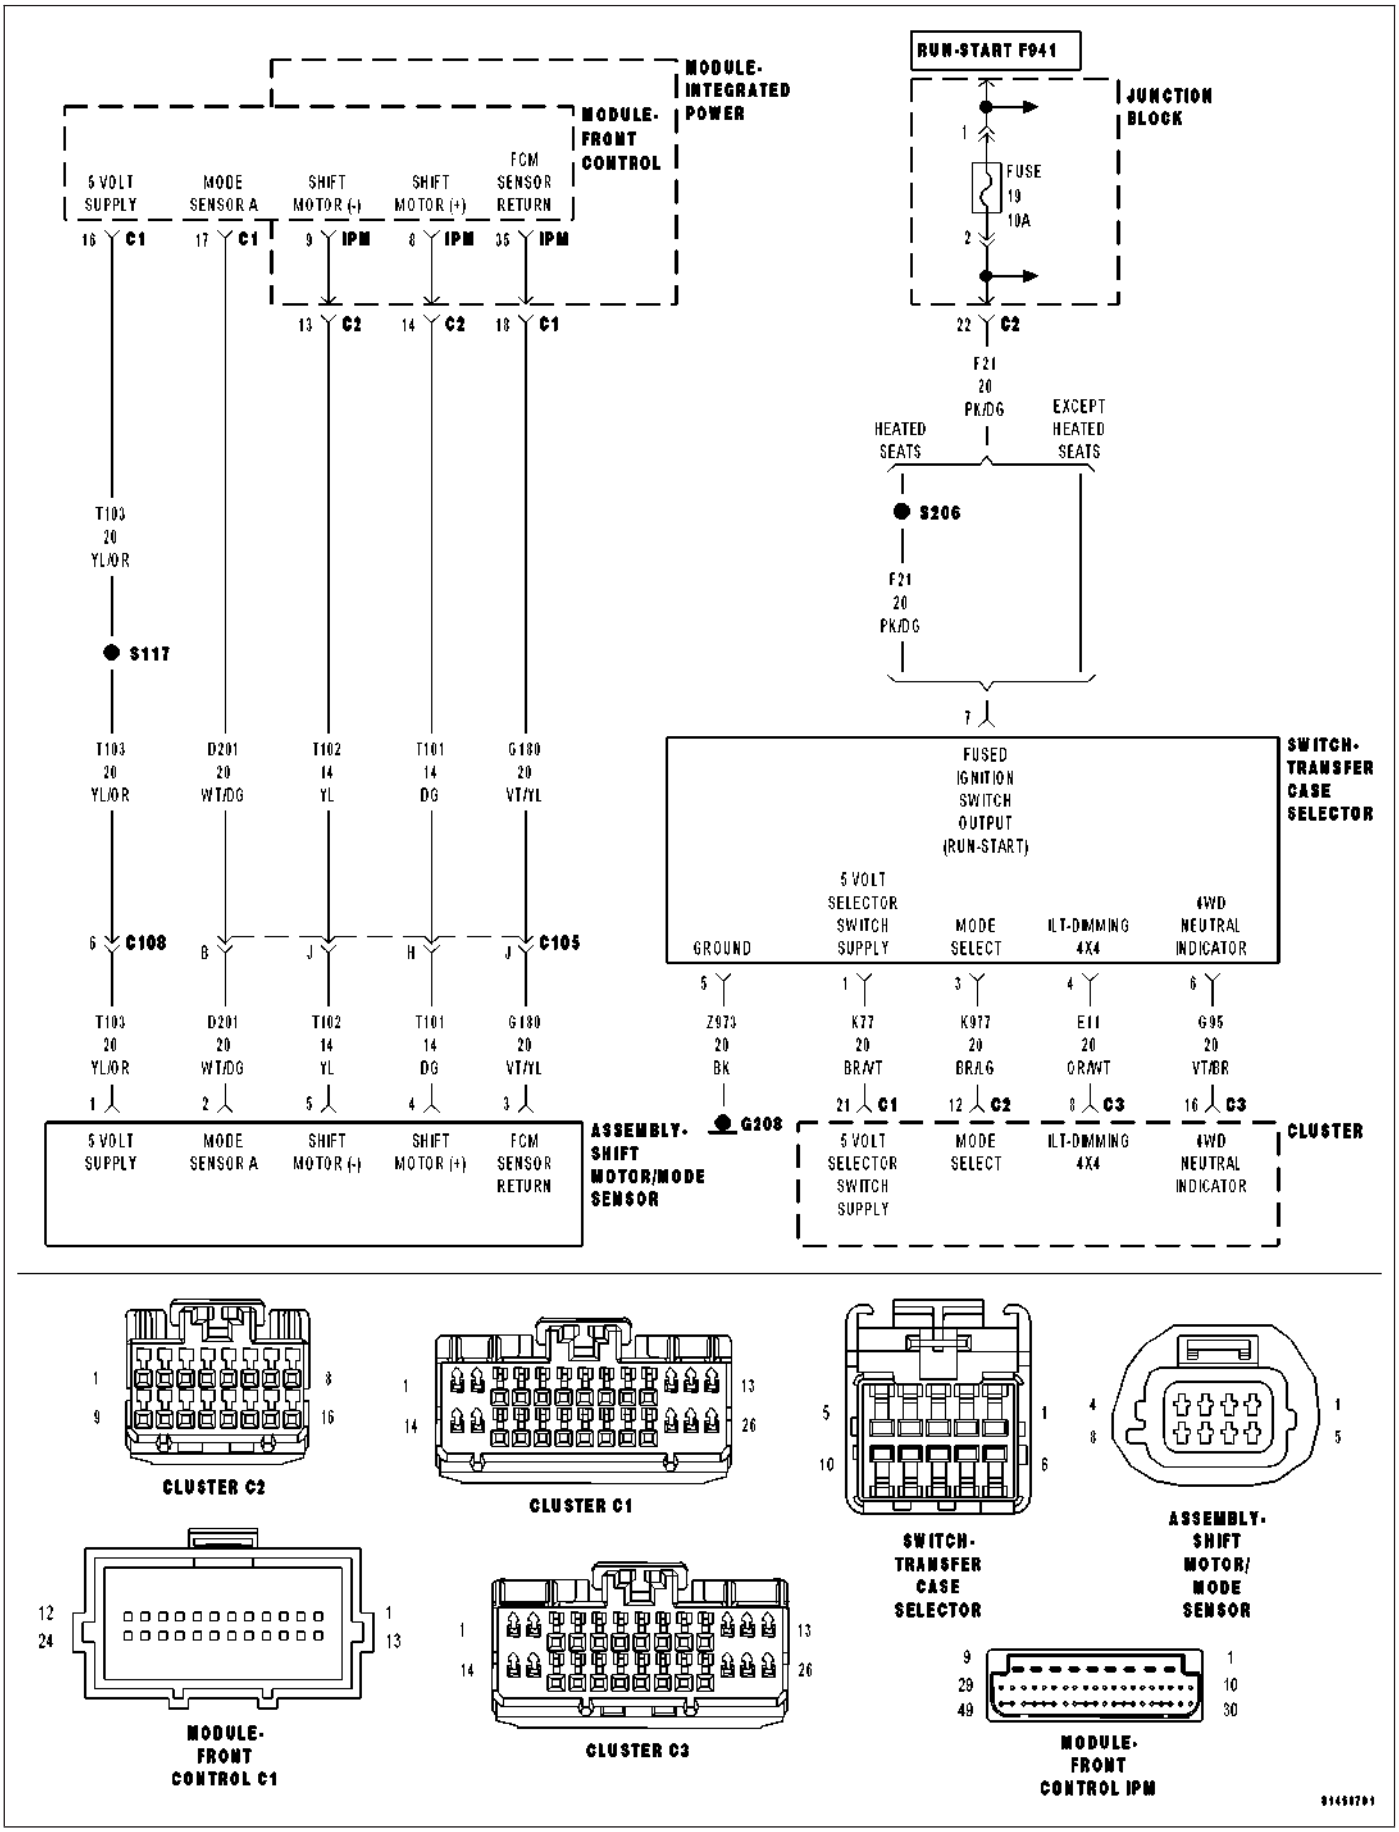
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Test complete.

C230A- NEUTRAL INDICATOR CONTROL CIRCUIT LOW



C230A- NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  CCM detects low voltage on the Neutral Indicator Control Circuit.

Possible Causes
INTERMITTENT CONDITION
(G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN
(G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO GROUND
TRANSFER CASE SELECTOR SWIITCH
INSTRUMENT CLUSTER MODULE (CCN)

Diagnostic Test

1. NEUTRAL INDICATOR CONTROL CIRCUIT DTC IS ACTIVE

Ignition on.

With the scan tool, Clear DTCs.

Shift the Transfer Case into neutral for 30 seconds.

NOTE: To select or deselect Transfer Case Neutral, vehicle speed must be 0 MPH with the ignition ON, engine OFF, the brake pedal applied, and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

NOTE: To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.

With the scan tool, Read DTCs.

Does the Neutral Indicator DTC reset?

Yes >> Go to 2

No >> Go to 6

C230A- NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

2. (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO GROUND

Turn the ignition off.

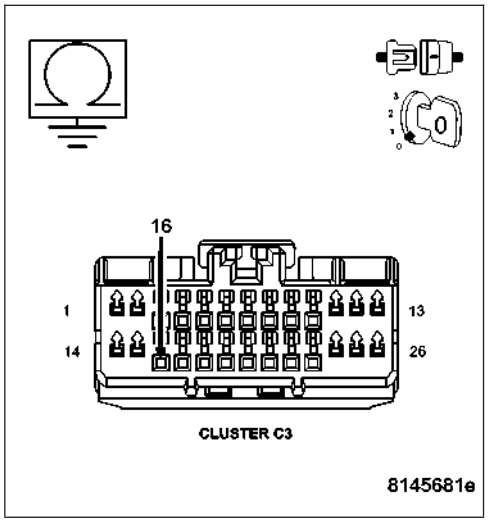
Disconnect the Instrument Cluster Module (CCN) C3 connector.

Measure the resistance between ground and the (G95) 4WD Neutral Indicator circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 3

No >> Go to 4



3. TRANSFER CASE SELECTOR SWITCH

Disconnect the Transfer Case Selector Switch connector.

Measure the resistance between ground and the (G95) 4WD Neutral Indicator circuit.

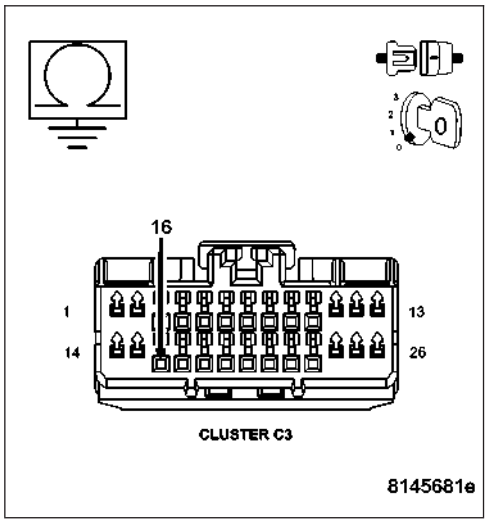
Is the resistance below 5.0 ohms?

Yes >> Repair the (G95) 4WD Neutral Indicator circuit for a short to ground.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Transfer Case Selector Switch.

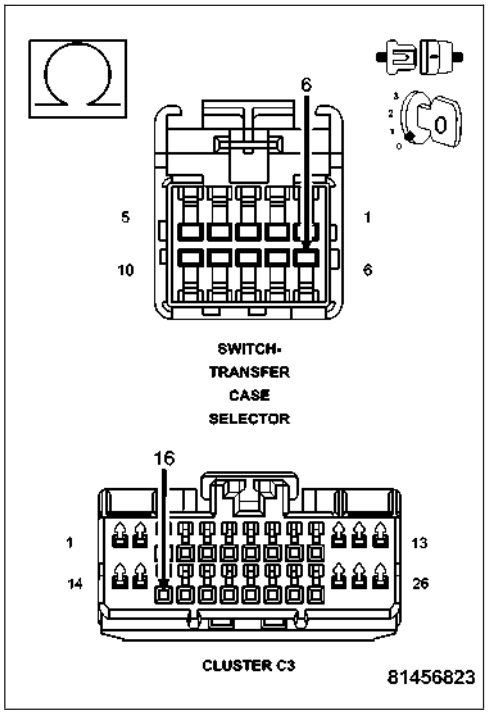
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)



C230A- NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

4. (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN

Disconnect the Transfer Case Selector Switch connector.
Measure the resistance of the (G95) 4WD Neutral Indicator circuit.



Is the resistance above 5.0 ohms?

Yes >> Repair the open (G95) 4WD Neutral Indicator circuit.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go to 5

---

5. INSTRUMENT CLUSTER MODULE

View repair.

Repair

Replace the Instrument Cluster Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

---

6. INTERMITTENT WIRING AND CONNECTORS

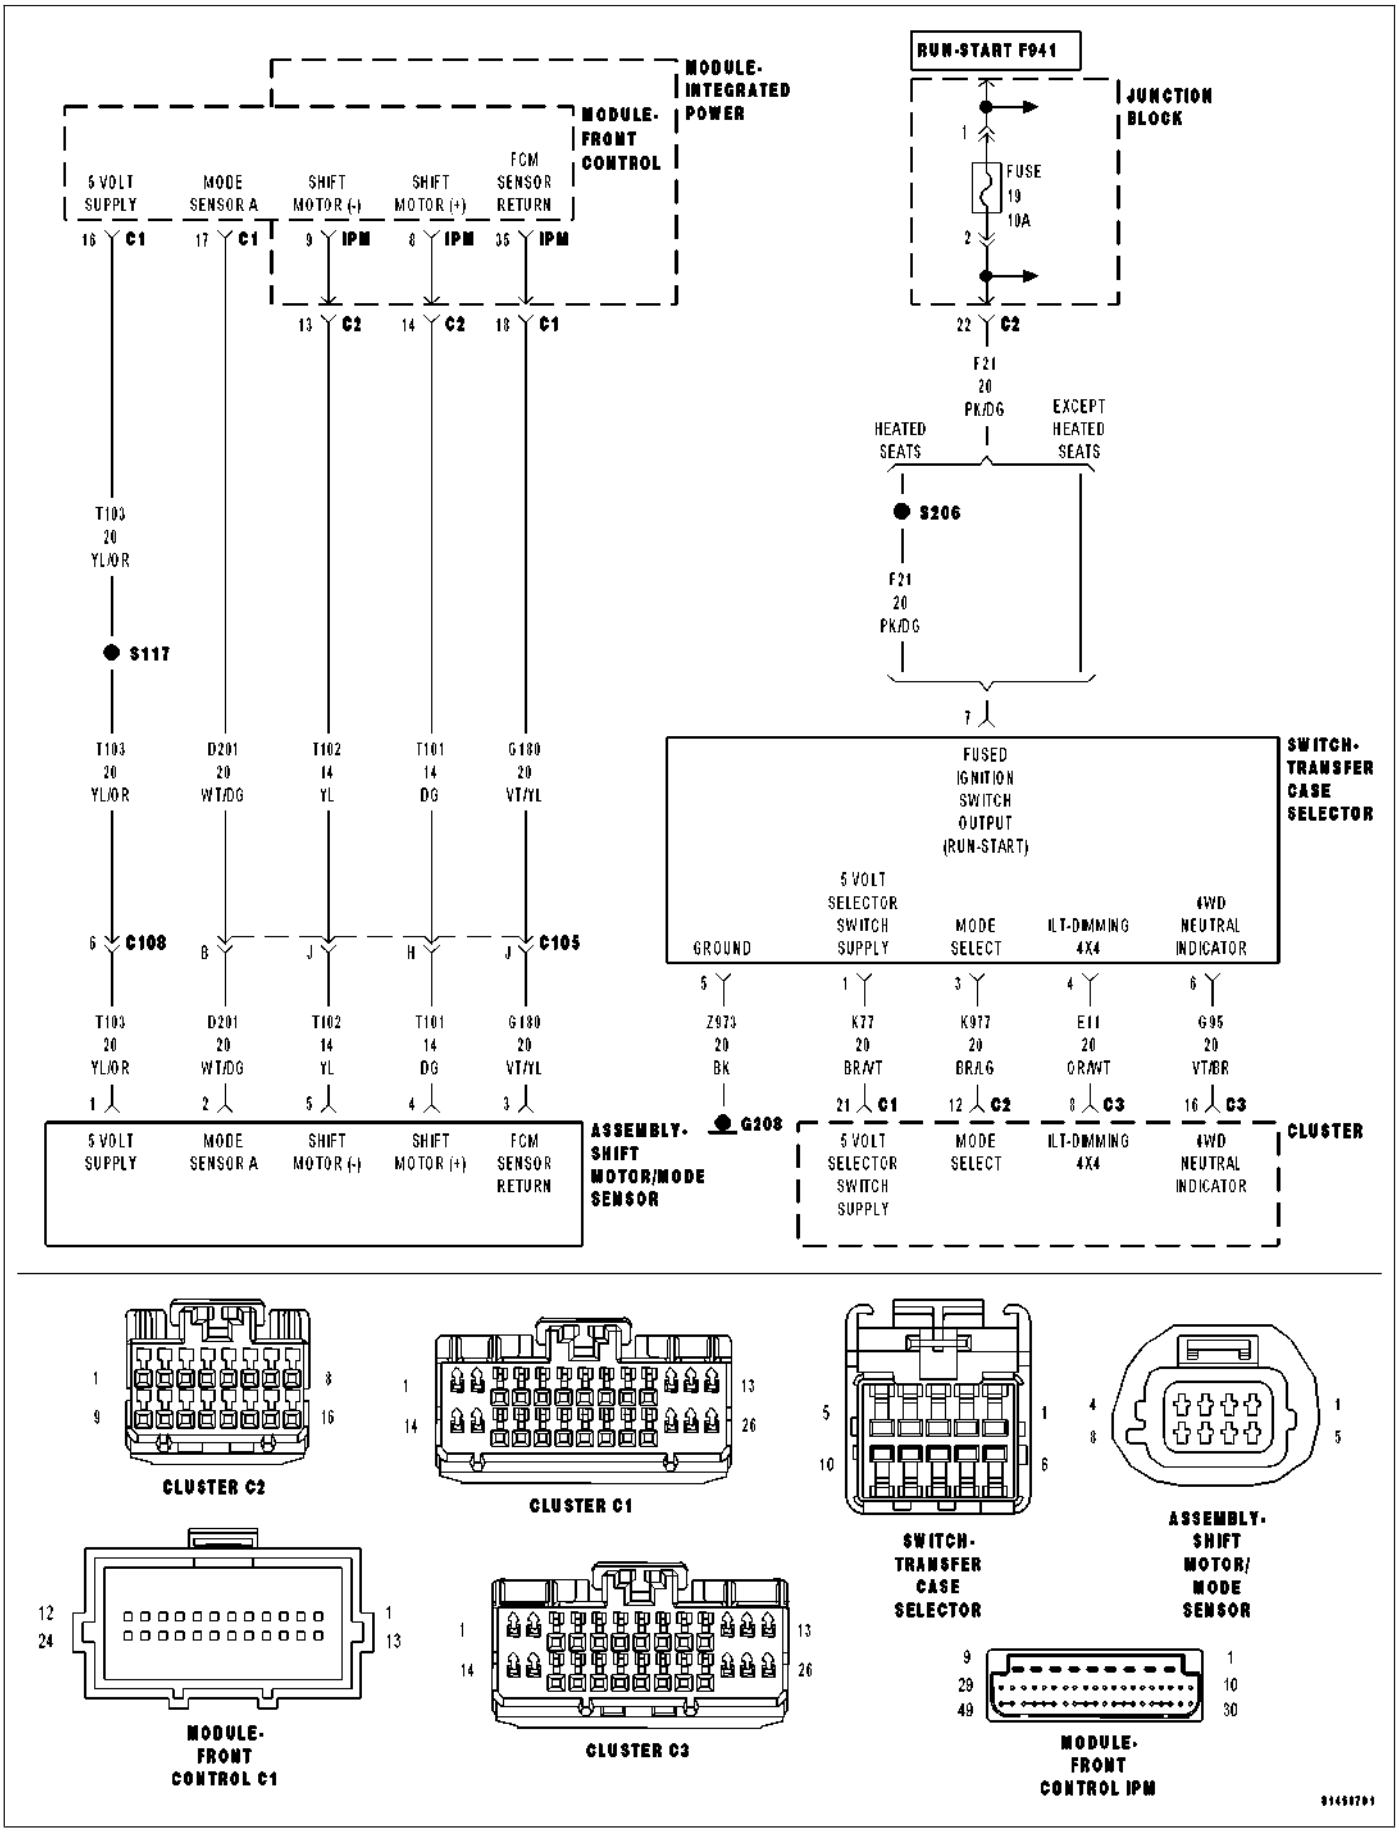
The conditions necessary to set this DTC are not present at this time.
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Test complete.

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH



C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  CCM detects high voltage on the Neutral Indicator Control Circuit.

Possible Causes
INTERMITTENT CONDITION
(G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN
(G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO VOLTAGE
TRANSFER CASE SELECTOR SWIITCH
INSTRUMENT CLUSTER MODULE (CCN)

Diagnostic Test

1. NEUTRAL INDICATOR CONTROL CIRCUIT DTC IS ACTIVE

Ignition on.

With the scan tool, Clear DTCs.

Shift the Transfer Case into neutral for 30 seconds.

NOTE: To select or deselect Transfer Case Neutral, vehicle speed must be 0 MPH with the ignition ON, engine OFF, the brake pedal applied, and the transmission in neutral (auto trans) or the clutch pedal pressed (man trans). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

NOTE: To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.

With the scan tool, Read DTCs.

Does the Neutral Indicator DTC reset?

Yes >> Go to 2

No >> Go to 6

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

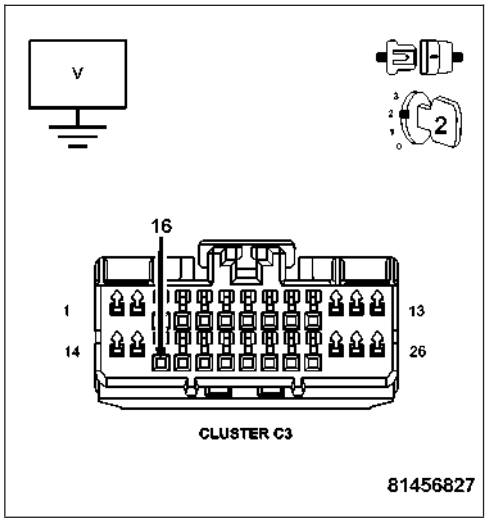
2. (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Instrument Cluster Module (CCN) C3 connector.
Turn the ignition on.
Measure the voltage of the (G95) 4WD Neutral Indicator circuit.

Is there any voltage present?

Yes >> Go to 3

No >> Go to 4



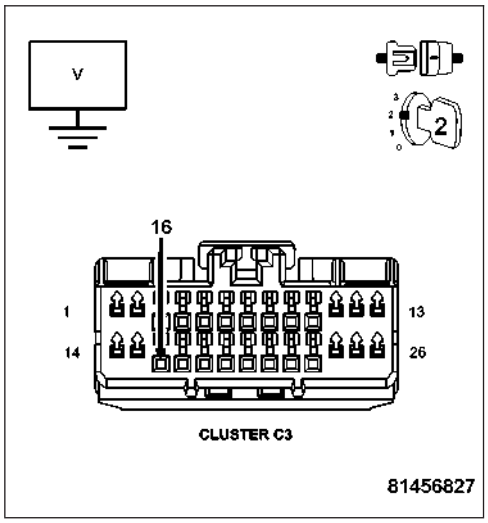
3. TRANSFER CASE SELECTOR SWITCH

Disconnect the Transfer Case Selector Switch connector.
Measure the voltage of the (G95) 4WD Neutral Indicator circuit.

Is there any voltage present?

Yes >> Repair the (G95) 4WD Neutral Indicator circuit for a short to voltage.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Replace the Transfer Case Selector Switch.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)



C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

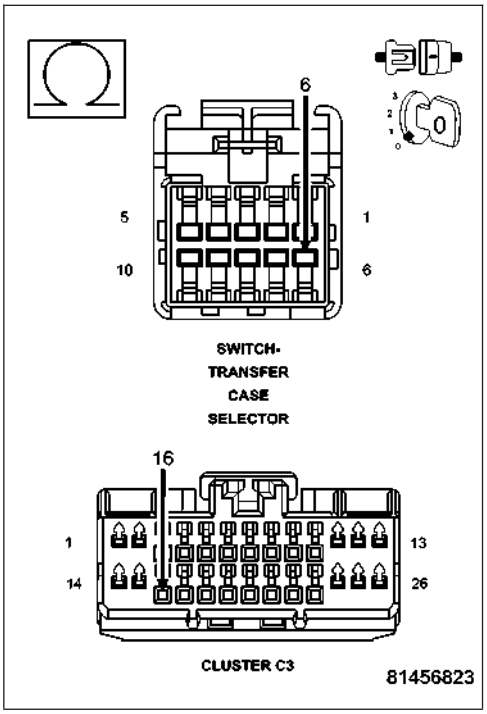
4. (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN

Disconnect the Transfer Case Selector Switch connector.
Measure the resistance of the (G95) 4WD Neutral Indicator Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the open (G95) 4WD Neutral Indicator circuit.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Go to 5



5. INSTRUMENT CLUSTER MODULE

View repair.

Repair

Replace the Instrument Cluster Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - DIAGNOSIS AND TESTING)

No >> Test complete.

TRANSFER CASE - NV144 - SERVICE INFORMATION

DESCRIPTION

The NV144 is an electronically controlled, single-speed, AWD transfer case.

The geartrain is mounted in two aluminum case halves attached with bolts.

OPERATING RANGES

Transfer case operating ranges are:

- AWD (All-wheel drive)
- 4HI (4-wheel drive)

The AWD range is for use on any road surface at any time.

The 4HI range is for off road use only. It is not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

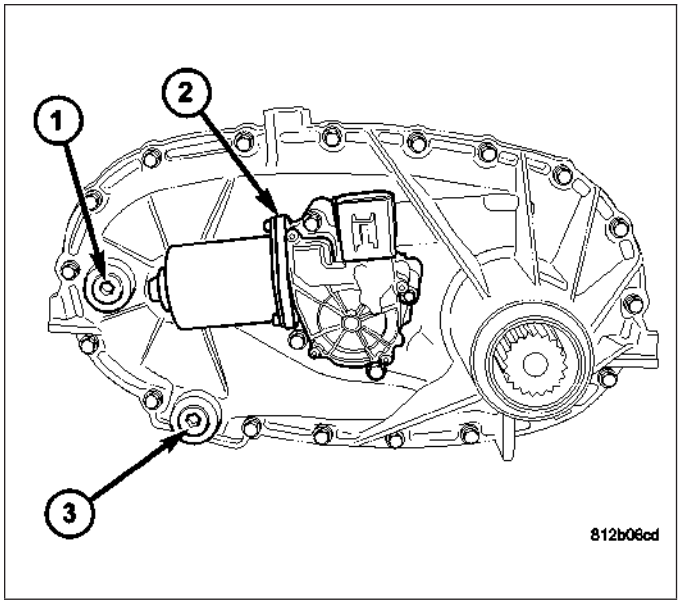
SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Front Control Module (FCM) to indicate the driver's desire to change operating ranges. The FCM uses this input, along with input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the FCM decides the shift is permitted, the FCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case. The ID tag provides the transfer case model number, assembly number, and serial number.

The transfer case serial number also represents the date of build.



OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the differential assembly. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft.

DIAGNOSIS AND TESTING

TRANSFER CASE - NV144

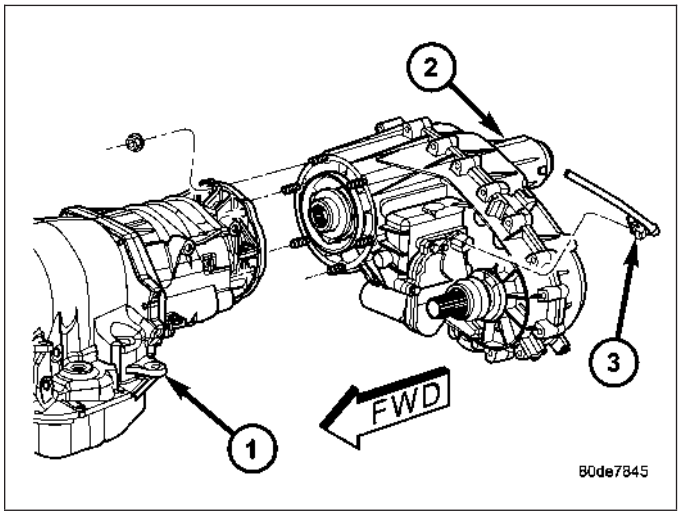
DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer case difficult to shift or will not shift into desired mode.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) If vehicle was operated for an extended period in 4HI mode on dry surface, driveline torque load may cause difficulty.	2) Drive the vehicle in a straight line and momentarily release the accelerator. The transfer case can then be shifted to the desired mode.
	3) Insufficient or incorrect lubricant.	3) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	4) Internal transfer case components binding, worn, or damaged.	4) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.

Condition	Possible Cause	Correction
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4HI mode on dry surfaces,	1) Operate vehicle in AWD mode on dry surfaces.

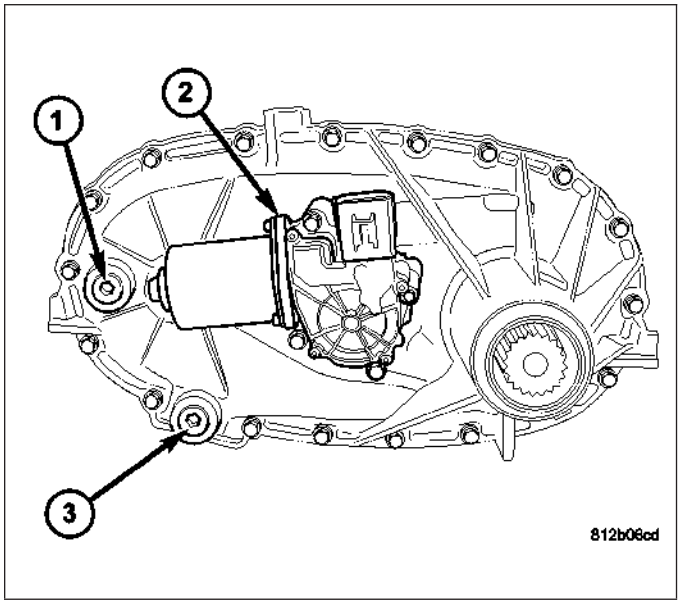
REMOVAL

1. Shift transfer case into AWD.
2. Raise vehicle.
3. Drain transfer case lubricant.
4. Mark front and rear propeller shafts for alignment reference.
5. Support transmission (1) with jack stand.
6. Remove the transfer case skid plate, if equipped.
7. Disconnect front and rear propeller shafts at transfer case.
8. Disconnect transfer case shift motor and mode sensor wire connectors (3).
9. Disconnect transfer case vent hose.
10. Support transfer case (2) with transmission jack.
11. Secure transfer case (2) to jack with chains.
12. Remove nuts attaching transfer case to transmission.
13. Pull transfer case and jack rearward to disengage transfer case.
14. Remove transfer case (2) from under vehicle.



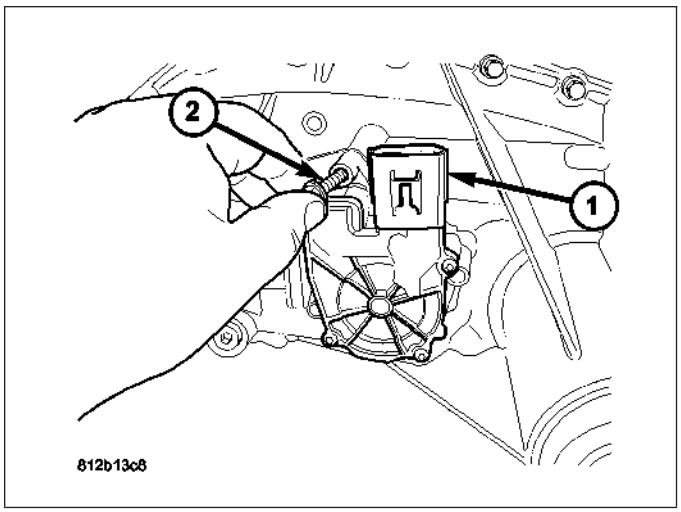
DISASSEMBLY

Position transfer case on shallow drain pan. Remove drain plug (3) and drain lubricant remaining in case.

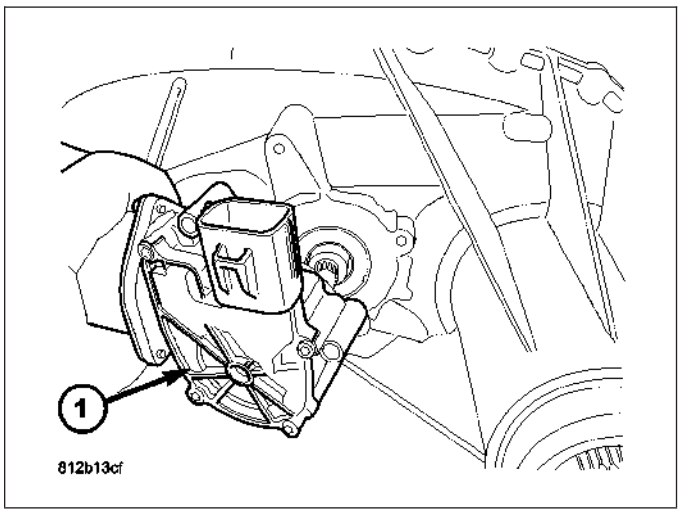


SHIFT MOTOR ASSEMBLY

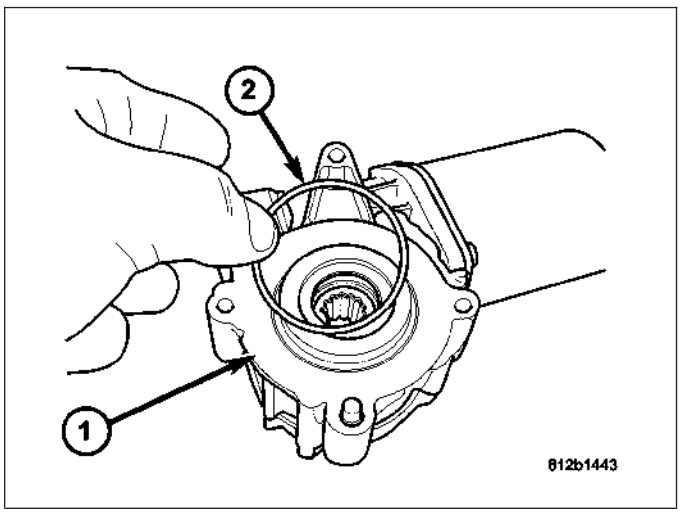
1. Remove the bolts (2) which hold the shift motor and mode sensor assembly (1) to the transfer case.



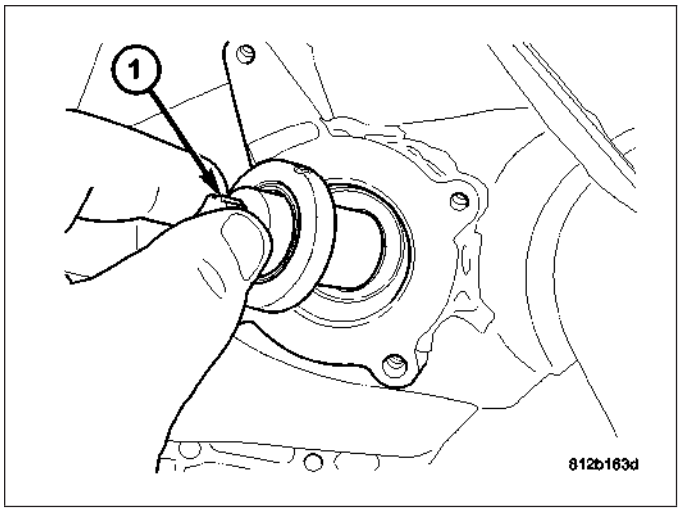
2. Remove the shift motor and mode sensor assembly (1) from the transfer case.



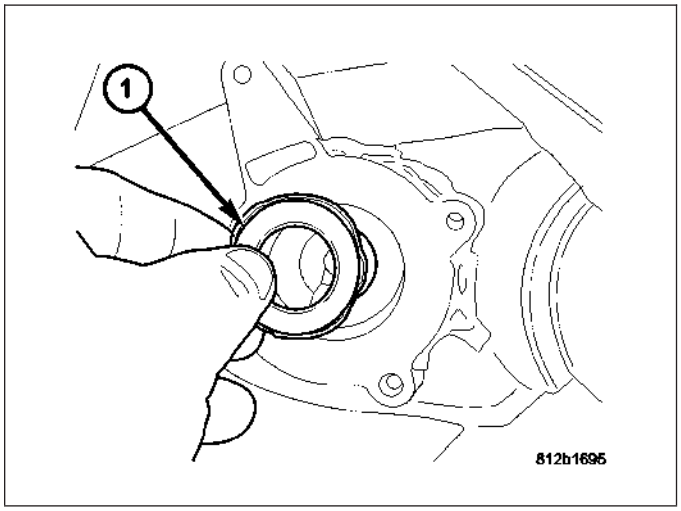
3. Remove and discard the shift motor o-ring (2) from the shift motor (1).



4. Remove the transfer case shift screw (1) and top bearing from the transfer case.

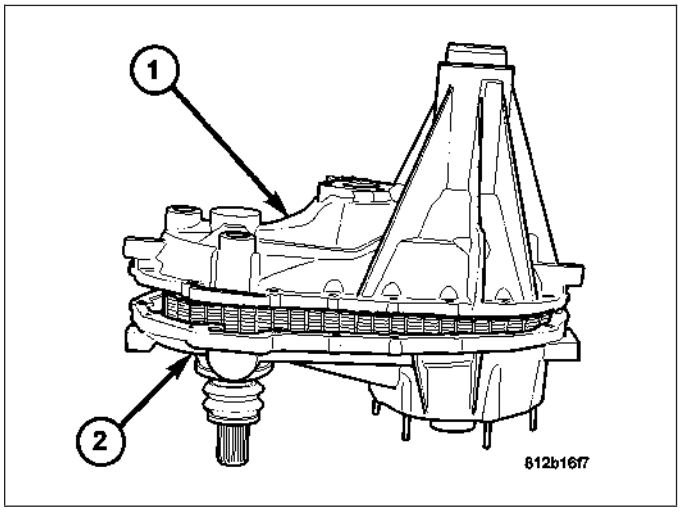


5. Remove the shift screw lower bearing (1) from the transfer case.



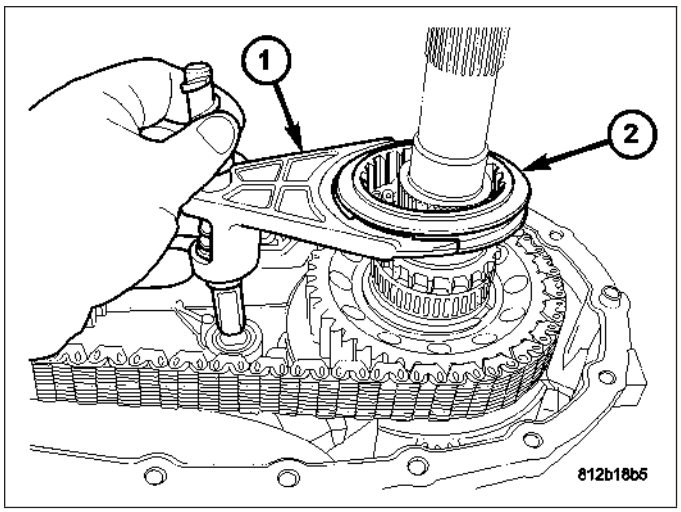
REAR CASE

1. Support transfer case so rear case is facing upward.
2. Remove bolts holding the front case (2) to the rear case (1).
3. Loosen rear case with flat blade screwdriver to break sealer bead.
4. Remove the rear case (1) from the front case (2).

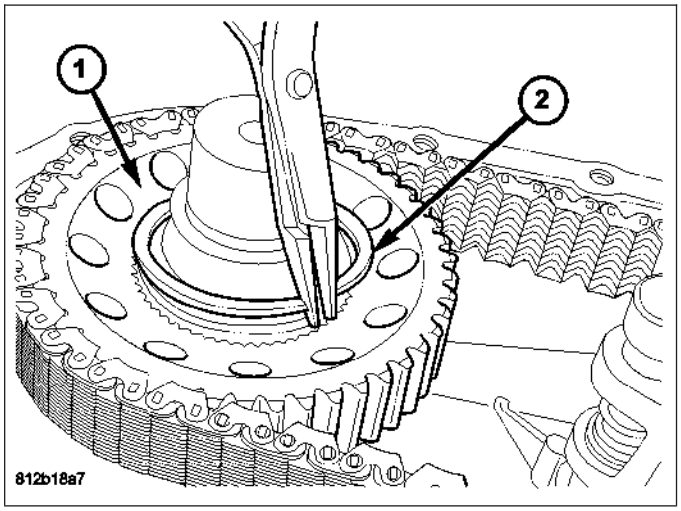


DRIVE CHAIN AND SPROCKETS

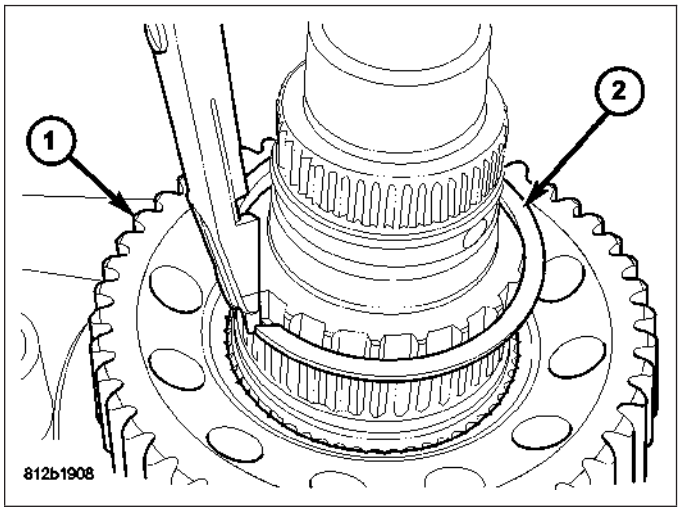
1. Remove the shift fork (1) and sleeve (2) as an assembly.



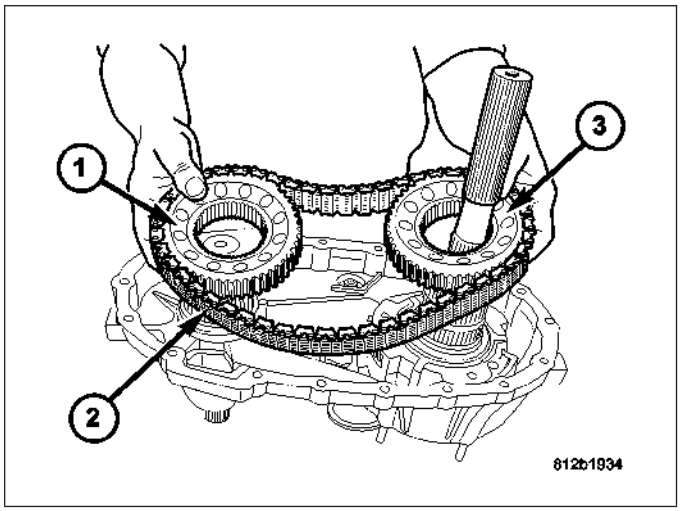
2. Remove the front output shaft drive sprocket (1) retaining ring (2).



3. Remove the mainshaft drive sprocket (1) retaining ring (2).

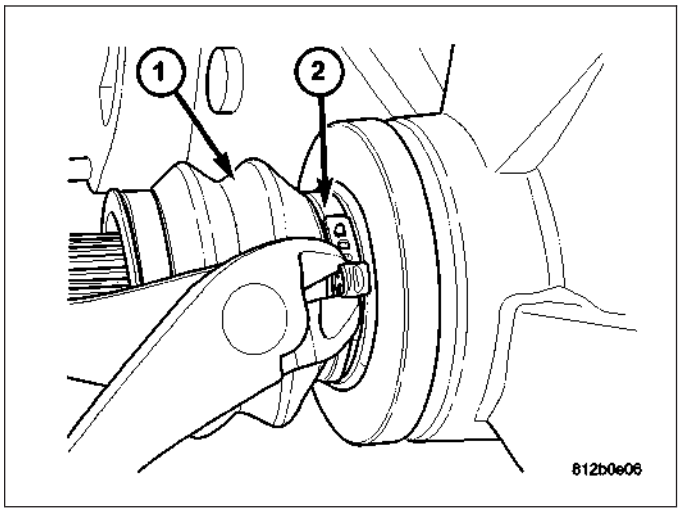


4. Remove the front output shaft drive sprocket (1), the mainshaft drive sprocket (3), and the drive chain (2) as one unit.

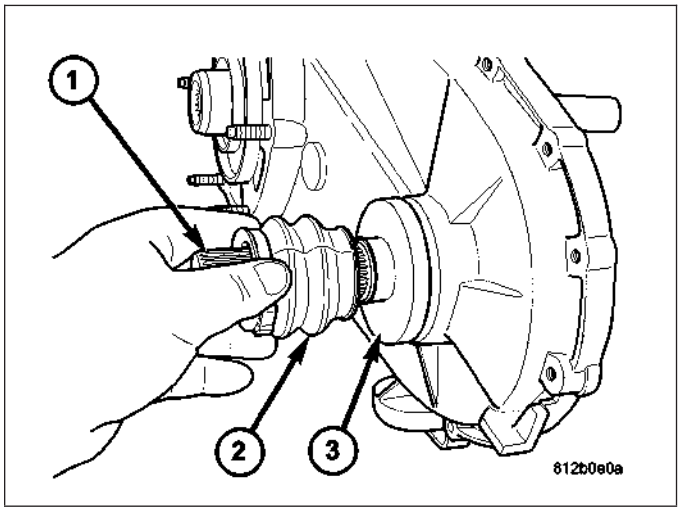


FRONT OUTPUT SHAFT

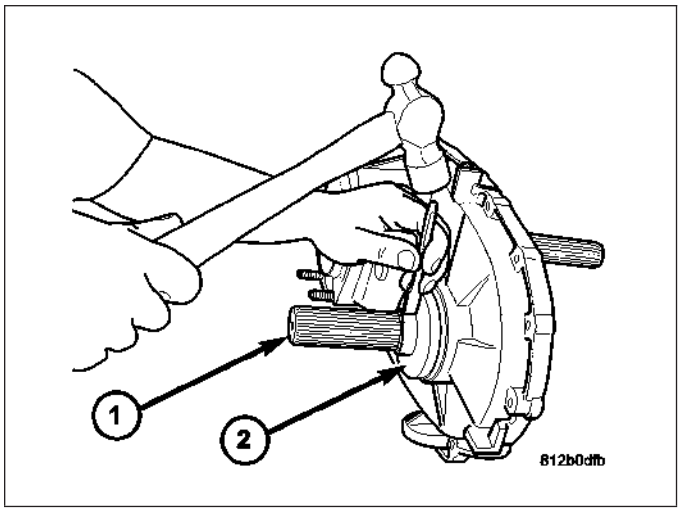
1. Remove the front propeller shaft seal boot (1) retaining clamp (2).



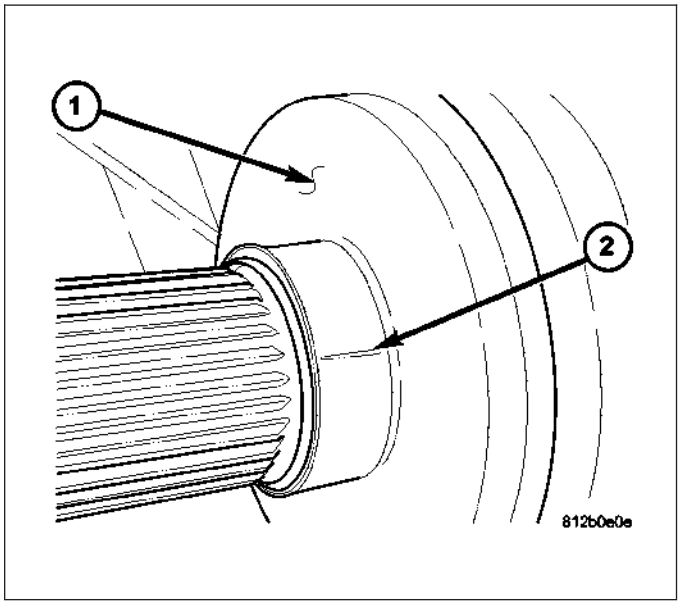
2. Remove the front propeller shaft seal boot (2) from the front output shaft seal slinger (3).



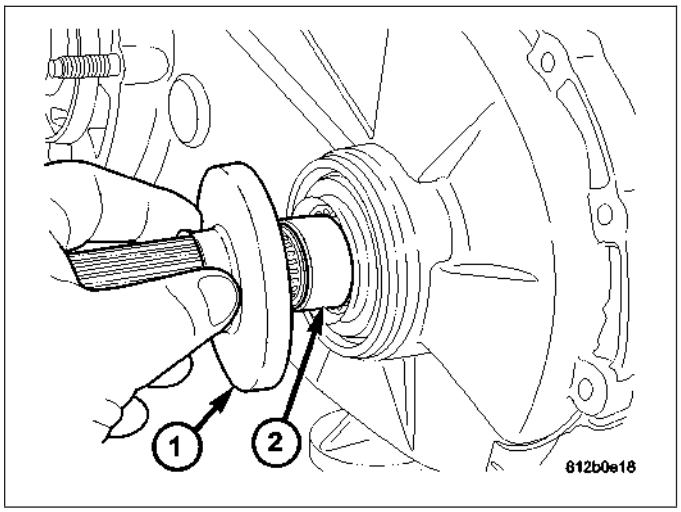
3. Using a suitable hammer and chisel, strike the seal slinger (2) with the chisel as shown in three, equally spaced locations.



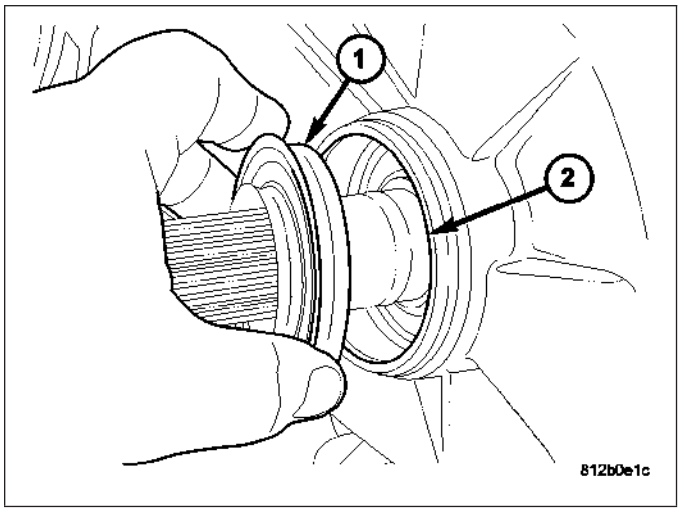
4. The indentations (2) should appear as shown here.



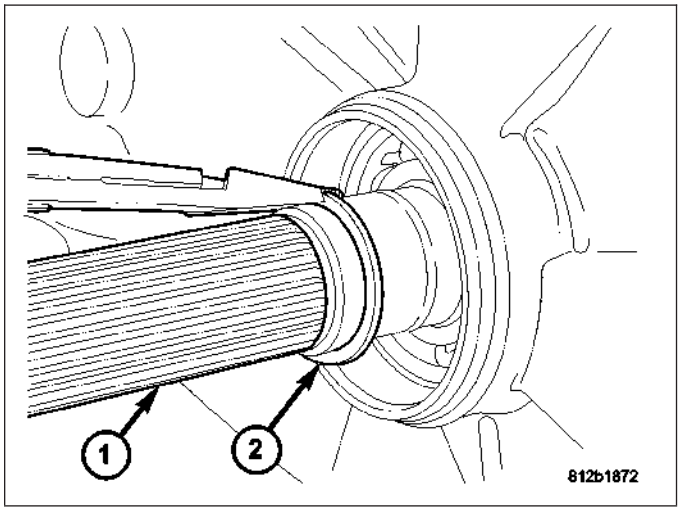
5. Remove the front output shaft seal slinger (1) from the output shaft (2).



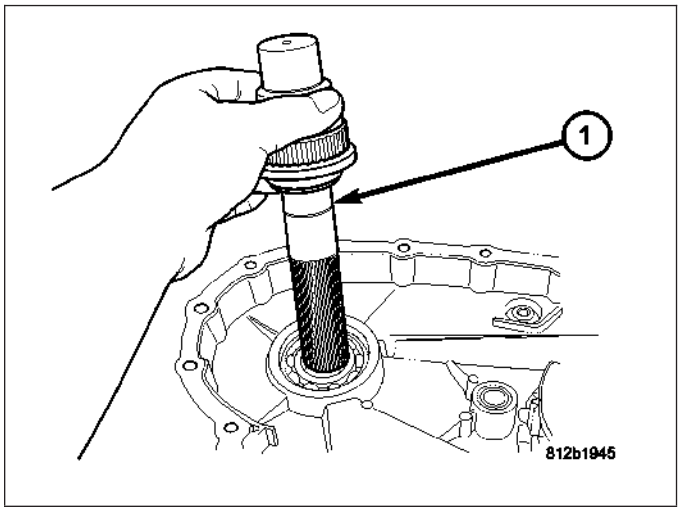
6. Remove the front output shaft seal (1) from the transfer case bore (2) using a suitable tool.



7. Remove the front output shaft retaining ring (2) from the output shaft (1).

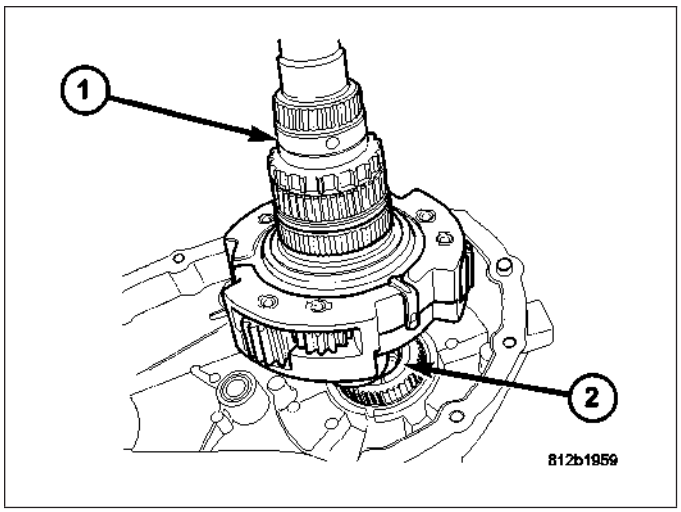


8. Remove the front output shaft (1) from the transfer case front case.

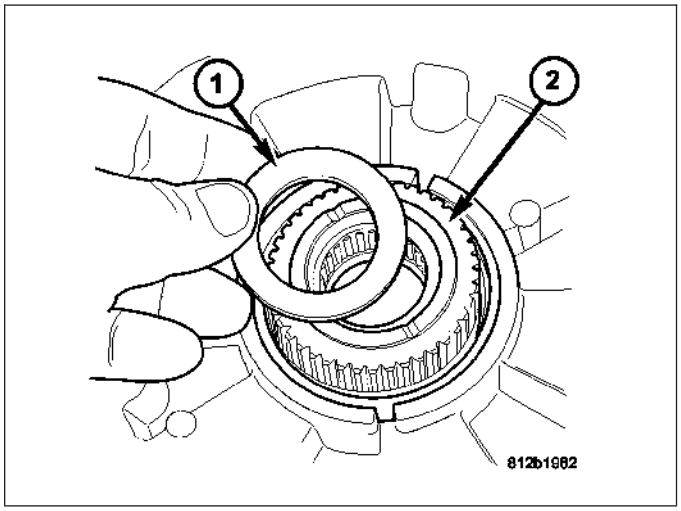


MAINSHAFT

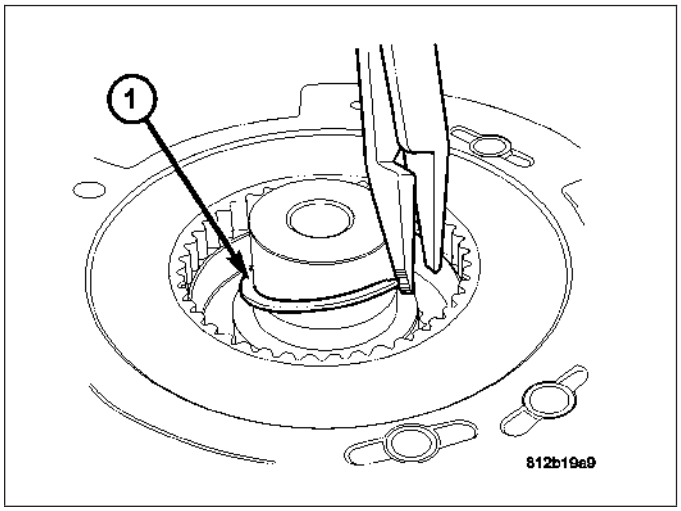
1. Remove the mainshaft assembly (1) from the input gear (2).



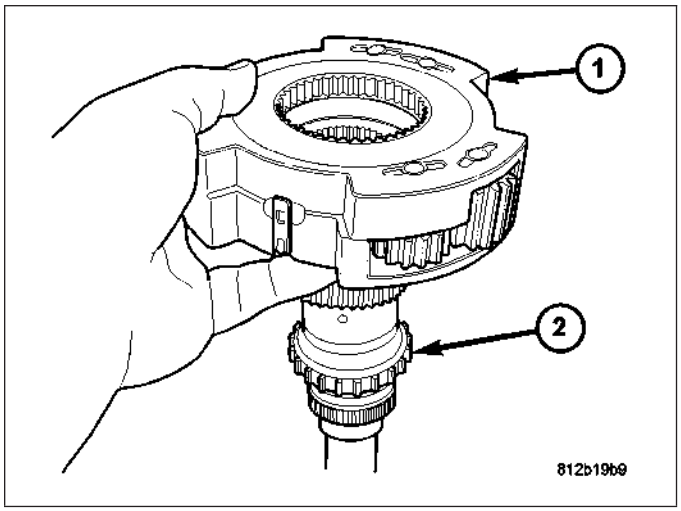
2. Remove the mainshaft thrust washer (1) from the input gear (2).



3. Remove the differential retaining ring (1) from the mainshaft.

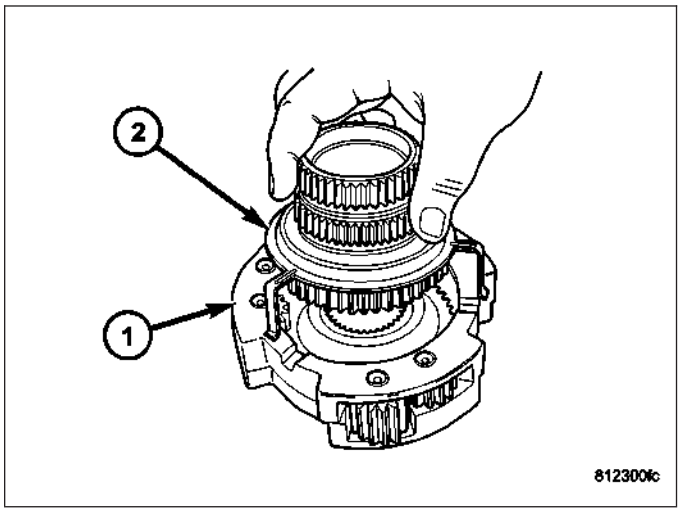


4. Remove the differential assembly (1) from the mainshaft (2).

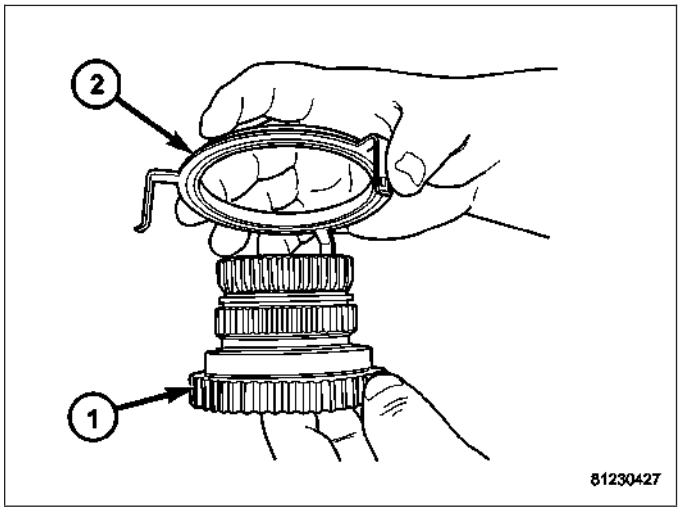


DIFFERENTIAL

1. Remove the mode hub and mode hub retainer (2) from the differential assembly (1).

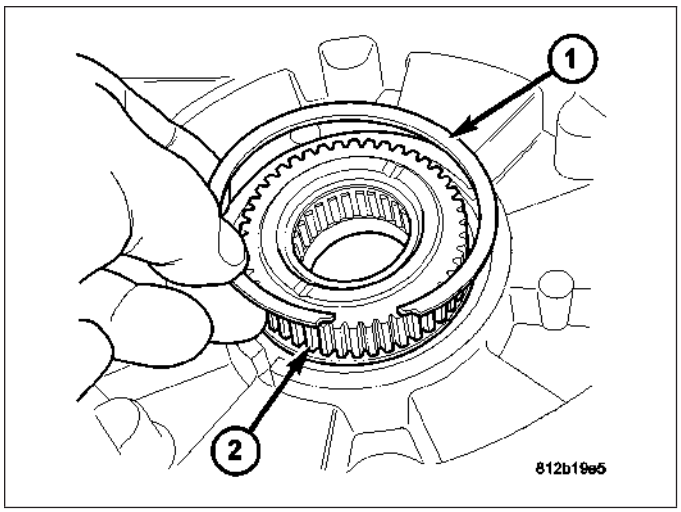


2. Remove the mode hub retainer (1) from the mode hub (2).

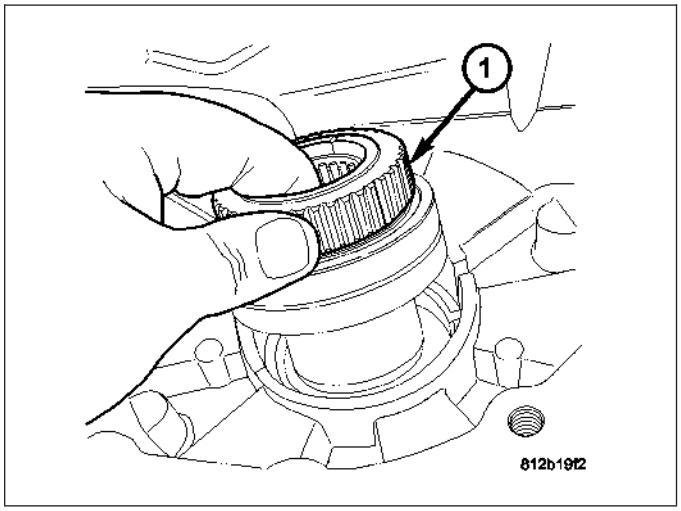


INPUT GEAR

1. Remove the input gear assembly (2) retaining ring (1) from the transfer case.



2. Remove the input gear assembly (1) from the transfer case front case.



CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

INSPECTION

MAINSHAFT AND SPROCKET INSPECTION

Inspect the splines on the shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

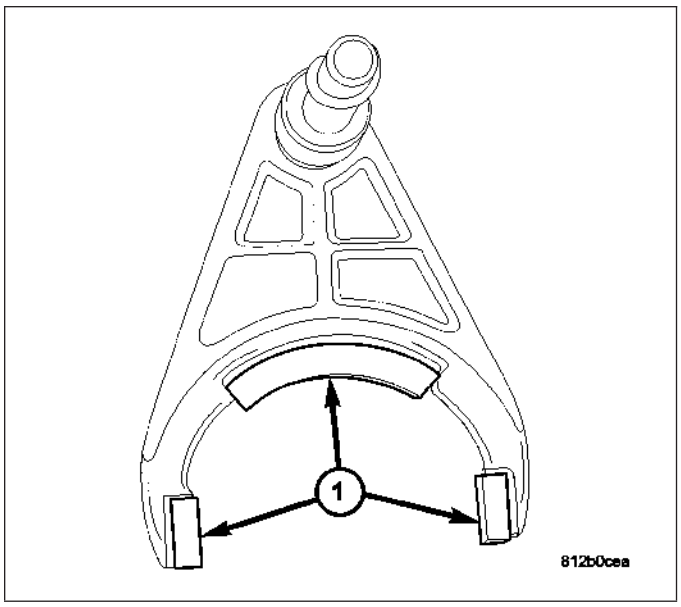
INPUT GEAR AND BEARING ASSEMBLY

Check the teeth on the input gear. Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. Check the bearing for smooth operation. Replace the input gear and bearing assembly if the bearing exhibits any sign of damage or rough rotation.

SHIFT FORK AND SLEEVE

Check condition of the shift fork and mode fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (1). The mode fork pads are serviceable and can be replaced if necessary.



FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the sprocket teeth and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Replace the shaft if the splines are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

FRONT/REAR CASES

Inspect the cases for wear and damage. Replace the input shaft seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

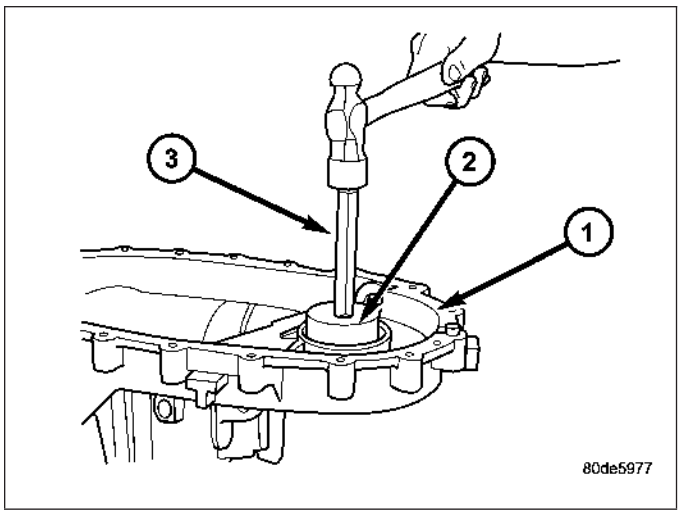
Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

ASSEMBLY

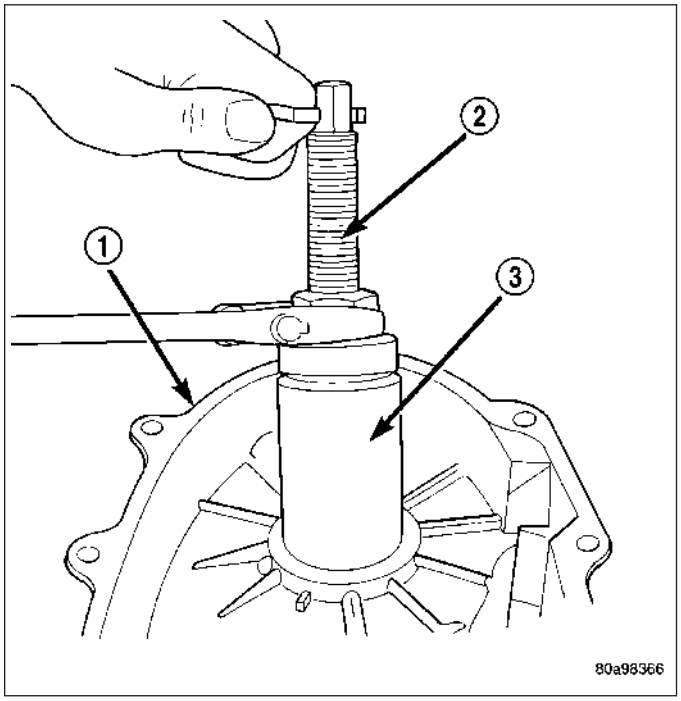
Lubricate transfer case components with Mopar® ATF +4, Automatic Transmission Fluid or petroleum jelly (where indicated) during assembly.

BEARINGS

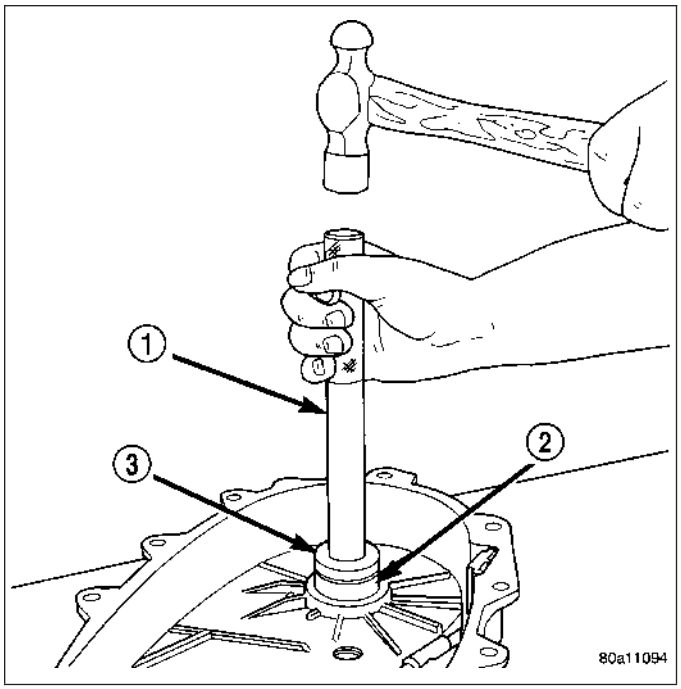
1. Remove the front output shaft bearing retaining ring from inside the front case (1) half.
2. Using Installer 6953 and Handle C-4171, remove front output shaft bearing.
3. Start the front output shaft bearing in case. Then seat bearing with Handle C-4171 (3) and Installer 6953 (2).
4. Install the front output shaft bearing retaining ring.



5. Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).

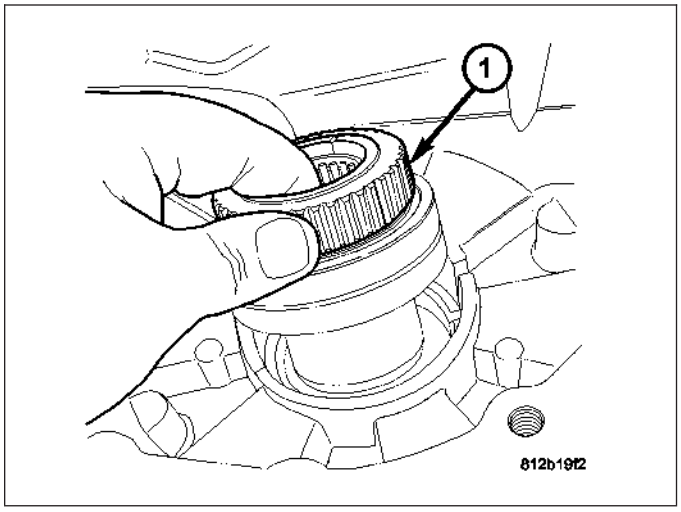


6. Install the new front output shaft rear bearing (2) with Tool Handle C-4171 (1) and Installer 5066 (3).

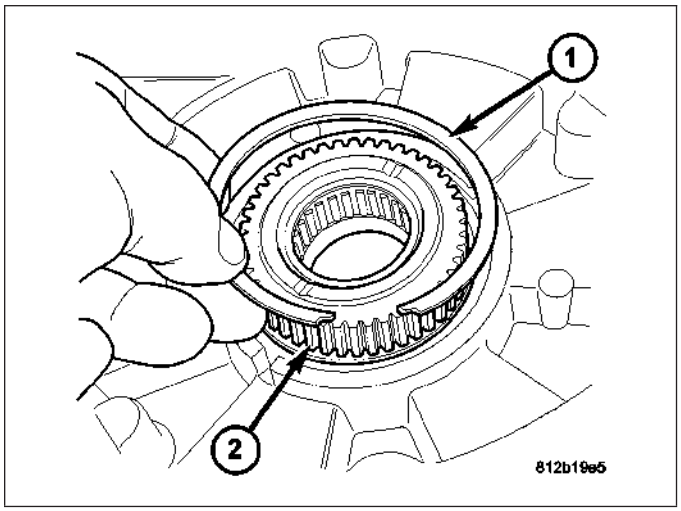


INPUT GEAR

1. Align and install the input gear and bearing assembly (1) into the front case. Be sure that the input gear bearing is fully seated in the front case.



2. Install snap-ring (2) to hold the input gear assembly (2) into the front case.
3. Install a new input shaft oil seal with Handle C-4171 and Installer 8841.

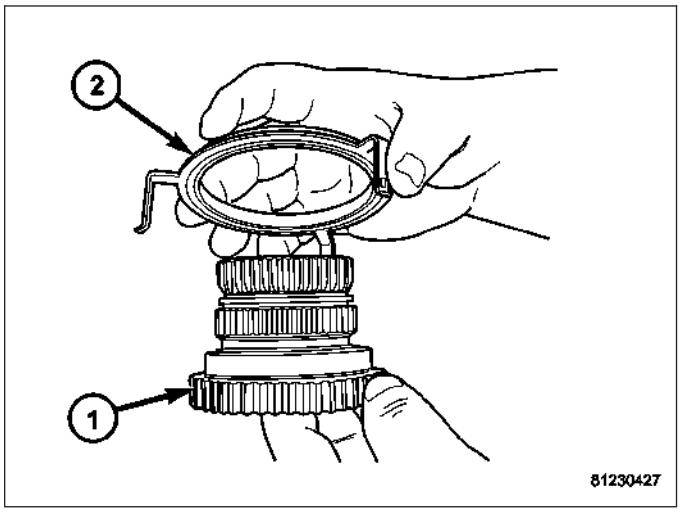


MAINSHAFT

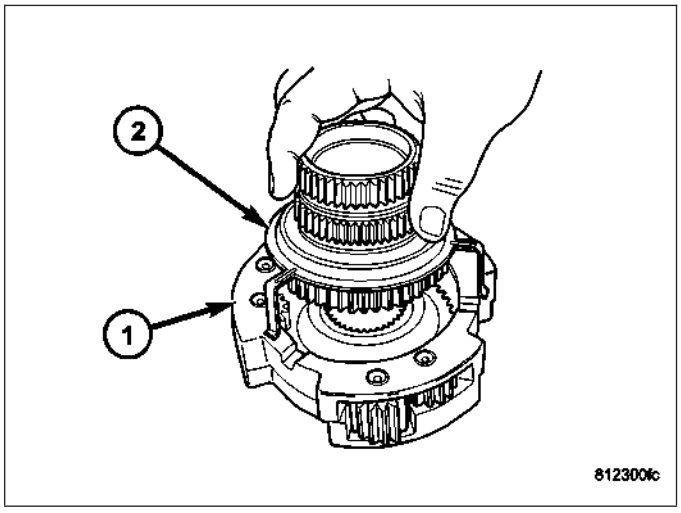
1. Lubricate the mainshaft splines with recommended transmission fluid.

NOTE: Replace the mode hub retainer if the legs were distorted during removal.

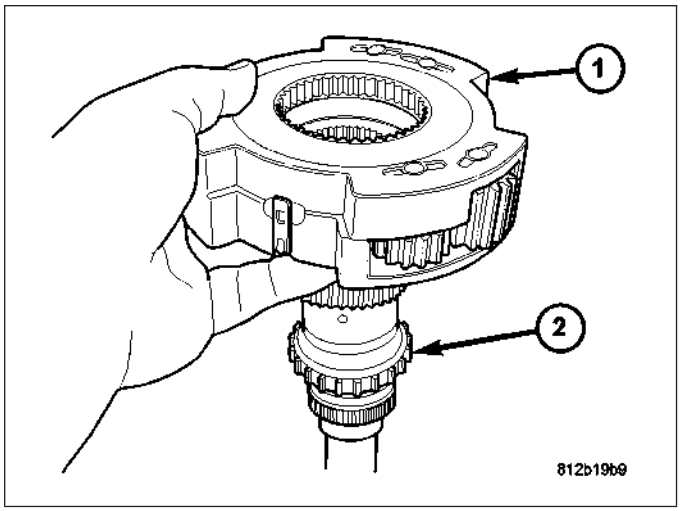
2. Install the mode hub retainer (1) onto the mode hub (2).



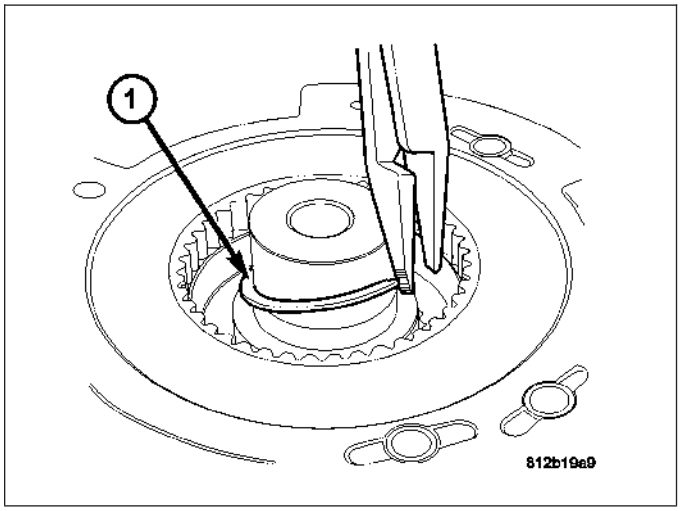
3. Install the mode hub and mode hub retainer (2) onto the differential assembly (1). Make sure the retainer is fully seated onto the differential.



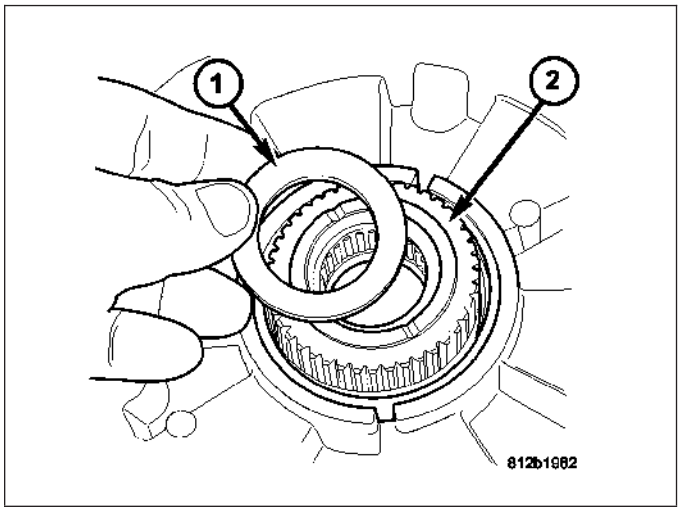
4. Install the differential assembly (1) onto the mainshaft (2).



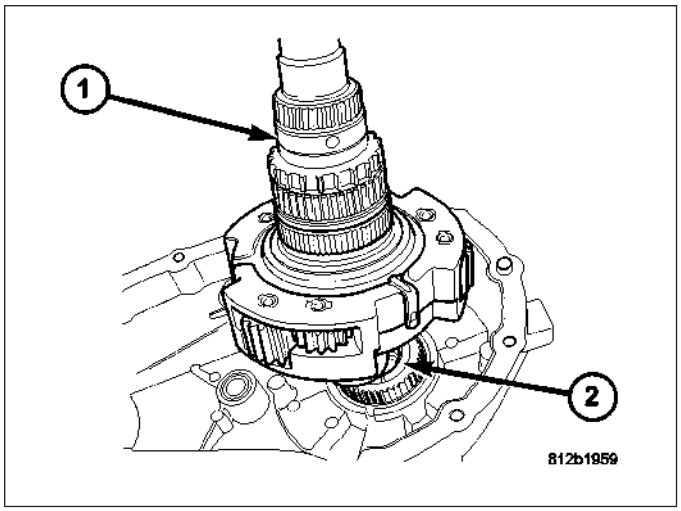
5. Install the differential snap-ring (1).



6. Install the mainshaft thrust washer (1) onto the input gear assembly (2).

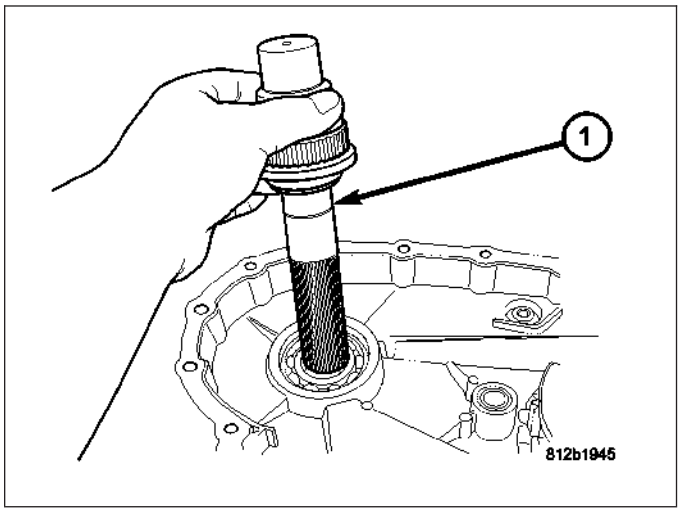


7. Install the mainshaft and differential assembly (1) into the input gear (2).

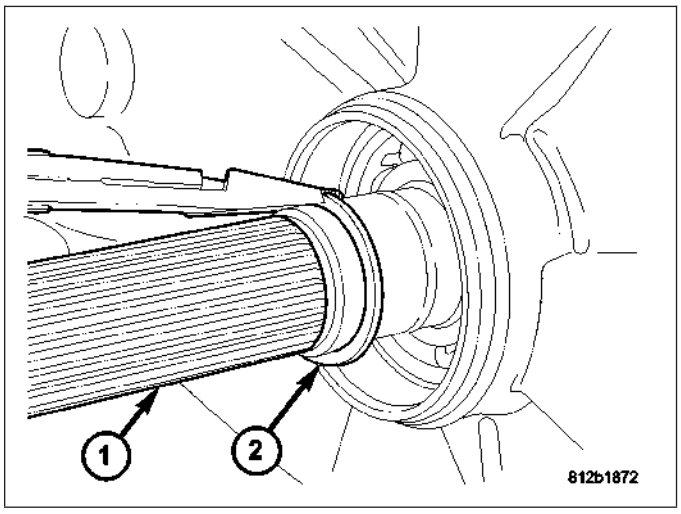


FRONT OUTPUT SHAFT

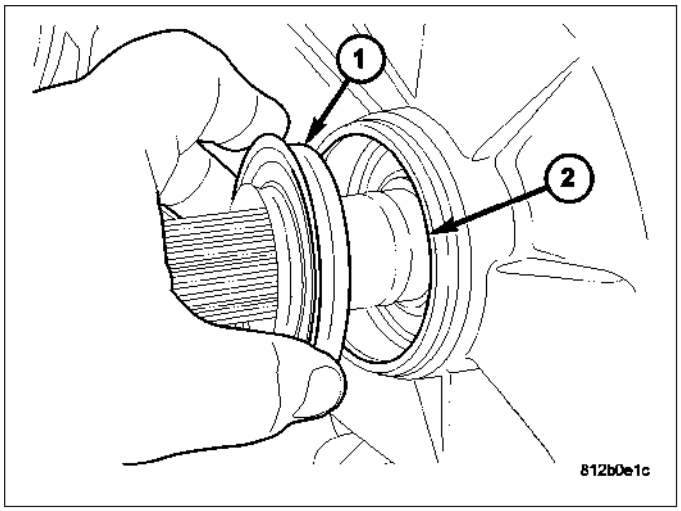
1. Install the front output shaft (1) into the transfer case front case.



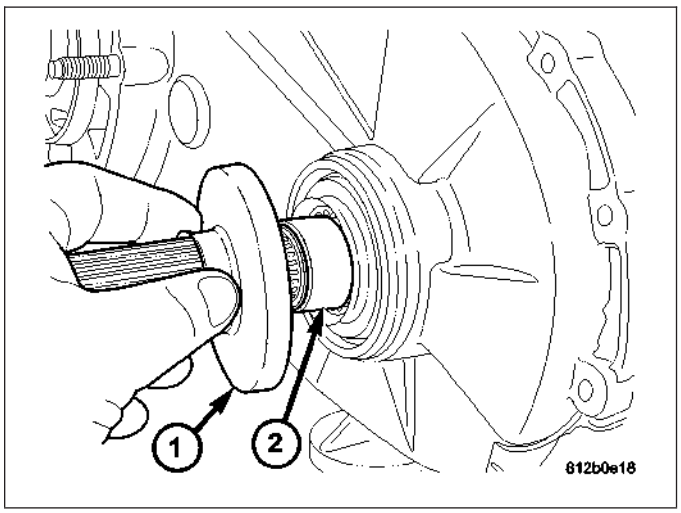
2. Install the front output shaft retaining ring (2) onto the output shaft (1).



