40°	1.8V	3.2V
50°	2.3V	2.7V
60°	2.7V	2.3V
70°	3.2V	1.8V
80°	3.6V	1.4V
90°	4.1V	0.9V
100°	4.5V	0.5V
110°	5.0V	0.0V

SCHEMATIC DIAGRAM

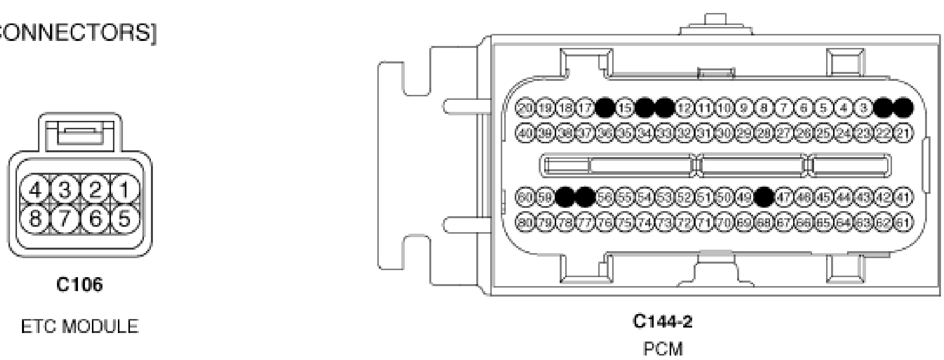
Terminal	Connected to	Funtion
1	PCM C144-2 (13)	TPS 2 Reference Voltage (+5V)
2	PCM C144-2 (2)	ETC Motor [+] Control
3	PCM C144-2 (1)	ETC Motor [-] Control
4	PCM C144-2 (16)	TPS 1 Reference Voltage (+5V)
5	PCM C144-2 (58)	TPS 2 Ground
6	PCM C144-2 (57)	TPS 2 Signal
7	PCM C144-2 (48)	TPS 1 Signal
8	PCM C144-2 (14)	TPS 1 Ground

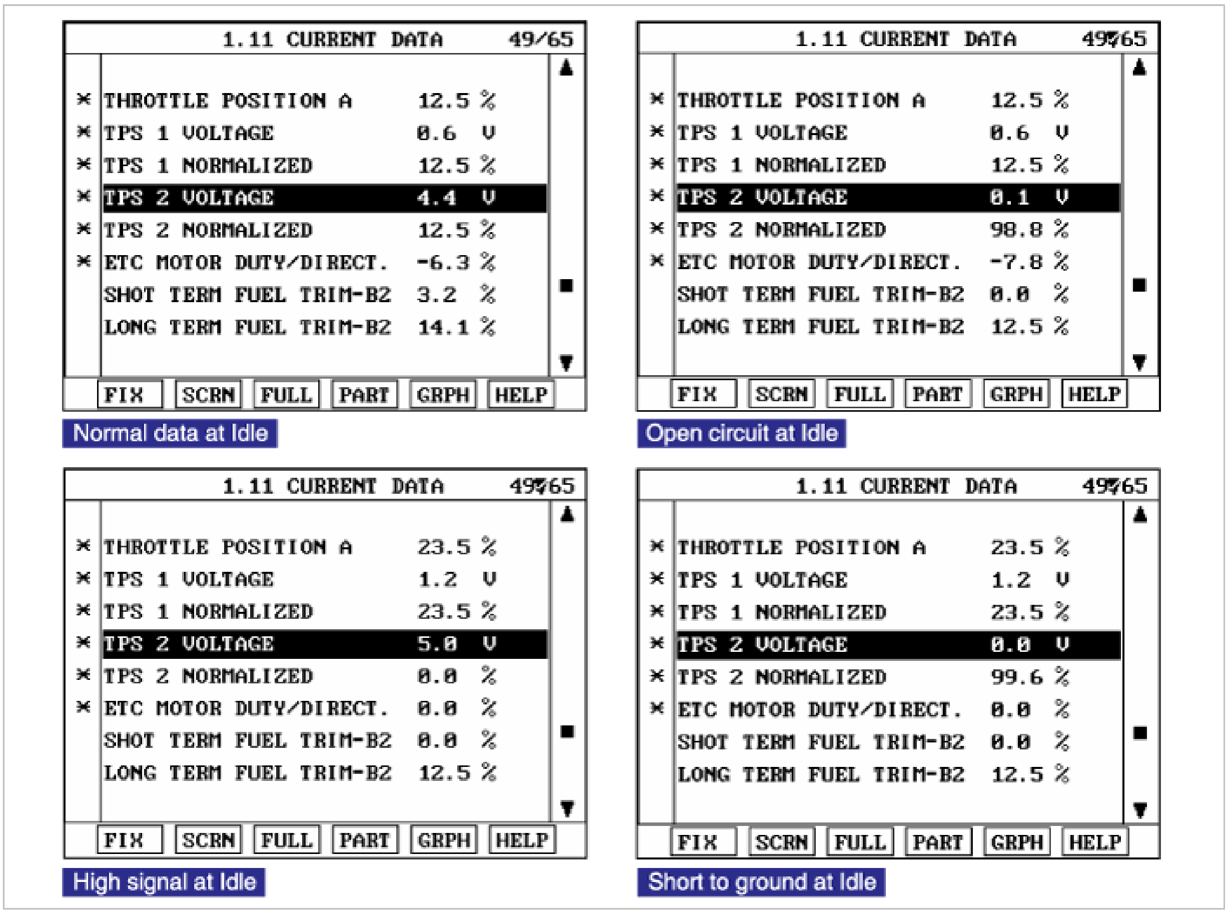
[HARNESS CONNECTORS]



MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.

3. Monitor "TPS" item on the service data.



Normal data at Idle

Open circuit at Idle

High signal at Idle

Short to ground at Idle

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

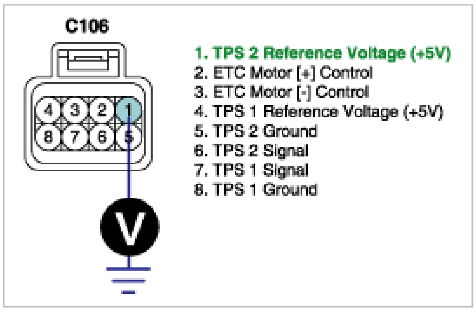
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect TPS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of TPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Repair open or short to ground in power harness, and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.

   (2) Measure resistance between terminal 6 of TPS harness connector and chassis ground.

   (3) Measure resistance between terminals 6 and 5(8) of TPS harness connector.

   Specification : Infinite

   (4) Is the measured resistance within specification?

   YES

   ▸ Go to "Check open in harness" as follows

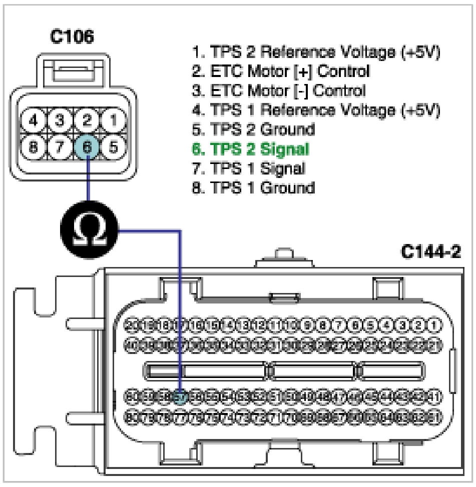
   NO

   ▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnect TPS connector and PCM connector.

   (2) Measure resistance between terminal 6 of TPS harness connector and terminal 57 of PCM harness connector.

   Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to " Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Repair" procedure.

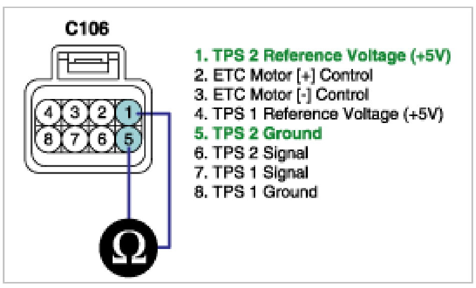
COMPONENT INSPECTION

1. Check TPS

(1) IG "OFF" and disconnect TPS connector.

(2) Measure resistance between terminals 1 and 5 of TPS connector.(Component side)

Specification : 2.7 ~ 4.1kΩ



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good TPS and check for proper operation. If the problem is corrected, replace TPS and go to "Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

CAUTION

Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10sec.)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

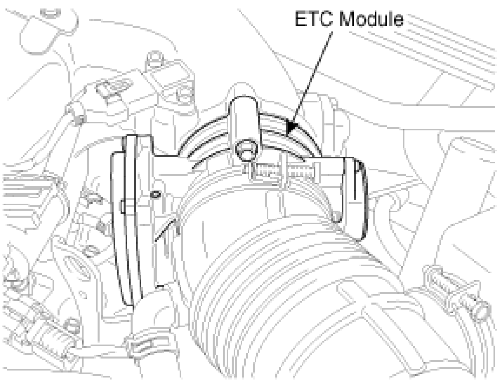
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0223

COMPONENT LOCATION



GENERAL DESCRIPTION

ETC(Electronic Throttle Control Valve) is the device controlling amount of air to engine acccording to driver's intension. Different from the existing mechanical throttle valve which is composed of accelerator pecal and connecting wire cable, ETC consists of a motor, a throttle body and a throttle position sensor. Receiving input signals from electronic accelerator pedal module, PCM lets ETC motor control throttle valve. With ETC, cruise control system works without any additional device.

DTC DESCRIPTION

Checking output signals from TPS2 every 8.5 sec. under detecting condition, if an output signal is above 4.75V for more than 0.1 sec., PCM sets P0223. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal High	• Poor connection • Short to battery in signal harness • Open in ground harness • TPS • PCM
Enable condition	• IG "ON"

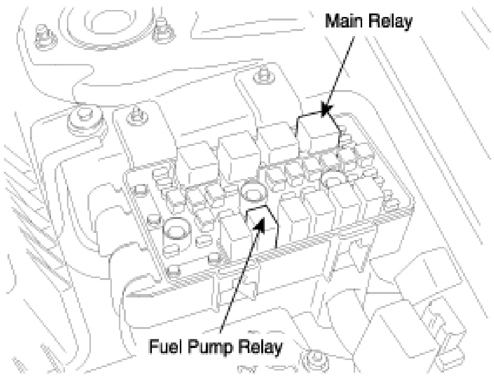
Fuel System > Troubleshooting > P0230

COMPONENT LOCATION



GENERAL DESCRIPTION

The PCM provides ground to one side of the coil in the fuel pump relay to control the fuel pump relay. The other side of the fuel pump relay coil is connected to fuel pump relay, which activates when the ignition switch is ON. The PCM monitors the control circuit between the fuel pump relay and the ECM. When the ignition switch is turned ON, the PCM energizes the fuel pump relay, which sends power to the fuel pump.

DTC DESCRIPTION

Checking fuel pump relay circuit continuously under detecting condition, if open or short in the circuit is detected PCM sets P0230.In addition, Take note that open circuit in Main Relay may cause this P0230 code.
※ In addition, Take note that open circuit in Main Relay may cause this P0230 code.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low or High	• Poor connection • Open or short in fuel pump relay circuit • Open in Main Relay circuit • Fuel Pump Relay • PCM
Enable condition	• 11V ≤ Battery Voltage ≤ 16V	
threshold value	• Open or short	
diagnosis time	• Continuous	
MIL ON condition	• NO MIL ON(DTC only)

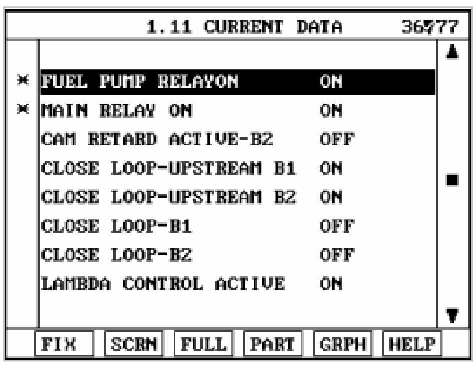
PCM

MONITOR SCANTOOL DATA

1. Connect Scantool to Data Link Cable(DLC).
2. ENG "ON"
3. Monitor "Fuel Pump Relay" item on the scantool.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair" .

NO

▸ Go to "Terminal and connector inspection" procedure.

▸ In case of open in Main Relay, this DTC can be set. so, check it for open before going next procedure.(Refer to DTC relating to Main relay)

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair or replace if necessary and go to "Verification of Vehicle Repair" procedure

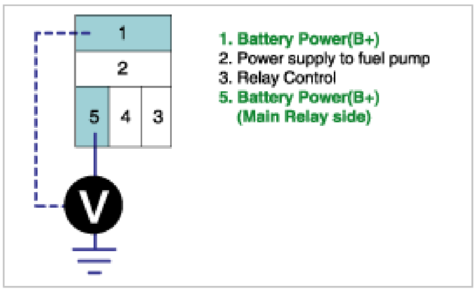
NO

▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" & ENG "OFF"
2. Disconnect fuel pump relay.
3. IG "ON" & ENG "OFF"
4. Measure voltage between harness terminal 1(5) of chassis ground.

Specification : B+



5. Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection" procedure.

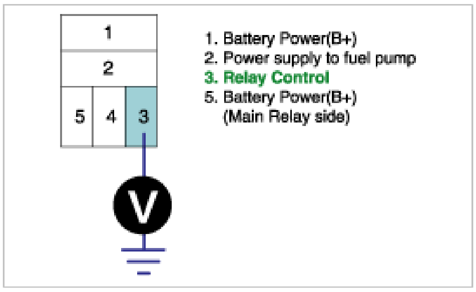
NO

▸ Check "Fuse" between fuel pump relay and main relay is not installed or blown off
▸ Check "Fuse" between fuel pump relay and battery is not installed or blown off
▸ Especially, if battery voltage at terminal 5 is not detected, replace the Main Relay.
▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect fuel pump relay.
3. IG "ON" & ENG "OFF"
4. Measure voltage between harness terminal 5 and chassis ground.

Specification : Approx. 2.5V



5. Is the measured voltage within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair or repalce as necessary and then, go to "Verification of Vehicle Repair" procedure.

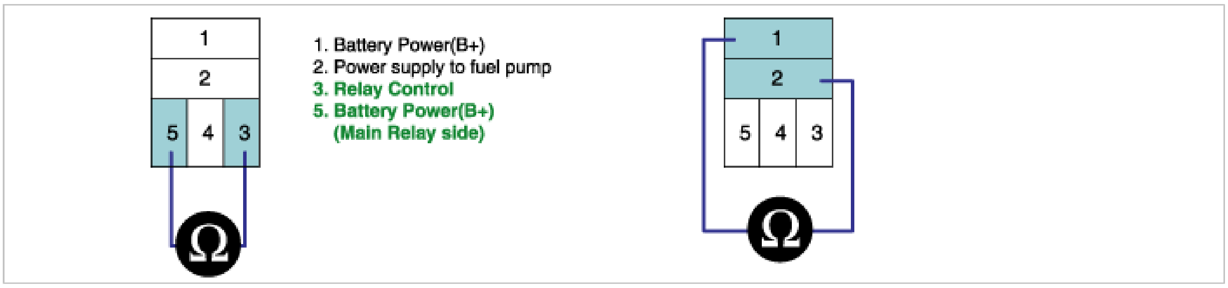
COMPONENT INSPECTION

1. Check fuel pump relay
   (1) IG "OFF"
   (2) Disconnect Fuel Pump Relay
   (3) Measure resistance between terminal 1 and 2 of Fuel Pump Relay

(4) Measure resistance between terminal 3 and 5 of Fuel Pump Relay

Specification :

Terminal	continuity
1~2	NO
3~5	YES (Approx. 70Ω ~ 120Ω)



(5) Is the measured resistance within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good Fuel Pump Relay and check for proper operation.If the problem is corrected, replace Fuel Pump Relay and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

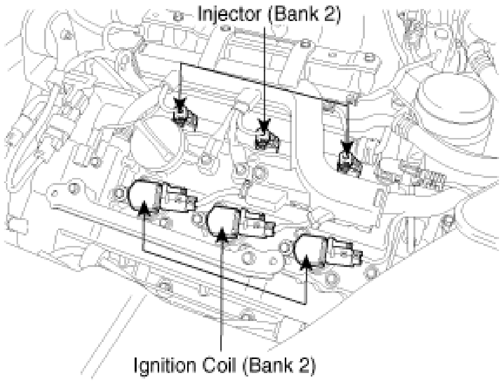
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0261

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

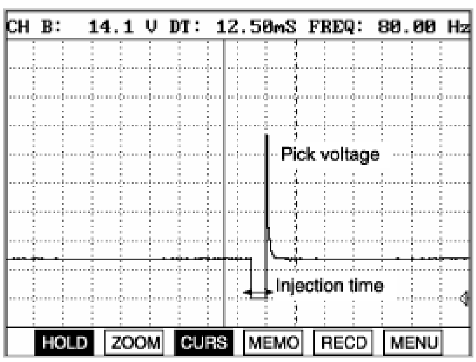
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is low for more than 5 sec., PCM sets P0261. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low	• Poor connection • Open or short to ground in power harness • Open or short to ground in control harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met > 0.5sec.	
threshold value	• Open or short to ground	
diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

Item	Coil resistance(Ω)

▸ Go to "Component Inspection" procedure.

NO

▸ Go to "Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of injector harness connector.

Specification : Below 1Ω

   (3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)
   Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)

   (3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

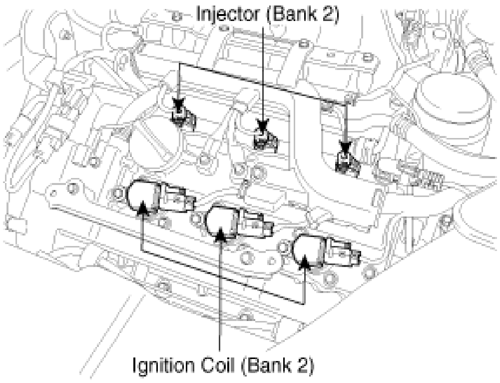
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0264

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

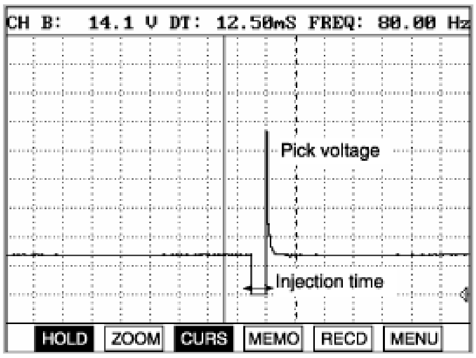
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is low for more than 5 sec., PCM sets P0264. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal Low	• Poor connection • Open or short to ground in power harness • Open or short to ground in control harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met >0.5sec.	
threshold value	• Open or short to ground	
diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminaal and connector inspection" procedure.

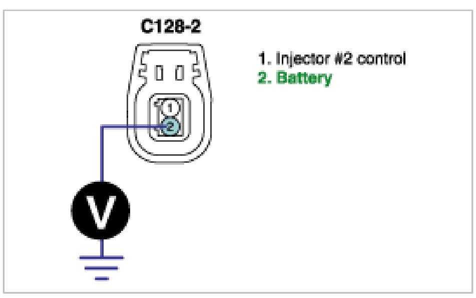
POWER CIRCUIT INSPECTION

1. IG "ON" and disconnect injector connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 2 of injector harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification?

YES

▸ Go to "Control Circuit Inspection" procedure.

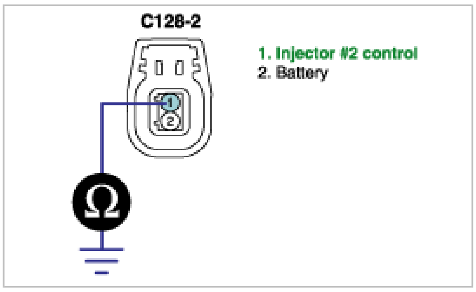
NO

▸ Check open or connection of the fuse connected to injector power supply.
▸ Repair open or short to ground in harness, and go to "Verification of Vehicle Repair' procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminal 1 of injector harness connector and chassis ground.

   Specification : Infinite



(3) Is the measured resistance within specification?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
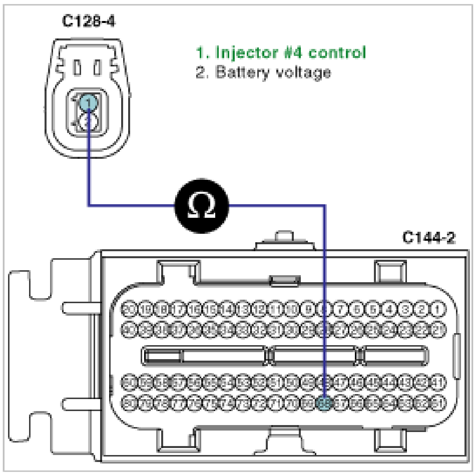
   (2) Measure resistance between terminal 1 of injector harness connector and 68 of PCM harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

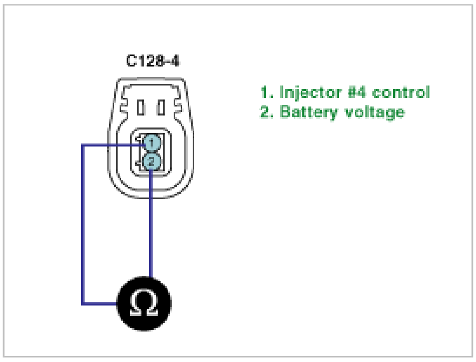
▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)

Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

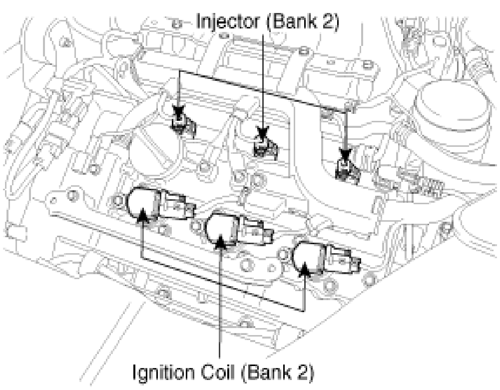
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0271

COMPONENT LOCATION



GENERAL DESCRIPTION

Electronically controlled fuel injector is a solenoid valve which supplies exactly calculated amount of fuel to engine for optimum conbustion under various engine load and speed. To meat air-fuel ratio required in system, PCM regulates fuel injection quantity

as controlling injector solenoid operating duration referring air flow to cylinders and output signals from HO2S. For this precise control, quick response of solenoid is required and for perfect combustion, injection characteristic is important.

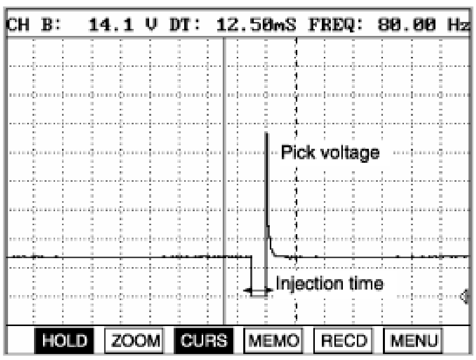
DTC DESCRIPTION

Checking output signals from injectors every 10 sec. under detecting condition, if an output signal is high for more than 5 sec., PCM sets P0271. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible Cause
DTC Strategy	• Signal High	• Poor connection • Short to battery in harness • Injector • PCM
Enable condition	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above conditions are met >0.5sec.	
Threshold value	• Short to battery	
Diagnosis time	• Continuous (More than 2 sec.failure for every 4 sec.test)	
MIL ON condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



When the PCM energizes the injector by grounding control circuit, the circuit voltage should be low (theoretically 0V) and the fuel is injected. When the PCM de-energizes the injector by opening control circuit, the fuel injector is closed and circuit voltage should be peak at a moment.

SPECIFICATION

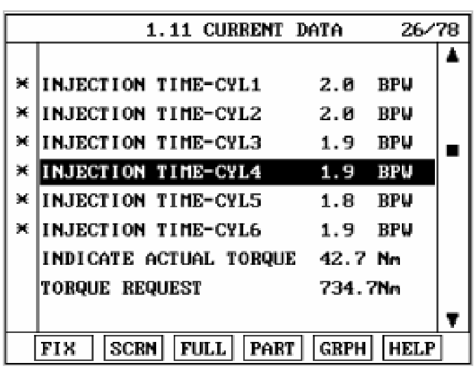
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "fuel injection time" item on the service data.



4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Control Circuit Inspection" procedure.

CONTROL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect injector connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 1 of injector harness connector and chassis ground.

   Specification : Approx. 0V

   (4) Is the measured voltage within specification?

YES

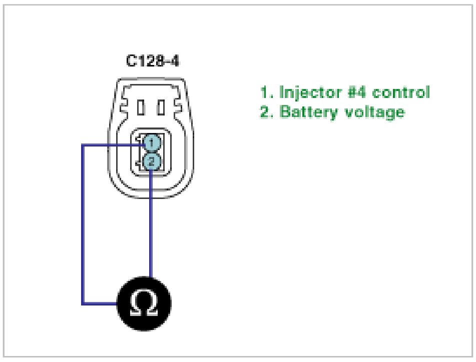
▸ Go to "Component Inspection" procedure.

NO

▸ Go to "Check short to battery in harness" as follows.

2. Check short to battery in harness
   (1) IG "OFF" and disconnect injector connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of injector harness connector.

   Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

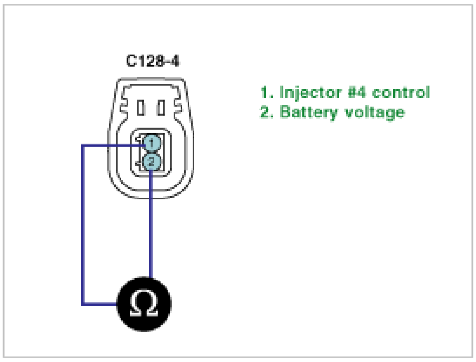
NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check injector
   (1) IG "OFF" and disconnect injector connector.
   (2) Measure resistance between terminals 1 and 2 of injector connector.(Component side)
   Specification :

Item	Coil resistance(Ω)
Injector	11.4 ~ 12.6Ω (at 20°C/ 68°F)



(3) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good injector and check for proper operation. If the problem is corrected, replace injector and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "

5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

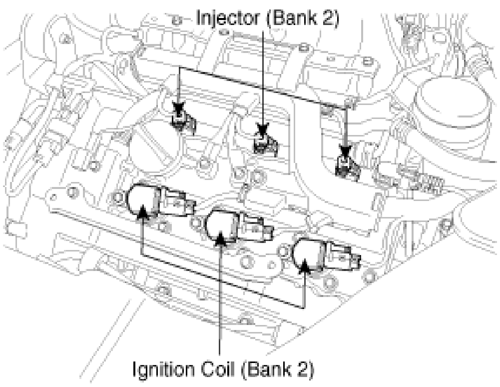
Fuel System > Troubleshooting > P0300

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0300. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• Determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misfre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold (based on vehicle speed) then the engine is considered to	

Enable condition	Case 3	be operation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥ 11 engine cycles (If negative torque load condition is detected. Negative torque is determined by load conditions less than a 'zero torque' line which is determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a cam synchronization problem is detected internal to the Misfire diagnostic >30 engine cycles If false information is received, a false misfire could be diagnosed. • Intrusive diagnostics not enabled (EGR FLOW) • Number of engine cycles to delay the misfire diagnostic if any intrusive diagnostic test that could potentially interfere with the misfire diagnostic detectability has been determined to be active • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period (31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times < 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times < 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of

		number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F) • Calculated coolant temperature with default applied > 120°C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults • P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.

▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"

   (2) Connect Scantool and Engine "ON"

   (3) Monitor parameters related to "Random Misfire Detected" on CURRENT DATA

   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

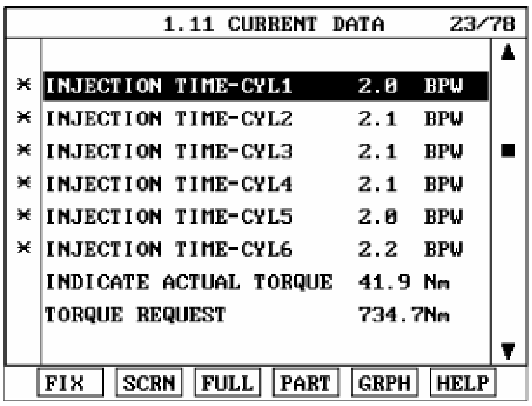


Fig. 1

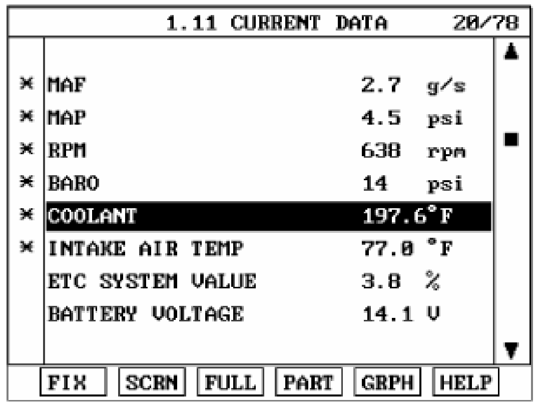

Fig. 2

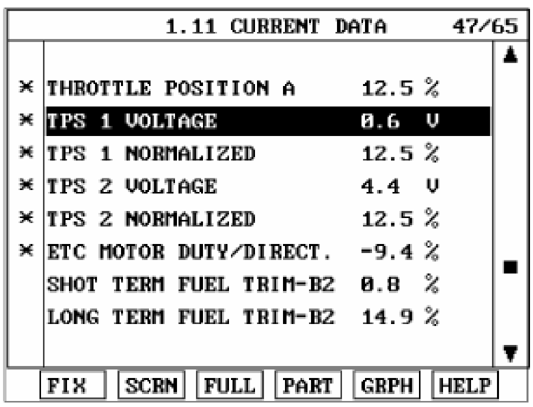

Fig. 3

   (4) Are the parameters related to "Random/Multi Misfire Detected" displayed correctly on Current Data ?

   YES

   ▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg

(1) Remove cylinder's spark plugs

(2) Visually/physically inspect the following items:
- Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
- Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
- Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

(3) Has a problem been found in any of the above areas?

YES

▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Check Air Leakage " as below

2. Check Air Leakage
(1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
- Vacuum hoses for splits, kinks and improper connections.
- Throttle body gasket
- Gasket between intake manifold and cylinder head
- Seals between intake manifold and fuel injectors
- Exhaust system between HO2S and Three way catalyst for air leakage

(2) Has a problem been found in any of the above areas?

YES

▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
(1) Remove PCV valve from cylinder head cover by puling ventilation hose

(2) With engine idling block PCV valve opening

(3) Verify that vacuum is felt

(4) Remove PCV valve

(5) Blow through valve from prot "A" and verify that air comes out of prot "B"

(6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

(7) Has a problem been found ?

YES

▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Check Compression pressure" as below

4. Check Compression pressure
(1) Warm up the engine to normal operating temperature

(2) Disconnect the spark plug cables and remove the spark plugs.

(3) Crank the engine to remove any foreign material in the cylinders.

(4) Put compression pressure gauge into spark pulg hole

(5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

(6) Is compression pressure for each cylinder displayed within specifications ?

Specification : 1323kPa(13.5 kg/cm²,192 psi)

YES

▶ Go to "Check Timing " as below

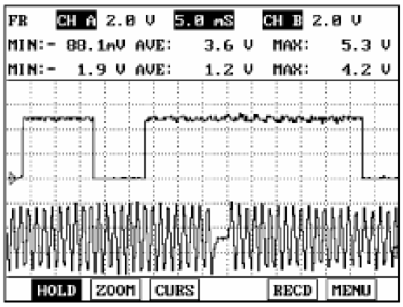
NO

▶ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.
▶ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
(1) Ignition "OFF"

(2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

(3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment



(4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. Negative torque isdetermined by load conditions less than a 'zero torque' line whichis determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a camsynchronization problem is detected internal to the Misfirediagnostic > 30 engine cyclesIf false information is received, a false misfire could bediagnosed. • Intrusive diagnostics not enabled (EGRFLOW) • Number of engine cycles to delay the misfire diagnostic ifany intrusive diagnostic test that could potentially interferewith the misfire diagnostic detectability has been determined to beactive • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel	

Enable condition	Case 3	Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period (31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times< 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times< 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F)	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM

		• Calculated coolant temperature with default applied > 120° C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults • P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.
▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 2 Misfire Detected" on CURRENT DATA
   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

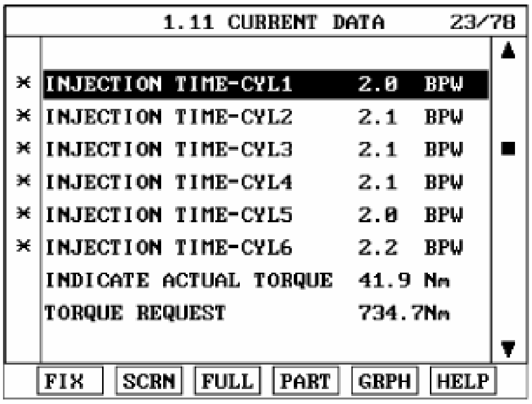

Fig. 1

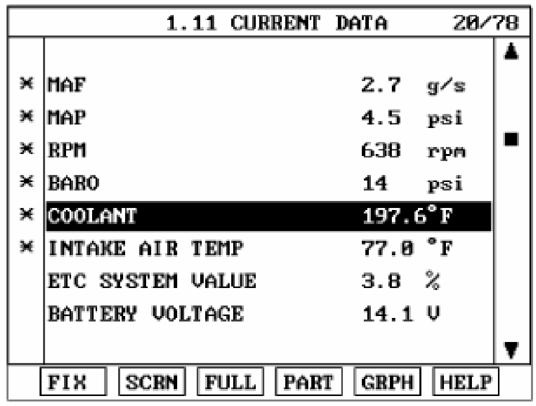

Fig. 2

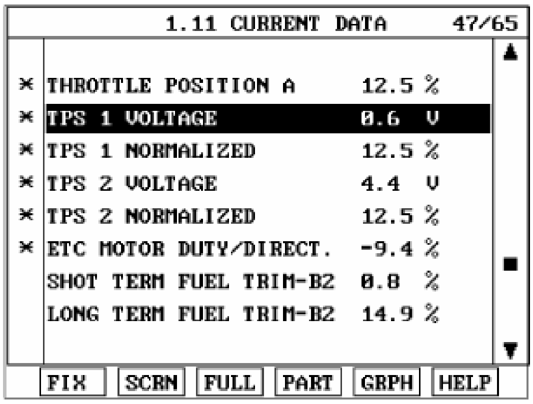

Fig. 3

(4) Are the parameters related to "Cylinder 2 Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg
   (1) Remove cylinder's spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.

▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

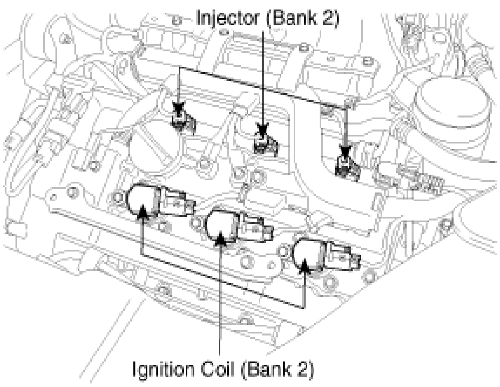
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0303

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0303. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating

and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.

▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data

(1) Ignition "OFF"

(2) Connect Scantool and Engine "ON"

(3) Monitor parameters related to " Cylinder 4 Misfire Detected" on CURRENT DATA

Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

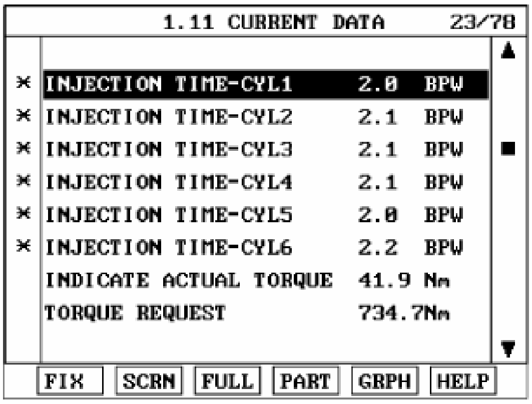

Fig. 1

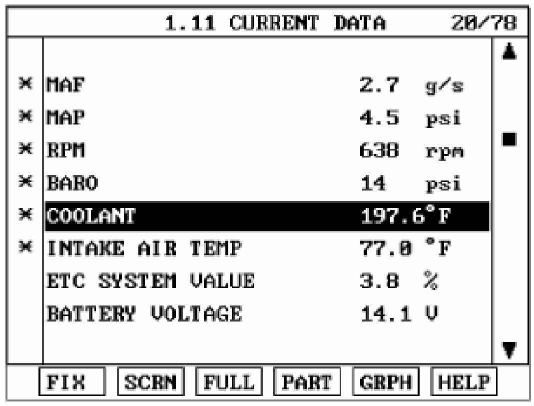

Fig. 2

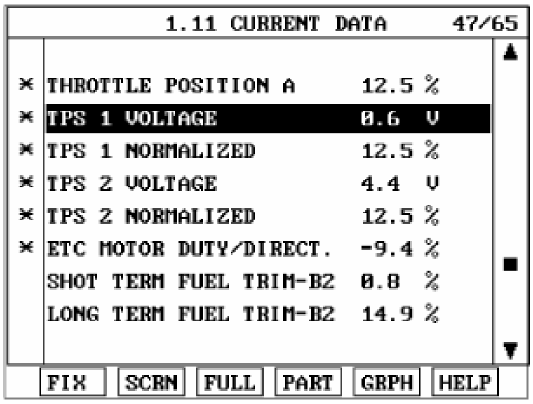

Fig. 3

(4) Are the parameters related to "Cylinder 4 Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg
   (1) Remove cylinder’s spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

Specification : 1323kPa(13.5 kg/cm²,192 psi)

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.

▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

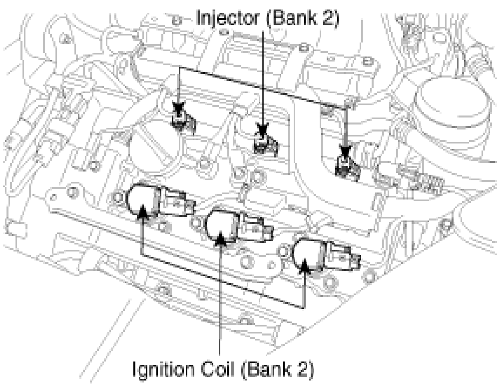
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0305

COMPONENT LOCATION



GENERAL DESCRIPTION

Misfires can be caused by lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or many other causes. Even a small number of misfires may result in excessive exhaust emissions due to the unburned mixture. Increased misfire rates cause damage to the catalytic converter. The PCM monitors the crankshaft speed variation to determine if any misfiring generated. The PCM identifies the specific cylinder in which the misfire has occurred and counts individual misfire events by monitoring changes in the crankshaft rotation for each cylinder. A random misfire indicates two or more cylinders are misfiring.

DTC DESCRIPTION

The misfire diagnostic measures reference event times and calculates the positive and negative acceleration of the crank wheel to detrmine whether a misfire has occurred.
When the rate of misfire exceeds a threshold where the catalyst reaches a temperature where permanent damage can ocur, to the point that tail pipe emissions reach 1.5 times the tailpipe standard or where a cylinder misfire cause a loss of torque produced from that cylinder. PCM sets P0305. In case that misfire affects Catalyst damage, MIL(Malfunction Indicatin Lamp) will be illuminating

and blinking at 1HZ frequency. However, In case of Indivisual and Emission damaging misfire, MIL will be turned on when the malfunction is detected.
Especially, if injector connector is disconnected for more than 46 sec., PCM sets DTC relating to misfire and conducts the fuel-cut to protect the catalyst.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible Cause
DTC Strategy		• determine if a multiple cylinder misfire or a cylinder specific misfire is occurring by monitoring crankshaft acceleration.	
	Case 1	• Misifre Not Delayed (No active delays) • All delays expired (Misfire Delay Counter = 0) • Not the Air Conditioning Clutch is changing state • The number of engine cycles to delay misfire detection after the air conditioner has changed states.	
	Case 2	• The number of engine cycles to delay misfire detection if the engine is operating in a region where misfire is undetectable ≥ 10 engine cycles	
		• The time that most delays will not be enabled ≥ 10sec • If the engine load ≥ thrshold(based on vehicle speed) then the engine is considered to beoperation under negative torque conditions • Number of engine cycles to delay the misfire diagnostic ≥11 engine cycles(if negative torque load condition is detected. Negative torque isdetermined by load conditions less than a 'zero torque' line whichis determined by engine speed and engine coolant temperature.) • The vehicle is in the manufacturing plant. • This is not first crank • Engine Runtime >30 (Amount of time to delay the Misfire Diagnostic on the initial vehicle start when the vehicle is being manufactured in the plant. This delay will only occur once in the life of the vehicle and is used to prevent misfire on the initial start due to a lack of fuel) • The misfire diagnostic is synchronization with the cam event. • The number of engine cycles to delay misfire detection if a camsynchronization problem is detected internal to the Misfirediagnostic > 30 engine cyclesIf false information is received, a false misfire could bediagnosed. • Intrusive diagnostics not enabled (EGRFLOW) • Number of engine cycles to delay the misfire diagnostic ifany intrusive diagnostic test that could potentially interferewith the misfire diagnostic detectability has been determined to beactive • Fuel Level(Present) >0.15% • No fuel level fault • Vehicle not in plant • Engine cycles ≥ 500 • All cylinders fueled = 6 • Non in Fuel cut off not DFCO(Decelleration Fuel Cut Off) or not High Vehicle Speed Fuel Shut Off or not High RPM Fuel Shut Off • Transmission Shift in progress • Engine cycles ≥ 0 Increasing Throttle • Current Thorttle opening(WTHROT) >31ms old throttle opening(VVTHROT 31ms old) • VVTHROT - VVTHROT 31ms old< 64.9994% (Maximum positive delta throttle movement allowed in a 125 ms period	

Enable condition	Case 3	(31.25 ms if using ETC). If the throttle position increases more than this threshold, the misfire diagnostic will be inhibited.) Decreasing Throttle • VVTHROT 31ms old >VVTHROT • VVTHROT 31ms old - VVTHROT < 100% • For engine cycles ≥ 5 • Engine RPM ≥ 7100 • Engine cycles >4999 • Crankshaft speed patterns normal • The seconds that most delays will not be enabled ≥ 10 • The number of consecutive positive delta times< 60 events • For engine cycles ≥ 8 • The number of consecutive negative delta times< 30 events • For engine cycles ≥ 8 • The seconds that most delays will not be enabled ≥ 10 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 • This is the value which is multiplied The number of consecutive positive delta times with multiple values of the number of consecutive negative delta times and The number of consecutive positive delta times while within the power-up no-delay timer.< 200 * 1 events • For engine cycles ≥ 8 Not negative torque driving conditions • throttle not less than threshold < 0% • while vehicle speed > 511KPH • For engine cycles ≥ 7 Engine Speed with in range • Run Time ≥ 10 • 470 < Engine RPM < 6600 • For engine cycles ≥ 15 • TEC(Tooth Error Correction) factor not learned • RPM >1600 • For engine Cycles ≥ 40 Ignition Voltage in range • Run Time > 10 • 10.9936 < Battery Voltage < 15.9907 • For engine cycles ≥ 15 Coolant Temperature in range If (start up coolant temperature < cold start thresh and coolant temperature greater that after cold start thresh) • Coolant temperature at start-up < -7°C(19.4 °F) • Calculated coolant temperature with default applied > 21°C (69.8 °F) Else if(coolant temperature greater that lo threshold and coolant temperature less than High threshold) • Calculated coolant temperature with default applied > -7°C (19.4 °F) • Calculated coolant temperature with default applied > 120° C(248 °F) • For engine cycles ≥ 15 Power Up delay not active • Run time > 0 Misfire not requesting TCC unlock and TCC still locked • For engine cycles ≥ 0 no disabling faults present / no disabiling Active Faults	• Faulty Spark plugs • Faulty Spark plug cables • Air Leakage • Belt deflection and Air gap of CKPS • Incorrect timing • Faulty injector • Improper fuel pressure • Improper engine compression • Faulty PCM

		• P0340 / P0341 / P0118 / P0117 / P0115 / P0336 / P0335 / P1295 / P0103 / P0102 / 0108 / P0107 / P0106 / P0501 • Run Time< 10 • Engine Load is below zero torque line. • RPM < 1500 • For engine cycles ≥ 11	
Thresh old value	Case 1	• Individual event misfire detection > Threshold	
	Case 2	• Emissions damaging >Threshold	
	Case 3	• Catalyst damaging > Threshold	
Diagnosis time		• Continuous	
MIL ON condition		• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.
▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 5 Misfire Detected" on CURRENT DATA

   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm

MONITOR SCANTOOL DATA

1. Is the power balance test done?

YES

▸ If injector connector for power balance test is disconnect for over 46 sec., this can cause DTC relating to misfire. Stop the test and connect it and delete DTC and then go to "Verification of Vehicle repair" procedure.

▸ If power balance test is finished within 46 sec., go to next procedure.

NO

▸ Go to "Monitor scantool data" as follows.

2. Monitor scantool data
   (1) Ignition "OFF"
   (2) Connect Scantool and Engine "ON"
   (3) Monitor parameters related to " Cylinder 6 Misfire Detected" on CURRENT DATA

   Specification :

Ignition	BTDC 10° ± 5°		
Idle speed	A/CON OFF	Neutral, N, R, P-range	620 ± 100 rpm
		D-range	
	A/CON ON	Neutral, N, R, P-range	
		D-range	

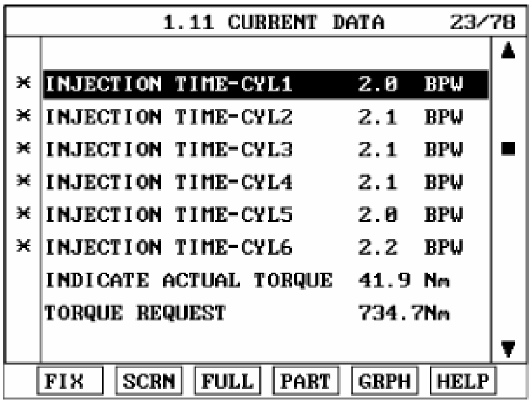

Fig. 1

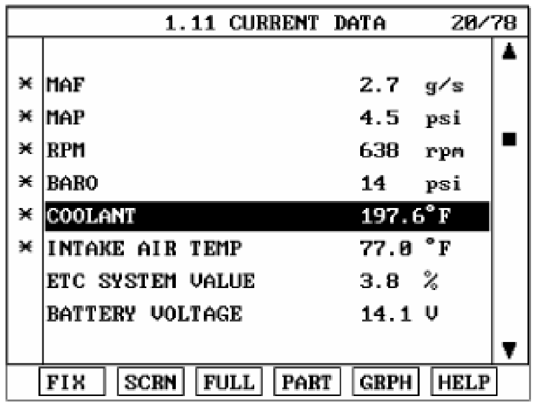

Fig. 2

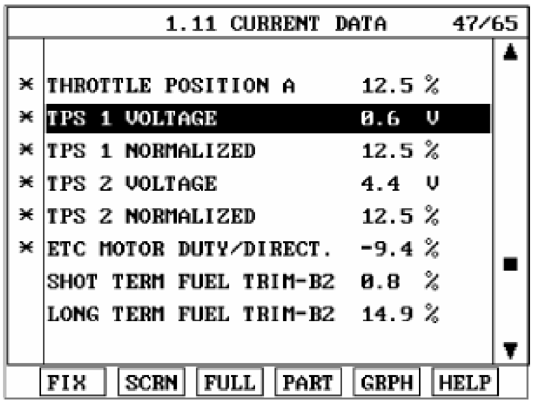

Fig. 3

(4) Are the parameters related to "Cylinder 6 Misfire Detected" displayed correctly on Current Data ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "System Inspection " procedure

SYSTEM INSPECTION

1. Check Spark Pulg
   (1) Remove cylinder's spark plugs
   (2) Visually/physically inspect the following items:
   - Damaged insulation, Worn electrodes, Oil or fuel fouled, Loose terminals and cracks
   - Check for plug gap : 1.0 - 1.1 mm (0.039 - 0.043 in.)
   - Check if the spark plug for the relevant cylinder is lighter in color than the other plugs.

   (3) Has a problem been found in any of the above areas?

   YES

   ▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▸ Go to "Check Air Leakage " as below

2. Check Air Leakage
   (1) Visually/physically inspect the air leakage in intake/exhaust system as following items,
   - Vacuum hoses for splits, kinks and improper connections.
   - Throttle body gasket
   - Gasket between intake manifold and cylinder head
   - Seals between intake manifold and fuel injectors
   - Exhaust system between HO2S and Three way catalyst for air leakage

   (2) Has a problem been found in any of the above areas?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check for air leakage in Positive Crankcase Ventilation Valve(PCV)

3. Check for air leakage in Positive Crankcase Ventilation Valve(PCV)
   (1) Remove PCV valve from cylinder head cover by puling ventilation hose

   (2) With engine idling block PCV valve opening

   (3) Verify that vacuum is felt

   (4) Remove PCV valve

   (5) Blow through valve from prot "A" and verify that air comes out of prot "B"

   (6) Blow through valve from prot "B" and verifty that no air comes out of port "A"

   (7) Has a problem been found ?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Check Compression pressure" as below

4. Check Compression pressure
   (1) Warm up the engine to normal operating temperature

   (2) Disconnect the spark plug cables and remove the spark plugs.

   (3) Crank the engine to remove any foreign material in the cylinders.

   (4) Put compression pressure gauge into spark pulg hole

   (5) Crank the engine with widely opend throttle valve and check compression pressure at each cylinder

---

Specification : 1323kPa(13.5 kg/cm²,192 psi)

---

   (6) Is compression pressure for each cylinder displayed within specifications ?

YES

▸ Go to "Check Timing " as below

NO

▸ Add a small amount of oil through the spark plug hole, and repeat above steps. If the addition of oil causes the compression to rise, the cause is a worn or damaged piston ring or cylinder inner surface.
▸ If the compression remains the same, the cause is a burnt or defective valve seat, or pressure is leaking from the gasket. Repair as necessary and go to "Verification of Vehicle Repair" procedure

5. Check Timing
   (1) Ignition "OFF"

   (2) Check that Cam, Crank and Oil pump sprocket timing marks are correctly in alignment

   (3) Monitor these signal waveforms from CAM and Crank shaft position Sensor are correctly in alignment

   (4) Are all timing marks alligned correctly ?

YES

▸ Go to "Check Fuel Pressure Test" as below

NO

   (5) ▸ Repair or readjust as necessary and go to "Verification of Vehicle Repair" procedure

6. Check Fuel Pressure Test
   (1) Refer to "Fuel pressure test" in "Fuel delivery system"
   (2) Are the measured fuel pressure within specifications ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Repair or replace as necessary above and then, go to " Verification of Vehicle Repair"procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

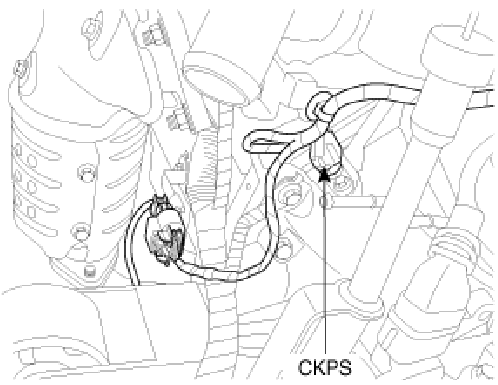
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0315

COMPONENT LOCATION



GENERAL DESCRIPTION

The Tooth Error Correction (TEC) Learn Algorithm determines engine-specific variation in crankshaft position sensing. The largest factor of variation is geometric tooth spacing although other factors, such as bearing run out, may also be present. Once TEC is learned, compensation factors are then calculated and used by the Misfire Diagnostic algorithm to improve the accuracy of engine positiondeterminations.Tooth error correction factors are normally learned only once during the life of a vehicle. However, if a vehicle controller, engine crankshaft, target wheel, or crank sensor is replaced or serviced, tooth error correction factors must be re-learned. This can be performed in a service environment with serial data commands.

