VEHICLE CERTIFICATION LABEL

DESCRIPTION

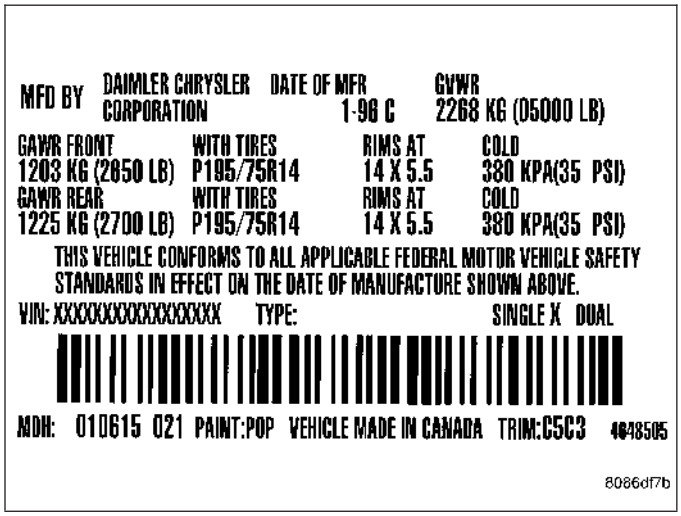
A vehicle certification label is attached to every DaimlerChrysler Corporation vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

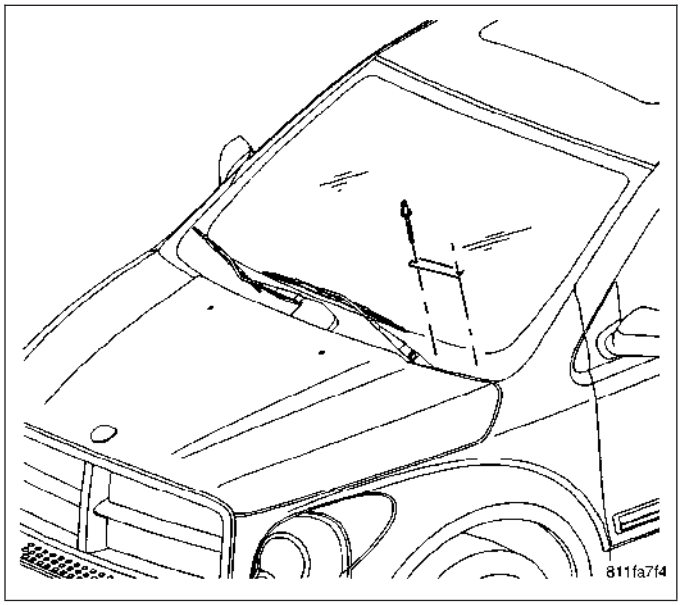


VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) plate is attached to the top left side of the instrument panel. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the decoding chart to determine the identification of a vehicle.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.



VIN DECODING INFORMATION

POSITION	INTERPRETATION	CODE = DESCRIPTION
1	Country of Origin	1 = Manufactured by DaimlerChrysler Corporation
2	Make	D = Dodge
3	Vehicle Type	4 = Multipurpose Passenger Vehicle less Side Airbags 8 = Multipurpose Passenger Vehicle with Side Airbags
4	Gross Vehicle Weight Rating	H = 6001-7000 lbs.
5	Vehicle Line	D = Durango 4x2 B = Durango 4x4
6	Series	3 = Durango ST 4 = Durango SLT 5 = Durango LIMITED
7	Body Style	8 = Sport Utility 4 Door
8	Engine	K = 3.7L 6 cyl. MPI Gasoline N = 4.7L 8 cyl. MPI Gasoline D = 5.7L 8 cyl. SMPI Gasoline
9	Check Digit	0 through 9 or X
10	Model Year	5 = 2005
11	Assembly Plant	F = Newark Assembly
12 Thru 17	Vehicle Build Sequence	

VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL

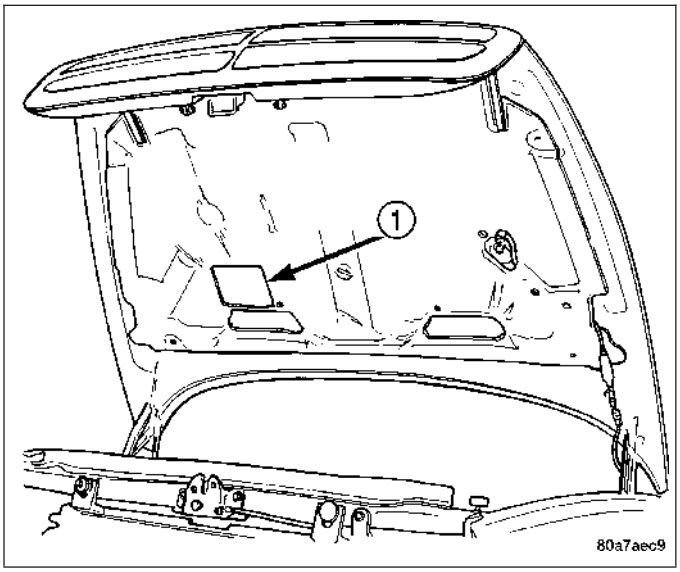
DESCRIPTION

All vehicles are equipped with a combined VECI label. This label is located in the engine compartment.

The VECI label contains the following:

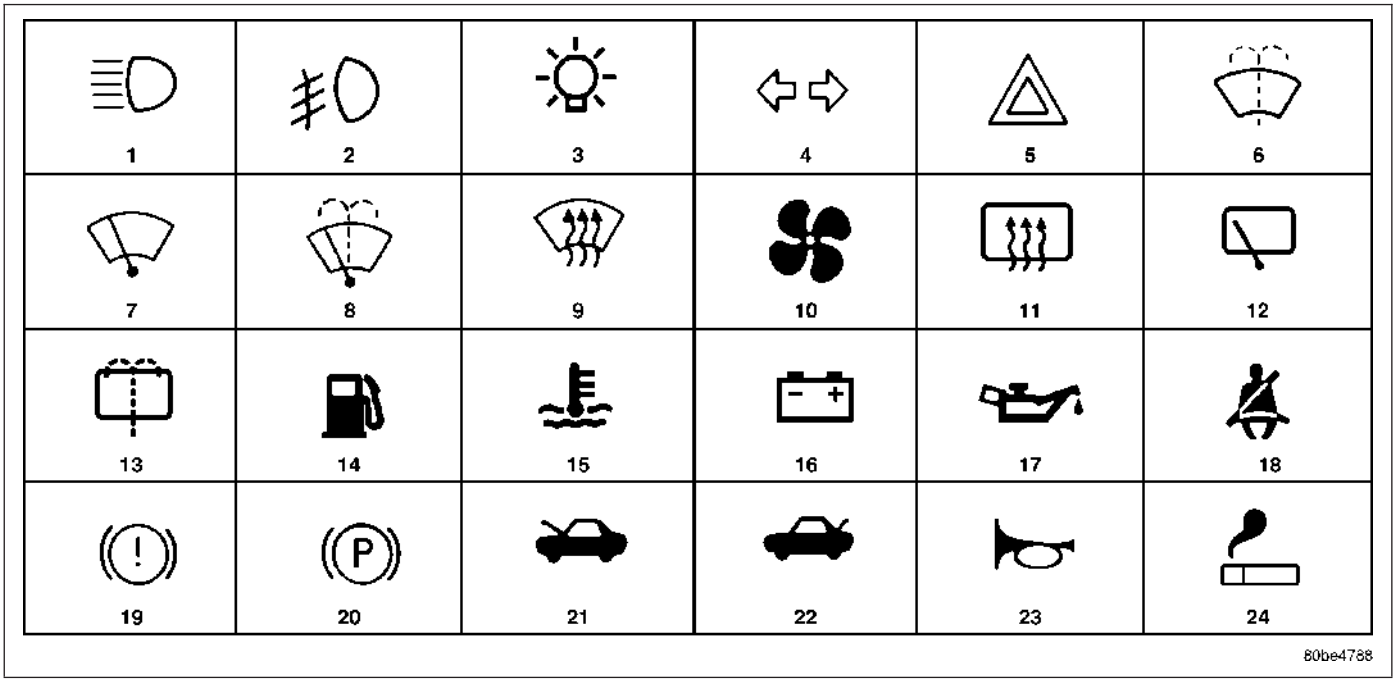
- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages. These labels are permanently attached and cannot be removed without defacing information and destroying label.



INTERNATIONAL SYMBOLS

DESCRIPTION



The graphic symbols illustrated in the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

Bolt Markings and Torques - Metric

FASTENER USAGE

DESCRIPTION

FASTENER USAGE

WARNING: Use of an incorrect fastener may result in component damage or personal injury.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

DESCRIPTION

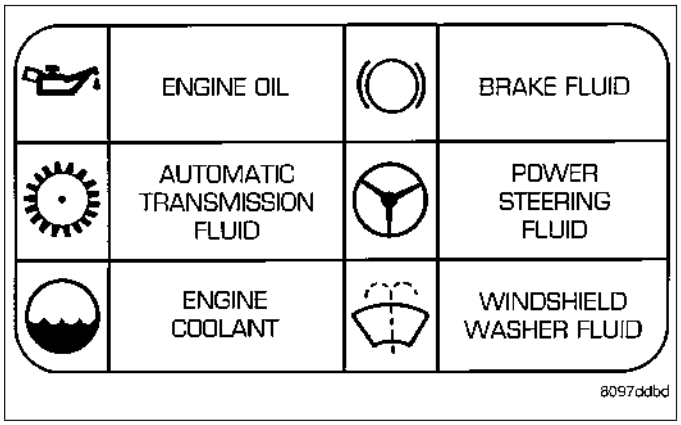
DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations.



PARTS & LUBRICANT RECOMMENDATION

DESCRIPTION

LUBRICANT RECOMMENDATIONS

Chassis

Component	Fluid, Lubricant, or Genuine Part
Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

Body

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door & Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

FLUID TYPES

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler Corporation vehicle.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by DaimlerChrysler Corporation.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

FLUID TYPES

DESCRIPTION

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded “regular” gasoline having an octane rating of 87. The routine use of premium gasoline is not recommended. Under normal conditions the use of premium fuel will not provide a benefit over high quality regular gasolines and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly support the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle’s catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of DaimlerChrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

WARNING: DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified non-HOAT or other HOAT coolant, may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and distilled water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Distilled Water - Distilled water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of distilled water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Distilled Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

ENGINE OIL

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

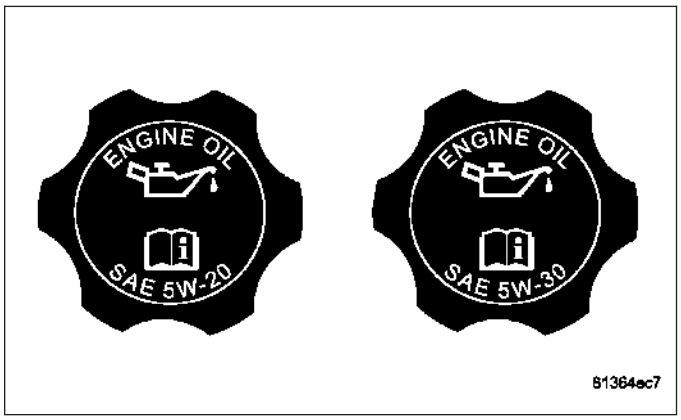
- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation. **For 3.7L/4.7L engines SAE 5W-30 engine oil is recommended for all operating temperatures. For 5.7L engines SAE 5W-20 engine oil is recommended for all operating temperatures. These engine oils improve low temperature starting and vehicle fuel economy. Refer to your engine oil filler cap for the recommended engine oil viscosity for your vehicle.**



ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Diamler-Chrysler only recommend API Certified engine oils. Use Mopar® engine oil or equivalent.

TRANSFER CASE - NV144

Recommended lubricant for the NV144 transfer case is Mopar® ATF +4, Automatic Transmission Fluid.

TRANSFER CASE - NV244

Recommended lubricant for the NV244 transfer case is Mopar® ATF +4, Automatic Transmission Fluid.

AXLE

NOTE: DaimlerChrysler recommends Mopar® lubricants or lubricants of equal quality.

FRONT AXLE

- C205F - Mopar® Gear Lubricant 75W-90

REAR AXLE

- 8 1/4 - Mopar® Synthetic Gear Lubricant 75W-140
- 9 1/4 - Mopar® Synthetic Gear Lubricant 75W-140

POWER STEERING FLUID

Mopar® ATF +4, Automatic Transmission Fluid is required in the power steering system. Substitute fluids can induce power steering system failure.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

OPERATION - AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

FLUID CAPACITIES

SPECIFICATIONS

FLUID CAPACITIES

DESCRIPTION	SPECIFICATION
FUEL TANK	27 U.S. Gallons (102 Liters)****

Power Steering	
Power steering fluid capacities are dependent on engine/chassis options as well as steering gear/cooler options. Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these capacities may vary.	

FLUID FILL/CHECK LOCATIONS

DESCRIPTION

The fluid check/fill points and lubrication locations are located in each applicable Sections.

MAINTENANCE SCHEDULES

DESCRIPTION

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **"B"**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule "B" of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first and follow schedule "B" of the ″Maintenance Schedules″ section of this manual.

NOTE: Most vehicles are operated under the conditions listed for Schedule ″B″.

Second is Schedule **"A"**. It is for vehicles that are not operated under any of the conditions listed under Schedule ″B″.

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints (if equipped) and front suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

Schedule “B”

Follow schedule “B” if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

NOTE: If ANY of these apply to you then change your coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first and follow schedule “B” of the ″Maintenance Schedules″ section of this manual.

Replace spark plugs.				X
Inspect PCV valve, replace as necessary.*				X

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

HOISTING

STANDARD PROCEDURE

HOISTING AND JACKING

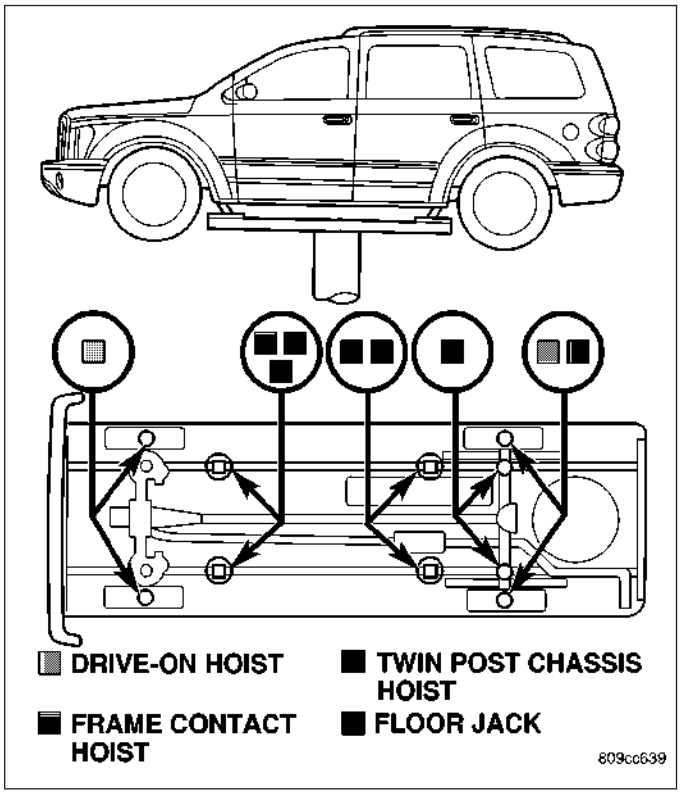
WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN A CHASSIS OR DRIVETRAIN COMPONENT IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.

FLOOR JACKING

CAUTION: Do not attempt to lift a vehicle with a floor jack positioned under:

- **An axle tube.**
- **Aluminum differential.**
- **A body side sill.**
- **A steering linkage component.**
- **A drive shaft.**
- **The engine or transmission oil pan.**
- **The fuel tank.**
- **A front suspension arm.**

When properly positioned, a floor jack can be used to lift a Durango vehicle. Support the vehicle in the raised position with jack stands at the front and rear ends of the frame rails.



HOISTING

A vehicle can be lifted with:

- A single-post, frame-contact hoist.
- A twin-post, chassis hoist.
- A ramp-type, drive-on hoist.

NOTE: When a frame-contact type hoist is used, verify that the lifting pads are positioned properly.

JUMP STARTING

STANDARD PROCEDURE

JUMP STARTING

WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS IN THE BATTERY SYSTEM SECTION OF THE SERVICE MANUAL. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)

- **DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.**
- **IF EQUIPPED, DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR.**
- **DO NOT JUMP START A VEHICLE WHEN THE BATTERY FLUID IS BELOW THE TOP OF LEAD PLATES.**
- **DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.**
- **DO NOT USE OPEN FLAME NEAR BATTERY.**
- **REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.**
- **WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS. REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.**
  FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.

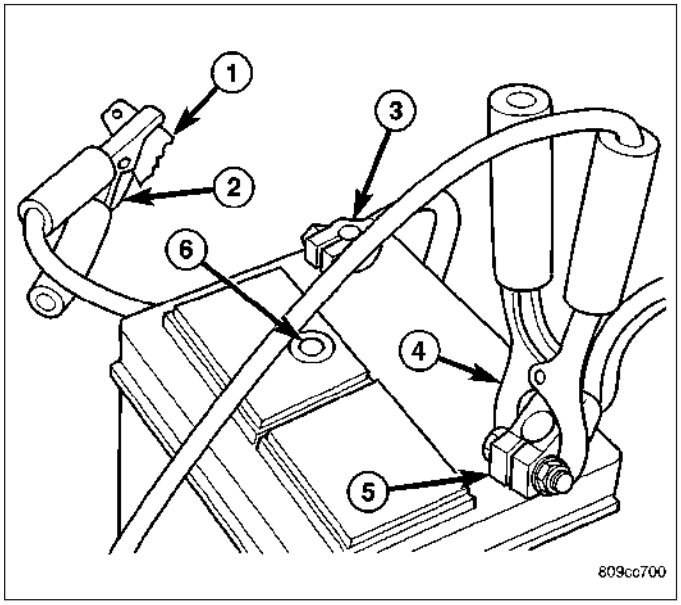
CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

TO JUMP START A DISABLED VEHICLE:

1. Raise hood on disabled vehicle and visually inspect engine compartment for:
   - Battery cable clamp condition, clean if necessary.
   - Frozen battery.
   - Yellow or bright color test indicator, if equipped.
   - Low battery fluid level.
   - Generator drive belt condition and tension.
   - Fuel fumes or leakage, correct if necessary.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

2. When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.



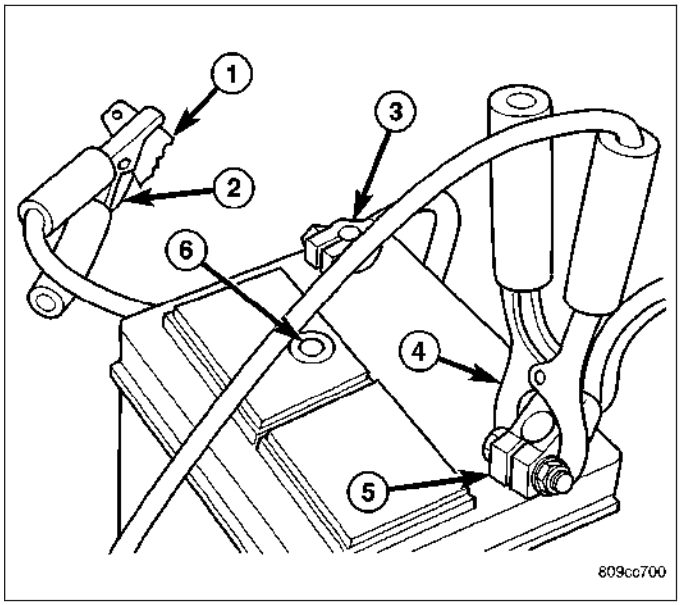
3. On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.
4. Connect jumper cables to booster battery. RED clamp (4) to positive terminal (+). BLACK clamp (2) to negative (3) terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.
5. On disabled vehicle, connect RED jumper cable (4) clamp to positive (+) terminal. Connect BLACK jumper cable clamp to engine ground (1) as close to the ground cable attaching point as possible.
6. Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

7. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp (2) from engine ground (1) on disabled vehicle.
- When using a booster vehicle, disconnect BLACK cable clamp (2) from battery negative terminal (3). Disconnect RED cable clamp (4) from battery positive terminal (5).
- Disconnect RED cable clamp (4) from battery positive terminal (4) on disabled vehicle.



TOWING

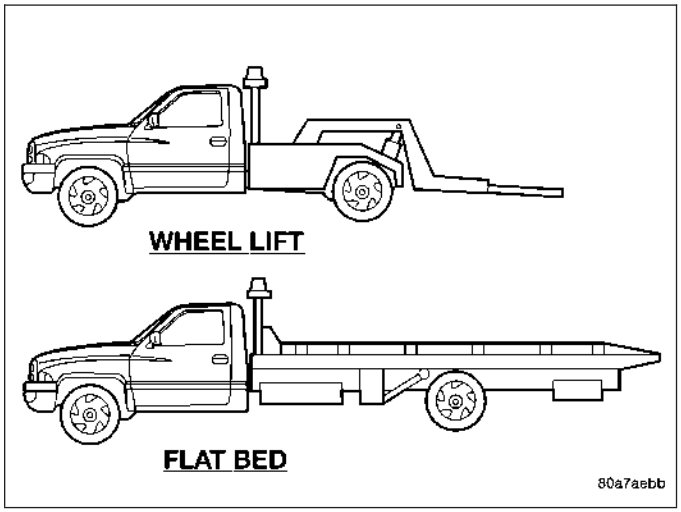
STANDARD PROCEDURE

TOWING RECOMMENDATIONS

A vehicle equipped with SAE approved wheel lift-type towing equipment can be used to tow all vehicles. When towing a 4WD vehicle using a wheel-lift towing device, use tow dollies under the opposite end of the vehicle. A vehicle with flatbed device can also be used to transport a disabled vehicle.

SAFETY PRECAUTIONS

CAUTION: The following safety precautions must be observed when towing a vehicle:



- Secure loose and protruding parts.
- Always use a safety chain system that is independent of the lifting and towing equipment.
- Do not allow towing equipment to contact the disabled vehicle's fuel tank.
- Do not allow anyone under the disabled vehicle while it is lifted by the towing device.
- Do not allow passengers to ride in a vehicle being towed.
- Always observe state and local laws regarding towing regulations.
- Do not tow a vehicle in a manner that could jeopardize the safety of the operator, pedestrians or other motorists.
- Do not attach tow chains, T-hooks, or J-hooks to a bumper, steering linkage, drive shafts or a non-reinforced frame hole.

- Do not tow a heavily loaded vehicle. Use a flatbed device to transport a loaded vehicle.

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until lifted wheels are a minimum 100 mm (4 in) from the ground. Be sure there is adequate ground clearance at the opposite end of the vehicle, especially when towing over rough terrain or steep rises in the road.

RAMP ANGLE

If a vehicle with flatbed towing equipment is used, the approach ramp angle should not exceed 15 degrees.

TOWING WHEN KEYS ARE NOT AVAILABLE

When the vehicle is locked and keys are not available, use a flat bed hauler. A wheel-lift device can be used on 4WD vehicles provided **all the wheels are lifted off the ground using tow dollies.**

FOUR WHEEL DRIVE TOWING

Chrysler Corporation recommends that a vehicle be transported on a flat-bed device. A Wheel-lift device can be used provided **all the wheels are lifted off the ground using tow dollies.**

WARNING: WHEN TOWING A DISABLED VEHICLE AND THE DRIVE WHEELS ARE SECURED IN A WHEEL LIFT OR TOW DOLLIES, ENSURE THE TRANSMISSION IS IN THE PARK POSITION.

CAUTION: Many vehicles are equipped with air dams, spoilers, and/or ground effect panels. To avoid component damage, a wheel-lift towing vehicle or a flat-bed hauling vehicle is recommended.

FOUR WHEEL DRIVE TOWING – REAR END LIFTED

WARNING: ENSURE VEHICLE IS ON A LEVEL SURFACE OR THE WHEELS ARE BLOCKED TO PREVENT VEHICLE FROM ROLLING.

1. Attach wheel lift device to front wheels.
2. Place the transmission in neutral.
3. Raise the front of the vehicle off the ground and install tow dollies under front wheels.
4. Attach wheel lift device to rear wheels and raise vehicle to towing position.
5. Attach safety chains to frame rails. Route chains so not to interfere with tail pipe when vehicle is lifted.
6. Turn the ignition switch to the OFF position to unlock the steering wheel.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place the transmission in park.

FOUR WHEEL DRIVE TOWING – FRONT END LIFTED

WARNING: ENSURE VEHICLE IS ON A LEVEL SURFACE OR THE WHEELS ARE BLOCKED TO PREVENT VEHICLE FROM ROLLING.

1. Attach wheel lift device to rear wheels.
2. Place the transmission in neutral.
3. Raise the rear of the vehicle off the ground and install tow dollies under rear wheels.
4. Attach wheel lift device to front wheels and raise vehicle to towing position.
5. Attach the safety chains.

CAUTION: Do not use steering column lock to secure steering wheel during towing operation.

6. Turn the ignition switch to the OFF position to unlock the steering wheel.
7. Secure steering wheel in straight ahead position with a clamp device designed for towing.
8. Place the transmission in park.

RECREATIONAL TOWING (BEHIND MOTORHOME, ETC.) OF 4X4 VEHICLES

WARNING: You or others could be injured if you leave the vehicle unattended with the transfer case in the Neutral (N) position without first fully engaging the parking brake. The transfer case Neutral (N) position disengages both the front and rear driveshafts from the powertrain and will allow the vehicle to move despite the transmission position. The parking brake should always be applied when the driver is not in the vehicle.

CAUTION: Internal damage to the transfer case will occur if a front or rear wheel lift is used when recreational towing.

NOTE: Because of the design of the transfer cases only vehicles equipped with a NV 244 Generation II transfer case should be used for recreational towing.

NOTE: The NV 244 Generation II transfer case must be shifted into Neutral (N) for recreational towing. The Neutral (N) selection button is located on the lower left hand corner of the 4WD Control Switch. Shifts into and out of transfer case Neutral (N) can take place with the selector switch in any mode position.

NOTE: If the vehicle is to be towed for multiple days or one day for an eight hour or above duration, disconnect and isolate the battery to prevent discharge do to the illumination of the odometer and PRNDL light. After the battery negative cable is reinstalled the radio clock and stations will need to be reset.

Shifting into Neutral (N)

Use the following procedure to prepare your vehicle for recreational towing.

CAUTION: It is necessary to follow these steps to be certain that the transfer case is fully in Neutral (N) before recreational towing to prevent damage to internal parts.

1. Bring vehicle to a complete stop.
2. Shut engine OFF.
3. Place ignition key in the ON position.
4. Depress brake pedal.
5. Shift automatic transmission to Neutral (N) or depress clutch on manual transmission.
6. Using the point of a ballpoint pen or similar object, depress the recessed transfer case Neutral (N) button for 4 seconds.
7. After shift is completed and the Neutral (N) light comes on release Neutral (N) button.
8. Start engine.
9. Shift automatic transmission into Reverse (R).
10. Release brake pedal for five seconds and ensure that there is no vehicle movement.
11. Repeat steps 9 and 10 with the transmission in Drive (D).
12. Shut engine OFF and place ignition key to the unlocked OFF position.
13. Shift automatic transmission into Park (P).
14. Attach vehicle to tow vehicle with tow bar.

NOTE: Items 1 through 5 are requirements that must be met prior to depressing the Neutral (N) selection button, and must continue to be met until the 4 seconds elaspes and the shift has been completed. If any of these requirements (with the exception of 3 - Key ON) are not met prior to depressing the Neutral (N) button or are no longer met during the 4 second timer, then the Neutral (N) indicator light will flash continuously until all requirements are met or until the Neutral (N) button is released.

NOTE: The ignition key must be ON for a shift to take place and for the position indicator lights to be operable. If the key in not ON, the shift will not take place and no position indicator lights will be on or flashing.

NOTE: Flashing neutral (N) position indicator light indicates that shift requirements have not been met.

CAUTION: Damage to the transmission may occur if the transmission is shifted into Park (P) with the transfer case in Neutral (N) and the engine RUNNING. With the transfer case in Neutral (N) ensure that the engine is OFF prior to shifting the transmission into Park (P).

Shifting OUT of Neutral (N)

Use the following procedure to prepare your vehicle for normal usage.

1. Bring vehicle to a complete stop.
2. Shut engine OFF.
3. Place ignition key in the ON position.
4. Depress brake pedal.
5. Shift automatic transmission to Neutral (N) or depress clutch on manual transmission.
6. Using the point of a ballpoint pen or similar object, depress the recessed transfer case Neutral (N) button for 1 second.
7. After the Neutral (N) indicator light turns off release the Neutral (N) button.
8. After the Neutral (N) button has been released the transfer case will shift to the position identified by the selector switch.
9. Shift automatic transmission into Drive (D), release the clutch on manual transmission.

NOTE: Items 1 through 5 are requirements that must be met prior to depressing the Neutral (N) selection button, and must continue to be met until 1 second elapses and the shift has been completed. If any of these requirements (with the exception of 3 - key ON) are not met prior to depressing the Neutral (N) button or are no longer met during the 1 second time, then all of the mode position indicator lights will flash continuously until all requirements are met or until the Neutral (N) button is released.

NOTE: The ignition key must be ON for a shift to take place and for the position indicator lights to be operable. If the key is not ON, the shift will not take place and no position indicator lights will be on or flashing.

NOTE: Flashing neutral (N) position indicator light indicates that shift requirements have not been met.

CAUTION:

- **Do not use a bumper mounted clamp-on tow bar on your vehicle. The bumper face bar will be damaged.**
- **Do not disconnect the rear driveshaft because fluid will leak from the transfer case and damage internal parts.**

WHEEL ALIGNMENT

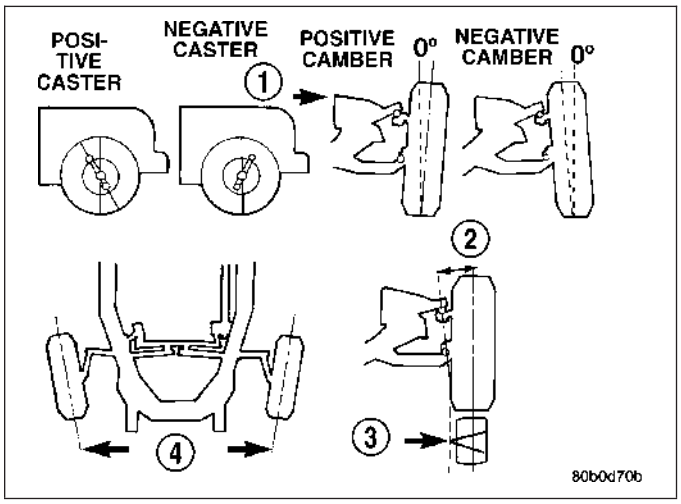
DESCRIPTION

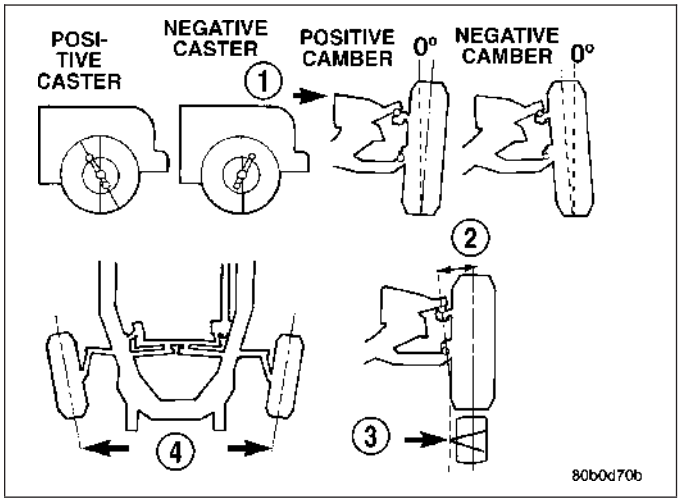
NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

Wheel alignment involves the correct positioning of the wheels in relation to the vehicle. The positioning is accomplished through suspension and steering linkage adjustments. An alignment is considered essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe.



CAUTION: Never attempt to modify suspension or steering components by heating or bending.

OPERATION



- **CASTER (1)** is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle forward provides less positive caster. Tilting the top of the knuckle rearward provides more positive caster. Positive caster promotes directional stability. This angle enables the front wheels to return to a straight ahead position after turns.
- **CAMBER (2)** is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire.
- **TOE (4)** is the difference between the leading inside edges and trailing inside edges of the front tires. Wheel toe position out of specification cause's unstable steering, uneven tire wear and steering wheel off- center. The wheel toe position is the **final** front wheel alignment adjustment.
- **THRUST ANGLE (3)** is the angle of the rear axle relative to the centerline of the vehicle. Incorrect thrust angle can cause off-center steering and excessive tire wear. This angle is not adjustable, damaged component(s) must be replaced to correct the thrust angle.

DIAGNOSIS AND TESTING

PRE-ALIGNMENT INSPECTION

Before starting wheel alignment, the following inspection and necessary corrections must be completed. Refer to Suspension and Steering System Diagnosis Chart below for additional information.

1. Inspect tires for size, air pressure and tread wear.
2. Inspect front wheel bearings for wear.
3. Inspect front wheels for excessive radial or lateral runout and balance.
4. Inspect ball studs, linkage pivot points and steering gear for looseness, roughness or binding.
5. Inspect suspension components for wear and noise.
6. Check suspension ride height.
7. Road test the vehicle.

SUSPENSION AND STEERING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT END NOISE	1. Loose or worn wheel bearing.	1. Replace wheel bearing.
	2. Loose or worn steering or suspension components.	2. Tighten or replace components as necessary.
	3. Loose or worn steering or suspension components.	3. Tighten or replace components as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE PLAY IN STEERING	1. Loose or worn wheel bearing. 2. Loose or worn steering or suspension components. 3. Loose or worn steering gear.	1. Replace wheel bearing. 2. Tighten or replace components as necessary. 3. Replace steering gear.
FRONT WHEELS SHIMMY	1. Loose or worn wheel bearing. 2. Loose or worn steering or suspension components. 3. Tires worn or out of balance. 4. Alignment.	1. Replace wheel bearing. 2. Tighten or replace components as necessary. 3. Replace or balance tires. 4. Align vehicle to specifications.
VEHICLE INSTABILITY	1. Loose or worn wheel bearing. 2. Loose or worn steering or suspension components. 3. Tire pressure. 4. Alignment.	1. Replace wheel bearing. 2. Tighten or replace components as necessary. 3. Adjust tire pressure. 4. Align vehicle to specifications.
EXCESSIVE STEERING EFFORT	1. Loose or worn steering gear. 2. Column coupler binding. 3. Tire pressure. 4. Alignment.	1. Replace steering gear. 2. Replace coupler. 3. Adjust tire pressure. 4. Align vehicle to specifications.
VEHICLE PULLS TO ONE SIDE	1. Tire pressure. 2. Tire. 3. Alignment. 4. Loose or worn steering or suspension components. 5. Radial tire lead. 6. Brake pull. 7. Weak or broken torsion bar. 8. Ride height.	1. Adjust tire pressure. 2. Criss-Cross Front Tires. 3. Align vehicle to specifications. 4. Tighten or replace components as necessary. 5. Rotate or replace tire as necessary. 6. Repair brake as necessary. 7. Readjust or Replace torsion bar. 8. Measure and adjust ride height.

STANDARD PROCEDURE

HEIGHT MEASUREMENT

The vehicle suspension height MUST be measured and adjusted before performing wheel alignment procedure. Also when front suspension components have been replaced. This measure must be performed with the vehicle supporting it's own weight and taken on both sides of the vehicle.

FRONT RIDE HEIGHT MEASUREMENT

1. Inspect tires and set to correct pressure.
2. Jounce the front of the vehicle.
3. With vehicle on level ground or hoist, make the following measurements:
   a. Front wheel spindle (center) to ground vertical distance.
   b. Center of the front face of bolt on the rear leg of Lower control arm to ground vertical distance.
   c. Difference between spindle and control arm bolt to ground distances should be 81mm+/-3.2mm **Note that the control arm bolt is lower than the spindle**.

4. If adjustment is required, turn the torsion bar adjuster bolts- if lowering ride height, unscrew Torsion bar adjuster bolt beyond desired point so as to set height when screwing-in adjuster bolt.
5. After making any ride height adjustment, roll vehicle preferably jouncing it also, to relieve camber Effects and then re-measure Lower control arm bolt to ground height.
6. Repeat the previous steps until the ride height is within specifications.

REAR RIDE HEIGHT MEASUREMENT

1. Inspect tires and set to correct pressure.
2. Jounce the front of the vehicle.
3. With vehicle on level ground or hoist, make the following measurements:
   a. Distance from the landing pad of the jounce bumper on the axle side to the jounce bumper cup lip of the frame side.
   b. The difference between the jounce bumper landing pad and the jounce bumper cup lip the reading should be 148 mm +/-10 mm for 9.25″ axle, 154 mm +/-10 mm for 8.25″ axle.

HEIGHT ADJUSTMENT

The vehicle suspension height MUST be measured and adjusted before performing wheel alignment procedure (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE). Also when front suspension components have been replaced. This measurement must be performed with the vehicle supporting it's own weight and taken on both sides of the vehicle.

To adjust the vehicle height turn the torsion bar adjustment bolt CLOCKWISE to raise the vehicle and COUNTER CLOCKWISE to lower the vehicle.

CAUTION: ALWAYS raise the vehicle to the correct suspension height, NEVER lower the vehicle to obtain the correct suspension height. If the vehicle suspension height is too high, lower the vehicle below the height specification. Then raise the vehicle to the correct suspension height specification. This will insure the vehicle maintains the proper suspension height.

NOTE: If a height adjustment has been made, perform height measurement again on both sides of the vehicle.

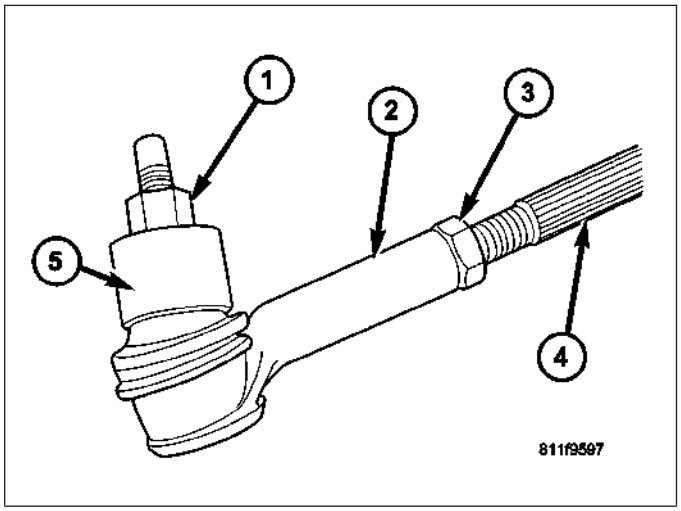
TOE ADJUSTMENT

SUSPENSION HEIGHT MESUREMENT MUST BE PERFORMED BEFORE AN ALIGNMENT.

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts (3).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.



3. Adjust the wheel toe position by turning the inner tie rod (4) as necessary.
4. Tighten the tie rod jam nut (3) to 130 N·m (96 ft. lbs.).
5. Verify the specifications.
6. Turn off engine.

CAMBER, CASTER AND TOE ADJUSTMENT

NOTE: SUSPENSION HEIGHT MEASUREMENT MUST BE PERFORMED BEFORE AN ALIGNMENT.

Camber and caster angle adjustments involve changing the position of the lower control arm with the slots in the frame brackets to move the lower control arm inwards or outwards for proper adjustment. **This can be achieved by using a long pry bar with a curved tip and inserting the pry bar into the lower control arm frame brackets and prying inwards or outwards.**

NOTE: Camber and caster adjustments must be made at the lower control arm Do not use the upper control arm for Camber and Caster adjustments.

NOTE: When the lower control arm pivot bolts are loosened the lower control arm will normally go outwards automatically with the weight of the vehicle.

CASTER

Moving the rear position of the lower control arm at the frame in or out, will change the caster angle significantly and camber angle only slightly. To maintain the camber angle while adjusting caster, move the rear of the lower control arm in or out. Then move the front of the lower control arm slightly in the opposite direction.

CAMBER

Move both the front and rear of the lower control arm together in or out. This will change the camber angle significantly and caster angle slightly.

After adjustment is made tighten the lower control arm bolt & nuts to 244 N·m (180 ft. lbs.).

TOE ADJUSTMENT

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts (3).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

3. Adjust the wheel toe position by turning the inner tie rod (4) as necessary.
4. Tighten the tie rod jam nut (3) to 130 N·m (96 ft. lbs.).
5. Verify the specifications.
6. Turn off engine.

FRONT

DESCRIPTION

SUSPENSION

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub/bearings units bolted to the steering knuckle. The double-row hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints.

The front suspension is comprised of :

- Shock absorbers
- Torsion bar
- Control arms
- Steering knuckles
- Stabilizer bar
- Stabilizer link
- Tie Rod Ends
- Hub/Bearing
- Rack & Pinion
- Ball Joints

NOTE: Components attached with a nut must be torqued to specification.

NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

CONTROL ARMS

The lower control arms bolt to the lower frame brackets and pivots through bushings. The frame brackets have slotted holes which allow the arms to be adjusted for caster and camber.

The control arms have lube for life ball studs. The control arm travel (jounce) is limited through the use of rubber/urethane bumpers. Rebound travel is limited by the shock absorber.

BUSHINGS

DESCRIPTION

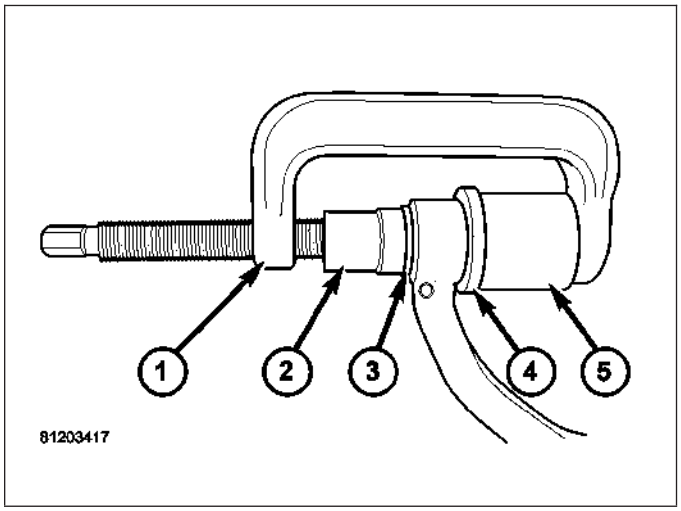
Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

REMOVAL

LOWER CONTROL ARM BUSHINGS

1. Remove the lower control arm (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - REMOVAL).
2. Secure the control arm in a vise.

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

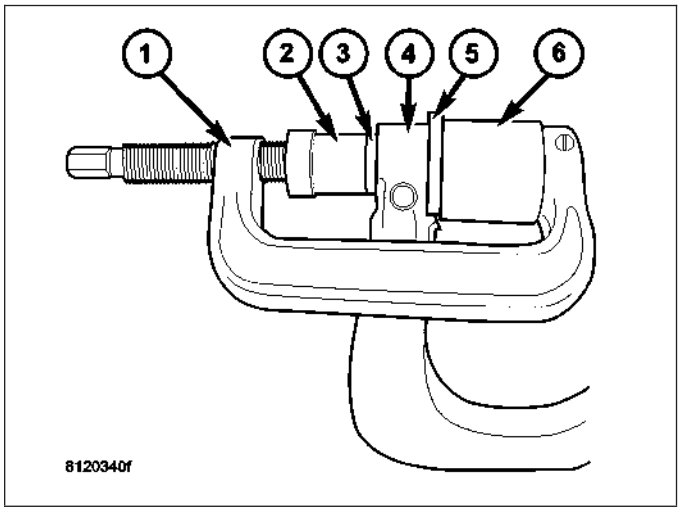


LARGE BUSHING FRONT PART OF THE CONTROL ARM

1. Install the bushing tools C4212–F (Press)(1), (9334-4 (Driver)(2), 9334–6 (Spacer)(4) and 9334-5 (Receiver)(5) as shown for the replacement of the large bushing (3).

SMALL BUSHING TORSION BAR SIDE

1. Install bushing remover tools C4212–F (Press)(1), 9334-4 (Driver)(2), 9334-6 (Spacer)(5) and 9334-5 (Receiver)(6) as shown for the small bushing (3) removal.

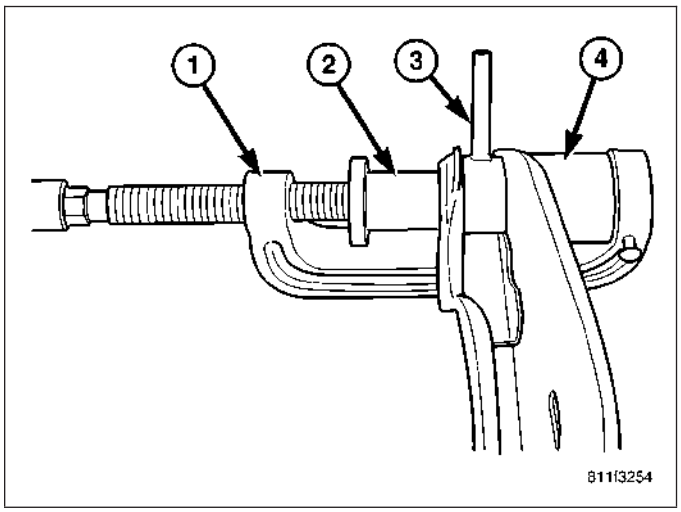


TORSION BAR CROSSMEMBER BUSHING

1. Remove the torsion bar cross member.
2. Secure the cross member in a vise.

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

3. Install special tools C4212–F (Press)(1), 9335-2 (Reciever)(4), 9335-3 (Driver)(2) and 9335-4 (Spacer)(3) as shown in the graphic.
4. Press out the bushing.



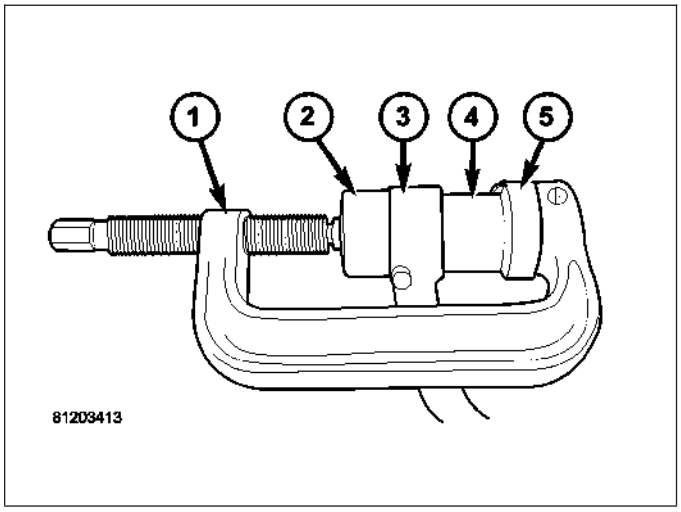
INSTALLATION

LOWER CONTROL ARM BUSHINGS

LARGE BUSHING FRONT PART OF THE CONTROL ARM

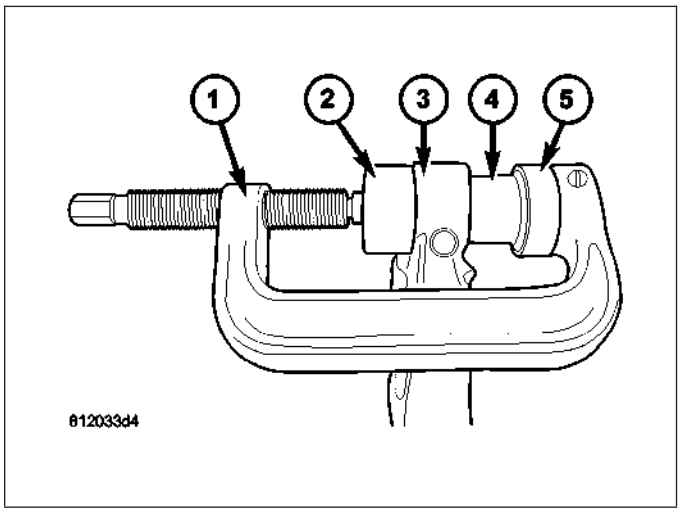
NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the new bushing (4) into the control arm (3) using special tools C4212–F (Press)(1), 9334-3 (Bushing installation depth spacer)(2), 9334-1 (driver)(5) as shown.



SMALL BUSHING TORSION BAR SIDE

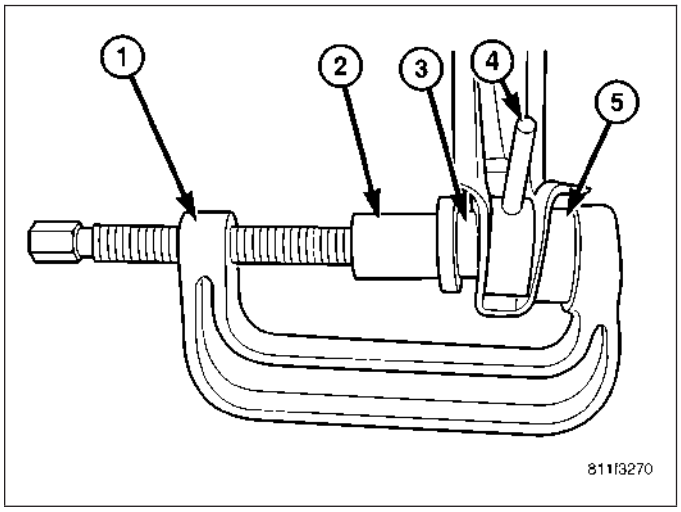
1. Install the new bushing (4) into the lower control arm (3) using tools C4212–F (Press)(1), 9334-3 (Bushing installation depth spacer), 9334-2 (Driver) as shown.



1. Remove the control arm from the vise.
2. Install the lower control arm (Refer to 2 - SUSPENSION/FRONT/LOWER CONTROL ARM - INSTALLATION).
3. Reset the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
4. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

TORSION BAR CROSS MEMBER BUSHING

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.



1. Install the new bushing (3) into the cross member using special tools C4212–F (Press)(1), 9335-3(Driver)(2), 9335-4 (Spacer)(4) and 9335-1 (Depth setting cup)(5) making sure to properly orient the bushing.
2. Remove the cross member from the vise.
3. Install the torsion bar cross member.
4. Reset the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
5. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

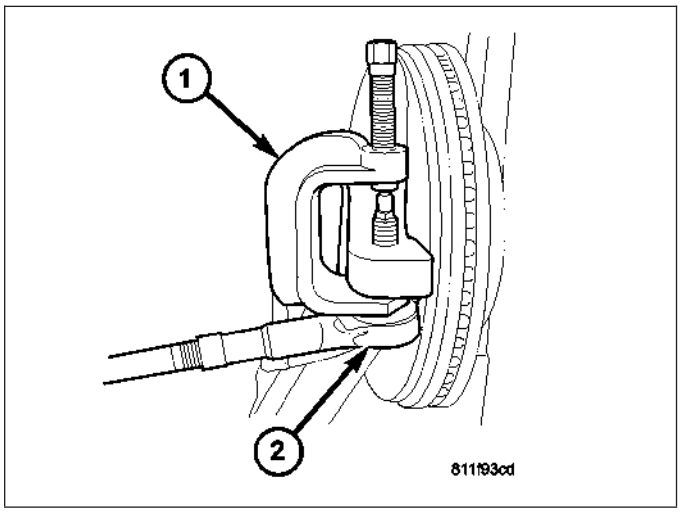
HUB / BEARING

REMOVAL

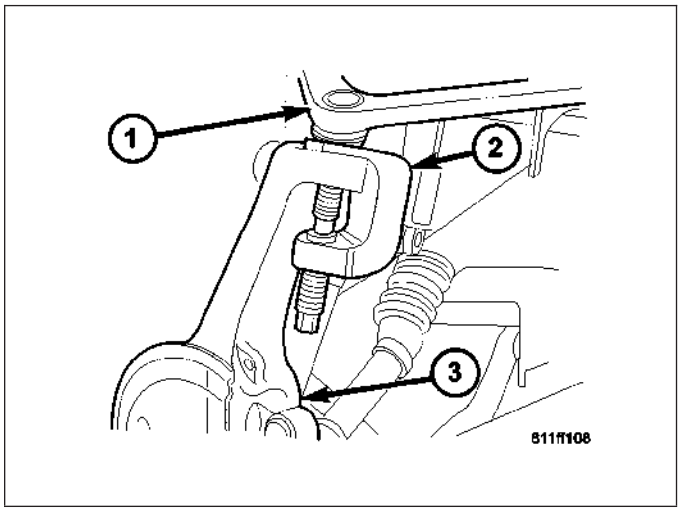
1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove the ABS wheel speed sensor if equipped, (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - REMOVAL).
5. Remove the halfshaft nut **4X4 only**.

NOTE: Do not strike the knuckle with a hammer to remove the tie rod end or the ball joint. Damage to the steering knuckle will occur.

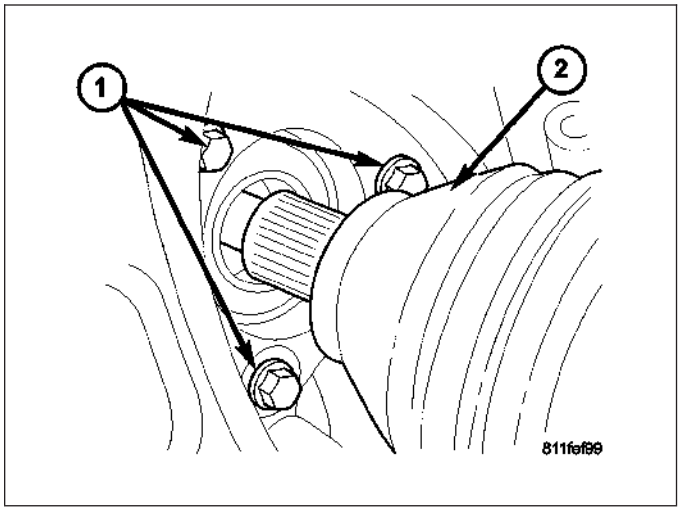
6. Remove the tie rod end nut and separate the tie rod (2) from the knuckle using special tool 8677 (1).



7. Remove the upper ball joint nut and separate the upper ball joint (1) from the knuckle (3) using special tool 8677 (2).

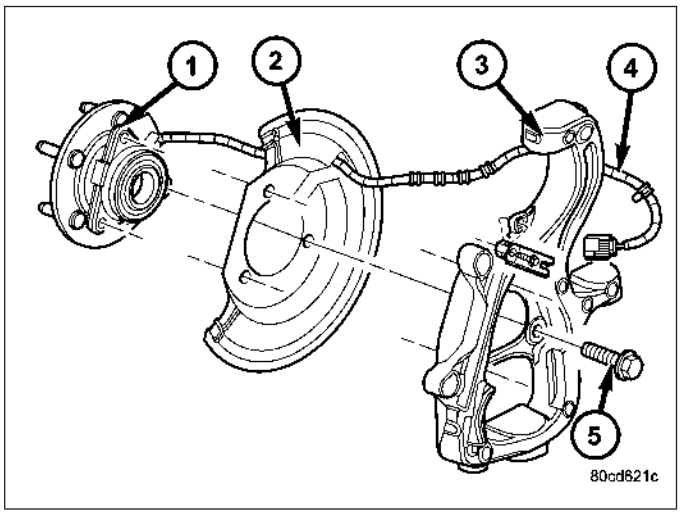


8. Pull down on the steering knuckle to separate the halfshaft from the hub/bearing. **4X4 only**
9. Remove the three hub/bearing mounting bolts (1) from the steering knuckle.
10. Slide the hub/bearing out of the steering knuckle.
11. Remove the brake dust shield.



INSTALLATION

1. Install the brake dust shield (2).
2. Install the hub/bearing (1) into the steering knuckle (3) and tighten the bolts (5) to 163 N·m (120 ft. lbs.).
3. Install the brake rotor and caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
4. Install the ABS wheel speed sensor (4) if equipped (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION).



5. Install the upper ball joint nut to the steering knuckle and tighten to 75 N·m (55 ft. lbs.).
6. Install the tie rod end nut to the steering knuckle and tighten to 81 N·m (60 ft. lbs.).
7. Install the halfshaft nut and tighten to 251 N·m (185 ft. lbs.) **4X4 only**.
8. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Remove the support and lower vehicle.

KNUCKLE

DESCRIPTION

The knuckle is a single casting with legs machined for the upper and lower ball joints. The knuckle also has machined mounting locations for the front brake calipers and hub bearing.

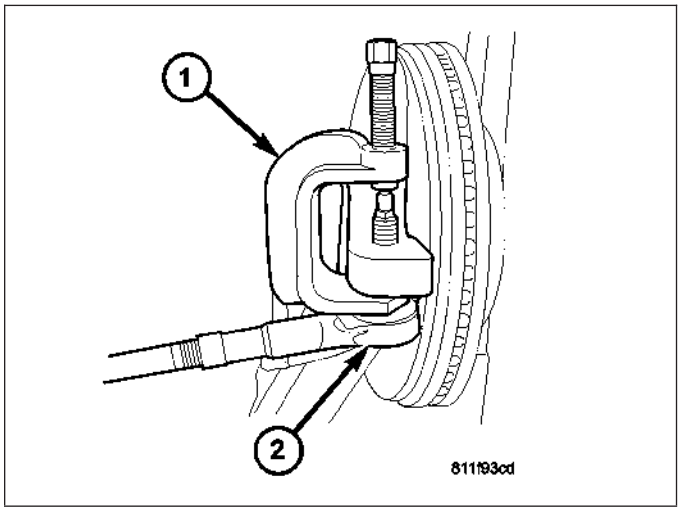
OPERATION

The steering knuckle pivot between the upper and lower ball joint. Steering linkage attached to the knuckle allows the vehicle to be steered.

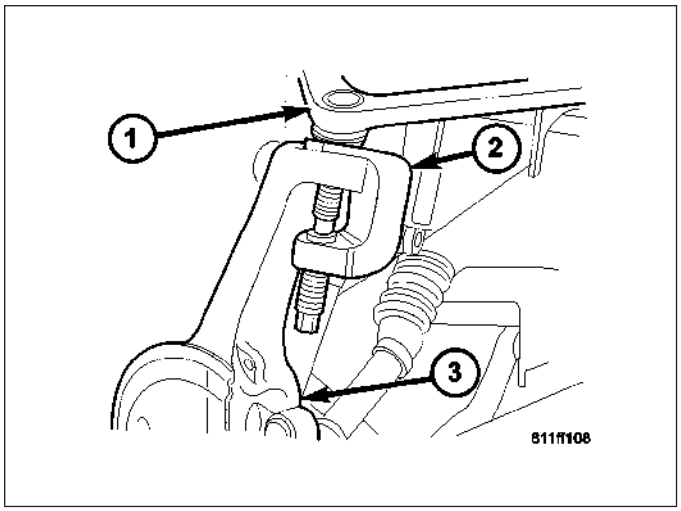
REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper, rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL), shield and ABS wheel speed sensor if equipped (Refer to 5 - BRAKES/ELECTRICAL/ FRONT WHEEL SPEED SENSOR - REMOVAL).
4. Remove the front halfshaft nut **4X4 only**.
5. Remove the tie rod end nut. Separate the tie rod (2) from the knuckle with Remover 8677 (1).

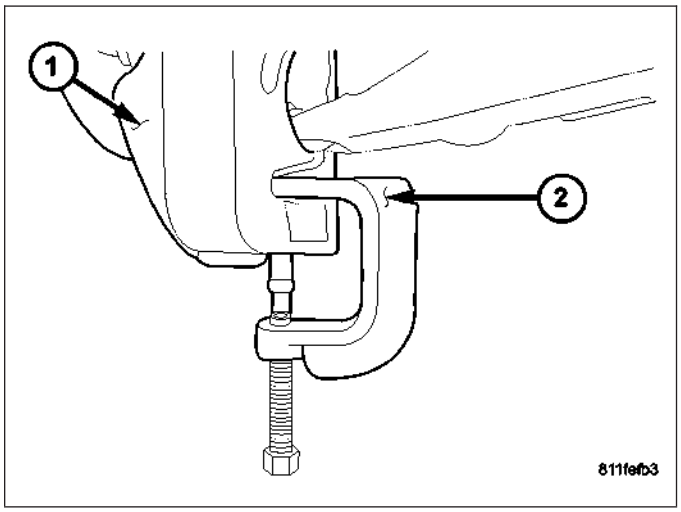
CAUTION: When installing Remover 8677 to separate the ball joint, be careful not to damage the ball joint seal.



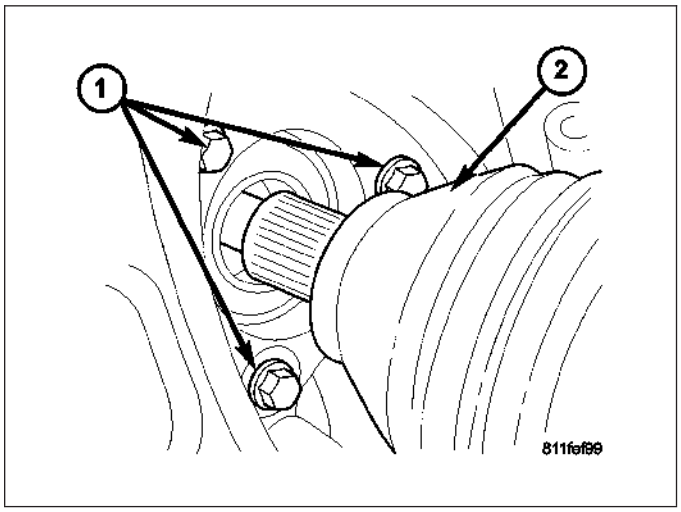
6. Remove the upper ball joint nut. Separate the ball joint (1) from the knuckle (3) with Remover 8677 (2).



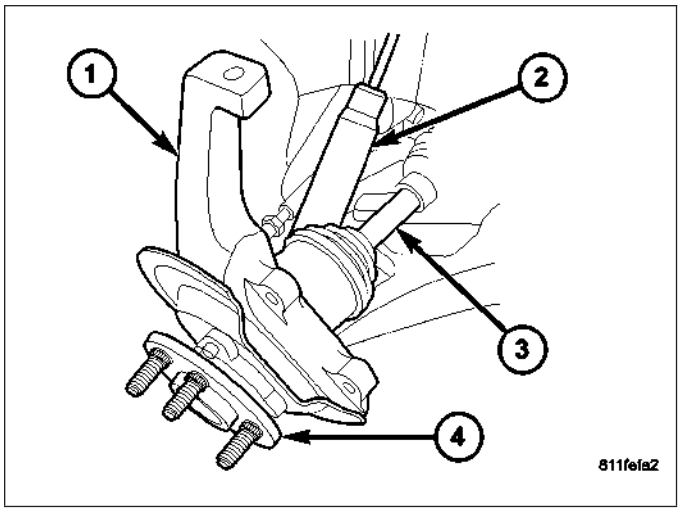
7. Install an hydraulic jack to support the lower control arm.
8. Remove the lower ball joint nut. Separate the ball joint from the knuckle (1) with Remover 8677 (2) and remove the knuckle.



9. Remove the hub/bearing bolts (1) from the knuckle.



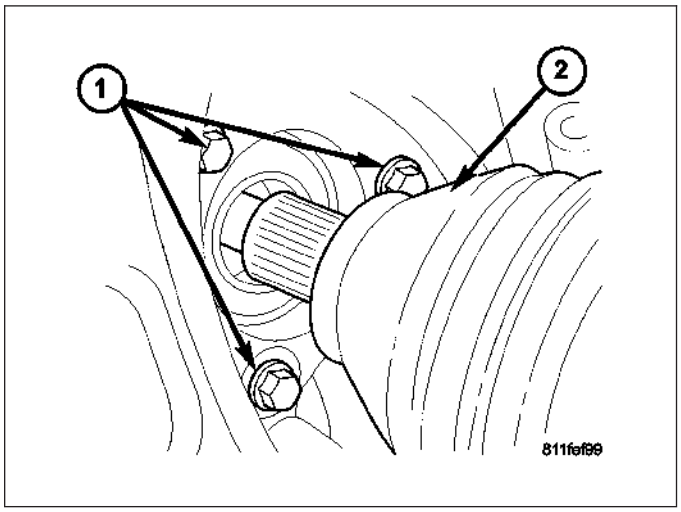
10. Remove the hub/bearing (4) from the steering knuckle (1) (Refer to 2 - SUSPENSION/FRONT/ HUB / BEARING - REMOVAL).
11. Remove the steering knuckle (1).



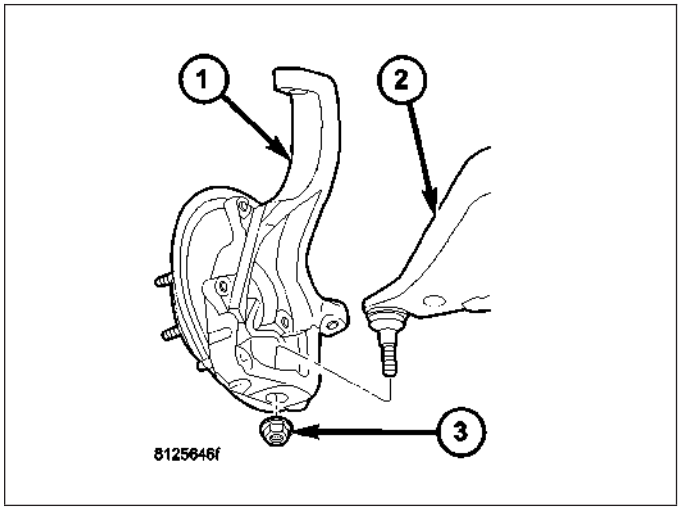
INSTALLATION

CAUTION: The ball joint stud tapers must be CLEAN and DRY before installing the knuckle. Clean the stud tapers with mineral spirits to remove dirt and grease.

1. Install the hub/bearing to the steering knuckle and tighten the bolts (1) to 163 N·m (120 ft. lbs.).

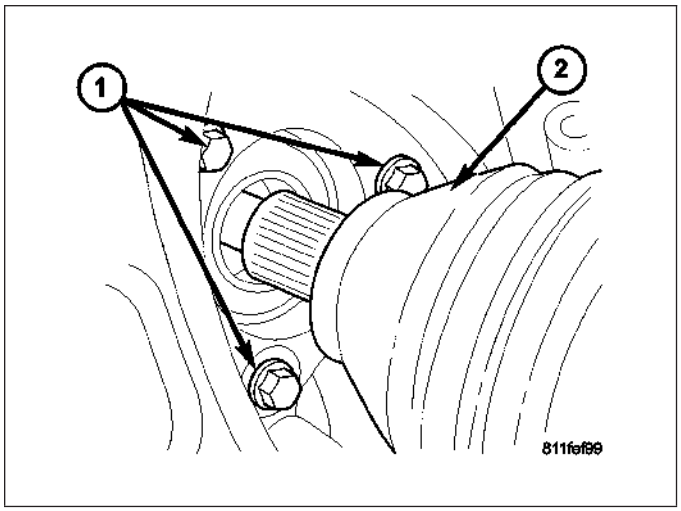


2. Install the knuckle (1) onto the upper and lower ball joints.
3. Install the upper ball joint nut. Tighten the nut to 75 N·m (55 ft. lbs.).
4. Install the lower ball joint nut (3). Tighten the nut to 95 N·m (70 ft. lbs.).
5. Remove the hydraulic jack from the lower suspension arm (2).



6. Install the tie rod end and tighten the nut to 75 N·m (55 ft. lbs.).

7. Install the front halfshaft (2) into the hub/bearing **4X4 only**.
8. Install the the halfshaft nut and tighten to 251 N·m (185 ft. lbs.) **4X4 only**.
9. Install the ABS wheel speed sensor if equipped (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION) and brake shield, rotor and caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
10. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
11. Remove the support and lower the vehicle.
12. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).



BALL JOINT-LOWER

DIAGNOSIS AND TESTING

LOWER BALL JOINT

NOTE: If the ball joint is equipped with a lubrication fitting, grease the joint then road test the vehicle before performing test.

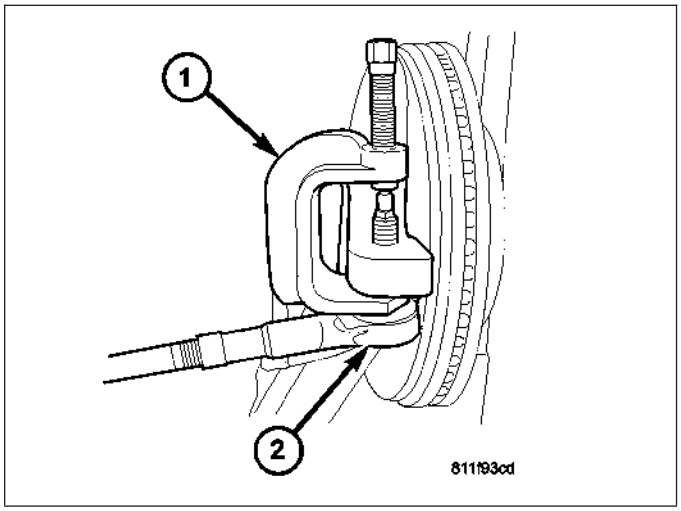
1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Mount a dial indicator solidly to the topside of the lower control arm and then zero the dial indicator.
3. Position the indicator plunger against the bottom surface of the steering knuckle.

NOTE: The dial indicator plunger must be perpendicular to the machined surface of the steering knuckle.

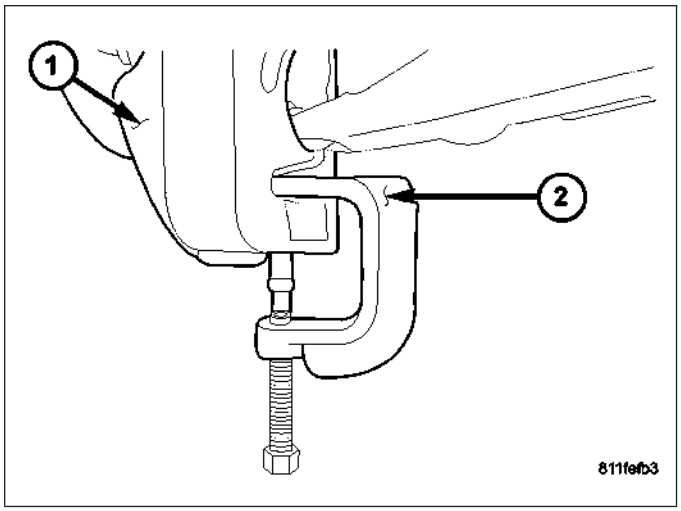
4. Position a pry bar under the tire assembly. Pry upwards on the tire assembly.
5. If the travel exceeds 0.5 mm (0.020 in.), replace the lower ball joint (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - REMOVAL).

REMOVAL

1. Remove the tire and wheel assembly.
2. Remove the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
3. Disconnect the tie rod (1) from the steering knuckle using special tool 8677 (1) (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).

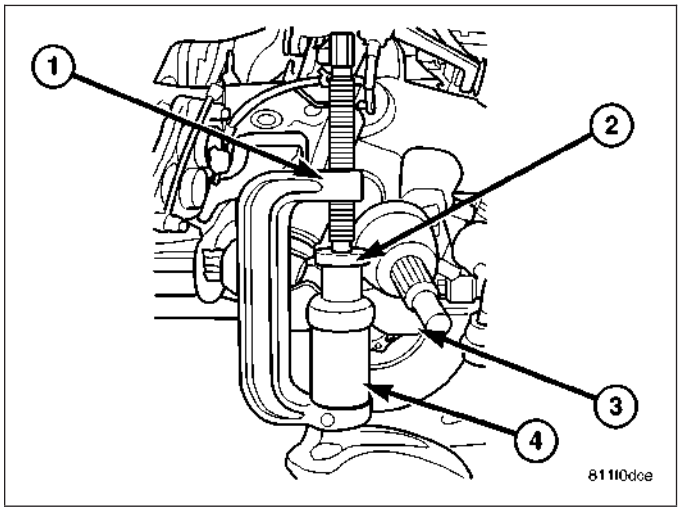


4. Seperate the lower ball joint from the steering knuckle (1) using special tool 8677 (2).
5. Remove the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL).
6. Move the halfshaft to the side and support the halfshaft out of the way **4X4 only**.
7. Chisel out the ball joint stakes.



NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

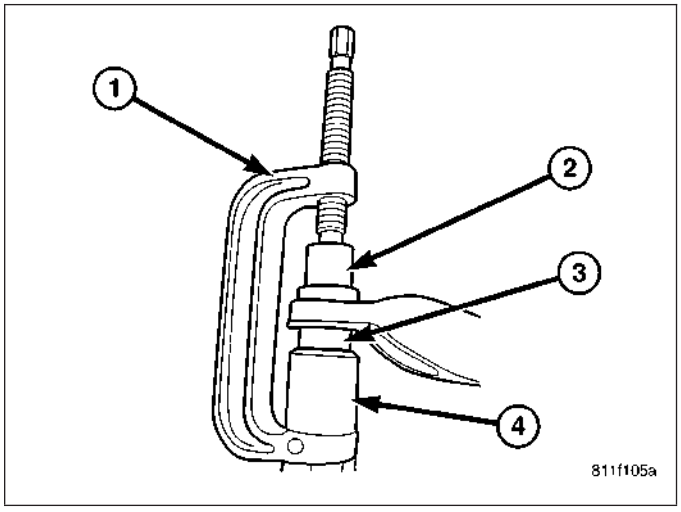
8. Press the ball joint from the lower control arm (3) using special tools C-4212–F (PRESS) (1), 9331-1 (Driver) (2) and 9331-2 (Reciever) (4).



INSTALLATION

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the ball joint (3) into the control arm and press in using special tools C-4212–F (press) (1), 9331-1 (Reciever) (2) and 9331-3 (Driver) (4).



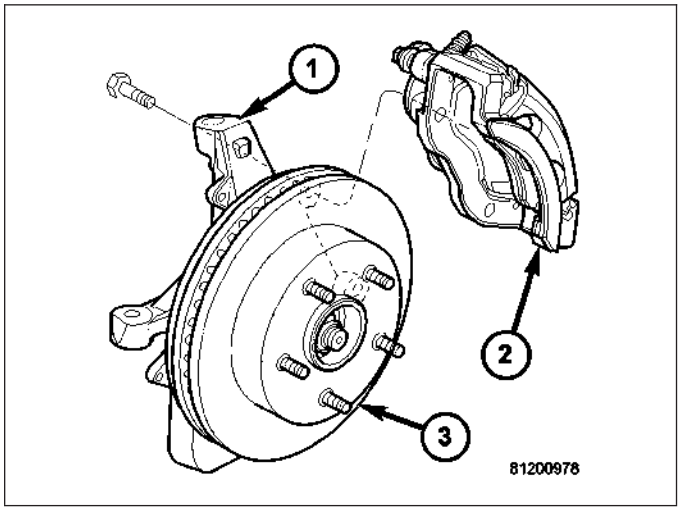
2. Stake the ball joint flange in four evenly spaced places around the ball joint flange, using a chisel and hammer.
3. Remove the support for the halfshaft and install into position **4X4 only**.
4. Install the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION).
5. Install the tie rod end into the steering knuckle (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).
6. Install and tighten the halfshaft nut to 251 N·m (185 ft. lbs.). (If Equipped).

7. Install the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
8. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Check the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
10. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

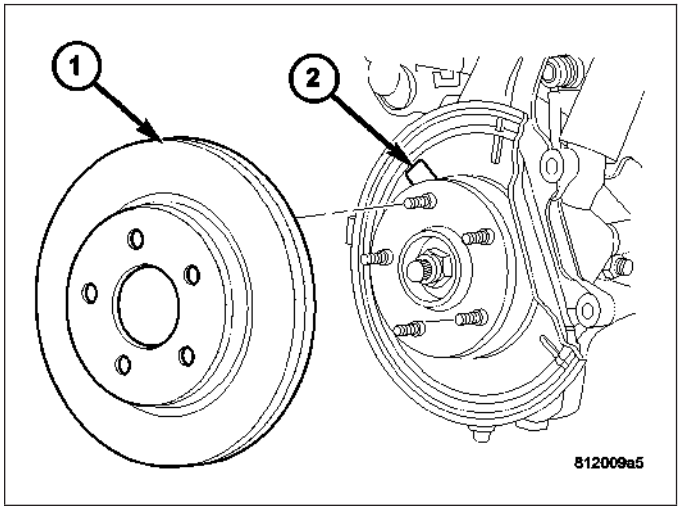
CONTROL ARM-LOWER

REMOVAL

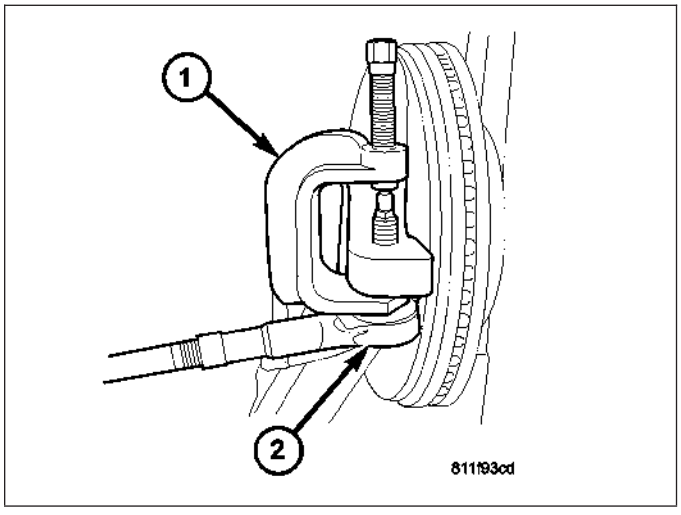
1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the disc brake caliper assembly (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).



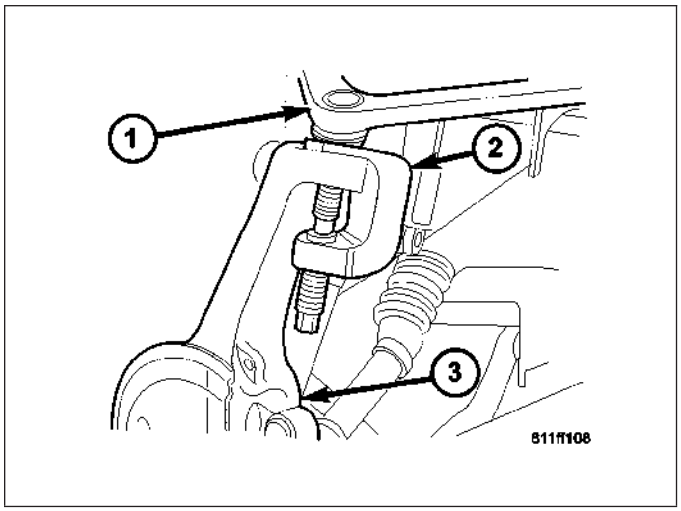
4. Remove the disc brake rotor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Disconnect the wheel speed sensor at the wheel well.



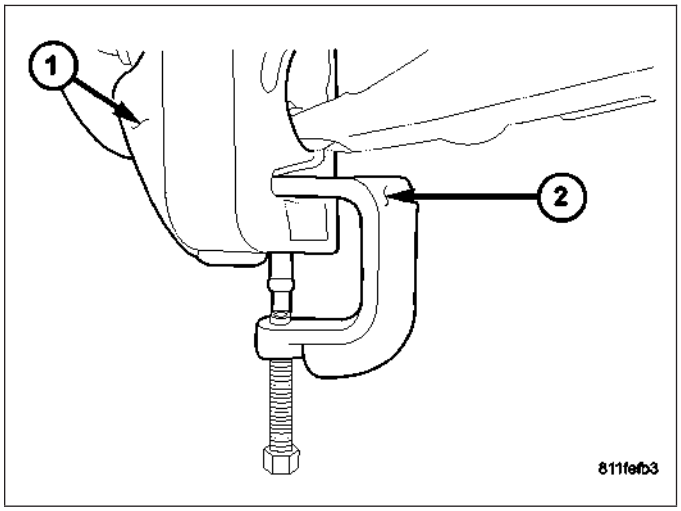
6. Disconnect the tie rod (2) from the knuckle using special tool 8677 (1) (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).



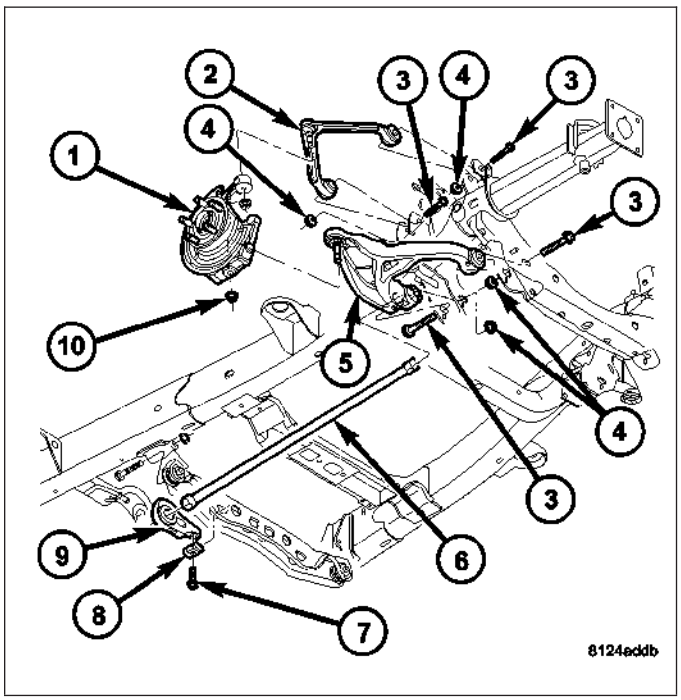
7. Remove the front halfshaft nut **4X4**.
8. Remove the upper ball joint nut. Separate the upper ball joint (1) from the steering knuckle (3) with Remover 8677 (2).



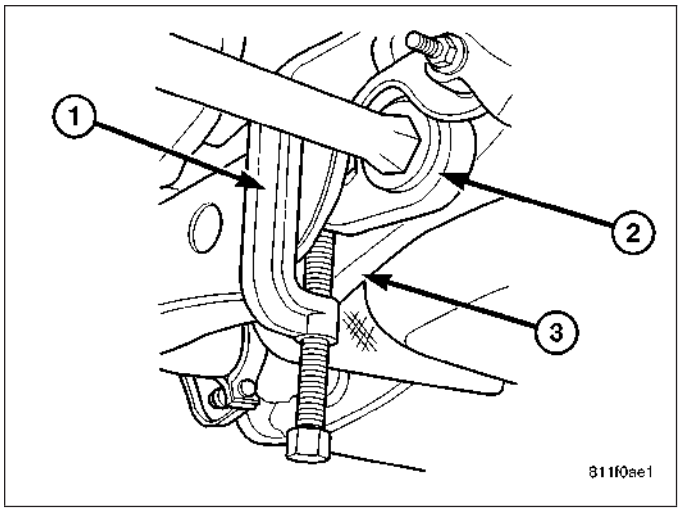
9. Remove the lower ball joint nut. Separate the lower ball joint from the steering knuckle (1) with Remover 8677 (2).



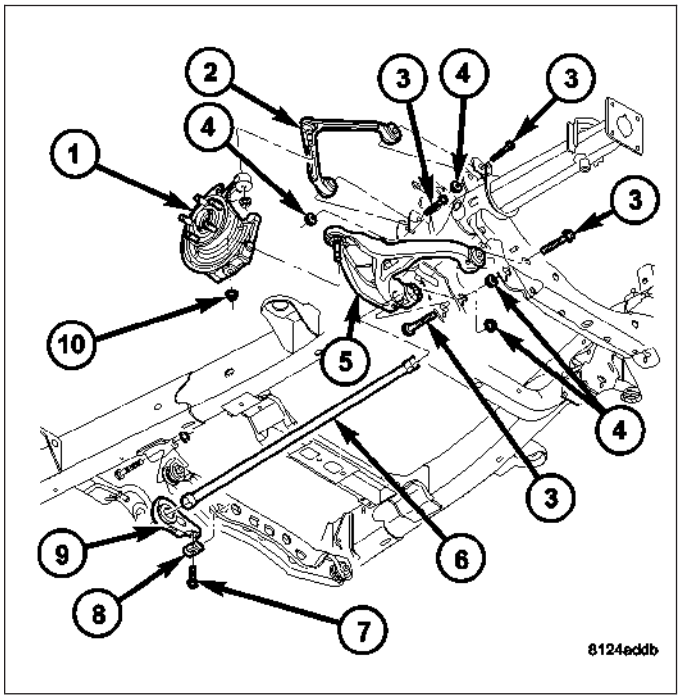
10. Remove the steering knuckle (1).



11. Unload the torsion bar using special tool 8686 (1).

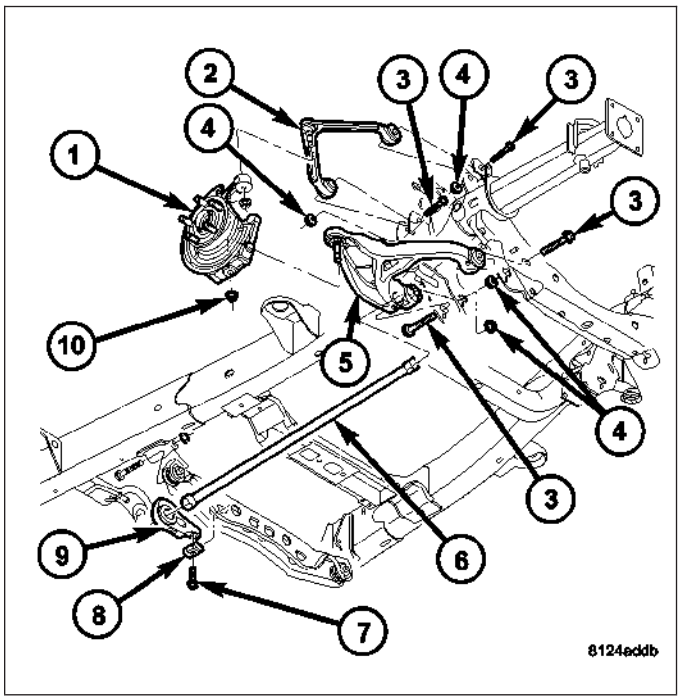


12. Remove the torsion bar (6) from the vehicle (Refer to 2 - SUSPENSION/FRONT/TORSION BAR - REMOVAL).
13. Remove the stabilizer bar link (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - REMOVAL).
14. Remove the shock absorber lower bolt.
15. Remove the front and rear pivot bolts (3&4).
16. Remove the lower control arm (5) from the vehicle.



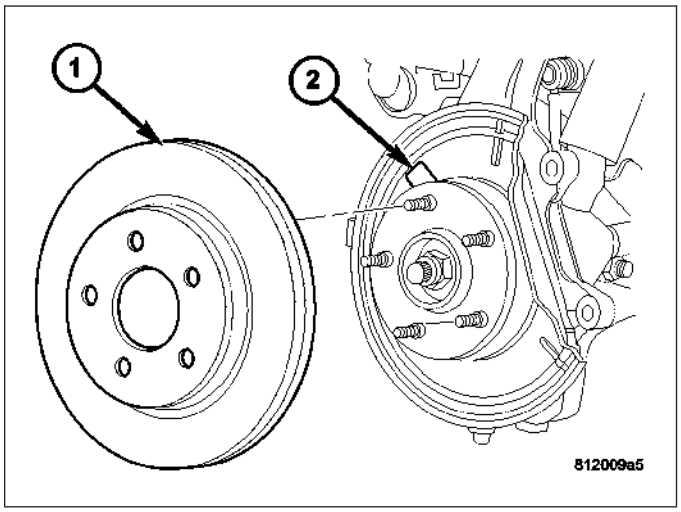
INSTALLATION

1. Position the lower control arm (5) at the frame rail brackets. Install the pivot bolts (3) and nuts (4). Tighten the nuts finger-tight.

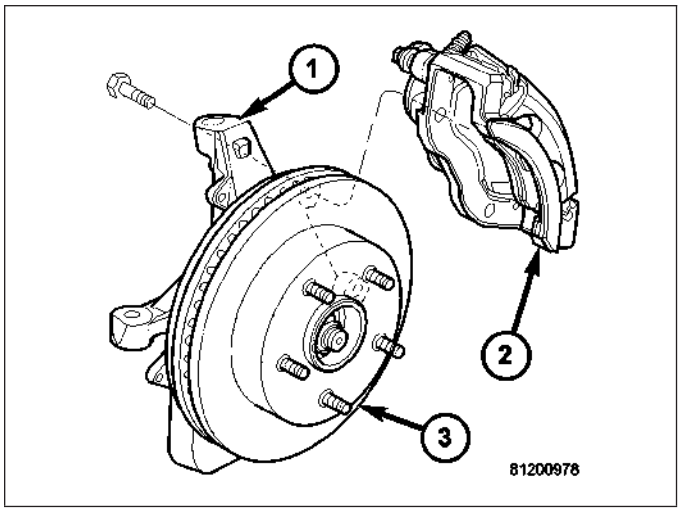


CAUTION: The ball joint stud taper must be CLEAN and DRY before installing the knuckle. Clean the stud taper with mineral spirits to remove dirt and grease.

2. Install the steering knuckle (1).
3. Insert the lower ball joint into the steering knuckle. Install and tighten the retaining nut to 95 N·m (70 ft. lbs.).
4. Install the torsion bar (6) (Refer to 2 - SUSPENSION/FRONT/TORSION BAR - INSTALLATION).
5. Install shock absorber lower bolt and tighten to 81 N·m (60 ft. lbs.).
6. Install the front halfshaft nut **4X4**.
7. Insert the upper ball joint into the steering knuckle (1). Install and tighten the retaining nut to 75 N·m (55 ft. lbs.).
8. Install the stabilizer bar link (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - INSTALLATION) and tighten to 169 N·m (125 ft. lbs.).
9. Tighten the lower control arm pivot nut (4) and bolts (3) (to 244 N·m (180 ft. lbs.).
10. Insert the outer tie rod end into the steering knuckle (1). Install and tighten the retaining nut to 75 N·m (55 ft. lbs.).
11. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).



12. Install the disc brake caliper and adaptor assembly (2) and tighten to 135 N·m (100 ft. lbs.) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
13. Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
14. Remove the support and lower the vehicle.
15. Adjust the front suspension height and perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).



SHOCK ABSORBER

DIAGNOSIS AND TESTING

SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

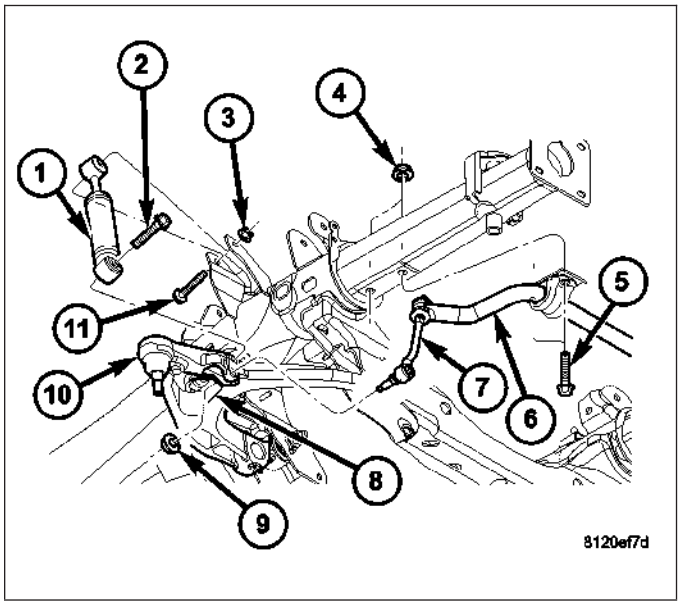
A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

The shock absorber bushings do not require any type of lubrication. Do not attempt to stop bushing noise by lubricating them. Grease and mineral oil-base lubricants will deteriorate the bushing.

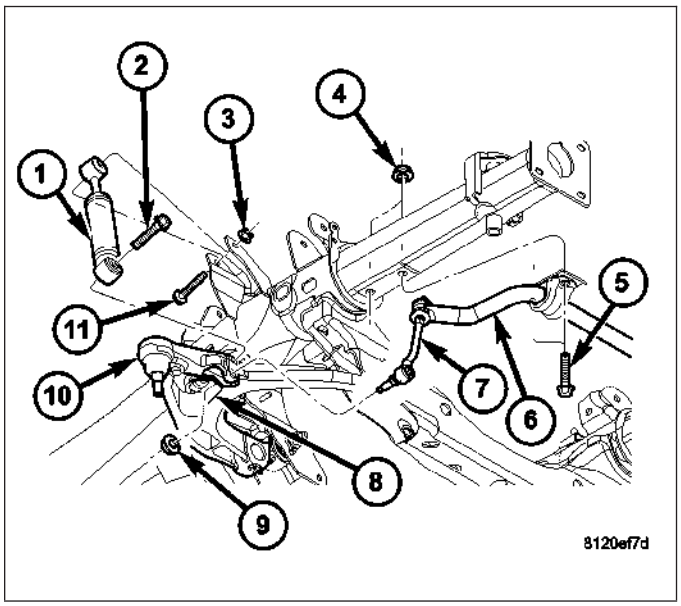
REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Support the lower control arm outboard end.
4. Remove the upper shock bolt (11) and nut (3).
5. Remove the stabilizer link (7) lower nut and then separate the stabilizer link from the lower control arm to gain access to the lower shock bolt (2) (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - REMOVAL).
6. Remove the lower shock bolt (2).
7. Remove the shock (1).



INSTALLATION

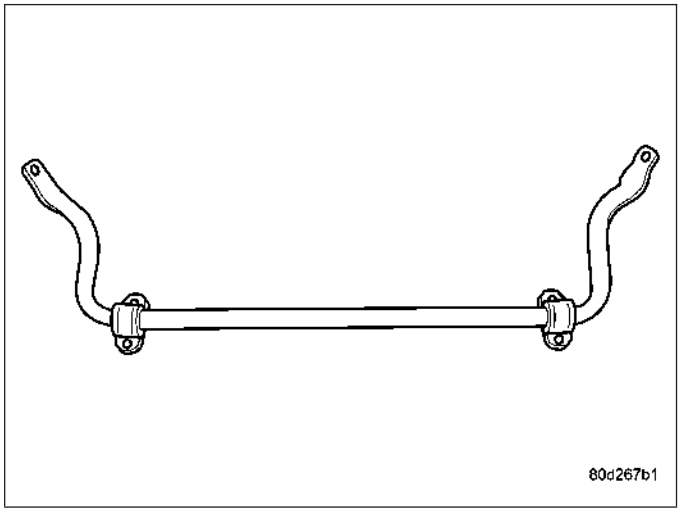
1. Install the upper part of the shock (1) into the frame bracket.
2. Install the nut (3) and bolt (11). Tighten to 102 N·m (75 ft. lbs.).
3. Install the lower part of the shock (1) into the lower control arm and Tighten the bolt (2) to 81 N·m (60 ft. lbs.).
4. Install the stabilizer link (7) lower nut to the lower control arm (Refer to 2 - SUSPENSION/FRONT/ STABILIZER LINK - INSTALLATION).
5. Remove the support from the lower control arm outboard end.
6. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
7. Remove the support and lower the vehicle.



STABILIZER BAR

DESCRIPTION

The bar extends across the front underside of the chassis and connects to the frame crossmember. The ends of the bar mount to the lower suspension arm. All mounting points of the stabilizer bar are isolated by bushings.



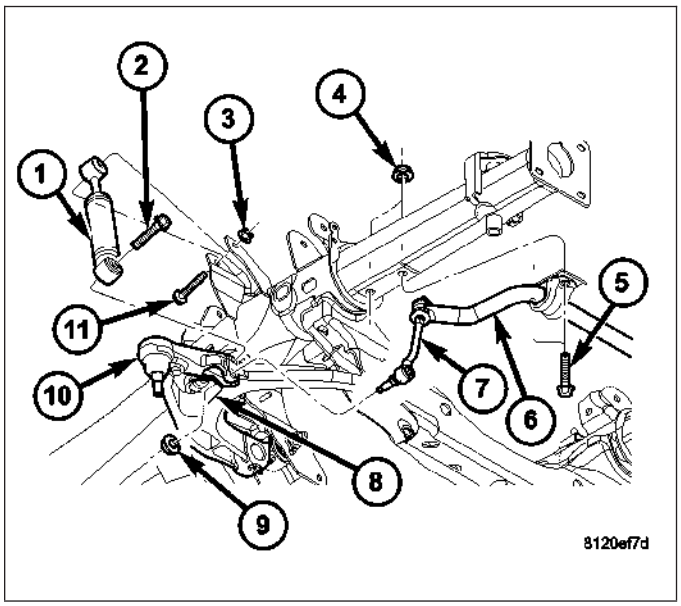
OPERATION

The stabilizer bar is used to minimize vehicle front sway during turns. The bar helps to maintain a flat attitude to the road surface.

REMOVAL

NOTE: To service the stabilizer bar the vehicle should be on a drive on hoist. The vehicle suspension must be at curb height for stabilizer bar installation.

1. Remove the stabilizer link upper nut and remove the retainers and grommets (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - REMOVAL).
2. Remove the stabilizer bar retainer bolts (5) and nuts (4) also remove the retainers (5) from the frame sway bar and remove the bar (6).
3. If necessary, remove the bushings from the stabilizer bar.

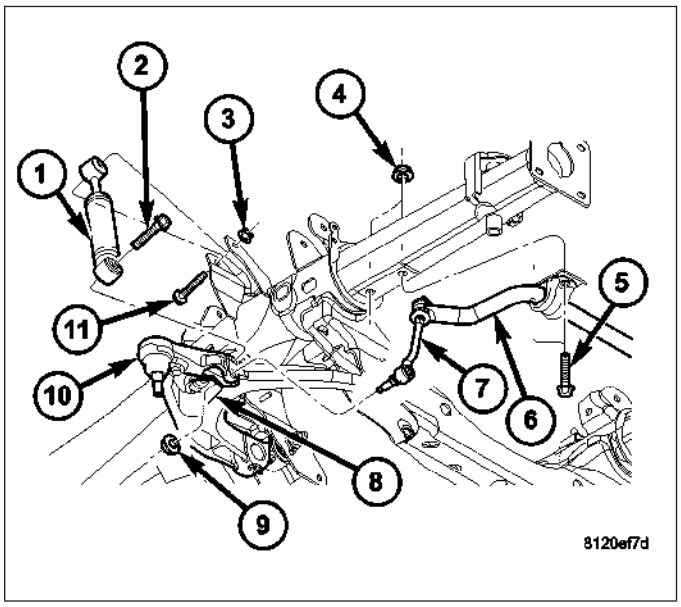


INSTALLATION

NOTE: To service the stabilizer bar the vehicle must be on a drive on hoist. The vehicle suspension must be at curb height for stabilizer bar installation.

1. If removed, install the bushings on the stabilizer bar.
2. Position the stabilizer bar (6) on the frame crossmember brackets and install the bracket and bolts (5) finger-tight.

NOTE: Check the alignment of the bar to ensure there is no interference with the either frame rail or chassis component. Spacing should be equal on both sides.

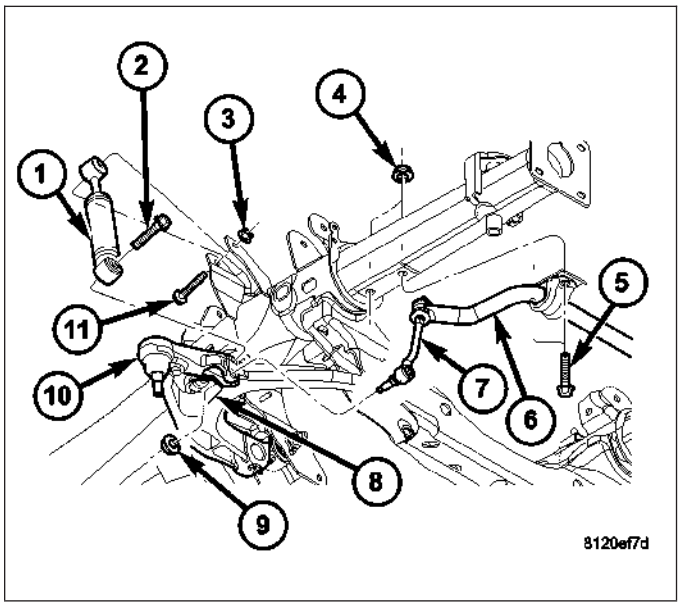


3. Install the stabilizer bar (6) to the stabilizer link (7) and install the grommets and retainers and tighten to 61 N·m (45 ft. lbs.).
4. Tighten the brackets to the frame and tighten to 61N·m (45 ft. lbs.).
5. Install the nuts to the stabilizer link and tighten to 169 N·m (125 ft. lbs.) (Refer to 2 - SUSPENSION/FRONT/STABILIZER LINK - INSTALLATION).

STABILIZER LINK

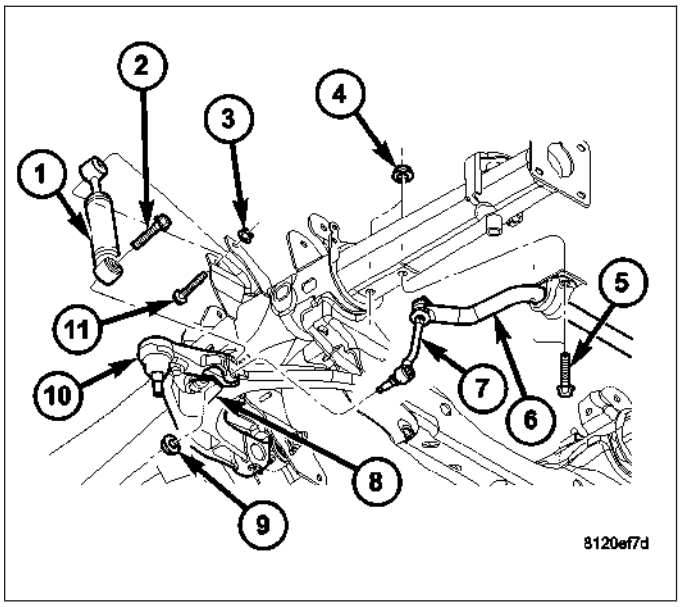
REMOVAL

1. Raise and support the vehicle.
2. Remove the lower nut (9).
3. Remove the upper nut, retainers and grommets from the stabilizer bar.
4. Remove the stabilizer link (7) from the vehicle.



INSTALLATION

1. Install the stabilizer link (7) to the vehicle.
2. Install the retainers, grommets and upper nut to the stabilizer bar (6) and Tighten to 61 N·m (45 ft. lbs.).
3. Install the lower nut and Tighten to 169 N·m (125 ft. lbs.).
4. Remove the support and lower the vehicle.



BAR-TORSION

DESCRIPTION

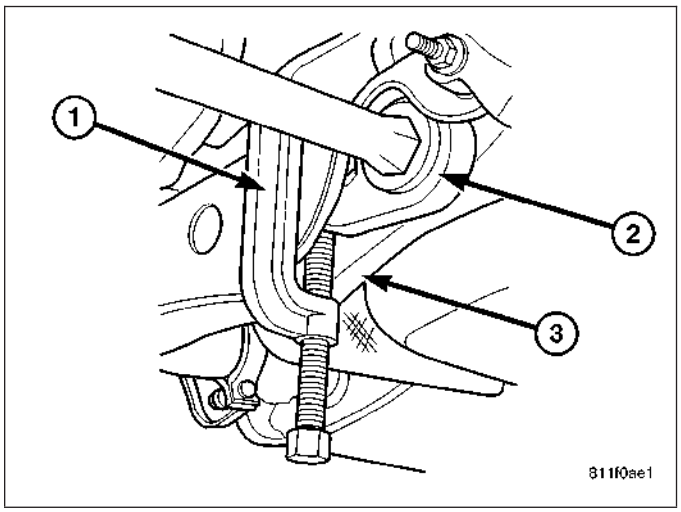
The front of the bar connects to the back side of the lower suspension arm. The rear end of the bar is mounted in a anchor that rests in the frame crossmember.

OPERATION

The torsion bars are used to control ride height and ride quality. The vehicle height is adjusted through an anchor adjustment bolt that increases or decreases the wind up of the torsion bar. Increasing or decreasing the bar angle changes the wind up of the suspension arms.

REMOVAL

CAUTION: The left and right side torsion bars are NOT interchangeable. The bars are identified and stamped R or L, for right or left. The bars do not have a front or rear end and can be installed with either end facing forward.



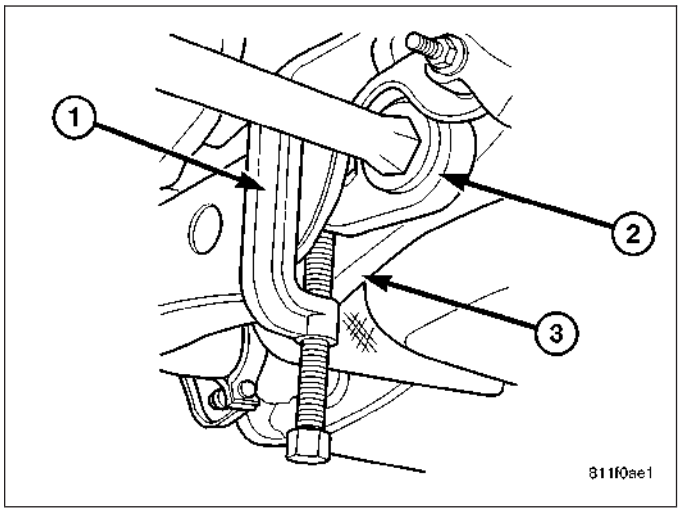
1. Raise and support the vehicle with the front suspension hanging.
2. Remove the transfer case skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - REMOVAL).

NOTE: Count and record the number of turns for installation reference.

3. Mark the adjustment bolt setting.
4. Install Special Tool - 8686 (1) to the anchor arm (2) and the cross member (3).
5. Increase the tension on the anchor arm tool 8686 (1) until the load is removed from the adjustment bolt and the adjuster nut.
6. Turn the adjustment bolt counterclockwise to remove the bolt and the adjuster nut..
7. Remove the Special Tool - 8686 (1) , allowing the torsion bar to unload.

INSTALLATION

CAUTION: The left and right side torsion bars are NOT interchangeable. The bars are identified and stamped R or L, for right or left. The bars do not have a front or rear end and can be installed with either end facing forward.



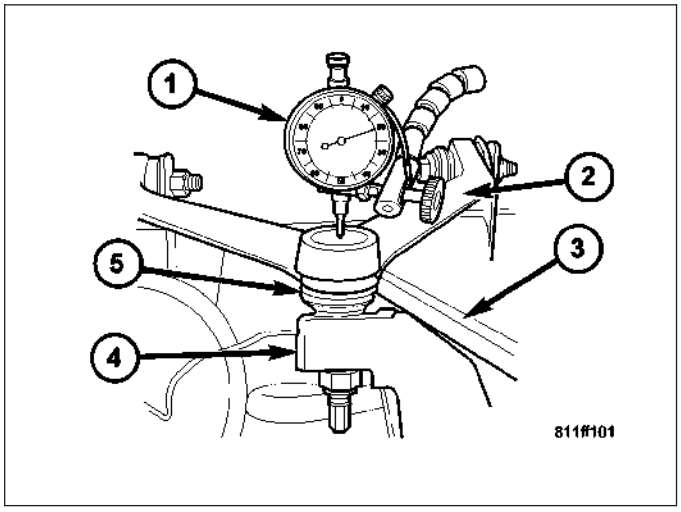
1. Insert torsion bar ends into anchor and suspension arm.
2. Position the anchor (2) in the crossmember frame (3).
3. Install Special Tool - 8686 (1) to the anchor (2) and the crossmember (3).
4. Increase the tension on the anchor in order to load the torsion bar.
5. Install the adjustment bolt and the adjuster nut.
6. Turn adjustment bolt clockwise the recorded amount of turns.
7. Remove tool - 8686 (1)from the torsion bar crossmember (3).
8. Install the transfer case skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/TRANSFER CASE SKID PLATE - INSTALLATION).
9. Lower vehicle and adjust the front suspension height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
10. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

BALL JOINT-UPPER

DIAGNOSIS AND TESTING

UPPER BALL JOINT

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Remove the front tires.
3. Mount a dial indicator (1) solidly to the frame and then zero the dial indicator.
4. Position dial indicator plunger on the topside of the upper ball joint (5).



NOTE: The dial indicator plunger must be perpendicular to the machined surface of the ball joint.

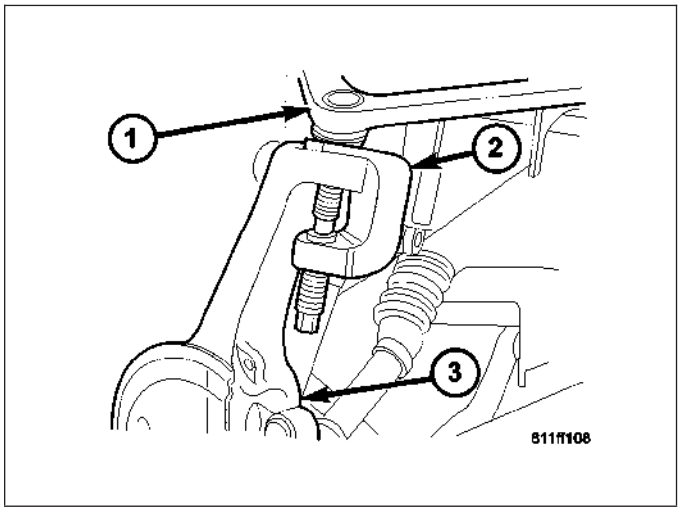
NOTE: Use care not to pry or tear the ball joint boot, when checking the free play.

5. Position a pry bar (3) between the steering knuckle (4) and the upper control arm (2). Pry upwards on the upper control arm.
6. If the travel exceeds 0.5 mm (0.020 in.), replace the upper control arm since the upper ball joint is integral to the arm (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL).
7. If the upper ball joint is within specs reinstall the front tires (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

CONTROL ARM-UPPER

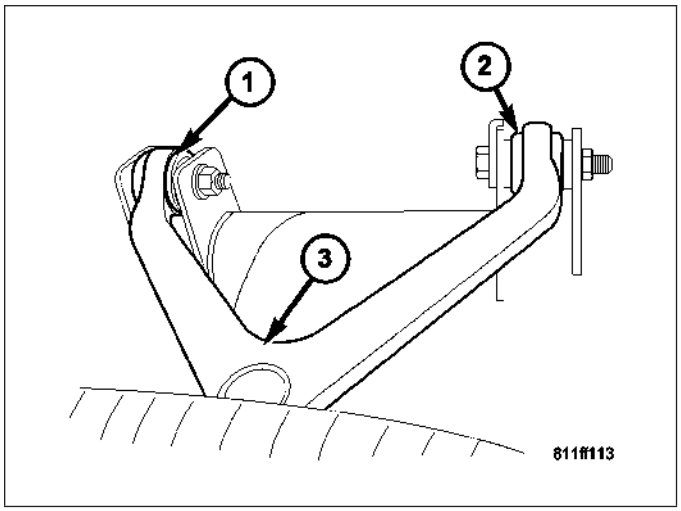
REMOVAL

1. Raise and support vehicle.
2. Remove wheel and tire assembly.
3. Remove the nut from upper ball joint.
4. Separate upper ball joint (1) from the steering knuckle (3) with Remover 8677 (2).



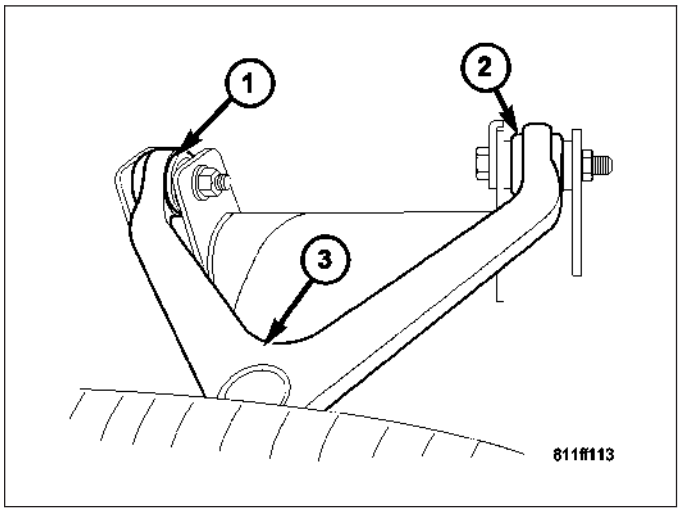
CAUTION: When installing Remover 8677 (2) to separate the ball joint, be careful not to damage the ball joint seal.

5. Remove the control arm pivot bolts (1&2) and remove control arm (3).



INSTALLATION

1. Position the control arm (3) into the frame brackets (1&2). Install bolts and tighten to 102 N·m (75 ft. lbs.).



2. Insert ball joint in steering knuckle and tighten ball joint nut to 75 N·m (55 ft. lbs.).
3. Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
4. Remove the support and lower vehicle.
5. Perform a wheel alignment, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

REAR

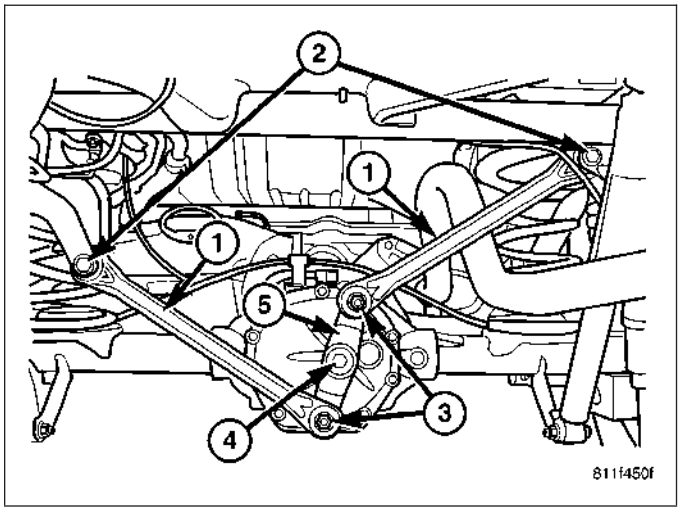
DESCRIPTION

The rear suspension is comprised of:

- Shock Absorbers
- Jounce Bumpers
- Stabilizer Bar
- Stabilizer links
- Coil Springs
- Watts Links (1)
- Bell Crank (5)
- Upper Control Arms
- Lower Control Arms
- Drive Axle



CAUTION: A vehicle should always be loaded so the vehicle weight center-line is located immediately forward of the rear axle. Correct vehicle loading provides proper front tire-to-road contact. This results in maximum vehicle handling stability and safety. Incorrect vehicle weight distribution can cause excessive tire tread wear, spring fatigue or failure, and erratic steering.

CAUTION: Suspension components with rubber/urethane bushings (except stabilizer bar) should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

DIAGNOSIS AND TESTING

SPRING AND SHOCK

A knocking or rattling noise from a shock absorber may be caused by movement between mounting bushings and metal brackets or attaching components. These noises can usually be stopped by tightening the attaching nuts. If the noise persists, inspect for damaged and worn bushings, and attaching components. Repair as necessary if any of these conditions exist.

A squeaking noise from the shock absorber may be caused by the hydraulic valving and may be intermittent. This condition is not repairable and the shock absorber must be replaced.

The shock absorbers are not refillable or adjustable. If a malfunction occurs, the shock absorber must be replaced. To test a shock absorber, hold it in an upright position and force the piston in and out of the cylinder four or five times. The action throughout each stroke should be smooth and even.

If the vehicle is used for severe, off-road operation, the springs should be examined periodically. Check for broken colis. Refer to Spring and Shock Absorber Diagnosis chart for additional information.

SPRING AND SHOCK ABSORBER

CONDITION	POSSIBLE CAUSES	CORRECTION
REAR OF VEHICLE SAGS	1. Broken coil spring. 2. Spring fatigue.	1. Replace spring. 2. Replace spring.
SPRING NOISE	1. Worn springs. 2. Worn isolators. 3. Severly overloaded.	1. Replace spring. 2. Replace isolators. 3. Check GVW of vehicle (Unload cargo).
SHOCK NOISE	1. Loose mounting fastener. 2. Worn bushings. 3. Leaking shock.	1. Tighten to specification. 2. Replace shock. 3. Replace shock.

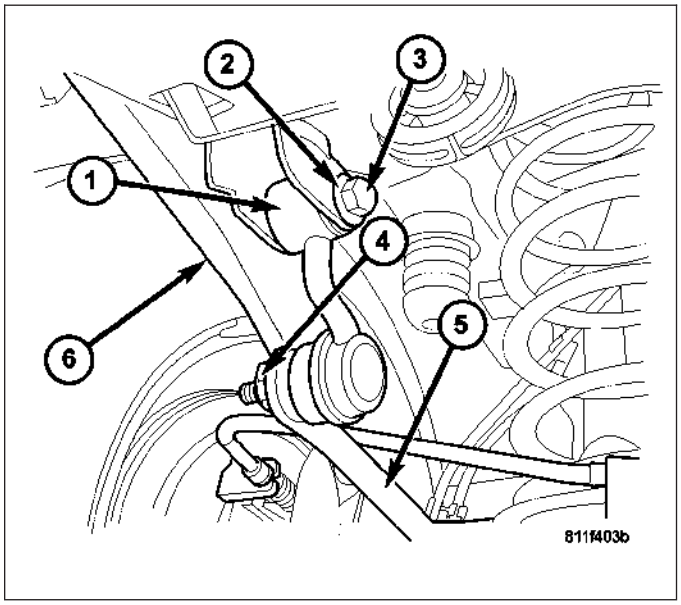
JOUNCE BUMPER

REMOVAL

1. Raise and support the vehicle.

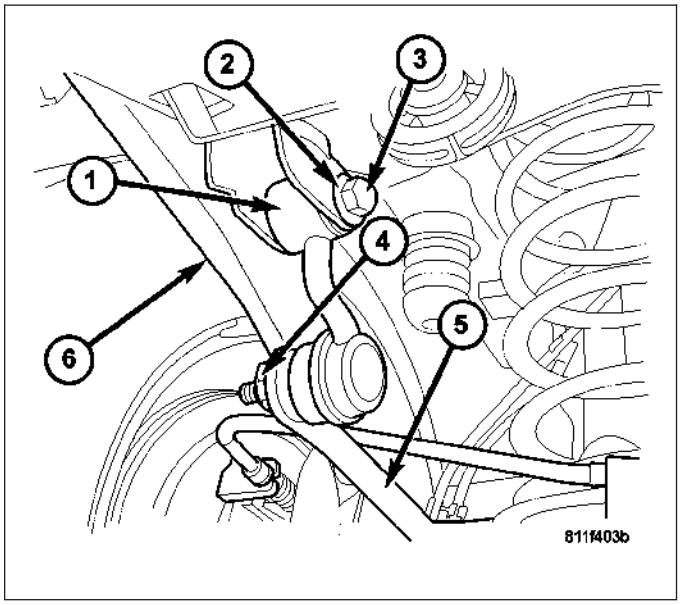
NOTE: Rocking motion may be required while pulling the jounce bumper from the seating bracket

2. Twist and pull out the jounce bumper to remove the jounce bumper from the seating bracket.



INSTALLATION

1. Install the jounce bumper and twist to seat in the bracket.
2. Remove the support and lower the vehicle.



SHOCK ABSORBER

REMOVAL

1. Raise vehicle and support the axle.
2. Lower the spare tire **This step must be done if replacing the left side shock.**
3. Remove the upper shock bolt and flag nut.
4. Remove the lower shock bolt and nut.
5. Remove the rear shock absorber from the vehicle.

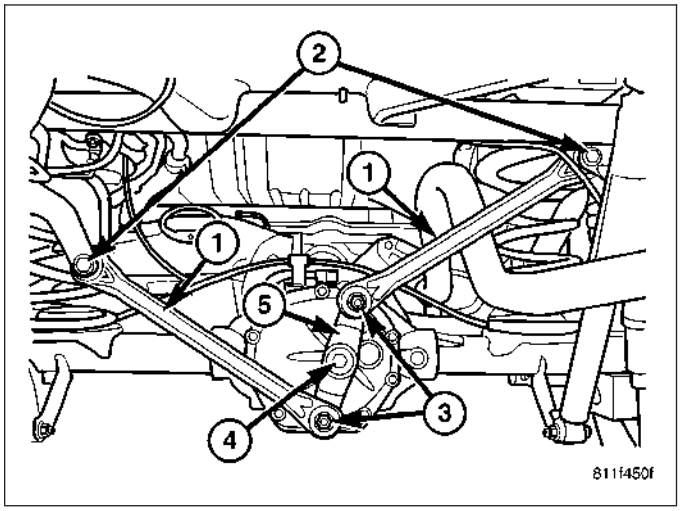
INSTALLATION

1. Position the shock absorber in the brackets.
2. Install the bolts through the brackets and the shock. Install the flag nut on the top bolt and nut on lower bolt.
3. Tighten the upper and lower bolt/nuts Tighten to 102 N.m (75 ft. lbs.)
4. Raise the spare tire back in place if lowered for the left shock.
5. Remove the support and lower the vehicle.

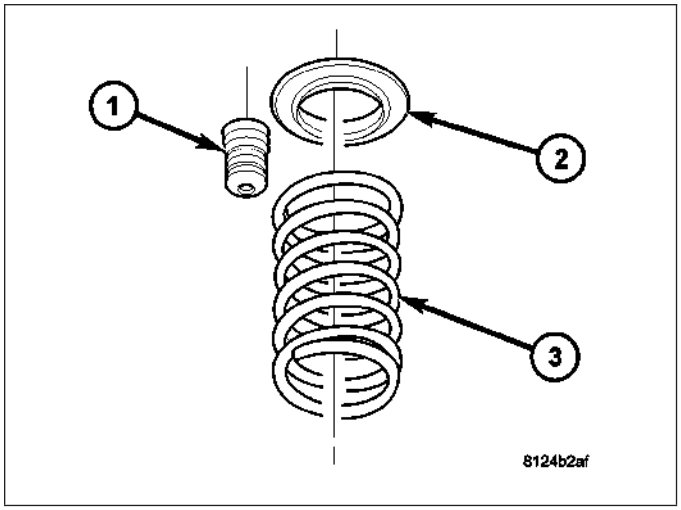
SPRING-REAR-COIL

REMOVAL

1. Raise and support the vehicle.
2. Support the axle with a suitable holding fixture.
3. Remove the lower shock bolt.
4. Remove the bell crank bolt (4) to the rear axle.



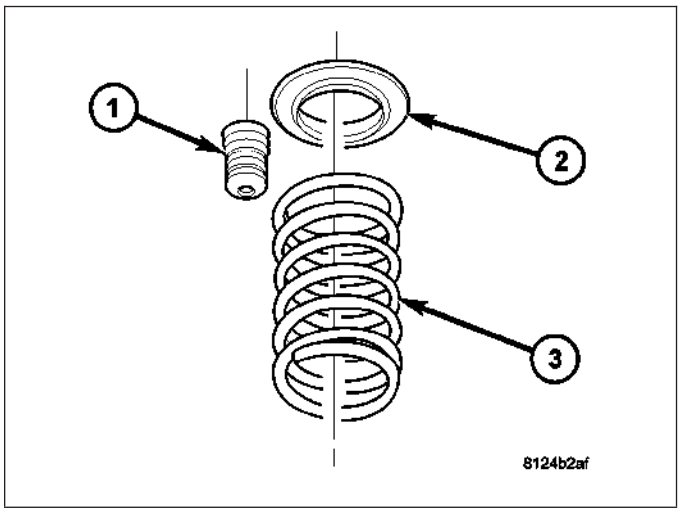
5. Lower the jack to remove the spring and isolator from the vehicle.



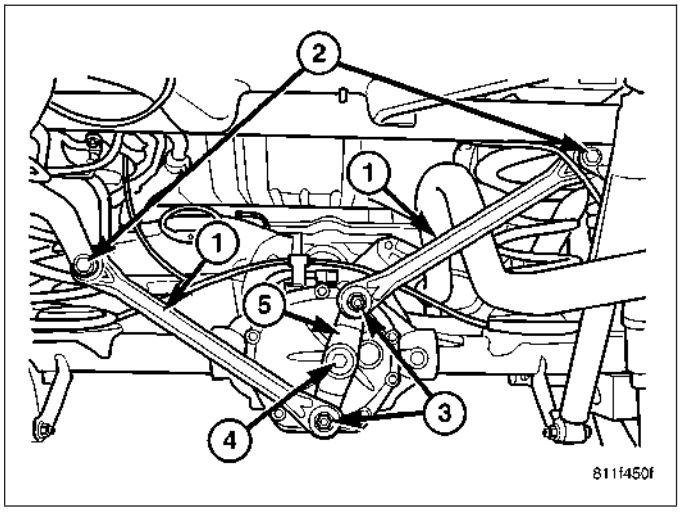
INSTALLATION

NOTE: All torques should be made with the full vehicle weight on the ground being supported by the tires.

1. Position spring (3) to the vehicle on top of the isolator (2).
2. Align the springs (3) to the spring pockets.
3. Raise the rear axle into place.



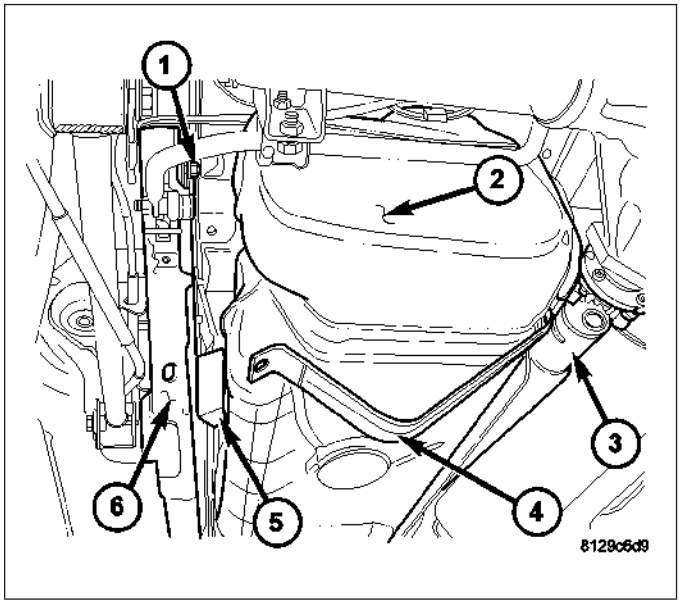
4. Install the bell crank bolt (4) to the rear axle. Tighten to 251 N·m (185 ft. lbs.).
5. Install the lower shock bolts to the rear axle. Tighten to 102 N·m (75 ft. lbs.).
6. Remove the holding fixture for the rear axle.



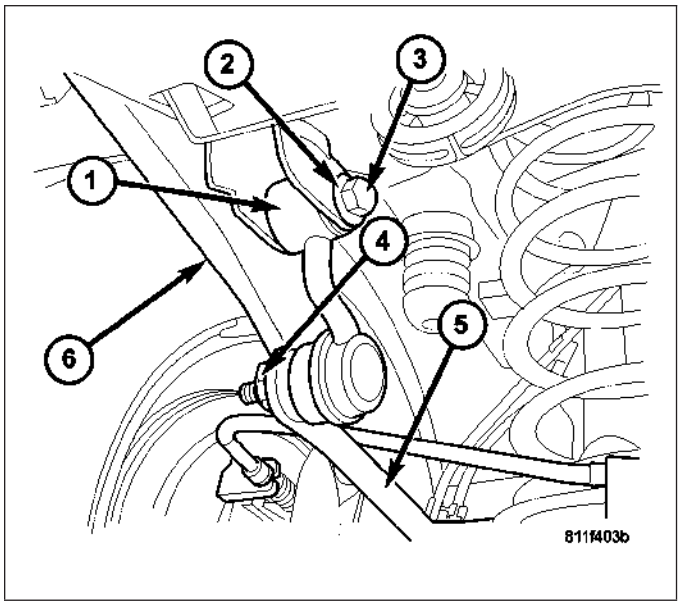
STABILIZER LINK

REMOVAL

1. Raise and support the vehicle.
2. Remove the rear tire.
3. Support the rear axle with a jack.
4. Remove the fuel tank skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FUEL TANK SKID PLATE - REMOVAL). **This step must be done for replacement of the left side stabilizer link.**
5. Remove the rear fuel tank strap bolt and let the strap (3) hang. **This step must be done for replacement of the left side stabilizer link.**
6. Push the fuel tank (2) over towards the driveshaft (3) and install a block of wood (5) between the frame (6) and the fuel tank (2) to allow for clearance of the upper stabilizer link bolt (1) **This step must be done for replacement of the left side stabilizer link.**

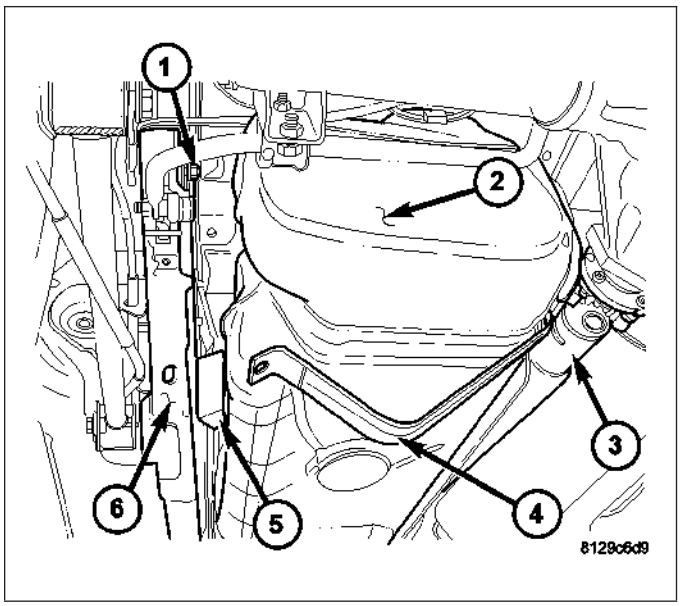


7. Remove the upper link nut (2) and bolt (3) at the frame.
8. Remove the lower link nut (4) at the stabilizer bar (5).
9. Remove stabilizer link (1).

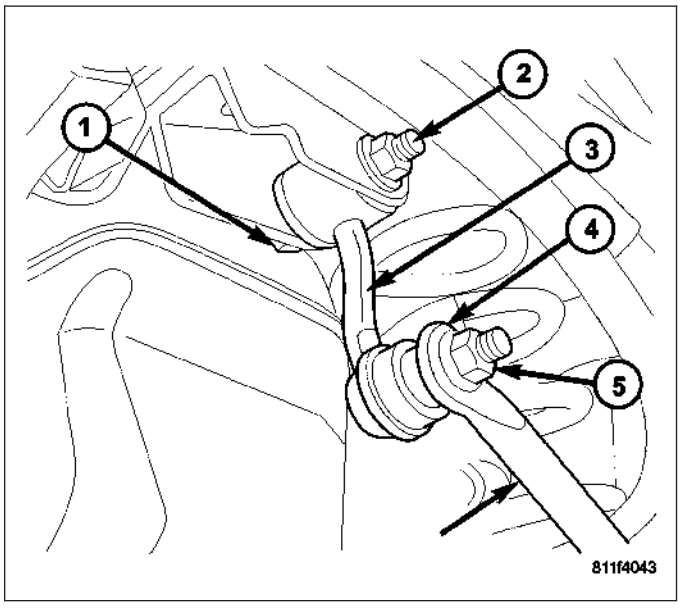


INSTALLATION

1. Install the upper bolt (1) and nut (1) for the stabilizer link to the frame and tighten to 102 N·m (75 ft. lbs.).
2. Remove the block of wood (5) between the frame (6) and fuel tank (2) **If replacement of left stabilizer link was performed**.
3. Install the rear fuel tank strap (4) **If replacement of left stabilizer link was performed**.
4. Install the fuel tank skid plate (Refer to 13 - FRAME & BUMPERS/FRAME/FUEL TANK SKID PLATE - INSTALLATION). **If replacement of left stabilizer link was performed.**



5. Install the stabilizer link (3) to the stabilizer bar (4).
6. Install the nut (5) and tighten to 102 N·m (75 ft. lbs.).
7. Remove the jack and lower the vehicle.



STABILIZER BAR

DESCRIPTION

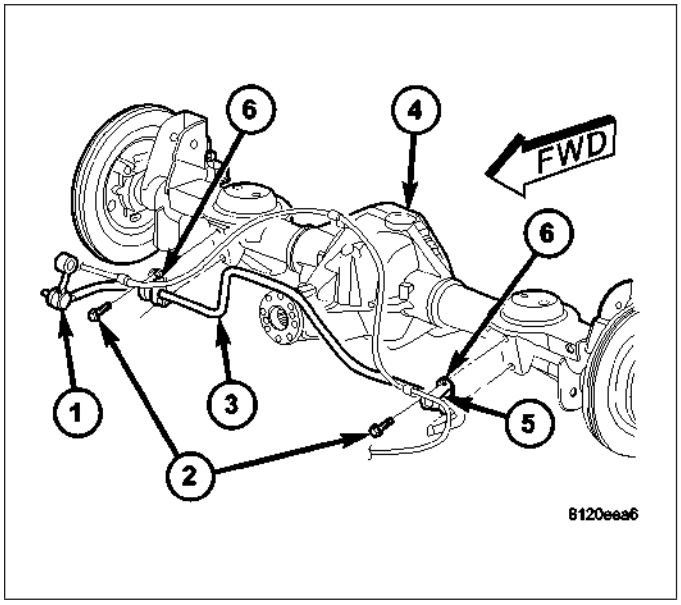
The stabilizer bar extends across the underside of the vehicle and is bolted to the top of the axle. Links at the end of the bar are bolted to the frame.

OPERATION

The stabilizer bar is used to minimize vehicle body sway. The spring steel bar helps to control the vehicle body in relationship to the suspension.

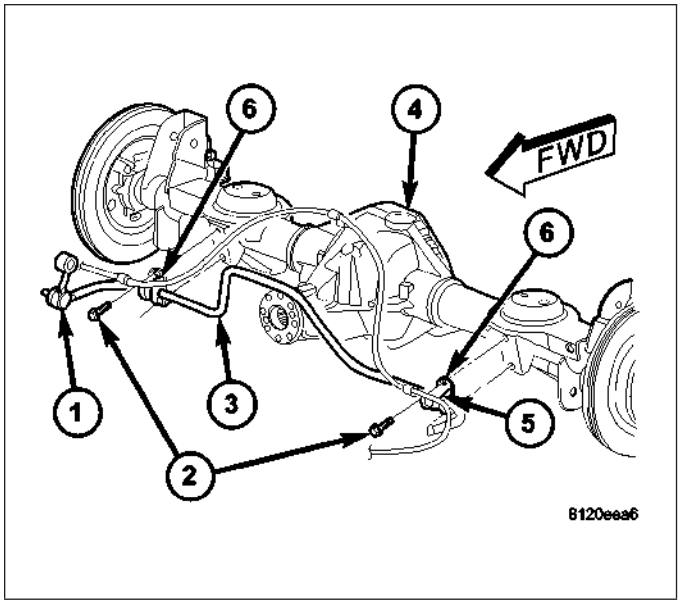
REMOVAL

1. Raise and support vehicle.
2. Remove lower links mounting nuts (1).
3. Remove stabilizer bar retainer bolts (2) and retainers (6) at the axle (4).
4. Remove the park brake cable bracket from the retainers.
5. Remove stabilizer bar (3) and remove bushings (5).



INSTALLATION

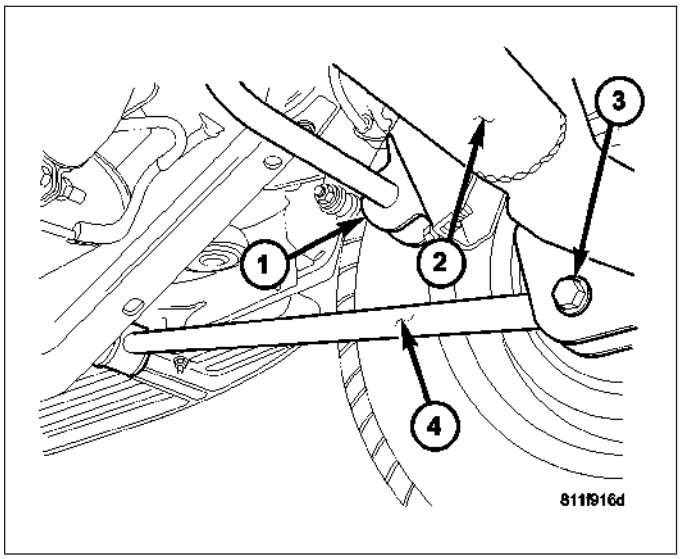
1. Install stabilizer bar bushings (5).
2. Install the stabilizer bar (3) and center it with equal spacing on both sides.
3. Install stabilizer bar retainers (6) and tighten bolts (2) to 61 N·m (45 ft. lbs.).
4. Install the park brake cable bracket to the retainers.
5. Install the links (1) on the stabilizer bar (3). Install mounting bolts and nuts.
6. Remove support and lower vehicle.
7. Tighten stabilizer link lower nuts (2) to 102 N·m (75 ft. lbs.).



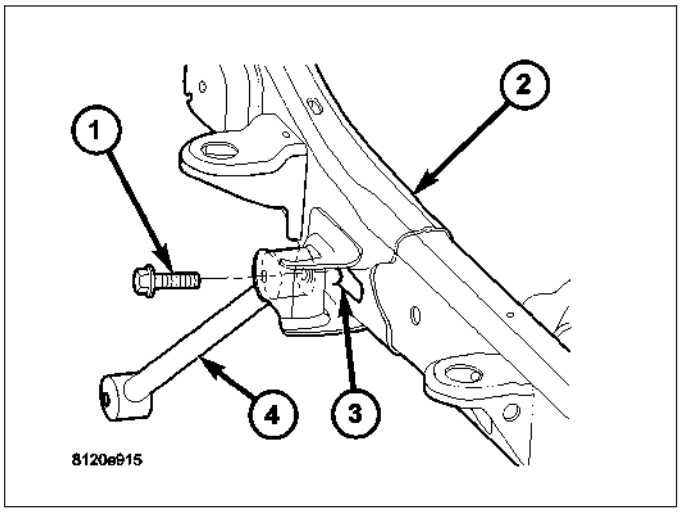
CONTROL ARM-LOWER

REMOVAL

1. Raise and support the rear axle.
2. Remove the lower control arm bolt (3) and flag nut at the axle (2).

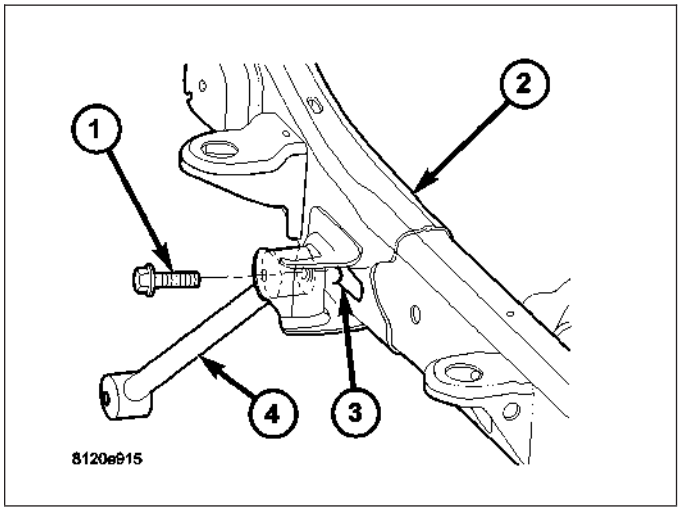


3. Remove the lower control arm bolt (1) and flag nut (3) at the frame (2).
4. Remove the lower control arm (4) from the vehicle.

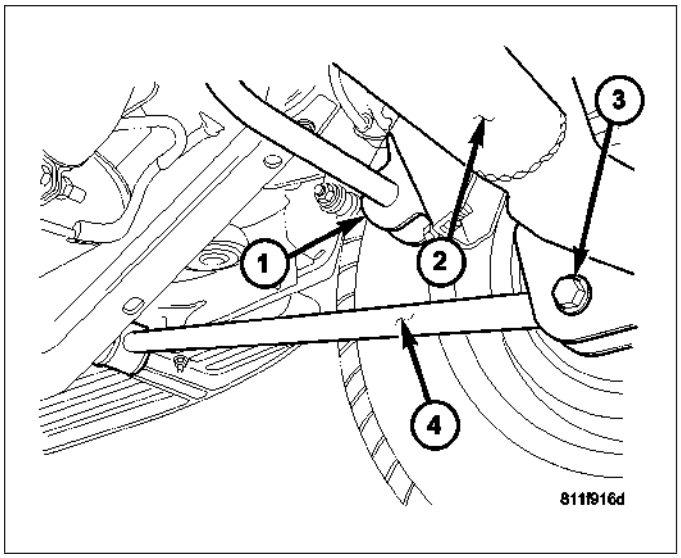


INSTALLATION

1. Install the lower control arm (4) to the vehicle.
2. Install the lower control arm bolt (1) and flag nut (3) at the frame (2).



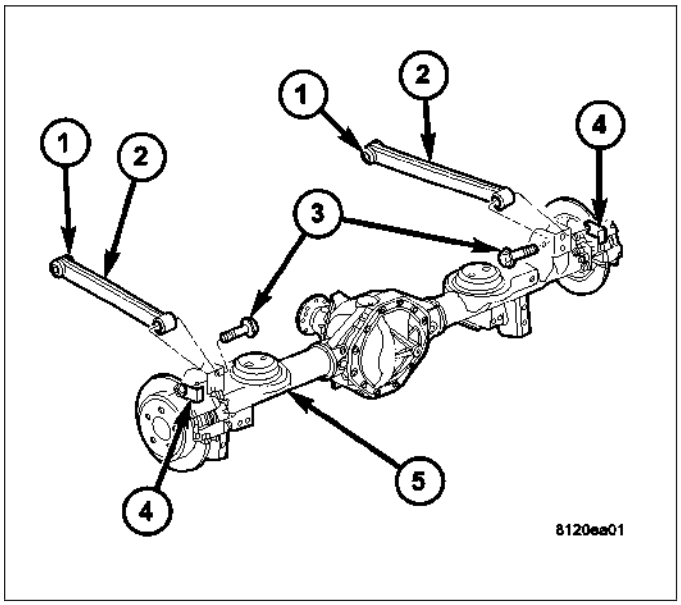
3. Install the lower control arm bolt (3) and flag nut at the axle (2).
4. Lower the vehicle to the ground and then tighten the bolts to 251 N·m (185 ft.lbs.).



CONTROL ARM-UPPER

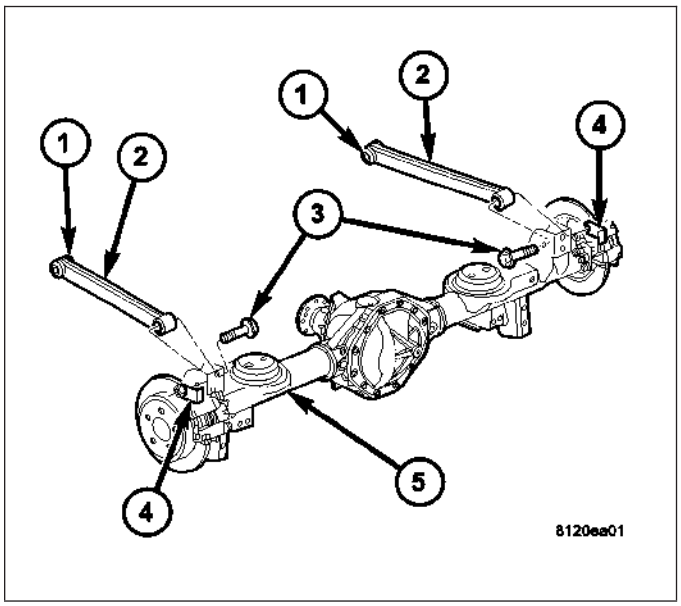
REMOVAL

1. Raise and support the rear axle.
2. Remove the upper control arm bolt (3) and flag nut (4) at the axle (5).
3. Remove the upper control arm bolt and flag nut at the frame side (1).
4. Remove the upper control arm (2) from the vehicle.



INSTALLATION

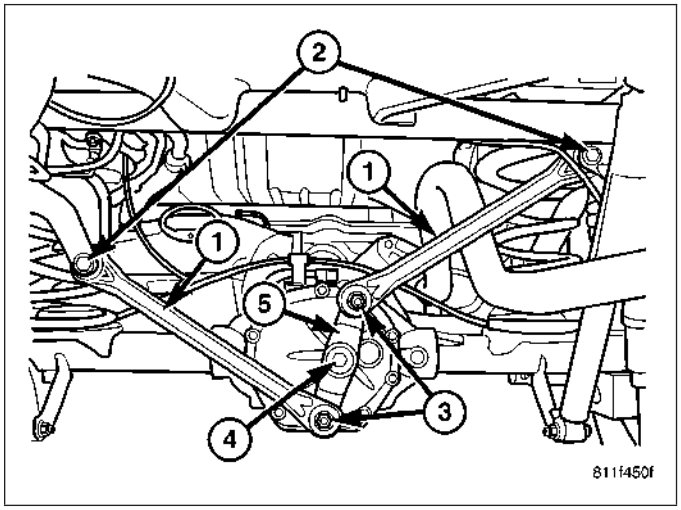
1. Install the upper control arm (2) to the vehicle.
2. Install the upper control arm bolt and flag nut (1) at the frame.
3. Install the upper control arm bolt (3) and flag nut (4) at the axle (5).
4. Lower the vehicle to the ground and then tighten the bolts to 156 N·m (115 ft.lbs.).



BELL CRANK

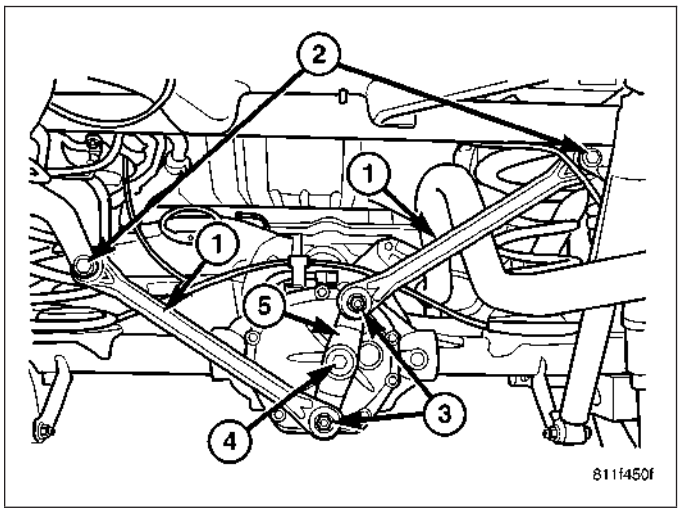
REMOVAL

1. Raise and support the vehicle.
2. Remove the watts link nuts (3) at the bell crank (5).
3. Remove both watts links (1) from the bell crank (5).
4. Remove the bell crank bolt (4) from the differential cover and remove the bell crank (5).



INSTALLATION

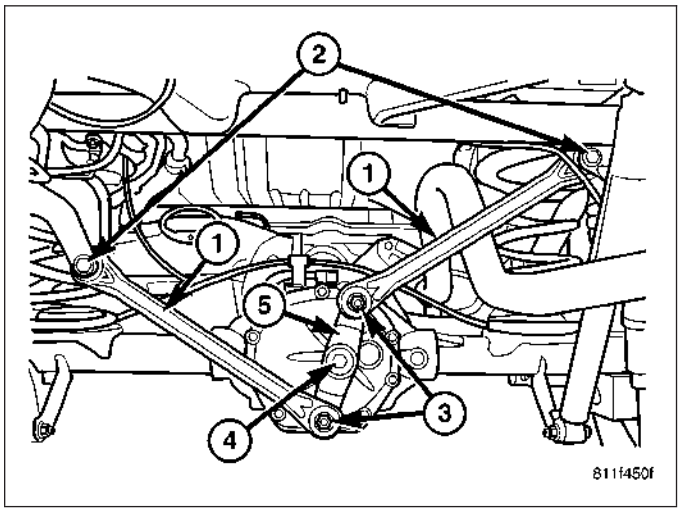
1. Install the bell crank (5) and bolt (4) to the differential cover and tighten 251 N·m (185 ft.lbs).
2. Install the watts links (1) and nuts (3) to the bell crank (5) and tighten 108 N·m (80 ft.lbs).
3. Lower the vehicle.



WATTS LINK

REMOVAL

1. Raise and support the vehicle.
2. Remove the upper nut (2) and bolt (2) to the watts link at the frame.
3. Remove the lower nut (3) to the watts link at the bell crank (5) and remove the watts link.



INSTALLATION

1. Install the watts link in position at the frame.
2. Install the watts link nut and bolt (2) at the frame and tighten 169 N·m (125 ft.lbs).
3. Install the watts links nuts (3) to the bell crank (5) and tighten 108 N·m (80 ft.lbs).
4. Lower the vehicle.

PROPELLER SHAFT

DIAGNOSIS AND TESTING

PROPELLER SHAFT

PROPELLER SHAFT VIBRATION

Out-of-round tires or wheels that are out of balance, will cause a low frequency vibration.

Driveline vibration can also caused by loose or damaged engine mounts.

Propeller shaft vibration increases with vehicle speed. A vibration that occurs at a specific speed range, is not usually caused by an out of balance propeller shaft. Defective universal joints or an incorrect propeller shaft angle are usually the cause of such a vibration.

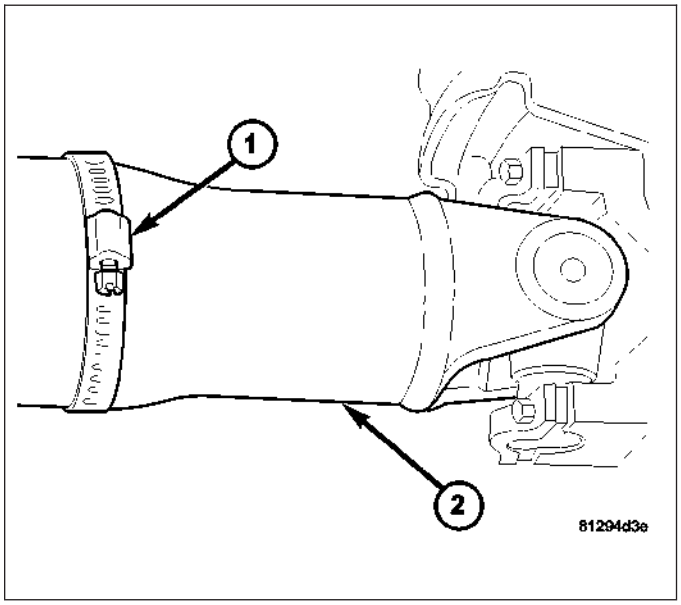
DRIVELINE VIBRATION

Drive Condition	Possible Cause	Correction
Propeller Shaft Noise	1) Undercoating or other foreign material on shaft.	1) Clean exterior of shaft and wash with solvent.
	2) Loose U-joint clamp screws.	2) Install new clamps and screws and tighten to proper torque.
	3) Loose or bent U-joint yoke or excessive runout.	3) Install new yoke.
	4) Incorrect driveline angularity.	4) Measure and correct driveline angles.
	5) Rear spring center bolt not in seat.	5) Loosen spring u-bolts and seat center bolt.
	6) Worn U-joint bearings.	6) Install new U-joint.
	7) Propeller shaft damaged or out of balance.	7) Installl new propeller shaft.
	8) Broken rear spring.	8) Install new rear spring.
	9) Excessive runout or unbalanced condition.	9) Re-index propeller shaft, test, and evaluate.
	10) Excessive drive pinion gear shaft runout.	10) Re-index propeller shaft and evaluate.
	11) Excessive axle yoke deflection.	11) Inspect and replace yoke if necessary.
	12) Excessive transfer case runout.	12) Inspect and repair as necessary.
Universal Joint Noise	1) Loose U-joint clamp screws.	1) Install new clamps and screws and tighten to proper torque.
	2) Lack of lubrication.	2) Replace as U-joints as necessary.

PROPELLER SHAFT BALANCE

If propeller shaft is suspected of being out of balance, use the following procedure.

NOTE: Indexing propeller shaft 180° relative to the yoke may eliminate some vibrations.

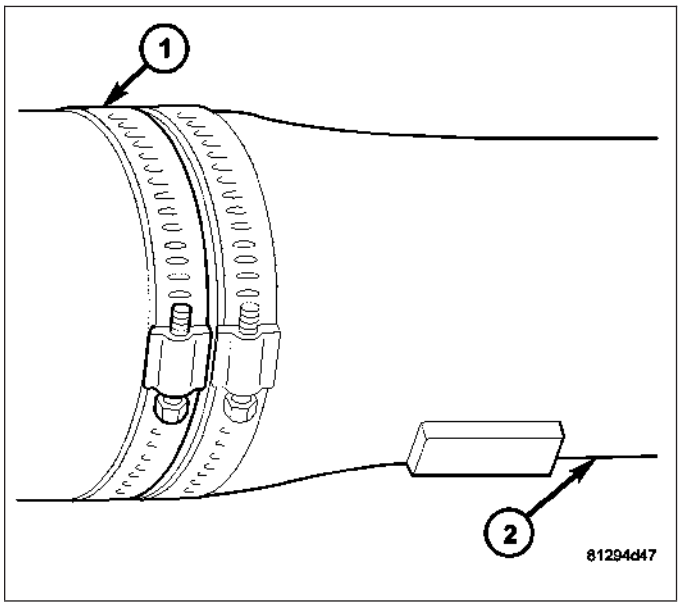


1. Raise and support vehicle.
2. Clean all foreign material from the propeller shaft and universal joints.
3. Inspect propeller shaft for missing balance weights, broken welds and bent areas. **If propeller shaft is bent, it must be replaced.**
4. Inspect universal joints for wear and properly installed.
5. Check propeller shaft bolt torques.
6. Remove wheels and install lug nuts to retain brake rotors.
7. Mark and number the shaft six inches from the pinion yoke end at four positions 90° apart.
8. Run and accelerate vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.

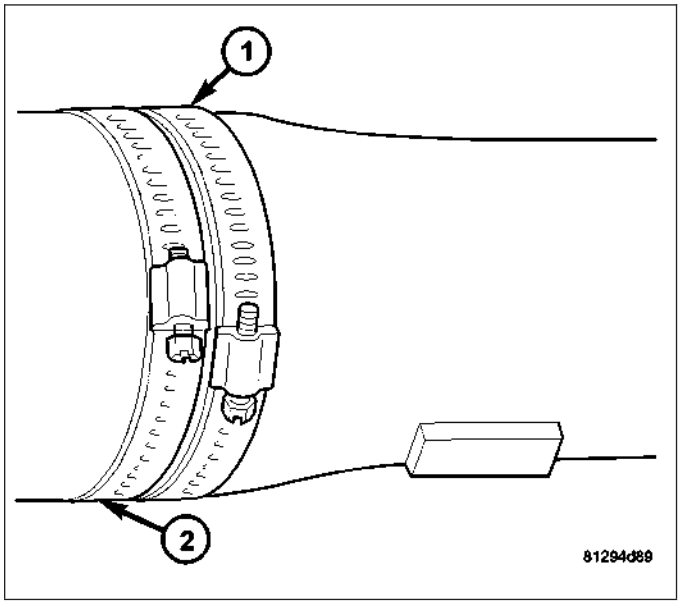
9. Install a screw clamp at position (1).
10. Start engine and check vibration. If there is little or no change move the clamp to the next positions. Repeat the vibration test.

NOTE: If there is no difference in vibration at this positions, the vibration may not be the propeller shaft.

11. If vibration decreased, install a second clamp (1) and repeat the test.



12. If additional clamp causes an additional vibration, separate the clamps 1/2 inch (1) above and below the mark. Repeat the vibration test.
13. Increase distance between the clamp screws (1) (2) and repeat test, until the least amount of vibration is noticed. Bend the slack end of the clamps so screws will not loosen.
14. If vibration remains unacceptable, repeat the procedure to the front end of the propeller shaft.
15. Install wheels and lower vehicle.



PROPELLER SHAFT RUNOUT

1. Clean propeller shaft surface, where dial indicator will contact the shaft.
2. Install dial indicator perpendicular to the shaft surface.
3. Measure runout at the center and ends of the shaft away from weld areas, so weld process does not affect measurements.
4. Refer to Runout Specifications chart.
5. If runout is out of specification, index the shaft 180° and take shaft runout measurements again.
6. If runout is now within specifications, mark shaft and yokes for proper orientation.
7. If runout is not within specifications, verify runout of the transmission/transfer case and axle are within specifications. Correct as necessary and measure propeller shaft runout again.
8. Replace propeller shaft if the runout still exceeds the limits.

RUNOUT SPECIFICATIONS

Front of Shaft	0.020 in. (0.50 mm)
Center of Shaft	0.025 in. (0.63 mm)
Rear of Shaft	0.020 in. (0.50 mm)
NOTE: Measure front/rear runout approximately 3 inches (76 mm) from the weld seam at each end of the shaft tube for tube lengths over 30 inches. For tube lengths under 30 inches, the maximum allowed runout is 0.020 in. (0.50 mm) for the full length of the tube.	

STANDARD PROCEDURE

PROPELLER SHAFT ANGLE

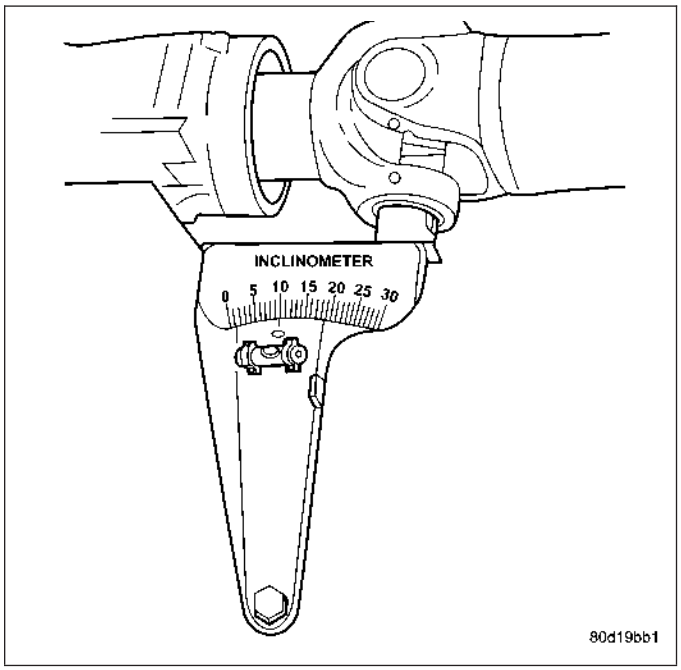
NOTE: This procedure applies to the front and rear propeller shaft.

1. Raise and support vehicle at the axles as level as possible, allowing wheels and propeller shaft to turn.
2. Remove universal joint snap rings if equipped, so inclinometer base will sits flat.
3. Rotate shaft until transmission/transfer case output yoke bearing cap is facing downward.

NOTE: Always make measurements from front to rear and from the same side of the vehicle.

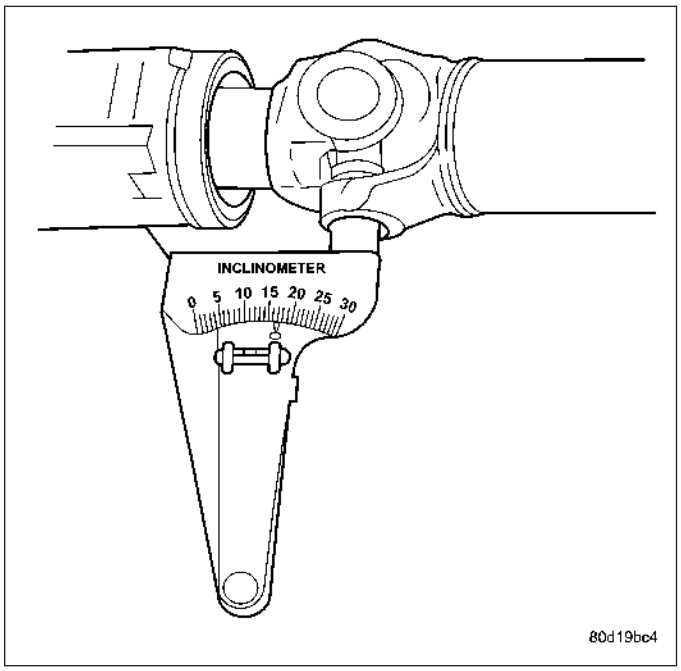
4. Place Inclinometer 7663 on yoke bearing cap or pinion flange ring, parallel to the shaft. Center bubble in sight glass and record measurement (A).

This measurement will give you the transmission or Output Yoke Angle (A).



5. Rotate propeller shaft 90 degrees and place Inclinometer 7663 on yoke bearing cap parallel to the shaft. Center bubble in sight glass and record measurement (C). This measurement can also be taken at the rear end of the shaft.

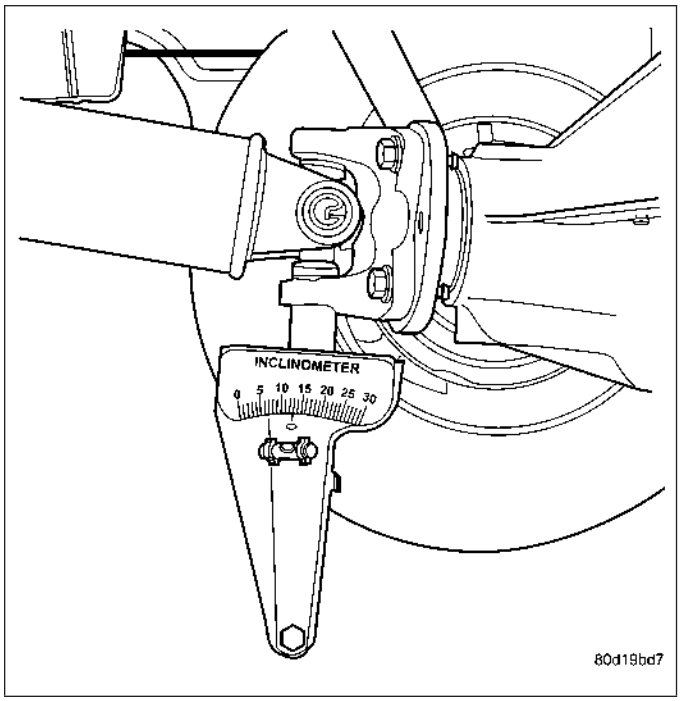
This measurement will give you the propeller shaft angle (C).



6. Subtract smaller figure from larger (C minus A) to obtain transmission output operating angle.
7. Rotate propeller shaft 90 degrees and place Inclinometer 7663 on pinion yoke bearing cap parallel to the shaft. Center bubble in sight glass and record measurement (B).

This measurement will give you the pinion shaft or input yoke angle (B).

8. Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.



PROPELLER SHAFT ANGLE RULES

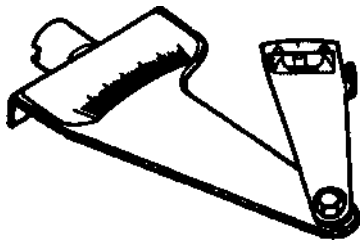
- Good cancellation of U-joint operating angles is within 1 degree.
- Operating angles less than 3 degrees.
- At least 1/2 of one degree continuous operating (propeller shaft) angle.

SPECIFICATIONS

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Center Bearing Bolts	68	50	-
Front Companion Flange Bolts	115	85	-
Rear Companion Flange Bolts	115	85	-

SPECIAL TOOLS

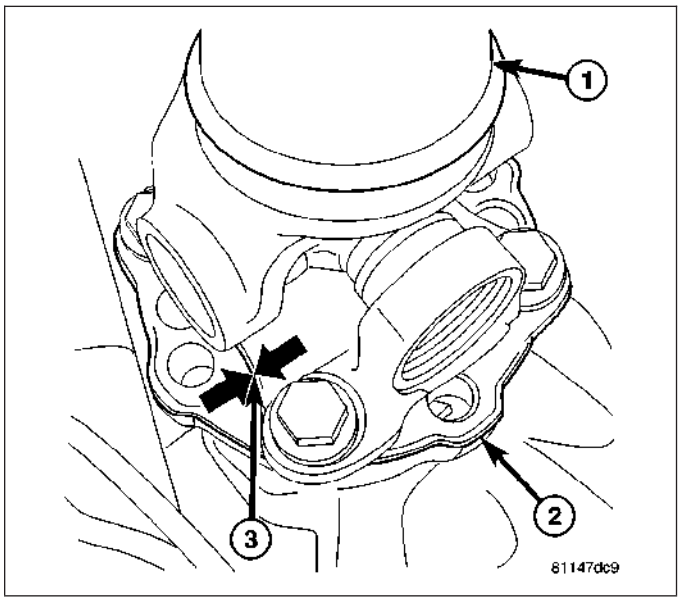


INCLINOMETER 7663

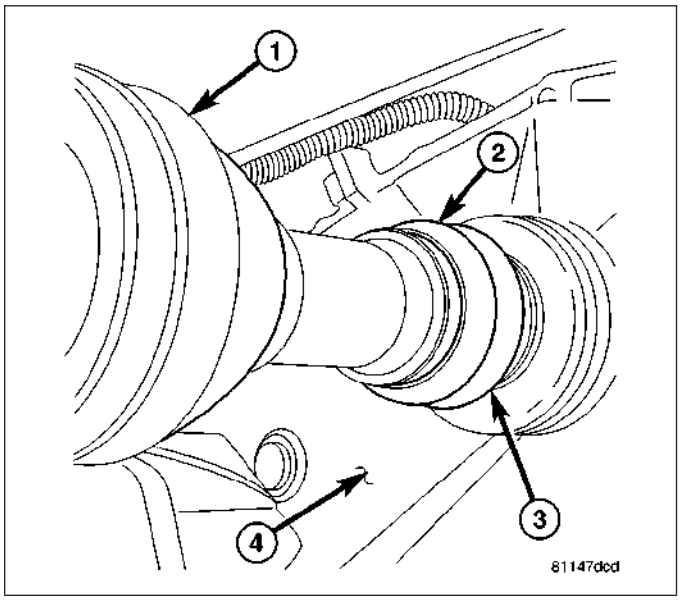
SHAFT-PROPELLER FRONT

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate if equipped.
3. Mark a reference line (3) across propeller shaft flange and pinion flange (2).

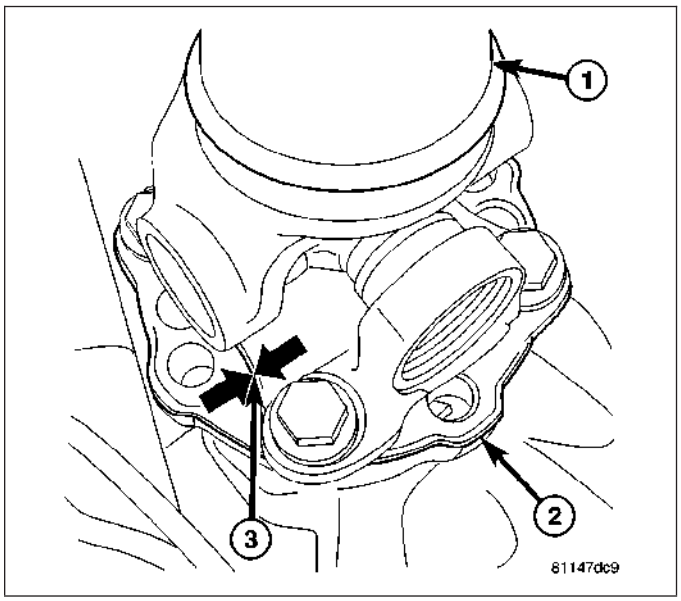


4. Remove exhaust crossover bolts from exhaust manifolds and lower crossover.
5. Remove boot clamp (3) from CV joint (1).
6. Remove pinion flange bolts.
7. Slide propeller shaft off the transfer case and remove shaft.



INSTALLATION

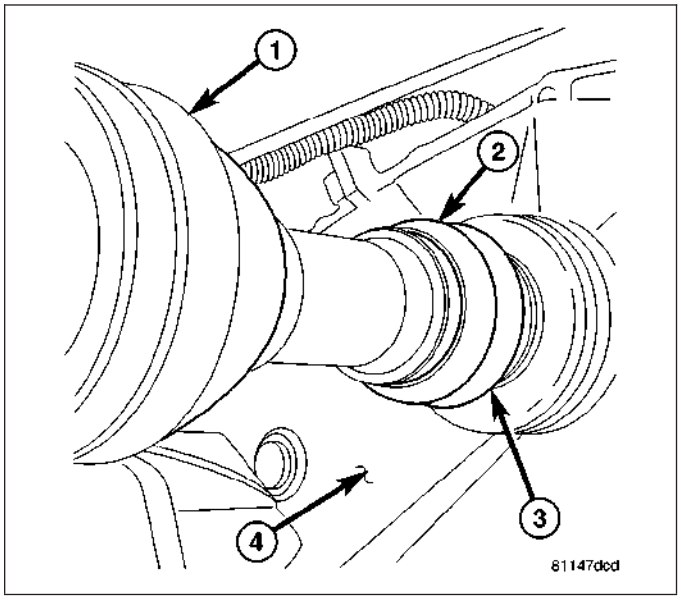
1. Slide propeller shaft onto transfer case.
2. Install propeller shaft with reference marks (3) aligned on pinion flange.



3. Install **new** pinion flange bolts and tighten to 115 N·m (85 ft. lbs.).

NOTE: Flange bolts incorporate a Loctite® patch, new bolts should be used. If bolts are not available, clean bolts and apply Loctite® 242 to the threads.

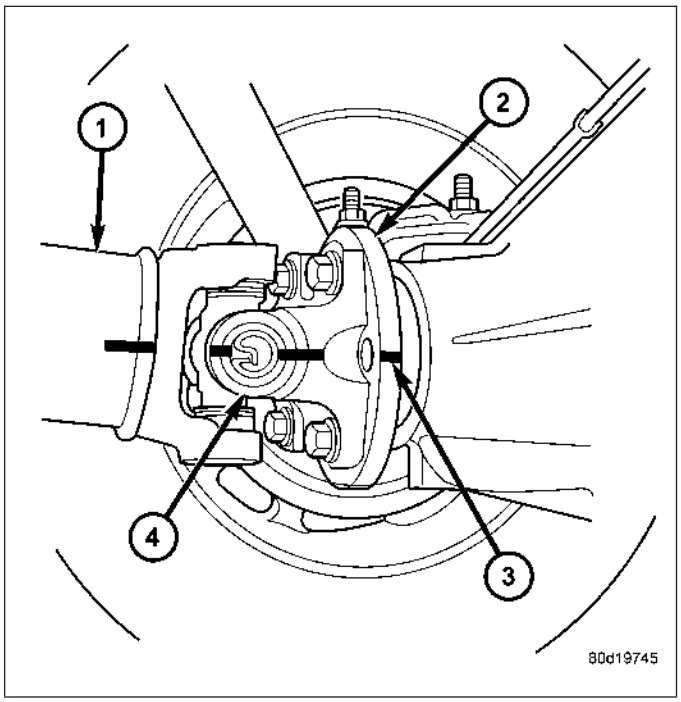
4. Install CV boot clamp (3).
5. Install skid plate, if equipped.



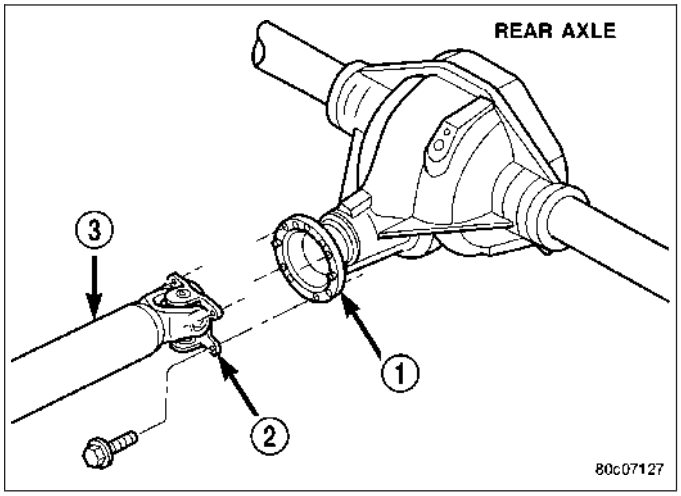
SHAFT-PROPELLER REAR

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line (3) across the pinion flange (2) and propeller shaft flange (4).



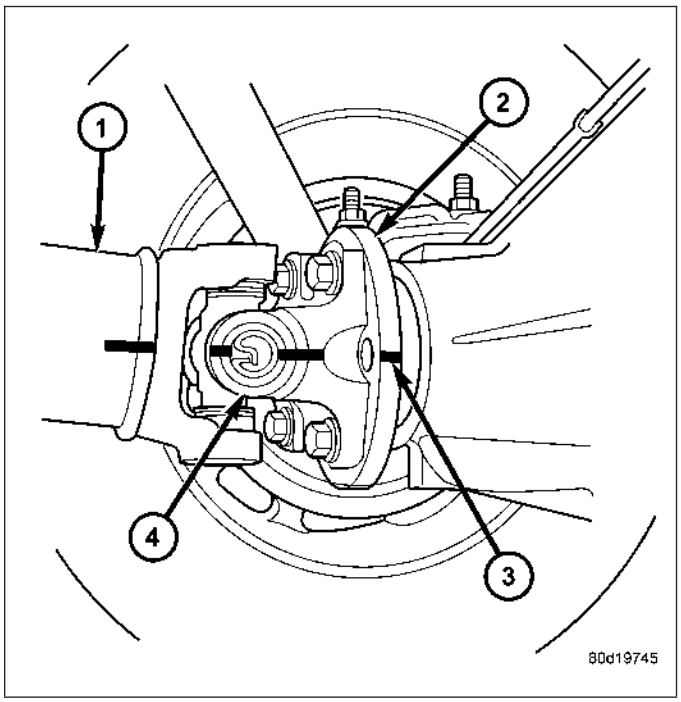
3. Remove flange bolts.
4. Slide slip yoke off of the transmission/transfer case output shaft and remove propeller shaft (3).



INSTALLATION

1. Slide slip yoke onto transmission/transfer case output shaft.
2. Align flange reference marks (3).
3. Install **new** flange bolts and tighten to 115 N·m (85 ft. lbs.).

NOTE: Flange bolts incorporate a Loctite® patch, new bolts should be used. If bolts are not available, clean bolts and apply Loctite® 242 to the threads.



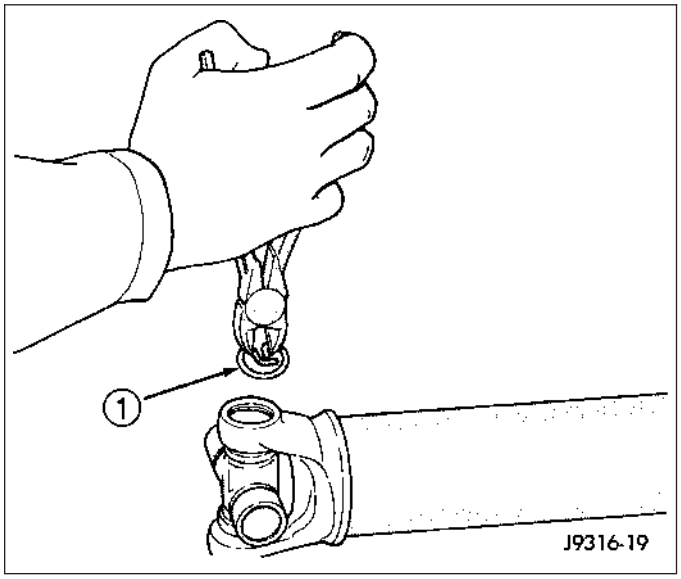
UNIVERSAL JOINTS-SINGLE CARDAN

DISASSEMBLY

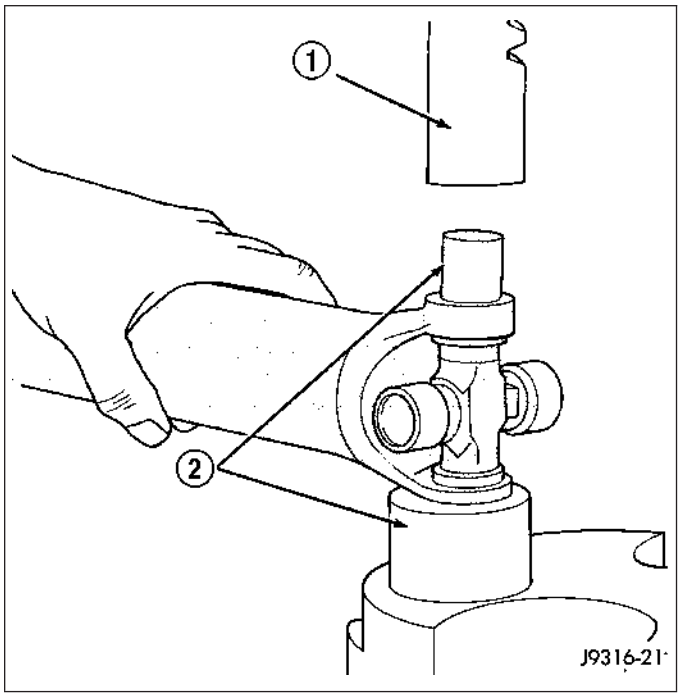
DISASSEMBLY - WITH SNAP RINGS

NOTE: This procedure describes a propeller shaft equipped with a cardan joint in the tube yoke. For propeller shafts equipped with a companion/slip yoke, repeat the steps to remove the remaining cardan joint.

1. Tap outside of bearing cap with a drift to loosen snap ring.
2. Remove snap rings (1) from both sides of yoke.



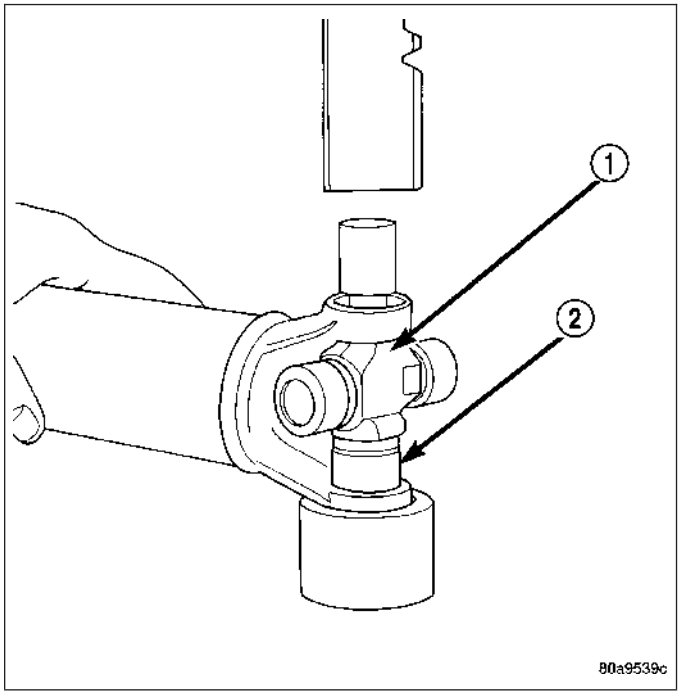
3. Position yoke with the grease fitting if equipped, pointing up.
4. Position a socket with a inside diameter large enough to receive the bearing cap, beneath the yoke on a press.
5. Place another socket with an outside diameter smaller than bearing cap on the upper bearing cap and press (1) the lower cap through the yoke.



NOTE: If the bearing cap will not pull out of the yoke by hand after pressing, tap the yoke ear near the bearing cap to dislodge the cap.

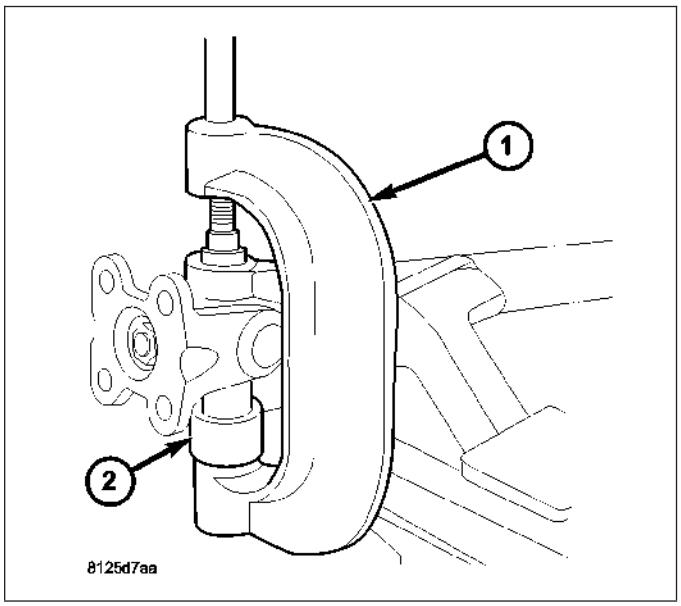
6. Pull bearing cap of the yoke.
7. Turn yoke over in the press and straighten the cross (1). Press the cross until the remaining bearing cap (2) can be removed.

CAUTION: If cross or bearing cap are not straight during removal, the bearing cap will score the walls of the yoke bore and damage can occur.

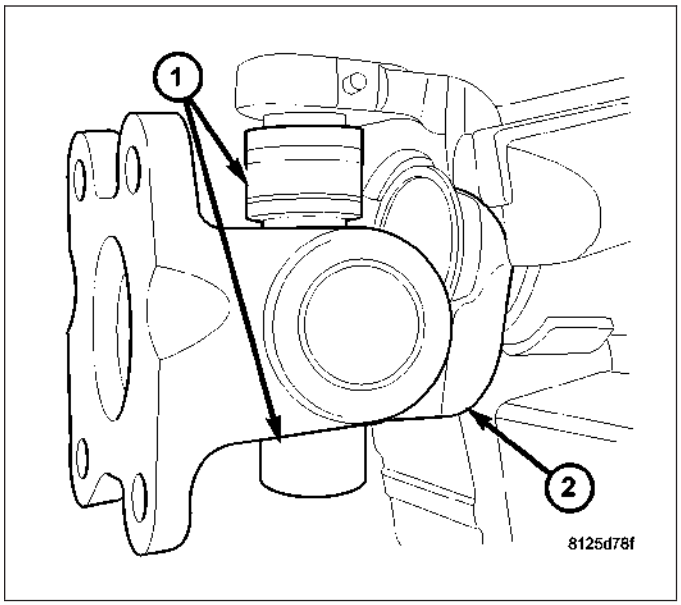


DISASSEMBLY - WITH INJECTED RINGS

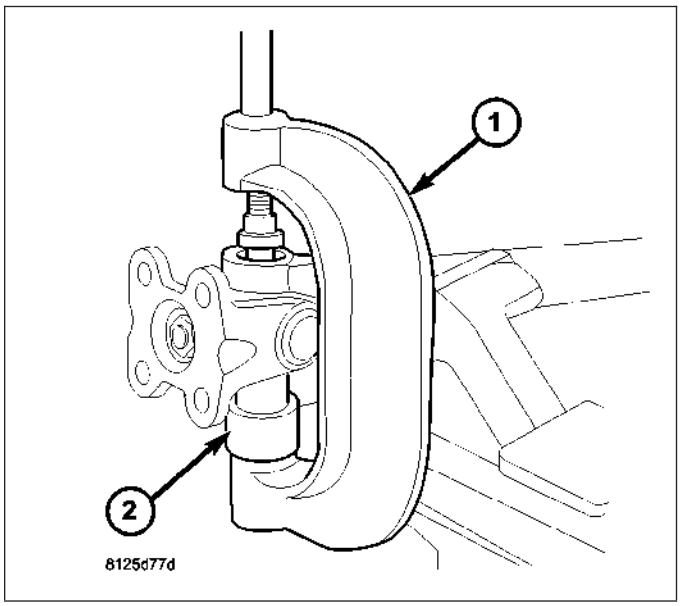
1. Place shaft yoke in vise.
2. Position U-joint press (1) with receiver (2) on propeller shaft yoke.



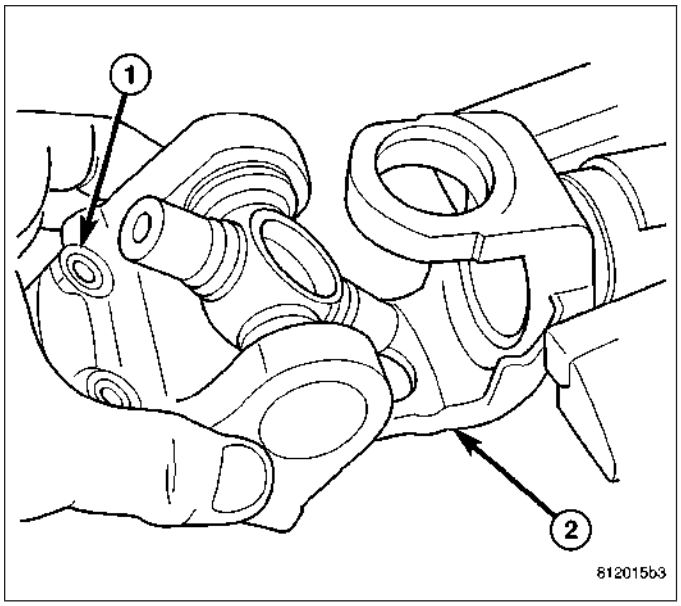
3. Pressed U-joint bearing caps (1) out of shaft yoke (2).



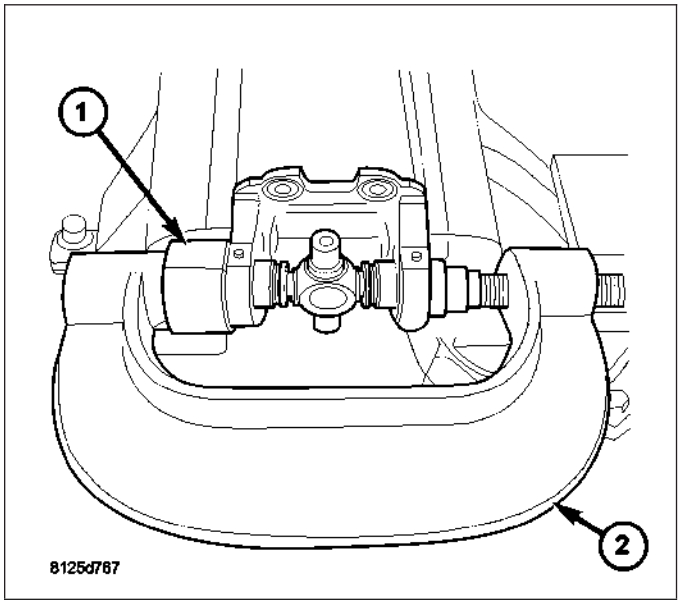
4. Remove lower bearing cap from shaft yoke.
5. Turn shaft over and position press (1) with receiver (2) on shaft yoke.



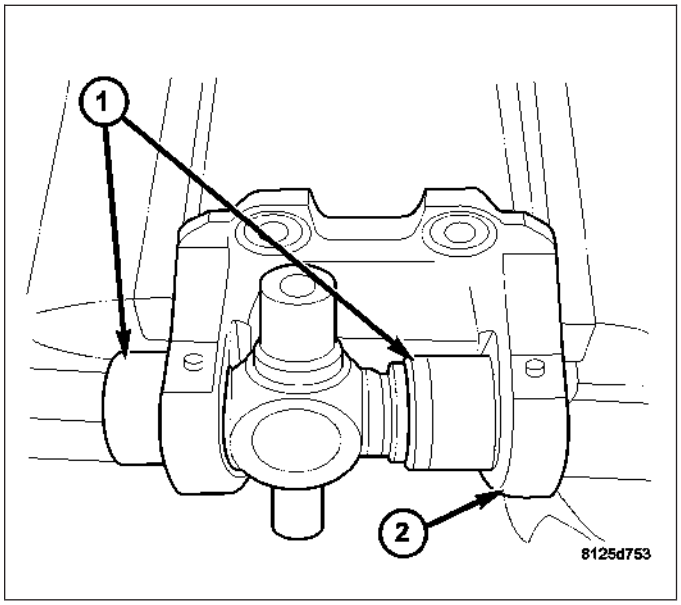
6. Press remaining U-joint bearing cap out of shaft yoke.
7. Remove flange (1) with U-joint out of shaft yoke (2).



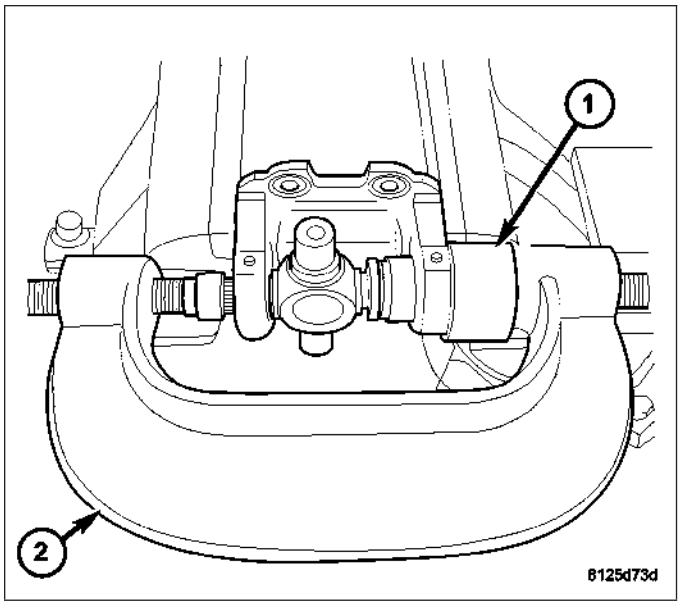
8. Position U-joint press (2) with receiver (1) on flange.



9. Press U-joint bearing caps (1) out of flange (2).



10. Remove bearing cap on the outside of the flange.
11. Position U-joint press (2) with receiver (1) on flange.
12. Press remaining U-joint bearing cap out of flange.
13. Remove U-joint from flange.

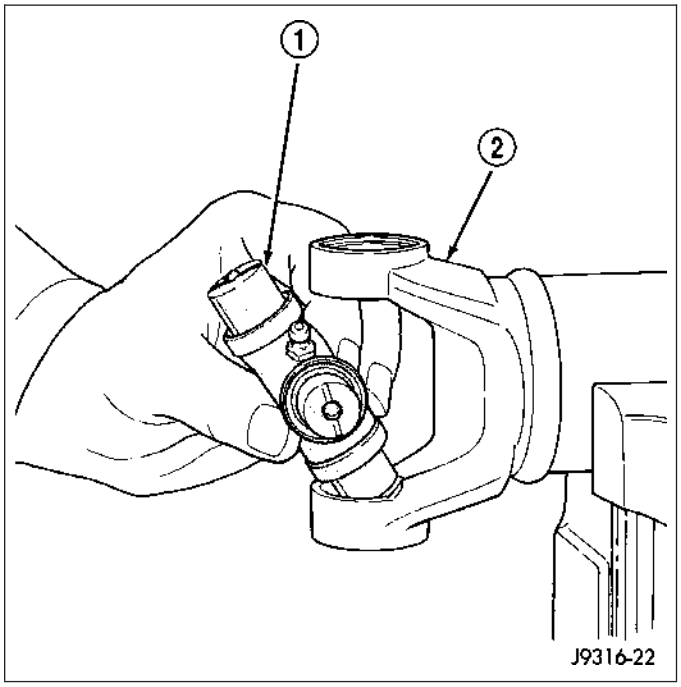


ASSEMBLY

ASSEMBLY - WITH SNAP RINGS

NOTE: This procedure describes a propeller shaft equipped a cardan joint in the tube yoke. For propeller shafts equipped with a companion/slip yoke, repeat the steps to remove the remaining cardan joint.

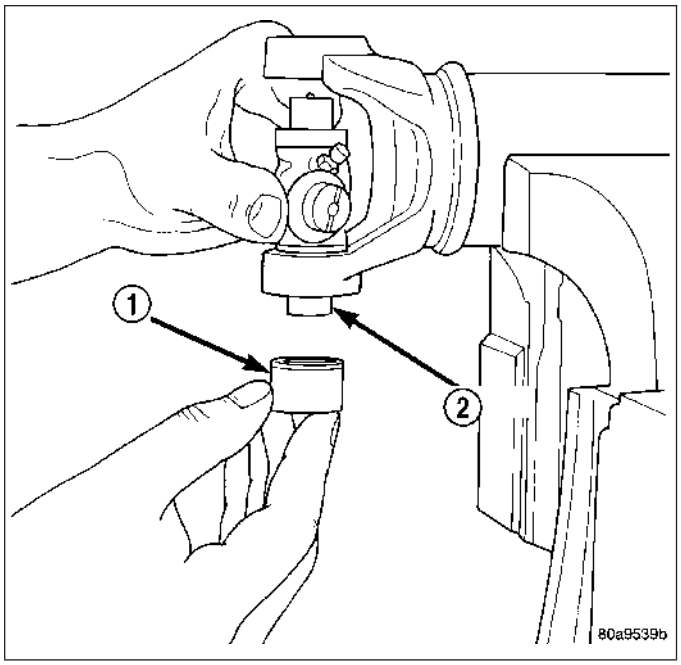
1. Apply (EP) N.L.G.I. Grade 1 or 2 grease to inside of yoke bores.
2. Position cross (1) in yoke with lube fitting pointing up, if equipped.



3. Place a bearing cap (1) over the cross end (2) and align cap with yoke bore.
4. Press bearing cap into the yoke bore enough to clear snap ring groove.
5. Repeat Step 3 and Step 4 to install the opposite bearing cap.

NOTE: If joint is stiff or binding, strike the yoke with a soft hammer to seat the needle bearings.

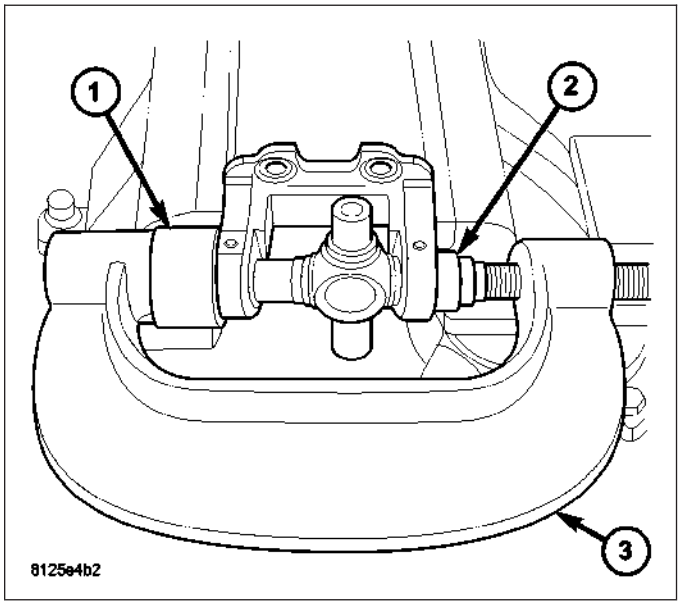
6. Add grease to lube fitting, if equipped.



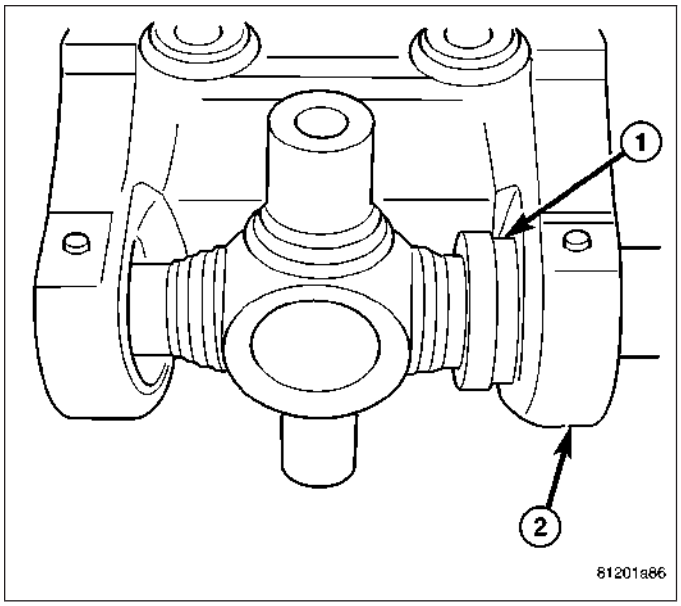
ASSEMBLY - WITH INJECTED RINGS

NOTE: Replacement joint has internal snap rings.

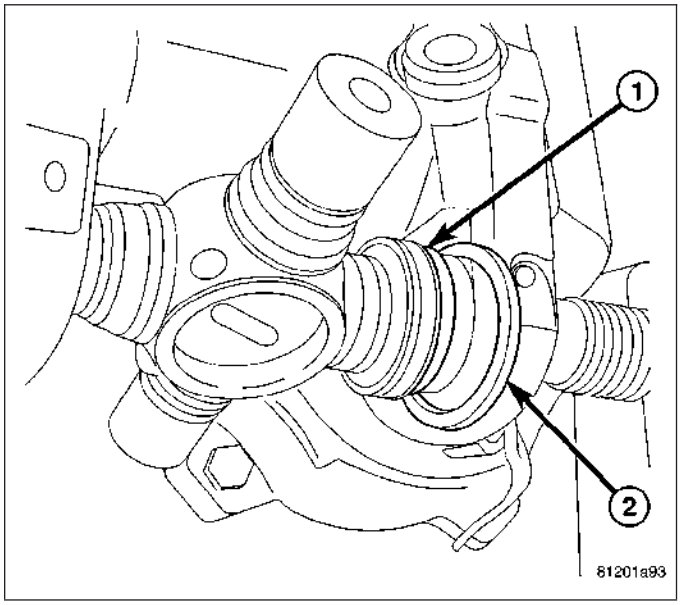
1. Place joint in flange with one bearing cap.
2. Position press (3) with receiver (1) on flange and bearing cap (2).



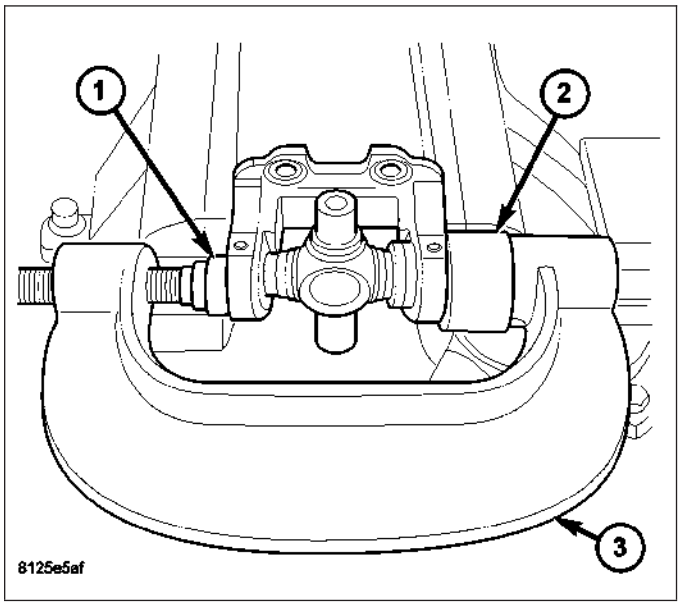
3. Press bearing cap until snap ring groove (1) is through the flange (2).



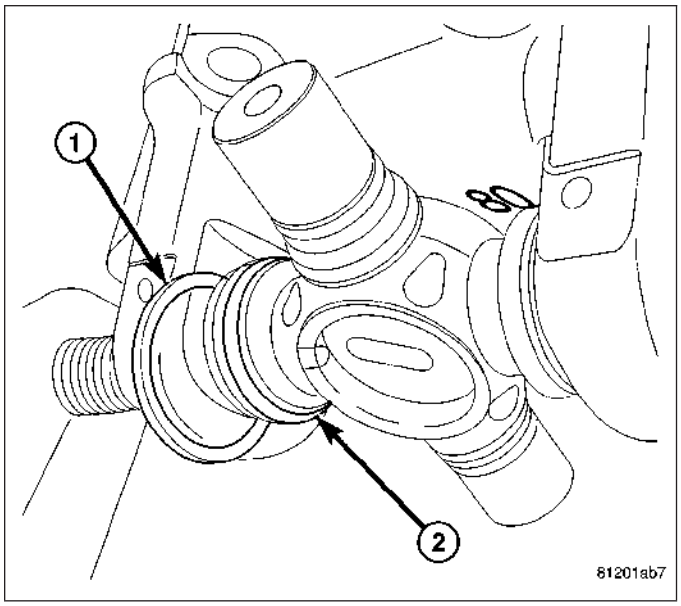
4. Install snap ring (2) on bearing (1).



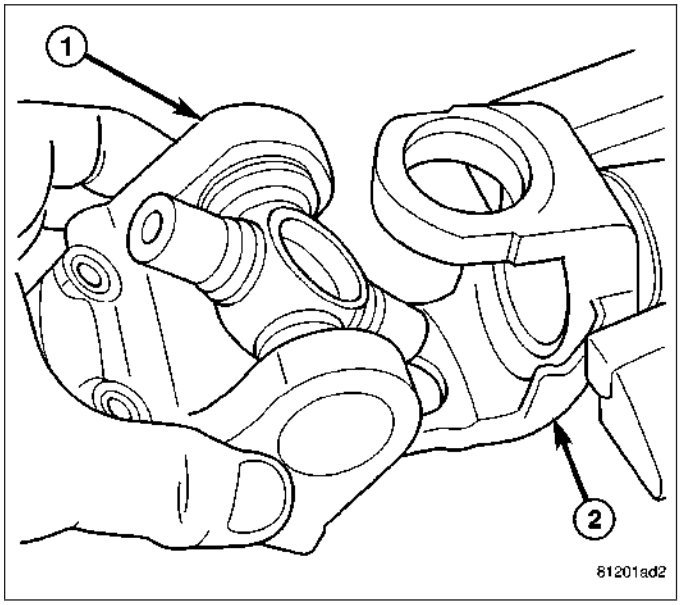
5. Position press (3) with receiver (2) on remaining bearing cap (1) and flange.



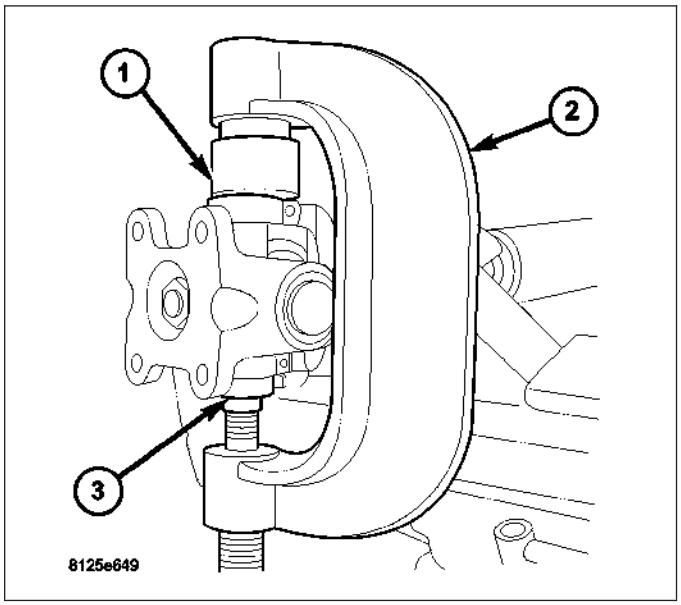
6. Press bearing cap until snap ring groove is through the flange.
7. Install snap ring (1) on bearing cap (2).



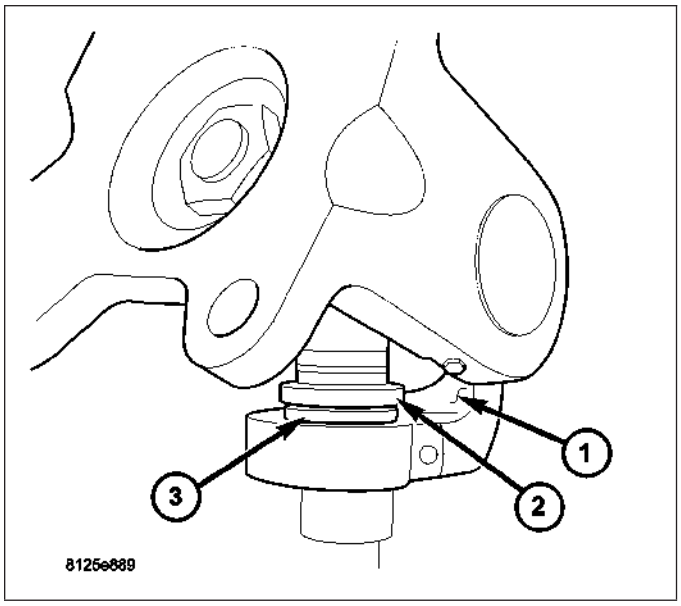
8. Install flange (1) with U-joint in yoke (2).



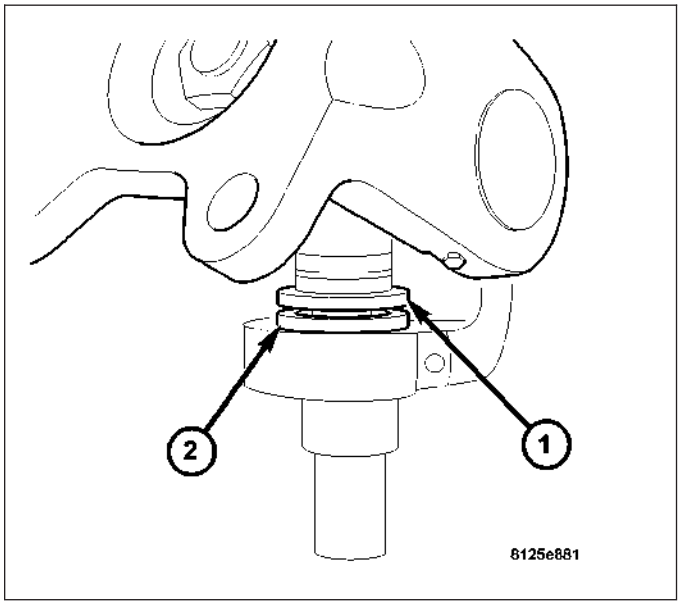
9. Position press (2) with receiver (1) and lower bearing cap (3) on yoke.



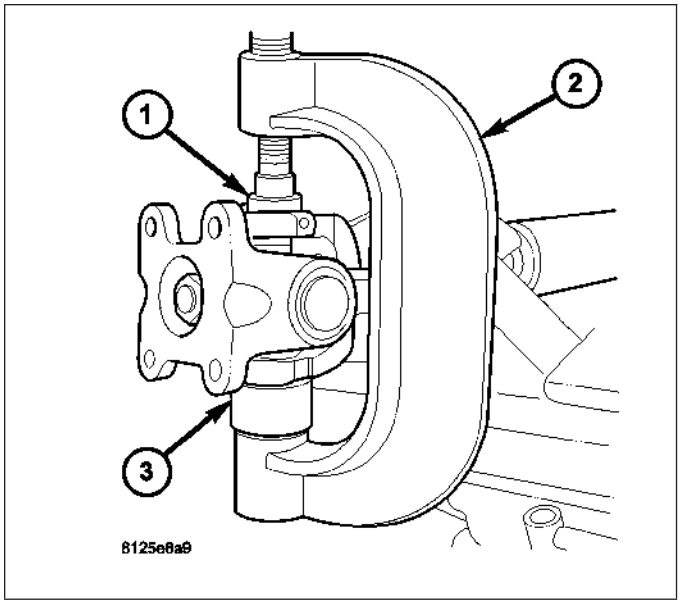
10. Press bearing cap until snap ring groove is through the yoke.



11. Install snap ring (2) on bearing cap (1).



12. Position press (2) with receiver (3) on remaining bearing cap (1) and yoke.



13. Press remaining bearing cap until snap ring groove is through the yoke.
14. Install snap ring (2) on bearing cap (1).

INSTALLATION 29

HALF SHAFT

CAUTION

CAUTION:: Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.
Avoid over angulating or stroking the C/V joints when handling the half shaft.
Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate. Failure to follow these instruction will result in damage.

DIAGNOSIS AND TESTING

HALF SHAFT

Check inboard and outboard C/V joint for leaking grease. This is a sign of boot or boot clamp damage.

NOISE/VIBRATION IN TURNS

A clicking noise or vibration in turns could be caused by a damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss/contamination of the joint grease, resulting in inadequate lubrication of the joint. Noise could also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a damaged or worn C/V joint. A torn boot or loose/missing clamp on the inner/outer joint which has allowed the grease to be lost will damage the C/V joint.

SHUDDER/VIBRATION DURING ACCELERATION

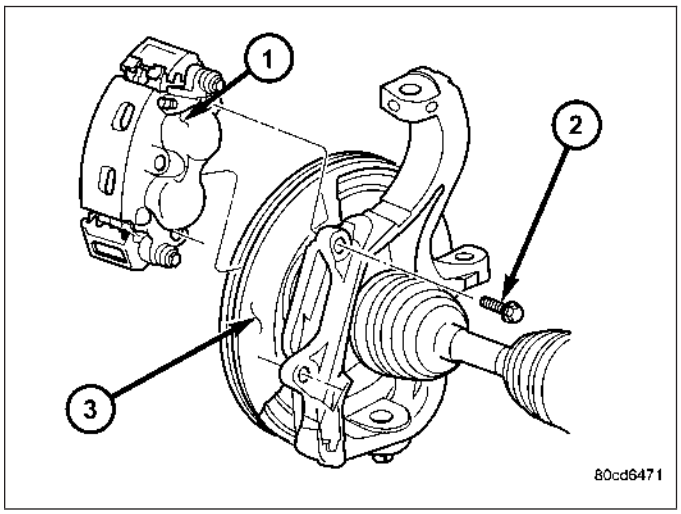
This could be a worn/damaged inner tripod joint or a sticking tripod joint. Improper wheel alignment may also cause a shudder or vibration.

VIBRATION AT HIGHWAY SPEEDS

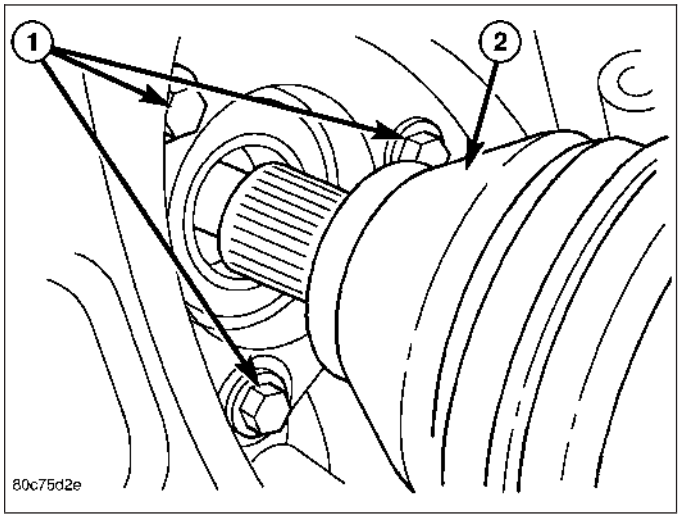
This problem could be a result of out of balance front tires or tire/wheel runout. Foreign material (mud, etc.) packed on the backside of the wheel(s) will also cause a vibration.

REMOVAL

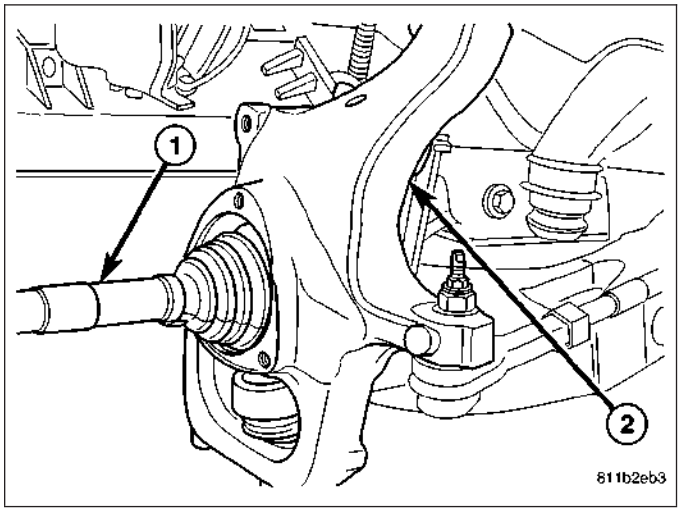
1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate, if equipped.
3. Remove hub nut from the half shaft.
4. Remove brake caliper (1) and rotor (3).



5. Remove wheel speed sensor if equipped.
6. Remove hub bearing bolts (1) from the knuckle.

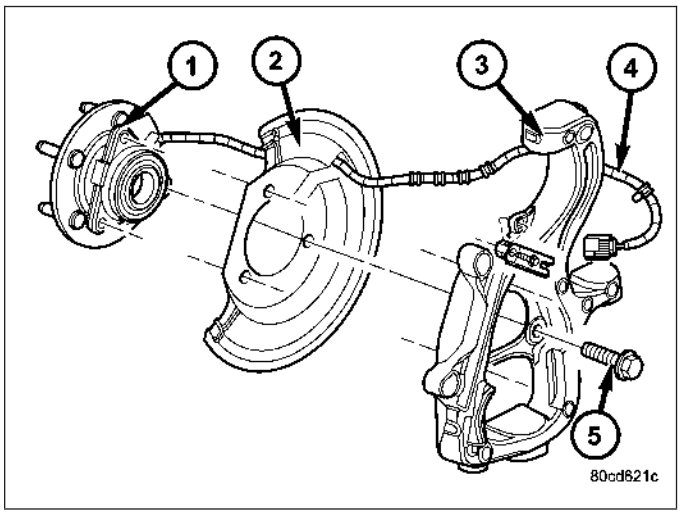


7. Remove hub bearing and brake shield from knuckle.
8. Support half shaft at the C/V joint housings.
9. Position two pry bars behind the inner C/V housing and disengage the C/V joint from the axle.
10. Remove half shaft (1) from vehicle.



INSTALLATION

1. Apply a light coating of wheel bearing grease on the axle splines.
2. Insert half shaft into steering knuckle and onto the axle. Verify shaft snap-ring engages with the groove on the inside of the joint housing.
3. Clean hub bearing bore and hub bearing mating surface. Lightly coat mating surfaces with grease.
4. Install hub bearing (1) onto the axle half shaft and into steering knuckle (3). Tighten hub bearing bolts to 163 N·m (120 ft. lbs.).



5. Install wheel speed sensor, if equipped.
6. Install brake rotor (3) and caliper adapter with caliper (1).
7. Install half shaft nut. Apply brakes and tighten shaft nut to 251 N·m (185 ft. lbs.).
8. Install skid plate, if equipped.

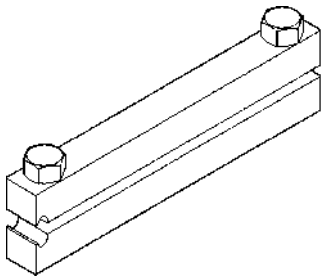
SPECIAL TOOLS



CLAMP INSTALLER C-4975A

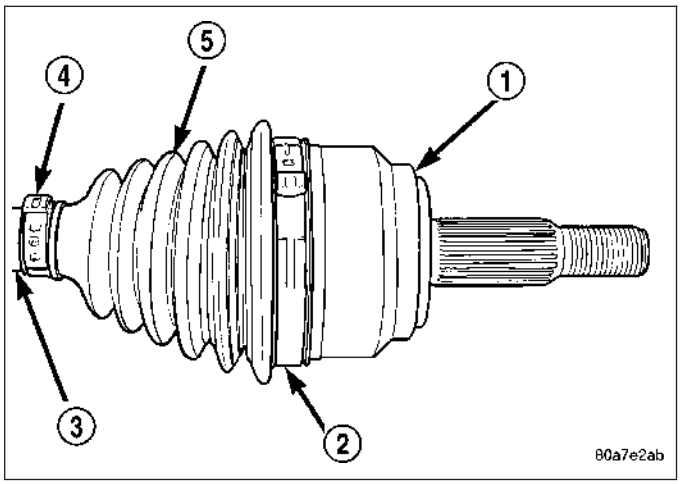
C/V JOINT/BOOT-OUTER

REMOVAL

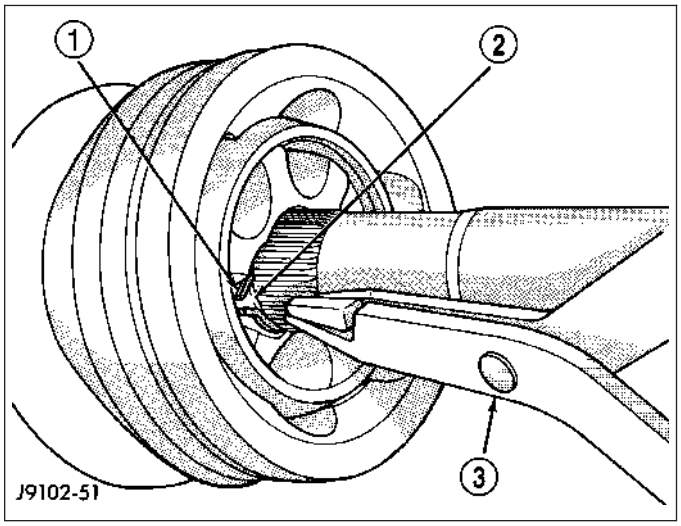
1. Place shaft in vise with soft jaws and support C/V joint.

CAUTION: Do not damage C/V housing or half shaft.

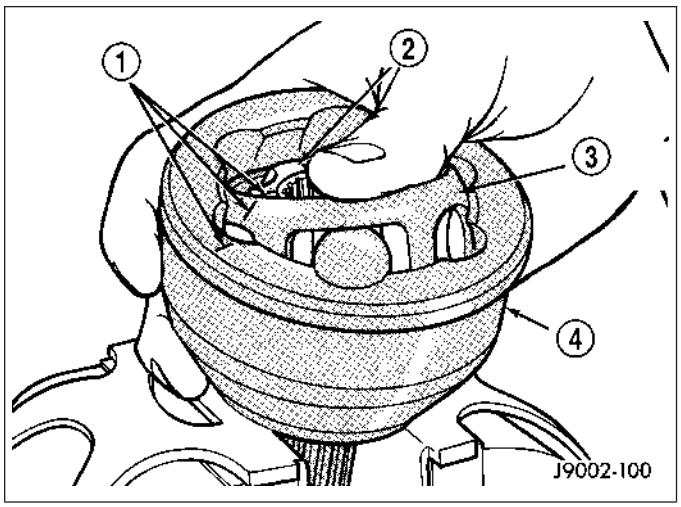
2. Remove clamps (2) (4) with a cut-off wheel or grinder.



3. Slide the boot down the shaft.
4. Remove lubricant to expose the C/V joint snap ring.
5. Spread snap ring (1) and slide the joint off the shaft.



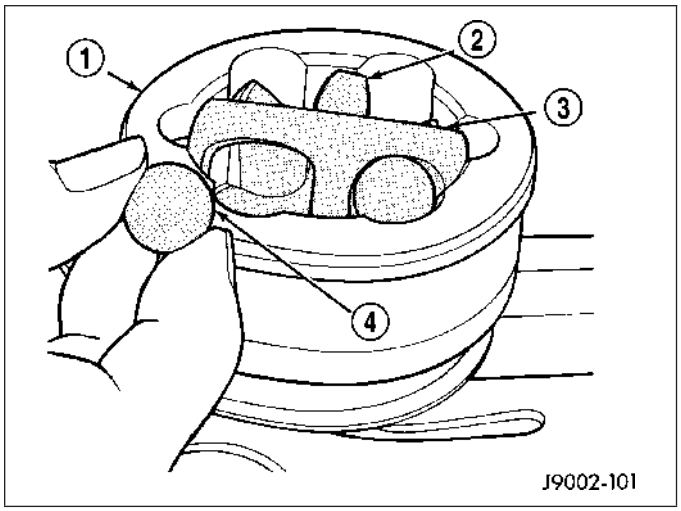
6. Slide boot off the shaft and discard old boot.
7. Mark alignment marks (1) on the inner race/hub (2), bearing cage (3) and housing with dabs of paint.



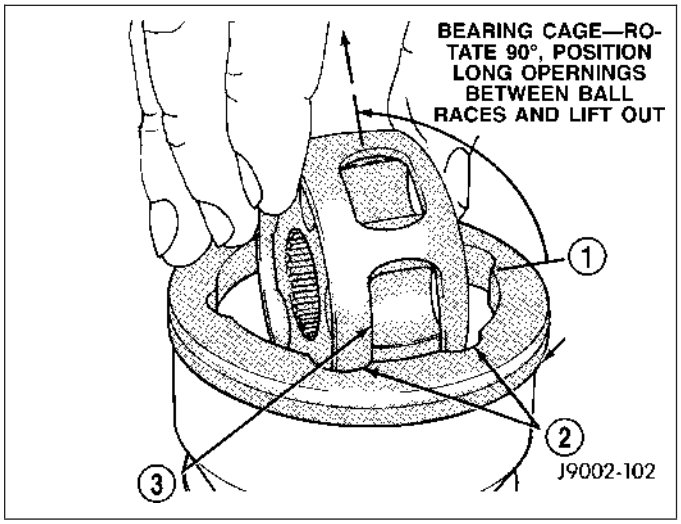
8. Clamp C/V joint in a vertical position in a soft jawed vise.
9. Press down one side of the bearing cage (3) to gain access to the ball at the opposite side.

NOTE: If joint is tight, use a hammer and brass drift to loosen the bearing hub. Do not contact the bearing cage with the drift.

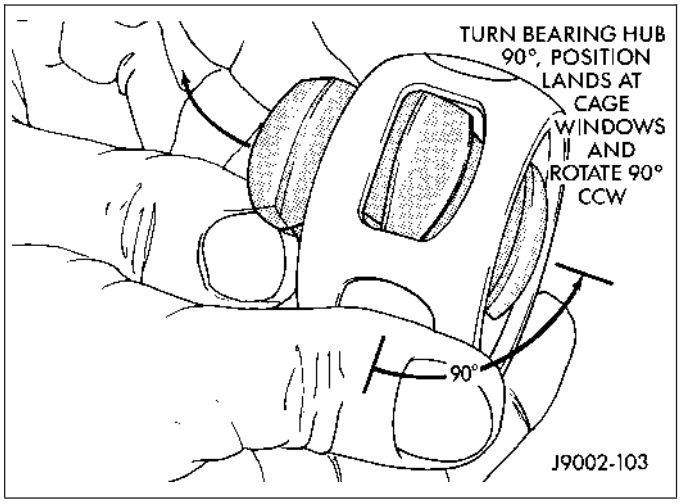
10. Remove ball (4) from the bearing cage (3).



11. Repeat step above until all six balls are removed from the bearing cage.
12. Lift cage and inner race (2) upward and out from the housing (1).

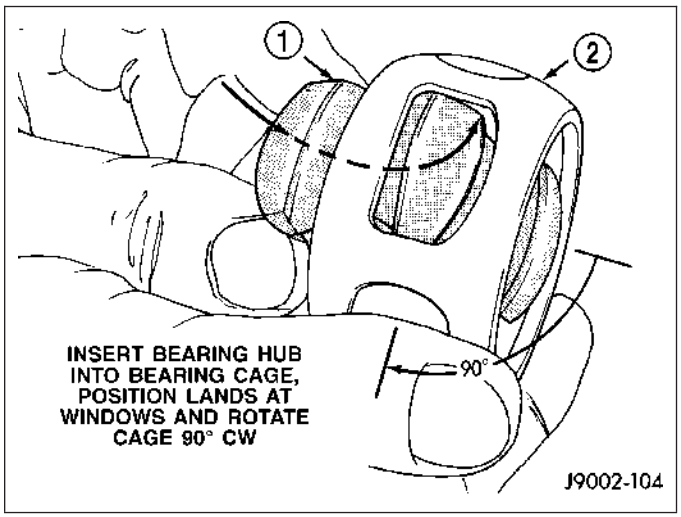


13. Turn inner race 90° in the cage and rotate the inner race/hub out of the cage.

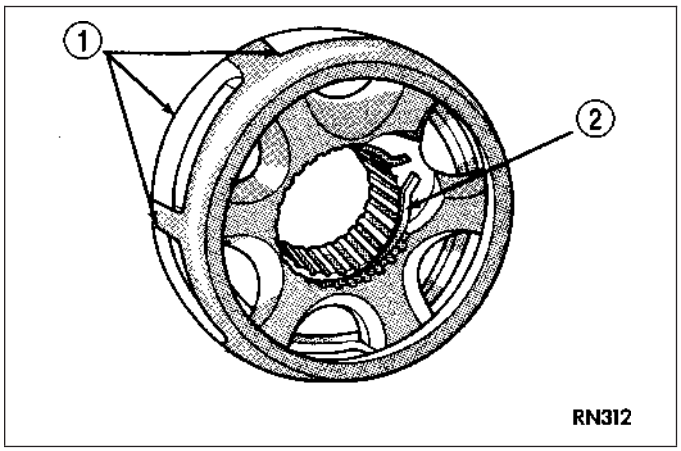


INSTALLATION

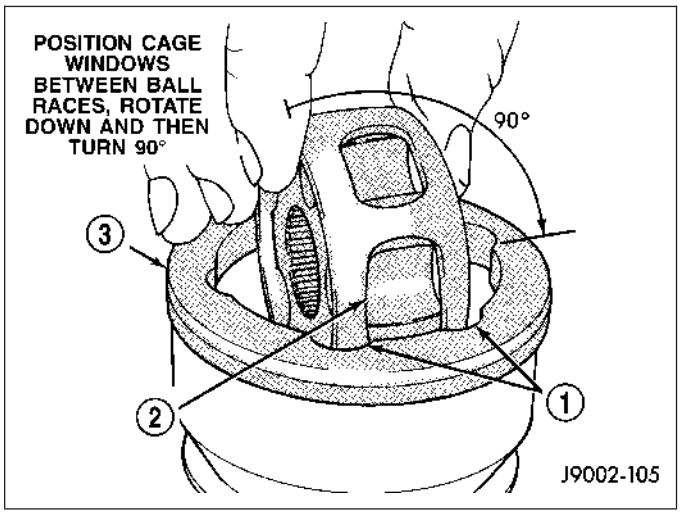
1. Apply a light coat of grease to the C/V joint components before assembling them.
2. Align inner race, cage and housing according to the alignment reference marks.
3. Insert inner race (1) into the cage (2) and rotate race into the cage.



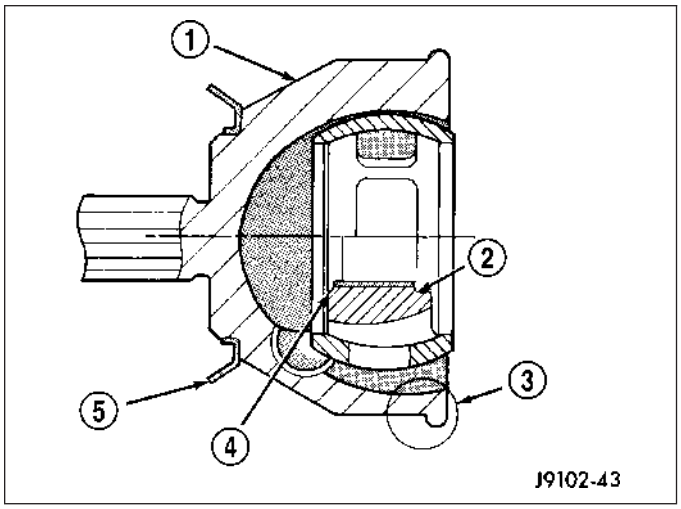
4. Rotate inner race/hub in the cage (1).



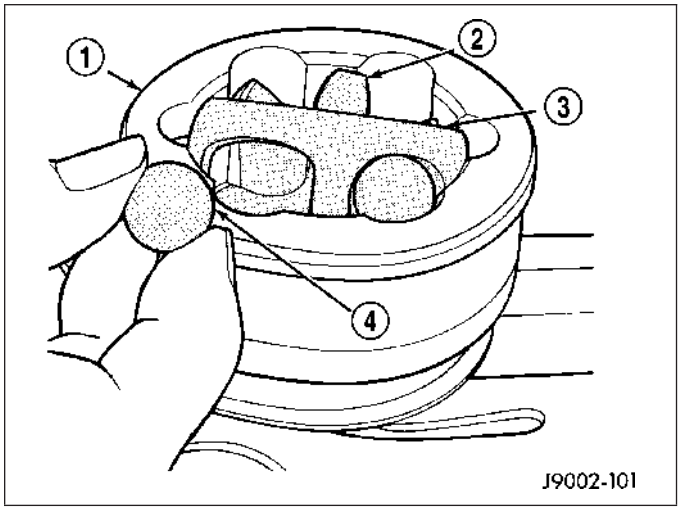
5. Insert cage into the housing (3).



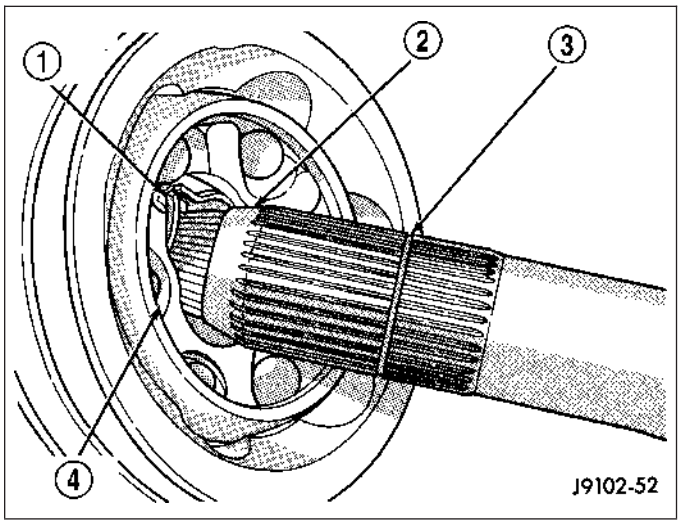
6. Rotate cage 90° into the housing (1).



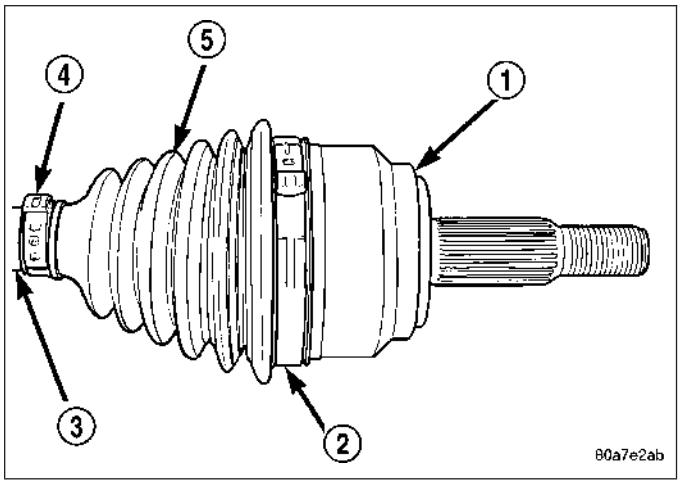
7. Apply lubricant included with replacement boot/joint to the ball races. Spread lubricant equally between all the races.
8. Tilt inner race/hub (2) and cage (3) and install the balls (4).



9. Place new clamps onto new boot and slide boot onto the shaft to it's original position.
10. Apply the rest of lubricant to the C/V joint and boot.
11. Push the joint onto the shaft until the snap ring (1) seats in the groove (3). Pull on the joint to verify the span ring has engaged.



12. Position boot on the joint in it's original position. Ensure boot is not twisted and remove any excess air.
13. Secure both boot clamps (2) (4) with Clamp Installer C-4975A. Place tool on clamp bridge and tighten tool until the jaws of the tool are closed.

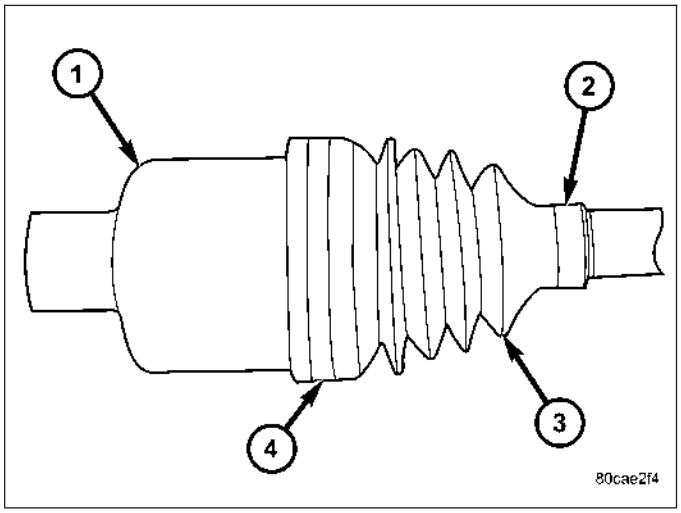


C/V JOINT/BOOT-INNER

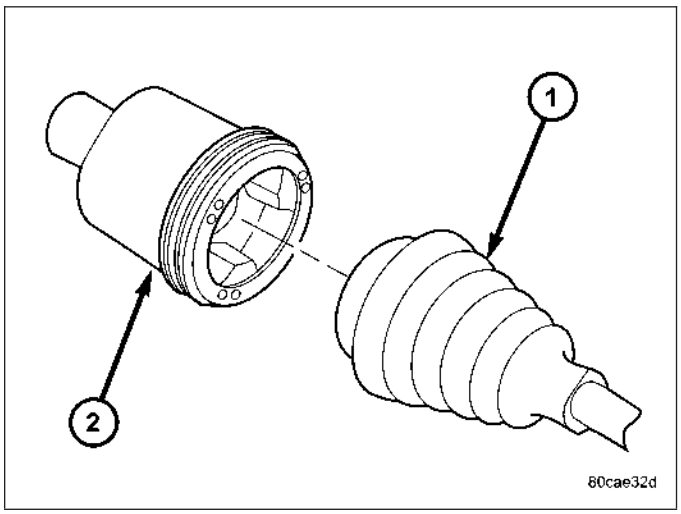
REMOVAL

1. Place shaft in vise with soft jaws and support C/V joint.
2. Remove clamps (2) (4) with a cut-off wheel or grinder.

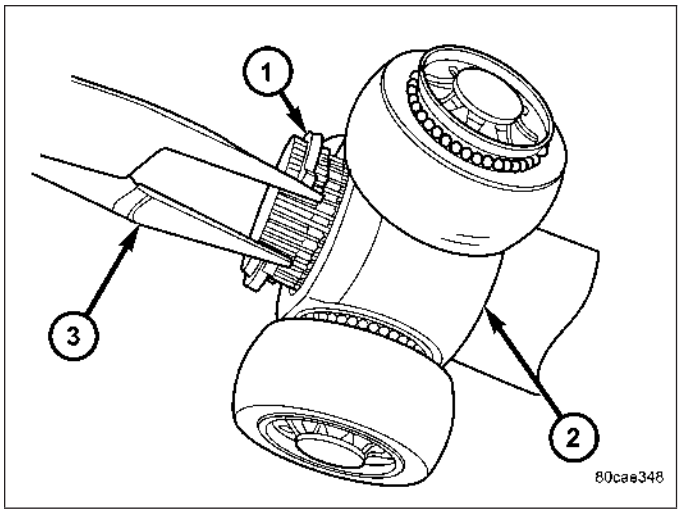
NOTE: Do not damage C/V housing or half shaft with cut-off wheel or grinder.



3. Remove housing (1) from the half shaft and slide boot (2) down shaft.

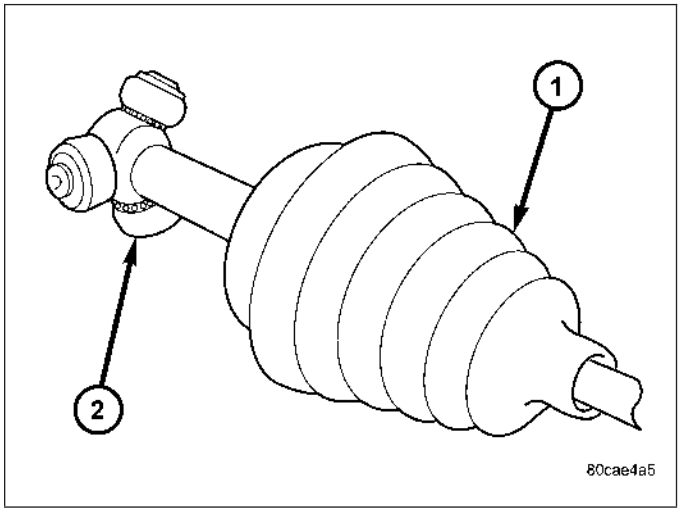


4. Remove housing bushing from the housing.
5. Remove tripod (2) snap ring (1).
6. Remove tripod and boot from the half shaft.
7. Clean and inspect C/V components for excessive wear and damage. Replace the tripod as a unit only if necessary.

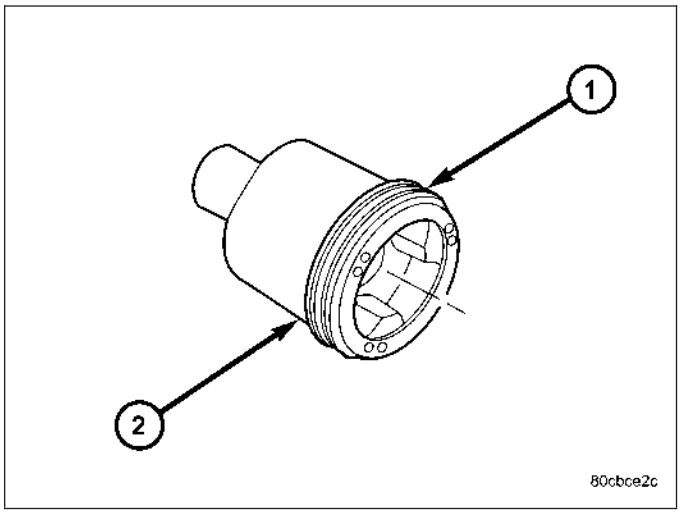


INSTALLATION

1. Slide **new** boot down the half shaft.
2. Install tripod (1) and tripod snap ring on the half shaft.



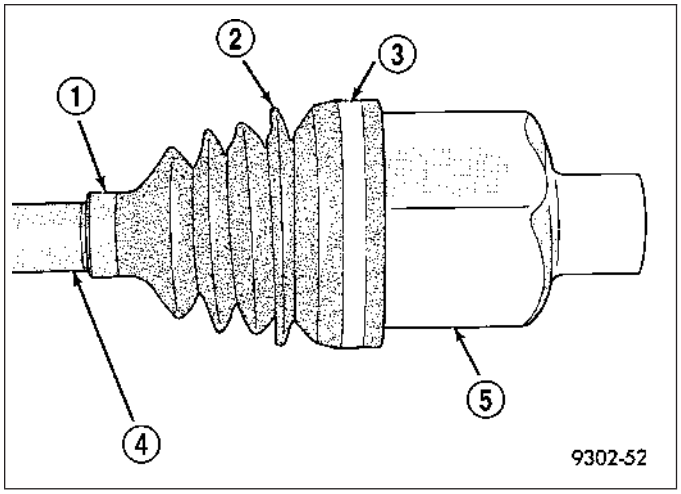
3. Pack grease supplied with the joint/boot into the housing and boot.
4. Coat tripod with supplied grease.
5. Install **new** bushing (2) onto the housing (1).



6. Insert tripod and shaft in the housing.
7. Position boot (2) on the joint in it's original position.

NOTE: Verify boot is not twisted and remove any excess air.

8. Secure both boot clamps with Clamp Installer C-4975A. Place tool on clamp bridge and tighten tool until the jaws of the tool are closed.



FRONT AXLE - C205F

DIAGNOSIS AND TESTING

FRONT AXLE - C205F

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or C/V joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or C/V joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

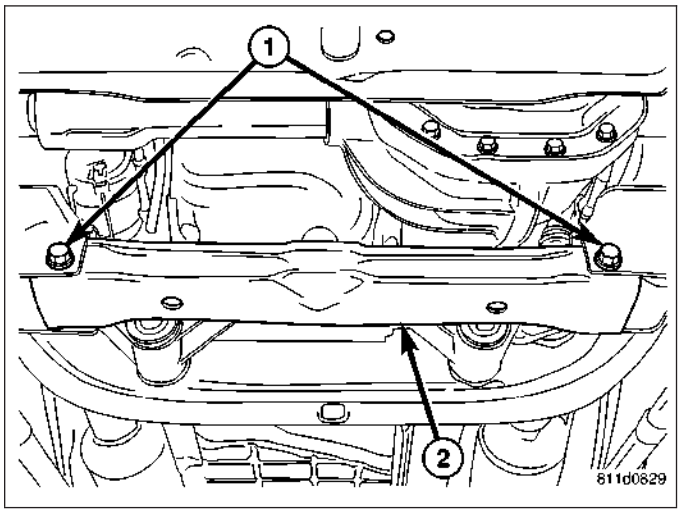
DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
	3. End-play in pinion bearings.	3. Refer to pinion pre-load information and correct as necessary.
	4. Excessive gear backlash between the ring gear and pinion.	4. Check adjustment of the ring gear and pinion backlash. Correct as necessary.
	5. Improper adjustment of pinion gear bearings.	5. Adjust the pinion bearings pre-load.
	6. Loose pinion yoke nut.	6. Tighten the pinion yoke nut.
	7. Scuffed gear tooth contact surfaces.	7. Inspect and replace as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.

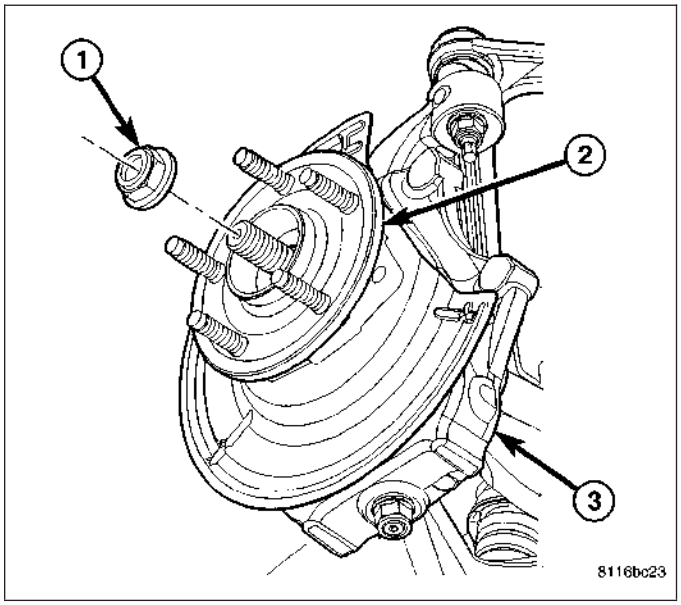
Condition	Possible Causes	Correction
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Re-adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Mis-aligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued tot he proper specification.
	9. Housing not machined properly.	9. Replace housing.

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove the skid plate, if equipped.
3. Remove support crossmember bolts (1) and remove crossmember (2).

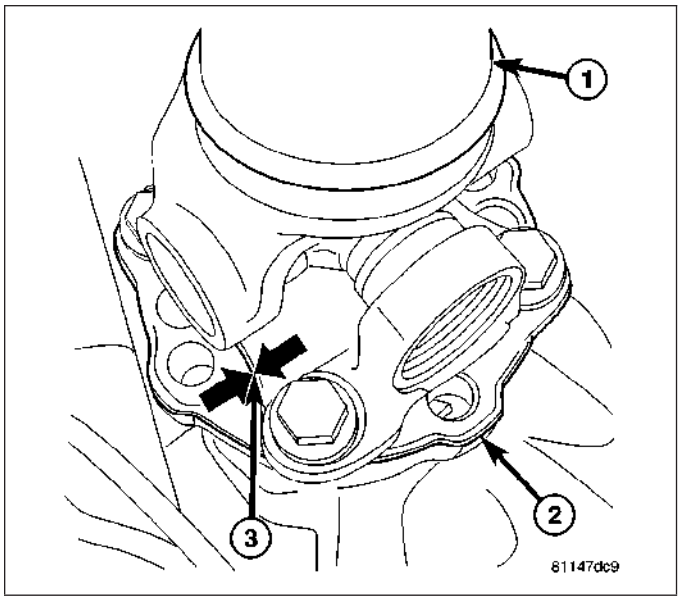


4. Remove brake components.
5. Remove axle hub nut (1).

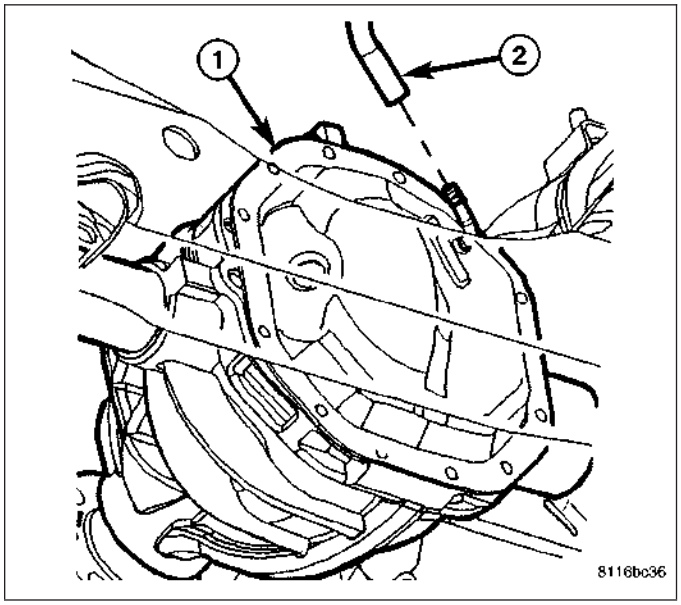


6. Remove hub bearing and brake shield.
7. Remove half shafts.

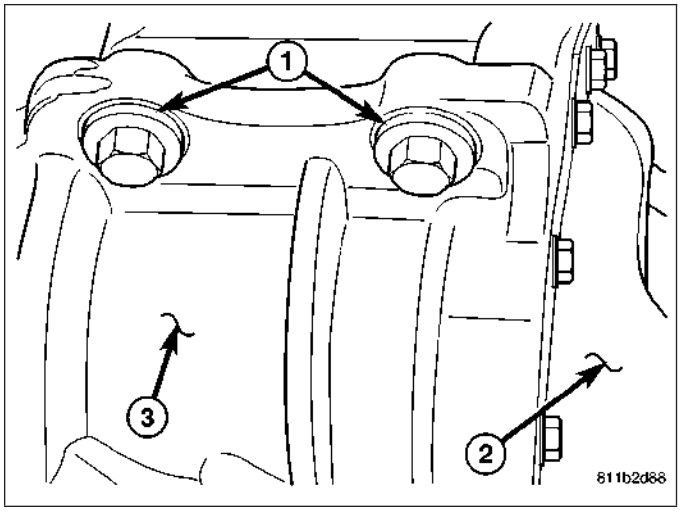
8. Mark propeller shaft (1) and flange (2) for installation reference.



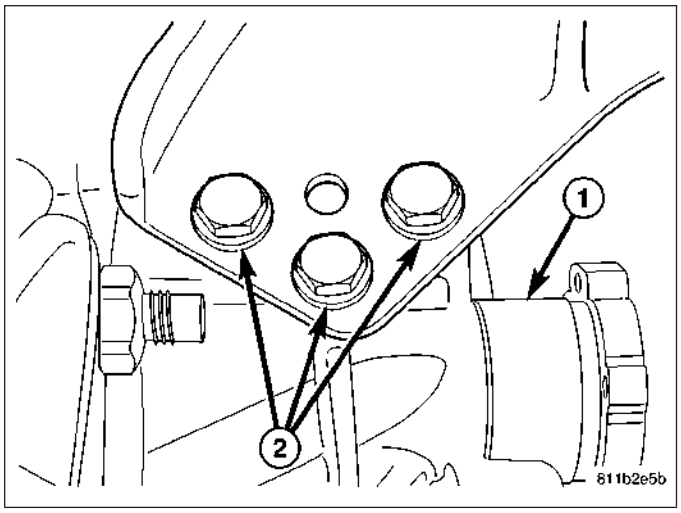
9. Remove propeller shaft.
10. Remove axle vent tube (2) from the differential cover (1).



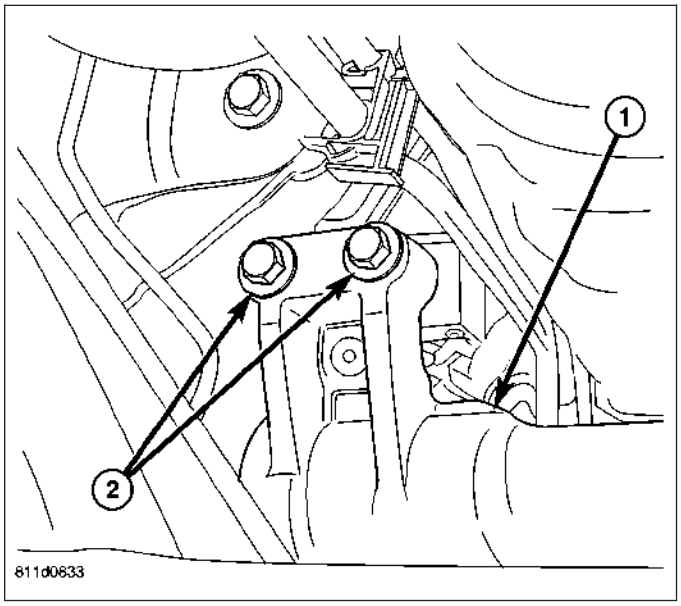
11. Support axle with a jack and secure axle to jack.
12. Remove 2 bolts (1) holding the differential housing (3) to the left engine mount.



13. Remove 3 bolts (2) holding the axle to the pinion nose bracket.



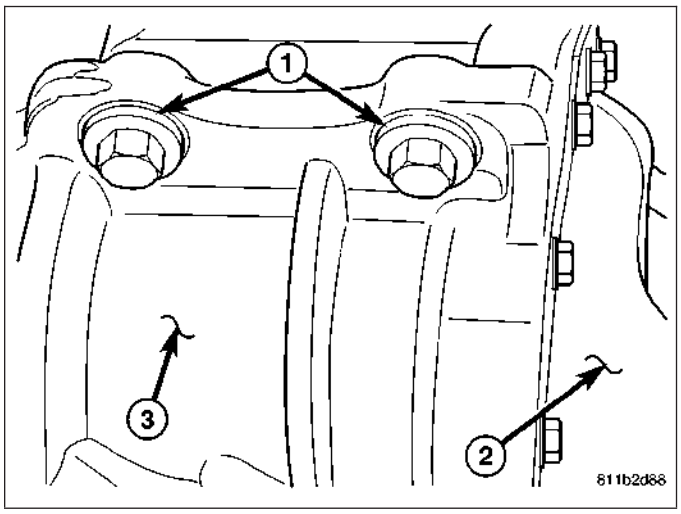
14. Remove 2 bolts (2) holding axle tube (1) to right engine mount.



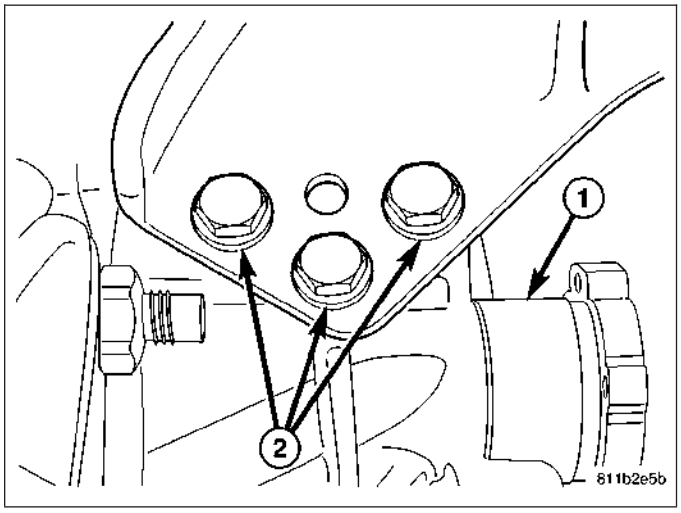
15. Lower axle from vehicle.

INSTALLATION

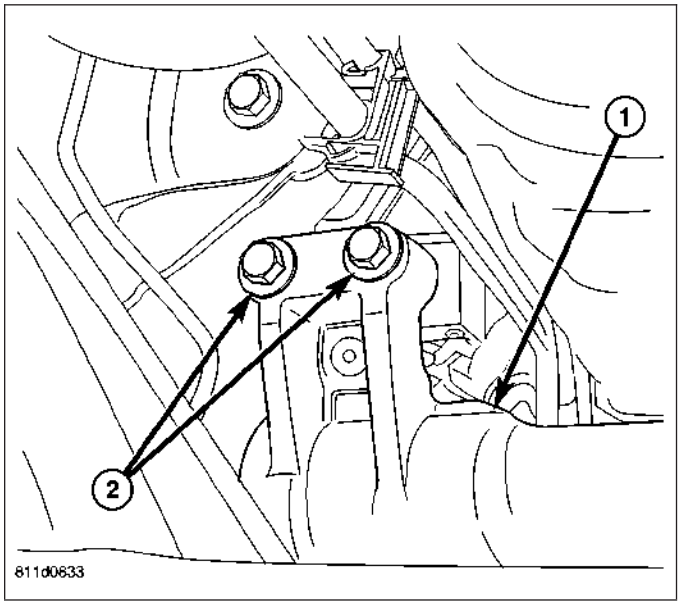
1. Raise axle into position.
2. Loosely install nuts and bolts (1) in engine mount.



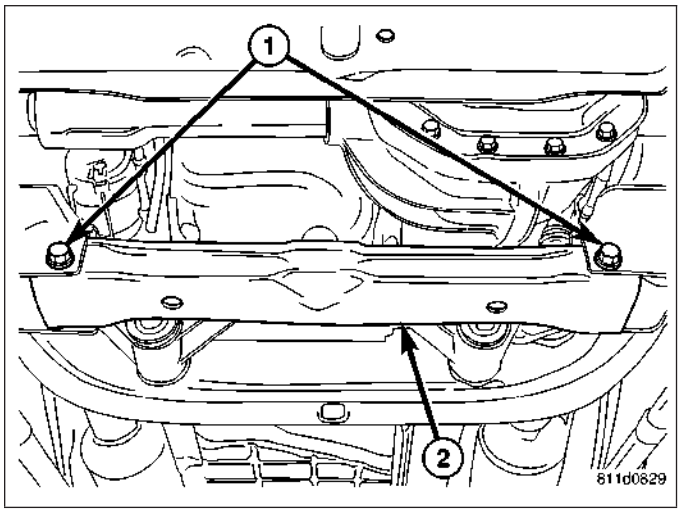
3. Loosely install nuts and bolts (2) in pinion nose bracket.



4. Loosely install bolts (2) in axle tube mount.



5. Tighten all the bolts finger-tight, then tighten all bolts to 95 N·m (70 ft. lbs.).
6. Install the axle vent tube.
7. Install propeller shaft with reference marks aligned.
8. Install half shafts.
9. Install support crossmember (2).
10. Install half shafts.
11. Install hub bearing and brake shield.
12. Install brake components.
13. Install half shafts.
14. Install skid plate, if necessary.

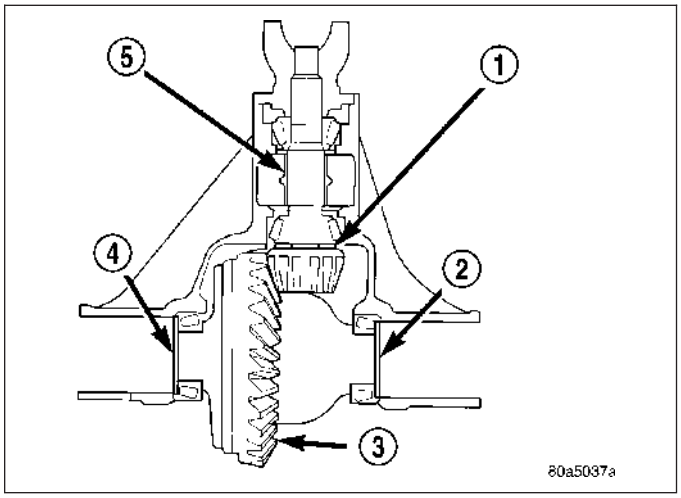


ADJUSTMENTS

FRONT AXLE - C205F

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (–) number or zero (0) along with the gear set sequence number (01 to 99) is on each gear. This first number is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0). The next two numbers are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.

Compensation for pinion depth variance is achieved with select shims (1) located between the rear pinion bearing cone and pinion gear head.



PINION GEAR DEPTH VARIANCE

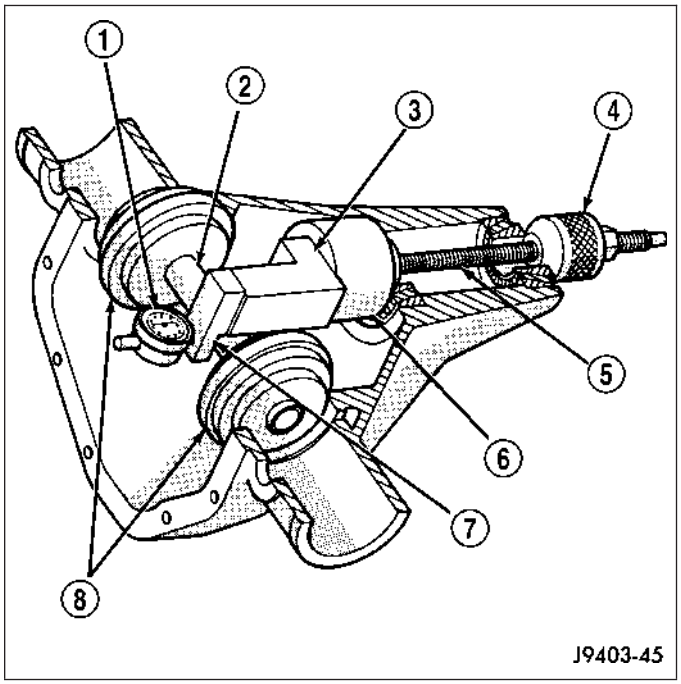
Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	−4	−3	−2	−1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0
+3	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001
+2	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002
+1	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003
0	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004
−1	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005
−2	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006
−3	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006	−0.007
−4	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006	−0.007	−0.008

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

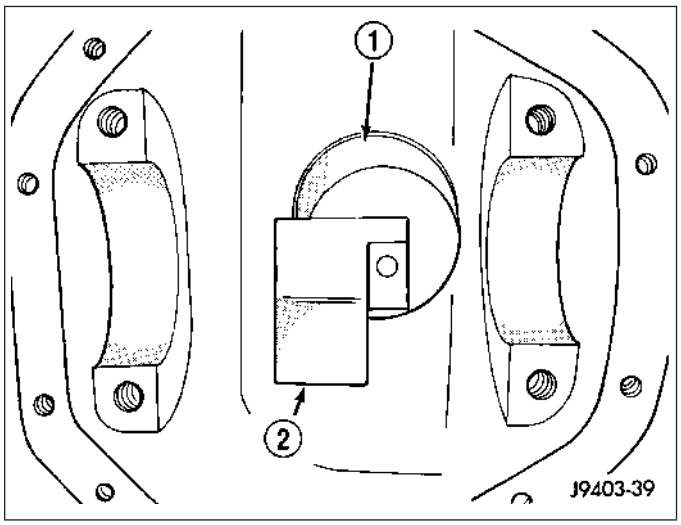
Pinion Gear Depth Variance Chart: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

PINION DEPTH MEASUREMENT AND ADJUSTMENT

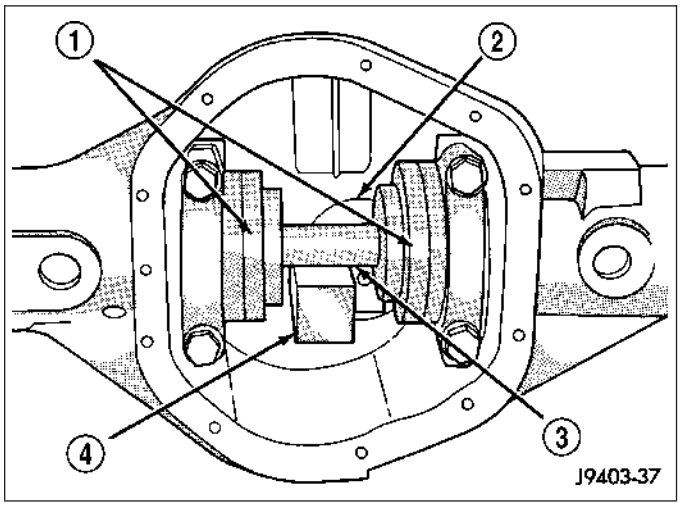
Measurements are taken with pinion cups and pinion bearings installed in housing. Take measurements with a Pinion Gauge Set, Pinion Block 8177 (6) Arbor Discs 8541 (8) and Dial Indicator C-3339.

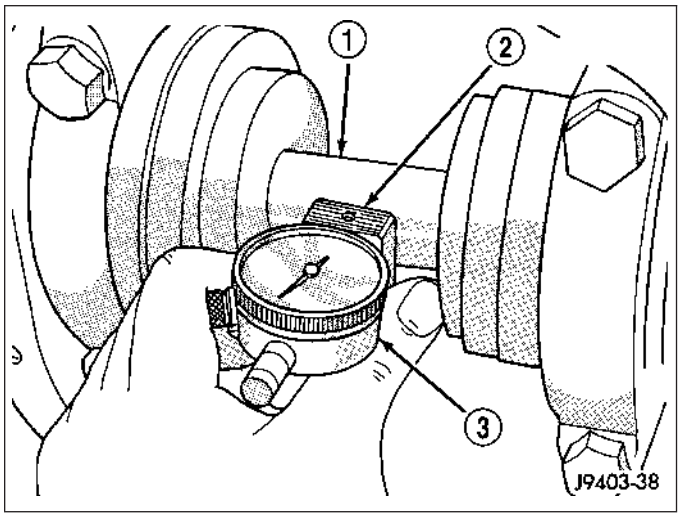


1. Assemble Pinion Height Block 6739 (2) Pinion Block 8177 (1) and rear pinion bearing onto Screw 6741.



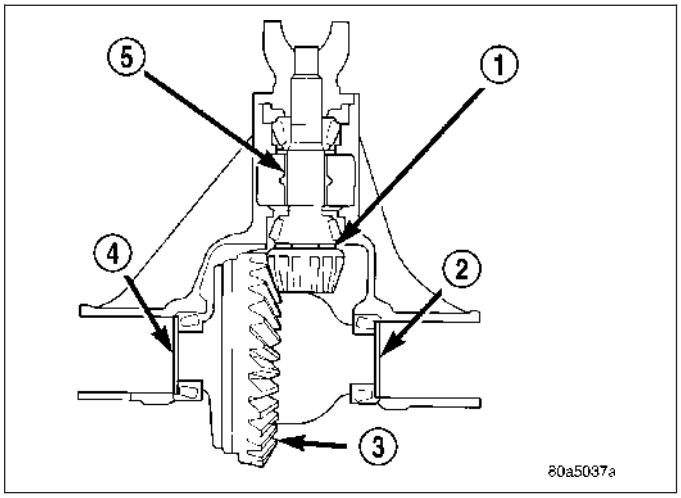
2. Insert assembled height gauge components, rear bearing and screw into the housing through the pinion bearing cups.
3. Install front pinion bearing and Cone-Nut 6740 onto the screw. Tighten cone-nut until Torque To Rotate screw is 1.7 N·m (15 in. lbs.).
4. Place Arbor Discs 8541 (1) on Arbor D-115-3 (1) in position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to specification.





5. Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.
6. Place Scooter Block/Dial Indicator in position in the housing so dial probe and scooter block are flush against the surface of the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slide the dial indicator (3) probe across the gap between the pinion height block and the arbor bar (1) with the scooter block (2) against the pinion height block. Slide the dial probe to the crest of the arbor bar and record the highest reading.
8. Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number marked on the shaft of the pinion gear using the opposite sign on the variance number. For example, if the depth variance is –2, add +0.002 in. to the dial indicator reading.
9. Remove the pinion depth gauge components from the housing.

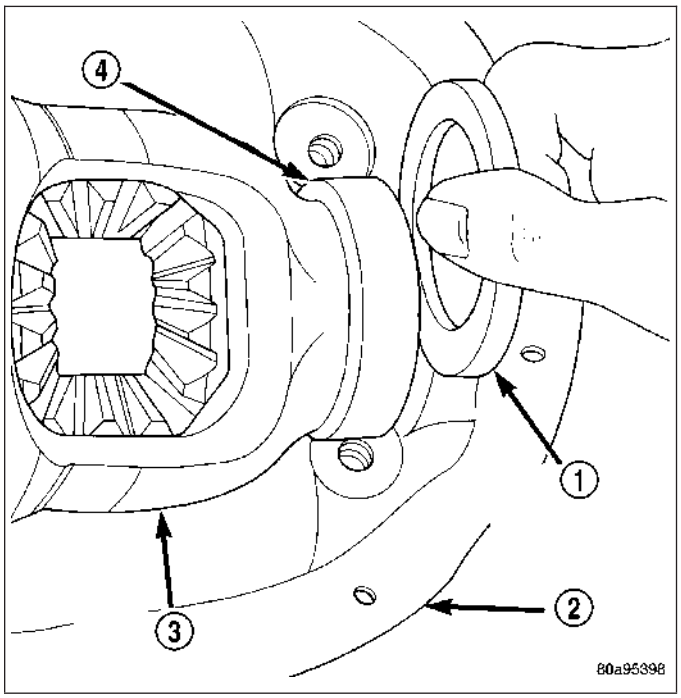
DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH



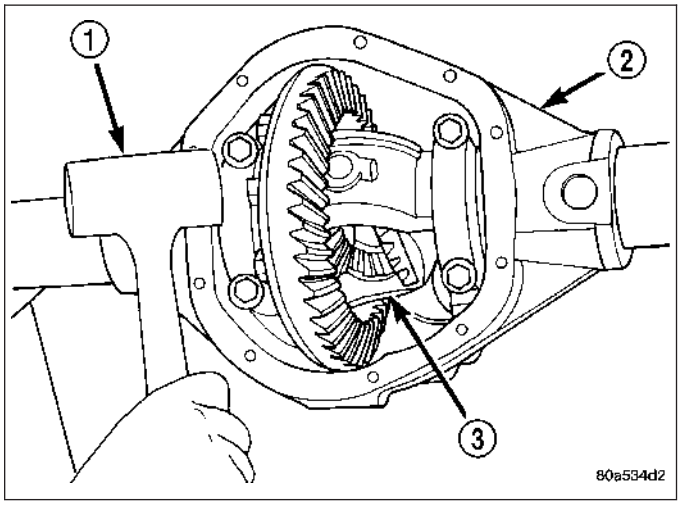
Differential side bearing preload and gear backlash is achieved by selective shims (2) (4) inserted between the bearing cup and the housing. The proper shim thickness can be determined using slip-fit Dummy Bearings 8398 in place of the differential side bearings and a Dial Indicator C-3339. Before measuring differential bearing preload and gear backlash, measure pinion gear depth and prepare pinion for installation. Pinion gear depth is essential to establishing gear backlash and tooth contact patterns. After measuring shim thickness to take up differential side play, install pinion and measure gear backlash shim thickness. Overall shim thickness is the dial indicator reading and preload specification added together. The gear backlash measurement determines the shim thickness used on the ring gear side of the differential case. Subtract gear backlash shim thickness from overall shim thickness to determine shim thickness for pinion gear side of the differential.

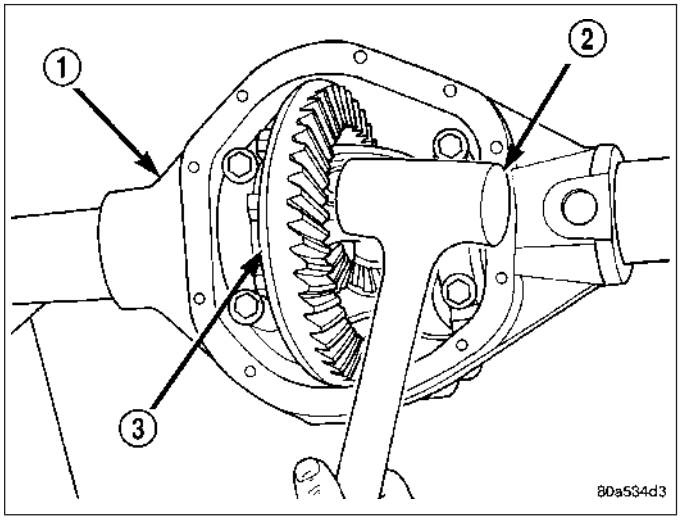
SHIM SELECTION

1. Remove side bearings from differential case.
2. Install ring gear, if necessary, on differential case and tighten bolts to specification.
3. Install Dummy Bearings 8398 on differential case.
4. Install differential case in the housing.
5. Insert Dummy Shims 8107 (1) starting point shims between both dummy bearings (4) and the housing (2).

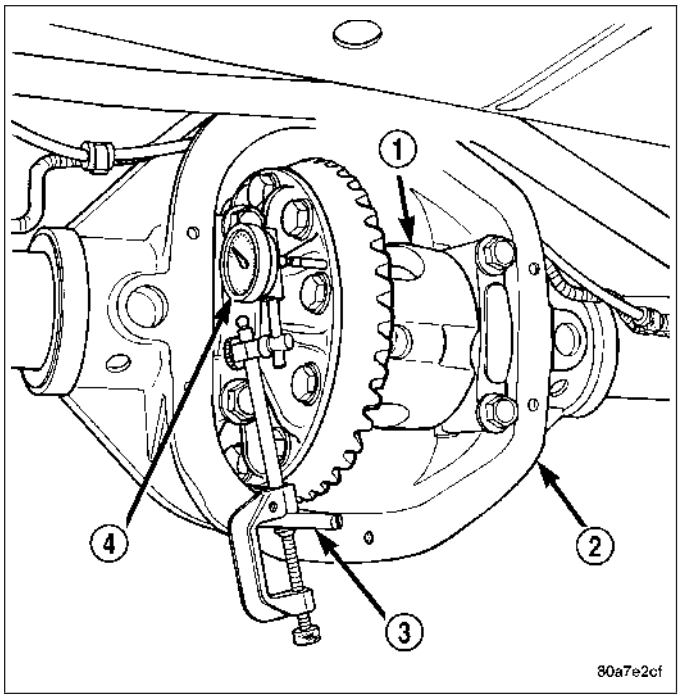


6. Install the marked bearing caps in their correct positions. Install and snug the bolts.
7. Seat differential dummy bearings to each side of the housing (2) (1) with a dead-blow hammer (1) (2).

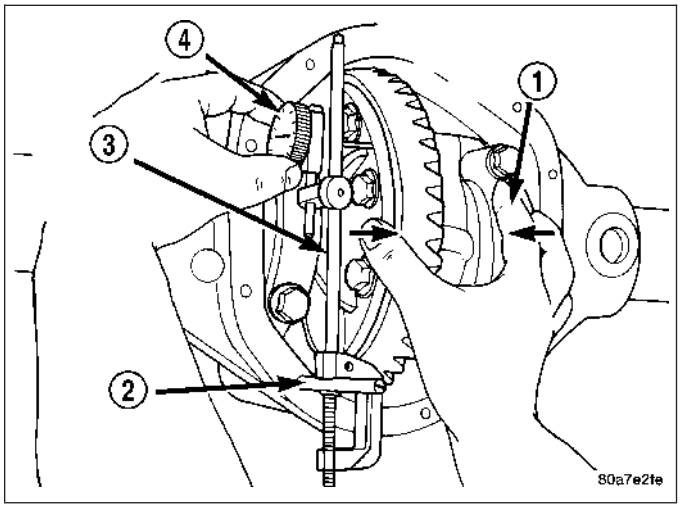




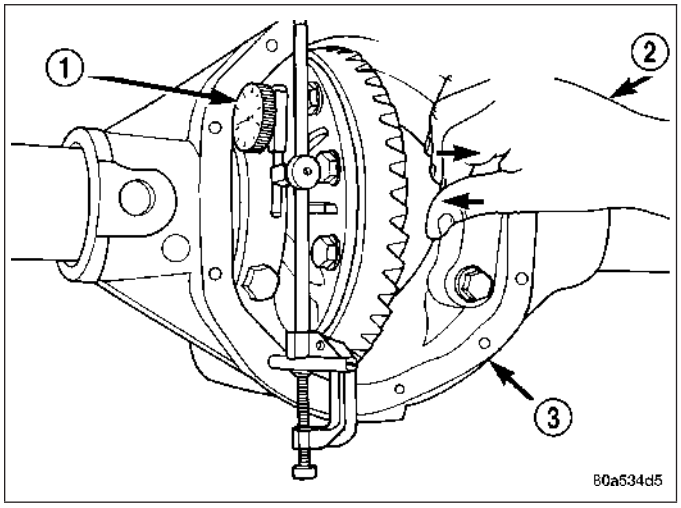
8. Thread Pilot Stud C-3288-B (3) into rear cover bolt hole below ring gear.
9. Attach Dial Indicator C-3339 (4) to post and position dial indicator plunger on a flat surface on a ring gear bolt head.

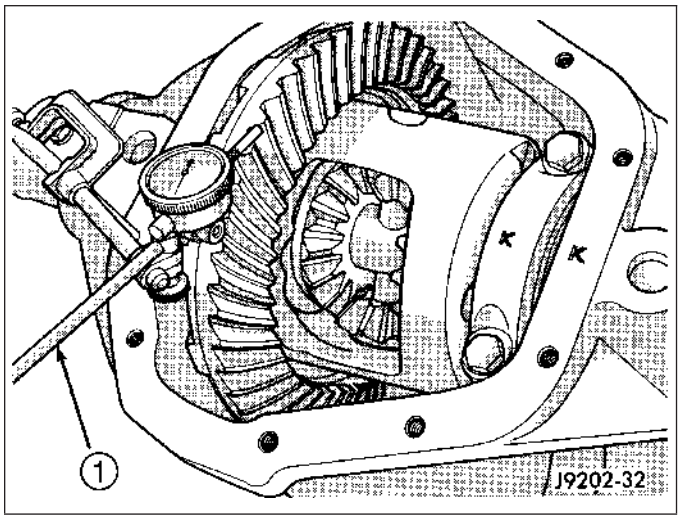


10. Hold differential case firmly to pinion side (1) of axle housing and zero dial indicator (4).



11. Hold differential case firmly (2) to the ring gear side and record dial (1) indicator reading.

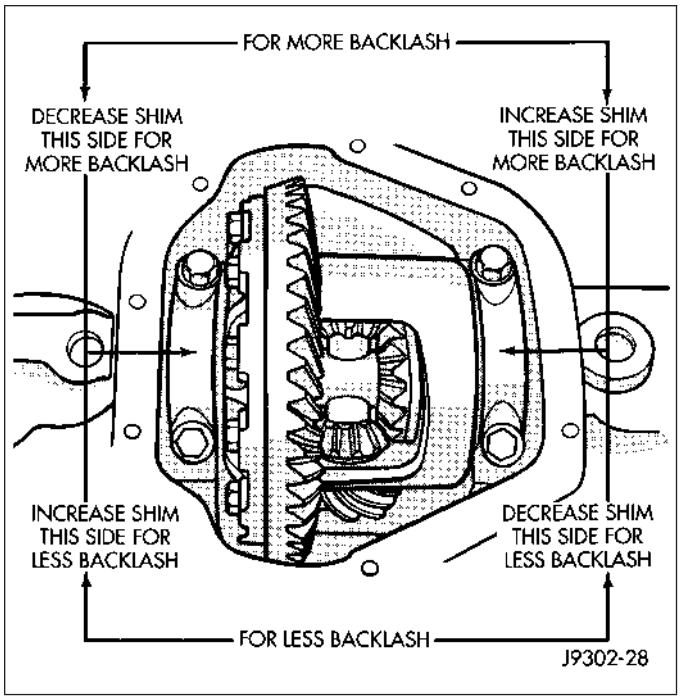




12. Add the dial indicator reading to the starting point shim thicknesses to determine the total shim thickness necessary to achieve zero differential end play.
13. Add 0.2 mm (0.008 in) to the zero end play total. This new total represents the thickness of shims necessary to compress, or preload the new bearings when the differential is installed.
14. Rotate dial indicator out of the way on pilot stud.
15. Remove differential case, dummy bearings, and starting point shims from the housing.
16. Install the pinion in the axle housing. Install the companion flange and establish the correct pinion rotating torque.
17. Install differential case and Dummy Bearings in axle housing with a single dummy shim on the ring gear side of the axle and tighten retaining cap bolts.
18. Position the dial indicator plunger on a flat surface between the ring gear bolt heads.
19. Push and hold differential case toward pinion.
20. Zero dial indicator face to pointer.
21. Push and hold differential case to ring gear side of the housing.
22. Record dial indicator reading.
23. Subtract 0.05 mm (0.002 in.) from the dial indicator reading to compensate for backlash between ring and pinion gears. Add the resulting measurement to the thickness of the single starting point shim. This total is the thickness of shim required to achieve proper backlash.
24. Subtract the backlash shim thickness from the total preload shim thickness. The remainder is the shim thickness required on the pinion side of the axle housing.
25. Rotate dial indicator out of the way on pilot stud.
26. Remove differential case, dummy bearings and dummy shim from the housing.
27. Install new side bearing cones and cups on differential case.
28. Install Spreader W-129-B and Adapter Plates 8142-A on the housing and spread open enough to receive differential case.
29. Place the side bearing shims in the differential housing against the housing shoulder.
30. Install the differential case in the housing.
31. Rotate the differential case several times to seat the side bearings.
32. Position the dial indicator (1) plunger against a ring gear tooth.
33. Push and hold ring gear upward while not allowing the pinion gear to rotate.
34. Zero dial indicator face to pointer.

35. Push and hold ring gear downward while not allowing the pinion gear to rotate. Dial indicator reading should be between 0.12 mm (0.005 in.) and 0.20 mm (0.008 in.). If backlash is not within specifications transfer the necessary amount of shim thickness from one side of the differential housing to the other.
36. Verify differential case and ring gear runout by measuring ring to pinion gear backlash at eight locations around the ring gear. Readings should not vary more than 0.05 mm (0.002 in.). If readings vary more than specified, the ring gear or the differential case is defective.

After the proper backlash is achieved, perform the Gear Contact Pattern procedure.

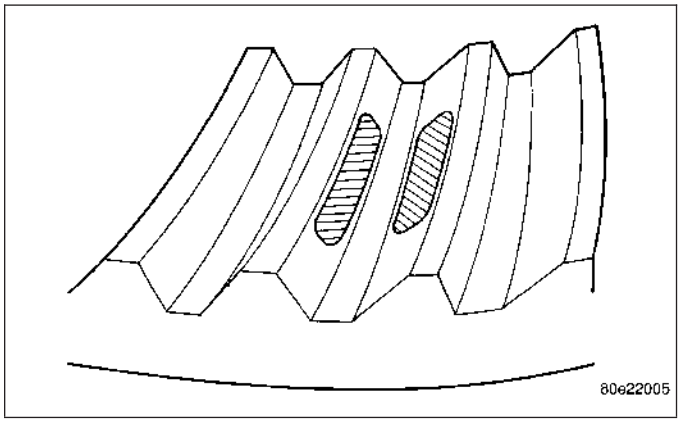


GEAR CONTACT PATTERN

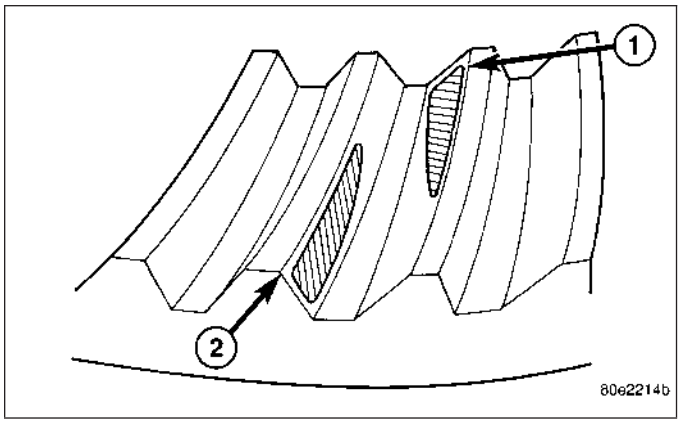
Gear tooth contact pattern is used to verify the correct running position of the ring and pinion gears. This will produce low noise and long gear life. Gears which are not positioned properly may be noisy and have shorten gear life.

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

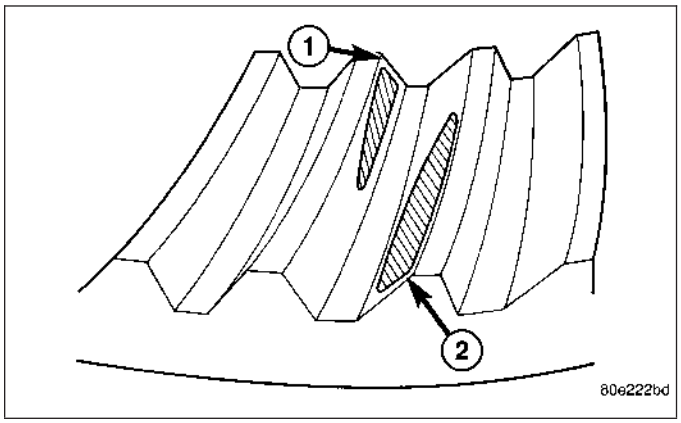
Gear contact pattern is correct. Backlash and pinion depth is correct.



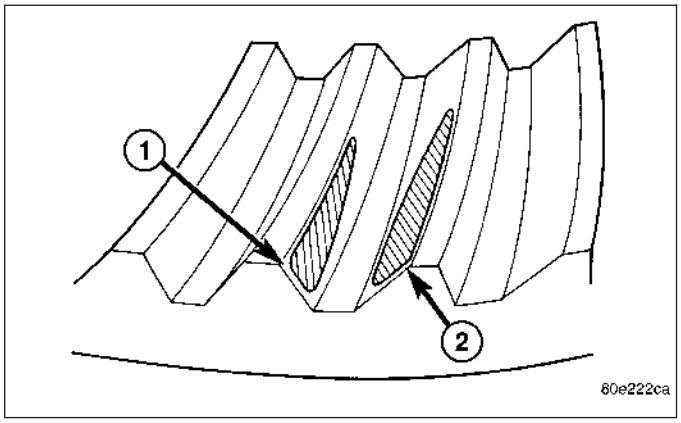
Ring gear is too far away from the pinion gear, coats side toe (1) drive side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.



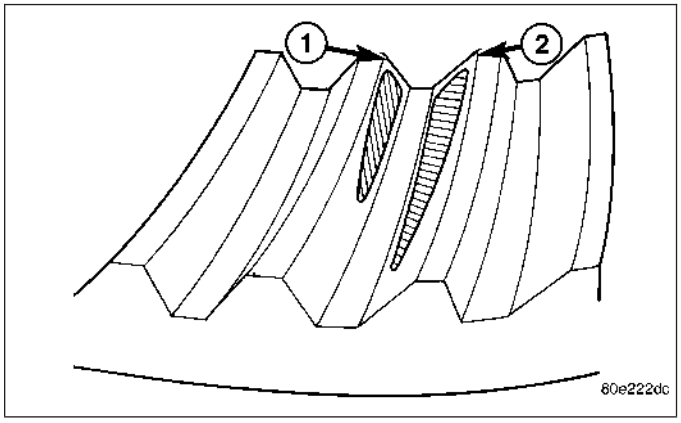
Ring gear is too close to the pinion gear, drive side toe (1) coast side heel (2). Increase backlash by moving ring gear away from the pinion gear using the adjusters.



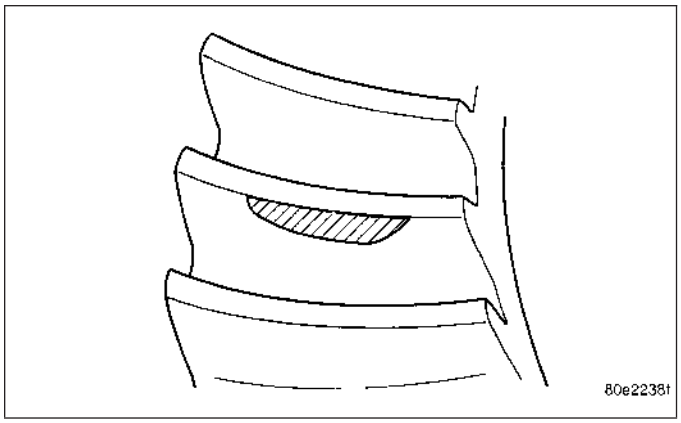
Ring gear is too far away from the pinion gear drive side heel (1) coast side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.



Ring gear is too close to the pinion gear, drive side toe (1) coast side toe (2). Increase backlash, by moving ring gear away from the pinion gear using the adjusters.



Pinion gear is set too low. Increase pinion gear height, by increasing pinion depth shim thickness.



Pinion gear is set too high. Decrease pinion height, by decreasing pinion depth shim thickness.

COVER-DIFFERENTIAL

REMOVAL

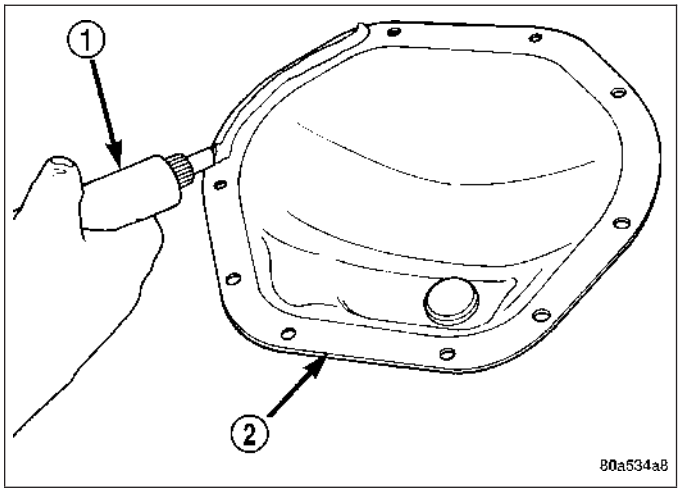
1. Remove fill plug.
2. Remove differential cover bolts.
3. Remove cover and drain fluid.

INSTALLATION

1. Apply a bead of orange Mopar Axle RTV Sealant (1) or equivalent to the housing cover (2).

CAUTION: If cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will compromise adhesion quality.

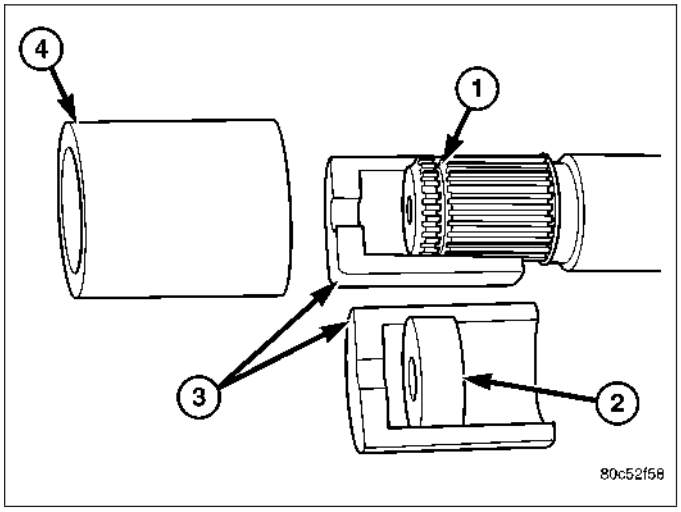
2. Install cover and tighten bolts in a criss-cross pattern to 22.5 N·m (16.5 ft. lbs.).
3. Fill differential with 1.66 L (3.5 pts.) of gear lubricant.
4. Install fill plug.



SHAFT-AXLE

REMOVAL

1. Remove half shaft from vehicle.
2. Clean axle seal area.
3. Remove snap ring from the axle shaft.
4. Remove axle (1) with Remove 8420A (2) (3) (4) and slide hammer.



INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Install axle shaft and engage shaft into side gear. Push firmly on axle shaft to engage snap-ring.
3. Check the differential fluid level and add fluid if necessary.
4. Install half shaft.
5. Install skid plate, if necessary.

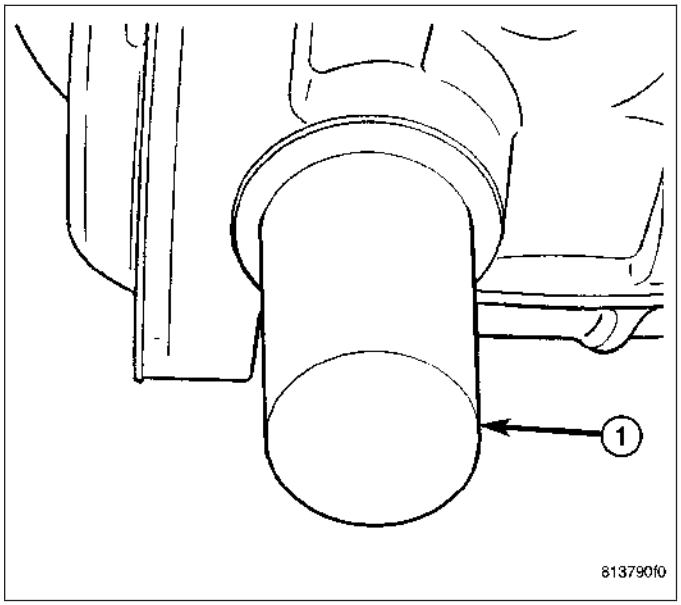
SEAL-AXLE SHAFT

REMOVAL

1. Remove half shaft and axle shaft.
2. Remove axle shaft seal with a small pry bar.

INSTALLATION

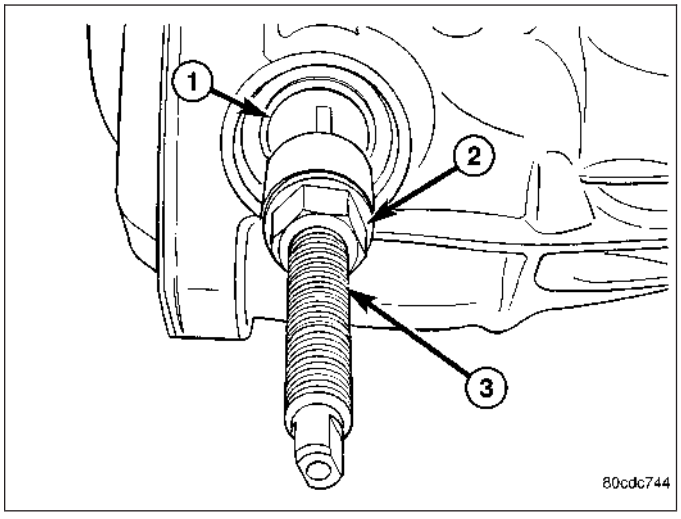
1. Wipe axle shaft tube bore clean.
2. Install **new** axle shaft seal with Installer 8402 (1).
3. Install axle shaft and half shaft.



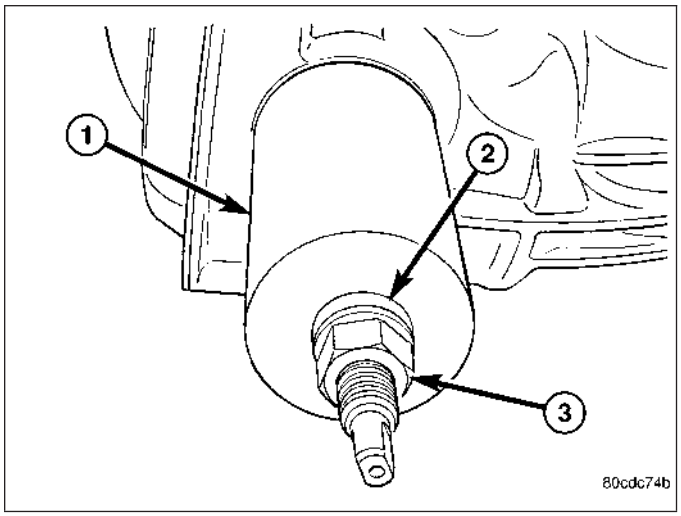
BEARING/BUSHING-AXLE

REMOVAL

1. Remove half shaft, axle shaft and seal.
2. Install axle shaft bearing Remover C-4660-A (3) in the bearing (1). Then tighten the nut (2) to spread the remover in the bearing.

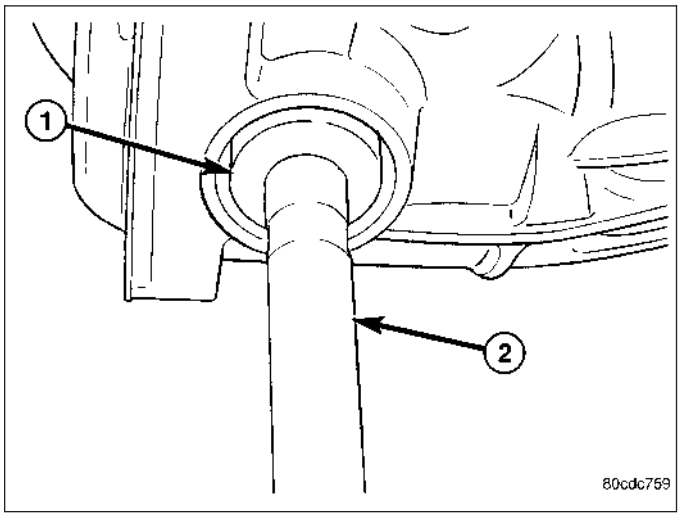


3. Install bearing remove cup (1) bearing (2) and nut (3). Tighten nut to draw bearing out.
4. Inspect axle shaft tube bore for roughness and burrs.

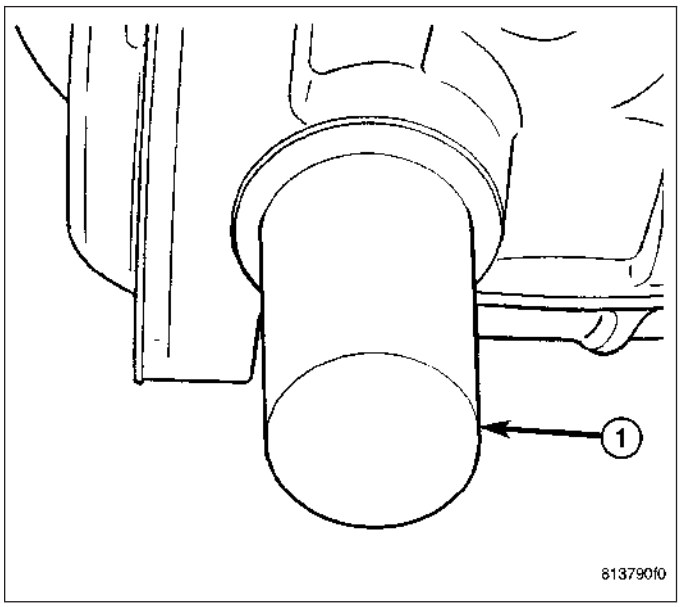


INSTALLATION

1. Wipe the axle shaft tube bore clean.
2. Install axle shaft bearing with Installer 5063 (1) and Handle C-4171 (2).



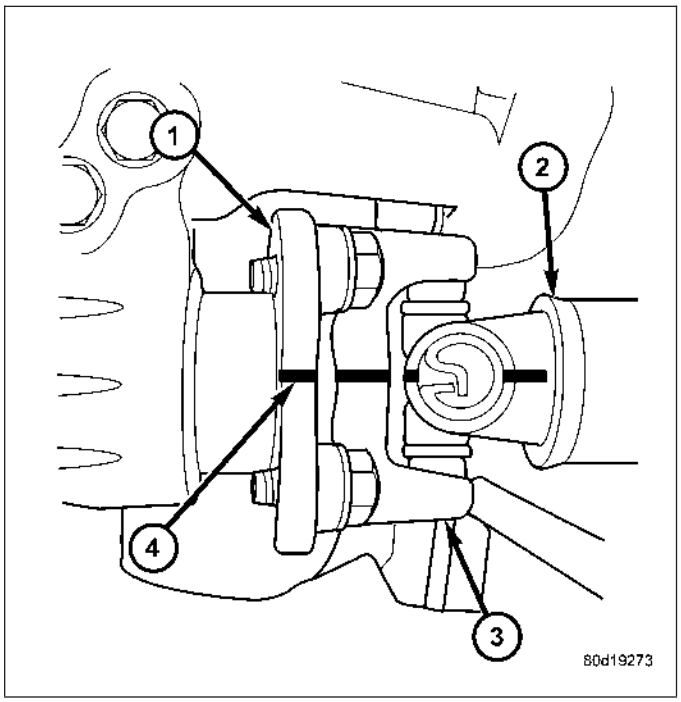
3. Install **new** axle shaft seal with Installer 8402 (1).
4. Install axle shaft and half shaft.



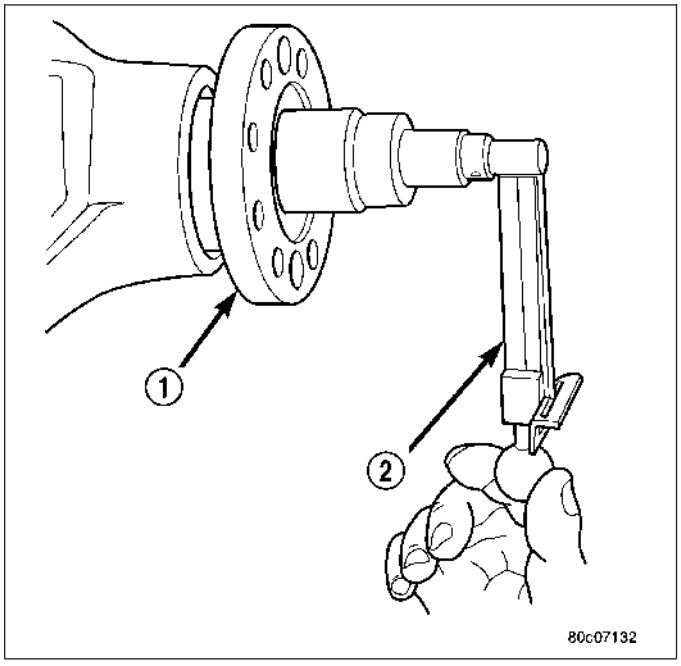
SEAL-PINION

REMOVAL

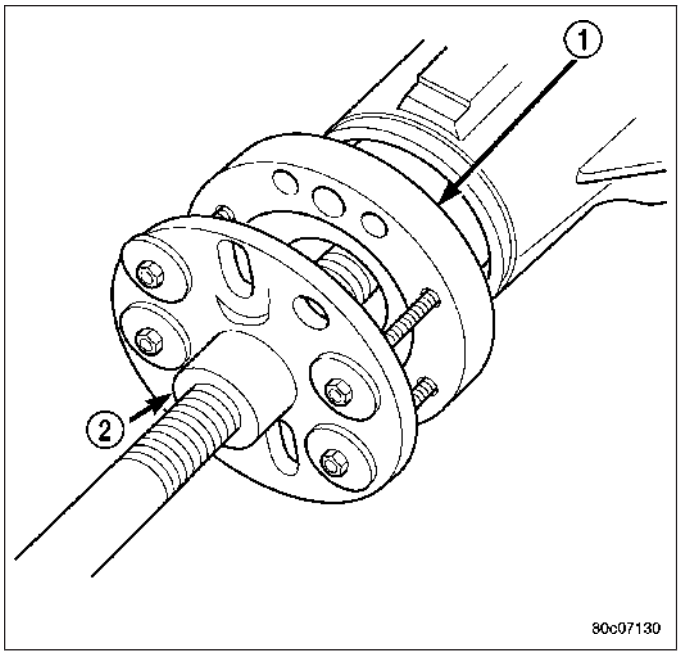
1. Remove both half shafts.
2. Mark propeller shaft (2) and pinion flange (2) for installation reference.



3. Remove front propeller shaft.
4. Rotate pinion gear three to four times, to verify pinion rotates smoothly.
5. Record pinion flange (1) rotating torque with an inch pound torque wrench (2) for installation reference.

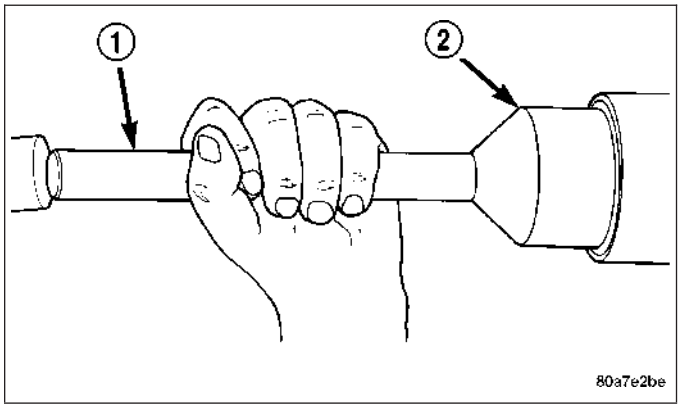


6. Hold flange with Holder 6719 and four bolts and washers.
7. Remove pinion nut.
8. Remove flange (1) with Remover C-452 (2).
9. Remove pinion seal with a pry tool.

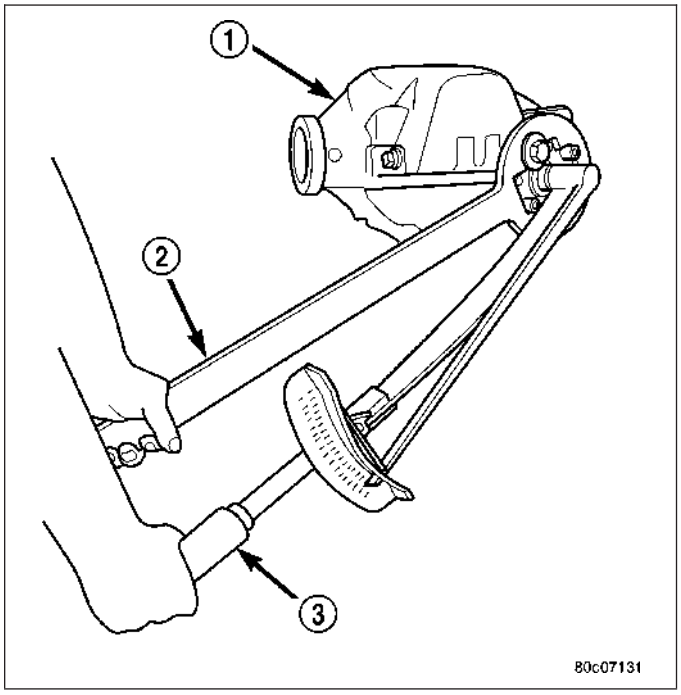


INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install seal with Installer C-3972-A (2) and Handle C-4171 (1)
   .



3. Install pinion flange onto the pinion with Installer C-3718 and holder.
4. Hold pinion flange with Holder 6719A (2).
5. Install **new** pinion nut and tighten nut until there is zero bearing end-play.

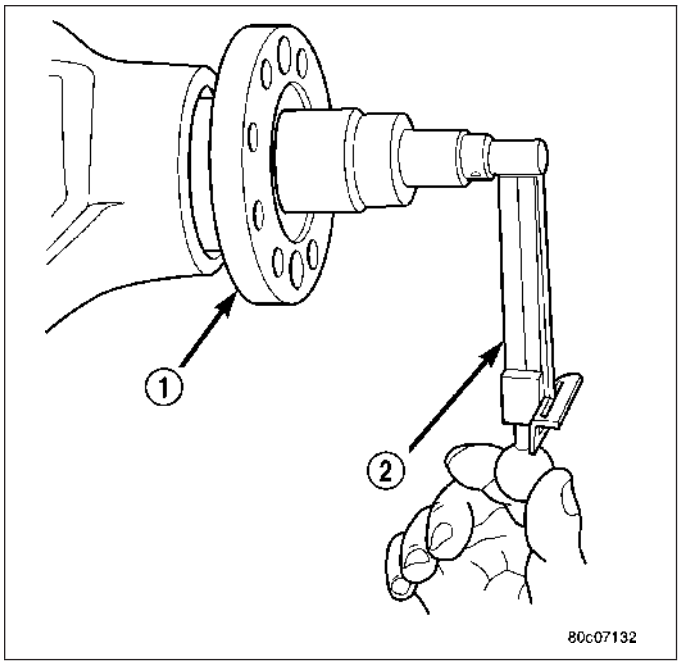


CAUTION: Do not exceed the minimum tightening torque when installing the companion flange at this point. Damage to the collapsible spacer or bearings may result.

6. Tighten pinion nut to 271 N·m (200 ft. lbs.).

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed.

7. Record pinion flange (1) rotating torque, with a torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).
8. If rotating torque is low, tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until rotating torque is achieved.



CAUTION: If maximum tightening torque is reached prior to reaching the required rotating torque, the collapsible spacer may have been damaged. Replace the collapsible spacer.

9. Install propeller shaft with reference marks aligned.
10. Install half shafts.

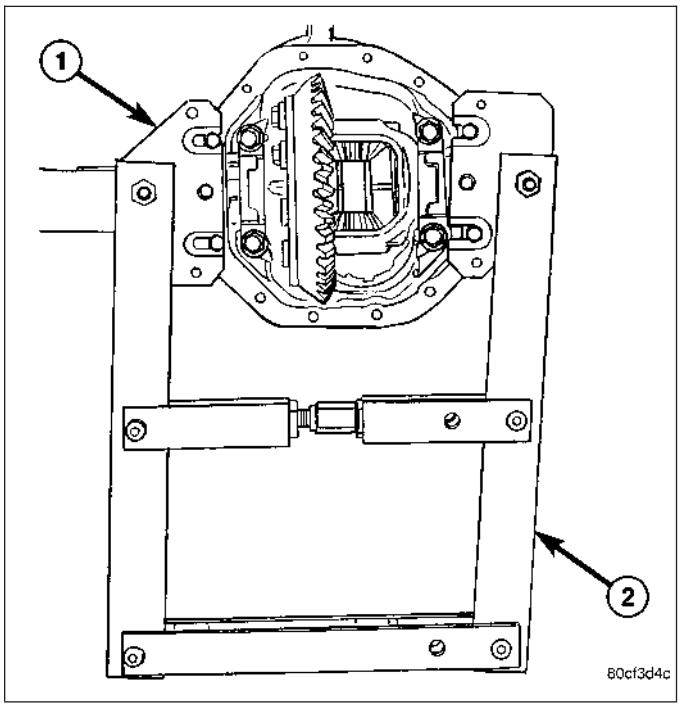
DIFFERENTIAL

REMOVAL

1. Remove differential housing cover and drain fluid.
2. Remove axle shafts.
3. Loosen bearing cap bolts.

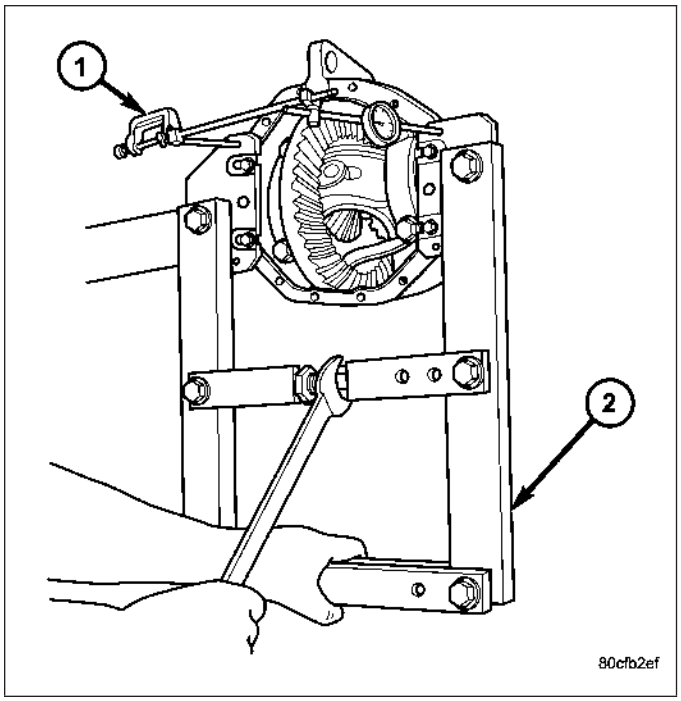
NOTE: Differential bearing cap reference numbers are stamped on caps and machined flat on the housing. If reference numbers cannot be found, make new marks for later reference.

4. Install Adapter Plates 8142-A (1) onto the housing.
5. Install Spreader W-129-B (2) onto the adapter plates and tighten the turnbuckle finger-tight.

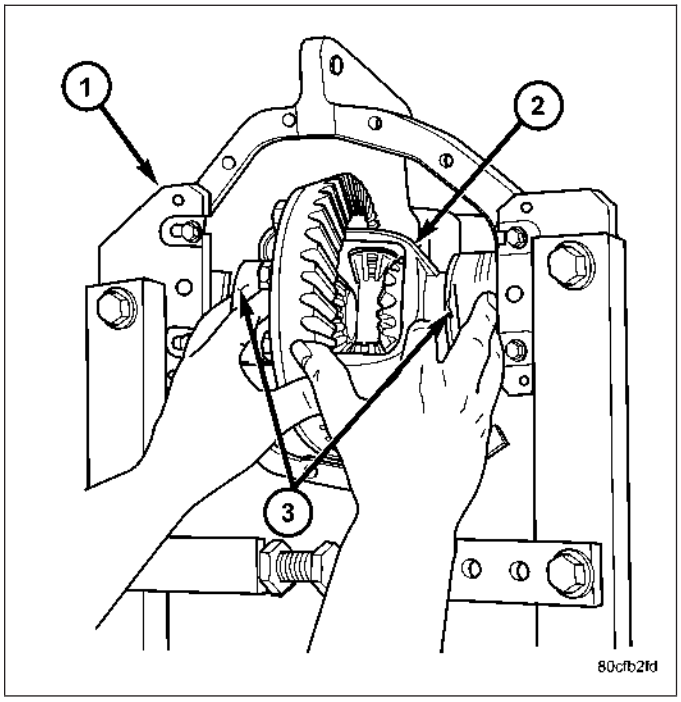


6. Install a Pilot Stud L-4438 at the left side of the differential housing. Attach Dial Indicator C-3339 (1) to pilot stud. Load the indicator plunger against the opposite side of the housing and zero the indicator.
7. Spread the housing to remove the differential case from the housing. Measure the distance with the dial indicator.

CAUTION: Never spread over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

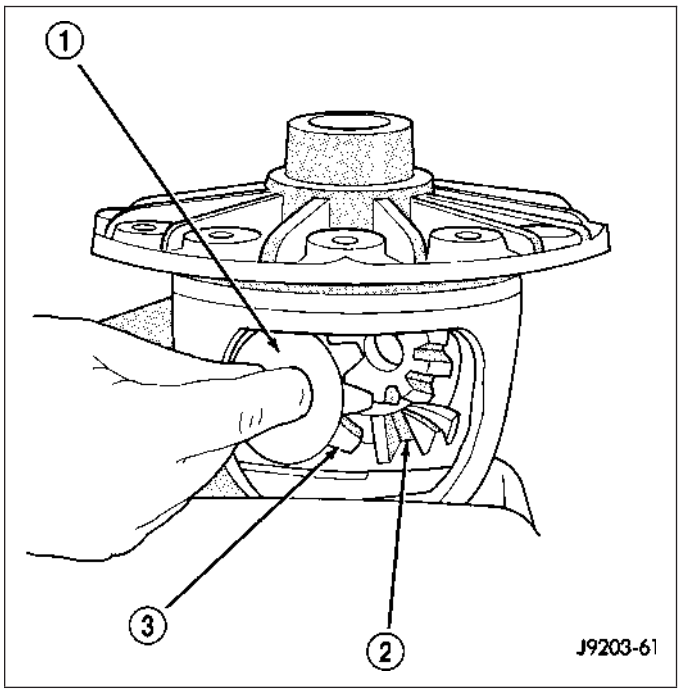


8. Remove dial indicator.
9. While holding the differential case in position, remove bearing cap bolts and caps.
10. Remove differential (2) from the housing (1). Ensure differential bearing cups and shims remain in position on the differential bearings.
11. Tag differential bearing cups and shims to indicate their location.
12. Remove spreader from housing.



DISASSEMBLY

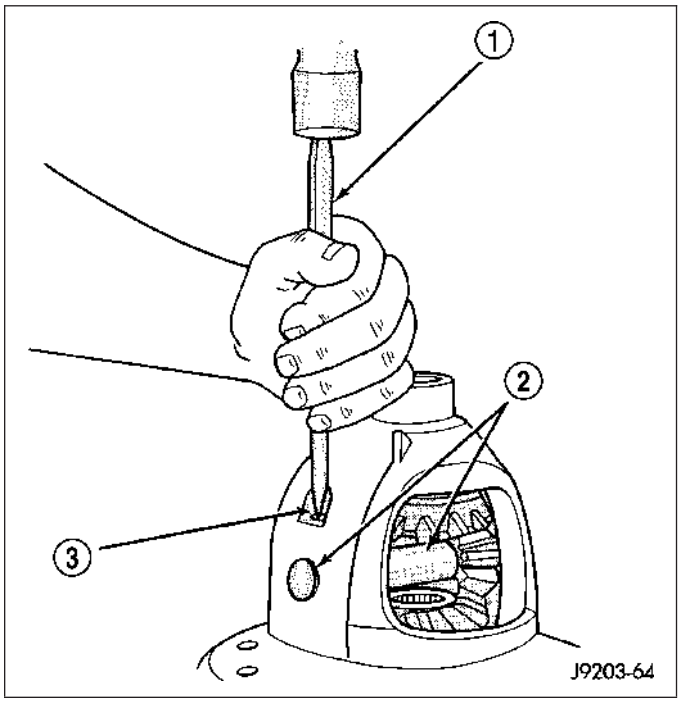
1. Remove ring gear.
2. Remove roll-pin holding mate shaft in housing.
3. Remove pinion gear mate shaft.
4. Rotate differential side gears (2) and remove pinion gears (3) and thrust washers (1)
5. Remove differential side gears and thrust washers.



ASSEMBLY

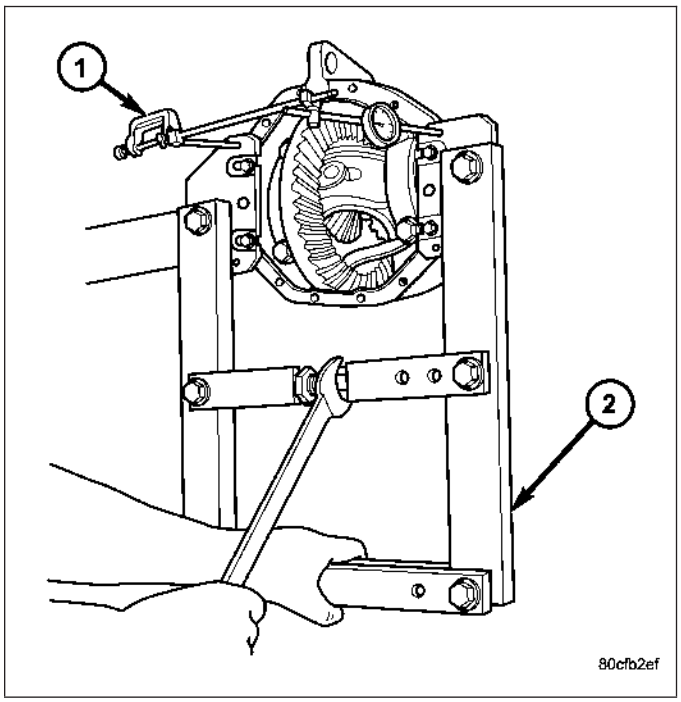
NOTE: If the same gears and thrust washers are being used, install them into their original locations.

1. Lubricate differential components with hypoid gear lubricant.
2. Install side gears and thrust washers into the differentail case.
3. Rotate pinion mate gears and thrust washers into the differentail case.
4. Install pinion gear mate shaft.
5. Align hole in pinion gear mate shaft with hole in the differential case.
6. Install roll-pin (3) in the differential case with a punch (1) and hammer. Peen edge of roll-pin hole in differential case in two places 180° apart.
7. Install ring gear.



INSTALLATION

NOTE: If replacement differential bearings or differential case are replaced, Refer to adjustments for Differential Bearing Preload and Gear Backlash procedures.



1. Install Spreader W-129-B (1) with the Adapter Plates 8142-A and install the safety hold-down clamps. Tighten the tool turnbuckle finger-tight.
2. Install a Pilot Stud L-4438 at the left side of the differential housing. Attach Dial Indicator C-3339 (2) to pilot stud. Load indicator plunger against the opposite side of the housing and zero the indicator.
3. Spread housing and measure the distance with the dial indicator.