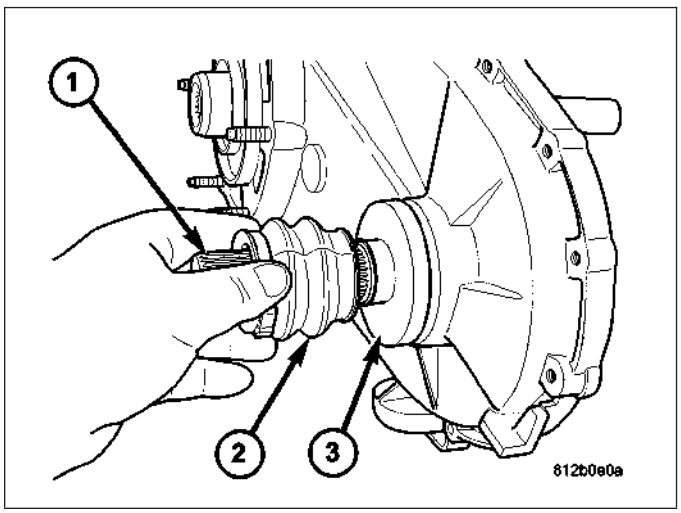
3. Install the new front output shaft seal (1) into position in the transfer case bore (2).
4. Install the new front output shaft seal (1) with Installer MB991168A.



5. Install the new front output shaft seal slinger (1) into position on the output shaft (2).
6. Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.

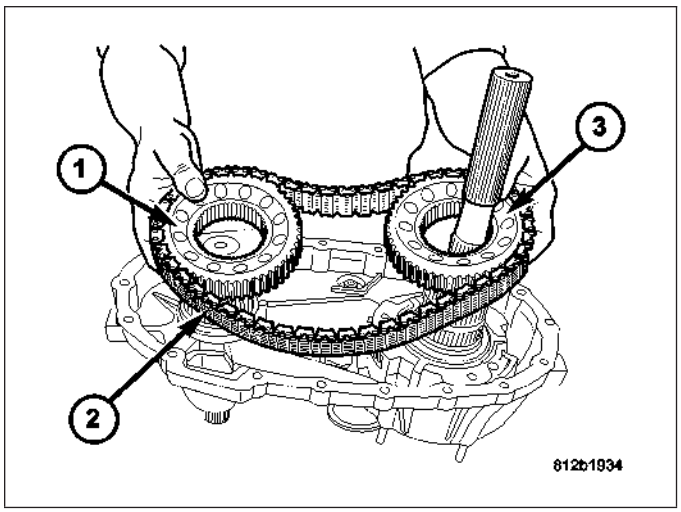


7. Install the seal boot (2) onto the seal slinger (3)
8. Install a new seal boot clamp onto the seal boot.
9. Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.

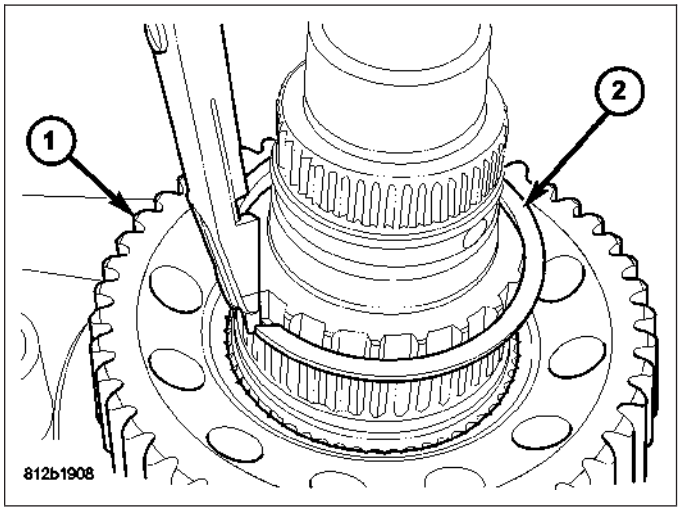


DRIVE CHAIN AND SPROCKETS

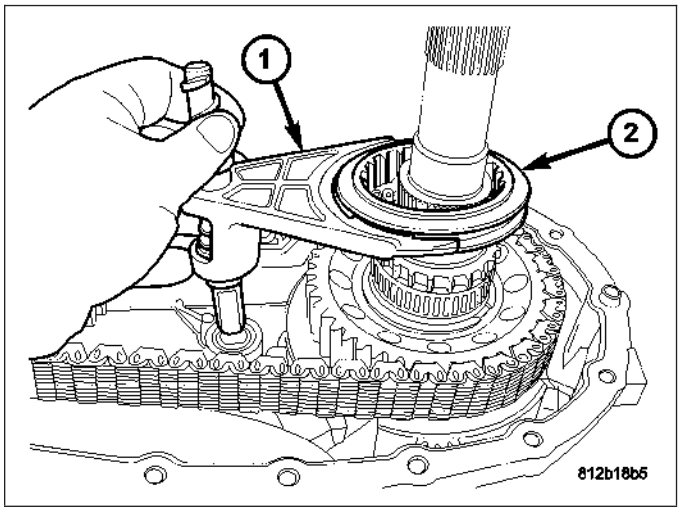
1. Install the front output shaft drive sprocket (1), the mainshaft drive sprocket (3), and the drive chain (2) as one unit.



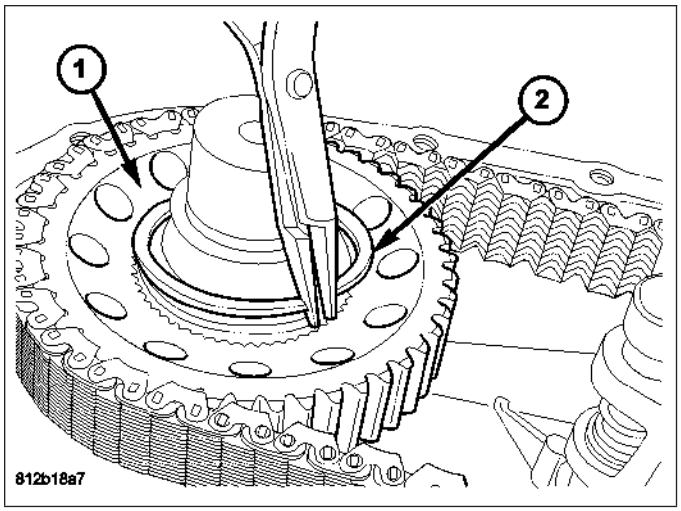
2. Install the mainshaft drive sprocket (1) retaining ring (2).



3. Install the shift fork (1) and sleeve (2) as an assembly.

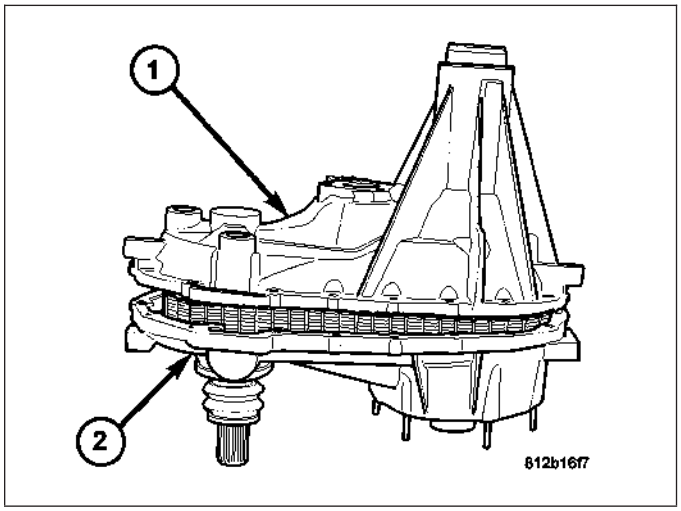


4. Install the front drive sprocket (1) retaining ring (2).



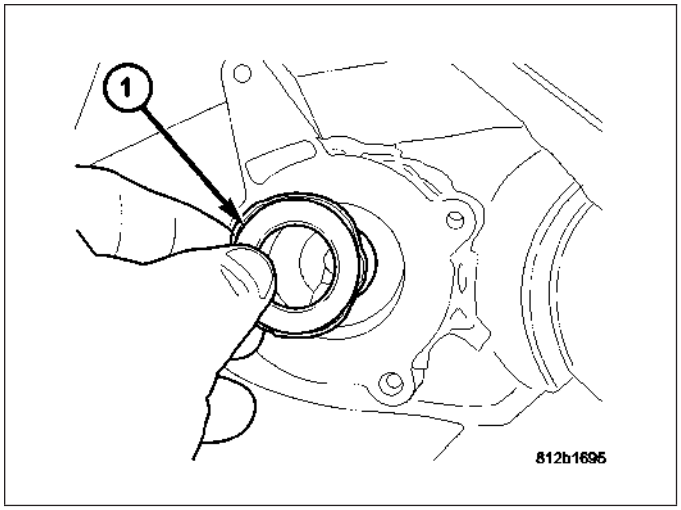
REAR CASE

1. Install the magnet in the front case pocket.
2. Support transfer case so that the rear case is facing upward.
3. Apply 3 mm (1/8 in.) wide bead of Mopar® Gasket Maker, or equivalent silicone adhesive sealer, to mounting flange of front case. Work sealer bead around bolt holes.
4. Install the rear case (1) onto the front case (2).
5. Install the bolts to hold the front case (2) to the rear case (1).
6. Tighten case bolts to 25-28 N·m (18-21 ft. lbs.) torque.

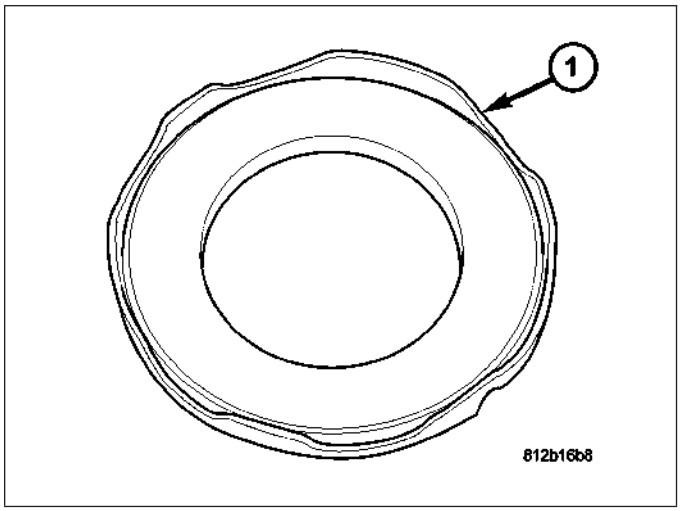


SHIFT MOTOR AND MODE SENSOR ASSEMBLY

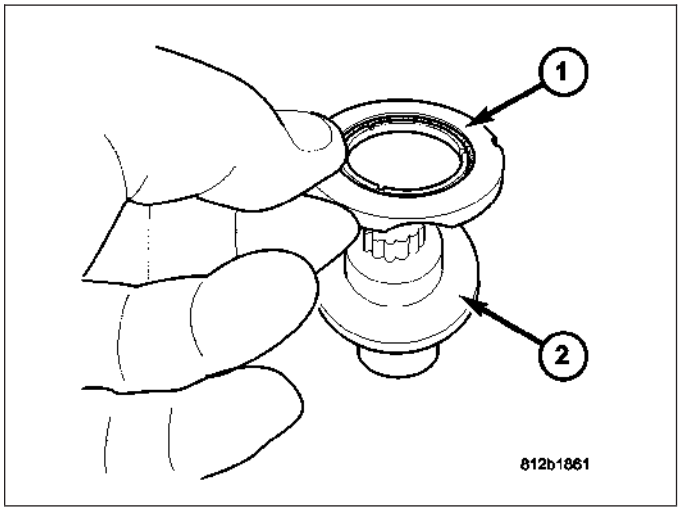
1. Install the shift screw lower bearing (1) into the transfer case.



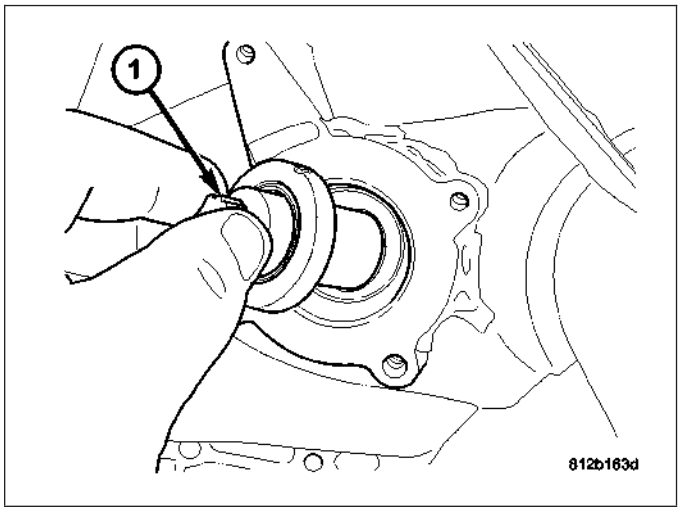
2. Make sure the bearing is installed with the tabs (1) up.



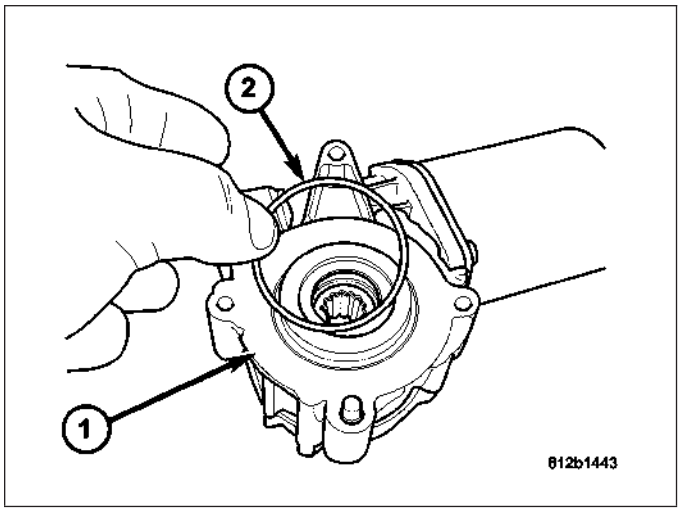
3. Install the shift screw top bearing (1) onto the shift screw (2). Make sure the bearing is installed with the tabs down.



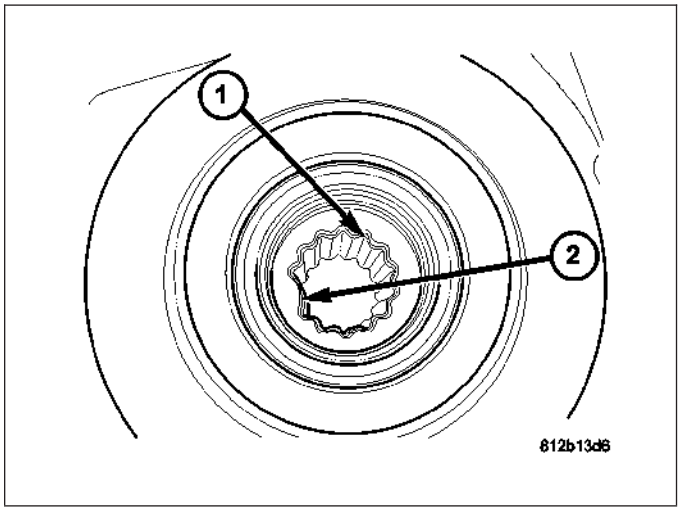
4. Install the transfer case shift screw (1) and top bearing from the transfer case. Make sure that the shift screw is fully seated in the case. The missing tooth in the shift screw spines should be aligned with the indicator groove in the case.



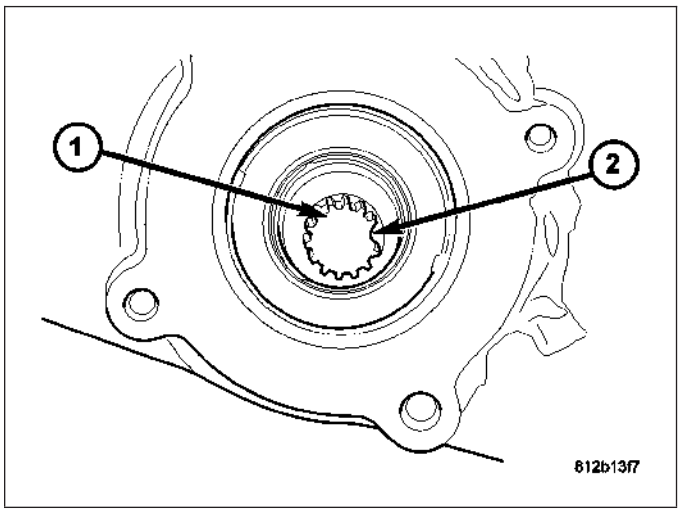
5. Verify that the shift motor o-ring (2) is clean and properly positioned inside the machined o-ring groove of the shift motor (1).
6. Add high temperature grease between the shift motor assembly and the transfer case mating surface for sealing purposes.



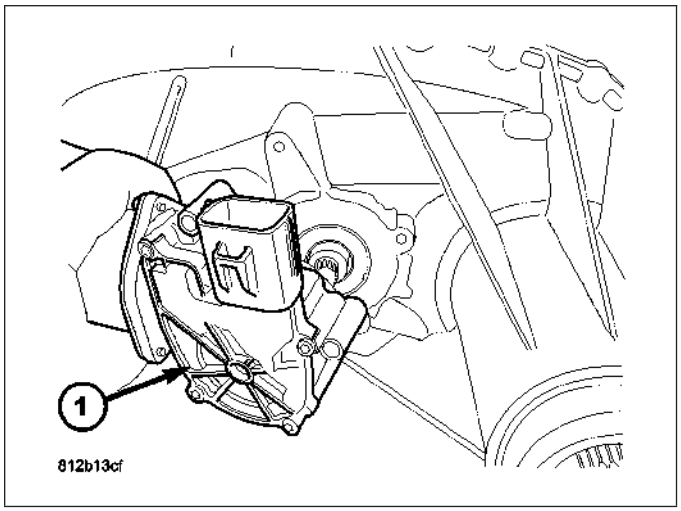
NOTE: Verify that the missing tooth (2) in the shift motor drive spline (1)...



NOTE: ...and the transfer case drive spline (1) missing tooth (2) are aligned. It may be necessary to manually shift the transfer case if the shift motor and transfer case shaft are not aligned.

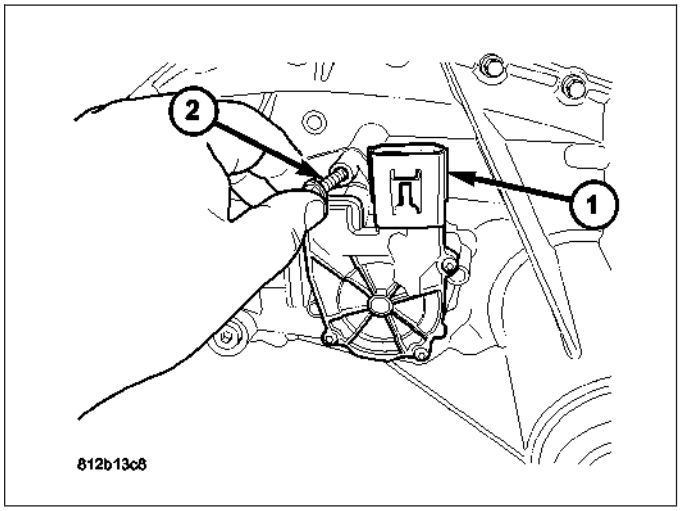


7. Position the shift motor and mode sensor assembly (1) onto the transfer case.



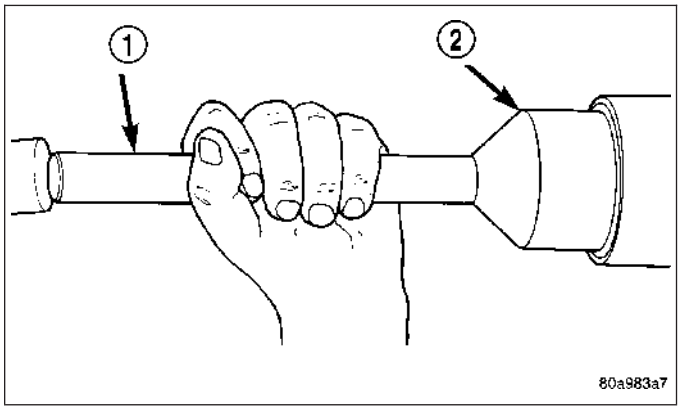
CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

8. Install the bolts (2) to hold the shift motor and mode sensor assembly (1) to the transfer case. Tighten the bolts to 9-14 N·m (7-10 ft.lbs.).



EXTENSION SEAL

1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Installer D-163 (2) and Handle C-4171 (1), install the new seal into the rear case extension.



INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case onto the transmission.

5. Install and tighten transfer case attaching nuts to 27-34 N·m (20-25 ft. lbs.) torque.
6. Connect the vent hose.
7. Connect the shift motor and mode sensor assembly wiring connector. Secure wire harness to clips on transfer case.
8. Align and connect the propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/FRONT PROPELLER SHAFT - INSTALLATION) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/REAR PROPELLER SHAFT - INSTALLATION)
9. Fill transfer case with correct fluid. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE)
10. Install skid plate, if equipped.
11. Remove transmission jack and support stand.
12. Lower vehicle and verify transfer case shift operation.

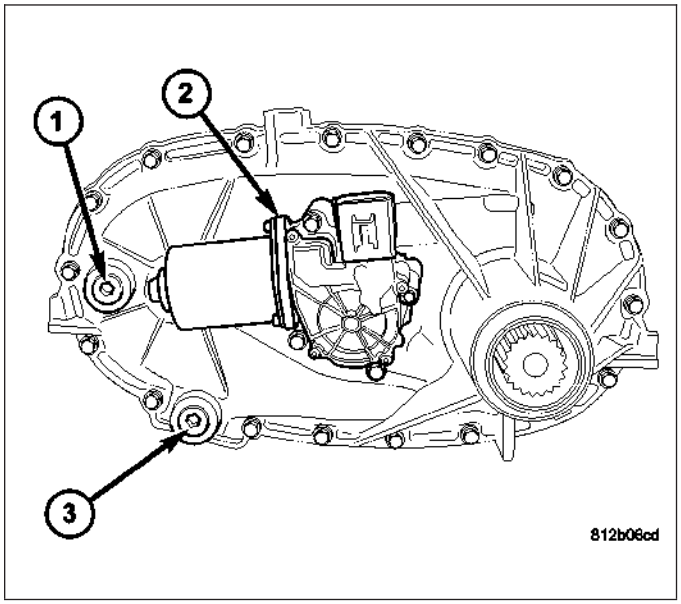
FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

The fill and drain plugs (1, 3) are both in the rear case.

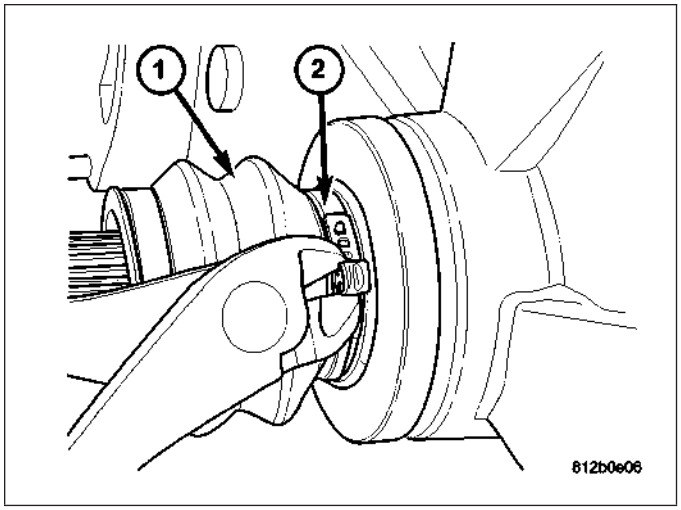
1. Raise vehicle.
2. Position drain pan under transfer case.
3. Remove drain (3) and fill plugs (1) and drain lubricant completely.
4. Install drain plug (3). Tighten plug to 20-34 N·m (15-25 ft.lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
7. Install and tighten fill plug (1) to 20-34 N·m (15-25 ft.lbs.).
8. Lower vehicle.



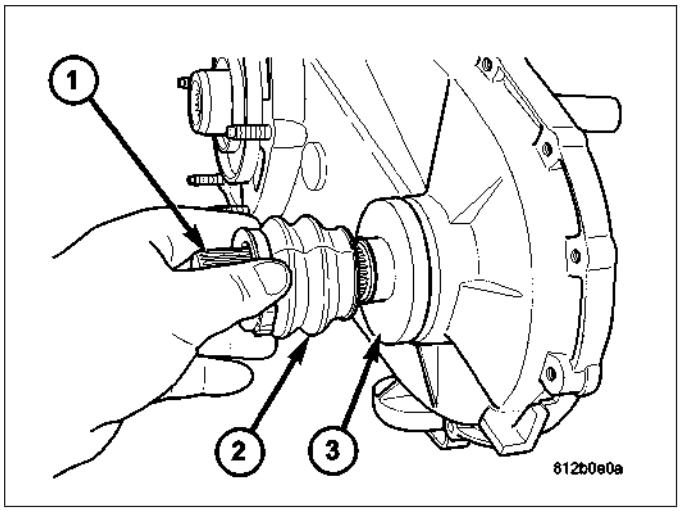
SEAL-FRONT OUTPUT SHAFT

REMOVAL

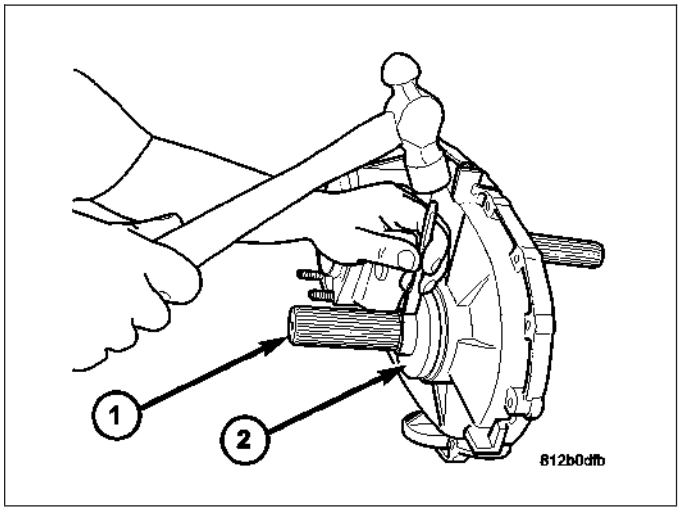
1. Remove the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).
2. Remove the front propeller shaft seal boot (1) retaining clamp (2).



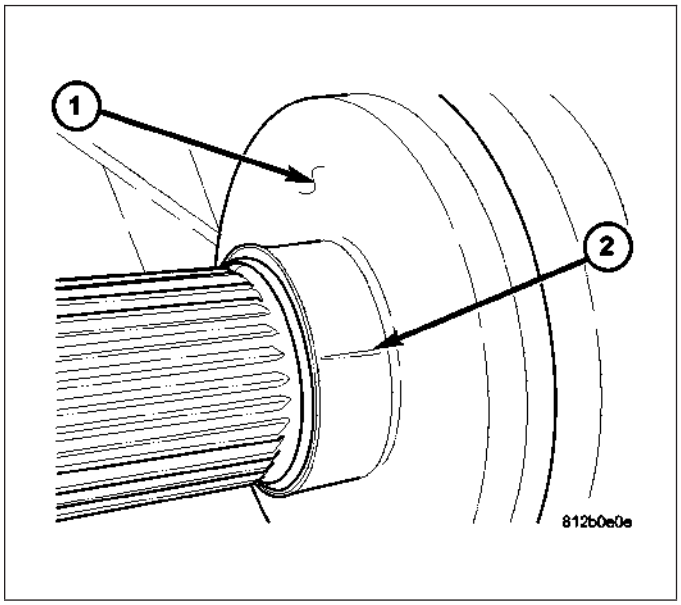
3. Remove the front propeller shaft seal boot (2) from the front output shaft seal slinger (3).



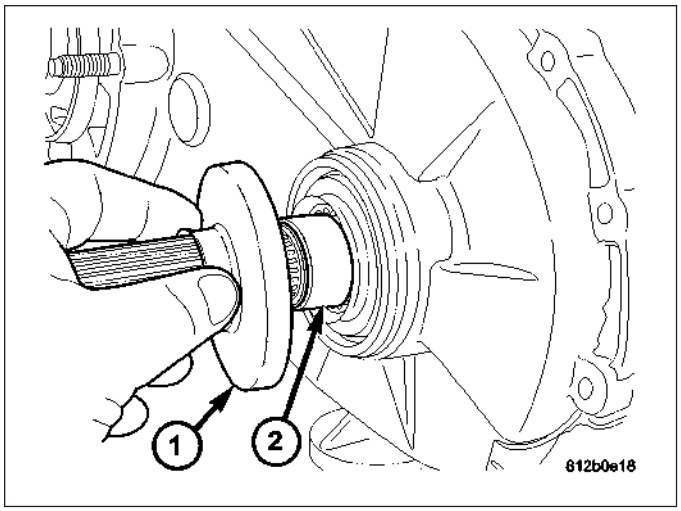
4. Using a suitable hammer and chisel, strike the seal slinger (2) with the chisel as shown in three, equally spaced locations.



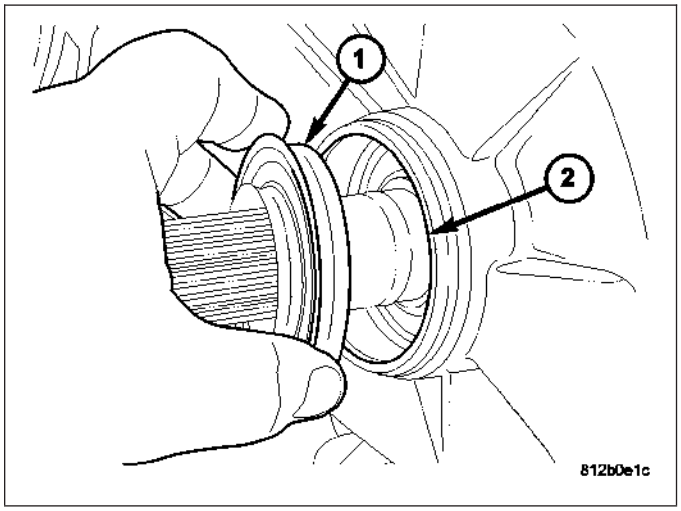
5. The indentations (2) should appear as shown here.



6. Remove the front output shaft seal slinger (1) from the output shaft (1).

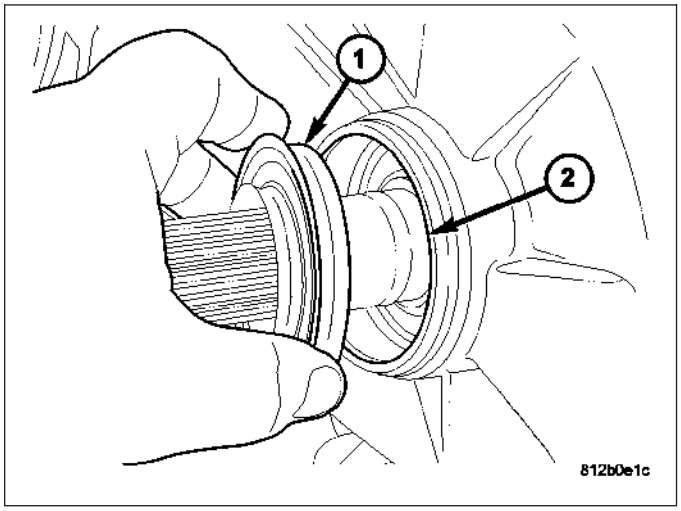


7. Remove the front output shaft seal (1) from the transfer case bore (2) using a suitable tool.

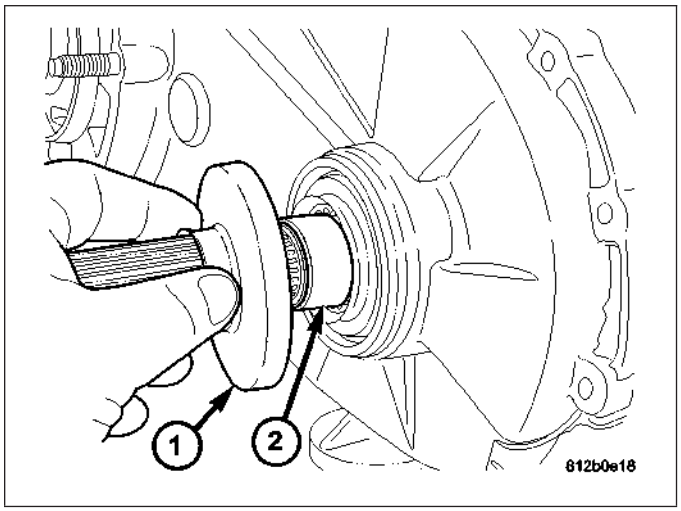


INSTALLATION

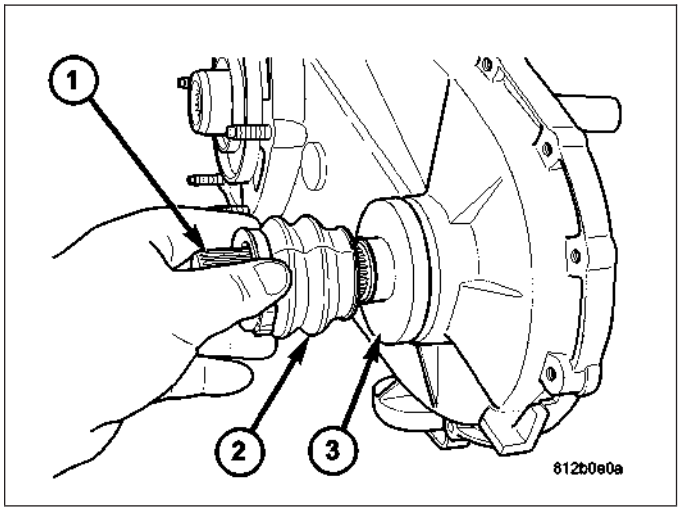
1. Install the new front output shaft seal (1) into position in the transfer case bore (2).
2. Install the new front output shaft seal (1) with Installer MB991168A.



3. Install the new front output shaft seal slinger (1) into position on the output shaft (2).
4. Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.



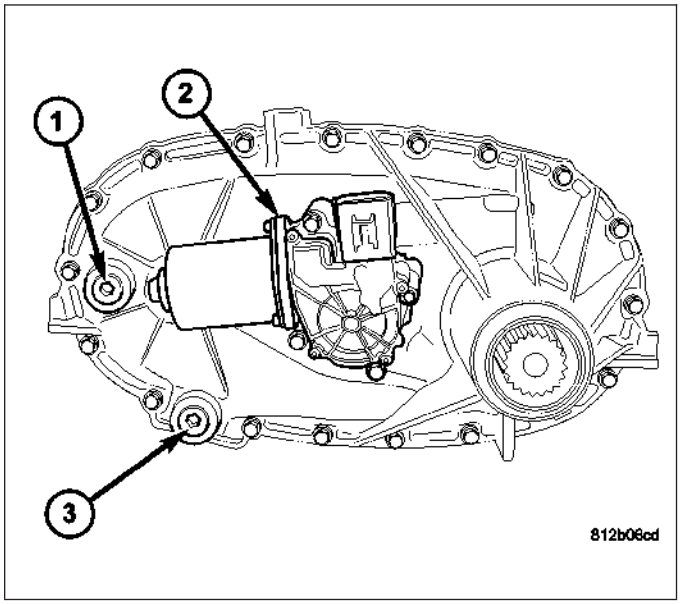
5. Install the seal boot (2) onto the seal slinger (3)
6. Install a new seal boot clamp onto the seal boot.
7. Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.
8. Install the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).



SENSOR-MODE

DESCRIPTION

The transfer case mode sensor (2) provides the Front Control Module (FCM) feedback about the position of the transfer case. The sensor consists of a linear analog position sensor that converts the motor output shaft position into a DC signal. The sensor may rotate a full 360 degrees for both the NV144 and the NV244 GENII. The operating envelope or sector rotation is -5 to 180 degrees for the NV144 and -40 to 20 degrees for the NV244 GENII. The FCM must supply 5VDC (+/- 0.5v) to the sensor whenever the FCM is not in sleep mode and monitor the shift motor position. The sensor position is monitored when the ignition is in the RUN position and for 10 seconds after the ignition is shifted to the OFF position. The sensor is mechanically linked to the shaft of the cam which allows the transfer case to shift. The mode sensor will draw less than 20 mA of current during operation.



OPERATION

During normal vehicle operation, the Front Control Module (FCM) monitors the mode sensor outputs at least every 2 milliseconds when the shift motor is stationary or active.

Refer to SHAFT ANGLE vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode.

SHAFT ANGLE vs. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
0	AWD
-20	4LOCK

NOTE: All the parameter voltages referred to in the following information are calibrated items in the controller software and are subject to change.

NOTE: For a further explanation of Phase 1 through 3 shifting, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION).

The following information describes the different mode sensor positions:

- 4LOCK TARGET REGION - The position shall be considered 4LOCK if the voltage is greater than or equal to encoder_4LOCK_min Volts and it is also less than or equal to encoder_4LOCK_max Volts.
- AWD TARGET REGION - The position shall be considered AWD if the voltage is greater than or equal to encoder_AWD_min Volts and it is also less than or equal to encoder_AWD_max Volts.
- AWD SHIFT LIMIT - During Phase 2 and Phase 3 shifting, shifts may become unidirectional when a voltage is greater than or equal to encoder_AWD_min Volts has been reached.

The mode sensor position will be considered invalid by the FCM if the voltage is greater than or equal to encoder_High_Range_Limit Volts or if it is less than or equal to encoder_Low_Range_Limit Volts.

If FCM looses the encoder signal in a NV144 transfer case during a shift, the FCM will respond with a shift back in the opposite direction of travel to first attempt to find the encoder signal. If the signal is not found, the FCM will drive motor in AWD direction for 1 second.

Refer to MODE SENSOR VOLTAGES - NV144 table for the mode sensor voltages.

MODE SENSOR VOLTAGES - NV144

Parameter Name	Voltage
encoder_4LOCK_Min	4.19
encoder_4LOCK_Max	4.35
encoder_AWD_Min	0.45
encoder_AWD_Max	0.55
encoder_High_Range_Limit	4.51
encoder_Low_Range _Limit	0.20

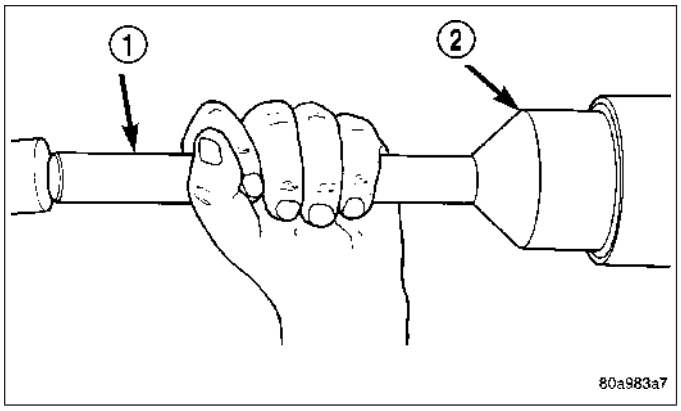
SEAL-REAR CASE EXTENSION

REMOVAL

1. Raise vehicle.
2. Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Using a suitable pry tool or slide-hammer mounted screw, remove the rear case extension seal.

INSTALLATION

1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Installer D-163 (2) and Handle C-4171 (1), install the new seal into the rear case extension.
3. Install the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/ PROPELLER SHAFT - INSTALLATION)
4. Verify proper fluid level.
5. Lower vehicle.



SWITCH-TRANSFER CASE SELECTOR

DESCRIPTION

The selector switch assembly is mounted in the right side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode shift selections.

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Front Control Module (FCM) are provided that interpret the selector switch resistance as given in the table below: SELECTOR SWITCH INTERPRETATION

SELECTOR SWITCH INTERPRETATION

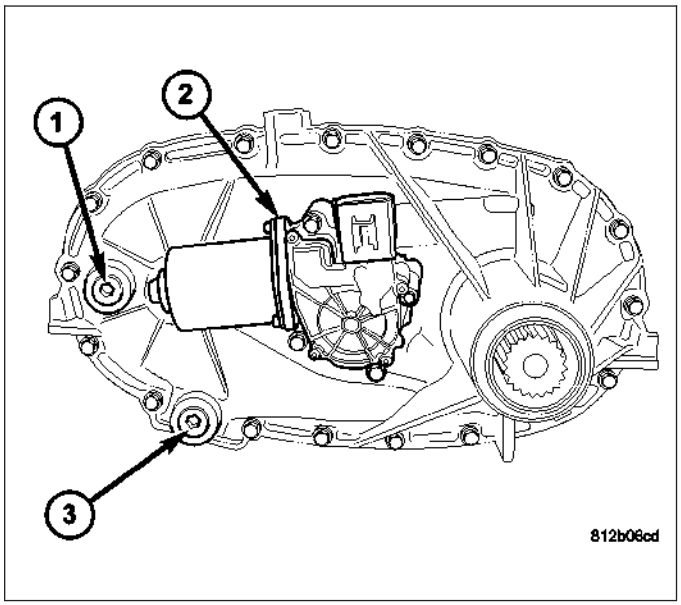
Required Interpretation	Resistance Range (ohms)
Shorted	<150
AWD (Default)	1159-1287
4LOCK	2259-2503
Open/Diagnostic	>19K

The internal structure and function of the selector switch is such that the connection is made to the Open/Diagnostic resistor before the connection to the individual position resistors is broken. Because of this characteristic, if the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output pin is >19k ohms, the position resistor is open.

ASSEMBLY-SHIFT MOTOR/MODE SENSOR

DESCRIPTION

The shift motor (1) is an electromechanical device consisting of a DC permanent magnet motor, a motor brake, a gear train and an analog position sensor. The shift motors' overall function is to move and lock a gear that moves the mode fork found in the transfer case. This allows the transfer case to be shifted electrically to multiple operating positions (4LOCK and AWD). The operating current of the shift motor under stall conditions is 30 amps maximum at 72° F with 13.5 volts, at the motor leads.



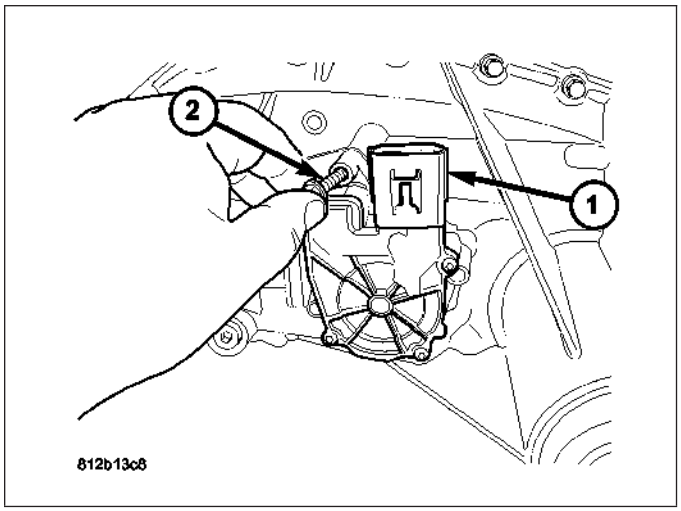
OPERATION

Shifting in the transfer case occurs when the shift motor brake is released and a Pulse Width Modulated (PWM) voltage is supplied to the shift motor by the Front Control Module (FCM). A linear analog position sensor located inside the shift motor, provides the FCM with the motors' angular, rotational position. With this information, the FCM continuously knows the motors' position, and therefore allows it to accurately control the motors' operation, including voltage polarity which is used to control motor direction.

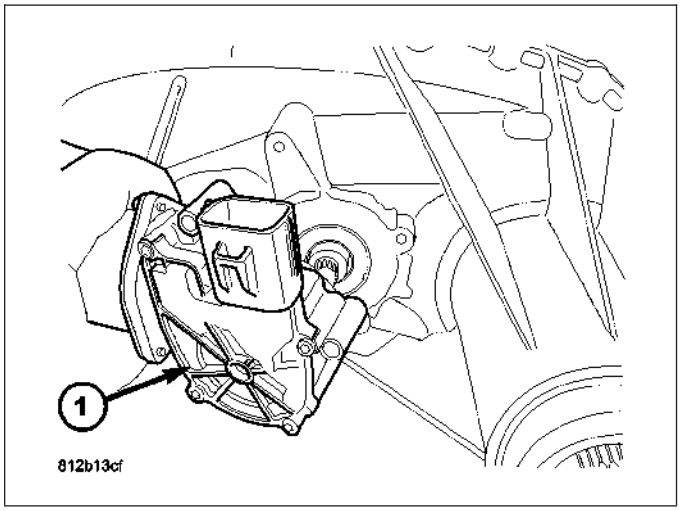
REMOVAL

NOTE: New shift motor assemblies are shipped in the AWD position. If a new shift motor assembly must be installed, it will be necessary to shift the transfer case to the AWD position prior to motor installation.

1. Raise the vehicle on a suitable hoist.
2. Disengage the wiring connector from the shift motor and mode sensor assembly.
3. Remove the bolts (2) holding the shift motor and mode sensor assembly (1) onto the transfer case.

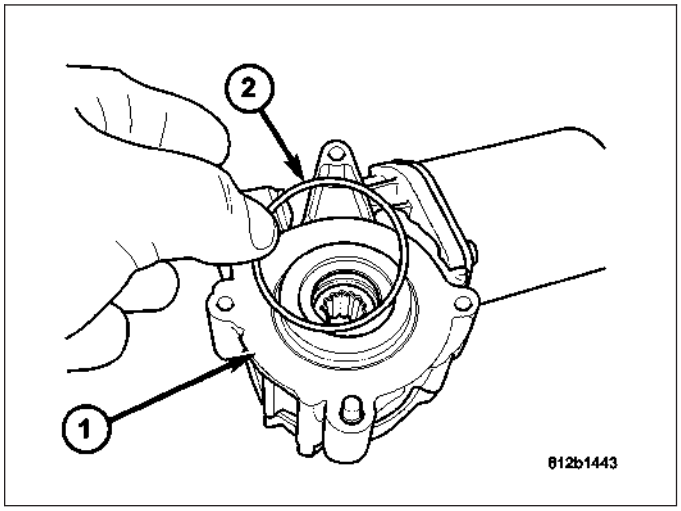


4. Separate the shift motor and mode sensor assembly (1) from the transfer case.

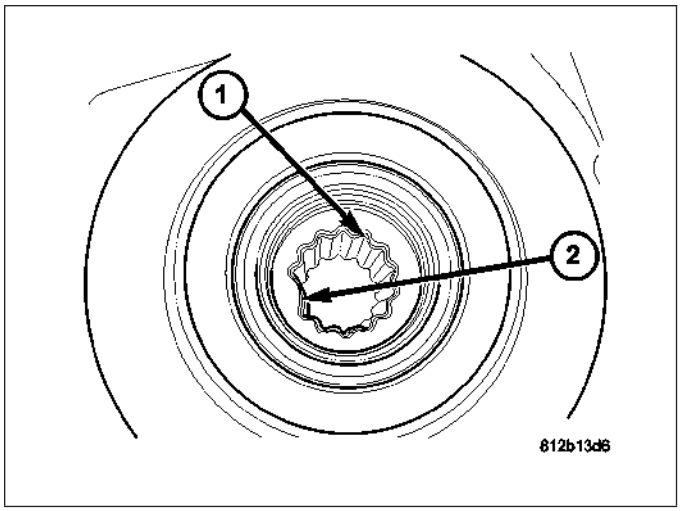


INSTALLATION

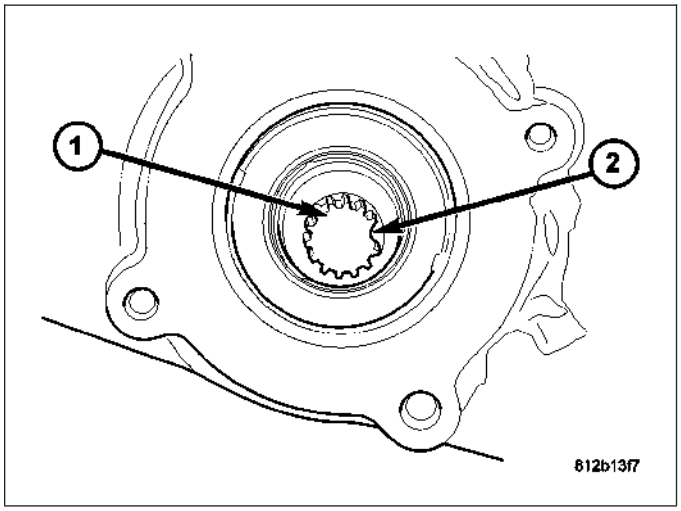
1. Verify that the shift motor o-ring is clean and properly positioned inside the machined o-ring groove of the shift motor.
2. Add high temperature grease between the shift motor assembly and the transfer case mating surface for sealing purposes.



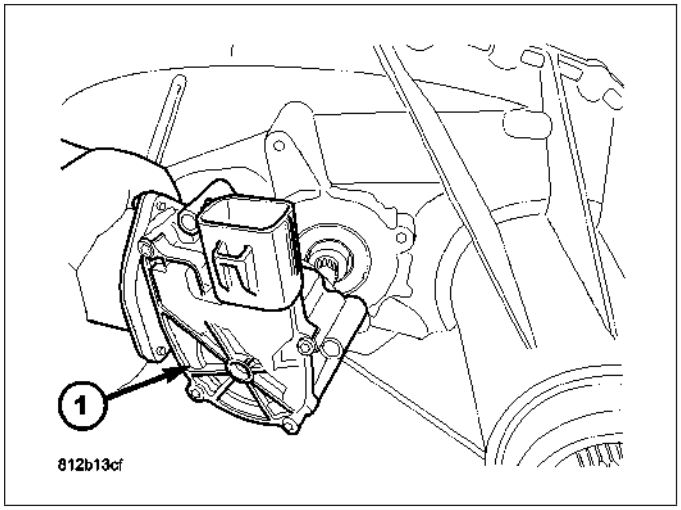
NOTE: Verify that the missing tooth (2) in the shift motor drive spline (1)...



NOTE: ...and the transfer case drive spline (1) missing tooth (2) are aligned. It may be necessary to manually shift the transfer case if the shift motor and transfer case shaft are not aligned.



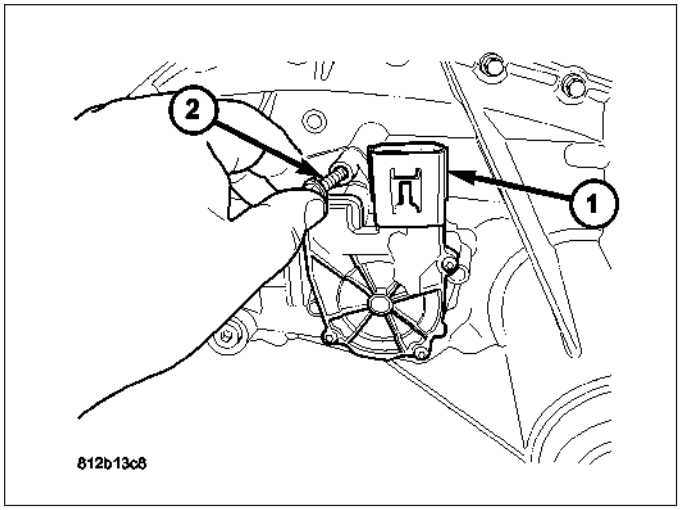
3. Position the shift motor and mode sensor assembly (1) onto the transfer case.



4. Install the bolts (2) to hold the assembly (1) onto the transfer case. Tighten the bolts to 9-14 N·m (7-10 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

5. Engage the wiring connector to the shift motor and mode sensor assembly.
6. Refill the transfer case as necessary.
7. Lower vehicle and verify transfer case operation.



TRANSFER CASE - NV244 GENII - SERVICE INFORMATION

DESCRIPTION

The NV244 GENII is an electronically controlled full and part-time transfer case with no two wheel drive operation.

A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear reduction system provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

OPERATING RANGES

NV244 GENII operating ranges are:

- AWD(All-Wheel Drive)
- 4LOCK (Part-time)
- 4LO
- NEUTRAL

The AWD mode can be used at any time and on any road surface.

The 4LOCK (Part-time) and 4LO ranges are for off road use only. The only time these ranges can be used is when the road surface is covered with snow, ice, or other loose slippery material.

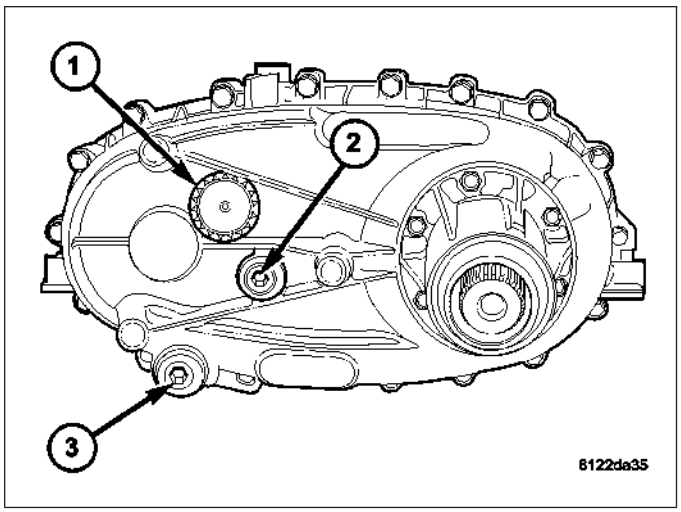
SHIFT MECHANISM

Operating ranges are selected with a dash mounted shift selector switch. The shift selector switch provides a input to the Transfer Case Control Module (TCCM) to indicate the driver's desire to change operating ranges. The TCCM uses this input, along with the input from the transfer case mounted mode sensor and information from the vehicle's bus, to determine if a shift is permitted. If the TCCM decides the shift is permitted, the TCCM controls the shift motor, mounted to the exterior of the transfer case, to perform the shift.

IDENTIFICATION

A circular ID (1) tag is attached to the rear case of each transfer case. The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.



OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range sleeve. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is splined to a differential assembly. Depending on the position of the mode fork and sleeve, the front output shaft is driven directly by the mainshaft or through the differential. The mode fork operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

DIAGNOSIS AND TESTING

TRANSFER CASE - NV244

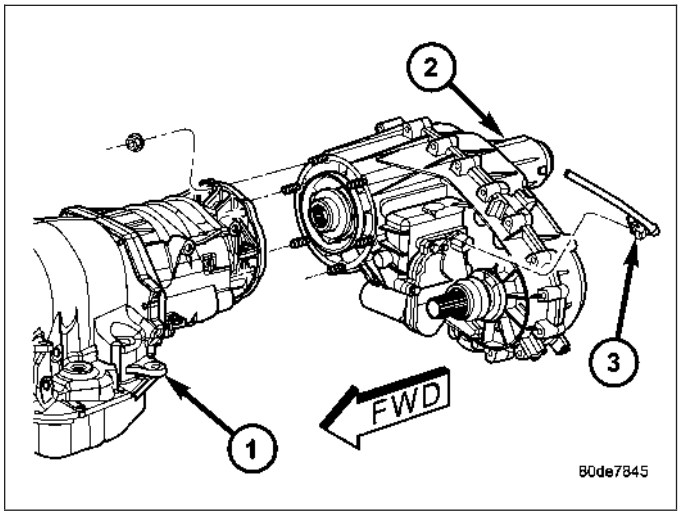
DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case noisy while in, or jumps out of, 4LO.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or the clutch depressed on vehicles equipped with a manual transmission, shift the transfer case to the AWD or 4LOCK position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Transfer case will not shift through 4LOCK (Part-time) range.	1) Incomplete shift due to drivetrain torque load.	1) Drive in a straight line and momentarily release the accelerator pedal to complete the shift.
	2) Incorrect tire pressure.	2) Correct tire pressure as necessary.
	3) Excessive tire wear.	3) Correct tire condition as necessary.
	4) Excessive vehicle loading.	4) Correct as necessary.

REMOVAL

1. Shift transfer case into AWD.
2. Raise vehicle.
3. Drain transfer case lubricant.
4. Mark front and rear propeller shafts for alignment reference.
5. Support transmission (1) with jack stand.
6. Remove the transfer case skid plate, if equipped.
7. Disconnect front and rear propeller shafts at transfer case.
8. Disconnect transfer case shift motor and mode sensor wire connectors (3).
9. Disconnect transfer case vent hose.
10. Support transfer case (2) with transmission jack.
11. Secure transfer case (2) to jack with chains.
12. Remove nuts attaching transfer case to transmission.
13. Pull transfer case and jack rearward to disengage transfer case.
14. Remove transfer case (2) from under vehicle.

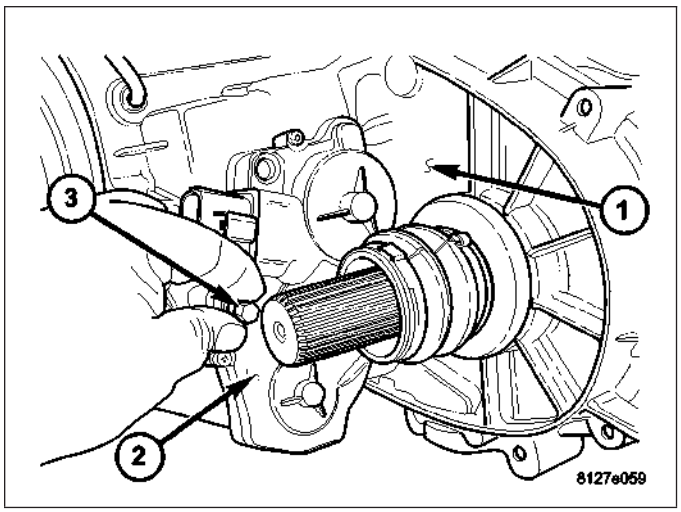


DISASSEMBLY

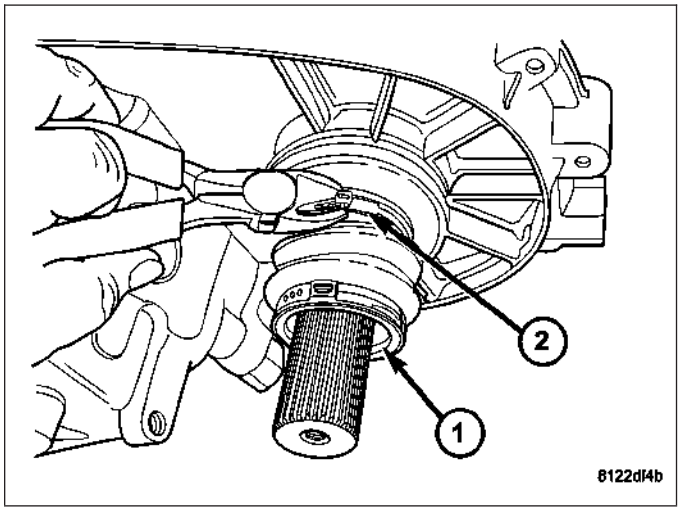
Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

SHIFT MOTOR ASSEMBLY AND FRONT OUTPUT SHAFT SEAL

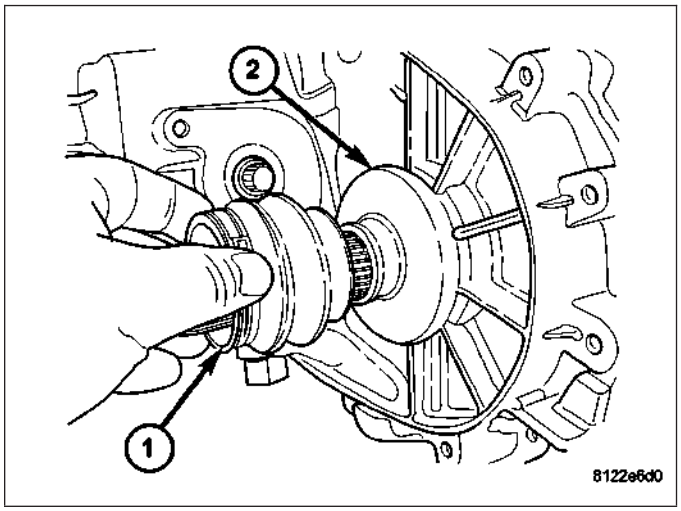
1. Remove the bolts (3) which hold the shift motor and mode sensor assembly (2) to the transfer case (1).
2. Remove the shift motor and mode sensor assembly (2) from the transfer case (1).



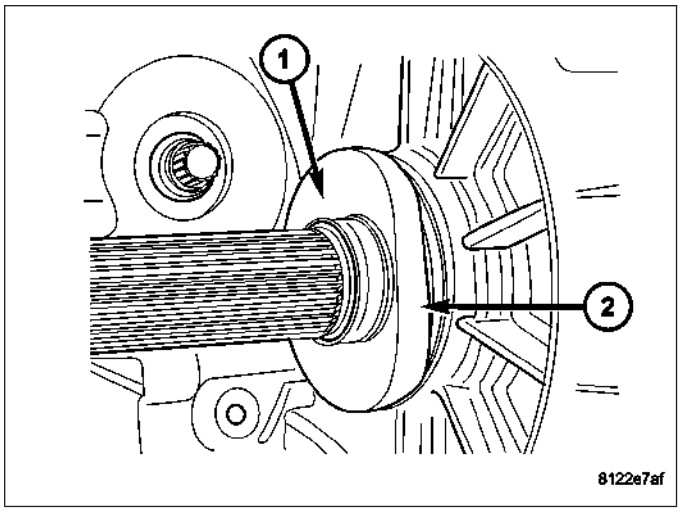
3. Remove the front propeller shaft seal boot retaining clamp (2).



4. Remove the front propeller shaft seal boot (1) from the output shaft seal slinger (2).

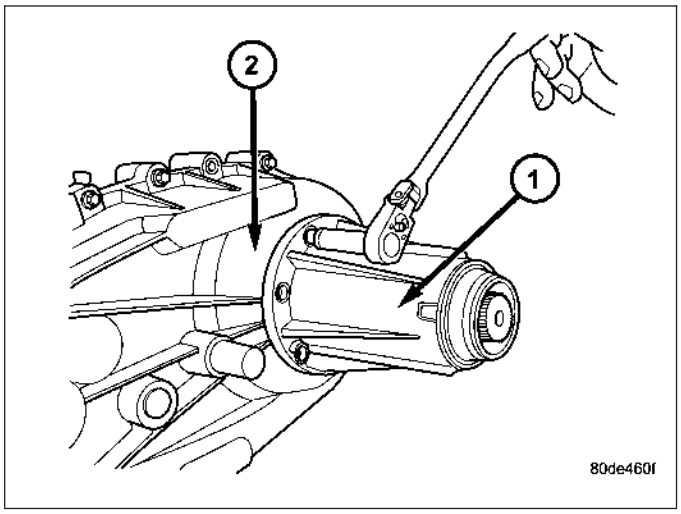


5. Remove the front output shaft seal slinger (1) by bending the slinger away (2) from the transfer case.
6. Using a suitable pry tool, remove the slinger from the output shaft using care not to damage the shaft.
7. Using a screw and a slide hammer, remove the front output shaft seal.

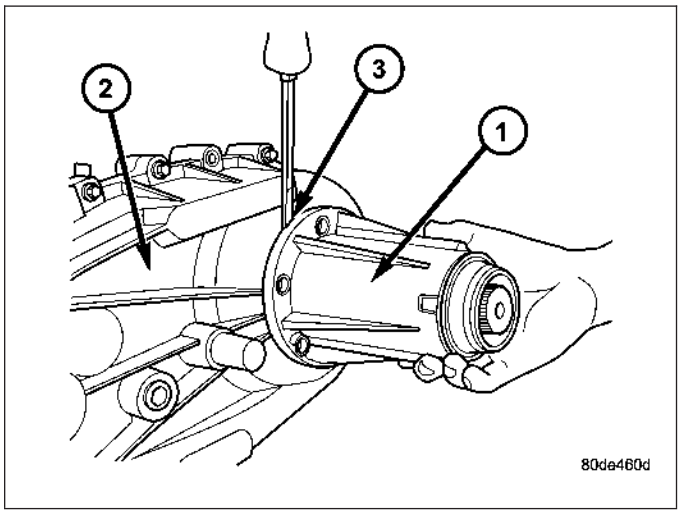


REAR EXTENSION

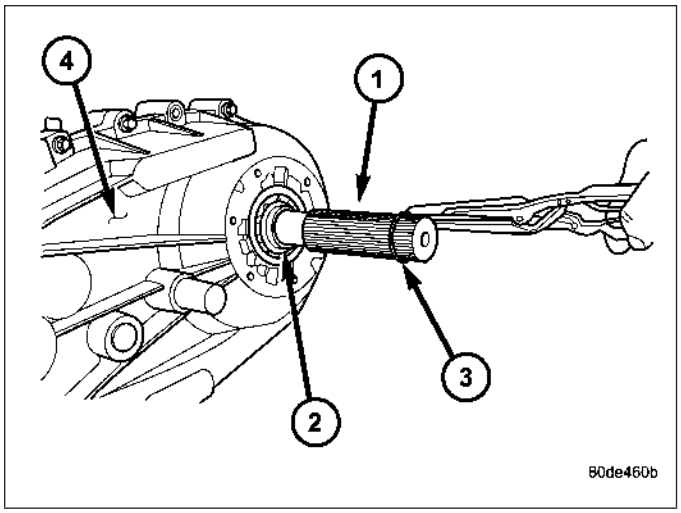
1. Remove the rear extension housing (1) bolts.



2. Remove the rear extension housing (1) from the transfer case (2). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it using the supplied pry slots (3).

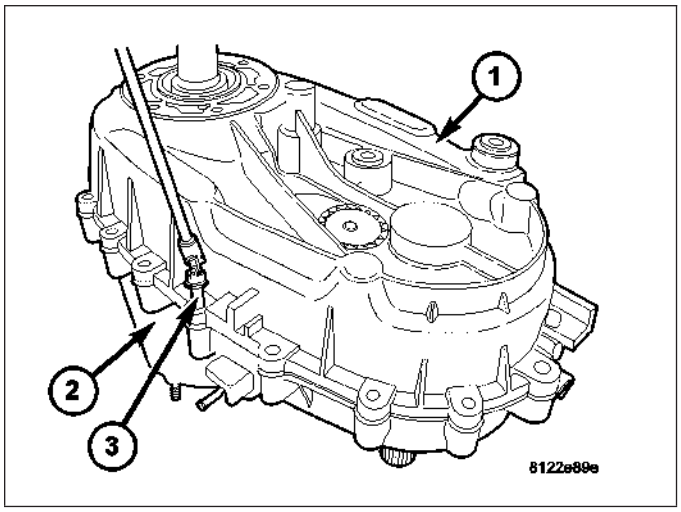


3. Remove the output bearing retaining ring (3) with heavy duty snap-ring pliers.

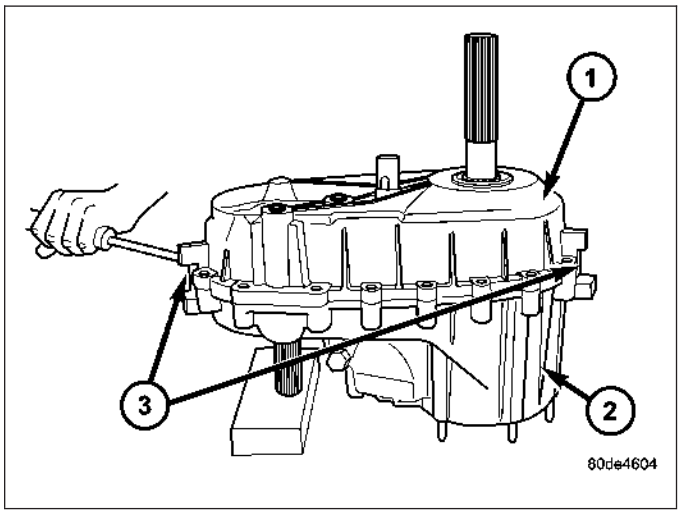


OIL PUMP AND REAR CASE

1. Remove the rear case-to-front case bolts (3).

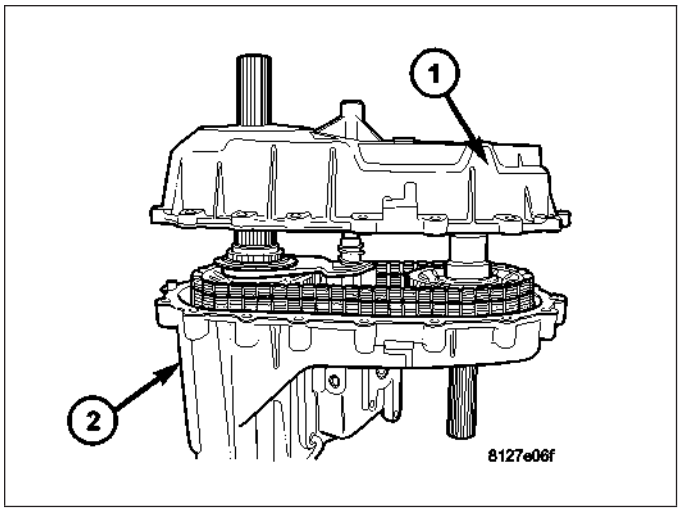


2. Loosen the rear case (1) with pry tool to break sealer bead. Insert tool in slot (3) at each end of case.
3. Unseat the rear case from alignment dowels.



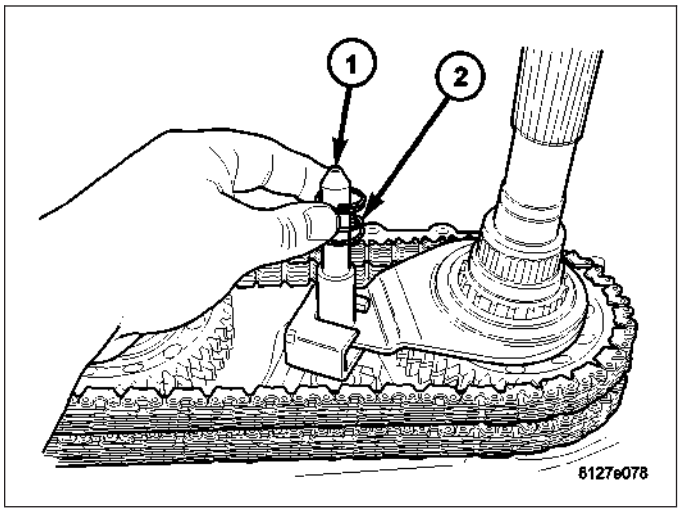
CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump. the rear case and oil pump assembly MUST be replaced.

4. Remove the rear case (1) and oil pump assembly from front case (2).
5. Remove the oil pump pickup tube.

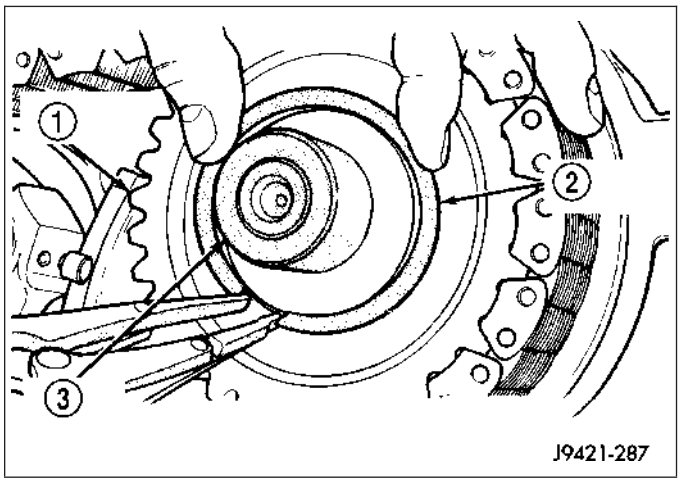


FRONT OUTPUT SHAFT AND DRIVE CHAIN

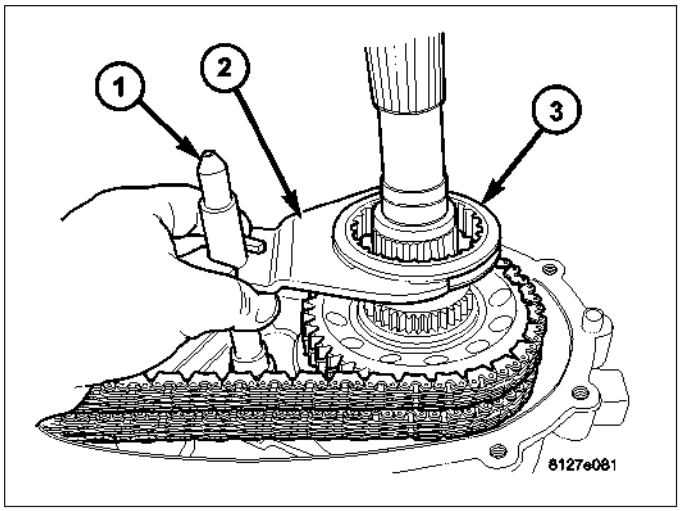
1. Remove the shift rail spring (2).



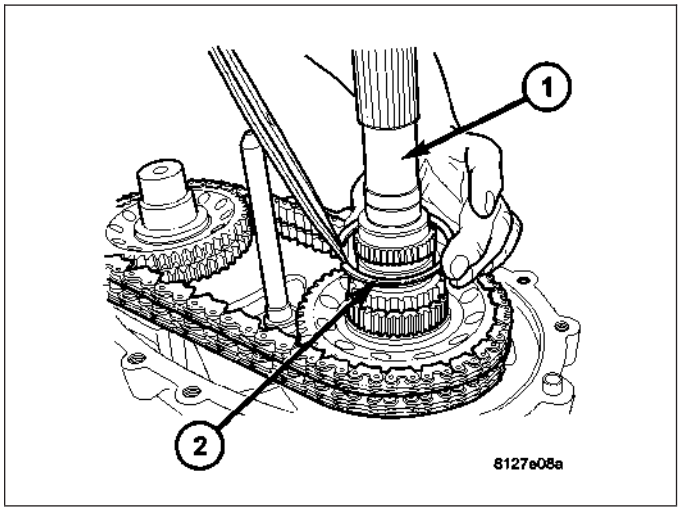
2. Remove the front sprocket retaining ring (2).



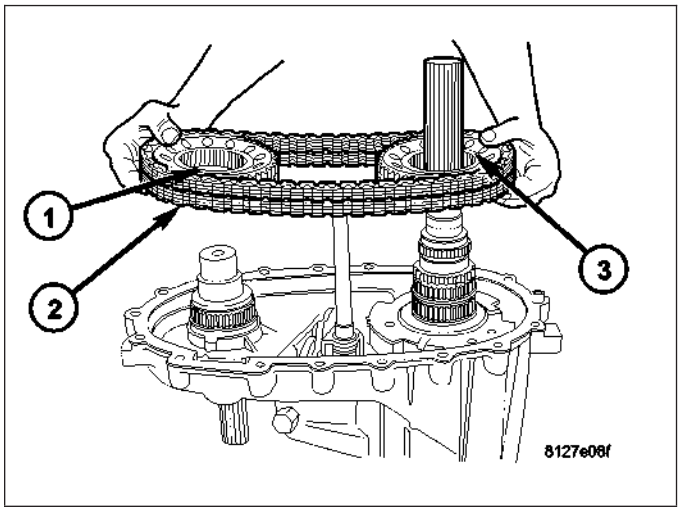
3. Remove the mode fork (2) and sleeve (3) from the shift rail (1) and mainshaft.



4. Remove the rear output shaft retaining ring (2) from the output shaft (1).

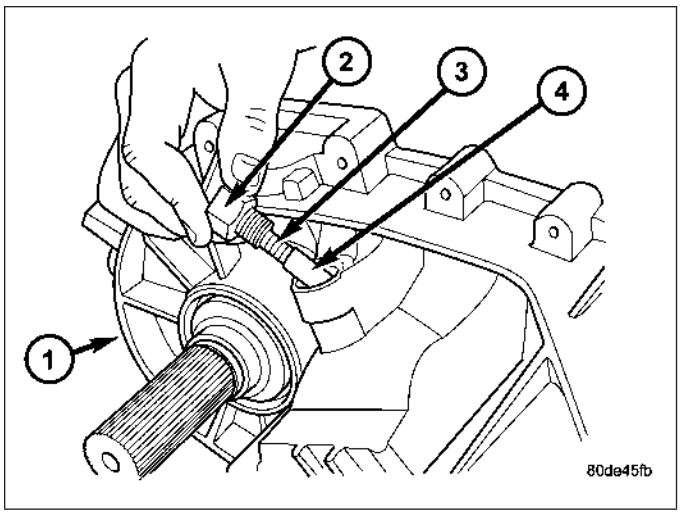


5. Pull front sprocket (1), rear sprocket (3), and chain (2) outward simultaneously.
6. Remove front sprocket (1), rear sprocket (3), and chain (2) as an assembly.

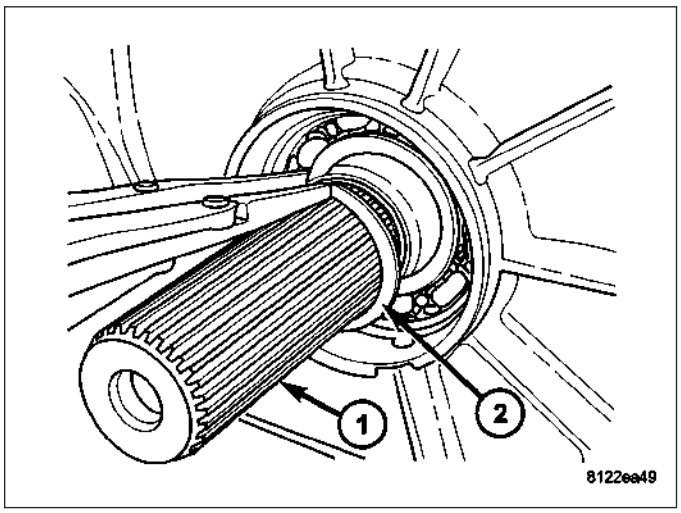


SHIFT FORKS AND MAINSHAFT

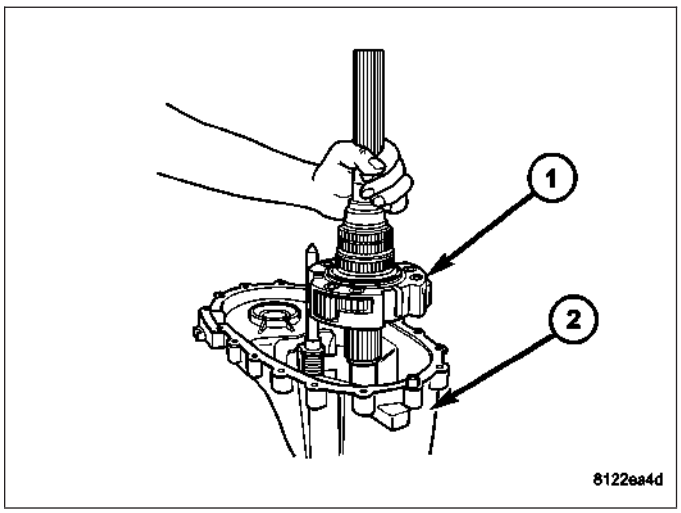
1. Loosen detent plug (2).
2. Remove the detent plug (2), spring(3), and plunger (4). Note that the plug has an O-ring seal. Remove and discard this seal.



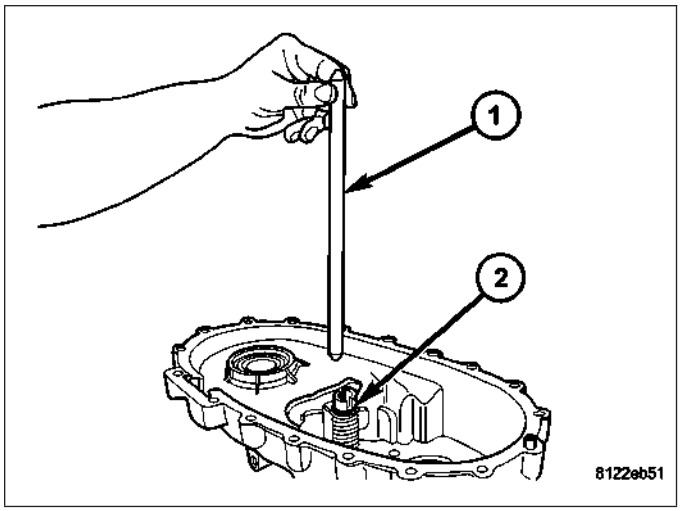
3. Remove the front output shaft snap-ring (2).
4. Remove front output shaft (1) from the front output shaft front bearing.



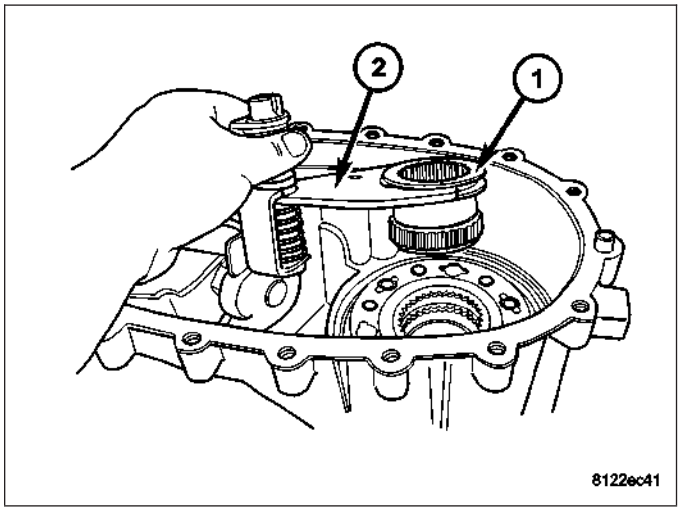
5. Remove the mainshaft and differential assembly (2) from the input gear and transfer case.



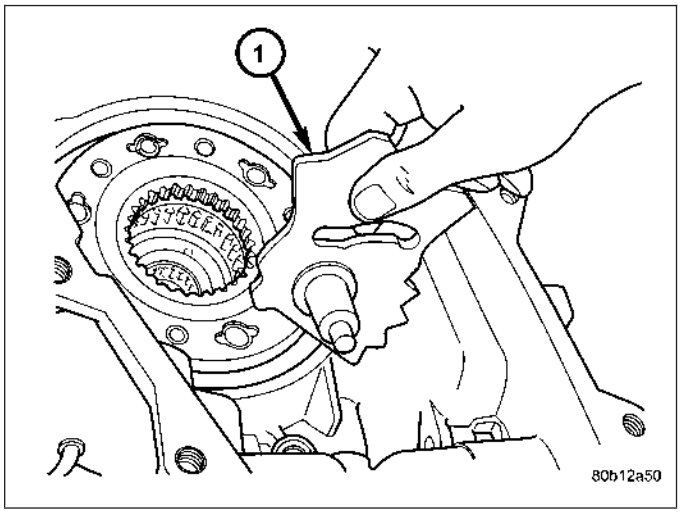
6. Remove the shift rail (1) from the range fork assembly (2) and the front case.



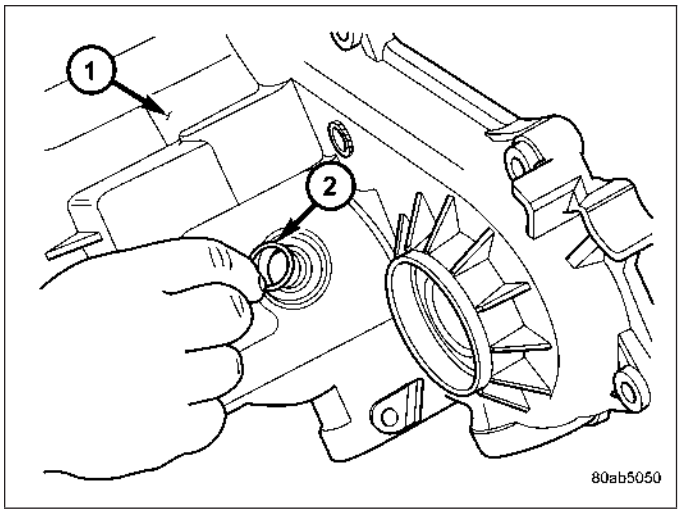
7. Remove range fork (2) and hub as an assembly. Note fork position for installation reference.