DTC DESCRIPTION

It is impossible to forge or machine a perfectly proportioned crankshaft wheel. Therefore, each crankshaft wheel produced will have minor variations in the spacing and/or width of its gear teeth.These variations (tooth error), if not compensated for, can cause false misfire detection. In order to account for tooth error, the tooth error correction algorithm measures the variation in crankshaft wheel teeth and calculates a compensation factor, which is applied to the reference periods when the misfire detection algorithm runs. This compensation factor is learned once, early in the life of the vehicle, and need never be learned again unless the crank

wheel is replaced or the vehicle's PCM EEPROM or similar storage device is erased.
Checking tooth error correction under detecting condition, if the TEC is out of Threshold value, PCM sets P0315.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This DTC indicates that crankwheel tooth error has not been learned.	• CKPS • Target wheel • PCM
Enable Conditions	• 11.4932 ≤ Ignition Voltage ≤15.9907 • 10.0006 ≤ Engine load< 89.9993 • 2000 ≤ engine speed ≤ 4000 • Vehicle speed < 5kph(3.106856 mph) • Tec RPM stability timer >10sec • 0°C(32°F)< coolant temp< 110°C(230°F) • Not active disabling faults • Not key on disabling faults	
Threshold value	• Distance driven without learning tooth error ≥ 4000km (2485.484769 mile) • Maximum allowed number of tooth error correction samples taken in the On The Road(OTR)learning mode< 50 counts • Individual tooth error factors outside calibratable range = True • Sum of tooth error factors variation outside calibratable range ≥ 50 counts	
Diagnosis Time	• Continuous (More than 0.15sec failure)	
MIL On Condition	• DTC only	

COMPONENT INSPECTION

1. Visually check CKPS and target wheel
   (1) IG "OFF"
   (2) Check CKPS and target wheel for deformation or damage visually
   (3) Is the above items normal ?

   YES

   ▸ Go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

   > **NOTE**
   >
   > There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

   YES

   ▸ Go to the applicable troubleshoooting procedure.

   NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0325

COMPONENT LOCATION

GENERAL DESCRIPTION

Knocking is a phenomenon characterized by undesirable vibration and noise that can cause engine damage. A knock sensor (KS) is mounted on the cylinder block and senses engine knocking. A knocking vibration from the cylinder block is applied as pressure to the piezoelectric element. A knock sensor (KS) detects vibration when RPM rises or drops and generates voltages based on this vibration. The PCM controls the ignition timing based on the amplitude and frequency of the knock sensor signal. For example, if engine knocking occurs, the ignition timing is retarded to prevent it.

DTC DESCRIPTION

Checking the range of input signal with a knock sensor under detecting condition, PCM senses open or short in knock sensor circuit or malfunction of sensor. If a knock signal or noise level is without the specified value during standard duration, PCM sets P0325. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Signal open	• Poor connection • Open in harness • Knock sensor • PCM
Enable Conditions	• Pressure in intake manifold is normal. • Engine speed ≤ 1600rpm	
Threshold value	• Filter coefficient < 0.8	
Diagnosis Time	• Continuous (More than 12.5 sec.failure for every 25 sec.test)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA

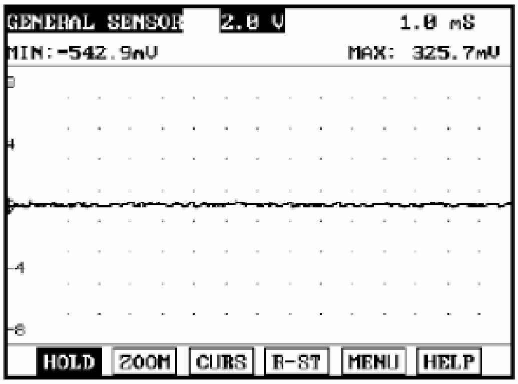


Fig. 1

The knock sensor is installed at cycliner block to detect the vibration effectively during engine running.
The above waveform shows the signal waveform of knock sensor when knock dosen't happen. Generally, knock signal has more noise than other sensor.

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor item related to knock sensor on the service data.

Normal data at idle

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and connector inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

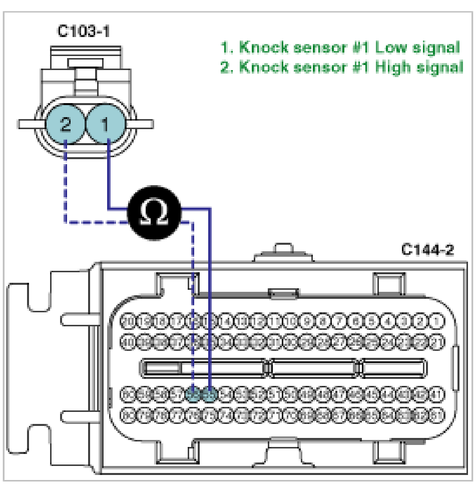
1. Check open in harness

(1) IG "OFF" and disconnect knock sensor connector and PCM connector.

(2) Measure resistance between terminal 1 of knock sensor harness connector and terminal 55 of PCM harness connector.

(3) Measure resistance between terminal 2 of knock sensor harness connector and terminal 56 of PCM harness connector.

Specification : Below 1Ω



(4) Is the measured resistance within specification?

YES

- If the problem is corrected after substituting with a known - good knock sensor, replace it. If the problem is pending, check for proper operating after substituting with a known - good PCM. and then if the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

- Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

- Go to the applicable troubleshoooting procedure.

NO

- System is performing to specification at this time.

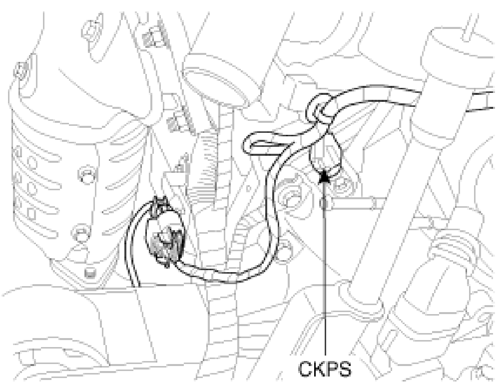
Fuel System > Troubleshooting > P0335

COMPONENT LOCATION



GENERAL DESCRIPTION

Crankshaft Position Sensor (58X) derives its name from the fact that current systems utilize a Crankshaft Position Sensor, coupled with a 58-tooth crankshaft wheel, to determine crankshaft angular position. Each edge of the wheel corresponds to a change in crank sensor output voltage as a tooth edge passes the sensor. The sensor will produce 58 pulses with one rotation of the crankshaft.

DTC DESCRIPTION

Checking reference signals from CKPS under detecting condition, if any signal is detected for more than 0.15 sec., PCM sets P0335. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Check reference wave during cranking	• Poor connection • Open in harness • CKP sensor • PCM
Enable Conditions	• IG "ON", Cranking or engine-off during driving • No DTC related to CAM	
Threshold value	• No reference signal over 0.15 sec.	
Diagnosis Time	• 0.15 sec.	
MIL On Condition	• 2 driving cycles

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Signal Circuit Inspection" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect CKPS connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 1 of CKPS harness connector and chassis ground.
   (4) Measure voltage between terminal 2 of CKPS harness connector and chassis ground.

Specification : Approx. 1.4V

   (5) Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Go to "Check short in harness" as follows.

2. Check short in harness
   (1) IG "OFF" and disconnect CKPS connector and PCM connector.
   (2) Measure resistance between terminal 1(2) of CKPS harness connector and chassis ground.
   (3) Measure resistance between terminals 1 and 2 of CKPS harness connector.

Specification : Infinite

   (4) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair short in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Visually check CKPS and Target wheel
   (1) IG "OFF"
   (2) Check CKPS and target wheel for deformation or damage visually
   (3) Is the above items normal ?

YES

▸ Go to "Check CKPS resistance" as follows.

NO

▸ Repair or replace it, and go to "Verification of Vehicle Repair" procedure.

2. Check CKPS resistance
   (1) IG "OFF" and disconnect CKPS connector.
   (2) Measure resistance between terminals 1 and 2 of CKPS connector. (Component side)

Specifiation :

Resistance	700 ± 70Ω

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check signal waveform of CKPS" as follows.

NO

▸ Substitute with a known - good CKPS and check for proper operation. If the problem is corrected, replace CKPS and go to "Verification of Vehicle Repair" procedure.

3. Check signal waveform of CKPS
   (1) IG "OFF" and connect scantool.
   (2) ENG "ON" and Measure signal waveform at terminal 1 or 2 of CKPS.

Reference signal waveform :

   (3) Is the measured siganl waveform normal?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary, and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

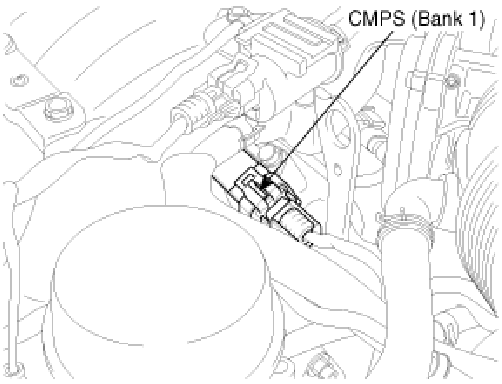
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0340

COMPONENT LOCATION



GENERAL DESCRIPTION

Camshaft Position Sensor (CMPS) is a hall sensor and detects the camshaft position by using a hall element. It is related with Crankshaft Position Sensor (CKPS) and detects the piston position of the each cylinder which the CKPS can't detect. The two CMPS are installed on engine head cover of bank 1 and 2 and uses a target wheel installed on the camshaft. This sensor has a hall-effect IC which output voltage changes when magnetic field is made on the IC with current flow. When teeth on the target wheel trigger the sensor, output voltage is 5V. If not, it is 0V. These CMPS signal is sent to the PCM and it uses CMPS signals for determining the ignition timing with CKPS signals. CMPS makes Sequential Injection possible.

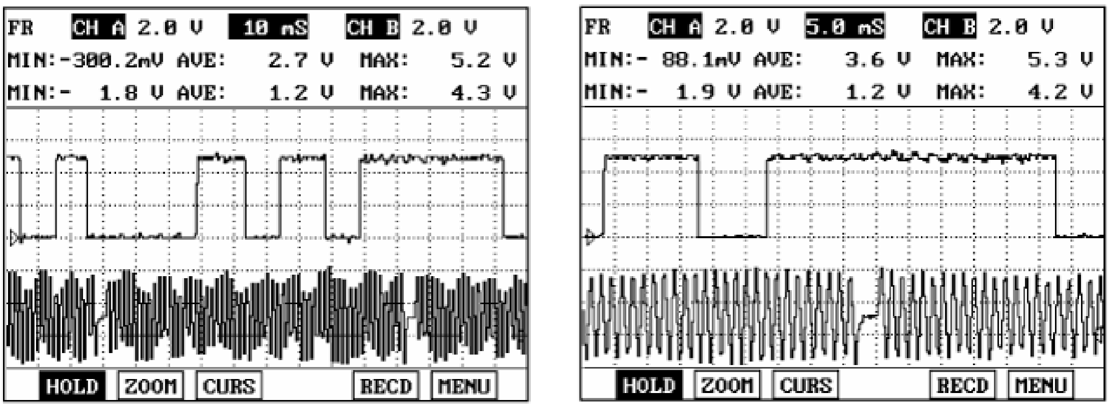
DTC DESCRIPTION

If signals from CMPS is not synchronised with CKPS for more than 3 times under detecting condition, PCM sets P0340. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Check if CAM sensor is synchronized correctly	• Poor connection • Open in harness • CMPS(Bank 1) • PCM
Enable Conditions	• Engine running state	
Threshold value	• The number of time that CAM signal is not synchronized ≥ 3	
Diagnosis Time	• Continuous	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFROM AND DATA



This example shows a typical Crankshaft Position Sensor(CKPS) and Camshaft Position Sensor(CMPS) waveform at idle. The PCM controls the injection and ignition timing by using these signals. Generally CKPS signal is used to detect the piston's position and CMPS signal is used to detect the Top Dead Center of each cylinder.

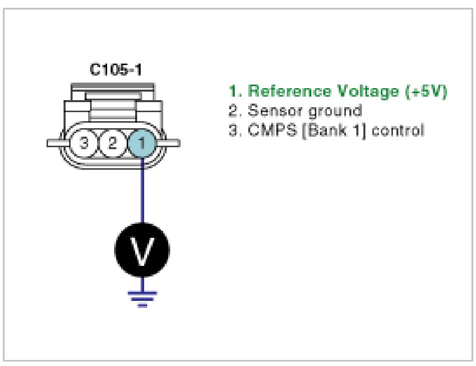
▸ Go to "Power Circuit Inspection" procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect CMPS connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of CMPS(B1) harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification?

YES

▸ Go to "Signal Circuit Inspection" procedure.

NO

▸ Repair open or short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

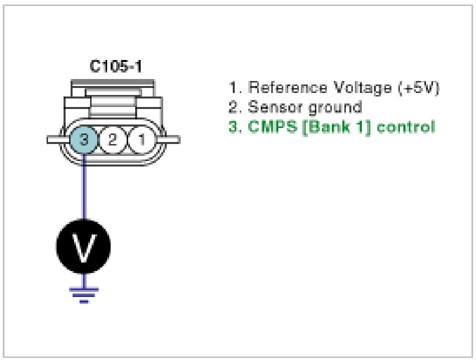
SIGNAL CIRCUIT INSPECTION

1. Check voltage
   (1) IG "OFF" and disconnect CMPS connector.

(2) IG "ON" and ENG "OFF"

(3) Measure voltage between terminal 3 of CMPS(B1) harness connector and chassis ground.

Specification : Approx. 5V



(4) Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" as follows.

NO

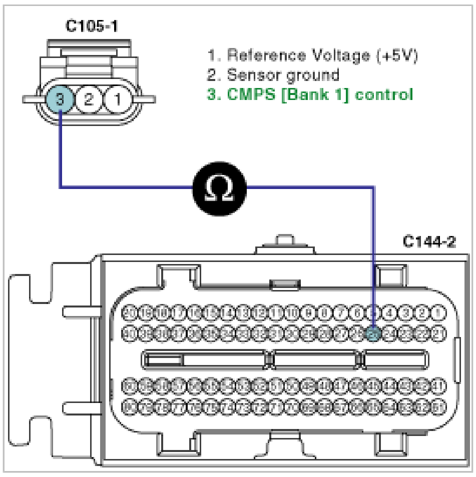
▸ Go to "Check open in harness' as follows.

2. Check open in harness

(1) IG "OFF" and disconnect CMPS connector and PCM connector.

(2) Measure resistance between terminal 3 of CMPS harness connector and terminal 25 of PCM harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Ground Circuit Inspection" procedure.

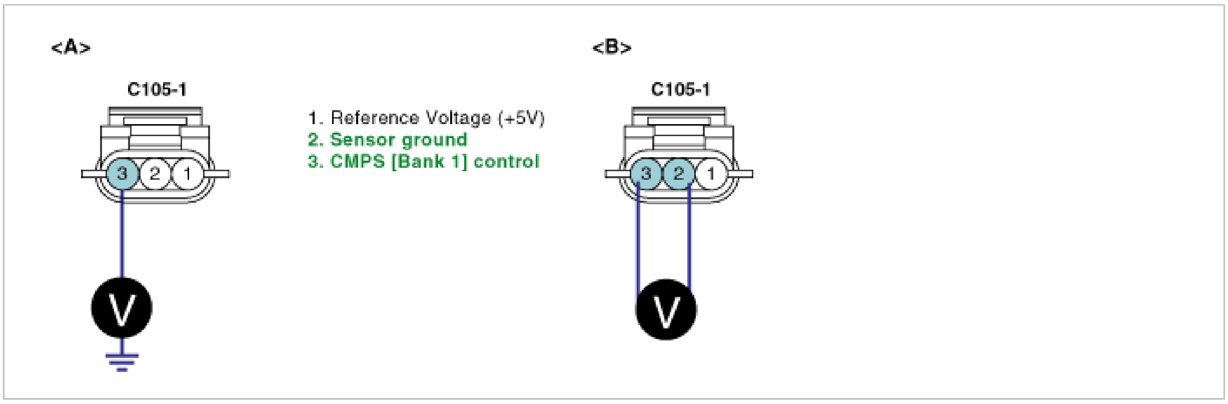
NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. IG "OFF" and disconnect CMPS connector.
2. Measure voltage between terminal 3 of CMPS harness connector and chassis ground.
3. Measure voltage between terminals 2 and 3 of CMPS harness connector.

Specification : Measurement "A" - Measurement 'B' = Approx. below 200mV



4. Is the measured voltage within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open or contact resistance in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check CMPS
   (1) IG "OFF" and connect scantool.
   (2) ENG "ON" and Measure signal waveform at terminal 3 of CMPS.

Reference signal waveform :

   (3) Is the measured siganl waveform normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good CMPS and check for proper operation. If the problem is corrected, replace CMPS and go to "Verification of Vehicle Repair" procedure.

4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0351

COMPONENT LOCATION

GENERAL DESCRIPTION

When the ignition switch is ON or START position, voltage is applied to the ignition coil. Each ignition coil consists of two coils. High tension leads go to each cylinder from ignition coils. Ignition coils fire two spark plugs on every power stroke (the cylinder under compression and the one on the exhaust stroke). PCM provides ground to a switching circuit for energizing the primary ignition coils. PCM uses the crankshaft position sensor and camshaft position sensor signals to meet the timing of energizing coil. When a primary ignition coil is energized or de-energized, the secondary coil produces a high voltage spike to the attached spark plugs.

DTC DESCRIPTION

Checking output signals from ignition coils every 10 sec. under detecting condition, if signals indicating open of short in the circuit are detected for more than 10 sec., PCM sets P0351. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground, to battery or open circuit	• Poor connection • Open or short in harness • Ignition Coil • PCM
EnableConditions	• NO DTC related to this item • Engine running state • 11V ≤ Battery voltage ≤ 16V • The above conditions are met > 0.5 sec.	
Threshold value	• Open or short	
DiagnosisTime	• Continuous (More than 5 sec.failure for every 10 sec.test)	
MIL On Condition	• 2 driving cycles	

SPECIFICATION

Resistance (Ω)	Primary Coil	Secondary Coil
	0.62 ± 10%	7.0k ± 15%

3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSEPCTION

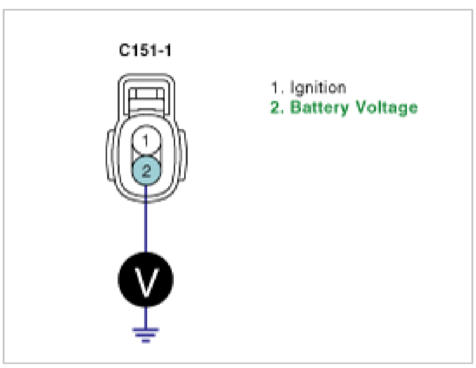
1. Check voltage

(1) IG "OFF" and disconnect Ignition Coil connector.

(2) IG "ON" and ENG "OFF"

(3) Measure voltage between terminal 2 of ignition coil harness connector and chassis ground.

Specification : Approx. B+



(4) Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection" procedure.

NO

▸ Check fuse connected to ignition coil for open.

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to battery in harness.
   (1) IG "OFF" and disconnect ignitioncoil connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of ignition coil harness connector.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check short to ground in harness" as follows.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check short to ground in harness
   (1) IG "OFF" and disconnect ignition coil connector and PCM connector.
   (2) Measure resistance between terminal 1 of ignition coil harness connector and chassis ground.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

3. Check open in harness
   (1) IG "OFF" and disconnect Ignition Coil connector and PCM connector.
   (2) Measure resistance between terminal 1 of Ignition Coil harness connector and terminal 79 of PCM harness connector.

Specification : Below 1Ω

   (3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Ignition Coil
   (1) IG "OFF" and disconnect ignition coil connector.

   (2) Measure resistance between terminals 1 and 2 of ignition coil connector.(Component side)

   (3) Measure resistance between terminal 1 of ignition coil connector and out terminal of secondary ignition coil.
   Specification :

Resistance (Ω)	Primary Coil	Secondary Coil
	0.62 ± 10%	7.0k ± 15%

   (4) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation
▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good Ignition Coil and check for proper operation.
▸ If the problem is corrected, replace Ignition Coil and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0352

COMPONENT LOCATION

GENERAL DESCRIPTION

When the ignition switch is ON or START position, voltage is applied to the ignition coil. Each ignition coil consists of two coils. High tension leads go to each cylinder from ignition coils. Ignition coils fire two spark plugs on every power stroke (the cylinder under compression and the one on the exhaust stroke). PCM provides ground to a switching circuit for energizing the primary ignition coils. PCM uses the crankshaft position sensor and camshaft position sensor signals to meet the timing of energizing coil. When a primary ignition coil is energized or de-energized, the secondary coil produces a high voltage spike to the attached spark plugs.

DTC DESCRIPTION

Checking output signals from ignition coils every 10 sec. under detecting condition, if signals indicating open of short in the circuit are detected for more than 10 sec., PCM sets P0352. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

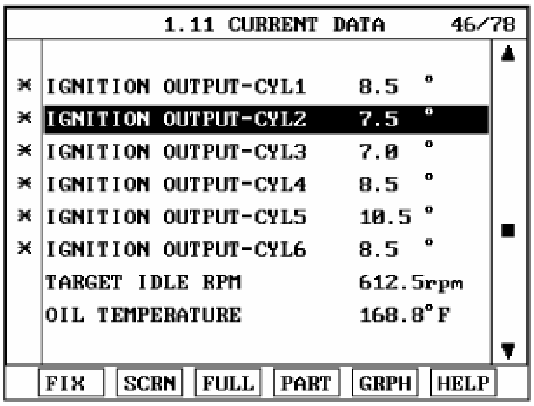
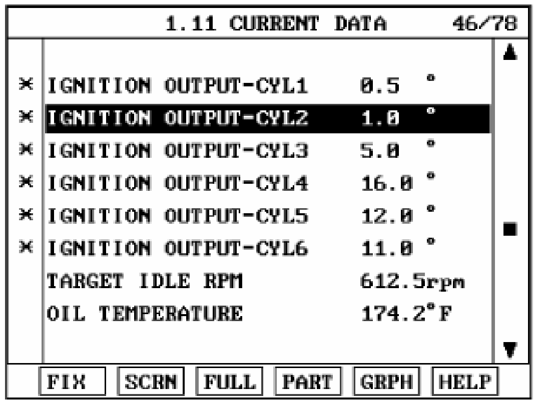
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor items related to Ignition on the service data.

Specification : BTDC 10° ± 5°



Normal at idle



Open at idle

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, ending, corrosion, contamination, deterioration, or damage. Repair or replace asnecessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSEPCTION

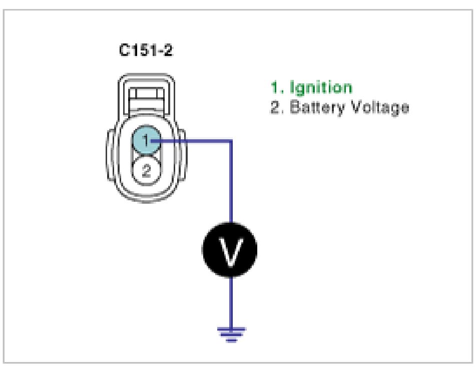
1. Check voltage

(1) IG "OFF" and disconnect Ignition Coil connector.

(2) IG "ON" and ENG "OFF"

(3) Measure voltage between terminal 1 of ignition coil harness connector and chassis ground.

Specification : Approx. B+



(4) Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection" procedure.

NO

▸ Check fuse connected to ignition coil for open.

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to battery in harness.
   (1) IG "OFF" and disconnect ignitioncoil connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of ignition coil harness connector.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check short to ground in harness" as follows.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check short to ground in harness
   (1) IG "OFF" and disconnect ignition coil connector and PCM connector.
   (2) Measure resistance between terminal 2 of ignition coil harness connector and chassis ground.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

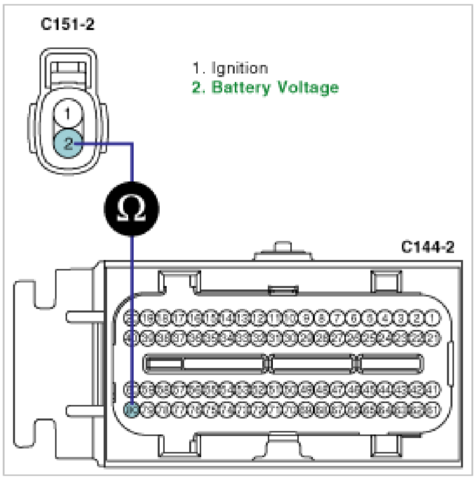
▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

3. Check open in harness
   (1) IG "OFF" and disconnect Ignition Coil connector and PCM connector.
   (2) Measure resistance between terminal 2 of Ignition Coil harness connector and terminal 60 of PCM harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Ignition Coil

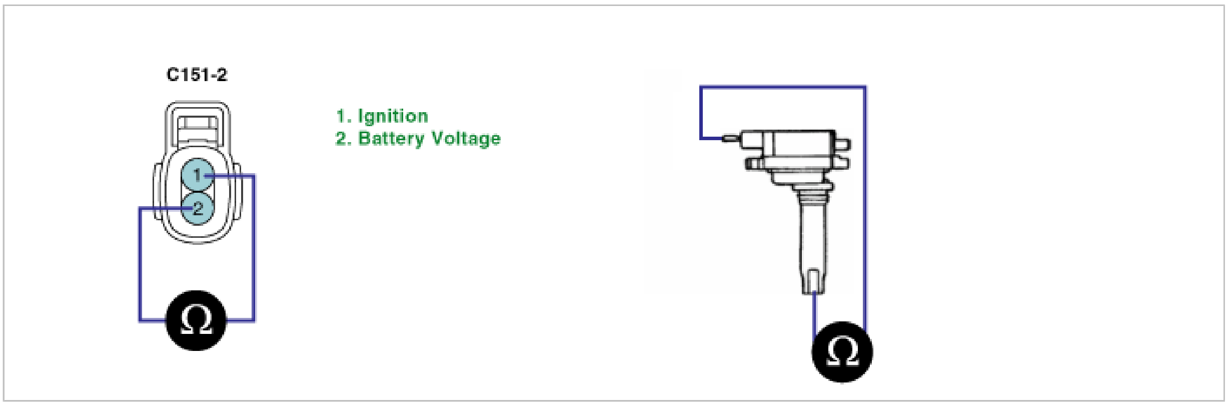
(1) IG "OFF" and disconnect ignition coil connector.