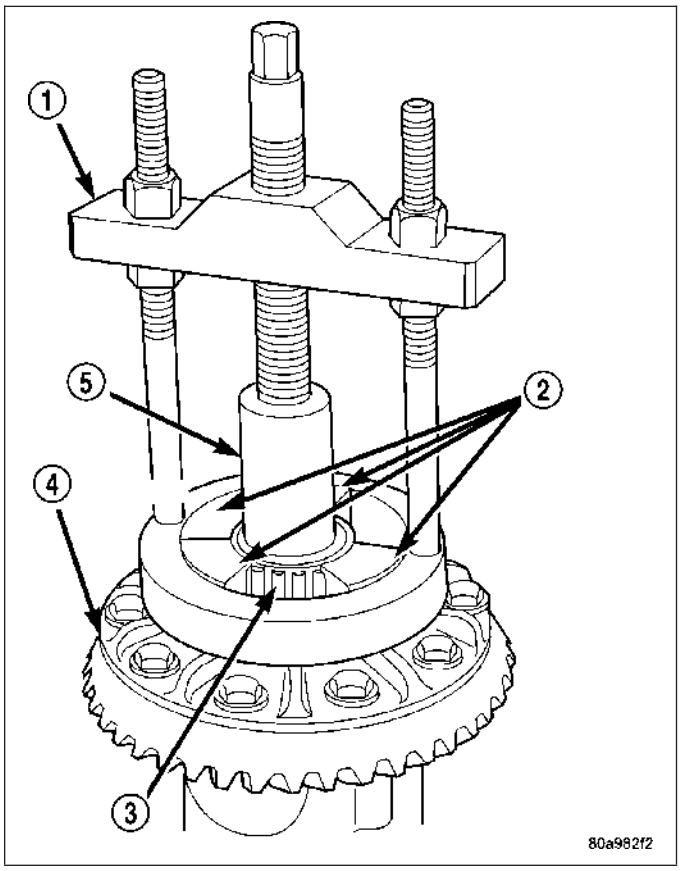
CAUTION: Never spread housing over 0.50 mm (0.020 in). Failure to follow these instructions will damage the housing.

4. Remove dial indicator (1).
5. Install differential case in the housing. Ensure differential bearing cups remain in position on the bearings and the differential preload shims are seated in the housing. Tap differential case to ensure bearings cups are seated in the housing.
6. Install bearing caps to their original locations and loosely install cap bolts.
7. Remove housing spreader (2).
8. Tighten the bearing cap bolts to 61 N·m (45 ft. lbs.).
9. Install differential.

BEARINGS-DIFFERENTIAL CASE

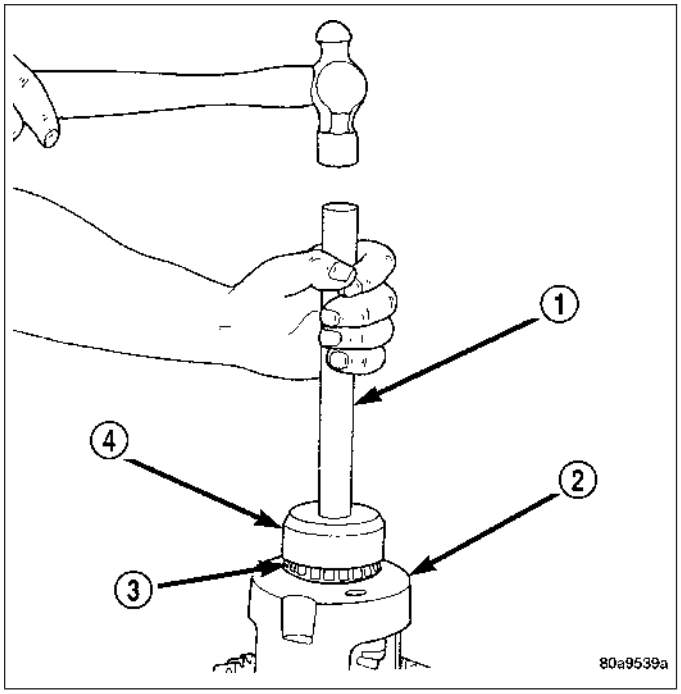
REMOVAL

1. Remove differential from housing.
2. Remove bearings (3) from differential case (4) with Puller C-293-PA (1) Adapters C-293-48 (2) and Plug C-293-3 (5).



INSTALLATION

1. Install differential case bearings (3) with Installer C-3716-A (4) and Handle C-4171 (1).
2. Install differential in axle housing.

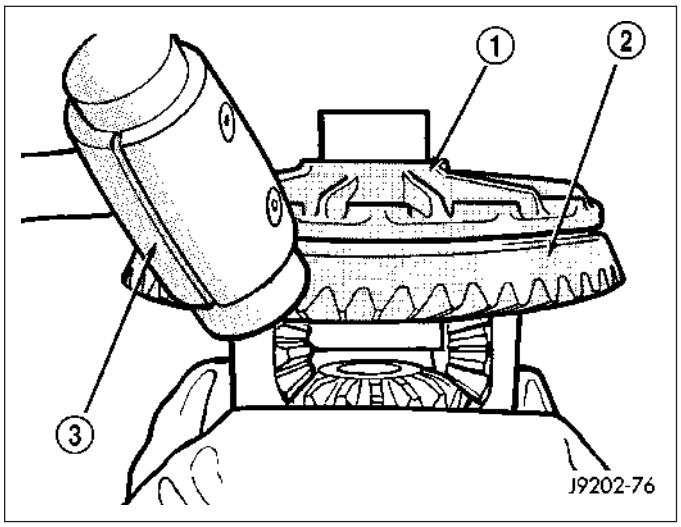


GEAR-PINION/RING

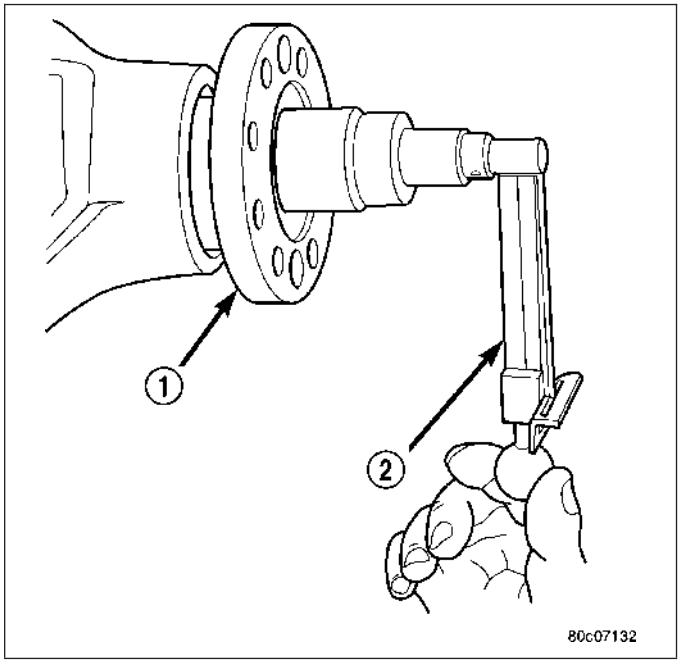
REMOVAL

NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the other matching gear.

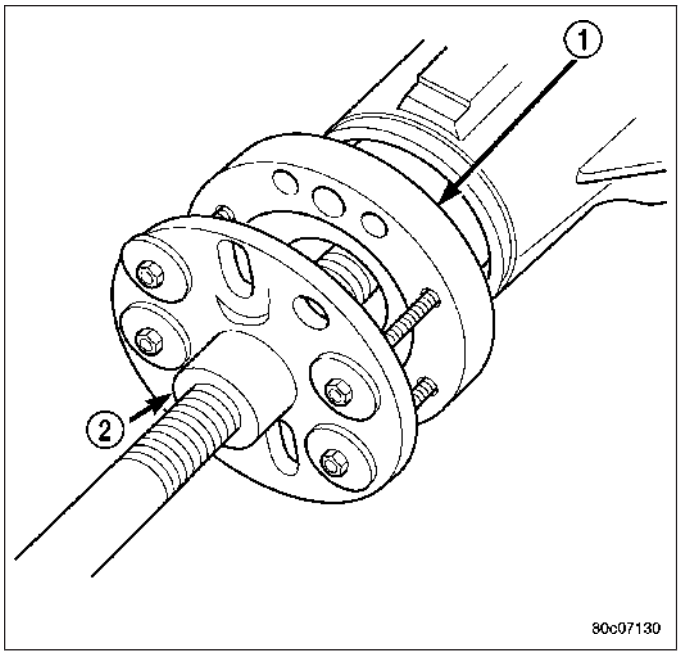
1. Remove differential from axle housing.
2. Place differential case in a vise with soft jaw.
3. Remove ring gear bolts.
4. Drive ring gear (2) from differential case (1) with a soft hammer.



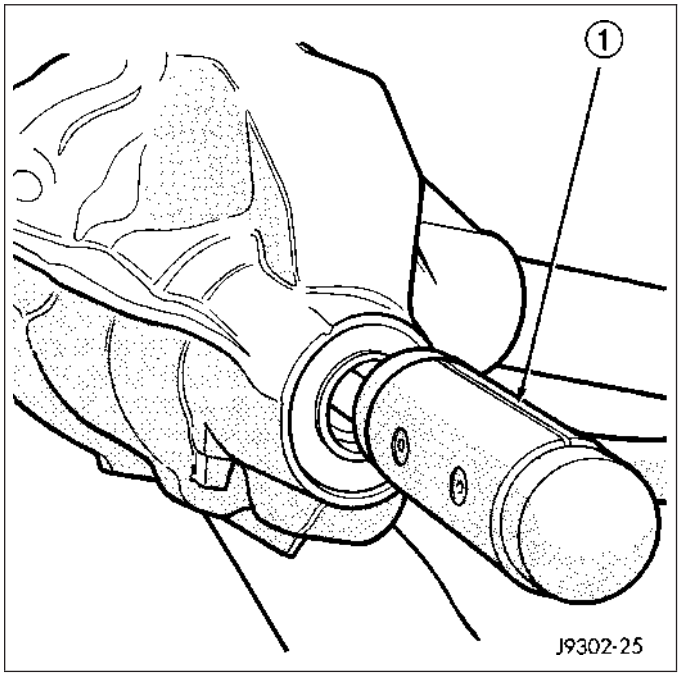
5. Remove propeller shaft.
6. Rotate companion flange and verify flange rotates smoothly.
7. Record pinion rotating torque with an inch pound torque wrench (2) for installation reference.



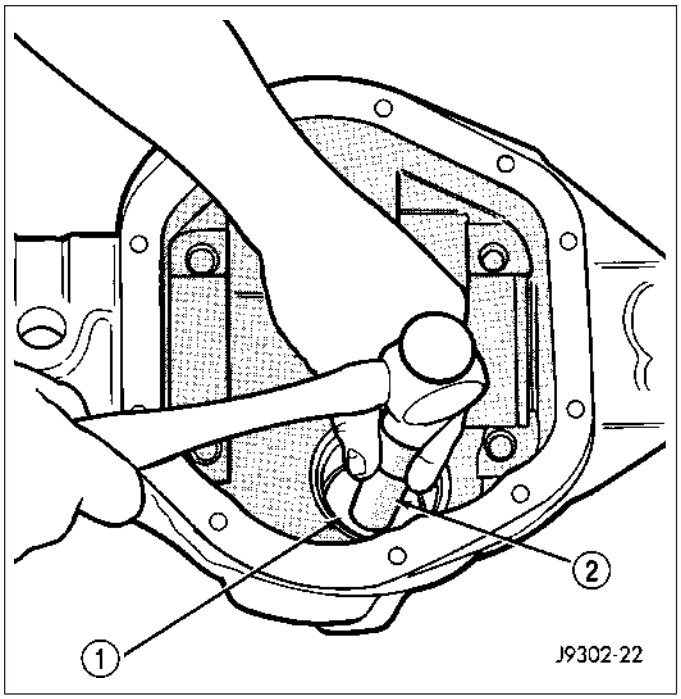
8. Install bolts into two of the threaded holes in the companion flange 180° apart.
9. Position Holder 6719 against the companion flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so that the Holder 6719 is held to the flange.
10. Remove pinion nut.
11. Remove companion flange (1) with Remover C-452 (2).



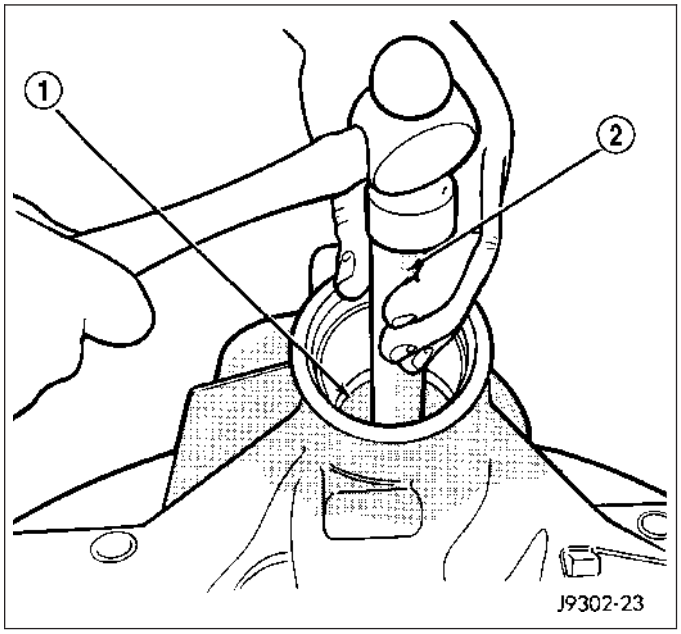
12. Remove pinion from differential housing with a hammer (1).



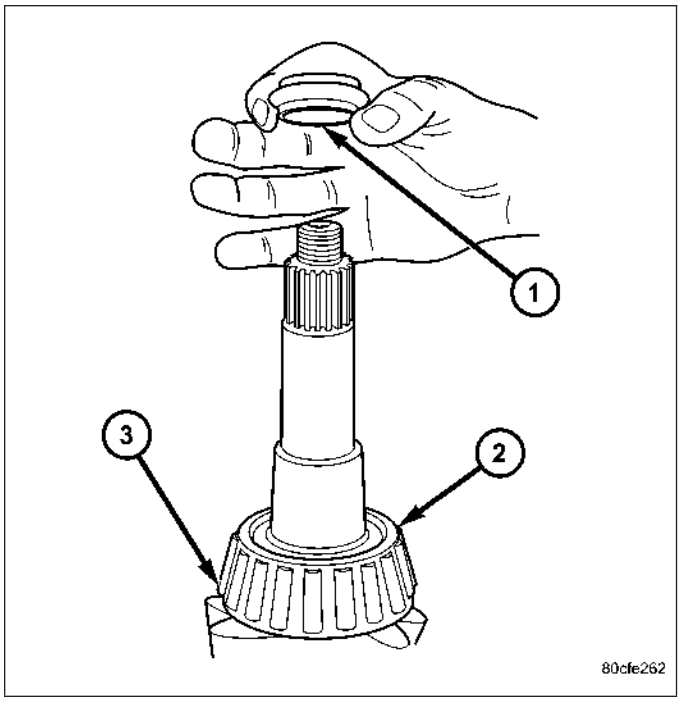
13. Remove pinion seal with a pry tool or a slide hammer mounted screw.
14. Remove oil slinger, if equipped, and front pinion bearing.
15. Remove front pinion bearing cup with Remover D-103 (1) and Handle C-4171 (2).



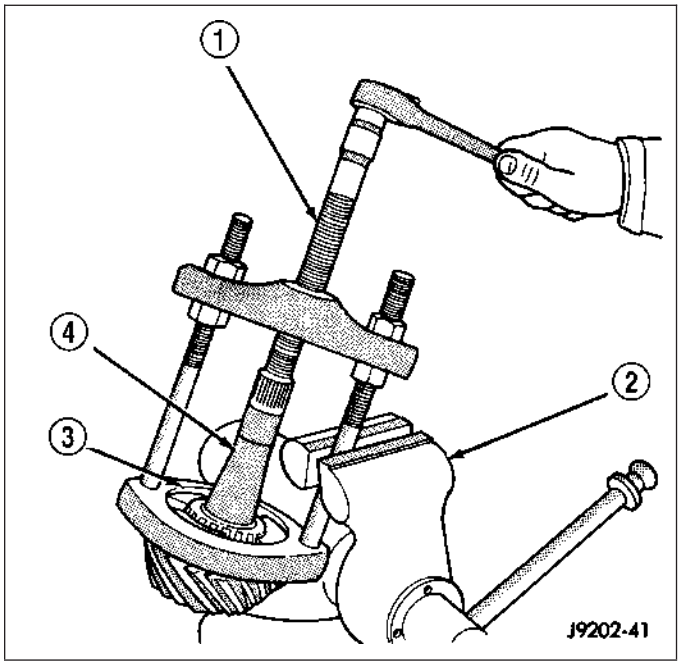
16. Remove rear pinion bearing cup with Remover 8401 (1) and Handle C-4171 (2).



17. Remove collapsible preload spacer (1).



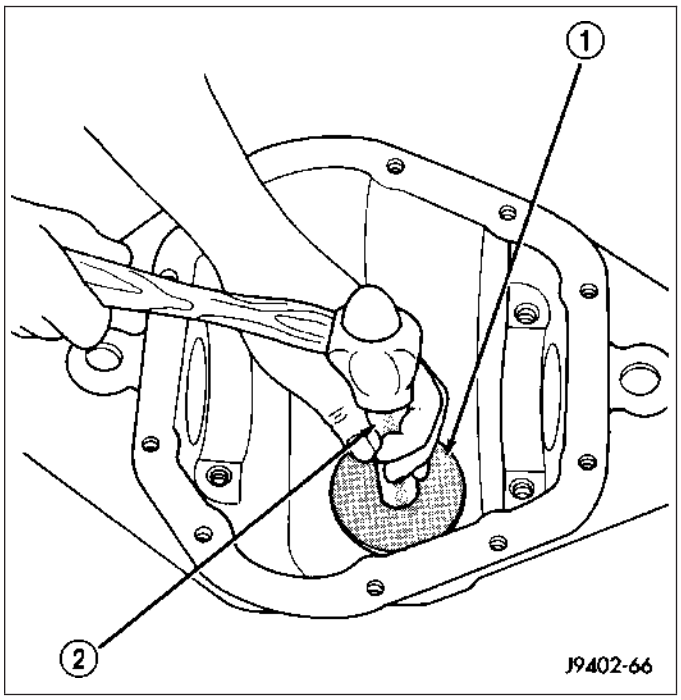
18. Remove rear pinion bearing from pinion shaft (4) with Puller C-293-PA (1) and Adapters C-293-42 (3).
19. Remove depth shims from pinion shaft and record shim thickness.



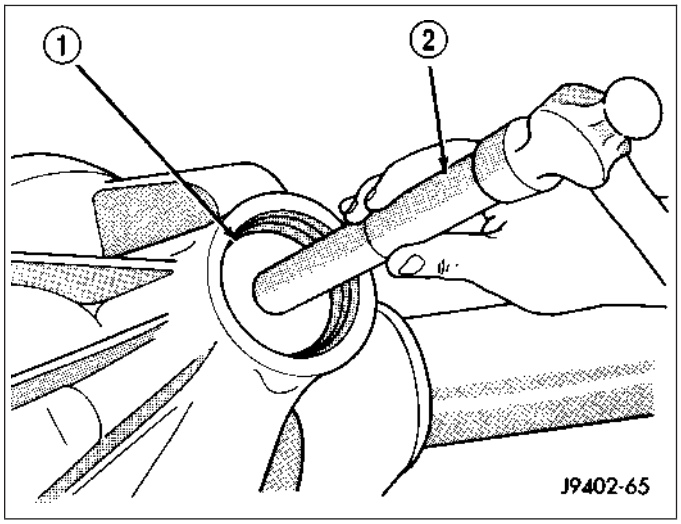
INSTALLATION

NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the other. If ring and pinion gears or bearings are replaced, Refer to Adjustments for Pinion Gear Depth Setting.

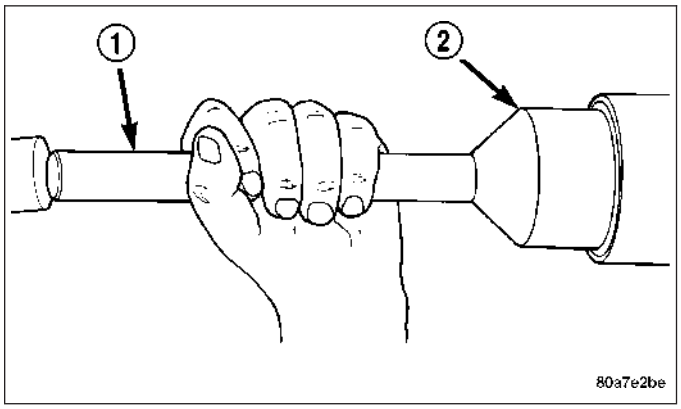
1. Apply Mopar Door Ease or equivalent lubricant to outside surface of the bearing cups.
2. Install rear pinion bearing cup with Installer D-145 (1) and Handle C-4171 (2).



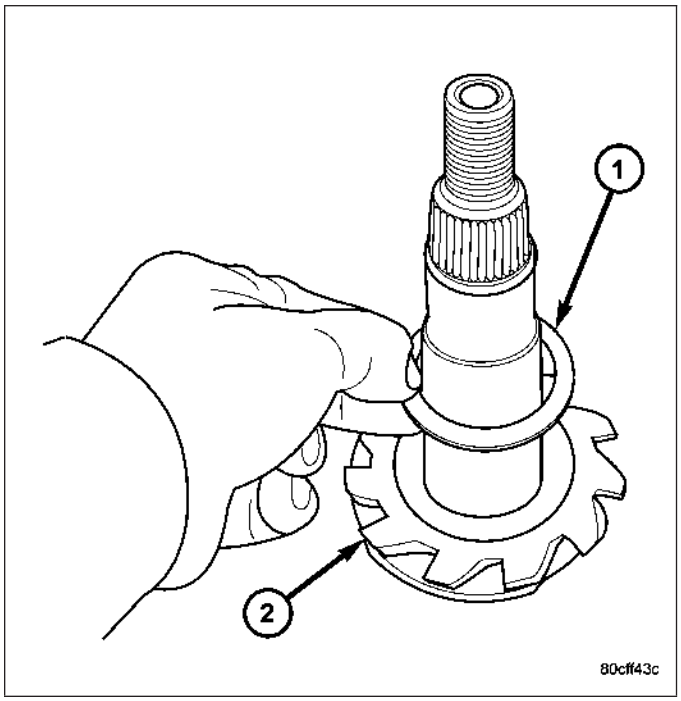
3. Install front pinion bearing cup with Installer D-129 (1) and Handle C-4171 (2).



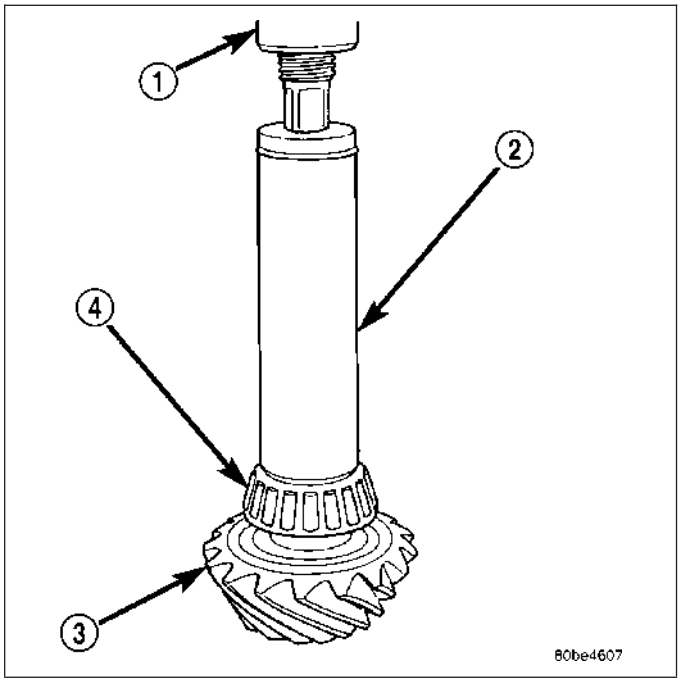
4. Install pinion front bearing and oil slinger if equipped.
5. Apply a light coating of gear lubricant on the lip of pinion seal.
6. Install pinion seal with an appropriate installer (2) and handle (1).



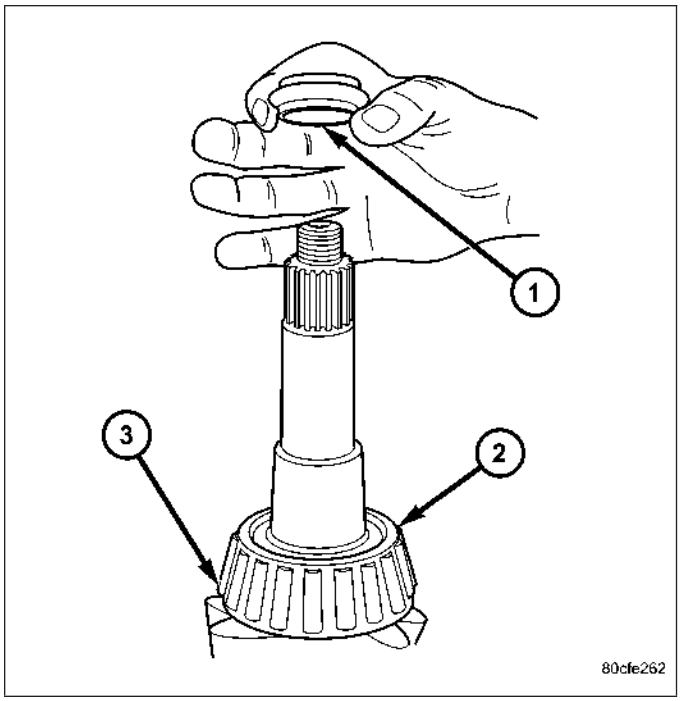
7. Place proper thickness depth shim (1) on pinion (2).



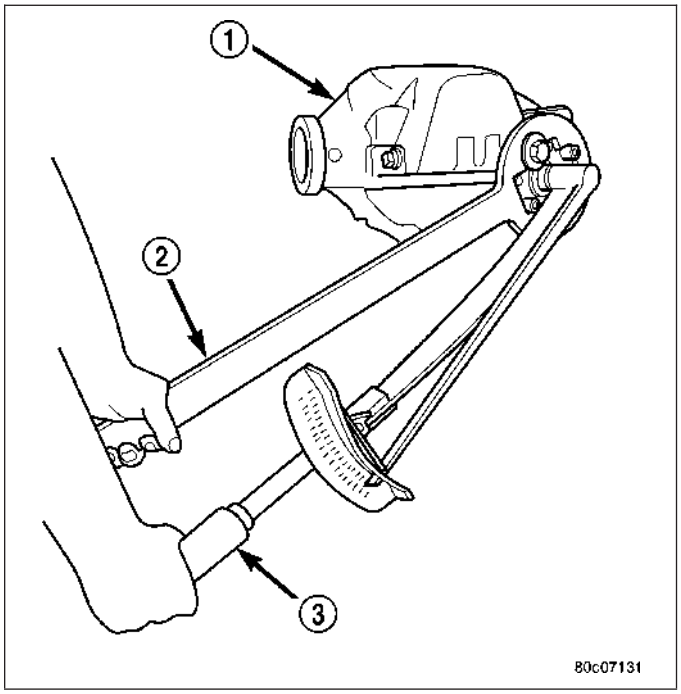
8. Install rear bearing (1) on pinion with Installer 6448 (2) and a press (1).



9. Install **new** collapsible preload spacer (1) onto the pinion.

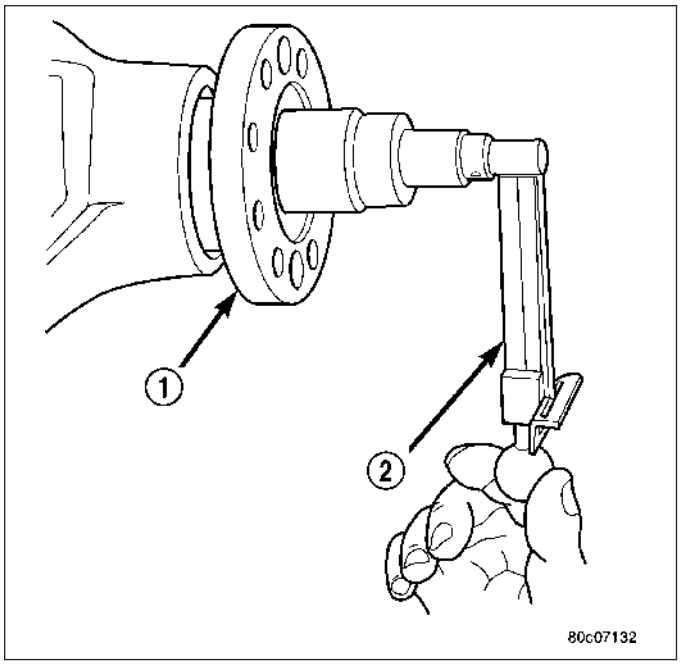


10. Install pinion gear into housing.
11. Install companion flange with Installer C-3718.
12. Install **new** pinion nut and tighten to 271 N·m (200 ft. lbs.).
13. With holder (2) and a torque wrench (3) set at 474 N·m (350 ft. lbs.), tighten pinion nut until end play is taken up.



14. Slowly tighten the pinion flange (1) nut in 6.8 N·m (5 ft. lbs.) increments until rotating torque is achieved. Measure rotating torque frequently to avoid overcrushing the collapsible spacer. The pinion rotating torque should be:
    - Original Bearings: 1 to 2.5 N·m (10 to 20 in. lbs.)
    - New Bearings: 1.7 to 2.5 N·m (15 to 22 in. lbs.)

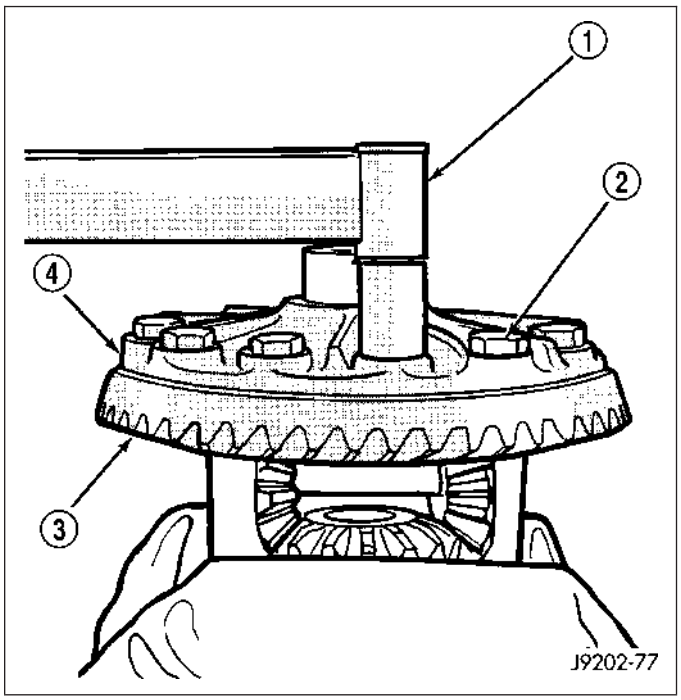
NOTE: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque.



15. Invert differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
16. Invert differential case in the vise.
17. Install **new** ring gear bolts (2) and alternately tighten to 108 N·m (80 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will damage bolts.

18. Install differential in axle housing and verify gear mesh and contact pattern.
19. Install differential cover.



REAR AXLE - 8 1/4

DIAGNOSIS AND TESTING

REAR AXLE - 8 1/4

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints or C/V joints.
- Worn side-gear thrust washers
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or C/V joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or C/V joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

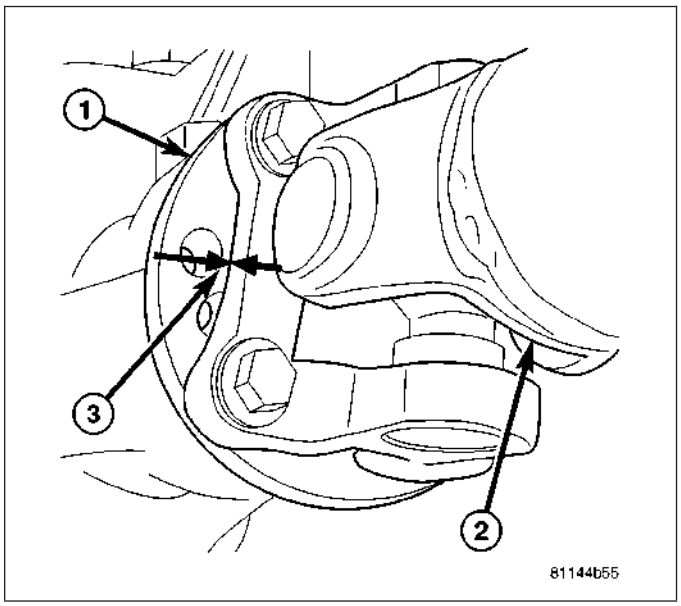
DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.

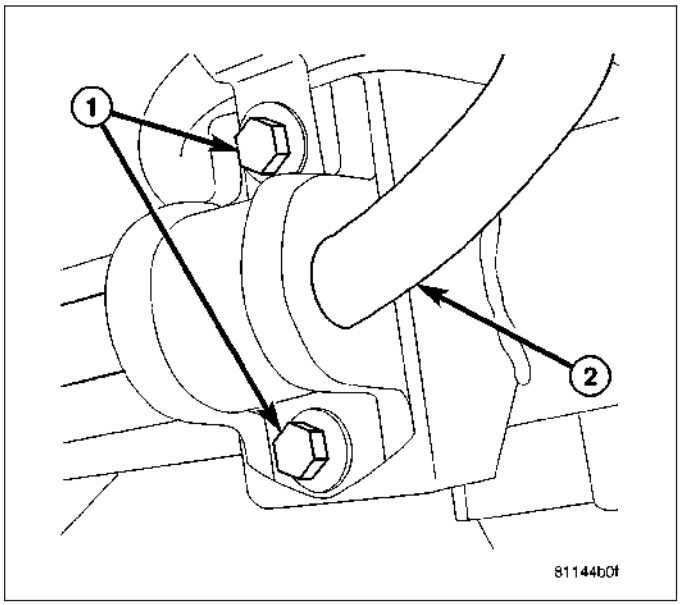
Condition	Possible Causes	Correction
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Re-adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Mis-aligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued tot he proper specification.
	9. Housing not machined properly.	9. Replace housing.

REMOVAL

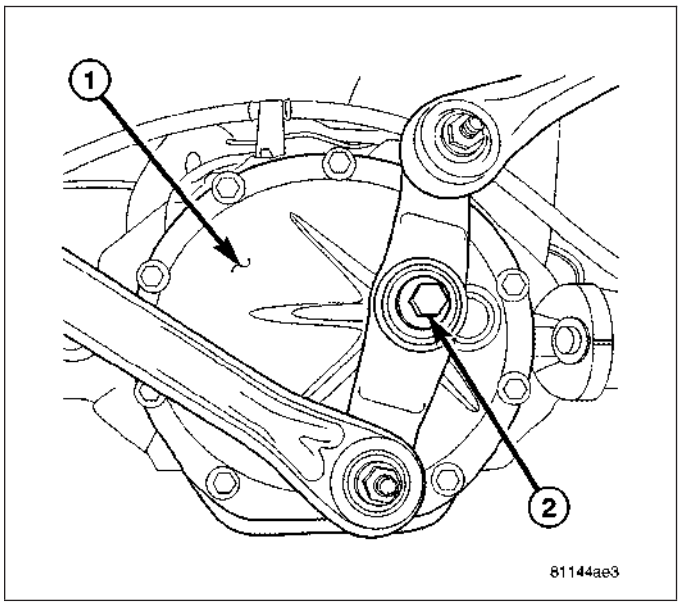
1. With vehicle in neutral, position it on a hoist.
2. Position a lift under axle and secure lift to axle.
3. Remove brake components from the axle.
4. Remove ABS wheel speed sensors.
5. Remove vent hose from the axle shaft tube.
6. Mark a reference line (3) across the propeller shaft (2) and pinion flange (1) for installation alignment.



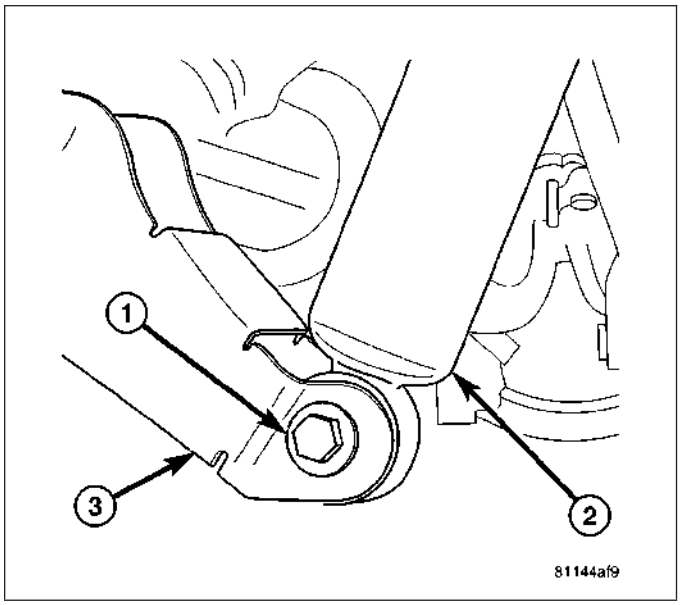
7. Remove propeller shaft.
8. Remove stabilizer bar (2) clamps bolts (1) from the axle.



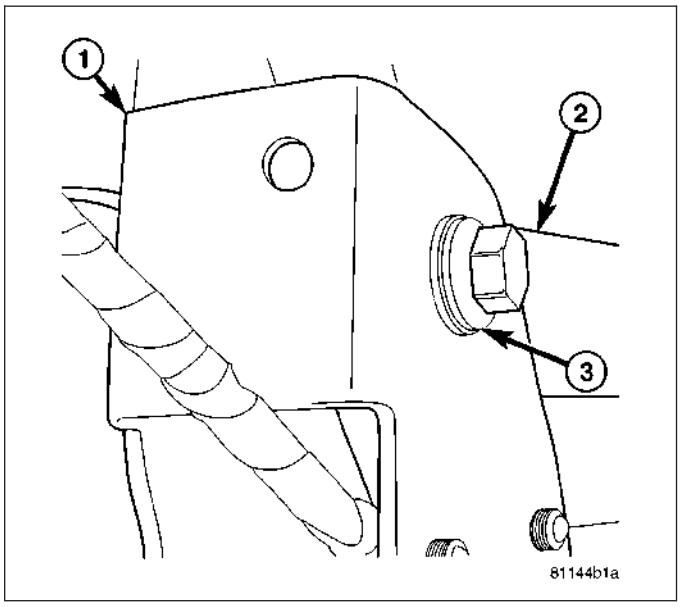
9. Remove watts link bell crank bolt (2) from differential cover (1).



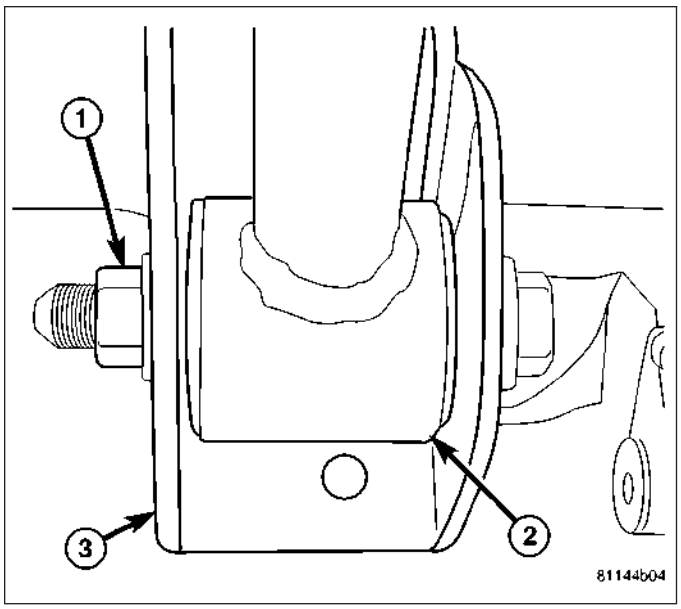
10. Remove shock absorbers (2) from axle bracket (3).



11. Remove upper control arms (2) from axle brackets (1).



12. Lower axle and remove coil springs and spring isolators.
13. Remove lower control arms (2) from axle brackets (3).
14. Lower axle and remove from vehicle.

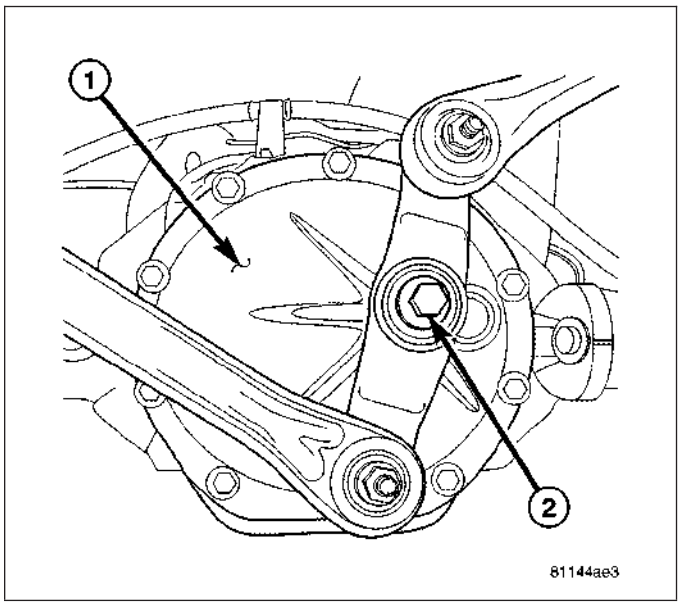


INSTALLATION

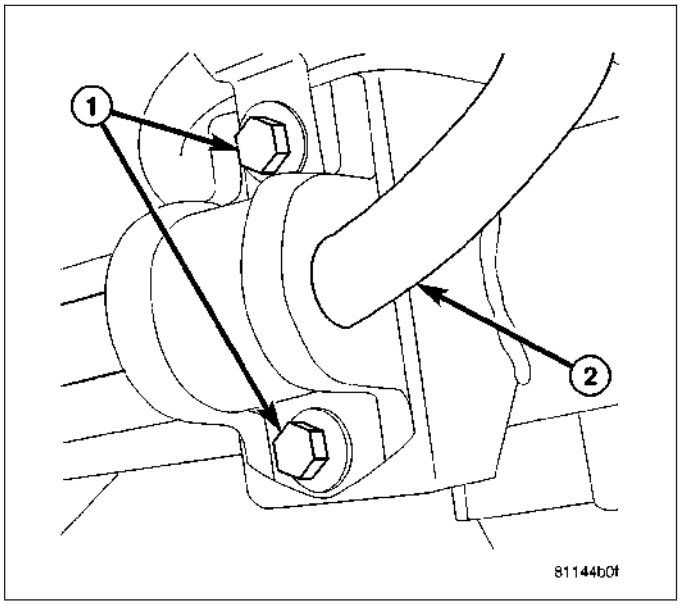
1. Raise axle and align lower control arms. Install control arm bolts loose at this time.
2. Install coil springs.
3. Raise axle and align upper control arms. Install control arm bolts loose at this time.

NOTE: Bell crank bolt has a Loctite® patch, a new bolt should be used. If bolt is not available, clean bolt and apply Loctite® 242 to the threads.

4. Install watts link bell crank bolt (2) and tighten to 217 N·m (160 ft. lbs.).



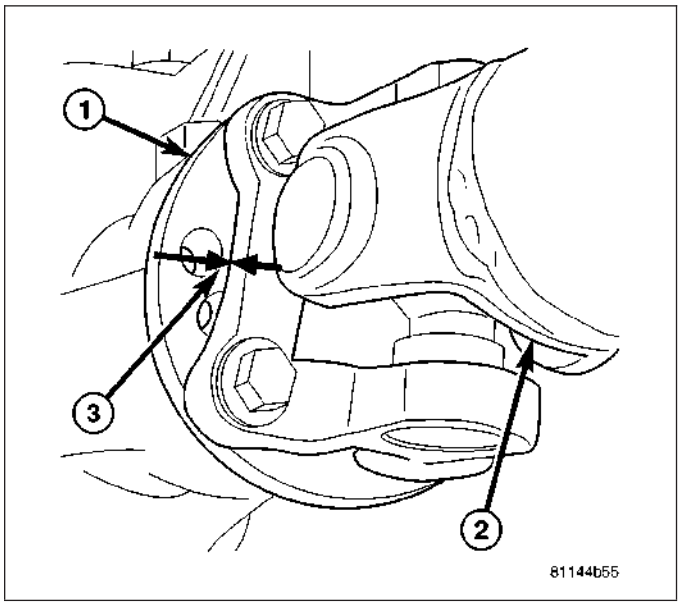
5. Install shock absorbers and tighten nuts to 102 N·m (75 ft. lbs.).
6. Install parking brake and brake components.
7. Install axle vent hose.
8. Install stabilizer bar (2) and center it with equal spacing on both sides. Tighten bolts to 61 N·m (45 ft. lbs.).



9. Install propeller shaft (2) with reference marks (3) aligned.
10. Install **new** companion flange bolts and tighten to 108 N·m (80 ft. lbs.).

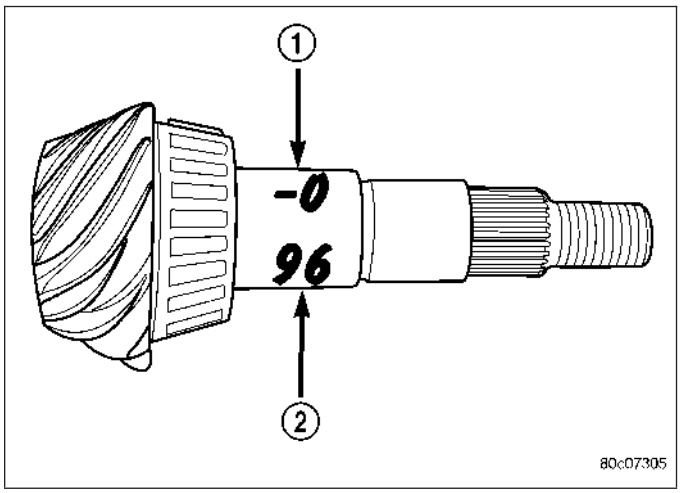
NOTE: Companion flange bolts have a Loctite® patch, new bolts should be used. If bolts are not available, clean bolts and apply Loctite® 242 to the threads.

11. With vehicle on the ground, tighten upper control arm bolts to 170 N·m (125 ft. lbs.). Tighten lower control arm nuts to 230 N·m (170 ft. lbs.).



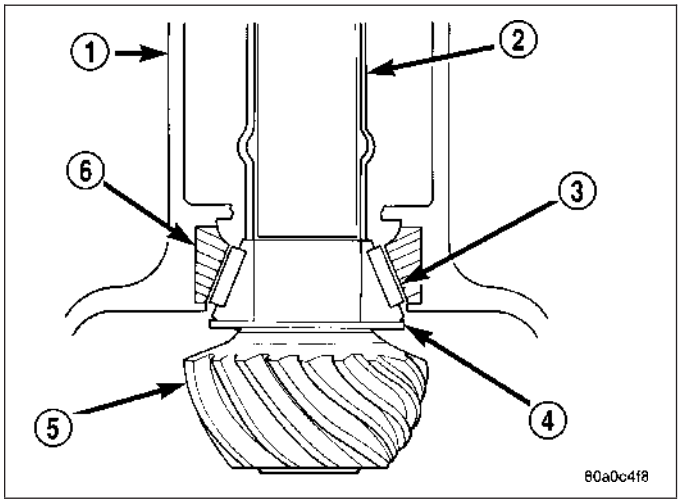
ADJUSTMENTS

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus + number, minus – number or zero 0 along with the gear set sequence number 01 to 99 is on each gear. This first number (1) is the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a zero 0. The next two numbers (2) are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.



The pinion depth variance select shims (4) are placed behind the rear pinion bearing (3).

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.



Pinion Gear Depth Variance Chart: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	−4	−3	−2	−1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0
+3	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001
+2	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002

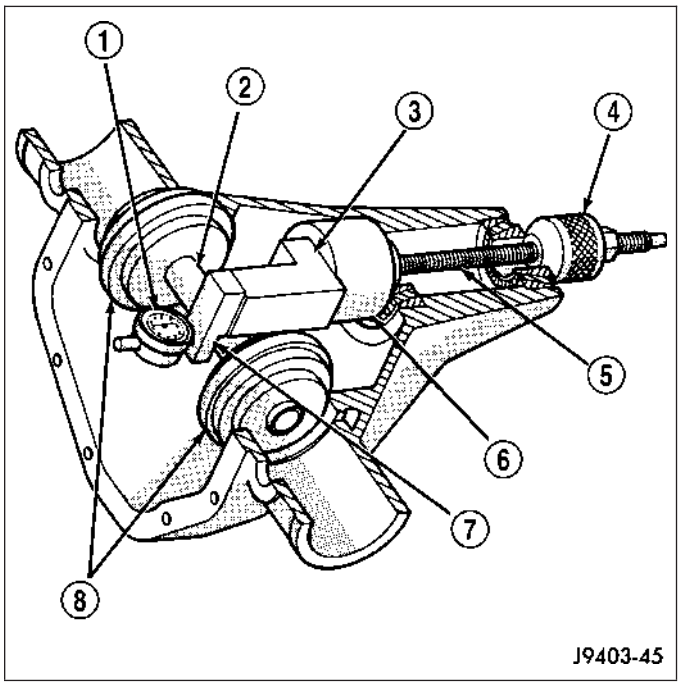
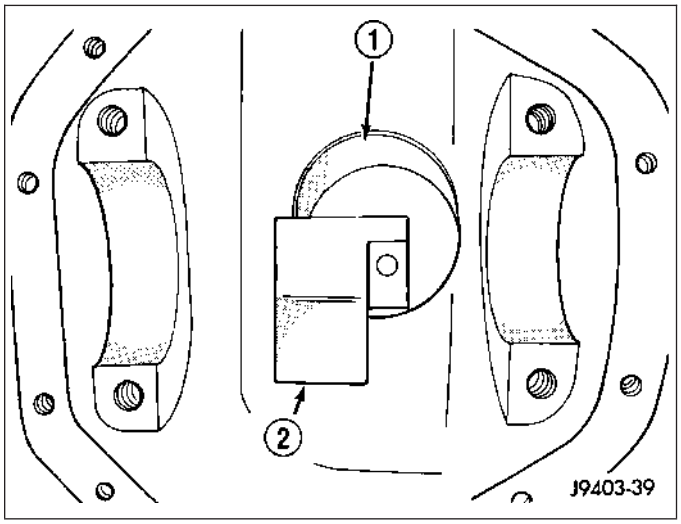
−4	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006	−0.007	−0.008

PINION DEPTH MEASUREMENT

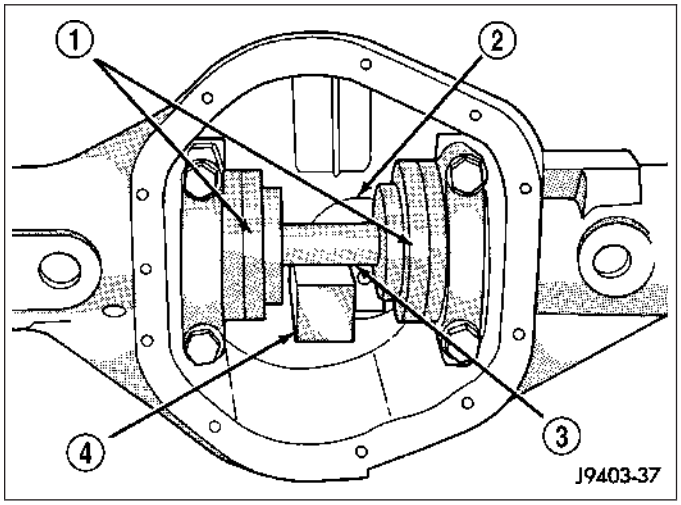
Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).



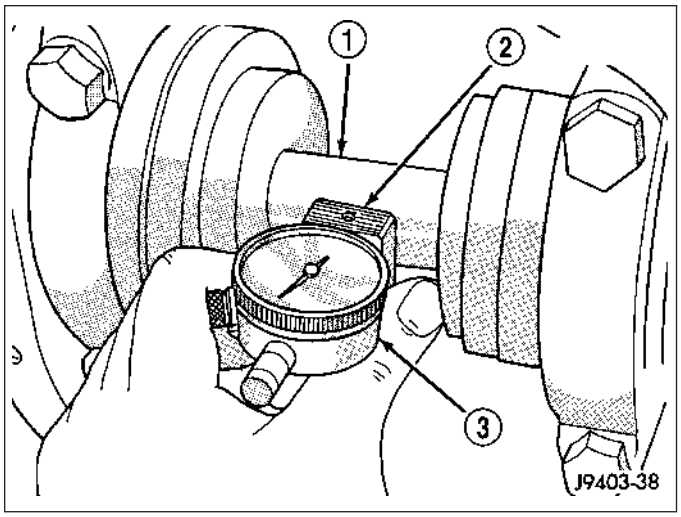
1. Assemble Pinion Height Block 6739 (2) Pinion Block 8540 (1) and rear pinion bearing onto Screw 6741.



2. Insert assembled height gauge components, rear bearing and screw into housing through pinion bearing cups.
3. Install front pinion bearing and Cone-Nut 6740 onto the screw. Tighten cone-nut until Torque To Rotate screw is 1.7 N·m (15 in. lbs.).
4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (3) in position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to specifications.



NOTE: Arbor Discs 8541 (1) has different step diameters to fit other axles. Choose proper step for axle being serviced.

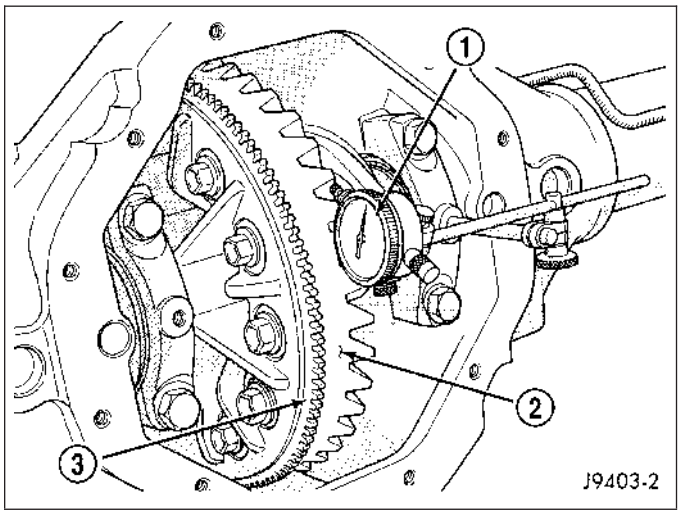


5. Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.
6. Place Scooter Block/Dial Indicator in position in axle housing so dial probe and scooter block are flush against the rearward surface of the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slowly slide dial indicator probe over the edge of the pinion height block.
8. Slide dial indicator (3) probe across the gap between the pinion height block and arbor bar (1) with the scooter block (2) against the pinion height block. When dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving dial probe to the crest of the arbor bar and record the highest reading. If the dial indicator can not achieve a zero reading, the rear bearing cup or the pinion depth gauge set is not installed correctly.
9. Select a shim equal to the dial indicator reading, plus the drive pinion gear depth variance number marked on the shaft of the pinion. For example, if the depth variance is –2, add +0.002 in. to the dial indicator reading. Then subtract 0.04064 mm (0.0016 in.) from the total measurement. This will be the correct shim selection for the pinion height.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

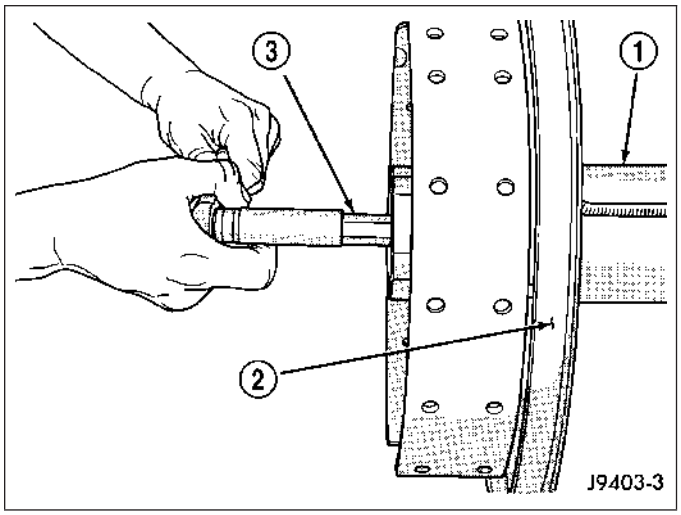
The following must be considered when adjusting bearing preload and gear backlash:

- The maximum ring gear backlash variation is 0.076 mm (0.003 in.).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.



NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:

- **Maintain the gear teeth engaged (meshed) as marked.**
- **The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.**
- **Do this five to ten times each time the threaded adjusters are adjusted.**



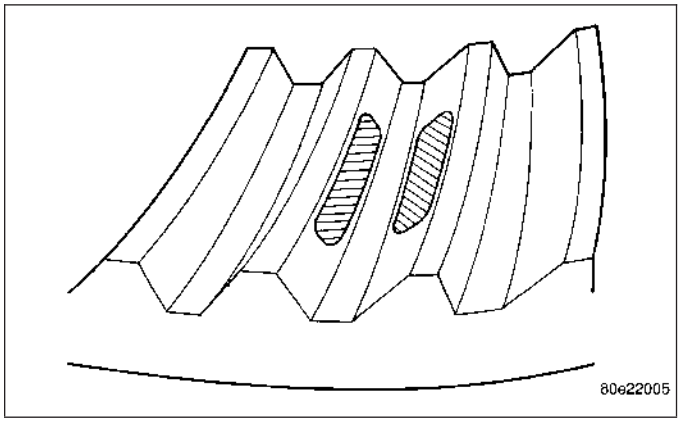
1. Through the axle tube with Wrench C-4164 adjust each threaded adjuster inward until the differential bearing free-play is eliminated. Allow some ring gear backlash, approximately 0.25 mm (0.01 in.) between the ring and pinion gear. Seat the bearing cups with the procedure described above.
2. Install dial indicator (1) and position the plunger against the drive side of a ring gear (2) tooth. Measure the backlash at 4 positions, 90 degrees apart around the ring gear. Locate and mark the area of minimum backlash.
3. Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.
4. Loosen the right-side, tighten the left-side threaded adjuster. Obtain backlash of 0.076-0.102 mm (0.003-0.004 in.) with each adjuster tightened to 14 N·m (10 ft. lbs.). Seat the bearing cups with the procedure described above.
5. Tighten the differential bearing cap bolts to 135 N·m (100 ft. lbs.).
6. Tighten the right-side threaded adjuster to 102 N·m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N·m (75 ft. lbs.)
7. Measure the ring gear backlash. The range of backlash is 0.15-0.203 mm (0.006-0.008 in.).
8. Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

NOTE: The left-side threaded adjuster torque should have approximately 102 N·m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.

9. Tighten the left-side threaded adjuster until 102 N·m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.
10. Install the threaded adjuster locks and tighten the lock screws to 10 N·m (90 in. lbs.).

After the proper backlash is achieved, perform the Gear Contact procedure.

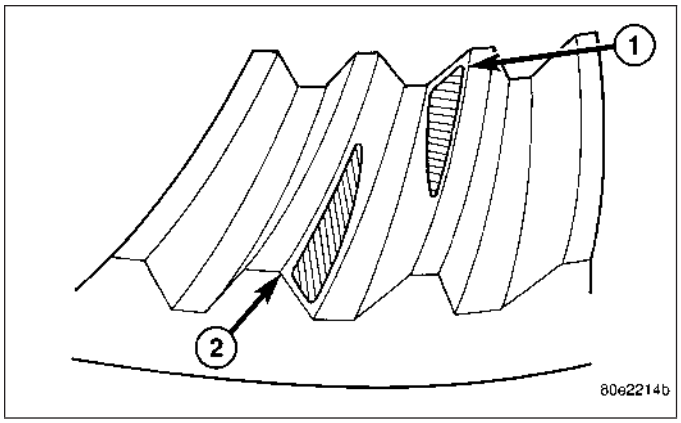
GEAR CONTACT PATTERN



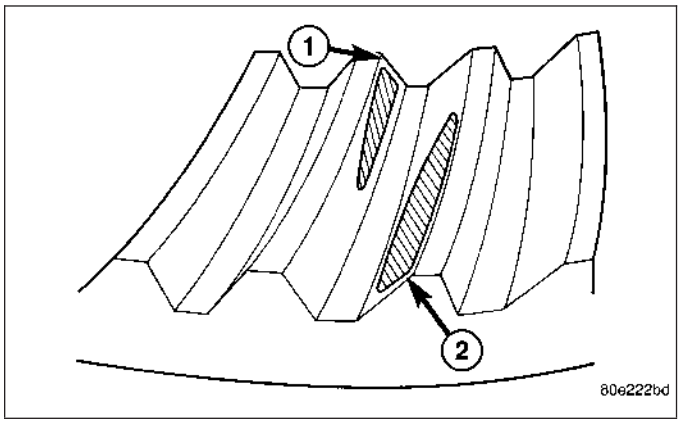
1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern is correct. Backlash and pinion depth is correct.

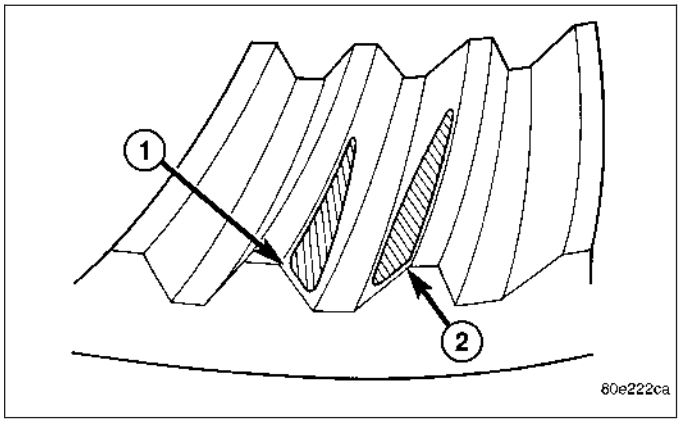
Ring gear is too far away from the pinion gear, coast side toe (1) drive side heel (2). Decrease backlash by moving ring closer to the pinion gear using the adjusters.



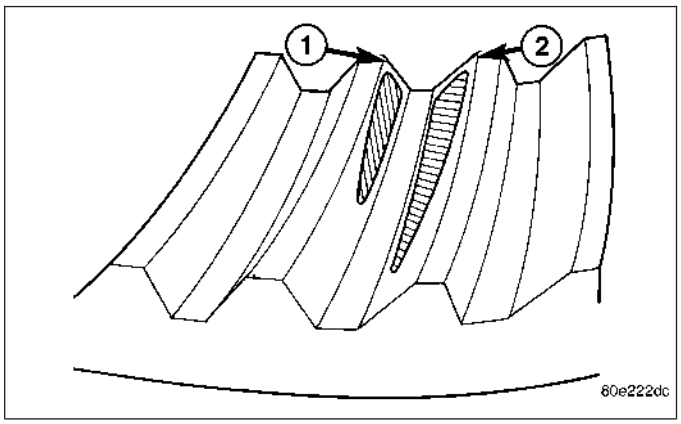
Ring gear is too close to the pinion gear, drive side toe (1) coast side heel (2). Increase backlash by moving ring away from the pinion gear using the adjusters.



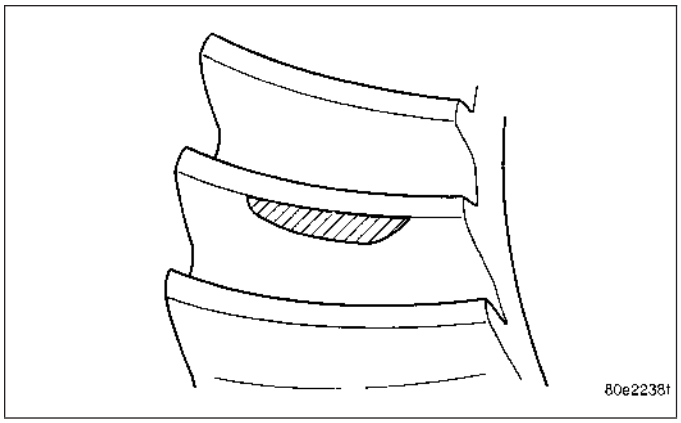
Ring gear is too far away from the pinion gear, drive side heel (1) coast side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.



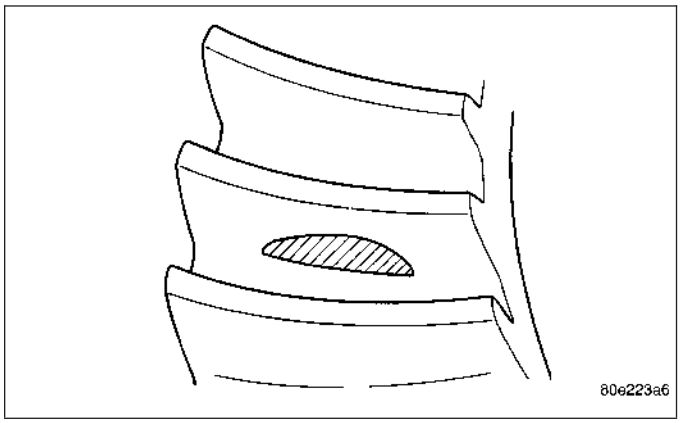
Ring gear is too close to the pinion gear, drive side toe (1) coast side toe (2). Increase backlash by moving ring gear away from the pinion gear using the adjusters.



Pinion gear is set too low. Increase pinion gear height, by increasing pinion depth shim thickness.



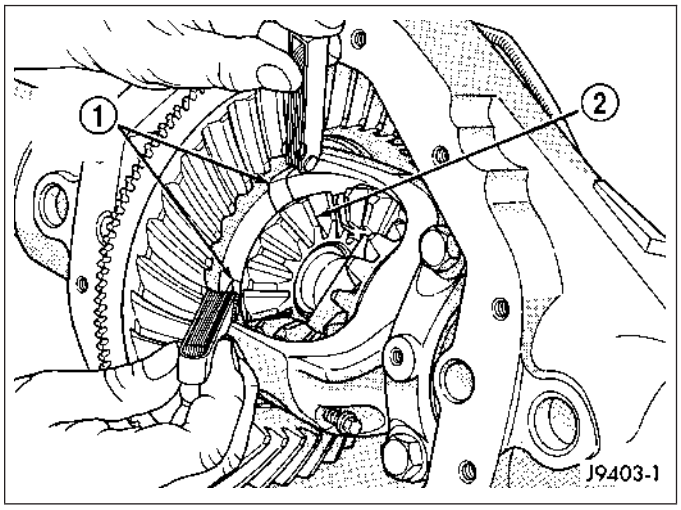
Pinion gear is set too high. Decrease pinion height by decreasing the pinion depth shim thickness.



SIDE GEAR CLEARANCE

When measuring side gear clearance, check each gear independently. If it necessary to replace a side gear, replace both gears as a matched set.

1. Install axle shafts and C-locks and pinion mate shaft.
2. Measure each side gear clearance. Insert a matched pair of feeler gauge (1) blades between the side gear (2) and differential housing on opposite sides of the hub.



SIDE GEAR CLEARANCE	0.007
THRUST WASHER THICKNESS	+ 0.033
TOTAL	0.040
	0.040
REPLACEMENT WASHER THICKNESS	− 0.037
NEW SIDE GEAR CLEARANCE	0.003

J9203-31

3. If side gear clearances is no more than 0.005 inch. Determine if the axle shaft is contacting the pinion mate shaft. **Do not remove the feeler gauges, inspect the axle shaft with the feeler gauge inserted behind the side gear.** If the end of the axle shaft is not contacting the pinion mate shaft, the side gear clearance is acceptable.
4. If clearance is more than 0.005 inch (axle shaft not contacting mate shaft), record the side gear clearance. Remove the thrust washer and measure its thickness with a micrometer. Add the washer thickness to the recorded side gear clearance. The sum of gear clearance and washer thickness will determine required thickness of replacement thrust washer.

In some cases, the end of the axle shaft will move and contact the mate shaft when the feeler gauge is inserted. The C-lock is preventing the side gear from sliding on the axle shaft.

5. If there is no side gear clearance, remove the C-lock from the axle shaft. Use a micrometer to measure the thrust washer thickness. Record the thickness and re-install the thrust washer. Assemble the differential case without the C-lock installed and re-measure the side gear clearance.
6. Compare both clearance measurements. If the difference is less than 0.012 inch (0.305 mm), add clearance recorded when the C-lock was installed to thrust washer thickness measured. The sum will determine the required thickness of the replacement thrust washer.
7. If clearance is 0.012 inch (0.305 mm) or greater, both side gears must be replaced (matched set) and the clearance measurements repeated.
8. If clearance (above) continues to be 0.012 inch (0.305 mm) or greater, the case must be replaced.

SPECIFICATIONS

REAR AXLE - 8 1/4

AXLE SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Axle Ratio	3.55, 3.92
Differential Case Flange Runout	0.076 mm (0.003 in.)
Differential Case Clearance	0.12 mm (0.005 in.)
Ring Gear Diameter	209.5 mm (8.25 in.)
Ring Gear Backlash	0.12-0.20 mm (0.005-0.008 in.)
Ring Gear Runout	0.12 mm (0.005 in.)
Pinion Bearing Preload - Original Bearings	1-2 N·m (10-20 in. lbs.)
Pinion Bearing Preload - New Bearings	1.7-4 N·m (15-35 in. lbs.)

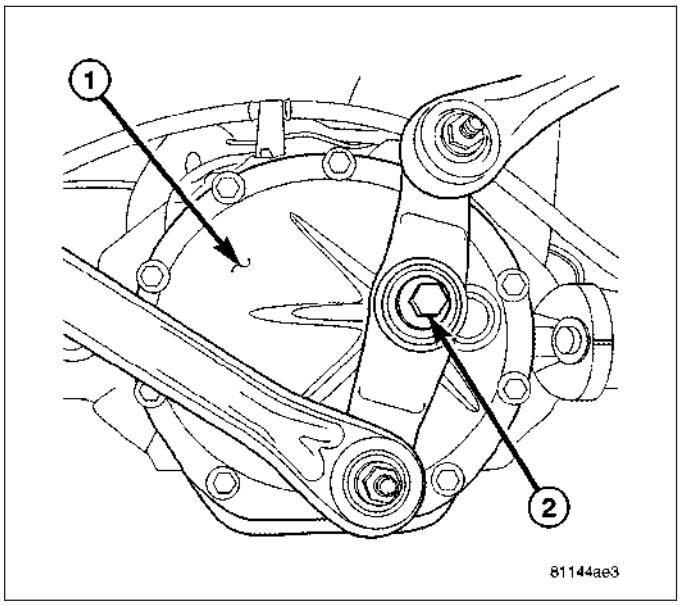
COVER-DIFFERENTIAL

REMOVAL

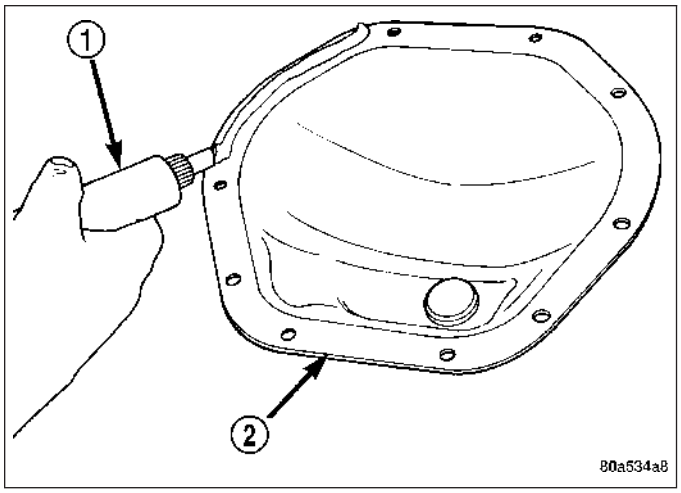
1. Remove diffrential fill plug.
2. Remove watts link bell crank bolt (2) from differential cover (1).
3. Remove differential cover bolts.
4. Remove cover and drain fluid.



INSTALLATION

1. Clean differential cover.
2. Apply a bead of orange Mopar Axle RTV Sealant (1) or equivalent to the cover (2).

CAUTION: If cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will compromise adhesion quality.



3. Install cover and tighten bolts in a criss-cross pattern to 44 N·m (32 ft. lbs.).
4. Fill differential with 2.07 L (4.375 pts.) of gear lubricant.

CAUTION: Fill differential by volume only, not to the bottom of fill plug. Failure to follow these instructions will cause an over fill condition.

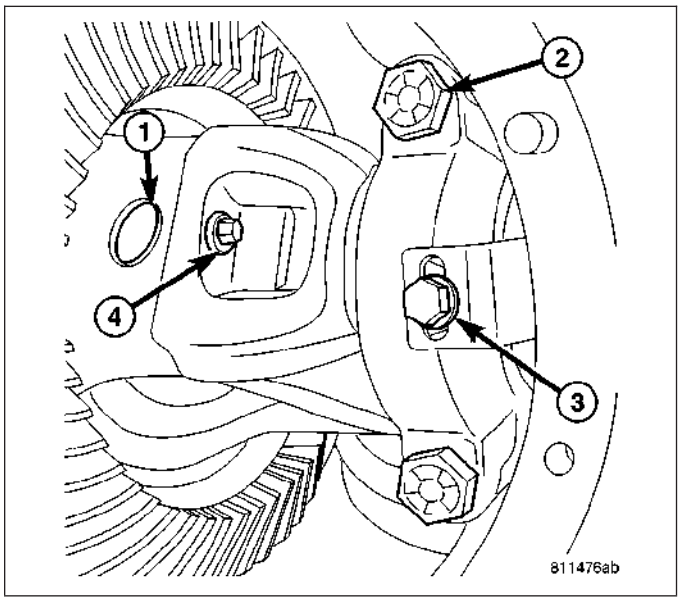
5. Install fill hole plug.
6. Install watts link bell crank bolt and tighten to 217 N·m (160 ft. lbs.).

NOTE: Bell crank bolt has a Loctite® patch, a new bolt should be used. If bolt is not available, clean bolt and apply Loctite® 242 to the threads.

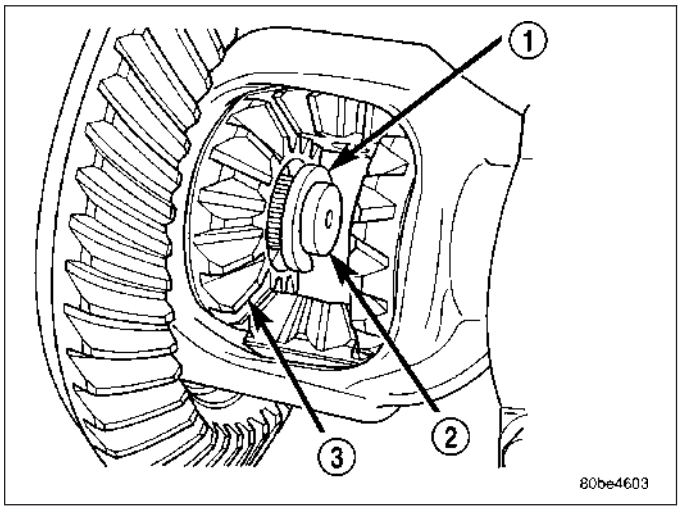
SHAFT-AXLE

REMOVAL

1. With vehicle in neutral, position it on a hoist.
2. Remove brake caliper adapter with caliper and remove rotor.
3. Remove differential housing cover and drain lubricant.
4. Rotate differential case, to access pinion mate shaft lock screw (4). Remove screw (4) and pinion mate shaft (1) from differential case.

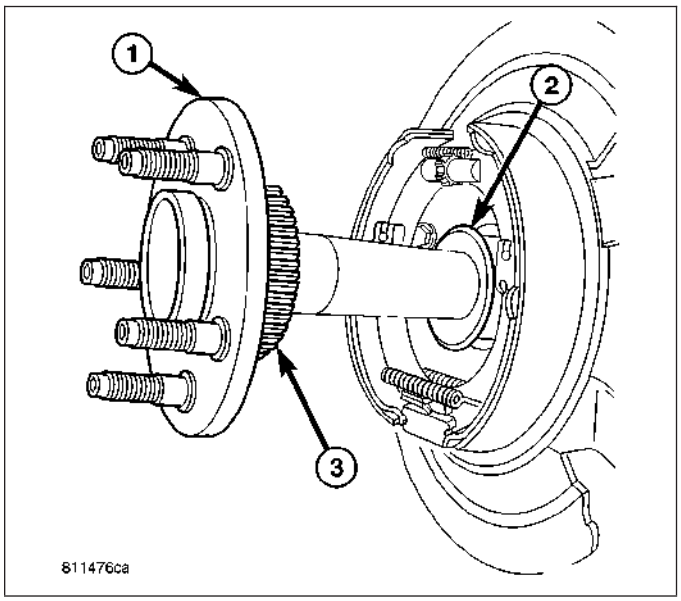


5. Push axle shaft (2) inward and remove axle shaft C-lock (1).
6. Remove axle shaft.

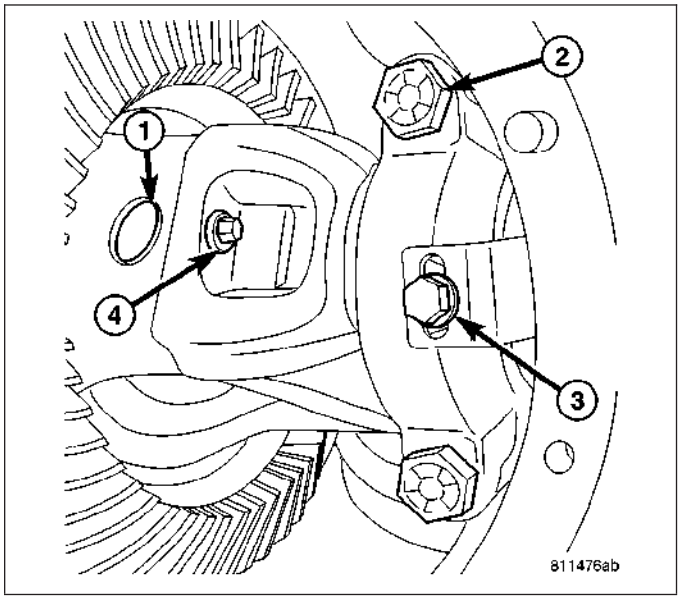


INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Insert axle shaft (1) through seal (2) and engage into side gear splines.



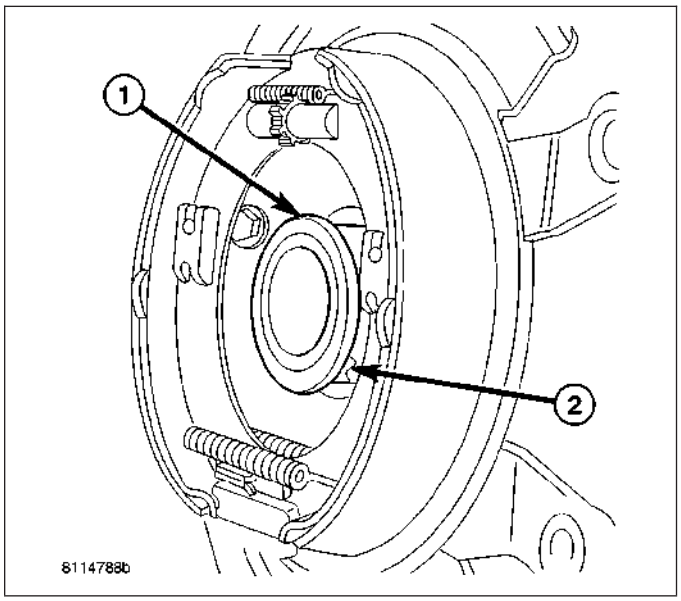
3. Insert C-lock in end of axle shaft then push axle shaft outward to seat C-lock in side gear.
4. Insert pinion shaft into differential case and through thrust washers and differential pinions.
5. Align hole in shaft with hole in differential case and install lock screw (4) with Loctite® on the threads. Tighten lock screw to 25 N·m (220 in. lbs.).
6. Install differential cover and fill with gear lubricant.
7. Install brake rotor and caliper adapter with caliper.



SEAL-AXLE SHAFT

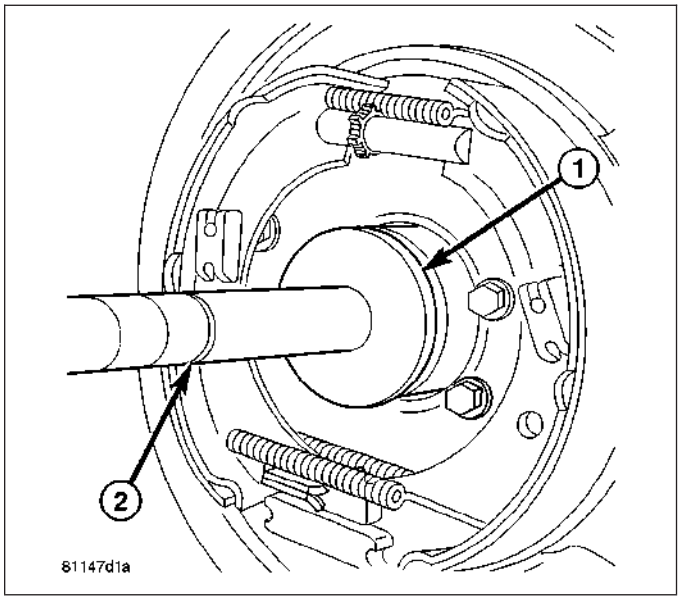
REMOVAL

1. Remove axle shaft.
2. Remove axle shaft seal (1) from end of the axle tube (2) with a pry bar.



INSTALLATION

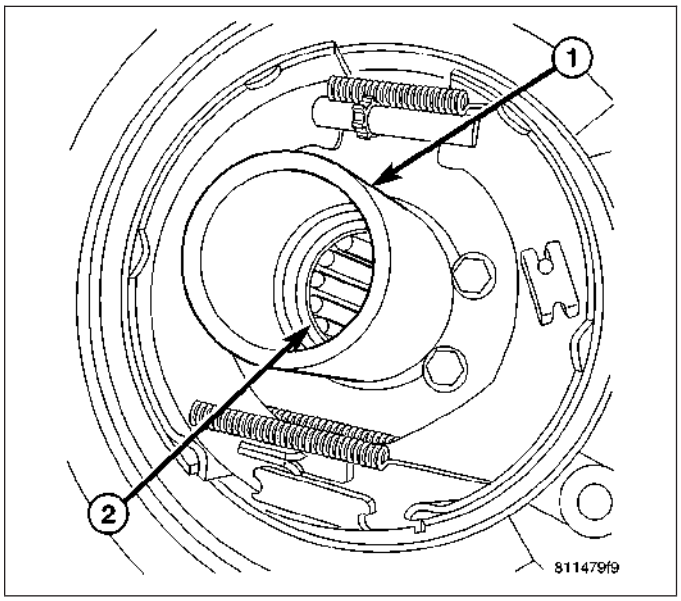
1. Remove any old sealer/burrs from axle tube.
2. Coat **new** seal lip with axle lubricant and install seal with Installer 9337 (1) and Handle C-4171 (2).
3. Install axle shaft.



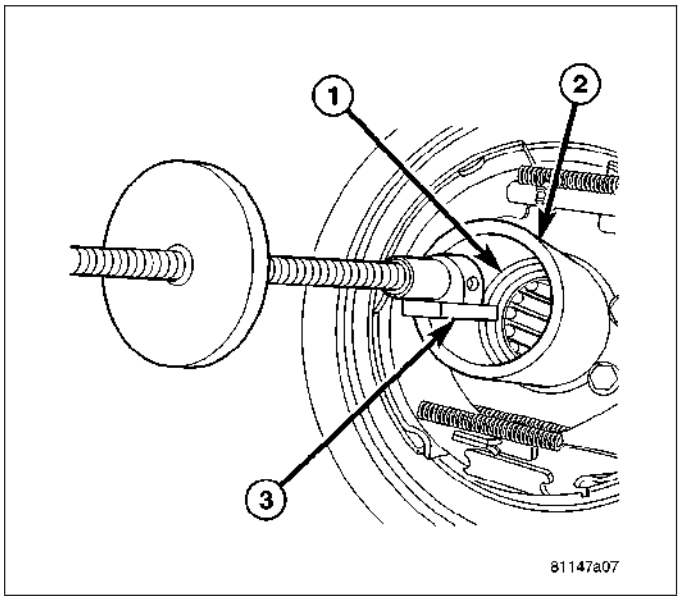
BEARING-AXLE

REMOVAL

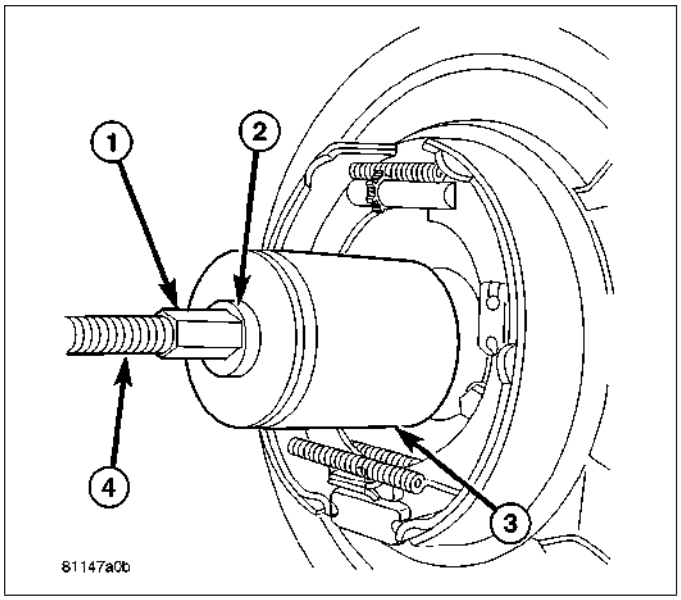
1. Remove axle shaft.
2. Remove axle seal with pry bar.
3. Position bearing Receiver 9338 (1) on axle tube.



4. Insert bearing Remover 6310 (4) with Foot 6310-9 (3) through receiver (2) and bearing (1).



5. Tighten Remove 6310 nut (1) to pull bearing into the receiver (3).

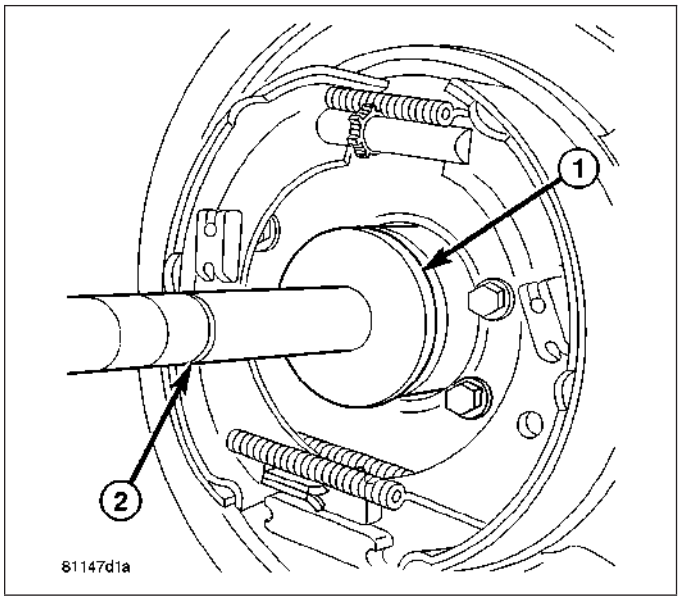


INSTALLATION

1. Remove any old sealer/burrs from axle tube.
2. Install axle shaft bearing with Installer 9337 (1) and Handle C-4171 (2). Drive bearing in until tool contacts the axle tube.

NOTE: Bearing is installed with the bearing part number against the installer.

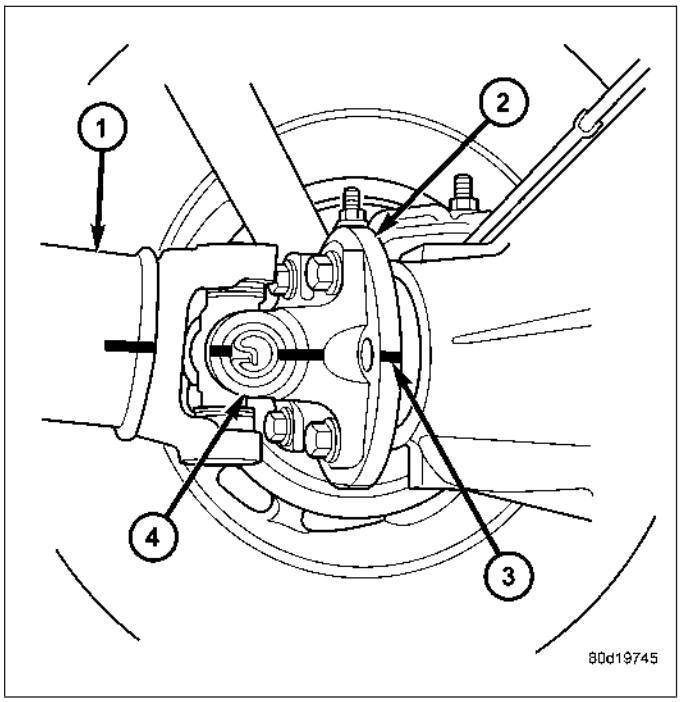
3. Coat **new** axle seal lip with axle lubricant and install with Installer 9337 and Handle C-4171.
4. Install axle shaft.



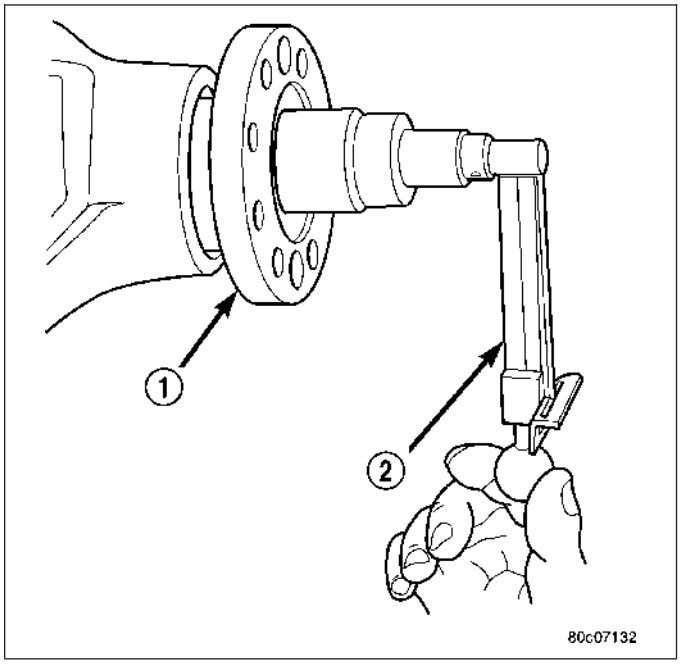
SEAL-PINION

REMOVAL

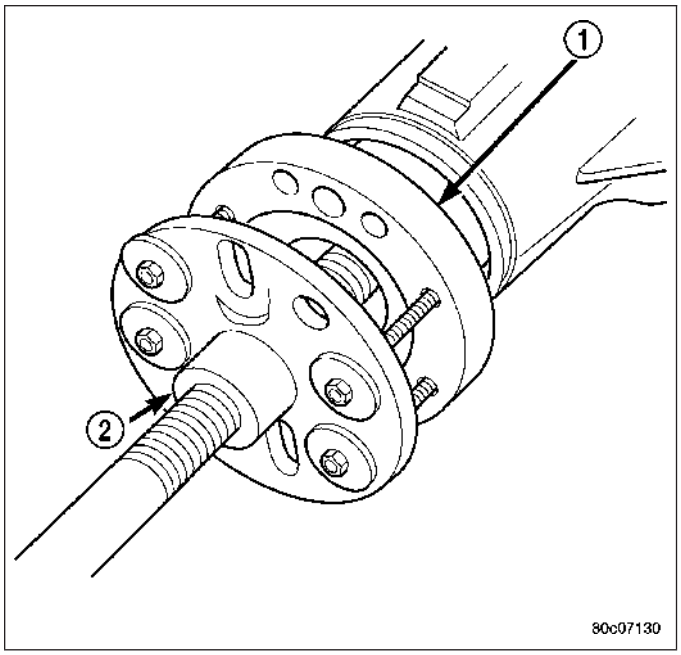
1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line across the axle flange (3) and propeller shaft flange (4).



3. Remove propeller shaft
4. Remove brake calipers and rotors to prevent any drag.
5. Rotate flange three or four times and verify flange rotates smoothly.
6. Measure torque to rotating pinion flange (1) with a inch pound torque wrench (2). Record reading for installation reference.

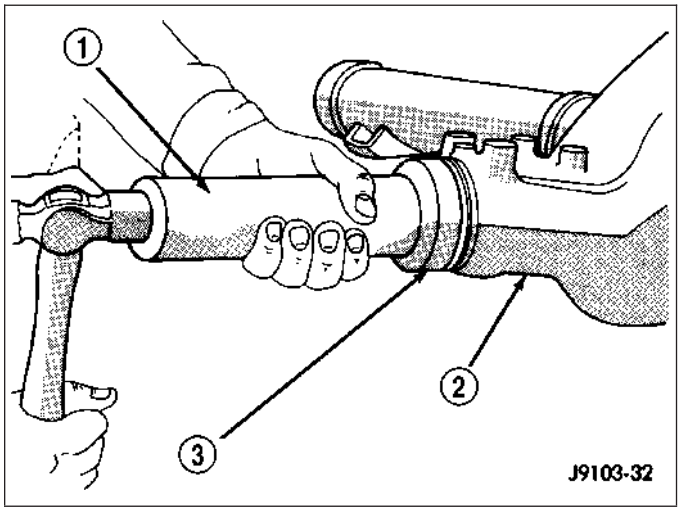


7. Install bolts into two of the threaded holes in the flange 180° apart.
8. Position Holder 6719 against the flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so the Holder 6719 is held to the flange.
9. Remove pinion nut and washer.
10. Remove flange (1) with Remover C-452 (2).
11. Remove pinion seal with a pry tool or slide-hammer mounted screw.

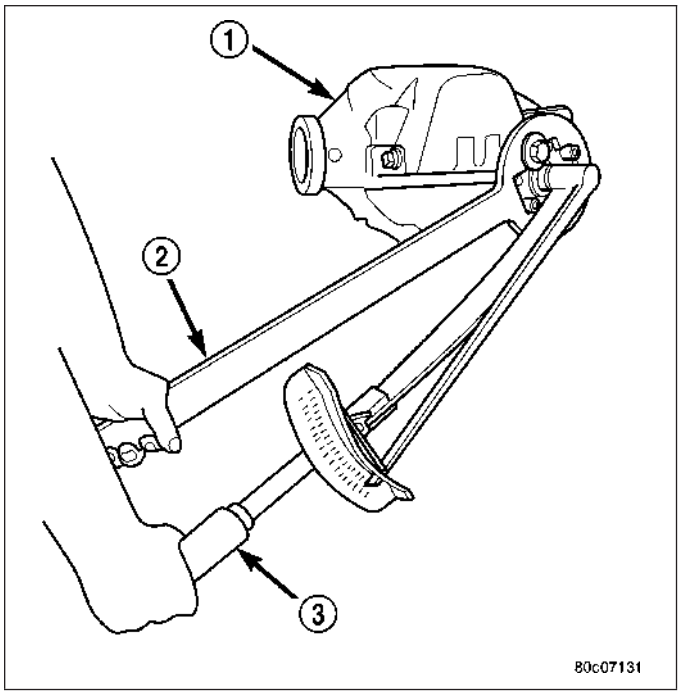


INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install **new** pinion seal with Installer C-4076-B (3) and Handle C-4735 (1).



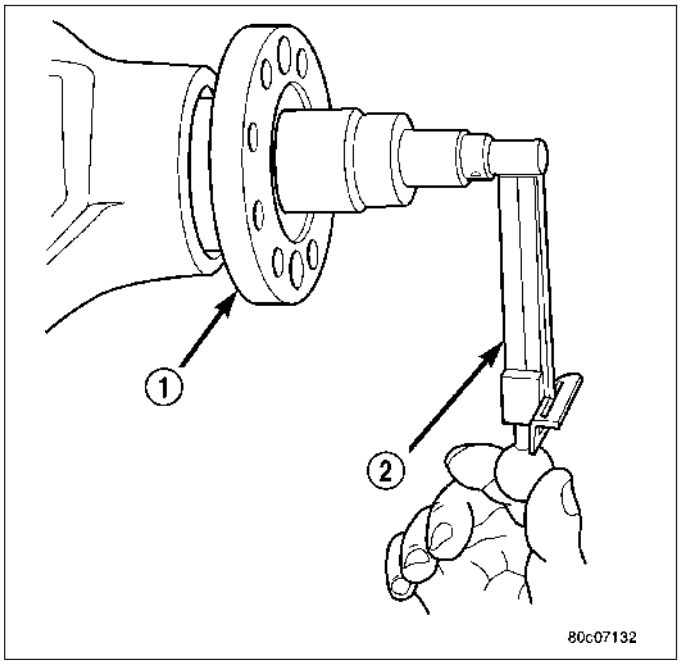
3. Install flange on the end of the shaft with the reference marks aligned.
4. Install bolts into two of the threaded holes in the flange 180° apart.
5. Position Holder 6719 against flange. Install a bolt and washer into one of the remaining threaded holes. Tighten bolts so Holder 6719 is held to the flange.
6. Install flange on pinion shaft with Installer C-3718 and Holder 6719.
7. Install pinion washer and a **new** pinion nut. The convex side of the washer must face outward.



CAUTION: Do not exceed the minimum tightening torque when installing the companion flange retaining nut at this point. Failure to follow these instructions can damage the collapsible spacer or bearings.

8. Hold flange with Holder 6719 (2) and tighten pinion nut to 285 N·m (210 ft. lbs.). Rotate pinion several revolutions to ensure bearing rollers are seated.

9. Rotate pinion flange (1) with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).



CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If rotating torque is exceeded, a new collapsible spacer must be installed. Failure to follow these instructions can damage the collapsible spacer or bearings.

10. If rotating torque is low use Holder 6719, to hold flange and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

NOTE: The seal replacement is unacceptable if final pinion nut torque is less than 285 N·m (210 ft. lbs.).

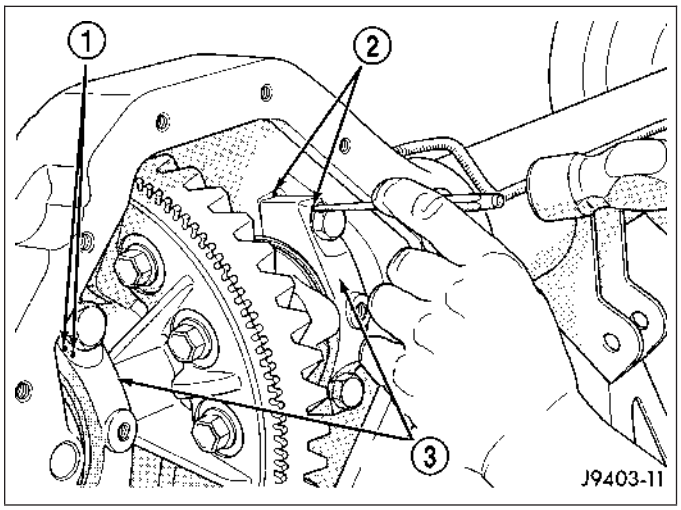
NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

11. Install propeller shaft.
12. Install rear brake rotors components.

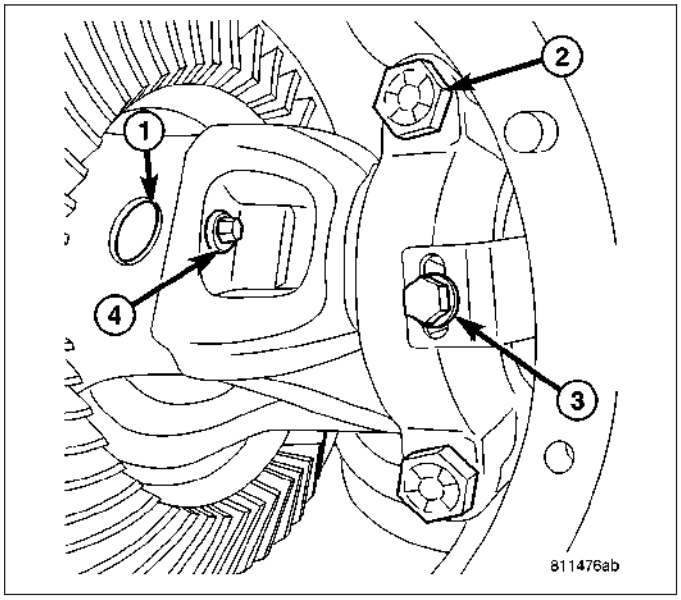
DIFFERENTIAL

REMOVAL

1. Remove differential cover.
2. Remove axle shafts.
3. Remove ABS sensor from housing.
4. Mark differential housing and bearing caps (3) for installation reference.

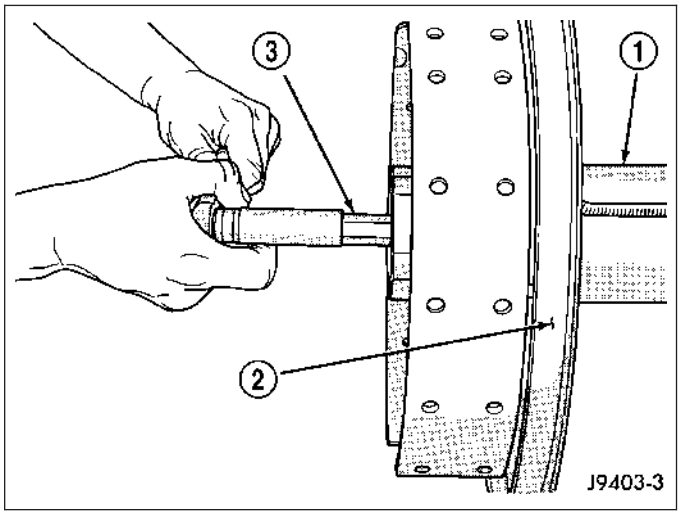


5. Remove bearing adjuster lock bolt (3) from bearing caps.



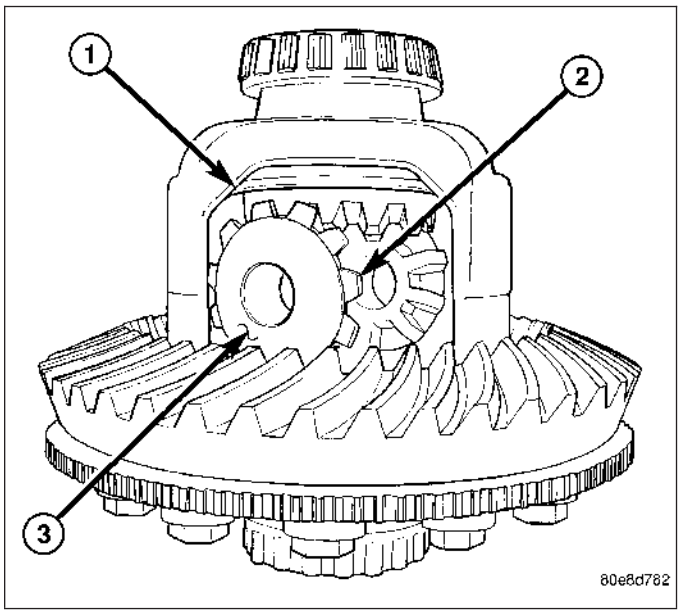
6. Loosen differential bearing cap bolts.
7. Loosen differential bearing adjusters through the axle tubes (1) with Wrench C-4164 (3).
8. Hold differential case while removing bearing caps and adjusters.
9. Remove differential case and tag differential bearing cups and adjusters to indicate location.
10. Clean housing cavity with flushing oil, light engine oil or a lint free cloth.

NOTE: Do not use steam, kerosene or gasoline to clean the housing.

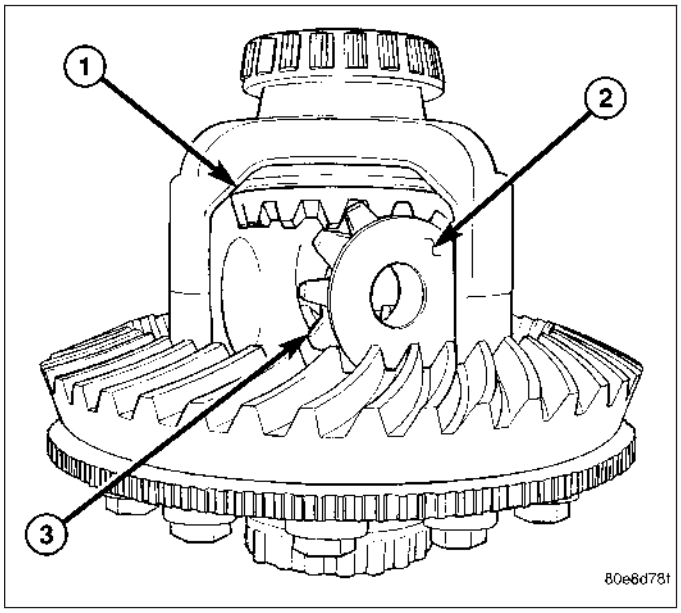


DISASSEMBLY

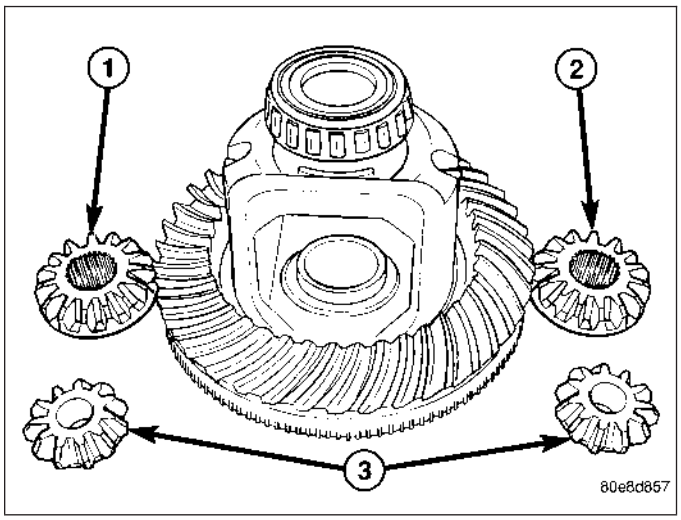
1. Rotate one pinion gear (2) with thrust washer (3) to the differential window (1). Remove gear and thrust washer.



2. Rotate remaining pinion gear (3) with thrust washer (2) to the differential window (1). Remove gear and washer.



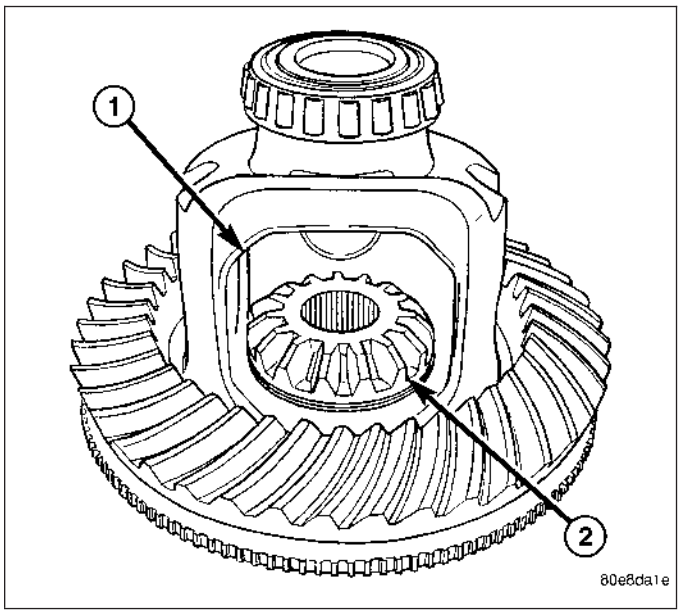
3. Remove differential side gears (1) (2) and thrust washers.



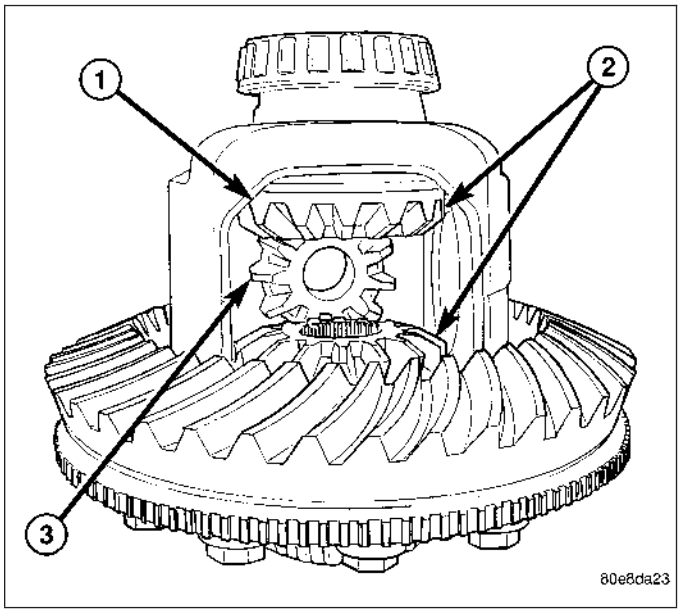
ASSEMBLY

NOTE: If same gears and thrust washers are being used, install them into their original locations.

1. Lubricate all differential components with axle lubricant.
2. Install differential side gears (2) and thrust washers.



3. Install first pinion gear (3) with thrust washer into differential window (1) and side gears (2). Rotate pinion gear into the case.
4. Install remaining pinion gear and thrust washer. Rotate gears to align hole in the pinion gears with hole in the differential case.
5. Slide pinion shaft into the case and through the pinion gears to align the gears.

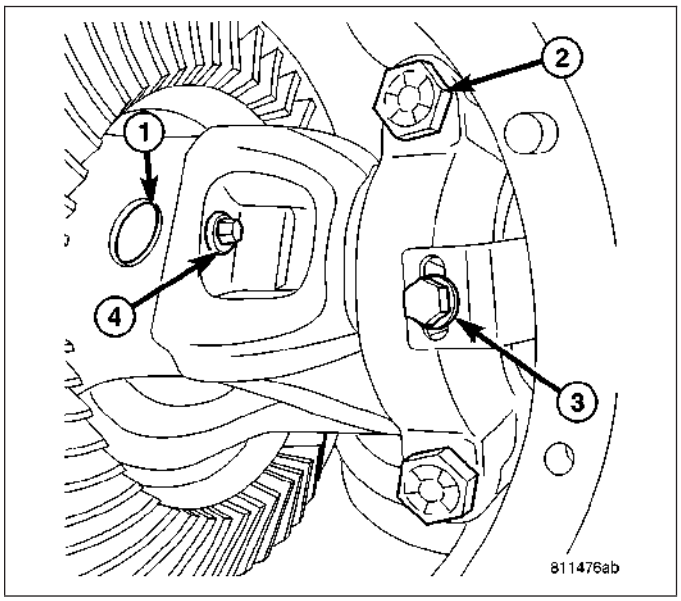


INSTALLATION

1. Apply a coat of hypoid gear lubricant to differential bearings, bearing cups and threaded adjusters.

NOTE: Grease can be used to keep the adjusters in position.

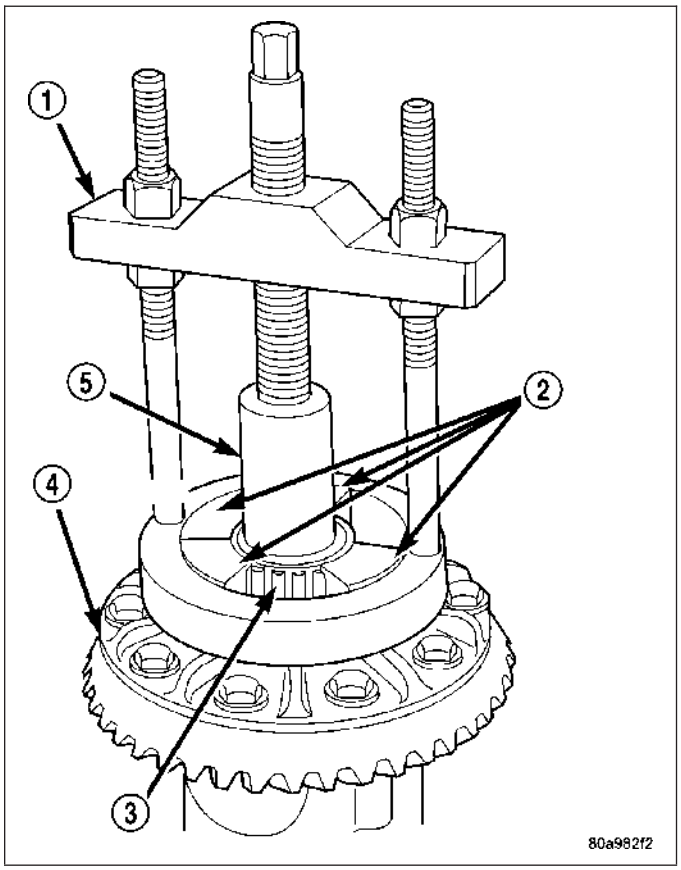
2. Install differential assembly into the housing.
3. Install differential bearing caps in their original locations.
4. Install bearing cap bolts and tighten upper bolts to 14 N·m (10 ft. lbs.). Tighten lower bolts finger-tight until the bolt head is seated.
5. Perform differential bearing preload and adjustment procedure.
6. Tighten bearing cap bolts (2) to 135 N·m (100 ft. lbs).
7. Install adjuster locks (3) on bearing caps and tighten bolts to 10 N·m (95 in. lbs.).
8. Install axle shafts.
9. Install differential cover.



BEARINGS-DIFFERENTIAL CASE

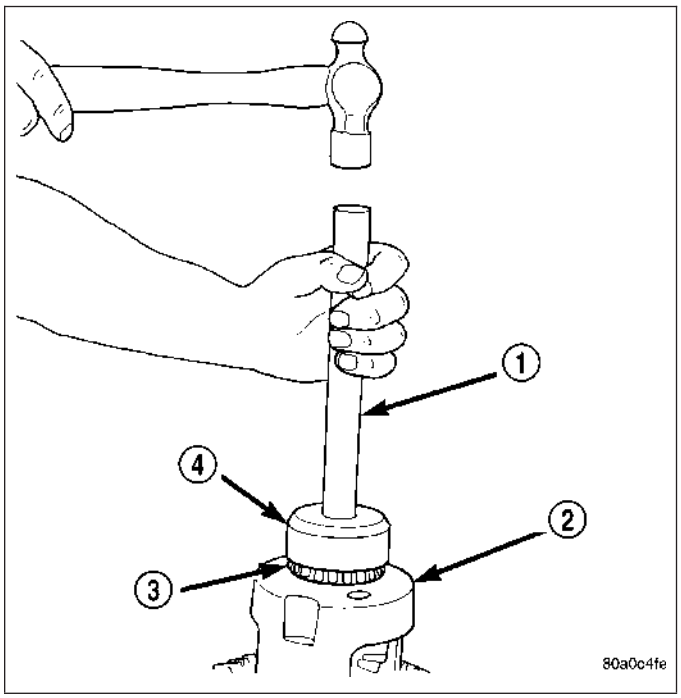
REMOVAL

1. Remove differential case.
2. Remove differential bearings with Puller C-293-PA (1) and Adapters C-293-48 (2) and Plug SP-3289 (5).



INSTALLATION

1. Install differential side bearings (3) with Installer C-4340 (4) and Handle C-4171 (1).
2. Install differential case.

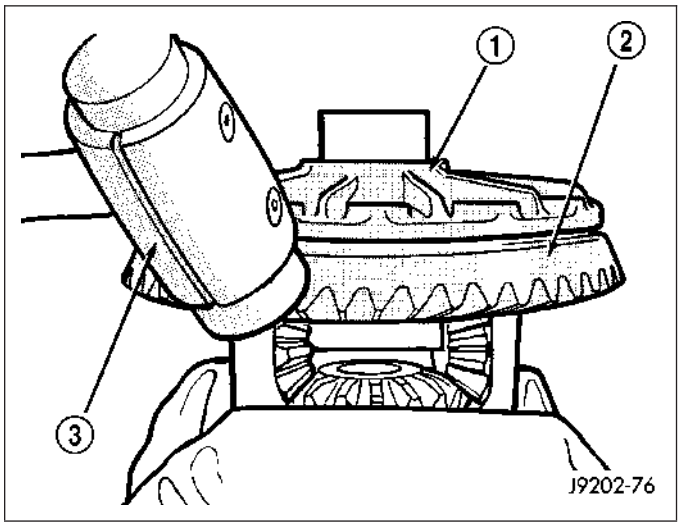


GEAR-PINION/RING/TONE RING

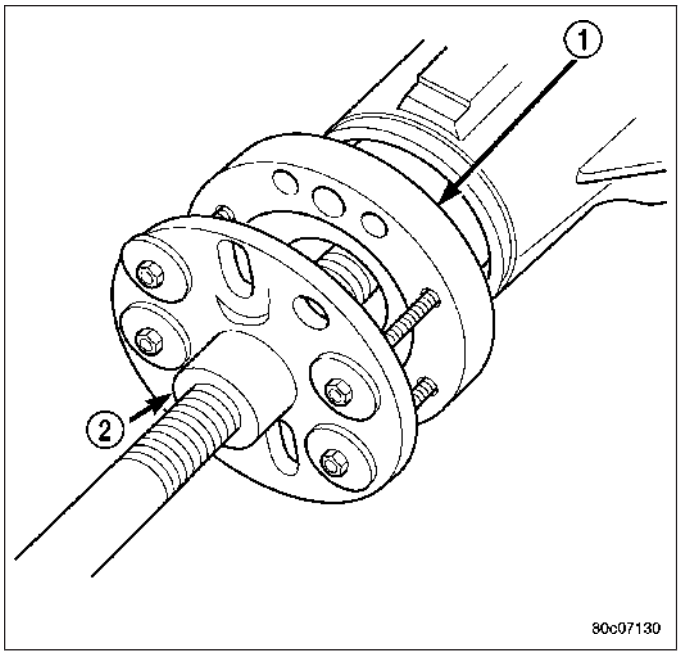
REMOVAL

NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the matching gear.

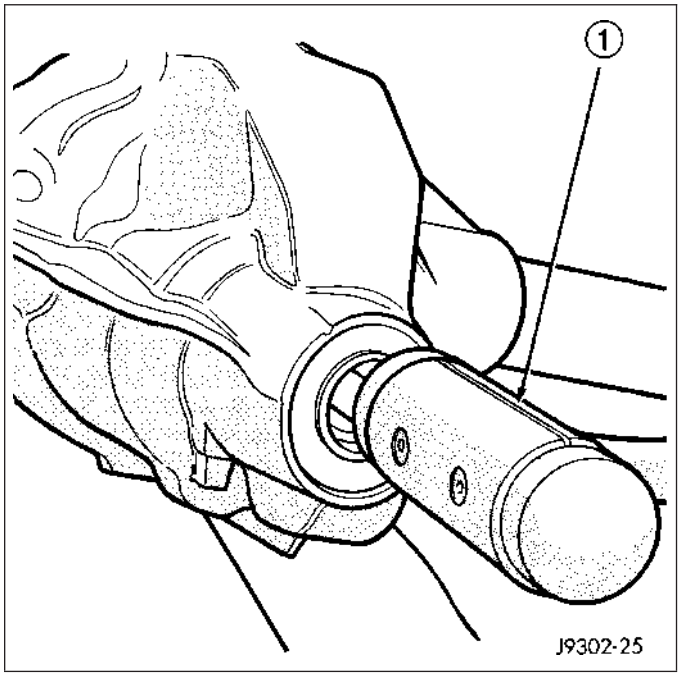
1. Remove propeller shaft.
2. Remove differential from the axle housing.
3. Place differential case in vise with soft metal jaw protectors.
4. Remove ring gear bolts and drive ring gear (2) off differential case with a soft hammer (3).



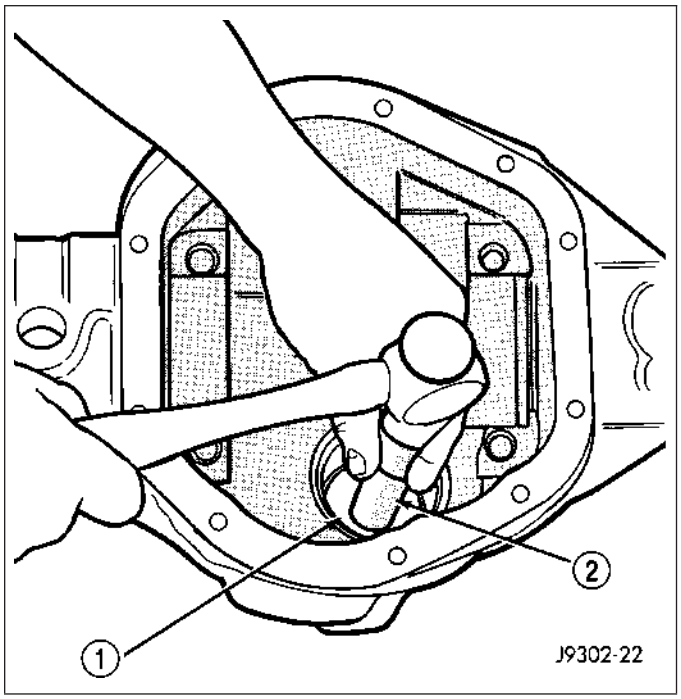
5. Install bolts into two of the threaded holes in the pinion flange 180° apart.
6. Position Holder 6719 against flange and install a bolt and washer into one of the remaining threaded holes. Tighten bolts so the Holder 6719 is held to the flange.
7. Hold flange with Holder 6719 and remove flange nut and washer.
8. Remove flange (1) with Remover C-452 (2).



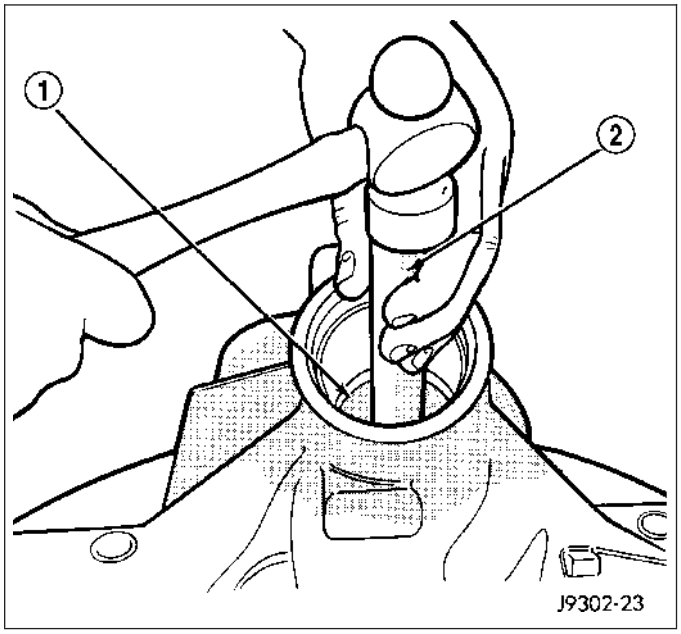
9. Remove pinion from housing with a soft hammer (1).



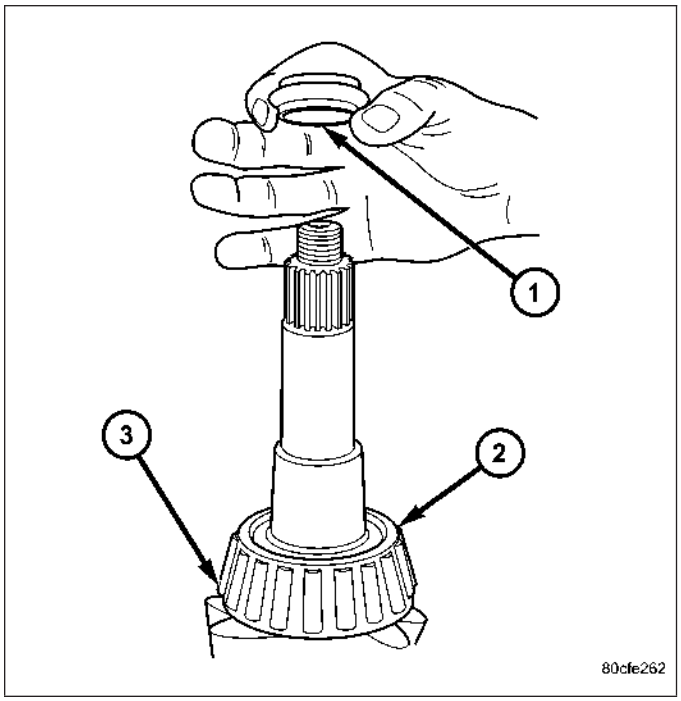
10. Remove pinion seal with a pry tool or slide-hammer mounted screw.
11. Remove oil slinger if equipped and front pinion bearing.
12. Remove front pinion bearing cup with Remover C-4345 (1) and Handle C-4171 (2).



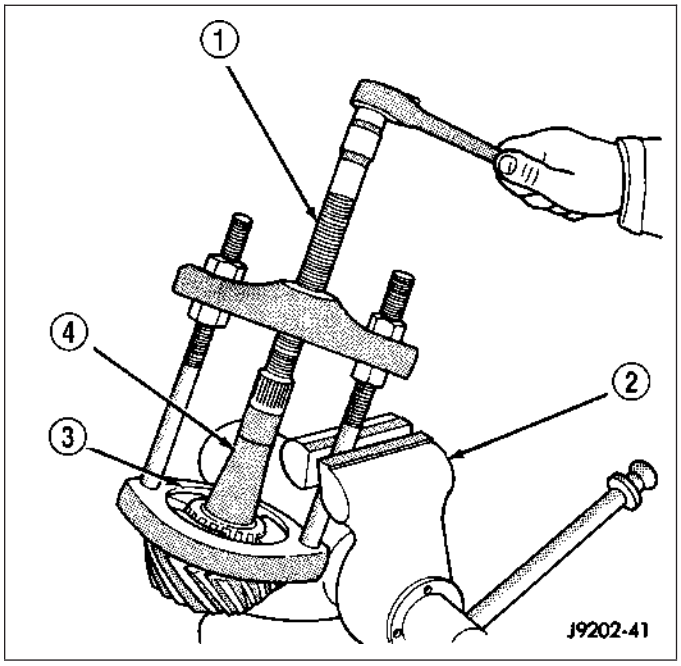
13. Remove rear bearing cup from housing with Remover C-4307 (1) and Handle C-4171 (2).



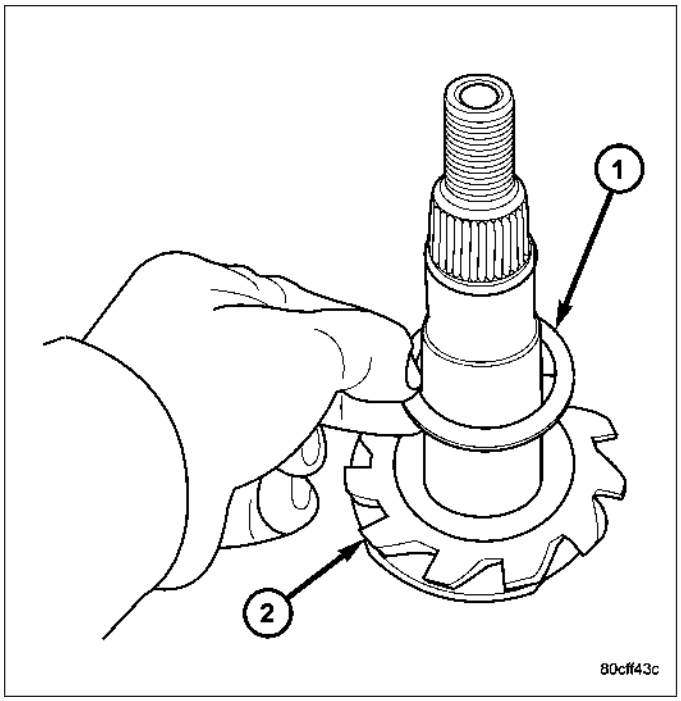
14. Remove collapsible preload spacer (1) from pinion gear.



15. Remove rear bearing from pinion with Puller/ Press C-293-PA (1) and Adapters C-293-47 (3).



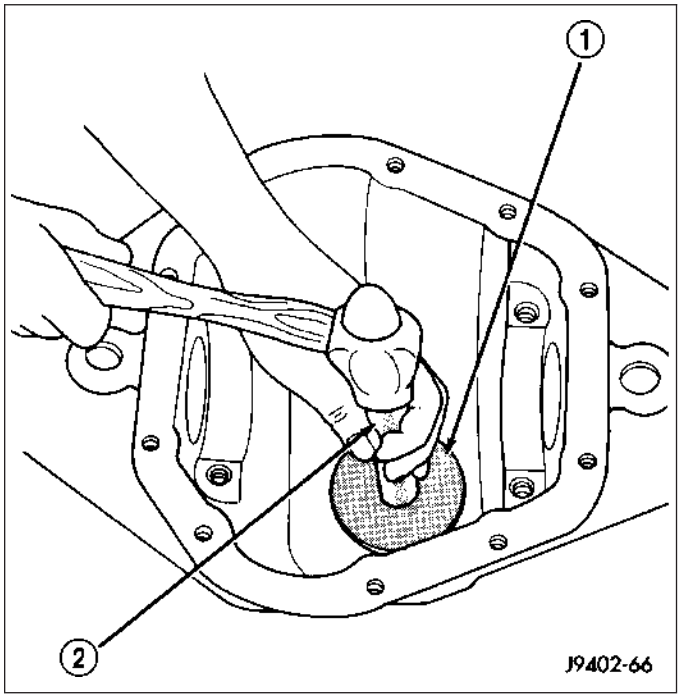
16. Remove depth shims (1) from pinion gear (2) and record shim thickness.



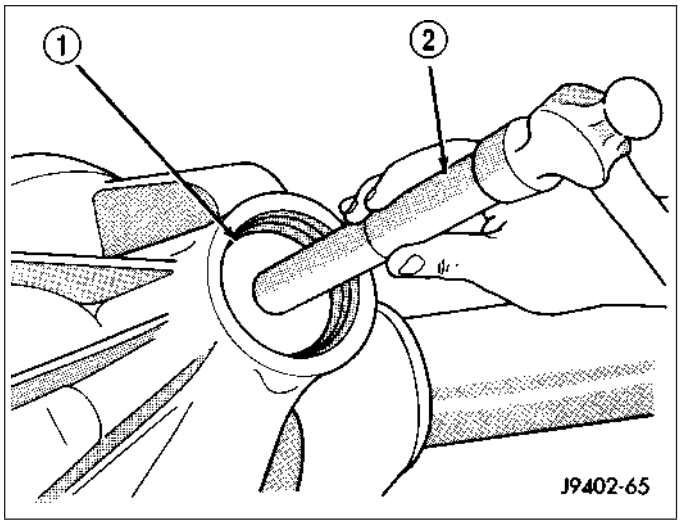
INSTALLATION

NOTE: Ring and pinion gears are a matched set. Do not replace one gear without replacing the other matching gear. If ring and pinion gears or bearings are replaced, Refer to Adjustments for Pinion Gear Depth Setting.

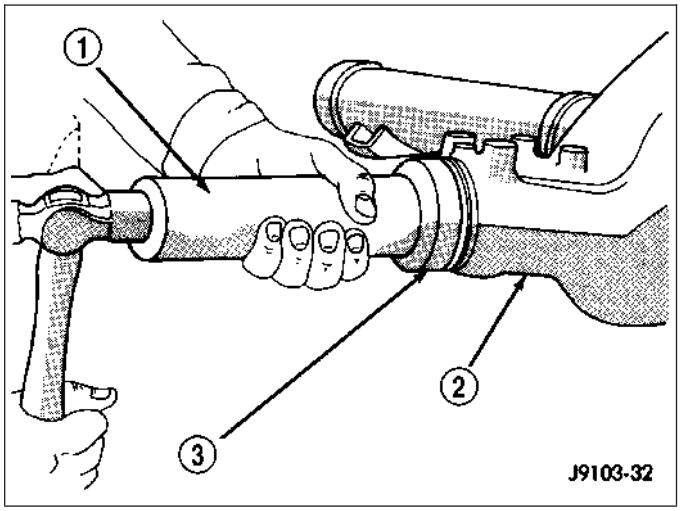
1. Apply Mopar Door Ease or stick lubricant to outside surface of pinion bearing cups.
2. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (20).



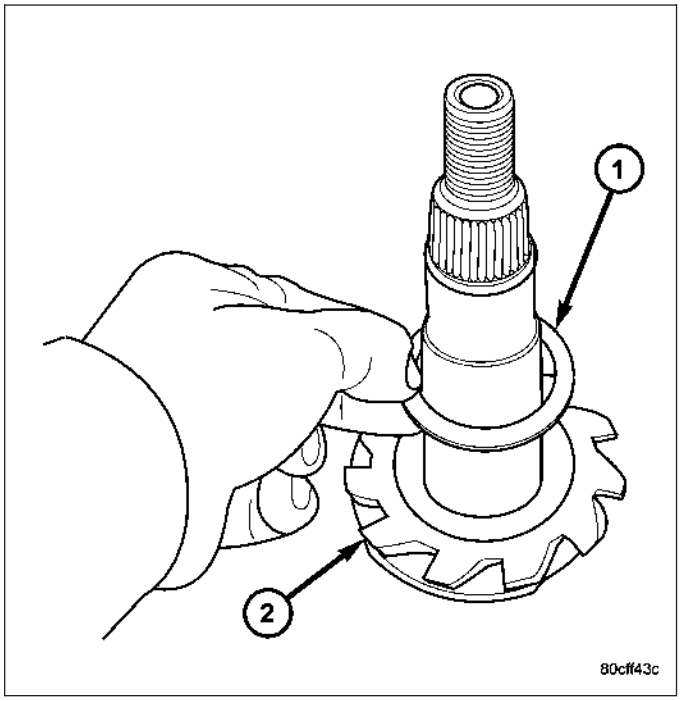
3. Install front pinion bearing cup with Installer D-130 (1) and Handle C-4171 (2).



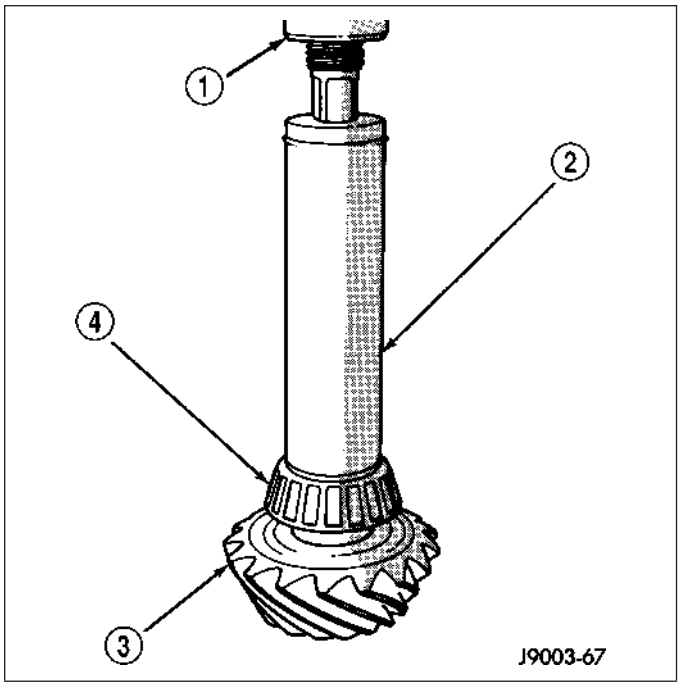
4. Install front pinion bearing and oil slinger if equipped.
5. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer C-4076-B (3) and Handle C-4735 (1).



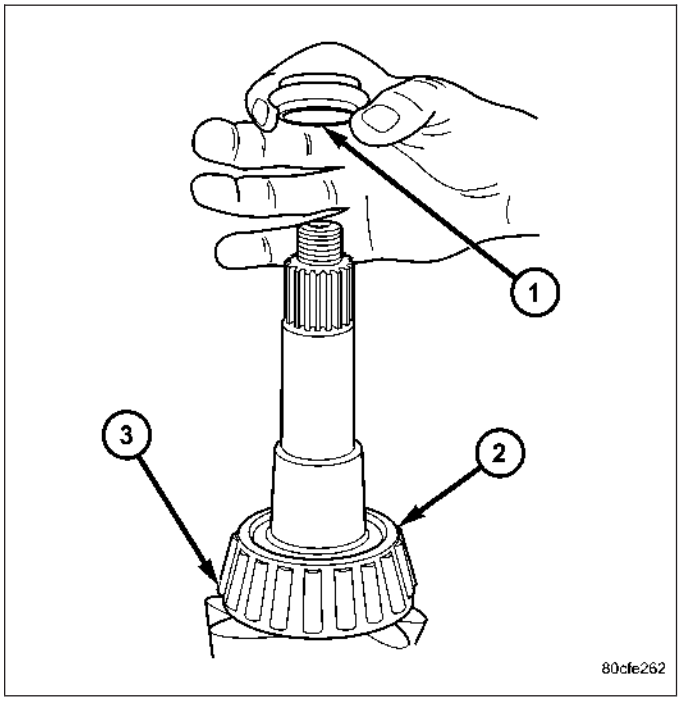
6. Install proper thickness depth shim (1) on pinion gear (2).



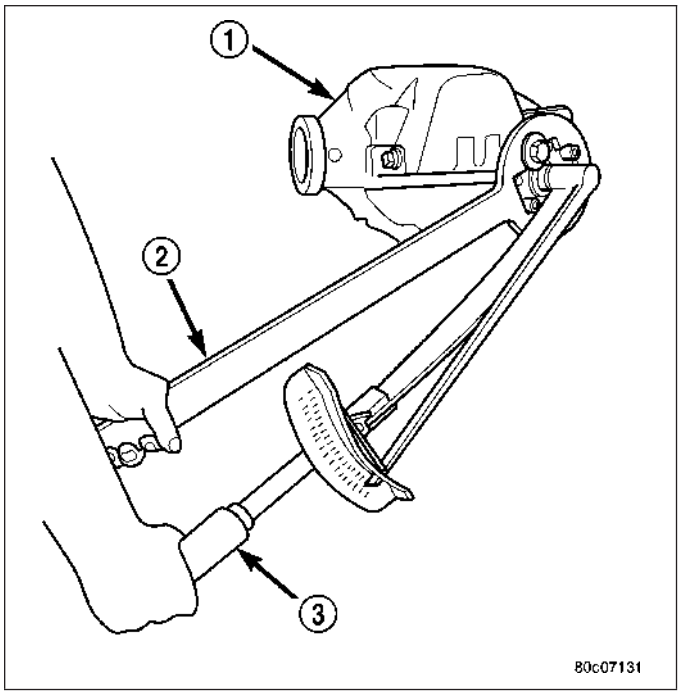
7. Install rear bearing (4) and slinger if equipped, on pinion gear (3) with Installer 6448 (2) and a press (1).



8. Install **new** collapsible spacer (1) on pinion gear and install pinion in housing.

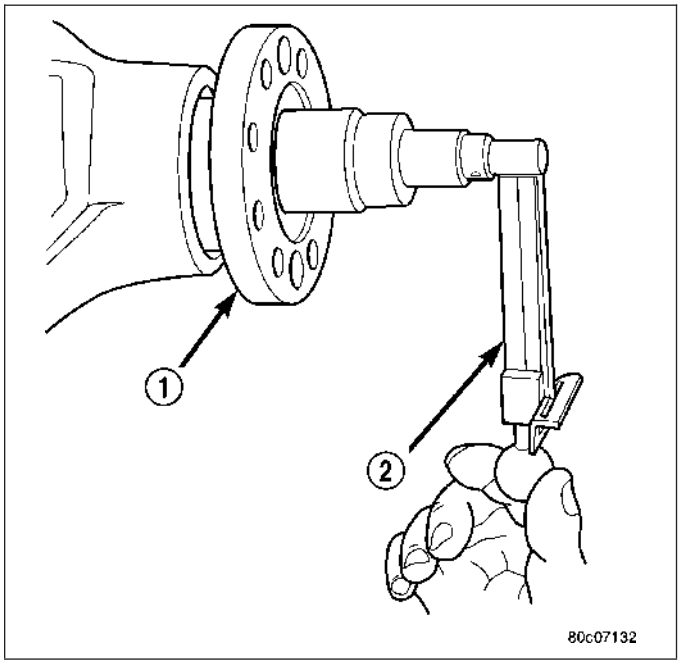


9. Install front pinion bearing on pinion shaft.
10. Install new pinion seal with Installer C-4076-B and Handle C-4735-1.
11. Install pinion flange with Installer C-3718.
12. Install bolts into two of the threaded holes in the flange 180° apart.
13. Position Holder 6719 against the flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so the Holder 6719 is held to the flange.
14. Install flange washer and a new nut on pinion and tighten pinion nut until there is zero end-play.
15. With a torque wrench (3) tighten the pinion nut to 285 N·m (210 ft. lbs.).



CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed. Failure to follow these instructions will result in damage.

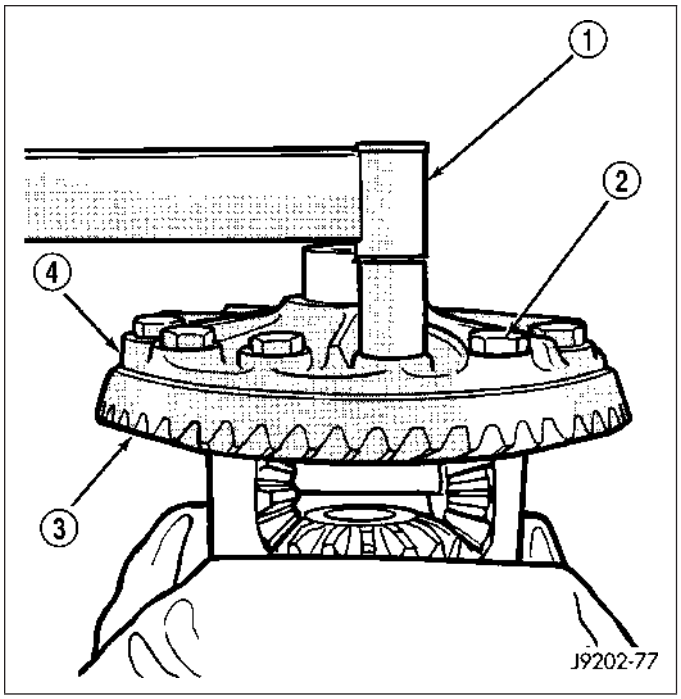
16. Slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the desired rotating torque is achieved. Measure rotating torque frequently with an inch pound torque wrench (2) to avoid over crushing the collapsible spacer.
17. Check pinion rotating torque with an inch pound torque wrench. The pinion rotating torque should be:
    - Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
    - New Bearings: 2 to 5 N·m (15 to 35 in. lbs.).



18. Position exciter ring on differential case. With a brass drift slowly and evenly tap the exciter ring into position.
19. Position ring gear on the differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
20. Invert the differential case in the vise.
21. Install **new** ring gear bolts (2) and alternately tighten to 102 N·m (75 ft. lbs.).

CAUTION: Never reuse the bolts that held the ring gear to the differential case. Failure to follow these instructions will result in fracture bolts can causing extensive damage.

22. Install differential in housing and verify gear mesh, backlash and contact pattern.
23. Install differential cover.



REAR AXLE - 9 1/4

DIAGNOSIS AND TESTING

REAR AXLE - 9 1/4

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints or C/V joints.
- Worn side-gear thrust washers
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or C/V joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or C/V joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determined the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

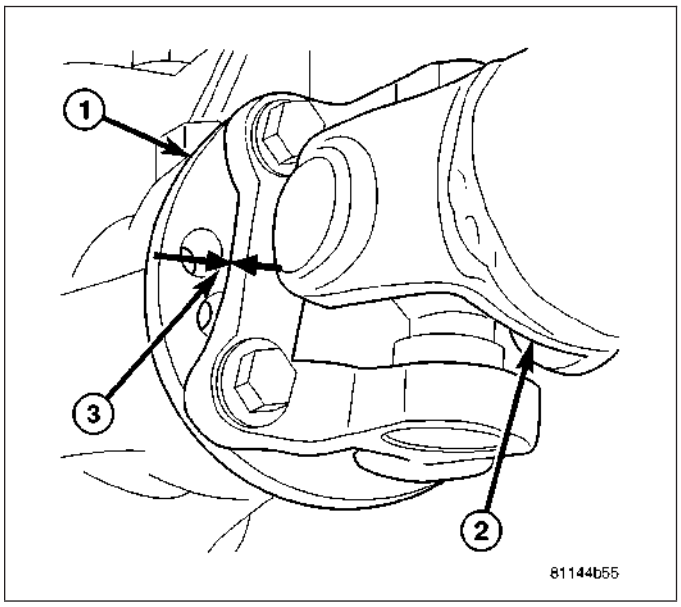
DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	1. Wheel loose.	1. Tighten loose nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace bearing.
Axle Shaft Noise	1. Misaligned axle tube.	1. Inspect axle tube alignment. Correct as necessary.
	2. Bent or sprung axle shaft.	2. Inspect and correct as necessary.
Axle Shaft Broke	1. Misaligned axle tube.	1. Replace the broken shaft after correcting tube mis-alignment.
	2 Vehicle overloaded.	2. Replace broken shaft and avoid excessive weight on vehicle.
	3. Erratic clutch operation.	3. Replace broken shaft and avoid or correct erratic clutch operation.
	4. Grabbing clutch.	4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	1. Improper adjustment of the differential bearings.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly.
	2. Excessive ring gear backlash.	2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.
	3. Vehicle overloaded.	3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
	4. Erratic clutch operation.	4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid type and quantity.
	2. Improper grade of lubricant.	2. Replace scored gears. Fill differential with the correct fluid type and quantity.
	3. Excessive spinning of one wheel/tire.	3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle shaft seals.	2. Replace seals.
	3. Cracked differential housing.	3. Repair as necessary.
	4. Worn pinion seal.	4. Replace seal.
	5. Worn/scored yoke.	5. Replace yoke and seal.
	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.

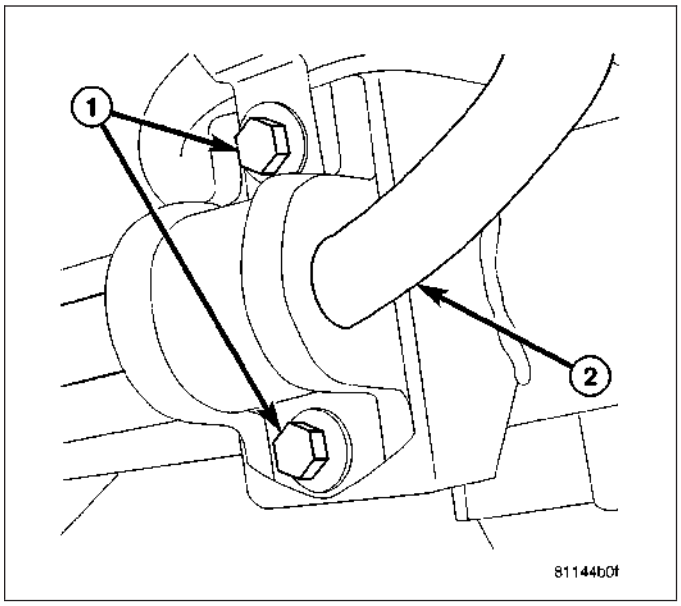
Condition	Possible Causes	Correction
Axle Overheating	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing pre-loads too high.	3. Re-adjust bearing pre-loads.
	4. Insufficient ring gear backlash.	4. Re-adjust ring gear backlash.
Gear Teeth Broke	1. Overloading.	1. Replace gears. Examine other gears and bearings for possible damage.
	2. Erratic clutch operation.	2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation.
	3. Ice-spotted pavement.	3. Replace gears and examine remaining parts for damage.
	4. Improper adjustments.	4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	1. Insufficient lubricant.	1. Fill differential with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.
	3. Unmatched ring gear and pinion.	3. Replace gears with a matched ring gear and pinion.
	4. Worn teeth on ring gear and/or pinion.	4. Replace ring gear and pinion.
	5. Loose pinion bearings.	5. Adjust pinion bearing pre-load.
	6. Loose differential bearings.	6. Adjust differential bearing pre-load.
	7. Mis-aligned or sprung ring gear.	7. Measure ring gear run-out. Replace components as necessary.
	8. Loose differential bearing cap bolts.	8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued tot he proper specification.
	9. Housing not machined properly.	9. Replace housing.

REMOVAL

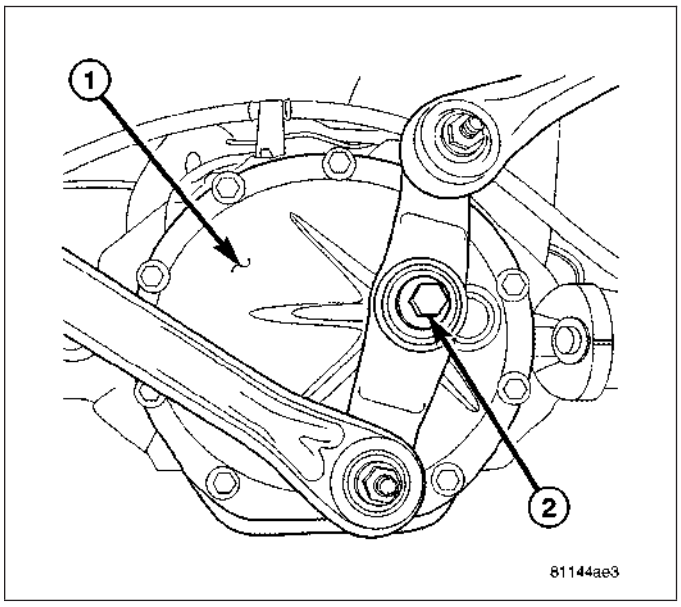
1. With vehicle in neutral, position it on a hoist.
2. Position a lift under axle and secure lift to axle.
3. Remove brake components from the axle.
4. Remove ABS wheel speed sensors.
5. Remove vent hose from the axle shaft tube.
6. Mark a reference line (3) across the propeller shaft (2) and pinion flange (1) for installation alignment.



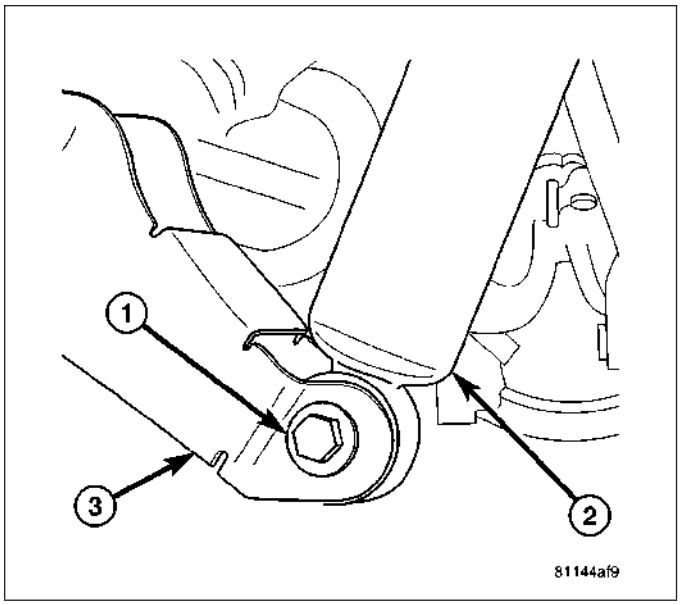
7. Remove propeller shaft.
8. Remove stabilizer bar (2) clamps bolts (1) from the axle.



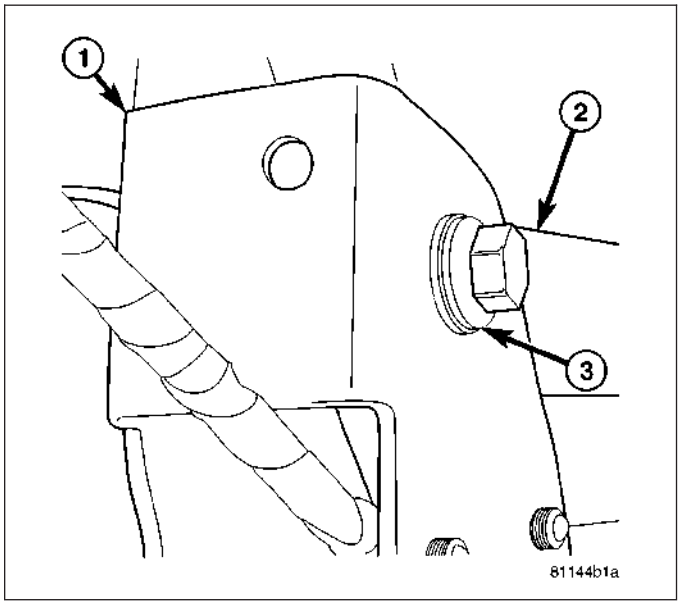
9. Remove watts link bell crank bolt (2) from differential cover (1).



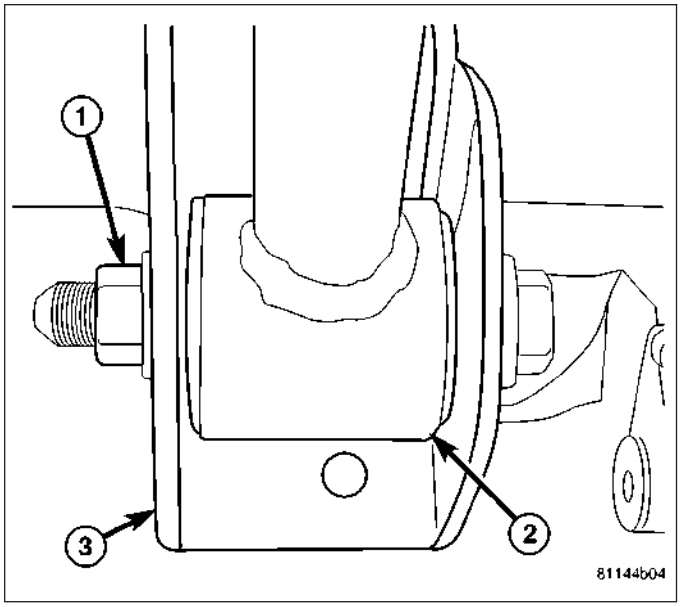
10. Remove shock absorbers (2) from axle bracket (3).



11. Remove upper control arms (2) from axle brackets (1).



12. Lower axle and remove coil springs and spring isolators.
13. Remove lower control arms (2) from axle brackets (3).
14. Lower axle and remove from vehicle.

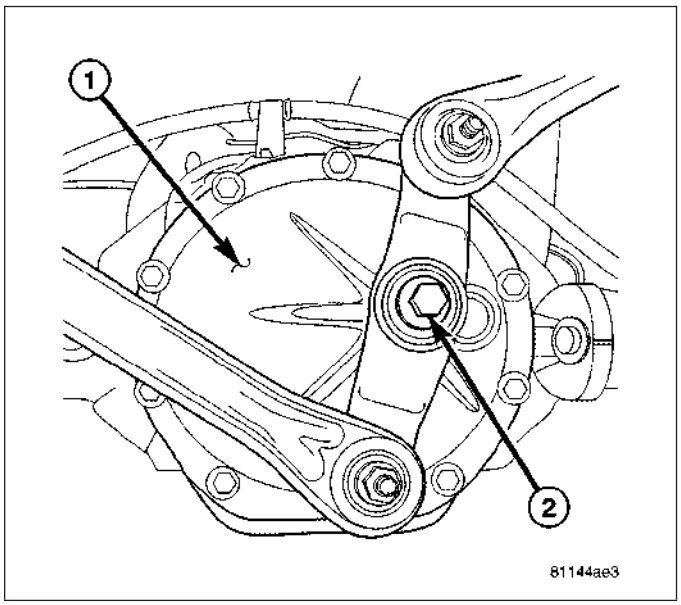


INSTALLATION

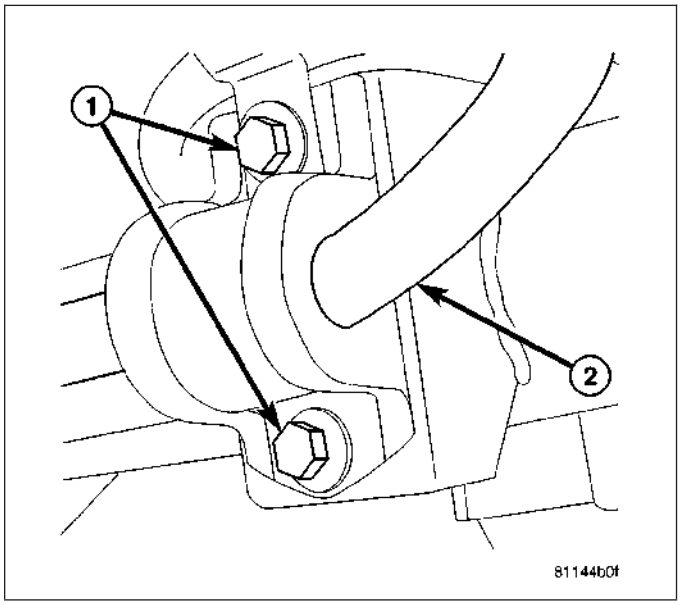
1. Raise axle and align lower control arms. Install control arm bolts loose at this time.
2. Install coil springs.
3. Raise axle and align upper control arms. Install control arm bolts loose at this time.

NOTE: Bell crank bolt has a Loctite® patch, a new bolt should be used. If bolt is not available, clean bolt and apply Loctite® 242 to the threads.

4. Install watts link bell crank bolt (2) and tighten to 217 N·m (160 ft. lbs.).



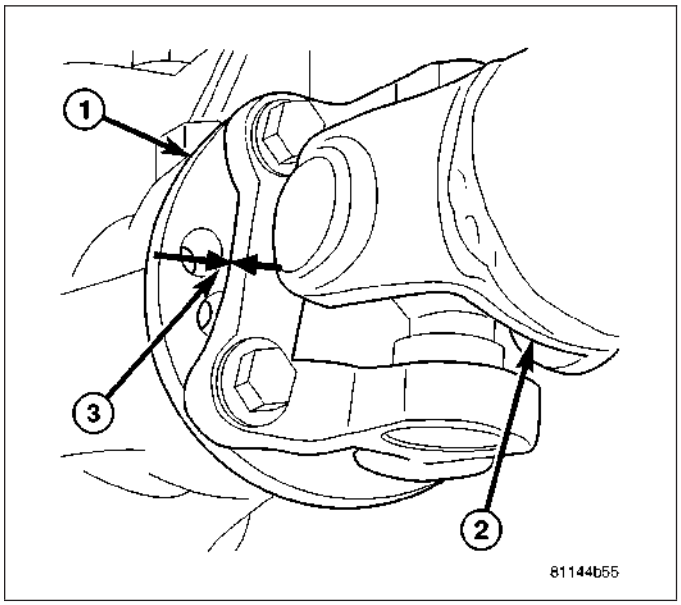
5. Install shock absorbers and tighten nuts to 102 N·m (75 ft. lbs.).
6. Install parking brake and brake components.
7. Install axle vent hose.
8. Install stabilizer bar (2) and center it with equal spacing on both sides. Tighten bolts to 61 N·m (45 ft. lbs.).



9. Install propeller shaft (2) with reference marks (3) aligned.
10. Install **new** companion flange bolts and tighten to 108 N·m (80 ft. lbs.).

NOTE: Companion flange bolts have a Loctite® patch, new bolts should be used. If bolts are not available, clean bolts and apply Loctite® 242 to the threads.

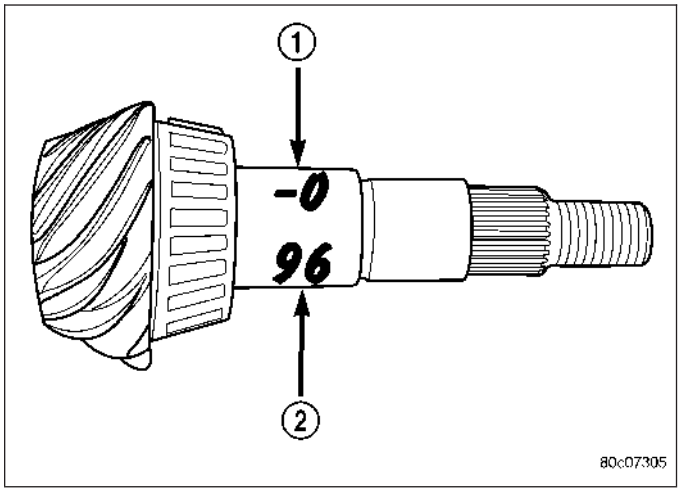
11. With vehicle on the ground, tighten upper control arm bolts to 170 N·m (125 ft. lbs.). Tighten lower control arm nuts to 230 N·m (170 ft. lbs.).



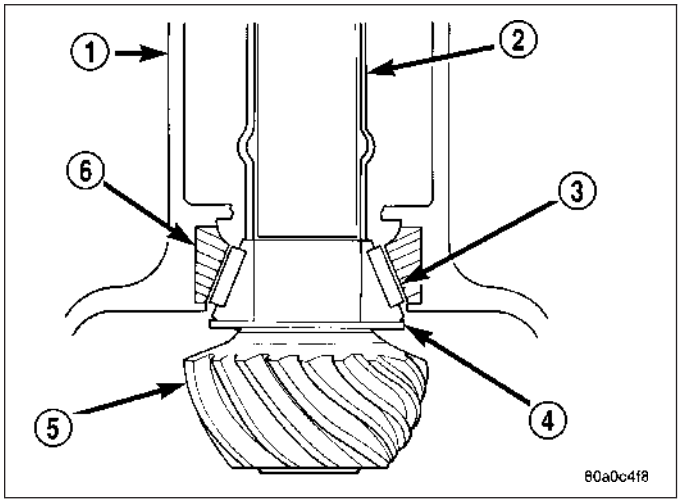
ADJUSTMENTS

REAR AXLE - 9 1/4

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus + number, minus – number or zero 0 along with the gear set sequence number 01 to 99 is on each gear. This first number (1) is the amount in thousandths of an inch the depth varies from the standard depth setting of a pinion marked with a zero 0. The next two numbers (2) are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.



Compensation for pinion depth variance is achieved with select shims (4) located behind the rear pinion bearing (3).



PINION GEAR DEPTH VARIANCE

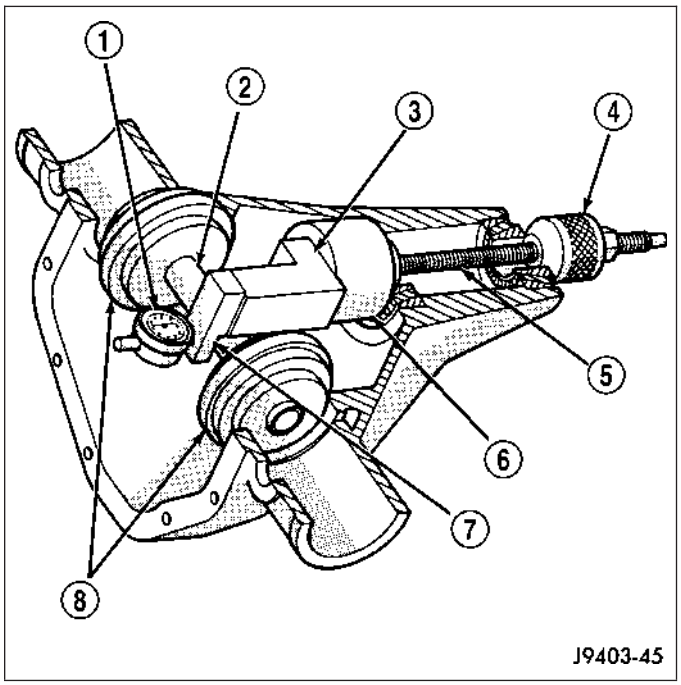
Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	−4	−3	−2	−1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0
+3	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001
+2	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002
+1	+0.005	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003
0	+0.004	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004
−1	+0.003	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005
−2	+0.002	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006
−3	+0.001	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006	−0.007
−4	0	−0.001	−0.002	−0.003	−0.004	−0.005	−0.006	−0.007	−0.008

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

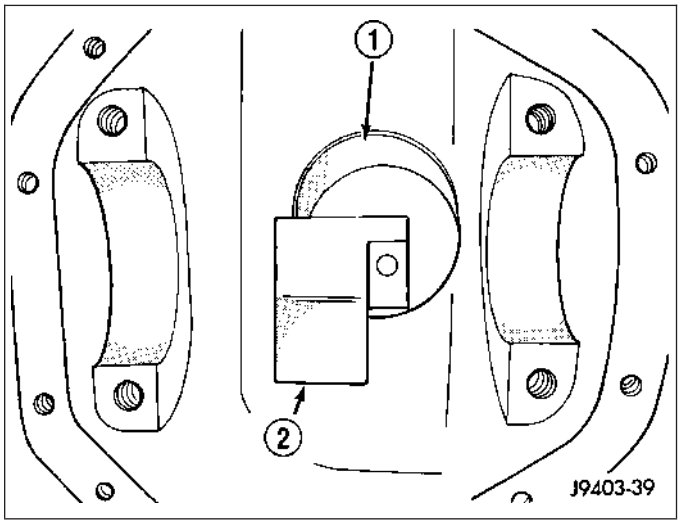
Pinion Gear Depth Variance Chart: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

PINION DEPTH MEASUREMENT

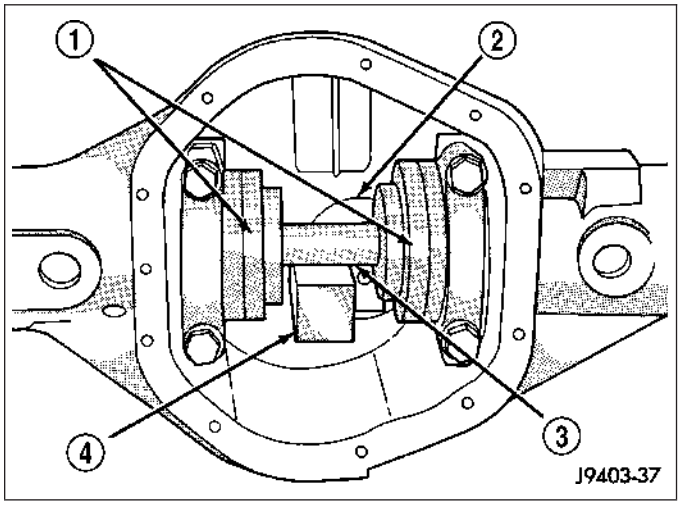
Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).



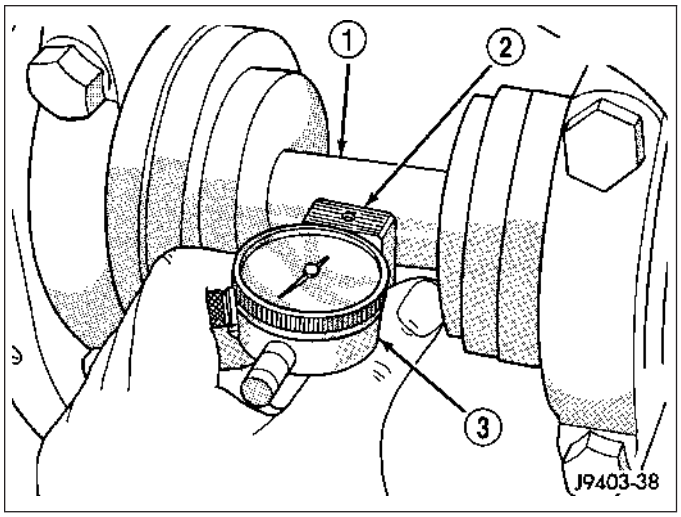
1. Assemble Pinion Height Block 6739 (1) Pinion Block 8542 (1) and rear pinion bearing onto Screw 6741.



2. Insert assembled height gauge components, rear bearing, and screw into the housing through pinion bearing cups.
3. Install front pinion bearing and Cone-Nut 6740 on screw. Tighten cone-nut on screw until Torque To Rotate screw is 1.7 N·m (15 in. Lbs.).
4. Place Arbor Disc 8541 (1) on Arbor D-115-3 (3) in position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to 41 N·m (30 ft. lbs.).



NOTE: Arbor Discs 8541 has different step diameters to fit other axles. Choose proper step for axle being serviced.

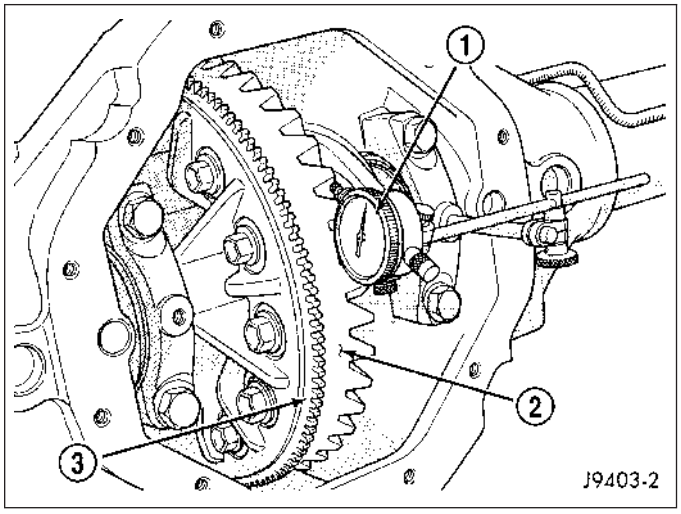


5. Assemble Dial Indicator C-3339 into Scooter Block D-115-2 and secure set screw.
6. Place Scooter Block/Dial Indicator in axle housing so dial probe and scooter block are flush against the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slide the dial indicator (3) probe across the gap between the pinion height block and the arbor bar (1) with the scooter block (2) against the pinion height block. Move the dial probe to the crest of the arbor bar and record the highest reading.
8. Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number marked on the shaft of the pinion. For example, if the depth variance is –2, add +0.002 in. to the dial indicator reading.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

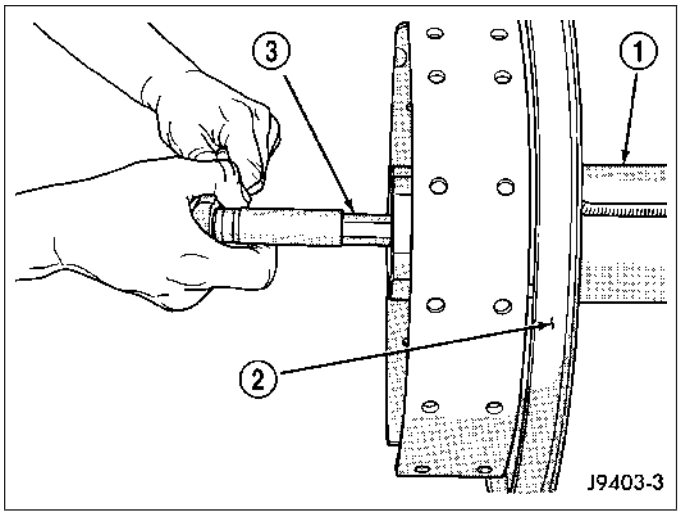
The following must be considered when adjusting bearing preload and gear backlash:

- The maximum ring gear backlash variation is 0.076 mm (0.003 in.).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.



NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:

- **Maintain the gear teeth engaged (meshed) as marked.**
- **The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.**
- **Do this five to ten times each time the threaded adjusters are adjusted.**



1. Through the axle tube use Wrench C-4164 to adjust each threaded adjuster inward until the differential bearing free-play is eliminated. Allow some ring gear backlash approximately 0.25 mm (0.01 in.) between the ring and pinion gear. Seat the bearing cups with the procedure described above.
2. Install dial indicator (1) and position the plunger against the drive side of a ring gear (2) tooth. Measure the backlash at 4 positions, 90 degrees apart around the ring gear. Locate and mark the area of minimum backlash.
3. Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.
4. Loosen the right-side, tighten the left-side threaded adjuster. Obtain backlash of 0.076-0.102 mm (0.003-0.004 in.) with each adjuster tightened to 14 N·m (10 ft. lbs.). Seat the bearing cups with the procedure described above.
5. Tighten differential bearing cap bolts to 135 N·m (100 ft. lbs.).
6. Tighten right-side threaded adjuster to 102 N·m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N·m (75 ft. lbs.)
7. Measure the ring gear backlash. The range of backlash is 0.15-0.203 mm (0.006-0.008 in.).
8. Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

NOTE: The left-side threaded adjuster torque should have approximately 102 N·m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.

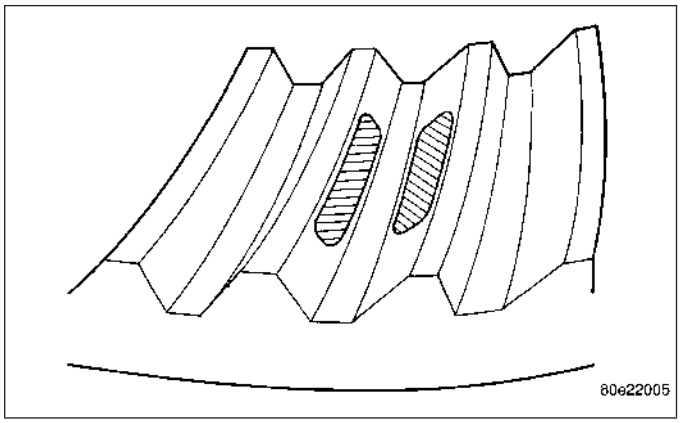
9. Tighten the left-side threaded adjuster until 102 N·m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.
10. Install the threaded adjuster locks and tighten the lock screws to 10 N·m (90 in. lbs.).

GEAR CONTACT PATTERN

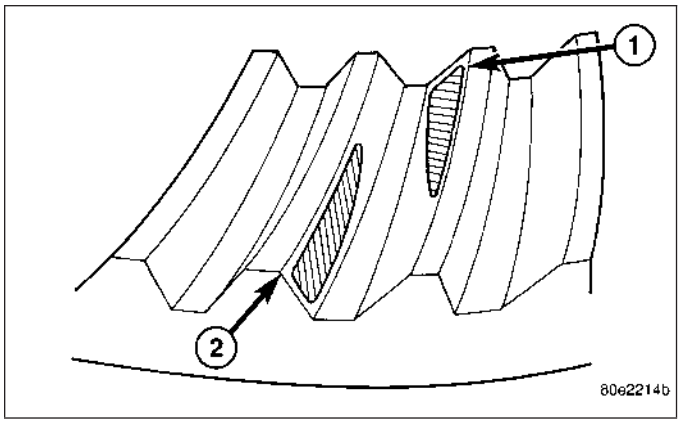
Gear tooth contact pattern is used to verify the correct running position of the ring and pinion gears. This will produce low noise and long gear life. Gears which are not positioned properly may be noisy and have shorten gear life.

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

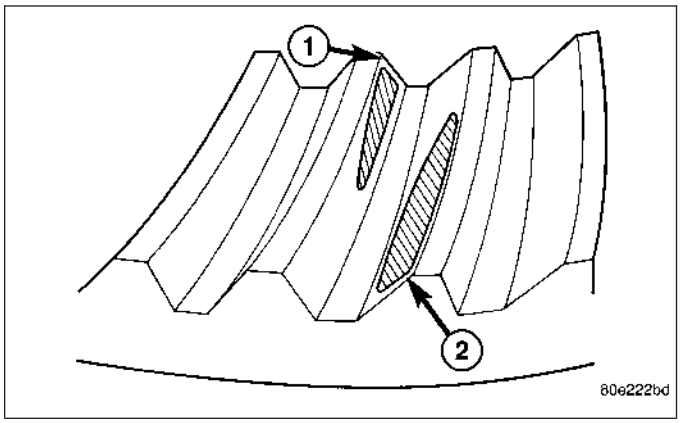
Gear contact pattern is correct. Backlash and pinion depth is correct.



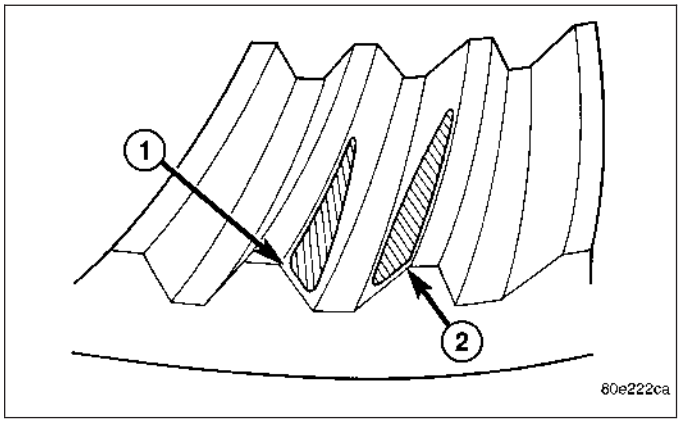
Ring gear is too far away from the pinion gear, coast side toe (1) drive side heel (2). Decrease the backlash, by moving the ring closer to the pinion gear using the adjusters.



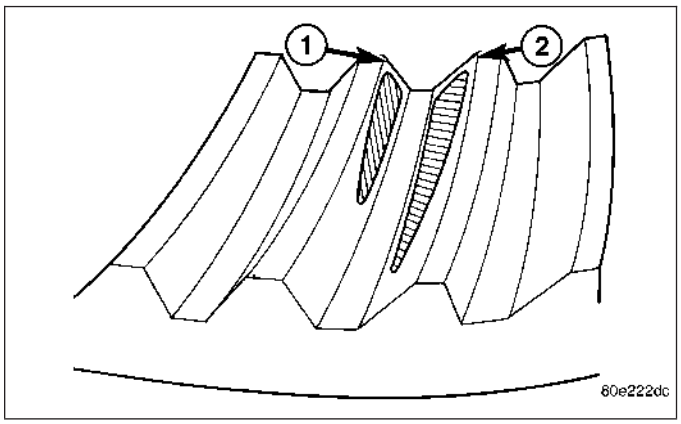
Ring gear is too close to the pinion gear, drive side toe (1) and coast side heel (2). Increase the backlash, by moving the ring away from the pinion gear using the adjusters.



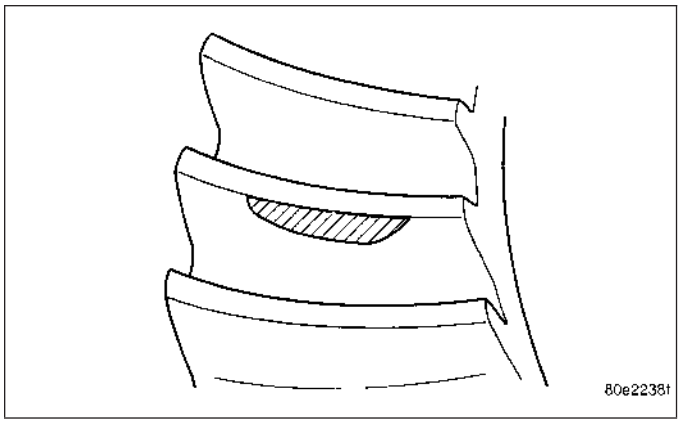
Ring gear is too far away from the pinion gear, drive side heel (1) and coast side heel (2). Decrease the backlash, by moving the ring closer to the pinion gear using the adjusters.



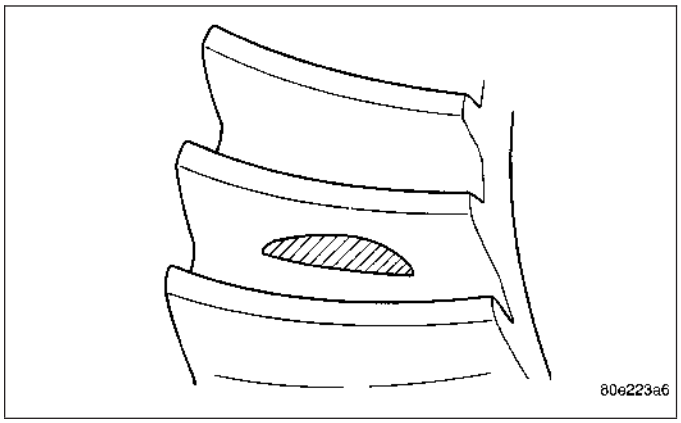
Ring gear is too close to the pinion gear, drive side toe (1) and coast side toe (2). Increase the backlash, by moving the ring away from the pinion gear using the adjusters.



Pinion gear is set too low. Increase the pinion gear height, by increasing the pinion depth shim thickness.



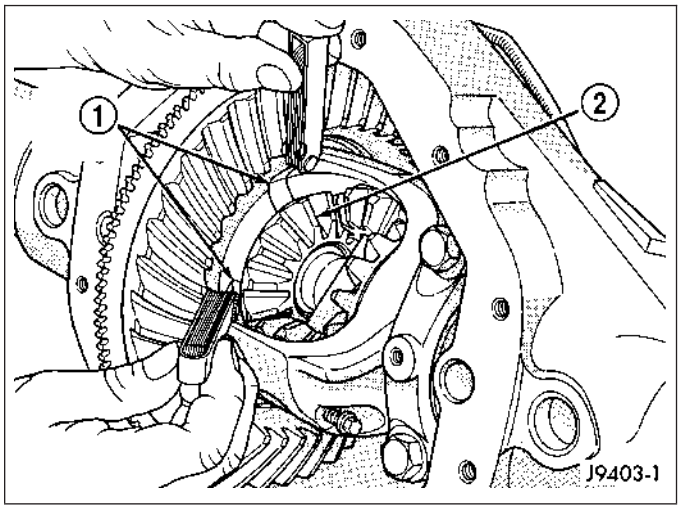
Pinion gear is set too high. Decrease the pinion depth, by decreasing the pinion depth shim thickness.



SIDE GEAR CLEARANCE

When measuring side gear clearance, check each gear independently. If it necessary to replace a side gear, replace both gears as a matched set.

1. Install the axle shafts and C-locks and pinion mate shaft.
2. Measure each side gear clearance. Insert a matched pair of feeler gauge (1) blades between the side gear (2) and differential housing on opposite sides of the hub.



3. If side gear clearances is no more than 0.005 inch. Determine if the axle shaft is contacting the pinion mate shaft. **Do not remove the feeler gauges, inspect the axle shaft with the feeler gauge inserted behind the side gear.** If the end of the axle shaft is not contacting the pinion mate shaft, the side gear clearance is acceptable.

SIDE GEAR CLEARANCE	0.007
THRUST WASHER THICKNESS	+ 0.033
TOTAL	0.040
	→ 0.040
REPLACEMENT WASHER THICKNESS	− 0.037
NEW SIDE GEAR CLEARANCE	0.003

J9203-31

4. If clearance is more than 0.005 inch (axle shaft not contacting mate shaft), record the side gear clearance. Remove the thrust washer and measure its thickness with a micrometer. Add the washer thickness to the recorded side gear clearance. The sum of gear clearance and washer thickness will determine required thickness of replacement thrust washer.

In some cases, the end of the axle shaft will move and contact the mate shaft when the feeler gauge is inserted. The C-lock is preventing the side gear from sliding on the axle shaft.

5. If there is no side gear clearance, remove the C-lock from the axle shaft. Use a micrometer to measure the thrust washer thickness. Record the thickness and re-install the thrust washer. Assemble the differential case without the C-lock installed and re-measure the side gear clearance.
6. Compare both clearance measurements. If the difference is less than 0.012 inch (0.305 mm), add clearance recorded when the C-lock was installed to thrust washer thickness measured. The sum will determine the required thickness of the replacement thrust washer.
7. If clearance is 0.012 inch (0.305 mm) or greater, both side gears must be replaced (matched set) and the clearance measurements repeated.
8. If clearance (above) continues to be 0.012 inch (0.305 mm) or greater, the case must be replaced.

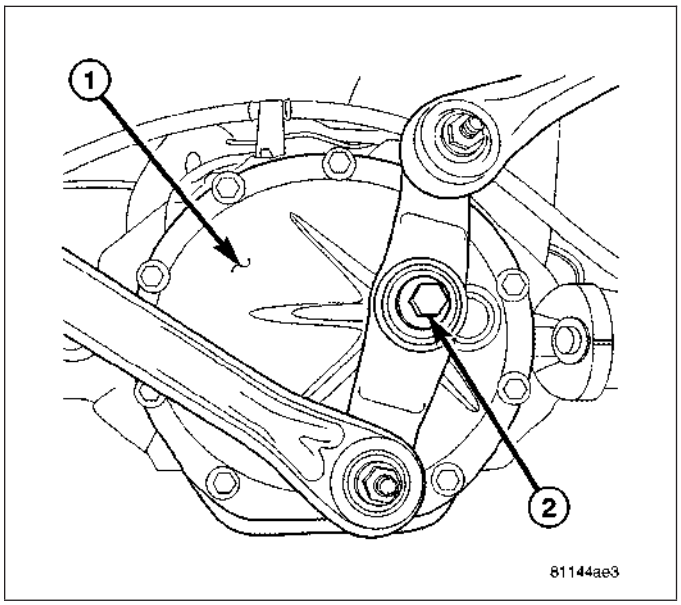
COVER-DIFFERENTIAL

REMOVAL

1. Remove watts link bell crank bolt (2) from differential cover (1).
2. Remove differential cover bolts.
3. Remove cover and drain fluid.



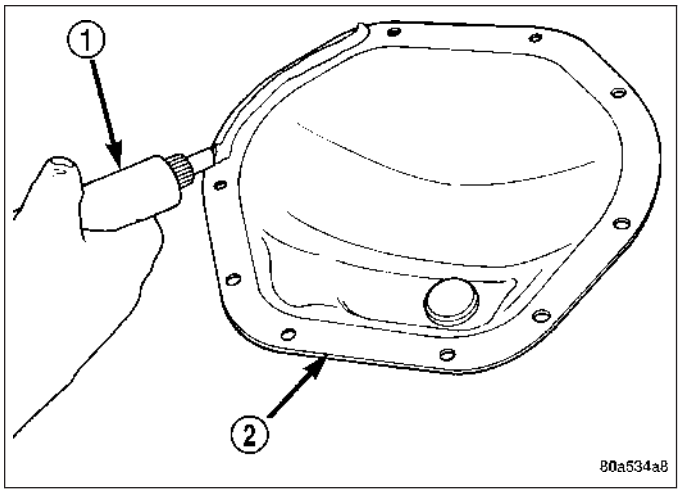
INSTALLATION

1. Clean differential cover.
2. Apply a bead of orange Mopar Axle RTV Sealant (1) or equivalent to the cover (2).

CAUTION: If cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied or adhesion quality will be compromised.

3. Install cover and tighten bolts in a criss-cross pattern to 44 N·m (32 ft. lbs.).
4. Fill differential with 2.13 L (4.501 pts.) of gear lubricant.

CAUTION: Fill differential by volume only, not to the bottom of fill plug.



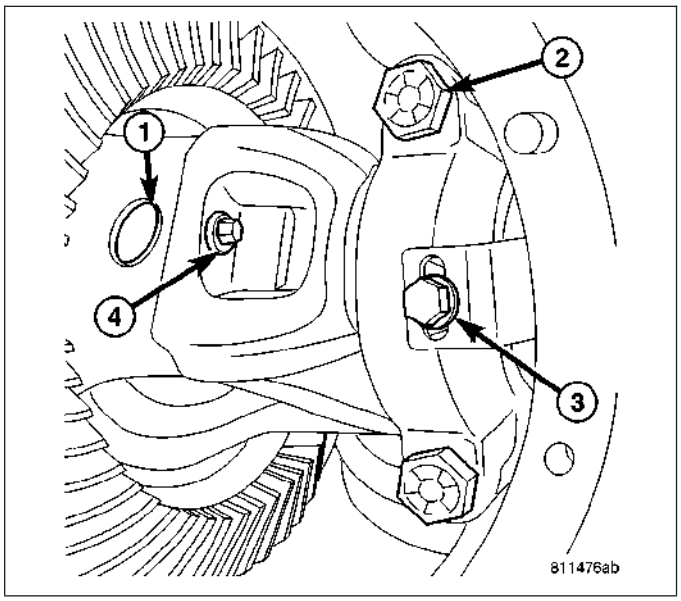
5. Install fill hole plug.
6. Install watts link bell crank bolt and tighten to 217 N·m (160 ft. lbs.).

NOTE: Bell crank bolt has a Loctite® patch, a new bolt should be used. If bolt is not available, clean bolt and apply Loctite® 242 to the threads.

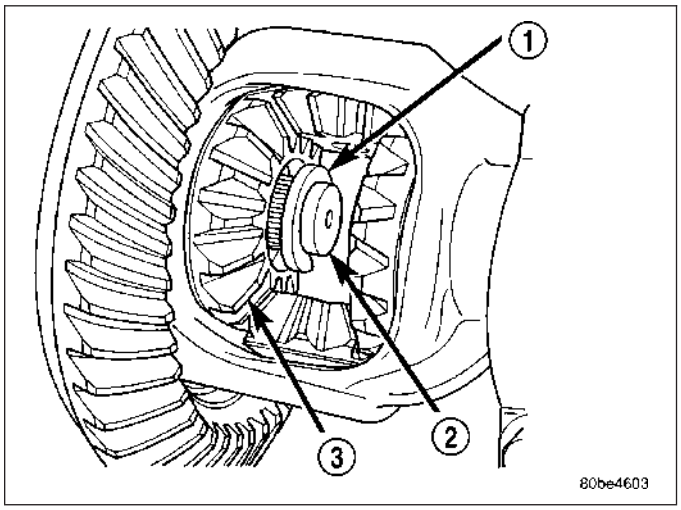
SHAFT-AXLE

REMOVAL

1. With vehicle in neutral, position it on a hoist.
2. Remove brake caliper adapter with caliper and remove rotor.
3. Remove differential housing cover and drain lubricant.
4. Rotate differential case, to access pinion mate shaft lock screw (4). Remove screw (4) and pinion mate shaft (1) from differential case.

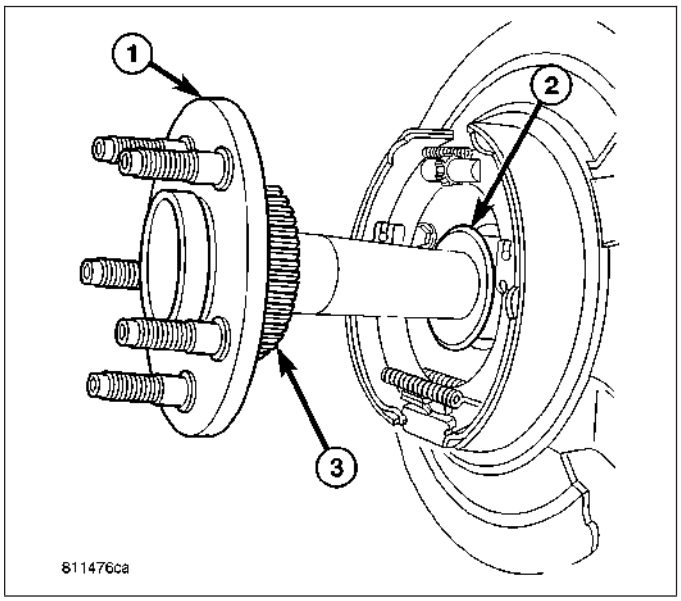


5. Push axle shaft (2) inward and remove axle shaft C-lock (1).
6. Remove axle shaft.

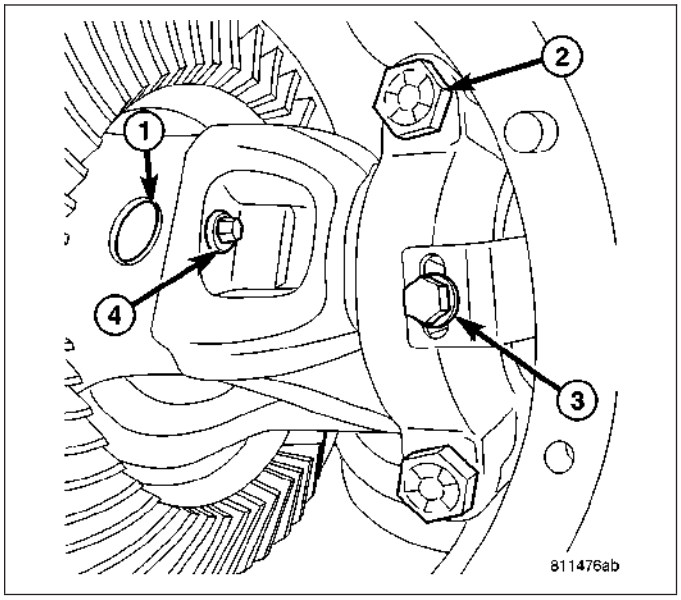


INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Insert axle shaft (1) through seal (2) and engage into side gear splines.



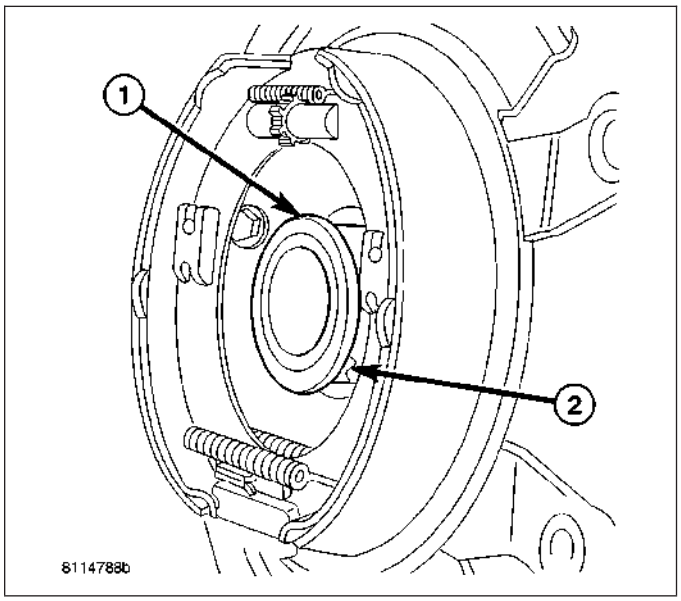
3. Insert C-lock in end of axle shaft then push axle shaft outward to seat C-lock in side gear.
4. Insert pinion shaft into differential case and through thrust washers and differential pinions.
5. Align hole in shaft with hole in differential case and install lock screw (4) with Loctite® on the threads. Tighten lock screw to 25 N·m (220 in. lbs.).
6. Install differential cover and fill with gear lubricant.
7. Install brake rotor and caliper adapter with caliper.



SEAL-AXLE SHAFT

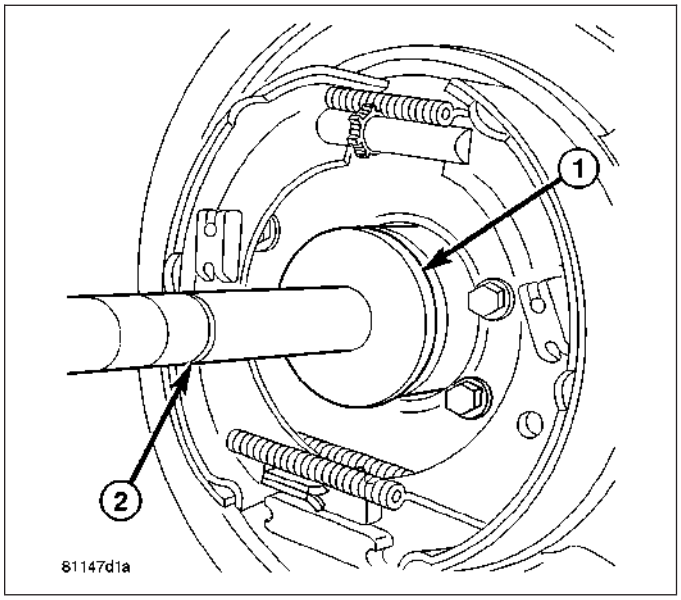
REMOVAL

1. Remove axle shaft.
2. Remove axle shaft seal (1) from end of the axle tube (2) with a pry bar.



INSTALLATION

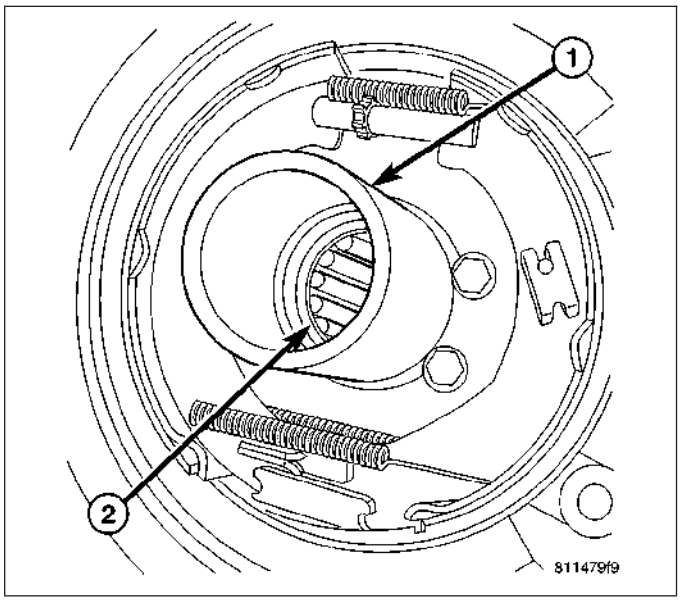
1. Remove any old sealer/burrs from axle tube.
2. Coat **new** seal lip with axle lubricant and install seal with Installer 9337 (1) and Handle C-4171 (2).
3. Install axle shaft.



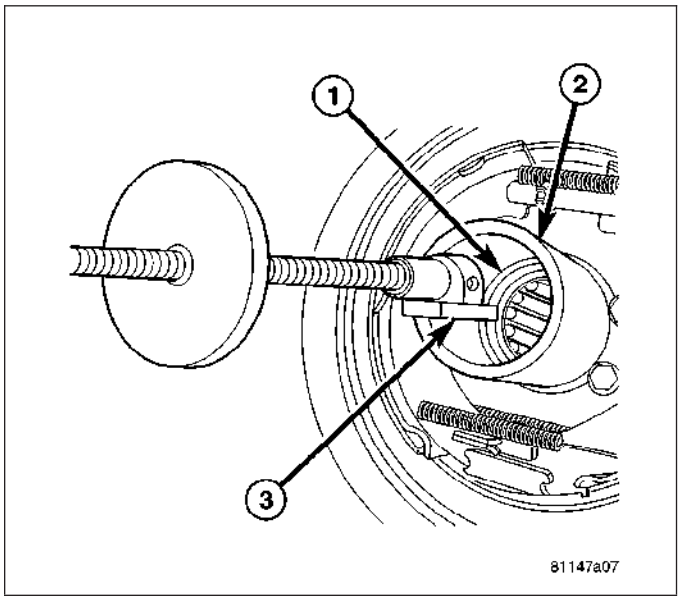
BEARING-AXLE

REMOVAL

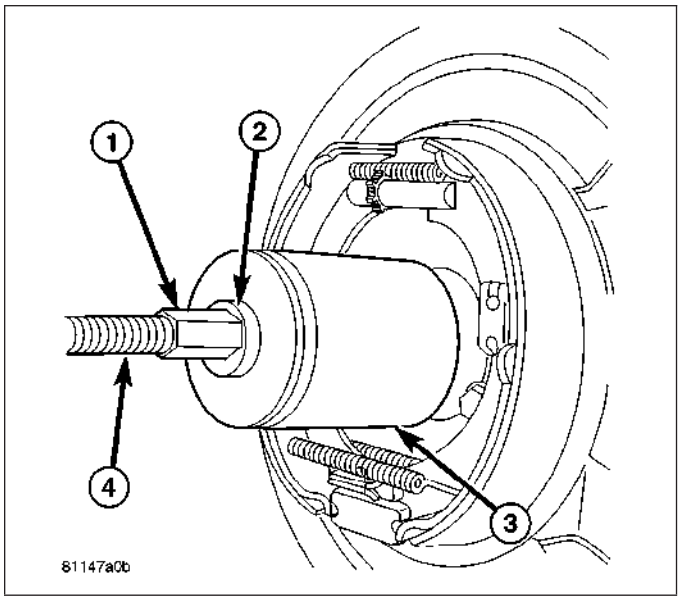
1. Remove axle shaft.
2. Remove axle seal with pry bar.
3. Position bearing Receiver 9338 (1) on axle tube.



4. Insert bearing Remover 6310 (4) with Foot 6310-9 (3) through receiver (2) and bearing (1).



5. Tighten Remove 6310 nut (1) to pull bearing into the receiver (3).

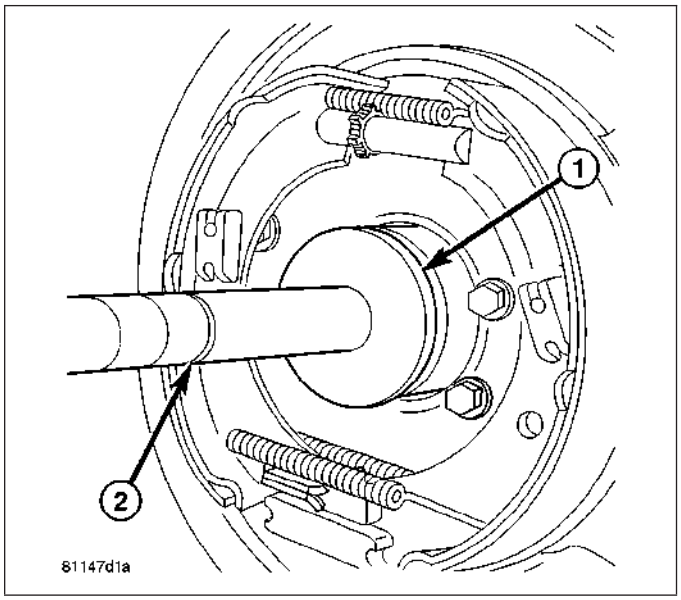


INSTALLATION

1. Remove any old sealer/burrs from axle tube.
2. Install axle shaft bearing with Installer 9337 (1) and Handle C-4171 (2). Drive bearing in until tool contacts the axle tube.

NOTE: Bearing is installed with the bearing part number against the installer.

3. Coat **new** axle seal lip with axle lubricant and install with Installer 9337 and Handle C-4171.
4. Install axle shaft.

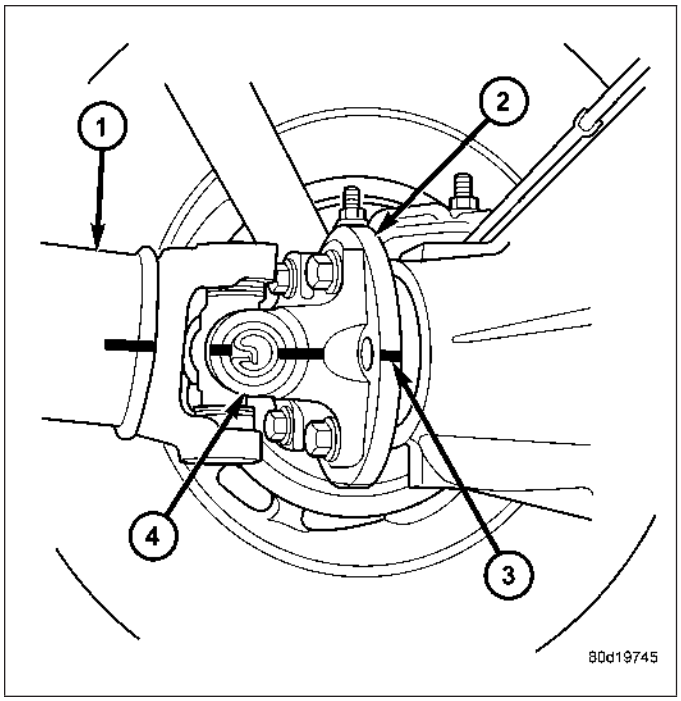


SEAL-PINION

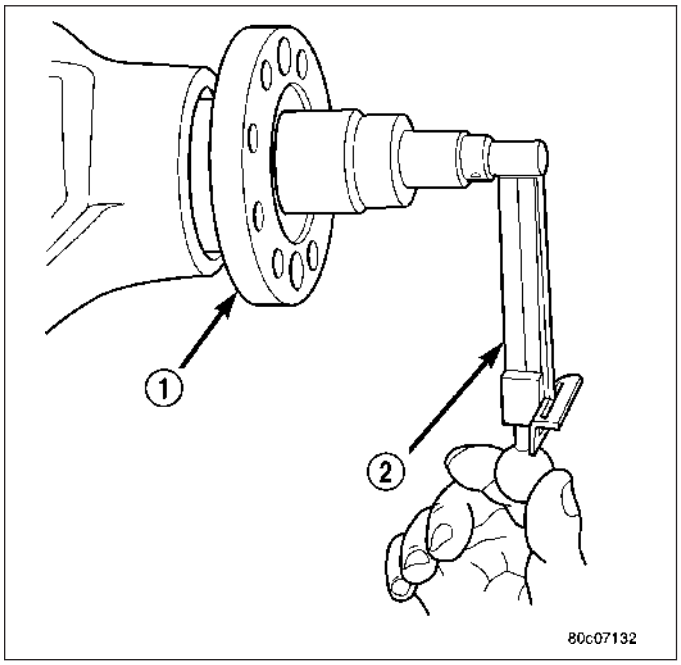
REMOVAL

1. With vehicle in neutral, position it on a hoist.

2. Mark a installation reference line (3) across the pinion flange (3) and propeller shaft flange (4).

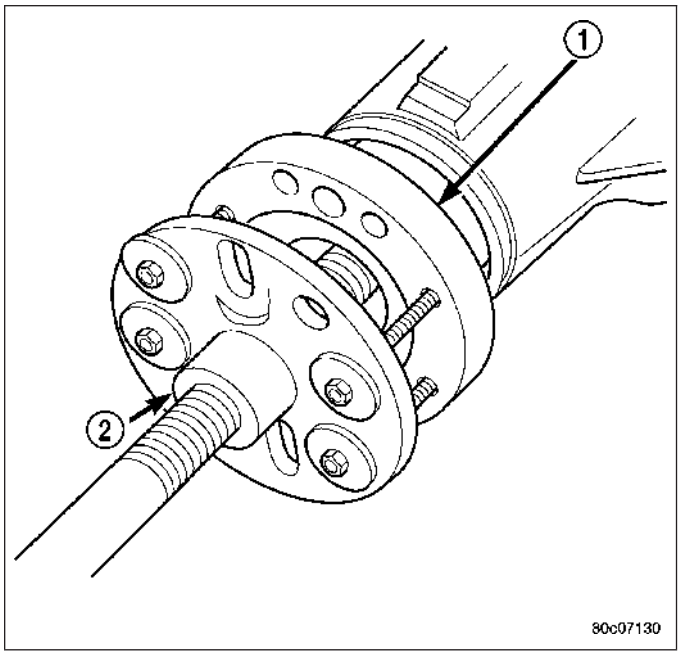


3. Remove propeller shaft.
4. Remove brake calipers and rotors to prevent any drag.
5. Rotate pinion flange three or four times and verify flange rotates smoothly.
6. Measure rotating torque of the pinion with a inch pound torque wrench (2) and record reading.



7. Install two bolts into the pinion flange threaded holes, 180° apart. Position Holder 6719A against the flange and install and tighten two bolts and washers into the remaining holes.
8. Hold the flange with Holder 6719A and remove pinion nut and washer.

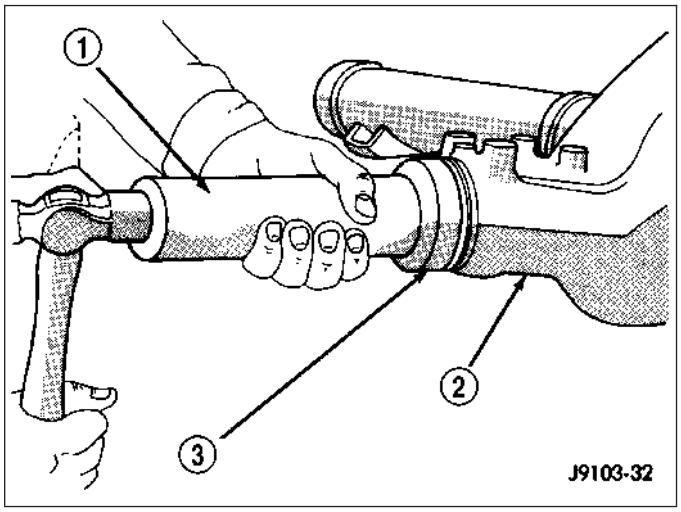
9. Remove companion flange (1) with Remover C-452 (2).



10. Remove pinion seal with pry tool or slide-hammer mounted screw.

INSTALLATION

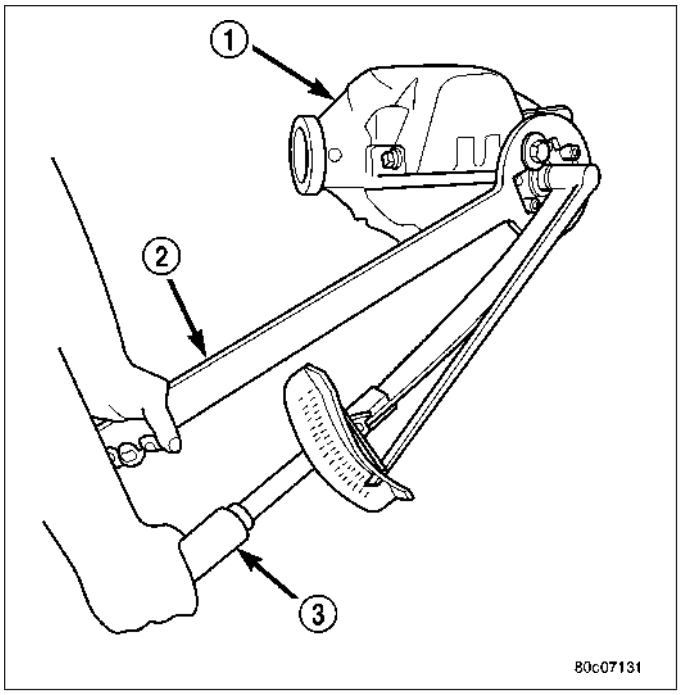
1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install **new** pinion seal with Installer C-4076-B (3) and Handle C-4735 (1).



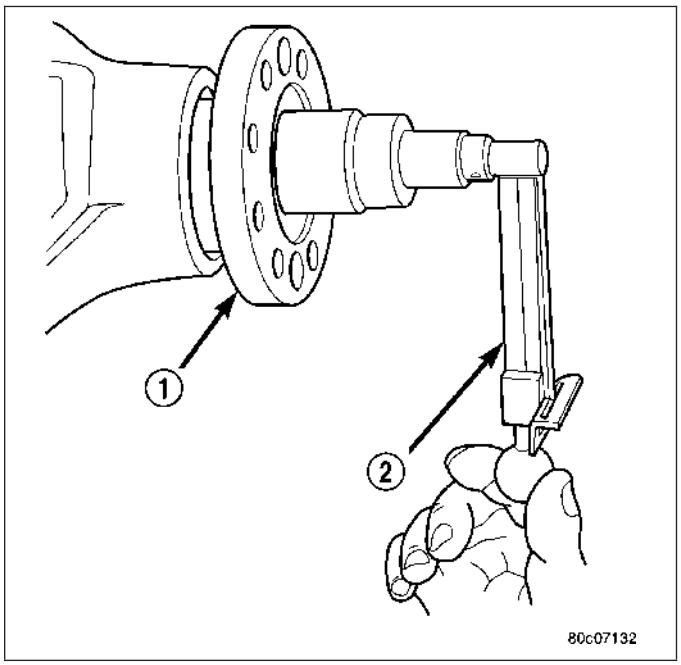
3. Install pinion flange on pinion shaft with Installer C-3718.
4. Install two bolts into the threaded holes in the flange, 180° apart.
5. Position Holder 6719 against the flange and install a bolt and washer into one of the remaining threaded holes. Tighten the bolts so holder is held to the flange.
6. Install pinion washer and a **new** pinion nut. The convex side of the washer must face outward.

CAUTION: Never exceed the minimum tightening torque 285 N·m (210 ft. lbs.) when installing the companion flange retaining nut at this point. Failure to follow these instruction will result in damage to collapsible spacer or bearings.

7. Hold companion flange with Holder 6719 (2) and tighten pinion nut with a torque set to 285 N·m (210 ft. lbs.). Rotate pinion several revolutions to ensure the bearing rollers are seated.



8. Rotate pinion with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).



CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If rotating torque is exceeded, a new collapsible spacer must be installed. Failure to follow these instructions will result in damage to the collapsible spacer

9. If rotating torque is low, use Holder 6719 to hold the companion flange and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

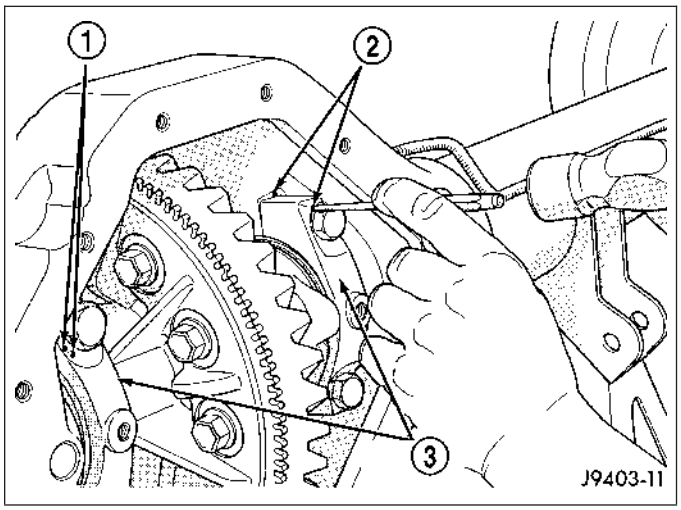
NOTE: The seal replacement is unacceptable if the final pinion nut torque is less than 285 N·m (210 ft. lbs.).

10. Install propeller shaft..

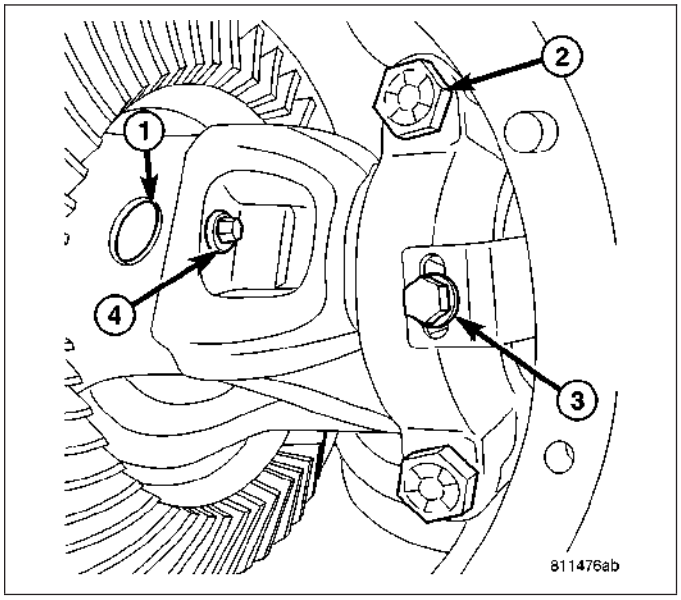
DIFFERENTIAL

REMOVAL

1. Remove differential cover.
2. Remove axle shafts.
3. Remove ABS sensor from housing.
4. Mark differential housing and bearing caps (3) for installation reference.

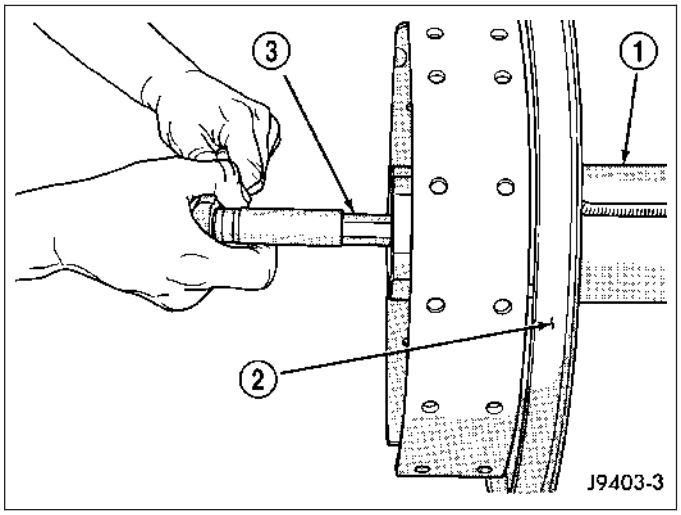


5. Remove bearing adjuster lock bolt (3) from bearing caps.



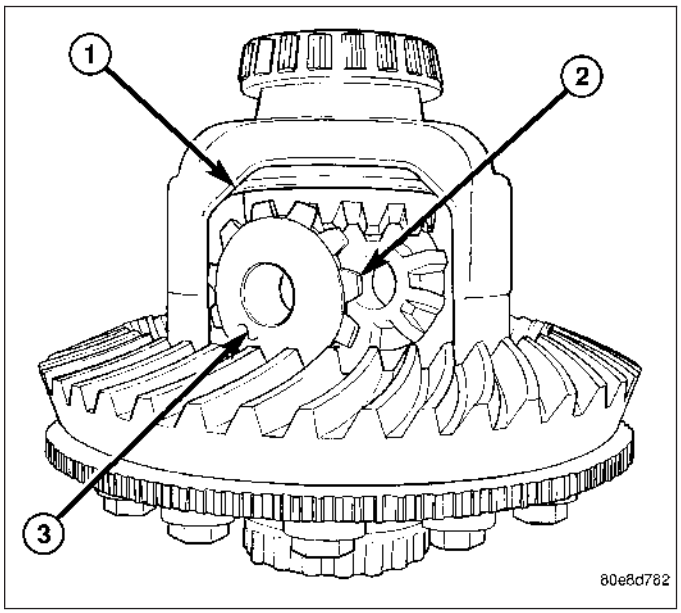
6. Loosen differential bearing cap bolts.
7. Loosen differential bearing adjusters through the axle tubes (1) with Wrench C-4164 (3).
8. Hold differential case while removing bearing caps and adjusters.
9. Remove differential case and tag differential bearing cups and adjusters to indicate location.
10. Clean housing cavity with flushing oil, light engine oil or a lint free cloth.

NOTE: Do not use steam, kerosene or gasoline to clean the housing.

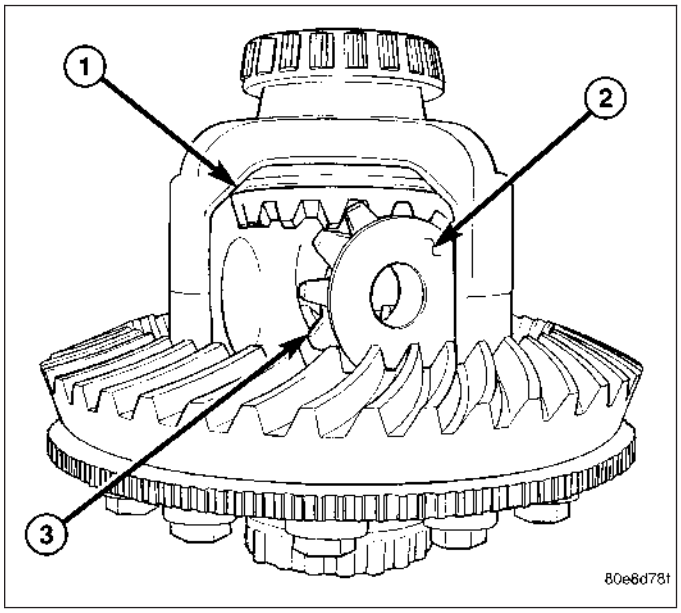


DISASSEMBLY

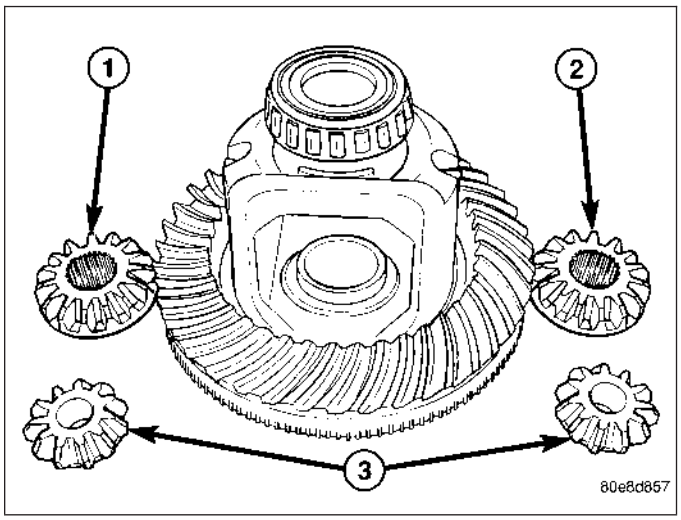
1. Rotate one pinion gear (2) with thrust washer (3) to the differential window (1). Remove gear and thrust washer.



2. Rotate remaining pinion gear (3) with thrust washer (2) to the differential window (1). Remove gear and washer.



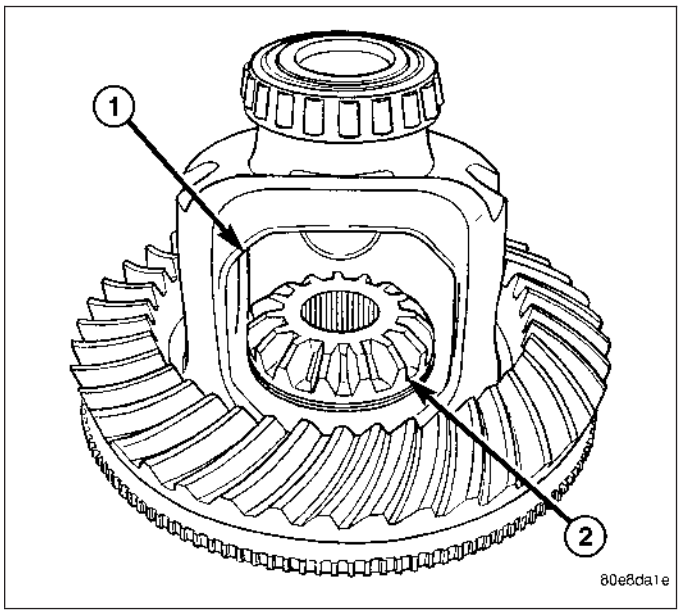
3. Remove differential side gears (1) (2) and thrust washers.



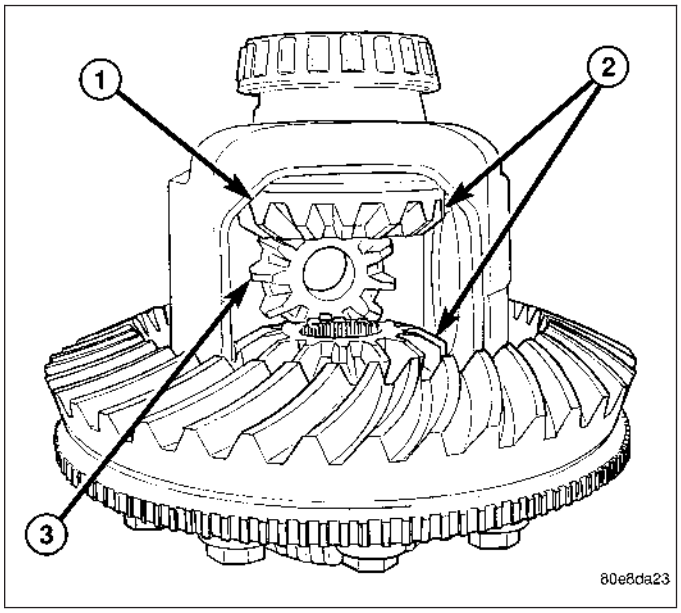
ASSEMBLY

NOTE: If same gears and thrust washers are being used, install them into their original locations.

1. Lubricate all differential components with axle lubricant.
2. Install differential side gears (2) and thrust washers.



3. Install first pinion gear (3) with thrust washer into differential window (1) and side gears (2). Rotate pinion gear into the case.
4. Install remaining pinion gear and thrust washer. Rotate gears to align hole in the pinion gears with hole in the differential case.
5. Slide pinion shaft into the case and through the pinion gears to align the gears.



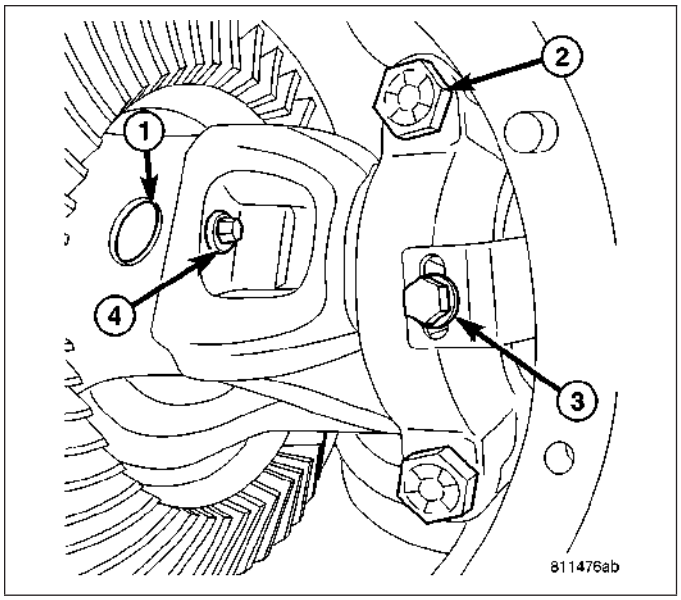
INSTALLATION

1. Apply a coat of hypoid gear lubricant to differential bearings, bearing cups and threaded adjusters.

NOTE: Grease can be used to keep the adjusters in position.

2. Install differential assembly into the housing.
3. Install differential bearing caps in their original locations.
4. Install bearing cap bolts and tighten the upper bolts to 14 N·m (10 ft. lbs.). Tighten lower bolts finger-tight until the bolt head is seated.
5. Perform differential bearing preload and adjustment procedure.

6. Tighten bearing cap bolts (2) to 136 N·m (100 ft.lbs.). Install adjuster locks and tight adjuster lock bolts (3) to 10 N·m (95 in. lbs.).

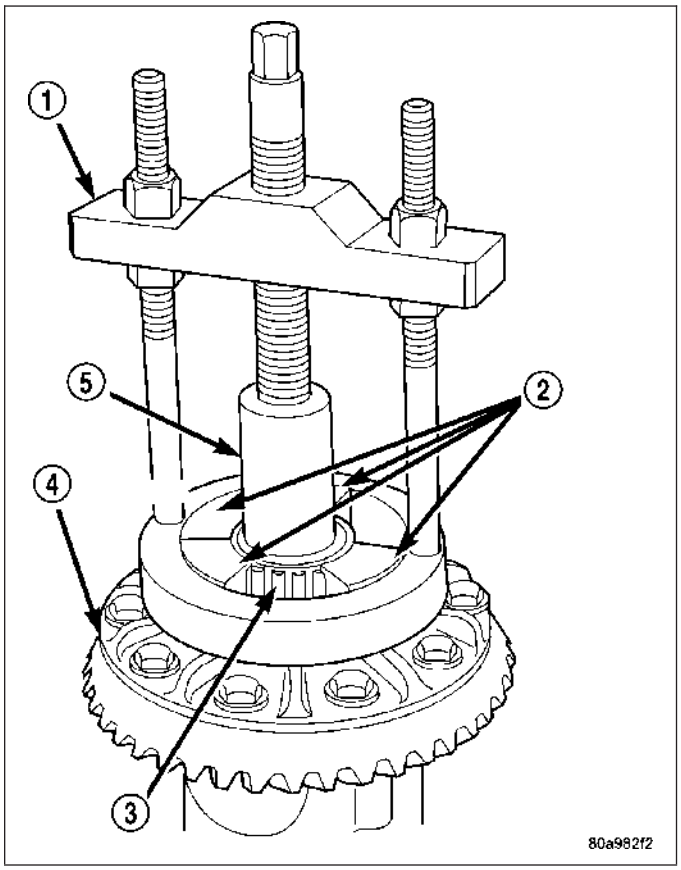


7. Install axle shafts.

BEARINGS-DIFFERENTIAL CASE

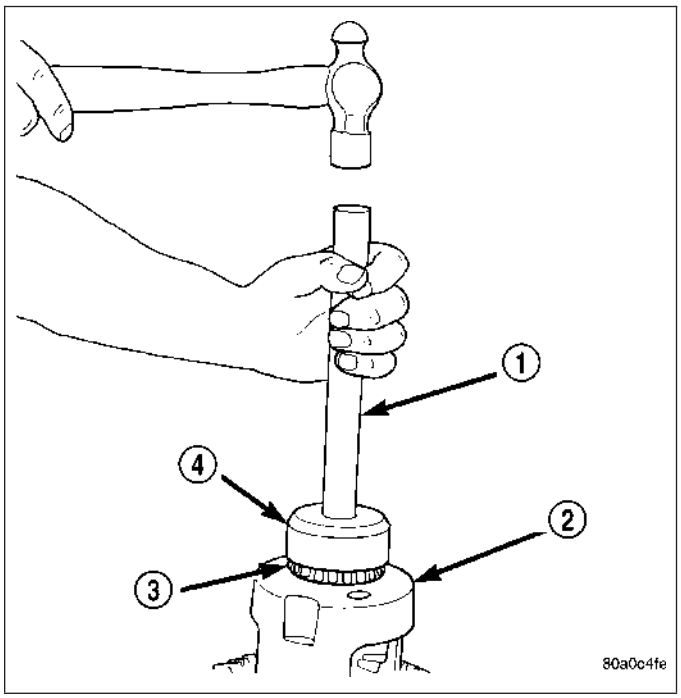
REMOVAL

1. Remove differential case from axle housing.
2. Remove differential bearings from the case with Puller/Press C-293-PA (1) Adapters C-293-47 (2) and Plug C-293-3 (5).



INSTALLATION

1. Install differential side bearings (3) with Installer C-4213 (4) and Handle C-4171 (1).



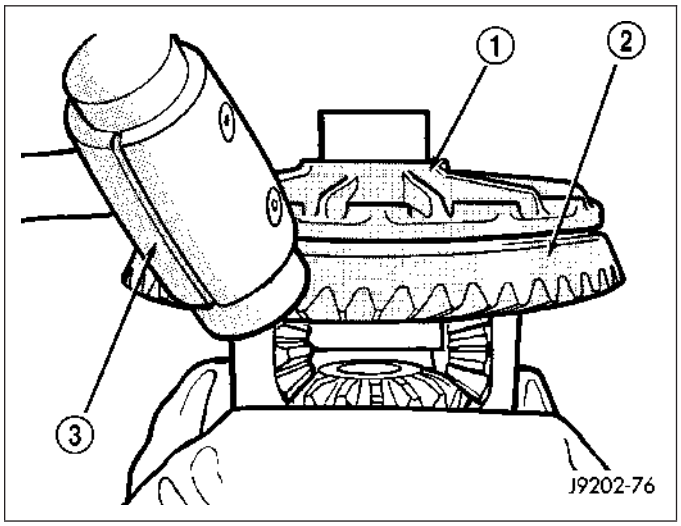
2. Install differential case into housing.

GEAR-PINION/RING/TONE RING

REMOVAL

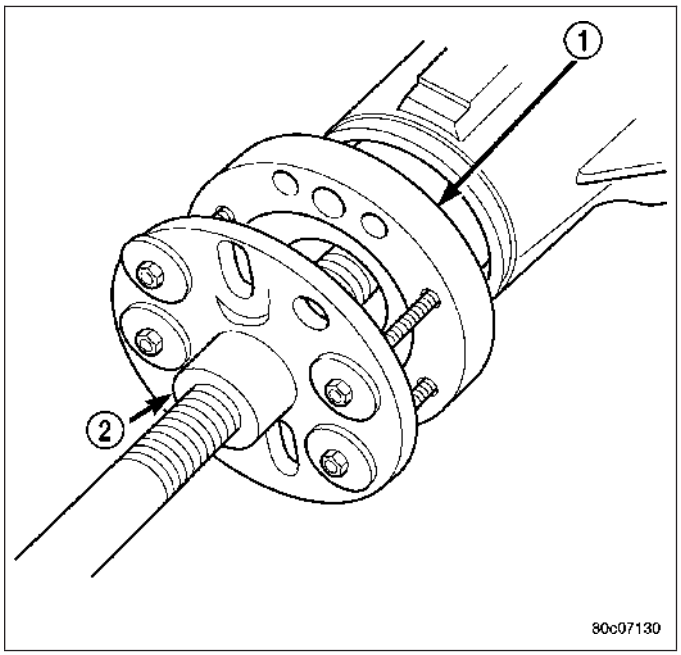
NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the other matching gear.

1. Remove differential from differential housing.
2. Place differential case in a vise with soft metal jaw protectors.
3. Remove ring gear bolts and drive ring gear (2) off the differential case (1) with a soft hammer (3).

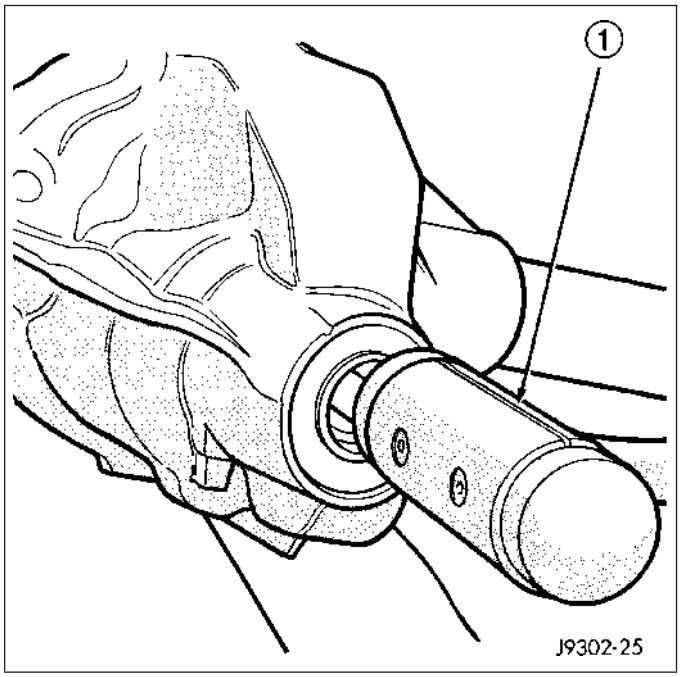


4. Install bolts into two of the threaded holes in the pinion flange 180° apart.
5. Position Holder 6719 against flange and install a bolt and washer into one of the remaining threaded holes. Tighten bolts so the Holder 6719 is held to the flange.

6. Use Holder 6719 to hold flange and remove the companion flange nut and washer.
7. Remove flange (1) from pinion with Remover C-452 (2).

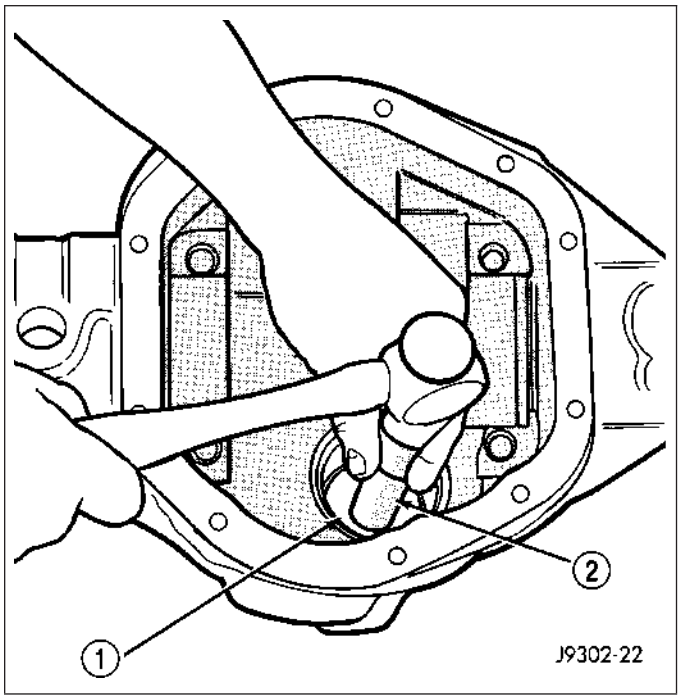


8. Remove pinion from housing with a soft hammer (1).

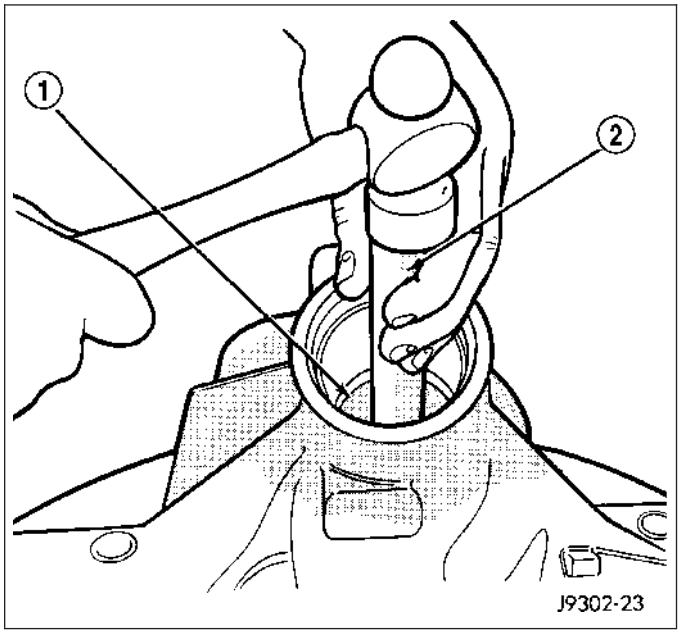


9. Remove pinion seal with a pry tool or slide-hammer mounted screw.
10. Remove oil slinger if equipped and front pinion bearing.

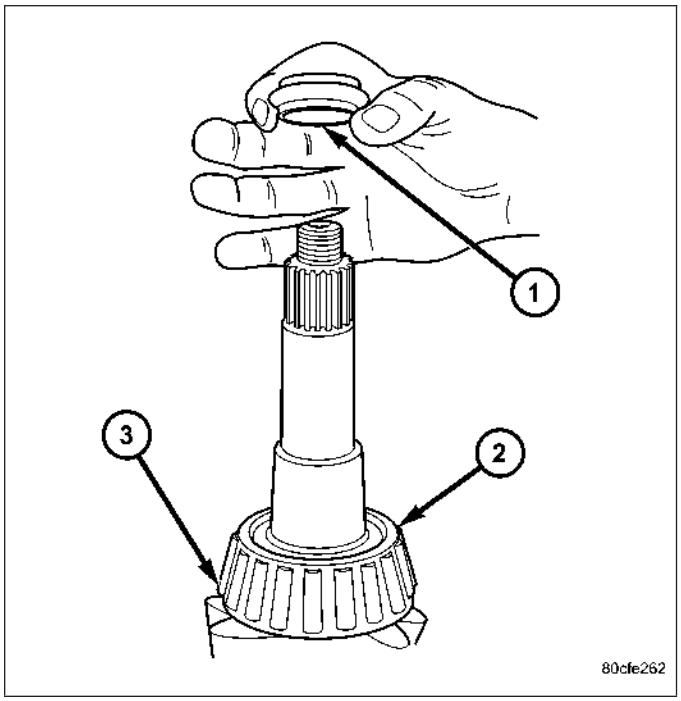
11. Remove front pinion bearing cup with Remover C-4345 (1) and Handle C-4171 (2).



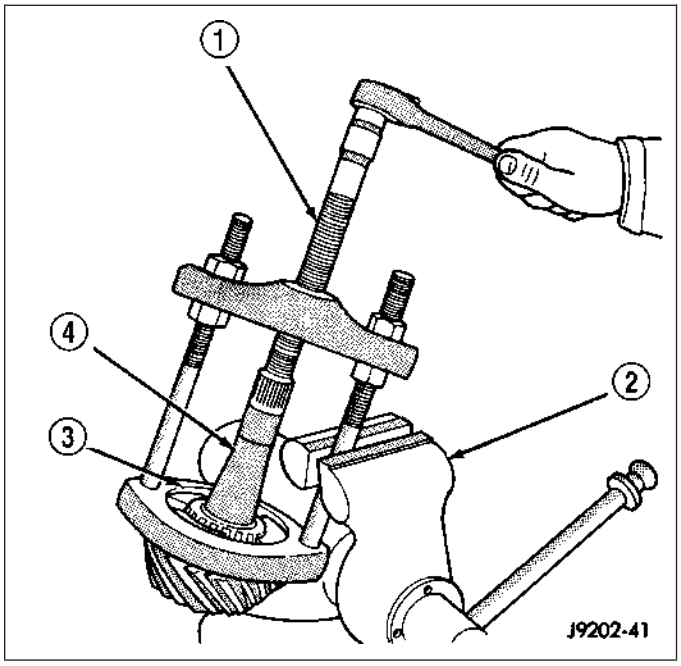
12. Remove rear bearing cup from housing with Remover C-4307 (1) and Handle C-4171 (2).



13. Remove collapsible spacer (1) from pinion gear.



14. Remove rear bearing from the pinion with Puller/ Press C-293-PA (1) and Adapters C-293-47 (3).



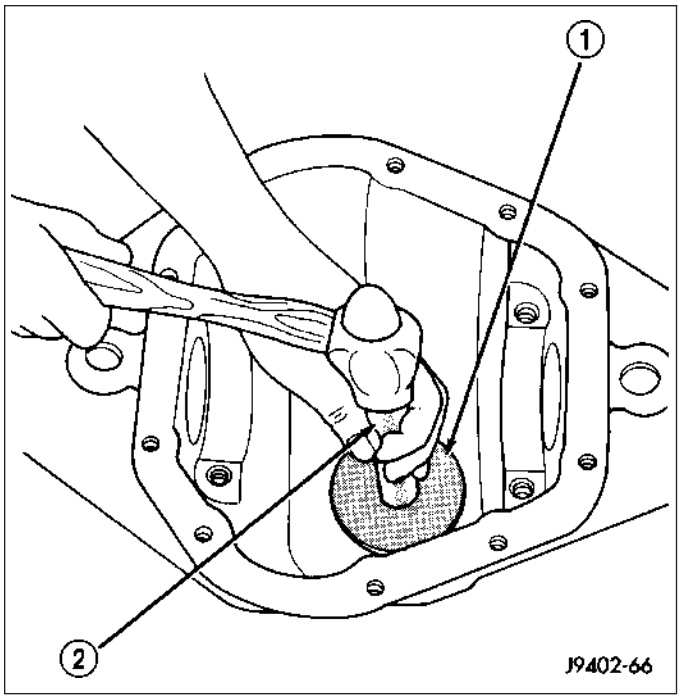
15. Remove depth shims from the pinion shaft and record shim thickness.

INSTALLATION

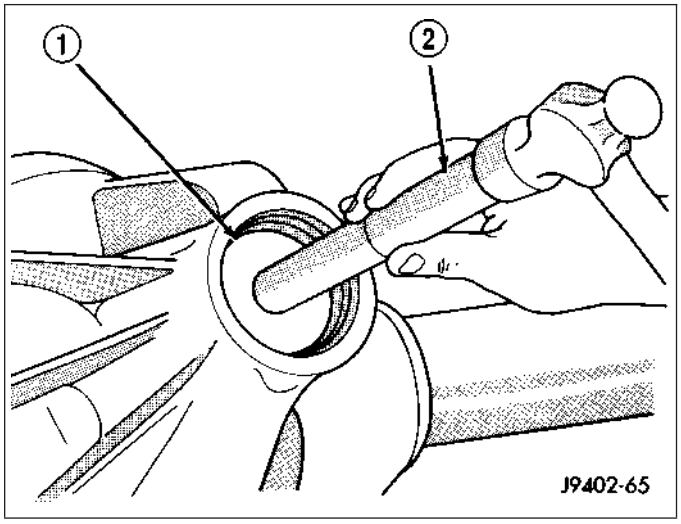
NOTE: The ring gear and pinion are serviced in a matched set. Do not replace the one gear without replacing the other matching gear. If ring and pinion gears or bearings are replaced, Refer to Adjustments for Pinion Gear Depth Setting.

1. Apply Mopar Door Ease or stick lubricant to outside surface of pinion bearing cups.

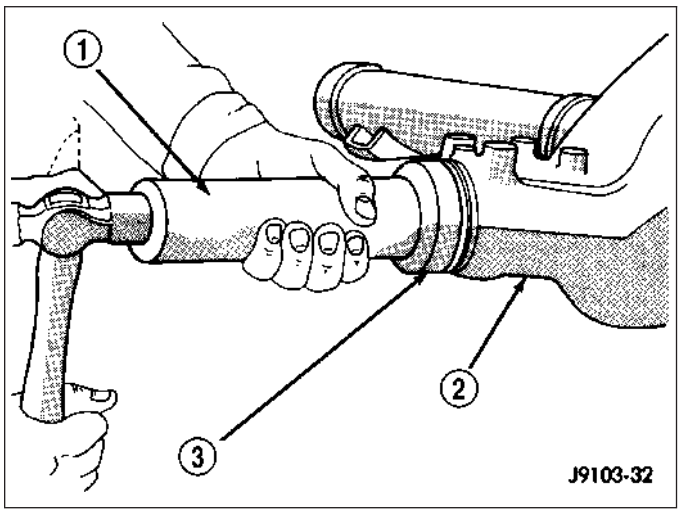
2. Install rear pinion bearing cup with Installer C-4308 (1) and Driver Handle C-4171 (2).



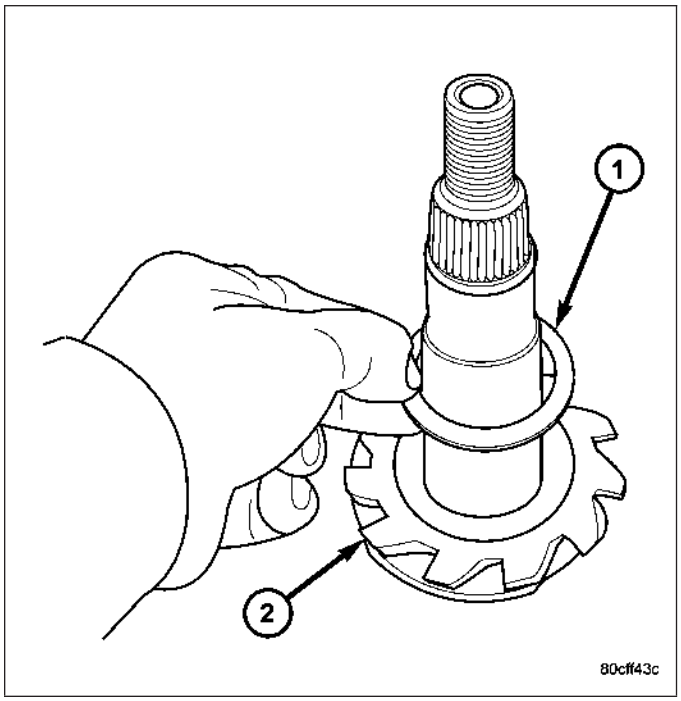
3. Install front pinion bearing cup with Installer D-129 (1) and Handle C-4171 (2).



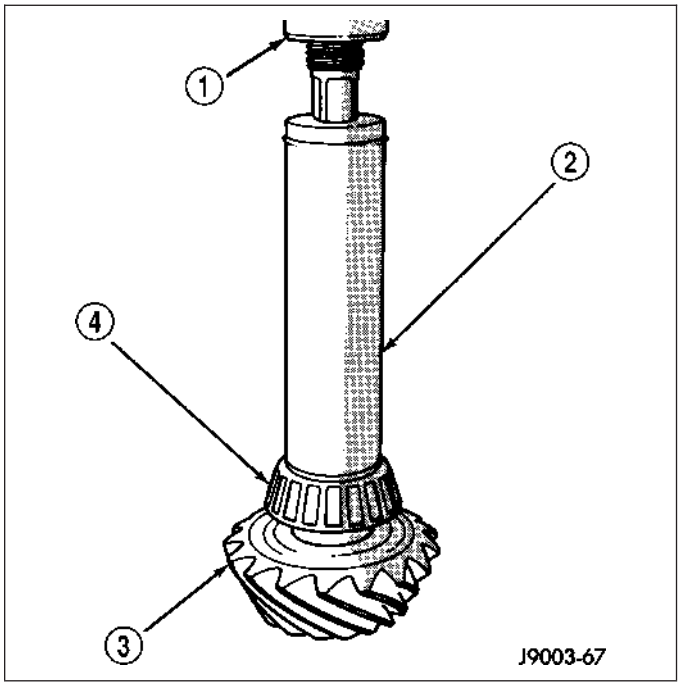
4. Lubricate and install front pinion bearing.
5. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer C-4076-B (1) and Handle C-4735 (3).



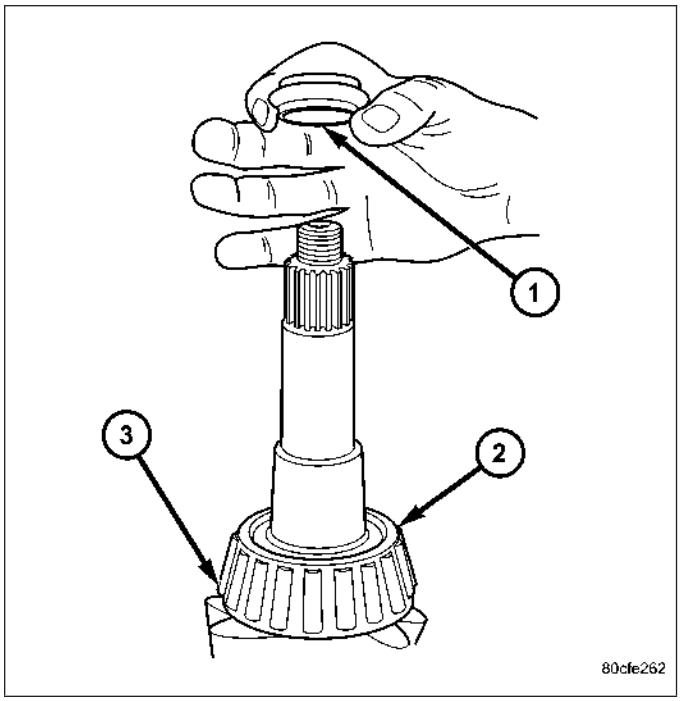
6. Install proper thickness depth shim (1) on the pinion gear (2).



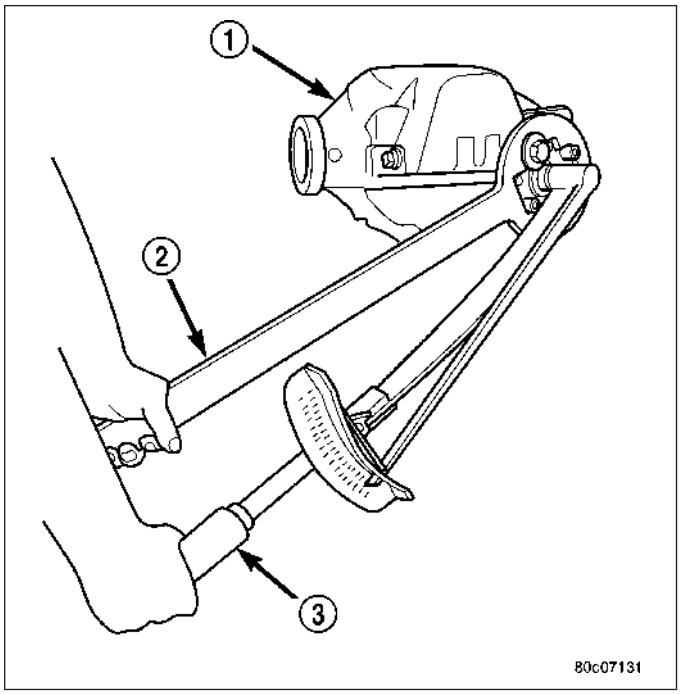
7. Install rear bearing (4) on pinion gear (3) with Installer C-3095-A (2) and a press (1).



8. Install a **new** collapsible spacer (1) on pinion shaft. Lubricate rear bearing and install pinion into the housing.

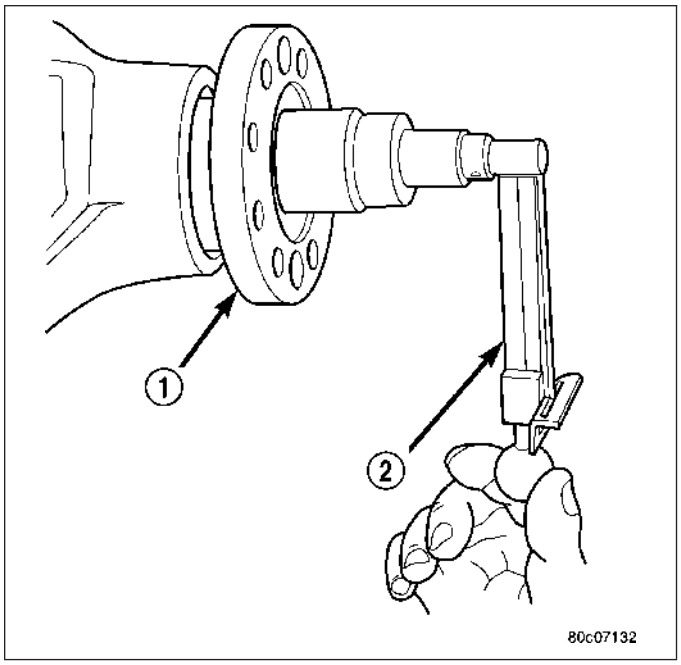


9. Install pinion flange with Installer C-3718.
10. Install bolts into two of the threaded holes in the flange 180° apart.
11. Position Holder 6719 against the flange and install a bolt and washer into one of the remaining threaded holes. Tighten bolts so the Holder 6719 is held to the flange.
12. Install flange washer and new nut on the pinion and tighten nut until there is zero bearing end-play.
13. With a torque wrench (3) tighten the pinion nut to 285 N·m (210 ft. lbs.).



CAUTION: Never loosen pinion nut to decrease pinion rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed. Failure to follow these instructions will result in damage.

14. Slowly tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until the desired rotating torque is achieved. Measure the rotating torque frequently with an inch pound torque wrench (2) to avoid over crushing the collapsible spacer.
15. Check pinion rotating torque with an inch pound torque wrench. The pinion rotating torque should be:
    - Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
    - New Bearings: 2 to 5 N·m (15 to 35 in. lbs.).
16. Position exciter ring on differential case. With a brass drift, slowly and evenly tap the exciter ring into position.



17. Position ring gear on the differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
18. Invert the differential case in the vise.
19. Install **new** ring gear bolts (2) and alternately tighten to 156 N·m (115 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions will result in bolts fracture.

20. Install differential in housing and verify gear mesh and contact pattern.

BRAKES - BASE

DIAGNOSIS AND TESTING

BASE BRAKE SYSTEM

Base brake components consist of the brake pads, calipers, brake drum in hat rotor in the rear, rotors, brake lines, master cylinder, booster, and parking brake components.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.
3. Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**
   a. If fluid level is abnormally low, look for evidence of leaks at calipers, wheel cylinders, brake lines, and master cylinder.
   b. If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals and cups will also have to be replaced after flushing. Use clean brake fluid to flush the system.

4. Check parking brake operation. Verify free movement and full release of cables and pedal. Also note if vehicle was being operated with parking brake partially applied.
5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.
6. Check booster vacuum check valve and hose.
7. If components checked appear OK, road test the vehicle.

ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.
2. Check brake pedal response with transmission in Neutral and engine running. Pedal should remain firm under constant foot pressure.
3. During road test, make normal and firm brake stops in 10 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.
4. Attempt to stop the vehicle with the parking brake only and note grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper/wheel cylinder. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS system may also be the problem with no physical evidence.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up worn linings, rotors, drums, or rear brakes out of adjustment are the most likely causes. The proper course of action is to inspect and replace all worn component and make the proper adjustments.

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However, thin brake drums or substandard brake lines and hoses can also cause a spongy pedal. The proper course of action is to bleed the system, and replace thin drums and substandard quality brake hoses if suspected.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster or check valve could also be faulty.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation, or out of round brake drums (If Equipped). Other causes are loose wheel bearings or calipers and worn, damaged tires.

NOTE: Some pedal pulsation may be felt during ABS activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake shoe release. Drag can be minor or severe enough to overheat the linings, rotors and drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and drums from the overheat-cool down process. In most cases, the rotors, drums, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors and drums to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Seized or improperly adjusted parking brake cables.
- Loose/worn wheel bearing.
- Seized caliper or wheel cylinder piston.
- Caliper binding on corroded bushings or rusted slide surfaces.
- Loose caliper mounting.
- Drum brake shoes binding on worn/damaged support plates.
- Mis-assembled components.
- Long booster output rod.

If brake drag occurs at all wheels, the problem may be related to a blocked master cylinder return port, or faulty power booster (binds-does not release).

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to the Brake Drag information in this section for causes.

BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper
- Seized caliper piston
- Binding caliper
- Loose caliper
- Rusty caliper slide surfaces
- Improper brake pads
- Damaged rotor

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE GRAB OR PULL

Rear grab or pull is usually caused by improperly adjusted or seized parking brake cables, contaminated lining, bent or binding shoes and support plates, or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or proportioning valve could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and/or replacement will be necessary.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers or worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem.

A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. A tire with internal damage such as a severe bruise, cut, or ply separation can cause pull and vibration.

BRAKE NOISES

Some brake noise is common with rear drum brakes and on some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake pads in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors can become so scored that replacement is necessary.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

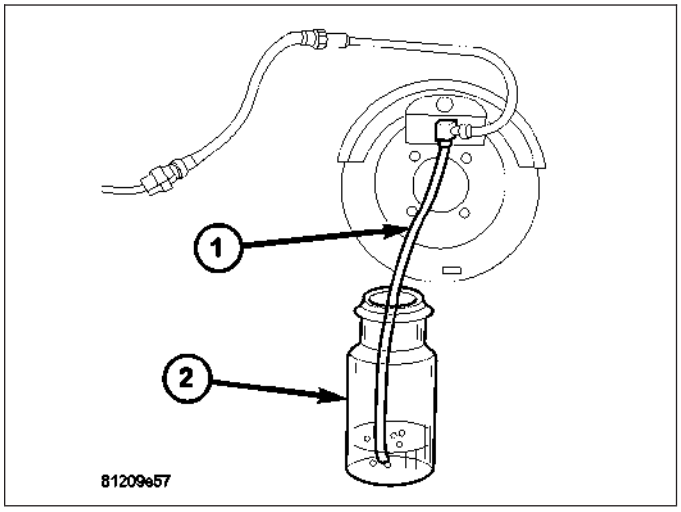
Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components. However, calipers that bind on the slide surfaces can generate a thump or clunk noise.

STANDARD PROCEDURE

MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

1. Remove reservoir filler caps and fill reservoir.
2. If calipers were overhauled, open all caliper bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.
3. Attach one end of bleed hose (1) to bleed screw and insert opposite end in glass container (2) partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.



NOTE: Bleed procedure should be in this order (1) Right rear (2) Left rear (3) Right front (4) Left front.

4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.
5. Before moving the vehicle verify the pedal is firm and not mushy.
6. Top off the brake fluid and install the reservoir cap.

PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 15-20 psi is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system.

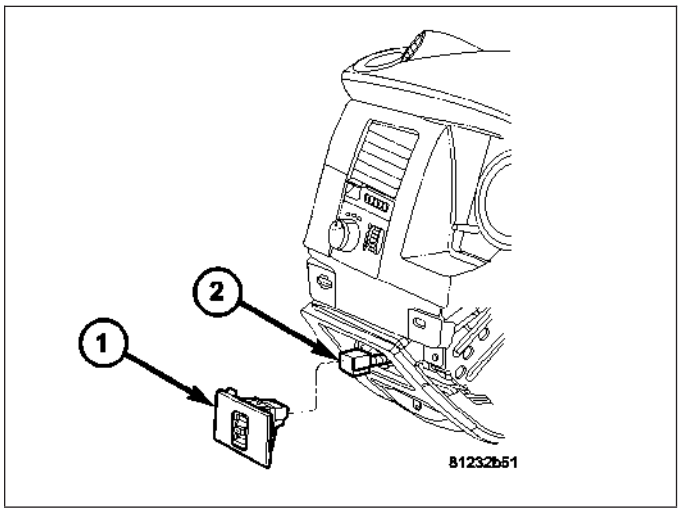
SWITCH-ADJUSTABLE PEDALS

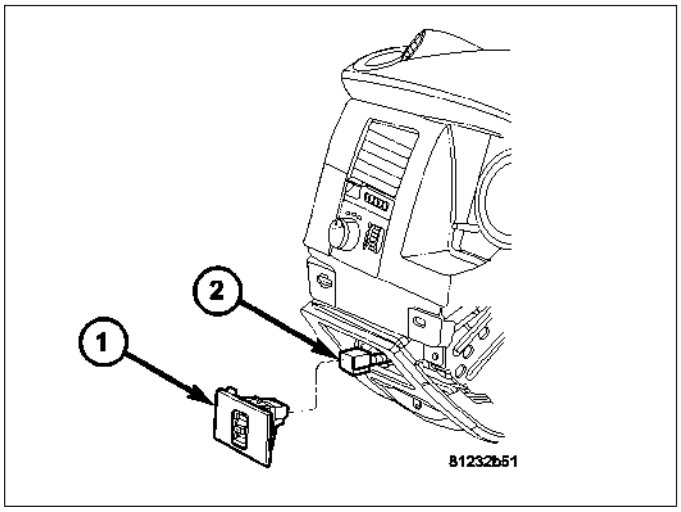
REMOVAL

1. Remove the lower drivers side bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DR SIDE BEZEL - REMOVAL).
2. Disconnect the electrical connector (2) from the adjustable pedal switch(1).
3. Remove the switch from the lower drivers side bezel by squeezing the retaining clips together and pushing the switch outwards



INSTALLATION

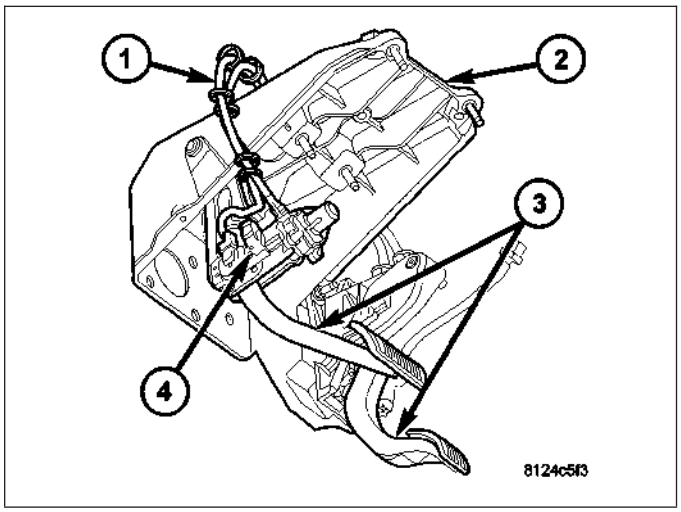
1. Install the switch to the lower drivers side bezel by pushing the switch inwards seating the retaining clips to the lower drivers side bezel.
2. Reconnect the electrical connector to the adjustable pedal switch.
3. Install the lower drivers side bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL DR SIDE BEZEL - INSTALLATION).



MOTOR-ADJUSTABLE PEDALS

DESCRIPTION

NOTE: The Adjustable Pedal Motor (4) is not serviced separately. The Adjustable Pedal Motor (4) comes as an assembly which includes the aluminum pedals bracket (2), pedals (3), cables (1) and motor (4).



The Adjustable Pedals System (APS) is designed to enable the fore and aft repositioning of the brake and accelerator pedals. This results in improved ergonomics in relation to the steering wheel for taller and shorter drivers. Being able to adjust the pedal positions also allows the driver to set steering wheel tilt and seat position to the most comfortable position. The position of the brake and accelerator pedals can be adjusted without compromising safety or comfort in actuating the pedals.

Change of pedal position is accomplished by means of a motor driven screw. Operating the adjustable pedal switch activates the pedal drive motor. The pedal drive motor turns a screw that changes the position of the brake and accelerator pedals. The pedal can be moved rearward (closer to the driver) or forward (away from driver). The brake pedal is moved on its drive screw to a position where the driver feels most comfortable.

The accelerator pedal is moved at the same time and the same distance as the brake pedal.

Neither the pedal drive motor nor drive mechanism are subject to the mechanical stress of brake or accelerator application.

- SYSTEM FEATURES:
  - Range of Adjustment: The pedals may be adjusted up to 3 in. (75 mm)
  - Pedal Adjustment Speed: 0.5 in./sec (12.5 mm/sec)
  - Pedal Adjustment Inhibitors: Pedal adjustment is inhibited when the vehicle is in reverse or when cruise control is activated.

REMOVAL

The Adjustable Pedal Motor is not serviced separately, It is service as an assembly. For service refer to the brake pedal replacement (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - REMOVAL).

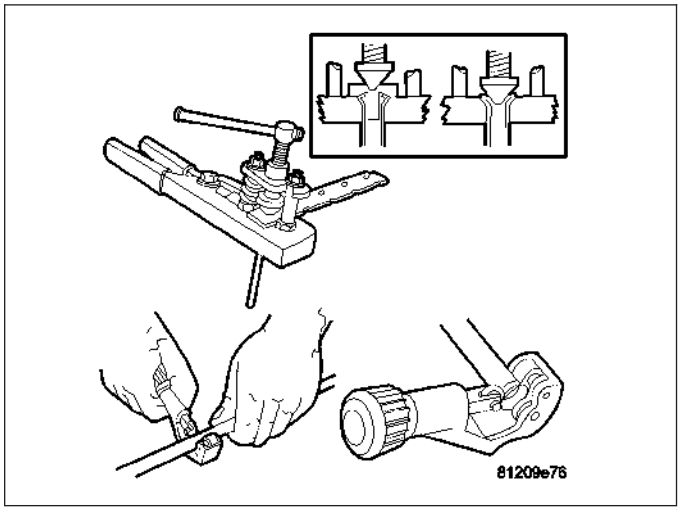
BRAKE LINES

STANDARD PROCEDURE

DOUBLE INVERTED FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

1. Cut off damaged tube with Tubing Cutter.
2. Ream cut edges of tubing to ensure proper flare.
3. Install replacement tube nut on the tube.
4. Insert tube in flaring tool.
5. Place gauge form over the end of the tube.
6. Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
7. Tighten the tool bar on the tube
8. Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc.
9. Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.



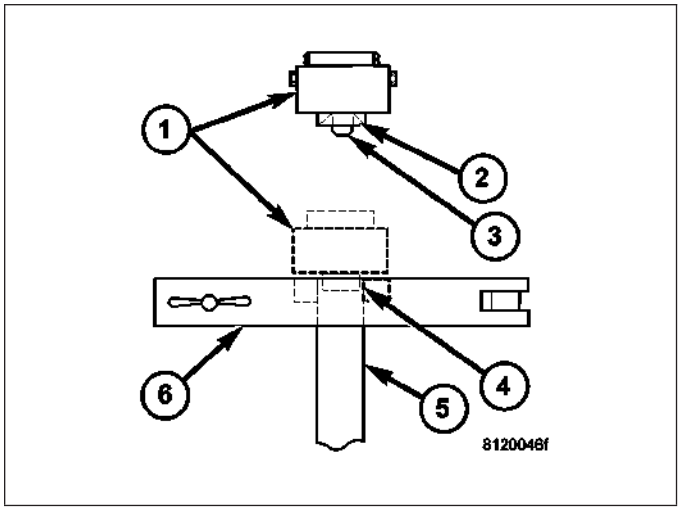
10. Remove the plug gauge and complete the inverted flare.

ISO FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

To make a ISO flare use an ISO flaring tool kit.

1. Cut off damaged tube with Tubing Cutter.
2. Remove any burrs from the inside of the tube.
3. Install tube nut on the tube.
4. Position the tube in the flaring tool flush with the top of the tool bar (6). Then tighten the tool bar on the tube.
5. Install the correct size adaptor (1) on the flaring tool yoke screw.
6. Lubricate the adaptor (2).
7. Align the adaptor and yoke screw over the tube.
8. Turn the yoke screw in until the adaptor is squarely seated on the tool bar.



REMOVAL

REAR BRAKE LINES

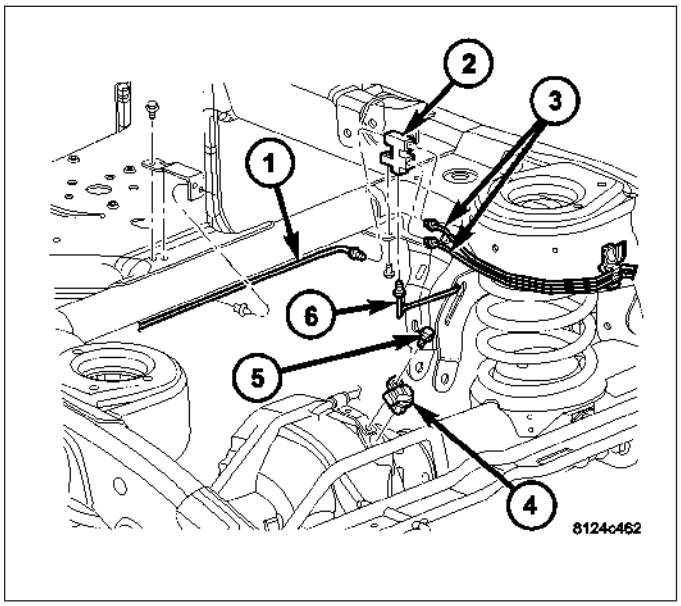
1. Raise and support the vehicle.

NOTE: If brake line (6) is being replaced

2. Remove the brake line (6) from the junction block (2) at the frame, then remove the other end of the line at the caliper hose connection.

NOTE: If brake line (1) is being replaced

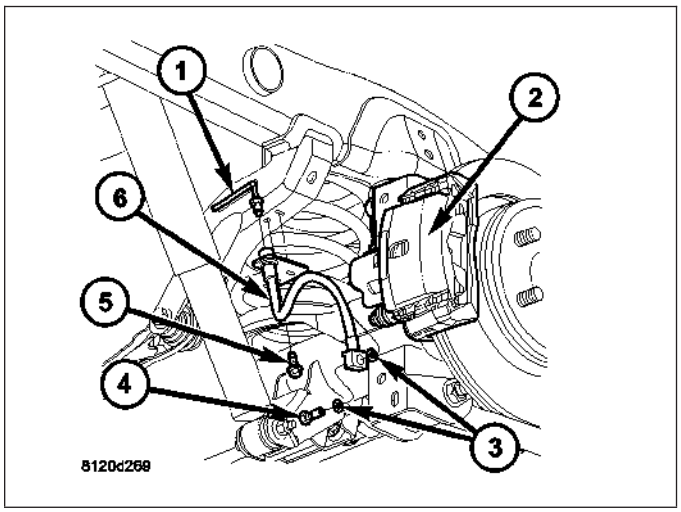
3. Remove the brake line (1) from the junction block (2) at the frame, then remove the other end of the line at the caliper hose connection.
4. Remove the line being replaced.



CALIPER HOSE ASSEMBLY

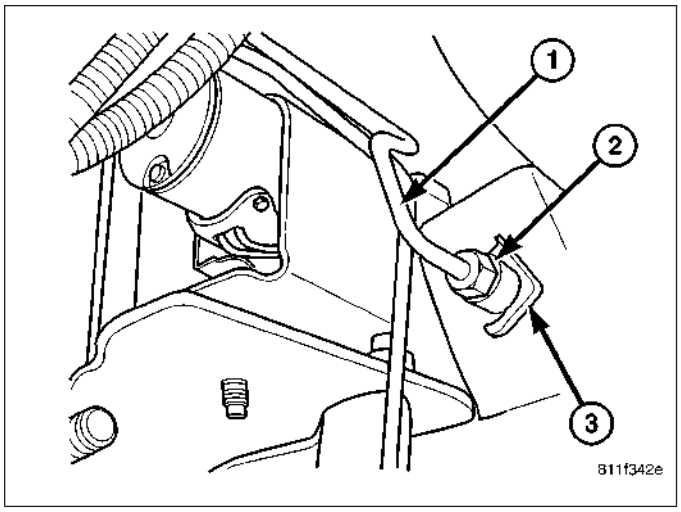
NOTE: The axle should be supported in the normal curb position for rear brake hose change.

1. Raise and support the vehicle.
2. Remove the brake line going into the brake hose.
3. Remove the mounting bolt for the brake hose at the frame.
4. Remove the banjo bolt (4) at the caliper (2) and discard the copper washers (3).
5. Remove the hose (6).

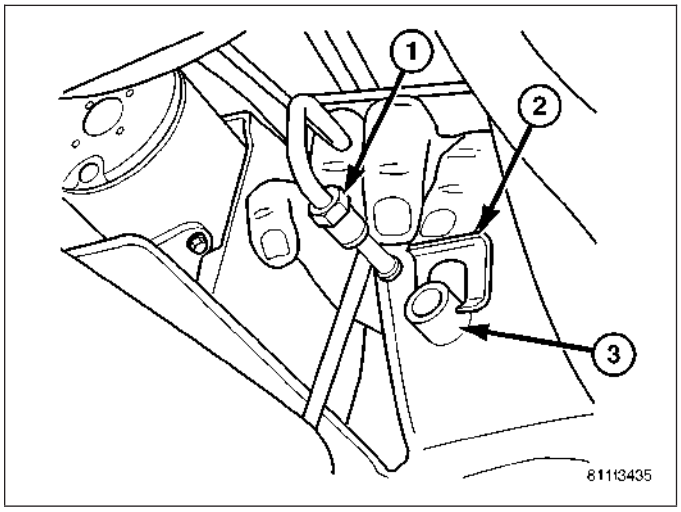


FRONT HOSE

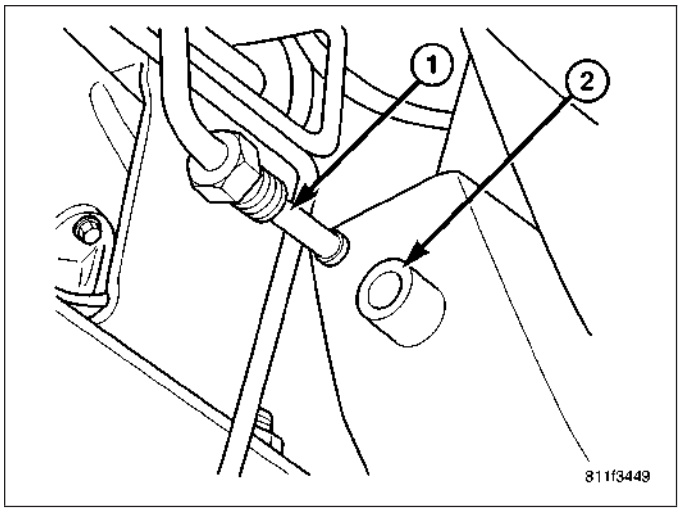
1. Raise and support vehicle.
2. Remove the tire and wheel assembly.
3. Loosen the brake line (1) from the brake hose (2) at the frame.



4. Remove the brake line (1) from the brake hose (3) and remove the retaining clip (2) located at the frame.



5. Remove the retaining clip from the brake hose (2).
6. Remove the brake hose banjo bolt at the caliper.
7. Remove the hose.



INSTALLATION

REAR BRAKE LINE

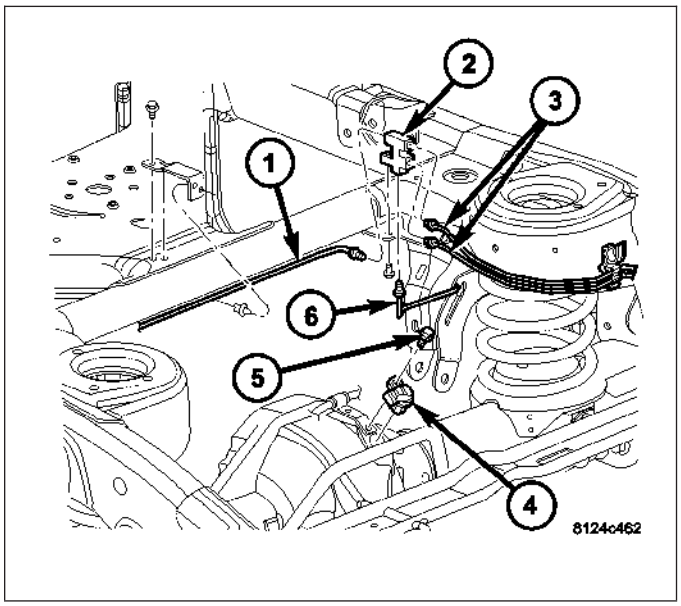
1. Install the line.

NOTE: If brake line (6) was replaced

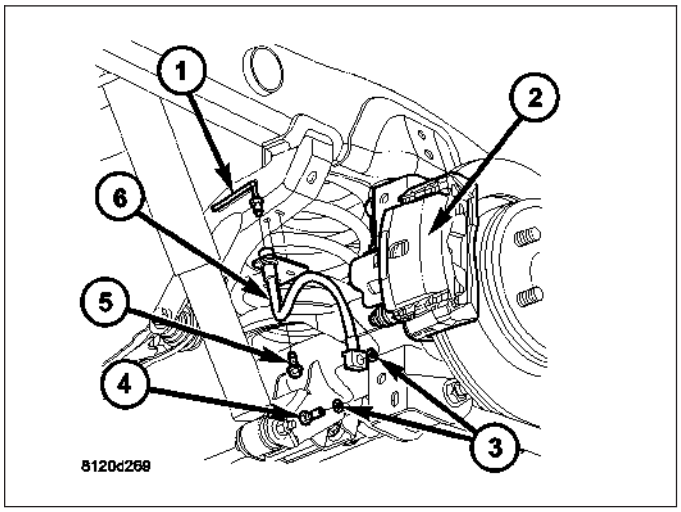
2. Install the brake line (6) at the junction block (2) located at the frame.
3. Install the brake line (6) at the brake caliper hose.

NOTE: If brake line (1) was replaced

4. Install the brake line (1) at the junction block located at the frame.

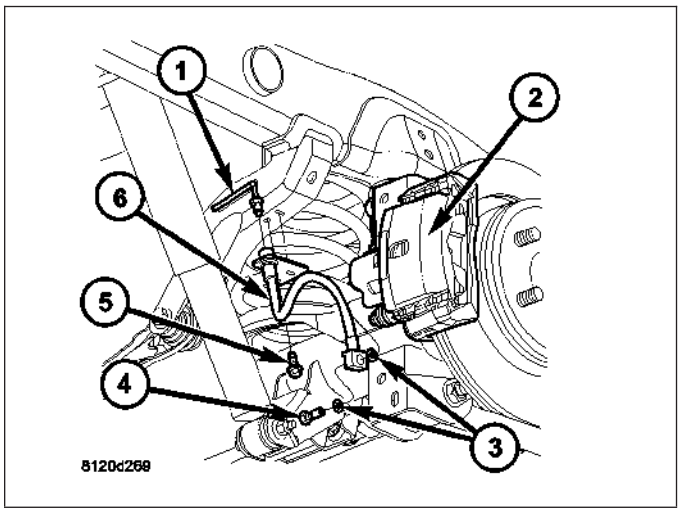


5. Install the brake line (1) at the brake caliper hose (6).
6. Lower the vehicle and remove the support.
7. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



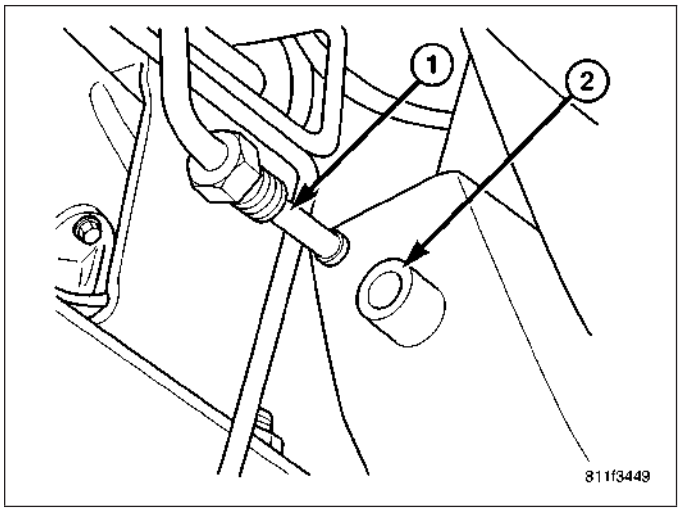
CALIPER HOSE ASSEMBLY

1. Install the hose (6).
2. Install the banjo bolt (4) and new cooper washers (3) at the caliper (2).
3. Install the mounting bolt (5) for the brake hose (6) at the frame.
4. Install the brake line (1) into the caliper hose (6).
5. Lower the vehicle and remove the support.
6. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).

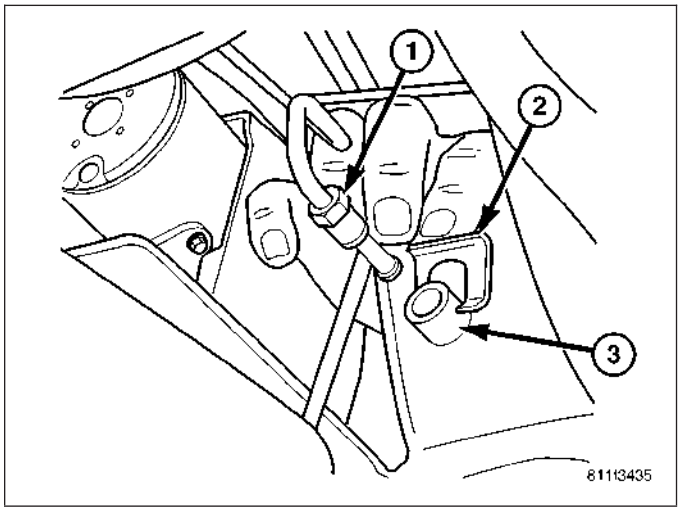


FRONT BRAKE HOSE

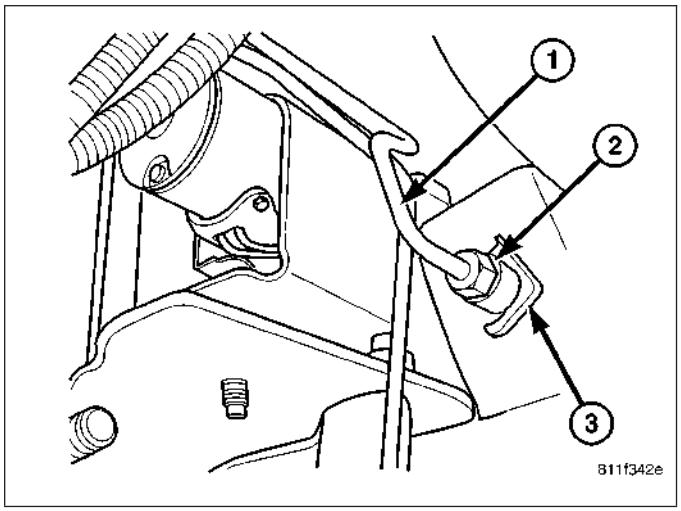
1. Install the brake hose (2) in position.



2. Install the retaining clip (2) for the brake hose (3) at the frame.



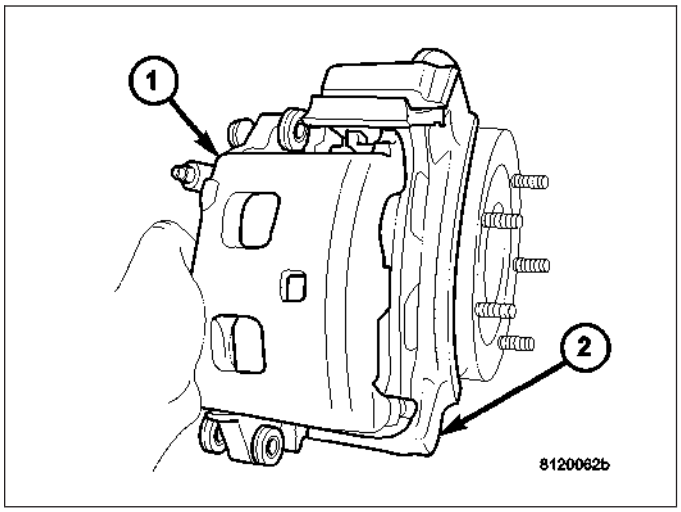
3. Install the brake line (1) into the brake hose (2) and tighten to 19 N·m (250 in.lbs).
4. Install the brake hose banjo bolt at the caliper and tighten to 27 N·m (245 in.lbs).
5. Remove the support and lower the vehicle.
6. Bleed the brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



BRAKE PADS/SHOES

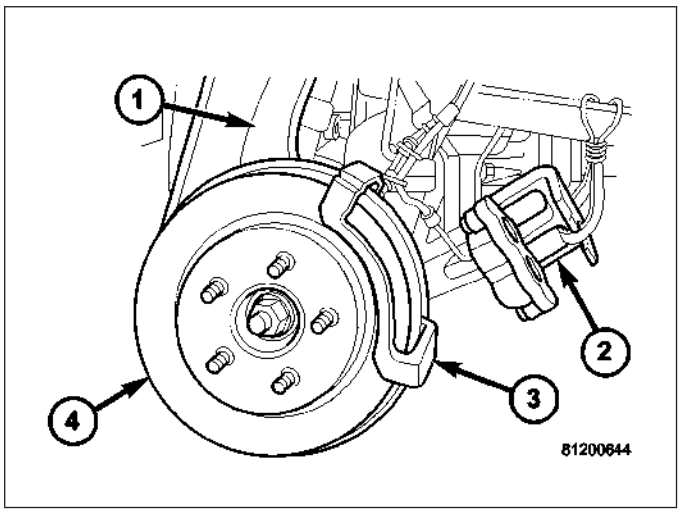
REMOVAL

1. Raise and support vehicle.
2. Remove the wheel and tire assemblies.
3. Compress the caliper.
4. Remove the caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
5. Remove the caliper by tilting the top up and off the caliper adapter.

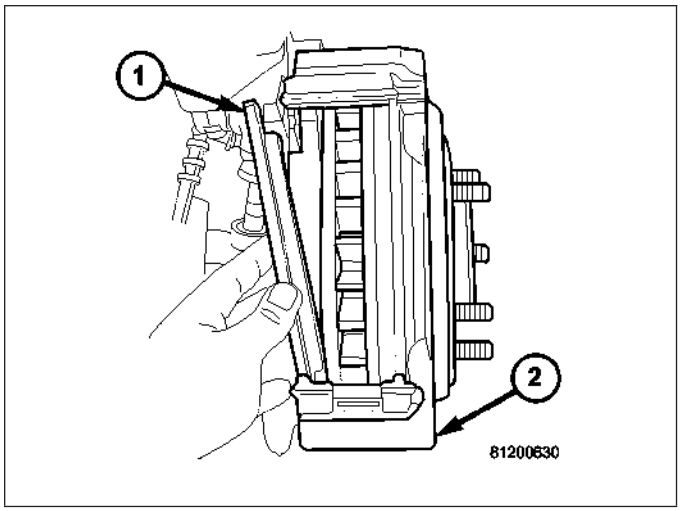


NOTE: Do not allow brake hose to support caliper assembly.

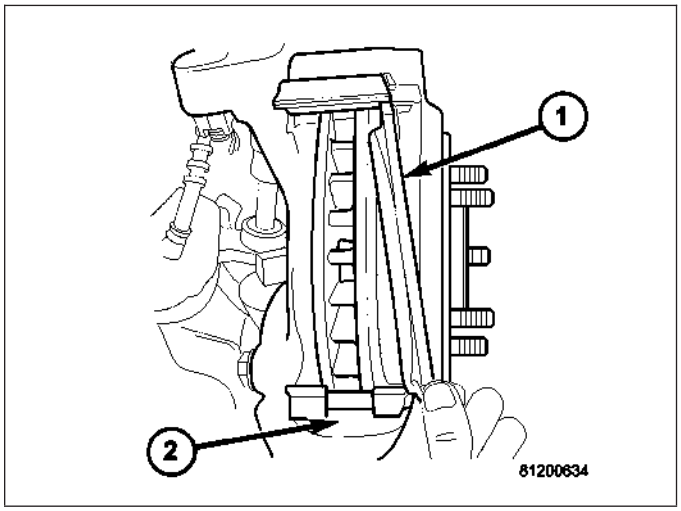
6. Support and hang the caliper.



7. Remove the inboard brake shoe from the caliper adapter.

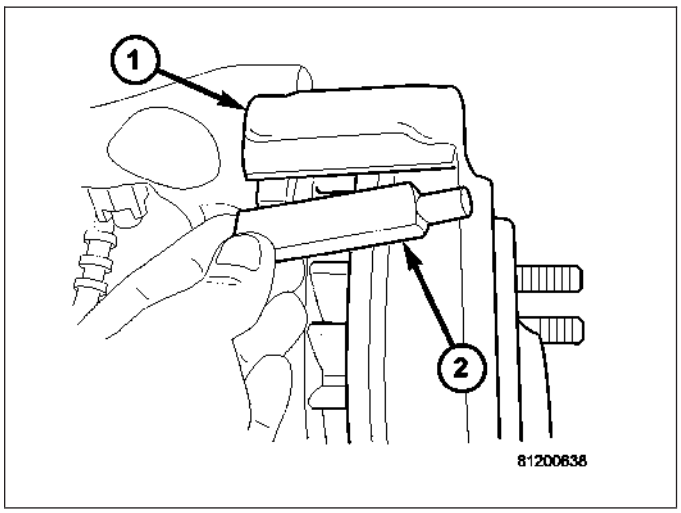


8. Remove the outboard brake shoe from the caliper adapter.

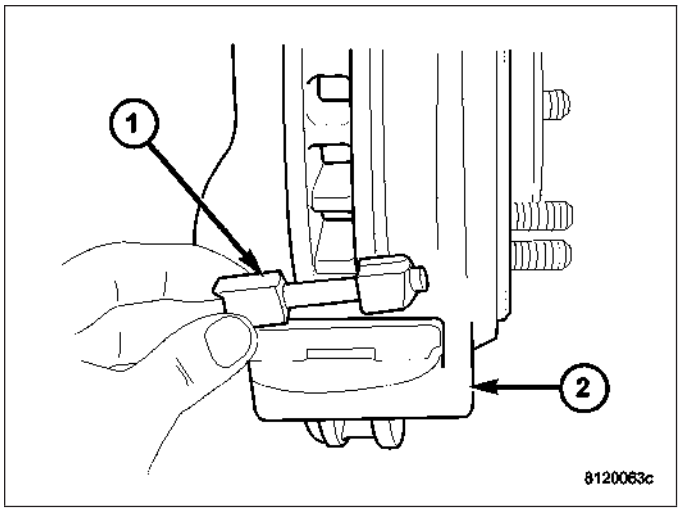


NOTE: Anti-rattle springs are not interchangeable.

9. Remove the top anti-rattle springs from the caliper adapter.



10. Remove the bottom anti-rattle springs from the caliper adapter.

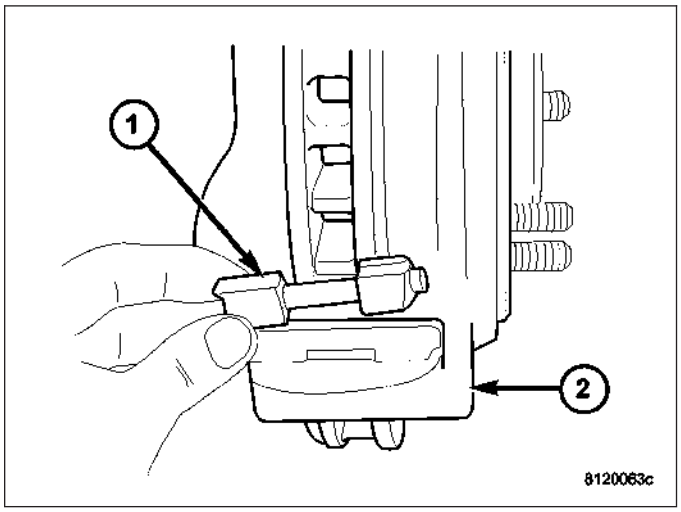


INSTALLATION

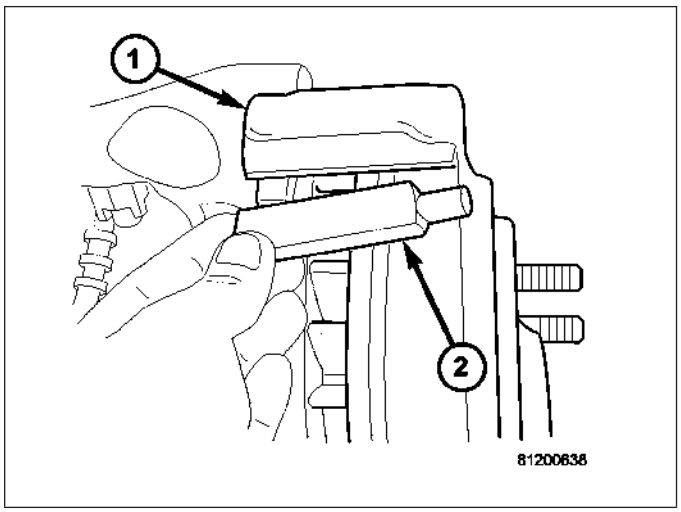
1. Bottom pistons in caliper bore with C-clamp. Place an old brake shoe between a C-clamp and caliper piston.
2. Clean caliper mounting adapter and anti-rattle springs.
3. Lubricate anti-rattle springs with Mopar brake grease.

NOTE: Anti-rattle springs are not interchangeable.

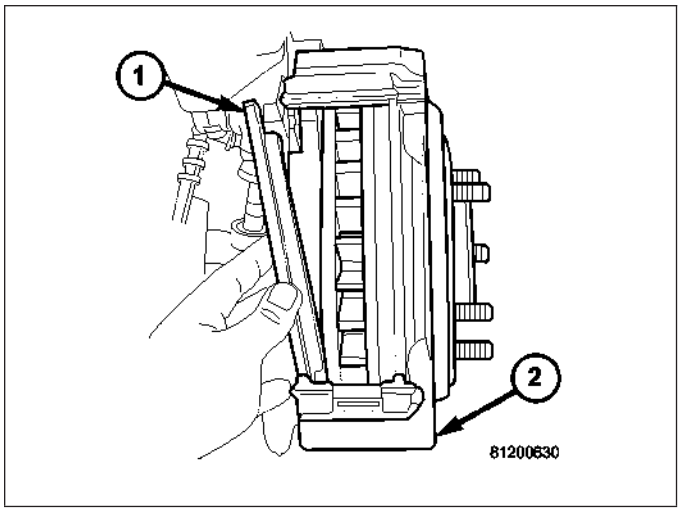
4. Install the bottom anti-rattle springs.



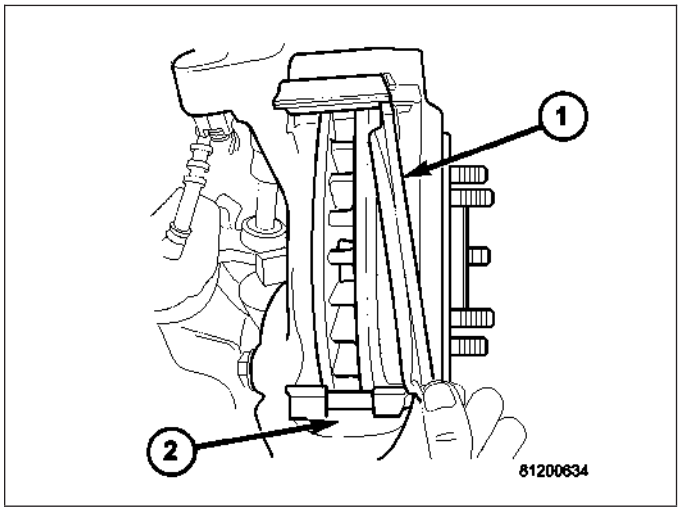
5. Install the top anti-rattle springs.



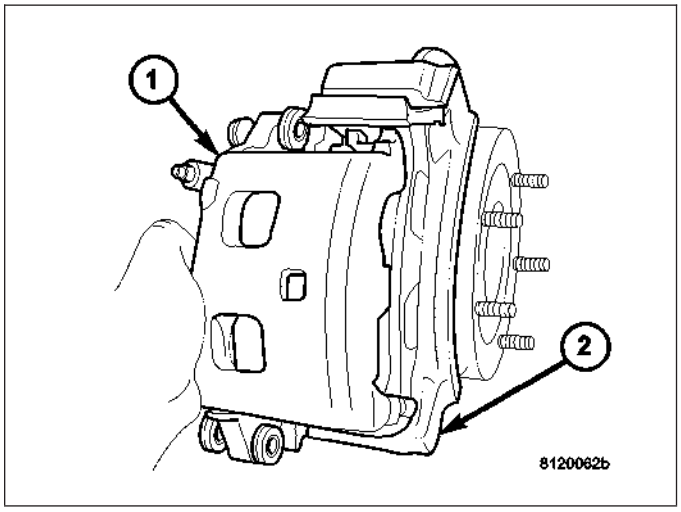
6. Install inboard brake shoe in adapter.



7. Install outboard brake shoe in adapter.



8. Tilt the top of the caliper over rotor and under adapter. Then push the bottom of the caliper down onto the adapter.
9. Install caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
10. Install wheel and tire assemblies and lower vehicle, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
11. Apply brakes several times to seat caliper pistons and brake shoes and obtain firm pedal.
12. Top off master cylinder fluid level.



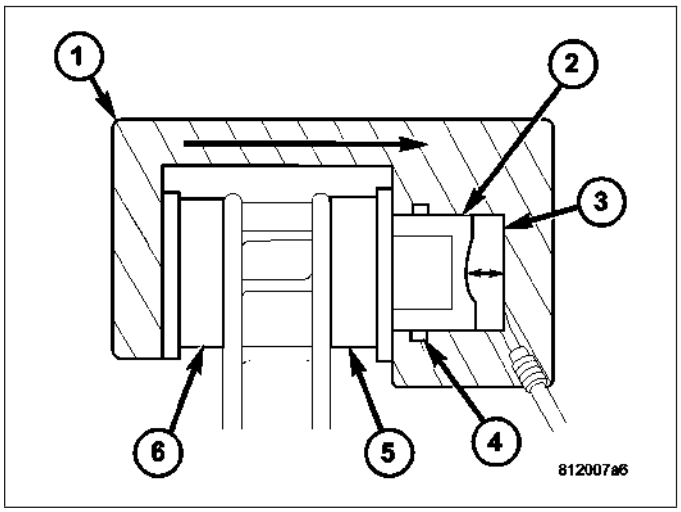
DISC BRAKE CALIPERS

DESCRIPTION

The calipers are a single piston type in the rear and dual piston type in the front. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

OPERATION

When the brakes are applied fluid pressure is exerted against the caliper piston (2). The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal.



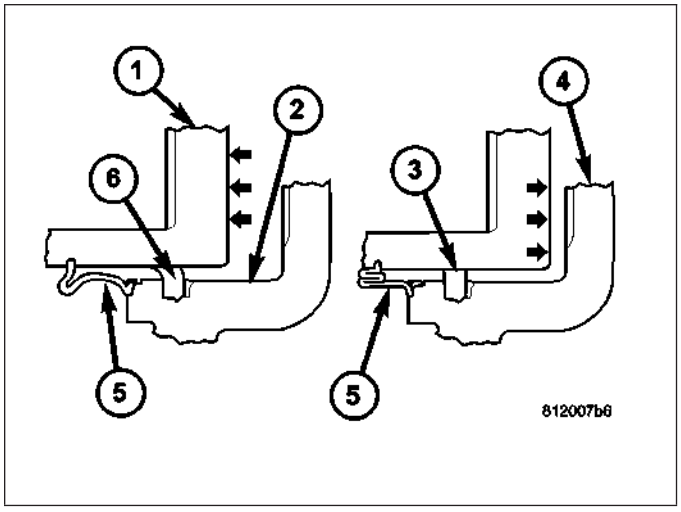
Fluid pressure applied to the piston is transmitted directly to the inboard brake pad (5). This forces the pad lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake pad lining (6) into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake pads do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal (4) controls the amount of piston (2) extension needed to compensate for normal lining wear.

During brake application, the seal is deflected outward by fluid pressure and piston movement(6). When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston (3).



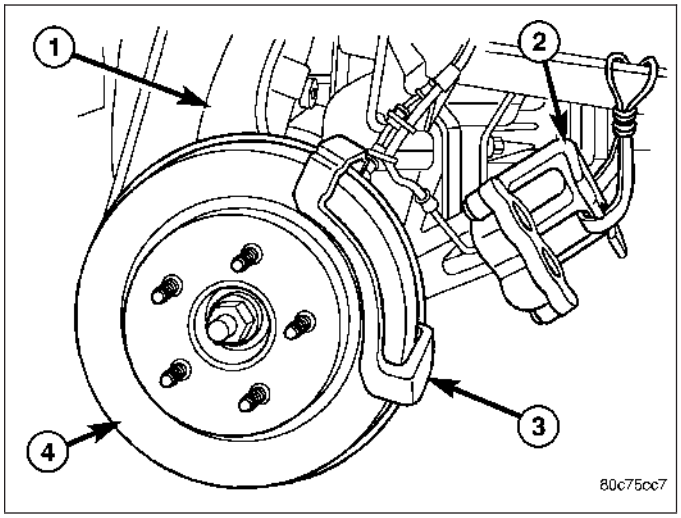
The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake pad.

REMOVAL

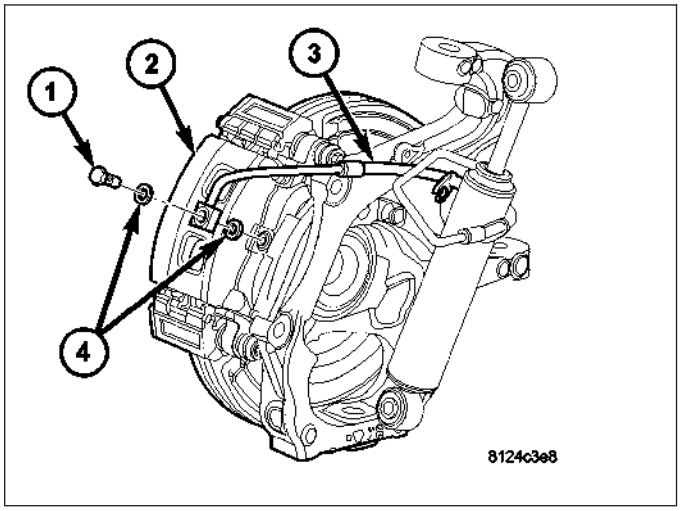
FRONT

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose with result. Provide a suitable support to hang the caliper securely.

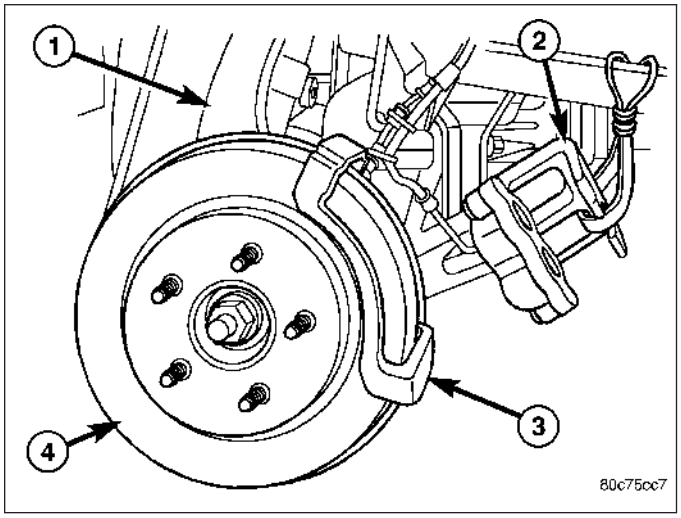
1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Compress the disc brake caliper (2).



4. Remove the banjo bolt (1) and discard the copper washers (4).

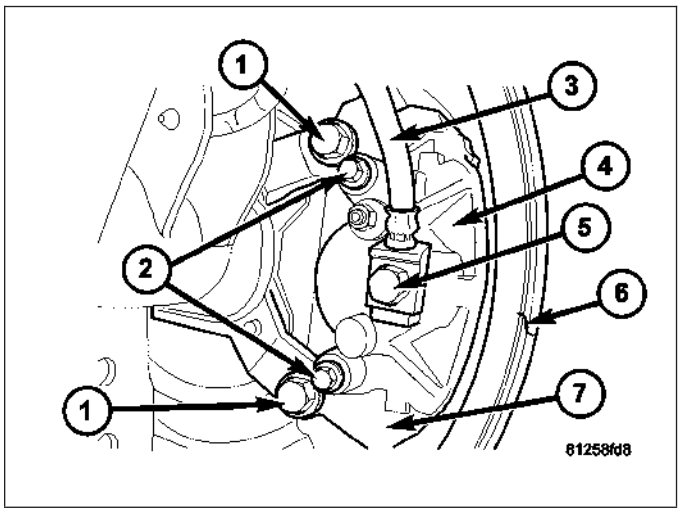


5. Remove the caliper slide pin bolts.
6. Remove the disc brake caliper from the caliper adapter (3).



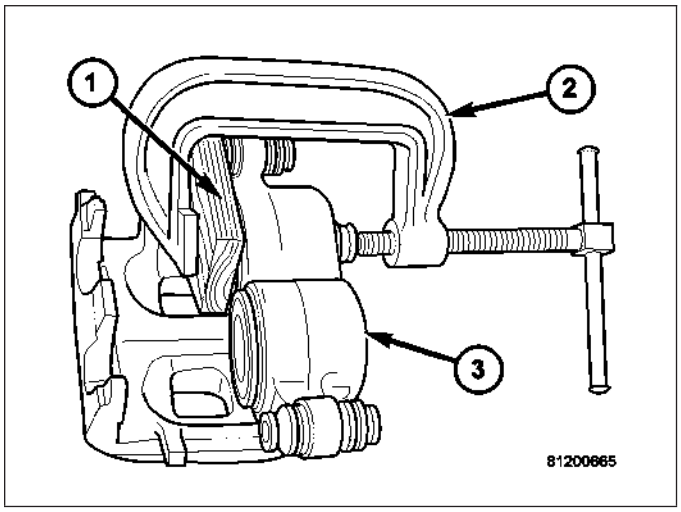
REAR

1. Raise and support vehicle.
2. Remove the wheel and tire assembly (6).
3. Drain small amount of fluid from master cylinder brake reservoir with suction gun.
4. Remove the brake hose banjo bolt (5) if replacing caliper (4).
5. Remove the caliper mounting slide pin bolts (2).
6. Remove the caliper (4) from vehicle.

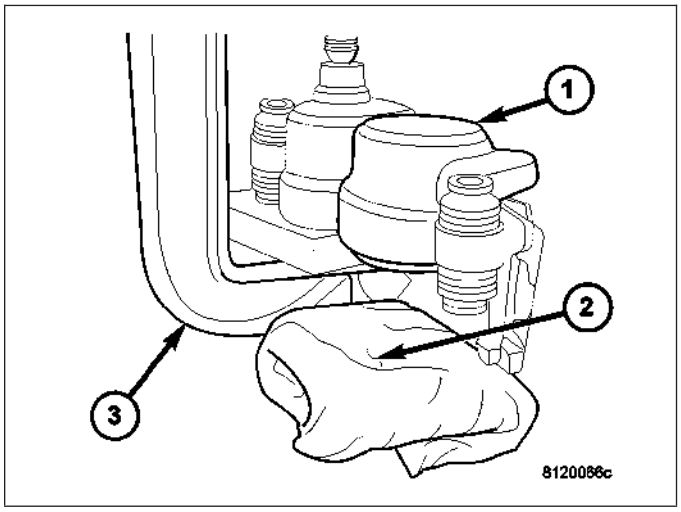


DISASSEMBLY

1. Drain the brake fluid from caliper.
2. C-clamp (2) a block of wood (1) over one piston.



3. Take another piece of wood and pad it with one-inch thickness of shop towels (2). Place this piece in the outboard shoe side of the caliper in front of the other piston. This will cushion and protect caliper piston during removal.
4. To remove the caliper piston direct **short bursts of low pressure air** with a blow gun through the caliper brake hose port. Use only enough air pressure to ease the piston out.

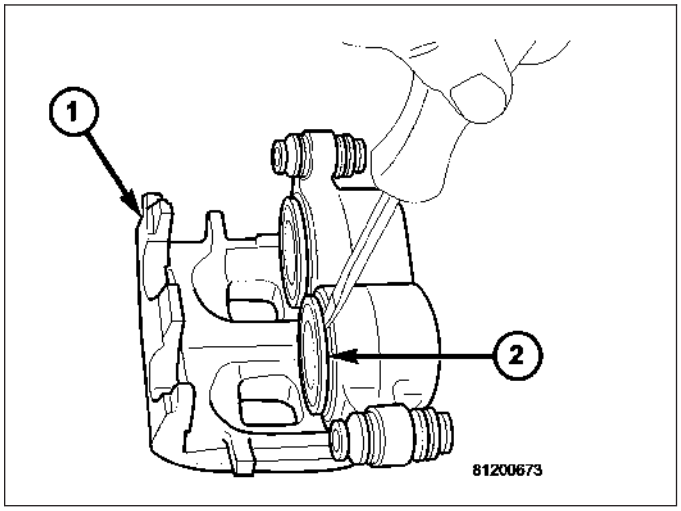


CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston.

WARNING: NEVER ATTEMPT TO CATCH THE PISTON AS IT LEAVES THE BORE. THIS COULD RESULT IN PERSONAL INJURY.

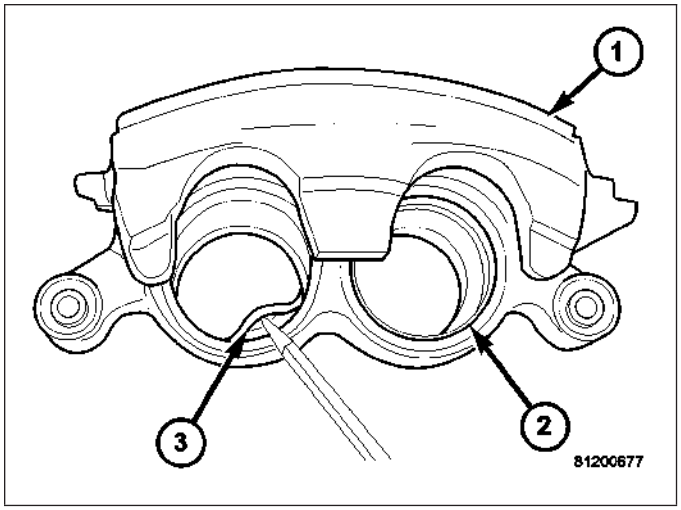
5. Remove the C-clamp and block of wood from the caliper and clamp it over the dust boot of the first piston removed. This will seal the empty piston bore.

6. Move the padded piece of wood in front of the other piston.
7. Remove the second piston using the same procedure with **short bursts of low pressure air**.
8. Remove piston dust boots (2) with a suitable pry tool.

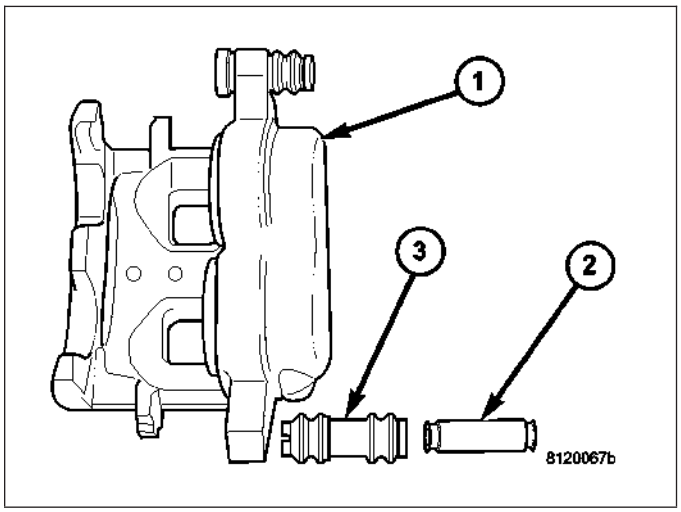


CAUTION: Do not scratch piston bore while removing the seals.

9. Remove piston seals (3) from caliper (1).



10. Push caliper mounting bolt bushings (3) out of the boot seals (2) and remove the boot seals from the caliper (1).
11. Remove caliper bleed screw.



CLEANING - DISC BRAKE CALIPER

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

CAUTION: Do not use gasoline, kerosene, paint thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.

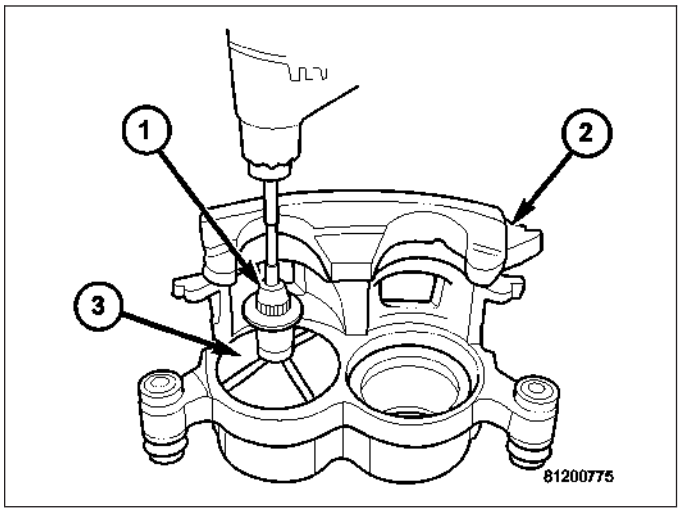
INSPECTION

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.

The bore can be **lightly** polished with a brake hone (3) to remove very minor surface imperfections. The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).



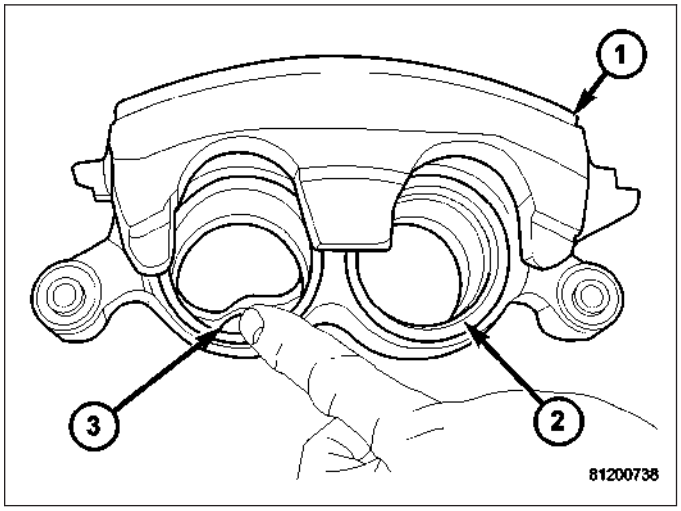
ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Insure assembly area is clean and dry.

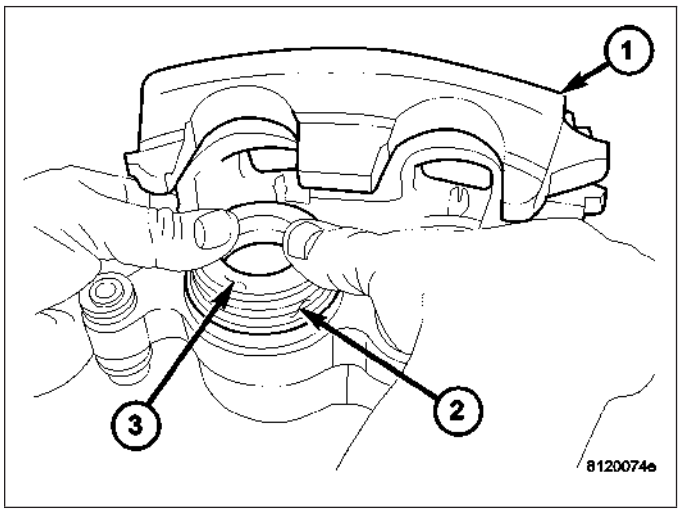
1. Lubricate caliper pistons, piston seals and piston bores with clean, fresh brake fluid.

NOTE: Verify seal is fully seated and not twisted.

2. Install new piston seals (3) into caliper bores (2).



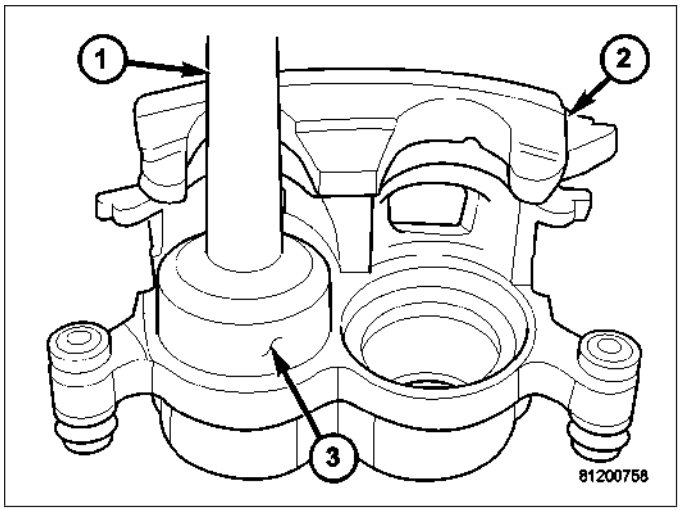
3. Lightly lubricate lip of new boot with silicone grease. Install boot on piston and work boot lip into the groove at the top of piston (3).
4. Stretch boot (2) rearward to straighten boot folds, then move boot forward until folds snap into place.
5. Install piston (3) into caliper bore and press piston down to the bottom of the caliper bore by hand or with hammer handle.