8. Remove shift sector (1).

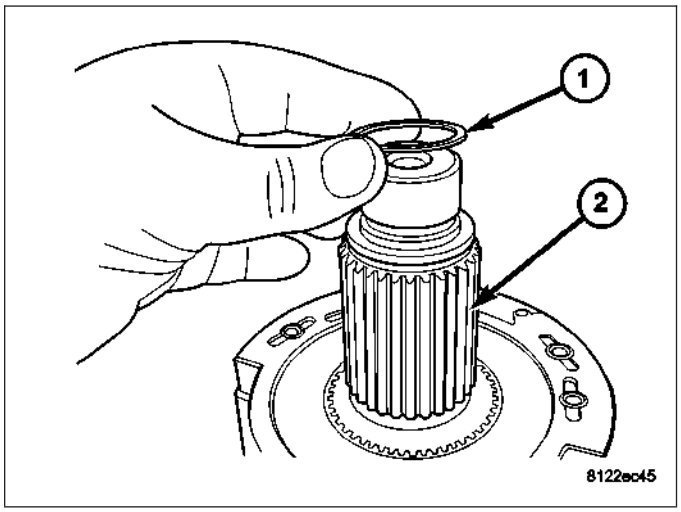


9. Remove the shift sector o-ring (2).

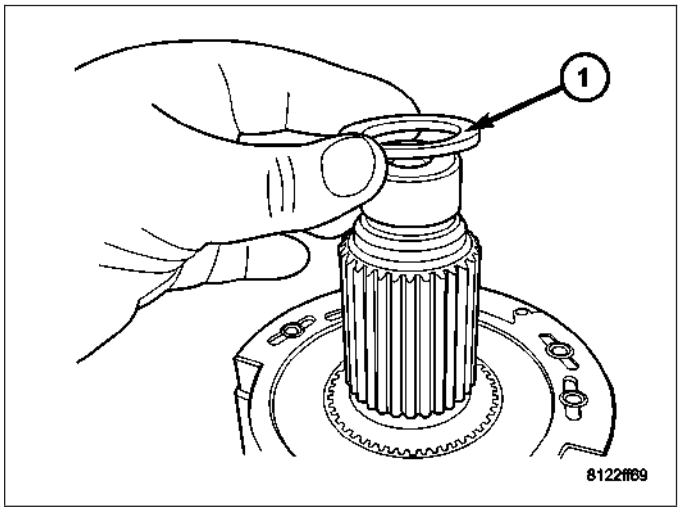


MAINSHAFT

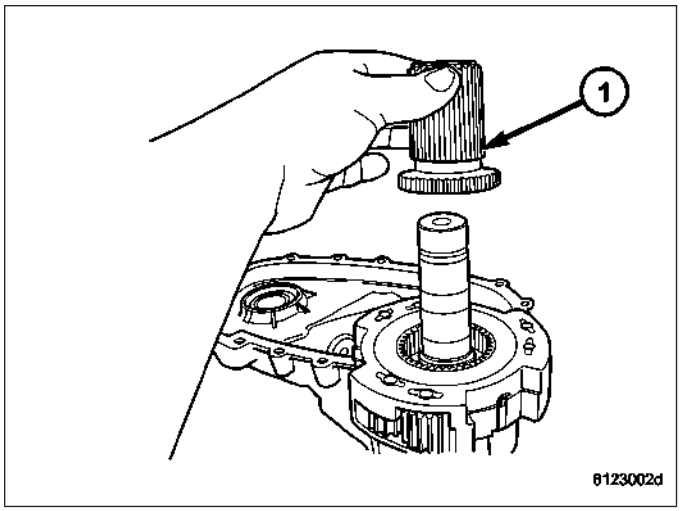
1. Remove intermediate clutch shaft snap-ring (1).



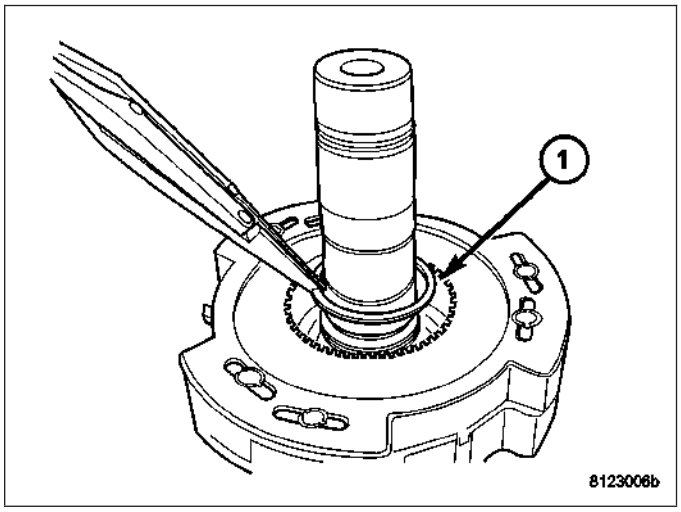
2. Remove the intermediate clutch shaft thrust ring (1).



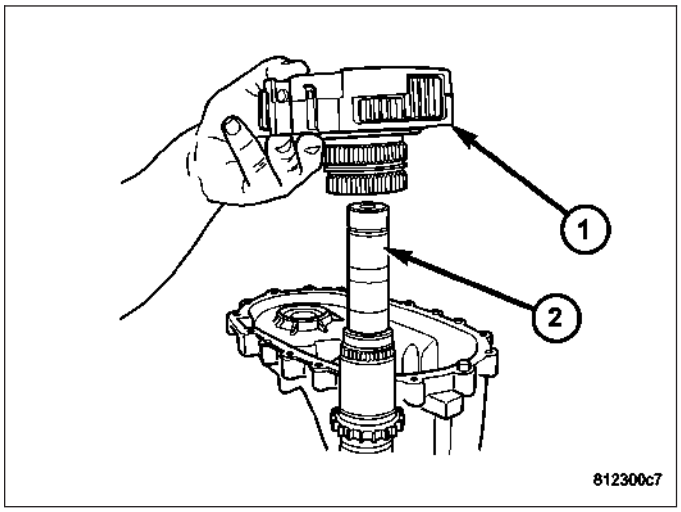
3. Remove the intermediate clutch shaft (1).



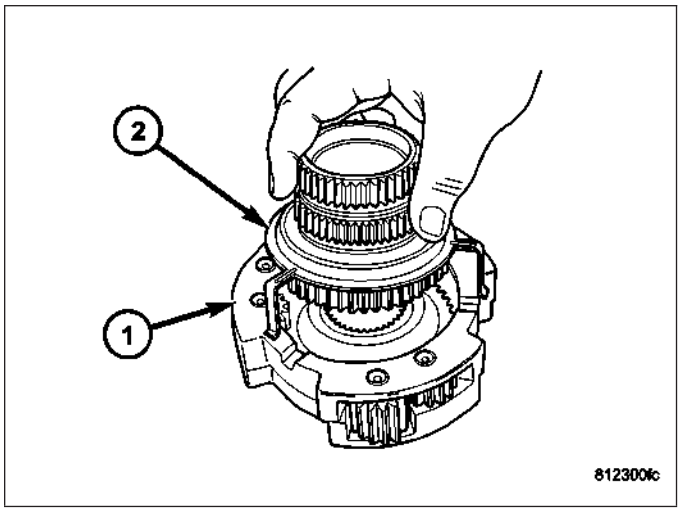
4. Remove the differential snap-ring (1).



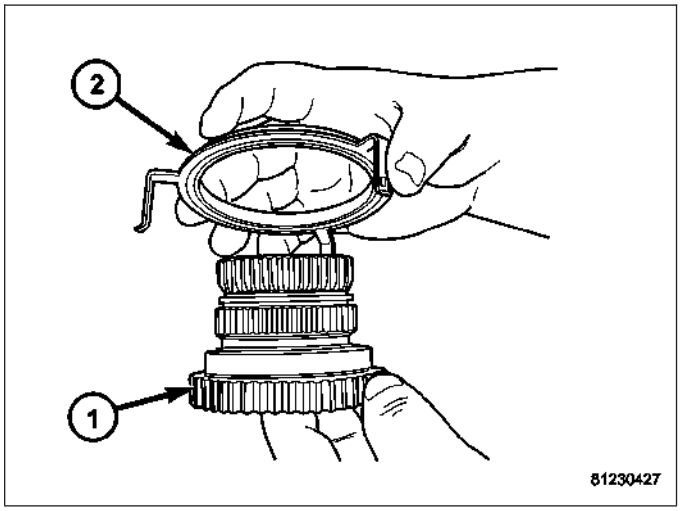
5. Remove the differential assembly (1) from the mainshaft (2).



6. Remove the mode hub and mode hub retainer (2) from the differential assembly (1).

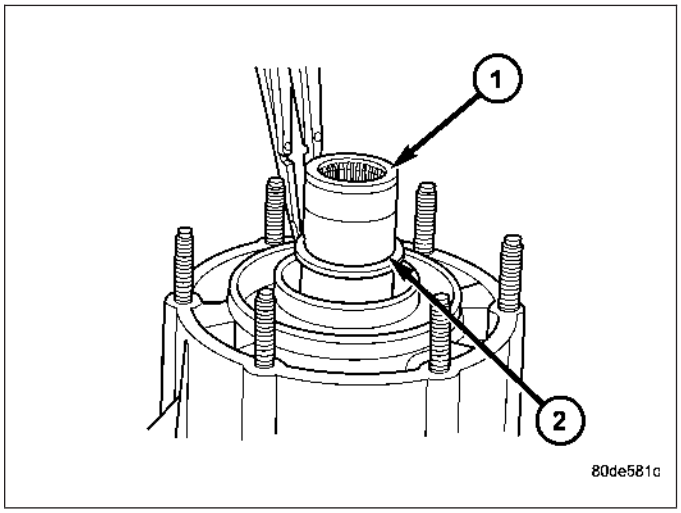


7. Remove the mode hub retainer (1) from the mode hub (2).

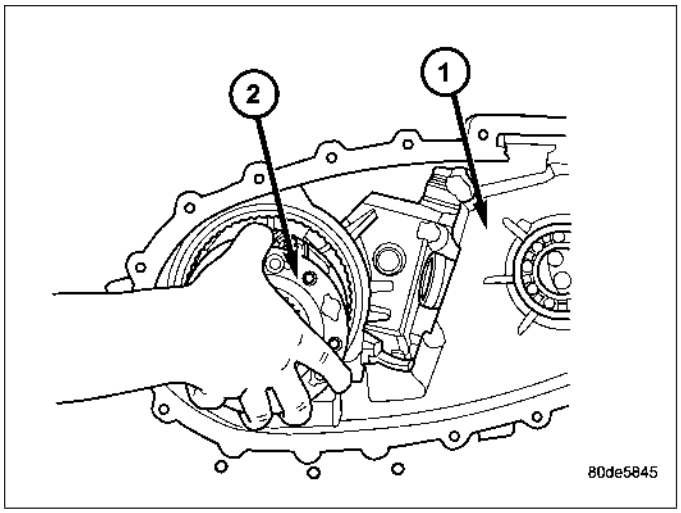


INPUT AND PLANETARY GEAR

1. Remove the input gear seal with suitable screw and slide hammer.
2. Remove the input gear retaining ring (2) with heavy duty snap-ring pliers.

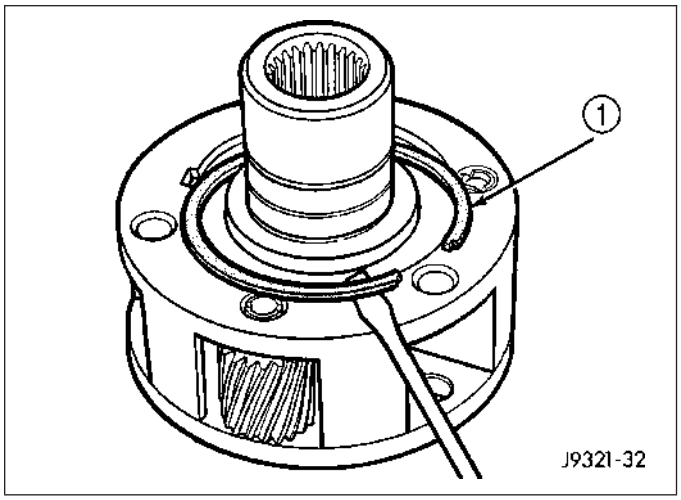


3. Place front case in horizontal position. Then remove input gear and low range gear as an assembly (2). Tap gear out of bearing with plastic mallet, if necessary.

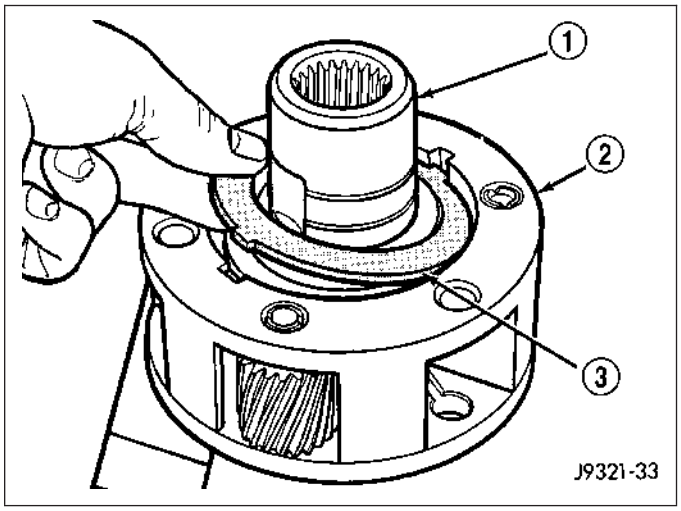


INPUT AND PLANETARY GEAR

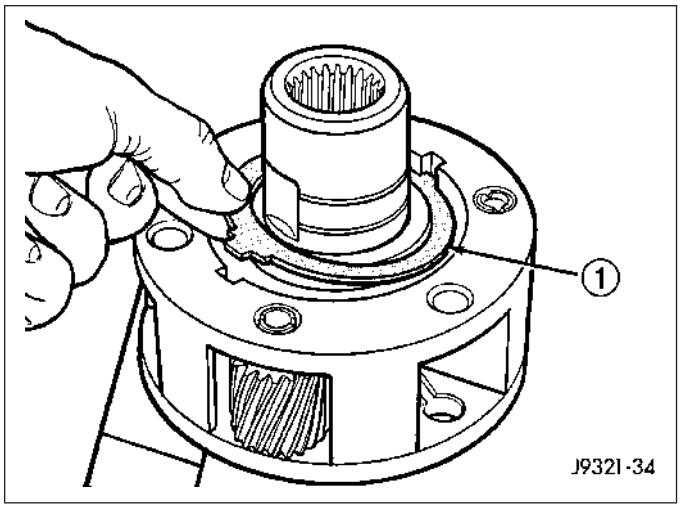
1. Remove the snap-ring (1) that retains input gear in low range gear.



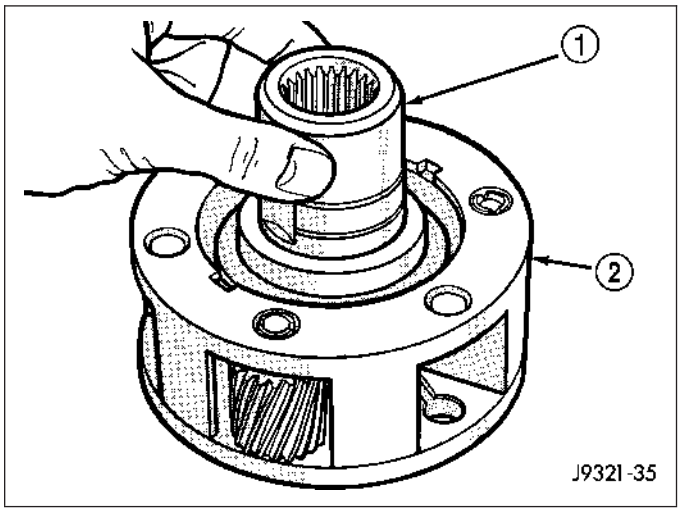
2. Remove the retainer (3).



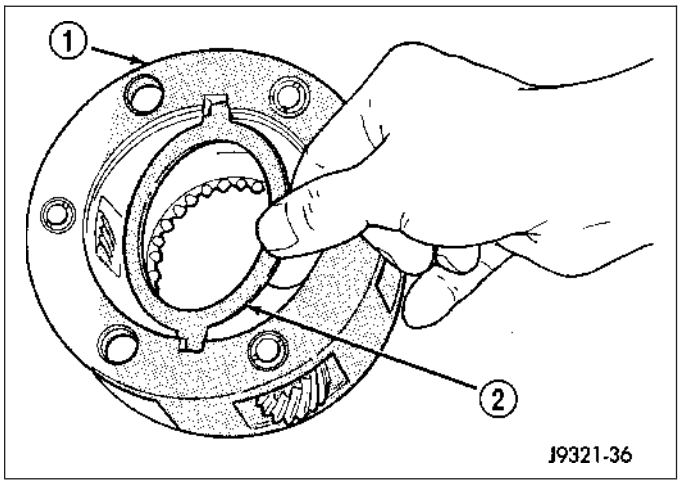
3. Remove the front tabbed thrust washer (1).



4. Remove the input gear (1).



5. Remove the rear tabbed thrust washer (2) from the low range gear (1).



CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M™ all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

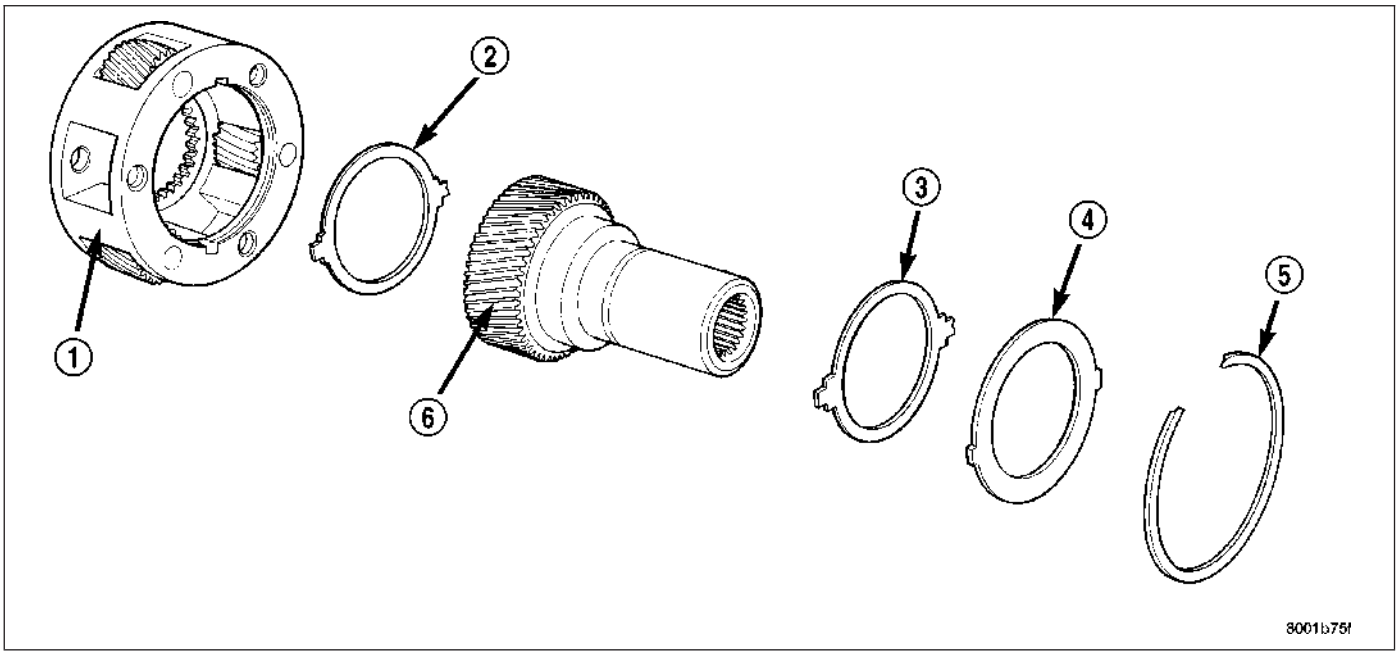
INSPECTION

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER



Input Gear and Carrier Components

1 - PLANETARY CARRIER
2 - REAR THRUST WASHER
3 - FRONT THRUST WASHER
4 - CARRIER LOCK RING
5 - CARRIER LOCK RETAINING RING
6 - INPUT GEAR

Check the teeth on the gear. Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

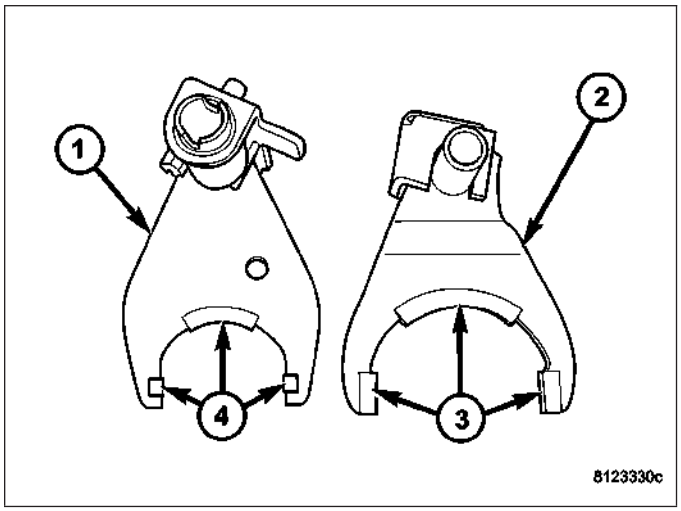
Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail. Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads (3, 4). The mode (2) and range (1) fork pads are serviceable and can be replaced if necessary.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.



REAR EXTENSION HOUSING

Inspect the extension housing seal and bushing. Replace both components if either show any sign of wear or damage.

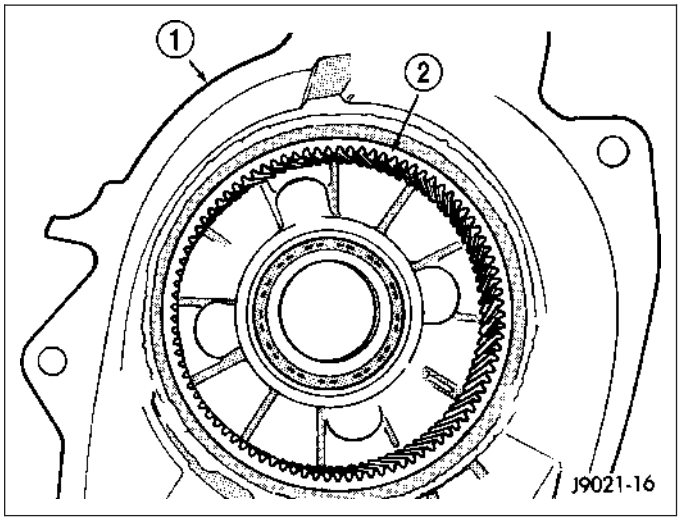
FRONT OUTPUT SHAFT AND DRIVE CHAIN

Inspect the shaft splines and bearing surfaces. Minor nicks on the splines can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Replace the shaft if the bearing surfaces are scored or if any of the splines are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear (2) condition carefully. The gear is only serviced as part of the front case (1). If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear.



FRONT AND REAR CASES

Inspect the cases for wear and damage.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite™ 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the

rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil® stainless steel inserts if required.

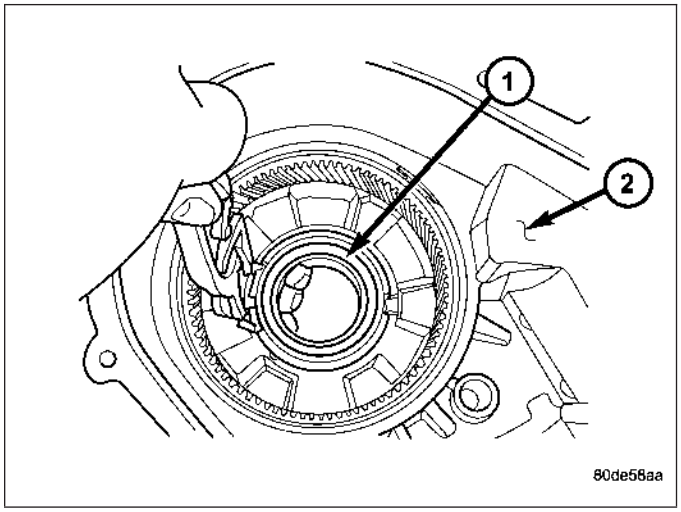
OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

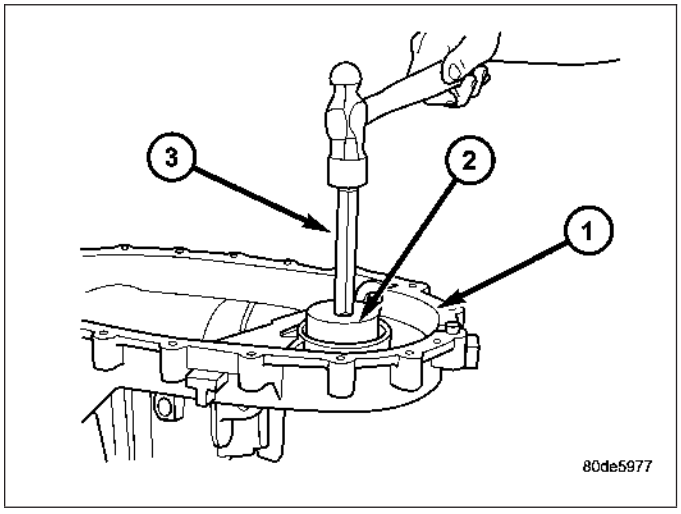
ASSEMBLY

BEARINGS AND SEALS

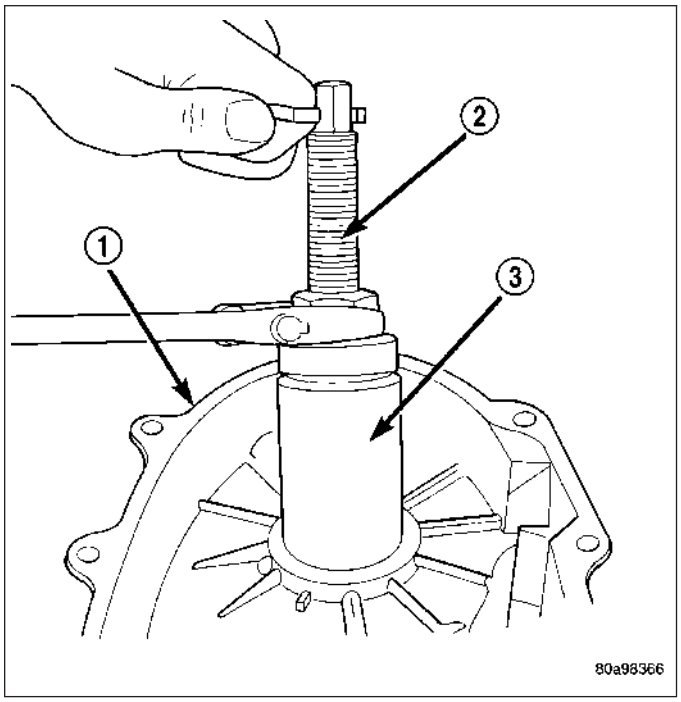
1. Remove the input shaft bearing (1) from the front case (2) with suitable snap-ring pliers.
2. Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.



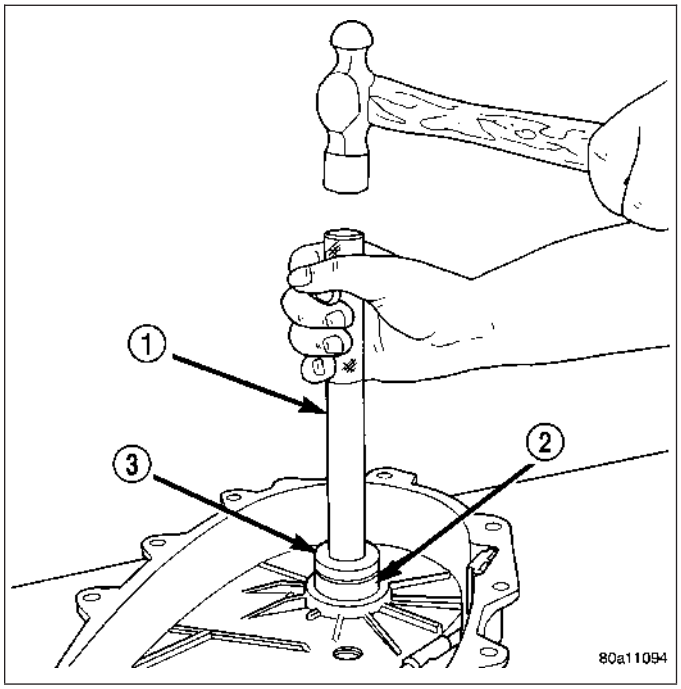
3. Remove the front output shaft bearing retaining ring from inside the front case (1) half.
4. Using Installer 6436 and Handle C-4171, remove front output shaft bearing.
5. Start the front output shaft bearing in case. Then seat bearing with Handle C-4171 (3) and Installer 6953 (2).
6. Install the front output shaft bearing retaining ring.



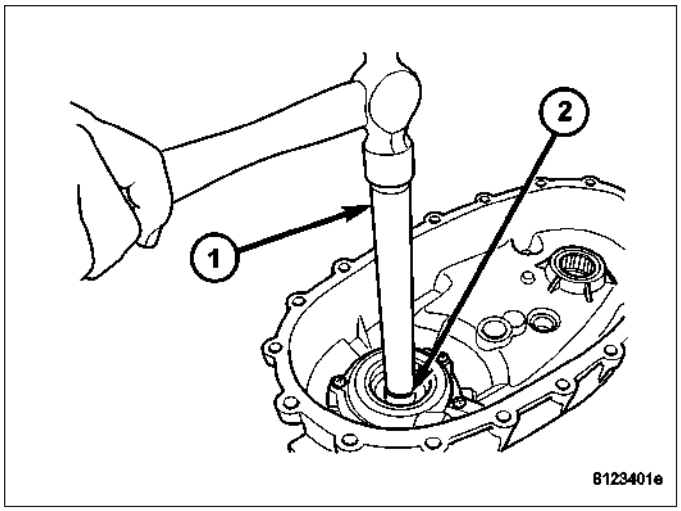
7. Remove the front output shaft rear bearing with the screw and jaws from Remover L-4454 (2) and Cup 8148 (3).



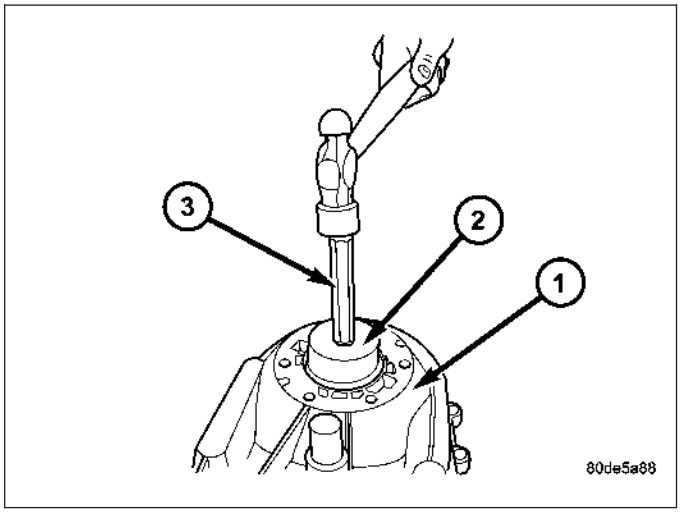
8. Install the new bearing with Tool Handle C-4171 (1) and Installer 5066 (2).



9. Remove the rear output shaft bearing from the rear case using Installer 5065 (2) and Handle C-4171 (1).

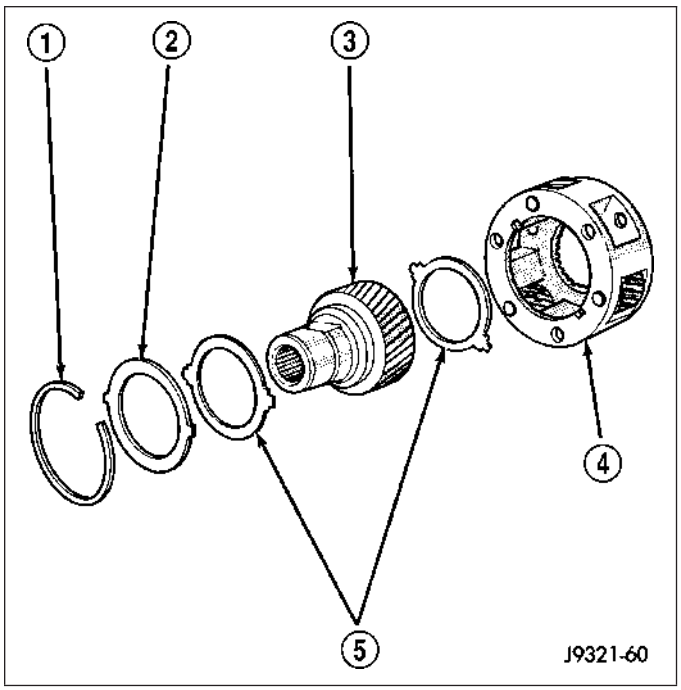


10. Install the rear output shaft bearing into the rear case (1) using Remover/Installer 6953 (2) and Handle C-4171 (3).

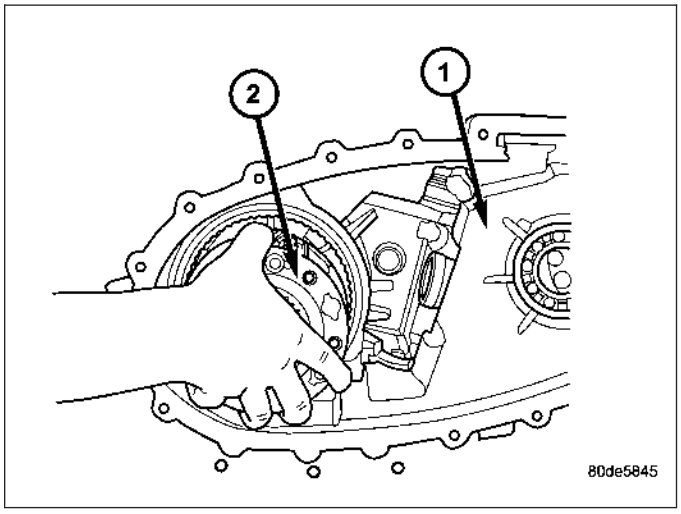


INPUT AND PLANETARY GEAR

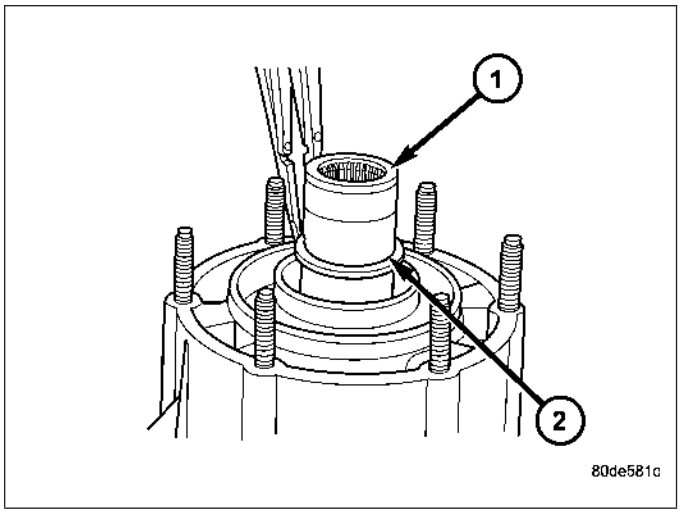
1. Lubricate the gears (3, 4) and thrust washers (5) with recommended transmission fluid.
2. Install the first thrust washer (5) in low range gear (4). Be sure washer tabs are properly aligned in gear notches.
3. Install the input gear (3) in low range gear (4). Be sure input gear is fully seated.
4. Install the remaining thrust washer (5) in low range gear (4) and on top of input gear (3). Be sure washer tabs are properly aligned in gear notches.
5. Install the retainer (2) on input gear (3) and install snap-ring (1).



6. Align and install the low range/input gear assembly (2) in front case (1). Be sure the low range gear pinions are engaged in the annulus gear and that the input gear shaft is fully seated in the front bearing.



7. Install the snap-ring (2) to hold input/low range gear (1) into the front bearing.
8. Install a new input gear seal using Installer 8841 and Handle C-4171.

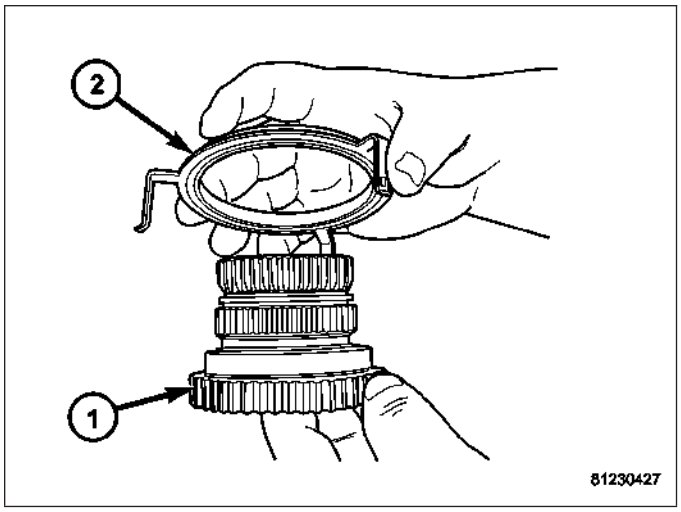


SHIFT FORKS AND MAINSHAFT

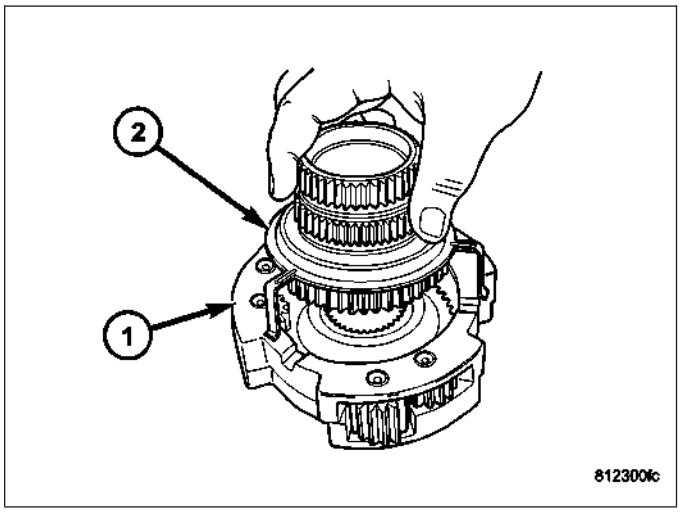
1. Lubricate the mainshaft splines with recommended transmission fluid.

NOTE: Replace the mode hub retainer if the legs were distorted during removal.

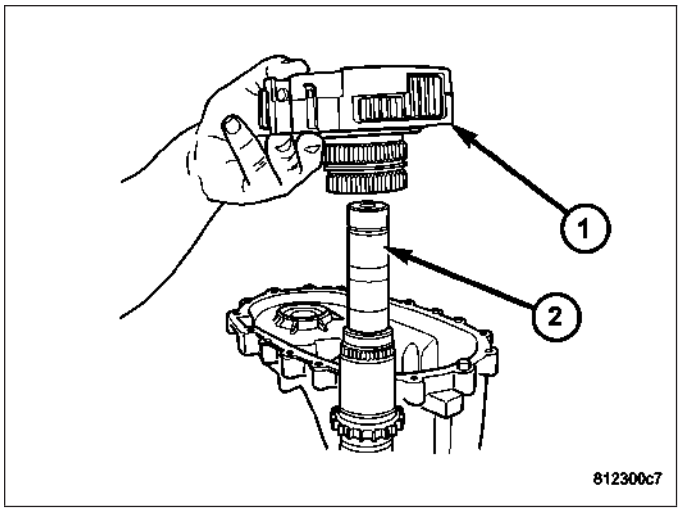
2. Install the mode hub retainer (1) onto the mode hub (2).



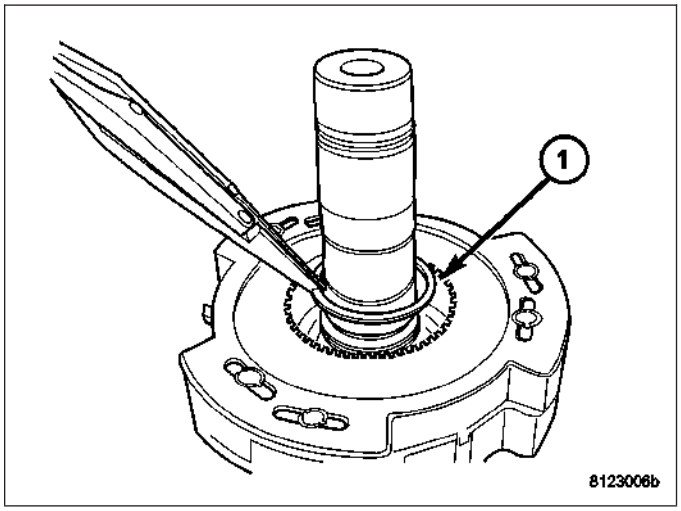
3. Install the mode hub and mode hub retainer (2) onto the differential assembly (1). Make sure the retainer is fully seated onto the differential.



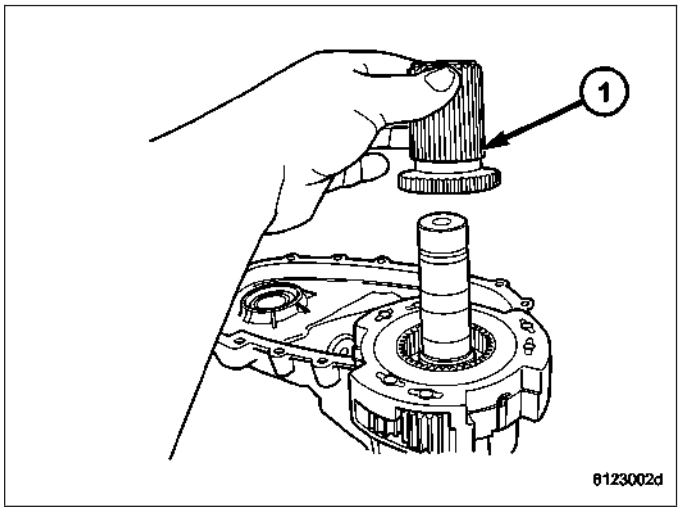
4. Install the differential assembly (1) onto the mainshaft.



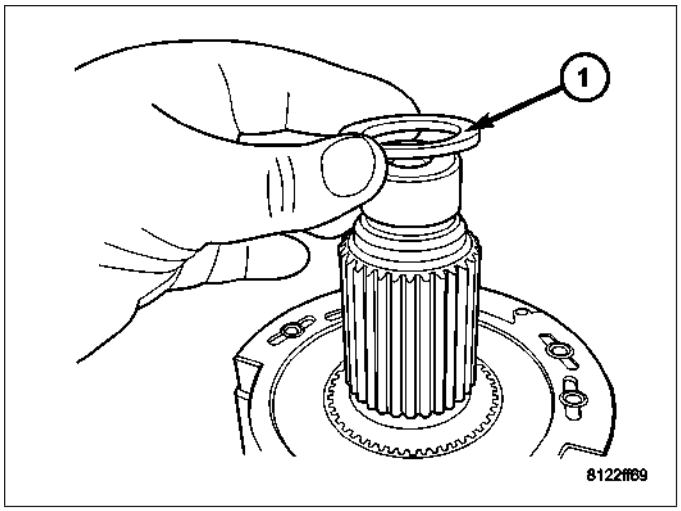
5. Install the differential snap-ring (1).



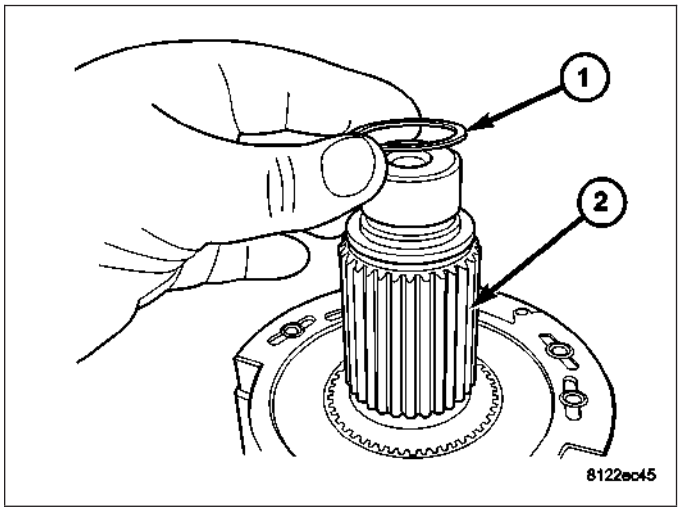
6. Install the intermediate clutch shaft (1).



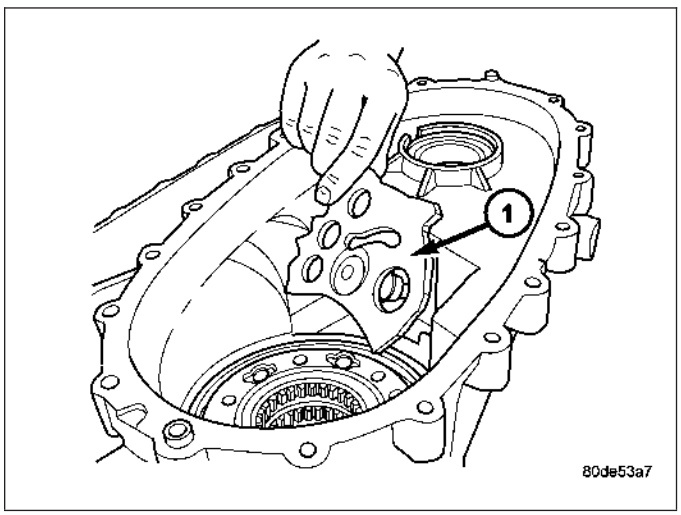
7. Install the clutch shaft thrust ring (1).



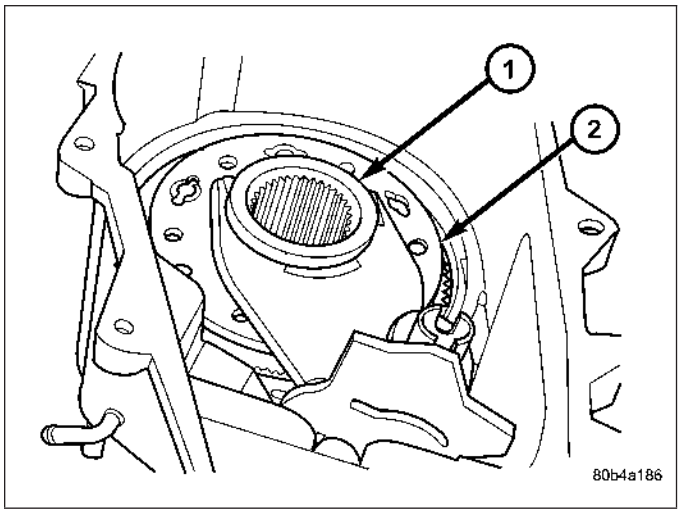
8. Install the clutch shaft snap-ring (1).



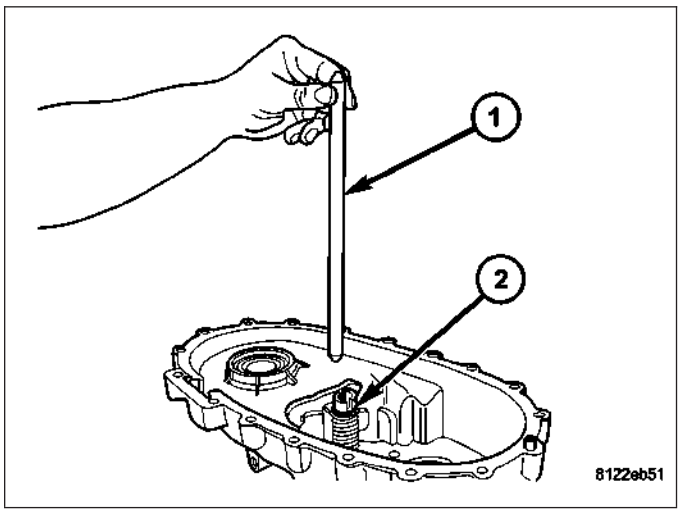
9. Lubricate the sector shaft (1) with transmission fluid and install shift sector in case. Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.
10. Install the shift sector o-ring.



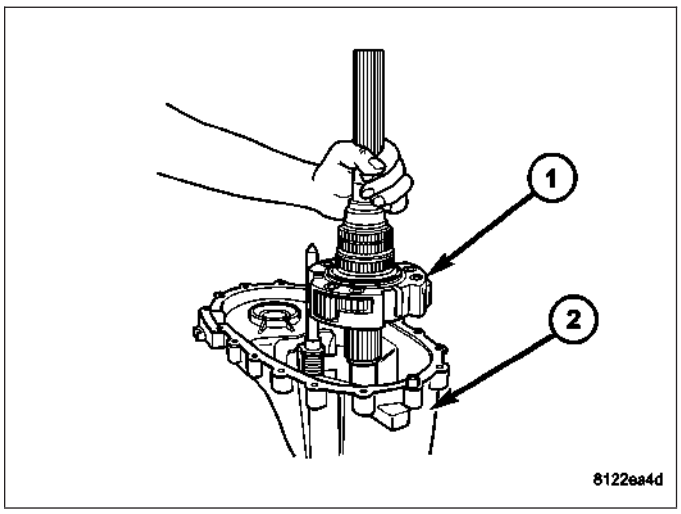
11. Assemble and install the range fork (2) and hub (1). Be sure the hub is properly seated in the low range gear and engaged to the input gear.
12. Align and insert the range fork pin in the shift sector slot.



13. Install the shift rail (1) into the range fork assembly (2) and the front case.

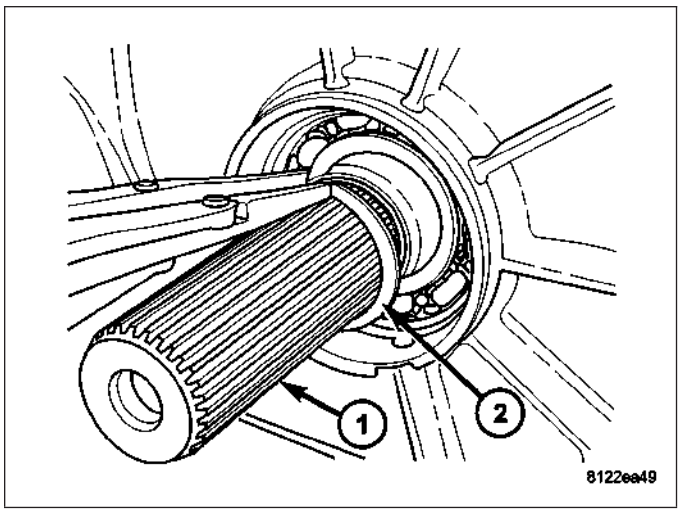


14. Install the mainshaft and differential assembly (2) into the input gear and transfer case front case (1).

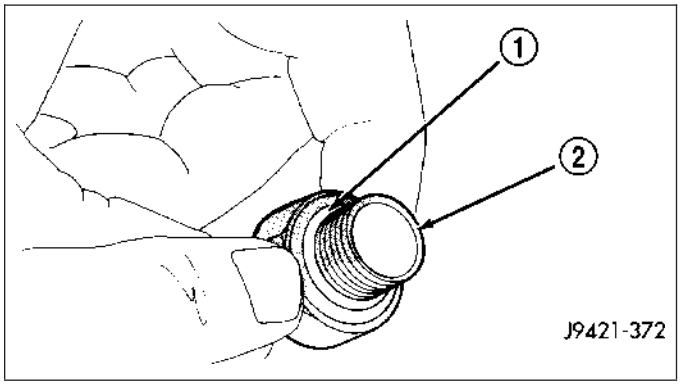


FRONT OUTPUT SHAFT AND DRIVE CHAIN

1. Install the front output shaft into the front output shaft bearing.
2. Install the front output shaft snap-ring (2) onto the output shaft (1).
3. Install the new front output shaft seal with Installer MB991168A.

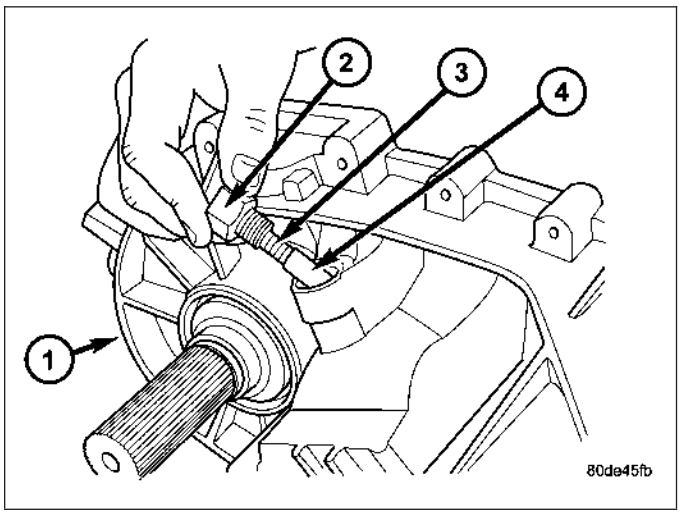


4. Install new o-ring (1) on detent plug (2).

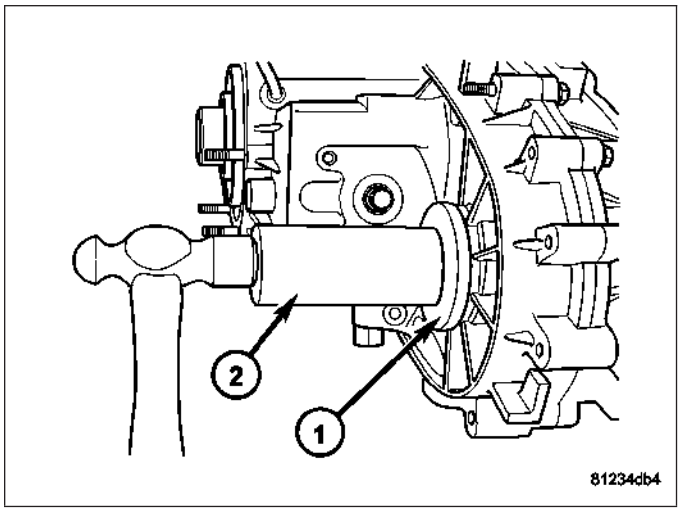


NOTE: Shift the transfer case to the same range/ mode position it was in when the shift motor was removed prior to installing the shift detent components.

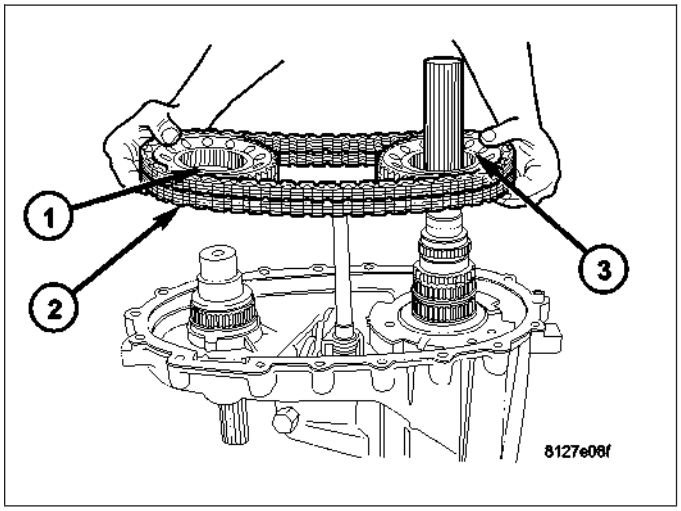
5. Install detent plunger (4), spring (3), and plug (2). Tighten the plug to 16-25 N·m (12-18 ft. lbs.).



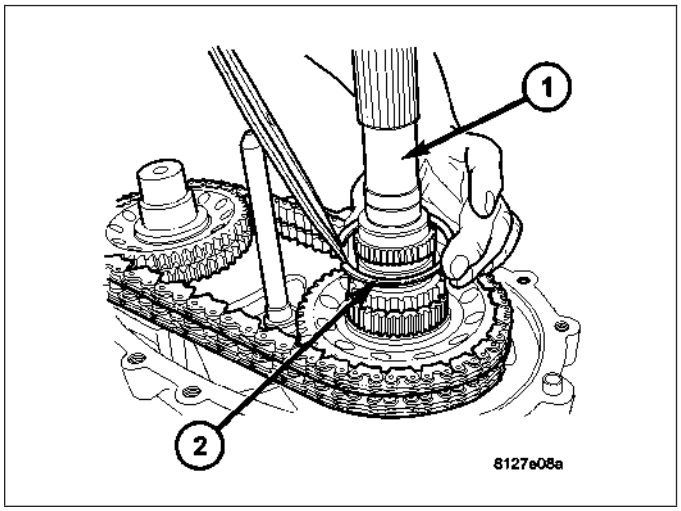
6. Install the new front output shaft seal slinger (1) with Installer 8840 (2). Install the slinger onto the shaft until the tool contacts the front of the output shaft.



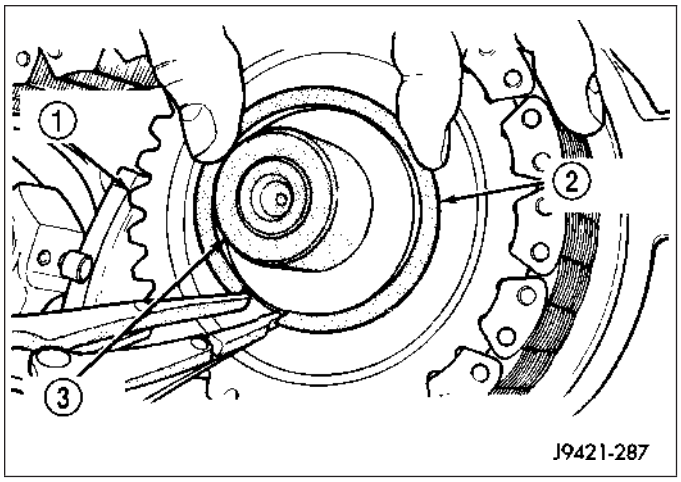
7. Install the front sprocket (1), rear sprocket (3), and chain (2) as an assembly.
8. Lower the front sprocket (1), rear sprocket (3), and chain (2) over the front and rear output shafts simultaneously until fully seated on both splines.



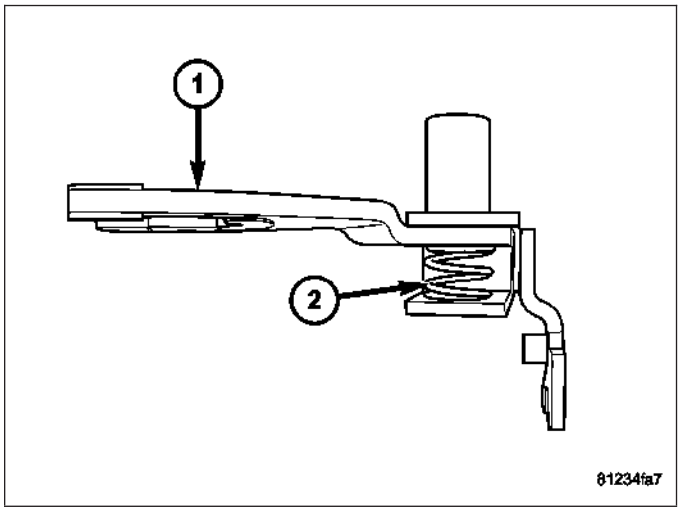
9. Install the rear output shaft retaining ring (2) onto the output shaft (1).



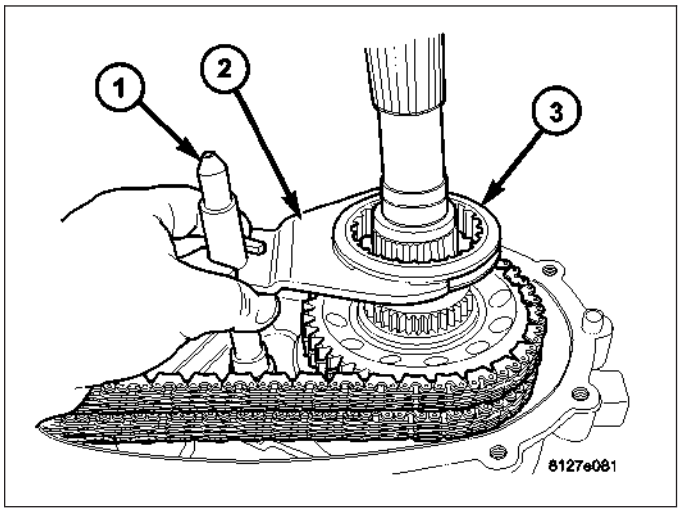
10. Install the front sprocket retaining ring (2).



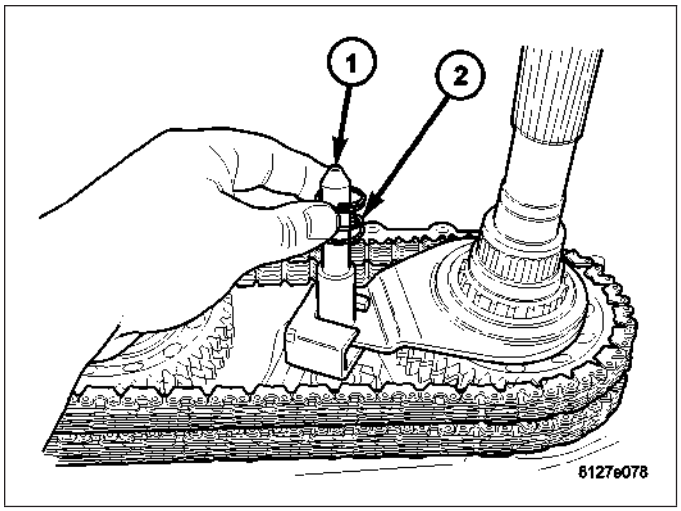
11. Inspect the mode fork assembly (1). Replace pads if necessary. Also check springs (2) and slider bracket. Replace worn or damaged components.



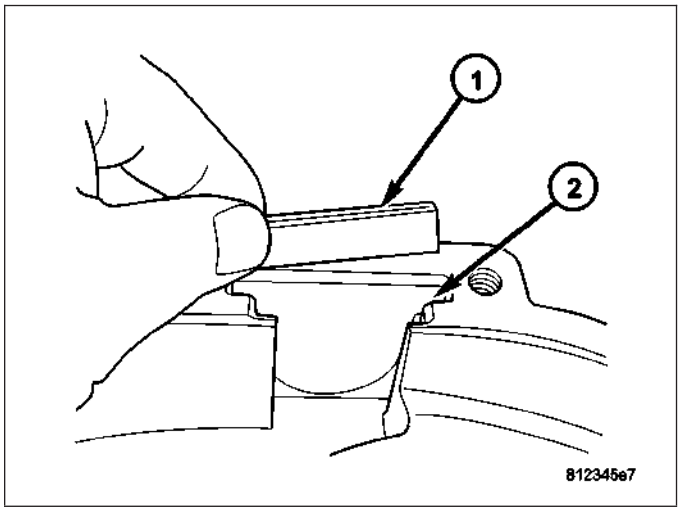
12. Install the mode fork (2) and sleeve (3) over the shift rail (1) and mainshaft.



13. Install the shift rail spring (2) onto the shift rail (1).



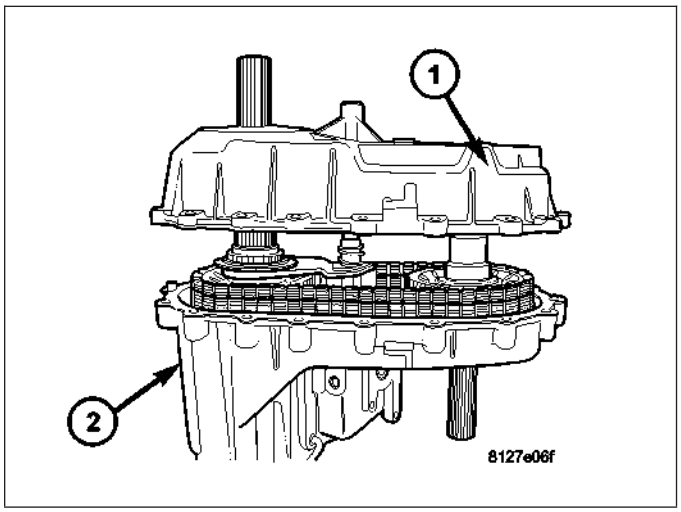
14. Insert the transfer case sump magnet (1) into the front case pocket (2).



OIL PUMP AND REAR CASE

Lubricate the oil pump components with transmission fluid before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

CAUTION: Do not remove the bolts holding the oil pump cover to the rear case half. The oil pump cover is aligned to the rear output shaft inner bearing race and will become mis-aligned if the bolts are loosened. If the transfer case failure has generated any debris which may have become trapped in the oil pump. the rear case and oil pump assembly MUST be replaced.

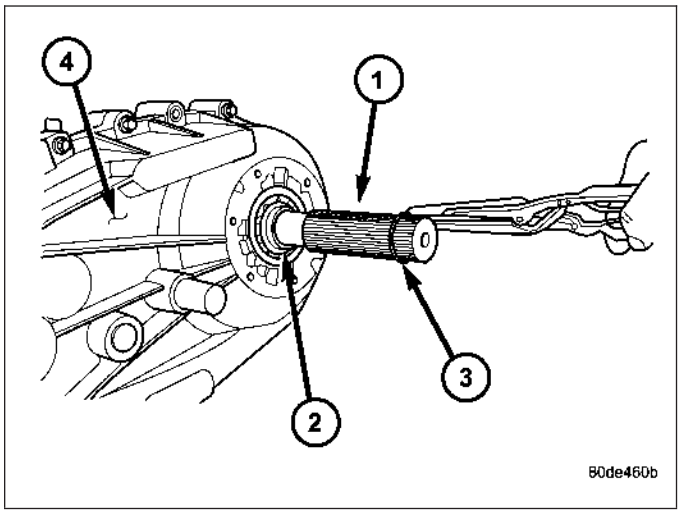


1. Install a new o-ring in pickup tube inlet of oil pump, if necessary.
2. Insert the oil pickup tube into the oil pump.
3. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case (2). Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

NOTE: Lift upward and gently shake the rear output shaft while settling the rear case onto the front case dowels. This will allow the mainshaft splines to more easily engage the oil pump.

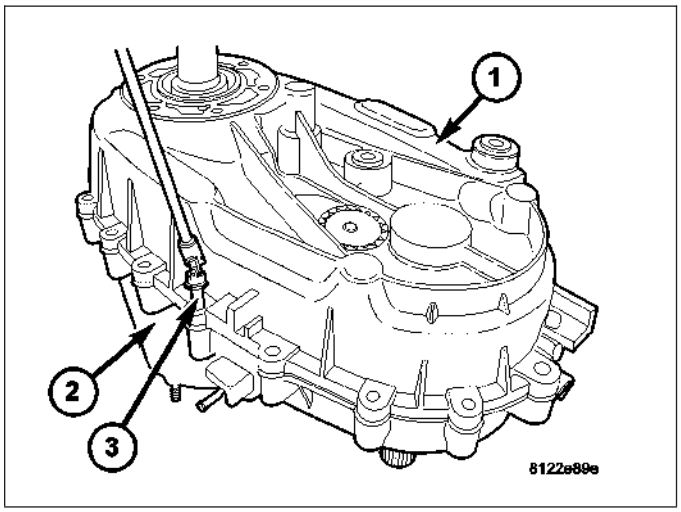
4. Align the oil pump with mainshaft and align shift rail with bore in rear case (1). Then install rear case (1) and oil pump assembly.

5. Install the rear output bearing snap-ring (3) to the rear output shaft (1).



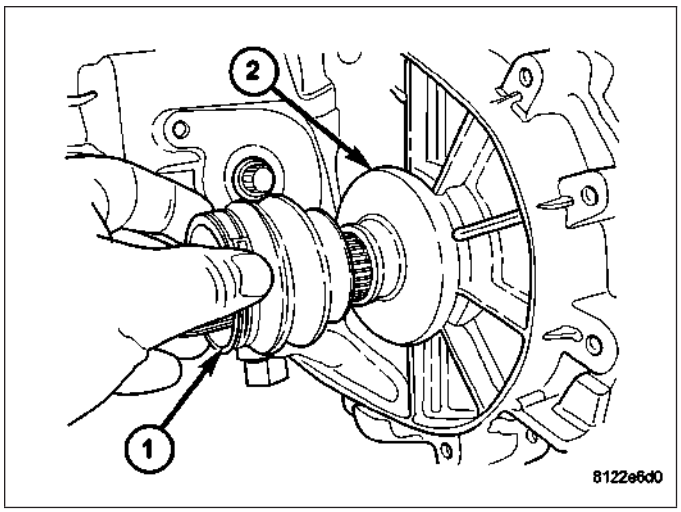
CAUTION: Verify that shift rail, and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

6. Install 4-5 rear case-to front case bolts (3) to hold rear case in position. Tighten bolts snug but not to specified torque at this time.
7. Apply Mopar® Lock 'n Seal Adhesive to remainder of rear case-to-front case bolt threads and install bolts. Tighten bolts to 25-28 N·m (18-21 ft. lbs.).

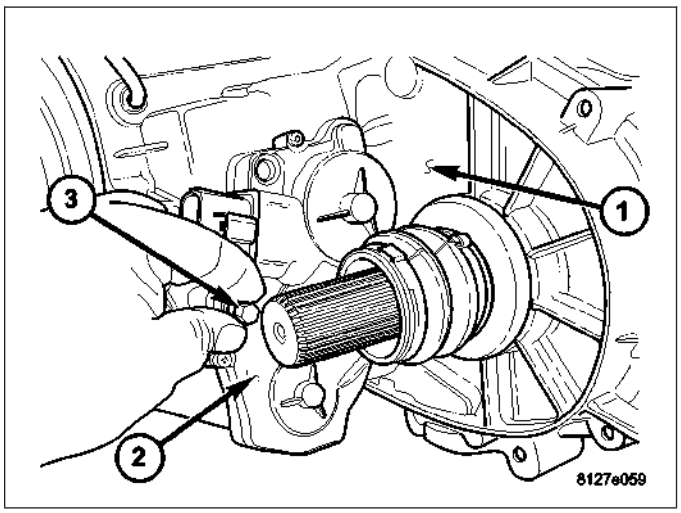


SEAL BOOT AND SHIFT MOTOR ASSEMBLY

1. Install a new seal boot clamp onto the seal boot (1).
2. Install the seal boot (1) and clamp onto the slinger (2) hub and tighten the clamp with Crimp Tool C-4975-A.

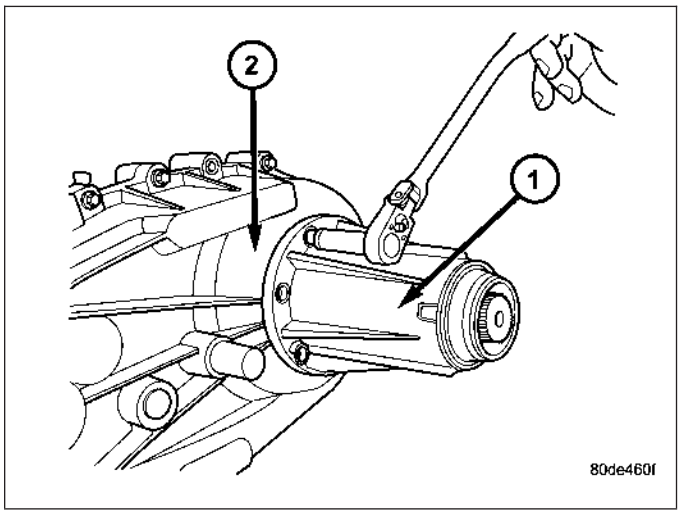


3. Position the shift motor and mode sensor assembly (2) onto the transfer case (1).
4. Install the bolts (3) to hold the shift motor and mode sensor assembly (2) to the transfer case(1). Tighten the bolts to 16-25 N·m (12-18 ft. lbs.).



REAR EXTENSION

1. Install new seal in rear extension housing seal with Installer D-163 and Handle C-4171. Verify that the weep hole in the rebber is oriented downward.
2. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.
3. Align and install rear extension housing (1) onto the rear case (2).
4. Apply Mopar® Silicone Sealer to threads of rear extension housing bolts. Then install and tighten bolts to 16-24 N·m (12-18 ft. lbs.) torque.



INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case and transmission shafts and install transfer case onto the transmission.
5. Install and tighten transfer case attaching nuts to 27-34 N·m (20-25 ft. lbs.) torque.
6. Connect the vent hose.
7. Connect the shift motor and mode sensor assembly wiring connector. Secure wire harness to clips on transfer case.
8. Align and connect the propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/FRONT PROPELLER SHAFT - INSTALLATION) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/REAR PROPELLER SHAFT - INSTALLATION)
9. Fill transfer case with correct fluid. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE)
10. Install skid plate, if equipped.
11. Remove transmission jack and support stand.
12. Lower vehicle and verify transfer case shift operation.

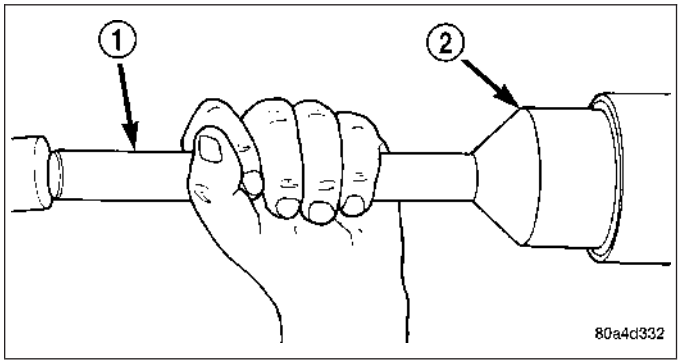
SEAL-EXTENSION HOUSING

REMOVAL

1. Raise and support vehicle.
2. Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
3. Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

INSTALLATION

1. Clean fluid residue from sealing surface and inspect for defects.
2. Using Installer D-163 (2) and Handle C-4171 (1), install seal in extension housing.
3. Install propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
4. Verify proper transfer case fluid level.
5. Lower vehicle.

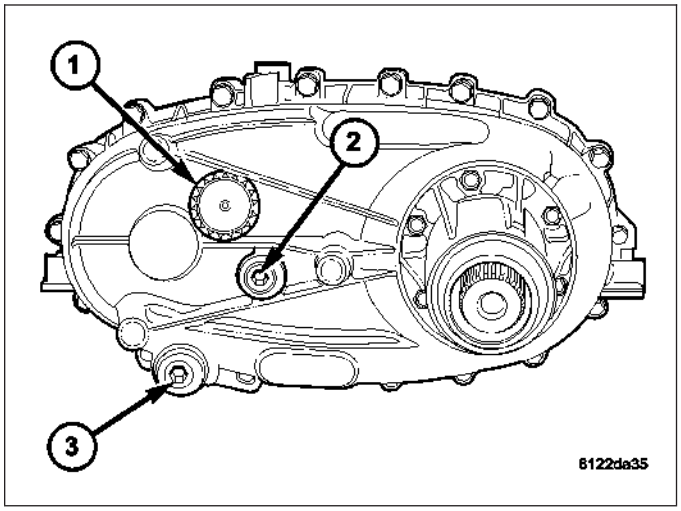


FLUID

STANDARD PROCEDURE - FLUID DRAIN AND REFILL

NOTE: The fill (2) and drain (3) plugs are both in the rear case.

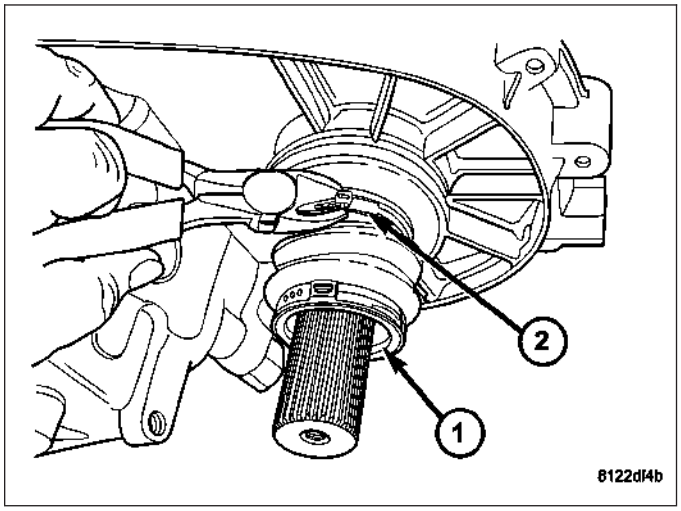
1. Raise vehicle.
2. Position drain pan under transfer case.
3. Remove drain (3) and fill (2) plugs and drain lubricant completely.
4. Install drain plug (3). Tighten plug to 20-34 N·m (15-25 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with Mopar® ATF +4, Automatic Transmission fluid.
7. Install and tighten fill plug (2) to 20-34 N·m (15-25 ft. lbs.).
8. Lower vehicle.



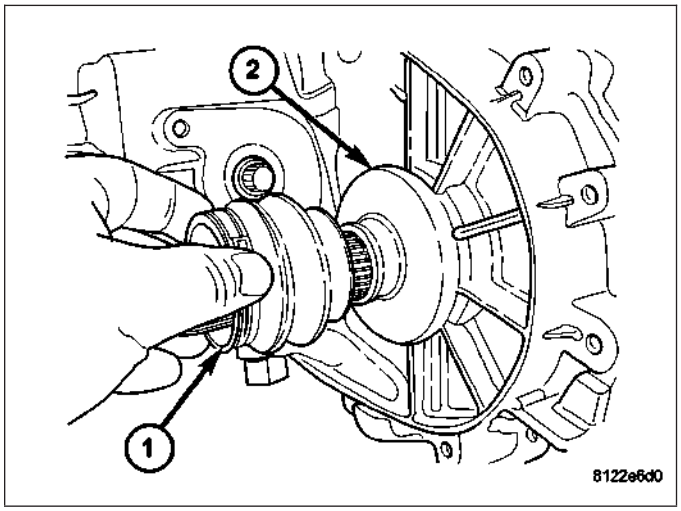
SEAL-FRONT OUTPUT SHAFT

REMOVAL

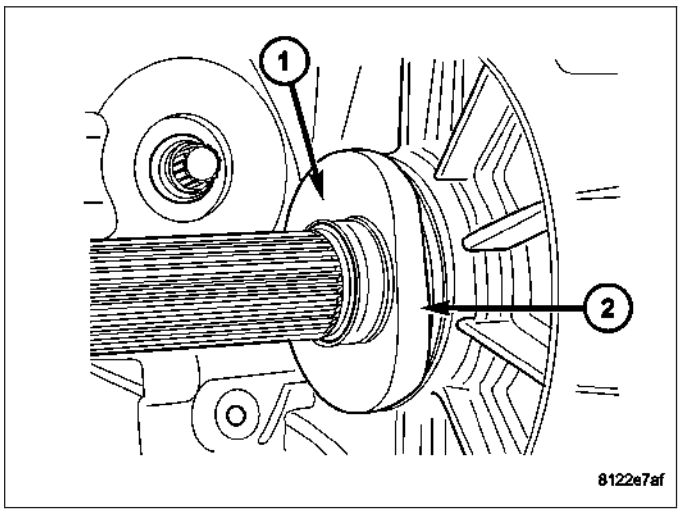
1. Remove the front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).
2. Remove the front propeller shaft seal boot retaining clamp (2).



3. Remove the front propeller shaft seal boot (1) from the front output shaft seal slinger.



4. Remove the front output shaft seal slinger (1) by bending the slinger away (2) from the transfer case.
5. Using a suitable pry tool, remove the slinger from the output shaft using care not to damage the shaft.
6. Using a screw and a slide hammer, remove the front output shaft seal.



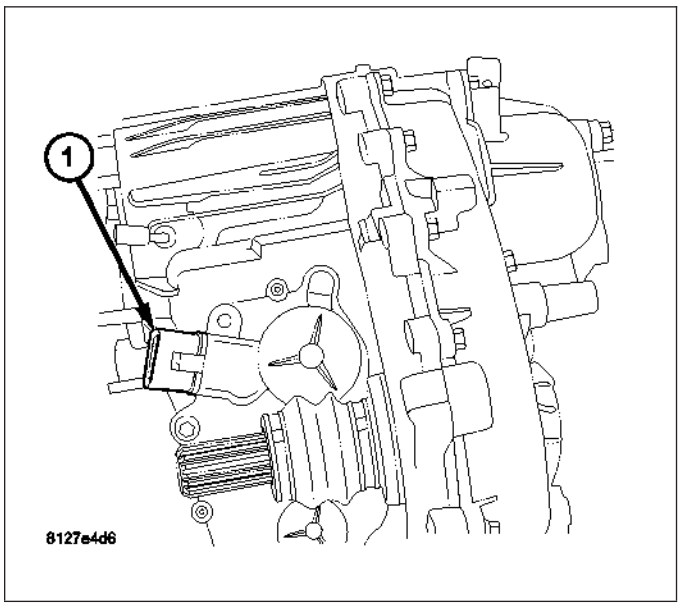
INSTALLATION

1. Install the new front output shaft seal with Installer MB991168A.
2. Install the front output shaft seal slinger with Installer 8840. Install the slinger onto the shaft until the tool contacts the rear of the output shaft.
3. Install a new seal boot clamp onto the seal boot.
4. Install the seal boot and clamp onto the slinger hub and tighten the clamp with Crimp Tool C-4975-A.
5. Install front propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

SENSOR-MODE

DESCRIPTION

The transfer case mode sensor (1) provides the Front Control Module (FCM) feedback about the position of the transfer case. The sensor consists of a linear analog position sensor that converts the motor output shaft position into a DC signal. The sensor may rotate a full 360 degrees for both the NV144 and the NV244 GENII. The operating envelope or sector rotation is -5 to 180 degrees for the NV144 and -40 to 20 degrees for the NV244 GENII. The FCM must supply 5VDC (+/- 0.5v) to the sensor whenever the FCM is not in sleep mode and monitor the shift motor position. The sensor position is monitored when the ignition is in the RUN position and for 10 seconds after the ignition is shifted to the OFF position. The sensor is mechanically linked to the shaft of the cam which allows the transfer case to shift. The mode sensor will draw less than 20 mA of current during operation.



OPERATION

During normal vehicle operation, the Front Control Module (FCM) monitors the mode sensor outputs at least every 2 milliseconds when the shift motor is stationary or active.

Refer to SECTOR ANGLES vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode.

SECTOR ANGLES vs. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
+20	4LO
0	N
-20	AWD
-40	4LOCK

NOTE: All the parameter voltages referred to in the following information are calibrated items in the controller software and are subject to change.

NOTE: For a further explanation of Phase 1 through 3 shifting, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION).

The following information describes the different mode sensor positions:

- 4LO TARGET REGION - The position shall be considered 4LO if the voltage is greater than or equal to encoder_4LO_min Volts and it is also less than or equal to encoder_4LO_max Volts.
- 4LO SHIFT LIMIT - During Phase 2 and Phase 3 shifting, shifts may become unidirectional when a voltage is less than or equal to encoder_4LO_min Volts has been reached.
- 4LOCK TARGET REGION - The position shall be considered 4LOCK if the voltage is greater than or equal to encoder_4LOCK_min Volts and it is also less than or equal to encoder_4LOCK_max Volts.
- NEUTRAL TARGET REGION - The position shall be considered NEUTRAL if the voltage is greater than or equal to encoder_Neutral_min Volts and it is also less than or equal to encoder_Neutral_max Volts.
- AWD TARGET REGION - The position shall be considered AWD if the voltage is greater than or equal to encoder_AWD_min Volts and it is also less than or equal to encoder_AWD_max Volts.
- AWD SHIFT LIMIT - During Phase 2 and Phase 3 shifting, shifts may become unidirectional when a voltage is greater than or equal to encoder_AWD_min Volts has been reached.

The mode sensor position will be considered invalid by the FCM if the voltage is greater than or equal to encoder-_High_Range_Limit Volts or if it is less than or equal to encoder_Low_Range_Limit Volts.

Refer to MODE SENSOR VOLTAGES - NV244 GENII table for the mode sensor voltages.

MODE SENSOR VOLTAGES - NV244 GENII

Parameter Name	Voltage
encoder_4LOCK_Min	4.26
encoder_4LOCK_Max	4.36
encoder_AWD_Min	3.36
encoder_AWD_Max	3.44
encoder_Neutral_Min	2.45
encoder_Neutral_Max	2.54
encoder_4LO _Min	1.48
encoder_4LO _Max	1.57
encoder_High_Range_Limit	4.51
encoder_Low_Range _Limit	0.50

SWITCH-TRANSFER CASE SELECTOR

DESCRIPTION

The selector switch assembly is mounted in the right side of the vehicle's Instrument Panel (IP) and consists of a rotary knob connected to a resistive network for the mode and range shift selections. Also located in this assembly is a recessed, normally open momentary switch for making shifts into and out of transfer case NEUTRAL. A pen, or similar instrument, is used to make a NEUTRAL shift selection, thus reducing the likelihood of an inadvertent shift request.

OPERATION

As the position of the selector switch varies, the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output will vary. Hardware, software, and calibrations within the Front Control Module (FCM) are provided that interpret the selector switch resistance as given in the table below: SELECTOR SWITCH INTERPRETATION

SELECTOR SWITCH INTERPRETATION

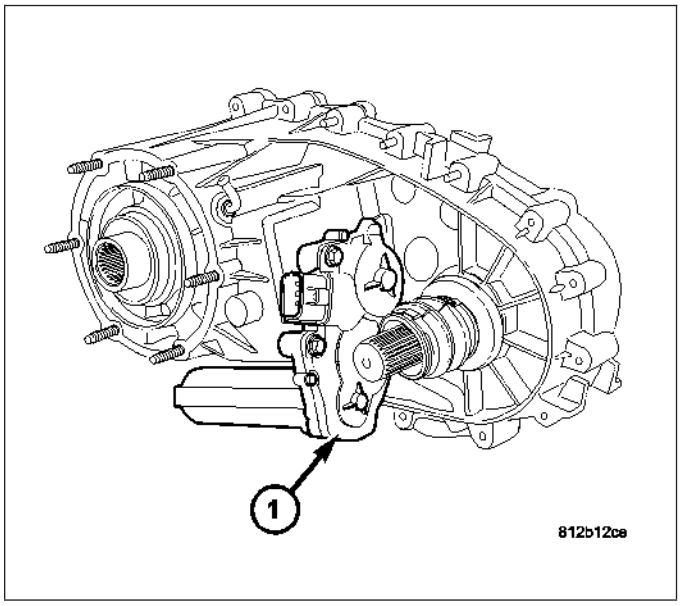
Required Interpretation	Resistance Range (ohms)
Shorted	<150
AWD+NEUTRAL	176-200
4LOCK+NEUTRAL	190-216
4LO+NEUTRAL	199-226
AWD (Default)	1159-1287
4LOCK	2259-2503
4LO	4820-5334
Open/Diagnostic	>19K

The internal structure and function of the selector switch is such that the connection is made to the Open/Diagnostic resistor before the connection to the individual position resistors is broken. Because of this characteristic, if the resistance between the Mode Sensor supply voltage pin and the Mode Sensor output pin is >19k ohms, the position resistor is open.