(2) Measure resistance between terminals 1 and 2 of ignition coil connector.(Component side)

(3) Measure resistance between terminal 1 of ignition coil connector and out terminal of secondary ignition coil.

Specification :

Resistance (Ω)	Primary Coil	Secondary Coil
	0.62 ± 10%	7.0k ± 15%



(4) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation
▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good Ignition Coil and check for proper operation.
▸ If the problem is corrected, replace Ignition Coil and go to "Verification of Vehicle Repair" procedure.

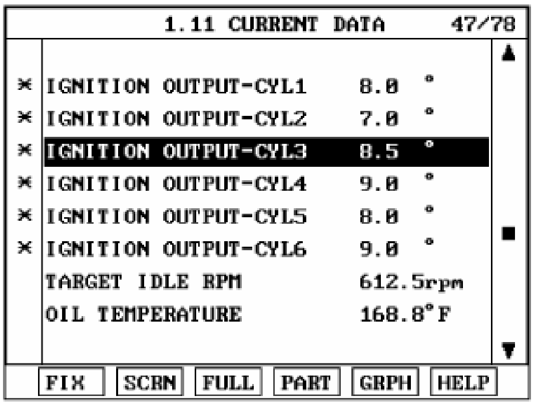
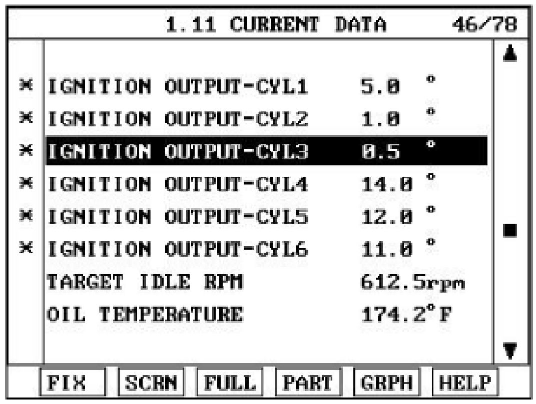
MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor items related to Ignition on the service data.

Specification : BTDC 10° ± 5°



Normal at idle



Open at idle

4. Is the service data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, ending, corrosion, contamination, deterioration, or damage. Repair or replace asnecessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals.
   Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSEPCTION

1. Check voltage
   (1) IG "OFF" and disconnect Ignition Coil connector.
   (2) IG "ON" and ENG "OFF"
   (3) Measure voltage between terminal 1 of ignition coil harness connector and chassis ground.

Specification : Approx. B+

   (4) Is the measured voltage within specification ?

YES

▸ Go to "Control Circuit Inspection" procedure.

NO

▸ Check fuse connected to ignition coil for open.

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to battery in harness.
   (1) IG "OFF" and disconnect ignitioncoil connector and PCM connector.
   (2) Measure resistance between terminals 1 and 2 of ignition coil harness connector.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check short to ground in harness" as follows.

NO

▸ Repair short to battery in harness, and go to "Verification of Vehicle Repair" procedure.

2. Check short to ground in harness
   (1) IG "OFF" and disconnect ignition coil connector and PCM connector.
   (2) Measure resistance between terminal 2 of ignition coil harness connector and chassis ground.

Specification : Infinite

   (3) Is the measured resistance within specification?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

3. Check open in harness
   (1) IG "OFF" and disconnect Ignition Coil connector and PCM connector.
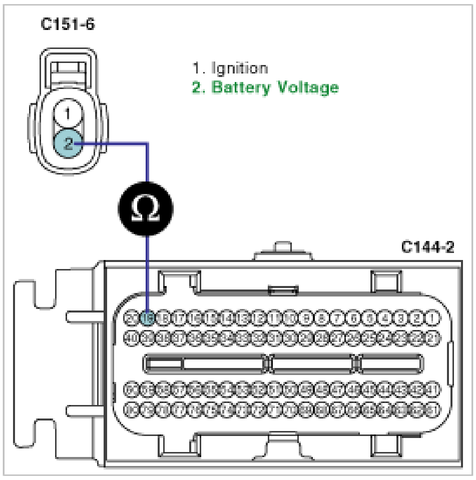
   (2) Measure resistance between terminal 2 of Ignition Coil harness connector and terminal 19 of PCM harness connector.

Specification : Below 1Ω



(3) Is the measured resistance within specification?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check Ignition Coil

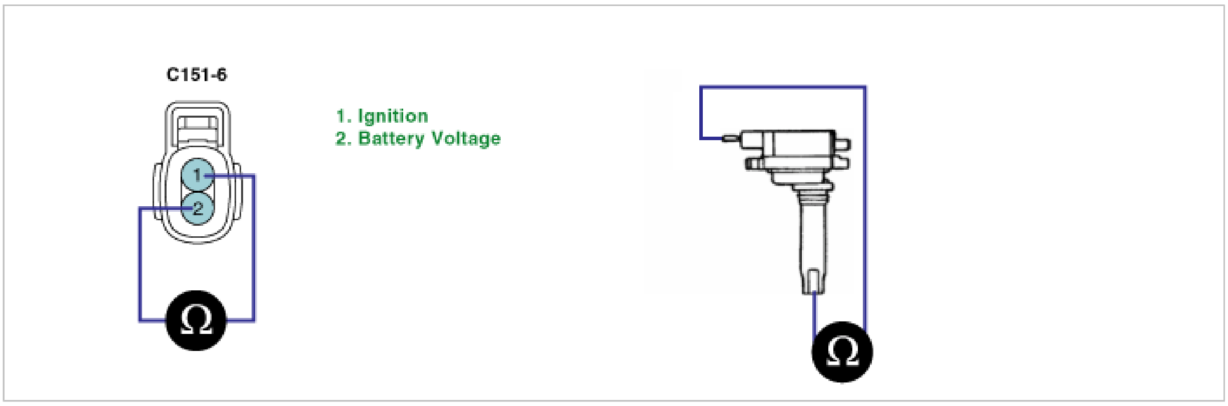
(1) IG "OFF" and disconnect ignition coil connector.

(2) Measure resistance between terminals 1 and 2 of ignition coil connector.(Component side)

(3) Measure resistance between terminal 1 of ignition coil connector and out terminal of secondary ignition coil.

Specification :

Resistance (Ω)	Primary Coil	Secondary Coil
	0.62 ± 10%	7.0k ± 15%



(4) Is the measured resistance within specification?

YES

▸ Substitute with a known - good PCM and check for proper operation

▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good Ignition Coil and check for proper operation.

▸ If the problem is corrected, replace Ignition Coil and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0420

COMPONENT LOCATION

GENERAL DESCRIPTION

The catalyst’s efficiency is demonstrated by its ability to oxidize CO and hydrocarbon emissions. The Powertrain Control Module (PCM) compares the output signals of the front and rear oxygen sensors to determine whether the output of the rear sensor is beginning to match the output of the front oxygen sensor. Air/fuel mixture compensation keeps the frequency of the front oxygen sensor high due to the changes from rich-to-lean combusition. The catalyst causes the rear oxygen sensor to have a lower frequency. As the catalyst wears, the rear oxygen sensor’s signal trace begins to match the front oxygen sensor’s signal trace. That is because the catalyst becomes saturated with oxygen and cannot use the oxygen to convert hydrocarbon and CO into H_2O and CO_2 with the same efficiency as when it was new. A completely worn catalyst shows a 100% match between the frequency of the front and rear sensors.

DTC DESCRIPTION

If the oxygen storage time for B1 is higher than threshold , the PCM determines that a fault exists and a DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

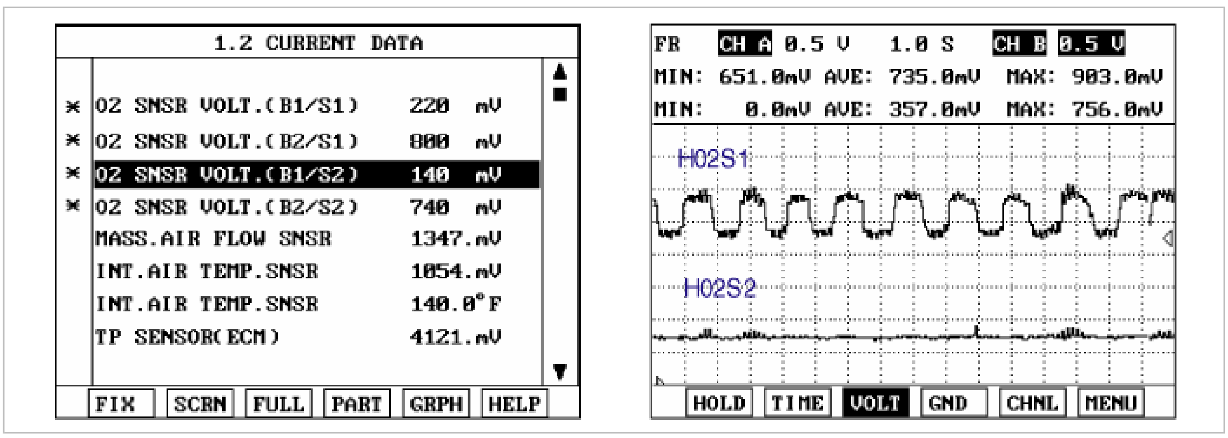
DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• The ICMD Diagnostic manipulates Airfuel and stores the times it takes for the pre and post converter oxygen sensors to switch. It then calculates EWMA values and compares them against calibratable thresholds in order to determine the PASS/FAIL status.	
	• Engine Runtime Sufficient ≥ 580sec • Purge Concentration Learned • 3g/s ≤ Airflow within range ≤ 10g/s • Throttle closed ≤ 1.5015% • 70°C(158 °°F) ≤ Coolant Temp ≤ 120°C(248 °F) • -7°C(19.4 °F) ≤ Ambient Temp ≤ 105°C(221 °F)	

EnableConditions	• Barometer ≥ 72kPa • Too many test attempts ≤ 12 • Closed Loop • 250°C(482 °F) ≤ Catalyst Temp ≤ 950°C(1742 °°F) • Fuel Integrator deviation from stoich below maximum ≤ 0.05 • Vehicle speed ≤ 3kph(1.864114mph) • BLM Learn completed • Low idle airflow not present (airflow delay complete) • Not airfuel ramping • Not idling for too long ≤ 60sec • Test not complete • No disabling faults present • No instrumentation slews active • No OFVC device control active	• Leakage in the exhaust system • Faulty Catalyst Converter • Faulty HO2S • Faulty PCM
Threshold value	• EWMA Oxygen Storage Time for Bank 1 ≥ 3.25s(Passing) 3.75s	
DiagnosisTime	• -	
MIL On Condition	• 1 Driving cycle	

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Ignition "ON".
3. Monitor the HO2S parameters and signal waveform on scantool.



4. Are the signal of rear HO2S and waveform the same as that of the front HO2S?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification vehicle Repair" procedure.

SYSTEM INSPECTION

1. Check Exhaust sytem.
   (1) Visually/physically inspect the following conditions:
      A. Exhaust system between HO2S and Three way catalyst for air leakage
      B. Damage, and for loose or missing hardware:

   (2) Has a problem been found in any of the above areas?

   YES

   ▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure.

   NO

▸ Go to "Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Rear HO2S.
   (1) Visually/physically inspect the rear HO2S for the following conditions:
      A. Ensure that the HO2S is securely installed.
         (Pigtail and wiring harness not making contact with the exhaust pipe)
      B. Check for corrosion on terminals.
      C. Check for terminal tension (at the HO2S and at the PCM).
      D. Any damage.

   (2) Has a problem been found in any of the above areas?

   YES

   ▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check TWC" as below.

2. Check TWC
   (1) Visually/physically inspect the three-way catalyst(TWC) converter for the following damage:
      A. Severe discoloration caused by excessive temperature
      B. Dents and holes
      C. Internal rattle caused by a damaged catalyst

   (2) Also, ensure that the TWC is a proper original equipment manufacturer part.

   (3) Has a problem been found?

   YES

   ▸ Substitute with a known - good TWC and check for proper operation.
   ▸ If the problem is corrected, replace TWC and go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Substitute with a known - good PCM and check for proper operation.
   ▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

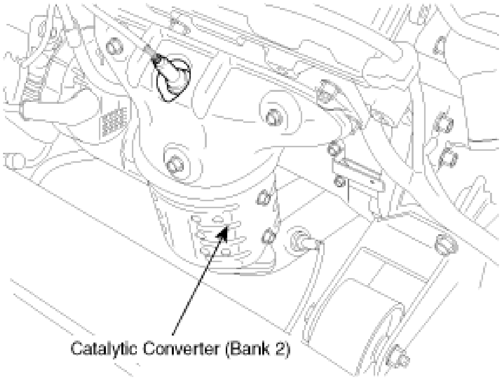
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0430

COMPONENT LOCATION



GENERAL DESCRIPTION

The catalyst's efficiency is demonstrated by its ability to oxidize CO and hydrocarbon emissions. The Powertrain Control Module (PCM) compares the output signals of the front and rear oxygen sensors to determine whether the output of the rear sensor is beginning to match the output of the front oxygen sensor. Air/fuel mixture compensation keeps the frequency of the front oxygen sensor high due to the changes from rich-to-lean combusition. The catalyst causes the rear oxygen sensor to have a lower frequency. As the catalyst wears, the rear oxygen sensor's signal trace begins to match the front oxygen sensor's signal trace. That is because the catalyst becomes saturated with oxygen and cannot use the oxygen to convert hydrocarbon and CO into H_2O and CO_2 with the same efficiency as when it was new. A completely worn catalyst shows a 100% match between the frequency of the front and rear sensors.

DTC DESCRIPTION

If the oxygen storage time for B2 is higher than threshold , the PCM determines that a fault exists and a DTC is stored. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0441

GENERAL DESCRIPTION

The evaporative emission control system prevents hydrocarbon (HC) vapors from the fuel tank from escaping into the atmosphere where they could form photochemical smog. Gasoline vapors are collected in the charcoal canister. The evaporative canister is designed to trap and store fuel vapor emissions from the fuel tank.
When the carbon in the canister is unsaturated, fuel vapor passing over and through the activated carbon surface is absorbed and fresh air can pass out through the vent system with very little residual fuel vapor. When fresh air is drawn through the canister from the vent system, fuel vapors recombine with the air and are metered into the engine.

DTC DESCRIPTION

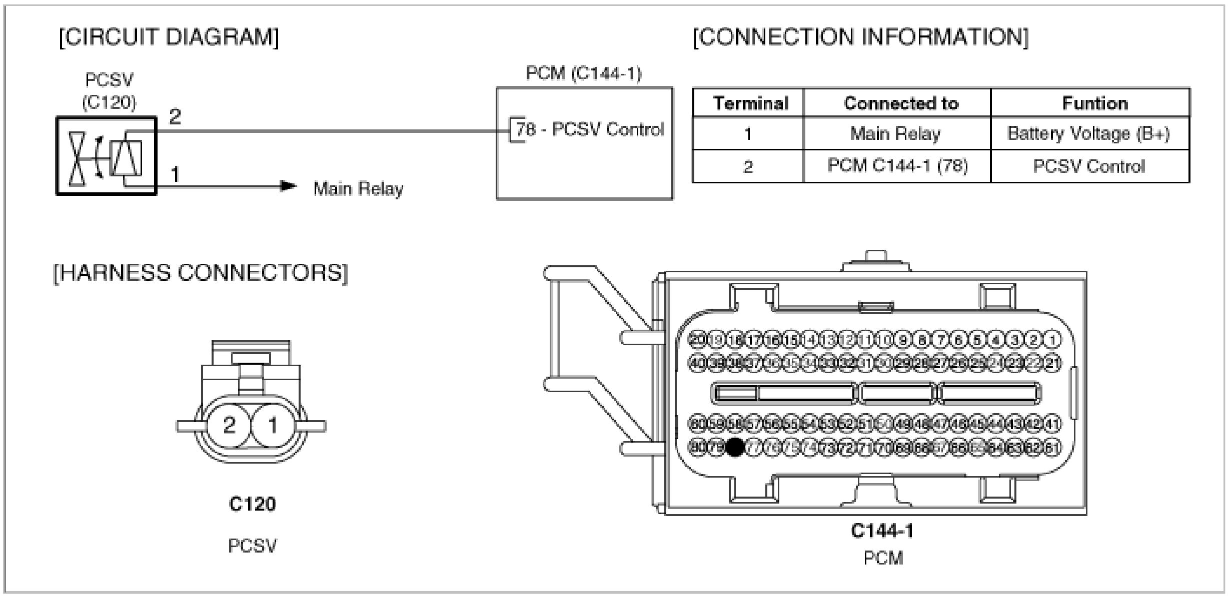
This test detects a leak across the purge valve by measuring an increase in evaporative system vacuum. A leak across the purge valve can allow hydrocarbons from the tank to leak to the atmosphere when the engine is off. The test should be calibrated to detect a 0.02” (0.5mm) leak path across the purge valve. This testdoes not require idle conditions to run.
Checking output signals from tank vaccum under detecting condition, if signals is high than threshold for more than 2 sec., PCM sets P0441. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Test is failed if tank vacuum exceeds prescribed threshold, based on fuel level for a prescribed time	
	• 10 < Ignition Volt < 15.9907 • Barometric pressure > 72 kPa	

EnableConditions	• Engine off time > 720min or Startup IAT-Startup ECT < 12°C(53.6 °F) • Startup ECT -Startup IAT < 12°C(53.6 °F) • 0°C(32 °F) < Startup ECT < 40°C(104 °F) • 0°C(32 °F) < Startup IAT < 40°C(104 °F) • Start-up IAT-IAT < 1°C(33.8 °F) • 1s < Engine Run Time < 100s	• PCSV • PCM
Threshold value	• Tank vacuum ≥ 10 inH2O • Fail time > 2s	
DiagnosisTime	• Continuous	
MIL On Condition	• 1 driving cycle	

SCHEMATIC DIAGRAM

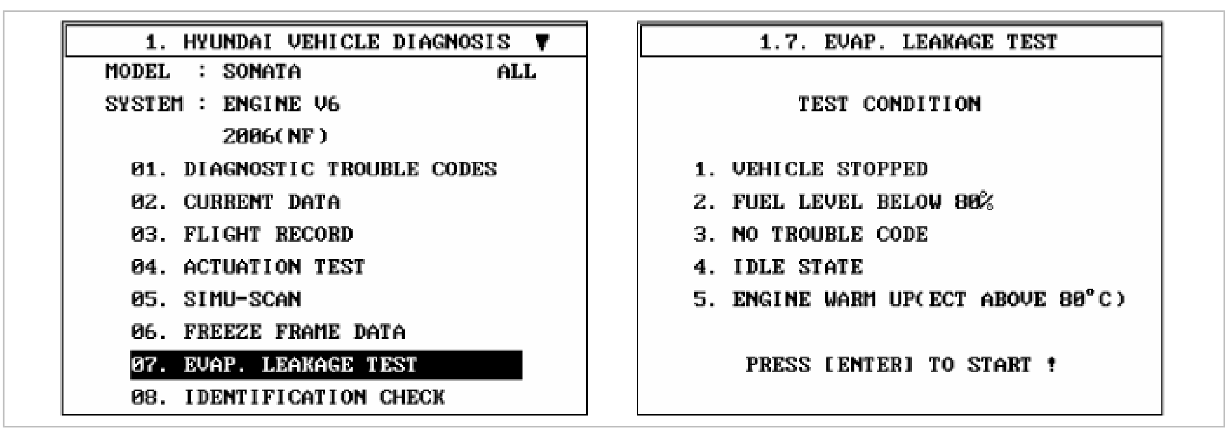


MONITOR SCANTOOL DATA

1. Warm-up engine to normal operating temperature.

> NOTE
>
> Evaporative Emissions Systems (EVAP) Leak Tests can be run by the Scan Tool.
> The tests are automated and provide either a pass-fail result or directions to check for DTCs.

2. Install scan tool and clear DTC
3. Perform "EVAP. LEAKAGE TEST" mode referring to enable conditions as below



4. Monitoring for (pending) DTC by performing " DIAGNOSTIC TROUBLE CODES" or "MONITORING TEST RESULTS". Is the

same DTC set ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check PCSV
   (1) Ignition "OFF"

   (2) Remove PCSV and check it for open stuck or leak

   (3) Measure resistance between terminals "1" and "2" of the PCSV connector.

   Specification: Approx. 24.5 ~ 27.5Ω(20°C(68°F))

   (4) Connect Scantool and Perform ACTUATION TEST for PCSV with scantool

   (5) Check that clicking sound can be heard by actuation test.

   (6) Monitor the PCSV signal waveform and verify that the ground voltage is less than approx. 0.3V (①) and the surge voltage (②) is between 40 V and 60 V.

   (7) Is the PCSV normal?

YES

▸ Substitute with a known - good PCM and check for proper operation.
▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

NO

▸ Substitute with a known - good PCSV and check for proper operation.
▸ If the problem is corrected, replace PCSV and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0442

GENERAL DESCRIPTION

The Small Leak test determines the presence of a leak in the evaporative system that is 0.040”diameter (1.0 mm) or larger, as defined by CARB. The EVPD(Evaporative System Diagnostics) will only perform this test when idle conditions are present and the Large Leak test has reported a “pass” condition, indicating that the current tank vacuum level is approximately 10.2inH2O.

DTC DESCRIPTION

This test detects a leak across the purge valve by measuring an increase in evaporative system vacuum. A leak across the purge valve can allow hydrocarbons from the tank to leak to the atmosphere when the engine is off. The test should be calibrated to detect a 0.02” (0.5mm) leak path across the purge valve. This testdoes not require idle conditions to run.
Checking output signal from tank vaccum under detecting condition, if the signal is high than threshold, PCM sets P0442. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• If a corrected vacuum decay slope and the individual segment slopes exceed their respective thresholds and the segment slopes are not convex then a small leak is present	• Leakage in each hose/fuel filler pipe • Leakage in PCSV/ CCV/Canister/ Fuel tank • PCM
EnableConditions	• 10 < Ignition Volt < 15.9907 • Barometric pressure > 72 kPa • Engine off time > 720min or Startup IAT-Startup ECT < 12°C(53.6 °F) • Startup ECT -Startup IAT < 12°C(53.6 °F) • 0°C(32 °F) < Startup ECT < 40°C(104 °F) • 0°C(32 °F) < Startup IAT < 40°C(104 °F) • Start-up IAT-IAT <1°C(33.8 °F) • 1s < Engine Run Time < 100s • Purge enabling Rum time < Threshold • Cold Test Timer < 300sec. • 0.03% < Fuel level < 0.97% **Under Idle conditions** • Engine RPM < 1500 • Vehicle Speed < 3KPH(1.864114 MPH) • Throttle Position < 1% **Creep Conditions** • Engine RPM < 1500 • Vehicle Speed < 6KPH(3.728227 MPH) • Throttle Position < 1.9989% **Fuel not Sloshing** • Vehicle Speed > 2KPH(1.242742 MPH) • Thorttle Postion > 1% • 125mS MAP change > 10KPa • 125mS Engine Speed > 100RPM • 125mS Fuel Level change > Threshold	
	• Decay slope (beginning at decay start < 10 inH2O and	

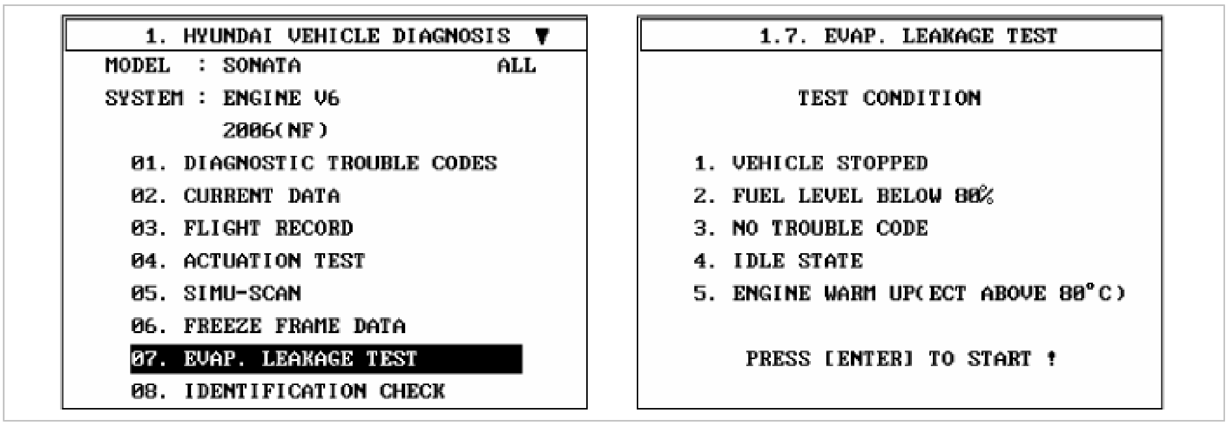
Threshold value	lasting for decay time < 10sec) minus the larger vapor correction term (purge leak vapor term OR Post decay vapor term) is greater than threshold (the product of a base term using fuel level AND a temperature bias term) • All segment slopes greater than their threshold(the product of a base term AND a temperature bias term AND a segment bias term)	
DiagnosisTime	• Continuous	
MIL On Condition	• 1 driving cycle	

MONITOR SCANTOOL DATA

1. Warm-up engine to normal operating temperature.

> NOTE
>
> Evaporative Emissions Systems (EVAP) Leak Tests can be run by the Scan Tool.
> The tests are automated and provide either a pass-fail result or directions to check for DTCs.

2. Install scan tool and clear DTC.
3. Perform "EVAP. LEAKAGE TEST" mode referring to enable conditions as below.



4. Monitoring for (pending) DTC by performing " DIAGNOSTIC TROUBLE CODES"or "MONITORING TEST RESULTS".
5. Is the same DTC set ?

YES

▸ Go to "System Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of vehicle Repair" procedure,

SYSTEM INSPECTION

1. Check vapor hoses for leakage in fuel system.
   (1) Check vapor hoses between the following components for leakage:
      A. Intake manifoled ~ Purge control solenoid valve (PCSV)
      B. Purge control solenoid valve (PCSV) ~ Canister
      C. Canister ~ Canister close valve (CCV)
      D. Canister ~ fuel tank

   (2) Does a leak exist?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check fuel filler pipe for leakage" as below.