6. Seat dust boot in caliper (2) with Handle C-4171 (1) and Installer (3):
   - 54 mm caliper: Installer C-3716-A
7. Install the second piston and dust boot.
8. Lubricate caliper mounting bolt bushings, boot seals and bores with Mopar brake grease or Dow Corning® 807 grease only.

CAUTION: Use of alternative grease may cause damage to the boots seals.

9. Install the boot seals into the caliper seal bores and center the seals in the bores.
10. Install mounting bolt bushings into the boot seals and insure seal lip is engaged into the bushing grooves at either end of the bushing.
11. Install caliper bleed screw.

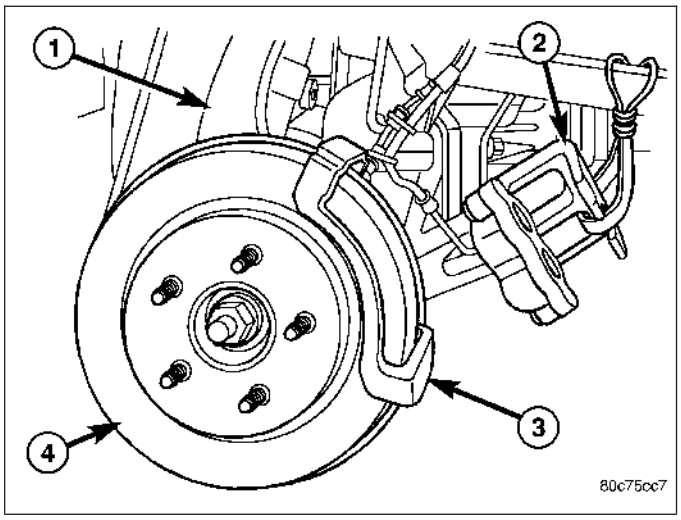


INSTALLATION

FRONT

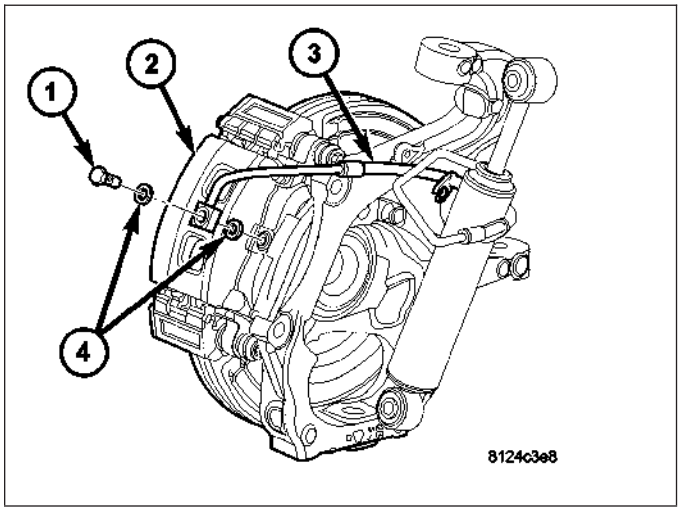
NOTE: Install a new copper washers on the banjo bolt when installing

1. Install the disc brake caliper (2) to the brake caliper adapter (3).

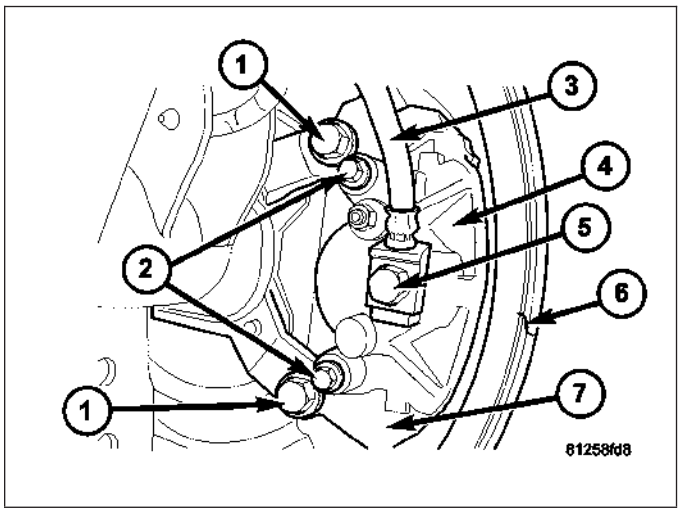


CAUTION: Verify brake hose (3) is not twisted or kinked before tightening fitting bolt.

2. Install the banjo bolt (1) with new copper washers (4) to the caliper (2). Tighten to 28 N·m (250 in. lbs.)
3. Install the caliper slide pin bolts. tighten to 32 N·m (24 ft. lbs.)
4. Bleed the base brake system, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL - STANDARD PROCEDURE).
5. Install the tire and wheel assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
6. Lower the vehicle.



REAR



1. Install caliper (4) to the caliper adapter (7).
2. Coat the caliper mounting slide pin bolts (2) with silicone grease. Then install and tighten the bolts to 15 N·m (11 ft. lbs.).
3. Install the brake hose banjo bolt (5) and **new copper seal washers** if caliper was removed.
4. Install the brake hose (3) to the caliper (4) with and tighten fitting bolt to 28 N·m (250 in. lbs.).

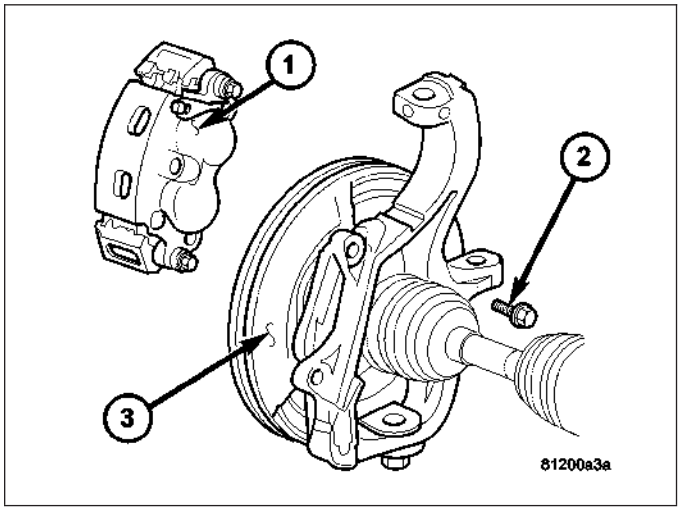
CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.

5. Bleed the base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
6. Install the wheel and tire assemblies (6) (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
7. Remove the supports and lower the vehicle.
8. Verify a firm pedal before moving the vehicle.

DISC BRAKE CALIPER ADAPTER

REMOVAL

FRONT



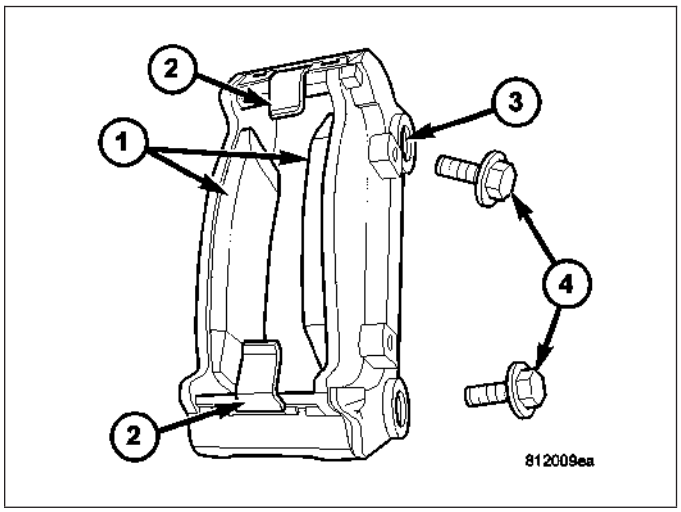
1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the bolts securing the caliper adapter (2) to the steering knuckle
5. Remove the caliper adapter.

REAR

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Drain a small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.
4. Bottom the caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper mounting bolts.
6. Remove the disc brake caliper from the mount.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

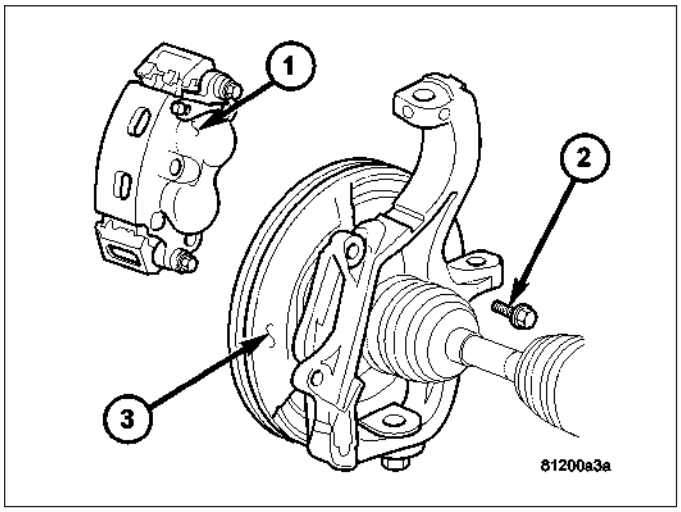
7. Remove the inboard and outboard brake pads (1).
8. Remove the anti-rattle clips (2).
9. Remove the caliper adapter mounting bolts (4).



INSTALLATION

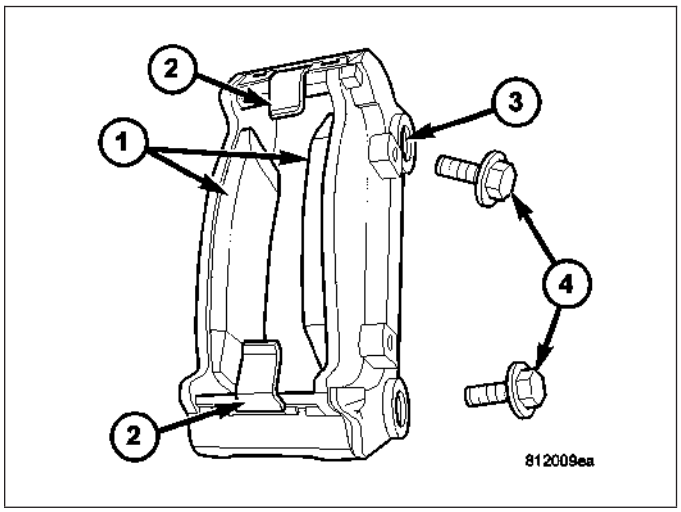
FRONT

1. Install the caliper adapter (1) to the steering knuckle.
2. Install the caliper adapter mounting bolts (2) and tighten to 176 N·m (130 ft.lbs.).
3. Install the disc brake caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
4. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
5. Remove the support and lower the vehicle.



REAR

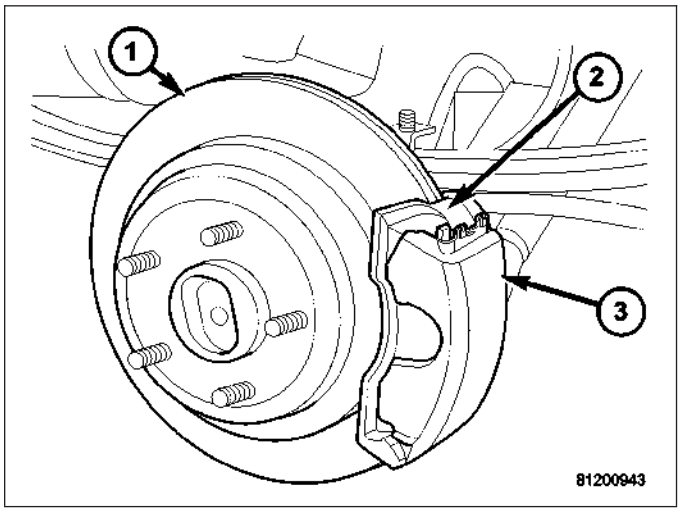
1. Install the caliper adapter mounting bolts (4). Tighten the mounting bolts to 135 N·m (100 ft.lbs).
2. Install the anti-rattle clips (2).
3. Install the inboard and outboard pads (1).
4. Install the caliper mounting bolts.
5. Install the tire and wheel assembly.



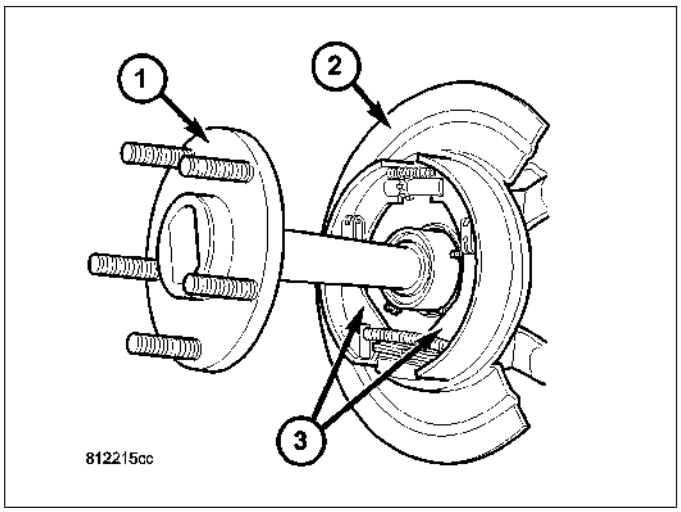
DISC BRAKE CALIPER ADAPTER MOUNT

REMOVAL - REAR

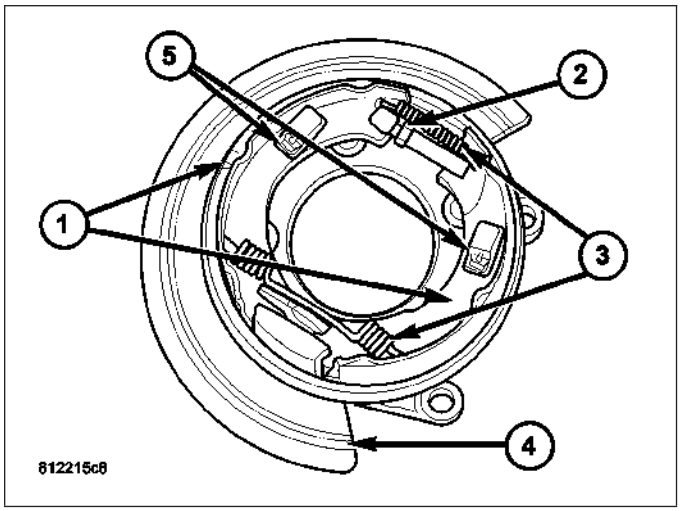
1. Remove wheel and tire assembly.
2. Remove the disc brake caliper (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
3. Remove the caliper adapter (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the rotor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).



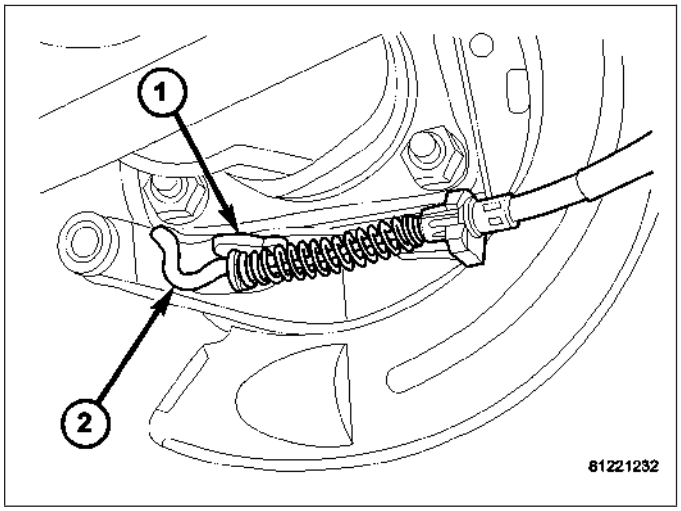
5. Remove the axle shaft (1) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - REMOVAL).



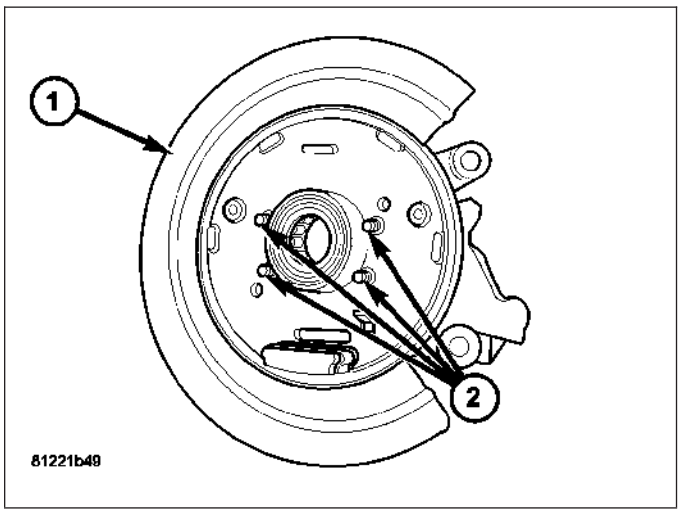
6. Remove the park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL).



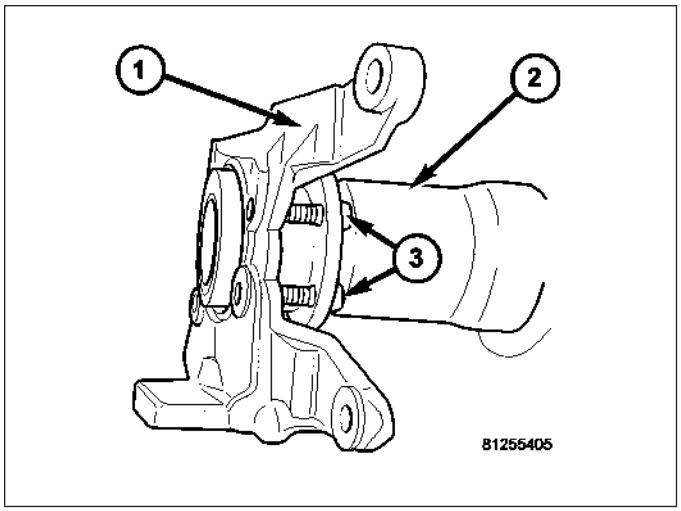
7. Remove the parking brake cable (2) from the brake lever (1).



8. Remove the bolts (2) attaching the support plate to the axle and remove the support plate (1).

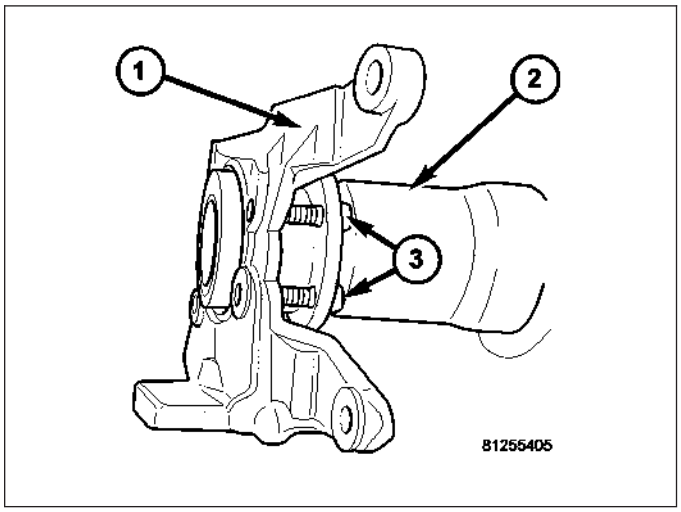


9. Remove the caliper adapter mount (1) from the axle housing (2).

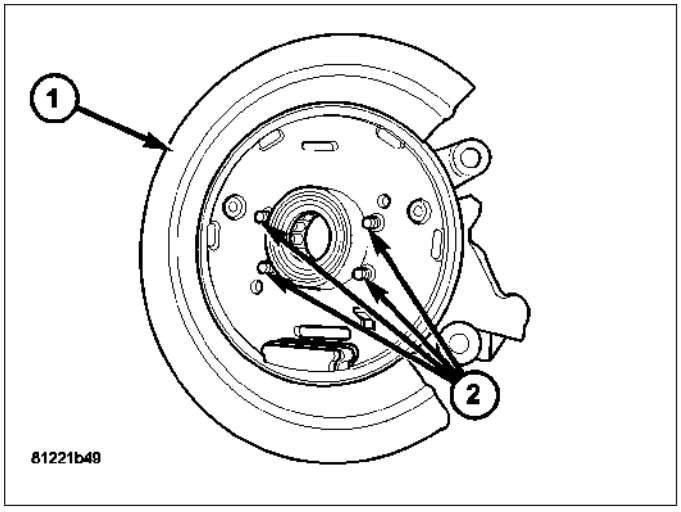


INSTALLATION

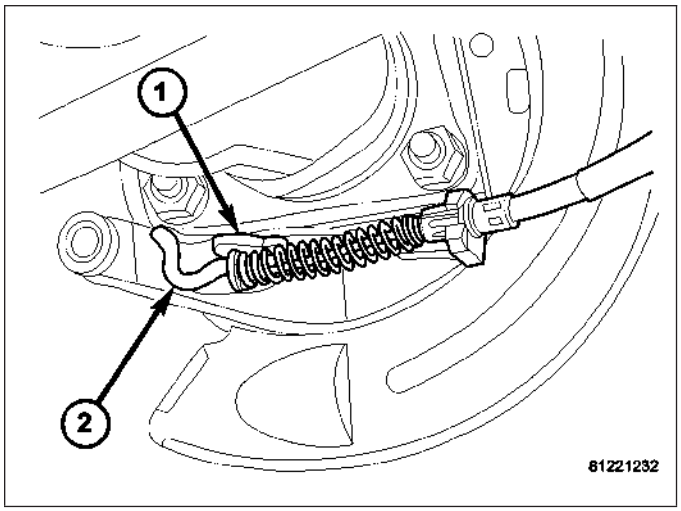
1. Install the caliper adapter mount (1) on the axle housing (2).



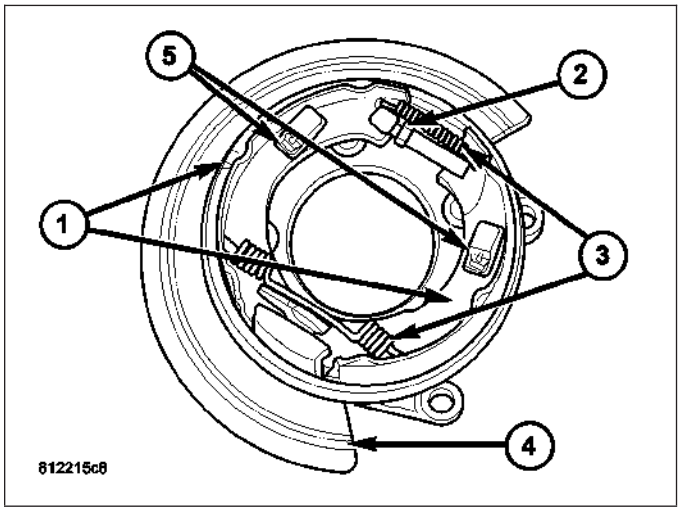
2. Install support plate (1) on axle flange. Tighten attaching bolts (2) to 115 N·m (85 ft. lbs.).



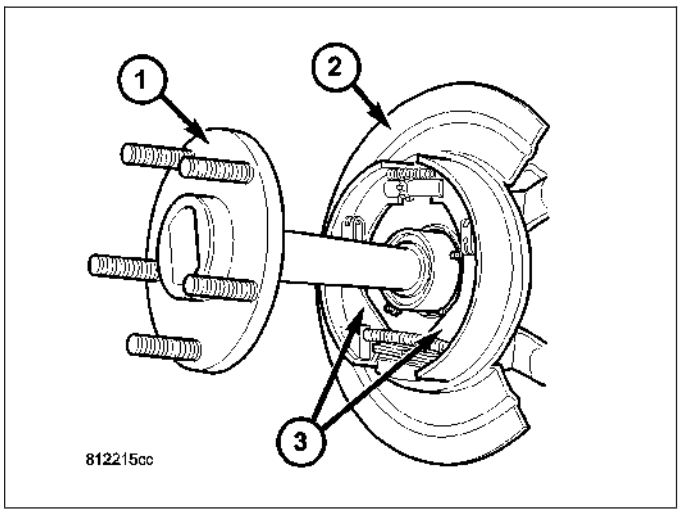
3. Install parking brake cable (2) in the brake lever (1).



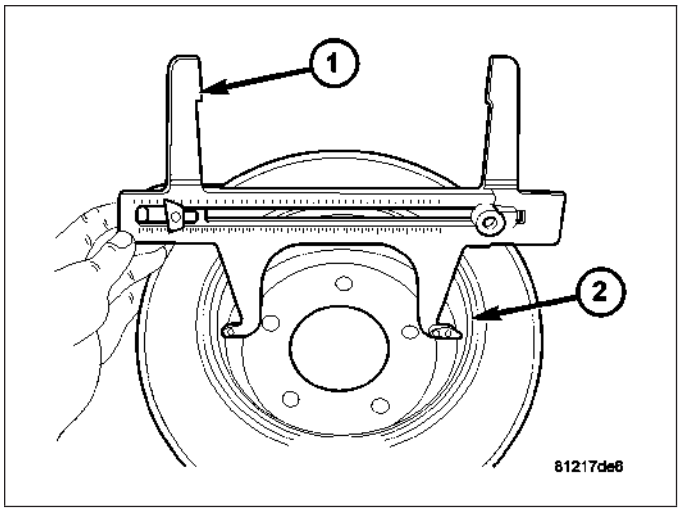
4. Install the park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION).



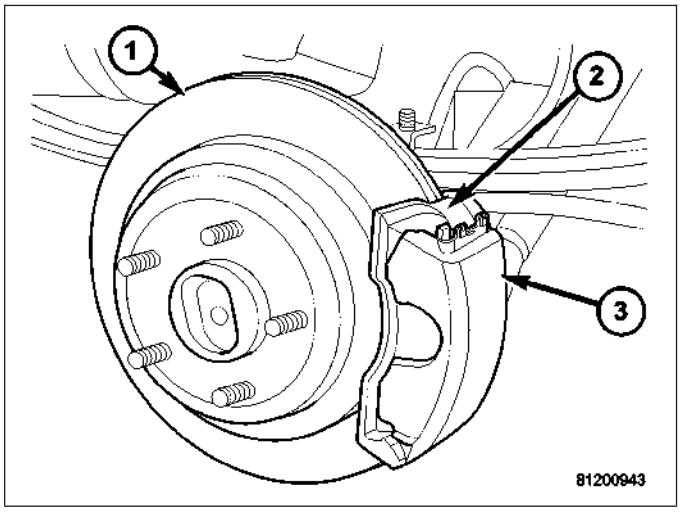
5. Install axle shaft (1), (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - INSTALLATION).



6. Adjust brake shoes to drum (2) with brake gauge (1) (Refer to 5 - BRAKES/PARKING BRAKE/ SHOES - ADJUSTMENTS).



7. Install the rotor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
8. Install the caliper adapter (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
9. Install the caliper (3) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
10. Install wheel and tire assembly.



FLUID

DIAGNOSIS AND TESTING

BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

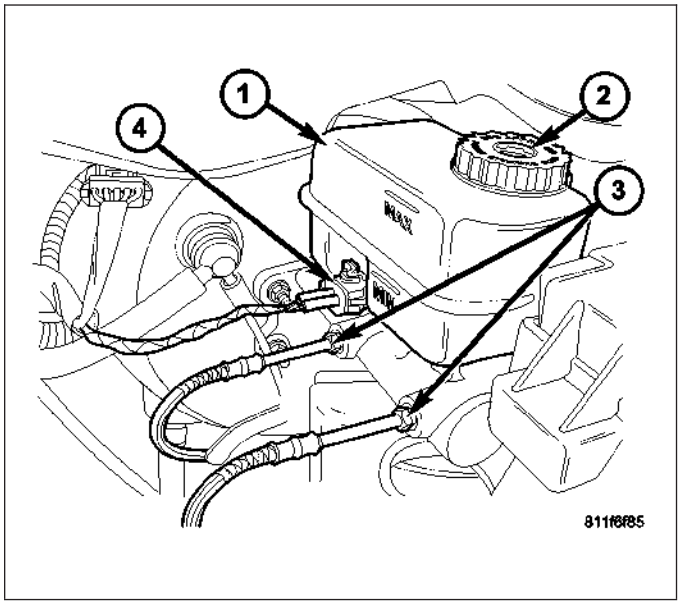
STANDARD PROCEDURE

BRAKE FLUID LEVEL

Always clean the master cylinder reservoir (1) and cap (2) before checking fluid level. If not cleaned, dirt could enter the fluid.

The fluid fill level is indicated on the side of the master cylinder reservoir (1).

The correct fluid level is to the MAX indicator on the side of the reservoir. If necessary, add fluid to the proper level.



SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

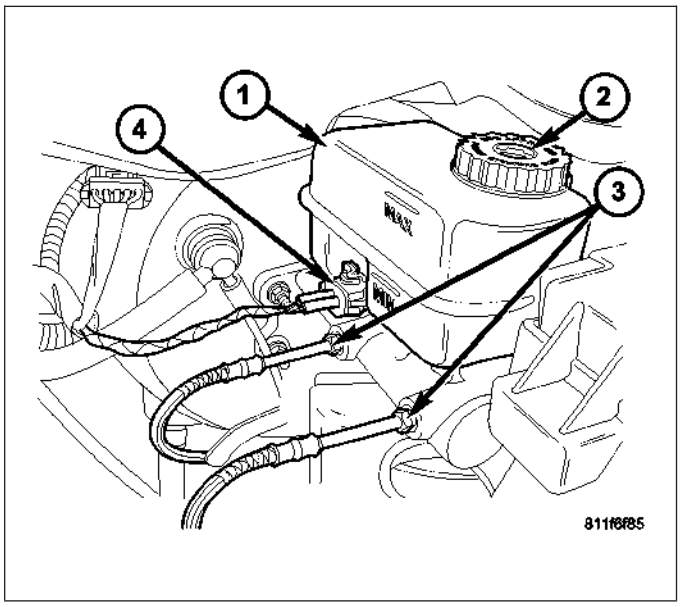
CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

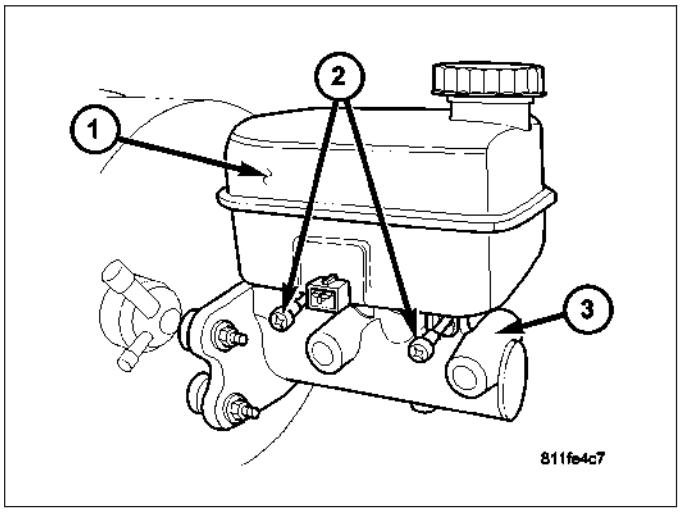
FLUID RESERVOIR

REMOVAL

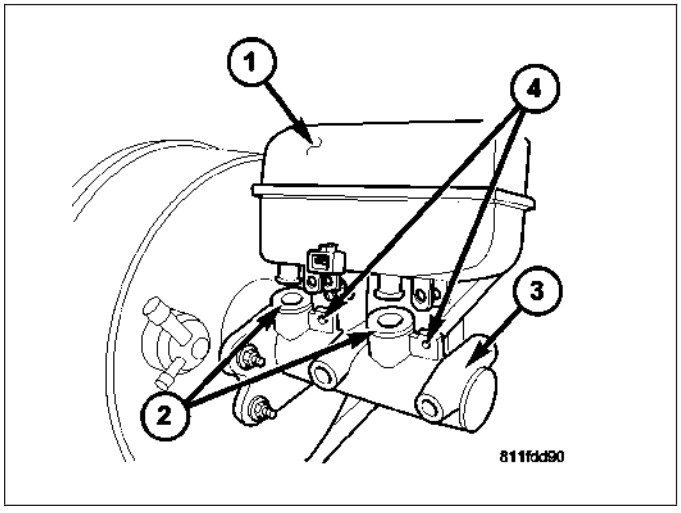
1. Install the prop rod on the brake pedal to keep pressure on the brake system.
2. Remove the reservoir cap (2) and siphon fluid into a drain container.
3. Disconnect the electrical connector (4) from the fluid level switch in the reservoir (1).



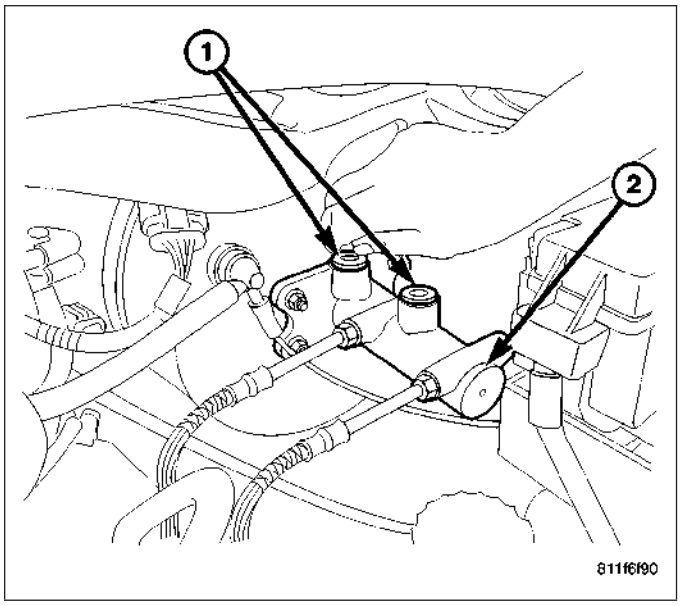
4. Remove the reservoir mounting bolts (2).



5. Remove the reservoir (1) from the master cylinder (3) by pulling upwards and to the side.



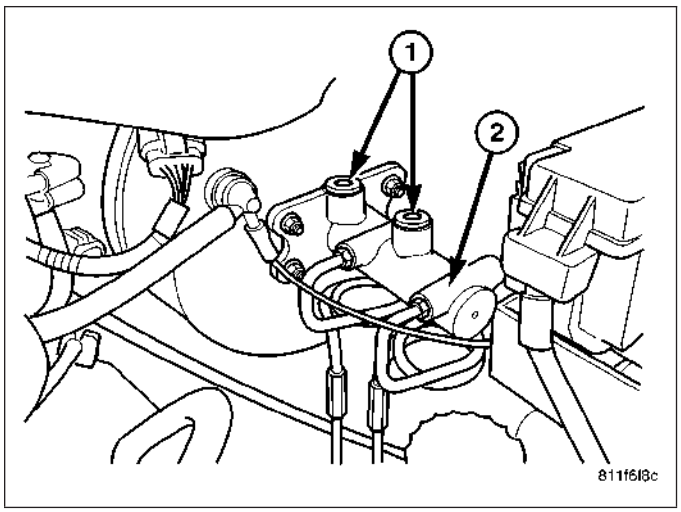
6. Remove old seals (1) from the cylinder body (2).



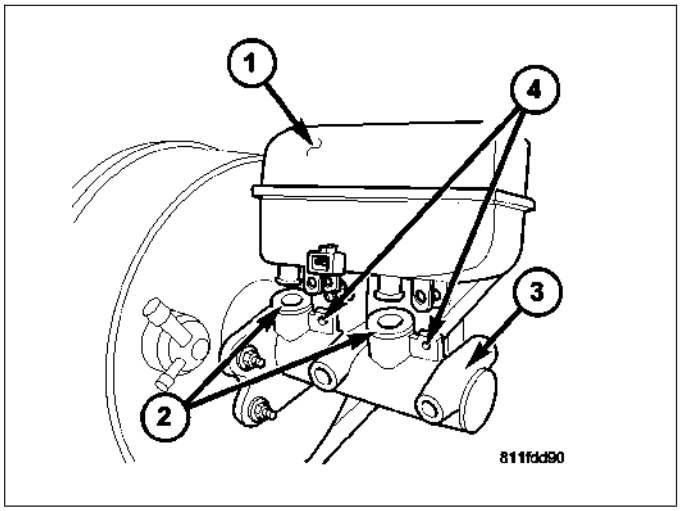
INSTALLATION

CAUTION: Do not use any type of tool to install the seals. Tools may cut, or tear the seals creating a leak problem after installation. Install the seals using finger pressure only.

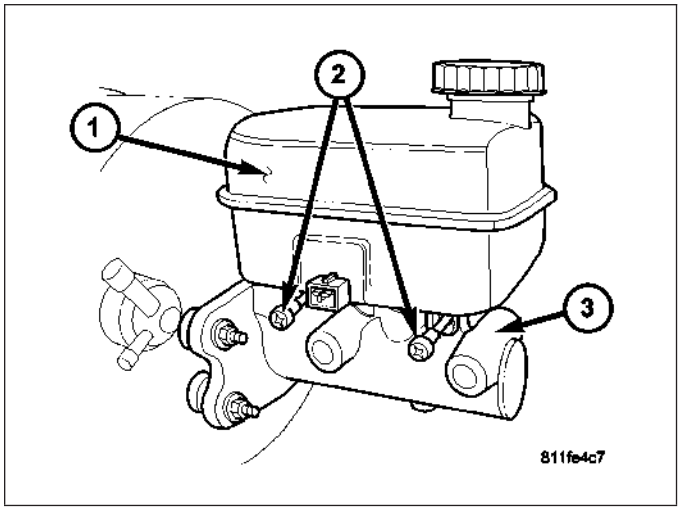
1. Lubricate the new seals (1) with clean brake fluid and Install new seals in cylinder body (2). Use finger pressure to install and seat seals.



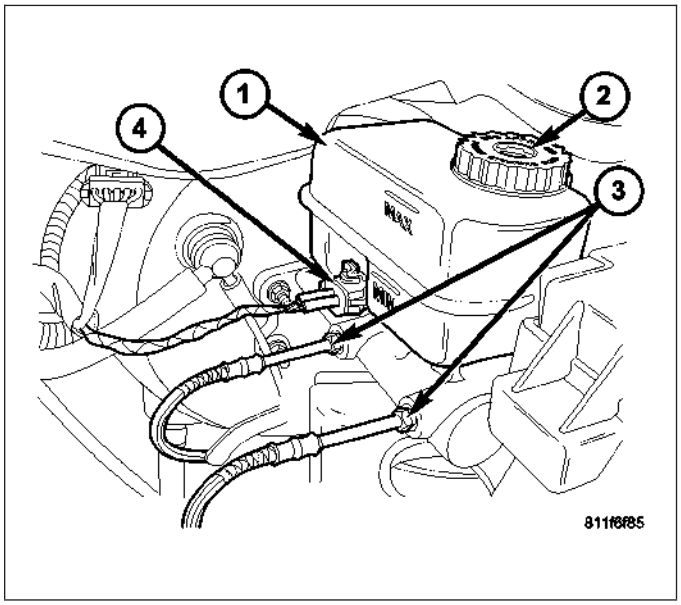
2. Start the reservoir (1) in the seals (2). Then rock the reservoir (1) back and forth while pressing downward to seat it into the seals (2).



3. Install the mounting bolts (2) for the reservoir (1) to the master cylinder (3).



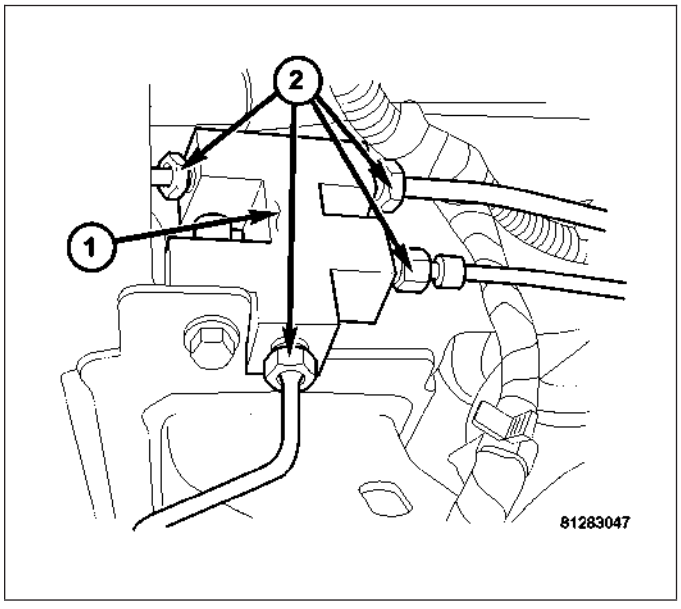
4. Reconnect the electrical connector (4) to the fluid reservoir level switch.
5. Remove the prop rod from the vehicle.
6. Fill and bleed base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).



BRAKE JUNCTION BLOCK

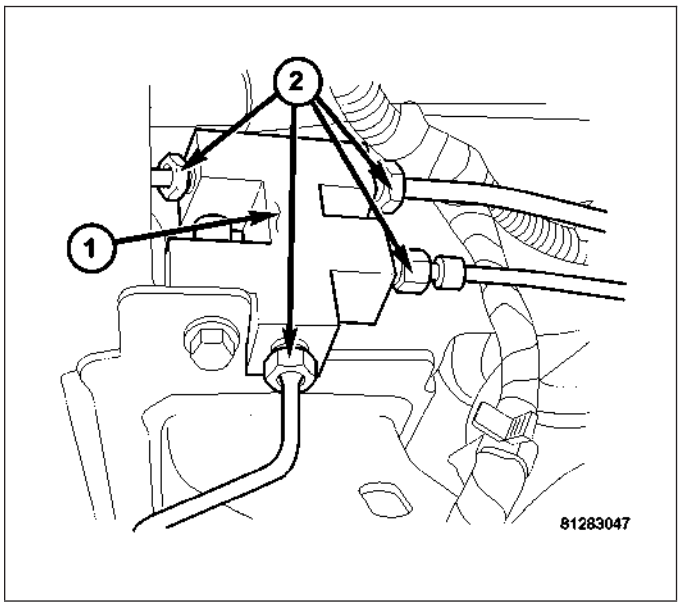
REMOVAL

1. Remove the brake lines (2) from the junction block (1).
2. Remove the junction block (1) mounting bolt and remove the junction block from the bracket.



INSTALLATION

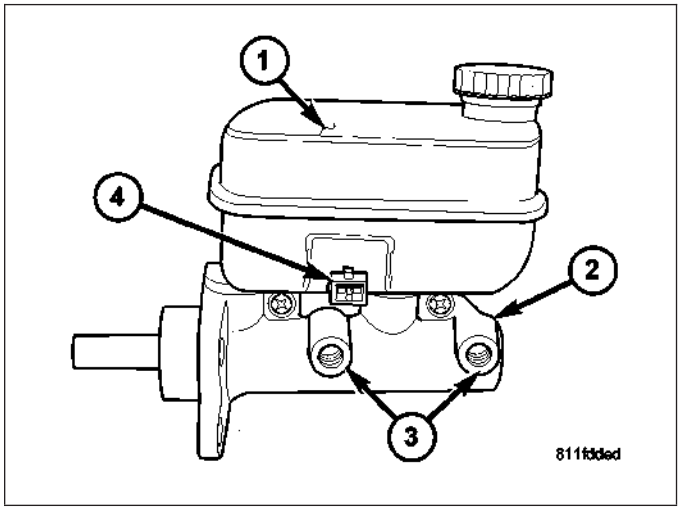
1. Position the junction block (1) on the bracket and install the mounting bolt. Tighten the mounting bolt to 23 N·m (210 in. lbs.).
2. Install the brake lines (2) into the junction block and tighten to 19-23 N·m (170-200 in. lbs.).
3. Bleed the base brake system, (Refer to 5 - BRAKES - STANDARD PROCEDURE).



MASTER CYLINDER

DESCRIPTION

A two-piece master cylinder is used on all models. The cylinder body containing the primary and secondary pistons is made of aluminum. The removable fluid reservoir (1) is made of nylon reinforced with glass fiber. The reservoir stores reserve brake fluid for the hydraulic brake circuits and has a switch (4) for indicating low fluid levels. The reservoir is the only serviceable component.



The fluid compartments of the nylon reservoir are interconnected to permit fluid level equalization. However, the equalization feature does not affect circuit separation in the event of a front or rear brake malfunction. The reservoir compartments will retain enough fluid to operate the functioning hydraulic circuit.

Care must be exercised when removing/installing the master cylinder connecting lines. The threads in the cylinder fluid ports (3) can be damaged if care is not exercised. Start all brake line fittings by hand to avoid cross threading.

The cylinder reservoir can be replaced when necessary. However, the aluminum body section (2) of the master cylinder is not a repairable component.

NOTE: If diagnosis indicates that an internal malfunction has occurred, the aluminum body section must be replaced as an assembly.

OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes.

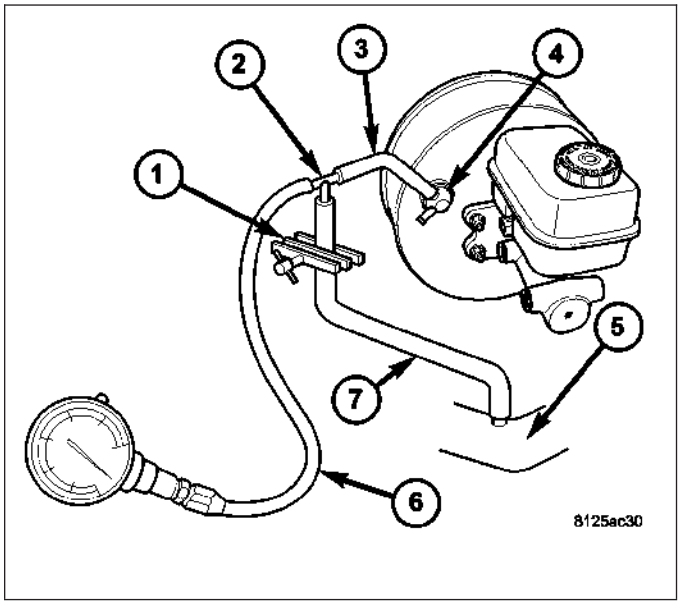
DIAGNOSIS AND TESTING

MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage).
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

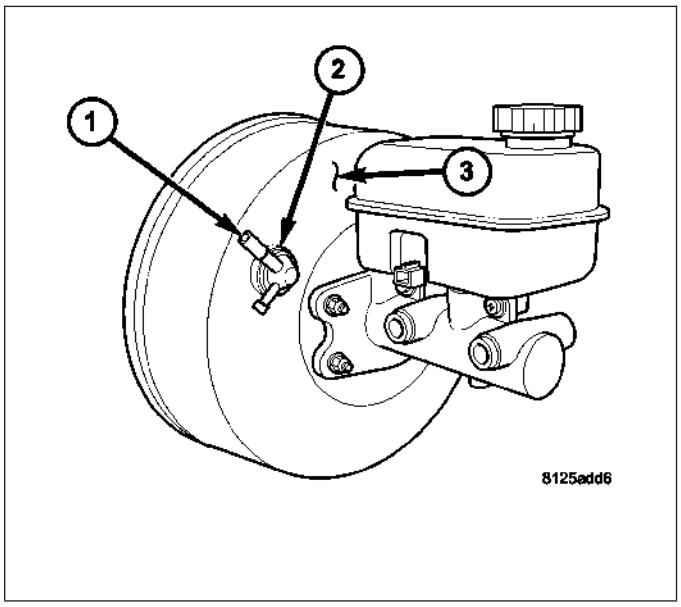
POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge (6) to booster check valve (4) with short length of hose (3) and T-fitting (2).
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp (1) hose (7) shut between intake vacuum source (5) and check valve (4).
5. Stop engine and observe vacuum gauge (6).
6. If vacuum drops more than one inch HG (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.



POWER BOOSTER CHECK VALVE TEST

1. Disconnect vacuum hose from check valve (1).
2. Remove check valve (1) and valve seal (2) from booster (3).
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve.
5. Plug off the small end to prevent vacuum leakage.
6. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

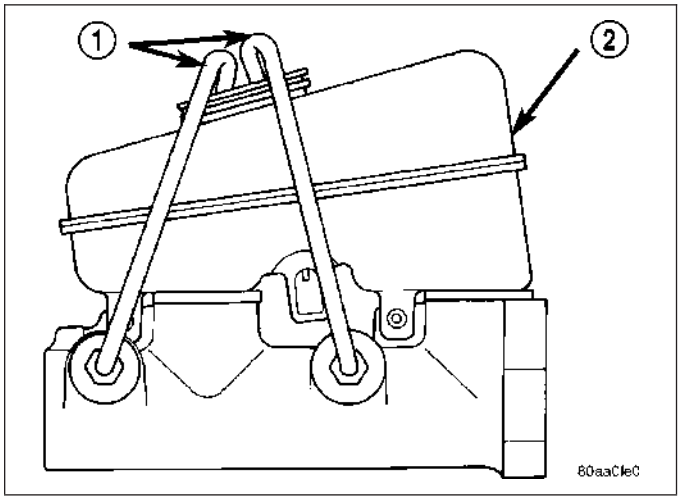


STANDARD PROCEDURE

MASTER CYLINDER BLEEDING

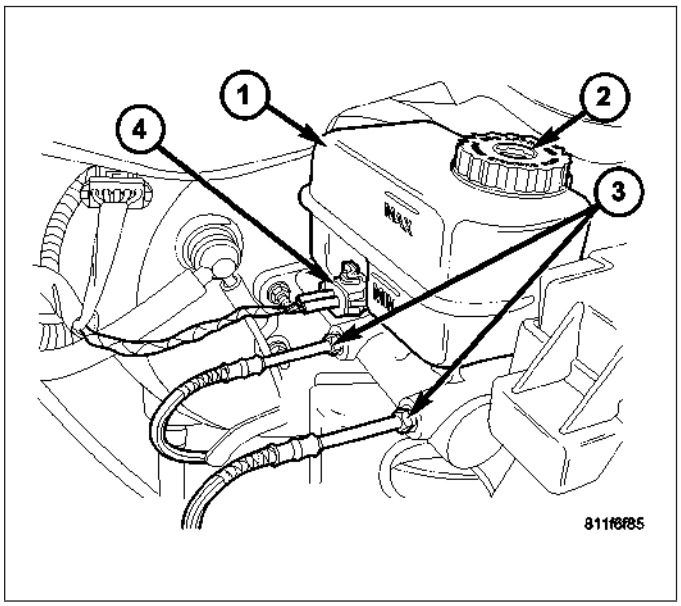
A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports (1). Then position each tube end into reservoir (2).
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.



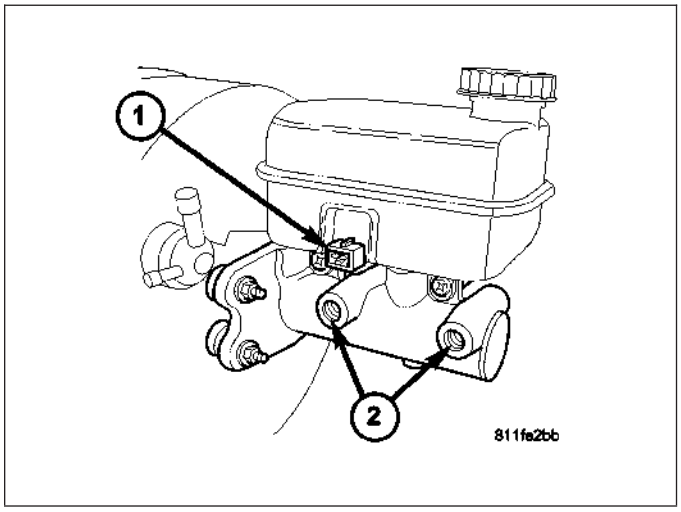
REMOVAL

1. Depress the brake pedal five times to deplete any vacuum that may remain in the booster unit.
2. Siphon and drain the fluid from the reservoir.
3. Disconnect the electrical connector (4) for the low fluid level.

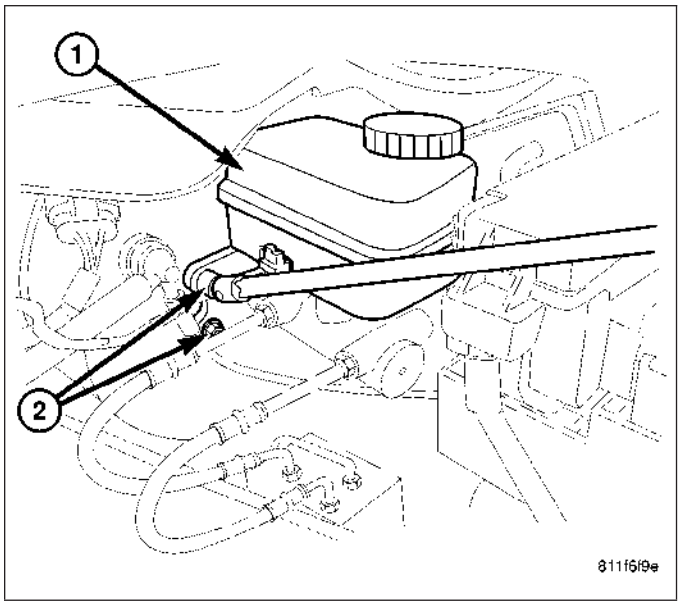


NOTE: Place a towel or rag under the master cylinder outlet port area to protect the vehicle from brake fluid damage.

4. Remove the brake lines (2) from the master cylinder.

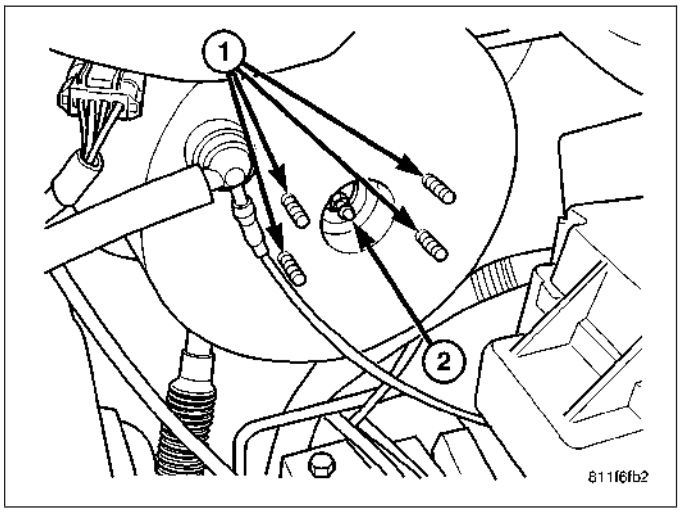


5. Remove the four mounting nuts (2) from the master cylinder (1).



6. Remove the master cylinder.

NOTE: Gently ease the master cylinder & reservoir assembly away from the booster, During removal the master cylinder should be kept as perpendicular to the front of the booster as possible to avoid excess interference with the booster output rod and in order not to dislodge the output rod (2) from its seat inside the booster.

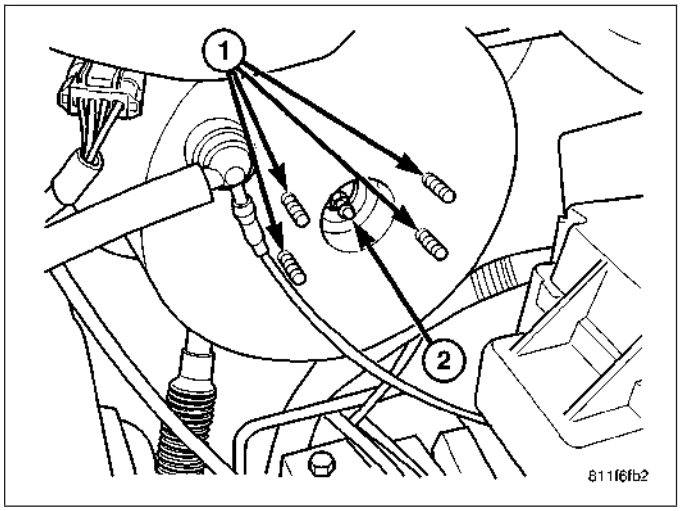


INSTALLATION

NOTE: If master cylinder is replaced bleed cylinder before installation.

NOTE: Make sure the output rod (2) of the brake booster is in position and retained by a output rod retaining ring, by looking into the boosters master cylinder mounting hole. This position will enable the output rod to enter inside of the master cylinder plunger sleeve during installation. Proper position is obtained when the output rod is centered perpendicular to the master cylinder mounting hole.

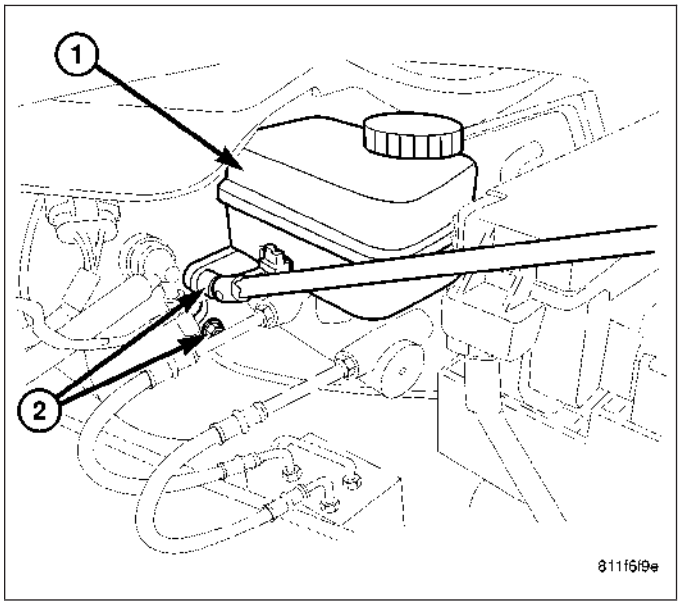
NOTE: Prior to installing the master cylinder assembly check that there is a vacuum seal present at the shoulder of the master cylinder flange and it's neck. A square seal must be present to ensure vacuum integrity with the booster.



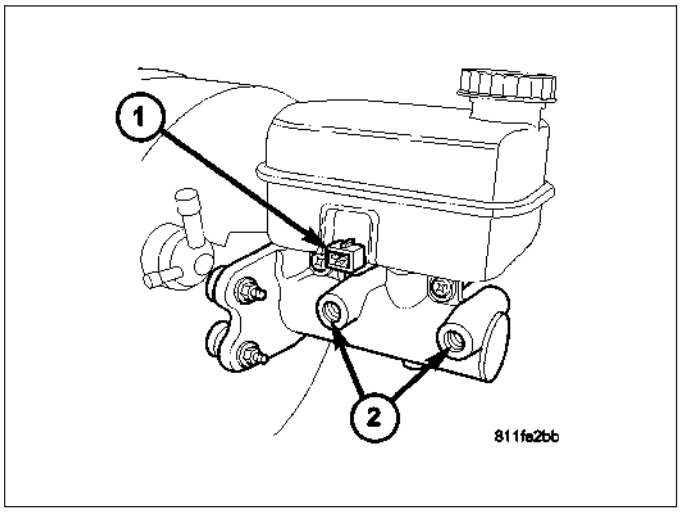
1. Gently install the master cylinder on the booster mounting studs (1).

NOTE: Take precautions to locate the master cylinder plunger over the booster output rod, before installing the master cylinder. If correctly fitted the master cylinder should slide easily onto the booster output rod before the mounting studs are engaged in the flange holes of the master cylinder.

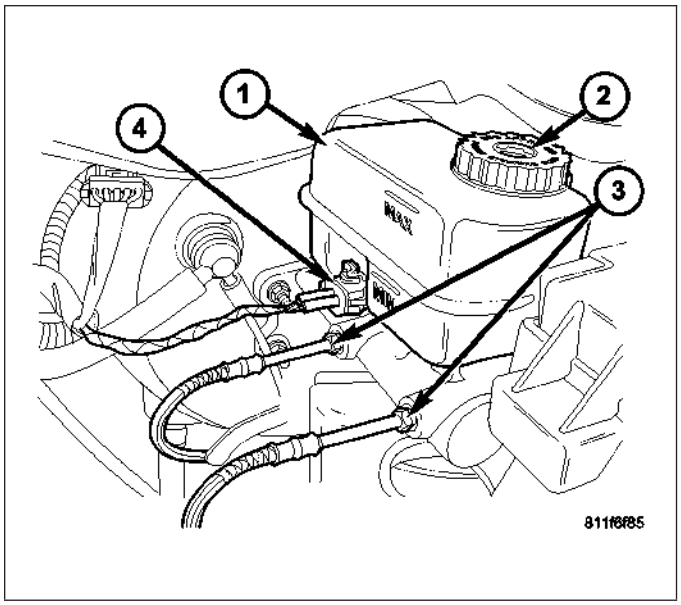
2. Install new mounting nuts (2) and tighten to 10 N·m (90 in. lbs.)



3. Install the brake lines (2) and tighten to 19 N·m (170 in. lbs.).



4. Reconnect the electrical connector (4) for the low fluid level switch.
5. Fill and bleed the base brake system. (Refer to 5 - BRAKES - STANDARD PROCEDURE).

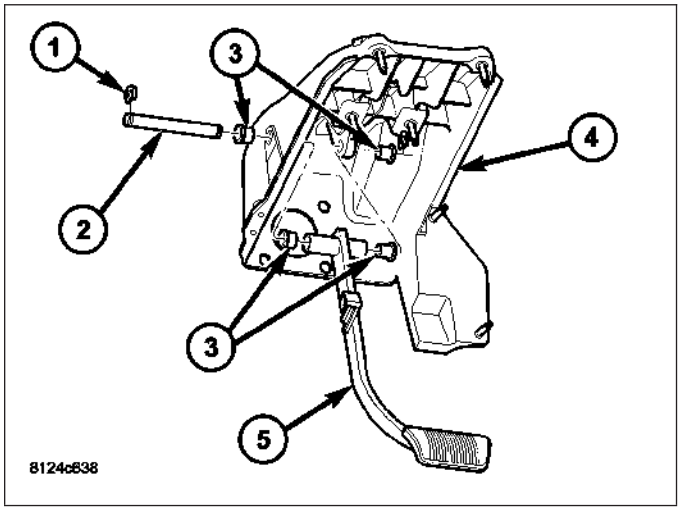


PEDAL

DESCRIPTION

NOTE: The brake pedal is serviced as a complete assembly including the bracket. Including vehicles with Adjustable Pedals.

A suspended-type brake pedal (5) is used. The pedal is attached to the pedal support bracket (4) with a pivot shaft pin (2), bushings (3) and clips (1). If the bushings (3) become dry a spray lubricant can be used to eliminate noises. The booster push rod is attached to the pedal with a clip. The pedal (5), bushings (3), pivot pin (2) and support bracket (4) are not serviceable components.



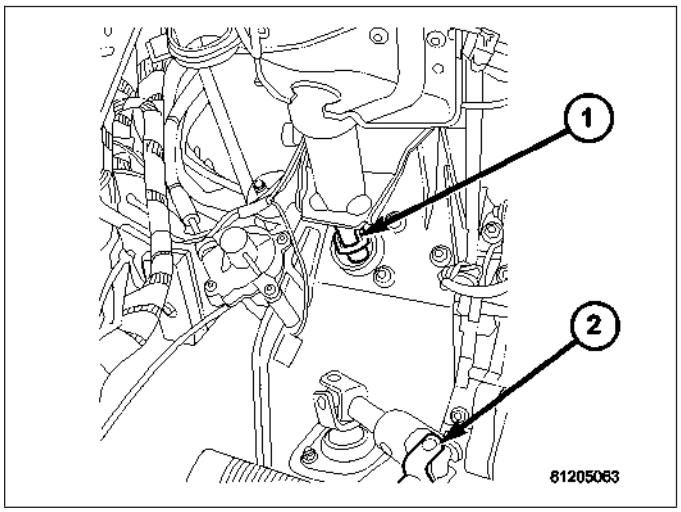
OPERATION

The brake pedal is attached to the booster push rod. When the pedal is depressed, the primary booster push rod is depressed which move the booster secondary rod. The booster secondary rod depress the master cylinder piston.

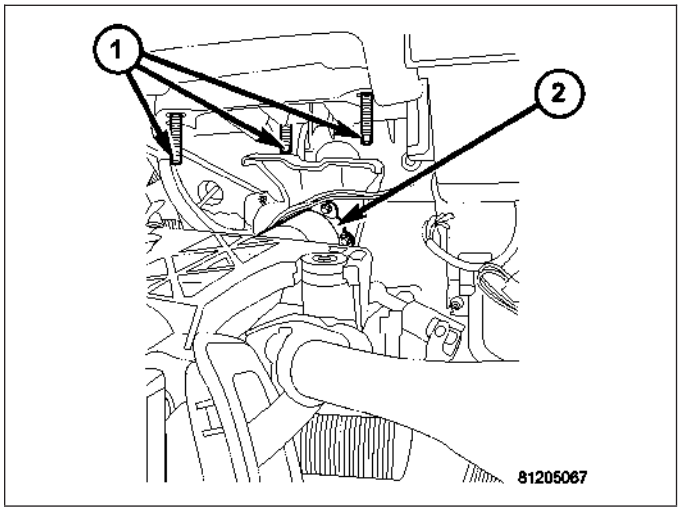
REMOVAL

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. REFER TO ELECTRICAL RESTRAINT SYSTEM FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.

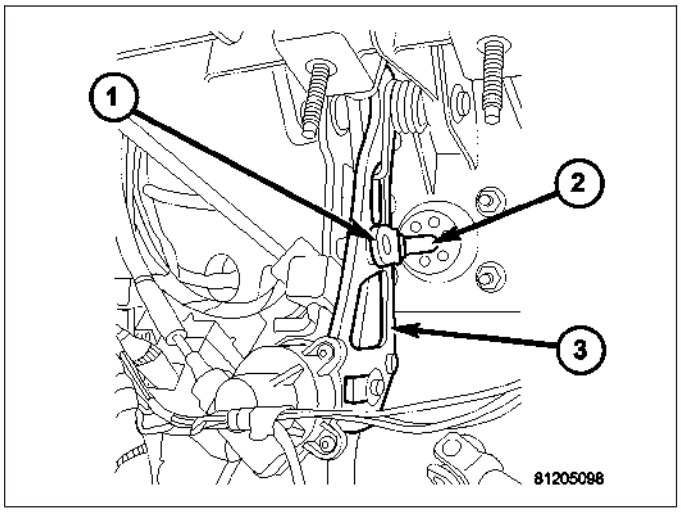
NOTE: The brake pedal is serviced as a complete assembly including accelerator pedal and the bracket.



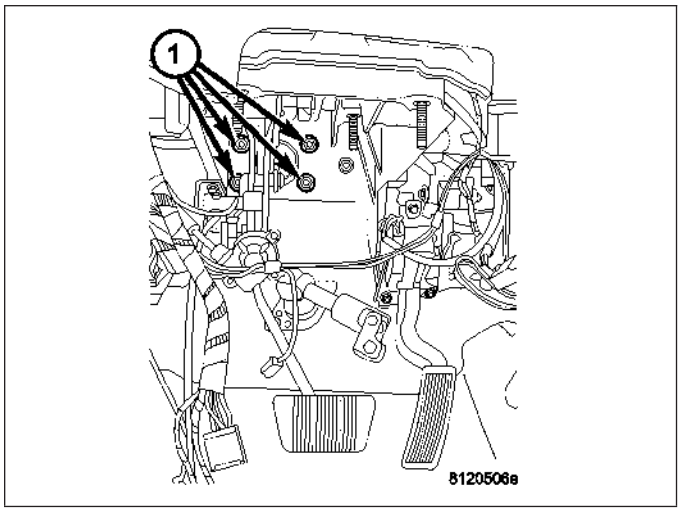
1. Disconnect and isolate the battery negative cable to disable the airbag system. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
3. Remove the steering column opening cover reinforcement.
4. Remove the upper and lower shrouds.
5. Remove the upper coupling pinch bolt and separate the upper coupling (2) from the steering column (1) (Refer to 19 - STEERING/COLUMN/STEERING COUPLING - REMOVAL).
6. Remove the column mounting nuts (1) and lower the column (2) downwards.
7. Remove the steering column (Refer to 19 - STEERING/COLUMN - REMOVAL).
8. Remove the brake lamp switch and discard (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).



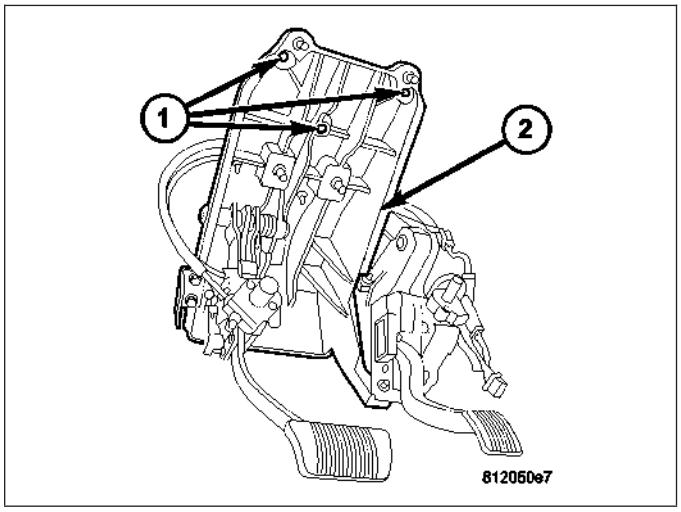
9. Disconnect the booster push rod clip (1) and remove the rod (2) from the pedal (3).



10. Remove the four booster mounting nuts (1).
11. Push the booster into the engine compartment for clearance.
12. Disconnect the adjustable pedal assembly electrical connectors.



13. Remove the two bolts securing the electrical bulkhead to the pedal bracket.
14. Remove the pedal assembly bracket bolts (1).
15. Remove the pedal assembly (2) from the vehicle.

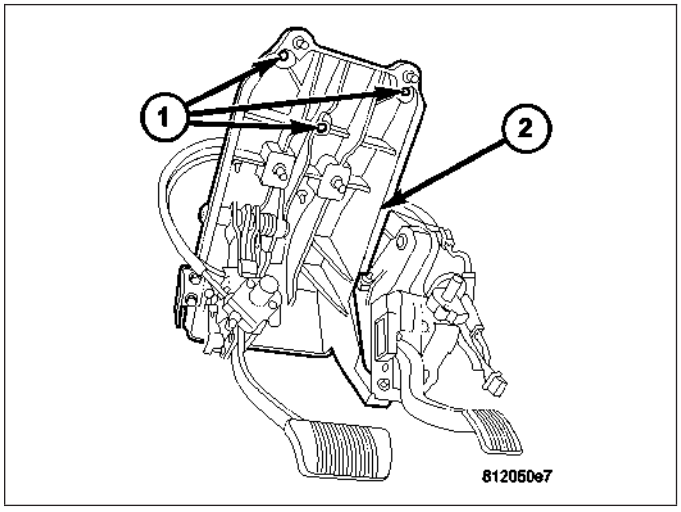


INSTALLATION

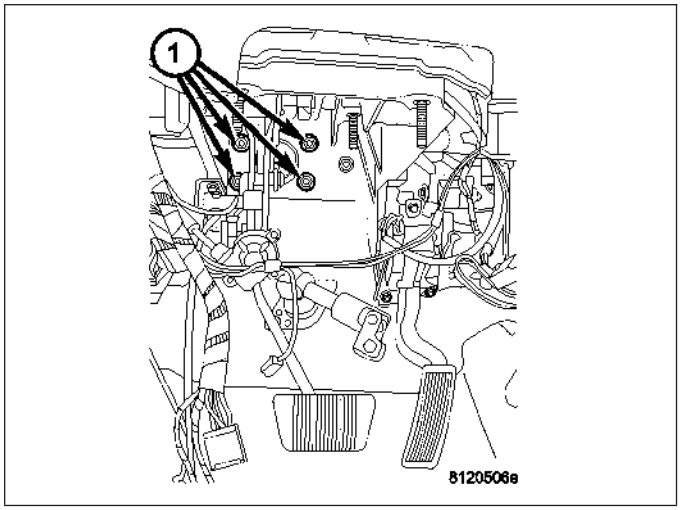
NOTE: The brake pedal is serviced as a complete assembly including accelerator pedal and the bracket.

NOTE: The adjustable brake pedal is serviced as a complete assembly including the adjustable pedal motor, cable and the bracket.

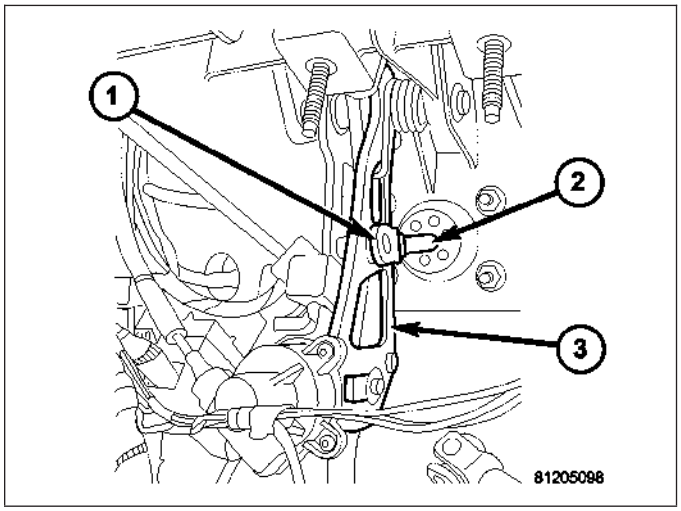
1. Install the pedal assembly (2) to the vehicle.
2. Install the mounting bolts (1) and tighten to 8 N·m (75 in. lbs.).
3. Push the booster back into the cowl.
4. Install the two bolts to the electrical bulkhead to the pedal bracket.
5. Reconnect the adjustable pedal assembly electrical connectors.**Adjustable pedals only.**



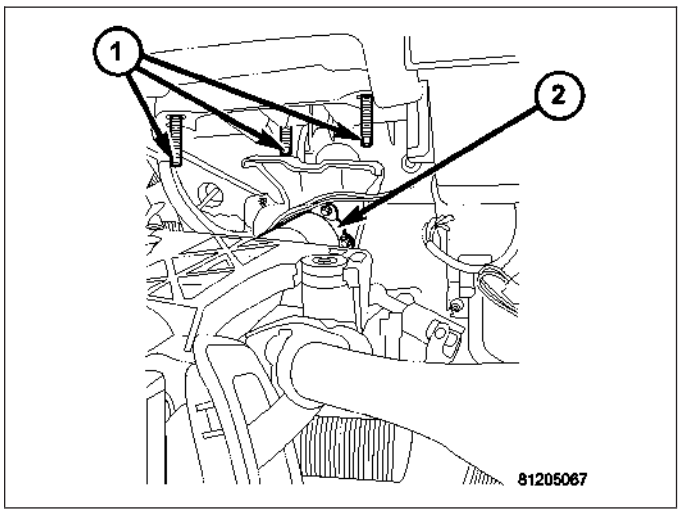
6. Install the four booster mounting nuts (1) Tighten to 28 N·m (250 in. lbs.).



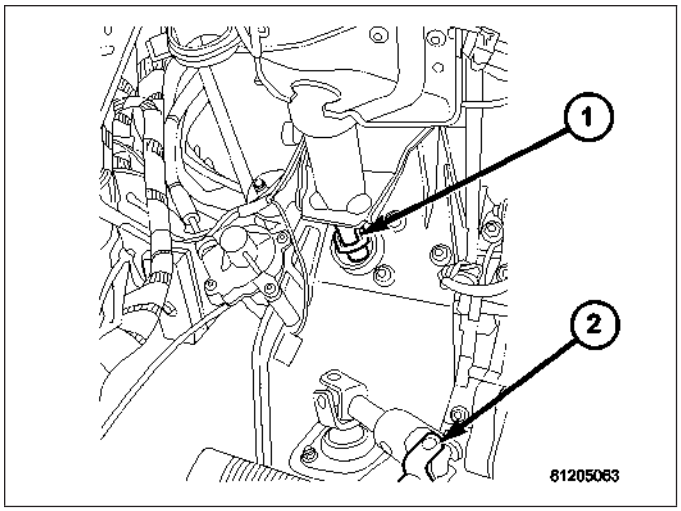
7. Reconnect the booster push rod clip (1) and install the rod (2) to the pedal (3).



8. Install the steering column (2) to the vehicle. (Refer to 19 - STEERING/COLUMN - REMOVAL).
9. Raise the column (2) upwards on the mounting studs and then install the mounting nuts (1). Tighten to 28 N·m (250 in. lbs.).
10. Install a new brake lamp switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - REMOVAL).



11. Install the upper coupling to the steering column (1) then install the pinch bolt to the upper coupling (2). Tighten to 38 N·m (28 ft. lbs.).
12. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
13. Install the steering column opening cover reinforcement.
14. Install the upper and lower shrouds.
15. Reconnect the negative battery cable.

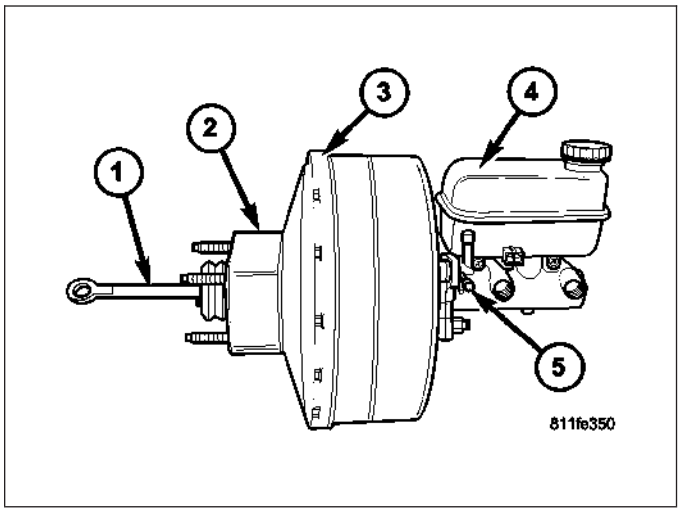


POWER BRAKE BOOSTER

DESCRIPTION

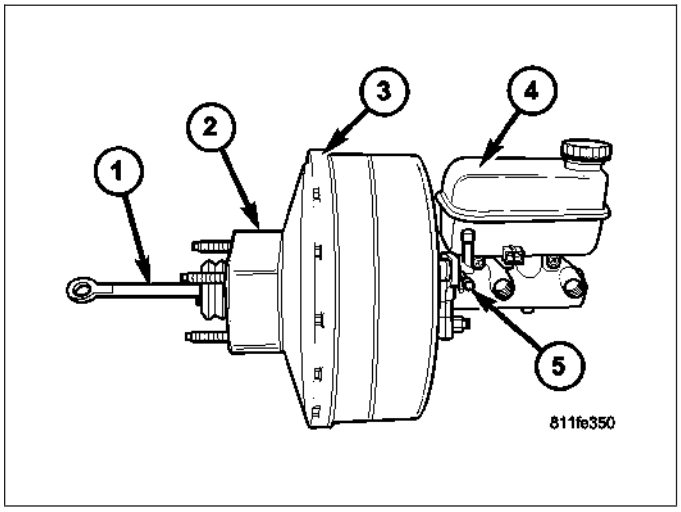
All models use a tandem diaphragm, power brake booster (3).

NOTE: The power brake booster is not a repairable component. The booster must be replaced as an assembly if diagnosis indicates a malfunction has occurred.



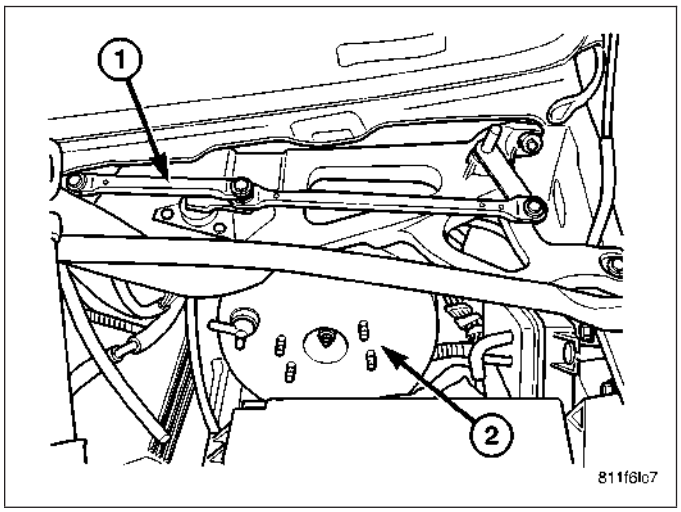
OPERATION

The booster unit consists of a single housing divided into two by a tandem diaphragm (3). The outer edge of the diaphragm is secured to the housing. A spacer block (2) is located in between the cowl and the booster housing. The booster push rod (1), connects the booster to the brake pedal and master cylinder (4), is attached to the center of the diaphragm. A check valve (5) is used in the booster outlet connected to the engine intake manifold. Power assist is generated by utilizing a combination of vacuum and atmospheric pressure to boost brake assist.

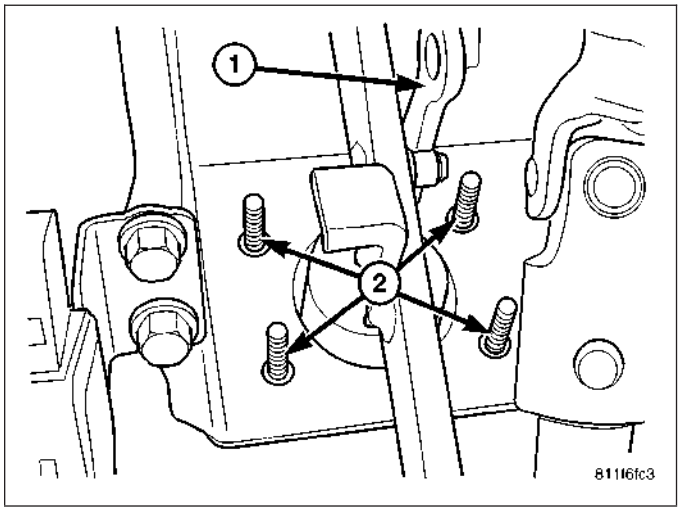


REMOVAL

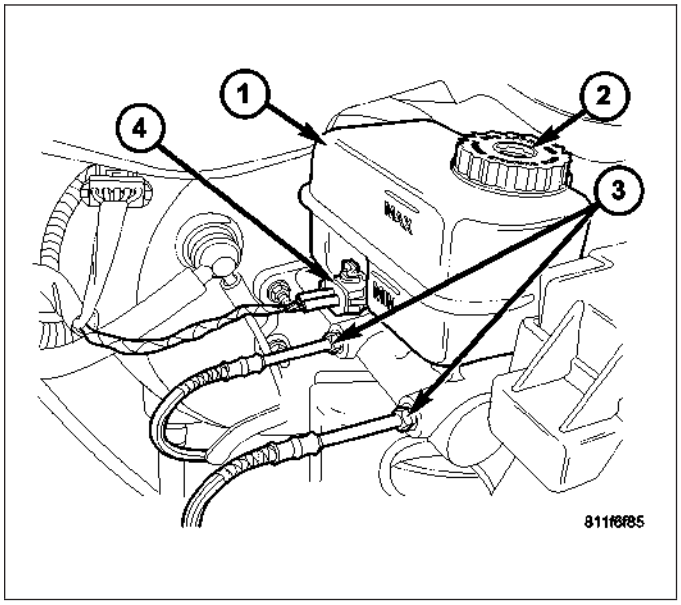
1. Depress the brake pedal five times to deplete any vacuum that may remain in the booster unit.
2. Siphon and drain the fluid from the reservoir.
3. Remove the wiper arm (1) and cowl assembly (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER ARMS - REMOVAL).



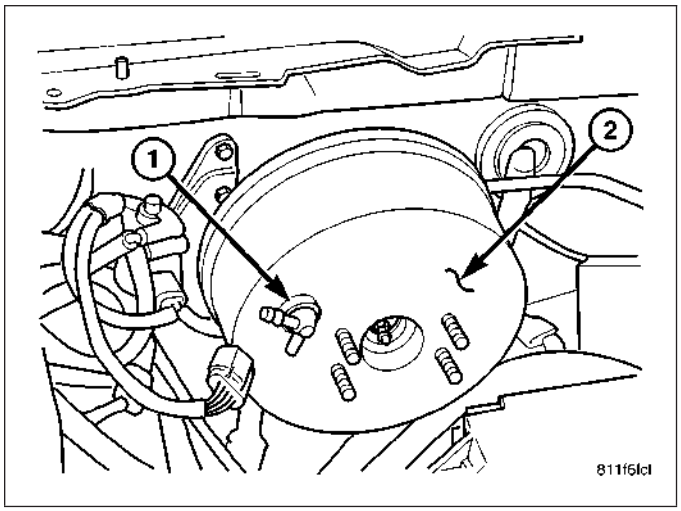
4. Remove the brake lamp switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).
5. Remove clip securing booster push rod to brake pedal (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - REMOVAL).
6. Remove the brake booster mounting nuts (2).



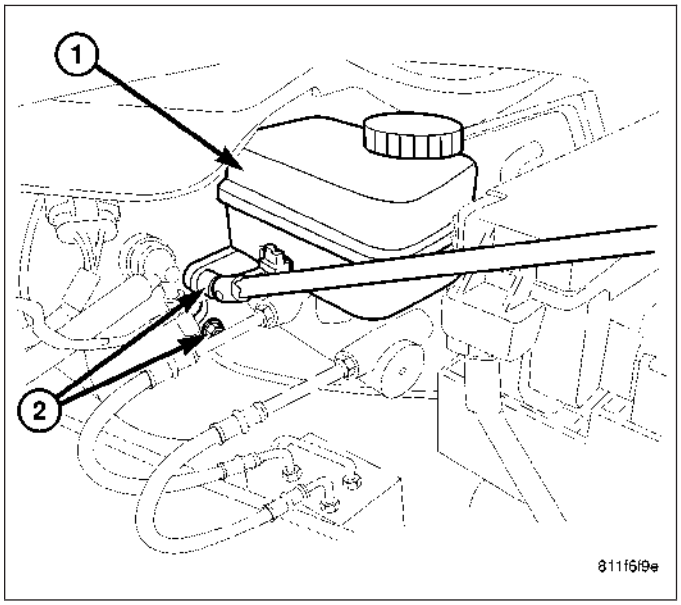
7. Disconnect the brake level electrical connector (4).



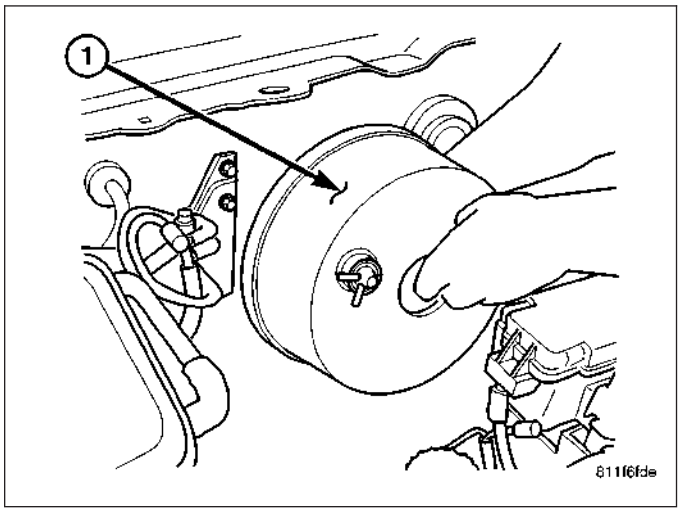
8. Disconnect the brake lines at the master cylinder.
9. Disconnect vacuum line (1) at booster.



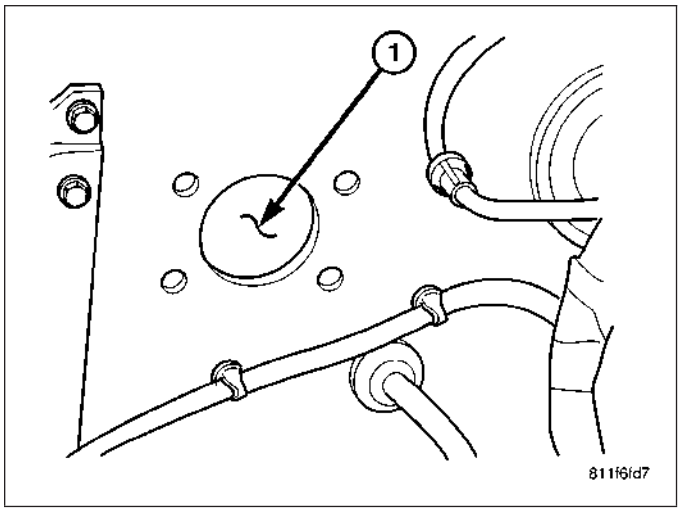
10. Remove master cylinder (1) from the mounting studs (2) on the power brake booster.



11. Remove the booster (1) and spacer block from front cowl panel.

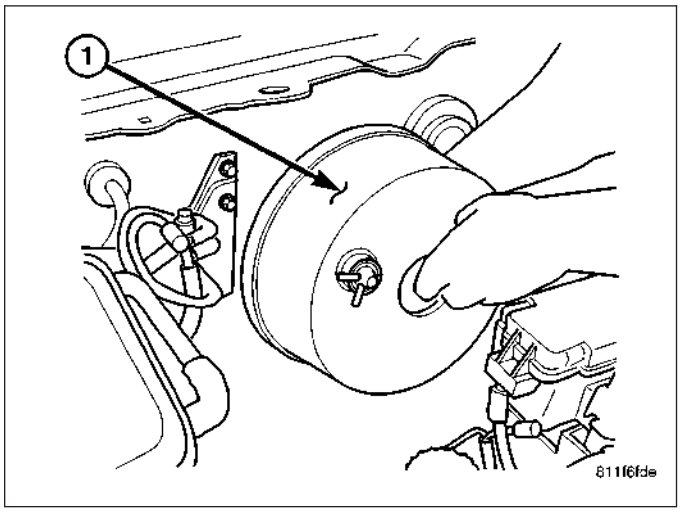


12. Wipe clean any debris from the brake booster cowl mounting hole (2).

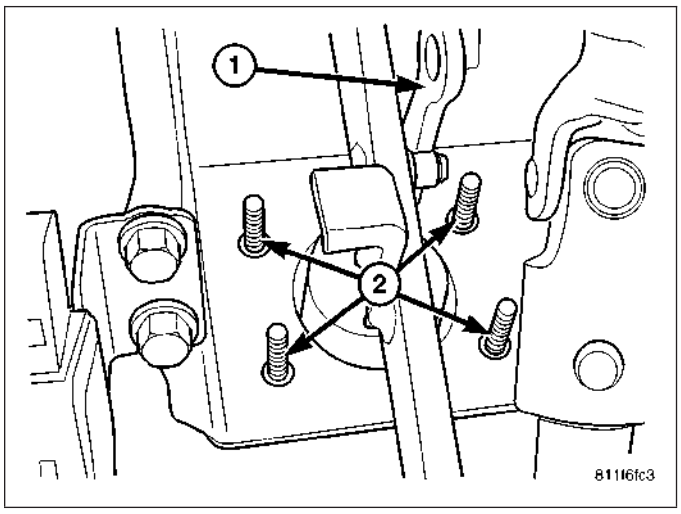


INSTALLATION

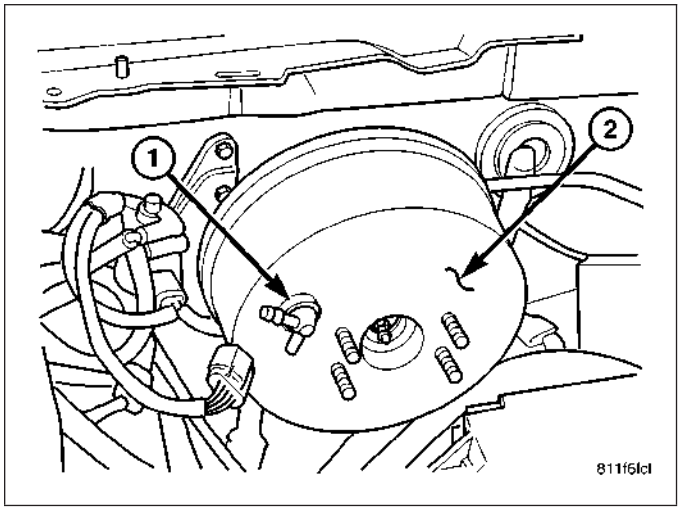
1. Install the spacer block and gaskets if removed.
2. Guide the booster studs into the cowl panel holes and seat the booster (1) on the panel.



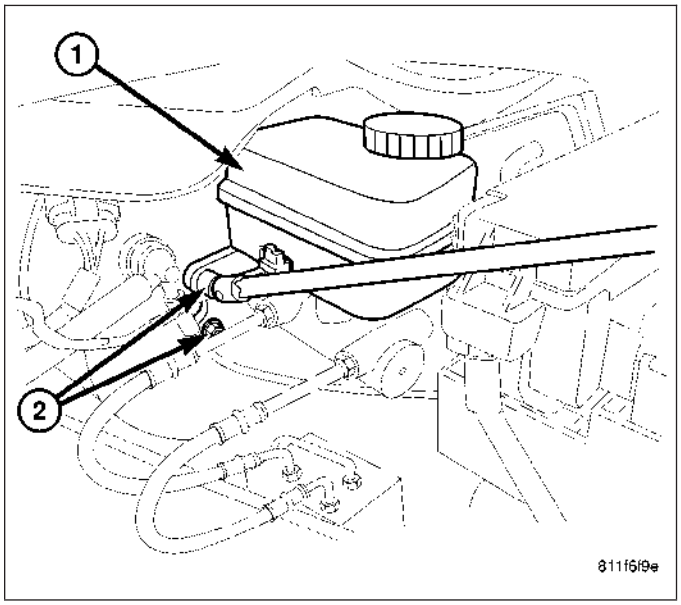
3. Install and tighten new booster attaching nuts (2) to 28 N·m (250 in. lbs.).
4. Install the booster push rod (1) on brake pedal and install clip.
5. Install a new brake lamp switch (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - INSTALLATION).



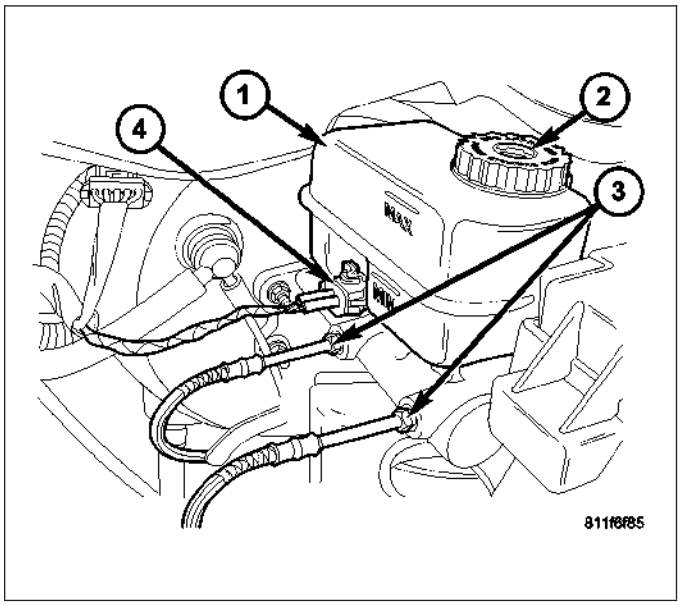
6. Install the vacuum hose to the check valve (1).



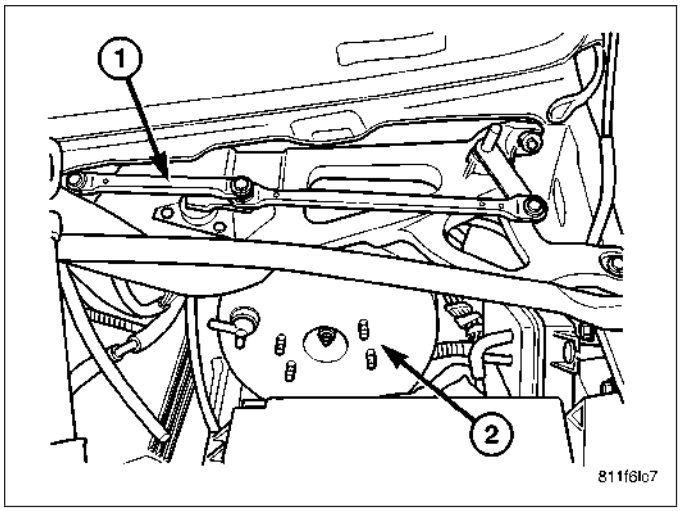
7. Install the master cylinder (1) on the brake booster and tighten the nuts (2) to 10 N·m (90 in. lbs.).



8. Reconnect the brake fluid level electrical connector (4).
9. Recconnect the brake lines at the master cylinder and tighten the lines to 19 N·m (170 in. lbs.)..



10. Install the wiper arm and cowl assembly (1) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER ARMS - INSTALLATION).
11. Fill and bleed the brake system. (Refer to 5 - BRAKES - STANDARD PROCEDURE).



ROTORS

DIAGNOSIS AND TESTING

DISC BRAKE ROTOR

The rotor braking surfaces should not be refinished unless necessary.

Light surface rust and scale can be removed with a lathe equipped with dual sanding discs. The rotor surfaces can be restored by machining with a disc brake lathe if surface scoring and wear are light.

Replace the rotor for the following conditions:

- Severely Scored
- Tapered
- Hard Spots
- Cracked
- Below Minimum Thickness

ROTOR MINIMUM THICKNESS

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if below minimum thickness, or if machining would reduce thickness below the allowable minimum.

Rotor minimum thickness is usually specified on the rotor hub. The specification is either stamped or cast into the hub surface.

ROTOR RUNOUT

Check rotor lateral runout with dial indicator C-3339. Excessive lateral runout will cause brake pedal pulsation and rapid, uneven wear of the brake shoes. Position the dial indicator plunger approximately 25.4 mm (1 in.) inward from the rotor edge.

NOTE: Be sure wheel bearing has zero end play before checking rotor runout.

Maximum allowable rotor runout is 0.131 mm (0.002 in.).

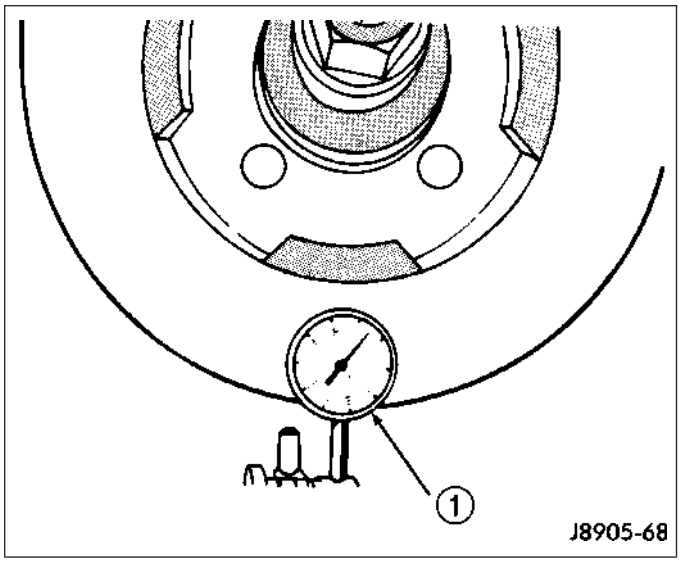
ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at 6 to 12 points around the rotor face.

Position the micrometer approximately 25.4 mm (1 in.) from the rotor outer circumference for each measurement.

Thickness should not **vary** by more than 0.015 mm (0.0059 in.) from point-to-point on the rotor. Machine or replace the rotor if necessary.

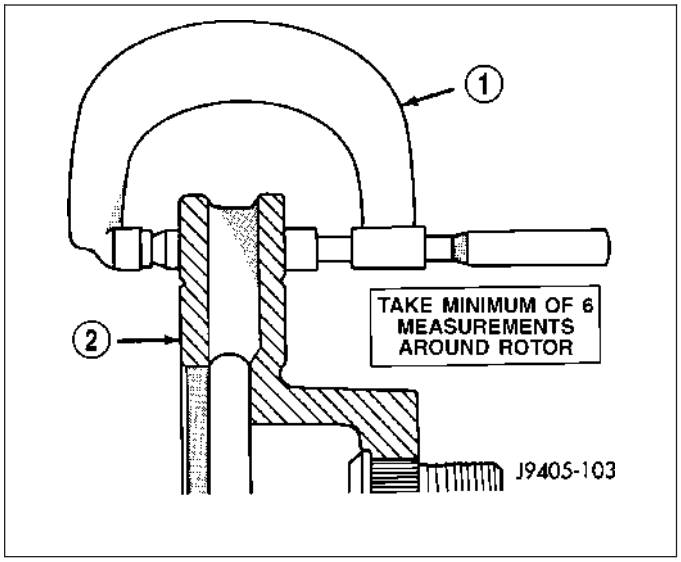


STANDARD PROCEDURE

FRONT/REAR - DISC BRAKE ROTORS

The disc brake rotor can be machined if scored or worn. The lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the lathe. Equipment capable of machining only one side at a time may produce a tapered rotor. A hub mounted on-vehicle lathe is recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.



BRAKE DRUM IN HAT ROTOR MACHINING

The brake drum in hat rotor can be machined on a drum lathe when necessary. Initial machining cuts should be limited to 0.12 - 0.20 mm (0.005 - 0.008 in.) at a time as heavier feed rates can produce taper and surface variation. Final finish cuts of 0.025 to 0.038 mm (0.001 to 0.0015 in.) are recommended and will generally provide the best surface finish.

Be sure the drum in hat rotor is securely mounted in the lathe before machining operations. A damper strap should always be used around the drum to reduce vibration and avoid chatter marks.

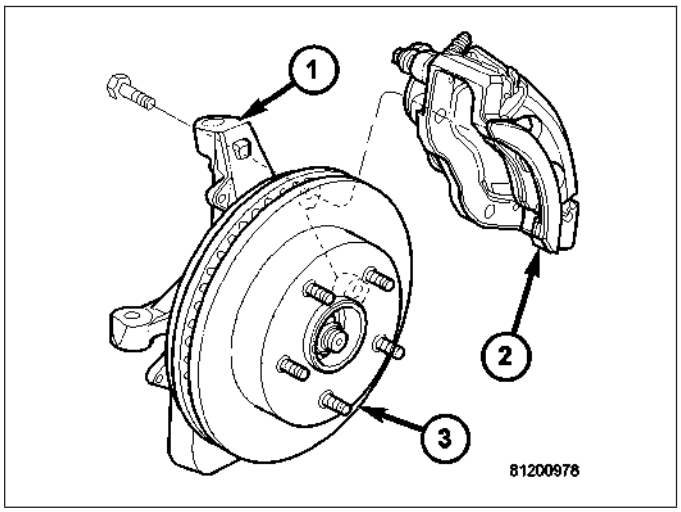
The maximum allowable diameter of the drum braking surface is stamped or cast into the drum in hat rotor.

CAUTION: Replace the drum in hat rotor if machining will cause the drum to exceed the maximum allowable diameter.

REMOVAL

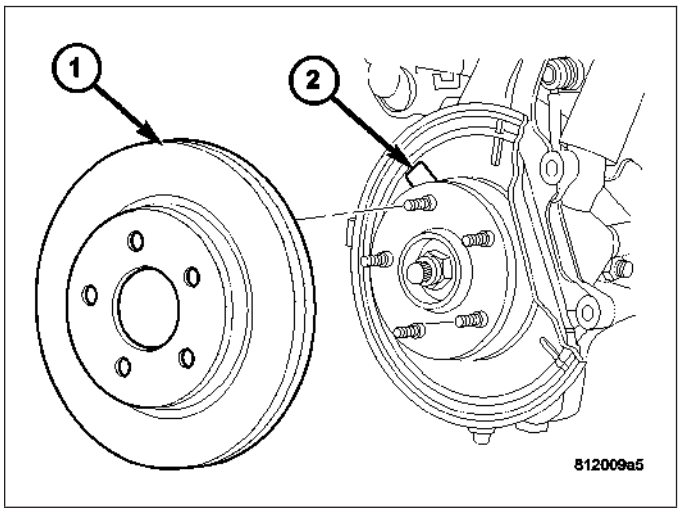
FRONT

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the caliper (2) from the steering knuckle (1), (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL) and remove caliper adapter assembly.



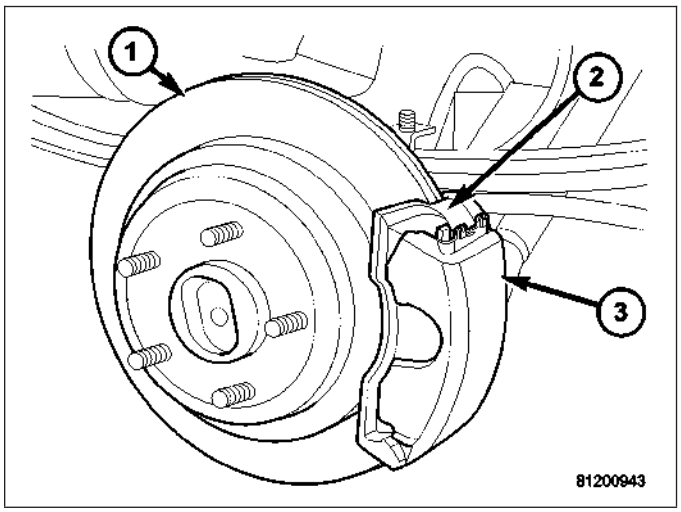
NOTE: Do not allow brake hose to support caliper adapter assembly.

4. Remove the rotor (1) from the hub/bearing wheel studs (2).



REAR

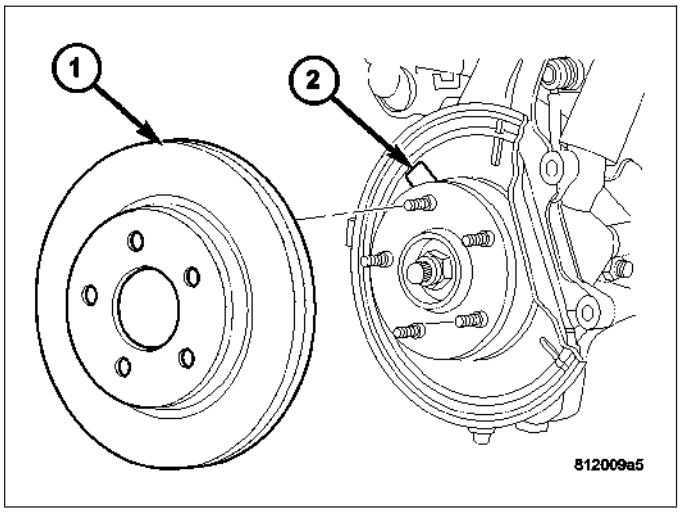
1. Raise and support the vehicle
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the caliper adapter bolts. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL)
5. Remove the disc brake caliper adapter (2).
6. Remove the retianing clips and rotor assembly (1).



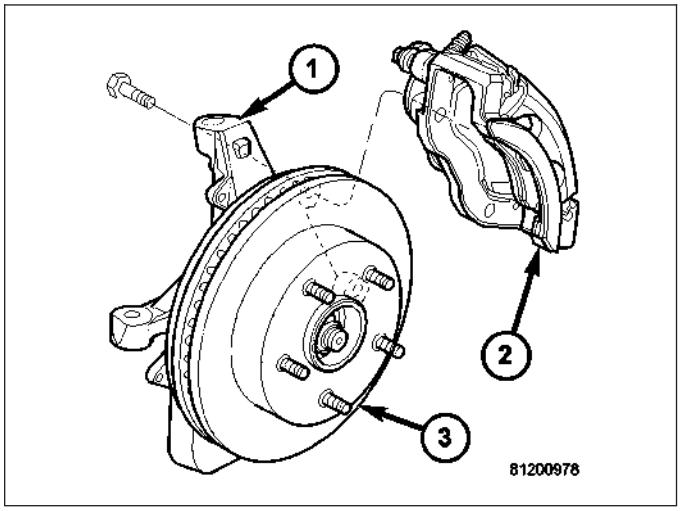
INSTALLATION

FRONT

1. On models with all-wheel antilock system (ABS), check condition of tone wheel on hub/bearing. If teeth on wheel are damaged, hub/bearing assembly will have to be replaced (tone wheel is not serviced separately).
2. Install the rotor (1) onto the hub/bearing wheel studs (2).

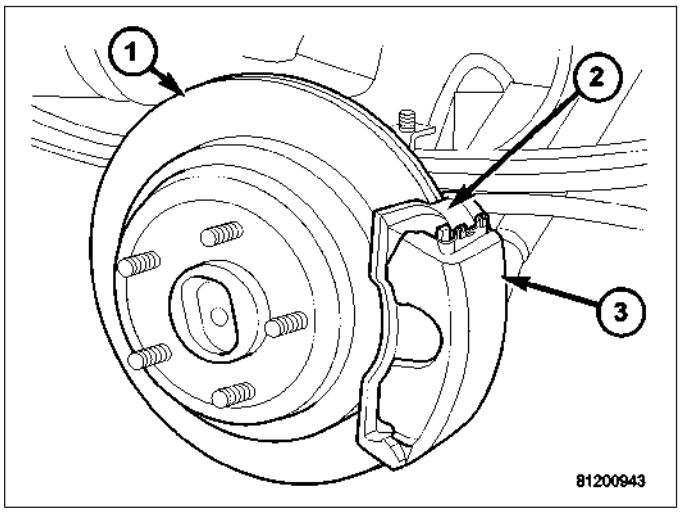


3. Install the caliper adapter assembly (2), (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION) and tighten adapter bolts to 176 N·m (130 ft.lbs.).
4. Install the wheel and tire assembly, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE) and lower the vehicle.
5. Apply the brakes several times to seat brake pads. Be sure to obtain firm pedal before moving vehicle.



REAR

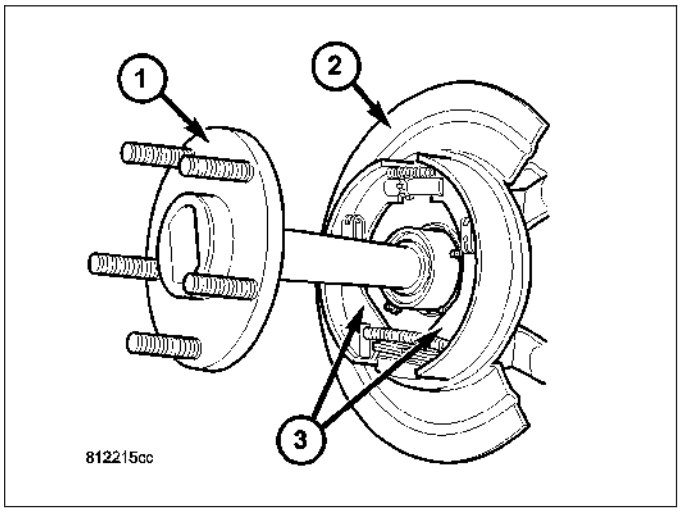
1. Install the rotor (1) to the hub/bearing.
2. Install the caliper adapter (2) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
3. Install the caliper adapter bolts and tighten the mounting bolts to 135 N·m (100 ft.lbs).
4. Install the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
5. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
6. Lower the vehicle.

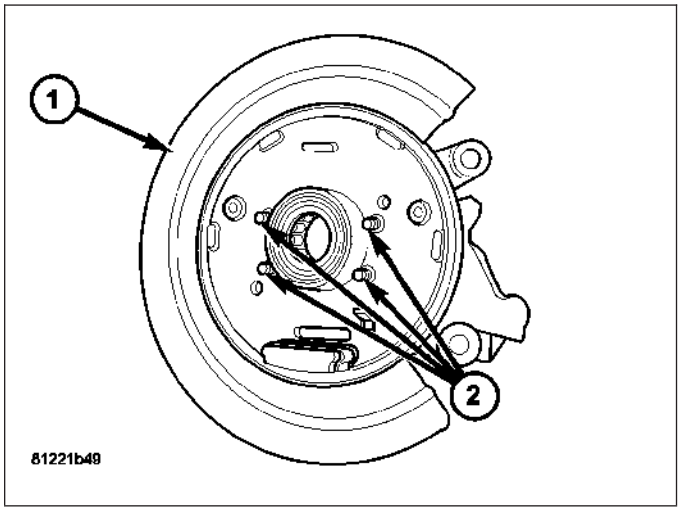


SUPPORT PLATE

REMOVAL

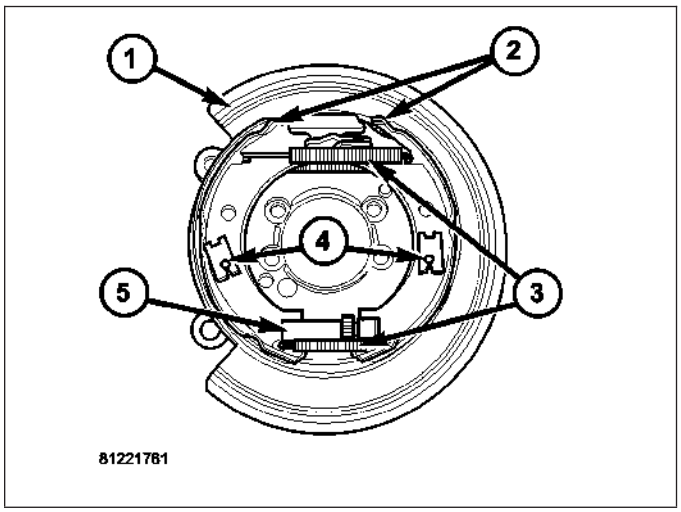
1. Remove wheel and tire assembly.
2. Remove the disc brake caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
3. Remove the caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).
4. Remove the rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Remove the axle shaft (1) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - REMOVAL).
6. Remove the park brake shoes (3) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL).
7. Remove the parking brake cable from the brake lever.
8. Remove the four bolts (2) attaching the support plate (1) to the axle and remove the support plate (1).



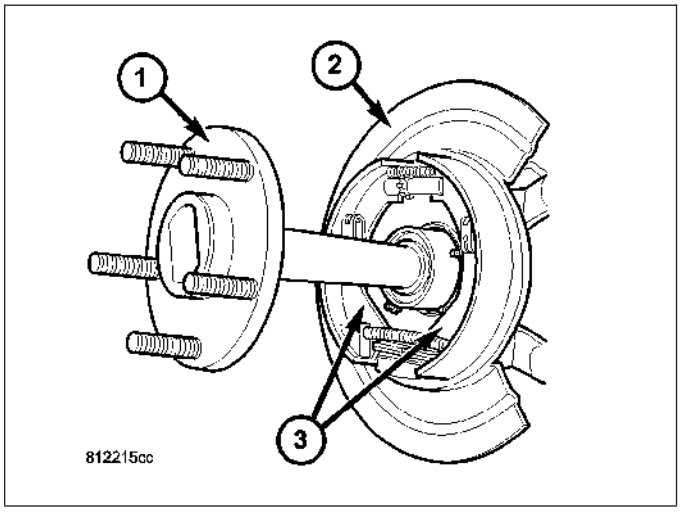


INSTALLATION

1. Install support plate (1) on axle flange. Tighten attaching bolts (3) to 115 N·m (85 ft. lbs.).
2. Install parking brake cable in the brake lever.
3. Install the park brake shoes (2) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION).



4. Install axle shaft (1), (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - INSTALLATION).
5. Adjust brake shoes to drum with brake gauge (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
6. Install the rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
7. Install the caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
8. Install the caliper (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).



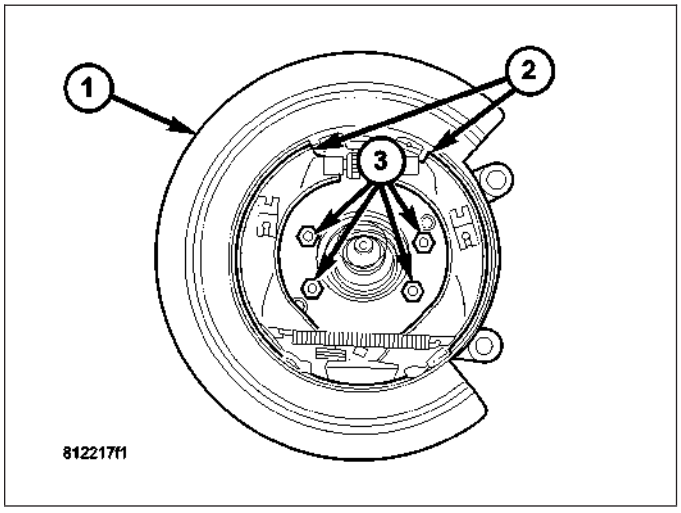
9. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

PARKING BRAKE

DESCRIPTION

The parking brakes are secured to a support plate (1) and operated by a system of cables and levers attached to a primary and secondary shoe (2) positioned within the drum section of the rotor.

The drum-in-hat design utilizes an independent set of shoes (2) to park the vehicle.



OPERATION

To apply the parking brake the pedal is depressed. This creates tension in the cable which pulls forward on the park brake lever. The lever pushes the park brake shoes outward and into contact with the drum section of the rotor. The contact of shoe to rotor parks the vehicle.

A torsion locking mechanism is used to hold the pedal in an applied position. Parking brake release is accomplished by the hand release.

A parking brake switch is mounted on the parking brake lever and is actuated by movement of the lever. The switch, which is in circuit with the red warning light in the dash, will illuminate the warning light whenever the parking brake is applied.

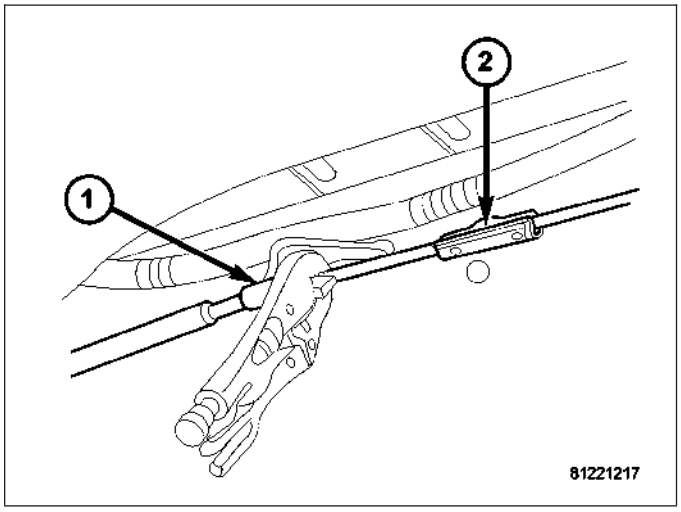
Parking brake adjustment is controlled by a cable tensioner mechanism. The cable tensioner, once adjusted at the factory, should not need further adjustment under normal circumstances. Adjustment may be required if a new tensioner, or cables are installed, or disconnected.

CABLES

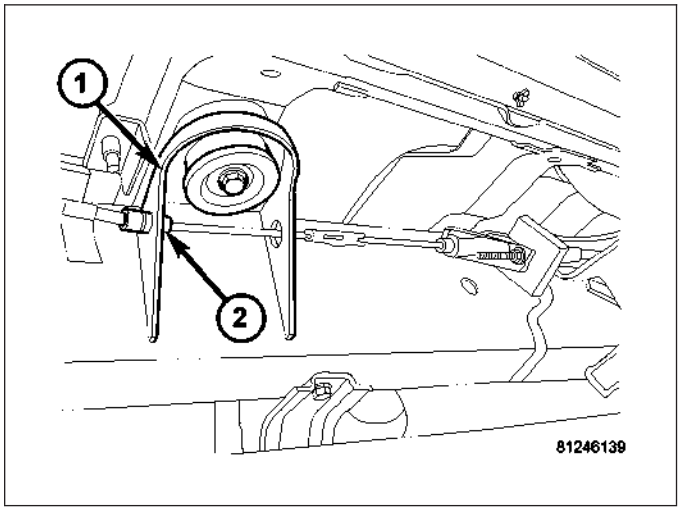
REMOVAL

FRONT PARKING BRAKE CABLE

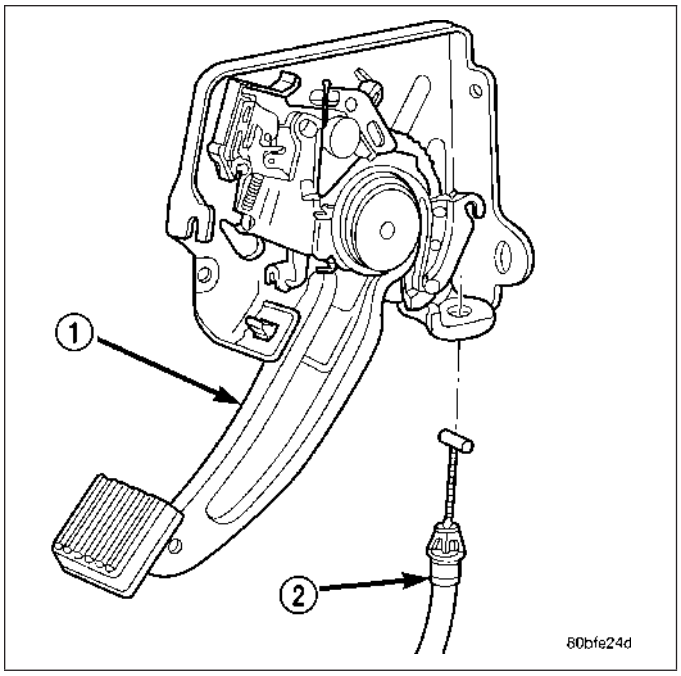
1. Raise and support vehicle.
2. Lockout the parking brake cable (2).
3. Loosen adjusting nut (1) to create slack in front cable.
4. Remove the front cable from the cable connector.



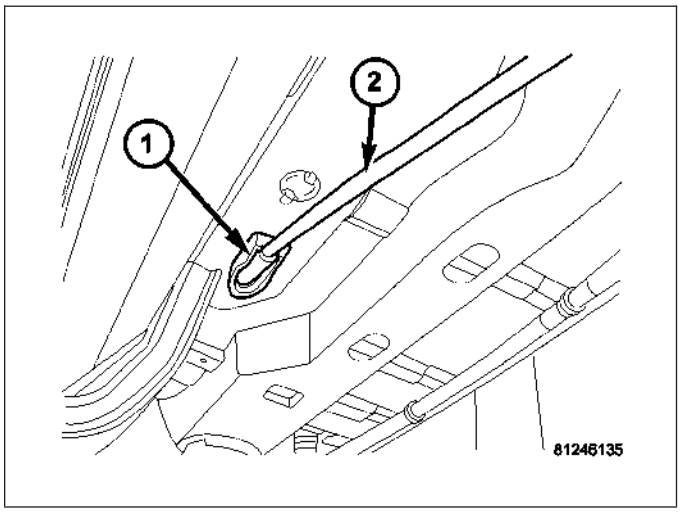
5. Compress cable end fitting at underbody bracket (1) and remove the cable (2) from the bracket.
6. Lower vehicle.



7. Push ball end of cable out of pedal clevis with small screwdriver.
8. Compress cable end fitting (2) at the pedal bracket and remove the cable (1).
9. Remove the left cowl trim and sill plate.
10. Pull up the carpet and remove the cable from the body clip.

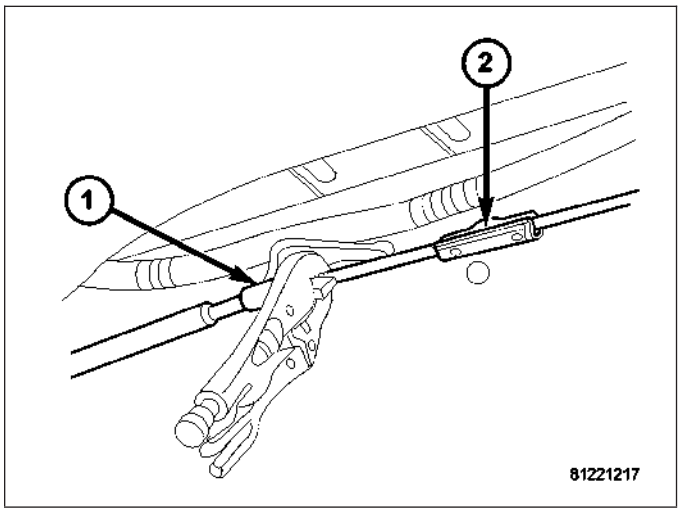


11. Pull up on the cable (2) and remove the cable with the body grommet (1).

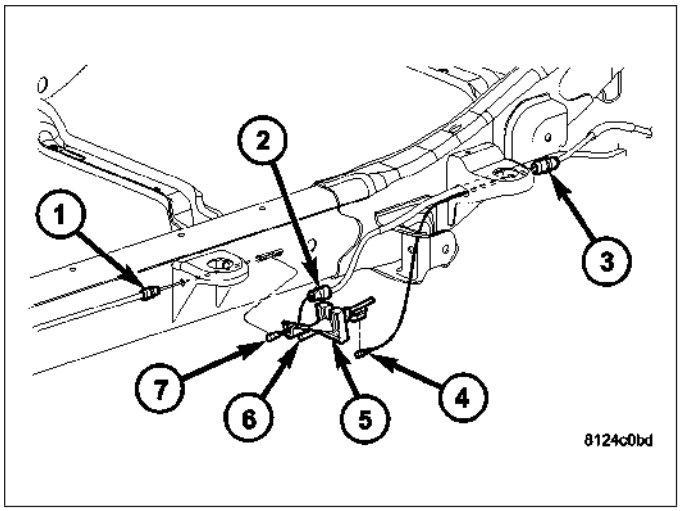


REAR PARK BRAKE CABLE

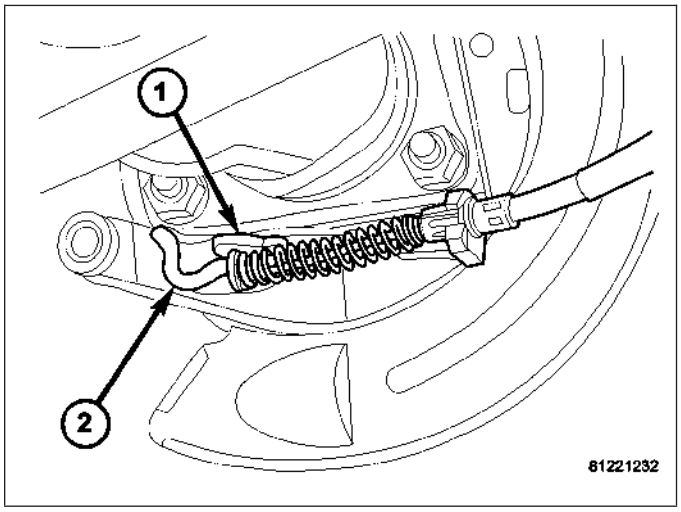
1. Raise and support the vehicle.
2. Lockout the parking brake cable (1).



3. Loosen cable adjuster nut (6).
4. Remove the rear park brake cable (5) from the intermediate park brake cable (1).
5. Compress tabs on cable end fitting (3) on the rear park brake cable (4) to the frame mount bracket. Then pull the cable through the bracket.

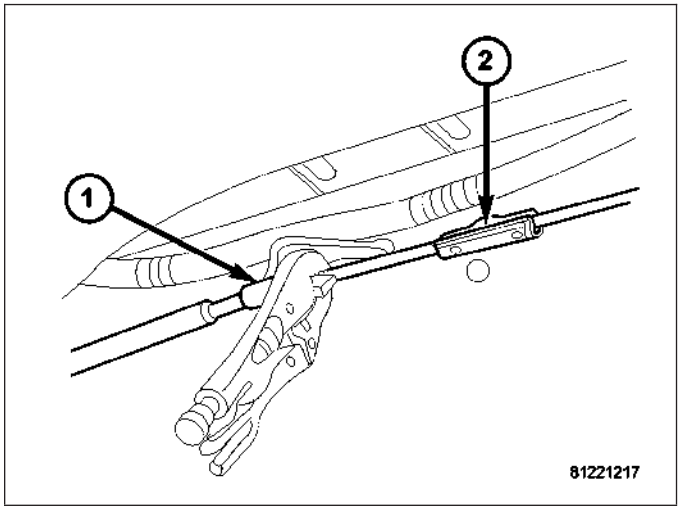


6. Disengage the park brake cable (2) from behind the rotor assembly.
7. Compress cable tabs on each cable end fitting at the brake cable support plate (1).
8. Remove the cables from the brake cable support plates.

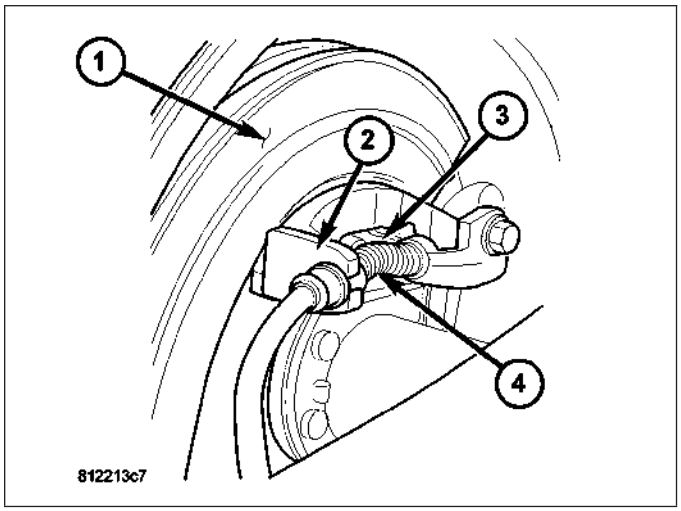


RIGHT REAR CABLE

1. Raise and support the vehicle.
2. Lockout the parking brake cable (1).
3. Loosen the brake cable at the equalizer and adjuster nut.
4. Remove the right cable from the front cable.
5. Remove the right cable from the equalizer.
6. Remove the cable from the frame bracket.

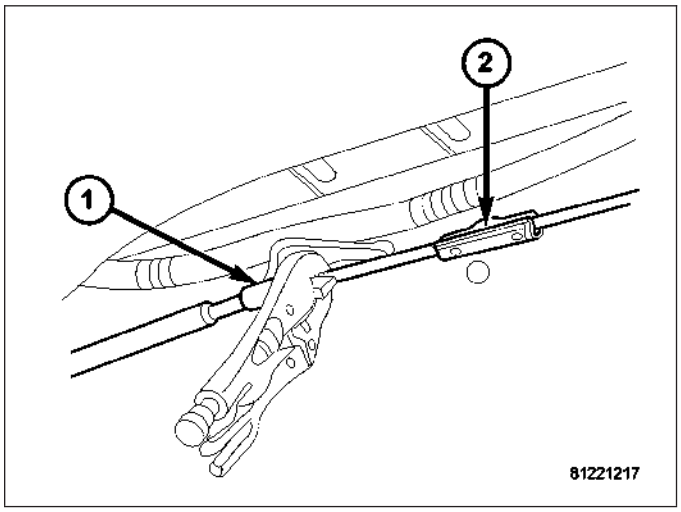


7. Remove the cable (4) from the axle bracket (2).
8. Remove the cable bracket from the shock bracket.
9. Remove the brake cable from the brake lever (3).

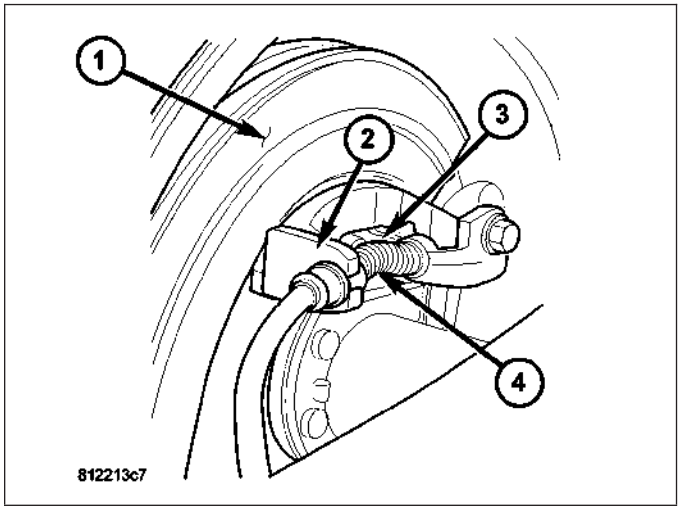


LEFT REAR CABLE

1. Raise and support the vehicle.
2. Lockout the parking brake cable (1).
3. Loosen the brake cable at the equalizer and adjuster nut.
4. Remove the left cable from the front cable.
5. Remove the left cable from the equalizer.
6. Remove the cable from the frame bracket.



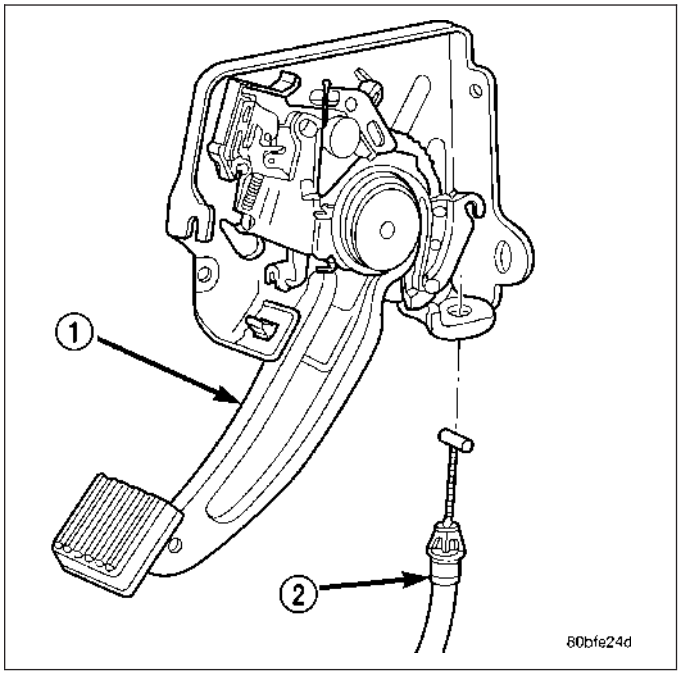
7. Remove the cable (4) from the axle bracket (2).
8. Remove the brake cable from the brake lever (3).



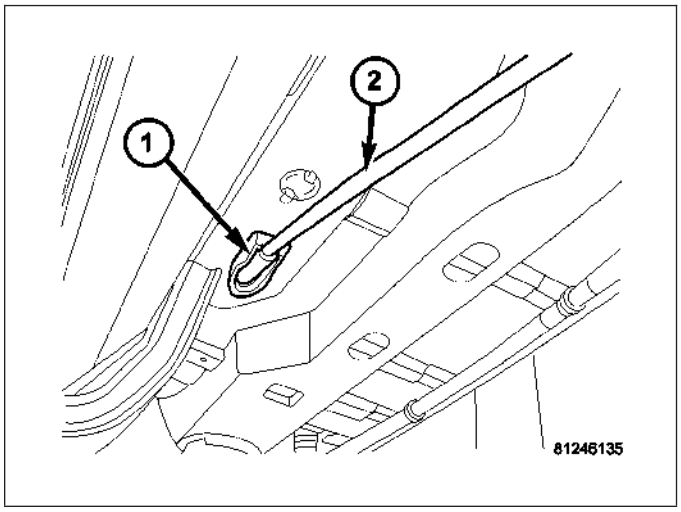
INSTALLATION

FRONT PARKING BRAKE CABLE

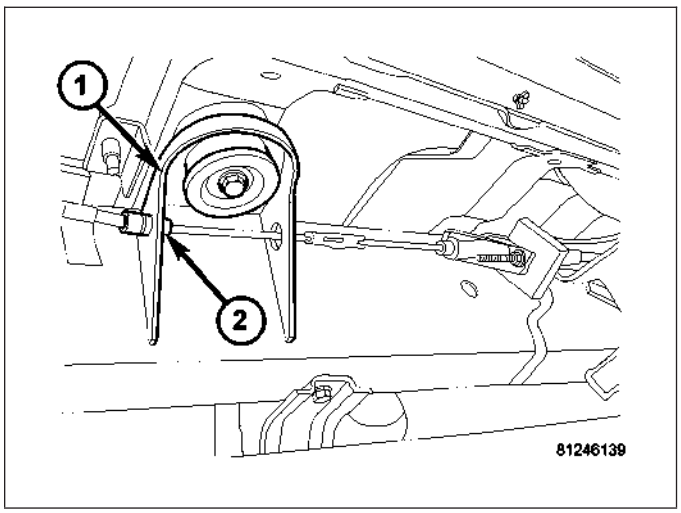
1. From inside the vehicle, insert the cable end fitting (2) into the hole in the pedal assembly (1).
2. Seat the cable retainer in the pedal assembly (1).
3. Engage the cable ball end in clevis on the pedal assembly.



4. Route the cable (2) through the floorpan and install the body grommet (1).
5. Place the carpet down and install the left cowl trim and sill plate.



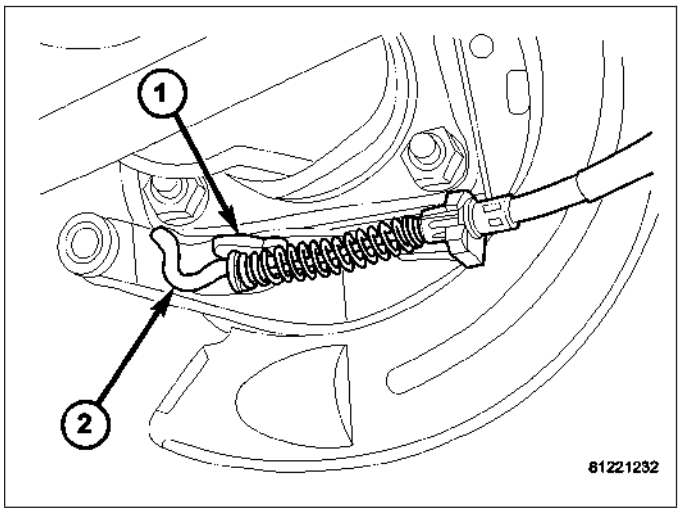
6. Raise and support the vehicle.
7. Route the cable through the underbody bracket (1) and seat the cable end fitting (2) in the bracket.
8. Connect the cable to the cable connector.
9. Perform the park brake adjustment procedure, (Refer to 5 - BRAKES/PARKING BRAKE/CABLE TENSIONER - ADJUSTMENTS).
10. Lower the vehicle.



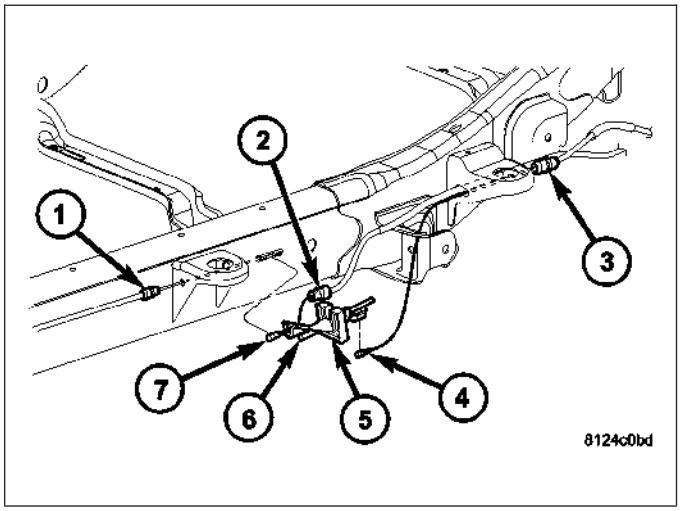
REAR PARK BRAKE CABLE

1. Push each cable end through the brake cable support plate hole until the cable end fitting tabs lock into place.

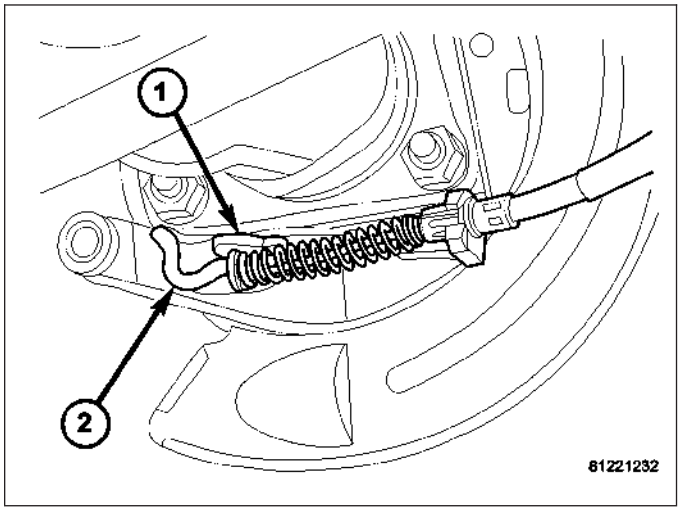
NOTE: Pull on the cable to ensure it is locked into place.



2. Push the cable (4) through the frame bracket.
3. Lock the left cable end fitting tabs (3) into the frame bracket hole.

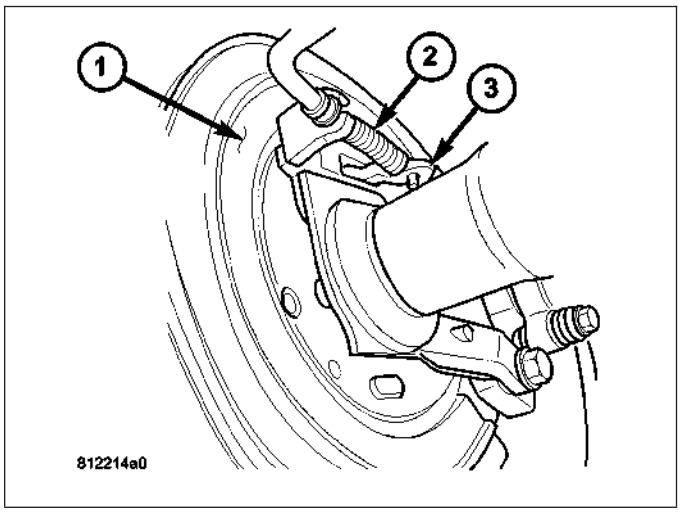


4. Install the rear cables (2) into the tensioner rod behind the rear of the brake assembly (1).
5. Install the cable to the intermediate cable connector.
6. Release and remove the lock out device.
7. Perform the park brake adjustment procedure, (Refer to 5 - BRAKES/PARKING BRAKE/CABLE TENSIONER - ADJUSTMENTS).
8. Remove the supports and lower the vehicle.



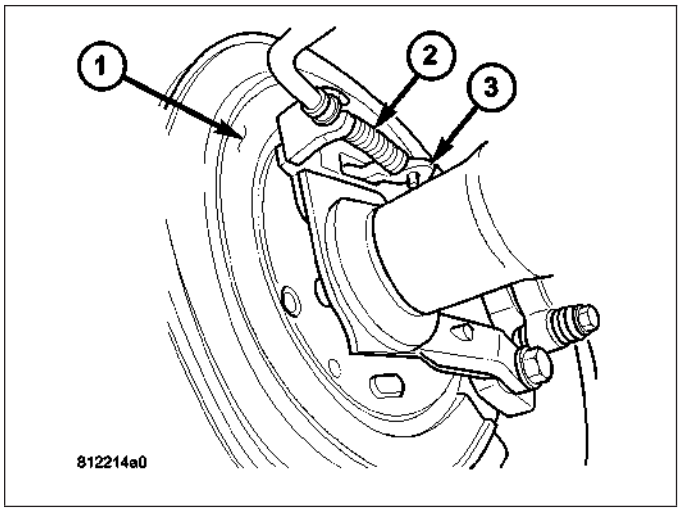
RIGHT REAR CABLE

1. Install the brake cable (2) to the brake lever (3).
2. Install the cable bracket to the shock bracket.
3. Install the cable to the axle bracket.
4. Install the cable to the frame bracket.
5. Install the right cable to the equalizer.
6. Install the right cable to the front cable.
7. Adjust the brake cable at the equalizer and using the adjuster nut.



LEFT REAR CABLE

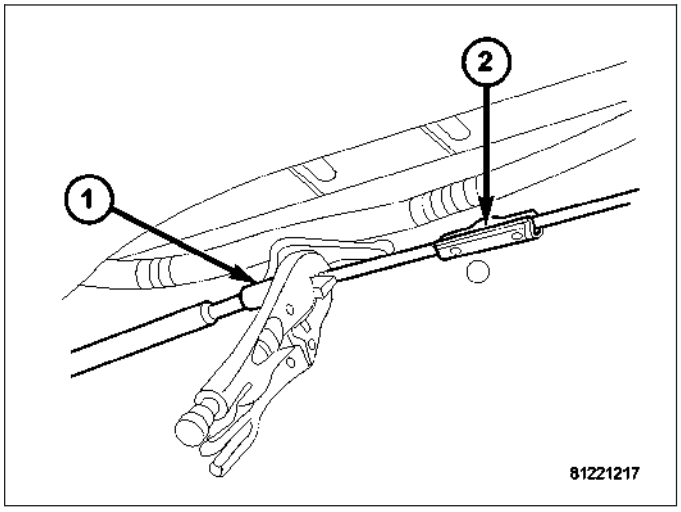
1. Install the brake cable (2) to the brake lever (3).
2. Install the cable to the axle bracket.
3. Install the cable to the frame bracket.
4. Install the left cable to the equalizer.
5. Install the left cable to the front cable.
6. Adjust the brake cable at the equalizer and using the adjuster nut.



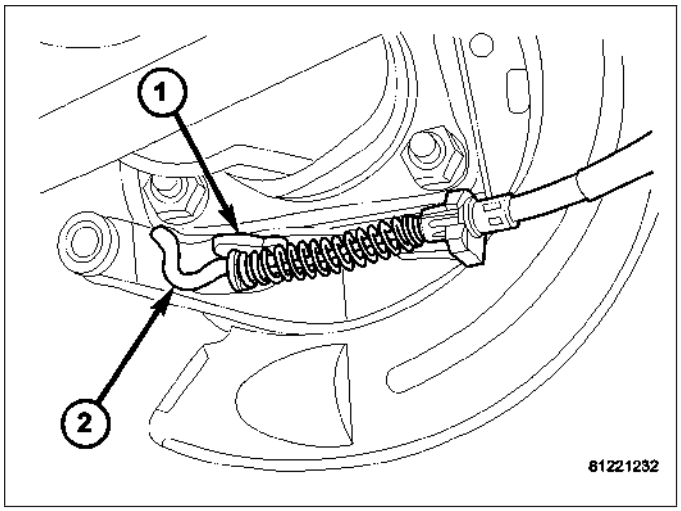
SHOES

REMOVAL

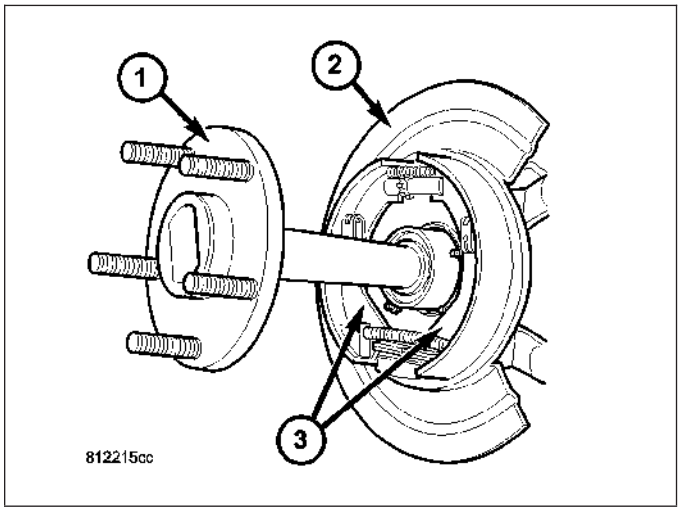
1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the disc brake caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
5. Lockout the parking brake cable (1).



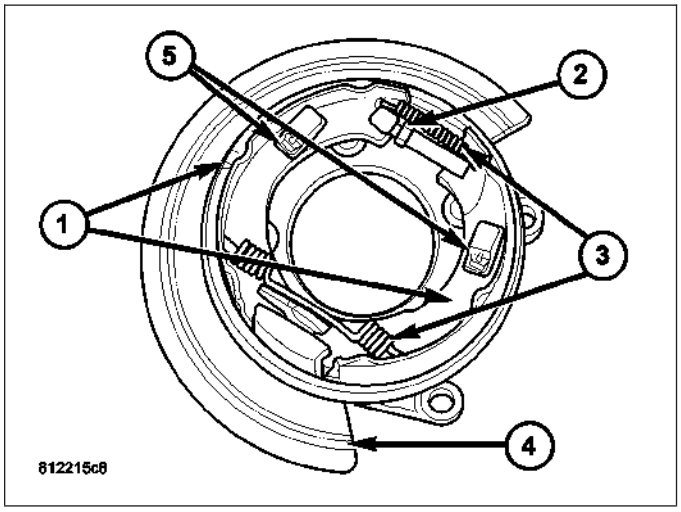
6. Disengage the park brake cable (2) from behind the rotor assembly to allow easier disassembly of the park brake shoes.



7. Remove the axleshaft (1) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - REMOVAL).



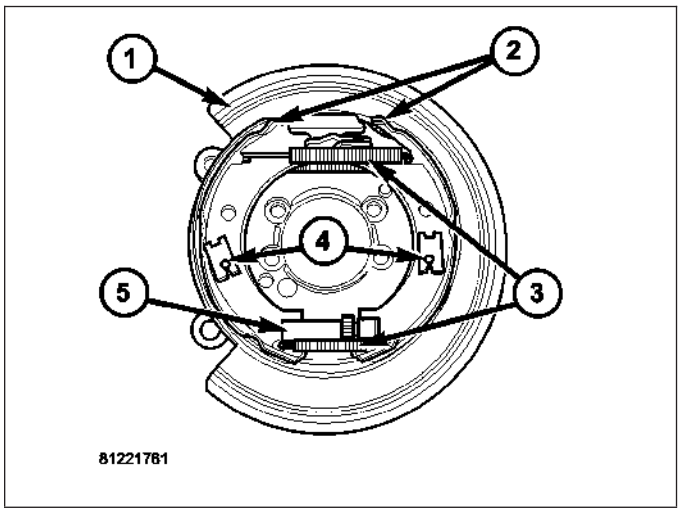
8. Disassemble the rear park brake shoes (1).



CLEANING - REAR DRUM IN HAT BRAKE

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

INSPECTION - REAR DRUM IN HAT BRAKE



As a general rule, riveted brake shoes (2) should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes (2) exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly (5). Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

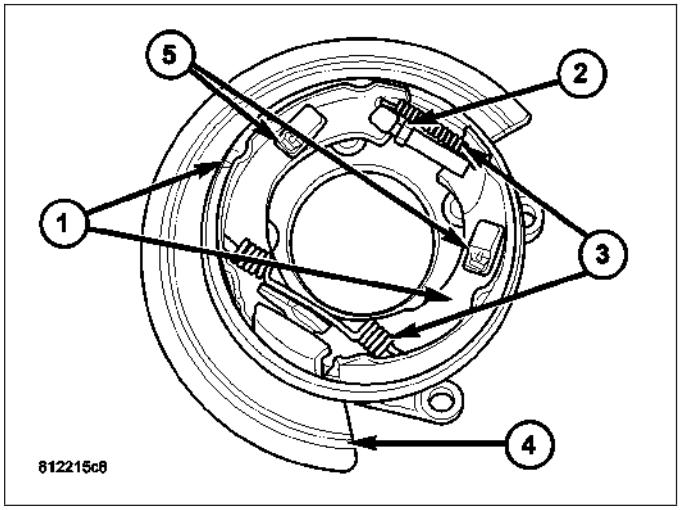
Discard the brake springs (3) and retainer components (4) if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate (1), replace the support plate if any of the pads are worn or rusted through. Also replace the plate (1) if it is bent or distorted.

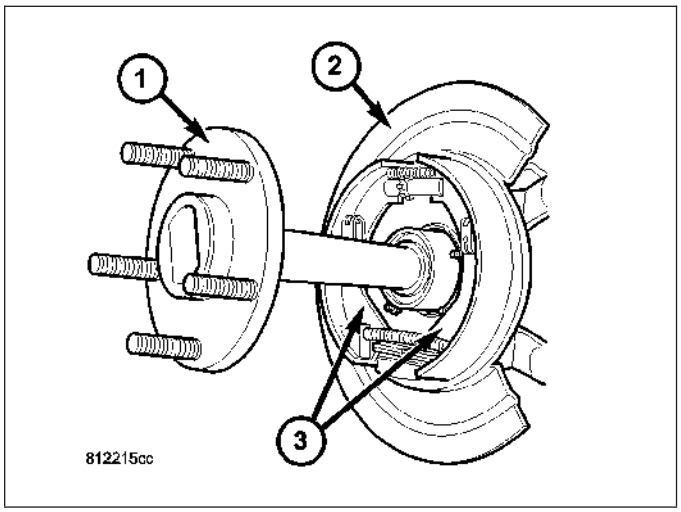
INSTALLATION

NOTE: On a new vehicle or after parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake foot pedal.

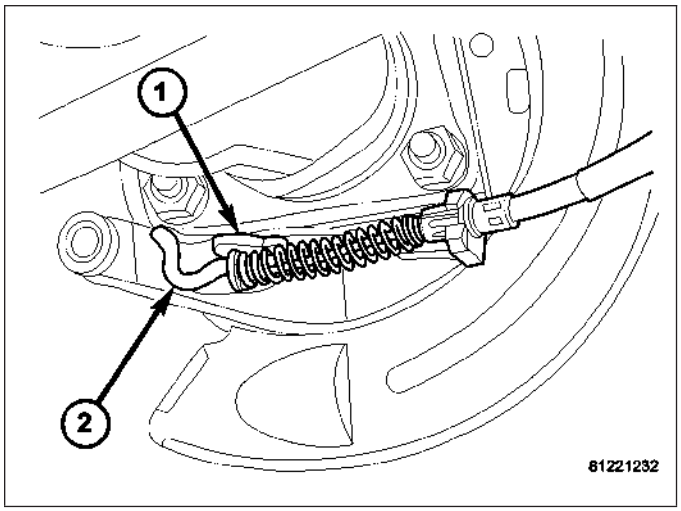
1. Reassemble the rear park brake shoes (1).



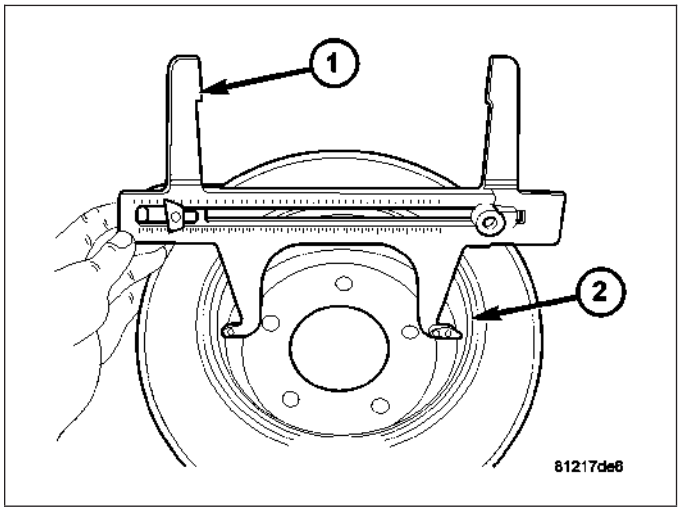
2. Install the axleshaft (1) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 9 1/4/AXLE SHAFTS - INSTALLATION).



3. Install the park brake cable (2) to the lever behind the support plate (1).
4. Unlock the park brake cable.



5. Adjust the rear brake shoes (Refer to 5 - BRAKES/ PARKING BRAKE/SHOES - ADJUSTMENTS).
6. Install the disc brake rotor (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
7. Install the disc brake caliper (Refer to 5 - BRAKES/ HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
8. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Lower the vehicle.

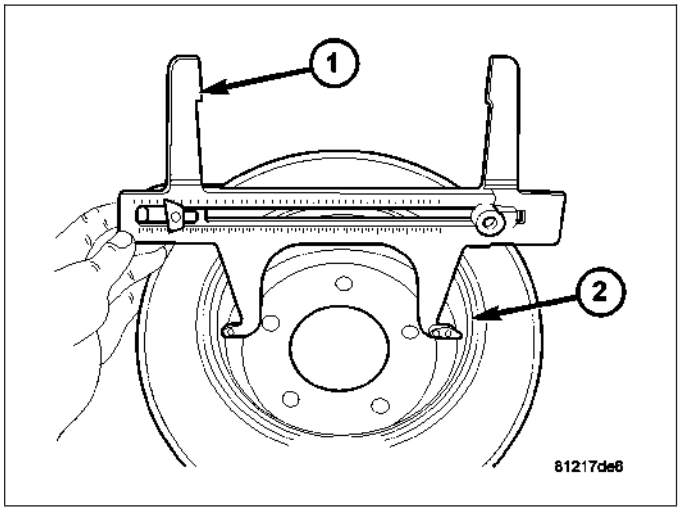


ADJUSTMENTS

PARKING BRAKE SHOES

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

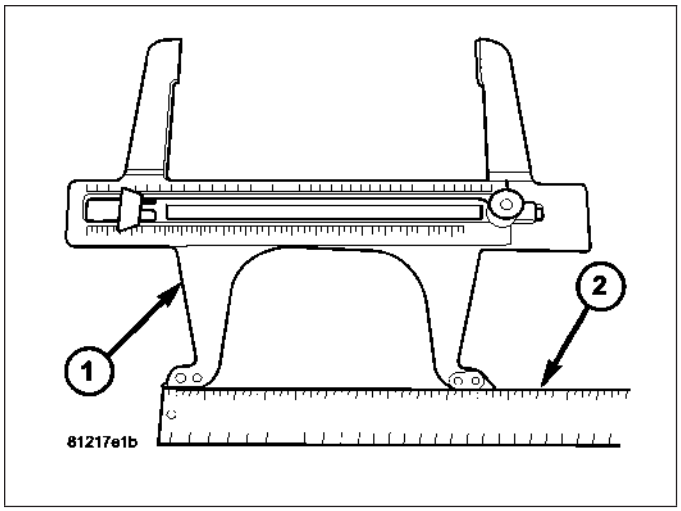
1. Raise vehicle.
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ DISC BRAKE CALIPERS - REMOVAL).
4. Remove rotor from the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).



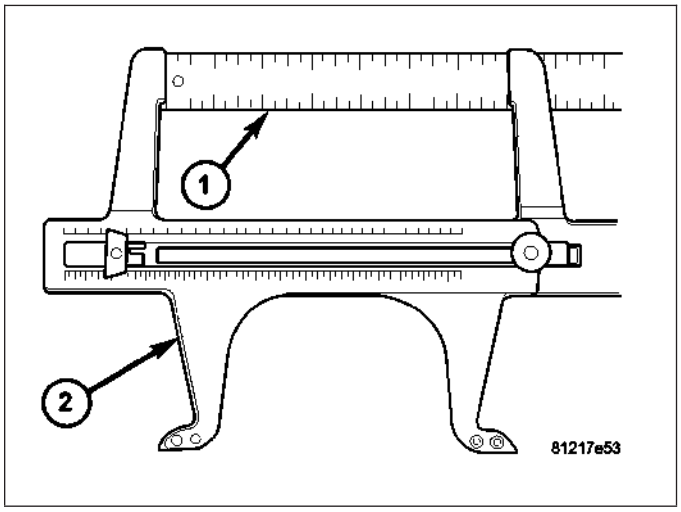
NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

5. Using Brake Shoe Gauge, Special Tool C-3919 (1), or equivalent, **accurately** measure the inside diameter of the park brake drum portion (2) of the rotor.

6. Using a ruler (2) that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool (2).



7. Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 (2) by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 (2) or the equivalent used, so that the outside measurement jaws are set to the reduced measurement.



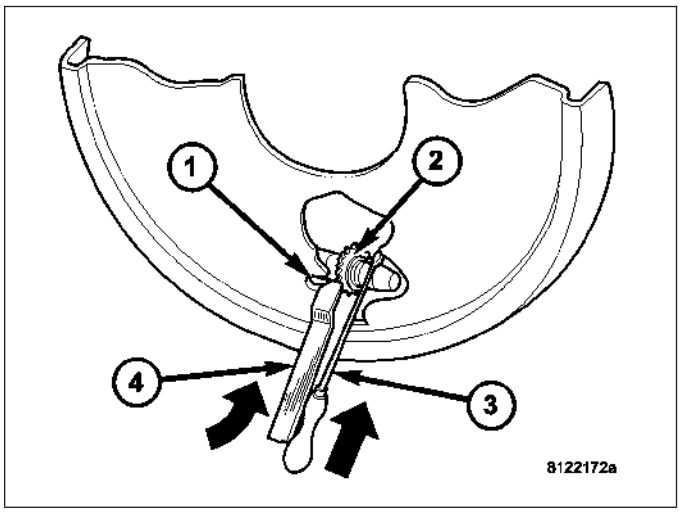
8. Place Gauge, Brake Shoe, Special Tool C-3919, or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.
9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.
10. Repeat step 8 above and measure shoes in both directions.
11. Install brake rotor on the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.
13. Install disc brake caliper on caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
14. Install wheel and tire.
15. Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N·m (95 ft. lbs.).
16. Lower vehicle.
17. Apply and release the park brake pedal one time. This will seat and correctly adjust the park brake cables.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

18. Road test the vehicle to ensure proper function of the vehicle's brake system.

WITH ADJUSTING TOOL

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

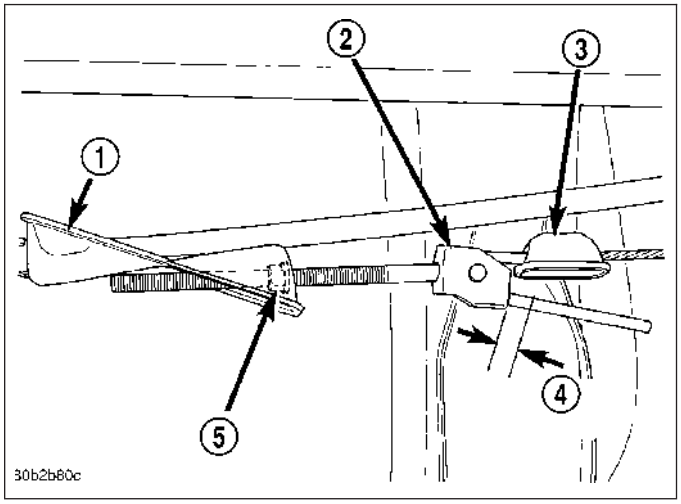


1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Loosen parking brake cable adjustment nut until there is slack in front cable.
5. Insert adjusting tool (4) through support plate access hole (1) and engage tool in teeth of adjusting screw star wheel (2).
6. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.
7. Push and hold adjuster lever away from star wheel with thin screwdriver (3).
8. Back off adjuster screw star wheel until brake drag is eliminated.
9. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.
10. Install support plate access hole plugs.
11. Adjust parking brake cable and lower vehicle.
12. Depress park brake pedal and make sure park brakes hold the vehicle staionary.
13. Release park brake pedal.

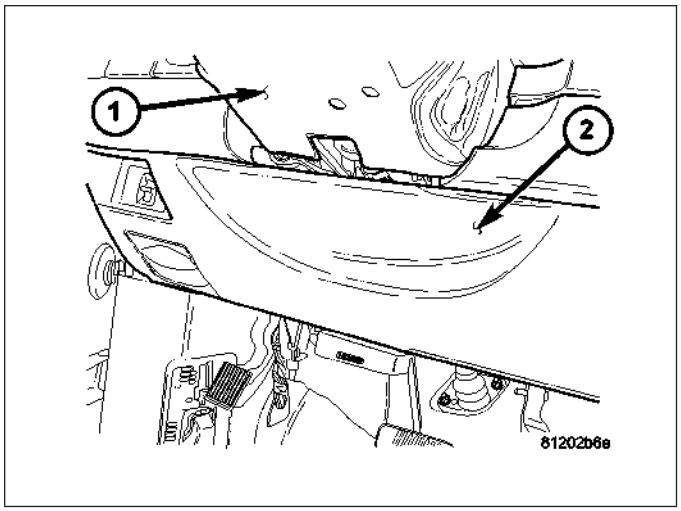
PEDAL

REMOVAL

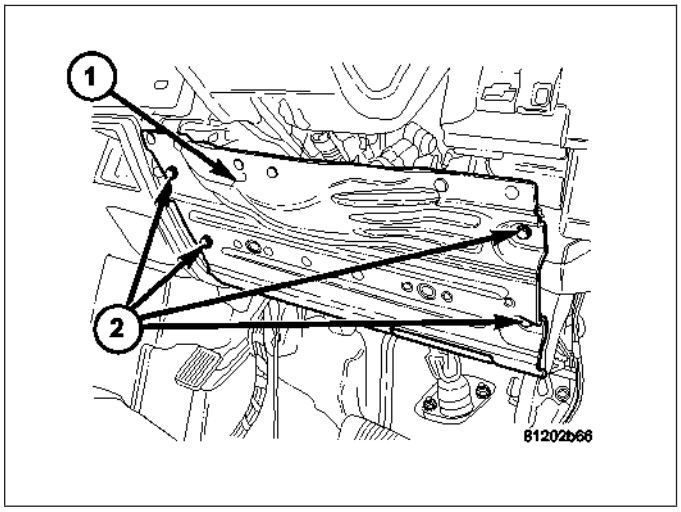
1. Release the parking brake.
2. Raise the vehicle.
3. Loosen the cable tensioner nut at the equalizer (5) to create slack in the front cable.
4. Lower the vehicle.



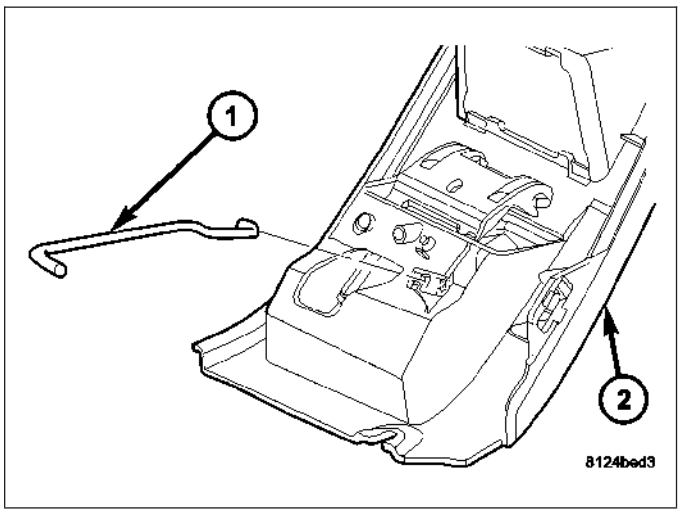
5. Remove the steering column opening cover (2), (Refer to 23 - BODY/INSTRUMENT PANEL/ STEERING COLUMN OPENING COVER - REMOVAL).



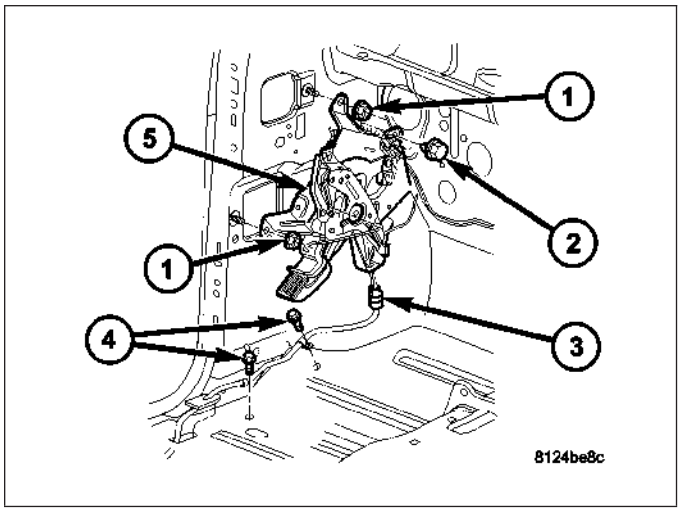
6. Remove the steering column opening reinforcement (1).



7. Disconnect the brake lamp wire from the switch on the pedal assembly.
8. Roll the carpet back, loosen the front cable grommet from the floor pan and the cable retainer.
9. Disengage the release rod (1) from the arm on the pedal assembly.

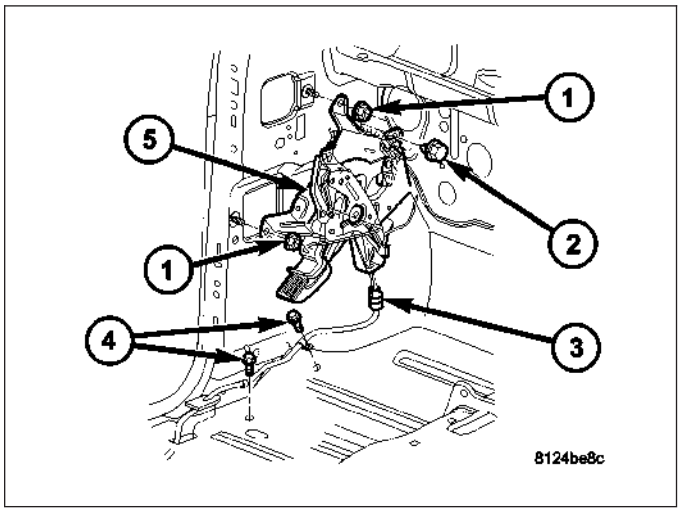


10. Remove the bolts (2) /nuts (1) from the pedal assembly (5) and remove the assembly.

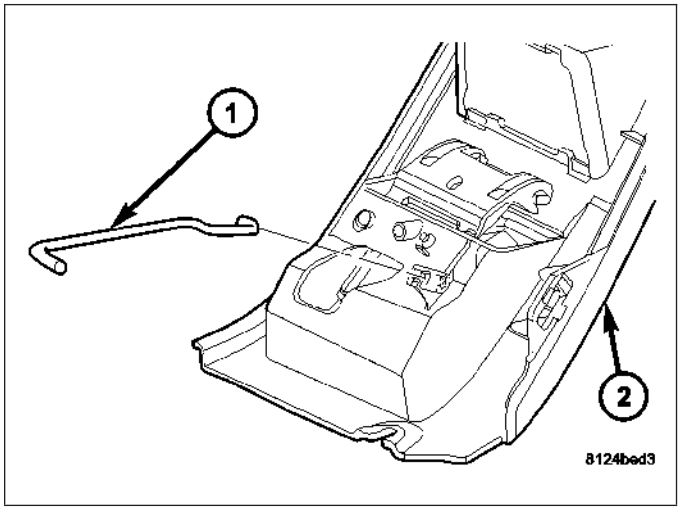


INSTALLATION

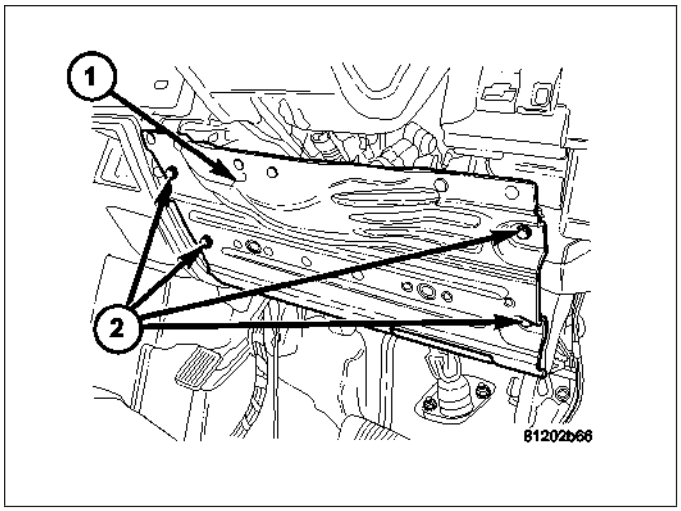
1. Position the replacement pedal assembly (5) on the dash and cowl.
2. Install the bolts (2) / nuts (1) and tighten to 14 N·m (125 in. lbs.).
3. Connect the front cable (3) to the arm on the pedal assembly (5).
4. Tighten the front cable grommet (4) to the floor pan and the cable retainer, roll the carpet back.
5. Connect the wires to the brake lamp switch.



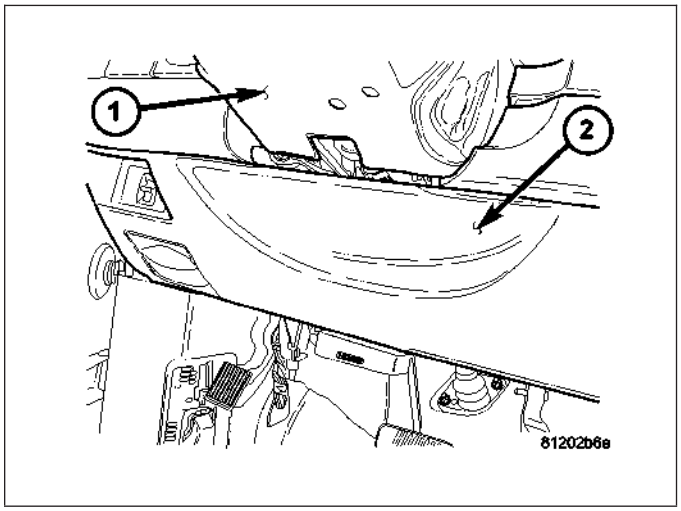
6. Install the park brake release rod (1).



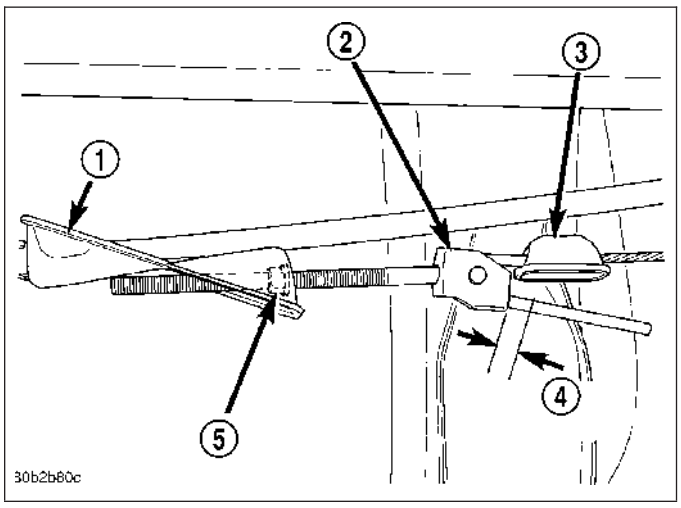
7. Install the steering column opening reinforcement.



8. Install the steering column opening cover, (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).



9. Raise the vehicle.
10. Adjust the parking brake cable tensioner (5) (Refer to 5 - BRAKES/PARKING BRAKE/CABLE TENSIONER - ADJUSTMENTS).



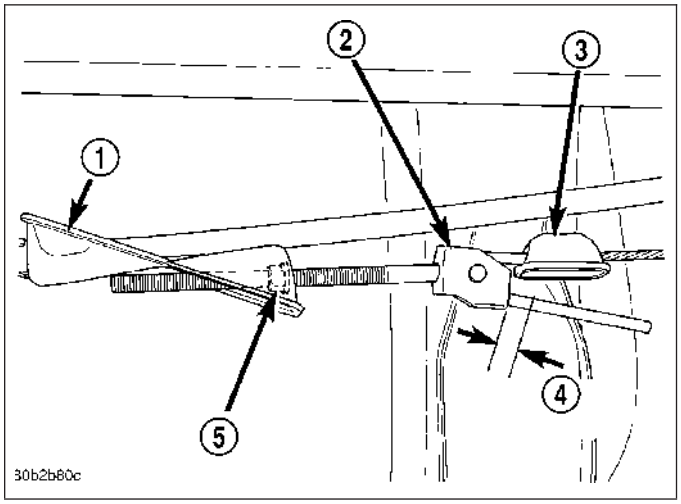
CABLE TENSIONER

ADJUSTMENTS

CABLE TENSIONER

NOTE: Tensioner adjustment is only necessary when the tensioner, or a cable has been replaced or disconnected for service. When adjustment is necessary, perform adjustment only as described in the following procedure. This is necessary to avoid faulty park brake operation.

1. Raise the vehicle.
2. Back off the cable tensioner adjusting nut (5) to create slack in the cables.



3. Remove the rear wheel/tire assemblies. Then remove the brake rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Verify the brakes are in good condition and operating properly.
5. Verify the park brake cables operate freely and are not binding, or seized.
6. Check the rear brake shoe adjustment with standard brake gauge (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
7. Install the rotors (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION) and verify that the rotors rotate freely without drag.
8. Install the wheel/tire assemblies, (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Lower the vehicle enough for access to the park brake foot pedal. Then fully apply the park brakes.

NOTE: Leave park brakes applied until adjustment is complete.

10. Raise the vehicle again.
11. Mark the tensioner rod 6.35 mm (1/4 in.) from edge of the tensioner (2).
12. Tighten the adjusting nut (5) on the tensioner rod until the mark is no longer visible.

CAUTION: Do not loosen, or tighten the tensioner adjusting nut for any reason after completing adjustment.

13. Lower the vehicle until the rear wheels are 15-20 cm (6-8 in.) off the shop floor.
14. Release the park brake foot pedal and verify that rear wheels rotate freely without drag. Then lower the vehicle.

SCHEMATICS AND DIAGRAMS 271

BRAKES - ABS ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

INTERMITTENT CONDITION

For the Brake circuit diagrams. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

POSSIBLE CAUSES
INTERMITTENT CONDITION

Diagnostic Test

1. INTERMITTENT CONDITION

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected faulty component and the Anti-Lock Brake Module.

Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits

For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.

Use the scan tool to perform a System Test if one applies to failing component.

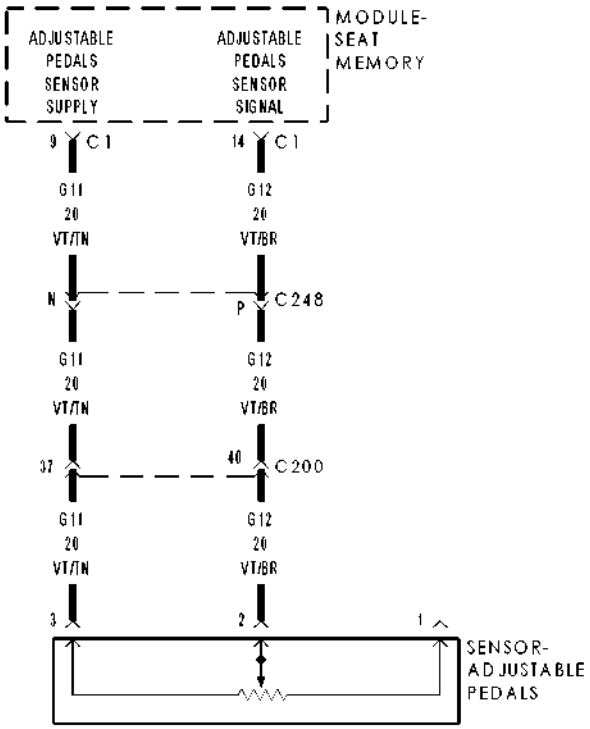
A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

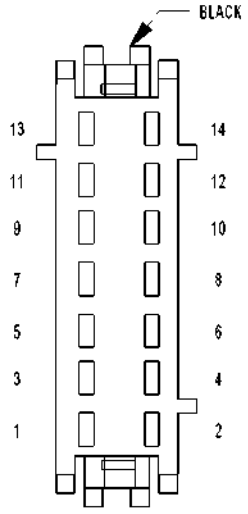
Were any problems found during the above inspections?

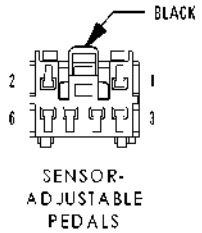
Yes >> Perform the necessary repairs.
Perform ABS VERIFICATION TEST VER - 1.

No >> Test Complete.

B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW







B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Adjustable Pedal Motor is in active operation.
- **Set Condition:**
  The Seat Memory Module detects a low signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND, OR OPEN
(G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO GROUND, OR OPEN
ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW

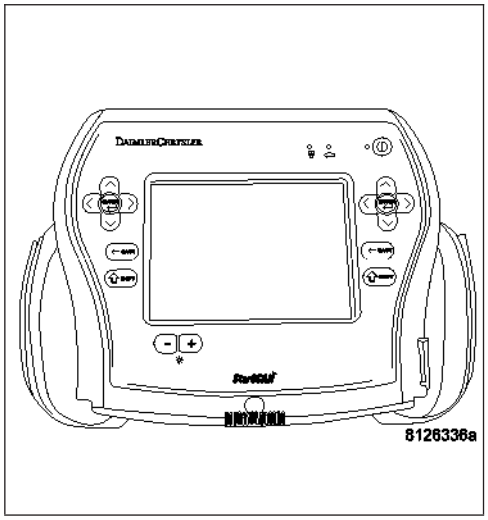
NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTC's.
Cycle the ignition switch from off to on.
Cycle the Adjustable Pedals Switch forward and rearward.
With the scan tool, read DTC's

Does the scan tool display: B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.



B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

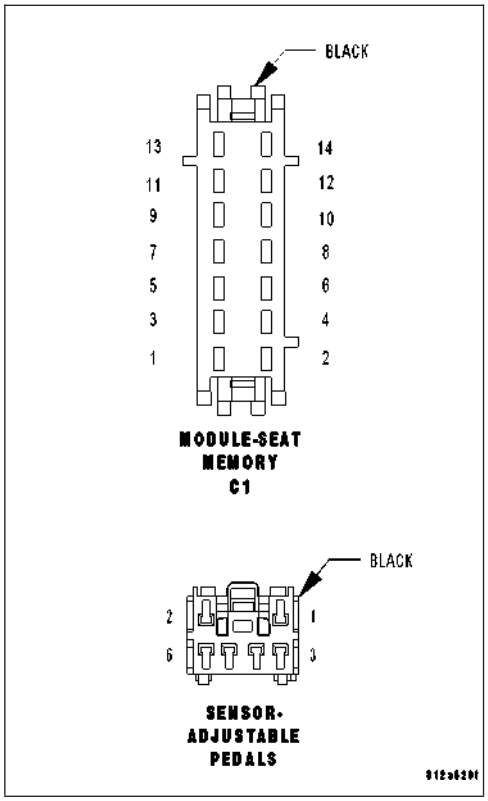
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Sensor, and Adjustable Pedals Sensor harness connector.

Is the Adjustable Pedals Sensor or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

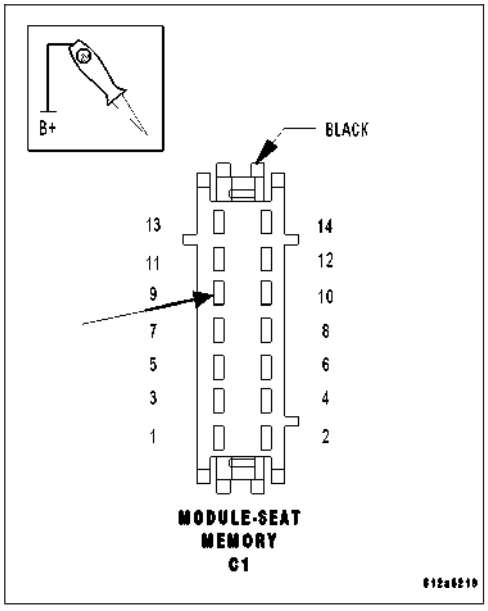
Disconnect the Adjustable Pedals Sensor harness connector.

Using a 12-volt test light connected to 12-volts, probe the (G11) Adjustable Pedals Sensor Supply circuit.

Does the test light illuminate brightly?

Yes >> Repair the (G11) Adjustable Pedals Sensor Supply circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4



B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

4. CHECK (G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR AN OPEN

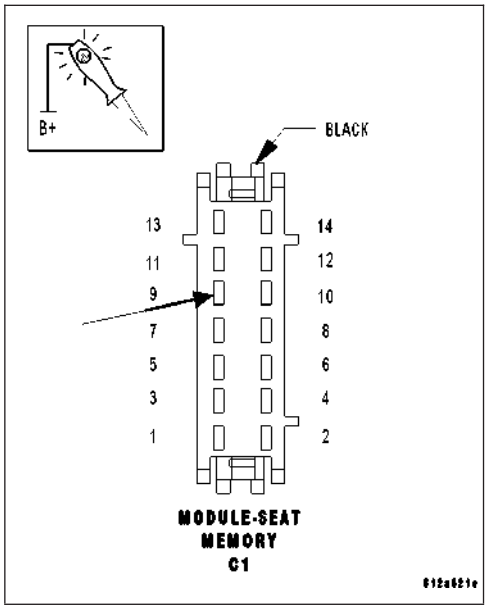
Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Connect a jumper wire between the (G11) Adjustable Pedals Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G11) Adjustable Pedals Sensor Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 5

No >> Repair the (G11) Adjustable Pedals Sensor Supply circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

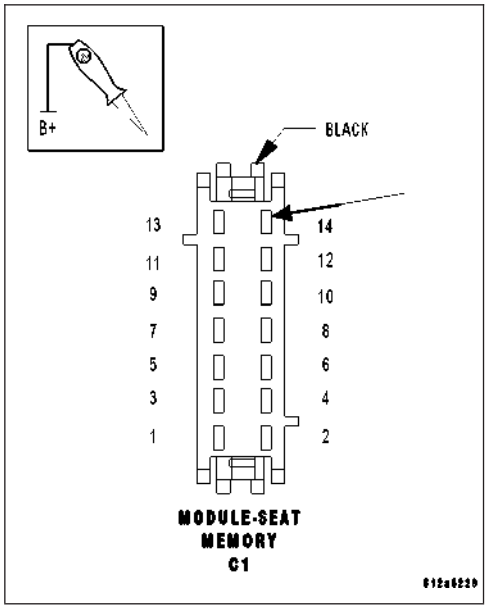
5. CHECK (G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Using a 12-volt test light connected to 12-volts, probe the (G12) Adjustable Pedals Sensor Signal circuit.



Does the test light illuminate brightly?

Yes >> Repair the (G12) Adjustable Pedals Sensor Signal circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 6

B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

6. CHECK (G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR AN OPEN

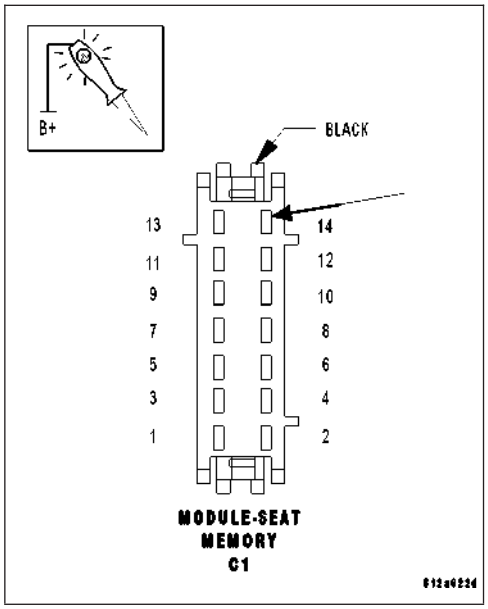
Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Connect a jumper wire between the (G12) Adjustable Pedals Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G12) Adjustable Pedals Sensor Signal circuit.



Does the test light illuminate brightly?

Yes >> Go To 7

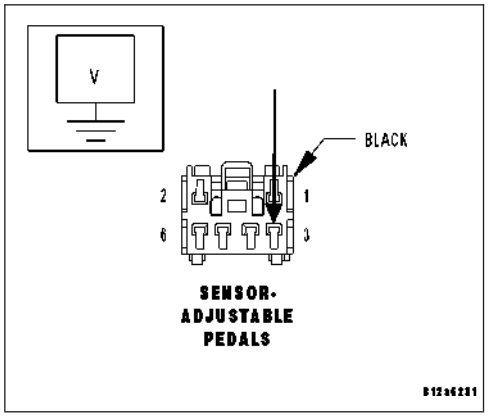
No >> Repair the (G12) Adjustable Pedals Sensor Signal circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

7. CHECK (G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Adjustable Pedals Sensor harness connector.

Measure the voltage between the (G11) Adjustable Pedals Sensor Supply circuit and ground.



Is the voltage between 4.0 and 5.0 volts?

Yes >> Go To 8

No >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

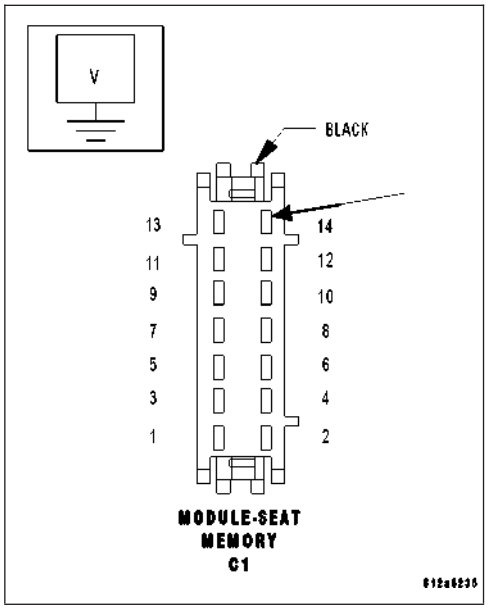
B1D56–ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

8. CHECK (G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Reconnect all connectors.

Measure the voltage of the (G12) Adjustable Pedals Sensor Signal circuit in the Seat Memory Module harness connector.

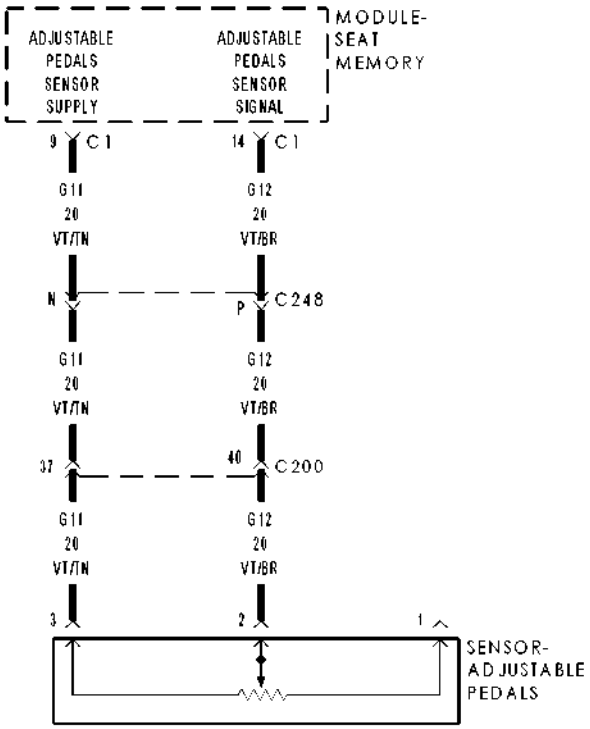


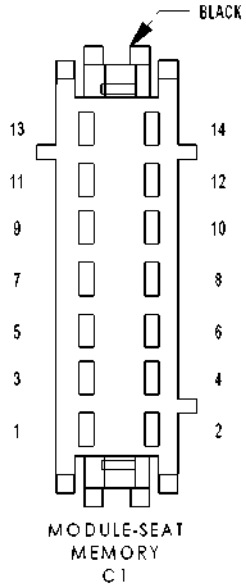
Is the voltage above 0.5 volts?

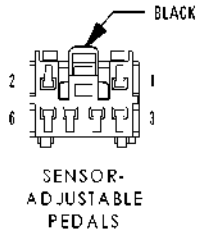
Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH







81dc4205

B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Adjustable Pedal Motor is in active operation.
- **Set Condition:**
  The Seat Memory Module detects a high signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

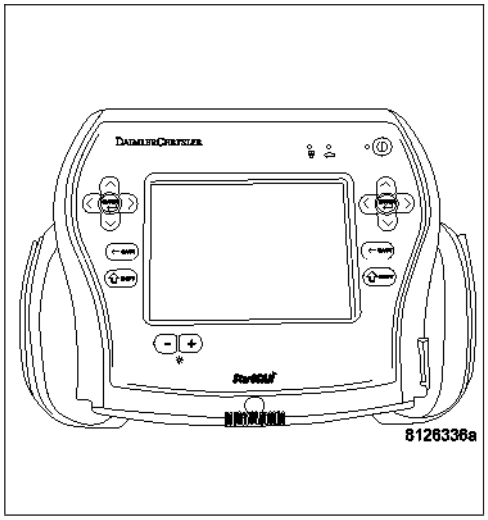
Possible Causes
CONNECTOR/TERMINAL DAMAGE
(G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTC's.
Cycle the ignition switch from off to on.
Cycle the Adjustable Pedals Switch forward and rearward.
With the scan tool, read DTC's



Does the scan tool display: B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

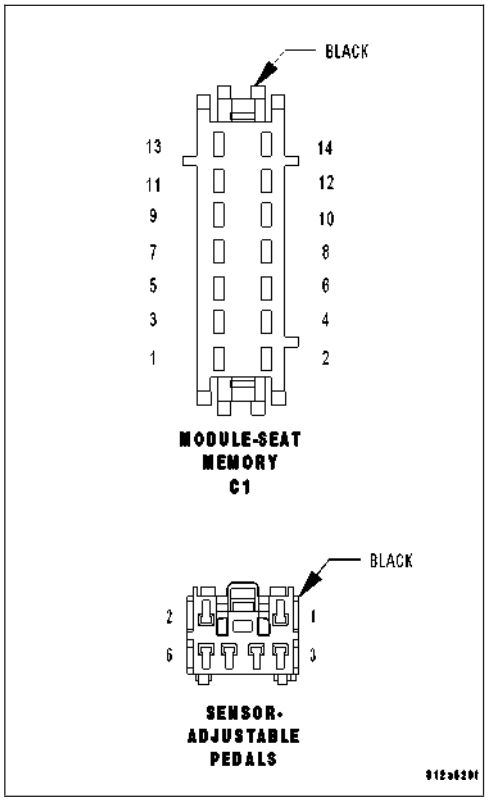
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Sensor, and Adjustable Pedals Sensor harness connector.

Is the Adjustable Pedals Sensor or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (G11) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

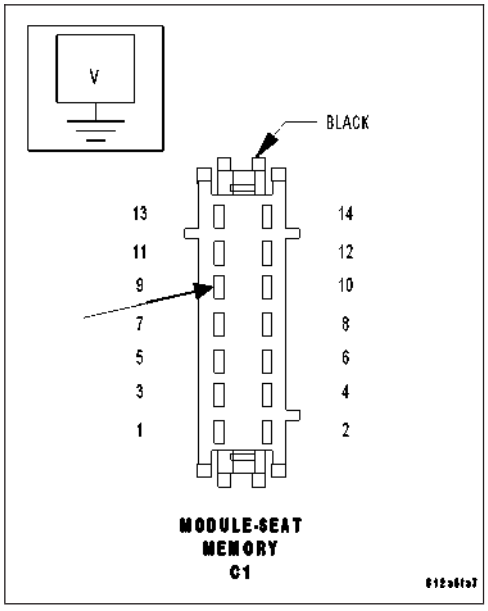
Turn the ignition on.

Measure the voltage between the (G11) Adjustable Pedals Sensor Supply circuit and ground.

Is the voltage above 5.0 volts?

Yes >> Repair the (G11) Adjustable Pedals Sensor Supply circuit for a short to voltage.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4



B1D57–ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

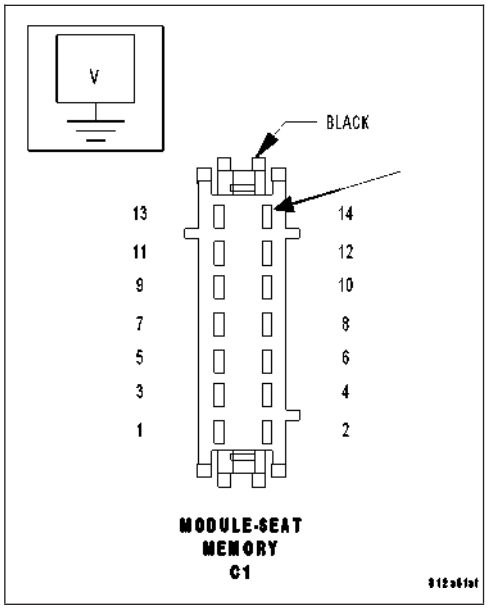
4. CHECK (G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Turn the ignition on.

Measure the voltage between the (G12) Adjustable Pedals Sensor Signal circuit and ground.



Is the voltage above 5.0 volts?

Yes >> Repair the (G12) Adjustable Pedals Sensor Signal circuit for a short to voltage.
Perform APS VERIFICATION TEST - VER 1.

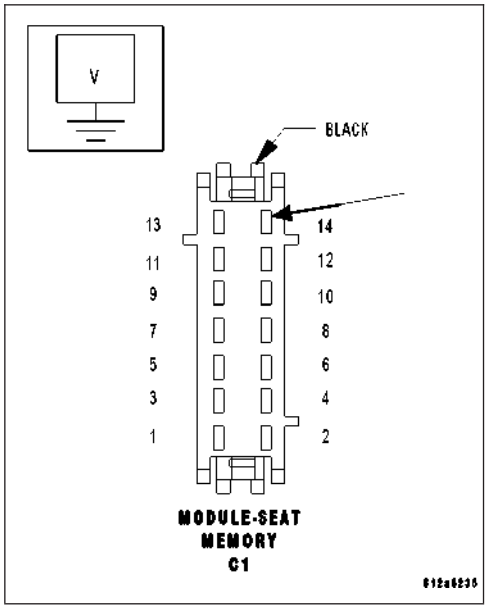
No >> Go To 5

5. CHECK (G12) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Reconnect all connectors.

Measure the voltage of the (G12) Adjustable Pedals Sensor Signal circuit in the Seat Memory Module harness connector.

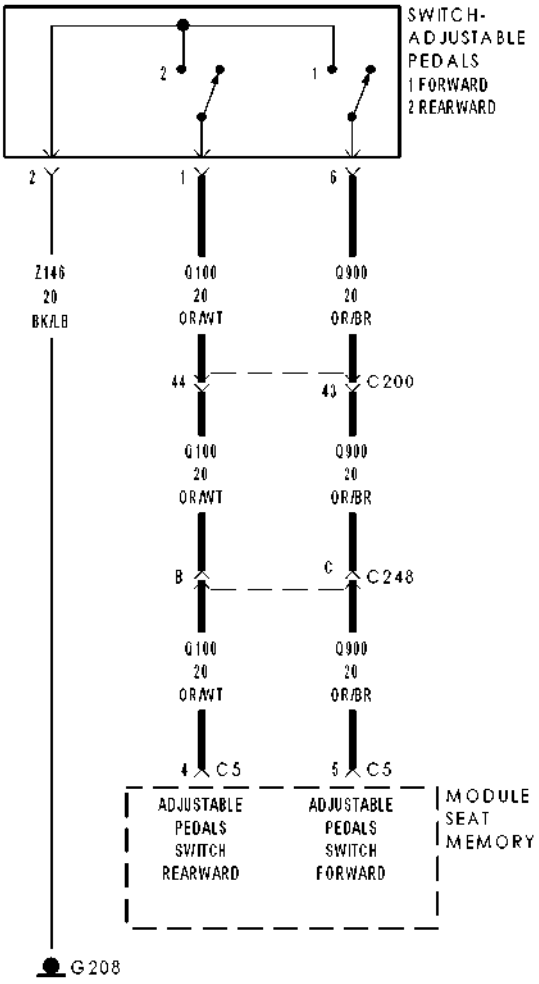


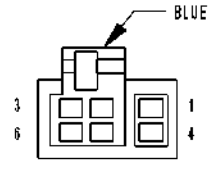
Is the voltage below 4.0 volts?

Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

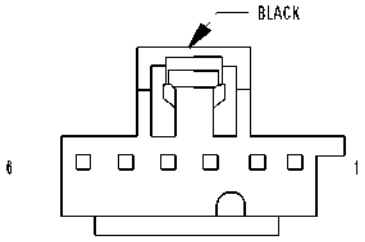
No >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE





SWITCH-ADJUSTABLE
PEDALS



MODULE-SEAT
MEMORY
C5
(ADJUSTABLE PEDALS)

812a79b9

B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
  The Seat Memory Module detects an activation of both pedal switches at the same time.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(Q100) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO GROUND
(Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
(Q100) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND (Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TOGETHER
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

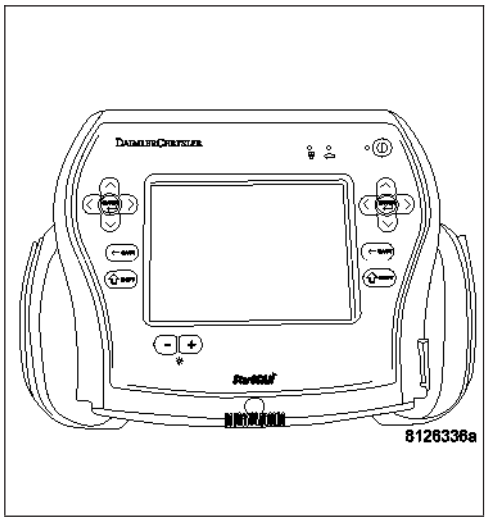
NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTC's.
Cycle the ignition switch from off to on.
Cycle the Adjustable Pedals Switch forward and rearward.
With the scan tool, read DTC's

Does the scan tool display: B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.



B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

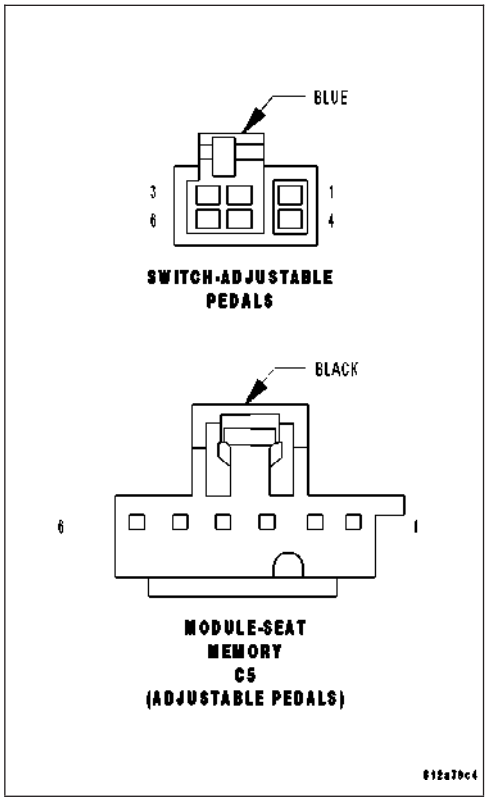
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (Q100) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

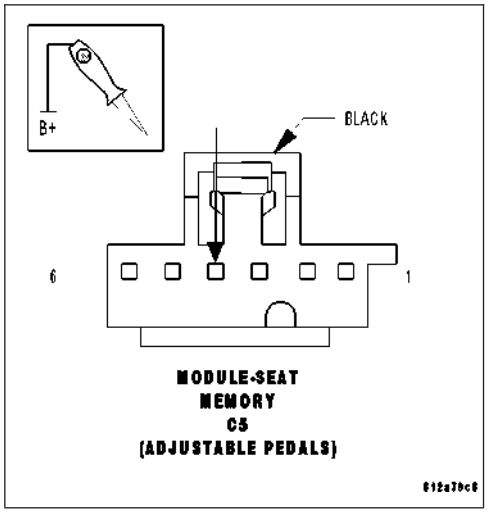
Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q100) Adjustable Pedals Switch Rearward circuit.

Does the test light illuminate brightly?

Yes >> Repair the (Q100) Adjustable Pedals Switch Rearward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4



B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

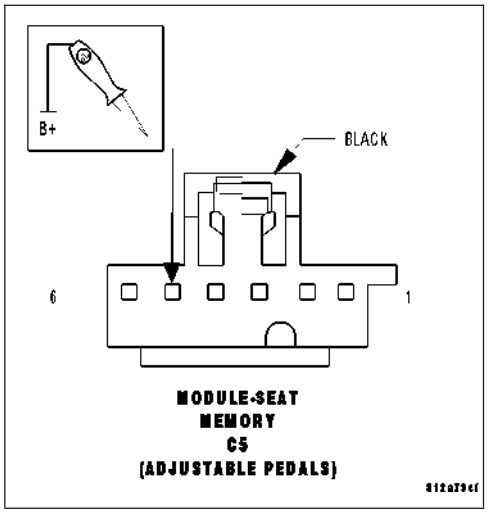
4. CHECK (Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q900) Adjustable Pedals Switch Forward circuit.



Does the test light illuminate brightly?

Yes >> Repair the (Q900) Adjustable Pedals Switch Forward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 5

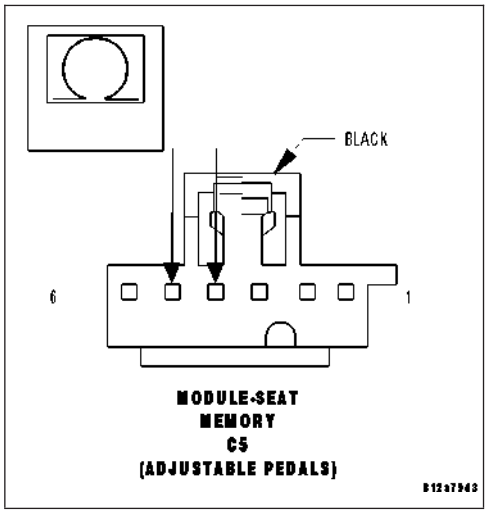
5. CHECK (Q100) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND (Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q100) Adjustable Pedals Switch Rearward circuit and (Q900) Adjustable Pedals Switch Forward circuit.



Is the resistance above 5.0 ohms?

Yes >> Go To 6

No >> Repair the (Q100) Adjustable Pedals Switch Rearward circuit and (Q900) Adjustable Pedals Switch Forward circuit for a short together.
Perform APS VERIFICATION TEST - VER 1.

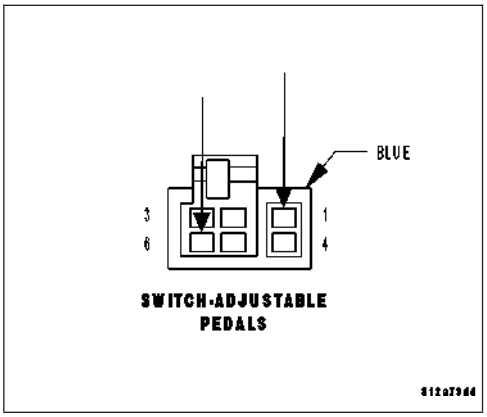
B1D5B–ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

6. CHECK ADJUSTABLE PEDALS SWITCH SHORTED

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q100) Adjustable Pedals Switch Rearward and (Q900) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.

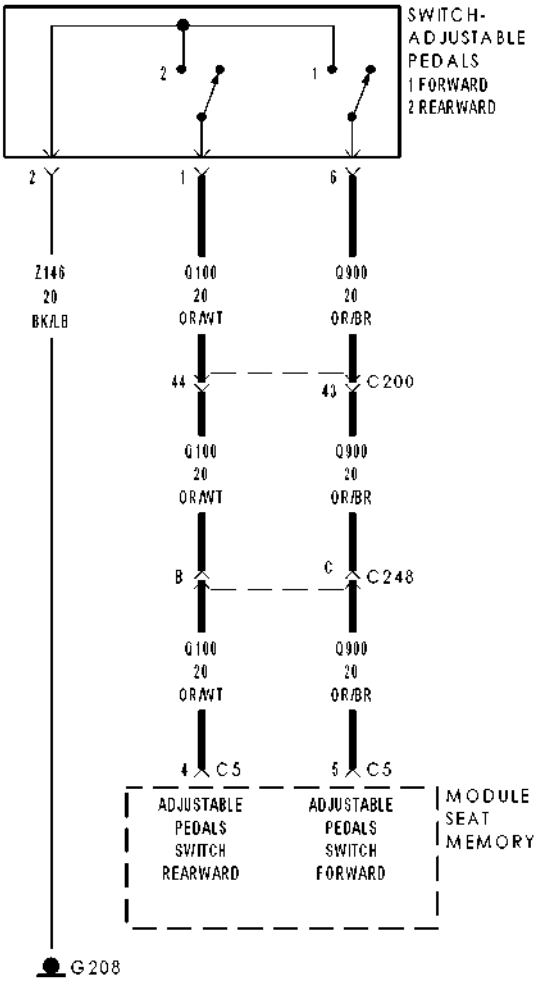


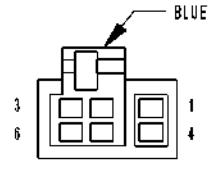
Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

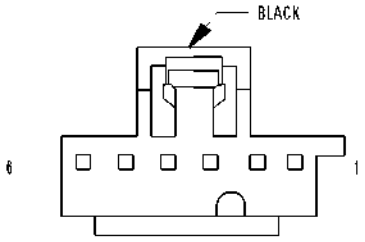
No >> Replace the Adjustable Pedals Switch in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD





SWITCH-ADJUSTABLE
PEDALS



MODULE-SEAT
MEMORY
C5
(ADJUSTABLE PEDALS)

812a79b9

B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
  The Seat Memory Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD

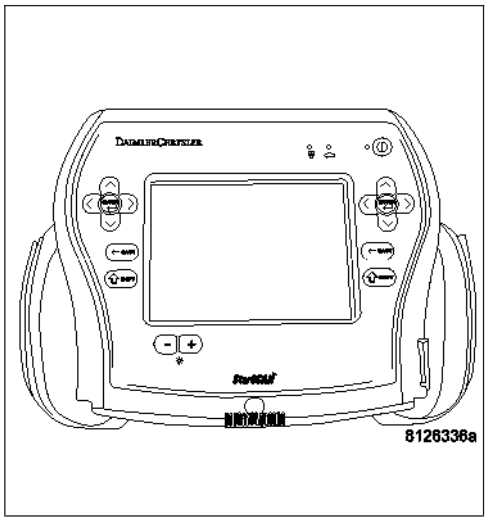
NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.
With the scan tool, record and erase DTC's.
Cycle the ignition switch from off to on.
Cycle the Adjustable Pedals Switch forward and rearward.
With the scan tool, read DTC's

Does the scan tool display: B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.



B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

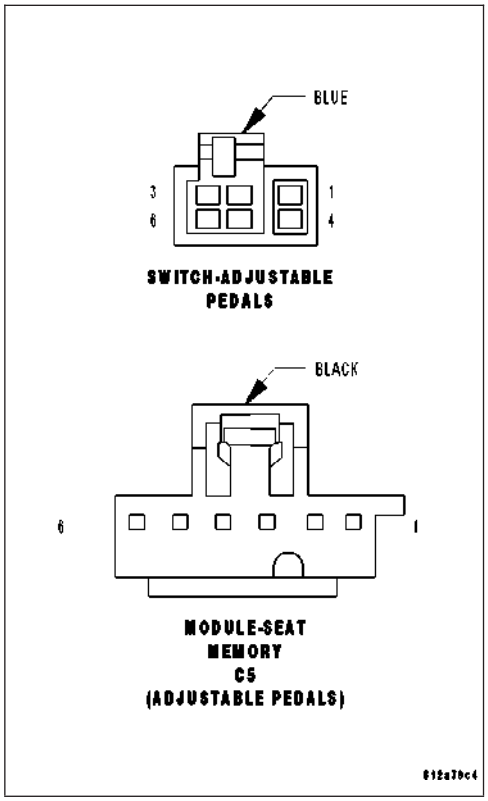
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (Q900) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

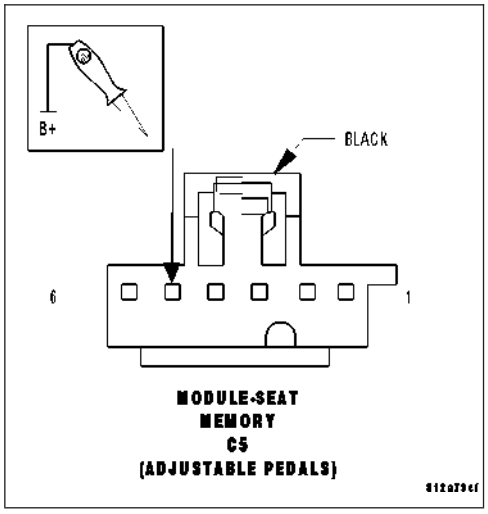
Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q900) Adjustable Pedals Switch Forward circuit.

Does the test light illuminate brightly?

Yes >> Repair the (Q900) Adjustable Pedals Switch Forward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4



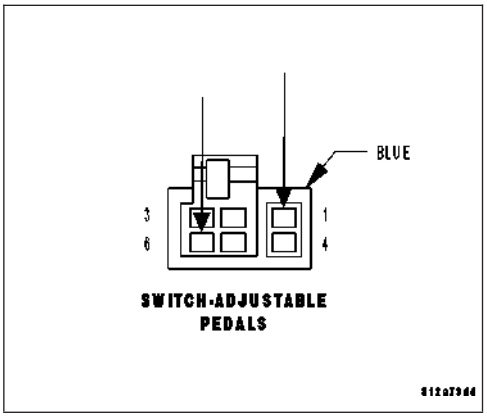
B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)

4. CHECK ADJUSTABLE PEDALS SWITCH SHORTED

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q100) Adjustable Pedals Switch Rearward and (Q900) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.



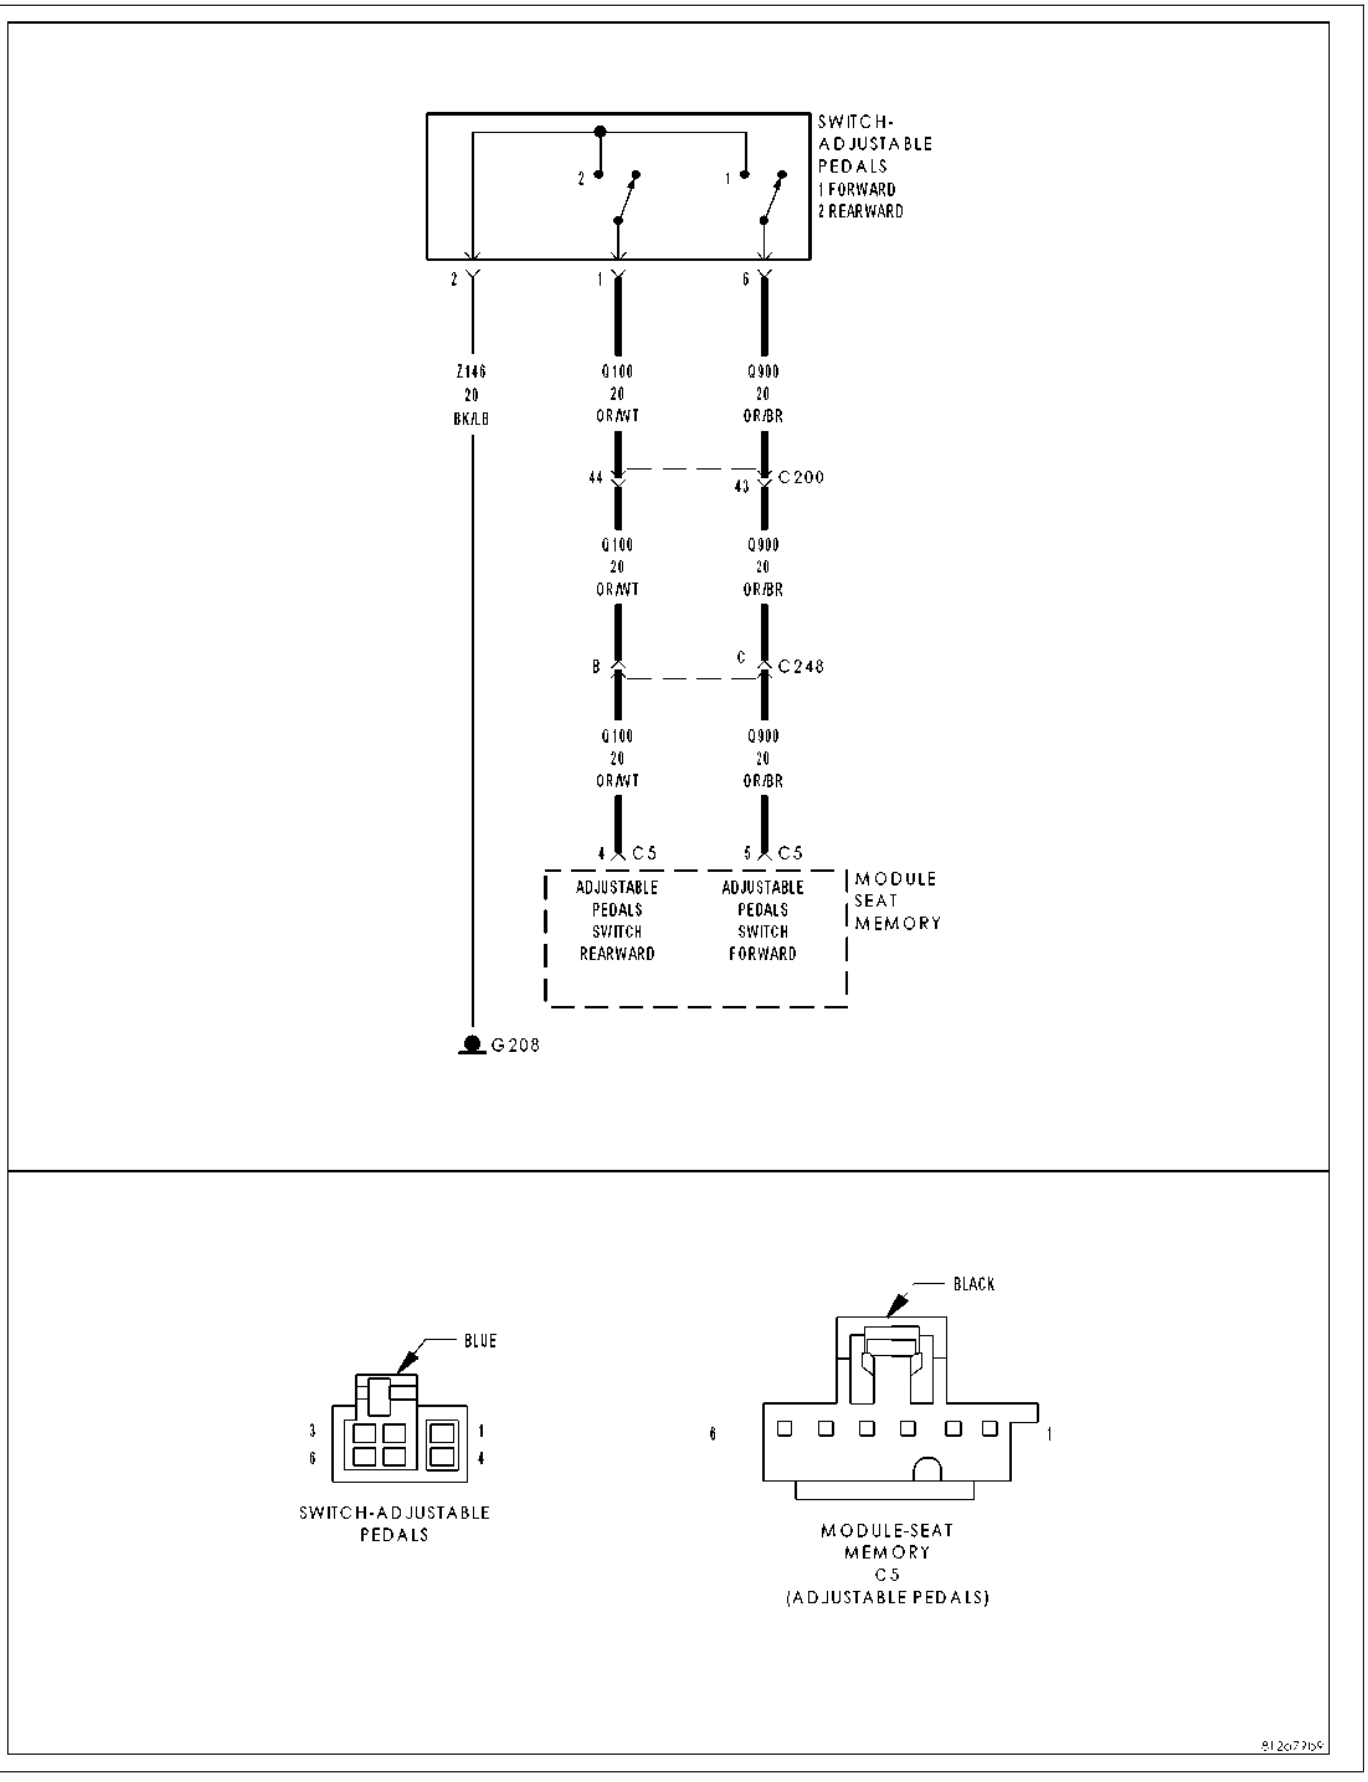
Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Switch in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)
For a complete wiring diagram **Refer to Section 8W**.



B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)

- **When Monitored:**
  The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
  The Seat Memory Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(Q100) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1.

NOTE: This DTC must be active for the results of this test to be valid. CHECK FOR DTC B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

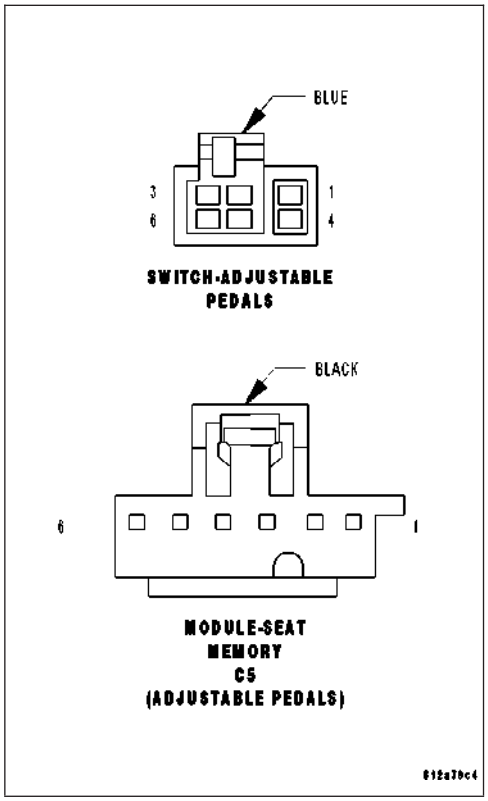
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (Q100) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

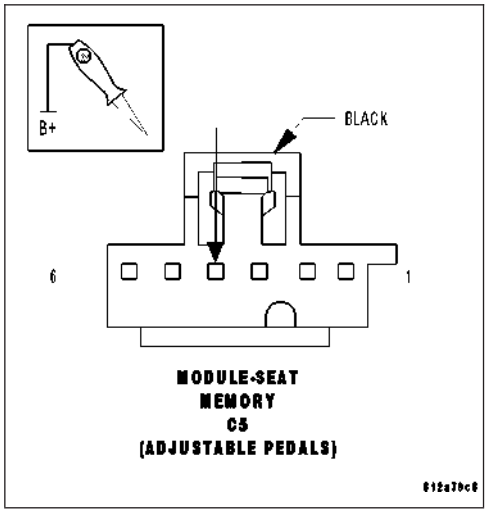
Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q100) Adjustable Pedals Switch Rearward circuit.

Does the test light illuminate brightly?

Yes >> Repair the (Q100) Adjustable Pedals Switch Rearward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4



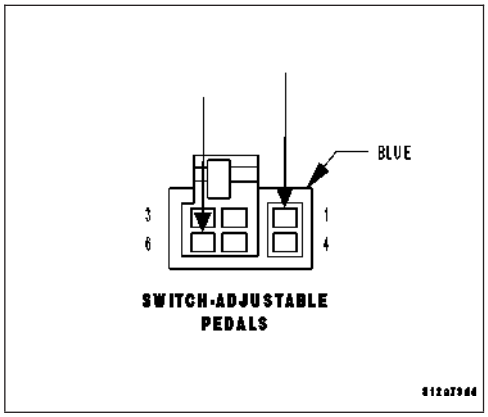
B1D5D–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)

4. CHECK ADJUSTABLE PEDALS SWITCH SHORTED

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q100) Adjustable Pedals Switch Rearward and (Q900) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.

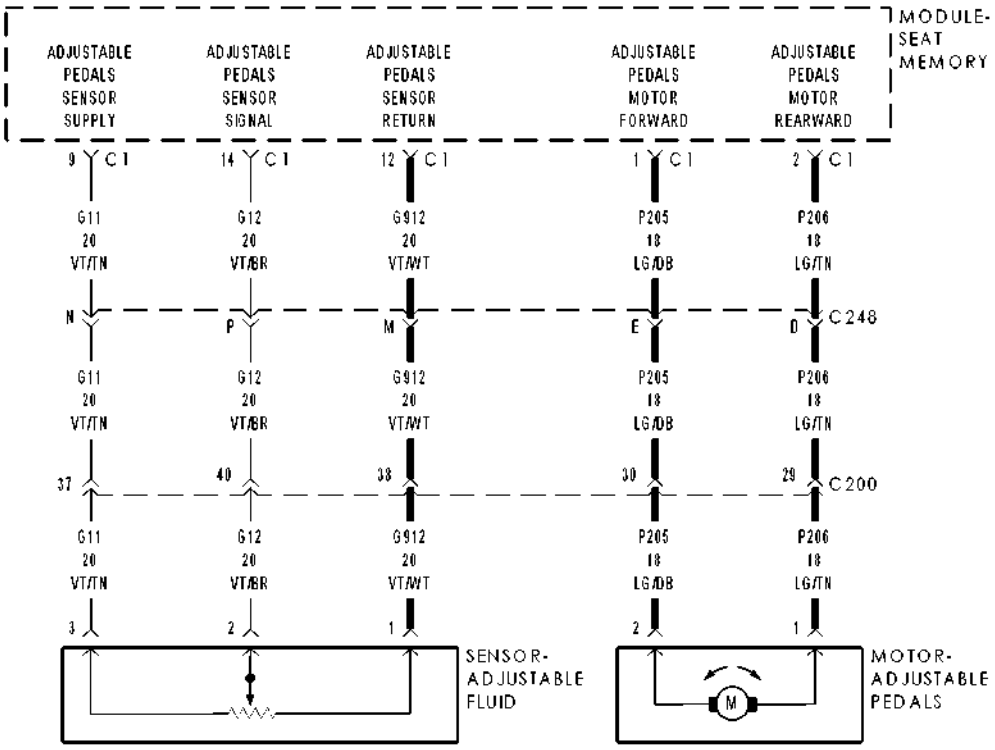


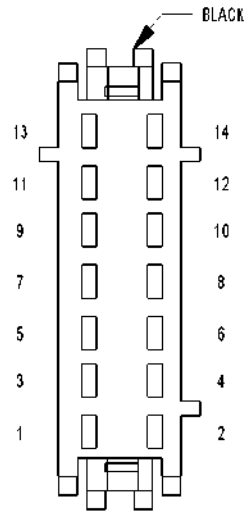
Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

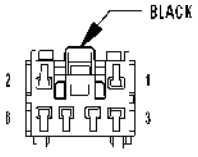
No >> Replace the Adjustable Pedals Switch in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

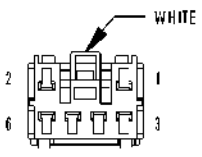




MODULE-SEAT MEMORY C1



SENSOR-ADJUSTABLE PEDALS



MOTOR-ADJUSTABLE PEDALS

512abfaf

B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  The Adjustable Pedals Motor is in active operation.
- **Set Condition:**
  The Seat Memory Module detects that the Adjustable Pedals Motor has been activated for a time period and has not spun with three motor direction commands.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
MECHANICAL FAILURE IN THE ADJUSTABLE PEDALS
(P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT OPEN
(P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT OPEN
(G912) ADJUSTABLE PEDALS SENSOR RETURN CIRCUIT OPEN
ADJUSTABLE PEDALS MOTOR - INTERNAL FAULT
SEAT MEMORY MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle and hold the Adjustable Pedals Switch forward, rearward, and forward at two second intervals.

With the scan tool, read DTC's

Does the scan tool display: B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

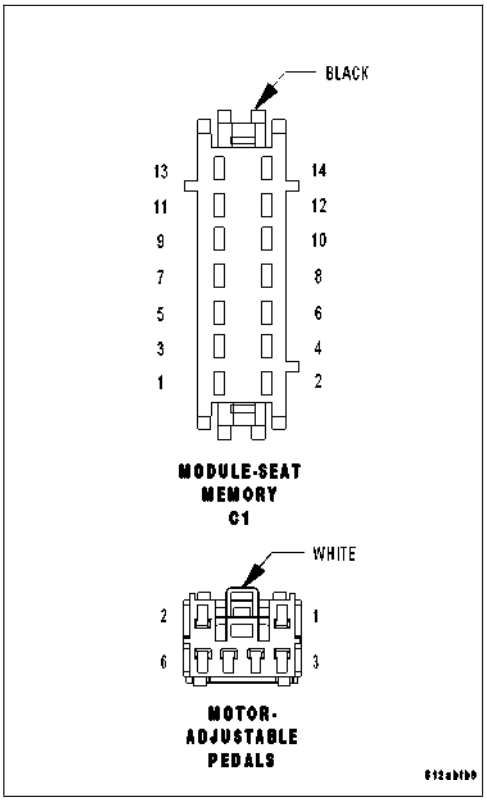
Turn the ignition off.

Inspect the Seat Memory Module harness connector, Adjustable Pedals Motor, and Adjustable Pedals Motor harness connector.

Is the Adjustable Pedals Motor or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK ADJUSTABLE PEDALS ASSEMBLY FOR MECHANICAL DAMAGE

Turn the ignition off.

Inspect the Adjustable Pedals Assembly for any physical damage.

NOTE: Check for any conditions that would cause the motor to stall or be stuck.

Is the Adjustable Pedals Assembly damaged or broken?

Yes >> Replace the Adjustable Pedals Assembly in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector

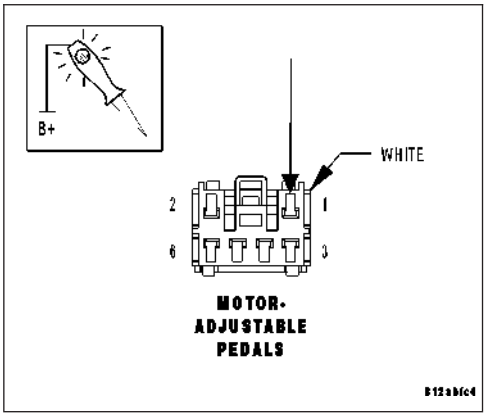
Connect a jumper wire between the (P205) Adjustable Pedals Motor Forward circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (P205) Adjustable Pedals Motor Forward circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (P205) Adjustable Pedals Motor Forward circuit for an open.
Perform APS VERIFICATION TEST - VER 1.



B1D67–ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)

5. CHECK (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT FOR AN OPEN

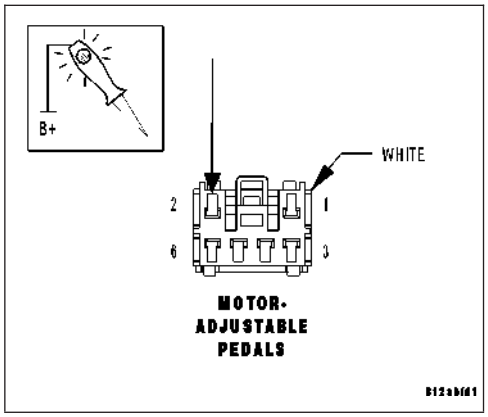
Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector

Connect a jumper wire between the (P206) Adjustable Pedals Motor Rearward circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (P206) Adjustable Pedals Motor Rearward circuit.



Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (P206) Adjustable Pedals Motor Rearward circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

6. CHECK (G912) ADJUSTABLE PEDALS SENSOR RETURN CIRCUIT FOR AN OPEN

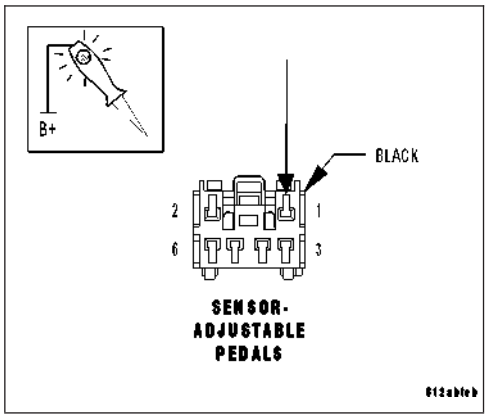
Turn the ignition off.

Disconnect the Seat Memory Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector

Connect a jumper wire between the (G912) Adjustable Pedals Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G912) Adjustable Pedals Sensor Return circuit.



Does the test light illuminate brightly?

Yes >> Go To

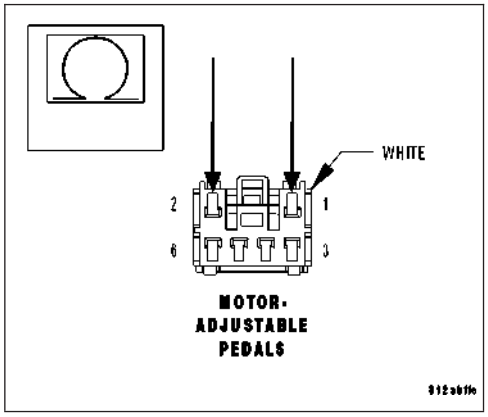
No >> Repair the (G912) Adjustable Pedals Sensor Return circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

7. CHECK ADJUSTABLE PEDALS MOTOR

Turn the ignition off.

Disconnect the Adjustable Pedals Motor harness connector.

Measure the resistance between the (P205) Adjustable Pedals Motor Forward and (P206) Adjustable Pedals Motor Rearward terminals at the Adjustable Pedals Motor.

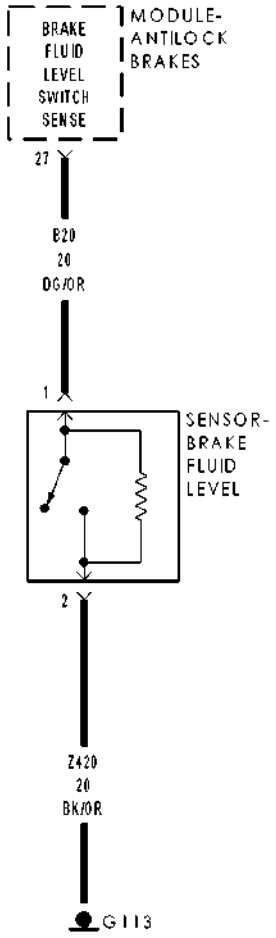


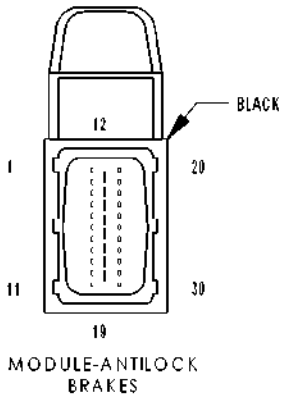
Is the resistance below 100.0 ohms?

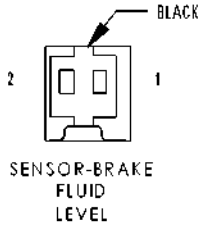
Yes >> Replace and reprogram the Seat Memory Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Motor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH







8125f11

C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When above normal voltage is detected on the Brake Fluid Level Switch Sense circuit.

Possible Causes
BRAKE FLUID LEVEL SENSOR CONNECTOR DAMAGED
(B20) BRAKE FLUID LEVEL SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE, OR OPEN
(Z420) GROUND CIRCUIT OPEN
BRAKE FLUID LEVEL SENSOR - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1.

CHECK FOR DTC C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

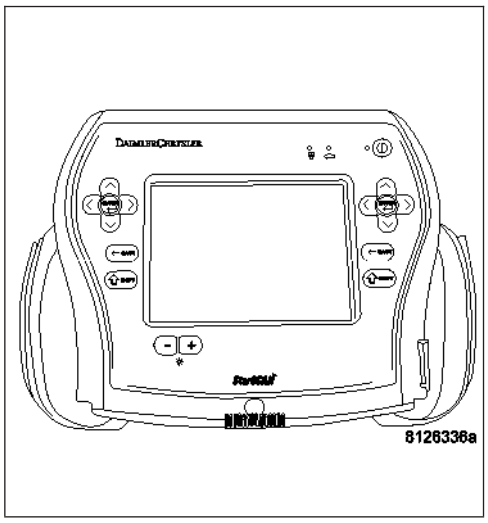
Cycle the ignition switch from off to on.

With the scan tool, read DTC's

Does the scan tool display: C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH (CONTINUED)

2. CHECK BRAKE FLUID LEVEL SENSOR CONNECTION

Turn the ignition off.

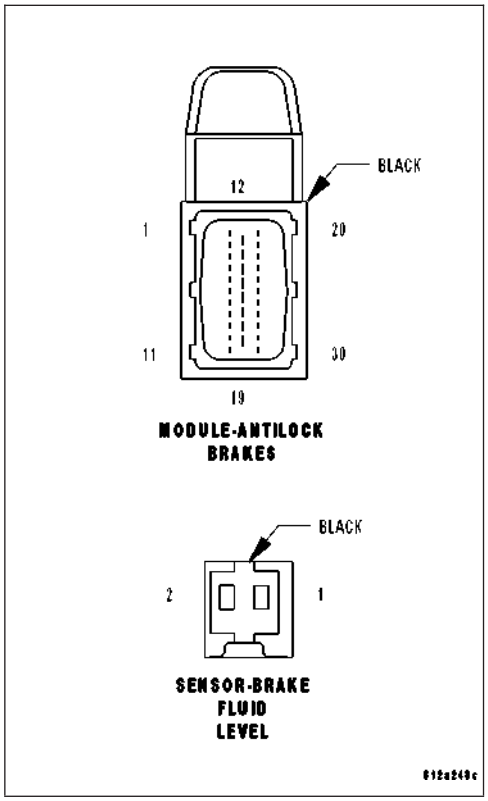
Inspect the connection of the Brake Fluid Level Sensor harness connector.

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Is there any damage?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B20) BRAKE FLUID LEVEL SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Fluid Level Sensor harness connector.

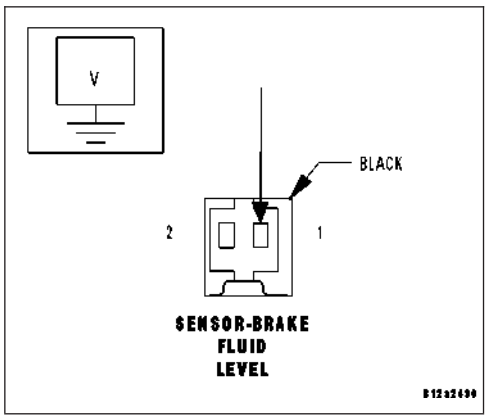
Turn the ignition on.

Measure the voltage between (B20) Brake Fluid Level Switch Sense circuit and ground.

Is there any voltage present?

Yes >> Repair the (B20) Brake Fluid Level Switch Sense circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1008–BRAKE FLUID LEVEL INPUT CIRCUIT HIGH (CONTINUED)

4. CHECK (B20) BRAKE FLUID LEVEL SWITCH SENSE CIRCUIT FOR AN OPEN

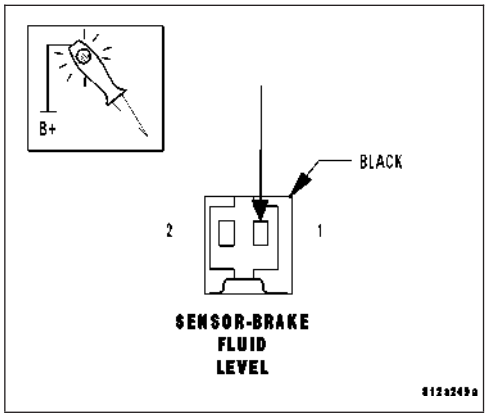
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Fluid Level Sensor harness connector.

Connect a jumper wire between the (B20) Brake Fluid Level Switch Sense and ground.

Using a 12-volt test light connected to 12-volts, probe the (B20) Brake Fluid Level Switch Sense circuit.



Does the test light illuminate brightly?

Yes >> Go To 5

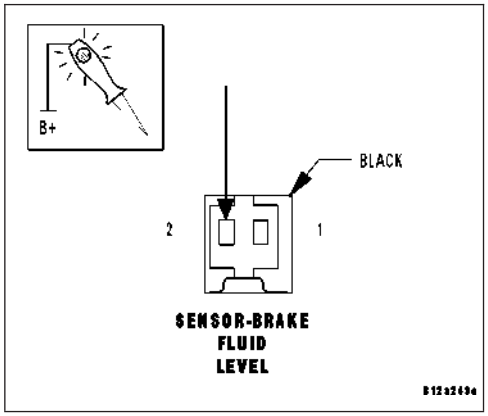
No >> Repair the (B20) Brake Fluid Level Switch Sense circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

5. CHECK (Z420) GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Brake Fluid Level Sensor harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Z420) Ground circuit.



Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (Z420) Ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

6. CHECK BRAKE FLUID LEVEL SENSOR FOR AN OPEN

Turn the ignition off.

Disconnect the Brake Fluid Level Sensor harness connector.

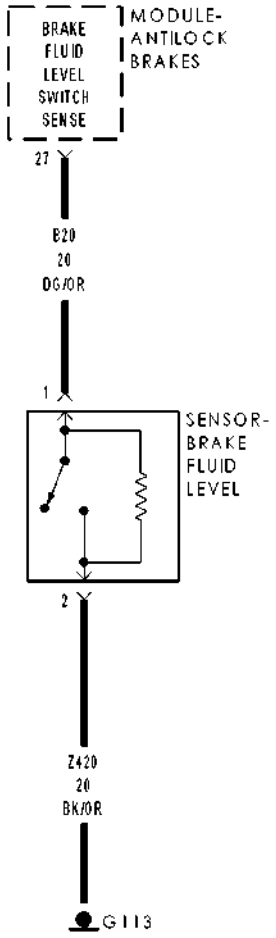
Measure the resistance between the Brake Fluid Level Sensor terminals.

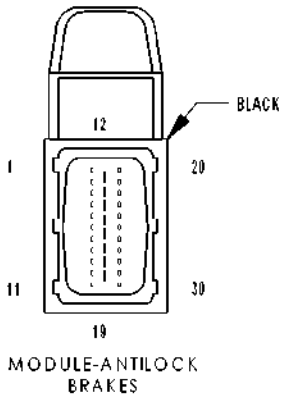
Is the resistance above 11.0k ohms?

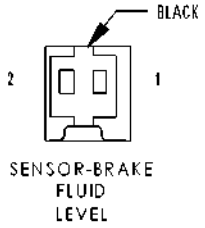
Yes >> Replace the Brake Fluid Level Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1009–BRAKE FLUID LEVEL LOW







8126f011

C1009–BRAKE FLUID LEVEL LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous.
- **Set Condition:**
  Below normal voltage detected on the brake fluid level sensor circuit.

Possible Causes
LOW BRAKE FlUID
(B20) BRAKE FlUID LEVEL SWITCH SENSE CIRCUIT SHORTED TO GROUND
DEFECTIVE SENSOR

Diagnostic Test

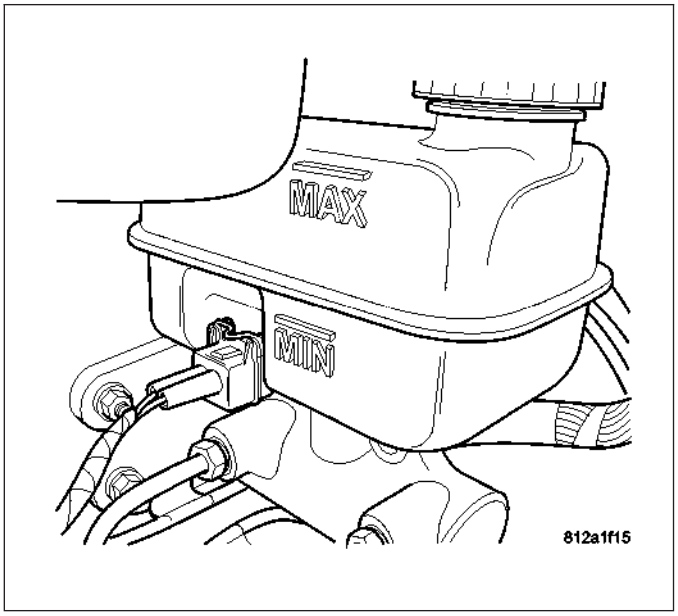
1. LOW BRAKE FlUID

Check the Brake fluid level.

Is the brake fluid full?

Yes >> Go To 2

No >> Fill the Brake fluid to proper level.
Perform ABS VERIFICATION TEST — VER 1.



C1009–BRAKE FLUID LEVEL LOW (CONTINUED)

2. (B20) BRAKE FIUID LEVEL SWITCH SENSE CIRCUIT SHORTED TO GROUND

Disconnect the Anti-lock brake module (ABM)

Disconnect the Brake fluid level sensor harness connector.

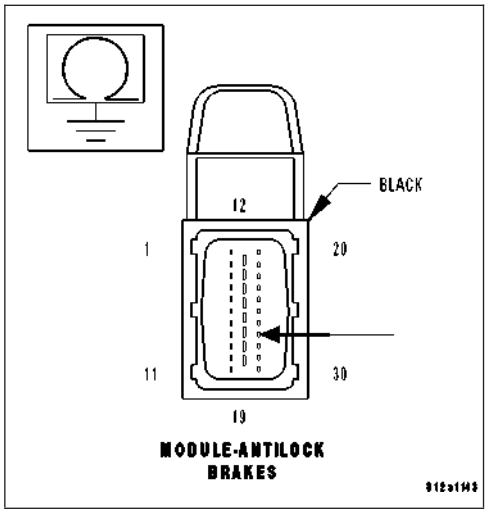
NOTE: Check connector - Clean/repair as necessary.

Measure the resistance of the Brake fluid level sensor switch sense circuit at the ABM harness connector to ground.

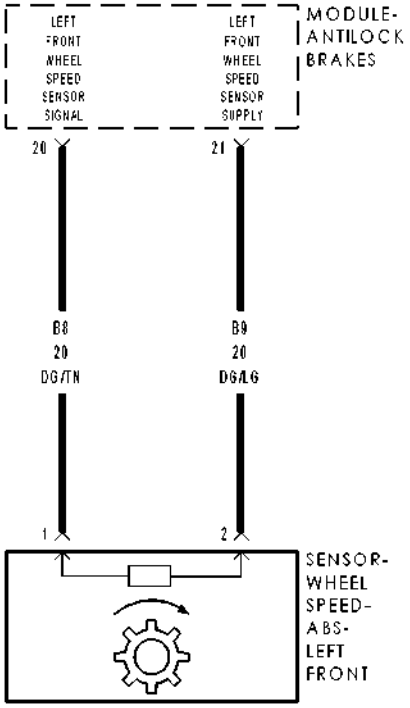
Is the resistance below 5 ohms?

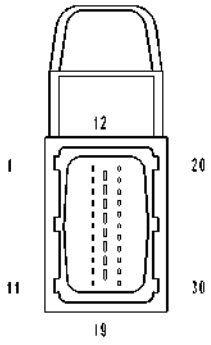
Yes >> Repair the (B20) Brake fluid level switch sense circuit for a short to ground.
Perform ABS VERIFICATION TEST — VER 1.

No >> Replace the Brake fluid level sensor.
Perform ABS VERIFICATION TEST — VER 1.

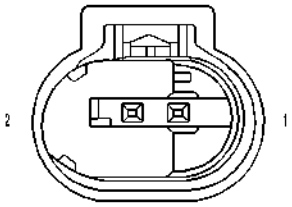


C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-LEFT FRONT

8l27a3f46

C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO GROUND OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER
LEFT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

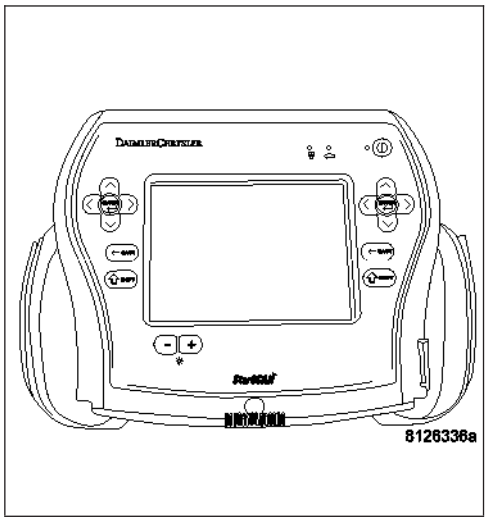
Cycle the ignition switch from off to on.

With the scan tool, read DTC's

Does the scan tool display: C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

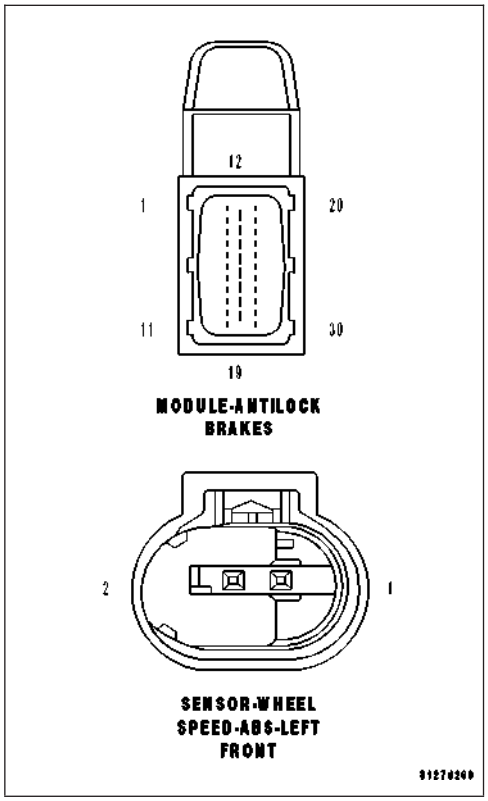
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

Is the Left Front WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

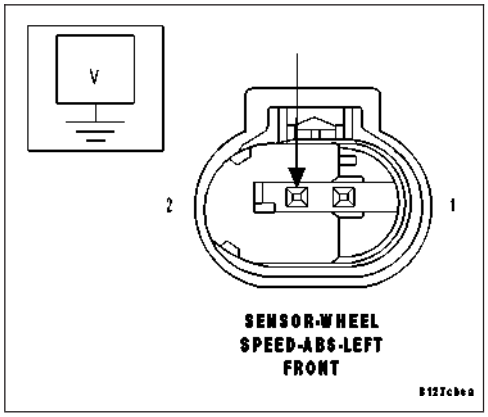
Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4



C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

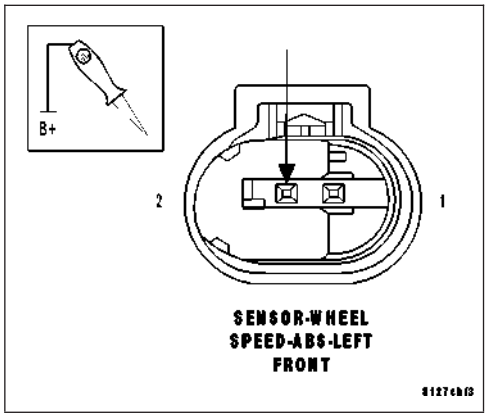
4. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

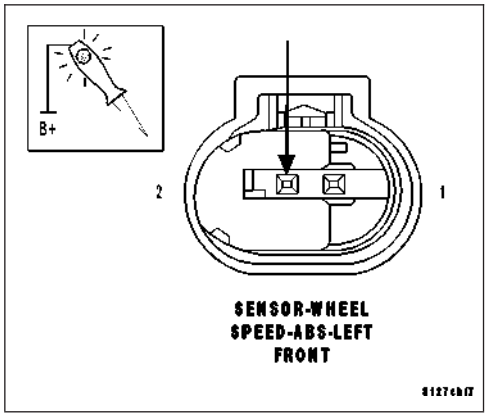
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Connect a jumper wire between the (B9) Left Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B9) Left Front WSS Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 6

No >> Repair the (B9) Left Front WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

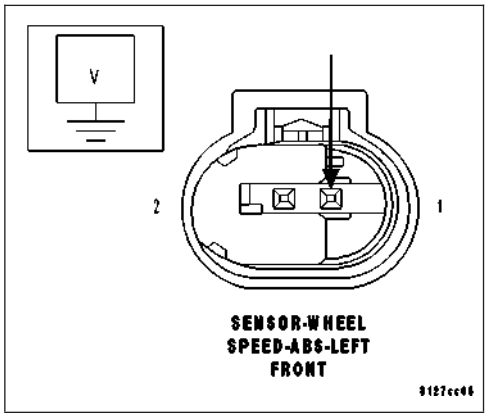
6. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B8) Left Front WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

7. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

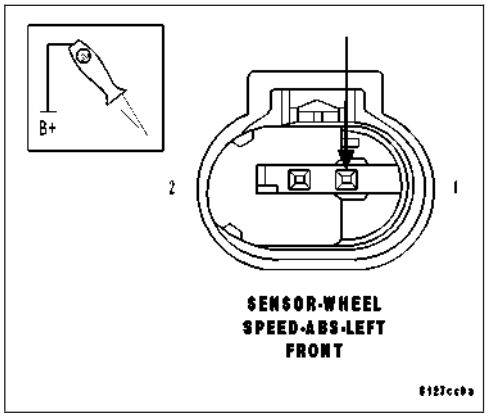
Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8



8. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

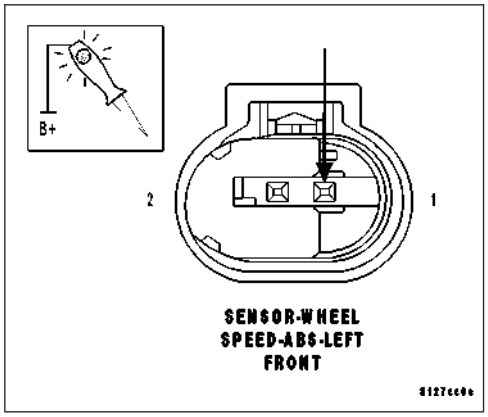
Connect a jumper wire between the (B8) Left Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B8) Left Front WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (B8) Left Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



9. CHECK (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

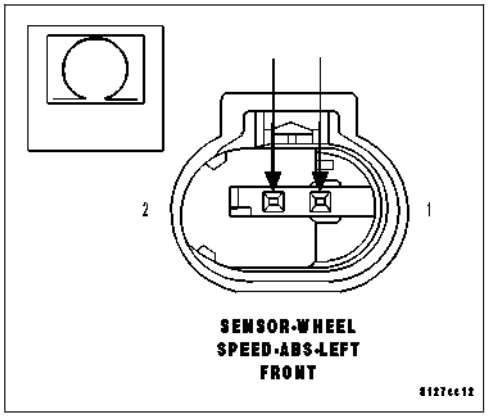
Disconnect the Left Front WSS harness connector.

Measure the resistance between the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B8) Left Front WSS Signal circuit and the (B9) Left Front WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.



C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

10. CHECK LEFT FRONT WSS

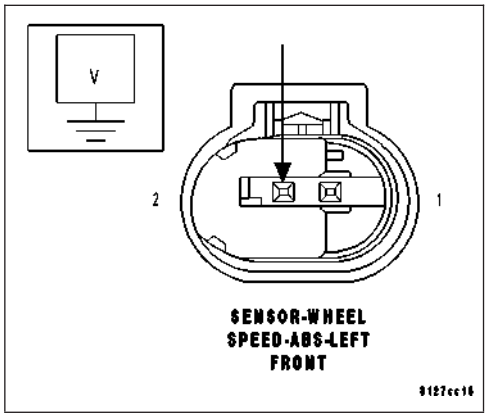
Turn the ignition off.

Reconnect all connectors.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit while reconnecting the Left Front WSS harness connector.



Did the (B9) Left Front WSS Supply circuit drop voltage to 0 volts?

Yes >> Replace the Left Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

---

11. CHECK LEFT FRONT WSS OUTPUT

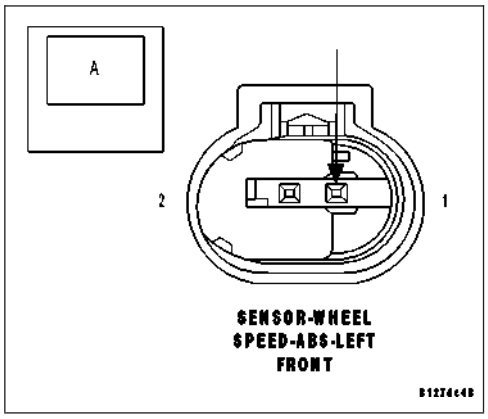
Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

Measure the amperage of the (B8) Left Front WSS Signal circuit in the Left Front WSS harness connector.

Slowly rotate the Left Front wheel.



Does the amperage toggle between 7 mA to 14 mA?

Yes >> Go To 12

No >> Replace the Left Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

---

12. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B9) LEFT FRONT WSS SUPPLY CIRCUIT

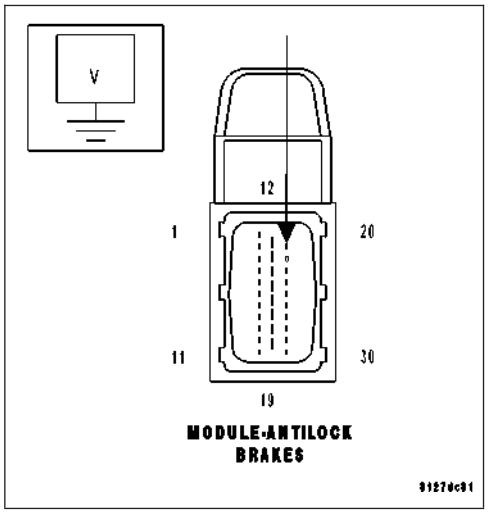
Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply circuit and ground.



Is the voltage above 10 volts?

Yes >> Go To 13

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B8) LEFT FRONT WSS SIGNAL CIRCUIT

Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

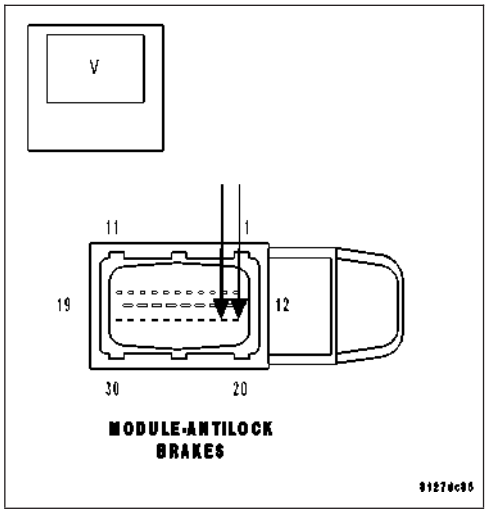
Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply circuit and the (B8) Left Front WSS Signal circuit.

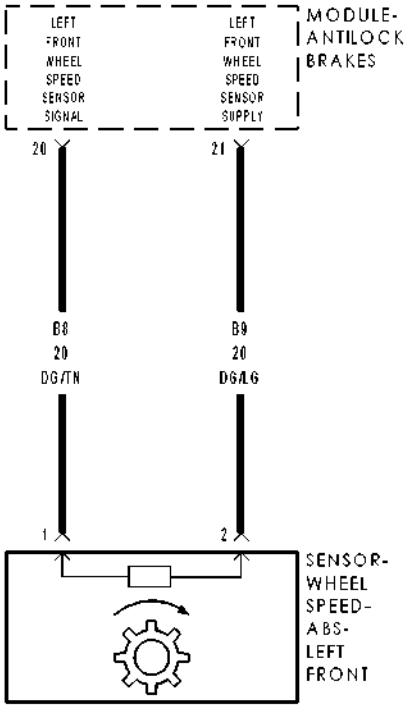
Is the voltage above 10 volts?

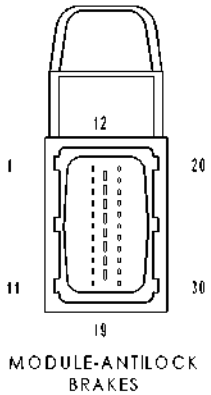
Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

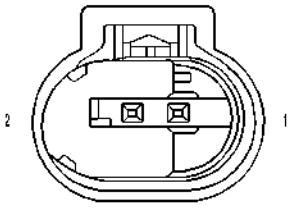
No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.



C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE







C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS Signal is intermittently missing at a vehicle speed above at 40 kph (25 mph) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT FRONT WSS LOOSE - B8,B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT WSS AIR GAP FAULT
LEFT FRONT WHEEL BEARING DAMAGE
LEFT FRONT BRAKE HARDWARE DAMAGE
LEFT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

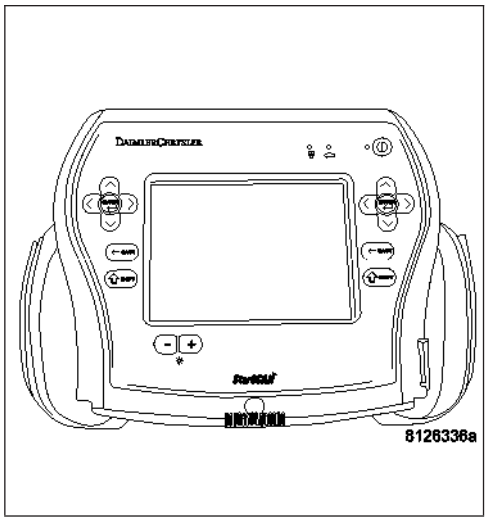
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the scan tool display: C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE and C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C100A–Left Front Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

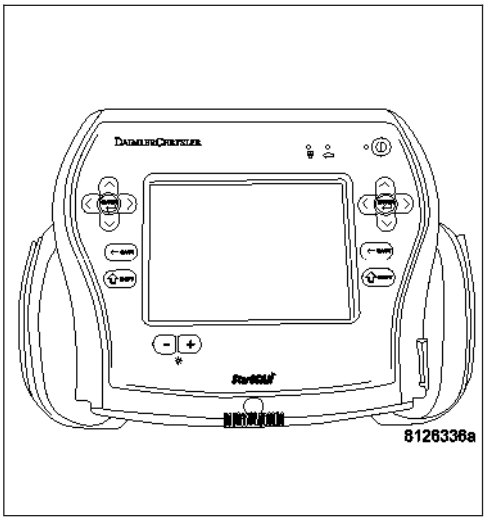
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8,B9 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

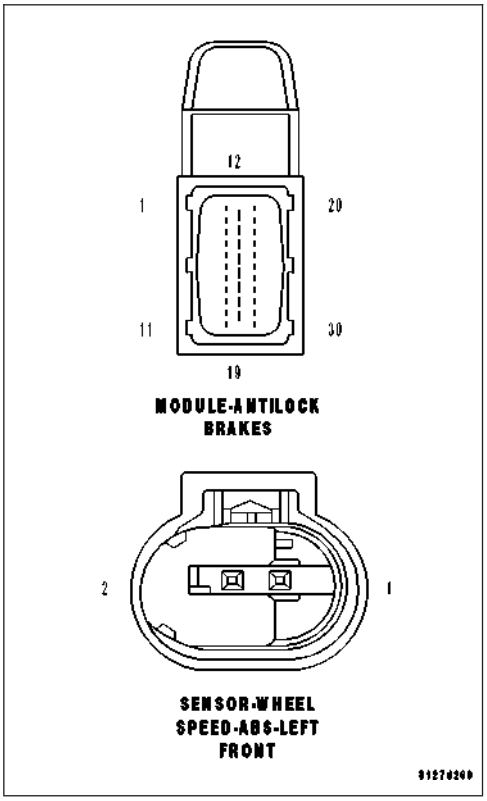
Inspect the Left Front WSS for looseness and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

4. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Turn the ignition off.

Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK LEFT FRONT WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Left Front WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Front WSS air gap within specifications?

Yes >> Go To 6

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

---

6. CHECK LEFT FRONT WHEEL BEARING DAMAGE

Turn the ignition off.

Inspect the Left Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Front Wheel Bearing damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

7. CHECK LEFT FRONT BRAKE HARDWARE DAMAGE

Turn the ignition off.

Visually inspect the Left Front brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

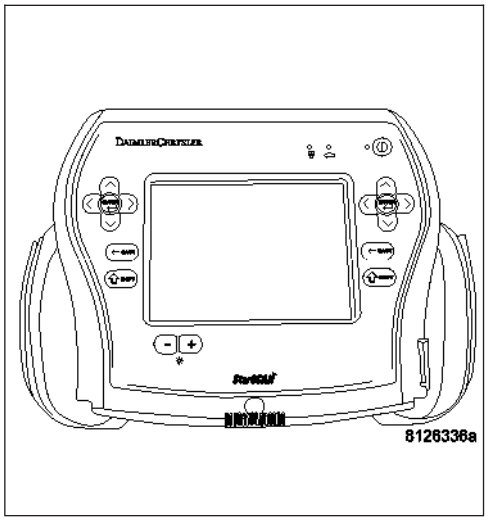
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Left Front WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

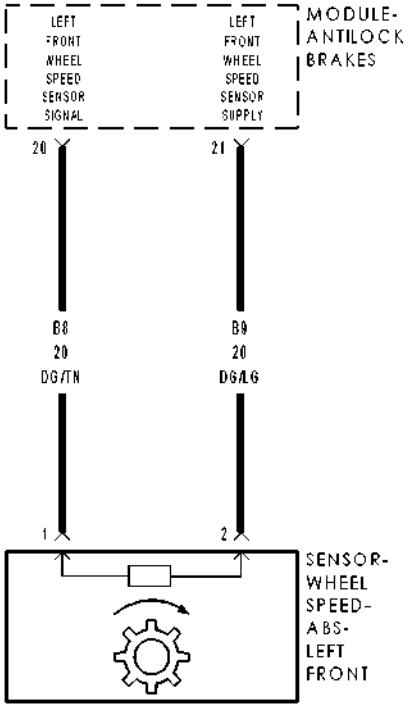


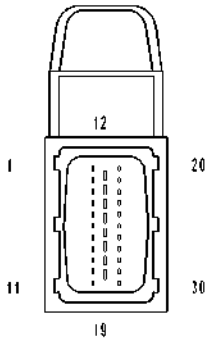
Did the DTC C1011–LEFT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

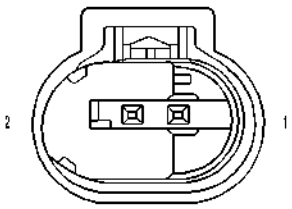
No >> Test Complete.

C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-LEFT FRONT

8127e3f46

C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Front WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT FRONT WSS LOOSE - B8,B9 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
LEFT FRONT TONE WHEEL DAMAGE
LEFT FRONT BRAKE HARDWARE DAMAGE
LEFT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

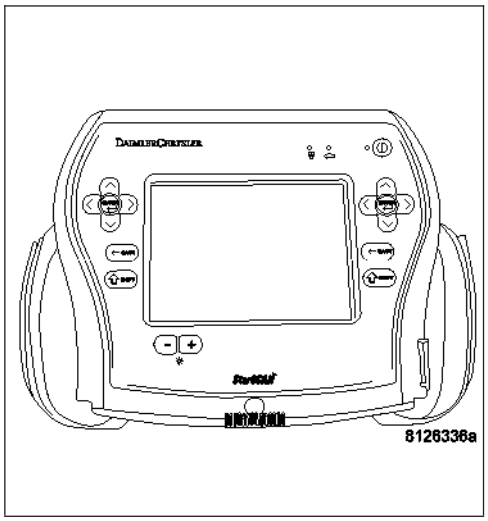
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE and C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C100A–Left Front Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

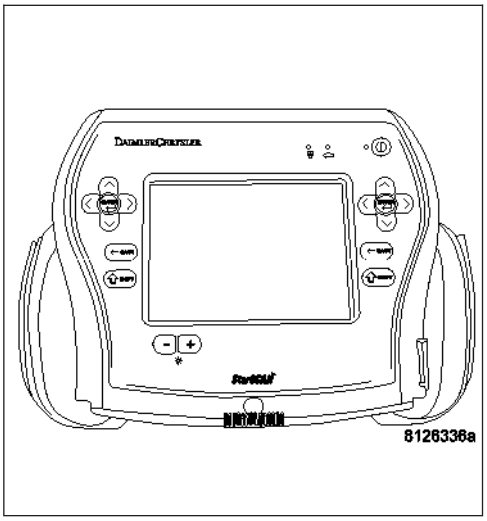
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK LEFT FRONT WSS LOOSENESS, INSPECT B8,B9 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, and Left Front WSS harness connector.

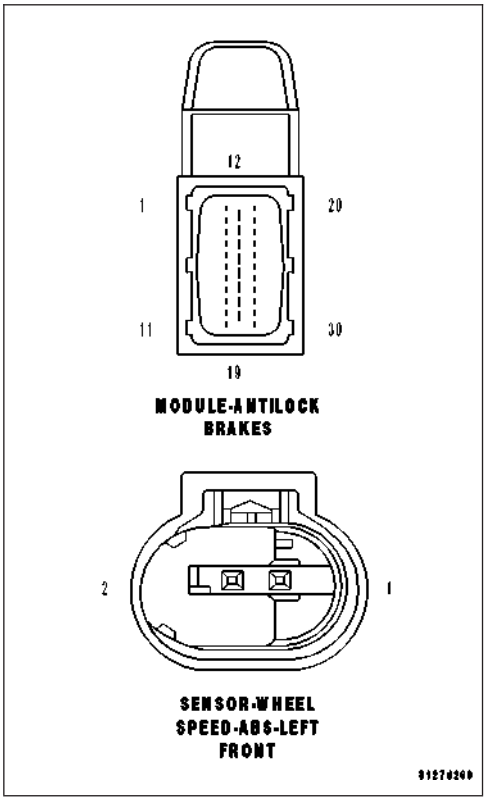
Inspect the Left Front WSS for looseness and not properly fastened.

Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK LEFT FRONT TIRE PRESSURE/INSPECT ALL TIRES

Turn the ignition off.
Check and adjust the Left Front Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK LEFT FRONT TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect the Left Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Front Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

6. CHECK LEFT FRONT BRAKE HARDWARE DAMAGE

Turn the ignition off.
Visually inspect the Left Front brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

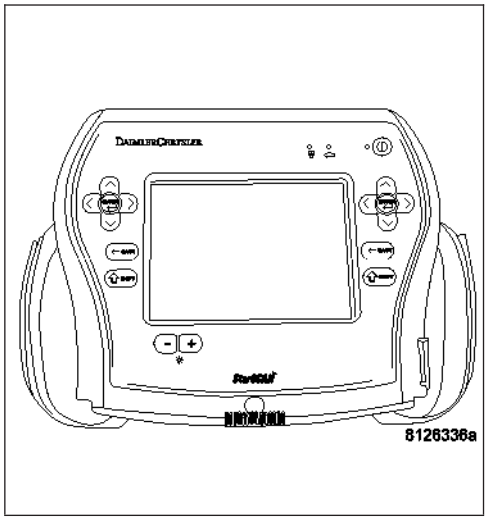
7. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Left Front WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

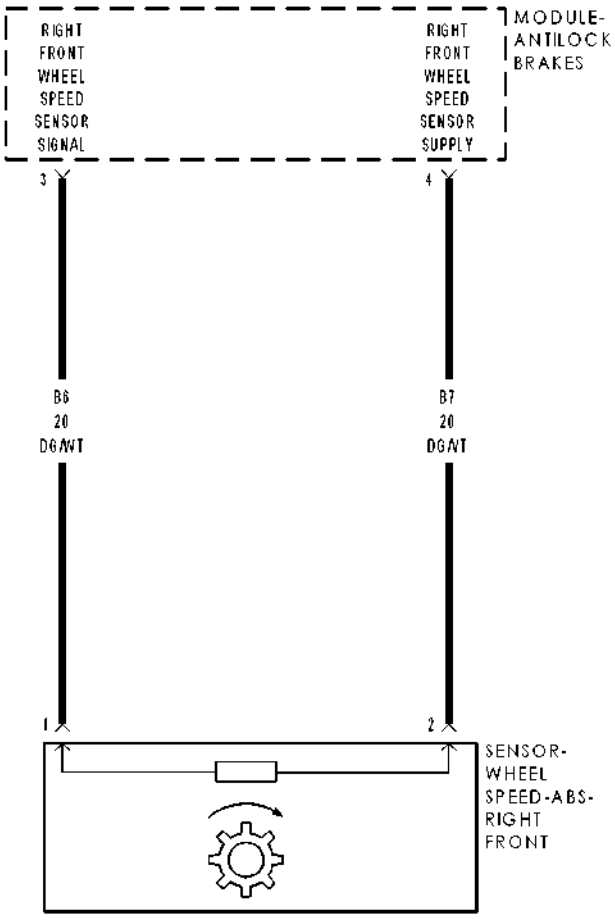
Did the DTC C1014–LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

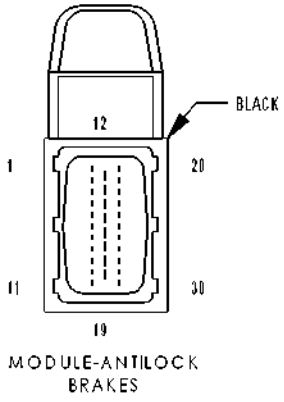
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

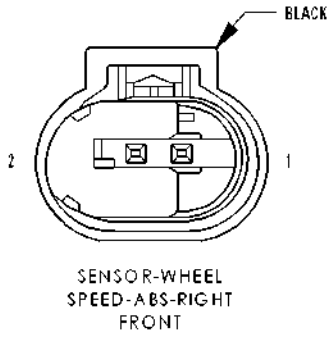
No >> Test Complete.



C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT







81269931

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

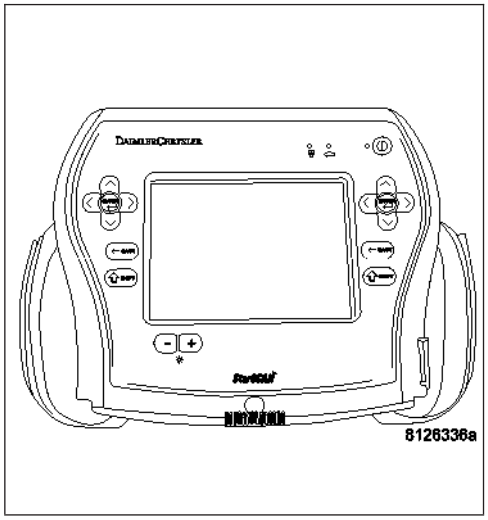
Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B4) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO GROUND OR OPEN
(B3) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B4) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER
RIGHT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1.

NOTE: This DTC must be active for the results of this test to be valid. CHECK FOR DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

Turn the ignition on.
With the scan tool, record and erase DTC's.
Cycle the ignition switch from off to on.
With the scan tool, read DTC's



Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

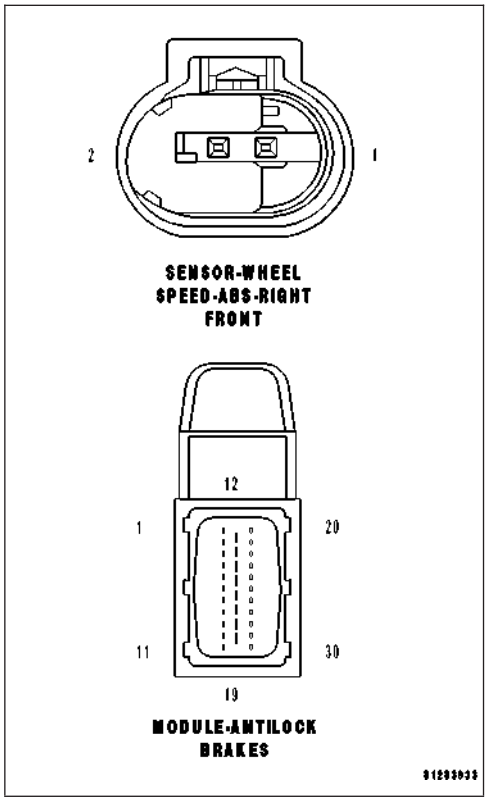
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

Is the Right Front WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B7) RIGHT FRONT WSS SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

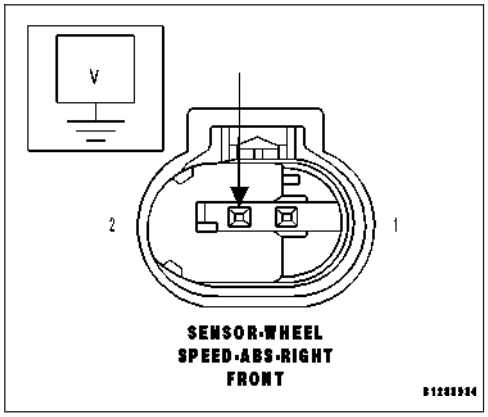
Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4



C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

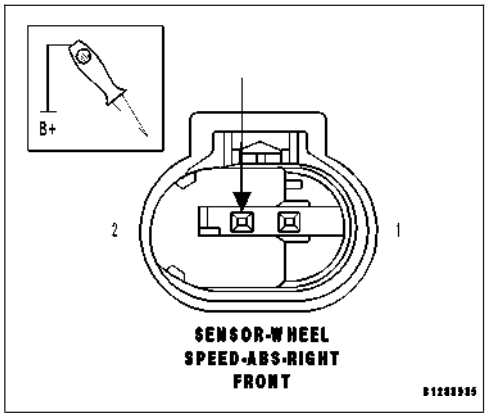
4. CHECK (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (B7) RIGHT FRONT WSS SUPPLY CIRCUIT OPEN

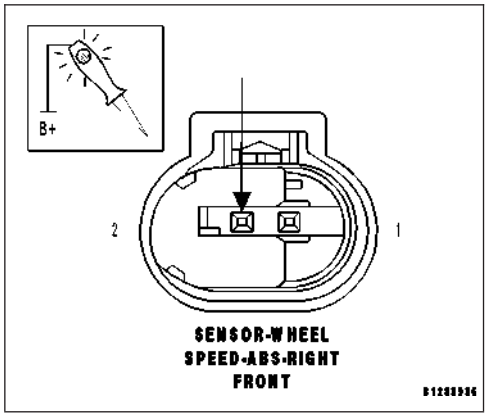
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B7) Right Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B7) Right Front WSS Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 6

No >> Repair the (B7) Right Front WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

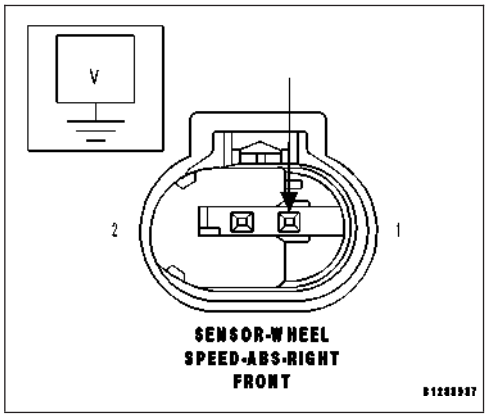
6. CHECK (B6) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B6) Right Front WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

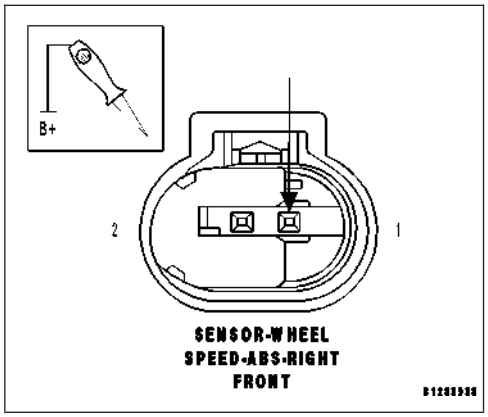
7. CHECK (B6) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

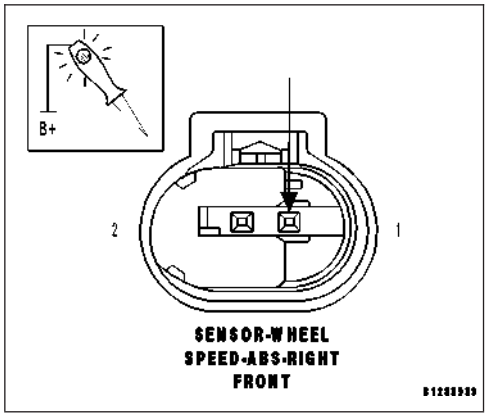
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B6) Right Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B6) Right Front WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

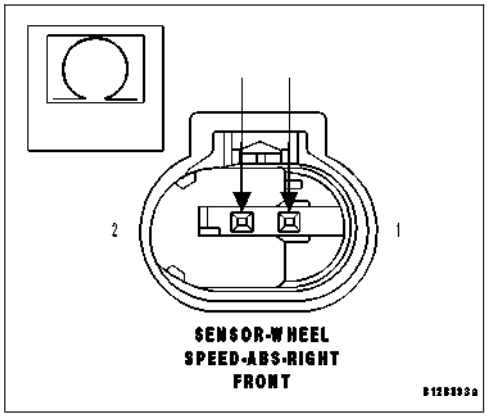
9. CHECK (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit.



Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B6) Right Front WSS Signal circuit and the (B7) Right Front WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

10. CHECK RIGHT FRONT WSS

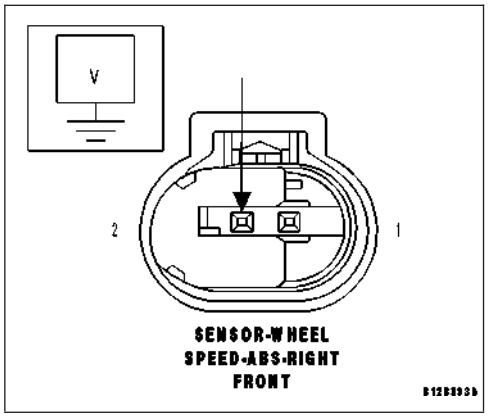
Turn the ignition off.

Reconnect all connectors.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit while reconnecting the Right Front WSS harness connector.



Did the (B7) Right Front WSS Supply circuit drop voltage to 0 volts?

Yes >> Replace the Right Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

11. CHECK RIGHT FRONT WSS OUTPUT

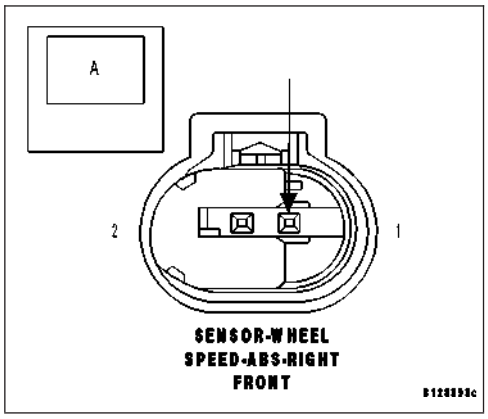
Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

Measure the amperage of the (B6) Right Front WSS Signal circuit in the Right Front WSS harness connector.

Slowly rotate the Right Front wheel.



Does the amperage toggle between 7 mA to 14 mA?

Yes >> Go To 12

No >> Replace the Right Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

12. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B7) RIGHT FRONT WSS SUPPLY CIRCUIT

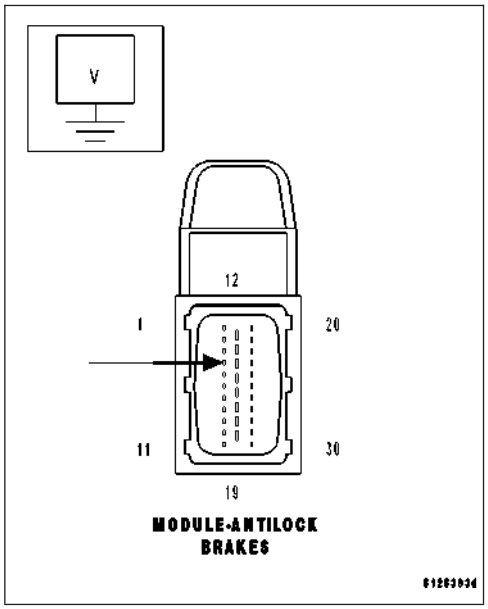
Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply circuit and ground.



Is the voltage above 10 volts?

Yes >> Go To 13

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B6) RIGHT FRONT WSS SIGNAL CIRCUIT

Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

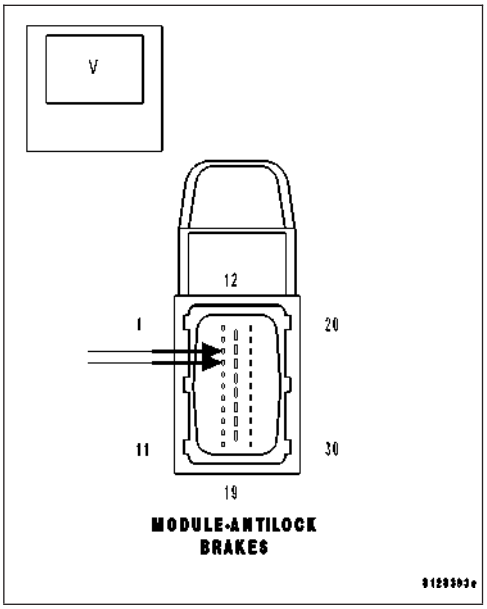
Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply circuit and the (B6) Right Front WSS Signal circuit.

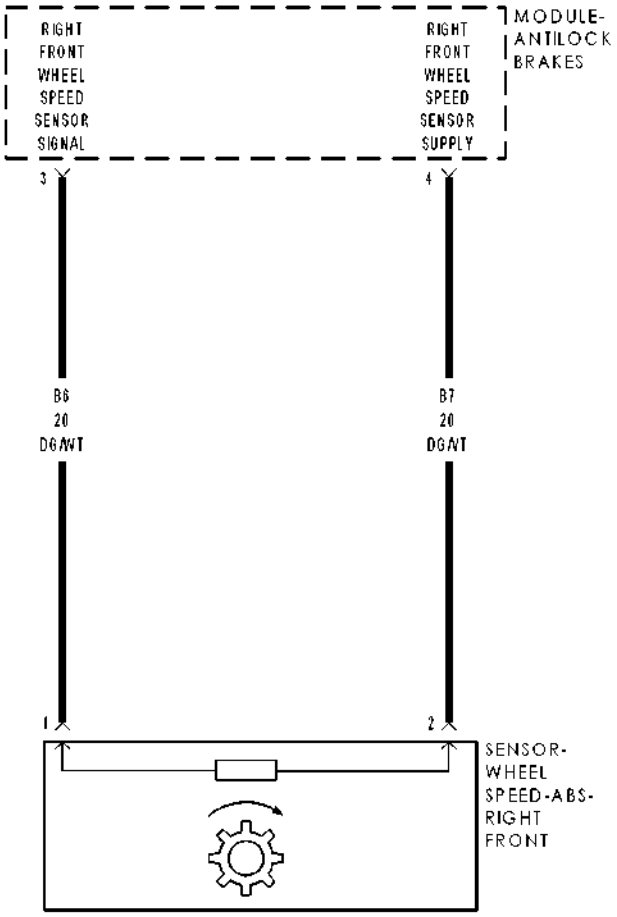
Is the voltage above 10 volts?

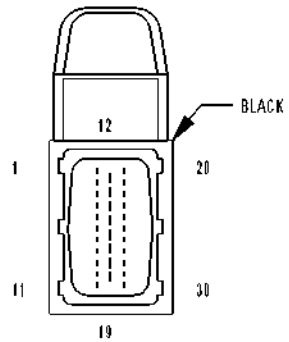
Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

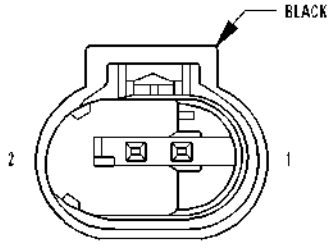


C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-RIGHT FRONT

81269931

C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS Signal is intermittently missing at a vehicle speed above at 40 kph (25 m.p.h.) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT FRONT WSS LOOSE - B6,B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT WSS AIR GAP FAULT
RIGHT FRONT WHEEL BEARING DAMAGE
RIGHT FRONT BRAKE HARDWARE DAMAGE
RIGHT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

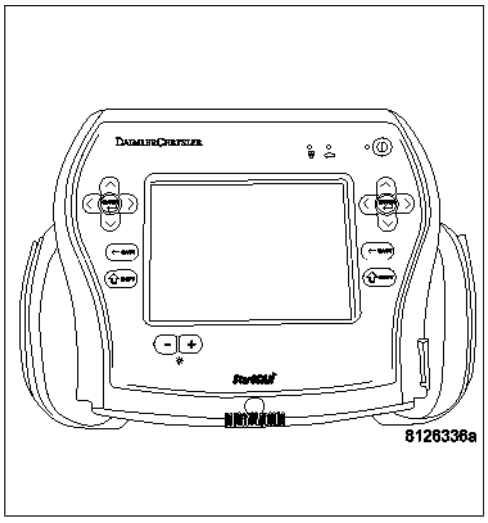
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE and C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1015–Right Front Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

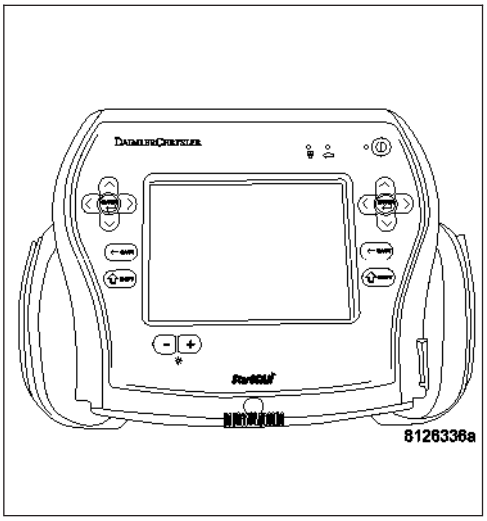
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6,B7 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

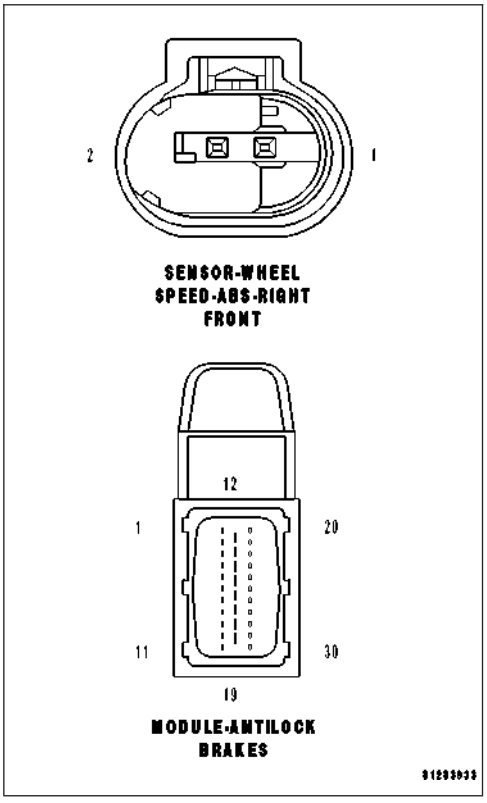
Inspect the Right Front WSS for looseness and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

4. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Turn the ignition off.

Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK RIGHT FRONT WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Right Front WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Front WSS air gap within specifications?

Yes >> Go To 6

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

---

6. CHECK RIGHT FRONT WHEEL BEARING DAMAGE

Turn the ignition off.

Inspect the Right Front wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Front Wheel Bearing damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

7. CHECK RIGHT FRONT BRAKE HARDWARE DAMAGE

Turn the ignition off.

Visually inspect the Right Front brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

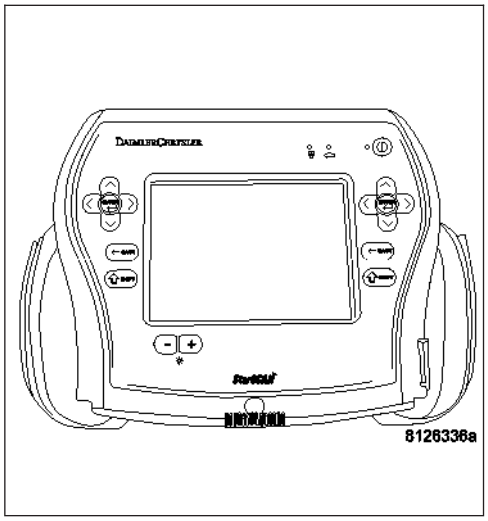
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Right Front WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

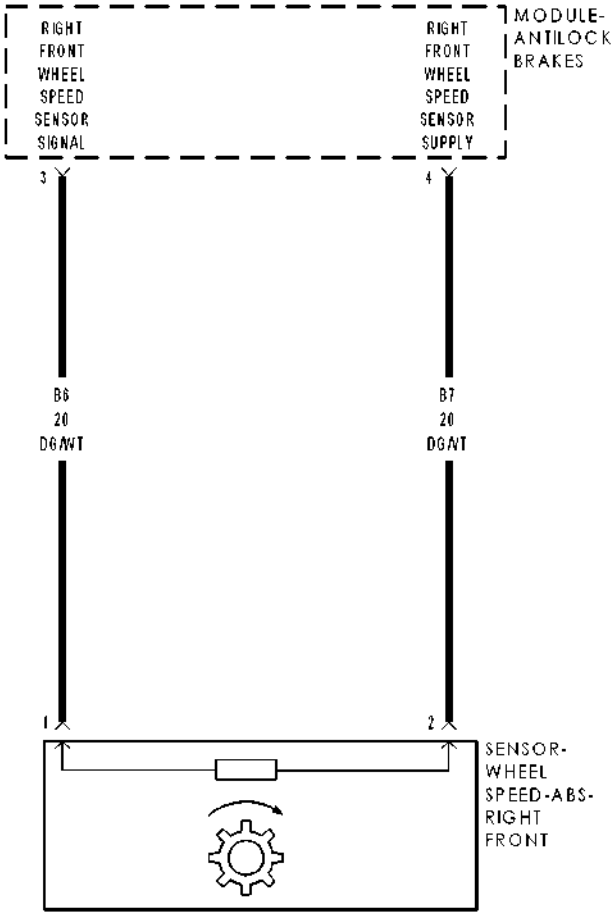


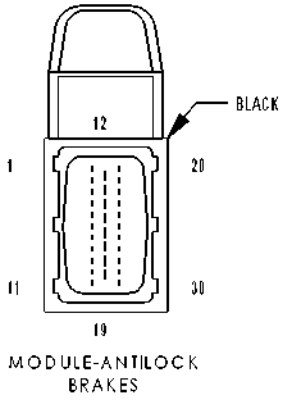
Did the DTC C101C–RIGHT FRONT WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE reset?

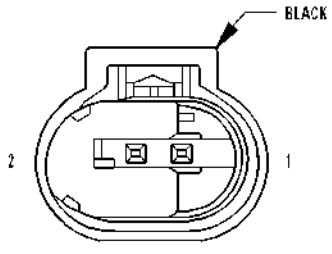
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE







81269931

C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Front WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT FRONT WSS LOOSE - B6,B7 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
RIGHT FRONT TONE WHEEL DAMAGE
RIGHT FRONT BRAKE HARDWARE DAMAGE
RIGHT FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

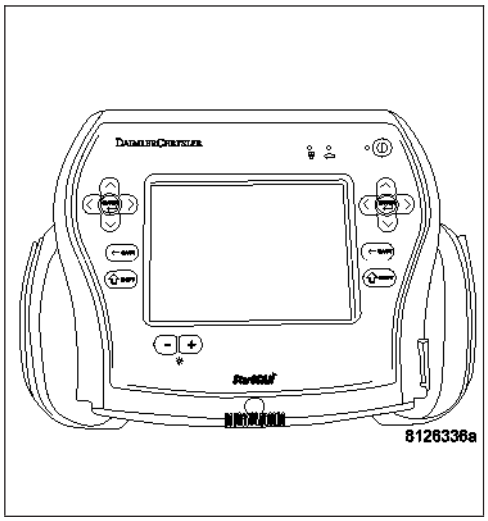
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE and C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1015–Right Front Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

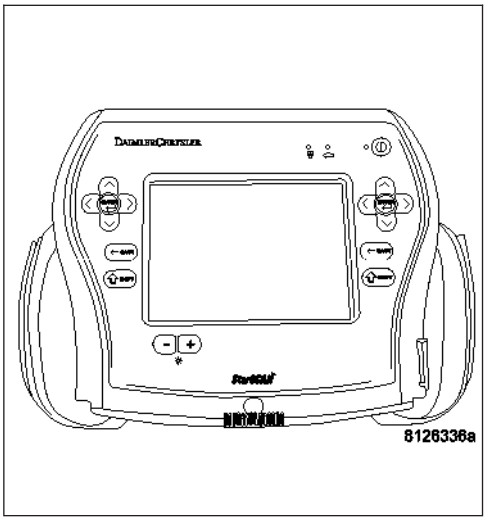
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Front WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK RIGHT FRONT WSS LOOSENESS, INSPECT B6,B7 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, and Right Front WSS harness connector.

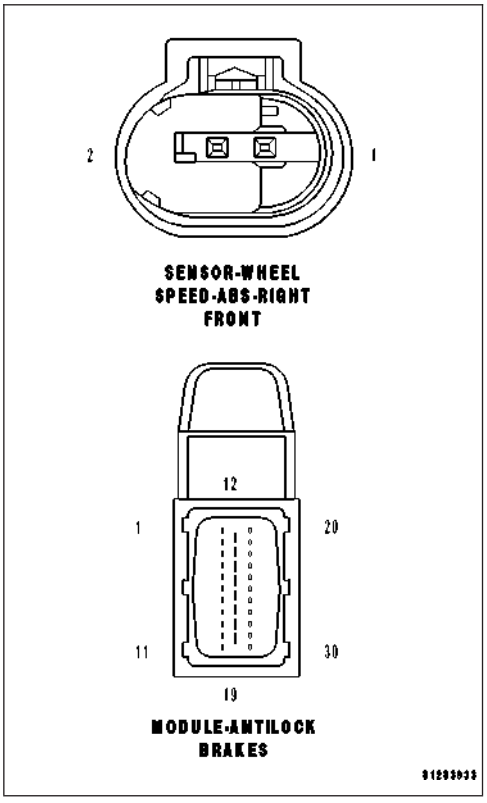
Inspect the Right Front WSS for looseness and not properly fastened.

Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK RIGHT FRONT TIRE PRESSURE/INSPECT ALL TIRES

Turn the ignition off.
Check and adjust the Right Front Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK RIGHT FRONT TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect the Right Front Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Front Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

6. CHECK RIGHT FRONT BRAKE HARDWARE DAMAGE

Turn the ignition off.
Visually inspect the Right Front brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

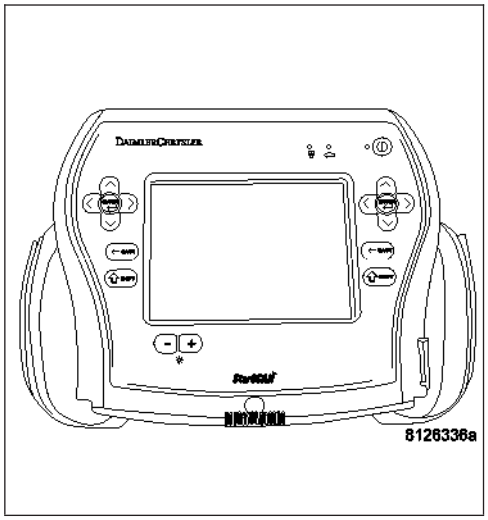
7. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Right Front WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

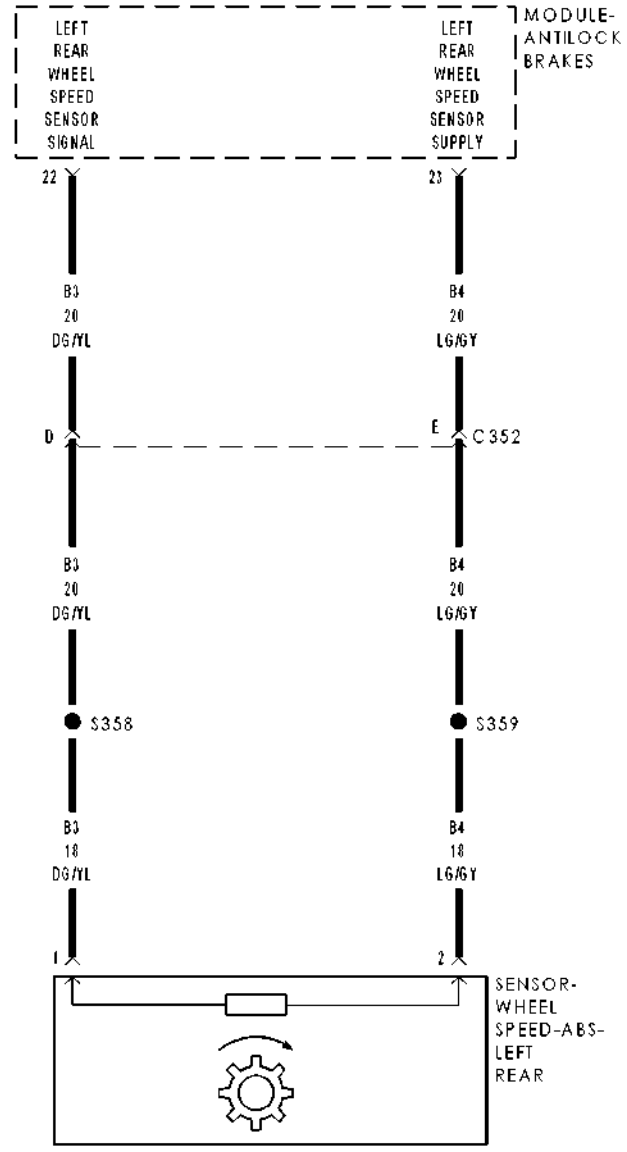
Did the DTC C101F–RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE reset?

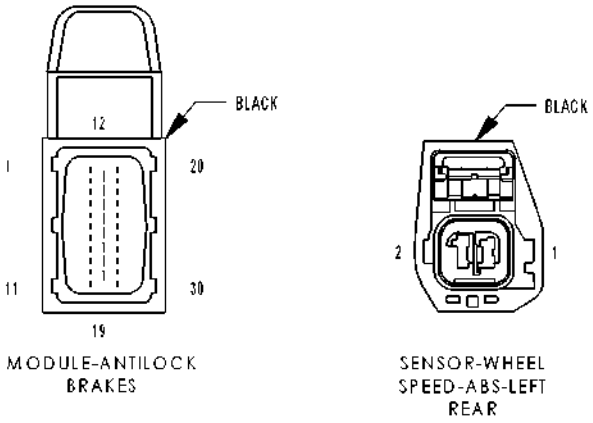
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.



C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT





81283956

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO GROUND OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER
LEFT REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

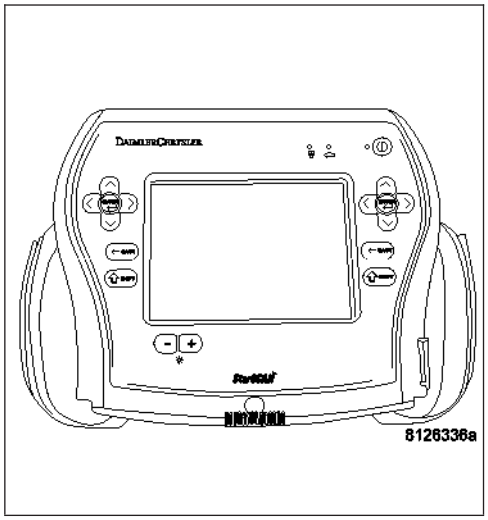
Cycle the ignition switch from off to on.

With the scan tool, read DTC's

Does the scan tool display: C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

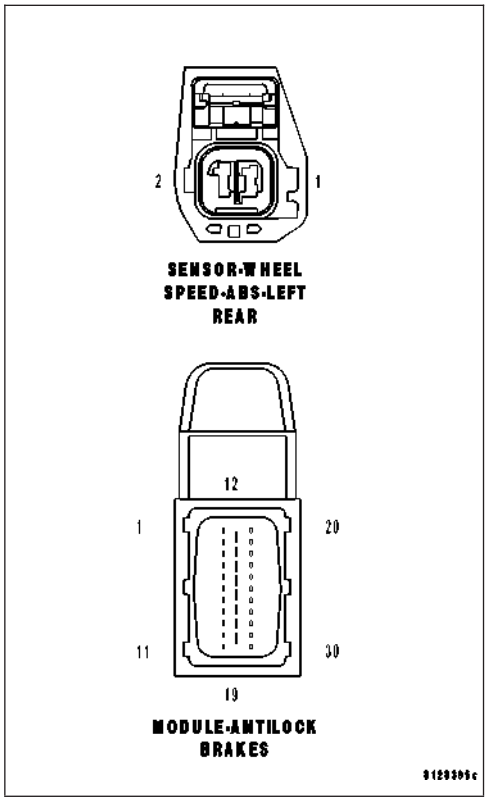
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

Is the Left Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B4) LEFT FRONT WSS SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

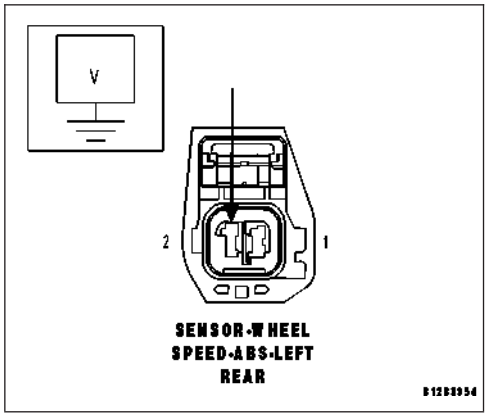
Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4



C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

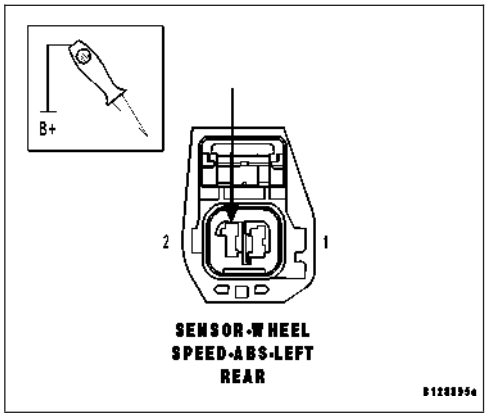
4. CHECK (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (B4) LEFT REAR WSS SUPPLY CIRCUIT OPEN

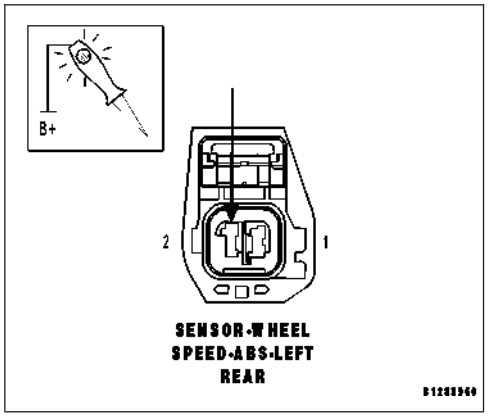
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Connect a jumper wire between the (B4) Left Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B4) Left Rear WSS Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 6

No >> Repair the (B4) Left Rear WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

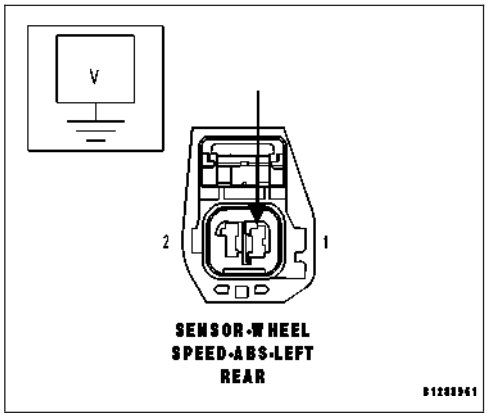
6. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B3) Left Rear WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

7. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

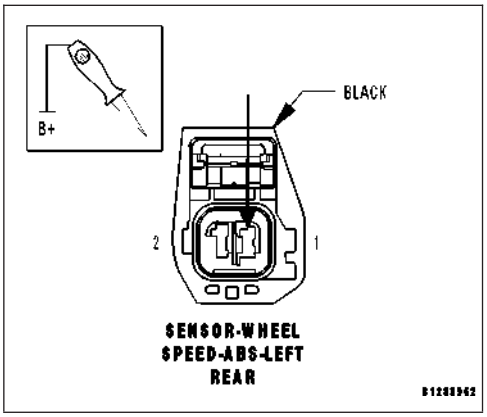
Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8



8. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

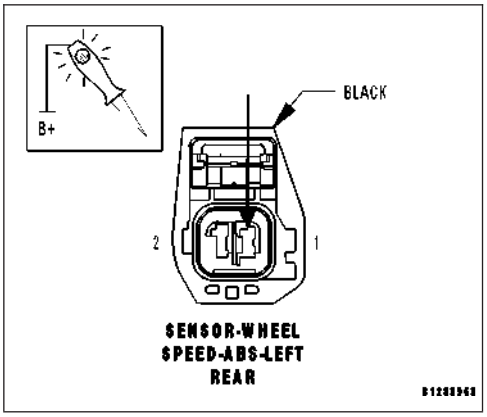
Connect a jumper wire between the (B3) Left Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B3) Left Rear WSS Signal circuit.

Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (B3) Left Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



9. CHECK (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

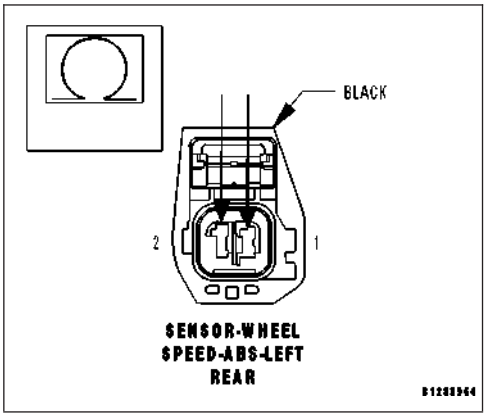
Disconnect the Left Rear WSS harness connector.

Measure the resistance between the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B3) Left Rear WSS Signal circuit and the (B4) Left Rear WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.



C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

10. CHECK LEFT REAR WSS

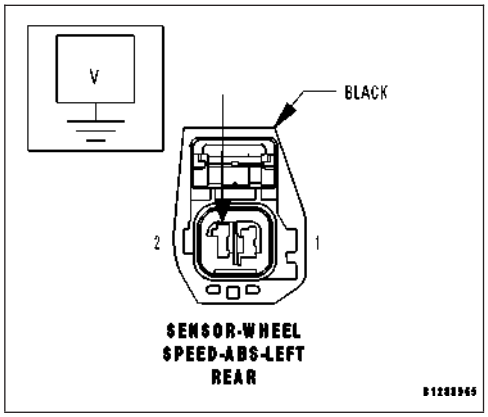
Turn the ignition off.

Reconnect all connectors.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit while reconnecting the Left Rear WSS harness connector.



Did the (B4) Left Rear WSS Supply circuit drop voltage to 0 volts?

Yes >> Replace the Left Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

11. CHECK LEFT REAR WSS OUTPUT

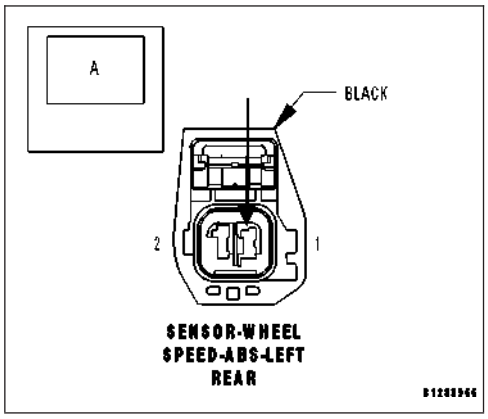
Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

Measure the amperage of the (B3) Left Rear WSS Signal circuit in the Left Rear WSS harness connector.

Slowly rotate the Left Rear wheel.



Does the amperage toggle between 7 mA to 14 mA?

Yes >> Go To 12

No >> Replace the Left Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

12. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B4) LEFT REAR WSS SUPPLY CIRCUIT

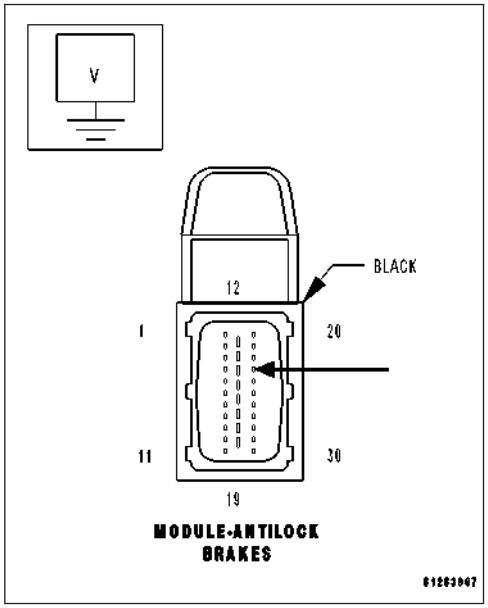
Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply circuit and ground.



Is the voltage above 10 volts?

Yes >> Go To 13

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B3) LEFT REAR WSS SIGNAL CIRCUIT

Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

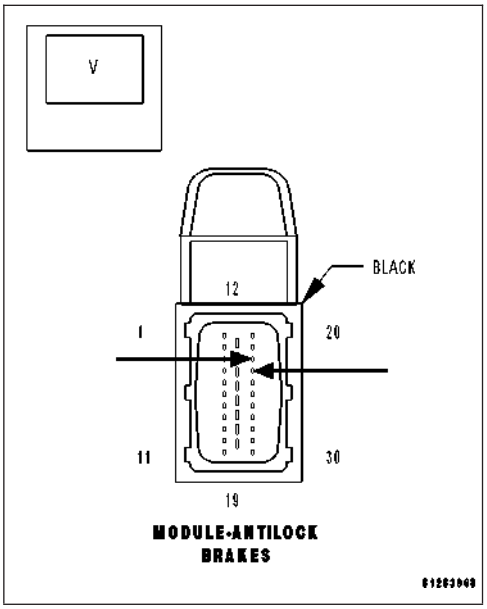
Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply circuit and the (B3) Left Rear WSS Signal circuit.

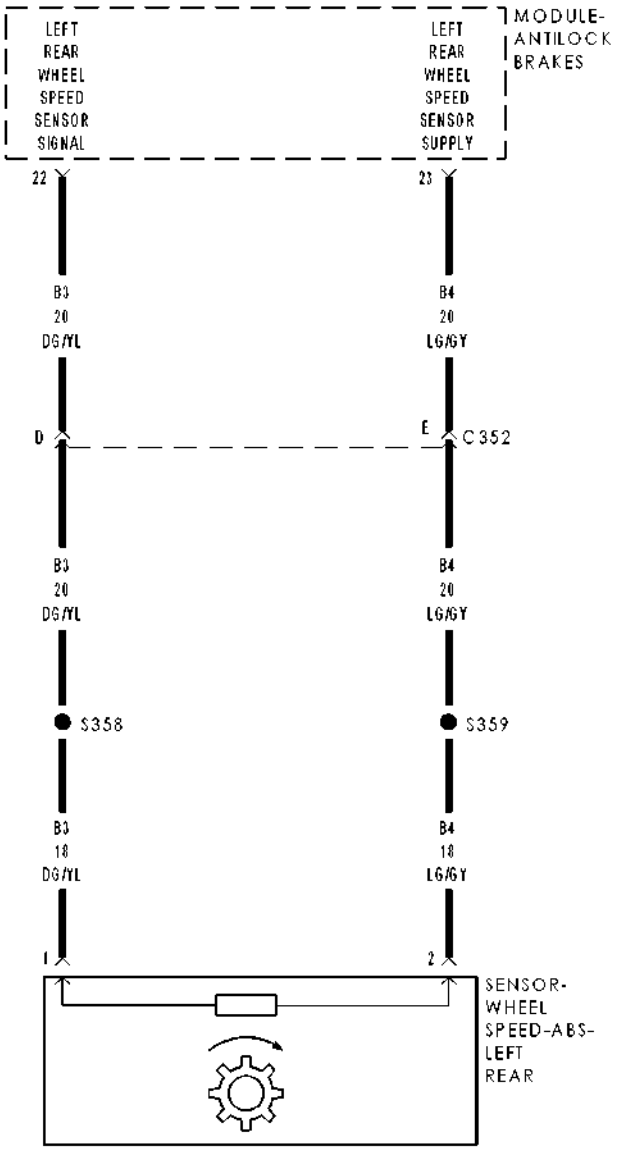
Is the voltage above 10 volts?