ASSEMBLY-SHIFT MOTOR/MODE SENSOR

DESCRIPTION

The shift motor (1) is an electromechanical device consisting of a DC permanent magnet motor, gear train, and an analog position sensor. The shift motors' overall function is to move and lock a gear that moves the mode and range forks found in the transfer case. This allows the transfer case to be shifted electrically to multiple operating positions (4LOCK, AWD, N (neutral), and 4LO). The operating current of the shift motor under stall conditions is 30 amps maximum at 72° F with 13.5 volts, at the motor leads.



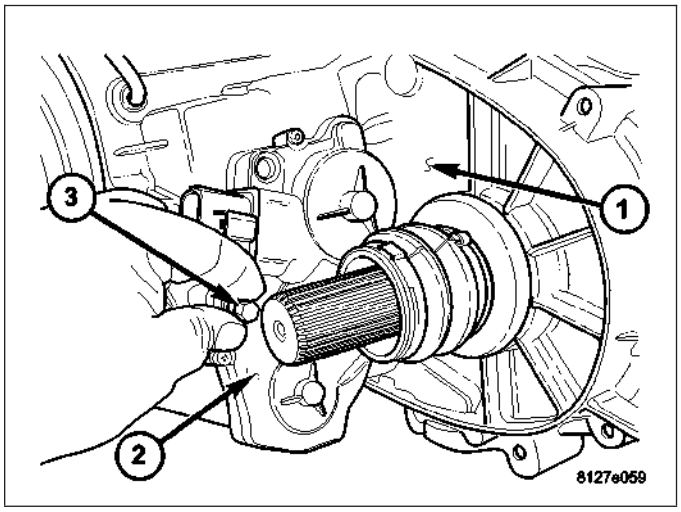
OPERATION

Shifting in the transfer case occurs when a Pulse Width Modulated (PWM) voltage is supplied to the shift motor by the Front Control Module (FCM). A linear analog position sensor located inside the shift motor, provides the FCM with the motors' angular, rotational position. With this information, the FCM continuously knows the motors' position, and therefore allows it to accurately control the motors' operation, including voltage polarity which is used to control motor direction.

REMOVAL

NOTE: New shift motor assemblies are shipped in the AWD position. If a new shift motor assembly must be installed, it will be necessary to shift the transfer case to the AWD position prior to motor installation.

1. Raise the vehicle on a suitable hoist.
2. Disengage the wiring connector from the shift motor and mode sensor assembly.
3. Remove the bolts (3) holding the shift motor and mode sensor assembly (2) onto the transfer case (1).
4. Separate the shift motor and mode sensor assembly (2) from the transfer case (1).

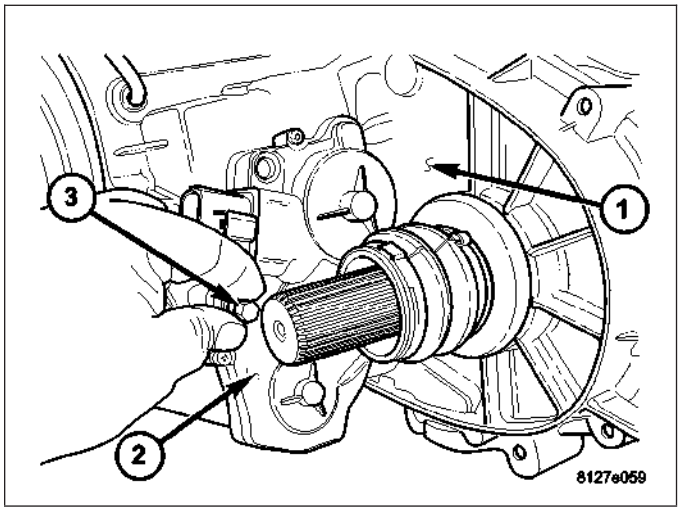


INSTALLATION

1. Verify that the shift motor o-ring is clean and properly positioned inside the machined o-ring groove of the shift motor.
2. Add high temperature grease between the actuator and the transfer case mating surface for sealing purposes.

NOTE: Verify that the shift motor position and sector shaft orientation are aligned. It may be necessary to manually shift the transfer case if the shift motor and sector shaft are not aligned.

3. Position the shift motor and mode sensor assembly (2) onto the transfer case (1).
4. Install the bolts (3) to hold the assembly (2) onto the transfer case (1). Tighten the bolts to 16-24 N·m (12-18 ft.lbs.).



CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

5. Engage the wiring connector to the shift motor and mode sensor assembly.
6. Refill the transfer case as necessary.
7. Lower vehicle and verify transfer case operation.

TIRES/WHEELS

DIAGNOSIS AND TESTING

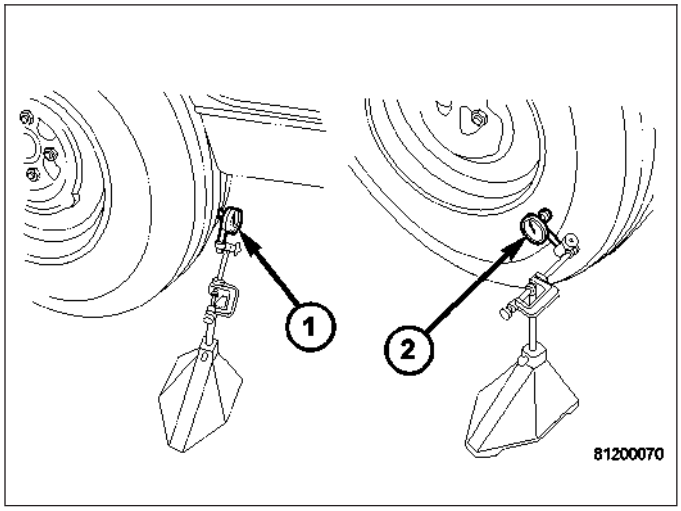
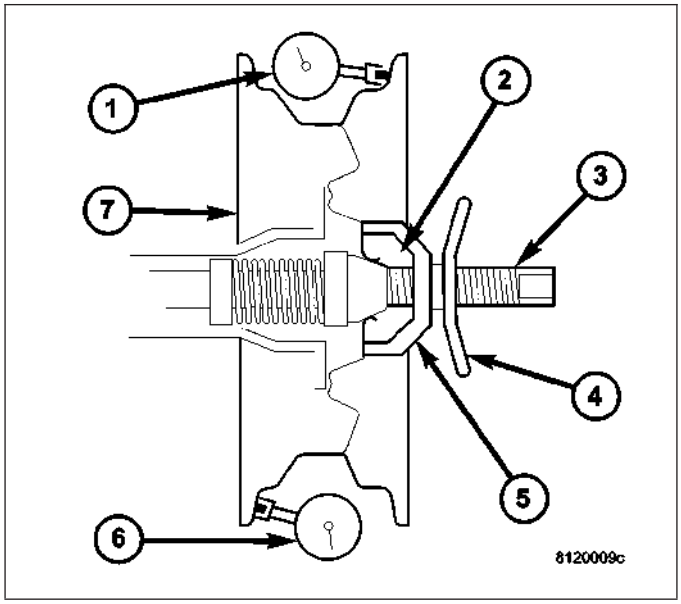
TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel.



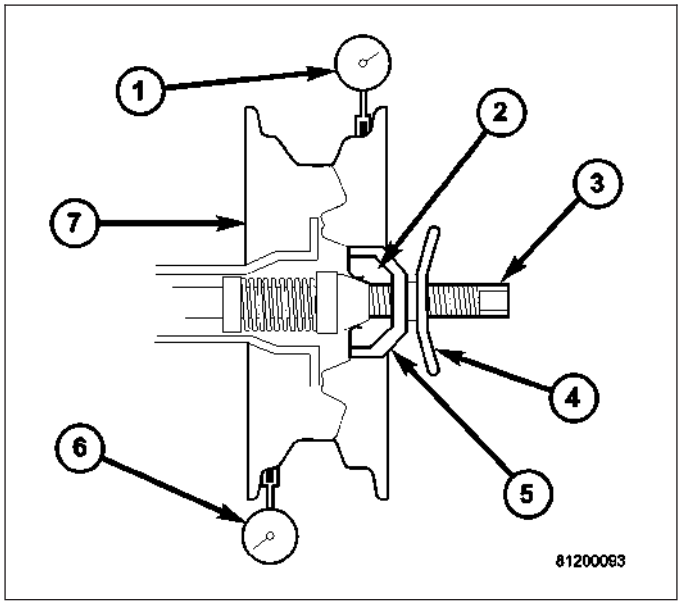
Lateral runout is the **wobble** of the tire or wheel.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.



Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).



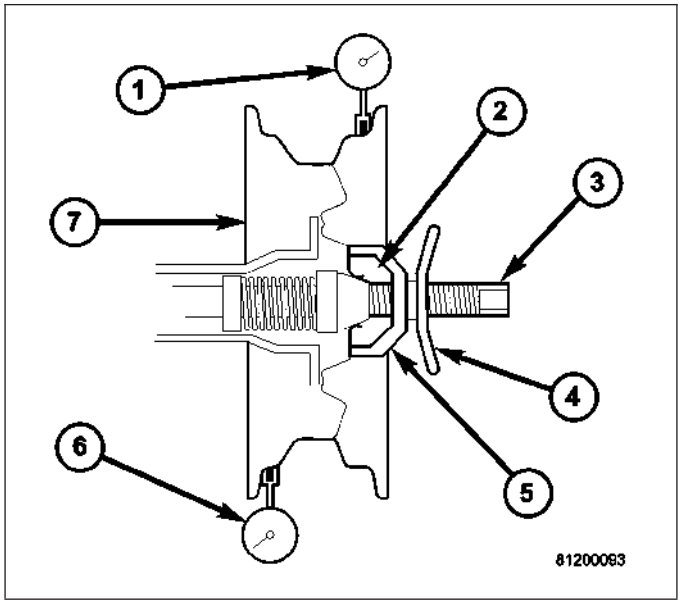
METHOD 1 (RELOCATE WHEEL ON HUB)

1. Drive vehicle a short distance to eliminate tire flat spotting from a parked position.
2. Check wheel bearings and adjust if adjustable or replace if necessary.
3. Check the wheel mounting surface.
4. Relocate wheel on the mounting, two studs over from the original position.
5. Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.
6. Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

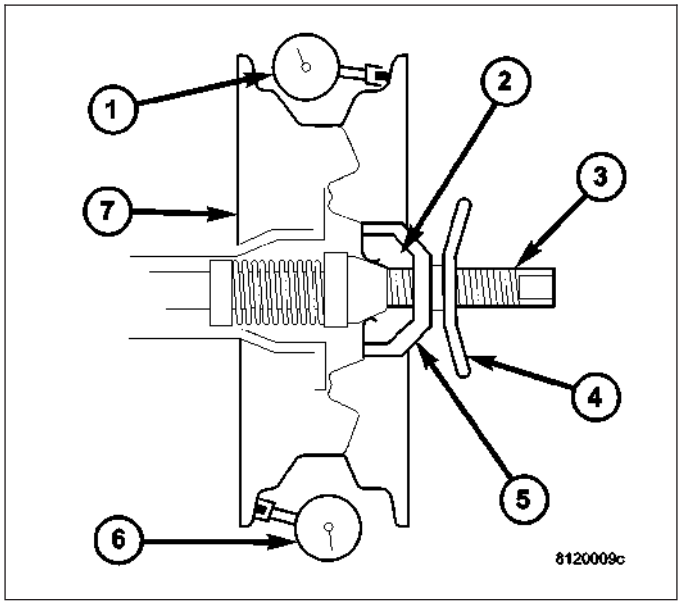
METHOD 2 (RELOCATE TIRE ON WHEEL)

Note: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

1. Remove tire from wheel and mount wheel on service dynamic balance machine.
2. Check the wheel radial runout.



3. Check the wheel lateral runout.
   - STEEL WHEELS: Radial runout 0.031 in., Lateral runout 0.031 in. (maximum)
   - ALUMINUM WHEELS: Radial runout 0.02 in., Lateral runout 0.025 in. (maximum)
4. If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout.



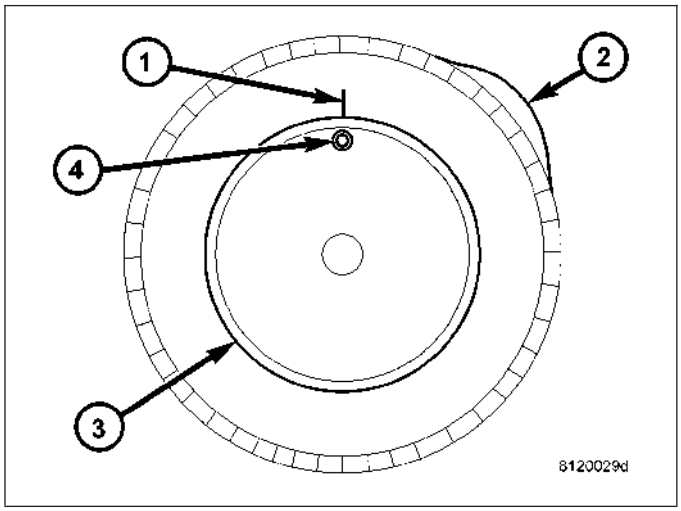
STANDARD PROCEDURE

MATCH MOUNTING

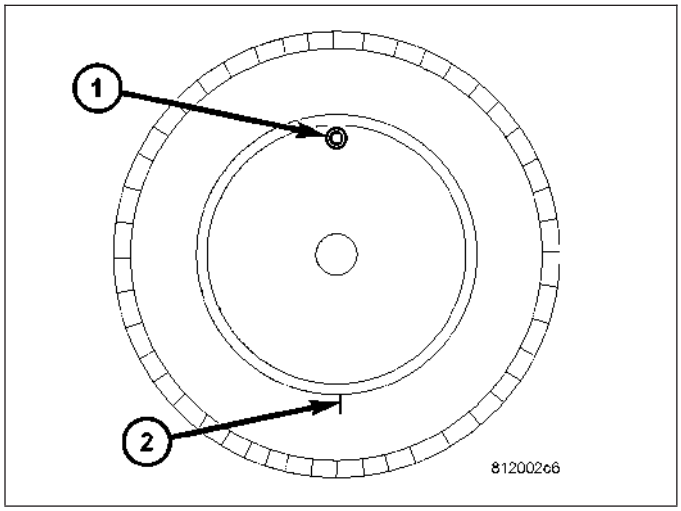
Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the outboard flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

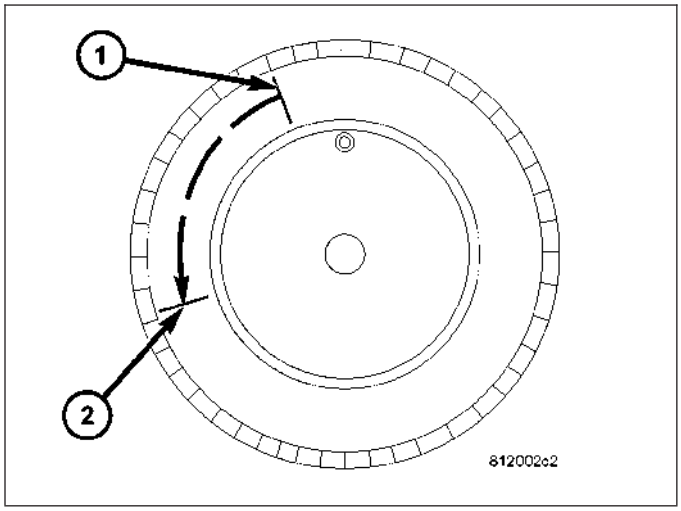
1. Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.
2. Measure the total runout on the center of the tire tread rib (3) with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot (2). Place a mark on the tire at the valve stem (4) location (1).



3. Break down the tire and remount it 180 degrees on the rim (1)(2).
4. Measure the total indicator runout again. Mark the tire to indicate the high spot.



5. If runout is still excessive, the following procedures must be done.
   - If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
   - If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
   - If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot (1) to first (2). Break down the tire and remount it 90 degrees on rim in that direction. This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

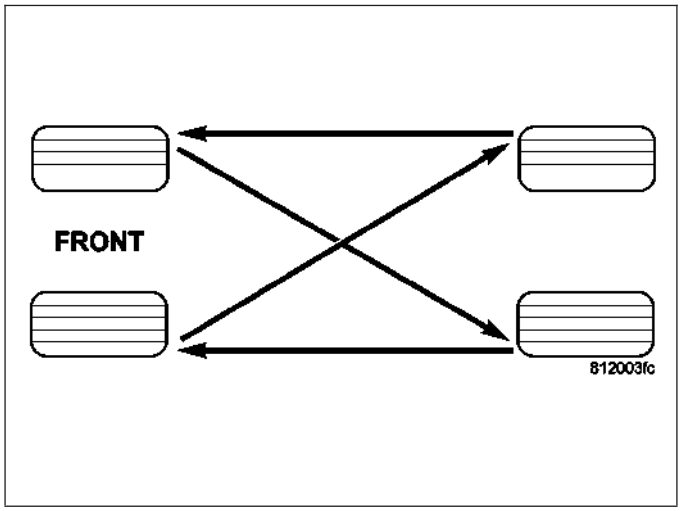


ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.



TIRE AND WHEEL BALANCE

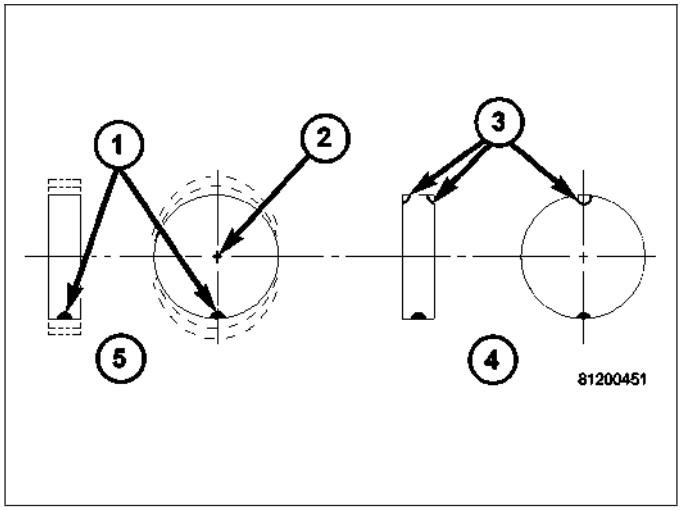
It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

Note: Static should be used only when a two plane balancer is not available.

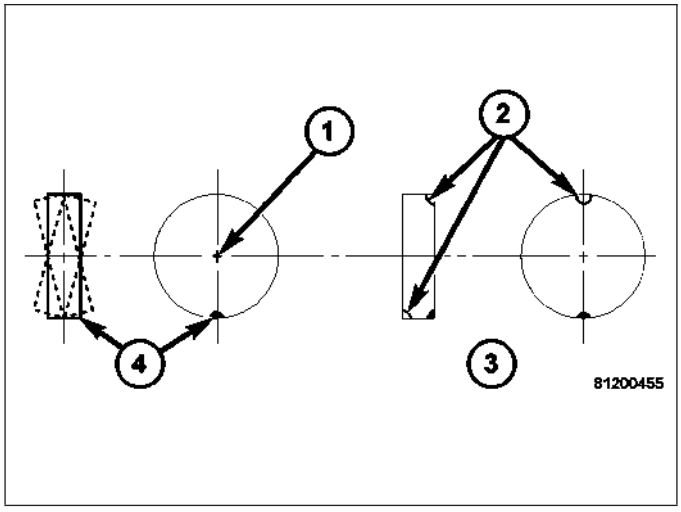
Note: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot (1) causing the imbalance (5). Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance (4). Place half of this weight on the **inner** rim flange (3) and the other half on the **outer** rim flange (3).



For dynamic balancing (3), the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (2).



TIRES

DESCRIPTION

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

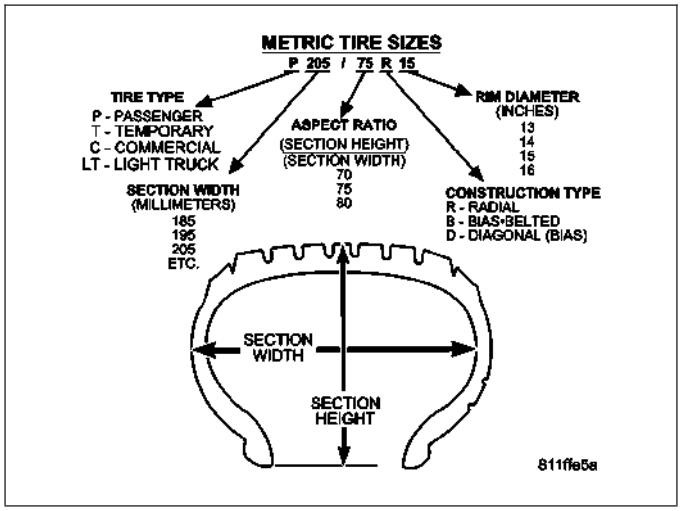
Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.



Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S, M & S or M–S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

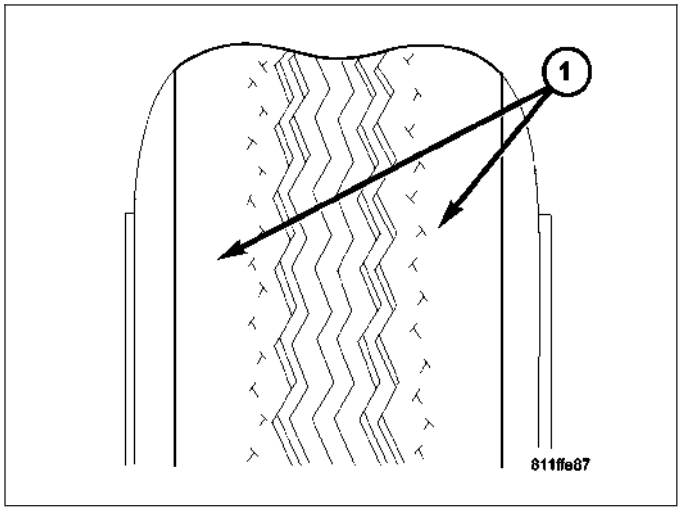
The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

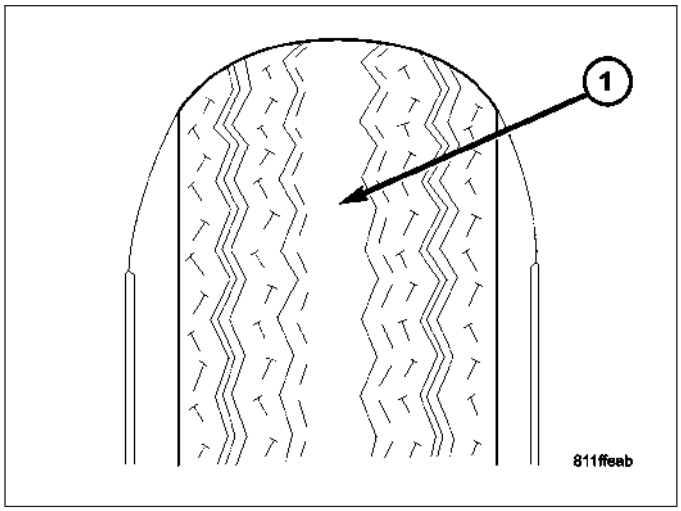
TIRE INFLATION PRESSURES

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation will cause rapid shoulder wear (1), tire flexing, and possible tire failure.



Over inflation will cause rapid center wear (1) and loss of the tire's ability to cushion shocks.



Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the vehicles Owners Manual.

TIRE PRESSURE FOR HIGH SPEED

Refer to the Vehicles Owners Manual package.

SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire, It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DIAGNOSIS AND TESTING

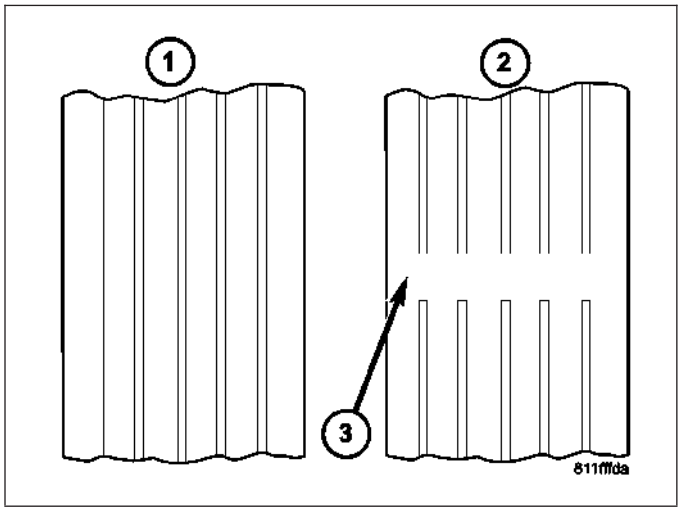
PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TREAD WEAR INDICATORS

Tread wear indicators (3) are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators (3) will appear as a 13 mm (1/2 in.) band.

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.



TIRE WEAR PATTERNS

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT	1. 2.						
CAUSE	UNDER-INFLATION OR LACK OF ROTATION	OVER-INFLATION OR LACK OF ROTATION	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER	INCORRECT TOE	UNBALANCED WHEEL OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	ROTATE TIRES AND INSPECT SUSPENSION SEE GROUP 2

* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

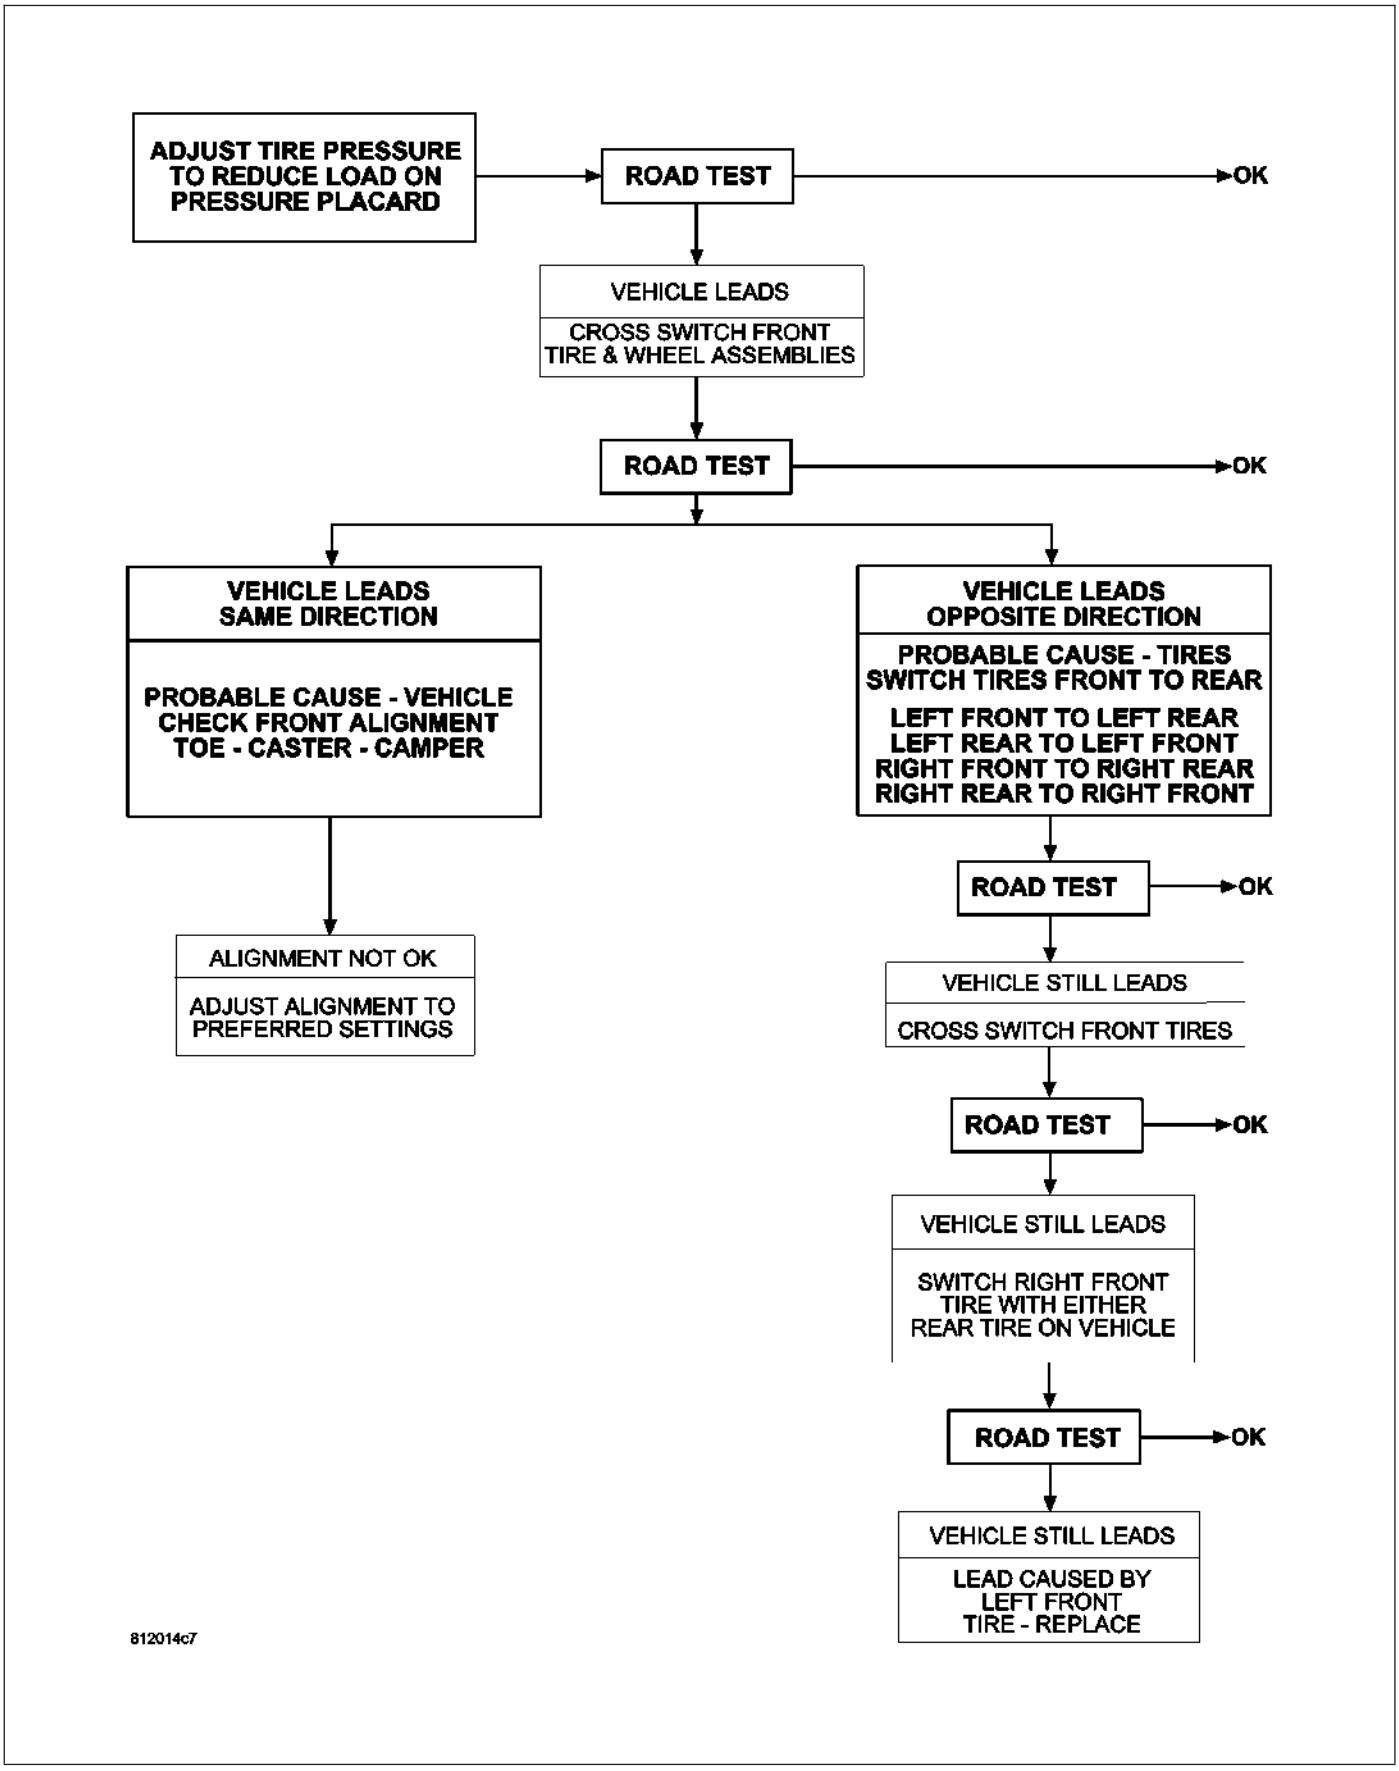
Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TIRE/VEHICLE LEAD



Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

STANDARD PROCEDURE

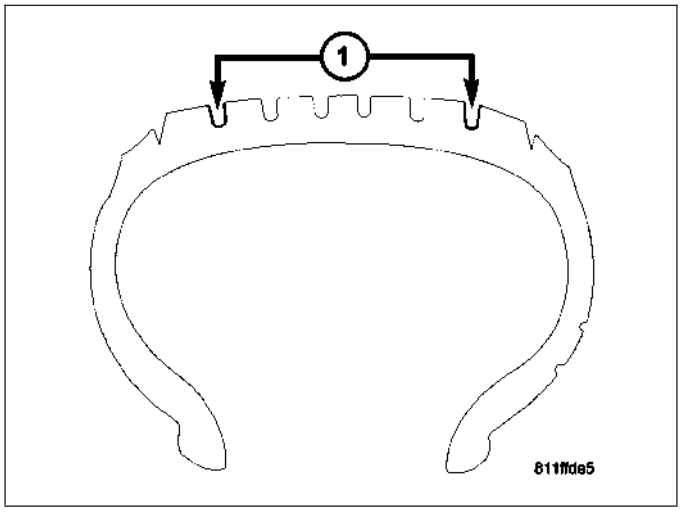
TIRE REPAIR AREA

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.



CLEANING

TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

Note: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

SPECIFICATIONS

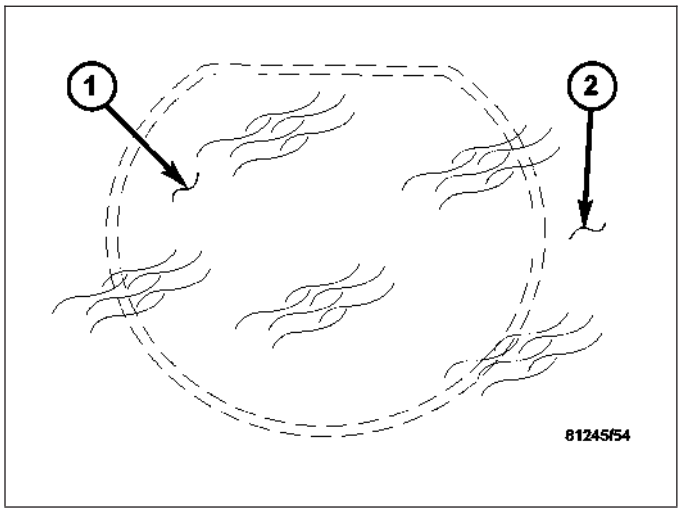
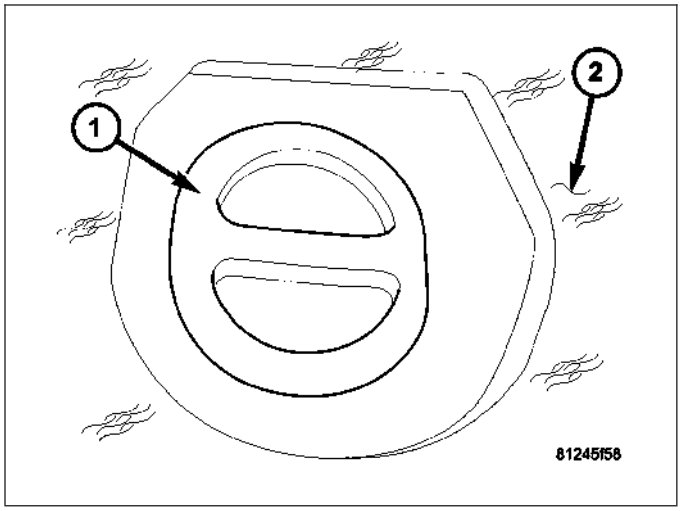
SPARE TIRE WINCH

REMOVAL

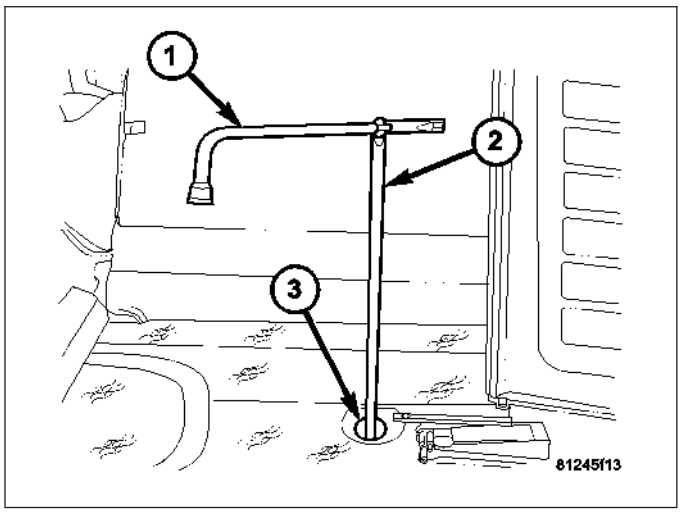
1. Pull up on the hole (1) cut in the carpet (2) to access the spare tire winch cover.



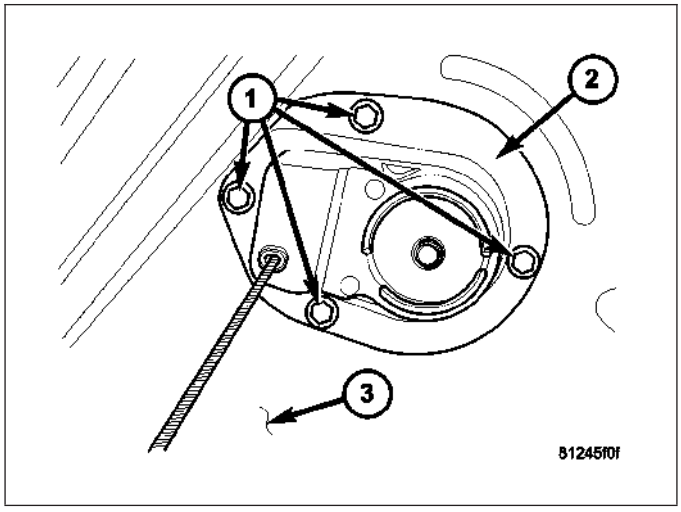
2. Remove the spare tire winch cover (1).



3. Install the jack handle (2) and lug wrench (1) to the spare tire winch (3) to loosen the spare tire to the ground.

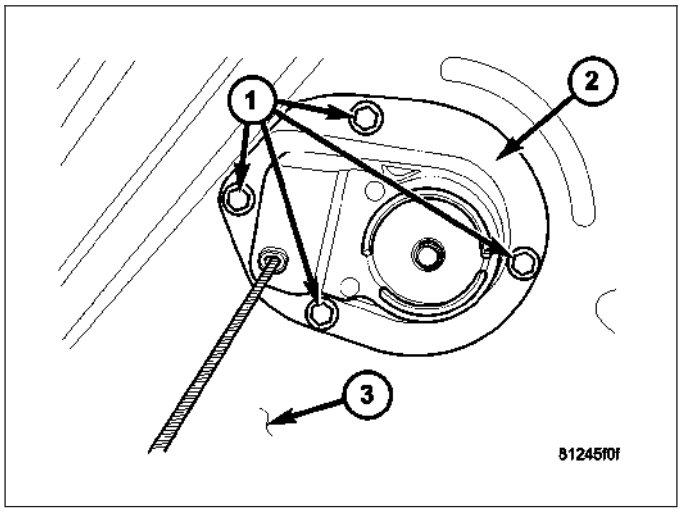


4. Remove spare tire.
5. Remove 4 bolts (1) attaching spare tire winch (2) to body (3).
6. Separate spare tire winch from vehicle.

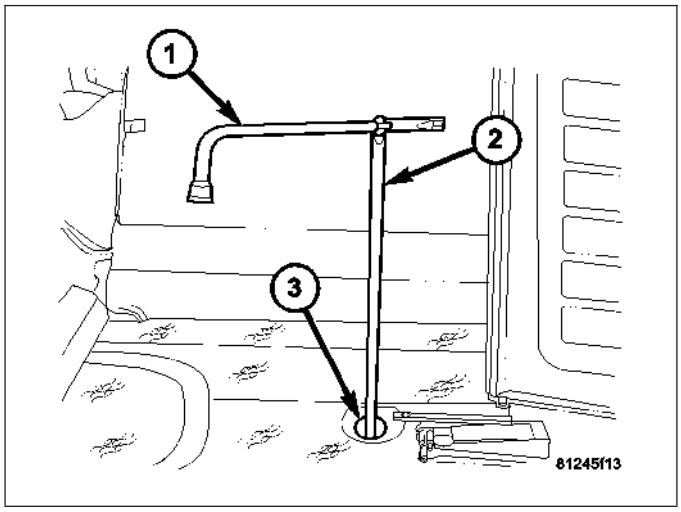


INSTALLATION

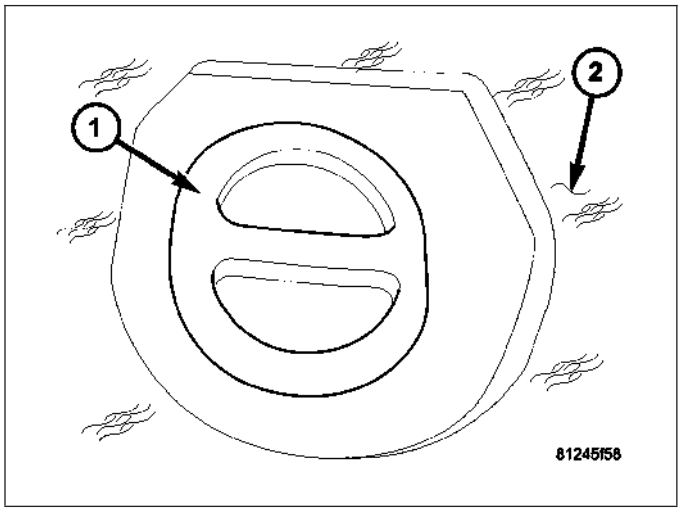
1. Position spare tire winch (2) on the vehicle.
2. Install and tighten 4 bolts (1) attaching the spare tire winch to body (3).
3. Install spare tire.



4. Tighten the spare tire up to the vehicle.
5. Remove the jack handle (2) and lug wrench (1).



6. Install the spare tire winch cover (1) and reseat the carpet access hole.



WHEELS

DESCRIPTION

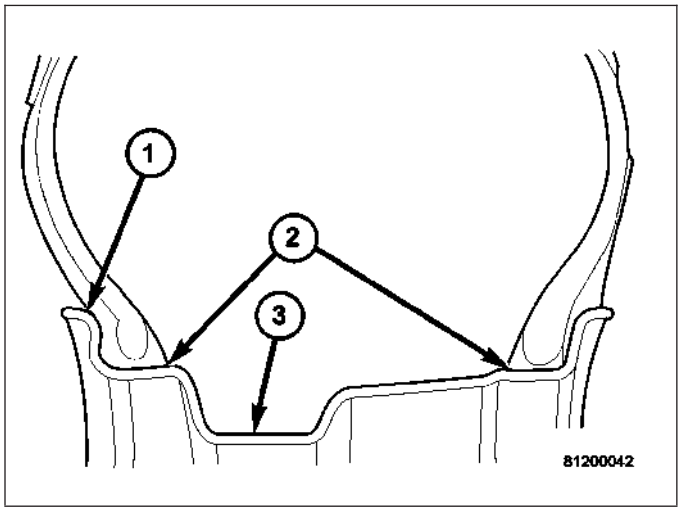
WHEEL DESIGN

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges (1) and rim drop well (3) called safety humps.

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.



DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

Note: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

STANDARD PROCEDURE

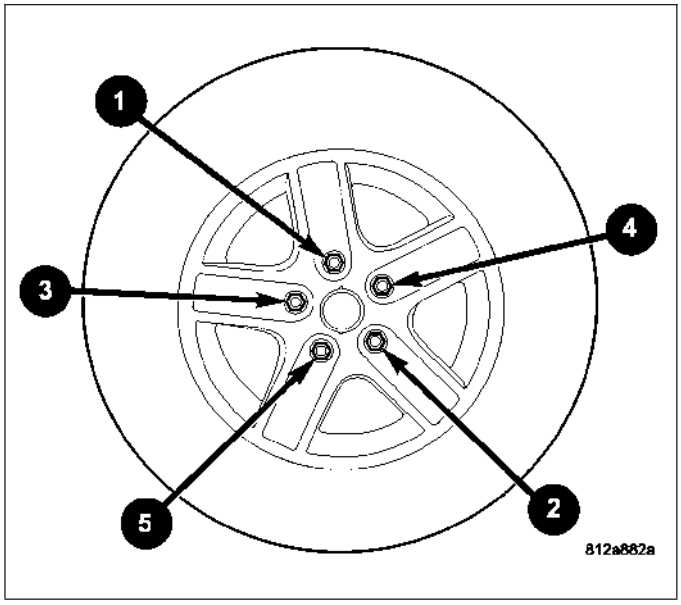
WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

Note: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**



WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

Note: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

SPECIFICATIONS

CAUTION: DO NOT USE CHROME PLATED LUG NUTS WITH CHROME PLATED WHEELS.

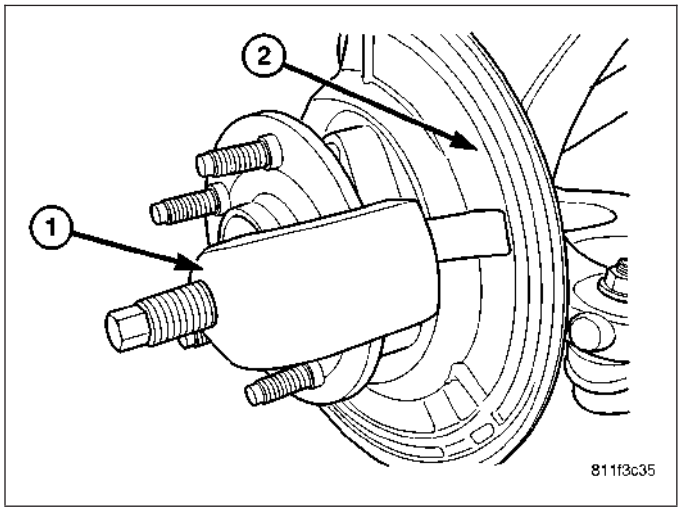
TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Wheel Lug Nut	183 ± 10	135 ± 10	—

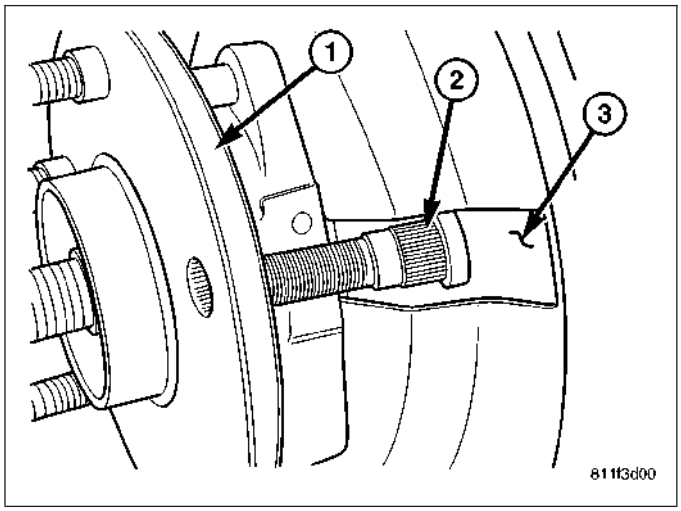
STUDS

REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove the wheel speed sensor from the hub.
5. Press the stud from the hub using special tool C-4150A (1).

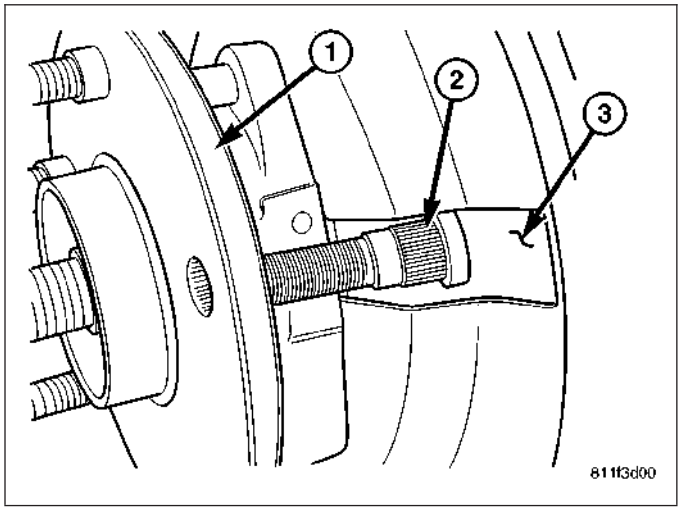


6. Remove the stud (2) from the hub (1) through the backing plate access hole (3).



INSTALLATION

1. Install the new stud (2) into the hub flange (1).
2. Install three proper sized washers onto the stud, then install lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ ROTORS - INSTALLATION).



6. Install the wheel speed sensor.
7. Install the wheel and tire assembly, use new lug nut on the stud or studs that were replaced.
8. Remove the support and lower the vehicle.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: Use an osha approved breathing filter when spraying paint or solvents in a confined area. Personal injury can result.

- **Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.**
- **Do not stand under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

- **Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **Always have a fire extinguisher ready for use when welding.**
- **Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.**
- **Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage

compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

1. When necessary, lubricate the operating mechanisms with the specified lubricants.
2. Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.
3. Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.
4. The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.
5. The door lock cylinders should be lubricated twice each year (preferably autumn and spring).
   - Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
   - Apply a small amount to the key and insert it into the lock cylinder.
   - Rotate it to the locked position and then back to the unlocked position several times.
   - Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.

a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.

4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

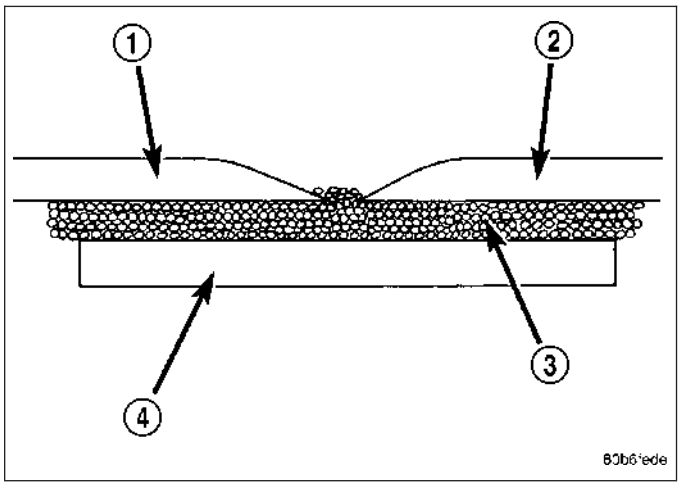
- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	″A″ PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, ″M″, PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/ POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/ PROPROPYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/ PROPROPYLENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	-
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLON, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

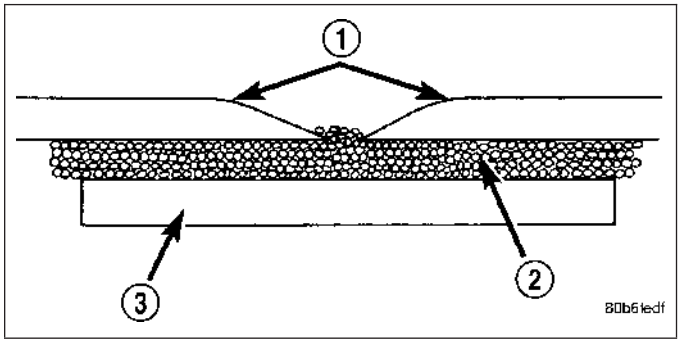
PANEL SECTIONING



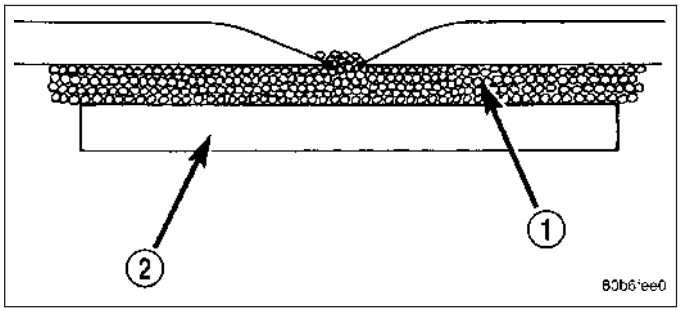
If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be “V’d” at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

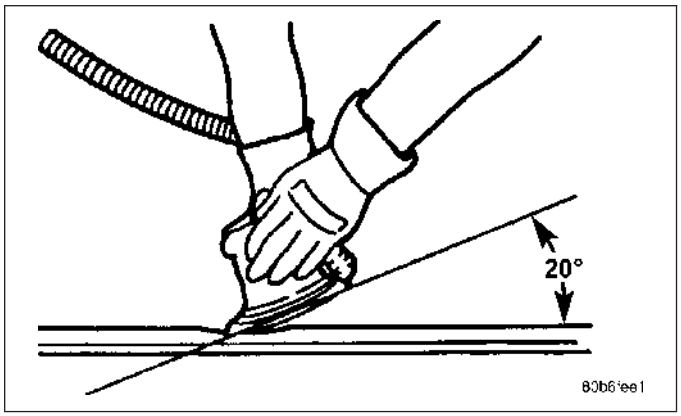


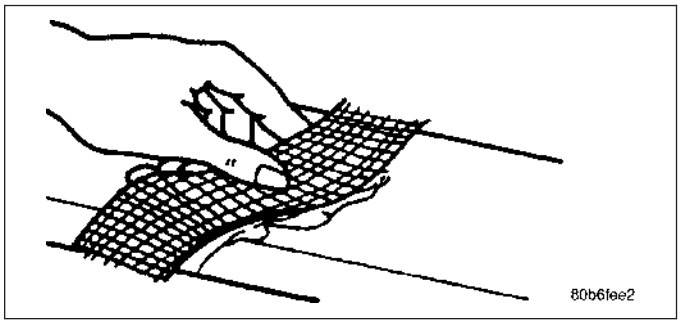
Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.



Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first “V’d” out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.



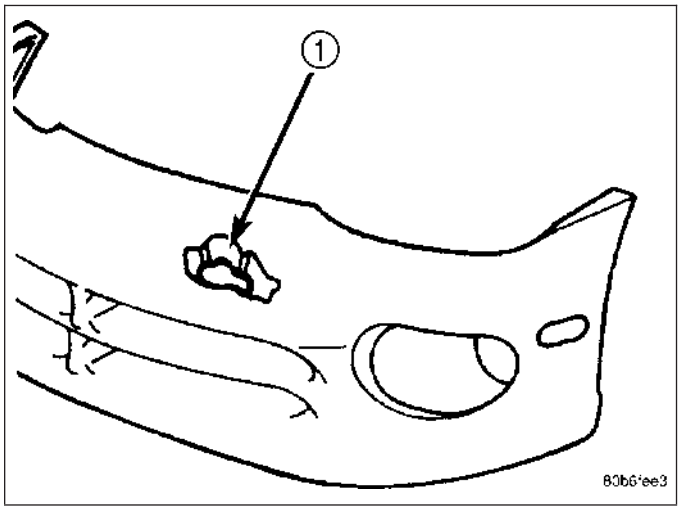


- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

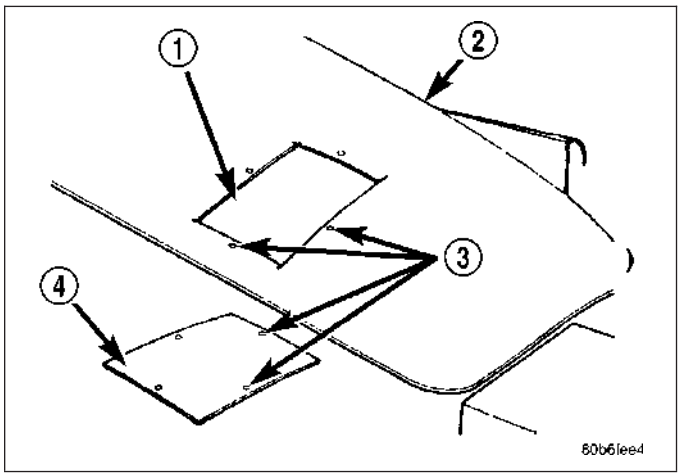


PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

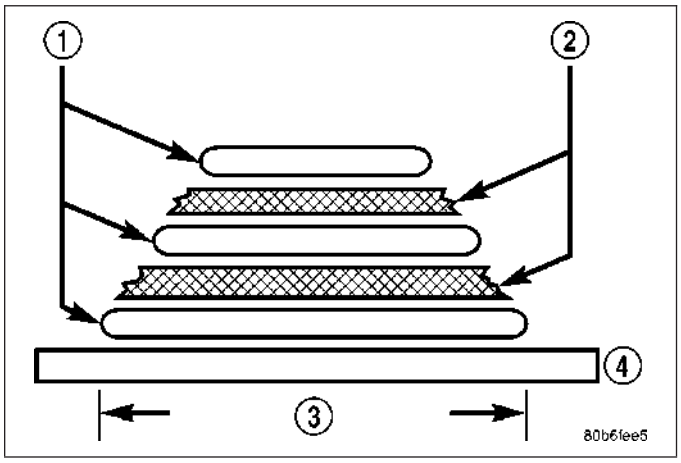
PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.



PANEL PATCH FABRICATIONS

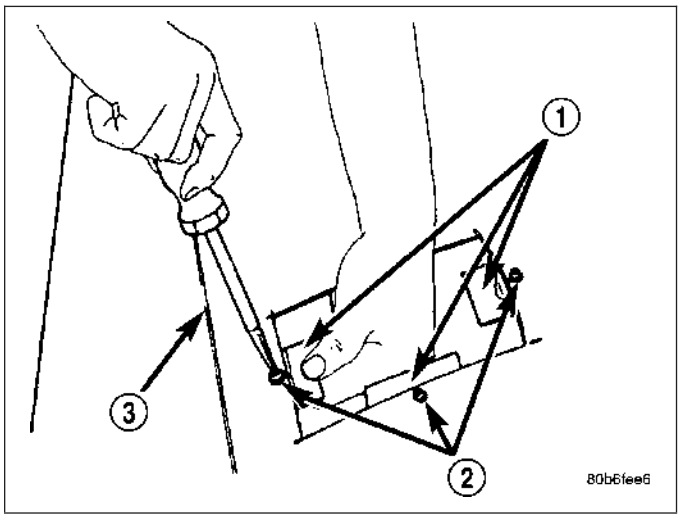
A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:



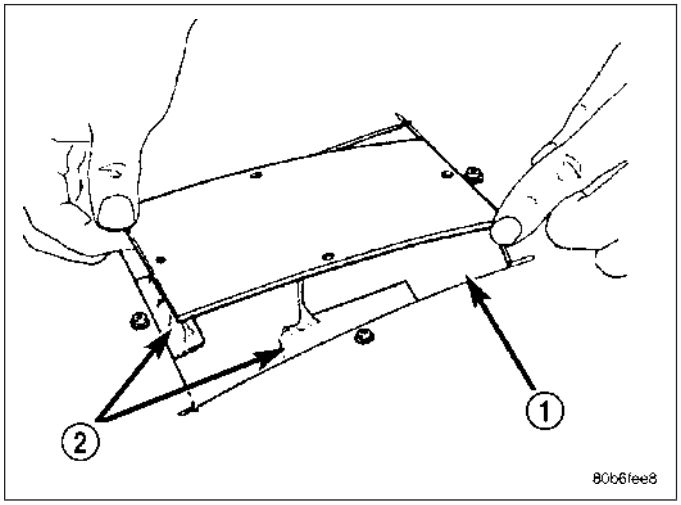
1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

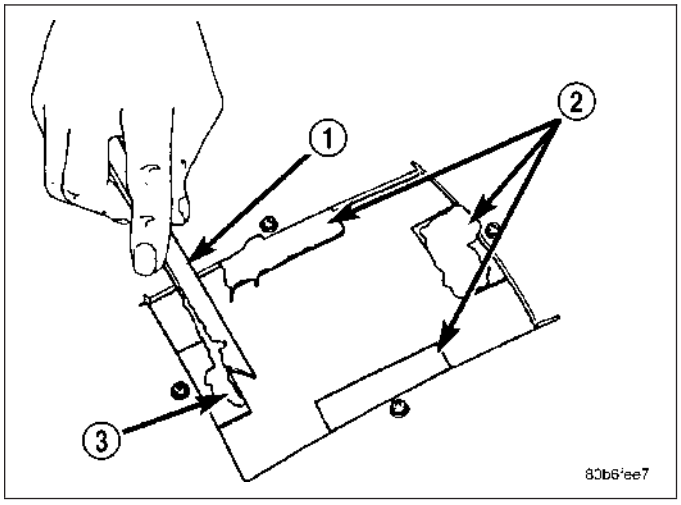
1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.



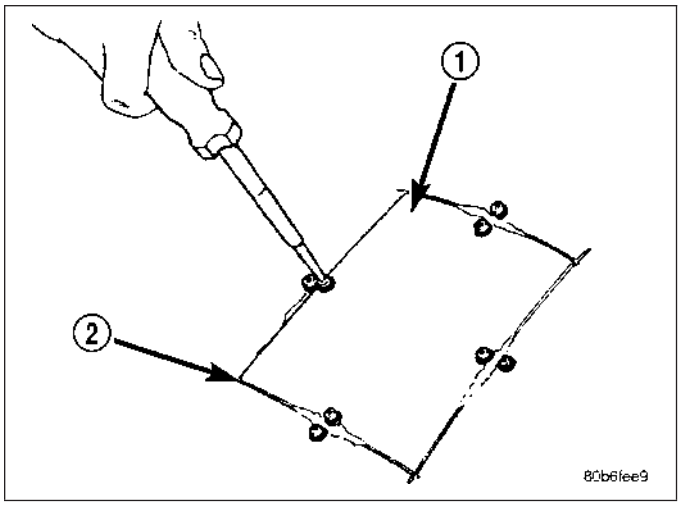
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.



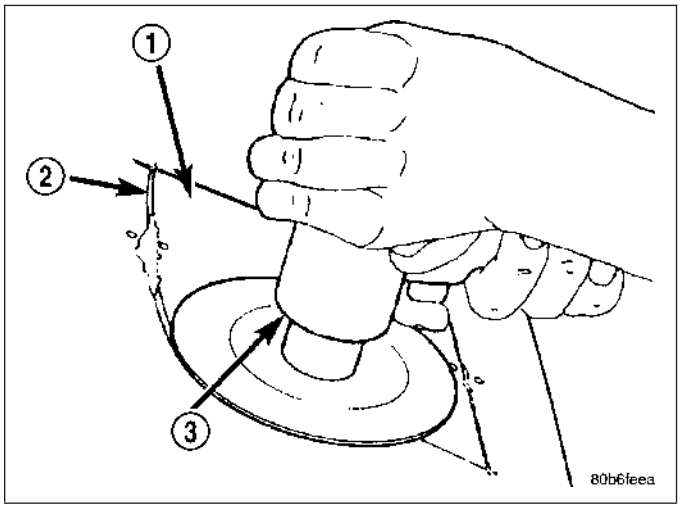
14. Apply a coat of adhesive to the exposed ends of the support squares.



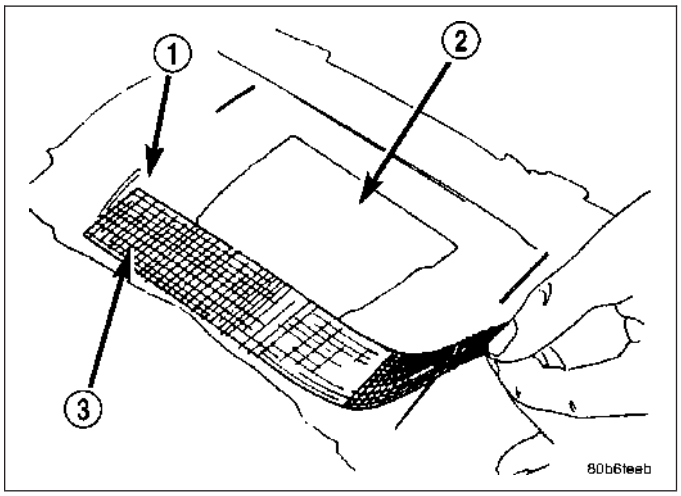
15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.



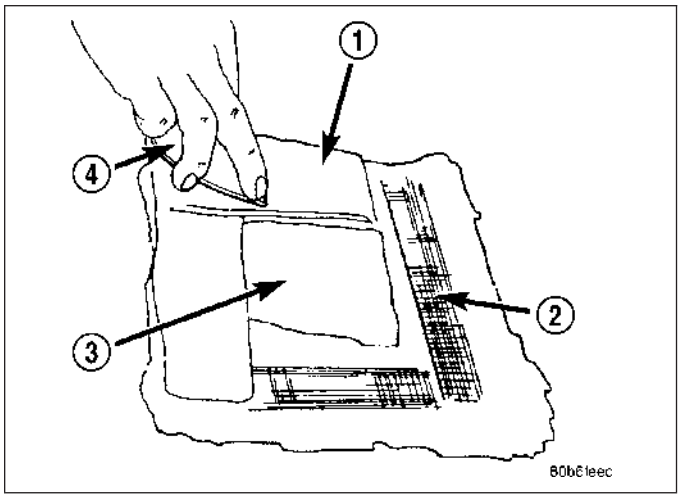
17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.



18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.



20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.



PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the Buzz, Squeak & Rattle Kit table for material contents and usage.

Buzz, Squeak & Rattle Kit

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 225° Fahrenheit (-40° to 107° Celsius)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 180° Fahrenheit (-40° to 82° Celsius)

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut busings, sway bars.	-40° to 390° Fahrenheit (-40° to 200° Celsius)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-30° to 400° Fahrenheit (-34° to 205° Celsius)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-30° to 400° Fahrenheit (-34° to 205° Celsius)

HINGE

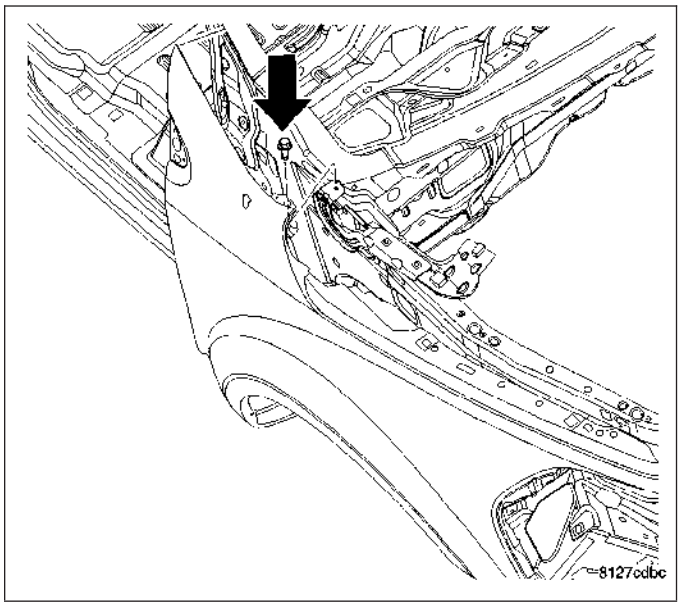
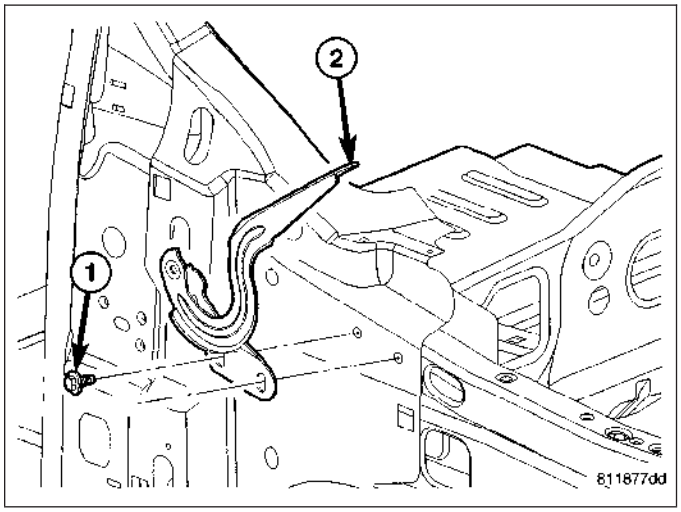
REMOVAL

NOTE: It is not necessary to remove the hood to replace one or both hinges. The hinges can be replaced one at a time.

1. Open hood and support the side that requires hinge replacement.
2. Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - REMOVAL)
3. Mark all bolt and hinge attachment locations using a grease pencil or equivalent, to provide reference marks for installation.
4. Remove the fender support bolt.

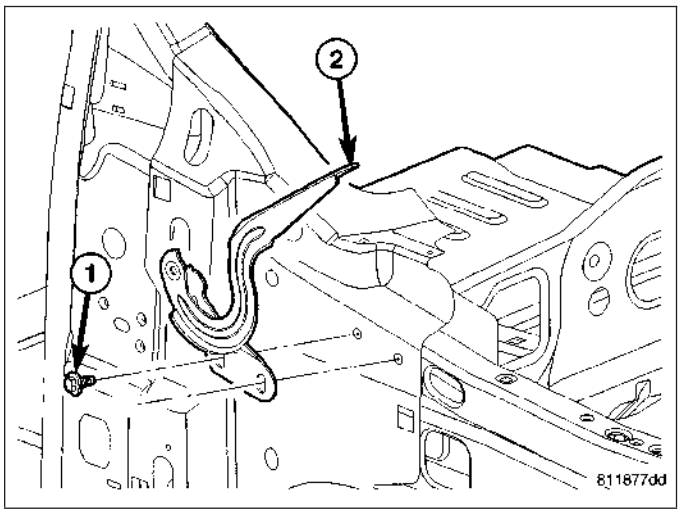


5. Remove the plastic rivets and remove the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
6. Remove the nuts attaching the hinge to the hood.
7. From inside the fender, remove the two hinge bolts (1).
8. Slide the hinge (2) forward and remove from the fender rail.

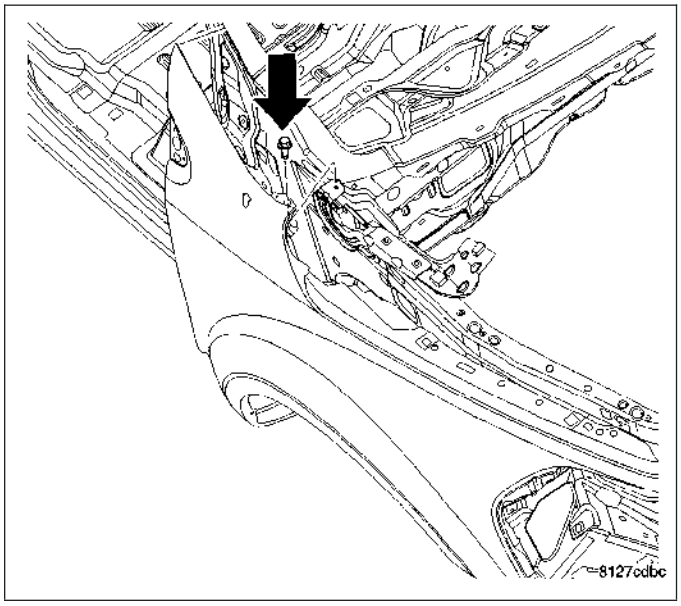


INSTALLATION

1. Install the hinge (2), slide back into position on the fender rail and align all marks.
2. From inside the fender, install the two hinge bolts (1).
3. Tighten the rear bolt to 20 N·m (15 ft. lbs.)
4. Tighten the front bolt to 20 N·m (15 ft. lbs.)



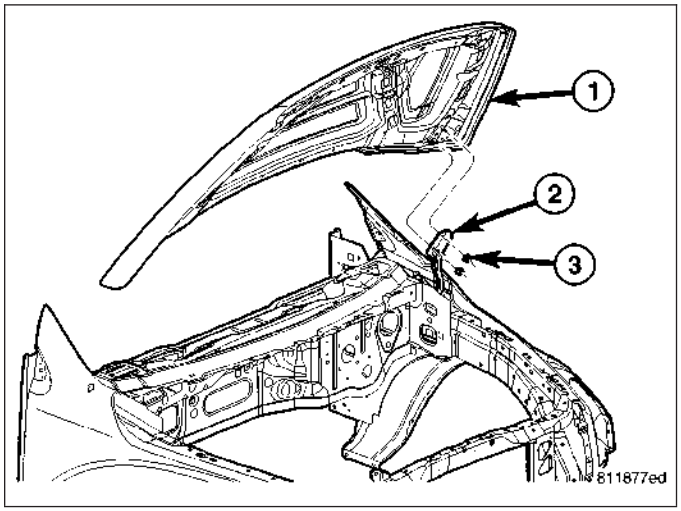
5. Install the nuts attaching the hinge to the hood and tighten the nuts to 23 N·m (17 ft. lbs.)
6. Install the fender support bolt and tighten to 8 N·m (75 in. lbs.).
7. Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - INSTALLATION)
8. Install the wheelhouse splash shield and install the rivets. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
9. Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



HOOD

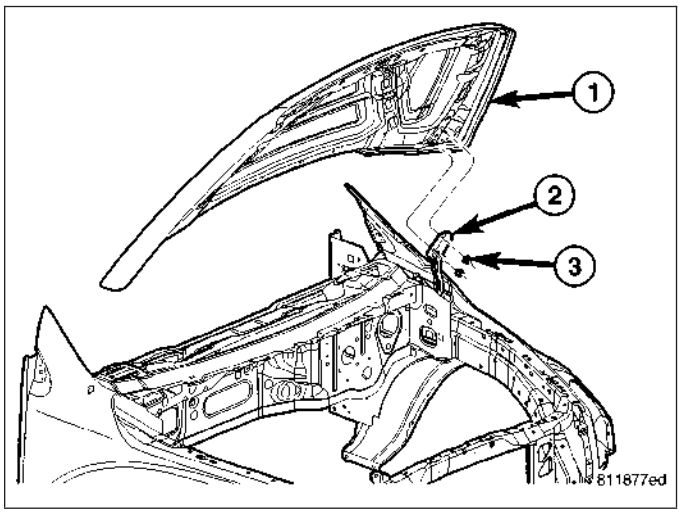
REMOVAL

1. Open hood and disconnect the washer hoses.
2. Mark all nut and hinge attachment locations using a grease pencil or equivalent, to provide reference marks for installation.
3. Remove the top nuts (3) attaching hood to hinge and loosen the bottom nuts (3) until they can be removed by hand.
4. Remove the bottom nuts (3) and separate the hood (1) from the vehicle.



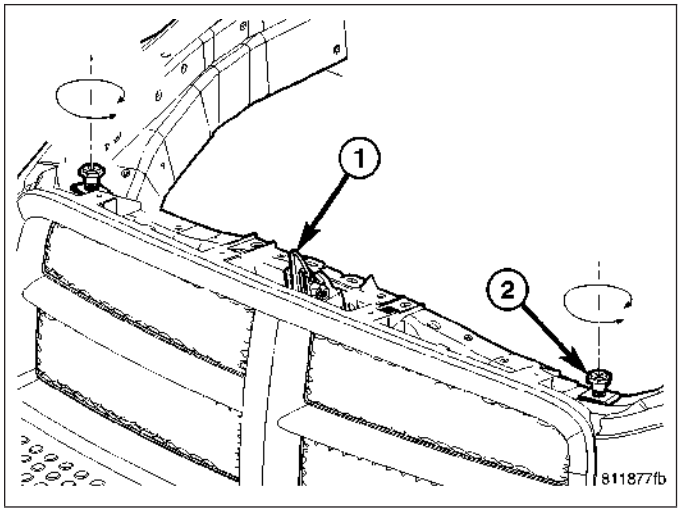
INSTALLATION

1. Position the hood (1) onto the hinges (2).
2. Align all marks and install the nuts.
3. Tighten the nuts too 23 N·m (17 ft. lbs.).
4. Connect the washer hoses.
5. Close hood and adjust as necessary. (Refer to 23 - BODY/HOOD/HOOD - ADJUSTMENTS)



ADJUSTMENTS

NOTE: For gap and flush specifications, (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

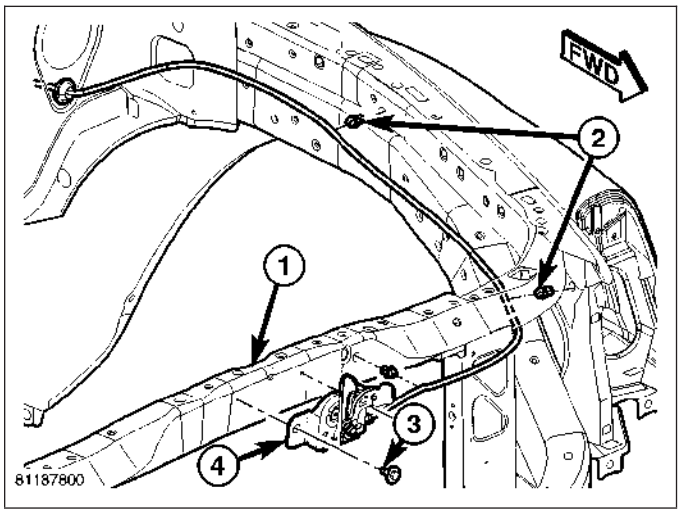


1. If hood is low in relation to cowl panel, loosen the hood to hinge nuts and insert shims between hinge and hood.
2. Adjust hood bumpers (2) in or out to adjust hood-to-fender height alignment.
3. Loosen the hood latch screws.
4. Close the hood and check the fore/aft position of the hood.
5. Loosen the hood to hinge nuts to adjust the fore/aft position.
6. Once the fore/aft position of the hood is correct, tighten the hood to hinge nuts to 23 N·m (17 ft. lbs.).
7. Lower the hood. Inspect clearance between the hood and the cowl cover.
8. Adjust the hood latch as necessary and tighten the bolts to 11 N·m (8 ft. lbs.).
9. Align the latch striker so that striker enters the latch squarely and without binding.

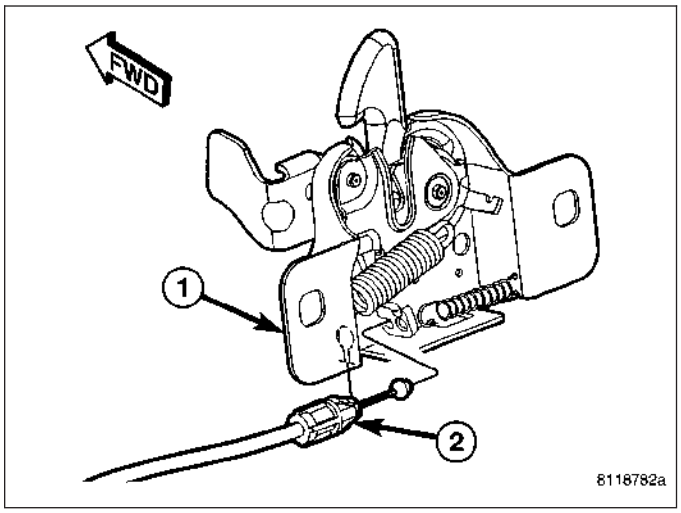
LATCH

REMOVAL

1. Remove the push pin fasteners and remove the upper radiator shroud.
2. Using a grease pencil or equivalent, mark latch position for installation alignment.
3. Remove bolts (3) attaching hood latch (4) to upper radiator crossmember (1).

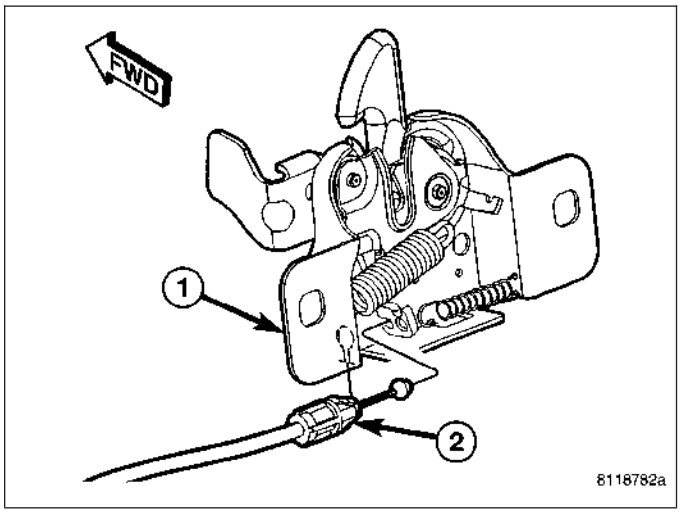


4. Separate hood latch (1) from crossmember and disconnect the release cable (2).

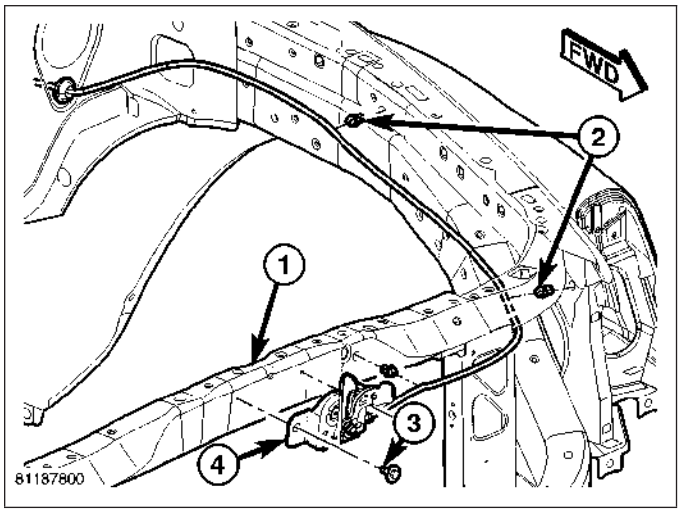


INSTALLATION

1. Connect release cable (2) to the hood latch (1).

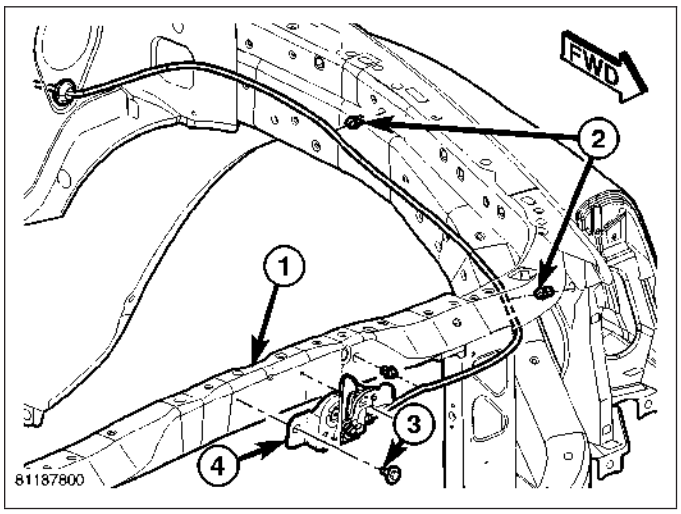


2. Install the latch (4) lining up the marks made previously and install the bolts (3).
3. Tighten the bolts to 11 N·m (8 ft. lbs.).
4. Close hood and adjust latch as necessary. (Refer to 23 - BODY/HOOD/LATCH - ADJUSTMENTS)



ADJUSTMENTS

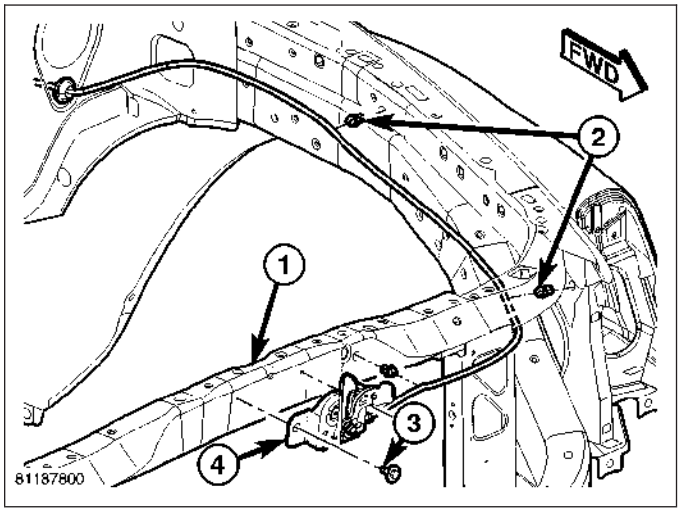
1. Check and adjust the hood if required. (Refer to 23 - BODY/HOOD/HOOD - ADJUSTMENTS)
2. Remove the push pin fasteners and remove the upper radiator shroud.
3. Loosen the hood latch bolts (3).
4. Move the latch to the correct location and lightly tighten the bolts.
5. Close the hood slowly and observe the latching operation.
6. If necessary, adjust the latch position and tighten the bolts to 11 N·m (8 ft. lbs.).