2. Check fuel filler pipe for crack or leakage.

(1) Check that there is crack or leakage in fuel filler pipe.

(2) Does a malfunction exist?

YES

▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Component inspection" procedure.

COMPONENT INSPECTION

1. Check CCV for leakage.

(1) Disconnect the hose leading from the CCV to Canister at CCV.

(2) When the CCV is operated, apply a vacuum at the nipple and verify that the CCV holds vacuum.

(3) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check Canister for leakage" as necessary.

2. Check Canister for leakage.

(1) Disconnect the hose leading from the CCV to Canister at Canister.

(2) When the other nipples are plugged, apply a vacuum at the vent nipple and verify that the Canister holds vacuum.

(3) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check fuel tank for leakage" as below.

3. Check fuel tank for leakage.

(1) Check fuel tank for crack or leakage.

(2) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation.
▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automaticallydetected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0444

COMPONENT LOCATION

GENERAL DESCRIPTION

The purge solenoid is a pneumatic device that meters the air and fuel (purge) vapor flow to thepurge port. In a sense, the purge solenoid is comparable to a fuel injector, because the meteredpurge flow follows the same slope and offset characteristics. However, the purge solenoidnormally runs with a duty cycle at a fixed frequency because the opening response is significantly slower than a fuel injector. It would not practical to run the solenoid synchronouslywith engine events except perhaps at very low RPM. The normal frequencies for the purgesolenoid are between 8 and 20 Hz.

DTC DESCRIPTION

Checking output signals from PCSV every 10 sec. under detecting condition, if signals indicating open or short to ground in the circuit are detected for more than 5 sec., PCM sets P0444. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Open, short to ground	• Poor connection • Open or short to ground in harness • PCSV • PCM
EnableConditions	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above enable conditions are met > 0.5 sec.	
Threshold value	• Open or short to ground	
DiagnosisTime	• Continuous (More than 5 sec.failure for every 10 sec.test)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA

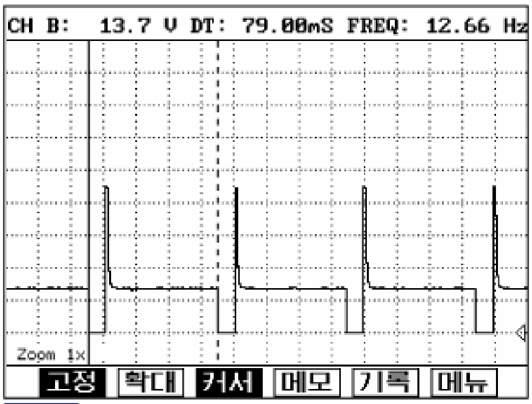


Fig. 1

The Purge Control Solenoid Valve(PCSV) is open or closed by PCM and vacuum of intake manifold.
At opening, fuel vapor from canister enters into intake manifold. To prevent vacuum from forming inside canister, PCM controls to open it. This photo shows the signal waveform of PCSV operating normally.

SPECIFICATION

Item	Coil resistance(Ω)
PCSV	19.0 ~ 22.0Ω (at 20°C / 68°F)

C144-1

PCM

MONITOR SCANTOOL DATA

1. Connect scantool to Data Link Cable (DLC)
2. Warm up engine to normal operating temperature.
3. Monitor "PCSV" parameter on the scantool.

4. Is the current data displayed correctly?

YES

▸ Fault is intermittently caused by poor contact in the sensor and/or PCM connector or non cleared PCM memory after repair. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace if necessary and go to "Verification of vehicle Repair".

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

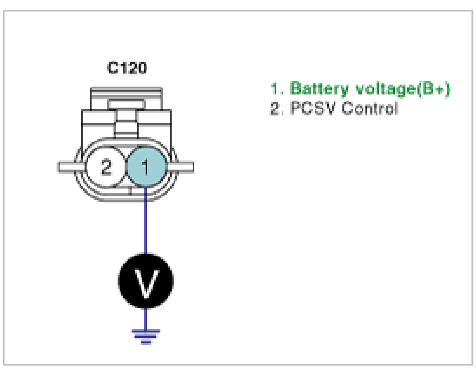
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSEPCTION

1. IG "OFF" and disconnect PCSV connector.
2. IG "ON" and ENG "OFF"
3. Measure voltage between terminal 1 of PCSV harness connector and chassis ground.

Specification : B+



4. Is the measured voltage within specification?

YES

▸ Go to "Control Circuit Inspection" procedure.

NO

▸ Repair open or short to ground in harness, and go to " Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check short to ground in harness.
   (1) IG "OFF" and disconnect PCSV connector.
   (2) IG "ON"
   (3) Measure voltage between terminal 2 of PCSV harness connector and chassis ground.

Specification : Approx. 0.5V

   (4) Is the measured resistance within specification?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to " Verification of Vehicle Repair" procedure.

2. Check open in harness.
   (1) IG "OFF" and disconnect PCSV connector and PCM connector.
   (2) Measure resistance between terminal 2 of PCSV harness connector and terminal 78 of PCM harness connector.

Specification : Below 1Ω

   (3) Is the measured voltage within specification?

YES

▸ Go to " Component Inspection" procedure.

NO

▸ Repair open in harness, and go to "Verification of Vehicle Repair" procedure.

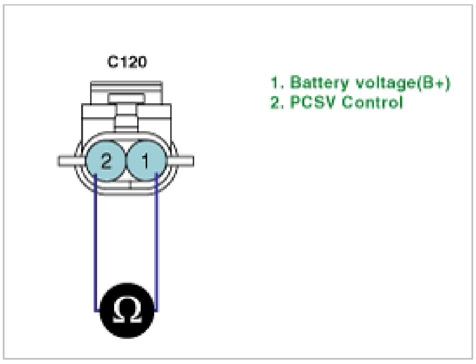
COMPONENT INSPECTION

1. Check PCSV
   (1) IG "OFF" and disconnect PCSV connector.
   (2) Measure resistance between terminals 1 and 2 of PCSV connector.(Component side)

Specification :

Item	Coil resistance(Ω)

PCSV	19.0 ~ 22.0Ω (at 20°C / 68°F)



(3) Is the measured resistance within specification?

YES

- Substitute with a known - good PCM and check for proper operation.
- If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

- Substitute with a known - good PCSV and check for proper operation.
- If the problem is corrected, replace PCSV and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

- Go to the applicable troubleshoooting procedure.

NO

- System is performing to specification at this time.

Fuel System > Troubleshooting > P0445

COMPONENT LOCATION

GENERAL DESCRIPTION

The purge solenoid is a pneumatic device that meters the air and fuel (purge) vapor flow to thepurge port. In a sense, the purge solenoid is comparable to a fuel injector, because the meteredpurge flow follows the same slope and offset characteristics. However, the purge solenoidnormally runs with a duty cycle at a fixed frequency because the opening response is significantly slower than a fuel injector. It would not practical to run the solenoid synchronouslywith engine events except perhaps at very low RPM. The normal frequencies for the purgesolenoid are between 8 and 20 Hz.

DTC DESCRIPTION

Checking output signals from PCSV every 10 sec. under detecting condition, if signals indicating short to battery in the circuit are detected for more than 5 sec., PCM sets P0445. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till consecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Short to battery	• Poor connection • Short to battery in harness • PCSV • PCM
EnableConditions	• Engine running state • 11V ≤ Battery voltage ≤ 16V • Above enable conditions are met > 0.5 sec.	
Threshold value	• Short to battery	
DiagnosisTime	• Continuous (More than 5 sec.failure for every 10 sec.test)	
MIL On Condition	• 2 driving cycles	

SIGNAL WAVEFORM AND DATA

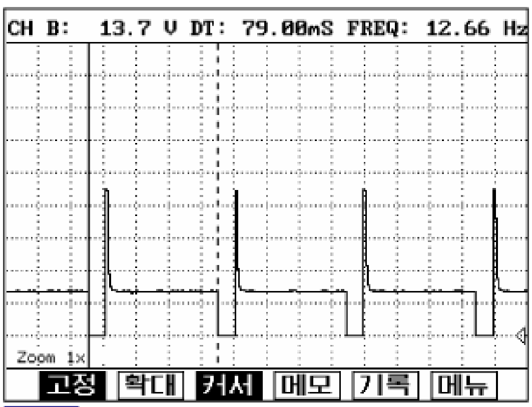


Fig. 1

The Purge Control Solenoid Valve(PCSV) is open or closed by PCM and vacuum of intake manifold.
At opening, fuel vapor from canister enters into intake manifold. To prevent vacuum from forming inside canister, PCM controls to open it. This photo shows the signal waveform of PCSV operating normally.

SPECIFICATION

Item	Coil resistance(Ω)
PCSV	19.0 ~ 22.0Ω (at 20°C / 68°F)

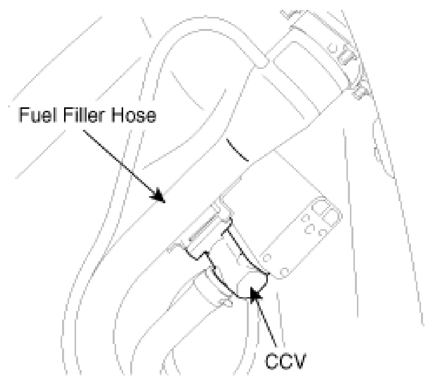
Fuel System > Troubleshooting > P0447

COMPONENT LOCATION



GENERAL DESCRIPTION

The vent valve is a device that is designed to close off the fresh air inlet to the canister. Currentvent valve designs are powered closed. An electrically operated vent valve solenoid is requiredfor OBD II compliant evaporative systems. Normally the vent valve is in the open (unpowered)state, but to control the vacuum levels in the fuel tank the EVPD will command the vent valvesolenoid to the closed position. This controlled vacuum level will allow the EVPD to determine the integrity of the evaporative system.
The vent valve orifice is much larger than the purge valve orifice or purge lines so that when thevent valve is open, the purge flow is not restricted. The fresh air inlet in the vent valve solenoid is normally filtered with a serviceable dust filter that helps to prevent contaminants from being drawn into the evaporative system (e.g. water, salt, silica, etc.).

DTC DESCRIPTION

Checking output signals from PCSV every 10 sec. under detecting condition, if signals indicating open or short to ground in the circuit are detected for more than 5 sec., PCM sets P0447. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

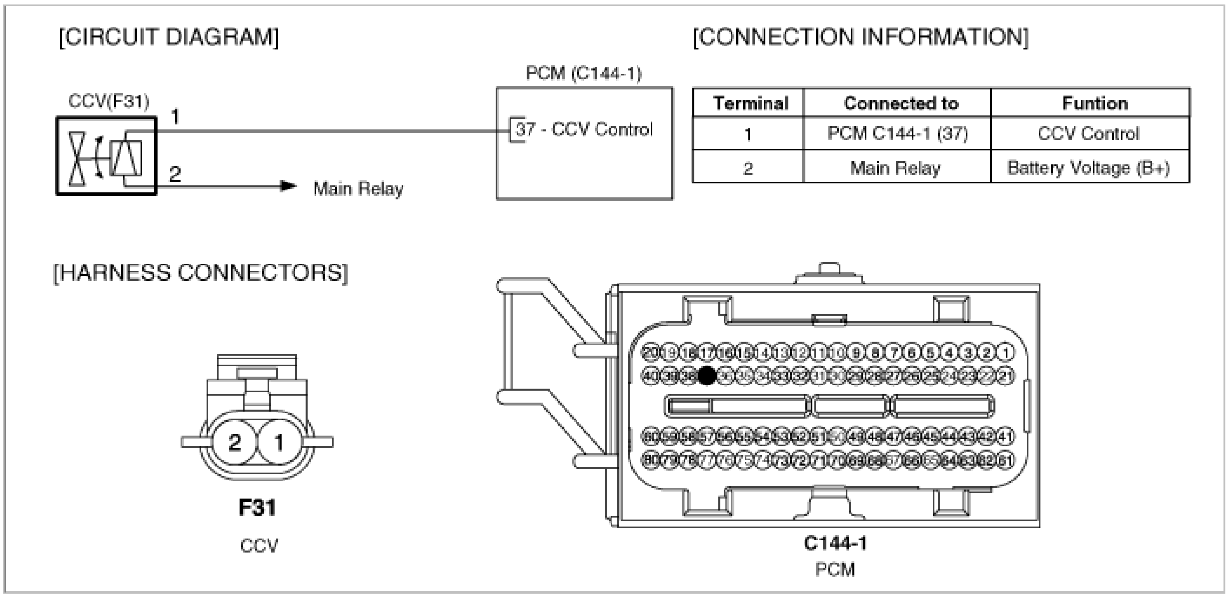
DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects a short to ground or open circuit on Vent Valve output circuit. Fault information provided by an output driver chip.	• Poor Connection • Open or Short in Power Circuit • Open or short in Control Circuit • CCV • PCM
EnableConditions	No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay ≥ 0.5sec.	
Threshold value	• Open or short to ground	
DiagnosisTime	• Continuous (More than 5sec.Test failure for every 10sec. tests)	
MIL On Condition	• 2 Driving Cycles	

SPECIFICATION

Item	Specification
Coil Resistance (Ω)	19.8 ~ 21.8Ω (20°C)

SCHEMATIC DIAGRAM



ACTUATION TEST

1. Connect scantool on the DLC(Data Link Connector).
2. Perform Actuation Test for Canister Vent Solenoid Valve with scantool.
3. Check that clicking sound can be heard by actuation test.
4. Is the CCV normal ?

YES

▸ Fault is intermittent caused by poor contact in the sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, ending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

- Repair as necessary and go to "Verification of Vehicle Repair" procedure

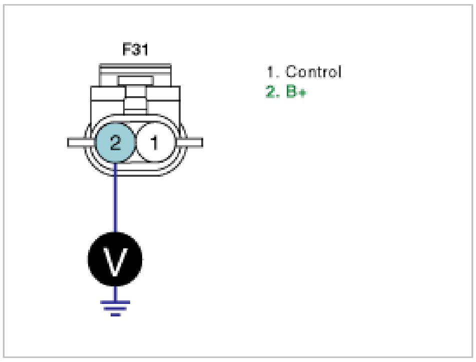
NO

- Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Engine "OFF"
2. Disconnect CCV connector.
3. Ignition " ON " & Engine "OFF".
4. Measure voltage between terminal "2" of CCV harness connector and chassis ground.

Specification : B+



5. s the measured voltage within specifications?

YES

- Go to " Control Circuit Inspection" procedure.

NO

- Check open or short to ground in harenss between control relay and CCV.
- Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. Check for short to ground in harness.
   (1) Ignition "OFF"
   (2) Disconnect CCV connector
   (3) Measure resistance between terminal "1" of CCV harness connector and chassis ground.

   Specification : Infinite

   (4) Is the measured resistance within specifications?

   YES

   - Go to " Check for open in harness" as below.

   NO

   - Check short to ground in signal harness.
   - Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

2. Check for open in harness.

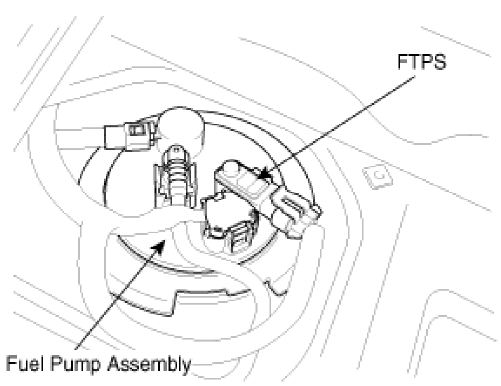
Fuel System > Troubleshooting > P0451

COMPONENT LOCATION



GENERAL DESCRIPTION

The Fuel Tank Pressure Sensor(FTPS) converts fuel tank pressure to a proportional analog voltage signal which is read by the engine controller for evaluation during execution of the Evaporative System Diagnostic. The Tank Pressure may be below atmospheric pressure (ie. a vacuum) or above atmospheric pressure.

The fuel tank pressure is used to measure the difference between the air pressure (or vacuum) in the fuel tank and the ambient air pressure. The Powertrain Control Module (ECM) supplies a 5-volt reference and a ground to the sensor, which allows the sensor’s output voltage to range from 0.1 to 4.9 volts. When the air pressure in the fuel tank is equal to the ambient air pressure, as when the fuel cap is removed, the output voltage of the sensor will be from 1.3 to 1.7 volts.

DTC DESCRIPTION

The Tank Pressure Sensor Stuck Diagnostic continuously monitors the fuel tank pressure sensor output for a stuck condition. It does this by comparing the maximum and minimum raw tank pressure voltages. If the difference between the two values exceeds a threshold, then the diagnostic is considered to have passed. The diagnostic is not allowed to fail unless (a) a significant portion of the EVPD(Evaporative Diagnostics) tank draw has occurred or (b) the tank pressure has not changed after purge transitions off from a flow level high enough to cause a change in the tank pressure.

Checking output signals of tank pressure under detecting condition, if the tank pressure difference between maximum and minimum is low than 0.9996 for 60 sec, PCM sets P0451 MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

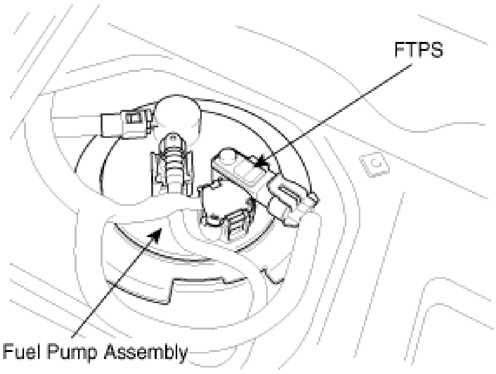
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0452

COMPONENT LOCATION



GENERAL DESCRIPTION

The Fuel Tank Pressure Sensor(FTPS) converts fuel tank pressure to a proportional analog voltage signal which is read by the engine controller for evaluation during execution of the Evaporative System Diagnostic. The Tank Pressure may be below atmospheric pressure (ie. a vacuum) or above atmospheric pressure.
The fuel tank pressure is used to measure the difference between the air pressure (or vacuum) in the fuel tank and the ambient air pressure. The Powertrain Control Module (ECM) supplies a 5-volt reference and a ground to the sensor, which allows the sensor's output voltage to range from 0.1 to 4.9 volts. When the air pressure in the fuel tank is equal to the ambient air pressure, as when the fuel cap is removed, the output voltage of the sensor will be from 1.3 to 1.7 volts.

DTC DESCRIPTION

The fuel tank pressure sensor diagnostic will detect a fuel tank pressure sensor signal that is outof range or malfunctioning. The Tank Pressure Sensor Circuit Diagnostic compares the sensor input voltage to low and high limits. When the analog voltage is outside the allowable limits, the circuit is determined to be failed.
Checking output signals of tank pressure under detecting condition, if the tank pressure is low than 2V PCM sets P0452. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects sensor signal short to low voltage	• Poor connection • Open in Power Circuit • Open or short to ground in signal Ciruict • Faulty FTPS • Faulty PCM

4. Is the "FTPS" data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in the sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poorconnection, ending, corrosion, contamination, deterioration, or damage. Repair or replace asnecessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

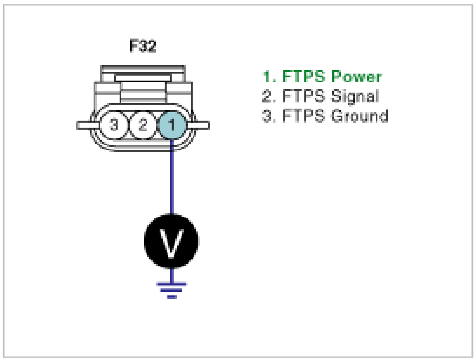
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect FTPS connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 1 of FTPS harness connector and chassis ground.

Specification : Approx. 5V



4. Is the measured voltage within specification ?

YES

▸ Go to "Ground circuit inspection" procedure.

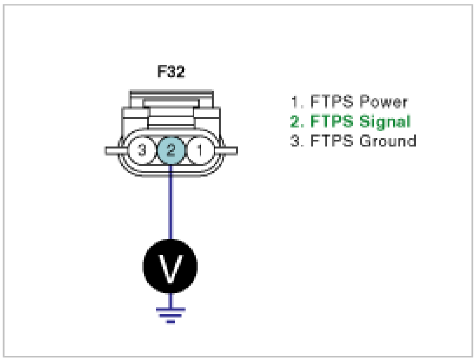
NO

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check voltage.
   (1) IG "OFF" and disconnect FTPS connector.
   (2) IG "ON" & ENG "OFF"
   (3) Measure voltage between terminal 2 of FTPS harness connector and chassis ground.

   Specification : Approx. 0V



(4) Is the measured voltage within specification ?

YES

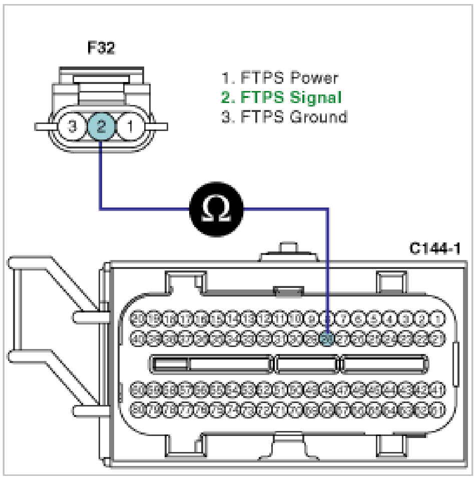
▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness.
   (1) IG "OFF" and disconnet FTPS and PCM connector.
   (2) Measure resistance between terminal 2 of FTPS harness connector and terminal 28/C144-1 of PCM harness connector.

Specification : Approx. Below 1Ω



(3) Is the measured resistance within specification ?

YES

▸ Go to "Component Inspection" procedure.

NO

▸ Repair open in harness and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Check FTPS.
   (1) IG "OFF" and connect scatool to DLC(Data Link Connector).
   (2) Monitor "FTPS" parameter with accelleration on service data.

Specification

Pressure (kPa)	Output Voltage (V)
-2.5 kPA	0.5V
0 kPA	2.5V
2.5 kPa	4.5V

(3) Does the "FTPS" parameter with accelleraton on the service data change ?

YES

▸ Go to "Check PCM" as follows.

NO

▸ Substitute with a known - good FTPS and check for proper operation.
▸ If the problem is corrected, replace FTPS and go to "Verification of Vehicle Repair" procedure.

2. Check PCM.
   (1) IG "OFF" disconnect FTPS connector
   (2) Connect Scantool and IG "ON" & ENG "OFF"
   (3) Select simulation function on scantool.
   (4) Simulate voltage at terminal 2 of FTPS harness connector.

   (5) Does the signal value of FTP sensor change according to simulation voltage ?

YES

▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation.
If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM
> Before or after testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

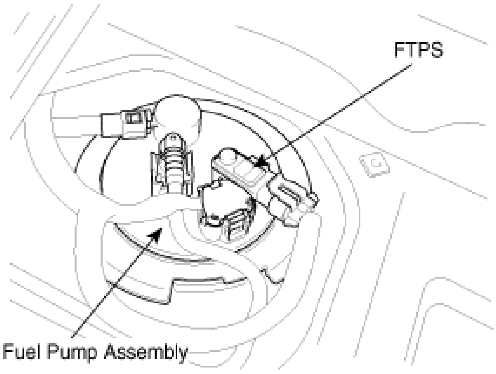
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0453

COMPONENT LOCATION



GENERAL DESCRIPTION

The Tank Pressure Sensor converts fuel tank pressure to a proportional analog voltage signal which is read by the engine controller for evaluation during execution of the Evaporative System Diagnostic. The Tank Pressure may be below atmospheric pressure (ie. a vacuum) or above atmospheric pressure.
The fuel tank pressure is used to measure the difference between the air pressure (or vacuum) in the fuel tank and the ambient air pressure. The Powertrain Control Module (ECM) supplies a 5-volt reference and a ground to the sensor, which allows the sensor's output voltage to range from 0.1 to 4.9 volts. When the air pressure in the fuel tank is equal to the ambient air pressure, as when the fuel cap is removed, the output voltage of the sensor will be from 1.3 to 1.7 volts.

DTC DESCRIPTION

The fuel tank pressure sensor diagnostic will detect a fuel tank pressure sensor signal that is outof range or malfunctioning. The Tank Pressure Sensor Circuit Diagnostic compares the sensor input voltage to low and high limits. When the analog voltage is outside the allowable limits, the circuit is determined to befailed.
Checking output signals of tank pressure under detecting condition, if the tank pressure is high than 2V PCM sets P0453. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects sensor signal short to high voltage	• Poor connection • Short to battery in signal Cirucit • Faulty FTPS • Faulty PCM
Enable Conditions	• Ignition ON • The FTPS diagnostic has met all enable criteria and will begin fault processing	
Threshold value	• Raw Tank Pressure > 2V	
Diagnosis Time	• Continuous (More than 15 seconds failure for every 32 seconds test)	
MIL On Condition	• 2 Driving Cycles	

SPECIFICATION

Pressure (kPa)	Output Voltage (V)
-2.5 kPA	0.5V
0 kPA	2.5V
2.5 kPa	4.5V

Fuel System > Troubleshooting > P0455

GENERAL DESCRIPTION

This test determines the presence of a large leak, such as a fuel fill cap not installed or a hosedisconnected, by initially bringing the evaporative system to a vacuum level of10.2inH2O during idle conditions. This is done by commanding the vent valve toclose and requesting the Canister Purge Subsystem to enter the tank draw mode. Note: thisvacuum increase process is a continuation

of the preset mode process that was initiated duringthe Preset Large Leak Function.
During this vacuum level increase process, the vacuum level in the fuel tank is monitored using afuel tank pressure sensor for a duration that is determined by the accumulated purge volume thathas exited the evaporative system. This accumulated purge volume is determined by the vacuumindex tracking logic. A normally functioning or passing evaporative system will achieve thecalibration-specified vacuum level before the accumulated purge volume exceeds calibratedthreshold, but a failing evaporative system will not achieve this calibration-specified vacuum level.