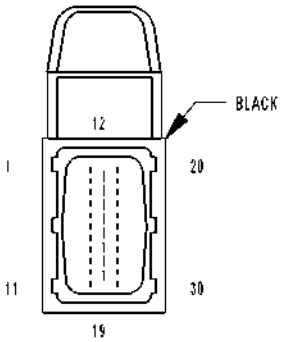
Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

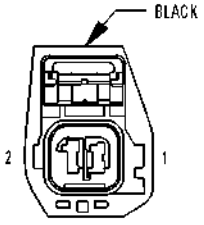


C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-LEFT REAR

81283956

C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS Signal is intermittently missing at a vehicle speed above at 40 kph (25 m.p.h.) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
LEFT REAR WSS LOOSE - B3,B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR WSS AIR GAP FAULT
LEFT REAR WHEEL BEARING DAMAGE
LEFT REAR BRAKE HARDWARE DAMAGE
LEFT REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1.

NOTE: This DTC must be active for the results of this test to be valid. CHECK FOR DTC C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

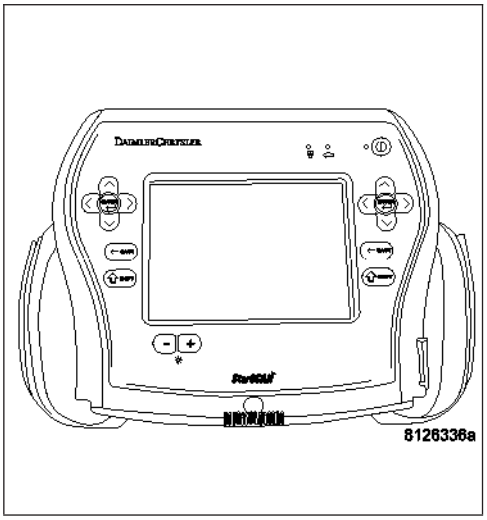
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE and C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1020–Left Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

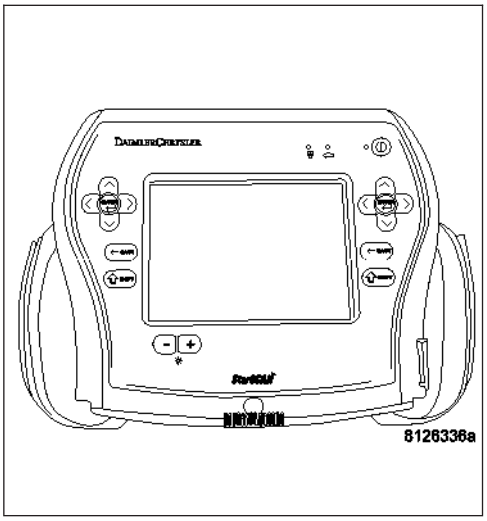
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3,B4 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

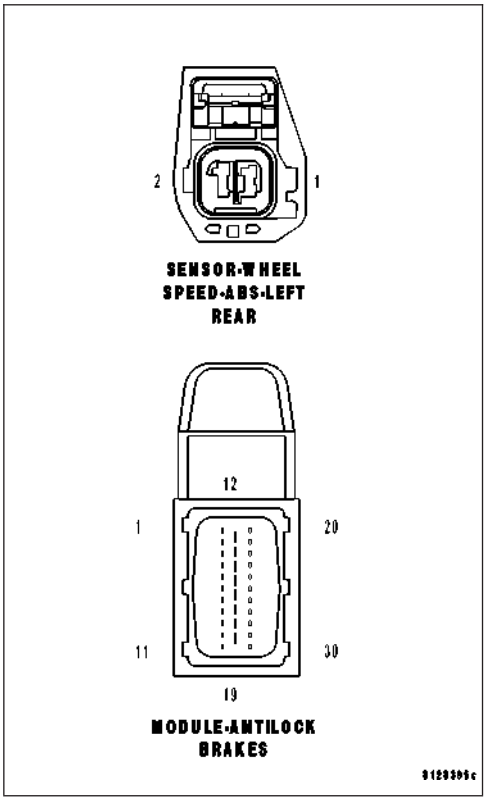
Inspect the Left Rear WSS for looseness and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

4. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.

Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK LEFT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Left Rear WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Rear WSS air gap within specifications?

Yes >> Go To 6

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

---

6. CHECK LEFT REAR WHEEL BEARING DAMAGE

Turn the ignition off.

Inspect the Left Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Left Rear Wheel Bearing damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

7. CHECK LEFT REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.

Visually inspect the Left Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

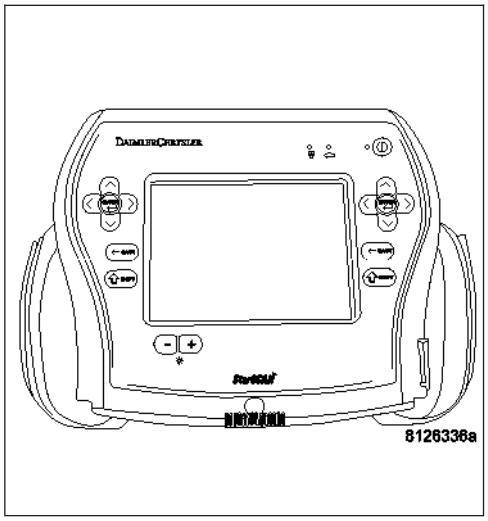
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Left Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

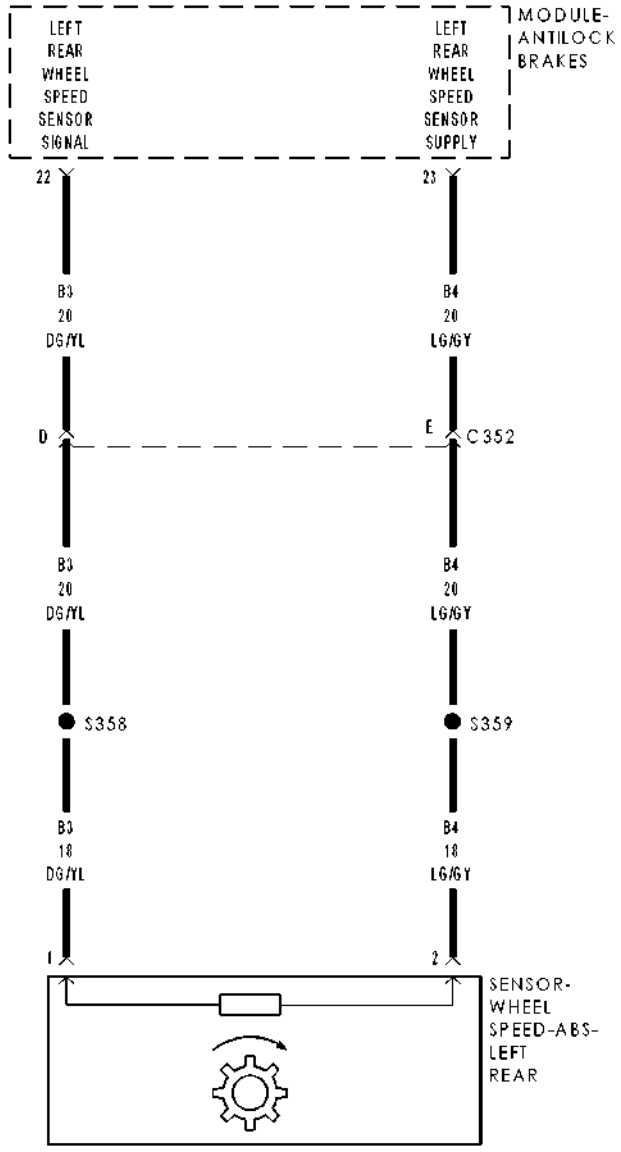


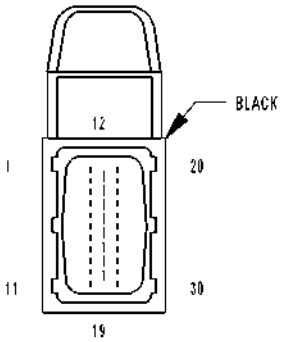
Did the DTC C1027–LEFT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

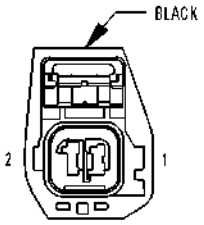
No >> Test Complete.

C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-LEFT REAR

81283956

C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Left Rear WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
LEFT REAR WSS LOOSE - B3,B4 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
LEFT REAR TONE WHEEL DAMAGE
LEFT REAR BRAKE HARDWARE DAMAGE
LEFT REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

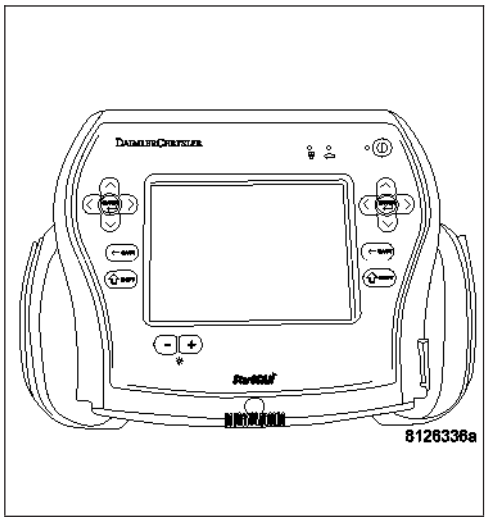
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE and C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1020–Left Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

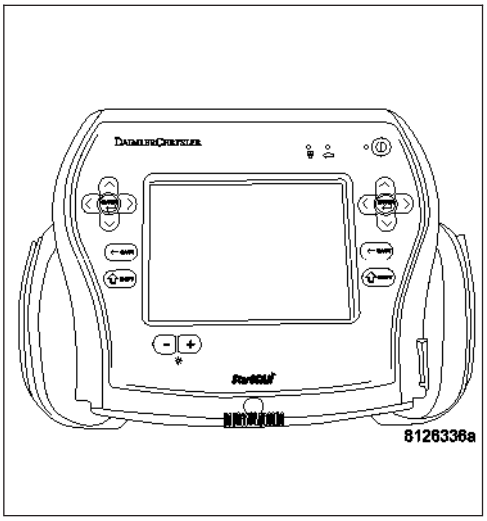
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Left Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK LEFT REAR WSS LOOSENESS, INSPECT B3,B4 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, and Left Rear WSS harness connector.

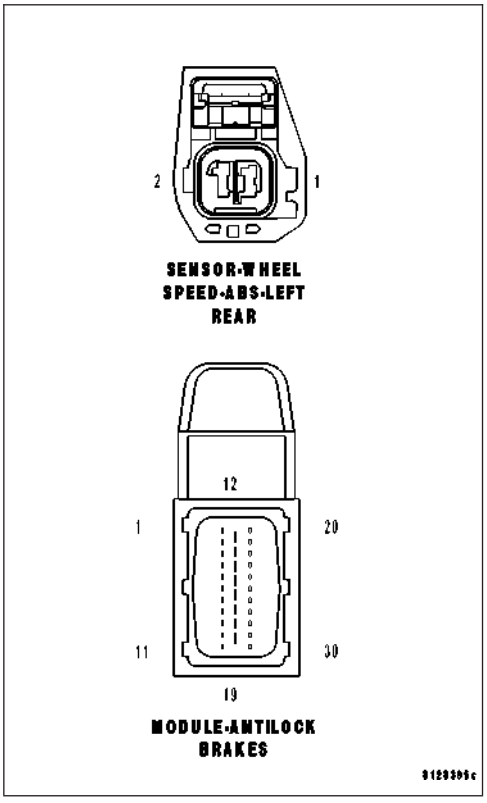
Inspect the Left Rear WSS for looseness and not properly fastened.

Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK LEFT REAR TIRE PRESSURE/INSPECT ALL TIRES

Turn the ignition off.
Check and adjust the Left Rear Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK LEFT REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect the Left Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Left Rear Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

6. CHECK LEFT REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.
Visually inspect the Left Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

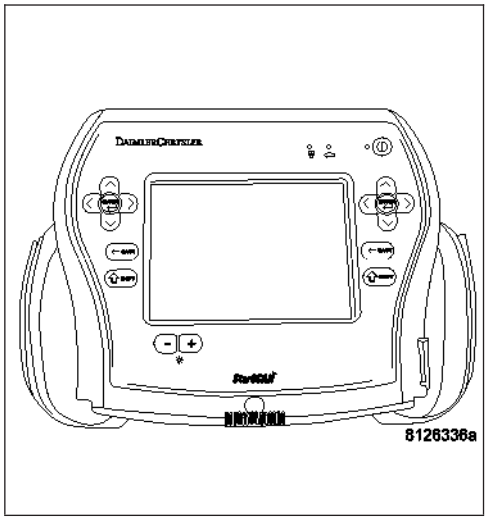
7. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Left Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

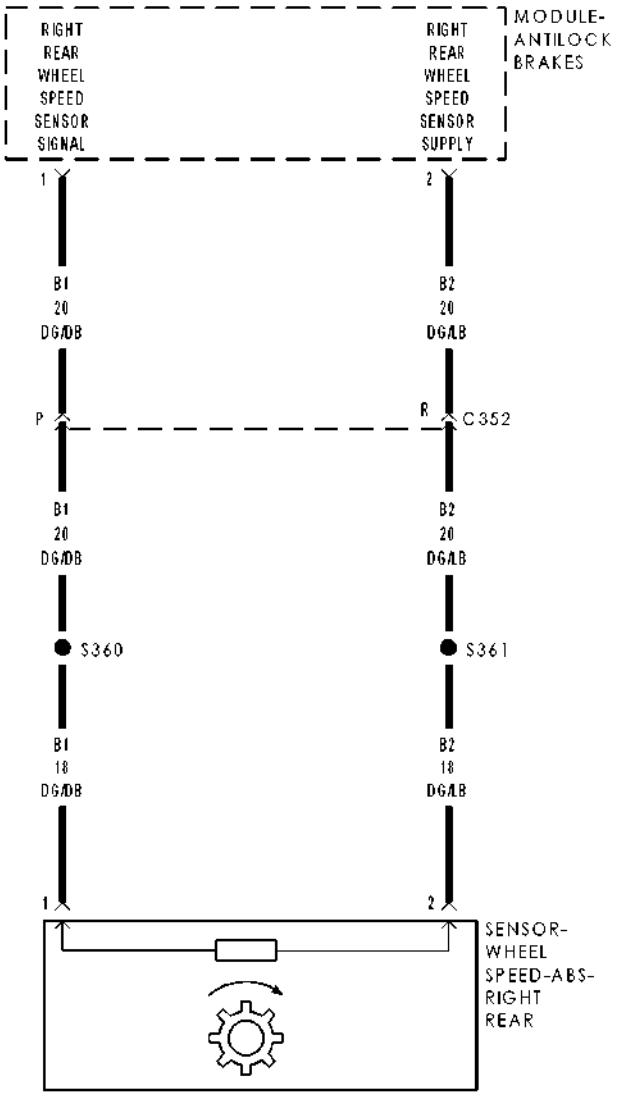
Did the DTC C102A–LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

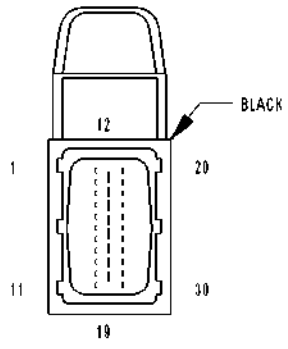
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

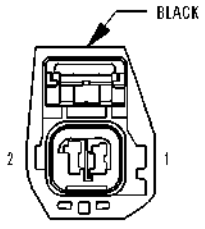


C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-RIGHT REAR

81269974

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO GROUND OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER
RIGHT REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

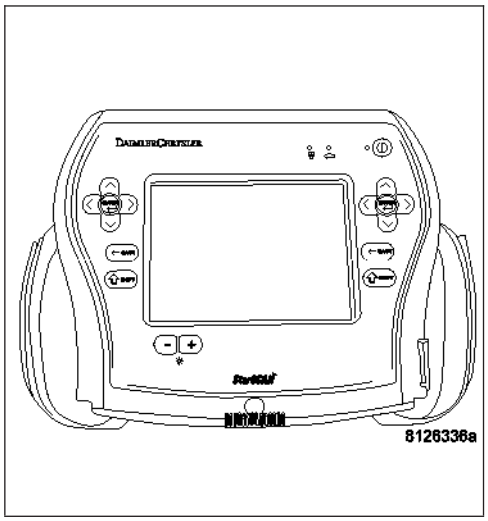
Cycle the ignition switch from off to on.

With the scan tool, read DTC's

Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

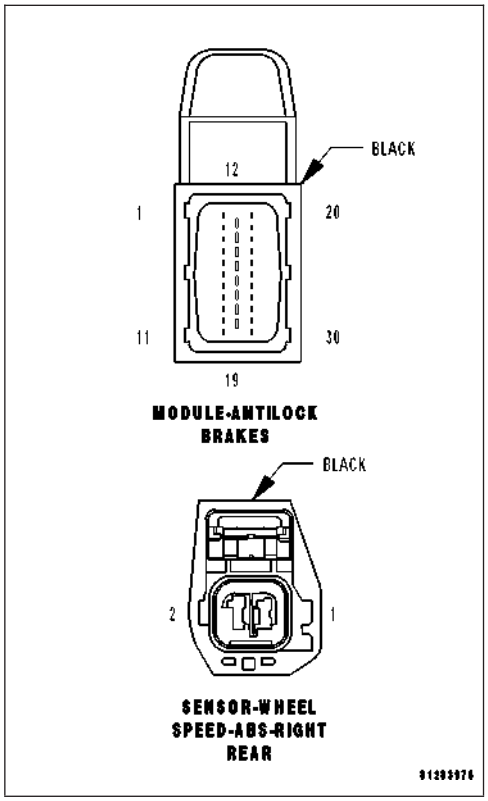
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

Is the Right Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B2) RIGHT REAR WSS SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

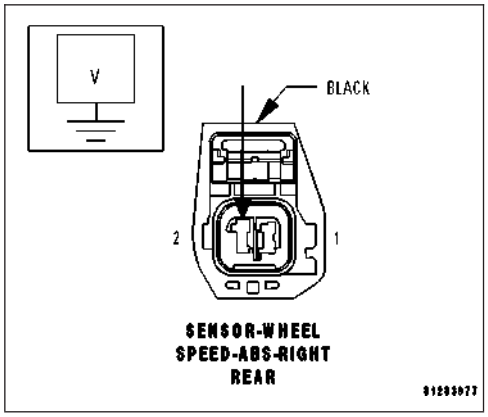
Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4



C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

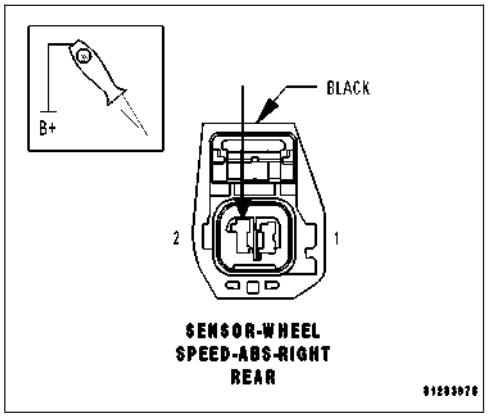
4. CHECK (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (B2) RIGHT REAR WSS SUPPLY CIRCUIT OPEN

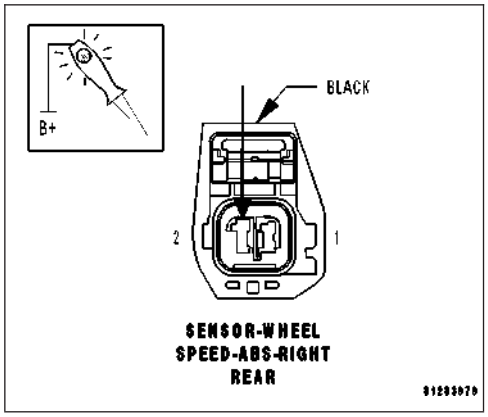
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B2) Right Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B2) Right Rear WSS Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 6

No >> Repair the (B2) Right Rear WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

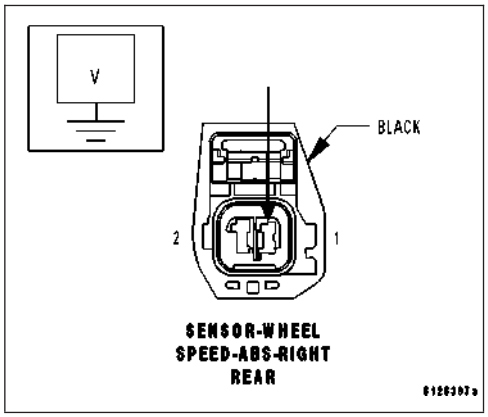
6. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B1) Right Rear WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

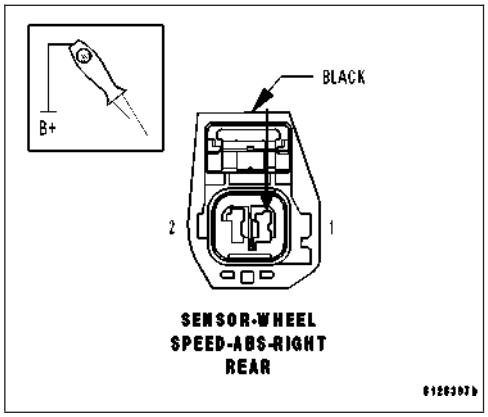
7. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN

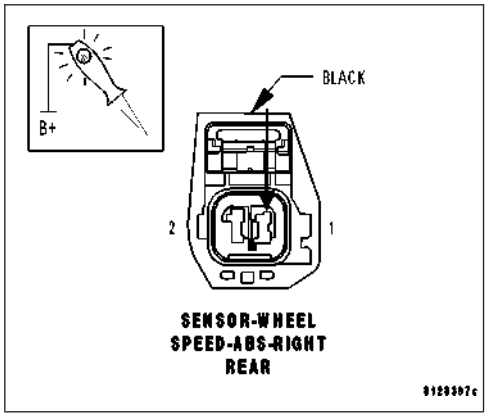
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B1) Right Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B1) Right Rear WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

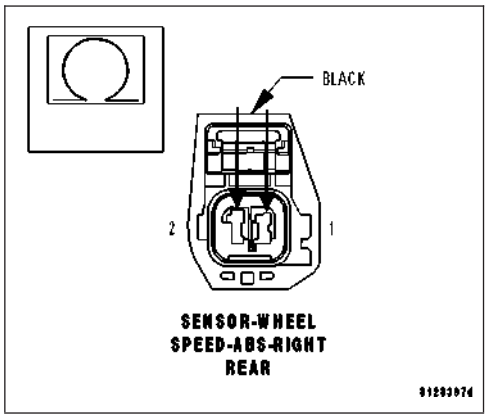
9. CHECK (B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Measure the resistance between the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit.



Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B1) Right Rear WSS Signal circuit and the (B2) Right Rear WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

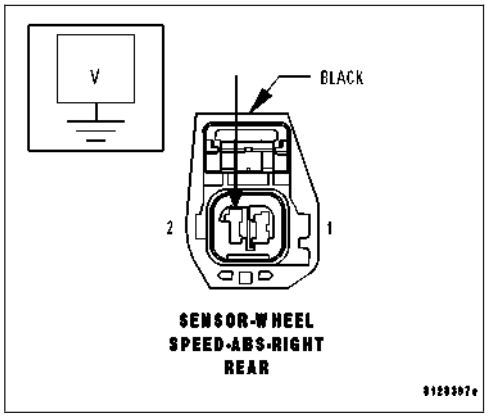
10. CHECK RIGHT REAR WSS

Turn the ignition off.
Reconnect all connectors.
Disconnect the Right Rear WSS harness connector.
Turn the ignition on.
Measure the voltage of the (B2) Right Rear WSS Supply circuit while reconnecting the Right Rear WSS harness connector.

Did the (B2) Right Rear WSS Supply circuit drop voltage to 0 volts?

Yes >> Replace the Right Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11



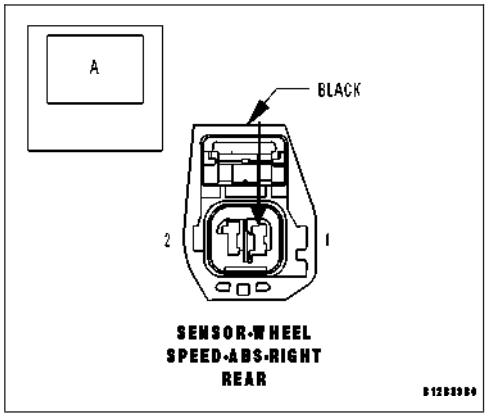
11. CHECK RIGHT REAR WSS OUTPUT

Turn the ignition off.
Reconnect all connectors.
Turn the ignition on.
Measure the amperage of the (B1) Right Rear WSS Signal circuit in the Right Rear WSS harness connector.
Slowly rotate the Right Rear wheel.

Does the amperage toggle between 7 mA to 14 mA?

Yes >> Go To 12

No >> Replace the Right Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.



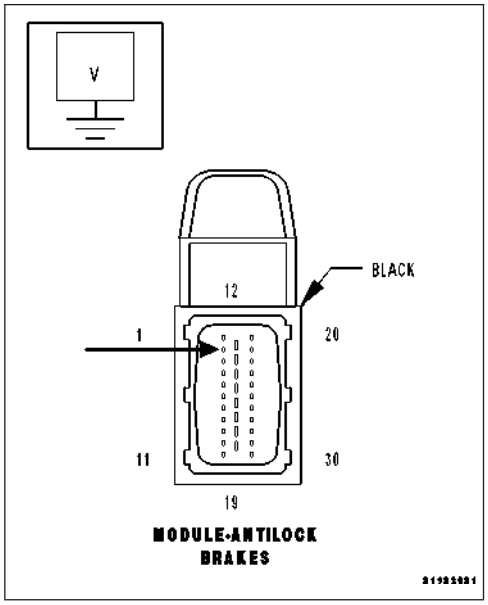
12. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B2) RIGHT REAR WSS SUPPLY CIRCUIT

Turn the ignition off.
Remove the Anti-Lock Brake Module harness connector strain relief to access wires.
Reconnect the Anti-Lock Brake Module harness connector.
Turn the ignition on.
Measure the voltage between the (B2) Right Rear WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 13

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.



C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B1) RIGHT REAR WSS SIGNAL CIRCUIT

Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

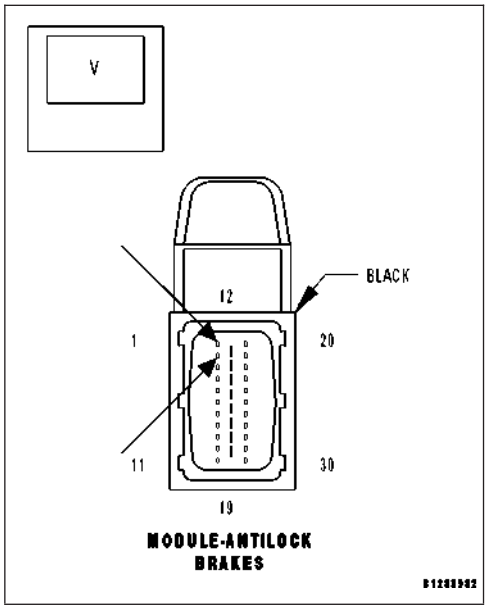
Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply circuit and the (B1) Right Rear WSS Signal circuit.

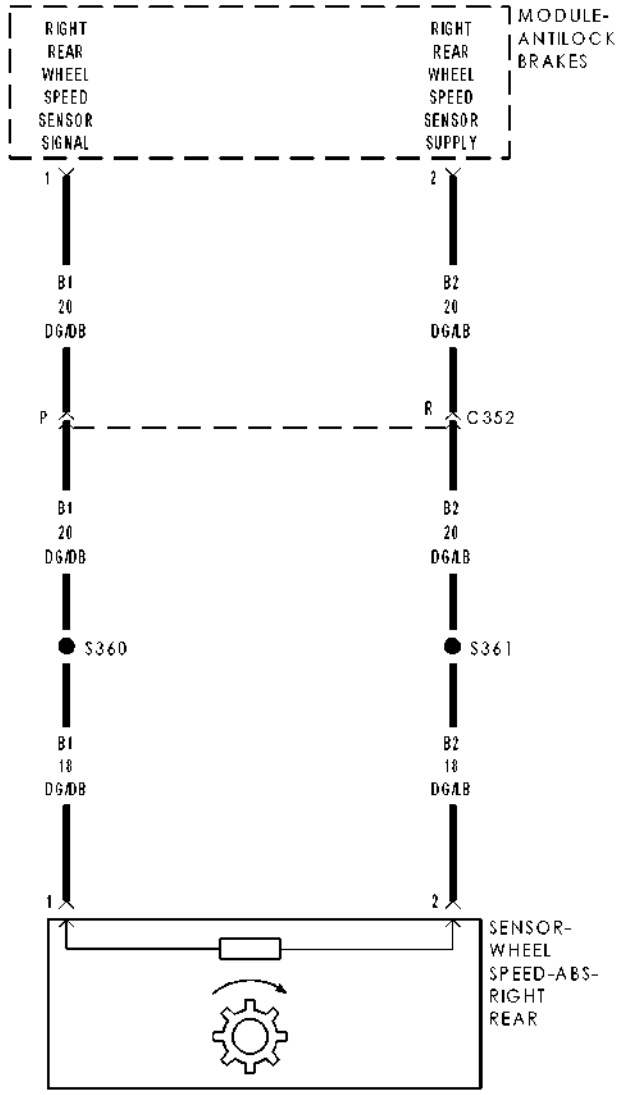
Is the voltage above 10 volts?

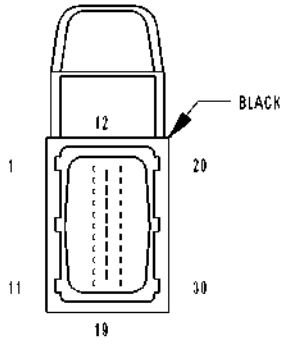
Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

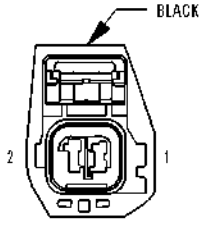


C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-RIGHT REAR

51269974

C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS Signal is intermittently missing at a vehicle speed above at 40 kph (25 m.p.h.) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
RIGHT REAR WSS LOOSE - B1,B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR WSS AIR GAP FAULT
RIGHT REAR WHEEL BEARING DAMAGE
RIGHT REAR BRAKE HARDWARE DAMAGE
RIGHT REAR FRONT WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

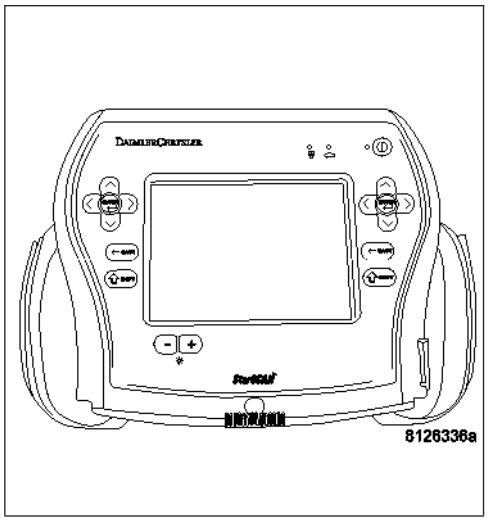
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE and C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C102B–Right Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

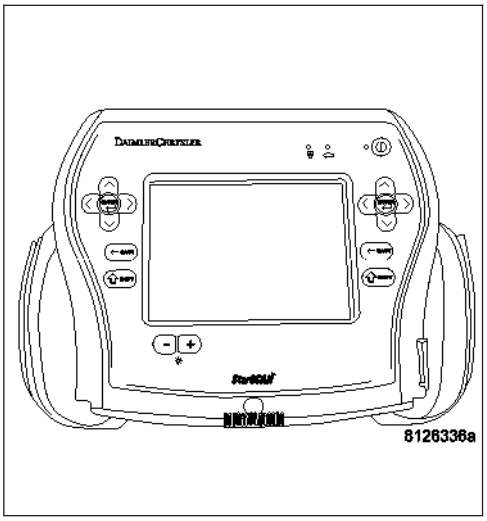
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1,B2 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

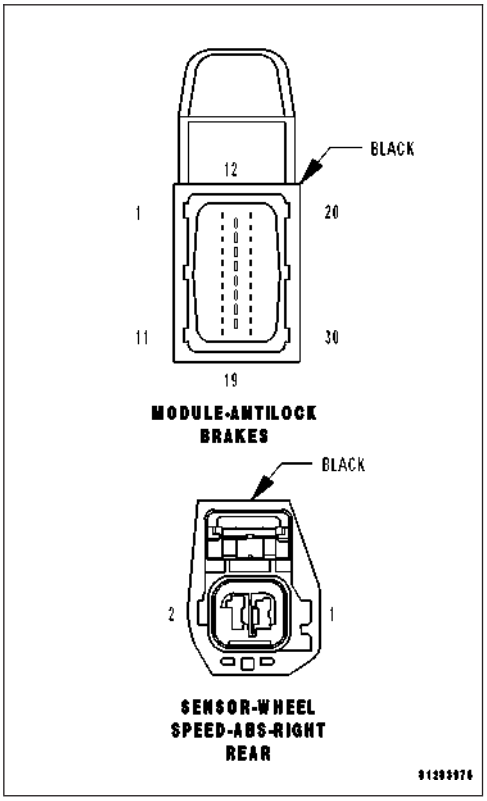
Inspect the Right Rear WSS for looseness and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

4. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.

Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK RIGHT REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Right Rear WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Rear WSS air gap within specifications?

Yes >> Go To 6

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

---

6. CHECK RIGHT REAR WHEEL BEARING DAMAGE

Turn the ignition off.

Inspect the Right Rear wheel bearing for excessive runout or clearance.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Right Rear Wheel Bearing damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

7. CHECK RIGHT REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.

Visually inspect the Right Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

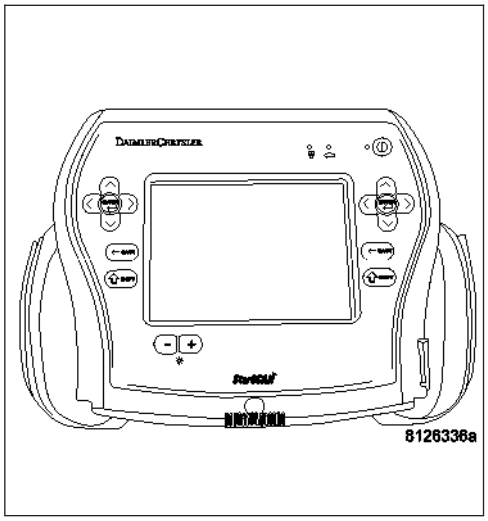
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Right Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

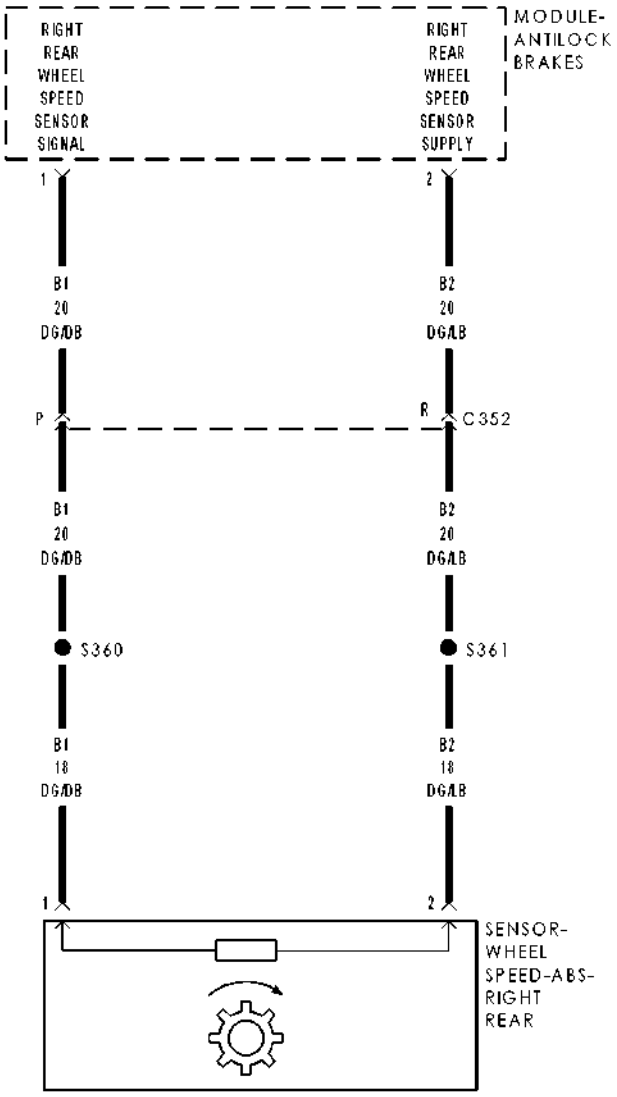


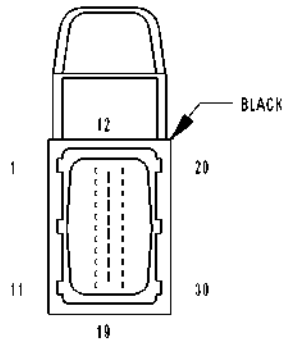
Did the DTC C1032–RIGHT REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

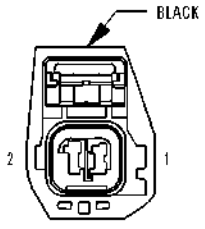
No >> Test Complete.

C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE





MODULE-ANTILOCK BRAKES



SENSOR-WHEEL SPEED-ABS-RIGHT REAR

81269974

C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Right Rear WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
RIGHT REAR WSS LOOSE - B1,B2 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
RIGHT REAR TONE WHEEL DAMAGE
RIGHT REAR BRAKE HARDWARE DAMAGE
RIGHT REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

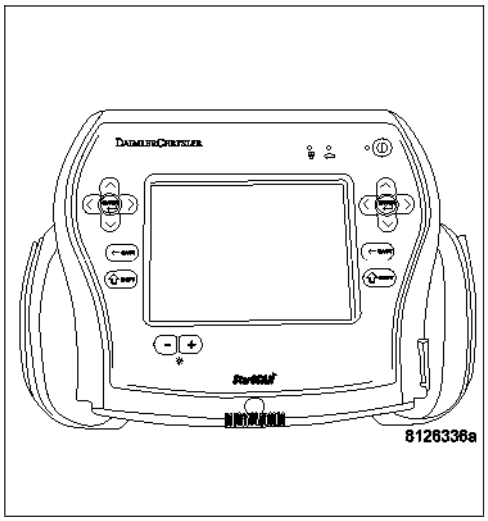
With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE and C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?



Yes >> Refer to C102B–Right Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2

C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

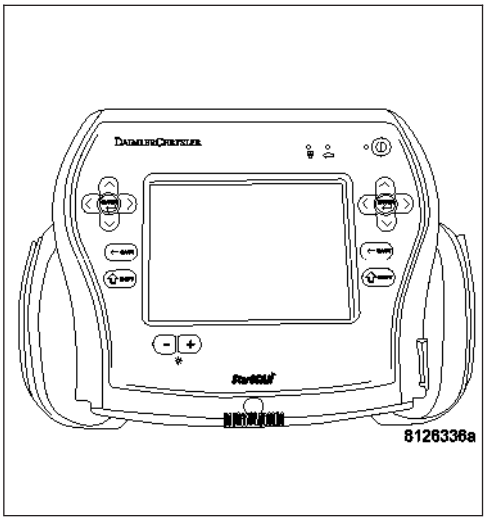
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Right Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK RIGHT REAR WSS LOOSENESS, INSPECT B1,B2 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, and Right Rear WSS harness connector.

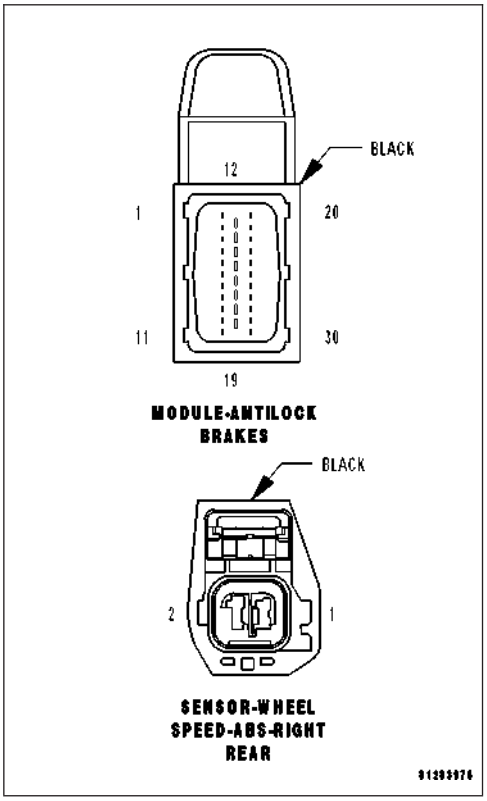
Inspect the Right Rear WSS for looseness and not properly fastened.

Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK RIGHT REAR TIRE PRESSURE/INSPECT ALL TIRES

Turn the ignition off.
Check and adjust the Right Rear Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK RIGHT REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect the Right Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Right Rear Front Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

6. CHECK RIGHT REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.
Visually inspect the Right Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

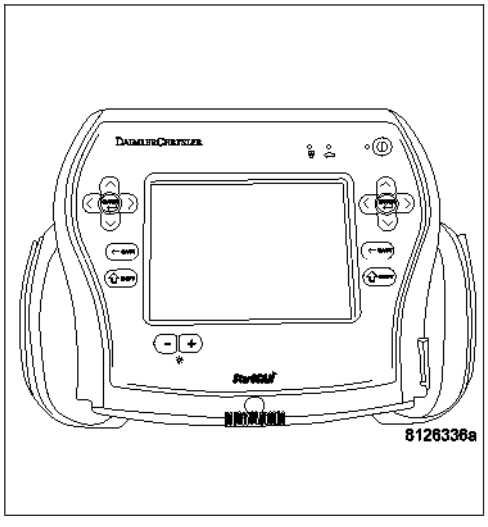
7. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Right Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

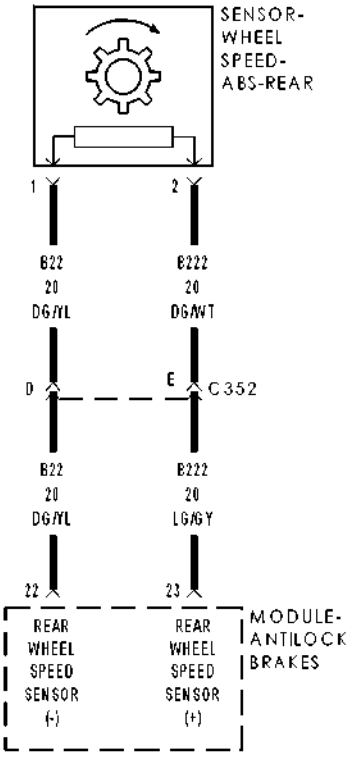
Did the DTC C1035–RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

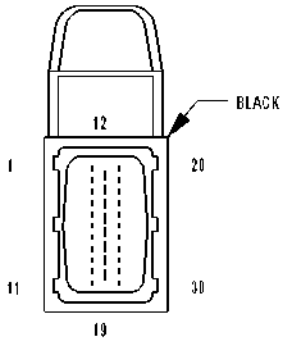
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

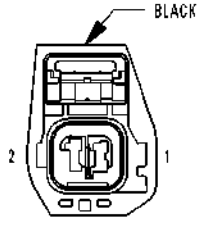


C1036–REAR WHEEL SPEED SENSOR CIRCUIT





MODULE-ANTILOCK
BRAKES



SENSOR-WHEEL
SPEED-ABS-REAR

81263987

C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B222) REAR WSS SUPPLY CIRCUIT SHORTED TO GROUND OR OPEN
(B22) REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(B22) REAR WSS SIGNAL CIRCUIT AND (B222) REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER
REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1036–REAR WHEEL SPEED SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

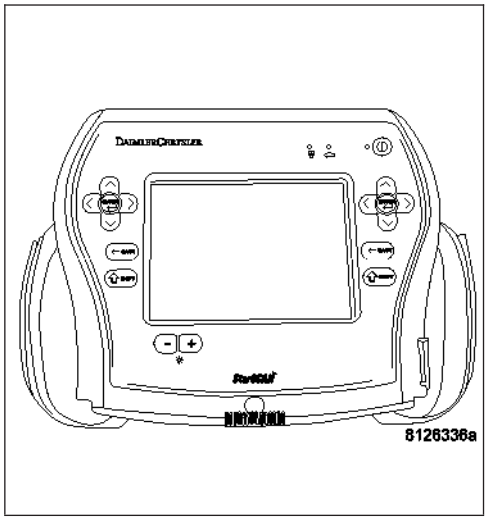
Cycle the ignition switch from off to on.

With the scan tool, read DTC's

Does the scan tool display: C1036–REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

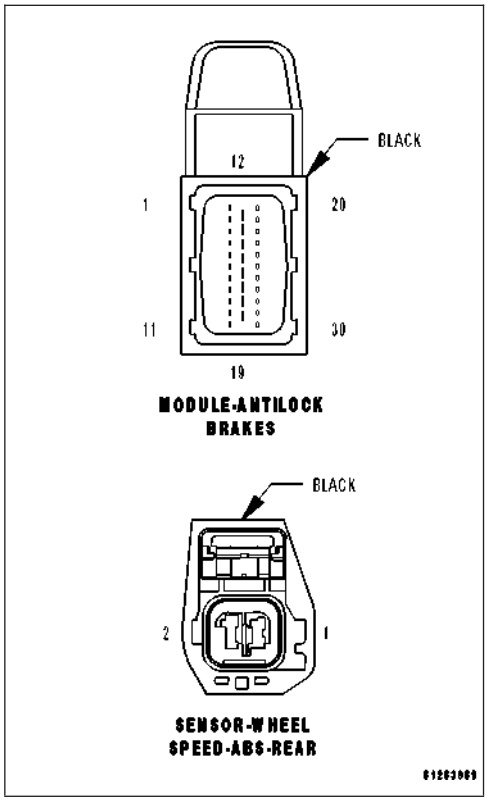
Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Rear WSS, and Rear WSS harness connector.

Is the Rear WSS or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3



3. CHECK (B222) REAR WSS SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Rear WSS harness connector.

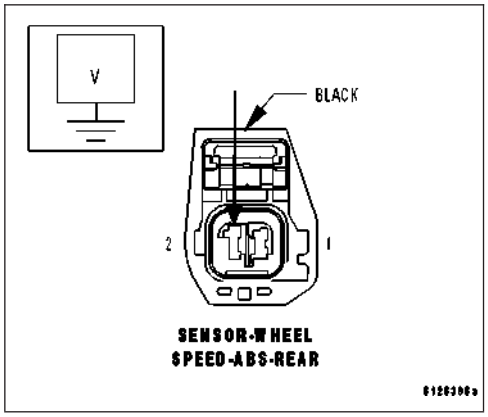
Turn the ignition on.

Measure the voltage between the (B222) Rear WSS Supply circuit and ground.

Is the voltage above 10 volts?

Yes >> Go To 6

No >> Go To 4



C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

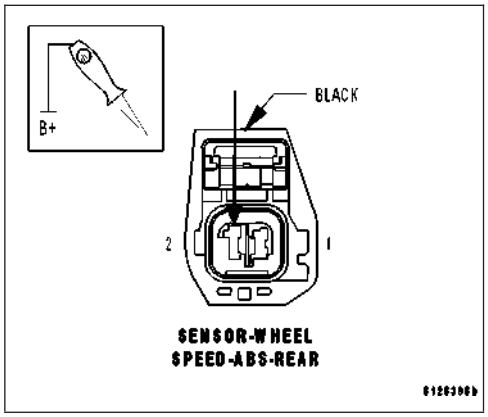
4. CHECK (B222) REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B222) Rear WSS Supply circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B222) Rear WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (B222) REAR WSS SUPPLY CIRCUIT OPEN

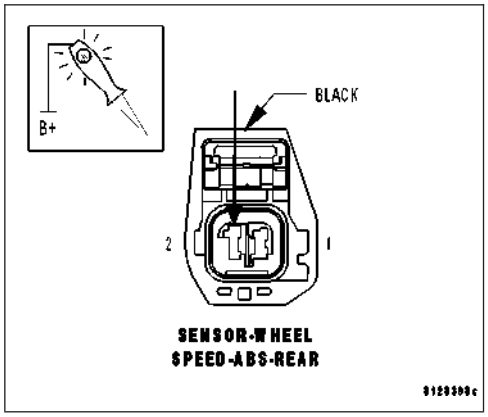
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Rear WSS harness connector.

Connect a jumper wire between the (B222) Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B222) Rear WSS Supply circuit.



Does the test light illuminate brightly

Yes >> Go To 6

No >> Repair the (B222) Rear WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

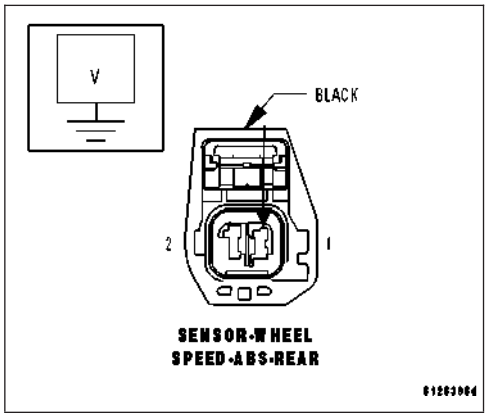
6. CHECK (B22) REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B22) Rear WSS Signal circuit and ground.



Is the voltage above one volt?

Yes >> Repair the (B22) Rear WSS Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

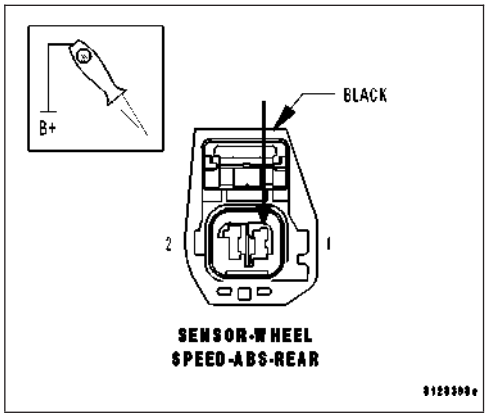
7. CHECK (B22) REAR WSS SIGNAL CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, probe the (B22) Rear WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Repair the (B22) Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK (B22) REAR WSS SIGNAL CIRCUIT OPEN

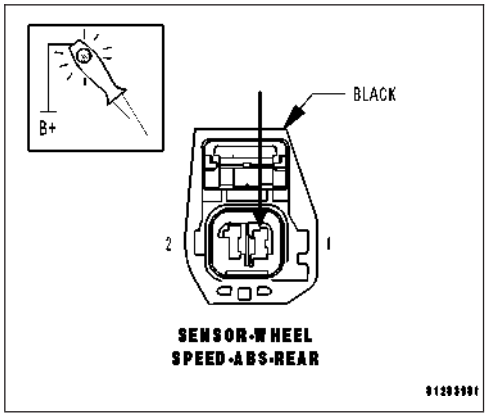
Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Rear WSS harness connector.

Connect a jumper wire between the (B22) Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (B22) Rear WSS Signal circuit.



Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (B22) Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

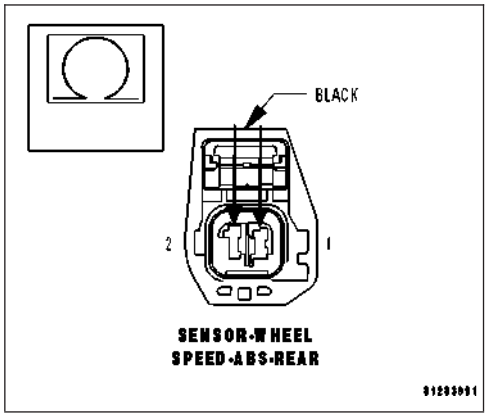
9. CHECK (B22) REAR WSS SIGNAL CIRCUIT AND (B222) REAR WSS SUPPLY CIRCUIT SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Rear Front WSS harness connector.

Measure the resistance between the (B22) Rear WSS Signal circuit and the (B222) Rear WSS Supply circuit.



Is the resistance above 5.0 ohms?

Yes >> Go To 10

No >> Repair the (B22) Rear WSS Signal circuit and the (B222) Rear WSS Supply circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.

C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

10. CHECK REAR WSS

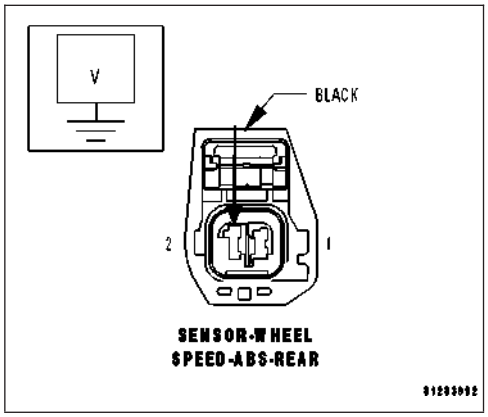
Turn the ignition off.

Reconnect all connectors.

Disconnect the Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B222) Rear WSS Supply circuit while reconnecting the Rear WSS harness connector.



Did the (B222) Rear WSS Supply circuit drop voltage to 0 volts?

Yes >> Replace the Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

11. CHECK REAR WSS OUTPUT

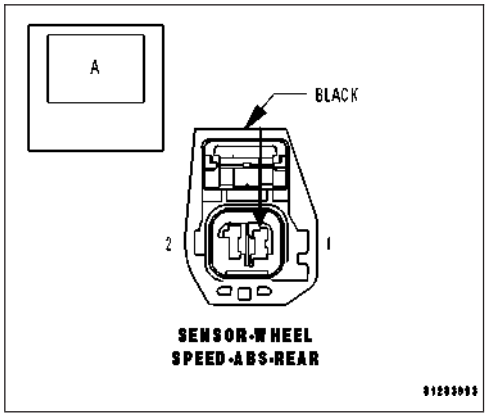
Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

Measure the amperage of the (B22) Rear WSS Signal circuit in the Rear WSS harness connector.

Slowly rotate the Rear wheels.



Does the amperage toggle between 7 mA to 14 mA?

Yes >> Go To 12

No >> Replace the Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

12. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B222) REAR WSS SUPPLY CIRCUIT

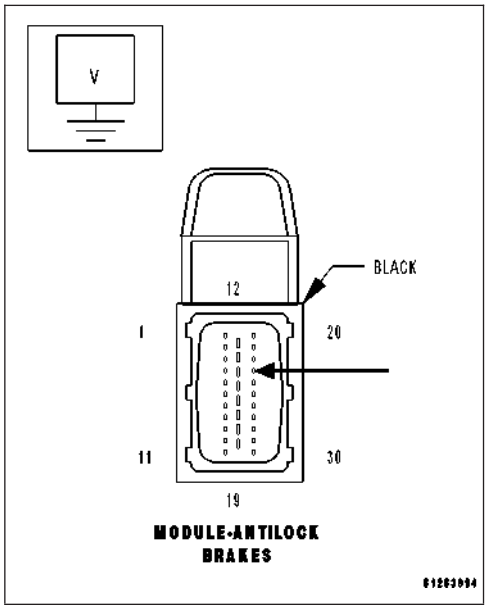
Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage between the (B222) Rear WSS Supply circuit and ground.



Is the voltage above 10 volts?

Yes >> Go To 13

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1036–REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. ANTI-LOCK BRAKE MODULE INTERNAL FAULT - (B22) REAR WSS SIGNAL CIRCUIT

Turn the ignition off.

Remove the Anti-Lock Brake Module harness connector strain relief to access wires.

Reconnect the Anti-Lock Brake Module harness connector.

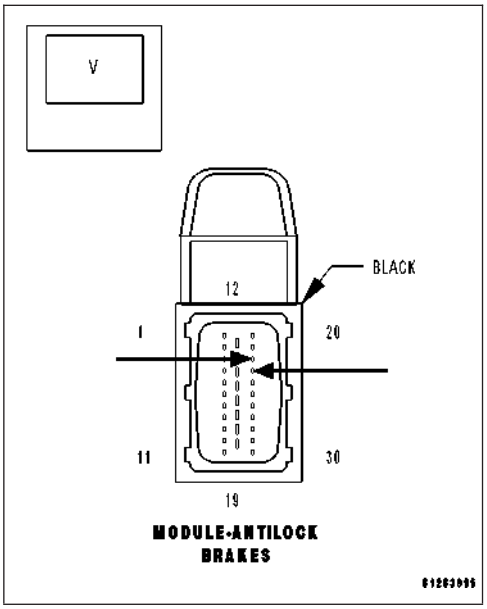
Turn the ignition on.

Measure the voltage between the (B222) Rear WSS Supply circuit and the (B22) Rear WSS Signal circuit.

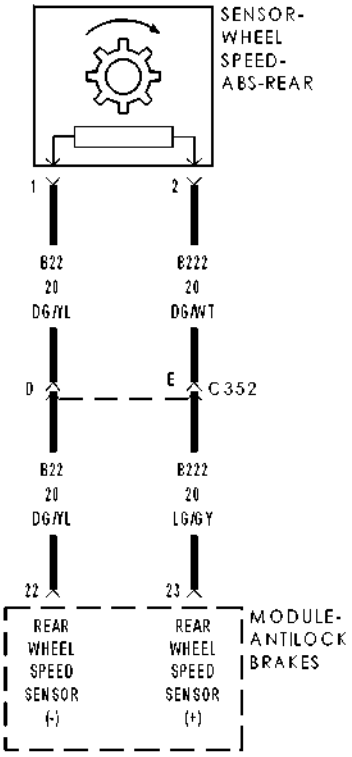
Is the voltage above 10 volts?

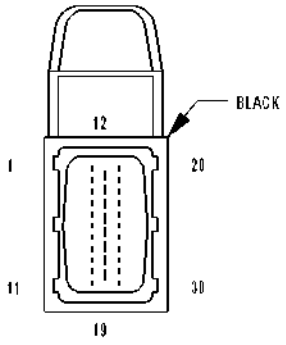
Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

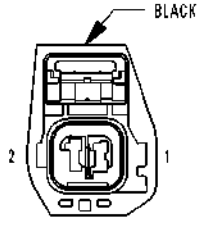


C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE





MODULE-ANTILOCK
BRAKES



SENSOR-WHEEL
SPEED-ABS-REAR

81263987

C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Rear WSS Signal is intermittently missing at a vehicle speed above at 40 kph (25 m.p.h.) or erratic wheel speed signal during acceleration or sensed wheel speed is different from other wheels.

Possible Causes
REAR WSS LOOSE - B22,B222 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
REAR TONE WHEEL DAMAGE
REAR WSS AIR GAP FAULT
REAR CARRIER BEARINGS LOOSE
REAR BRAKE HARDWARE DAMAGE
REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

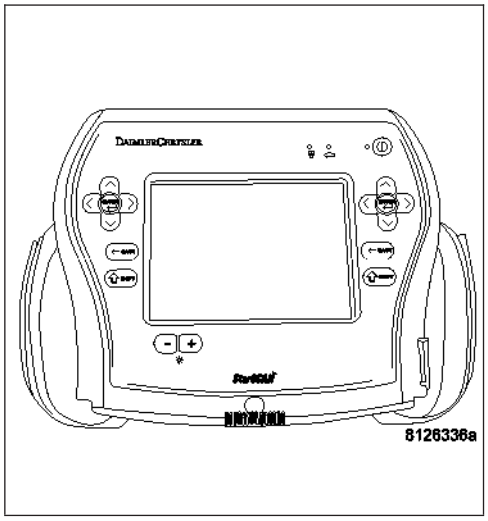
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE and C1036–REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1036–Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

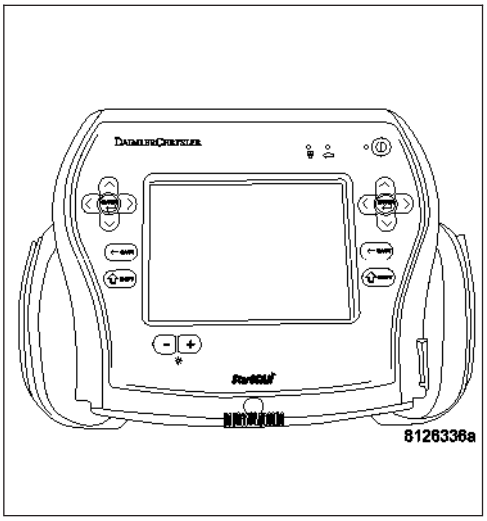
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK REAR WSS LOOSENESS, INSPECT B22,B222 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Rear WSS, and Rear WSS harness connector.

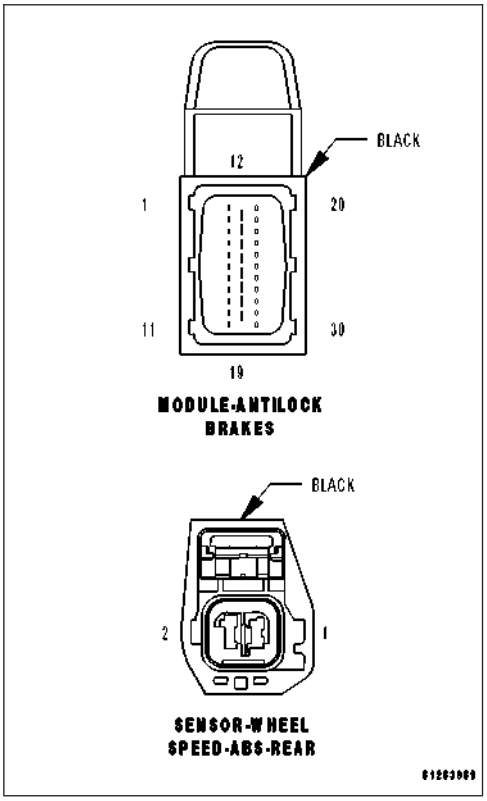
Inspect the Rear WSS for looseness and not properly fastened.

Inspect the (B22) Rear WSS Signal and (B222) Rear WSS Supply circuits between the Rear WSS and Anti-Lock Brake Module for damage.

Is the Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

4. CHECK REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.

Inspect the Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Rear Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK REAR WSS AIR GAP

Turn the ignition off.

Using a feeler gauge, measure the Rear WSS air gap.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Rear WSS air gap within specifications?

Yes >> Go To 6

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

---

6. CHECK REAR CARRIER BEARINGS LOOSE

Turn the ignition off.

Inspect the Rear Carrier Bearings for looseness.

NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

Is the Rear Carrier Bearings loose?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

7. CHECK REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.

Visually inspect both Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

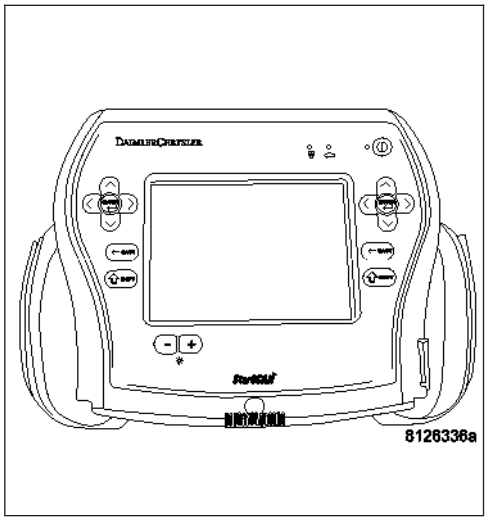
Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

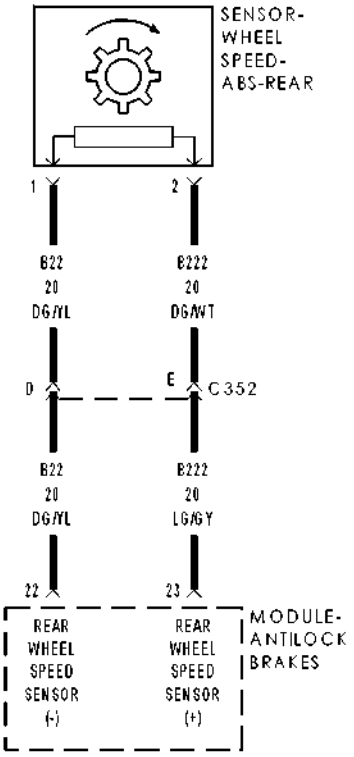


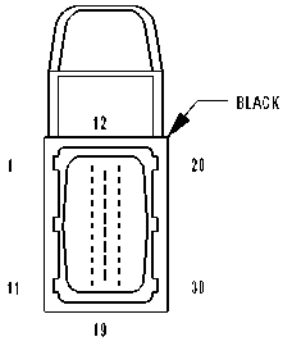
Did the DTC C103D–REAR WHEEL SPEED SENSOR INPUT SIGNAL ERRATIC PERFORMANCE reset?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

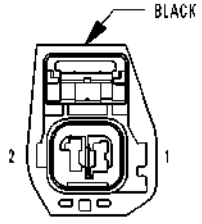
No >> Test Complete.

C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE





MODULE-ANTILOCK
BRAKES



SENSOR-WHEEL
SPEED-ABS-REAR

81269987

C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the Rear WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
REAR WSS LOOSE - B22,B222 CIRCUITS/CONNECTOR/TERMINAL DAMAGE
IMPROPER REAR TIRE PRESSURE/MISMATCHED TIRES
REAR TONE WHEEL DAMAGE
REAR BRAKE HARDWARE DAMAGE
REAR WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

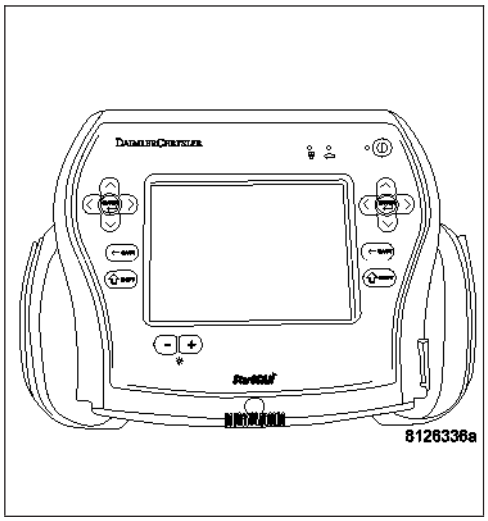
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE and C1036–REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Refer to C1036–Rear Wheel Speed Sensor Circuit for the related symptom(s).
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2



C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

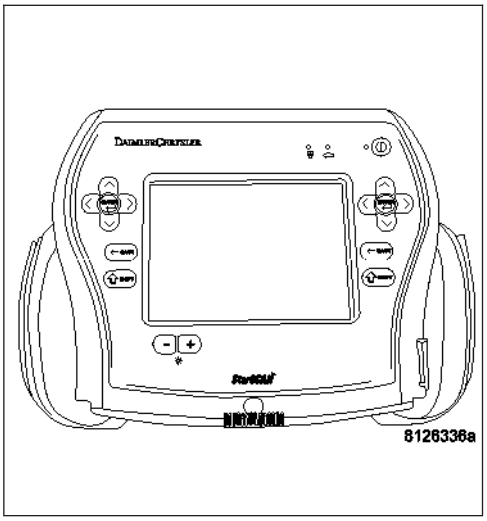
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is the Rear WSS speed showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK REAR WSS LOOSENESS, INSPECT B22,B222 CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Rear WSS, and Rear WSS harness connector.

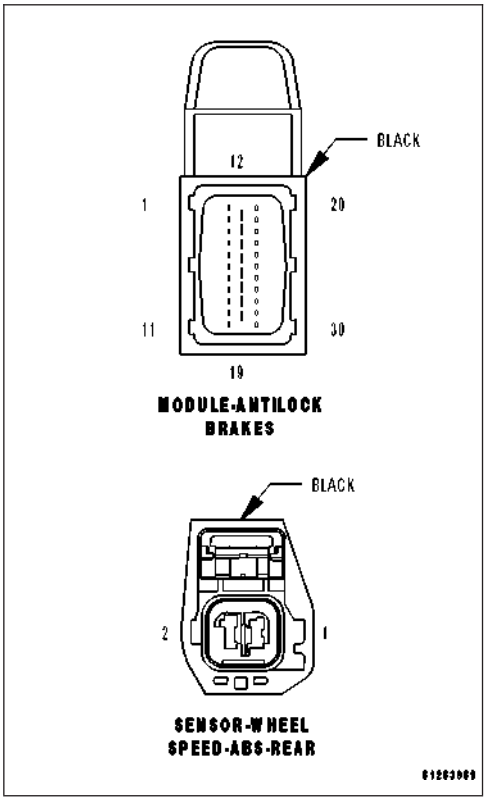
Inspect the Rear WSS for looseness and not properly fastened.

Inspect the (B22) Rear WSS Signal and (B222) Rear WSS Supply circuits between the Rear WSS and Anti-Lock Brake Module for damage.

Is the Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK REAR TIRE PRESSURE/INSPECT ALL TIRES

Turn the ignition off.
Check and adjust the Rear Tire pressure.
Check and adjust all other tire pressures.
Inspect for mismatched tires on vehicle.

Is the Rear Tire improperly inflated or mismatched tires on vehicle?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK REAR TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect the Rear Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Rear Tone Wheel damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

6. CHECK REAR BRAKE HARDWARE DAMAGE

Turn the ignition off.
Visually inspect the Rear brake linings for contamination or overheating. Check for dragging, bent, or seized components/hardware.

Is any brake lining, component, or hardware damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

---

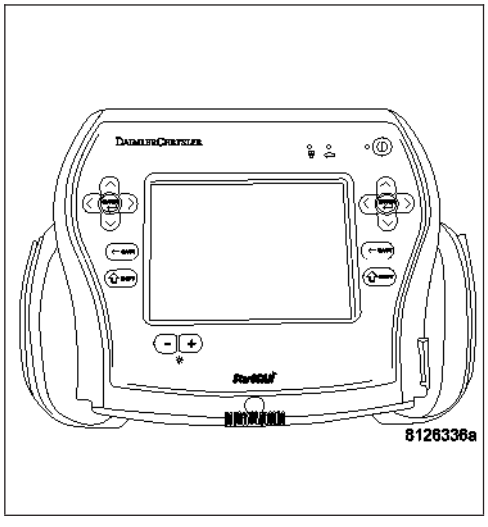
7. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace the Rear WSS.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

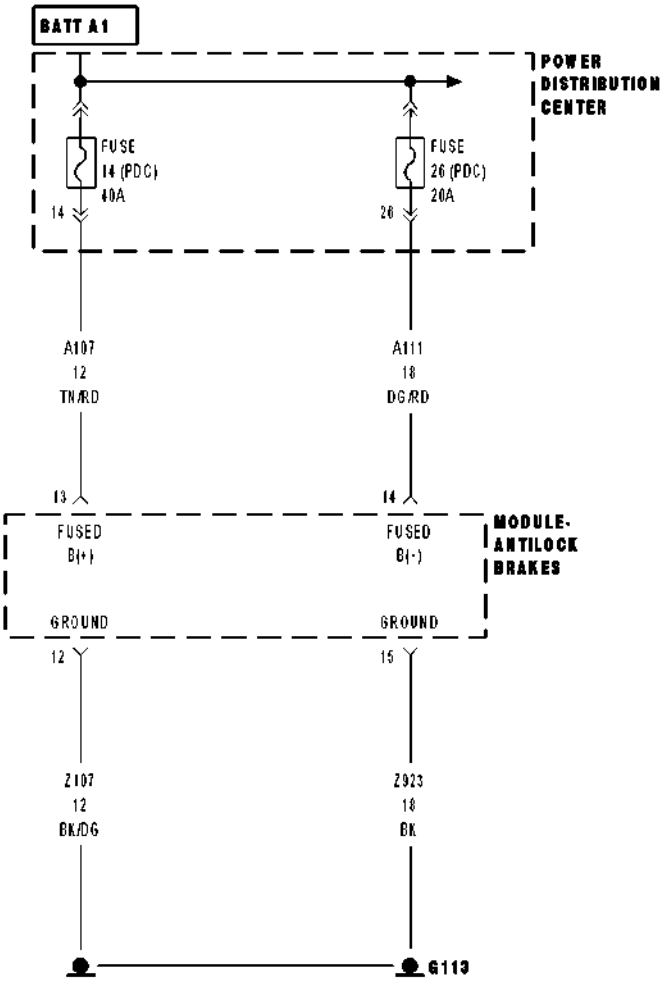
Did the DTC C1040–REAR WHEEL SPEED COMPARATIVE PERFORMANCE reset?

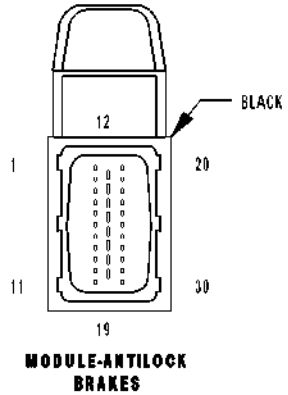
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.



C104C-LEFT FRONT INLET VALVE CONTROL CIRCUIT LOW





C104C-LEFT FRONT INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actuation signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

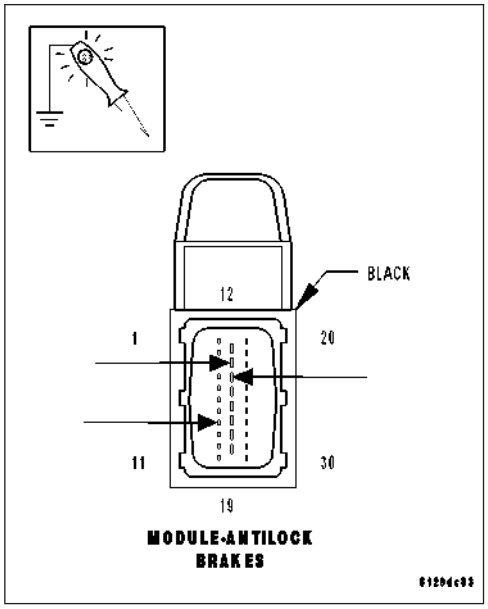
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

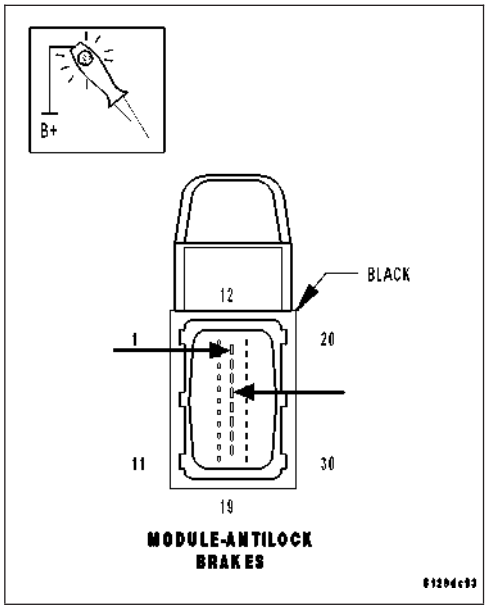
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C104C-LEFT FRONT INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

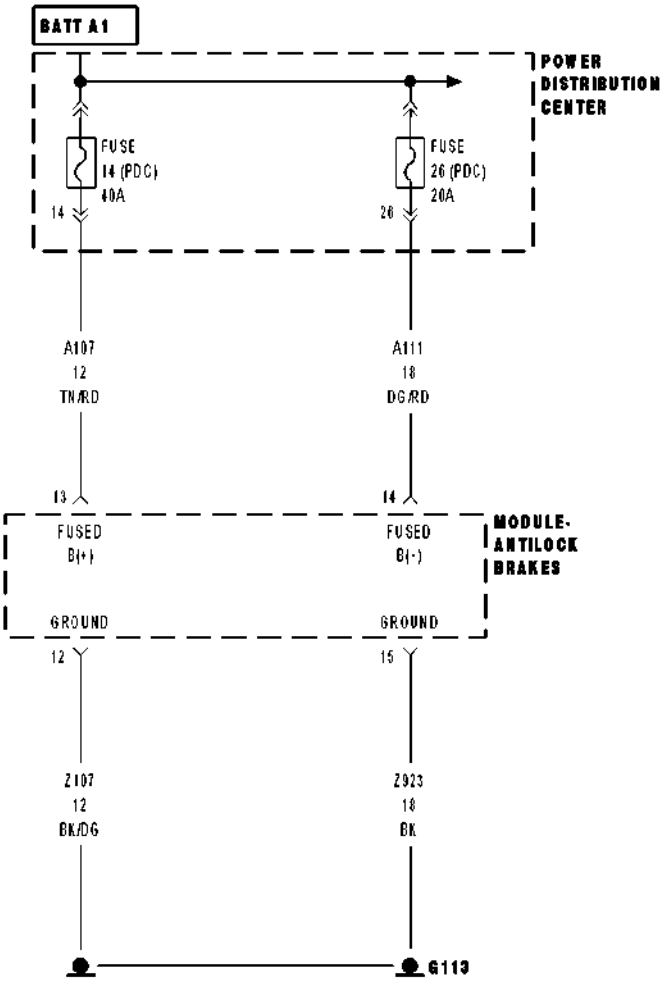


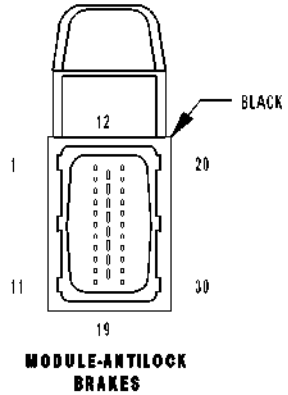
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1050-RIGHT FRONT INLET VALVE CONTROL CIRCUIT LOW





C1050-RIGHT FRONT INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actuation signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

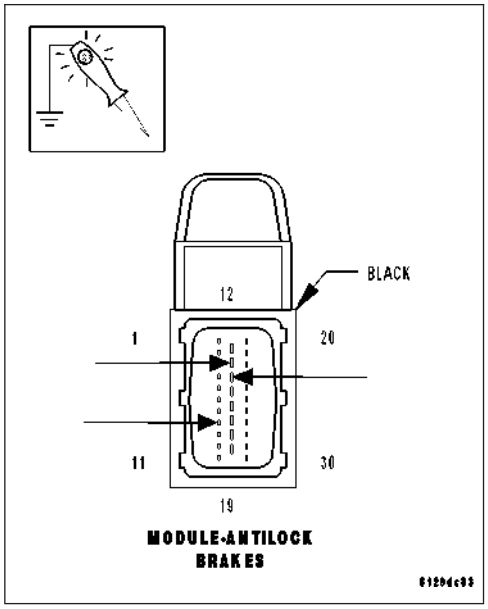
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

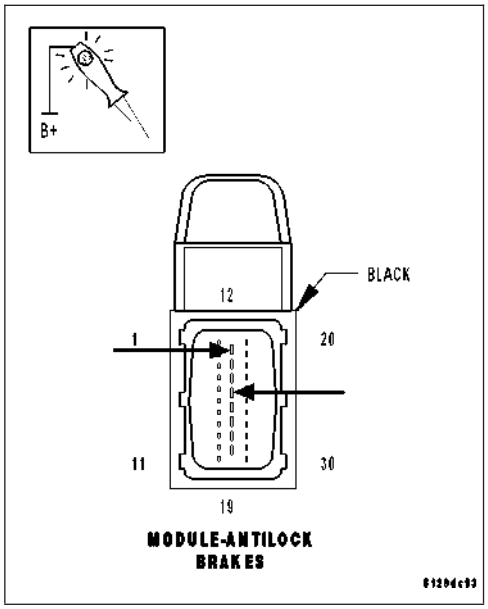
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1050-RIGHT FRONT INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

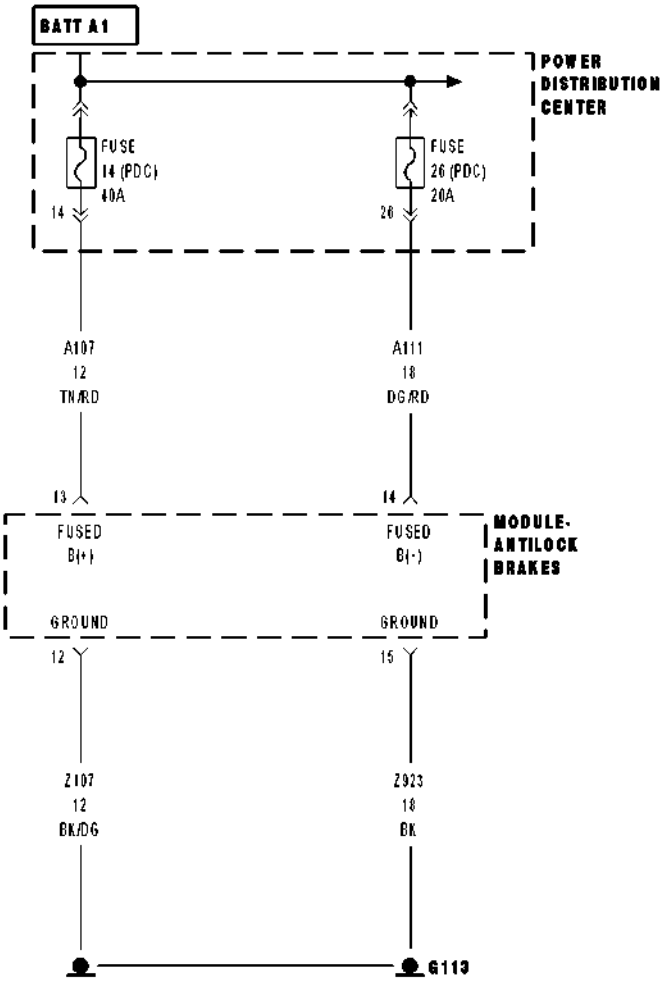


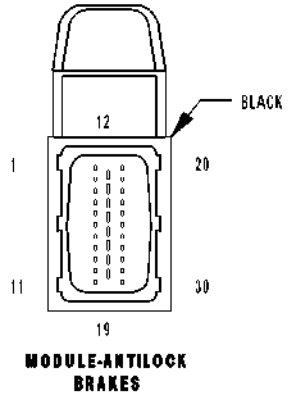
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1054-LEFT REAR INLET VALVE CONTROL CIRCUIT LOW





81284c7e

C1054-LEFT REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

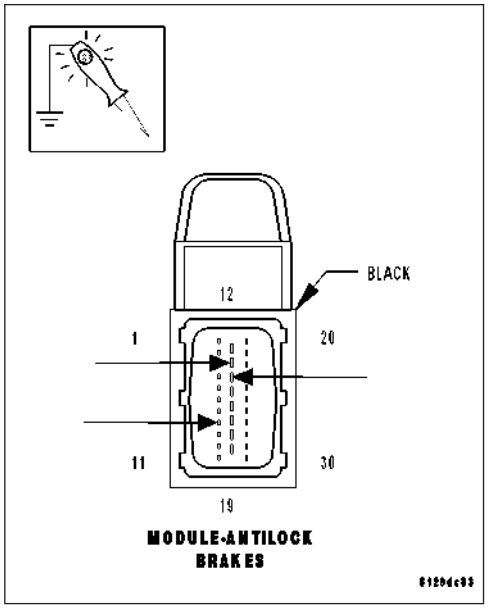
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

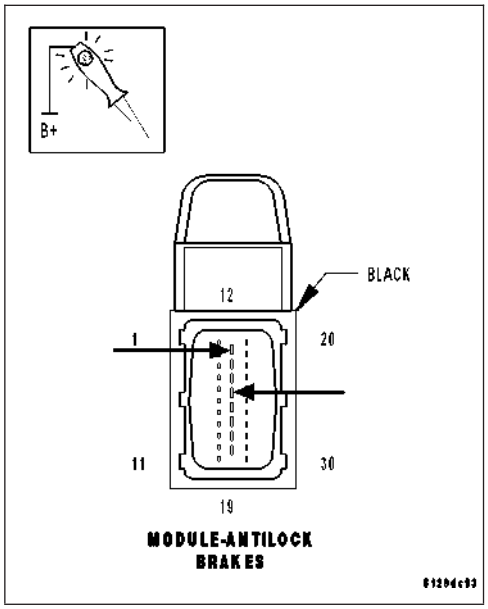
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1054-LEFT REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

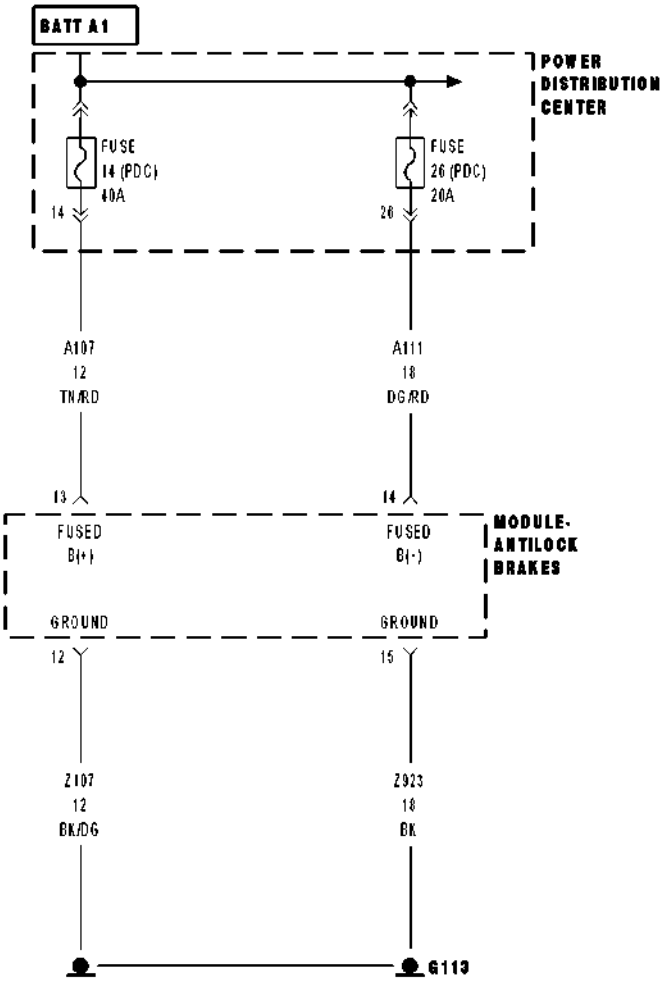


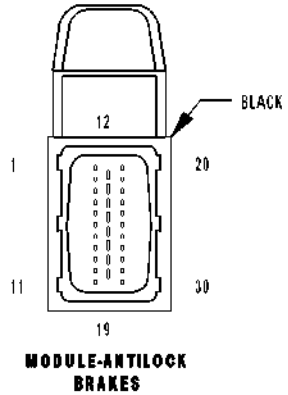
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1058-RIGHT REAR INLET VALVE CONTROL CIRCUIT LOW





C1058-RIGHT REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

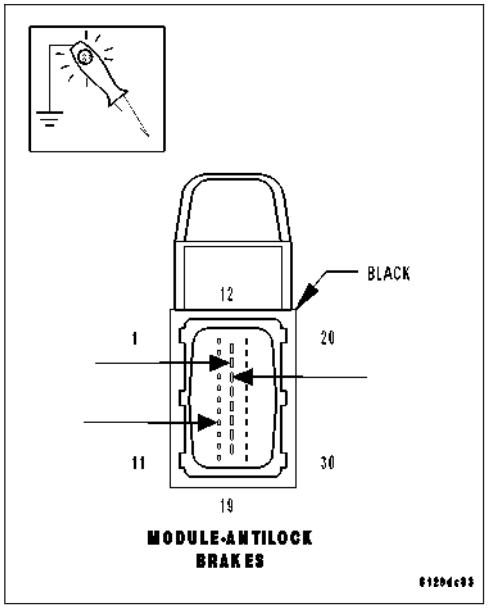
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

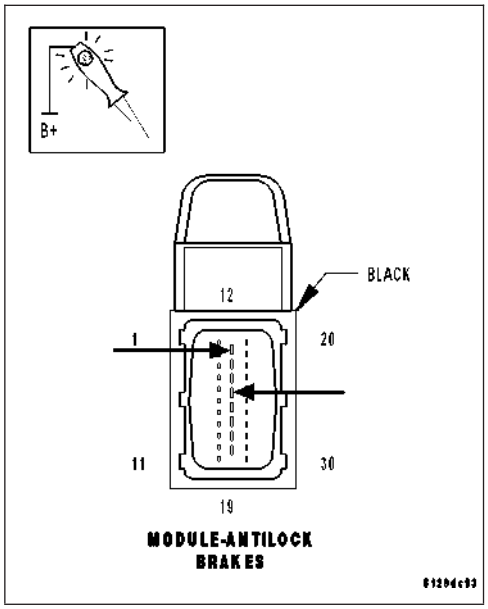
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1058-RIGHT REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

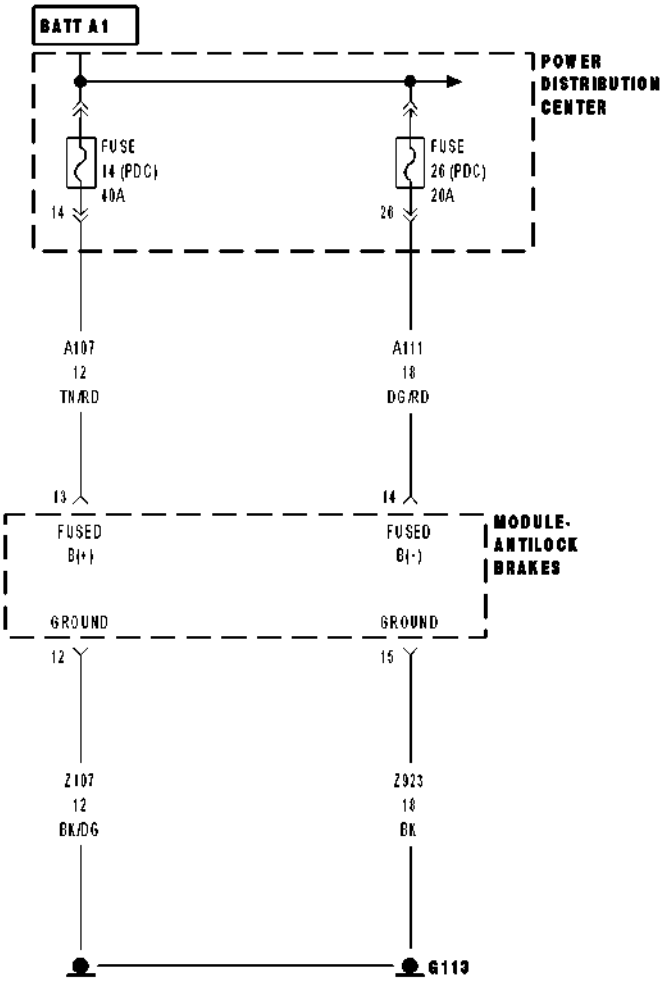


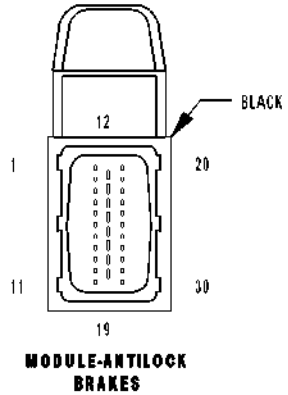
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C105C-REAR INLET VALVE CONTROL CIRCUIT LOW





C105C-REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

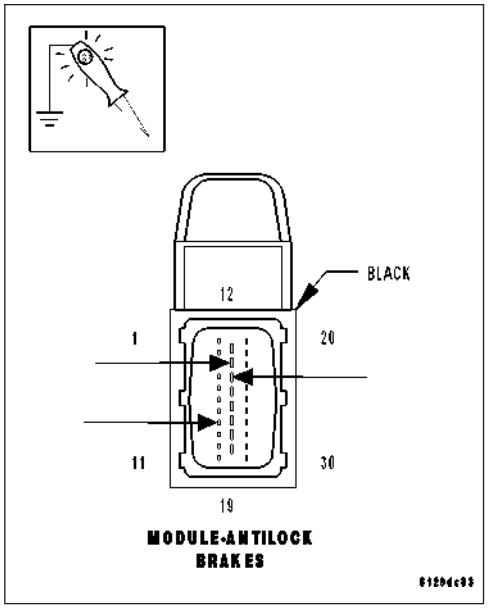
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

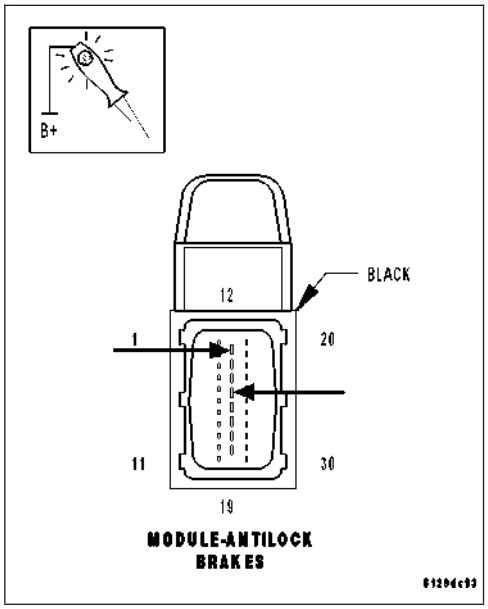
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C105C-REAR INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

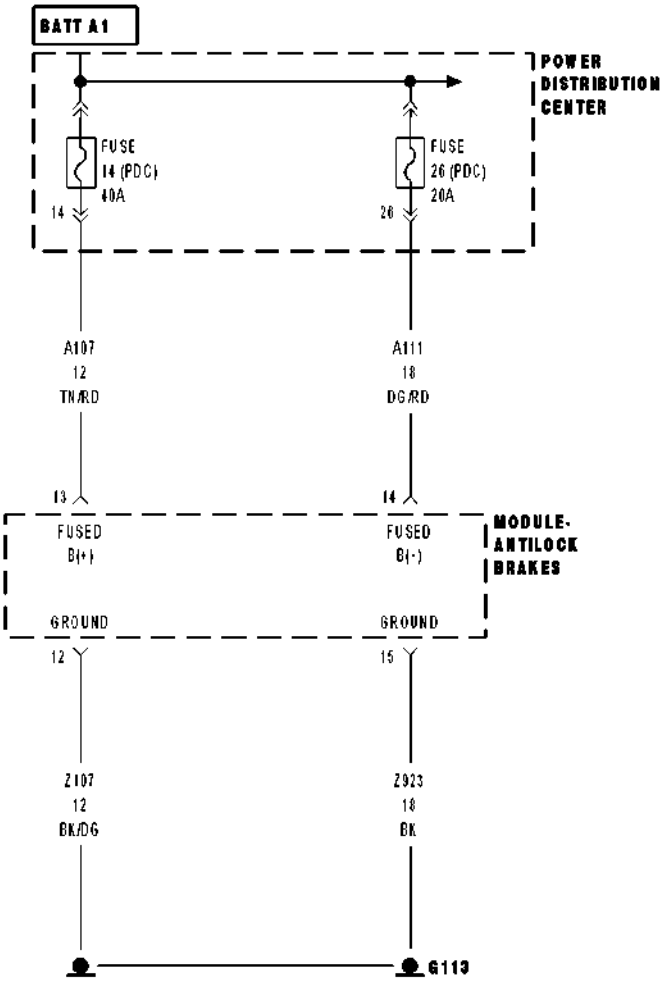


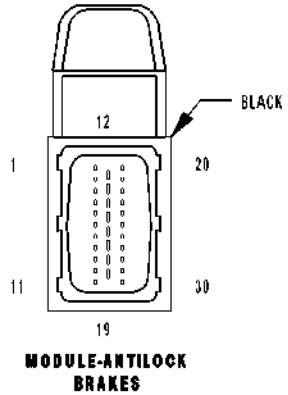
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1060-LEFT FRONT OUTLET VALVE CONTROL CIRCUIT LOW





C1060-LEFT FRONT OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

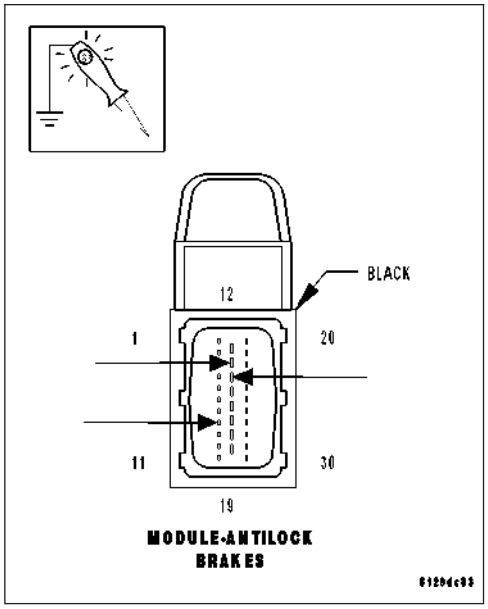
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

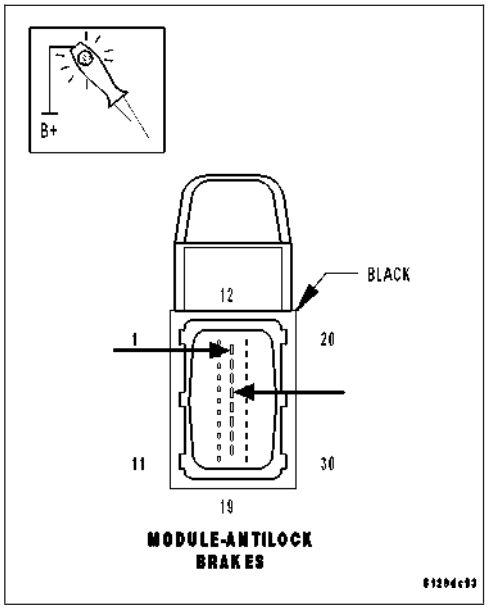
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1060-LEFT FRONT OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

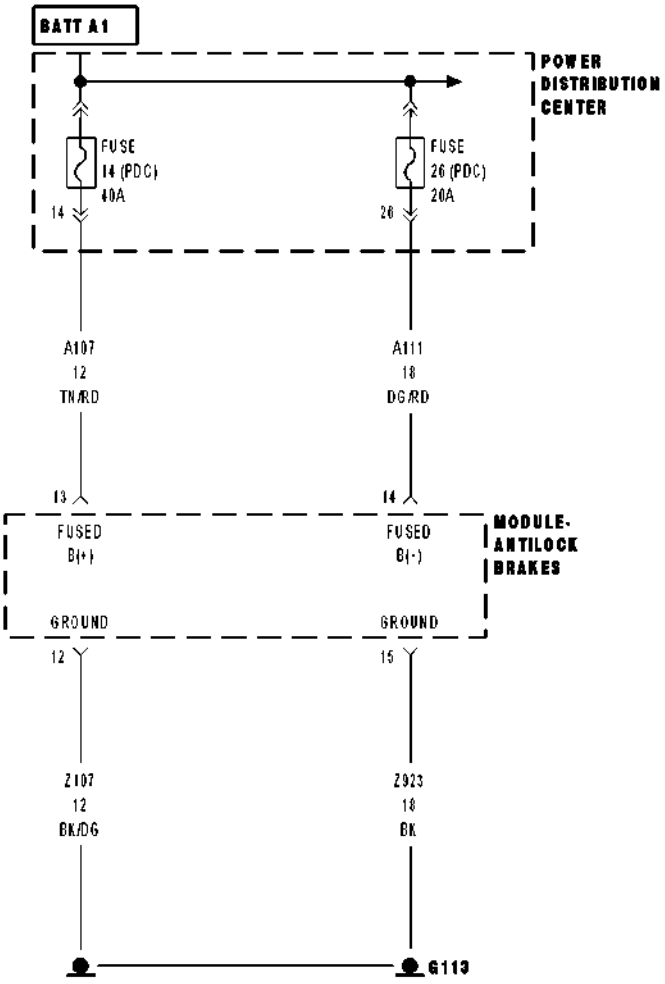


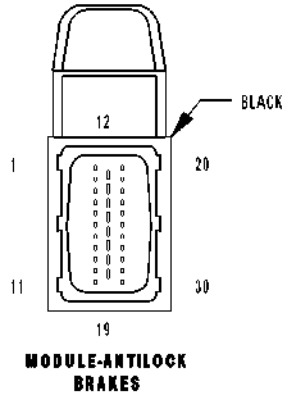
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1064-RIGHT FRONT OUTLET VALVE CONTROL CIRCUIT LOW





C1064-RIGHT FRONT OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

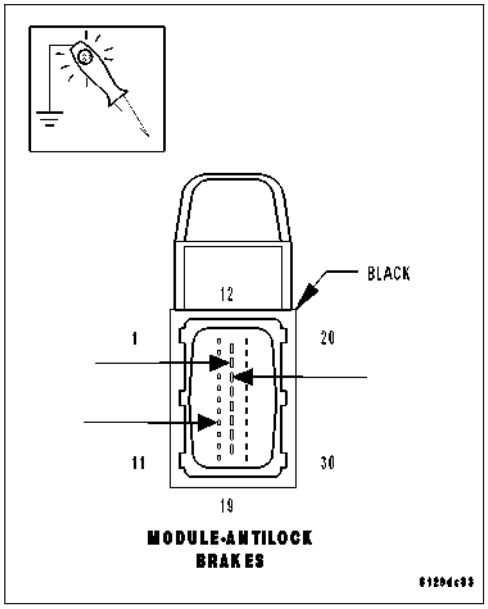
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

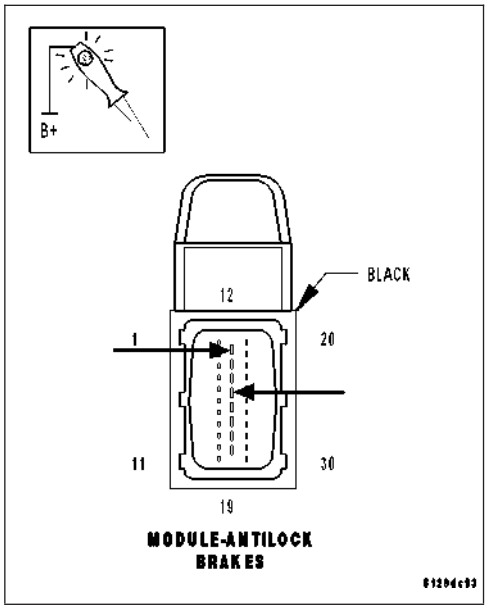
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1064-RIGHT FRONT OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

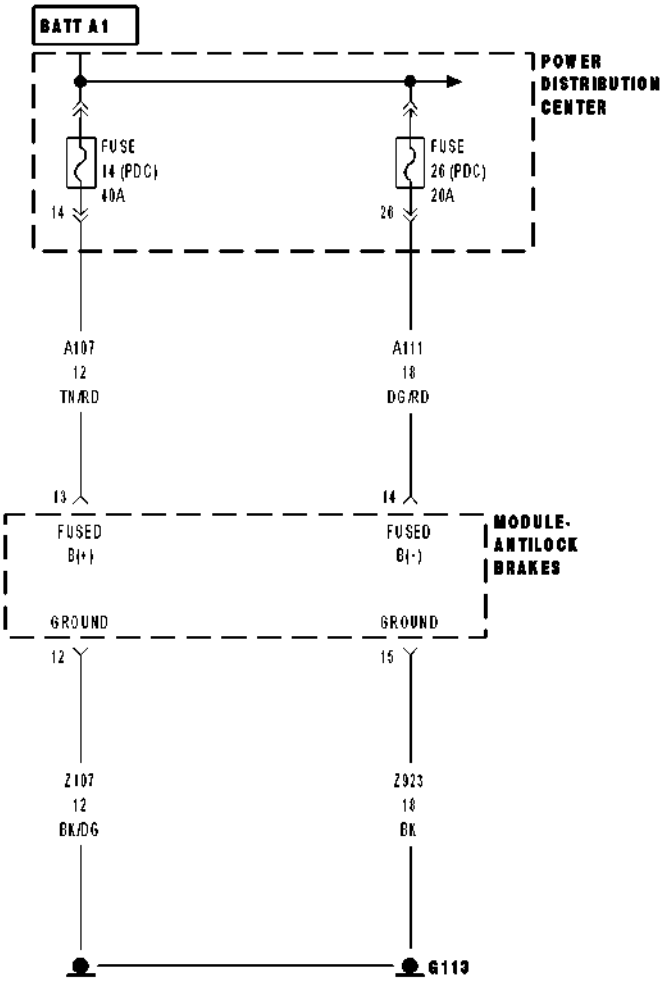


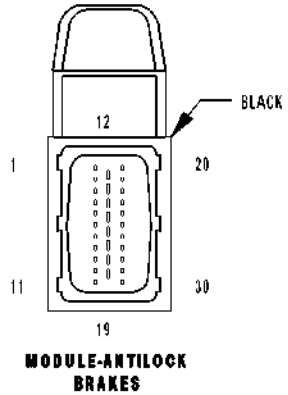
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1068-LEFT REAR OUTLET VALVE CONTROL CIRCUIT LOW





C1068-LEFT REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

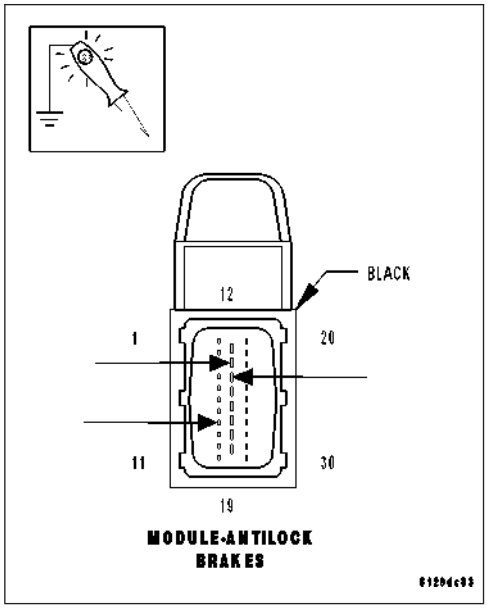
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

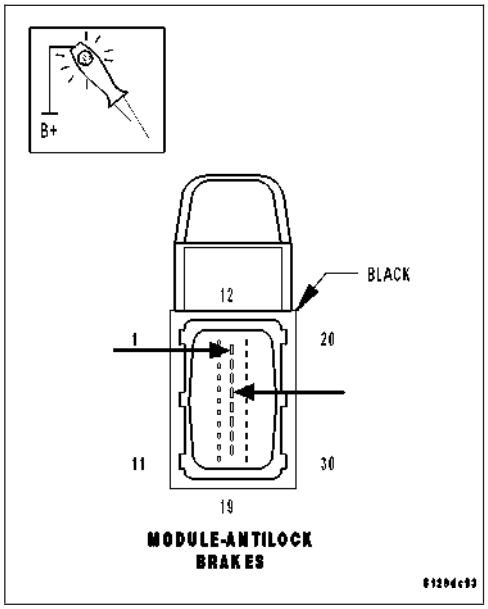
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1068-LEFT REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

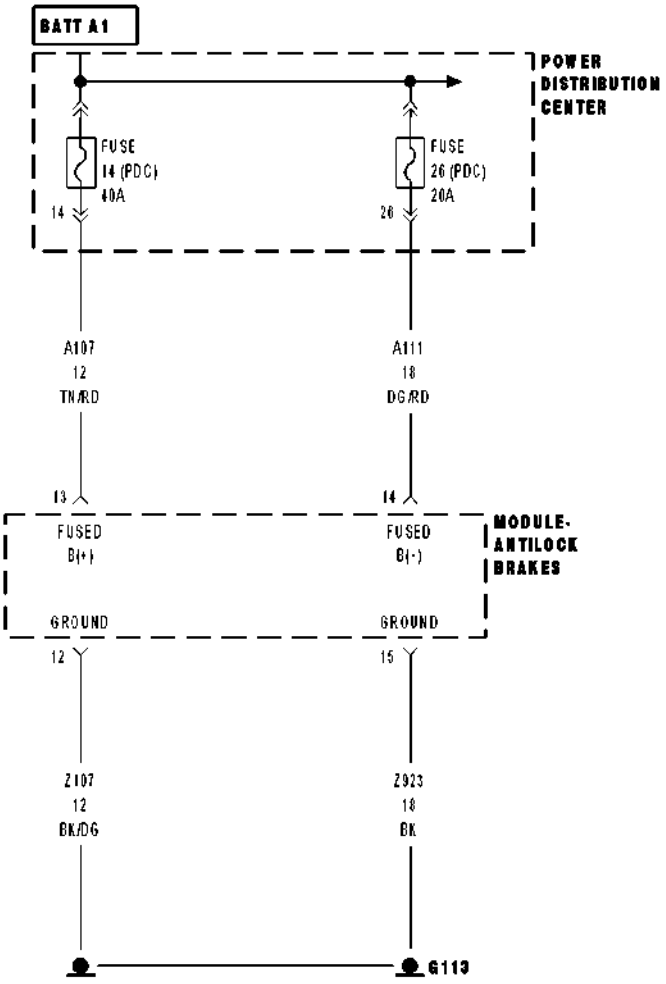


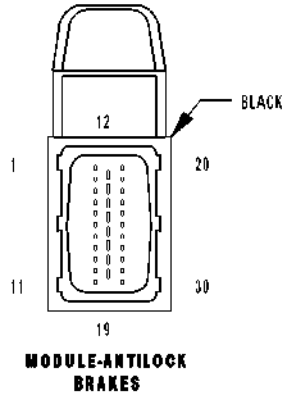
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C106C-RIGHT REAR OUTLET VALVE CONTROL CIRCUIT LOW





C106C-RIGHT REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

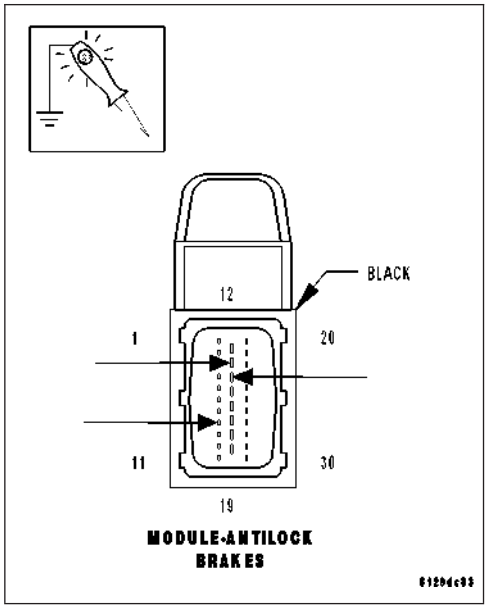
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

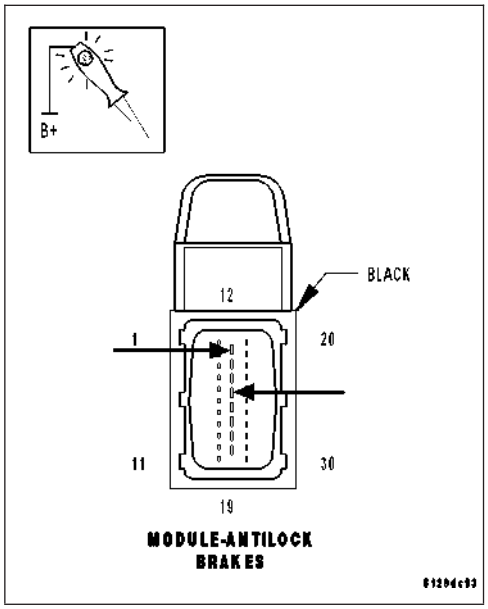
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C106C-RIGHT REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

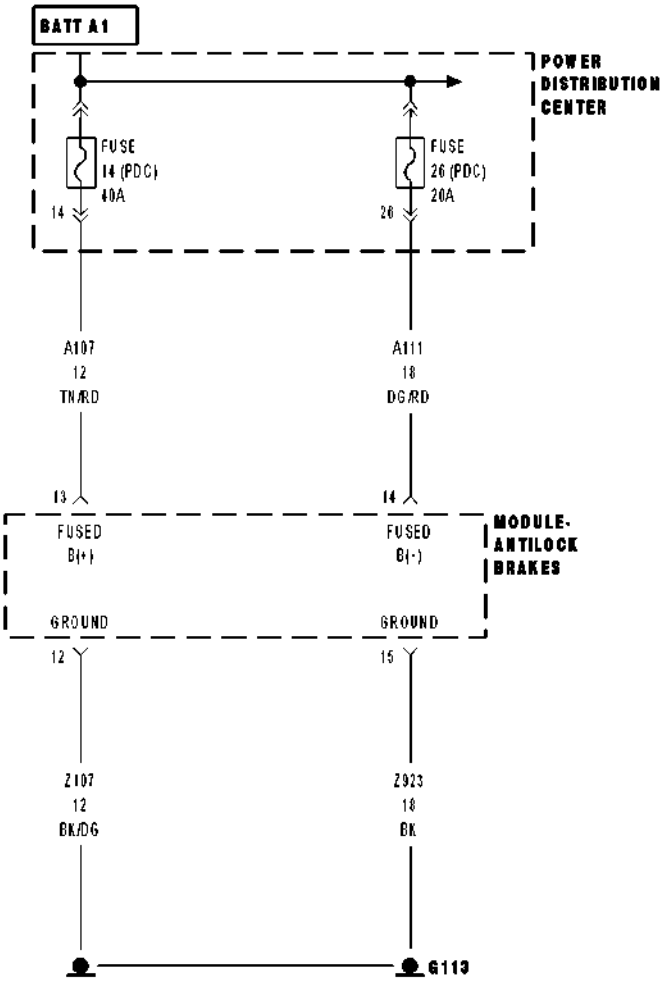


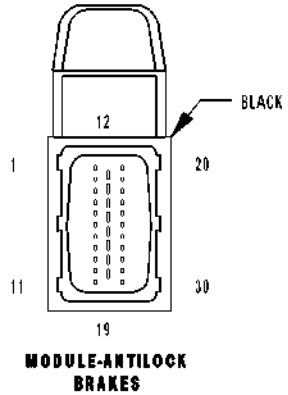
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1070-REAR OUTLET VALVE CONTROL CIRCUIT LOW





C1070-REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback signal does not match the actustion signal for the corresponding valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

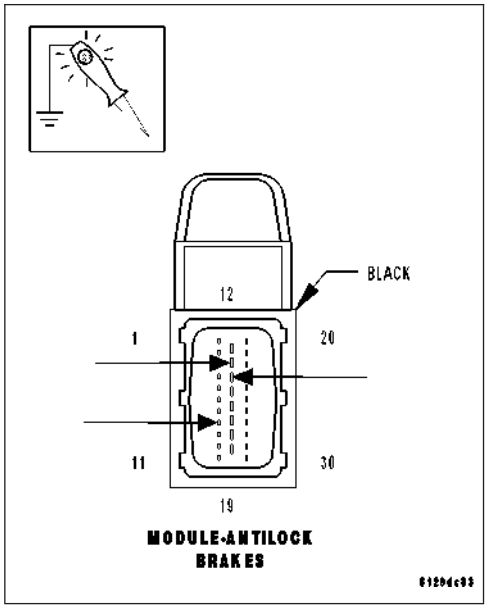
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

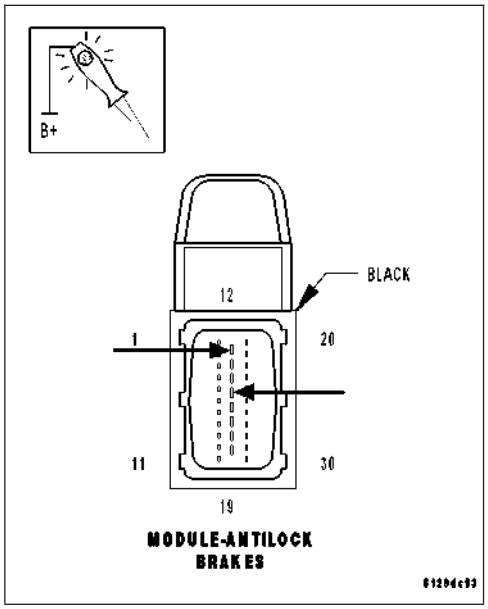
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1070-REAR OUTLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

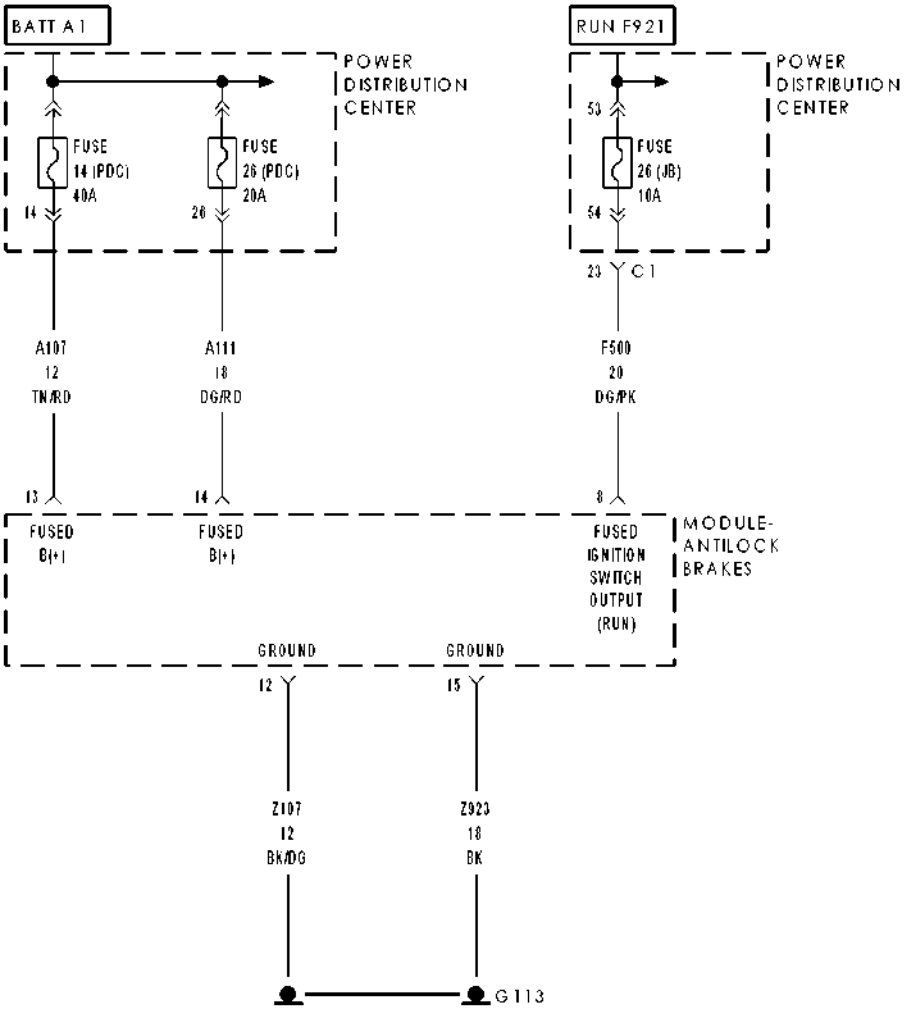


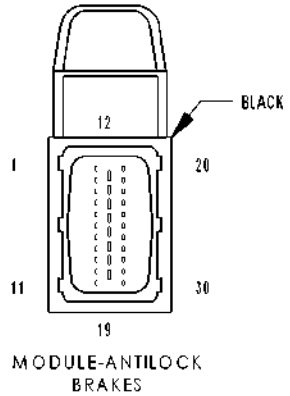
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1074-ABS PUMP MOTOR CONTROL CIRCUIT LOW





C1074-ABS PUMP MOTOR CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The ABM detects low pump motor feedback voltage with actuation of the pump motor relay.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

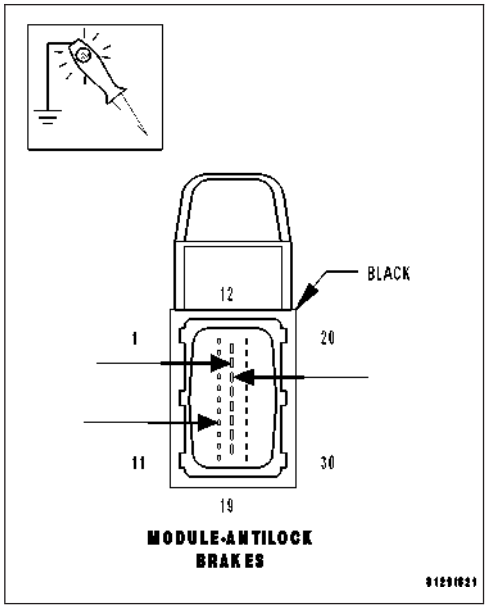
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

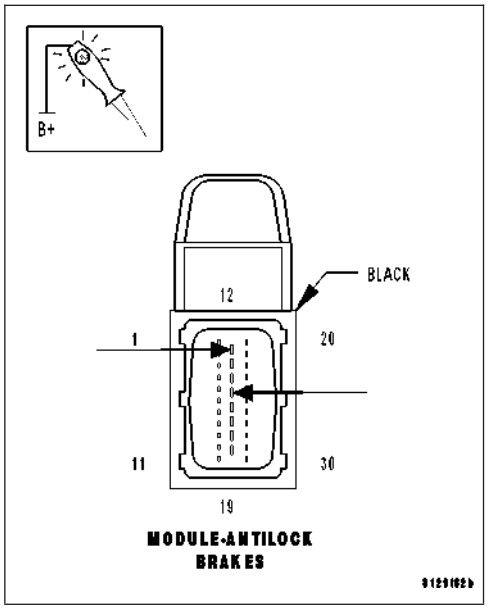
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1074-ABS PUMP MOTOR CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

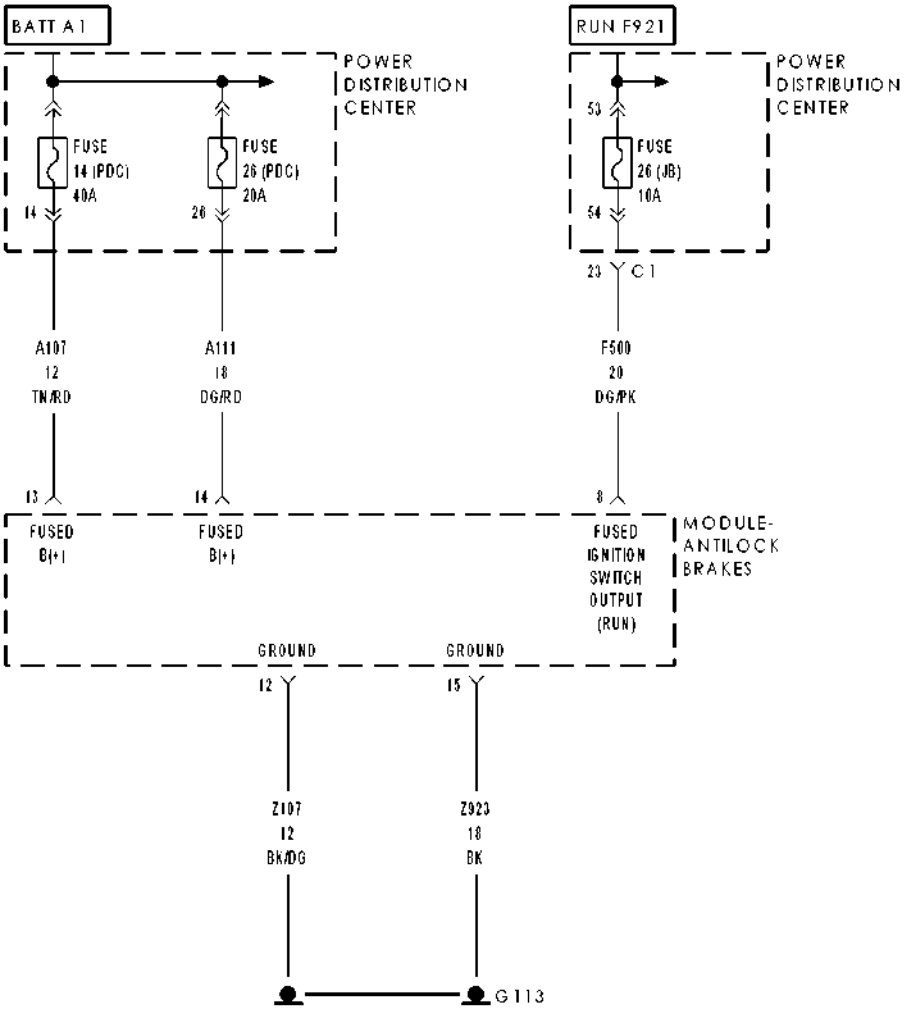


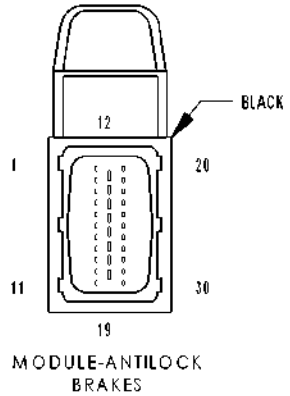
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1077-ABS PUMP MOTOR EXCESSIVE ON TIME





C1077-ABS PUMP MOTOR EXCESSIVE ON TIME (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The ABM detects pump motor feedback voltage with no actuation of the pump motor relay for more than 2.5 sec.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

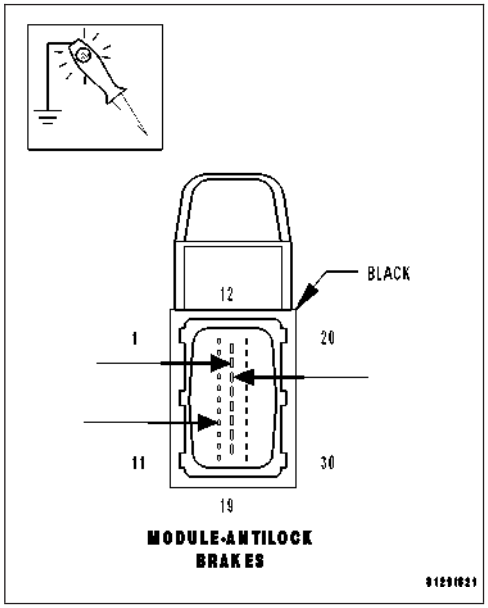
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

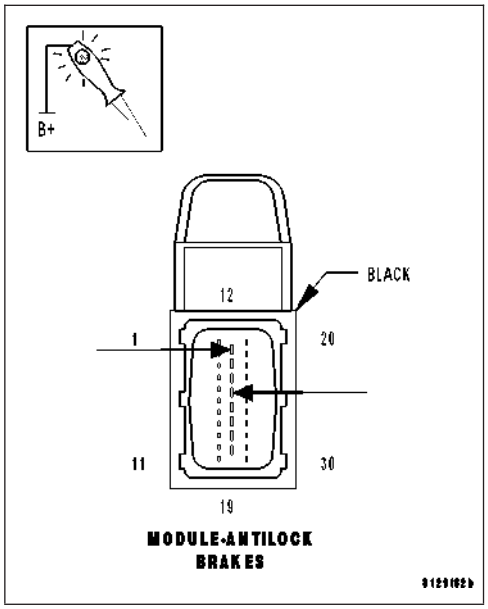
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1077-ABS PUMP MOTOR EXCESSIVE ON TIME (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.



Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

8136ca74

C1078-TIRE EVOLUTIONS RANGE PERFORMANCE (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous.
- **Set Condition:**
  Programmed value for tire sizeis not within acceptable range.

Possible Causes
INCORRECT VALUE PROGRAMED INTO ABM

Diagnostic Test

1. INCORRECT VALUE PROGRAMED INTO ABM

Verify the correct Tire/wheel information is programed in the ABM.

Is the correct value programed is the ABM acording to the chart?

Yes >> Test complete.
Perform ABS VERIFICATION TEST — VER 1.

No >> Program the correct Tire/Wheel information in the ABM.
Perform ABS VERIFICATION TEST — VER 1.

P1079-TONE WHEEL TEETH COUNT RANGE PERFORMANCE (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous.
- **Set Condition:**
  Programmed value for tone wheel is not within acceptable range.

Possible Causes
WRONG TONE WHEEL PROGRAMED INTO THE ABM

Diagnostic Test

1. WRONG TONE WHEEL PROGRAMED INTO THE ABM

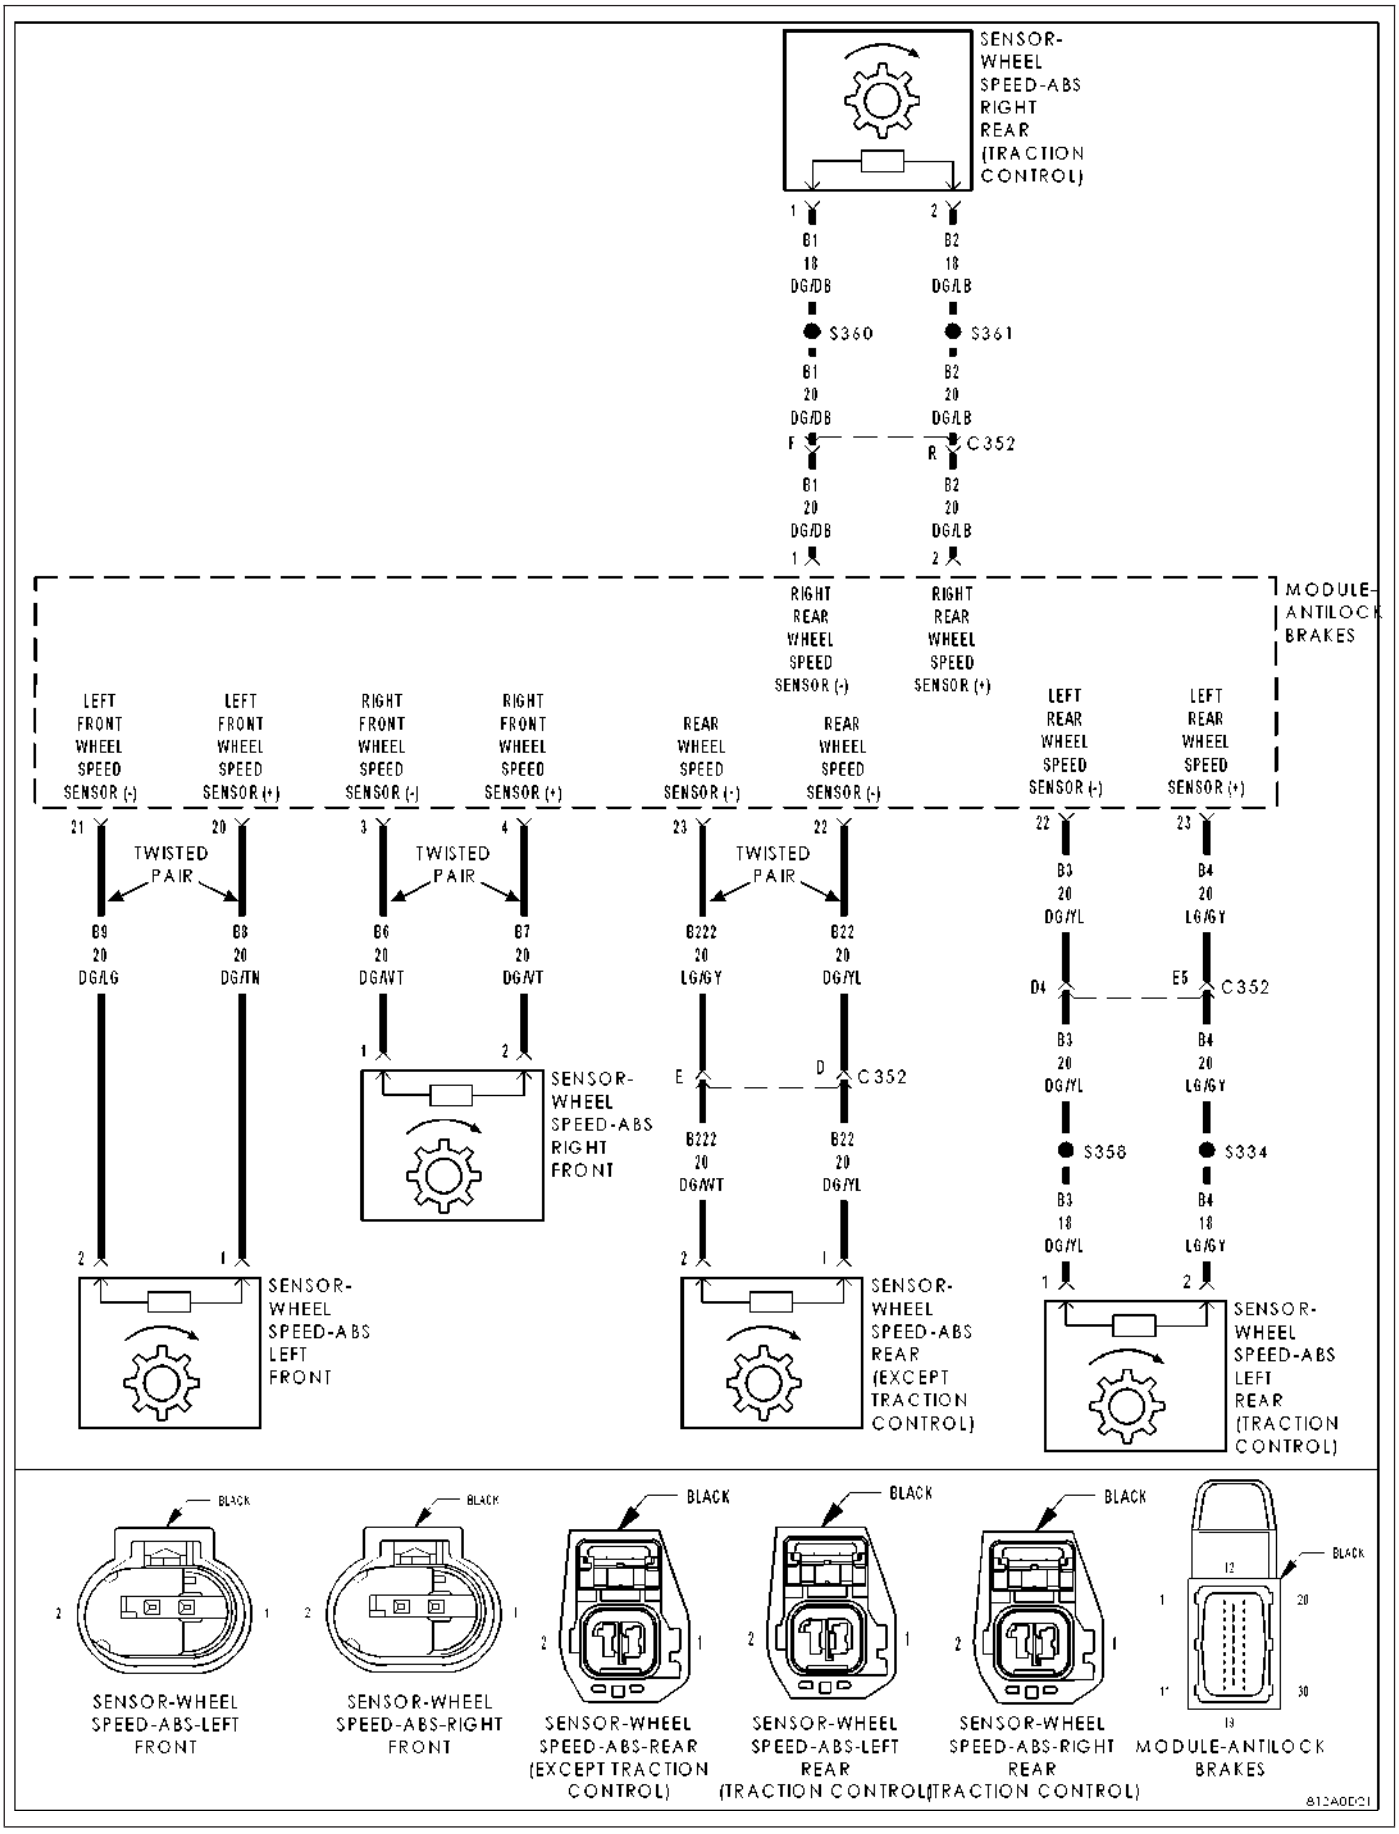
Compair the programed tone wheel value in the ABM to the actual tone wheels on the vehicle.

Is the ABM programed correctly?

Yes >> Test Complete.
Perform ABS VERIFICATION TEST VER — 1.

No >> Reprogram the ABM with the correct values.
Perform ABS VERIFICATION TEST VER — 1.

C107B–WHEEL SPEED COMPARATIVE PERFORMANCE



C107B–WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When one or more WSS reading is different from the readings received from the other WSS's. The Anti-Lock Brake Module compares WSS readings from side-to-side on an axle and front-to-rear.

Possible Causes
WSS LOOSE - SIGNAL,SUPPLY CIRCUITS/CONNECTOR/TERMINAL DAMAGE
BRAKE SYSTEM FAULT
TONE WHEEL DAMAGE
WSS - INTERNAL FAULT
ANTI-LOCK BRAKE MODULE - INTERNAL FAULT

Diagnostic Test

1.

NOTE: This DTC must be active for the results of this test to be valid. CHECK FOR DTC C107B–WHEEL SPEED COMPARATIVE PERFORMANCE

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

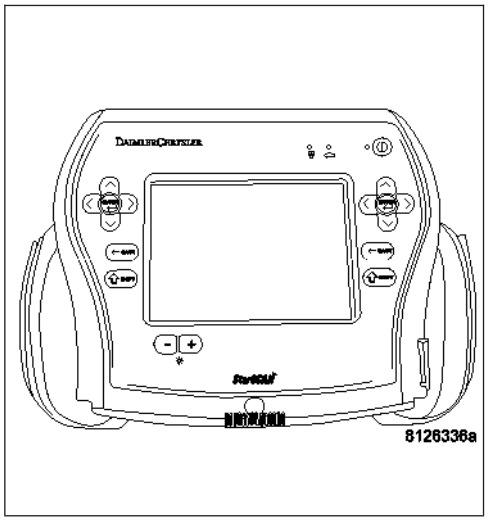
With the scan tool, read DTC's

NOTE: The Anti-Lock Brake Module must sense ALL 4 wheels at 12 km/h (7.5 m.p.h.) before it will extinguish the ABS indicators.

Does the scan tool display: C107B–WHEEL SPEED COMPARATIVE PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



C107B–WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

2. CHECK WHEEL SPEED SENSOR SIGNALS

Turn the ignition on.

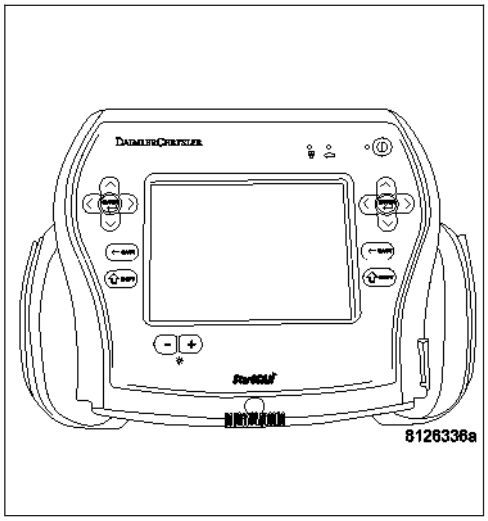
With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.

Slowly accelerate as straight as possible from a stop to 40 km/h (25 m.p.h.).

Is one or more WSS speeds showing 0 km/h (0 m.p.h.) or not matching other wheel speeds?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.



3. CHECK WSS LOOSENESS, INSPECT SIGNAL,SUPPLY CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, each WSS, and each WSS harness connector.

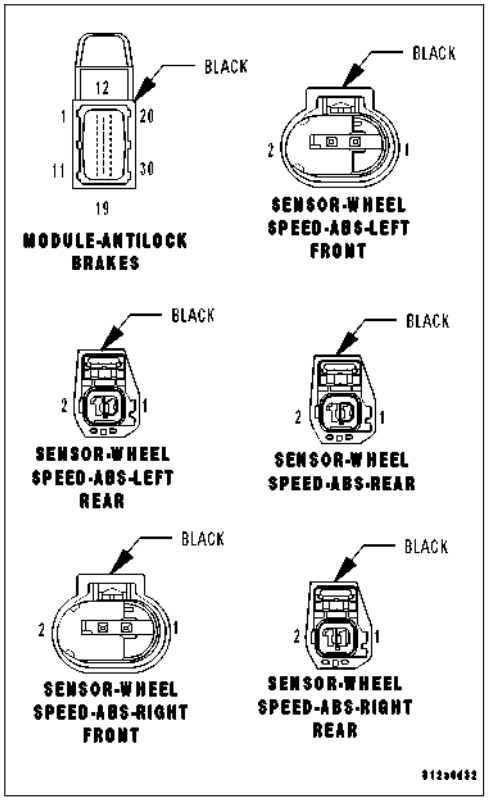
Inspect each WSS for looseness and not properly fastened.

Inspect each WSS Signal and WSS Supply circuits between each WSS and Anti-Lock Brake Module for damage.

Is any WSS loose or any of the wiring/connectors/terminals damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4



C107B–WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

4. CHECK BRAKE SYSTEM

Turn the ignition off.
Check the brake fluid level.
Check for trapped air in brake lines.
Inspect for brake fluid leakage on vehicle.
Inspect for loose mounted brake hardware.

Is any of the above conditions present?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. CHECK EACH TONE WHEEL FOR DAMAGE

Turn the ignition off.
Inspect each Tone Wheel for damage, missing teeth, cracks, or looseness.

NOTE: The Tone Wheel teeth should be perfectly square, not bent, or nicked.

Is the Tone Wheels damaged?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

---

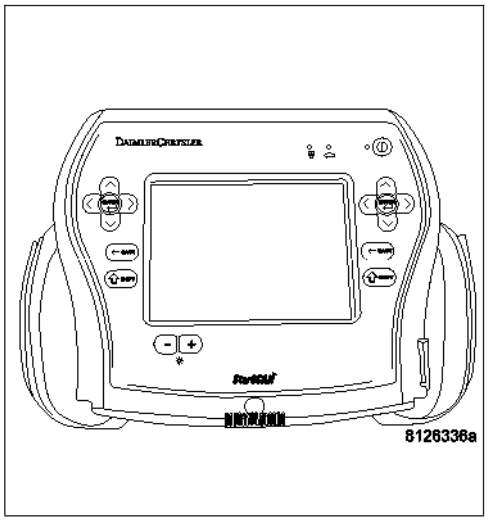
6. ANTI-LOCK BRAKE MODULE – INTERNAL FAULT

Turn the ignition off.
Replace all WSS's.
With the scan tool, erase DTC's.
Road test the vehicle over 40 km/h (25 m.p.h.).
Turn the ignition on.
With the scan tool, read DTC's

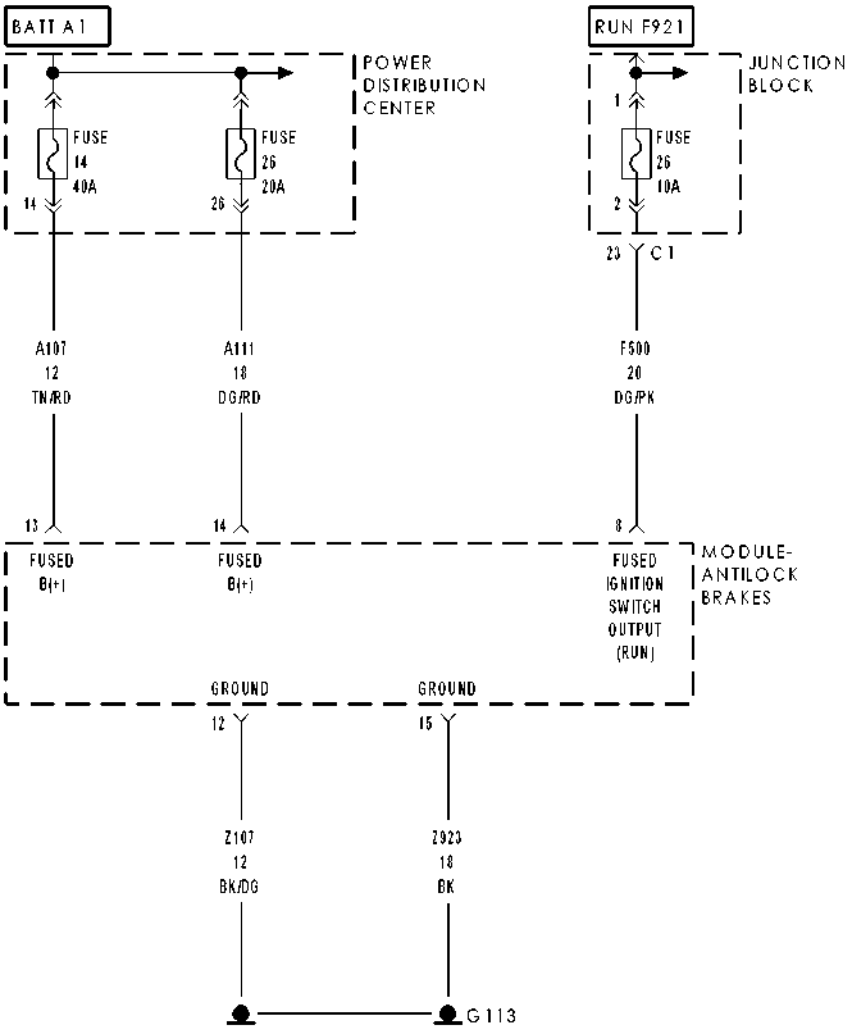
Did the DTC C107B–WHEEL SPEED COMPARATIVE PERFORMANCE reset?

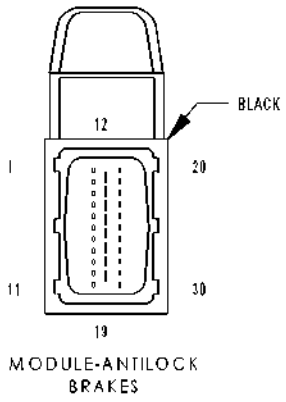
Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.



C1201-FRONT TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW





8129c130

C1201-FRONT TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback of the power stage does not correspond with the activation of the respective valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

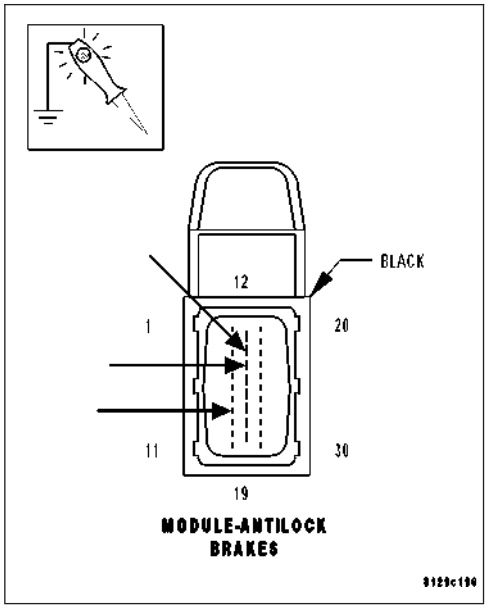
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

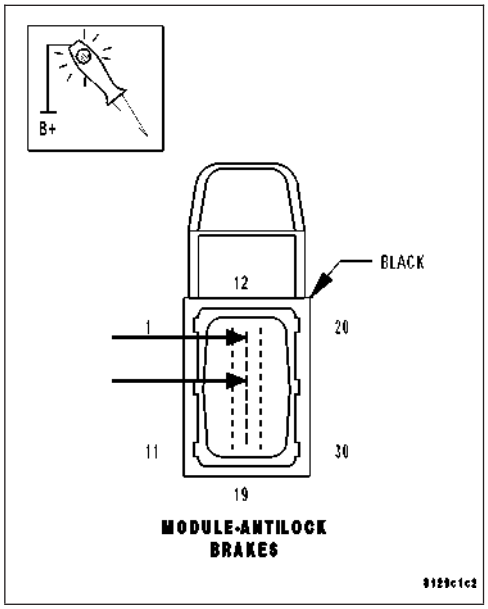
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1201-FRONT TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

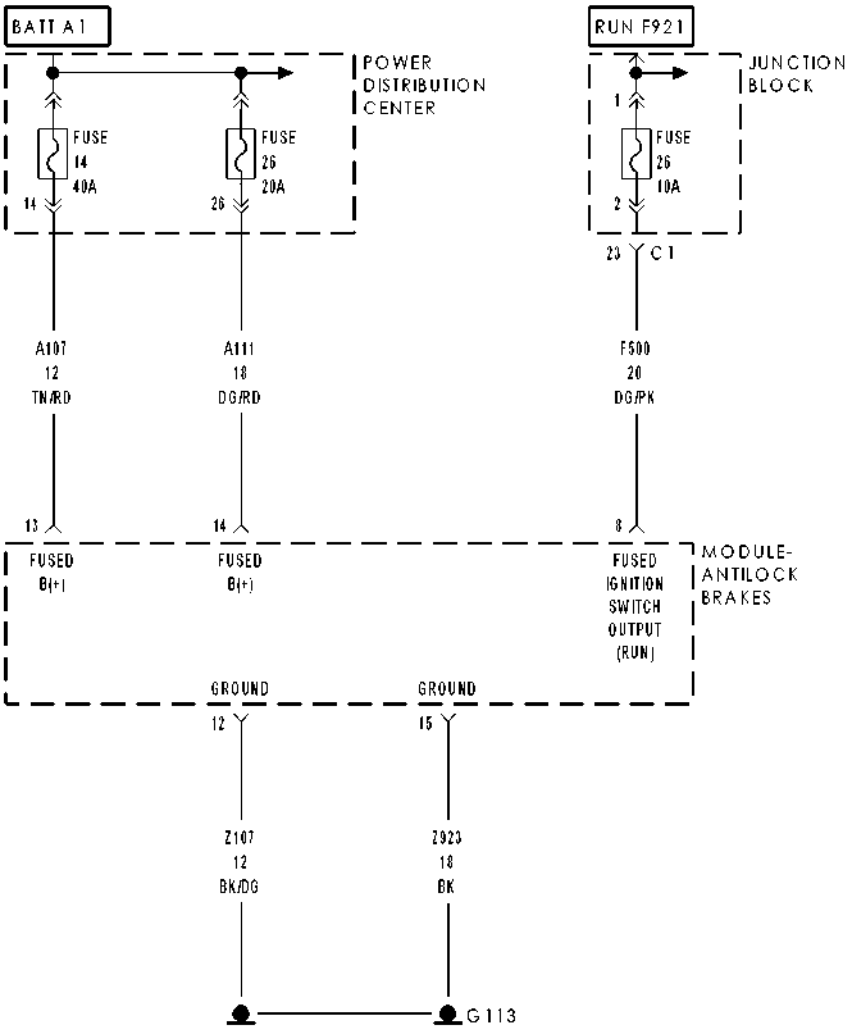


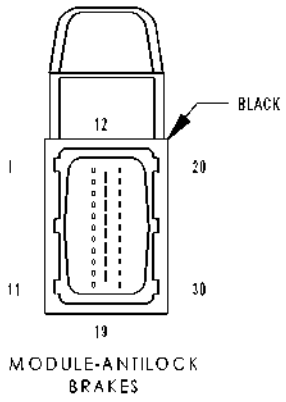
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1205-REAR TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW





8129c130

C1205-REAR TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback of the power stage does not correspond with the activation of the respective valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

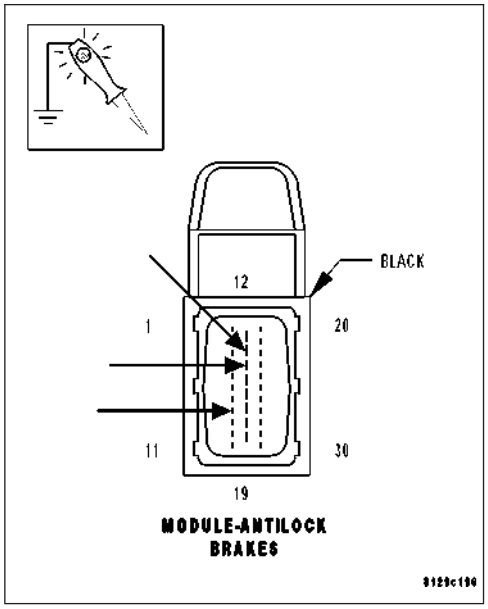
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

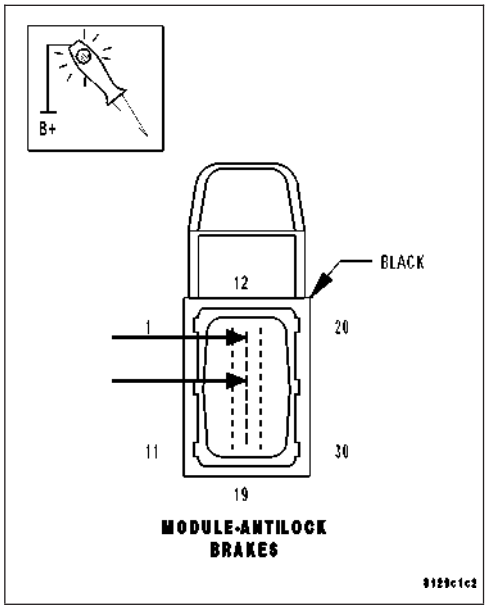
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1205-REAR TRACTION CONTROL INLET VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

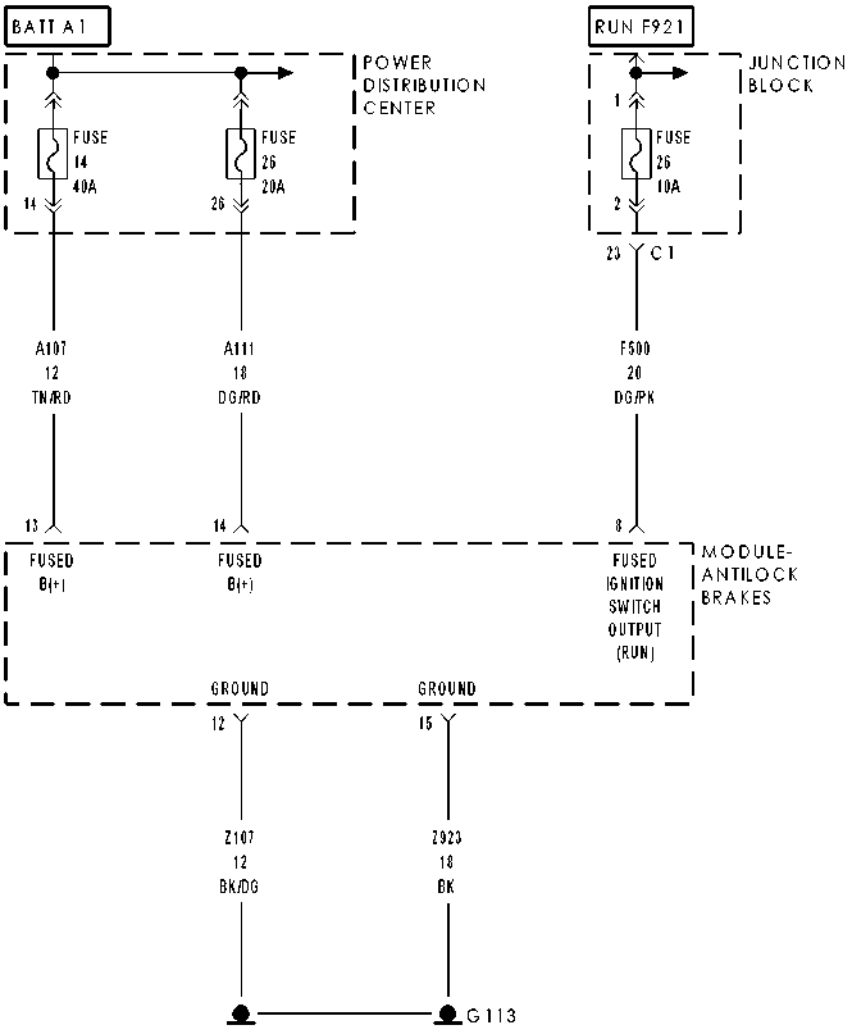


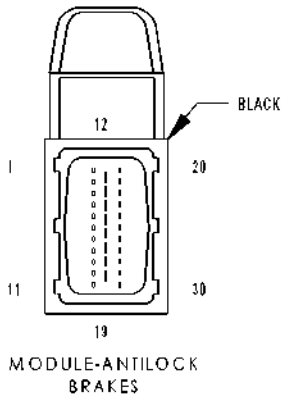
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1209-FRONT TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW





8129c130

C1209-FRONT TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback of the power stage does not correspond with the activation of the respective valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

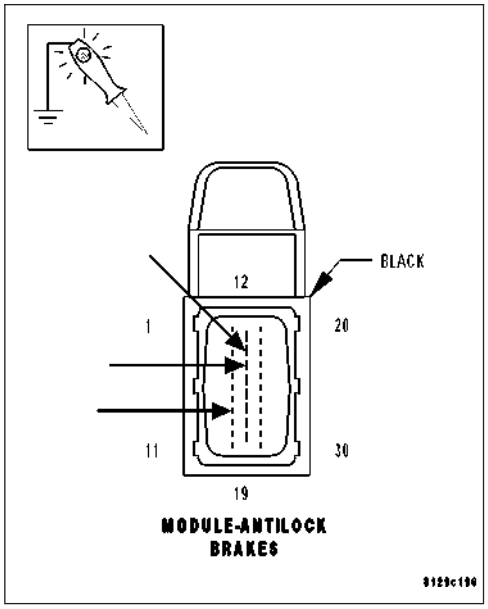
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

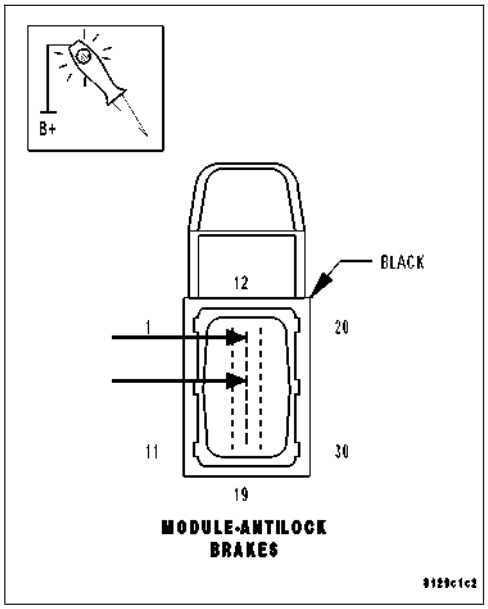
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C1209-FRONT TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

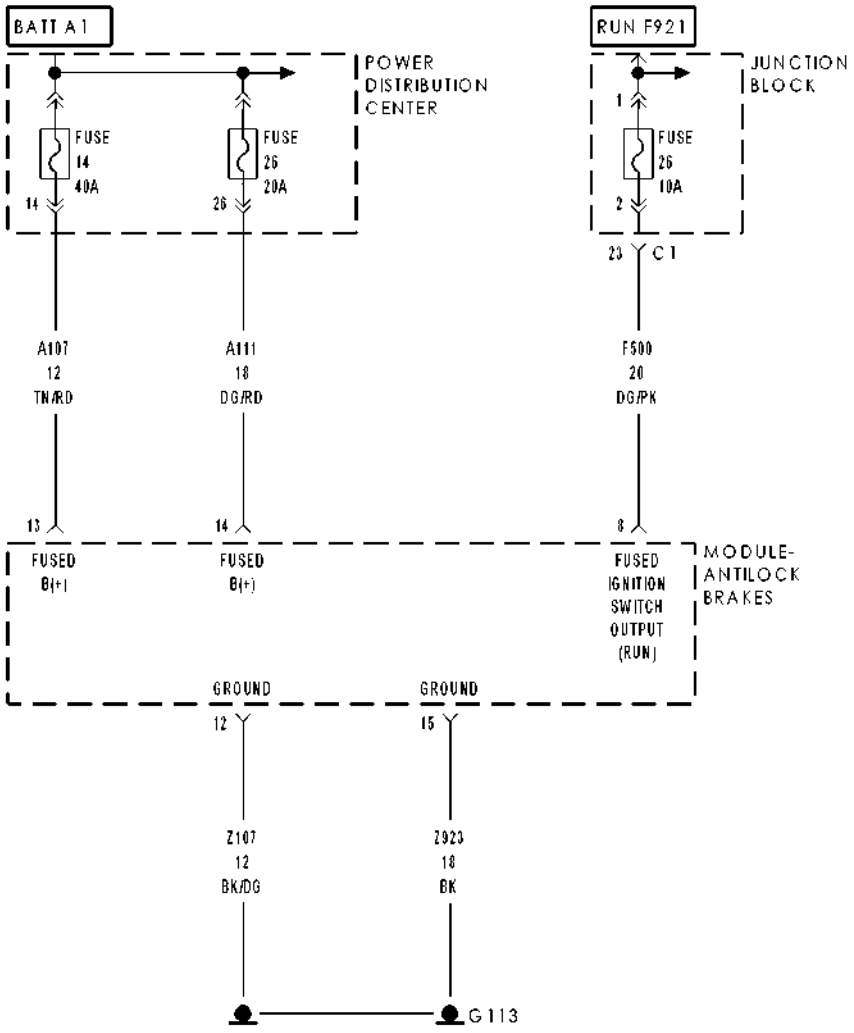


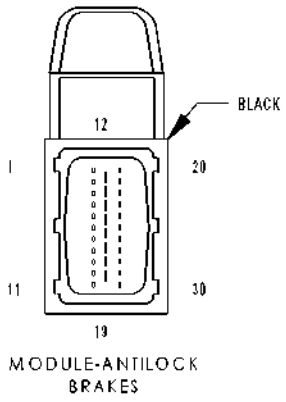
Is the test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C120D-REAR TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW





8129c130

C120D-REAR TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuous
- **Set Condition:**
  The electrical feedback of the power stage does not correspond with the activation of the respective valve.

Possible Causes
HIGH RESISTANCE IN B+ CIRCUITS
HIGH RESISTANCE IN GROUND CIRCUITS
ABM INTERNAL

Diagnostic Test

1. HIGH RESISTANCE IN B+ CIRCUITS

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

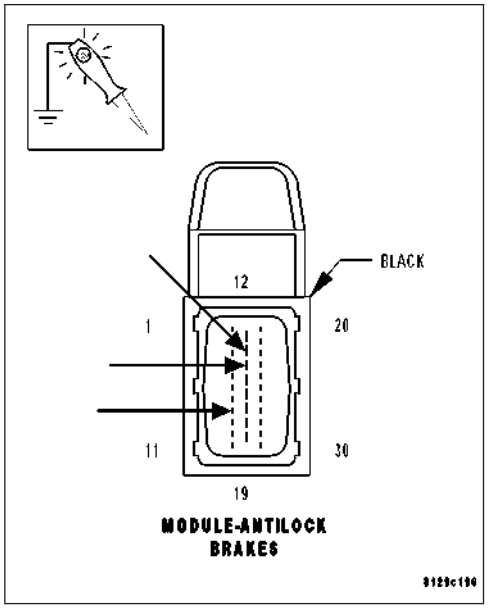
Turn key on, engine off.

With a test light connected to ground check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

Is the test light bright like when connected to the battery?

Yes >> Go to 2

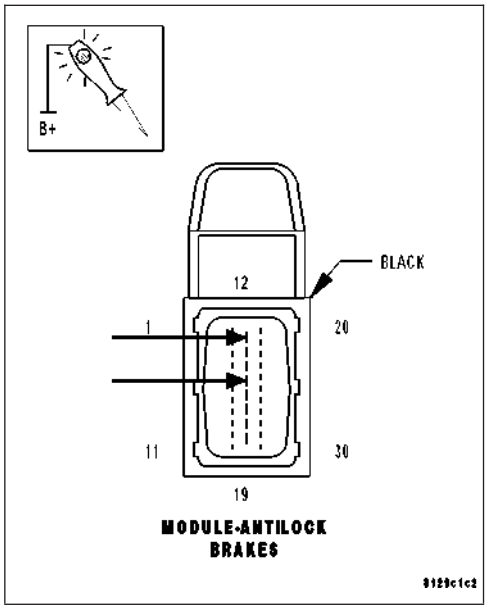
No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C120D-REAR TRACTION CONTROL PRIME VALVE CONTROL CIRCUIT LOW (CONTINUED)

2. HIGH RESISTANCE IN GROUND CIRCUITS

With a test light Connected to B+ check (Z923) Ground and (Z107) Ground.

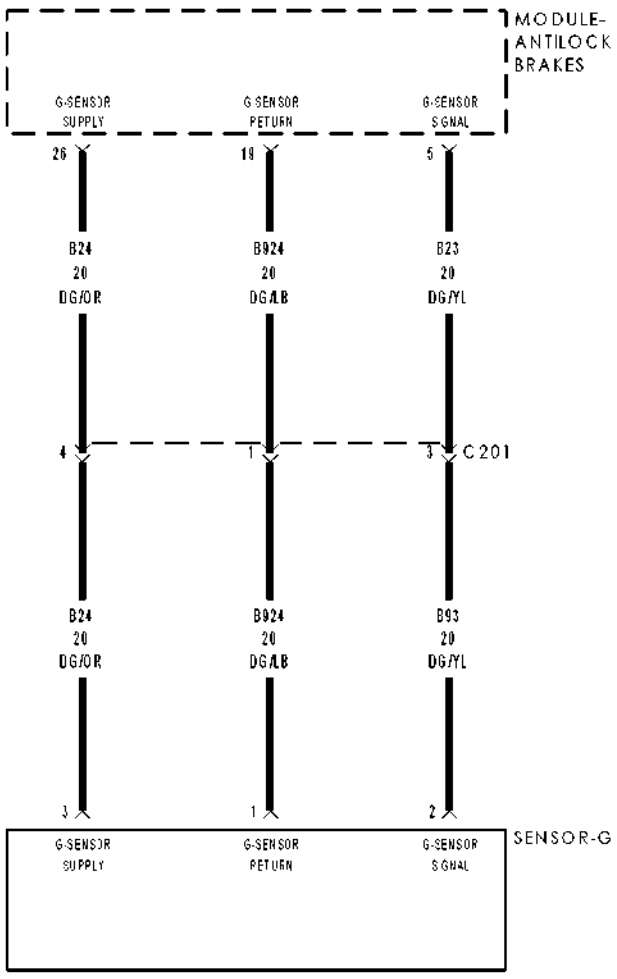


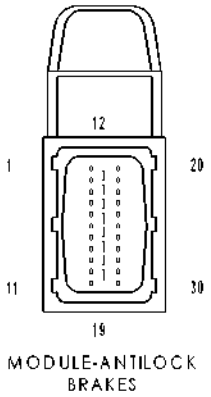
Is the test light bright like when connected to the battery?

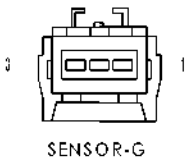
Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.

C1210-G SENSOR INPUT CIRCUIT PERFORMANCE







81278d0e

C1210-G SENSOR INPUT CIRCUIT PERFORMANCE (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After initialization.
- **Set Condition:**
  The voltage of the G-sensor is out of range < 0.48 volts or > 4.82 volts.

Possible Causes
(B24) G-SENSOR SUPPLY CIRCUIT OPEN
(B24) G-SENSOR SUPPLY CIRCUIT SHORT TO GROUND
(B23) G-SENSOR SIGNAL CIRCUIT OPEN
(B23) G-SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(B924) G-SENSOR RETURN CIRCUIT OPEN
(B924) G-SENSOR RETURN CIRCUIT SHORT TO GROUND
G-SENSOR

1. (B24) G-sensor supply circuit open

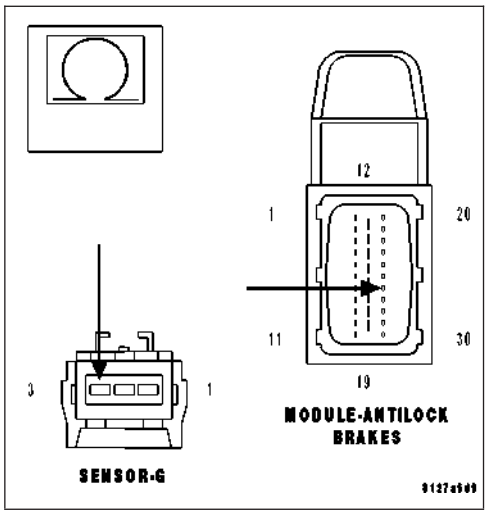
Turn the ignition off.
Disconnect the Anti-lock Brake module harness connector.
Disconnect the G—sensor harness connector.

NOTE: Check connector - Clean/repair as necessary.
Measure the resistance of the (B24) G-sensor supply circuit from the G-sensor harness connector to the Anti-lock brake module.

Is the resistance above 5 ohms?

Yes >> Repair the open (B24) G-sensor supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 2



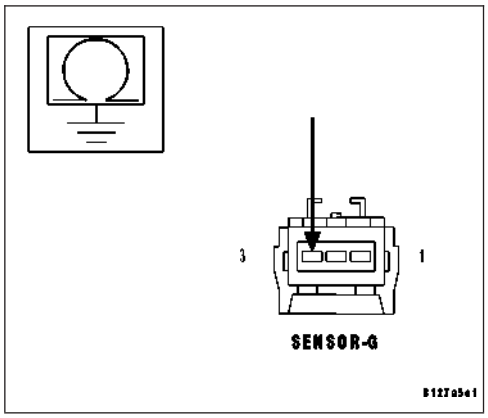
2. (B24) G-sensor supply circuit shorted to ground

Measure the resistance of the (B24) G-sensor supply circuit from the G-sensor harness connector to ground.

Is the resistance below 5 ohms?

Yes >> Repair the (B24) G-sensor supply circuit shorted to ground.
Perform ABS VERIFICATION TEST - VER 1.

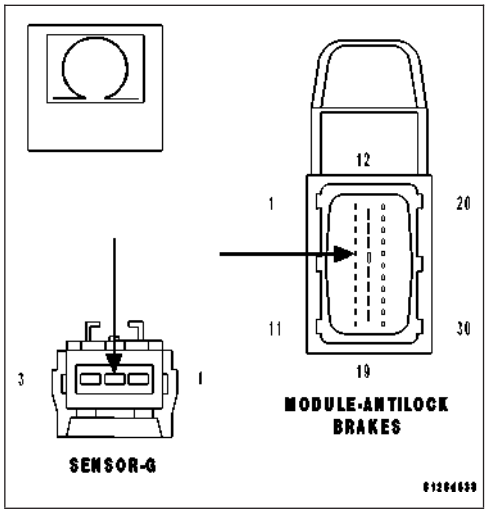
No >> Go to 3



C1210-G SENSOR INPUT CIRCUIT PERFORMANCE (CONTINUED)

3. (B23) G-sensorsignal circuit open

Measure the resistance of the (B23) G-sensor signal circuit from the G-sensor harness connector to the Anti-lock brake module.



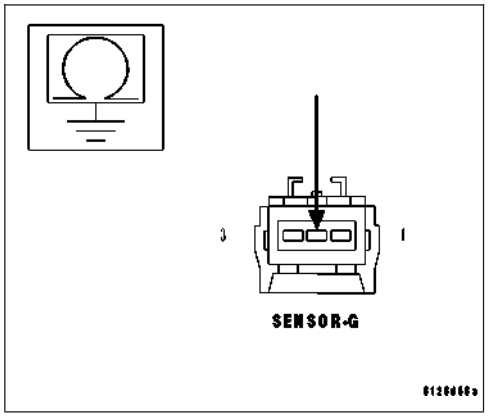
Is the resistance above 5 ohms?

Yes >> Repair the open (B23) G-sensor signal circuit. Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 4

4. (B23) G-sensor signal circuit shorted to ground

Measure the resistance of the (B23) G-sensor signal circuit from the G-sensor harness connector to ground.



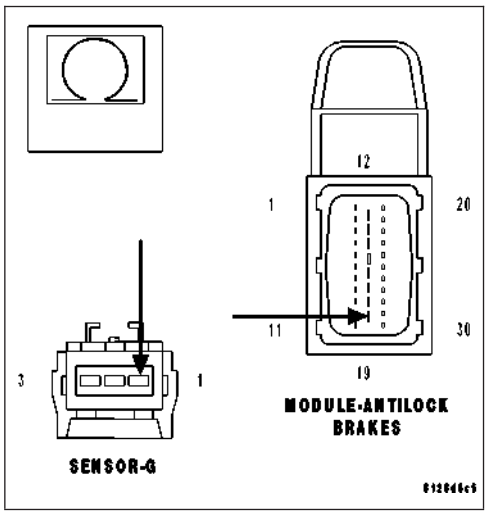
Is the resistance below 5 ohms?

Yes >> Repair the (B23) G-sensor signal circuit shorted to ground. Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 5

5. (B924) G-sensor return circuit open

Measure the resistance of the (B924) G-sensor return circuit from the G-sensor harness connector to the Anti-lock brake module.



Is the resistance above 5 ohms?

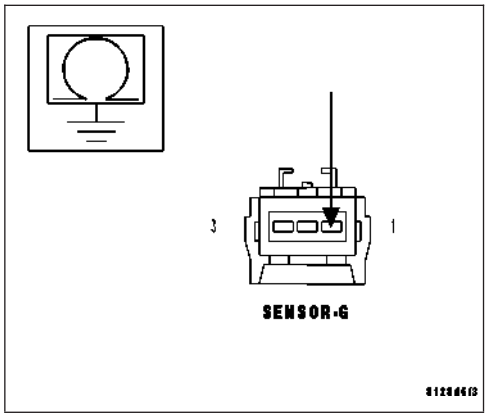
Yes >> Repair the open (B924) G-sensor return circuit. Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 6

C1210-G SENSOR INPUT CIRCUIT PERFORMANCE (CONTINUED)

6. (B924) G-sensor return circuit shorted to ground

Measure the resistance of the (B924) G-sensor return circuit from the G-sensor harness connector to ground.

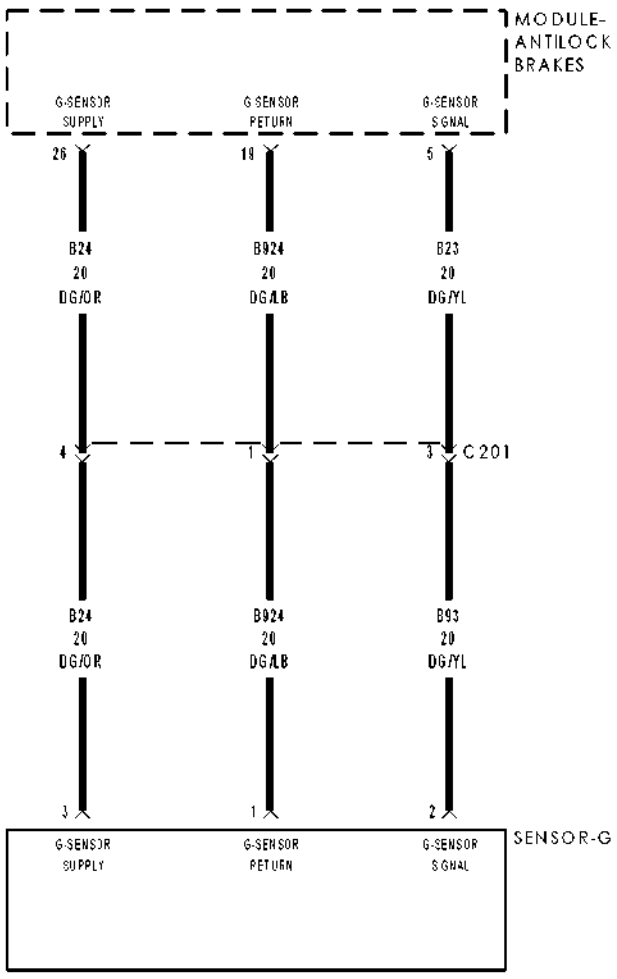


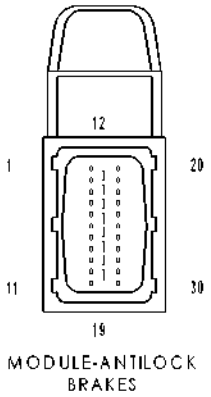
Is the resistance below 5 ohms?

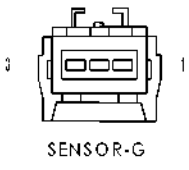
Yes >> Repair the (B924) G-sensor return circuit shorted to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the G-sensor.
Perform ABS VERIFICATION TEST - VER 1.

C1213-G SENSOR INPUT SIGNAL STUCK







81278d0e

C1213-G SENSOR INPUT SIGNAL STUCK (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition ON. Continuously monitored when speed is greater than 2 km/h (1 mph) and there is no Brake Lamp Switch input.
- **Set Condition:**
  When the ABM detects a condition outside programmed parameters from the G-Sensor.

Possible Causes
(B24) G-SENSOR SUPPLY CIRCUIT OPEN
(B24) G-SENSOR SUPPLY CIRCUIT SHORT TO GROUND
(B23) G-SENSOR SIGNAL CIRCUIT OPEN
(B23) G-SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(B924) G-SENSOR RETURN CIRCUIT OPEN
(B924) G-SENSOR RETURN CIRCUIT SHORT TO GROUND
G-SENSOR

1. (B24) G-sensor supply circuit open

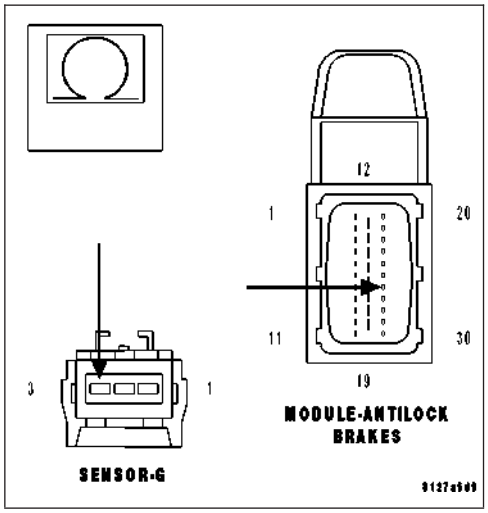
Turn the ignition off.

Disconnect the Anti-lock Brake module harness connector.

Disconnect the G—sensor harness connector.

NOTE: Check connector - Clean/repair as necessary.

Measure the resistance of the (B24) G-sensor supply circuit from the G-sensor harness connector to the Anti-lock brake module.



Is the resistance above 5 ohms?

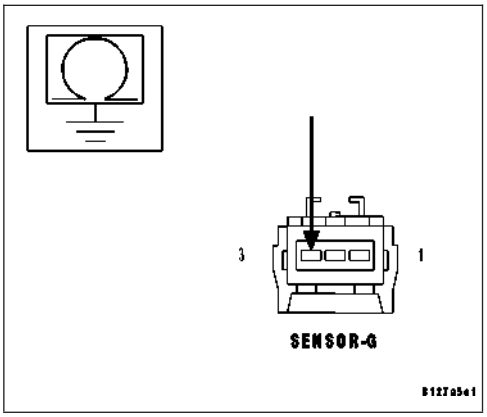
Yes >> Repair the open (B24) G-sensor supply circuit. Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 2

C1213-G SENSOR INPUT SIGNAL STUCK (CONTINUED)

2. (B24) G-sensor supply circuit shorted to ground

Measure the resistance of the (B24) G-sensor supply circuit from the G-sensor harness connector to ground.



Is the resistance below 5 ohms?

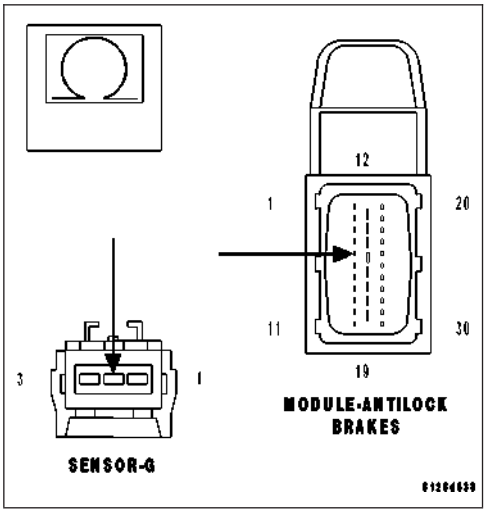
Yes >> Repair the (B24) G-sensor supply circuit shorted to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 3

---

3. (B23) G-sensorsignal circuit open

Measure the resistance of the (B23) G-sensor signal circuit from the G-sensor harness connector to the Anti-lock brake module.



Is the resistance above 5 ohms?

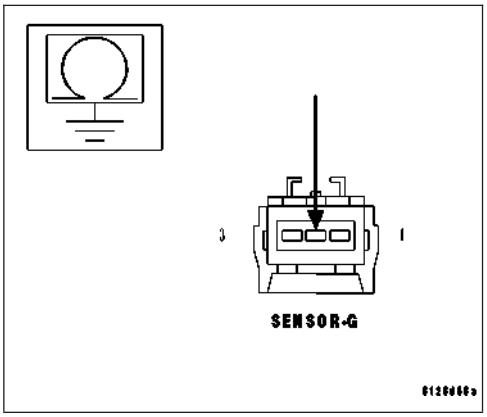
Yes >> Repair the open (B23) G-sensor signal circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 4

---

4. (B23) G-sensor signal circuit shorted to ground

Measure the resistance of the (B23) G-sensor signal circuit from the G-sensor harness connector to ground.



Is the resistance below 5 ohms?

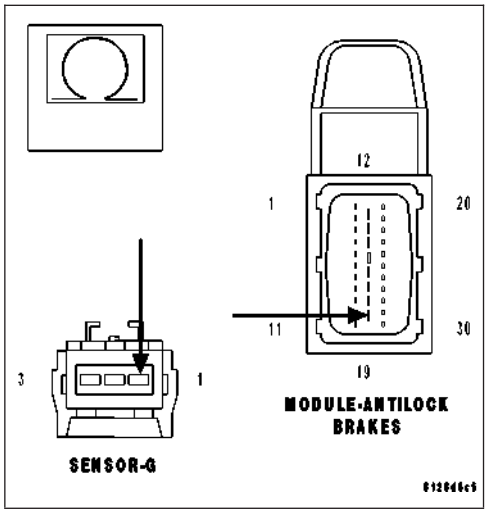
Yes >> Repair the (B23) G-sensor signal circuit shorted to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 5

C1213-G SENSOR INPUT SIGNAL STUCK (CONTINUED)

5. (B924) G-sensor return circuit open

Measure the resistance of the (B924) G-sensor return circuit from the G-sensor harness connector to the Anti-lock brake module.



Is the resistance above 5 ohms?

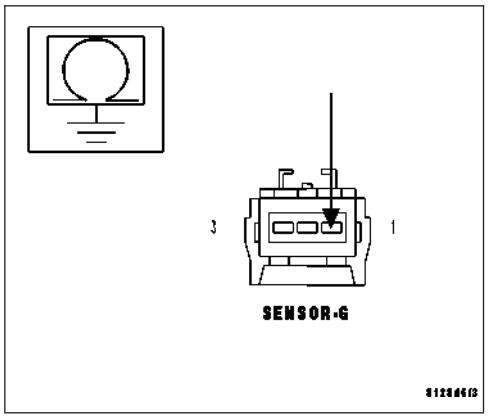
Yes >> Repair the open (B924) G-sensor return circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go to 6

---

6. (B924) G-sensor return circuit shorted to ground

Measure the resistance of the (B924) G-sensor return circuit from the G-sensor harness connector to ground.

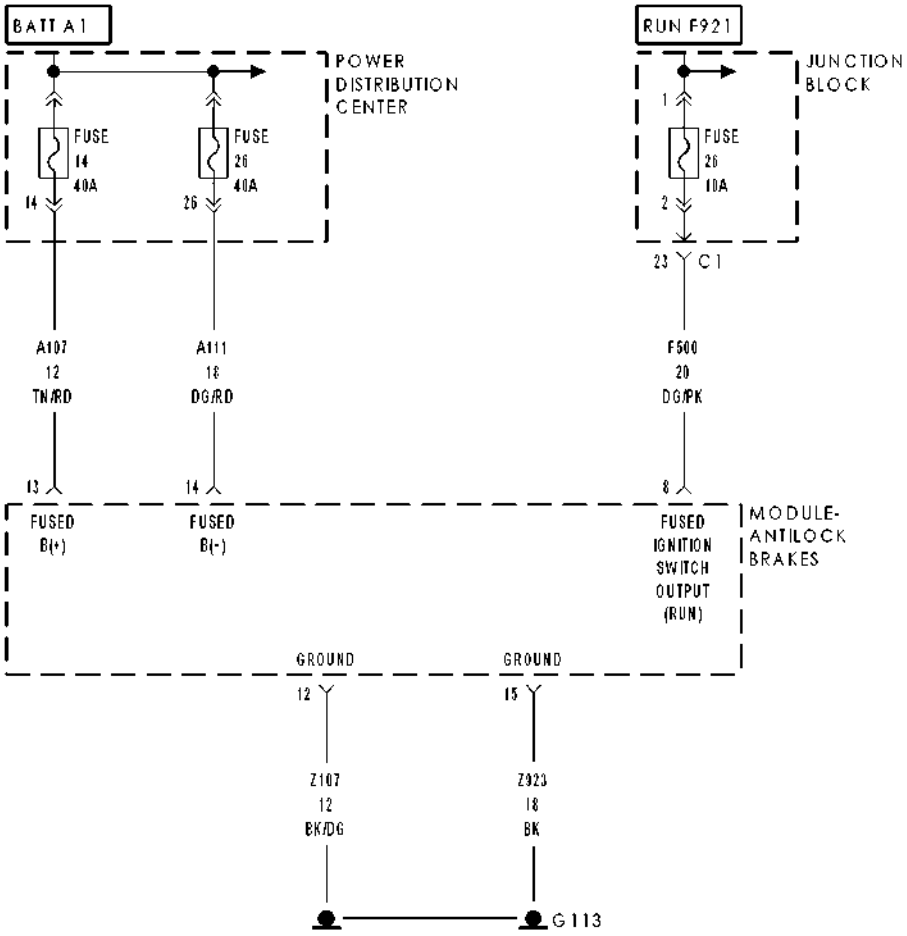


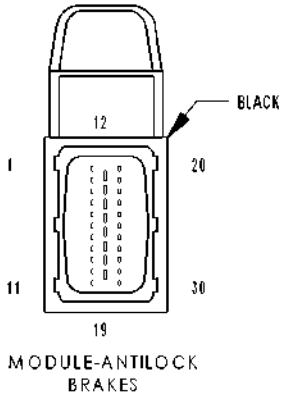
Is the resistance below 5 ohms?

Yes >> Repair the (B924) G-sensor return circuit shorted to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the G-sensor.
Perform ABS VERIFICATION TEST - VER 1.

C2100-BATTERY VOLTAGE LOW





81296169

C2100-BATTERY VOLTAGE LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Vehicle speeds above 6 km/h (3.4 mph).
- **Set Condition:**
  Voltage is <8.8 volts for >500 ms at vehicle speeds above 6 km/h (3.4 mph).

Possible Causes
DTC'S IN THE PCM
CHARGING SYSTEM FAILURE

Diagnostic Test

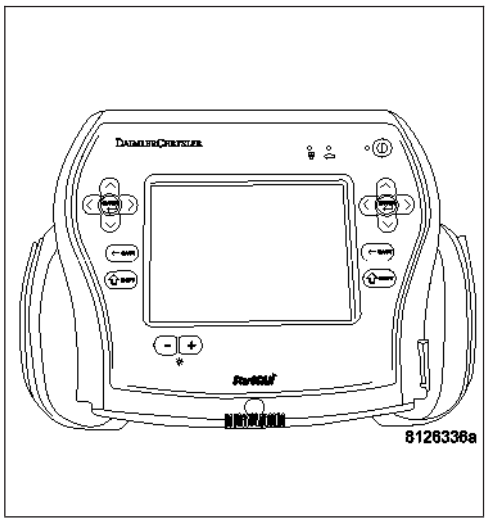
1. DTC'S IN THE PCM

With the scan tool read DTC's from the PCM.

Are any charging system codes present?

Yes >> Repair the charging system DTC in the PCM.
Perform ABS VERIFICATION TEST — VER 1.

No >> Go To 2



2. CHARGING SYSTEM FAILURE

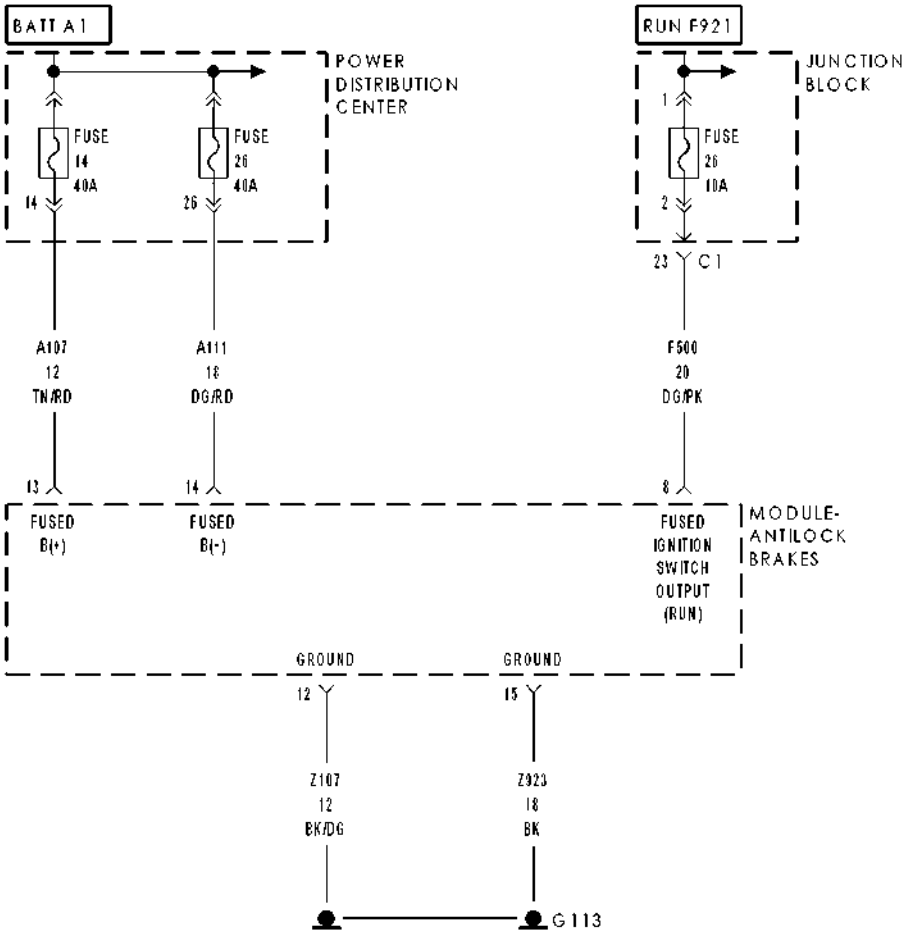
With a scan tool read input voltage.

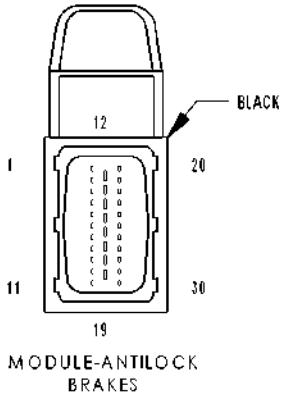
Is voltage under 8.8 volts?

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

Yes >> Repair the charging system per service information.
Perform ABS VERIFICATION TEST — VER 1.

C2101-BATTERY VOLTAGE HIGH





C2101-BATTERY VOLTAGE HIGH (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

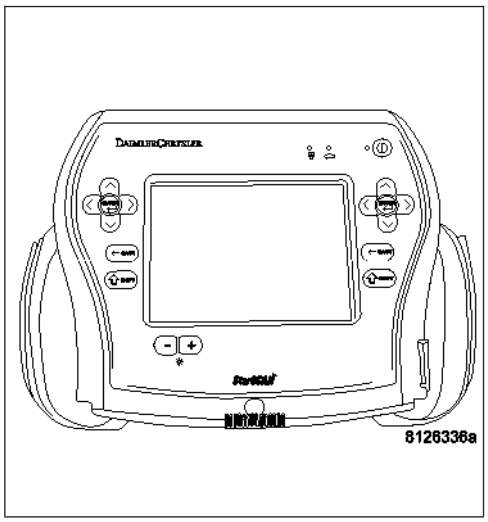
- **When Monitored:**
  Vehicle speeds above 6 km/h (3.4 mph).
- **Set Condition:**
  Voltage is >17.4 volts for >500 ms at vehicle speeds above 6 km/h

Possible Causes
DTC'S IN THE PCM
CHARGING SYSTEM FAILURE

Diagnostic Test

1. DTC'S IN THE PCM

With the scan tool read DTC's from the PCM.



Are any charging system codes present?

Yes >> Repair the charging system DTC in the PCM.
Perform ABS VERIFICATION TEST — VER 1.

No >> Go To 2

2. CHARGING SYSTEM FAILURE

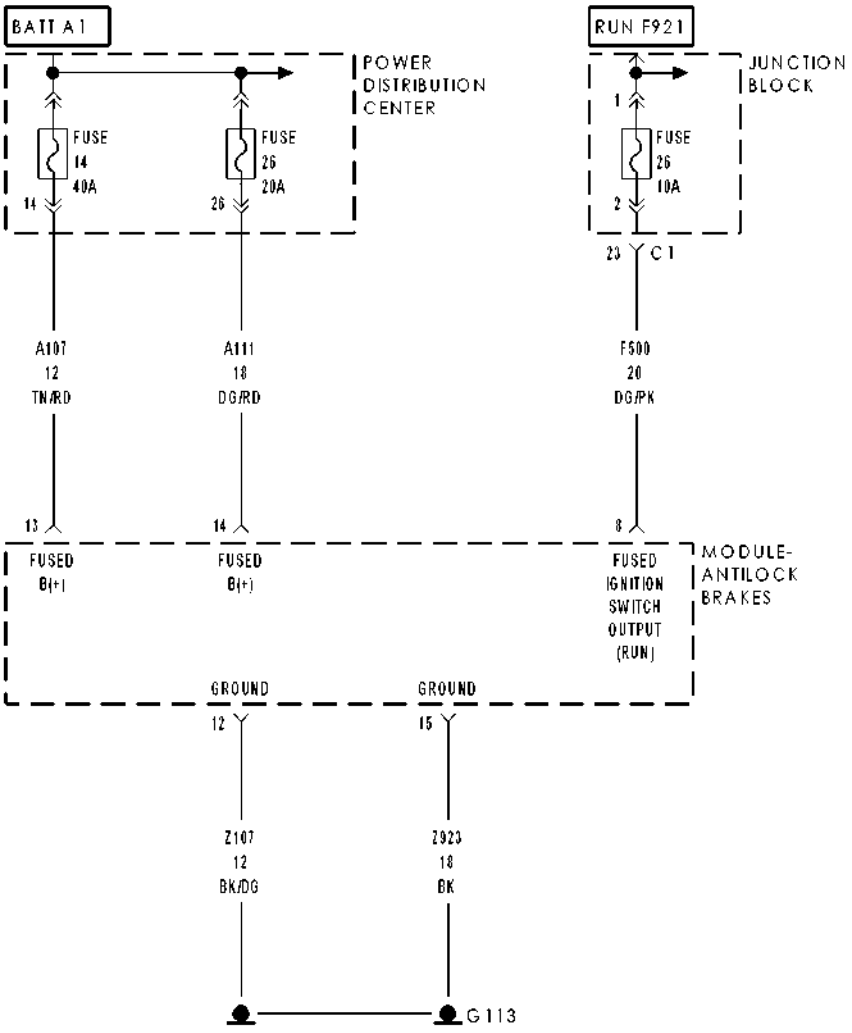
With a scan tool read input voltage.

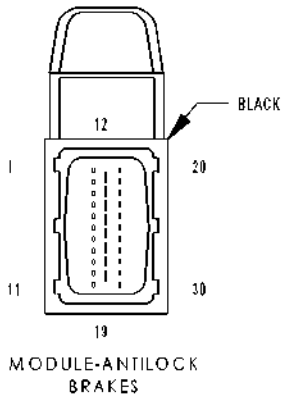
Is voltage over 17.0 volts?

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

Yes >> Repair the charging system per service information.
Perform ABS VERIFICATION TEST — VER 1.

C2105-ABS VALVE SUPPLY VOLTAGE CIRCUIT LOW





8129e736

C2105-ABS VALVE SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The monitor function test the supply voltage of the valves via the valve feedback lines. If three or more valve response falts occur simultaneously, a DTC is set.

Possible Causes
LOW VOLTAGE AT THE ABM
ABM INTERNAL

Diagnostic Test

1. LOW VOLTAGE AT THE ABM

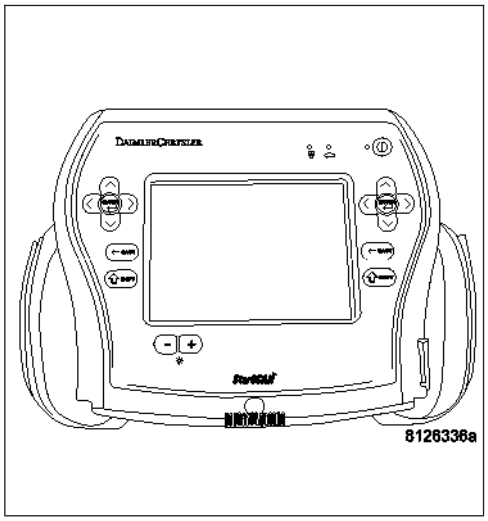
With the scan tool read battery voltage and ignition voltage in the ABM and compare the two reading to actual battery voltage from a voltmeter.

NOTE: Battery must be fully charged.

Are all readings within a half of volt?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Go To 2



C2105-ABS VALVE SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

2. ABM INTERNAL

Turn key off.

Disconnect the ABM harness connector.

NOTE: Check connector - Clean/repair as necessary.

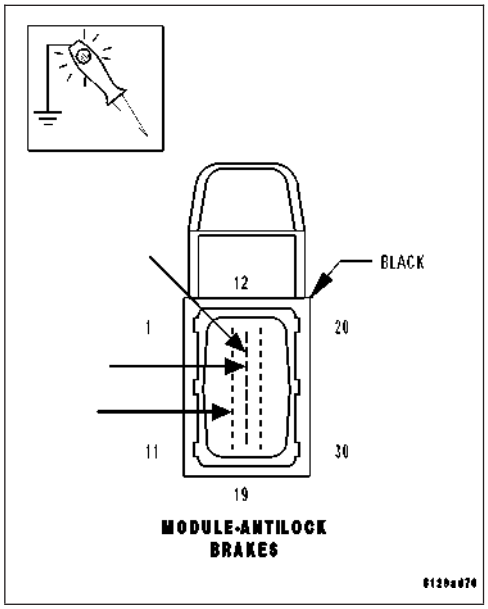
Turn key on, engine off.

With a test light check (A107) Fused B+, (A111) Fused B+ and (F500) Fused ignition switch output.

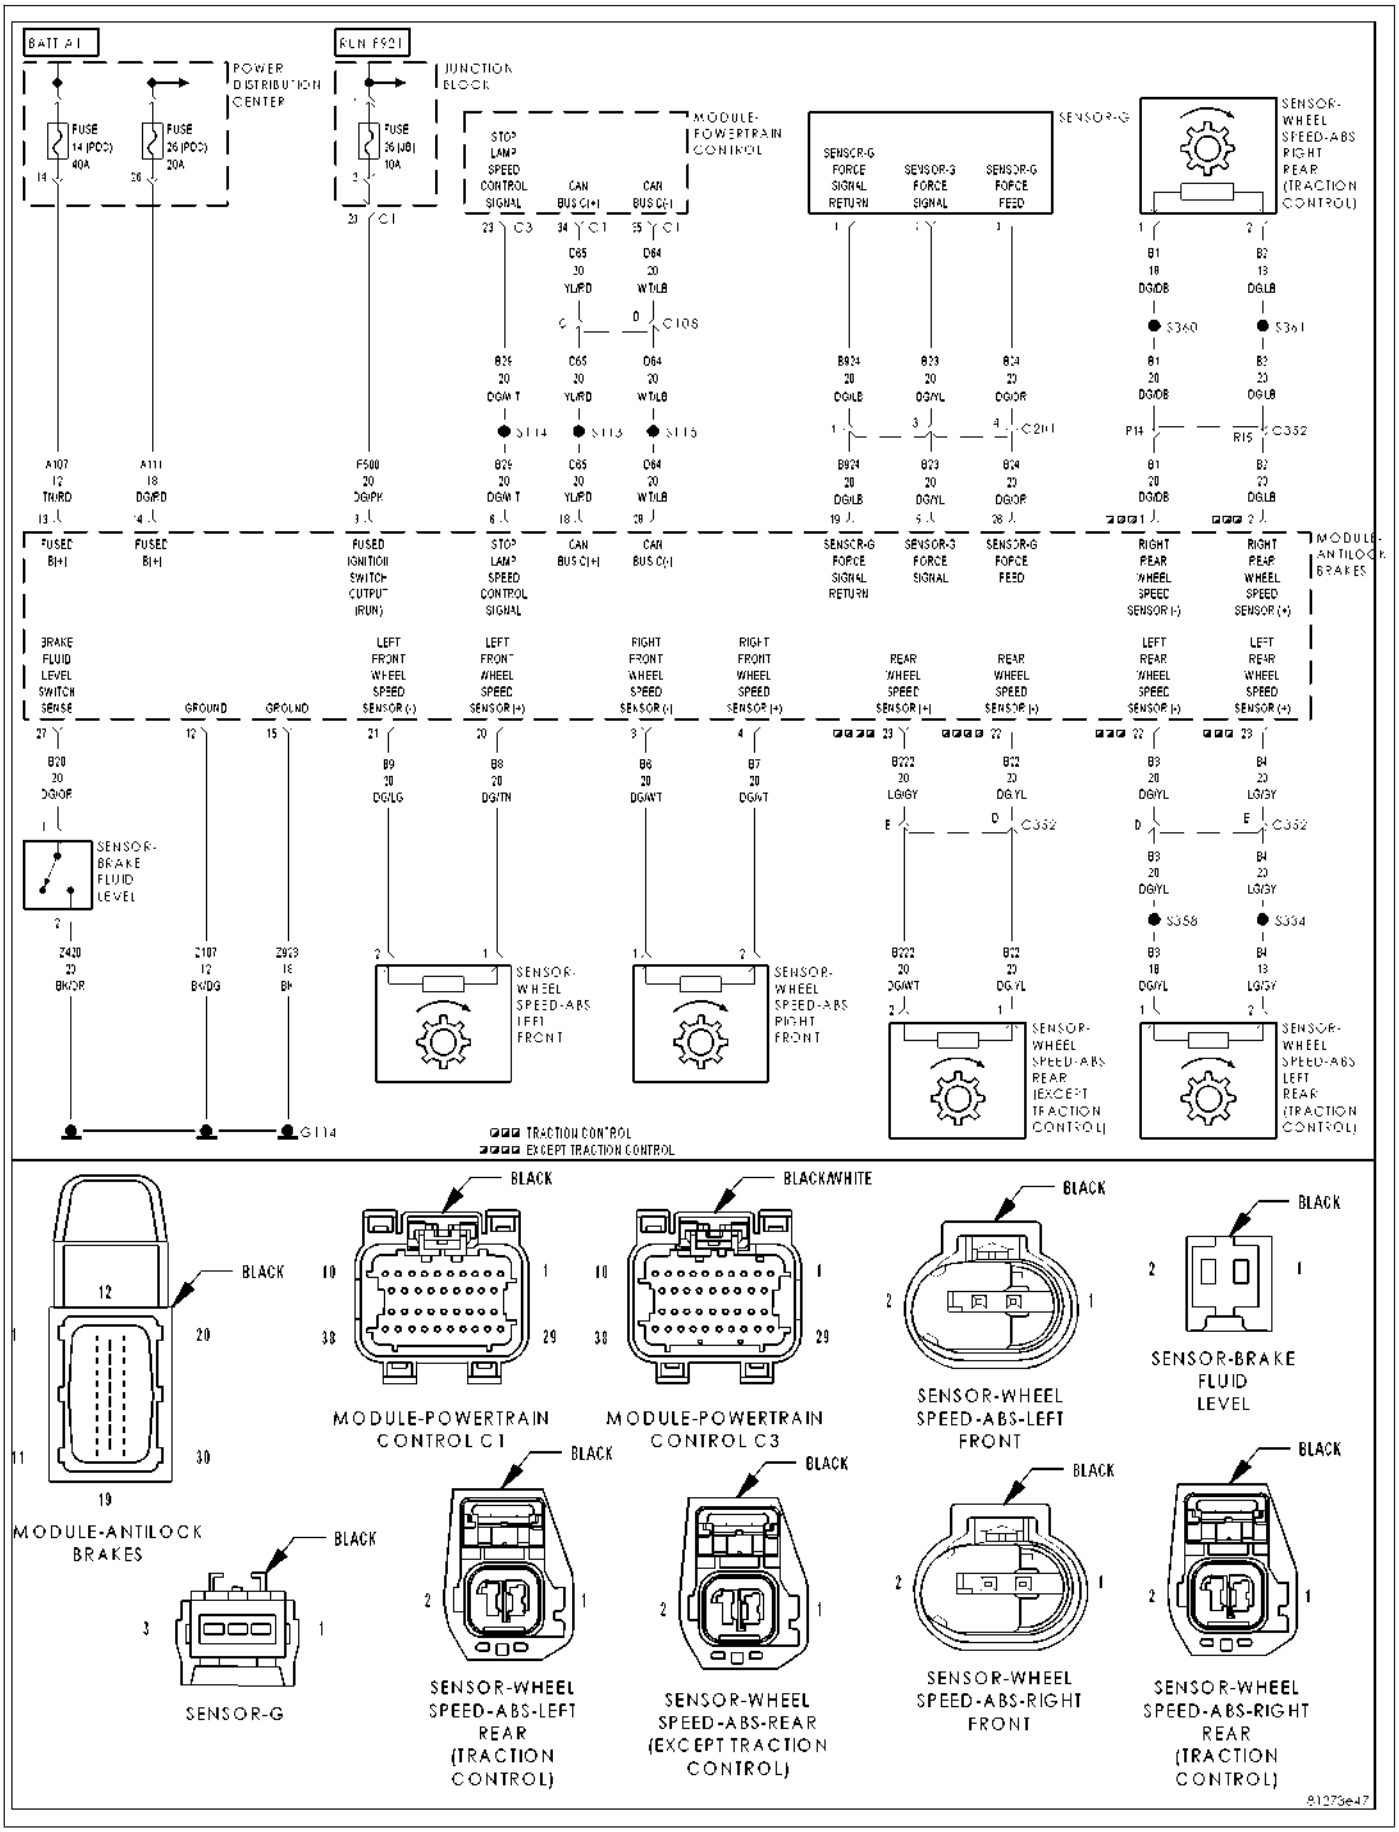
Is test light bright like when connected to the battery?

Yes >> Replace the ABM per service information.
Perform ABS VERIFICATION TEST — VER 1.

No >> Repair the high resistance in the circuits.
Perform ABS VERIFICATION TEST — VER 1.



C2200-ANTI—LOCK BRAKE MODULE INTERNAL



C2200-ANTI—LOCK BRAKE MODULE INTERNAL (CONTINUED)

For the ABS circuit diagram (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

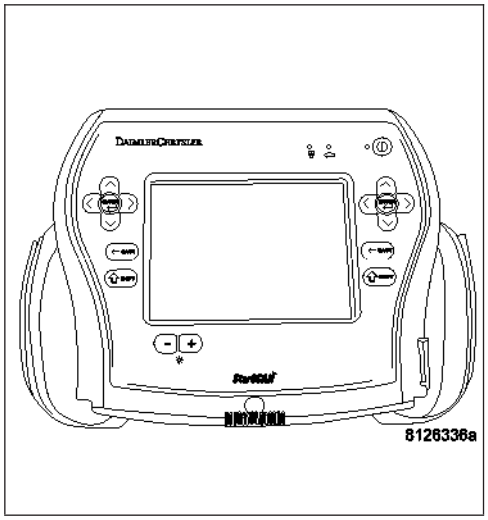
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on. The Anti—lock brake module monitors its internal microprocessors for correct operation.
- **Set Condition:**
  If the Anti—lock brake module detects an internal fault, the DTC is set.

Possible Causes
ABM - GROUND CIRCUIT OPEN
ABS FUSED B(+) CIRCUIT OPEN
ABS PUMP FUSED B(+) CIRCUIT OPEN
ABM - INTERNAL FAULT

Diagnostic Test

1. ABM INTERNAL FAILURE DTC PRESENT



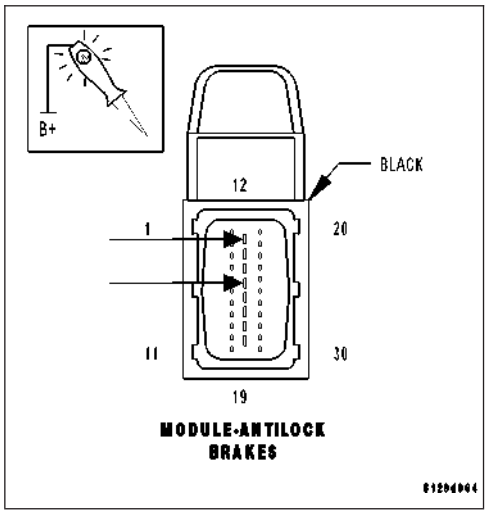
Turn the ignition on.
With the scan tool, read DTCs.
With the scan tool, erase DTCs.
Turn the ignition off.
Turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display ANTI—LOCK BRAKE MODULE INTERNAL FAILURE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

2. CAB - GROUND CIRCUIT OPEN



Turn the ignition off.
Disconnect the ABM harness connector.
Note: Check clean connectors and terminals,.
Using a 12-volt test light connected to 12-volts, probe the ABM harness connector ground circuits.

Did the test light illuminate?

Yes >> Go To 3

No >> Repair the ABM Ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C2200-ANTI—LOCK BRAKE MODULE INTERNAL (CONTINUED)

3. ABS FUSED B(+) CIRCUIT OPEN

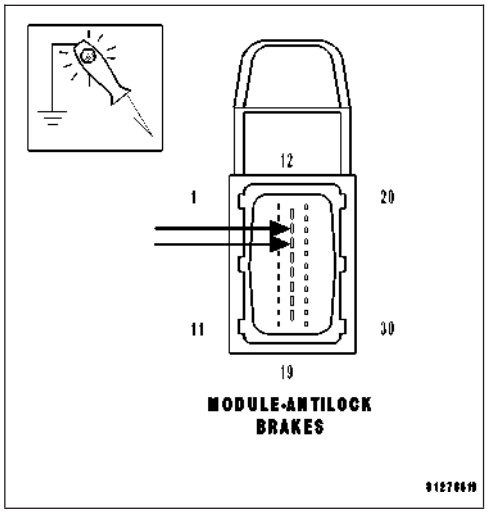
Turn the ignition on.

Using a 12-volt test light connected to ground, probe the ABS Fused B(+) circuit at the ABM harness connector.

Did the test light illuminate?

Yes >> Go To 4

No >> Repair the ABS Valve Fused B(+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



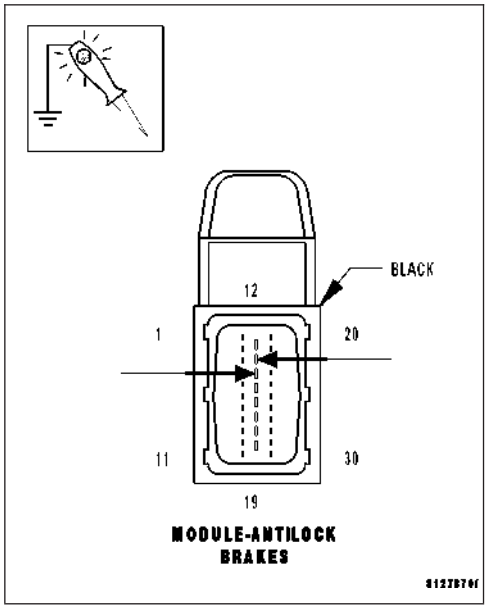
4. ABS PUMP FUSED B(+) CIRCUIT OPEN

Using a 12-volt test light connected to ground, probe the ABS Pump Fused B(+) circuit at the ABM harness connector.

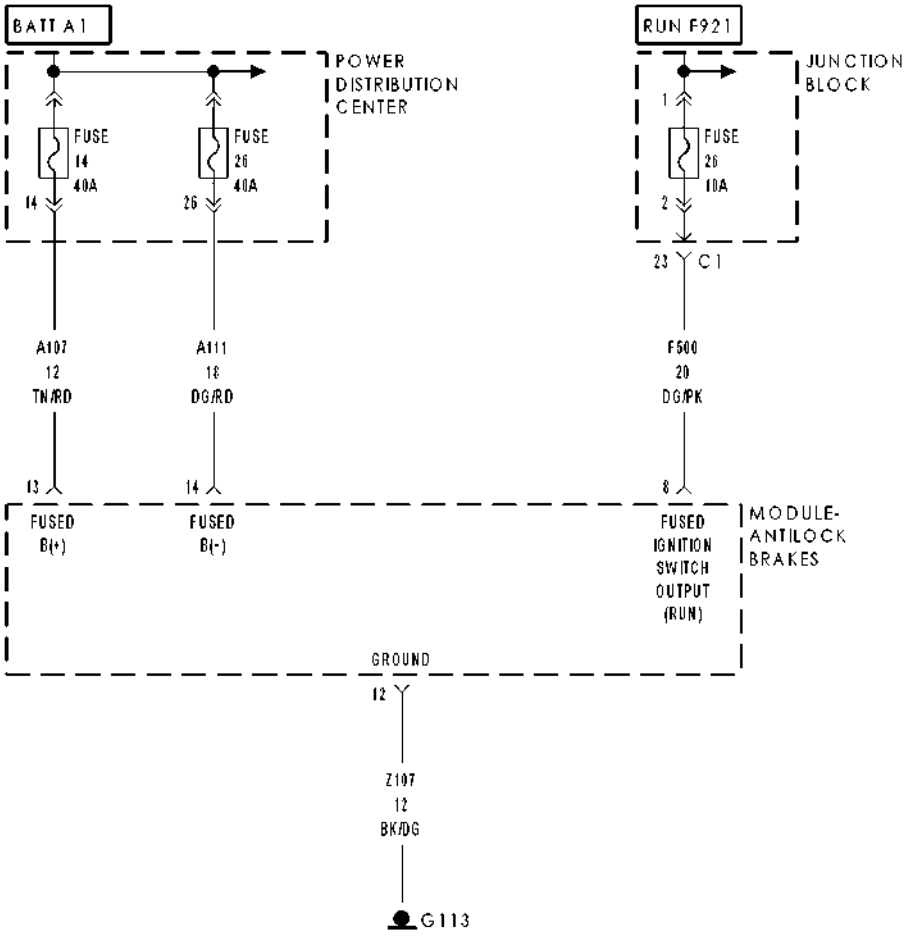
Did the test light illuminate?

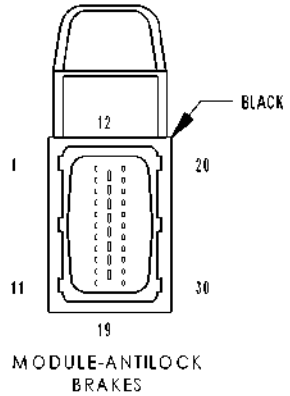
Yes >> Replace the Anti—lock brake module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the ABS Pump Fused B(+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



C2202-VIN 1 MISMATCH/MISSING





81298105

C2202-VIN 1 MISMATCH/MISSING (CONTINUED)

For the ABS circuit diagram (Refer to 5 — BRAKES — SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At power up, VIN is read off the CAN bus, If the VIN message is not received then the VIN stored in EEPROM is used for the comparison.
- **Set Condition:**
  The VIN stored in the ABM does not match the VIN read off of the CAN bus. The 5th character in the VIN should be 'D' for 4x2 or 'B' for4x4.

Possible Causes
WRONG MODULE
WRONG VIN PROGRAMED INTO VEHICLE

Diagnostic Test

1. WRONG VIN PROGRMED INTO VEHICLE

NOTE: 4x4 vehicles have different modules than 4x2 vehicles

Is the correct VIN programed into the vehicle?

Yes >> Replace the Anti-lock brake module with the correct module.
Perform ABS VERIFICATION TEST — VER 1.

No >> Reprogram the VIN per service information.
Perform ABS VERIFICATION TEST — VER 1.

ABS VERIFICATION TEST — VER 1

Diagnostic Test

1. ABS VERIFICATION TEST — VER 1

1. Turn the ignition off.

2. Connect all previously disconnected components and connectors.

3. Ensure all accessories are turned off and the battery is fully charged.

4. Ensure that the ignition is on, and with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning.

5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.

6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

7. NOTE: For Sensor Signal and Pump Motor faults, the ABM must sense all 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicator.

8. If there are no DTC's present after turning ignition on, road test the vehicle for at lleast 5 minutes. Perform several antilock braking stops.

9. Caution: Ensure braking capability is available before road testing.

10. Again, with the scan tool read DTC's. If any DTC's are present, return to Symptom list.

11.If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTC's present or is the original concern still present?

Yes >> Repair is not complete, refer to appropriate symptom.

No >> Repair is complete.

BRAKES - ABS SERVICE INFORMATION

DESCRIPTION

The antilock brake system (ABS) is an electronically operated, three channel brake control system. The vehicle has Electronic Brakeforce Distribution (EBD) designed into the system which eliminates the combination/proportioning valve.

The system is designed to prevent wheel lockup and maintain steering control during braking. Preventing lockup is accomplished by modulating fluid pressure to the wheel brake units.

The hydraulic system is a four channel design with traction control. The front wheel brakes are controlled individually and the rear wheel brakes in individually. The ABS electrical system is separate from other electrical circuits in the vehicle. A specially programmed controller antilock brake unit operates the system components.

ABS system major components include:

- Antilock Brake Module (ABM)
- Hydraulic Control Unit (HCU)
- Wheel Speed Sensors (WSS)
- G-Sensor
- ABS Warning Light

OPERATION

When wheel slip is detected during a brake application, the ABS enters antilock mode. During antilock braking, hydraulic pressure in the individual wheel circuits is controlled to prevent any wheel from slipping. A separate hydraulic line and specific solenoid valves are provided for each wheel. The ABS can decrease, hold, or increase hydraulic pressure to each wheel brake. The ABS cannot, however, increase hydraulic pressure above the amount which is transmitted by the master cylinder during braking

During antilock braking, a series of rapid pulsations is felt in the brake pedal. These pulsations are caused by the rapid changes in position of the individual solenoid valves as the ICU responds to wheel speed sensor inputs and attempts to prevent wheel slip. These pedal pulsations are present only during antilock braking and stop when normal braking is resumed or when the vehicle comes to a stop. A ticking or popping noise may also be heard as the solenoid valves cycle rapidly. During antilock braking on dry pavement, intermittent chirping noises may be heard as the tires approach slipping. These noises and pedal pulsations are considered normal during antilock operation.

Vehicles equipped with ABS may be stopped by applying normal force to the brake pedal. Brake pedal operation during normal braking is no different than that of previous non-ABS systems. Maintaining a constant force on the brake pedal provides the shortest stopping distance while maintaining vehicle stability.

PRESSURE DECREASE

The ICU (Integrated Control Unit) decreases the pressure to individual wheels during a deceleration when wheel slip occurs. The inlet valve is closed and the outlet valve is opened. The excess fluid is stored in the accumulator until the return pump can return the fluid to the master cylinder.

PRESSURE HOLD

The ICU closes the inlet valve and keeps the outlet valve closed in order to isolate the system when wheel slip occurs. This holds the pressure steady on the brake so that the hydraulic pressure does not increase or decrease.

PRESSURE INCREASE

The ICU increases the pressure to individual wheels during a deceleration in order to reduce the speed of the wheel. The inlet valve is opened and the outlet valve is closed. The increased pressure is delivered from the master cylinder.

ELECTRONIC BRAKEFORCE DISTRIBUTION (EBD)

The electronic brakeforce distribution (EBD) is a control system that replaces the hydraulic proportioning function of the mechanical proportioning valve in the base brake system. The EBD control system is part of the operation software in the ICU. The EBD uses active control with existing ABS in order to regulate the vehicle's rear brake pressure. The red brake warning indicator is illuminated when the dynamic rear proportioning function is disabled.

TRACTION CONTROL (TCS)

The primary function of the Traction Control System (TCS) is to optimize vehicle performance with varying vehicle load and changing road conditions by controlling wheel slip at the driven wheels during an acceleration maneuver. The wheel slip is controlled by actively applying braking force. This modulation is applied and occur under all throttle input conditions where the difference between wheel speed' and vehicle speed indicate a loss of longitudinal traction. TCS operation for each mode of driveline operation include the following. When high range is selected for the transfer case, the system controls wheel slip in the order of stability and acceleration. When low range is selected for the transfer case, the system controls wheel slip in the order of acceleration and stability. The TCS switch turns the system on/off. The braking is accomplished by closing the TCS Master Cylinder Isolating Valve, this isolates the master cylinder from the rest of the system. The TCS Prime valve opens to allow the pump to get brake fluid to build pressure for braking. The drive wheel circuit solenoids are energized as needed to allow for pressure hold, pressure increase, or pressure decrease

DIAGNOSIS AND TESTING

ANTILOCK BRAKE SYSTEM

Diagnosis of base brake conditions which are mechanical in nature should be performed first. This includes brake noise, lack of power assist, parking brake, or vehicle vibration during normal braking.

The Anitilock brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The ABM monitors the system inputs and outputs circuits to verify the system is operating properly. If the ABM senses a malfunction in the system it will set a DTC into memory and trigger the warning lamp.

NOTE: The scan tool is used to diagnose the Anitlock Braking System. For test procedures refer to the Chassis Diagnostic Manual.

STANDARD PROCEDURE

ABS BRAKE BLEEDING

ABS system bleeding requires conventional bleeding methods plus use of the scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

1. Perform base brake bleeding, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
2. Connect scan tool to the Data Link Connector.
3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
4. Perform base brake bleeding a second time, (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

ELECTRICAL

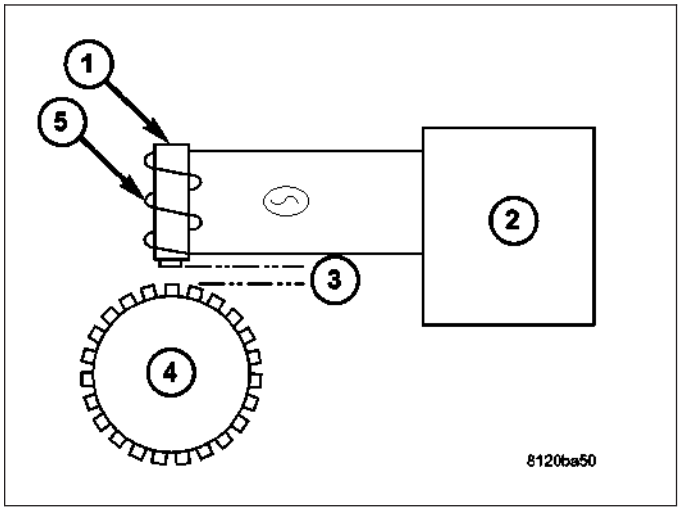
DESCRIPTION

WHEEL SPEED SENSORS

The ABS brake system uses 3 or 4 wheel speed sensors. Vehicles with **traction control** use 4 sensors, individual sensors are mounted to each front and rear hub/bearings. Vehicles **without traction control** use 3 sensors, 2 individual sensors are mounted to the front hub/bearing and the third sensor is mounted on top of the rear axle differential housing. **4X4 vehicles without traction control** use a G-sensor that is internally located in the ABM and is not serviced separately. **4X4 vehicles with traction control** use a G-sensor that is located under the Instrument Top Cover and can be serviced separately.

SENSOR-WHEEL SPEED-ABS-FRONT

OPERATION



The Wheel Speed Sensor consists of a magnet (1) surrounded by windings from a single strand of wire (5). The sensor sends a small AC signal to the ABM. This signal is generated by magnetic induction. The magnetic induction is created when a toothed sensor ring (exciter ring or tone wheel) (4) passes the stationary magnetic WSS.

When the ring gear is rotated, the exciter ring (4) passes the tip of the WSS. As the exciter ring tooth approaches the tip of the WSS, the magnetic lines of force expand, causing the magnetic field to cut across the sensor's windings (5). This, in turn causes current to flow through the WSS circuit in one direction. When the exciter ring tooth moves away from the sensor tip, the magnetic lines of force collapse cutting the winding in the opposite direction. This causes the current to flow in the opposite direction. Every time a tooth of the exciter ring passes the tip of the WSS, an AC signal is generated current. Each AC signal (positive to negative signal or squarewave) is interpreted by the ABM. It then compares the frequency of the sinewave to a time value to calculate vehicle speed. The ABM continues to monitor the frequency to determine a deceleration rate that would indicate a possible wheel-locking tendency.

The signal strength of any magnetic induction sensor is directly affected by:

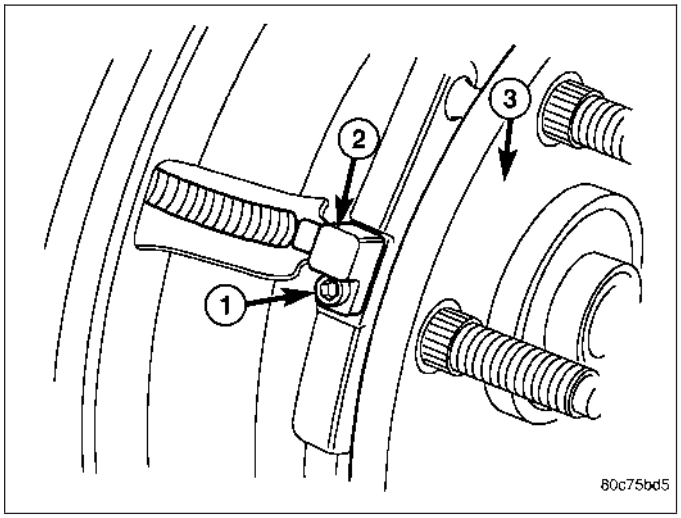
- Magnetic field strength; the stronger the magnetic field, the stronger the signal
- Number of windings in the sensor; more windings provide a stronger signal
- Exciter ring speed; the faster the exciter ring/tone wheel rotates, the stronger the signal will be
- Distance (3) "air gap" between the exciter ring teeth and WSS; the closer the WSS is to the exciter ring/tone wheel, the stronger the signal will be.

The WSS is not adjustable. A clearance specification has been established for manufacturing tolerances. If the clearance is not within these specifications, then either the WSS or other components may be damaged. The clearance between the WSS and the exciter ring is 0.005 – 0.050 in.

The assembly plant performs a "Rolls Test" on every vehicle that leaves the assembly plant. One of the test performed is a test of the WSS. To properly test the sensor, the assembly plant connects test equipment to the Data Link Connector (DLC). This connector is located to the right of the steering column and attached to the lower portion of the instrument panel. The rolls test terminal is spliced to the WSS circuit. The vehicle is then driven on a set of rollers and the WSS output is monitored for proper operation.

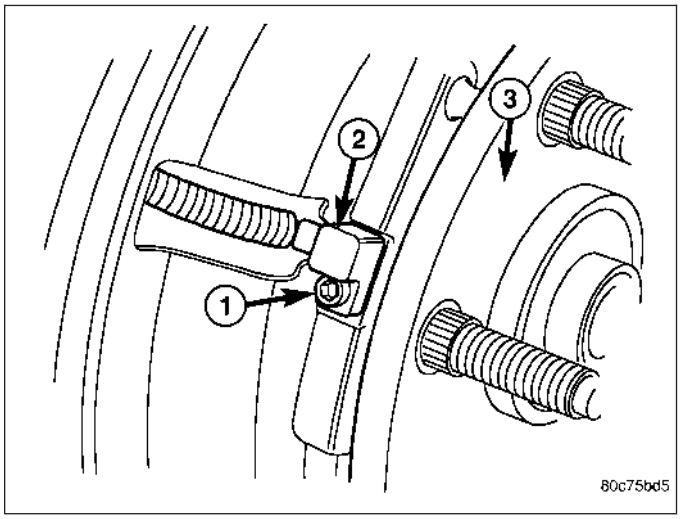
REMOVAL

1. Remove the front rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
2. Remove the wheel speed sensor mounting bolt (1) from the hub (3).
3. Remove the wheel speed sensor (2) from the hub (3).
4. Remove the wiring from the clips and disconnect the electrical connector.



INSTALLATION

1. Install the wiring to the clips and Reconnect the electrical connector.
2. Install the wheel speed sensor (2) to the hub (3).
3. Install the wheel speed sensor mounting bolt (1) to the hub (3). Tighten the bolt to 21 N·m (190 in. lbs.).
4. Install the front rotor and brake caliper assembly (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

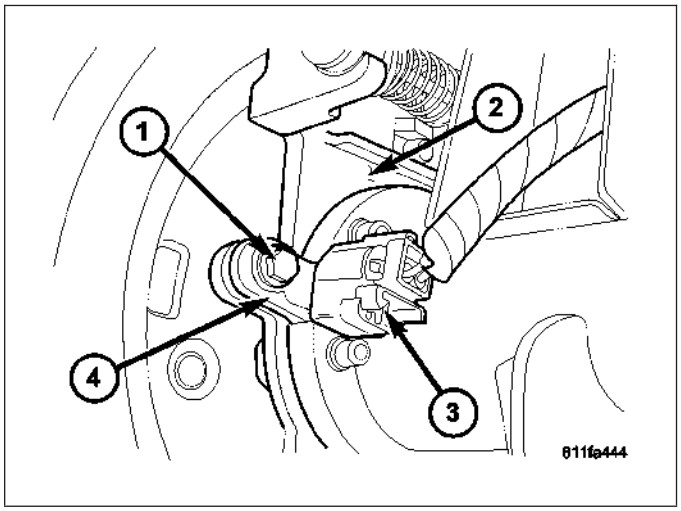


SENSOR-WHEEL SPEED-ABS-REAR

REMOVAL

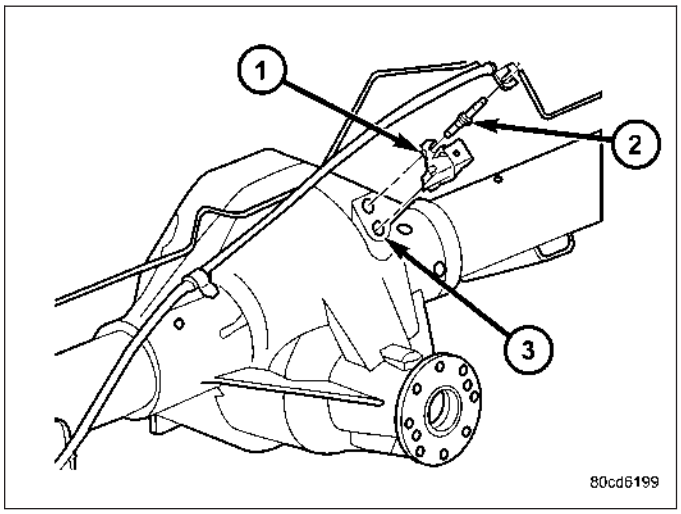
WITH TRACTION CONTROL

1. Raise the vehicle on a hoist.
2. Disconnect the wheel speed sensor electrical connector (3).
3. Remove the mounting bolt (1) from the sensor (4).
4. Remove the sensor (4) from the brake caliper adapter (2).



WITHOUT TRACTION CONTROL

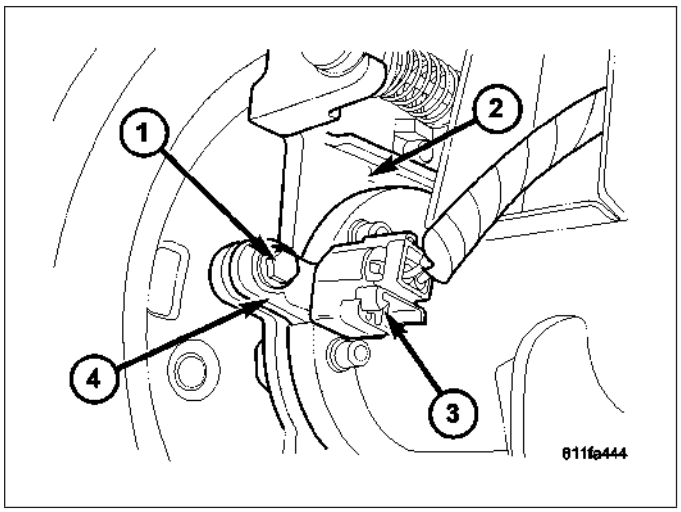
1. Raise the vehicle on a hoist.
2. Disconnect the sensor wire harness.
3. Remove the brake line mounting nut and remove the brake line from the sensor stud (2).
4. Remove the mounting stud (2) from the sensor (1) and shield.
5. Remove the sensor (1) and shield from the differential housing (3).



INSTALLATION

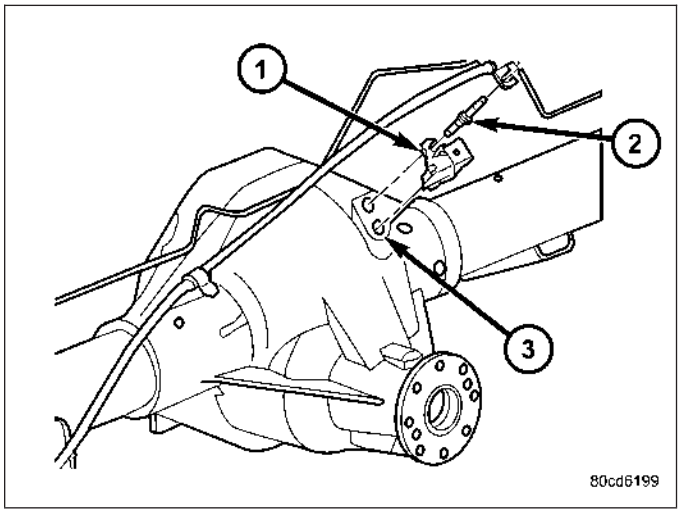
WITH TRACTION CONTROL

1. Insert the wheel speed sensor (4) in the brake caliper adapter (2).
2. Install the sensor mounting bolt (1) and tighten to 24 N·m (200 in. lbs.).
3. Reconnect the electrical wiring connector (3) to the sensor (4).
4. Lower the vehicle.



WITHOUT TRACTION CONTROL

1. Install the O-ring on the sensor (1) (if removed).
2. Insert the sensor (1) in the differential housing (3).
3. Install the sensor shield.
4. Install the sensor mounting stud (2) and tighten to 24 N·m (200 in. lbs.).
5. Install the brake line on the sensor stud (2) and install the nut.
6. Connect the harness to the sensor. **Be sure the seal is securely in place between the sensor and the wiring connector.**
7. Lower the vehicle.



SENSOR-G

DESCRIPTION

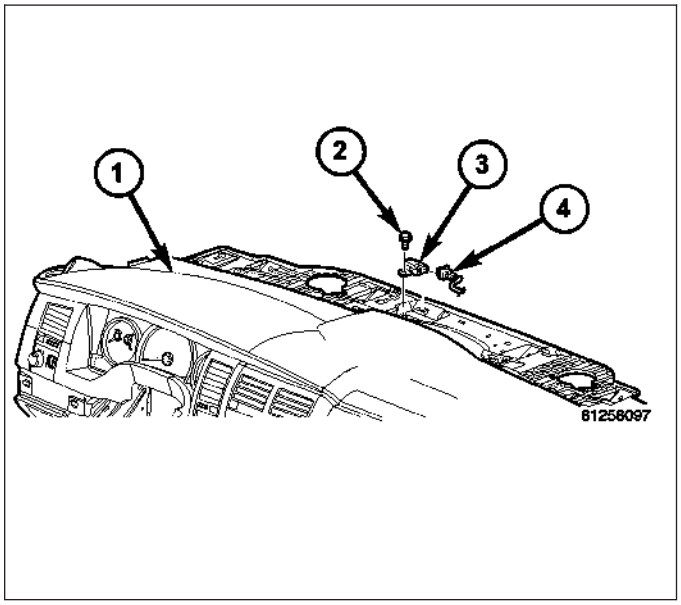
4X4 WITHOUT TRACTION CONTROL

The G-sensor is located inside the ABS controller. The sensor is not a separate serviceable part from the antilock brake module (ABM).

4X4 WITH TRACTION CONTROL

NOTE: If the G-sensor (3) was mounted incorrectly in the area designed for the GPS antenna, the G-sensor will be off 90 ° and not function properly.

The G-sensor (3) is located under the instrument panel top cover (1). The sensor (3) must be mounted with the electrical connector (4) facing the passenger side of the vehicle to function properly.



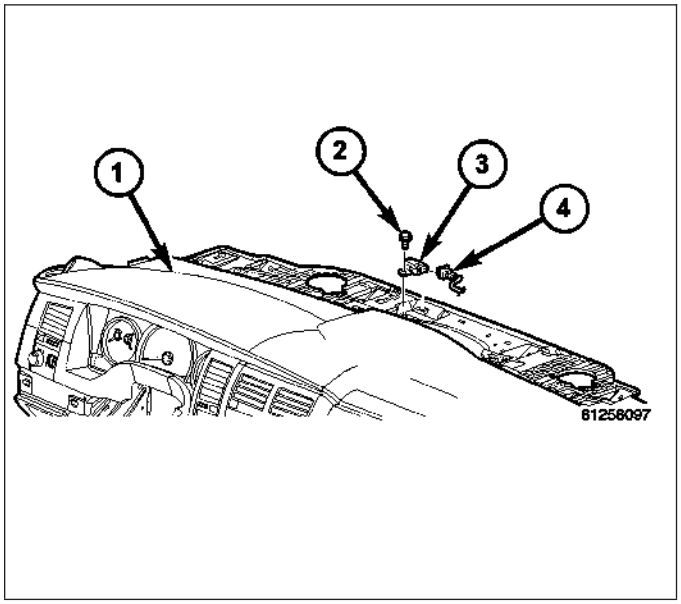
OPERATION

4X4 WITH TRACTION CONTROL

The sensor is monitored by the ABM at all times. The sensor contains an accelerometer which monitors vehicle deceleration rates (G-force). The accelerometer reads the rate of deceleration, sending a signal to the ABM.

REMOVAL – 4X4 WITH TRACTION CONTROL

1. Disconnect the battery.
2. Remove the IP top cover (1) for access to the sensor (3). (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
3. Disconnect the sensor harness (4).
4. Remove the sensor mounting bolt (2) and remove the sensor (3).

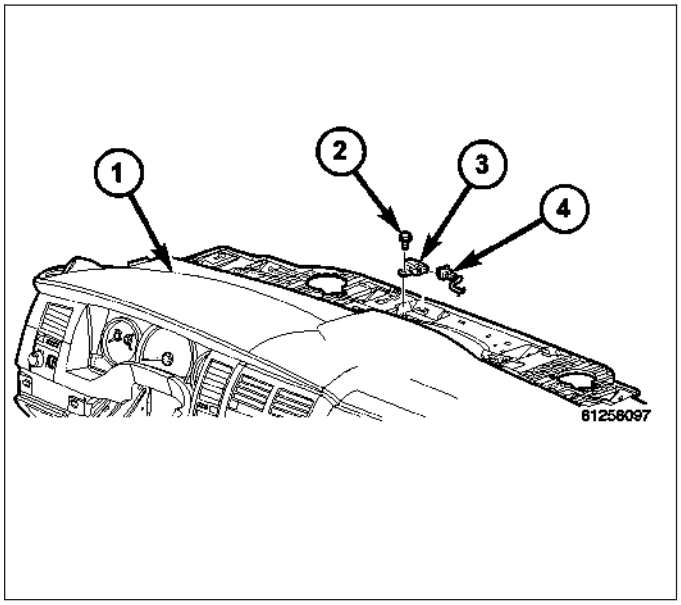


INSTALLATION – 4X4 WITH TRACTION CONTROL

CAUTION: The G-sensor (3), will not function properly if the sensor is installed incorrectly. Verify that the sensor is correctly installed when the electrical connector (4) is pointing toward the passenger side of the vehicle.

NOTE: If the G-sensor (3) was mounted incorrectly in the area designed for the GPS antenna, the G-sensor will be off 90 ° and not function properly.

1. Install the sensor (3) and tighten the mounting bolt (2) to 5.6 N·m (50 in. lbs.).
2. Connect the harness (4) to the sensor (3). Be sure the harness connector (4) is firmly seated.
3. Install the IP top cover (1) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
4. Reconnect the battery.



HYDRAULIC/MECHANICAL

DESCRIPTION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the Hydraulic control unit (HCU).

OPERATION - ELECTRONIC VARIABLE BRAKE PROPORTIONING

EVBP is able to decrease, hold and increase rear brake pressure without activating full ABS control. Upon entry into EVBP the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the hydraulic control unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The HCU consists of a valve body, pump motor, low pressure accumulators, inlet valves, outlet valves and noise attenuators.

OPERATION

Accumulators in the valve body store extra fluid released to the system for ABS mode operation. The pump provides the fluid volume needed and is operated by a DC type motor. The motor is controlled by the ABM.

The valves modulate brake pressure during antilock braking and are controlled by the ABM.

The HCU provides three channel **ABS** or four channel **With Traction Control** pressure control to the front and rear brakes. One channel controls the rear wheel brakes in tandem **ABS**. The two remaining channels control the front wheel brakes individually.

During antilock braking, the solenoid valves are opened and closed as needed.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

NOTE: The three modes mentioned below do occur but not necessarily in the order listed everytime.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

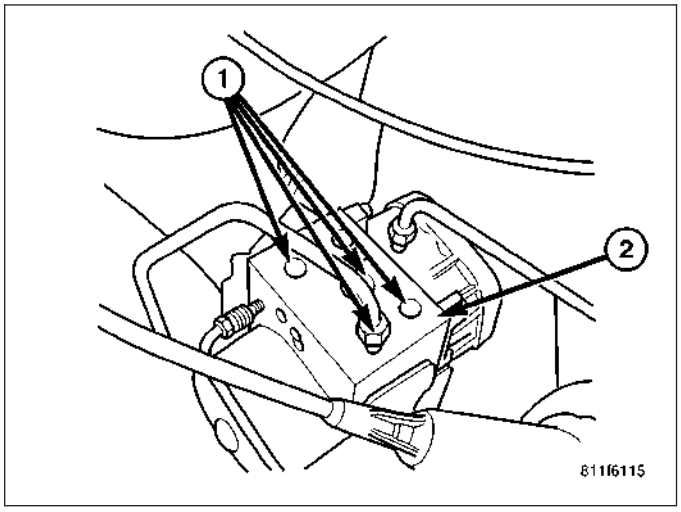
Both solenoid valves are closed in the pressure hold cycle but only the inlet valve is energized. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

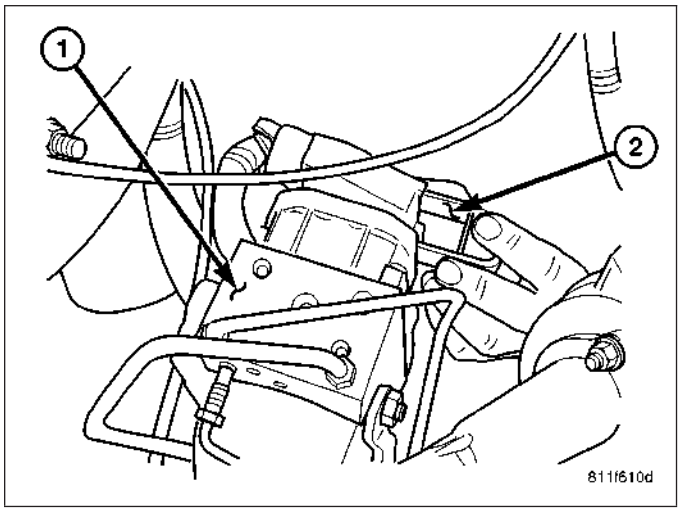
The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to reapply thew brakes. This cycle controls re-application of fluid apply pressure.

REMOVAL

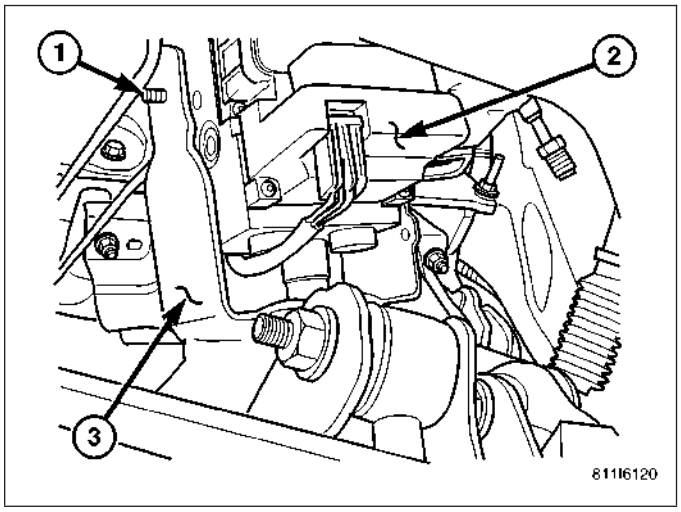
1. Disconnect the battery cables from the battery.
2. Disconnect the brake lines (1) to the HCU (2).



3. Disconnect the electrical harness connector (2).

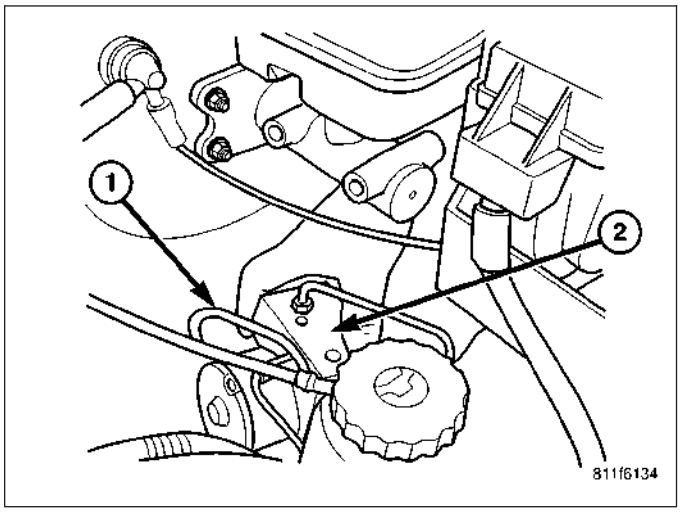


4. Remove HCU assembly mounting nuts (1).
5. Raise and support the vehicle.
6. Remove the left front tire.

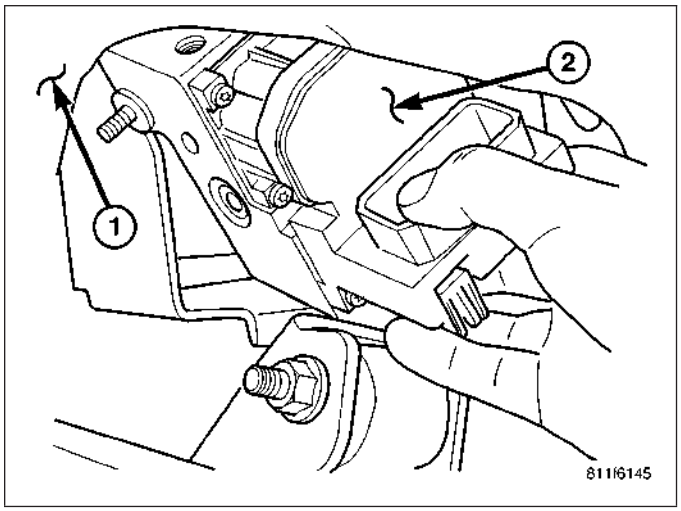


NOTE: Careful not to lose the mounting pins when remove the HCU from the vehicle.

7. Lift the HCU assembly (2) off the mounting bracket (1).



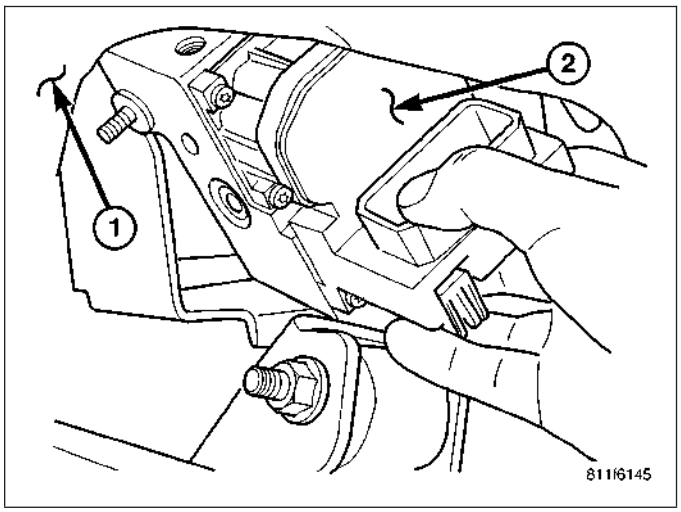
8. Remove the HCU assembly (2) through the left wheel well (1).



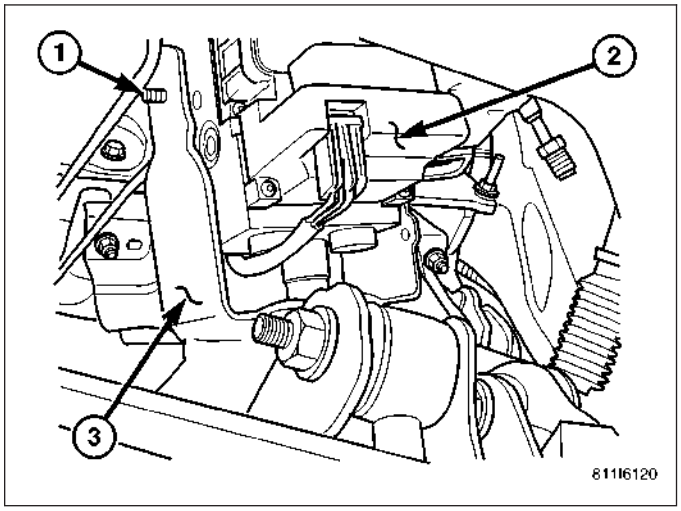
INSTALLATION

NOTE: If the ABM is being replaced with a new ABM it must be reprogrammed with the use of a scantool.

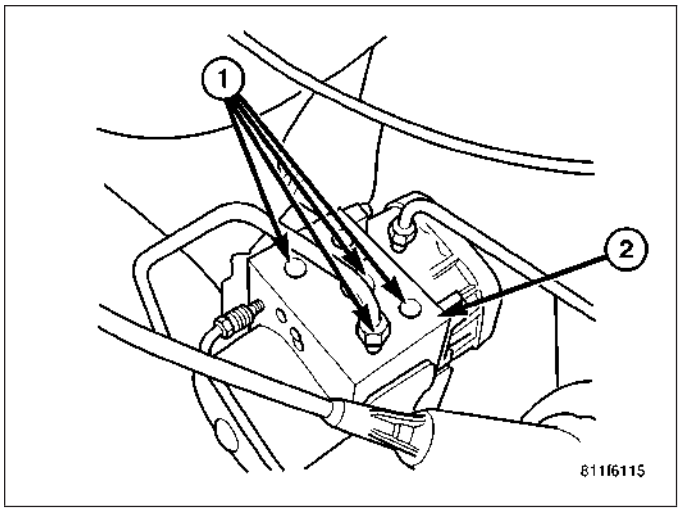
1. Reinstall the HCU assembly (2) through the left wheel well (1).



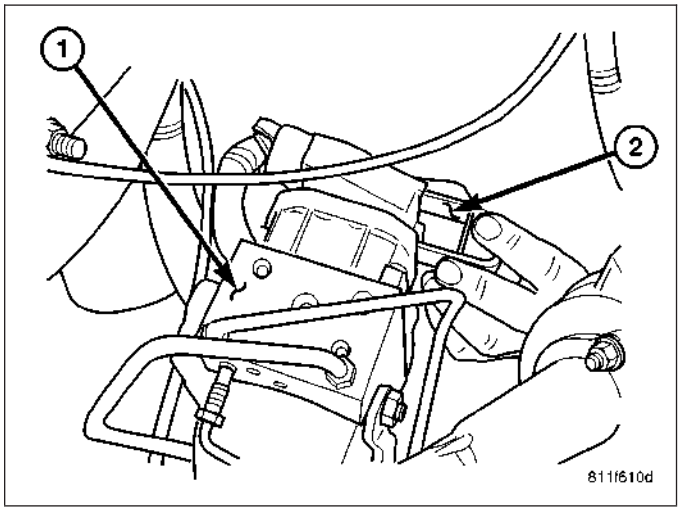
2. Install HCU assembly (2) on the mounting bracket (1) and Tighten the nuts to 15 N·m (11 ft. lbs.).



3. Install the brake lines (1) to the HCU (2) and tighten to 19 N·m (170 in. lbs.).



4. Install the electrical harness connector (2) to the HCU/ABM assembly (1).
5. Install the left front tire.
6. Install the battery cables to the battery.
7. Bleed ABS brake system (Refer to 5 - BRAKES - STANDARD PROCEDURE).



COOLING

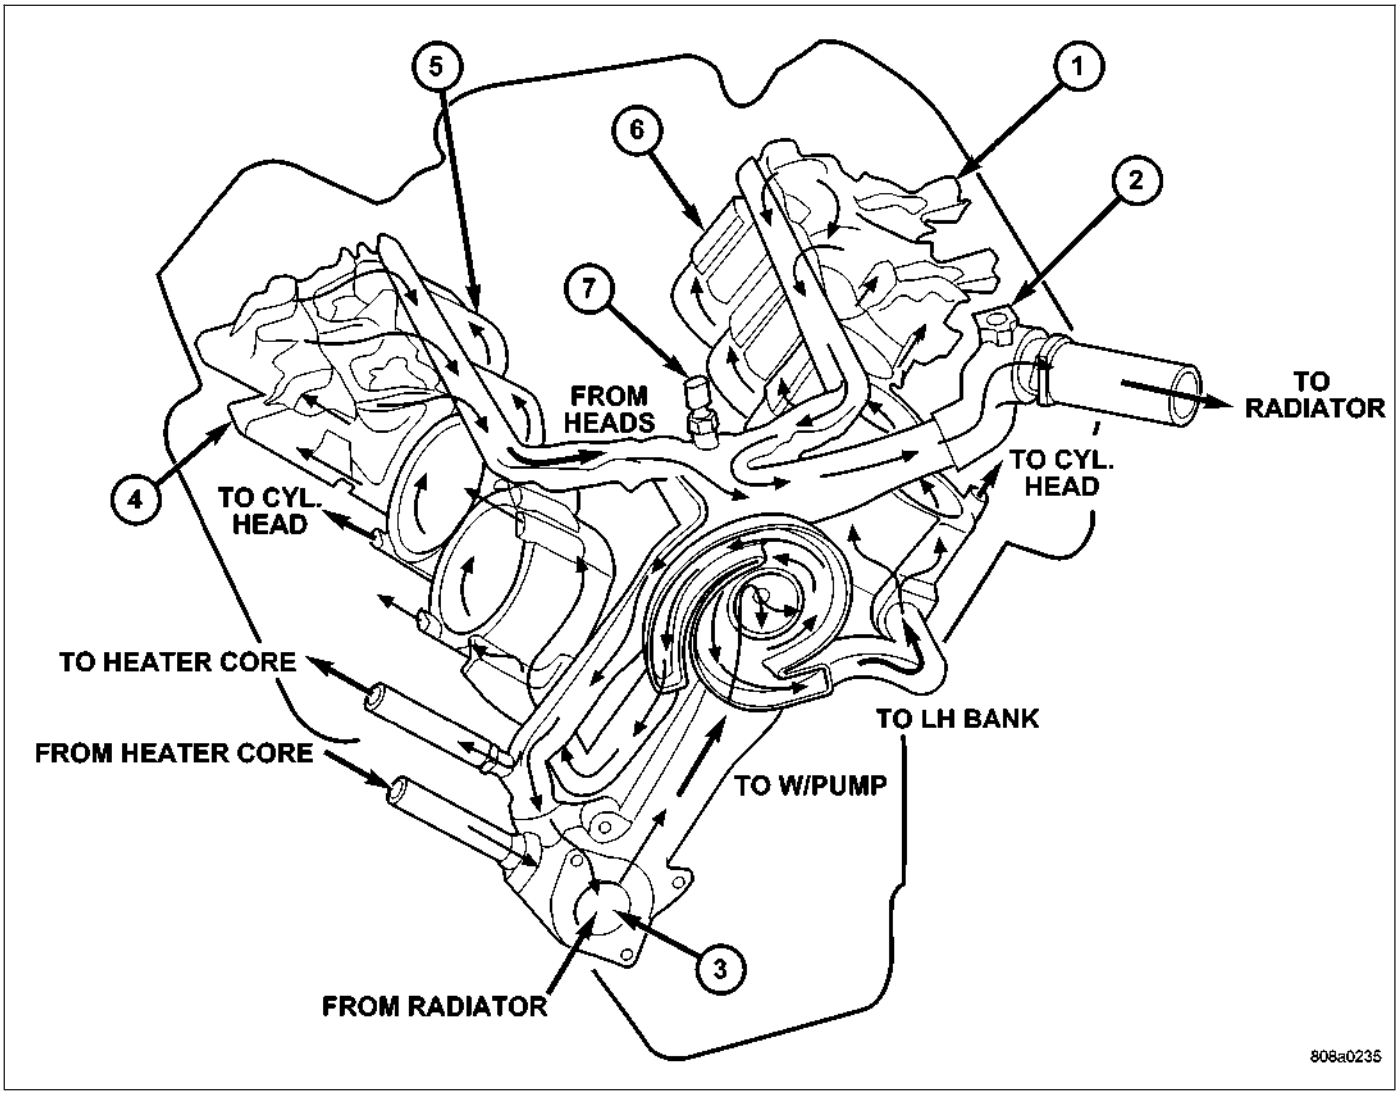
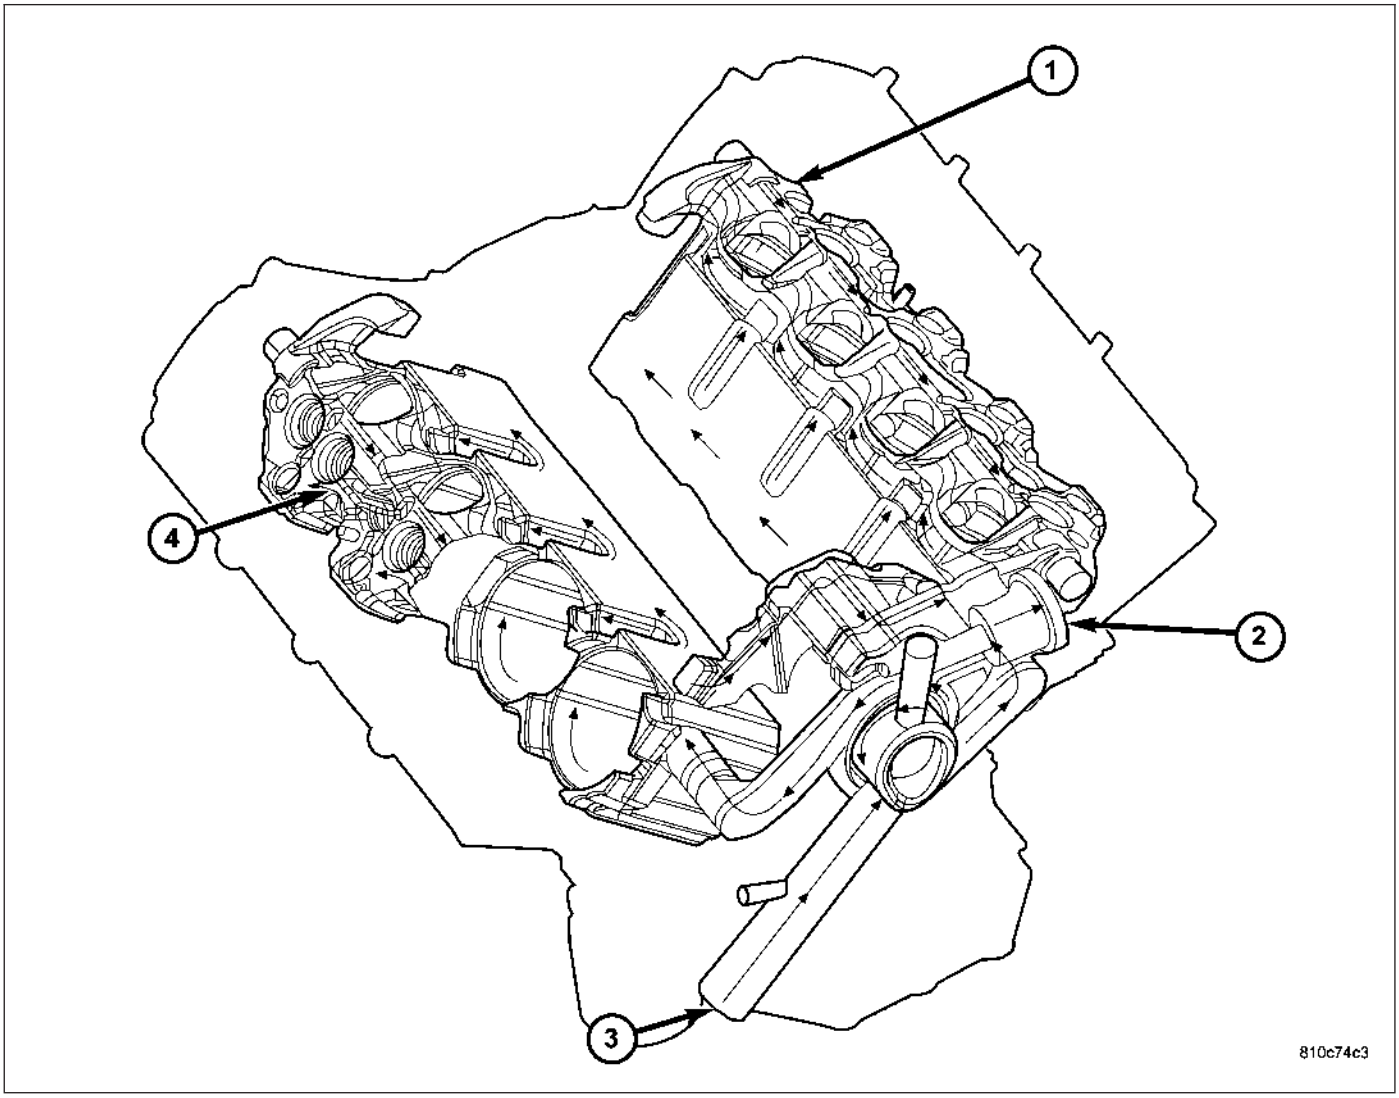
DESCRIPTION



3.7L/4.7L COOLANT FLOW

1 - LH CYL. HEAD
2 - BLEED
3 - THERMOSTAT LOCATION
4 - RH CYL. HEAD
5 - RH BANK CYL. BLOCK
6 - LH BANK CYL. BLOCK
7 - COOLANT TEMP. SENSOR
8 - FROM HEATER CORE
9 - TO HEATER CORE



5.7L Engine Coolant System Flow

1 - LH CYLINDER HEAD
2 - TO RADIATOR
3 - FROM RADIATOR
4 - TO RH CYLINDER HEAD

The cooling system consists of :

- Radiator
- Cooling fan (mechanical/Electrical)
- Thermal viscous fan drive
- Fan shroud
- Radiator pressure cap
- Thermostat
- Coolant reserve/overflow system (integral to upper fan shroud)
- Transmission oil cooler (if equipped with an automatic transmission)
- Coolant
- Water pump
- Hoses and hose clamps

OPERATION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

An optional factory installed maximum duty cooling package is available on most models. This package will provide additional cooling capacity for vehicles used under extreme conditions such as trailer towing in high ambient temperatures.

DIAGNOSIS AND TESTING

ON-BOARD DIAGNOSTICS (OBD)

COOLING SYSTEM RELATED DIAGNOSTICS

The powertrain control module (PCM) has been programmed to monitor certain cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicated an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ERASING TROUBLE CODES

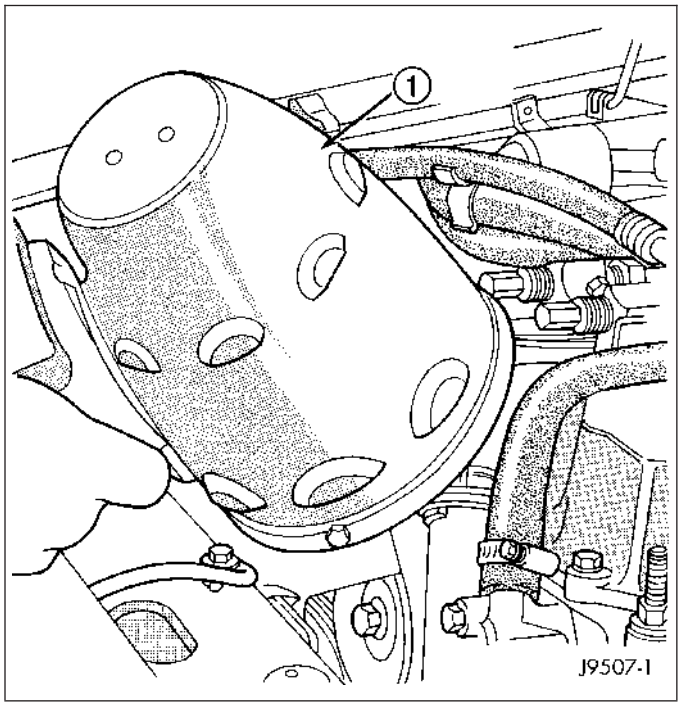
After the problem has been repaired, use the scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures service information for operation of the scan tool.

COOLING SYSTEM - TESTING FOR LEAKS

ULTRAVIOLET LIGHT METHOD

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light) (1). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until the radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause the additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.



PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during the warm engine examination.

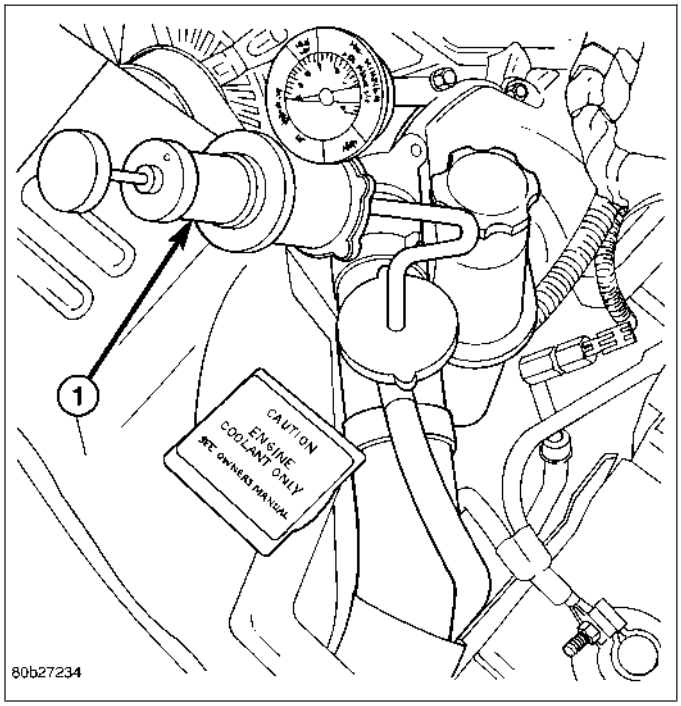
WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.

Carefully remove the radiator pressure cap from the filler neck and check coolant level. Push down on cap to disengage it from the stop tabs. Wipe the inside of filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on the outside of filler neck. If the cams are damaged, seating of the pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) to radiator filler neck (1).

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulge while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to the following criteria:



Holds Steady: If the pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to INTERNAL LEAKAGE INSPECTION .

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect the transmission dipstick for water globules and the transmission fluid cooler for leakage.

WARNING: WITH RADIATOR PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 145 KPA (21 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.

Operate the engine without the pressure cap on the radiator until the thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on the dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Drain sufficient coolant to allow thermostat removal. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL) for the 5.9L Diesel Engine or (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL) for the 3.7L/4.7L Engine. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) for the 5.9L Diesel Engine or (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) for the 3.7L/4.7L Engine.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed or steep grades

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended.

TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

Note: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to COOLING SYSTEM DIAGNOSIS CHART BELOW.

These charts are to be used as a quick-reference only. Refer to COOLING SYSTEM DIAGNOSIS CHART

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?	1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION). Replace thermostat if necessary.
	2. Is the temperature sending unit connected?	2. Check the temperature sensor connector. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) . Repair connector if necessary.
	3. Is the temperature gauge operating OK?	3. Check gauge operation. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ENGINE TEMPERATURE GAUGE - DESCRIPTION). Repair as necessary.
	4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.	4. Check coolant level in the coolant reserve/overflow tank or degas bottle and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and CAUTIONS associated with removing the radiator cap.
	5. Improper operation of internal heater doors or heater controls.	5. Inspect heater and repair as necessary. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) .

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-18).
	2. Is the temperature gauge reading correctly?	2. Check gauge. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Repair as necessary.
	3. Is the temperature warning illuminating unnecessarily?	3. (Refer to 8 - ELECTRICAL/ INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).
	4. Coolant low in coolant reserve/ overflow tank and radiator?	4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.	5. Tighten cap
	6. Poor seals at the radiator cap.	6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary. (b) Check condition of radiator filler neck or degas bottle. If neck is bent or damaged, replace radiator or degas bottle.
	7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools	7. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this Group. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
	8. Incorrect coolant concentration	8. Check coolant. (Refer to LUBRICATION & MAINTENANCE/ FLUID TYPES - DESCRIPTION)
	9. Coolant not flowing through system	9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.
	10. Radiator or A/C condenser fins are dirty or clogged.	10. Remove insects and debris. (Refer to 7 - COOLING - STANDARD PROCEDURE).
	11. Radiator core is corroded or plugged.	11. Have radiator re-cored or replaced.
	13. Dragging brakes	13. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)
	12. Fuel or ignition system problems.	12. Refer to 14 - Fuel System or 8 - Electrical for diagnosis and testing procedures.
	14. Bug screen or cardboard is being , reducing airflow.	14. Remove bug screen or cardboard.
	15. Thermostat partially or completely shut.	15. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).
	16. Viscous fan drive not operating properly.	16. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DIAGNOSIS AND TESTING).
	17. Cylinder head gasket leaking.	17. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	18. Heater core leaking.	18. Check heater core for leaks. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING). Repair as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTANT (FLUCTUATES, CYCLES, OR IS ERRATIC	1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.	1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair if necessary. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)	3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.
	4. Gauge reading high after re-starting a warmed up (hot) engine.	4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
	6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.	6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).
	8. Loose accessory drive belt. (water pump slipping)	8.. Check and correct as necessary. (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING)
	9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/ OVERFLOW TANK	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating. 2. Freeze point of coolant not correct. Mixture is too rich or too lean.	1. Check reason for overheating and repair as necessary. 2. Check coolant concentration. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING) . Replace if necessary (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
NOISY VISCOUS FAN/DRIVE	1. Fan blades loose. 2. Fan blades striking a surrounding object. 3. Air obstructions at radiator or air conditioning condenser. 4. Thermal viscous fan drive has defective bearing. 5. A certain amount of fan noise may be evident on models equipped with a thermal viscous fan drive. Some of this noise is normal.	1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/ FAN DRIVE VISCOUS CLUTCH - REMOVAL). 2. Locate point of fan blade contact and repair as necessary. 3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser. 4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL). 5. (Refer to 7 - COOLING/ENGINE/ FAN DRIVE VISCOUS CLUTCH - DESCRIPTION) for an explanation of normal fan noise.

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION	1. Has a Diagnostic trouble Code (DTC) been set?	1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary
	2. Coolant level low	2. (Refer to 7 - COOLING - STANDARD PROCEDURE)
	3. Obstructions in heater hose/ fittings	3. Remove heater hoses at both ends and check for obstructions
	4. Heater hose kinked	4. Locate kinked area and repair as necessary
	5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.	5. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - REMOVAL) If a slipping belt is detected, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). If heater core obstruction is detected, (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING).
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

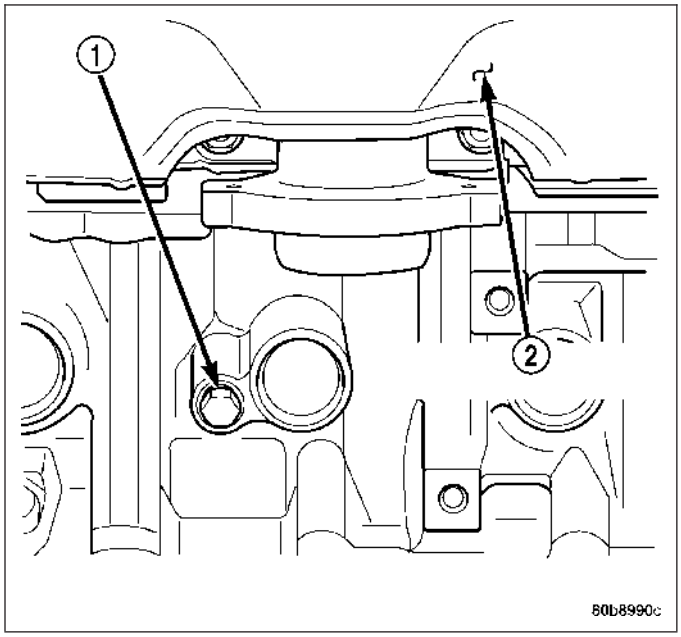
STANDARD PROCEDURE

DRAINING COOLING SYSTEM - ALL ENGINES

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Loosen radiator petcock.
3. Remove cylinder block drain plugs (1).

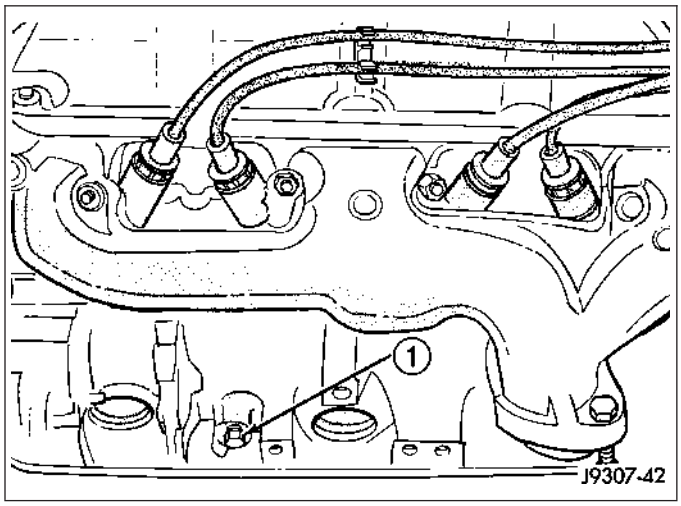


REFILLING COOLING SYSTEM

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

Clean cooling system prior to refilling. (Refer to 7 - COOLING - STANDARD PROCEDURE).



1. Install cylinder block drain plugs. Coat the threads with Mopar® Thread Sealant with Teflon.
2. Close radiator petcock.
3. Fill cooling system with a 50/50 mixture of water and antifreeze.
4. Fill coolant reserve/overflow tank to MAX mark on indicator stick.
5. Start and operate engine until thermostat opens (upper radiator hose warm to touch).
6. If necessary, add a 50/50 water and antifreeze mixture to the coolant reserve/overflow tank. This is done to maintain coolant level between the MAX and MIN marks. The level in the reserve/overflow tank may drop below the MIN mark after three or four warm-up and cool-down cycles.

ADDING ADDITIONAL COOLANT

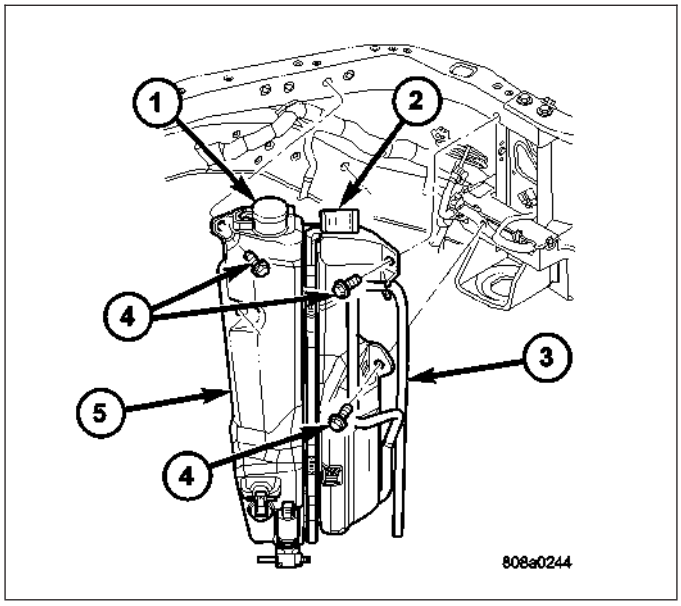
The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

COOLANT LEVEL CHECK

Note: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).

The coolant reserve/overflow system (5) provides a quick method for determining coolant level without removing radiator pressure cap. With engine not running, open the coolant recovery bottle cap and remove coolant level indicator dipstick to observe coolant level in coolant recovery bottle. The coolant level should be between ADD and FULL marks. If the coolant level is at or below the ADD mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.



COOLING SYSTEM CLEANING/REVERSE FLUSHING

CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect radiator hoses. Refill cooling system with correct antifreeze/water mixture. Refer to Refilling the Cooling System.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

TENSIONERS-BELT

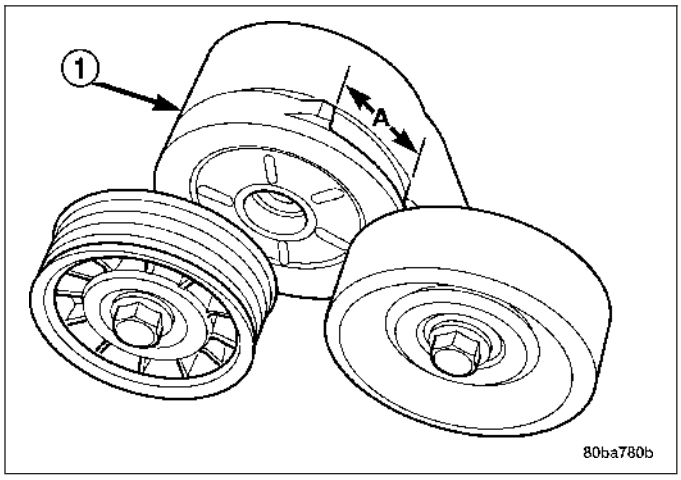
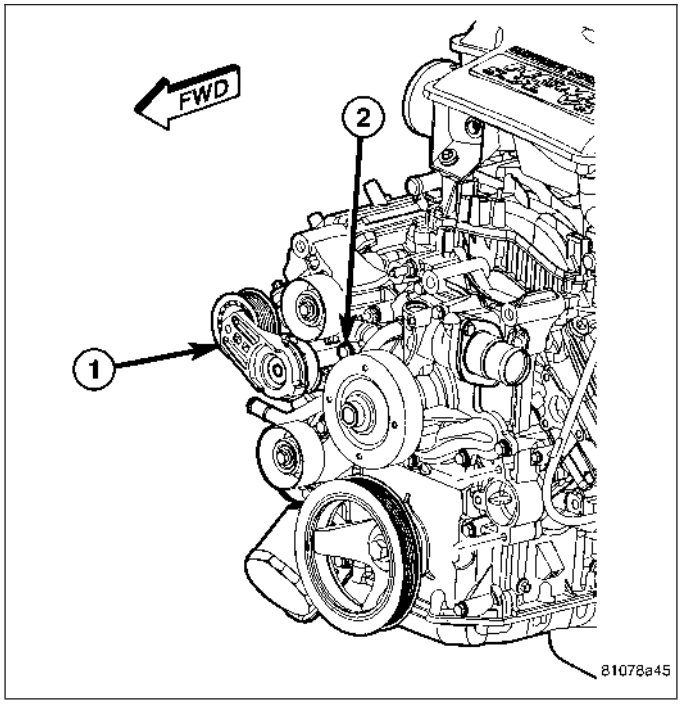
DESCRIPTION



Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension on the 3/7L/ 4.7L or 5.7L engines. These engines are equipped with an automatic belt tensioner (1). The tensioner maintains correct belt tension at all times. Due to use of this belt tensioner, do not attempt to use a belt tension gauge on these engines.



OPERATION

The automatic belt tensioner maintains belt tension by using internal spring pressure, a pivoting arm and pulley to press against the drive belt.

REMOVAL

3.7L/4.7L ENGINE

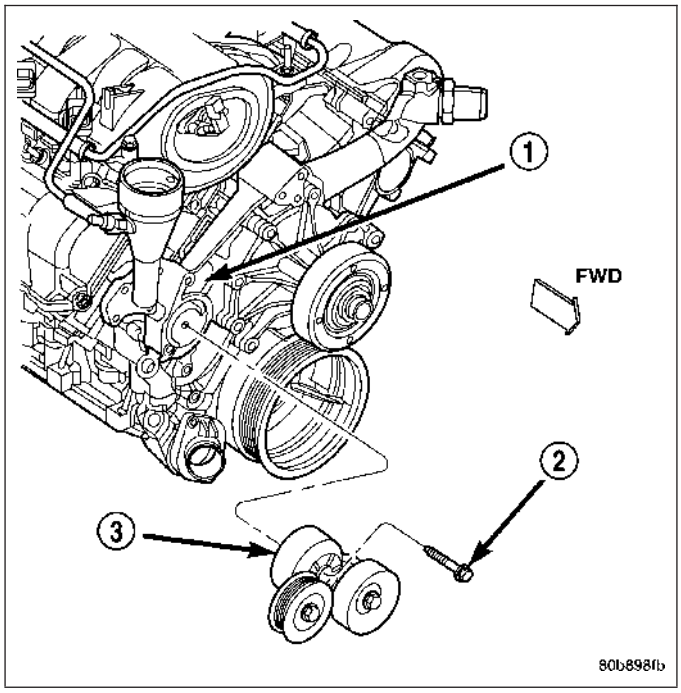
On 4.7L engines, the tensioner (3) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 24 mm (.94 inches) of indexing stop. Belt is considered new if it has been used 15 minutes or less.

If the above specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

Note: A used belt should be replaced if tensioner indexing arrow has moved to the minmum tension indicator. Tensioner travel stops at this point.

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).



2. Remove tensioner assembly from mounting bracket (1).

WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY EXCEPT FOR PULLEY ON TENSIONER.

3. Remove pulley bolt. Remove pulley from tensioner.

5.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove tensioner and mounting bracket.
3. Remove the tensioner assembly from the mounting bracket.
4.

INSTALLATION

3.7L/4.7L ENGINE

1. Install pulley and pulley bolt to tensioner. Tighten bolt to 61 N·m (45 ft. lbs.) torque.
2. An indexing slot is located on back of tensioner. Align this slot to the head of the bolt on the front cover. Install the mounting bolt. Tighten bolt to 41 N·m (30 ft. lbs.).
3. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
4. Check belt indexing marks.

5.7L ENGINE

1. Install tensioner on to the mounting bracket. Tighten bolt to 41 N·m (30 ft. lbs.).
2. Install tensioner and bracket assembly
3. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

BELTS-DRIVE

DIAGNOSIS AND TESTING

ACCESSORY DRIVE BELT

VISUAL DIAGNOSIS

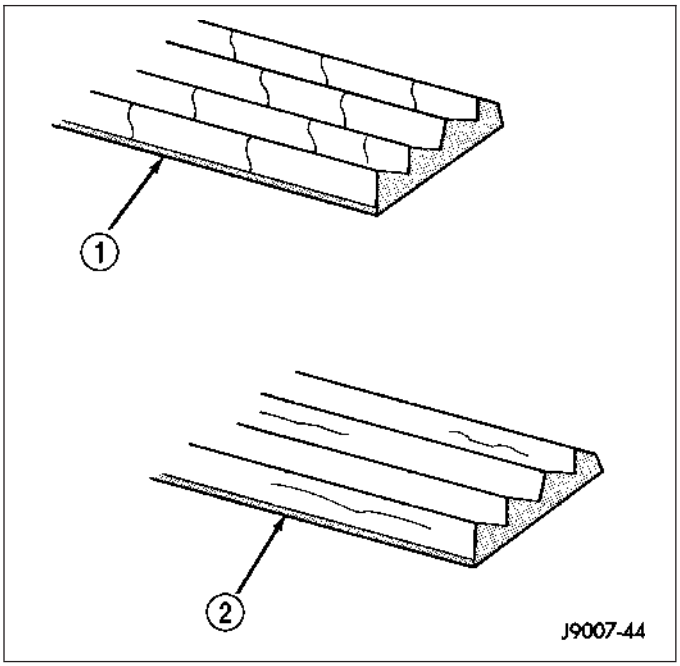
When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib , are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

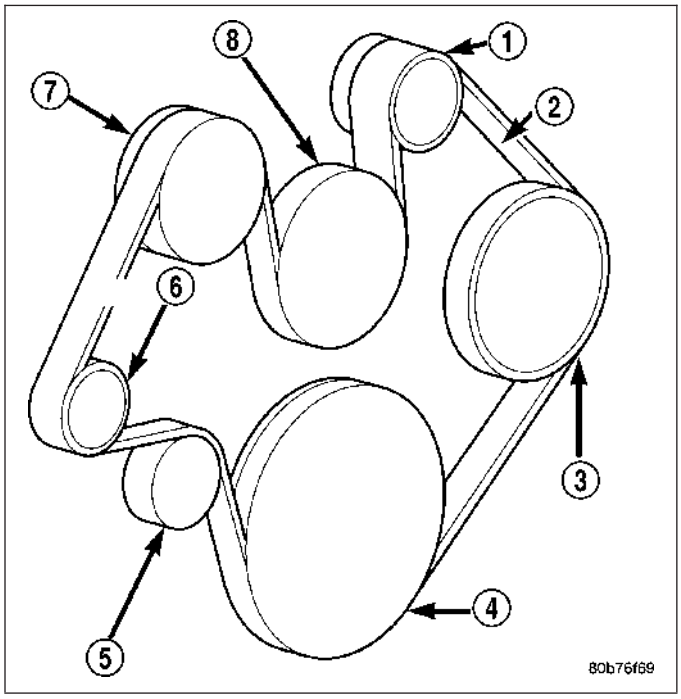
ACCESSORY DRIVE BELT DIAGNOSIS CHART



CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage	2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned	1. Align pulley(s)
	2. Abrasive environment	2. Clean pulley(s). Replace belt if necessary
	3. Rusted pulley(s)	3. Clean rust from pulley(s)
	4. Sharp or jagged pulley groove tips	4. Replace pulley. Inspect belt.
	5. Belt rubber deteriorated	5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension	1. Inspect/Replace tensioner if necessary
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)	2. Replace belt and clean pulleys
	3. Driven component bearing failure (seizure)	3. Replace faulty component or bearing
	4. Belt glazed or hardened from heat and excessive slippage	4. Replace belt.
LONGITUDAL BELT CRACKING	1. Belt has mistracked from pulley groove	1. Replace belt
	2. Pulley groove tip has worn away rubber to tensile member	2. Replace belt

CONDITION	POSSIBLE CAUSES	CORRECTION
″GROOVE JUMPING″ (Belt does not maintain correct position on pulley)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Pulley(s) not within design tolerance	2. Replace pulley(s)
	3. Foreign object(s) in grooves	3. Remove foreign objects from grooves
	4. Pulley misalignment	4. Align component
	5. Belt cordline is broken	5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension	1. Replace Inspect/Replace tensioner if necessary
	2. Tensile member damaged during belt installation	2. Replace belt
	3. Severe misalignment	3. Align pulley(s)
	4. Bracket, pulley, or bearing failure	4. Replace defective component and belt
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)
	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object	1. Correct rubbing condition
	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt

REMOVAL - 3.7L/4.7L/5.7L



CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVER DAMAGE MAY OCCUR TO THE TENSIONER.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

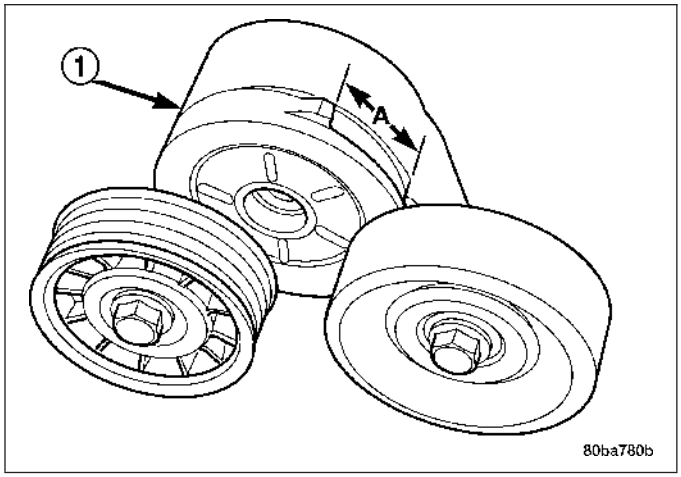
1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (6) until it contacts it's stop. Remove belt (2), then slowly rotate the tensioner (6) into the freearm position.

INSTALLATION - 3.7L/4.7L/5.7L

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.



2. Install new belt. Route the belt around all pulleys except the idler pulley (5). Rotate the tensioner arm until it contacts it's stop position. Route the belt around the idler (5) and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.
3. With the drive belt installed, inspect the belt wear indicator. On 4.7L Engines only, the gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches). If the measurement exceeds this specification replace the serpentine accessory drive belt.

CONTAINER-COOLANT RECOVERY

DESCRIPTION

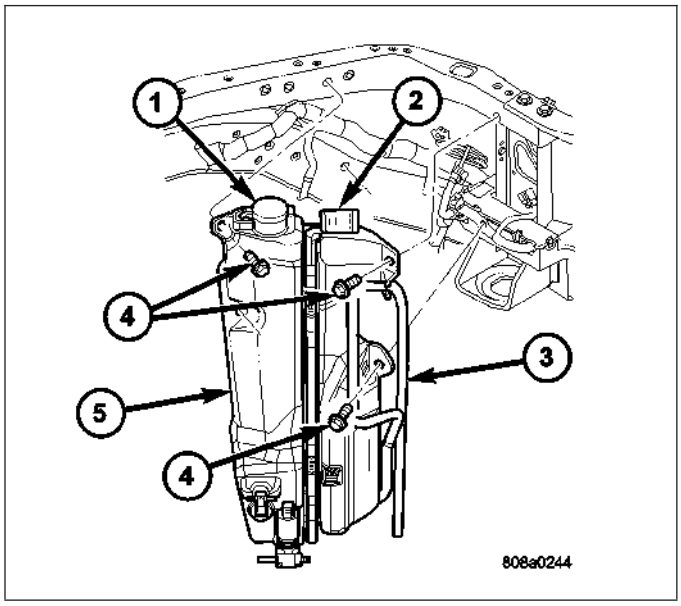
The coolant recovery containeris integral to the upper fan shroud assembly and is made of high temperature plastic.

OPERATION

The coolant recovery container works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also provides some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

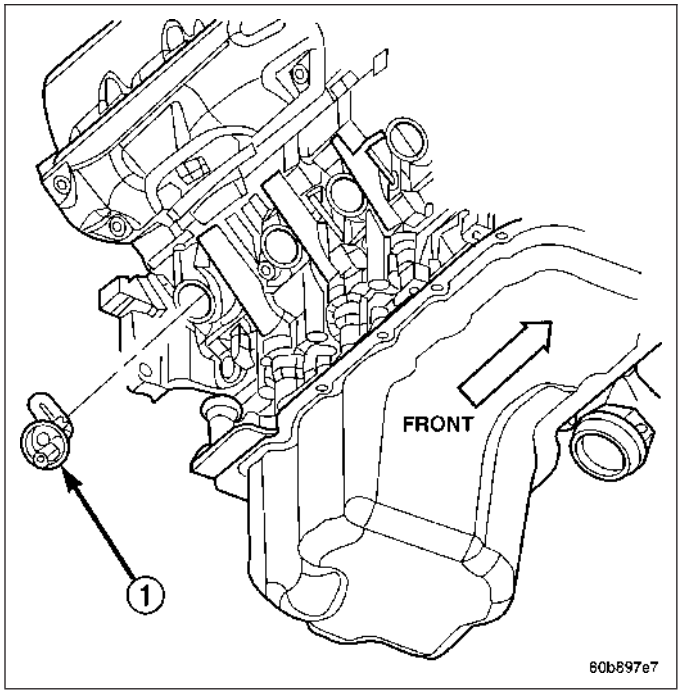


HEATER-ENGINE BLOCK

DESCRIPTION

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

An optional engine block heater is available on all models. The heater is equipped with a power cord. The heater is mounted in a core hole of the engine cylinder block (1) (in place of a freeze plug) with the heating element immersed in engine coolant. The cord is attached to an engine compartment component with tie-straps.



OPERATION

The heater warms the engine coolant providing easier engine starting and faster warm-up in low temperatures. Connecting the power cord to a grounded 110-120 volt AC electrical outlet with a grounded three wire extension cord provides the electricity needed to heat the element..

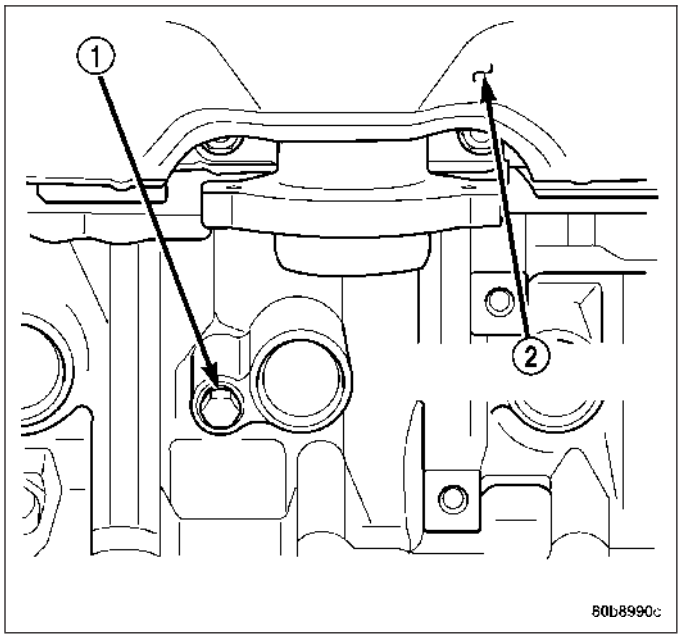
DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If the unit does not operate, possible causes can be either the power cord or the heater element. Test the power cord for continuity with a 110-volt voltmeter or 110-volt test light. Test heater element continuity with an ohmmeter or a 12-volt test light.

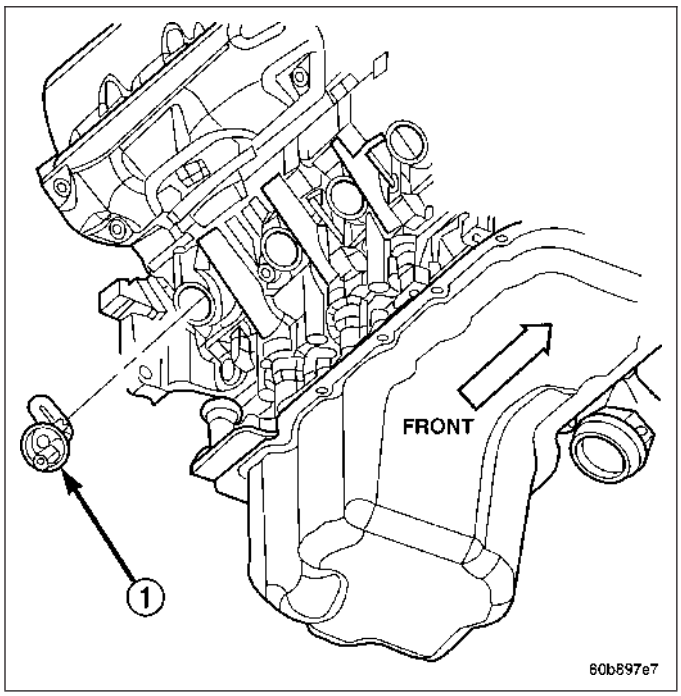
CAUTION: To prevent damage, the power cord must be secured in it's retainer clips and away from any components that may cause abrasion or damage, such as linkages, exhaust components, etc.

REMOVAL

1. Disconnect negative battery cable from battery.
2. Drain coolant from radiator (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Raise vehicle.
4. Remove engine cylinder block drain plug(s) (1) located on the sides of cylinder block above the oil pan rail.



5. Remove power cord from block heater.
6. Loosen screw at center of block heater. Remove heater assembly (1).



INSTALLATION

1. Thoroughly clean cylinder block core hole and block heater seat.
2. Insert block heater assembly with element loop pointing at twelve o'clock.
3. With block heater fully seated, tighten center screw to 2 N·m (17 in. lbs.) torque.
4. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Start and warm the engine. Check for leaks.

SENSOR-ENGINE COOLANT TEMPERATURE

DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

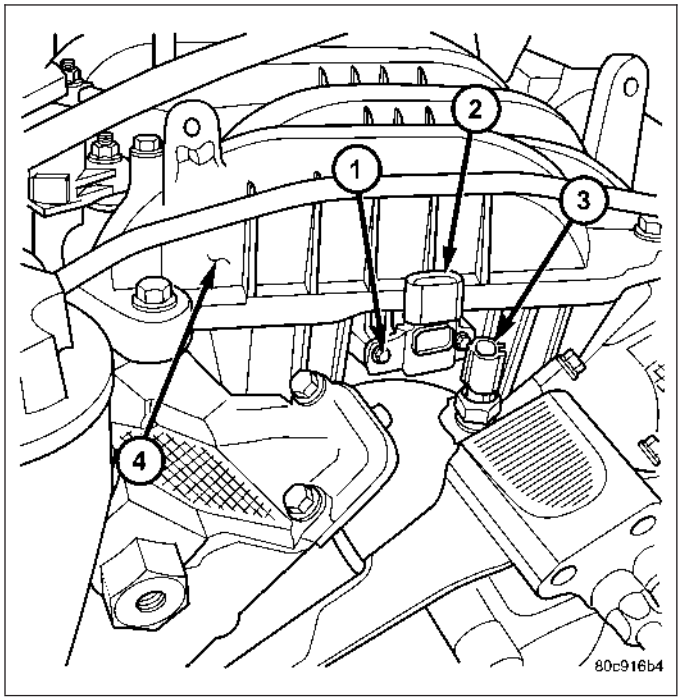
REMOVAL

3.7L ENGINE

The Engine Coolant Temperature (ECT) sensor (3) on the 3.7L engine is installed into a water jacket at front of intake manifold near rear of generator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

1. Partially drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Disconnect the electrical connector from the sensor (3).
3. Remove the sensor from the intake manifold.

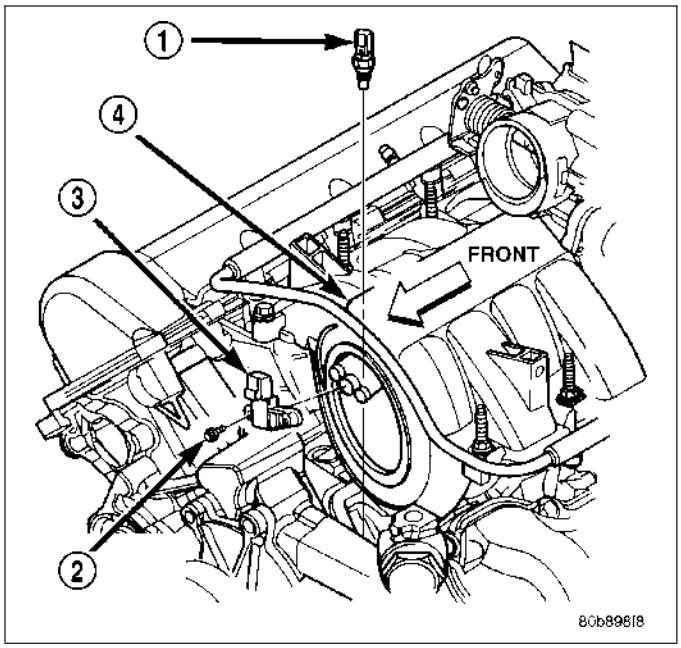


4.7L V-8

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR.

The Engine Coolant Temperature (ECT) sensor (1) on the 4.7L V-8 engine is located near the front of the intake manifold.

1. Partially drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Disconnect the electrical connector from the ECT sensor (1).
3. Remove the sensor (1) from the intake manifold.

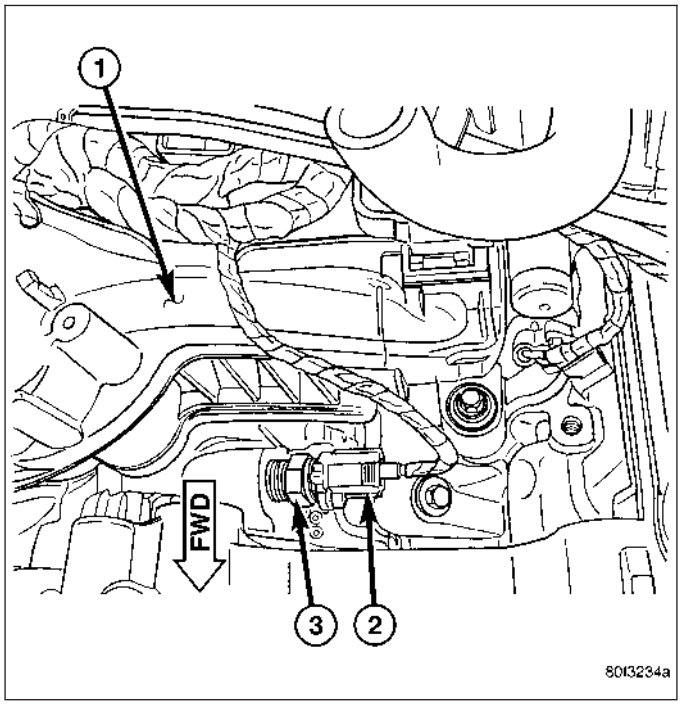


5.7L V-8

The Engine Coolant Temperature (ECT) sensor (3) on the 5.7L engine is located under the air conditioning compressor. It is installed into a water jacket at the front of the cylinder block.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

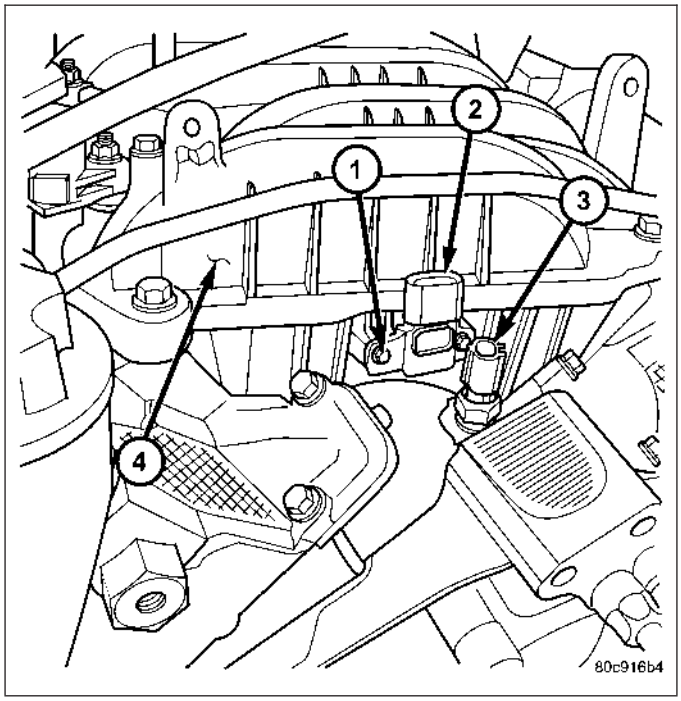
1. Partially drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Carefully unbolt air conditioning compressor from front of engine. Do not disconnect any A/C hoses from compressor. Temporarily support compressor to gain access to ECT sensor (3).
4. Disconnect electrical connector (2) from sensor (3).
5. Remove sensor (3) from cylinder block.



INSTALLATION

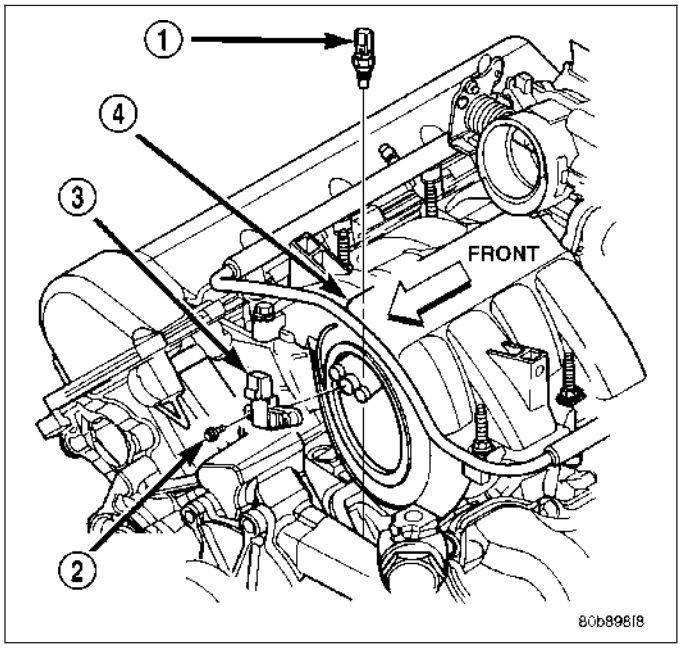
3.7L ENGINE

1. Apply thread sealant to sensor threads.
2. Install engine coolant sensor into intake manifold. (3). Tighten sensor to 11 N·m (97.3 in. lbs.) torque.
3. Connect the electrical connector.
4. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).



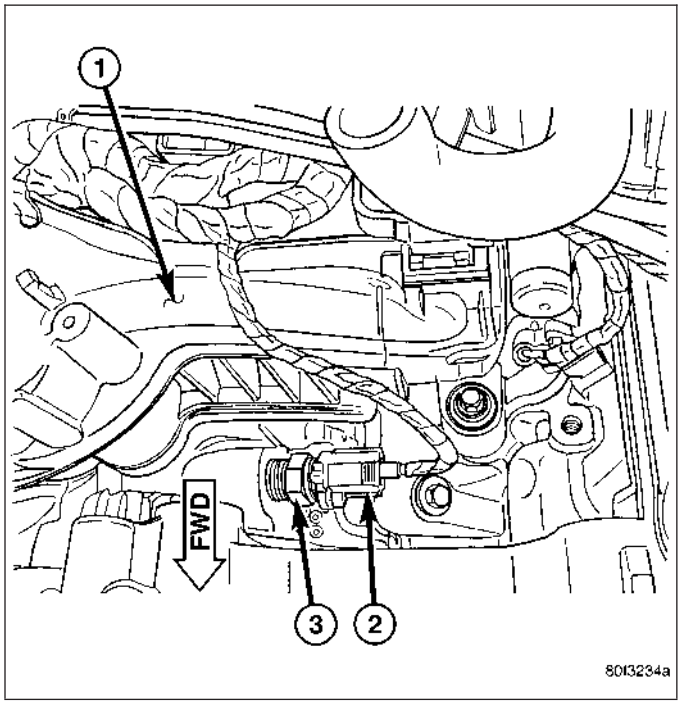
4.7L V-8

1. Apply thread sealant to sensor threads.
2. Install ECT sensor (1) to engine.
3. Tighten sensor to 11 N·m (97.3 in. lbs.) torque.
4. Connect electrical connector to sensor (1).
5. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).



5.7L V-8

1. Apply thread sealant to sensor threads.
2. Install ECT sensor (3) to engine.
3. Tighten sensor to 11 N·m (97.3 in. lbs.) torque.
4. Connect electrical connector (2) to ECT sensor (3).
5. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).



THERMOSTAT-ENGINE COOLANT

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

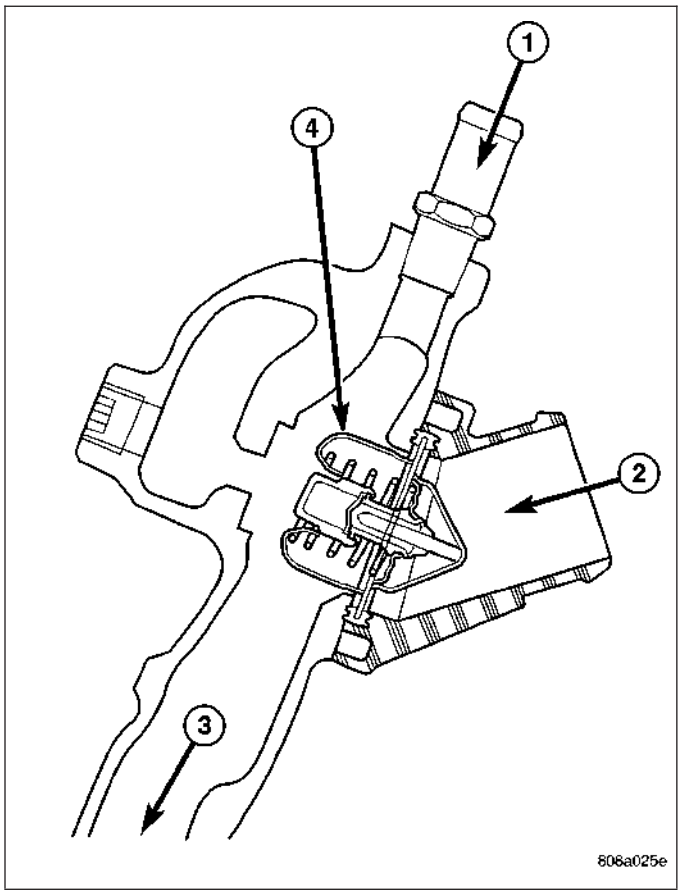
The thermostat on the 5.7L gas powered engine is located beneath the thermostat housing (1) at the front of the intake manifold.

On the 3.7L/4.7L engine the thermostat (4) is designed to block the flow of the coolant bypass journal by 50% instead of completely blocking the flow.

The thermostat is a wax pellet driven, reverse poppet choke type.

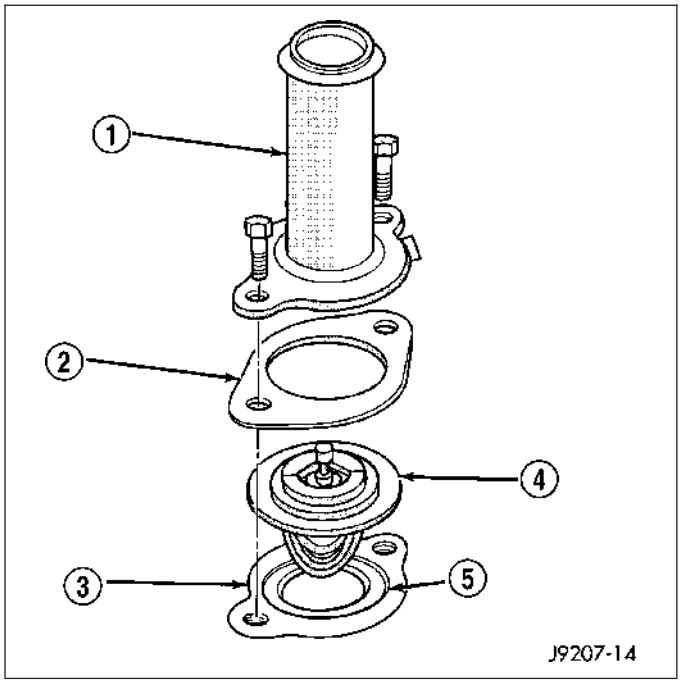
Coolant leakage into the pellet container will cause the thermostat to fail in the open position. Thermostats very rarely stick. Do not attempt to free a thermostat with a prying device.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation that can result in sludge formation.



OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.



DIAGNOSIS AND TESTING - THERMOSTAT

ON-BOARD DIAGNOSTICS

All **gasoline powered models** are equipped with On-Board Diagnostics for certain cooling system components. Refer to On-Board Diagnostics (OBD) in the Diagnosis section of this group for additional information. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC) in the PCM memory. Do not change a thermostat for lack of heat as indicated by the instrument panel gauge or by poor heater performance unless a DTC is present. Refer to the Diagnosis section of this group for other probable causes. For other DTCs, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION)

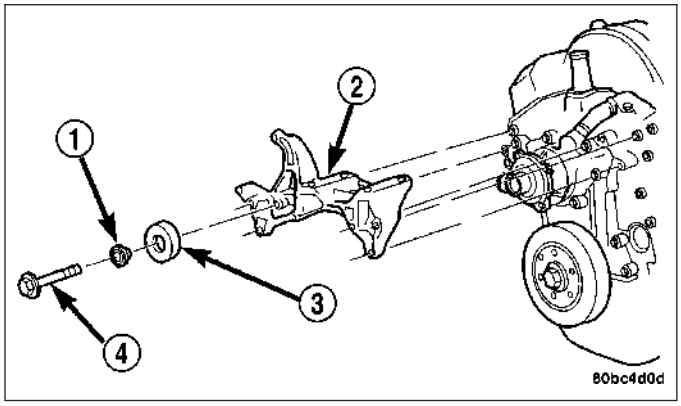
The DTC can also be accessed through the DRB scan tool. Refer to the appropriate Powertrain Diagnostic Procedures information for diagnostic information and operation of the DRB scan tool.

REMOVAL

5.7L ENGINE

If the thermostat is being replaced, be sure that the replacement is the specified thermostat for the vehicle model and engine type.

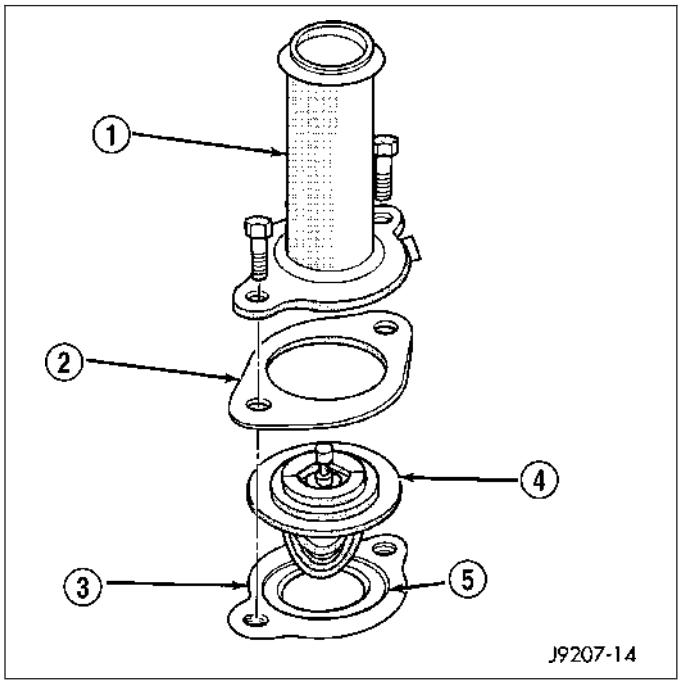
1. Disconnect the negative battery cable.
2. Drain the cooling system until the coolant level is below the thermostat (Refer to 7 - COOLING - STANDARD PROCEDURE)
3. Air Conditioned vehicles: Remove the support bracket (generator mounting bracket-to-intake manifold) (2) located near the rear of the generator.



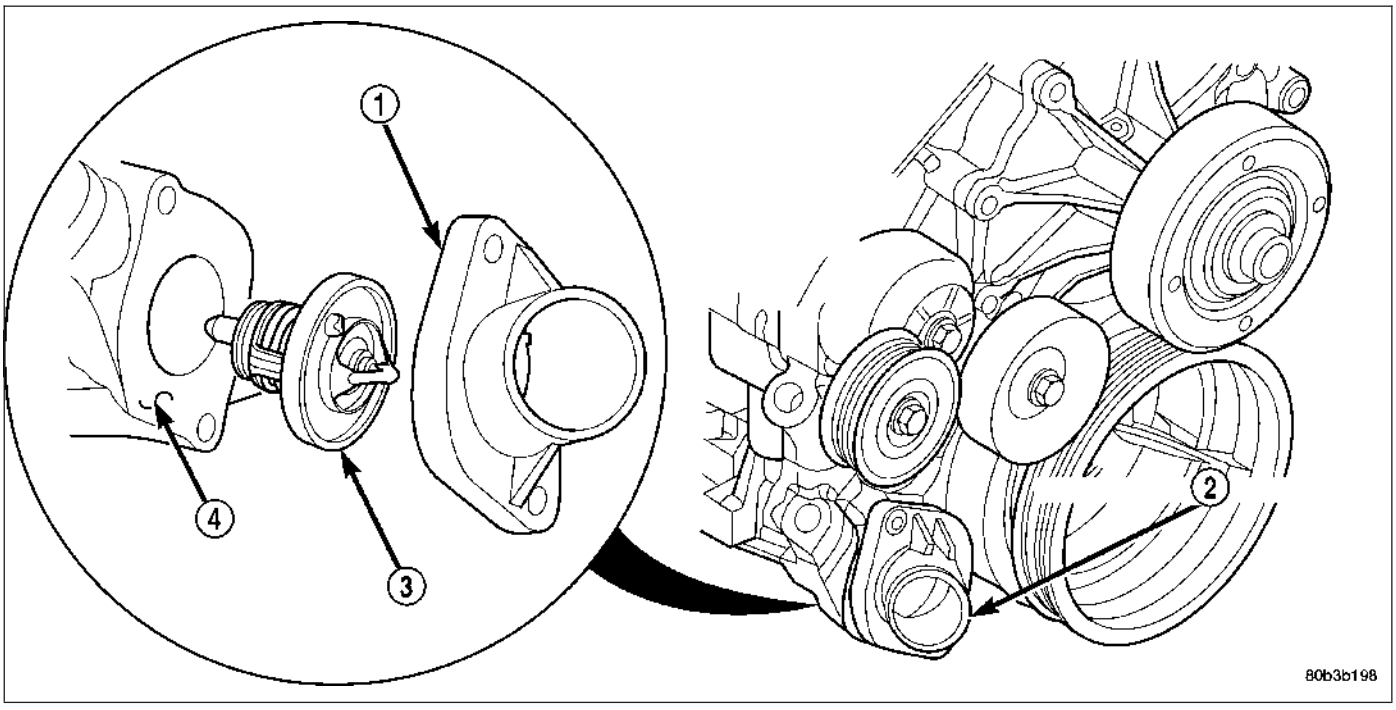
Note: On air conditioning equipped vehicles, the generator must be partially removed.

4. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove the generator mounting bolts. Do not remove any of the wiring at the generator. If equipped with 4WD, unplug the 4WD indicator lamp wiring harness (located near rear of generator).
6. Remove the generator. Position the generator to gain access for the thermostat gasket removal.
7. Remove the radiator upper hose clamp and upper hose at the thermostat housing.
8. Position the wiring harness (behind thermostat housing) to gain access to the thermostat housing.

9. Remove the thermostat housing mounting bolts, thermostat housing (1), gasket (2) and thermostat (3). Discard old gasket (3).



3.7L/4.7L ENGINE



If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

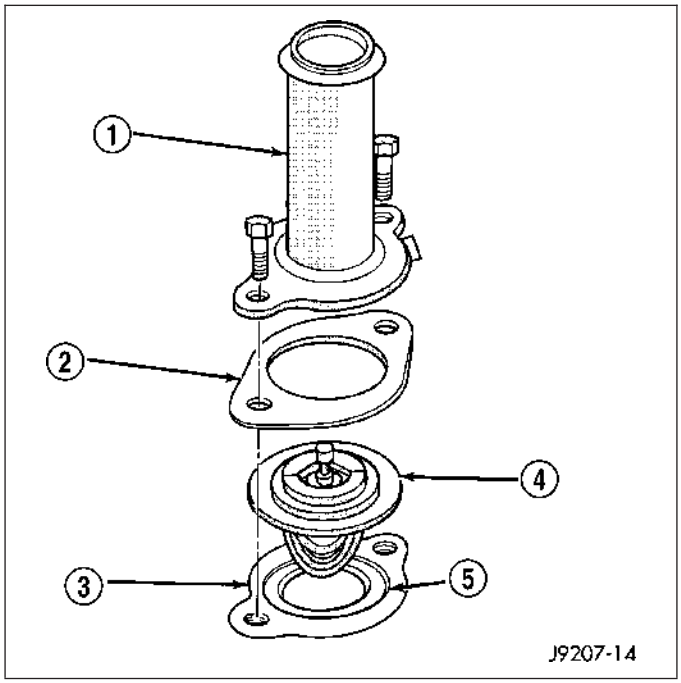
1. Disconnect negative battery cable at battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE)
3. Raise vehicle on hoist.
4. Remove splash shield.
5. Remove lower radiator hose clamp and lower radiator hose at thermostat housing.

6. Remove thermostat housing mounting bolts , thermostat housing (1) and thermostat (3).

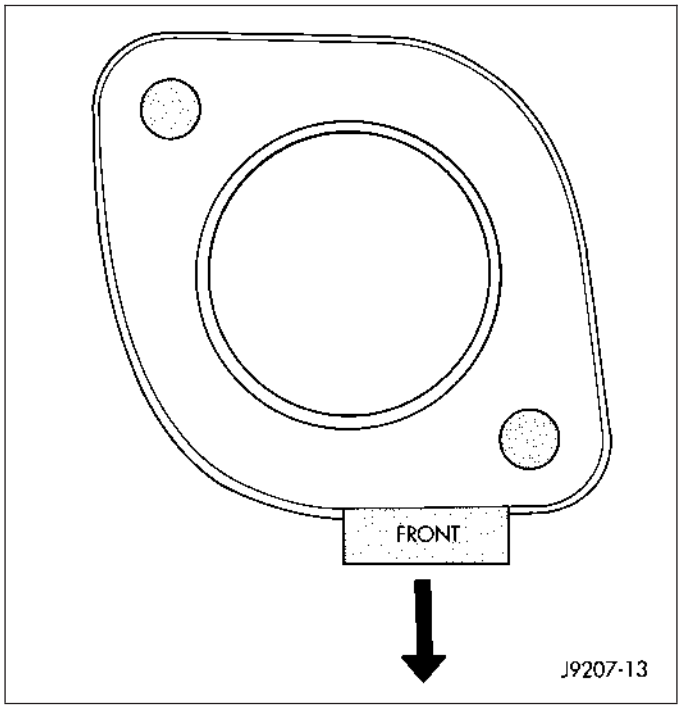
INSTALLATION

5.7L ENGINE

1. Clean the mating areas of the intake manifold and thermostat housing (1).
2. Install the thermostat (4) (spring side down) into the recessed machined groove on the intake manifold.
3. Install the gasket on the intake manifold and over the thermostat.
4. Position the thermostat housing (1) to the intake manifold. **Note:** The word FRONT stamped on housing. For adequate clearance, this **must** be placed towards the front of the vehicle. The housing is slightly angled forward after the installation to the intake manifold.
5. Install the housing-to-intake manifold bolts. Tighten the bolts to 23 N·m (200 in. lbs.)
   .



6. Install the radiator upper hose to the thermostat housing.
7. Air Conditioned vehicles; Install the generator. Tighten the bolts to 41 N·m (30 ft. lbs.).
8. Install the support bracket (generator mounting bracket-to-intake manifold).. Tighten the bolts to 54 N·m (40 ft. lbs.).
9. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
10. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
11. Connect battery negative cable.
12. Start and warm the engine. Check for leaks.



3.7L/4.7L ENGINE

1. Clean mating areas of timing chain cover and thermostat housing.
2. Install thermostat (spring side down) into recessed machined groove on timing chain cover.
3. Position thermostat housing on timing chain cover.
4. Install two housing-to-timing chain cover bolts. Tighten bolts to 13 N·m (112 in. lbs.) torque.

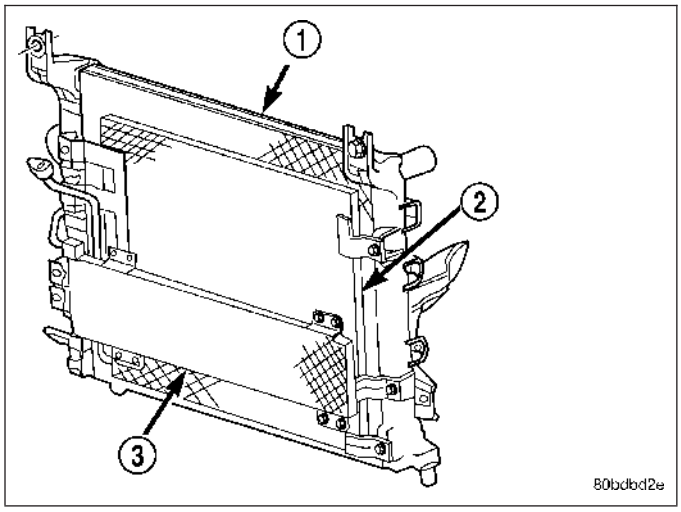
CAUTION: Housing must be tightened evenly and thermostat must be centered into recessed groove in timimg chain cover. If not, it may result in a cracked housing, damaged timing chain cover threads or coolant leaks.

5. Install lower radiator hose on thermostat housing.
6. Install splash shield.
7. Lower vehicle.
8. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
9. Connect negative battery cable to battery.
10. Start and warm the engine. Check for leaks.

RADIATOR

DESCRIPTION

The radiator (1) is a aluminum cross-flow design with horizontal tubes through the radiator core and vertical plastic side tanks.



OPERATION

The radiator supplies sufficient heat transfer using the cooling fins interlaced between the horizontal tubes in the radiator core to cool the engine.

DIAGNOSIS AND TESTING

RADIATOR COOLANT FLOW

Use the following procedure to determine if coolant is flowing through cooling system.

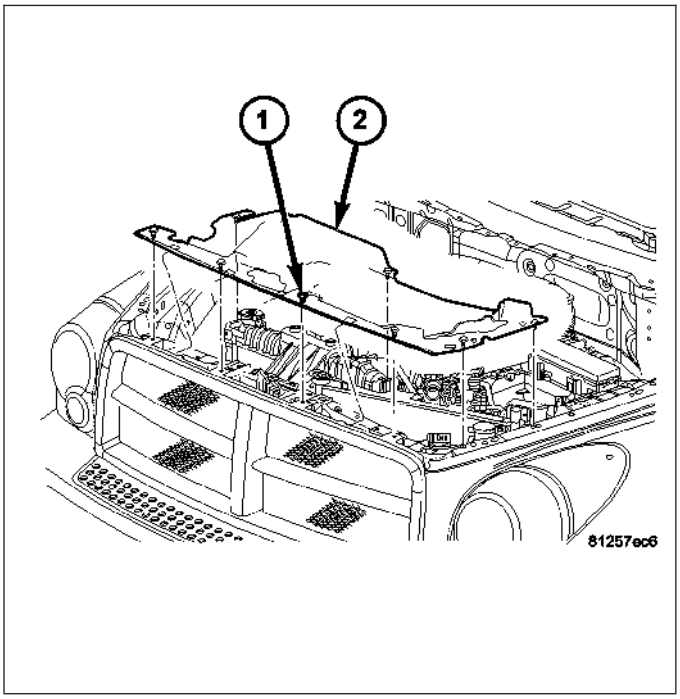
1. Idle engine until operating temperature is reached. If upper radiator hose is warm to the touch, thermostat is opening and coolant is flowing to radiator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. USING A RAG TO COVER RADIATOR PRESSURE CAP, OPEN RADIATOR CAP SLOWLY TO FIRST STOP. ALLOW ANY BUILT-UP PRESSURE TO VENT TO THE RESERVE/OVERFLOW TANK. AFTER PRESSURE BUILD-UP HAS BEEN RELEASED, REMOVE CAP FROM FILLER NECK.

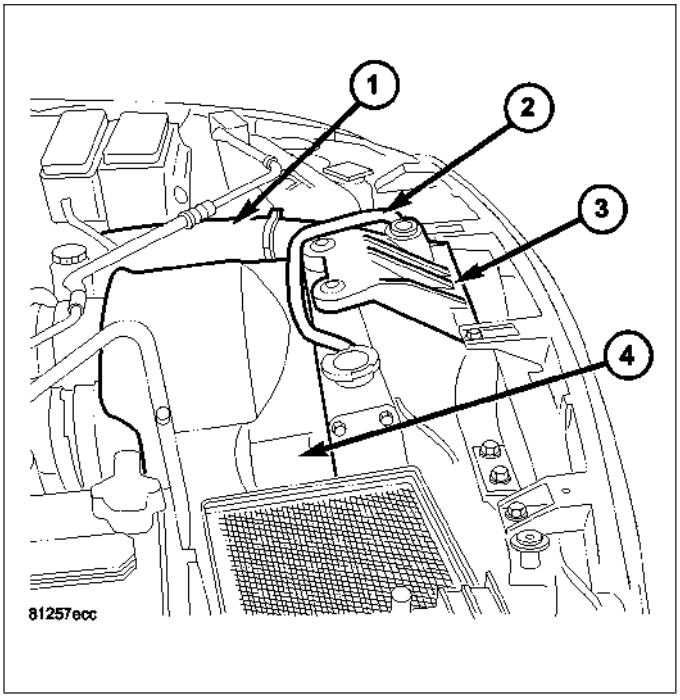
2. Drain a small amount of coolant from radiator until ends of radiator tubes are visible through filler neck. Idle engine at normal operating temperature. If coolant is flowing past exposed tubes, coolant is circulating.

REMOVAL

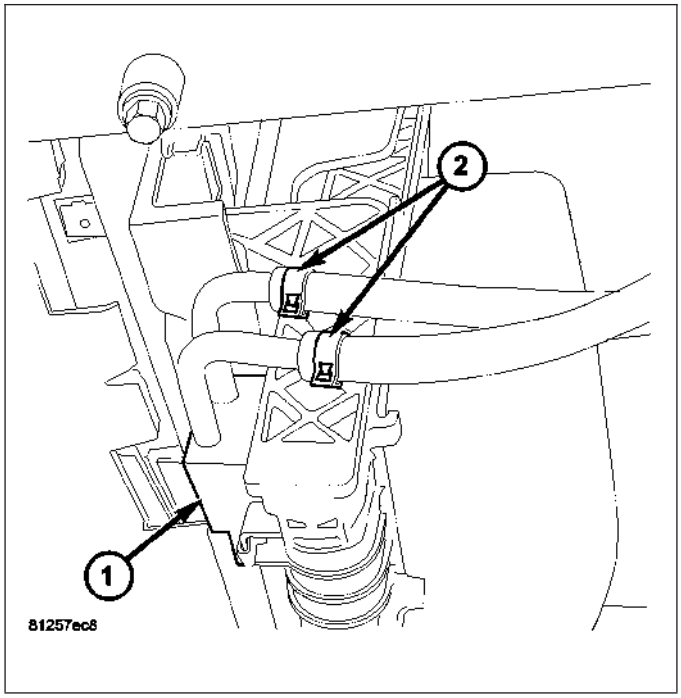
1. Disconnect battery negative cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE)
3. Remove pushpins (1) and the upper condenser/radiator seal (2).
4. Remove air filer housing assembly.(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).



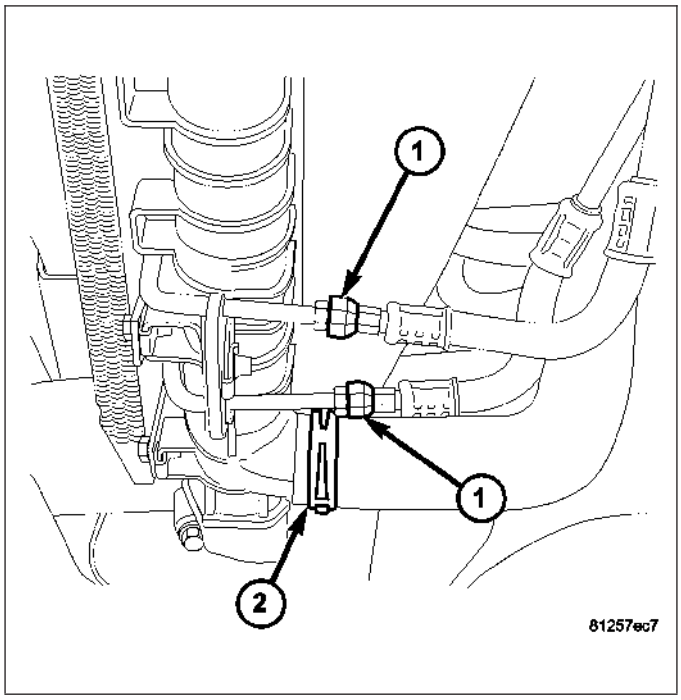
5. Remove upper radiator hose (1).
6. Remove overflow tube (2).
7. Remove radiator fan shroud (4) from the radiator and position over the radiator fan.
8. Remove the upper radiator support (3).
9. Raise vehicle.



10. Disconnect the power steering cooler lines (2).



11. Disconnect the transmission cooler lines (1).
12. Remove the lower radiator hose (2).
13. Lower vehicle.
14. Remove upper radiator mount.
15. Remove LH and RH radiator side seals.
16. Remove radiator.
17. Remove power steering cooler form the radiator, if necessary.
18. Remove transmission cooler from radiator, if necessary.



CLEANING

Clean radiator fins With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

The radiator cooling fins should be checked for damage or deterioration. Inspect cooling fins to make sure they are not bent or crushed, these areas result in reduced heat exchange causing the cooling system to operate at higher temperatures. Inspect the plastic end tanks for cracks, damage or leaks.

Inspect the radiator neck for damage or distortion.

INSTALLATION

The radiator has two isolator pins on bottom of both tanks. These fit into alignment holes in radiator lower support.

1. Install power steering cooler, if removed.
2. Install transmission oil cooler if removed.
3. Install the upper radiator mount
4. Position isolator pins into alignment holes in radiator lower support.
5. Install upper radiator support. Tighten bolts to 23 N·m (200 in. lbs.)
6. Install LH and RH radiator side seals.
7. Install upper radiator hose.
8. Install overflow tube.
9. Install radiator shroud.
10. Raise vehicle.
11. Install power steering cooler lines.
12. Install transmission cooler lines.
13. Install lower radiator hose.
14. Lower vehicle.
15. Install air filter housing assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - INSTALLATION).
16. Fill radiator (Refer to 7 - COOLING - STANDARD PROCEDURE).
17. Connect battery negative cable.
18. Start and warm the engine. Check for leaks.

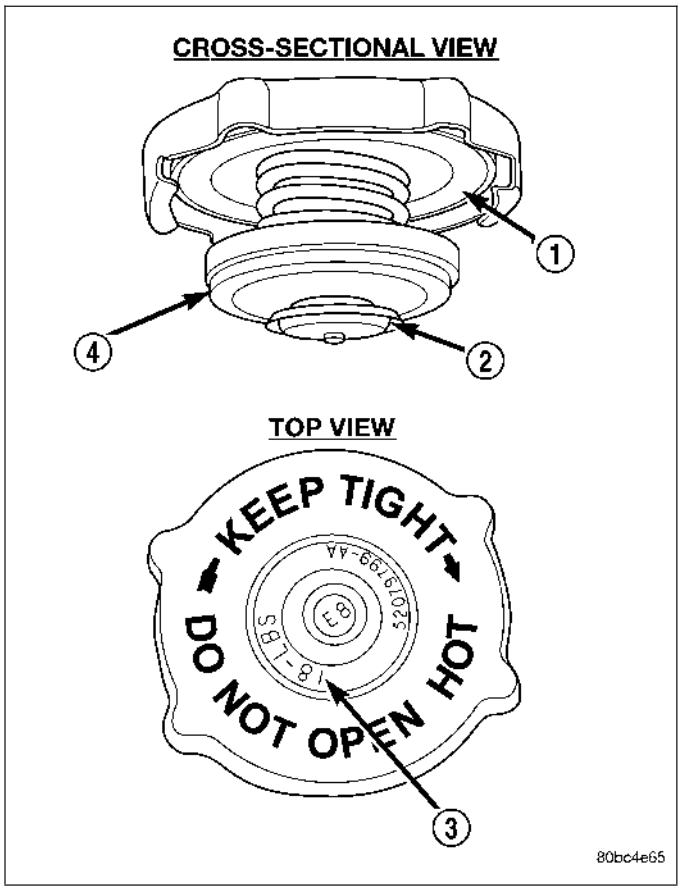
CAP-RADIATOR PRESSURE

DESCRIPTION

All cooling systems are equipped with a pressure cap on the radiator. This cap releases pressure at some point within a range of 131-to-158 kPa (19-to-23 psi). The pressure relief point (in pounds) is engraved on top of the cap (3).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve (4). This valve opens when system pressure reaches the release range of 131-to-158 kPa (19-to-23 psi).

A rubber gasket (2) seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.



OPERATION

A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

DIAGNOSIS AND TESTING

RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 131 kPa (21 psi) and hold pressure at a minimum of 130 kPa (18.8 psi).

WARNING: THE WARNING WORDS “DO NOT OPEN HOT” ON RADIATOR PRESSURE CAP, ARE A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, RADIATOR CAP SHOULD NOT BE REMOVED WHILE SYSTEM IS HOT AND/OR UNDER PRESSURE.

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.

4. Checking for vacuum leaks.

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT AT LEAST 15 MINUTES BEFORE REMOVING RADIATOR CAP. WITH A RAG, SQUEEZE RADIATOR UPPER HOSE TO CHECK IF SYSTEM IS UNDER PRESSURE. PLACE A RAG OVER CAP AND WITHOUT PUSHING CAP DOWN, ROTATE IT COUNTER-CLOCKWISE TO FIRST STOP. ALLOW FLUID TO ESCAPE THROUGH THE COOLANT RESERVE/OVERFLOW HOSE INTO RESERVE/OVERFLOW TANK. SQUEEZE RADIATOR UPPER HOSE TO DETERMINE WHEN PRESSURE HAS BEEN RELEASED. WHEN COOLANT AND STEAM STOP BEING PUSHED INTO TANK AND SYSTEM PRESSURE DROPS, REMOVE RADIATOR CAP COMPLETELY.

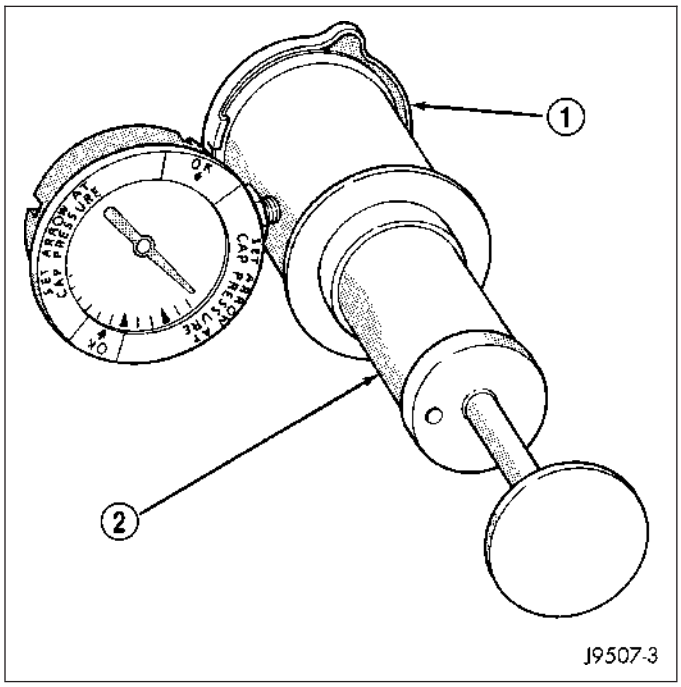
RADIATOR CAP

Remove cap (1) from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap (1) on pressure tester 7700 (2) or an equivalent.

Operate tester pump to bring pressure to 138 kPa (20 psi) on gauge. If pressure cap (1) fails to hold pressure of at least 131 kPa (19 psi) replace cap. Refer to the following **CAUTION** .

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.



CLEANING

Use only a mild soap and water to clean the radiator cap. Using any type solvent may cause damage to the seal in the radiator cap.

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

PUMP-WATER

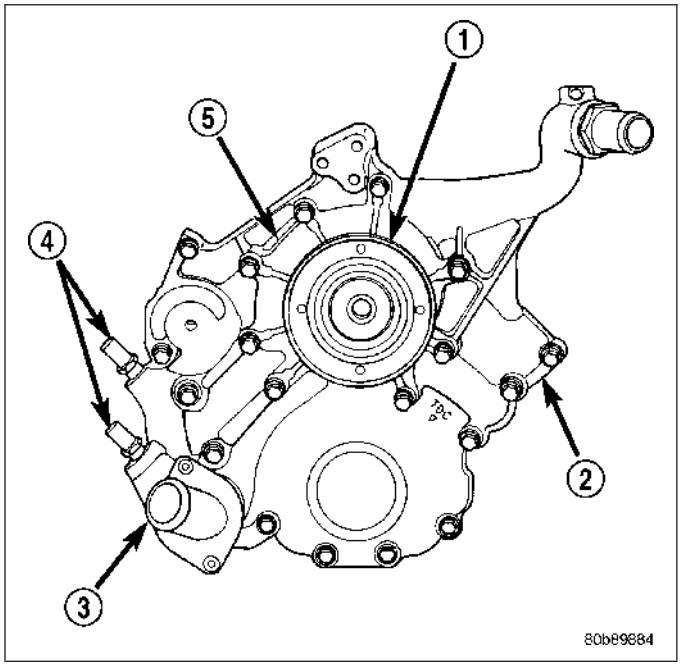
DESCRIPTION

WATER PUMP

A centrifugal water pump (1) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine drive belt that drives the water pump pulley (1).

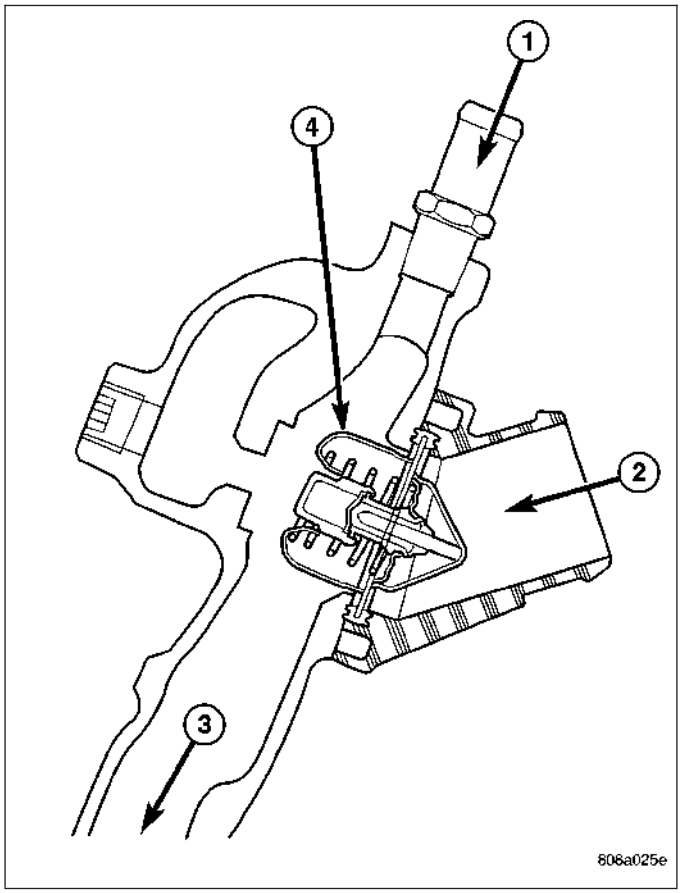
The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

Both heater hoses are connected to fittings on the timing chain front cover. The water pump is also mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.



WATER PUMP BYPASS - 4.7L

The 4.7L engine uses an internal water/coolant bypass system. The design uses galleries in the timing chain cover to circulate coolant during engine warm-up preventing the coolant from flowing through the radiator. The thermostat (4) uses a stub shaft located at the rear of the thermostat to control flow through the bypass gallery.



OPERATION

WATER PUMP

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core, this coolant absorbs the heat generated when the engine is running. The pump is driven by the engine crankshaft via a drive belt.

WATER PUMP BYPASS - 4.7L ENGINE

When the thermostat is in the closed position the bypass gallery is not obstructed allowing 100% flow. When the thermostat is in the open position the pill partially covers the bypass hole, reducing the amount of bypass flow. This design allows the coolant to reach operating temperature quickly when cold, while adding extra cooling during normal temperature operation.

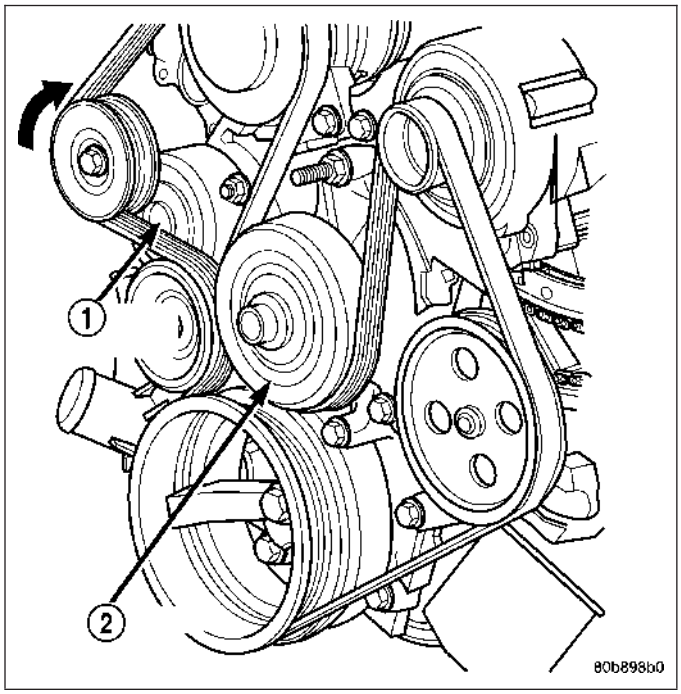
REMOVAL

3.7L/4.7L ENGINE

The water pump on 3.7L/4.7L engines is bolted directly to the engine timing chain case cover.

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

3. Remove fan/viscous fan drive assembly from water pump (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL). Do not attempt to remove fan/ viscous fan drive assembly from vehicle at this time.
4. If water pump is being replaced, do not unbolt fan blade assembly from thermal viscous fan drive.
5. Remove two fan shroud-to-radiator screws. Disconnect the coolant overflow hose, windshield washer fluid hose and washer pump electrical connector.
6. Remove fan shroud and fan blade/viscous fan drive assembly from vehicle.
7. After removing fan blade/viscous fan drive assembly, **do not** place thermal viscous fan drive in horizontal position. If stored horizontally, silicone fluid in viscous fan drive could drain into its bearing assembly and contaminate lubricant.
8. Remove accessory drive belt from the water pump pulley (2) (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).



9. Remove lower radiator hose clamp and remove lower hose at water pump.
10. Remove seven water pump mounting bolts and one stud bolt.

CAUTION: Do not pry water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

11. Remove water pump and gasket. Discard gasket.

5.7L ENGINE

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE)
3. Remove fan/viscous fan drive assembly from water pump (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL). Do not attempt to remove fan/ viscous fan drive assembly from vehicle at this time.

4. If water pump is being replaced, do not unbolt fan blade assembly from thermal viscous fan drive.
5. Remove two fan shroud-to-radiator screws. Disconnect the coolant overflow hose, windshield washer fluid hose and washer pump electrical connector.
6. Remove fan shroud and fan blade/viscous fan drive assembly from vehicle.
7. Remove A/C compressor and generator brace.
8. Remove idler pulleys.
9. Remove belt tensioner assembly (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL).
10. Remove upper and lower radiator hoses.
11. Remove heater hoses.
12. Remove water pump mounting bolts and remove pump.

CLEANING

Clean the gasket mating surface. Use caution not to damage the gasket sealing surface.

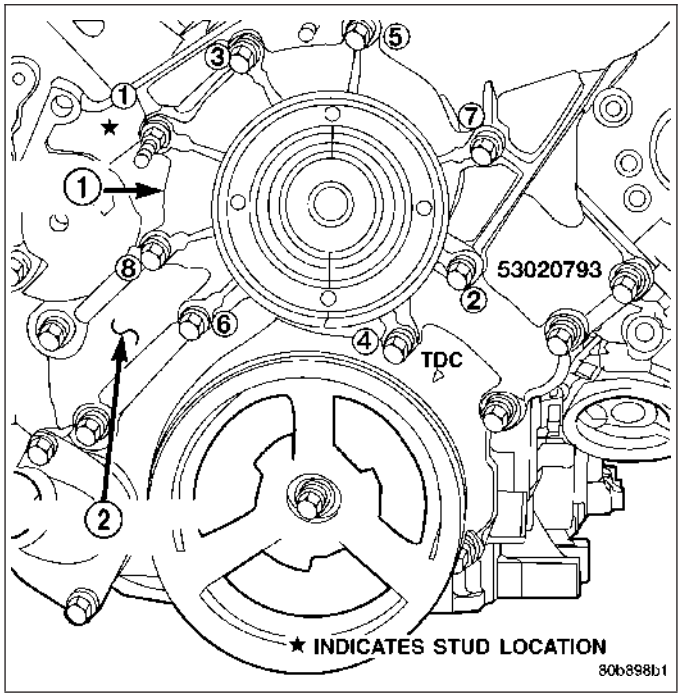
INSPECTION

Inspect the water pump assembly for cracks in the housing, water leaks from shaft seal, worn bearing or impeller rubbing either the pump body or timing chain case/cover.

INSTALLATION

3.7/4.7L ENGINE

1. Clean gasket mating surfaces.
2. Using a new gasket, position water pump (1) and install mounting bolts as shown. Tighten water pump mounting bolts to 58 N·m (43 ft. lbs.) torque.
3. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.



4. Connect radiator lower hose to water pump.

5. Install accessory drive belt (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Position fan shroud and fan blade/viscous fan drive assembly.
7. Install two fan shroud-to-radiator screws.
8. Be sure of at least 25 mm (1.0 inches) between tips of fan blades and fan shroud.
9. Install fan blade/viscous fan drive assembly to water pump shaft (Refer to 7 - COOLING/ENGINE/ RADIATOR FAN - INSTALLATION).
10. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
11. Connect negative battery cable.
12. Start and warm the engine. Check for leaks.

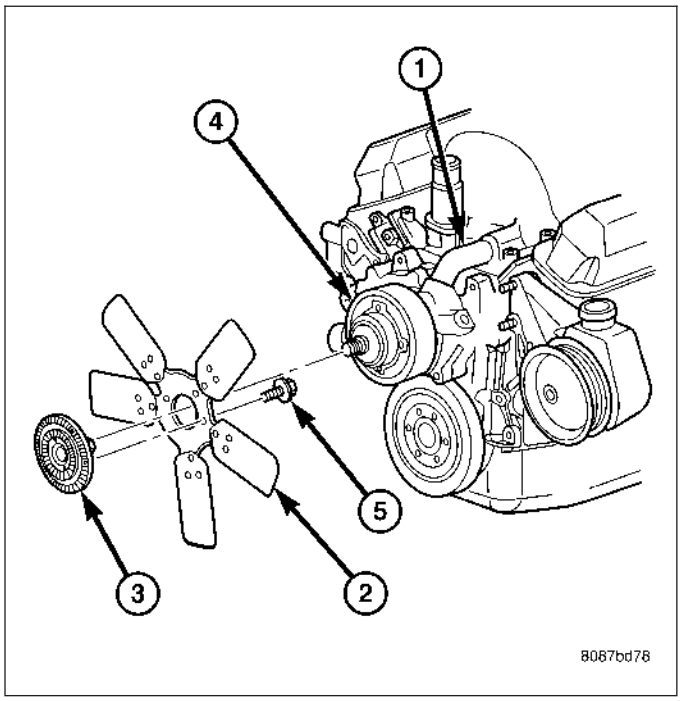
5.7L ENGINE

1. Install water pump and mounting bolts. Tighten moubting bolts to 24 N·m (18 ft. lbs.).
2. Install heater hoses.
3. Install upper and lower radiator hoses.
4. Install belt tensioner assembly (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION).
5. Install idler pulleys.
6. Install A/C compressor and alternator brace. Tighten bolt and nuts to 28 N·m (21 ft. lbs.).
7. Install fan shroud assembly and two fan shroud mounting screws.
8. Install the fan/viscous fdrive assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
9. Be sure of at least 25 mm (1.0 inches) between tips of fan blades and fan shroud.
10. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
11. Connect negative battery cable.
12. Fill coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
13. Pressure test coolant system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

FAN-RADIATOR VISCOUS

DESCRIPTION

The thermal viscous fan drive (3) is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft (4). The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

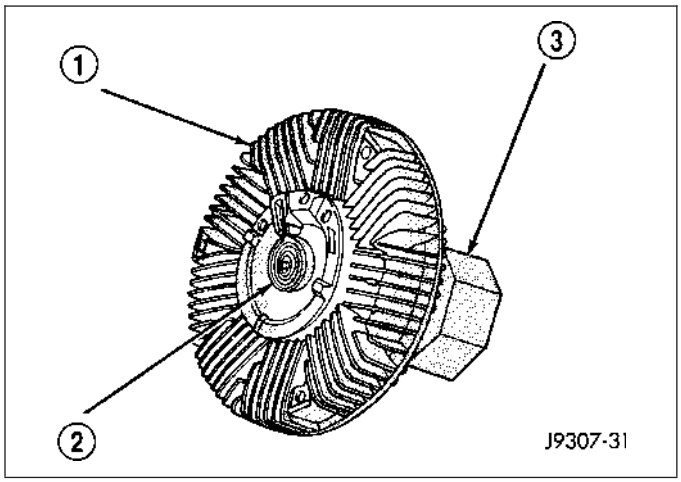


OPERATION

A thermostatic bimetallic spring coil (2) is located on the front face of the viscous fan drive unit (1). This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, the fan will remain at a reduced rpm regardless of engine speed.

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.



DIAGNOSIS AND TESTING - VISCOUS FAN DRIVE

NOISE

Note: It is normal for fan noise to be louder (roaring) when:

- The underhood temperature is above the engagement point for the viscous drive coupling. This may occur when ambient (outside air temperature) is very high.
- Engine loads and temperatures are high such as when towing a trailer.
- Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

VISCOUS DRIVE

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: BE SURE THAT THERE IS ADEQUATE FAN BLADE CLEARANCE BEFORE DRILLING.

1. Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18°-to-105°C (0°-to-220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.
3. Connect a tachometer and an engine ignition timing light. The timing light is to be used as a strobe light. This step cannot be used on the diesel engine.
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator. Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) and blowe fan is turned off.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

6. Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 88° C (190° F). Fan drive **engagement** should start to occur at/between:
   - 3.7L Automatic - 93° C - 99°C (200° F - 210° F)
   - 3.7L Manual/4.7L Automatic/5.9L - 85° - 91° C (185° - 195° F)
   - 4.7L Manual - 74° - 79° C (165° - 175° F)
   - 5.7L
   - 5.9L
   - Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.

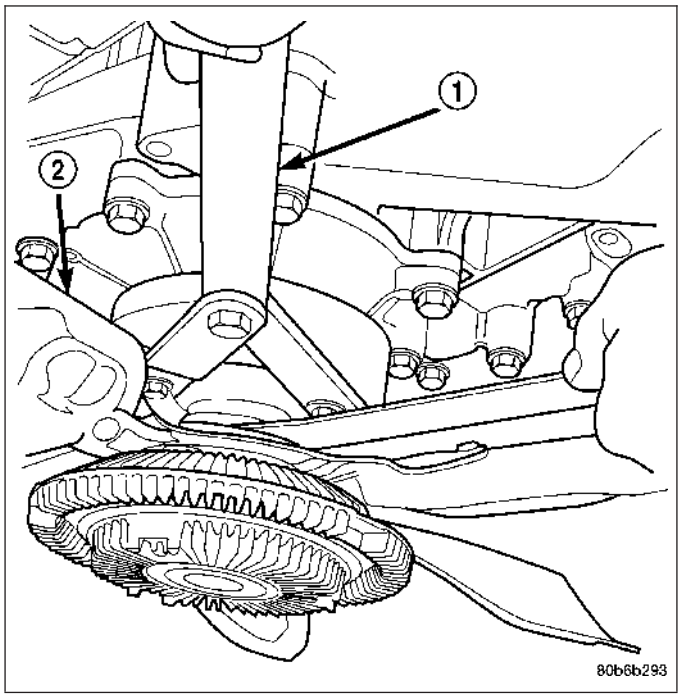
7. When viscous drive engagement is verified, remove the plastic sheet. Fan drive **disengagement** should start to occur at or between:
   - 3.7L Automatic - 76°C - 81°C (168° F - 178° F)
   - 3.7L Manual/4.7L Auto/ 5.9L - 67°C - 73°C (153° F - 163° F)
   - 4.7L Manual - 56°C - 62°C (133° F - 143° F)
   - 5.7L A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word REVERSE to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

REMOVAL

1. Partially drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove the upper radiator hose.
3. Remove the air filter housing assembly(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER ELEMENT - REMOVAL).
4. Using Tool 6958 and adapter pins 8346 (1), remove fan/viscous fan drive assembly from water pump. Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.
5. Position the fan/fan drive assembly in the radiator shroud.



6. Remove the two shroud mounting screws.
7. Remove the radiator shroud and fan drive assembly.
8. After removing fan blade/viscous fan drive assembly, **do not** place viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

9. Remove four bolts securing fan blade assembly to viscous fan drive.

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF FAN IS NOT WITHIN SPECIFICATIONS.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

1. Remove fan blade assembly from viscous fan drive unit (four bolts).
2. Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.
3. Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

INSTALLATION

1. Install fan blade assembly to viscous fan drive. Tighten bolts to 23 N·m (17 ft. lbs.) torque.
2. Position fan blade/viscous fan drive assembly into the radiator shroud.
3. Install the radiator shroud and fan drive assemblu into the vehicle.
4. Install fan shroud retaining screws.Tighten screws to 6 N·M (50 lbs. in.)
5. Install fan blade/viscous fan drive assembly to water pump shaft.
6. Install the upper radiator hose.
7. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Connect battery negative cable.

TUBE-WATER PUMP INLET

REMOVAL

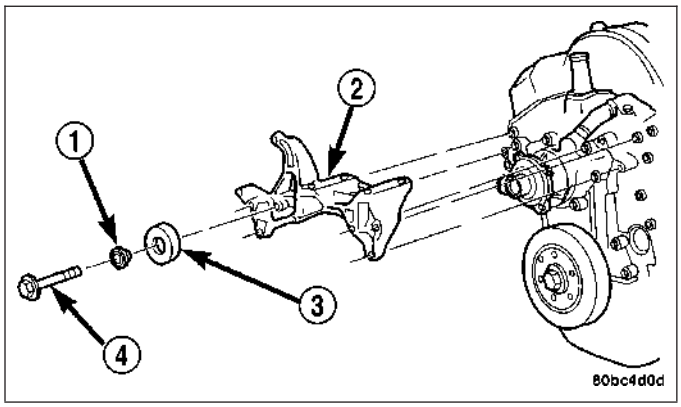
WITHOUT AIR CONDITIONING

1. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Loosen both bypass hose clamps and position to center of hose. Remove hose from vehicle.

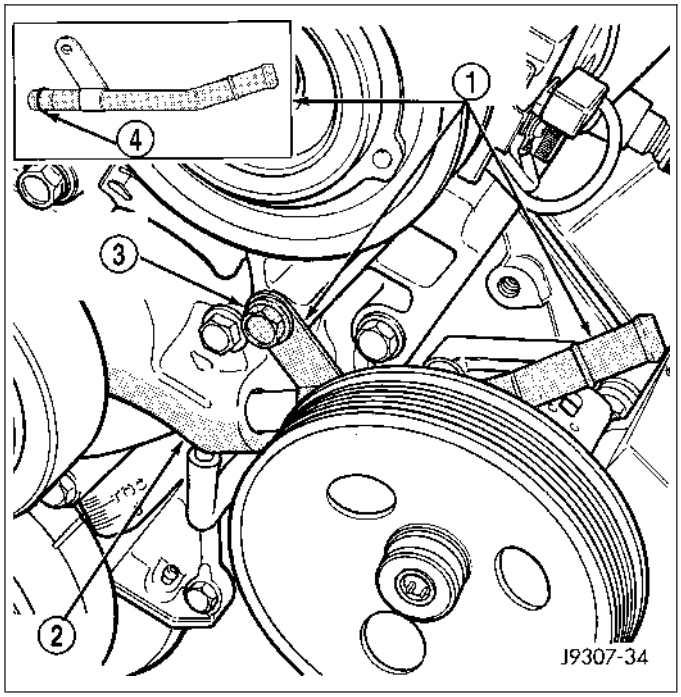
WITH AIR CONDITIONING

If equipped with A/C, the generator and A/C compressor along with their common mounting bracket (2) must be partially removed. Removing generator or A/C compressor from their mounting bracket is not necessary. Also, discharging A/C system is not necessary. **Do not** remove any refrigerant lines from A/C compressor.

WARNING: THE A/C SYSTEM IS UNDER PRESSURE EVEN WITH ENGINE OFF. REFER TO REFRIGERANT WARNINGS IN GROUP 24, HEATING AND AIR CONDITIONING.



1. Disconnect battery negative cable.
2. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove upper radiator hose clamp and hose at radiator.
4. Unplug wiring harness from A/C compressor.
5. Remove air cleaner assembly.
6. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
7. Remove bracket-to-intake manifold bolts.
8. The drive belt idler pulley must be removed to gain access to one of A/C compressor/generator bracket mounting bolts (3). Remove idler pulley bolt and remove idler pulley.
9. Remove oil dipstick tube mounting bol (3) at side of A/C-generator mounting bracket.
10. Disconnect throttle body cables.
11. Remove heater hose clamp and heater hose from heater hose coolant return tube.
12. Remove heater hose coolant return tube mounting bolt and remove tube from engine. Discard the old tube O-ring.
13. Remove six bracket bolts.
14. Lift and position generator and A/C compressor (along with their common mounting bracket) to gain access to bypass hose. A block of wood may be used to hold assembly in position.
15. Loosen and position both hose clamps to center of bypass hose. Remove hose from vehicle.



INSTALLATION

WITHOUT AIR CONDITIONING

1. Position bypass hose clamps to center of hose.
2. Install bypass hose to engine.
3. Secure both hose clamps.
4. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Start and warm the engine. Check for leaks.

WITH AIR CONDITIONING

1. Position bypass hose clamps to center of hose.
2. Install bypass hose to engine.
3. Secure both hose clamps.
4. Install generator-A/C mounting bracket assembly to engine. Tighten bolts (number 1 and 2) to 54 N·m (40 ft. lbs.) torque. Tighten bolts (number 3) to 40 N·m (30 ft. lbs.) torque.
5. Install a new O-ring to the heater hose coolant return tube. Coat the new O-ring with antifreeze before installation.
6. Install coolant return tube and its mounting bolt to engine.
7. Connect throttle body control cables.
8. Install oil dipstick mounting bolt.
9. Install idler pulley. Tighten bolt to 54 N·m (40 ft. lbs.) torque.

10. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
11. Install air cleaner assembly.
12. Install upper radiator hose to radiator.
13. Connect wiring harness to A/C compressor.
14. Connect battery negative cable.
15. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
16. Start and warm the engine. Check for leaks.

TRANSMISSION

TABLE OF CONTENTS

page

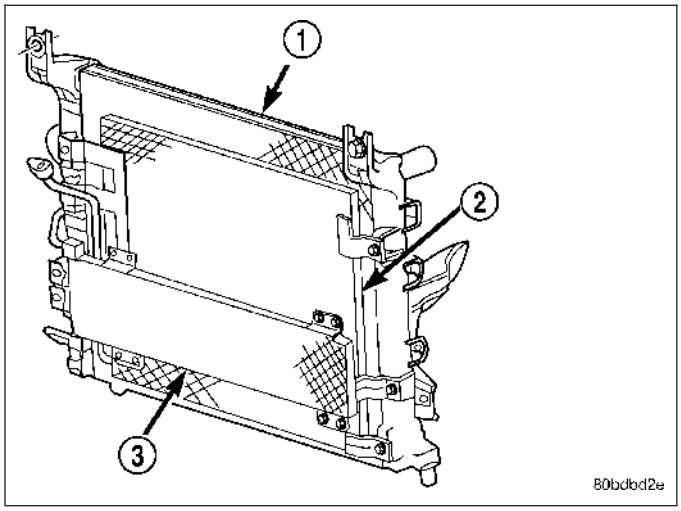
COOLER-TRANSMISSION
DESCRIPTION 53
REMOVAL 53
INSTALLATION 54

COOLER-TRANSMISSION

DESCRIPTION

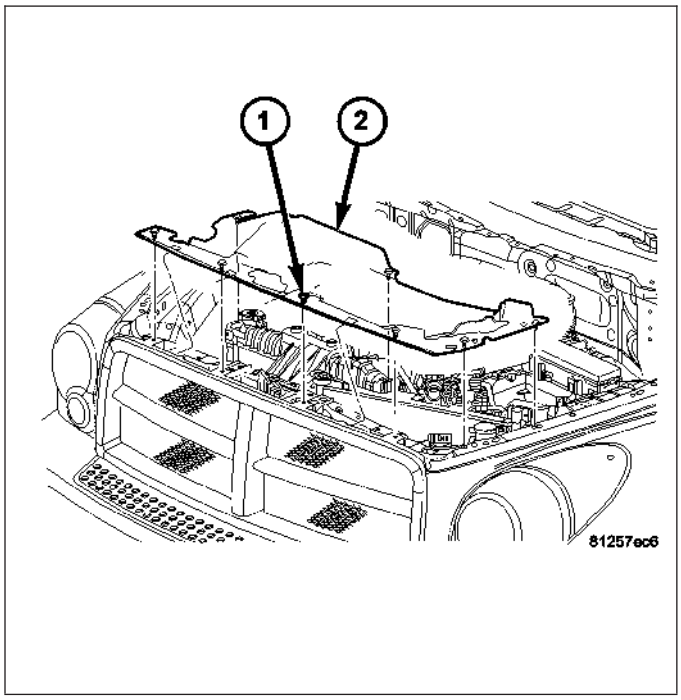
CAUTION: On in-radiator type oil coolers, if transmission oil cooler is leaking, engine coolant may enter cooler, or transmission oil may enter engine cooling system. Both engine cooling system and transmission oil circuit should be drained, flushed, and inspected.

There are two types of transmission oil coolers used. One type of cooler is the in-radiator type or oil to coolant type. This type oil cooler is not serviceable. The second type used is a remote type auxiliary oil cooler or oil to air cooler. The oil to air type cooler (3) is located in front of the radiator, and is serviceable.



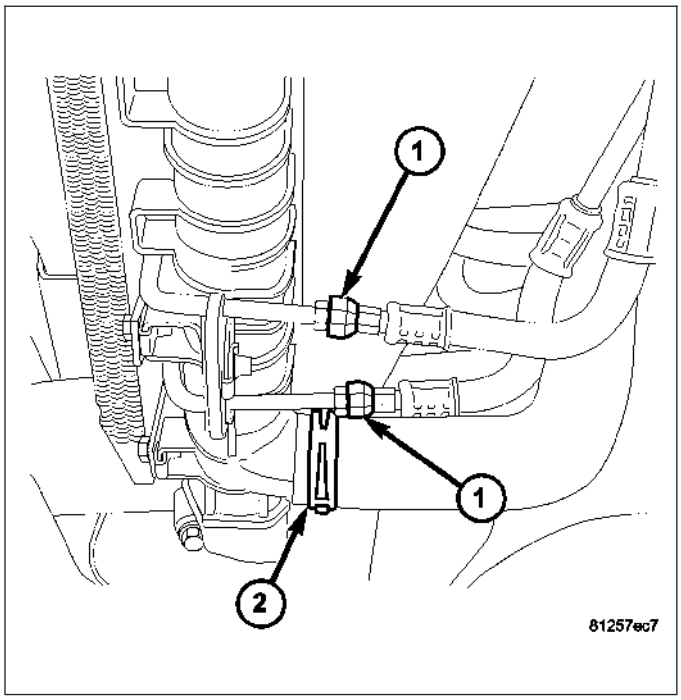
REMOVAL

1. Remove pushpins (1) and the upper condensor/radiator seal (2).



2. Remove upper radiator support.

3. Remove upper transmission cooler mounting bolt.
4. Raise vehicle.
5. Disconnect the transmission cooler lines (1).
6. Remove lower transmission cooler mounting bolts.
7. Remove transmission cooler from vehicle.



INSTALLATION

1. Position tramsmission cooler in vehicle.
2. Install lower transmission cooler mounting bolt. Tighten to 10 N·NM (90 in. lbs.)
3. Connect transmission cooler lines.
4. Lower vehicle.
5. Install upper tranmission cooler mounting bolt. Tighten bolt to 10 N·m (90 in. lbs.).
6. Install upper condenser/radiator seal.
7. Check transmission fluid level (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/545RFE/ FLUID - STANDARD PROCEDURE).

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

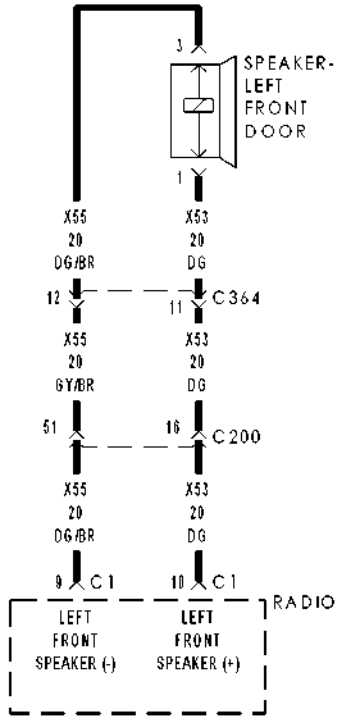
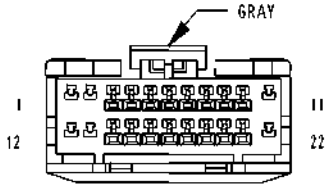
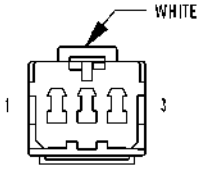
B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW





RADIO C1



SPEAKER-LEFT
FRONT DOOR

8l2ce839

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

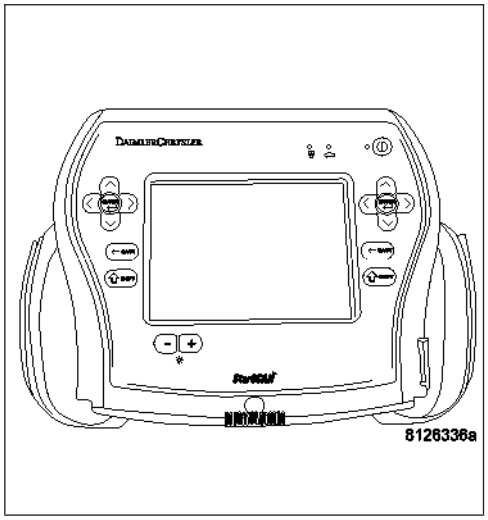
Possible Causes
SPEAKER
(X55) (X53) LEFT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X53) (X55) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Left Audio Speaker connector.
Measure the resistance between ground and each speaker (X53)(+) and (X55)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. SPEAKER

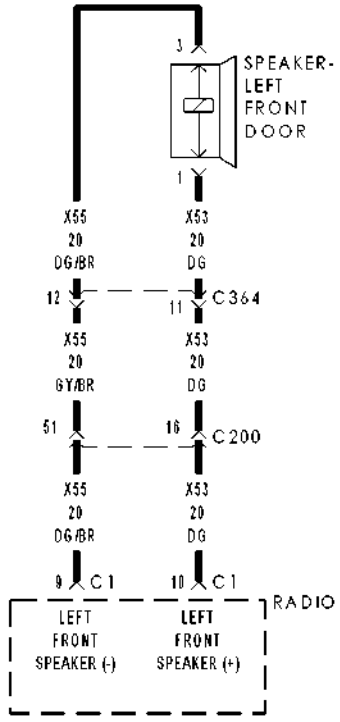
Turn the ignition off.
Disconnect the Front Left Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

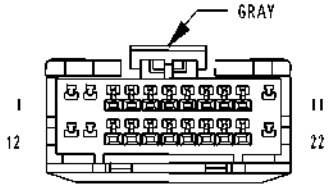
Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

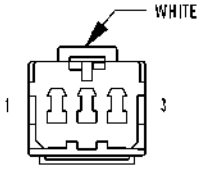
No >> Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH





RADIO C1



SPEAKER-LEFT
FRONT DOOR

8l2ce839

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER
(X53) SPEAKER OUTPUT CIRCUIT (+)
(X55) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

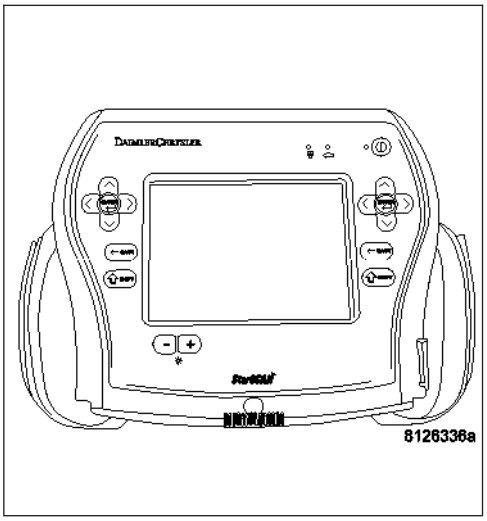
With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST VER-1.



B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

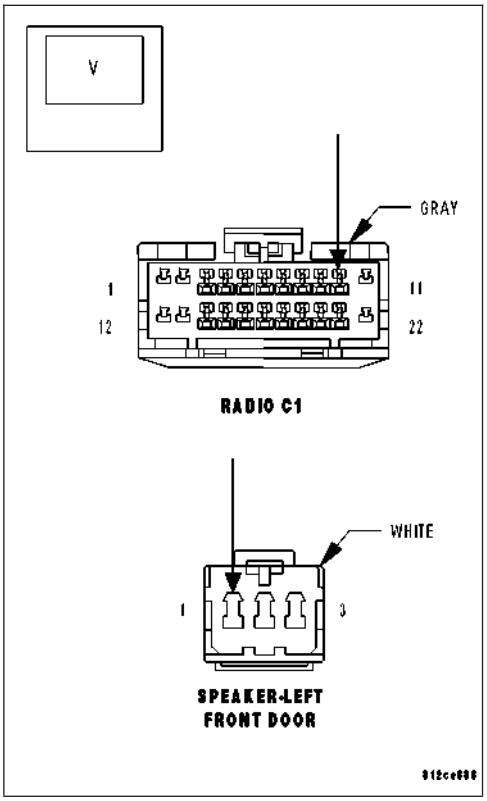
2. CHECK FOR VOLTAGE ON THE (X53) SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Left Front Speaker harness connector.
Measure for voltage on the (X53) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X53) Speaker (+) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



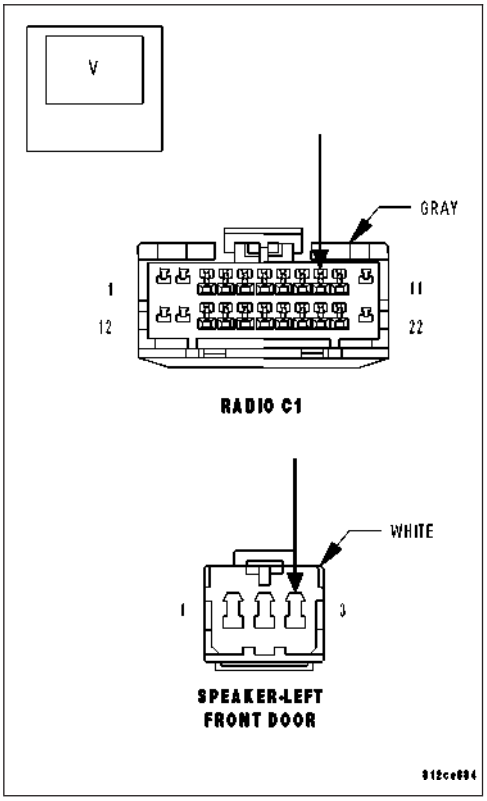
3. CHECK FOR VOLTAGE ON THE (X55) SPEAKER (-) CIRCUIT

Measure for voltage on the (X55) Speaker (-) circuit.

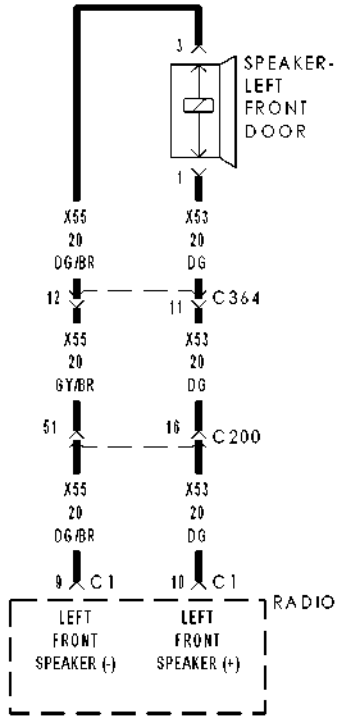
Is the voltage above 10.0 volts?

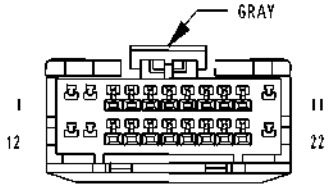
Yes >> Repair the (X55) Speaker (-) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

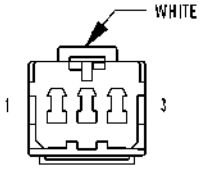


B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN





RADIO C1



SPEAKER-LEFT
FRONT DOOR

8l2ce839

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

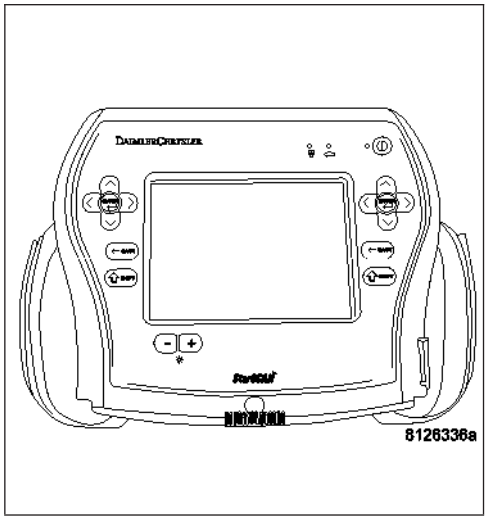
Possible Causes
SPEAKER
(X55) (X53) LEFT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X55) (X53) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Left Audio Speaker connector.
Measure the resistance of each speaker (X53)(+) and (X55)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.
Perform the BODY VERIFICATION TEST VER 1.

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. SPEAKER

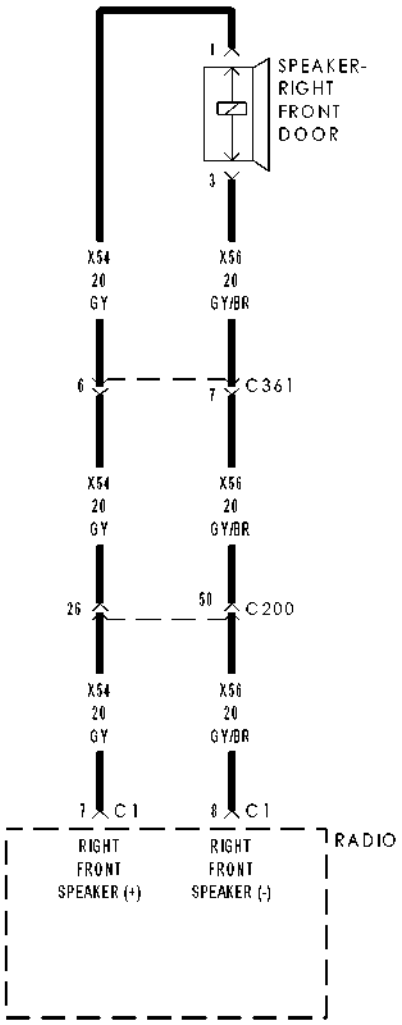
Turn the ignition off.
Disconnect the Front Left Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

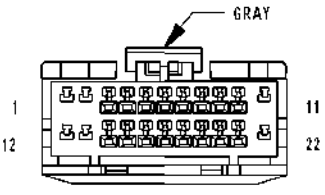
Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

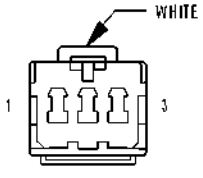
No >> Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW





RADIO C1



SPEAKER-RIGHT
FRONT DOOR

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

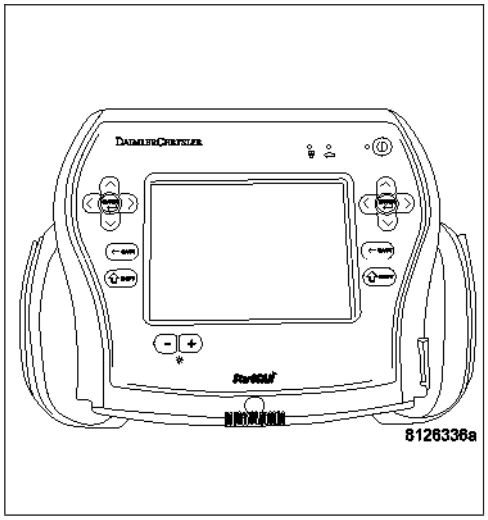
Possible Causes
SPEAKER
(X56) (X54) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X54) (X56) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Right Audio Speaker connector.
Measure the resistance between ground and each speaker (X54)(+) and (X56)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. SPEAKER

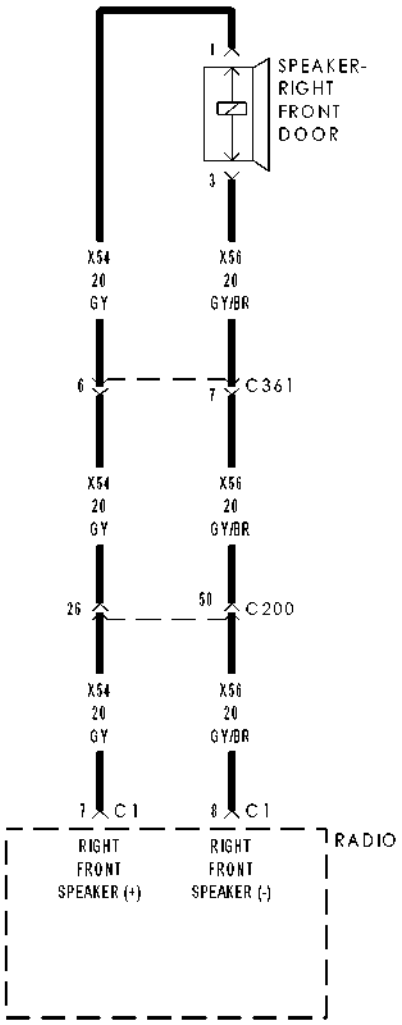
Turn the ignition off.
Disconnect the Front Right Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

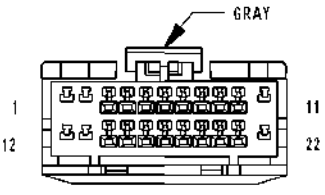
Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

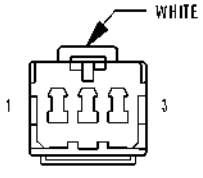
No >> Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH





RADIO C1



SPEAKER-RIGHT
FRONT DOOR

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER
(X54) SPEAKER OUTPUT CIRCUIT (+)
(X56) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

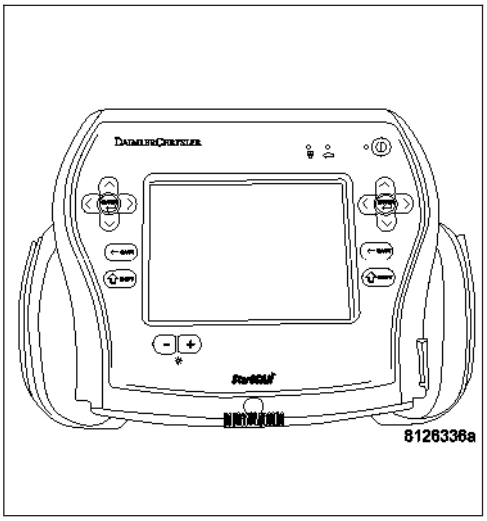
1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

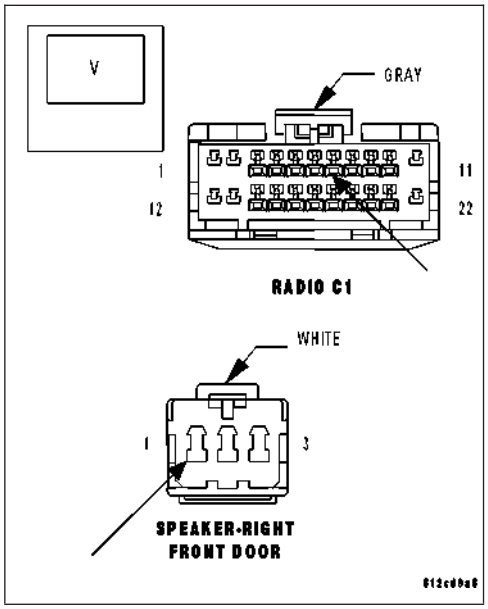
2. CHECK FOR VOLTAGE ON THE (X54) SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Right Rear Speaker harness connector.
Measure for voltage on the (X52) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X52) Speaker (+) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



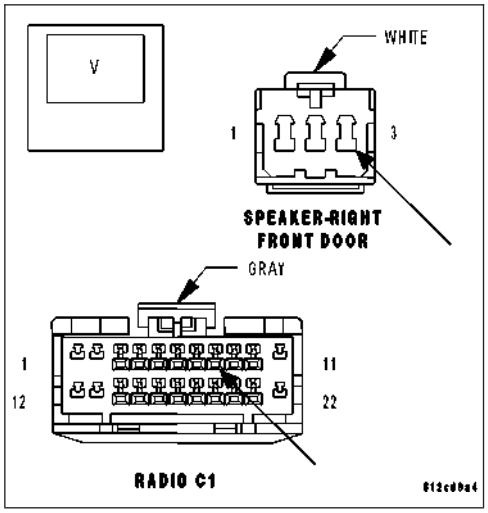
3. CHECK FOR VOLTAGE ON THE (X56) SPEAKER (-) CIRCUIT

Measure for voltage on the (X58) Speaker (-) circuit.

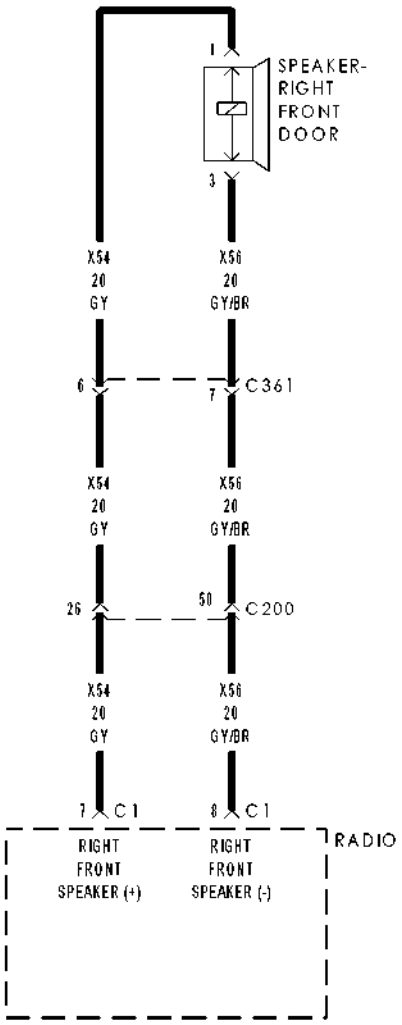
Is the voltage above 10.0 volts?

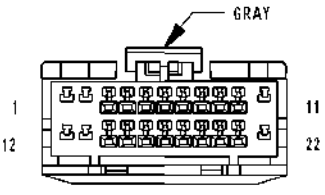
Yes >> Repair the (X58) Speaker (-) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

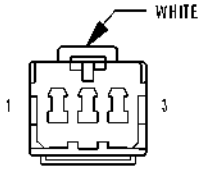


B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN





RADIO C1



SPEAKER-RIGHT
FRONT DOOR

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

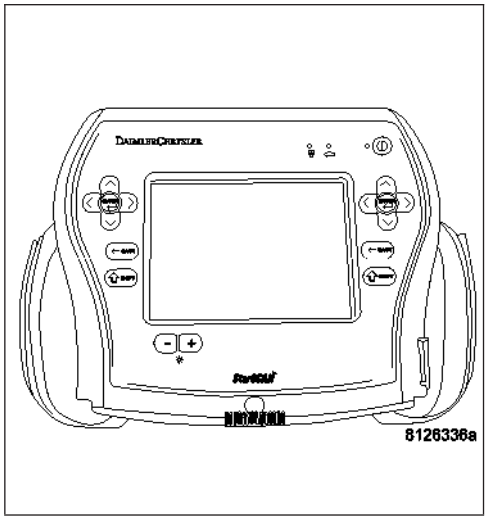
Possible Causes
SPEAKER
(X56) (X54) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X56) (X54) Speaker Output circuits.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Front Right Audio Speaker connector.
Measure the resistance of each speaker (X54)(+) and (X56)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.
Perform the BODY VERIFICATION TEST VER 1.

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. **Speaker**

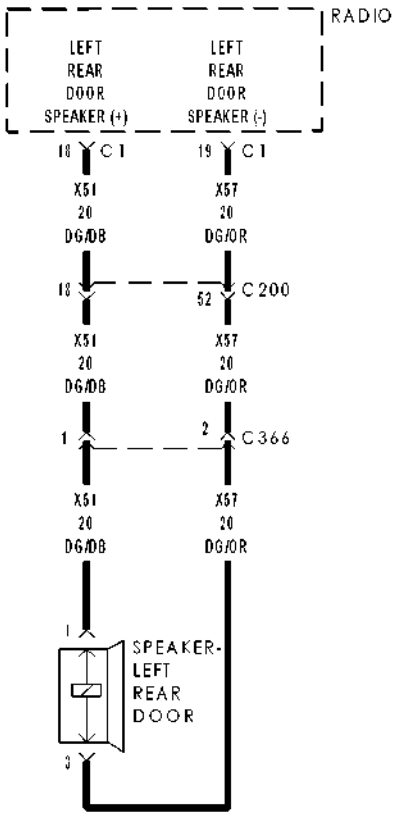
Turn the ignition off.
Disconnect the Front Right Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

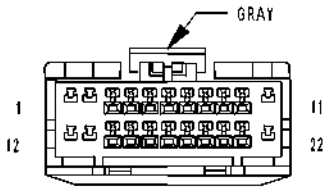
Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

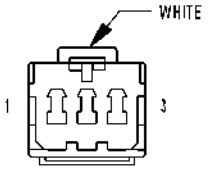
No >> Test Complete.

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW





RADIO C1



SPEAKER-LEFT REAR DOOR

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

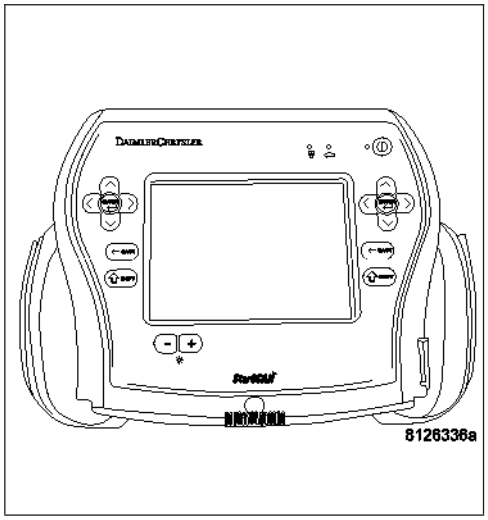
Possible Causes
SPEAKER
(X57) (X51) LEFT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X51) (X57) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Rear Left Audio Speaker connector.
Measure the resistance between ground and each speaker (X51)(+) and (X57)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. **SPEAKER**

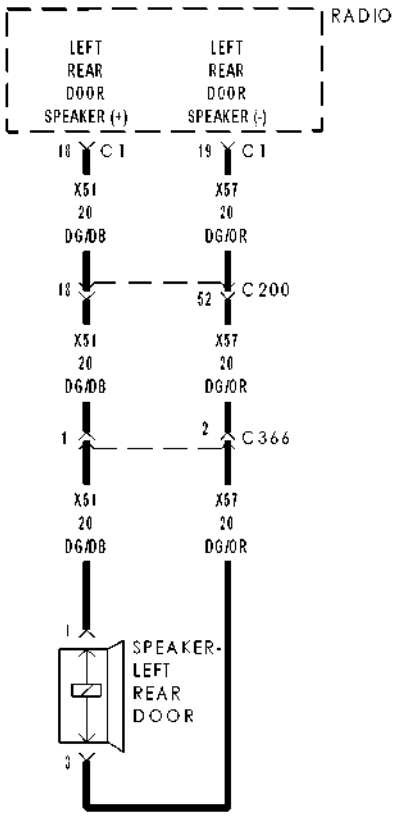
Turn the ignition off.
Disconnect the Rear Left Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

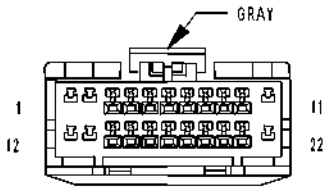
Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

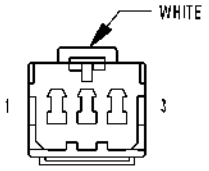
No >> Test Complete.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH





RADIO C1



SPEAKER-LEFT REAR DOOR

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER
(X51) SPEAKER OUTPUT CIRCUIT (+)
(X57) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

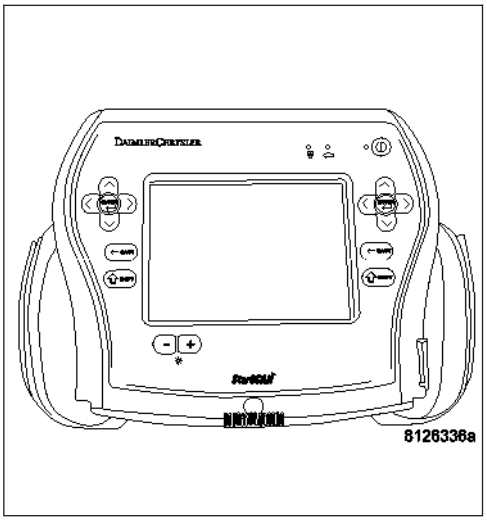
1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

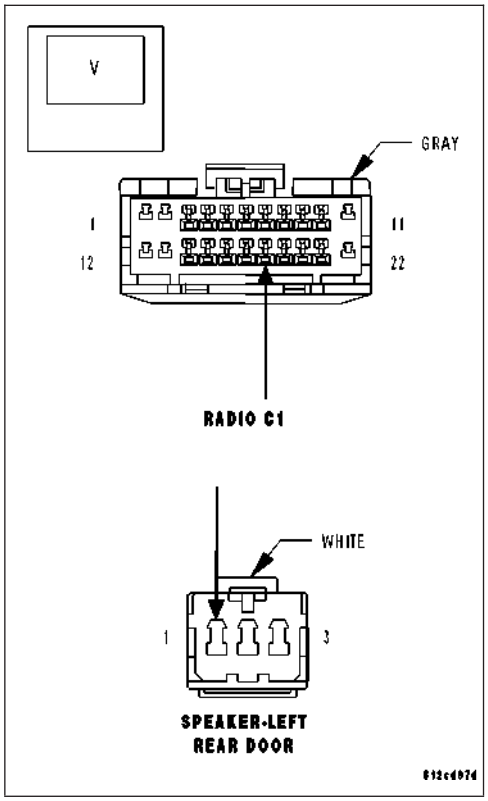
2. CHECK FOR VOLTAGE ON THE (X51) SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Left Rear Speaker harness connector.
Measure for voltage on the (X51) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X51) Speaker (+) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



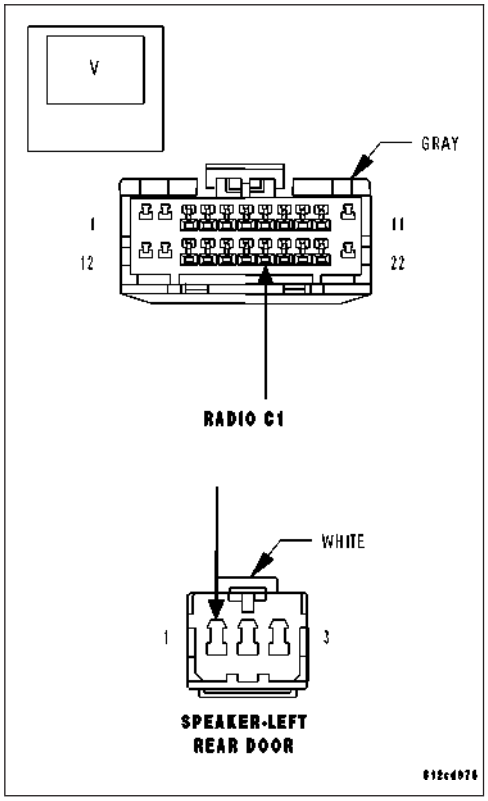
3. CHECK FOR VOLTAGE ON THE (X57) SPEAKER (-) CIRCUIT

Measure for voltage on the (X57) Speaker (-) circuit.

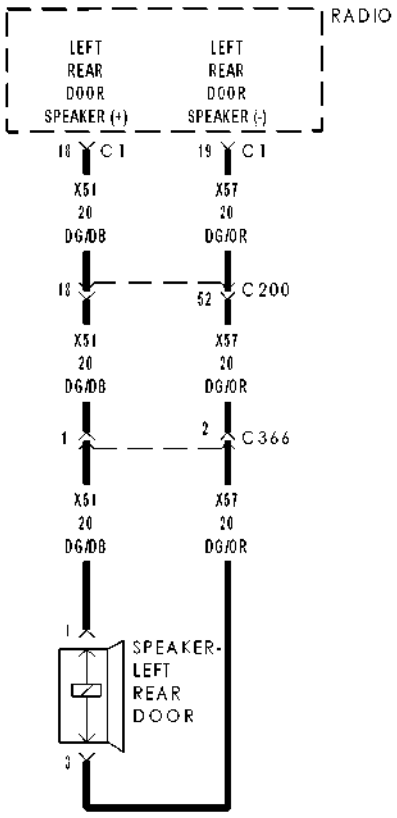
Is the voltage above 10.0 volts?

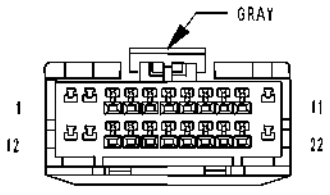
Yes >> Repair the (X57) Speaker (-) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

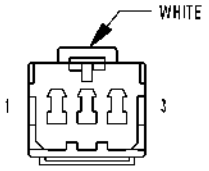


B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN





RADIO C1



SPEAKER-LEFT REAR DOOR

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

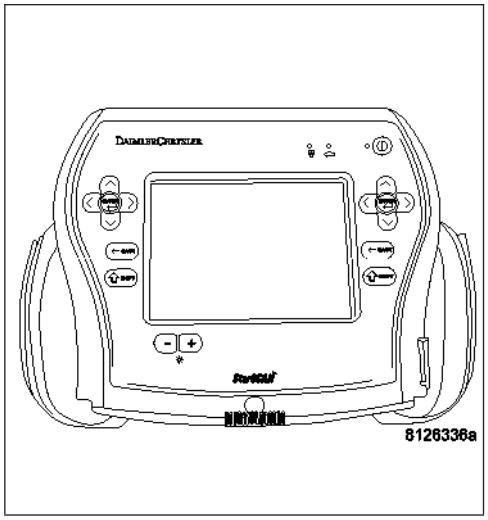
Possible Causes
SPEAKER
(X57) (X51) LEFT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Intermittent Condition

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X57) (X51) Speaker Output circuits.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Rear Left Audio Speaker connector.
Measure the resistance of each speaker (X51)(+) and (X57)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.
Perform the BODY VERIFICATION TEST VER 1.

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. **Speaker**

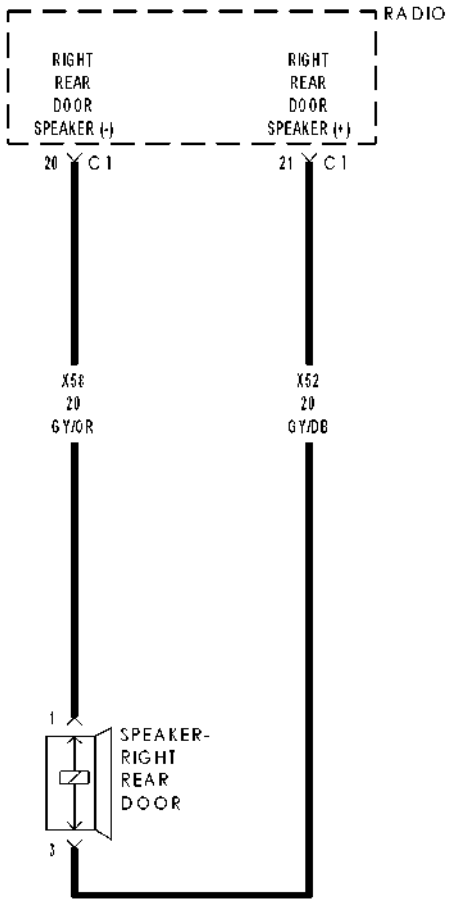
Turn the ignition off.
Disconnect the Rear Left Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

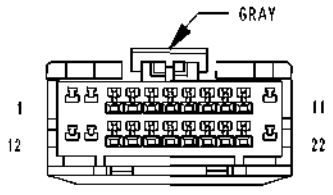
Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

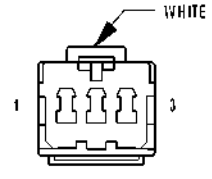
No >> Test Complete.

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW





RADIO C1



SPEAKER-RIGHT REAR DOOR

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

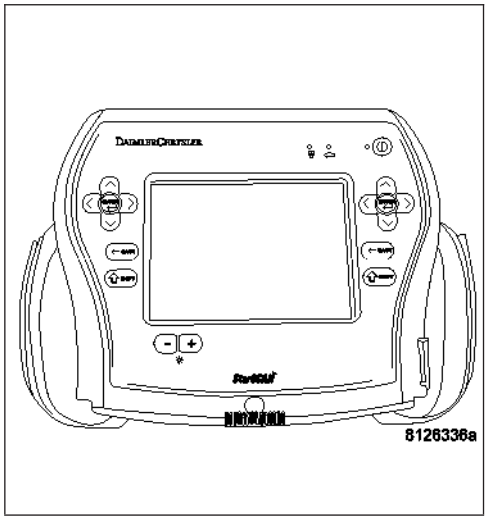
Possible Causes
SPEAKER
(X58) (X52) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Intermittent Condition

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X58) (X52) Speaker Output circuits.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Rear Right Audio Speaker connector.
Measure the resistance between ground and each speaker (X58)(+) and (X52)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. **Speaker**

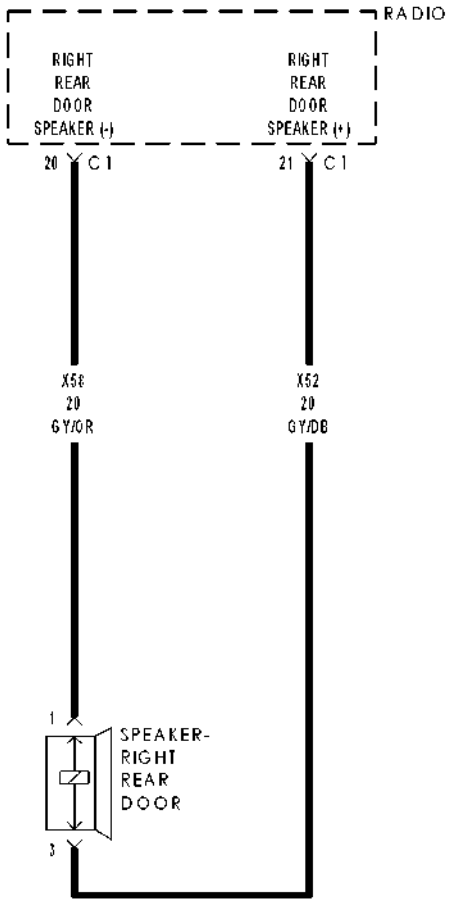
Turn the ignition off.
Disconnect the Rear Right Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

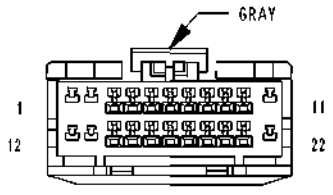
Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

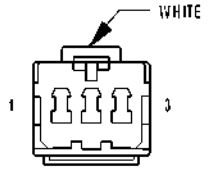
No >> Test Complete.

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH





RADIO C1



SPEAKER-RIGHT REAR DOOR

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER
(X52) SPEAKER OUTPUT CIRCUIT (+)
(X58) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

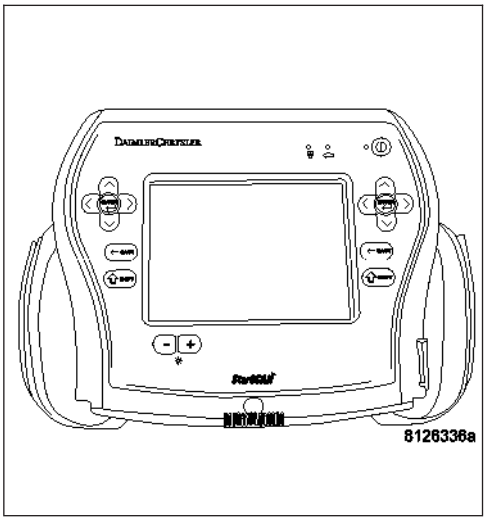
1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Radio DTCs.

Does the scan tool display active: B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

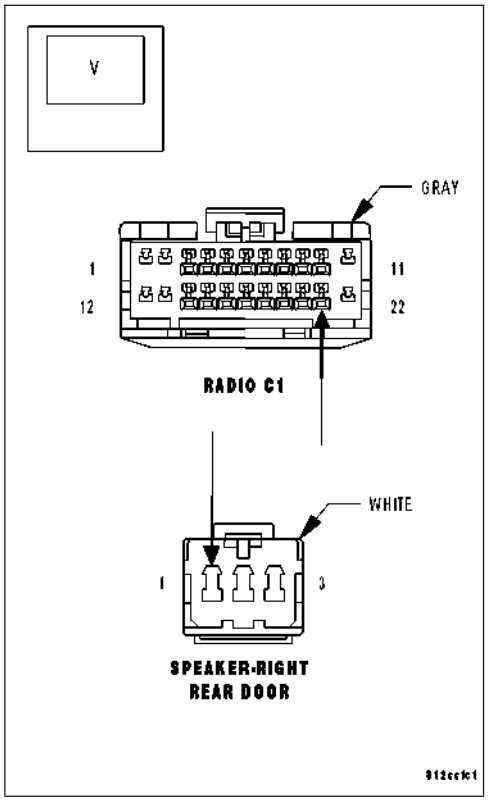
2. CHECK FOR VOLTAGE ON THE (X52) SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Right Rear Speaker harness connector.
Measure for voltage on the (X52) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X52) Speaker (+) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3



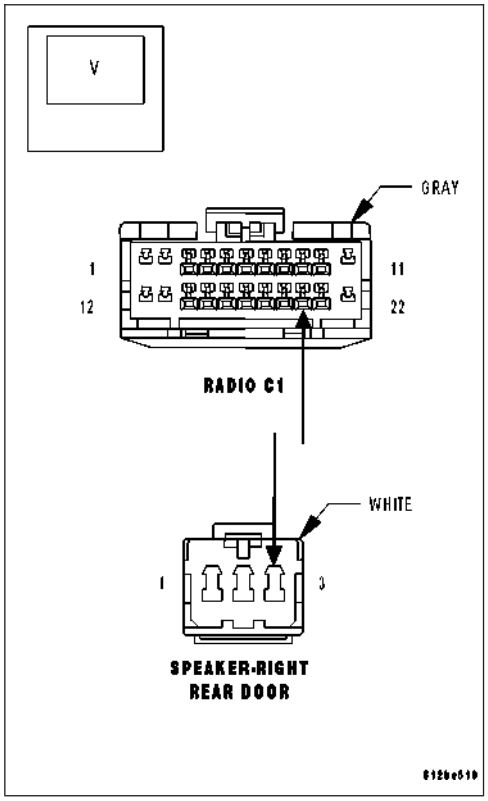
3. CHECK FOR VOLTAGE ON THE (X58) SPEAKER (-) CIRCUIT

Measure for voltage on the (X58) Speaker (-) circuit.

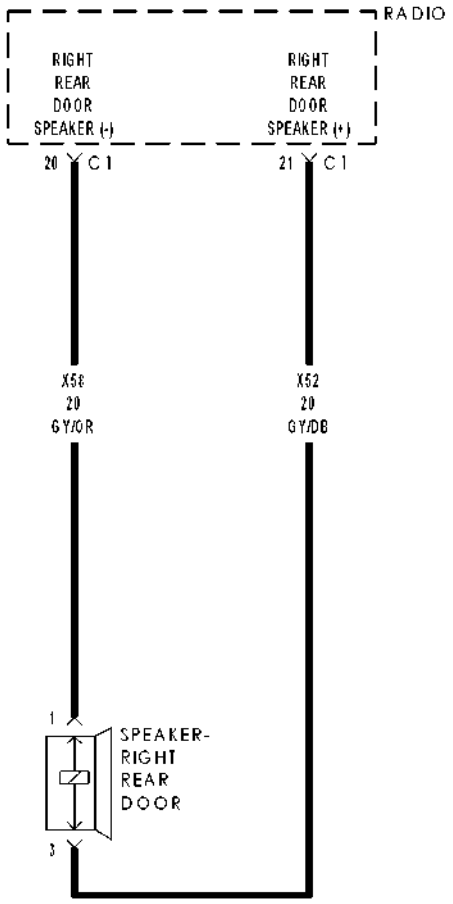
Is the voltage above 10.0 volts?

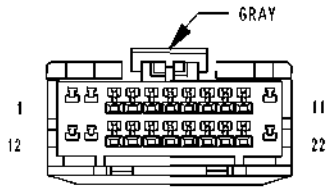
Yes >> Repair the (X58) Speaker (-) circuit for a short to voltage. Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

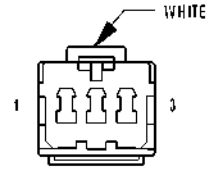


B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN





RADIO C1



SPEAKER-RIGHT REAR DOOR

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

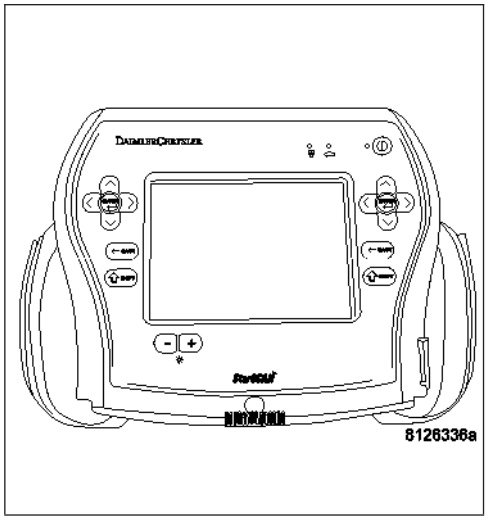
Possible Causes
SPEAKER
(X58) (X52) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Intermittent Condition

Turn the ignition on.
With the Scan Tool, clear all Audio DTC's.
Turn the Radio on.
With the Scan Tool, read the DTC information.



Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST VER 1.

---

2. (X58) (X52) Speaker Output circuits.

Turn the ignition off.
Disconnect the Radio C1 harness connector.
Disconnect the Rear Right Audio Speaker connector.
Measure the resistance of each speaker (X58)(+) and (X52)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.
Perform the BODY VERIFICATION TEST VER 1.

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. **Speaker**

Turn the ignition off.
Disconnect the Rear Right Audio Speaker.
Turn the ignition on.
Turn the Radio on.
With the Scan Tool, clear all Audio DTC's.
With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B142A-RADIO UNIT HIGH TEMPERATURE

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- When Monitored:
- Continuously with the ignition and Radio on.
- Set Condition:
- The code will set if the temperature inside the radio is above +65°C (+145°F)

Possible Causes
HIGH TEMPERATURE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B142A—RADIO UNIT HIGH TEMPERATURE IS ACTIVE.

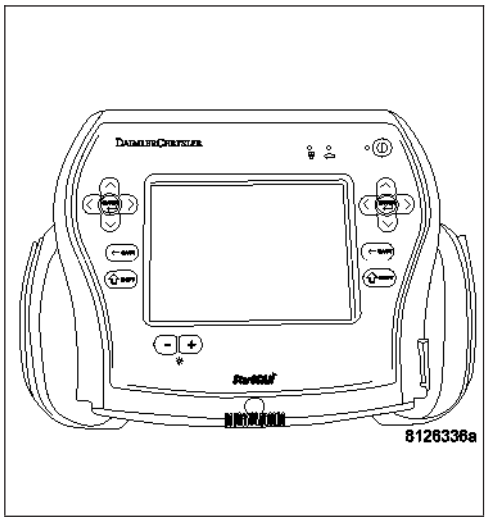
With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between —23°C and 65°C (—10°F and +145°F).

With the Scan Tool, read the DTC's.



Does the Scan Tool display, B142A— Radio Unit High Temperature?

Yes >> Replace the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on and the radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio station signal.

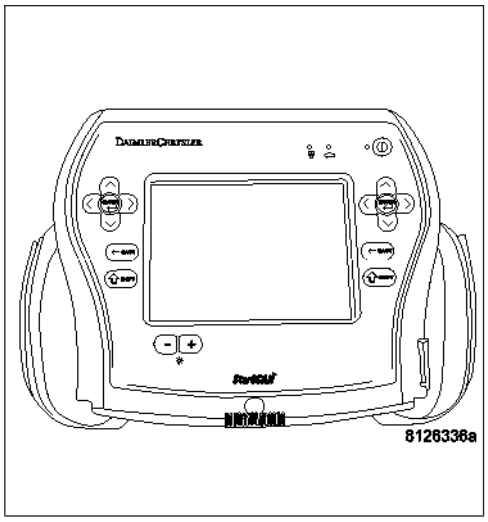
Possible Causes
BAD ANTENNA CONNECTION
RADIO

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Test Antenna

Turn the ignition off.
Disconnect the Radio Antenna connector.
Inspect the Radio Antenna connection.



Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

2. ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142D-AUDIO ANTENNA NOT CONNECTED (CONTINUED)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's, put the radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the radio in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on and the Satellite Radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio satellite signal.

Possible Causes
BAD ANTENNA CONNECTION
SATELLITE RADIO RECEIVER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

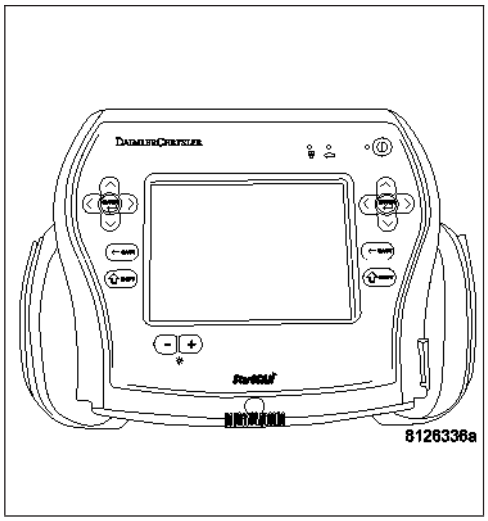
1. Test Antenna

Turn the ignition off.
Disconnect the Satellite Radio Antenna connector.
Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.



2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED (CONTINUED)

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the Satellite Radio Receiver in accordance with the service information. Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B221E-RADIO INTERNAL

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- When Monitored:
- Continuously with the ignition on and radio turned on.
- Set Condition:
- The code will set if the radio detects a radio internal failure.

Possible Causes
RADIO INTERNAL FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Verify DTC B221E-RADIO INTERNAL IS ACTIVE

NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If the DTC resets, follow test.

This is an internal radio failure

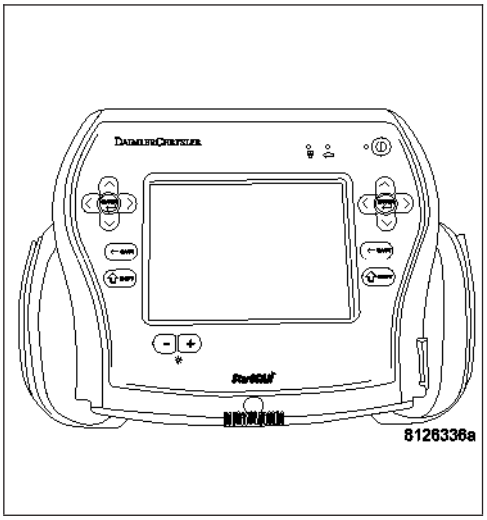
View repair

Does the DTC reset and read B221E-Radio Internal?

Repair

Replace the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.



B2222-SATELLITE RADIO RECEIVER INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes
SATELLITE RADIO RECEIVER

Diagnostic Test

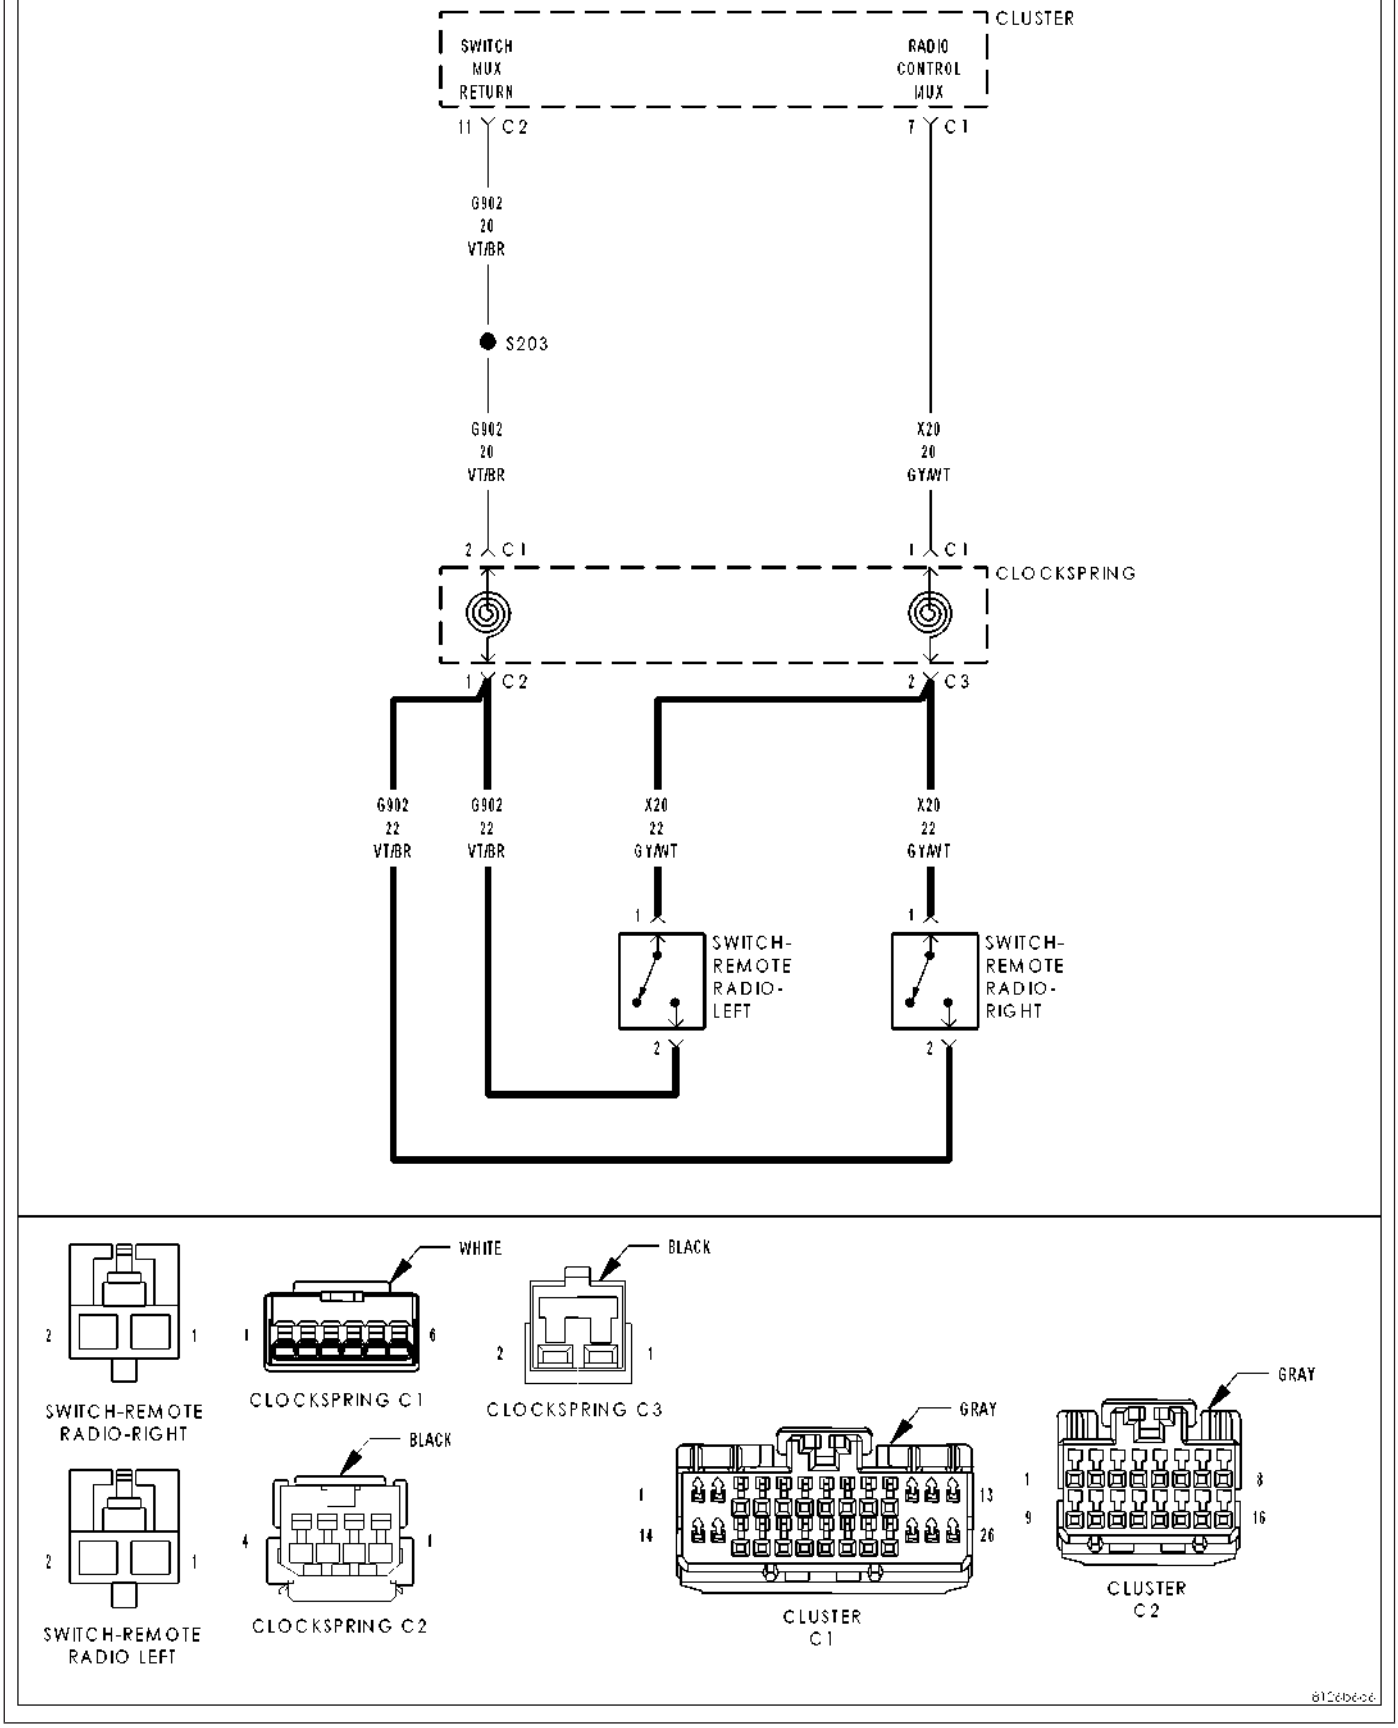
1. REPLACE THE SATELLITE RADIO RECEIVER

When this code is set, the Satellite Radio must be replaced.

Repair

Replace the Satellite Radio Receiver in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1.

B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK



B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in any position except off.
- **Set Condition:**
  The Instrument Cluster detects a stuck switch state on the (X20) Radio Control MUX circuit for more than 30 seconds.

Possible Causes
(X20) REMOTE CONTROL MUX CIRCUIT SHORT TO GROUND
(X20) REMOTE CONTROL MUX CIRCUIT SHORT TO (G902) SWITCH MUX RETURN CIRCUIT
LEFT REMOTE RADIO SWITCH
RIGHT REMOTE RADIO SWITCH
CLOCKSPRING
INSTRUMENT CLUSTER (CCN)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

2. LEFT REMOTE RADIO SWITCH

Turn the ignition off.

Disconnect the Left Remote Radio Switch harness connector.

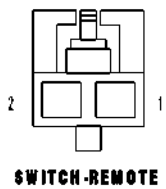
Turn the ignition on.

With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Replace the Left Remote Radio Switch in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3



B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)

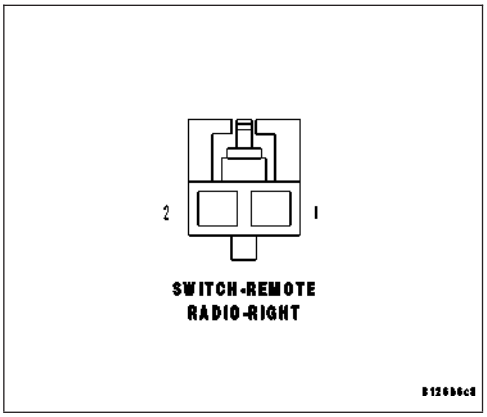
3. RIGHT REMOTE RADIO SWITCH

Turn the ignition off.
Disconnect the Right Remote Radio Switch harness connector.
Turn the ignition on.
With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Replace the Right Remote Radio Switch in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4



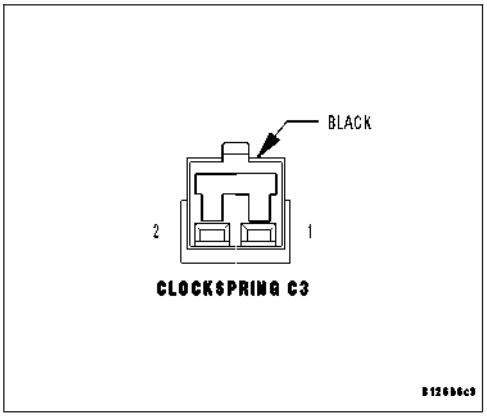
4. CLOCKSPRING

Turn the ignition off.
Disconnect the Clockspring C1 harness connector.
Turn the ignition on.
With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Check the (X20) Radio Control MUX circuit for a short between the clockspring and the remote radio switches. If ok, replace the Clockspring in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 5



B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)

5. (X20) RADIO CONTROL MUX CIRCUIT SHORT TO GROUND

Turn the ignition off.

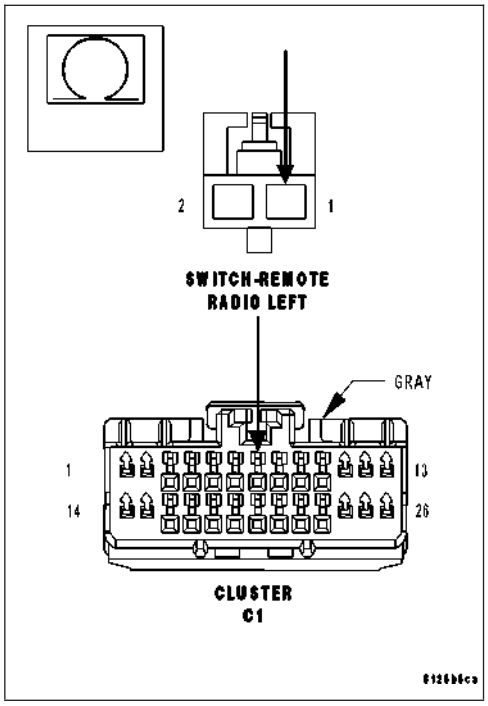
Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance between ground and the (X20) Radio Control MUX circuit.

Is the resistance below 100.0 ohms?

Yes >> Repair the (X20) Radio Control MUX circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 6



6. (X20) RADIO CONTROL MUX CIRCUIT SHORT TO (G902) SWITCH MUX RETURN CIRCUIT

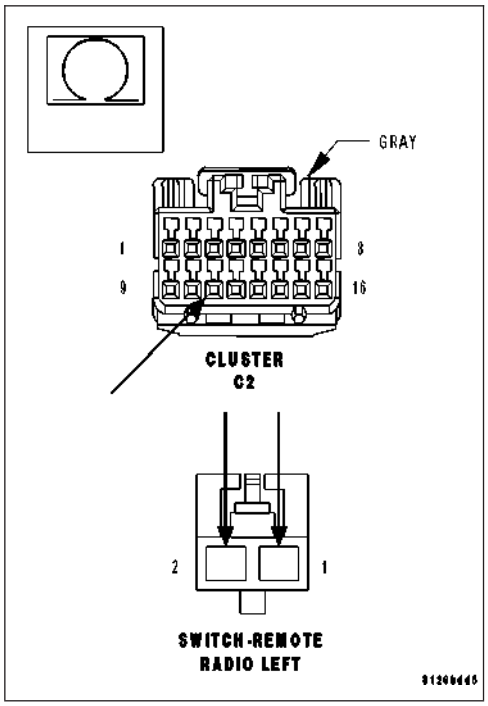
Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (X20) Radio Control MUX circuit and the (G902) Switch MUX Return circuit.

Is the resistance below 100.0 ohms?

Yes >> Repair the (X20) Radio Control MUX circuit for a short to the (G902) Switch MUX Return circuit.
Perform BODY VERIFICATION TEST – VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Instrument Cluster (CCN) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.



B1429-RADIO DISPLAY HIGH TEMPERATURE

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- When Monitored:
- Continuously with the ignition and Navigation Radio on.
- Set Condition:
- The code will set if the temperature inside the display exceeds 158°F

Possible Causes
HIGH TEMPERATURE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1429—RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

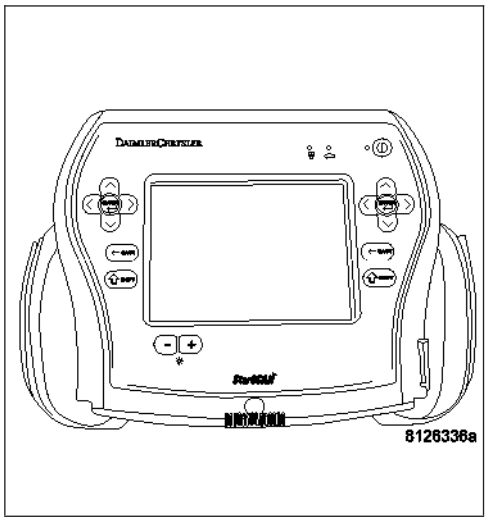
With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The radio display should operate to 158°F.

With the Scan Tool, read the DTC's.



Does the Scan Tool display, B1429— Radio Display High Temperature?

Yes >> Replace the Radio in accordance with the service information.
Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.

B142E-GPS ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the ignition on and the radio in navigation mode.
- **Set Condition:**
- With the radio does not detect GPS antenna connection.

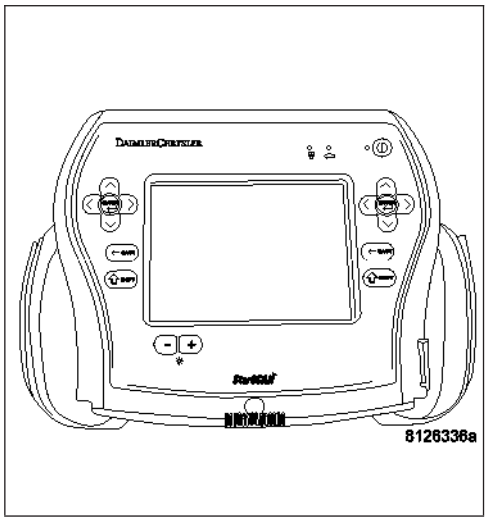
Possible Causes
BAD ANTENNA CONNECTION
RADIO

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. TEST ANTENNA

Turn the ignition off.
Disconnect the GPS Antenna connector.
Inspect the GPS Antenna connection.



Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

2. ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142E-GPS ANTENNA NOT CONNECTED (CONTINUED)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's and operate the navigation system.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the radio in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously with the ignition on and the radio CD player turned on.
- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes
CD READ FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean,unscratched, music CD.

Turn the radio CD player on.

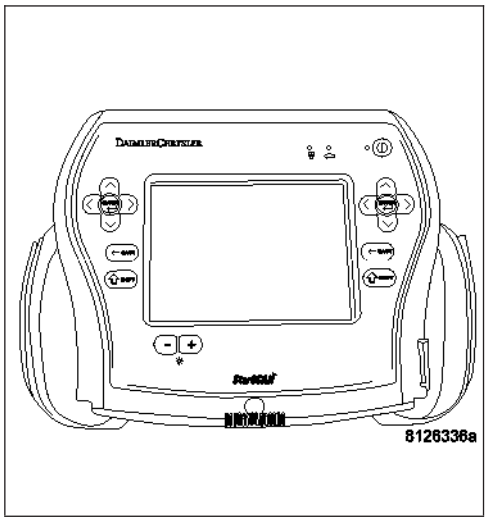
With the Scan Tool, read DTC's.

Does the Scan Tool display: B1421 Audio CD Read Error/Inoperable Disc?

Yes >> Eject the inoperative CD and replace the CD in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.



B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- Continuously with the ignition on and the DVD player turned on.
- **Set Condition:**
- The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean,unscratched DVD.

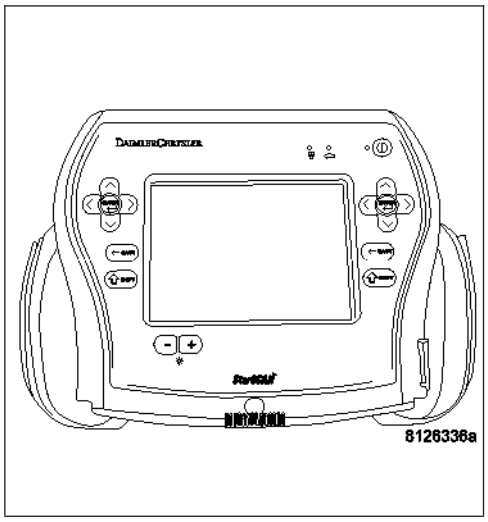
Turn the DVD player on.

With the Scan Tool, read DTC's.

Does the Scan Tool display: B1422 Audio DVD Read Error/Inoperable Disc?

Yes >> Eject the inoperative DVD and replace the DVD in accordance with the service information.
Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.



B221F-AMPLIFIER INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a software checksum test failure.

Possible Causes
AMPLIFIER

Diagnostic Test

1. REPLACE THE AMPLIFIER

When this code is set, the Amplifier must be replaced.

Repair

Replace the Amplifier in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1.

B210D-BATTERY VOLTAGE LOW

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

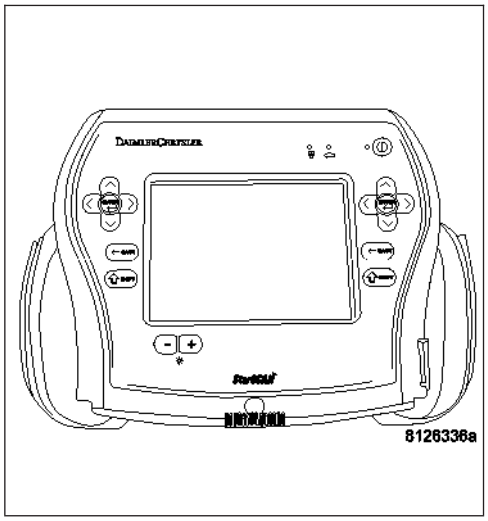
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the module detects that the battery voltage is less than 9.0 volts for 1 second.

Possible Causes
VEHICLE CHARGING SYSTEM
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B210D-BATTERY VOLTAGE LOW?

Yes >> Go To

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

---

2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

Is the battery voltage less than 9.0 volts?

Yes >> Go To 3

No >> Replace the Amplifier in accordance with the Service Information.
Perform OCS VERIFICATION TEST - VER 1.

---

3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

Does the scan tool display any Charging System related DTCs?

Yes >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Amplifier in accordance with the Service Information.
Perform OCS VERIFICATION TEST - VER 1.

B210E-BATTERY VOLTAGE HIGH

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the module detects that the battery voltage is greater 16.5 volts for 1 second.

Possible Causes
VEHICLE CHARGING SYSTEM
AMPLIFIER

Diagnostic Test

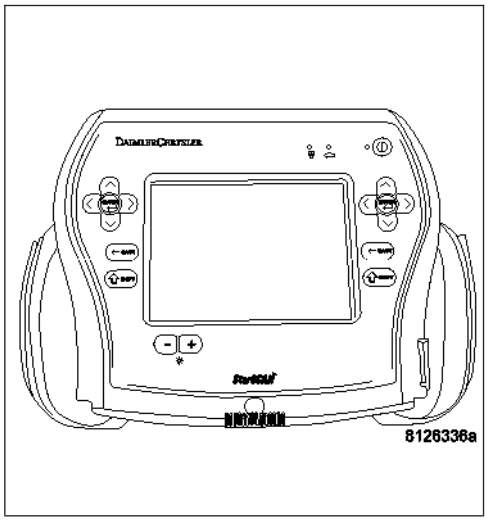
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



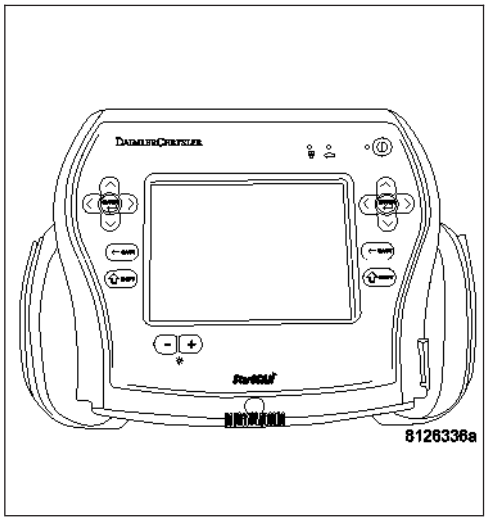
2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

Is the battery voltage greater than 16.5 volts?

Yes >> Go To 3

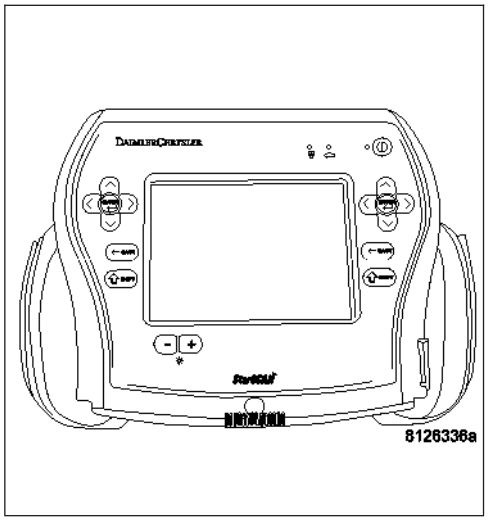
No >> Replace the Amplifier in accordance with the Service Information.
Perform OCS VERIFICATION TEST - VER 1.



B210E-BATTERY VOLTAGE HIGH (CONTINUED)

3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.



Does the scan tool display any Charging System related DTCs?

Yes >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Amplifier in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

B1488–CABIN EQ MISMATCH PERFORMANCE

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

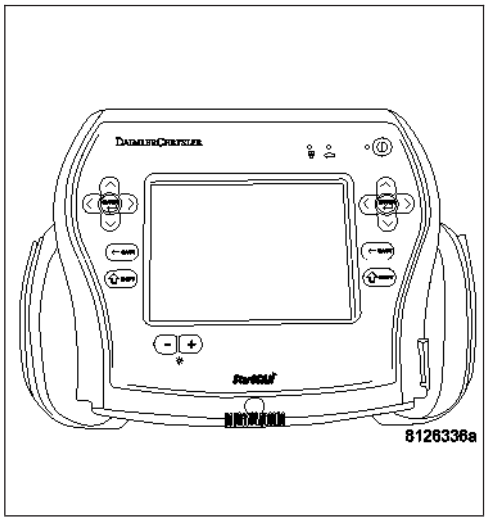
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the cabin EQ message is incompatible with the EQ's stored in the amplifier for 10 consecutive cycles, then the amplifier will set this DTC.

POSSIBLE CAUSES
NO COMMUNICATION WITH FRONT CONTROL MODULE
ACTIVE FCM DTCs
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1488–CABIN EQ MISMATCH PERFORMANCE?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

---

2. CHECK AMPLIFIER BUSSED INPUTS/OUTPUTS

With the scan tool in Amplifier Data Display, read the Cabin EQ# settings in the Bussed Inputs and Bussed Outputs Sections.

NOTE: The Cabin EQ# settings in the Inputs/Outputs section should match one another. The Cabin EQ# in the Inputs section is the information that is received form the FCM. The Cabin EQ# in the Outputs section is the information that is Stored in the Amplifier's memory.
The Cabin EQ# settings are as follows:

- •$51: HB Premium 1 (w/o Subwoofer)
- •$52: HB Premium 2 (with Subwoofer)

Do the Cabin EQ# settings match one another?

Yes >> Replace the Amplifier in accordance to the service information.
Perform the BODY VERIFICATION TEST-VER 1.

No >> Go To 3

B1488–CABIN EQ MISMATCH PERFORMANCE (CONTINUED)

3. VERIFY COMMUNICATION WITH FRONT CONTROL MODULE

With the scan tool in ECU VIEW, read active modules on the bus.

Does the scan tool show the Front Control Module active on the bus?

Yes >> Go To 4

No >> Refer to the Communication category for the related symptoms.
Perform the BODY VERIFICATION TEST VER 1.

---

4. CHECK FRONT CONTROL MODULE FOR ACTIVE DTCs

With the scan tool, erase FCM DTCs.
Turn the ignition off. Wait approximately 10 seconds.
Turn the ignition on.
With the scan tool, read FCM DTCs.

Are any active DTCs present?

Yes >> Refer to symptom list for problems related to the Front Control Module.
Perform the BODY VERIFICATION TEST VER 1.

No >> Replace the Front Control Module in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER.1

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

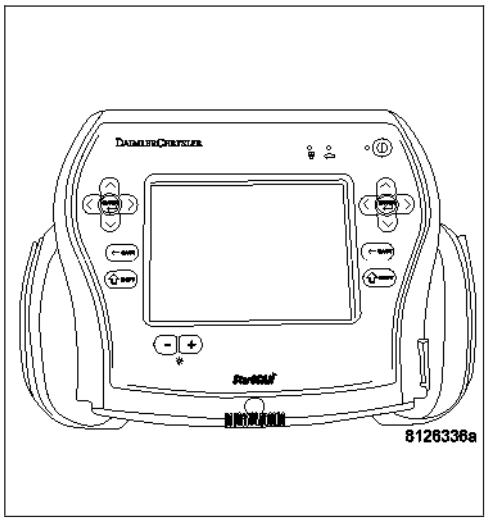
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

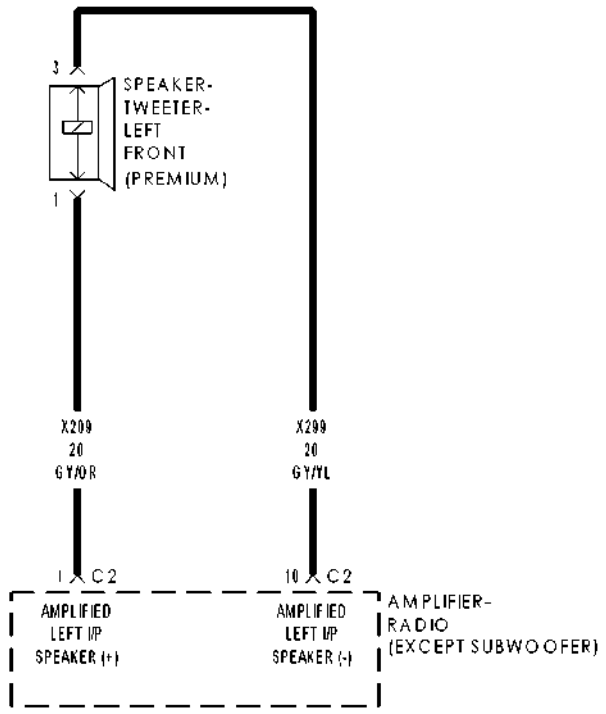
Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

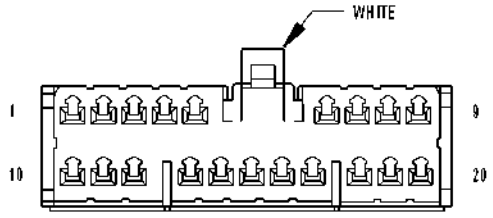
Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW





AMPLIFIER-RADIO

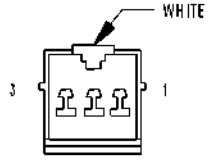
(EXCEPT SUBWOOFER)



SPEAKER-TWEETER
LEFT FRONT
(PREMIUM)

8l2eff7

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

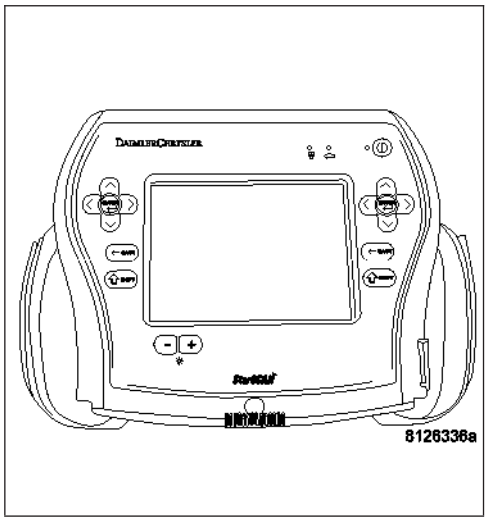
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



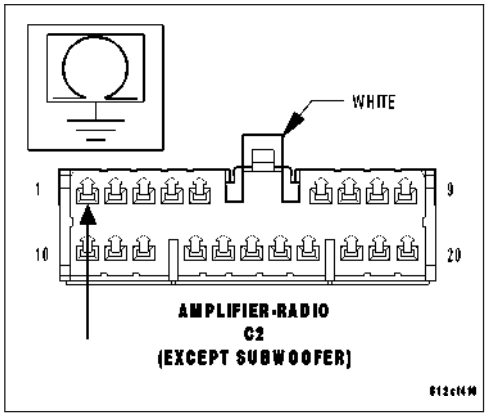
2. CHECK THE (X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.
Measure the resistance between ground and the (X209) Amplified Left Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X209) Amplified Left Front I/P Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

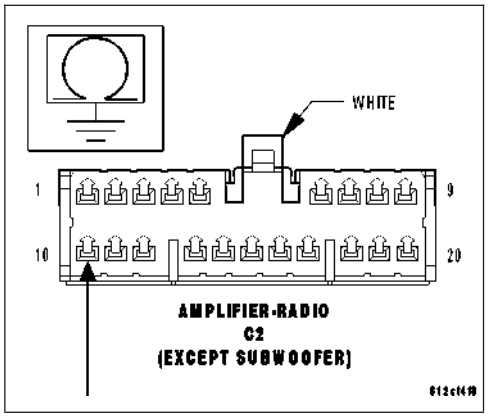
No >> Go To 3



B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X299) Amplified Left Front I/P Speaker (-) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X299) Amplified Left Front I/P Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

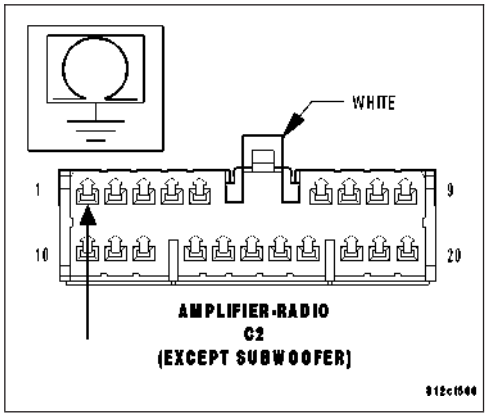
---

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.



Is the resistance below 10K ohms?

Yes >> Replace the Left Front I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

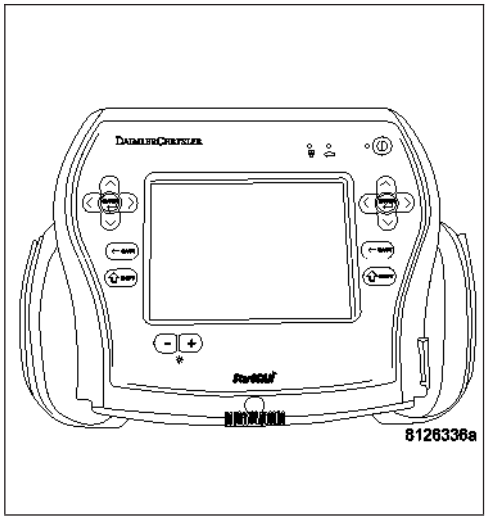
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



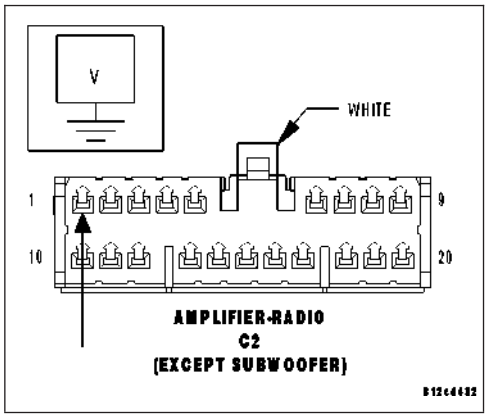
2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C2 harness connector.
Disconnect the Amplified Left I/P Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X209) Amplified Left I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

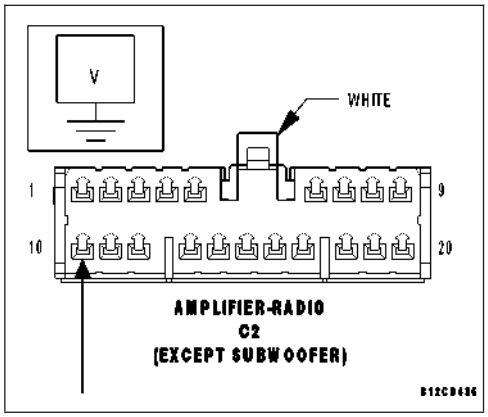
No >> Go To 3



B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT

Measure for voltage on the (X299) Amplified Left I/P Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

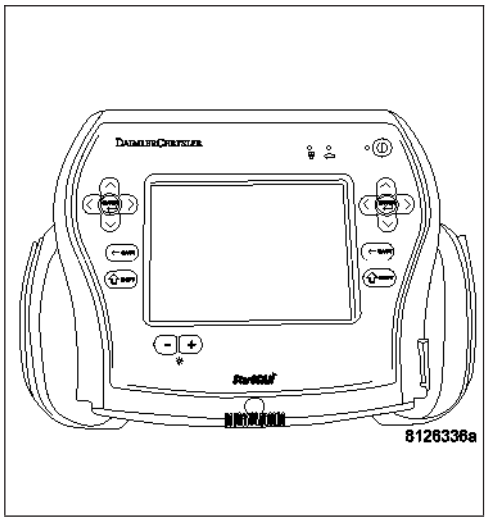
- **When Monitored:**
  Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
  The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



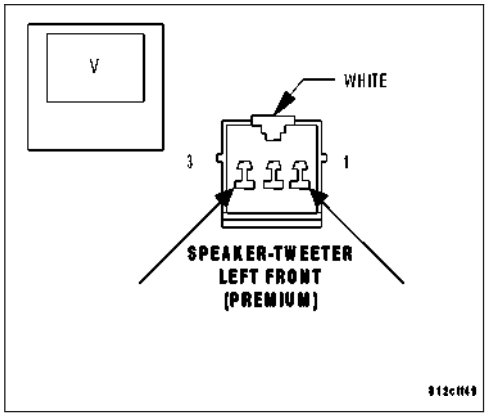
Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER

Disconnect the Left I/P Speaker harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.



Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

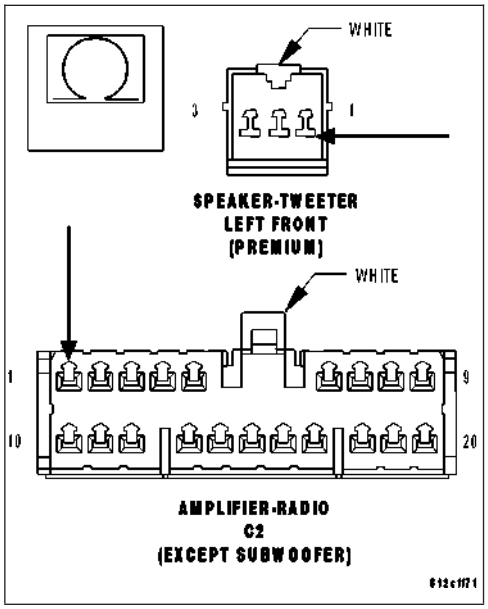
B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X209) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

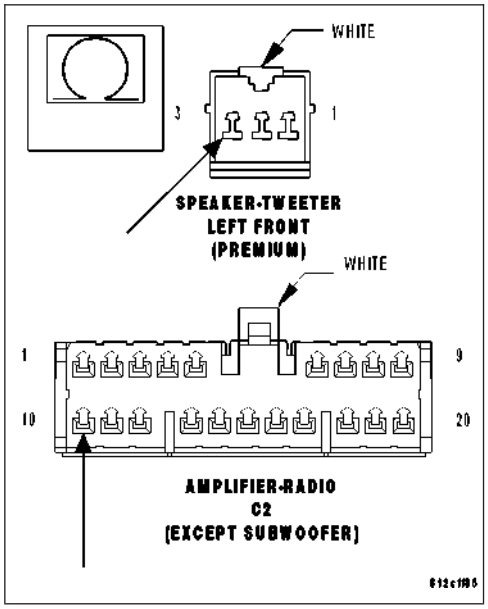
No >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X299) Amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

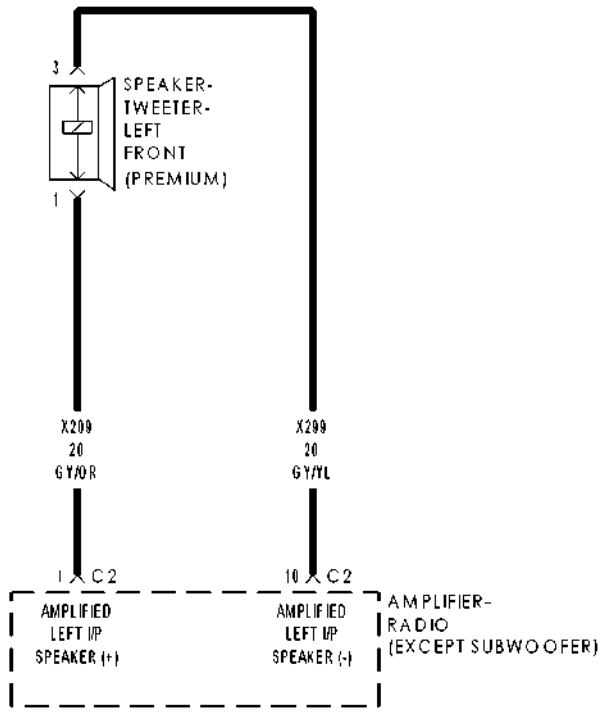


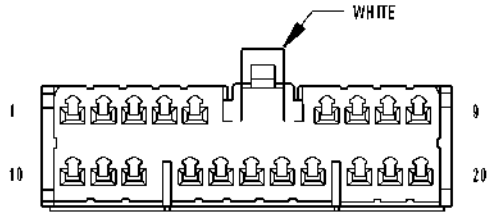
Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER





AMPLIFIER-RADIO
C2
(EXCEPT SUBWOOFER)

(PREMIUM)

8l2eff7

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

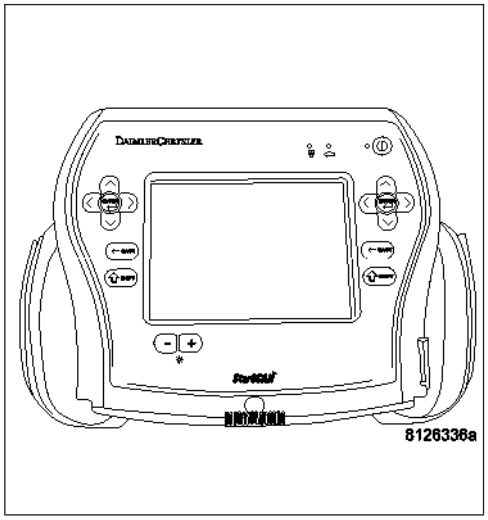
- **When Monitored:**
  With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
  The amplifier detects that the output circuits are shorted together.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT
AMPLIFIED LEFT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, erase Amplifier DTCs.
Turn the radio on.
Turn the volume level to 25.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

---

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER

Disconnect the Amplified Left I/P Speaker.
Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

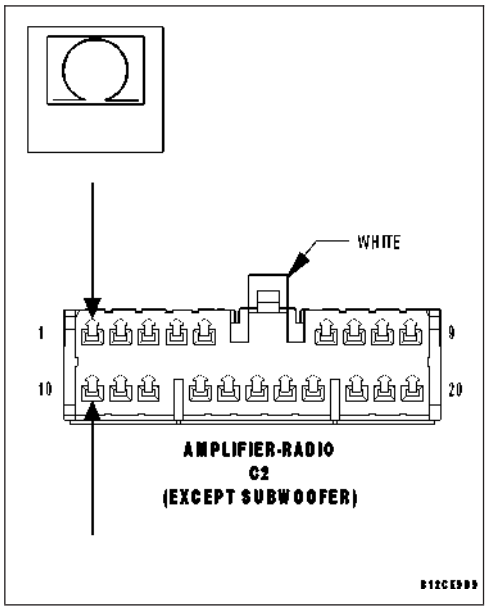
Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

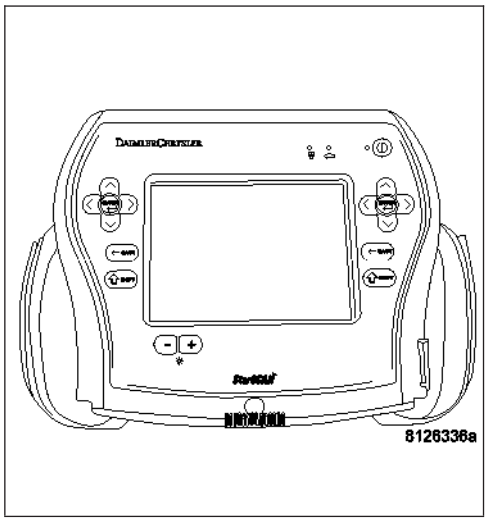
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

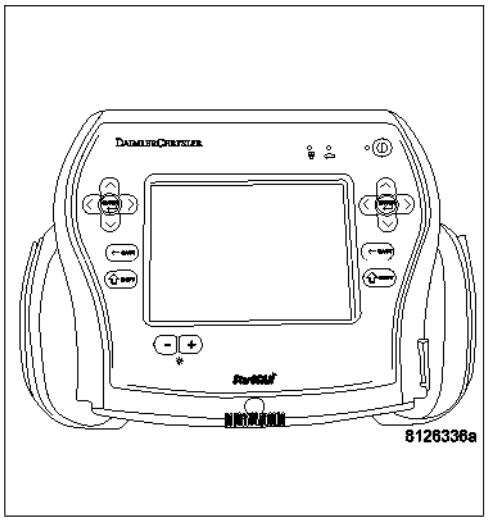
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



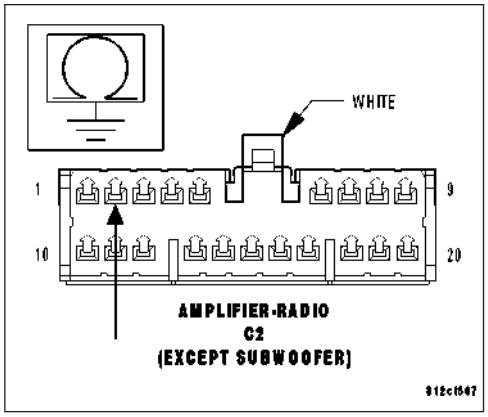
2. CHECK THE (X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.
Measure the resistance between ground and the (X208) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X208) Amplified Right Front I/P Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

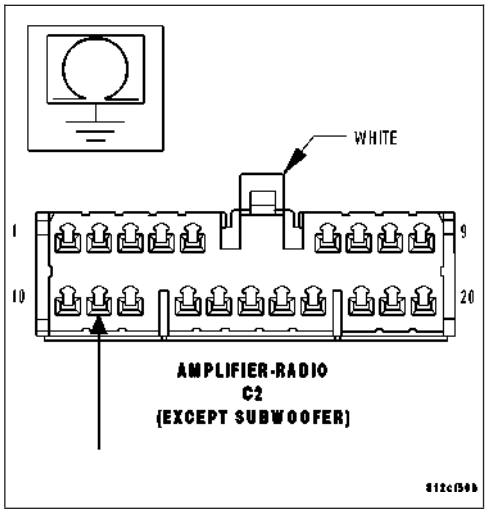
No >> Go To 3



B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X298) Amplified Right Front I/P Speaker (-) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X298) Amplified Right Front I/P Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

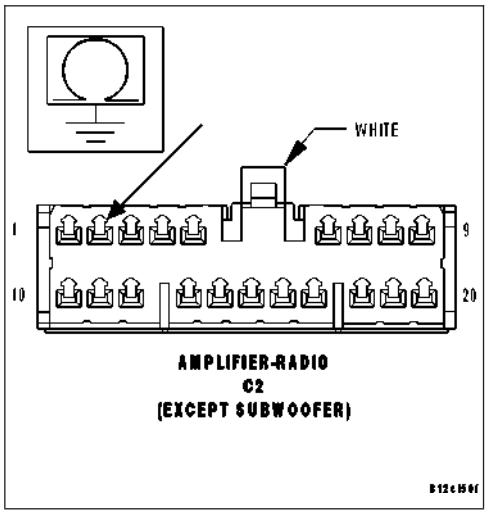
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER

Turn the ignition off.

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..



Is the resistance below 10K ohms?

Yes >> Replace the Right Front I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

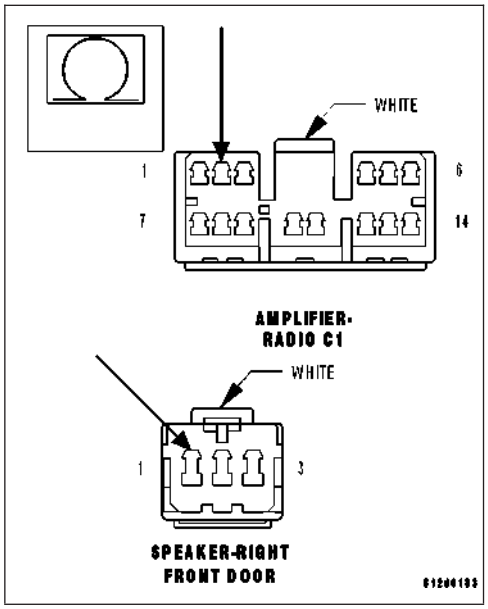
Measure the resistance of the (X202) Amplified Right Front Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

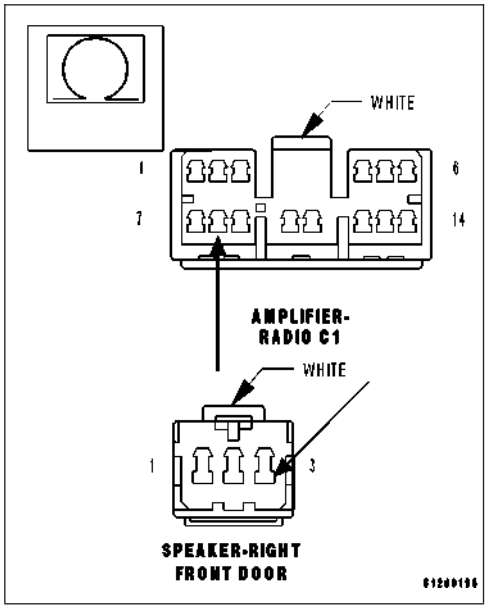
No >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X292) Amplified Right Front Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.

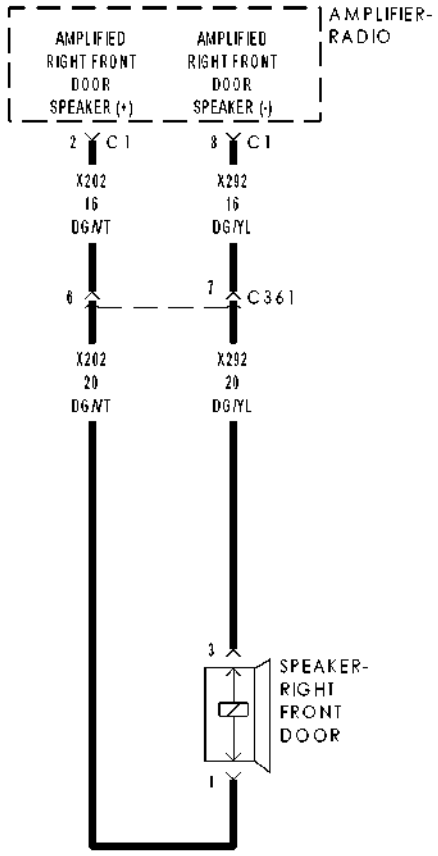


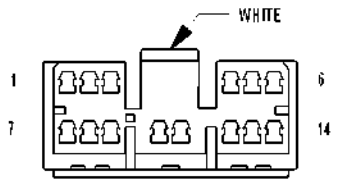
Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

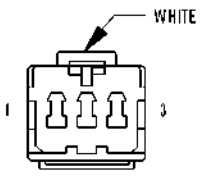
No >> Repair the (X292) Amplified Right Front Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER





AMPLIFIER-
RADIO C1



SPEAKER-RIGHT
FRONT DOOR

8J0af004

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

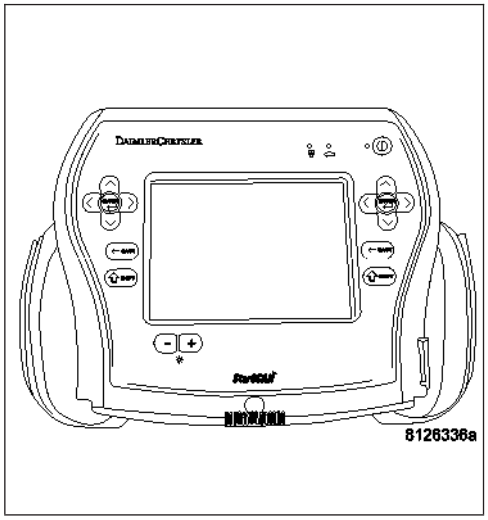
- **When Monitored:**
  With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
  The amplifier detects that the output circuits are shorted together.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, erase Amplifier DTCs.
Turn the radio on.
Turn the volume level to 25.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

---

2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER

Disconnect the Amplified Right Front Door Speaker.
Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

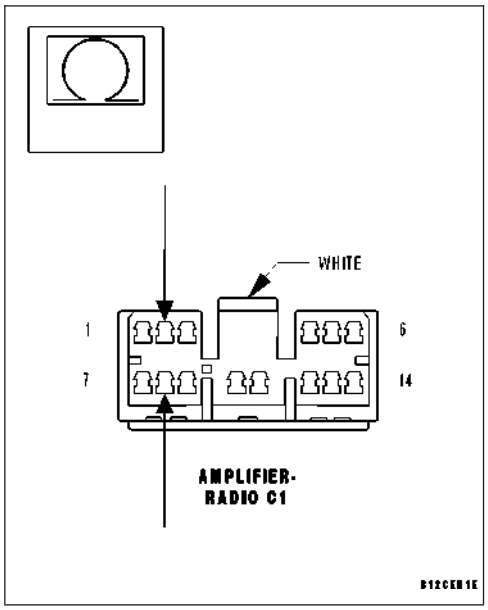
Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT REAR DOOR SPEAKER
AMPLIFIER

Diagnostic Test

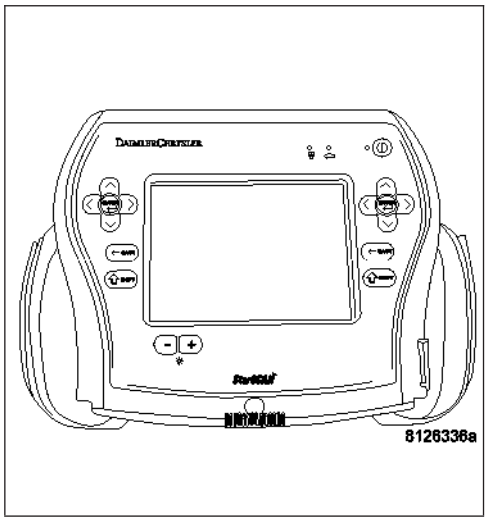
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



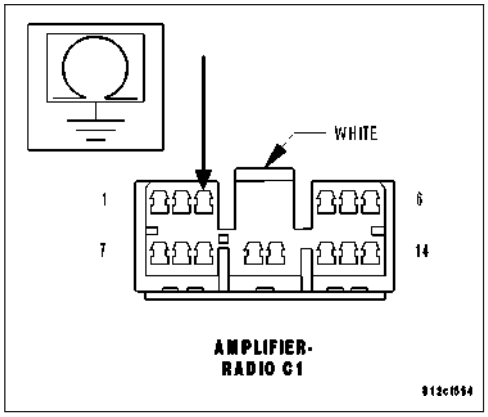
2. CHECK THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.
Measure the resistance between ground and the (X205) Amplified Left Rear Door Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

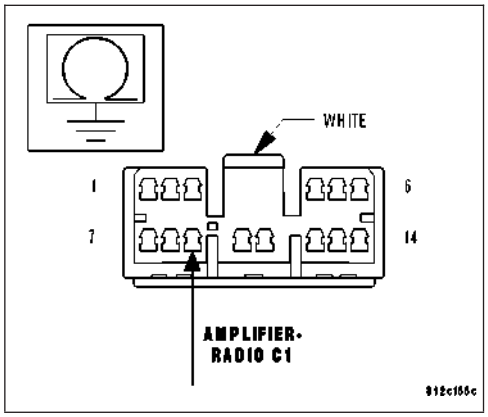
No >> Go To 3



B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X295) Amplified Left Rear Door Speaker (-) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X295) Amplified Left Rear Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

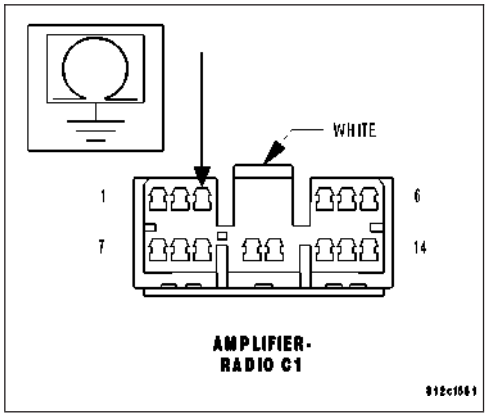
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR DOOR SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Rear Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..



Is the resistance below 10K ohms?

Yes >> Replace the Left Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

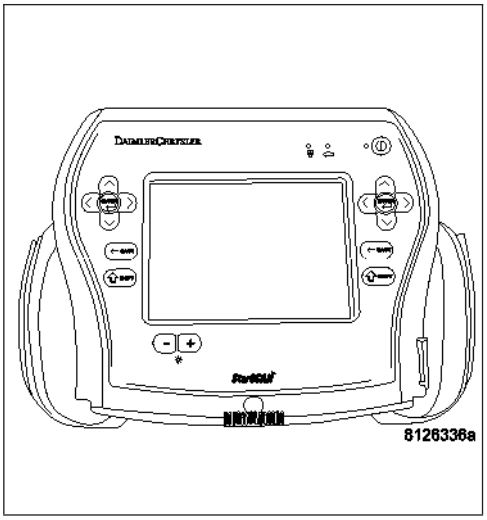
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



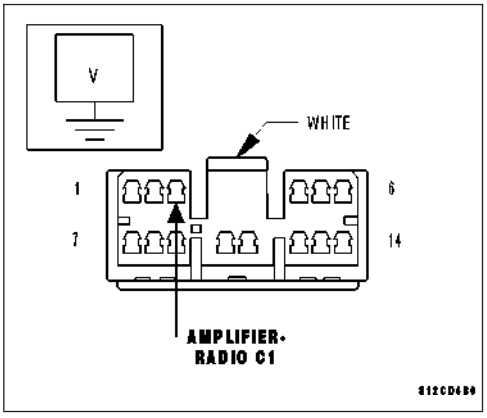
2. CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Amplified Left Rear Door Speaker harness connector.
Turn the ignition on.
Measure for voltage on the (X205) Amplified Left Rear Door Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

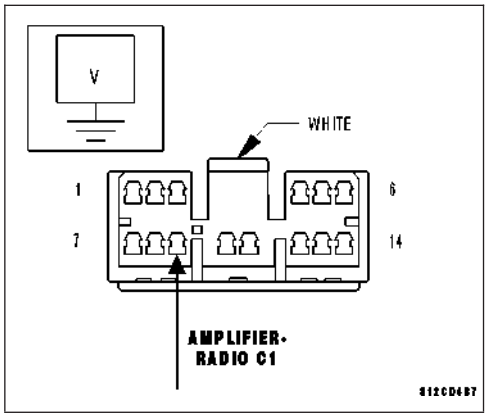
No >> Go To 3



B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT

Measure for voltage on the (X295) Amplified Left Rear Door Speaker (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X295) Amplified Left Rear Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

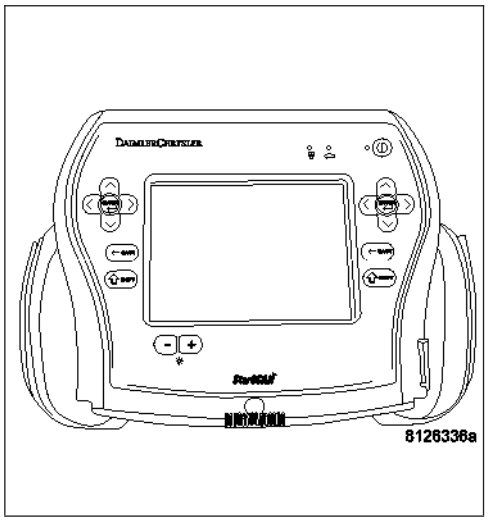
- **When Monitored:**
  Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
  The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT OPEN
(X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT OPEN
LEFT REAR DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



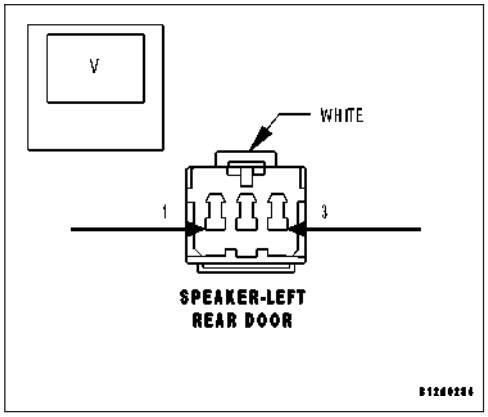
Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE LEFT REAR DOOR SPEAKER

Disconnect the Left Rear Door Speaker harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Door Speaker circuits in the Amplified Left Rear Door Speaker harness connector.



Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

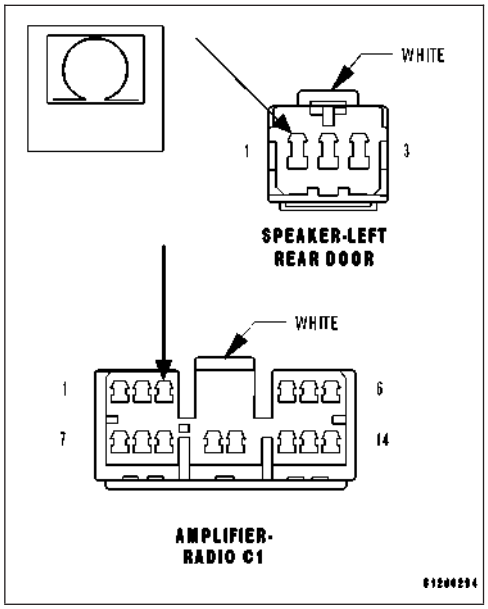
B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

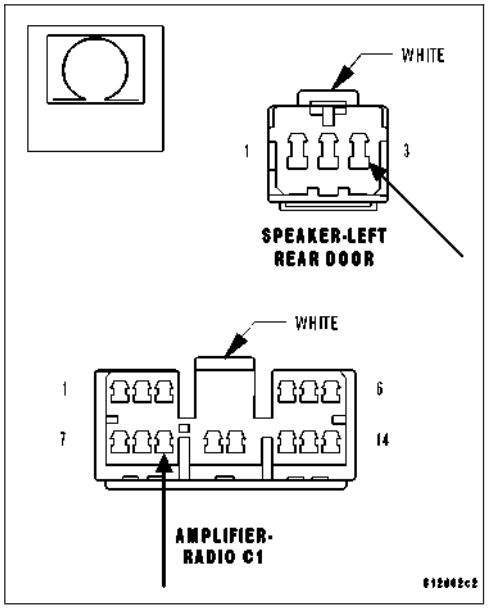
No >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X295) Amplified Left Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X295) Amplified Left Rear Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1480-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

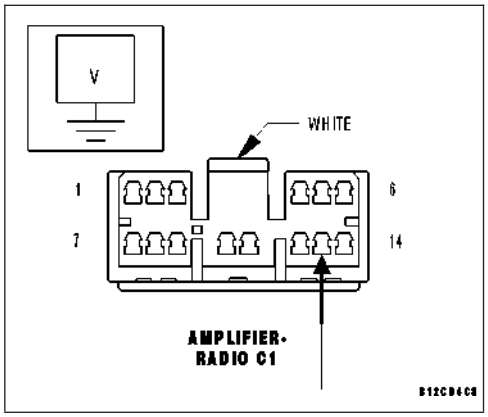
3. CHECK FOR VOLTAGE ON THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT

Measure for voltage on the (X390) Amplified Subwoofer 1 (-) circuit.

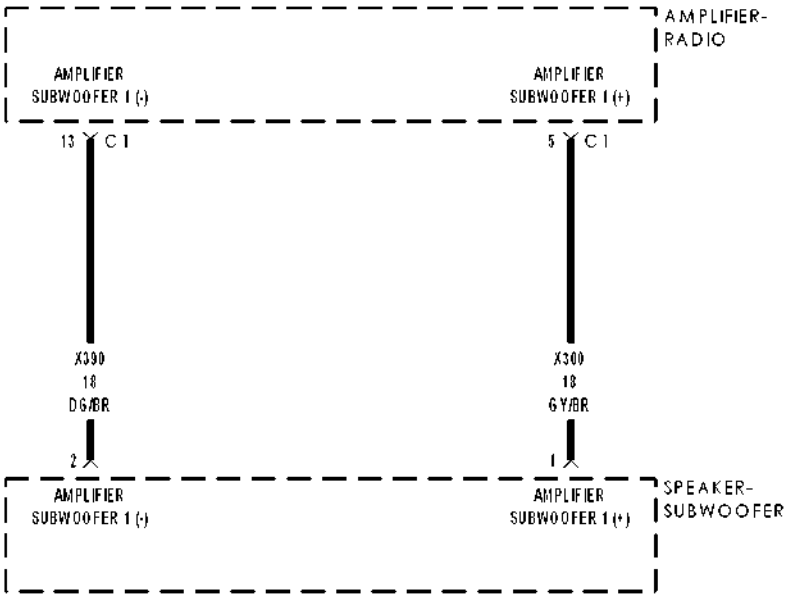


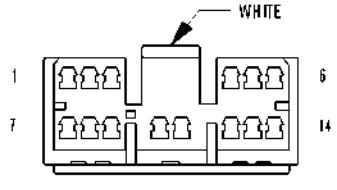
Is the voltage above 10.0 volts?

Yes >> Repair the (X390) Amplified Subwoofer 1 (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

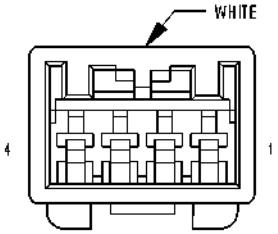
No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN





AMPLIFIER-
RADIO C1



SPEAKER-SUBWOOFER
(PREMIUM)

8l0cf020

B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

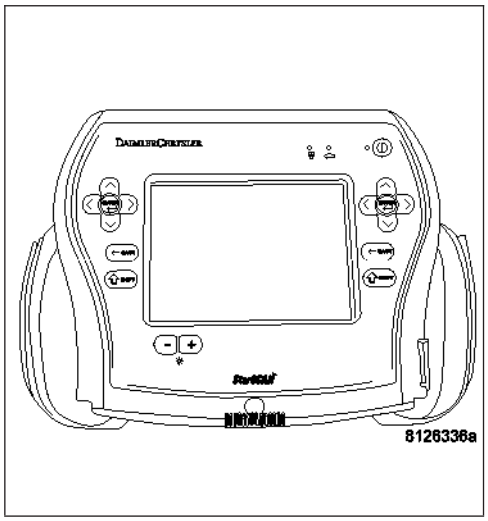
- **When Monitored:**
  Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
  The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT OPEN
(X299) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT OPEN
SUBWOOFER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on.
Turn the radio on.
With the scan tool, erase Amplifier DTCs.
With the scan tool, reset the amplifier.
With the scan tool, read Amplifier DTCs.



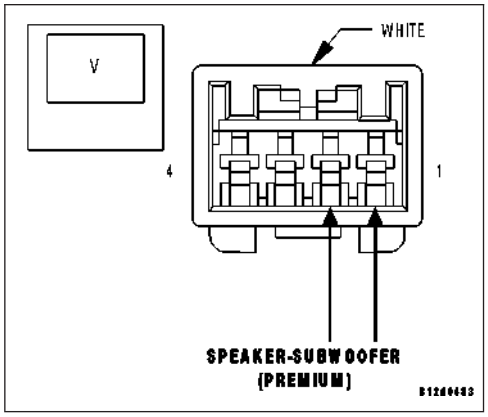
Does the scan tool display active: B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE SUBWOOFER

Disconnect the Subwoofer harness connector.
Turn the radio on and turn the volume to mid level.
With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Subwoofer 1 circuits in the Amplified Subwoofer harness connector.



Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Subwoofer in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

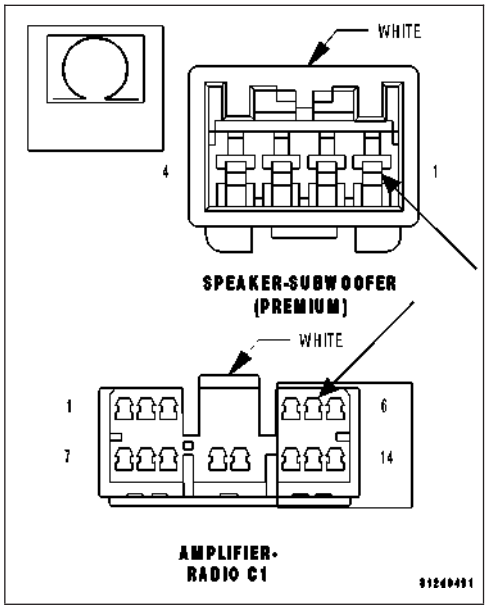
B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X300) Amplified Subwoofer 1 (+) circuit between the Amplifier C1 harness connector and the Amplified Subwoofer harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

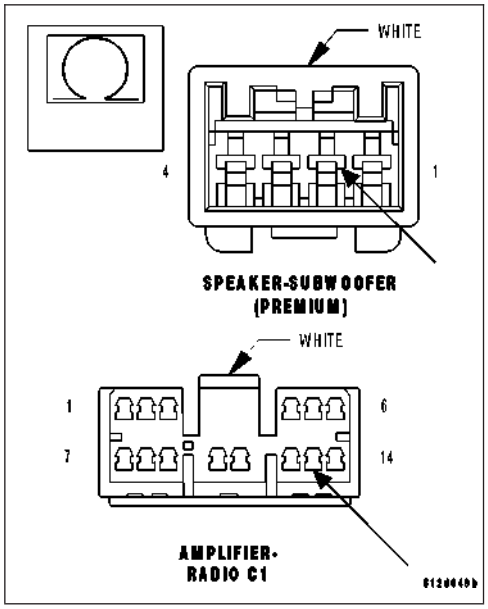
No >> Repair the (X300) Amplified Subwoofer 1 (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X390) Amplified Subwoofer 1 (-) circuit between the Amplifier C1 harness connector and the Amplified Subwoofer harness connector.

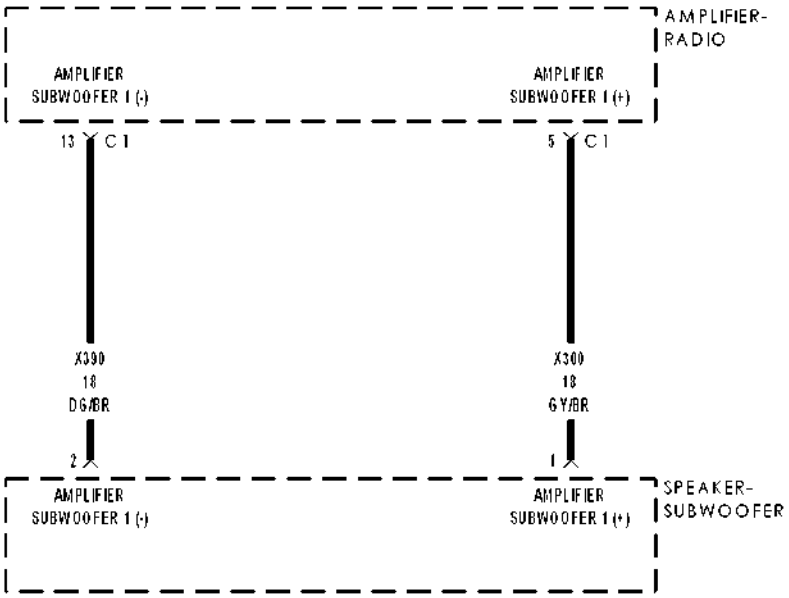


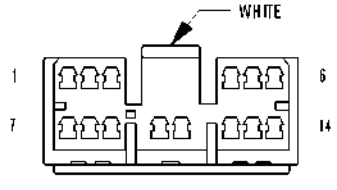
Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

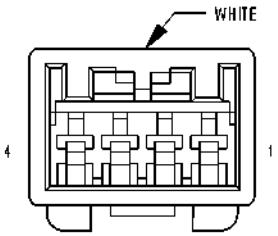
No >> Repair the (X390) Amplified Subwoofer 1 (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER





AMPLIFIER-
RADIO C1



SPEAKER-SUBWOOFER
(PREMIUM)

8ADaf020

B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

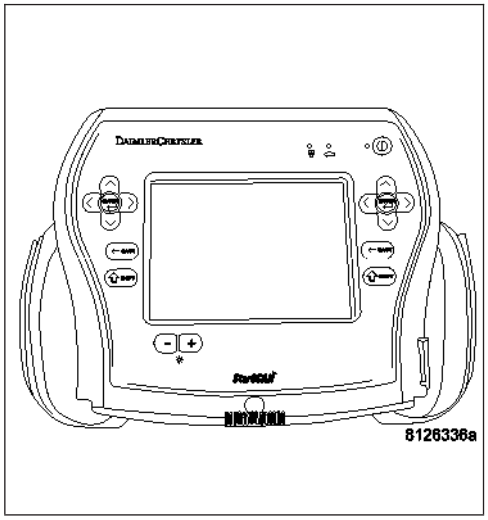
- **When Monitored:**
  With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
  The amplifier detects that the output circuits are shorted together.

Possible Causes
(X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT SHORTED TO THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT
AMPLIFIED SUBWOOFER 1
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, erase Amplifier DTCs.
Turn the radio on.
Turn the volume level to 25.
With the scan tool, read Amplifier DTCs.



Does the scan tool display active: B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

---

2. CHECK THE OPERATION OF THE AMPLIFIED SUBWOOFER 1

Disconnect the Amplified Subwoofer 1.
Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Subwoofer 1 in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT, AND THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

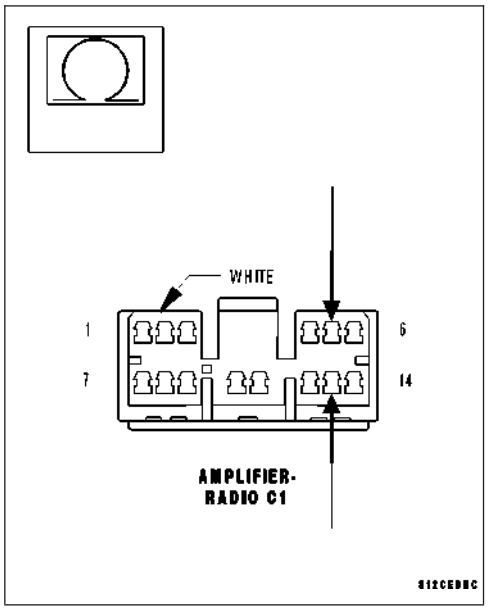
Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X300) Amplified Subwoofer 1 (+) circuit, and the (X390) Amplified Subwoofer 1 (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X300) Amplified Subwoofer 1 (+) circuit, and the (X390) Amplified Subwoofer 1 (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.



B1483-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

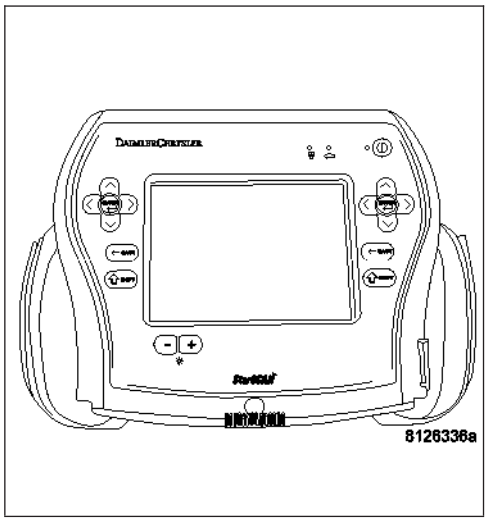
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

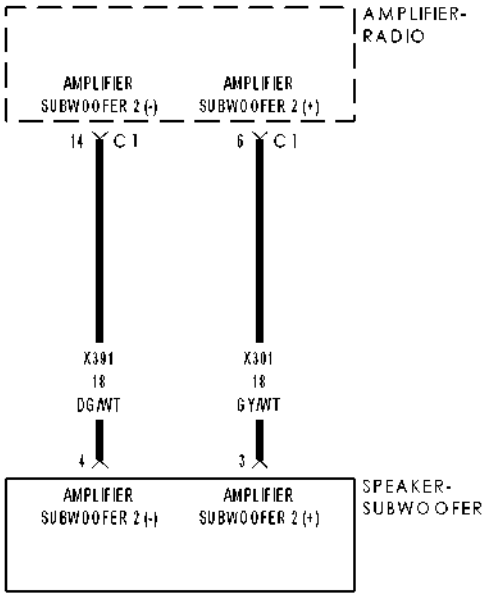


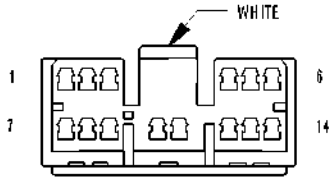
Does the scan tool display active: B1483-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

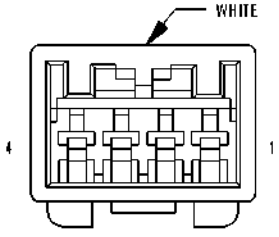
No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1484-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT LOW





AMPLIFIER-
RADIO C1



SPEAKER-SUBWOOFER
(PREMIUM)

8ACcf034

B1484-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X301) AMPLIFIED SUBWOOFER 2 (+) CIRCUIT SHORTED TO GROUND
(X391) AMPLIFIED SUBWOOFER 2 (-) CIRCUIT SHORTED TO GROUND
SUBWOOFER
AMPLIFIER

Diagnostic Test

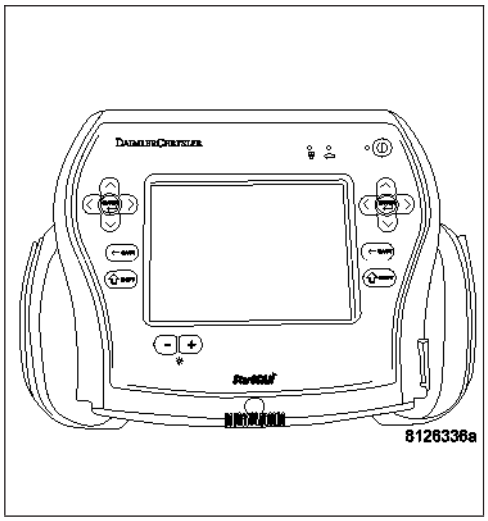
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1484-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



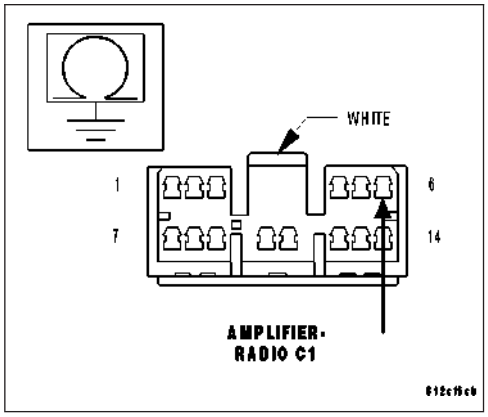
2. CHECK THE (X301) AMPLIFIED SUBWOOFER 2 (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.
Measure the resistance between ground and the (X301) Amplified Subwoofer 2 (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X301) Amplified Subwoofer 2 (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

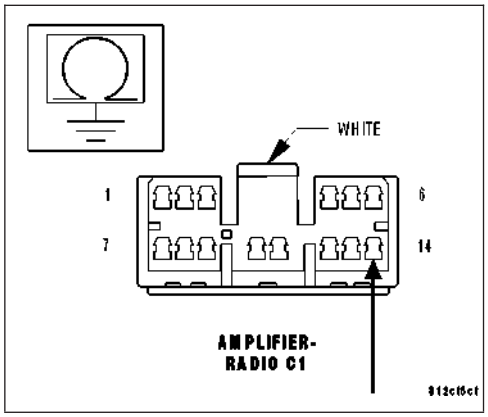
No >> Go To 3



B1484-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X391) AMPLIFIED SUBWOOFER 2 (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X391) Amplified Subwoofer 2 (-) circuit.



Is the resistance below 10K ohms?

Yes >> Repair the (X391) Amplified Subwoofer 2 (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

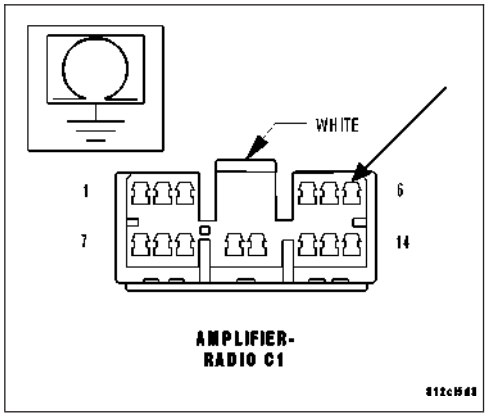
No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED SUBWOOFER

Turn the ignition off.

Reconnect the Subwoofer harness connector.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..



Is the resistance below 10K ohms?

Yes >> Replace the Subwoofer in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1485-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X301) AMPLIFIED SUBWOOFER 2 (+) CIRCUIT SHORT TO VOLTAGE
(X391) AMPLIFIED SUBWOOFER 2 (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

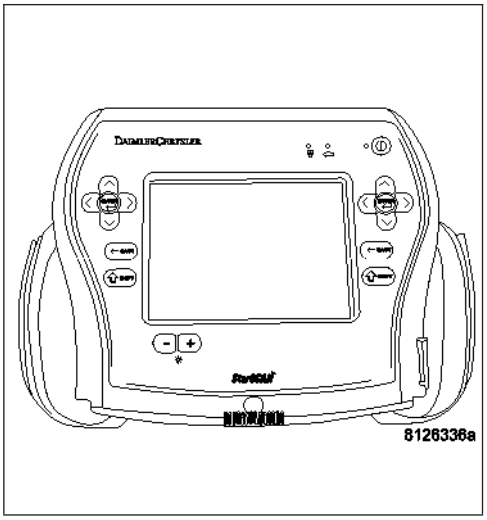
1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1485-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.



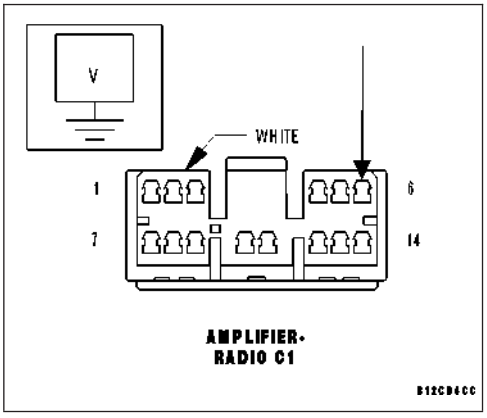
2. CHECK FOR VOLTAGE ON THE (X301) AMPLIFIED SUBWOOFER 2 (+) CIRCUIT

Turn the ignition off.
Disconnect the Amplifier C1 harness connector.
Disconnect the Amplified Subwoofer 2 harness connector.
Turn the ignition on.
Measure for voltage on the (X301) Amplified Subwoofer 2 (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X301) Amplified Subwoofer 2 (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

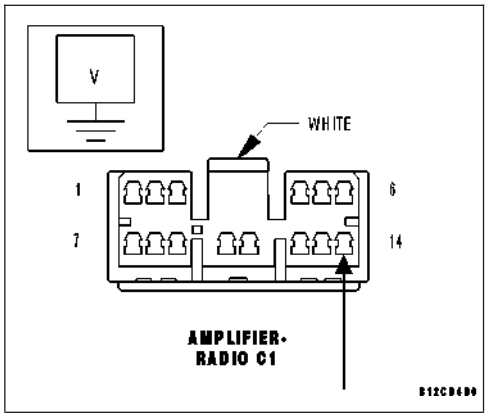
No >> Go To 3



B1485-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X391) AMPLIFIED SUBWOOFER 2 (-) CIRCUIT

Measure for voltage on the (X391) Amplified Subwoofer 2 (-) circuit.



Is the voltage above 10.0 volts?

Yes >> Repair the (X391) Amplified Subwoofer 2 (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

U0019–CAN B BUS (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

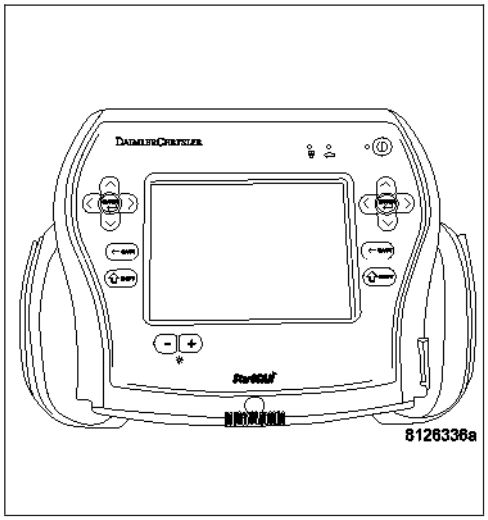
- **When Monitored:**
  Continuously.
- **Set Condition:**
  Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE
(D54) CAN B BUS (–) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase DTCs
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read DTCs.



Does the scan tool display U0019–CAN B BUS CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

---

2. CHECK FRONT CONTROL MODULE DTCs

With the scan tool, read Front Control Module DTCs

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

U0019–CAN B BUS (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier harness connector.

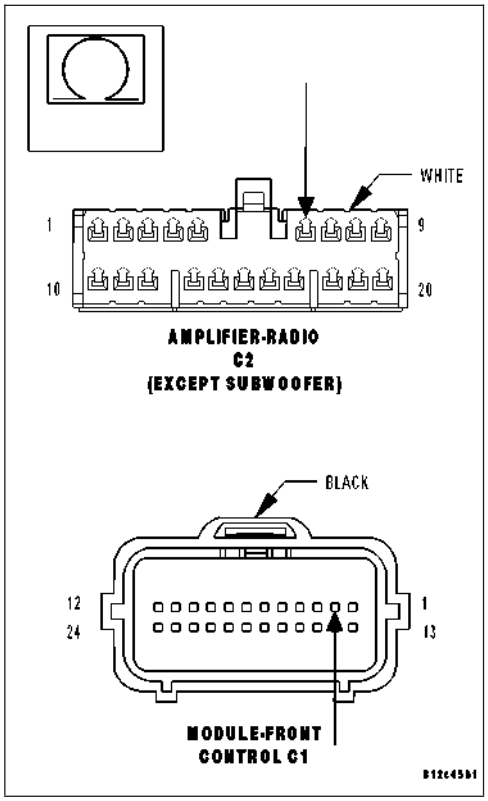
Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



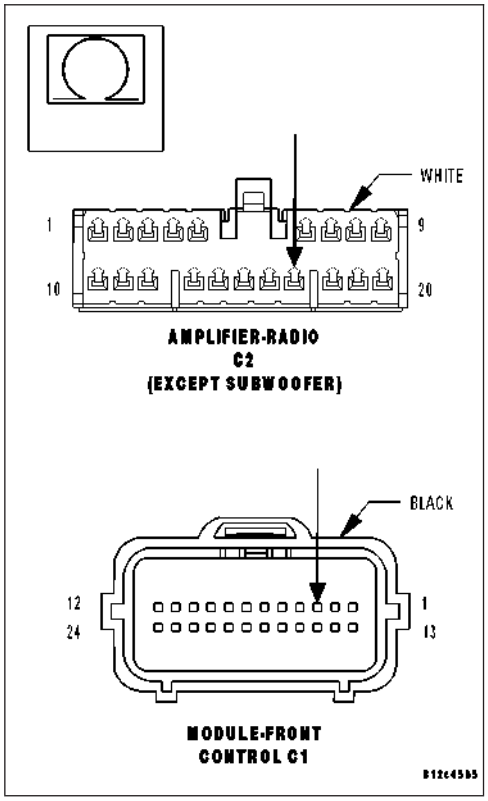
4. CAN B BUS (–) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (–) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information..
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the Can B Bus (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



U0020-CAN B BUS OFF PERFORMANCE

AUDIO/VIDEO - SERVICE INFORMATION

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered on this vehicle. A rear seat video system is also available. The audio system receives fused battery current from a fuse in the Junction Block (JB) at all times.

A navigation radio is available on this vehicle. With this system, the operator has the option of choosing a street address, point of interest, trip itinerary and other features outlined in the operator's manual. The audio/video system includes the following components:

- Antenna
- Clockspring (with remote radio switches only)
- DVD Player
- Hands free module
- Power amplifier
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)

- Speakers
- Video Monitor

DIAGNOSIS AND TESTING

AUDIO SYSTEM

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

AUDIO SYSTEM DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in the Integrated Power Module (IPM). Replace fuses, if required.
	2. Radio/amplifier (if equipped) connector damaged.	2. Check for loose or corroded radio/amplifier connector. Repair, if required.
	3. Wiring damaged.	3. Check for shorted or open wires. Repair wiring, if required.
	4. Radio/amplifier (if equipped) ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio/amplifier (if equipped) inoperative.	5. Refer to appropriate Diagnostic Service Information.
	6. Speakers inoperative.	6. Refer to speaker diagnosis.
NO RADIO DISPLAY	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Integrated Power Module (IPM). Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service Information.

CONDITION	POSSIBLE CAUSES	CORRECTION
CLOCK WILL NOT KEEP SET TIME	1. Fuse inoperative.	1. Check Ignition-Off Draw (IOD) fuse in the Integrated Power Module (IPM). Replace fuse, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service Information.
POOR RADIO RECEPTION	1. Antenna inoperative.	1. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - DIAGNOSIS AND TESTING).
	2. Radio ground damaged.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio noise suppression damaged.	3. Repair or replace ground strap as necessary.
	4. Radio inoperative.	4. Refer to appropriate Diagnostic Service Information.
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any misssing fasteners.
	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	Remove items from door trim panel. Ensure that vibration is no longer present.
NO COMPACT DISC OPERATION	1. CD faulty.	1. Insert known good CD and test operation.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative.	4. Refer to appropriate Diagnostic Service Information.

VIDEO SYSTEM DIAGNOSIS

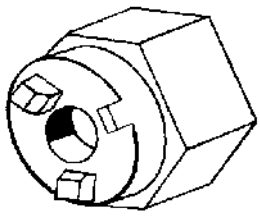
CONDITION	POSSIBLE CAUSES	CORRECTION
NO VIDEO (DVD PLAYER WILL NOT LOAD OR EJECT)	1. FUSE INOPERATIVE.	1. CHECK FUSES. REPLACE FUSES IF REQUIRED.
	2. LOOSE OR DAMAGED DVD PLAYER CONNECTOR	2. CHECK FOR LOOSE OR CORRODED DVD PLAYER CONNECTOR (16 PIN). REPAIR OR REPLACE AS REQUIRED.
	3. LOOSE OR DAMAGED WIRING/DVD PLAYER INOPERATIVE	3. CHECK PIN 1 (B+) AND PIN 9 (GROUND) OF THE 16 PIN CONNECTOR, THEN CHECK PIN 1 (B+) AND PIN 7 (GROUND) OF THE 12 PIN CONNECTOR. IF THE 16 PIN CONNECTOT DOES NOT SHOW VOLTAGE, THE 12 PIN CONNECTOR WILL NOT SHOW VOLTAGE (THE 12 PIN IS FED FROM THE 16 PIN). IF VOLTAGE IS OK ON THE 16 PIN, BUT NOT PRESENT ON THE 12 PIN, UNPLUG THE 12 PIN HARNESS FROM THE PLAYER AND CHECK THE CONNECTOR PINSON THE BACK OF THE PLAYER. IF VOLTAGE IS PRESENT ON THE 12 PIN CONNECTOR, THE SCREEN OR THE 12 PIN HARNESS SHOULD BE REPLACED. IF THERE IS STILL NO VOLTAGE ON THE 12 PIN CONNECTOR, THE DVD PLAYER SHOULD BE REPLACED.
	4. GROUND CONNECTION DAMAGED	4. CHECK FOR CONTINUITY BETWEEN DVD PLAYER AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND IF REQUIRED.
	5. DVD PLAYER DAMAGED	5. EXCHANGE OR REPLACE DVD PLAYER IF REQUIRED.
	6. DVD DAMAGED. AVOID USING CD'S OR DVD'S THAT HAVE ADHESIVE TYPE LABELS, AS THEY MAY CAUSE THE DISC TO BECOME JAMMED.	6. INSERT KNOWN GOOD DVD AND TEST OPERATION.

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DISPLAY. AUDIO HEARD THROUGH SPEAKERS	1. LOOSE OR DAMAGED CONNECTORS	1. CHECK FOR LOOSE OR CORRODED DVD PLAYER CONNECTOR (12 PIN). CHECK FOR LOOSE OR CORRODED VIDEO SCREEN CONNECTOR. REPAIR IF REQUIRED. CHECK FOR LOOSE OR DAMAGED IN-LINE CONNECTOR.
	2. WIRING DAMAGED	2. WITH HARNESS CONNECTED, CHECK FOR VIDEO SIGNAL VOLTAGE AT DVD PLAYER AND AT VIDEO SCREEN HARNESS. PLACE KNOWN GOOD DVD INTO DVD PLAYER. PLACE POSITIVE LEAD OF VOLTMETER ON PIN 5 (VIDEO SIGNAL) OF THE 12 PIN CONNECTOR. PLACE NEGATIVE LEAD ON PIN 6 (VIDEO GROUND). READINGS SHOULD BE BETWEEN 0.1V TO 2V DC.
	3. VIDEO SCREEN DAMAGED	3. EXCHANGE OR REPLACE VIDEO SCREEN IF REQUIRED.
WHITE DISPLAY	1. LOW VOLTAGE	1. CHECK FOR BATTERY VOLTAGE (9V-16V) AT DVD PLAYER 12 PIN CONNECTOR (PIN 1-BATTERY, PIN 7-GROUND). DISPLAY WILL BE WHITE IF VOLTAGE DROPS BELOW 6V.
	2. VIDEO SCREEN DAMAGED	2. EXCHANGE OR REPLACE VIDEO SCREEN IF REQUIRED.
DARK OR BRIGHT SPOTS ON SCREEN	1. BRIGHTNESS SETTING REQUIRES ADJUSTMENT.	1. ADJUST BRIGHTNESS SETTING OF VIDEO SCREEN BY PRESSING BUTTONS ON SIDE OF VIDEO SCREEN UNTIL DESIRED LEVEL IS REACHED. START WITH A BLACK SCREEN, THEN PRESS BUTTON UP 16-20 TIMES. THERE ARE 64 TOTAL STEPS OF BRIGHTNESS.

CONDITION	POSSIBLE CAUSES	CORRECTION
BRIGHT OR DARK DISPLAY	1. VIDEO SCREEN DISPLAY PIXEL DEFECT.	1. THE ACCEPTABLE LEVEL OF DOTS ON THE SCREEN IS (GREEN-1, RED-2) OR A TOTAL (GREEN+RED+BLUE+WHITE +BLACK) = 8. REPLACE OR EXCHANGE VIDEO SCREEN IF NECESSARY.
VIDEO SELECTIONS DO NOT APPEAR FULL SCREEN WIDTH	1. ASPECT RATIO IS SET INCORRECTLY.	1. USING MODE BUTTON, ADJUST UNTIL VIDEO APPEARS CORRECTLY.
	2. SOME DVD'S ARE TWO SIDED. ONE SIDE IS WIDE SCREEN FORMAT AND THE OTHER IS FULL SCREEN OR THERE MAY BE A WIDE SCREEN OR STANDARD SCREEN FORMAT ON THE DISC.	2. ENSURE THAT DVD IS INSERTED CORRECTLY.
BUTTONS ON VIDEO SCREEN INOPERATIVE	1. VIDEO SCREEN DAMAGED.	1. PLACE KNOWN GOOD DVD INTO DVD PLAYER. ONCE IMAGE APPEARS ON VIDEO SCREEN, PRESS TOP BUTTON ON SIDE OF VIDEO SCREEN TO ADJUST WIDTH OF DISPLAY. PRESS BOTTOM BUTTONS TO ADJUST BRIGHTNESS. ONCE DVD MENU APPEARS ON VIDEO SCREEN, PRESS MIDDLE BUTTON ON VIDEO SCREEN. HIGHLIGHTED SELECTION WILL BEGIN TO PLAY. IF ANY OF THE BUTTONS DO NOT FUNCTION, REPLACE OR EXCHANGE VIDEO SCREEN.

SPECIAL TOOLS

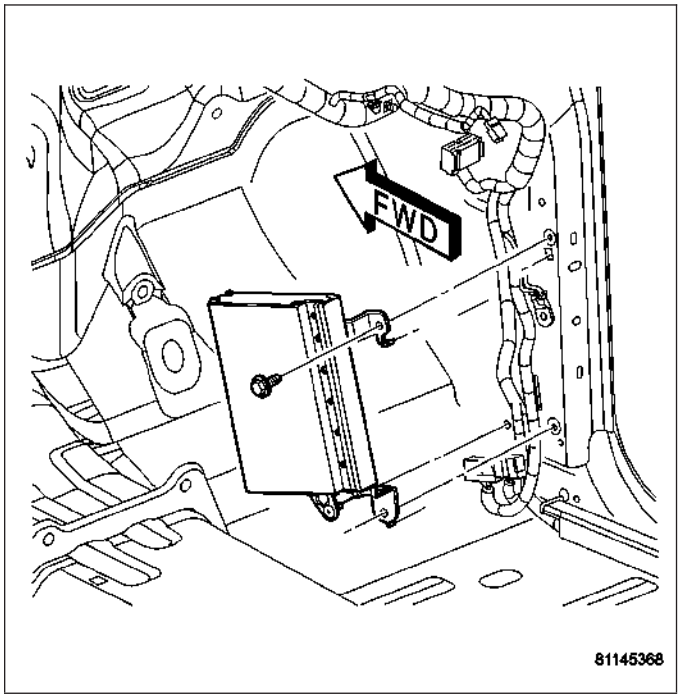
AUDIO SYSTEMS



AMPLIFIER-RADIO

DESCRIPTION

The amplifier can have two ratings: 288 watt (RD7), and 384 watt (RD6). The amplifier is mounted to the right cowl side panel under the passenger side of the instrument panel.



OPERATION

The amplifier receives fused battery current from a fuse in the Junction Block (JB) at all times. The internal circuitry of the amplifier switches the amplifier on based upon a CAN bus message that is received from the radio receiver whenever the radio is turned on. The amplifier receives the sound signal inputs from the left and right rear outputs of the radio, then sends the amplified speaker outputs for each of those channels to the speakers.

DIAGNOSIS AND TESTING

AMPLIFIER

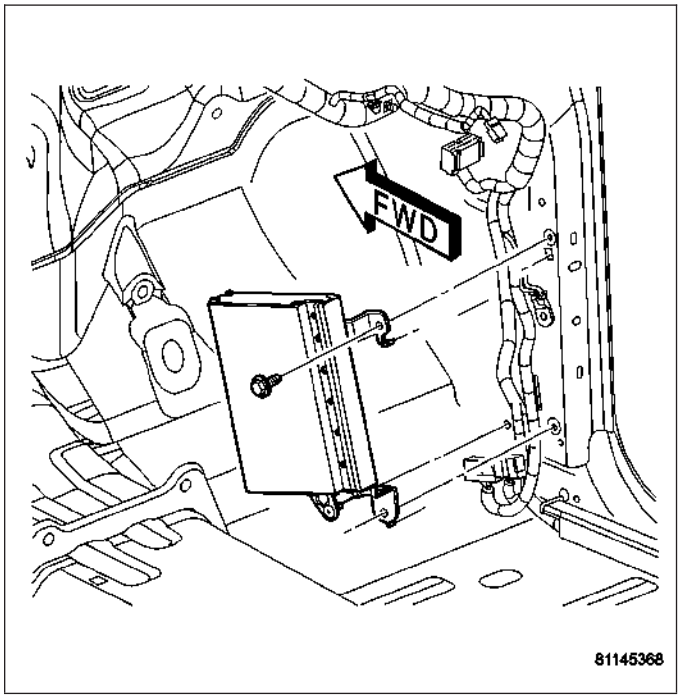
Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

The amplifier unit should be checked if there is no sound output noted from the speakers. For diagnosis of the power amplifier, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - DIAGNOSIS AND TESTING).

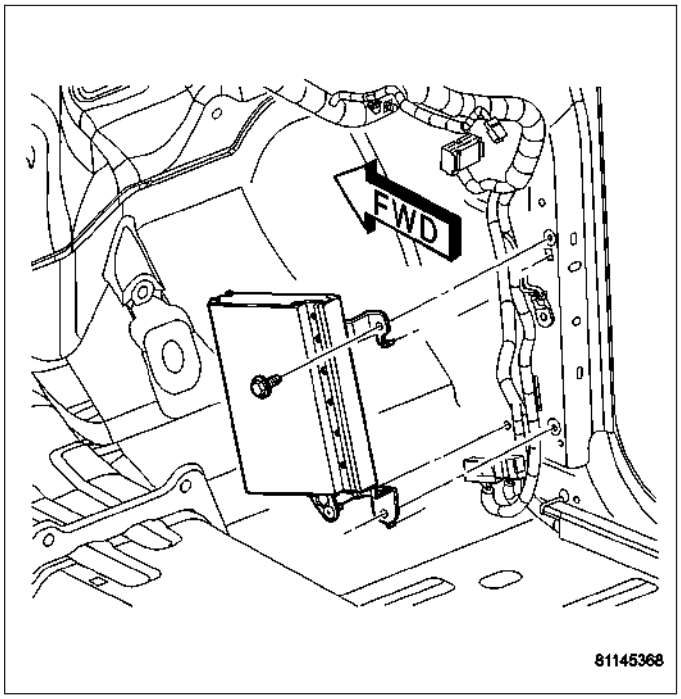
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right side cowl trim.
3. Remove mounting fasteners.
4. Disconnect electrical harness connectors and remove amplifier.



INSTALLATION

1. Connect wire harness connectors to amplifier. Position amplifier into place.
2. Install and tighten mounting fasteners.
3. Install right side cowl trim cover.
4. Connect battery negative cable.



ANTENNA BODY & CABLE

DESCRIPTION

A fixed-length stainless steel antenna mast is used, installed on the right front fender of the vehicle. The antenna mast is connected to the center wire of the coaxial antenna cable, and is not grounded to any part of the vehicle.

To eliminate static, the antenna base must have a good ground. The coaxial antenna cable shield (the outer wire mesh of the cable) is grounded to the antenna base and the radio receiver chassis.

The antenna coaxial cable has an additional disconnect, located near the outboard side of the glove box opening on the back side of the lower instrument panel reinforcement.

DIAGNOSIS AND TESTING

ANTENNA BODY AND CABLE

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to coaxial shield test.

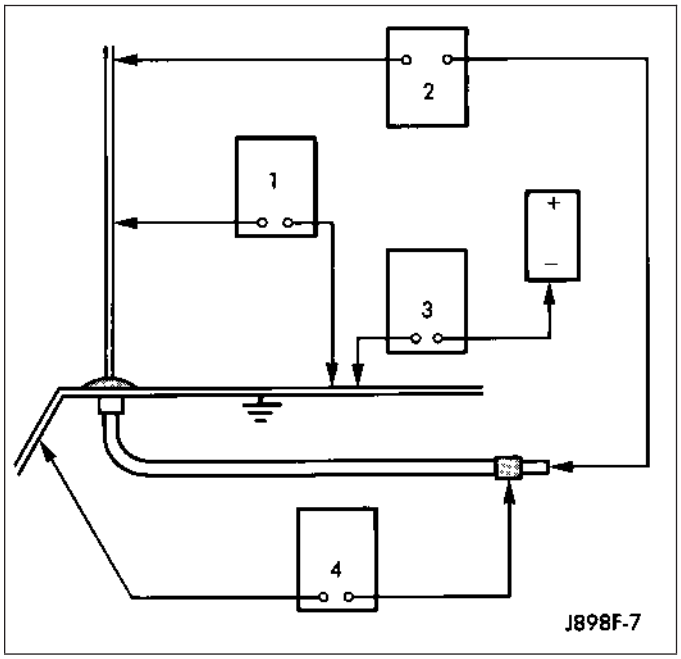
The ohmmeter test lead connections for each test are shown in Antenna Tests.

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate a coaxial cable problem; from the coaxial cable connection under the right end of the instrument panel near the outboard side of the glove box opening to the antenna base, and then from the coaxial cable connection to the radio chassis connection.

TEST 1

Test 1 determines if the antenna mast is insulated from the base. Proceed as follows:

1. Disconnect the antenna coaxial cable connector from the radio receiver chassis and isolate.
2. Connect one ohmmeter test lead to the antenna mast in the center of the antenna base. Connect the other test lead to the perimeter of the antenna base. Check for continuity.
3. There should be no continuity. If continuity is found, replace the faulty or damaged antenna base and cable assembly.



TEST 2

Test 2 checks the antenna for an open circuit as follows:

1. Disconnect the antenna coaxial cable connector from the radio receiver chassis.
2. Connect one ohmmeter test lead to the antenna mast in the center of the antenna base. Connect the other test lead to the center pin of the antenna coaxial cable connector.
3. Continuity should exist (the ohmmeter should only register a fraction of an ohm). High or infinite resistance indicates damage to the base and cable assembly. Replace the faulty base and cable, if required.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. This test should be performed with the battery positive cable removed from the battery. Disconnect both battery cables, the negative cable first. Reconnect the battery negative cable and perform the test as follows:

1. Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the battery negative terminal post.
2. The resistance should be less than one ohm.
3. If the resistance is more than one ohm, check the braided ground strap(s) connected to the engine and the vehicle body for being loose, corroded, or damaged. Repair the ground strap connections, if required.

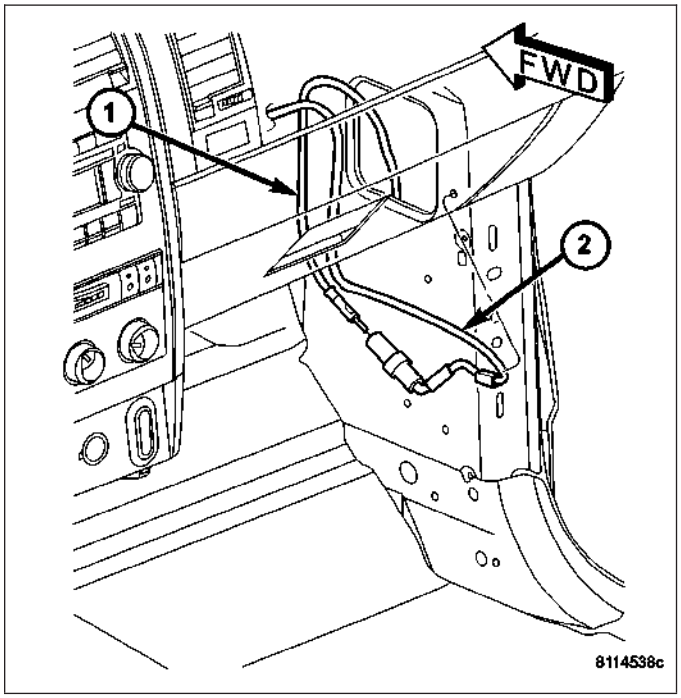
TEST 4

Test 4 checks the condition of the ground between the antenna base and the vehicle body as follows:

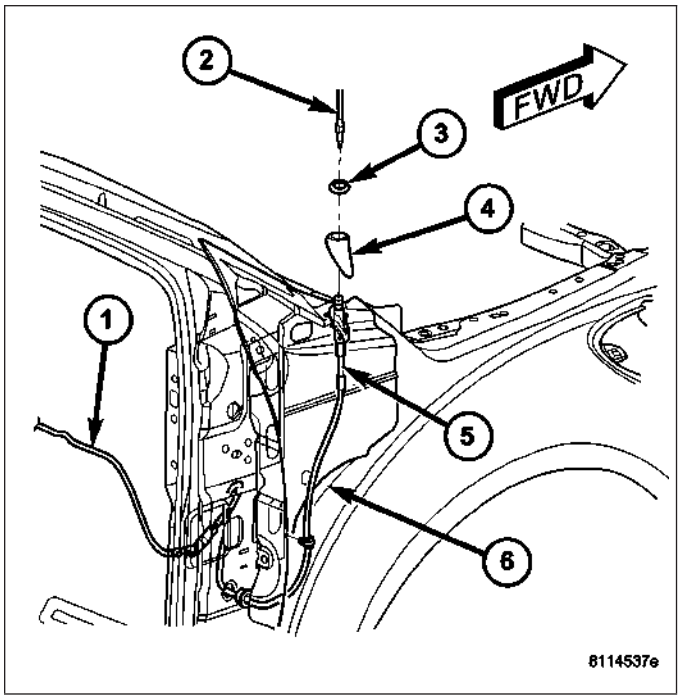
1. Connect one ohmmeter test lead to the vehicle fender. Connect the other test lead to the outer crimp on the antenna coaxial cable connector.
2. The resistance should be less then one ohm.
3. If the resistance is more then one ohm, clean and/or tighten the antenna base to fender mounting hardware.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right side cowl trim cover.
3. Reach under the instrument panel outboard of the glove box to access and disconnect the antenna coaxial cable connector (2). Disconnect the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.
4. Disengage the antenna coaxial cable retainer at the right cowl side inner panel.

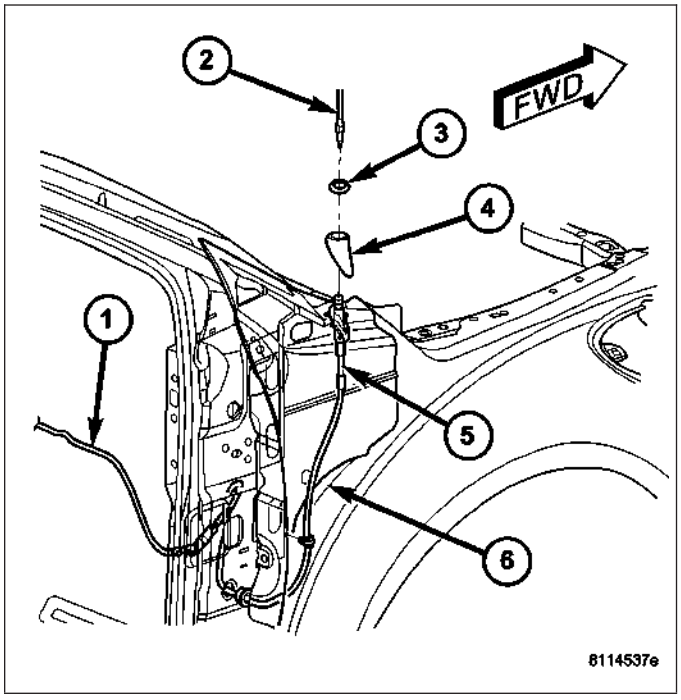


5. Remove the right side wheelhouse splash shield.
6. Unscrew the antenna mast (2) from the antenna body.
7. Remove the antenna cap nut (3) using an antenna nut wrench (Special Tool C-4816)
8. Remove the antenna adapter (4) from the top of the fender.
9. Lower the antenna body (5) through the mounting hole in the top of the fender.
10. Disengage the antenna coaxial cable grommet from the hole in the right cowl side outer panel.
11. Pull the antenna body and cable out through the opening between the right cowl side outer panel and the fender.

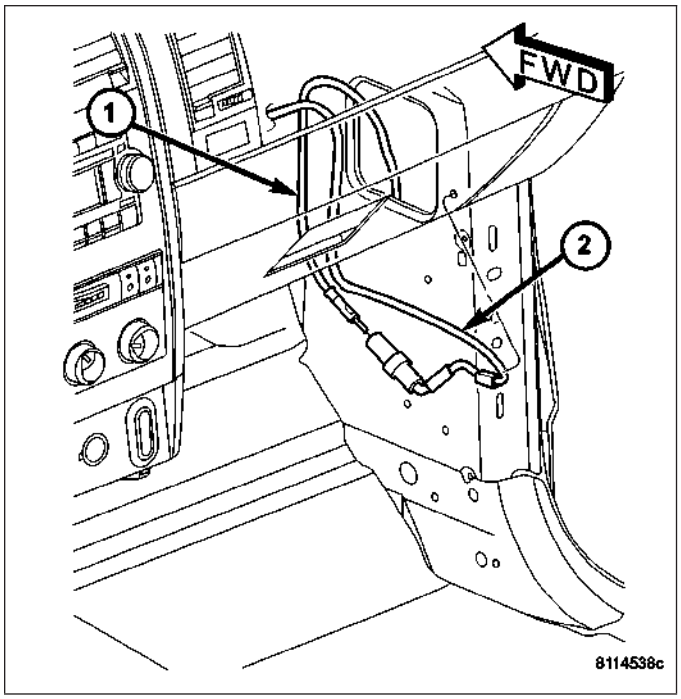


INSTALLATION

1. Position the antenna body and cable (5) in the opening between the right cowl side outer panel and the fender.
2. Push the antenna coaxial cable into the passenger compartment through the hole in the right cowl side outer panel.
3. Engage the antenna coaxial cable grommet in the hole in the right cowl side outer panel.
4. Position the antenna body through the mounting hole in the top of the fender.
5. Install the adapter (4) over the antenna body from the top of the fender.
6. Install and tighten the antenna cap nut (3) using an antenna nut wrench (Special Tool C-4816).
7. Install and tighten the antenna mast (2) onto the antenna body.
8. Engage the antenna coaxial cable retainers at the right cowl side inner panel and inside the right front fender.



9. Engage the antenna coaxial cable in the retainer clips on the lower instrument panel support and the glovebox.
10. Reach under the instrument panel outboard of the glove box to reconnect the antenna coaxial cable connector (2).
11. Install the cowl trim cover.
12. Install the wheelhouse splash shield.
13. Connect the battery negative cable.

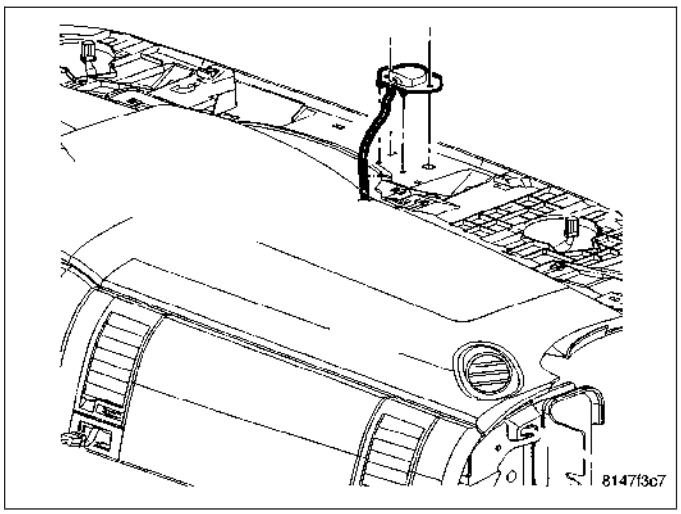


ANTENNA - NAVIGATION RADIO

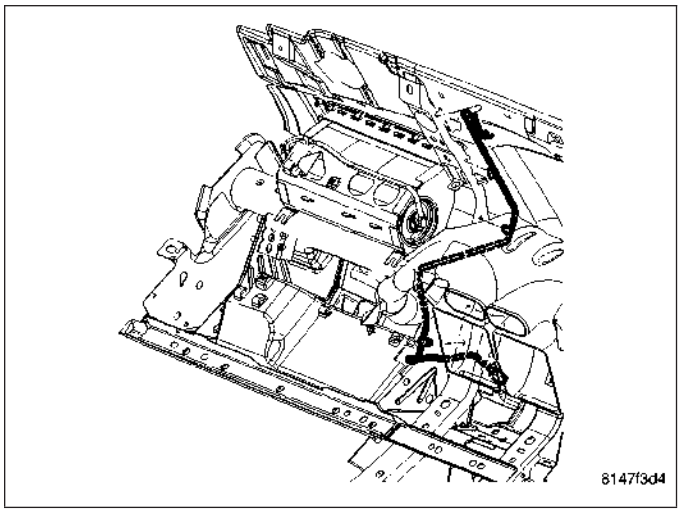
REMOVAL

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
3. Remove the instrument panel defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).
4. Remove the passenger airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).
5. Remove the antenna mounting fasteners
   .



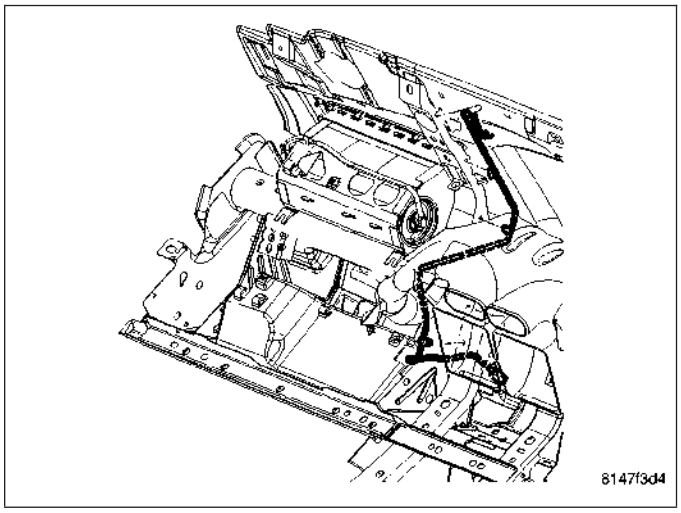
6. Remove the navigation radio antenna .



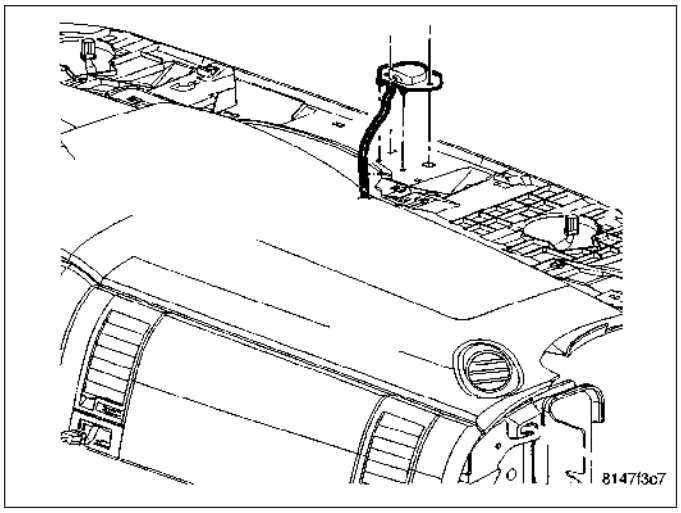
INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position antenna to instrument panel.
2. Connect antenna to radio.
3. Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).



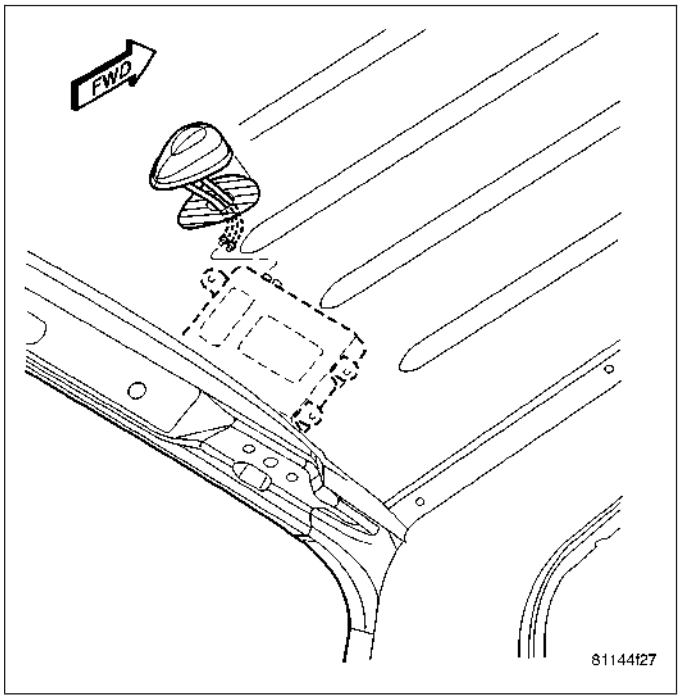
4. Install and tighten mounting fasteners.
5. Install instrument panel defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - INSTALLATION).
6. Install passenger airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).
7. Connect battery negative cable.



ANTENNA-SATELLITE

DESCRIPTION

The satellite radio antenna is secured by a threaded fastener and two retainers which protrude through a hole in the roof panel. Two wires from the antenna are connected to the satellite receiver module located above the headliner.

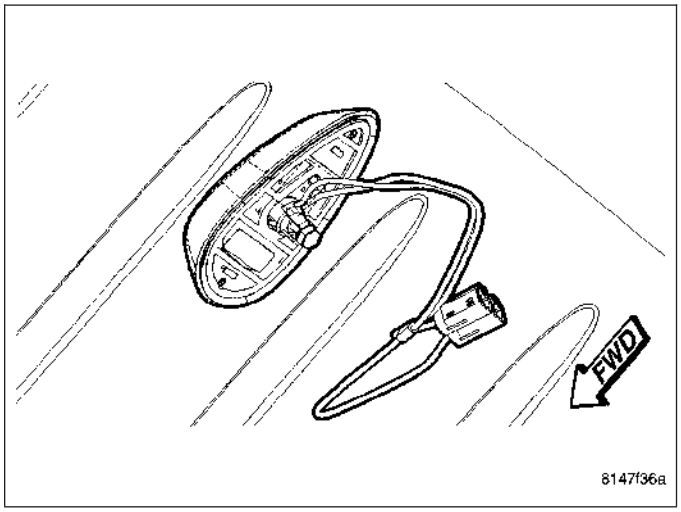


OPERATION

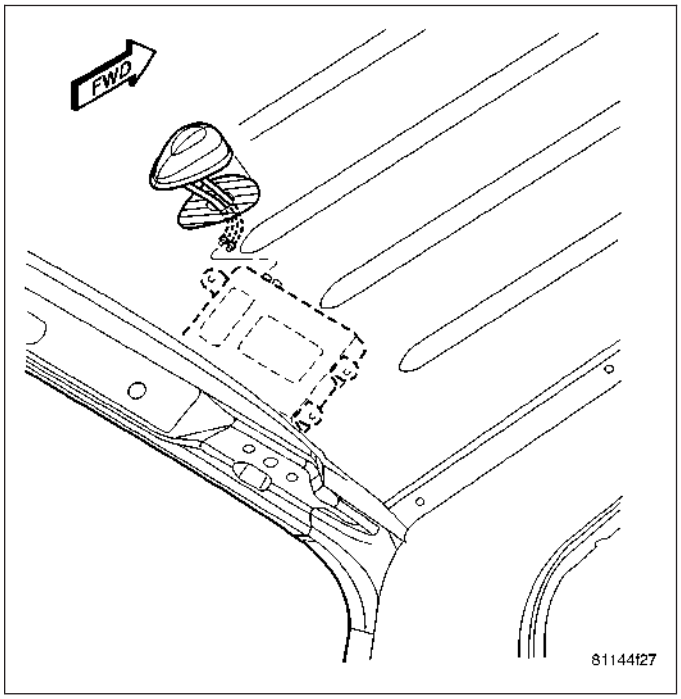
The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to access underside of antenna (1) (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Disconnect the wire harness connectors from the antenna.
4. Remove fastener and retainer.

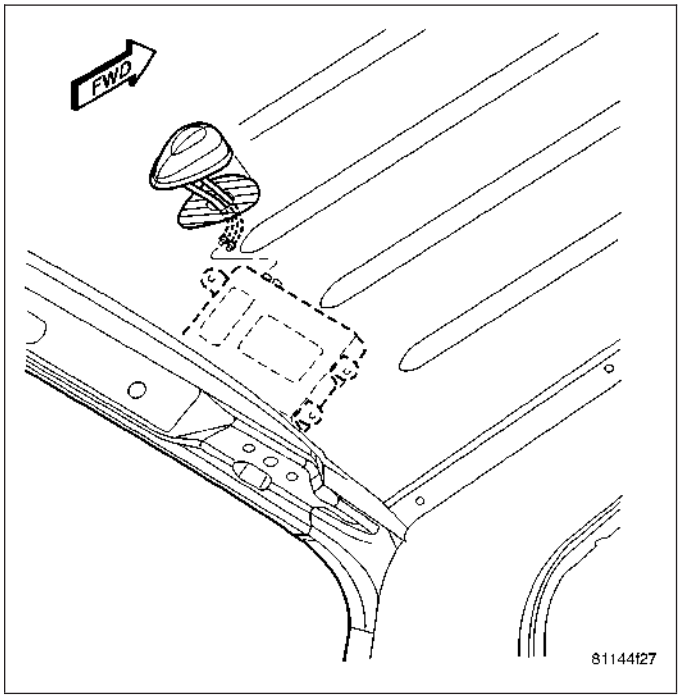


5. From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

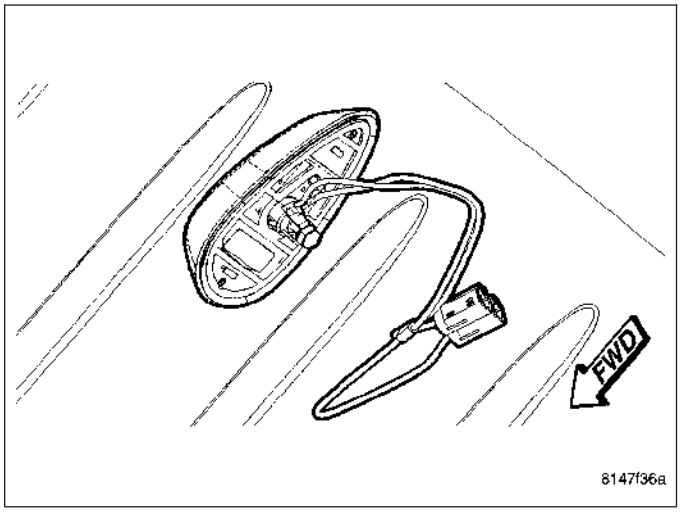


INSTALLATION

1. Insert wire harness through hole in roof panel. Press antenna into position until both retainers snap into place.



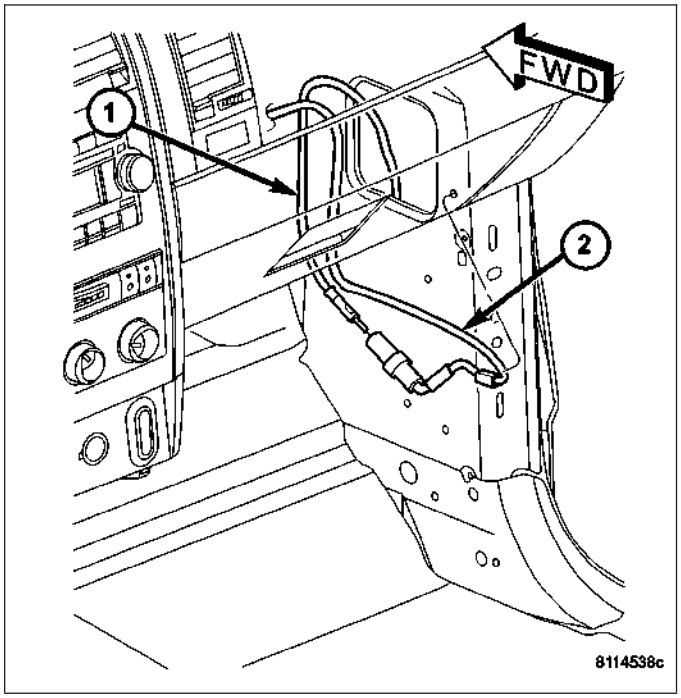
2. Connect wire harness connectors to antenna.
3. Install and tighten retaining fastener.
4. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).
5. Connect battery negative cable.



ANTENNA CABLE-INSTRUMENT PANEL

REMOVAL

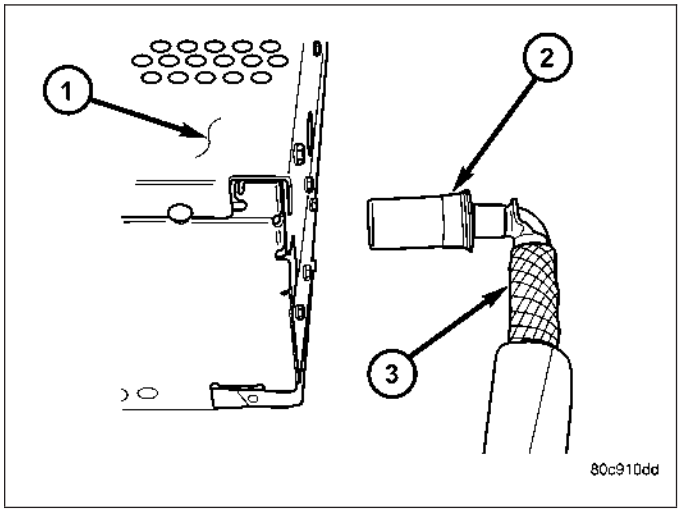
1. Disconnect and isolate the battery negative cable.
2. Remove the right side cowl trim.
3. Reach under the instrument panel outboard of the glove box to access and disconnect the antenna coaxial cable connector (1) and (2). Disconnect the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.
4. Disengage the instrument panel antenna cable from the retainer clips on the glove box opening and instrument panel support.



5. Remove the radio (1) (Refer to 8 - ELECTRICAL/ AUDIO/RADIO - REMOVAL).

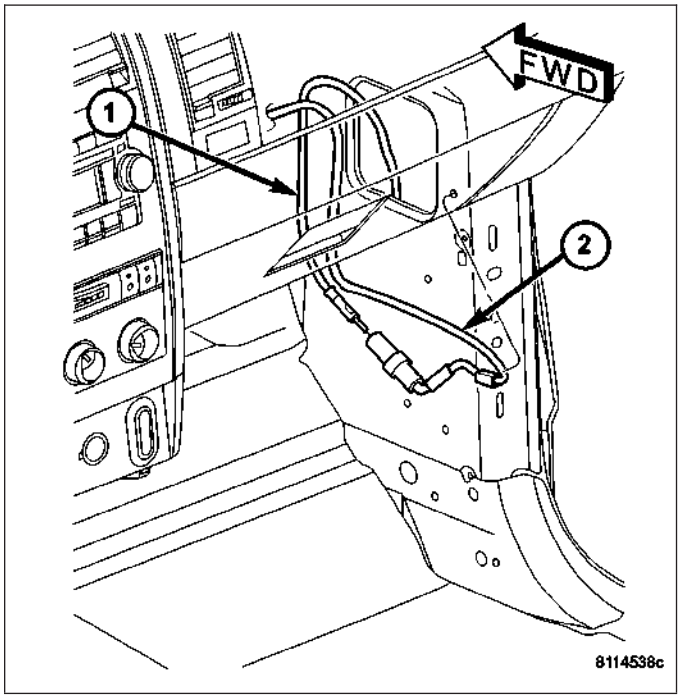
CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

6. Disconnect the antenna cable by pulling the locking antenna connector (2) away from the radio.
7. Pull the antenna cable out through the radio opening in the instrument panel.



INSTALLATION

1. Insert cable through radio opening. Route behind glove box and attach to retainers.
2. Install the radio.
3. Reach under the instrument panel outboard of the glove box to access and connect the antenna coaxial cable connector (1) and (2).
4. Install cowl trim.
5. Connect the battery negative cable.

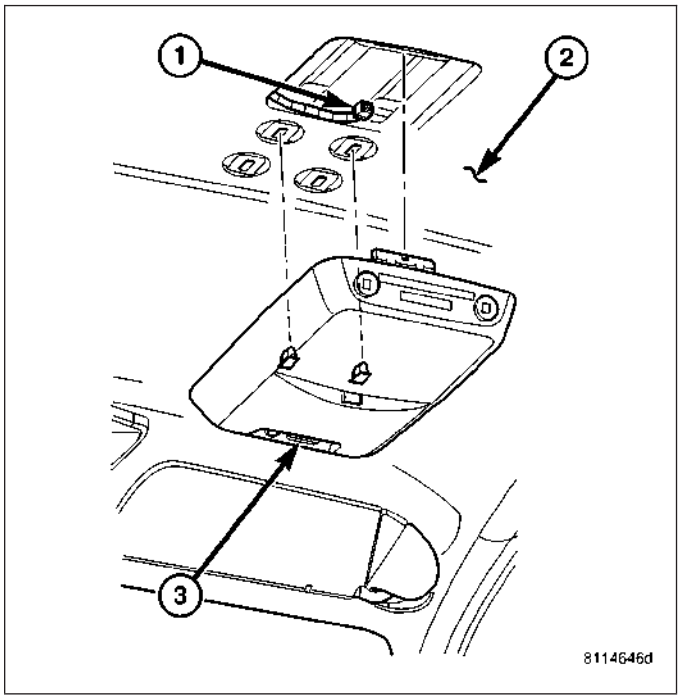


MEDIA SYSTEM-MONITOR/DVD

DESCRIPTION

The video entertainment system, consist of a DVD player (3), battery powered remote control, and two headsets. the DVD player is located on the headliner (2) behind the driver and front seat passenger seat. In addition to video DVDs, the system will play audio DVDs, audio CDs, MP3 audio disc, and video CDs.

There are plug-in jacks on the housing to show video directly from a video camera, connect video games for display on the screen, and play music directly from a MP3 player.

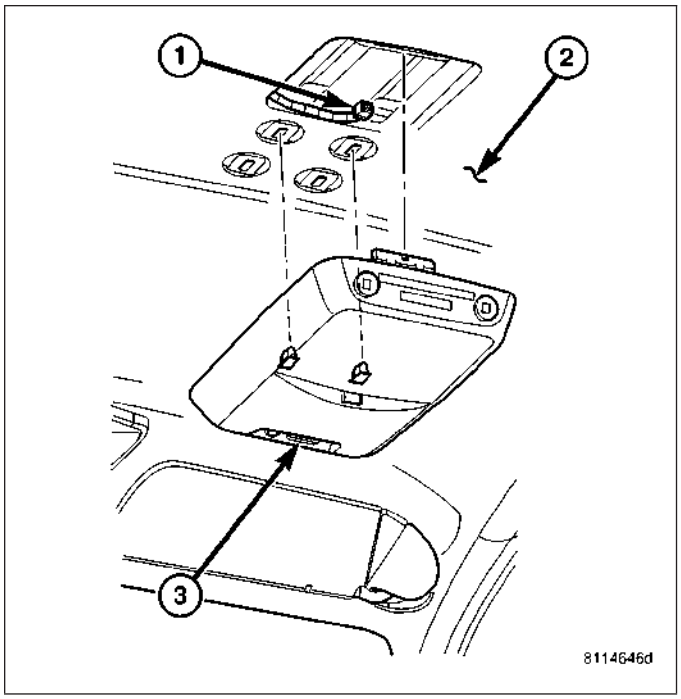


OPERATION

The DVD player is self contained. The DVD disc are loaded and ejected through a slot in the faceplate. A seven inch (diagonal measurement) liquid crystal display (LCD) screen supports both 3 X 4 and 6 X 9 video formats. The hinged screen latches in the closed position and swings down for viewing. A lock-out switch on the front of the housing enables front seat occupants to disable the DVD player.

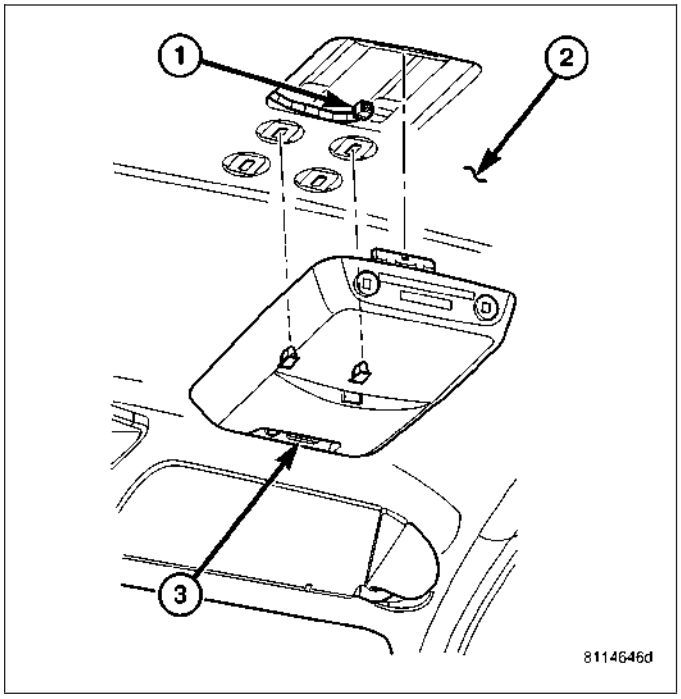
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the two mounting fasteners.
3. Using a trim stick, press the retaining clip at the rear of the DVD player. Move the DVD player from side to side to release from roof panel (2).
4. Disconnect electrical harness connector (1) and remove DVD player.



INSTALLATION

1. Connect electrical harness connector (1) to DVD player (3).
2. Position DVD player and press into place.
3. Install and tighten mounting fasteners.
4. Connect battery negative cable.

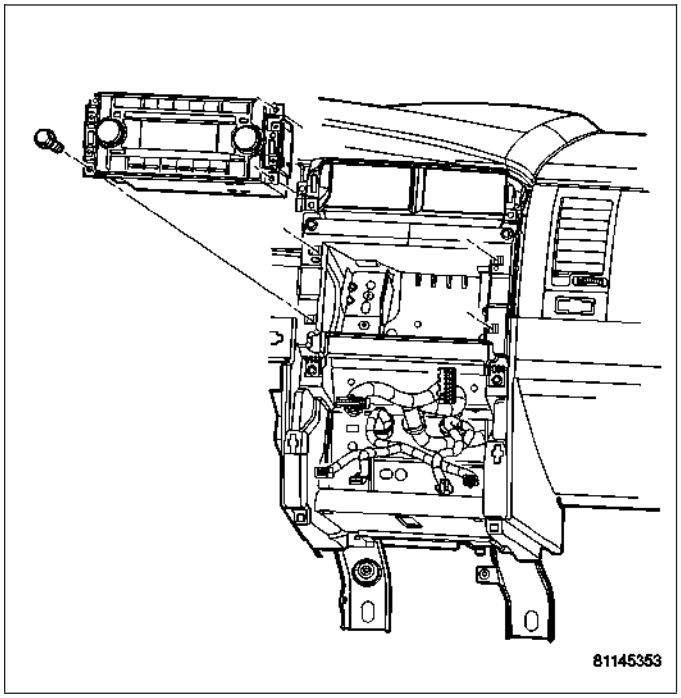


RADIO

DESCRIPTION

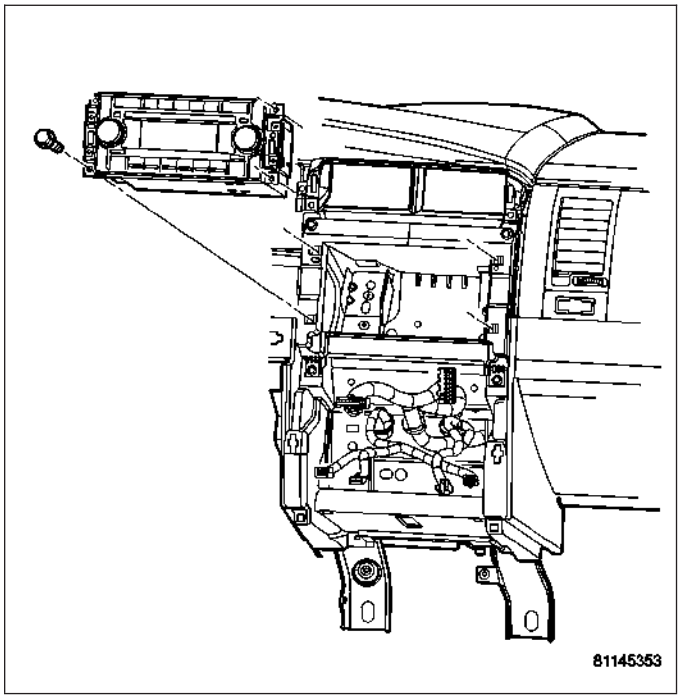
Available radios include:

- AM/FM/CD (REF sales code)
- AM/FM/6 disc CD/MP3 (RAQ sales code)
- AM/FM/6CD/RDS/MP3/Navigation with integrated display (REC sales code)
- AM/FM/CD/RDS (RAR sales code) - export only



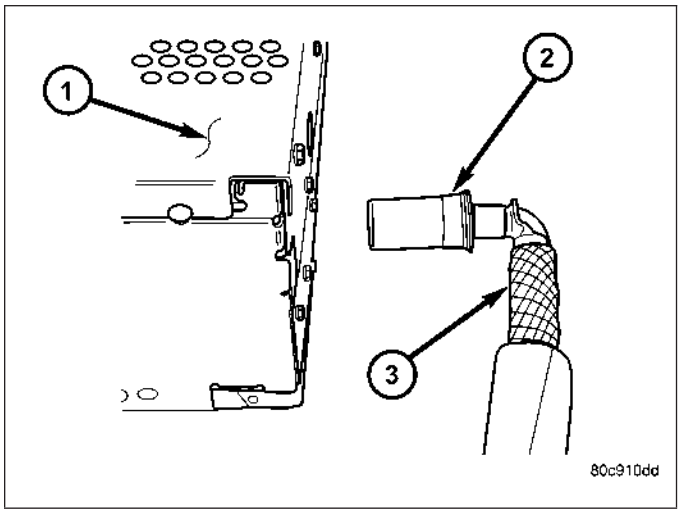
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the radio mounting fasteners.



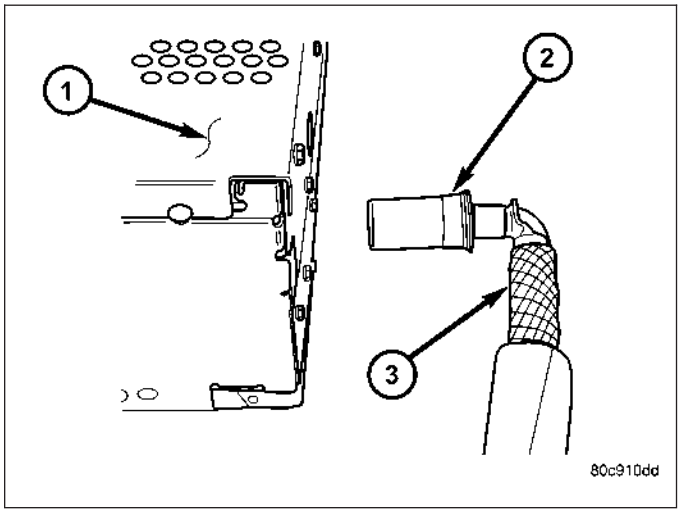
CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Disconnect the antenna cable (3) by pulling the locking antenna connector (2) away from the radio (1).
5. Disconnect the electrical harness connector and remove radio.

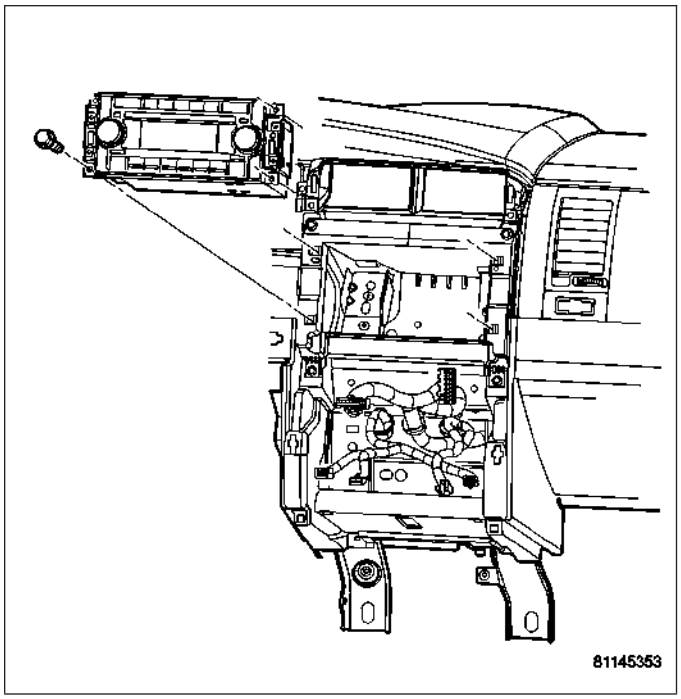


INSTALLATION

1. Connect the electrical harness and antenna cable (3) to radio.



2. Position radio to instrument panel, and install mounting fasteners.
3. Install instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).



RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of “buzzing,” “hissing,” “popping,” “clicking,” “crackling,” and/or “whirring” sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder heads. The other is secured to the frame.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.
- **Exhaust-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the exhaust pipe. The other is secured to the frame.

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and Electro-Magnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of

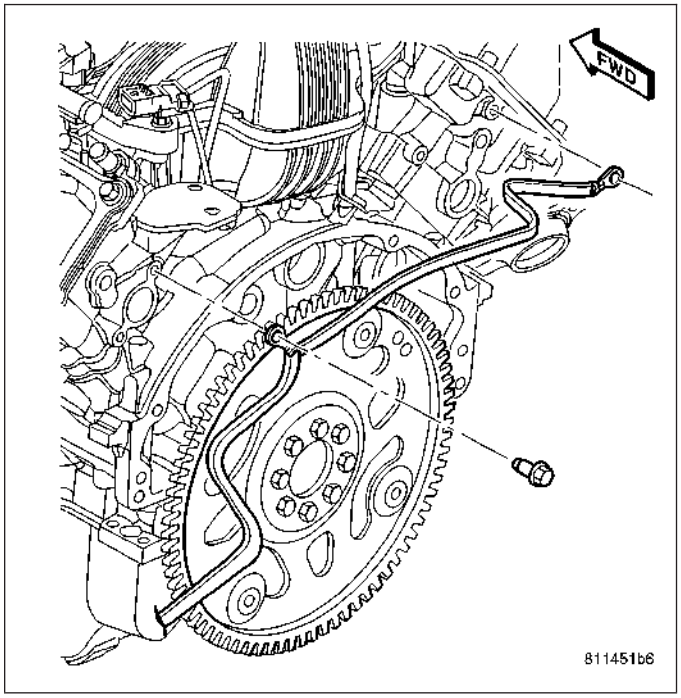
these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

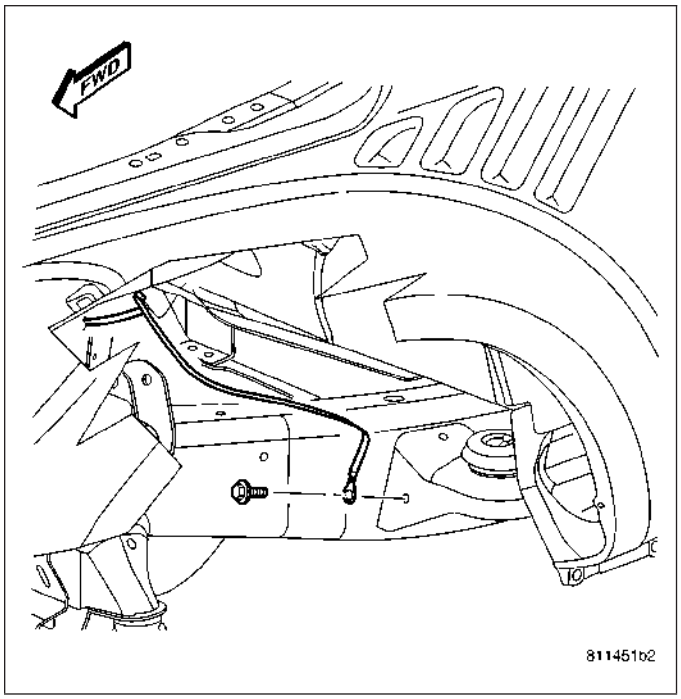
REMOVAL

ENGINE TO FRAME

1. Disconnect and isolate the battery negative cable.
2. Remove the mounting fasteners from the engine cylinder heads.

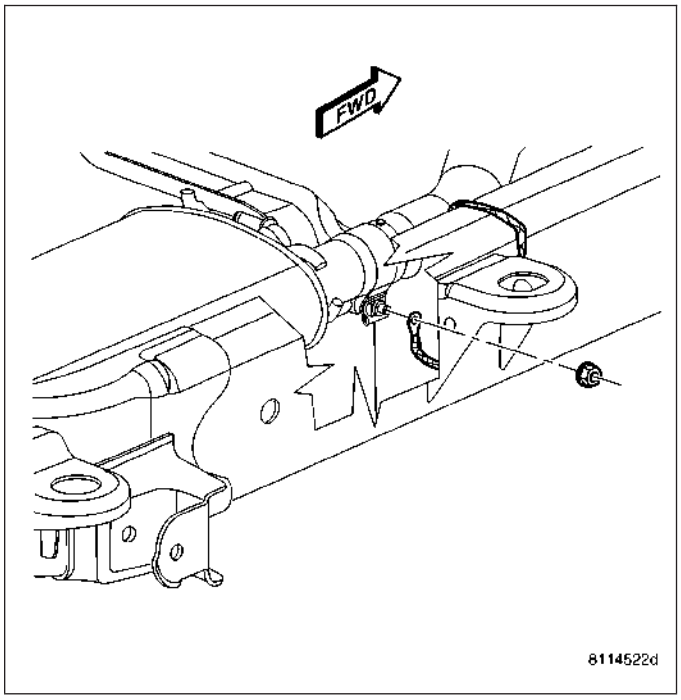


3. Remove mounting fastener from frame and remove strap.

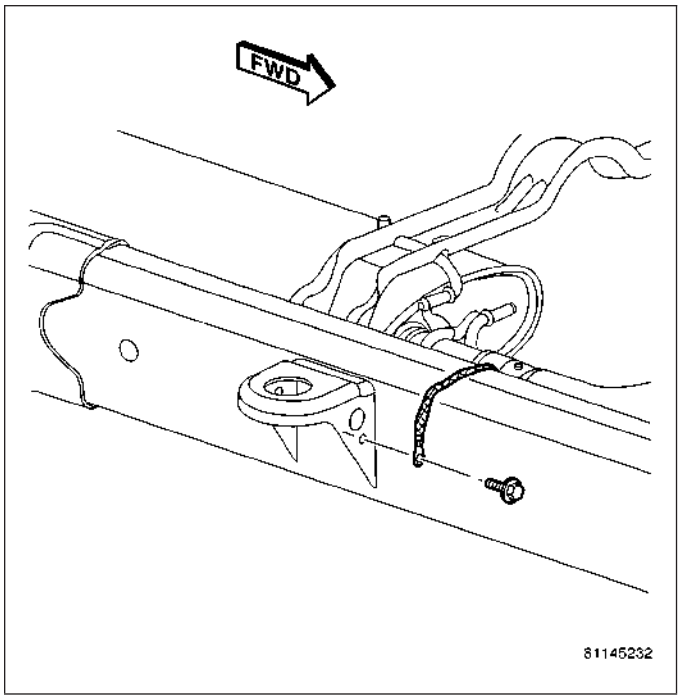


EXHAUST TO FRAME GROUND STRAP

1. Disconnect and isolate the battery negative cable.
2. Remove mounting fastener from exhaust pipe.



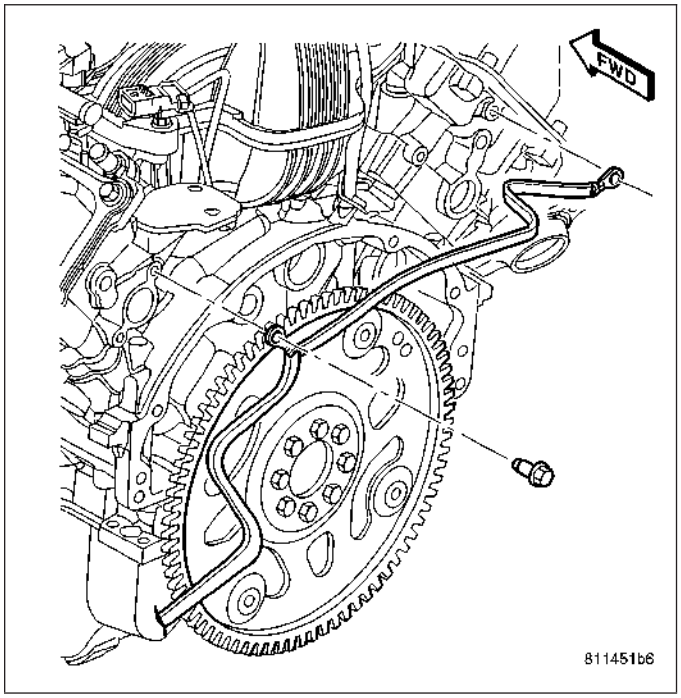
3. Remove mounting fastener from frame and remove ground strap.



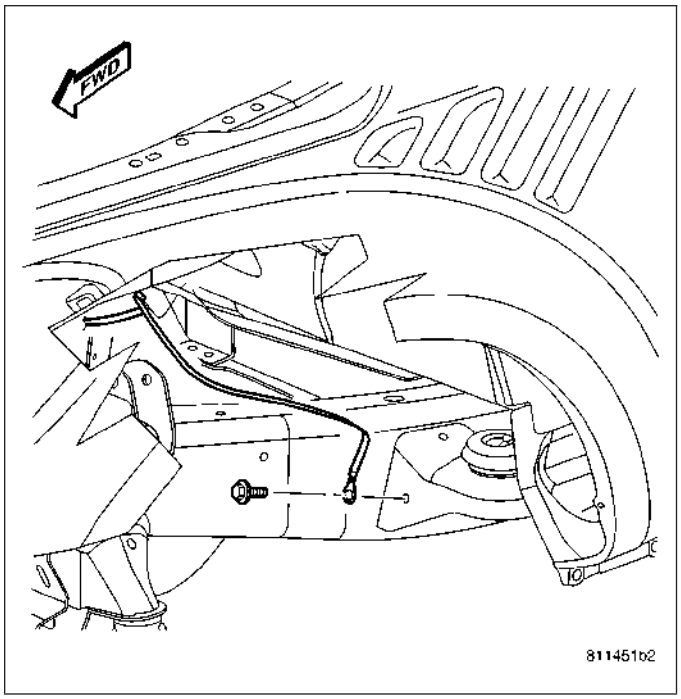
INSTALLATION

ENGINE TO BODY

1. Position ground strap to engine and install mounting fasteners.
2. Tighten mounting fasteners.

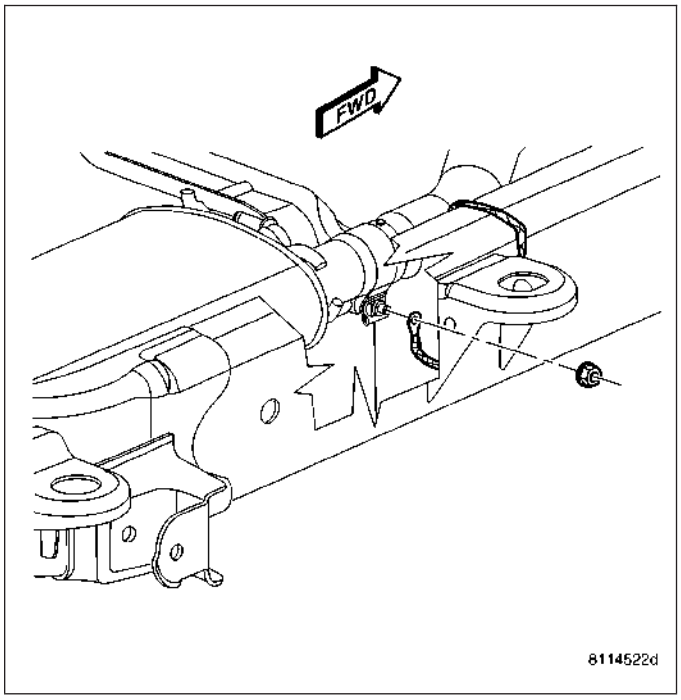


3. Position ground strap and install mounting fastener.
4. Tighten mounting fastener.

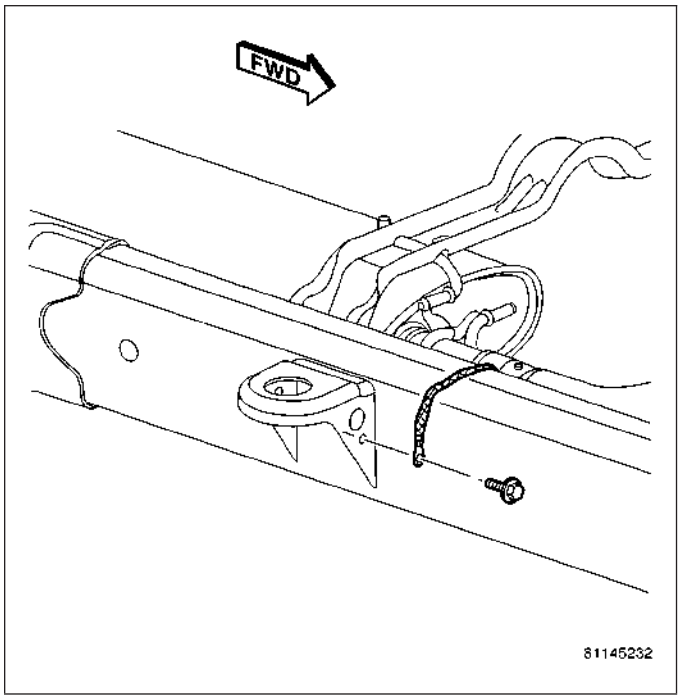


EXHAUST TO FRAME GROUND STRAP

1. Position ground strap to exhaust pipe and install mounting fastener.
2. Tighten mounting fastener.



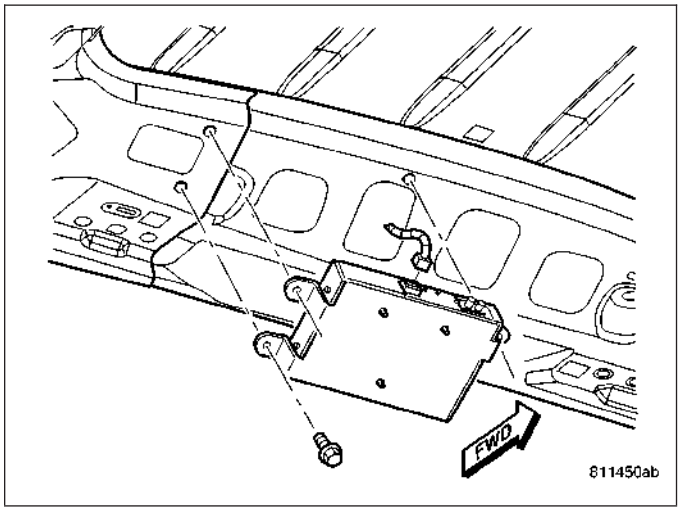
3. Position ground strap to frame and install mounting fastener.
4. Tighten mounting fastener.



RECEIVER-SATELLITE

DESCRIPTION

The satellite receiver module is located above the headliner near the rear liftgate opening. It is mounted to the roof panel with three mounting fasteners.



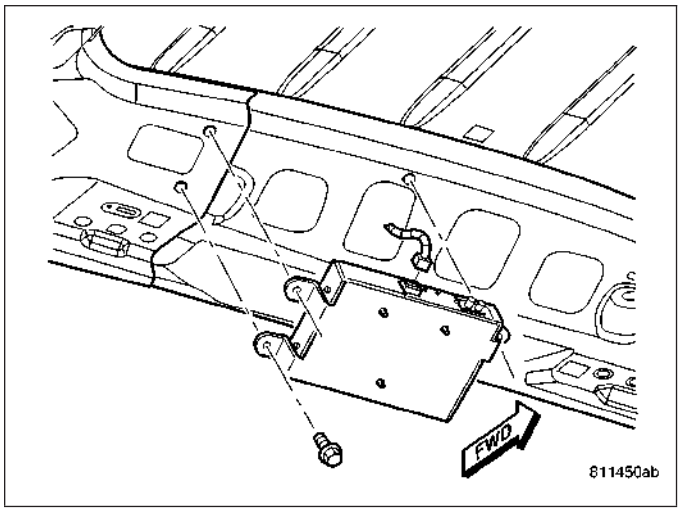
OPERATION

The satellite receiver module receives signals from the roof mounted antenna and processes this information before it is sent to the radio. The module operates on both battery feed circuits and CAN bus messages. It will operate with the ignition key in the run or accessory position only.

REMOVAL

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

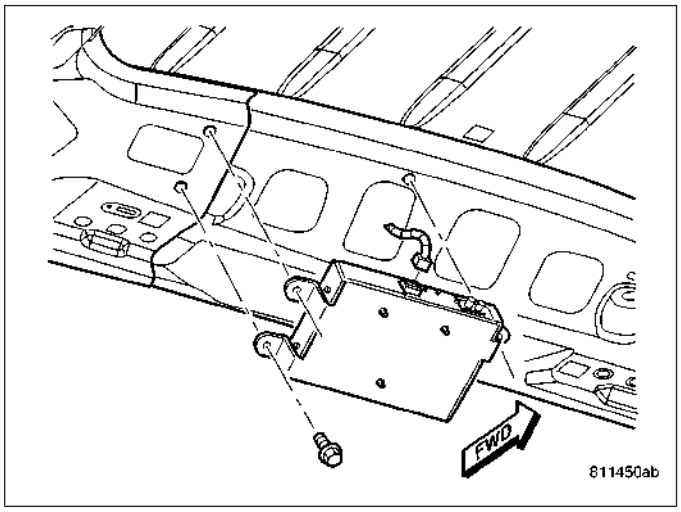
1. Disconnect and isolate the battery negative cable.
2. Lower the headliner as necessary.
3. Remove the mounting bracket fasteners.
4. Disconnect the antenna and electrical harness connectors.
5. Remove the module from the mounting bracket.



INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

1. Connect antenna and electrical harness connector to module.
2. Install module to mounting bracket. Tighten mounting fasteners.
3. Position module and bracket. Install new mounting fasteners.
4. Install headliner.
5. Connect battery negative cable.



SPEAKER

DESCRIPTION

STANDARD

The standard equipment speaker system includes speakers in four locations. One 16.5 centimeter (6.5 inch) diameter speaker is located in each front door. There is also one 16.5 centimeter (6.5 inch) diameter speaker located in each rear door.

MIDLEVEL

The midlevel speaker system features eight speakers in eight locations. One 16.5 centimeter (6.5 inch) diameter speaker is located in each front door. There is also one 16.5 centimeter (6.5 inch) diameter speaker located in each rear door. A 1.9 centimeter tweeter is mounted high in each rear door trim panel. Two tweeters (8.9 centimeter (3.5

inch)) are also located on the top portion of the instrument panel. The midlevel speaker system includes an amplifier. The total available power of the premium speaker system is 288 watts.

PREMIUM

The premium speaker system features nine speakers in nine locations. One 16.5 centimeter (6.5 inch) diameter speaker is located in each front door. There is also one 16.5 centimeter (6.5 inch) diameter speaker located in each rear door. A 1.9 centimeter tweeter is mounted high in each rear door trim panel. Two tweeters (8.9 centimeter (3.5 inch)) are also located on the top portion of the instrument panel. Included with the premium speaker package is a subwoofer located in the left rear quarter panel. The premium speaker system also includes an amplifier. The total available power of the premium speaker system is 384 watts.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

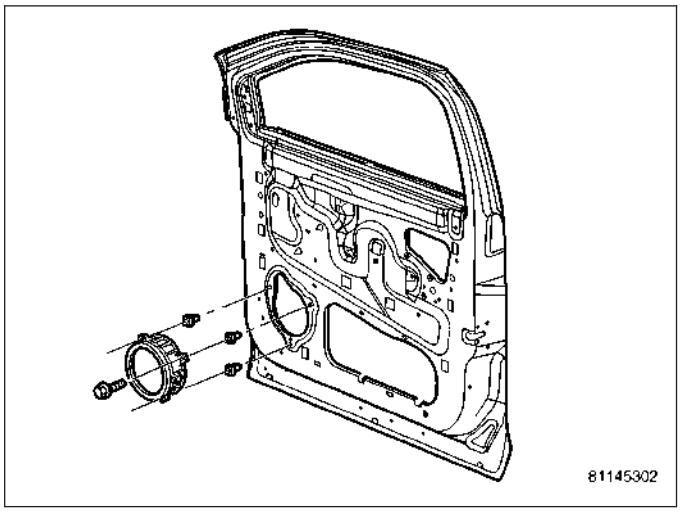
CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

1. If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with a amplifier, remove the radio receiver. If the vehicle is equipped with an amplifier, disconnect the wire harness connectors. There are two connectors. The one on the body harness has body speakers only. The other on the instrument panel harness has the instrument panel speakers, battery, ground, and CAN. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

REMOVAL

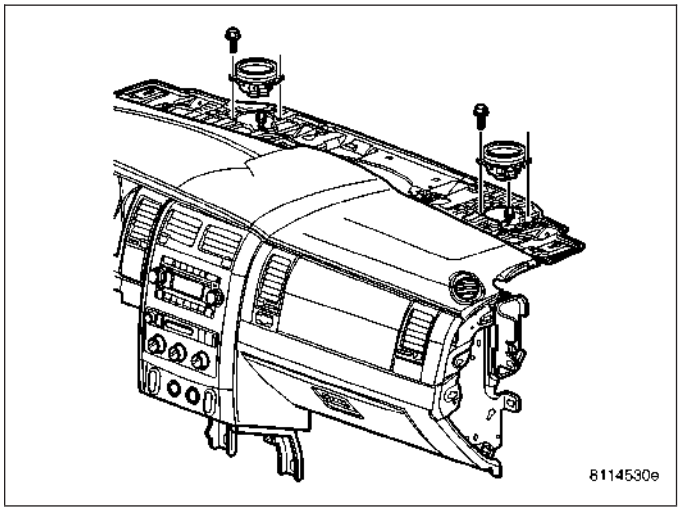
FRONT DOOR

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Remove the mounting fasteners.
4. Remove speaker and disconnect the electrical harness connector.



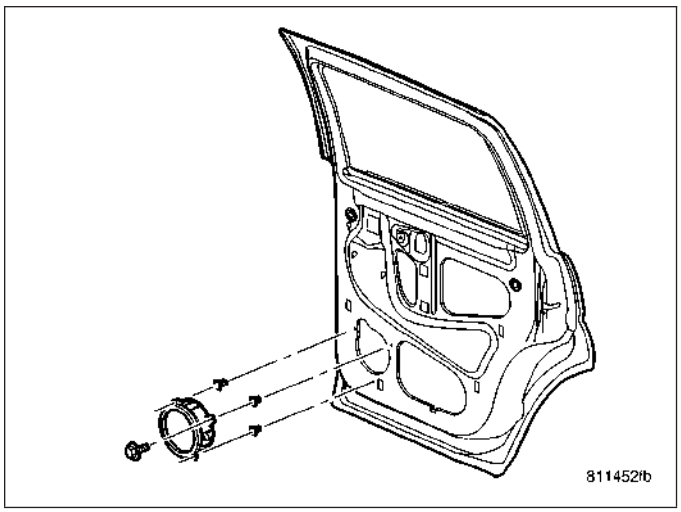
INSTRUMENT PANEL

1. Disconnect and isolate the battery negative cable.
2. Remove instrument panel defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).
3. Remove the mounting fasteners.
4. Remove speaker and disconnect the electrical harness connector.



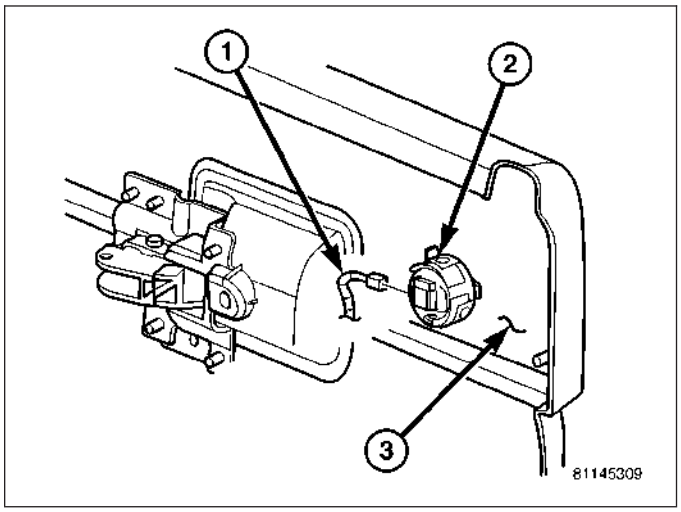
REAR DOOR

1. Disconnect and isolate the battery negative cable.
2. Remove the rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. Remove the mounting fasteners.
4. Remove speaker and disconnect the electrical harness connector.



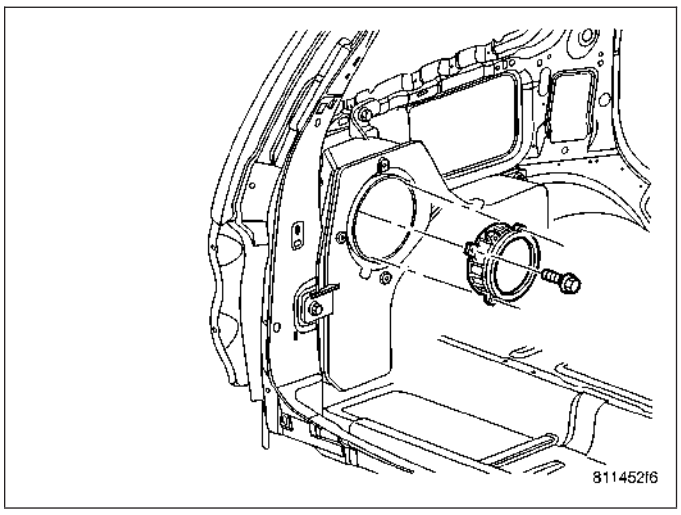
REAR DOOR TWEETER

1. Disconnect and isolate the battery negative cable.
2. Remove the rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. Disconnect the electrical harness connector (1) and remove tweeter (2).



SUBWOOFER

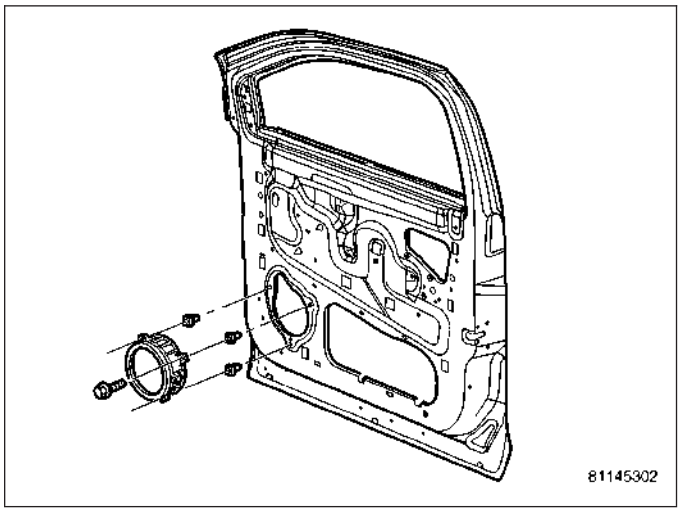
1. Disconnect and isolate the battery negative cable.
2. Remove the quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Remove the mounting fasteners.
4. Remove speaker and disconnect the electrical harness connectors.



INSTALLATION

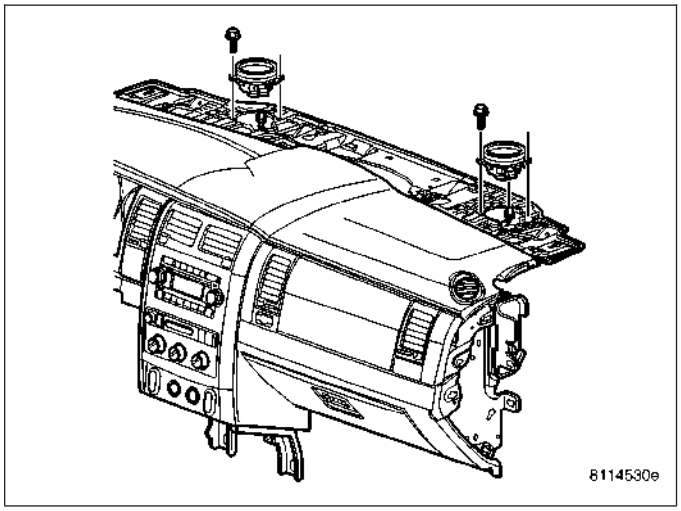
FRONT DOOR

1. Connect electrical harness connector and position speaker to door.
2. Install and tighten mounting fasteners.
3. Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.



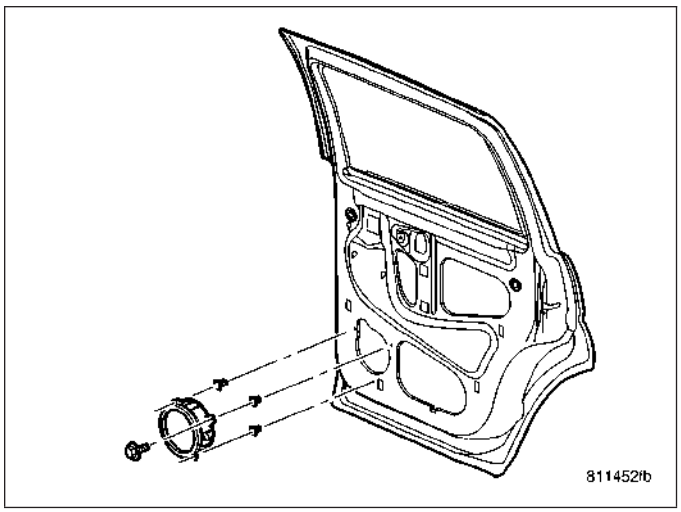
INSTRUMENT PANEL

1. Connect electrical harness connector and position speaker to instrument panel.
2. Install and tighten mounting fasteners.
3. Install instrument panel top cover.
4. Connect battery negative cable.



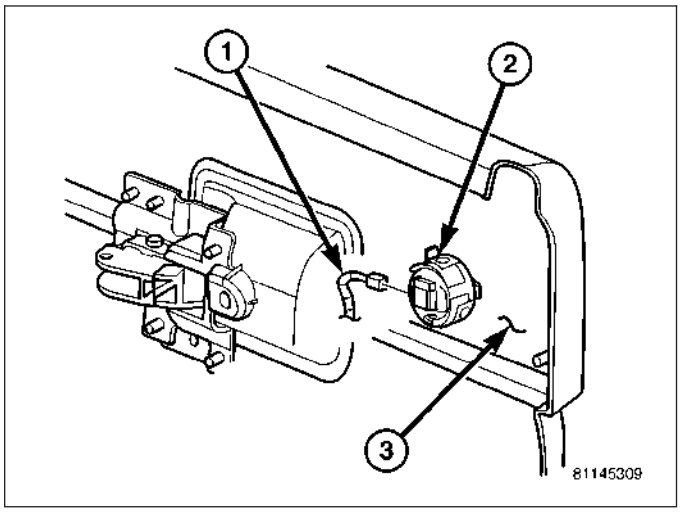
REAR DOOR

1. Connect electrical harness connector and position speaker to door.
2. Install and tighten mounting fasteners.
3. Install door trim panel (Refer to 23 - BODY/ DOORS - REAR/TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.



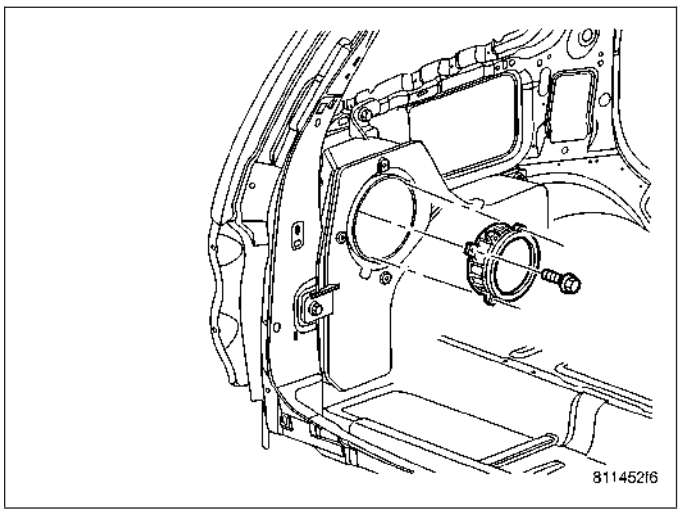
REAR DOOR TWEETER

1. Connect electrical harness connector and position speaker to door trim panel.
2. Install and tighten mounting fasteners.
3. Install door trim panel (Refer to 23 - BODY/ DOORS - REAR/TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.



SUBWOOFER

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).
4. Connect battery negative cable.



SWITCH-REMOTE RADIO

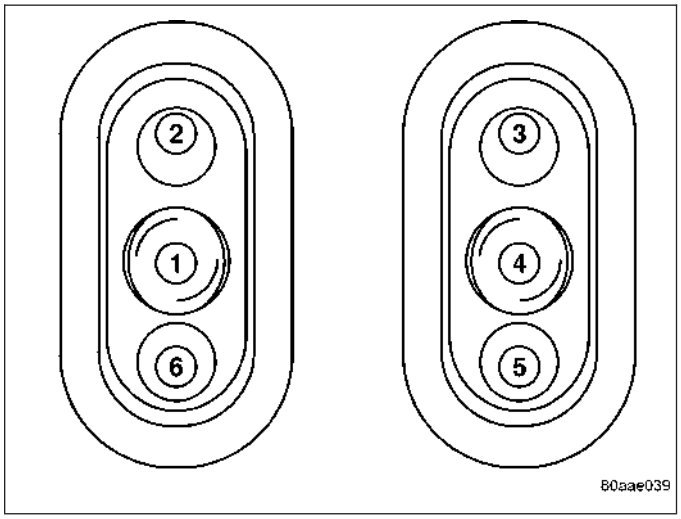
DESCRIPTION

Two rocker-type switches are mounted in the sides of the rear (instrument panel side) steering wheel trim cover. The switch on the left spoke is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right spoke is the volume control switch and has volume up, and volume down functions. The switch on the right spoke also includes a “mode” control that allows the driver to sequentially select AM radio, FM radio, cassette player or CD player.

OPERATION

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Instrument cluster through the clockspring. The instrument cluster sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the instrument cluster senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Controller Area Network (CAN) data bus to the radio. The electronic circuitry within the radio is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested.



DIAGNOSIS AND TESTING

REMOTE SWITCHES

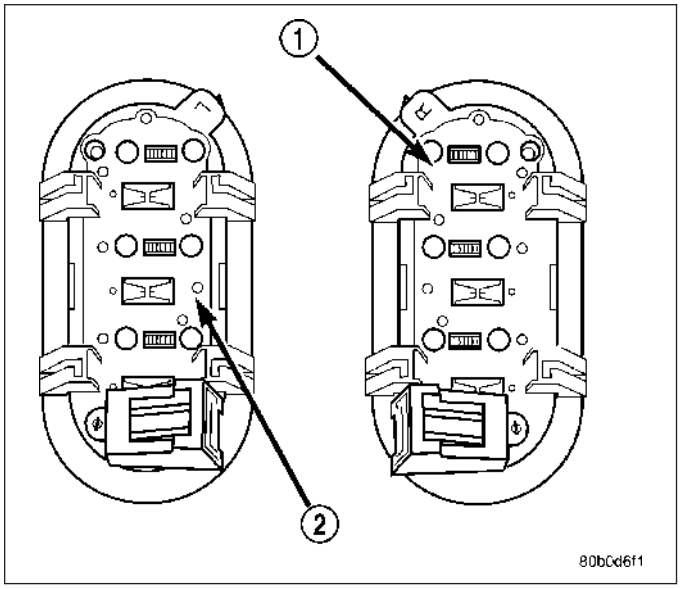
Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Remove the remote radio switch(es) (1) and (2) from the steering wheel (Refer to 8 - ELECTRICAL/ AUDIO/REMOTE SWITCHES - REMOVAL).
2. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch test table. If the remote radio switch resistances are not as indicated, replace the inoperative switch.

REMOTE RADIO SWITCH TEST

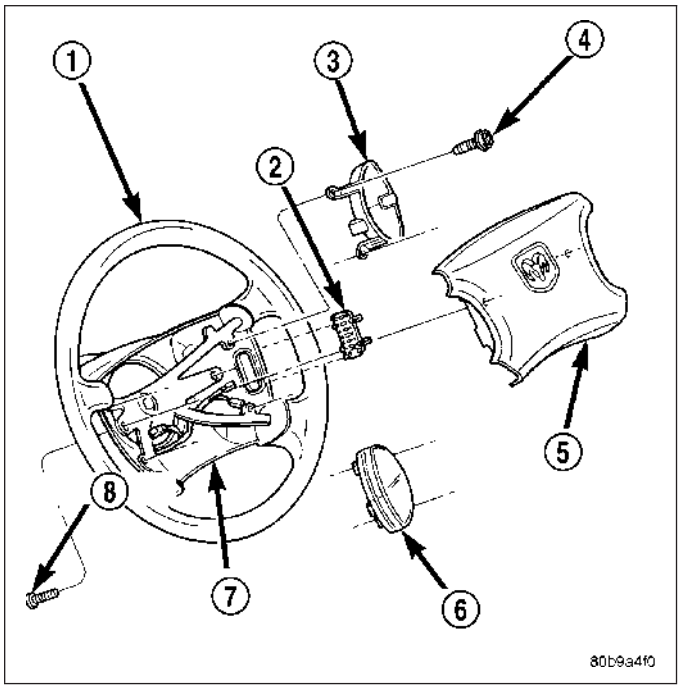


SWITCH	SWITCH POSITION	RESISTANCE
Right or Left	Neutral	24K Ohms ± 5%
Right (White)	Volume Up	6.8K Ohms ± 5%
Right (White)	Volume Down	15.6K Ohms ± 1%
Right (White)	Mode	0 Ohms
Left (Black)	Seek Up	1.2K Ohms ± 5%
Left (Black)	Seek Down	3.3K Ohms ± 5%
Left (Black)	Pre-Set Station Advance	.47K Ohms ± 5%

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the driver side airbag (5) from the steering wheel (1). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the speed control switch (3) or (6) located on the same side of the steering wheel as the remote radio switch that is being serviced. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - REMOVAL).
4. Disconnect the steering wheel wire harness connector from the connector receptacle of the remote radio switch.
5. Disengage the four remote radio switch latches that secure the switch to the inside of the mounting hole in the steering wheel rear trim cover.
6. From the outside of the steering wheel rear trim cover, remove the remote radio switch (2) from the trim cover.



INSTALLATION

1. Position the remote radio switch to the mounting hole on the outside of the steering wheel rear trim cover. Be certain that the connector receptacle is oriented toward the bottom of the switch and pointed toward the center of the steering wheel.
2. Press firmly and evenly on the remote radio switch until each of the switch latches is fully engaged in the mounting hole of the steering wheel rear trim cover.
3. Reconnect the steering wheel wire harness connector to the connector receptacle of the remote radio switch.
4. Install the speed control switch onto the steering wheel. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - INSTALLATION).
5. Install the driver side airbag to the steering wheel. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
6. Reconnect the battery negative cable.

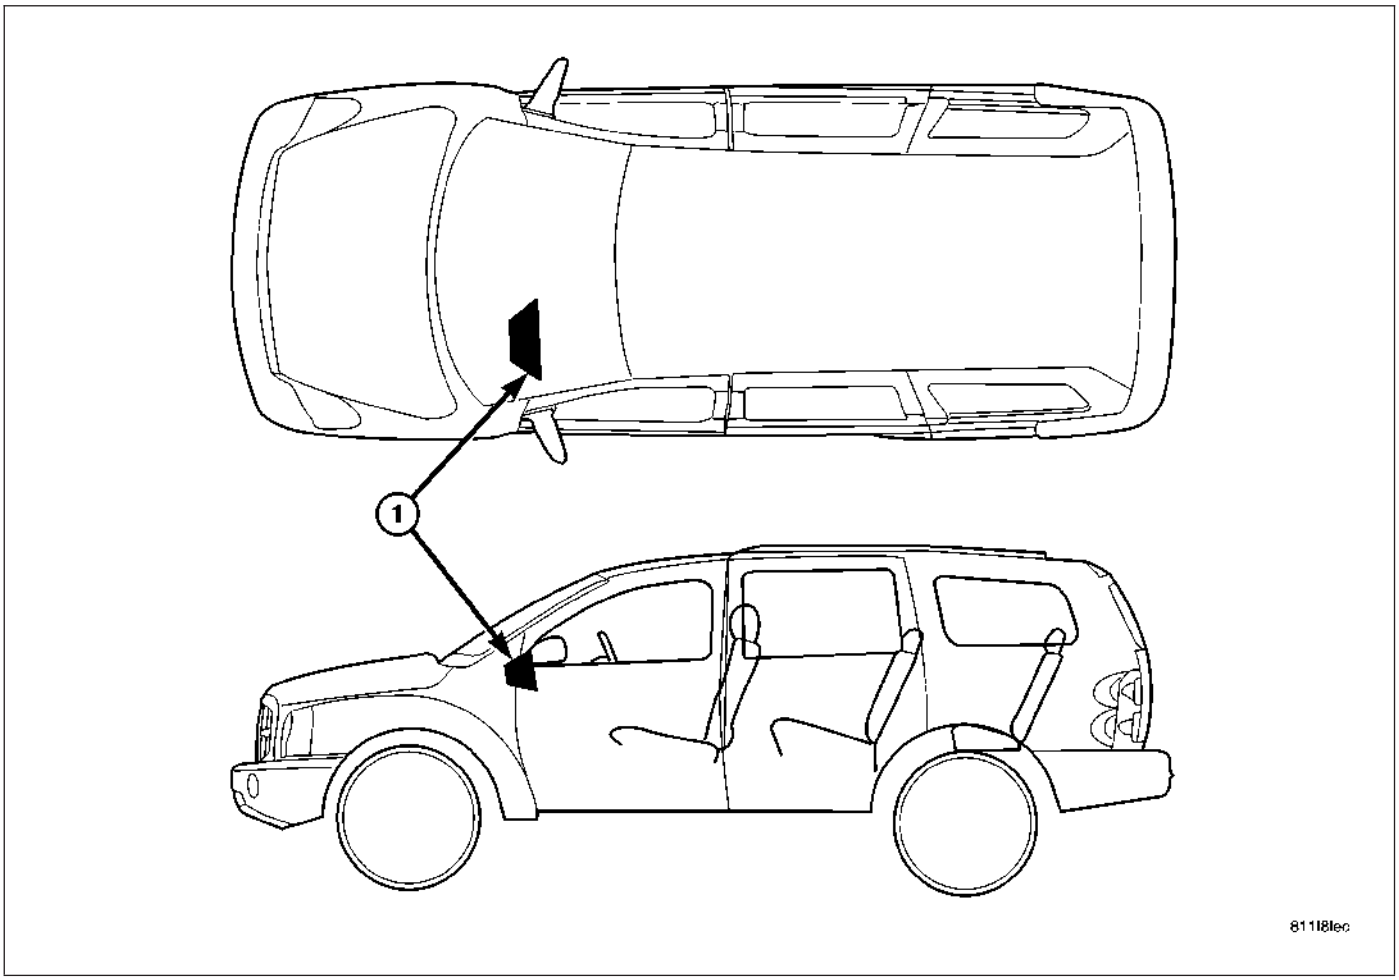
CHIME/BUZZER - SERVICE INFORMATION		DIAGNOSIS AND TESTING	
DESCRIPTION	1	CHIME WARNING SYSTEM	4
OPERATION	2		

CHIME/BUZZER - SERVICE INFORMATION

DESCRIPTION



A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based EMIC utilizes electronic chime request messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors

and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The EMIC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated “click” tones that are issued at a slow rate of about 50 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated “click” tones that are issued at a fast rate of more than about 100 clicks per minute.
- **Fixed Duration Beep** - A short, sharp, single tactile “beep” tone.
- **Single Chime Tone** - A single “chime” tone.
- **Slow Rate Repetitive Chime** - Repeated “chime” tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated “chime” tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the EMIC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC chime warning system circuits and components cannot be adjusted or repaired. If the EMIC circuitry, the on-board transducer or the relay are damaged or faulty, the EMIC unit must be replaced.

OPERATION

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the On position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The ElectroMechanical Instrument Cluster (EMIC) transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting “Airbag” indicator illumination. This warning will only occur following completion of the “Airbag” indicator bulb test, and will only occur once during any ignition cycle.
- **Compass Mini-Trip Computer Global Reset** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the CAN data bus from the optional Compass Mini-Trip Computer (CMTC) requesting that the CMTC average fuel economy, trip odometer and distance to empty data be reset. The CMTC monitors hard wired inputs from the U.S./Metric and Reset button switches to determine the proper reset messages to send to the EMIC.
- **Door Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of any door ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Fasten Seat Belt Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to announce that a hard wired input from the seat belt switch indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seatbelt reminder (beltminder) when this feature is enabled. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SEATBELT INDICATOR - OPERATION).
- **Gate Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of the liftgate ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.

- **Head/Park Lamps-On Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Key-In-Ignition Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the ignition switch, and the key-in ignition switch circuitry of the ignition switch indicate that the key is in the ignition lock cylinder with the driver side front door open and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Fuel Indicator Warning** - The EMIC transducer will generate one short chime when the low fuel indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Low Wash Indicator Warning** - The EMIC transducer will generate one short chime when the low washer fluid indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Overspeed Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that the vehicle speed is over a pre-programmed speed value. The EMIC monitors electronic vehicle speed messages received over the CAN data bus. This feature is only enabled on an EMIC that has been programmed with a Middle East Gulf Coast Country (GCC) country code.
- **Park Brake Reminder** - The EMIC transducer will generate one short chime to announce that the hard wired input from the park brake switch and a vehicle speed message input received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Sentry Key “Customer Learn” Mode Announcement** - The EMIC transducer will generate one short chime to confirm that an electronic “Customer Learn” mode message has been received over the CAN data bus to indicate that the Sentry Key Remote Entry Module (SKREEM) is prepared for programming additional sentry key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where “Customer Learn” programming is an allowed feature.
- **Trans Overtemp Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate when the transmission overtemp indicator is illuminated by the instrument cluster for a high or critical transmission fluid temperature condition. This chime will repeat each time the trans overtemp indicator is cycled from Off to On.
- **Turn Signal/Hazard Warning Flasher Emulation** - The EMIC relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The EMIC relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs inoperative. In either case, the clicks will continue until the turn signal and hazard warning systems are turned off.
- **Turn Signal On Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The EMIC transducer will generate one short chime each time the check gauges indicator is illuminated by the instrument cluster circuitry. The check gauges indicator may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate the check gauges indicator.

The EMIC provides chime service for all available features in the chime warning system. The EMIC relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the CAN data bus network to provide the chime warning system features. The internal programming of the EMIC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired chime warning system inputs to the EMIC may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the CAN data bus, or the electronic messages received by the EMIC from other modules. The most reliable, efficient and accurate means to diagnose the EMIC, the CAN data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired chime warning system inputs to the ElectroMechanical Instrument Cluster (EMIC), as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Area Network (CAN) data bus, or the electronic message inputs used by the EMIC to provide chime warning system service. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAN data bus, and the electronic message inputs for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If an electronic control module was replaced, select the applicable module from the scan tool menu and press “Misc. Functions”. If the module has programable features, program as necessary.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Battery voltage less than 9 volts for more than 15 seconds.

Possible Causes
RESISTANCE IN THE (A1) BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
GENERATOR OPERATION
(K20) GENERATOR FIELD CONTROL CIRCUIT OPEN
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
(Z20) GROUND CIRCUIT OPEN
PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No >> Check the above conditions that can cause a low voltage condition. Repair as necessary. Perform BODY VERIFICATION TEST – VER 1.

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Battery voltage greater than 16 volts for more than 15 seconds.

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
GENERATOR
PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

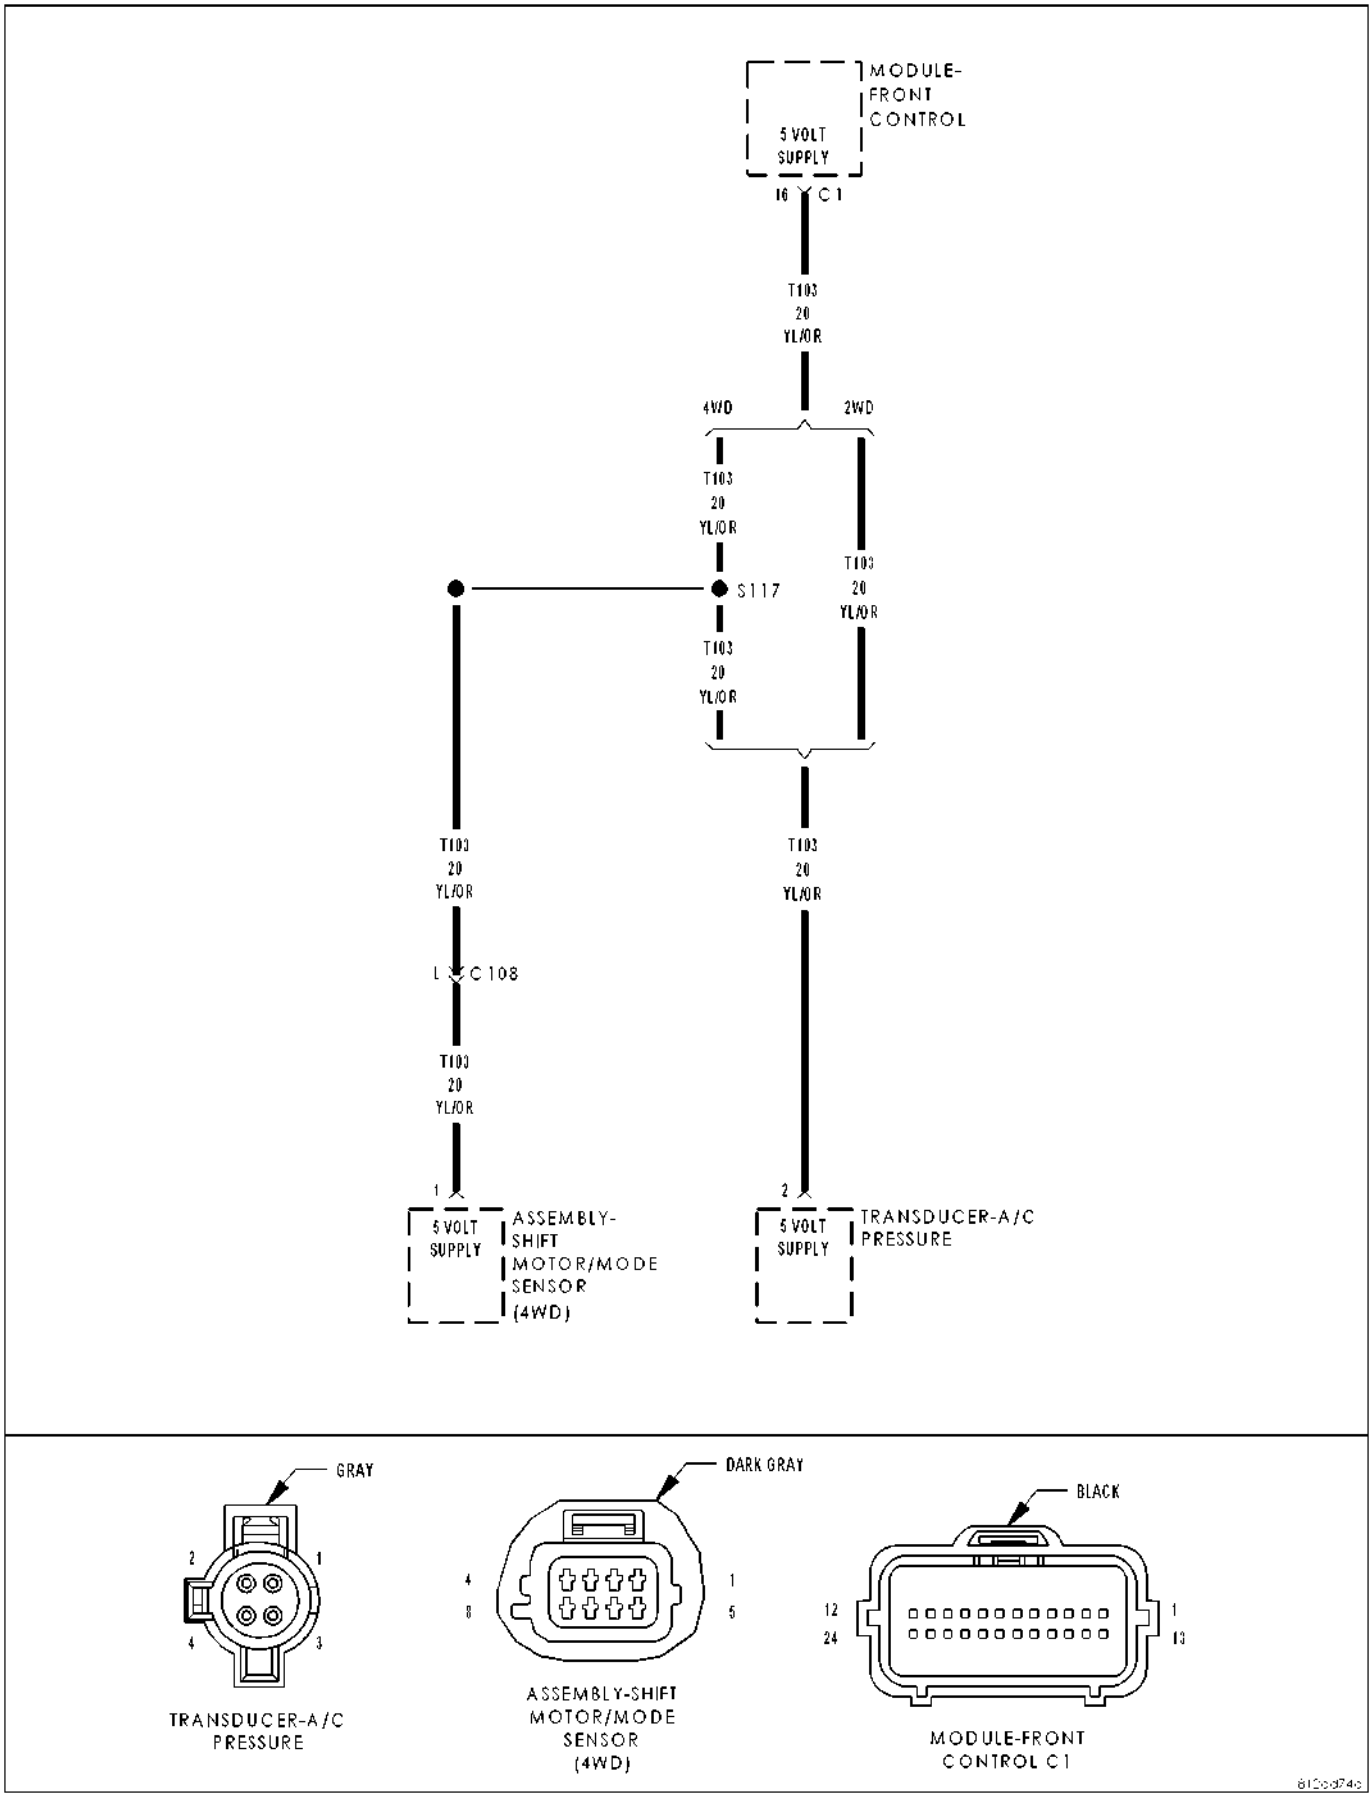
With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No >> Check the above conditions that can cause a high voltage condition. Repair as necessary. Perform BODY VERIFICATION TEST – VER 1.

B2112-5 VOLT SUPPLY CIRCUIT LOW



B2112-5 VOLT SUPPLY CIRCUIT LOW (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Front Control Module detects the (T103) 5 volt supply circuit voltage below 0.3 volts.

Possible Causes
(T103) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
A/C PRESSURE TRANSDUCER
SHIFT MOTOR/MODE SENSOR ASSEMBLY
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

2. A/C PRESSURE TRANSDUCER

Turn the ignition off.
Disconnect the A/C Pressure Transducer harness connector.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the A/C Pressure Transducer in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

---

3. SHIFT MOTOR/MODE SENSOR ASSEMBLY

Turn the ignition off.
Disconnect the Shift Motor/Mode Sensor Assembly harness connector.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 4

No >> Replace the Shift Motor/Mode Sensor Assembly in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

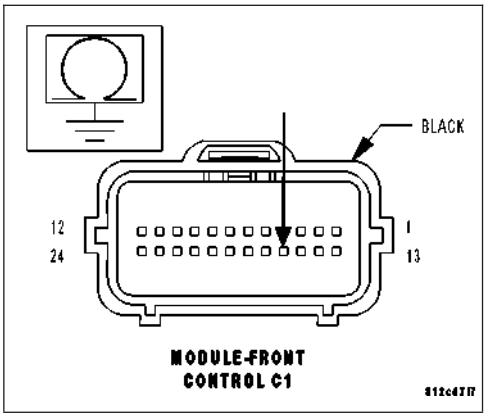
B2112-5 VOLT SUPPLY CIRCUIT LOW (CONTINUED)

4. (T103) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance between ground and the (T103) 5 Volt Supply circuit.

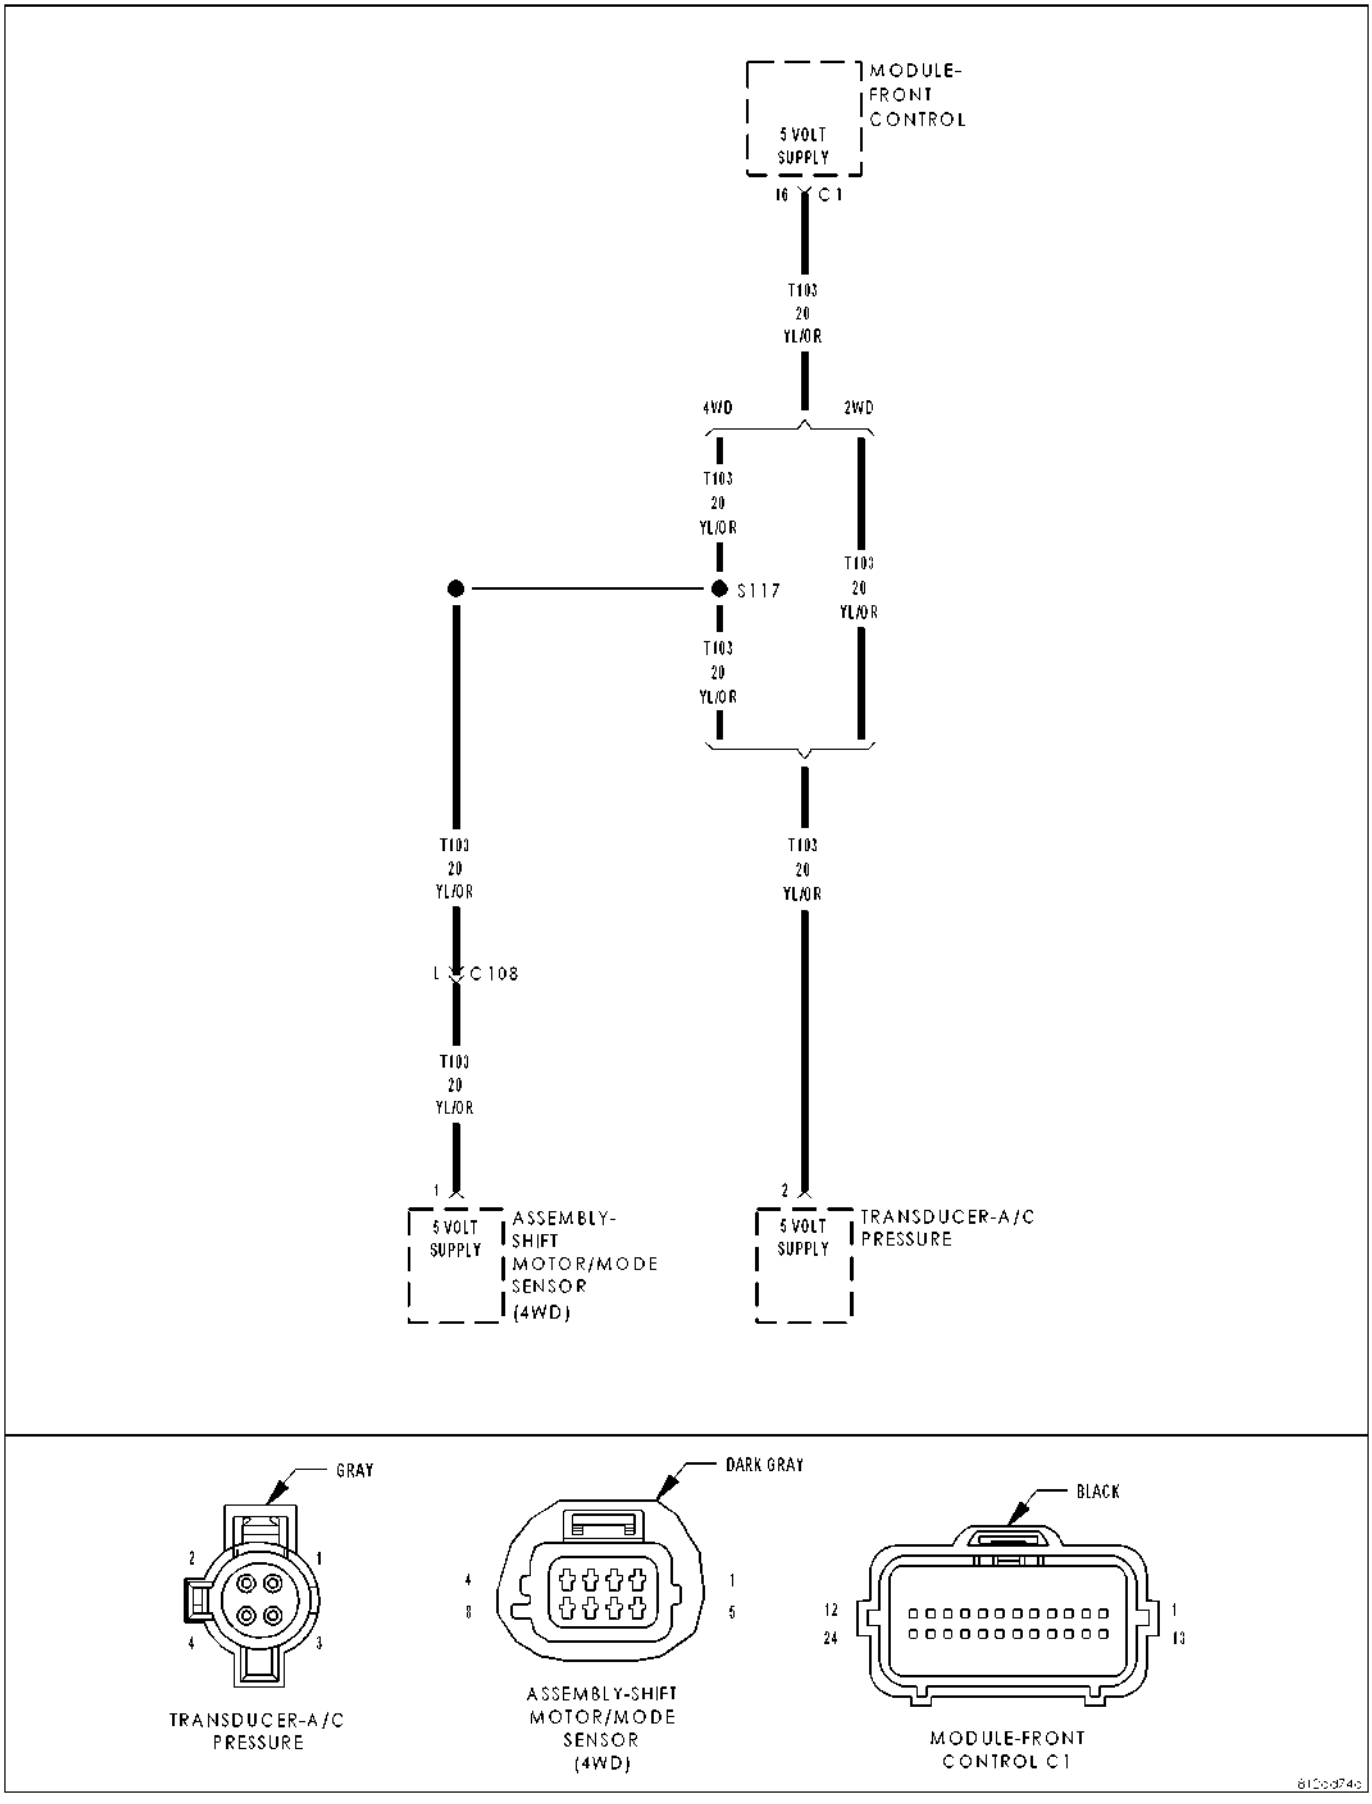


Is the resistance below 1000.0 ohms?

Yes >> Repair the (T103) 5 Volt Supply circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

B2113-5 VOLT SUPPLY CIRCUIT HIGH



B2113-5 VOLT SUPPLY CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Front Control Module detects the (T103) 5 volt supply circuit voltage above 5.0 volts.

Possible Causes
(T103) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
A/C PRESSURE TRANSDUCER
SHIFT MOTOR/MODE SENSOR ASSEMBLY
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

2. A/C PRESSURE TRANSDUCER

Turn the ignition off.
Disconnect the A/C Pressure Transducer harness connector.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the A/C Pressure Transducer in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

---

3. SHIFT MOTOR/MODE SENSOR ASSEMBLY

Turn the ignition off.
Disconnect the Shift Motor/Mode Sensor Assembly harness connector.
Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.
With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

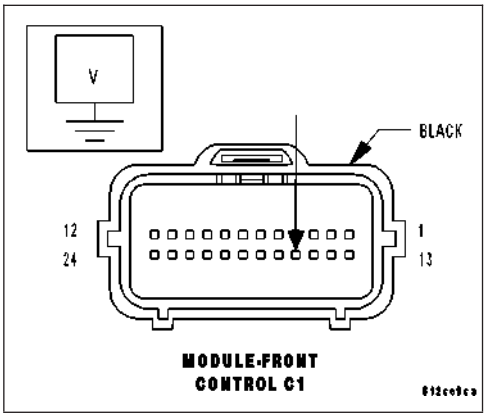
Yes >> Go To 4

No >> Replace the Shift Motor/Mode Sensor Assembly in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

B2113-5 VOLT SUPPLY CIRCUIT HIGH (CONTINUED)

4. (T103) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the FCM C1 harness connector.
Turn the ignition on.
Measure the voltage of the (T103) 5 Volt Supply circuit.



Is the voltage above 5.5 volts?

Yes >> Repair the (T103) 5 Volt Supply circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

B2215-FRONT CONTROL MODULE INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The Front Control Module detects an internal fault.

Possible Causes
FRONT CONTROL MODULE

Diagnostic Test

1. REPLACE THE FRONT CONTROL MODULE IF DTC IS ACTIVE

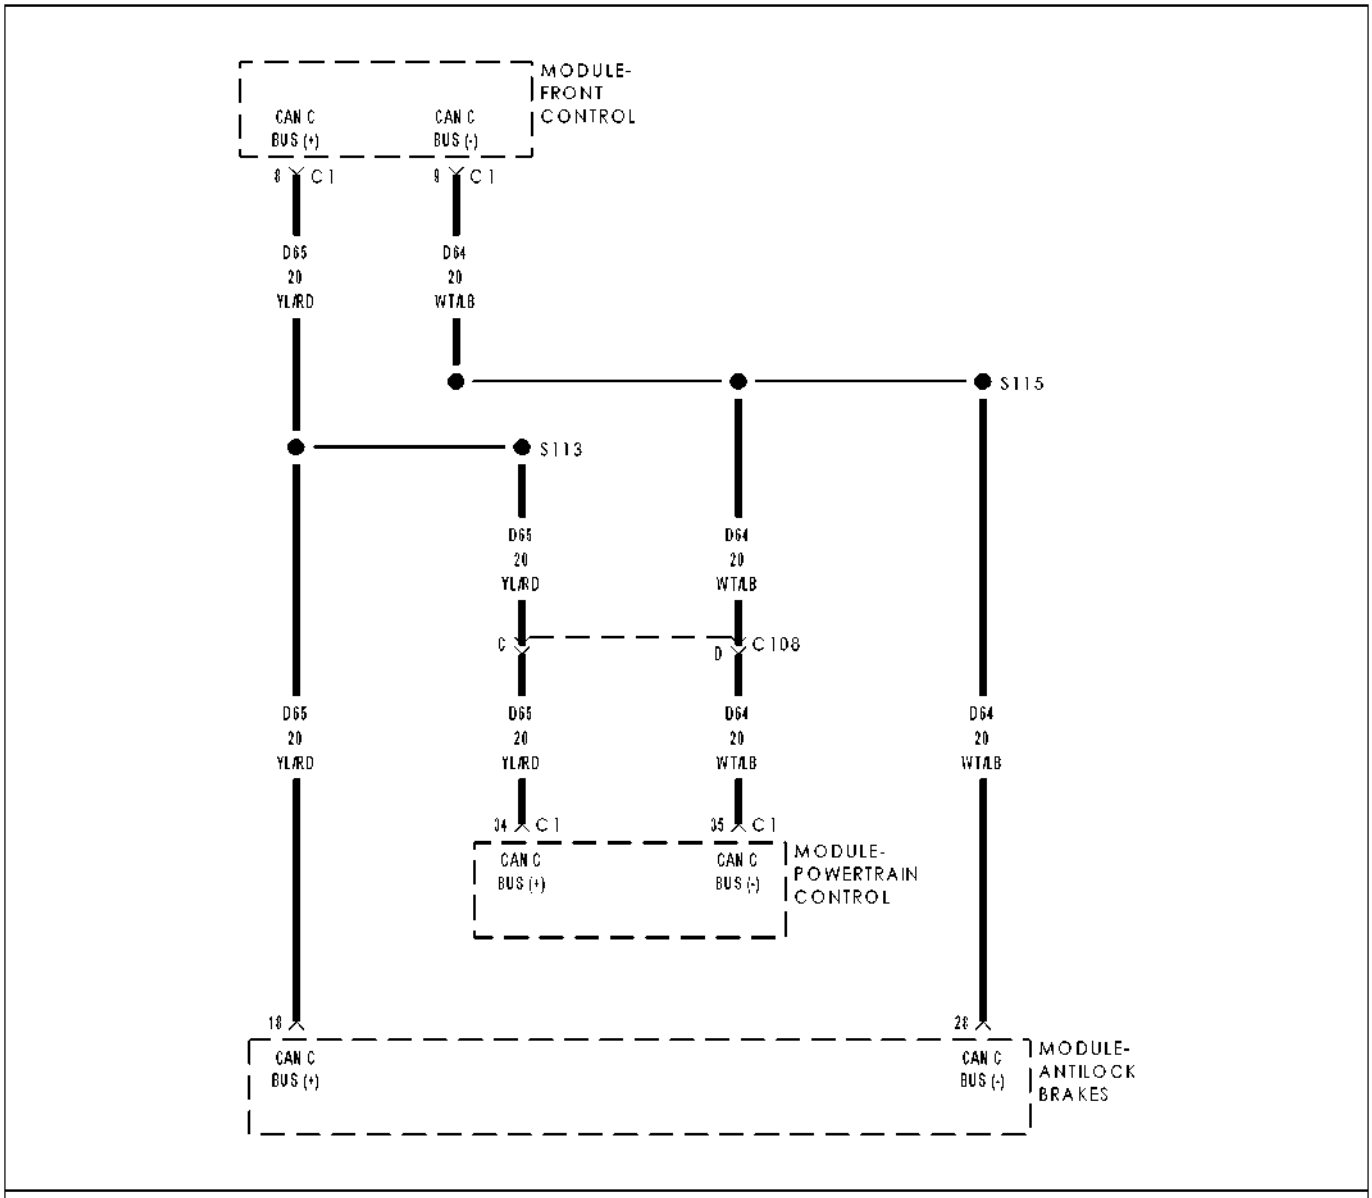
With the scan tool, read the active DTC's.

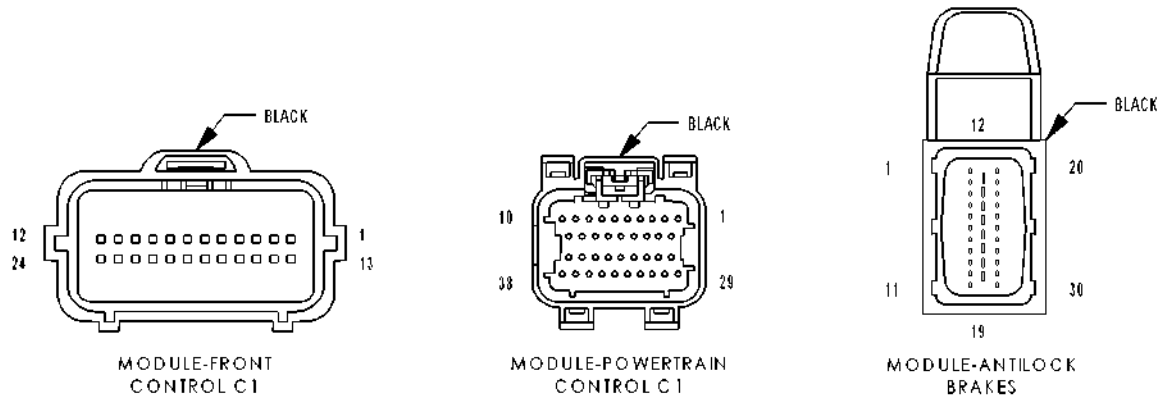
Does the scan tool display this DTC as active?

Yes >> Replace and program the Front Control Module in accordance with the service information. Perform BODY VERIFICATION TEST – VER 1.

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

U0001-CAN C BUS CIRCUIT





U0001-CAN C BUS CIRCUIT (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The FCM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

2. ANTILOCK BRAKE MODULE — INTERNAL SHORT

Turn the ignition off.
Disconnect the Antilock Brake Module harness connector.
Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST — VER 1.

U0001-CAN C BUS CIRCUIT (CONTINUED)

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.
Disconnect the Powertrain Control Module C1 harness connector.
Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

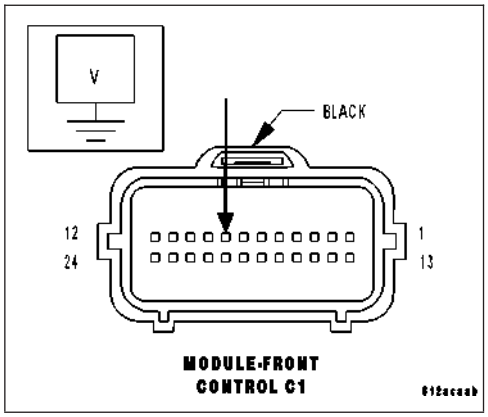
Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

---

4. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Turn the ignition on.
Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.



Is there any voltage present?

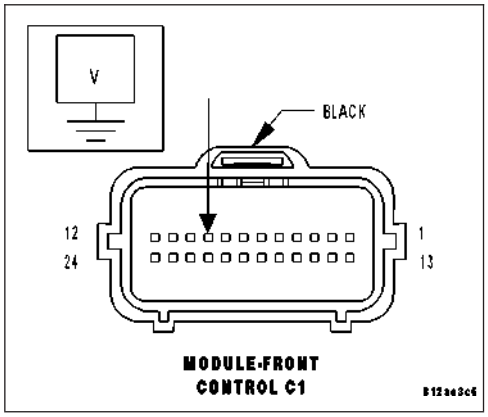
Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

---

5. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.



Is there any voltage present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

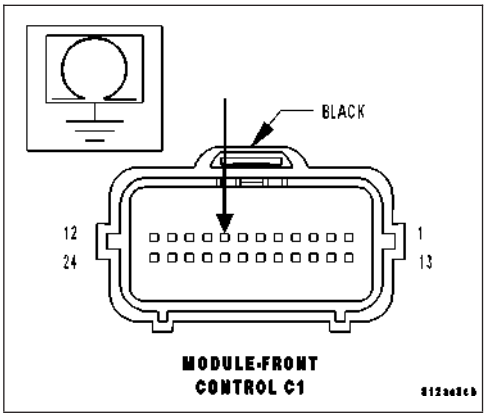
No >> Go To 6

U0001-CAN C BUS CIRCUIT (CONTINUED)

6. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.