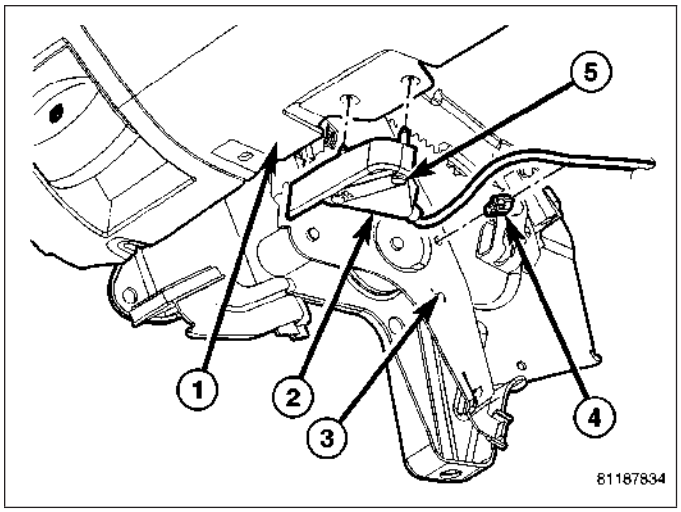
RELEASE-HOOD LATCH

REMOVAL

1. Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
2. Remove hood latch (4). (Refer to 23 - BODY/HOOD/LATCH - REMOVAL)
3. Remove the left headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)
4. Remove the plastic rivets and remove the left front wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
5. Detach the release cable and the retainer clips (2) in the engine compartment.



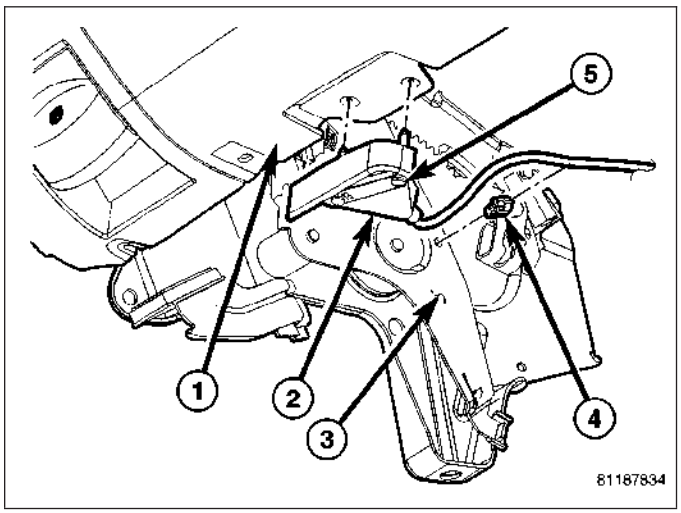
6. Separate the release cable grommet from the dash panel hole.
7. Detach the release cable and the retainer clips (4).
8. From the inside of the vehicle, remove the screws (5) attaching the hood release handle (2) to the bottom of the instrument panel (1).
9. Pull/route the hood release cable through the dash panel hole and remove it from the inside of the vehicle.



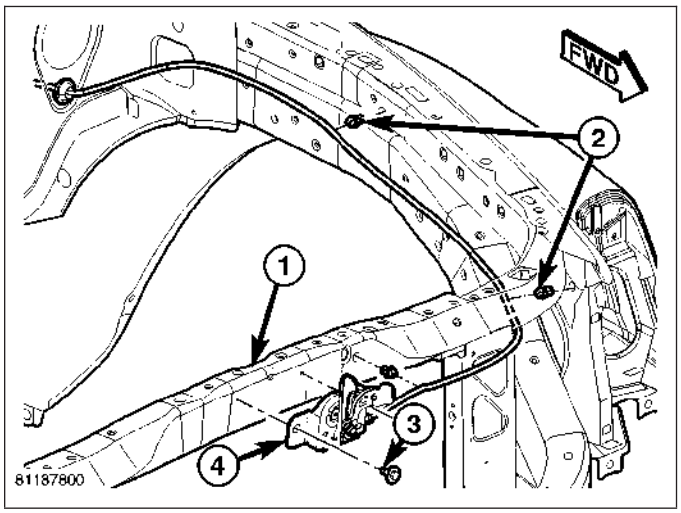
INSTALLATION

NOTE: If replacement hood latch is also being installed, ensure that it is thoroughly lubricated.

1. From inside the vehicle, pull/route the hood release cable through the dash panel hole and into the engine compartment.
2. Install the hood release handle (2) and install the screws (5).
3. Install the cable grommet in the dash panel hole.
4. Attach the retainer clip (4) to the release cable and install.



5. Attach the retainer clips (2) to the release cable and install them into the holes in the engine compartment.
6. Install hood latch. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION)



7. Install the wheelhouse splash shield and install the rivets. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
8. Install the left headlamp unit. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)
9. Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)

PANEL-TRIM

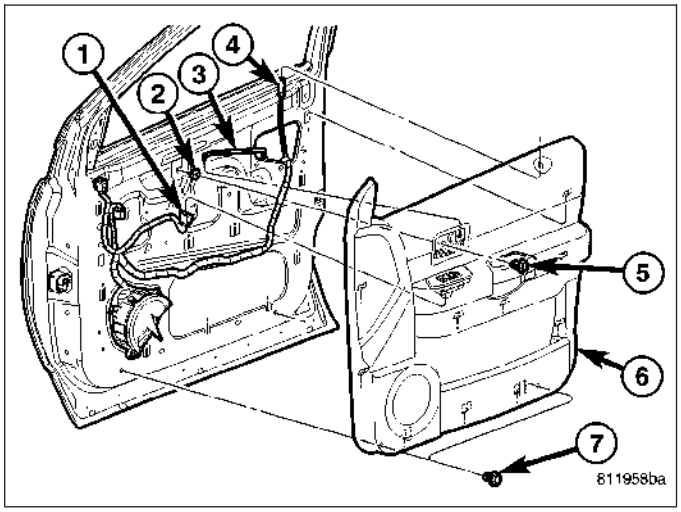
REMOVAL

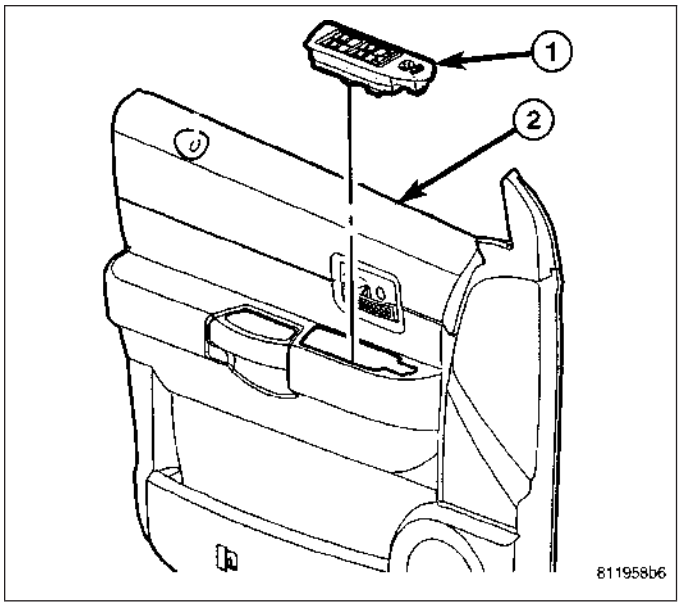
1. Remove the screws (5 & 7).

CAUTION: Trim panel is attached to the door using hooks molded into the panel. Do not pull the trim panel straight off or damage to the panel and/or power switch assembly may occur.

2. Lift the trim panel up off the lock rod (4) and attachment hooks and separate the panel from the door slightly.
3. Disconnect the electrical connectors (1).
4. Disconnect the inside handle actuator rod (3) and remove the trim panel (6).

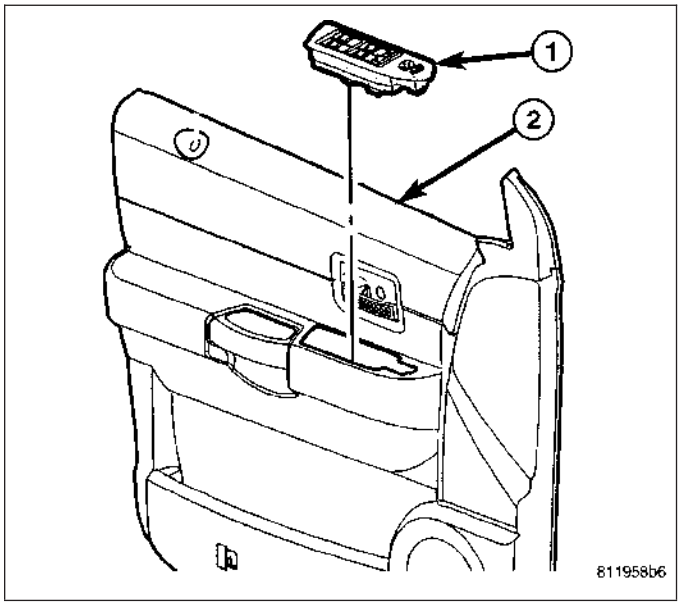


5. Remove the switch panel (1) if necessary.

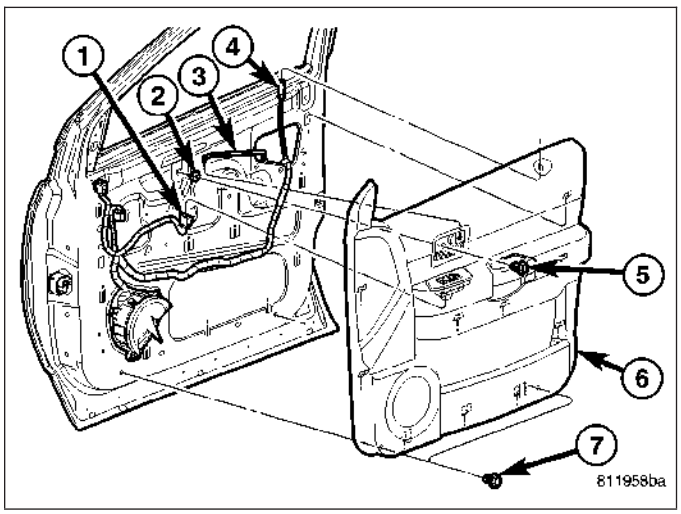


INSTALLATION

1. Install the switch assembly (1).



2. Position the trim panel (6) and connect the inside handle actuator rod (3).
3. Connect the electrical connectors (1).
4. Lift the trim panel up and onto the lock rod (4) and attachment hooks.
5. Install the screws (5 & 7).



WATERSHIELD

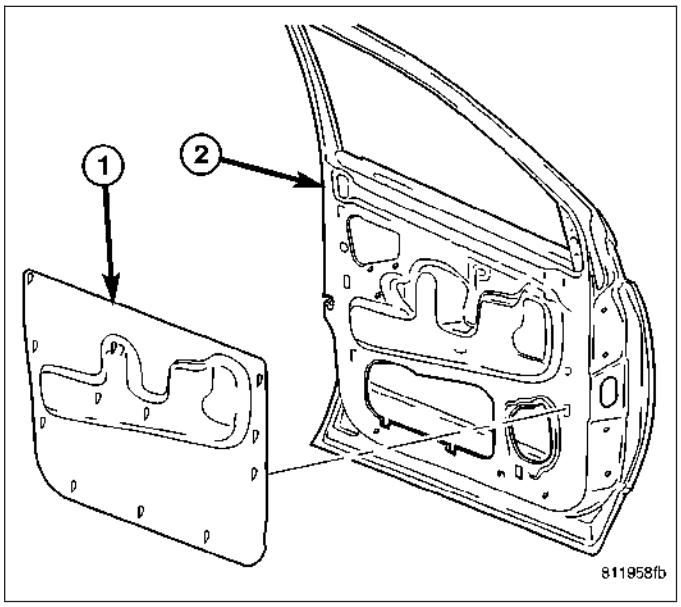
REMOVAL

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Remove the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)
2. Remove the door trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
3. Separate the watershield (1) from the inner door panel (2) and off of the latch linkages.



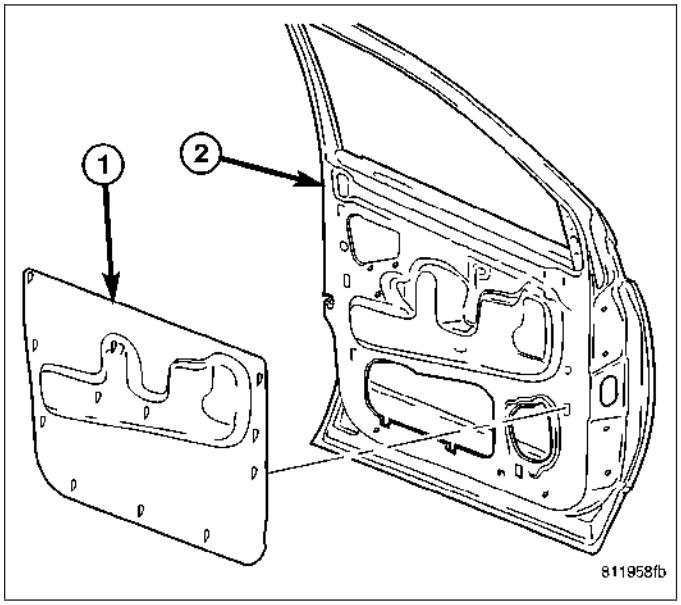
INSTALLATION

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Position the wire harness and actuator rods through the holes in the watershield.
2. Secure the watershield to the inner door panel.
3. Install the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)
4. Install the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)



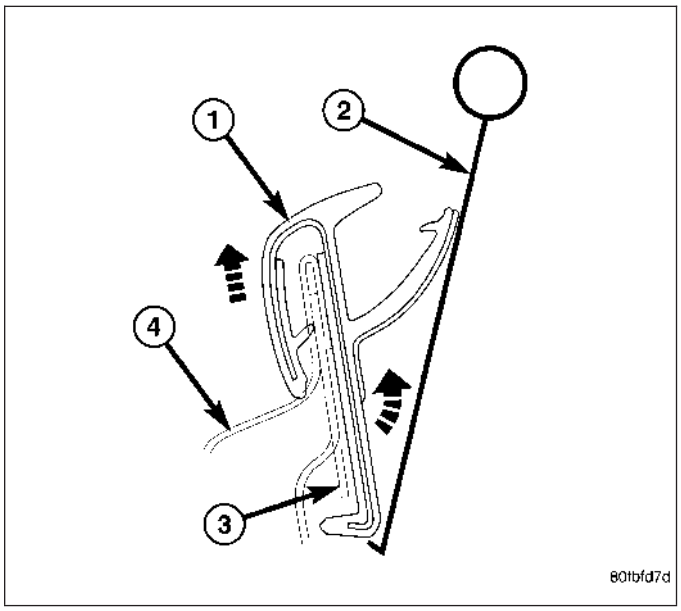
GLASS

REMOVAL

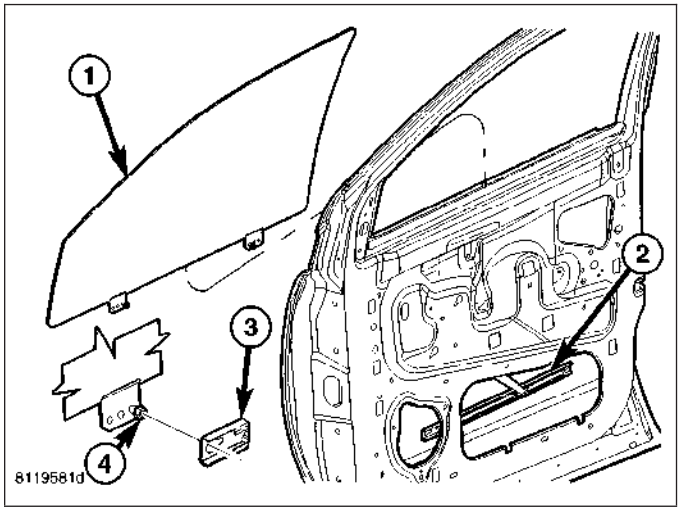
1. Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)
2. Separate the inner belt molding from the mounting flange from the rear to the front.
3. Insert special tool #9093 (2) between the outer belt molding (1) and glass at the rear.
4. Push down on outer belt molding (1) and rotate upper part of tool (2) outward from vehicle then lift up on molding (1) to disengage from locking tabs (3) working from back to front.

NOTE: Typical outer belt molding design shown.

5. Slide molding out from under the side view mirror and remove.

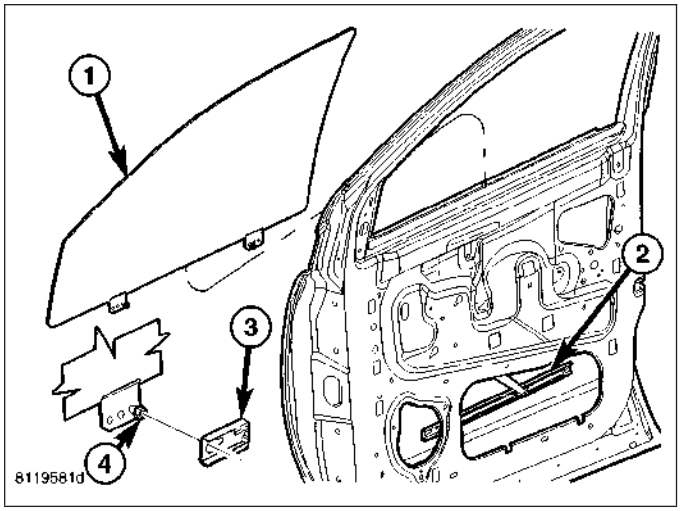


6. Temporarily install the window switch and position the glass (1) to gain access to the regulator nuts (4).
7. Remove the nuts (4) and remove the glass (1).



INSTALLATION

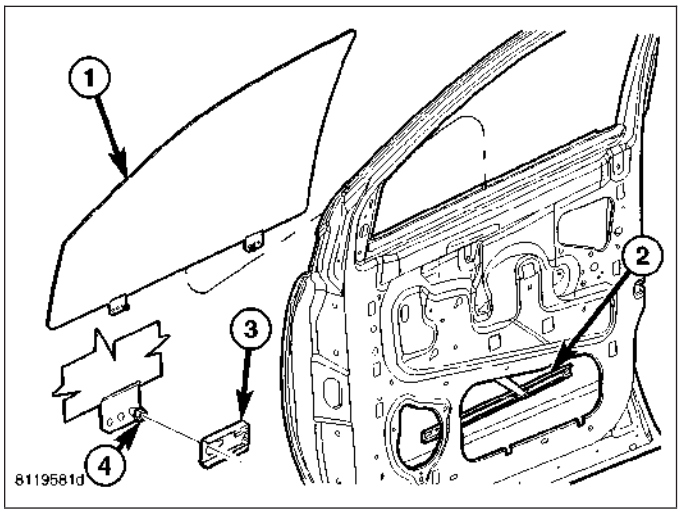
1. Position the glass into the door and install onto the regulator.
2. Install the nuts (4) and tighten to 9 N·m (80 in. lbs.).
3. Position the outer belt molding onto the door and position forward under the side view mirror. Seat the molding fully.
4. Position the inner belt molding onto the door and seat fully starting at the back of the door.
5. Install the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION)



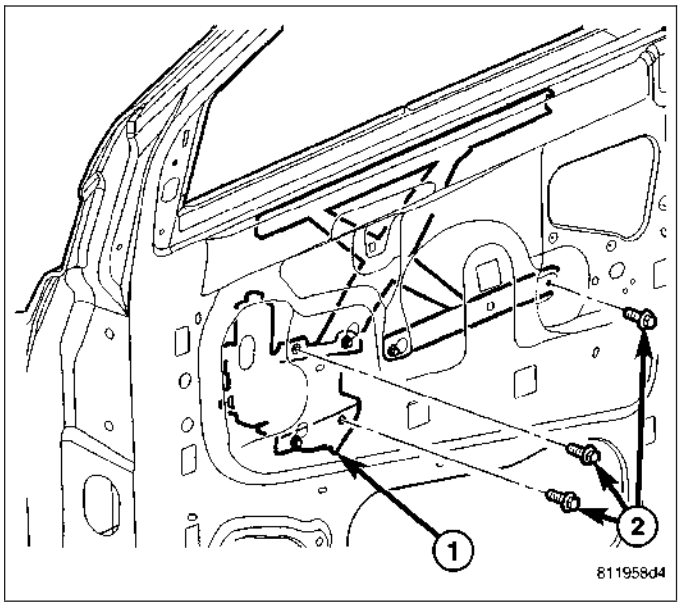
REGULATOR-WINDOW

REMOVAL

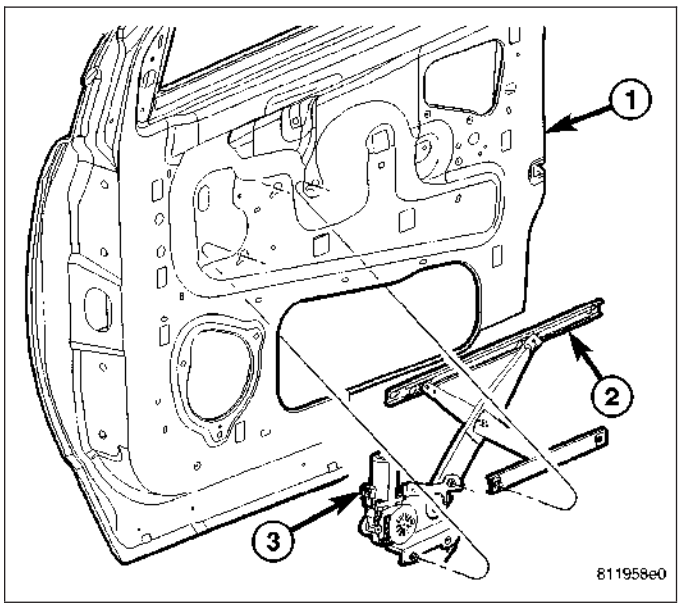
1. Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)
2. Temporarily install the window switch and position the glass (1) to gain access to the regulator nuts (4).
3. Remove the nuts (4).
4. Secure the glass in the up position using a wood wedge or equivalent.



5. Remove the bolts (2) and loosen the remaining regulator bolts.

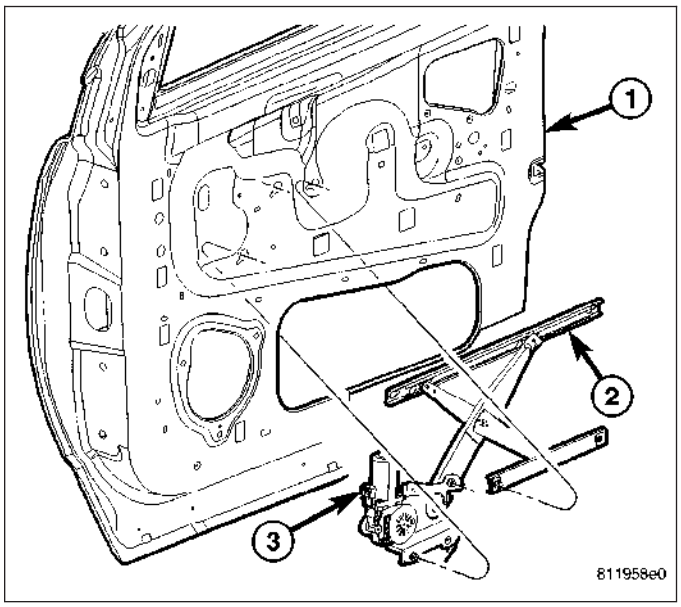


6. Separate the regulator (2) from the door panel (1) and disconnect the electrical connector (3).

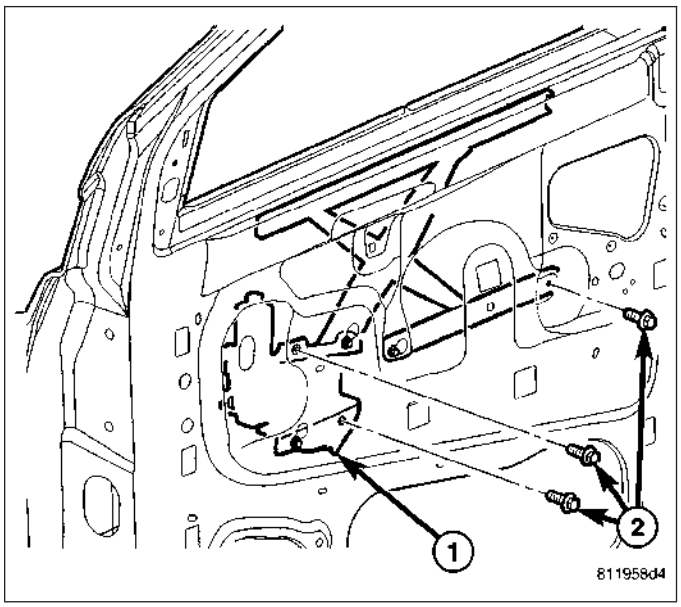


INSTALLATION

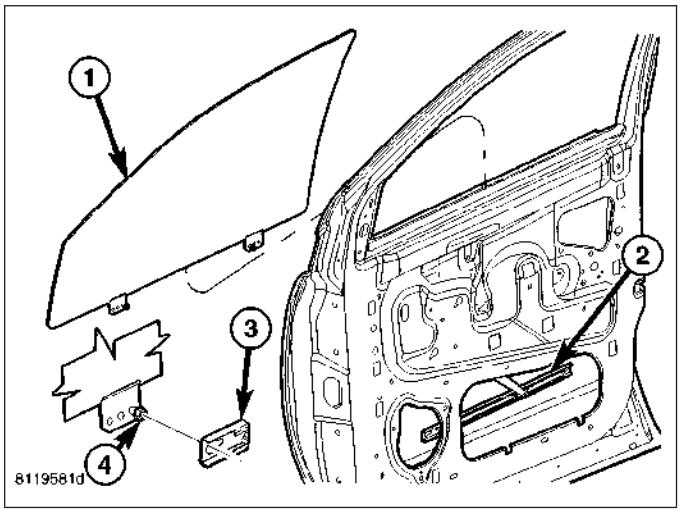
1. Position the regulator (2) into the door (1) and connect the electrical connector (3).



2. Position the regulator bolts into the keyhole slots and slide into place.
3. Install the remaining regulator bolts (2).
4. Tighten the bolts to 9 N·m (80 in. lbs.).



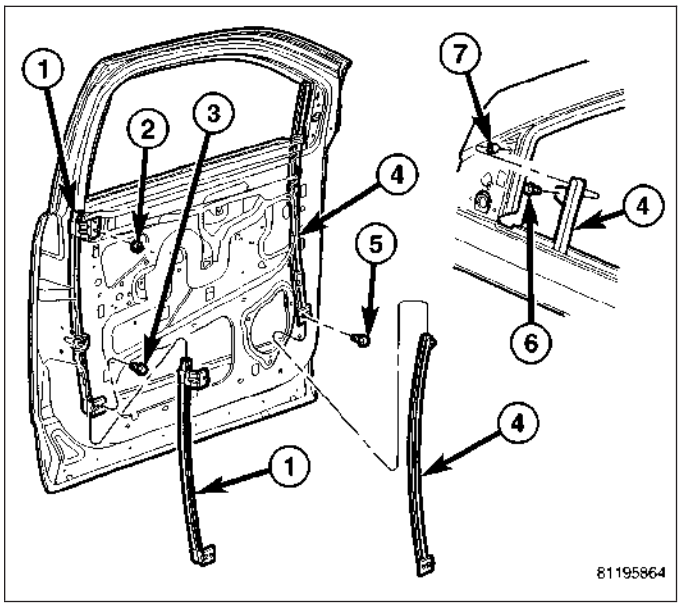
5. Position the glass (1) onto the door regulator (3).
6. Install the nuts (4) and tighten to 9 N·m (80 in. lbs.).
7. Install the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION)



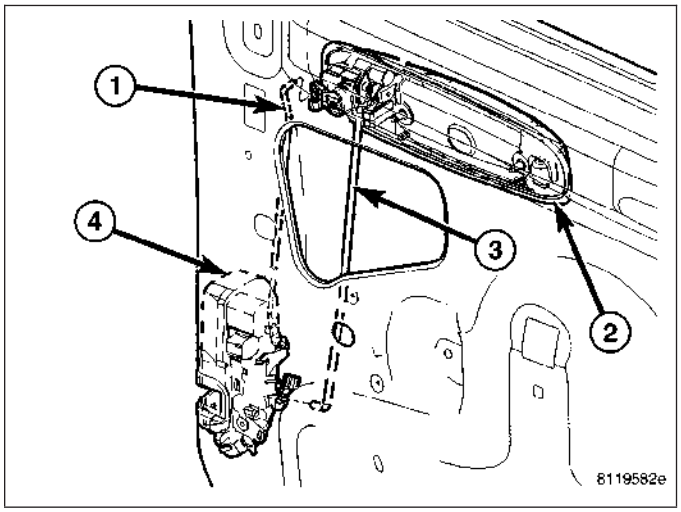
HANDLE-EXTERIOR

REMOVAL

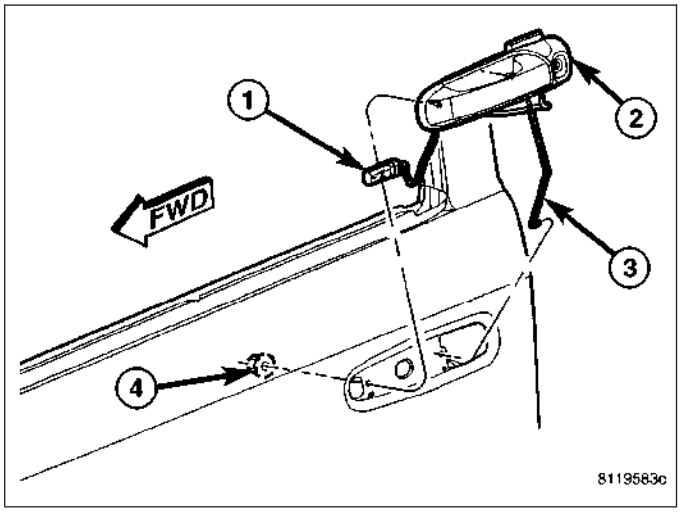
1. Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)
2. Remove the bolt (3) and nut (2) and position aside the rear glass run channel (1).



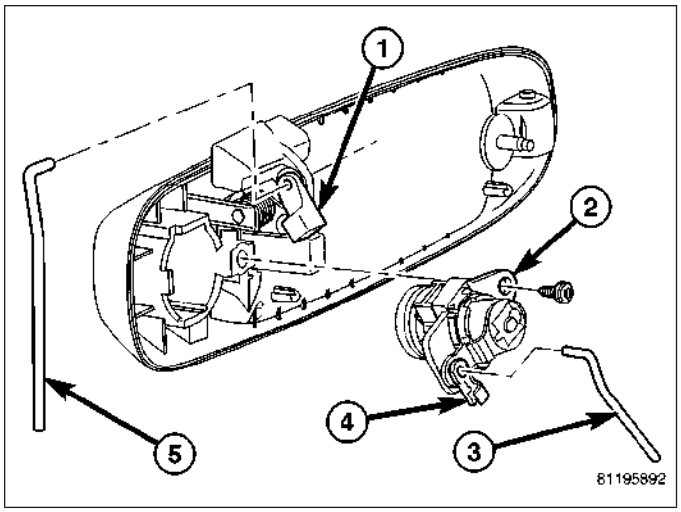
3. Disconnect the links (1 & 3) from the latch (4).



4. Remove the nut (4), the handle (2) and disconnect the electrical connector (1).

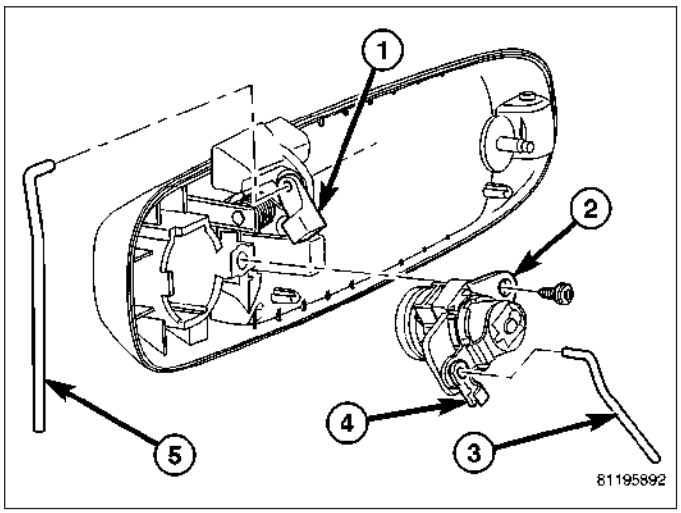


5. Separate the links (3 & 5) from the clips (1 & 4) and remove the lock cylinder (2).

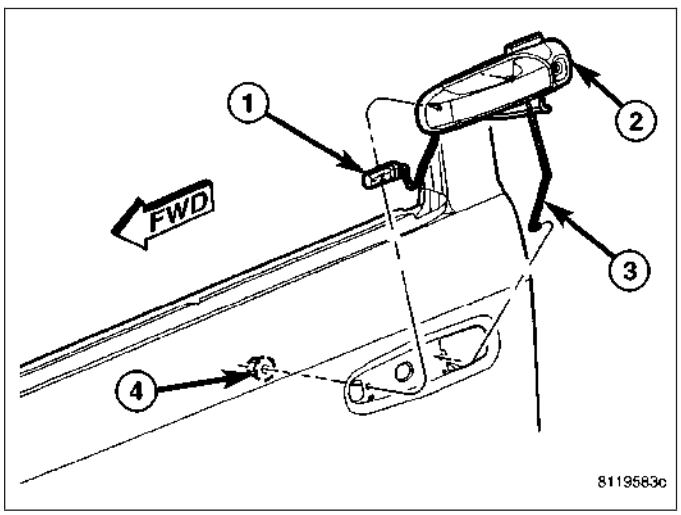


INSTALLATION

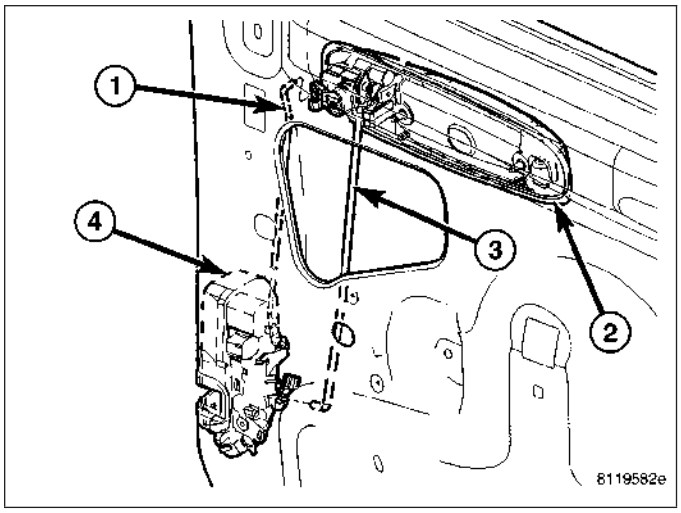
1. Install the links (3 & 5) into the clips (1 & 4) and install the lock cylinder (2) into the exterior handle.



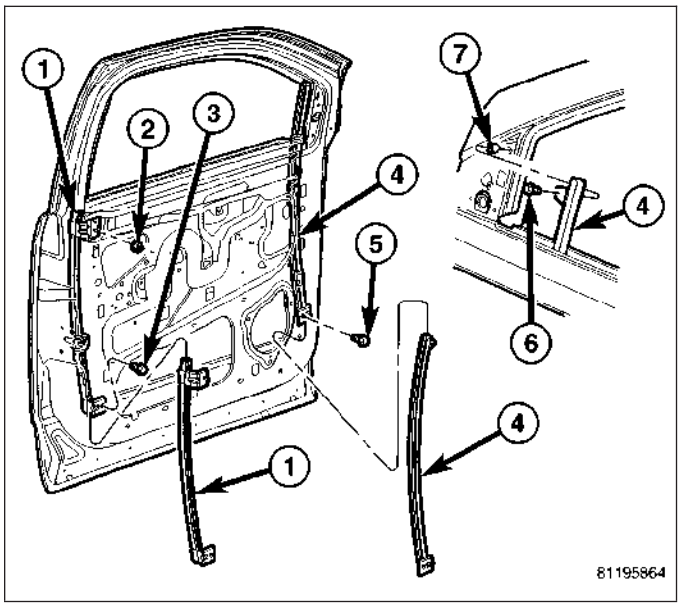
2. Connect the electrical connector (1), and position the handle (2) onto the door.
3. Install the nuts (4) and tighten to 5 N·m (45 in. lbs.).



4. Connect the links (1 & 3) to the latch (4).



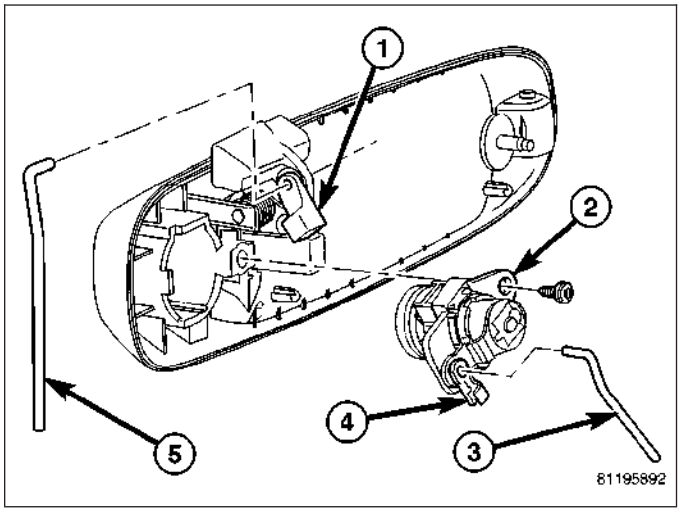
5. Position the rear glass run channel back and install the nut and bolt.
6. Tighten the fasteners to 8 N·m (70 in. lbs.).
7. Install the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION) (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION)
8. Adjust the latch as needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH - ADJUSTMENTS)



CYLINDER-LOCK

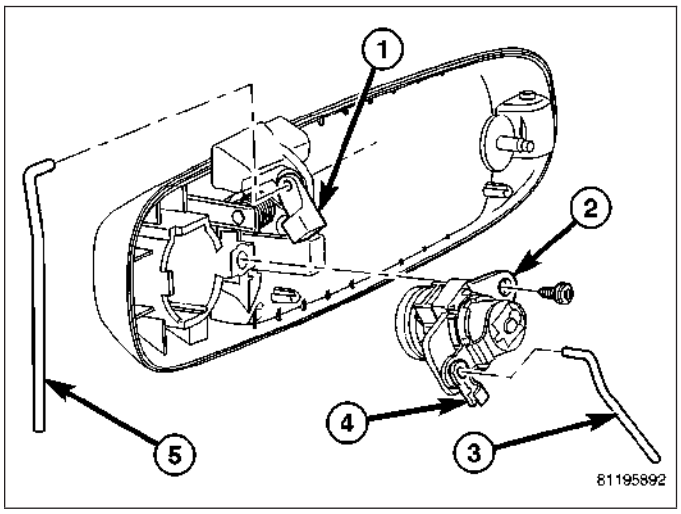
REMOVAL

1. Remove the exterior handle. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL)
2. Remove the screw and remove the lock cylinder (2).



INSTALLATION

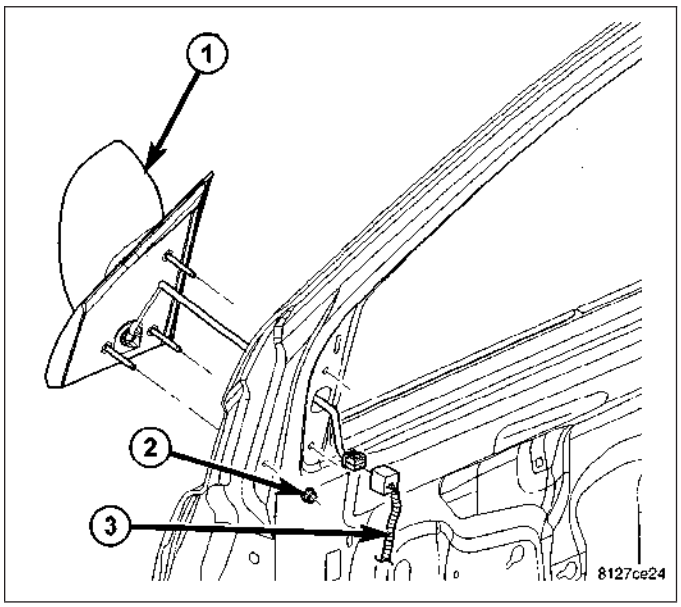
1. Install the lock cylinder (2) and install the screw.
2. Install the exterior handle. (Refer to 23 - BODY/ DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION)



CHANNEL-GLASS

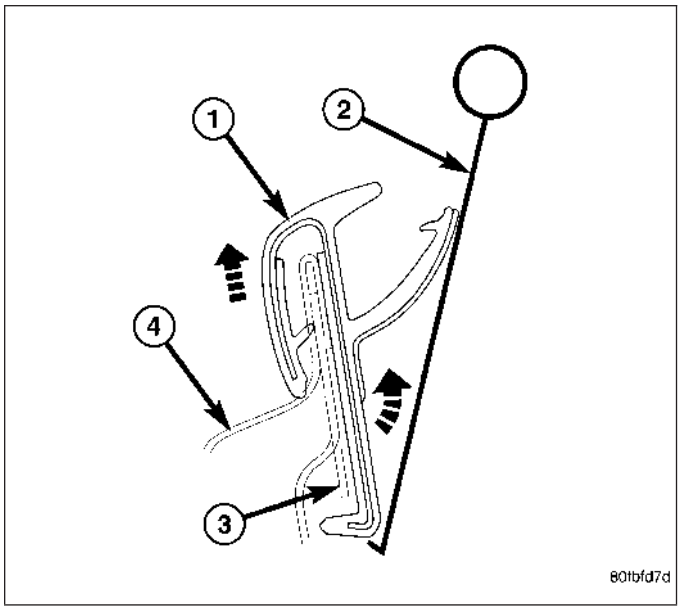
REMOVAL

1. Raise the glass to the full up position.
2. Remove the watershield. (Refer to 23 - BODY/ DOOR - FRONT/WATERSHIELD - REMOVAL)
3. Remove the nuts (2) and disconnect the electrical connector (3), if equipped.
4. Remove the side view mirror (1).

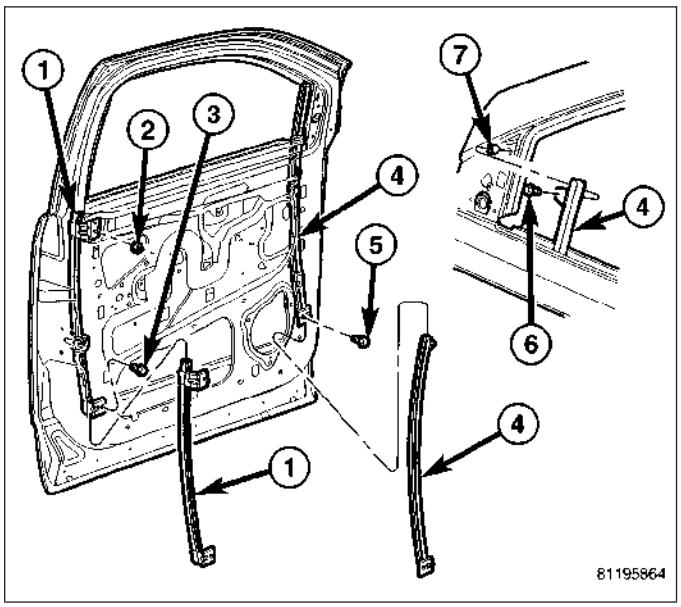


5. Separate the inner belt molding from the mounting flange from the rear to the front.
6. Insert special tool #9093 (2) between the outer belt molding (1) and glass at the rear.
7. Push down on outer belt molding (1) and rotate upper part of tool (2) outward from vehicle then lift up on molding (1) to disengage from locking tabs (3) working from back to front.

NOTE: Typical outer belt molding design shown.

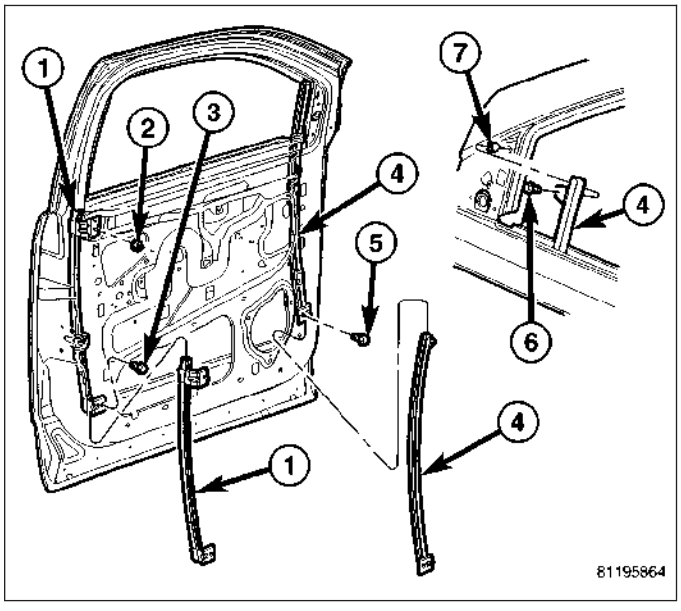


8. Remove the nut (2) and bolt (3) and remove the rear glass run channel (1).
9. Remove the bolts (6 & 5) and remove the front glass run channel (4).

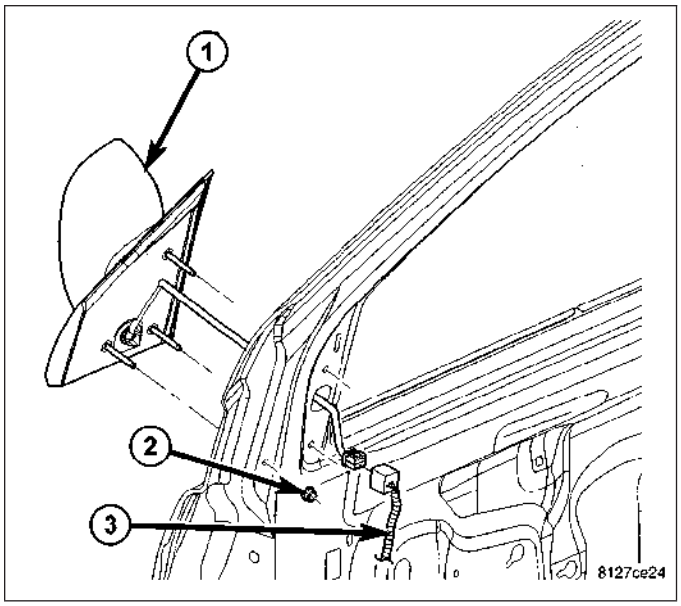


INSTALLATION

1. Install the front glass run channel (4) and install the bolts (6 & 5). Tighten the bolts to 8 N·m (70 in. lbs.).
2. Install the rear glass run channel and install the nut and bolt.
3. Tighten the fasteners to 8 N·m (70 in. lbs.).
4. Position the inner and outer belt molding onto the door and seat fully.



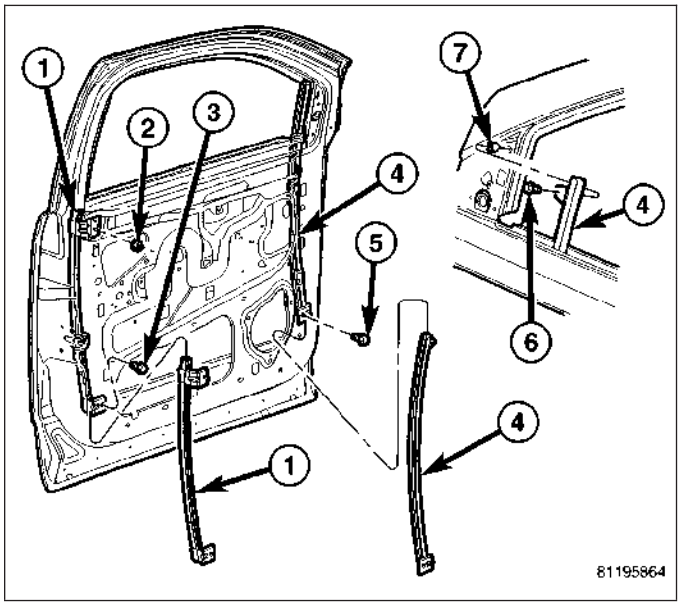
5. Install the side view mirror.
6. Install the nuts and connect the electrical connector.
7. Install the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION)



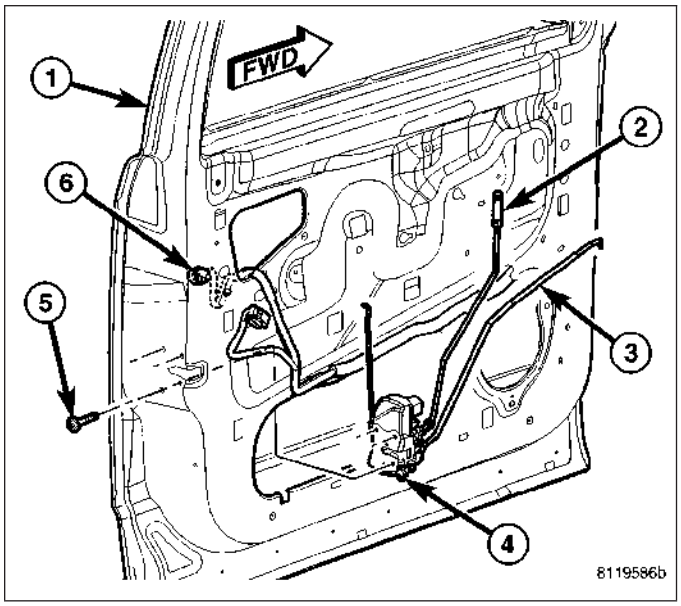
LATCH

REMOVAL

1. Remove the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL)
2. Remove the bolt (3) and nut (2) and position aside the rear glass run channel (1).

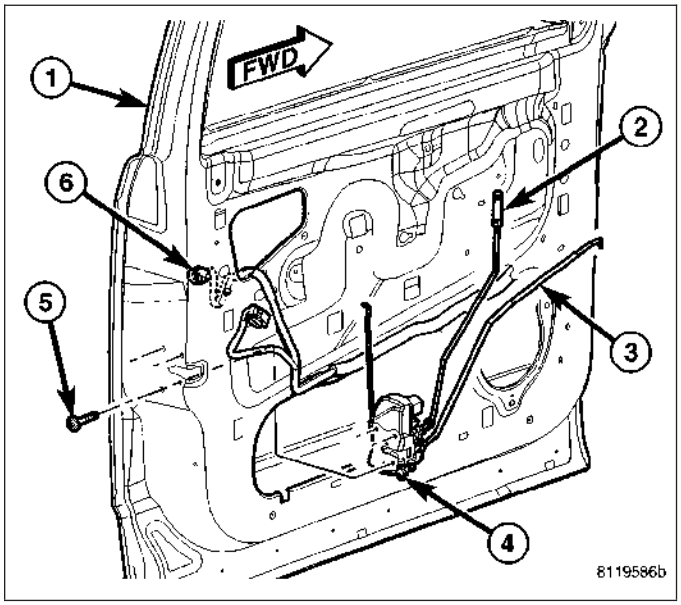


3. Remove the latch screws (5).
4. Disconnect the actuator rods (3).
5. Disconnect the electrical connectors (6) and remove the latch.

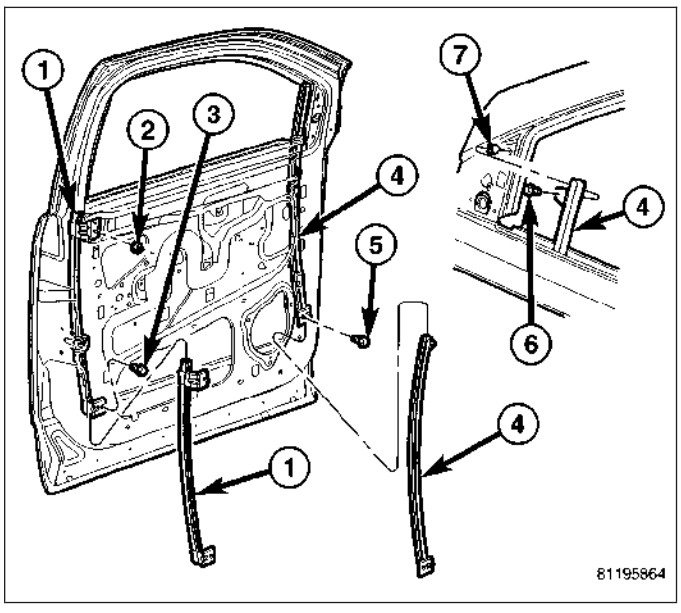


INSTALLATION

1. Install the latch into the door.
2. Connect the electrical connectors (6).
3. Connect the actuator rods (3).
4. Install the screws and tighten to 10 N·m (85 in. lbs.).
5. Adjust the latch as needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH - ADJUSTMENTS)



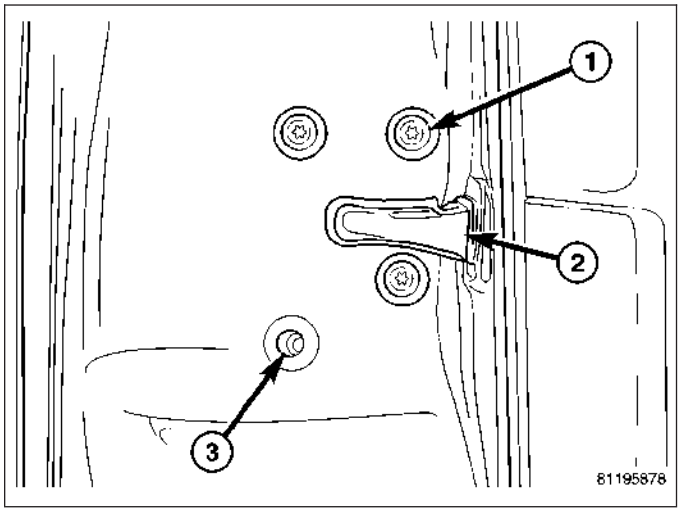
6. Position the rear glass run channel back and install the nut and bolt.
7. Tighten the fasteners to 8 N·m (70 in. lbs.).
8. Install the watershield. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION) (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION)



ADJUSTMENTS

ADJUSTMENT

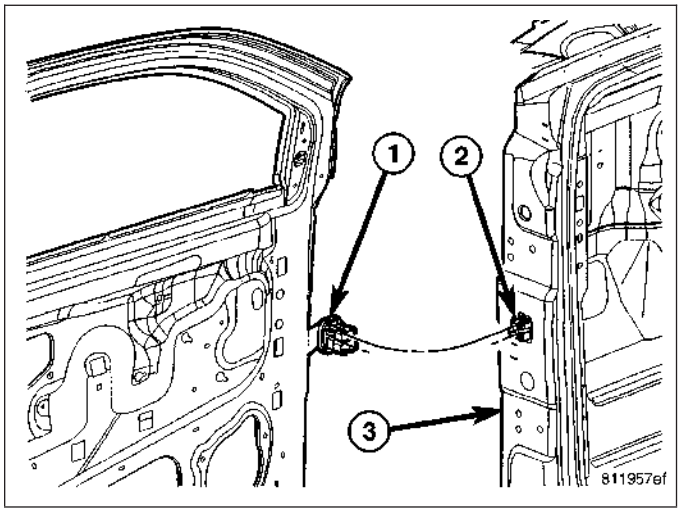
1. Locate access hole (3) and remove the trim plug covering it.
2. Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
3. Operate outside handle several times to release any restriction because of mis-alignment.
4. Tighten adjustment screw to 3 N·m (30 in. lbs.).
5. Test handle for proper operation.



DOOR

REMOVAL

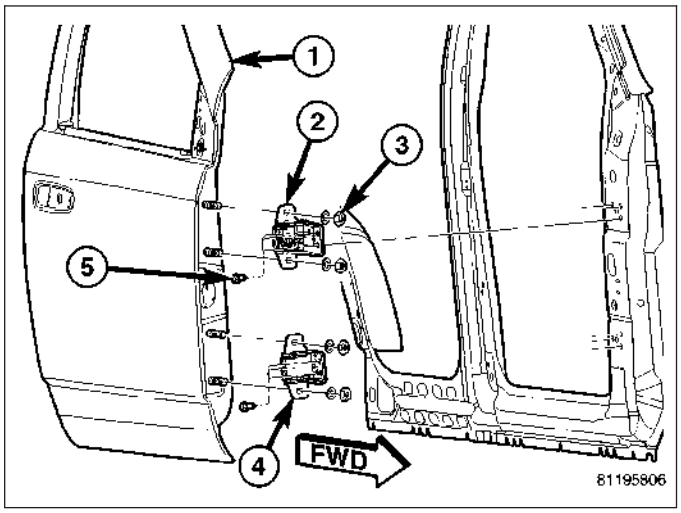
1. Disconnect the door wire harness electrical connector (1) at the a-pillar (2).



2. Using a grease pencil or equivalent, mark the outline of the door hinges on the door end to aid installation.
3. Support the door with a suitable lifting device.

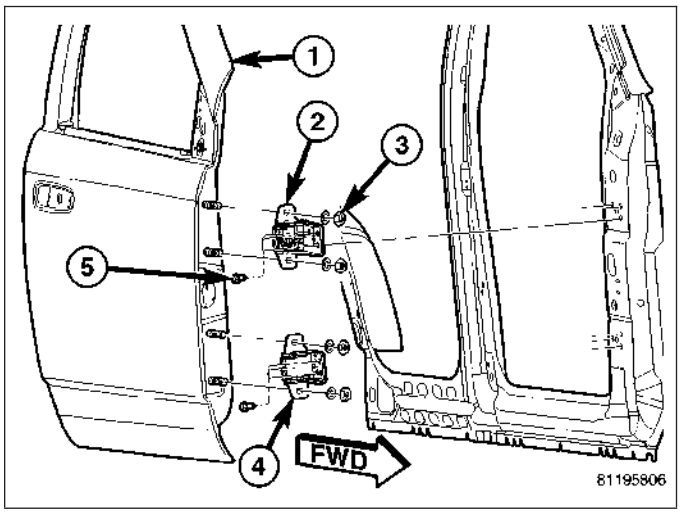
NOTE: The welded washers should not be separated from the hinge. If the washers are removed the door may have to be re-adjusted.

4. Remove the nuts (3) attaching the door hinges (2) to the door (1).

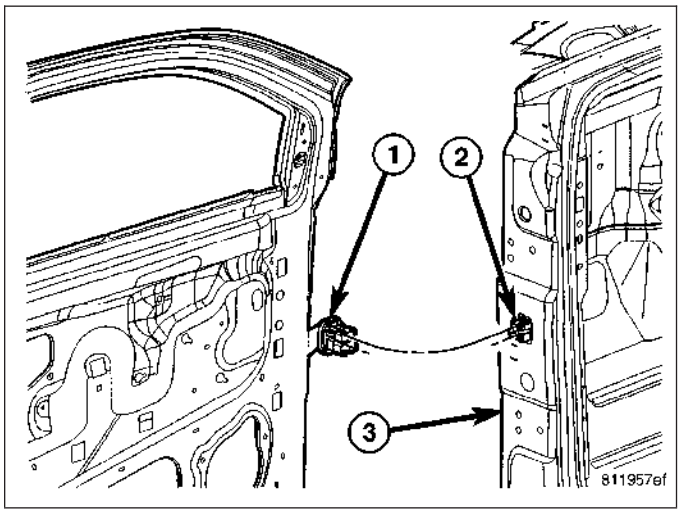


INSTALLATION

1. Support the door with a suitable lifting device and install the door (1) onto the hinges (2).
2. Install the washers, if they were removed previously, nuts and tighten to 28 N·m (21 ft. lbs.).



3. Connect the electrical connectors (1 & 2).
4. Adjust the door as necessary. (Refer to 23 - BODY/DOOR - FRONT/DOOR - ADJUSTMENTS)



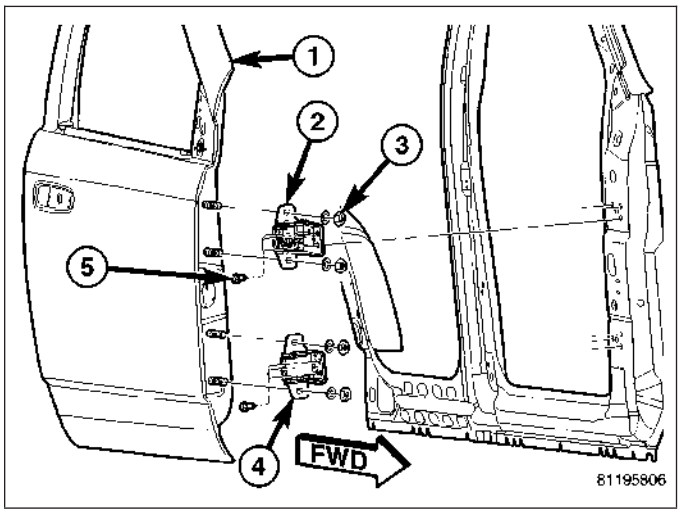
ADJUSTMENTS

NOTE: For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.



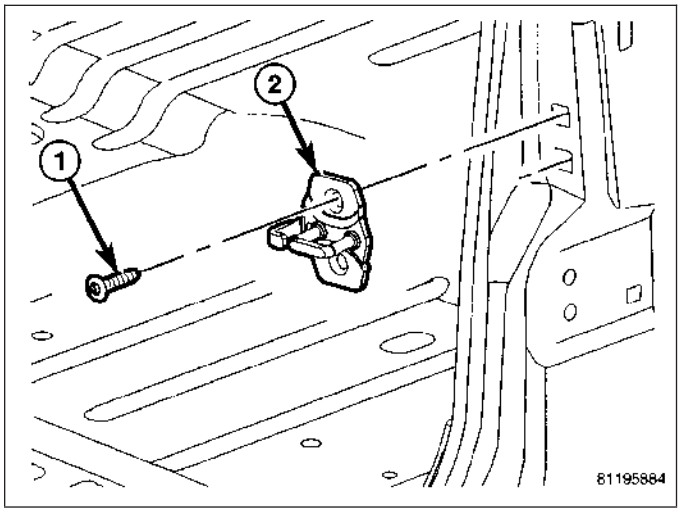
1. Support the door with a suitable lifting device.
2. Loosen the hinge (2) to hinge pillar fasteners (5). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge pillar fasteners to 28 N·m (21 ft. lbs.).

UP/DOWN

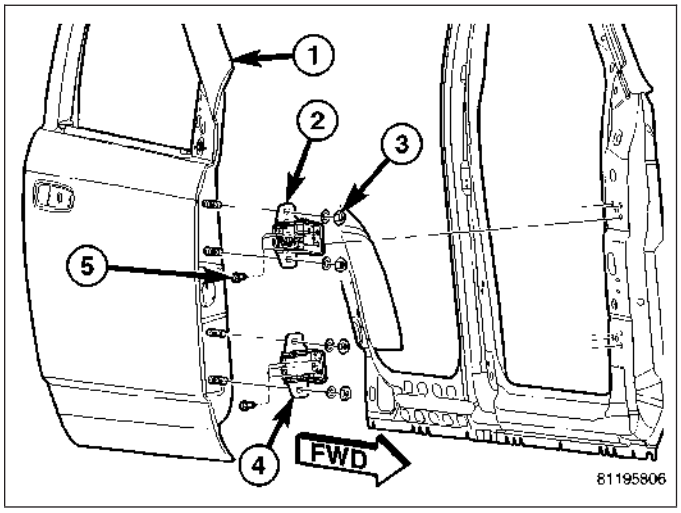
NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the welded washers with a chisel or other suitable tool.

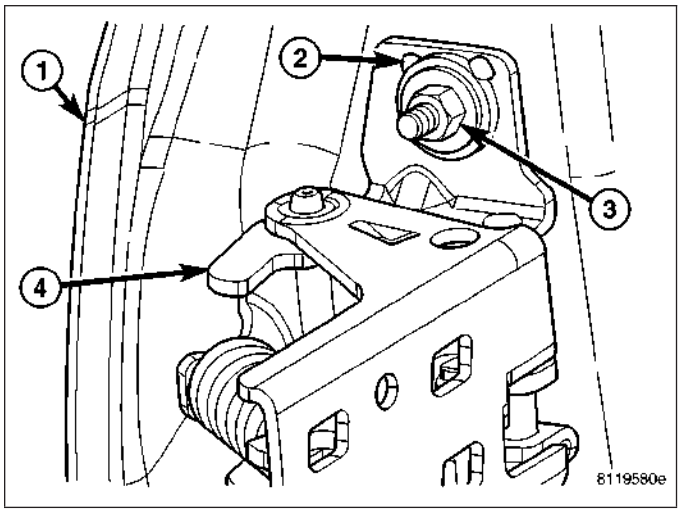
NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)
3. Loosen the hinge to door fasteners (3) (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL) or loosen the hinge to hinge pillar fasteners (5) (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).

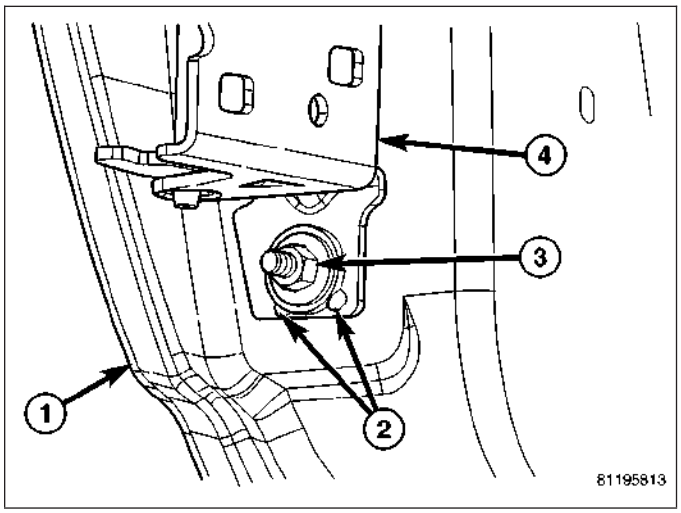


NOTE: When adjusting the door using the door to hinge adjustment, remove the upper hinge welds (2) and separate the washers from the hinge (4).

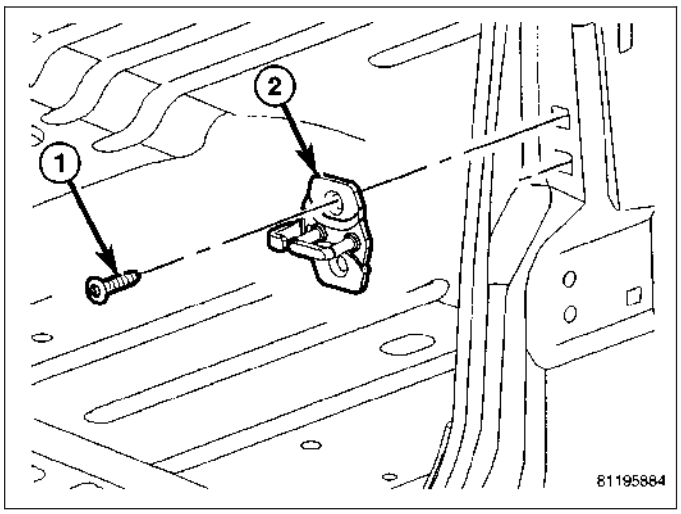


NOTE: When adjusting the door using the door to hinge adjustment, remove the lower hinge welds (2) and separate the washers from the hinge (4).

4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge pillar fasteners or the door to hinges fasteners to 28 N·m (21 ft. lbs.).



6. Tighten the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

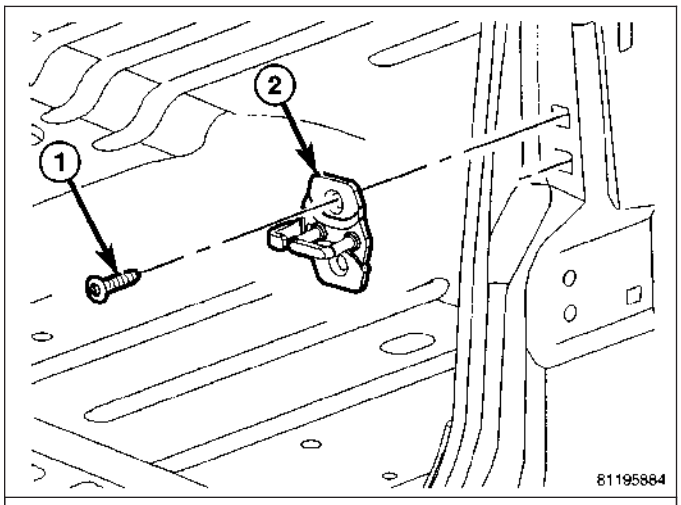


IN/OUT

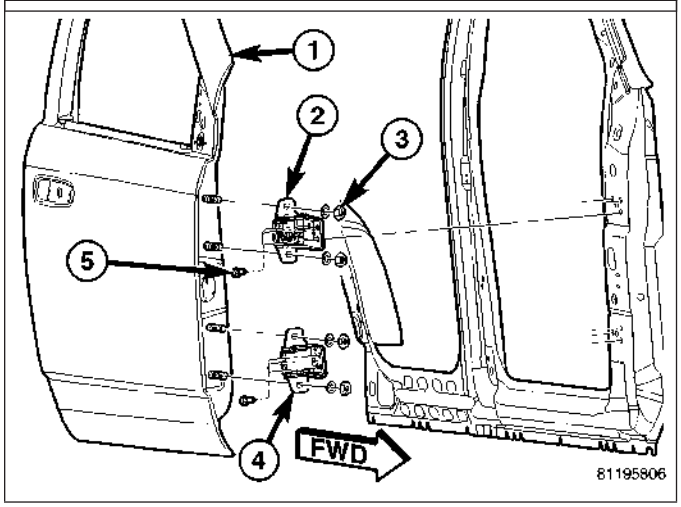
NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the welded washers with a chisel or other suitable tool.

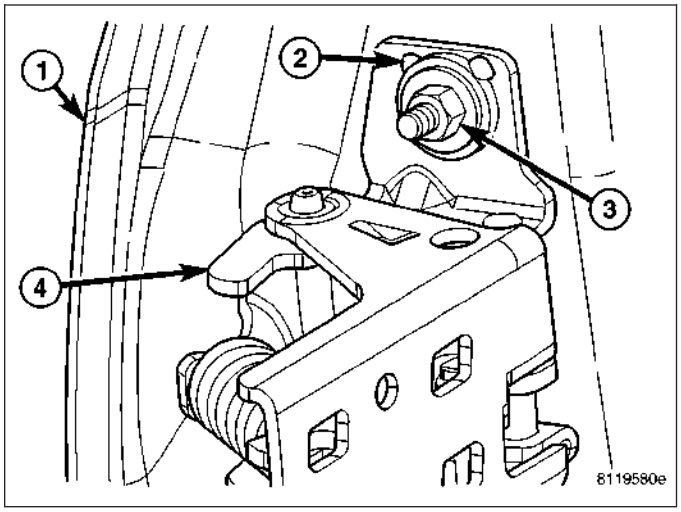
1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)



3. Loosen the hinge to door fasteners (3). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

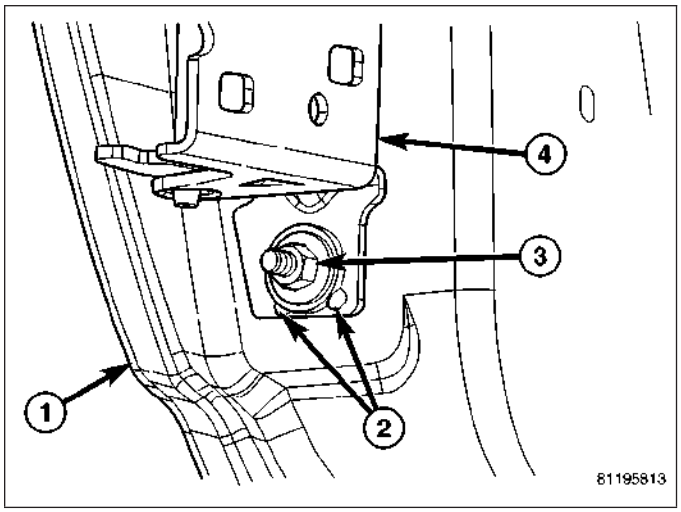


NOTE: When adjusting the door using the door to hinge adjustment, remove the upper hinge welds (2) and separate the washers from the hinge (4).

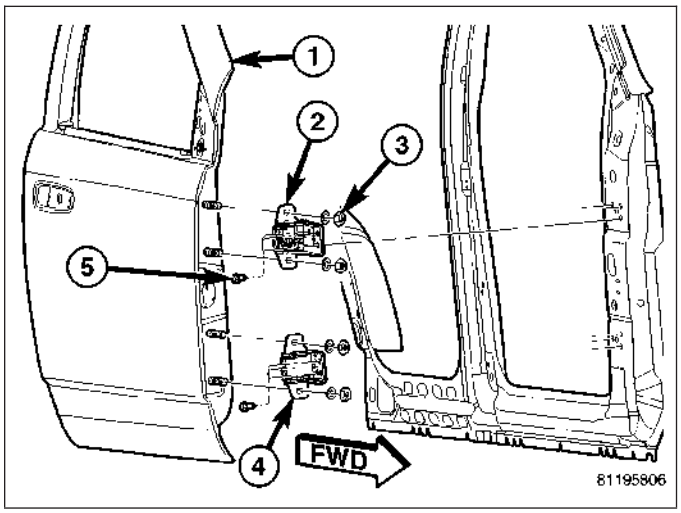


NOTE: When adjusting the door using the door to hinge adjustment, remove the lower hinge welds (2) and separate the washers from the hinge (4).

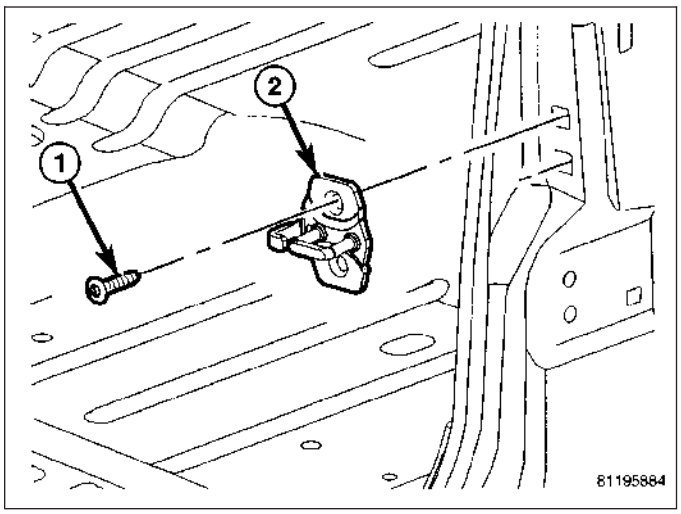
4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)



5. Tighten the door to hinges fasteners (3) to 28 N·m (21 ft. lbs.).



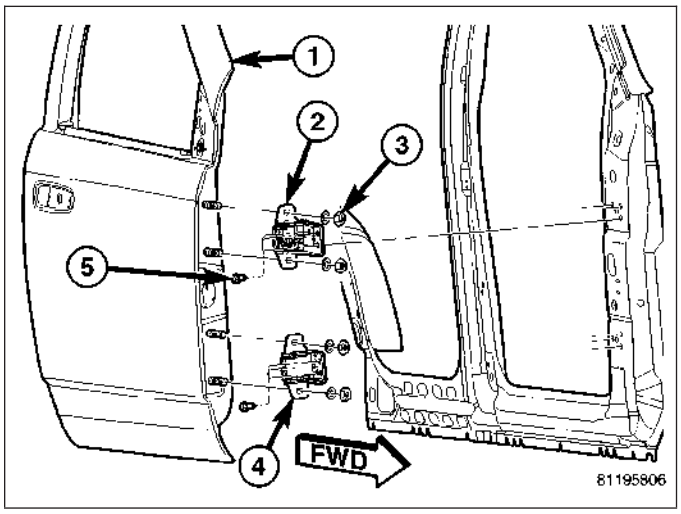
6. Tighten the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)



HINGE

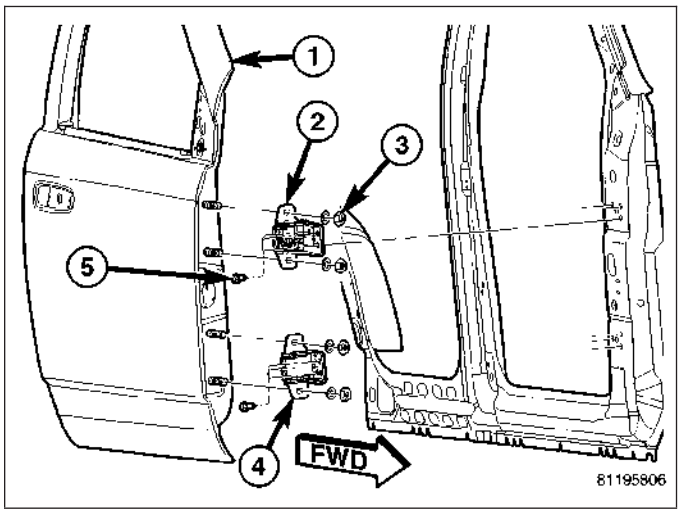
REMOVAL

1. Remove the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
2. Using a grease pencil or equivalent, mark the outline of the door hinges on a-pillar end to aid installation.
3. Remove the bolts (5) and remove the hinges (2 & 4).



INSTALLATION

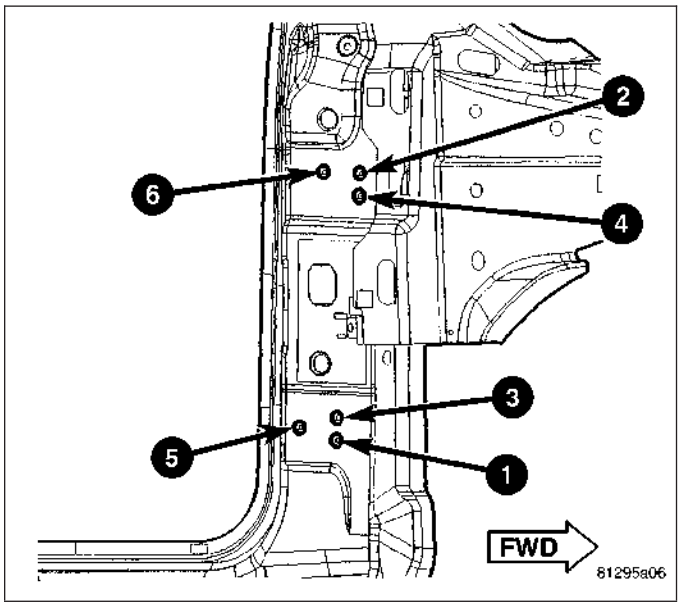
1. If necessary, paint replacement door hinge before installation.
2. Position door hinge (2 & 4) on hinge pillar using alignment marks and install the bolts (5).



3. Tighten the bolts to 28 N·m (21 ft. lbs.) using the sequence shown.

NOTE: Right hand door shown, left hand door opposite.

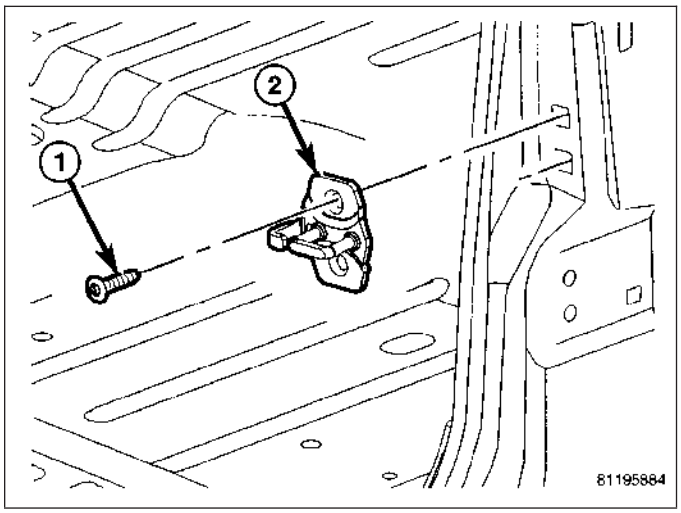
4. Install the door. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)



STRIKER

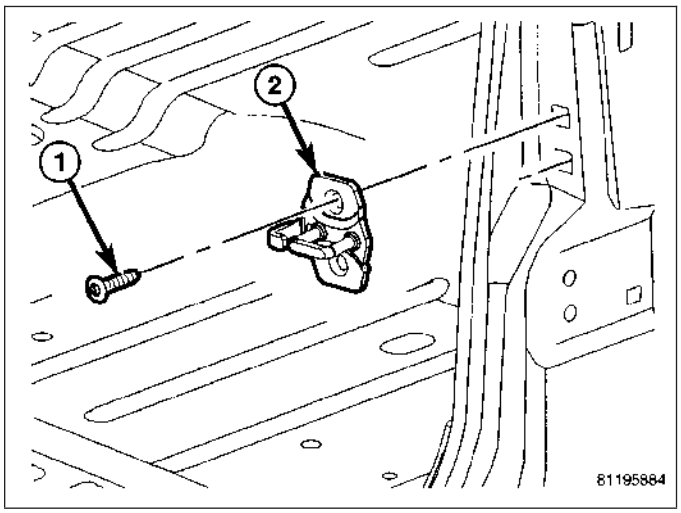
REMOVAL

1. Using a grease pencil or equivalent, mark the position of the striker (2).
2. Remove the bolts (1) and remove the striker.



INSTALLATION

1. Install the striker and install the bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Adjust the striker if needed. (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - ADJUSTMENTS)



ADJUSTMENTS

ADJUSTMENT

1. Using a grease pencil or equivalent, mark the position of the striker (2) to aid in adjustment.
2. Loosen the striker bolts (1).
3. Change the striker position to adjust the rear gap and flush measurement. (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the bolts to 28 N·m (21 ft. lbs.).

PANEL-TRIM

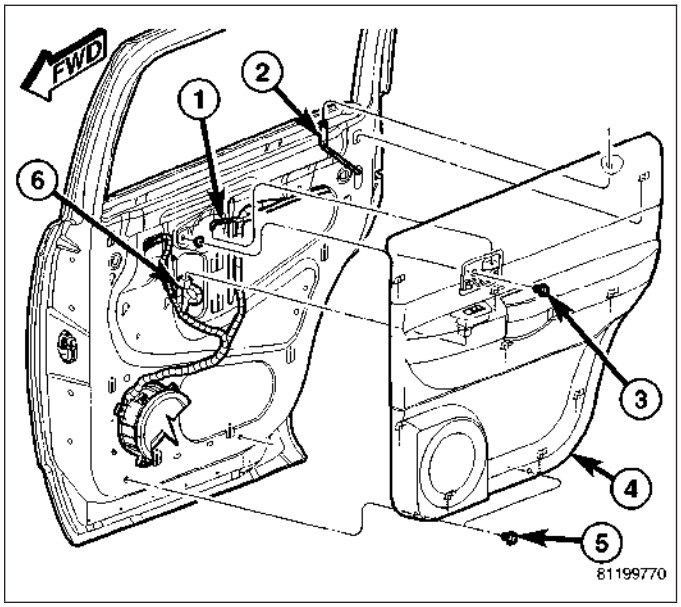
REMOVAL

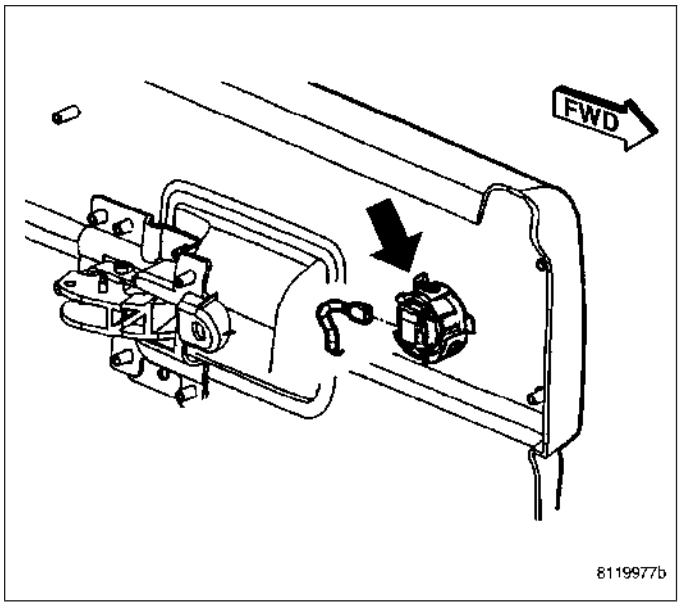
1. Remove the screws (3 & 5).