DTC DESCRIPTION

This test detects a large leak (> 0.04”) in the evaporative system by measuring the time it takes to draw a pre-determined amount of vacuum in the evaporative system. The inability to draw a vacuum under controlled conditions is indicative of having a large leak. Test failures can be caused by either hardware failures (i.e. a hole, broken seal, etc) or by the customer not correctly reinstalling the gas cap following re-fueling.
The Large Leak test is split up in to two sub-tests, the Preset Large Leak Test and the Idle Large Leak Test. The Idle Large Leak test runs when the vehicle is at idle. The Preset Large Leak test runs when the vehicle is off idle and will report it’s results if the diagnostic times out and ends before the vehicle returns to idle.
Checking tank vaccum from tank pressure sensor under detecting condition, if tank vaccum signals is less than 10.0996 at idle condition or not after purge volume has been drawn from tank, PCM sets P0455. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

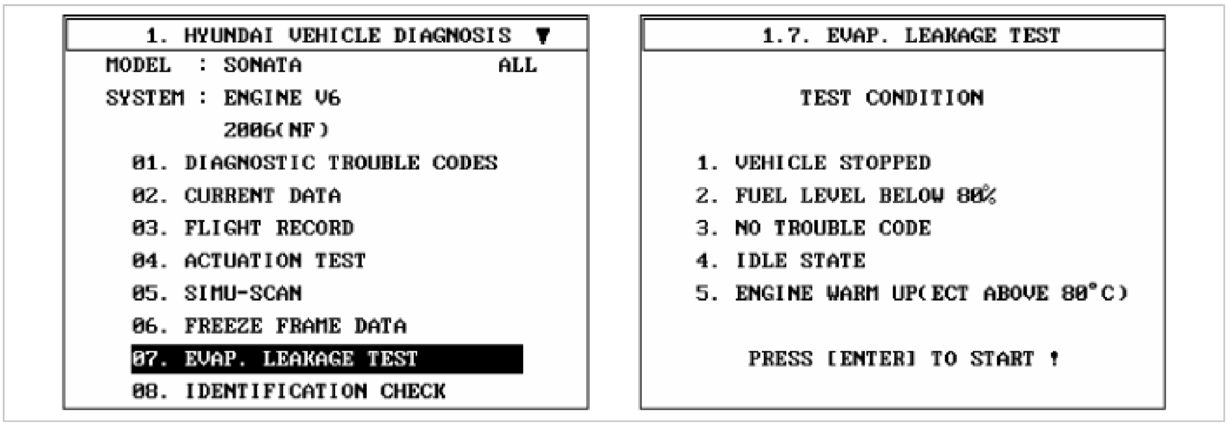
Item	Detecting Condition	Possible cause
DTC Strategy	• Test is failed if tank vacuum cannot reach prescribedvaccum after a prescribed purge volume has been drawn from the tank	
Enable Conditions	• 10 < Ignition Volt < 15.9907 • Barometric pressure > 72 kPa • Engine off time > 720min or Startup IAT-Startup ECT < 12°C(53.6 °F) • Startup ECT -Startup IAT < 12°C(53.6 °F) • 0°C(32 °F) < Startup ECT < 40°C(104 °F) • 0°C(32 °F) < Startup IAT < 40°C(104 °F) • Start-up IAT-IAT < 1°C(33.8 °F) • 1s < Engine Run Time < 100s • Purge enabling Rum time < Threshold • Cold Test Timer < 300sec. • 15% < Fuel level < 85% • Engine RPM < 1500 • Vehicle Speed < 3KPH(1.864114 MPH) • Throttle Position < 1% • Engine RPM < 1500 • Vehicle Speed < 6KPH(3.728227 MPH) • Throttle Position < 1.9989% • Vehicle Speed > 2KPH(1.242742 MPH)	• Leakage in each hose/fuel filler pipe • Leakage in CCV/Canister/ Fuel tank • Faulty PCM
Threshold value	At idle Condition • Tank Vaccum <10.0996 in HO2 • purge integral > Threshold	
Diagnosis Time	• -	
MIL On Condition	• 1 driving cycles	

MONITOR SCANTOOL DATA

1. Warm-up engine to normal operating temperature.

> **NOTE**
>
> Evaporative Emissions Systems (EVAP) Leak Tests can be run by the Scan Tool.
> The tests are automated and provide either a pass-fail result or directions to check for DTCs.

2. Install scan tool and clear DTC
3. Perform "EVAP. LEAKAGE TEST" mode referring to enable conditions as below



4. Monitoring for (pending) DTC by performing " DIAGNOSTIC TROUBLE CODES" or "MONITORING TEST RESULTS". Is the same DTC set ?

YES

▸Go to "System Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in sensor’s and/or PCM’s connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of vehicle Repair" procedure.

SYSTEM INSPECTION

1. Check vapor hoses for leakage in fuel system.
   (1) Check vapor hoses between the following components for leakage:
      A. Intake manifoled ~ Purge control solenoid valve (PCSV)
      B. Purge control solenoid valve (PCSV) ~ Canister
      C. Canister ~ Canister close valve (CCV)
      D. Canister ~ fuel tank

   (2) Does a leak exist?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check fuel filler pipe for leakage" as below.

2. Check fuel filler pipe for crack or leakage.
   (1) Check that there is crack or leakage in fuel filler pipe

   (2) Is there any crack or leakage ?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Component inspection" procedure.

COMPONENT INSPECTION

1. Check CCV for leakage.
   (1) Disconnect the hose leading from the CCV to Canister at CCV.

   (2) Visually Check any tear of the hose leading from the CCV to Canister

   (3) When the CCV operates, apply a vacuum at the nipple and verify that the CCV holds vacuum.

   (4) Does a leak exist?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check Canister for leakage" as necessary.

2. Check Canister for leakage.
   (1) Disconnect the hose leading from the CCV to Canister at Canister.
   (2) When the other nipples are plugged, apply a vacuum at the vent nipple and verify that the Canister holds vacuum
   (3) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check fuel tank for leakage" as below.

3. Check fuel tank for leakage.
   (1) Check fuel tank for crack or leakage.
   (2) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation.
▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0456

GENERAL DESCRIPTION

Similar in operation to the Small Leak test, the Very Small Leak test will detect the presence of aleak that is 0.020” (0.5 mm) or larger in the evaporative system if the Small Leak test reports a“pass” condition. To prevent a possible misdiagnosis, the Very Small Leak test may use tighteroperational limits than required by the Small Leak test. If any of the Very Small Leak test enablingconditions are not met, such as coolant and intake air temperature, the Very Small Leak test willbe disabled for the current trip.

DTC DESCRIPTION

The EVPD(Evap. Leak Diagnostic) calculates some intermediate segment slopes for the Very Small Leak test as in theSmall Leak test. These segment slopes may result in the disablement of only the Very Small Leaktest, not the Small Leak test.
The very small leak test normally takes 25 seconds to complete. However, it may be allowed topass at the end of the small leak test if the decay slope is sufficiently small enough to pass thevery small leak slope criteria. This is allowed because the decay slope decreases with time.If the decay slope is passing after 10 seconds, then it will pass by an even greater marginafter 25 seconds.
Checking tank vaccum from tank pressure sensor under detecting condition, if tank vaccum signals is less than 10.0996 at idle condition or not after purge volume has been drawn from tank, PCM sets P0455. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till 1 driving cycle.

DTC DETECTING CONDITION

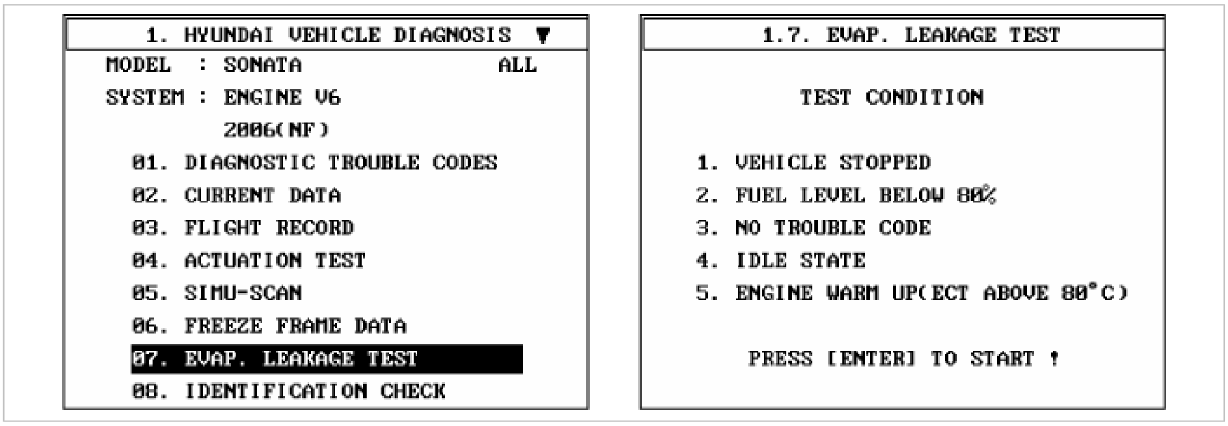
Item	Detecting Condition	Possible cause
DTC Strategy	• If a corrected vacuum decay slope and the individual segment slopes exceed their respective thresholds and the segment slopes are not convex then a small leak is present	• Leakage in each hose/fuel filler pipe • Leakage in CCV/Canister/ Fuel tank • Faulty PCM
Enable Conditions	• 10 < Ignition Volt < 15.9907 • Barometric pressure > 72 kPa • Engine off time > 720min or Startup IAT-Startup ECT < 12°C(53.6 °F) • Startup ECT -Startup IAT < 12°C(53.6 °F) • 0°C(32 °F) < Startup ECT < 40°C(104 °F) • 0°C(32 °F) < Startup IAT < 40°C(104 °F) • Start-up IAT-IAT < 1°C(33.8 °F) • 1s < Engine Run Time < 100s • Purge enabling Rum time < Threshold • Cold Test Timer < 300sec. • 15% < Fuel level < 85%Under Idle conditions • Engine RPM < 1500 • Vehicle Speed < 3KPH(1.864114 MPH) • Throttle Position < 1%Creep Conditions • Engine RPM < 1500 • Vehicle Speed < 6KPH(3.728227 MPH) • Throttle Position < 1.9989%Fuel not Sloshing • Vehicle Speed > 2KPH(1.242742 MPH)OR • Throttle position > 1.1%OR • 125ms MAP change > 10kPaOR • 125ms Engine speed > 100OR • 125ms Fuel level delta > Threshold(Creep delay time • Time vehicle speed > 2kph • divided by decay time = 25sec.	
Threshold value	• Decay slope(beginning at decay start < 10in HO2 and lasting 300sec for decay time) minus the larger vapor correction term ,(purge leak vapor term OR Post decay vapor term) greater than a threshold, (the product of a base term using fuel level AND a temperature bias term) • All segment slopes greater than their threshold(The product of bias term and temperature bias term,anda segment bias term) • The current segment slope minus the prior segment slope less thanthe convex threshold(in HO2)	
Diagnosis Time	• -	
MIL On Condition	• 1 driving cycles	

MONITOR SCANTOOL DATA

1. Warm-up engine to normal operating temperature.

> NOTE
>
> Evaporative Emissions Systems (EVAP) Leak Tests can be run by the Scan Tool.
> The tests are automated and provide either a pass-fail result or directions to check for DTCs.

2. Install scan tool and clear DTC
3. Perform "EVAP. LEAKAGE TEST" mode referring to enable conditions as below



4. Monitoring for (pending) DTC by performing " DIAGNOSTIC TROUBLE CODES" or "MONITORING TEST RESULTS". Is the same DTC set ?

YES

▸Go to "System Inspection" procedure.

NO

▸ Fault is intermittent caused by poor contact in sensor's and/or PCM's connector or was repairedand PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection,bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and goto "Verification of vehicle Repair" procedure.

SYSTEM INSPECTION

1. Check vapor hoses for leakage in fuel system.
   (1) Check vapor hoses between the following components for leakage:
      A. Intake manifoled ~ Purge control solenoid valve (PCSV)
      B. Purge control solenoid valve (PCSV) ~ Canister
      C. Canister ~ Canister close valve (CCV)
      D. Canister ~ fuel tank

   (2) Does a leak exist?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check fuel filler pipe for leakage" as below.

2. Check fuel filler pipe for crack or leakage.
   (1) Check that there is crack or leakage in fuel filler pipe

   (2) Is there any crack or leakage ?

   YES

   ▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Component inspection" procedure.

COMPONENT INSPECTION

1. Check CCV for leakage.
   (1) Disconnect the hose leading from the CCV to Canister at CCV.

   (2) Visually Check any tear of the hose leading from the CCV to Canister

   (3) When the CCV operates, apply a vacuum at the nipple and verify that the CCV holds vacuum.

   (4) Does a leak exist?

   YES

   ▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

   NO

   ▸ Go to "Check Canister for leakage" as necessary.

2. Check Canister for leakage.
   (1) Disconnect the hose leading from the CCV to Canister at Canister.

(2) When the other nipples are plugged, apply a vacuum at the vent nipple and verify that the Canister holds vacuum

(3) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check fuel tank for leakage" as below.

3. Check fuel tank for leakage.

(1) Check fuel tank for crack or leakage.

(2) Does a leak exist?

YES

▸ Repair or replace as necessary and then go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good PCM and check for proper operation.

▸ If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

> NOTE
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

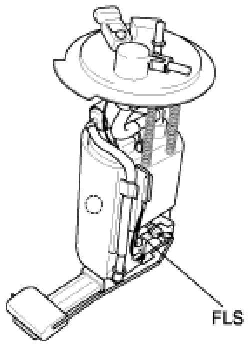
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0461

COMPONENT LOCATION



GENERAL DESCRIPTION

In order to measure the Fuel Level within the tank, the Fuel Level Sender consists of a variable resistor card mounted in the Fuel Pump and Sender unit (located in the fuel tank). A float located in the fuel tank swivels up and down as fuel level varies. A wiper is attached to the float and sweeps across the resistor card, thus providing a variable resistive input to the PCM. As the float sweeps across the Fuel Level Sender resistor card, the input voltage to the PCM varies accordingly. The PCM has calibrations and software which convert this analog voltage to a Fuel Level reading.

DTC DESCRIPTION

This function will check the difference between the current fuel level sender voltage and the previous fuel level sender voltage to determine the amount of fuel removed from the tank. This information, coupled with the distance traveled, can determine whether the fuel level sender is functioning correctly, or if it is stuck.
When the Fuel Level Sender fails, it may cause the Evaporative System Diagnostic to function improperly since it relies on Fuel Level in its leak detection algorithm. A failed Fuel Level Sender will also provide misleading Fuel Level information to the driver (in cases where the PCM drives the fuel gauge).
Checking fuel level change under detecting condition, if not only the fuel level difference between current and previous is lower than 0.035 but also odometer difference between present and previous is higher than 200km, PCM sets P0451. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

Fuel System > Troubleshooting > P0480

GENERAL DESCRIPTION

When the ambient air temperature is warm or the airflow across the engine is low, the enginecoolant temperature can become hot. If the coolant temperature becomes too hot, it is possiblethat the engine could be damaged. High coolant temperatures can also cause the A/C system tobe disabled, in order to reduce load on the engine and protect the A/C system components. Thepurpose of activating the engine compartment ventilation fan(s) is to help reduce the enginecoolant temperature to a level that is not threatening to engine performance and maintains the airconditioning system pressure at safe levels.
Electric fan responsible for causing air movement around the engine coolant radiator. The amount of air movement caused by the fan is controlled based on the Vehicle Speed, coolant temperature, A/C pressure status, A/C switch request status, and A/C clutch state. A duty cycle is determined based on these input parameters. This duty cycle corresponds to fan speed which correlates to the amount of air movement caused by the fan. The increased air movement enhances the heat exchanger function of the radiator in the confined space of the enginecompartment, thereby reducing the engine coolant temperature more quickly.This fan also causes air movement around the A/C Condenser, thereby enhancing condensationwithin the condenser, results in lower pressure within the A/C system.

DTC DESCRIPTION

The Delphi EMS system provides for a method of electrically controlling when the fan(s) should beactivated and deactivated based on a variety of engine conditions, including the coolanttemperature, vehicle speed, air conditioning switch status and air conditioning pressurestatus. As the coolant temperature or air conditioning pressure rises, increased airflow is requiredto reduce the engine temperature and A/C system pressure. The engine cooling fan(s) areactivated to increase airflow across the engine components.
Checking power supply to cooling fan relay to cooling fan module and control signals under detecting condition, if the PCM detects short to ground, to battery or open circuit, PCM sets P0480. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• This will detect a short to ground, to battery or open circuit on Fan relay output. Fault information provided by an output driver chip.	• Poor connection • Open in Power circuit to cooling fan module • Open or short in control circuit to PCM • Faulty Fan Relay • Faulty cooling fan module • Faulty PCM
Enable Conditions	• No disabling Faults Present • Engine Running • 11V ≤ Ignition Voltage ≤ 16V • Enable Time delay ≥ 0.5sec.	
Threshold value	• Open or short on Fan relay output	
Diagnosis Time	• Continuous (More than 5sec. failure for every 10 sec. test.)	
MIL On Condition	• 2 driving cycles

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

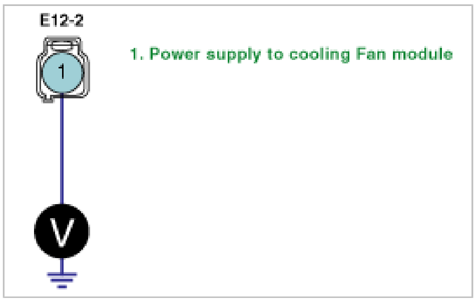
NO

▸ Go to " Power Circuit Inspection " procedure

POWER CIRCUIT INSPECTION

1. IG "OFF" and disconnect Cooling fan module connector.
2. IG "ON" & ENG "OFF"
3. Measure voltage between terminal 1 of Cooling fan module harness connector and chassis ground.

Specification : Approx. B+



4. Is the measured voltage within specification

YES

▸ Go to "Control Circuit Inspection" procedure.

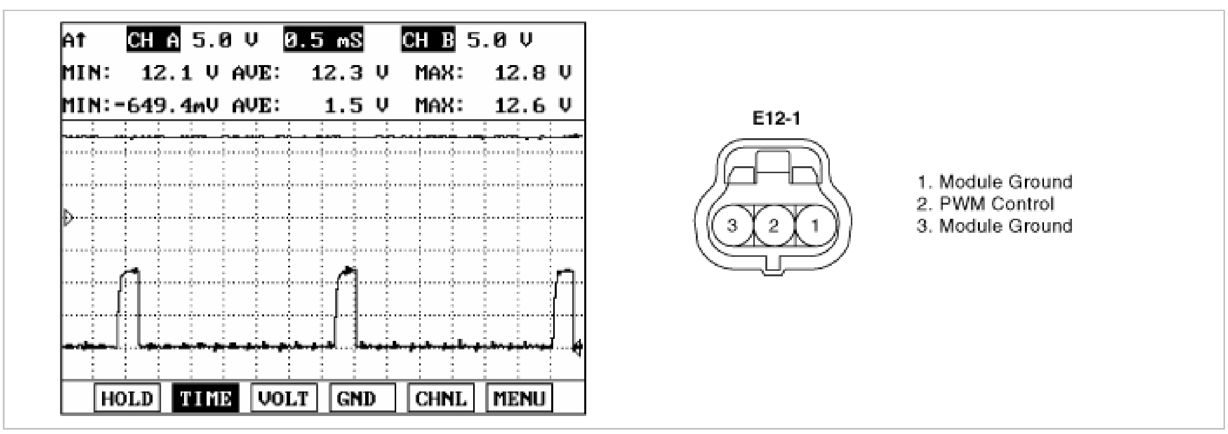
NO

▸ Check if cooling fan fusible link 60A is open or not installed.
▸ Check if cooling fan relay is not installed or faulty
▸ Check if the line between cooling fan relay and Cooling fan module is open.
▸ Repair or replace as necessary and then, go to "Verification of Vehicle Repair" procedure.

CONTROL CIRCUIT INSPECTION

1. IG "OFF"
2. Disconnect Cooling fan module connector.
3. IG "ON" & ENG "OFF"
4. Measure signal waveform at terminal 2 of cooling fan module.

Reference signal waveform :



5. Is the measured signal waveform normal?

YES

▸ If the problem is corrected after substituting with a known - good Cooling Fan module, replace it. If the problem is pending, check for proper operating after substituting with a known - good PCM. and then if the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Check that harness connected at engine compartment junction block is disconnected or not.
▸ Check the line between terminal 2 of Cooling Fan module harness connector and terminal 66 of PCM harness connector for open.
▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0501

GENERAL DESCRIPTION

The wheel speed sensor is the essential component taht the PCM uses to calculate vehicle speed. This wheel speed sensor is the active hall-sensor type and good at temperature and noise chariteristic. Digital wave is produced as tone wheel rotate according as hall sensor principle. Frequency of duty wave is changed in proportion to rotation of tone wheel and PCM gets vehicle speed through ABS control unit or ESP control unit.

DTC DESCRIPTION

Checking vehicle speed signal every from wheel speed sensor or ABS control unit 30 sec. under detecting condition, if an signal is in the detecting condition for more than 20 sec., PCM sets P0501. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

<table>
<tr><th colspan="2">Item</th><th>Detecting Condition</th><th>Possible cause</th></tr>
<tr><td colspan="2">DTC Strategy</td><td>• Detects the lack of vehicle speed signal to the PCM</td><td rowspan="3">• Poor connection

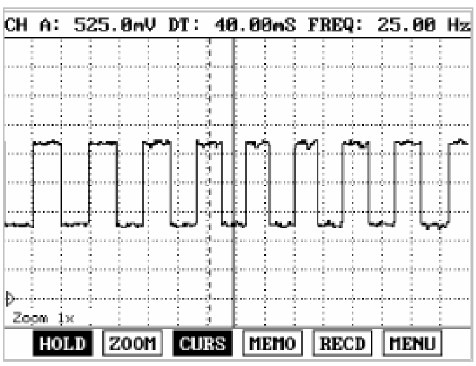
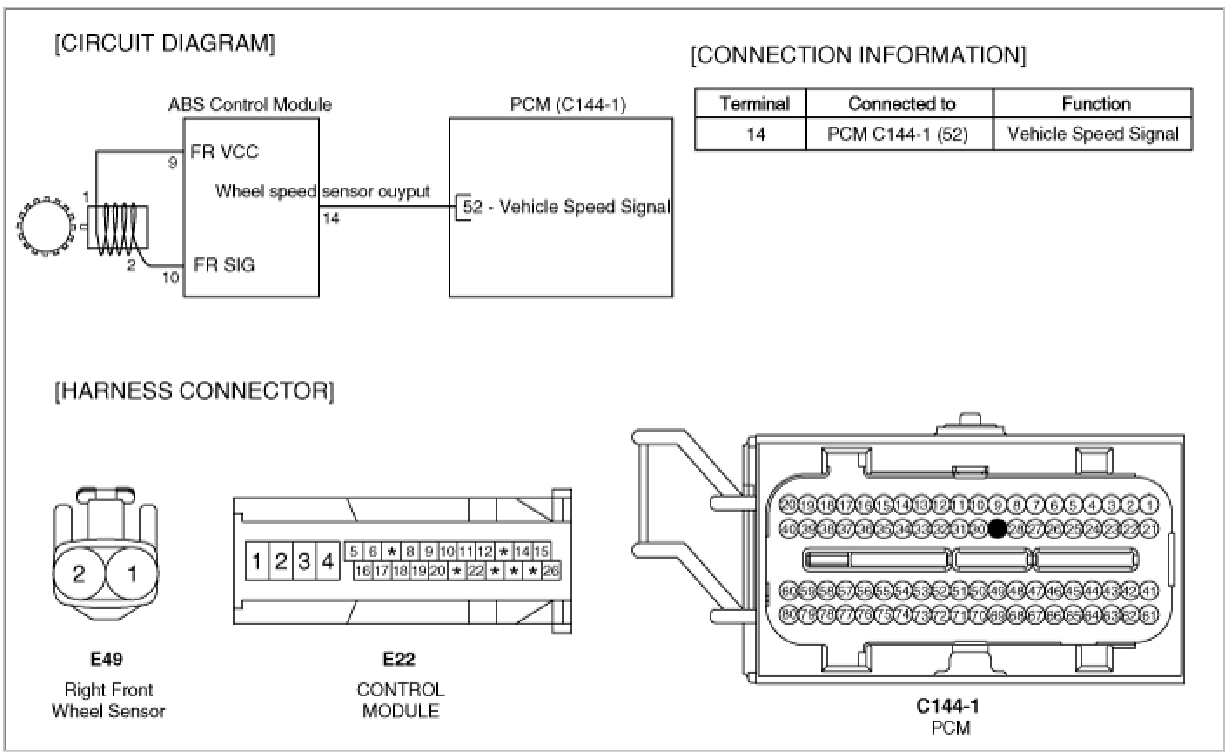
MIL On Condition		• 2 driving cycles	

SIGNAL WAVEFROM AND DATA

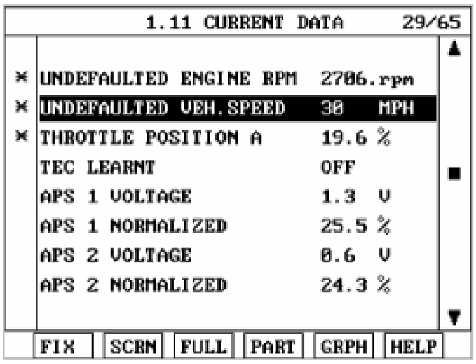


SCHEMATIC DIAGRAM



MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Drive vehicle in gear and monitor "vehicle speed" item on the scantool.



4. Are thsoe "VSS" parameters displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

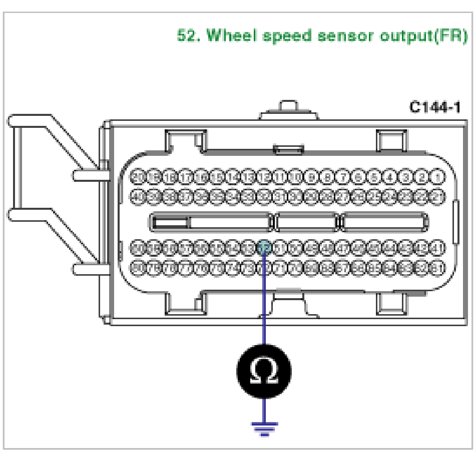
NO

▸ Go to " Signal Circuit Inspection " procedure.