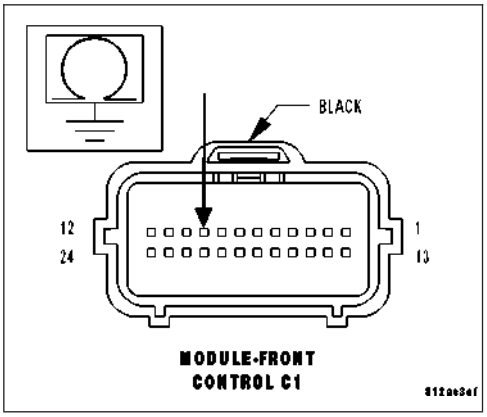
Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 7

7. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.



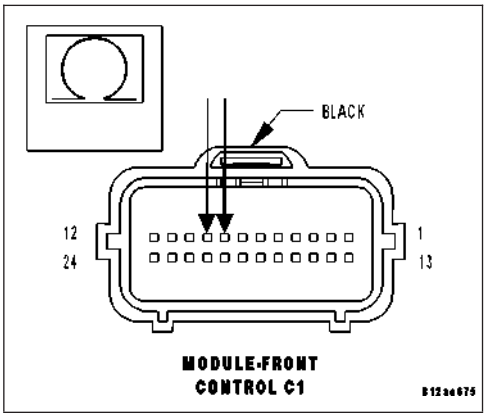
Is any resistance present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 8

8. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

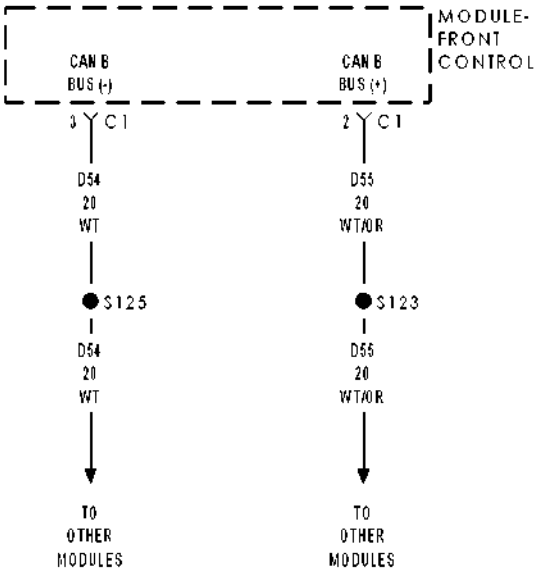


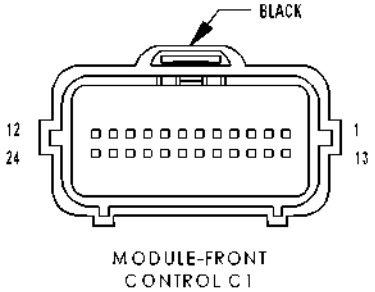
Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0021-CAN B BUS (+) CIRCUIT OPEN





U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
  The FCM detects the (D55) CAN B Bus (+) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT
SPREAD CAN B BUS TERMINAL
(D55) CAN B BUS (+) CIRCUIT OPEN
INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

Verify that all CAN B Bus modules are communicating with the scan tool.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

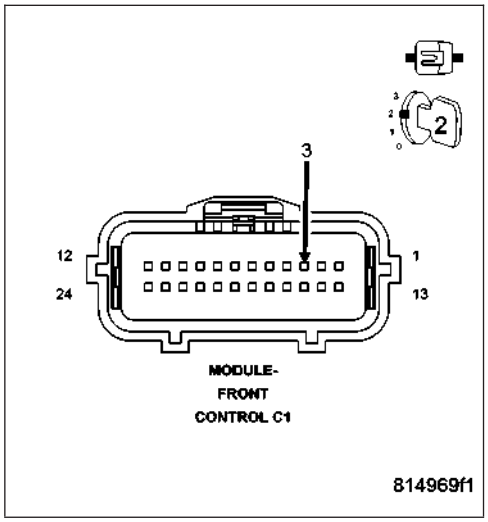
NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Front Control Module C1 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (-) circuit at the FCM C1 harness connector.

Turn the ignition on.



With the scan tool monitor the network status screen and document all modules that display a red X.

Are there any red X's displayed next to the modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the network status screen.

Are there multiple red X's displayed next to the modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (+) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams will help you determine where open condition exists.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

No >> Go To 4

U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

4. (D55) CAN B BUS (+) CIRCUIT OPEN — SINGLE RED X

Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

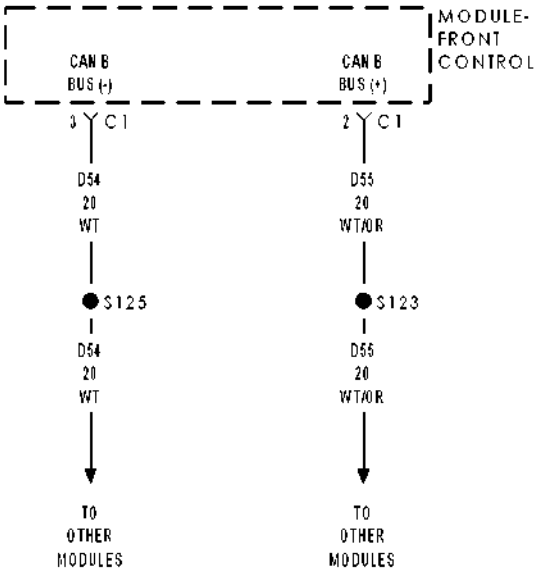
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

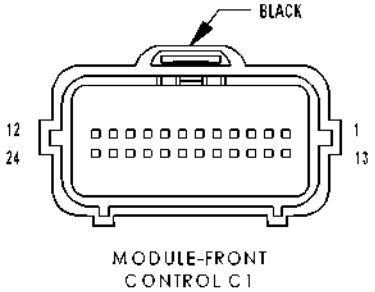
Is there any voltage present?

Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or push out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

No >> Repair the (D55) CAN B Bus (+) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams will help you determine where open condition exists.
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

U0022-CAN B BUS (+) CIRCUIT LOW





U0022-CAN B BUS (+) CIRCUIT LOW (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  The FCM detects the (D55) CAN B Bus (+) circuit is shorted to ground.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
ANY CAN B BUS MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

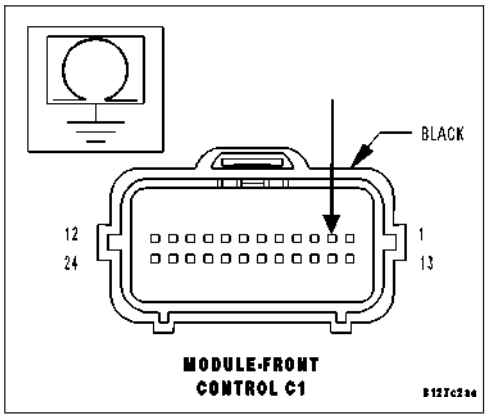
---

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0022-CAN B BUS (+) CIRCUIT LOW (CONTINUED)

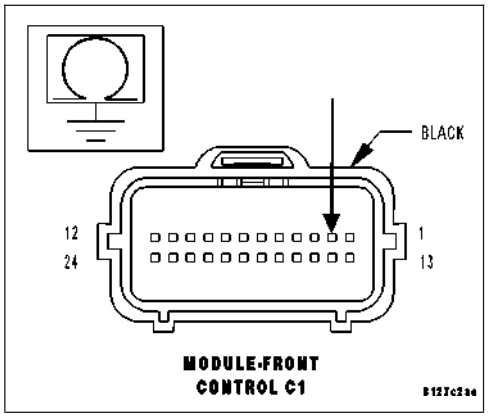
3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short to ground is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

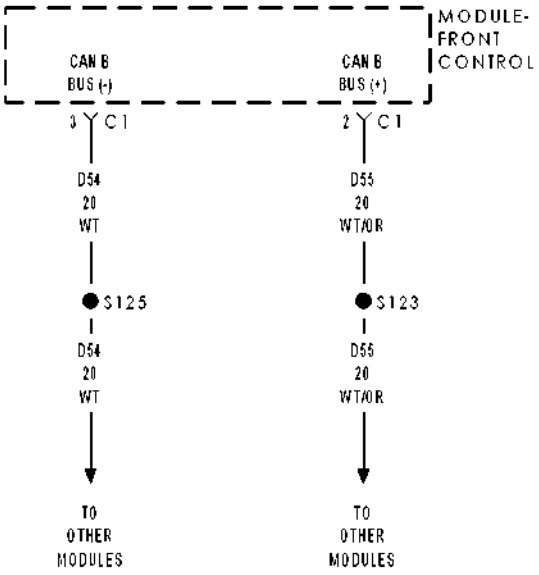


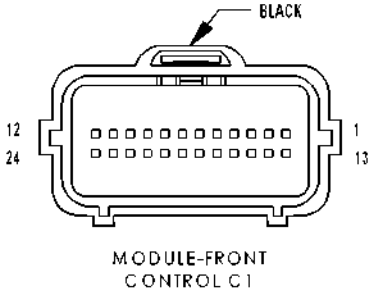
Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0023-CAN B BUS (+) CIRCUIT HIGH





8l27a9c0

U0023-CAN B BUS (+) CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  The FCM detects the (D55) CAN B Bus (+) circuit is shorted to voltage.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
ANY CAN B BUS MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

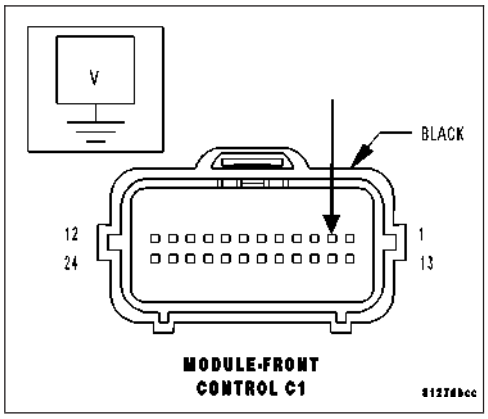
2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.



Is voltage above 10.0 volts?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

U0023-CAN B BUS (+) CIRCUIT HIGH (CONTINUED)

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE

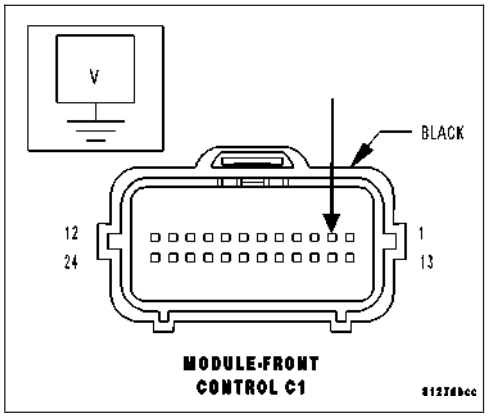
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the short to voltage is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

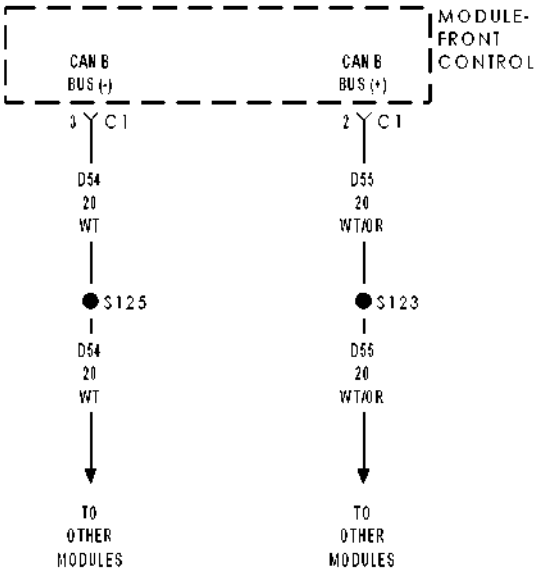


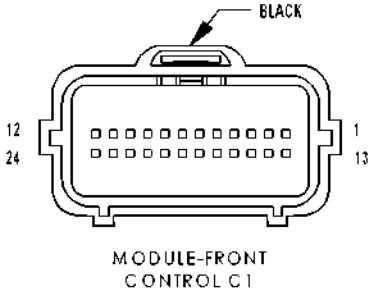
Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to voltage was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0024-CAN B BUS (-) CIRCUIT OPEN





8E27a9c0

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
  The FCM detects the (D54) CAN B Bus (-) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT
SPREAD CAN B BUS TERMINAL
(D54) CAN B BUS (-) CIRCUIT OPEN
INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

Verify that all CAN B Bus modules are communicating with the scan tool.

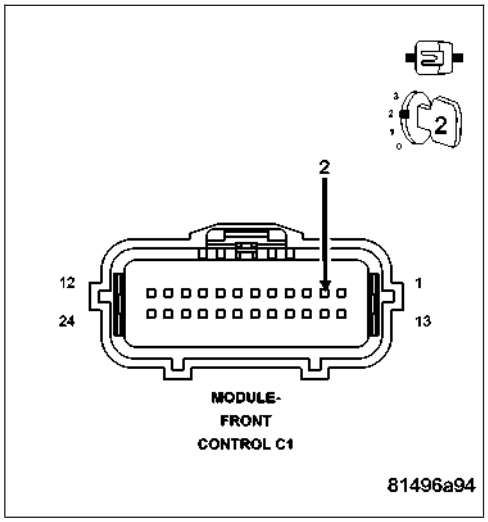
NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Front Control Module C1 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (+) circuit at the FCM C1 harness connector.



Turn the ignition on.

With the scan tool monitor the network status screen and document all modules that display a red X.

Are there any red X's displayed next to the modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the network status screen.

Are there multiple red X's displayed next to the modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (-) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams will help you determine where open condition exists.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

No >> Go To 4

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

4. (D54) CAN B BUS (-) CIRCUIT OPEN — SINGLE RED X

Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

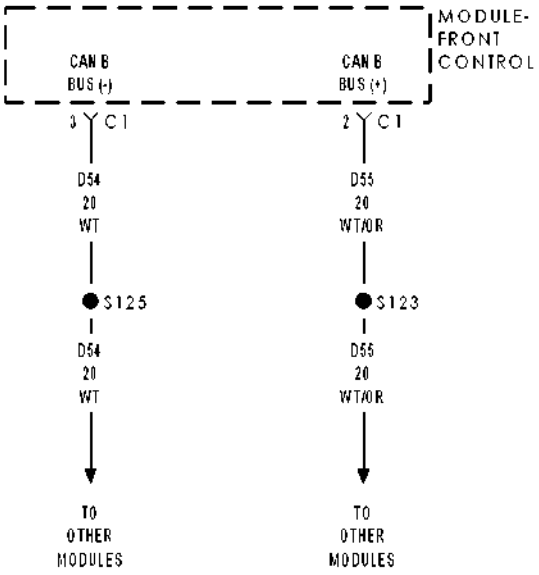
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

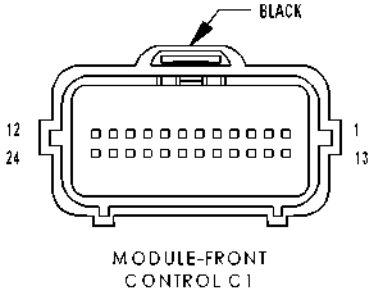
Is there any voltage present?

Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or push out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

No >> Repair the (D54) CAN B Bus (-) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams will help you determine where open condition exists.
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

U0025-CAN B BUS (-) CIRCUIT LOW





U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  The FCM detects the (D54) CAN B Bus (-) circuit is shorted to ground.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND OR TO (D54) CAN B BUS (-) CIRCUIT
ANY CAN B BUS MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

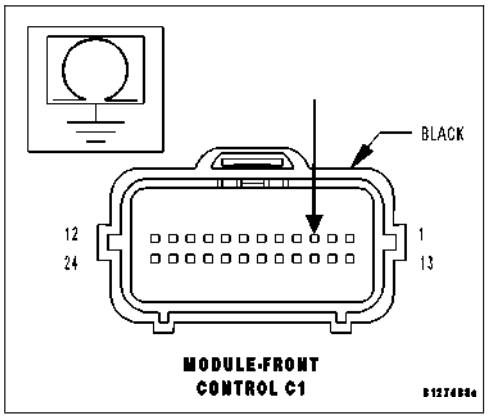
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 3

No >> Go To 4

U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)

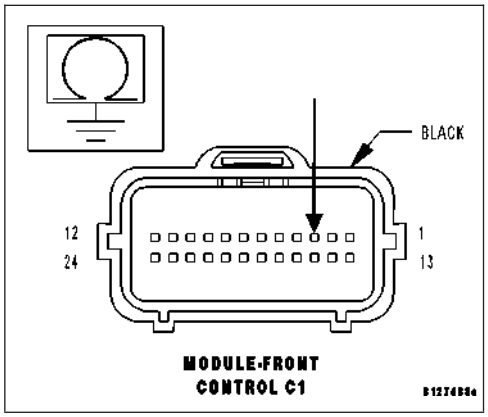
3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short to ground is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.



Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

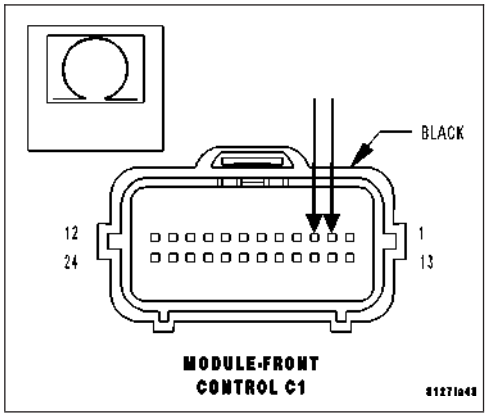
Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

---

4. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 5

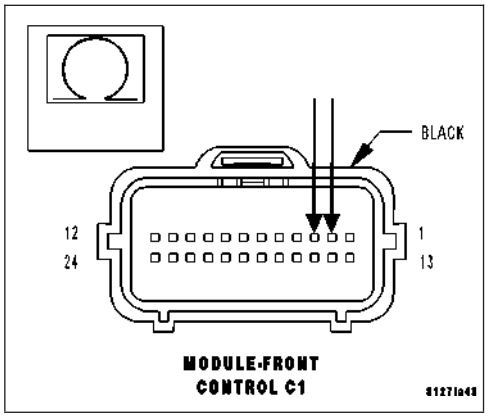
No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)

5. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.



NOTE: This is to determine if the short together is internal within a module or if the circuits are shorted together.

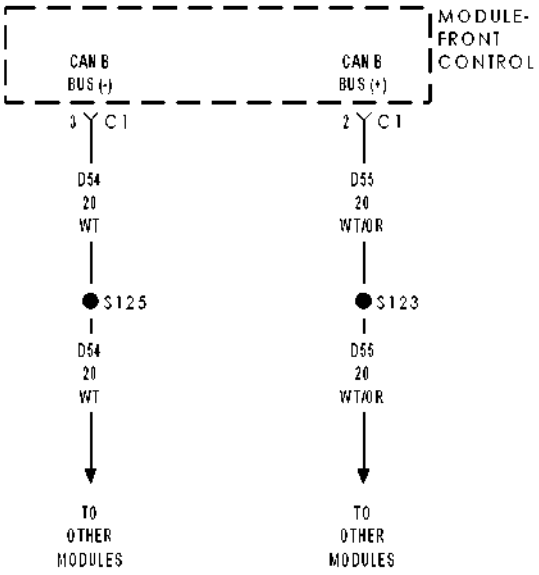
NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

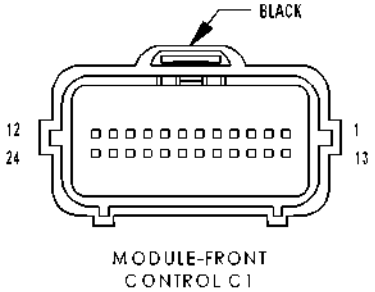
Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0026-CAN B BUS (-) CIRCUIT HIGH





U0026-CAN B BUS (-) CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  The FCM detects the (D54) CAN B Bus (-) circuit is shorted to voltage.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
ANY CAN B BUS MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

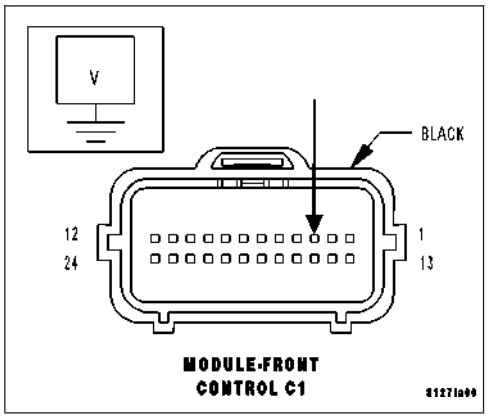
2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.



Is voltage above 10.0 volts?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0026-CAN B BUS (-) CIRCUIT HIGH (CONTINUED)

3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE

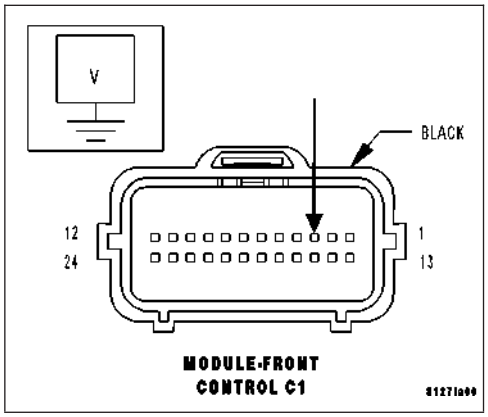
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the short to voltage is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

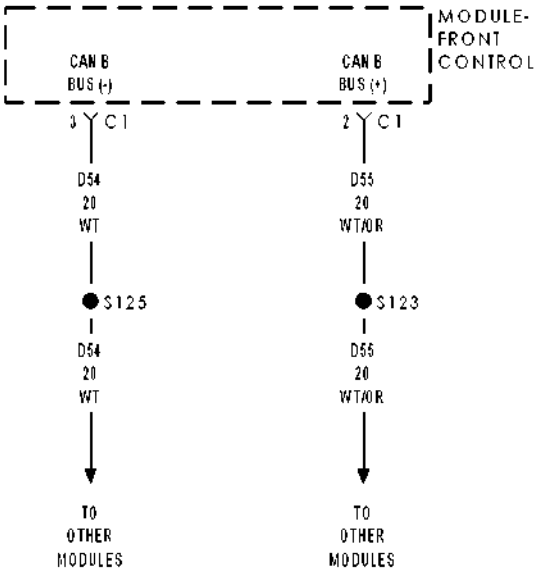


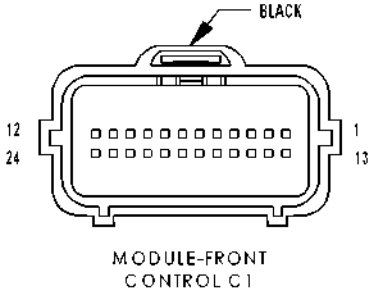
Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?

Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to voltage was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0027-CAN B BUS (-) SHORTED TO BUS (+)





8l27a9c0

U0027-CAN B BUS (-) SHORTED TO BUS (+) (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  The FCM detects the (D55) CAN B Bus (+) circuit is shorted to the (D54) CAN B Bus (-) circuit.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT
ANY CAN B BUS MODULE
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

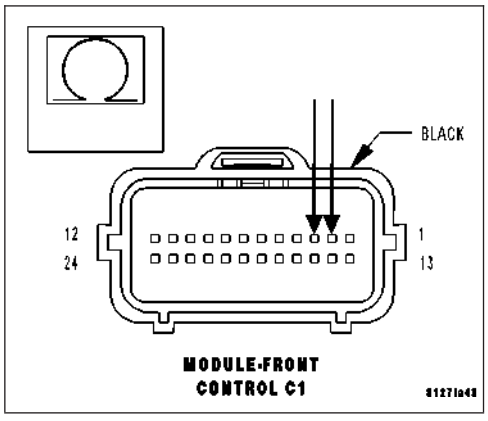
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.



Is resistance below 1000.0 ohms?

Yes >> Go To 3

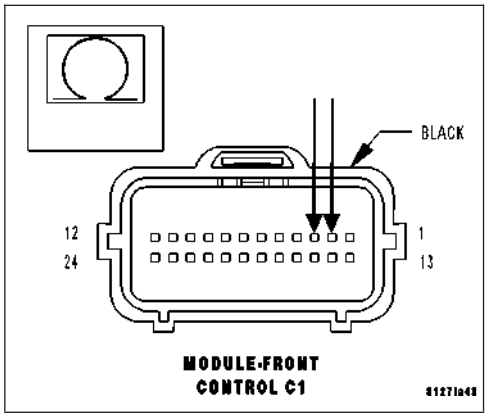
No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0027-CAN B BUS (-) SHORTED TO BUS (+) (CONTINUED)

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.



NOTE: This is to determine if the short together is internal within a module or if the circuits are shorted together.

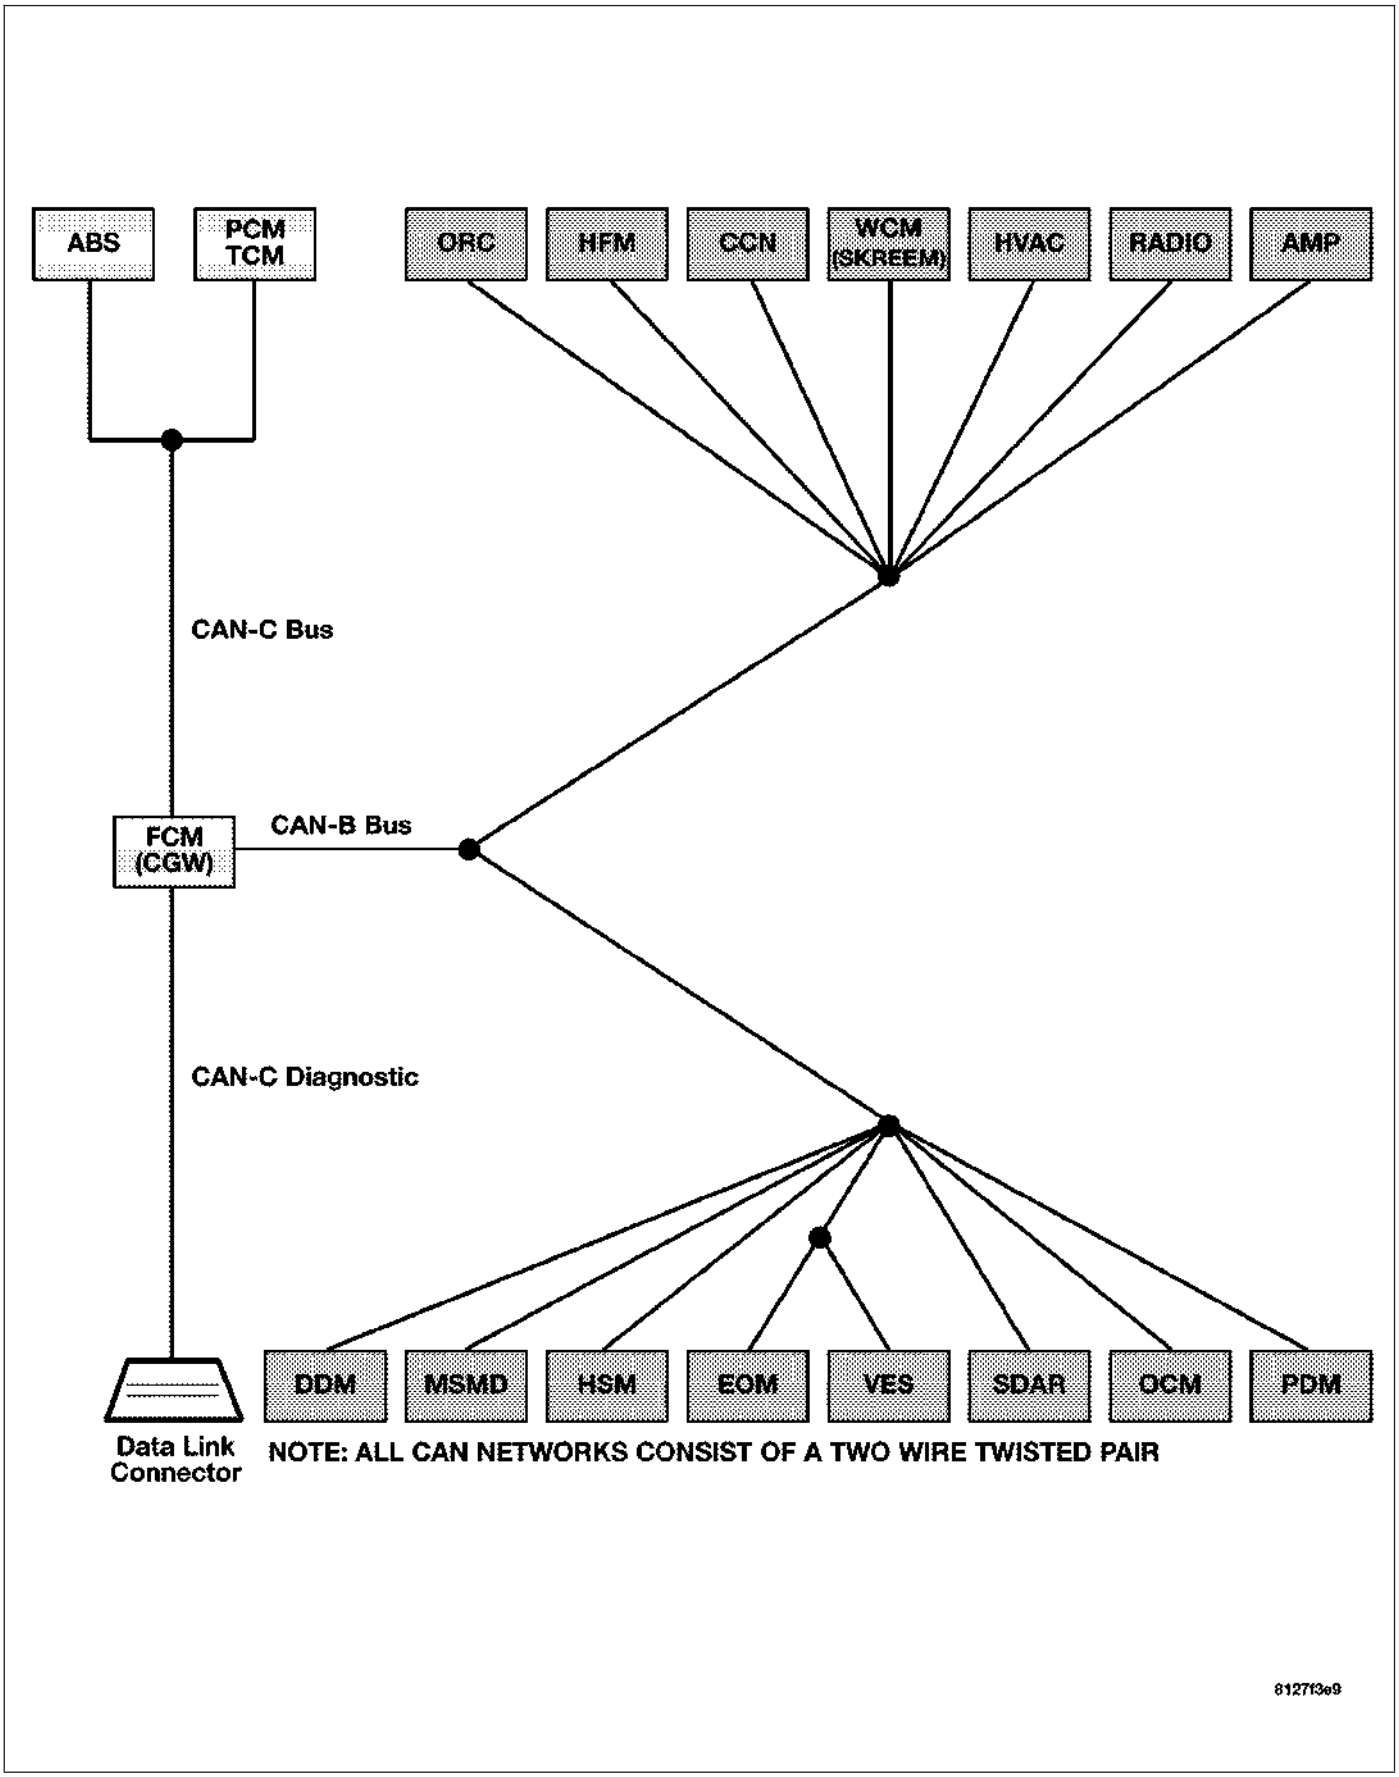
NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.
Perform BODY VERIFICATION TEST - VER 1

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0100-LOST COMMUNICATION WITH ECM/PCM



U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ECM/PCM
ECM/PCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

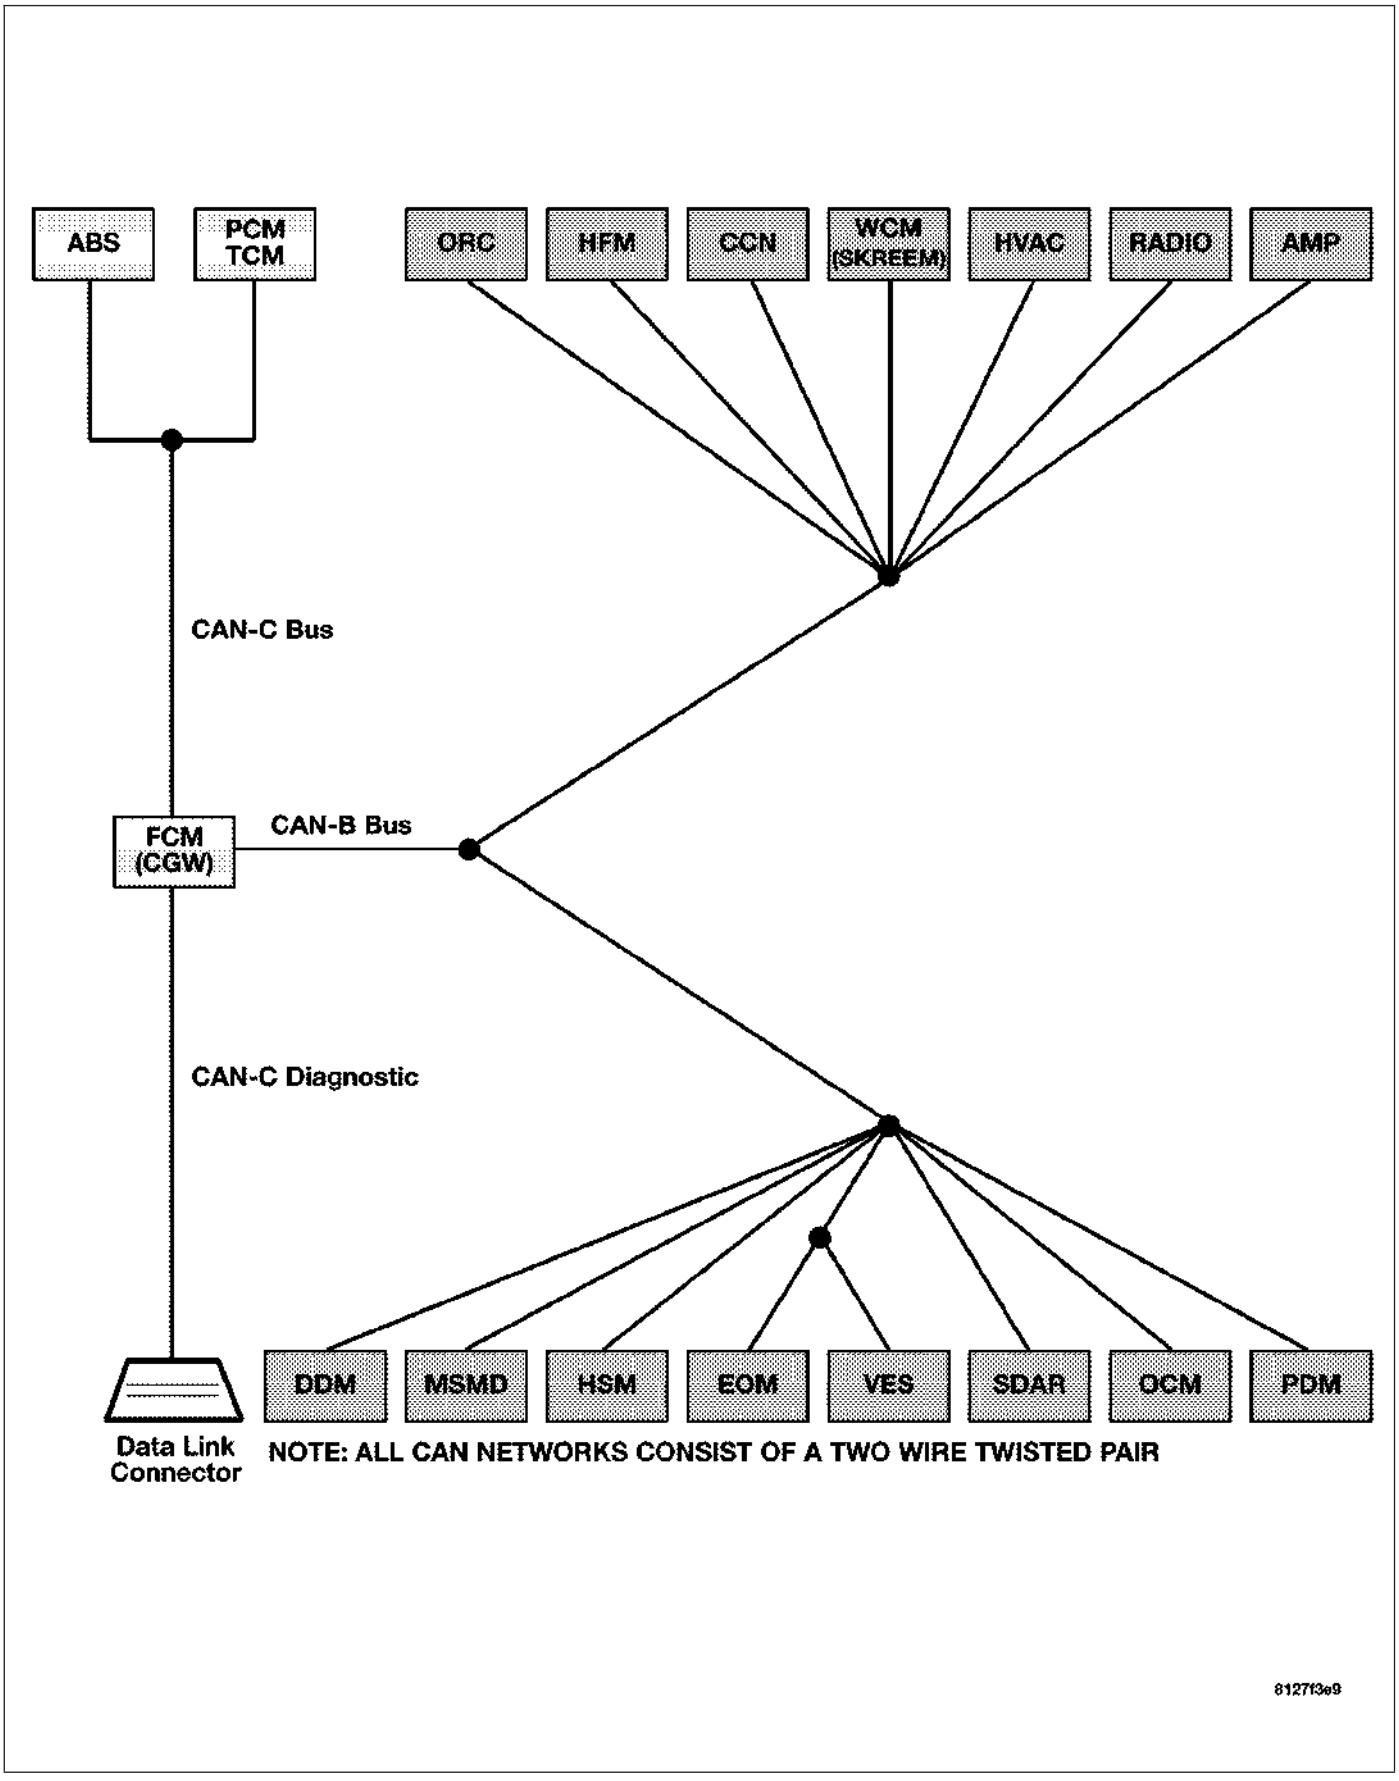
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ECM/PCM?

Yes >> Replace/update the ECM/PCM in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0101-LOST COMMUNICATION WITH TCM



U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the TCM for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
TCM (PCM)
TCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

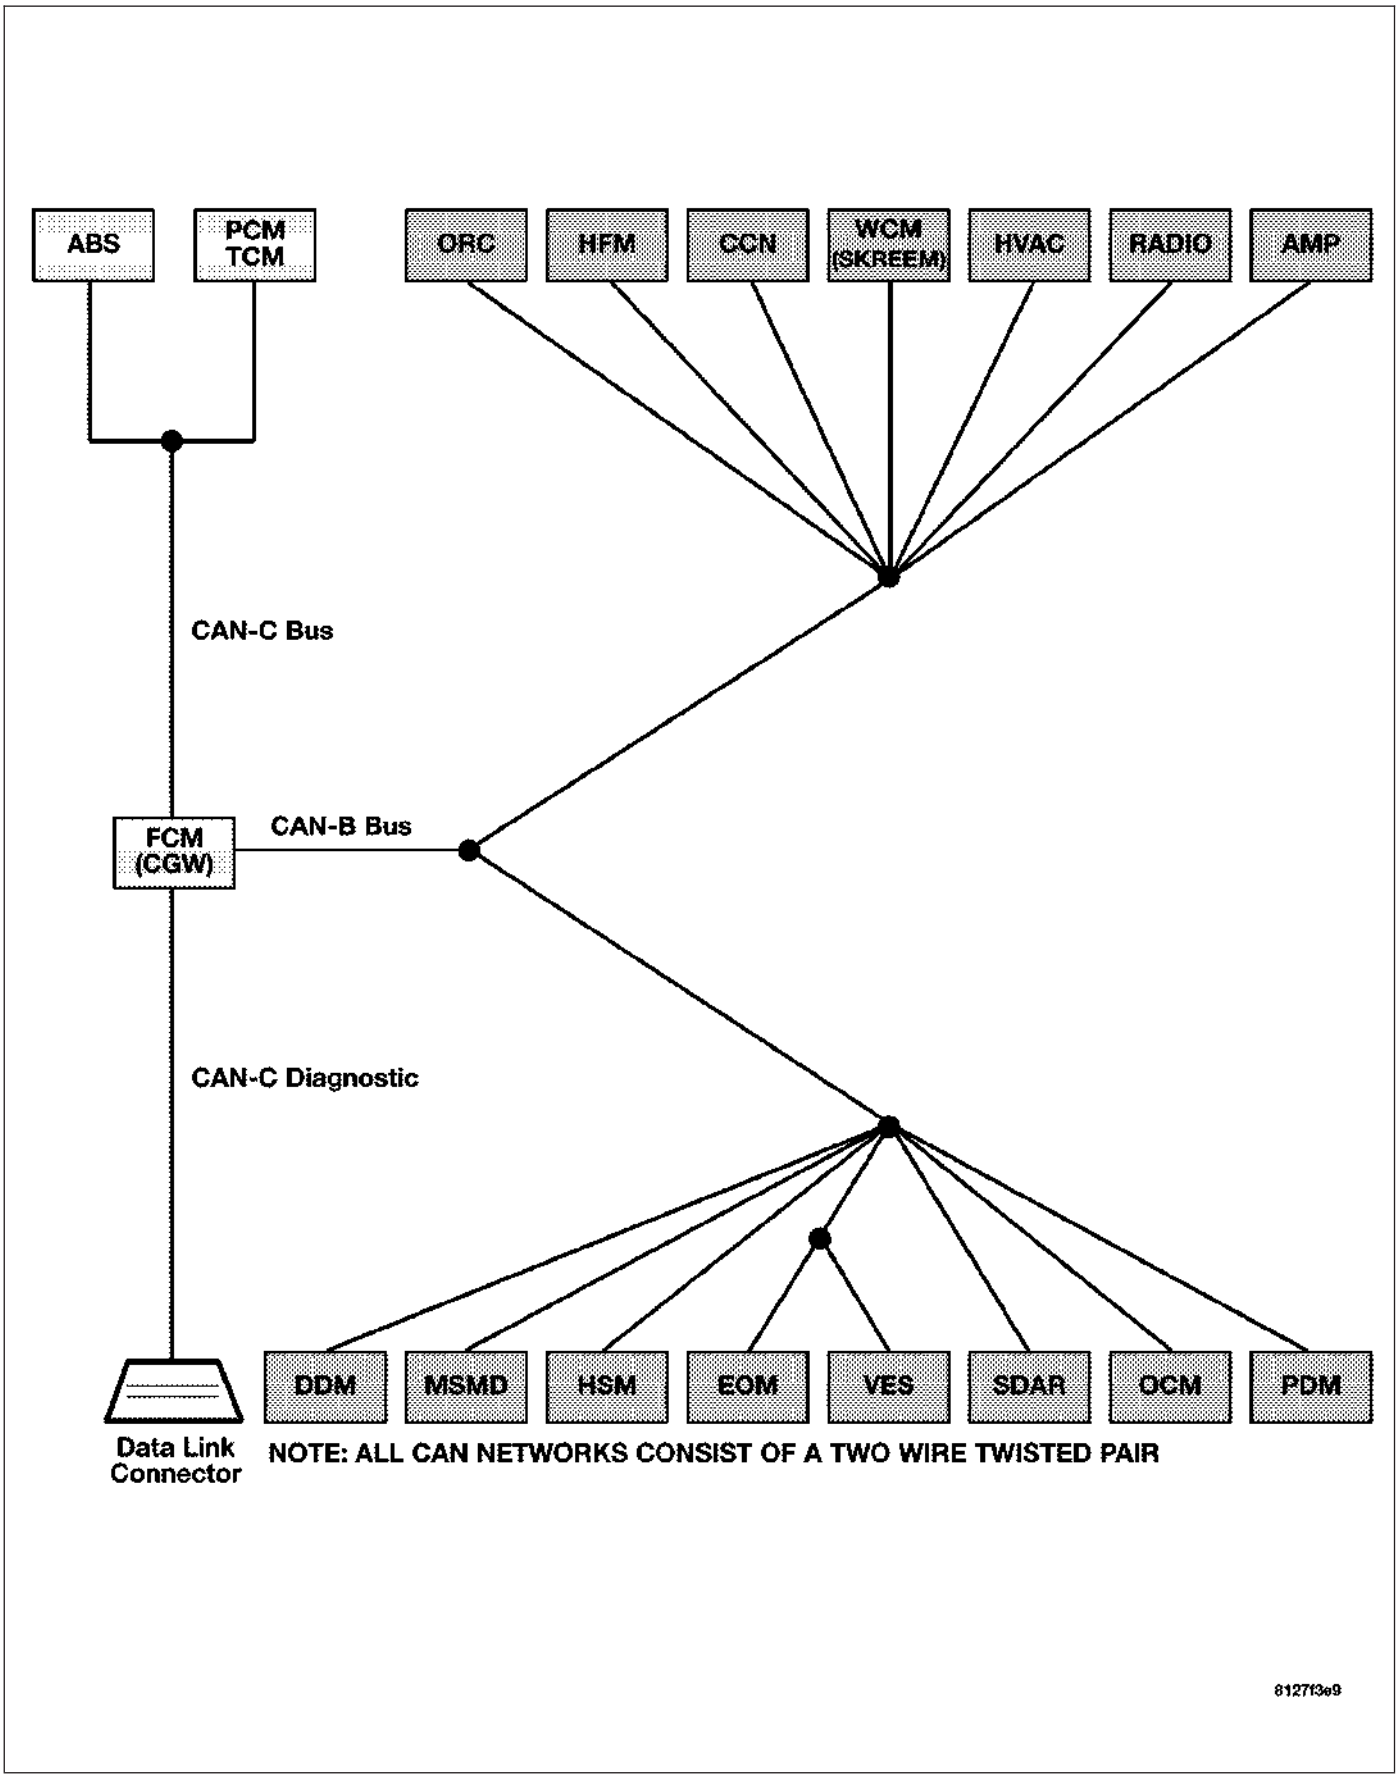
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TCM?

Yes >> Replace/update the TCM (PCM) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE



U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Antilock Brake Module for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ANTILOCK BRAKE MODULE
ANTILOCK BRAKE MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS

Turn the ignition on.
With the scan tool, select Network Diagnostics.
Verify that the ABS is active on the bus.

Is the ABS active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

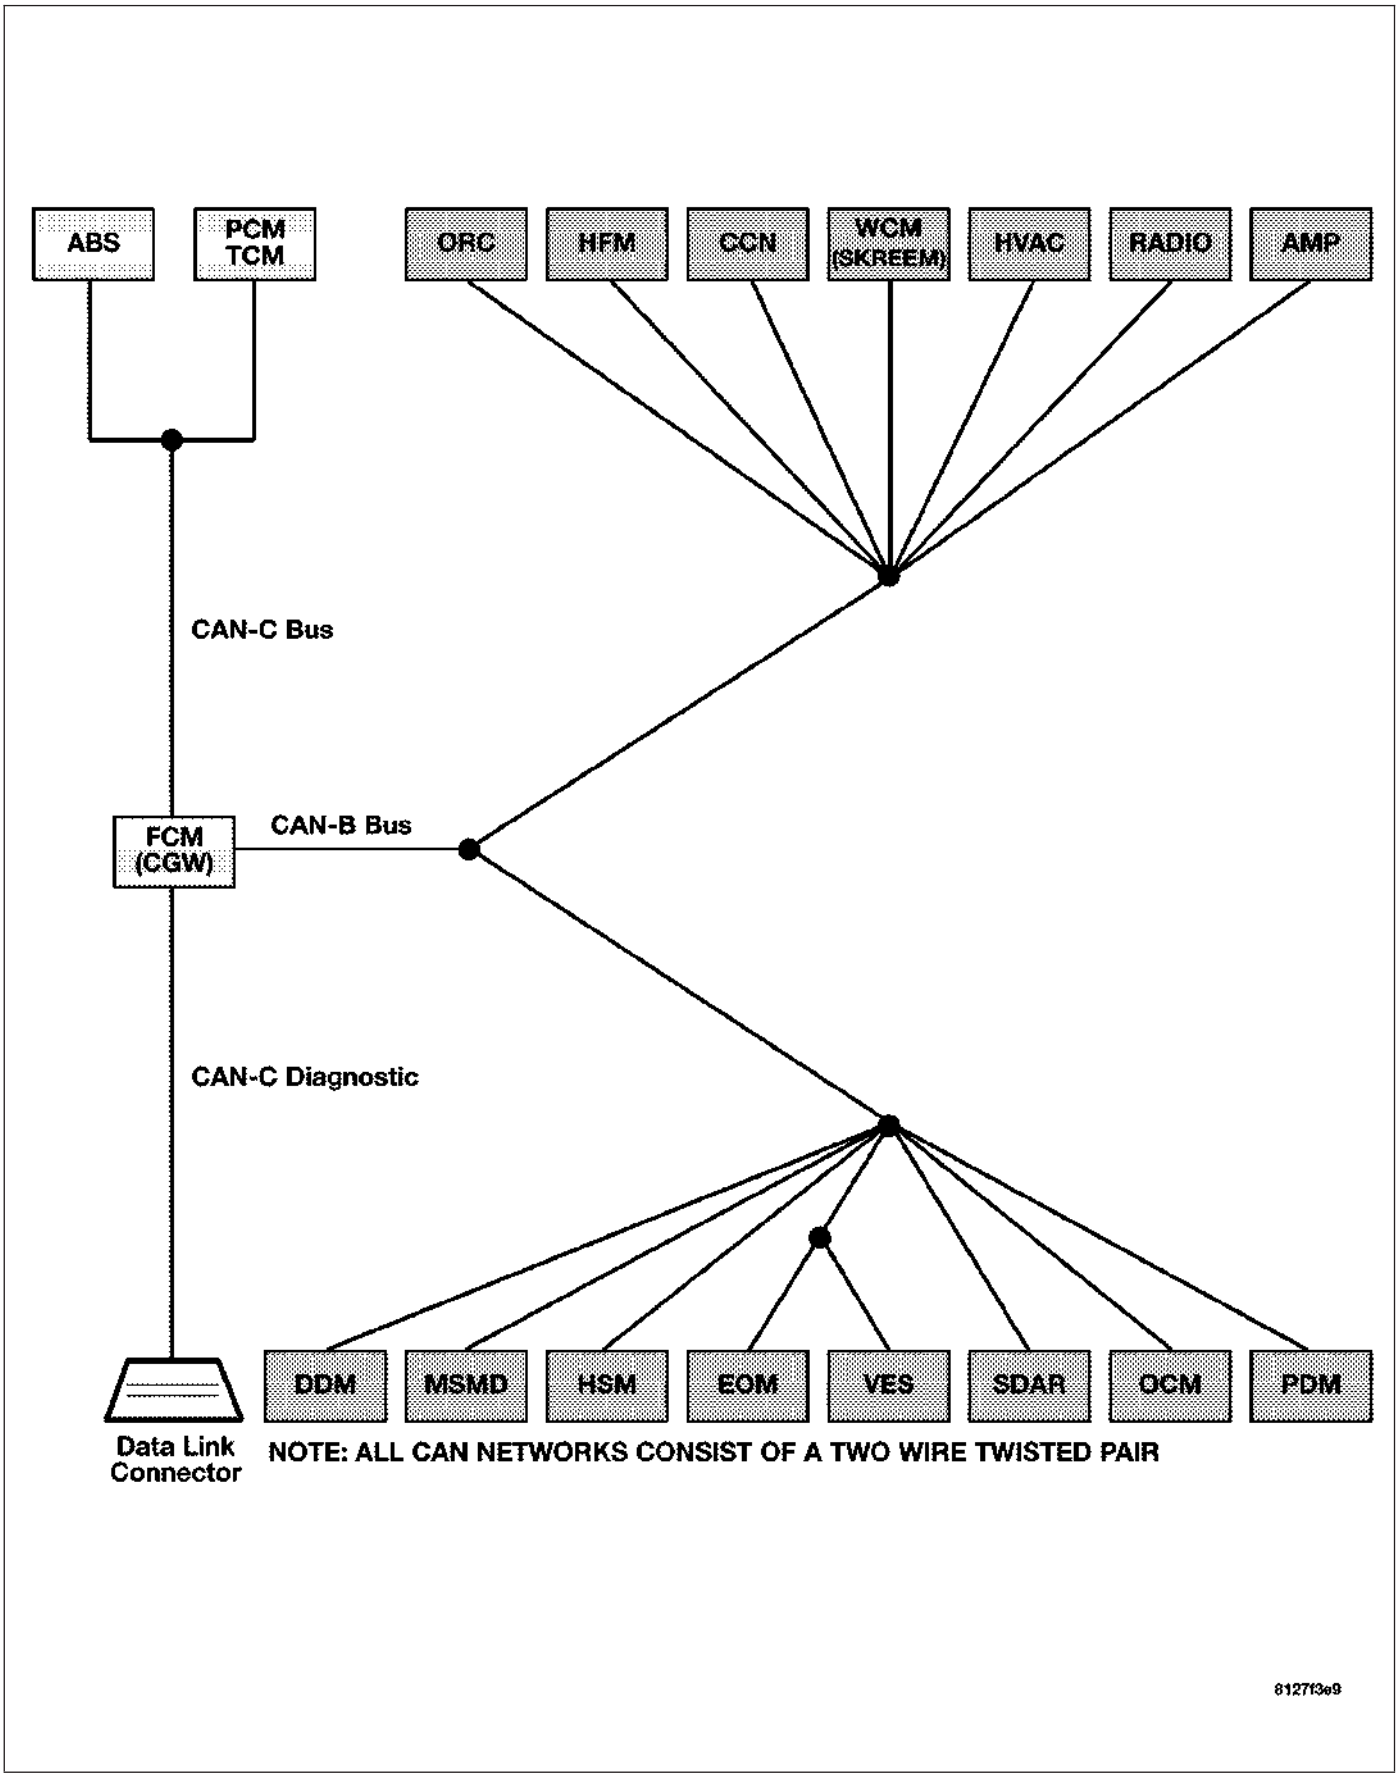
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ABS?

Yes >> Replace/update the Antilock Brake Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE



U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
FRONT CONTROL MODULE
FRONT CONTROL MODULES POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE FCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FCM is active on the bus.

Is the FCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

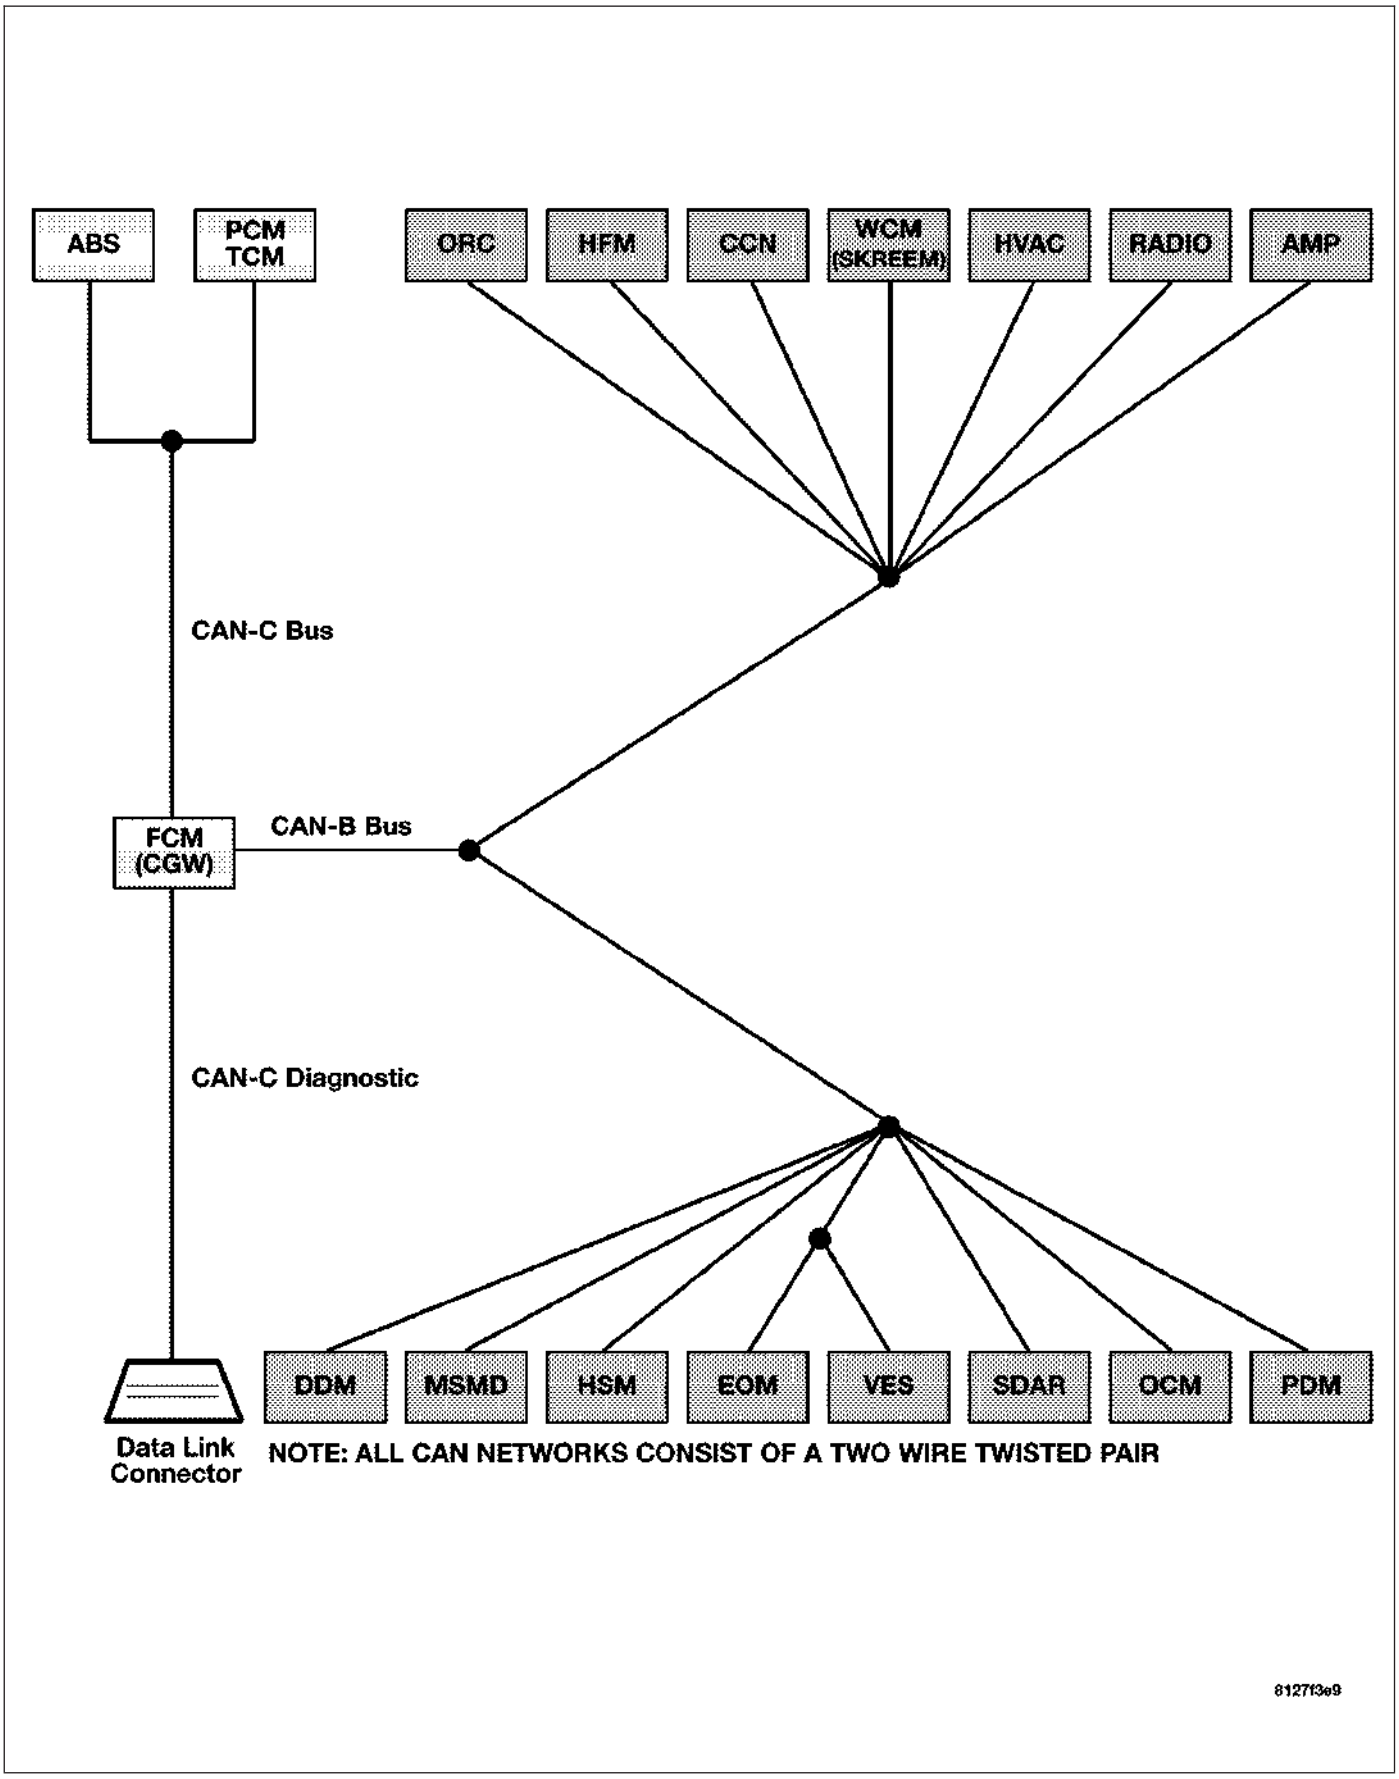
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the FCM?

Yes >> Replace/update the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0151–LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)



U0151–LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Occupant Restraint Controller for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
OCCUPANT RESTRAINT CONTROLLER
OCCUPANT RESTRAINT CONTROLLERS POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0151–LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)

3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ORC is active on the bus.

Is the ORC active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

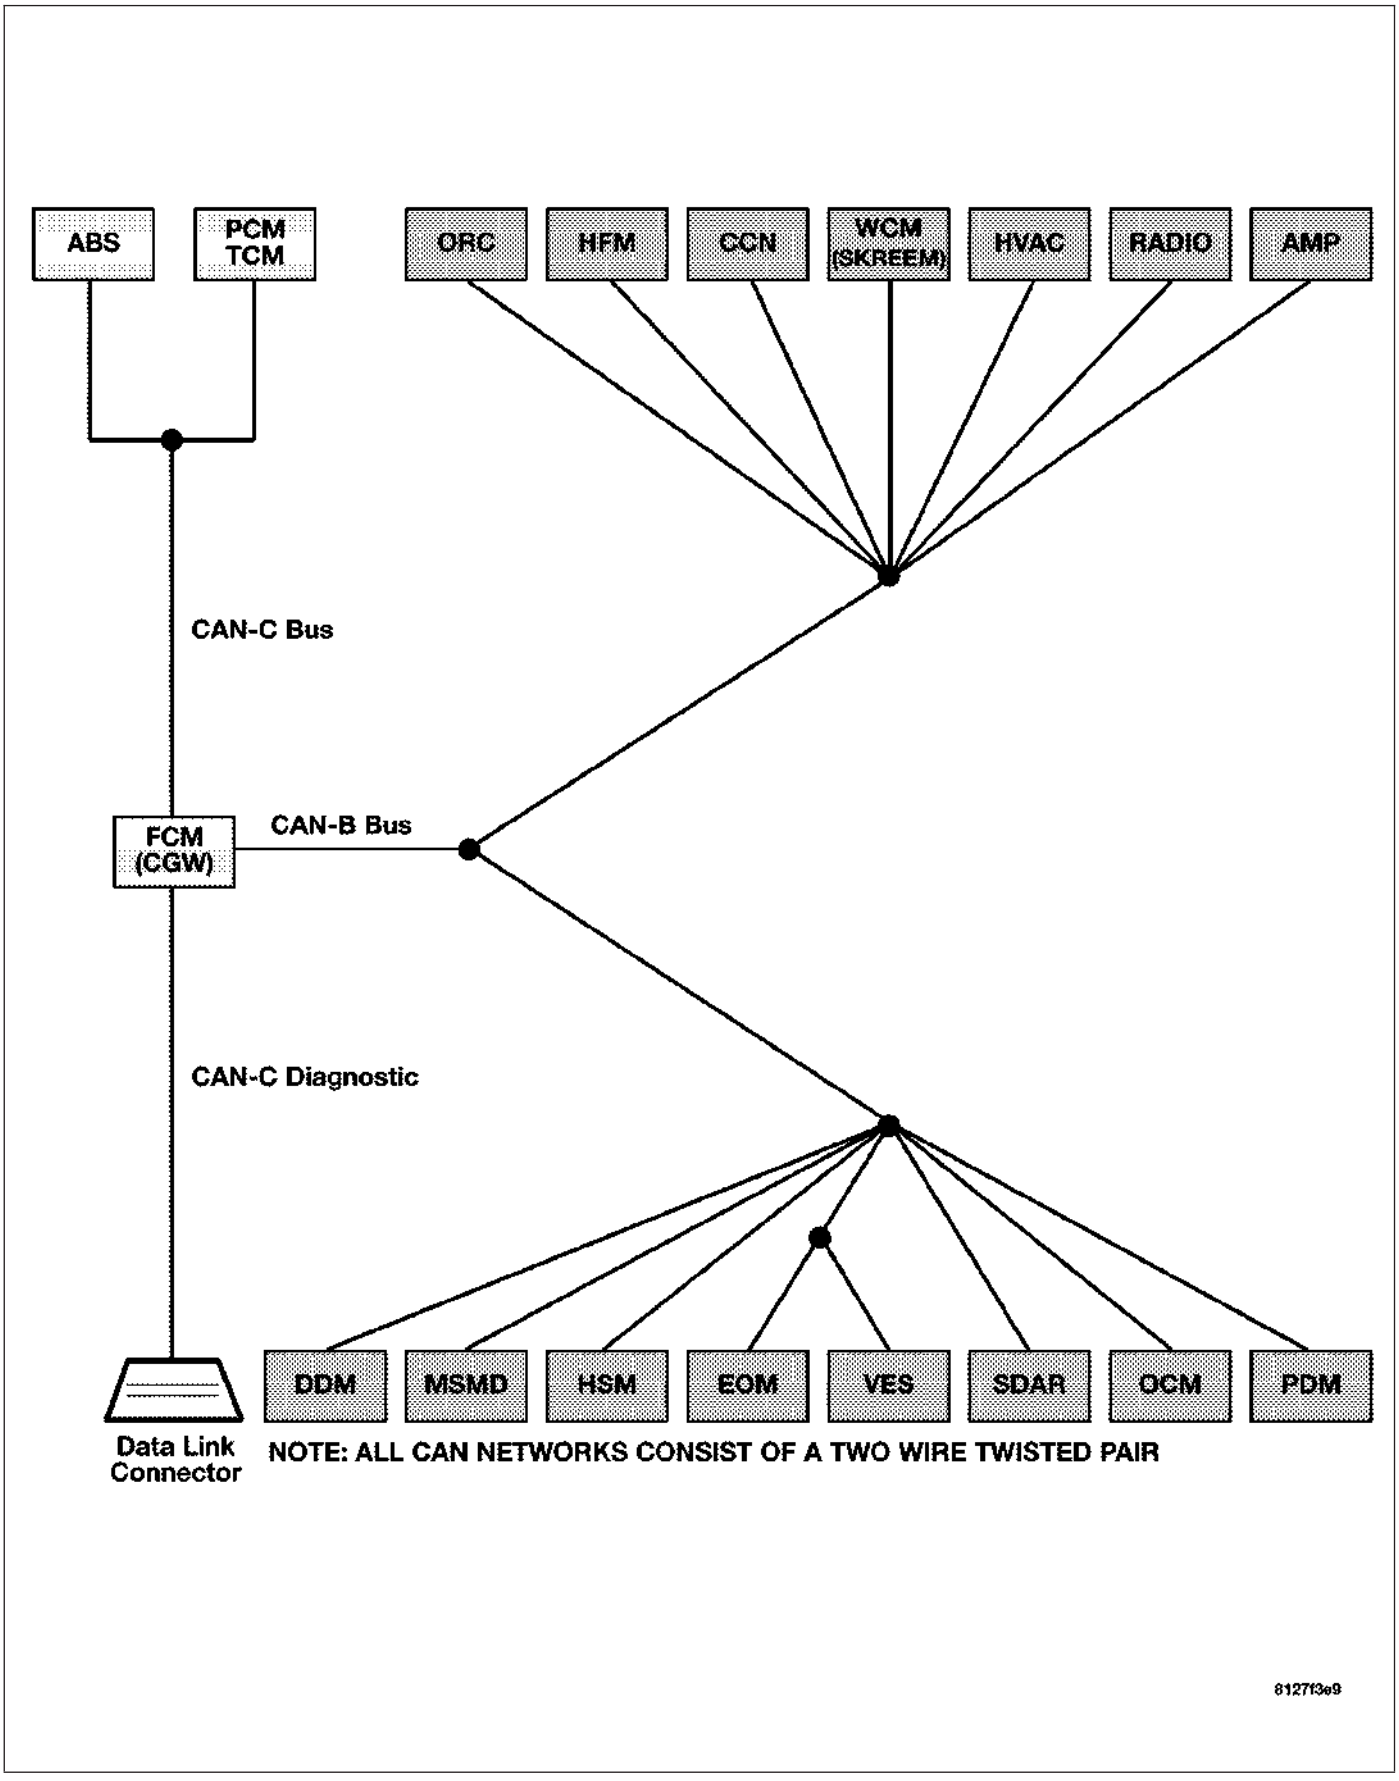
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the ORC?

Yes >> Replace/update the Occupant Restraint Controller in accordance with the service information.
Perform AIRBAG VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE



U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Occupant Classification Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
OCCUPANT CLASSIFICATION MODULE
OCCUPANT CLASSIFICATION MODULES POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)

3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the OCM is active on the bus.

Is the OCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

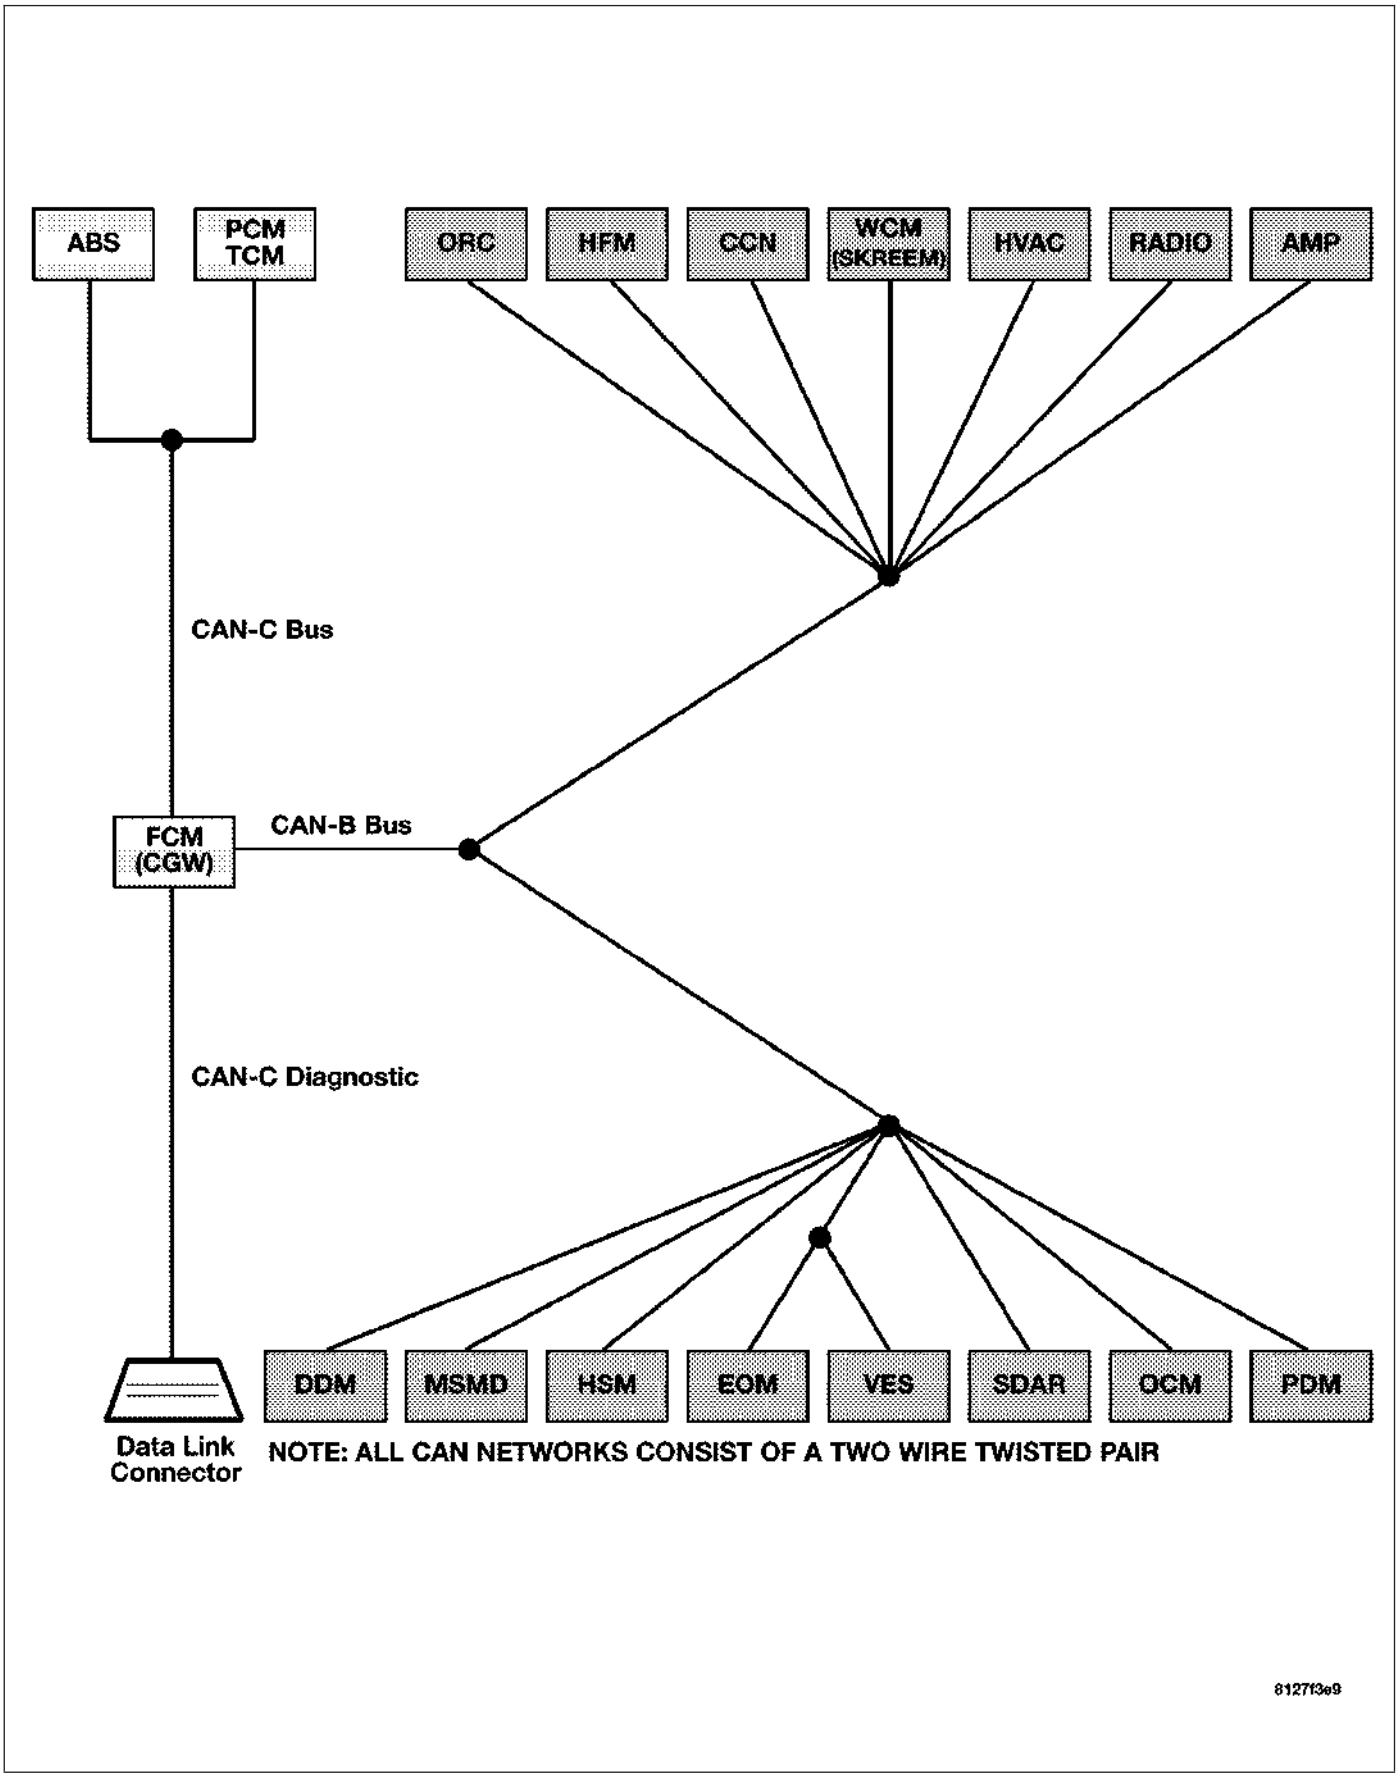
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the OCM?

Yes >> Replace/update the Occupant Classification Module in accordance with the service information.
Perform AIRBAG VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN



U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
CLUSTER/CCN
CLUSTER/CCN POWER AND GROUND
MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)

3. VERIFY THAT THE CCN IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the CCN is active on the bus.

Is the CCN active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

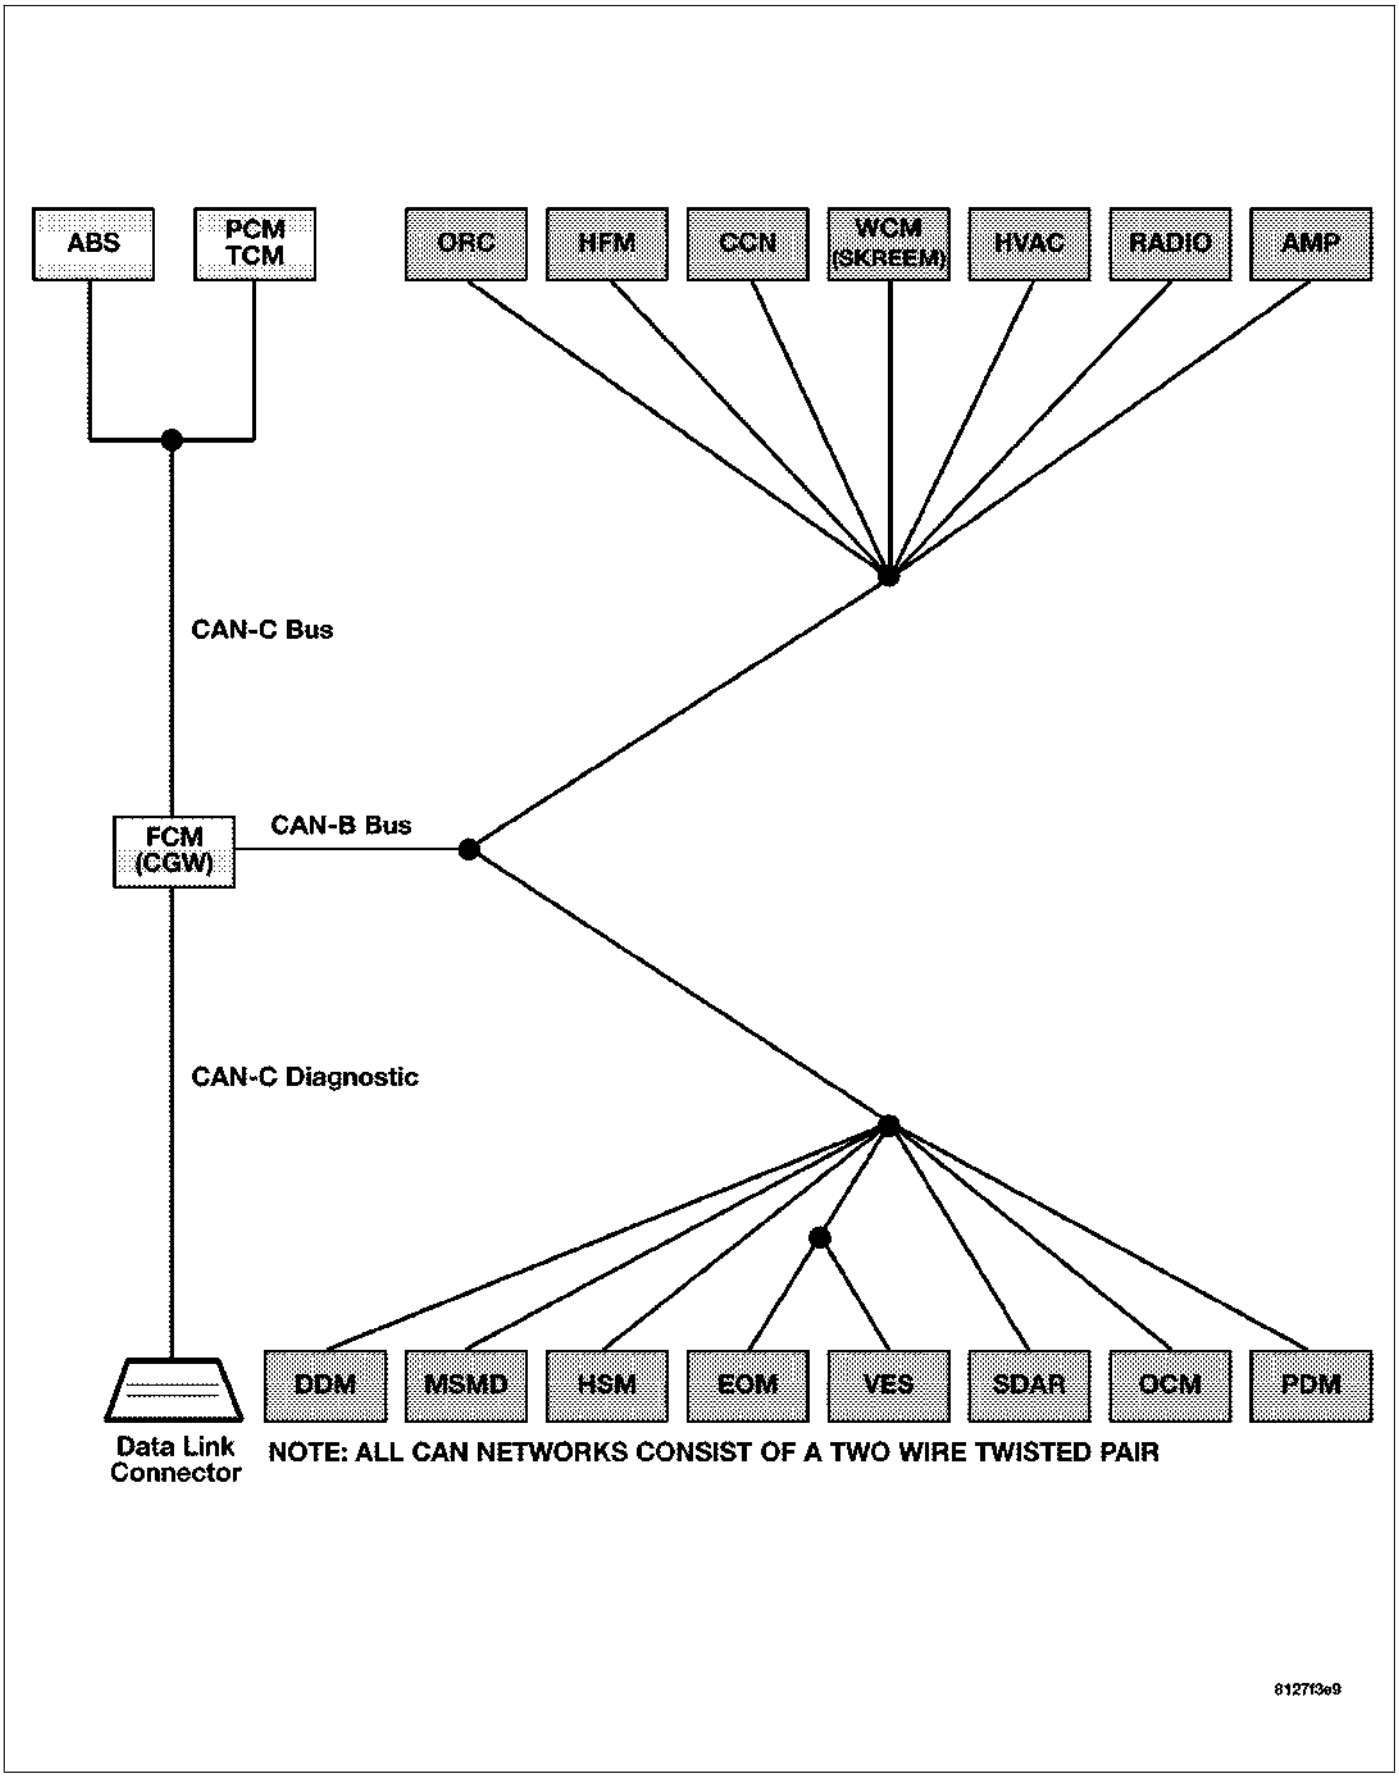
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the CCN?

Yes >> Replace/update the Cluster (CCN) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0156–LOST COMMUNICATION WITH EOM



U0156–LOST COMMUNICATION WITH EOM (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Compass Temperature Module (EOM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
COMPASS TEMPERATURE MODULE (EOM)
COMPASS TEMPERATURE MODULES POWER OR GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0156–LOST COMMUNICATION WITH EOM (CONTINUED)

3. VERIFY THAT THE EOM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the EOM is active on the bus.

Is the EOM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

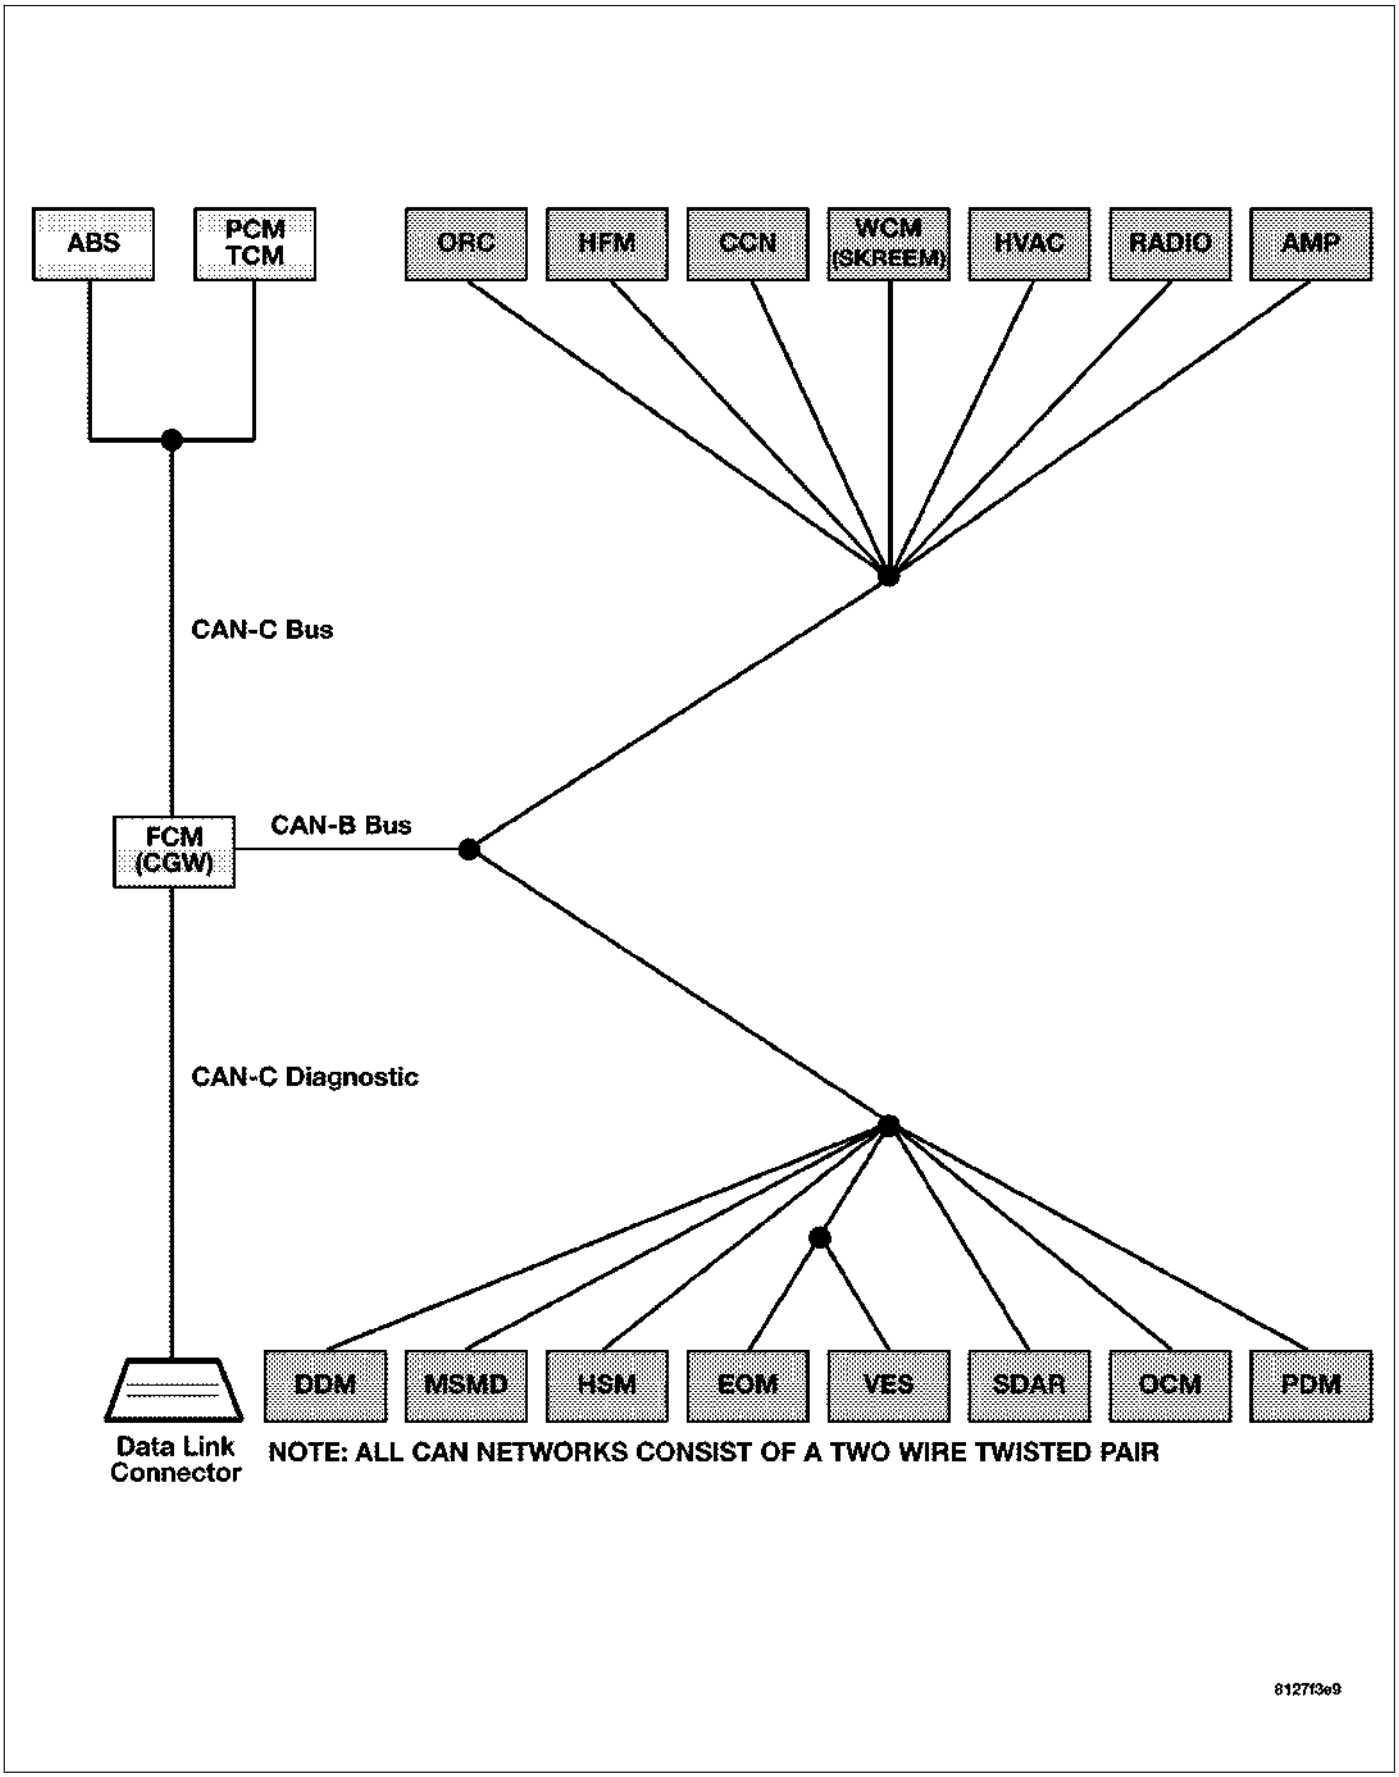
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the EOM?

Yes >> Replace/update the Compass Temperature Module (EOM) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE



U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the A/C Heater Control (HVAC) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
A/C HEATER CONTROL
A/C HEATER CONTROLS POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE HVAC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HVAC is active on the bus.

Is the HVAC active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

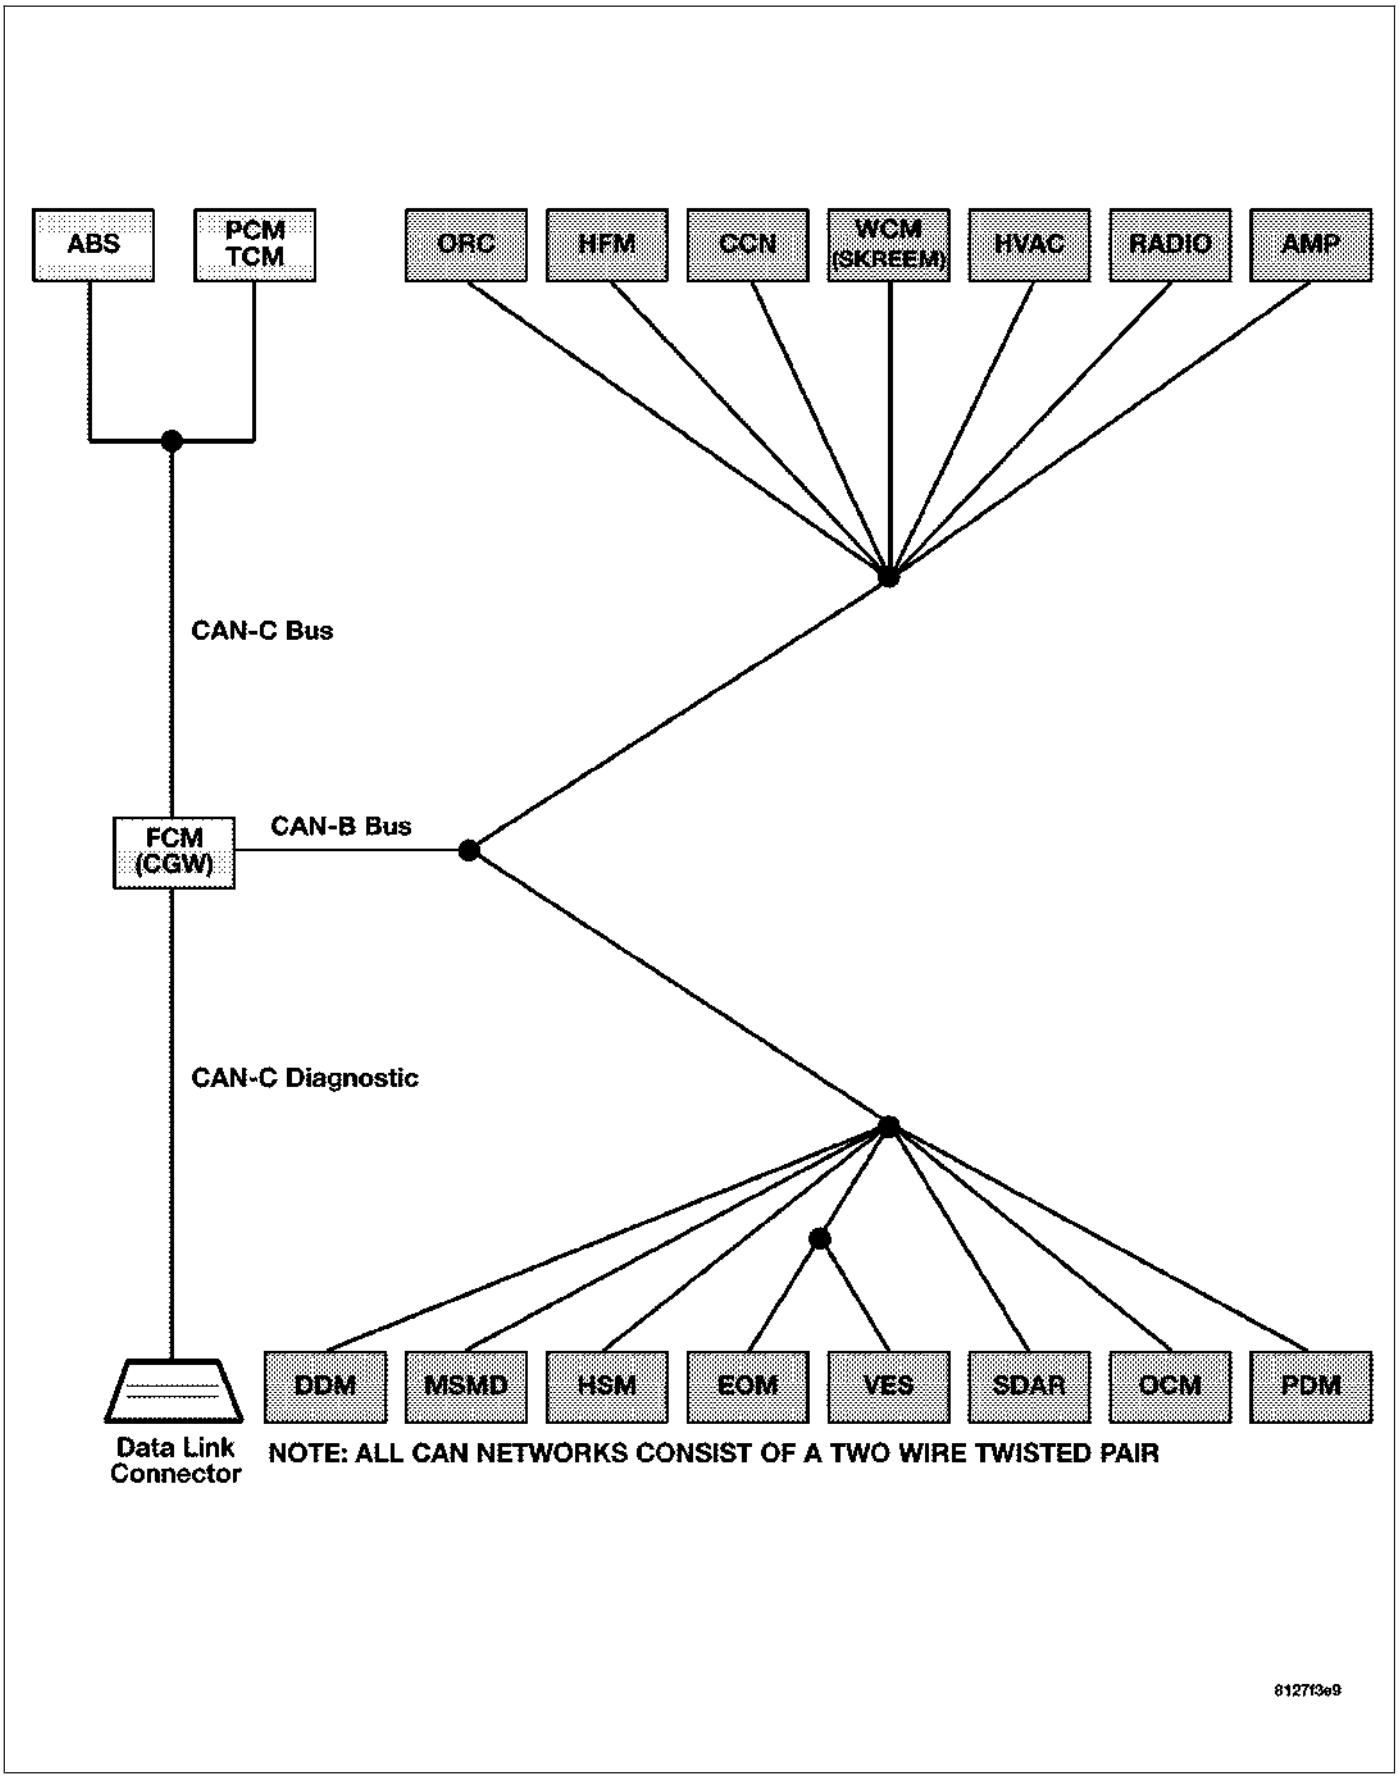
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the HVAC?

Yes >> Replace/update the A/C Heater Control in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set the DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)



U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Sentry Key Remote Entry Module (WCM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SENTRY KEY REMOTE ENTRY MODULE
SENTRY KEY REMOTE ENTRY MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)

3. VERIFY THAT THE WCM IS ACTIVE ON THE BUS

Turn the ignition on.
With the scan tool, select Network Diagnostics.
Verify that the WCM is active on the bus.

Is the WCM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

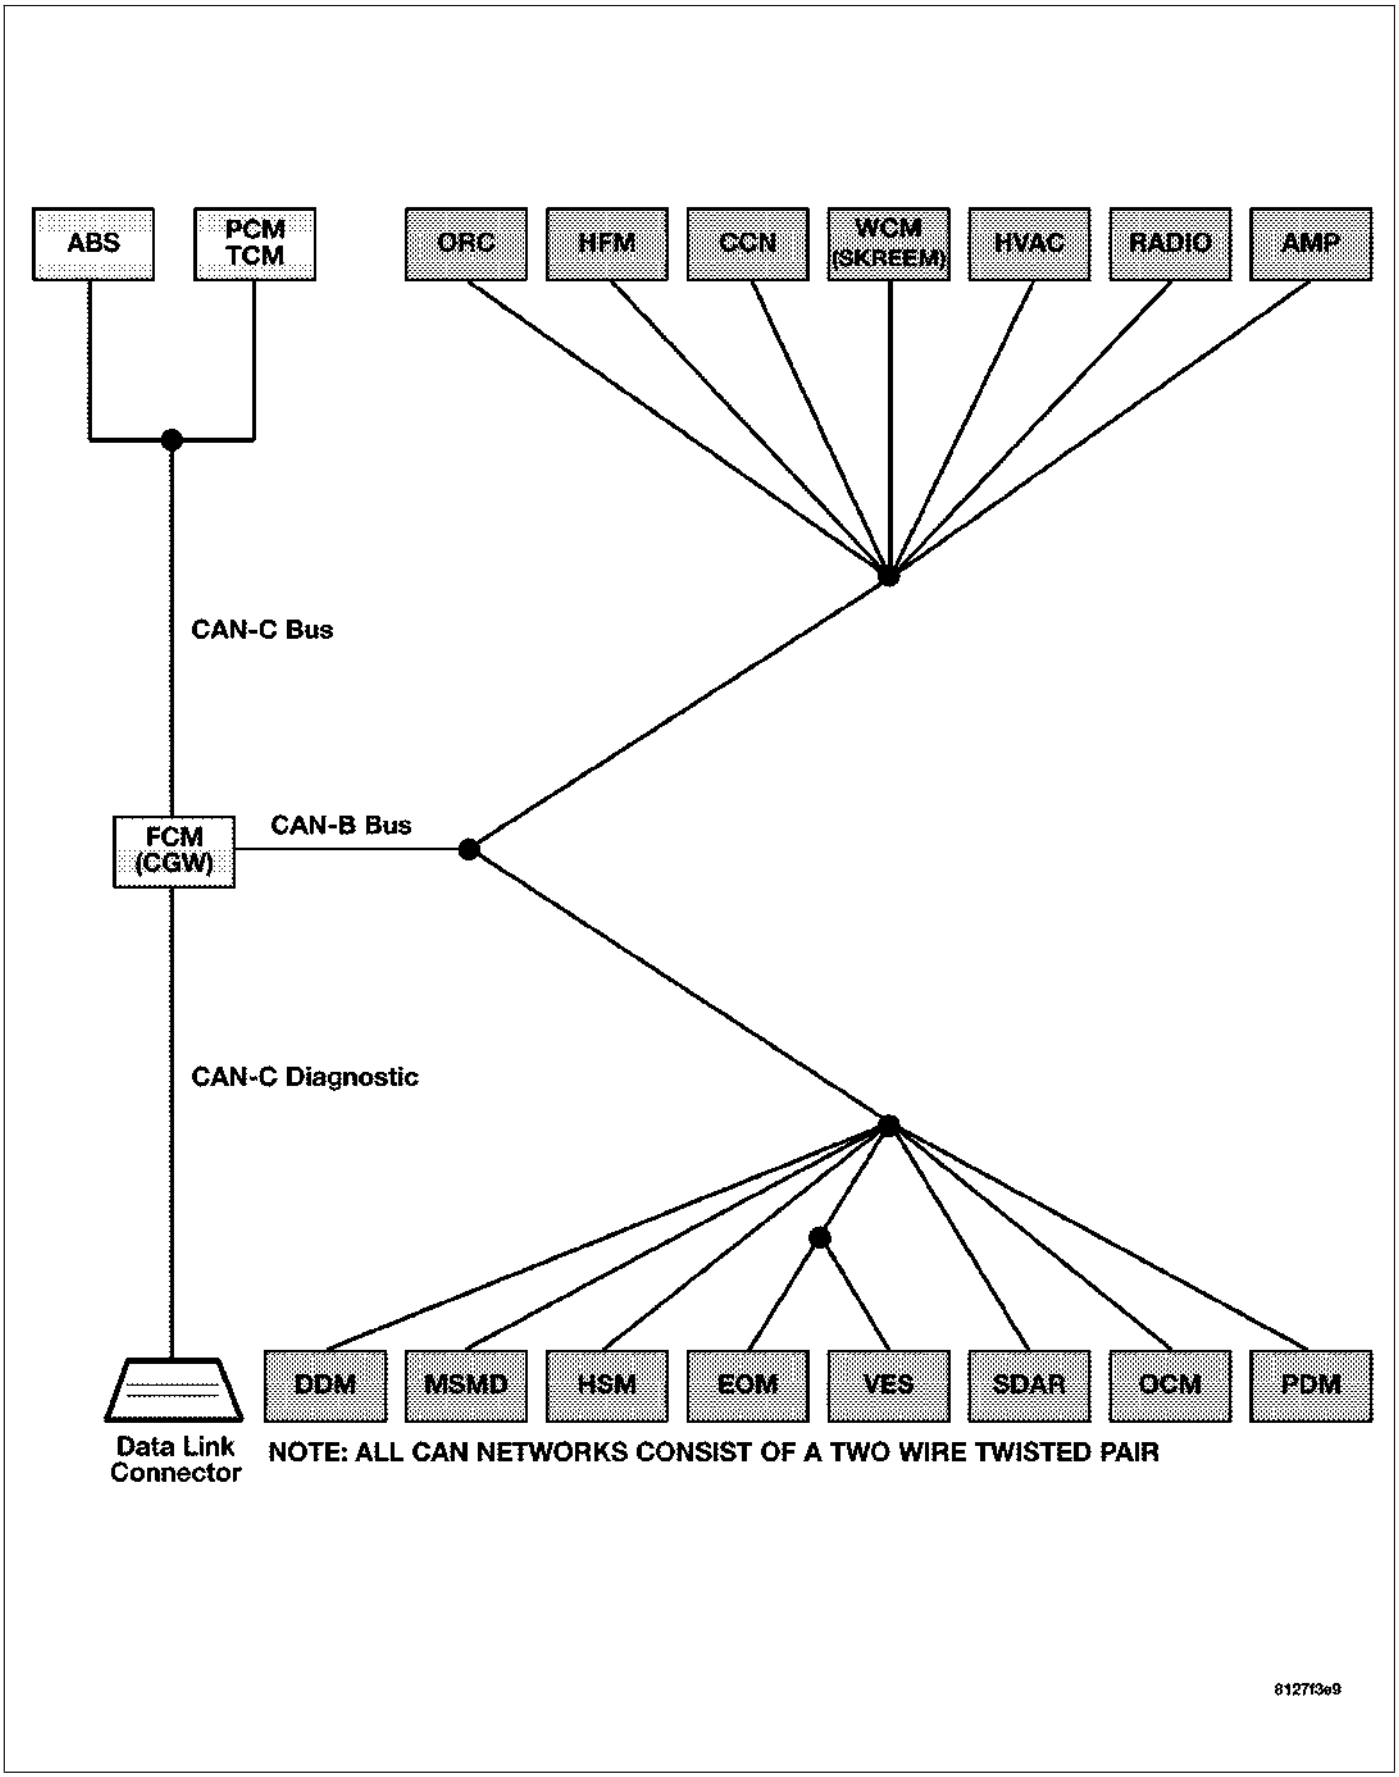
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the WCM?

Yes >> Replace/update the Sentry Key Remote Entry Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0184-LOST COMMUNICATION WITH RADIO



U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
RADIO
RADIO POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)

3. VERIFY THAT THE RADIO IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Radio is active on the bus.

Is the Radio active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

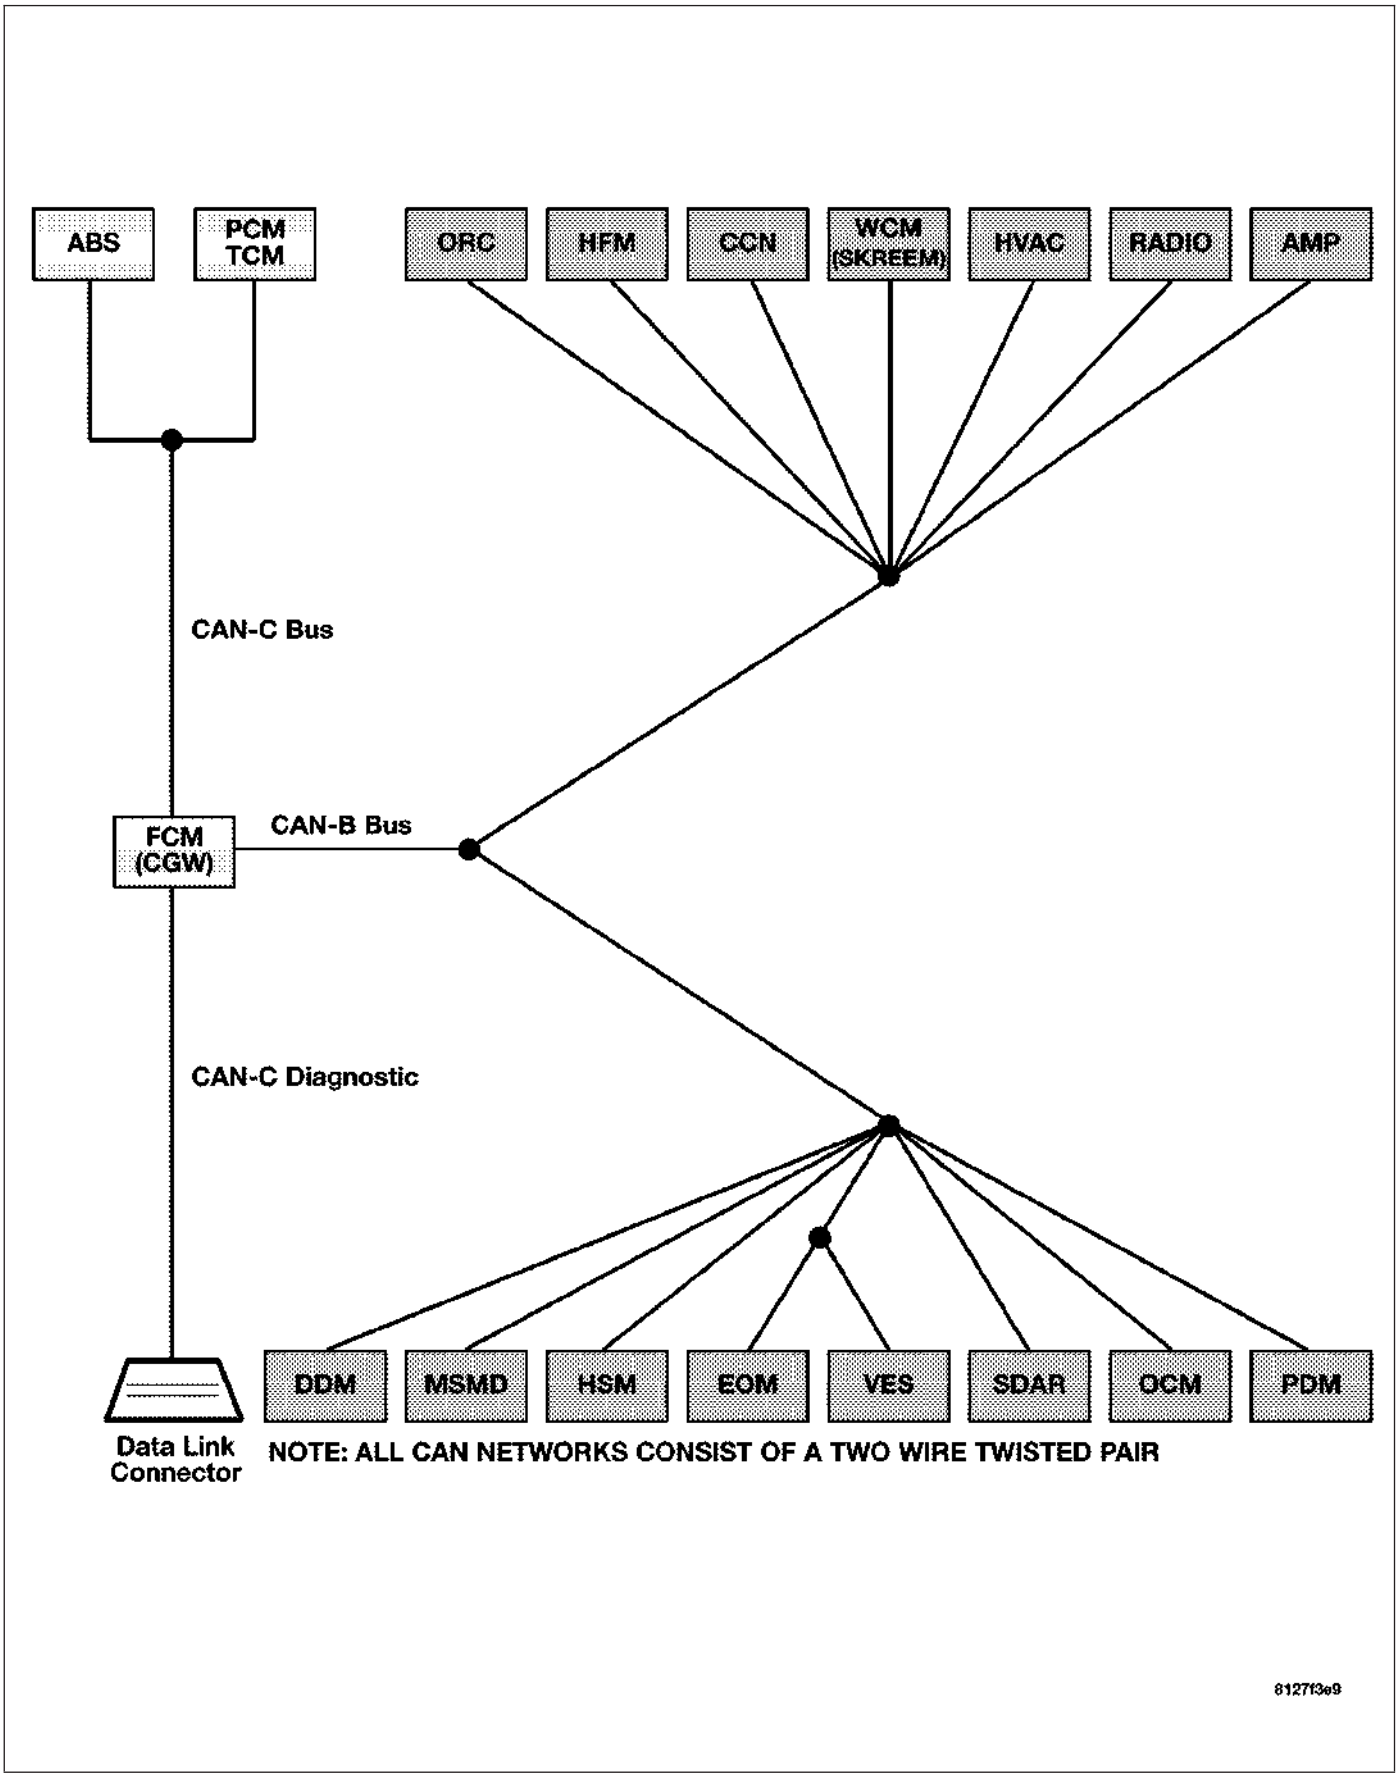
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the Radio?

Yes >> Replace/update the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER



U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
AMPLIFIER
AMPLIFIER POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)

3. VERIFY THAT THE AMPLIFIER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Amplifier is active on the bus.

Is the Amplifier active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

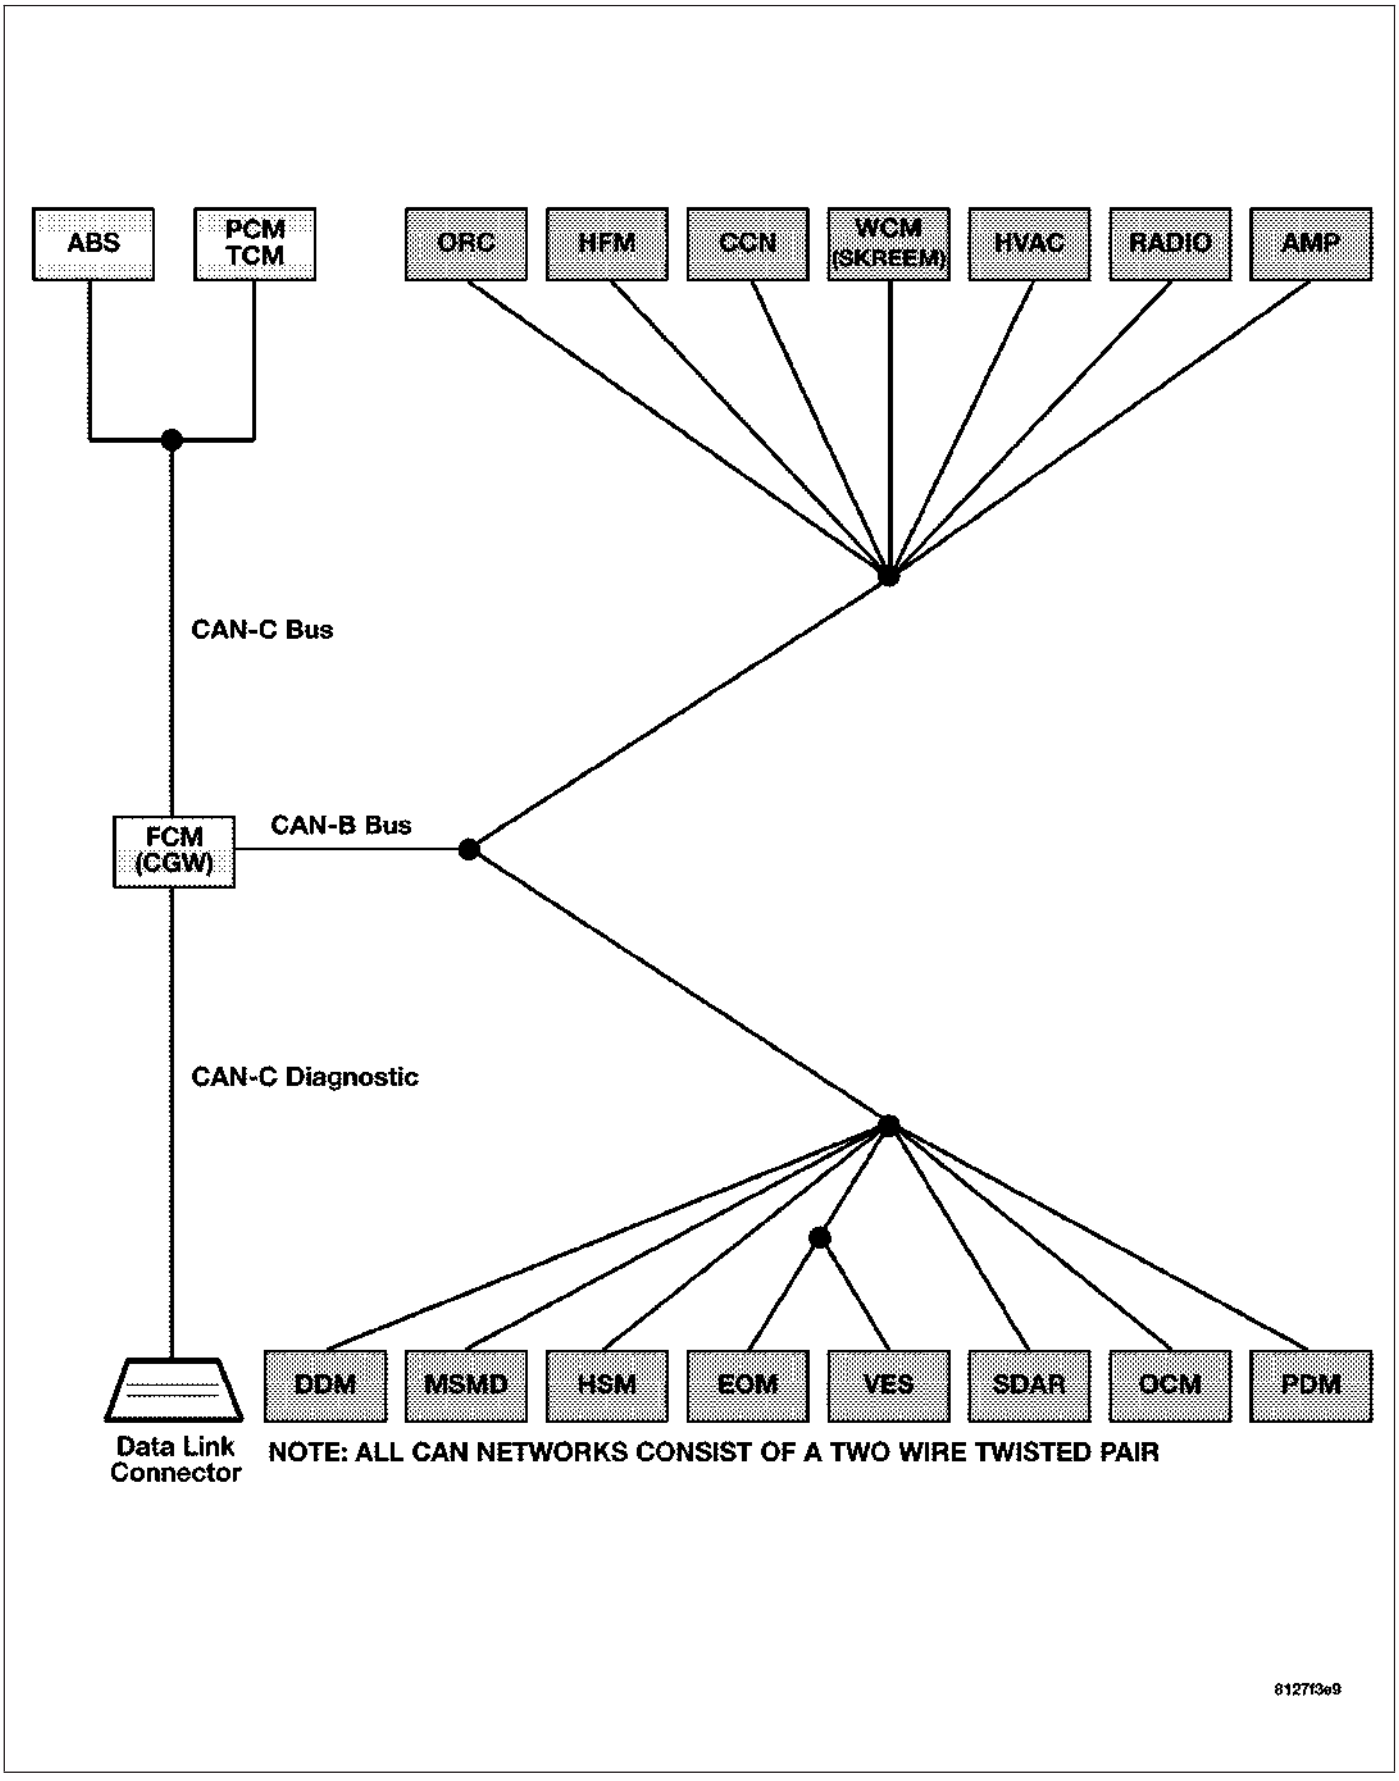
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the Amplifier?

Yes >> Replace/update the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0195-LOST COMMUNICATION WITH SDARS



U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the Satellite Receiver (SDAR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SATELLITE RECEIVER
SATELLITE RECEIVER POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)

3. VERIFY THAT THE SATELLITE RECEIVER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SDARS is active on the bus.

Is the SDARS active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

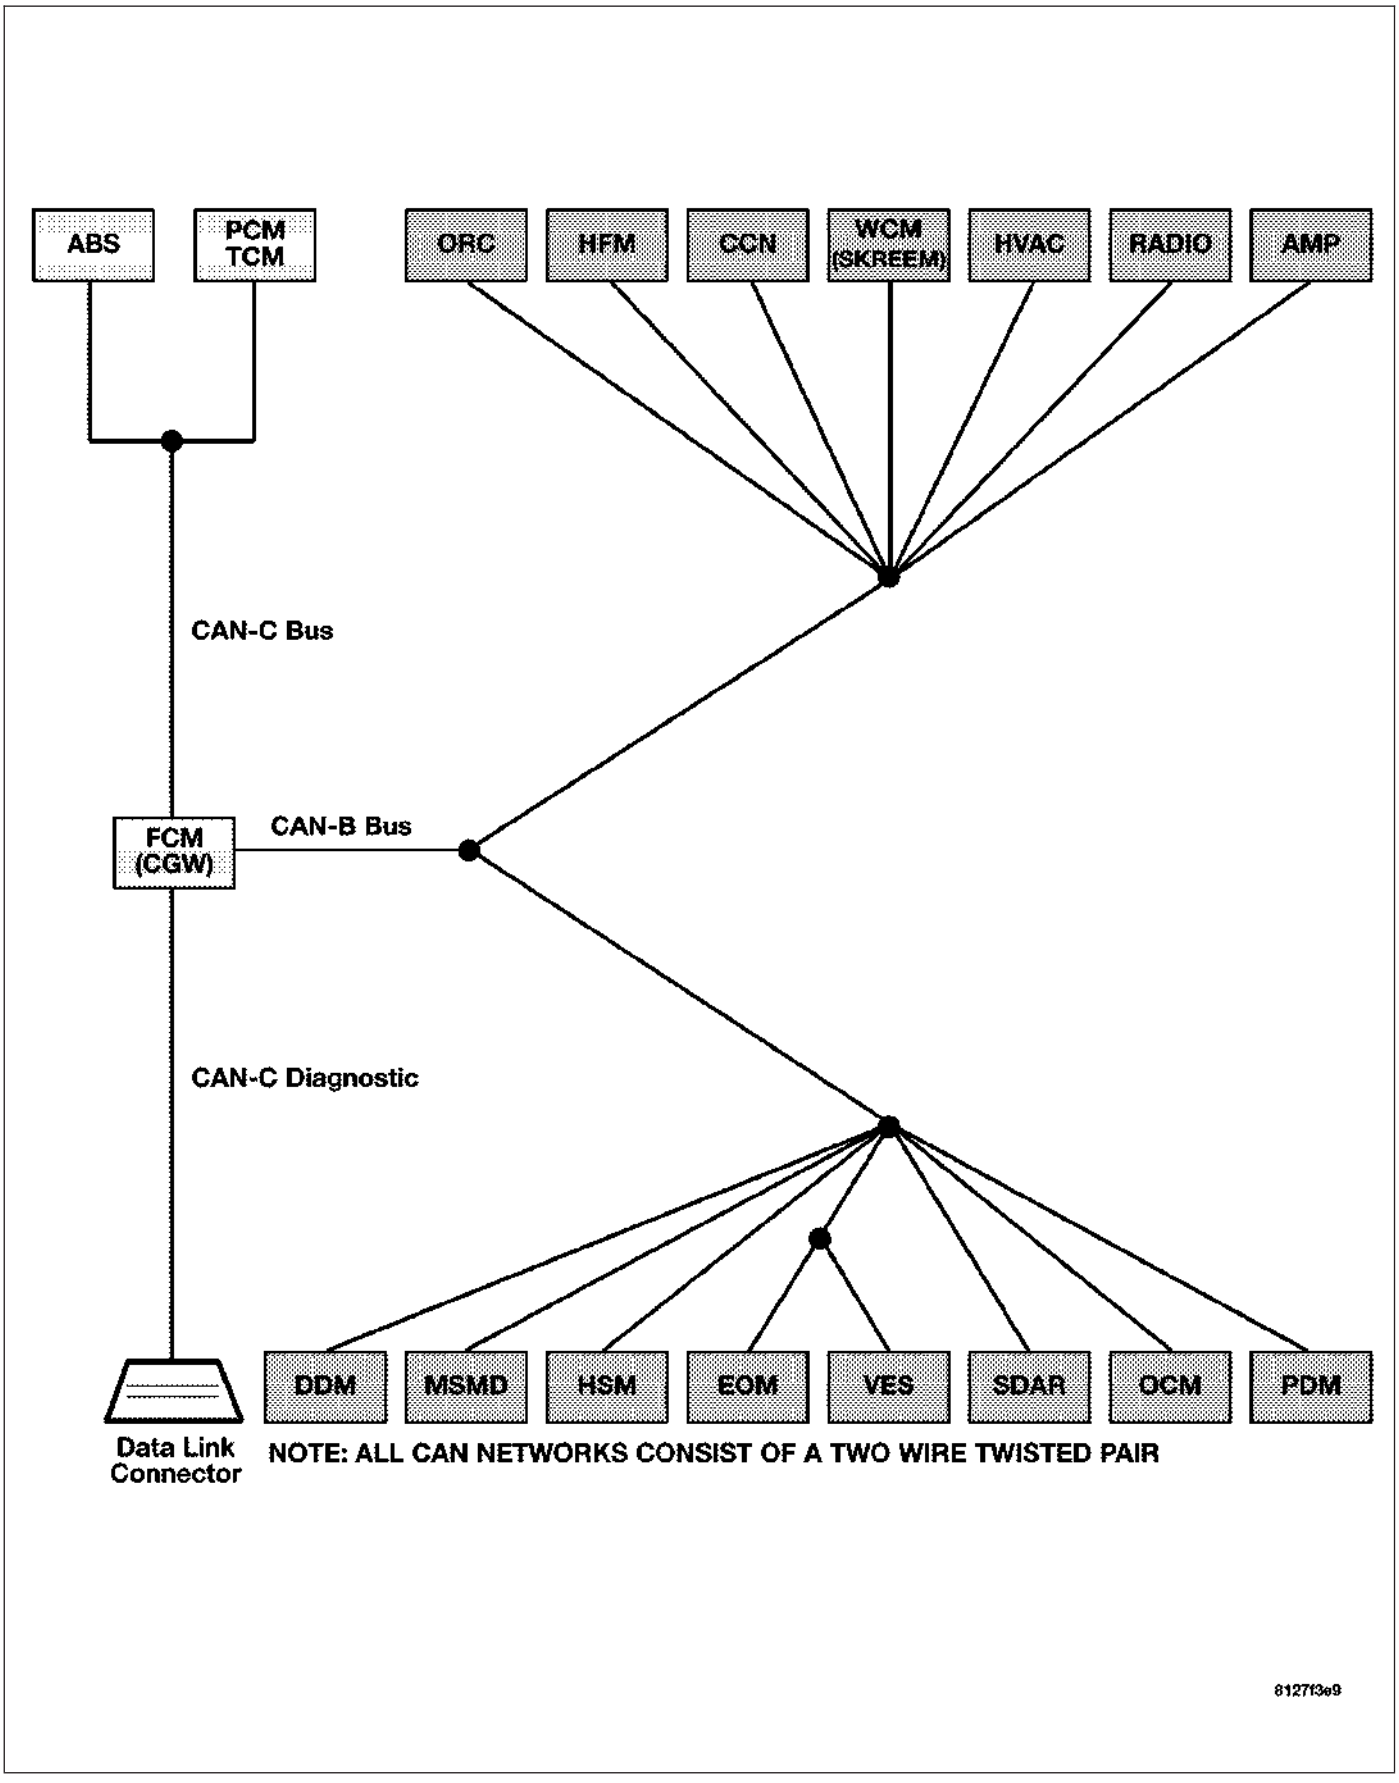
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the SDARS?

Yes >> Replace/update the Satellite Receiver in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set the DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE



U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the vehicle entertainment system (DVD player) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
MONITOR/DVD MEDIA SYSTEM (DVD PLAYER)
MONITOR/DVD MEDIA SYSTEM (DVD PLAYER) POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE VES IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the VES is active on the bus.

Is the VES active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

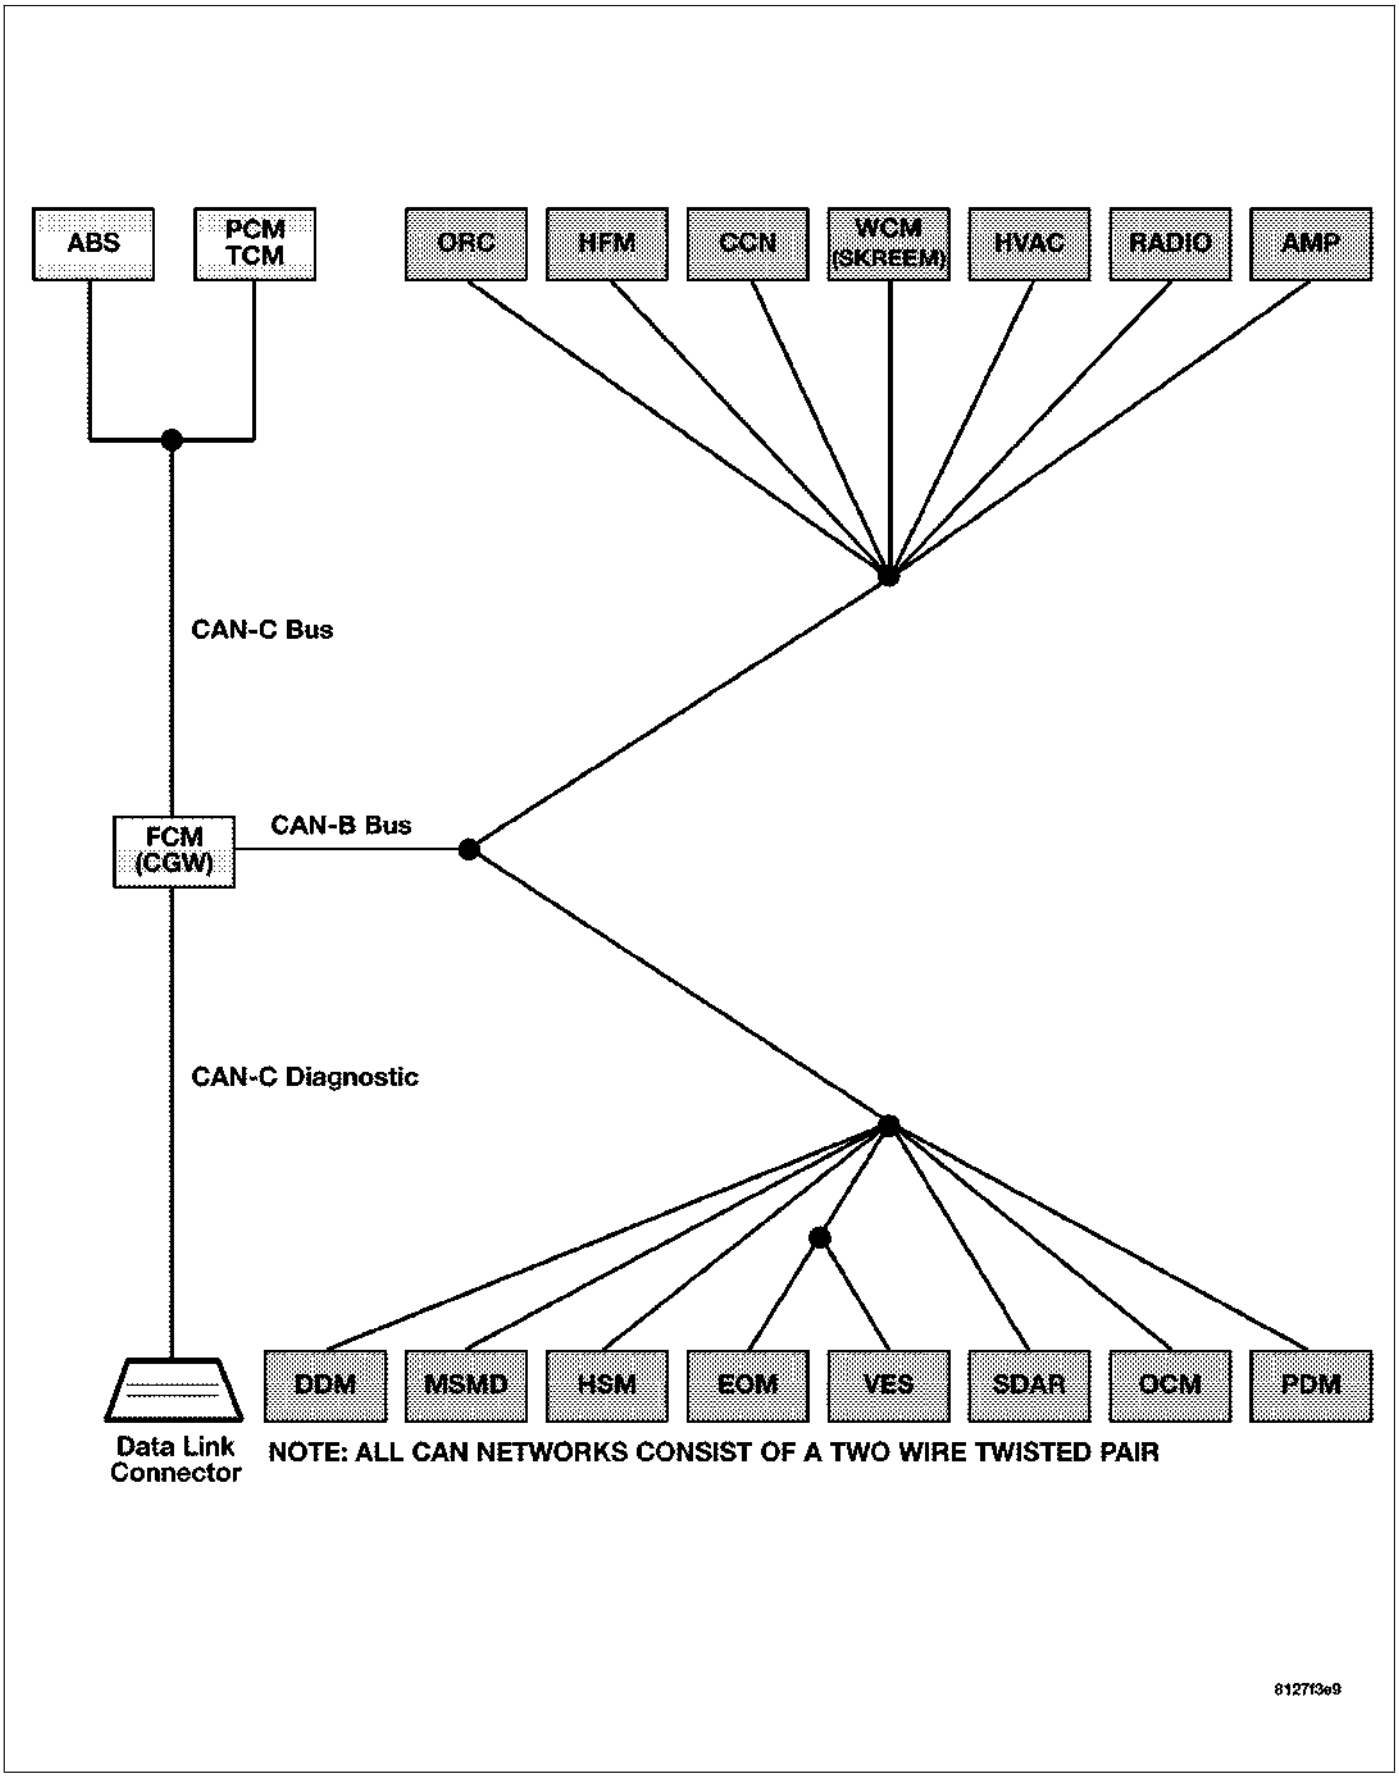
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the VES?

Yes >> Replace/update the Monitor/DVD Media System (DVD Player) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE



U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the HFM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
HANDS FREE MODULE
HANDS FREE MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)

3. VERIFY THAT THE HFM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HFM is active on the bus.

Is the HFM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

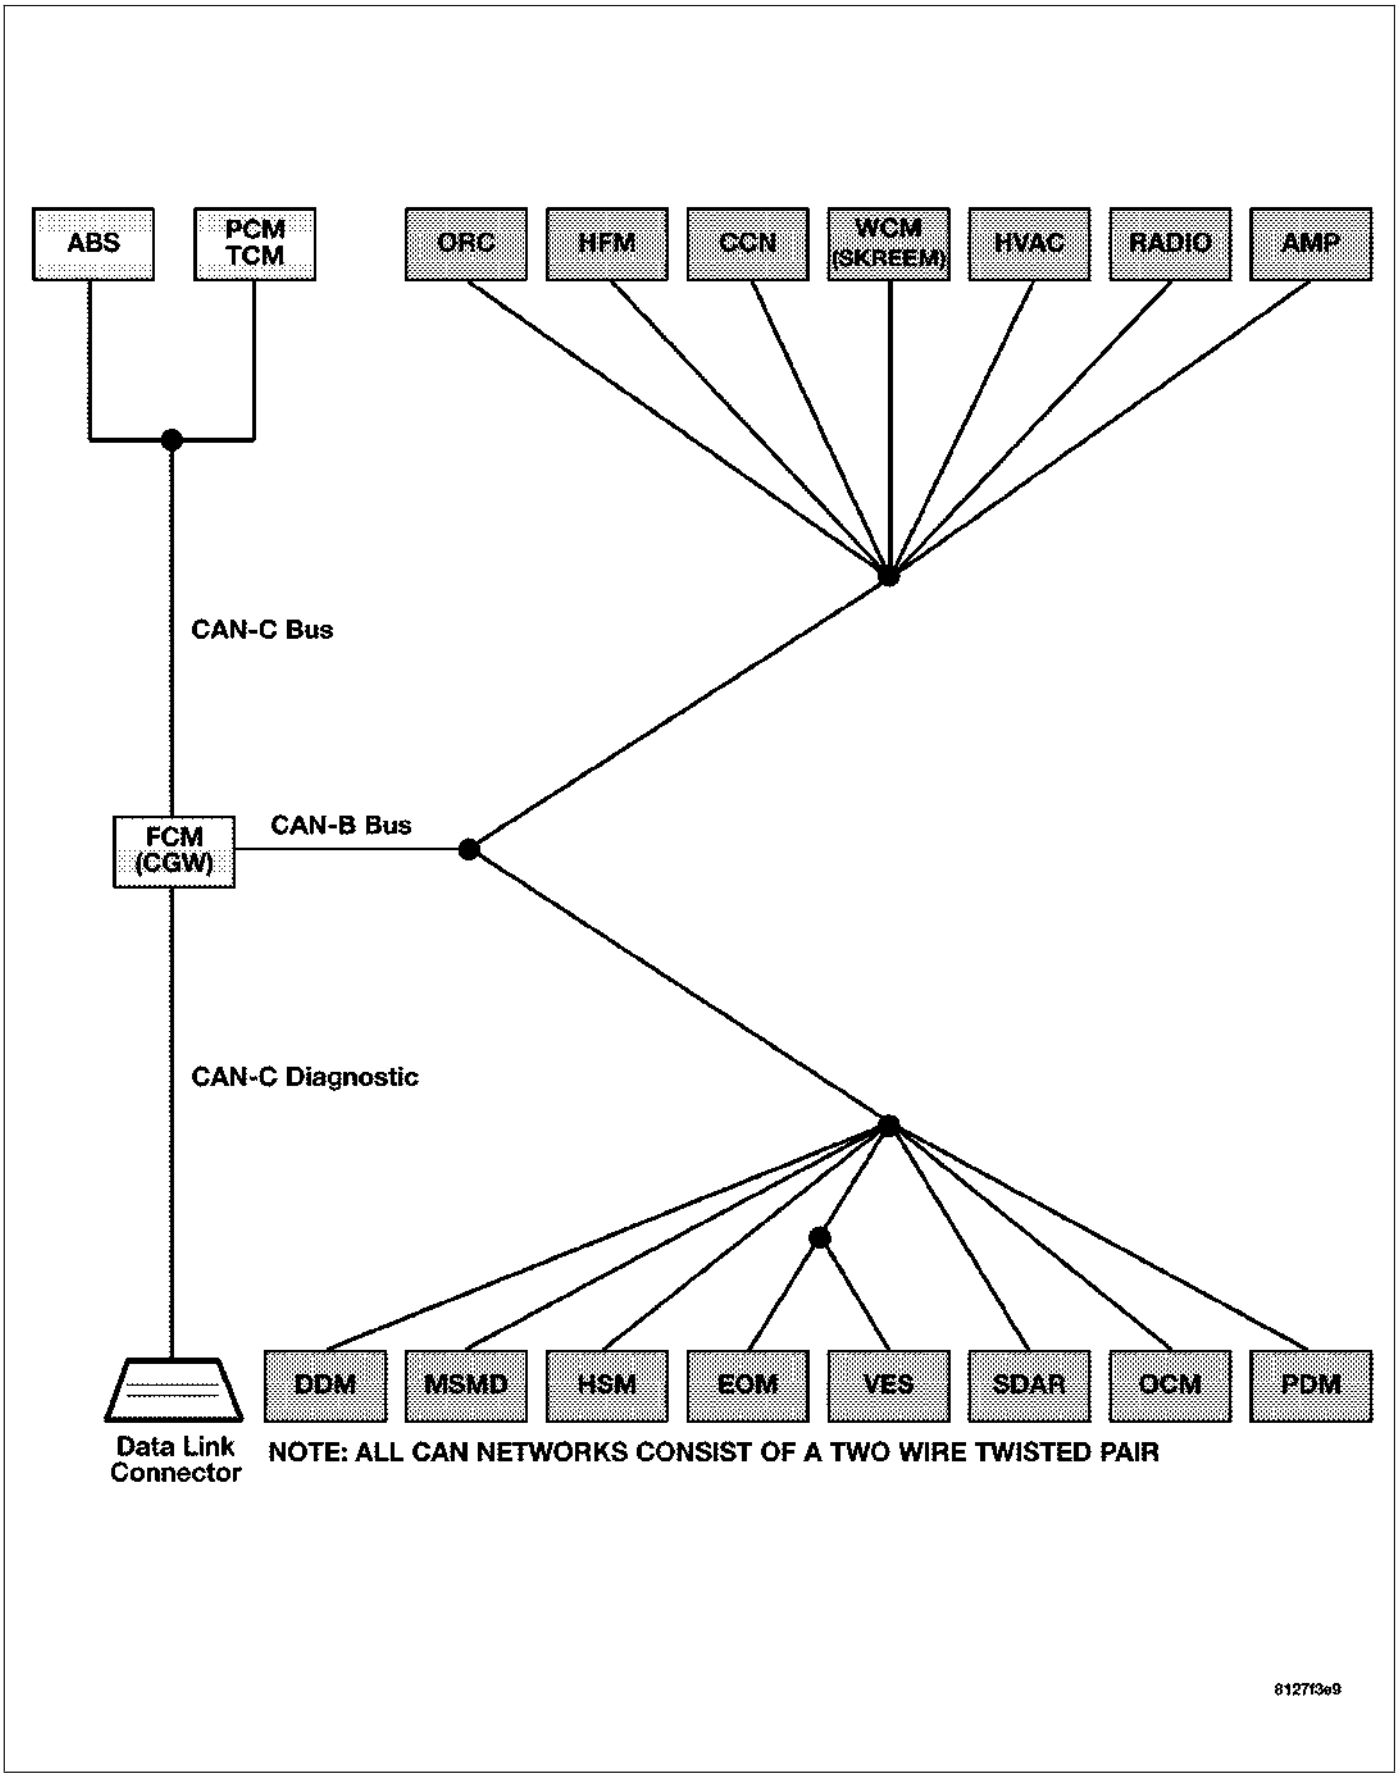
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the HFM?

Yes >> Replace/update the Hands Free Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE



U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the DDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
DRIVER MEMORY MIRROR MODULE
DRIVER MEMORY MIRROR MODULE POWER AND GROUND
MODULE THAT SET THE DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)

3. VERIFY THAT THE DDM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the DDM is active on the bus.

Is the DDM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

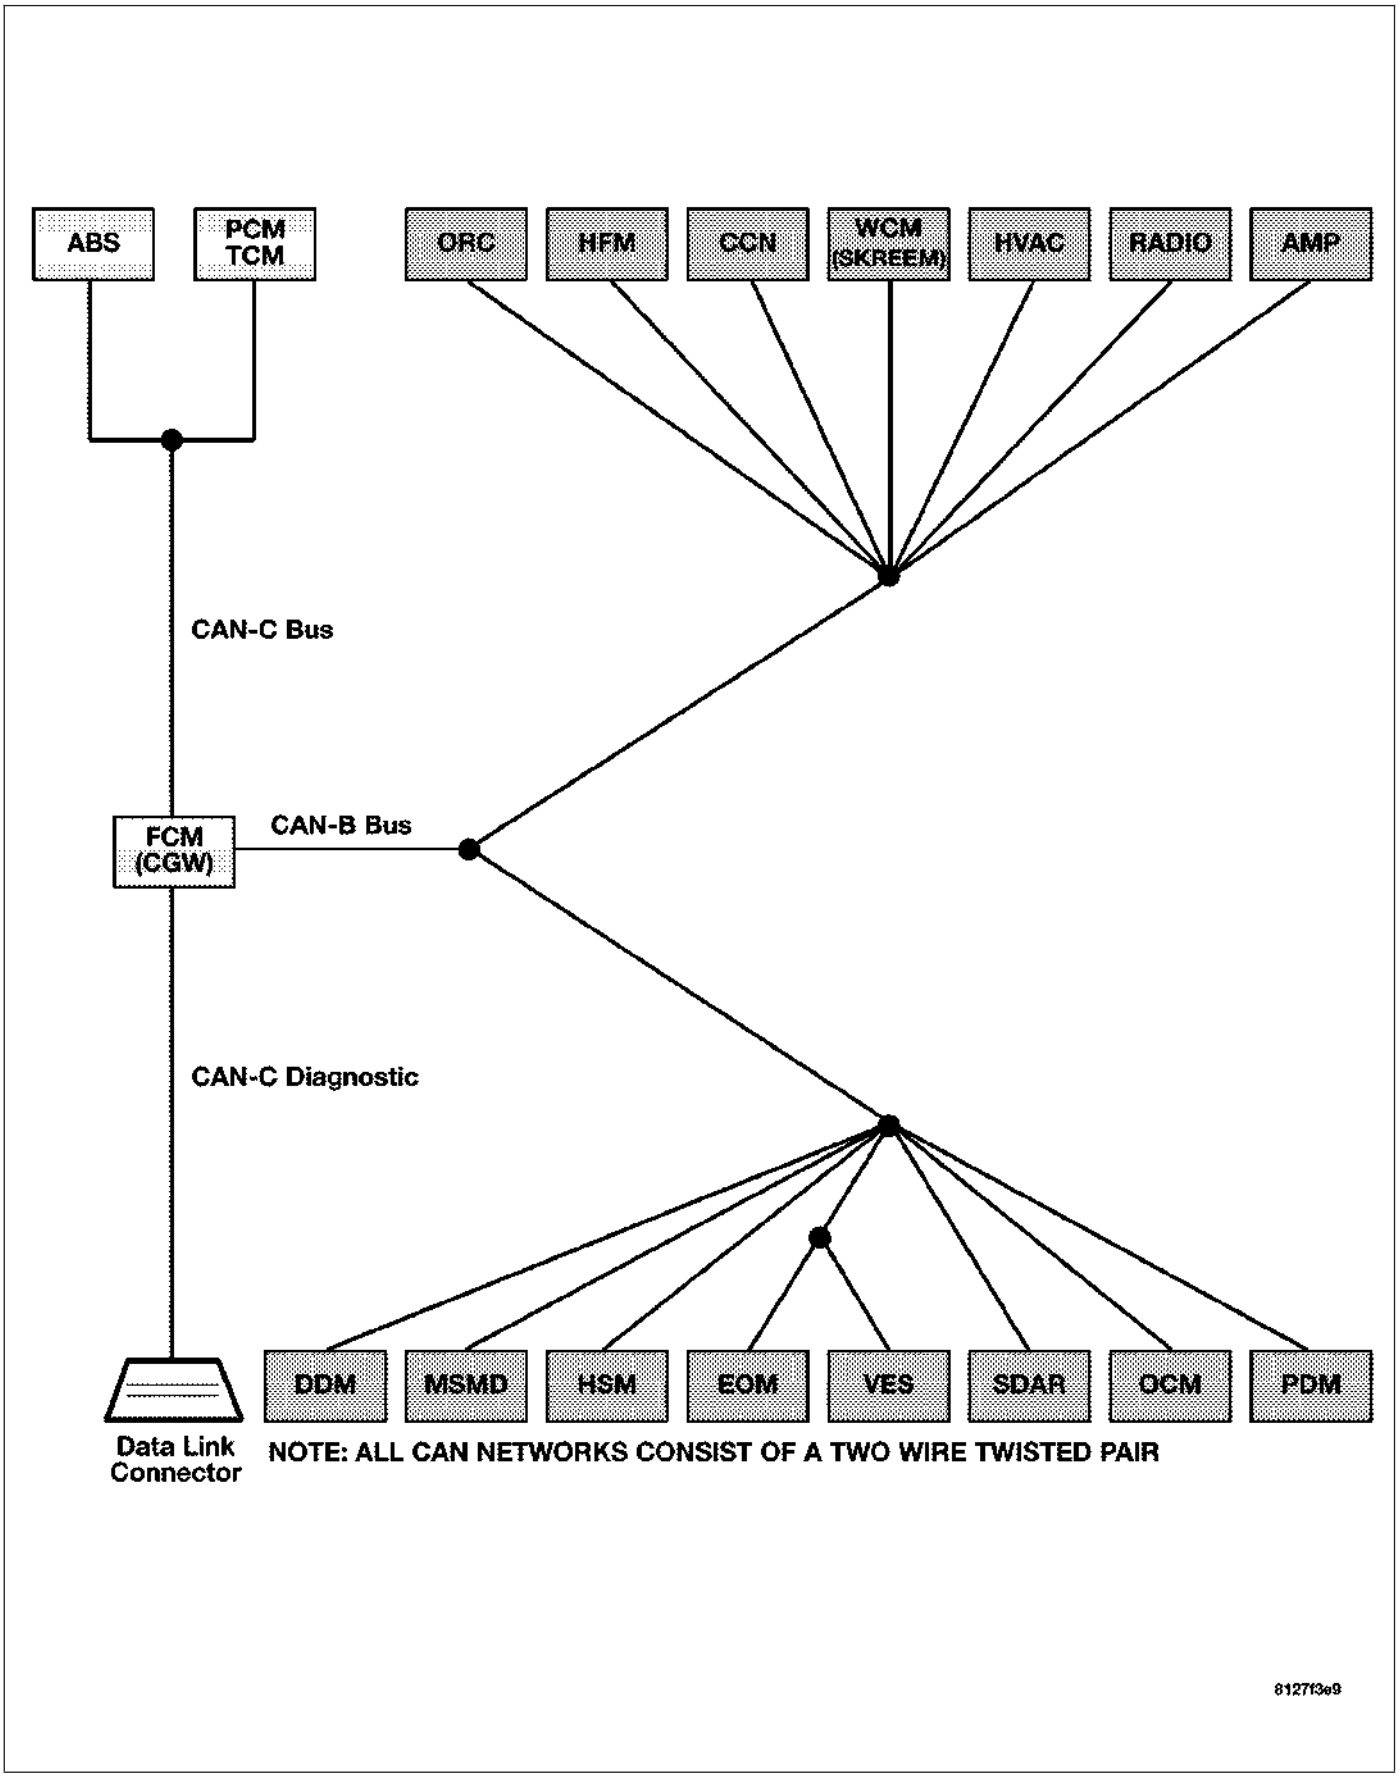
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the DDM?

Yes >> Replace/update the Driver Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE



U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the PDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
PASSENGER MEMORY MIRROR MODULE
PASSENGER MEMORY MIRROR MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)

3. VERIFY THAT THE PDM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PDM is active on the bus.

Is the PDM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

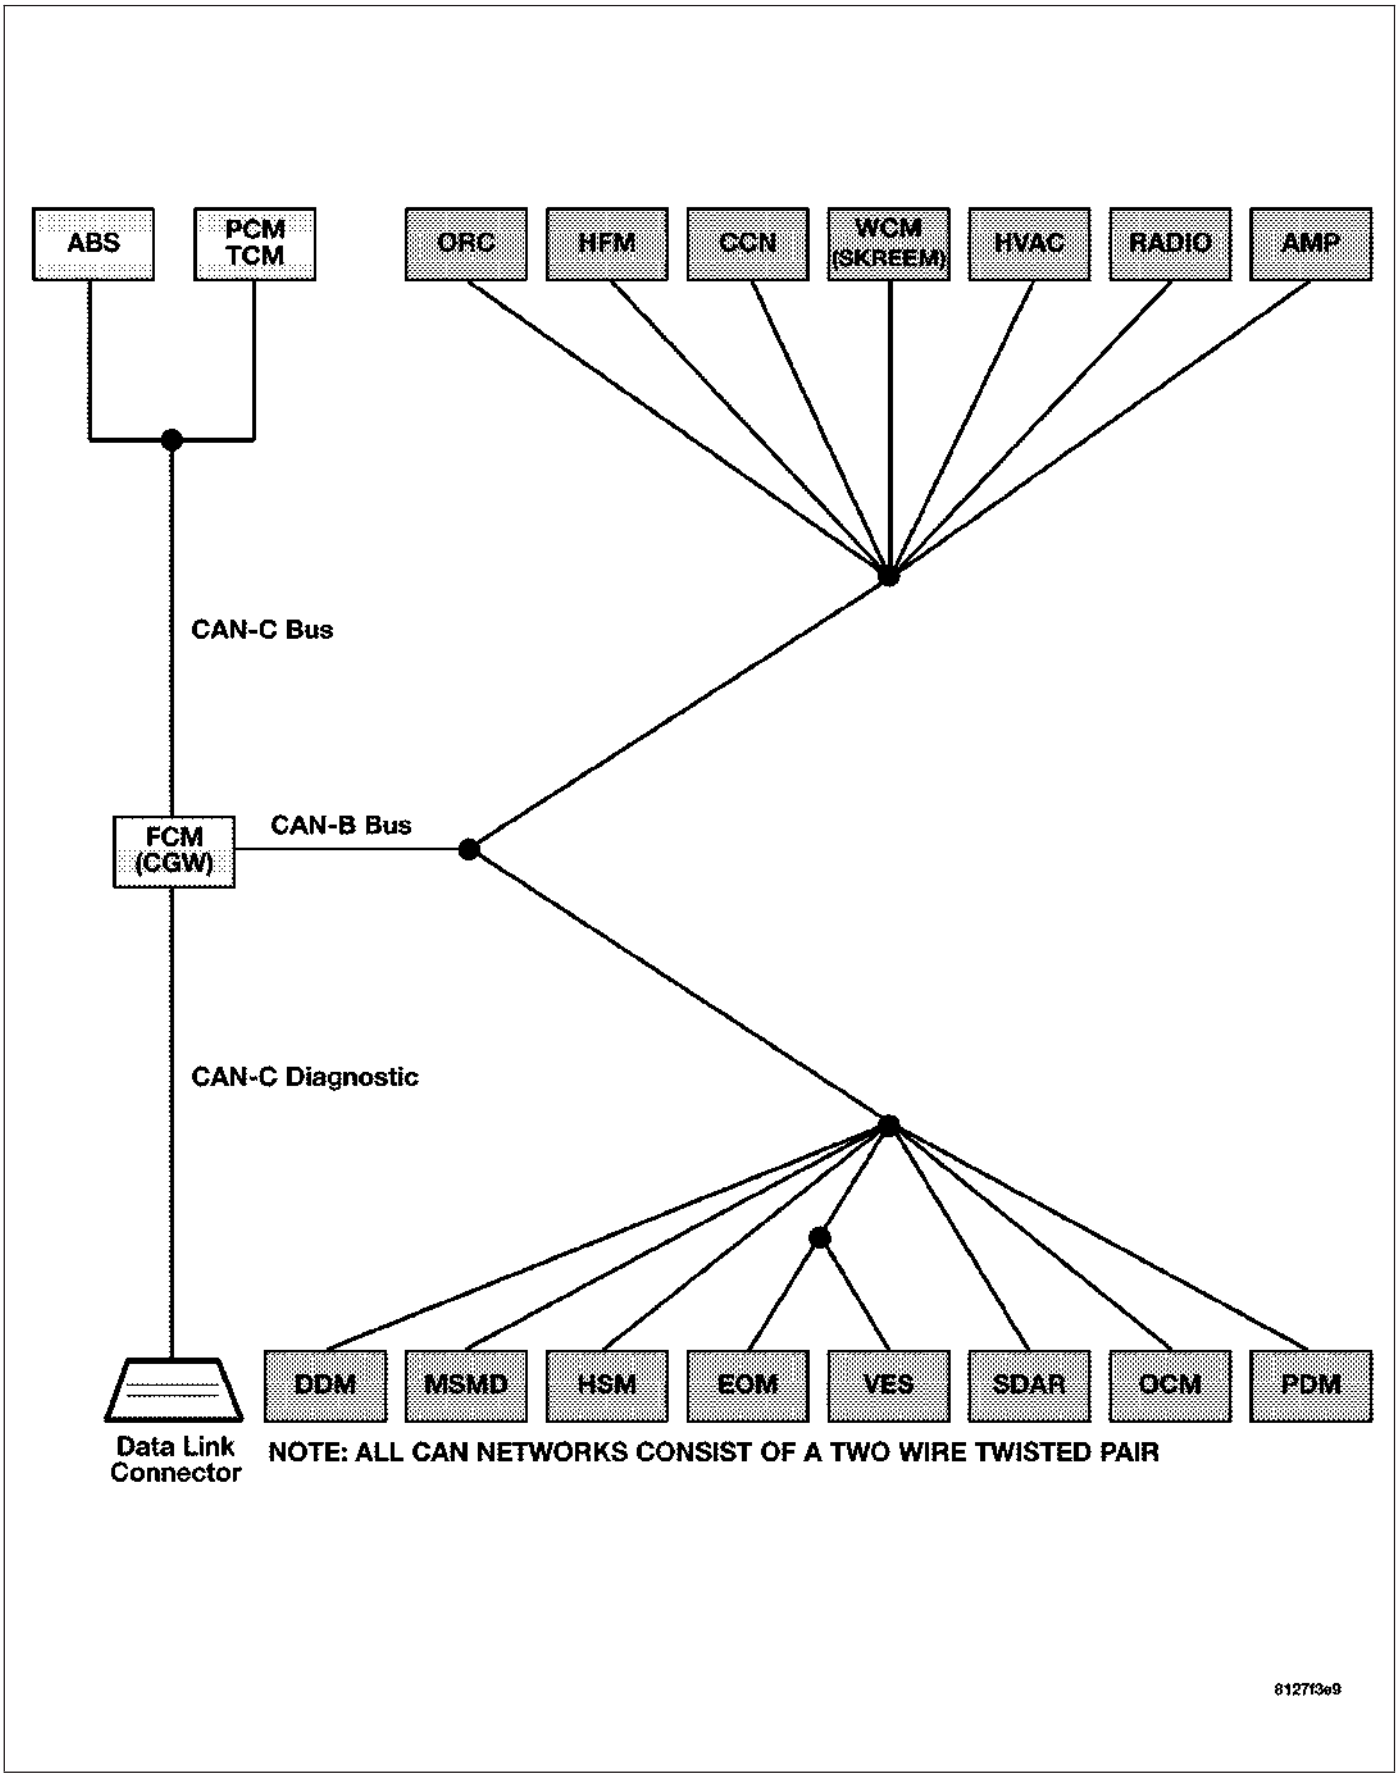
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the PDM?

Yes >> Replace/update the Passenger Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE



U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the HSM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
HEATED SEAT MODULE
HEATED SEAT MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE HSM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HSM is active on the bus.

Is the HSM active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

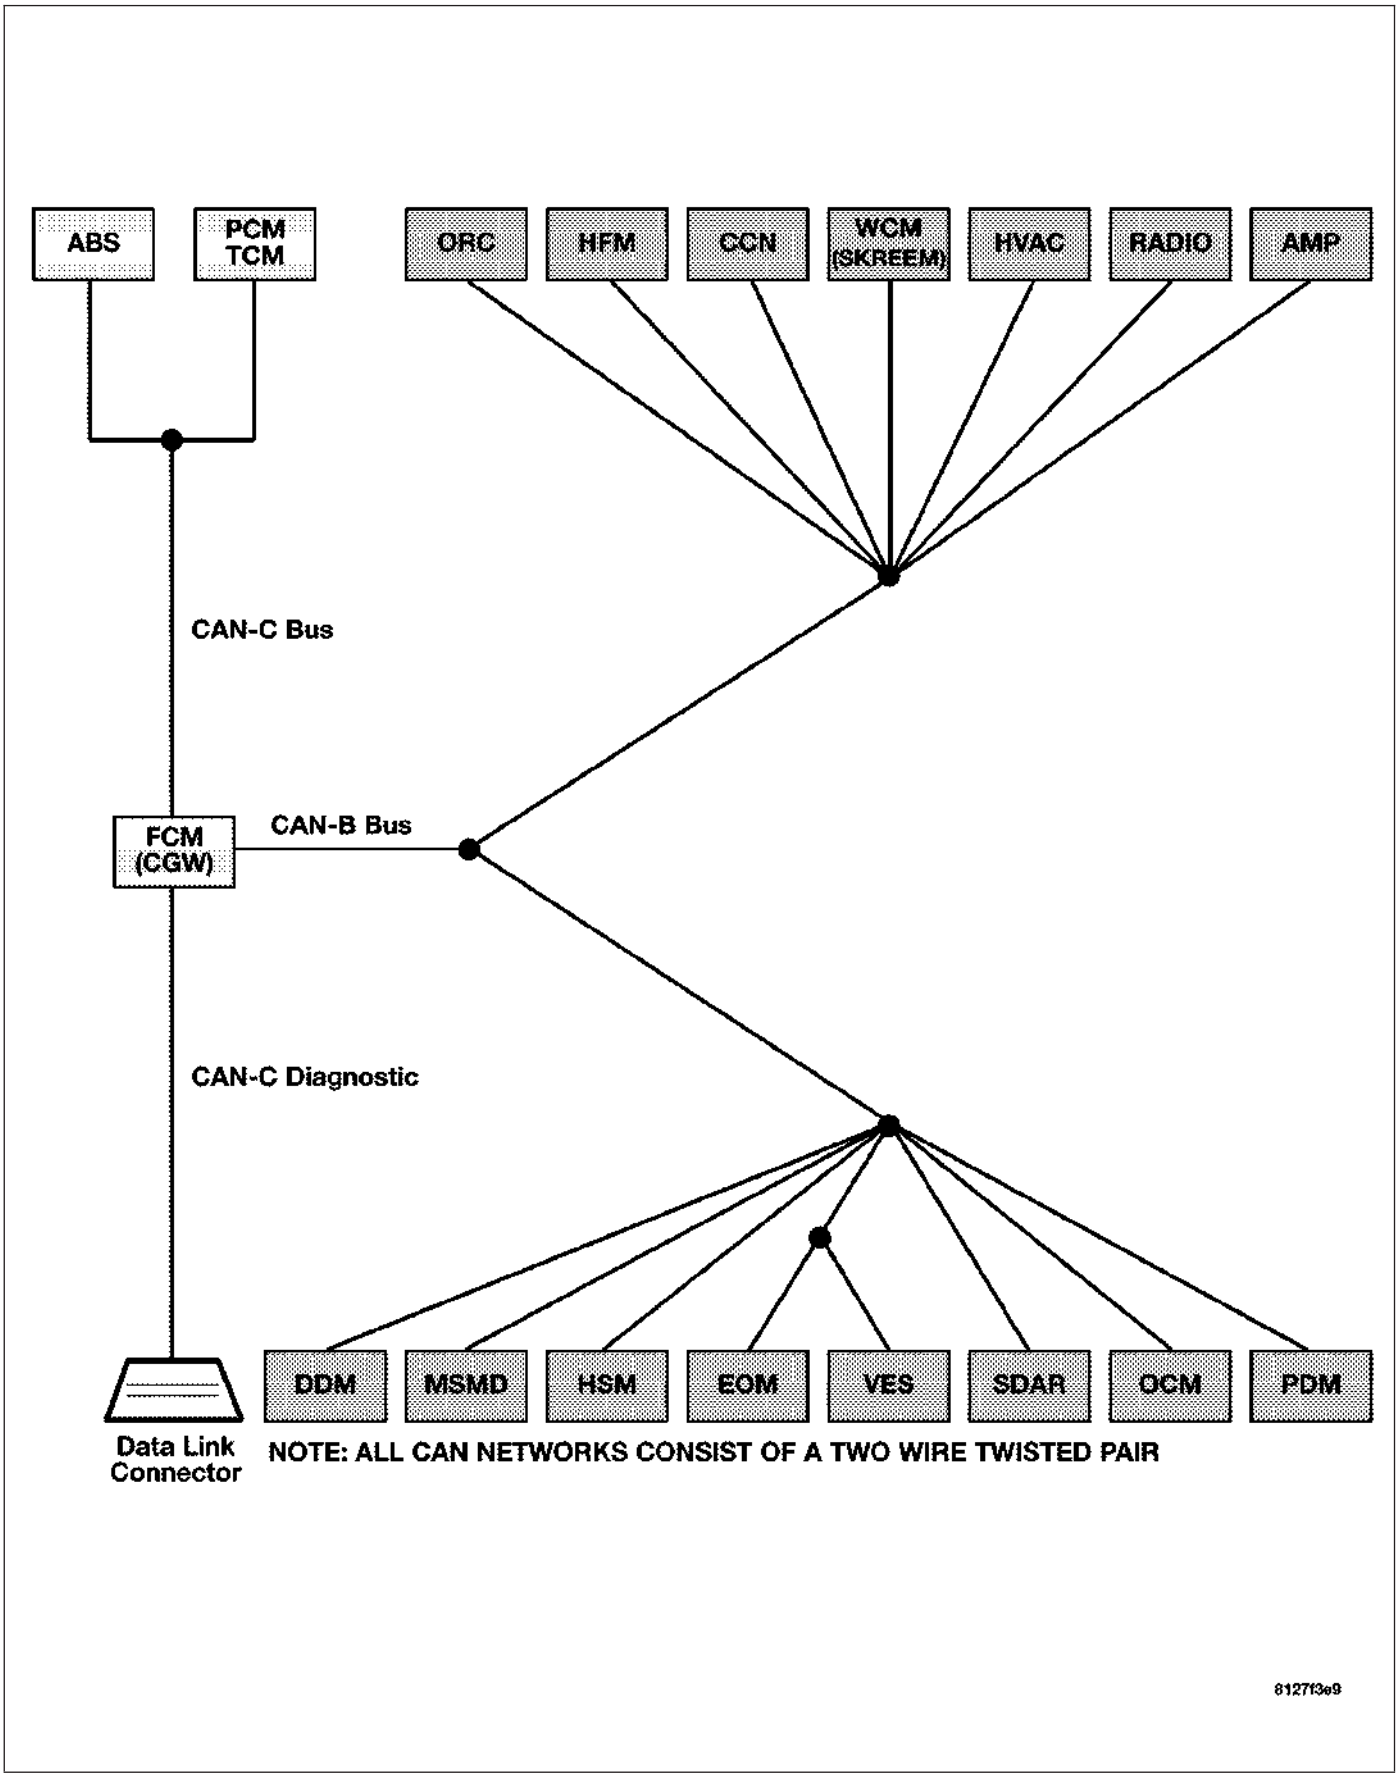
With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the HSM?

Yes >> Replace/update the Heated Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE



U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from the MSMD for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SEAT MEMORY MODULE
SEAT MEMORY MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE MSMD IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the MSMD is active on the bus.

Is the MSMD active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs "Logged Against" the MSMD?

Yes >> Replace/update the Seat Memory Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U1108-ADDITIONAL CAN B ECU DETECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The Front Control Module detects an additional CAN B module and requires a reconfiguration.

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN B BUS NETWORK

Diagnostic Test

1. RECONFIGURE THE FRONT CONTROL MODULE

Turn the ignition on.

With the scan tool, select network view and press the gateway button. This will list the CAN modules on the vehicle. Read and record the listed modules.

With the scan tool, select FCM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the FCM.

With the scan tool, erase DTC's.

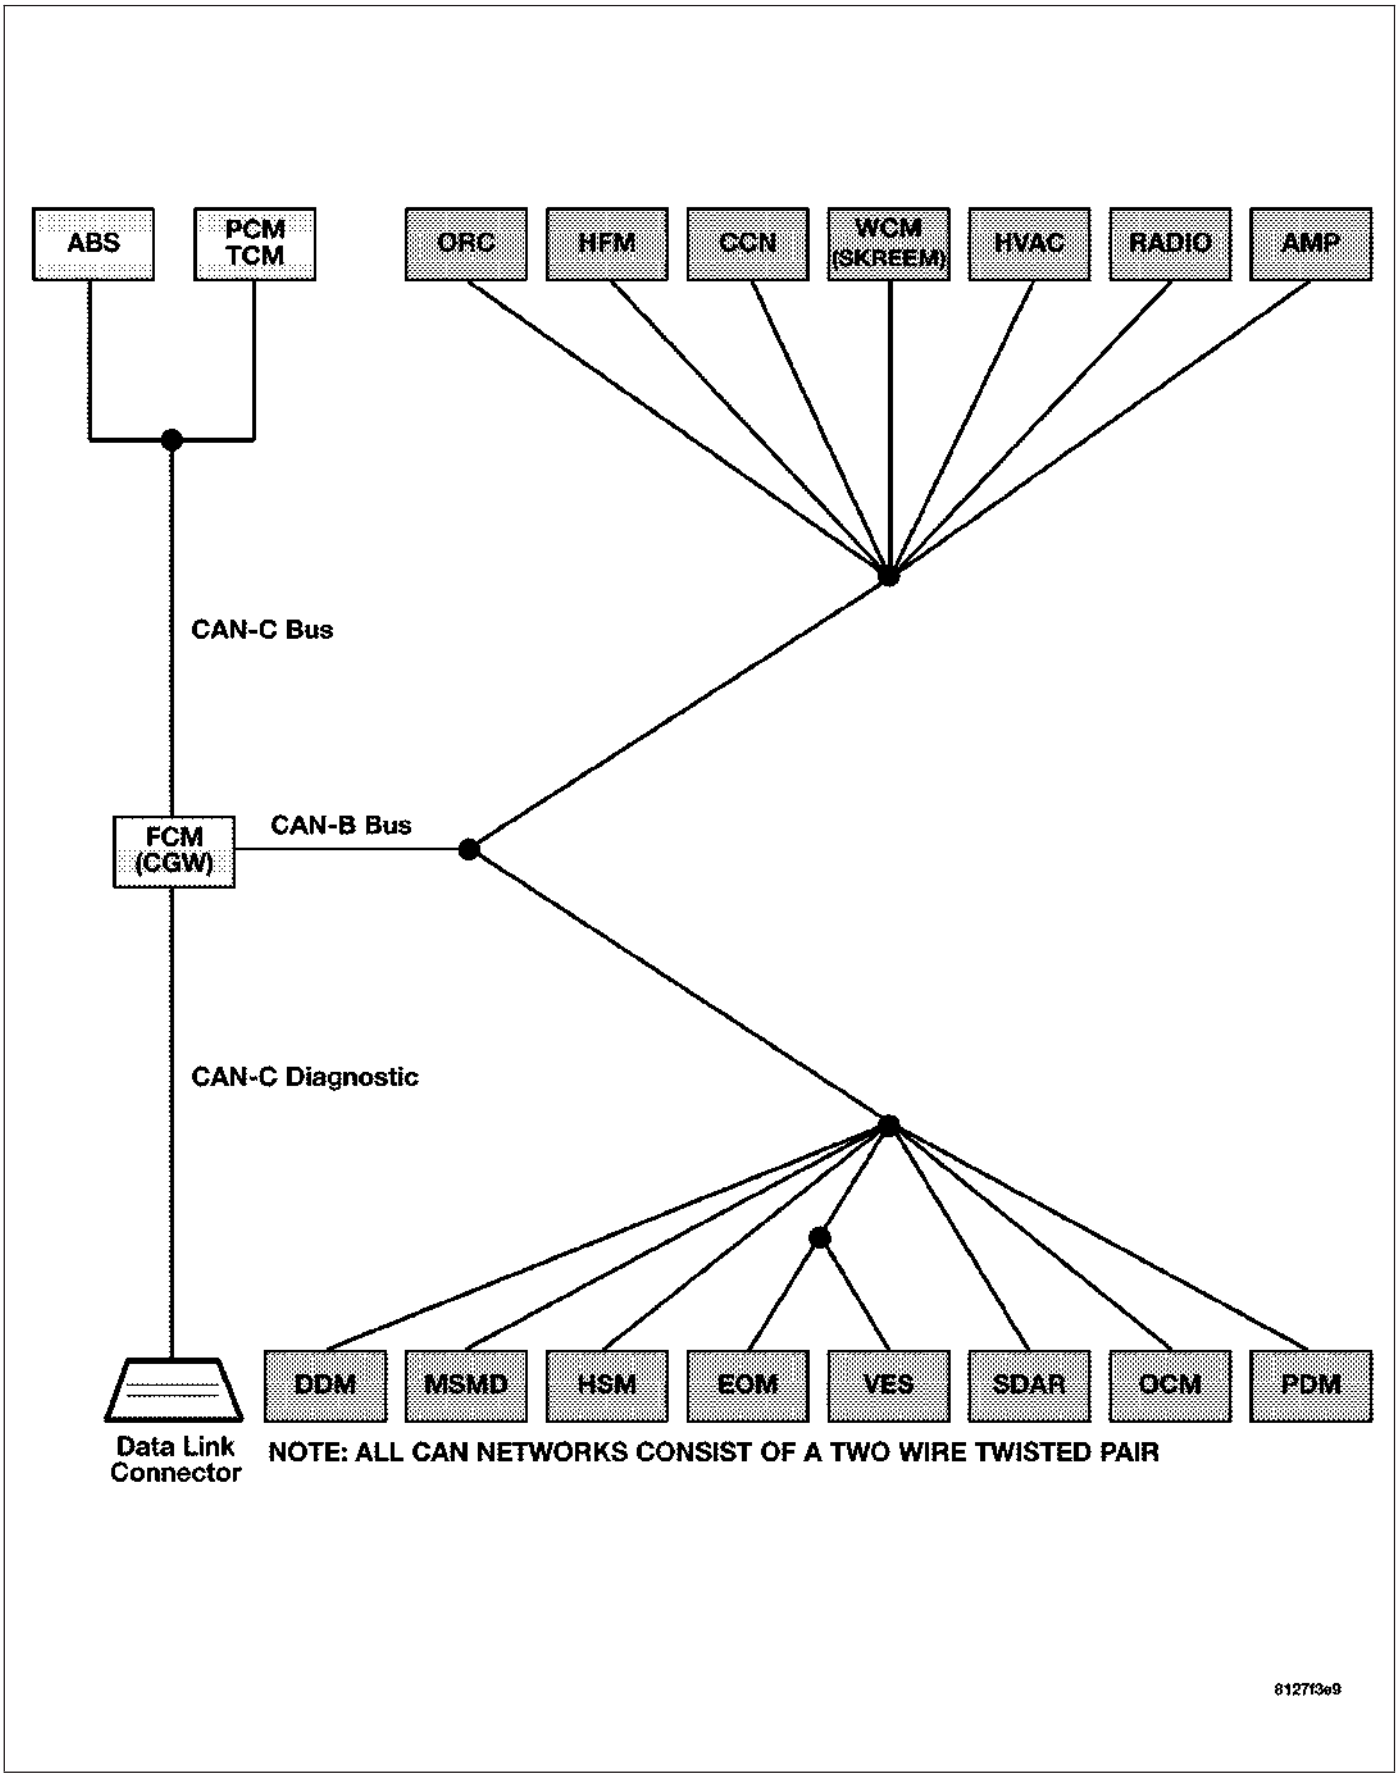
Cycle the ignition from on to off 3 times and read the active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Retest system and attempt to reconfigure the FCM.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair is complete.
Perform BODY VERIFICATION TEST – VER 1.

*STORED LOST COMMUNICATION DTCS



***STORED LOST COMMUNICATION DTCS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**
  Bus messages not received from for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSBS

Diagnostic Test

1. VERIFY DTC IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read stored DTCs.

Is this DTC stored?

Yes >> Go To 2

No >> Diagnose the active DTC. Refer to the table of contents for a list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are their any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, FCM configuration DTCs present with match environmental data?

Yes >> These DTCs may have been the result of other service procedures performed. Clear DTCs. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

***STORED LOST COMMUNICATION DTCS (CONTINUED)**

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC-WIRING CONCERNS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Is there more than one ECU with stored DTCs "Logged Against" the module and one or more lost communication DTCs stored in the offending module?

Yes >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No >> Go To 4

---

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC-OFFENDING MODULE

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Is there more than one ECU with stored DTCs "Logged Against" the module and NO lost communication DTCs stored in the offending module?

Yes >> Check for TSB related to this offending module.

No >> Go To 5

---

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC-REPORTING MODULE

Turn the ignition on.

With the scan tool, select Network Diagnostics.

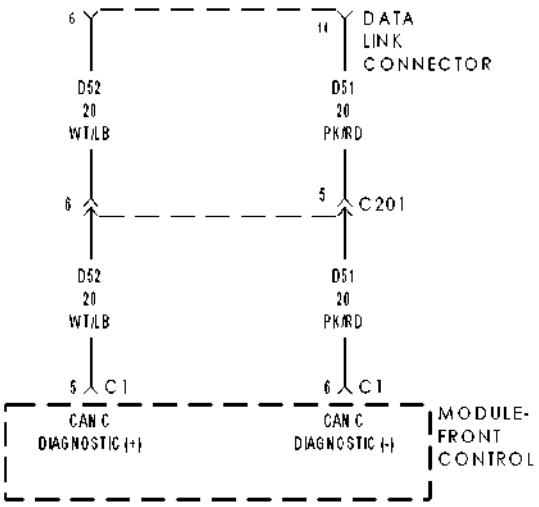
Is there ONLY ONE ECU with stored DTCs "Logged Against" the module?

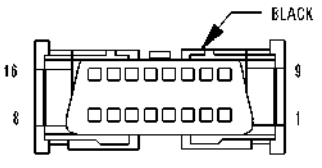
Yes >> Check for TSB related to the module that set this DTC.

No >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

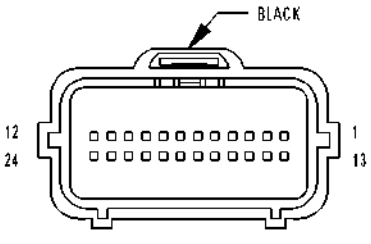
---

*CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH





DATA LINK
CONNECTOR



MODULE-FRONT
CONTROL C1

81a99a36

***CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the FCM.
- **Set Condition:**
  The scan tool has detected a shorted high condition on either or both CAN C Diagnostic circuits.

Possible Causes
(D52) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO VOLTAGE
(D51) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO VOLTAGE
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

2. CAN C DIAGNOSTIC CIRCUITS SHORTED TO VOLTAGE

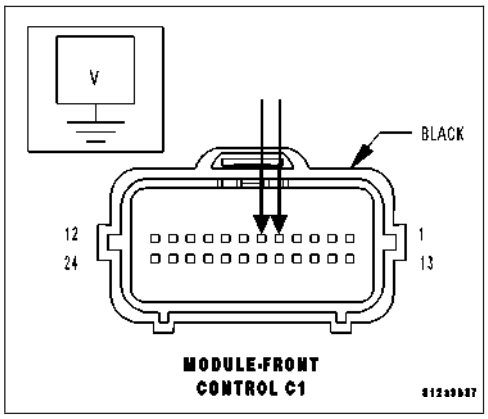
Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Turn the ignition on.

Measure the voltage of the CAN C Diagnostic circuits.



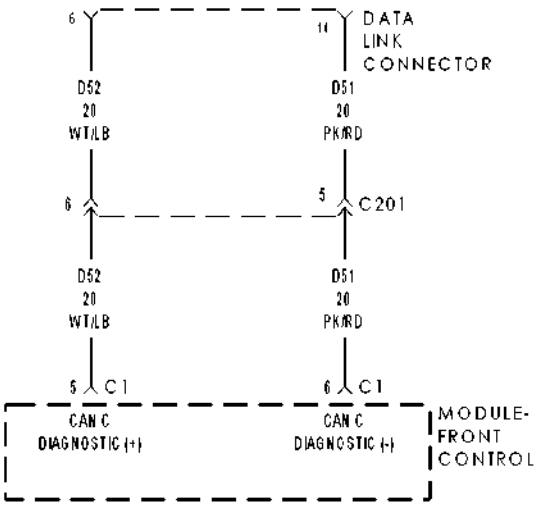
Is the voltage above 6.0 volts for either circuit?

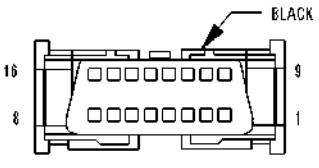
Yes >> Repair the CAN C Diagnostic circuits for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

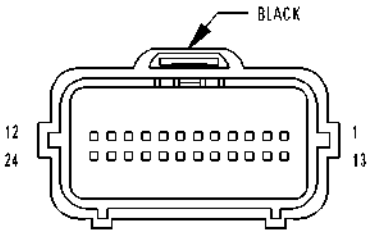
---

*CAN C DIAGNOSTIC (+) CIRCUIT LOW





DATA LINK
CONNECTOR



MODULE-FRONT
CONTROL C1

81209e36

***CAN C DIAGNOSTIC (+) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the FCM.
- **Set Condition:**
  The scan tool has detected a shorted low condition on the (D52) CAN C Diagnostic (+) circuit.

Possible Causes
(D52) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

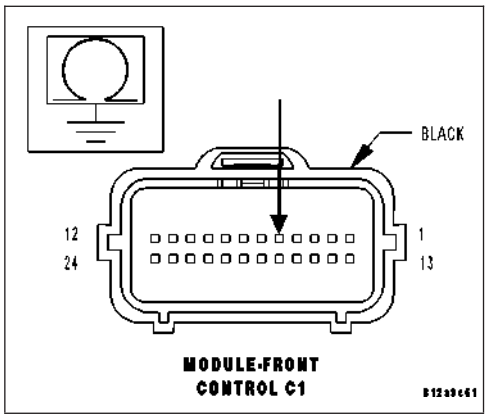
2. (D52) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D52) CAN C Diagnostic (+) circuit.



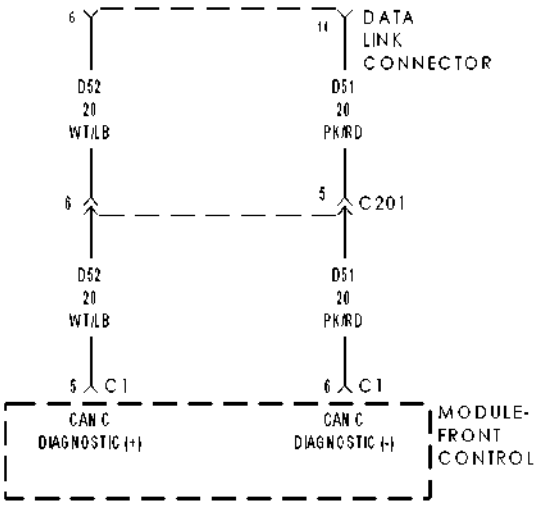
Is the resistance below 100.0 ohms?

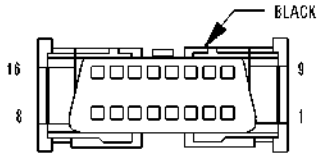
Yes >> Repair the (D52) CAN C Diagnostic (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

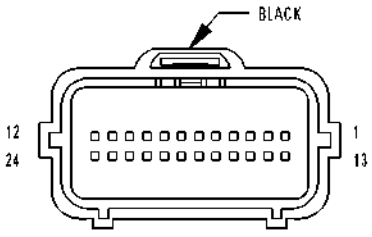
---

*CAN C DIAGNOSTIC (-) CIRCUIT LOW





DATA LINK
CONNECTOR



MODULE-FRONT
CONTROL C1

***CAN C DIAGNOSTIC (-) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the scan tool queries the FCM.
- **Set Condition:**
  The scan tool has detected a shorted low condition on the (D51) CAN C Diagnostic (-) circuit.

Possible Causes
(D51) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

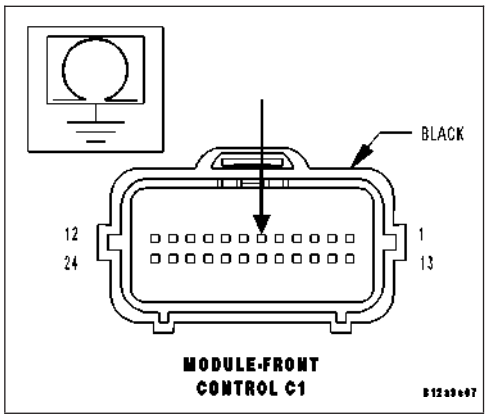
2. (D51) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D51) CAN C Diagnostic (-) circuit.



Is the resistance below 100.0 ohms?

Yes >> Repair the (D51) CAN C Diagnostic (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

*BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)

2. (D52) CAN C DIAGNOSTIC (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

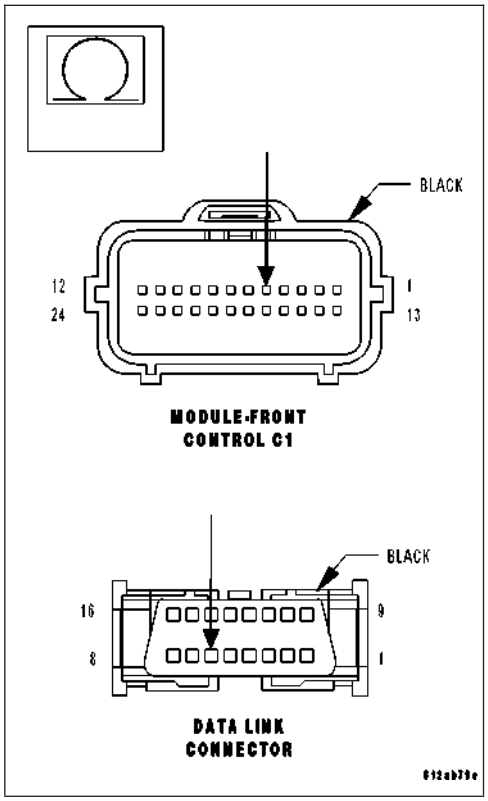
NOTE: Check the connectors at both the DLC and the FCM.

Measure the resistance of the (D52) CAN C Diagnostic (+) circuit between the FCM connector and the DLC.

Is the resistance below 5.0 ohms?

Yes >> Go To 3

No >> Repair the (D52) CAN C Diagnostic (+) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.



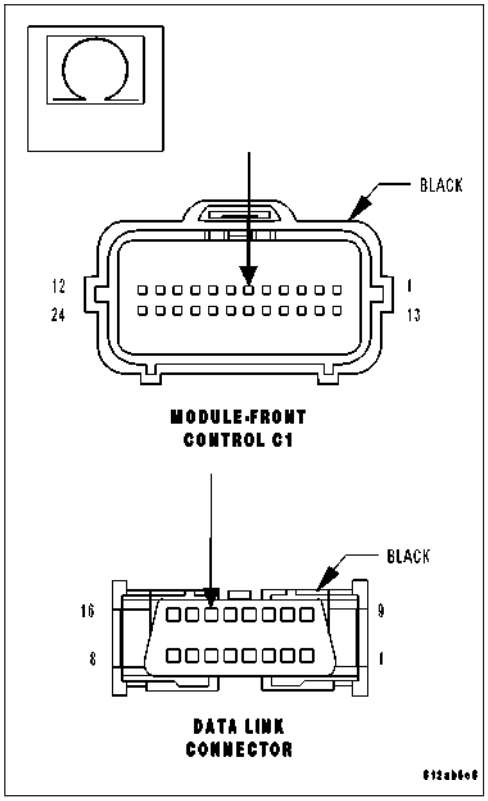
3. (D51) CAN C DIAGNOSTIC (-) CIRCUIT OPEN

Measure the resistance of the (D51) CAN C Diagnostic (-) circuit between the FCM connector and the DLC.

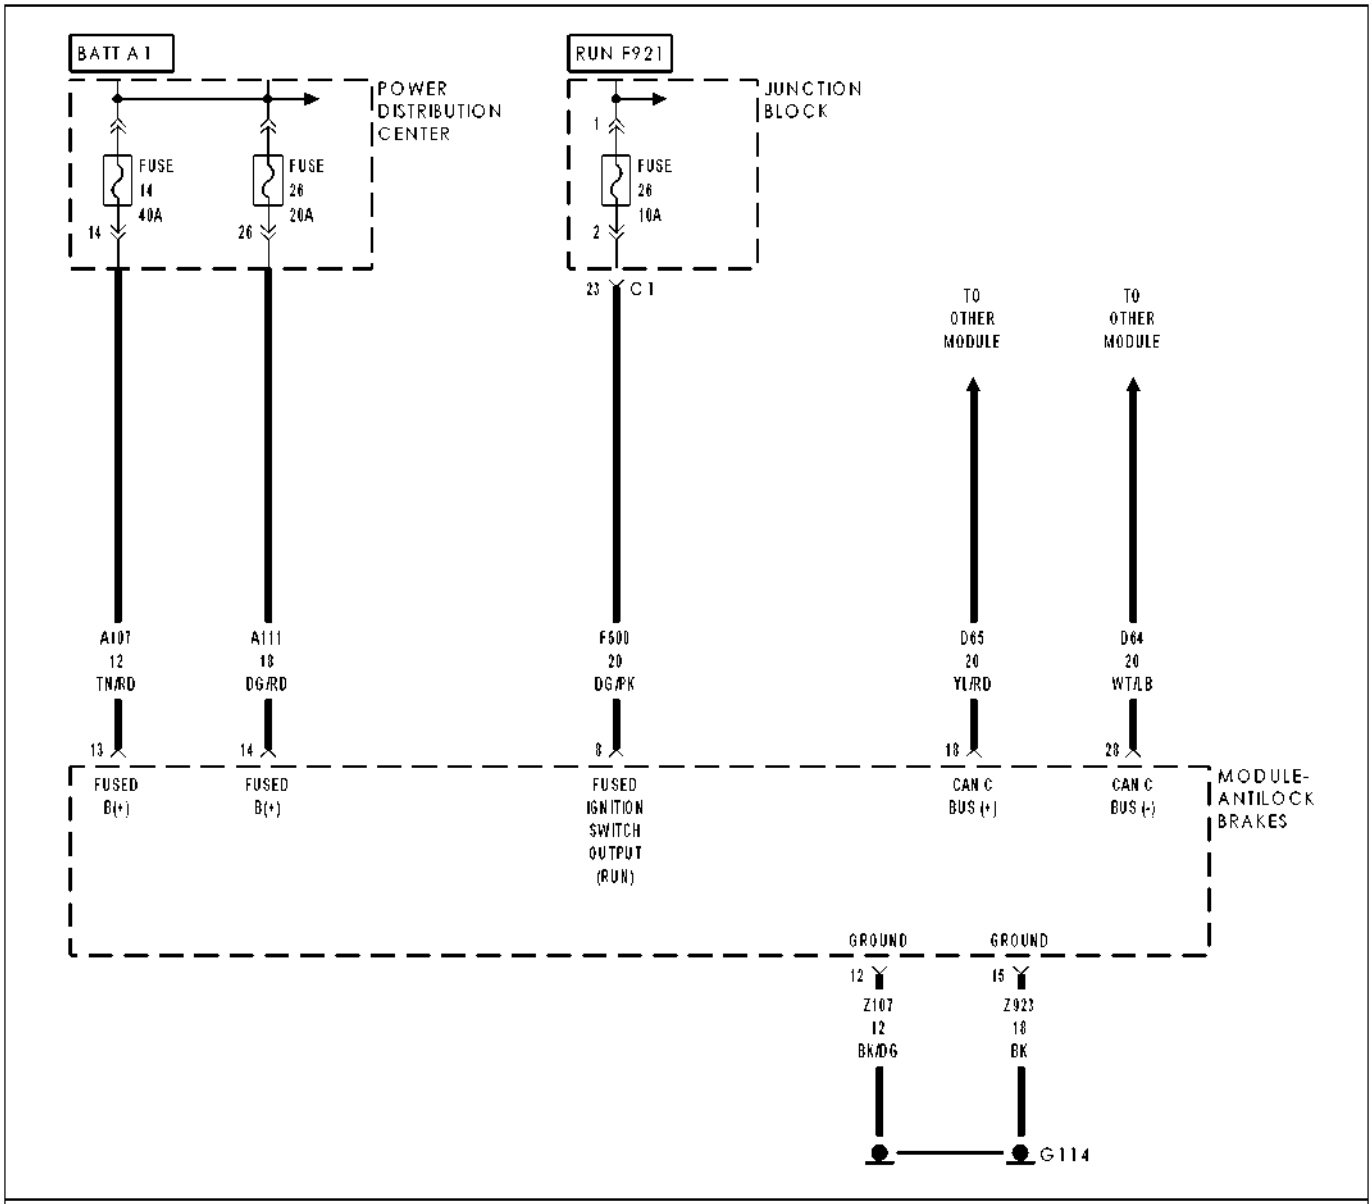
Is the resistance below 5.0 ohms?

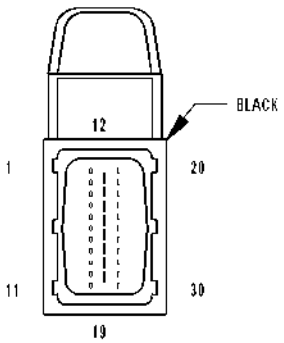
Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D51) CAN C Diagnostic (-) circuit for an open. Perform BODY VERIFICATION TEST - VER 1.



*NO RESPONSE FROM ABS





MODULE-ANTILOCK BRAKES

81c046e5

***NO RESPONSE FROM ABS (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z107) (Z923) GROUND CIRCUIT OPEN
(F500) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ANTILOCK BRAKE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

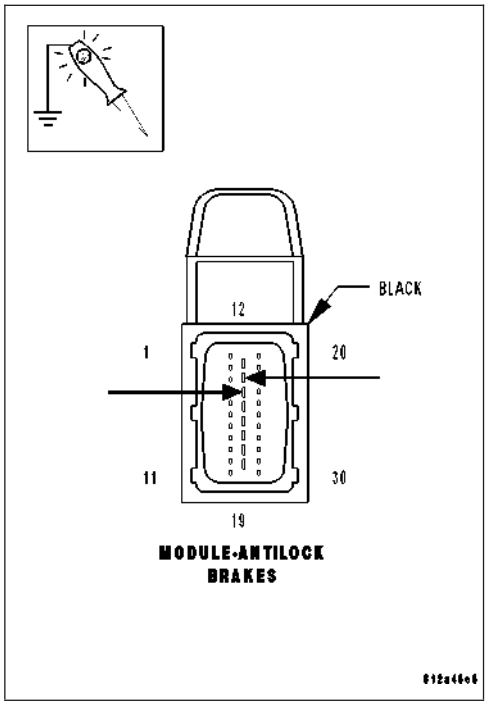
***NO RESPONSE FROM ABS (CONTINUED)**

2. (A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Using a 12-volt test light connected to ground, check each (A107) and (A111) Fused B(+) circuit.



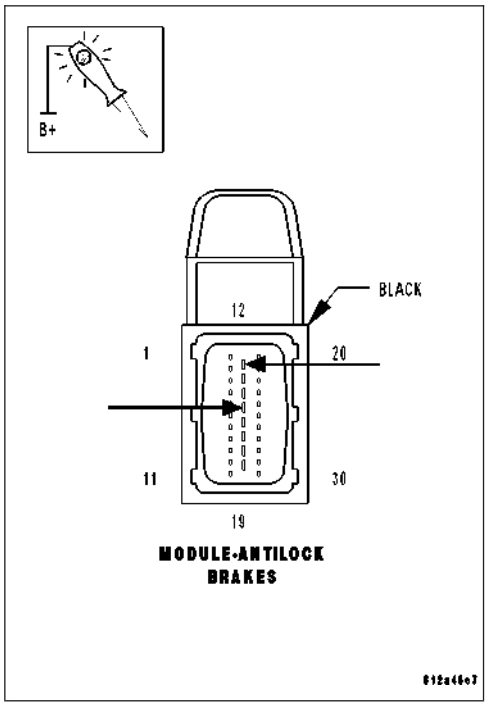
Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the Fused B(+) circuit for an open or short. Perform ABS VERIFICATION TEST - VER 1.

3. (Z107) (Z923) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z107) and (Z923) ground circuit.



Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ABS (CONTINUED)**

4. (F500) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

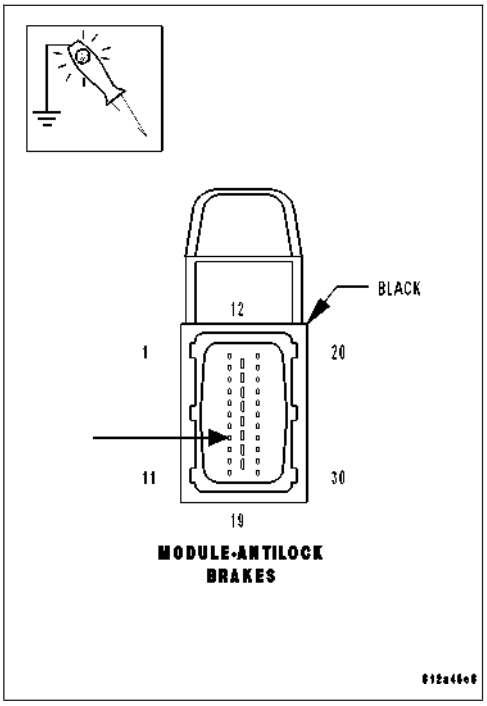
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F500) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the Fused Ignition Switch Output circuit for an open or short.
Perform ABS VERIFICATION TEST - VER 1..



5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

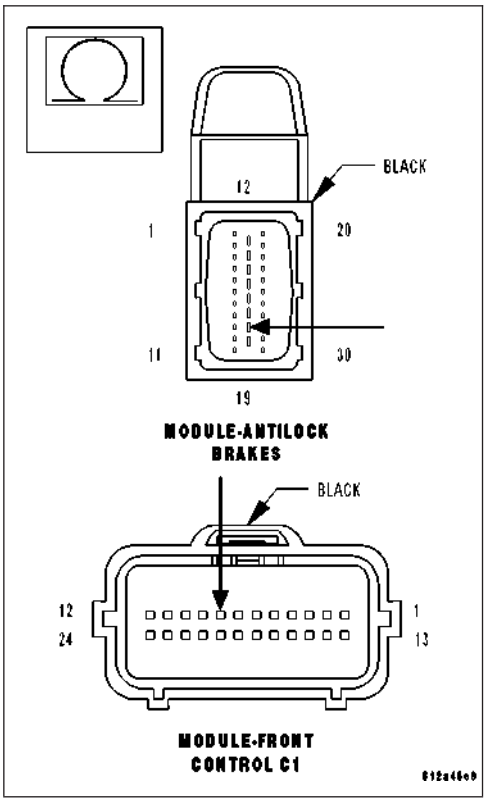
Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes >> Go To 6

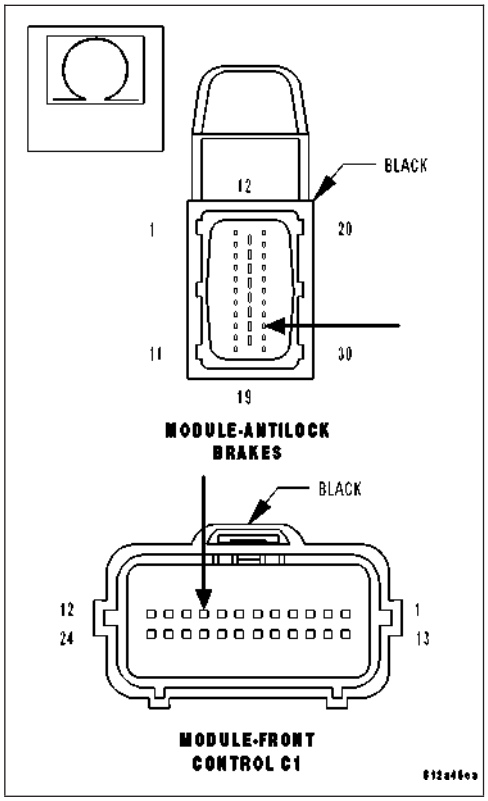
No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.



***NO RESPONSE FROM ABS (CONTINUED)**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the Antilock Brake Module connector.

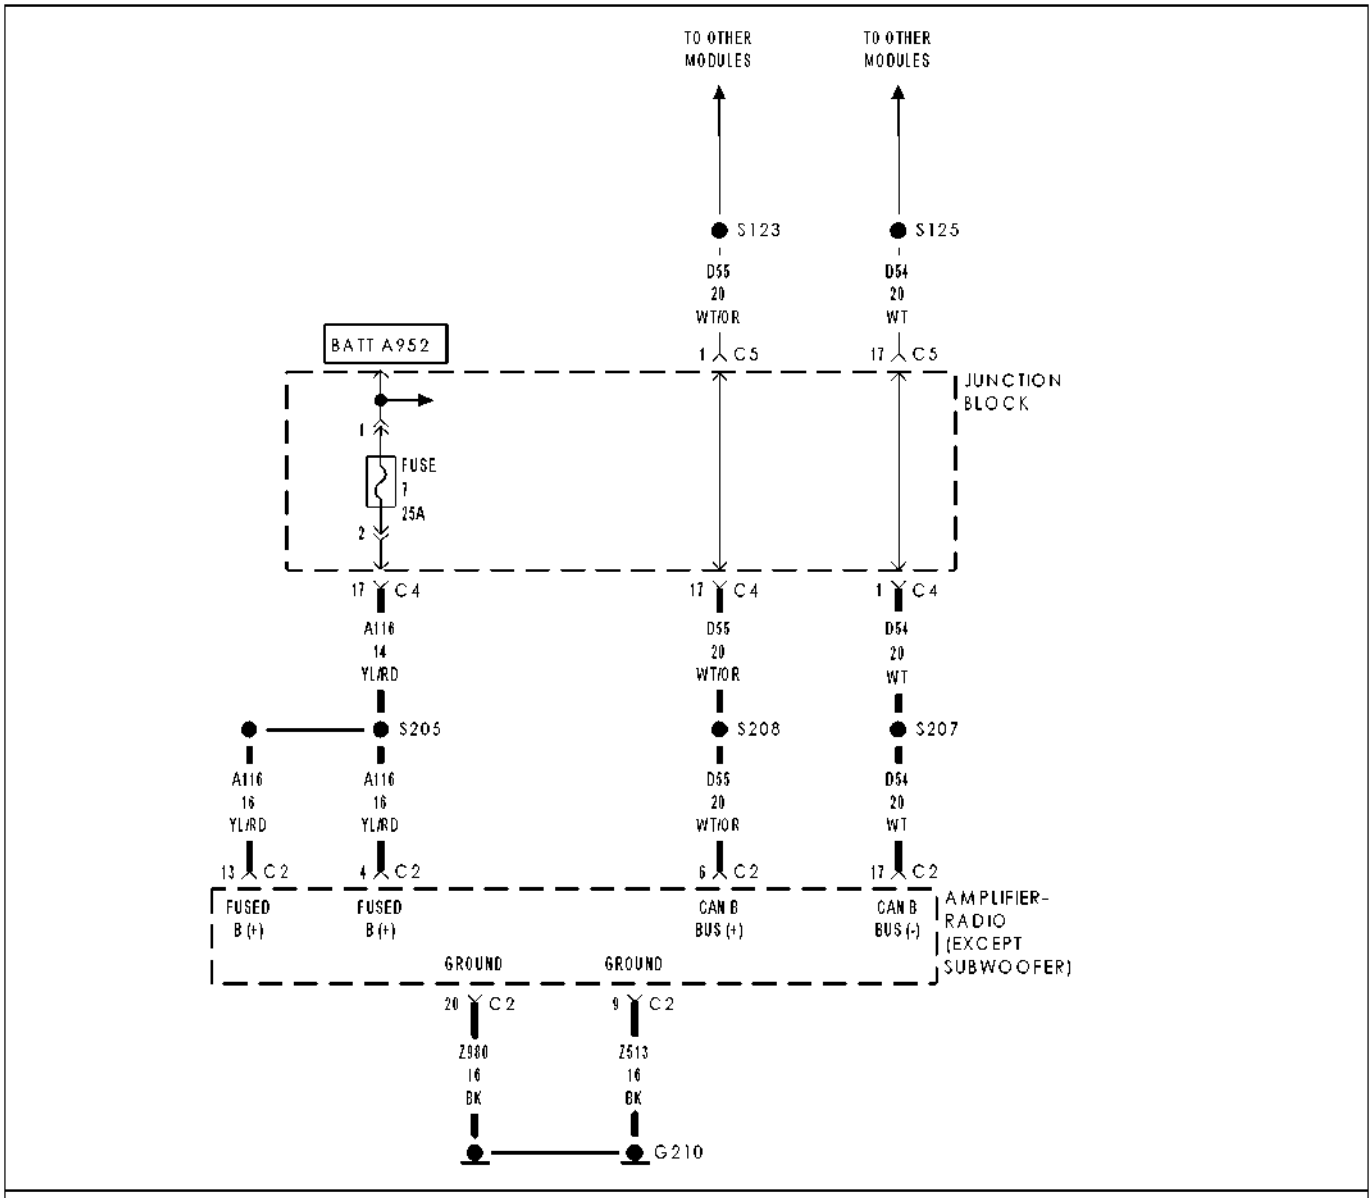


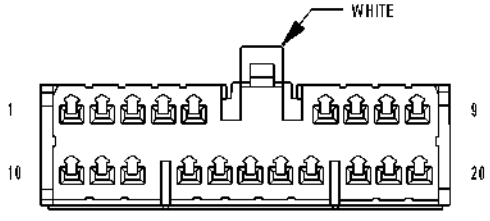
Is resistance below 5.0 ohms?

Yes >> Replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

*NO RESPONSE FROM AMP





AMPLIFIER-RADIO
C2
(EXCEPT SUBWOOFER)

81281369

***NO RESPONSE FROM AMP (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A116) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z513) OR (Z980) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

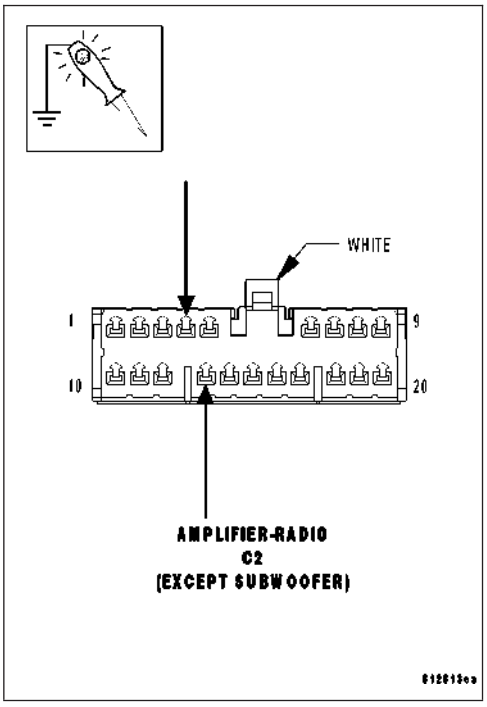
2. (A116) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Radio Amplifier C2 harness connector.
Using a 12-volt test light connected to ground, check each (A116) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

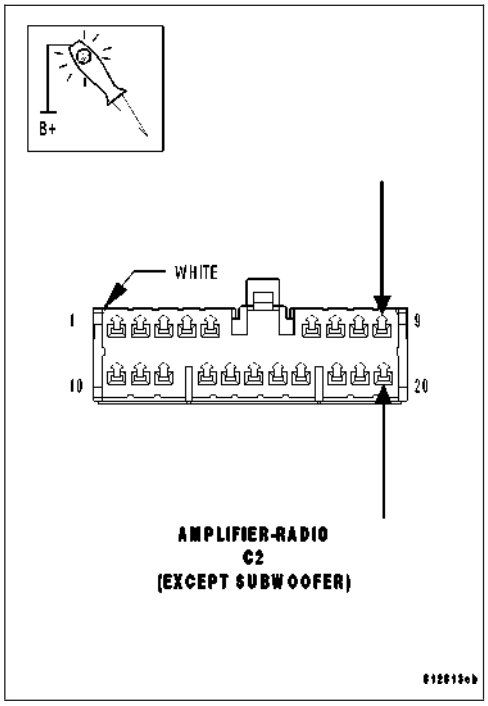
No >> Repair the (A116) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.



***NO RESPONSE FROM AMP (CONTINUED)**

3. (Z513) OR (Z980) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z513) and (Z939) ground circuits.



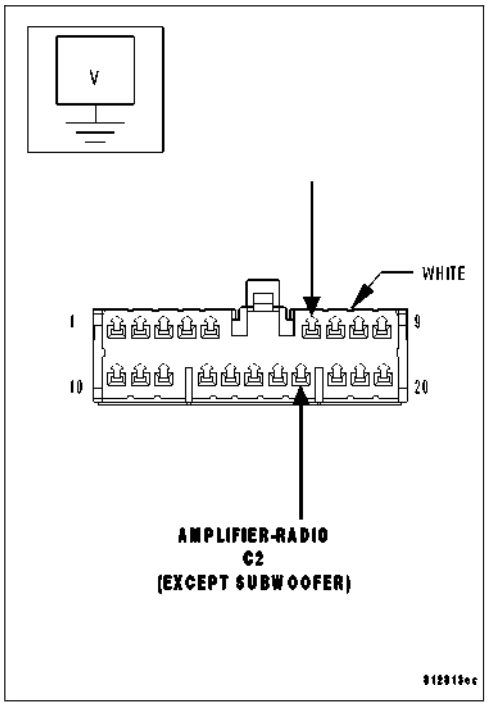
Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z513) or the (Z939) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

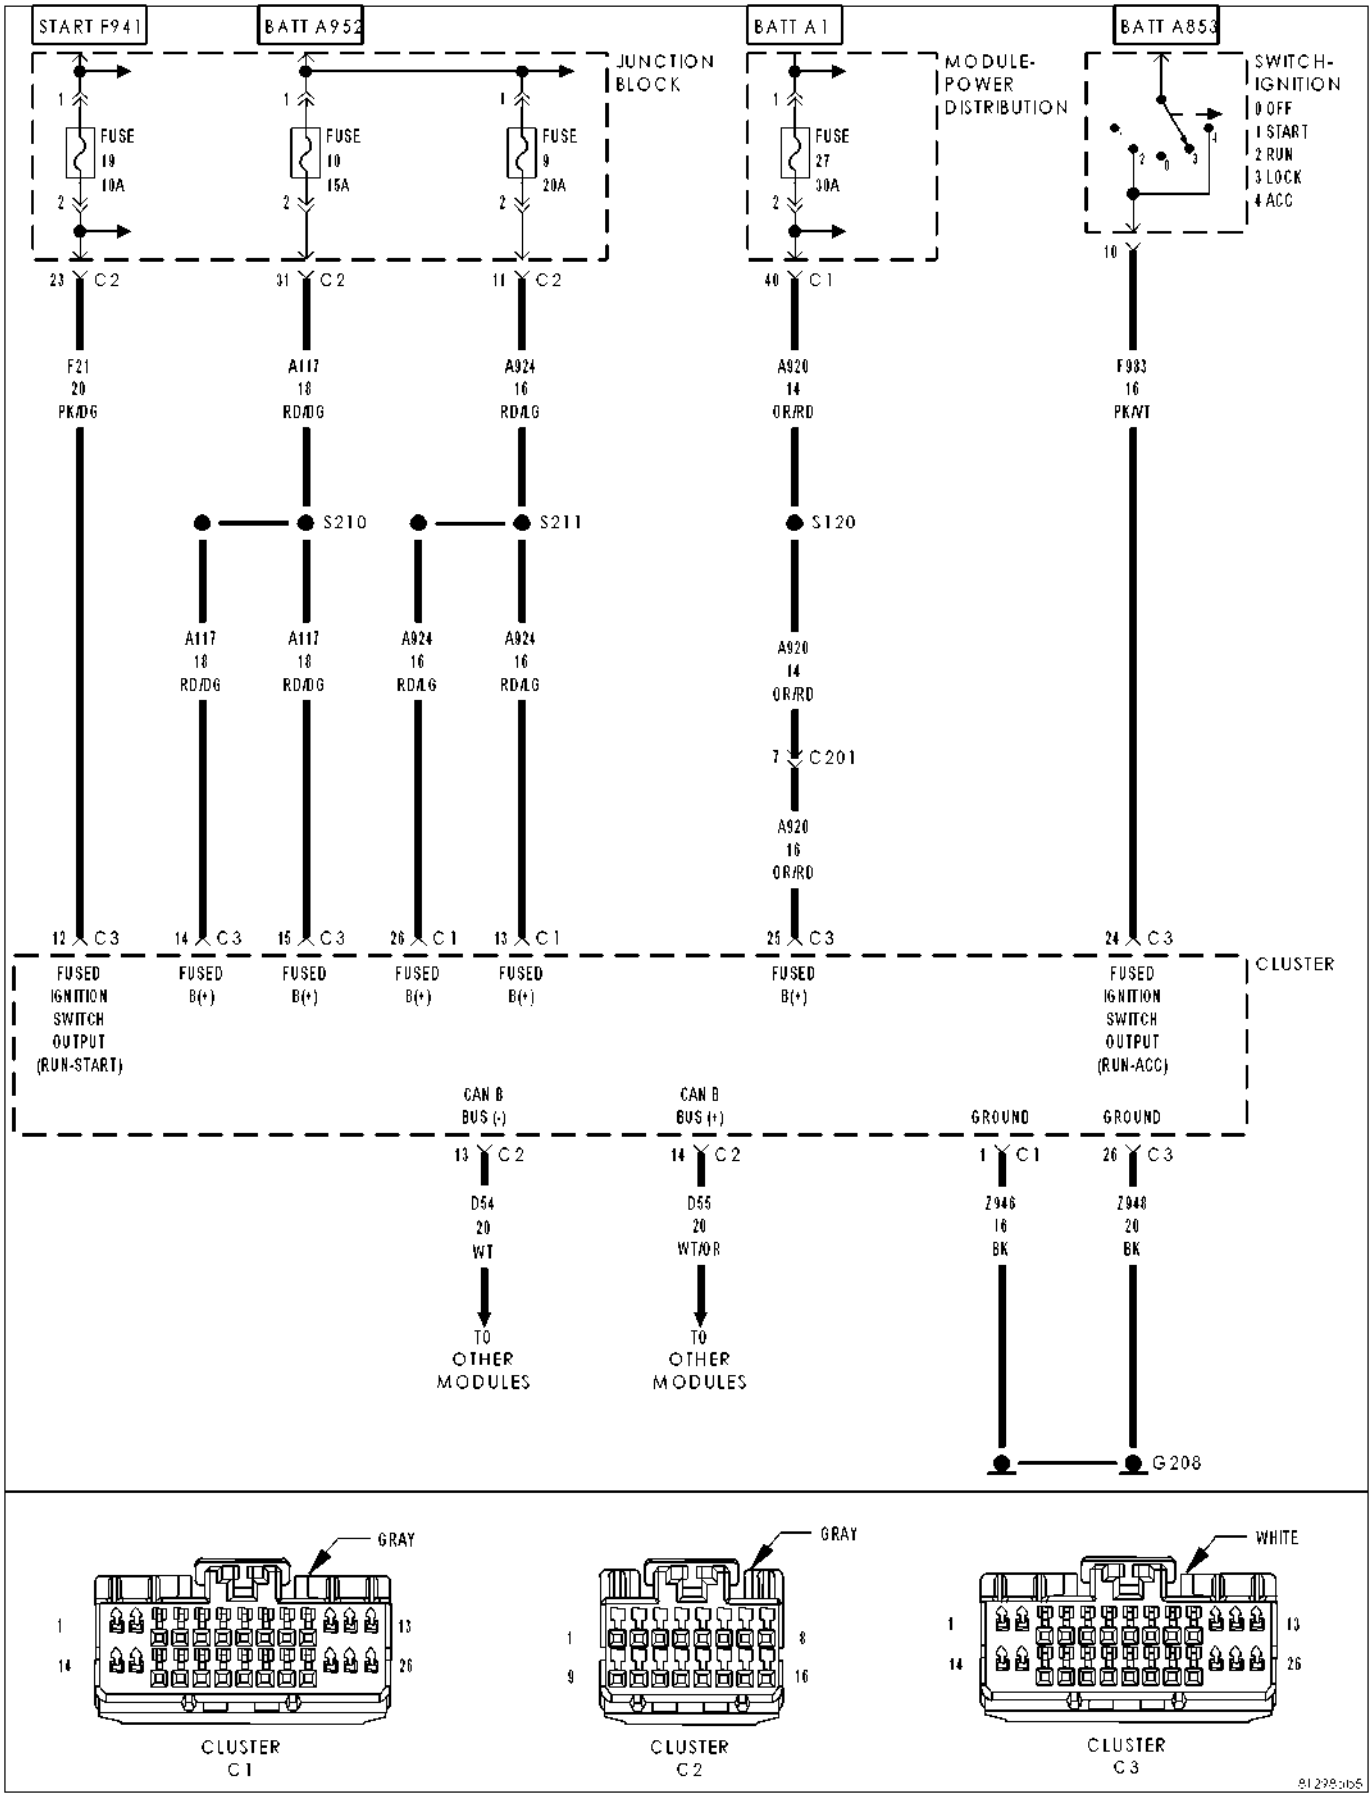


Is there any voltage present on either circuit?

Yes >> Replace the Radio Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM CCN



***NO RESPONSE FROM CCN (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A924) (A920) (A117) FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z946) (Z948) GROUND CIRCUITS OPEN
(F21) (F983) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
CLUSTER (CCN)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

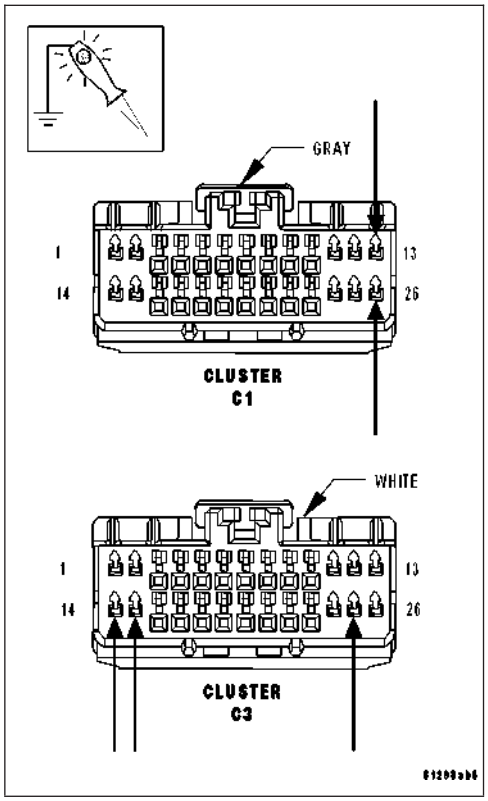
***NO RESPONSE FROM CCN (CONTINUED)**

2. (A924) (A920) (A117) FUSED B(+) CIRCUITS OPEN OR SHORTED

Turn the ignition off.

Disconnect the Cluster harness connectors.

Using a 12-volt test light connected to ground, check each (A924) (A920) (A117) Fused B(+) circuit.



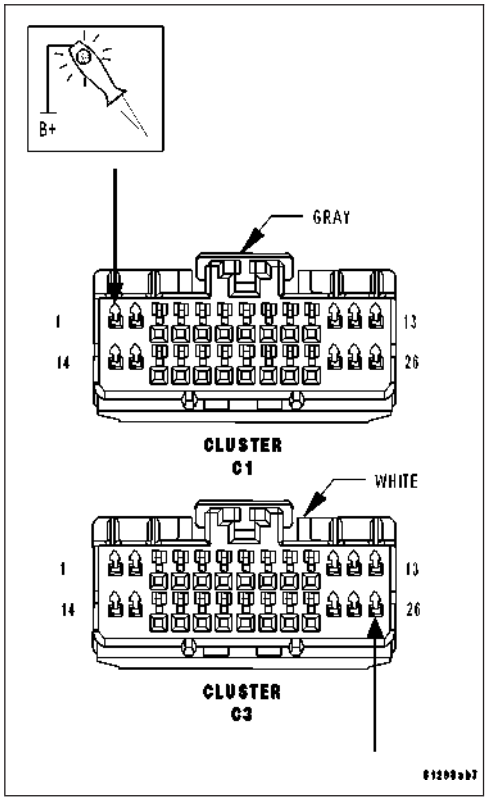
Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the (A924) (A920) (A117) Fused B(+) circuit for an open or short.
Perform BODY VERIFICATION TEST - VER 1.

3. (Z946) (Z948) GROUND CIRCUITS OPEN

Using a 12-volt test light connected to 12-volts, check each (Z946) (Z948) ground circuit.



Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

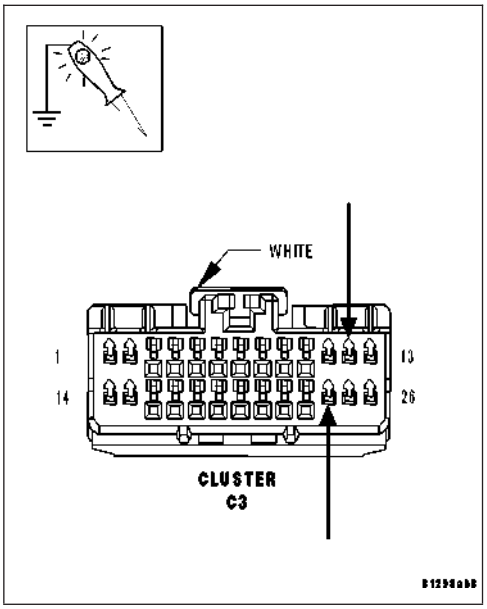
No >> Repair the (Z946) (Z948) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM CCN (CONTINUED)**

4. (F21) (F983) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check each (F21) (F983) Fused Ignition Switch Output circuit.



Does the test light illuminate brightly for each circuit?

Yes >> Go To 5

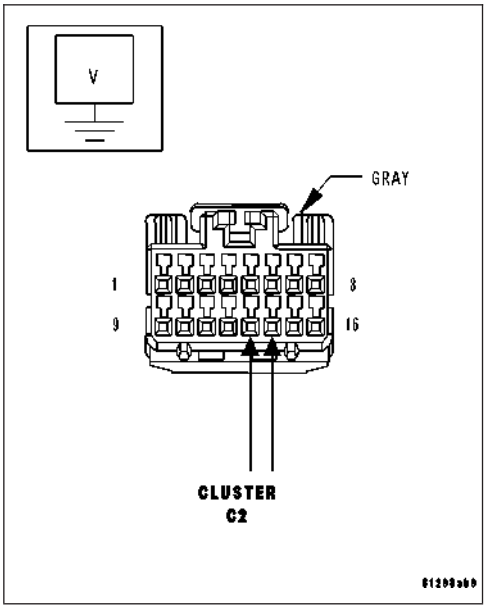
No >> Repair the (F21) (F983) Fused Ignition Switch Output circuit for an open or short.
Perform BODY VERIFICATION TEST - VER 1.

5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

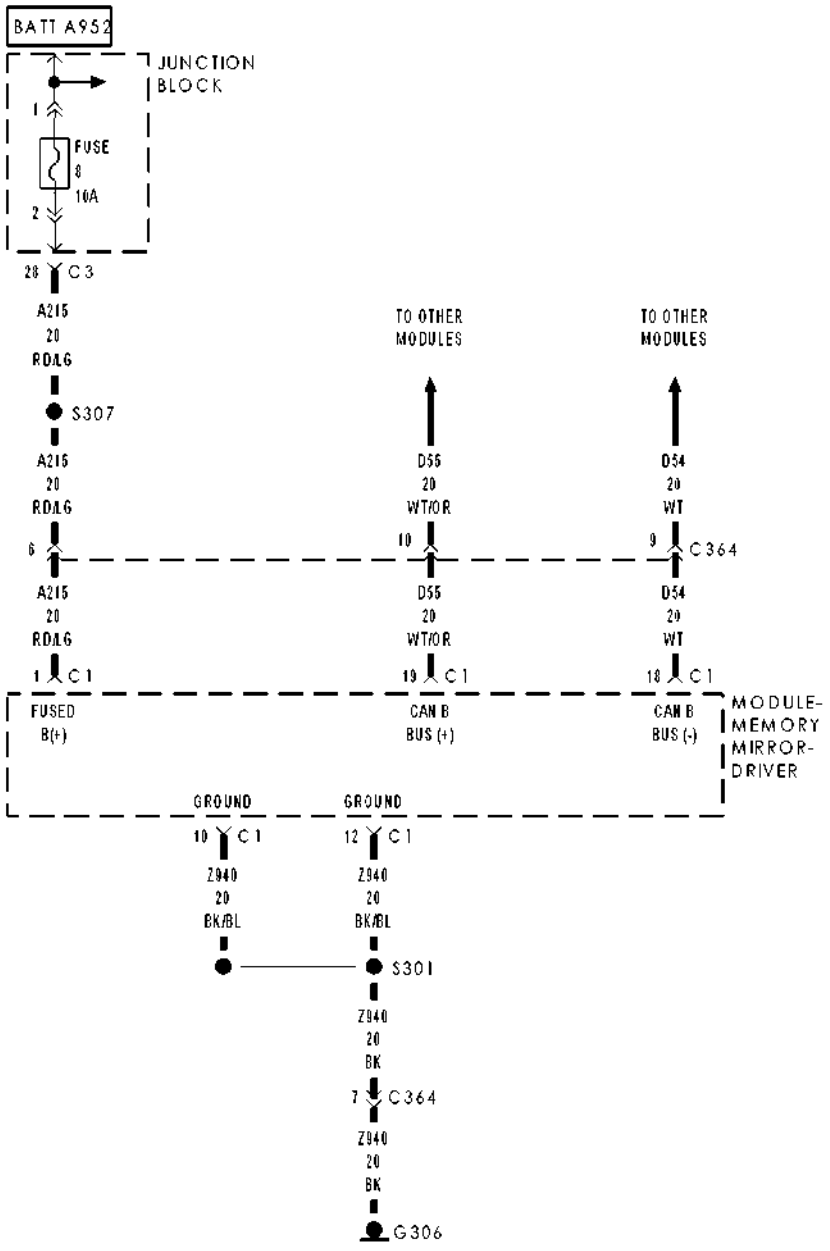


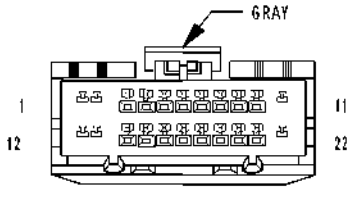
Is there any voltage present on either circuit?

Yes >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM DDM





MODULE-MEMORY MIRROR-DRIVER C1

81294C03

***NO RESPONSE FROM DDM (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A215) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z940) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
DRIVER MEMORY MIRROR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

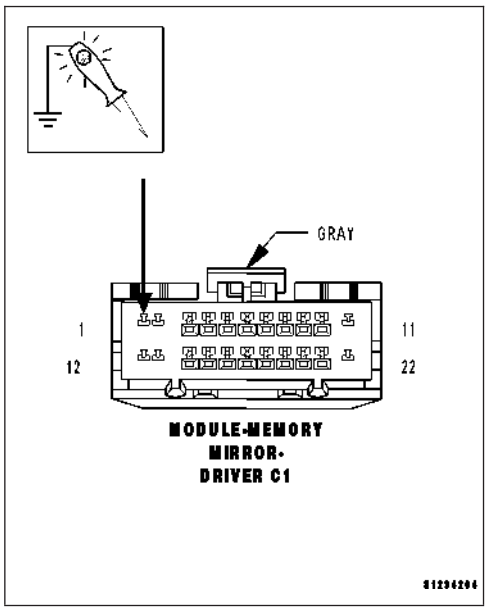
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A215) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Driver Memory Mirror Module C1 harness connector.
Using a 12-volt test light connected to ground, check the (A215) Fused B(+) circuit.



Does the test light illuminate brightly?

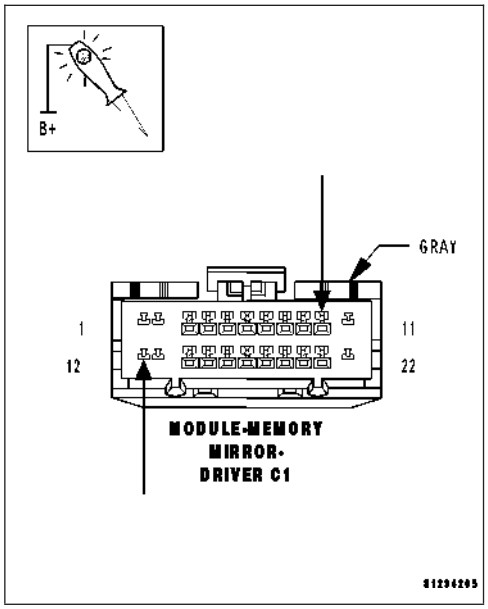
Yes >> Go To 3

No >> Repair the (A215) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM DDM (CONTINUED)**

3. (Z940) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z940) ground circuit.



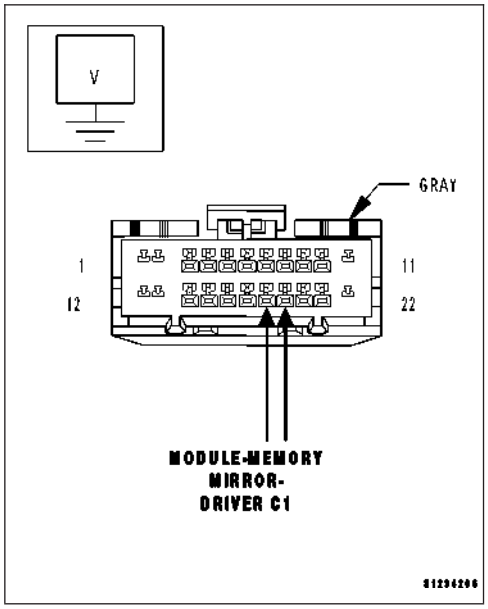
Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z940) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

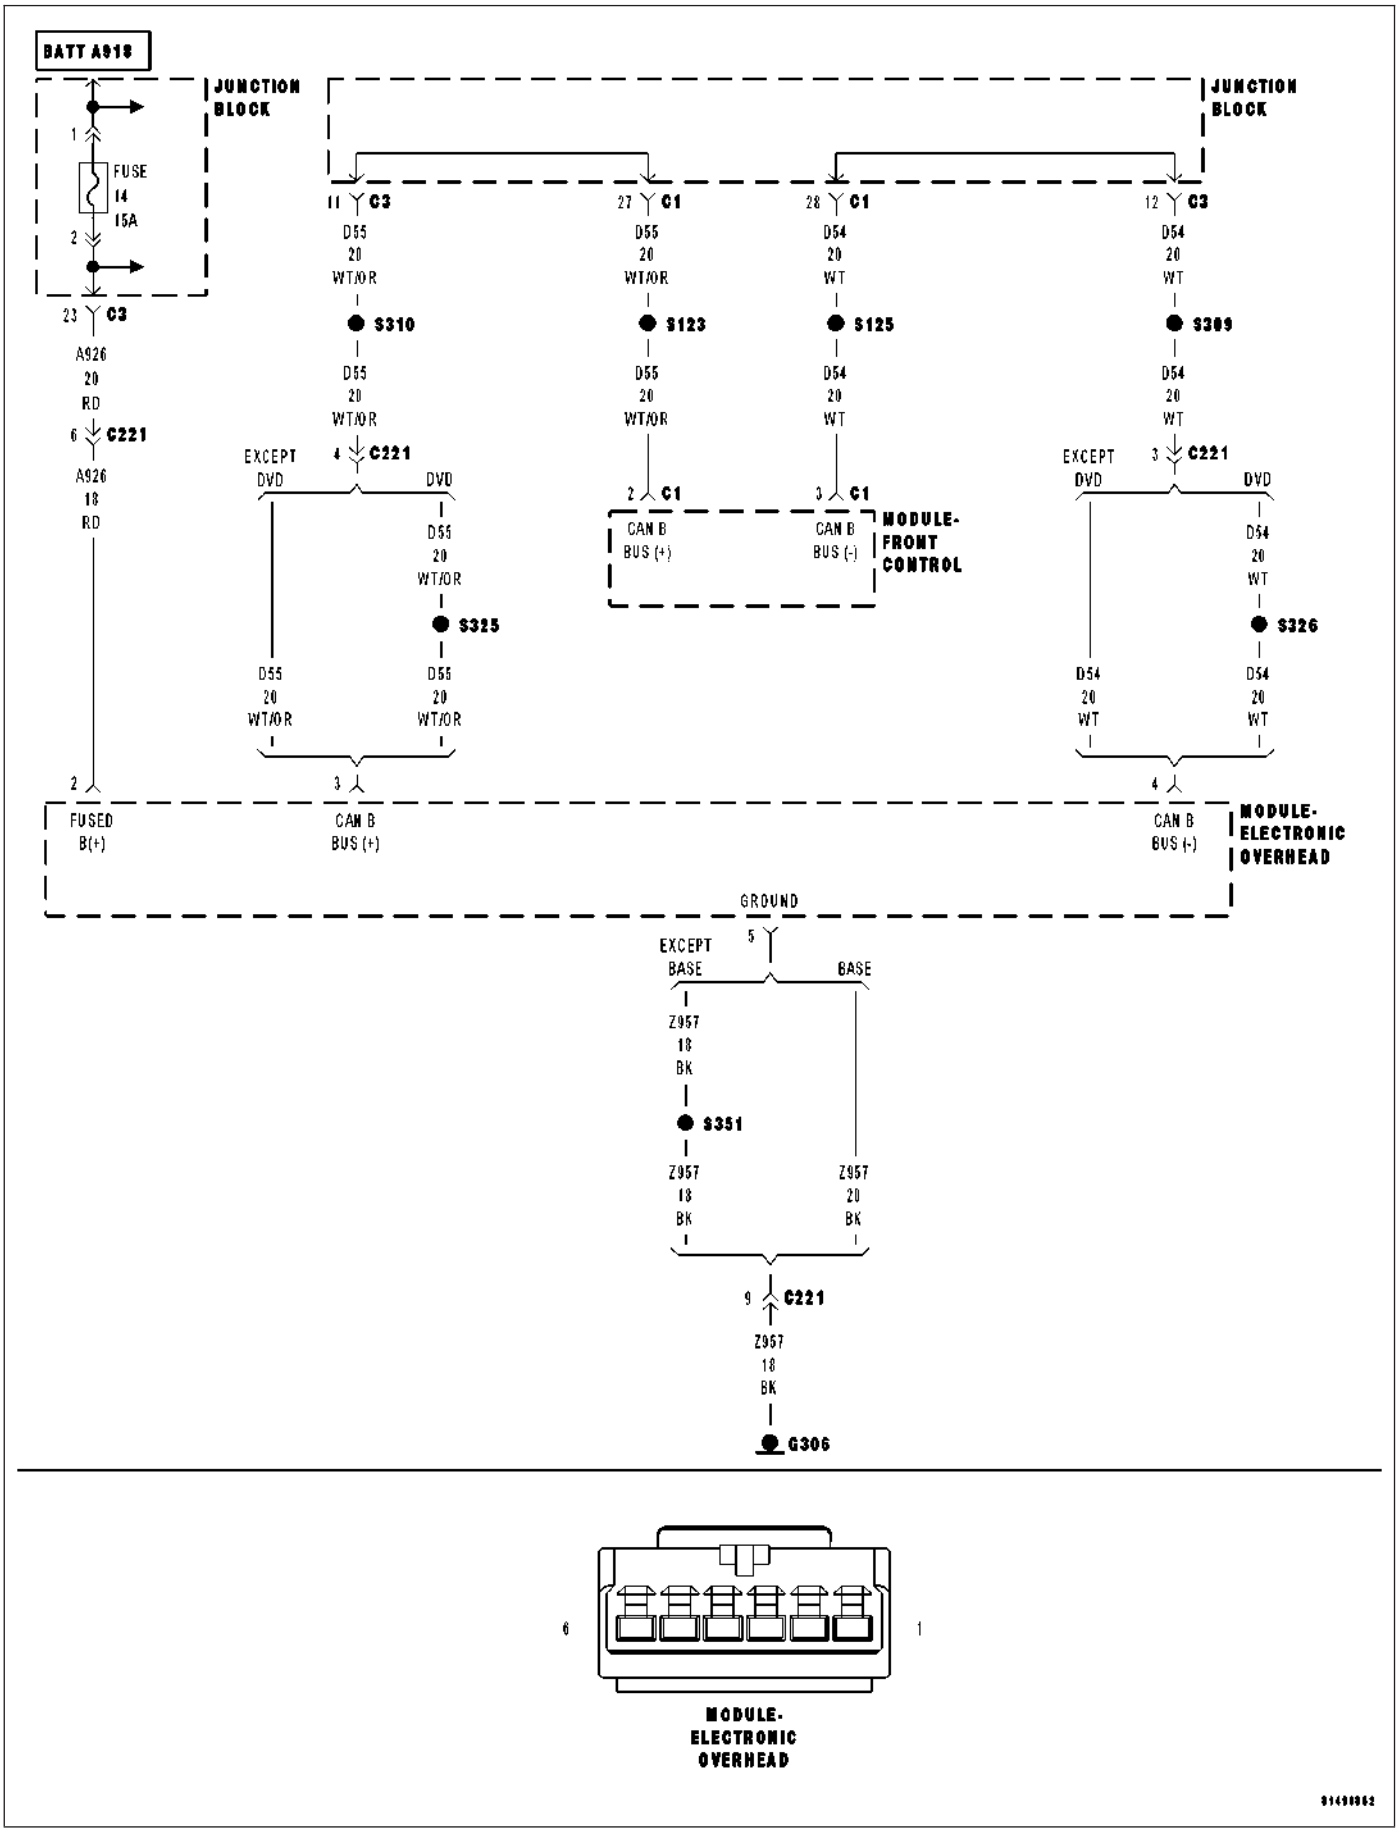


Is there any voltage present on either circuit?

Yes >> Replace the Driver Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM EOM



***NO RESPONSE FROM EOM (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A926) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z957) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
ELECTRONIC OVERHEAD MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

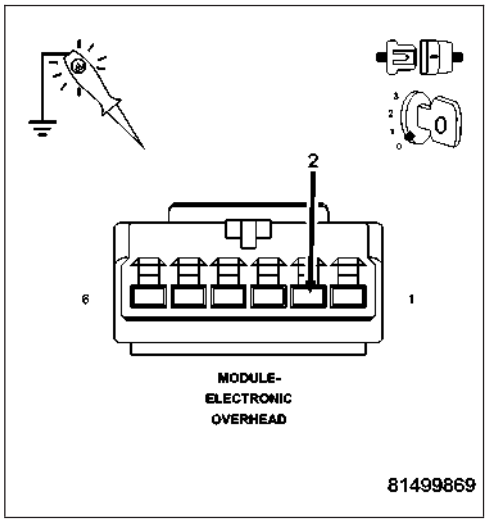
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A926) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Electronic Overhead Module harness connector.
Using a 12-volt test light connected to ground, check the (A926) Fused B(+) circuit.



Does the test light illuminate brightly?

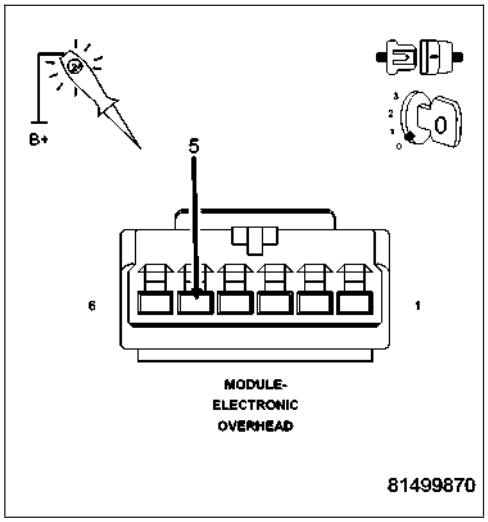
Yes >> Go To 3

No >> Repair the (A926) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM EOM (CONTINUED)**

3. (Z957) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z957) ground circuit.



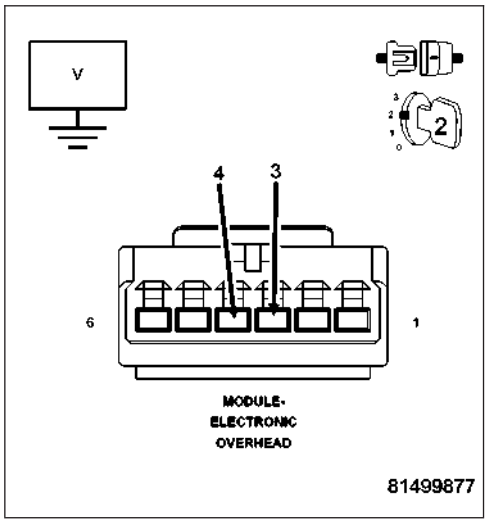
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z957) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

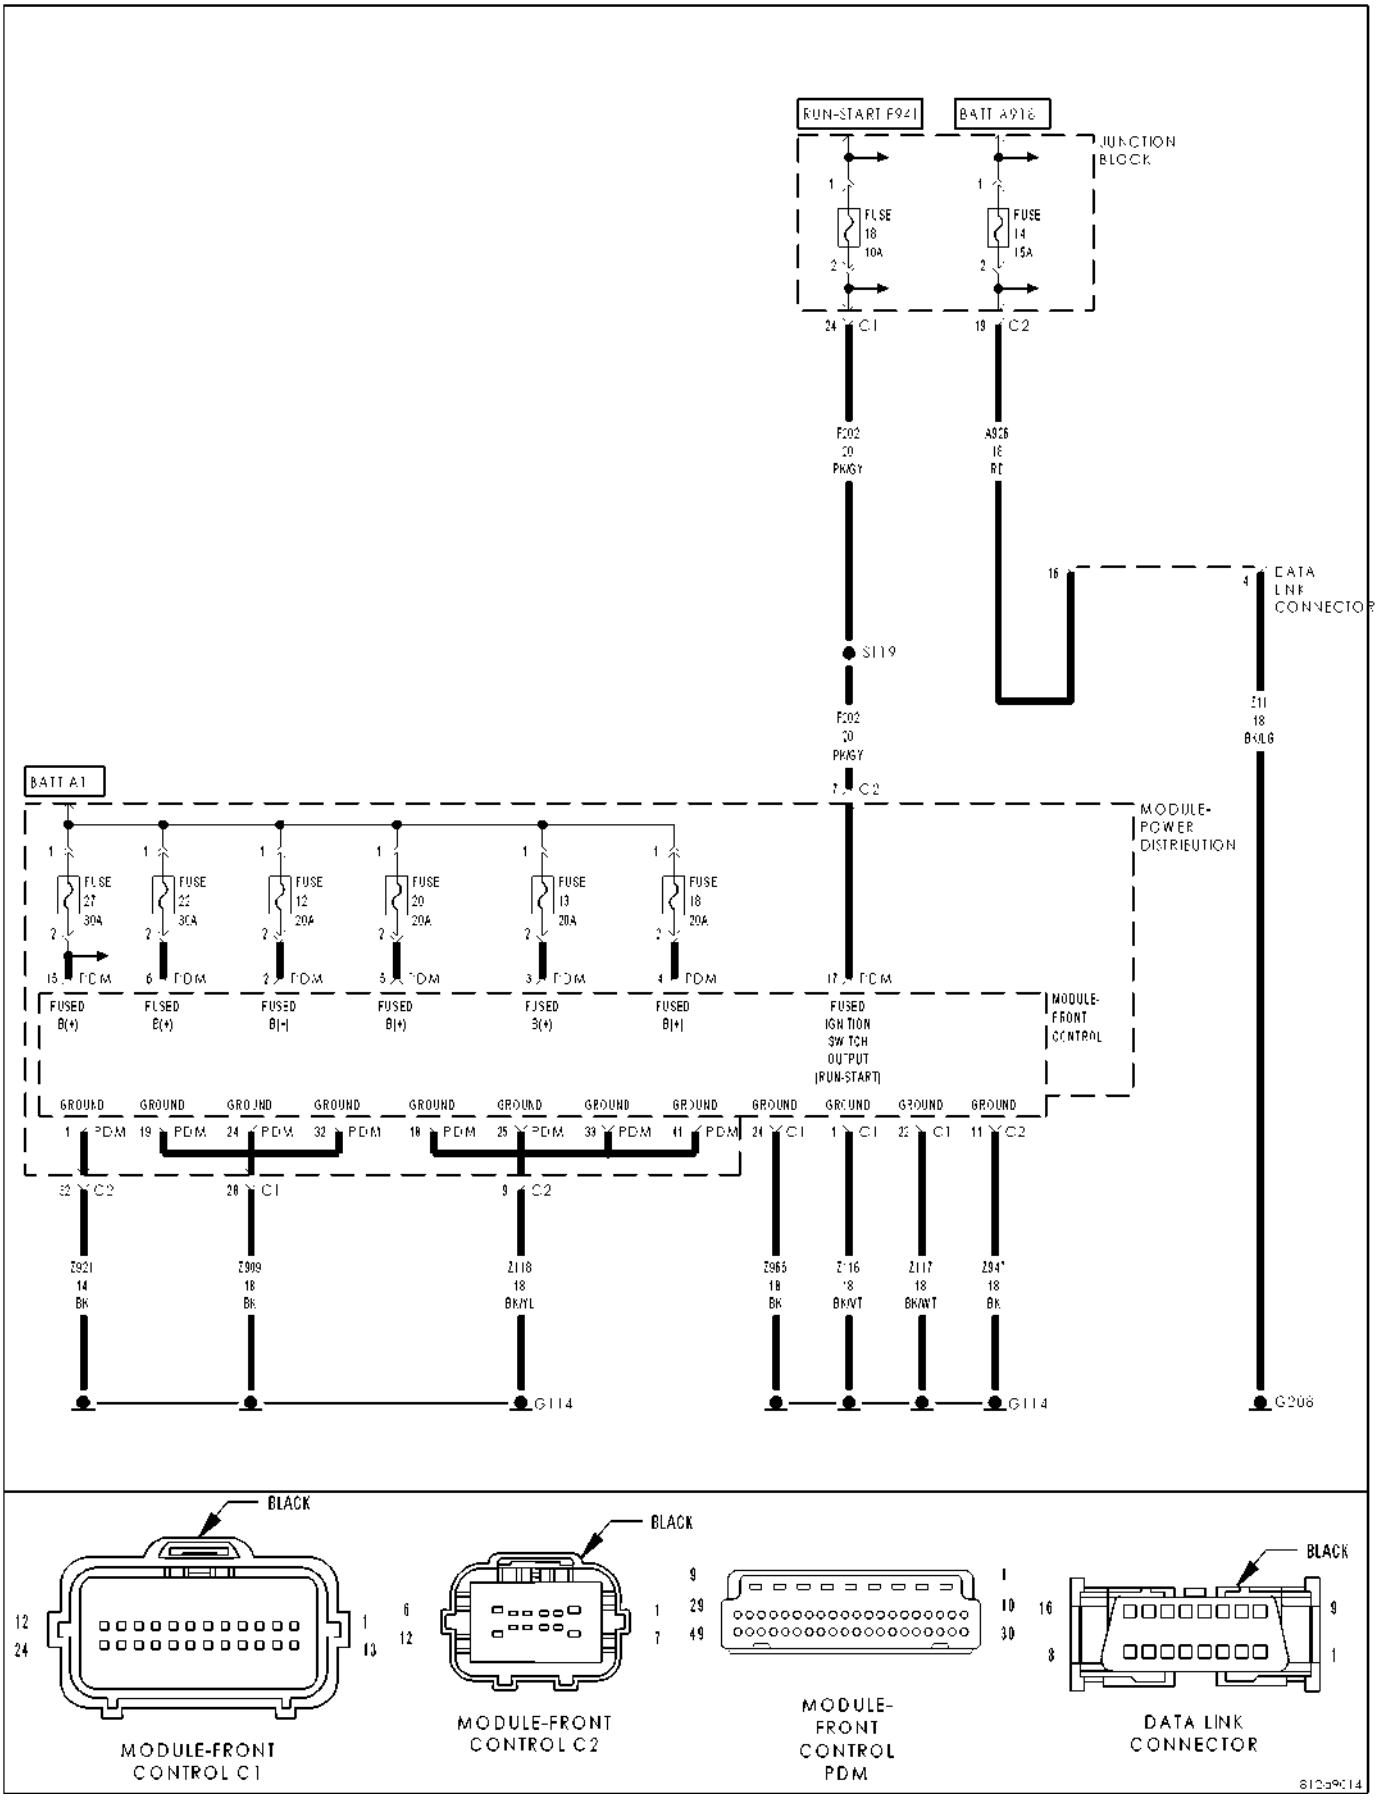


Is there any voltage present on either circuit?

Yes >> Replace the Electronic Overhead Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM FCM



***NO RESPONSE FROM FCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A926) FUSED B (+) CIRCUIT OPEN AT DLC
(Z11) GROUND CIRCUIT OPEN AT DLC
GROUND CIRCUITS OPEN AT FCM
FUSED B+ CIRCUITS OPEN AT FCM
(202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN AT FCM
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: Ensure the scan tool is updated to the latest software.

NOTE: If the scan tool displays any error messages involving the CAN C Diagnostic circuits, diagnose and repair the error message before proceeding. Refer to the Table of Contents.

NOTE: A loss of communication with the FCM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU view.

Can the scan tool communicate with the FCM?

Yes >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

No >> Go To 2

---

2. (A926) FUSED B(+) CIRCUIT OPEN AT DLC

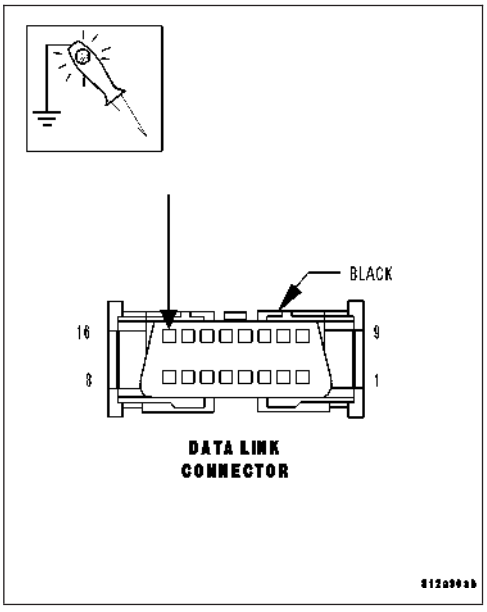
Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, check the (A926) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A926) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.



***NO RESPONSE FROM FCM (CONTINUED)**

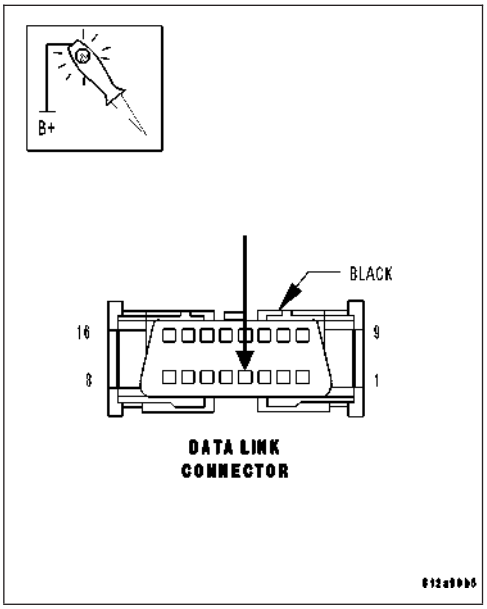
3. (Z11) GROUND CIRCUIT OPEN AT DLC

Using a 12-volt test light connected to 12-volts, check the (Z11) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z11) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



4. GROUND CIRCUITS OPEN AT FCM C1 AND C2 CONNECTORS

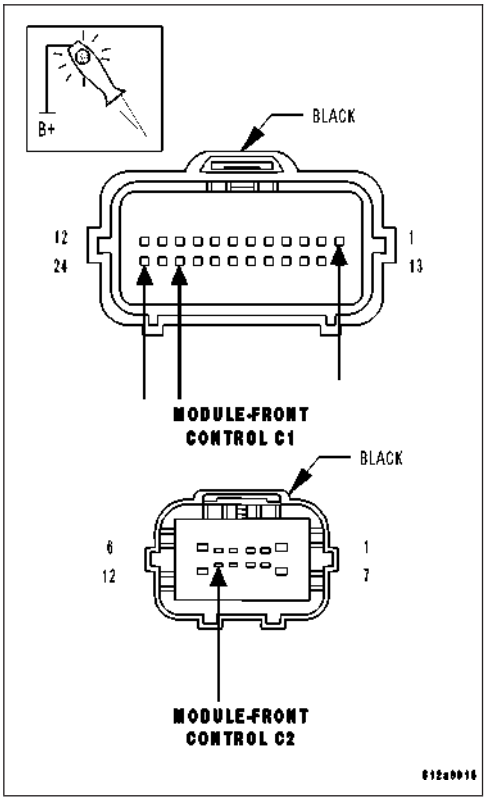
Disconnect the FCM C1 and C2 harness connectors.

Using a 12-volt test light connected to 12-volts, check each ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 5

No >> Repair the ground circuit for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

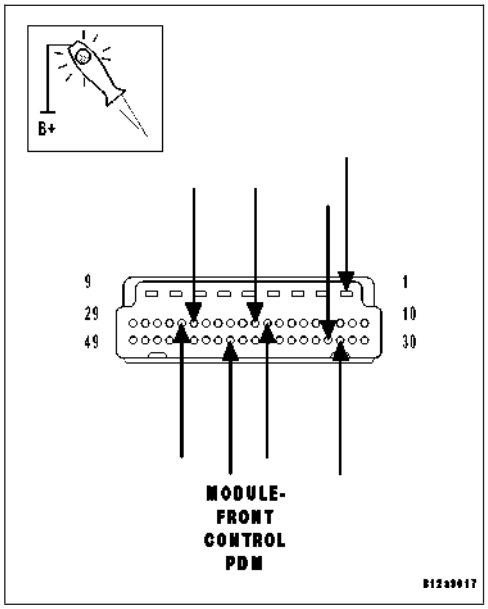


***NO RESPONSE FROM FCM (CONTINUED)**

5. GROUND CIRCUITS OPEN AT FCM PDM CONNECTOR

Remove the FCM from the PDM.

Using a 12-volt test light connected to 12-volts, check each ground circuit.



Does the test light illuminate brightly for each circuit?

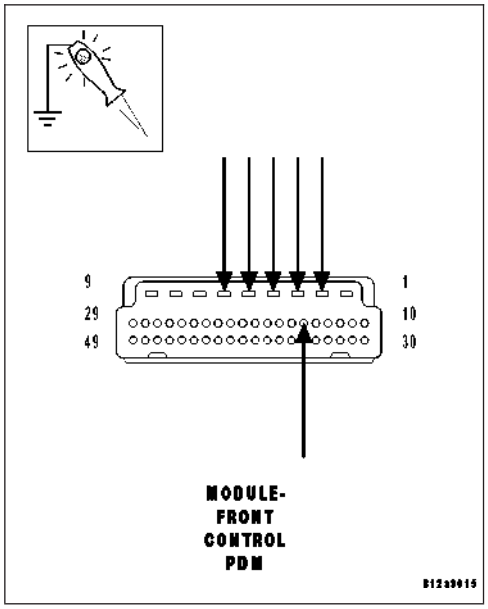
Yes >> Go To 6

No >> Repair the ground circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

6. FUSED B(+) CIRCUITS OPEN AT FCM PDM CONNECTOR

Using a 12-volt test light connected to ground, check each Fused B(+) circuit.



Does the test light illuminate brightly for each circuit?

Yes >> Go To 7

No >> Repair the Fused B(+) circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM FCM (CONTINUED)**

7. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN AT FCM PDM CONNECTOR

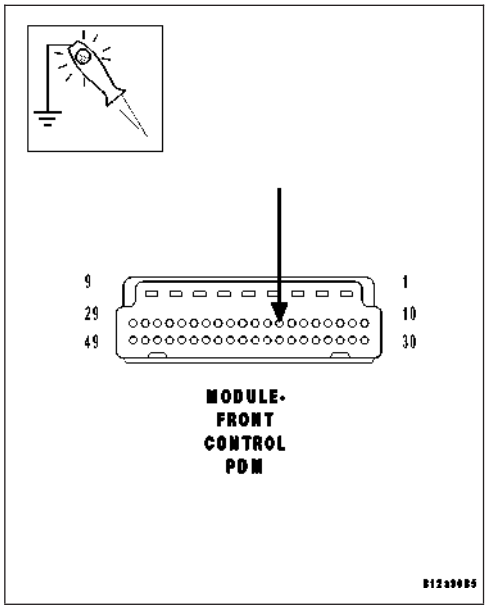
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.

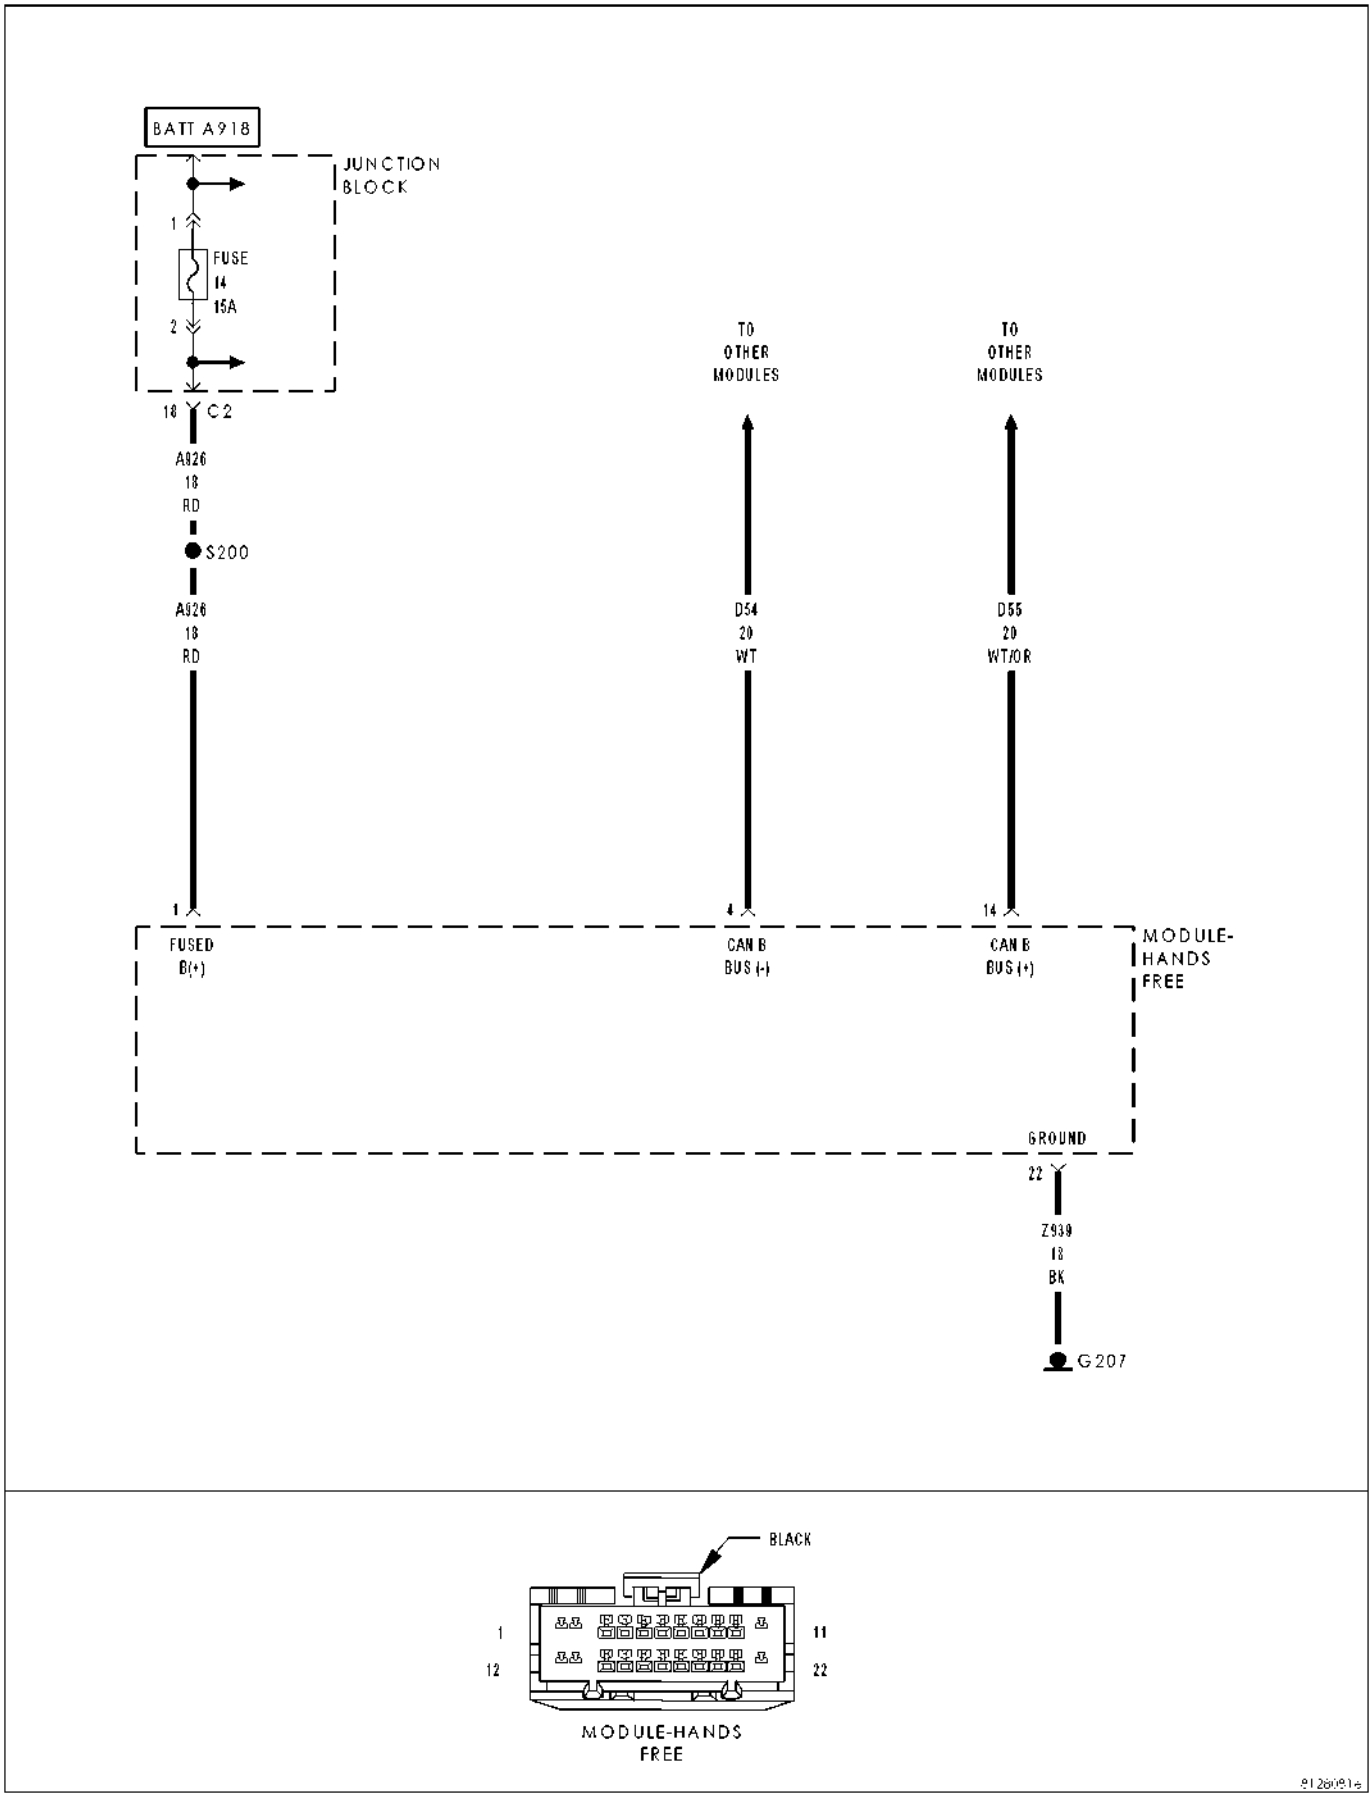
Does the test light illuminate brightly?

Yes >> Replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (F202) Fused Ignition Switch Output circuit for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.



*NO RESPONSE FROM HFM



***NO RESPONSE FROM HFM (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A926) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z939) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
HANDS FREE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

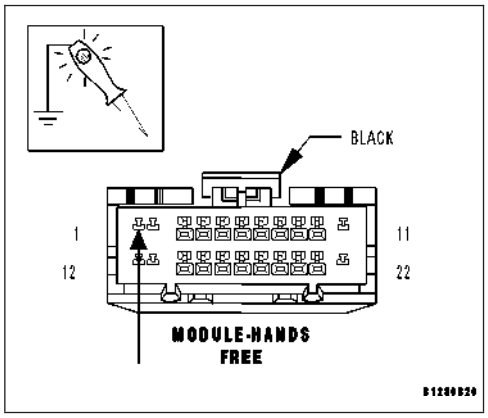
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A926) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Hands Free Module harness connector.
Using a 12-volt test light connected to ground, check the (A926) Fused B(+) circuit.



Does the test light illuminate brightly?

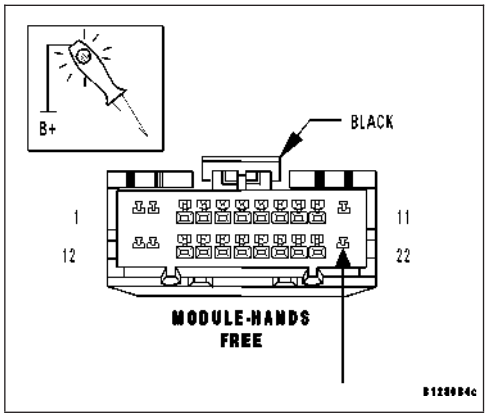
Yes >> Go To 3

No >> Repair the (A926) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM HFM (CONTINUED)**

3. (Z939) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z939) ground circuit.



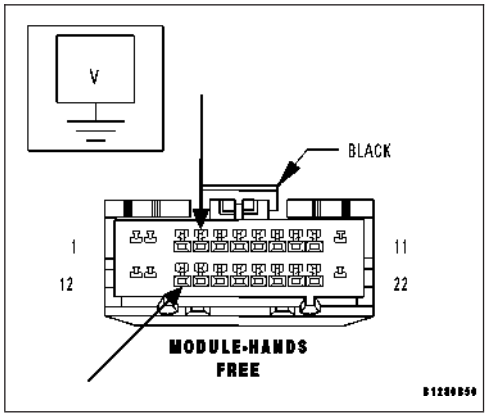
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z939) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

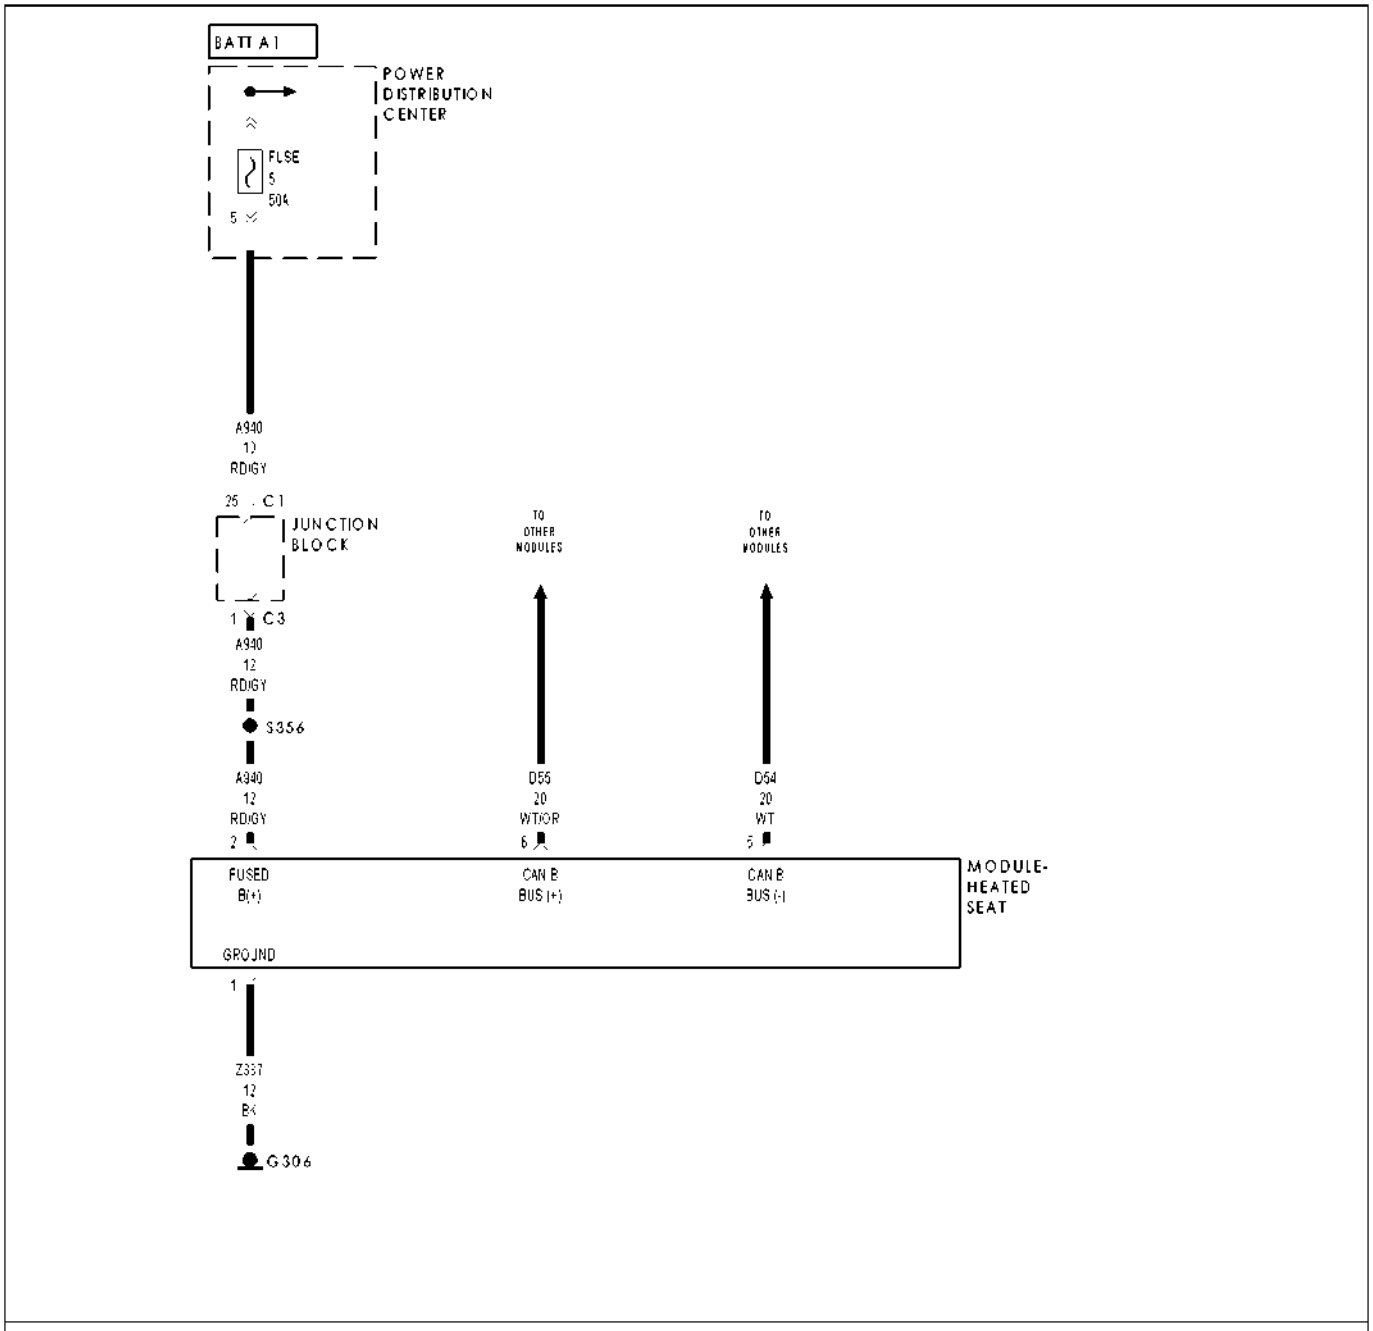


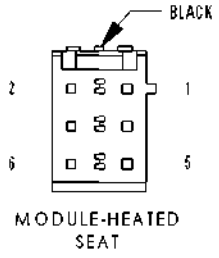
Is there any voltage present on either circuit?

Yes >> Replace the Hands Free Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM HSM





81293ff2

***NO RESPONSE FROM HSM (CONTINUED)**

Possible Causes
(A940) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z387) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
HEATED SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

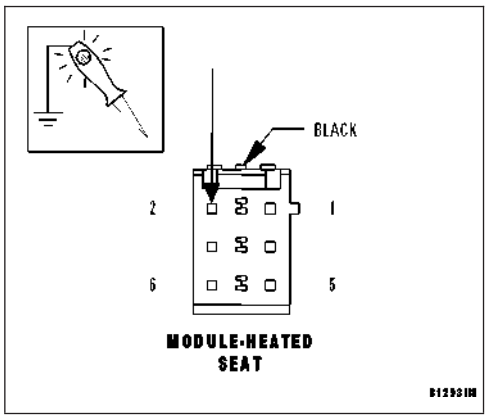
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A940) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Heated Seat Module harness connector.
Using a 12-volt test light connected to ground, check the (A940) Fused B(+) circuit.



Does the test light illuminate brightly?

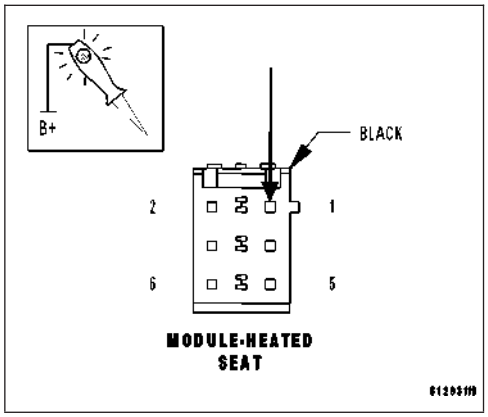
Yes >> Go To 3

No >> Repair the (A940) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM HSM (CONTINUED)**

3. (Z387) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z387) ground circuit.



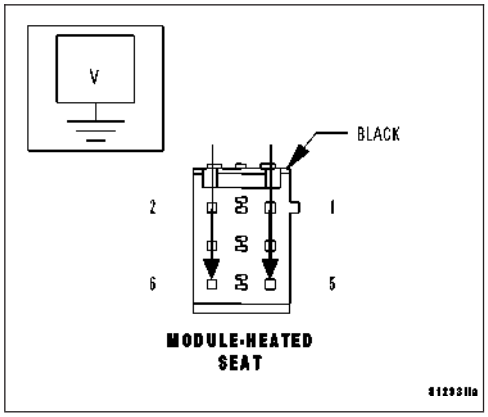
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z387) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.



Is there any voltage present on either circuit?

Yes >> Replace the Heated Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

SEAT MEMORY MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

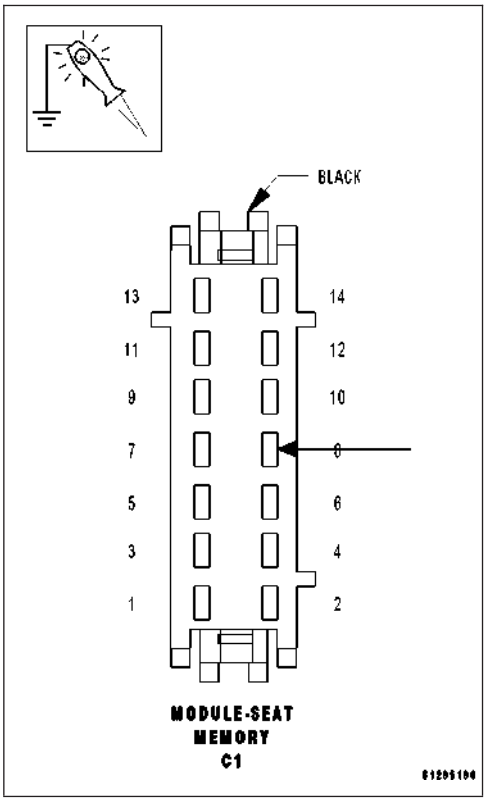
2. (A940) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Seat Memory Module C1 harness connector.
Using a 12-volt test light connected to ground, check the (A940) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

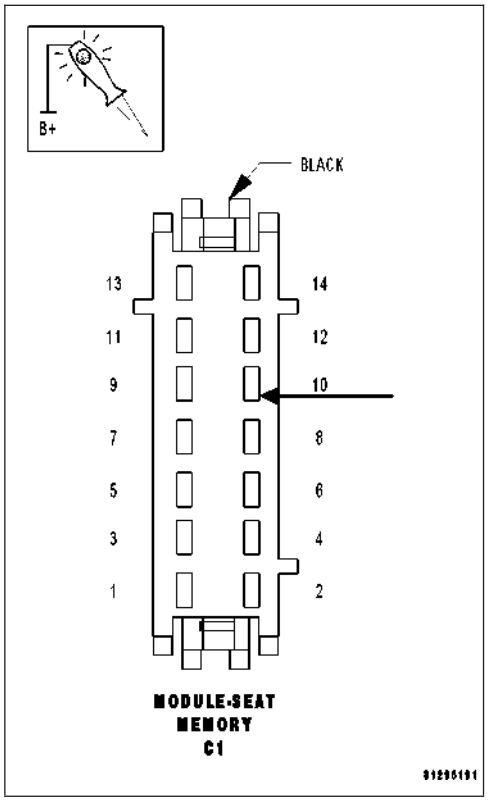
No >> Repair the (A940) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.



***NO RESPONSE FROM MSMD (CONTINUED)**

3. (Z930) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z930) ground circuit.



Does the test light illuminate brightly?

Yes >> Go To 4

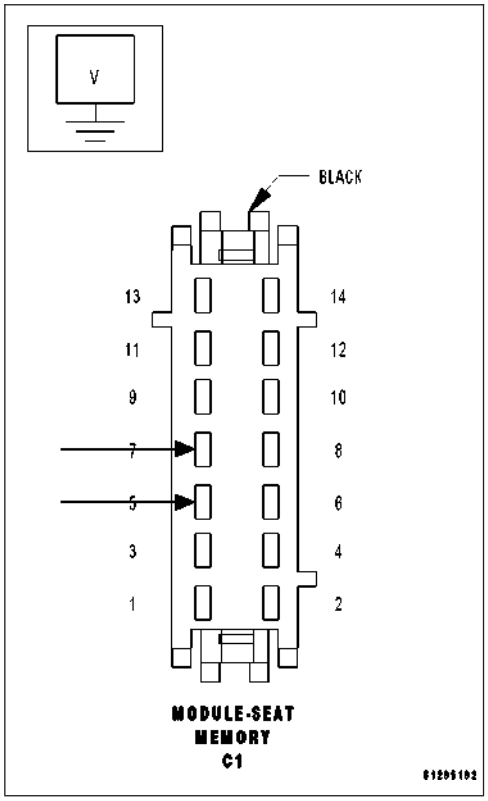
No >> Repair the (Z930) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

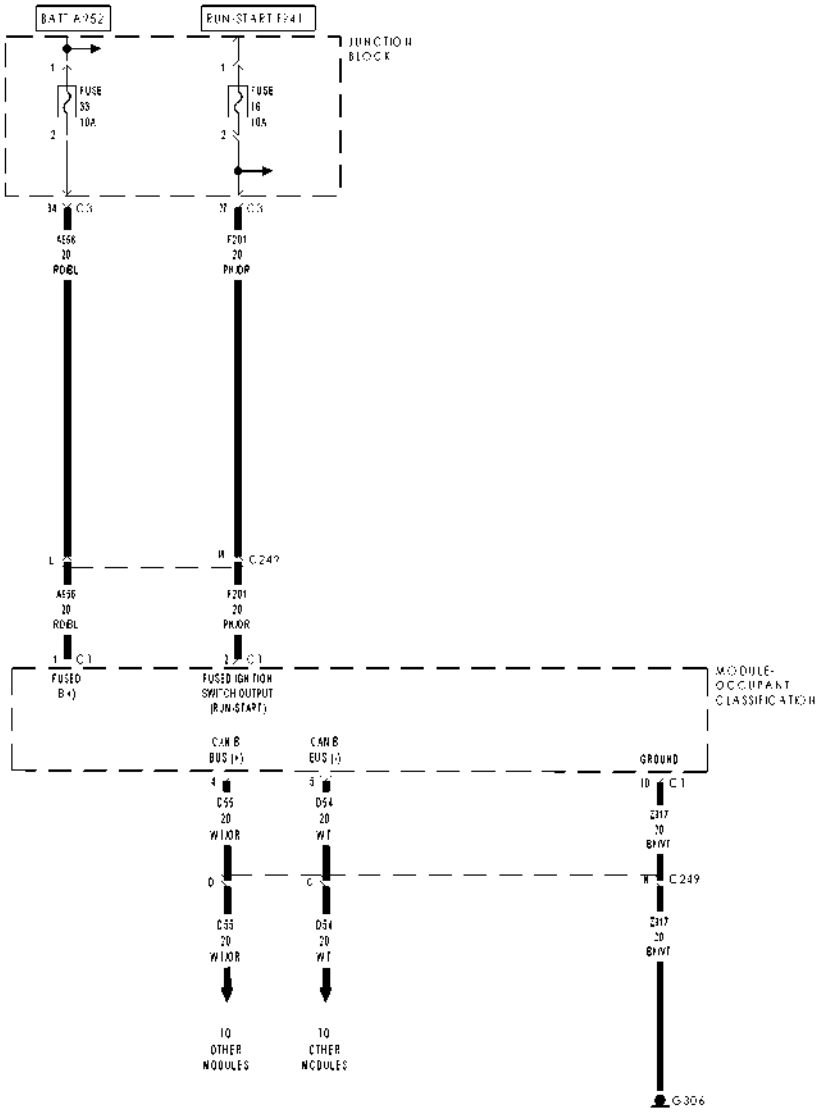


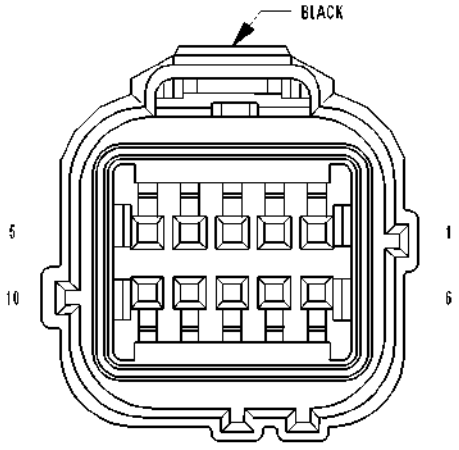
Is there any voltage present on either circuit?

Yes >> Replace the Seat Memory Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM OCM





MODULE-OCCUPANT CLASSIFICATION C1

81093b8

***NO RESPONSE FROM OCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A956) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z917) GROUND CIRCUIT OPEN
(F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
OCCUPANT CLASSIFICATION MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

***NO RESPONSE FROM OCM (CONTINUED)**

2. (A956) FUSED B(+) CIRCUIT OPEN OR SHORTED

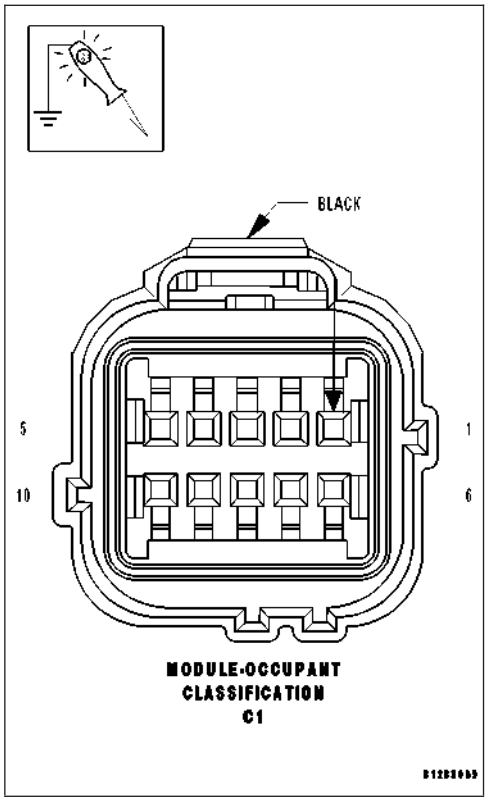
WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.
Disconnect the Occupant Classification Module C1 harness connector.

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.
Using a 12-volt test light connected to ground, check the (A956) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A956) Fused B(+) circuit for an open or short. Perform AIRBAG VERIFICATION TEST - VER 1.



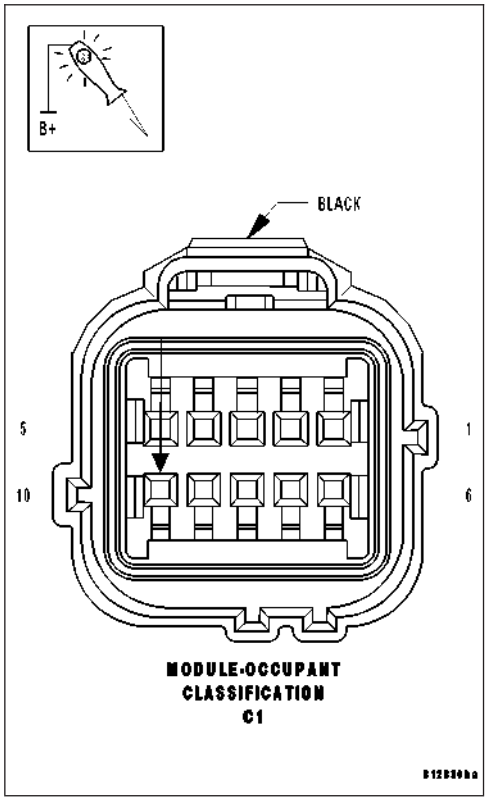
3. (Z917) GROUND CIRCUIT OPEN

Turn the ignition off.
Using a 12-volt test light connected to 12-volts, check the (Z917) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z917) ground circuit for an open. Perform AIRBAG VERIFICATION TEST - VER 1.



***NO RESPONSE FROM OCM (CONTINUED)**

4. (F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

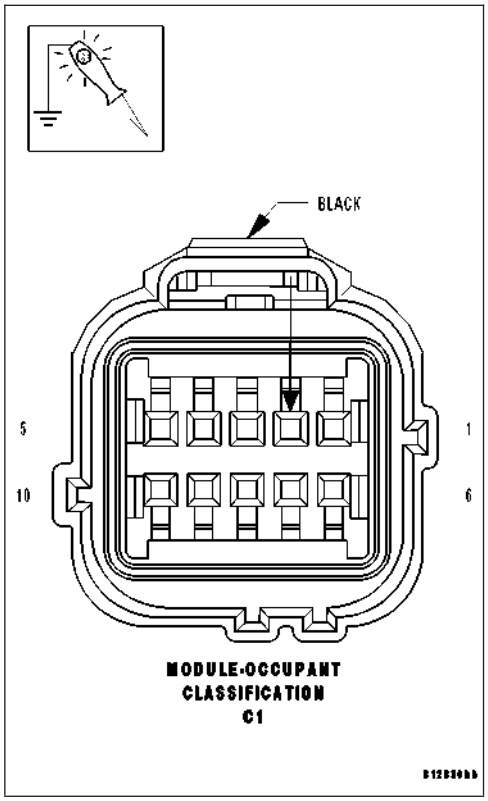
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F201) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F201) Fused Ignition Switch Output circuit for an open or short.
Perform AIRBAG VERIFICATION TEST - VER 1.



5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

WARNING: If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

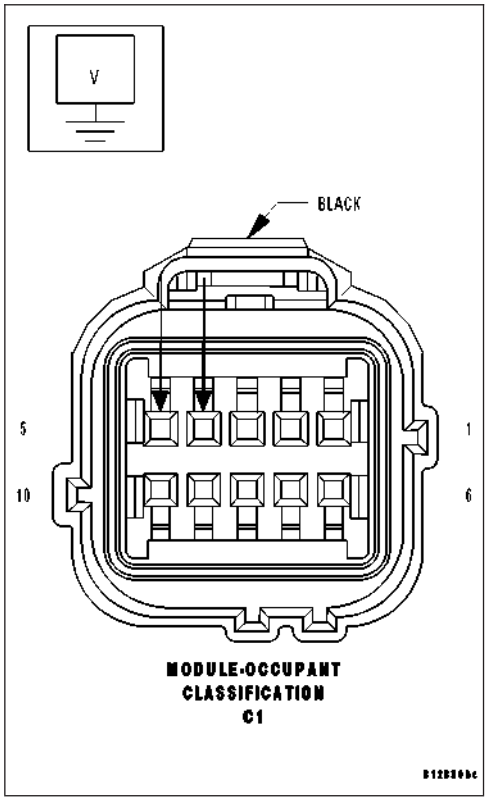
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

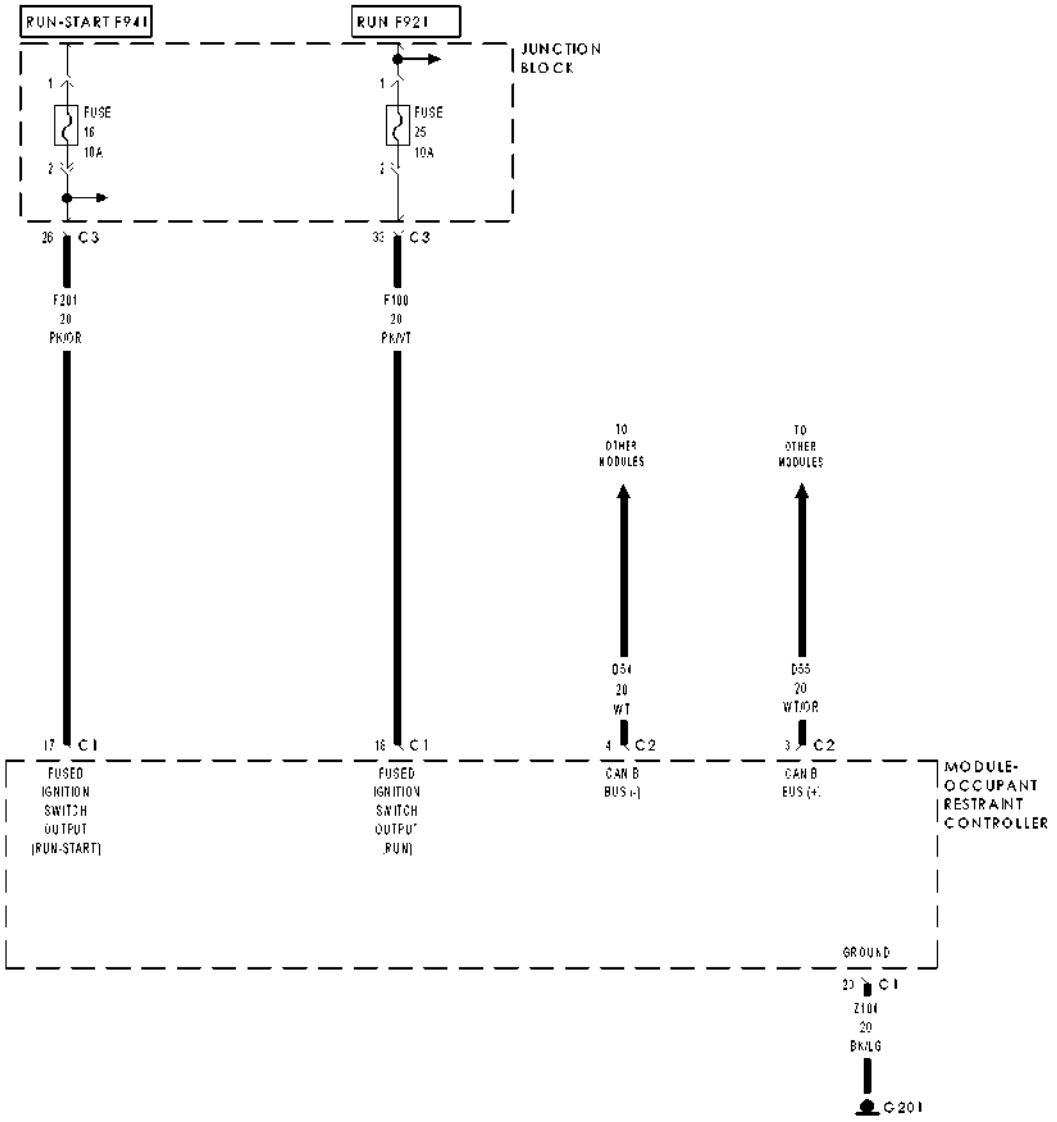
Is there any voltage present on either circuit?

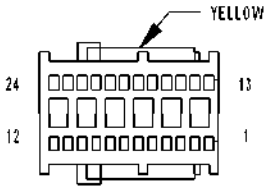
Yes >> Replace the Occupant Classification Module in accordance with the service information.
Perform AIRBAG VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform AIRBAG VERIFICATION TEST - VER 1.

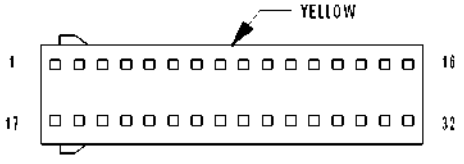


*NO RESPONSE FROM ORC





MODULE-OCCUPANT RESTRAINT CONTROLLER C2 (SAB)



MODULE-OCCUPANT RESTRAINT CONTROLLER C1

***NO RESPONSE FROM ORC (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(Z104) GROUND CIRCUIT OPEN
(F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED
(F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

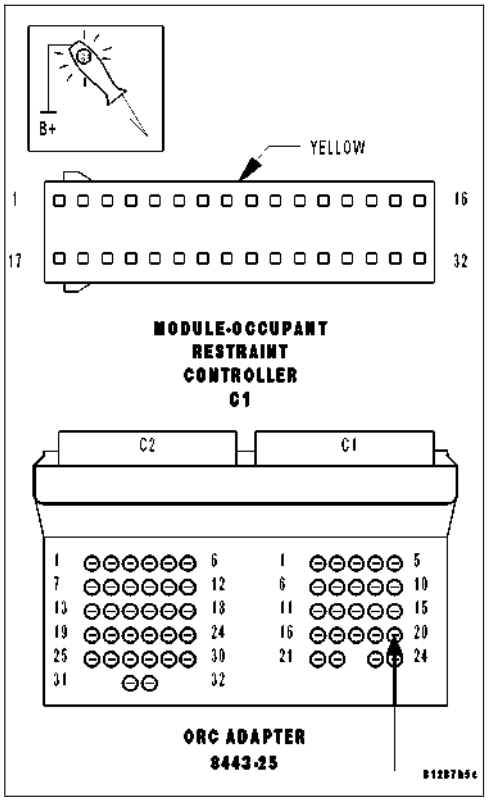
***NO RESPONSE FROM ORC (CONTINUED)**

2. (Z104) GROUND CIRCUIT OPEN

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.
Disconnect the Occupant Restraint Controller harness connectors.

Connect the appropriate Load Tool ACM Adaptor to the ORC connector.

Using a 12-volt test light connected to 12-volts, check the (Z104) ground circuit.



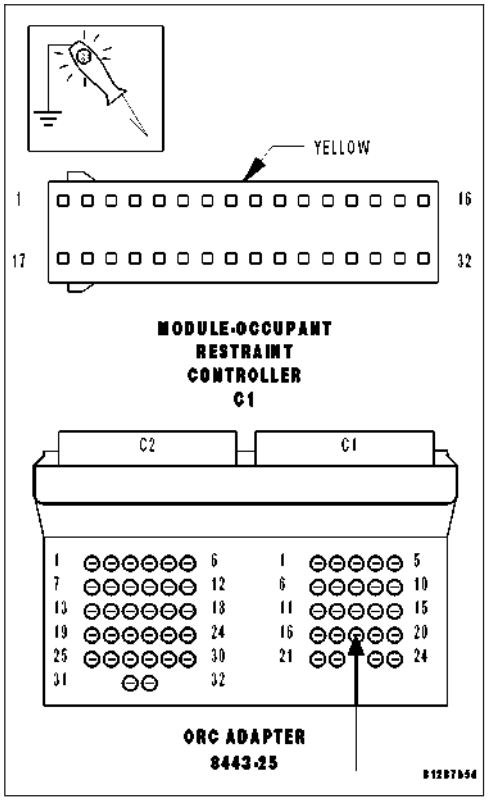
Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (Z104) ground circuit for an open.
Perform AIRBAG VERIFICATION TEST - VER 1.

3. (F100) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.
Using a 12-volt test light connected to ground, check the (F100) Fused Ignition Switch Output (RUN) circuit.



Does the test light illuminate brightly?

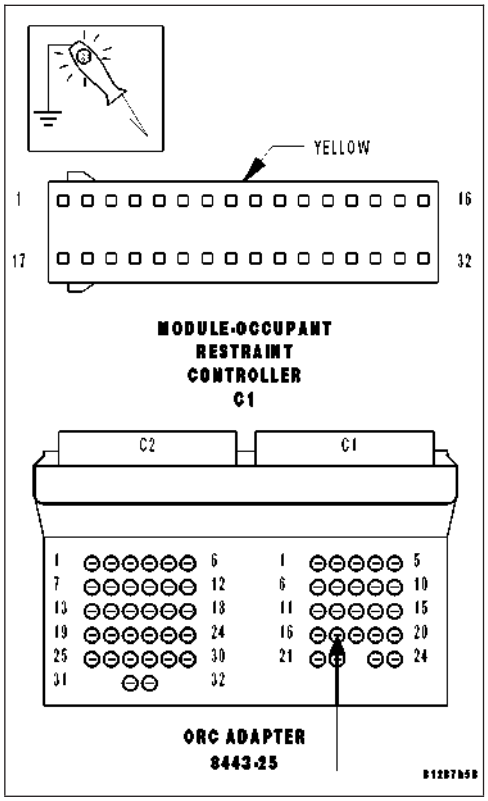
Yes >> Go To 4

No >> Repair the (F100) Fused Ignition Switch Output (RUN) circuit for an open or short.
Perform AIRBAG VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ORC (CONTINUED)**

4. (F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (F201) Fused Ignition Switch Output (RUN/START) circuit.



Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F201) Fused Ignition Switch Output (RUN/START) circuit for an open or short.
Perform AIRBAG VERIFICATION TEST - VER 1.

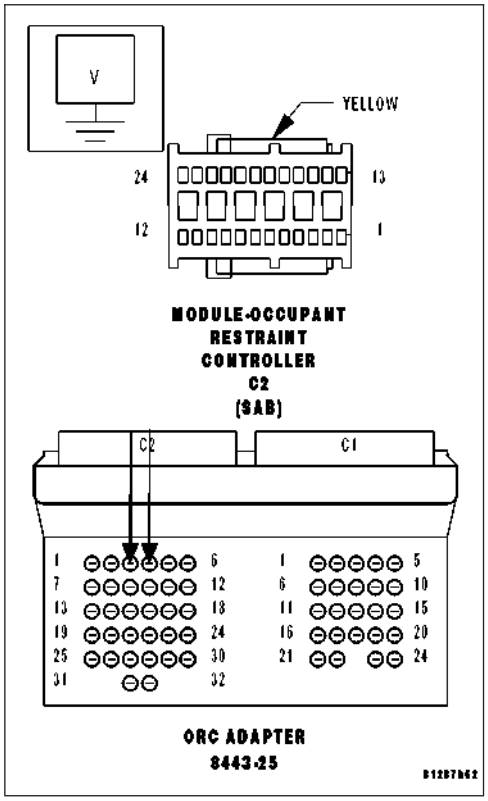
5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

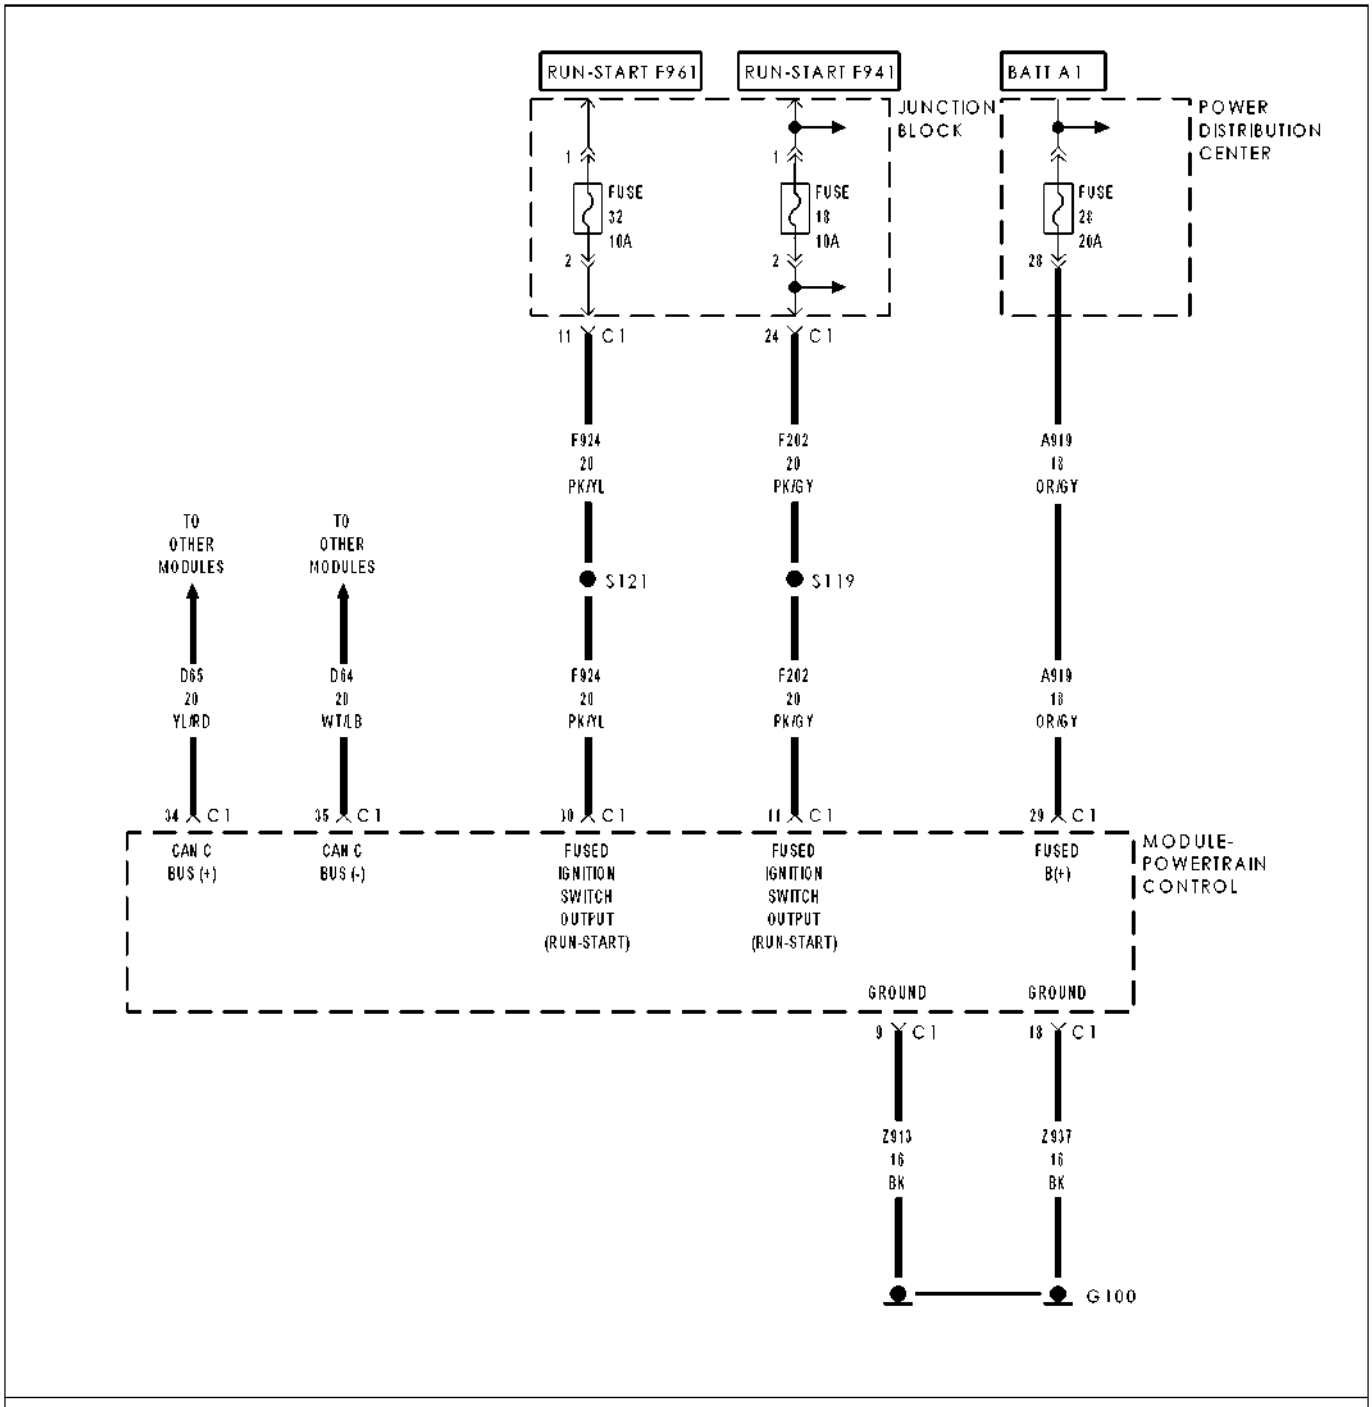


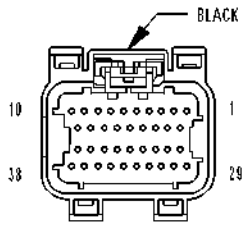
Is there any voltage present on either circuit?

Yes >> Replace the Occupant Restraint Controller in accordance with the service information.
Perform AIRBAG VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform AIRBAG VERIFICATION TEST - VER 1.

*NO RESPONSE FROM PCM





MODULE-POWERTRAIN CONTROL C1

***NO RESPONSE FROM PCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A919) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z937) (Z913) GROUND CIRCUIT OPEN
(F202) (F924) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

***NO RESPONSE FROM PCM (CONTINUED)**

2. (A919) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the PCM C1 harness connector.

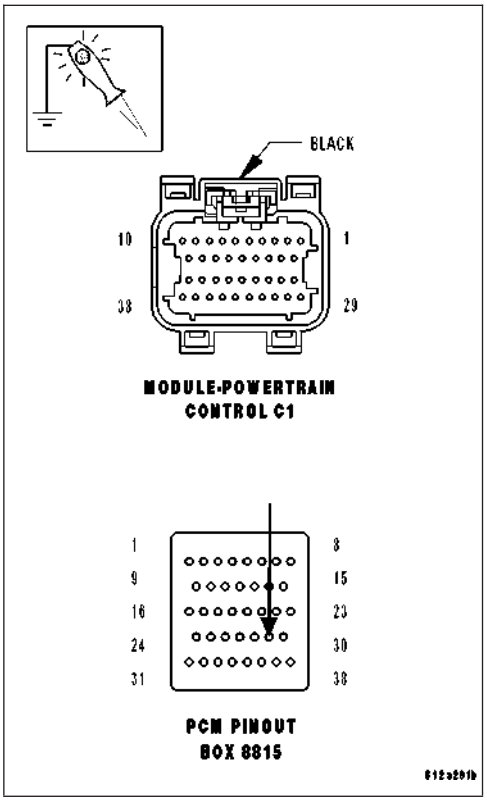
CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A919) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A919) Fused B(+) circuit for an open or short. Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



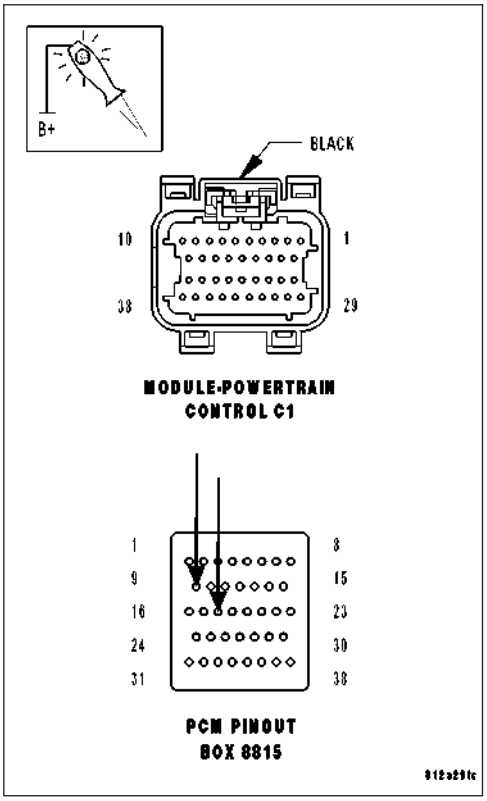
3. (Z913) (Z937) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z913) and (Z937) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



***NO RESPONSE FROM PCM (CONTINUED)**

4. (F202) (F924) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

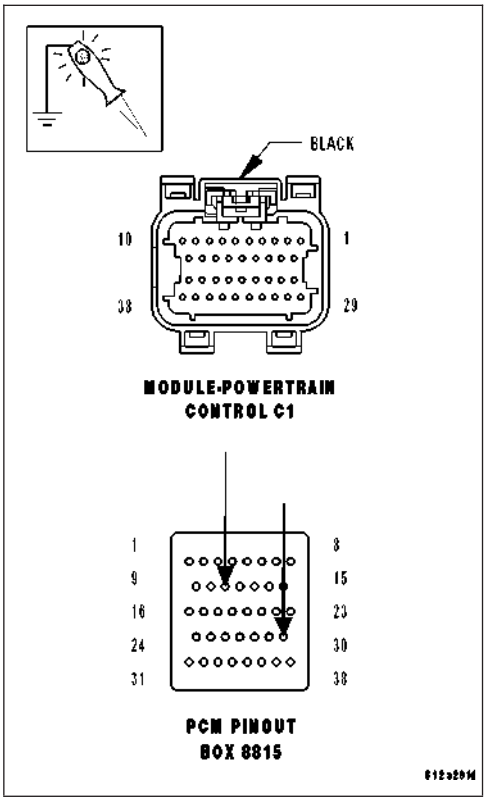
Turn the ignition on.