CAUTION: Trim panel is attached to the door using hooks molded into the panel. Do not pull the trim panel straight off or damage to the panel and/or power switch assembly may occur.

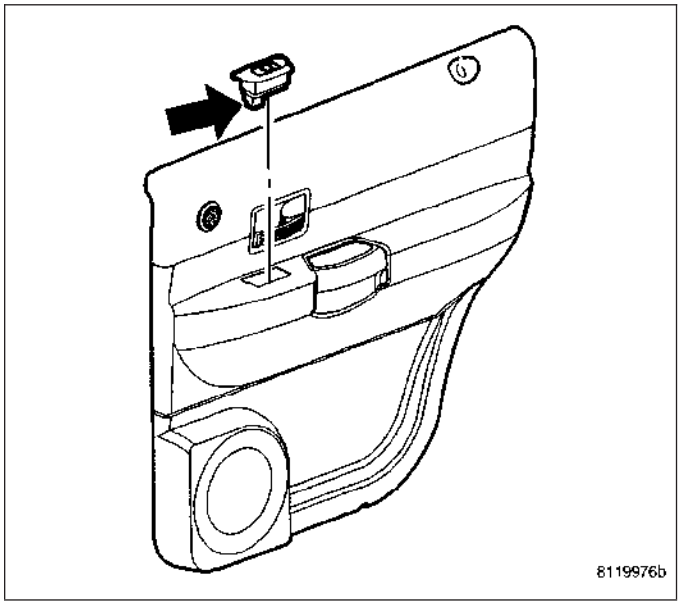
2. Lift the trim panel up off the lock rod (2) and attachment hooks and separate the panel from the door slightly.
3. Disconnect the electrical connectors (6).
4. Disconnect the inside handle actuator rod (1).



5. Disconnect the electrical connector and remove the tweeter.

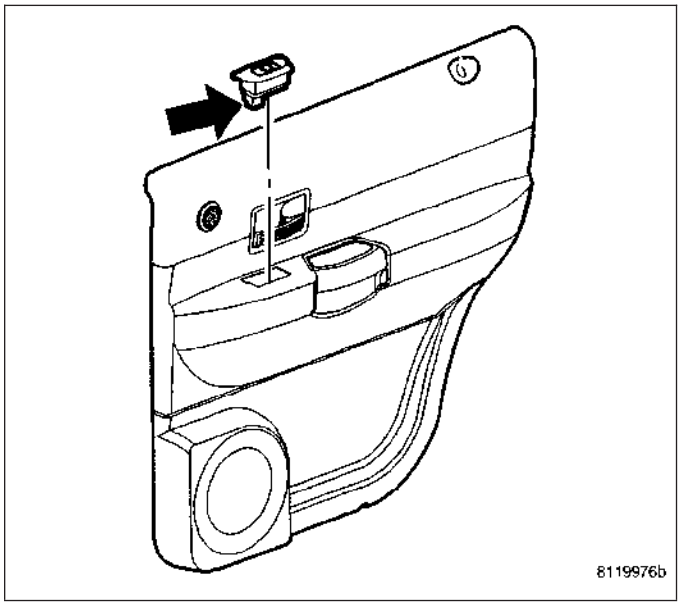


6. Remove the switch panel if necessary.

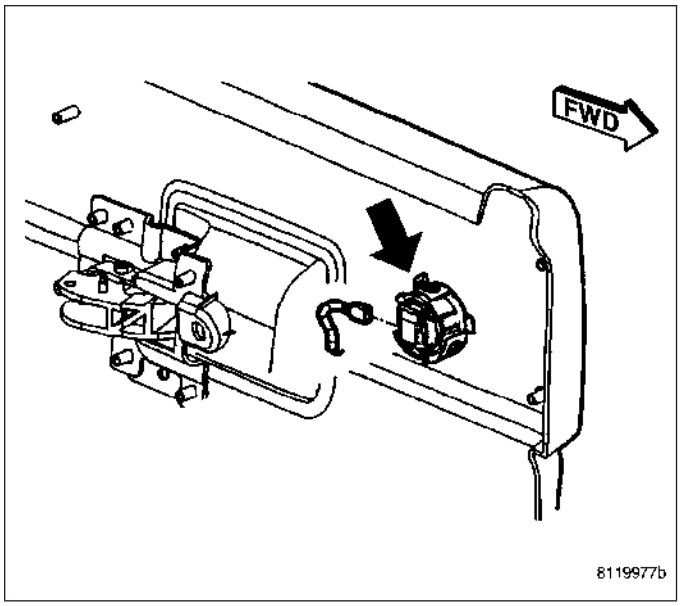


INSTALLATION

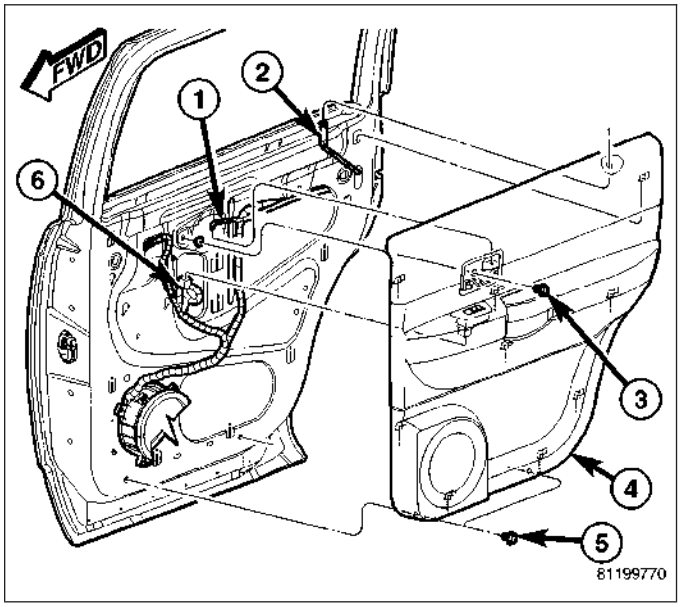
1. Install the switch assembly.



2. Install the tweeter and connect the electrical connector.



3. Position the trim panel (4) and connect the inside handle actuator rod (1).
4. Connect the electrical connectors (6).
5. Lift the trim panel up and onto the lock rod (2) and attachment hooks.
6. Install the screws (3 & 5).



WATERSHIELD

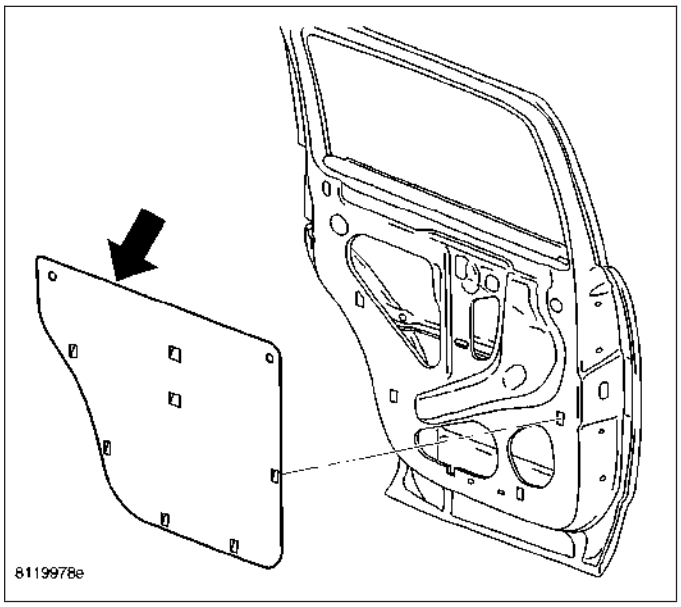
REMOVAL

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Remove the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)
2. Remove the door trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
3. Separate the watershield from the inner door panel and off of the latch linkages.



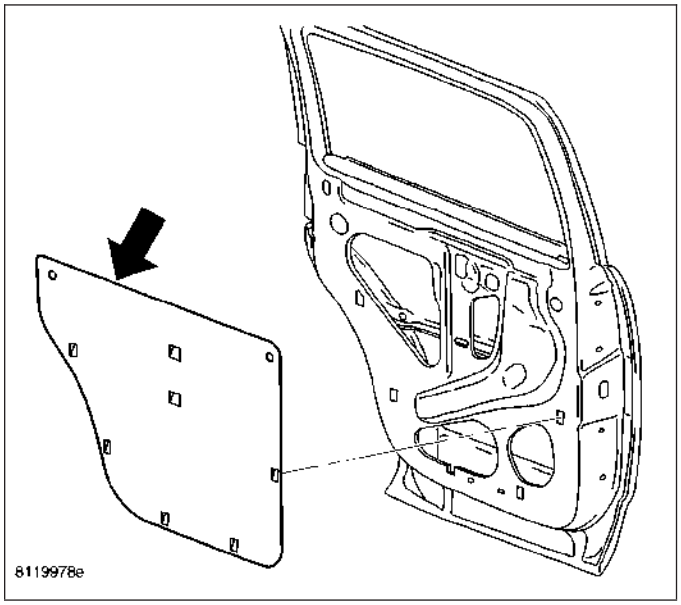
INSTALLATION

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Position the wire harness and actuator rods through the holes in the watershield.
2. Secure the watershield to the inner door panel.
3. Install the speaker. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)
4. Install the trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)



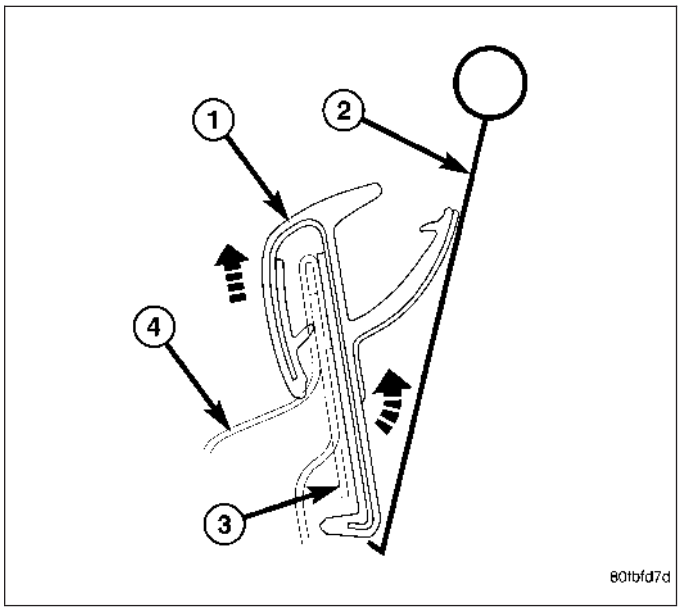
GLASS

REMOVAL

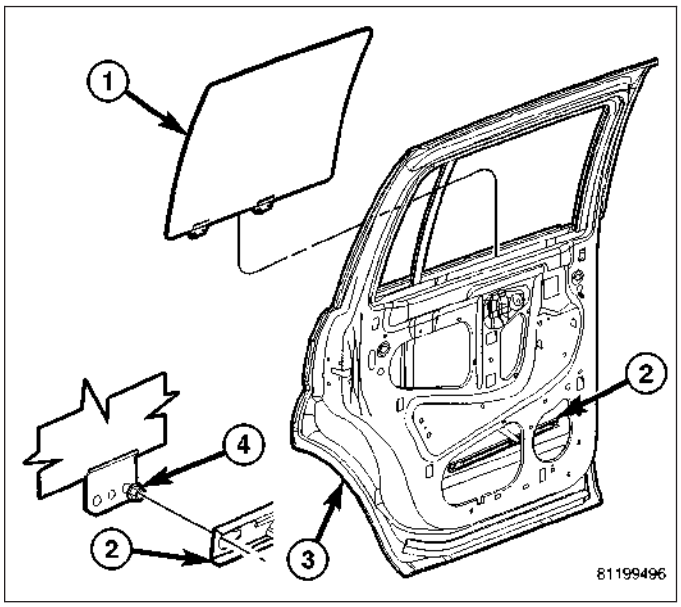
1. Remove the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - REMOVAL)
2. Separate the inner belt molding from the mounting flange from the rear to the front.
3. Insert special tool #9093 (2) between the outer belt molding (1) and glass at the rear.
4. Push down on outer belt molding (1) and rotate upper part of tool (2) outward from vehicle then lift up on molding (1) to disengage from locking tabs (3) working from back to front.

NOTE: Typical outer belt molding design shown.

5. Slide molding out from under the side view mirror and remove.



6. Temporarily install the window switch and position the glass (1) to gain access (2) to the regulator nuts (4).
7. Remove the nuts (4) and remove the glass (1).

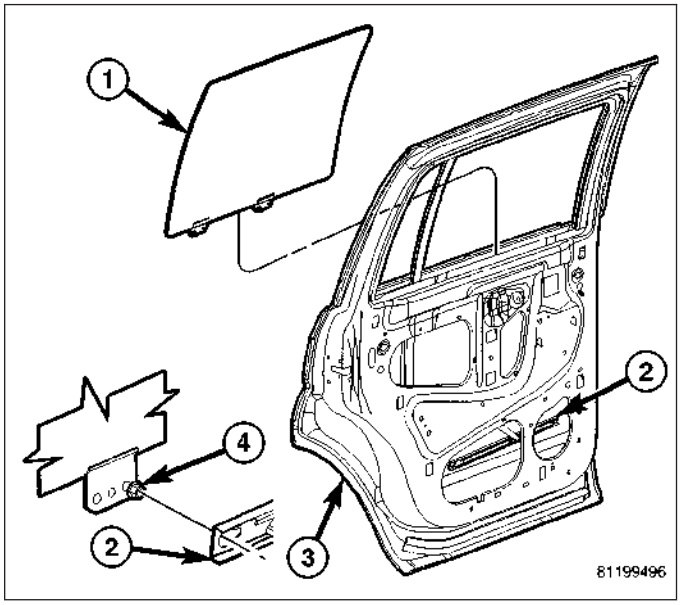


NOTE: When removing the quarter glass, remove rear glass run channel and weather strip and separate the glass from the strip. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

INSTALLATION

NOTE: When installing the quarter glass, position the glass in the glass run weather strip and seat fully then install the rear glass run channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

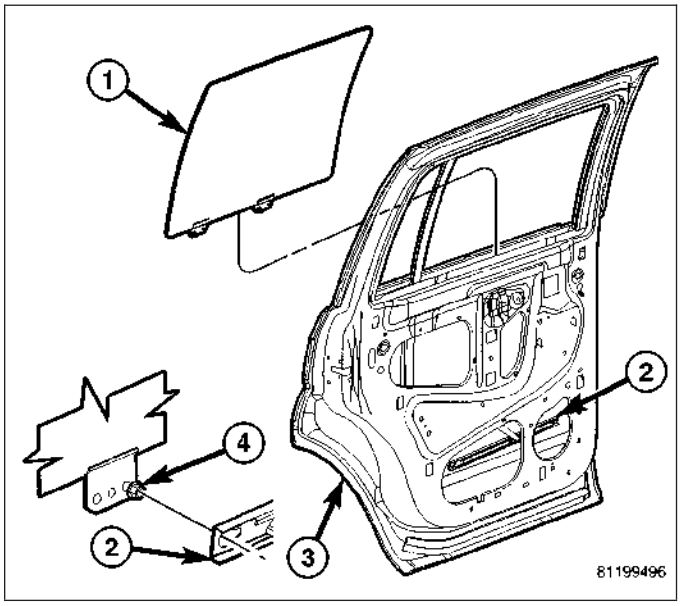
1. Position the glass into the door and install onto the regulator.
2. Install the nuts (4) and tighten to 9 N·m (80 in. lbs.).
3. Position the outer belt molding onto the door and seat the molding fully starting at the back of the door.
4. Position the inner belt molding onto the door and seat fully starting at the back of the door.
5. Install the watershield. (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - INSTALLATION)



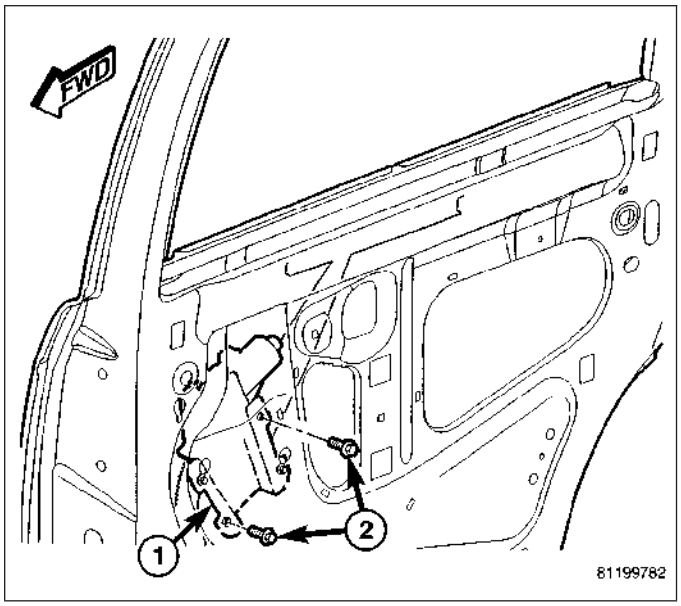
REGULATOR-WINDOW

REMOVAL

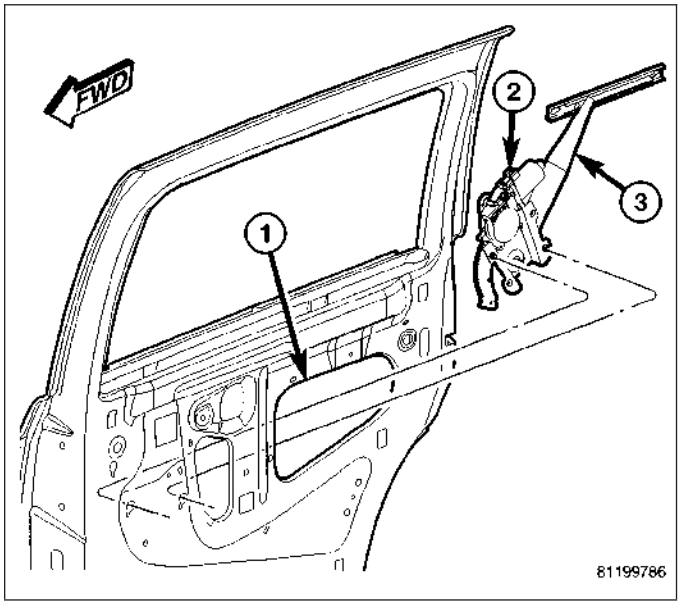
1. Remove the watershield. (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - REMOVAL)
2. Temporarily install the window switch and position the glass (1) to gain access to the regulator nuts (4).
3. Remove the nuts (4).
4. Secure the glass in the up position using a wood wedge or equivalent.



5. Remove the bolts (2) and loosen the remaining regulator bolts.

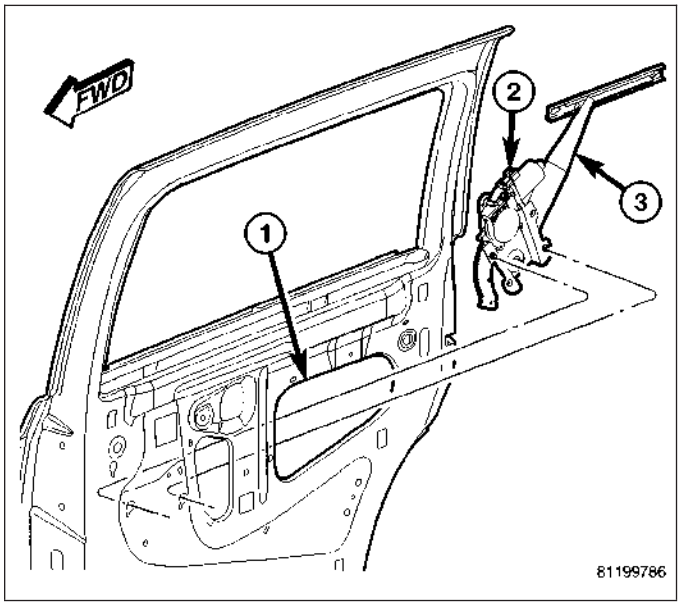


6. Separate the regulator (3) from the door panel (1) and disconnect the electrical connector (2).

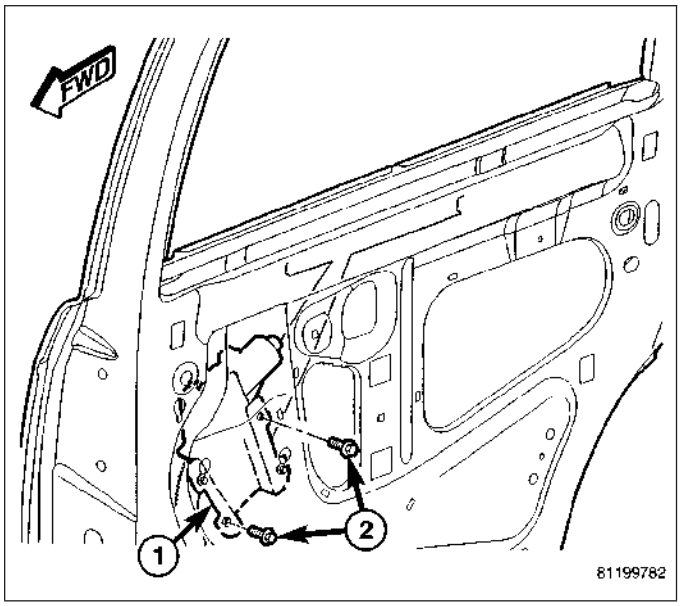


INSTALLATION

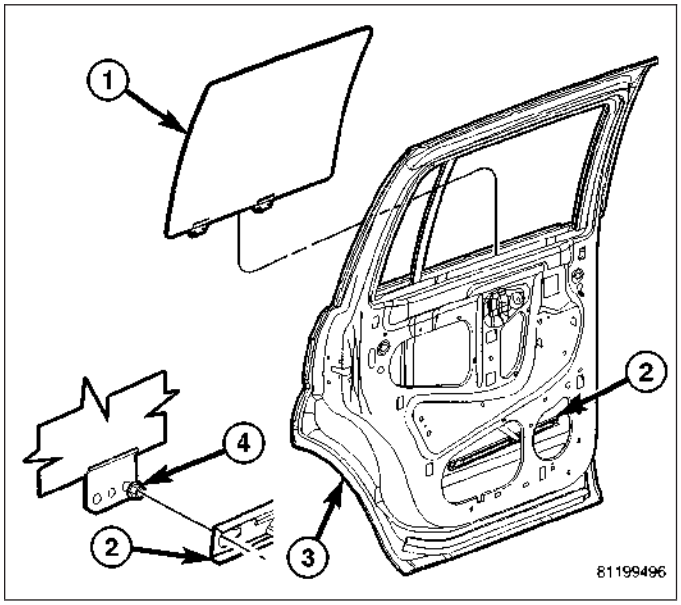
1. Position the regulator (3) into the door (1) and connect the electrical connector (2).



2. Position the regulator bolts into the keyhole slots and slide into place.
3. Install the remaining regulator bolts (2).
4. Tighten the bolts to 9 N·m (80 in. lbs.).



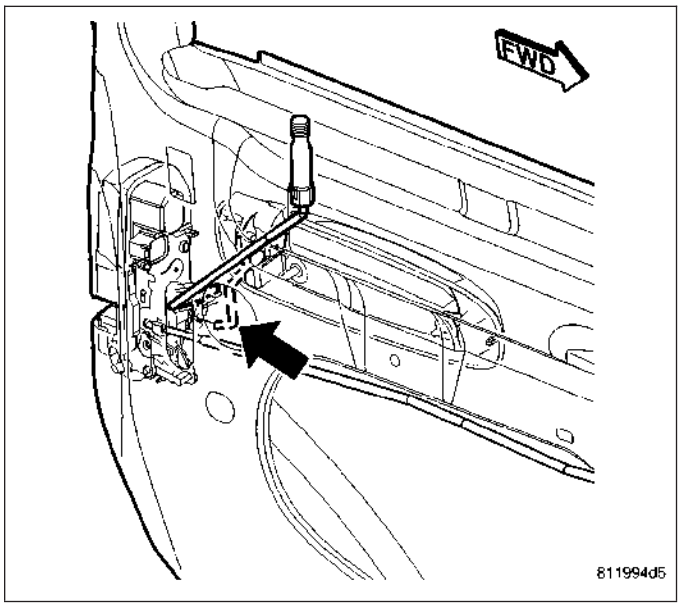
5. Position the glass (1) onto the door regulator (3).
6. Install the nuts (4) and tighten to 9 N·m (80 in. lbs.).
7. Install the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - INSTALLATION)



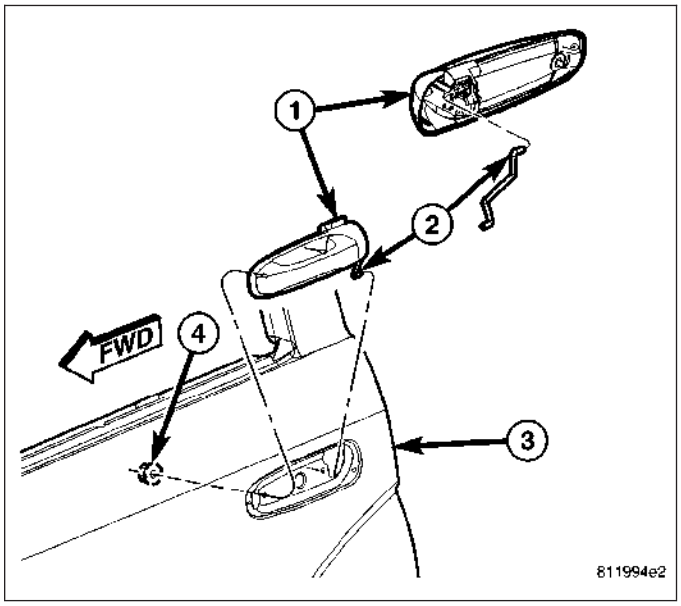
HANDLE-EXTERIOR

REMOVAL

1. Remove the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - REMOVAL)
2. Disconnect the link from the latch.

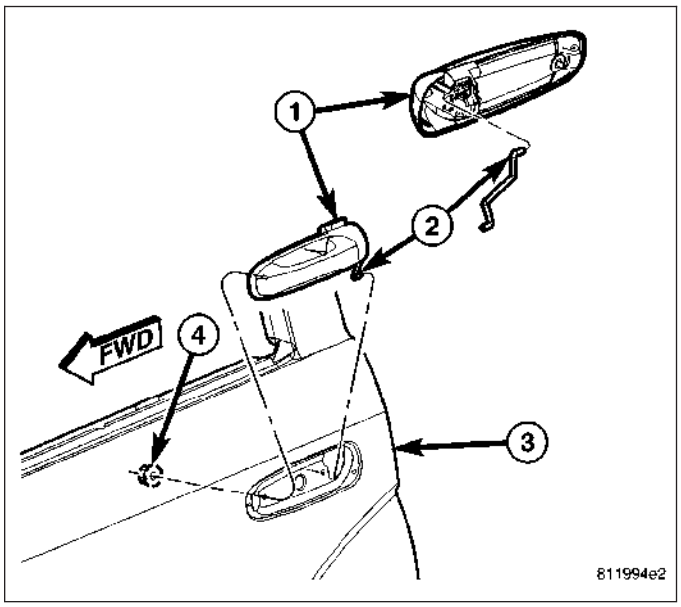


3. Remove the nut (4) and the handle (1).

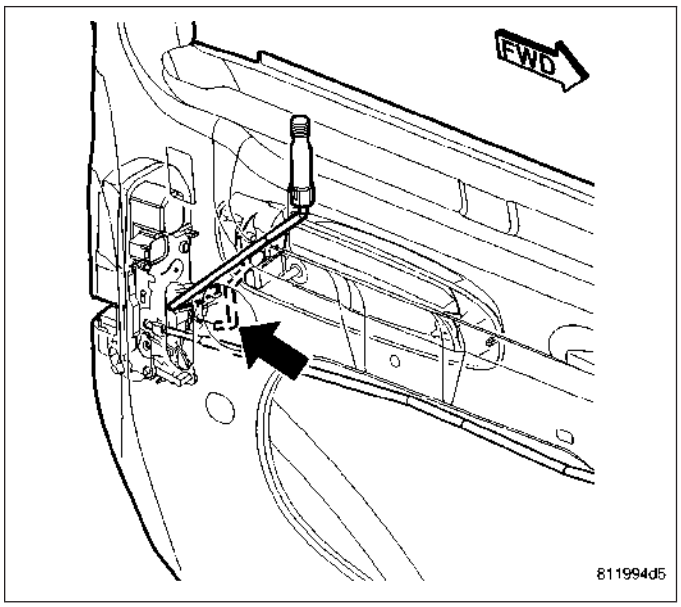


INSTALLATION

1. Position the handle (1) into the door and install the nuts (4).
2. Tighten the nuts to 5 N·m (45 in. lbs.).



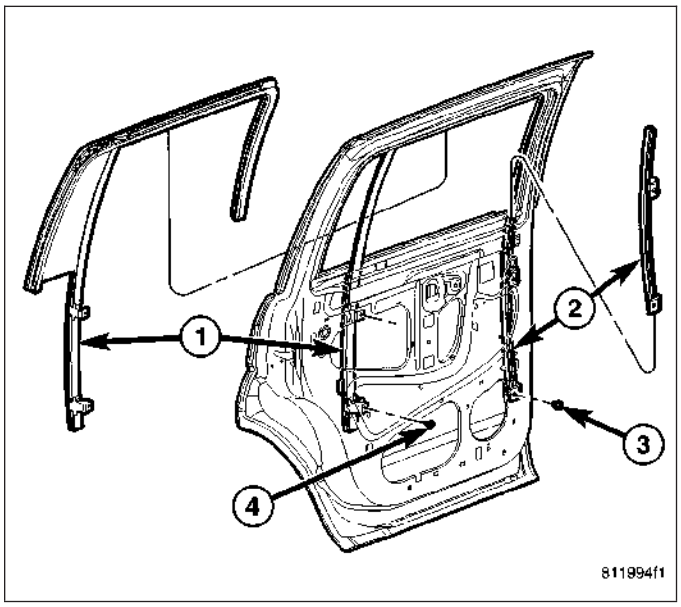
3. Connect the link.
4. Install the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - INSTALLATION)



CHANNEL-GLASS

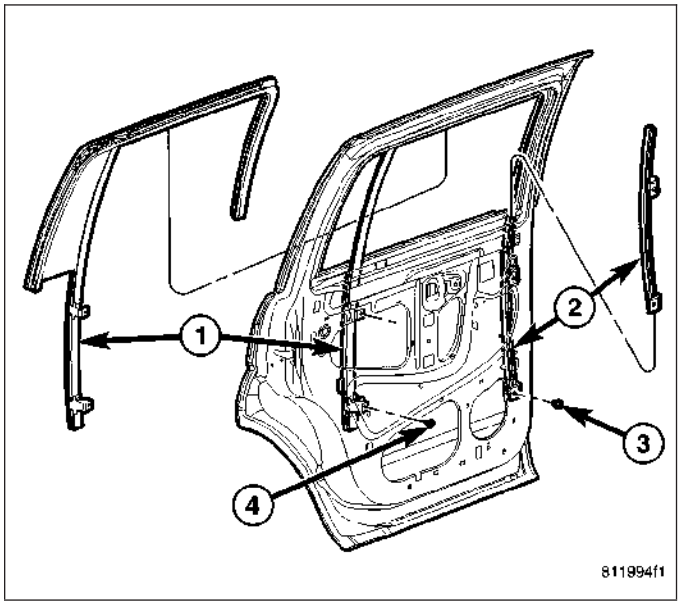
REMOVAL

1. Raise glass to the up position and remove the watershield. (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - REMOVAL)
2. Remove the inner belt molding.
3. Remove the bolt and nut (3) and remove the front channel.
4. Remove the door glass as necessary. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL)
5. Remove the bolt (4) and remove the rear glass run channel and stationary glass (1).



INSTALLATION

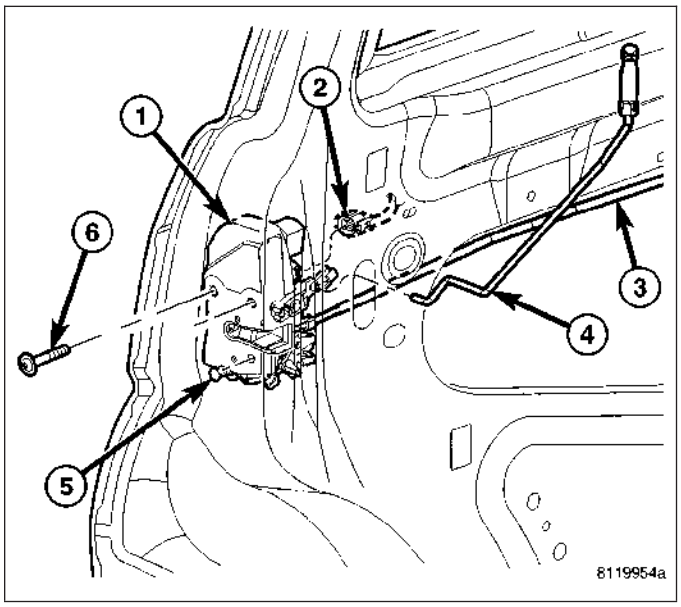
1. Install the rear glass run channel and stationary glass (1) into the door and seat fully along the door frame.
2. Install the bolt (4) and tighten to 9 N·m (80 in. lbs.).
3. Install the door glass as necessary except for the inner belt molding. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)
4. Install the front glass run channel and install the bolt and nut (3).
5. Tighten the bolt and nut (3) to 9 N·m (80 in. lbs.).
6. Install the inner belt molding and install the watershield. (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - INSTALLATION)



LATCH

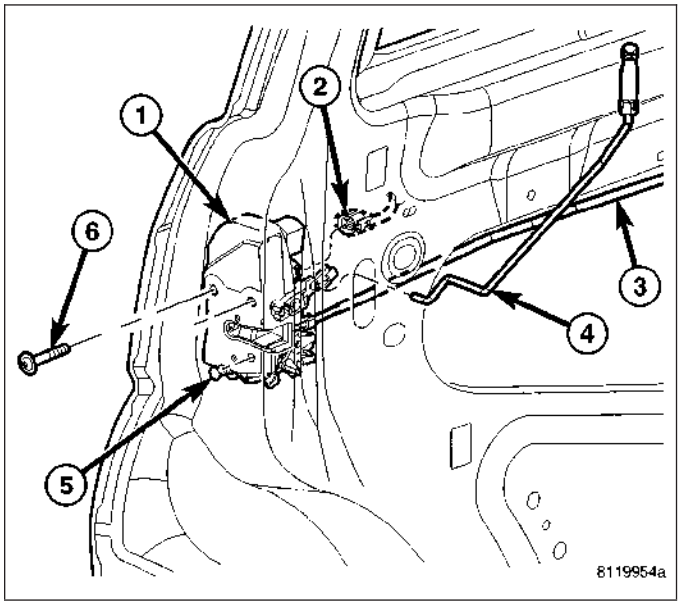
REMOVAL

1. Remove the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - REMOVAL)
2. Disconnect the latch actuator rods (3 & 4).
3. Remove the screws (5) and remove the latch (1).
4. Disconnect the electrical connector (2).



INSTALLATION

1. Position the latch (1) into the door and connect the electrical connector (2).
2. Install the latch and install the screws (5).
3. Tighten the screws to 10 N·m (85 in. lbs.).
4. Connect the actuator rods (3 & 4).
5. Install the watershield. (Refer to 23 - BODY/ DOORS - REAR/WATERSHIELD - INSTALLATION)



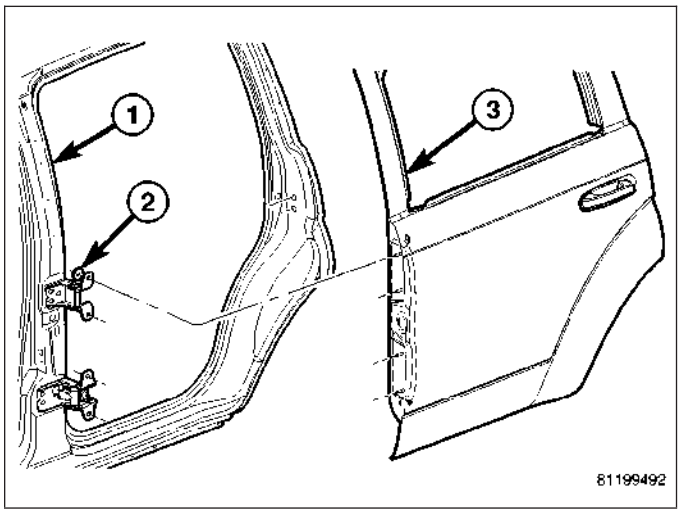
DOOR

REMOVAL

1. Disconnect the door wire harness electrical connector at the b-pillar.
2. Using a grease pencil or equivalent, mark the outline of the door hinges on the door end to aid installation.
3. Support the door with a suitable lifting device.

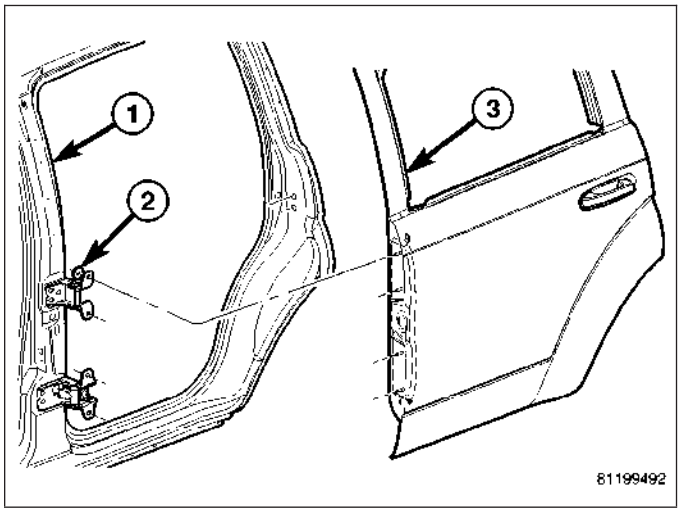
NOTE: The welded washers should not be separated from the hinge. If the washers are removed the door may have to be re-adjusted.

4. Remove the nuts attaching the door hinges (2) to the door (3).



INSTALLATION

1. Support the door with a suitable lifting device and install the door onto the hinges.
2. Install the nuts and washers, if there were removed previously, and tighten to 28 N·m (21 ft. lbs.).
3. Connect the electrical connector.
4. Adjust the door as necessary. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)



ADJUSTMENTS

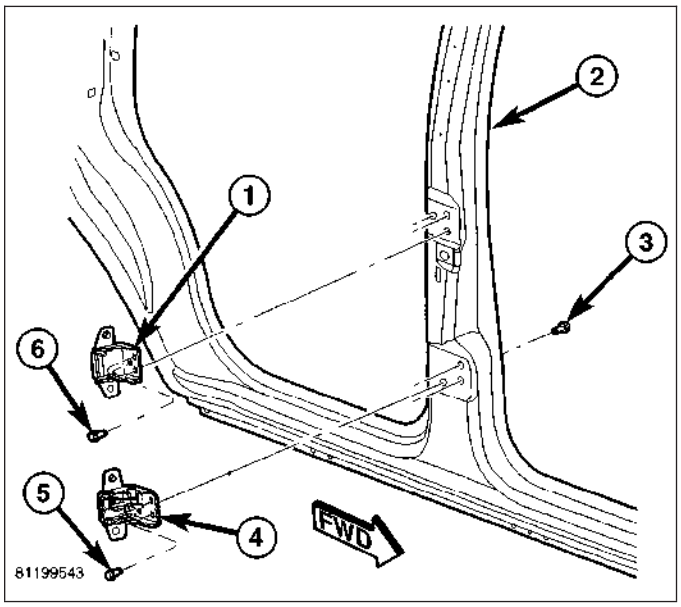
NOTE: For vehicles with four doors, it is recommended that you adjust the rear door before adjusting the front door. (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS)

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the hinge (1) to hinge pillar fasteners (3). (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL)
3. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the hinge pillar fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)



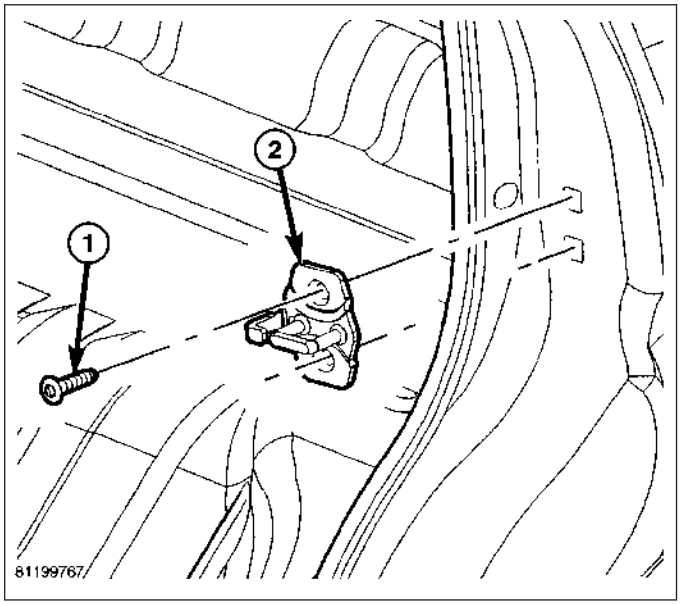
UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the welded washers with a chisel or other suitable tool.

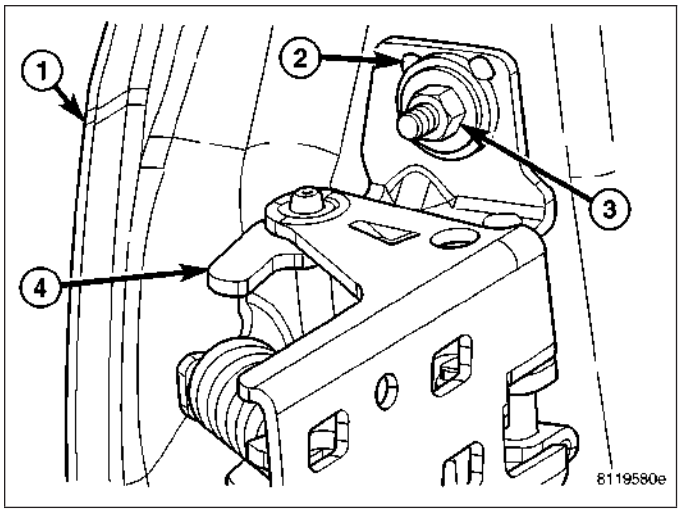
NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)



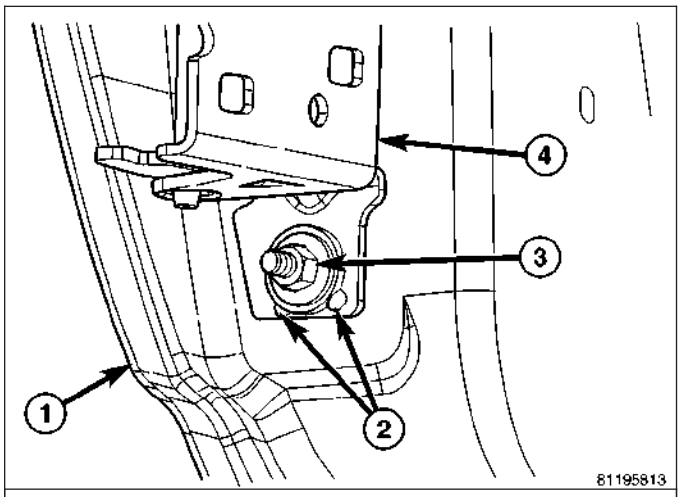
3. Loosen the hinge to door fasteners (3) (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL) or loosen the hinge to hinge pillar fasteners (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).

NOTE: When adjusting the door using the door to hinge adjustment, remove the upper hinge welds (2) and separate the washers from the hinge (4).

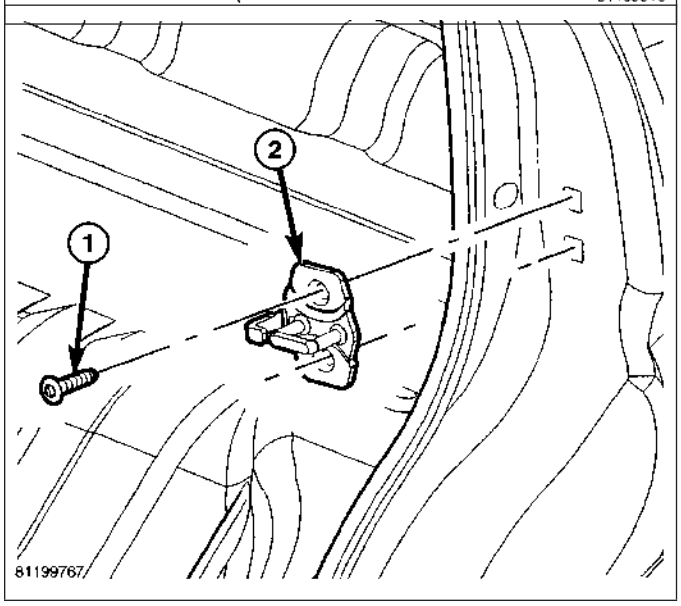


NOTE: When adjusting the door using the door to hinge adjustment, remove the lower hinge welds (2) and separate the washers from the hinge (4).

4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the hinge pillar fasteners or the door to hinges fasteners to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION)



6. Tighten the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)

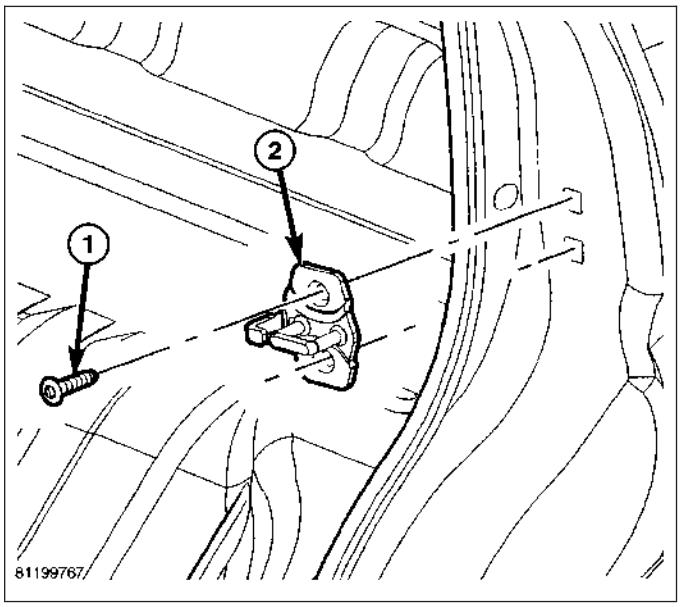


IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

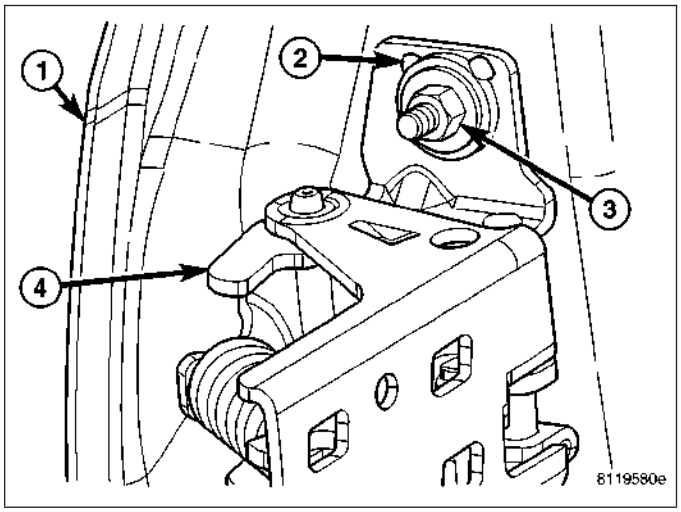
NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the welded washers with a chisel or other suitable tool.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - REMOVAL)



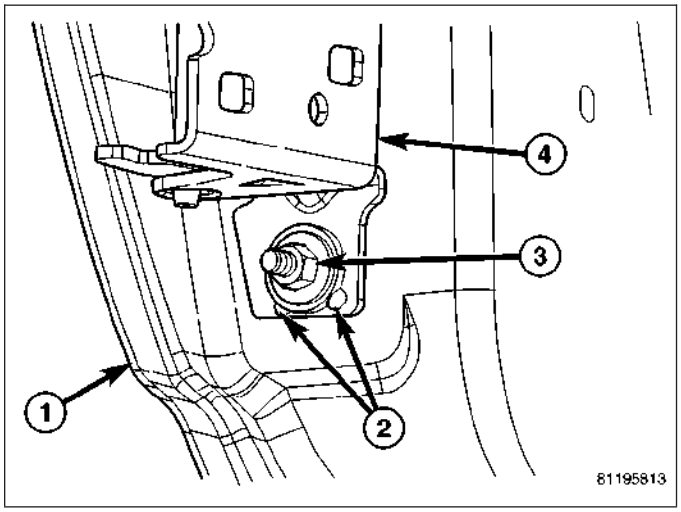
3. Loosen the hinge to door fasteners (3). (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

NOTE: When adjusting the door using the door to hinge adjustment, remove the upper hinge welds (2) and separate the washers from the hinge (4).

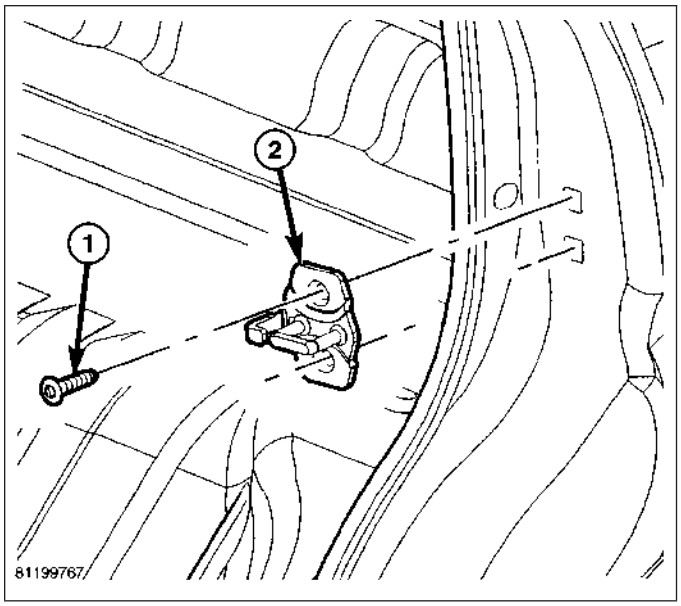


NOTE: When adjusting the door using the door to hinge adjustment, remove the lower hinge welds (2) and separate the washers from the hinge (4).

4. Adjust the door to the correct position. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten the door to hinges fasteners (3) to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)



6. Tighten the latch striker bolts (1). (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - INSTALLATION)



HINGE

REMOVAL

NOTE: It is not necessary to remove the door to replace the hinges if they are replaced one at a time.

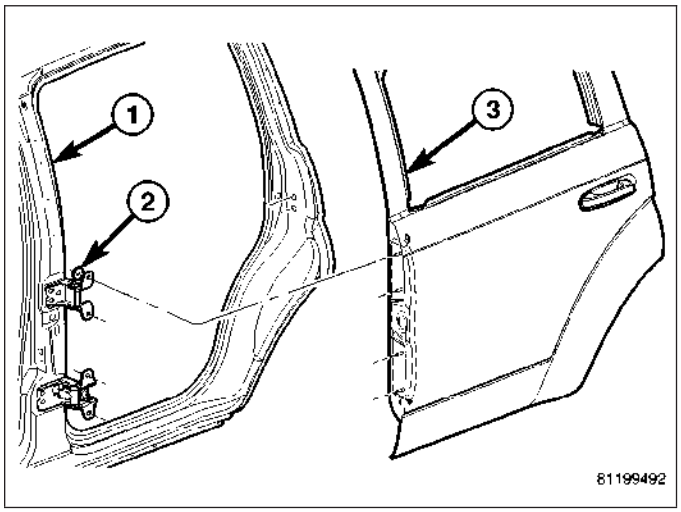
NOTE: The welded washers should not be separated from the hinge. If the washers are removed the door may have to be re-adjusted.

NOTE: A suitable body sealant should be used when removing or moving the hinges.

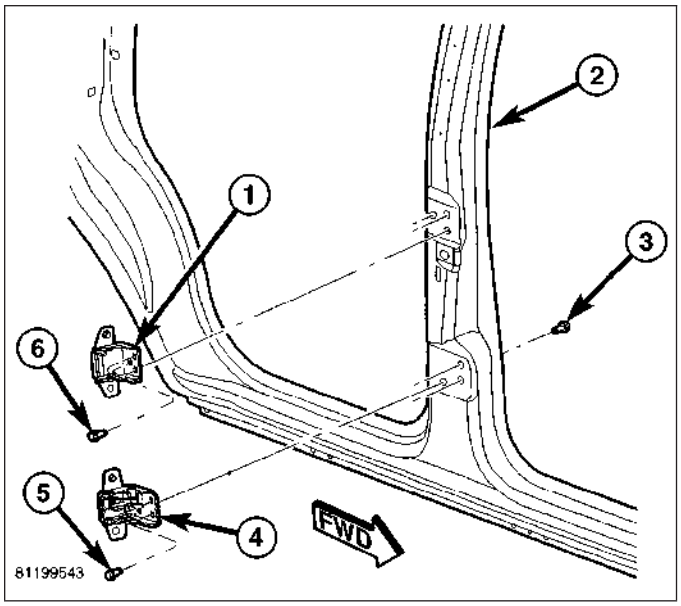
1. Open the front door.

UPPER HINGE

1. Using a grease pencil or equivalent, mark the position of the hinge on the door and b-pillar.
2. Remove the nuts (2) attaching the hinge to the door (3).

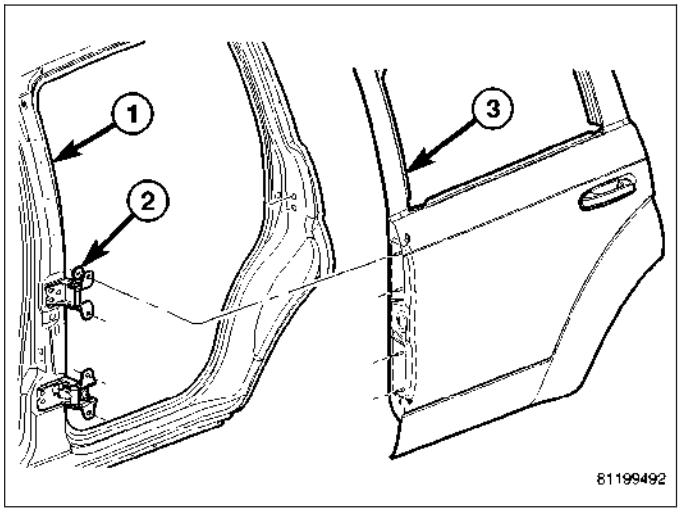


3. Remove the three bolts (6) attaching the hinge (1) to the b-pillar (2) and remove the hinge.

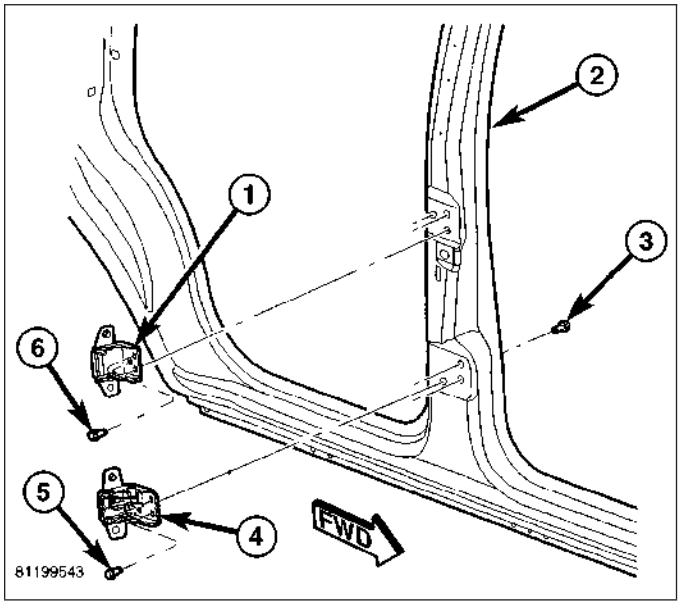


LOWER HINGE

1. Using a grease pencil or equivalent, mark the position of the hinge on the door and b-pillar.
2. Remove the lower b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
3. Remove the nuts (2) attaching the hinge to the door (3).



4. Remove the two bolts (5) attaching the hinge (4) to the b-pillar (2).
5. From the inside of the vehicle remove the remaining bolt (3) attaching the hinge (4) to the b-pillar (2) and remove the hinge.

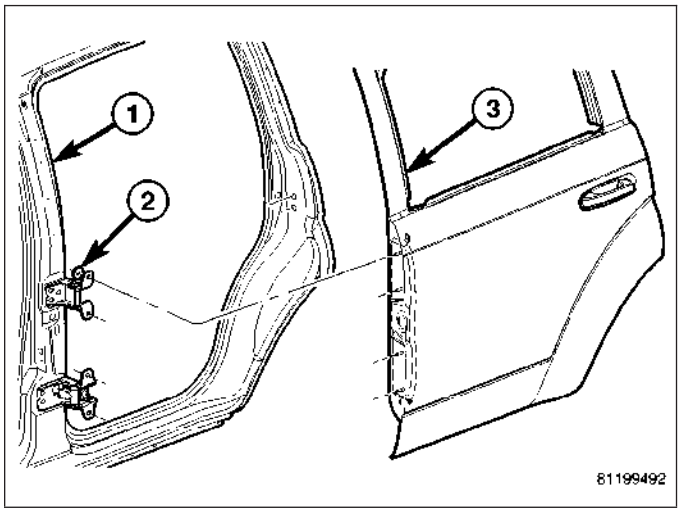


INSTALLATION

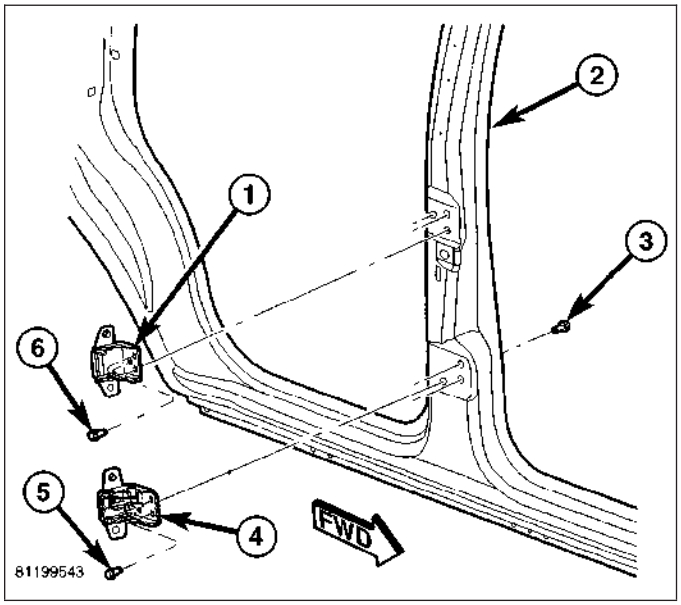
UPPER HINGE

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the hinge to door washers, if there were removed previously, and nuts (2) and tighten to 28 N·m (21 ft. lbs.).



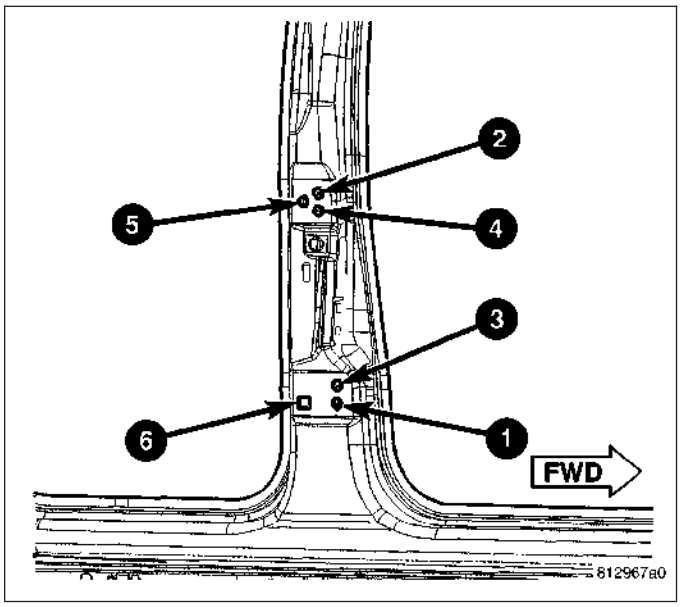
2. Install the three hinge to b-pillar bolts (6).



3. Tighten the bolts to 28 N·m (21 ft. lbs.) using the sequence shown.

NOTE: Right hand door shown, left hand door opposite.

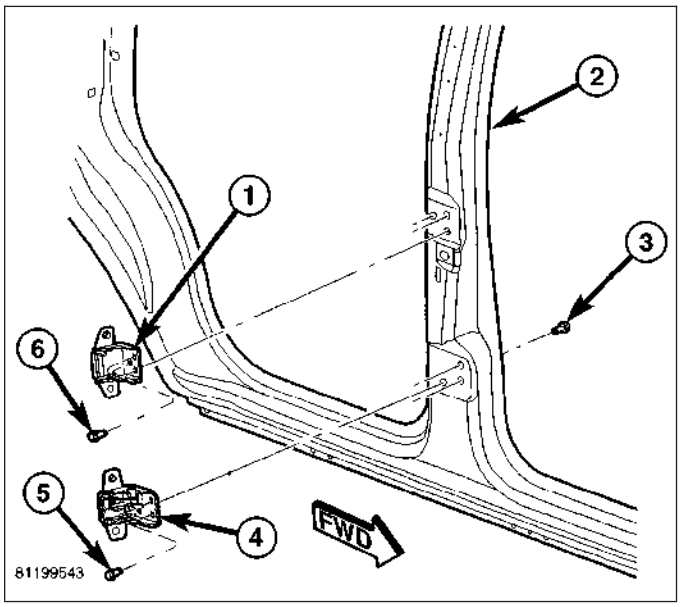
4. Adjust the door if needed. (Refer to 23 - BODY/ DOORS - REAR/DOOR - ADJUSTMENTS)



LOWER HINGE

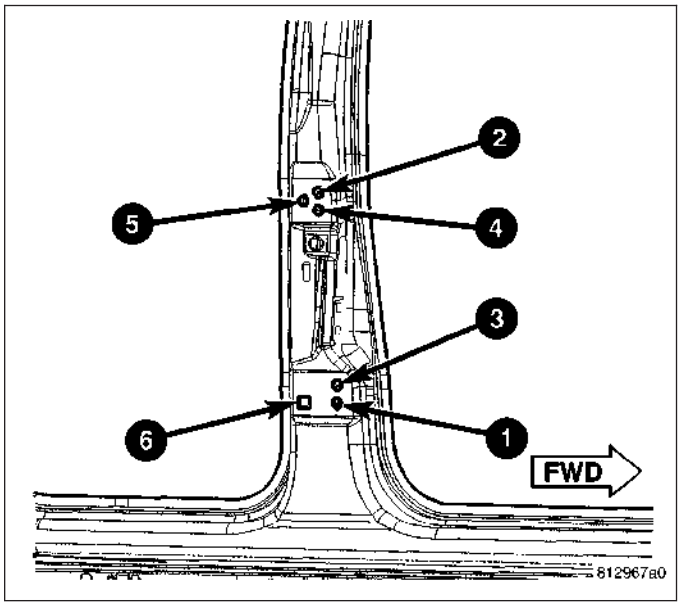
NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Install the hinge (4) and install the b-pillar bolts (5 & 3).

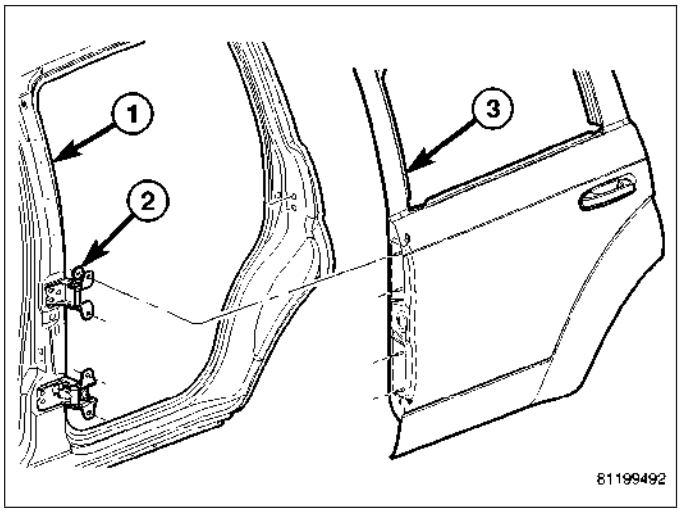


2. Tighten the bolts to 28 N·m (21 ft. lbs.) using the sequence shown.

NOTE: Right hand door shown, left hand door opposite.



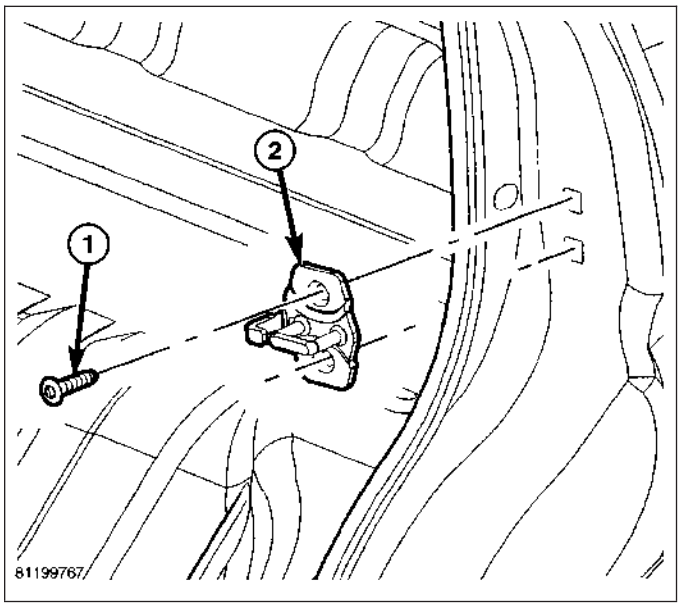
3. Install the hinge to door washers, if there were removed previously, and nuts (2) and tighten to 28 N·m (21 ft. lbs.).
4. Adjust the door if needed. (Refer to 23 - BODY/ DOORS - REAR/DOOR - ADJUSTMENTS)
5. Install the lower b-pillar trim. (Refer to 23 - BODY/ INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)



STRIKER

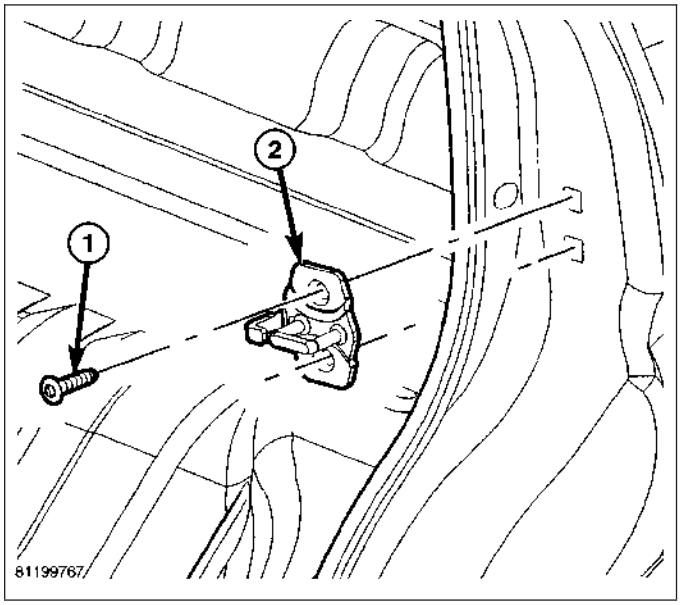
REMOVAL

1. Using a grease pencil or equivalent, mark the position of the striker (2).
2. Remove the bolts (1) and remove the striker.



INSTALLATION

1. Install the striker and install the bolts.
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Adjust the striker if needed. (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - ADJUSTMENTS)



ADJUSTMENTS

ADJUSTMENT

1. Using a grease pencil or equivalent, mark the position of the striker (2) to aid in adjustment.
2. Loosen the striker bolts (1).
3. Change the striker position to adjust the rear gap and flush measurement. (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the bolts to 28 N·m (21 ft. lbs.).

PANEL-TRIM

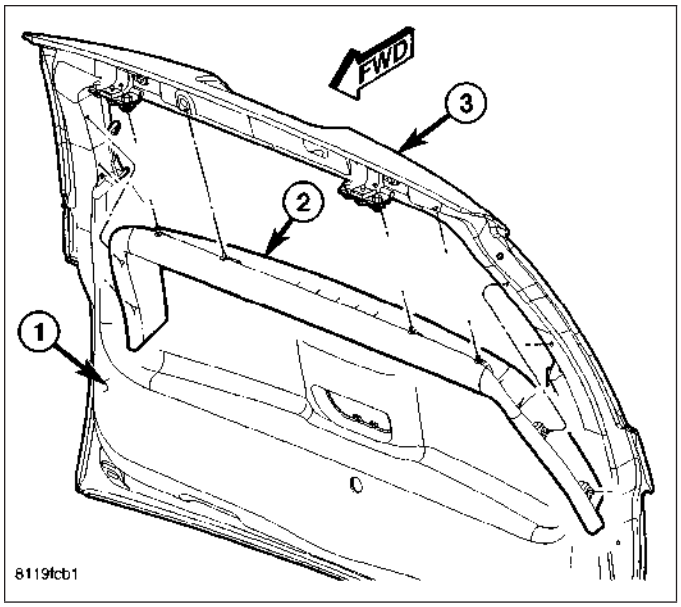
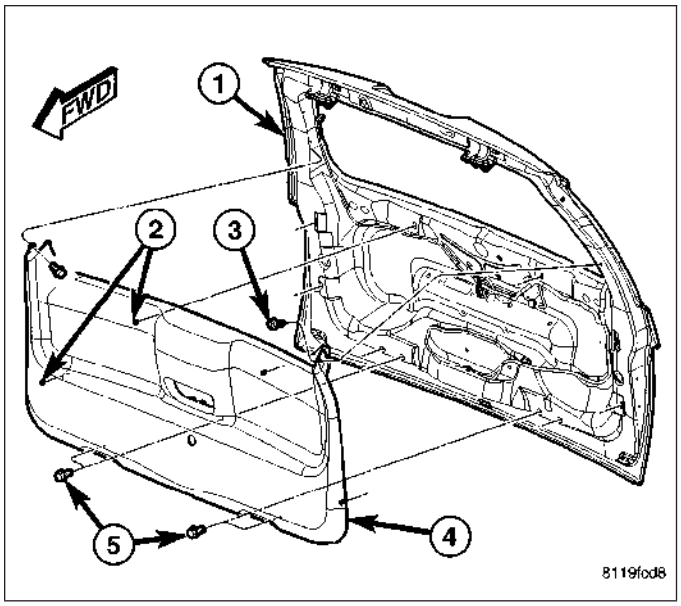
REMOVAL

1. Using a trim stick C-4829-A or equivalent, separate the pushpin fasteners and remove the upper trim panel (2).

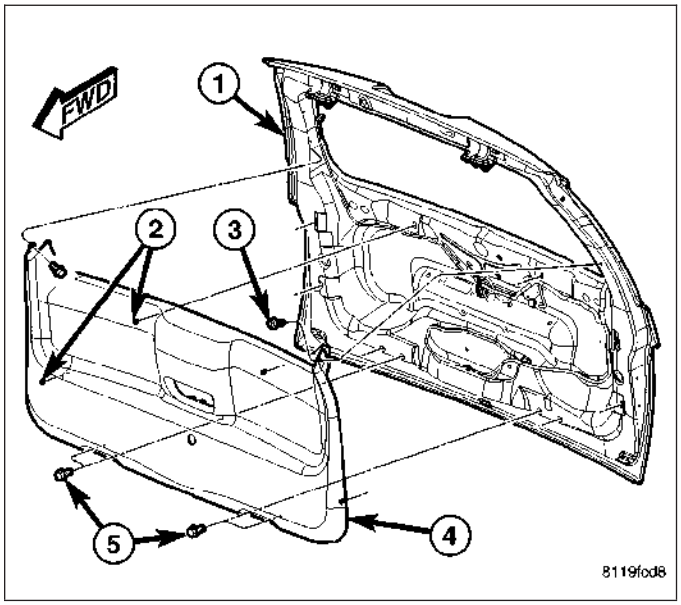


2. Remove the two upper screws (3) and the four lower screws (5).
3. Remove the lower trim panel (4) and disconnect the electrical connector.

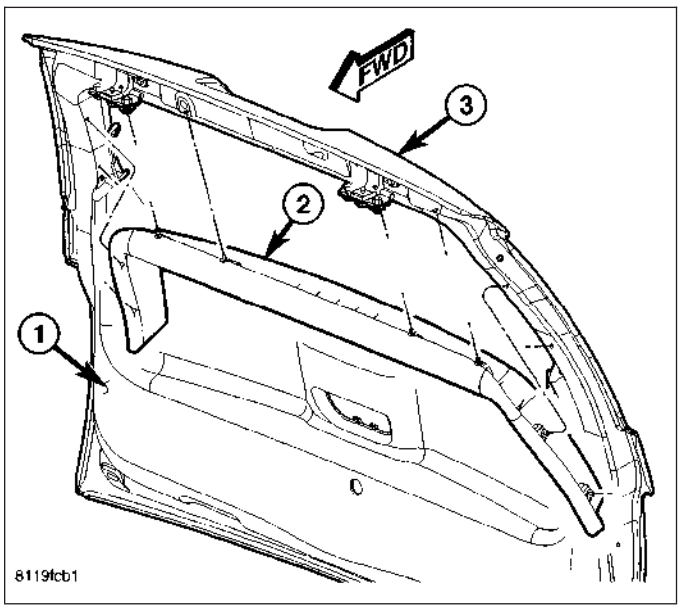


INSTALLATION

1. Connect the electrical connector and install the lower trim panel (4) onto the guide pins (2).
2. Install the four lower screws (5) and two upper screws (3).



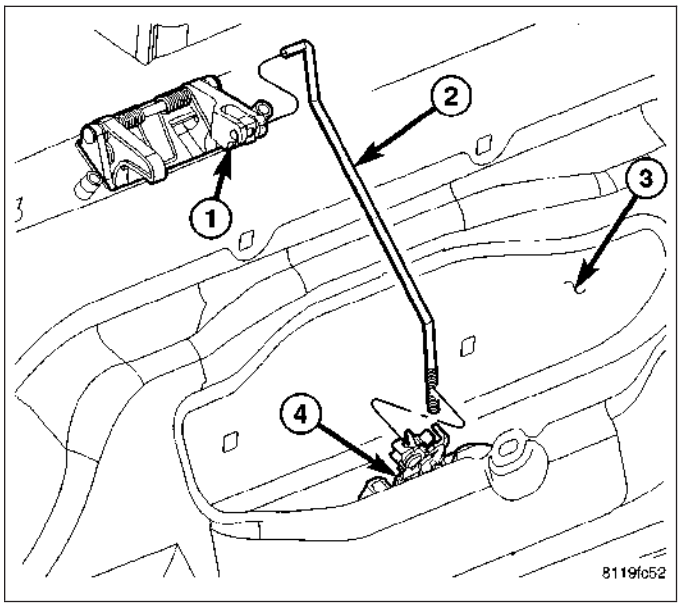
3. Position the upper trim (2) into place and seat the push pin fasteners fully.



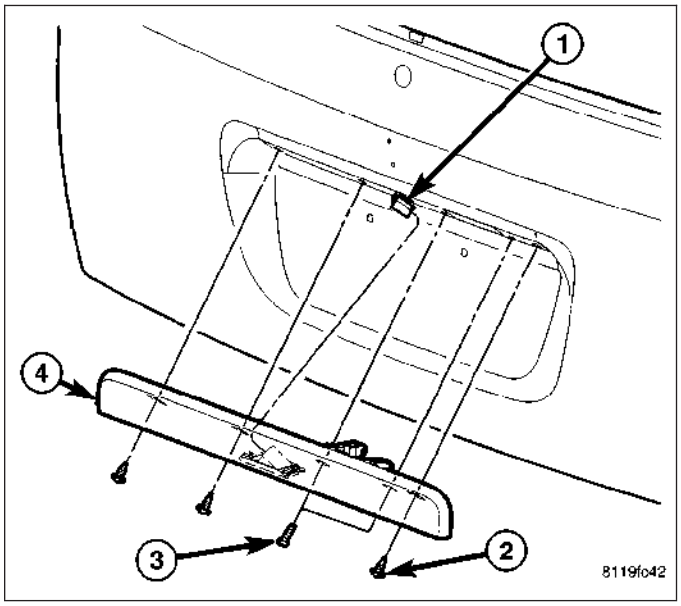
HANDLE

REMOVAL

1. Remove the trim panels. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL)
2. Disconnect the latch actuator rod (2).

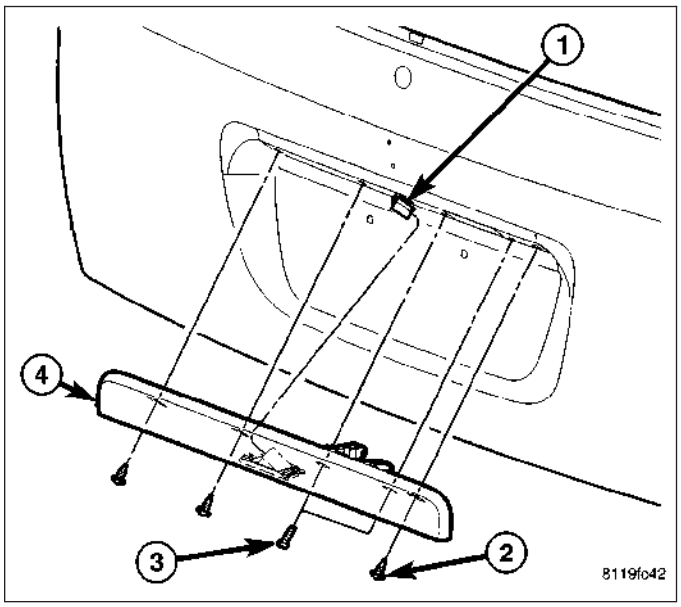


3. Remove the screws (2 & 3) and remove the handle.
4. Disconnect the electrical connector (1).

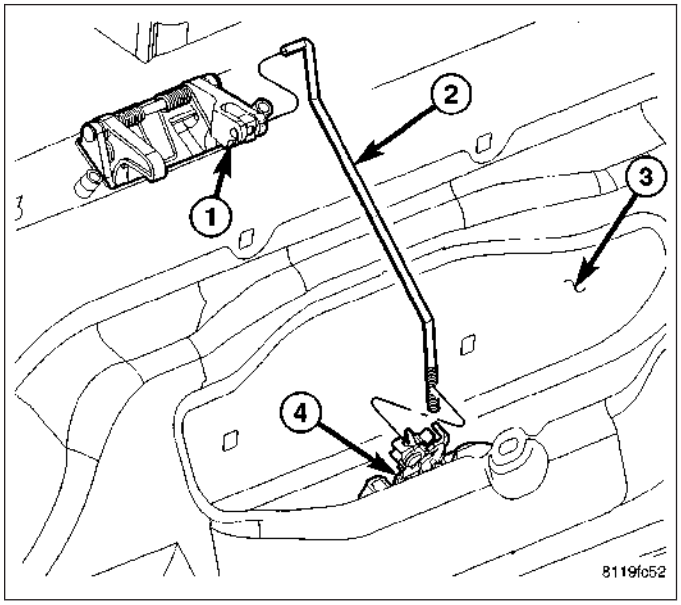


INSTALLATION

1. Connect the electrical connector (1) and install the handle (4).
2. Install the screws (2 & 3).



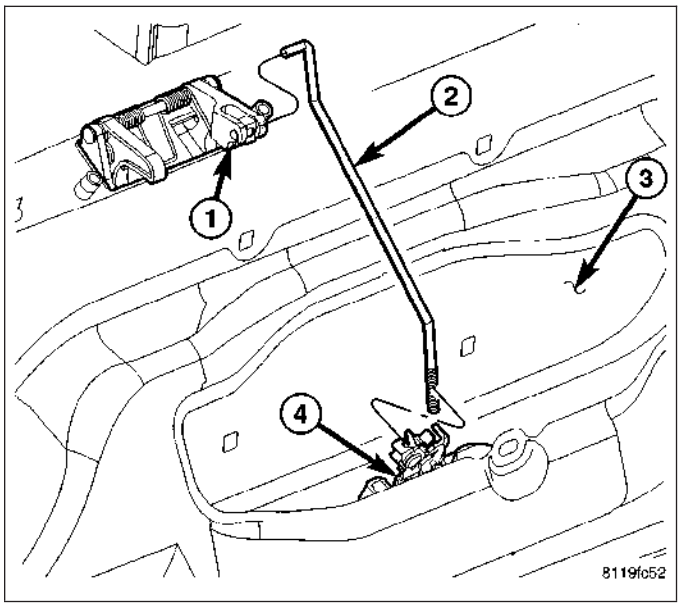
3. Connect the latch actuator rod (2) to the handle (1).
4. Install the trim panels. (Refer to 23 - BODY/DECK-LID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION)



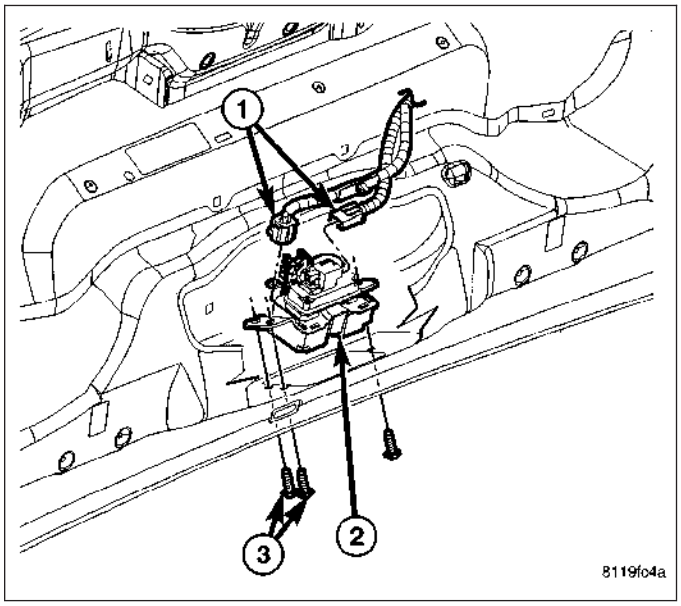
LATCH

REMOVAL

1. Remove liftgate trim panels. (Refer to 23 - BODY/ LIFTGATE/TRIM PANEL - REMOVAL)
2. Disconnect the exterior handle actuator rod (2).

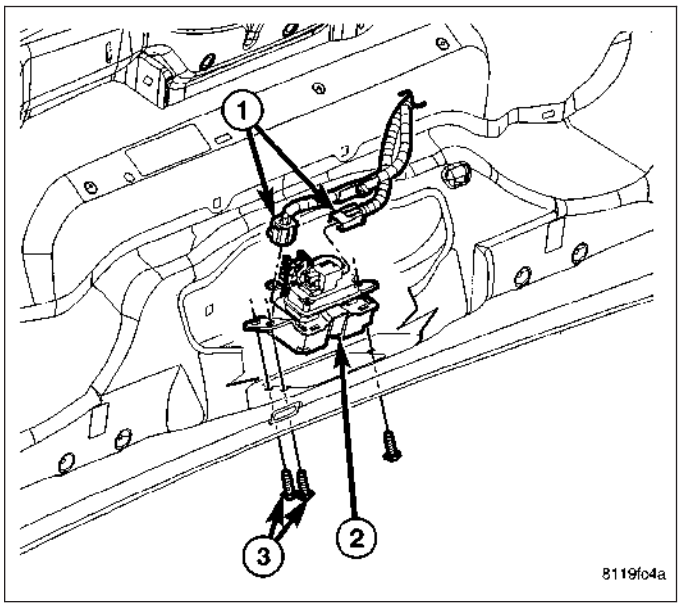


3. Disconnect the electrical connectors (1).
4. Remove the screws (3) and remove the latch (2).



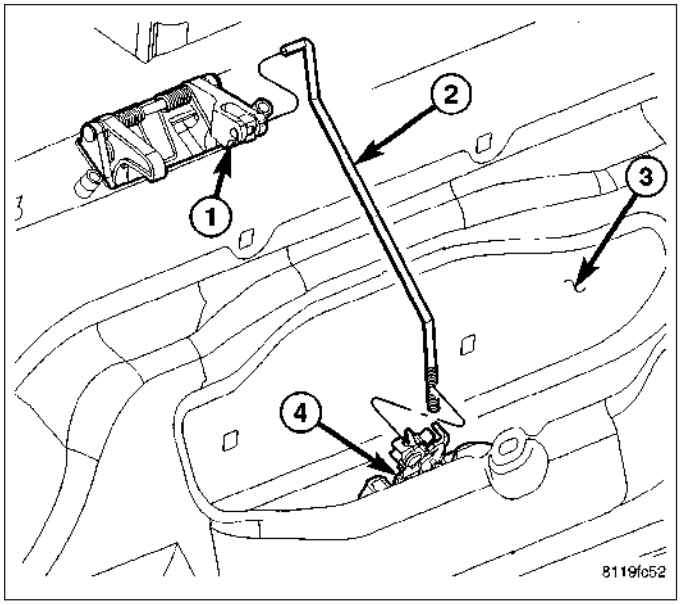
INSTALLATION

1. Position the latch (2) into the liftgate and install the screws (3).
2. Tighten the screws to 11 N·m (95 in. lbs.).
3. Connect the electrical connectors (1).