SIGNAL CIRCUIT INSPECTION

> **WARNING**
>
> This procedure is applied to vehicle with ABS (or ESP). In case of no ABS(or ESP), refer to "C1203 Wheel speed sensor front-RH open/short".

1. Check short to ground in harness
   (1) IG "OFF"
   (2) Disconnect PCM connector and ABS or EPS control module connector.
   (3) Measure resistance between terminal 52 of PCM harness connector and chassis ground.



Specification : Infinite

(4) Is the measured resistance within specifications?

YES

▸ Go to "Check open in harness" as follows.

NO

▸ Repair short to ground in harness, and go to "Verification of Vehicle Repair" procedure.

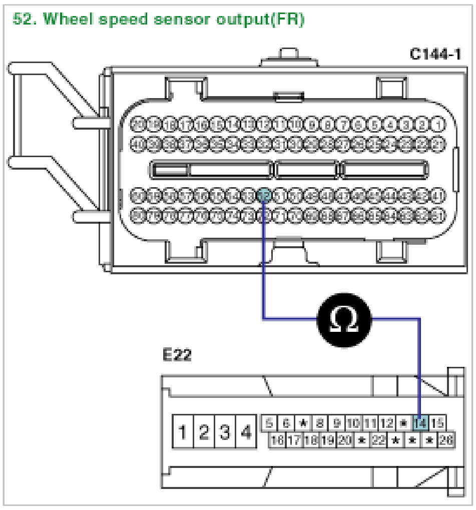
2. Check for open in harness

(1) Ignition "OFF"

(2) Disconnect PCM connector and ABS or ESP control module connector.

(3) Measure resistance between terminal "52" of PCM harness connector and terminal "14(With ESP: terminal 40)" of ABS control module harness connector.

Specification : Approx. below 1Ω



NOTE

Note: This picture is only applied to vehicle with ABS

(4) Is the measured resistance within specifications?

YES

▸ Go to " Check wheel speed sensor " procedure.

NO

▸ Check open in harenss.
▸ Repair or replace as necessary and then, go to " Verification of Vehicle Repair" procedure.

3. Check wheel speed sensor

(1) IG "OFF"

(2) Check open or short in wheel speed sensor (Refer to "C1203 Wheel speed sensor front-RH open/short")

(3) Is the wheel speed sensor normal?

YES

▸ Substitute with a known - good PCM/ ABS or ESP control unit and check for proper operation. If the problem is corrected, replace PCM/ ABS or ESP control unit and go to "Verification of Vehicle Repair" procedure.

NO

▸ Repair or replace it as necessary.
▸ And then go to " Verification of Vehicle Repair" procedure.

NOTE

There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

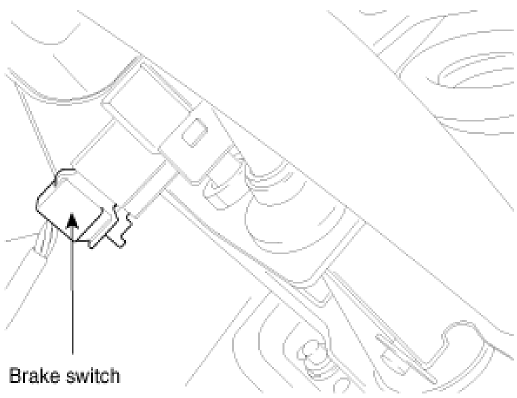
▶ Go to the applicable troubleshoooting procedure.

NO

▶ System is performing to specification at this time.

Fuel System > Troubleshooting > P0504

COMPONENT LOCATION



GENERAL DESCRIPTION

Brake switch connected to brake pedal transfers brake operating state to ECM. For diagnosis of abnormal operation of Brake switch, two types of signals(one from Brake warning lamp switch, the other from Brake checking switch) are used and those two types output different signals at both condition, depressing or releasing brake pedal. When brake pedal is depressed brake checking switch outputs B+ voltage while brake warning lamp switch emits 0V. Conversly, when brake pedal is released, the output signals of each switch are opposite.

DTC DESCRIPTION

Checking output signals from both brake switch every 2.5 sec. when all of them are On or OFF simultaneously, if abnormal signal is detected for more than 0.5 sec., an error is recognized. And if this condition lasts for more than 4.8 sec., PCM sets P0504. MIL (Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item		Detecting Condition	Possible cause
DTC Strategy		• Comparing 2 brake signals during driving	• Poor connection • Open or Short • Faulty PCM
Enable Conditions	Case 1	• Engine works • Vehicle Speed Sensor is abnormal.	
	Case 2	• Engine works • Vehicle Speed Sensor is normal and Vehicle Speed is over 20kph dring 1sec or more.	
Threshold value		• The one brake signal's change duration when another signal has been changed < 0.5 sec	
Diagnosis Time		• Continuous (More than 1.625 seconds for every 2.5 seconds test)	
MIL On Condition		• 2 driving cycles	

SPECIFICATION

Item	During taking off the brake	During stepping on the brake
Brake Lamp Switch	0V	Battery voltage
Brake Switch	Battery voltage	0V

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Monitor "Brake Switch" parameter on Current Data

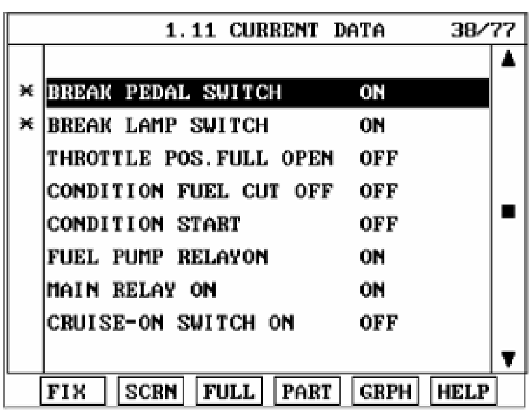

Fig. 1

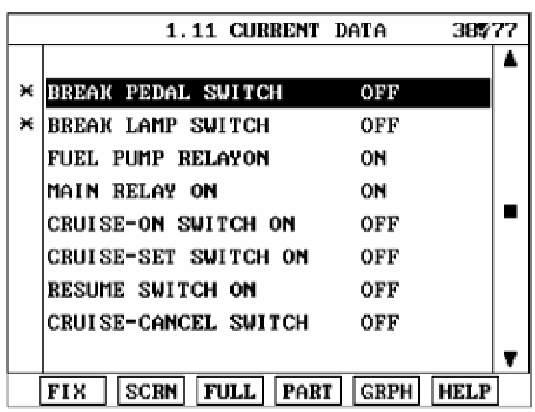

Fig. 2

4. Are those "Brake Switch" parameters displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Votage check
   (1) Key "OFF".
   (2) Disconnect the PCM connector.
   (3) Key "ON" and keep the brake taking off.
   (4) Measure the voltage between terminal 21 of PCM connector and chassis ground.
   (5) Measure the voltage between terminal 23 of PCM connector and chassis ground .
   (6) Keep the brake stepping on.
   (7) Measure the voltage between terminal 21 of PCM connector and chassis ground.
   (8) Measure the voltage between terminal 23 of PCM connector and chassis ground .

Specification :

Item	During taking off the brake	During stepping on the brake
Brake Lamp Switch	0V	Battery voltage
Brake Switch	Battery voltage	0V

   (9) Is the measured voltage within specification ?

YES

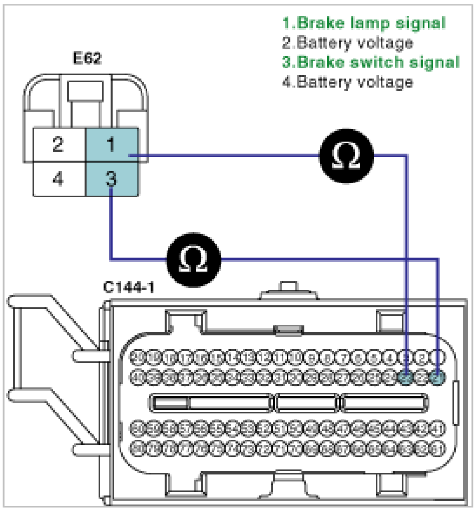
▸ Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to "Check open in harness" as follows.

2. Check open in harness
   (1) Key "OFF".
   (2) Disconnect the brake switch and PCM connector.
   (3) Measure the resistance between terminal 21 of PCM harness connector and terminal 3 of Brake switch harness side.
   (4) Measure the resistance between terminal 23 of PCM harness connector and terminal 1 of Brake switch harness side.

Specification : Approx. below 1Ω



(5) Is the measured resistance within specification ?

YES

▸ Go to "Check voltagen" procedure.

NO

▸ Repair open in circuit and go to "Verification of Vehicle Repair" procedure.

3. Check voltage

(1) Key "OFF".

(2) Disconnect the brake switch connector.

(3) Measure the voltage between brake lamp switch terminal and chassis ground.

(4) Measure the voltage between brake switch terminal and chassis ground.

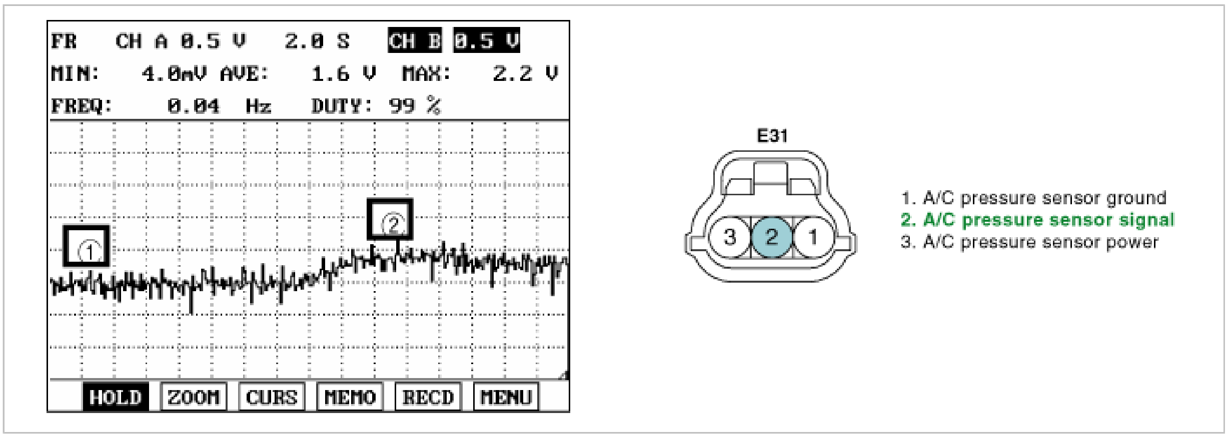
(5) Key "ON".

(6) Measure the voltage between brake lamp switch terminal and chassis ground.

(7) Measure the voltage between brake switch terminal and chassis ground.

Specification :

Item	During taking off the brake	During stepping on the brake
Brake Lamp Switch	0V	Battery voltage
Brake Switch	Battery voltage	0V



(8) Is the measured voltage within specification ?

YES

▸ Substitute with a known - good brake switch and check for proper operation. If the problem is corrected, replace brake switch and go to "Verification of Vehicle Repair" procedure.

NO

▸ Check the fuse between battery and brake switch.

▸ Repair open or short in power circuit of brake switch and go to "Verification of Vehicle Repair" procedure.

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0506

GENERAL DESCRIPTION

The IAC System is designed to maintain a steady desired idle speed. Idle airflow is adjustedthrough the idle air actuator, which may be ETC throttle body, in order to maintain the desired idle speed under various load conditions. Load conditions vary due to numerous factors, such as engine temperature, air conditioning, electrical load and power steering load.

DTC DESCRIPTION

Checking idle RPM from ETC throttle body under detecting condition, if if the idle speed is 100RPM below desired idle speed for 10 sec., PCM sets P0506. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if a low idle condition exists.	• Poor connection • Intake/Exhaust system for blockage • Throttle plate for carbon deposits • Faulty ETS motor • Faulty TPS • Faulty ETS system • Faulty PCM
Enable Conditions	• Normal Idle conditions • Canister Purge Fuel Flow ≤ 100 • Barometric Pressure > 72kPa • Engine running long enough • Air Intake Temperature • Coolant Temperature • 10V ≤ Ignition Voltage ≤ 16V • Above conditions met period • No intrumentation slew commanded • OFVC Device Control Not Active	
Thresh old value	• Real engine speed - Target engine speed< -100rpm	
Diagnosis Time	• Continuous	
MIL On Condition	• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Monitor items which affect idle rpm on scantool.

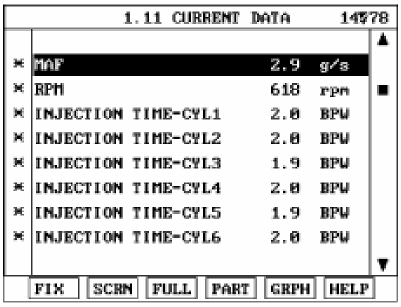


Fig. 1

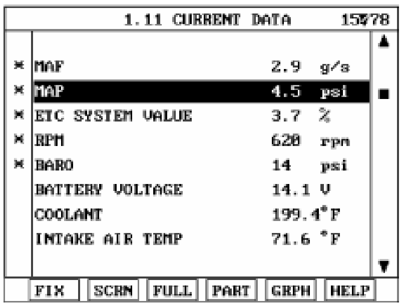

Fig. 2

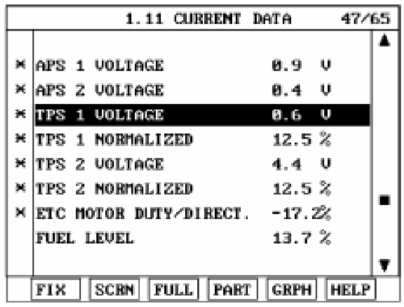

Fig. 3

4. Are those items on scantool displayed correctly ?

YES

▸ Go to "Terminal and Connector Inspection" procedure.

NO

▸ Check DTCs related to Mass airflow sensor(MAF),Injectors,Throttle position sensor(TPS), Purge control solenoid valve (PCSV), Acceleration position sensor(APS), Heated oxygen sensors(HO2S), ETS system

▸ Perform all repairs associated with those codes and go to "Verification of Vehicle Repair" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to " System Inspection " procedure

SYSTEM INSPECTION

1. Check intake/exhaust system for blockage

(1) Visually/physically inspect the following items:

- Air cleaner filter element for excessive dirt or for any foreign objects
- Hoses of intake system for blockage
- Throttle body inlet for damage or for any foreign objects
- Throttle plate for carbon deposits
- Restricted exhaust system

(2) Has a problem been found in any of the above areas?

YES

▸ Replace or repair as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Visually check ETS System" as below

2. Visually check ETS System

(1) Ignition "OFF"

(2) Remove the air hose between MAF sensor and Throttle body.

(3) Visually check the overall ETS system(Throttle valve,ETS motor,APS and TPS).

(4) Has a problem been found?

YES

▸ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

NO

▸ Go to " Component Inspection" procedure.

COMPONENT INSPECTION

1. Check ETS motor

(1) Ignition "OFF"

(2) Disconnect ETS motor connector

(3) Measure resistance between terminals "1" and "2" of the ETS motor connector.

Specification: Approx. 1.275 ~ 1.725Ω at 20°C(68 °F)

(4) Is the measured resistance within specifications?

YES

▸ Go to "Check TPS" as below

NO

▸ Substitute with a known-good ETS motor and check for proper operation. If the problem is corrected, replace ETS motor and then do "ETS Initialization" and go to "Verification of Vehicle Repair" procedure.

2. Check TPS

(1) Disconnect TPS connector and measure resistance between terminals 4 and 8 of the TPS connector.

Specification : Approx. 4.0~6.0kΩ(with throttle valve fully closed) at 20°C(68°F)

(2) Disconnect TPS connector and measure resistance between terminals 1 and 5 of the TPS connector.

Specification:

Item	Sensor Resistance
TPS 1	4.0 ~ 6.0 kΩ (20°C)
TPS 2	2.72 ~ 4.08 kΩ (20°C)

(3) Are the TPS resistance within specifications?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure. If PCM needs to be replaced, do "ETS Initialization" after it is replaced.

NO

▸ Substitute with a known-good TPS and check for proper operation.If the problem is corrected, replace TPS and then do "ETS Initialization". And go to "Verification of Vehicle Repair" procedure.

※ Procedure of ETS Initialization

1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0507

GENERAL DESCRIPTION

The IAC System is designed to maintain a steady desired idle speed. Idle airflow is adjustedthrough the idle air actuator, which may be ETC throttle body, in order to maintain the desired idle speed under various load conditions. Load conditions vary due to numerous factors, such as engine temperature, air conditioning, electrical load and power steering load.

DTC DESCRIPTION

Checking idle RPM from ETC throttle body under detecting condition, if the idle speed is more than 200 RPM above desired idle speed for 10 sec., PCM sets P0507. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Determines if a high idle condition exists.	• Poor connection • Intake system/Vapor hoses for air leakage or disconnection • Faulty Accelerator cable • Faulty ETS motor • Faulty TPS • Faulty ETS system • Faulty PCM
Enable Conditions	• Normal Idle conditions • Canister Purge Fuel Flow ≤ 100 • Barometric Pressure > 72kPa • Engine running long enough • Air Intake Temperature • Coolant Temperature • 10V ≤ Ignition Voltage ≤ 16V • Above conditions met period • No intrumentation slew commanded • OFVC Device Control Not Active	
Thresh old value	• Real engine speed - Target engine speed >200rpm	
Diagnosis Time	• Continuous	
MIL On Condition	• 2 driving cycles	

MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Monitor items which affect idle rpm on scantool.

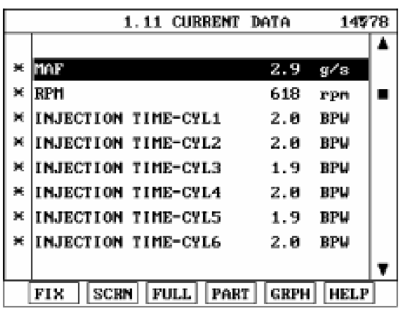

Fig. 1

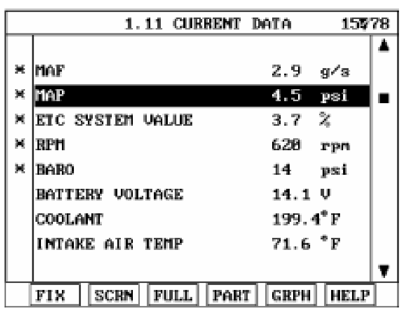

Fig. 2

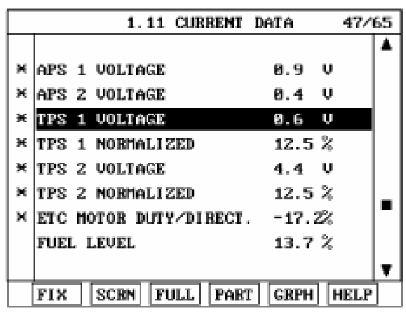

Fig. 3

4. Are those items on scantool displayed correctly ?

YES

▸ Go to "Terminal and Connector Inspection" procedure.

NO

▸ Check DTCs related to Mass airflow sensor(MAF),Injectors,Throttle position sensor(TPS), Purge control solenoid valve (PCSV), Acceleration position sensor(APS), Heated oxygen sensors(HO2S), ETS system
▸ Perform all repairs associated with those codes and go to "Verification of Vehicle Repair" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

NO

▸ Go to " System Inspection " procedure

SYSTEM INSPECTION

1. Check intake/exhaust system for blockage
   (1) Visually/physically inspect the following items:
   - Intake system for air leakage
   - Vapor hoses for cracks or disconnection

   (2) Has a problem been found in any of the above areas?

   YES

   ▶ Replace or repair as necessary and go to "Verification of Vehicle Repair" procedure

   NO

   ▶ Go to "Visually check ETS System" as below

2. Visually check ETS System
   (1) Ignition "OFF"

   (2) Remove the air hose between MAF sensor and Throttle body.

   (3) Visually check the overall ETS system(Throttle valve,ETS motor,APS and TPS).

   (4) Has a problem been found?

   YES

   ▶ Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure.

   NO

   ▶ Go to " Component Inspection" procedure.

COMPONENT INSPECTION

1. Check Accelerator Cable
   (1) Ignition "OFF" & Engine "OFF"

   (2) Check free play of accelerator Cable

   Specification 1.0 ~ 3.0mm(0.04 ~ 0.12 in)

   (3) Is the measured resistance within specifications?

   YES

   ▶ Go to "Check TPS" as below

   NO

   ▶ Substitute with a known-good ETS motor and check for proper operation. If the problem is corrected, replace ETS motor and then do "ETS Initialization" and go to "Verification of Vehicle Repair" procedure.

2. Check ETS motor
   (1) Ignition "OFF"

   (2) Disconnect ETS motor connector

   (3) Measure resistance between terminals "1" and "2" of the ETS motor connector.

   Specification: Approx. 1.275 ~ 1.725Ω at 20°C(68 °F)

Item	Sensor Resistance
Coll Resistance (Ω)	1.275 ~ 1.725Ω (20°C)

   (4) Are the TPS resistance within specifications?

   YES

   ▶ Go to "Check TPS" as below

   NO

   ▶ Substitute with a known-good ETS motor and check for proper operation. If the problem is corrected, replace ETS motor and then do "ETS Initialization" and go to "Verification of Vehicle Repair" procedure.

3. Check TPS
   (1) Disconnect TPS connector and measure resistance between terminals 4 and 8 of the TPS connector.

Specification : Approx. 4.0~6.0kΩ(with throttle valve fully closed) at 20°C(68°F)

(2) Disconnect TPS connector and measure resistance between terminals 1 and 5 of the TPS connector.
Specification:

Item	Sensor Resistance
TPS 1	4.0 ~ 6.0 kΩ (20°C)
TPS 2	2.72 ~ 4.08 kΩ (20°C)

(3) Are the TPS resistance within specifications?

YES

▸ Substitute with a known-good PCM and check for proper operation. If the problem is corrected,replace PCM and then go to "Verification of Vehicle Repair" procedure. If PCM needs to be replaced, do "ETS Initialization" after it is replaced.

NO

▸ Substitute with a known-good TPS and check for proper operation.If the problem is corrected, replace TPS and then do "ETS Initialization". And go to "Verification of Vehicle Repair" procedure.
※ Procedure of ETS Initialization
1. Erase the trouble codes on PCM
2. Turn the ignition key off and keep this condition until the main relay is turned off.(It will takes 10 second)
3. Turn ignition key on more than 1second to record the throttle motor position on the EEPROM

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.
1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

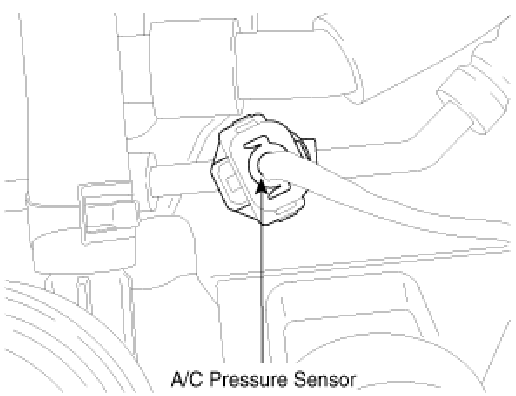
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0532

COMMPONENT LOCATION



GENERAL DESCRIPTION

A/C pressure sensor is installed betweem receiver driver and inflation valve. Sensing coolant pressure, this sensor converts pressure into voltage to input the value to PCM. With this signal, PCM performs idle control, cooling fan control, aircon compresser control.

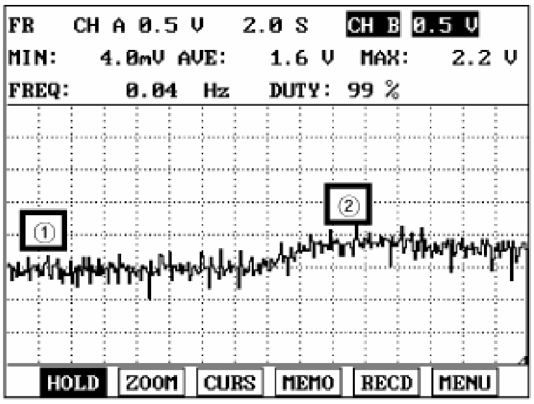
DTC DESCRIPTION

Checking output signals from A/C pressure sensor every 25 sec. under detecting condition, if an signal below 0.05V lasts for more than 12.5 sec., PCM sets P0532.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects sensor signal short to low voltage	• Poor connection • Open in power circuit • Open or short to ground in signal circuit • Faulty A/C pressure sensor • Faulty PCM
Enable Conditions	• Engine works	
Thresh old value	• Sensor output voltage< 0.05V	
Diagnosis Time	• Continuous (More than 12.5 seconds failure for every 25 seconds test)	
MIL On Condition	• DTC only (NO MIL ON)	

SIGNAL WAVEFORM AND DATA



① - A/C OFF & idle state
② - A/C ON & idle state

SPECIFICATION

Pressure(psi)	14.7	56.7	250	439.7	465

4. Are those items on scantool displayed correctly ?

YES

▶ Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▶ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▶ Repair as necessary and go to "Verification of Vehicle Repair" procedure

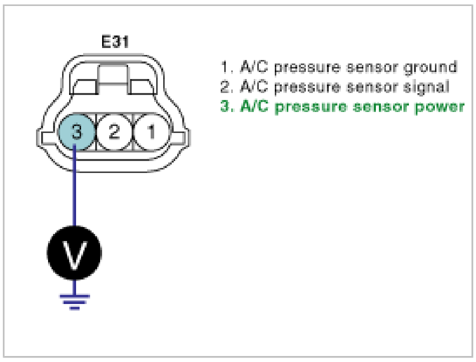
NO

▶ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Key "OFF".
2. Disconnect the A/C pressure sensor connector.
3. Key "ON".
4. Measure the voltage between terminal 3 of A/C pressure sensor harness connector and chassis ground.

Specification : approx. 5V



5. Is the measured voltage within specification ?

YES

▸ Go to "Signal circuit inspection" procedure.

NO

▸ Repair Open or Short to ground in A/C pressure sensor power circuit and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Check short to ground inspection
   (1) Key "OFF".
   (2) Disconnect A/C pressure sensor and PCM connector.
   (3) Measure the resistance between terminal 2 of A/C pressure sensor harness connector and chassis ground.