Using a 12-volt test light connected to ground, check each (F202) and (F924) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 5

No >> Repair the Fused Ignition Switch Output circuit for an open or short.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

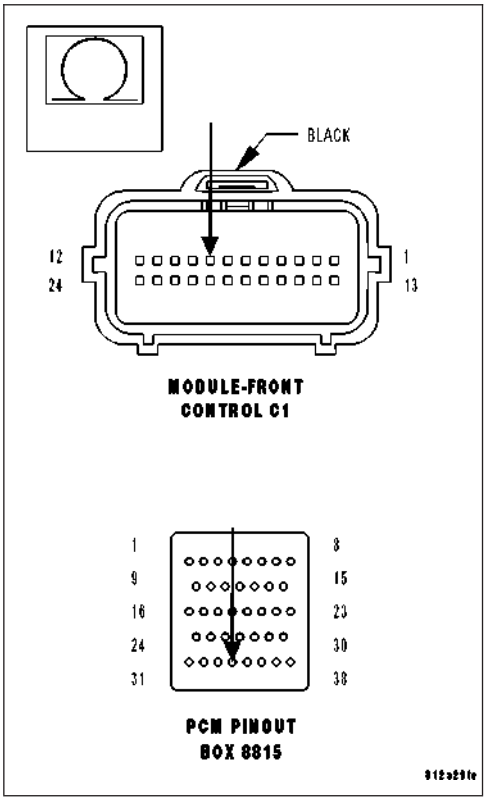
Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

Is resistance below 5.0 ohms?

Yes >> Go To 6

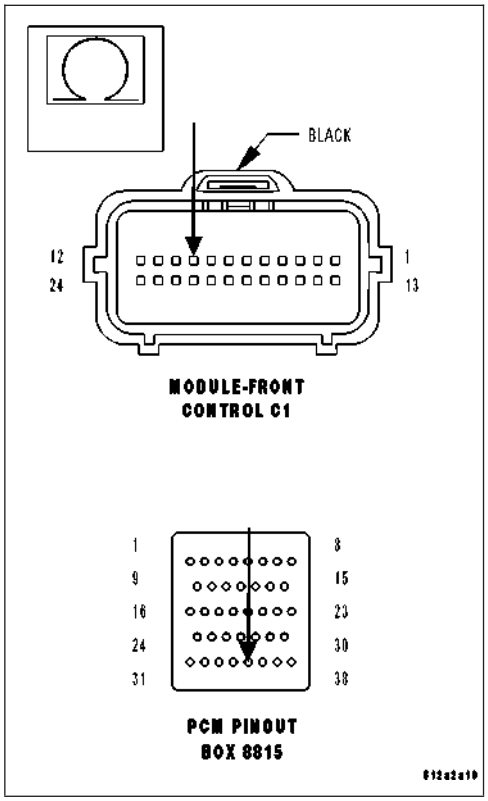
No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.



***NO RESPONSE FROM PCM (CONTINUED)**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

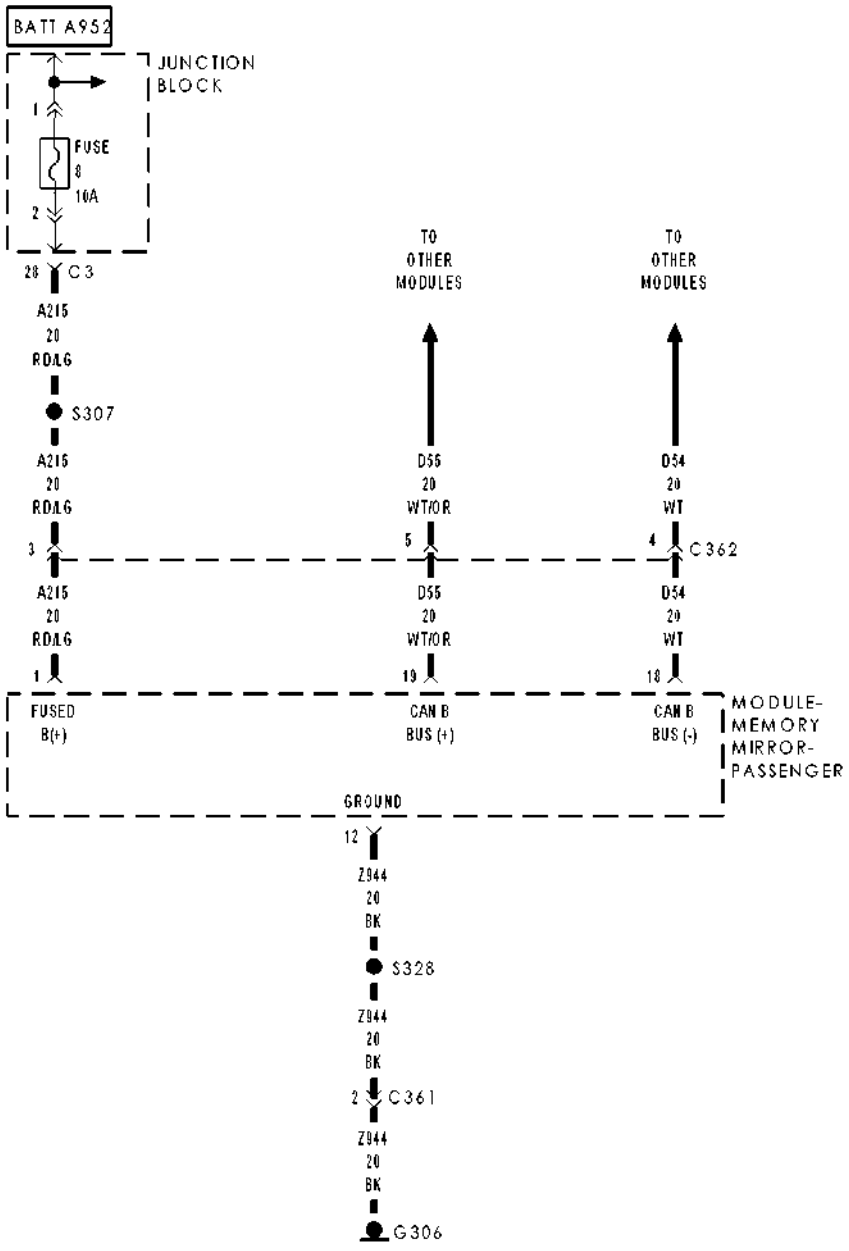


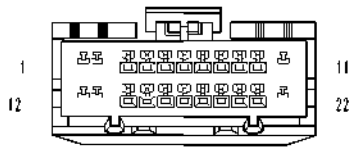
Is resistance below 5.0 ohms?

Yes >> Replace and program the Powertrain Control Module in accordance with the service information.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

*NO RESPONSE FROM PDM





MODULE-MEMORY MIRROR-PASSENGER

81294088

***NO RESPONSE FROM PDM (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A215) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z944) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
PASSENGER MEMORY MIRROR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

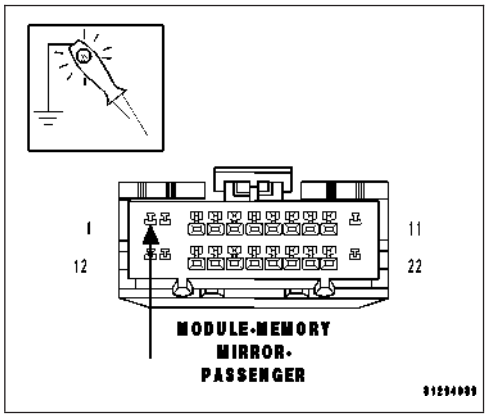
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A215) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Passenger Memory Mirror Module harness connector.
Using a 12-volt test light connected to ground, check the (A215) Fused B(+) circuit.



Does the test light illuminate brightly?

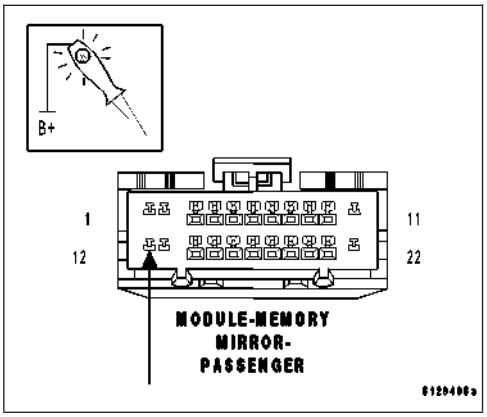
Yes >> Go To 3

No >> Repair the (A215) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM PDM (CONTINUED)**

3. (Z944) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z944) ground circuit.



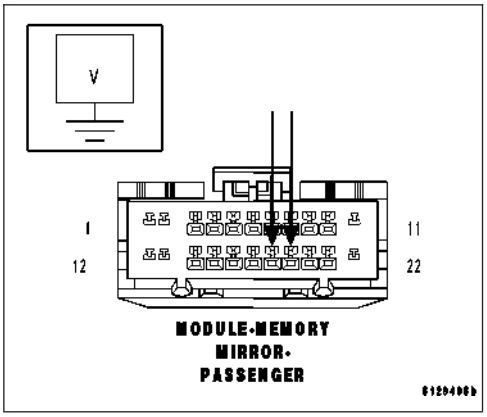
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z944) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

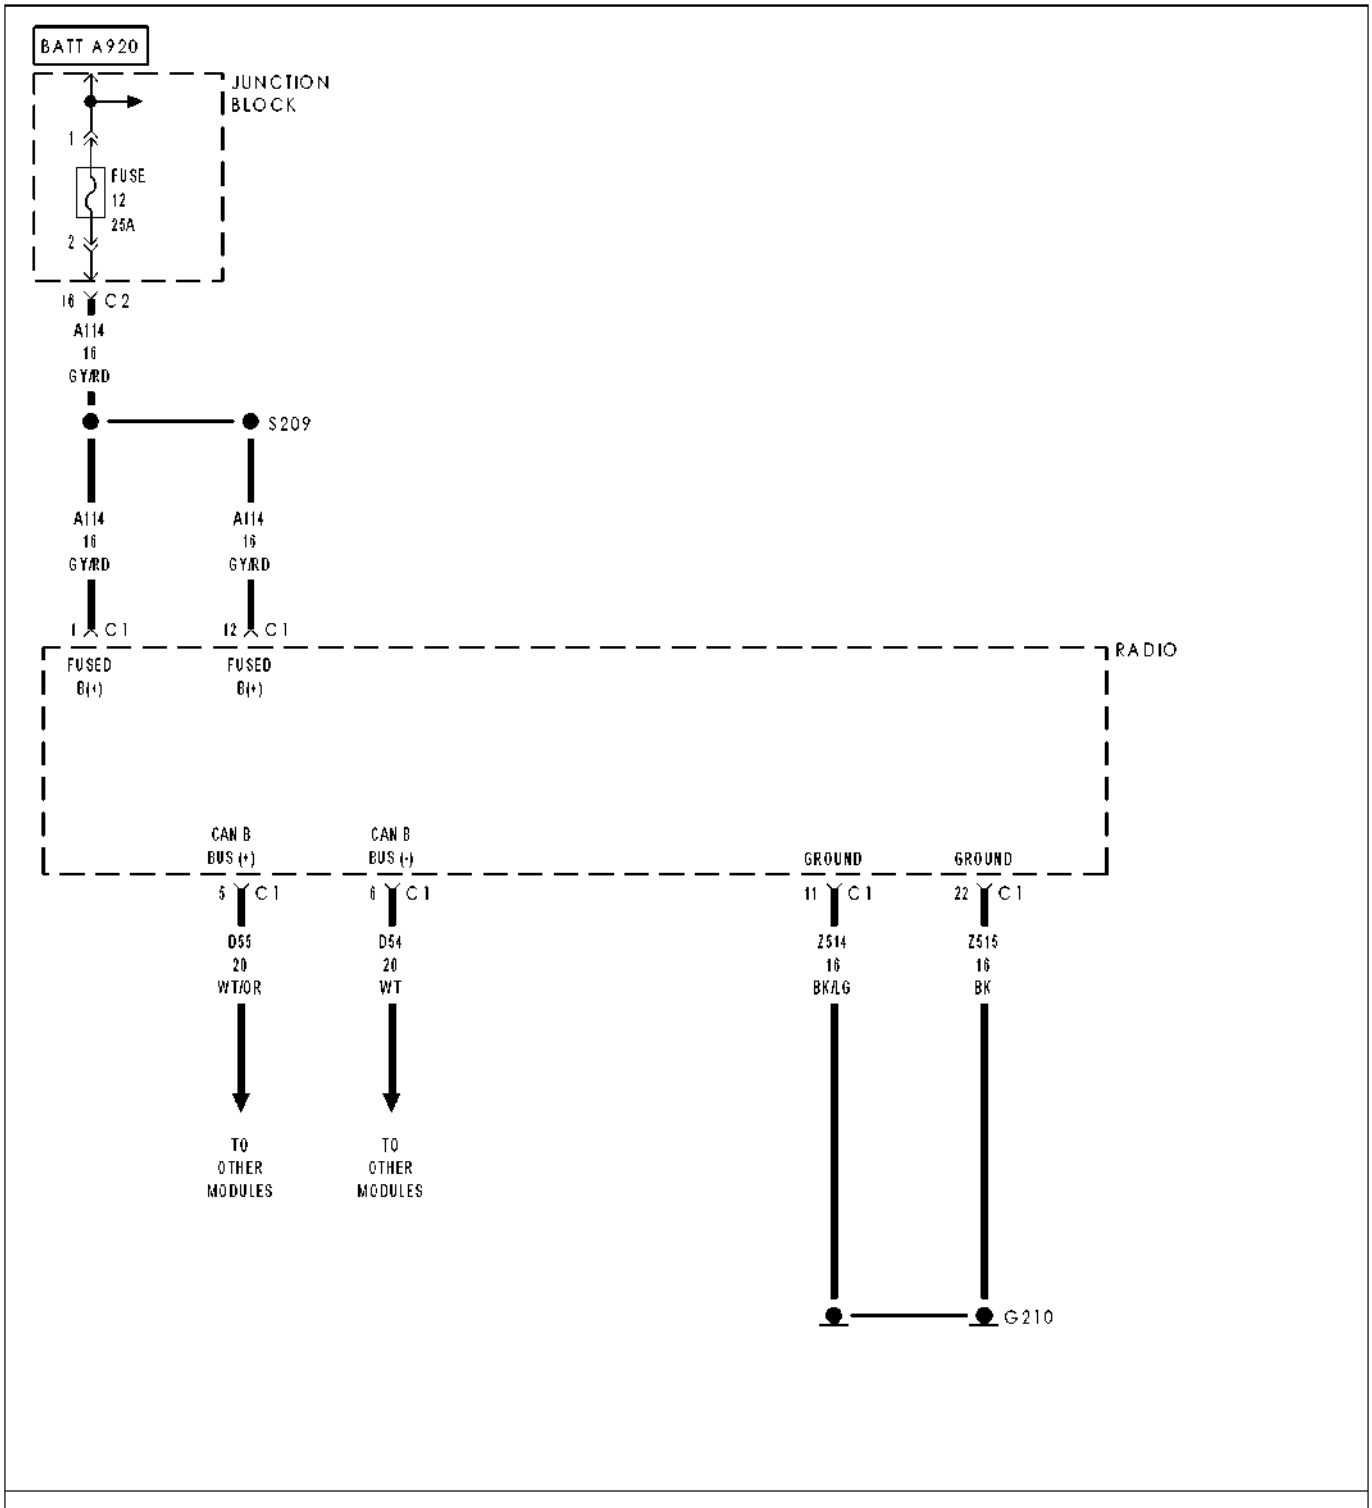


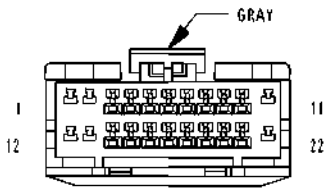
Is there any voltage present on either circuit?

Yes >> Replace the Passenger Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM RADIO





RADIO C1

81261029

***NO RESPONSE FROM RADIO (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A114) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z514) OR (Z515) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
RADIO

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

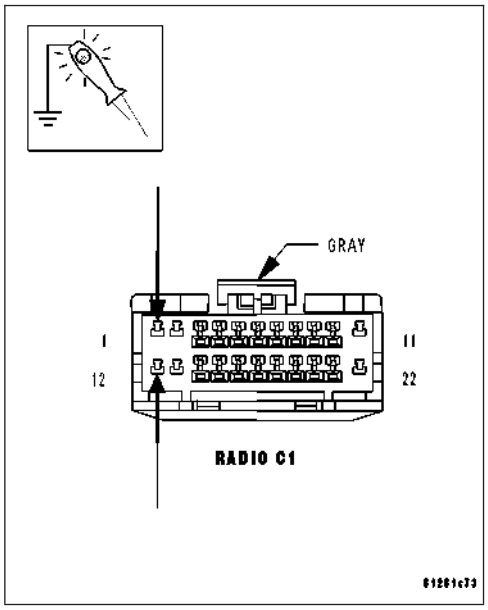
---

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Using a 12-volt test light connected to ground, check each (A114) Fused B(+) circuit.



Does the test light illuminate brightly for each circuit?

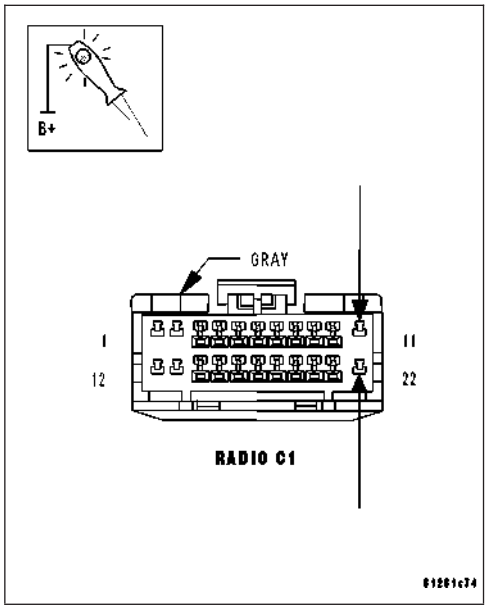
Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM RADIO (CONTINUED)**

3. (Z514) OR (Z515) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z514) and (Z515) ground circuits.



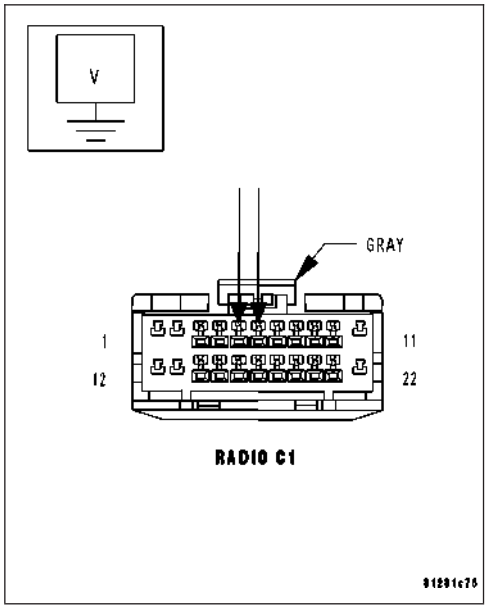
Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z514) or the (Z515) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

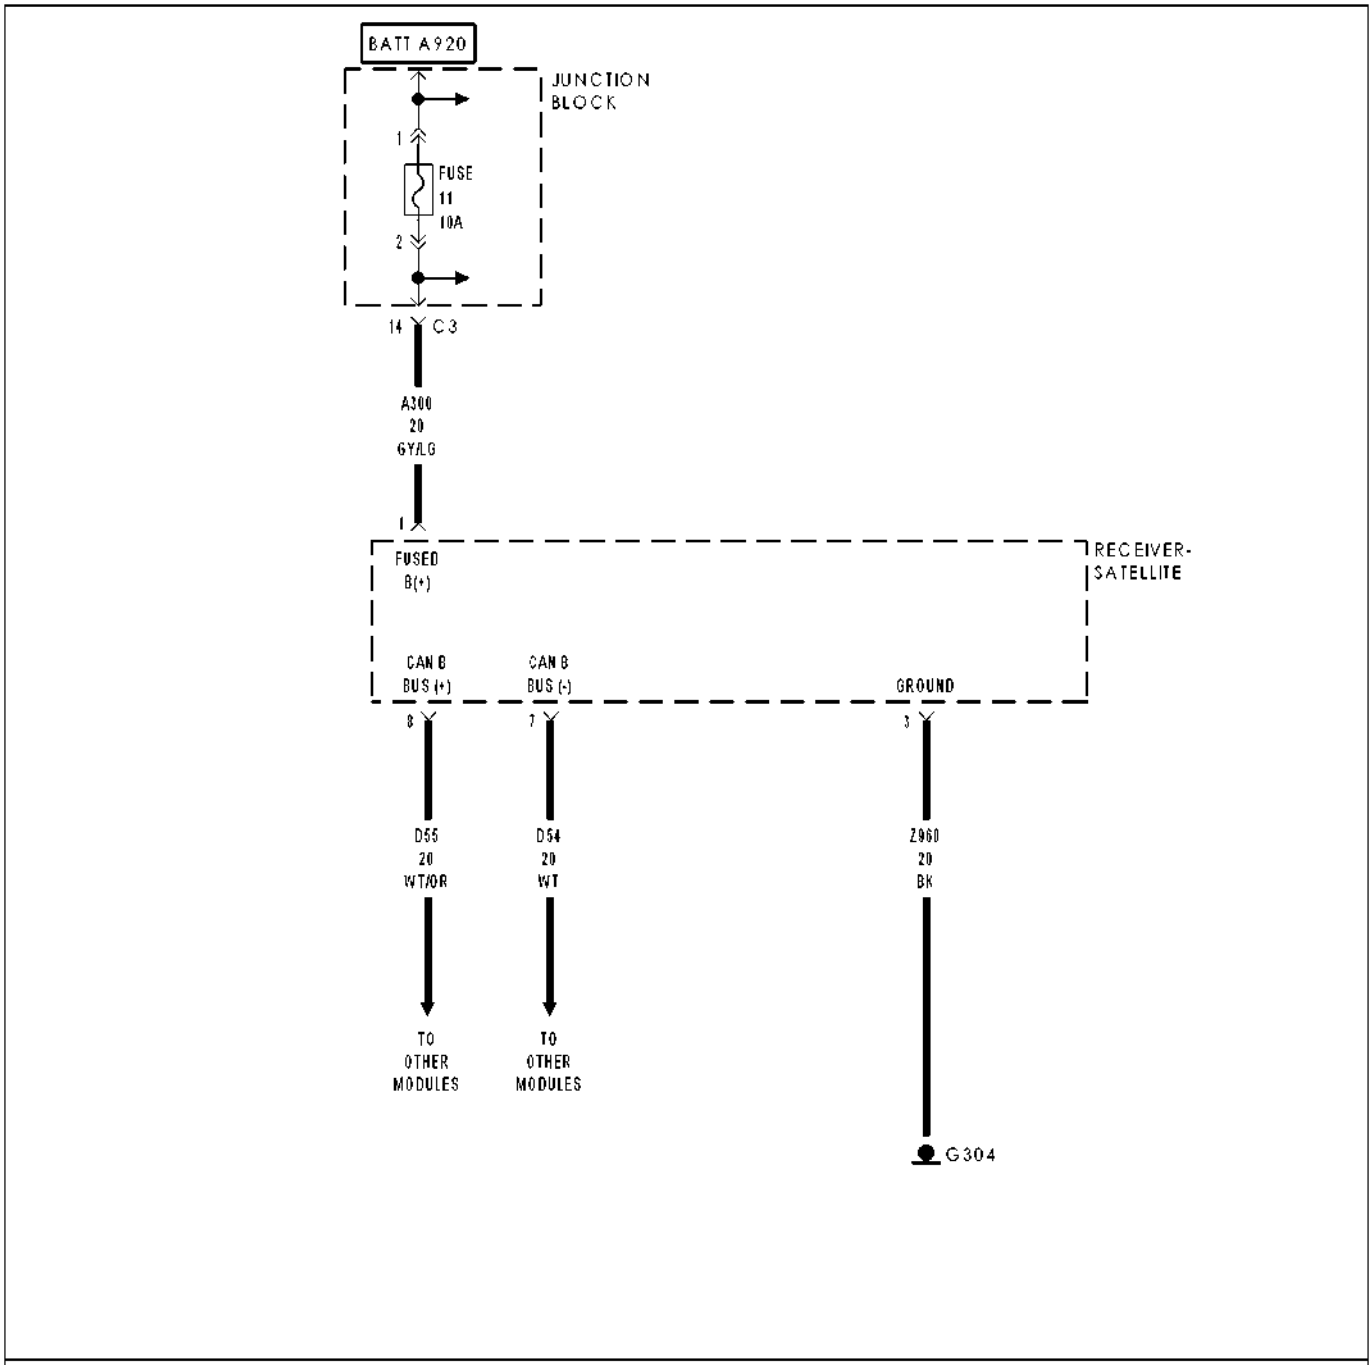


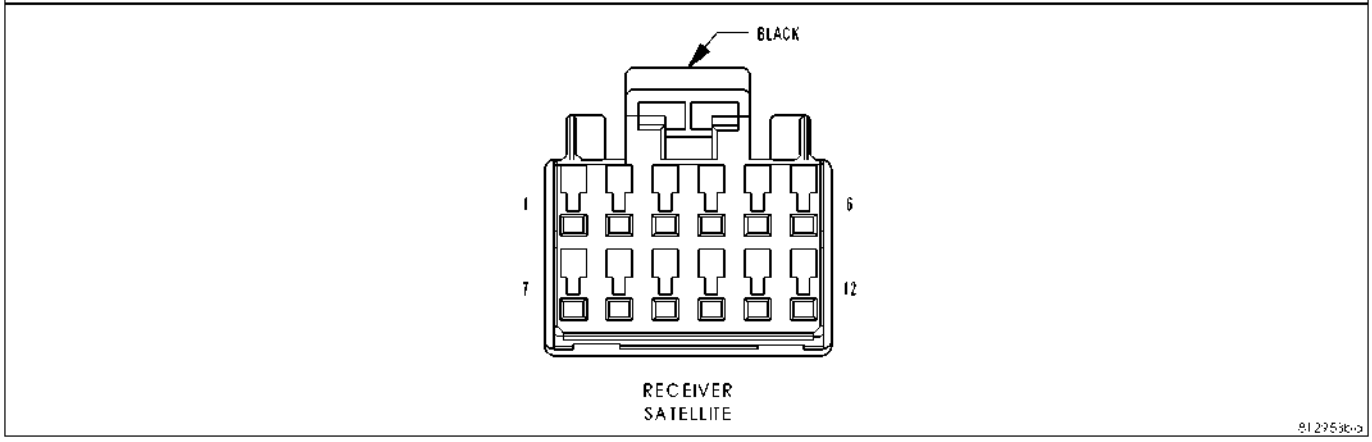
Is there any voltage present on either circuit?

Yes >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM SDAR





***NO RESPONSE FROM SDAR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A300) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z960) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
SATELLITE RECEIVER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A300) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

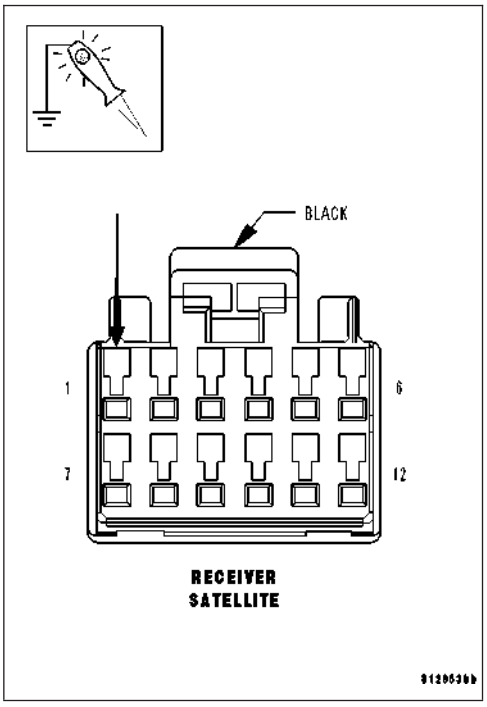
Disconnect the Satellite Receiver harness connector.

Using a 12-volt test light connected to ground, check the (A300) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

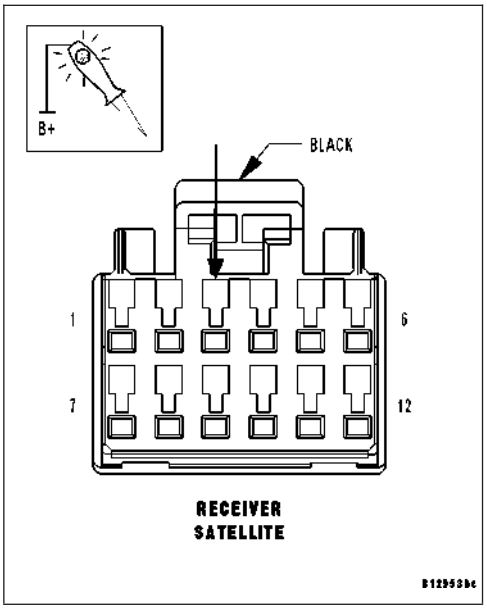
No >> Repair the (A300) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.



***NO RESPONSE FROM SDAR (CONTINUED)**

3. (Z960) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z960) ground circuit.



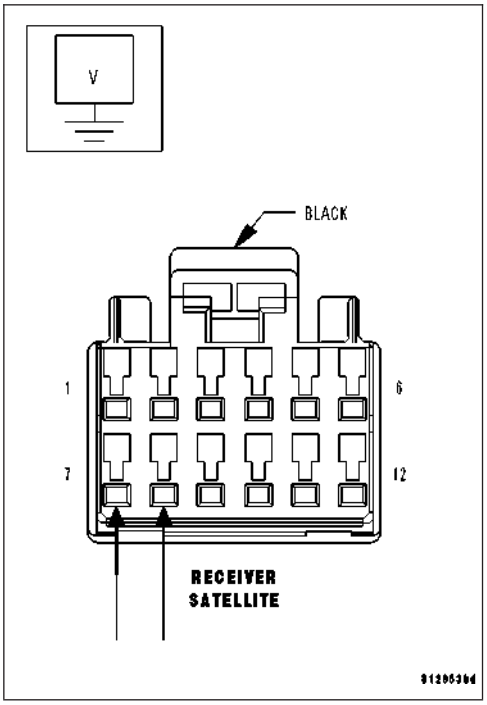
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z960) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

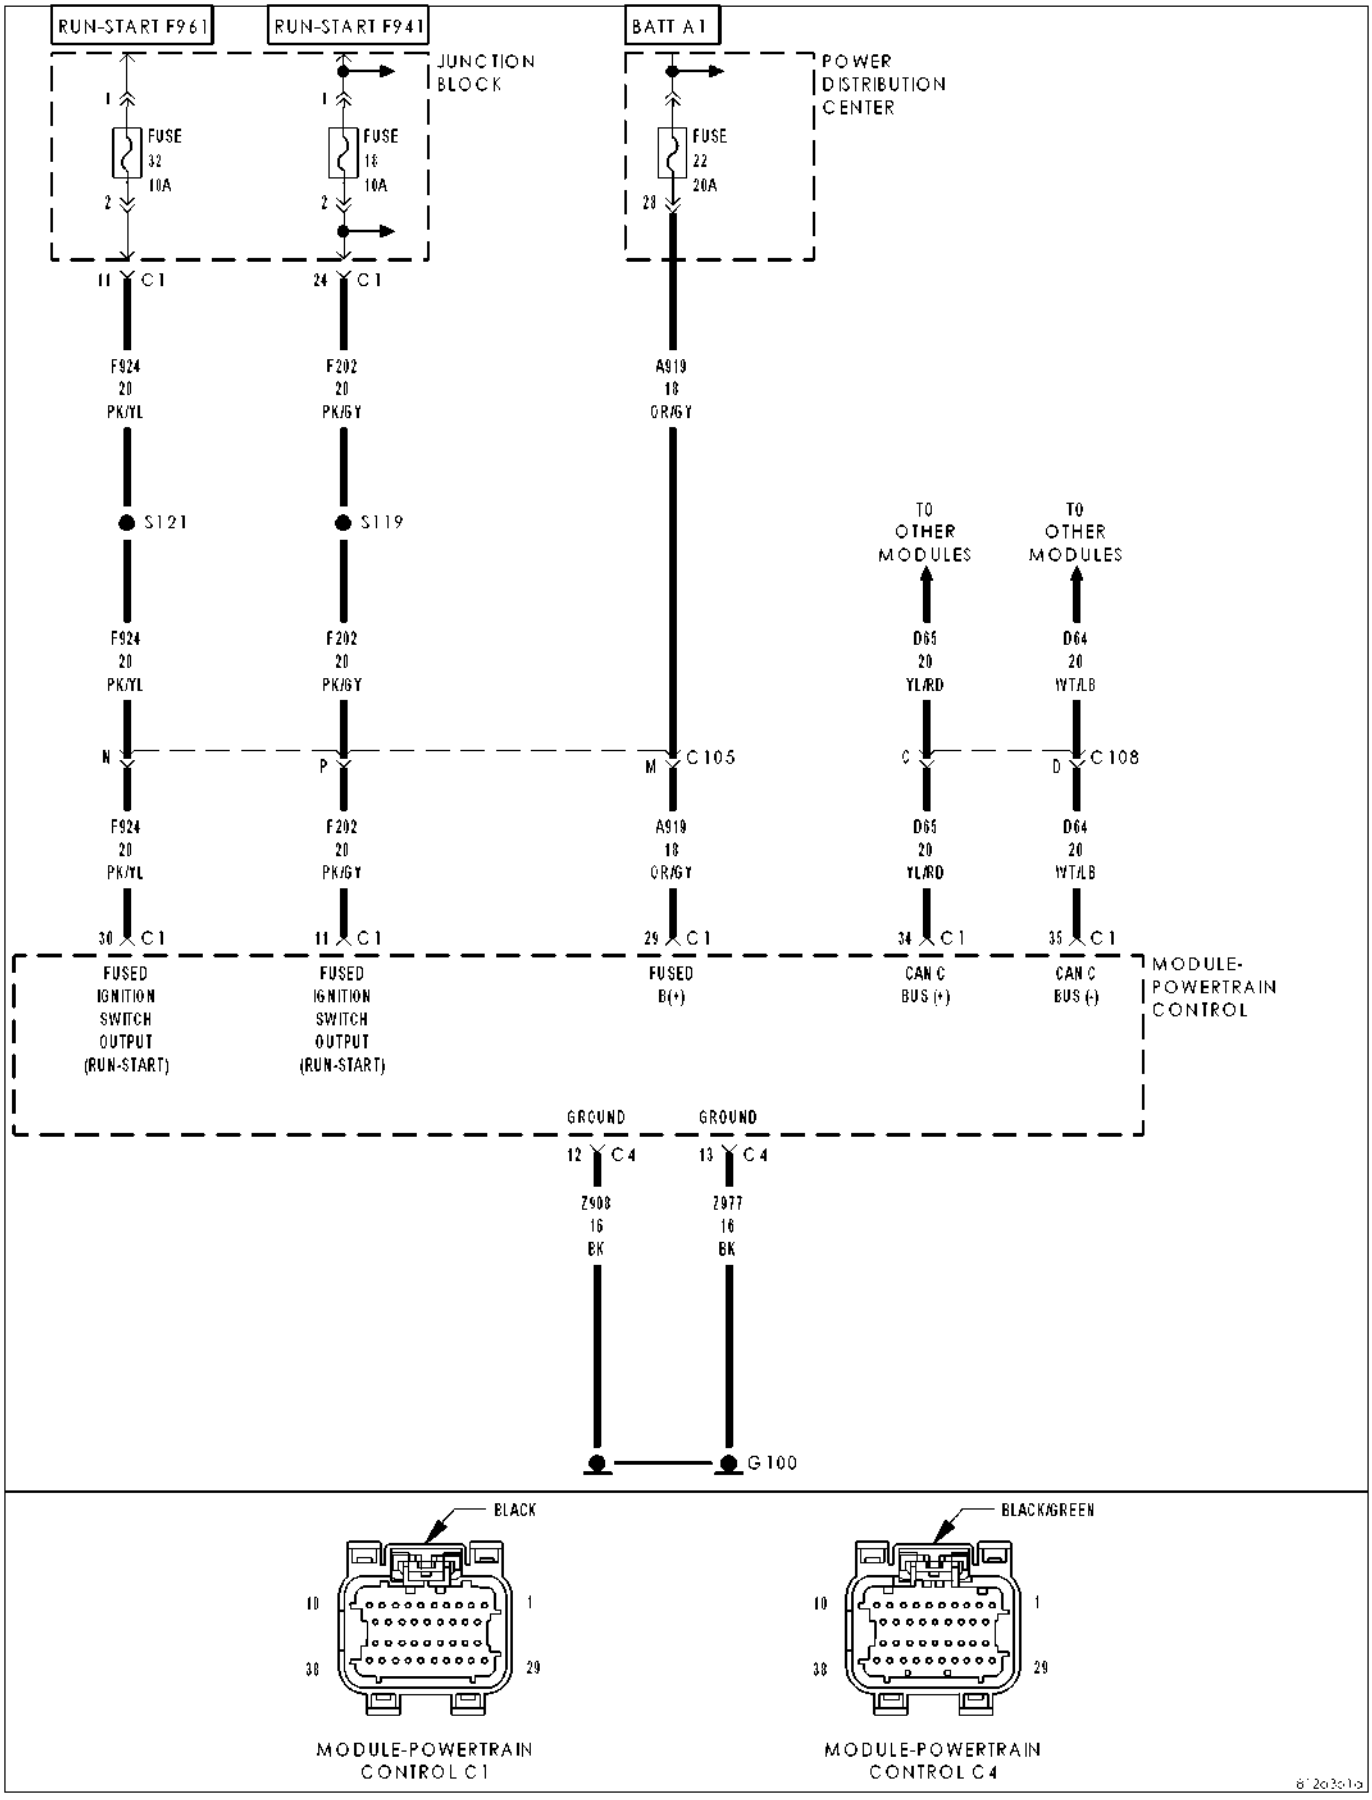


Is there any voltage present on either circuit?

Yes >> Replace the Satellite Receiver in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM TCM



***NO RESPONSE FROM TCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A919) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z908) (Z977) GROUND CIRCUIT OPEN
(F202) (F924) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. ATTEMPT TO COMMUNICATE WITH THE PCM

With the scan tool in ECU view, observe the status of the PCM.

Does the scan tool display a red X next to the PCM?

Yes >> Refer to the No Response From PCM test procedure. Refer to the table of contents in this section.

No >> Go To 3

***NO RESPONSE FROM TCM (CONTINUED)**

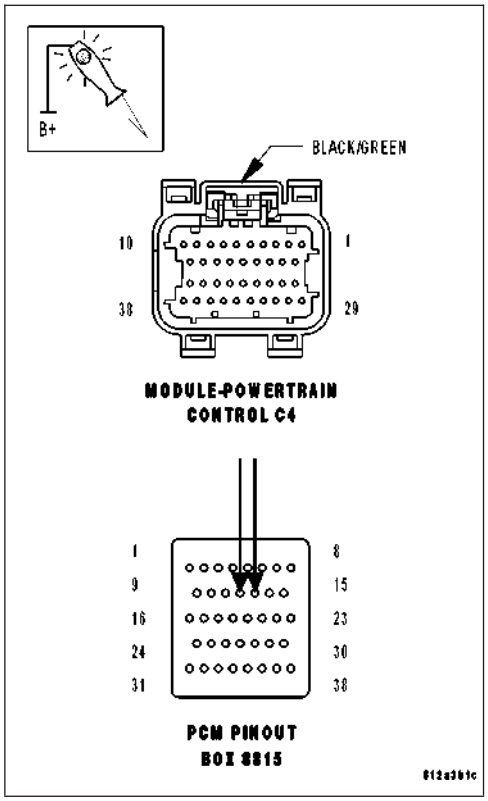
3. (Z908) (Z977) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check each (Z908) and (Z977) ground circuit.



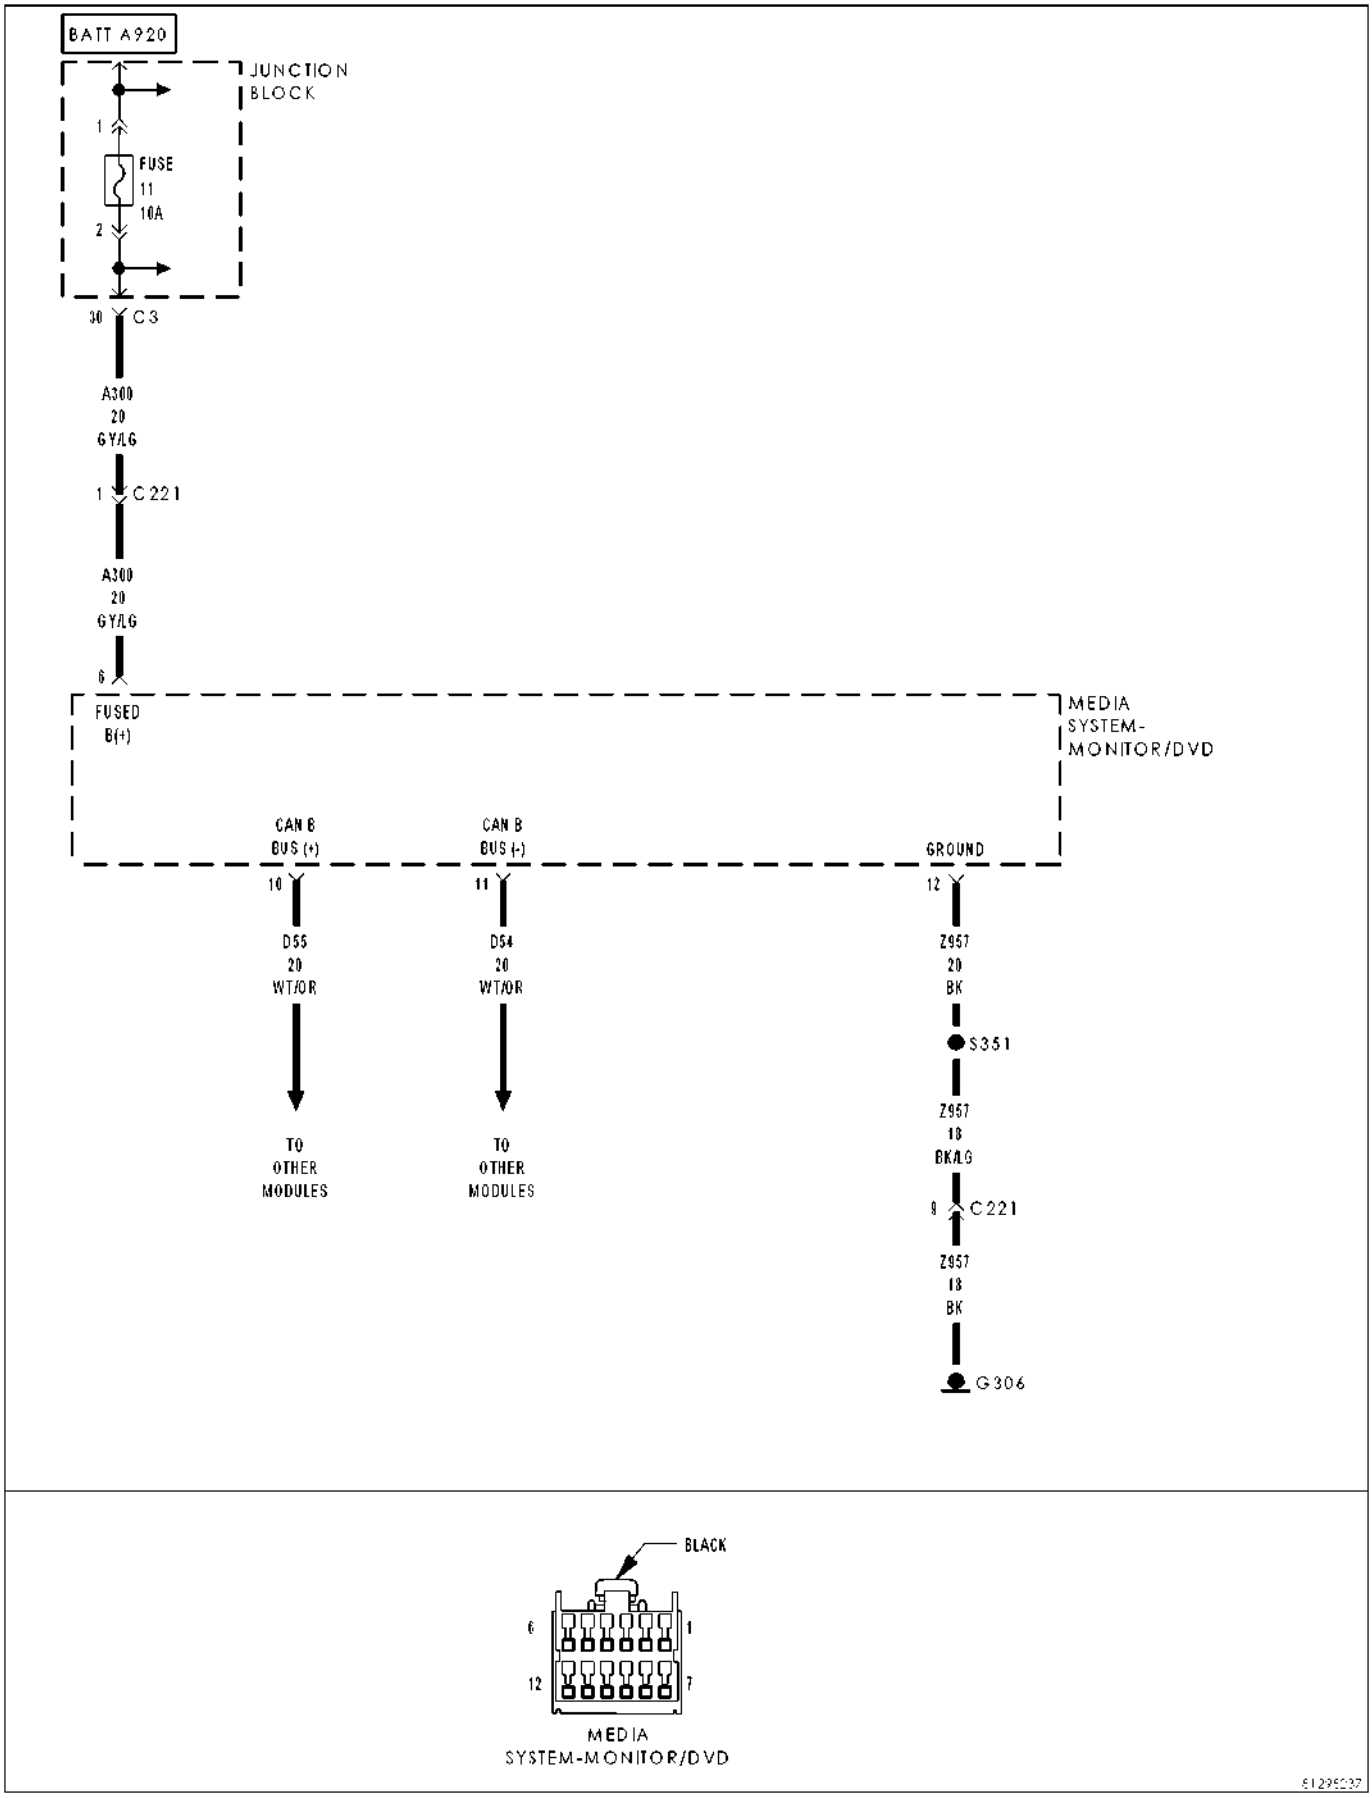
Does the test light illuminate brightly for each circuit?

Yes >> Replace and program the Powertrain Control Module in accordance with the service information.

No >> Repair the ground circuit for an open.

Perform the appropriate TRANSMISSION VERIFICATION TEST.

*NO RESPONSE FROM VES



***NO RESPONSE FROM VES (CONTINUED)**

Possible Causes
(A300) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z957) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
MONITOR/DVD MEDIA SYSTEM (DVD PLAYER)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

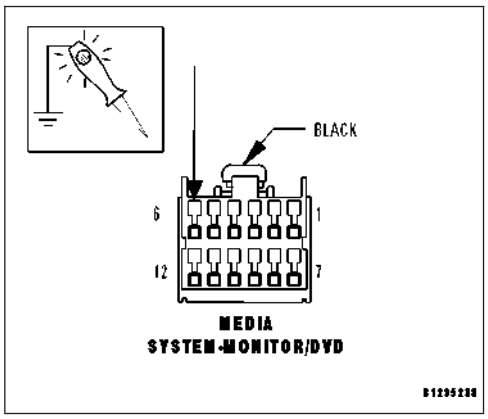
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A300) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Monitor/DVD Media System (DVD Player) harness connector.
Using a 12-volt test light connected to ground, check the (A300) Fused B(+) circuit.



Does the test light illuminate brightly?

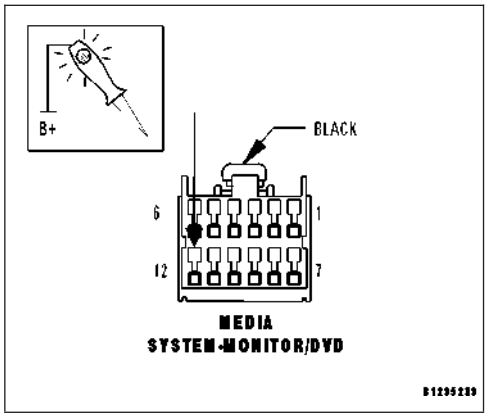
Yes >> Go To 3

No >> Repair the (A300) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM VES (CONTINUED)**

3. (Z957) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z957) ground circuit.



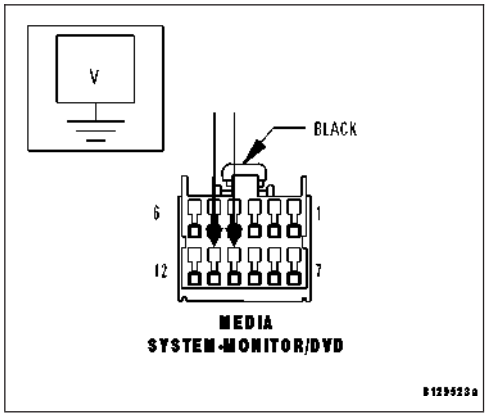
Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z957) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

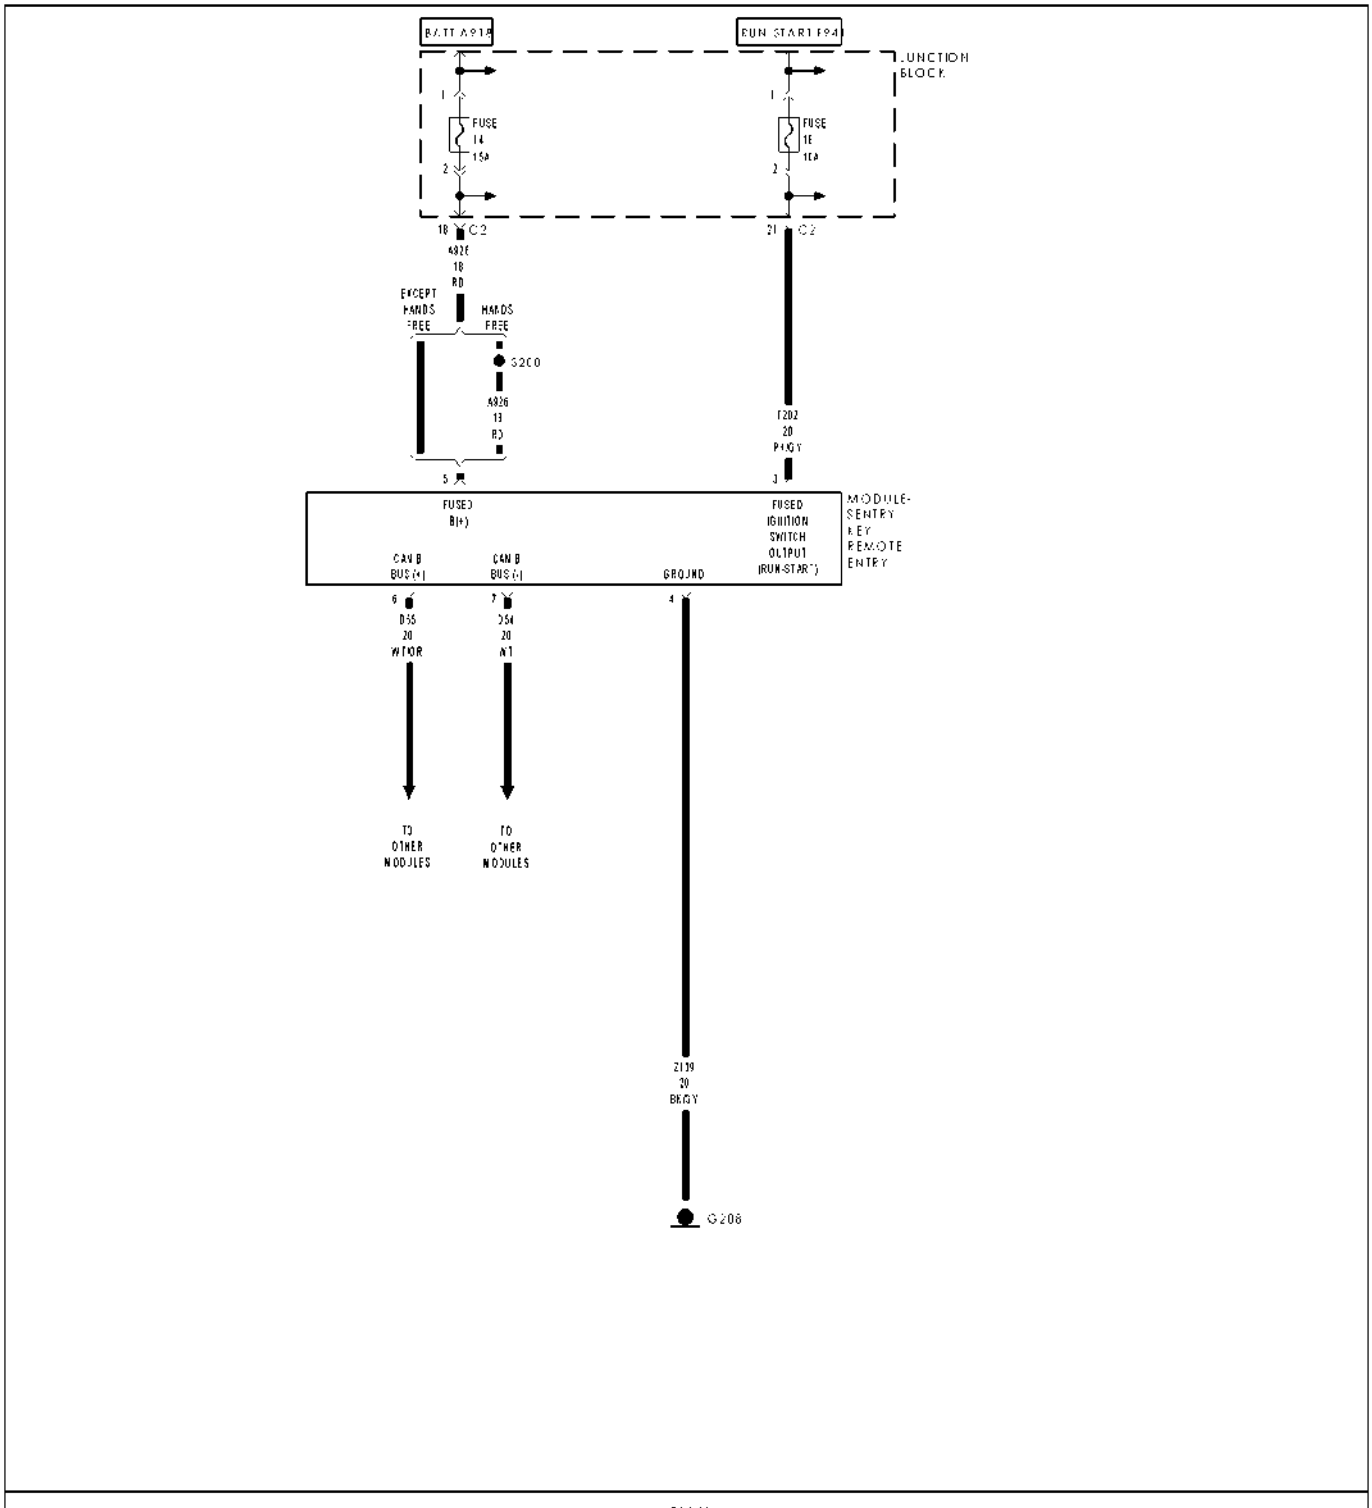


Is there any voltage present on either circuit?

Yes >> Replace the Monitor/DVD Media System (DVD Player) in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM WCM



***NO RESPONSE FROM WCM (CONTINUED)**
For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
(A926) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z109) GROUND CIRCUIT OPEN
(F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
SENTRY KEY REMOTE ENTRY MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.
With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

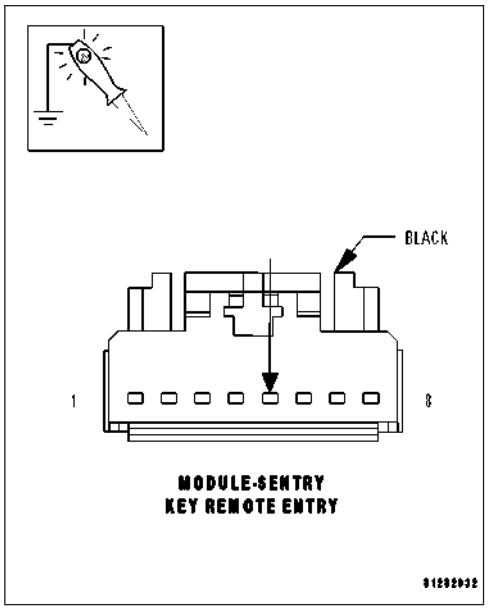
Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

2. (A926) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.
Disconnect the Sentry Key Remote Entry Module harness connector.
Using a 12-volt test light connected to ground, check the (A926) Fused B(+) circuit.



Does the test light illuminate brightly?

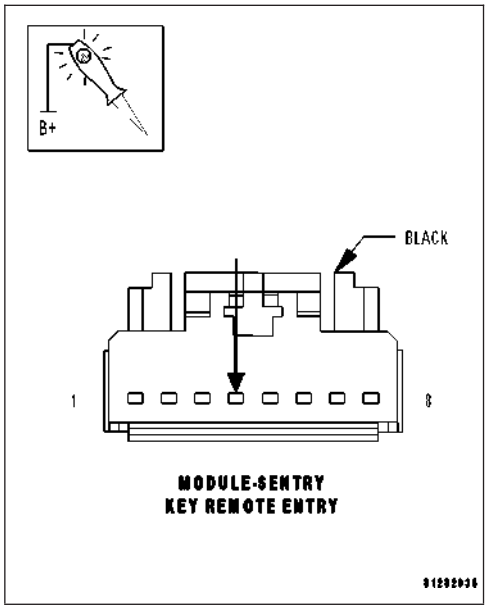
Yes >> Go To 3

No >> Repair the (A926) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST - VER 1.

***NO RESPONSE FROM WCM (CONTINUED)**

3. (Z109) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z109) ground circuit.



Does the test light illuminate brightly?

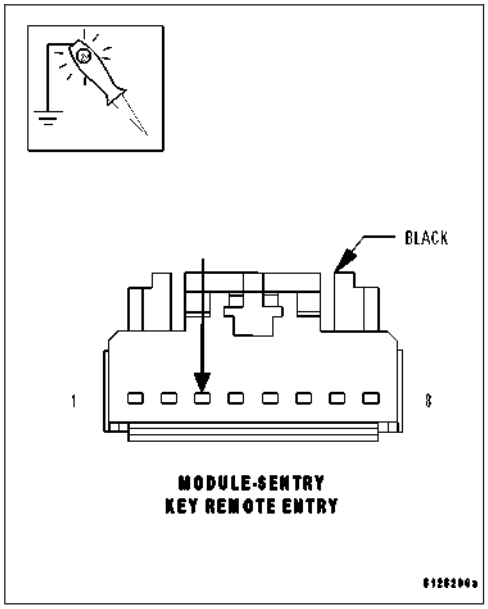
Yes >> Go To 4

No >> Repair the (Z109) ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.



Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F202) Fused Ignition Switch Output circuit for an open or short.
Perform BODY VERIFICATION TEST - VER 1.

*NO RESPONSE FROM WCM (CONTINUED)

5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

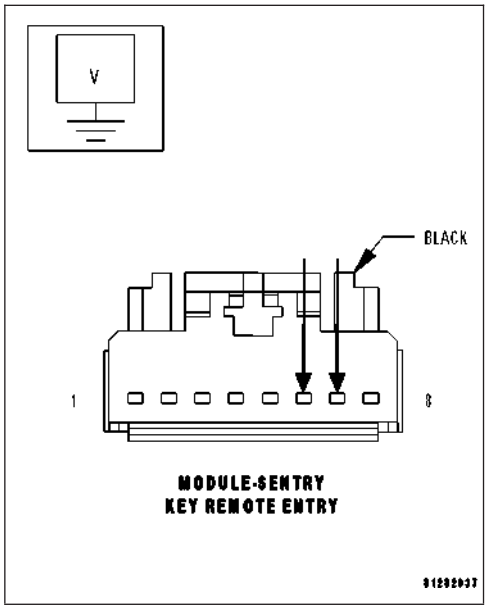
Is there any voltage present on either circuit?

Yes >> Replace the Sentry Key Remote Entry Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.



ELECTRONIC CONTROL MODULES - SERVICE INFORMATION

STANDARD PROCEDURE

PCM/SKREEM PROGRAMMING

NOTE: Before replacing the Powertrain Control Module (PCM), be certain to check the related component/ circuit integrity for failures not detected due to a double fault in the circuit. Most PCM driver/control circuit failures are caused by internal component failures (i.e. relays and solenoids) and shorted circuits (i.e. pull-ups, drivers, and switched circuits). These failures are difficult to detect when a double fault has occurred and only one DTC has been set.

When a Powertrain Control Module (PCM) and the Sentry Key REmote Entry Module (SKREEM) on vehicles equipped with the Sentry Key Immobilizer System (SKIS) are replaced at the same time, perform the following steps in order:

1. Program the new PCM.

2. Program the new SKREEM (also sometimes referred to as the Wireless Control Module or WCM).
3. Replace all ignition keys and program them into the new SKREEM/WCM.

PROGRAMMING THE PCM/SKREEM

The SKIS Secret Key is an ID code that is unique to each SKREEM/WCM. This code is programmed and stored in the SKREEM/WCM, the PCM, and each ignition key transponder chip. When the PCM or SKREEM/WCM is replaced, it is necessary to program the Secret Key into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for “PCM Replaced” or “WCM Replaced” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item as appropriate.

NOTE: Be certain to enter the correct country code for the SKREEM/WCM. If the incorrect country code is programmed into the SKREEM, it cannot be changed and the SKREEM must be replaced.

NOTE: If the PCM and the SKREEM/WCM are replaced at the same time, all vehicle ignition keys will need to be replaced and new keys programmed into the new SKREEM/WCM.

NOTE: Programming the PCM or SKREEM is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour then enter the correct PIN. (Ensure all accessories are turned OFF. Also monitor the battery state and connect a battery charger if necessary).

PROGRAMMING IGNITION KEYS TO THE SKREEM

Each ignition key transponder also has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the SKREEM/WCM, the transponder ID code is learned by the module and the transponder acquires the unique Secret Key ID code from the SKREEM/WCM. To program ignition keys into the SKREEM/WCM, follow the programming steps outlined in the diagnostic scan tool for “Program Ignition Keys or Key FOBs” under “Miscellaneous Functions” for the “WCM/Wireless Control Module” menu item.

NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM, that key has acquired the Secret Key for that SKREEM and cannot be transferred to any other SKREEM or vehicle.

If ignition key programming is unsuccessful, the scan tool will display one of the following error messages:

- **Programming Not Attempted** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **Programming Key Failed (Possible Used Key From Wrong Vehicle)** - SKREEM is unable to program an ignition key transponder due to one of the following:
  - The ignition key transponder is faulty.
  - The ignition key transponder is or has been already programmed to another vehicle.
- **8 Keys Already Learned, Programming Not Done** - The SKREEM transponder ID memory is full.
- **Learned Key In Ignition** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed into SKREEM memory.

MODULE-ANTI-LOCK BRAKES

DESCRIPTION

The Antilock Brake Module (ABM) is a microprocessor which handles testing, monitoring and controlling the ABS brake system operation.

The ABM is mounted on the top of the hydraulic control unit (HCU). The ABM operates the ABS system and is separate from other vehicle electrical circuits. ABM voltage source is through CKT A111 (fused B+).

NOTE: If the ABM needs to be replaced, the rear axle type and tire revolutions per mile must be programed into the new ABM. For axle type refer to Group 3 Differential and Driveline. For tire revolutions per mile, (Refer to 22 - TIRES/WHEELS/TIRES - SPECIFICATIONS) . To program the ABM refer to the Appropriate Diagnostic Service Information.

OPERATION

SYSTEM SELF-TEST

When the ignition switch is turned-on the microprocessor is tested. If an error occurs during the test, a DTC will be set into the memory. However it is possible the DTC will not be stored in memory if the error has occurred in the module were the DTC's are stored.

The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in memory and are accessible with the scan tool.

ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

ABM INPUTS

The ABM continuously monitors the speed of the vehicle by monitoring signals generated by the wheel speed sensors. The ABM determines a wheel locking tendency when it recognizes the axle is decelerating too rapidly. The ABM monitors the following inputs to determine when a wheel locking tendency may exists:

- Wheel Speed Sensors
- Brake Lamp Switch
- Brake Fluid Level Sensor
- G-Sensor (4X4 TCS)
- 4WD Switch (If equipped)

ABM OUTPUTS

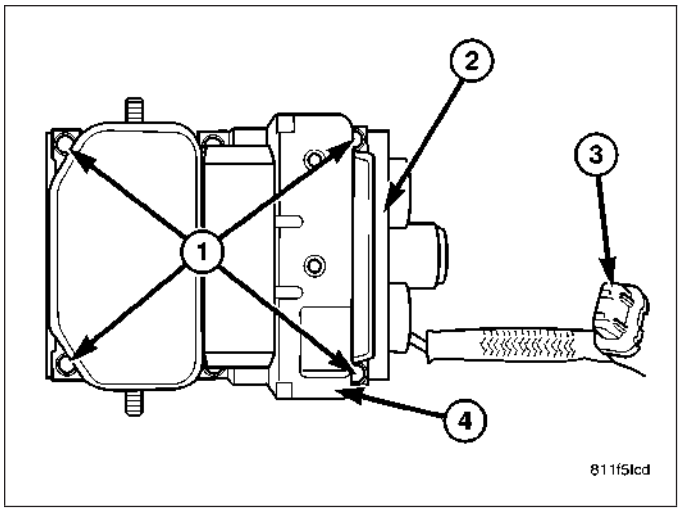
The ABM requests the following outputs for antilock braking and brake warning information from the CCN via CAN C Bus:

- ABS Warning Lamp
- Brake Warning Lamp

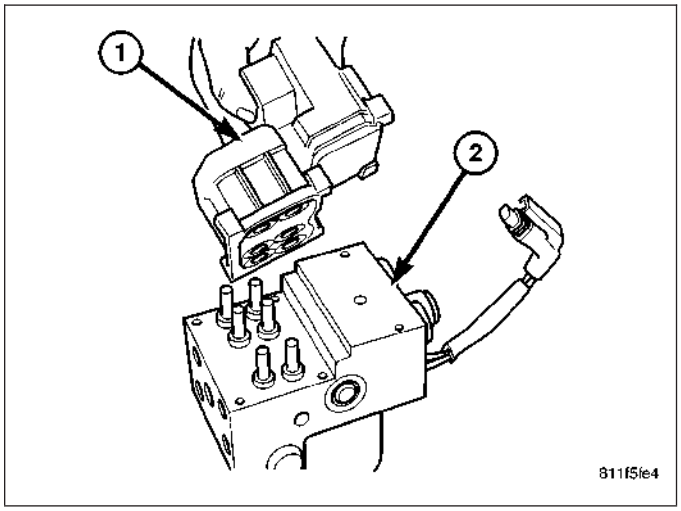
REMOVAL

NOTE: If the ABM needs to be replaced, the rear axle type and tire revolutions per mile must be programed into the new ABM. For axle type refer to Group 3 Differential and Driveline. For tire revolutions per mile, (Refer to 22 - TIRES/WHEELS/TIRES - SPECIFICATIONS). To program the ABM refer to the Appropriate Diagnostic Service Information.

1. Remove the HCU from the vehicle (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - REMOVAL).
2. Remove the module mounting screws (1).
3. Disconnect the pump electrical connector (3) from the HCU (2).



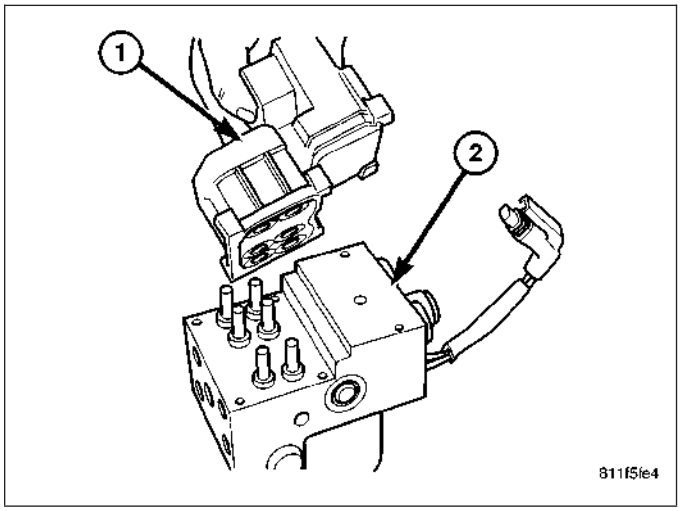
4. Remove the module (1) from the HCU (2).



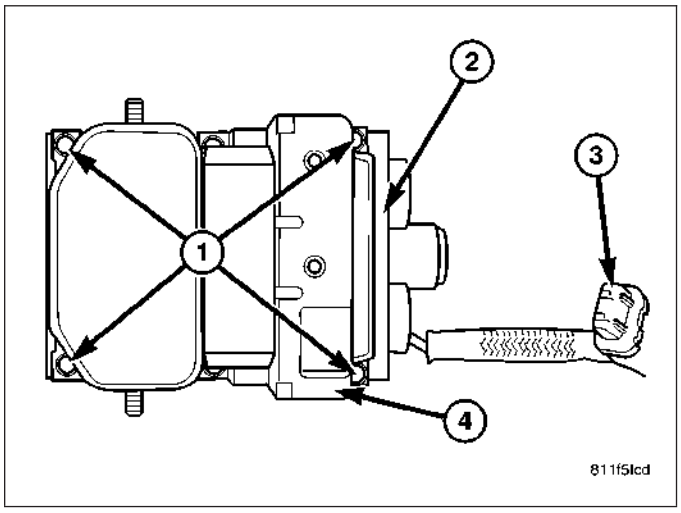
INSTALLATION

NOTE: If the ABM needs to be replaced, the rear axle type and tire revolutions per mile must be programed into the new ABM. For axle type refer to Group 3 Differential and Driveline. For tire revolutions per mile (Refer to 22 - TIRES/WHEELS/TIRES - SPECIFICATIONS). To program the ABM refer to the Appropriate Diagnostic Service Information.

1. Position the module (1) on the HCU (2).



2. Install the mounting screws (1) and tighten to 6 N·m (53 in. lbs).
3. Install the pump electrical connector (3) to the module (4).
4. Install the HCU to the vehicle (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/HCU (HYDRAULIC CONTROL UNIT) - INSTALLATION).



COMMUNICATION

DESCRIPTION

The Controller Area Network (CAN) is a serial data bus communication network used for interconnecting numerous electronic control modules throughout the vehicle in a two-wire multiplexed system. Within this context the term serial refers to electronic data that is transferred bit by bit, while bus refers to the shared wires through which that data is transferred. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The communication protocol being used is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b and uses an 11-bit message identifier.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-B, the CAN-C and the Diagnostic CAN-C. The CAN-B and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps), but is less fault tolerant than the CAN-B system. The CAN-C is used exclusively for communications between critical powertrain and chassis nodes. The slower (83.3 Kbps), but more fault tolerant CAN-B system is

used for communications between body and interior nodes. The CAN-B fault tolerance comes from its ability to revert to a single wire communication mode if there is a fault in the bus wiring.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. A central gateway or hub integral to the Front Control Module (FCM) physically and electrically isolates the three CAN buses from each other and coordinates the bi-directional transfer of messages between the three buses. The FCM is located on the Integrated Power Module (IPM), which is located in the engine compartment near the battery. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the FCM/gateway and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

Each node is connected in parallel to its CAN-B or CAN-C bus using a two-wire twisted pair. These wires are wrapped around each other to provide shielding from unwanted electromagnetic induction interfering with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter. While the CAN bus is operating, one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (–) wire. Each twisted pair terminates at the FCM/gateway.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle. Like prior data bus systems, the CAN data bus minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one node. Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data.

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Each node can both send and receive serial data simultaneously. The CAN bus signal lines have termination through a termination resistor within each node, either dominant or recessive. The serial data is made up of high and low voltage pulses strung together. Each string of voltage pulses forms a message.

Regardless of whether a message originates from a node on the medium speed CAN-B bus or on the high speed CAN-C bus, the message structure and layout is the same, which allows the Front Control Module (FCM)/Central GateWay (sometimes referred to as the FCMCGW) to process and transfer messages between the buses. The priority of each message is based upon the 11-bit message identifier. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The FCM used in the CAN system has more control than a non-CAN FCM. Available options are configured into the FCM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The FCM also has two 64-bit registers, which register each of the “as-built” and “currently responding” nodes on the CAN-B and CAN-C buses. The FCM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the FCM. To aid in CAN network diagnosis, the FCM will provide CAN-B and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a “bus off hardware failure,” while the transceiver in each node on the CAN-B bus will identify a “general bus hardware failure.” The transceivers for some CAN-B nodes will also identify “bus shorted high,” “bus shorted low,” “bus open” or “bus shorted together” failures for both CAN-B bus signal wires.

In order to minimize the potential effects of Ignition-Off Draw (IOD), the CAN-B network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the On or Start positions; however, the FCM or the Transmission Control Module (TCM), which are on the CAN-C bus, may still be awake with the ignition switch in the Accessory or Unlock positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

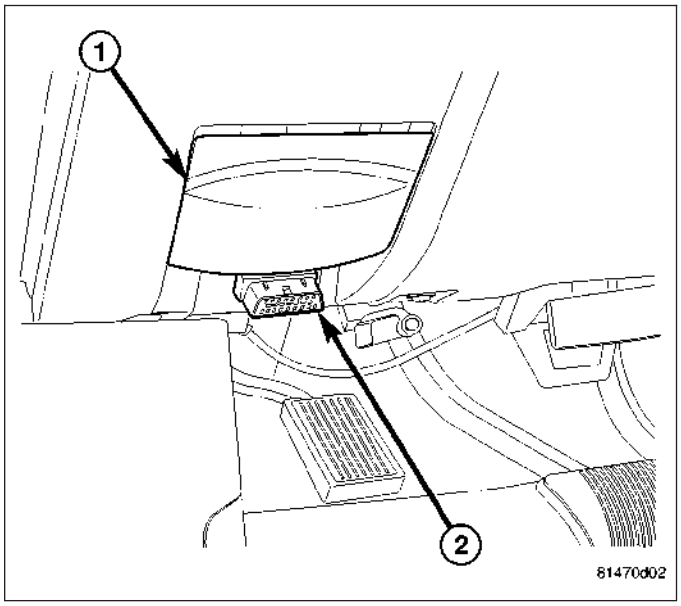
The CAN-B bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready

for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a “bus sleep acknowledgment” message that causes the network to sleep. Once the CAN-B bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The FCM will keep either the CAN-B or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

DATA LINK CONNECTOR

DESCRIPTION

The Data Link Connector (DLC) (2) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, outboard of the steering column. The connector insulator is retained by integral snap features within a rectangular cutout in the lower instrument panel reinforcement, just below the park brake release handle (1).



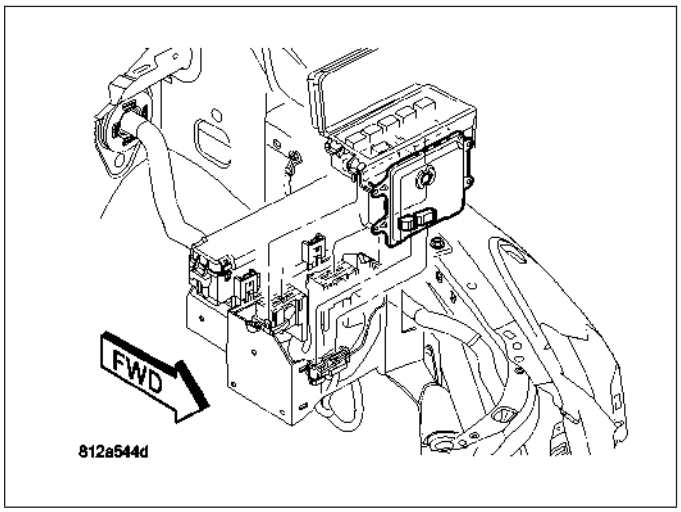
OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

MODULE-FRONT CONTROL

DESCRIPTION

The Front Control Module (FCM) is a micro controller based module located in the left front corner of the engine compartment. The front control module mates to the power distribution center to form the Integrated Power Module (IPM). The IPM connects directly to the battery and provides the primary means of circuit protection and power distribution for all vehicle electrical systems. The front control module controls power to some of these vehicle systems electrical and electromechanical loads based on inputs received from hard wired switch inputs and data received on the CAN bus circuit.



OPERATION

As messages are sent over the CAN bus circuit, the Front Control Module (FCM) reads these messages and controls power to some of the vehicles electrical systems by completing the circuit to ground (low side driver) or completing the circuit to 12 volt power (high side driver). The following functions are controlled by the FCM:

- Front turn signals
- Stop, turn signal and tail lamps
- Front and rear hazard warning lamps
- Headlamps
- Fog Lamps
- Daytime running lamps - if equipped
- Horn
- Windshield and liftgate wiper and washer systems
- Transfer case shifting
- Trailer tow wiring output
- Rear window defroster power and timing
- Air conditioning condenser cooling fan

The FCM provides the following features for the above function:

- It provides a illuminated approach feature that turns the headlamps on when the vehicle is unlocked with the Remote Keyless Entry (RKE) transmitter.
- It flashes lamps in response to turn signal, RKE and Vehicle Theft Security System (VTSS) inputs.
- It sounds the horn in response to RKE and VTSS inputs.
- It turns off the horn in the event of excessively long operation that could otherwise damage the horn.
- It turns off the windshield washer motor after 10 seconds of continuous operation to protect the motor.
- It minimizes voltage variations to the headlamps to extend bulb life and to equalize the light output from the lamps, which might otherwise differ due to variations in wiring resistance.
- If the headlamps are left on, it automatically turns them off after eight minutes to protect the battery from discharge.It monitors battery voltage and turns off non-essential functions such as the fog lamps, rear window defogger, and heated seats if necessary to conserve battery power.
- It operates the high-beam headlamps at reduced intensity by pulse-width modulation of the power supply to provide the daytime running lamps.
- It provides the variable delay intermittent windshield and liftgate wiper time delay features, and the vehicle speed sensitive windshield wiper delay variation.
- It acts as a link between the CAN bus network for critical powertrain and anti-lock brake systems and the network for body and interior modules.

DIAGNOSIS AND TESTING

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. **Perform Body Verification Test**

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If an electronic control module was replaced, select the applicable module from the scan tool menu and press “Misc. Functions”. If the module has programable features, program as necessary.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

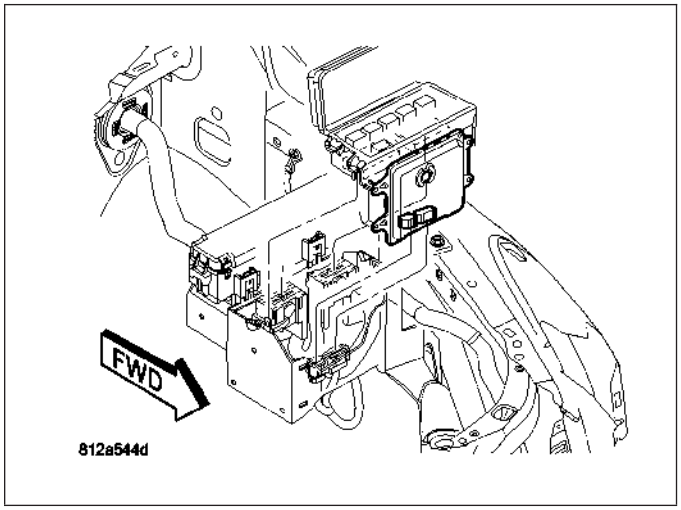
Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

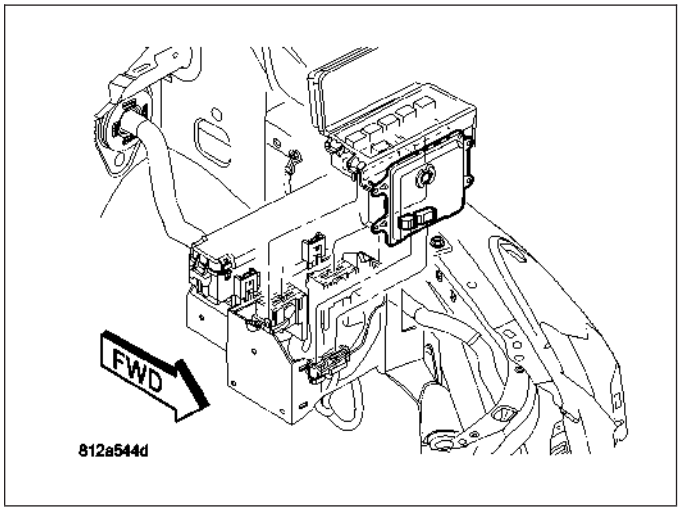
REMOVAL

1. Disconnect the positive and negative battery cables from the battery.
2. Partially remove the Integrated Power Module (IPM) from the engine compartment.
3. Remove the front control module retaining screws.
4. Pull the front control module straight from the IPM.



INSTALLATION

1. Press the Front Control Module (FCM) onto the Integrated Power Module (IPM).
2. Install the mounting fasteners.
3. Install the IPM.
4. Connect the positive and negative battery cables.



MODULE-MEMORY MIRROR

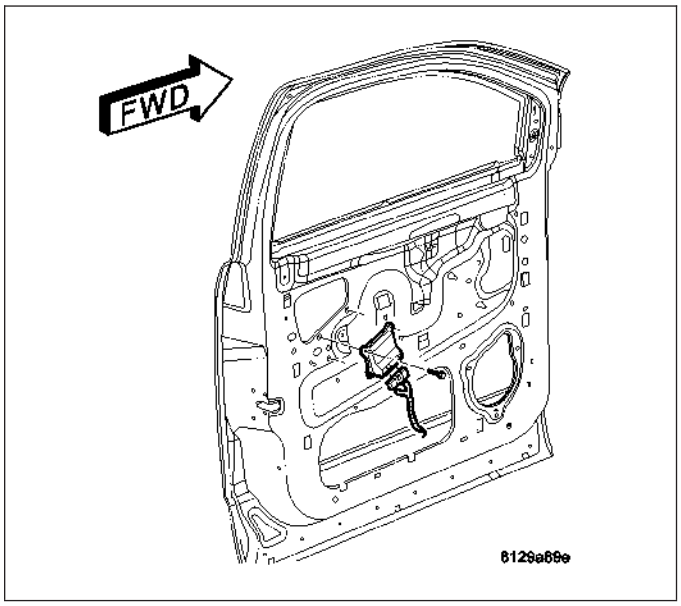
DESCRIPTION

There are two Memory Mirror Modules (these are sometimes referred to as Driver Door Modules (DDM) and Passenger Door Modules (PDM) within the memory system. One located in the driver door and one in the passenger door, just behind the door trim panel. The modules send a bus message to the power mirrors to adjust them to a preset position when a memory recall request has been made.

The memory mirror modules also act as an interface in each door for electrical functions (door lock switches and door ajar switches).

The **Memory System** makes available for immediate recall personalized preferences of the following:

- Automatic temperature control settings.
- Outside mirror positions.
- Power adjustable brake and accelerator pedal position.
- Power seat horizontal, vertical, recliner, and easy entry positions.
- Radio push button station selections.



The major components of the **Memory System** are:

- **Memory Selector Switch** - located in the driver door trim panel.
- **Driver Memory Mirror Module (DMMM)** - located in the driver door, behind the trim panel.
- **Passenger Memory Mirror Module (PMMM)** - located in the passenger door, behind the trim panel.
- **Sentry Key Remote Entry Module (SKREEM)** - located at ignition key cylinder.
- **Remote Keyless Entry (RKE) Transmitter** - located with ignition key.
- **Memory Seat Module (MSM)** - located underneath the driver seat and also controls the Adjustable Pedals.
- **Radio** - located in the instrument panel center stack.
- **Automatic Temperature Control (ATC)** - located in the instrument panel center stack.

The memory recall is available at the press of a button on the drivers door trim panel or, by using the Remote Keyless Entry (RKE) transmitter if it is programmed to trigger the recall.

Radio settings include up to 20 push button presets (10 AM and 10 FM), and the last station selection, even if it is not one of the 20 preset selections.

OPERATION

The memory mirror module receives input from the door lock switches and sends that message to the cluster for door lock operation (vehicles equipped with memory system only). It also controls the mirror adjustment by receiving input from the mirror switch on the door trim panel. Sensors in the mirrors act as inputs to the memory mirror module in order to position the mirrors to presets by the driver(s). The power supply to the mirrors is supplied by the mirror memory modules. On vehicles equipped with a memory system, the front door ajar switches are inputs to the memory mirror module. The modules use this information for door lock inhibit etc.

A memory setting is saved by pressing the “set” button, then pressing either the memory “1” or “2” button within 5 seconds of pressing the “set” button.

A memory setting is recalled by pressing either the memory “1” or “2” button, or by pressing the unlock button on a “linked” Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

Both driver and passenger modules provide active and stored Diagnostic Trouble Codes (DTC’s) to aid in diagnosis.

Both modules are identical in appearance with the exception of an extra ground wire on the driver side memory mirror module.

DIAGNOSIS AND TESTING

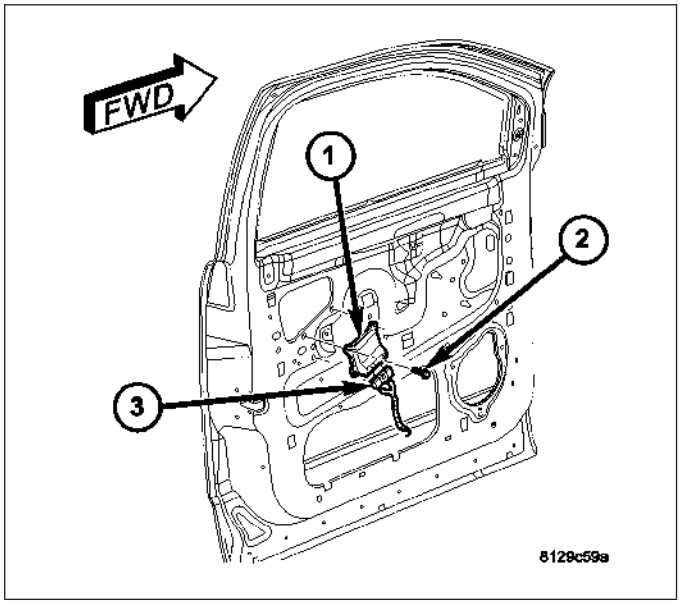
MEMORY MIRROR MODULE

Any diagnosis of the memory mirror module should begin with the use of a scan tool and the appropriate Diagnostic information.

Refer to the appropriate wiring information.

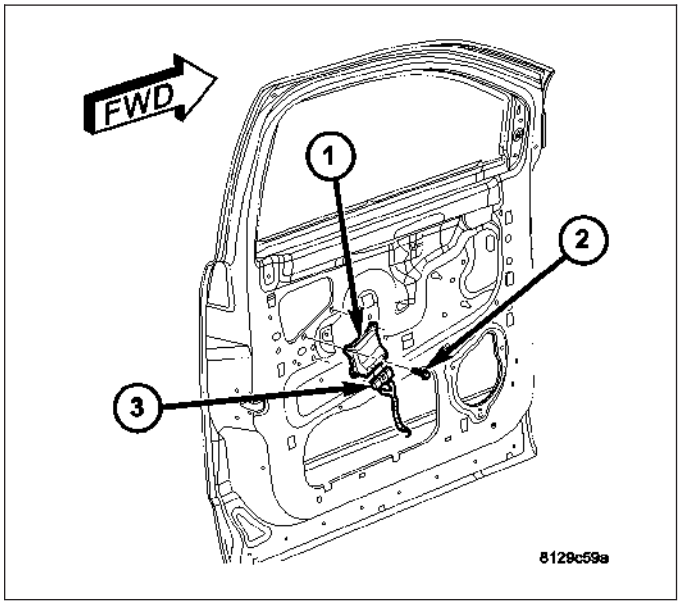
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Disconnect the electrical connector (3) from module (1).
4. Remove fasteners (2) and module (1) from vehicle.



INSTALLATION

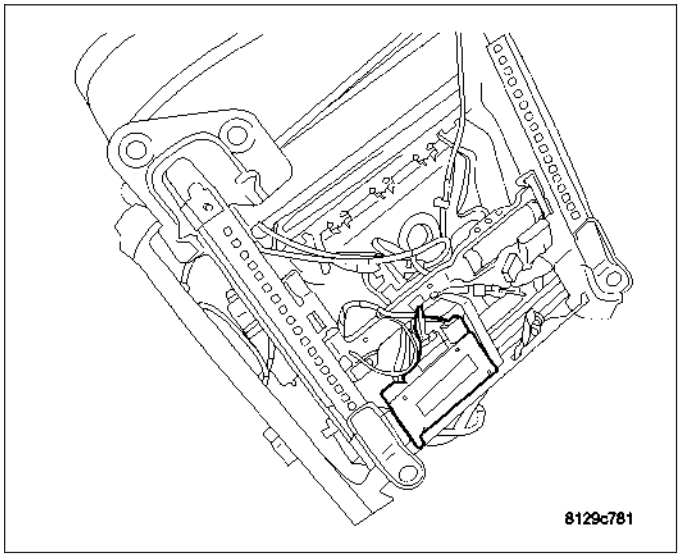
1. Position module (1) on door and install fasteners (2).
2. Connect the electrical connector (3) to module (1).
3. Install the door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect the battery negative cable.
5. Verify system and vehicle operation.



MODULE-SEAT MEMORY

DESCRIPTION

The Memory Seat Module (MSM) is located underneath the driver seat, towards the front and on the outboard side. It is used in conjunction with the other modules in the memory system (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/MEMORY HEATED SEAT/MIRROR MODULE - DESCRIPTION) to recall the seat to one of two preset seat functional adjustments (horizontal, vertical, and recliner). The switch for the memory seat programming and selection mounts on the driver door trim panel. The MSM also controls the adjustable pedals, both for the memory and manual functionality. The adjustable accelerator and brake pedals are available on SLT and Limited models. On Limited, their positioning can be stored for recall by the memory system, allowing for two drivers to have unique, pre-programmed settings.



OPERATION

POWER/MEMORY SEAT

The memory seat module receives input from the 8-way power seat switch, the driver seat position sensors, adjustable pedal control circuits (switch, sensor, and motor), and the data bus circuit. The memory switch, is wired to the memory mirror module which sends the message over the data bus.

The memory seat module performs the following functions:

- Positions the driver seat (vertical, horizontal, and recliner positions) and adjustable pedals.
- Sends the memory save or recall (#1 or #2) command over the data bus circuit to the memory mirror modules, HVAC, and radio.
- Provides for “linking” the key FOBs to memory.

- Provides for the easy entry/exit feature.
- Provides the tilt mirrors in reverse feature

When a memory button is pressed (#1 or #2) on the memory switch, the driver door memory mirror module sends a recall message to the memory seat module (MSM). Then the MSM will position the driver seat and adjustable pedals to its preprogrammed location/setting. When the Remote Keyless Entry (RKE) Transmitter button is pressed, depending on which transmitter (#1 or #2), the SKREEM (RKE Receiver) sends the recall request and FOB number (#1 or #2) data message. This RKE transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBs).

A memory setting is saved by pressing the “set “ button, then pressing either the memory “1” or “2” button within 5 seconds of pressing the “set” button.

A memory setting is recalled by pressing either the memory “1” or “2” button, or by pressing the unlock button on a “linked” Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in any position other than park or the seat belt is latched.

A key FOB is “linked” to a memory setting by pressing the “set” button and then pressing either the memory “1” or “2” button within 5 seconds of pressing the set button, then by pressing the “lock” button on the selected key FOB.

Easy Entry and Exit provides the driver with more room for entry or exit from the vehicle. The Easy Entry and Exit feature is disabled when the vehicle leaves the factory. An authorized dealer can enable this feature. Operation of the Easy Entry and Exit function is as follows:

- If the seat is in a memorized position, it will move back a predetermined distance when the driver removes the key from the ignition switch. This new position for the seat is the Easy Exit position for that driver. The seat may not move to an easy entry/exit position, if it is already position at or behind a predetermined point for the seat. This limited travel avoids obstructed customer exit/entry from behind the driver’s rear door post.
- The seat will move forward to a memory position when the driver turns the vehicle’s ignition switch out of the LOCK position.
- The tilt mirrors in reverse feature provides for tilting the sideview (outside) mirrors down a predetermined angle, providing a better view of the ground next to the rear portion of the vehicle. The tilt mirrors in reverse feature is disabled when the vehicle leaves the factory. An authorized dealer can enable this feature. Operation of the tilt mirrors is as follows:
  - − Sideview mirrors will tilt down when the vehicle transmission is shifted into Reverse.
  - − Sideview mirrors will return to the original position when the vehicle transmission is shifted out of Reverse.

ADJUSTABLE PEDALS

The pedals swing on a large arc, the radius and angle of which were selected on the basis of ergonomic studies, that puts them in the proper position for use by the smaller driver - higher and angled upward as well as rearward. Powered by the small electric motor driving a gear train at each pedal, adjustment is precise, quiet, and smooth throughout the range. A paddle-type switch on the instrument panel to the left of the steering column actuates the electric motor-driven mechanism through the memory seat module (MSM). Pushing up the paddle brings the pedals closer and vice versa. Movement stops when the switch is released. MSM logic prevents pedal adjustment when the automatic speed control (cruise control) is set (controlling speed), and when the transmission is in reverse. This feature protects against a loss of reference position when neither foot is on the pedal.

DIAGNOSIS AND TESTING

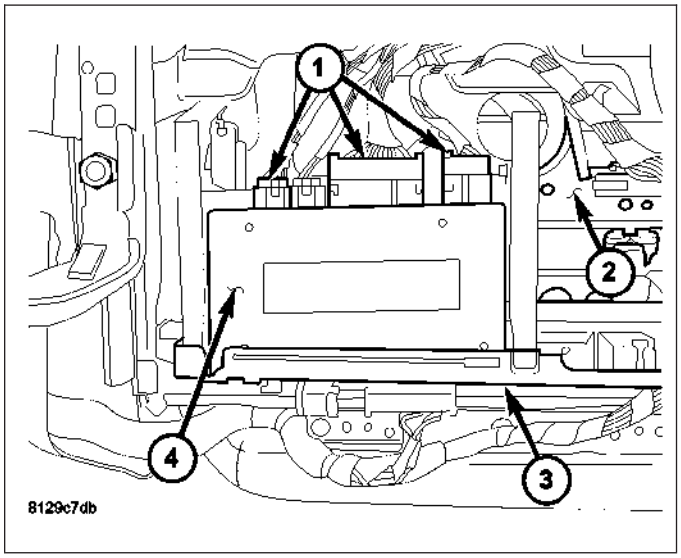
MEMORY SEAT MODULE

Any diagnosis of the memory seat system/module should begin with, the use of a scan tool and the appropriate diagnostic service information.

Refer to the appropriate wiring information.

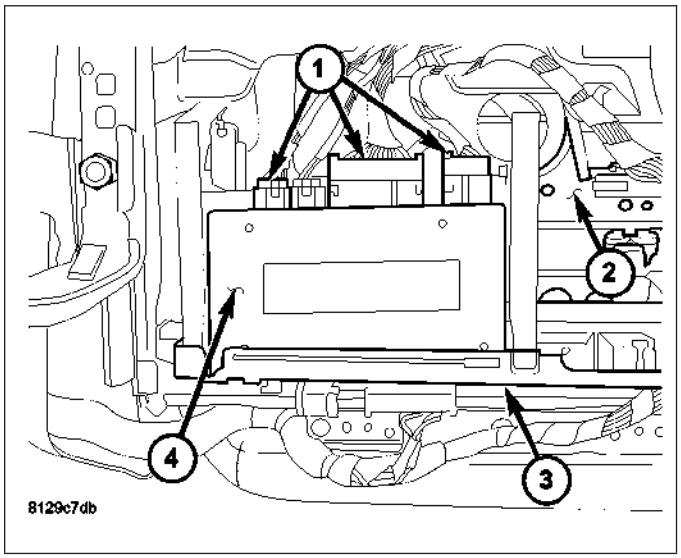
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION/COVER - FRONT - REMOVAL).
3. Unsnap the memory seat module (4) from the side brackets.
4. Pivot the module upward and disconnect the electrical connectors (1).
5. Pull the module rearward to remove it from the front of the seat frame (3).



INSTALLATION

1. Place the module (4) into position making sure the front snaps into the seat frame (3).
2. Connect the memory seat module harness connectors (1).
3. Pivot the module (4) downward and snap it into place in the side brackets.
4. Install the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - FRONT - INSTALLATION).
5. Connect the battery negative cable.
6. Verify system and vehicle operation.

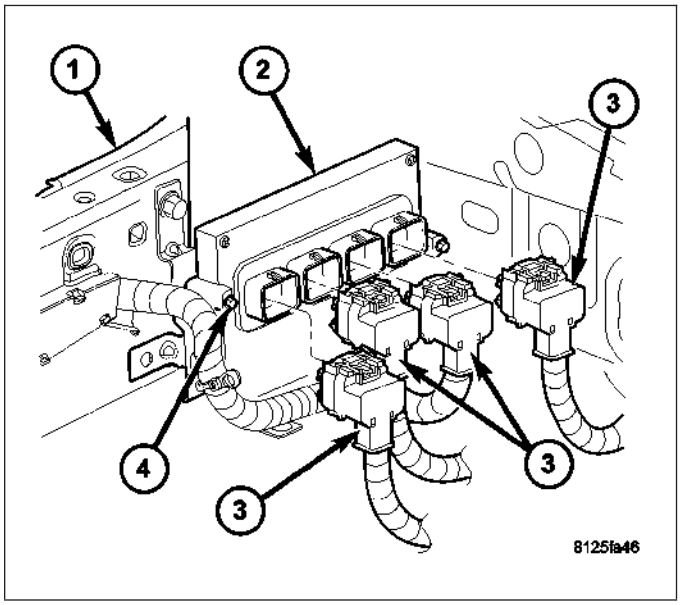


MODULE-POWERTRAIN CONTROL

DESCRIPTION

DESCRIPTION

The PCM (2) is attached to the right-front inner fender (1) located in the engine compartment.



MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices.

The PCM will operate in two different modes: **Open Loop and Closed Loop**.

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the ASD relay. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Starter motor relay
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

- When engine has reached operating temperature, the PCM will begin monitoring O2S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed sensor

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM). Battery voltage is supplied to the PCM through the ignition switch when the ignition is in the Run or Start position. This is referred to as the “ignition sense” circuit and is used to “wake up” the PCM.

POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low–noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

SIGNAL GROUND

Signal ground provides a low noise ground to the data link connector.

OPERATION

POWERTRAIN CONTROL MODULE (PCM)

The PCM is a pre-programmed, microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- Accelerator pedal position sensor (if equipped)
- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage

- Brake switch
- CAN bus (+) circuits
- CAN bus (-) circuits
- Camshaft position sensor signal
- Clutch Interlock Switch (if equipped)
- Crankshaft position sensor
- Data link connection for diagnostic scan tool
- EGR position sensor (if equipped)
- Engine coolant temperature sensor
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Knock sensor(s) (if equipped)
- Leak detection pump (switch) sense (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure sensor
- Output shaft speed sensor
- Overdrive/override switch
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Power steering pressure switch (if equipped)
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission output speed sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CAN bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Data link connection for diagnostic scan tool
- Double start override (if equipped)
- EGR valve control solenoid (if equipped)
- Electronic throttle control
- EVAP canister purge solenoid
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Idle air control (IAC) motor
- Ignition coil(s)

- CAN bus circuits
- Leak detection pump (if equipped)
- Malfunction indicator lamp (Check engine lamp). Driven through CAN bus circuits.
- Overdrive indicator lamp (if equipped)
- Radiator cooling fan (if equipped)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Starter relay
- Tachometer (if equipped). Driven through CAN bus circuits.
- Transmission convertor clutch circuit
- Transmission 3-4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid

5 VOLT SUPPLIES

Primary 5–volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensor.

Secondary 5–volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).
- supplies the 5 volt power source to the transmission pressure sensor (if equipped with an RE automatic transmission).

IGNITION CIRCUIT SENSE

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the ″ignition sense″ circuit and is used to ″wake up″ the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM’s 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions.

REMOVAL

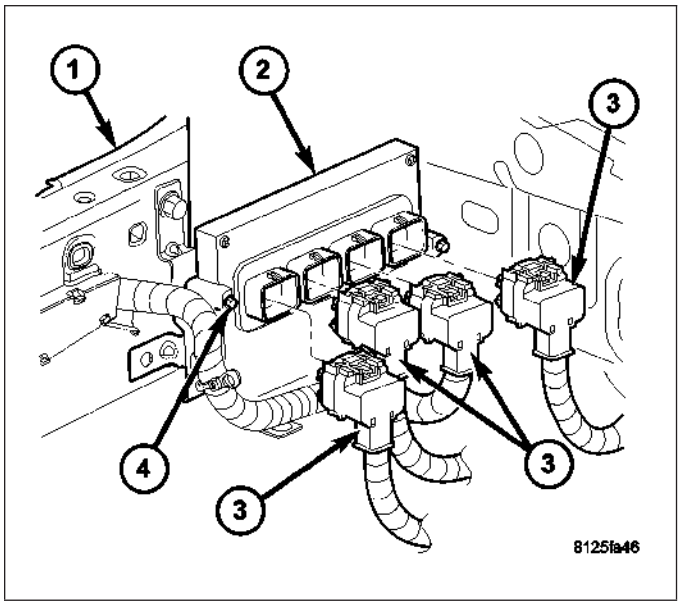
CAUTION: Certain ABS systems rely on having the Powertrain Control Module (PCM) broadcast the Vehicle Identification Number (VIN) over the bus network. To prevent problems of DTCs and other items related to the VIN broadcast, it is recommend that you disconnect the ABS CAB (controller) temporarily when replacing the PCM. Once the PCM is replaced, write the VIN to the PCM using the DRB scan tool. This is done from the engine main menu. Arrow over to the second page to “1. Miscellaneous”. Select “Check VIN” from the choices. Make sure it has the correct VIN entered before continuing. When the VIN is complete, turn off the ignition key and reconnect the ABS module connector. This will prevent the setting of DTCs and other items associated with the lack of a VIN detected when you turn the key ON after replacing the PCM.

CAUTION: Use the DRB scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

The PCM (2) is attached to the right-front inner fender (1) located in the engine compartment.

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect and isolate the negative battery cable.
2. Remove both wiper arms. Refer to Wipers/Washers section.
3. Remove wiper cowl (two screws, four pins).
4. Remove wiper cowl support (three bolts).
5. Remove air intake tube (four nuts).
6. Carefully unplug the four 38-way connectors (3) from PCM.
7. Remove three PCM mounting bolts (4), and remove PCM from vehicle.

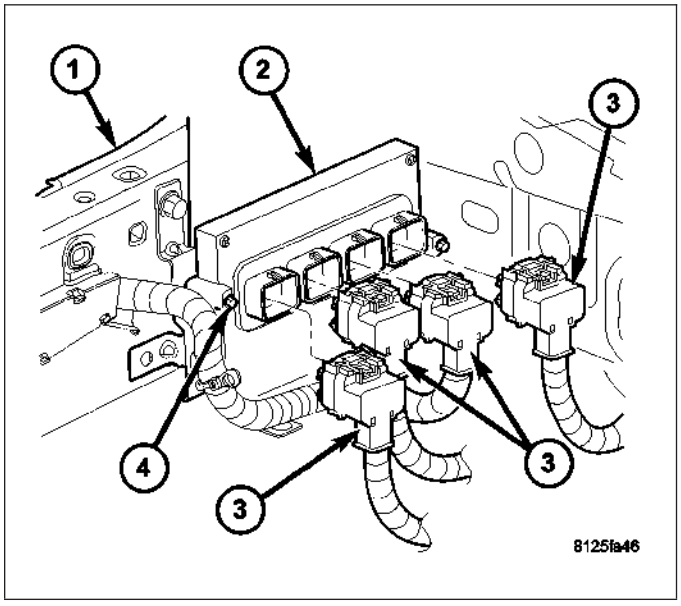


INSTALLATION

CAUTION: Certain ABS systems rely on having the Powertrain Control Module (PCM) broadcast the Vehicle Identification Number (VIN) over the bus network. To prevent problems of DTCs and other items related to the VIN broadcast, it is recommend that you disconnect the ABS CAB (controller) temporarily when replacing the PCM. Once the PCM is replaced, write the VIN to the PCM using the DRB scan tool. This is done from the engine main menu. Arrow over to the second page to "1. Miscellaneous". Select "Check VIN" from the choices. Make sure it has the correct VIN entered before continuing. When the VIN is complete, turn off the ignition key and reconnect the ABS module connector. This will prevent the setting of DTCs and other items associated with the lack of a VIN detected when you turn the key ON after replacing the PCM.

CAUTION: Use the DRB scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

1. Position PCM (2) to vehicle.
2. Install three PCM mounting bolts (4).
3. Tighten bolts to 3–5 N·m (30–40 in. lbs.).
4. Check pin connectors in the PCM. Also check the four 38–way connectors (3) for corrosion or damage. Repair as necessary.
5. Install the four 38–way connectors (3) to PCM.
6. Install air intake tube (four nuts).
7. Install wiper cowl support (three bolts).
8. Install wiper cowl (two screws, four pins).
9. Install both wiper arms. Refer to Wipers/Washers section.
10. Connect negative battery cable.
11. **Use the diagnostic scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.**

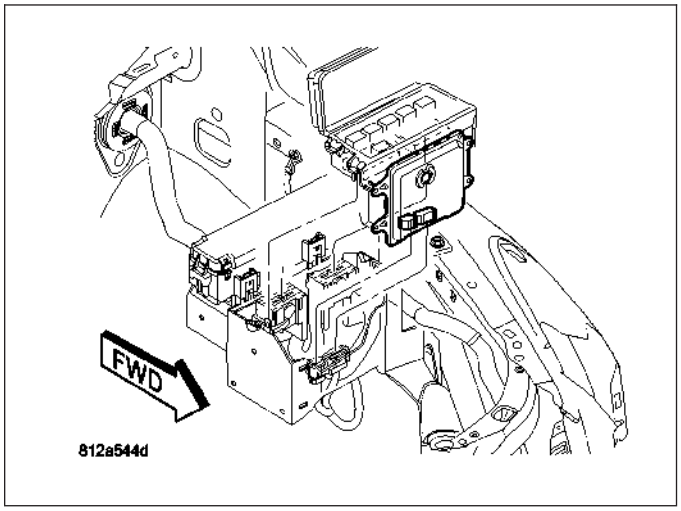


MODULE-TRANSFER CASE CONTROL

DESCRIPTION

The Front Control Module (FCM) contains the software to control the electric shift transfer cases in this vehicle. A separate Transfer Case Control Module (TCCM) is not used. The FCM is a microprocessor-based assembly, controlling the 4X4 transfer case shift functions via the actuation of a shift motor and utilizing the feedback of a mode sensor assembly. Communication is via the CAN bus. Inputs include user selectable 4X4 modes that include AWD, 4LOCK, 4LO, and Neutral.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DESCRIPTION) for additional information.



OPERATION

The Front Control Module (FCM) utilizes the input from the transfer case mounted mode sensor, the instrument panel mounted selector switch, and the following information from the vehicle's CAN bus to determine if a shift is allowed.

- Engine RPM and Vehicle Speed
- Diagnostic Requests
- Manual Transmission Clutch Switch
- Brake Applied
- PRNDL
- Ignition Status
- ABS Messages

Once the FCM determines that a requested shift is allowed, it actuates the bi-directional shift motor as necessary to achieve the desired transfer case operating mode. The FCM also monitors the mode sensor while controlling the shift motor to determine the status of the shift attempt.

Several items can cause the requested shift not to be completed. If the FCM has recognized a fault (DTC) of some variety, it will begin operation in one of four Functionality Levels. These levels are:

- **Level Zero** - Normal Operation.
- **Level One** - Only Mode Shifts Are Allowed.
- **Level Two** - Only Mode Shifts and Shifts Into LOW Are Allowed (No Neutral Shifts Are Allowed).
- **Level Three** - No Shifts Are Allowed

The FCM can also be operating in one of three possible power modes. These power modes are:

- **Full Power Mode** is the normal operational mode of the module. This mode is achieved by normal CAN bus traffic being present and the ignition being in the RUN position.
- **Reduced Power Mode** will be entered when the ignition has been powered off. In this state, the module will shut down power supplied to external devices, and to electronic interface inputs and outputs. From this state the module can enter either Sleep Mode or Full Power Mode. To enter this mode, the module must receive an ignition message denoting that the ignition is off, or not receive any messages for 5 ±0.5 seconds. To exit this mode, the module must receive one ignition message that denotes that the ignition is in the RUN position.
- **Sleep Mode** will be entered, from the Reduced Power Mode, when no CAN traffic has been sensed for 20 ±1 seconds. If during Sleep Mode the module detects CAN bus traffic, it will revert to the Reduced Power mode while monitoring for ignition messages. It will remain in this state as long as there is traffic other than run or start messages, and will return to Sleep mode if the bus goes without traffic for 20 ±1 seconds.

SHIFT REQUIREMENTS

If the FCM is in full power mode and at functionality level zero, it uses the following criteria to determine if a shift is allowed.

If any of the driver controllable conditions are not met once the shift request is recognized, the FCM may illuminate one or more of the 4WD system message icons in the instrument cluster display.

Mode shifts will be allowed regardless of transmission gear or vehicle speed, whenever the following conditions are met:

- Ignition key switch is in the RUN position.
- Front and rear wheel speed are within 21 km/hr (13 mph).
- A change in the Selector switch state indicates that a mode shift has been requested.
- A valid mode sensor signal is being sensed by the FCM.
- Proper transmit/receive messages are occurring on the CAN bus.
- An Anti-lock Brake System (ABS) event is not in progress.

Range shifts will be allowed only if all of the following conditions are met:

- Ignition key switch is in the RUN position.
- Front and rear wheel speed are within 21 km/hr (13 mph).
- A change in the Selector Switch state indicating a range shift has been requested.
- Transmission in NEUTRAL signal must be recognized for at least 1.5 seconds ±100 msec. (Automatic transmissions only)
- Proper transmit/receive messages are occurring on the CAN bus.
- Clutch signal is recognized for 500 msec ± 50 msec (Manual transmissions only).
- Vehicle speed is less than or equal to 4.8 km/hr (3 miles per hour).
- A valid mode sensor signal is being sensed by the FCM.
- An Anti-lock Brake System (ABS) event is not in progress.

A **shift into transfer case Neutral** will be allowed only if all of the following conditions are met:

- Ignition key switch is in the RUN position, engine off.
- Front and rear wheel speed are within 21 km/hr (13 mph).
- The recessed Neutral Selection switch has been depressed continuously for 4.0 seconds ±100 msec while all shift conditions have been continuously met.
- Transmission in NEUTRAL signal recognized from the bus. (Automatic transmissions only)
- Clutch signal is recognized from the bus (Manual transmissions only).
- Proper message transmissions/receptions are occurring on the CAN bus.
- Vehicle speed is less than or equal to 4.8 km/hr (3 miles per hour).
- Foot Brake is applied.
- A valid mode sensor signal is being sensed by the FCM.
- An Anti-lock Brake System (ABS) event is not in progress.

A **shift out of transfer case Neutral** will be allowed only if all of the following conditions are met:

- Ignition key switch is in the RUN position.
- Front and rear wheel speed are within 21 km/hr (13 mph).
- The recessed Neutral Selection switch has been depressed continuously for 1.0 seconds ±100 msec while all shift conditions have been continuously met.
- Transmission in NEUTRAL signal recognized from the bus. (Automatic transmissions only)
- Clutch signal is recognized from the bus (Manual transmissions only).
- Proper message transmissions/receptions are occurring on the CAN bus.
- Vehicle speed is less than or equal to 4.8 km/hr (3 miles per hour).
- A valid mode sensor signal is being sensed by the FCM.
- An Anti-lock Brake System (ABS) event is not in progress.

LAMP STRATEGY

The following strategy for the FCM controlled transfer case system uses the instrument cluster VF display's 4LOCK, 4LO, Service 4WD, and Mode Switch Transfer Case Neutral LED. Flashing any of the lamps or LED is accomplished at a 2Hz rate.

NOTE: There is no lamp for the AWD position. If no 4WD system message icons are illuminated in the instrument cluster, the operator is to assume that the transfer case is in the AWD position.

- AWD to 4LO - Successful shifts will flash 4LO during a shift, then after the 4LO position has been met, display the 4LO lamp solid. In the blocked condition, flash the 4LO lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in AWD and no lamps are illuminated. When shift conditions are not met, no shift attempts are made and the 4LO lamp is flashing.
- AWD to 4LOCK - Successful shifts will flash 4LOCK during a shift, then after the 4LOCK position has been met, display the 4LOCK lamp solid. In the blocked condition, flash the 4LOCK lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in AWD and no lamps are illuminated. When shift conditions are not met, no shift attempts are made and the 4LOCK lamp is flashing.
- 4LOCK to 4LO - Successful shifts will turn off the 4LOCK lamp and flash 4LO during a shift, then after the 4LO position has been met, display the 4LO lamp solid. In the blocked condition, turn off 4LOCK and flash the 4LO lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in 4LOCK and the 4LOCK lamp turns on solid. When shift conditions are not met, the 4LOCK lamp remains illuminated solid and the 4LO lamp is flashing.
- 4LOCK to AWD - Successful shifts will flash the 4LOCK lamp during a shift, then after the AWD position has been met, turn off the 4LOCK lamp. In the blocked condition, flash the 4LOCK lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in 4LOCK and the 4LOCK lamp turns on solid. When shift conditions are not met, no shift attempts are made and the 4LOCK lamp is flashing.
- 4LO to AWD - Successful shifts will flash the 4LO lamp during a shift, then after the AWD position has been met, turn off the 4LO lamp. In the blocked condition, flash the 4LO lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in 4LO and the 4LO lamp turns on solid. When shift conditions are not met, no shift attempts are made and the 4LO lamp is flashing.
- 4LO to 4LOCK - Successful shifts will turn off the 4LO lamp and flash 4LOCK during a shift, then after the 4LOCK position has been met, display the 4LOCK lamp solid. In the blocked condition, turn off 4LO and flash the 4LOCK lamp during the 5 Phase 1 shift attempts. After 5 unsuccessful attempts, the transfer case remains in 4LO and the 4LO lamp turns on solid. When shift conditions are not met, the 4LO lamp remains illuminated solid and 4LOCK is flashing.
- AWD to NEUTRAL - Successful shifts have no lamps illuminated, then after the NEUTRAL position has been met, display the NEUTRAL LED solid. In the blocked condition, no lamps are illuminated during the 5 Phase 1 attempts. After 5 unsuccessful attempts, the transfer case remains in AWD and no lamps are illuminated. When shift conditions are not met, flash the NEUTRAL lamp while the push button is depressed.
- 4LOCK to NEUTRAL - Successful shifts have no lamps illuminated, then after the NEUTRAL position has been met, display the NEUTRAL LED solid. In the blocked condition, no lamps are illuminated during the 5 Phase 1 attempts. After 5 unsuccessful attempts, the transfer case remains in 4LOCK and the 4LOCK lamp is illuminated. When shift conditions are not met, flash the NEUTRAL lamp while the push button is depressed.
- 4LO to NEUTRAL - Successful shifts have no lamps illuminated, then after the NEUTRAL position has been met, display the NEUTRAL LED solid. In the blocked condition, no lamps are illuminated during the 5 Phase 1 attempts. After 5 unsuccessful attempts, the transfer case remains in 4LO and the 4LO lamp is illuminated. When shift conditions are not met, flash the NEUTRAL lamp while the push button is depressed.
- NEUTRAL to AWD - Successful shifts have no lamps illuminated, then after the AWD position has been met, no lamps are illuminated. In the blocked condition, no lamps are illuminated during the 5 Phase 1 attempts. After 5 unsuccessful attempts, Phase 2 shifting will continue until the transfer case is in the AWD or 4LO position. If the final position is AWD, no lamp is illuminated, if the final position is 4LO, illuminate the 4LO lamp. When shift conditions are not met, flash the 4LOCK and 4LO lamps and the NEUTRAL LED remains solid while the push button is depressed,
- Neutral to 4LOCK - Successful shifts will flash the 4LOCK lamp during a shift, then after the 4LOCK position has been met, display the 4LOCK lamp solid. In a blocked condition, the 4LOCK lamp will flash during the 5 Phase 1 attempts. After 5 unsuccessful attempts, continue to flash the 4LOCK, Phase 2 shifting will continue until the transfer case is in the AWD or 4LO position. If the final position is AWD, turn off the 4LOCK lamp, if

the final position is 4LO, illuminate the 4LO lamp. When shift conditions are not met, flash the 4LOCK and 4LO lamps and the NEUTRAL LED remains solid while the push button is depressed.

- NEUTRAL to 4LO - Successful shifts will flash the 4LO lamp during a shift, then after the 4LOCK position has been met, display the 4LO lamp solid. In a blocked condition, the 4LO lamp will flash during the 5 Phase 1 attempts. After 5 unsuccessful attempts, continue to flash 4LO, Phase 2 shifting will continue until transfer case is in the AWD or 4LO position. If the final position is AWD, turn off the 4LO lamp, if the final position is 4LO, illuminate the 4LO lamp solid. When shift conditions are not met, flash the 4LOCK and 4LO lamps and the NEUTRAL LED remains solid while push the button is depressed.

SHIFT SEQUENCES (PHASE 1 SHIFTS)

Once all the driver controllable conditions for the requested shift have been met, the FCM begins a shift timer with a maximum duration of 1 second per mode sensor target segment. If the shift timer expires before the FCM recognizes to correct mode sensor position, the shift is considered to have been blocked. The blocked shift will increment the blocked shift counter by one. The FCM strategy for handling blocked shifts will be described later. The process the FCM performs for the various shifts will be described first.

RANGE AND MODE SHIFTS

The process for performing all the range and mode shifts are the same. The following steps describe the process.

- Allow time for Selector Switch debounce; 250 msec ±50 msec.
- Activate/deactivate the 4WD system message icons in the instrument cluster as necessary.
- Engage the shift motor for a maximum of 1 second ±100 msec per mode sensor target segment in the destination gear's direction while monitoring the mode sensor.
- Disengage the shift motor when the correct mode sensor position is recognized.
- Solidly illuminate the achieved position's instrument panel icon, unless the target is AWD.
- Transmit a bus message that the transfer case shift is complete.
- If the desired mode sensor position is not reached after the shift timer expires (i.e.: a blocked shift motor or other condition exists), the FCM will stop driving the motor and wait for 200 msec ±50 msec. The shift motor is then reversed in the direction back toward the source gear for up to 1.0 seconds ±100 msec. per mode sensor target segment. The FCM waits for 2.0 seconds ±50 msec. and repeats the attempt to shift to the desired position.

The exception to the preceding sequence is when a shift from 4LO to AWD is requested. If AWD is requested from the 4LO position, the transfer case is first driven to the 4LOCK position. If the 4LOCK position is reached, the transfer case is then driven back to the AWD position and the shift is considered complete.

SHIFT OUT OF NEUTRAL

The following steps describe the process for a shift out of NEUTRAL.

- Extinguish the Neutral LED.
- Engage the shift motor for a maximum of 1 second ±100 msec toward the transfer case 4LOCK mode position while monitoring the mode sensor position.
- Disengage the shift motor when the correct mode sensor position is recognized.
- Extinguish the Neutral LED.
- Transmit a bus message that the transfer case shift is complete.
- If the desired mode sensor position is not received after the shift timer expires (i.e. a blocked or other condition exists), stop driving the motor and wait for 200 msec ±50 msec. The shift motor is then reversed in the direction back toward the source gear for up to 1.0 seconds 100 msec. The FCM waits for 2.0 seconds ±50 msec. and repeats the attempt to shift to the desired position.
- When the Neutral button is released, if the 4LOCK position is the desired position, the shift is complete. Illuminate the 4LOCK message icon.
- Otherwise when the Neutral button is released, if all of the shift requirements are being met then engage the shift motor towards the desired position for 1 second ±100 msec per 'D' channel. (if requirements for shifting are not met, illuminate the 4LOCK message icon and flash the destination message icon as an indication to the driver that all of the driver controllable shift conditions are not being met). If this requires another range or mode shift, begin the range/mode shift process.

- If the desired mode sensor position is not achieved after the shift timer expires (i.e. a blocked or other condition exists), refer to the section on Blocked Shift Strategy, also known as Phase 2 shifts.

NEUTRAL BLOCKED SHIFT STRATEGY (PHASE 2 SHIFTS)

When a shift is commanded out of neutral, the shift motor will be driven towards its destination position, except in the case of shifting out of NEUTRAL if 4LO was selected (the transfer case will shift to the 4LOCK position first, before proceeding to 4LO). If the shift is blocked on the way to the destination, the FCM may attempt to drive the motor back to the original position. This process will be allowed to occur 5 times. If the transfer case has reached a non-NEUTRAL position during the shift re-attempts, the message icon for the achieved gear position is illuminated and the shift attempts are stopped. To re-attempt the desired shift, the selector switch will need to be rotated to the current position until the switch debounce timer expires then a shift will need to be requested again.

At the end of the 5th blocked attempt, the shift motor is driven towards the last known mode sensor position. If this motor drive allows the transfer case to reach the AWD position, the shift is considered complete and the shift attempts are ended.

If the mode sensor is in the NEUTRAL region at the expiration of the shift timer, the FCM will continue to make the shift attempts according to the blocked shift strategy independent of whether or not the driver controlled conditions are met.

For shifts from NEUTRAL, if all 5 attempts fail to reach the desired position (which by default is 4LOCK), the motor will be driven to stall in the direction of 4LOCK or 4LO, depending on the achieved position. Otherwise, the transfer case will be driven in the direction opposite the last attempt with the desired target being 4LOCK or 4LO.

If the transfer case reaches the AWD position when being driven in the 4LOCK direction, then one final 1.0 second drive toward 4LOCK is attempted. If the transfer case then reaches the 4LOCK position, the shift is considered complete and the 4LOCK message icon is illuminated. If the transfer case is still the AWD position, the shift is considered complete and all message icons are extinguished.

NEUTRAL DRIFT SHIFT STRATEGY (PHASE 3 SHIFTS)

NOTE: If after the 5th blocked shift and reversal attempt, if the transfer case position is in the NEUTRAL or other undesired region, shift attempts will continue until a non-NEUTRAL or a desired position is reached.

Phase 3 is a series of shifts whose intent is to escape from an undesired position that has been reached outside of a shift. A perceived drift of the transfer case into a non-target region without the FCM driving the shift motor will initiate a phase III shift. Phase 3 will be initiated by any non-target region with the exception of a position greater then encoder_4LO_min or less then encoder_4LOCK_max. Whenever these encoder readings have been seen for defined period of time, Phase III shifting will begin.

The shifts in a given Phase 3 shifting event are always in a single-direction, toward the target region from which the drift occurred. These shifts are performed without regard to shift conditions. The timing of each shift should follow the outline of the Phase 1 forward attempts, allowing the shift timer to reach the target. Between each attempt, there is a calibrated delay. After each attempt the shift counter and the Phase 3 max shifts counter will be updated.

SHIFT REVERSAL TARGETS

If the shift timer expires (1.0 seconds per mode sensor position) and the transfer case has not reached the desired position, all shifts will attempt to return to their original position with the exceptions of:

- If the intended shift is going to the High rail from Low and can't make it, but it can make the AWD position, the motor stops at that position. The FCM will not attempt to cross back over NEUTRAL if it does not have to. This means that there was a block on the first attempt to go to 4LOCK and the transfer case has made it through NEUTRAL to a known good position, then the motor will go back only to the AWD position and execute the remainder of the attempts from there.
- For shifts out of NEUTRAL, any time a shift is commanded out of NEUTRAL, the system needs to get out. The FCM should never go to NEUTRAL unless the driver is commanding it and all required conditions are being met.

ENCODER DRIFT CORRECTION

Whenever a shift is completed, the FCM stores the position in memory as the transfer case's intended position. The FCM continuously monitors the mode sensor and if the mode sensor drifts toward into a NEUTRAL region sensor position for 2.0 seconds, the FCM will perform a motor drive to correct the drift. The transfer case will be driven

toward the intended position for 1.0 seconds ±100 msec. The FCM will wait for 2.0 seconds ±50 msec. and repeat the attempt to shift to the desired position. This will continue until the intended position is reached.

SHIFT MOTOR CONTROL

The FCM will have the ability to vary the speed of the transfer case motor through pulse width modulation (PWM). It is recommended to PWM from 0 to 100% at 100Hz.

The PWM will function as follows:

- Apply an initial duty cycle to shift motor control wires.
- Control the acceleration of the shift motor by increasing the applied duty cycle at a specified rate.
- Control the deceleration of the shift motor by updating the applied duty cycle to the shift motor control wires at a specified rate based upon the difference between the desired position and the current position.

SHIFT MOTOR BRAKING

Static shift motor braking is utilized under the following conditions:

- Whenever the transfer case is in the AWD or 4LO position.
- Whenever an invalid mode sensor code is present.

Static motor braking is achieved by applying +12V on both shift motor wires.

NOTE: Static Shift Motor Braking is independent of ignition key position.

SHIFT ATTEMPT LIMIT

To protect the transfer case system, the FCM will impose a limit on the number of shifts that can occur over a calibrated time period. The system will monitor the number of mode sensor position changes that occur in any 30 second time period. If the number of changes is 25 or greater, the system will go into a default mode. The default mode of operation for shifting is that the number of allowed changes permitted to occur will be 3 over each 15 second ±100 msec calibrated window of time. After 5 minutes ±100 msec, the motor can be assumed to have cooled down and the system will revert to normal operation. The following rules also apply to the shift limit:

- The attempt limit will not prevent shifts coming out of NEUTRAL, they will be allowed regardless of the counter/timer.
- Any shift that is in progress when the counter reaches a maximum count in time will be allowed to complete before the default mode is entered. Position changes during this period will not be counted towards the default mode limit.
- A block, regardless of the direction, whether towards destination or back towards reversal target (shift timer expiring), will count as a value of 2 position changes towards the 30 position changes to go into default mode as defined above. Current attempt limit values are 25 transitions in 30 seconds and default mode values are 3 transitions every 15 seconds for 5 minutes.

DIAGNOSIS AND TESTING

TRANSFER CASE VERIFICATION TEST VER 1

Diagnostic Test

1. **TRANSFER CASE VERIFICATION TEST— VER 1**

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

With the scan tool, Clear DTCs.

Make sure that all accessories are turned off and that the battery is fully charged.

Move the Transfer Case Selector Switch to the desired position.

Test drive the vehicle in each Transfer Case range and verify proper operation in each range.

NOTE: To select or deselect 2WD, AWD or 4HI mode, vehicle speed must be below 55 MPH (88 KM/H) with all wheels at vehicle speed.

NOTE: Shifts will not take place with a wheel speed difference of greater than 13 MPH between the front and rear wheels.

NOTE: To select or deselect 4LO (if equipped), vehicle speed must be below 3 MPH (5 KM/H) with the ignition ON and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans).

NOTE: To select or deselect Transfer Case Neutral, vehicle speed must be 0 MPH with the ignition ON, engine OFF, the brake pedal applied, and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

NOTE: To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.

With the scan tool, read DTCs in the Front Control Module (FCM) and the Instrument Cluster Module (CCN).

Are there any Transfer Case DTCs present in the Front Control Module (FCM) or the Instrument Cluster Module (CCN)?

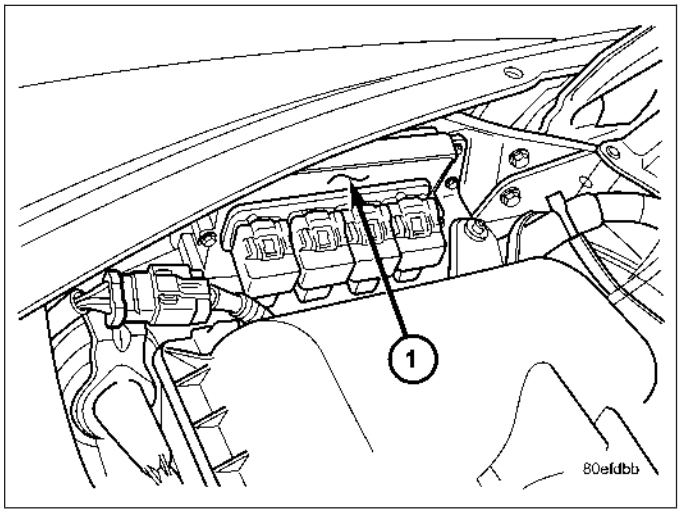
Yes >> Return to the symptom list and perform the appropriate diagnostic test.

No >> Repair is complete.

MODULE-TRANSMISSION CONTROL

DESCRIPTION

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM). The PCM is located on the right inner fender.



OPERATION

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard wired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition “ON” voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to cluster/CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

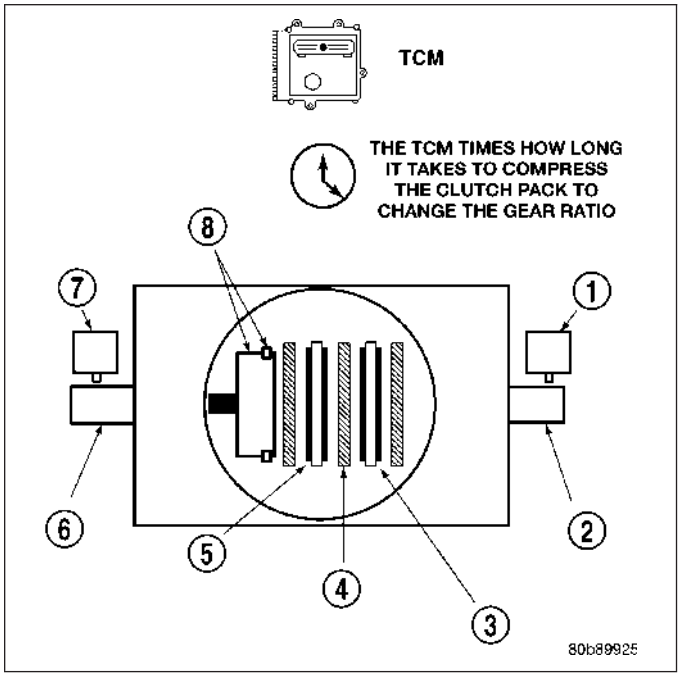
- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

NOTE: If the TCM has been replaced, the “Quick Learn Procedure” must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain memory in the TCM. When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

CLUTCH VOLUME INDEXES (CVI)



An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following charts identifies the appropriate clutch volumes and when they are monitored/updated:

42RLE

CLUTCH VOLUMES				
Clutch	When Updated			Proper Clutch Volume
	Shift Sequence	Oil Temperature	Throttle Angle	
L/R	2-1 or 3-1 coast downshift	> 70°	< 5°	35 to 83
2/4	1-2 shift	> 110°	5 - 54°	20 to 77
OD	2-3 shift			48 to 150
UD	4-3 or 4-2 shift		> 5°	24 to 70

545RFE

CLUTCH VOLUMES		
Clutch	When Updated	Proper Clutch Volume
L/R	2-1 or 3-1 downshift	45 to 134
2C	3-2 kickdown shift	25 to 85
OD	2-3 upshift	30 to 100
4C	3-4 upshift	30 to 85
UD	4-3 kickdown shift	30 to 100

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature below -16° F	-Park, Reverse, Neutral and 1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L -No EMCC
Super Cold	Oil temperature between -12° F and 10° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - Early 4-3 coastdown shift - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented -Shifts at high throttle openings willl be early. - No EMCC
Cold	Oil temperature between 10° F and 36° F	-Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed.
Warm	Oil temperature between 40° F and 80° F	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC
Hot	Oil temperature between 80° F and 240° F	- Normal operation (upshift, kickdowns, and coastdowns) - Normal EMCC operation
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC above 35 mph - Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

STANDARD PROCEDURE

TCM QUICK LEARN

The quick learn procedure requires the use of a scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the DRB® indicates the procedure is complete
- The calculated oil temperature must be above 60° and below 200°

DRIVE LEARN

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.
2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat Step 1 and Step 2 until the recorded 1st N-D UD CVI value stabilizes.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 80°F (27°C).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat Step 1 and Step 2 until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat Step 1 until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 MPH), perform repeated 4-3 kickdown shifts.
2. Repeat Step 1 until the UD volume becomes somewhat stable and the shift becomes smooth.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 km/h (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat Step 1 until the 3-2 kickdowns become smooth and the 2C CVI becomes stable.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat Step 1 until the LR CVI becomes stable and the manual 2-1 becomes smooth.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat Step 1 until the 4-5 shift become smooth and theAlt 2C CVI become stable. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

BATTERY SYSTEM

DESCRIPTION

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment of the vehicle. The battery system for this vehicle covers the following related components:

- **Battery** - A 12 volt storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the battery terminal posts to the vehicle electrical system.
- **Battery Hold down** - The battery hold down hardware secures the battery in the battery tray.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery hold down hardware.

For battery jump starting procedures, refer to Lubrication and Maintenance.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to assist the technician diagnose a inoperative battery. Follow the instruction manual supplied with the tester to properly diagnose a battery. If the instruction manual is not available, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Charge the faulty battery, as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to Battery Cables for the proper battery cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to Battery System Specifications for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Determine the battery cranking capacity using the Micro 420 battery tester. Refer to the Standard Procedures in this section for additional test procedures. Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to Battery System Specifications for the proper specifications. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to Battery Cable for the proper cable diagnosis and testing procedures. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. Refer to the IGNITION-OFF DRAW TEST Standard Procedure for the proper test procedures. Repair the faulty electrical system, as required.
	4. The battery is faulty.	4. Test the battery using the Micro 420 battery tester. Refer to Standard Procedures for additional test procedures. Replace the faulty battery, as required.
	5. The starting system is faulty.	5. Determine if the starting system is performing to specifications. Refer to Starting System for the proper starting system diagnosis and testing procedures. Repair the faulty starting system, as required.
	6. The charging system is faulty.	6. Determine if the charging system is performing to specifications. Refer to Charging System for additional charging system diagnosis and testing procedures. Repair the faulty charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw systems in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is faulty.	1. Test the battery using the Micro 420 battery tester. Charge or replace the faulty battery, as required.

ABNORMAL BATTERY DISCHARGING

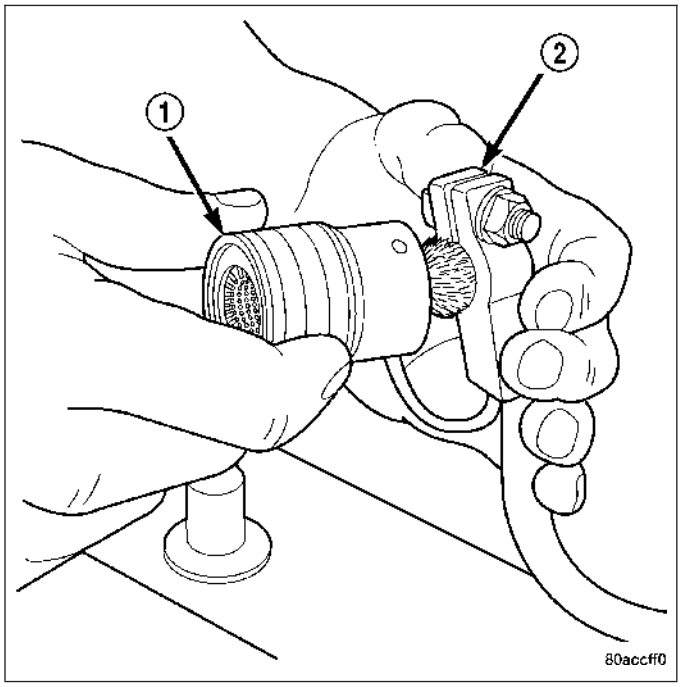
Any of the following conditions can result in abnormal battery discharging:

1. A faulty or incorrect charging system component. Refer to Charging System for additional charging system diagnosis and testing procedures.
2. A faulty or incorrect battery. Use Micro 420 battery tester and refer to Battery System for additional battery diagnosis and testing procedures.
3. A faulty circuit or component causing excessive ignition-off draw.
4. Electrical loads that exceed the output of the charging system. This can be due to equipment installed after manufacture, or repeated short trip use.
5. A faulty or incorrect starting system component. Refer to Starting System for the proper starting system diagnosis and testing procedures.
6. Corroded or loose battery posts and/or terminal clamps.
7. Slow driving speeds (heavy traffic conditions) or prolonged idling, with high-amperage draw systems in use.

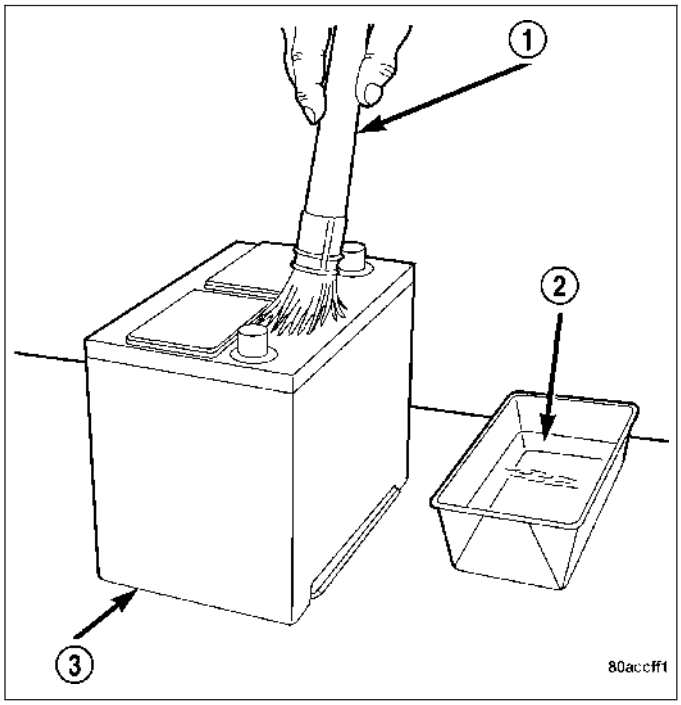
CLEANING

The following information details the recommended cleaning procedures for the battery and related components. It is recommended that these procedures be performed any time the battery or related components must be removed (if required).

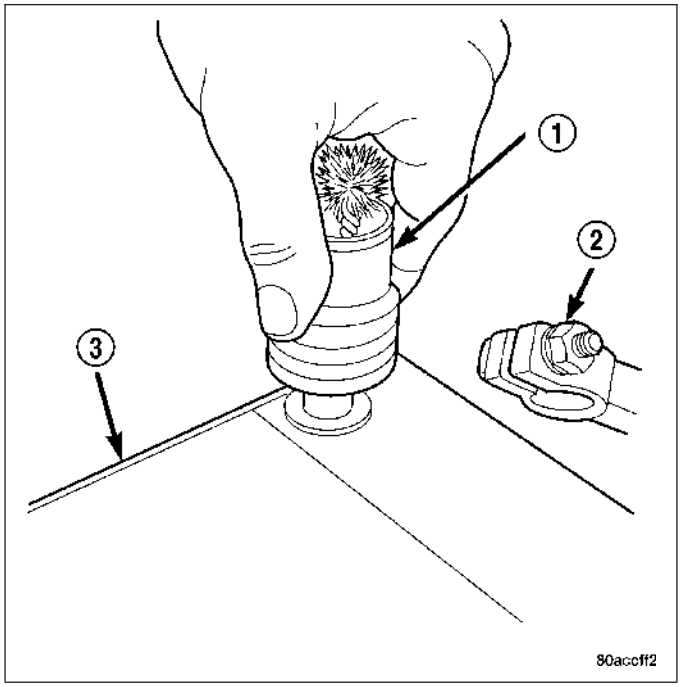
1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.



2. Clean the battery tray and battery hold down hardware of all corrosion. Remove any corrosion using a wire brush (1) and a sodium bicarbonate (baking soda) and warm water cleaning solution (2). Paint any exposed bare metal.
3. If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film.



5. Clean any corrosion from the battery terminal posts (2) with a wire brush or a post and terminal cleaner (1) and a sodium bicarbonate (baking soda) and warm water cleaning solution.



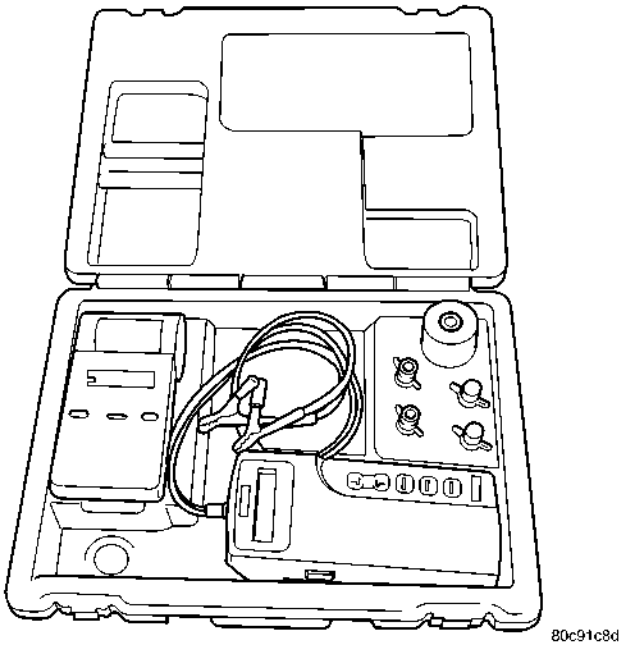
INSPECTION

The following information details the recommended inspection procedures for the battery and related components. It is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required.

SPECIAL TOOLS

BATTERY SYSTEM SPECIAL TOOLS

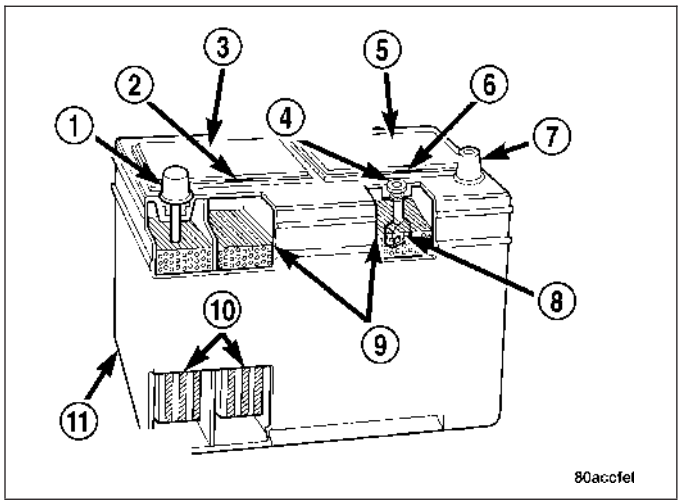


MICRO 420 BATTERY TESTER

BATTERY

DESCRIPTION

A large capacity, low-maintenance storage battery is installed on this vehicle. Male post type terminals (1&7) made of soft lead protrude from the top of the molded plastic battery case to provide the means for connecting the battery to the vehicle electrical system. The battery positive terminal post (1) is physically larger in diameter than the negative terminal post (7) to ensure proper battery connection. The letters **POS** and **NEG** are also molded into the top of the battery case adjacent to their respective positive and negative terminal posts for identification confirmation.



The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups (10) that are connected with lead straps to the positive terminal post (1), and negatively charged plate groups (10) that are connected with lead straps to the negative terminal post (7). Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte (9).

The battery has a built-in test indicator (hydrometer) (4). The color visible in the sight glass of the indicator will reveal the battery condition. Water cannot be added to this battery. The battery is not sealed and has vent holes (2) and (6) in the cell caps (3) and (5). The chemical composition of the metal coated plates within the low-maintenance battery reduces battery gassing and water loss, at normal charge and discharge rates. Therefore, the battery should not require additional water in normal service.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. The battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to assist the technician diagnose the cause of a defective battery. Follow the instruction manual supplied with the tester to properly diagnose a battery.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is faulty, and must be replaced. Further testing is not required. A fully-charged battery must be checked with Micro 420 tester or load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is faulty and must be replaced.

Note: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- Three hydrometer tests, taken at one-hour intervals, indicate no increase in the temperature-corrected specific gravity of the battery electrolyte.
- Passes Load test.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

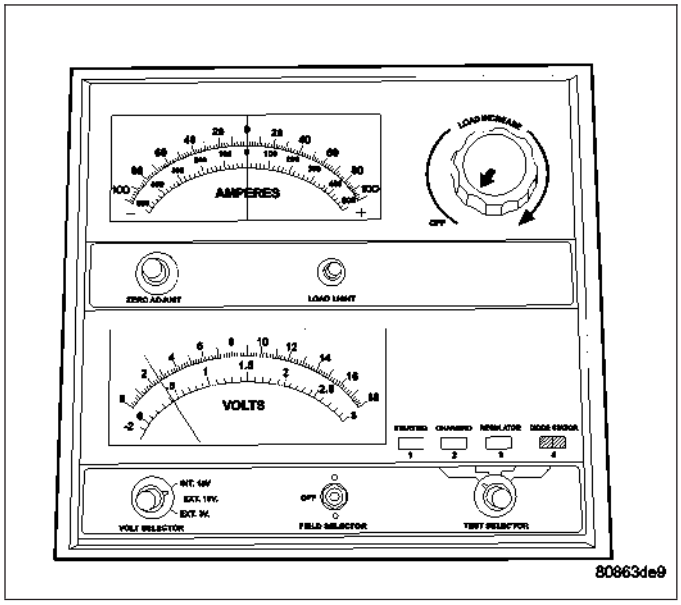
After the battery has been charged to 12.4 volts or greater, retest the battery using the Micro 420 tester or perform a load test to determine the battery cranking capacity. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is faulty and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.



2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is faulty and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block (JB). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Faulty or improperly adjusted switches.
- Faulty or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliampere	N/A
Combination Flasher	No	0.08 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.

4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information in this service manual for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, refer to Charging System for the proper charging system diagnosis and testing procedures. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

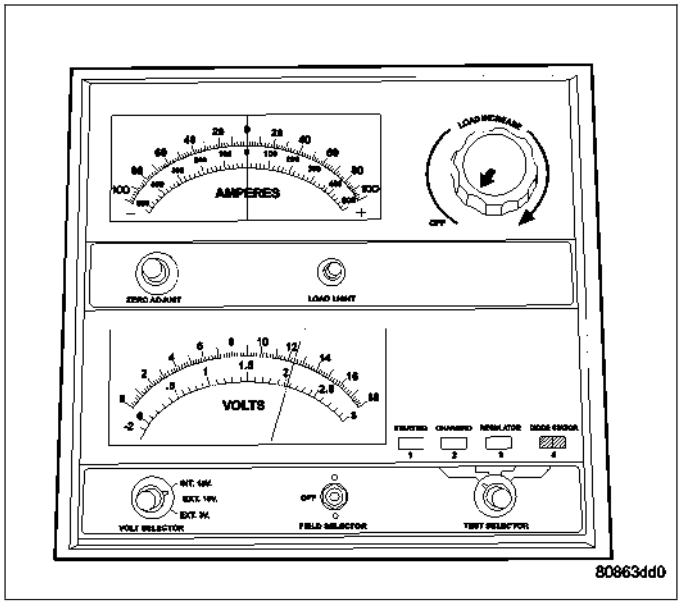
6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or a component failure is at fault.

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

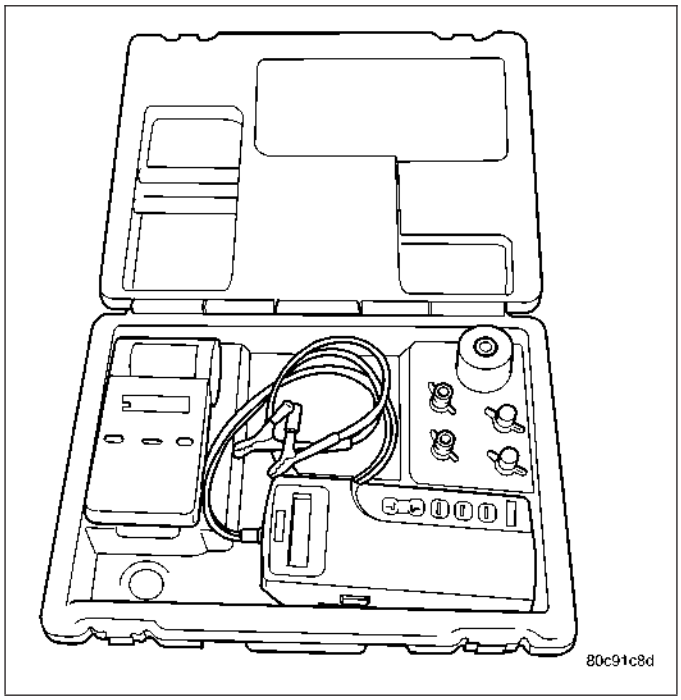


See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

MICRO 420 BATTERY TESTER

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:



WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminal**. If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.
3. Connect the tester to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (–).

Note: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

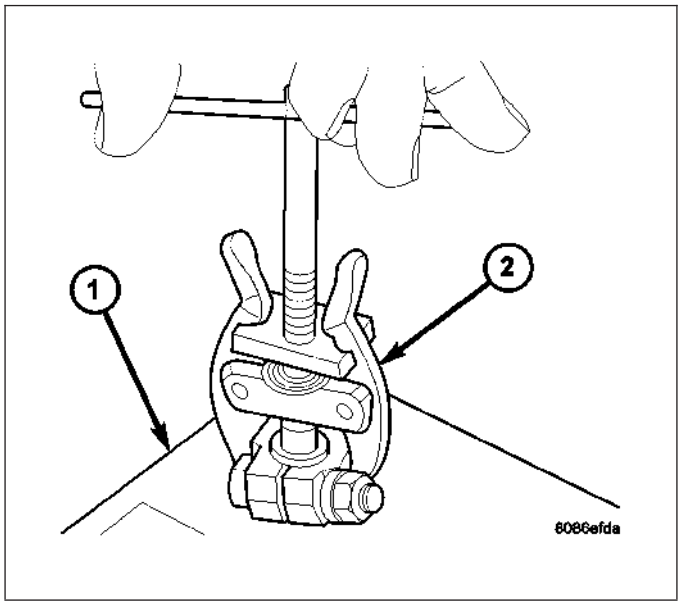
6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

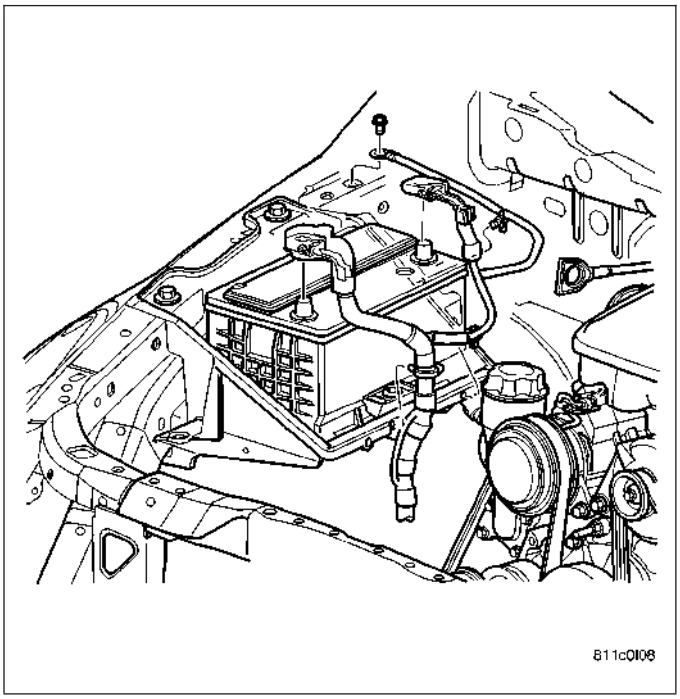
Note: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

REMOVAL

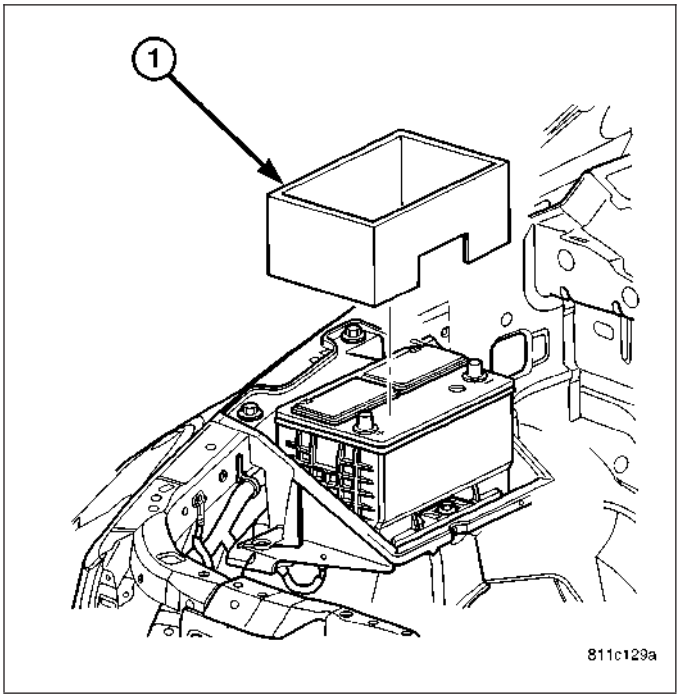
1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Loosen the battery negative cable terminal clamp pinch-bolt hex nut.
3. Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller (2) to remove the terminal clamp from the battery post.
4. Loosen the battery positive cable terminal clamp pinch-bolt hex nut.
5. Disconnect the battery positive cable terminal clamp from the battery positive terminal post. If necessary, use a battery terminal puller (2) to remove the terminal clamp from the battery post.



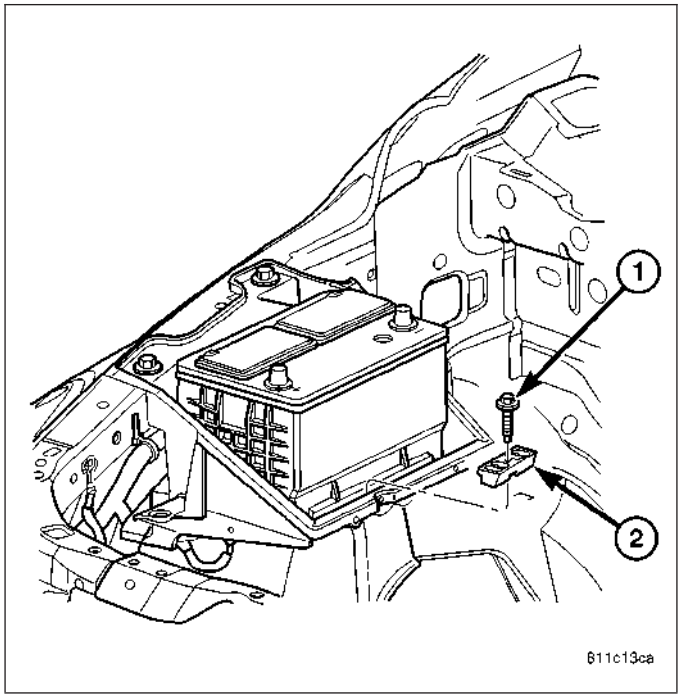
6. Remove the battery cables from the battery.



7. Remove the battery thermal guard (1).

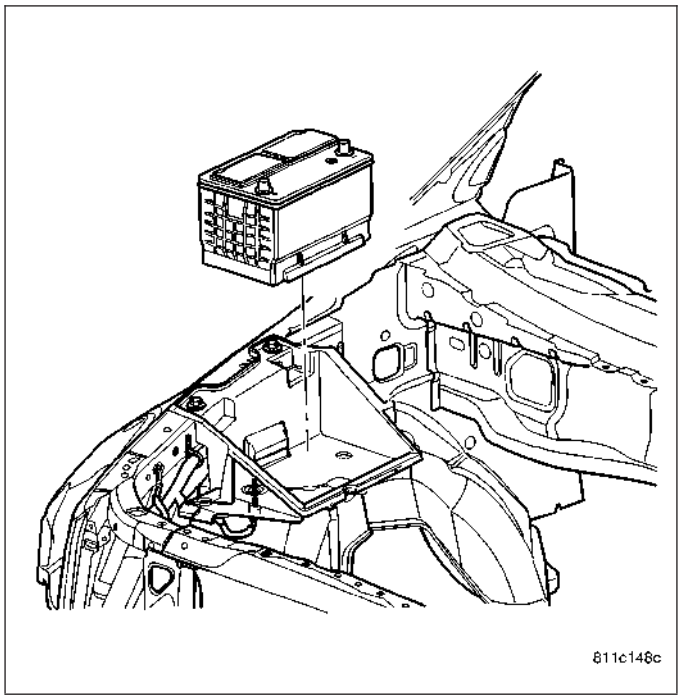


8. Remove the battery hold down (1) and bolt (2) from the battery.



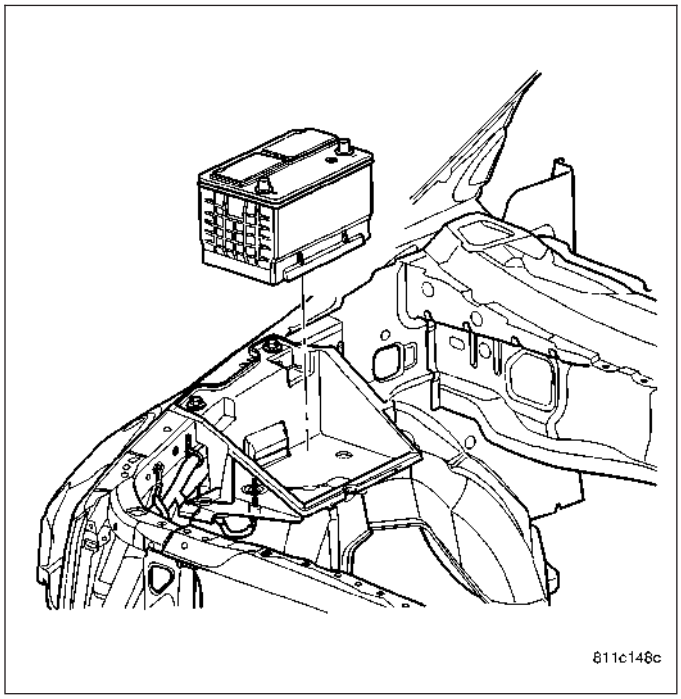
WARNING: WEAR A SUITABLE PAIR OF RUBBER GLOVES (NOT THE HOUSEHOLD TYPE) WHEN REMOVING A BATTERY BY HAND. SAFETY GLASSES SHOULD ALSO BE WORN. IF THE BATTERY IS CRACKED OR LEAKING, THE ELECTROLYTE CAN BURN THE SKIN AND EYES.

9. Remove the battery from the battery tray.

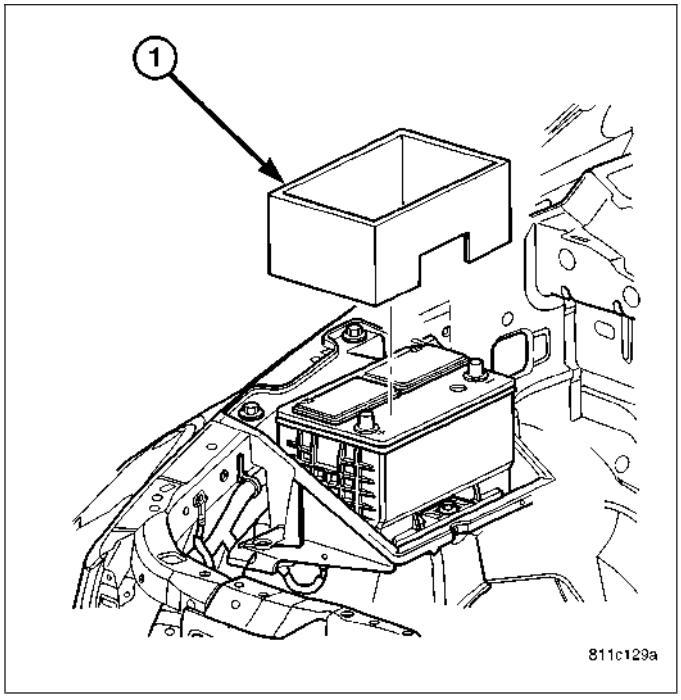


INSTALLATION

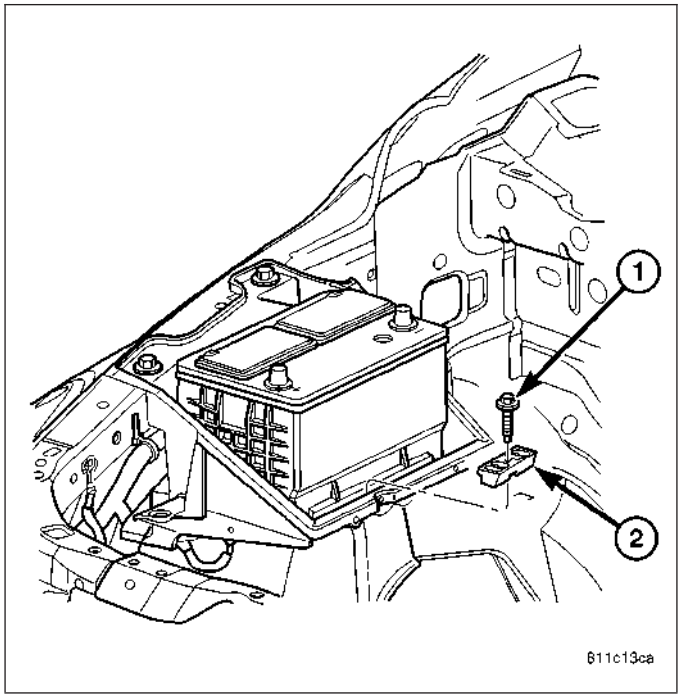
1. Clean and inspect the battery.
2. Position the battery onto the battery tray. Ensure that the battery positive and negative terminal posts are correctly positioned. The battery cable terminal clamps must reach the correct battery terminal post without stretching the cables.



3. Install the thermal guard (1) and slide battery toward fender.

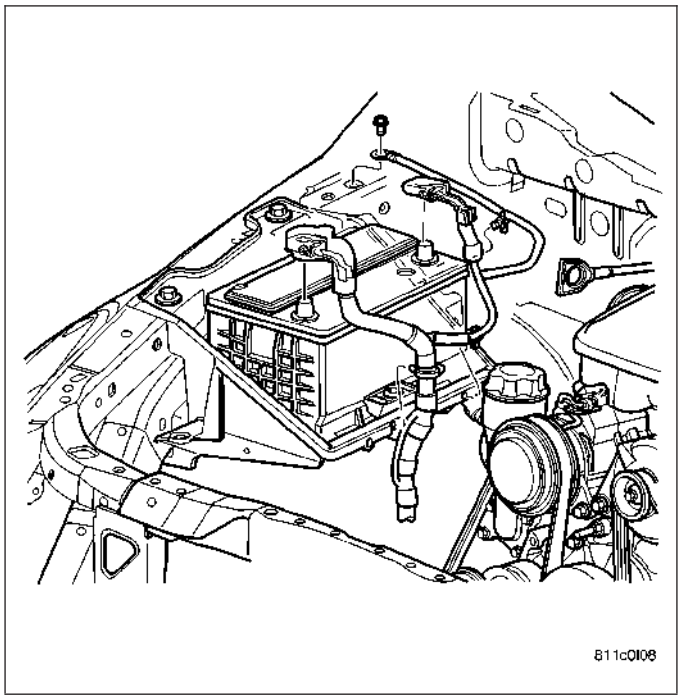


4. Install the battery hold down (1) and bolt (2) onto the battery.



CAUTION: Be certain that the battery cable terminal clamps are connected to the correct battery terminal posts. Reverse battery polarity may damage electrical components of the vehicle.

5. Clean the battery cable terminal clamps and the battery terminal posts.
6. Connect the battery positive cable terminal clamp to the battery positive terminal post.
7. Connect the battery negative cable terminal clamp to the battery negative terminal post.
8. Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.



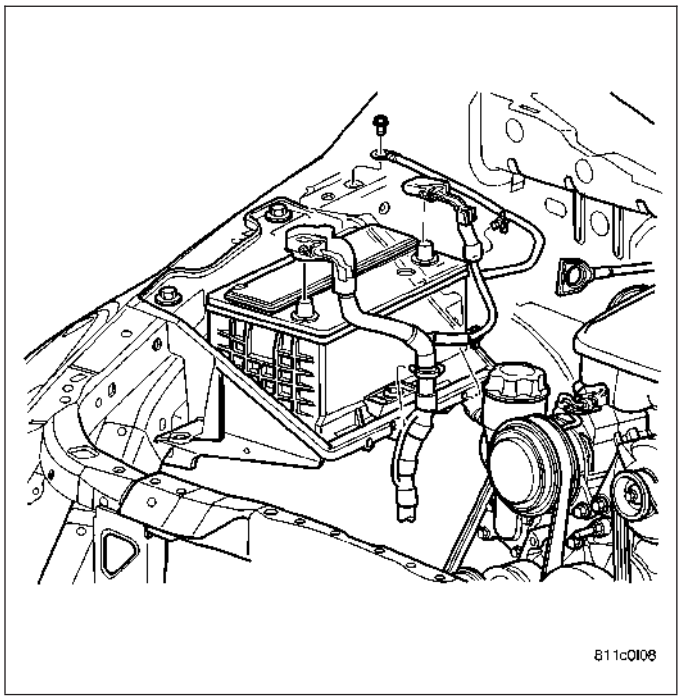
BATTERY CABLES

DESCRIPTION

The battery cables are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity.

The battery cables cannot be repaired and, if damaged or inoperative, they must be replaced.

The battery cables feature a stamped brass clamping type female battery terminal crimped onto one end of the battery cable wire and then solder-dipped. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. The battery positive cable also includes a red molded rubber protective cover for the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires have a black insulating jacket and a smaller female battery terminal clamp.



OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a return path for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the ends of the battery cable wires opposite the female battery terminal clamps provide secure and reliable connection of the battery to the vehicle electrical system.

DIAGNOSIS AND TESTING

BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cables. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

TESTING

VOLTAGE DROP TEST

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, OR LOW ELECTROLYTE LEVEL, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

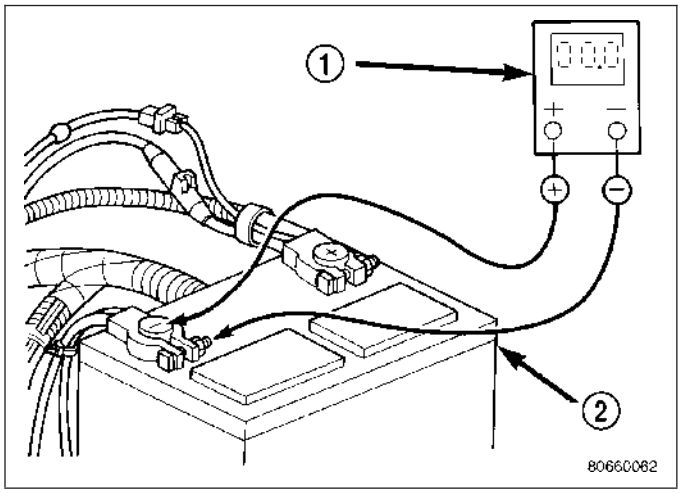
WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

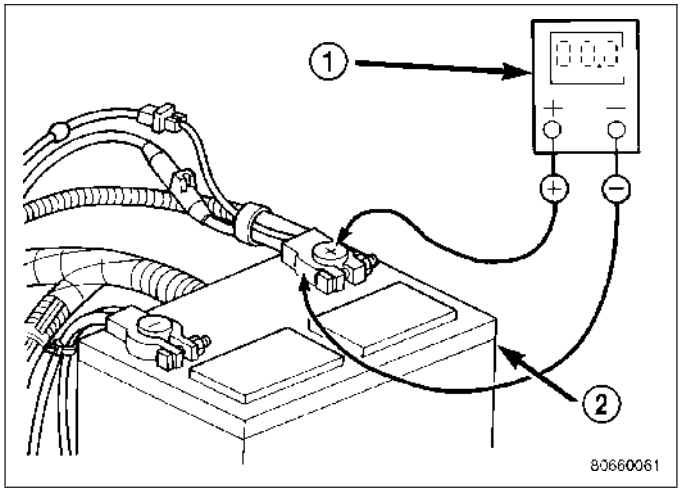
The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and tested.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the proper fuse in the PDC.

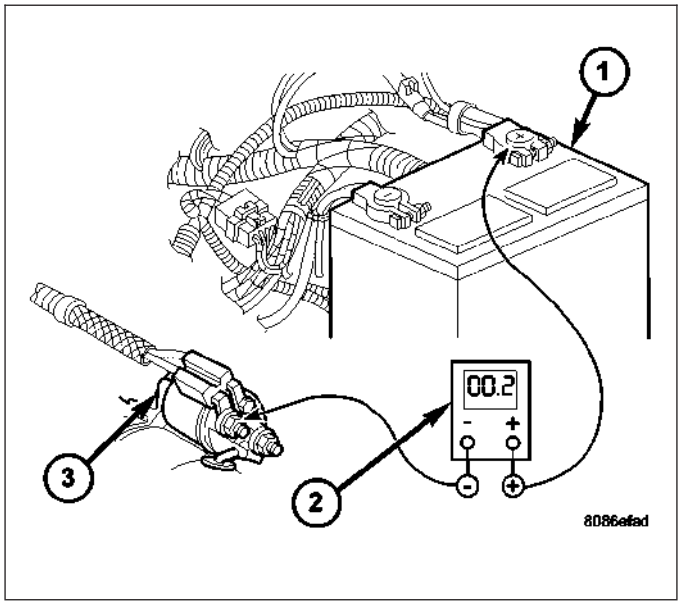
1. Connect the positive lead of the voltmeter (1) to the battery negative terminal post. Connect the negative lead of the voltmeter (1) to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.



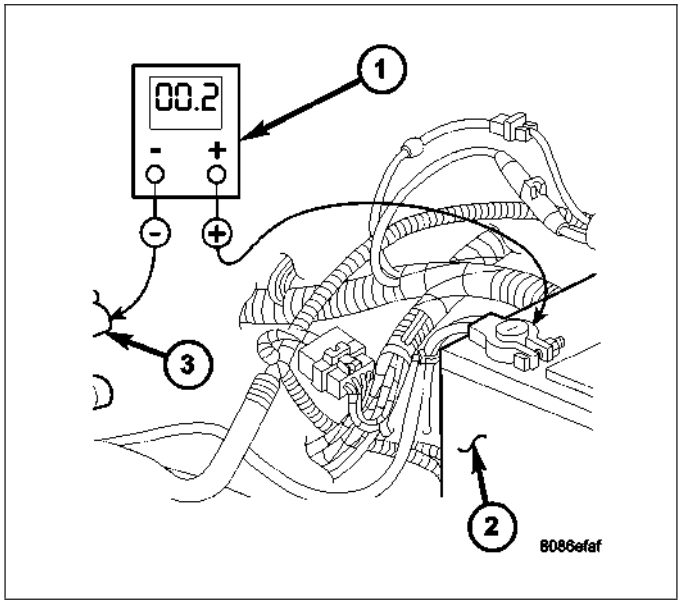
2. Connect the positive lead of the voltmeter (1) to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.



3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid (3) B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.



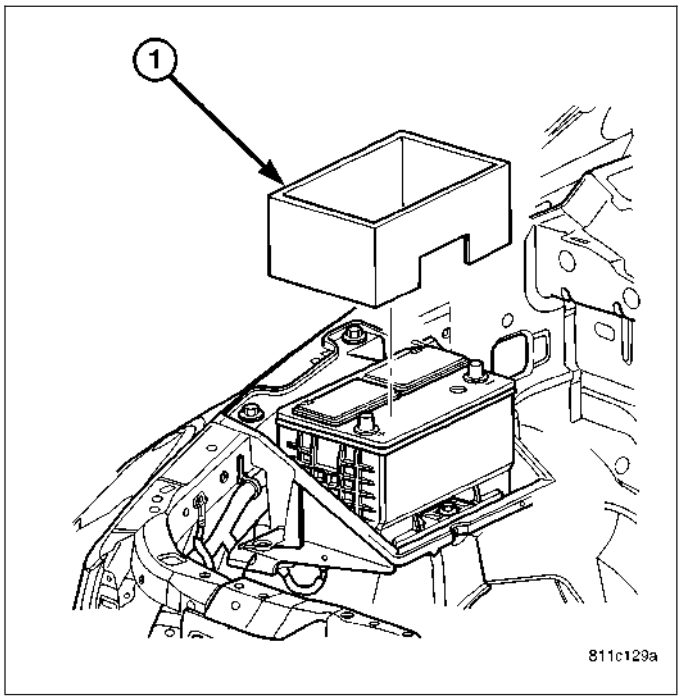
4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground (3) on the engine block. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.



THERMAL GUARD - BATTERY

DESCRIPTION

A flexible plastic bubble-wrap style thermal guard wraps around the battery case to enclose the sides of the battery. The thermal guard (1) consists of a heavy black plastic outer skin and two lighter plies of plastic that have been formed into a sheet with hundreds of small air pockets entrapped between them.



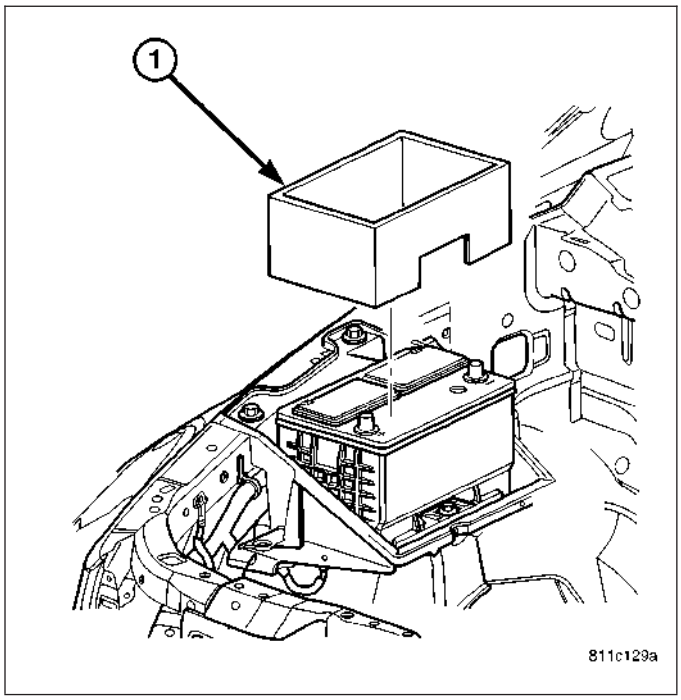
OPERATION

The thermal guard protects the battery from engine compartment temperature extremes. The temperature of the battery can affect battery performance. The air trapped between the plastic plies of the thermal guard create a dead air space, which helps to insulate the sides of the battery case from the air temperature found in the surrounding engine compartment.

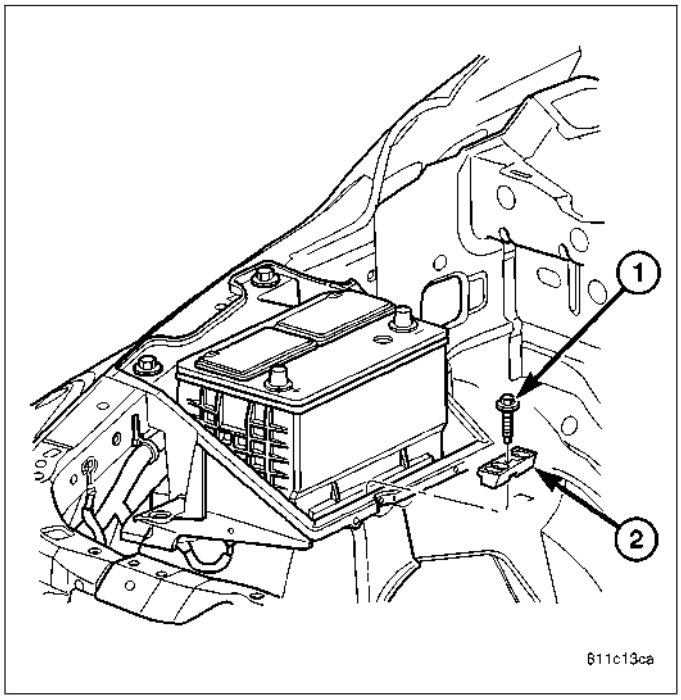
BATTERY TRAY

REMOVAL

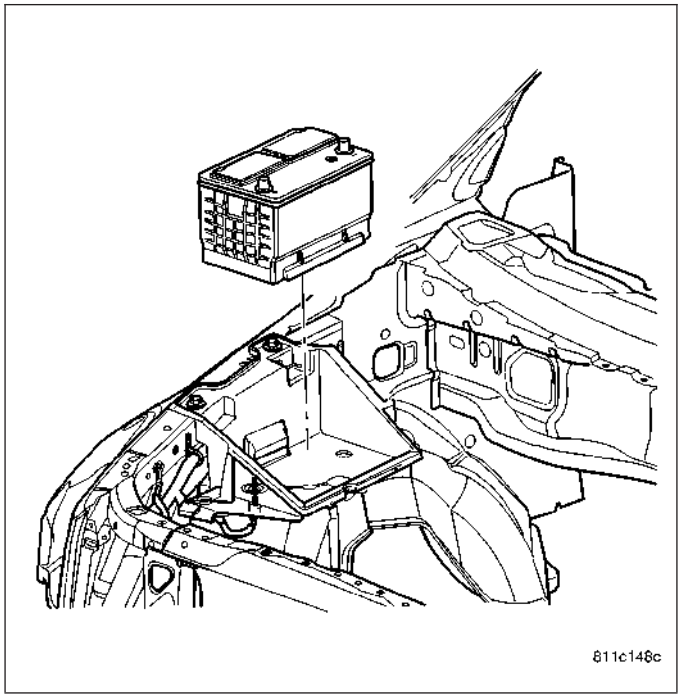
1. Disconnect the battery cables.
2. Remove the battery thermal guard (1).



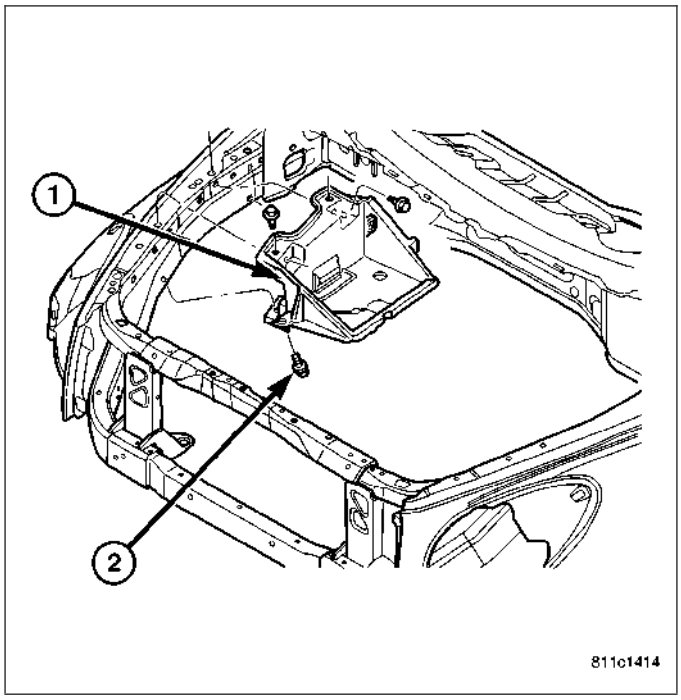
3. Remove the battery hold down (2) and bolt (1).



4. Remove the battery from the battery tray.

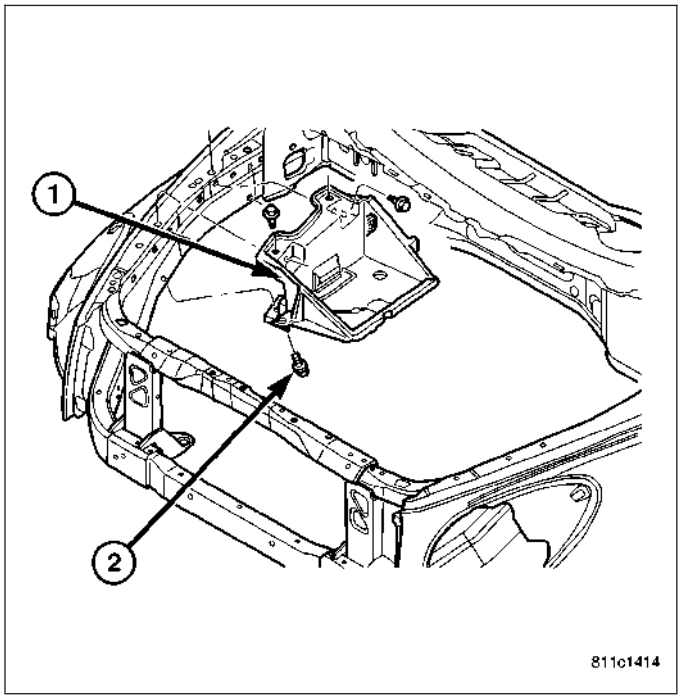


5. Remove the two upper bolts for the battery tray (1).
6. Remove the right front tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
7. Remove the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - DESCRIPTION).
8. Remove the lower battery tray (1) mounting bolts (2).
9. Remove the electrical routing clips at the battery tray.
10. Remove the battery temperature sensor from the battery tray (1). (Refer to 8 - ELECTRICAL/CHARGING/BATTERY TEMPERATURE SENSOR - REMOVAL).
11. Remove the battery tray (1) from the vehicle.

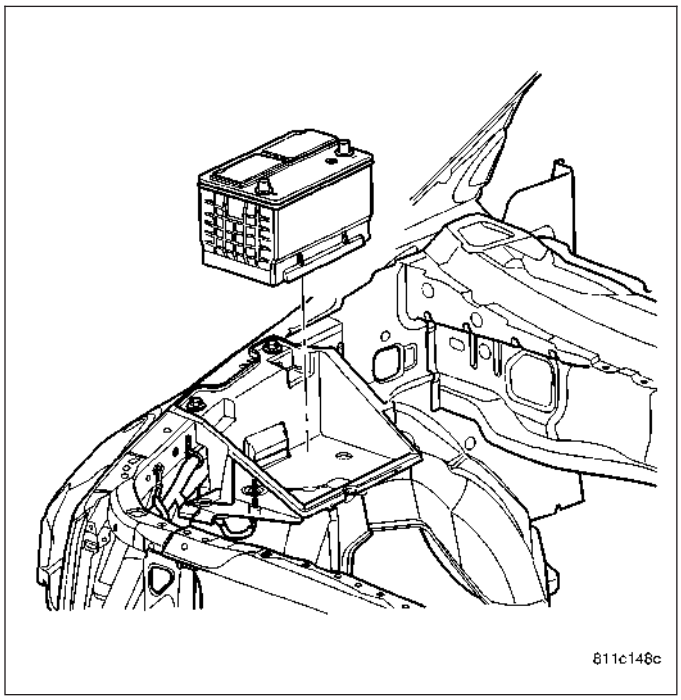


INSTALLATION

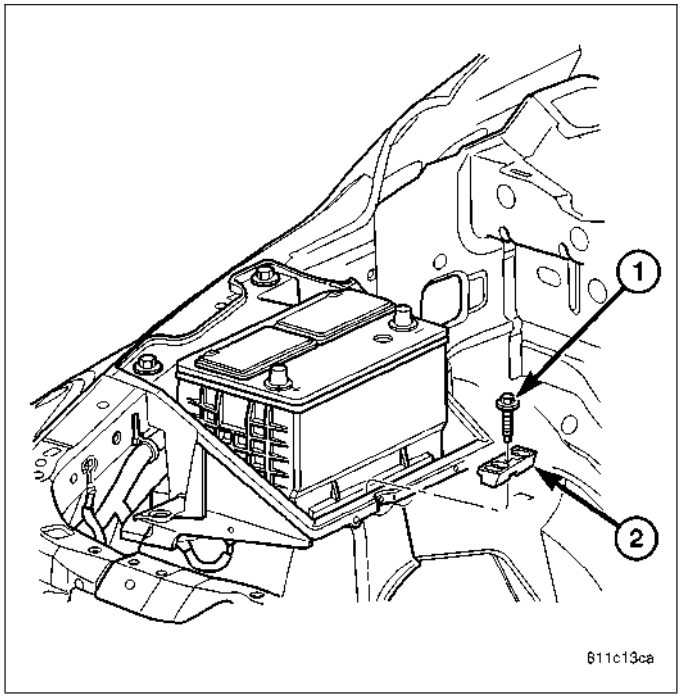
1. Clean and inspect the battery tray (1). Refer to Battery System for battery tray cleaning and inspection procedures.
2. Position the battery tray (1) into the vehicle.
3. Install and tighten the lower bolts (2) that secure the battery tray (1). Tighten the screws to 12.4 N·m (110 in. lbs.).
4. Install the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - DESCRIPTION).
5. Install the right front tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
6. Install the battery temperature sensor onto the battery tray (1). (Refer to 8 - ELECTRICAL/CHARGING/BATTERY TEMPERATURE SENSOR - INSTALLATION).
7. Install and tighten upper bolts that secure the battery tray to fender frame. Tighten the screws to 12.4 N·m (110 in. lbs.).



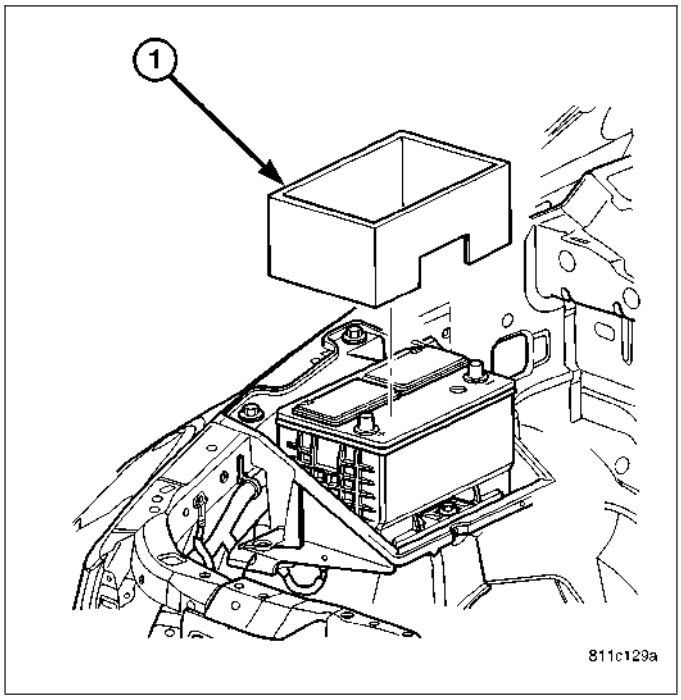
8. Install the battery onto the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).



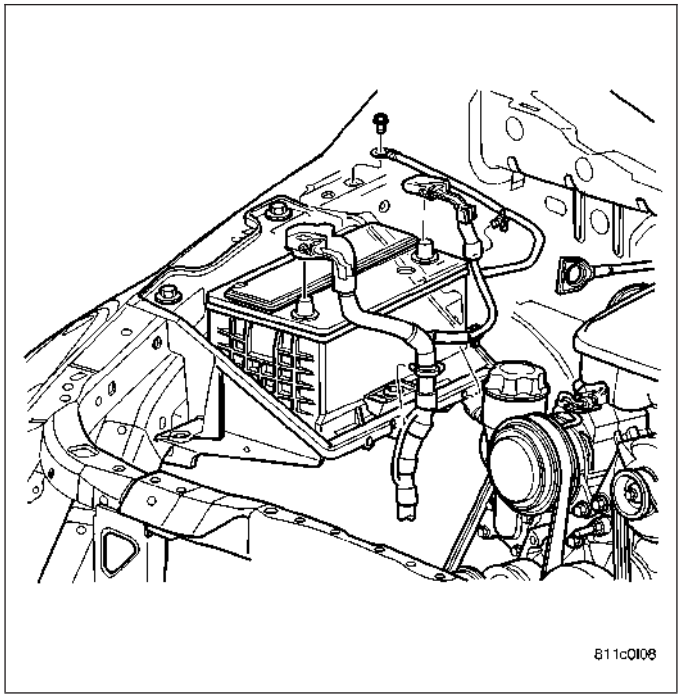
9. Install and tighten the battery holddown (1) and bolt (2).



10. Install the battery thermal guard (1).



11. Reconnect the battery cables.



CHARGING

DESCRIPTION

The charging system consists of:

- Generator
- Generator decoupler pulley (if equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to Battery for information)
- Battery temperature sensor
- Generator lamp (if equipped)
- Check gauges lamp (if equipped)
- Voltmeter (refer to Instrument Cluster for information)
- Wiring harness and connections (refer to Wiring for information)

OPERATION

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. When the ASD relay is on, voltage is supplied to the ASD relay sense circuit at the PCM. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

A battery temperature sensor, located in the battery tray housing, is used to sense battery temperature. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as a reminder to check the three gauges. The signal to activate the lamp is sent via the CAN bus circuits. The lamp is located on the instrument panel. Refer to Instrument Cluster for additional information.

DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test in the Battery section for more information.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Diagnostic Test Procedures and use a diagnostic scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to Battery for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications.
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in Cooling System.
6. Inspect automatic belt tensioner (if equipped). Refer to Cooling System for information.
7. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

SENSOR-BATTERY TEMPERATURE

DESCRIPTION

The Battery Temperature Sensor (BTS) is attached to the battery tray located under the battery.

OPERATION

The Battery Temperature Sensor (BTS) is used to determine the battery temperature and control battery charging rate. This temperature data, along with data from monitored line voltage, is used by the Powertrain Control Module (PCM) to vary the battery charging rate. System voltage will be higher at colder temperatures and is gradually reduced at warmer temperatures.

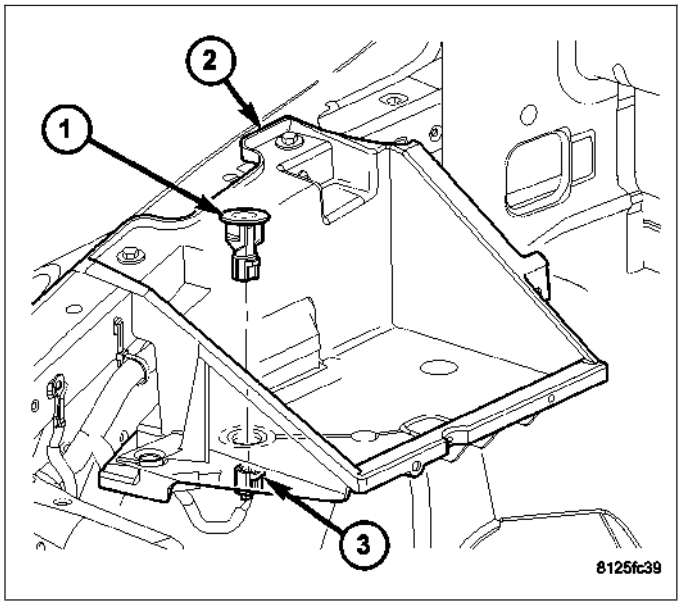
The PCM sends 5 volts to the sensor and is grounded through the sensor return line. As temperature increases, resistance in the sensor decreases and the detection voltage at the PCM increases.

The BTS is also used for OBD II diagnostics. Certain faults and OBD II monitors are either enabled or disabled, depending upon BTS input (for example, disable purge and enable Leak Detection Pump (LDP) and O2 sensor heater tests). Most OBD II monitors are disabled below 20 degrees F.

REMOVAL

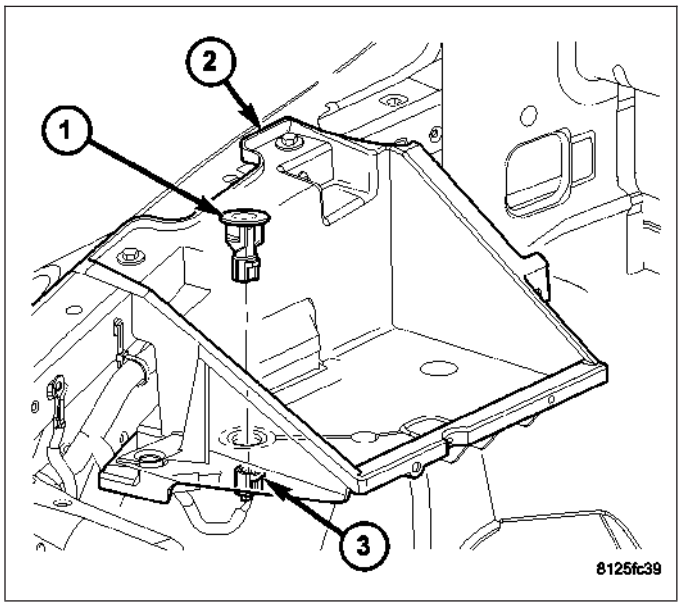
The battery temperature sensor (1) is located under vehicle battery and is attached to a mounting hole on battery tray (2).

1. Remove battery. Refer to Battery for procedures.
2. Disconnect sensor from engine wire harness (3).
3. Pry sensor straight up from battery tray mounting hole.



INSTALLATION

1. Feed engine wire harness (3) through hole in top of battery tray and attach sensor (1).
2. Press sensor (1) into hole of battery tray (2).
3. Install battery. Refer to Battery for procedures.



GENERATOR

DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The stator winding connections deliver the induced alternating current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified direct current is delivered to the vehicle electrical system through the generator battery terminal.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to Generator Ratings for amperage ratings and part numbers.

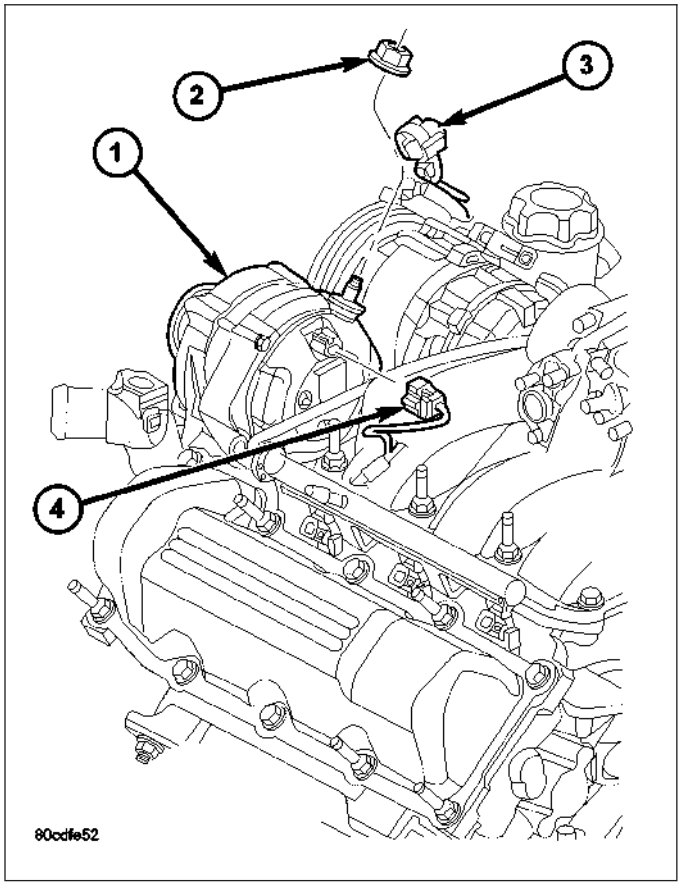
Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

REMOVAL

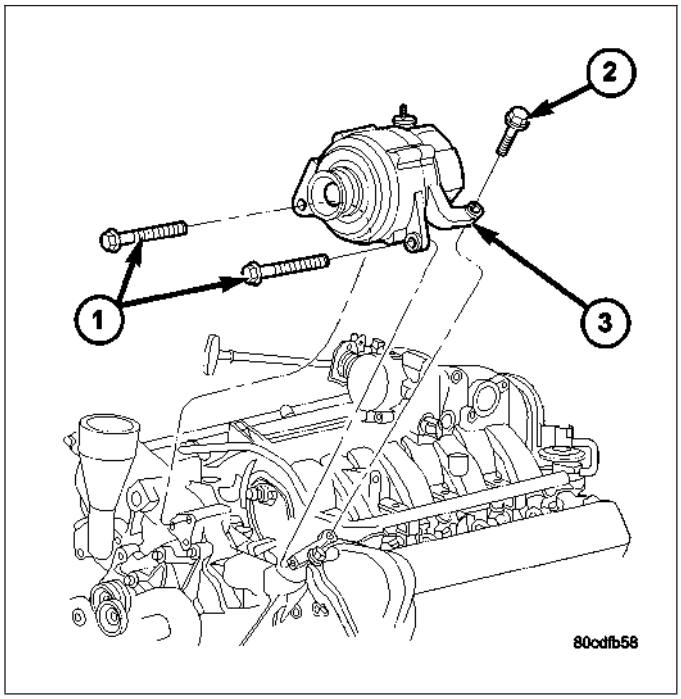
3.7L / 4.7L

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Unsnap plastic insulator cap (3) from B+ output terminal.
4. Remove B+ terminal mounting nut (2) at rear of generator. Disconnect terminal from generator.
5. Disconnect field wire connector (4) at rear of generator by pushing on connector tab.



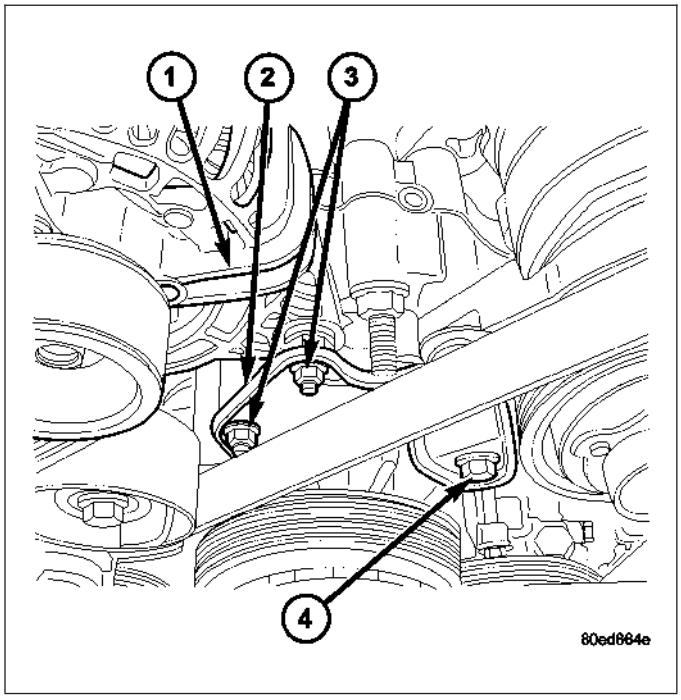
6. Remove 1 rear vertical generator mounting bolt (2).
7. Remove 2 front horizontal generator mounting bolts (1).
8. Remove generator from vehicle.



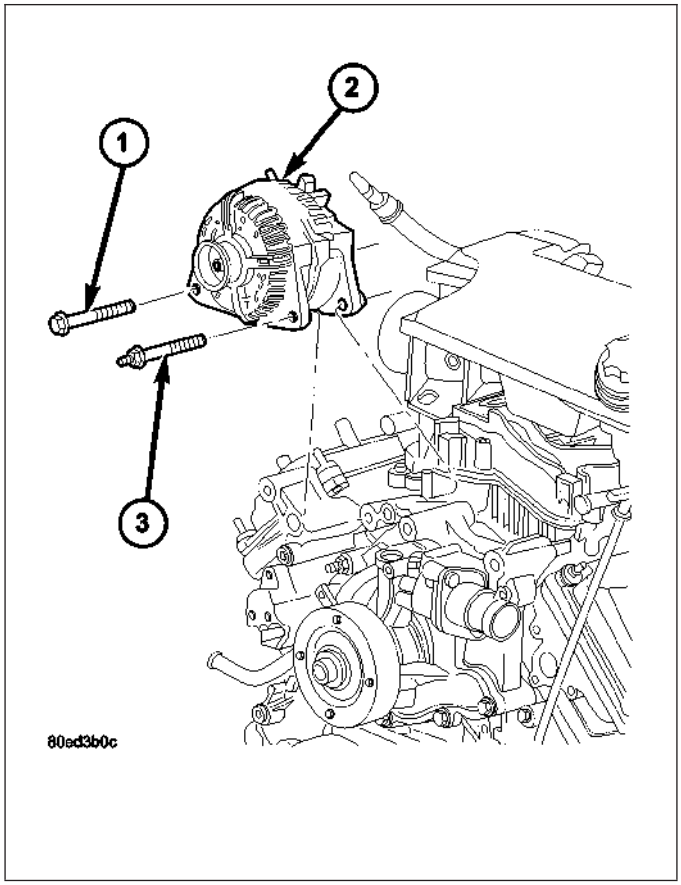
5.7L

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Unsnap plastic insulator cap from B+ output terminal.
4. Remove B+ terminal mounting nut at rear of generator. Disconnect terminal from generator.
5. Disconnect field wire connector at rear of generator by pushing on connector tab.
6. Remove generator support bracket nuts and bolt (3) and (4) and remove support bracket (2).



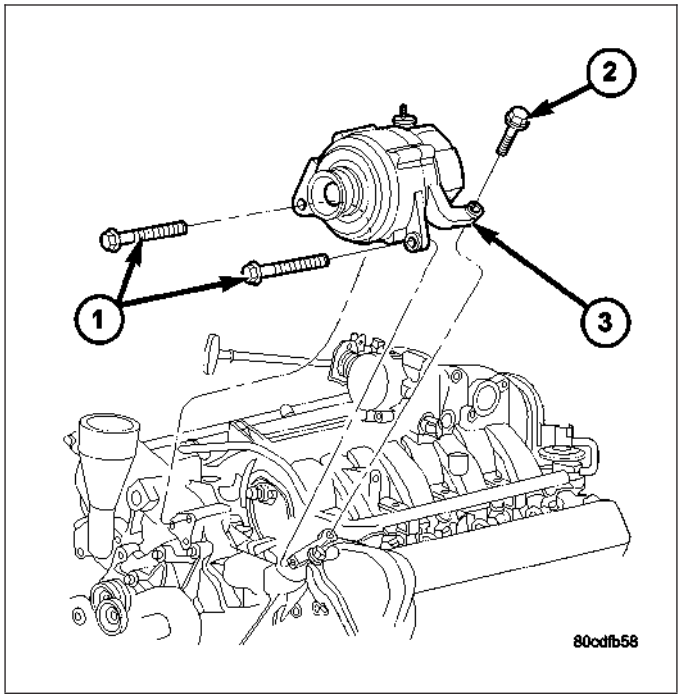
7. Remove 2 generator mounting bolts (1) and (3).
8. Remove generator (2) from vehicle.



INSTALLATION

3.7L / 4.7L

1. Position generator (3) to engine and install 2 horizontal bolts (1) and 1 vertical bolt (2).
2. Tighten all 3 bolts. Refer to Torque Specifications.

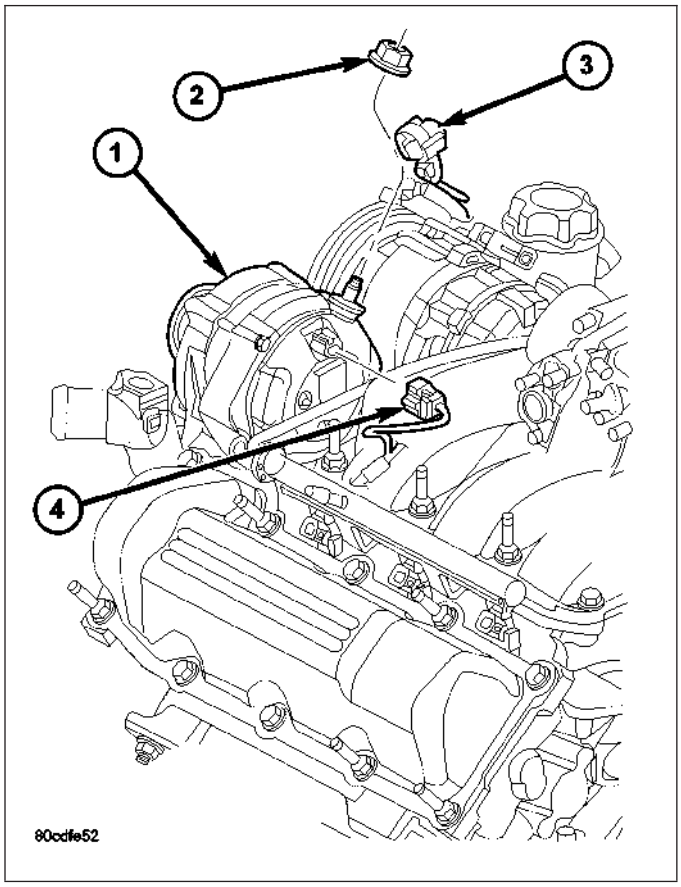


3. Snap field wire connector (4) into rear of generator.
4. Install B+ terminal eyelet to generator output stud. Tighten mounting nut (2). Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

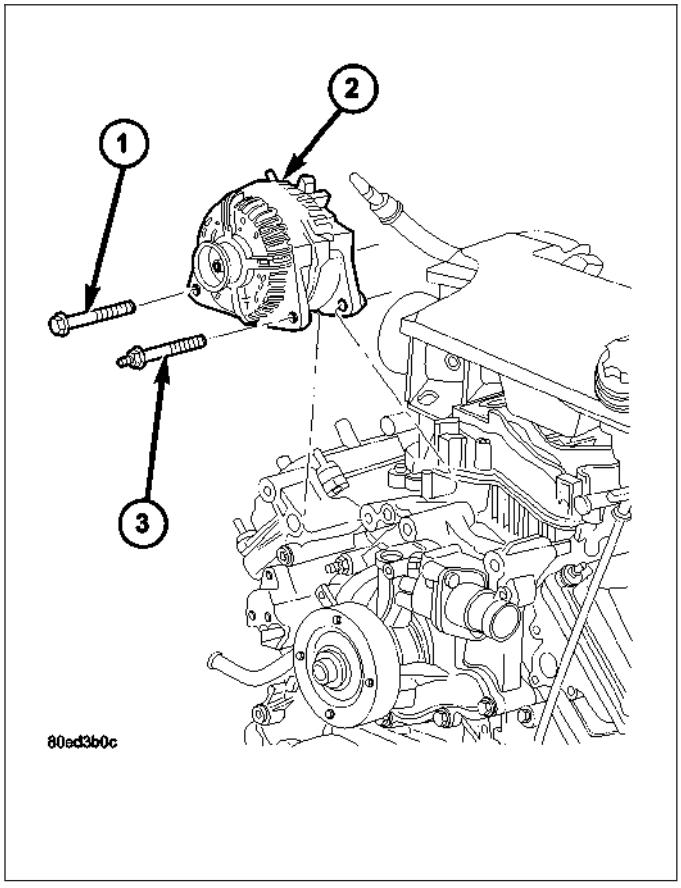
CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

5. Install generator drive belt. Refer to 7, Cooling System for procedure.
6. Install negative battery cable to battery.



5.7L

1. Position generator (2) to engine and install 2 mounting bolts (1) and (2).
2. Tighten bolts. Refer to Torque Specifications.

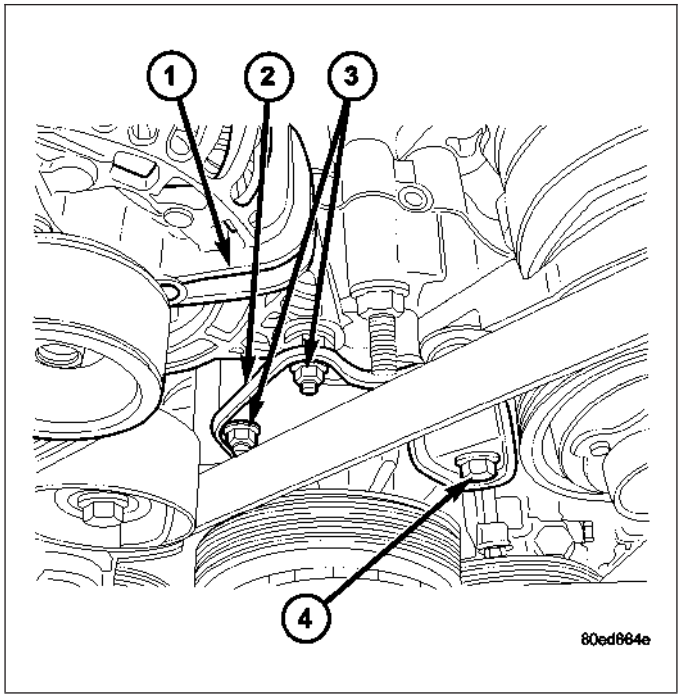


3. Position support bracket (2) to front of generator and install bolt and nuts (3). Tighten bolt / nuts. Refer to Torque Specifications.
4. Snap field wire connector into rear of generator.
5. Install B+ terminal eyelet to generator output stud. Tighten mounting nut. Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

6. Install generator drive belt. Refer to 7, Cooling System for procedure.
7. Install negative battery cable to battery.



REGULATOR, VOLTAGE

DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to Battery Temperature Sensor for more information). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM grounds the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the ground side of the generator field up to 100 times per second (100Hz), but has the capability to ground the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output.

STARTING

DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes (700 amperes - diesel engine), and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the clutch pedal position switch (manual transmission), the park/neutral position switch (automatic transmission), the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

If the vehicle is equipped with a manual transmission, it has a clutch pedal position switch installed in series between the ignition switch and the coil battery terminal of the starter relay. This normally open switch prevents the starter relay from being energized when the ignition switch is turned to the Start position, unless the clutch pedal is depressed. This feature prevents starter motor operation while the clutch disc and the flywheel are engaged. The starter relay coil ground terminal is always grounded on vehicles with a manual transmission.

If the vehicle is equipped with an automatic transmission, battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground. This normally open switch prevents the starter relay from being energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the starter pinion gear to spin faster than the pinion shaft. When the ignition switch is released to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

DIAGNOSIS AND TESTING - STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these 3 systems must perform within specifications.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. Refer to Starter Relay in Diagnosis and Testing. Replace starter relay if required.
	4. Ignition switch faulty.	4. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	5. Clutch pedal position switch faulty.	5. Refer to Clutch Pedal Position Switch.
	6. Park/Neutral position switch faulty or misadjusted.	6. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required.
	7. Starter solenoid faulty.	7. Refer to Starter Motor. Replace starter motor assembly if required.
	8. Starter motor faulty.	8. If all other starting system components and circuits test OK, replace starter motor.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to Engine Diagnosis in the Diagnosis and Testing section of 9, Engine.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to Starter Relay Diagnosis and Testing. Replace starter relay if required.
	3. Ignition switch faulty.	3. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO 8, PASSIVE RESTRAINT SYSTEMS, BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

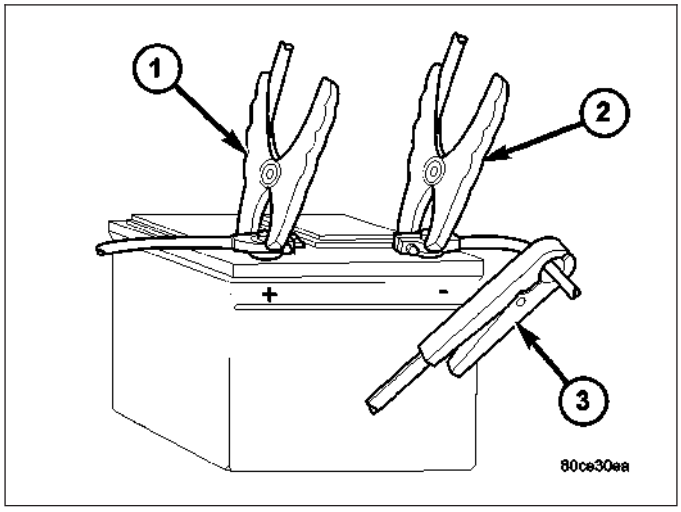
- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in 8, Battery. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Ignition Switch** - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder.**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, visually inspect clutch pedal position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Starter Relay** - Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.

- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to 8, Wiring Diagrams.

TESTING

COLD CRANKING TEST

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to **Battery** in Battery.



1. Connect volt-ampere tester to battery terminals (1), (2) and (3). See instructions provided by manufacturer of volt-ampere tester being used. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, tester should be connected to battery on left side of vehicle only. Also, tester current reading must be taken from positive battery cable lead that connects to starter motor.**
2. Fully engage parking brake.
3. If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

WARNING: IF EQUIPPED WITH DIESEL ENGINE, ATTEMPT TO START ENGINE A FEW TIMES BEFORE PROCEEDING WITH FOLLOWING STEP.

6. Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
   a. If voltage reads below 9.6 volts, refer to **Starter Motor** in Diagnosis and Testing. If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.
   b. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **Feed Circuit Test** in this section.
   c. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **Control Circuit Testing** in this section.
   d. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **Feed Circuit Test** in this section.

Note: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer 8, Wiring Diagrams.

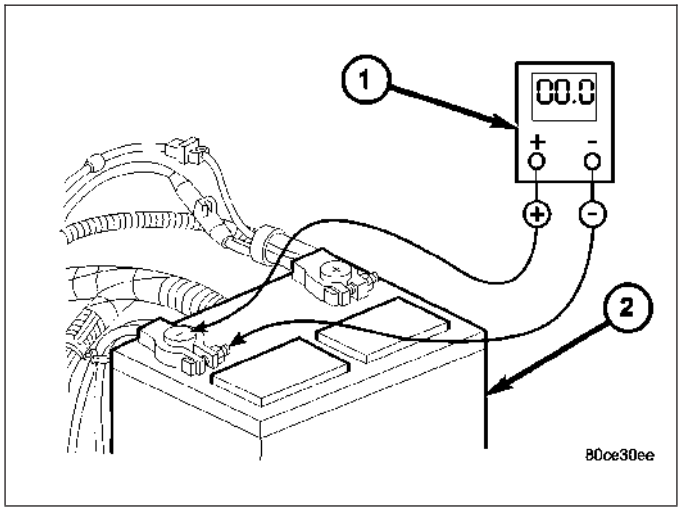
When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

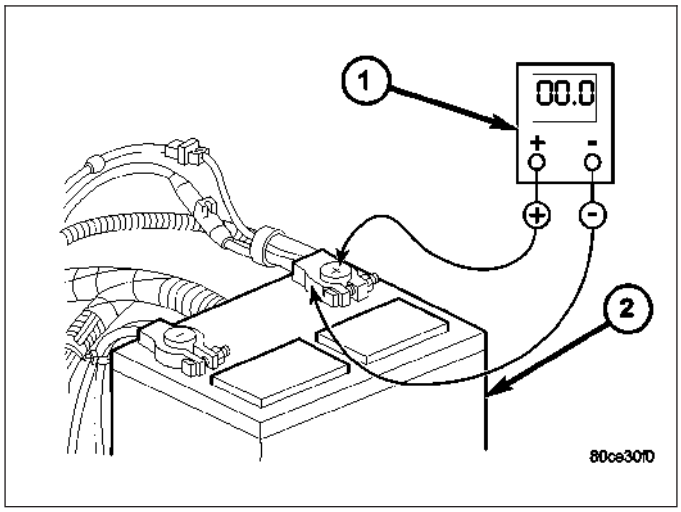
The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in 8, Battery.
- Fully engage parking brake.
- If equipped with manual transmission, place gearshift selector lever in Neutral position and block clutch pedal in fully depressed position. If equipped with automatic transmission, place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

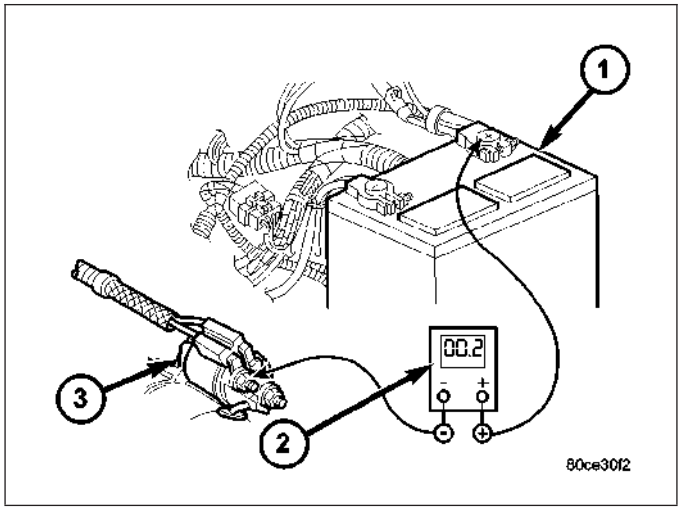
1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, procedure must be performed twice, once for each battery.**



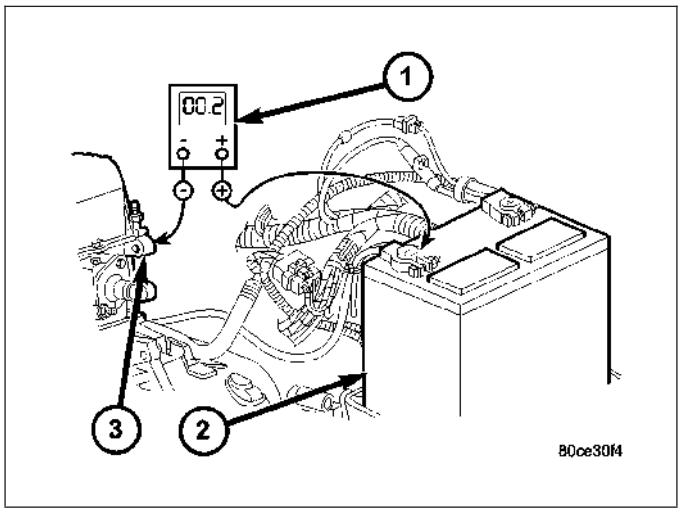
2. Connect positive lead of voltmeter (1) to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**



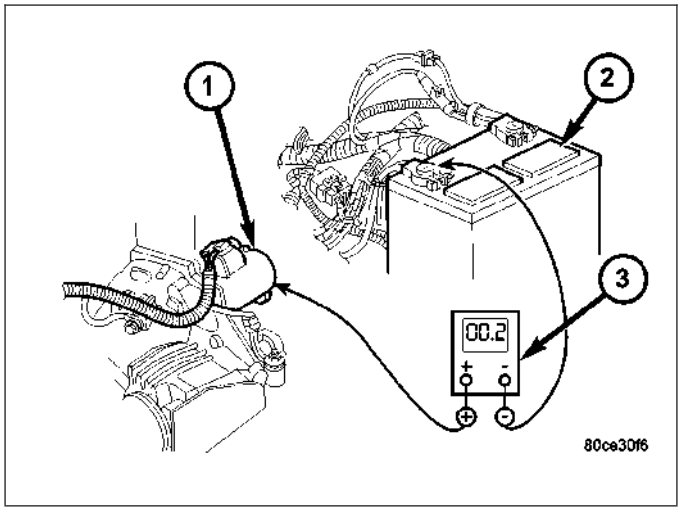
3. Connect voltmeter (2) to measure between battery positive terminal post and starter solenoid battery terminal stud (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**



4. Connect voltmeter (1) to measure between negative battery terminal post and a good clean ground on engine block (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed twice, once for each battery.**



5. Connect positive lead of voltmeter (3) to starter housing (1). Connect negative lead of voltmeter to negative battery terminal post. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact. **Note: Certain diesel equipped models use dual batteries. If equipped with dual battery system, this procedure must be performed on driver side battery only.**
6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.



If resistance tests detect no feed circuit problems, refer to **Starter Motor** in the Diagnosis and Testing.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** Diagnosis and Testing.
- **Starter Solenoid** - Refer to **Starter Motor** Diagnosis and Testing.
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Clutch Pedal Position Switch** - If equipped with manual transmission, refer to **Clutch Pedal Position Switch** in 6, Clutch.
- **Park/Neutral Position Switch** - If equipped with automatic transmission, refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Wire harnesses and connections** - Refer to 8, Wiring Diagrams.

SPECIFICATIONS

STARTING SYSTEM

Starter Motor and Solenoid	
Manufacturer	Denso
Part Number	56028715AD
Engine Application	3.7L / 4.7L / 5.7L
Power Rating	1.4 Kilowatt / 1.9 Horsepower
Voltage	12 Volts
Number of Brushes	4
Drive Type	Gear Reduction
Free Running Test Voltage	11 Volts
Free Running Test Amperage Draw	73 Amperes
Free Running Test Minimum Speed	3601 rpm
Solenoid Closing Maximum Voltage Required	7.5 Volts
* Cranking Amperage Draw Test	125 - 250 Amperes
* Test at operating temperature. Cold engine, tight (new) engine, or heavy oil will increase starter amperage draw.	

SPECIFICATIONS - TORQUE - STARTING SYSTEM

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Battery Cable Eyelet Nut at Solenoid (large nut)	25	19	221
Starter Solenoid Nut (small nut)	6	-	55
Starter Mounting Bolts	68	50	-
Starter Mounting Nut	68	50	-

STARTER

DIAGNOSIS AND TESTING - STARTER MOTOR

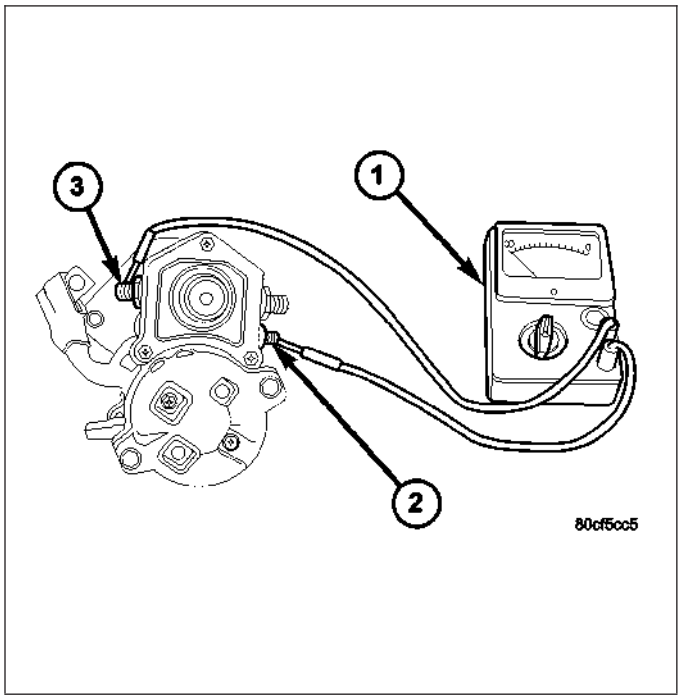
Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle. Refer to Specifications for starter motor specifications.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on the mounting flange of starter motor. Never clamp on starter motor by field frame.
3. Connect a suitable volt-ampere tester and a 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale. See instructions provided by manufacturer of volt-ampere tester being used.
4. Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.
5. Adjust carbon pile load of tester to obtain free running test voltage. Refer to Specifications for starter motor free running test voltage specifications.
6. Note reading on ammeter and compare reading to free running test maximum amperage draw. Refer to Specifications for starter motor free running test maximum amperage draw specifications.
7. If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

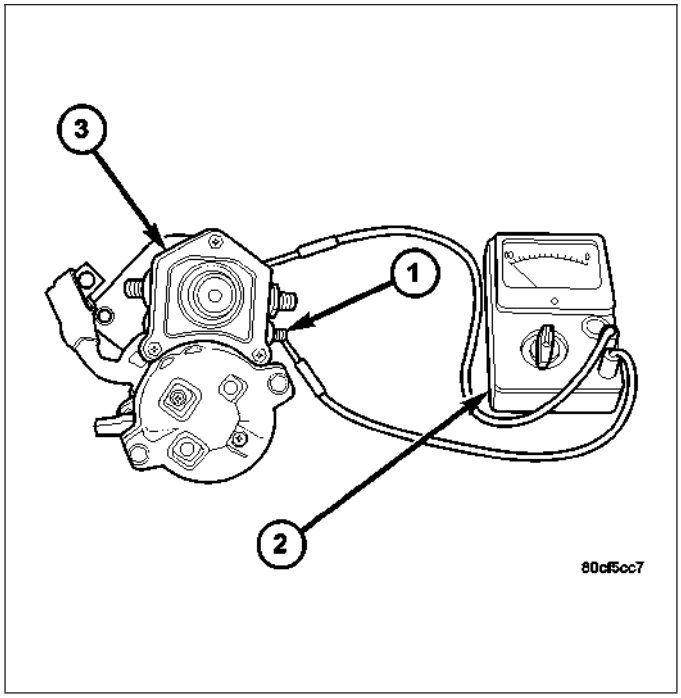
STARTER SOLENOID

This test can only be performed with starter motor removed from vehicle.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Disconnect wire from solenoid field coil terminal.
3. Check for continuity between solenoid terminal (3) and solenoid field coil terminal (2) with a continuity tester (1). There should be continuity. If OK, go to Step 4. If not OK, replace faulty starter motor assembly.



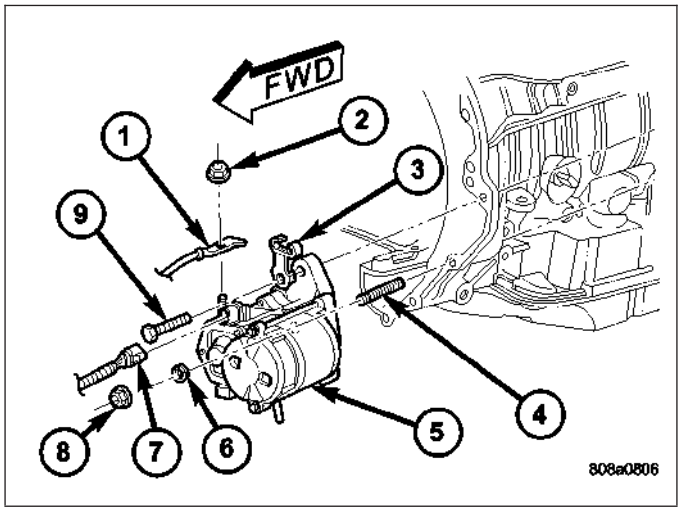
4. Check for continuity between solenoid terminal (1) and solenoid case. There should be continuity. If not OK, replace faulty starter motor assembly.



REMOVAL

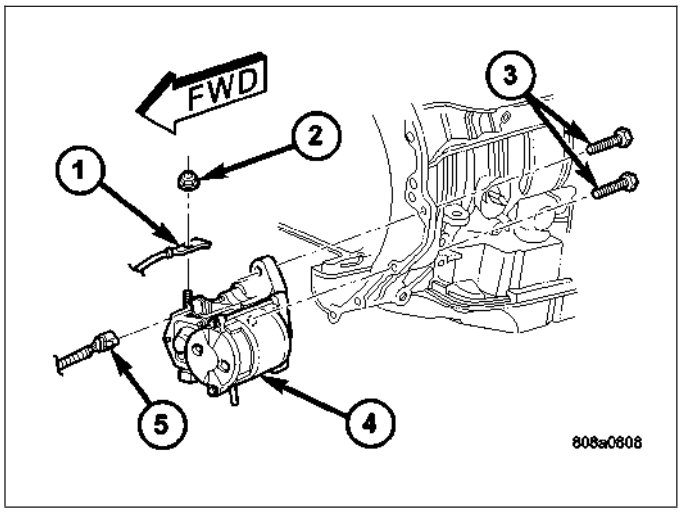
3.7L / 4.7L With Manual Trans.

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Note: If equipped with 4WD and certain transmissions, a support bracket is used between front axle and side of transmission. Remove 2 support bracket bolts at transmission. Pry support bracket slightly to gain access to lower starter mounting bolt.
4. Remove one bolt (9) and one nut (8) if equipped with a manual transmission.
5. Move starter motor (5) towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor during this process, do not let starter motor hang from wire harness.
6. Tilt nose downwards and lower starter motor far enough to access and remove nut (2) that secures battery positive cable wire harness connector eyelet to solenoid battery terminal stud. Do not let starter motor hang from wire harness.



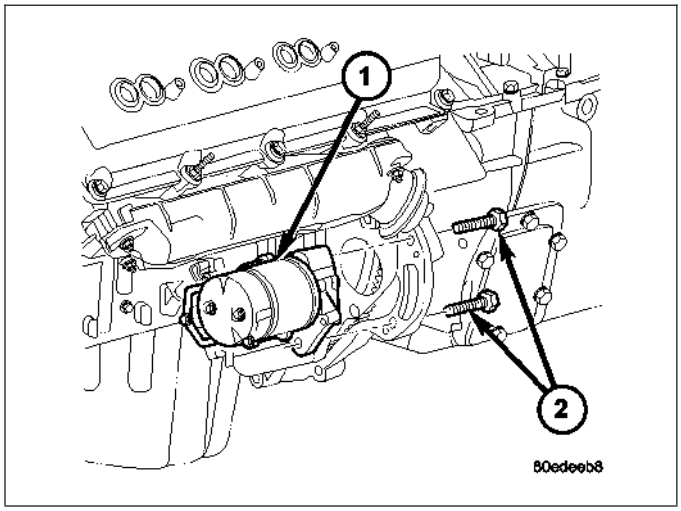
7. Remove battery positive cable wire harness connector eyelet (1) from solenoid battery terminal stud.
8. Disconnect battery positive cable wire harness connector (7) from solenoid terminal connector receptacle.
9. Remove starter motor.

3.7L / 4.7L With Auto. Trans.



1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Note: If equipped with 4WD and certain transmissions, a support bracket is used between front axle and side of transmission. Remove 2 support bracket bolts at transmission. Pry support bracket slightly to gain access to lower starter mounting bolt.
4. Remove two bolts (3) if equipped with an automatic transmission.
5. Move starter motor (4) towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor during this process, do not let starter motor hang from wire harness.
6. Tilt nose downwards and lower starter motor far enough to access and remove nut (2) that secures battery positive cable wire harness connector eyelet (1) to solenoid battery terminal stud. Do not let starter motor hang from wire harness.
7. Remove battery positive cable wire harness connector eyelet (5) from solenoid battery terminal stud.
8. Disconnect battery positive cable wire harness connector from solenoid terminal connector receptacle.
9. Remove starter motor.

5.7L V-8

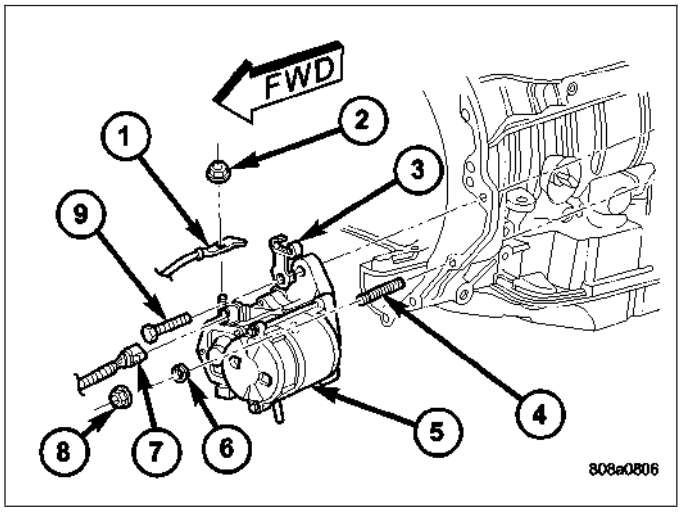


1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Note: If equipped with 4WD and certain transmissions, a support bracket is used between front axle and side of transmission. Remove 2 support bracket bolts at transmission. Pry support bracket slightly to gain access to lower starter mounting bolt.
4. Remove two mounting bolts (2).
5. Move starter motor towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor (1) during this process, do not let starter motor hang from wire harness.
6. Tilt nose downwards and lower starter motor far enough to access and remove nut that secures battery positive cable wire harness connector eyelet to solenoid battery terminal stud. Do not let starter motor hang from wire harness.
7. Remove battery positive cable wire harness connector eyelet from solenoid battery terminal stud.
8. Disconnect battery positive cable wire harness connector from solenoid terminal connector receptacle.
9. Remove starter motor.

INSTALLATION

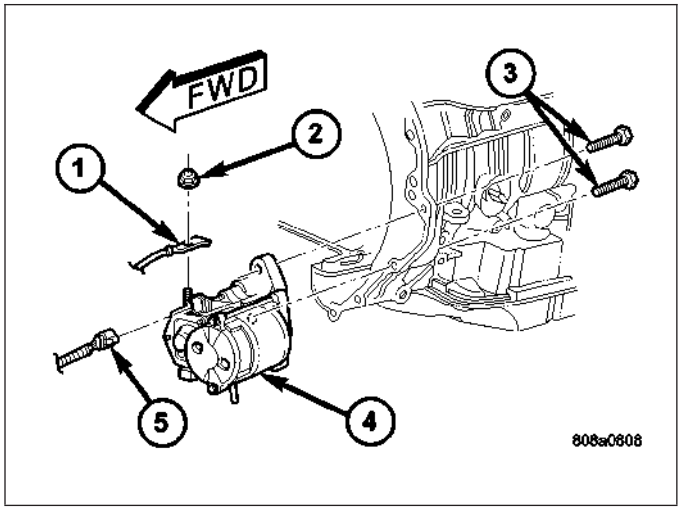
3.7L / 4.7L With Manual Trans.

1. Connect solenoid wire to starter motor (snaps on).
2. Position battery cable (1) to solenoid stud. Install and tighten battery cable eyelet nut (2). Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
3. Position starter motor (5) to transmission.
4. Install and tighten lockwasher (6) nut (8) and bolt (9). Refer to Torque Specifications.
5. Lower vehicle.
6. Connect negative battery cable.



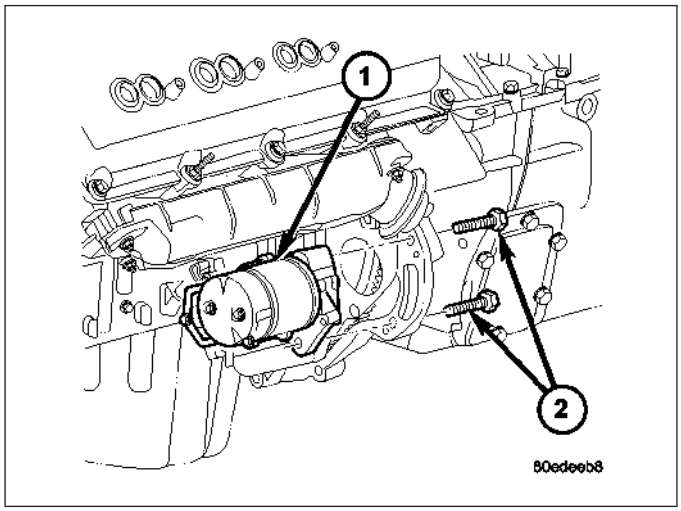
3.7L / 4.7L With Auto. Trans.

1. Connect solenoid wire to starter motor (snaps on).
2. Position battery cable (1) to solenoid stud. Install and tighten battery cable eyelet nut (2). Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
3. Position starter motor (4) to transmission.
4. If equipped with automatic transmission, slide cooler tube bracket into position.
5. Install and tighten both bolts (3). Refer to Torque Specifications.
6. Lower vehicle.
7. Connect negative battery cable.



5.7L V-8

1. Connect solenoid wire to starter motor (snaps on).
2. Position battery cable to solenoid stud. Install and tighten battery cable eyelet nut. Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
3. Position starter motor (1) to engine.
4. If equipped with automatic transmission, slide cooler tube bracket into position.
5. Install and tighten both mounting bolts (2). Refer to Torque Specifications.
6. Lower vehicle.
7. Connect negative battery cable.



RELAY-STARTER MOTOR

DESCRIPTION

The starter relay is an electromechanical device that switches battery current to the pull-in coil of the starter solenoid when the ignition switch is turned to the Start position. The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. See the PDC cover for relay identification and location.

The starter relay is a International Standards Organization (ISO) relay. Relays conforming to ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The starter relay cannot be repaired or adjusted. If faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When electromagnetic coil is energized, it draws the movable contact away from normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When electromagnetic coil is de-energized, spring pressure returns movable contact to normally closed position. The resistor or diode is connected in parallel with electromagnetic coil within relay, and helps to dissipate voltage spikes produced when coil is de-energized.

REMOVAL

The starter relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Disconnect and isolate negative battery cable.
2. Remove cover from Power Distribution Center (PDC) for relay identification and location.
3. Remove starter relay from PDC.
4. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
5. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

1. Push down firmly on starter relay until terminals are fully seated into PDC receptacle.
2. Install PDC cover.
3. Connect battery cable.

MODULE-FRONT CONTROL PDM

812c66ca

B106B,B106D–REAR DEFROST CONTROL CIRCUIT LOW/OPEN – FCM — (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

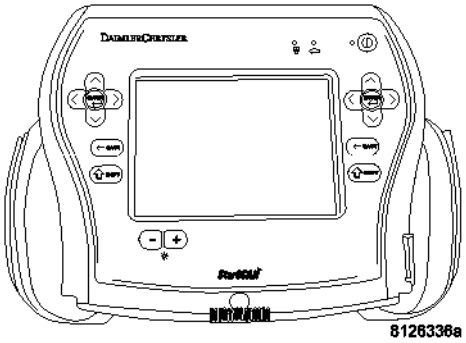
- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module does not detect voltage on the Defogger Relay Control circuit.1

Possible Causes
REAR DEFOGGER J/B FUSE
REAR WINDOW DEFOGGER RELAY
IGNITION SWITCH OUTPUT OPEN
DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO GROUND
DEFOGGER RELAY CONTROL CIRCUIT OPEN
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's
Operate the Rear Defogger Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.



Does the scan tool display the same DTC?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

---

2. JUNCTION BLOCK FUSE

Turn the ignition on.
Using a 12-volt test light connected to ground, check the Rear Window Defogger fuse in the Junction Block.

Does the test light illuminate and was the fuse OK?

No >> Repair the Ignition Switch Output (Run) circuit for an open or replace the fuse if open and check for a shorted Defogger Relay.
Perform BODY VERIFICATION TEST - VER 1.

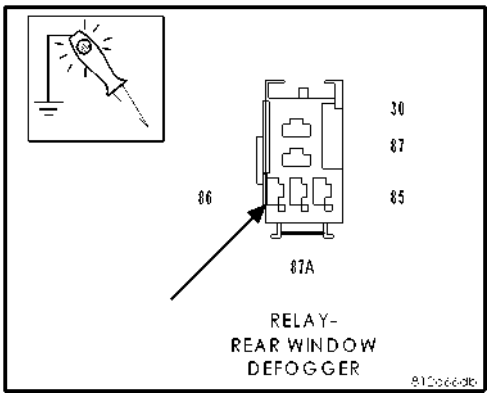
Yes >> Go To 3

B106B,B106D–REAR DEFROST CONTROL CIRCUIT LOW/OPEN – FCM — (CONTINUED)

3. OPEN IGNITION SWITCH OUTPUT (RUN) TO RELAY

Remove the Rear Defogger Relay from the Junction Block.

Using a 12-volt test light connected to ground, check the Ignition Switch Output circuit at the relay connector.



Does the test light illuminate?

No >> Replace the Junction Block.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 4

---

4. REAR WINDOW DEFOGGER RELAY

Install a known good relay in place of the Rear Window Defogger Relay.

With the scan tool erase DTC's

Operate the Rear Window Defogger several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?

No >> Replace the original Rear Window Defogger Relay.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 5

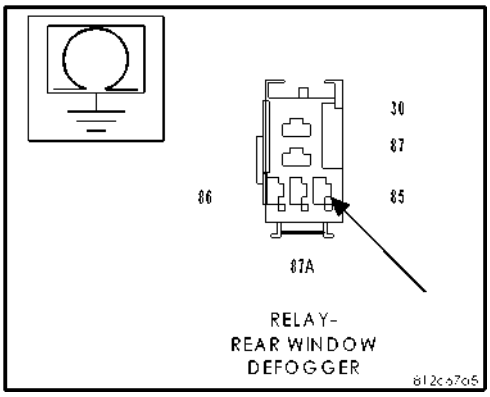
---

5. CHECK THE (C115)DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Remove the Rear Window Defogger Relay from the junction block.

Disconnect the Front Control Module from the PDC 49 – way connector.

Measure the resistance between ground and the (C115) Defogger Relay Control circuit at the relay.



Is the resistance below 1000.0 ohms?

Yes >> Repair the (C115) Defogger Relay Control circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

B106B,B106D–REAR DEFROST CONTROL CIRCUIT LOW/OPEN – FCM — (CONTINUED)

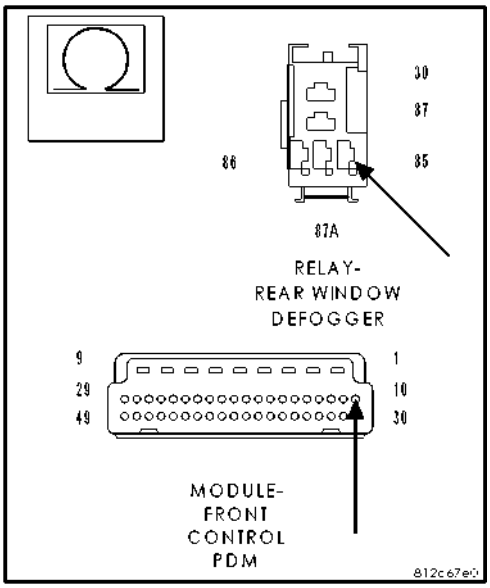
6. CHECK THE (C115)DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (C115) Defogger Relay Control circuit from the relay connector to FCM connector.

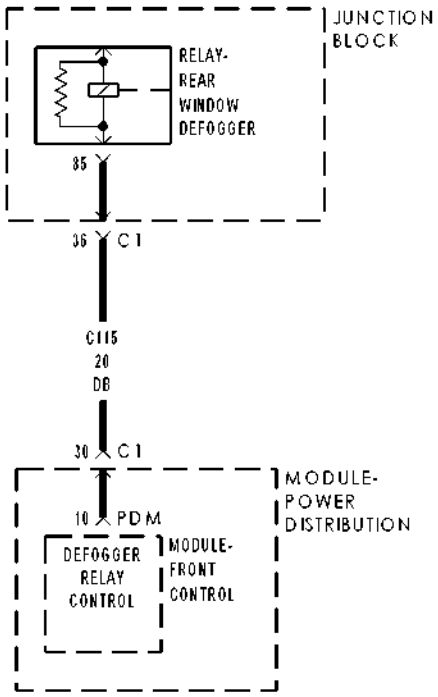
Is the resistance below 3.0 ohms?

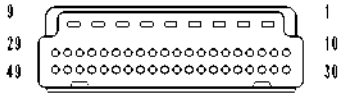
Yes >> Replace the Front Control Module.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C115) Defogger Relay Control circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B106C–REAR DEFROST CONTROL CIRCUIT HIGH – FCM





MODULE-FRONT CONTROL PDM

812c692c

B106C–REAR DEFROST CONTROL CIRCUIT HIGH – FCM — (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module detects a short to battery on the Defogger Relay Control circuit.

Possible Causes
REAR WINDOW DEFOGGER RELAY
(C115) DEFOGGER RELAY CONTROL
FRONT CONTROL MODULE

Diagnostic Test

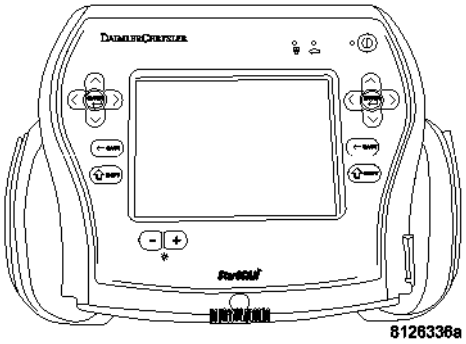
1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's
Operate the Rear Window Defogger switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display B106C – REAR DEFROST CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.



---

2. REAR DEFOGGER RELAY

Turn the ignition off.
Install a known good relay in place of the Rear Window Defogger Relay.
With the scan tool erase DTC's
Operate the Rear Window Defogger Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display B106C – REAR DEFROST CONTROL CIRCUIT HIGH?

No >> Replace the original Rear Window Defogger Relay.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3

B106C–REAR DEFROST CONTROL CIRCUIT HIGH – FCM — (CONTINUED)

3. (C115)–DEFOGGER RELAY CONTROL CIRCUIT

Remove the Rear Window Defogger Relay.

Disconnect the Front Control Module from the PDC 49 – way connector.

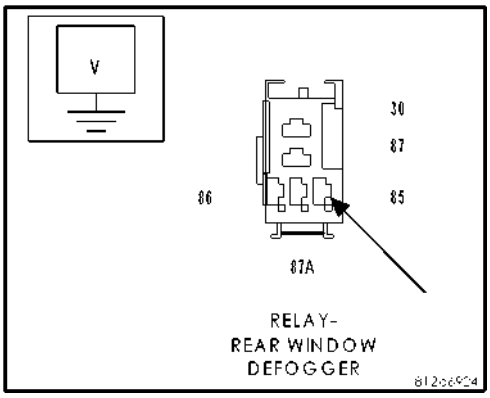
Turn the ignition on.

Measure the voltage between (C115) Defogger Relay Control circuit and ground.

Is there any voltage present?

Yes >> Repair the (C115) Defogger Relay Control circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Control Module.
Perform BODY VERIFICATION TEST - VER 1.



BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

HEATED GLASS - SERVICE INFORMATION

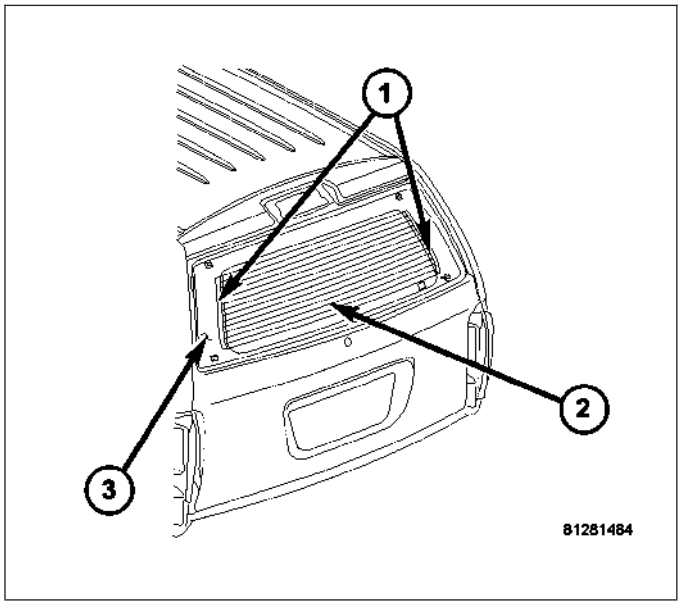
DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

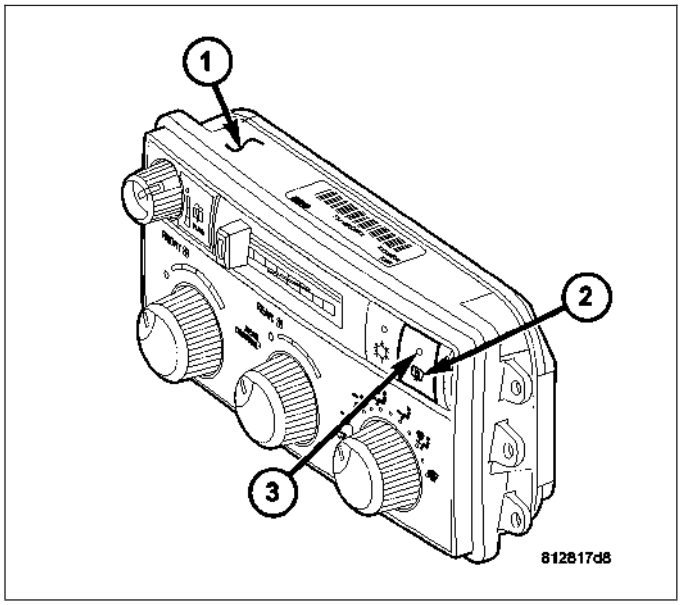
The rear window defogger system, also known as electrical backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned ON or OFF by a control switch located on the A/C-heater control at the center of the instrument panel and by a rear window defogger relay timing circuit integral to the front control module (FCM) (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER SWITCH - DESCRIPTION).

Circuit protection is provided by a fuse located in the junction block (JB) and a fuse located in the power distribution center (PDC).



OPERATION



The electric backlight (EBL) system is controlled by a momentary switch (2) located in the A/C-heater control (1) on the instrument panel. When the defogger switch for the EBL system is pressed to the On position, current is directed to the rear defogger grid lines and the heated power mirrors (if equipped). The heated grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

A yellow indicator (3) in the defogger switch will illuminate to indicate when the EBL system is turned on. The front control module (FCM) contains the EBL system control circuitry.

Note: The EBL system turns off automatically after approximately 15 minutes of initial operation. Each following activation cycle of the EBL system will last approximately 10 minutes.

The EBL system will be automatically turned off after a programmed time interval of about 15 minutes. After the initial time interval has expired, if the defogger switch is turned on again during the same ignition cycle, the defogger system will automatically turn off after about 10 minutes.

The EBL system will automatically shut off if the ignition switch is turned to the Off position, or it can be turned off manually by depressing the defogger switch a second time.

DIAGNOSIS AND TESTING

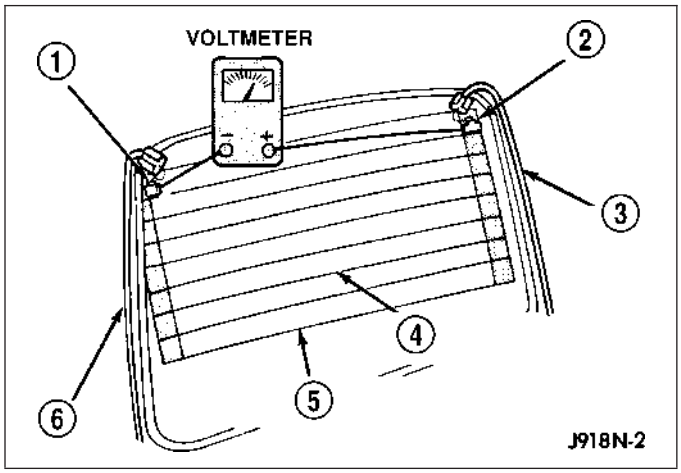
REAR WINDOW DEFOGGER SYSTEM

Note: Illumination of the defogger switch indicator lamp means that there is electrical current available at the output of the rear window defogger logic circuitry, but does not confirm that the electrical current is reaching the rear glass heating grid lines.

Note: For circuit descriptions and diagrams of the rear window defogger system, refer to 8W - WIRING DIAGRAM INFORMATION.

Operation of the electrical backlight (EBL) system can be confirmed by the following:

1. Using a scan tool, check for diagnostic trouble codes (DTCs) related to the A/C-heater control and the front control module (FCM). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2
2. Turn the ignition switch to the On position. Set the defogger switch in the On position. The rear window defogger operation can be checked by feeling the rear window or outside rear view mirror glass. A distinct difference in temperature between the grid lines (4 and 5) and the adjacent clear glass or the mirror glass can be detected within three to four minutes of operation.
3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm that the ignition switch is in the On position.
   - Make sure that the rear glass heating grid feed wire (3) and ground wire (6) are connected to the terminals. Confirm that the ground wire has continuity to ground.
   - Check the EBL relay and fuse located in the junction block (JB). The relay and fuse must be tight in their receptacles and all electrical connections must be secure.
   - Check the fuse located in the power distribution center (PDC). The fuse must be tight in its receptacle and all electrical connections must be secure.



When the above steps have been completed and the rear glass heating grid is still inoperative, one or more of the following is faulty:

- Rear window defogger control switch in the A/C-heater control.
- Rear window defogger grid lines (all grid lines would have to be broken, or the power feed or the ground wire disconnected, for the entire heating grid to be inoperative).

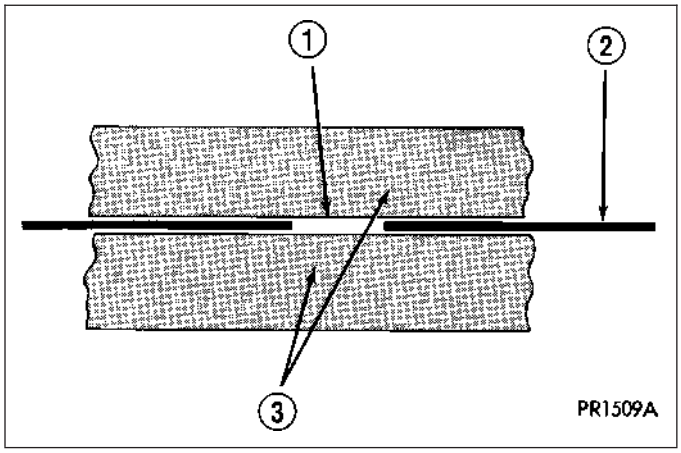
GRID-REAR WINDOW DEFOGGER

STANDARD PROCEDURE

GRID REPAIR PROCEDURE

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings could result in possible personal injury or death.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.



1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. For grid line repairs, mask the area to be repaired with masking tape or use a template.
5. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
6. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
7. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
8. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) or the glass may fracture.

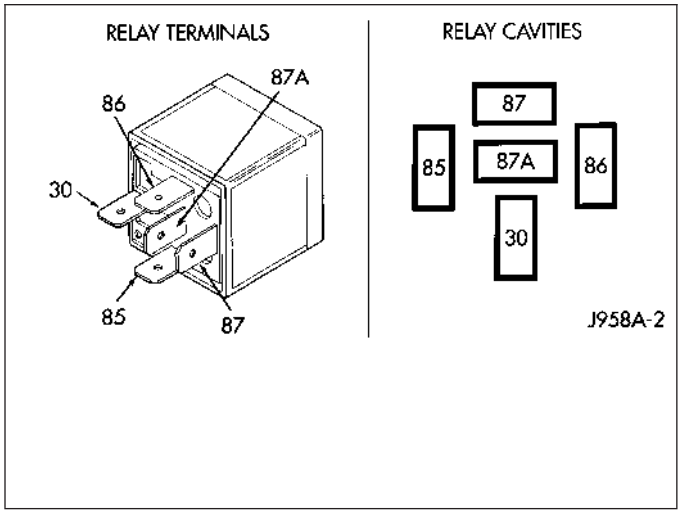
9. Allow the epoxy to cure 24 hours at room temperature, or use a heat gun with a 260° to 371° C (500° to 700° F) range for fifteen minutes. Hold the heat gun approximately 25.4 centimeters (10 inches) from the repair.
10. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire. Do not attach the wire harness connectors until the curing process is complete.
11. Check the operation of the rear window defogger glass heating grid.

RELAY-REAR WINDOW DEFOGGER

DESCRIPTION

The rear window defogger (EBL) relay is a International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The EBL relay is a electromechanical device that switches battery current through a fuse in the power distribution center (PDC) to the rear window defogger grid and to the outside mirror heating grids. The EBL relay is energized when the relay coil is provided a ground path by the rear window defogger relay control in the front control module (FCM).

The EBL relay is located in the junction block (JB) in the passenger compartment.



OPERATION

The ISO-standard rear window defogger (EBL) relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

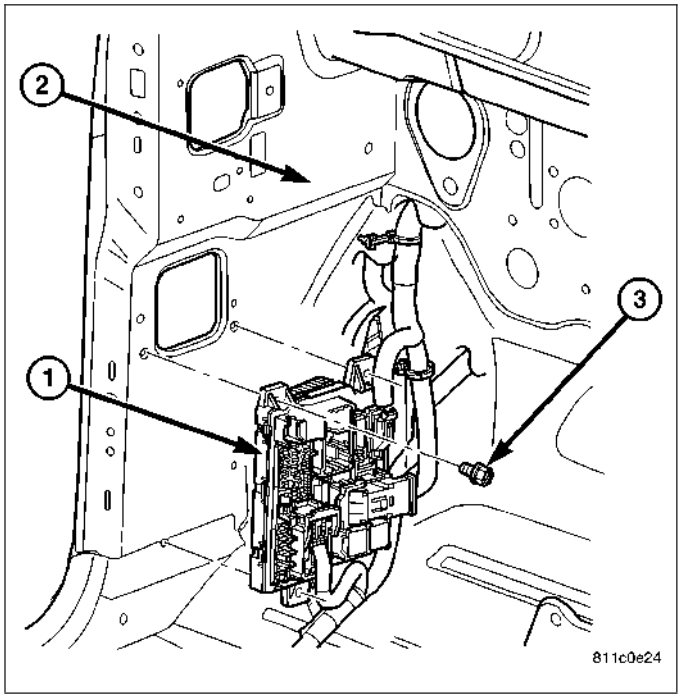
Refer to the appropriate wiring information for diagnosis and testing of the EBL relay and for complete EBL system wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the trim cover from the cowl (2) on the driver side of the vehicle (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - DESCRIPTION).
3. Locate the junction block (JB) (1).

Note: Refer to the fuse and relay layout map on the inner surface of the JB cover for EBL relay identification and location.

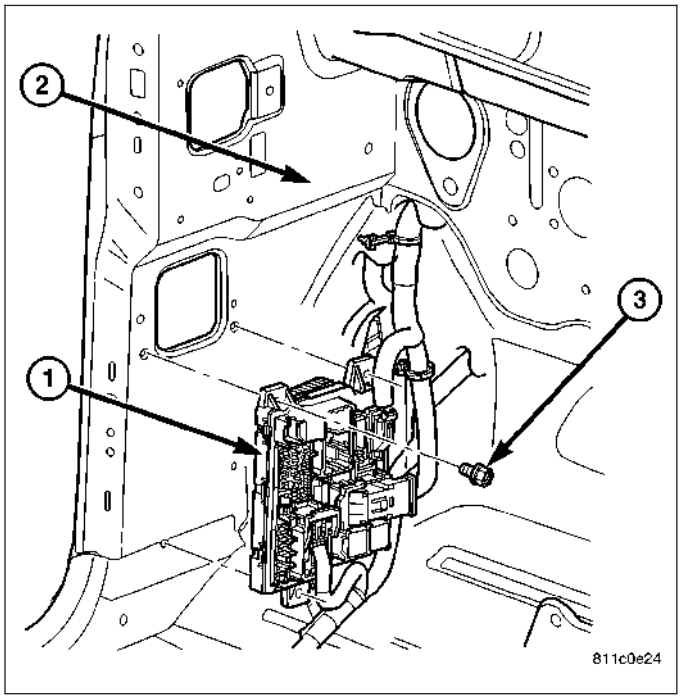
4. Remove the EBL relay from the JB.



INSTALLATION

Note: Refer to the fuse and relay layout map on the inner surface of the junction block (JB) cover for EBL relay identification and location.

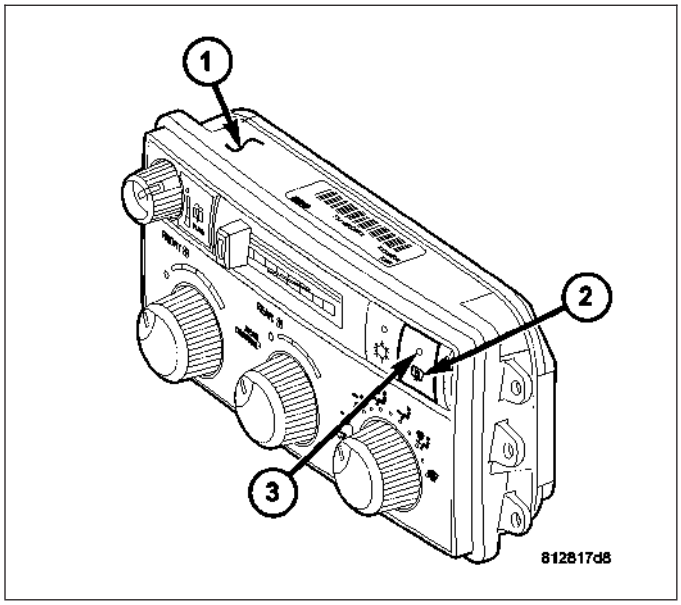
1. Position the EBL relay into the proper receptacle of the JB (1).
2. Align the EBL relay terminals with the terminal cavities in the JB receptacle and push down firmly on the relay until the terminals are fully seated.
3. Install the trim cover onto the driver side cowl (2).(Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - DESCRIPTION).
4. Reconnect the negative battery cable.



SWITCH-REAR WINDOW DEFOGGER

DESCRIPTION

The rear window defogger switch (2) is integrated into the A/C-heater control (1) which is mounted to the center of the instrument panel. The rear window defogger switch and the rear window defogger LED indicator (3) cannot be repaired and, if faulty or damaged, the A/C-heater control must be replaced.



OPERATION

An LED indicator will illuminate when the rear window defogger control switch is activated. When the control switch is activated, the A/C-heater control requests the front control module (FCM) to operated the rear window defogger (EBL) relay via the controller area network (CAN) B bus. The EBL relay controls the current flow to the grids of the rear window defogger and to the heated power side view mirrors, when equipped. The EBL relay will be on for approximately 15 minutes or until the control switch or the ignition switch is turned off.

HEATED MIRRORS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

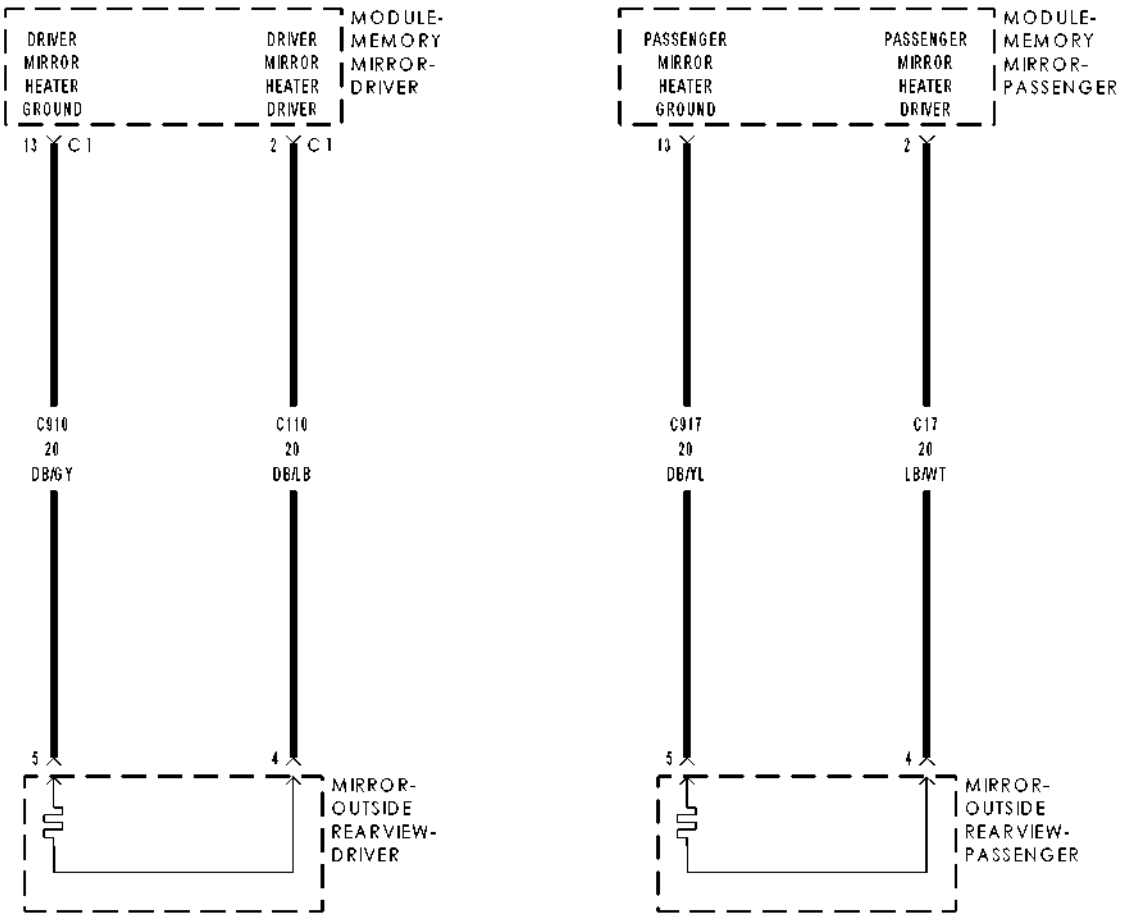
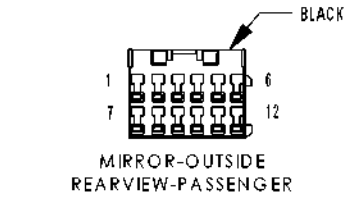
B1D35,B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN – MEMORY MIRROR MODULE

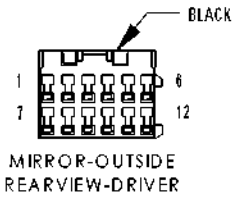
For the Power Memory Mirror System circuit diagram(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

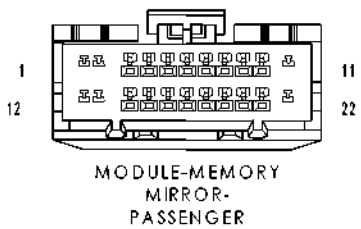
For a complete wiring diagram **Refer to Section 8W**.

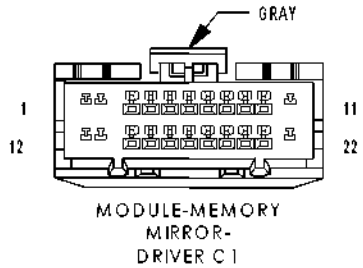
B1D35,B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN – MEMORY MIRROR MODULE — (CONTINUED)











8129e6-36

B1D35,B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN – MEMORY MIRROR MODULE — (CONTINUED)

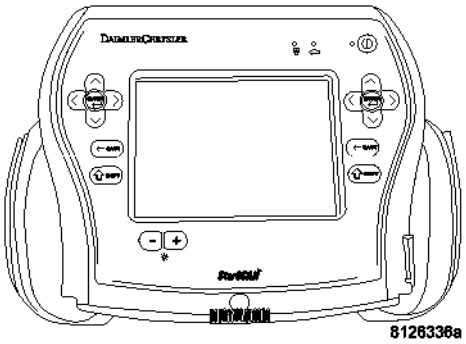
- **When Monitored:**
  Ignition on, during the heated mirror operation.
- **Set Condition:**
  This code is set 10 seconds after the Memory Mirror Module detects an open in the control circuit.**Note: This test covers both the Driver and Passenger code depending on the side the code appeared in.**

Possible Causes
(C110) OR (C17) MIRROR HEATER DRIVER CIRCUIT OPEN
(C910) OR (C917) MIRROR HEATER GROUND CIRCUIT OPEN
MIRROR HEATER OPEN
DRIVER/PASSENGER MEMORY MIRROR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase DTC's
Turn the Rear Defogger Switch On.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read DTC's.



Does the scan tool display B1D35 or B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

B1D35,B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN – MEMORY MIRROR MODULE — (CONTINUED)

2. TEST FOR A OPEN MIRROR HEATER ELEMENT

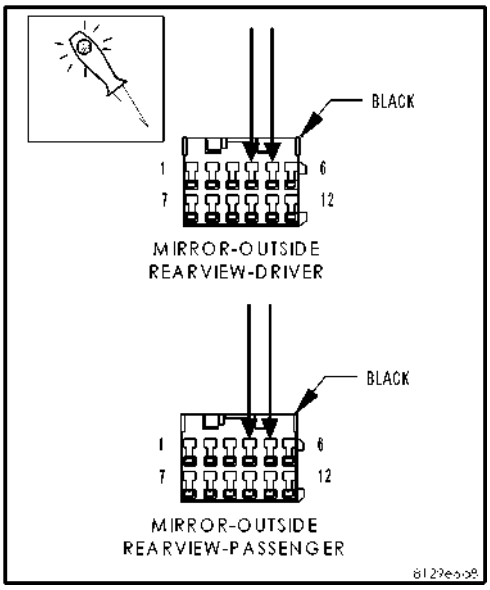
Turn the ignition off.

Disconnect the appropriate mirror connector.

Using a 12-volt test light, connect between the (C110) or (C17) Driver Mirror Heater Driver circuit and the (C910) or (C917) Mirror Heater Ground circuit in the mirror connector.

Turn the ignition on

Turn the Rear Defogger Switch on.



Does the test light illuminate brightly?

Yes >> Check the mirror/pigtail harness for an open, repair or replace as necessary.
Perform BODY VERIFICATION TEST - VER 1.

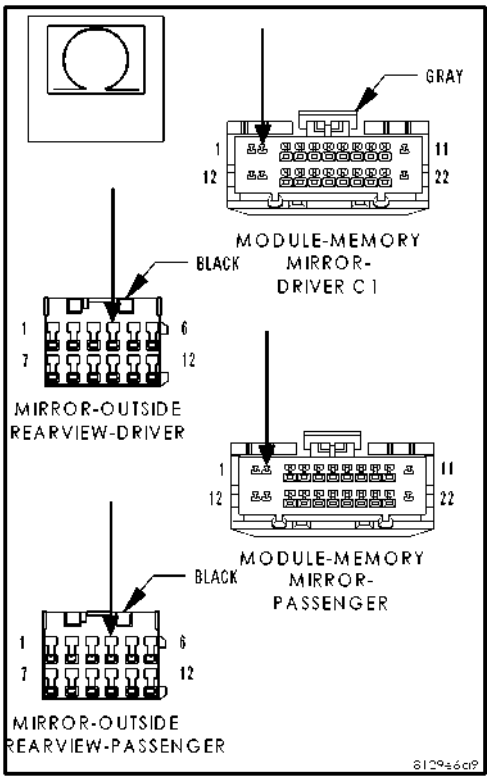
No >> Go To 3

3. TEST THE (C110) OR (C17) MIRROR HEATER DRIVER WIRE FOR AN OPEN

Turn the ignition off.

Disconnect the appropriate memory mirror module connector.

Note: Note: Check connectors - Clean and repair as necessary.
Measure the resistance of the (C110) or (C17) Mirror Heater Driver circuit from the Module connector to the Mirror connector.



Is the resistance below 2.0 ohms?

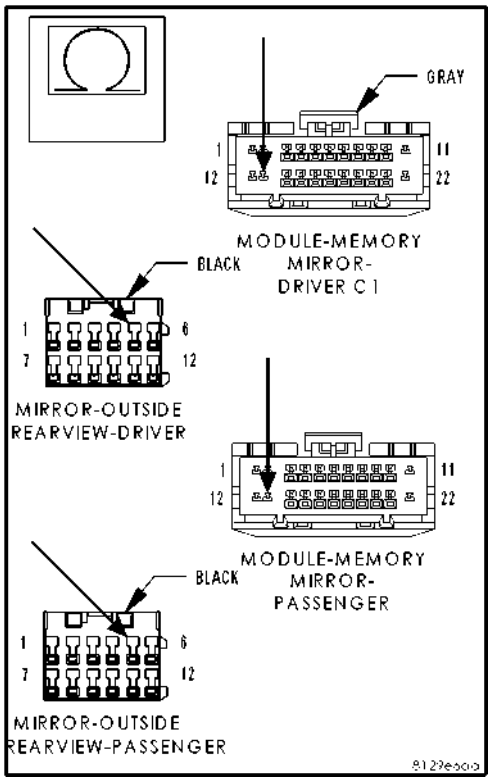
No >> Repair the (C110) or (C17) Mirror Heater Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 4

B1D35,B1D39–MIRROR HEATER CONTROL CIRCUIT OPEN – MEMORY MIRROR MODULE — (CONTINUED)

4. TEST THE (C910) OR (C917) MIRROR HEATER GROUND WIRE FOR AN OPEN

Measure the resistance of the (C910) or (C917) Mirror Heater Ground circuit between the Module connector and the Mirror connector.



Is the resistance below 2.0 ohms?

No >> Repair the (C910) or (C917) Mirror Heater Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Replace the appropriate Memory Mirror Module.
Perform BODY VERIFICATION TEST - VER1.

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

TABLE OF CONTENTS

	page		page
HEATED MIRRORS - SERVICE INFORMATION		OPERATION	24
DESCRIPTION	24		

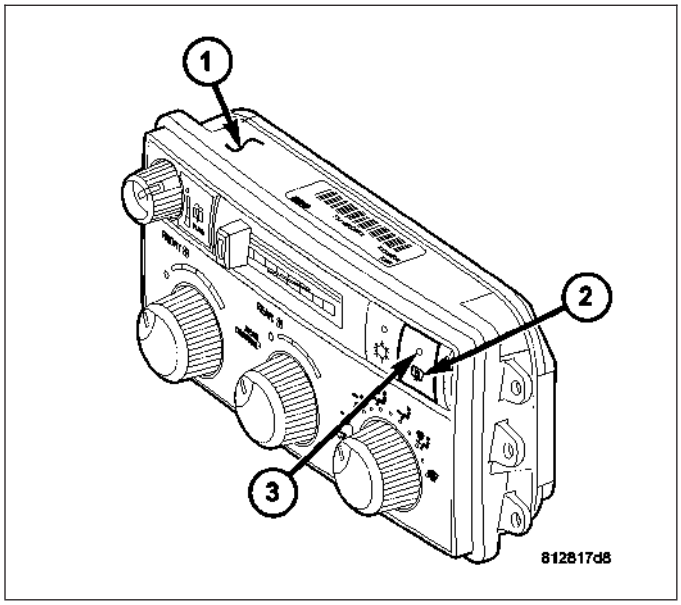
HEATED MIRRORS - SERVICE INFORMATION

DESCRIPTION

The optional heated mirror system is controlled by the momentary rear window defogger switch (2) on the A/C-heater control (1). An amber indicator lamp (3) in the switch will illuminate to indicate when the rear window defogger (EBL) system is turned on.

The heated mirror system only operates in concert with the EBL system, and will be automatically shut off after a programmed time interval of about 15 minutes. After the initial time interval has expired, if the defogger switch is turned on again during the same ignition cycle, the heated mirror system will automatically shut off after about 10 minutes.

The heated mirror system will automatically shut off if the ignition switch is turned to the Off position, or it can be shut off manually by pressing the rear window defogger switch a second time.



OPERATION

When the rear window defogger switch is in the On position, an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to DIAGNOSIS AND TESTING - REAR WINDOW DEFOGGER SYSTEM in his group. If only one of the outside mirror heating grids is inoperative, Refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING.

The heating grid behind each outside mirror glass cannot be repaired and, if faulty or damaged, the entire power mirror assembly must be replaced.

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes
(P187) DRIVER SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

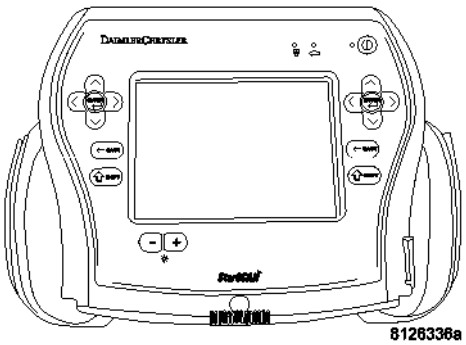
1. VERIFY THAT DTC B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1092 FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

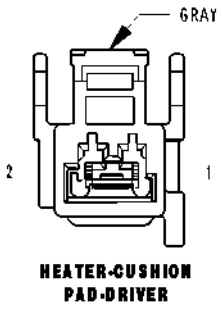


B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

2. DISCONNECT DRIVER CUSHION PAD HEATER 2-WAY CONNECTOR AND READ DTC'S

Disconnect the Driver Cushion Pad Heater connector.

Note: Check connectors - Clean and repair as necessary.
With the scan tool, erase HSM DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the scan tool display the same DTC?

Yes >> Go To 7

No >> Go To 3

---

3. CHECK THE DRIVER SEAT BACK PAD HEATER RESISTANCE

Disconnect the Driver Seat Back Pad Heater connector.

Note: Check connectors - Clean and repair as necessary.
Check the resistance of the seat back heater element by measuring between the (P187) Driver Seat Heater B(+) Driver and the Ground circuit at the driver seat back pad connector.

Is the resistance below 4.0 ohms?

No >> Go To 4

Yes >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1

---

4. CHECK THE DRIVER SEAT BACK PAD HEATER FOR A SHORT TO GROUND

Measure between the (P187) Driver Seat Heater B(+) Driver circuit at the Driver Seat Back Pad Heater connector and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

Yes >> Repair the pigtail harness for a short to ground condition or replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 5

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

5. CHECK THE DRIVER CUSHION PAD HEATER RESISTANCE

Check the resistance of the cushion heater element by measuring between the (P187) Driver Seat Heater B(+) Driver and the Ground circuit at the driver cushion pad connector.

Was the resistance below 3.5 ohms?

No >> Go To 6

Yes >> Replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

---

6. CHECK THE DRIVER CUSHION PAD HEATER FOR A SHORT TO GROUND

Measure between the (P187) Driver Seat Heater B(+) Driver circuit at the Driver Cushion Pad Heater connector and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

Yes >> Repair the pigtail harness or replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

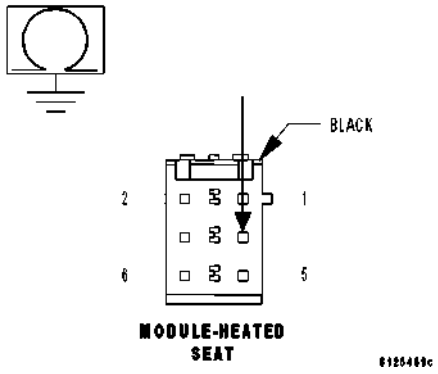
No >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.
Perform BODY VERIFICATION TEST – VER 1.

---

7. Check the (P187) Driver Seat Heater B(+) Driver circuit for a short to ground

Disconnect the Heat Seat Module connector.

Note: Check connectors - Clean and repair as necessary.
Measure the (P187) Driver Seat Heater B(+) Driver circuit to ground at the HSM connector.



Is the resistance below 5.0 ohms?

Yes >> Repair the (P187) Driver Seat Heater B(+) Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module detects the seat heater B(+) circuit shorted to ground.

Possible Causes
(P188) PASSENGER SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

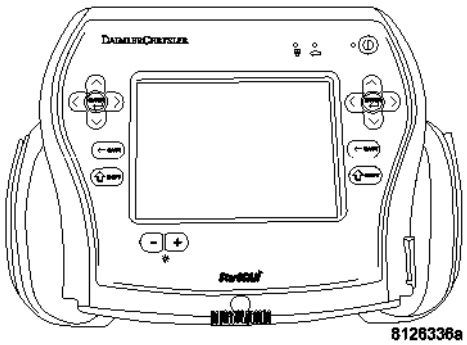
1. VERIFY THAT DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.



B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

2. DISCONNECT PASSENGER CUSHION PAD HEATER 2-WAY CONNECTOR AND READ DTC'S

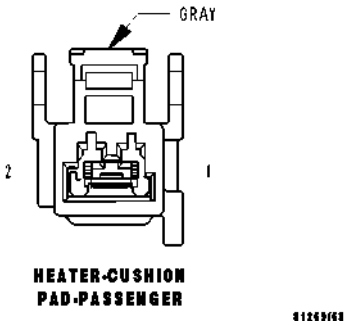
Disconnect the Passenger Cushion Pad Heater connector.

Note: Check connectors - Clean and repair as necessary.
With the scan tool, erase HSM DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes >> Go To 7

No >> Go To 3



---

3. CHECK THE PASSENGER SEAT BACK PAD HEATER RESISTANCE

Disconnect the Passenger Seat Back Pad Heater connector.

Note: Check connectors - Clean and repair as necessary.
Check the resistance of the seat back heater element by measuring between the (P188) Passenger Seat Heater B(+) Driver and the Ground circuit at the Passenger Seat Back Pad connector.

Is the resistance below 4.0 ohms?

No >> Go To 4

Yes >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK THE PASSENGER SEAT BACK PAD HEATER FOR A SHORT TO GROUND

Measure between the (P188) Passenger Seat Heater B(+) Driver circuit at the Passenger Seat Back Pad Heater connector and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

Yes >> Repair the pigtail harness for a short to ground condition or replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 5

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW — (CONTINUED)

5. CHECK THE PASSENGER CUSHION PAD HEATER RESISTANCE

Check the resistance of the cushion heater element by measuring between the (P188) Passenger Seat Heater B(+) Driver and the Ground circuit at the Passenger Cushion Pad Heater connector.

Was the resistance below 3.5 ohms?

No >> Go To 6

Yes >> Replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

---

6. CHECK THE PASSENGER CUSHION PAD HEATER FOR A SHORT TO GROUND

Measure between the (P188) Passenger Seat Heater B(+) Driver circuit at the Passenger Cushion Pad Heater connector and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

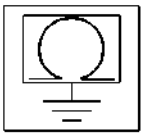
Yes >> Repair the pigtail harness or replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.
Perform BODY VERIFICATION TEST – VER 1.

---

7. Check the (P188) Passenger Seat Heater B(+) Driver circuit for a short to ground

Disconnect the Heated Seat Module connector.



Note: Check connectors - Clean and repair as necessary.
Measure the (P188) Passenger Seat Heater B(+) Driver circuit to ground at the HSM connector.

Is the resistance below 5.0 ohms?

Yes >> Repair the (P188) Passenger Seat Heater B(+) Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
(P187) DRIVER SEAT HEATER B(+) DRIVER WIRE OPEN
(Z971) GROUND WIRE OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

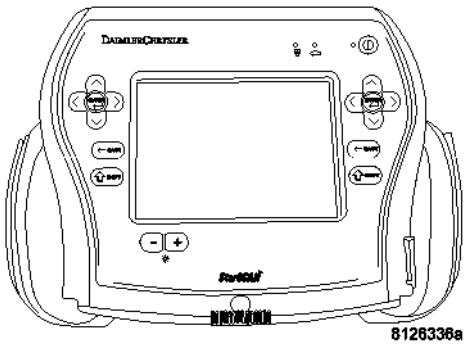
1. VERIFY THAT DTC B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1094 FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

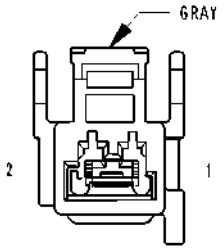


B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN — (CONTINUED)

2. CHECK FOR AN OPEN SEAT HEATER ELEMENT

Disconnect the Driver Cushion Pad Heater 2 – way connector.

Note: Check connectors - Clean and repair as necessary.
Measure the total resistance of the cushion and seat back heater elements at the Driver Cushion Pad 2 – way connector (seat side).



Is the total resistance 2.5 ohms + or – .5 ohms?

Yes >> Go To 4

No >> Go To 3

---

3. CHECK THE DRIVER SEAT BACK PAD HEATER RESISTANCE

Disconnect the Driver Seat Back Pad Heater 2 – way connector.

Note: Check connectors - Clean and repair as necessary.
Check the resistance of the seat back heater element by measuring between the (P187) Driver Seat Heater B(+) Driver and the Ground circuit at the connector.

Is the resistance above 5.8 ohms?

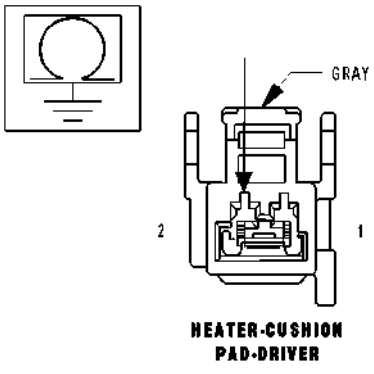
Yes >> Repair the open pigtail harness or replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the open pigtail harness or replace the seat cushion heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK THE DRIVER SEAT HEATER GROUND CIRCUIT RESISTANCE

Measure the resistance of the Ground circuit at the Heater Cushion Pad 2 – way connector.



Was the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the open ground circuit.
Perform BODY VERIFICATION TEST – VER 1.

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN — (CONTINUED)

5. Check the (P187) Driver Seat Heater B(+) Driver circuit for an open.

Disconnect the Heated Seat Module connector.

Note: Check connectors - Clean and repair as necessary.
Measure the (P187) Driver Seat Heater B(+) Driver circuit from the Driver Cushion Pad connector to the HSM connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (P187) Driver Seat Heater B(+) Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.

SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

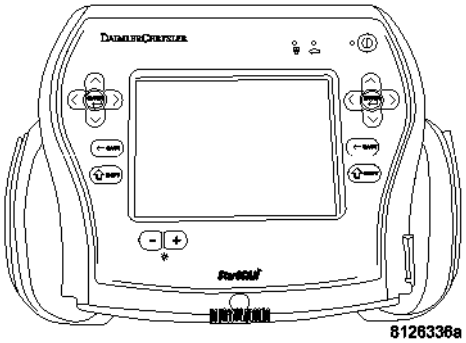
1. VERIFY THAT DTC B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1098 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

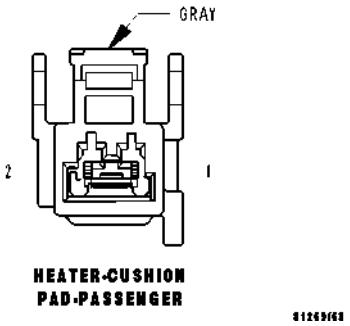


B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN — (CONTINUED)

2. CHECK FOR AN OPEN SEAT HEATER ELEMENT

Disconnect the Passenger Cushion Pad Heater 2 – way connector.

Note: Check connectors - Clean and repair as necessary.
Measure the total resistance of the cushion and seat back heater elements at the Passenger Cushion Pad 2 – way connector (seat side).



Is the total resistance 2.5 ohms + or – .5 ohms?

Yes >> Go To 4

No >> Go To 3

---

3. CHECK THE PASSENGER SEAT BACK PAD HEATER RESISTANCE

Disconnect the Passenger Seat Back Pad Heater 2 – way connector.

Note: Check connectors - Clean and repair as necessary.
Check the resistance of the seat back heater element by measuring between the (P188) Passenger Seat Heater B(+) Driver and the Ground circuit at the passenger seat back pad connector.

Is the resistance above 5.8 ohms?

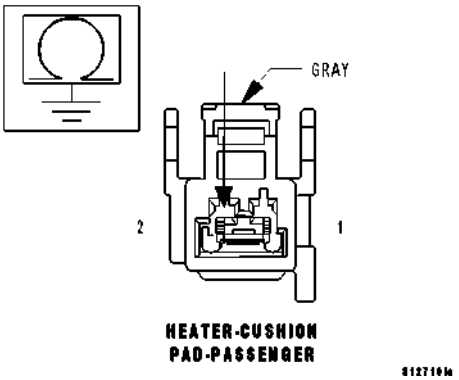
Yes >> Repair the open pigtail harness or replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the open pigtail harness or replace the seat cushion heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK THE PASSENGER SEAT HEATER GROUND CIRCUIT RESISTANCE

Measure the resistance of the Ground circuit at the Heater Cushion Pad 2 – way connector.



Was the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the open ground circuit.
Perform BODY VERIFICATION TEST – VER 1.

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN — (CONTINUED)

5. Check the (P188) Passenger Seat Heater B(+) Driver circuit for an open.

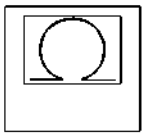
Disconnect the Heated Seat Module connector.

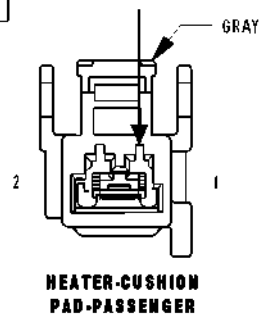
Note: Check connectors - Clean and repair as necessary.
Measure the (P188) Passenger Seat Heater B(+) Driver circuit from the Passenger Cushion Pad connector to the HSM connector.

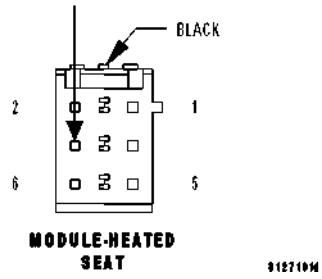
Is the resistance below 5.0 ohms?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (P188) Passenger Seat Heater B(+) Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.







B210D-BATTERY VOLTAGE LOW

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Engine running, during heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module receives a low charging system voltage message over the CAN B Bus or detects voltage under 11.3 volts on the (A940) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLAGE LOW
(A940) FUSED B(+) CIRCUIT
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

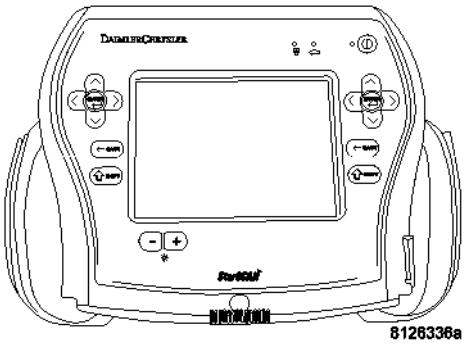
1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

No >> Go To 2
Perform BODY VERIFICATION TEST – VER 1.



B210D-BATTERY VOLTAGE LOW — (CONTINUED)

2. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

With the scan tool, read DTC's.

Does the DTC B210D-BATTERY VOLTAGE LOW reset?

Yes >> Go To 3

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

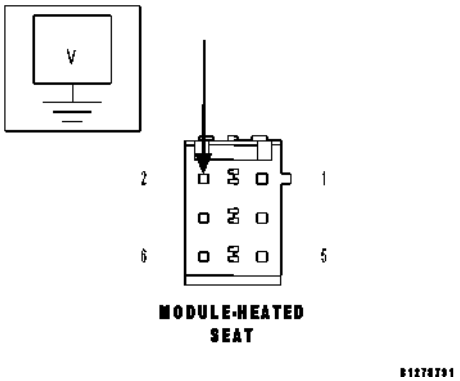
---

3. CHECK THE VOLTAGE ON THE (A940) FUSED B(+) CIRCUIT

Disconnect the Heated Seat Module connector.

Note: Check connectors - Clean and repair as necessary.
Start the engine and let idle.

Measure the voltage on the (A940) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicle battery.



Is the voltage at the HSM connector the same as measured at the battery?

Yes >> Replace the Heated Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (A940) Fused B(+) circuit as necessary.
Perform BODY VERIFICATION TEST – VER 1.

B221A-HEATED SEAT MODULE INTERNAL

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Ignition on.
- **Set Condition:**This code is set immediately if the Heated Seat Module internal self test fails.

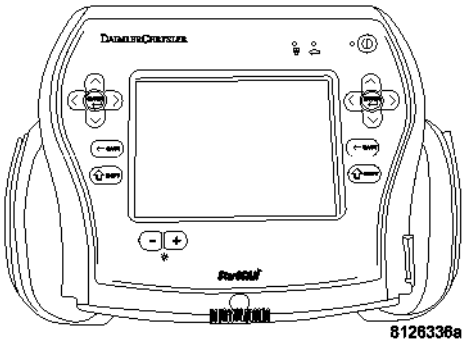
Possible Causes
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B221A-HEATED SEAT MODULE INTERNAL IS ACTIVE

With the scan tool, record and erase DTC's
Cycle the ignition switch off then back on.
With the scan tool, read DTC's.



Does the DTC B221A-HEATED SEAT MODULE INTERNAL reset?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

B210E-BATTERY VOLTAGE HIGH

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Engine running, during heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module receives a high charging system voltage message over the CAN B Bus or detects voltage over 15 volts on the (A940) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLAGE HIGH
(A940) FUSED B(+) CIRCUIT
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

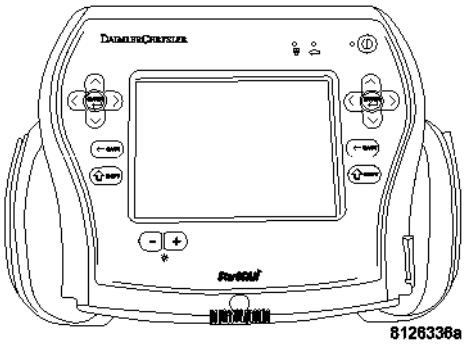
1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

Yes >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

No >> Go To 2



B210E-BATTERY VOLTAGE HIGH — (CONTINUED)

2. VERIFY THAT DTC B210E-BATTERY VOLTAGE HIGH IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

Attempt to operate the heated seats.

With the scan tool, read DTC's.

Does the DTC B210E-BATTERY VOLTAGE HIGH reset?

Yes >> Go To 3

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

---

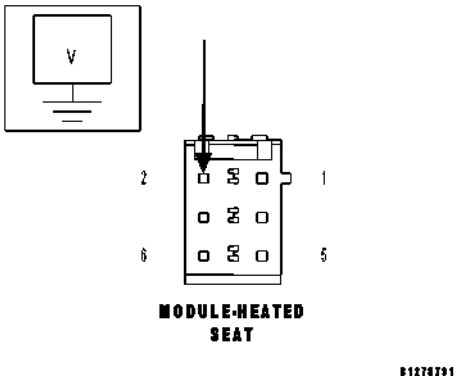
3. CHECK THE VOLTAGE ON THE (A940) FUSED B(+) CIRCUIT

Disconnect the Heated Seat Module connector.

Note: Check connectors - Clean and repair as necessary.

Start the engine and let idle.

Measure the voltage on the (A940) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicles battery.

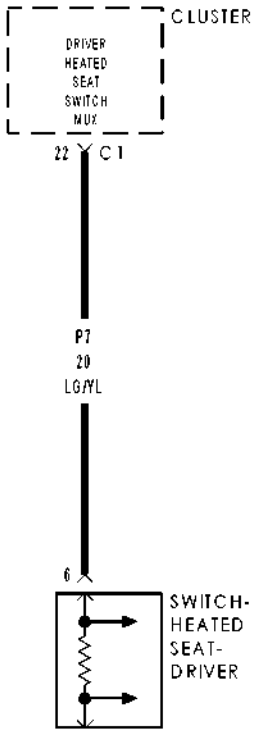


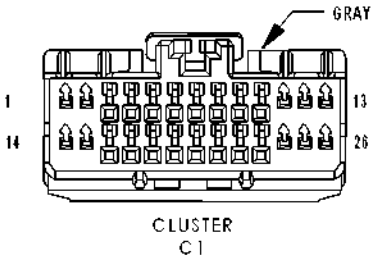
Is the voltage at the HSM connector the same as measured at the battery?

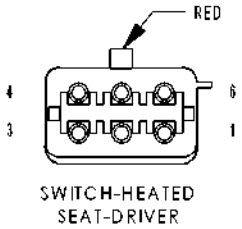
Yes >> Replace the Heated Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (A940) Fused B(+) circuit as necessary.
Perform BODY VERIFICATION TEST – VER 1.

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW







8127af77

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Cluster detects the heated seat switch MUX circuit low.

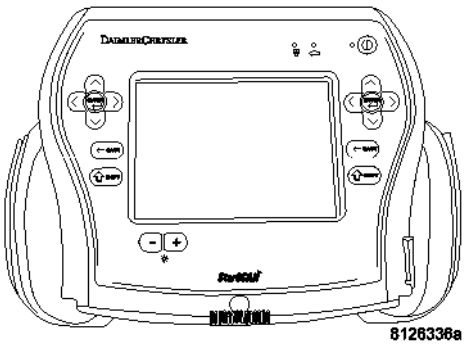
Possible Causes
JUNCTION BLOCK FUSE #2
(F21) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(P7) DRIVER HEATED SEAT SWITCH MUX OPEN/SHORTED TO GROUND
DRIVER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the DTC B1085 LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

---

2. INSPECT JUNCTION BLOCK FUSE #2

Check the Junction Block Fuse #2.

Is the fuse open?

Yes >> Check for a possible short to ground on the (F21) Fused Ignition Switch Output Circuit and replace the fuse as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

3. DISCONNECT THE CLUSTER C–1 CONNECTOR AND CHECK FOR VOLTAGE

Reinstall the fuse if removed in previous test.

Disconnect the Cluster C-1 connector.

Note: Check connectors - Clean and repair as necessary.

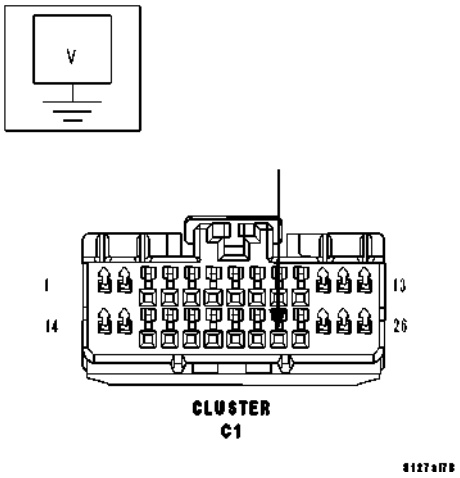
Turn the ignition on.

Measure the voltage at the (P7) Driver Heated Seat Switch MUX circuit at the Cluster C-1 connector.

Is the voltage above 10.0 volts?

Yes >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4



---

4. CHECK THE (F21) FUSED IGNITION SWITCH OUTPUT (RUN-START)

Disconnect the Driver Heated Seat switch connector.

Note: Check connectors - Clean and repair as necessary.

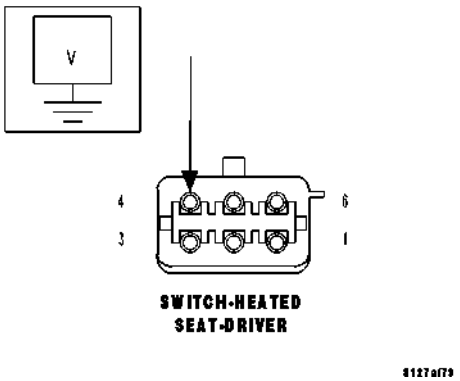
Turn the ignition on.

Measure the voltage of the (F21) Fused Ignition Switch Output circuit at the Driver Heated Seat Switch connector.

Is the voltage above 10.0 volts ?

Yes >> Go To 5

No >> Repair the (F21) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



---

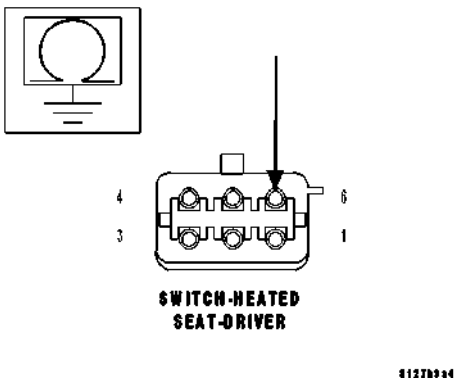
5. CHECK THE (P7) DRIVER HEATED SEAT SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P7) Driver Heated Seat Switch MUX circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P7) Driver Heated Seat Switch MUX circuit for a short to ground
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 6



B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

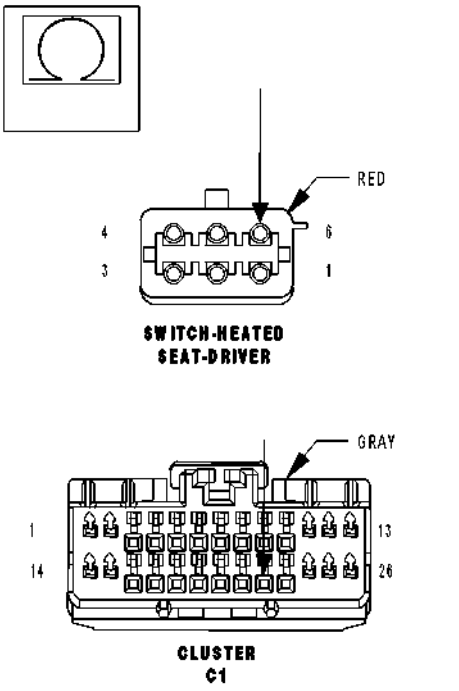
6. CHECK THE (P7) DRIVER HEATED SEAT SWITCH MUX CIRCUIT FOR AN OPEN

Measure the resistance of the (P7) Driver Heated Seat Switch MUX circuit between the Cluster C-1 connector and the Driver Heated Seat Switch connector.

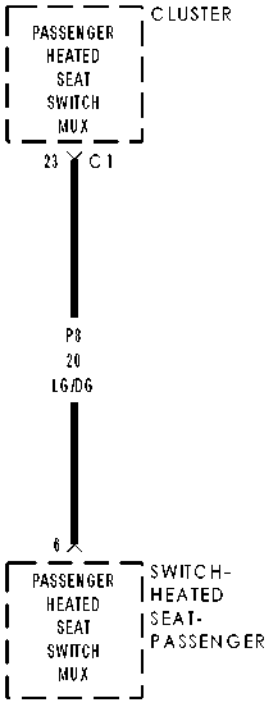
Is the resistance below 5.0 ohms?

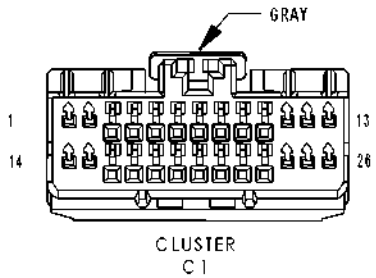
Yes >> Replace the Driver Heated Seat Switch.
Perform BODY VERIFICATION TEST – VER 1.

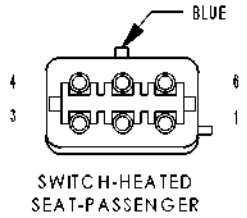
No >> Repair the (P7) Driver Heated Seat Switch MUX circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW







81280375

B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Cluster detects the heated seat switch MUX circuit low.

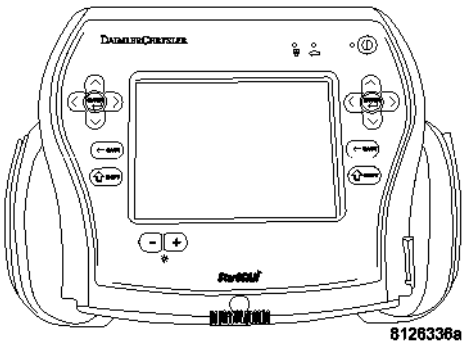
Possible Causes
JUNCTION BLOCK FUSE #2
(F21) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(P8) PASSENGER HEATED SEAT SWITCH MUX OPEN/SHORTED TO GROUND
PASSENGER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the DTC B1088 RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

---

2. INSPECT JUNCTION BLOCK FUSE #2

Check the Junction Block Fuse #2.

Is the fuse open?

Yes >> Check for a possible short to ground on the (F21) Fused Ignition Switch Output Circuit and replace the fuse as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

3. DISCONNECT THE CLUSTER C–1 CONNECTOR AND CHECK FOR VOLTAGE

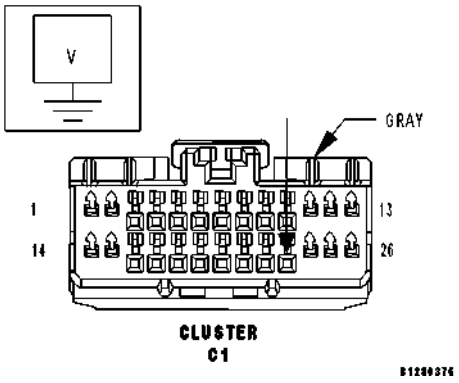
Reinstall the fuse if removed in previous test.
Disconnect the Cluster C-1 connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage at the (P8) Passenger Heated Seat Switch MUX circuit at the Cluster C-1 connector.

Is the voltage above 10.0 volts?

Yes >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4



---

4. CHECK THE (F21) FUSED IGNITION SWITCH OUTPUT (RUN-START)

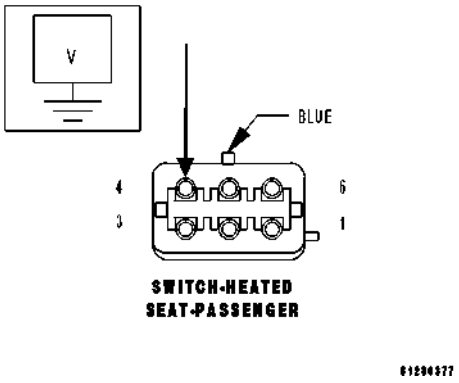
Disconnect the Passenger Heated Seat switch connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage of the (F21) Fused Ignition Switch Output circuit at the Passenger Heated Seat Switch connector.

Is the voltage above 10.0 volts ?

Yes >> Go To 5

No >> Repair the (F21) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



---

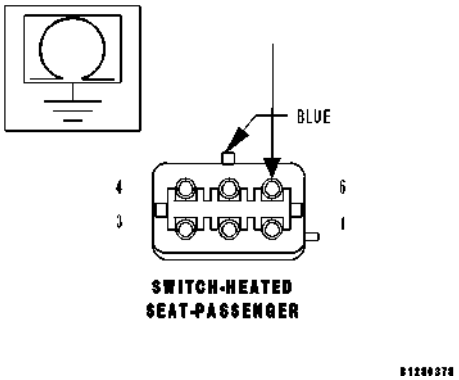
5. CHECK THE (P8) PASSENGER HEATED SEAT SWITCH MUX CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P8) Passenger Heated Seat Switch MUX circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P8) Passenger Heated Seat Switch MUX circuit for a short to ground
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 6



B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW — (CONTINUED)

6. CHECK THE (P8) PASSENGER HEATED SEAT SWITCH MUX CIRCUIT FOR AN OPEN

Measure the resistance of the (P8) Passenger Heated Seat Switch MUX circuit between the Cluster C-1 connector and the Passenger Heated Seat Switch connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Passenger Heated Seat Switch.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (P8) Passenger Heated Seat Switch MUX circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.

SWITCH-HEATED SEAT-DRIVER

8103034f

B120D-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Continously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects low voltage on the heated seat indicator control circuit.

Possible Causes
JUNCTION BLOCK FUSE #2
(F21) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(P83) DRIVER HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND
DRIVER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

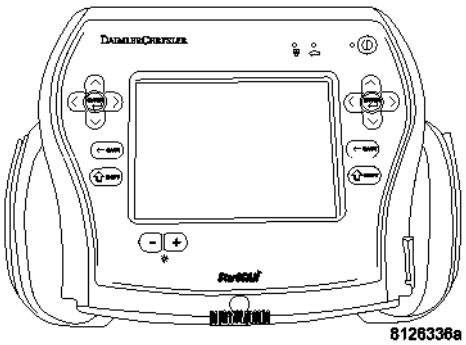
1. VERIFY THAT DTC B120D-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B120D-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.



---

2. INSPECT JUNCTION BLOCK FUSE #2

Check Junction Block fuse #2.

Is the fuse open?

Yes >> Check for a possible short to ground on the (F21) Fused Ignition Switch Output Circuit and replace the fuse as necessary.

Possible Causes
JUNCTION BLOCK FUSE #2
(F21) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
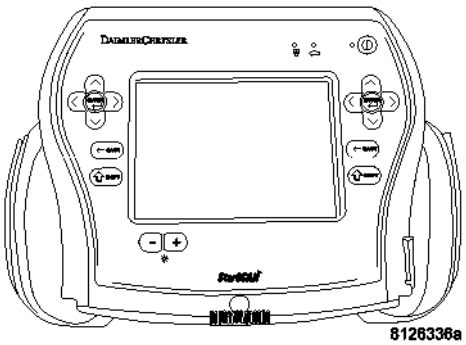
(P84) PASSENGER HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND
PASSENGER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1219-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the DTC B1219-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

---

2. INSPECT JUNCTION BLOCK FUSE #2

Check Junction Block fuse #2.

Is the fuse open?

Yes >> Check for a possible short to ground on the (F21) Fused Ignition Switch Output Circuit and replace the fuse as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

B1219-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW — (CONTINUED)

3. DISCONNECT THE CLUSTER C–3 CONNECTOR AND CHECK FOR VOLTAGE

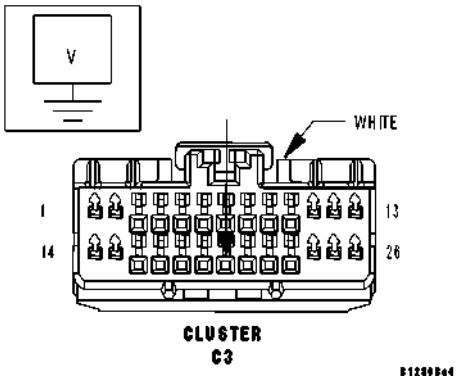
Reinstall fuse if removed in previous test.
Disconnect the Cluster C-3 connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage at the (P84) Passenger Heated Seat High Indicator Driver circuit at the Cluster C-3 connector.

Is the voltage above 10.0 volts?

Yes >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4



---

4. CHECK THE (F21) FUSED IGNITION SWITCH OUTPUT (RUN-START)

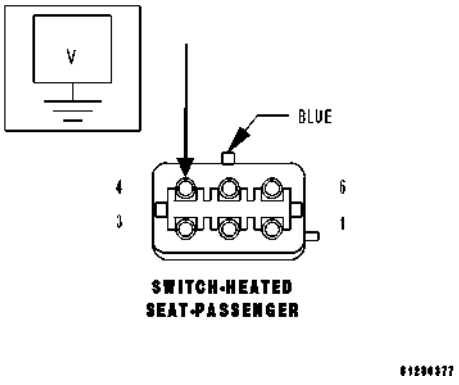
Disconnect the Passenger Heated Seat switch connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage of the (F21) Fused Ignition Switch Output circuit at the Passenger Heated Seat Switch connector.

Is the voltage above 10.0 volts ?

Yes >> Go To 5

No >> Repair the (F21) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



---

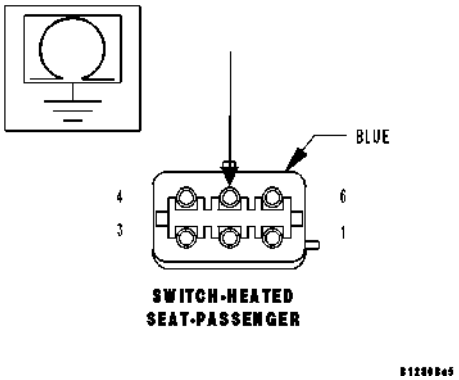
5. CHECK THE (P84) PASSENGER HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P84) Passenger Heated Seat High Indicator Driver circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P84) Passenger Heated Seat High Indicator Driver circuit for a short to ground
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 6



B1219-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT LOW — (CONTINUED)

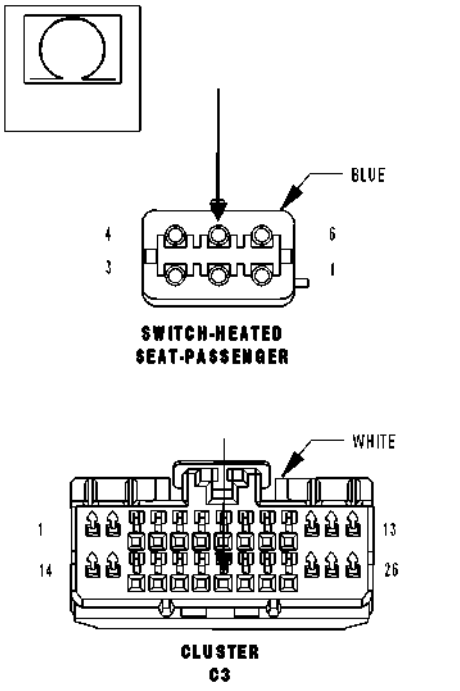
6. CHECK THE (P84) PASSENGER HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (P84) Passenger Heated Seat High Indicator Driver circuit between the Cluster C-3 connector and the Passenger Heated Seat Switch connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Passenger Heated Seat Switch.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (P84) Passenger Heated Seat High Indicator Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



B1221-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT LOW

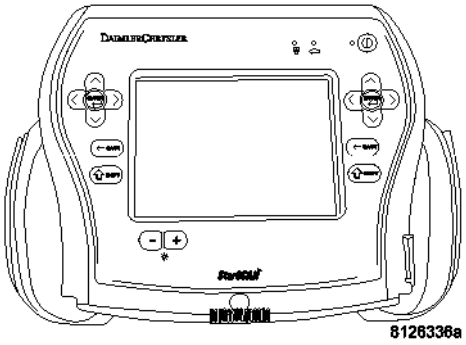
Possible Causes
JUNCTION BLOCK FUSE #2
(F21) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(P82) PASSENGER HEATED SEAT LOW INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND
PASSENGER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1221-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.



Does the DTC B1221-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

---

2. INSPECT JUNCTION BLOCK FUSE #2

Check Junction Block fuse #2.

Is the fuse open?

Yes >> Check for a possible short to ground on the (F21) Fused Ignition Switch Output Circuit and replace the fuse as necessary.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

B1221-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT LOW — (CONTINUED)

3. DISCONNECT THE CLUSTER C–3 CONNECTOR AND CHECK FOR VOLTAGE

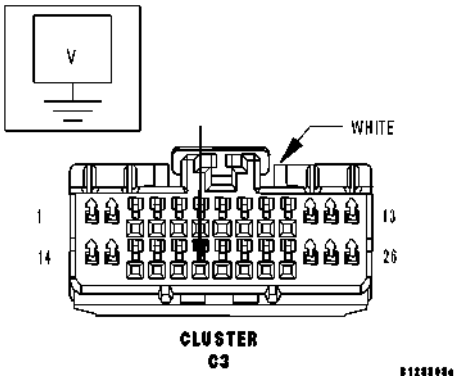
Reinstall fuse if removed in previous test.
Disconnect the Cluster C-3 connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage at the (P82) Passenger Heated Seat Low Indicator Driver circuit at the Cluster C-3 connector.

Is the voltage above 10.0 volts?

Yes >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4



---

4. CHECK THE (F21) FUSED IGNITION SWITCH OUTPUT (RUN-START)

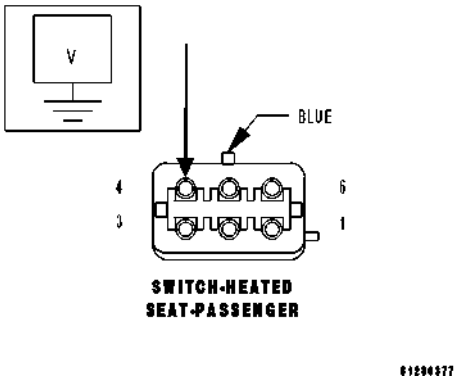
Disconnect the Passenger Heated Seat switch connector.

Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.
Measure the voltage of the (F21) Fused Ignition Switch Output circuit at the Passenger Heated Seat Switch connector.

Is the voltage above 10.0 volts ?

Yes >> Go To 5

No >> Repair the (F21) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.