Connect the latch actuator rod (2) to the exterior handle (1) and the latch (4).

4. Install the trim panels. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - INSTALLATION)

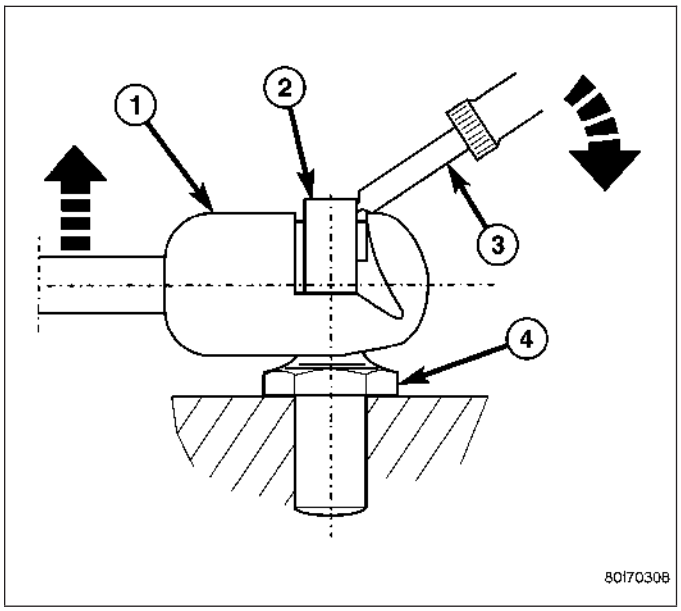


SUPPORT-STRUT

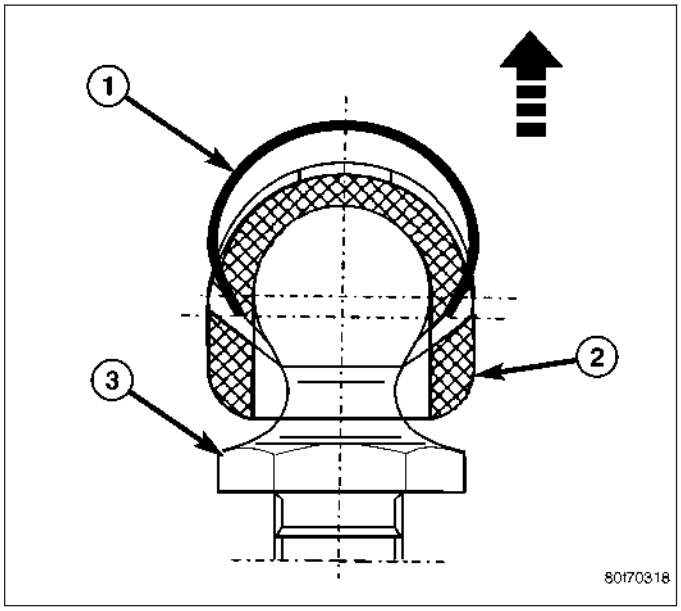
REMOVAL

WARNING: DO NOT REMOVE THE LIFTGATE SUPPORT RODS WITH THE LIFTGATE CLOSED. THE SUPPORT ROD PISTONS ARE OPERATED BY HIGH PRESSURE GAS AND COULD CAUSE PERSONAL INJURY AND/OR VEHICLE DAMAGE IF THEY ARE REMOVED WITH THE PISTONS COMPRESSED (LIFTGATE CLOSED). ONCE REMOVED, DO NOT ATTEMPT TO DISASSEMBLE OR REPAIR THE SUPPORT RODS.

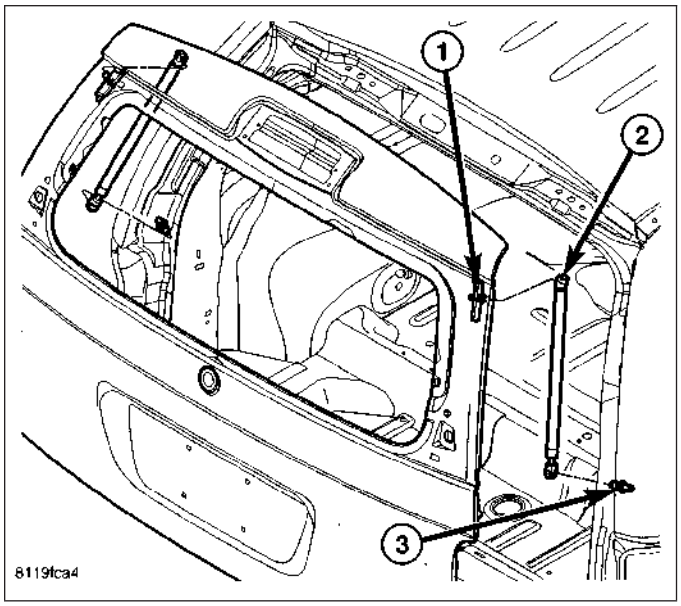
1. Open the liftgate and support.
2. Using a small flat bladed tool (3), or equivalent, release the retaining clips (2) while pulling the ball socket (1) away from the ball stud (4).



NOTE: Lift the clips (1) only enough to release the ball studs (3).



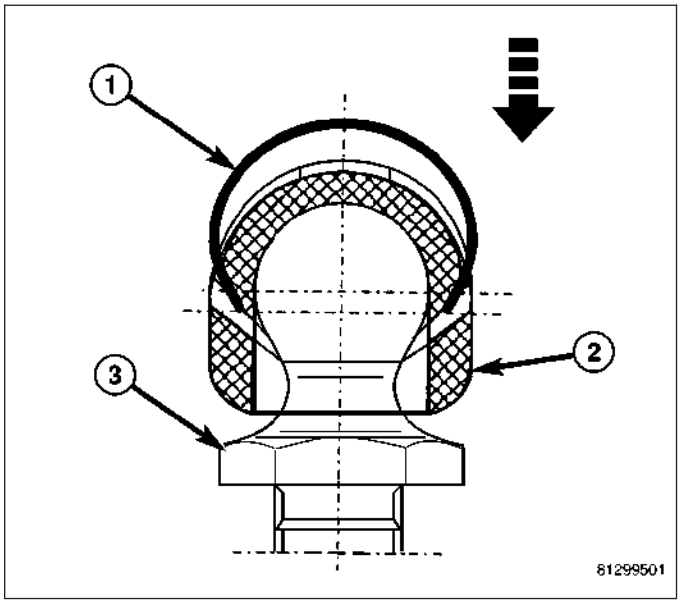
3. Remove the support cylinder (2) from the upper (1) and lower (3) ball studs.



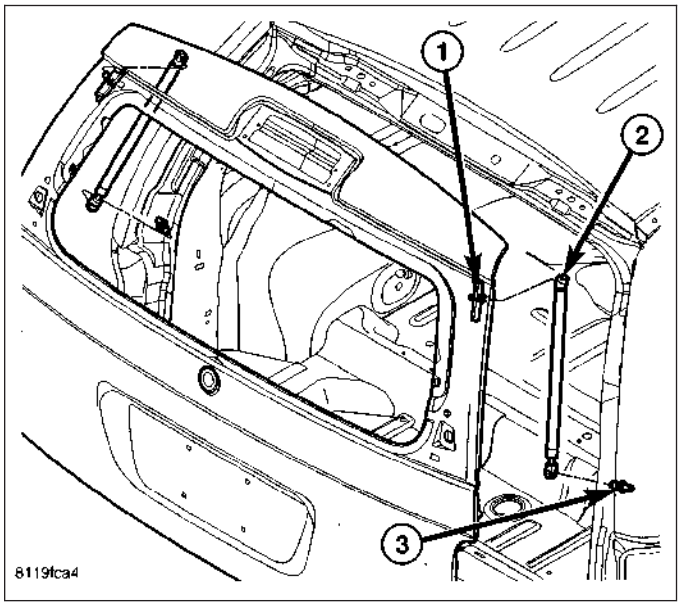
INSTALLATION

WARNING: DO NOT REMOVE THE LIFTGATE SUPPORT RODS WITH THE LIFTGATE CLOSED. THE SUPPORT ROD PISTONS ARE OPERATED BY HIGH PRESSURE GAS AND COULD CAUSE PERSONAL INJURY AND/OR VEHICLE DAMAGE IF THEY ARE REMOVED WITH THE PISTONS COMPRESSED (LIFTGATE CLOSED). ONCE REMOVED, DO NOT ATTEMPT TO DISASSEMBLE OR REPAIR THE SUPPORT RODS.

1. Make sure the retaining clips (1) are seated into the ball socket (2) fully.



2. Install the support cylinder (2) over the ball studs (1 & 3) with the thin end connected to the body and the retaining clips snapping into place.

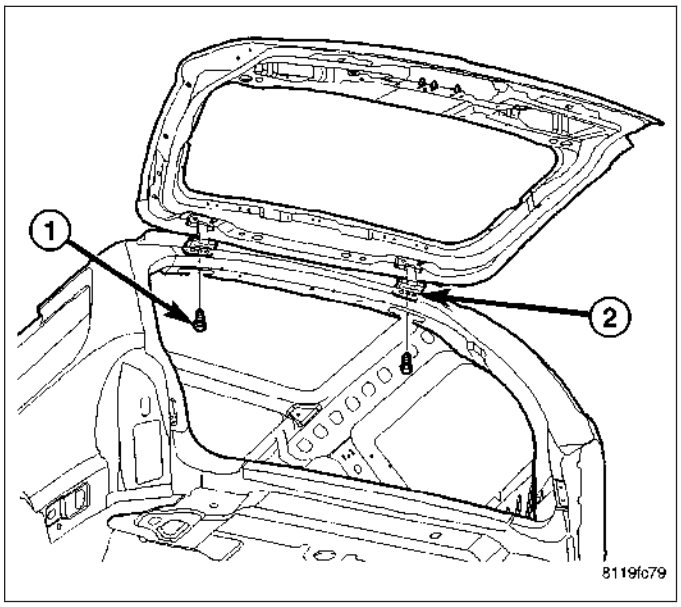


LIFTGATE

REMOVAL

WARNING: Do not disconnect the support rod cylinders with the liftgate closed. The support rod pistons are operated by high pressure gas. This pressure could cause damage and/or personal injury if they are removed while the pistons are compressed.

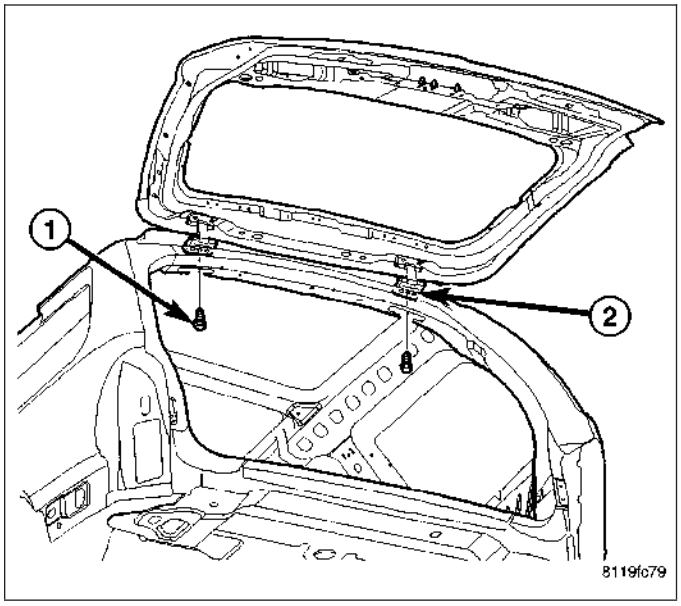
1. Open and support the liftgate.
2. Using a trim stick C-4755 or equivalent, remove the upper rear headliner trim.
3. Remove the support cylinders from the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/SUPPORT CYLINDER - REMOVAL)
4. Disconnect the wire harnesses and the washer hose.
5. Using a grease pencil or equivalent, mark the hinge location.
6. Remove the six liftgate to body bolts (1) and remove liftgate from vehicle.



INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Position the liftgate onto the vehicle and install the six body bolts (1).
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Check and adjust the liftgate if necessary. (Refer to 23 - BODY/LIFTGATE/LIFTGATE - ADJUSTMENTS)
4. Position the upper rear headliner trim and seat fully.

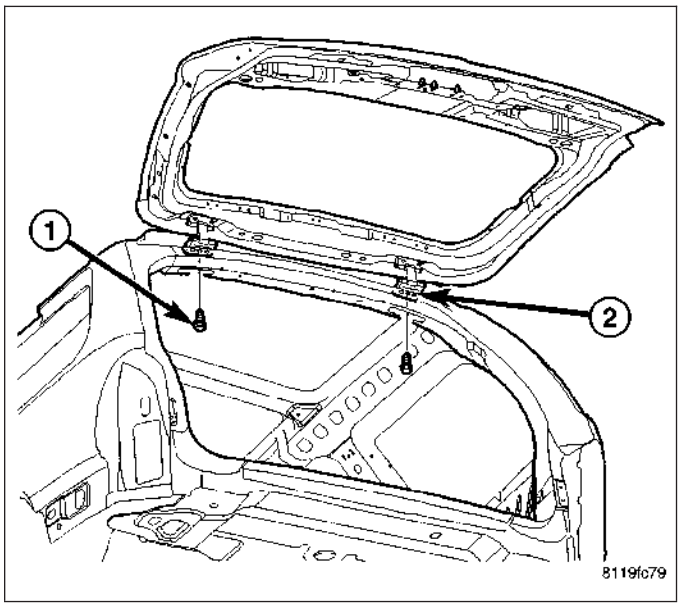


ADJUSTMENTS

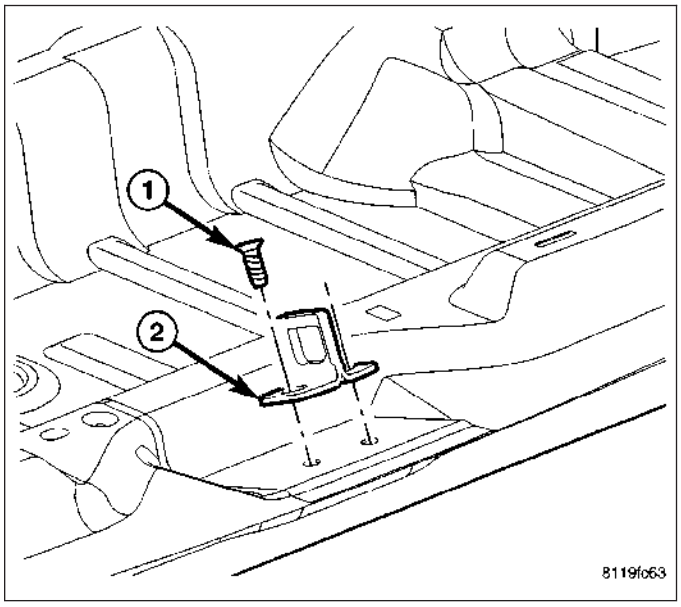
NOTE: The position of the liftgate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use a body sealer on the hinge to body mating surface.

In/out

1. Using a trim stick C-4755 or equivalent, remove the upper rear headliner trim.
2. For the upper lift gate adjustments, loosen the six hinge to header bolts (1) and adjust to specifications (Refer to 23 - BODY/BODY STRUCTURE/ GAP AND FLUSH - SPECIFICATIONS)
3. Tighten the hinge bolts to 28 N·m (21 ft. lbs.).

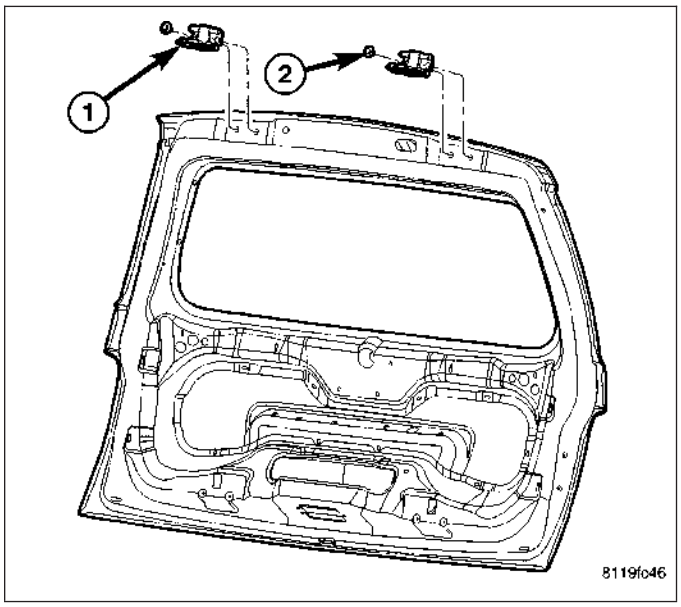


4. Open the load floor, remove the scuff plate screws and remove liftgate trim scuff plate.
5. For the lower lift gate adjustments, loosen the striker screws (1) and adjust to specifications (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
6. Tighten the striker screws to 28 N·m (21 ft. lbs.).
7. Install the liftgate trim scuff plate and install the screws.
8. Position the upper rear headliner trim and seat fully.

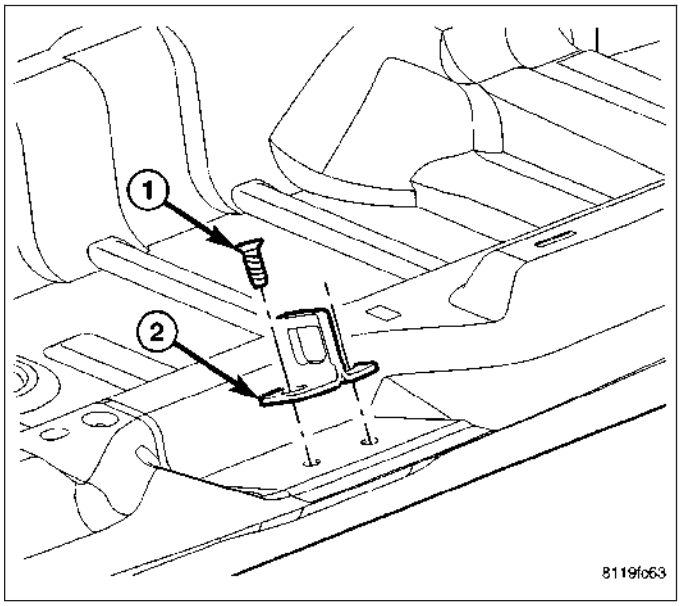


Up/Down and Left/Right

1. Loosen the hinge to liftgate bolts (2).



2. Open the load floor, remove the scuff plate screws and remove liftgate trim scuff plate.
3. Loosen the striker screws (1).
4. Adjust the liftgate up/down position and tighten the hinge bolts to 28 N·m (21 ft. lbs.). (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Confirm the lower liftgate in/out position and tighten the striker screws to 28 N·m (21 ft. lbs.).
6. Install the liftgate trim scuff plate and install the screws.



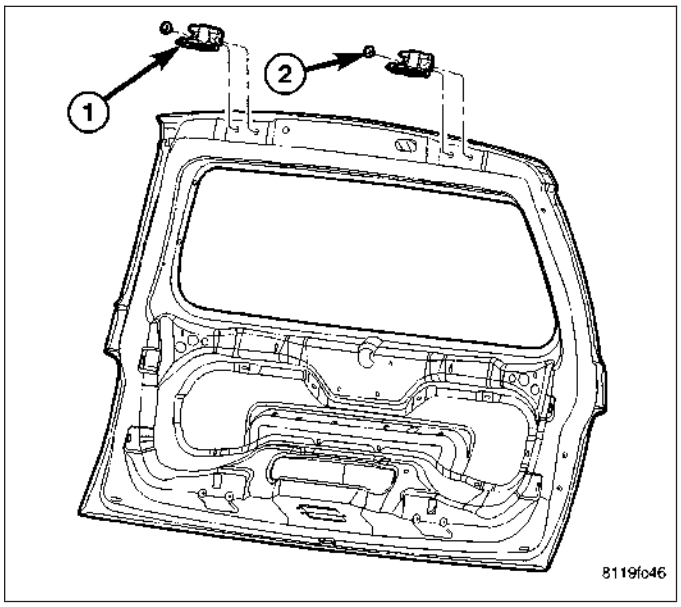
HINGE

REMOVAL

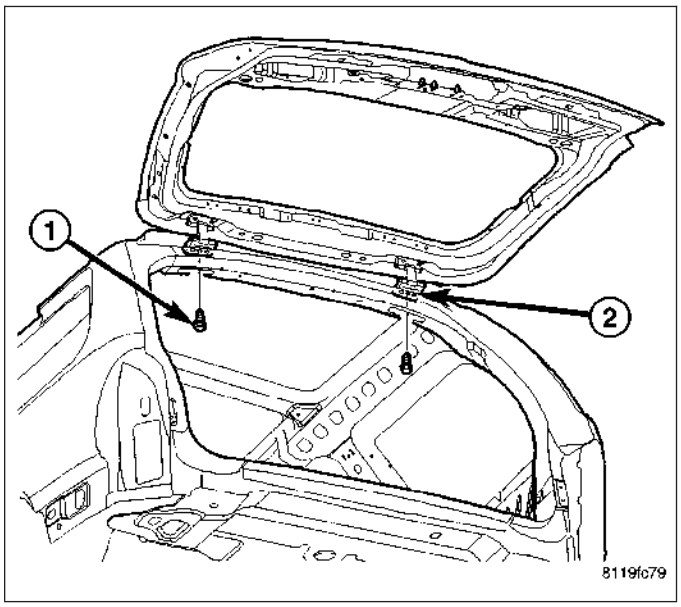
NOTE: It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. Support liftgate on a suitable lifting device.
2. Using a trim stick C-4755 or equivalent, remove the upper rear headliner trim.
3. Using a grease pencil or equivalent, mark the location of the hinge to aid installation.
4. Remove the liftgate bolts (2).



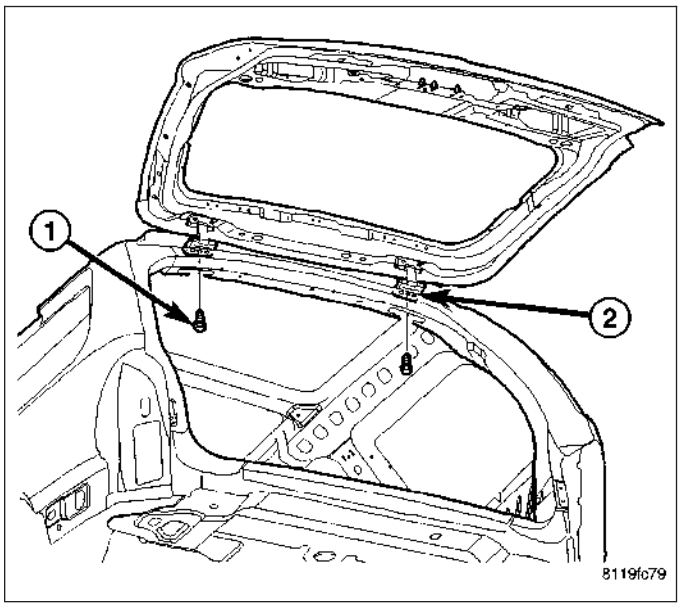
5. Remove the body bolts (1) and remove the hinge.



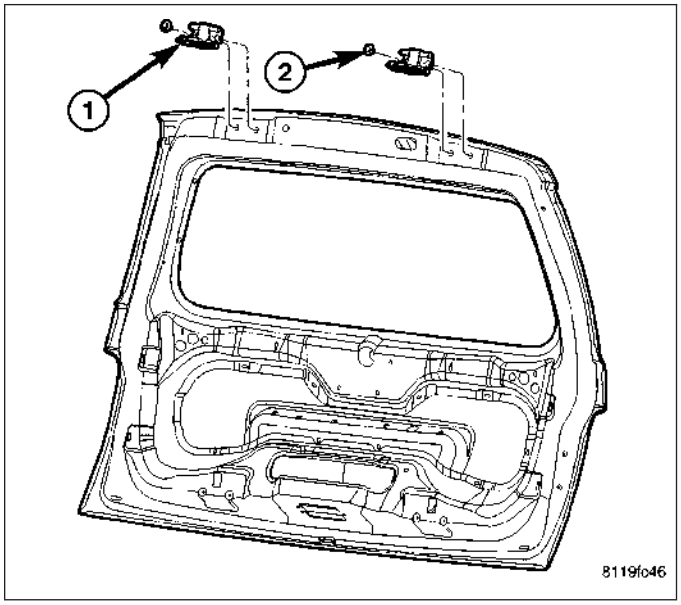
INSTALLATION

NOTE: A suitable body sealant should be used when removing or moving the hinges.

1. If necessary, paint replacement hinge before installation.
2. Install the hinge (2) and install the body bolts (1).
3. Tighten the bolts to 28 N·m (21 ft. lbs.).



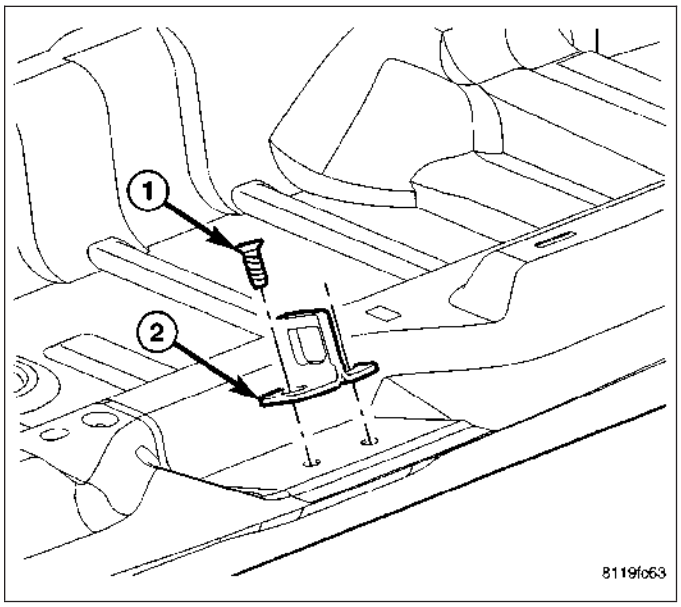
4. Install the liftgate bolts (2) and tighten to 28 N·m (21 ft. lbs.).
5. Adjust liftgate if necessary. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/LIFTGATE - ADJUSTMENTS)
6. Position the upper rear headliner trim and seat fully.



STRIKER

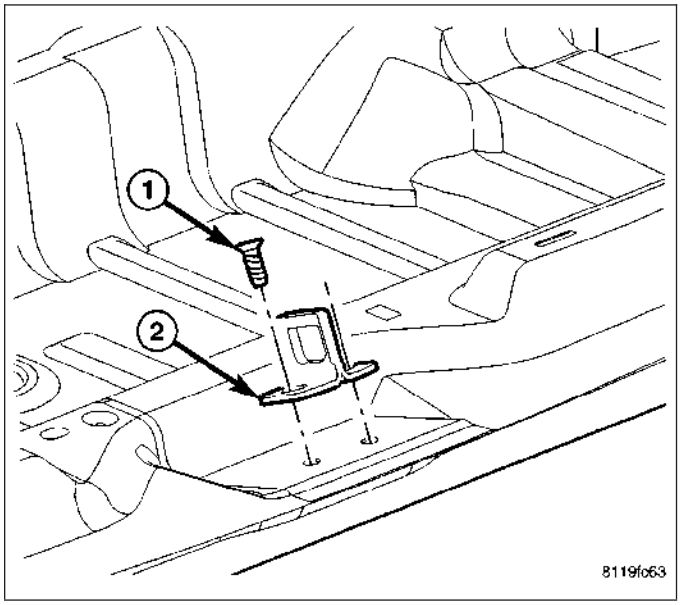
REMOVAL

1. Open the load floor, remove the scuff plate screws and remove liftgate trim scuff plate.
2. Remove screws attaching liftgate striker to floor pan (1) and remove the striker.



INSTALLATION

1. Install the striker (2) and install the bolts (1).
2. Tighten the bolts to 28 N·m (21 ft. lbs.).
3. Adjust the striker if needed. (Refer to 23 - BODY/ LIFTGATE/LATCH STRIKER - ADJUSTMENTS)
4. Install the liftgate trim scuff plate and install the screws.



ADJUSTMENTS

ADJUSTMENT

1. Using a grease pencil or equivalent, mark the position of the striker (2) to aid in adjustment.
2. Loosen the striker bolts (1).
3. Change the striker position to adjust the lower liftgate gap and flush measurement. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
4. Tighten the bolts to 28 N·m (21 ft. lbs.).

BODY SIDE MOLDINGS

REMOVAL

1. Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary.
2. Warm the effected adhesive type molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
3. Pull stick-on molding from painted surface.

INSTALLATION

1. Clean body surface with MOPAR® Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.
2. Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide.
3. Remove masking tape guide and firmly press molding to body surface to assure adhesion.

STRIPES AND DECALS-BODY

REMOVAL

1. Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
2. Peel decal from body panel using an even pressure pull.
3. Remove adhesive residue from body panel using a suitable adhesive removing solvent.

INSTALLATION

The painted surface of the body panel to be covered by a decal must be smooth and completely cured before decal can be applied. Ripples and feather edging will read through if surface is not properly prepared. Clean all residue from surface.

1. Peel paper backing away from decal exposing adhesive back of decal.
2. Apply soap solution liberally to adhesive back of decal.

3. Apply soap solution liberally to body panel surface.
4. Place decal into position on body panel. Smooth out wrinkles by pulling lightly on edges of decal until it lays flat on painted surface.
5. Push air pockets from under decal to the perimeter of the panel from the center of the decal out.
6. Squeegee soap solution and air bubbles from behind decal from the center of the panel out using a body putty applicator squeegee.
7. Small air or water bubbles under decal can be pierced with a pin and smoothed out.

PLATES-EXTERIOR NAME

REMOVAL

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

1. Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.
2. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.
3. Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.
4. Clean adhesive residue from body with MOPAR® Super Clean solvent or equivalent.

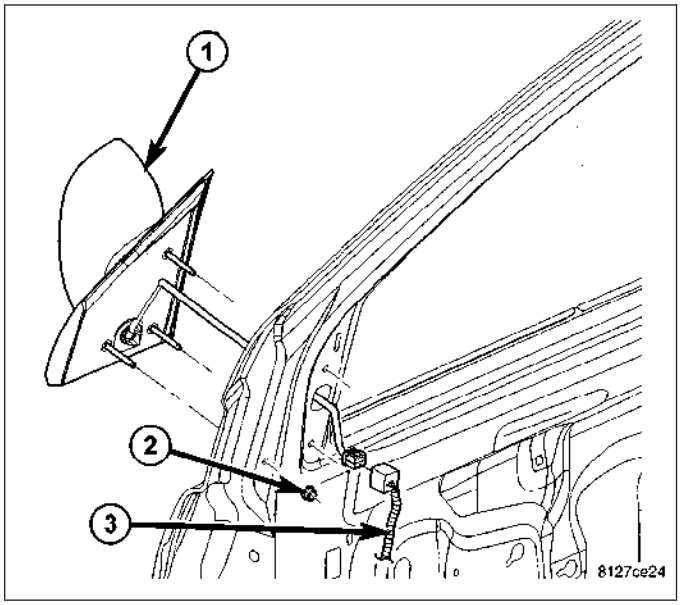
INSTALLATION

1. Remove carrier from adhesive tape on back of emblem.
2. Position emblem properly on body.
3. Press emblem firmly to body with palm of hand.
4. If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

MIRROR-OUTSIDE REARVIEW

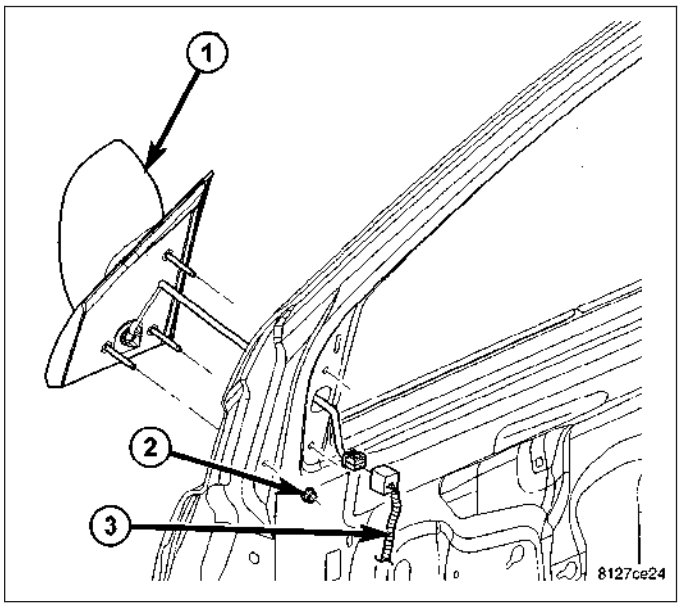
REMOVAL

1. Partially remove the door trim panel to gain access to the mirror fasteners. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
2. Disconnect the electrical connector (3), if equipped.
3. Remove the nuts (2) and remove the mirror (1).



INSTALLATION

1. Install the mirror (1) and install the nuts (2).
2. Tighten the nuts to 7 N·m (60 in. lbs.).
3. Connect the electrical connector (3).
4. Install the door trim panel. (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - INSTALLATION)



GLASS-OUTSIDE REARVIEW MIRROR

REMOVAL

WARNING: ALWAYS WEAR EYE AND HAND PROTECTION WHEN SERVICING THE MIRROR ASSEMBLY. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY FROM BROKEN GLASS.

1. Carefully pull/pry the broken glass holder from the mirror assembly.
2. Disconnect the heated mirror electrical connectors from the terminals on the mirror glass holder, if equipped.

INSTALLATION

CAUTION: It is important to make sure the motor is square to the glass holder (attaching fingers) prior to glass holder attachment, otherwise the glass holder could be installed incorrectly causing poor retention and possible repeat failure.

1. Position the new mirror glass holder to the mirror assembly.

NOTE: Position the mirror glass holder so that the moisture drain hole on the mirror glass holder assembly is facing downward.

2. Align the mirror glass holder's attaching fingers to the mirror motor housing.

NOTE: Ensure that the protective rubber cover of the mirror motor housing is positioned correctly around the bottom of the fingers area.

3. Using one hand, firmly press the mirror glass holder assembly into place while at the same time supporting the housing assembly from the backside with the other hand.

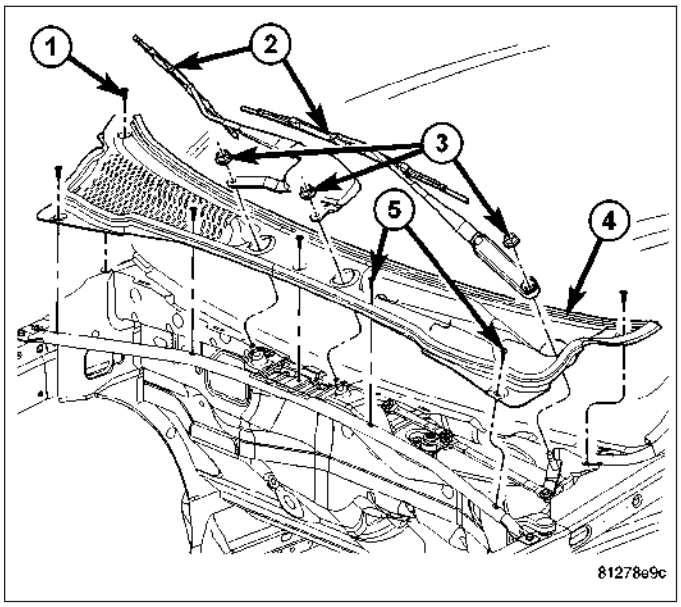
NOTE: Pressure must be applied equally over the center portion of the mirror to engage the mirror glass holder's attaching fingers to the corresponding fingers on the housing assembly. One or more clicks may be heard when finger engagement takes place.

4. Verify retention of the mirror glass holder assembly by gently pulling outward on the mirror glass holder.

PANEL-COWL TOP

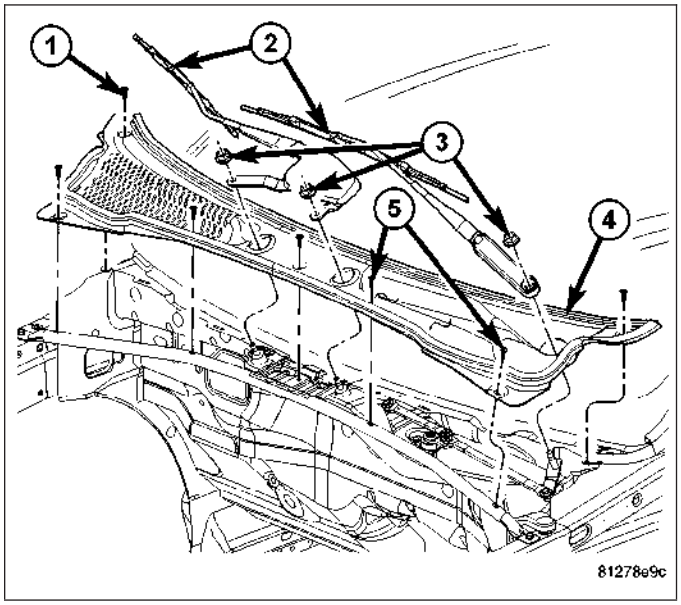
REMOVAL

1. Open the hood and remove the wiper arm nuts (3) and wiper arms (2). (Refer to 8 - ELECTRICAL/ WIPERS/WASHERS/WIPER ARMS - REMOVAL)
2. Remove the two rear screws (1) and the five front screws (5).
3. Remove the cowl grille (4).



INSTALLATION

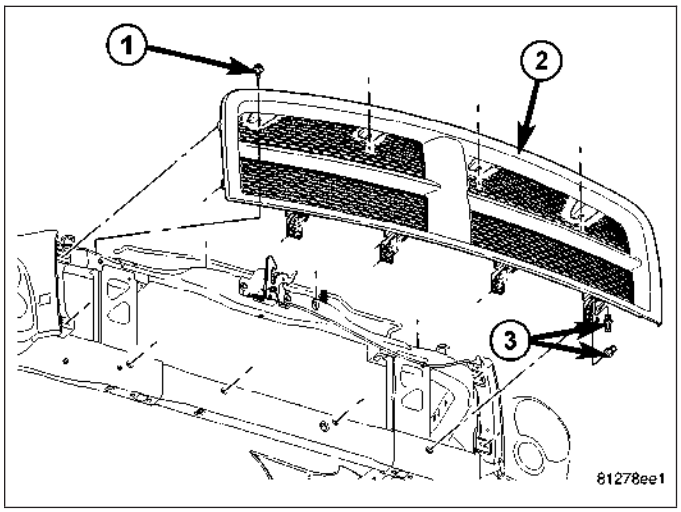
1. Install the grille (4) and install the front and rear screws (1 & 5).
2. Install the wiper arms (2) and install the nuts (3). (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/ WIPER ARMS - INSTALLATION)



GRILLE

REMOVAL

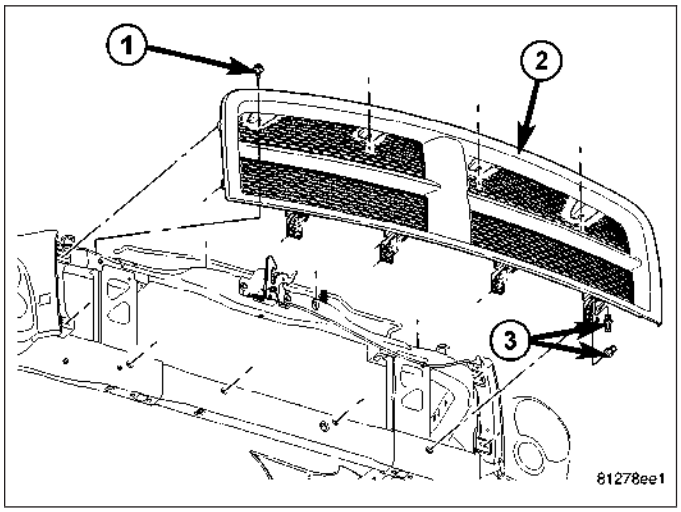
1. Remove the push pin fasteners and remove the upper radiator shroud.
2. Remove the upper bolts (1) and separate the four side clips.
3. From underneath, remove the push pins (3) and remove the grille.



INSTALLATION

CAUTION: Do not use a hammer or mallet to install the upper radiator shroud push pins, due to potential damage to the grille.

1. Install the grille (2) and seat the side clips fully.
2. From underneath install the push pin fasteners (3).
3. Install the upper bolts (1) and tighten to 13 N·m (10 ft. lbs.).
4. Install the upper radiator shroud and install the push pin fasteners.



RACK-LUGGAGE

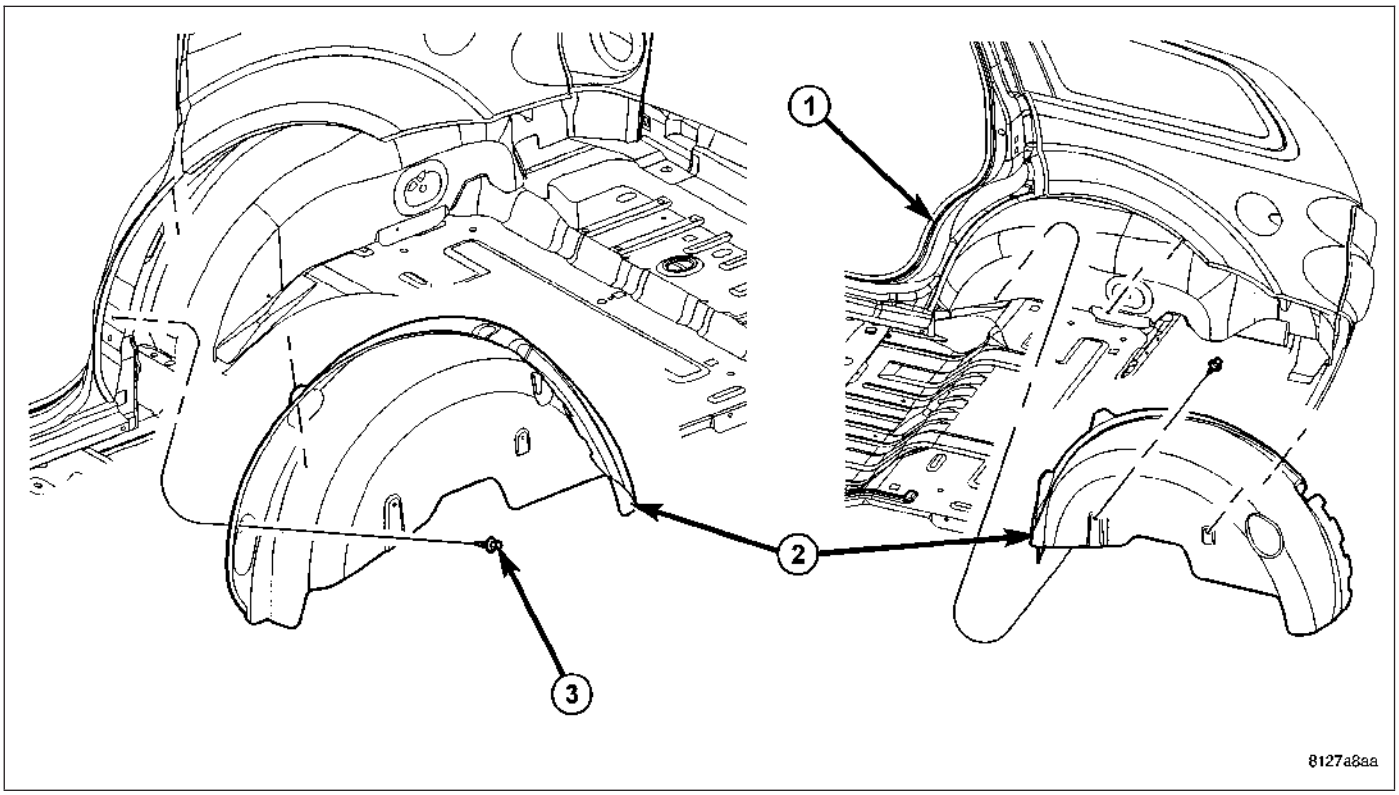
3 - PLASTIC RIVETS (7 PER SIDE)

LINER-QUARTER PANEL

DESCRIPTION



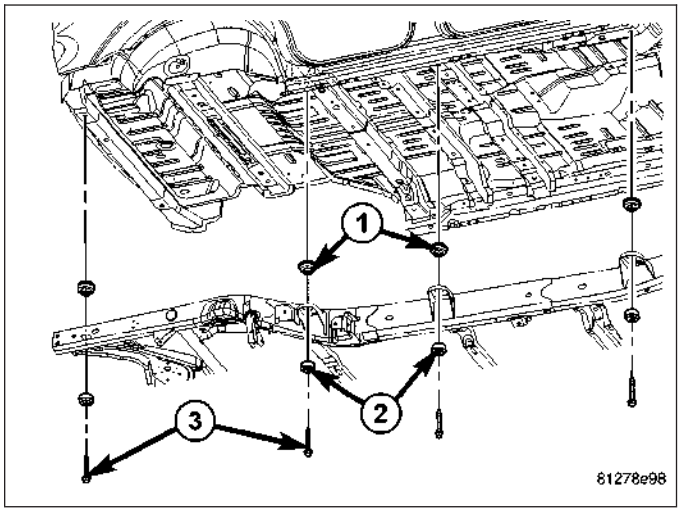
QUARTER PANEL LINER

1 - C-PILLAR
2 - QUARTER PANEL LINER
3 - PLASTIC RIVET (5 PER SIDE)

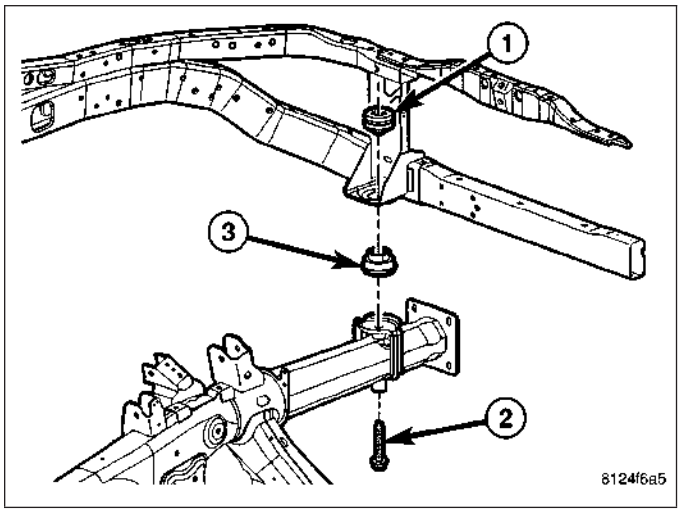
ISOLATORS-BODY

REMOVAL

1. Remove all cab to frame mounting bolts (3) and rebound cushions (2).

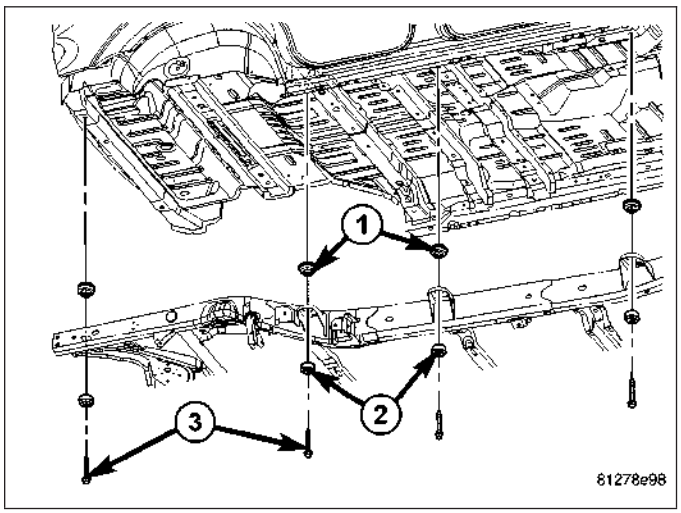


2. Remove the front end sheet metal mounting bolt (2).
3. Using a floor jack and block of wood under the cab sill, lift the body to gain access to the isolators.
4. Remove the cab isolators (1 above) and the front end sheet metal mounting isolator (3).
5. Install new isolators and repeat steps one through 4, for the opposite side.

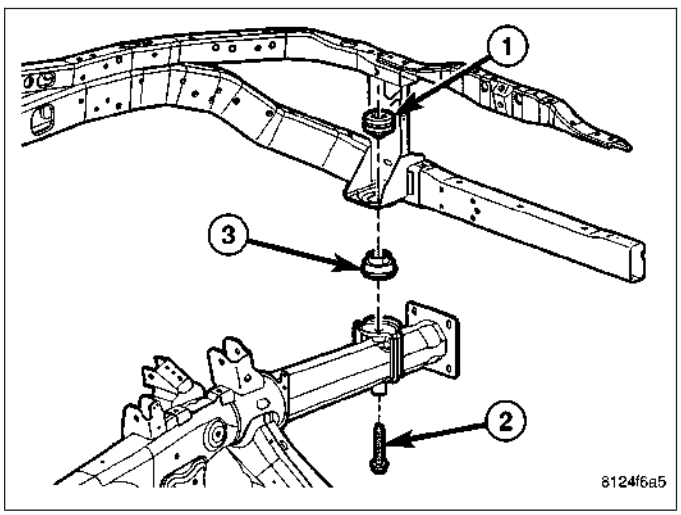


INSTALLATION

1. Install the isolators (1) rebound cushions (2), and bolts (3).



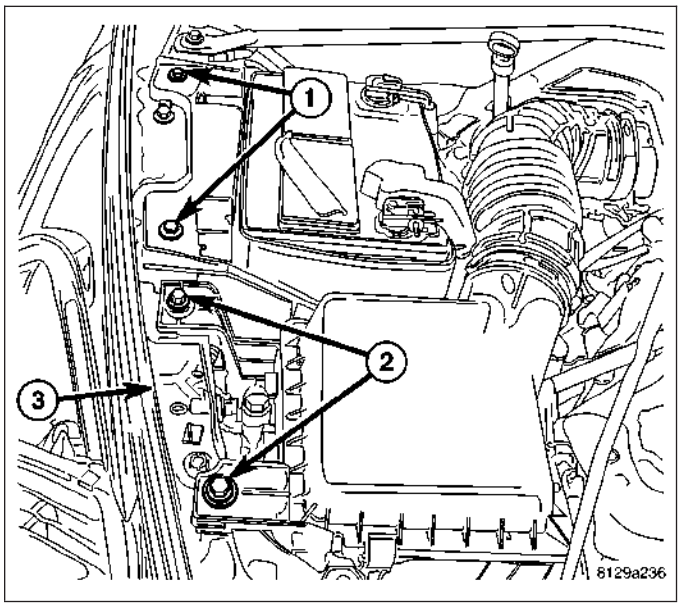
2. Install the front end sheet metal mounting isolators (1 & 3) and install the bolt (2).
3. Tighten the bolts to 81 N·m (60 ft. lbs.).



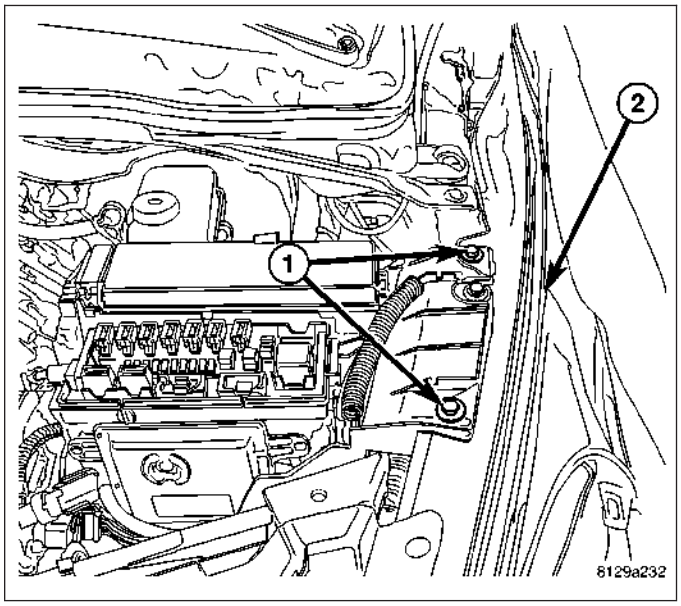
FENDER

REMOVAL

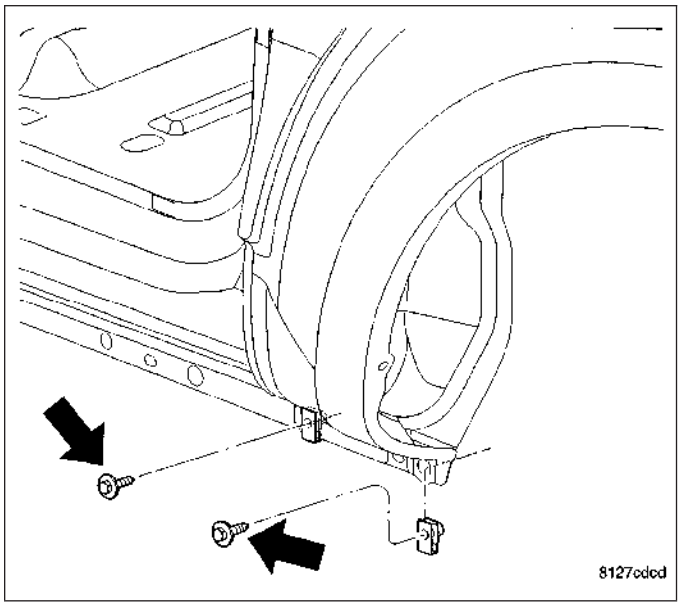
1. Remove the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL)
2. Remove the headlight assembly. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL)
3. Remove the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
4. Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - REMOVAL)
5. When servicing the right side fender, remove the battery tray (1) and air cleaner bolts (2) from the front end sheet metal (3).



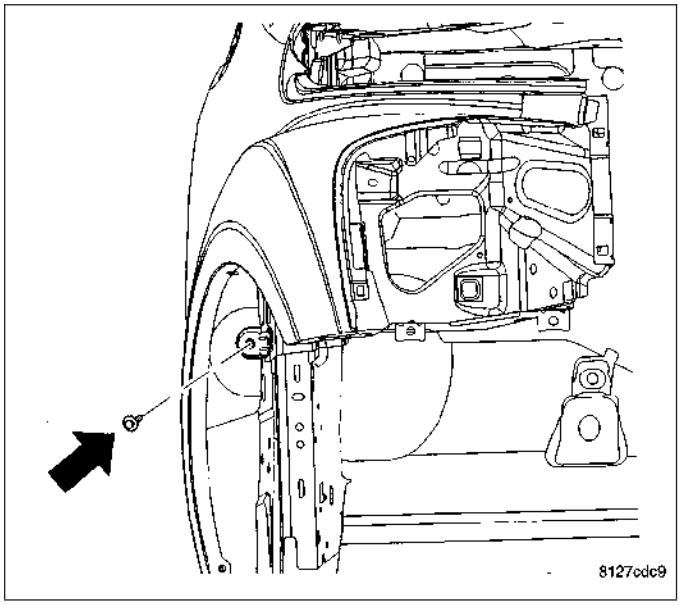
6. When servicing the left side fender, remove the power distribution center bolts (1) from the front end sheet metal (2).



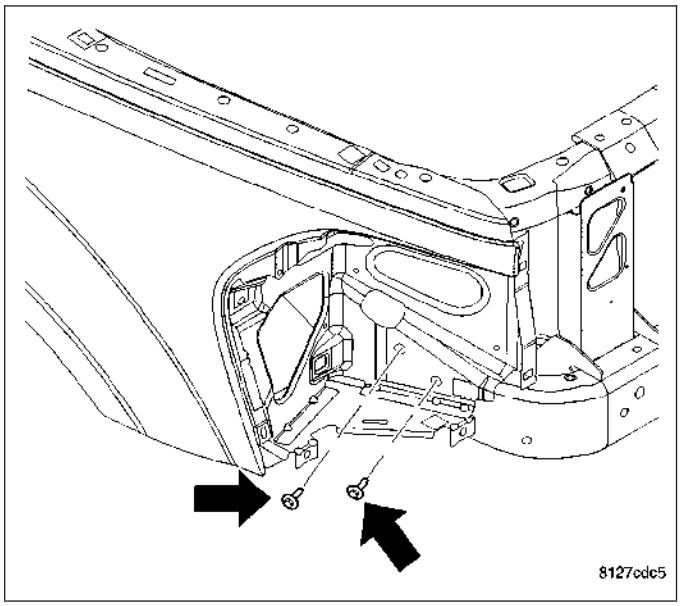
7. Remove the two bolts from the fender behind the wheel.



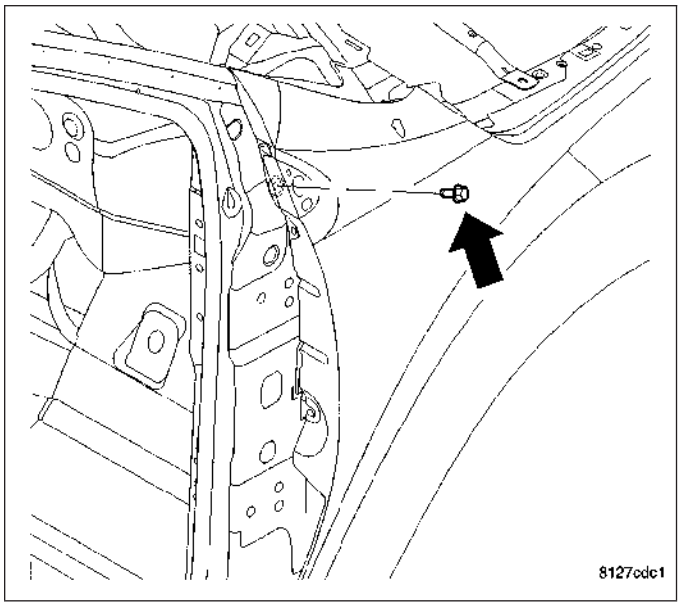
8. Remove the bolt from inside the wheel well.



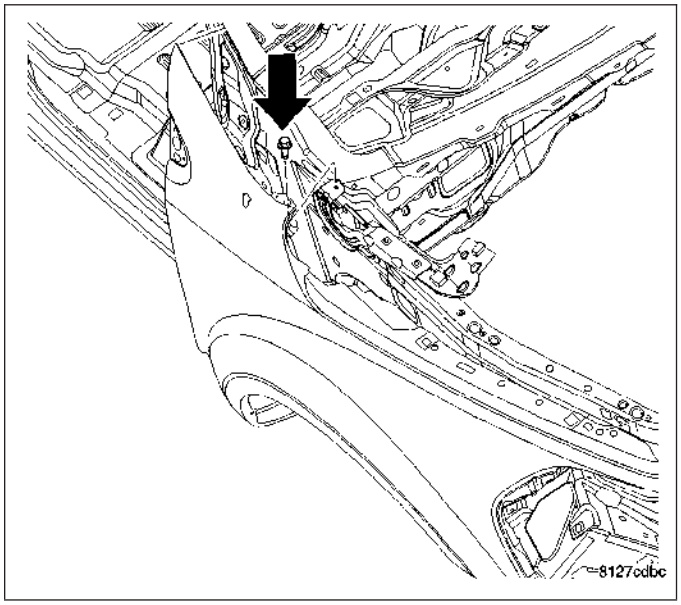
9. Remove the bolts from the headlamp opening.



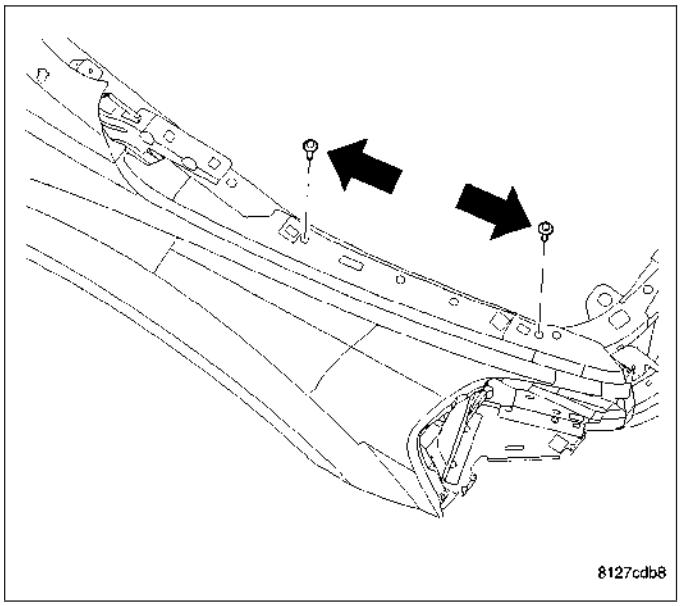
10. Using a trim stick C-4755 or equivalent, remove the trim and remove the bolt at the upper rear of the fender.



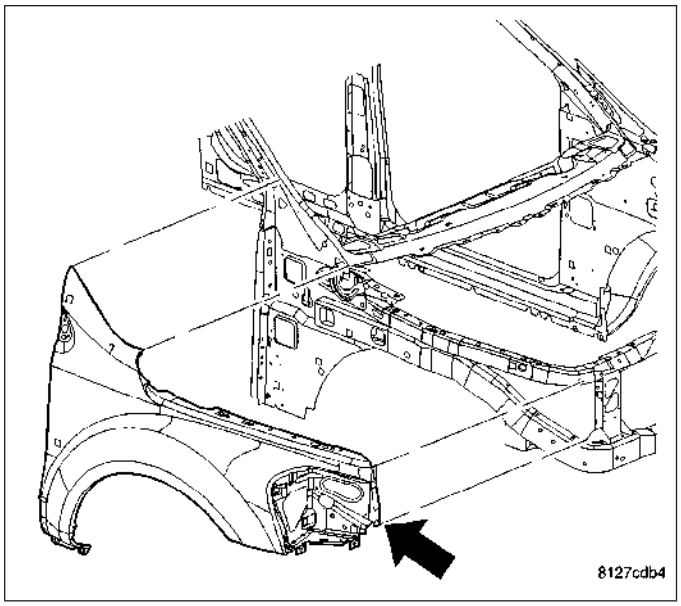
11. Remove the upper fender bolt support bolt to the hood hinge.



12. Remove the front end sheet metal mounting bolts.

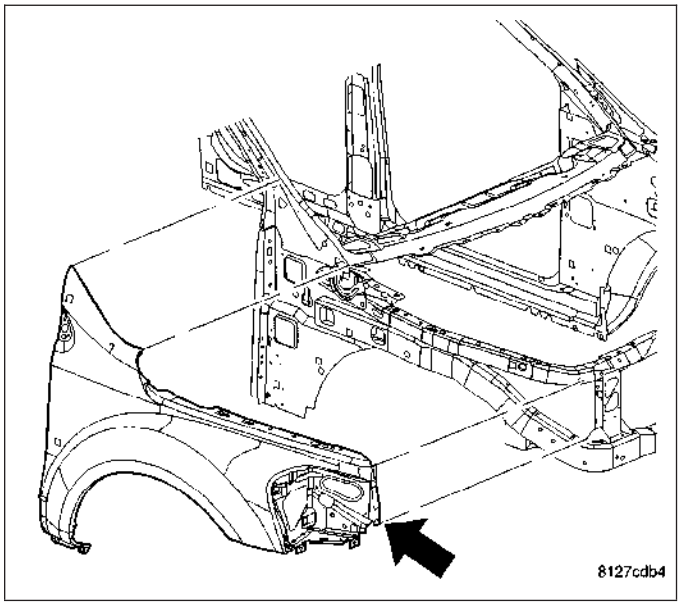


13. Slide the fender off the front end sheet metal mounting support.



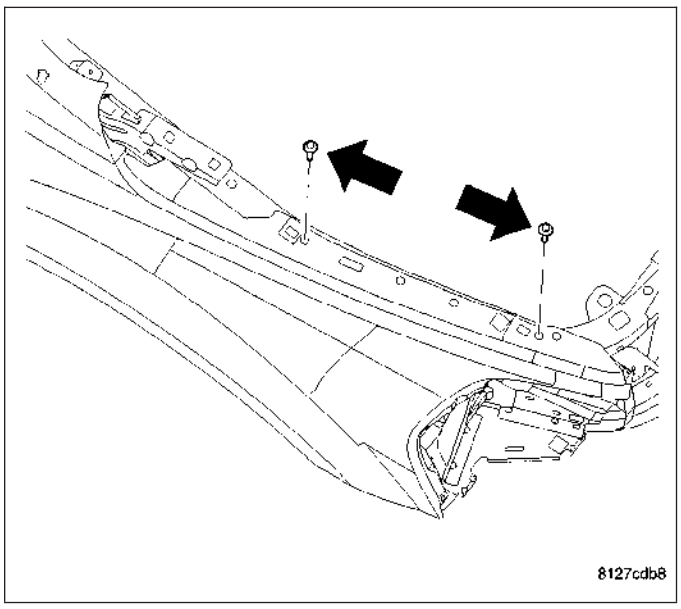
INSTALLATION

1. When installing the left side fender, position the fender onto the Front End Sheet Metal mounting hydroform and slide under the power distribution center.
2. When installing the right side fender, position the fender onto the FESM mounting hydroform and slide under the battery tray and air cleaner mounting brackets.

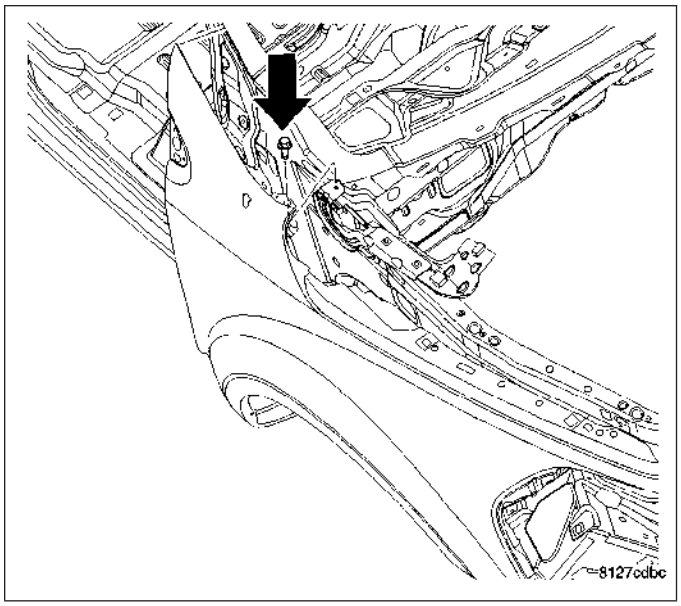


NOTE: Tighten the fender fasteners only after all fasteners are installed loosely and fender is adjusted for gap and flush, using the sequence provided at the end of the installation procedure.

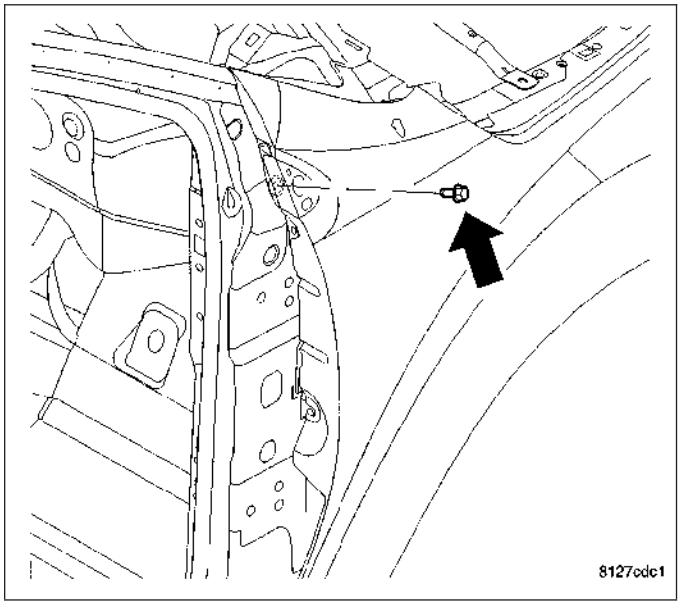
3. Loosely install the upper FESM mounting bolts.



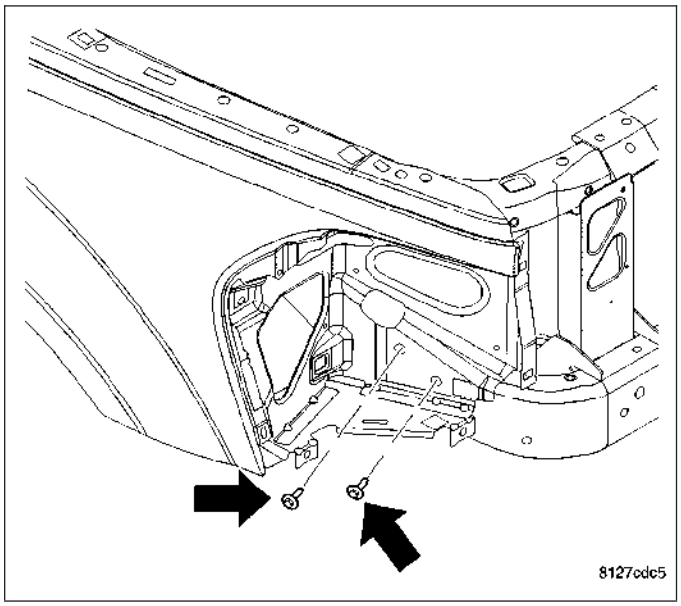
4. Loosely install the bolt attaching the rear upper fender to the hood hinge.



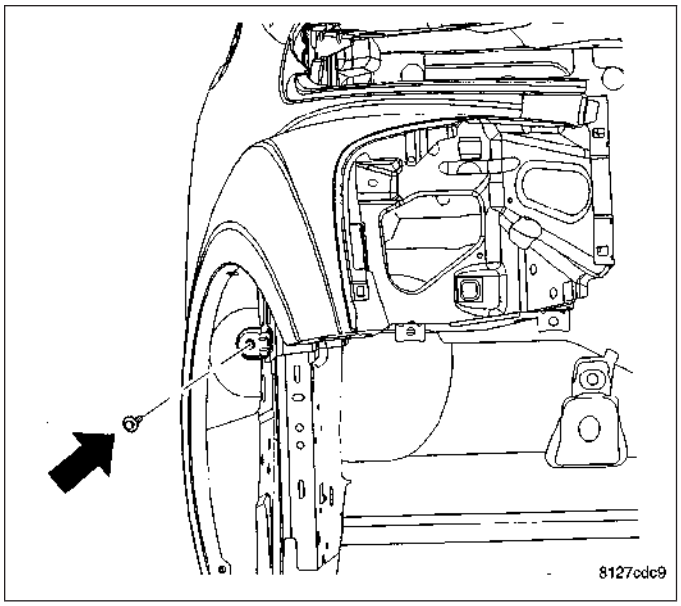
5. Loosely install the bolt attaching the rear upper fender to the a-pillar.



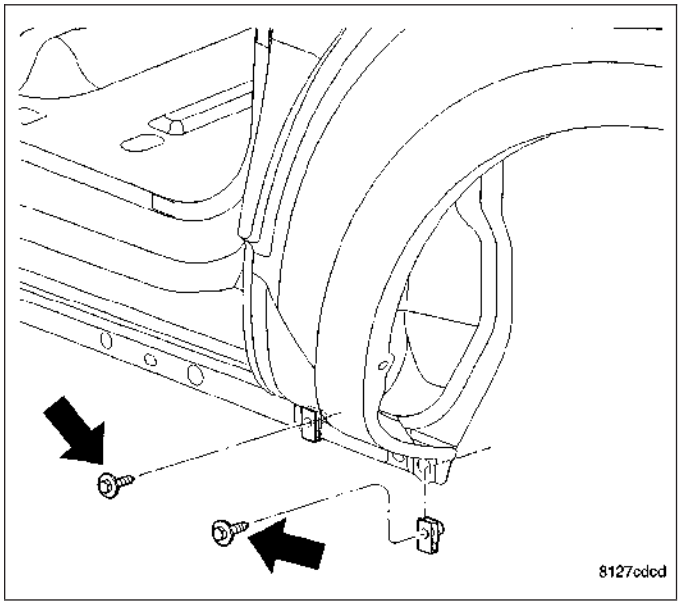
6. Loosely install the two bolts located in the headlamp opening.



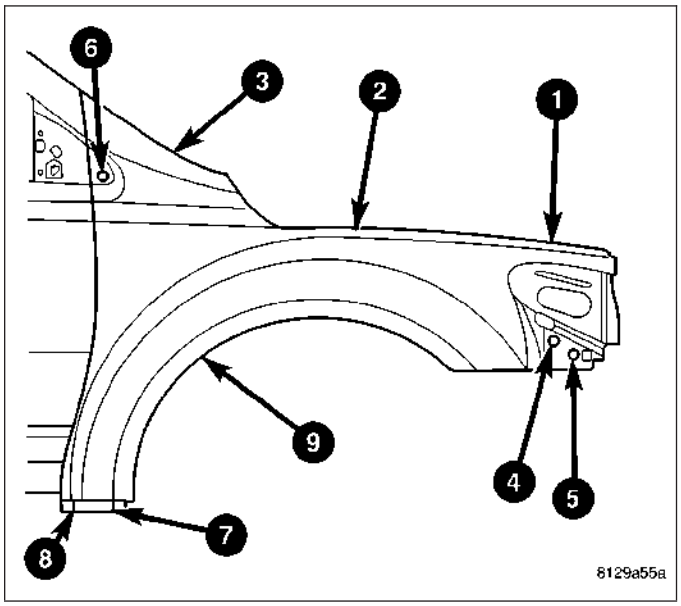
7. Loosely install the bolt located inside the wheel well.



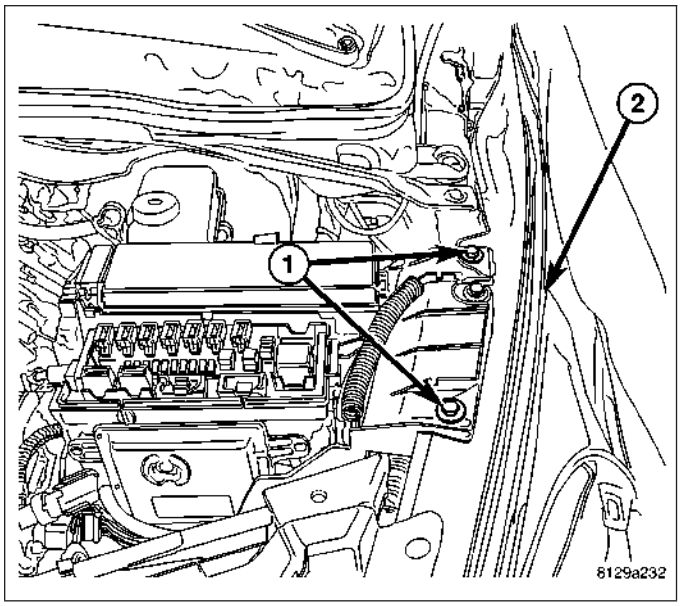
8. Loosely install the two lower bolts located at the a-pillar.



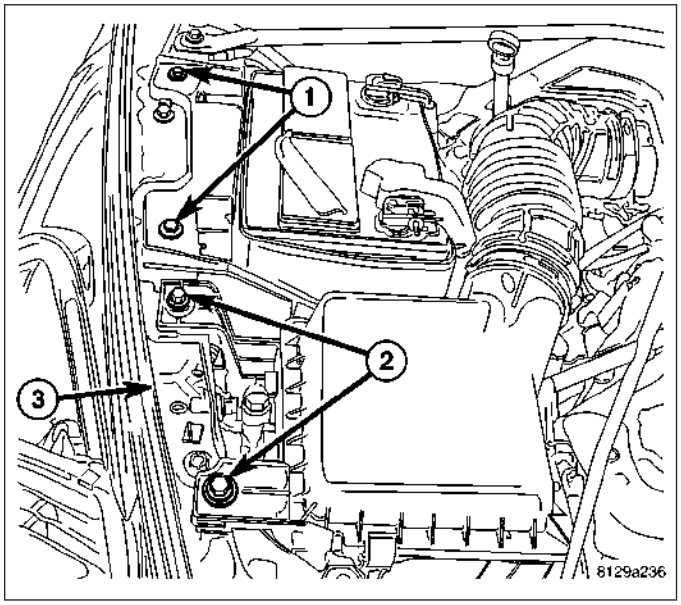
9. Check the fender positioning and adjust as required by adding shims. (Refer to 23 - BODY/ BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
10. Tighten the fender bolts to 8 N·m (75 in. lbs.) using the sequence shown.



11. When installing the left side fender, install the power distribution center bolts (1) to the FESM (2) and tighten to 11 N·m (100 in. lbs.).



12. When installing the right side fender, install the battery tray bolts and tighten to 11 N·m (100 in. lbs.).
13. Install the air cleaner mounting bolts and tighten to 10 N·m (85 in. lbs.).
14. Install the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - INSTALLATION)
15. Install the wheelhouse splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT WHEELHOUSE SPLASH SHIELD - DESCRIPTION)
16. Install the headlight assembly. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION)
17. Install the grille. (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION)



INSTRUMENT PANEL

WARNING

RESTRAINT SYSTEM

WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the daimlerchrysler mopar parts catalog.

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (acm). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.

WARNING: To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° c (200° f). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.

WARNING: To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid personal injury or death, replace all restraint system components only with parts specified in the daimlerchrysler mopar parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

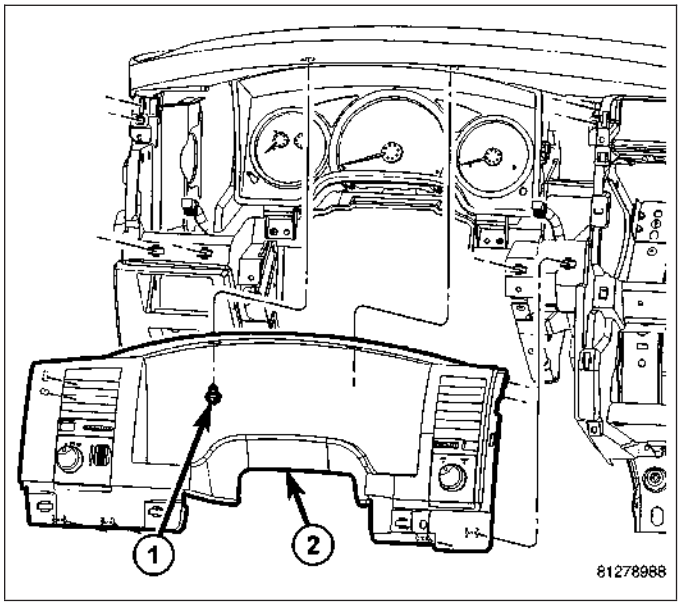
WARNING: To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the daimlerchrysler mopar parts catalog.

WARNING: To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

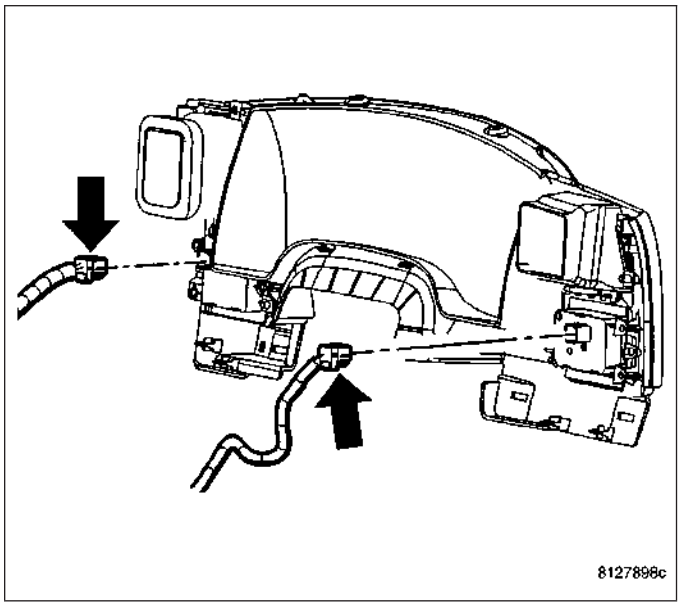
BEZEL-CLUSTER

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)
3. Remove the screws (1) and using a trim stick C-4755 or equivalent, separate the cluster bezel from the instrument panel.

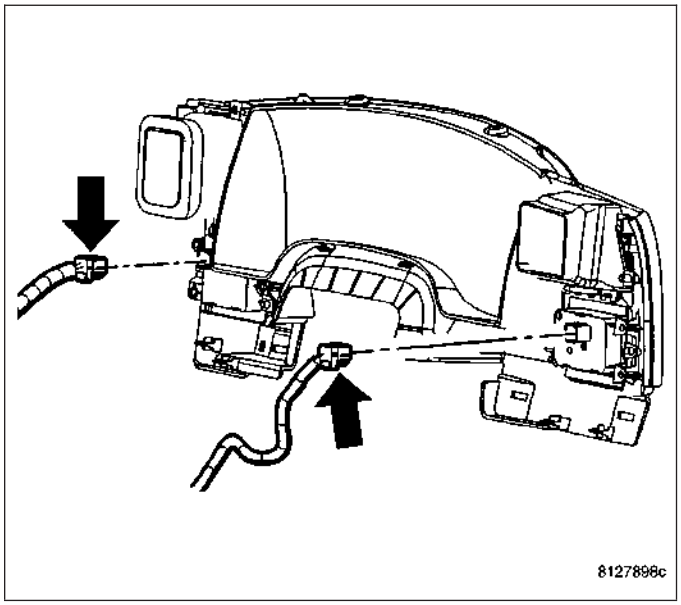


4. Disconnect the electrical connectors.

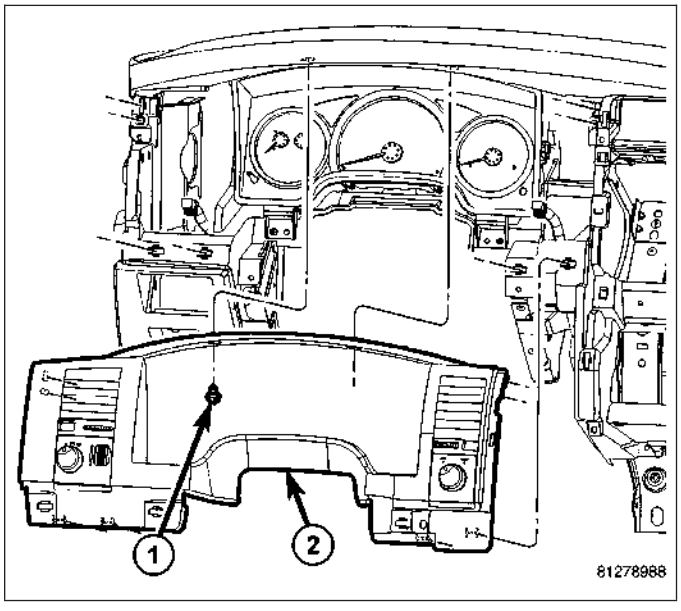


INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Connect the electrical connectors.