   Specification : Infinite

   (4) Is the measured resistance within specification ?

   YES

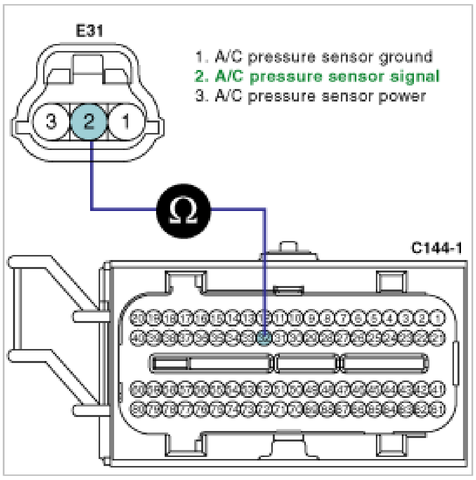
   ▸ Go to "Check open in harness" procedure.

   NO

   ▸ Repair Short to ground in A/C pressure sensor signal circuit and go to "Verification of Vehicle Repair" procedure.

2. Check open in harness
   (1) Key "OFF".
   (2) Disconnect A/C pressure sensor and PCM connector.
   (3) Measure the resistance between terminal 2 of A/C pressure sensor harness connector and terminal 32/C144-1 of PCM harness connector.

   Specification : Approx. below 1Ω



(4) Is the measured resistance within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

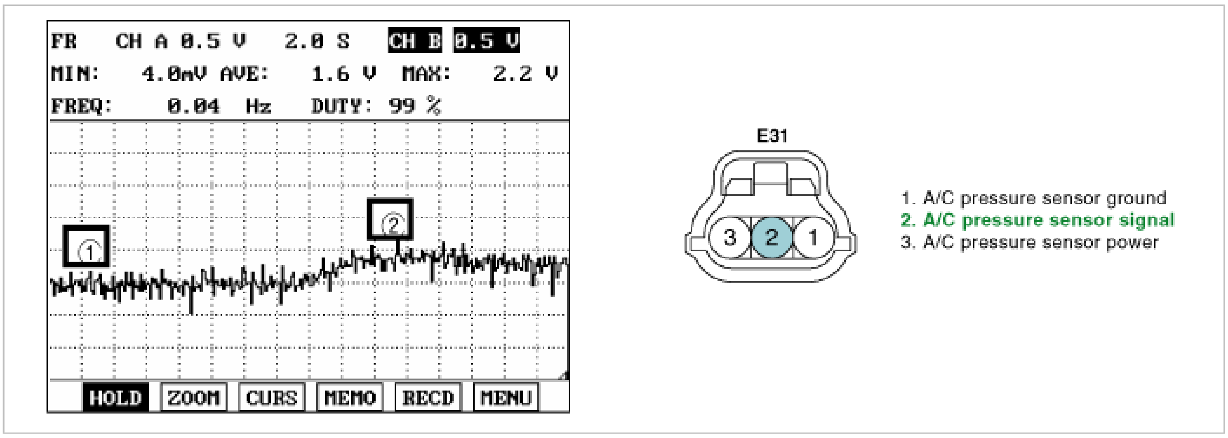
▸ Repair Open in A/C pressure signal circuit and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. A/C pressure sensor inspection
   (1) Key "OFF" and connect the scantool.
   (2) Connect the probe to A/C pressure sensor signal and select the oscilloscope in the menu.
   (3) Check the waveform with acceleration and deceleration after engine start.

Specification :

Pressure(psi)	14.7	56.7	250	439.7	465
Voltage(V)	0.203	0.629	2.633	4.649	4.8



(4) Is the measured waveform of A/C pressure sensor normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good A/C pressure sensor and check for proper operation. If the problem is corrected, replace A/C pressure sensor and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

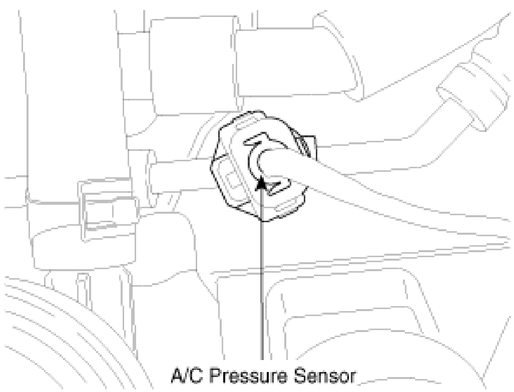
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0533

COMMPONENT LOCATION



GENERAL DESCRIPTION

A/C pressure sensor is installed betweem receiver driver and inflation valve. Sensing coolant pressure, this sensor converts pressure into voltage to input the value to PCM. With this signal, PCM performs idle control, cooling fan control, aircon compresser control.

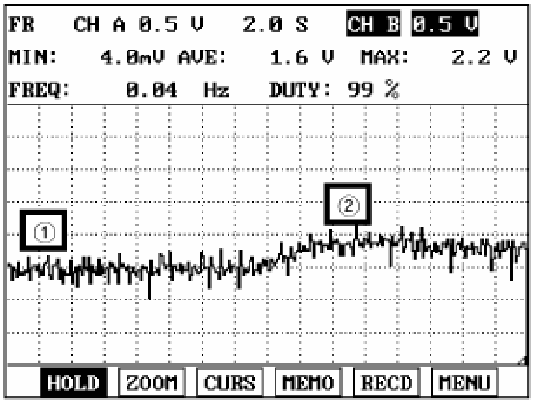
DTC DESCRIPTION

Checking output signals from A/C pressure sensor every 25 sec. under detecting condition, if an signal above 4.65V lasts for more than 12.5 sec., PCM sets P0533.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• Detects sensor signal short to high voltage	• Poor connection • Short in signal circuit • Open in ground circuit • Faulty A/C pressure sensor • Faulty PCM
Enable Conditions	• Engine works	
Thresh old value	• Sensor output voltage< 4.65V	
Diagnosis Time	• Continuous (More than 12.5 seconds failure for every 25 seconds test)	
MIL On Condition	• DTC only (NO MIL ON)	

SIGNAL WAVEFORM AND DATA



① - A/C OFF & idle state
② - A/C ON & idle state

SPECIFICATION

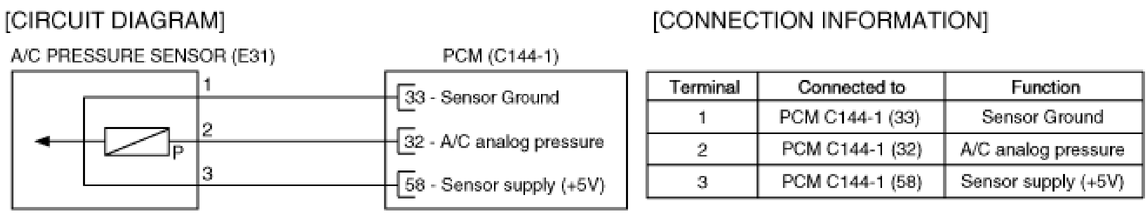
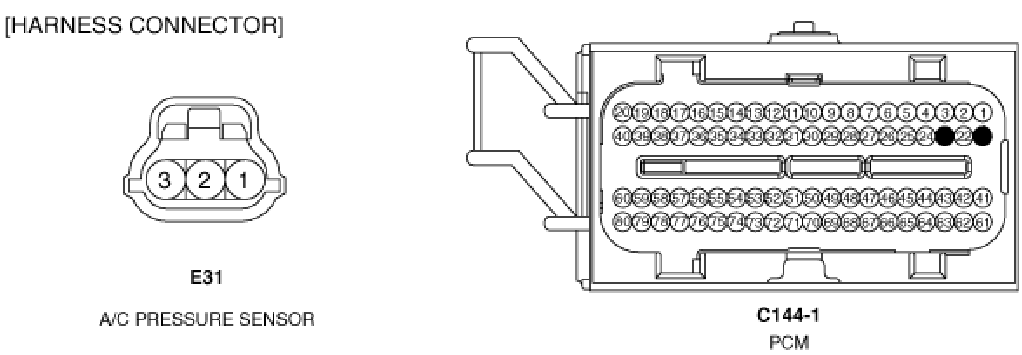
Voltage(V)	0.203	0.629	2.633	4.649	4.8

SCHEMATIC DIAGRAM





MONITOR SCANTOOL DATA

1. Ignition "OFF"
2. Connect Scantool and Engine "ON"
3. Check whether Air-Con pressure is rising during acceclerating.

Fig : A/C - OFF

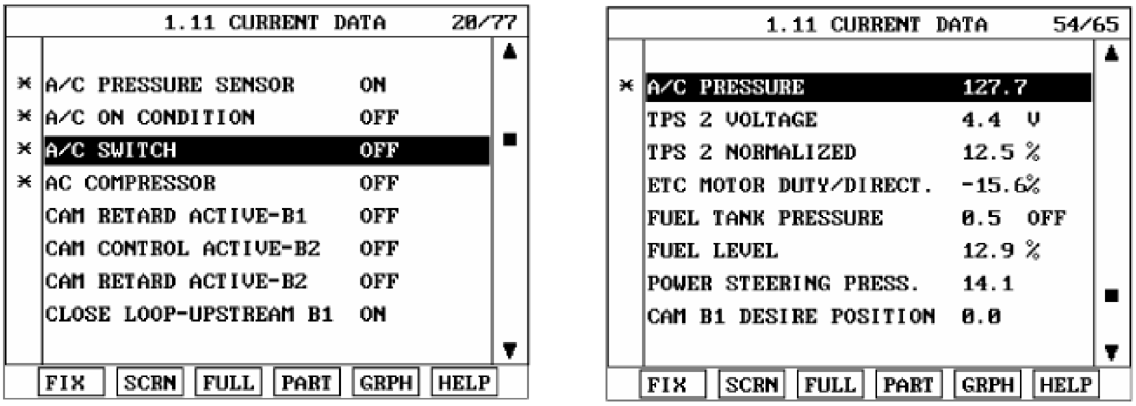


Fig : A/C Switch - ON

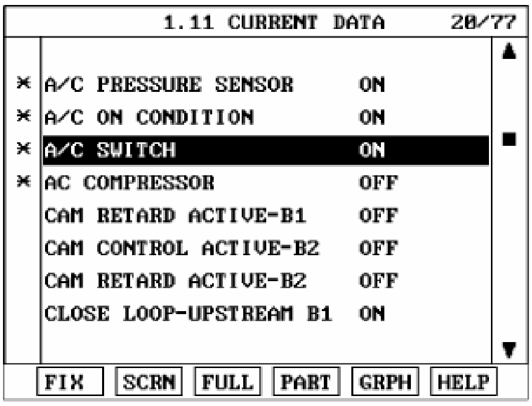


4. Are those items on scantool displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor's and/or PCM's connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

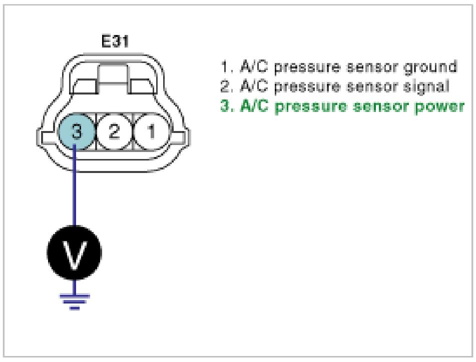
NO

▸ Go to " Power Circuit Inspection " procedure.

POWER CIRCUIT INSPECTION

1. Key "OFF".
2. Disconnect the A/C pressure sensor connector.
3. Key "ON".
4. Measure the voltage between terminal 3 of A/C pressure sensor harness connector and chassis ground.

Specification : approx. 5V



5. Is the measured voltage within specification ?

YES

▸ Go to "Ground inspection" procedure.

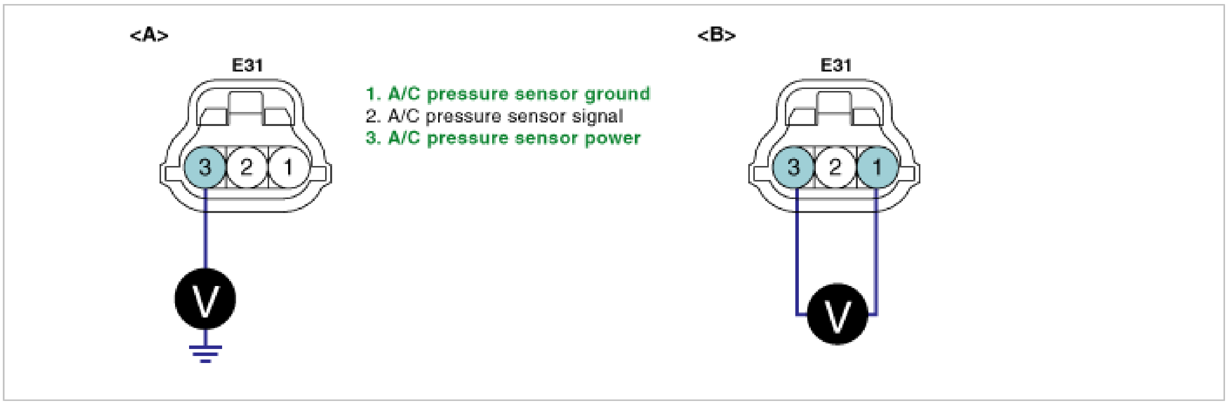
NO

▸ Repair Open in power circuit and go to "Verification of Vehicle Repair" procedure.

GROUND CIRCUIT INSPECTION

1. Key "OFF".
2. Disconnect the A/C pressure sensor connector.
3. Key "ON".
4. Measure the voltage between terminal 3 of A/C pressure sensor harness connector and chassis ground. (Fig A)
5. Measure the voltage between terminal 3 and terminal 1 of A/C pressure sensor harness connector. (Fig B)

Specification : The Difference between "A" and "B" is below 200mV.



6. Is the measured voltage within specification ?

YES

▸ Go to "Signal circuit inspection" procedure.

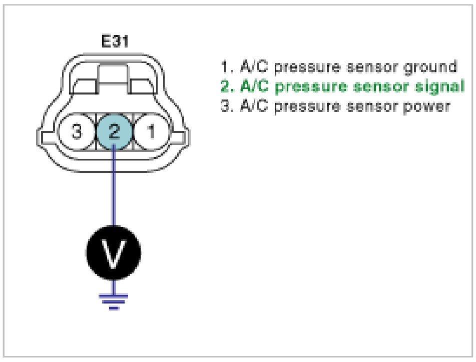
NO

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure.

SIGNAL CIRCUIT INSPECTION

1. Voltage inspection
   (1) Key "OFF".
   (2) Disconnect the A/C pressure sensor connector.
   (3) Key "ON".
   (4) Measure the voltage between terminal 2 of A/C pressure sensor harness connector and chassis ground.

   Specification : Approx. 0V



(5) Is the measured voltage within specification ?

YES

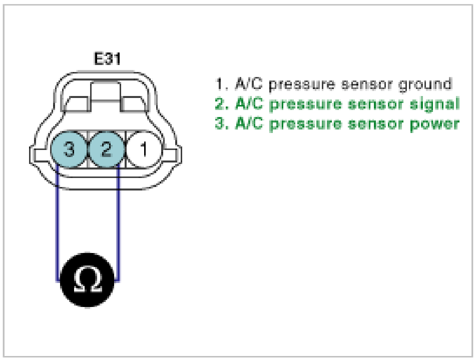
▸ Go to "Component inspection" procedure.

NO

▸ Go to "Short in circuit inspection" procedure.

2. Short in circuit inspection
   (1) Key "OFF".
   (2) Disconnect A/C pressure sensor connector and PCM connector.
   (3) Measure the resistance between terminal 2 and terminal 3 of A/C pressure sensor harness connector.

Specification : Infinite



(4) Is the measured resistance within specification ?

YES

▸ Go to "Component inspection" procedure.

NO

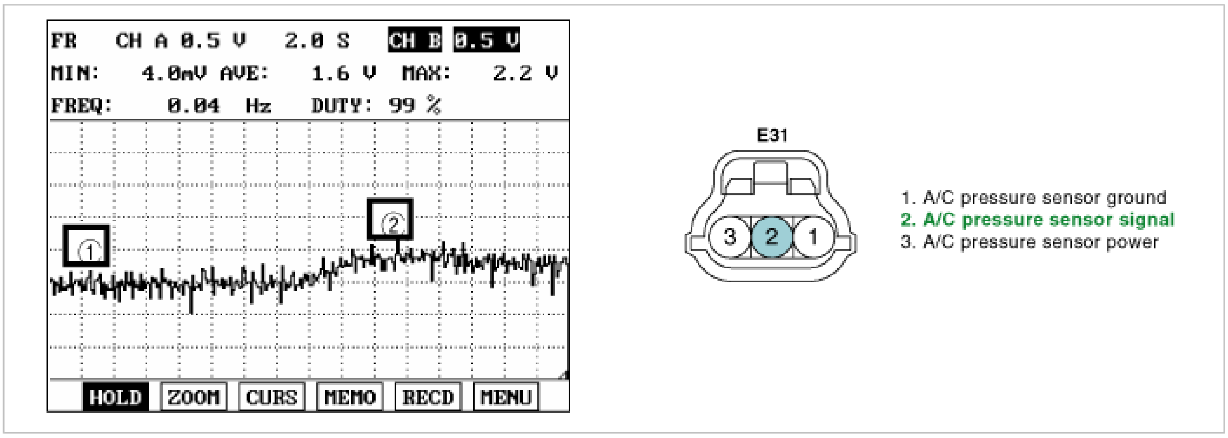
▸ Repair Short in signal circuit and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. A/C pressure sensor inspection
   (1) Key "OFF" and connect the scantool.
   (2) Connect the probe to A/C pressure sensor signal and select the oscilloscope in the menu.
   (3) Check the waveform with acceleration and deceleration after engine start.

Specification :

Pressure(psi)	14.7	56.7	250	439.7	465
Voltage(V)	0.203	0.629	2.633	4.649	4.8



(4) Is the measured waveform of A/C pressure sensor normal?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

   (1) Key "OFF".
   (2) Disconnect the main relay connector.
   (3) Key "ON".
   (4) Measure the voltage between terminal 2 of main relay harness connector and chassis ground.
   (5) Measure the voltage between terminal 5 of main relay harness connector and chassis ground.

   Specification : B+

   
   (6) Is the measured voltage within specification ?

   YES

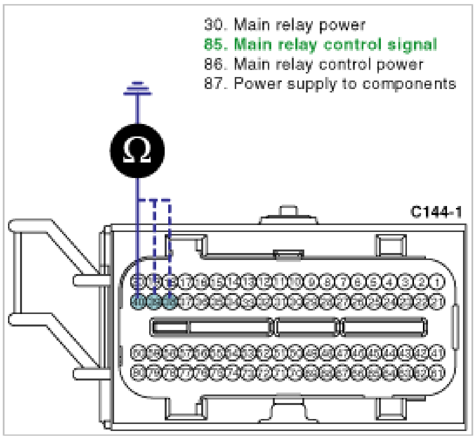
   ▸ Go to "Check short in harness" procedure.

   NO

   ▸ Repair Short in power harness and go to "Verification of Vehicle Repair" procedure.

2. Check short in harness
   (1) Key "ON".
   (2) Measure the voltage between terminal 38, 40 of PCM harness terminal and chassis ground.

   Specification : B+



(3) Is the measured voltage within specification ?

YES

▸ Go to "System inspection" procedure.

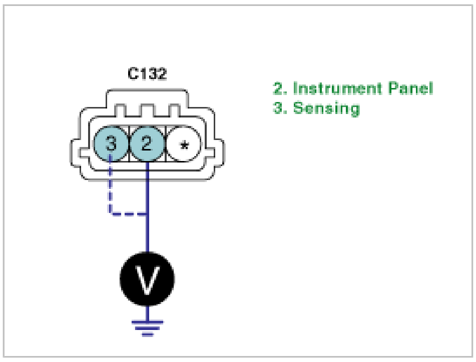
NO

▸ Repair short in power harness and go to "Verification of Vehicle Repair" procedure .

SYSTEM INSPECTION

1. Check Alternator circuit
   (1) Key "OFF".
   (2) Disconnect alternator connector.
   (3) Key "ON".
   (4) Measure the voltage between terminal 2 of alternator and chassis gound.
   (5) Measure the voltage between terminal 3 of alternator and chassis gound.

Specification : B+



(6) Is the measured voltage within specification?

YES

▸ Go to "Component inspection" procedure.

NO

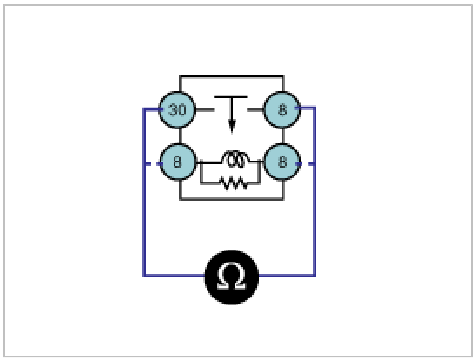
▸ Repair short in Sensing circuit or MIL circuit and go to "Verification of Vehicle Repair" procedure.

COMPONENT INSPECTION

1. Main relay inspection
   (1) Key "OFF".
   (2) Disconnect the main relay.
   (3) Measure the resistance between terminal 3 and 5 of main relay.
   (4) Measure the resistance between terminal 2 and 4 of main relay.

Specification : 70 ~ 120Ω

Terminal	Power approval
3 ~ 5	NO
2 ~ 4	YES (Approx. 70Ω ~ 120Ω)



(5) Is the measured resistance within specification ?

YES

▸ Go to "Check Alternator" procedure.

NO

▸ Substitute with a known - good Main relay and check for proper operation. If the problem is corrected, replace Main relay and go to "Verification of Vehicle Repair" procedure.

2. Check Alternator

(1) Key "OFF".

(2) Check the tension of the belt.

(3) Check Battery terminal and Alternator B+ terminal for looseness, corrosion or damage.

(4) Engine "ON".

(5) Operate electric equipments (Head lamp, Hot wire, etc).

(6) accelerate engine to 2000 RPM and measure the battery voltage.

Specification : Approx. 12.5V ~ 14.5V

(7) Is the measured voltage within specification ?

YES

▸ Substitute with a known - good PCM and check for proper operation. If the problem is corrected, replace PCM and go to "Verification of Vehicle Repair" procedure.

NO

▸ Substitute with a known - good Alternator and check for proper operation. If the problem is corrected, replace Alternator and go to "Verification of Vehicle Repair" procedure.

> **NOTE**
>
> There is a memory reset function on scantool that can erase optional parts automatically detected and memorized by PCM. After testing PCM on the vehicle, use this function to reuse the PCM on the others

VERIFICATION OF VEHICLE REPAIR

After a repair, it is essential to verify that the fault has been corrected.

1. Monitor and record the Freeze Frame Data for the Diagnostic Trouble Code(DTC) which has been diagnosed.
2. Using a Scantool, Clear the DTCs
3. Operate the vehicle within conditions noted in the freeze frame data or enable conditions
4. Monitor that all rediness test have been verified as " Complete "
5. Are any DTCs present ?

YES

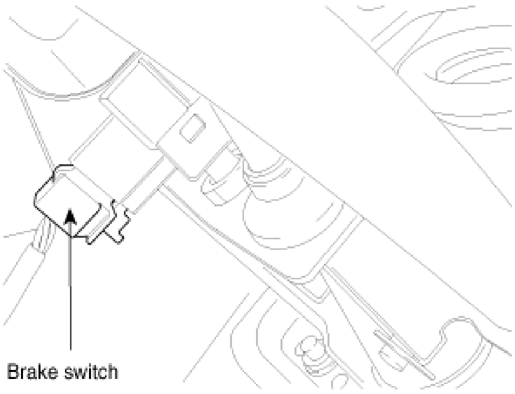
▸ Go to the applicable troubleshoooting procedure.

NO

▸ System is performing to specification at this time.

Fuel System > Troubleshooting > P0571

COMPONENT LOCATION



GENERAL DESCRIPTION

Brake switch connected to brake pedal transfers brake operating state to ECM. For diagnosis of abnormal operation of Brake switch, two types of signals(one from Brake warning lamp switch, the other from Brake checking switch) are used and those two types output different signals at both condition, depressing or releasing brake pedal. When brake pedal is depressed brake checking switch outputs B+ voltage while brake warning lamp switch emits 0V. Conversly, when brake pedal is released, the output signals of each switch are opposite.

DTC DESCRIPTION

Checking input signals from brake lamp switch every 2 sec. under detecting condition, if the operation state of brake lamp switch does not change for more than 2 sec., PCM sets P0571. MIL(Malfunction Indicatin Lamp) turns on when the malfunction lasts till cosecutive 2 driving cycle.

DTC DETECTING CONDITION

Item	Detecting Condition	Possible cause
DTC Strategy	• PCM detects brake lamp input signal when vehicle stops.	• Poor connection • Open or short to ground in signal circuit • Faulty PCM
Enable onditions	• Engine works • Vehicle speed signal is normal. • Vehicle speed >0kph (during 1sec or more)	
Threshold value	• Vehicle speed < 3kph • Vehicle acceleration< 20kph/s • Brake lamp "ON" • There should be a brake lamp change.	
Diagnosis Time	• Continuous (More than 2 seconds failure for every 2 seconds test)	
MIL On Condition	• 2 driving cycles	

SCHEMATIC DIAGRAM

PCM

MONITOR SCANTOOL DATA

1. IG "OFF" & connect scantool.
2. ENG "ON" and warm -up the engine to normal operating temperature.
3. Monitor "Brake Switch" parameter on the service data with stepping on and off the brake.

Fig. 1

Fig. 2

4. Are those related current data displayed correctly ?

YES

▸ Fault is intermittent caused by poor contact in Sensor’s and/or PCM’s connector or was repaired and PCM memory was not cleared. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage. Repair or replace as necessary and go to "Verification of Vehicle Repair" procedure

NO

▸ Go to "Terminal and Connector Inspection" procedure.

TERMINAL AND CONNECTOR INSPECTION

1. Many malfunctions in the electrical system are caused by poor harness and terminals. Faults can also be caused by interference from other electrical systems, and mechanical or chemical damage.
2. Thoroughly check connectors for looseness, poor connection, bending, corrosion, contamination, deterioration, or damage.
3. Has a problem been found?

YES

▸ Repair as necessary and go to "Verification of Vehicle Repair" procedure

NO