---

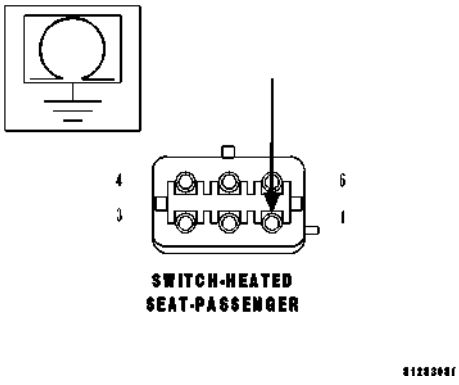
5. CHECK THE (P82) PASSENGER HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (P82) Passenger Heated Seat Lo Indicator Driver circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P82) Passenger Heated Seat Lo Indicator Driver circuit for a short to ground
Perform BODY VERIFICATION TEST – VER 1.

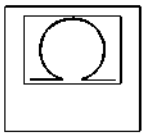
No >> Go To 6



B1221-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT LOW — (CONTINUED)

6. CHECK THE (P82) PASSENGER HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (P82) Passenger Heated Seat Lo Indicator Driver circuit between the Cluster C-3 connector and the Passenger Heated Seat Switch connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Passenger Heated Seat Switch.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (P82) Passenger Heated Seat Lo Indicator Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

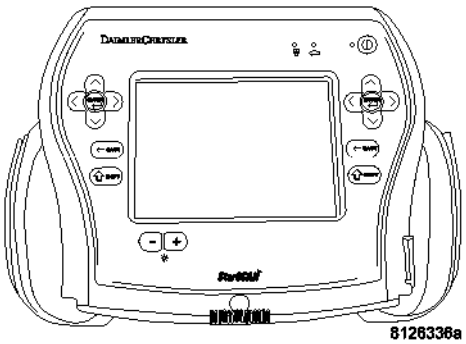
1. VERIFY THAT DTC B120E-LEFT HEATED SEAT SWITCH HI INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.



---

2. DISCONNECT THE DRIVER HEATED SEAT SWITCH AND RE-READ DTC

Disconnect the Driver Heated Seat Switch connector.
With the scan tool erase DTC's
Cycle the ignition switch off then back on.
With the scan tool, read DTC's.

Does the DTC B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 3

No >> Replace the Driver Heated Seat switch.
Perform BODY VERIFICATION TEST – VER 1.

B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH — (CONTINUED)

3. DISCONNECT THE CLUSTER C–3 CONNECTOR AND CHECK FOR VOLTAGE

Disconnect the Cluster C-3 connector.

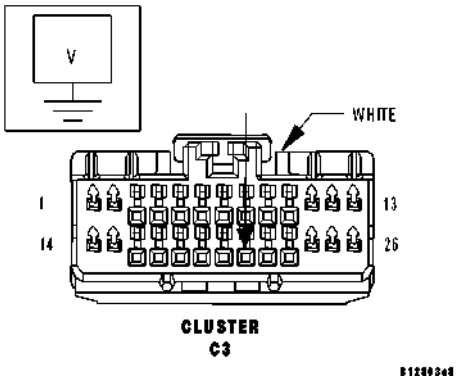
Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.

Measure the voltage at the (P83) Driver Heated Seat High Indicator Driver circuit at the Cluster C-3 connector.

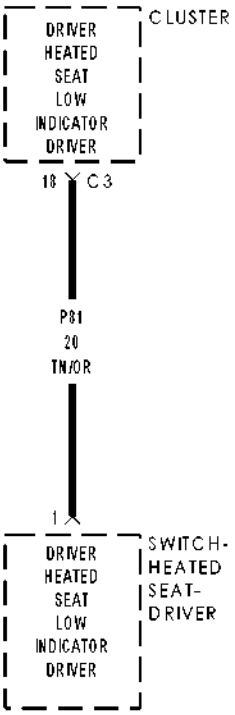
Is there any voltage present?

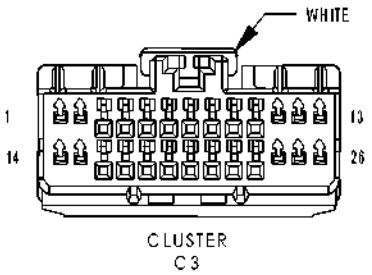
Yes >> Repair the (P83) Driver Heated Seat High Indicator Driver circuit for a short to battery.
Perform BODY VERIFICATION TEST – VER 1.

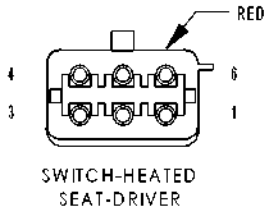
No >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.



B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH







81295371

B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH — (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**Continously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects excessive voltage on the heated seat indicator control circuit.

Possible Causes
(P81) DRIVER HEATED SEAT LO INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
DRIVER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

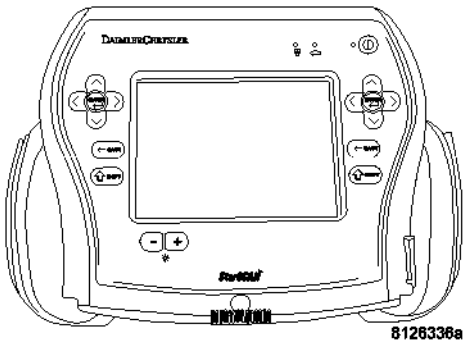
1. VERIFY THAT DTC B1216-LEFT HEATED SEAT SWITCH LO INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.



---

2. DISCONNECT THE DRIVER HEATED SEAT SWITCH AND RE-READ DTC

Disconnect the Driver Heated Seat Switch connector.
With the scan tool erase DTC's
Cycle the ignition switch off then back on.
With the scan tool, read DTC's.

Does the DTC B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 3

No >> Replace the Driver Heated Seat switch.
Perform BODY VERIFICATION TEST – VER 1.

B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH — (CONTINUED)

3. DISCONNECT THE CLUSTER C–3 CONNECTOR AND CHECK FOR VOLTAGE

Disconnect the Cluster C-3 connector.

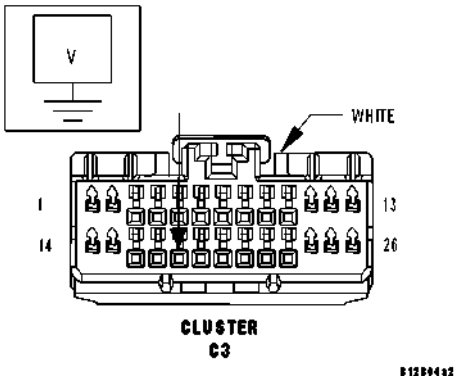
Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.

Measure the voltage at the (P81) Driver Heated Seat Low Indicator Driver circuit at the Cluster C-3 connector.

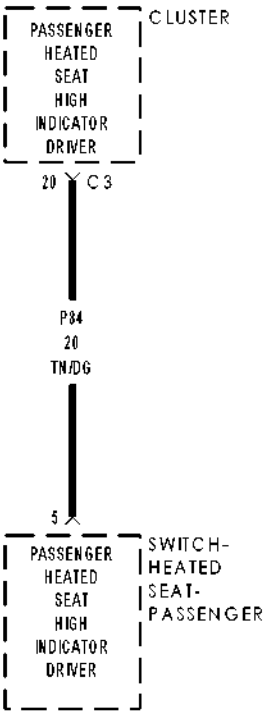
Is there any voltage present?

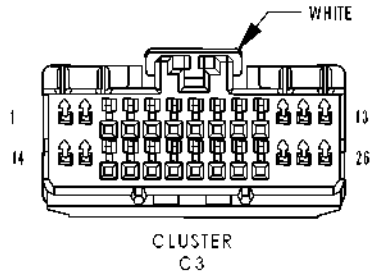
Yes >> Repair the (P81) Driver Heated Seat Low Indicator Driver circuit for a short to battery.
Perform BODY VERIFICATION TEST – VER 1.

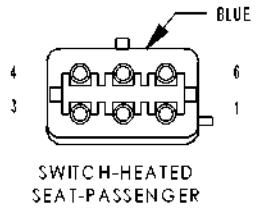
No >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.



B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH







81295831

B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH — (CONTINUED)

Possible Causes
(P82) PASSENGER HEATED SEAT LOW INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
PASSENGER HEATED SEAT SWITCH
CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

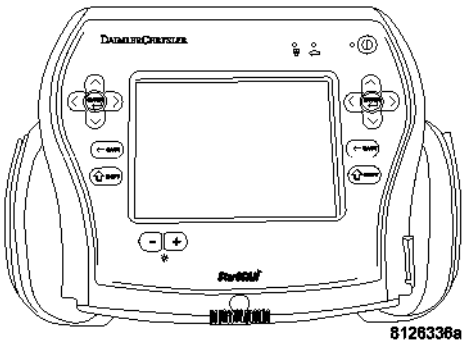
1. VERIFY THAT DTC B1222-RIGHT HEATED SEAT SWITCH LO INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE

With the scan tool, record and erase DTC's
Operate the Heated Seat Switch in both positions several times.
With the scan tool, read DTC's.

Does the DTC B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.



8126338a

---

2. DISCONNECT THE PASSENGER HEATED SEAT SWITCH AND RE-READ DTC

Disconnect the Passenger Heated Seat Switch connector.
With the scan tool erase DTC's
Cycle the ignition switch off then back on.
With the scan tool, read DTC's.

Does the DTC B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?

Yes >> Go To 3

No >> Replace the Passenger Heated Seat switch.
Perform BODY VERIFICATION TEST – VER 1.

B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH — (CONTINUED)

3. DISCONNECT THE CLUSTER C–3 CONNECTOR AND CHECK FOR VOLTAGE

Disconnect the Cluster C-3 connector.

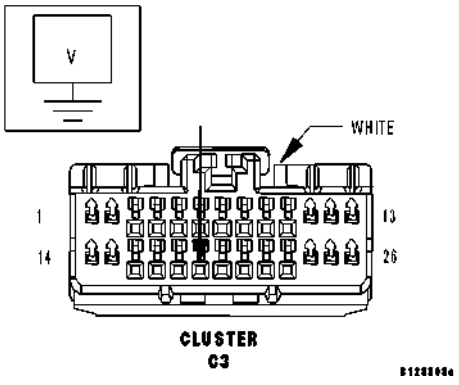
Note: Check connectors - Clean and repair as necessary.
Turn the ignition on.

Measure the voltage at the (P82) Passenger Heated Seat Low Indicator Driver circuit at the Cluster C-3 connector.

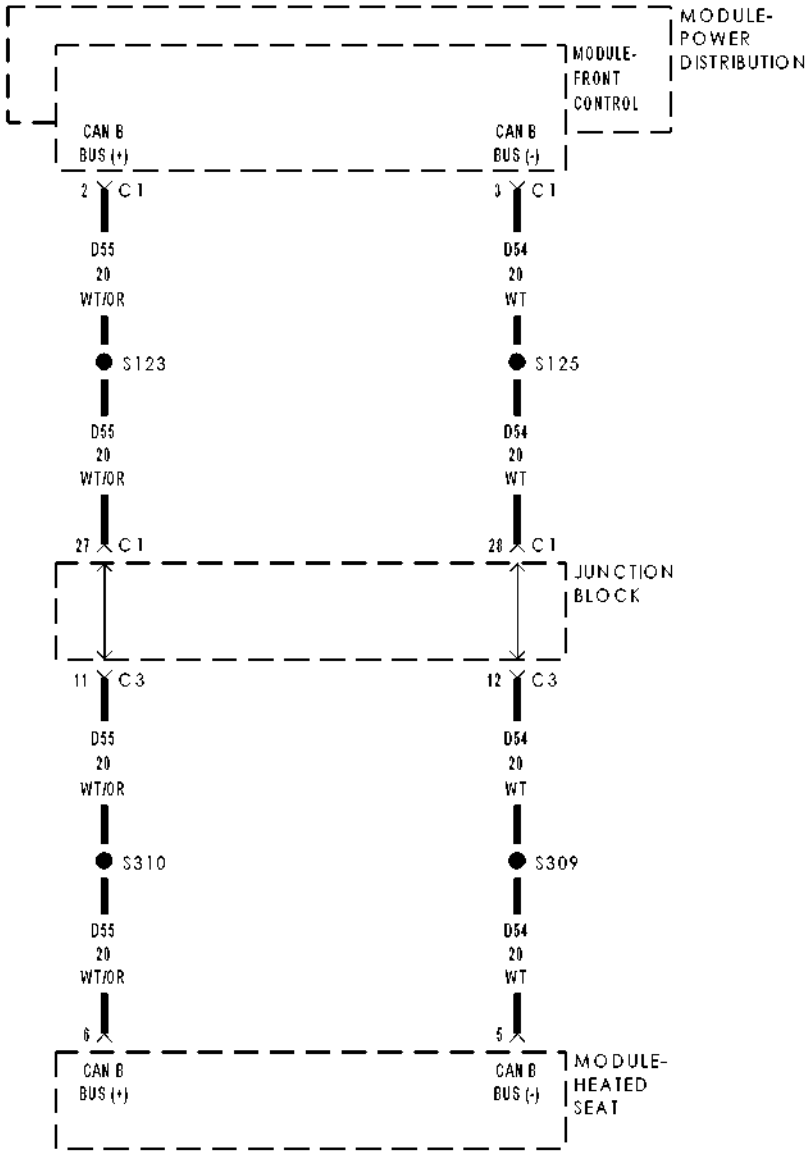
Is there any voltage present?

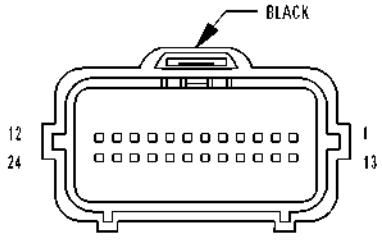
Yes >> Repair the (P82) Passenger Heated Seat Low Indicator Driver circuit for a short to battery.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Cluster in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

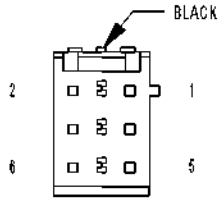


U0019–CAN B BUS – HSM





MODULE-FRONT
CONTROL C1



MODULE-HEATED
SEAT

81297271

U0019–CAN B BUS – HSM — (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

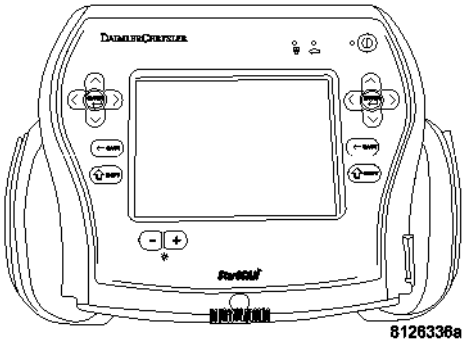
- **When Monitored:**
  Continuously
- **Set Condition:**
  Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE
(D54) CAN B BUS (–) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
HEATED SEAT MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase DTC's
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read DTC's.



Does the scan tool display U0019 CAN B BUS CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

2. CHECK FRONT CONTROL MODULE DTC's

With the scan tool, read Front Control Module DTC's

Does the scan tool display any CAN B BUS DTC's – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

U0019–CAN B BUS – HSM — (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Heated Seat Module connector.

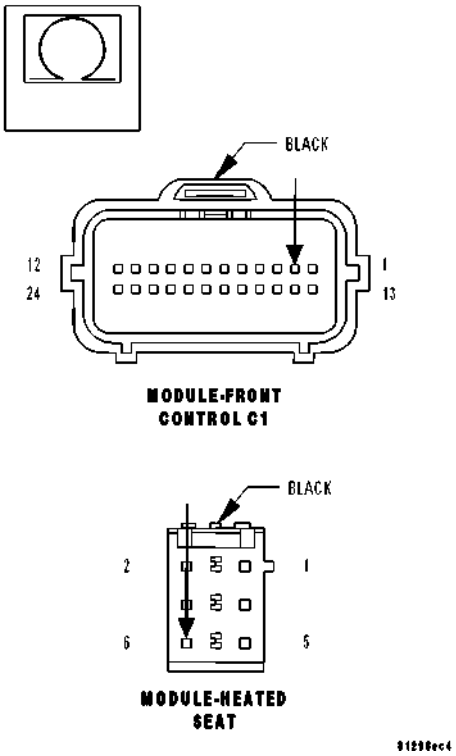
Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



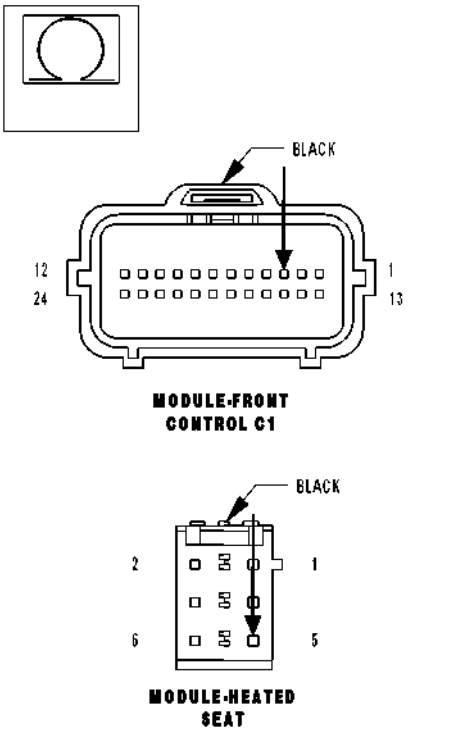
4. CAN B BUS (–) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (–) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the Can B Bus (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

HEATED SEATS - SERVICE INFORMATION

DESCRIPTION

HEATED SEAT SYSTEM

Vehicles with the heated seat option can be visually identified by the two heated seat switches located in the center stack of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted behind the right rear D-pillar trim panel. This module contains the control logic and software for the front heated seat system. The module also communicates on the CAN data bus network.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - A Cab Compartment Node (CCN) is part of the instrument cluster on this vehicle. The CCN utilizes integrated software and information carried on the CAN data bus network. The Cab Compartment Node (CCN) serves as the link between the heated seat switches and the heated seat module.

OPERATION

HEATED SEAT SYSTEM

The heated seat system operates on battery current received through a fuse in the Integrated Power Module (IPM). Fused ignition switch output (run-acc) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On or Accessory positions. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On or Accessory.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a resistance signal is sent to the Cab Compartment Node (CCN) or instrument cluster. The Cab Compartment Node (CCN) then sends a CAN bus message to the heated seat module, signaling the module to energize the heating element for the selected seat. The Cab Compartment Node (CCN) also turns on the HI and LO LED indicators on each of the heated seat switches.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When the pre-programmed duty-cycle has been achieved (approx. 2 hours), the module de-energizes the solid-state relay. The module will continue to cycle the solid-state relay as needed to maintain the temperature set point. No heated seat sensors are used with the heated seat system option.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit. See the owner's manual in the vehicle glove box for more information on the features, use and operation of the heated seat system.

DIAGNOSIS AND TESTING

HEATED SEAT SYSTEM

In order to obtain conclusive testing of the heated seat system, the Controller Area Network (CAN) data bus system must be checked.

The most reliable, efficient, and accurate means to diagnose the heated seat system requires the use of a Scan Tool and the Service and Body Diagnostic Information. The Scan Tool can provide vital information to the technician trying to find a problem with the heated seat system. Diagnostic logic is built into the heated seat module and the instrument cluster (CCN) to help the person trying to locate the problem by the most efficient means possible. Anytime a problem is suspected, a Scan Tool should be obtained and used to retrieve any stored fault codes in the heated seat module and/or instrument cluster.

If diagnostic fault codes are present in the module, record them on a piece of paper immediately before proceeding any further. Then, use these fault codes to identify the problem by verifying the fault code. Example, If the module records "DRIVER SEAT HEAT OUTPUT OPEN" fault code, locate the diagnostic procedure for this code in the appropriate Body Diagnostic information and follow the steps until the specific problem is located and resolved. Once the problem is thought to be corrected, erase the stored fault code using the Scan Tool and verify correct system operation. If the heated seat system is functioning correctly, verify that there are no other stored codes in the module and return the vehicle to service.

If the fault code could not be verified, such as not finding anything wrong when following the diagnostic steps in the Body Diagnostic information. This is a good indication that a INTERMITTENT problem may be present. You must than attempt to find the intermittent problem, such as moving the heating element within the seat while testing continuity or wiggling the wire harness/electrical connectors under the seat while testing continuity. Always, eliminate all other potential problems before attempting to replace module.

PRELIMINARY TEST

Before testing the individual components in the heated seat system, check the following:

- Using Scan Tool, check the heated seat module for any stored fault codes. Record these codes on paper for reference and resolve using the appropriate Body Diagnostic information.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicles electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.
- If the heated seat switch backlighting does not light with the ignition switch in the On position, check the fused ignition switch fuse in the integrated power module. If OK, (Refer to 8 - ELECTRICAL/HEATED SEATS/SEAT SWITCH - DIAGNOSIS AND TESTING). If not OK, repair the shorted circuit or component as required and replace the faulty fuse or repair the open ground circuit as required.
- If the heated seat switch HI/LO LED indicators do not light with the ignition switch in the On position and the heated seat switch in the Low or High position, check the fused ignition switch fuse in the integrated power module. If OK, (Refer to 8 - ELECTRICAL/HEATED SEATS/SEAT SWITCH - DIAGNOSIS AND TESTING). If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

HEATER-CUSHION PAD

DESCRIPTION

Vehicles equipped with the optional heated seat system have two heated seat element located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat element consists of a single length of resistor wire that is routed in a zigzag pattern and captured between the leather trim cover and the seat cushion assembly. Short pigtail wires with connectors are soldered to each end of each resistor wire element grid, which connect all of the element grids to each other in series with the heated seat module through the wire harness.

The heated seat elements cannot be repaired. If found to be damaged or faulty, a new heating element assembly must be installed.

OPERATION

One end of the heated seat element resistor wire is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element resistor wire by the energized N-channel Field Effect Transistor located within the heated seat module. The heated seat module will energize the N-FET when the heated seat switch is depressed in the Low or High position.

As electrical current passes through the heating element grid, the resistance of the wire used in the element disperses some of that electrical current in the form of heat. The heat produced by the heated seat element grid then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

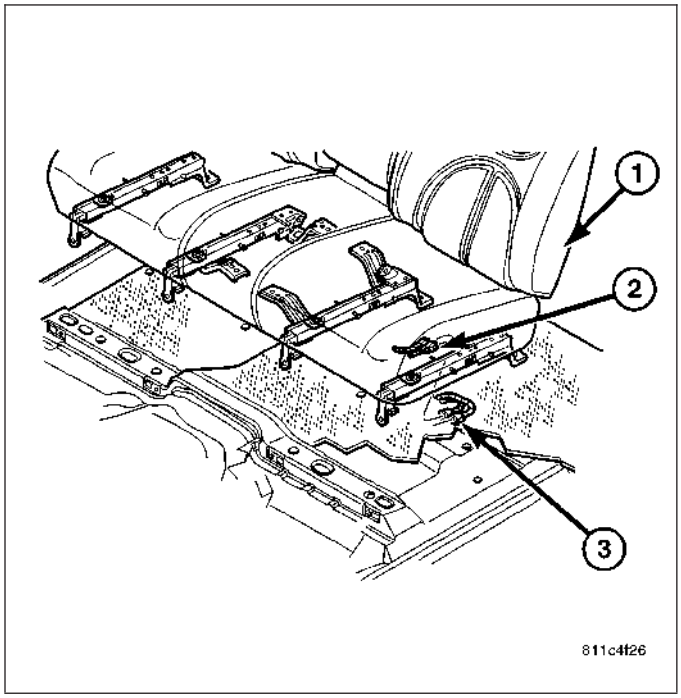
DIAGNOSIS AND TESTING

HEATED SEAT ELEMENT

The wire harness connectors (2&3) for the heating elements are located under the seat (1).

Note: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

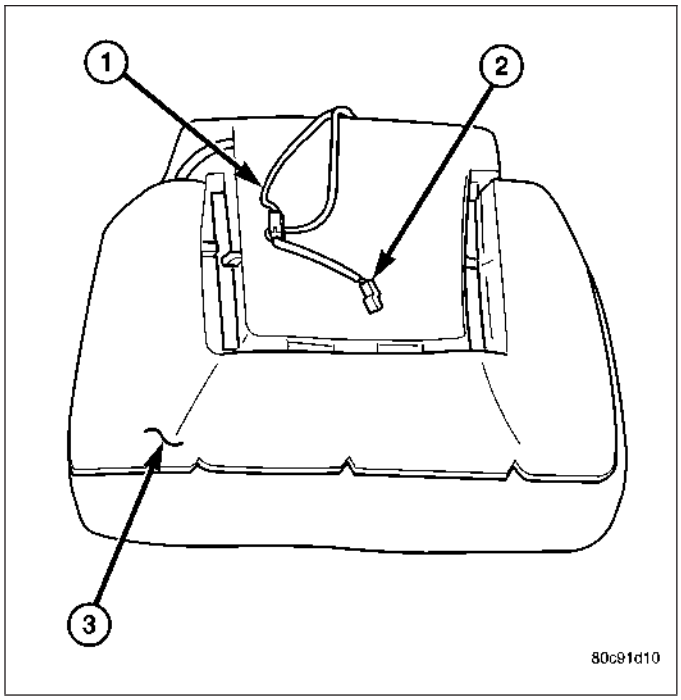
1. Locate and disconnect the seat electrical connector.
2. Check for continuity between the circuit leading in and out of the appropriate heated seat element. There should be continuity (less than 6 ohms). If OK, (Refer to 8 - ELECTRICAL/HEATED SEATS/ HEATED SEAT MODULE - DIAGNOSIS AND TESTING). If not OK, replace the heated seat element.



REMOVAL

Do not remove the OEM heating elements (3) from the seat or seat back cushions. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on the seat cushion.

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat cushion or seat back trim cover.(Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REMOVAL).
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

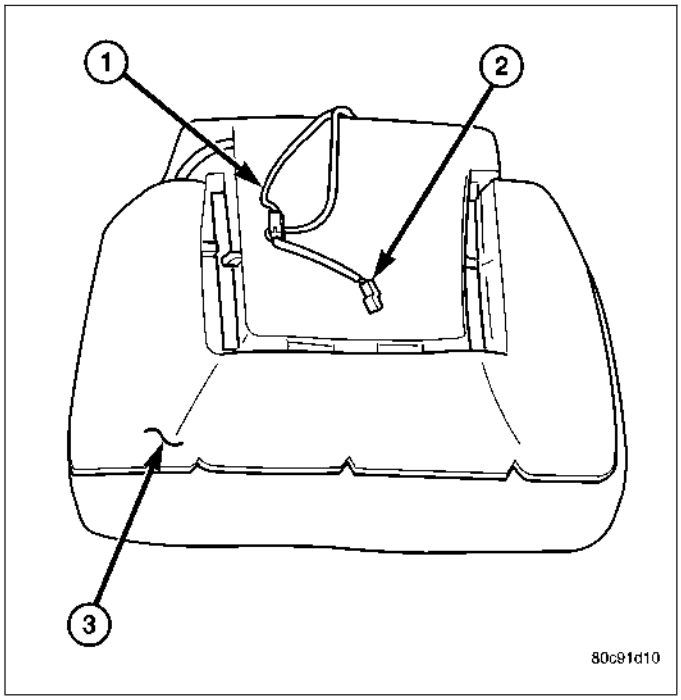


INSTALLATION

1. Peel off the adhesive backing on the back of the replacement heating element and stick directly on the foam cushion or directly on top of the original heating element.

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

2. Connect the new heating element electrical connectors (1&2).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion or seat back trim cover. Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.

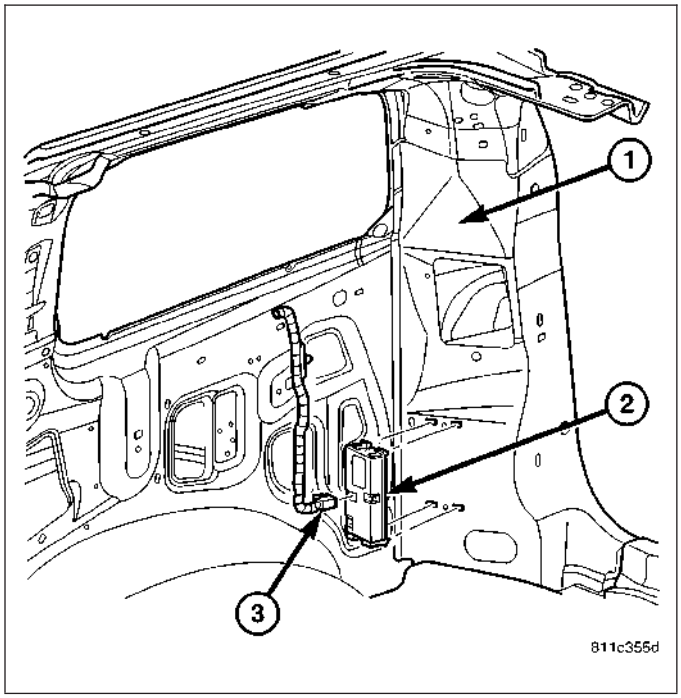


MODULE-HEATED SEAT

DESCRIPTION

The heated seat module (2) is located behind the right rear D-pillar trim (1). The heated seat module has a single electrical connector (3).

The heated seat module is an microprocessor designed to use CAN bus messages from the cluster Cabin compartment Node (CCN) to operate the heated seat elements in both front seats.



OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded at all times through a ground lug on the right rear D-pillar. Inputs to the module include CAN bus messages and standard hardwired 12volt power and ground. In response to those inputs the heated seat module controls the battery current to the heated seat elements.

When a heated seat switch CAN bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38C (100.4°F), and the High heat set point is about 42C (107.6°F).

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store an diagnostic trouble code (DTC).

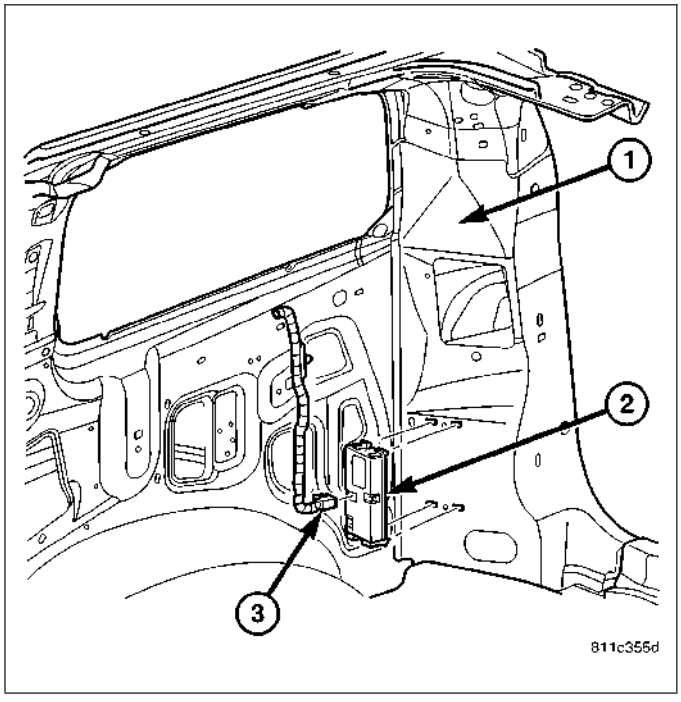
DIAGNOSIS AND TESTING

HEATED SEAT MODULE

1. Test the appropriate heated seat element (Refer to 8 - ELECTRICAL/HEATED SEATS/HEATED SEAT ELEMENT - DIAGNOSIS AND TESTING).
2. Test the appropriate heated seat switch.
3. Using a voltmeter, backprobe the heated seat module connector, do not disconnect. Check for voltage at the appropriate pin cavities. 12v should be present. If OK go to Step 4, if Not, repair the open or shorted voltage supply circuit as required.
4. Using a ohmmeter, backprobe the appropriate heated seat module connector, do not disconnect. Check for proper continuity to ground on the ground pin cavities. Continuity should be present. If OK test the Cabin compartment Node (CCN) cluster using a scan tool for proper heated seat system function. If Not OK, Repair the open or shorted ground circuit as required.

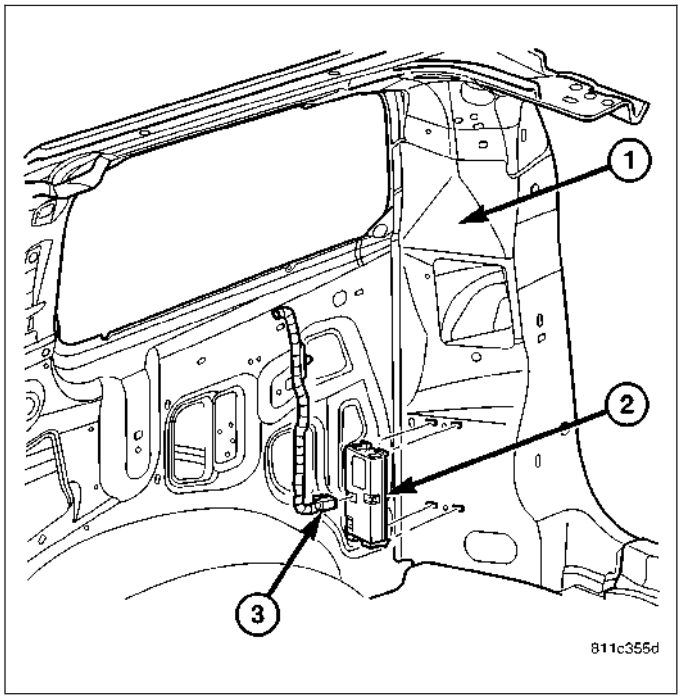
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate and remove the upper D-pillar trim (1) from the vehicle. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
3. Remove the lower D-pillar trim (2) from the vehicle. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
4. Disconnect the wire harness connector from the back of the heated seat module (2).
5. Unsnap the heated seat module (2) from the D-pillar (1).
6. Remove the heated seat module (2) from the vehicle.



INSTALLATION

1. Install the heated seat module on the D-pillar (1).
2. Connect the wire harness connector (3) to the heated seat module (2).
3. Reconnect the negative battery cable.
4. Check for proper heated seat system operation.
5. Install the upper and lower D-pillar trim to the vehicle. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).
6. Connect the battery negative cable.

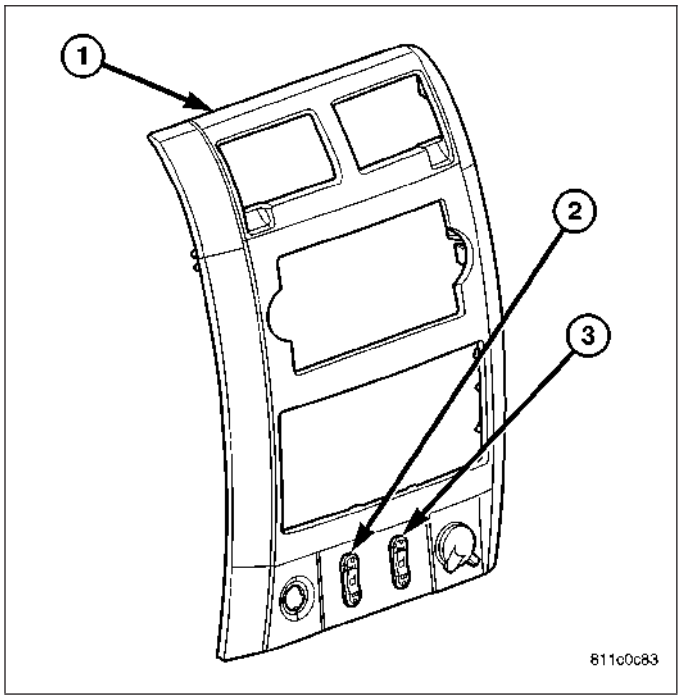


SWITCH-HEATED SEAT

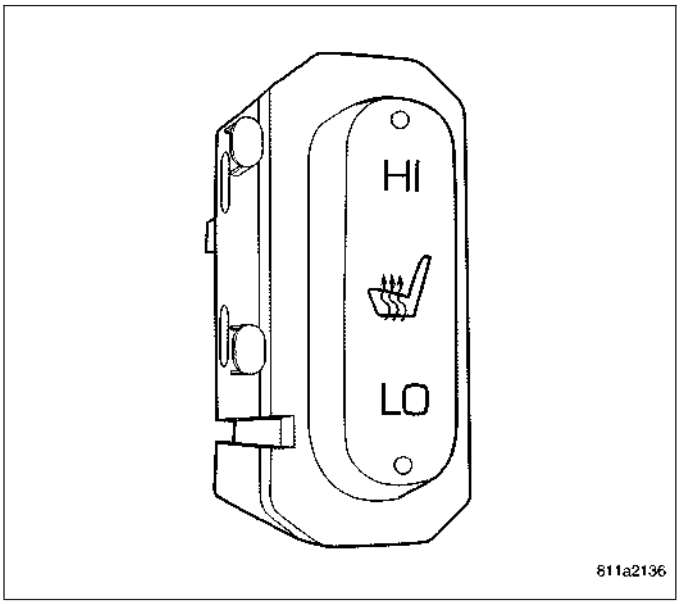
DESCRIPTION

HEATED SEAT SWITCH

The heated seat switches are both mounted in the instrument panel. The two switches are snapped into mounting holes in the instrument panel center bezel (1). The two heated seat switches (2) and (3) are identical in appearance and construction, except for the location of a keyway in the connector receptacle on the back of each switch. The instrument panel wire harness connectors for the heated seat switches are keyed to match the connector receptacles so that the two heated seat switches can only be connected to the proper heated seat.



Each momentary, bidirectional rocker-type heated seat switch provides a resistor-multiplexed signal to the Cab Compartment Node (CCN). Each switch has a center neutral position and momentary Low and High positions so that the driver and the front seat passenger can select a preferred seat heating level. Each heated seat switch has two Light-Emitting Diode (LED) indicator lamps, which indicate the selected level (Low or High) of the seat heater. Each switch also has one indicator lamp for back lighting of the switch when the ignition switch is in the Run position.



The five LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are faulty or damaged, or the switch is faulty or damaged the individual heated seat switch assembly must be replaced.

OPERATION

HEATED SEAT SWITCH

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch rocker to its momentary High or Low position provides a hard-wired resistor multiplexed signal to the Cabin Compartment Node (CCN). The CCN is responsible for supplying the CAN bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting.

If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting. If a heated seat switch is depressed a second time to the same position as the currently selected state, the CCN and heated seat module interprets the second input as a request to turn the seat heater OFF. The CCN will then signal the heated seat module to turn the heated seat elements for that seat off.

The backlighting LED's in each of the heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. The ground side of the indicator lamp is divided by a separate lamp driver circuit in the CCN.

DIAGNOSIS AND TESTING

HEATED SEAT SWITCH

Refer to the **Wiring** section for complete heated seat system wiring diagrams.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. If the problem being diagnosed involves inoperative heated seat switch back lighting and the heated seat elements do heat, disconnect the inoperative switch and check for continuity between the ground pin at the heated seat switch connector and ground. If there is no continuity, repair an open wire between ground and the heated seat switch connector. If there is continuity, replace the inoperative heated seat switch. If the problem being diag-

nosed involves a heated seat switch indicator lamp that remains illuminated after the heated seat has been turned Off, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Also refer to the Body Diagnostic Information for additional diagnosis and testing procedures.

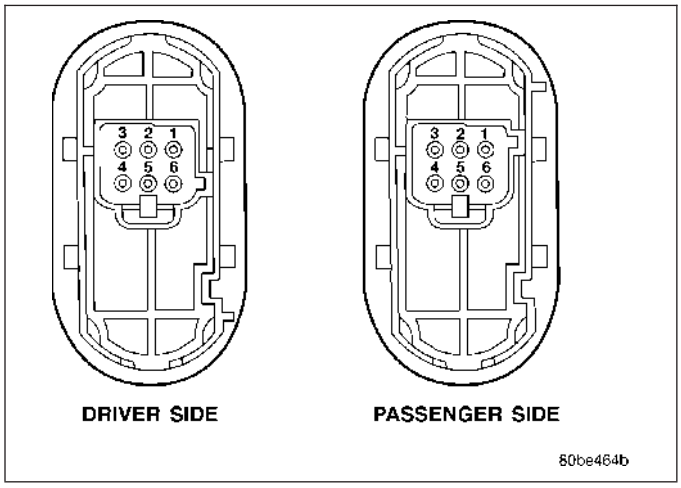
2. Check the fused ignition switch output (run) fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) fuse in the PDC. If OK, go to Step 4. If not OK, repair the open fused ignition switch output (run) circuit to the ignition switch as required.
4. Disconnect and isolate the battery negative cable. Disconnect the wire harness connector from the connector receptacle on the back of the heated seat switch to be tested. Reconnect the battery negative cable. Turn the ignition switch to the Run position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the heated seat switch. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (run) circuit to the PDC fuse as required.
5. Check the continuity and resistance values of the heated seat switch in the Neutral, Low and High positions as shown in the Heated Seat Switch Continuity chart below. If OK, (Refer to 8 - ELECTRICAL/HEATED SEATS/ HEATED SEAT MODULE - DIAGNOSIS AND TESTING). Also refer to the Body Diagnostic Information for additional diagnosis and testing procedures. If not OK, replace the faulty heated seat switch.

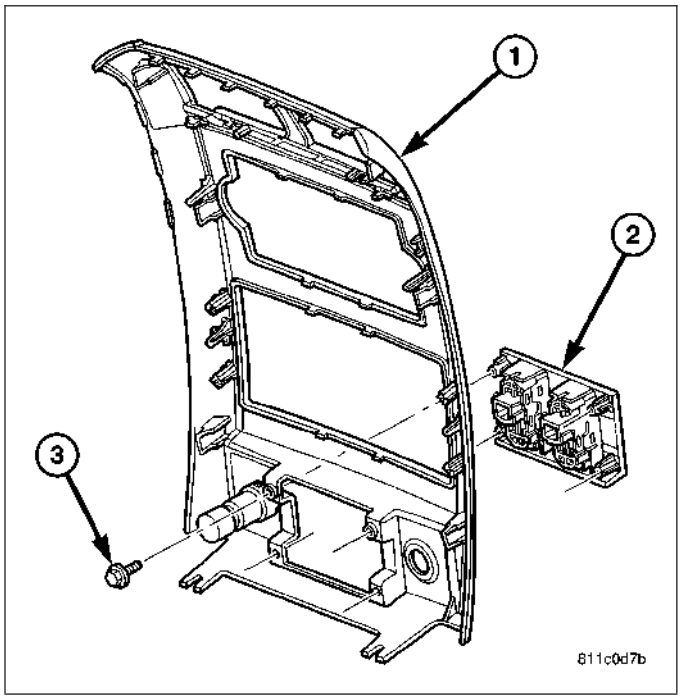
HEATED SEAT SWITCH CONTINUITY CHART

Switch Position	Continuity Between	Resistance
Neutral	4 & 6	2.2 Kilohms
Low	4 & 6	415 Ohms
High	4 & 6	33 Ohms

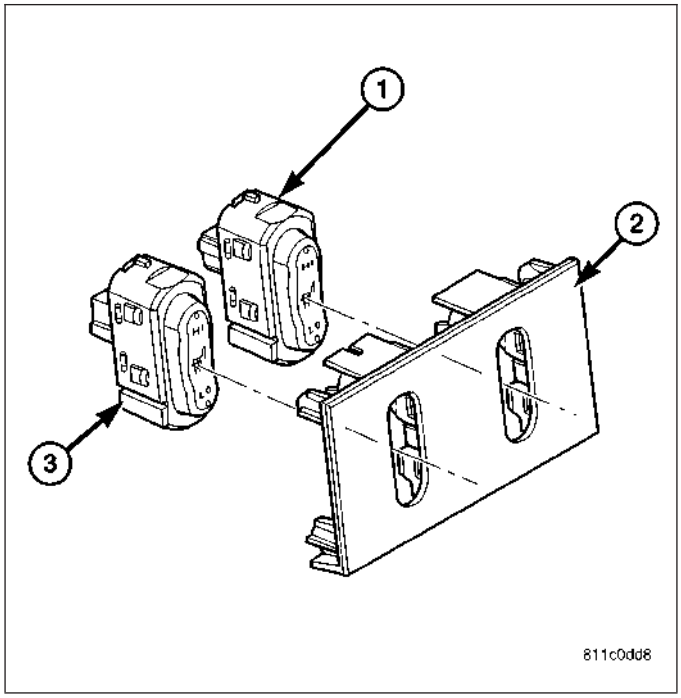
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (1) from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the heated seat switch bezel and both switches from the center bezel as a unit.





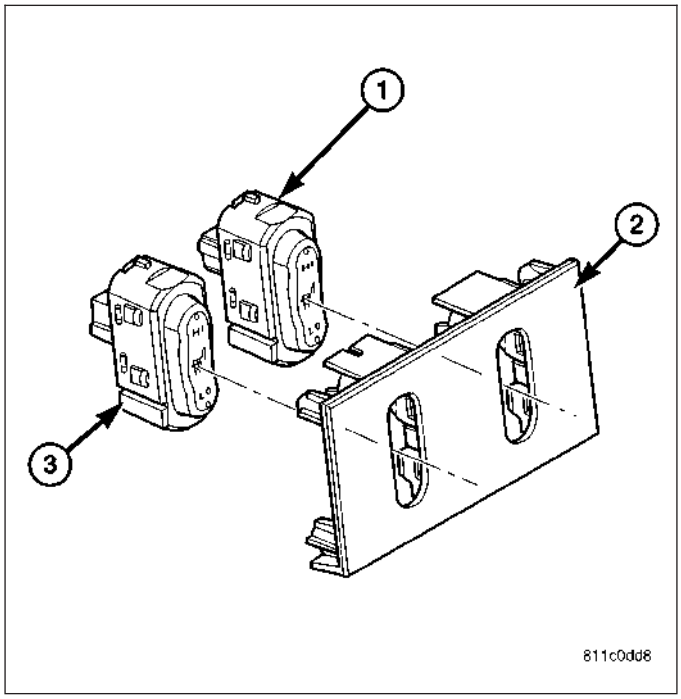
4. From the back of the heated seat switch bezel (2), gently pry the switch free and push the heated seat switch out through the rear of the bezel.



INSTALLATION

Note: When installing the heated seat switches, be certain they are installed in the proper mounting holes of the heated seat switch bezel (2). The heated seat switches are identified by a keyway in the connector receptacle on the back of each switch.

1. From the back of the heated seat switch bezel, gently push the heated seat switch in through the rear of the bezel.



2. Install the center bezel on the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
3. Connect the battery negative cable.
4. Verify heated seat system operation.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module does not detect voltage on the Horn Relay Control circuit.

Possible Causes
HORN FUSE
B(+) OPEN
RELAY
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

Diagnostic Test

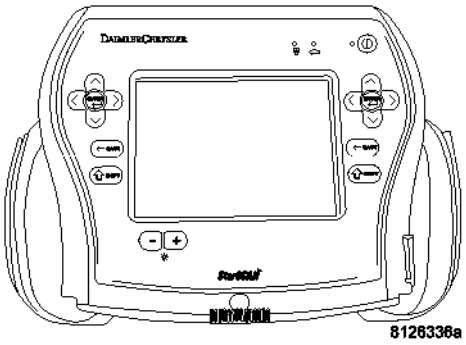
1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's
Operate the Horn Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.



---

2. HORN FUSE

Using a 12-volt test light connected to ground, check the Horn fuse.

Does the test light illuminate and was the fuse OK?

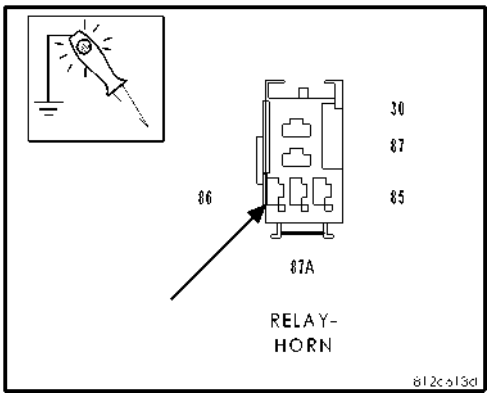
No >> Replace the horn fuse if open and check for a short to ground on the Horn Relay Output circuit or correct the open B(+) circuit to the fuse.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3

B2336,B2338–HORN CONTROL CIRCUIT LOW/OPEN – FCM — (CONTINUED)

3. OPEN FUSED B(+) TO RELAY

Remove the Horn Relay from the PDC.
Using a 12-volt test light connected to ground, check the Fused B(+) circuit at the relay connector.



Does the test light illuminate?

No >> Replace the Power Distribution Center.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 4

---

4. HORN RELAY

Install a known good relay in place of the Horn Relay.
With the scan tool erase DTC's
Operate the Horn Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display the same DTC?

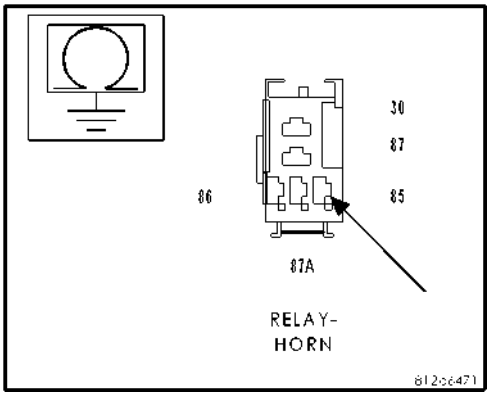
No >> Replace the original Horn Relay.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 5

---

5. (X4) HORN RELAY CONTROL SHORTED

Remove the Horn Relay.
Disconnect the Front Control Module from the PDC 49 – way connector.
Measure the resistance between ground and the (X4) Horn Relay Control circuit at the relay.



Is the resistance below 1000.0 ohms?

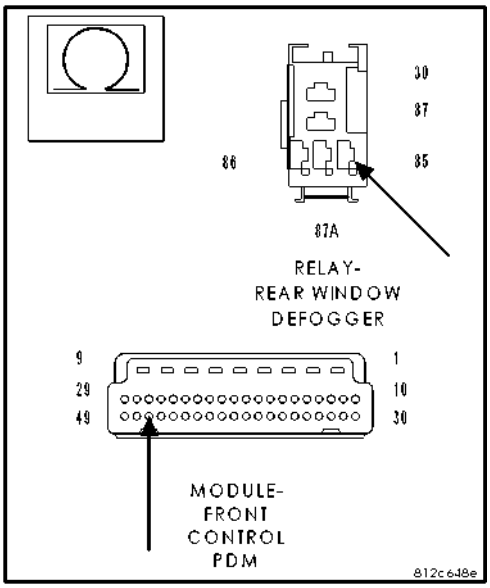
Yes >> Replace the Power Distribution Center.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

B2336,B2338–HORN CONTROL CIRCUIT LOW/OPEN – FCM — (CONTINUED)

6. (X4)HORN RELAY CONTROL OPEN

Measure the resistance of the (X4)Horn Relay Control circuit from the relay connector to FCM connector.

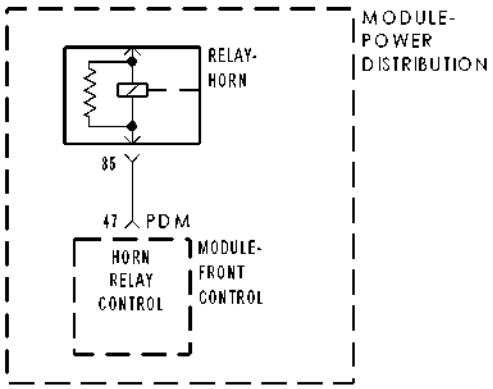


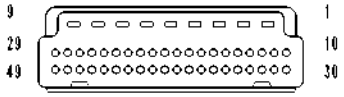
Is the resistance below 3.0 ohms?

Yes >> Replace the Front Control Module.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Power Distribution Center.
Perform BODY VERIFICATION TEST - VER 1.

B2337–HORN CONTROL CIRCUIT HIGH – FCM





MODULE-
FRONT
CONTROL
PDM

B2337–HORN CONTROL CIRCUIT HIGH – FCM — (CONTINUED)

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module detects a short to battery on the Horn Relay Control circuit.

Possible Causes
HORN RELAY
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

Diagnostic Test

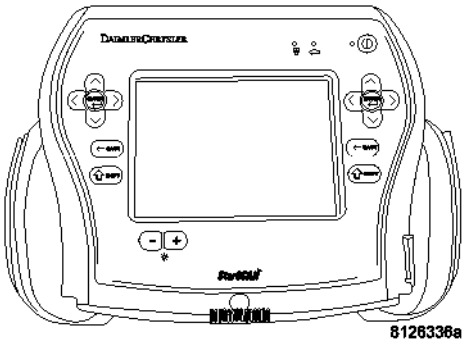
1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's
Operate the Horn Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display B2337 – HORN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.



---

2. HORN RELAY

Turn the ignition off.
Install a known good relay in place of the Horn Relay.
With the scan tool erase DTC's
Operate the Horn Switch several times.
Cycle the ignition from on to off 3 times and leave on.
With the scan tool, read DTC's.

Does the scan tool display B2337 – HORN CONTROL CIRCUIT HIGH?

No >> Replace the original Horn Relay.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3

B2337–HORN CONTROL CIRCUIT HIGH – FCM — (CONTINUED)

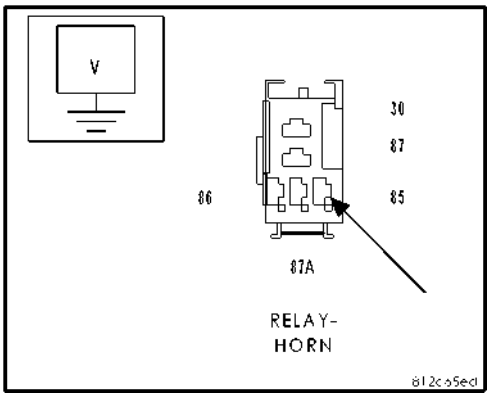
3. SHORTED POWER DISTRIBUTION CENTER

Remove the Horn Relay.

Disconnect the Front Control Module from the PDC 49 – way connector.

Turn the ignition on.

Measure the voltage between (X4) Horn Relay Control circuit and ground.

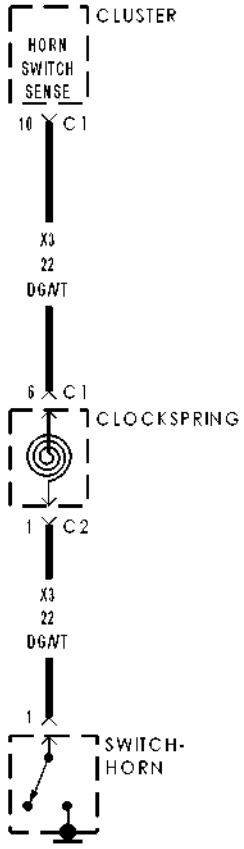


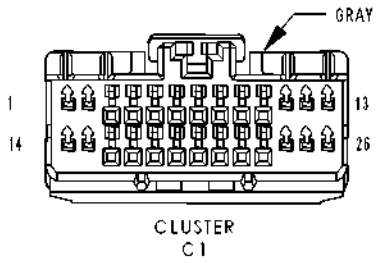
Is there any voltage present?

Yes >> Replace the Power Distribution Center.
Perform BODY VERIFICATION TEST - VER 1.

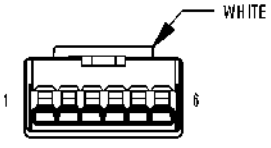
No >> Replace the Front Control Module.
Perform BODY VERIFICATION TEST - VER 1.

B2339–HORN SWITCH STUCK – CLUSTER

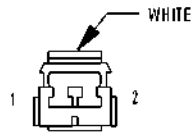




CLUSTER
C1



CLOCKSPRING C1



SWITCH-HORN

B2339–HORN SWITCH STUCK – CLUSTER — (CONTINUED)

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**.

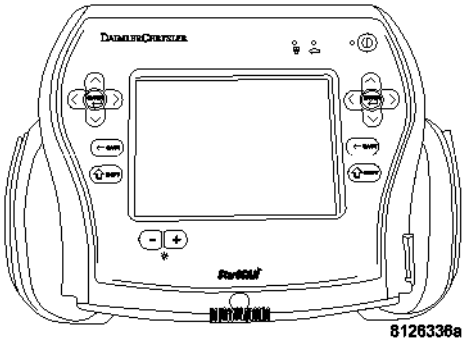
- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Cluster senses the Horn Switch input for over 30 seconds, this code will set.

Possible Causes
HORN SWITCH
CLOCKSPRING
(X3)HORN SWITCH SENSE CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

With the scan tool, record and erase DTC's
Operate the Horn Switch several times.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read DTC's.



Does the scan tool display HORN SWITCH STUCK?

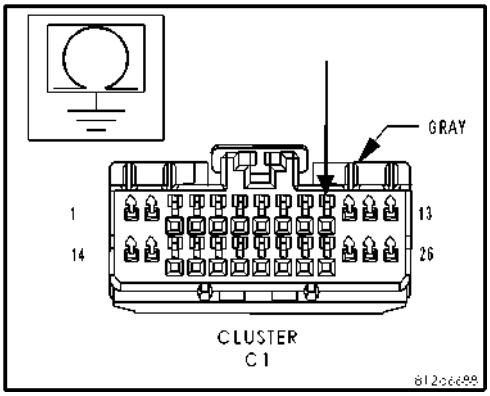
Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

---

2. (X3)HORN SWITCH SENSE SHORTED

Turn the ignition off.
Disconnect the Cluster C1connector.
Measure the resistance between ground and the (X3) Horn Switch Sense circuit.



Is the resistance below 1000.0 ohms?

No >> Replace the Cluster.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3

B2339–HORN SWITCH STUCK – CLUSTER — (CONTINUED)

3. HORN SWITCH SHORTED

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Horn switch connector.

Measure the resistance between ground and the (X3) Horn Switch Sense circuit.

Is the resistance below 1000.0 ohms?

Yes >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Horn Switch.
Perform BODY VERIFICATION TEST - VER 1.

---

4. CLOCKSPRING SHORTED

Disconnect the Clockspring C1connector.

Measure the resistance between ground and the (X3) Horn Switch Sense circuit.

Is the resistance below 1000.0 ohms?

Yes >> Repair the Horn Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Clockspring.
Perform BODY VERIFICATION TEST - VER 1.

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

HORN SYSTEM - SERVICE INFORMATION

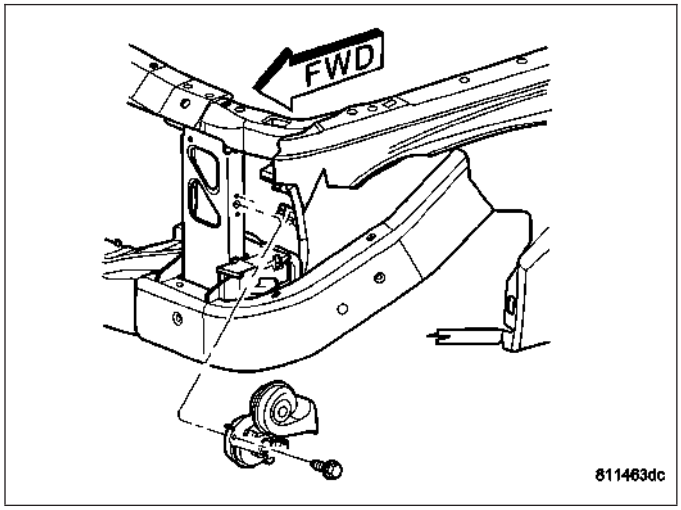
DESCRIPTION

The dual-note horn system features dual electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located on the left side of the engine compartment behind the grille.
- **Horn Switch** - The horn switch is molded into the driver airbag trim cover.



OPERATION

The horn system operates on battery current received through a fuse in the Integrated Power Module (IPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Integrated Power Module (IPM).

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

HORN

DIAGNOSIS AND TESTING

HORN

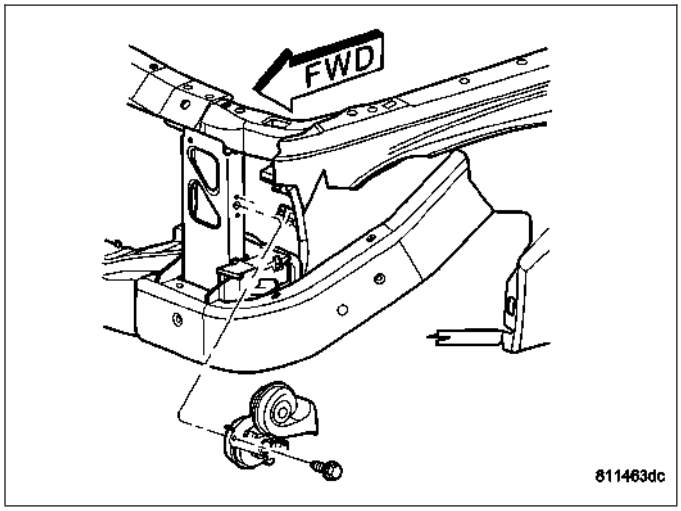
The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

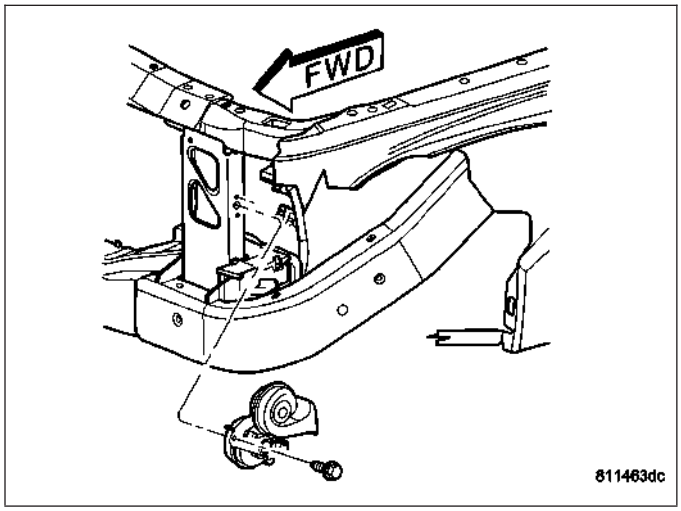
REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Remove the horn mounting fasteners.
4. Disconnect the electrical harness connector and remove the horns.



INSTALLATION

1. Connect the electrical harness connector to the horns.
2. Position horns and install mounting fastener. Tighten fastener.
3. Install grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
4. Connect battery negative cable.



SWITCH-HORN

DESCRIPTION

The horn switch is molded into the driver airbag cover. The horn switch can not be serviced separately. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - DISASSEMBLY).

DIAGNOSIS AND TESTING

HORN SWITCH

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

B2100-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Front Control Module will set this DTC if the CAN bus message and the hardwired ignition switch circuit do not match the position of the ignition switch.

Possible Causes
JUNCTION BLOCK FUSE #18
(F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

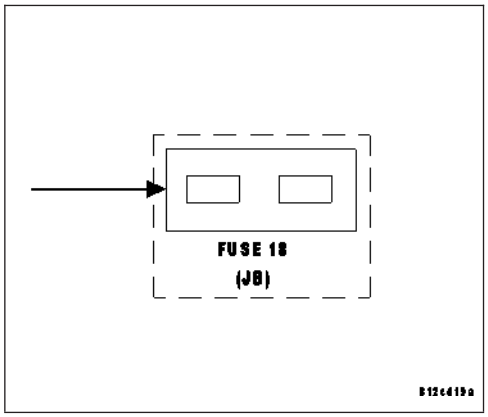
No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

2. INSPECT JUNCTION BLOCK FUSE #18

Turn the ignition off.

Remove and inspect Junction Block Fuse #18.



Is the fuse open?

Yes >> Replace fuse and retest. If fuse continues to fail inspect the wiring between the Junction Block and the Front Control Module for a short to ground.

Perform BODY VERIFICATION TEST – VER 1.

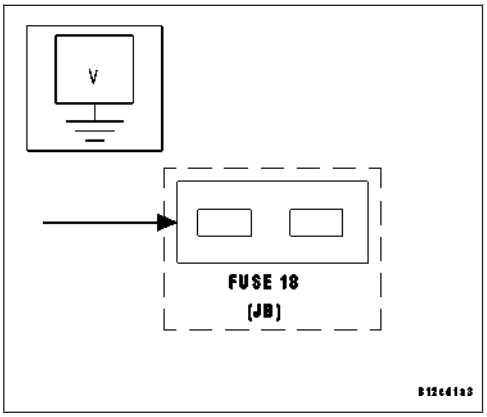
No >> Go To 3

B2100-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE (CONTINUED)

3. (F941) IGNITION SWITCH OUTPUT CIRCUIT OPEN

Turn the ignition on.

Measure the voltage of the (F941) Ignition Switch Output circuit at the fuse input terminal.



Is the voltage above 10.0 volts?

Yes >> Go To 4

No >> Repair the (F941) Ignition Switch Output circuit for an open. Refer to the wiring diagrams located in 8W.
Perform BODY VERIFICATION TEST – VER 1.

4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN

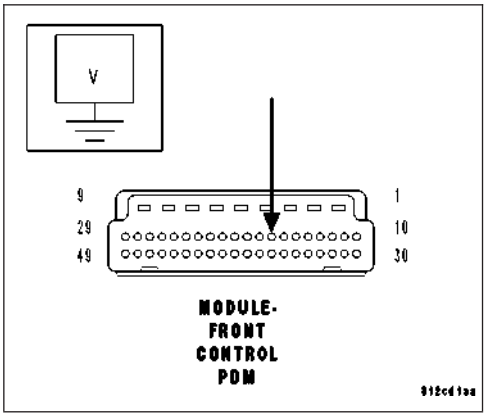
Turn the ignition off.

Install Fuse #18 in the Junction Block.

Remove the FCM from the Power Distribution Module.

Turn the ignition on.

Measure the voltage of the (F202) Fused Ignition Switch output circuit.



Is the voltage above 10.0 volts?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (F202) Fused Ignition Switch Output circuit for an open.
Perform BODY VERIFICATION TEST – VER 1.

IGNITION SYSTEM - SERVICE INFORMATION

DESCRIPTION

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

3.7L V-6 ENGINE

The 3.7L V-6 engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 6 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used with the 3.7L engine.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil.

The ignition system consists of:

- 6 Spark Plugs
- 6 Separate Ignition Coils
- 2 Knock Sensors
- Powertrain Control Module (PCM)

- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

4.7L V-8 ENGINE

The 4.7L V-8 engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 8 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used with the 4.7L engine.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

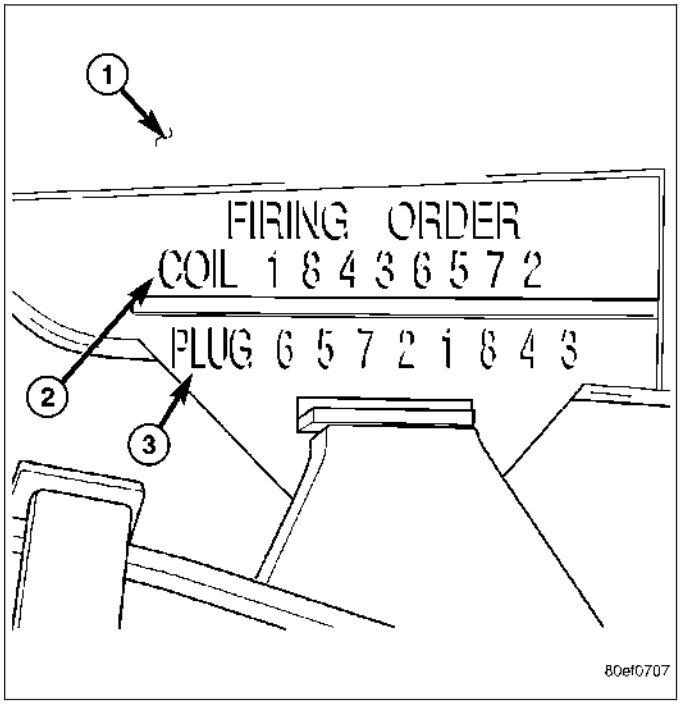
The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil.

The ignition system consists of:

- 8 Spark Plugs
- 8 Separate Ignition Coils
- 2 Knock Sensors
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

5.7L V-8 ENGINE

For additional information, also refer to Ignition Coil Description and Operation.



The 5.7L V-8 engine is equipped with 16 spark plugs. Two plugs are used for each cylinder. The 5.7L is also equipped with 8 separate and independent ignition coils. The one-piece coil bolts directly to the cylinder head cover and attaches the coils secondary output terminal directly to a spark plug using a rubber boot seal. Each coil is also equipped with a second output terminal. This second terminal connects a conventional spark plug cable directly to a spark plug on the opposite cylinder bank. A separate primary electrical connector is used for each coil.

Eight conventional spark plug cables are used with the 5.7L. These cables connect a coil on one cylinder bank, directly to a spark plug on the opposite cylinder bank. The cables are placed and routed in a special plastic loom to keep them separated. This loom is clipped to the intake manifold. To prevent a miss-match of cables, a corresponding spark plug / coil number is displayed on each plug cable: 1/6, 2/3, 4/7 and 5/8. These numbers (2) and (3) can also be found on the top of the intake manifold (1) to the right of the throttle body.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The 5.7L engine will not use a conventional distributor.

The ignition system consists of:

- 16 Spark Plugs (2 per cylinder)
- 8 Separate, Dual-Secondary Output, Ignition Coils
- 2 Knock Sensors
- 8 Secondary Ignition Cables
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

IGNITION TIMING

Ignition timing is not adjustable on any engine.

RELAY-AUTO SHUT DOWN

DESCRIPTION - PCM OUTPUT

The 5–pin, 12–volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

OPERATION

OPERATION - PCM OUTPUT

The ASD relay supplies battery voltage (12+ volts) to the fuel injectors and ignition coil(s). With certain emissions packages it also supplies 12–volts to the oxygen sensor heating elements.

The ground circuit for the coil within the ASD relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay will be shut–down, meaning the 12–volt power supply to the ASD relay will be de-activated by the PCM if:

- the ignition key is left in the ON position. This is if the engine has not been running for approximately 1.8 seconds.
- there is a crankshaft position sensor signal to the PCM that is lower than pre-determined values.

OPERATION - ASD SENSE - PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The relay is used to connect the oxygen sensor heater element, ignition coil and fuel injectors to 12 volt + power supply.

This input is used only to sense that the ASD relay is energized. If the Powertrain Control Module (PCM) does not see 12 volts at this input when the ASD should be activated, it will set a Diagnostic Trouble Code (DTC).

REMOVAL

The ASD relay is located in the engine compartment within the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Remove PDC cover.
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The ASD relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Install relay to PDC.
2. Install cover to PDC.

SENSOR-CAMSHAFT POSITION

DESCRIPTION

3.7L V-6

The Camshaft Position Sensor (CMP) on the 3.7L 6-cylinder engine is bolted to the right-front side of the right cylinder head.

4.7L V-8

The Camshaft Position Sensor (CMP) on the 4.7L V-8 engine is bolted to the right-front side of the right cylinder head.

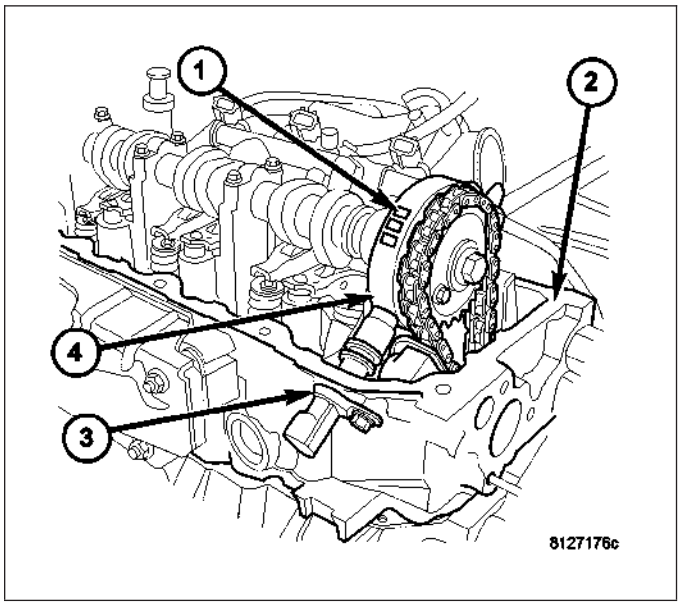
5.7L V-8

The Camshaft Position Sensor (CMP) on the 5.7L V-8 engine is located below the generator on the timing chain / case cover on the right/front side of engine.

OPERATION

3.7L V-6

The Camshaft Position Sensor (CMP) sensor on the 3.7L V-6 engine (3) contains a hall effect device referred to as a sync signal generator. A rotating target wheel (tonewheel) for the CMP is located (4) at the front of the camshaft for the right cylinder head (2). This sync signal generator detects notches (1) located on a tonewheel. As the tonewheel rotates, the notches pass through the sync signal generator. The signal from the CMP sensor is used in conjunction with the Crankshaft Position Sensor (CKP) to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

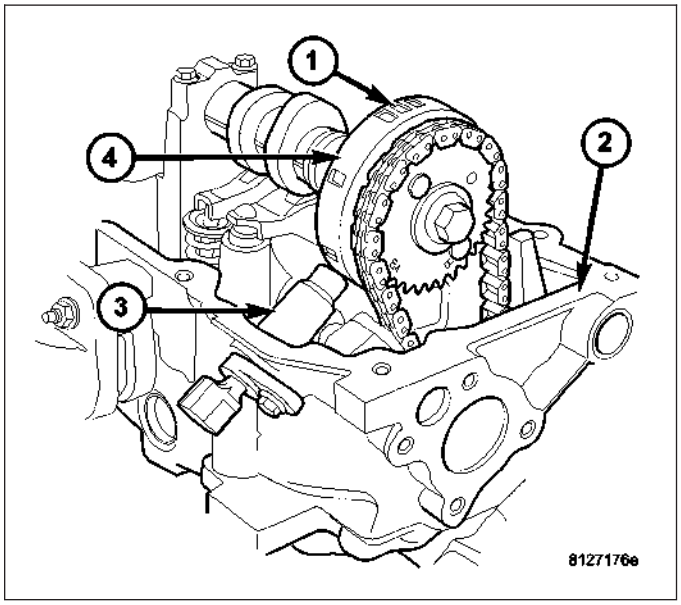


When the leading edge of the tonewheel notch enters the tip of the CMP, the interruption of magnetic field causes the voltage to switch high, resulting in a sync signal of approximately 5 volts.

When the trailing edge of the tonewheel notch leaves then tip of the CMP, the change of the magnetic field causes the sync signal voltage to switch low to 0 volts.

4.7L V-8

The CMP sensor on the 4.7L engine contains a hall effect device called a sync signal generator to generate a fuel sync signal. This sync signal generator detects notches located on a tonewheel. The tonewheel (4) is located at the front of the camshaft for the right cylinder head (2). As the tonewheel rotates, the notches (1) pass through the sync signal generator. The pattern of the notches (viewed counter-clockwise from front of engine) is: 1 notch, 2 notches, 3 notches, 3 notches, 2 notches 1 notch, 3 notches and 1 notch. The signal from the CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

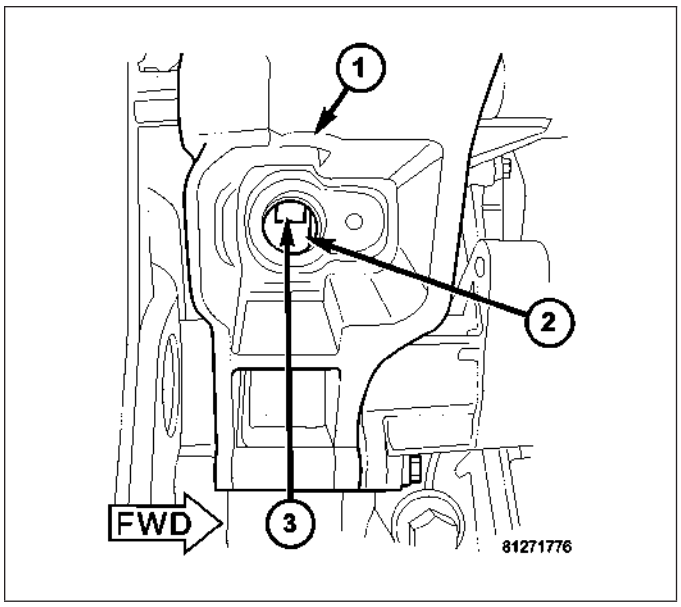


5.7L V-8

The CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the camshaft position sensor and crankshaft position sensor.

The tonewheel is located at the front of the camshaft (2). As the tonewheel rotates, notches (3) pass through the sync signal generator.

When the cam gear is rotating, the sensor will detect the notches. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects a notch has passed, the input voltage switches back low to approximately 0.3 volts.

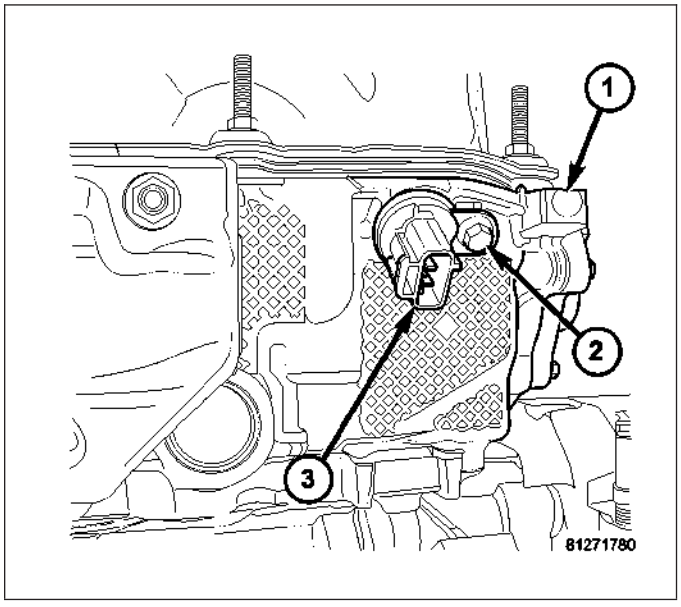


REMOVAL

3.7L V-6

The Camshaft Position Sensor (CMP) on the 3.7L V-6 engine (3) is bolted to the front/top of the right cylinder head (1).

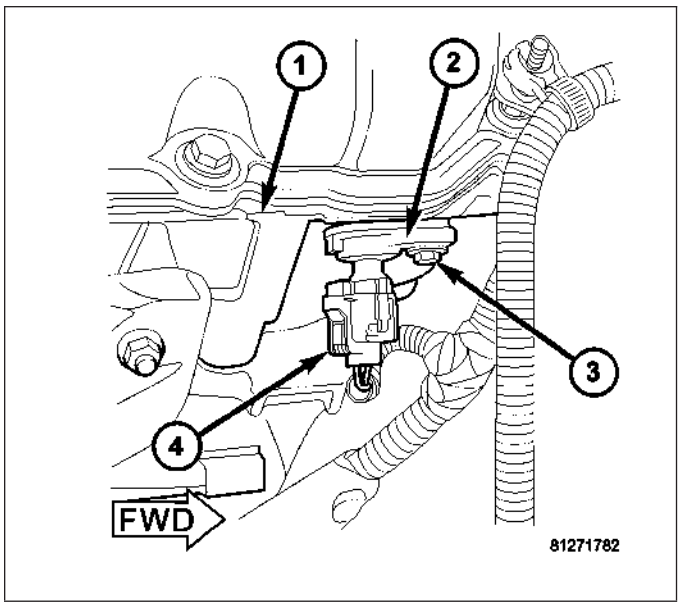
1. Disconnect electrical connector at CMP sensor.
2. Remove sensor mounting bolt (2).
3. Carefully twist sensor from cylinder head.
4. Check condition of sensor o-ring.



4.7L V-8

The Camshaft Position Sensor (CMP) on the 4.7L V–8 engine (2) is bolted to the front/top of the right cylinder head (1).

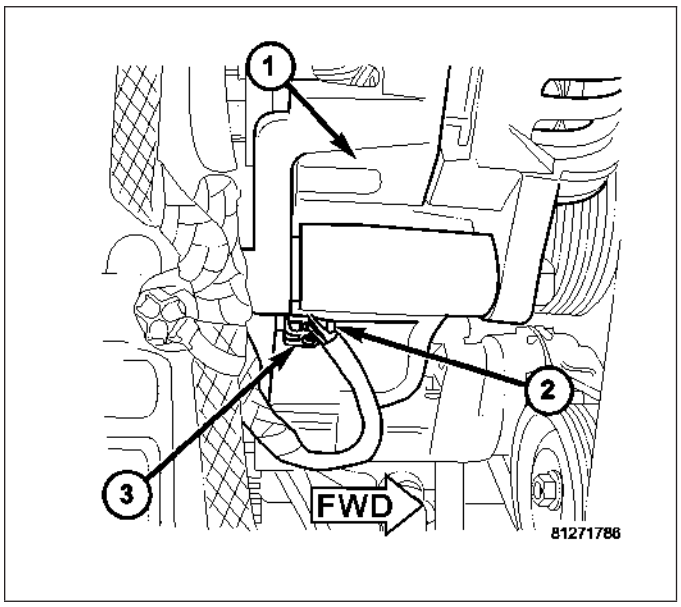
1. Raise and support vehicle.
2. Disconnect electrical connector (4) at CMP sensor.
3. Remove sensor mounting bolt (3).
4. Carefully twist sensor from cylinder head.
5. Check condition of sensor o-ring.



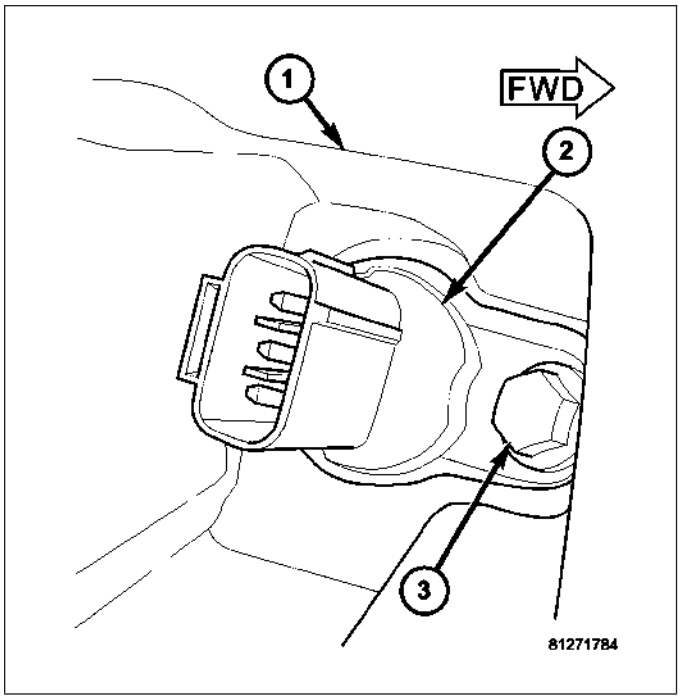
5.7L V-8

The Camshaft Position Sensor (CMP) on the 5.7L V-8 engine is located on right side of timing chain cover below generator (1).

1. Disconnect electrical connector (3) at CMP sensor.



2. Remove sensor mounting bolt (3).
3. Carefully twist sensor (2) from cylinder head.
4. Check condition of sensor o-ring.



INSTALLATION

3.7L V-6

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt and tighten. Refer to torque specifications.
5. Connect electrical connector to sensor.

4.7L V-8

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt and tighten. Refer to Torque Specifications.
5. Connect electrical connector to sensor.

5.7L V-8

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to timing chain cover. If sensor is not flush, damage to sensor mounting tang may result.

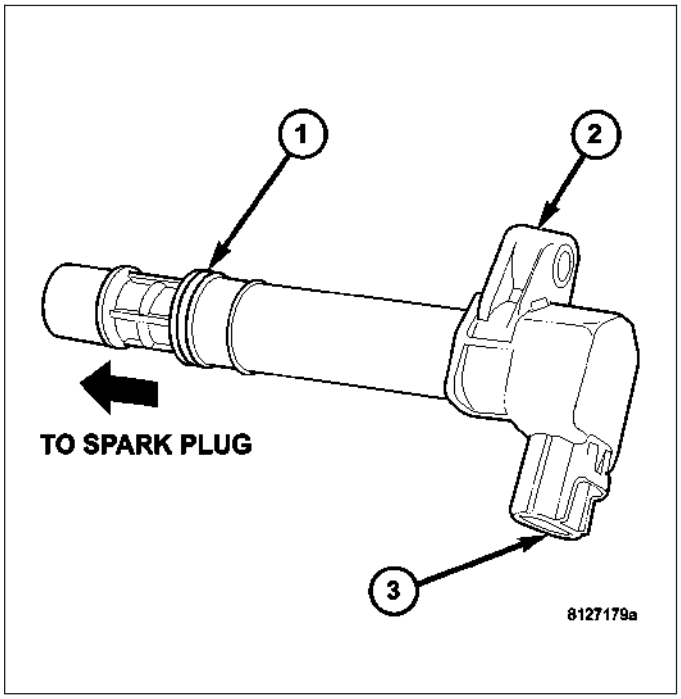
4. Install mounting bolt and tighten. Refer to Torque Specifications.
5. Connect electrical connector to sensor.

COIL-IGNITION

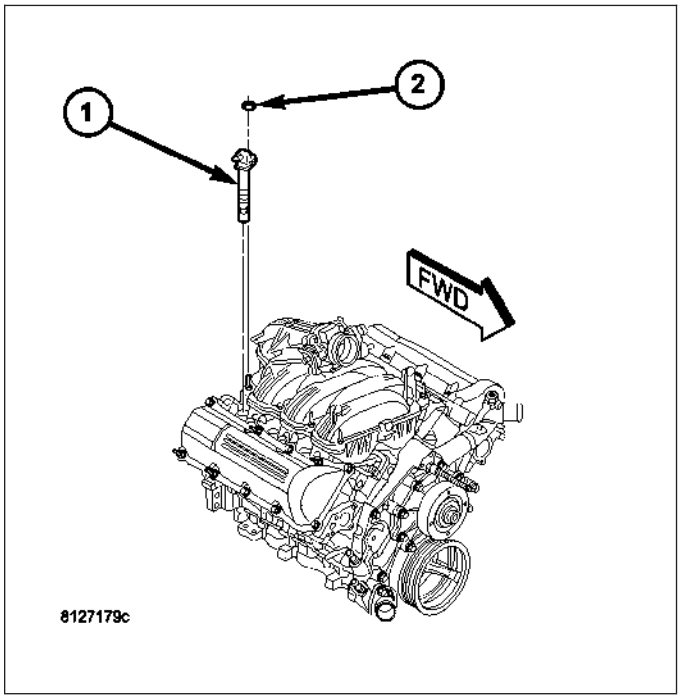
DESCRIPTION

3.7L V-6

The 3.7L V-6 engine uses 6 dedicated, and individually fired coil for each spark plug (2).

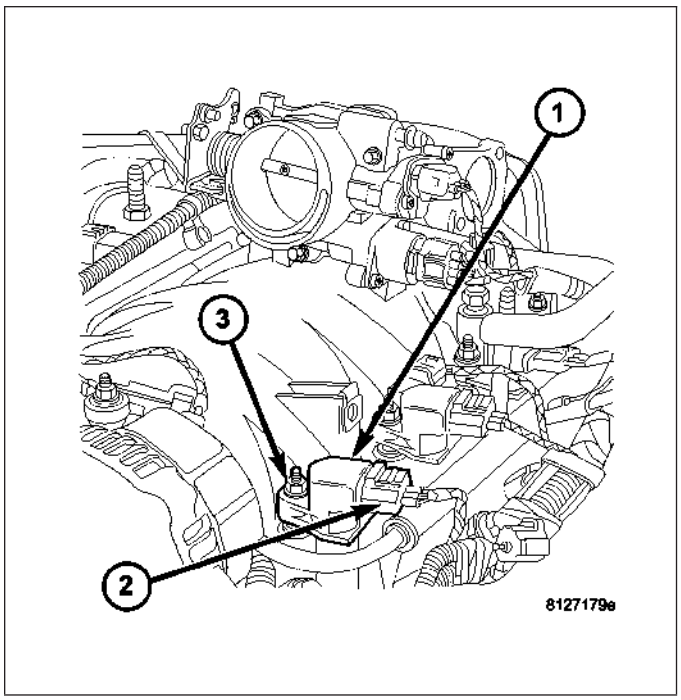


Each coil (1) is mounted directly into the cylinder head and onto the top of each spark plug.



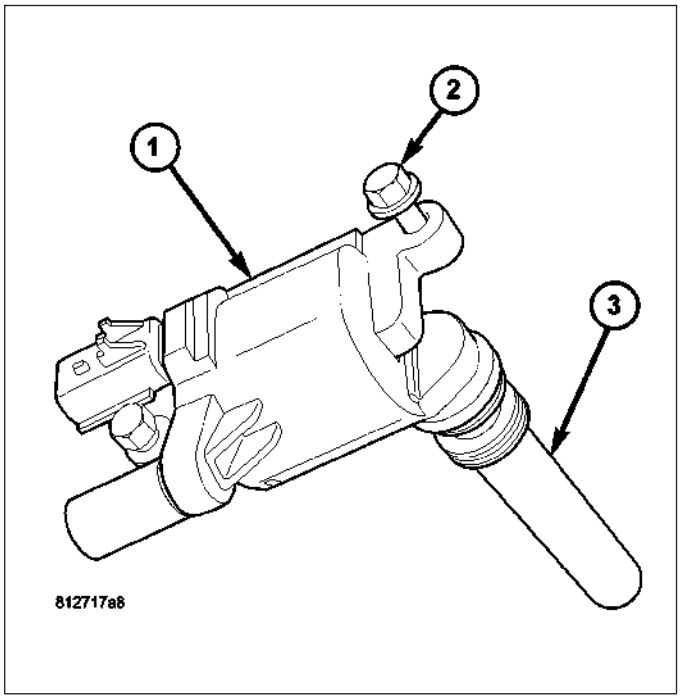
4.7L V-8

The 4.7L V–8 engine uses 8 dedicated, and individually fired coil (1) for each spark plug. Each coil is mounted directly to the top of each spark plug.

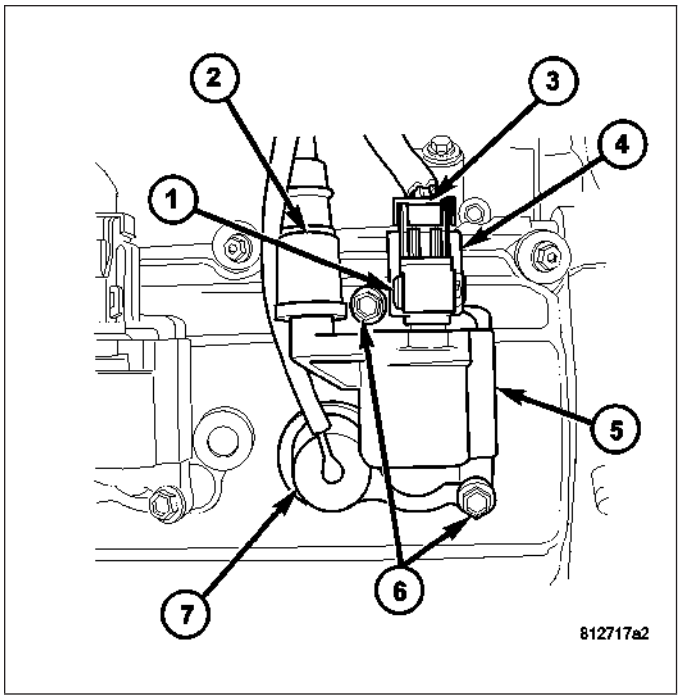


5.7L V-8

The 5.7L V–8 engine uses 8 dedicated, and individually fired coil (1) for each pair of spark plugs.



Each coil (5) is mounted directly to the top of each spark plug. Each coil is bolted (6) to the valve cover.



OPERATION

3.7L V-6

Battery voltage is supplied to the 6 individual ignition coils from the ASD relay. The Powertrain Control Module (PCM) opens and closes each ignition coil ground circuit at a determined time for ignition coil operation.

Base ignition timing is not adjustable. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The ignition coil is not oil filled. The windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the ignition coil to be mounted on the engine.

Because of coil design, spark plug cables (secondary cables) are not used with the 3.7L V-6 engine.

4.7L V-8

Battery voltage is supplied to the 8 individual ignition coils from the ASD relay. The Powertrain Control Module (PCM) opens and closes each ignition coil ground circuit at a determined time for ignition coil operation.

Base ignition timing is not adjustable. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The ignition coil is not oil filled. The windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the ignition coil to be mounted on the engine.

Because of coil design, spark plug cables (secondary cables) are not used with the 4.7L V-8 engine.

5.7L V-8

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

A “wasted spark” system is used on the 5.7L engine combining paired, or dual-firing coils, and 2 spark plugs per cylinder. The coils and spark plugs are connected with paired, secondary high-voltage cables.

Each cylinder is equipped with 1 dual-output coil. Meaning one coil mounts directly over one of the dual spark plugs for 1 high-voltage output. A second high-voltage output is supplied directly from the same coil (using a plug cable) to one of the dual spark plugs on a corresponding (paired) cylinder on the opposite cylinder bank.

Each coil fires 2 spark plugs simultaneously on each of the cylinder banks (one cylinder on compression stroke and one cylinder on exhaust stroke). **EXAMPLE :** When the #1 cylinder is on compression stroke and ready for spark, the #1 coil will fire one of the dual spark plugs on the #1 cylinder (directly below the coil). The other dual spark plug on the #1 cylinder will be fired by the #6 coil. At the same time, the #1 coil will fire a “wasted spark” to one of the dual spark plugs at the #6 cylinder as coil #6 also fires a “wasted spark” to one of the dual spark plugs at the #6 cylinder.

The firing order is paired at cylinders 1/6, 2/3, 4/7, 5/8. Basic cylinder firing order is 1–8–4–3–6–5–7–2.

Battery voltage is supplied to all of the ignition coils positive terminals from the ASD relay. If the PCM does not see a signal from the crankshaft and camshaft sensors (indicating the ignition key is ON but the engine is not running), it will shut down the ASD circuit.

Base ignition timing is not adjustable on the 5.7L V-8 engine. By controlling the coil ground circuits, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The PCM adjusts ignition timing based on inputs it receives from:

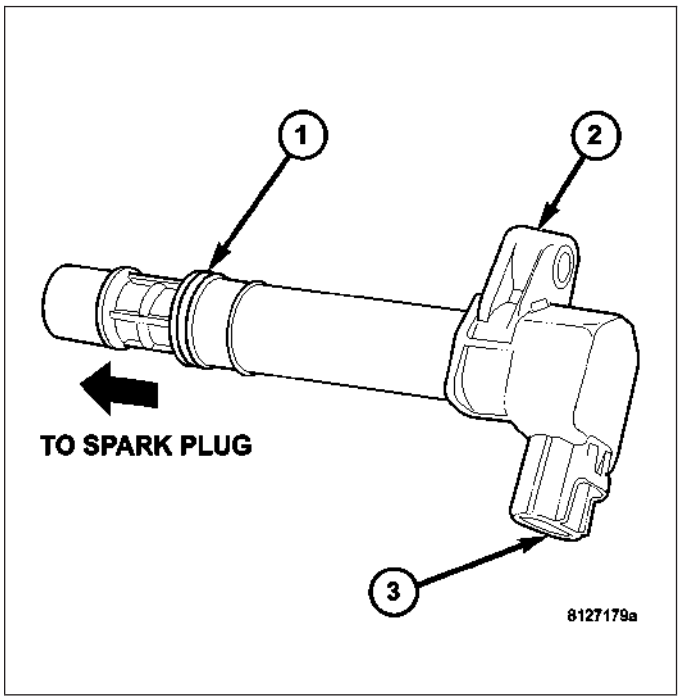
- The engine coolant temperature sensor
- The crankshaft position sensor (engine speed)
- The camshaft position sensor (crankshaft position)
- The manifold absolute pressure (MAP) sensor
- The throttle position sensor
- Transmission gear selection

REMOVAL

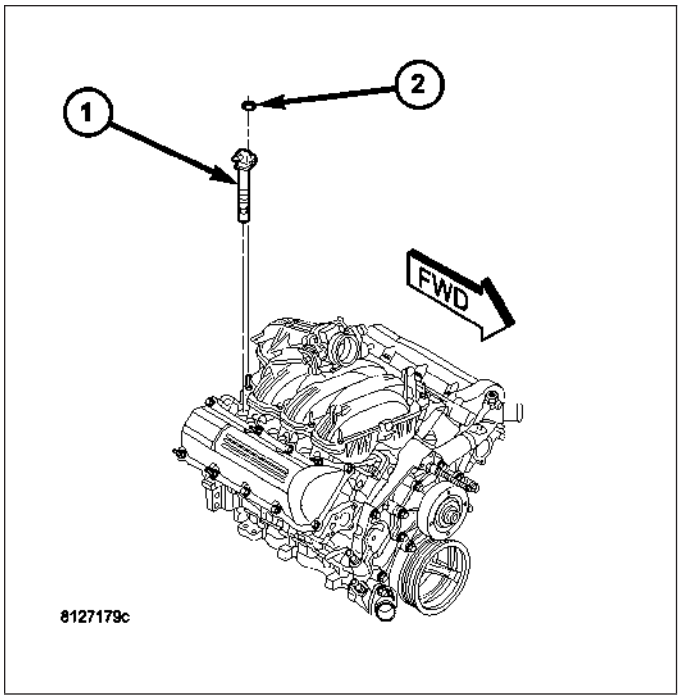
3.7L V-6

An individual ignition coil is used for each spark plug (2). The coil fits into machined holes in the cylinder head. A mounting stud/nut secures each coil to the top of the intake manifold. The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring (1) is used to seal the coil at the opening into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.



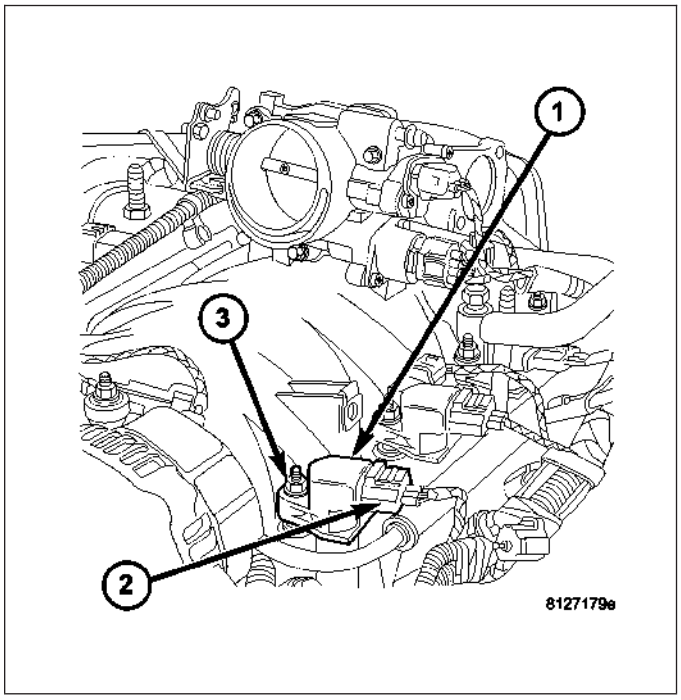
4. Remove coil mounting nut (2) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.
6. Remove coil from vehicle.



4.7L V-8

An individual ignition coil (1) is used for each spark plug. The coil fits into machined holes in the cylinder head. A mounting stud/nut (3) secures each coil to the top of the intake manifold . The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring is used to seal the coil at the opening into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector (2) from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.
4. Remove coil mounting nut (3) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.
6. Remove coil from vehicle.

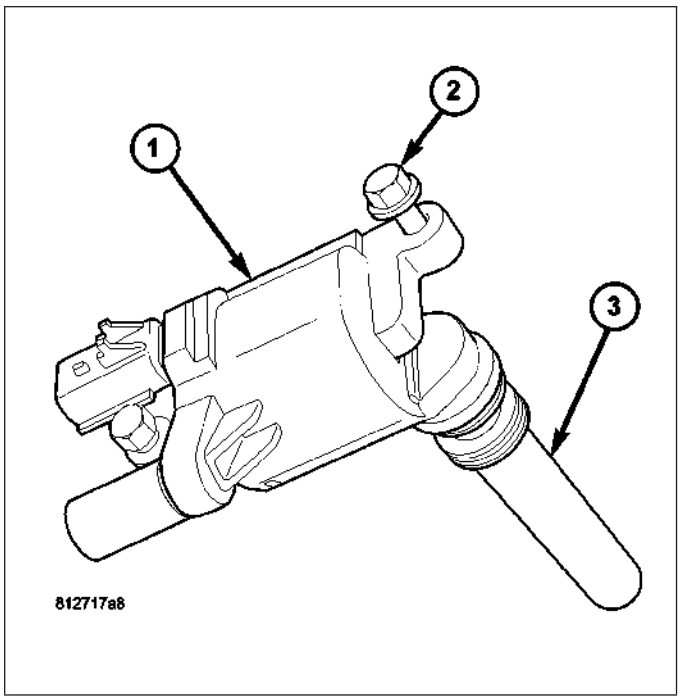


5.7L V-8

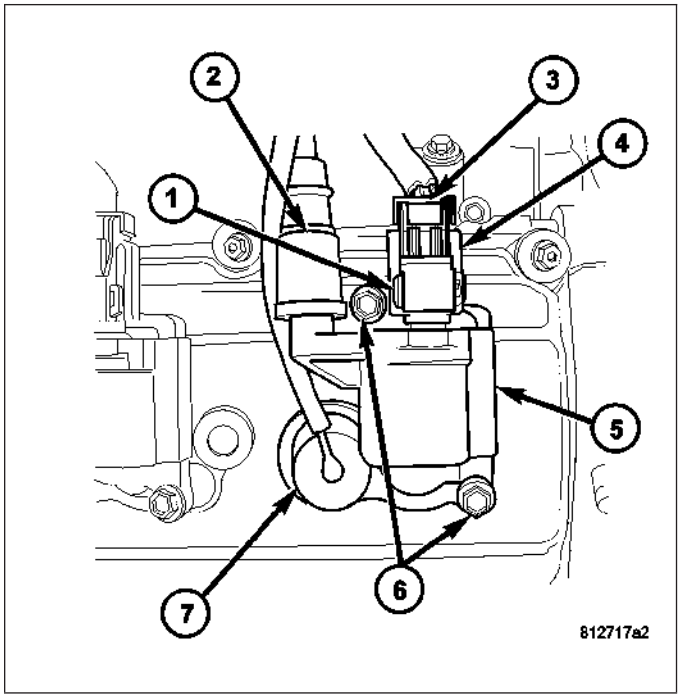
Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position.

An individual ignition coil (1) is used at each cylinder. The coil mounts to the top of the valve cover with two bolts (2). The bottom of the coil is equipped with a rubber boot (3) to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.



2. Unlock electrical connector (4) by moving slide lock (1) first. Press on release lock (3) while pulling electrical connector from coil.
3. Disconnect secondary high-voltage cable (2) from coil with a twisting action.
4. Clean area at base of coil with compressed air before removal.
5. Remove two mounting bolts (6) (note that mounting bolts are retained to coil).
6. Carefully pull up coil from cylinder head opening with a slight twisting action.
7. Remove coil from vehicle.
8. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.



INSTALLATION

3.7L V-6

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
3. Position ignition coil into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut. Refer to torque specifications.

5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.

4.7L V-8

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
3. Position ignition coil into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut. Refer to torque specifications.
5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.

5.7L V-8

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.
3. Position ignition coil into cylinder head opening and push onto spark plug. Twist coil into position.
4. Install 2 coil mounting bolts. Refer to torque specifications.
5. Connect electrical connector to coil by snapping into position.
6. Install cable to coil. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.
7. If necessary, install throttle body air tube.

SENSOR-KNOCK

DESCRIPTION

The sensors are used only with 3.7L V-6, 4.7L V-8 and 5.7L V-8 engines. On 3.7L V-6 and 4.7L V-8 engines, the 2 knock sensors are bolted into the cylinder block under the intake manifold.

On 5.7L V-8 engines, 2 knock sensors are also used. These are bolted into each side of the cylinder block (outside) under the exhaust manifold.

OPERATION

3.7L V-6 / 4.7L V-8 / 5.7L V-8 Engines Only

Two knock sensors are used; one for each cylinder bank. When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

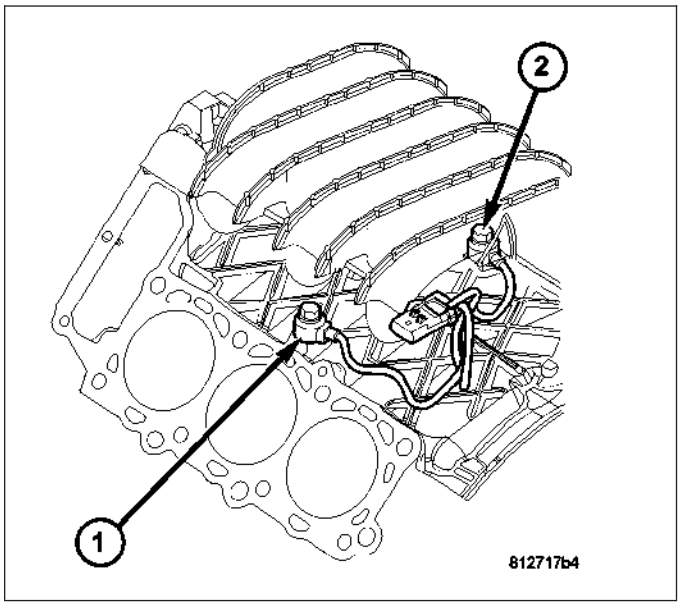
Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.

REMOVAL

3.7L V-6

The 2 knock sensors are bolted into the cylinder block under the intake manifold (1) and (2).

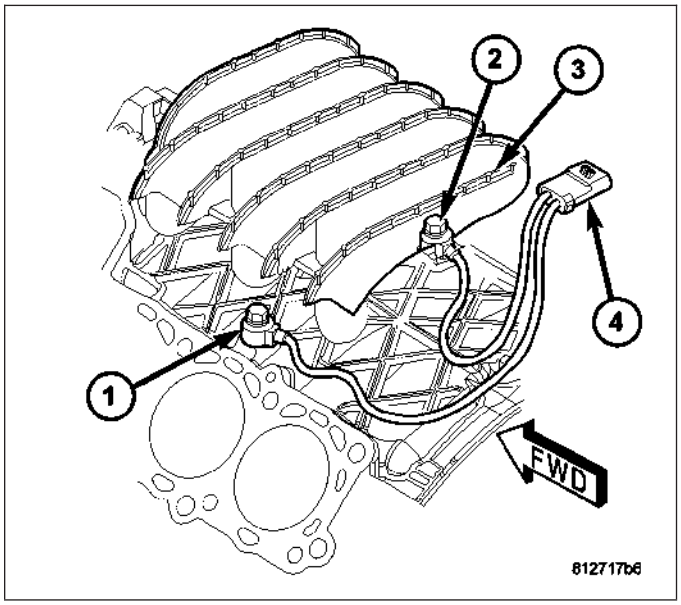


NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
2. Remove intake manifold. Refer to Engine section.
3. Remove sensor mounting bolts (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors from engine.

4.7L V-8

The two knock sensors (1) are bolted into the cylinder block under the intake manifold (3).



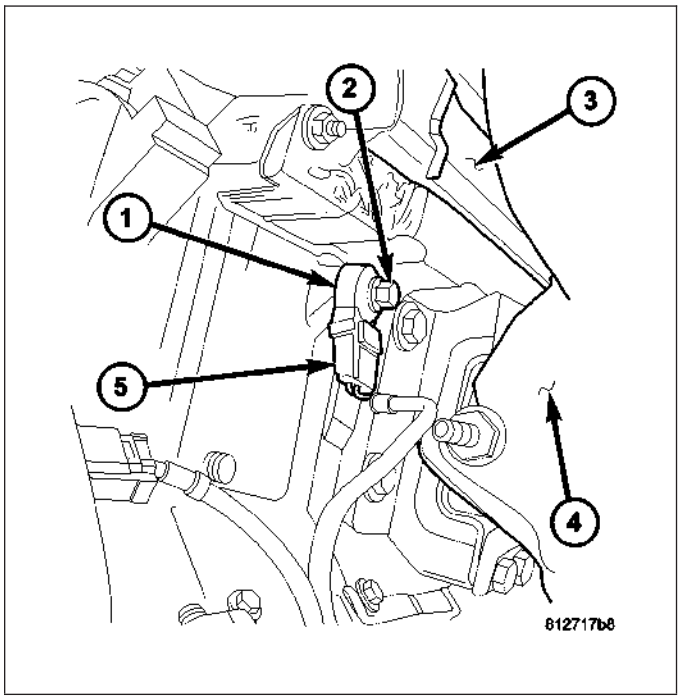
NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
2. Remove intake manifold. Refer to Engine section.
3. Remove sensor mounting bolts (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors from engine.

5.7L V8

Two sensors (1) are used. Each sensor is bolted into the outside of cylinder block below the exhaust manifold (3).

1. Raise vehicle.
2. Disconnect knock sensor electrical connector (5).
3. Remove sensor mounting bolt (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensor from engine.



INSTALLATION

3.7L V-6 / 4.7L V-8

NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Thoroughly clean knock sensor mounting holes.
2. Install sensors into cylinder block.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock senor bolt is relatively light for an 8mm bolt.

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolts. Refer to torque specification.
4. Install intake manifold. Refer to Engine section.
5. Connect knock sensor wiring harness to engine harness at rear of intake manifold.

5.7L V-8

1. Thoroughly clean knock sensor mounting hole.
2. Install sensor into cylinder block.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock senor bolt is relatively light for an 8mm bolt.

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolt. Refer to torque specification.
4. Install electrical connector to sensor.

SPARK PLUG

DESCRIPTION

Resistor type spark plugs are used on all engines.

Sixteen spark plugs (2 per cylinder) are used with 5.7L V-8 engines.

REMOVAL

3.7L V-6

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug. Refer to Ignition Coil Removal/Installation.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil o-ring and replace as necessary.
5. Inspect spark plug condition.

4.7L V-8

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug. Refer to Ignition Coil Removal/Installation.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil o-ring and replace as necessary.
5. Inspect spark plug condition..

5.7L V-8

Eight of the 16 spark plugs are located under an ignition coil; the other 8 are not. If spark plug being removed is under coil, coil must be removed to gain access to spark plug. Refer to Ignition Coil Removal/Installation and observe all CAUTIONS and WARNINGS.

Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.

Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil (if coil removal is necessary), spray compressed air around coil base at cylinder head cover.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert.
5. Inspect spark plug condition.

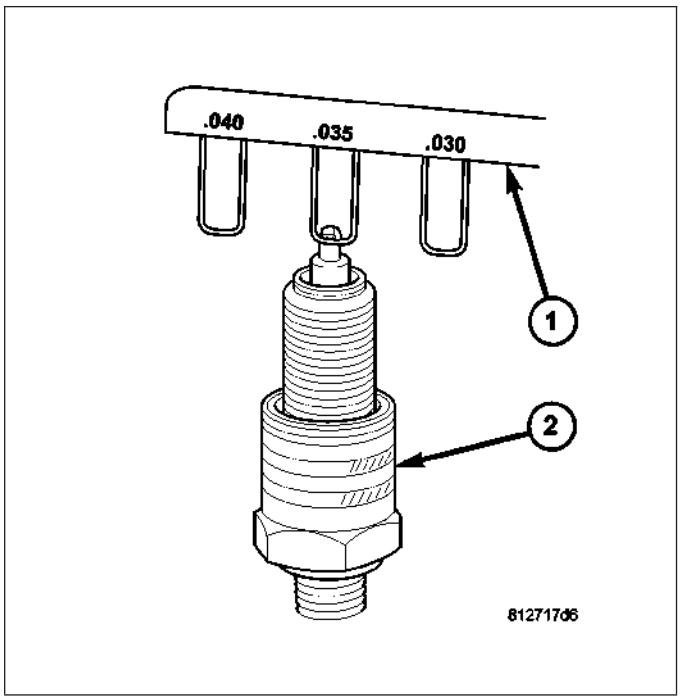
CLEANING

CLEANING AND ADJUSTMENT

The plugs may be cleaned using commercially available spark plug cleaning equipment. After cleaning, file center electrode flat with a small point file or jewelers file before adjusting gap.

CAUTION: Never use a motorized wire wheel brush to clean spark plugs. Metallic deposits will remain on spark plug insulator and will cause plug misfire.

Adjust spark plug gap with a gap gauging tool (1).



INSTALLATION

3.7L V-6

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

1. Start the spark plug into the cylinder head by hand to avoid cross threading.
2. Tighten spark plugs. Refer to torque specifications.
3. Before installing ignition coil(s), check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
4. Install ignition coil(s). Refer to Ignition Coil Removal/Installation.

4.7L V-8

CAUTION: The 4.7L V–8 engine is equipped with copper core ground electrode spark plugs. They must be replaced with the same type/number spark plug as the original. If another spark plug is substituted, pre-ignition will result.

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

1. Start the spark plug into the cylinder head by hand to avoid cross threading.
2. Tighten spark plugs. Refer to torque specifications.
3. Before installing ignition coil(s), check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
4. Install ignition coil(s). Refer to Ignition Coil Removal/Installation.

5.7L V-8

1. Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.
2. Start the spark plug into cylinder head by hand to avoid cross threading aluminum threads. To aid in installation, attach a piece of rubber hose, or an old spark plug boot to spark plug.
3. The 5.7L V-8 is equipped with torque critical design spark plugs. Do not exceed 15 ft. lbs. torque. Tighten spark plugs. Refer to torque specifications.
4. Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.
5. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.
6. Install ignition coil(s) to necessary spark plugs. Refer to Ignition Coil Installation.
7. Install spark plug cables to remaining spark plugs. Remember to apply dielectric grease to inside of boots.

CABLE-SPARK PLUG

DESCRIPTION

Spark plug cables are sometimes referred to as secondary ignition wires, or secondary ignition cables.

Plug cables are used only on the 5.7L V-8 engine.

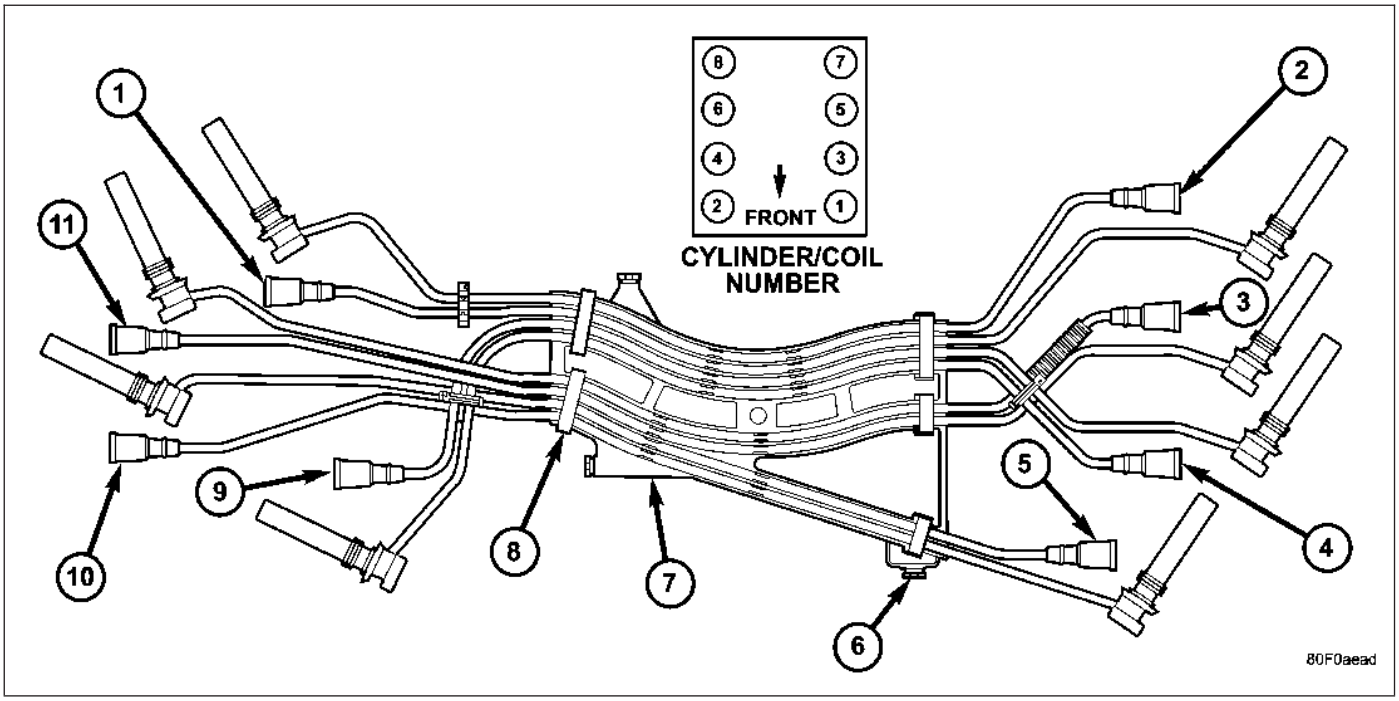
OPERATION

The spark plug cables transfer electrical current from the ignition coil(s) and/or distributor, to individual spark plugs at each cylinder. The resistive spark plug cables are of nonmetallic construction. The cables provide suppression of radio frequency emissions from the ignition system.

Plug cables are used only on the 5.7L V-8 engine.

REMOVAL

5.7L V-8



1 - #8 COIL-TO- #5 SPARK PLUG (MARKED 5/8)
2 - #5 COIL-TO- #8 SPARK PLUG (MARKED 5/8)
3 - #7 COIL-TO- #4 SPARK PLUG (MARKED 4/7)
4 - #3 COIL-TO- #2 SPARK PLUG (MARKED 2/3)
5 - #1 COIL-TO- #6 SPARK PLUG (MARKED 1/6)
6 - CLIPS (TRAY-TO-MANIFOLD RETENTION)
7 - CABLE TRAY
8 - CLIPS (SPARK PLUG CABLE-TO-TRAY- RETENTION)
9 - #2 COIL-TO- #3 SPARK PLUG (MARKED 2/3)
10 - #6 COIL-TO- #1 SPARK PLUG (MARKED 1/6)
11 - #4 COIL-TO- #7 SPARK PLUG (MARKED 4/7)

Spark plug cables on the 5.7L engine are paired on cylinders 1/6, 2/3, 4/7 and 5/8. Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. The cable retention clips (6) and (8) must also be securly locked.

Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.

If cable tray removal is necessary, release the 4 tray-to-manifold retention clips.

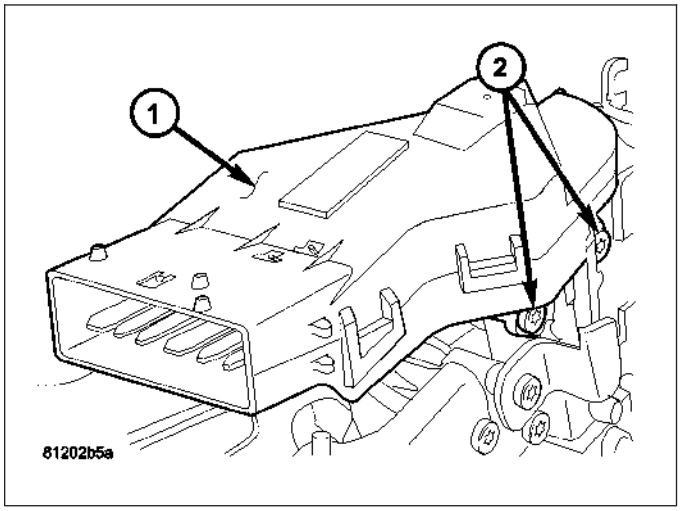
INSTALLATION

1. Install cables into the proper engine cylinder firing order sequence.
2. When replacing the spark plug and coil cables, route the cables correctly and secure them in the proper retainers. Failure to route the cables properly may cause the radio to reproduce ignition noise. It could also cause cross-ignition of the plugs, or, may short-circuit the cables to ground.
3. When installing new cables, make sure a positive connection is made. A snap should be felt when a good connection is made.
4. Refer to Spark Plug Cable Removal for additional information.

SWITCH-IGNITION

DESCRIPTION

The ignition switch (1) is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.



OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

DIAGNOSIS AND TESTING

IGNITION SWITCH

TEST AND REPAIR

If the key removal effort is excessive on a vehicle with a automatic transmission first adjust the shift linkage, (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 46RE/GEAR SHIFT CABLE - ADJUSTMENTS).

If the ignition switch effort is excessive remove the ignition key cylinder from the steering column. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL). Check the turning effort of the key cylinder. If the ignition key cylinder effort is excessive replace the key cylinder. If the ignition key cylinder operates properly look for the following conditions.

REMOVAL

SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

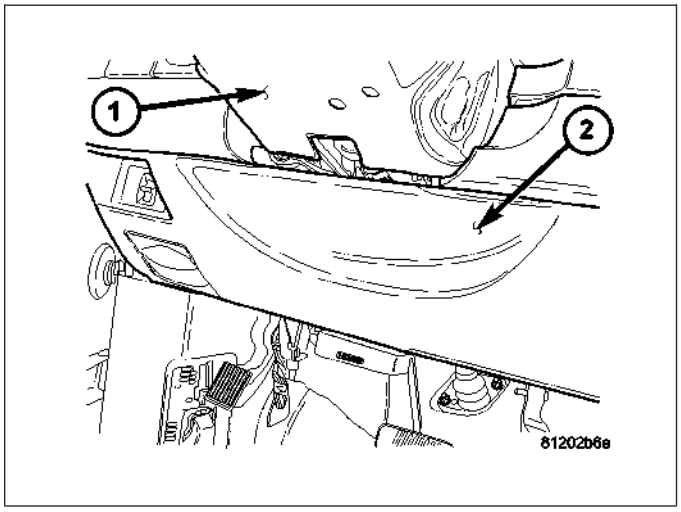
To service the steering wheel, switches or airbag, Refer to Electrical Restraints and follow all WARNINGS and CAUTIONS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

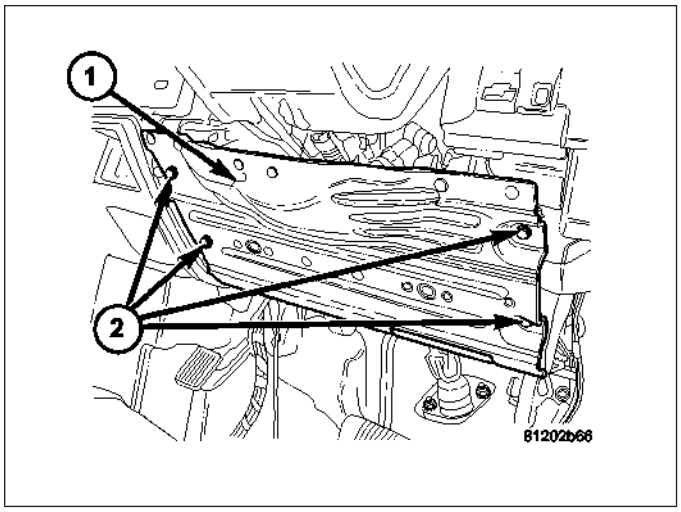
CAUTION: Do not hammer on steering column shaft. This may cause damage to the shaft or bearing.

CAUTION: Do not attempt to remove the pivot bolts to disassemble the tilting mechanism.

1. Remove the steering column opening cover (2).

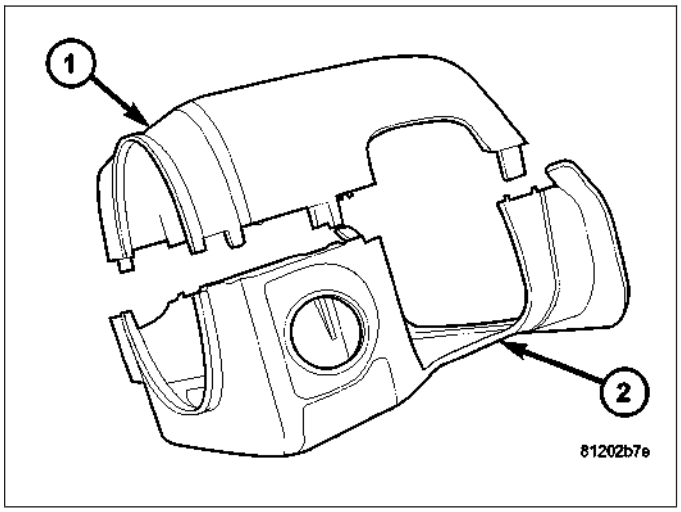


2. Remove the steering column opening reinforcement (1).



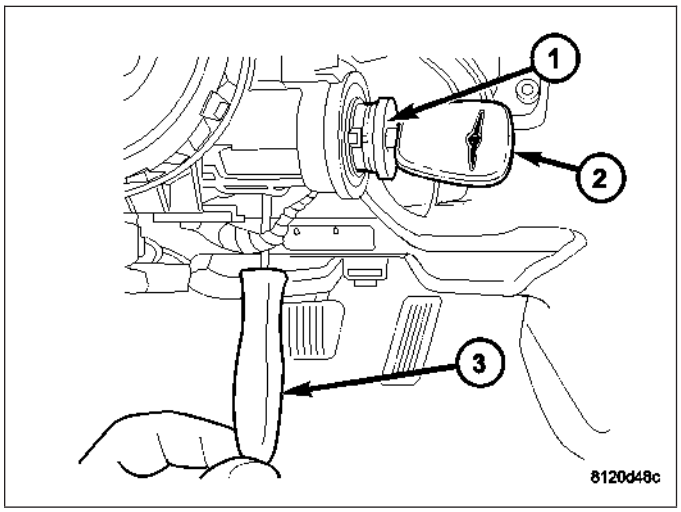
The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

3. Remove the negative (ground) cable from the battery.
4. Disable the airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

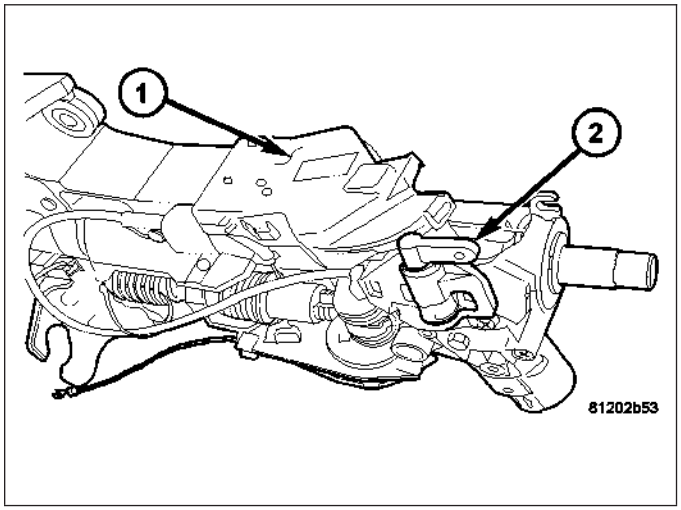


5. Remove the lower and upper shrouds (1&2).

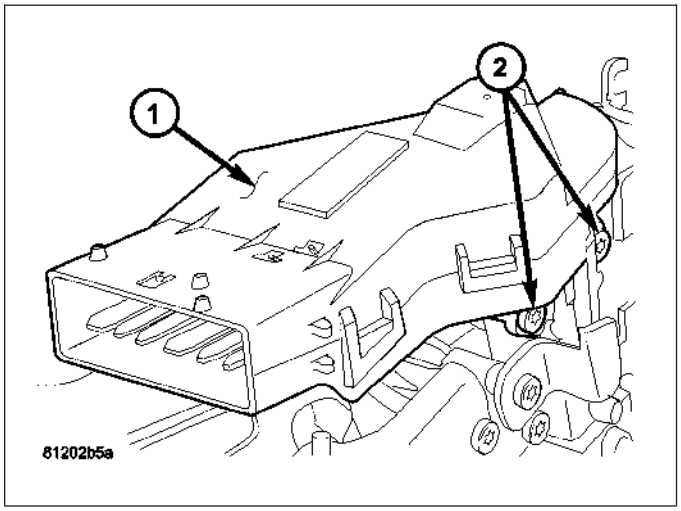
6. Remove key cylinder. (Refer to 19 - STEERING/ COLUMN/LOCK CYLINDER HOUSING - REMOVAL).



7. Disconnect the lower clockspring connectors.
8. Remove the wire retainer from the tilt lever bracket (2).
9. Remove the tilt lever mounting screws to gain access to the ignition switch mounting screws.

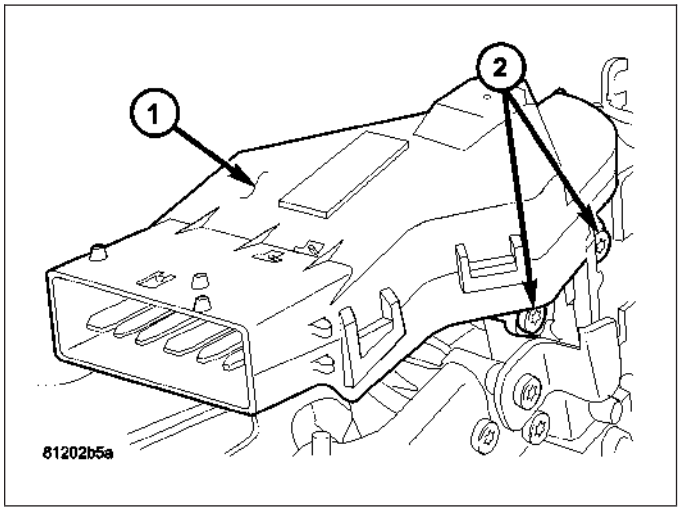


10. Disconnect the electrical connector at rear of ignition switch (1).
11. Remove ignition switch mounting screws (2).
12. Using a small screwdriver, push on locking tab and remove switch from steering column.

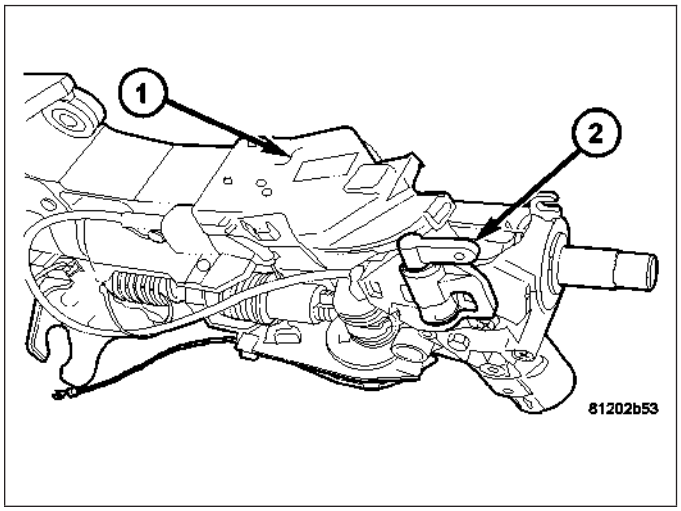


INSTALLATION

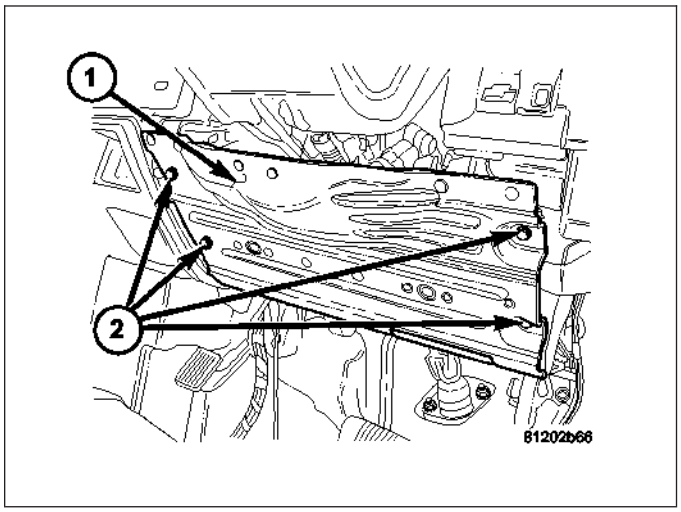
1. Before installing ignition switch (1), rotate the slot in the switch to the ON position.
2. Connect the electrical connector to rear of the ignition switch. Make sure that locking tabs are fully seated into wiring connector.
3. Position switch to column and install the mounting screws (2). Tighten screw to 3 N·m (26 in. lbs.).



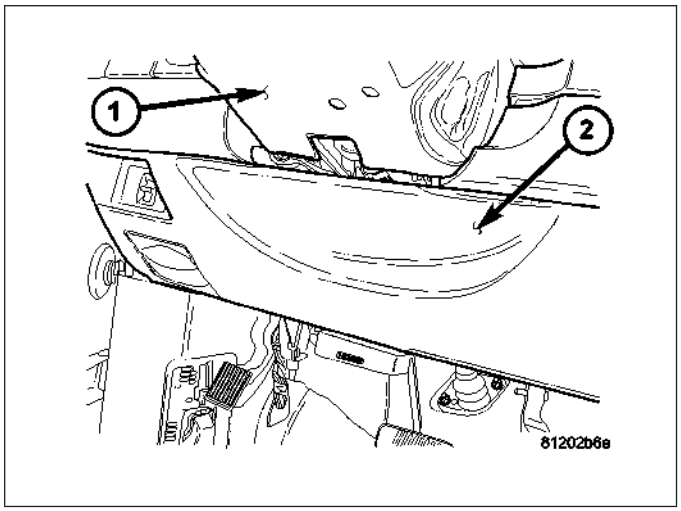
4. Install the tilt lever bracket (2) mounting screws. Tighten screws to 4.5 N·m (40 in. lbs.).
5. Position the wire retainer into the tilt lever bracket.
6. Reconnect the lower clockspring connectors.



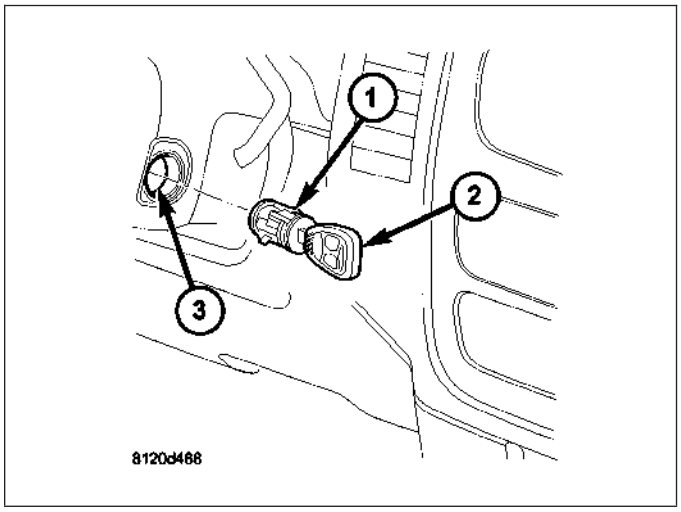
7. Install the steering column opening reinforcement (1).



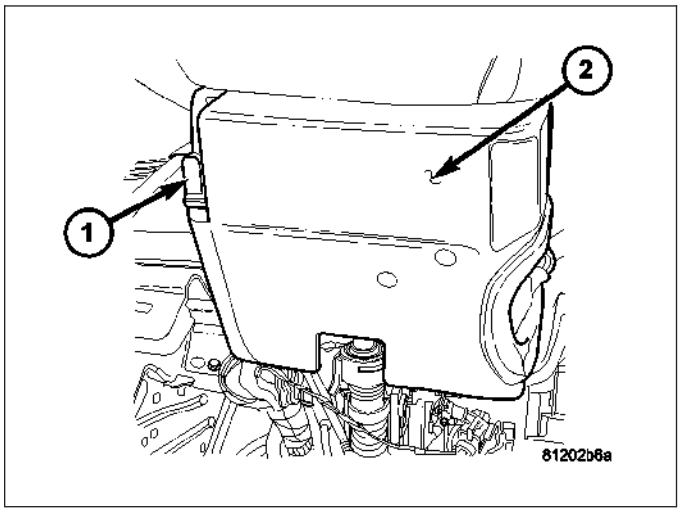
8. Install the steering column opening cover (2).



9. Install the key cylinder (1) with the key (2) in the cylinder (1).



10. Install steering column upper and lower shrouds (2).
11. Install the tilt lever knob (1).
12. Enable the airbag system. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).



SWITCH-KEY-IN IGNITION

DESCRIPTION

The key-in ignition switch is integral to the ignition switch, which is mounted on the left side of the steering column. It closes a path to ground for the Central Timer Module (CTM) when the ignition key is inserted in the ignition key cylinder and the driver door ajar switch is closed (driver door is open). The key-in ignition switch opens the ground path when the key is removed from the ignition key cylinder. The ground path is also opened when the driver door ajar switch is open (driver door is closed).

The key-in ignition switch cannot be repaired and, if faulty or damaged, the entire ignition switch must be replaced, (Refer to 19 - STEERING/COLUMN/IGNITION SWITCH - REMOVAL).

DIAGNOSIS AND TESTING

IGNITION SWITCH AND KEY LOCK CYLINDER

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to the appropriate section in Wiring Diagrams.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key cylinder. The lever must be manually operated to allow rotation of the ignition key cylinder to any position. If it is difficult to rotate the key to any position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced. (Refer to 19 - STEERING/COLUMN - REMOVAL).

DIAGNOSIS AND TESTING

B1200-AIRBAG WARNING INDICATOR CIRCUIT LOW

For a complete wiring diagram **Refer to section 8W**.

- **When Monitored:**
  With the ignition on and when requested to turn on by the Occupant Restraint Controller (ORC).
- **Set Condition:**
  The Instrument Cluster software detects the voltage across the Airbag Lamp is below 0.3 volts when ON.

Possible Causes
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK THE INSTRUMENT CLUSTER FOR DTC B1200-AIRBAG WARNING INDICATOR CIRCUIT LOW

NOTE: The Instrument Cluster performs internal tests on the Airbag Lamp during each ignition cycle.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Wait for the Instrument Cluster to perform the bulb check.

With the scan tool, read DTCs.

Did the DTC B1200-AIRBAG WARNING INDICATOR CIRCUIT LOW reset?

Yes >> Replace and program the Instrument Cluster in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Test complete.

B1201-AIRBAG WARNING INDICATOR CIRCUIT HIGH

For a complete wiring diagram **Refer to section 8W**.

- **When Monitored:**
  With the ignition on and when requested to turn on by the Occupant Restraint Controller (ORC).
- **Set Condition:**
  The Instrument Cluster software detects the voltage across the Airbag Lamp is above 5.0 volts when ON.

Possible Causes
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK THE INSTRUMENT CLUSTER FOR DTC B1201-AIRBAG WARNING INDICATOR CIRCUIT HIGH

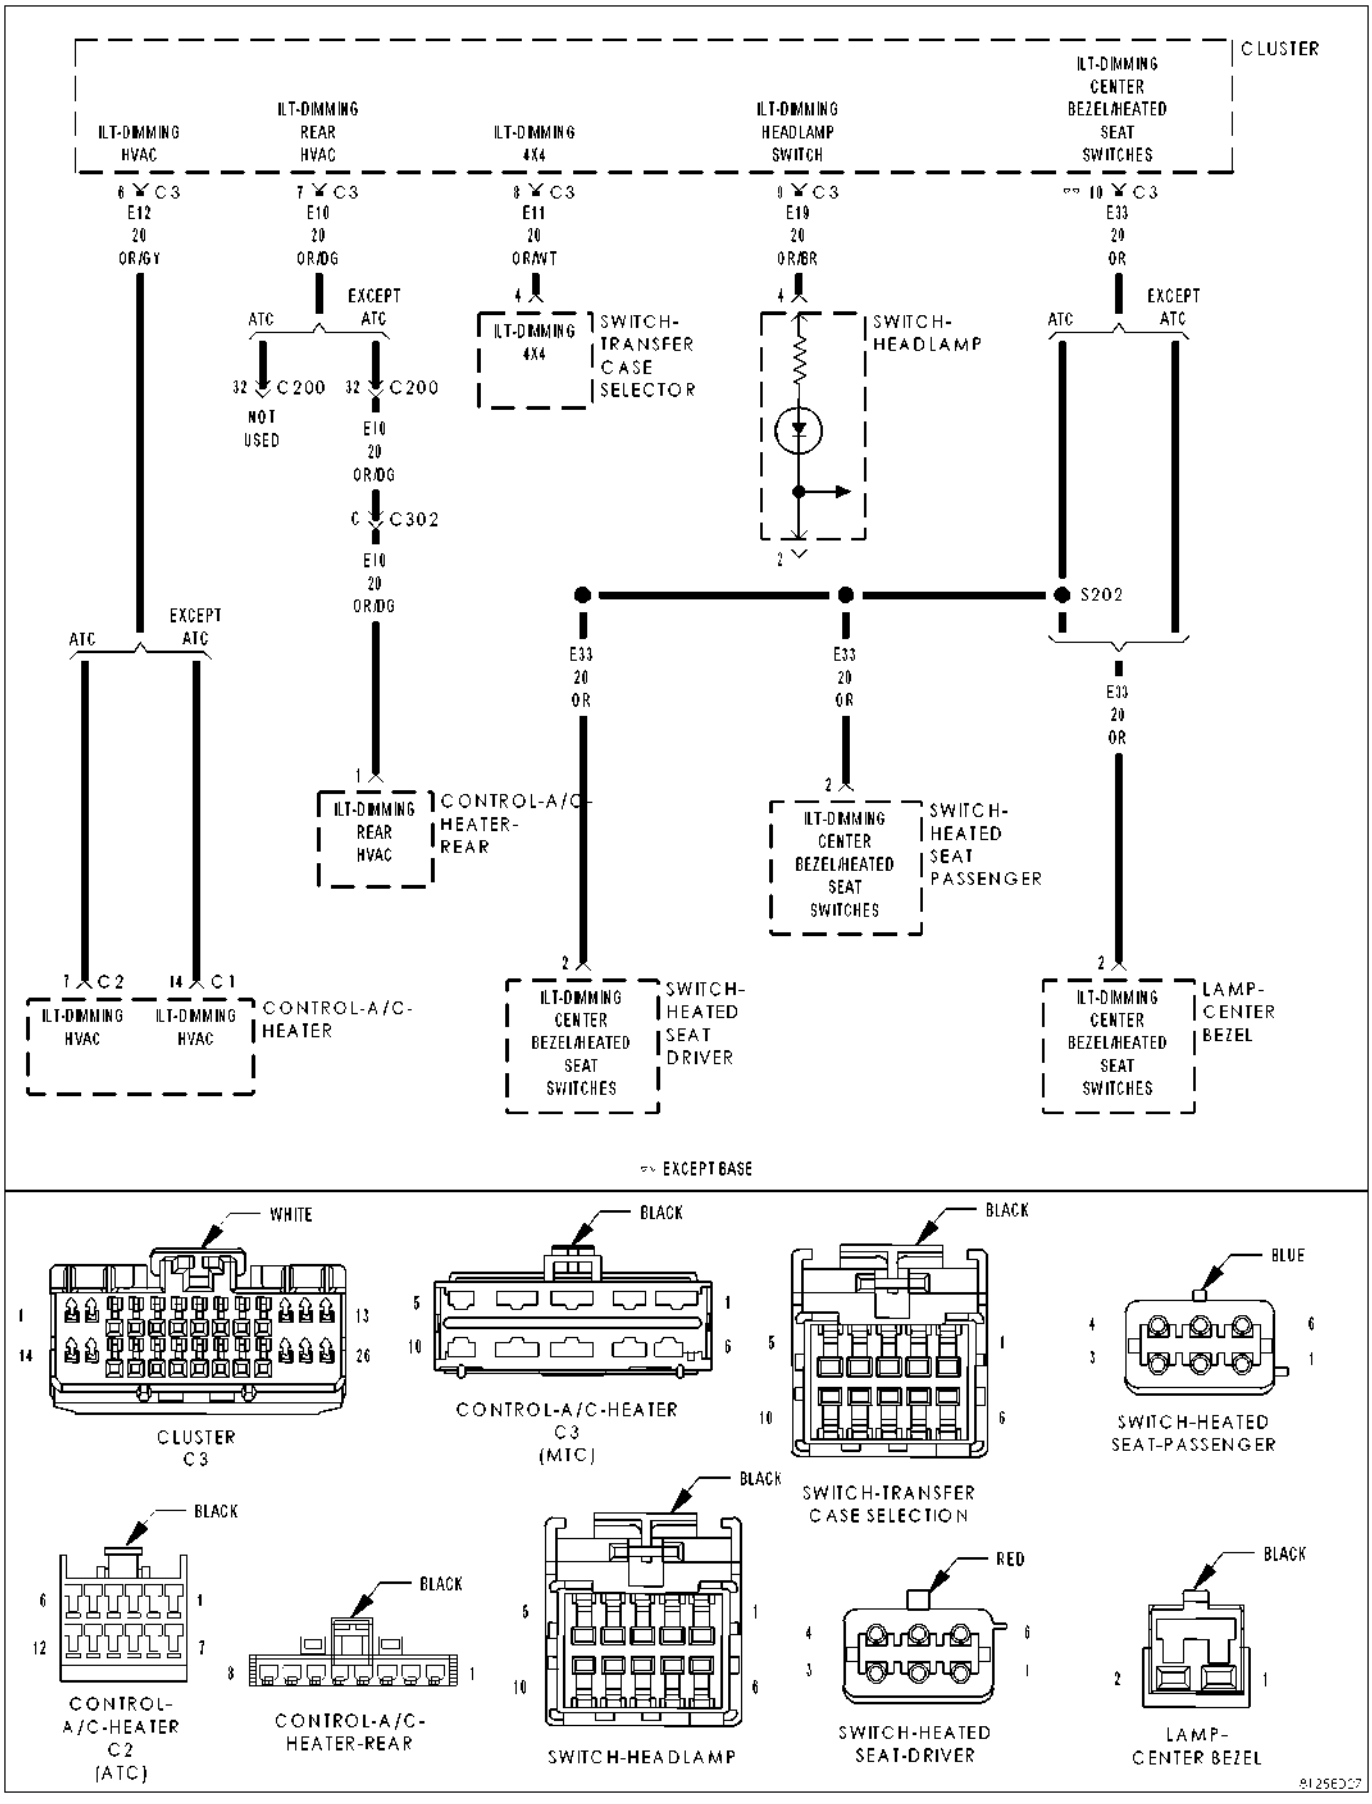
NOTE: The Instrument Cluster performs internal tests on the Airbag Lamp during each ignition cycle.
With the scan tool, erase DTCs.
Turn the ignition off, wait 10 seconds, then turn the ignition on.
Wait for the Instrument Cluster to perform the bulb check.
With the scan tool, read DTCs.

Did the DTC B1201-AIRBAG WARNING INDICATOR CIRCUIT HIGH reset?

Yes >> Replace and program the Instrument Cluster in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Test complete.

B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW



B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects a short to ground condition on the Panel Illumination circuit.

Possible Causes
PANEL LAMPS DIMMER CIRCUIT SHORTED TO GROUND
DIMMED COMPONENT INTERNALLY SHORTED
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Turn the headlamps on.

With the scan tool, read DTCs.

Does the scan tool display: B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

---

2. INTERNALLY SHORTED DIMMED COMPONENT

Turn the ignition on.

With the scan tool, erase Instrument Cluster DTCs.

Turn the ignition off.

Using the wiring diagrams as a guide, disconnect each dimmed component one at a time while checking for the DTC to reset.

Turn the ignition on.

Turn the headlamps on.

With the scan tool, read DTCs.

Does the scan tool display B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW?

Yes >> Go To 3

No >> Replace the shorted component as necessary.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)

3. PANEL LAMPS DIMMING CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

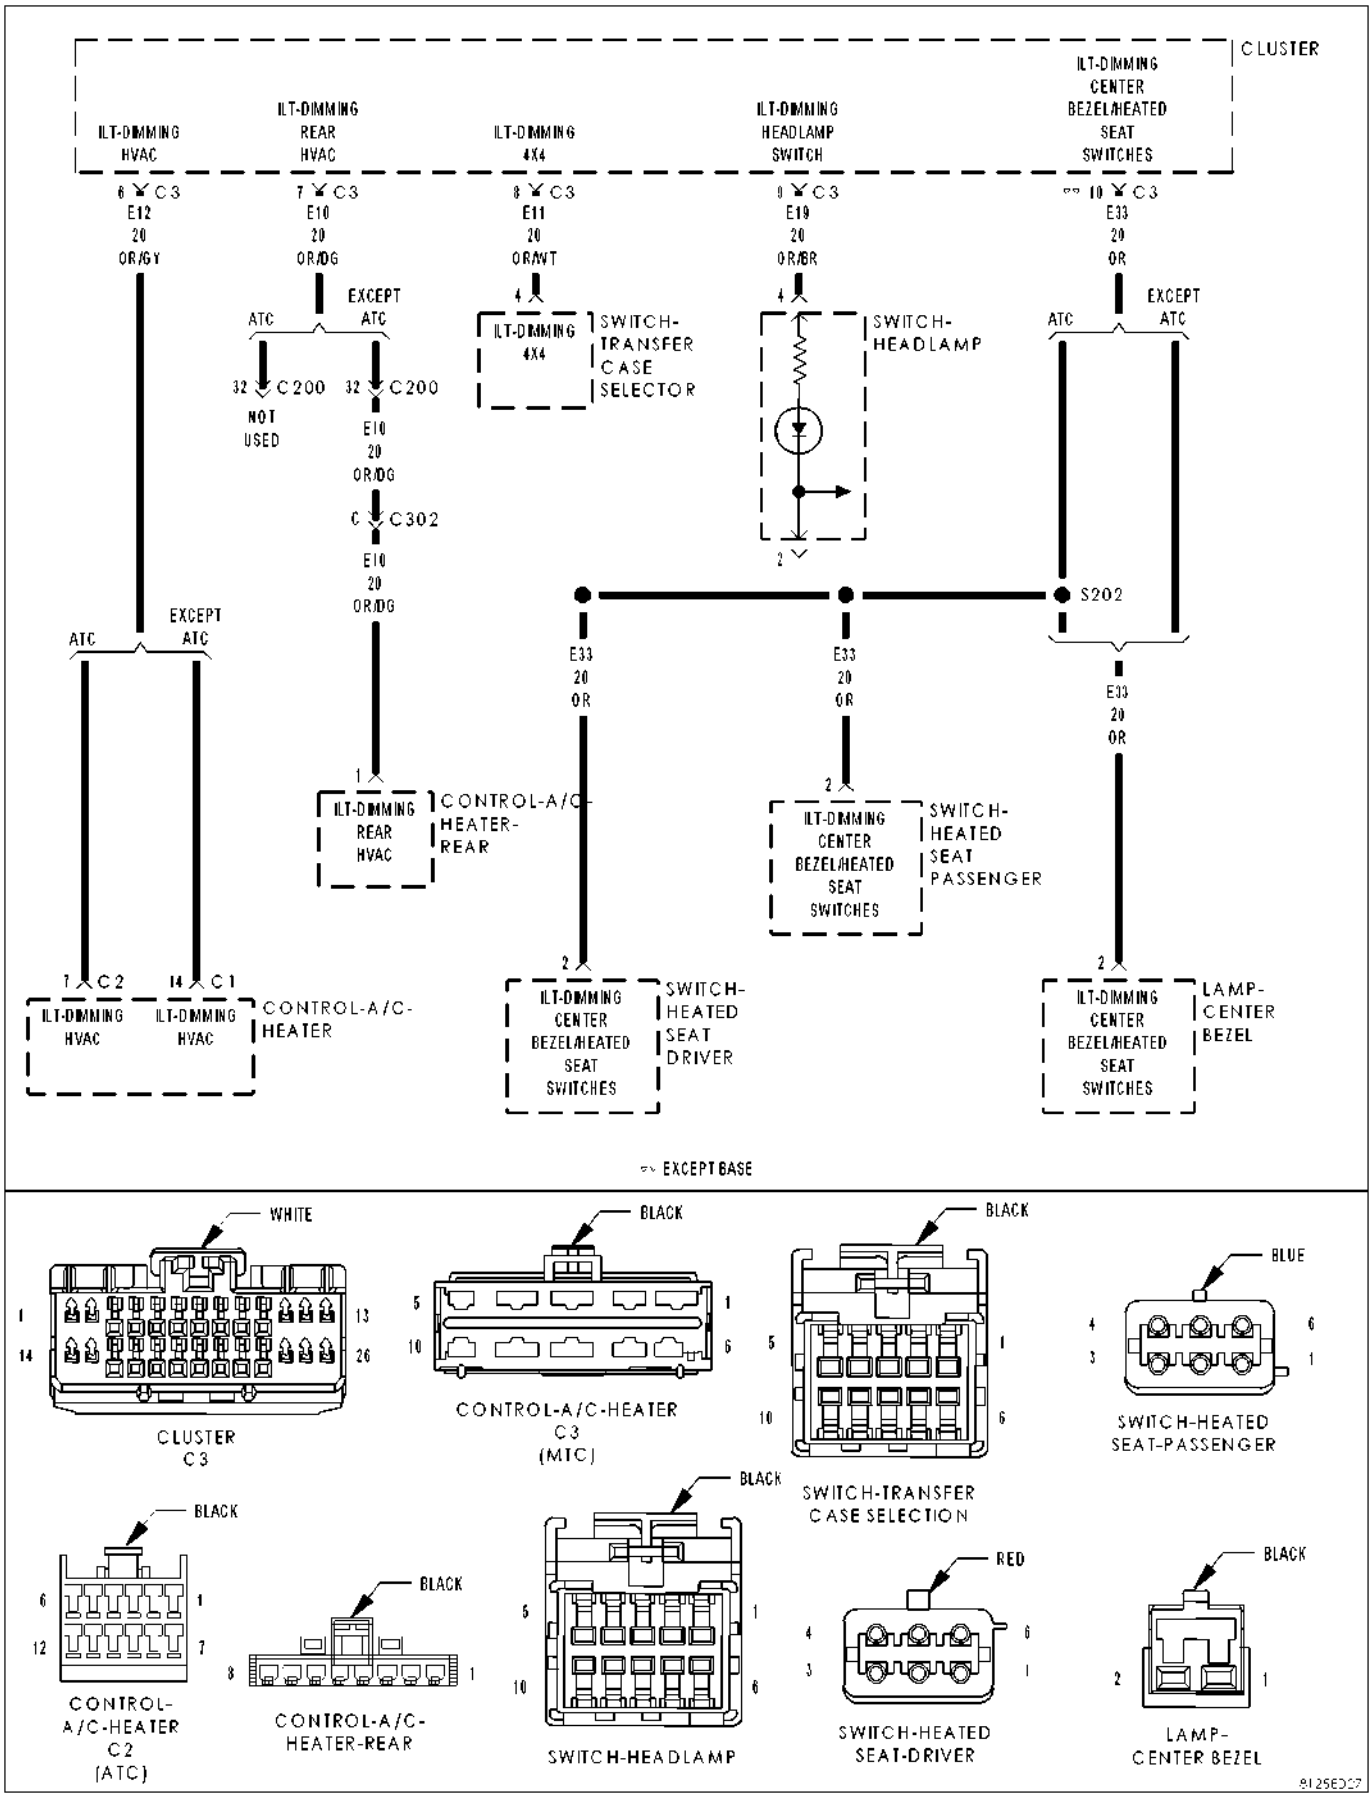
Using the wiring diagram as a guide, disconnect each dimmed component and measure the resistance of the Panel Illumination Control Circuits from the Cluster C3 harness connector to ground.

Was there a short to ground condition found?

Yes >> Repair the correct Panel Illumination Circuit for a short to ground.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Instrument Cluster in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN



B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN (CONTINUED)

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects an all open condition on the Panel Illumination Control circuits.

Possible Causes
ALL PANEL ILLUMINATON CIRCUITS OPEN
INSTRUMENT CLUSTER

Theory of Operation

The Panel Illumination Control Circuits share a common 12 volt driver from the Instrument Cluster. In order for this DTC to be set, ALL Panel Illumination circuits must be open.

Diagnostic Test

1. TEST FOR AN INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Turn the headlamps on.

With the scan tool, read DTCs.

Does the scan tool display: B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

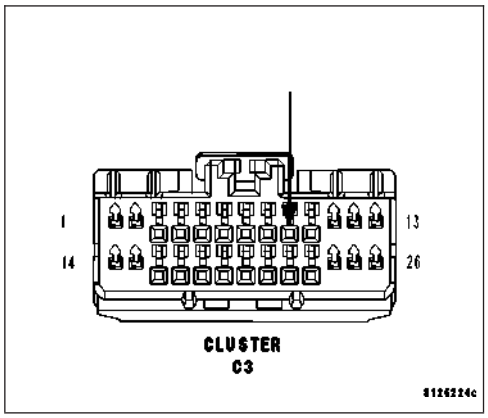
B1615-PANEL ILLUMINATION CONTROL CIRCUIT OPEN (CONTINUED)

2. CHECK CONDITION OF THE WIRING AND CONNECTORS ASSOCIATED WITH THE PANEL ILLUMINATION OUTPUT CIRCUITS

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector and inspect the connector and associated wiring for the Panel Illumination System.

Using a fused jumper wire, probe cavity 9 of the Instrument Cluster C3 connector.



Did the illumination of the Headlamp Switch illuminate?

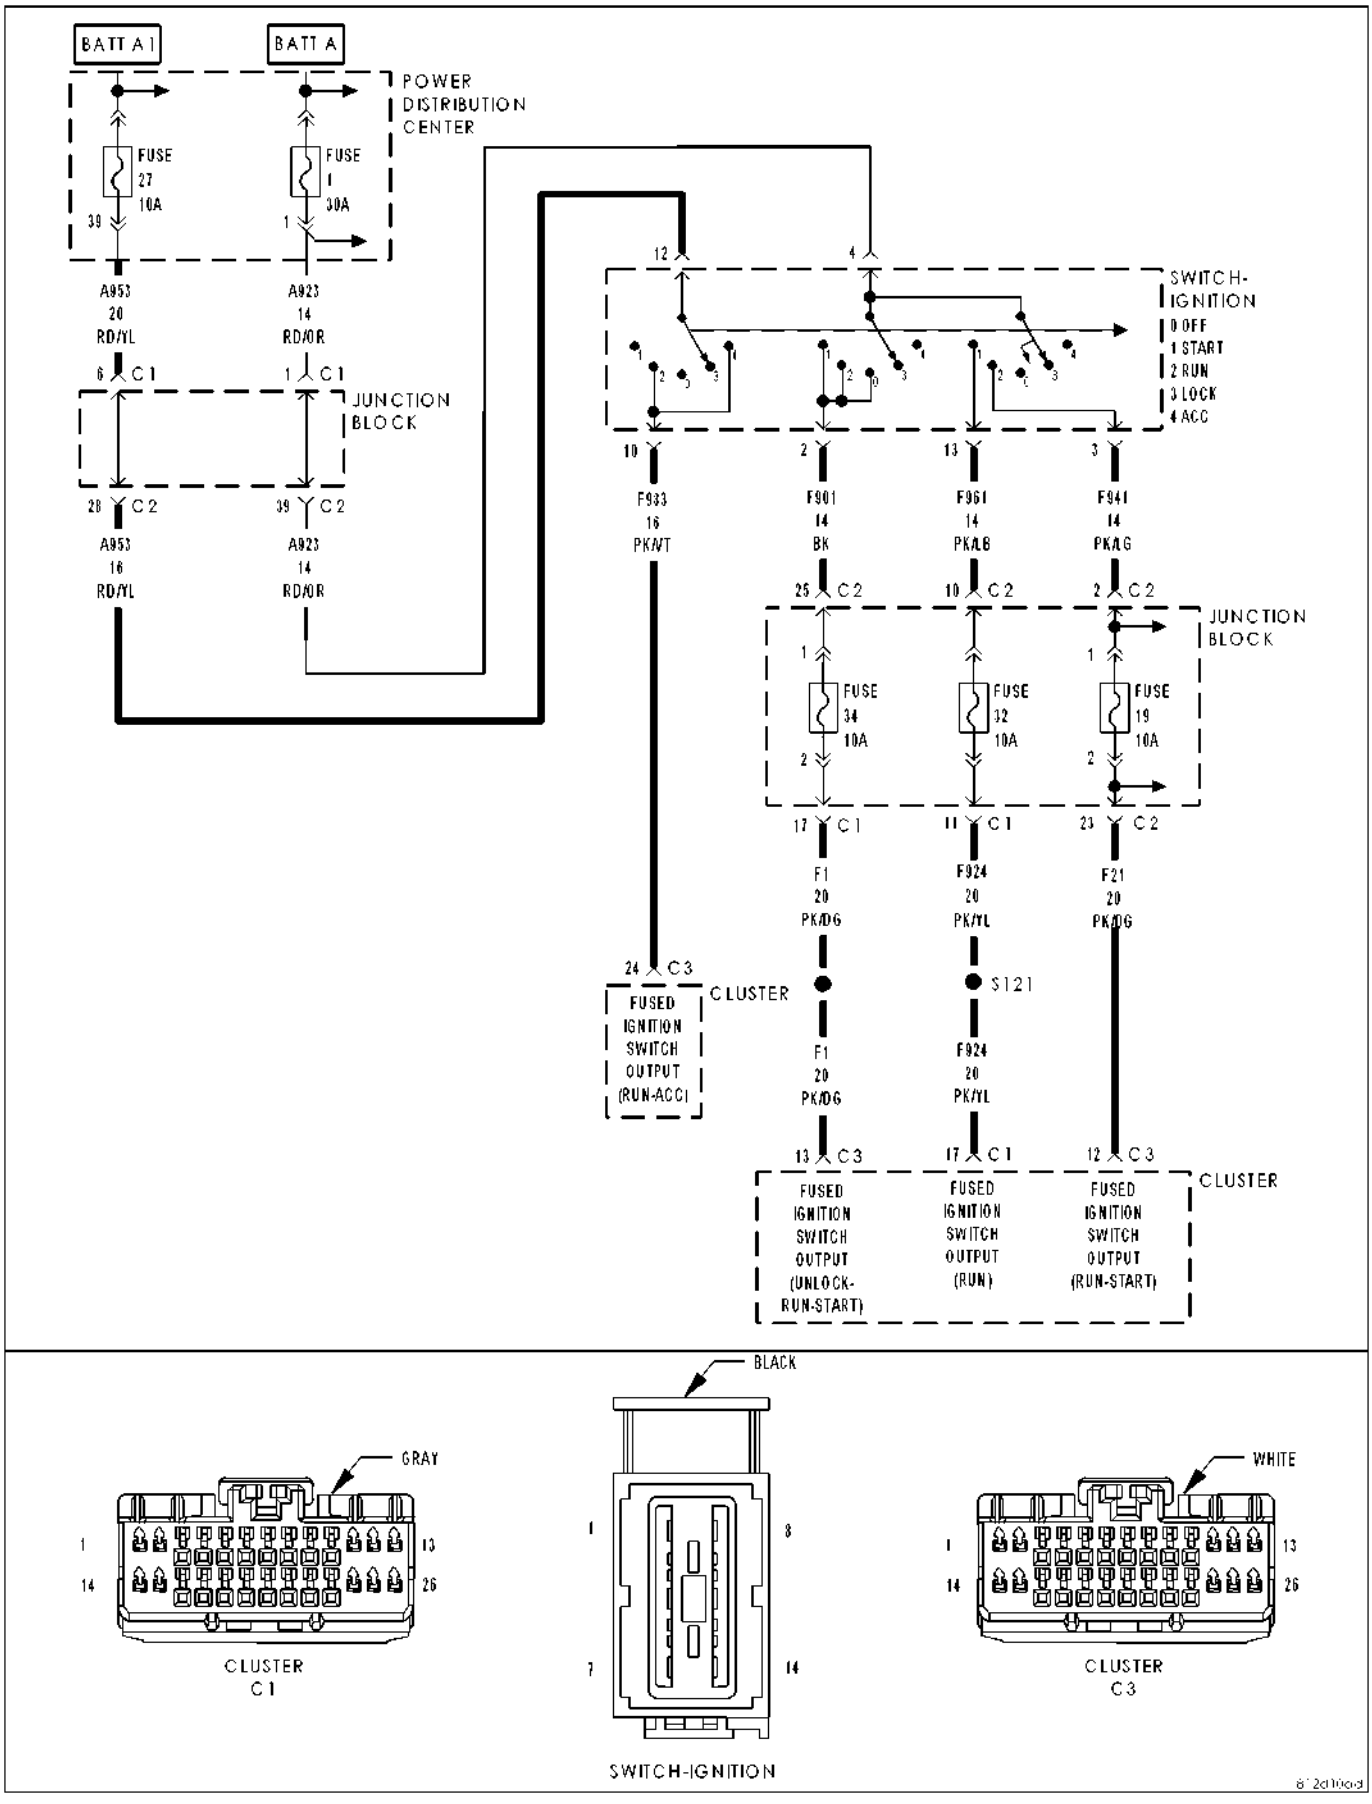
Yes >> Replace the Instrument Cluster in accordance with the Service Information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Repair the faulty wire(s)/connector(s).

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE



B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Cluster detects an Ignition Switch performance fault.

Possible Causes
OPEN IGNITION SWITCH OUTPUT FUSE(S)
(F21) IGNITION SWITCH OUTPUT (OFF/RUN/START) CIRCUIT OPEN OR SHORTED TO GROUND
(F1) IGNITION SWITCH OUTPUT (UNLOCK/RUN/START) CIRCUIT OPEN OR SHORTED TO GROUND
(F924) IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
(F983) IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT OPEN OR SHORTED TO GROUND
(A953) IGNITION (RUN/ACC) CIRCUIT OPEN OR SHORTED TO GROUND
IGNITION SWITCH
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR AN INTERMITTENT CONDITION

NOTE: Troubleshoot any Ignition, Battery, or Cluster DTCs before proceeding.

Turn the ignition on.

Using the scan tool, record and erase DTCs.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Using the scan tool, read DTCs.

Does the scan tool display: B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

2. CHECK FOR OPEN IGNITION SWITCH OUTPUT FUSES

Turn the ignition off.

Using the wiring/circuit diagrams, check the following fuses for an open:

- PDC fuse #27
- PDC fuse # 1
- JB fuse #9
- JB fuse #19
- JB fuse #34

Are any of the fuses open?

Yes >> Go To 3

No >> Go To 4

---

3. CHECK FOR OPEN IGNITION SWITCH OUTPUT FUSES

Replace the open fuse(s).

Cycle the ignition through ALL positions.

Turn the ignition off.

Check each fuse that was replaced for an open.

NOTE: Perform the diagnostic procedure for each fuse that is open before making any repairs. Doing so will identify all possible conditions causing this DTC to set.

Was any replaced fuse open? (Select from the following)

PDC fuse #27
Go To 9

JB fuse #19
Go To 12

JB fuse #34
Go To 13

JB fuse #9
Go To 14

PDC fuse #1
Go To 15

No fuses open
The condition that caused the fuse(s) to open is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

4. CHECK VOLTAGE OF THE IGNITION SWITCH OUTPUT CIRCUITS AT THE INSTRUMENT CLUSTER C1 AND C3 CONNECTORS

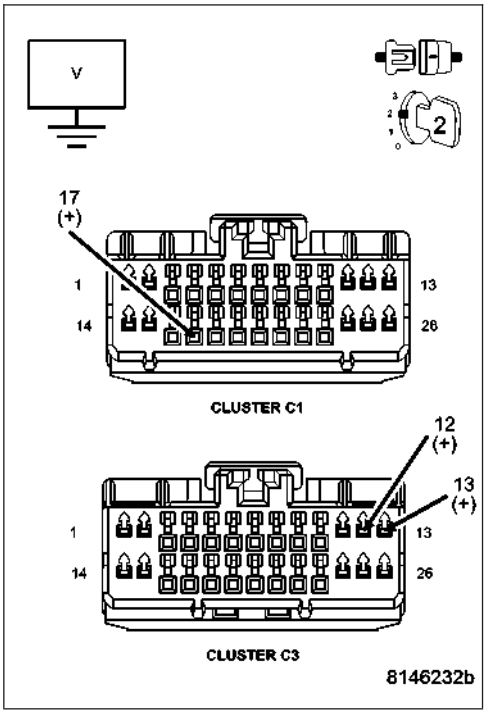
NOTE: Remove the starter relay.
Disconnect the Instrument Cluster C1 and C3 harness connectors.
Turn the ignition on.
Measure the voltage of the following circuits:

- (F21) Ignition Switch Output (RUN/START) circuit with the ignition in the RUN, and START positions.
- (F1) Ignition Switch Output (UNLOCK/RUN/START) circuit with the ignition in the RUN and START positions.
- (F924) Ignition Switch Output (RUN) circuit with the ignition in the RUN position.

Is the voltage above 10.0 volts on each circuit?

Yes >> Go To 5

No >> Go To 5



5. CHECK VOLTAGE OF THE (F983) IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT AT THE INSTRUMENT CLUSTER C3 HARNESS CONNECTOR

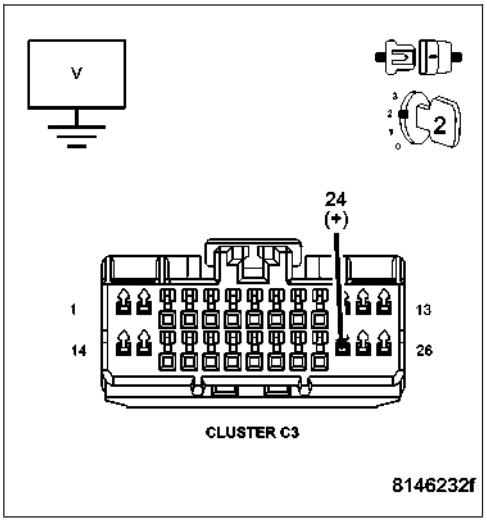
NOTE: Reinstall the Starter Relay.
Measure the voltage of the (F983) Ignition Switch Output (RUN/ACC) circuit.

Is the voltage above 10.0 volts on all the circuits tested in steps 4 and 5?

Yes >> Replace the Instrument Cluster in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER 1.

No: (F21) (F924) or (F1) below 10.0 volts
Go To 6

No: (F983) below 10.0 volts
Go To 7



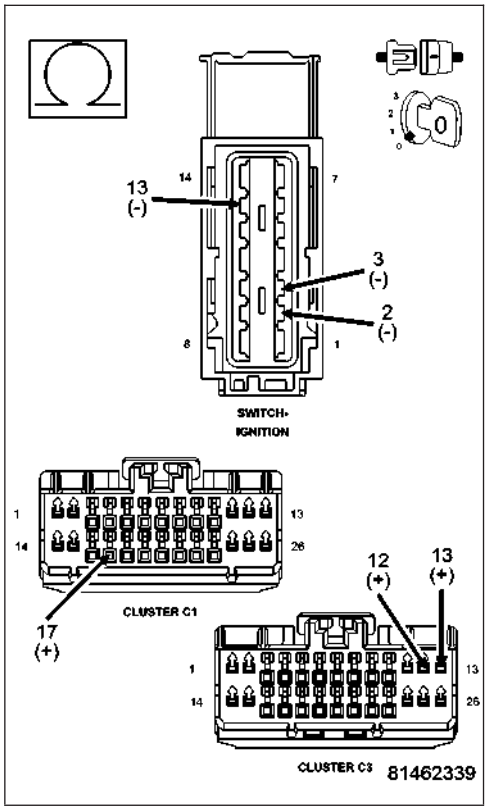
B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

6. CHECK THE IGNITION SWITCH OUTPUT CIRCUITS WITH VOLTAGE BELOW 10.0 VOLTS FOR AN OPEN

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Measure the resistance of the Ignition Switch Output circuit(s) (F21), (F924), (F1) (from step 5, the circuit(s) below 10.0 volts) between the Ignition Switch harness connector and the Instrument Cluster C1/C3 harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Ignition Switch in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Repair the circuit(s) with a resistance above 5.0 ohms.

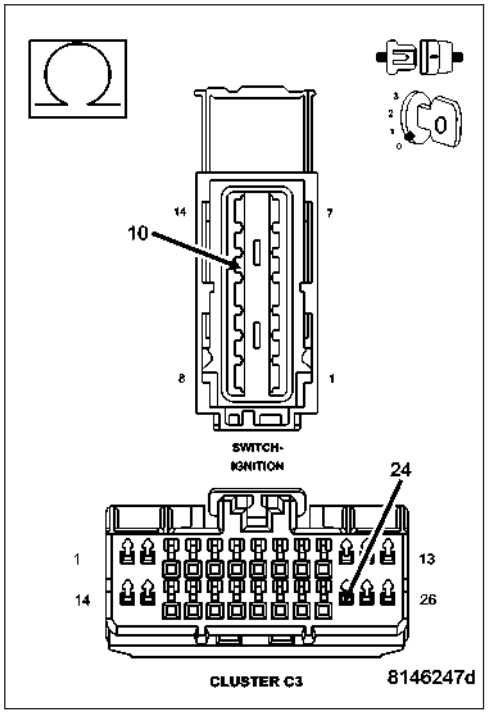
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

7. CHECK THE (F983) IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Measure the resistance of the (F983) Ignition Switch Output (RUN/ ACC) circuit between the Ignition Switch harness connector and the Instrument Cluster C3 harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 8

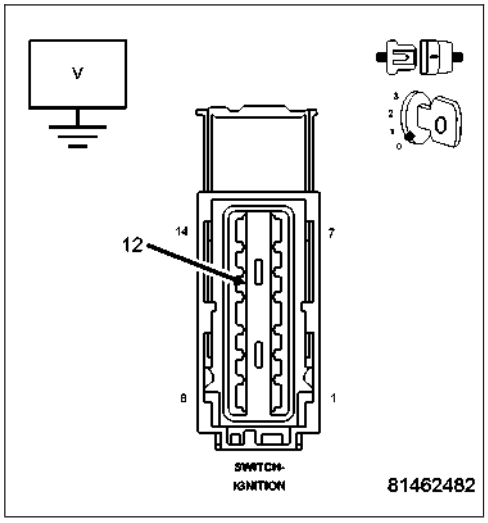
No >> Repair the (F983) Ignition Switch Output (RUN/ACC) circuit for an open.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

8. CHECK VOLTAGE OF THE (A953) IGNITION (RUN/ACC) CIRCUIT AT THE IGNITION SWITCH HARNESS CONNECTOR

Measure the voltage of the (A953) Ignition (RUN/ACC) circuit.



Is the voltage above 10.0 volts?

Yes >> Replace the Ignition Switch in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

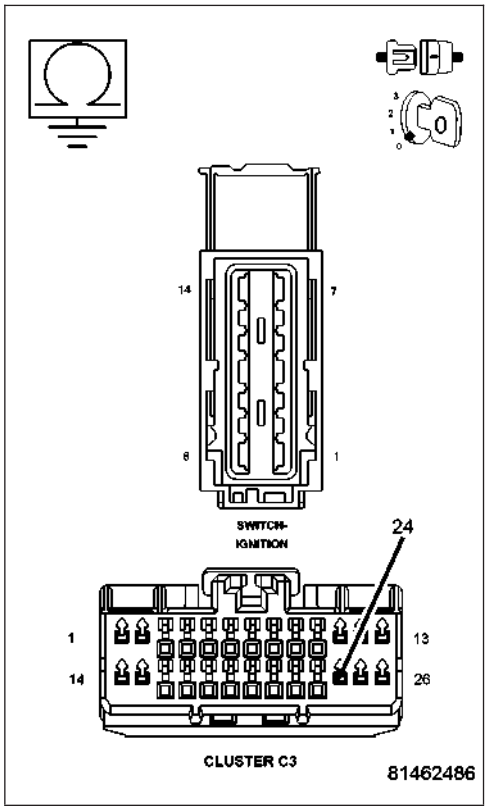
No >> Repair the (A953) Ignition (RUN/ACC) circuit for an open.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

9. CHECK (F983) IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Ignition Switch harness connector.

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance between ground and the (F983) Ignition Switch Output (RUN/ACC) circuit at the Ignition Switch harness connector.



Is the resistance below 10K ohms?

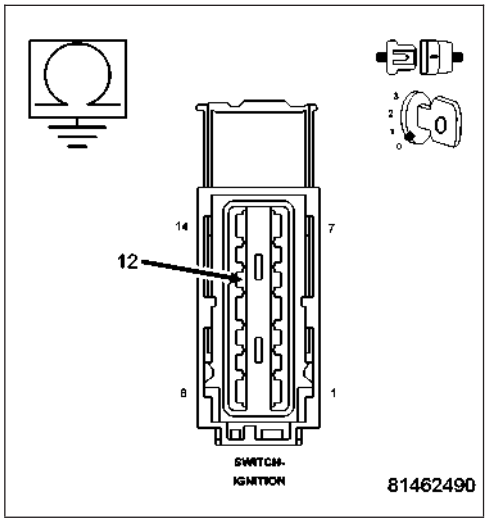
YES >> Repair the (F983) Ignition Switch Output (RUN/ACC) circuit for a short to ground.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Go To 10

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

10. CHECK (A953) IGNITION SWITCH OUTPUT (RUN/ACC) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (A953) Ignition Switch Output (RUN/ACC) circuit at the Ignition Switch harness connector.



Is the resistance below 10K ohms?

YES >> Repair the (A953) Ignition Switch Output (RUN/ACC) circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Go To 11

11. CHECK THE INSTRUMENT CLUSTER FOR A SHORT TO GROUND

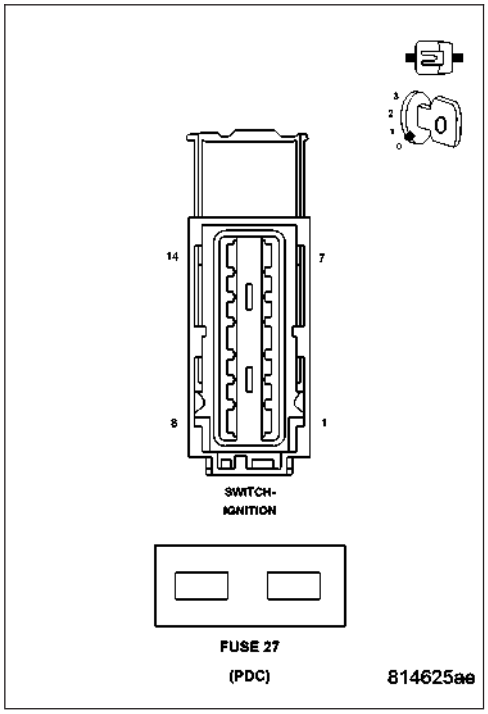
Reconnect the Ignition Switch harness connector.

Replace PDC fuse #27 for the (A953) Ignition Switch Output (RUN/ ACC) circuit.

Cycle the ignition switch through all positions.

Turn the ignition off.

Check the PDC fuse #27 for the (A953) Ignition Switch Output (RUN/ ACC) circuit.



Is the fuse open?

YES >> Replace the Ignition Switch in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Replace the Instrument Cluster in accordance with the service information

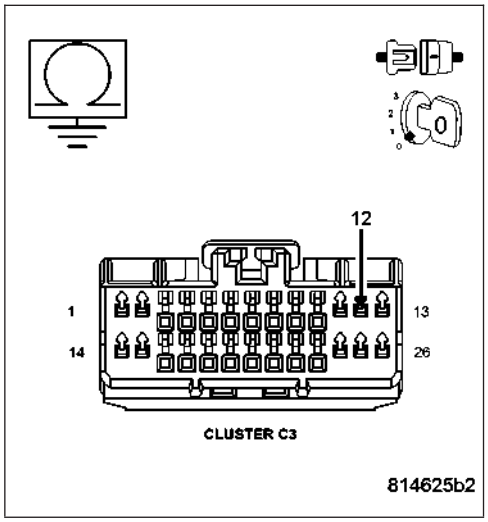
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

12. CHECK (F21) IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance between ground and the (F21) Ignition Switch Output (RUN/START) circuit.



Is the resistance below 10K ohms?

YES >> Repair the (F21) Ignition Switch Output (RUN/START) circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

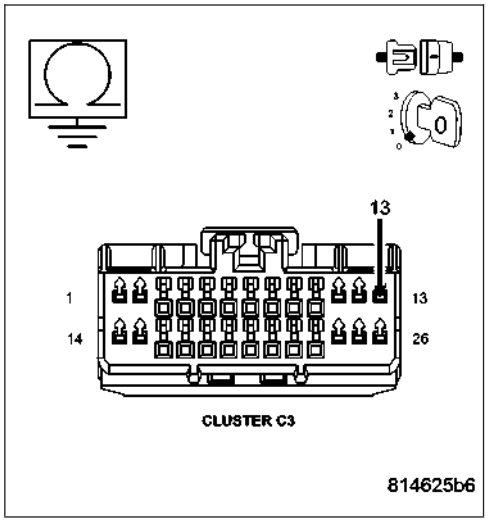
NO >> Replace the Instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

13. CHECK (F1) IGNITION SWITCH OUTPUT (OFF/RUN/START) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance between ground and the (F1) Ignition Switch Output (OFF/RUN/START) circuit.



Is the resistance below 10K ohms?

YES >> Repair the (F1) Ignition Switch Output (OFF/RUN/START) for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Replace the Instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

14. CHECK (F924) IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance between ground and the (F924) Ignition Switch Output (RUN) circuit.

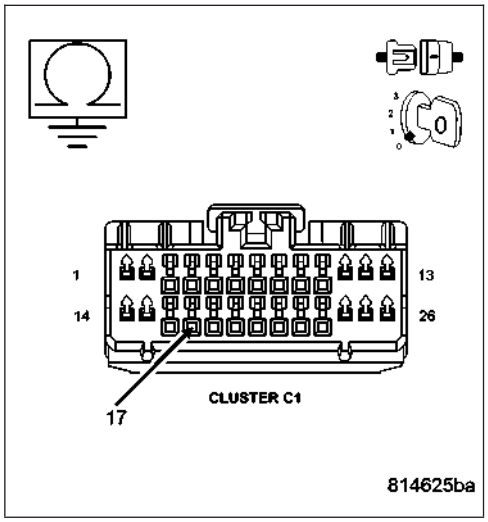
Is the resistance below 10K ohms?

YES >> Repair the (F924) Ignition Switch Output (RUN) circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Replace the Instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)



15. CHECK (A923) FUSED B+ CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

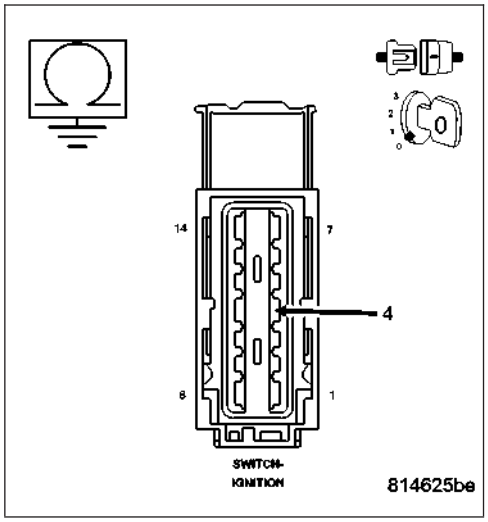
Measure the resistance between ground and the (A923) Fused B+ circuit.

Is the resistance below 10K ohms?

YES >> Repair the (A923) Fused B+ circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1.

NO >> Go To 16

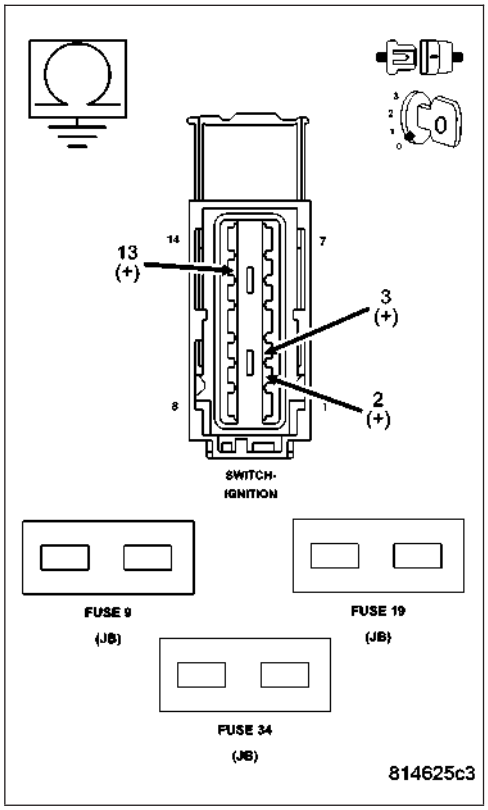


B2107–IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)

16. CHECK CIRCUITS F901, F941, F961 FOR A SHORT TO GROUND

Remove JB fuses: 9, 19, 34.

Using the wiring diagrams, measure the resistance between ground and the F901, F941, F961 circuits.



Is the resistance below 10K ohms on any one of these circuits?

YES >> Repair the appropriate circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Replace the Ignition Switch in accordance with the service information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B2213–CABIN COMPARTMENT NODE/CLUSTER INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Instrument Cluster detects an internal failure.

Possible Causes
INSTRUMENT CLUSTER

Diagnostic Test

1. VERIFY INSTRUMENT CLUSTER OPERATION

NOTE: When this DTC is active and the Instrument Cluster Backlighting is inoperative, the Instrument Cluster must be replaced.

Is DTC: B2213–CABIN COMPARTMENT NODE/CLUSTER INTERNAL active AND the Instrument Cluster Backlighting inoperative?

YES >> Replace the Instrument Cluster in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

NO >> Disregard DTC, test complete.

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Vehicle configuration information not programmed into the Instrument Cluster.

POSSIBLE CAUSES
NO COMMUNICATION WITH FRONT CONTROL MODULE
ACTIVE FCM DTCs
INSTRUMENT CLUSTER
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR AN INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase any Instrument Cluster DTCs.
Turn the ignition off, wait 10 seconds then turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display: B222C-VEHICLE CONFIGURATION NOT PROGRAMMED?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.
Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

---

2. VERIFY COMMUNICATION WITH FRONT CONTROL MODULE

With the scan tool in ECU VIEW, read active modules on the bus.

Does the scan tool show the Front Control Module active on the bus?

Yes >> Go To 3

No >> Refer to the Communication category for the related symptoms.
Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED (CONTINUED)

3. CHECK FRONT CONTROL MODULE FOR ACTIVE DTCS

With the scan tool, erase FCM DTCs.

Turn the ignition off. Wait approximately 10 seconds.

Turn the ignition on.

With the scan tool, read FCM DTCs.

Are any active DTCs present?

Yes >> Refer to symptom list for problems related to the Front Control Module.
Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go To 4

---

4. CHECK CLUSTER VEHICLE INFORMATION WITH SCAN TOOL

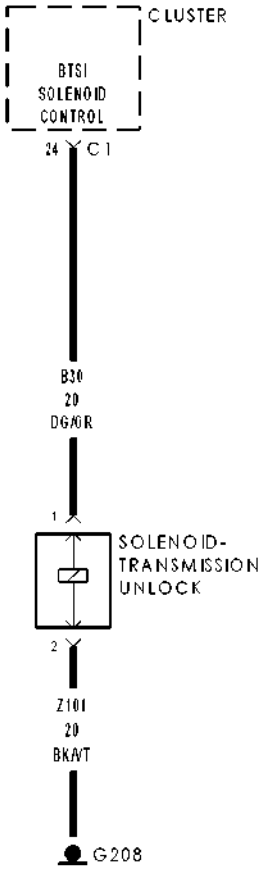
With the scan tool in Cluster ECU Identification, read the Original and Current VINs, and the Body Style of the vehicle.

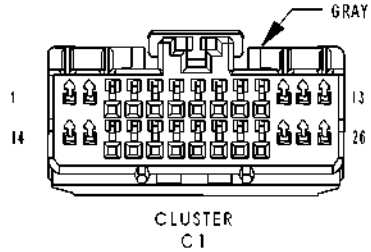
Does the information displayed match the vehicle?

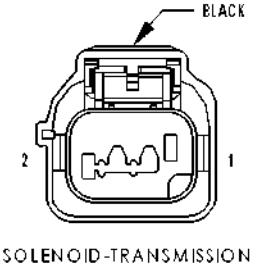
Yes >> Replace the Instrument Cluster in accordance with the Service Information.
Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Front Control Module in accordance with the Service Information.
Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

P0930-BTSI CONTROL CIRCUIT LOW







8l22ce81

P0930-BTSI CONTROL CIRCUIT LOW (CONTINUED)

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Unlock or Run position and the driver's foot applied to the brake pedal.
- **Set Condition:**
  The Instrument Cluster detects a low value on the BTSI Solenoid Control circuit.

Possible Causes
(B30) BTSI SOLENOID CONTROL CIRCUIT SHORTED TO THE (Z101) BTSI SOLENOID GROUND CIRCUIT
(B30) BTSI SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
TRANSMISSION UNLOCK SOLENOID (BTSI)
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Apply and release the brakes.

With the scan tool, read DTCs.

Does the scan tool display: P0930-BTSI CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

---

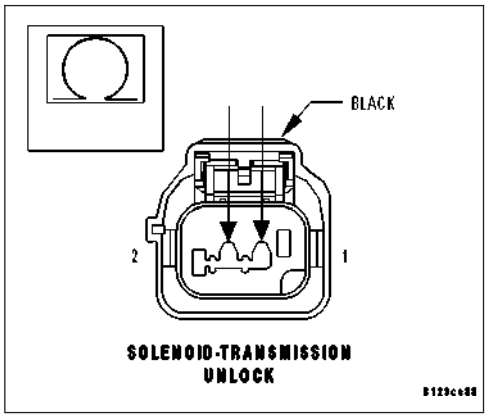
2. CHECK THE (B30) BTSI SOLENOID CONTROL CIRCUIT FOR A SHORT TO THE (Z101) BTSI SOLENOID GROUND CIRCUIT.

Turn the ignition off.

Disconnect the BTSI solenoid harness connector.

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance between the (B30) BTSI Solenoid Control Circuit and the (Z101) BTSI Solenoid Ground Circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (B30) BTSI Solenoid Control circuit for a short to the (Z101) BTSI Solenoid Ground Circuit.

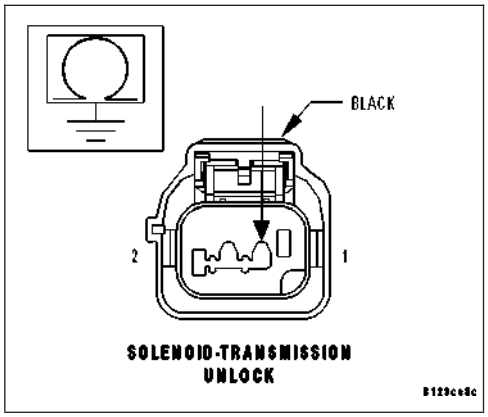
Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go To 3

P0930-BTSI CONTROL CIRCUIT LOW (CONTINUED)

3. CHECK THE (B30) BTSI SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (B30) BTSI Solenoid Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (B30) BTSI Solenoid Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go To 4

---

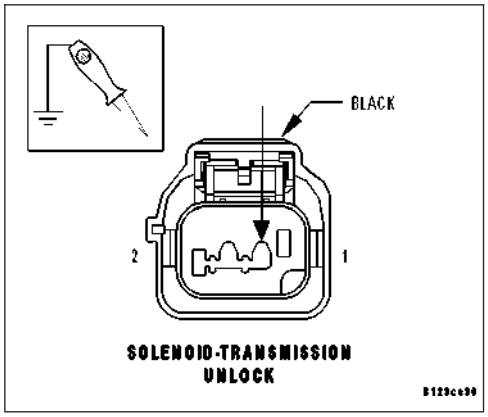
4. CHECK OPERATION OF THE BTSI SOLENOID

Reconnect the Instrument Cluster C1 harness connector.

Turn the ignition on.

Using a 12–volt test light connected to ground, check the BTSI Solenoid Control circuit.

With the scan tool, actuate the BTSI Solenoid.



Does the test light illuminate brightly?

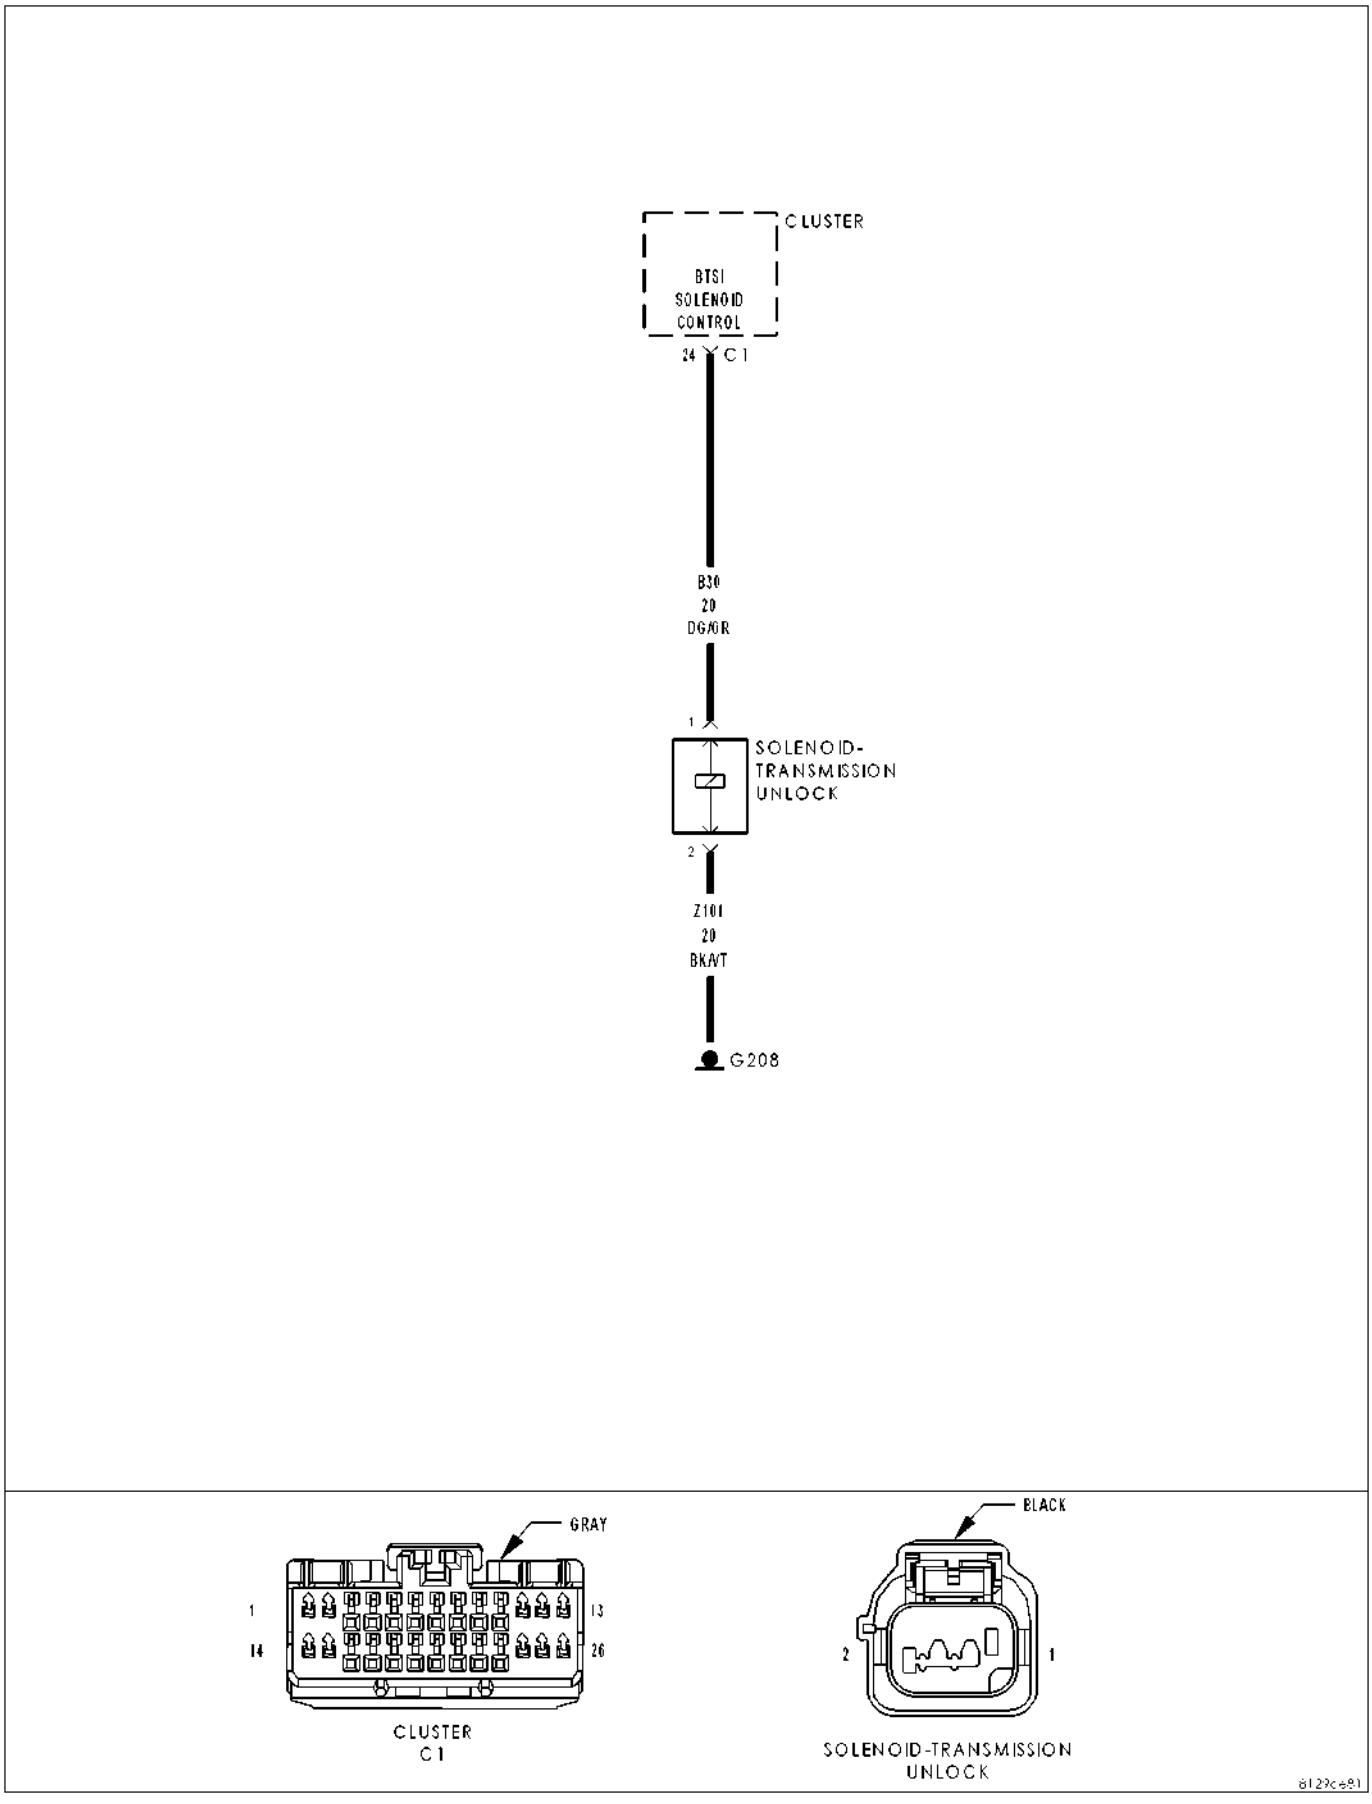
Yes >> Replace the Transmission Unlock (BTSI) Solenoid in accordance with the Service Information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Instrument Cluster in accordance with the Service Information.

Perform the BODY VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

P0931-BTSI CONTROL CIRCUIT HIGH



P0931-BTSI CONTROL CIRCUIT HIGH (CONTINUED)

For the Instrument Cluster Solenoid circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in the Unlock or Run position and the driver's foot applied to the brake pedal.
- **Set Condition:**
  The Instrument Cluster detects a high value on the BTSI Solenoid Control circuit.

Possible Causes
(Z101) BTSI SOLENOID GROUND CIRCUIT OPEN
(B30) BTSI SOLENOID CONTROL CIRCUIT OPEN
TRANSMISSION UNLOCK SOLENOID (BTSI)
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTCs.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Apply and release the brakes.

With the scan tool, read DTCs.

Does the scan tool display: P0930-BTSI CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs.

Perform the BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

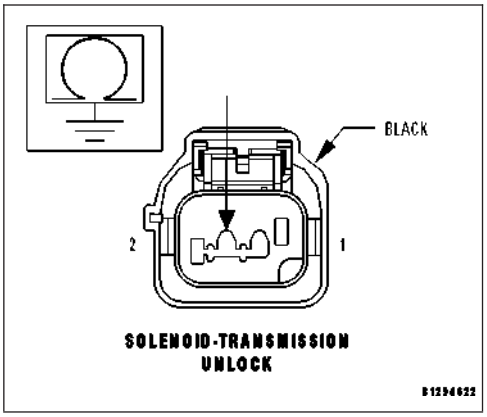
---

2. CHECK THE (Z101) BTSI SOLENOID GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the BTSI Solenoid harness connector.

Measure the resistance between ground and the (Z101) BTSI Solenoid Ground circuit.



Is the resistance above 5.0 ohms?

Yes >> Repair the (Z101) BTSI Solenoid Ground circuit for an open.

Perform the BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

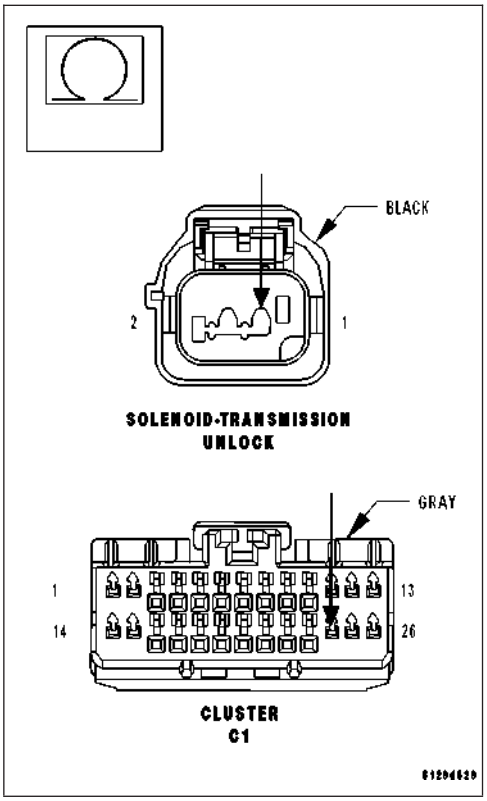
No >> Go To 3

P0931-BTSI CONTROL CIRCUIT HIGH (CONTINUED)

3. CHECK THE (B30) BTSI SOLENOID CONTROL CIRCUIT FOR AN OPEN

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance of the (B30) BTSI Solenoid Control circuit between the BTSI Solenoid harness connector and the Instrument Cluster C1 harness connector.



Is the resistance above 5.0 ohms?

Yes >> Repair the (B30) BTSI Solenoid Control circuit for an open.

Perform the BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go To 4

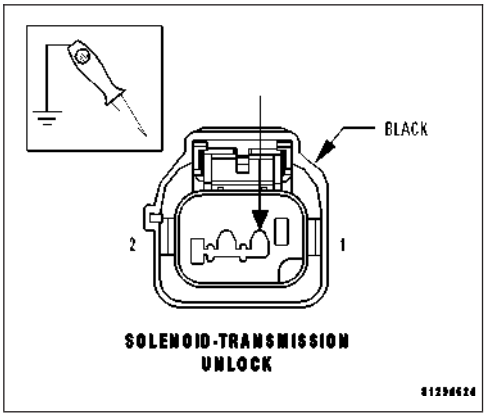
4. CHECK THE OPERATION OF THE BTSI SOLENOID

Reconnect the Instrument Cluster C1 harness connector.

Turn the ignition on.

Using a 12–volt test light connected to ground, check the (B30) BTSI Solenoid Control circuit.

With the scan tool, actuate the BTSI Solenoid.



Does the test light illuminate brightly?

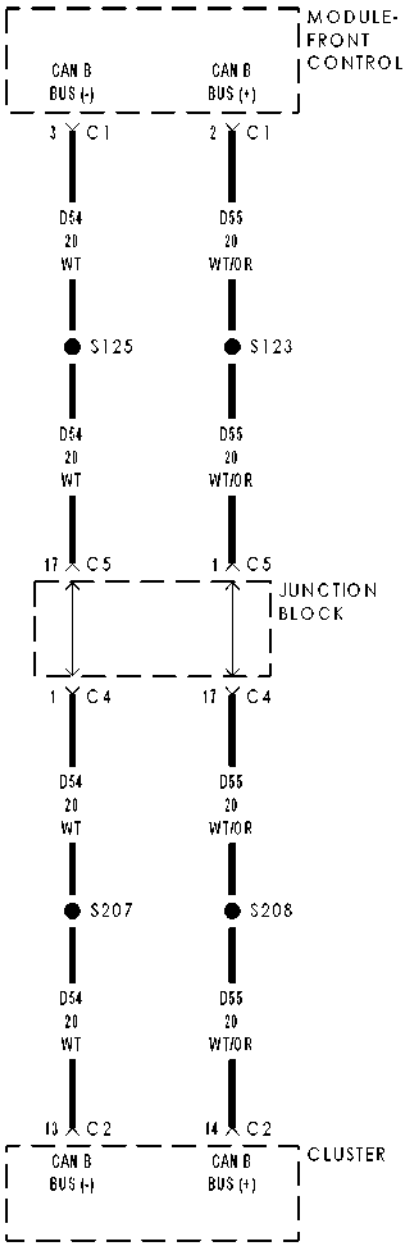
Yes >> Replace the Transmission Unlock (BTSI)Solenoid in accordance with the Service Information.

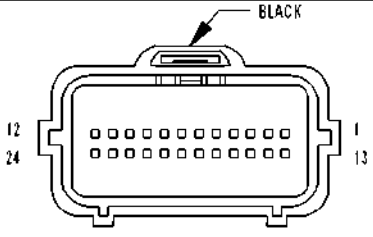
Perform the BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Instrument Cluster in accordance with the Service Information.

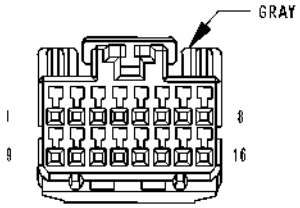
Perform the BODY VERIFICATION TEST VER-1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

U0019–CAN B BUS





MODULE-FRONT
CONTROL C1



CLUSTER
C2

U0019–CAN B BUS (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE
(D54) CAN B BUS (–) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
INSTRUMENT CLUSTER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase DTCs
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display U0019–CAN B BUS CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

---

2. CHECK FRONT CONTROL MODULE DTCs

With the scan tool, read Front Control Module DTCs

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go to 3

U0019–CAN B BUS (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Instrument Cluster C2 harness connector.

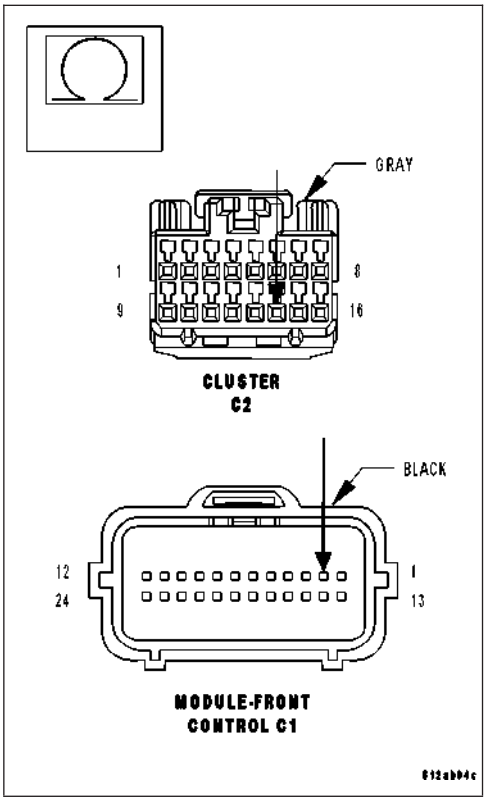
Is the resistance below 2.0 ohms?

Yes >> Go To 4

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Repair the Can B Bus (+) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)



4. CAN B BUS (–) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (–) circuit between the Front Control Module C1 harness connector and the Instrument Cluster C2 harness connector.

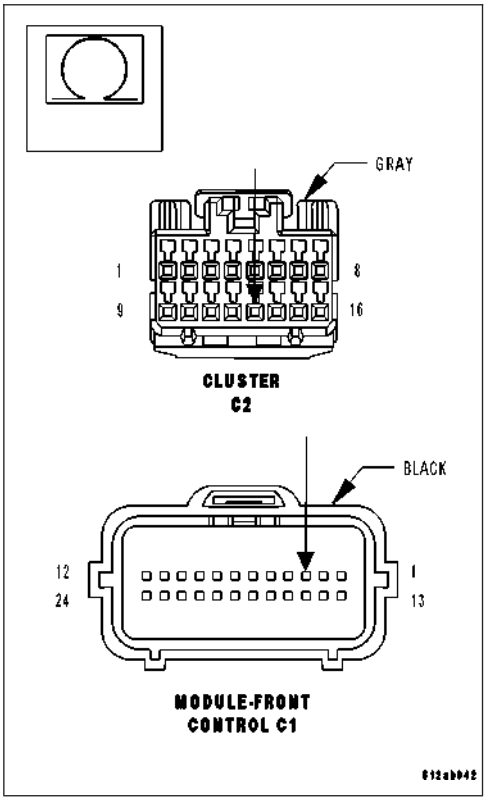
Is the resistance below 2.0 ohms?

Yes >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Repair the Can B Bus (–) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)



U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0156-LOST COMMUNICATION WITH EOM

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

CLUSTER

DESCRIPTION

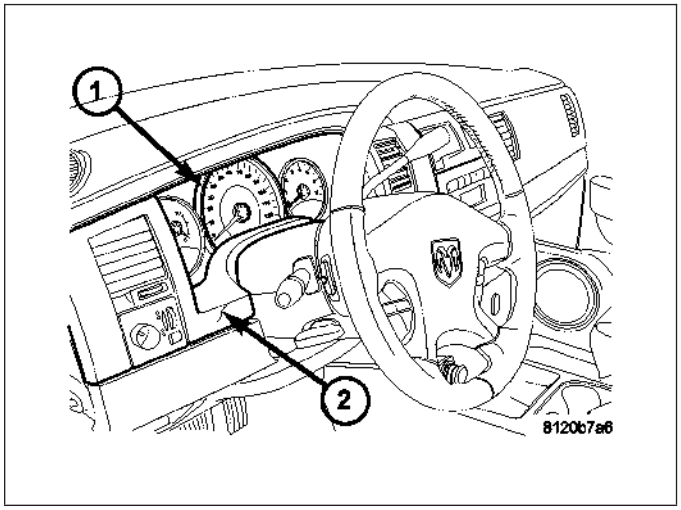
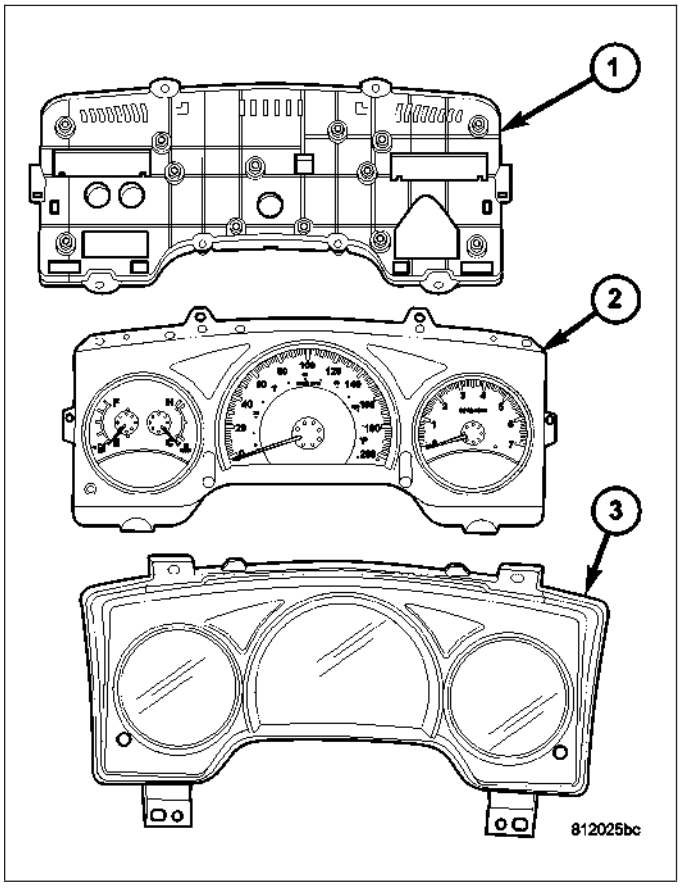
The instrument cluster (1) for this model is an Electro-Mechanical Instrument Cluster (EMIC) that is located in the instrument panel above the steering column opening, directly in front of the driver. The remainder of the EMIC, including the mounts and the electrical connections, are concealed within the instrument panel behind the cluster bezel (2). Besides analog gauges and indicators, the EMIC module incorporates a single blue-green digital Vacuum Fluorescent Display (VFD) unit for displaying odometer/trip odometer information, engine hours, automatic transmission gear selector position (PRNDL), several warning or reminder indications and certain diagnostic information. The instrument cluster for this model also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.



The EMIC gauges and indicators are visible through a dedicated opening in the cluster bezel on the instrument panel and are protected by a clear plastic cluster lens that is integral to a cluster lens, hood and mask unit (3). Just behind the cluster lens is the cluster hood and an integral cluster mask, which are constructed of molded black plastic. Two different masks are used, one with silver rings and one with chrome rings around the gauge openings. The cluster hood serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare, while the cluster mask serves to separate and define the individual gauges and indicators of the EMIC. A black plastic odometer/trip odometer switch button protrudes through dedicated holes in the cluster mask and the cluster lens, located near the lower edge of the cluster just to the left of the fuel gauge. The molded plastic EMIC lens, hood and mask unit has four integral mounting tabs, two each on the upper and lower edges of the unit. These mounting tabs are used to secure the EMIC to the molded plastic instrument panel cluster carrier with four screws.



The rear of the cluster housing and the EMIC electronic circuitry are protected by a molded plastic rear cover (1), which is secured to the cluster housing with fourteen screws, while eight screws installed around the outside perimeter of the rear cover secure it to the cluster lens, hood and mask unit. The rear cover includes clearance holes for the cluster connector receptacles. The connector receptacles on the back of the cluster

electronic circuit board connect the EMIC to the vehicle electrical system through three take outs with connectors from the instrument panel wire harness.

Sandwiched between the rear cover and the lens, hood and mask unit is the cluster housing (2). The molded plastic cluster housing serves as the carrier for the cluster circuit board and circuitry, the cluster connector receptacles, the gauges, a Light Emitting Diode (LED) for each cluster indicator, the VFD unit, an audible tone transducer, an electro-luminescent lamp for general cluster illumination, the cluster overlay, the gauge pointers, the odometer/trip odometer switch and the switch button.

The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated, while the translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the LED for each of the various indicators and an electro-luminescent lamp behind it to be visible through the outer layer of the overlay only through predetermined stencil-like cutouts. A rectangular opening in the overlay at the base of the tachometer dial faces has a smoked clear lens through which the illuminated VFD unit can be viewed.

Several versions of the EMIC module are offered on this model. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle will be offered. The microprocessor-based EMIC utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard wired analog and multiplexed inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the EMIC allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of electronic message outputs to other electronic modules in the vehicle over the CAN data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - CAN BUS).

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the EMIC supports or controls include the following:

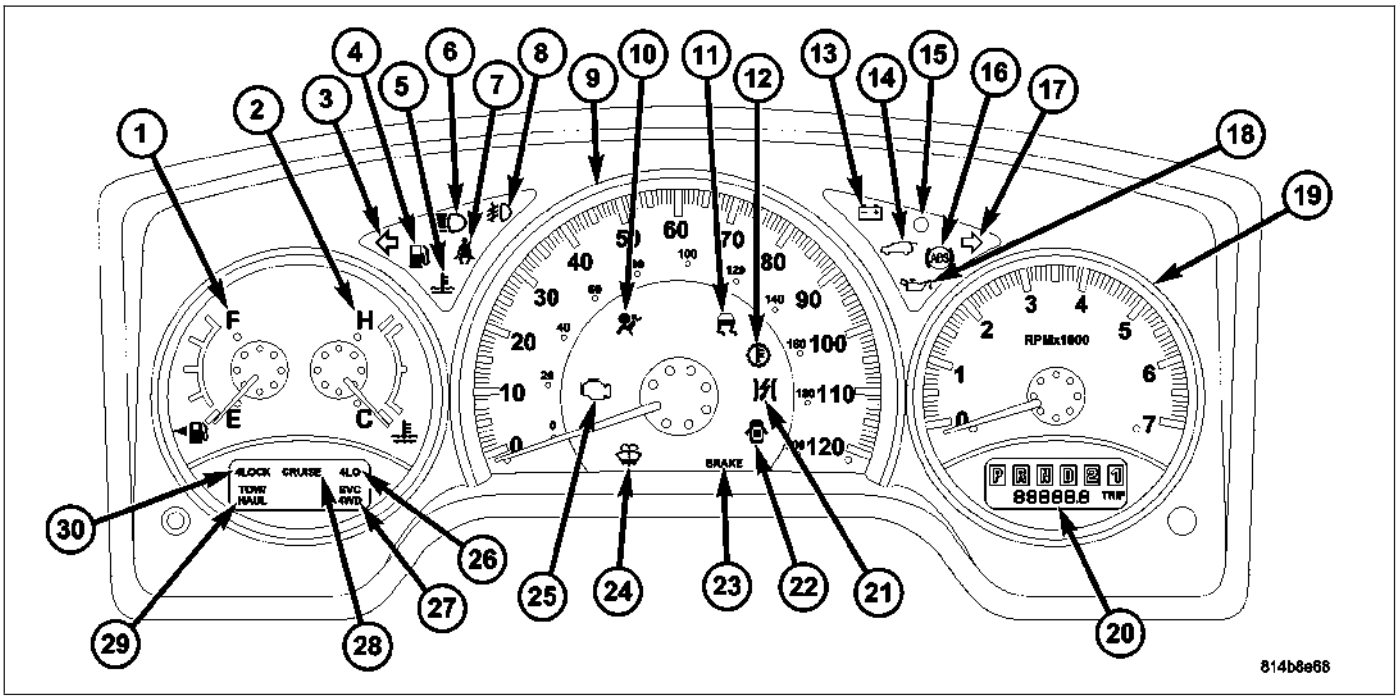
- **Audible Warnings** - The EMIC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator, including chime tones and beep tones. An electromechanical relay is also soldered onto the circuit board to produce audible clicks that emulate the sound of a conventional turn signal or hazard warning flasher. (Refer to 8 - ELECTRICAL/CHIME/BUZZER - DESCRIPTION).
- **Automatic Headlamps Control** - On models equipped with optional automatic headlamps, the EMIC monitors inputs from both the headlamp switch and a sun load sensor located on the top of the instrument panel to provide automatic headlamps.
- **Brake Lamp Control** - The EMIC provides electronic brake lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for brake lamp control, excluding control of the Center High Mounted Stop Lamp (CHMSL), which remains controlled by a direct hard wired output of the brake lamp switch.
- **Brake Transmission Shift Interlock Control** - The EMIC monitors inputs from the brake lamp switch, ignition switch, and the Transmission Range Sensor (TRS), then controls a high-side driver output to operate the Brake Transmission Shift Interlock (BTSI) solenoid that locks and unlocks the automatic transmission gearshift selector lever on the steering column.
- **Compass Mini Trip Computer Support** - The EMIC provides support for the optional Compass Mini Trip Computer (CMTC) by calculating average fuel economy, distance to empty and outside temperature values and storing trip odometer and elapsed ignition on time data. The EMIC receives data and reset requests from the CMTC and transmits the appropriate information for the CMTC to display using electronic messaging.
- **Electronic Transfer Case Interface** - On vehicles equipped with an electronic four-wheel drive transfer case, the EMIC monitors a hard wired multiplex input from the transfer case mode switch and then provides the appropriate electronic data bus messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for transfer case control. After the transfer case shift is completed, the FCM provides an electronic message to the EMIC and the EMIC responds by activating the appropriate 4WD indicators within the cluster or in the transfer case switch.
- **Enhanced Accident Response Support** - The EMIC monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment, will immediately disable the power lock output, unlock all doors by activating the power unlock output, then enables the power lock output if the power lock switch input remains inactive for two seconds. The EMIC also monitors an input from the Powertrain Control Module (PCM) to automatically turn on the interior lighting after an airbag deployment event, ten seconds after the vehicle speed is

zero. The interior lighting remains illuminated until the ignition switch is turned to the Off position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.

- **Exterior Lighting Control** - The EMIC provides electronic head lamp and/or park lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate exterior lamp control of standard head and park lamps, as well as optional front fog lamps. This includes support for headlamp beam selection and the optical horn feature, also known as flash-to-pass.
- **Exterior Lighting Fail-safe** - In the absence of a headlamp switch input, the EMIC will turn on the cluster illumination lamp and provide electronic headlamp low beam and park lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for default exterior lamp operation. The FCM will also provide default park lamp and headlamp low beam operation and the EMIC will turn on the cluster general illumination lighting at full intensity if there is a failure of the electronic data bus communication between the EMIC and the FCM.
- **Fuel Level Data Support** - The EMIC provides a current source for and receives a hard wired analog input from the fuel level sending unit located on the fuel pump module in the fuel tank. The EMIC uses this input to calculate the proper fuel gauge needle position and low fuel indicator operation. Based upon this input, the EMIC also calculates fuel level, average fuel economy and distance to empty data, then uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle.
- **Heated Seat Control** - The EMIC monitors inputs from the ignition switch and electronic engine speed messages from the Powertrain Control Module (PCM) to control a high side driver output to the heated seat switch Light Emitting Diode (LED) indicators. This input allows the heated seat switches to wake up the heated seat module if the switch is actuated. The EMIC will de-energize the heated seat switch LED indicators, which deactivates the heated seat system, if the ignition switch is turned to any position except On or Start, or if the engine speed message indicates zero. (Refer to 8 - ELECTRICAL/HEATED SEATS - DESCRIPTION).
- **Horn Control** - The EMIC monitors an input from the horn switch and provides electronic horn request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for horn relay control.
- **Interior Lamp Load Shedding** - The EMIC provides a battery saver feature which will automatically turn off all interior lamps if they remain on after a timed interval of about five minutes.
- **Interior Lighting Control** - The EMIC monitors inputs from the interior lighting switch, the door ajar switches, the reading lamp switches, and the Sentry Key Remote Entry Module (SKREEM) to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-off and courtesy illumination defeat features.
- **Panel Lamps Dimming Control** - The EMIC monitors hard wired multiplexed inputs from the headlamp switch on the instrument panel, then provides a hard wired 12-volt Pulse-Width Modulated (PWM) output that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster illumination lighting.
- **Power Locks** - The EMIC monitors inputs from the power lock switches and the Sentry Key REmote Entry Module (SKREEM) to provide control of the power lock motors through high side driver outputs to the motors. This includes support for rolling door locks (also known as automatic door locks), automatic door unlock, briefcase lock mode, and a door lock inhibit mode. (Refer to 8 - ELECTRICAL/POWER LOCKS - DESCRIPTION).
- **Remote Keyless Entry** - The EMIC supports the standard Remote Keyless Entry (RKE) system features, including support for the RKE Lock, Unlock (with optional driver-door-only unlock, and unlock-all-doors), Panic, audible chirp, optical chirp, illuminated entry modes, an RKE programming mode, as well as optional Vehicle Theft Security System (VTSS) arming (when the proper VTSS arming conditions are met) and disarming.
- **Remote Radio Switch Interface** - The EMIC monitors inputs from the optional remote radio switches and then provides the appropriate electronic data bus messages to the radio to select the radio or optional hands-free cellular system operating mode, volume control, preset station scan and station seek features.
- **Turn Signal & Hazard Warning Lamp Control** - The EMIC monitors hard wired multiplexed inputs from the multi-function switch on the steering column, then provides electronic turn and hazard lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for turn and hazard lamp control. The EMIC also provides an audible click at one of two rates to emulate normal and bulb out turn or hazard flasher operation based upon electronic lamp outage messages from the FCM, and provides an audible turn signal on chime warning if a turn is signalled continuously for more than about 1.6 kilometers (one mile) and the vehicle speed remains greater than about twenty-four kilometers-per-hour (fifteen miles-per-hour).
- **Vacuum Fluorescent Display Synchronization** - The EMIC monitors hard wired multiplexed inputs from the headlamp switch on the instrument panel, then transmits electronic panel lamp dimming level messages which

allows all other electronic modules on the CAN data bus with Vacuum Fluorescent Display (VFD) units to coordinate their illumination intensity with that of the EMIC VFD unit. This includes a parade mode (also known as funeral mode) that allows all VFD units in the vehicle to be illuminated at full (daytime) intensity while driving during daylight hours with the exterior lamps turned On.

- **Vehicle Theft Security System Control** - The EMIC monitors inputs from the door ajar switches, the liftgate ajar switch, the ignition switch, and the Sentry Key REmote Entry Module (SKREEM), then provides electronic horn and lighting request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate VTSS alarm output features.
- **Wiper/Washer System Control** - The EMIC monitors both hard wired multiplexed inputs from the front wiper and washer switches in the multi-function switch on the steering column and electronic messages from the rear wiper and washer switches in the heater and air conditioner control on the instrument panel. The EMIC then provides electronic wiper and/or washer request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate front or rear wiper and washer system features. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - DESCRIPTION).



The EMIC houses four analog gauges and has provisions for up to twenty-five indicators. Some of the EMIC indicators are automatically configured when the EMIC is connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each EMIC may have provisions for indicators to support every available option, the configurable indicators will not be functional in a vehicle that does not have the equipment that an indicator supports.

The EMIC includes the following analog gauges:

- **Engine Temperature Gauge (2)**
- **Fuel Gauge (1)**
- **Speedometer (9)**
- **Tachometer (19)**

The EMIC includes the following VFD unit:

- **Gear Selector/Odometer/Trip Indicator (20)**

The EMIC includes provisions for the following indicators:

- **Airbag Indicator (10)**
- **Antilock Brake System (ABS) Indicator (16)**
- **Brake Indicator (23)**
- **Charging Indicator (13)**
- **Cruise Indicator (28)**
- **Door Ajar Indicator (22)**

- **Electronic Throttle Control (ETC) Indicator (21)**
- **Engine Temperature Indicator (5)**
- **Fog Lamp Indicator (8)**
- **Four-Wheel Drive Low Indicator (26)**
- **Four-Wheel Drive Lock Indicator (30)**
- **Gate Ajar Indicator (14)**
- **High Beam Indicator (6)**
- **Low Fuel Indicator (4)**
- **Low Oil Pressure Indicator (18)**
- **Malfunction Indicator Lamp (MIL) (25)**
- **Seatbelt Indicator (7)**
- **Security Indicator (15)**
- **Service Four-Wheel Drive Indicator (27)**
- **Tow/Haul Indicator (29)**
- **Traction Control Indicator (11)**
- **Transmission Overtemp Indicator (12)**
- **Turn Signal (Right and Left) Indicators (3 & 17)**
- **Washer Fluid Indicator (24)**

Each indicator in the EMIC, except those located within a VFD unit, is illuminated by a dedicated LED that is soldered onto the EMIC electronic circuit board. Cluster illumination is accomplished by a dimmable electro-luminescent lamp, which illuminates each of the gauge dial faces for visibility when the exterior lighting is turned on. The LED units and the electro-luminescent lamp unit are not available for service replacement and, if damaged or faulty, the entire EMIC must be replaced.

Hard wired circuitry connects the EMIC to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC module for this model is serviced only as a complete unit. The EMIC module cannot be adjusted or repaired. If a gauge, an LED indicator, a VFD unit, the electronic circuit board, the circuit board hardware, the cluster overlay, or the EMIC housing are damaged or faulty, the entire EMIC module must be replaced. The cluster lens, hood and mask unit is available for separate service replacement.

OPERATION

The ElectroMechanical Instrument Cluster (EMIC) in this model also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN. The following information deals primarily with the instrument cluster functions of this unit. Additional details of the electronic body control functions of this unit may be found within the service information for the system or component that the EMIC controls. For example: Additional details of the audible warning functions of the EMIC are found within the Chime/Buzzer service information.

The EMIC is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the EMIC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The EMIC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during

normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The EMIC may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The EMIC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The EMIC circuitry is grounded through a ground circuit and take out of the instrument panel wire harness with an eyelet terminal connector that is secured by a ground screw to a ground location near the center of the instrument panel structural support.

The EMIC also has a self-diagnostic actuator test capability, which will test each of the CAN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the gear selector/odometer/trip odometer Vacuum-Fluorescent Display (VFD) unit. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

GAUGES

All gauges receive battery current through the EMIC circuitry only when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions.

All of the EMIC gauges are air core magnetic units. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field strength. The current flowing through the second coil is changed by the EMIC circuitry in response to messages received over the CAN data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

The gauges are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the EMIC that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for each gauge may be found elsewhere in this service information.

VACUUM-FLUORESCENT DISPLAY

The Vacuum-Fluorescent Display (VFD) unit is soldered to the EMIC electronic circuit board. With the ignition switch in the Off or Accessory positions, the odometer display is activated when the driver door is opened (Rental Car mode) and is deactivated when the driver door is closed. Otherwise, the display unit is active when the ignition switch is in the On or Start positions, and inactive when the ignition switch is in the Off or Accessory positions.

The illumination intensity of the VFD unit is controlled by the EMIC circuitry based upon an input from the headlamp switch and a dimming level input received from the panel dimmer switch. The EMIC synchronizes the illumination intensity of other VFD units with that of the unit in the EMIC by sending electronic dimming level messages to other electronic modules in the vehicle over the CAN data bus.

The EMIC VFD unit has several display capabilities including odometer, trip odometer, engine hours, gear selector indication (PRNDL), several warning or reminder indications, and various diagnostic information when certain fault conditions exist. An odometer/trip odometer switch on the EMIC circuit board is used to control some of the display modes. This switch is actuated manually by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the minor gauge set. Actuating this switch momentarily with the ignition switch in the On position will toggle the VFD between the odometer and trip odometer modes. Depressing the switch button for about two seconds while the VFD is in the trip odometer mode will reset the trip odometer value to zero.

While in the odometer mode with the ignition switch in the On position and the engine not running, depressing the odometer/trip odometer switch for about six seconds will display the engine hours information. Holding this switch depressed while turning the ignition switch from the Off position to the On position will initiate the EMIC self-diagnostic actuator test. Refer to the instrument cluster diagnosis and testing service information for additional details on this cluster function. The EMIC microprocessor remembers which display mode is active when the ignition switch is turned to the Off position, and returns the VFD display to that mode when the ignition switch is turned On again.

The VFD unit is diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the EMIC that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator and the various warning and reminder indicator functions of the VFD unit may be found elsewhere in this service information.

INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. The door ajar indicator, gate ajar indicator, high beam indicator, and turn signal indicators operate based upon hard wired inputs to the EMIC. The brake indicator is controlled by CAN data bus messages from the Controller Antilock Brake (CAB) as well as by hard wired park brake switch inputs to the EMIC. The seatbelt indicator is controlled by the EMIC programming, CAN data bus messages from the Occupant Restraint Controller (ORC), and a hard wired seat belt switch input to the EMIC. The Malfunction Indicator Lamp (MIL) is normally controlled by CAN data bus messages from the Powertrain Control Module (PCM); however, if the EMIC loses CAN data bus communication, the EMIC circuitry will automatically turn the MIL on until CAN data bus communication is restored. The EMIC uses CAN data bus messages from the Front Control Module (FCM), the PCM, the ORC, the CAB, and the Sentry Key REmote Entry Module (SKREEM) to control all of the remaining indicators.

The various EMIC indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed. However, all indicators are completely controlled by the EMIC microprocessor based upon various hard wired and electronic message inputs. The cruise, four low, four lock and tow/haul indicators and those located within the VFD unit are dimmable. All other indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the electro-luminescent EMIC general illumination lamp. The illumination intensity of the dimmable indicators is synchronized with that of the EMIC general illumination lamp.

In addition, certain indicators in this instrument cluster are automatically configured or self-configured. This feature allows the configurable indicators to be enabled by the EMIC circuitry for compatibility with certain optional equipment. The EMIC defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the EMIC using a diagnostic scan tool for vehicles that do not have this equipment. The automatically configured or self-configured indicators remain latent in each EMIC at all times and will be active only when the EMIC receives the appropriate CAN message inputs for that optional system or equipment.

The hard wired indicator inputs may be diagnosed using conventional diagnostic methods. However, the EMIC circuitry and CAN bus message controlled indicators are diagnosed using the EMIC self-diagnostic actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic message inputs to the EMIC that control an indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

CLUSTER ILLUMINATION

The EMIC has a single electro-luminescent lamp that provides cluster back lighting whenever the exterior lighting is turned On. The illumination intensity of this lamp is adjusted when the interior lighting thumbwheel on the headlamp switch is rotated (down to dim, up to brighten) to one of six available minor detent positions. The EMIC monitors a resistor multiplexed input from the headlamp switch on a dimmer input circuit. In response to that input, the EMIC electronic circuitry converts a fused 12-volt input it receives on a hard wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The EMIC uses this PWM output to control the illumination intensity of the electro-luminescent cluster illumination lamp and the VFD unit on the EMIC circuit board, then provides a synchronized PWM output on various hard wired fused panel lamps dimmer switch signal circuits to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The EMIC also transmits electronic dimming level messages over the CAN

data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their VFD units to that of the EMIC VFD unit.

In addition, the thumbwheel on the headlamp switch has a Parade Mode position to provide a parade or funeral mode. The EMIC monitors the request for this mode from the headlamp switch, then transmits an electronic dimming level message to illuminate all VFD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned On.

The electro-luminescent lamp unit consists of layers of phosphor, carbon, idium tin oxide, and dielectric applied by a silk-screen process between two polyester membranes and includes a short pigtail wire and connector. The lamp pigtail wire is connected to a connector receptacle on the EMIC circuit board. The EMIC powers this lamp with an Alternating Current (AC) rated at 80 volts rms (root mean squared) and 415 Hertz produced by a transformer on the circuit board, which excites the phosphor particles causing them to luminesce.

The hard wired headlamp switch and panel lamps dimmer inputs to and outputs from the EMIC may be diagnosed using conventional diagnostic methods. However, proper testing of the PWM processing of the EMIC and the electronic dimming level messages sent by the EMIC over the CAN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

INSTRUMENT CLUSTER

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is inoperative, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) data bus message-controlled gauge or indicator is inoperative, perform the Actuator Test as follows:

CAUTION: Instrument clusters used in this model automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the tow/haul indicator, the service four-wheel drive indicator, the four-wheel drive low indicator, the four-wheel drive lock indicator, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the On position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ACTUATOR TEST

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, and the indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry will position each of the gauge needles at various calibration points and illuminate all of the segments in the Vacuum Fluorescent Display (VFD) unit.

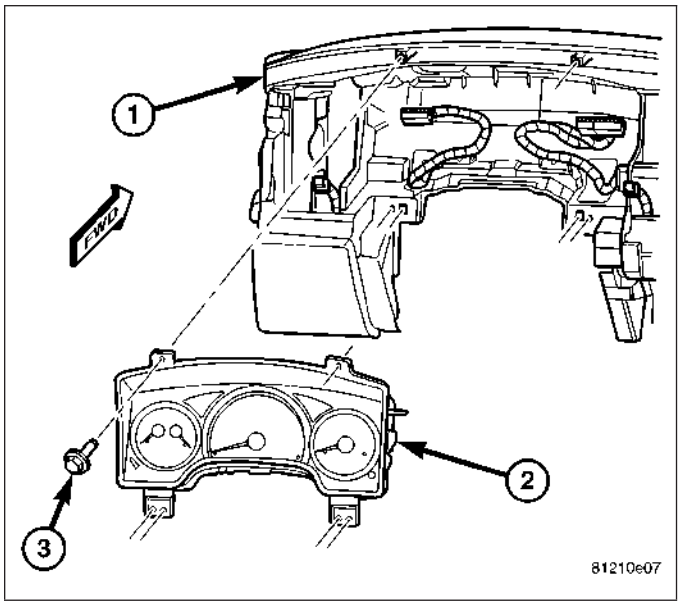
Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN data bus, the Powertrain Control Module (PCM), the Front Control Module (FCM), the Transmission Control Module (TCM), the Occupant Restraint Controller (ORC), the Controller Anti-lock Brake (CAB), or the hard wired inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the Off position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the VFD unit, and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is turned to the Off position, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the CAN data bus during the test.
7. Go back to Step 1 to repeat the test, if necessary.

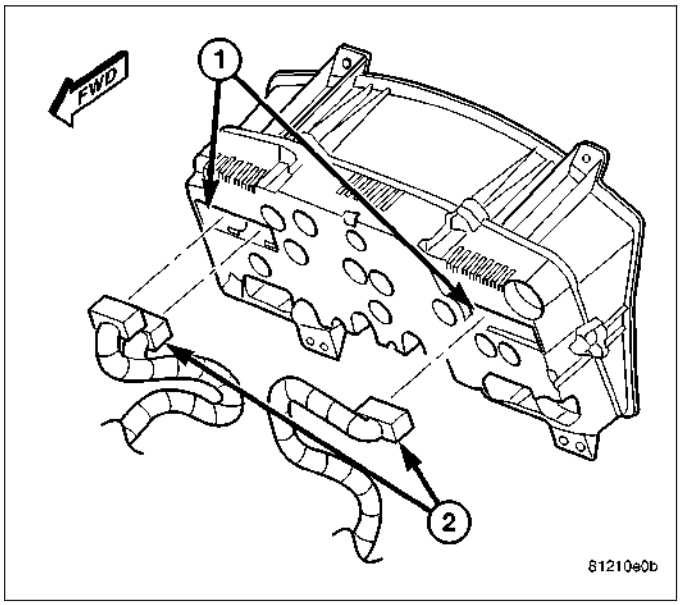
REMOVAL

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ CLUSTER BEZEL - REMOVAL).
3. Remove the four screws (3) that secure the instrument cluster (2) to the instrument panel structural support (1).



4. Pull the instrument cluster rearward far enough to access and disconnect the instrument panel wire harness connectors (2) from the connector receptacles (1) on the back of the cluster housing.
5. Remove the instrument cluster from the instrument panel.



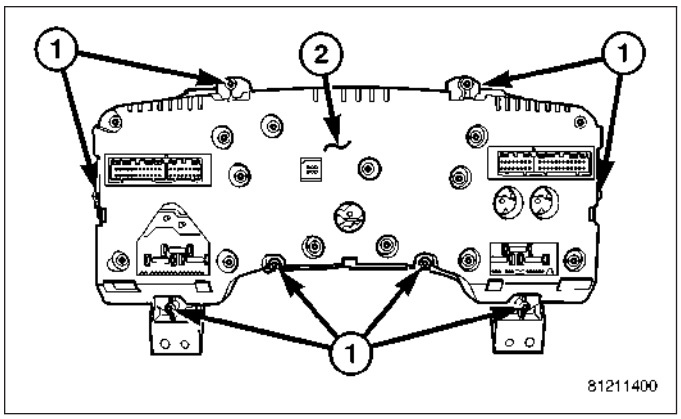
DISASSEMBLY

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

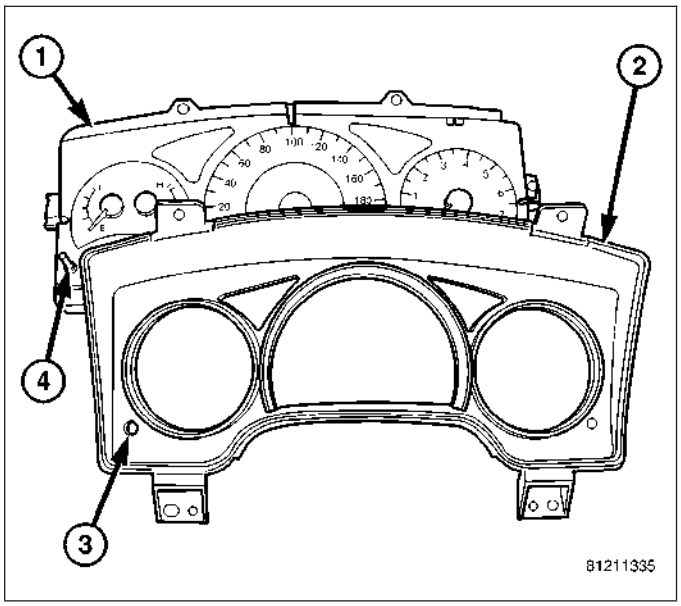
NOTE: The cluster lens, hood and mask unit is the only component of the instrument cluster used in this vehicle that is serviced separately. Following is the procedure for disassembling this component from the instrument cluster.

CLUSTER LENS, HOOD, AND MASK

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. From the back of the instrument cluster (2), remove the eight screws (1) around the outer perimeter of the rear cover that secure the lens, hood, and mask unit to the cluster housing.



4. Remove the lens, hood, and mask unit (2) from the face of the instrument cluster (1).



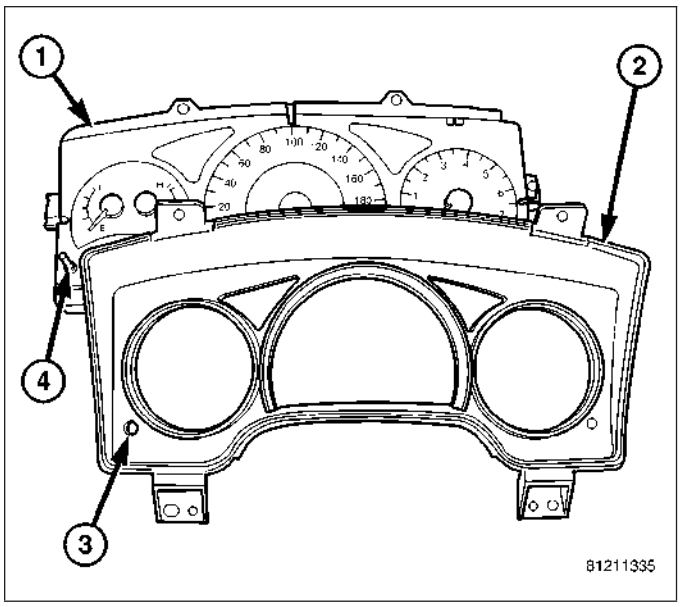
ASSEMBLY

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

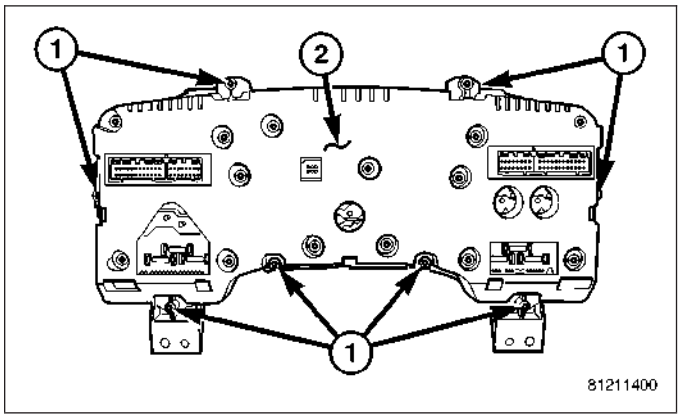
NOTE: The cluster lens, hood and mask unit is the only component of the instrument cluster used in this vehicle that is serviced separately. Following is the procedure for assembling this component to the instrument cluster.

CLUSTER LENS, HOOD, AND MASK

1. Position the cluster lens, hood, and mask unit (2) over the face of the instrument cluster (1). Be certain that the odometer/trip odometer switch button (4) is inserted through the proper clearance holes (3) in the mask and the lens.



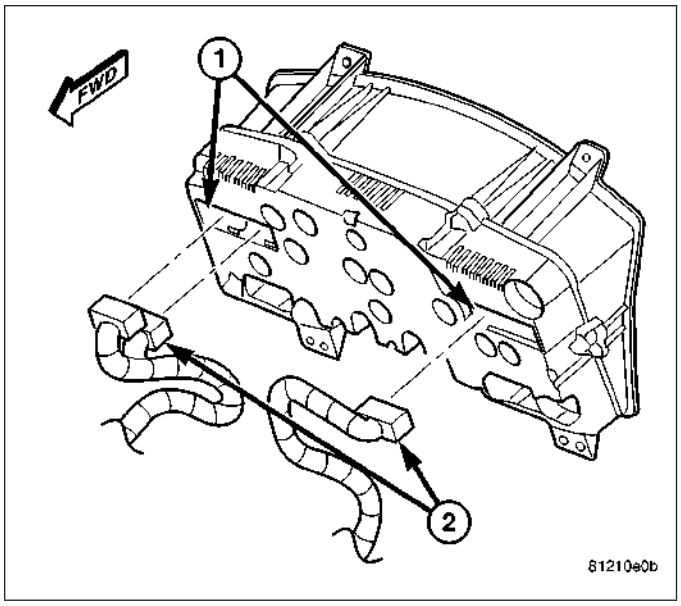
2. From the back of the instrument cluster (2), install and tighten the eight screws (1) around the outer perimeter of the rear cover that secure the lens, hood, and mask unit to the cluster housing. Tighten the screws to 1 N·m (10 in. lbs.).
3. Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
4. Reconnect the battery negative cable.



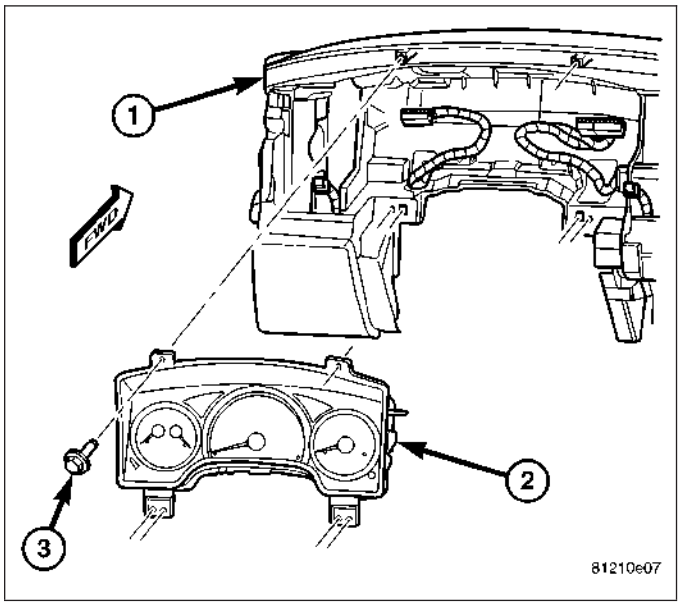
INSTALLATION

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

1. Position the instrument cluster close enough to the instrument panel to reconnect the instrument panel wire harness connectors (2) to the connector receptacles (1) on the back of the cluster housing.



2. Position the instrument cluster (2) into the instrument panel (1).
3. Install and tighten the four screws (3) that secure the instrument cluster to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).
4. Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ CLUSTER BEZEL - INSTALLATION).
5. Reconnect the battery negative cable.



NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If a problem is noted that involves improper illumination of the cruise indicator, the electronic throttle control indicator, the tow/haul indicator, the service four-wheel drive indicator, the four-wheel drive low indicator, the four-wheel drive lock indicator, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the On position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

ABS INDICATOR

DESCRIPTION

An Antilock Brake System (ABS) indicator is standard equipment on all instrument clusters. This indicator serves both the standard equipment Rear Wheel Anti-Lock (RWAL) and optional equipment 4-Wheel Anti-Lock (4WAL) brake systems. This indicator is located near the upper edge of the instrument cluster, between the tachometer and the speedometer.

The ABS indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Failure of Anti-lock Braking System” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The ABS indicator is serviced as a unit with the instrument cluster.

OPERATION

The ABS indicator gives an indication to the vehicle operator when the ABS system is faulty or inoperative. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ABS indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **ABS Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster receives no lamp-on or lamp-off messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the ABS indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.
- **ABS Diagnostic Test** - The ABS indicator is blinked on and off by lamp-on and lamp-off messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, then the instrument cluster and the CAB will each store a DTC.

For proper diagnosis of the antilock brake system, the CAB, the CAN data bus, or the electronic message inputs to the instrument cluster that control the ABS indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AIRBAG INDICATOR

DESCRIPTION

An airbag indicator is standard equipment on all instrument clusters. However, the instrument cluster can be programmed to disable this indicator on vehicles that are not equipped with the airbag system, which is not available in some markets. This indicator is located in the center of the speedometer, in the area above and left of the speedometer needle hub.

The airbag indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Airbag” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from

being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The airbag indicator is serviced as a unit with the instrument cluster.

OPERATION

The airbag indicator gives an indication to the vehicle operator when the airbag system is faulty or inoperative. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the airbag indicator is illuminated for about six to eight seconds. The entire bulb test is a function of the ORC.
- **ORC Lamp-On Message** - Each time the cluster receives a lamp-on message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about twelve seconds or until the cluster receives a lamp-off message from the ORC, whichever is longer.
- **Communication Error** - If the cluster receives no airbag messages for ten consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-off message from the ORC.
- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the airbag indicator is a function of the instrument cluster.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the ORC sends a lamp-on message after the bulb test, it indicates that the ORC has detected a system malfunction and/or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ORC of the condition, the instrument cluster and the ORC will each store a DTC, and the cluster will flash the seatbelt indicator on and off as a backup to notify the vehicle operator.

For proper diagnosis of the airbag system, the ORC, the CAN data bus, or the electronic message inputs to the instrument cluster that control the airbag indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

BRAKE/PARK BRAKE INDICATOR

DESCRIPTION

A brake indicator is standard equipment on all instrument clusters. This indicator is located in the center of the speedometer, in the area below and right of the speedometer needle hub.

The brake indicator consists of a stencil-like cutout of the word “BRAKE” (all clusters with a miles-per-hour primary speedometer scale), or the International Control and Display Symbol icon for “Brake Failure” (all clusters with a kilometers-per-hour primary scale) in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “BRAKE” text or the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The brake indicator is serviced as a unit with the instrument cluster.

OPERATION

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus, and a hard wired input from the park brake switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the brake indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Brake Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the brake indicator will be illuminated. The CAB can also send brake lamp-on messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Park Brake Switch Input** - Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the On position, the brake indicator flashes on and off. The indicator continues to flash until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake pedal mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the ABS system circuits and sensors, including the brake fluid level switch on the brake master cylinder reservoir, to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects.

For further diagnosis of the brake indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The park brake switch input to the instrument cluster may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the CAB, the CAN data bus, or the electronic message inputs to the instrument cluster that control the brake indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

BRAKE INDICATOR

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired park brake switch input to the EMIC may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Antilock Brake (CAB), the Controller Area Network (CAN) data bus, or the electronic message inputs also used by the EMIC to provide brake indicator operation. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAB, the CAN data bus, and the electronic message inputs for the brake indicator operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CHARGING INDICATOR

DESCRIPTION

A charging indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the tachometer and the speedometer.

The charging indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Battery Charging Condition” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The charging indicator is serviced as a unit with the instrument cluster.

OPERATION

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The charging indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the charging indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the charging indicator is illuminated by the instrument cluster for about two seconds as a bulb test.
- **Voltage Low Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the charging indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper system voltage messages to the instrument cluster. If the instrument cluster turns on the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service. For further diagnosis of the charging indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the charging system, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the charging indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CRUISE INDICATOR

DESCRIPTION

A cruise indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional speed control system, this indicator is electronically disabled. The cruise indicator is located below the minor gauge set on the left side of the cluster.

The cruise indicator consists of a stencil-like cutout of the word “CRUISE” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “CRUISE” text to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the cruise indicator is dimmable, which is adjusted along with the cluster illumination lamp using the panel lamps dimmer thumbwheel on the headlamp switch. The cruise indicator is serviced as a unit with the instrument cluster.

OPERATION

The cruise indicator gives an indication to the vehicle operator when the speed control system is turned On, regardless of whether the speed control is engaged. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The cruise indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the cruise indicator for the following reasons:

- **Cruise Lamp-On Message** - Each time the cluster receives a cruise lamp-on message from the PCM indicating the speed control system has been turned On, the cruise indicator is illuminated. The indicator remains illuminated until the cluster receives a cruise lamp-off message from the PCM or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the cruise indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the speed control switches to determine the proper outputs to the speed control servo. The PCM then sends the proper cruise indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the cruise indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the speed control system, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the cruise indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

DOOR AJAR INDICATOR

DESCRIPTION

A door ajar indicator is standard equipment on all instrument clusters. This indicator is located in the center of the speedometer, in the area below and right of the speedometer needle hub.

The door ajar indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Door(s) Ajar” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the

indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The door ajar indicator is serviced as a unit with the instrument cluster.

OPERATION

The door ajar indicator gives an indication to the vehicle operator that one or more of the passenger compartment doors may be open or not completely latched. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and hard wired inputs received by the cluster from the door ajar switches located in each door latch unit.

The door ajar indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the door ajar indicator for the following reasons:

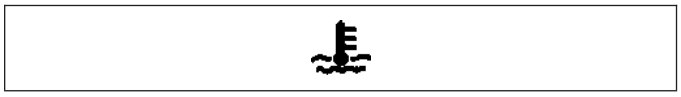
- **Door Ajar Switch Input** - Each time the cluster detects ground on any one of the door ajar switch sense circuits (door ajar switch closed = door is open or not completely latched) the door ajar indicator will be illuminated. The indicator remains illuminated until all of the door ajar switch sense inputs to the cluster are an open circuit (door ajar switch open = door fully closed), until the cluster has completed an interior lamps load shed (about five minutes), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the door ajar indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the door ajar switches to determine the status of the doors. For further diagnosis of the door ajar indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the door ajar switches and circuits, refer to the appropriate wiring information.

ENGINE TEMPERATURE GAUGE

DESCRIPTION



An engine coolant temperature gauge is standard equipment on all instrument clusters. This gauge is part of the minor gauge set with the fuel gauge located on the left side of the instrument cluster, just left of the speedometer. The gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree gauge scale on the cluster overlay that reads bottom-to-top from “C” (or Cold) to “H” (or Hot). An International Control and Display Symbol icon for “Engine Coolant Temperature” is located on the cluster overlay, directly below the bottom end of the scale.

The engine coolant temperature gauge graphics are black against a white field except for a single red graduation at the high end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white gauge dial face appears blue-green with the black graphics silhouetted against the illuminated background and the red graphics and the red gauge needle still appear red. Gauge illumination is provided by an integral electro-luminescent lamp that is serviced as a unit with the instrument cluster. The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

OPERATION

The engine coolant temperature gauge gives an indication to the vehicle operator of the engine coolant temperature. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine coolant temperature gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is between the low end of normal [about 54° C (130° F)] and the high end of normal [about 122° C (252° F)], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature Low Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is below the low end of normal [about 54° C (130° F)], the gauge needle is held at the “C” increment at low end of the gauge scale. The gauge needle remains at the low end of the gauge scale until the cluster receives a message from the PCM indicating that the engine temperature is above about 54° C (130° F), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is above about 122° C (252° F), the gauge needle is moved into the red zone on the gauge scale, the engine temperature indicator is illuminated, and a single chime tone is sounded. The gauge needle remains in the red zone and the engine temperature indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine temperature is below about 122° C (252° F), or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Communication Error** - If the cluster fails to receive an engine temperature message, it will hold the gauge needle at the last indication for about five seconds or until the ignition switch is turned to the Off position, whichever occurs first. After five seconds, the cluster will move the gauge needle to the low end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine coolant temperature gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine coolant temperature gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the engine coolant temperature gauge, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE INDICATOR

DESCRIPTION

An engine temperature indicator is standard equipment only on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the minor gauge set and the speedometer.

The engine temperature indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Engine Coolant Temperature” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The engine temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature gauge reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the engine temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the engine temperature indicator is illuminated for about two seconds as a bulb test. The entire bulb test is a function of the PCM.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is above about 122° C (252° F), the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine coolant temperature is below about 119° C (246° F), or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine temperature indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine temperature indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine coolant temperature sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the engine temperature indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ETC INDICATOR

DESCRIPTION

An Electronic Throttle Control (ETC) indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional 5.7 liter engine, this indicator is electronically disabled. This indicator is located in the center of the speedometer, in the area to the right of the speedometer needle hub.

The ETC indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Electronic Throttle Control” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The ETC indicator is serviced as a unit with the instrument cluster.

OPERATION

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system is faulty or inoperative. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based

upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ETC indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ETC indicator is illuminated for about fifteen seconds. The entire bulb test is a function of the PCM.
- **ETC Lamp-On Message** - Each time the cluster receives a lamp-on message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about twelve seconds or until the cluster receives a lamp-off message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ETC indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the ETC indicator is a function of the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the PCM sends a lamp-on message after the bulb test, it indicates that the PCM has detected an ETC system malfunction and/or that the ETC system is inoperative. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, the instrument cluster and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the ETC indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FOG LAMP INDICATOR

DESCRIPTION

A fog lamp indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with optional fog lamps, this indicator is electronically disabled. This indicator is located near the upper edge of the instrument cluster, between the minor gauge set and the speedometer.

The fog lamp indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Front Fog Light” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A green Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The fog lamp indicator is serviced as a unit with the instrument cluster.

OPERATION

The fog lamp indicator gives an indication to the vehicle operator whenever the optional fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

The fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only

illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the fog lamp indicator for the following reasons:

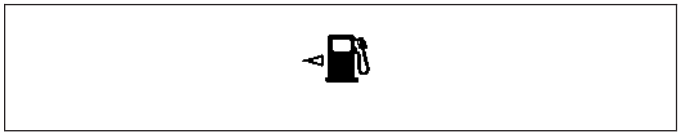
- **Fog Lamp-On Message** - Each time the cluster receives a fog lamp-on message from the FCM indicating the fog lamp relay is energized, the fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a fog lamp-off message from the FCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fog lamp indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors a hard wired input from the headlamp switch to determine the selected fog lamp switch status. The instrument cluster then sends the proper fog lamp-on and lamp-off messages to the FCM over the CAN data bus. The FCM activates the fog lamp relay then sends the proper fog lamp indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the fog lamp indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fog lamp system, the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the fog lamp indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FUEL GAUGE

DESCRIPTION



A fuel gauge is standard equipment on all instrument clusters. This gauge is part of the minor gauge set with the engine coolant temperature gauge located on the left side of the instrument cluster, just left of the speedometer. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree gauge scale on the cluster overlay that reads bottom-to-top from “E” (or Empty) to “F” (or Full). An International Control and Display Symbol icon for “Fuel” is located on the cluster overlay, in the center of the gauge directly below the bottom end of the scale. An arrowhead pointed to the left side of the vehicle is imprinted on the cluster overlay next to the “Fuel” icon on the gauge to provide the driver with a reminder as to the location of the fuel filler access.

The fuel gauge graphics are black against a white field except for a single red graduation at the low end of the gauge scale, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white gauge dial face appears blue-green with the black graphics silhouetted against the illuminated background and the red graphics and the red gauge needle still appear red. Gauge illumination is provided by an integral electro-luminescent lamp that is serviced as a unit with the instrument cluster. The fuel gauge is serviced as a unit with the instrument cluster.

OPERATION

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending unit on the fuel pump module in the fuel tank.

The fuel gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Fuel Level Sending Unit Input** - The cluster provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. The cluster programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level sense input, then moves the gauge needle to the proper relative position on the gauge

scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the cluster.

- **Less Than 12.5 Percent Tank Full Input** - Each time the fuel level sense input to the cluster indicates the fuel tank is about 12.5 percent full or less for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about 15.5 percent full for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the Empty gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the Full gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fuel gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

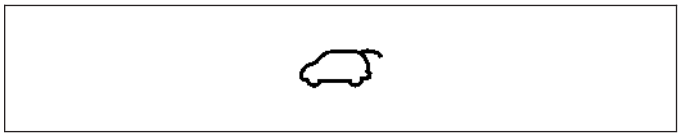
The instrument cluster continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fuel tank sending unit, the CAN data bus, or the electronic fuel level message outputs of the instrument cluster, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

GATE AJAR INDICATOR

DESCRIPTION

A gate ajar indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the tachometer and the speedometer.



The gate ajar indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Gate Ajar” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The gate ajar indicator is serviced as a unit with the instrument cluster.

OPERATION

The gate ajar indicator gives an indication to the vehicle operator that the passenger compartment liftgate may be open or not completely latched. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the liftgate ajar switch integral to the liftgate latch unit.

The gate ajar indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the gate ajar indicator for the following reasons:

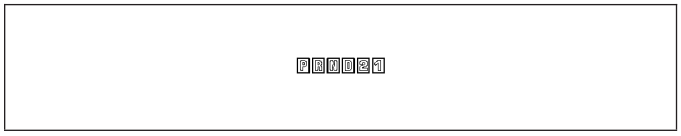
- **Liftgate Ajar Switch Input** - Each time the cluster detects ground on the liftgate ajar switch sense circuit (liftgate ajar switch closed = gate is open or not completely latched) the gate ajar indicator will be illuminated. The indicator remains illuminated until the liftgate ajar switch sense input to the cluster is an open circuit (liftgate ajar switch open = liftgate fully closed), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the gate ajar indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the liftgate ajar switch to determine the status of the liftgate. For further diagnosis of the liftgate ajar indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the liftgate ajar switch and circuits, refer to the appropriate wiring information.

GEAR SELECTOR INDICATOR

DESCRIPTION



An electronic automatic transmission gear selector indicator is standard factory-installed equipment on this model. The gear selector indicator information is displayed in an electronic, blue-green odometer/trip odometer Vacuum-Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located below the tachometer in the lower right area of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated.

The odometer/trip odometer VFD displays the following gear selector indicator characters from left to right: “P,” “R,” “N,” “D,” “2,” and “1.” Respectively, these characters represent the park, reverse, neutral, drive, second gear, and first gear positions of the transmission gear selector lever on the steering column. The VFD illuminates a rectangular box around the character that represents the currently selected lever position.

During daylight hours (exterior lamps are Off) the odometer/trip odometer VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are On), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer thumbwheel on the headlamp switch. However, a “Parade” mode position of the panel lamps dimmer thumbwheel allows the VFD to be illuminated at full brightness if the exterior lamps are turned On during daylight hours. The odometer/trip odometer VFD is serviced as a unit with the instrument cluster.

OPERATION

The electronic gear selector indicator gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The gear selector indicator information is displayed by the odometer/trip odometer Vacuum Fluorescent Display (VFD) unit soldered onto the instrument cluster electronic circuit board, and the VFD will not display the gear selector indicator information after the ignition switch is turned to the Off position. Each time the cluster is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission model that is in the vehicle once it is reconnected to battery current. The instrument cluster circuitry operates the gear selector indicator to provide the following features:

- **Selected Gear Message** - Each time the cluster receives a selected gear message from the PCM, a box will be illuminated around the appropriate character in the gear selector indicator. The box will remain illuminated until the cluster receives a different selected gear message, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a selected gear message from the PCM within three seconds, the instrument cluster circuitry will display all gear selector positions boxed (selected) until a valid selected gear message is received or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer/trip odometer VFD will display all of its characters at once, then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the proper selected gear messages to the instrument cluster. For further diagnosis of the gear selector indicator or the instrument cluster circuitry that controls this function, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the TRS, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the gear selector indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HIGH BEAM INDICATOR

DESCRIPTION

A high beam indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the minor gauge set and the speedometer.

The high beam indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “High Beam” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A blue Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in blue through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The high beam indicator is serviced as a unit with the instrument cluster.

OPERATION

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired multiplex input received by the cluster from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the high beam indicator for the following reasons:

- **High Beam Headlamps-On Input** - Each time the cluster detects a high beam headlamps-on input from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit, the headlamp high beams and the high beam indicator will be illuminated. The headlamp high beams and the high beam indicator remain illuminated until the cluster receives a high beam headlamps-off input from the multi-function switch, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the headlamp switch and the multi-function switch to determine the proper headlamp low beam and high beam control. The instrument cluster then sends the proper low beam and high beam lamp-on and lamp-off messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus and turns the high beam indicator on or off accordingly. For further diagnosis of the high beam indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the headlamps, or the headlamp switch and multi-function switch inputs to the instrument cluster that control the high beam indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW FUEL INDICATOR

DESCRIPTION

A low fuel indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the minor gauge set and the speedometer.

The low fuel indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Fuel” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The low fuel indicator is serviced as a unit with the instrument cluster.

OPERATION

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending unit on the fuel pump module in the fuel tank.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the low fuel indicator is illuminated for about two seconds as a bulb test.
- **Less Than 12.5 Percent Tank Full Input** - The cluster provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. Each time the fuel level sense input to the cluster indicates the fuel tank is about 12.5 percent full or less for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, the fuel gauge needle is moved to about the one-sixteenth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about 15.5 percent full for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the Empty gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the Full gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low fuel indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the low fuel indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the fuel tank sending unit, the CAN data bus, or the electronic fuel level message outputs of the instrument cluster, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW OIL PRESSURE INDICATOR

DESCRIPTION

A low oil pressure indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the tachometer and the speedometer.

The low oil pressure indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Engine Oil” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The low oil pressure indicator is serviced as a unit with the instrument cluster.

OPERATION

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure is above about 6.9 kPa (1 psi), or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the indicator on in response to an engine oil pressure low message if the engine speed is greater than zero.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low oil pressure indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper engine oil pressure messages to the instrument cluster. For further diagnosis of the low oil pressure indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the engine oil pressure sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the low oil pressure indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR LAMP (MIL)

DESCRIPTION

A Malfunction Indicator Lamp (MIL) is standard equipment on all instrument clusters. This indicator is

located in the center of the speedometer, in the area to the left of the speedometer needle hub.

The MIL consists of a stencil-like cutout of the International Control and Display Symbol icon for “Engine” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The MIL is serviced as a unit with the instrument cluster.

OPERATION

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The MIL Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about fifteen seconds as a bulb test. The entire bulb test is a function of the PCM.
- **MIL Lamp-On Message** - Each time the cluster receives a MIL lamp-on message from the PCM, the indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. For some DTC’s, if a problem does not recur, the PCM will send a lamp-off message automatically. Other DTC’s may require that a fault be repaired and the PCM be reset before a lamp-off message will be sent. For more information on the PCM, and the DTC set and reset parameters, (Refer to 25 - EMISSIONS CONTROL - OPERATION).
- **Communication Error** - If the cluster receives no messages from the PCM for ten consecutive message cycles, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems may require service.

For proper diagnosis of the fuel and emissions systems, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the MIL, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ODOMETER

DESCRIPTION

An odometer and trip odometer are standard equipment in all instrument clusters. The odometer, trip odometer, and engine hours information are displayed in a common electronic, blue-green Vacuum-Fluorescent Display (VFD) unit. This VFD unit is soldered onto the cluster electronic circuit board and is visible through a window with a smoked clear lens located below the tachometer in the lower right area of the cluster overlay. The dark lens over the VFD prevents the indicator from being clearly visible when it is not illuminated.

The odometer, trip odometer, and engine hours information are not displayed simultaneously. The trip odometer reset switch on the instrument cluster circuit board toggles the display between odometer and trip odometer modes by depressing the odometer/trip odometer switch button that extends through the lower edge of the cluster lens, just left of the minor gauge set. When the trip odometer information is displayed, the word “TRIP” is also illuminated in the lower right corner of the odometer/trip odometer VFD in a blue-green color and at the same lighting level as the trip odometer information. The engine hours information replaces the selected odometer or trip odometer information whenever the ignition switch is in the On position and the engine is not running.

The odometer, trip odometer, and engine hours information is stored in the instrument cluster memory. This information can be increased when the proper inputs are provided to the instrument cluster, but the information cannot be decreased. The odometer can display values up to 999,999 kilometers (999,999 miles). The odometer latches at these values, and will not roll over to zero. The trip odometer can display values up to 999.9 kilometers (999.9 miles) before it rolls over to zero. Engine hours are displayed in the format, “hr9999”. The cluster will accumulate values up to 9,999 hours before the display rolls over to zero.

The odometer display does not have a decimal point and will not show values less than a full unit (kilometer or mile), while the trip odometer display does have a decimal point and will show tenths of a unit (kilometer or mile). The unit of measure (kilometers or miles) for the odometer and trip odometer display is not shown in the VFD. The unit of measure for the instrument cluster odometer/trip odometer is selected at the time that it is manufactured, and cannot be changed. The odometer also has a “Rental Car” mode, which will illuminate the odometer information in the VFD whenever the driver side front door is opened with the ignition switch in the Off or Accessory positions.

During daylight hours (exterior lamps are Off) the odometer VFD is illuminated at full brightness for clear visibility. At night (exterior lamps are On), the VFD lighting level is adjusted with the other cluster illumination lamps using the panel lamps dimmer thumbwheel on the headlamp switch. However, a “Parade” mode position of the panel lamps dimmer thumbwheel allows the VFD to be illuminated at full brightness if the exterior lamps are turned On during daylight hours.

The odometer/trip odometer VFD, the trip odometer switch, and the trip odometer switch button are serviced as a unit with the instrument cluster.

OPERATION

The odometer and trip odometer give an indication to the vehicle operator of the distance the vehicle has traveled. The engine hours give an indication of the cumulative engine-on time. This indicator is controlled by the instrument cluster circuitry based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The odometer, trip odometer and engine hours information is displayed by the instrument cluster odometer/trip odometer Vacuum Fluorescent Display (VFD). The VFD will display the odometer information whenever any door is opened with the ignition switch in the Off or Accessory positions, and will display the last previously selected odometer or trip odometer information when the ignition switch is turned to the On or Start positions. The instrument cluster circuitry controls the VFD and provides the following features:

- **Odometer/Trip Odometer Display Toggling** - Actuating the trip odometer reset switch button momentarily with the VFD illuminated will toggle the display between the odometer and trip odometer information. Each time the VFD is illuminated with the ignition switch in the On or Start positions, the display will automatically return to the last mode previously selected (odometer or trip odometer).
- **Engine Hours Display Toggling** - When the trip odometer reset switch button is pressed and held for longer than about six seconds with the ignition switch in the On position and the engine speed message from the PCM is zero, the trip odometer information will be momentarily displayed, then the engine hours information will be displayed. The VFD must be displaying the odometer information when the trip odometer reset switch button is pressed in order to toggle to the engine hours display. The engine hours will remain displayed for about thirty seconds, until the engine speed message is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Trip Odometer Reset** - When the trip odometer reset switch button is pressed and held for longer than about two seconds with the ignition switch in the On or Start positions, the trip odometer will be reset to 0.0 kilometers (miles). The VFD must be displaying the trip odometer information in order for the trip odometer information to be reset.
- **“GASCAP” Message Display** - On vehicles manufactured with a United States country code, each time the cluster receives an electronic message from the PCM indicating a monitored leak in the evaporative emissions system, the cluster replaces the displayed odometer/trip odometer value with the text message “GASCAP.” This message serves as a reminder to the vehicle operator to check that the gas cap is properly installed and

tightened, but could also indicate another source of air leakage in the on-board evaporative and vapor recovery emissions systems. Unless the leak is corrected, this message will latch and remain displayed during the current and each subsequent ignition cycle until the trip odometer reset button is pressed and released momentarily, which will revert the display to the odometer/trip odometer information that was last displayed for the remainder of that ignition cycle. Once the source of a leak has been corrected, either momentarily pressing the trip odometer reset button or cycling the ignition switch will unlatch the message and return the odometer/trip odometer to normal operation.

- **Communication Error** - If the cluster fails to receive a distance message during normal operation, it will hold and display the last data received until the ignition switch is turned to the Off position. If the cluster does not receive a distance message within one second after the ignition switch is turned to the On position, it will display the last distance message stored in the cluster memory. If the cluster is unable to display distance information due to an error internal to the cluster, the VFD will display “Error.”
- **Actuator Test** - Each time the cluster is put through the actuator test, the odometer VFD will display all of its segments simultaneously, then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors the vehicle speed pulse information received from the vehicle speed sensor and engine speed pulse information received from the crankshaft position sensor, then sends the proper distance and engine speed messages to the instrument cluster. For further diagnosis of the odometer/trip odometer or the instrument cluster circuitry that controls these functions, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the vehicle speed sensor, the crankshaft position sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the odometer/trip odometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SEATBELT INDICATOR

DESCRIPTION

A seatbelt indicator is standard equipment on all instrument clusters. This indicator is located near the upper edge of the instrument cluster, between the minor gauge set and the speedometer.

The seatbelt indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Seat Belt” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The seatbelt indicator is serviced as a unit with the instrument cluster.

OPERATION

The seatbelt indicator gives an indication to the vehicle operator of the status of the driver side front seatbelt. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input from the seatbelt switch in the driver side front seatbelt retractor through the seat belt indicator driver circuit.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or “beltminder” feature that is enabled when the vehicle is shipped from the factory. This beltminder feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about six seconds, or

until the ignition switch is turned to the Off position, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch input to the cluster.

- **Driver Side Front Seatbelt Not Buckled - Beltminder Active** - Following the seatbelt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seatbelt switch open = seatbelt unbuckled) with the ignition switch in the Start or On positions, the indicator will be illuminated. In addition, if the driver side front seat belt remains unbuckled about sixty seconds after the conclusion of the seatbelt reminder function with the vehicle speed greater than about 8 kilometers-per-hour (5 miles-per-hour), the seatbelt indicator will begin to cycle between flashing on and off for three seconds, then lighting solid for two seconds. The seatbelt indicator will continue to cycle between flashing and solid illumination for thirteen complete cycles, until the seat belt indicator driver input to the cluster is closed to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Driver Side Front Seatbelt Not Buckled - Beltminder Inactive** - Following the seatbelt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seatbelt switch open = seatbelt unbuckled) with the ignition switch in the Start or On positions, the indicator will be illuminated. The seatbelt indicator remains illuminated until the seat belt indicator driver input to the cluster is closed to ground (seatbelt switch closed = seatbelt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Airbag Indicator Backup** - If the instrument cluster detects a fault in the airbag indicator circuit it will send a message indicating the fault to the Occupant Restraint Controller (ORC), then flash the seatbelt indicator on and off. The cluster will continue to flash the seatbelt indicator until the airbag indicator circuit fault is resolved, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the seatbelt indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The seatbelt switch is connected in series between ground and the seat belt indicator driver input to the instrument cluster. The seatbelt switch input to the instrument cluster circuitry may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information.

For further diagnosis of the seatbelt indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

STANDARD PROCEDURE

ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or “beltminder” feature that is enabled when the vehicle is shipped from the factory. This beltminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt. The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

CUSTOMER PROGRAMMING SEQUENCE

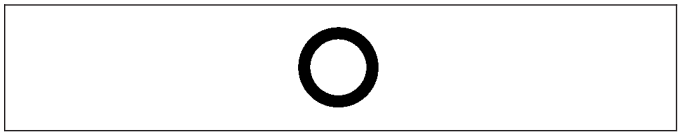
NOTE: The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully.

1. With the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except On or Start to toggle the beltminder feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

SECURITY INDICATOR

DESCRIPTION

A security indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Vehicle Theft Security System (VTSS), this indicator is electronically disabled. This indicator is located near the upper edge of the instrument cluster, between the tachometer and the speedometer.



The security indicator consists of a small round cutout in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the indicator to appear in red through the translucent outer layer of the overlay when it is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The security indicator is serviced as a unit with the instrument cluster.

OPERATION

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On models equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, hard wired inputs to the cluster from the various security system components, and electronic messages received by the cluster from the Sentry Key REmote Entry Module (SKREEM) over the Controller Area Network (CAN) data bus.

The security indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the security indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the security indicator illuminates for about two seconds as a bulb test. The entire bulb test is a function of the SKREEM.
- **VTSS Indication** - During the sixteen second VTSS arming function, the cluster will flash the security indicator on and off repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the cluster flashes the security indicator on and off continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the cluster will flash the security indicator at a steady, slow rate for about thirty seconds after the VTSS is disarmed.
- **SKIS Lamp-On Message** - Each time the cluster receives a SKIS lamp-on message from the SKREEM, the security indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated solid or continues to flash until the cluster receives a SKIS lamp-off message from the SKREEM, or until the ignition switch is turned to the Off position, whichever occurs first. For more information on the SKIS and the security indicator control parameters, (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/SENTRY KEY IMMOBILIZER SYSTEM - OPERATION).
- **Communication Error** - If the cluster receives no SKIS lamp-on or lamp-off messages from the SKREEM for ten consecutive message cycles, the security indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid SKIS lamp-on or lamp-off message is received from the SKREEM.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the security indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster circuitry controls the security indicator whenever the ignition switch is in the Off position and the VTSS is arming, armed, or alarming. Whenever the ignition switch is in the On or Start positions, the SKREEM performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The SKREEM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the security indicator or the instrument cluster circuitry that controls the indicator,

(Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster flashes the security indicator upon ignition On, or turns on the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is inoperative.

For proper diagnosis of the VTSS, the SKIS, the SKREEM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the security indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SERVICE 4WD INDICATOR

DESCRIPTION

A service 4WD indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system and electronically shifted transfer case, this indicator is electronically disabled. The service 4WD indicator is located below the minor gauge set on the left side of the cluster.

The service 4WD indicator consists of a stencil-like cutout of the text “SVC 4WD” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “SVC 4WD” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The service 4WD indicator is serviced as a unit with the instrument cluster.

OPERATION

The service 4WD indicator gives an indication to the vehicle operator when the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) has recorded a Diagnostic Trouble Code (DTC) for an electronic transfer case circuit or component malfunction. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the FCM over the Controller Area Network (CAN) data bus.

The service 4WD indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the service 4WD indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the service 4WD indicator is illuminated for about two seconds as a bulb test.
- **Service 4WD Lamp-On Message** - Each time the cluster receives a service 4WD lamp-on message from the FCM, the service 4WD indicator will be illuminated. The indicator remains illuminated until the cluster receives a service 4WD lamp-off message from the FCM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster receives no messages from the FCM for ten seconds, the service 4WD indicator is illuminated by the instrument cluster to indicate a loss of FCM communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the FCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the service 4WD indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The FCM continually monitors the electronic transfer case control circuits and transfer case shift motor/mode sensor assembly to determine the condition of the system. The FCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the service 4WD indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

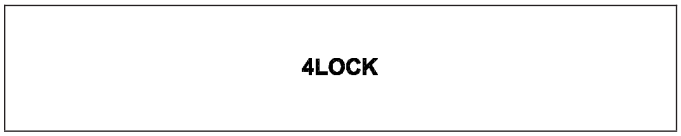
For proper diagnosis of the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the service 4WD indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SHIFT INDICATOR (TRANSFER CASE)

DESCRIPTION

4WD LOCK INDICATOR

A 4WD lock indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system and electronically shifted transfer case, this indicator is electronically disabled. The 4WD lock indicator is located below the minor gauge set on the left side of the cluster.



The 4WD lock indicator consists of a stencil-like cutout of the text “4LOCK” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “4LOCK” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the 4WD lock indicator is dimmable, which is adjusted along with the cluster illumination lamp using the panel lamps dimmer thumbwheel on the headlamp switch. The 4WD lock indicator is serviced as a unit with the instrument cluster.

4WD LOW INDICATOR

A 4WD low indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional four-wheel drive system and electronically shifted transfer case, this indicator is electronically disabled. The 4WD low indicator is located below the minor gauge set on the left side of the cluster.

The 4WD low indicator consists of a stencil-like cutout of the text “4LO” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “4LO” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the 4WD low indicator is dimmable, which is adjusted along with the cluster illumination lamp using the panel lamps dimmer thumbwheel on the headlamp switch. The 4WD low indicator is serviced as a unit with the instrument cluster.

OPERATION

4WD LOCK INDICATOR

The 4WD lock indicator gives an indication to the vehicle operator when the electronic transfer case has been shifted into the 4WD lock mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

The 4WD lock indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the 4WD lock indicator for the following reasons:

- **4WD Lock Lamp-On Message** - Each time the cluster receives a 4WD lock lamp-on message from the FCM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a 4WD lock lamp-off message from the FCM, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the 4WD lock indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The FCM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly to determine when the 4WD lock mode is engaged. The FCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the 4WD lock indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transfer case shift motor/mode sensor, the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the 4WD lock indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

4WD LOW INDICATOR

The 4WD low indicator gives an indication to the vehicle operator when the electronic transfer case has been shifted into the 4WD low mode. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

The 4WD low indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the 4WD low indicator for the following reasons:

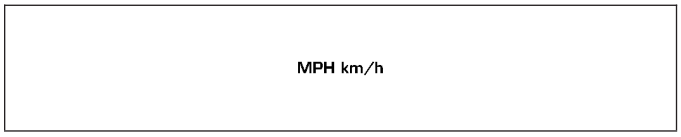
- **4WD Low Lamp-On Message** - Each time the cluster receives a 4WD low lamp-on message from the FCM, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a 4WD low lamp-off message from the FCM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the 4WD low indicator will be turned on, then off again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The FCM continually monitors the electronic transfer case through the transfer case shift motor/mode sensor assembly to determine when the 4WD low mode is engaged. The FCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the 4WD low indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transfer case shift motor/mode sensor, the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the 4WD low indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SPEEDOMETER

DESCRIPTION



A speedometer is standard equipment on all instrument clusters. The speedometer is located in the center of the instrument cluster, between the tachometer and the minor gauge set. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree primary scale on the gauge dial face that reads left-to-right either from “0” to “120” mph, or from “0” to “200” km/h, depending upon the market for which the vehicle is manufactured. Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. Text appearing on the cluster overlay above the hub of the speedometer needle abbreviates the unit of measure for the primary scale (i.e.: MPH or km/h), followed by the unit of measure for the secondary scale.

The speedometer graphics are black (primary scale) and blue (secondary scale) against a white field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white gauge dial face appears blue-green with the black and blue graphics silhouetted against the illuminated background and the red gauge needle still

appears red. Gauge illumination is provided by an integral electro-luminescent lamp that is serviced as a unit with the instrument cluster. The speedometer is serviced as a unit with the instrument cluster.

OPERATION

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The speedometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the cluster receives a vehicle speed message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new vehicle speed message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speedometer message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the speedometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

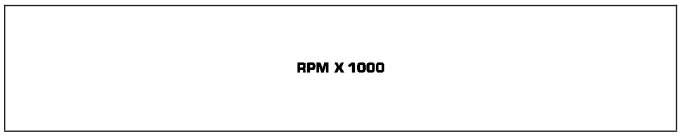
The PCM continually monitors the vehicle speed sensor to determine the vehicle road speed. The PCM then sends the proper vehicle speed messages to the instrument cluster. For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the vehicle speed sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the speedometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TACHOMETER

DESCRIPTION

A tachometer is standard equipment on all instrument clusters. The tachometer is located to the right side of the instrument cluster, just right of the speedometer. The tachometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree scale on the gauge dial face that reads left-to-right from “0” to “7”. The text “RPM X 1000” imprinted on the cluster overlay directly above the hub of the tachometer needle identifies that each number on the tachometer scale is to be multiplied by 1000 rpm.



The tachometer graphics are black against a white field, making them clearly visible within the instrument cluster in daylight. When illuminated from behind by the panel lamps dimmer controlled cluster illumination lighting with the exterior lamps turned On, the white gauge dial face appears blue-green with the black graphics silhouetted against the illuminated background and the red gauge needle still appears red. Gauge illumination is provided by an integral electro-luminescent lamp that is serviced as a unit with the instrument cluster. The tachometer is serviced as a unit with the instrument cluster.

OPERATION

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tachometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the cluster receives an engine speed message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new engine speed message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive an engine speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tachometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper engine speed messages to the instrument cluster. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the crankshaft position sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the tachometer, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TOW/HAUL INDICATOR

DESCRIPTION

A tow/haul indicator is standard equipment on all instrument clusters. The tow/haul indicator is located below the minor gauge set on the left side of the cluster.

The tow/haul indicator consists of a stencil-like cutout of the text “TOW/HAUL” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the “TOW/HAUL” text to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board.

When the exterior lighting is turned On, the illumination intensity of the tow/haul indicator is dimmable, which is adjusted along with the cluster illumination lamp using the panel lamps dimmer thumbwheel on the headlamp switch. The tow/haul indicator is serviced as a unit with the instrument cluster.

OPERATION

The tow/haul indicator gives an indication to the vehicle operator when the Off position of the tow/haul switch has been selected, disabling the electronically controlled overdrive feature of the automatic transmission. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tow/haul indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the tow/haul indicator for the following reasons:

- **Tow/Haul Lamp-On Message** - Each time the cluster receives a tow/haul lamp-on message from the PCM indicating that the Off position of the tow/haul switch has been selected, the indicator will be illuminated. The indicator remains illuminated until the cluster receives a tow/haul lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tow/haul indicator will be turned on, then off again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

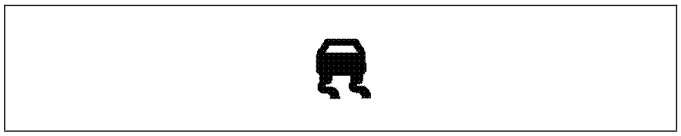
The PCM continually monitors the tow/haul switch to determine the proper outputs to the automatic transmission. The PCM then sends the proper lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the tow/haul indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the overdrive control system, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the tow/haul indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRACTION CONTROL INDICATOR

DESCRIPTION

A traction control indicator is standard equipment on all instrument clusters. However, on vehicles not equipped with the optional Traction Control System (TCS), this indicator is electronically disabled. This indicator is located in the center of the speedometer, in the area above and to the right of the speedometer needle hub.



The traction control indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Stability - Anti-Spin” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The traction control indicator is serviced as a unit with the instrument cluster.

OPERATION

The traction control indicator gives an indication to the vehicle operator when the electronic Traction Control System (TCS) has been activated. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The traction control indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster circuitry. The instrument cluster will turn on the traction control indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the traction control indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Traction Control Lamp-On Message** - Each time the cluster receives a traction control lamp-on message from the CAB indicating that the TCS has been activated, the traction control indicator will be illuminated. The indicator remains illuminated until the cluster receives a traction control lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Actuator Test** - Each time the cluster is put through the actuator test, the traction control indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

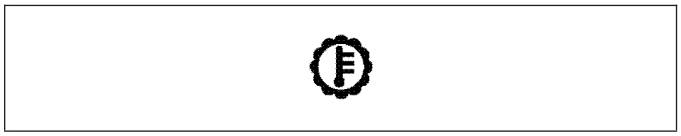
The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper traction control lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the traction control indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the traction control switch, the ABS, the CAB, the CAN data bus, or the electronic message inputs to the instrument cluster that control the traction control indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRANS TEMP INDICATOR

DESCRIPTION

A transmission over-temperature indicator is standard equipment on all instrument clusters. This indicator is located in the center of the speedometer, in the area above and to the right of the speedometer needle hub.



The transmission over-temperature indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Transmission Temperature” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. A red Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in red through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The transmission over-temperature indicator is serviced as a unit with the instrument cluster.

OPERATION

The transmission over-temperature indicator gives an indication to the vehicle operator when the transmission fluid temperature is excessive, which may lead to accelerated transmission component wear or failure. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The transmission over-temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the transmission over-temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the transmission over-temperature indicator is illuminated for about two seconds as a bulb test.
- **Trans Over-Temp Lamp-On Message** - Each time the cluster receives a trans over-temp lamp-on message from the PCM indicating that the transmission fluid temperature is 135° C (275° F) or higher, the indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a trans over-temp lamp-off message from the PCM, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the transmission over-temperature indicator is cycled off and then on again by the appropriate trans over-temp messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the transmission over-temperature indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the transmission temperature sensor to determine the transmission operating condition. The PCM then sends the proper trans over-temp lamp-on or lamp-off messages to the instrument cluster. If the

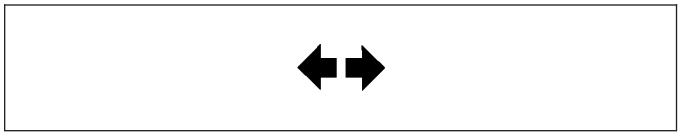
instrument cluster turns on the transmission over-temperature indicator due to a high transmission oil temperature condition, it may indicate that the transmission and/or the transmission cooling system are being overloaded or that they require service. For further diagnosis of the transmission over-temperature indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the transmission temperature sensor, the PCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the transmission over-temperature indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATOR

DESCRIPTION

Two turn signal indicators, one right and one left, are standard equipment on all instrument clusters. The turn signal indicators are located near the upper edge of the instrument cluster, the right one is between the speedometer and the tachometer, and the left one is between the speedometer and the minor gauge set.



Each turn signal indicator consists of a stencil-like cutout of the International Control and Display Symbol icon for “Turn Warning” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents these icons from being clearly visible when they are not illuminated. A green Light Emitting Diode (LED) behind each cutout in the opaque layer of the overlay causes the icon to appear in green through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The turn signal indicators are serviced as a unit with the instrument cluster.

OPERATION

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the instrument cluster electronic circuit board based upon the cluster programming, a hard wired multiplex input received by the cluster from the turn signal and hazard warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, and electronic messages received from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

Each turn signal indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the turn signal indicators for the following reasons:

- **Turn Signal-On Input** - Each time the cluster detects a turn signal-on input from the turn signal switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic turn signal switch status messages to the FCM over the CAN data bus. The FCM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps. The FCM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher. The turn signals and the turn signal indicators continue to flash on and off until the cluster receives a turn signal-off input from the multi-function switch, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Hazard Warning-On Input** - Each time the cluster detects a hazard warning-on input from the hazard warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic hazard switch status messages to the FCM over the CAN data bus. The FCM responds to these messages by controlling a battery voltage output and the flash rate for each of the right and left turn signal lamps. The FCM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional haz-

ard warning flasher. The turn signals and the turn signal indicators continue to flash on and off until the cluster receives a hazard warning-off input from the multi-function switch.

- **Lamp Out Mode** - The instrument cluster also sends electronic turn signal on and off messages to the FCM over the CAN data bus, and the FCM flashes the appropriate exterior turn signal lamps. If the FCM detects an inoperative turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message back to the instrument cluster. The instrument cluster then increases the flash rate of the turn signal indicator(s) and the clicking rate of the electromechanical relay to provide an indication of the problem to the vehicle operator.
- **Actuator Test** - Each time the cluster is put through the actuator test, the turn signal indicators will be turned on, then off again during the bulb check portion of the test to confirm the functionality of each LED and the cluster control circuitry.

The instrument cluster continually monitors the multi-function switch and electronic messages from the FCM to determine the proper turn signal and hazard warning system control. For further diagnosis of the turn signal indicators or the instrument cluster circuitry that controls the indicators, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the turn signal and hazard warning system, the multi-function switch, the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the turn signal indicators, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WASHER FLUID INDICATOR

DESCRIPTION

A washer fluid indicator is standard equipment on all instrument clusters. This indicator is located in the center of the speedometer, in the area below and to the left of the speedometer needle hub.

The washer fluid indicator consists of a stencil-like cutout of the International Control and Display Symbol Icon for “Windscreen Washer Fluid Level” in the opaque layer of the instrument cluster overlay. The dark outer layer of the overlay prevents the indicator from being clearly visible when it is not illuminated. An amber Light Emitting Diode (LED) behind the cutout in the opaque layer of the overlay causes the icon to appear in amber through the translucent outer layer of the overlay when the indicator is illuminated from behind by the LED, which is soldered onto the instrument cluster electronic circuit board. The washer fluid indicator is serviced as a unit with the instrument cluster.

OPERATION

The washer fluid indicator gives an indication to the vehicle operator that the fluid level in the washer reservoir is low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM or Power Distribution Center/PDC) over the Controller Area Network (CAN) data bus.

The washer fluid indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the washer fluid indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the washer fluid indicator is illuminated for about two seconds as a bulb test.
- **Washer Fluid Indicator Lamp-On Message** - Each time the cluster receives a washer fluid indicator lamp-on message from the FCM indicating that a low washer condition has been detected for sixty consecutive seconds, the washer fluid indicator is illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a washer fluid indicator lamp-off message for sixty consecutive seconds from the FCM or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the washer fluid indicator is cycled off and then on again by the appropriate washer fluid lamp messages from the FCM.

- **Actuator Test** - Each time the cluster is put through the actuator test, the washer fluid indicator will be turned on, then off again during the LED portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The FCM continually monitors the washer fluid level switch in the washer reservoir to determine the level of the washer fluid. The FCM then sends the proper lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the washer fluid indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).

For proper diagnosis of the washer fluid level switch, the FCM, the CAN data bus, or the electronic message inputs to the instrument cluster that control the washer fluid indicator, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

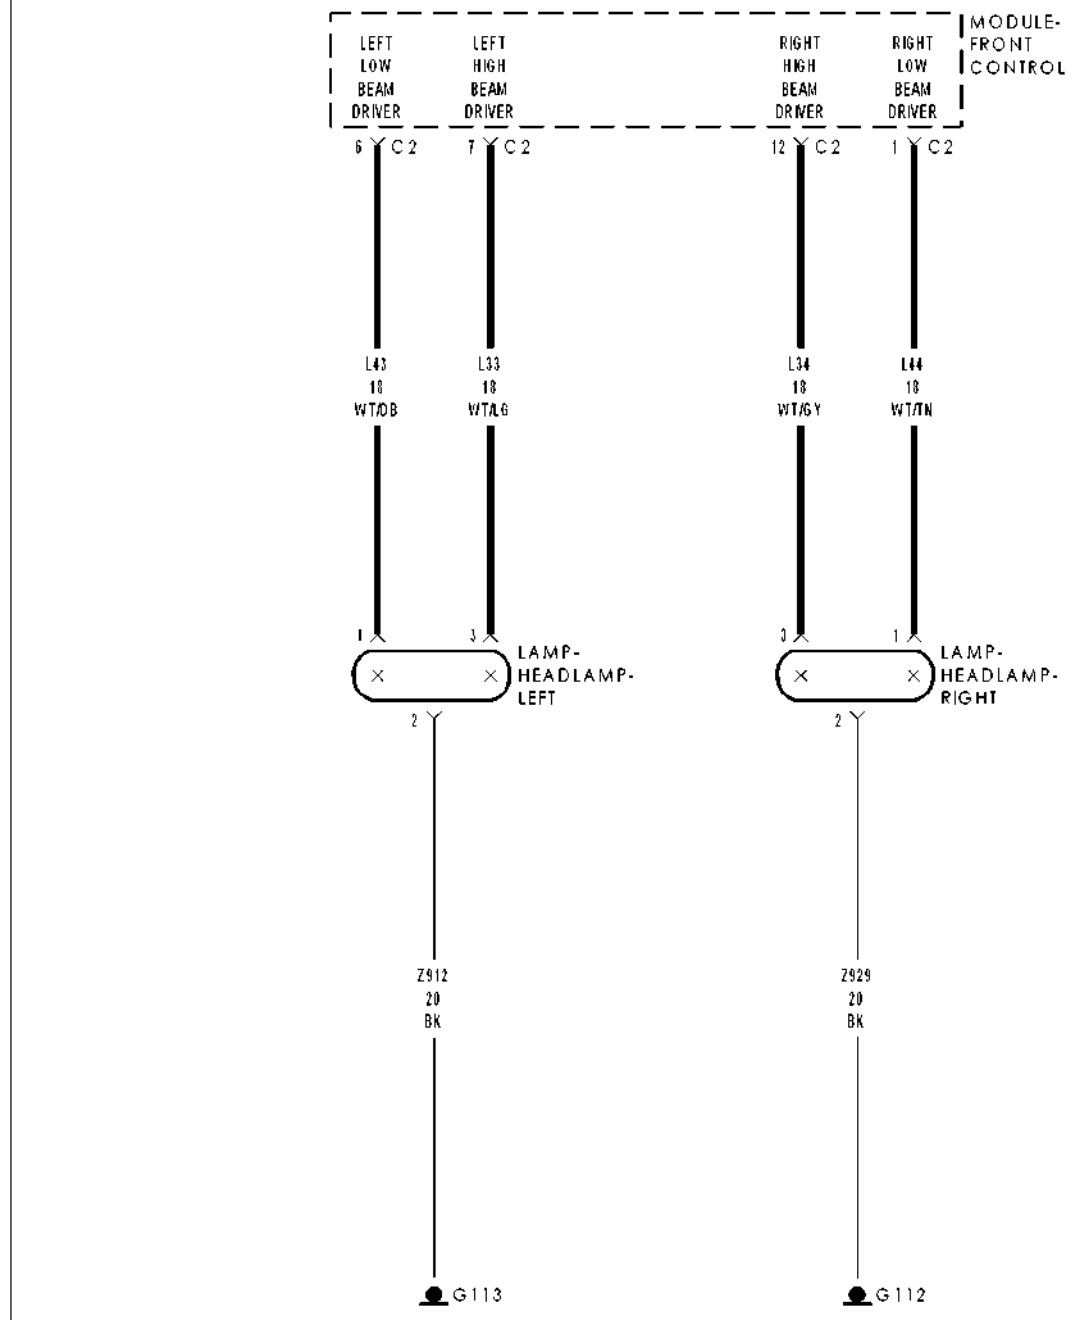
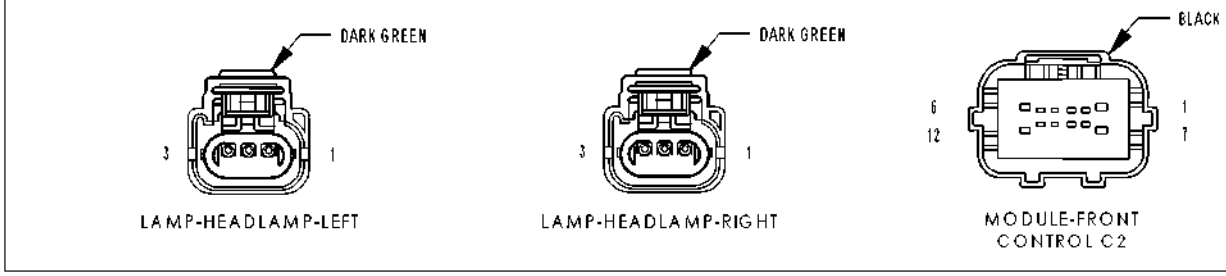
B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW





B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW (CONTINUED)

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT
FRONT CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
With the Scan Tool, clear all FCM DTC's.
Turn the Headlamps on.
With the Scan Tool read the DTC information.

Does the Scan Tool read: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?

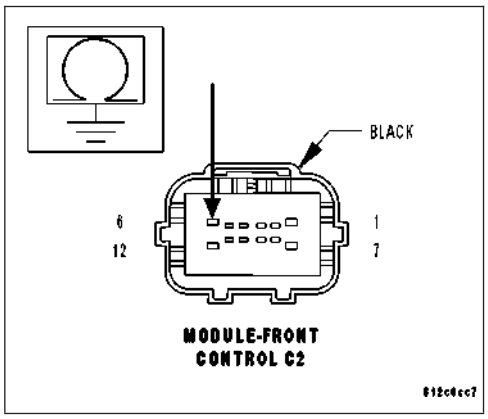
Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1.

---

2. (L43) LEFT LOW BEAM CONTROL CIRCUIT

Turn the ignition off.
Disconnect the FCM C2 harness connector.
Measure the resistance between ground and the (L43) Left Low Beam Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Replace the Front Control Module (FCM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

No >> Repair the (L43) Left Low Beam Control circuit for a short to ground condition.
Perform the BODY VERIFICATION TEST - VER 1.

Perform the BODY VERIFICATION TEST - VER 1.

---

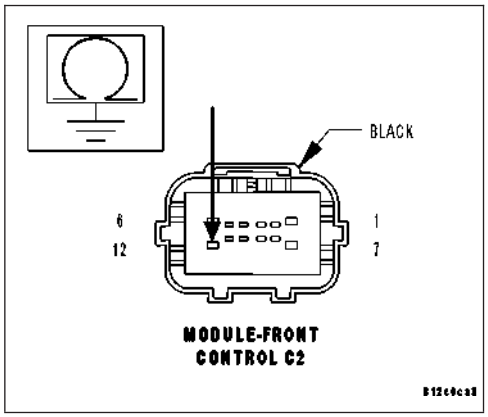
2. (L34) RIGHT HIGHBEAM OUTPUT CIRCUIT

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the Right Highbeam Output circuit.

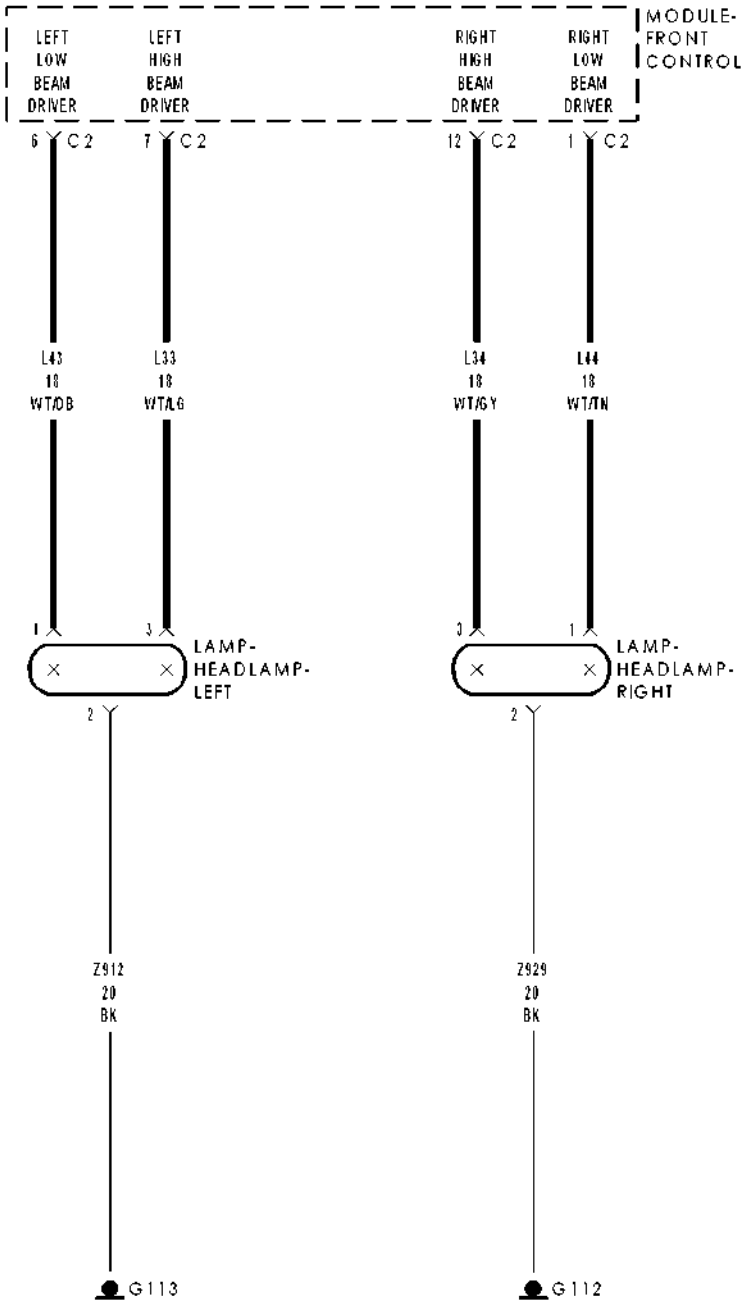


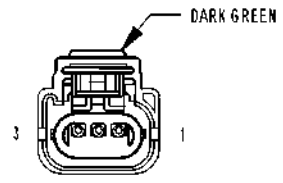
Is the resistance below 5.0 ohms?

Yes >> Replace the Front Control Module (FCM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

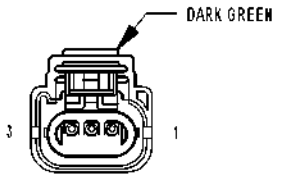
No >> Repair the (L34) Right Highbeam Output circuit for a short to ground condition.
Perform the BODY VERIFICATION TEST - VER 1.

B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH

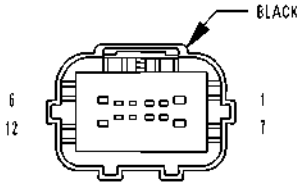




LAMP-HEADLAMP-LEFT



LAMP-HEADLAMP-RIGHT



MODULE-FRONT CONTROL C2

812c8091

B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH (CONTINUED)

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a HIGH condition.

Possible Causes
(L34) HIGH BEAM CONTROL CIRCUIT
FRONT CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1.

---

2. (L34) HIGH BEAM CONTROL CIRCUIT

Turn the ignition off.

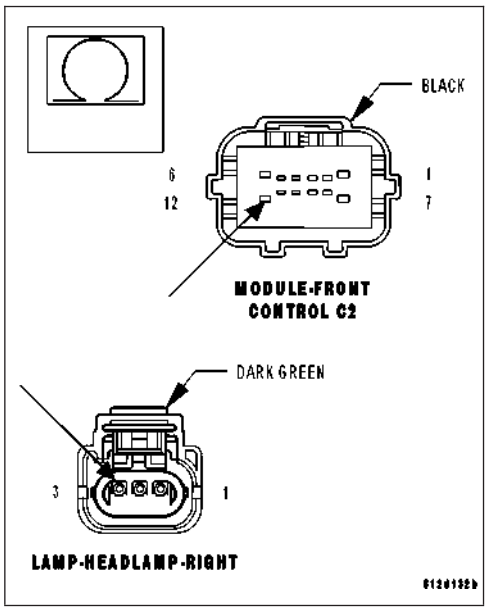
Disconnect the FCM C2 harness connector.

Measure the resistance of the (L34) High Beam Control circuit.

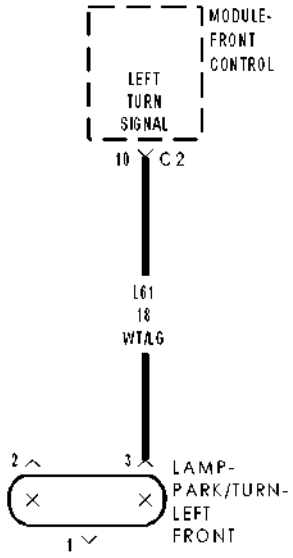
Is the resistance above 5.0 ohms?

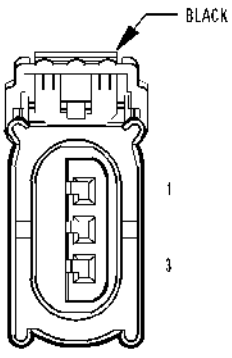
Yes >> Repair the (L34) High Beam Control circuit for a short to battery condition.
Perform the BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Control Module (FCM) in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

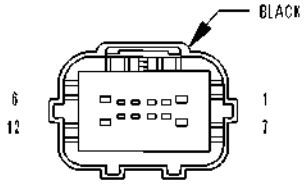


B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW





LAMP-PARK/TURN-LEFT FRONT



MODULE-FRONT CONTROL C2

B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Left Turn Signals on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1.

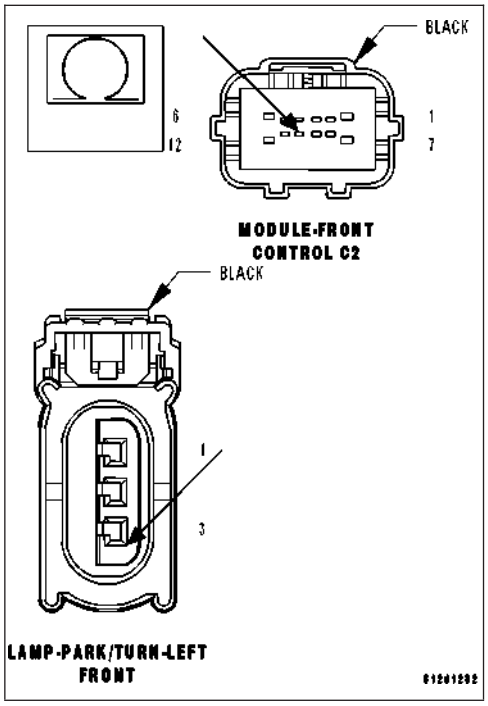
B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)

2. L61 FRONT LEFT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition off.

Disconnect the FCM C2 connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Go To 3

No >> Repair the (L61) Front Left Turn Signal Control circuit for a short to ground.
Perform the BODY VERIFICATION TEST - VER 1.

3. FRONT CONTROL MODULE

Turn the ignition off.

Disconnect the FCM C2 connector.

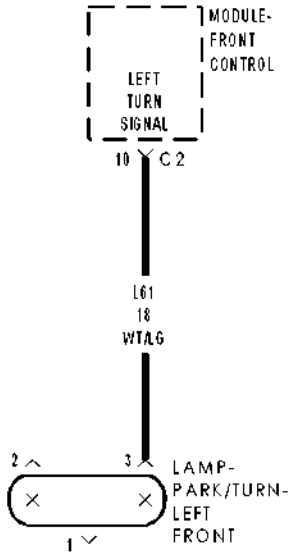
Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit in the FCM.

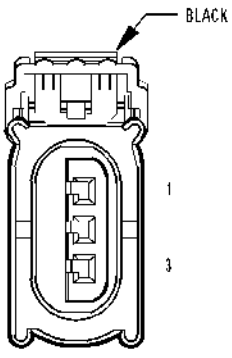
Is the resistance below 5.0 ohms?

Yes >> Replace the Power Distribution Center in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

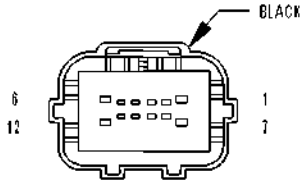
No >> Replace the Front Control Module in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH





LAMP-PARK/TURN-LEFT
FRONT



MODULE-FRONT
CONTROL C2

B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L61) TURN SIGNAL CONTROL CIRCUIT
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
Clear all FCM DTC's
Turn the Left Turn Signal on.
With the scan tool, read DTC's.

Does the scan tool read: B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)

2. L61 LEFT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition off.

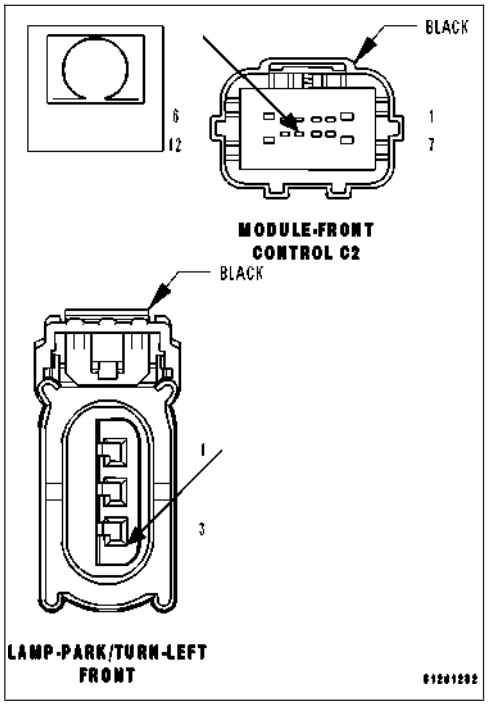
Disconnect the FCM C2 connector.

Measure the resistance of the (L61) Front Left Turn Signal Control circuit.

Is the resistance above 5.0 ohms?

No >> Repair the (L61) Turn Signal Control circuit.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3



3. FRONT CONTROL MODULE

Turn the ignition off.

Disconnect the Front Control Module from the PDC 49-way connector.

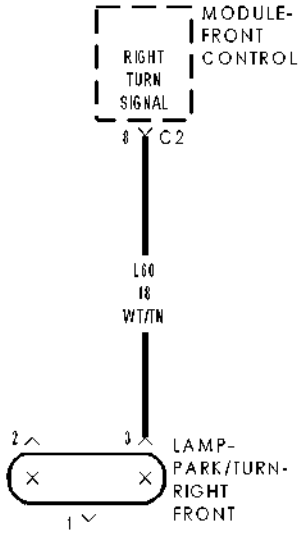
Measure the voltage between (L61) Front Left Turn Signal Control circuit and ground.

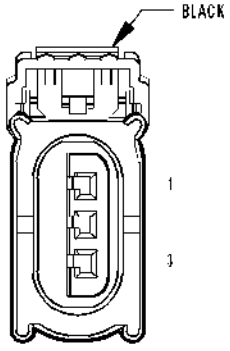
Is there any voltage present?

Yes >> Replace the Power Distribution Center in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

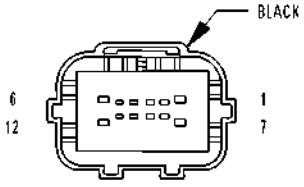
No >> Replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW





LAMP-PARK/TURN-RIGHT
FRONT



MODULE-FRONT
CONTROL C2

8l2a1286

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT
FRONT CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Right Turn Signals on.

With the Scan Tool read the DTC information.

Does the Scan Tool read: B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform the BODY VERIFICATION TEST - VER 1.

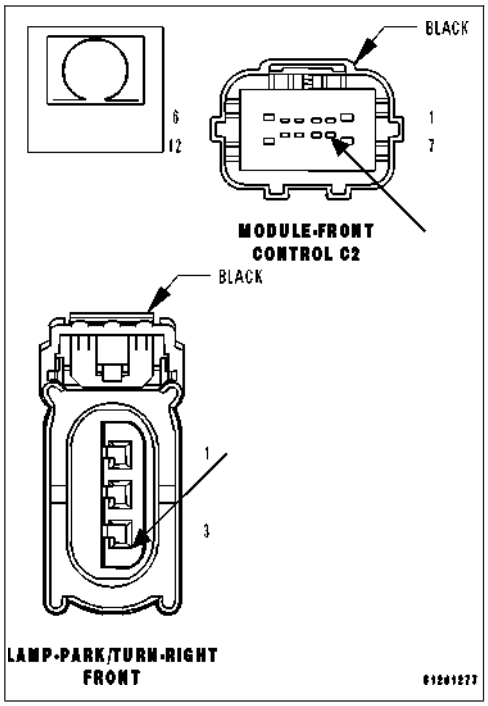
---

2. L60 FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the (L60) Front Turn Signal Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Go To 3

No >> Repair the (L60) Front Right Turn Signal Control circuit for a short to ground.
Perform the BODY VERIFICATION TEST - VER 1.

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)

3. FRONT CONTROL MODULE

Turn the ignition off.

Disconnect the FCM connector.

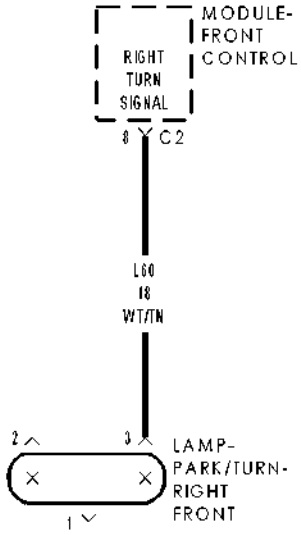
Measure the resistance between ground and the (L60) Front Right Turn Signal Control circuit in the FCM.

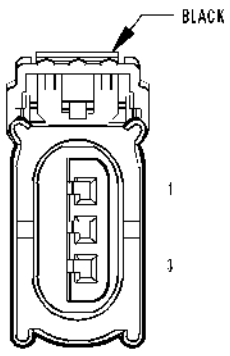
Is the resistance below 5.0 ohms?

Yes >> Replace the Power Distribution Center in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

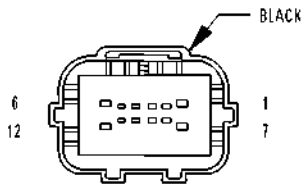
No >> Replace the Front Control Module in accordance with the service information.
Perform the BODY VERIFICATION TEST - VER 1.

B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH





LAMP-PARK/TURN-RIGHT
FRONT



MODULE-FRONT
CONTROL C2

8l2a1286

B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L60) TURN SIGNAL CONTROL CIRCUIT
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
Clear all FCM DTC's
Turn the Right Turn Signal on.
With the scan tool, read DTC's.

Does the scan tool read: B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

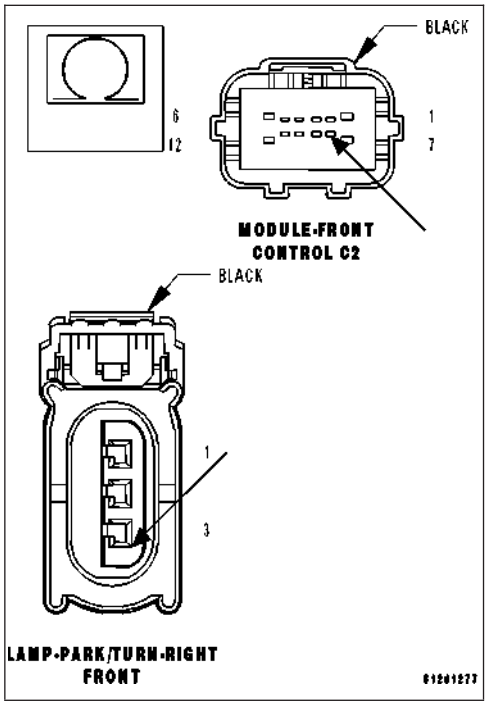
B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)

2. L60 RIGHT TURN SIGNAL CONTROL CIRCUIT

Turn the ignition off.

Disconnect the PDC connector from the FCM.

Measure the resistance of the (L60) Front Right Turn Signal Control circuit.



Is the resistance above 5.0 ohms?

No >> Repair the (L60) Turn Signal Control circuit.
Perform BODY VERIFICATION TEST - VER 1.

Yes >> Go To 3

---

3. FRONT CONTROL MODULE

Turn the ignition off.

Disconnect the Front Control Module from the PDC 49 way connector.

Measure the voltage between (L60) Front Right Turn Signal Control circuit and ground.

Is there any voltage present?

Yes >> Replace the Power Distribution Center.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Control Module.
Perform BODY VERIFICATION TEST - VER 1.