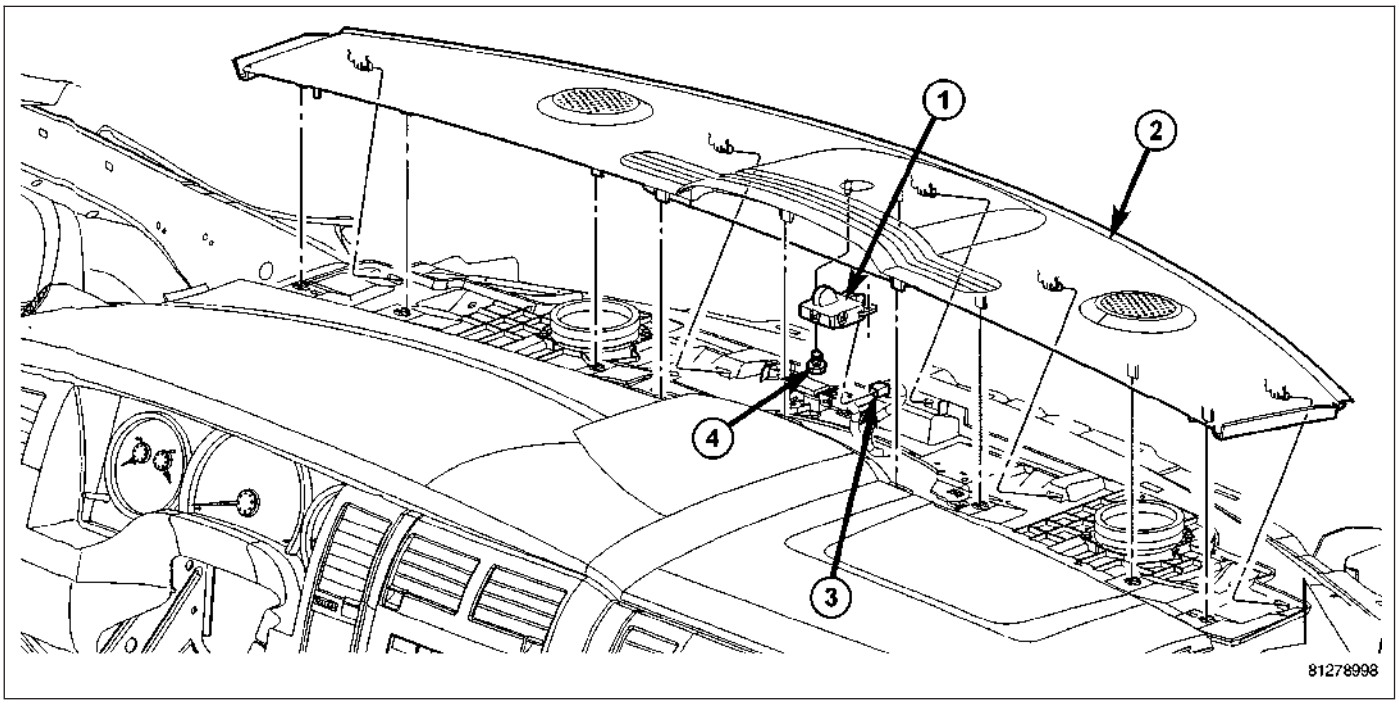


3. Position the bezel (2) onto the instrument panel and seat fully.
4. Install the screws (1).
5. Install the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)



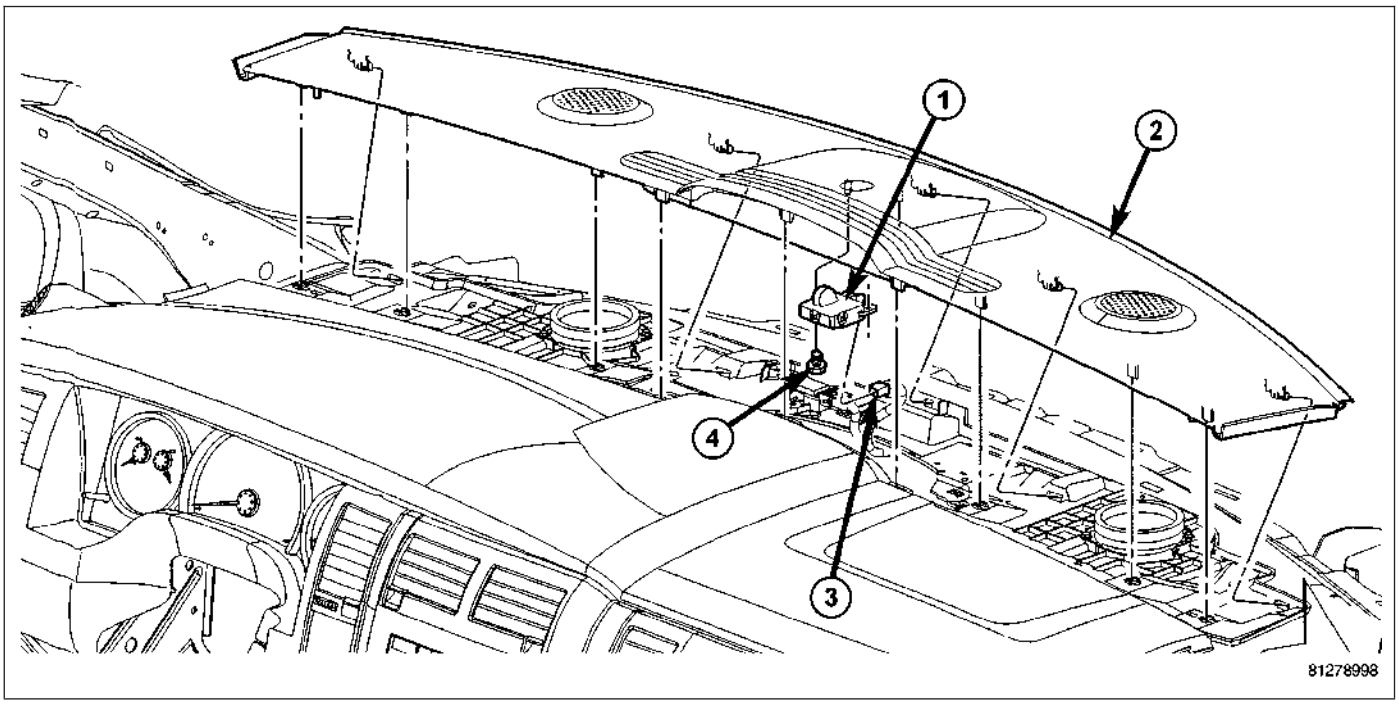
GRILLE-DEFROSTER

REMOVAL



1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Using a trim stick C-4755 or equivalent, remove the drivers side a-pillar trim.
3. Open the trim covers in the passenger side a-pillar grab handle and remove the bolts.
4. Remove the right a-pillar trim panel.
5. Using a trim stick C-4755 or equivalent, remove the instrument panel defroster grille.
6. Disconnect the sensor electrical connector (2).
7. Remove the screw (4) and remove the sun sensor (1).

INSTALLATION



1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Install the sun sensor (1) and install the screw (4).
3. Position the defroster grille (2) into place and connect the electrical connector (3).
4. Position the drivers side a-pillar trim into place and seat the retaining clips fully.
5. Position the passenger side a-pillar trim panel into place and seat fully.
6. Install the bolts and tighten to 6 N·m (55 in. lbs.).

ASSEMBLY-INSTRUMENT PANEL

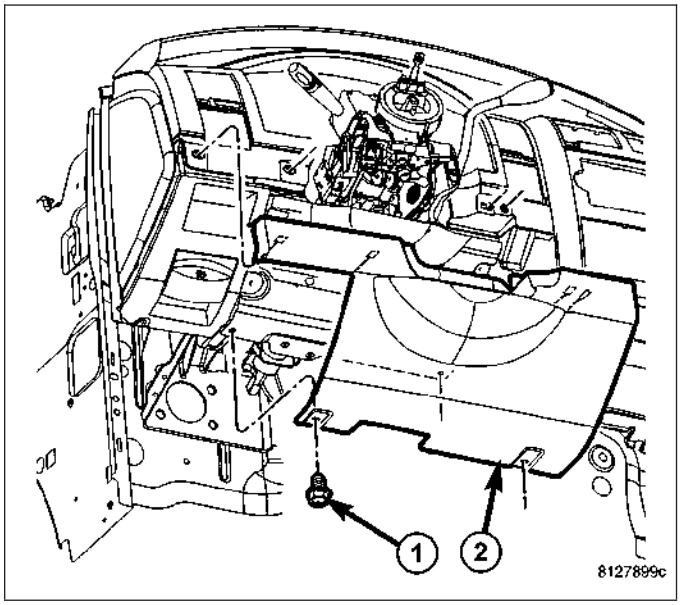
REMOVAL

WARNING: TO AVOID PERSONAL INJURY OR DEATH, ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, AIRBAG, OCCUPANT CLASSIFICATION SYSTEM, SEAT BELT TENSIONER, IMPACT SENSOR, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT.

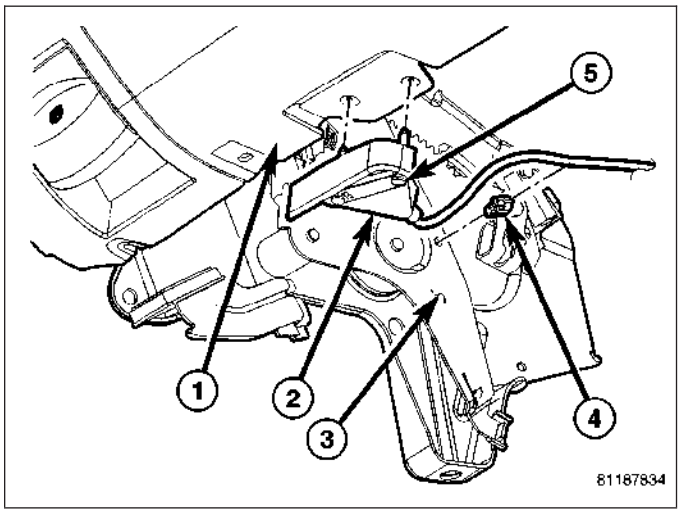
WARNING: TO AVOID PERSONAL INJURY OR DEATH, NEVER STRIKE OR DROP THE OCCUPANT RESTRAINT CONTROLLER, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. THE OCCUPANT RESTRAINT CONTROLLER CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE SUPPLEMENTAL RESTRAINTS. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER SUPPLEMENTAL RESTRAINT DEPLOYMENT.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

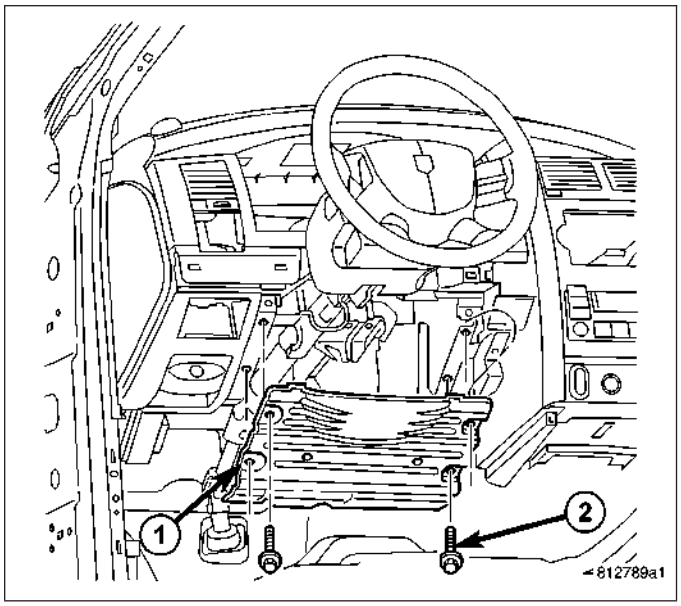
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Disconnect and isolate battery negative cable.
3. Using a trim stick C-4755 or equivalent, remove the left door sill trim cover.
4. Remove the screw and remove the left cowl trim cover.
5. Remove the left instrument panel end cap.
6. Remove the two screws (1) and remove the steering column opening cover (2).



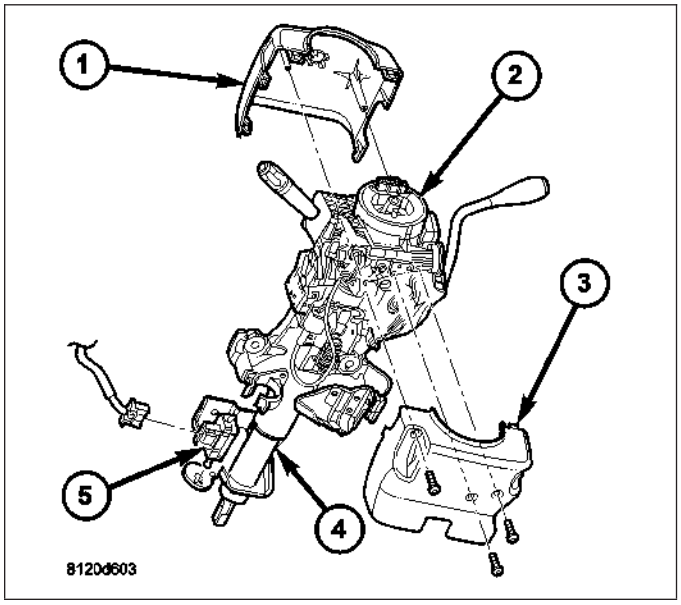
7. Remove the screws (5) and position aside the hood release handle (2).



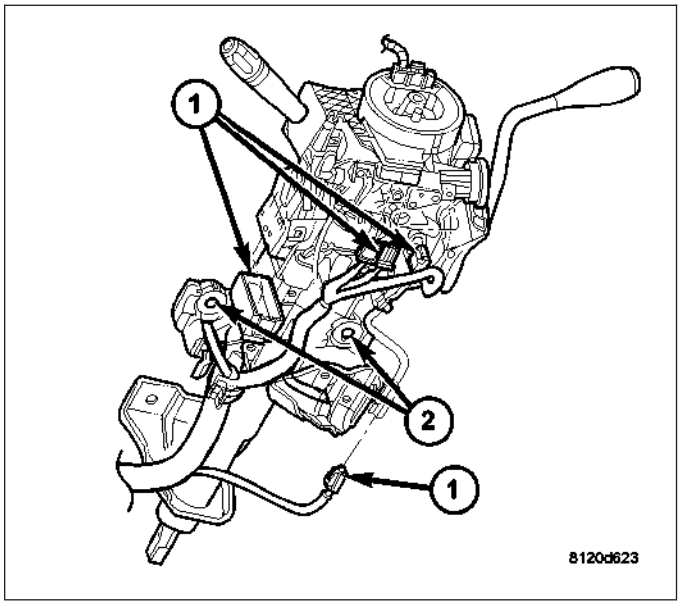
8. Remove the four screws (2) and remove the steering column opening reinforcement (1).



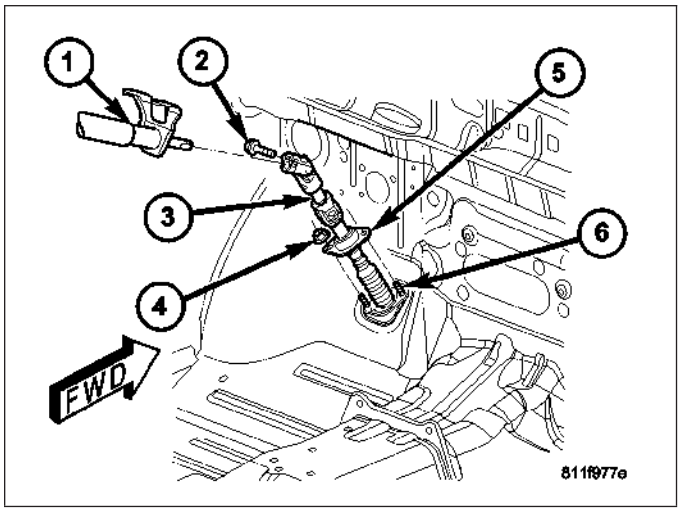
9. Remove the steering column tilt lever.
10. Remove the upper (1) and lower (3) column shrouds.



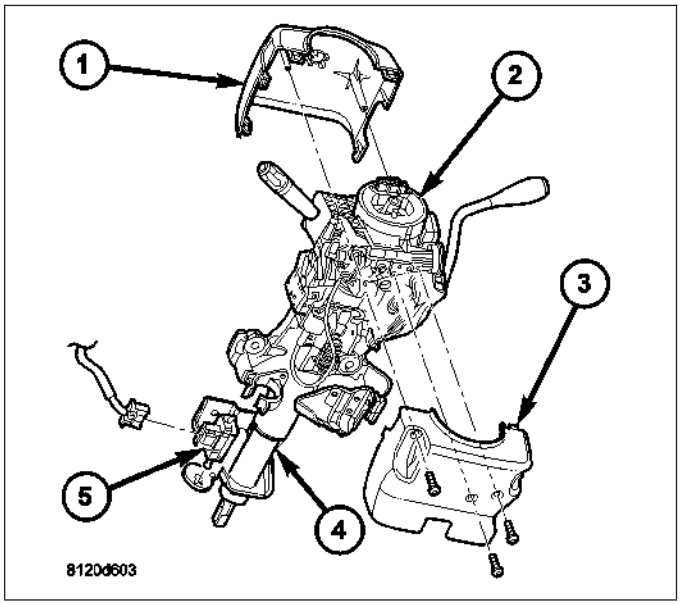
11. Disconnect the wiring harness connectors (1) to the column.
12. Remove the shift cable from the column shift lever actuator. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/GEAR SHIFT CABLE - REMOVAL)
13. Release the shift cable from the column bracket and remove it from the bracket.
14. Remove the SKIM module in order to disconnect the electrical connector.



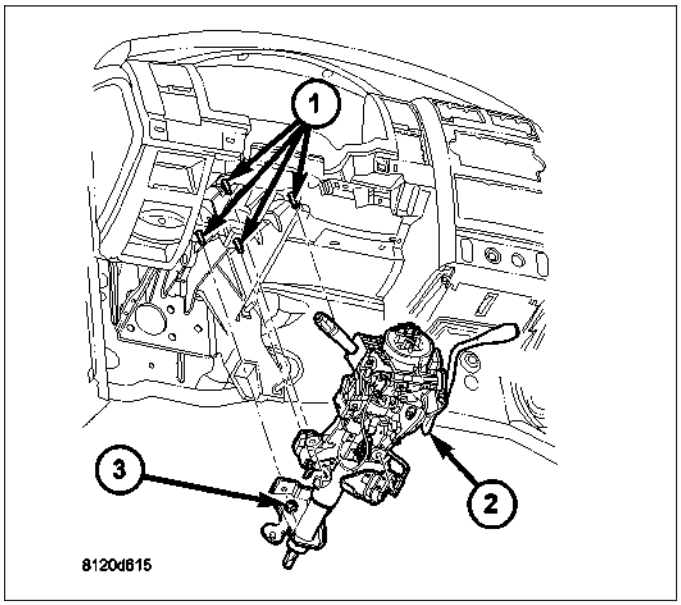
15. Remove the upper steering shaft coupler bolt (2) and slide the shaft (3) down.



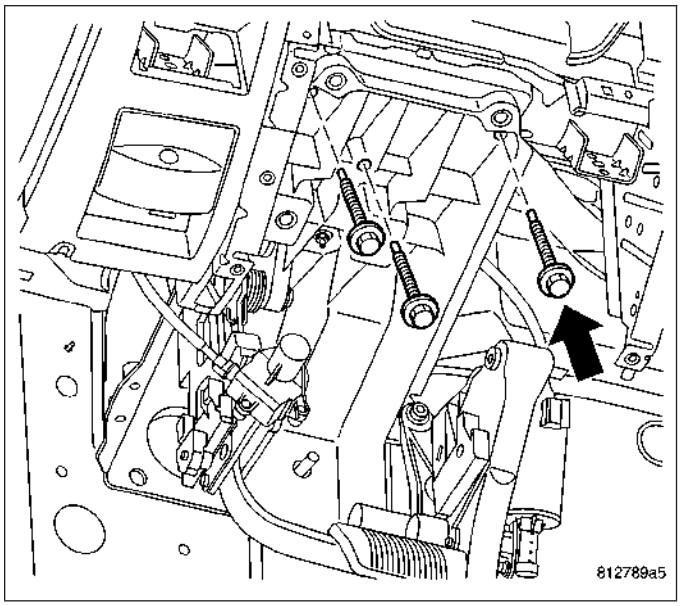
16. Remove the brake light switch (5) and discard (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL).



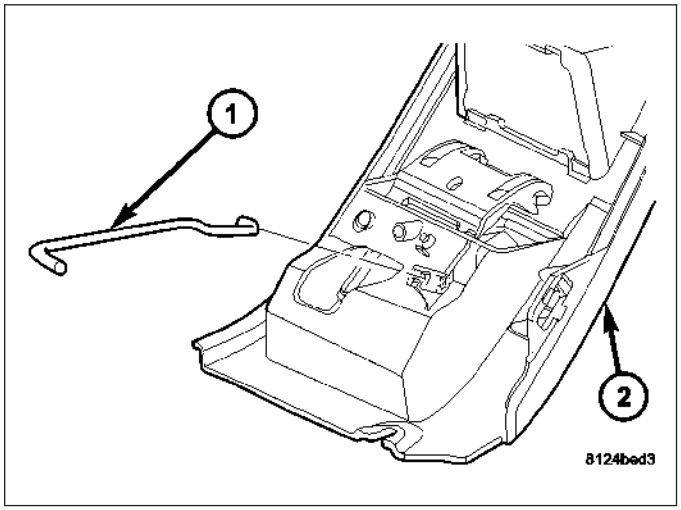
17. Remove the four steering column mounting nuts (3).
18. Lower the column from the mounting studs (1).
19. Remove the steering column assembly (2) from the vehicle.



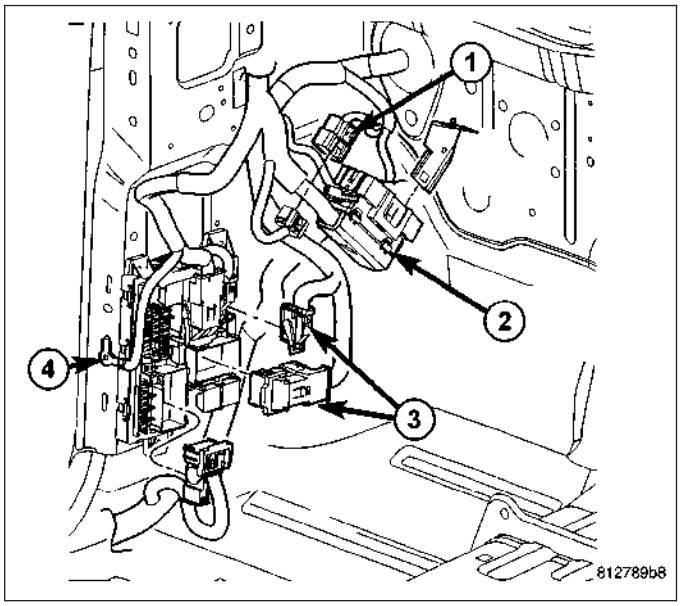
20. Remove the pedal support bracket bolts.



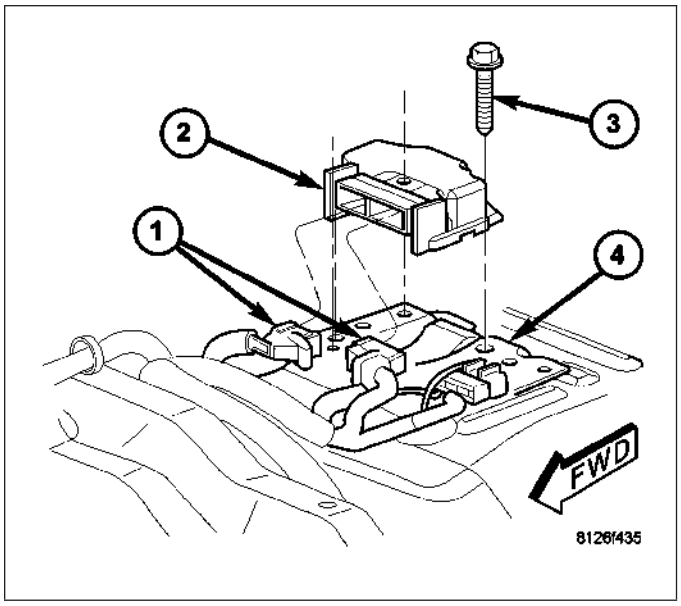
21. Disengage the release rod (1) from the arm on the pedal assembly.



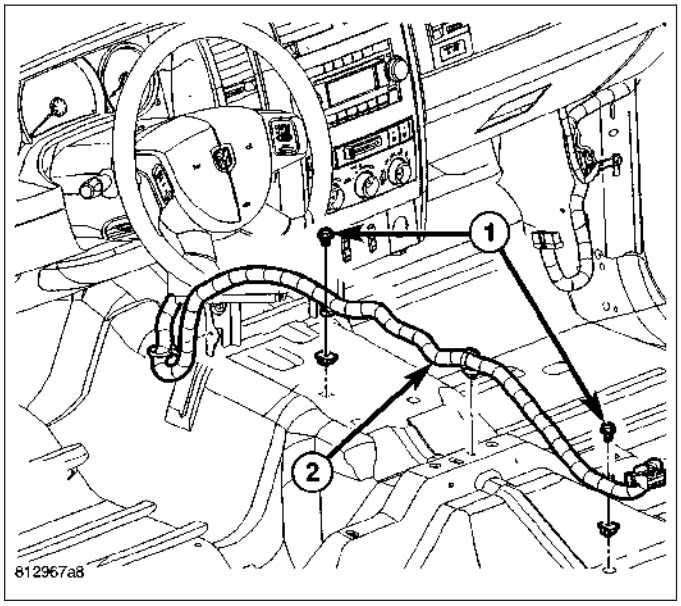
22. Disconnect the electrical connectors (1, 2 and 3) from the fuse block.
23. Remove the bolt and remove the ground wire (4).
24. Open the trim covers in the drivers side a-pillar grab handle and remove the bolts.
25. Remove the a-pillar trim panel.
26. Remove the floor console. (Refer to 23 - BODY/ INTERIOR/FLOOR CONSOLE - REMOVAL)



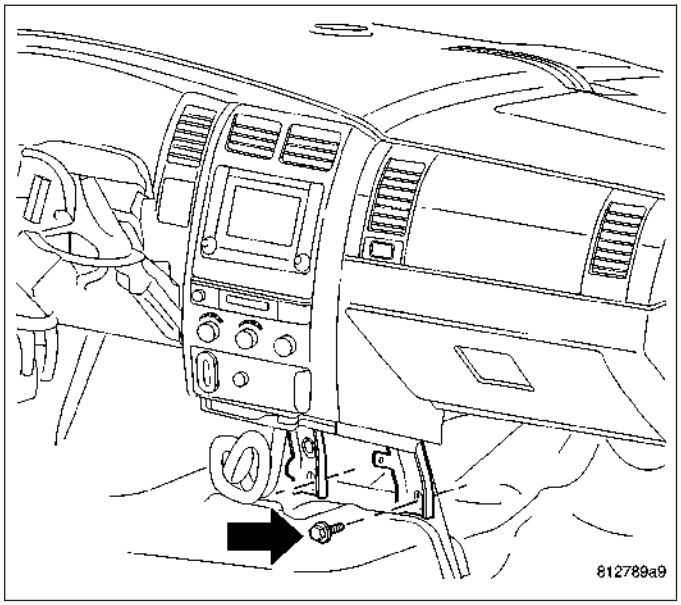
27. Disconnect the two body wire harness connectors (1) from the Occupant Restraint Controller (ORC) (2) connector receptacles located on the forward facing side of the module. To disconnect the wire harness connectors from the ORC, depress the release tab and lift the lever arm on each connector.



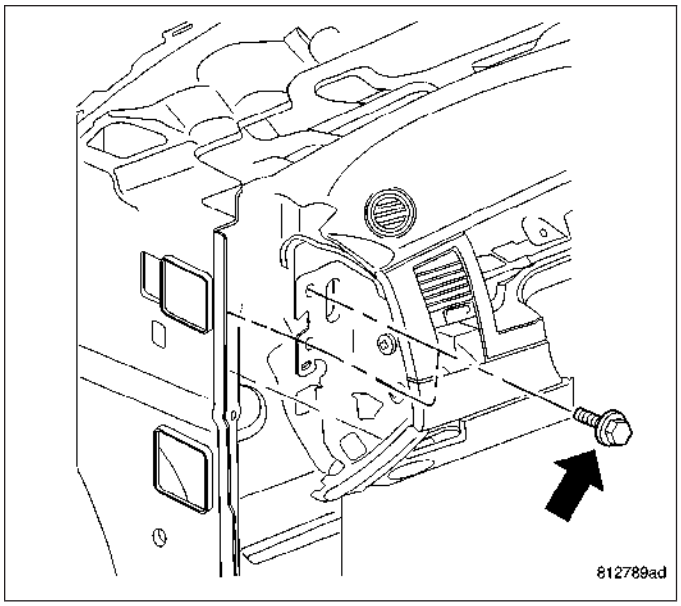
28. Position the carpet aside and remove the center harness screws (1). Pull instrument panel wiring harness (2) from under the carpet.



29. Remove the center support bolts.
30. Remove the drivers seat. (Refer to 23 - BODY/ SEATS/SEAT - REMOVAL)
31. Remove the drivers side floor duct.

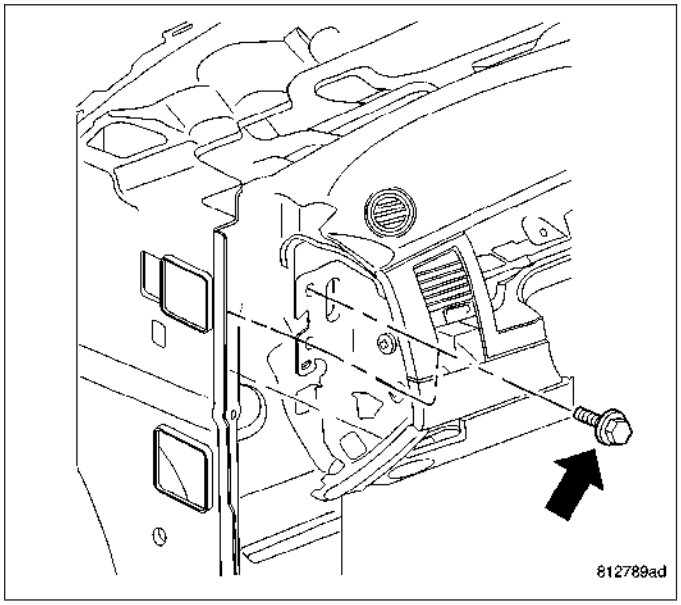


32. Remove the drivers side support bolts.

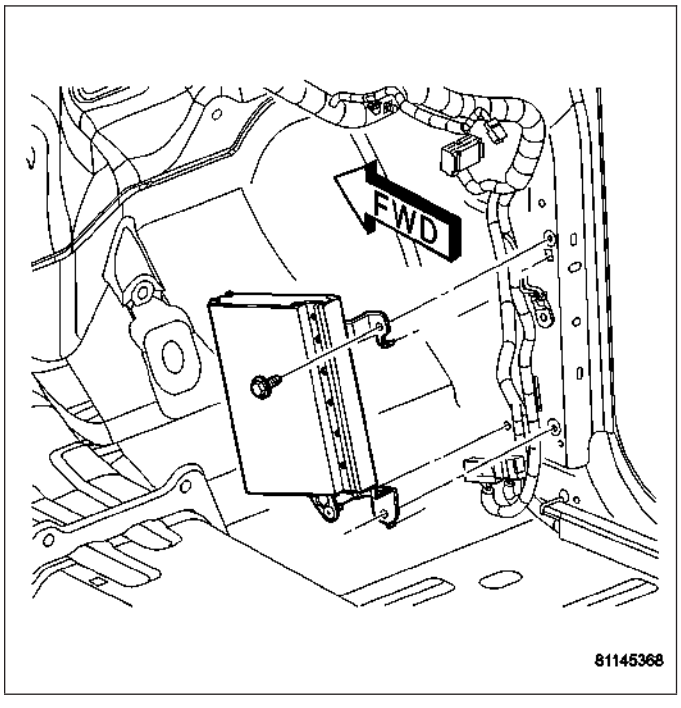


33. Remove the right instrument panel end cap.
34. Remove the passenger side support bolts.

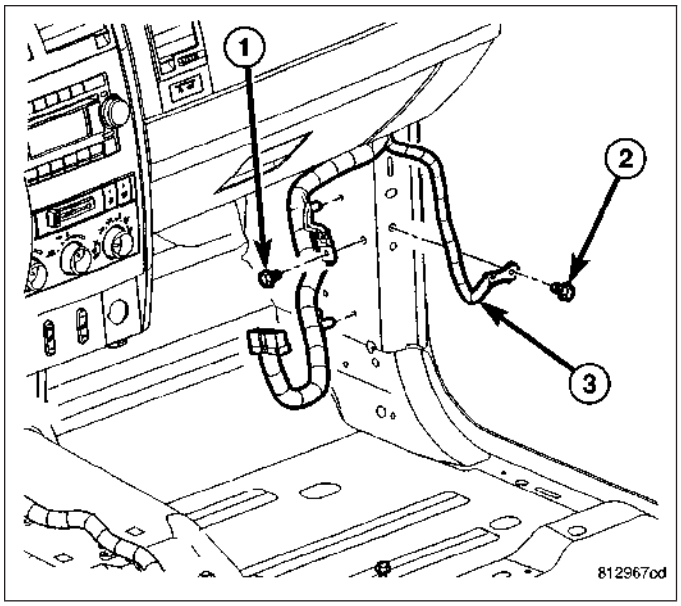
NOTE: Drivers side shown, passenger side similar.

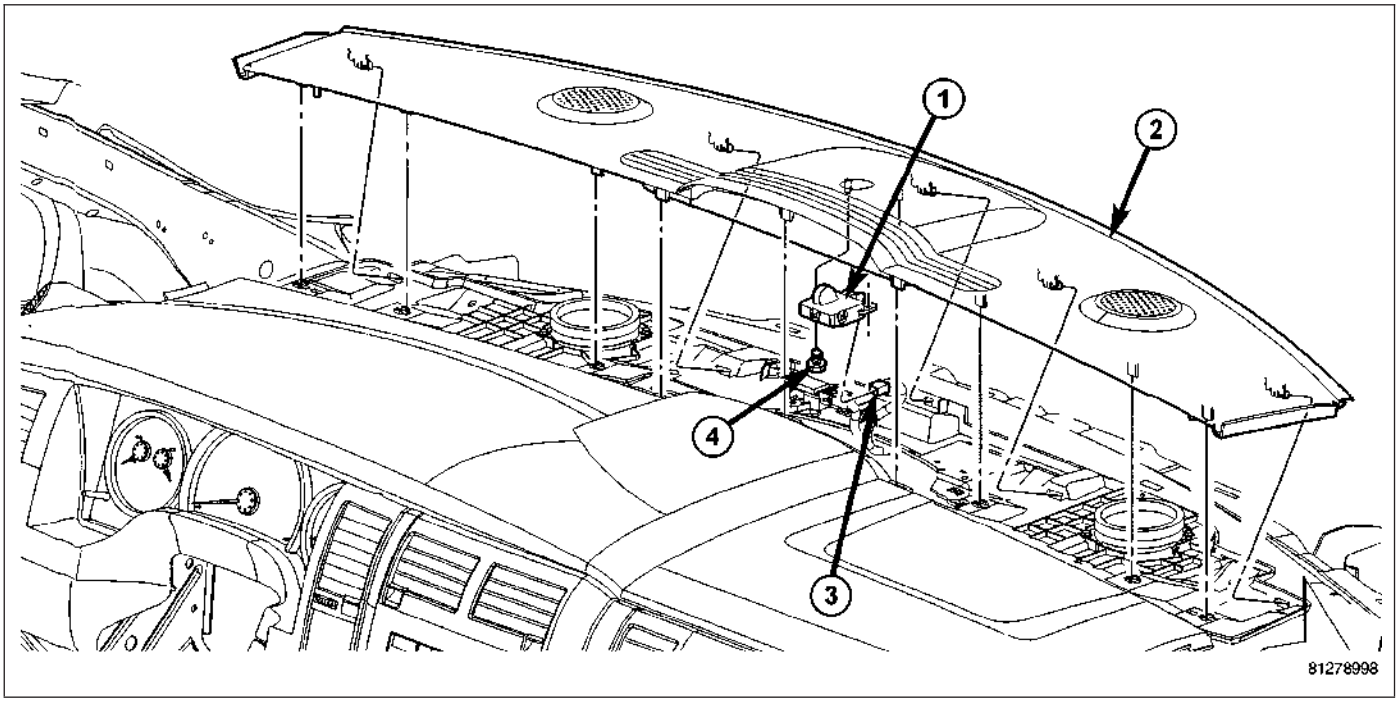


35. Using a trim stick C-4755 or equivalent, remove the right door sill trim cover.
36. Remove the screw and remove the right cowl trim cover.
37. Remove the bolts and remove the amplifier.
38. Disconnect the amplifier and antenna electrical connectors.

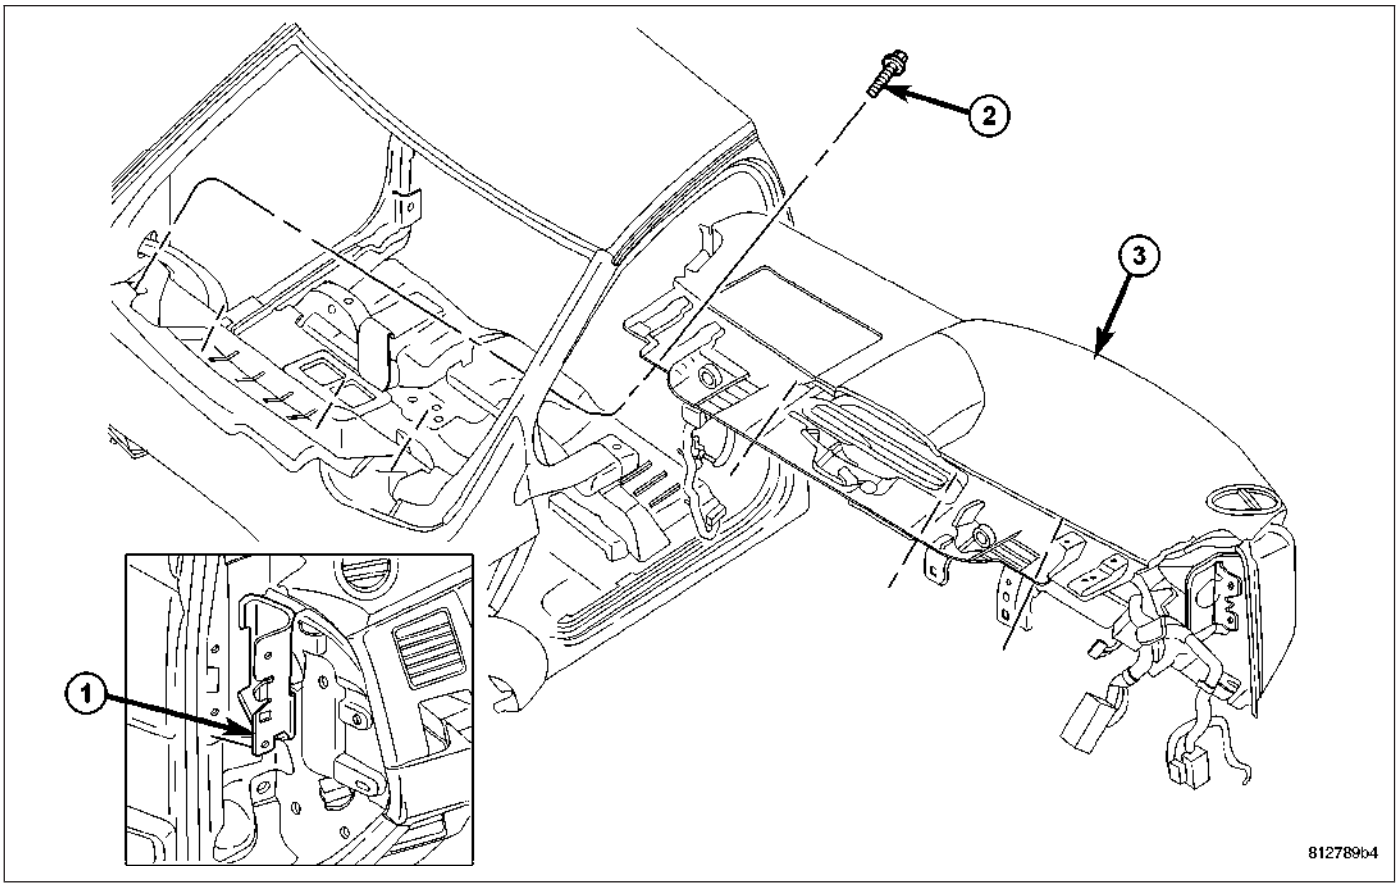


39. Remove the harness bolt (1) and the ground wire(3) bolt (2).
40. Remove the passenger side rear floor duct.





41. Open the trim covers in the passenger side a-pillar grab handle and remove the bolts.
42. Remove the a-pillar trim panel.
43. Using a trim stick C-4755 or equivalent, remove the instrument panel defroster grille.
44. Disconnect the sensor electrical connector (2).



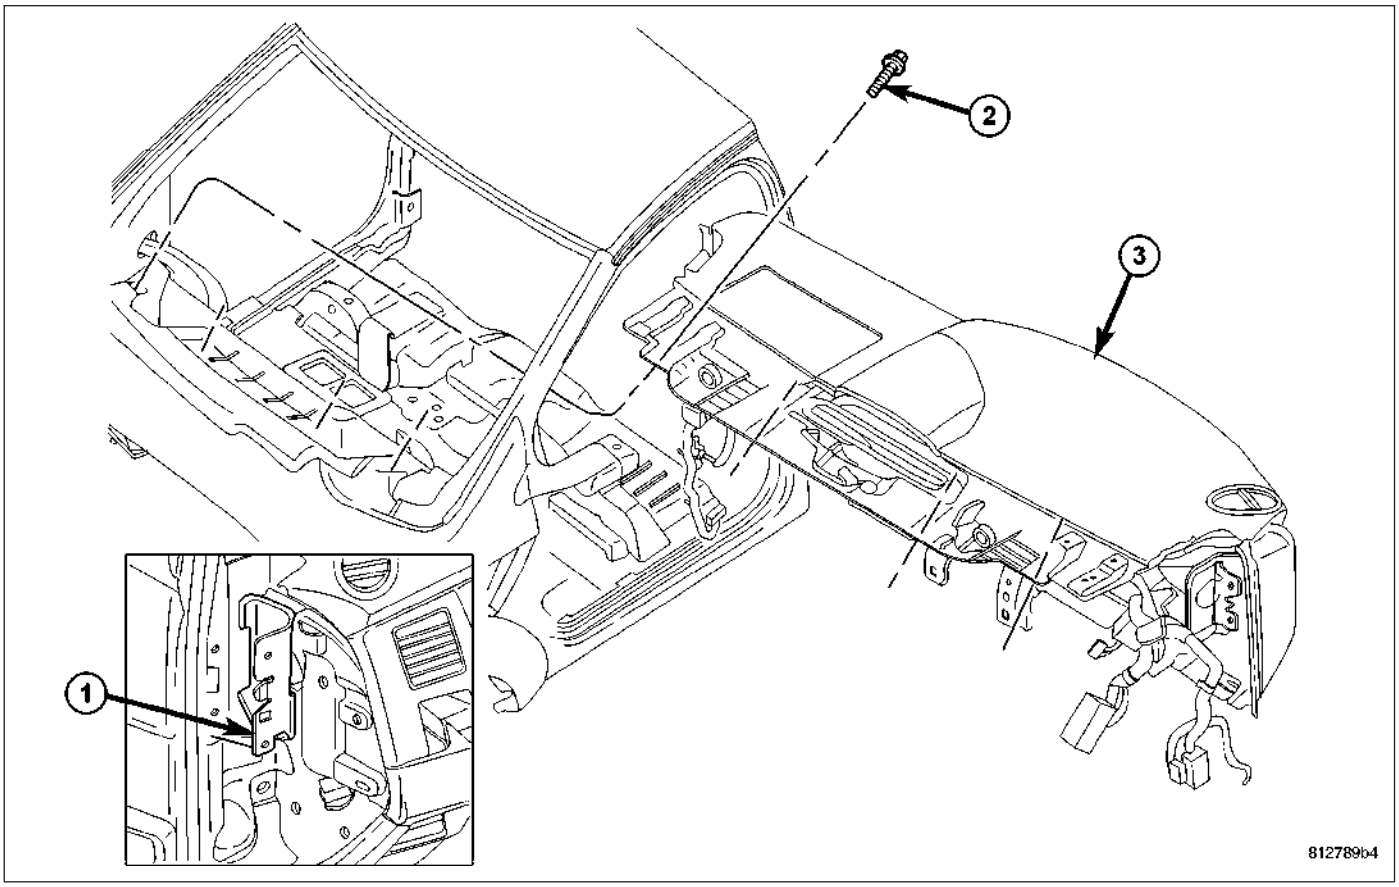
45. Remove the four fenceline bolts (2).
46. Lift the instrument panel assembly (3) off the side support pins (1) and remove assembly through the drivers door.

INSTALLATION

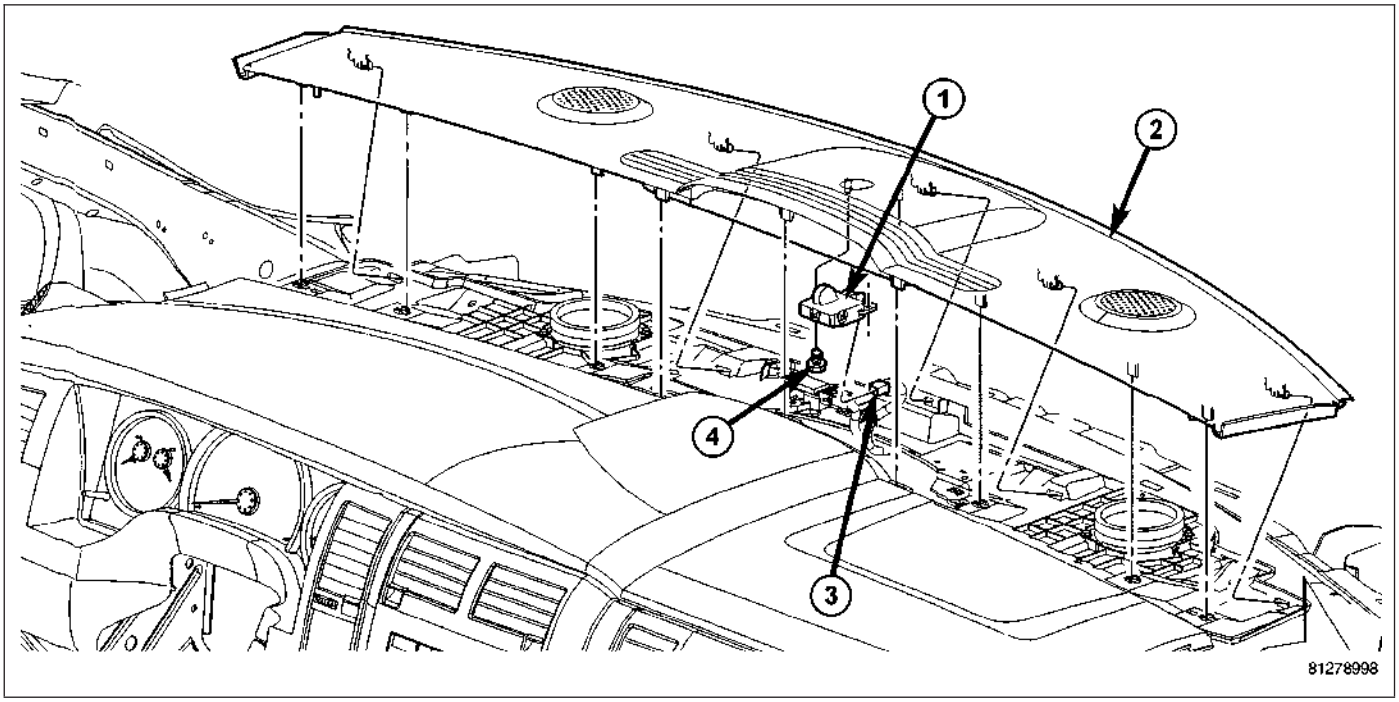
WARNING: TO AVOID PERSONAL INJURY OR DEATH, ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, AIRBAG, OCCUPANT CLASSIFICATION SYSTEM, SEAT BELT TENSIONER, IMPACT SENSOR, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT.

WARNING: TO AVOID PERSONAL INJURY OR DEATH, NEVER STRIKE OR DROP THE OCCUPANT RESTRAINT CONTROLLER, AS IT CAN DAMAGE THE IMPACT SENSOR OR AFFECT ITS CALIBRATION. THE OCCUPANT RESTRAINT CONTROLLER CONTAINS THE IMPACT SENSOR, WHICH ENABLES THE SYSTEM TO DEPLOY THE SUPPLEMENTAL RESTRAINTS. IF AN AIRBAG CONTROL MODULE IS ACCIDENTALLY DROPPED DURING SERVICE, THE MODULE MUST BE SCRAPPED AND REPLACED WITH A NEW UNIT. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN ACCIDENTAL, INCOMPLETE, OR IMPROPER SUPPLEMENTAL RESTRAINT DEPLOYMENT.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

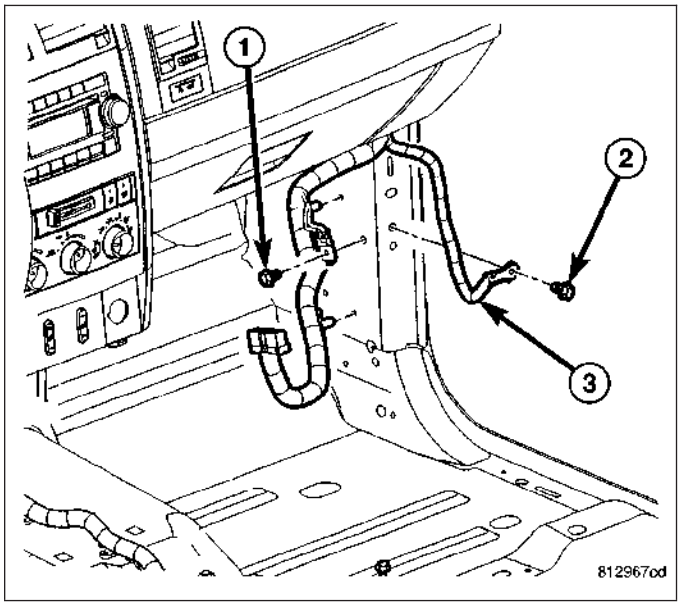


1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ INSTRUMENT PANEL - WARNING)
2. Position the instrument panel assembly (3) into the vehicle through the drivers side door and install onto the side support pins (1).
3. Install the four fenceline bolts and tighten to 8 N·m (70 in. lbs.).

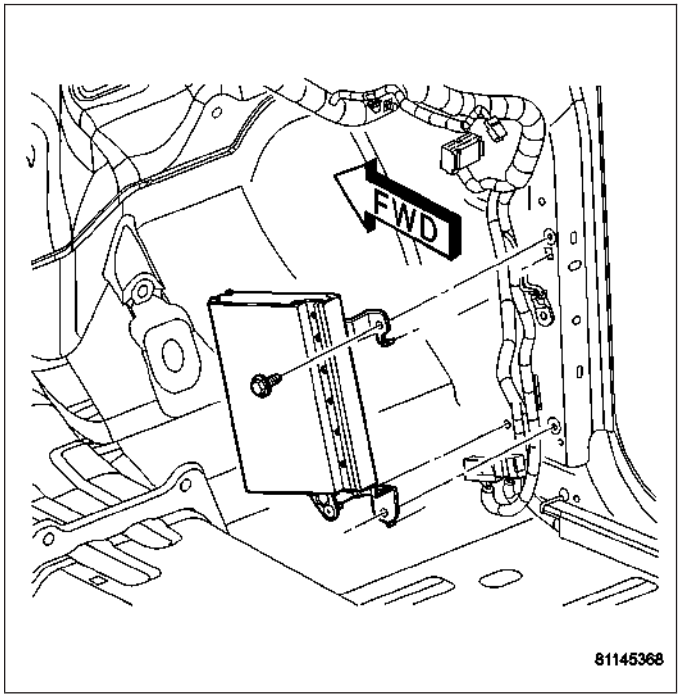


4. Connect the sensor electrical connector (2).

5. Install the instrument panel defroster grille and seat fully.
6. Position the passenger side a-pillar trim panel into place and seat fully.
7. Install the bolts and tighten to 6 N·m (55 in. lbs.).
8. Install the passenger side rear floor duct.
9. Install the screws for the ground wire (2) and passenger side wire harness (1).
10. Tighten the ground wire (2) and harness bolts (3) to 14 N·m (10 ft. lbs.).



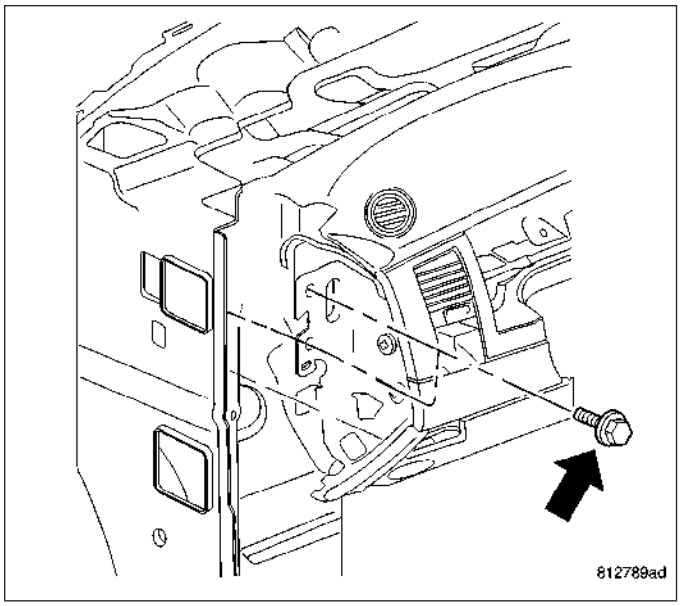
11. Connect the amplifier and antenna electrical connectors.
12. Install the amplifier and install the bolts.
13. Tighten the bolts to 6 N·m (50 in. lbs.).
14. Install the right cowl trim cover and install the screw.
15. Install the right door sill trim cover.



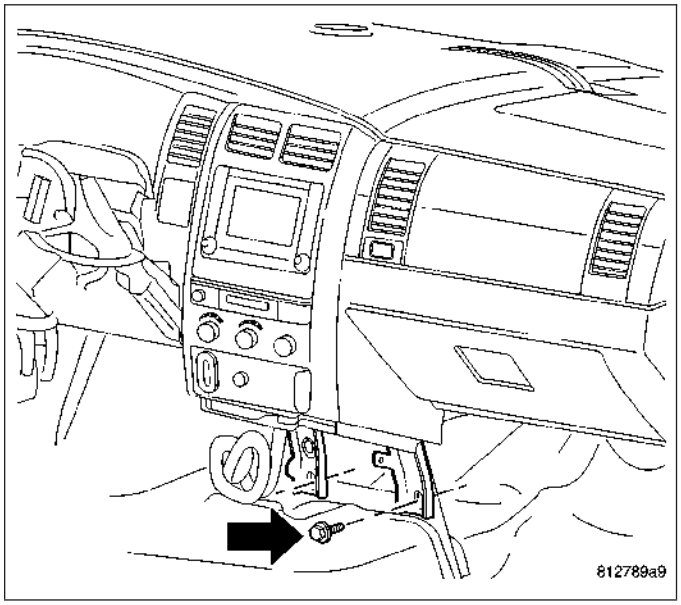
16. Install the passenger side support bolts and tighten to 27 N·m (20 ft. lbs.).
17. Install the right instrument panel end cap.

NOTE: Drivers side shown, passenger side similar.

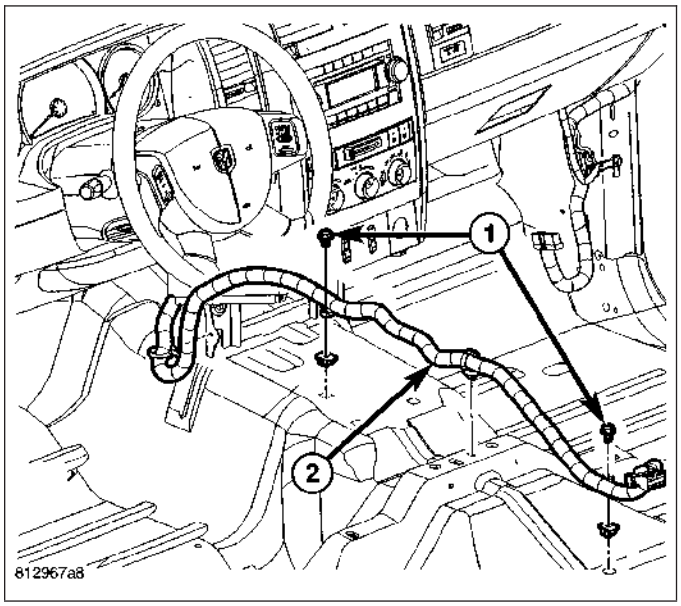
18. Install the drivers side support bolts and tighten to 27 N·m (20 ft. lbs.).



19. Install the drivers side floor duct.
20. Install the drivers seat. (Refer to 23 - BODY/ SEATS/SEAT - INSTALLATION)
21. Install the center support bolts and tighten to 11 N·m (95 in. lbs.).

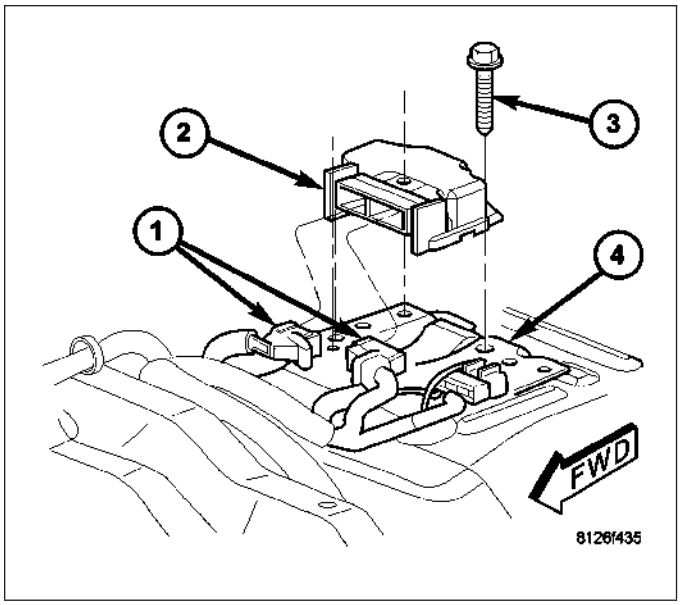


22. Position the center instrument panel wiring harness (2) under the carpet and install the bolts (1).

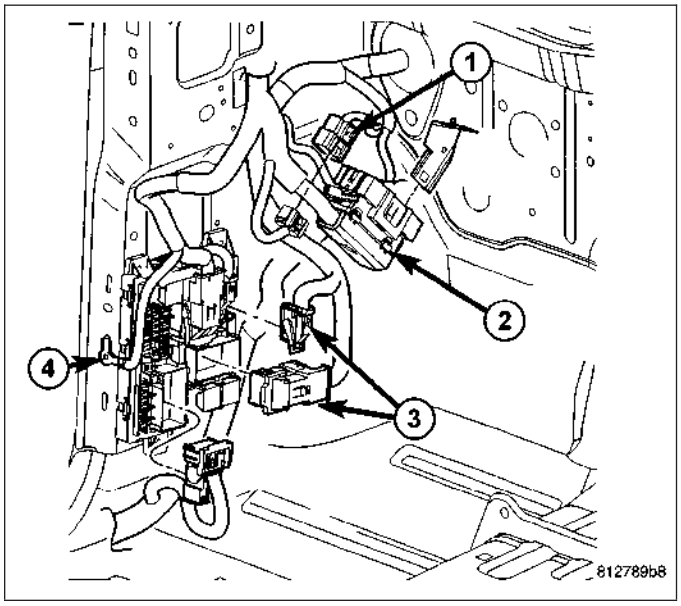


CAUTION: The lever arms of the wire harness connectors for the ORC MUST be in the unlatched position before they are inserted into their connector receptacles on the ORC or they may become damaged.

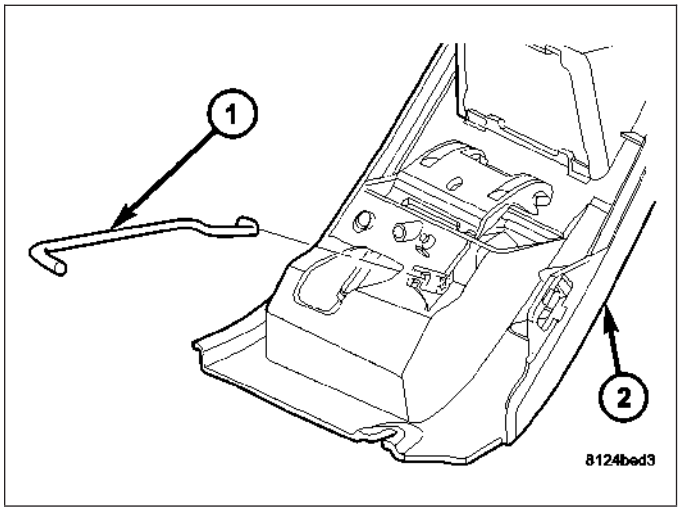
23. Reconnect the two body wire harness connectors (1) to the ORC connector receptacles located on the forward facing side of the module. Be certain that the latches on both connectors are each fully engaged.
24. Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)



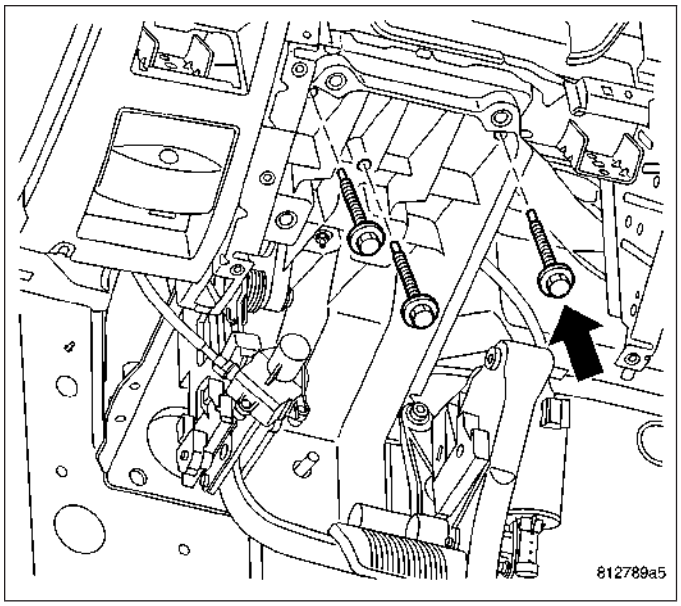
25. Position the drivers side a-pillar trim into place and seat the retaining clips fully.
26. Install the bolts and tighten to 6 N·m (55 in. lbs.).
27. Install the ground wire (4) and install the bolt.
28. Tighten the ground wire bolts to 14 N·m (10 ft. lbs.)
29. Connect the electrical connectors (1, 2 and 3) at the fuse block.



30. Connect the brake release rod (1) to the arm on the pedal assembly.

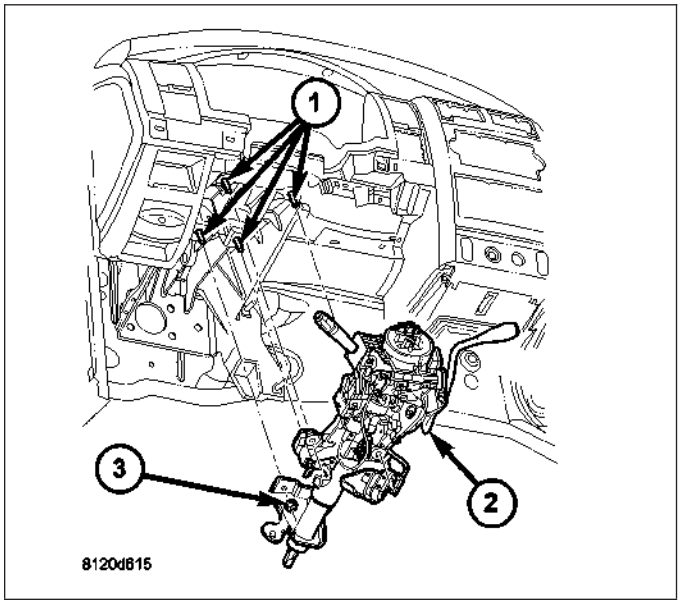


31. Install the pedal support bolts and tighten to 14 N·m (10 ft. lbs.).

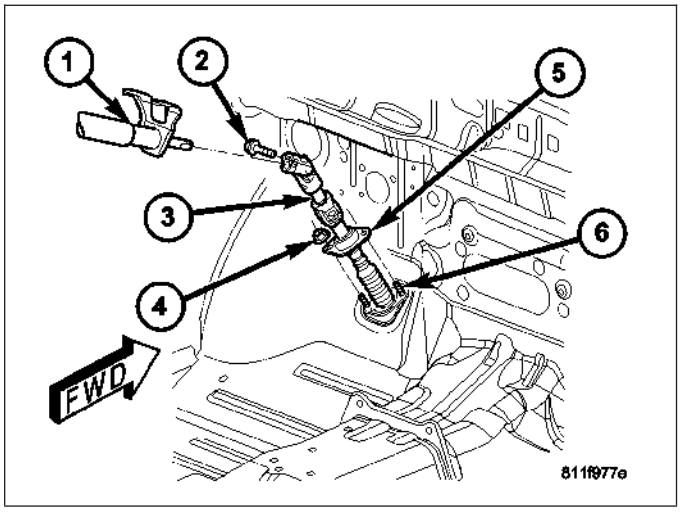


CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

32. Position the steering column (2) on the dash panel support (1) and loosely install the mounting nuts (3).
33. Firmly slide the steering column (2) upward against the studs (1) in dash panel and hand tighten the nuts (3).



34. Install the steering shaft coupler (3) on the steering shaft (1) and loosely install a **new** bolt (2).

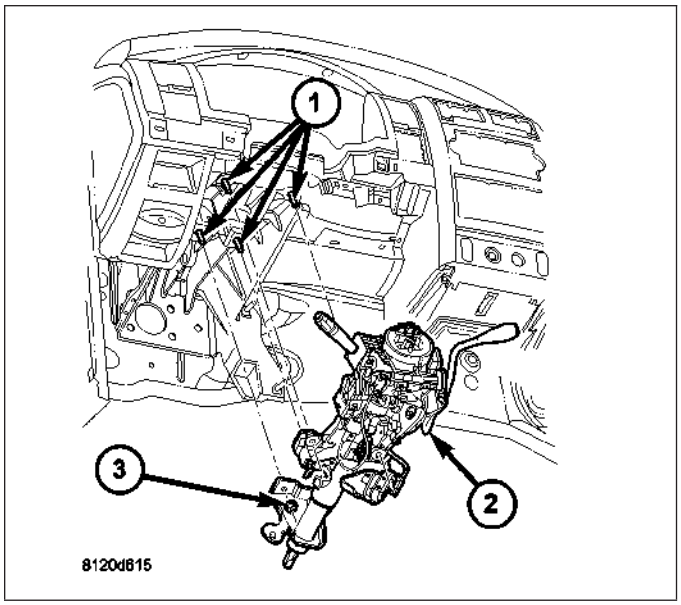


35. Center steering column (2) in dash opening and tighten mounting nuts (3) to 28 N·m (21 ft. lbs.).

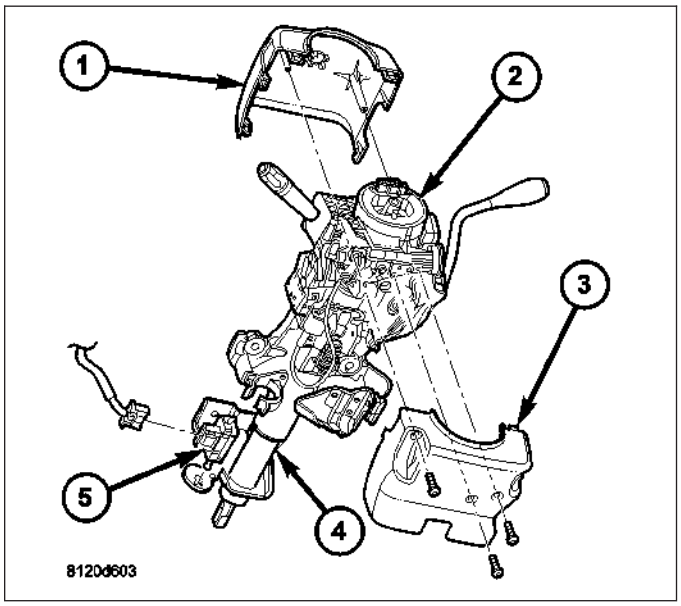
NOTE: Torque the upper left nut first then the lower right nut. Then torque the lower left nut then the upper right nut.

NOTE: A new bolt must be used for reinstallation.

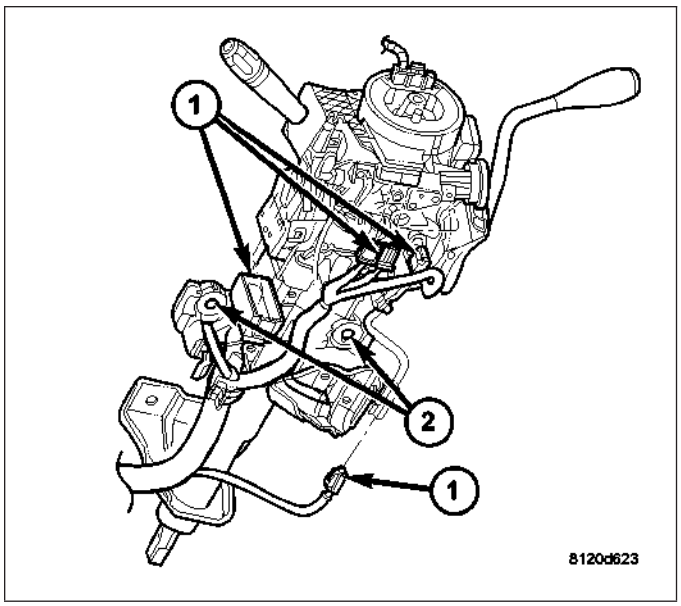
36. Tighten the coupler bolt to 38 N·m (28 ft. lbs.).



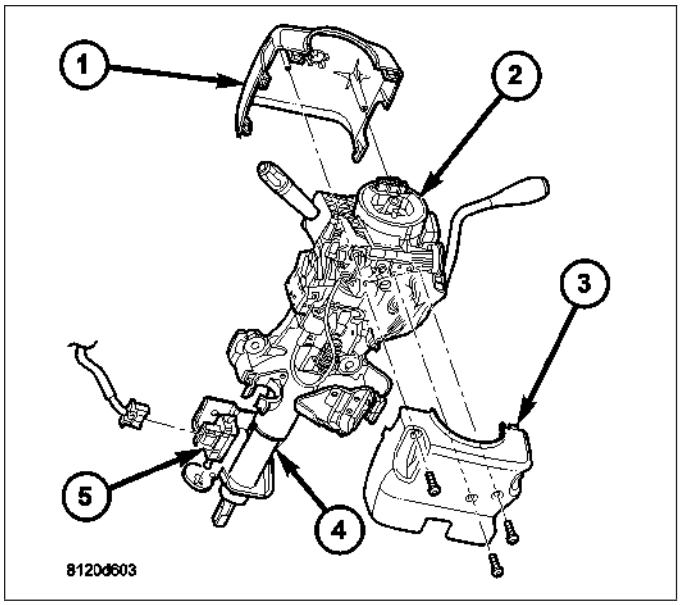
37. Install a new brake light switch (5) (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/ BRAKE LAMP SWITCH - REMOVAL).
38. Install the shifter cable. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/GEAR SHIFT CABLE - INSTALLATION)



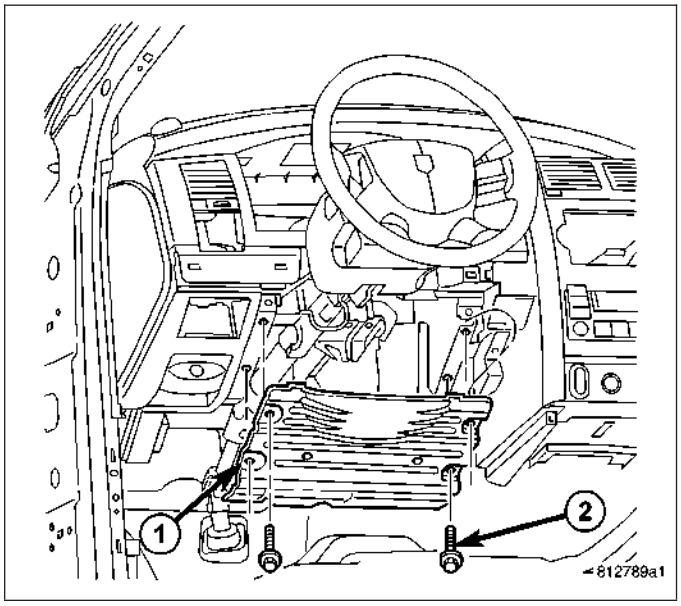
39. Connect the wiring harness (1) to the column (2).
40. Install the SKIM module.



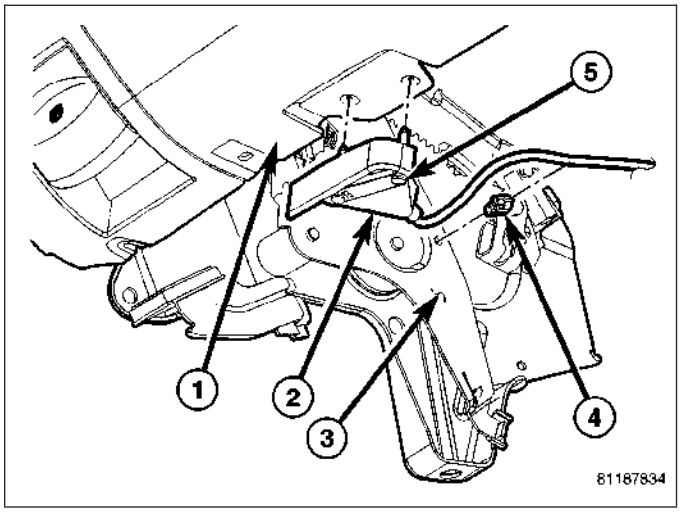
41. Install the upper (1) and lower (3) column shrouds and install the screws.
42. Install the column tilt lever.



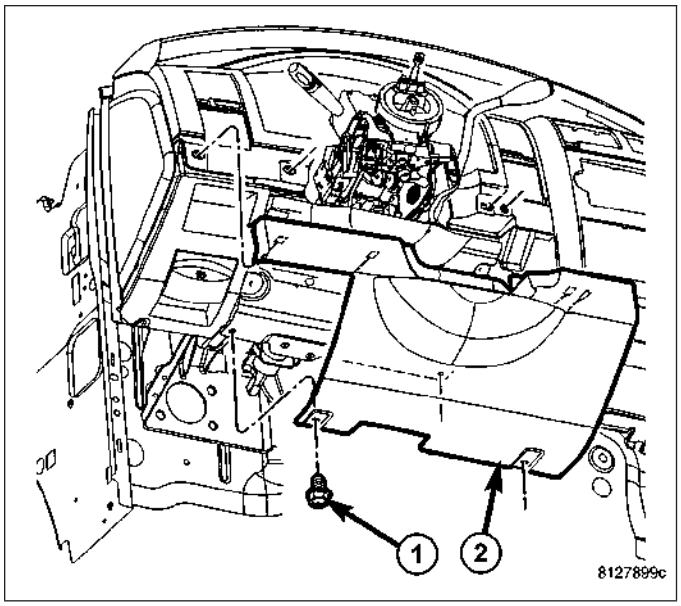
43. Install the steering column opening reinforcement (1) and install the four screws.



44. Install the hood release handle (2) and install the screws (5).



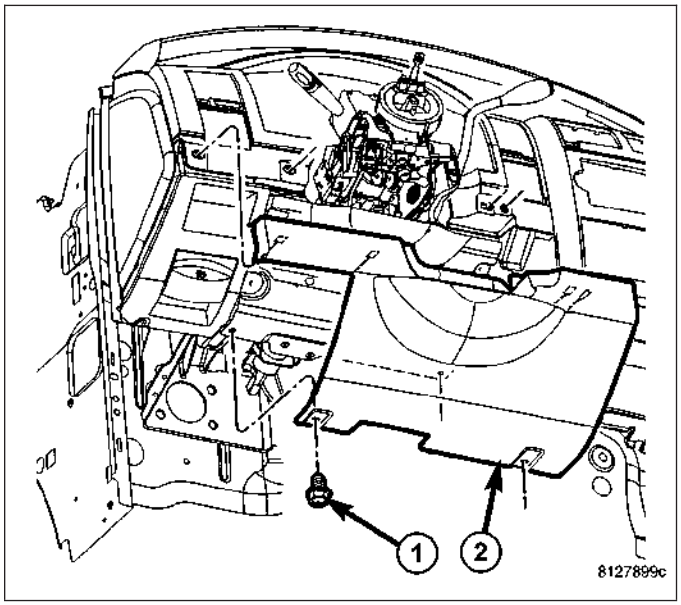
45. Install the steering column opening cover (2) and install the two screws (1).
46. Install the left instrument panel end cap.
47. Instal the left cowl trim cover and install the screw.
48. Install the left door sill trim cover and seat fully.
49. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/ RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).



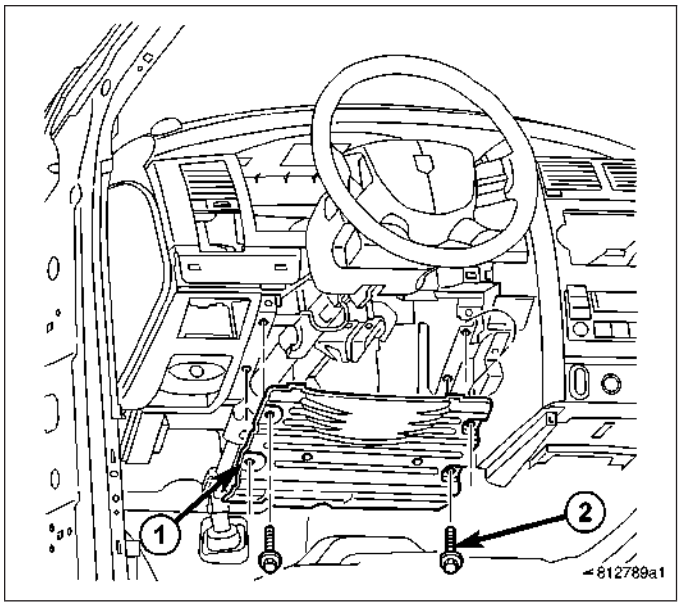
COVER-STEERING COLUMN OPENING

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the two screws (1) and remove the opening cover (2).

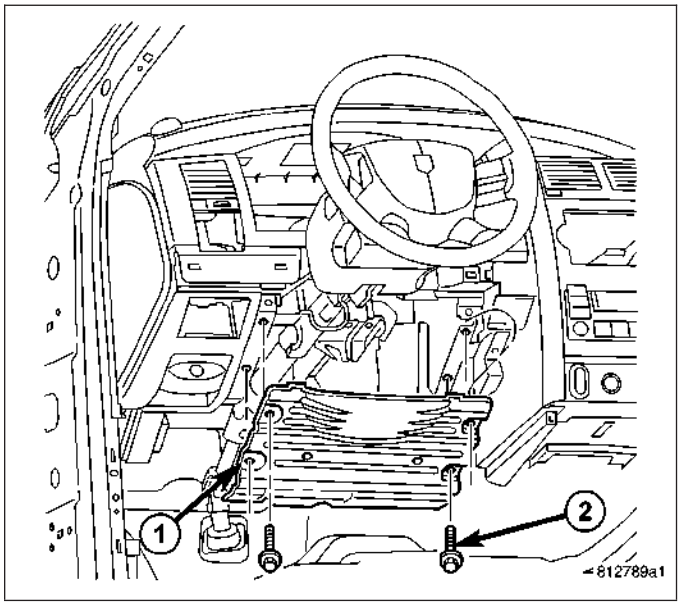


3. Remove the four screws (2) and remove the steering column opening reinforcement.

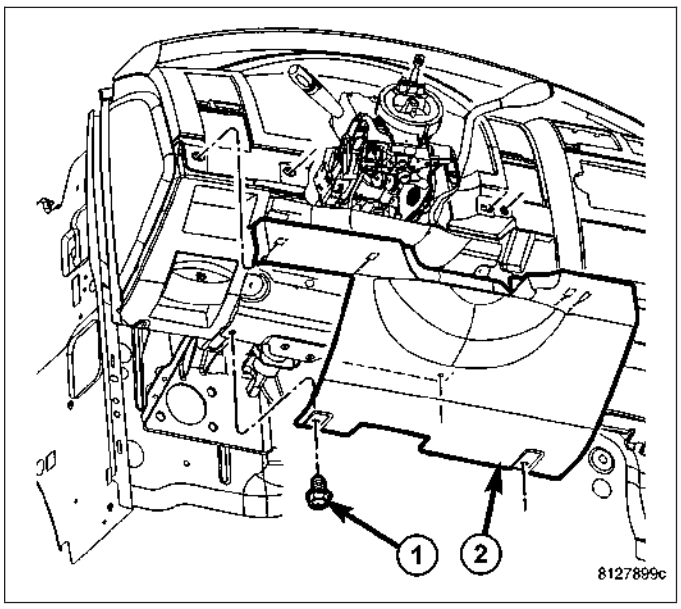


INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Install the opening reinforcement (1) and install the four screws (2).



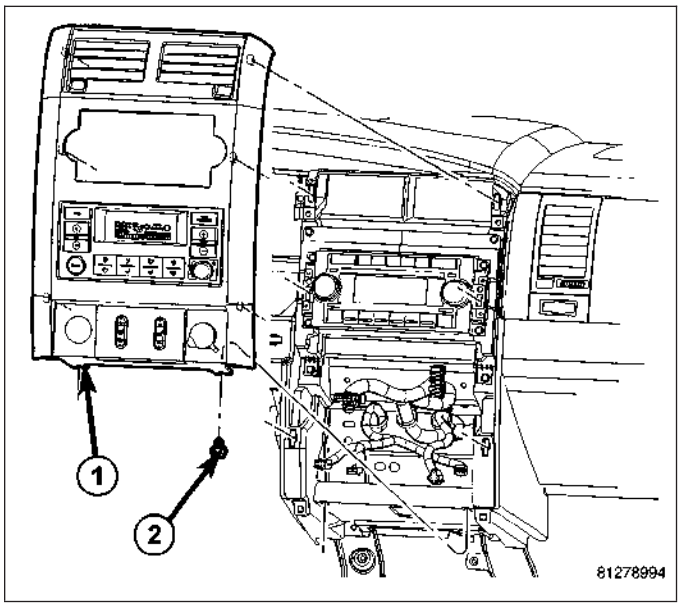
3. Install the opening cover (2) and seat fully.
4. Install the two screws (1).



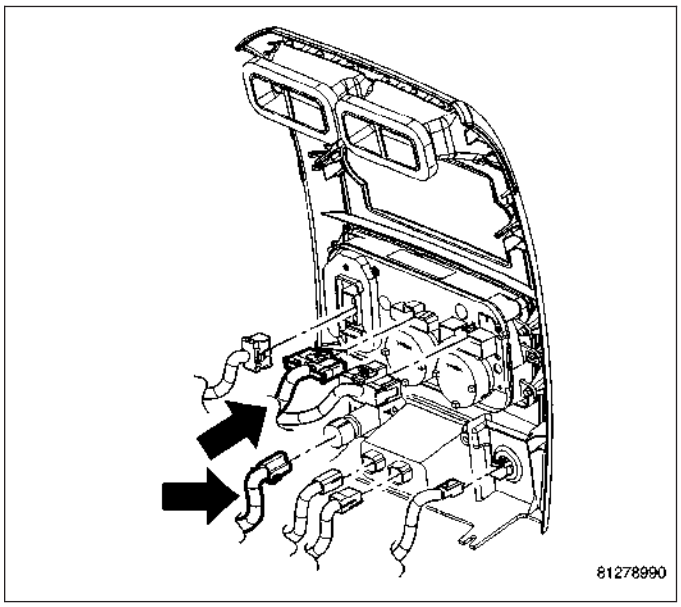
BEZEL-CENTER

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Remove the two screws (2) and remove the bezel (1).

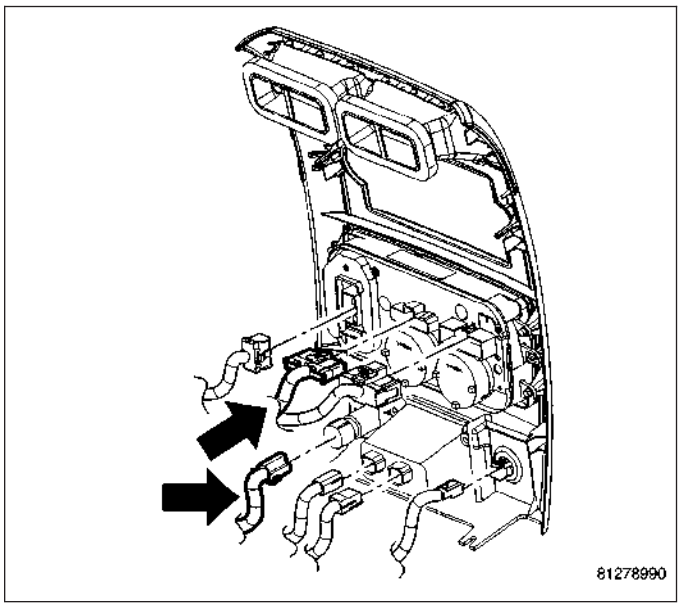


3. Disconnect the electrical connectors and remove the bezel.



INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Connect the electrical connectors.



3. Install the center bezel (1) and install the two screws (2).

PANEL-A PILLAR TRIM

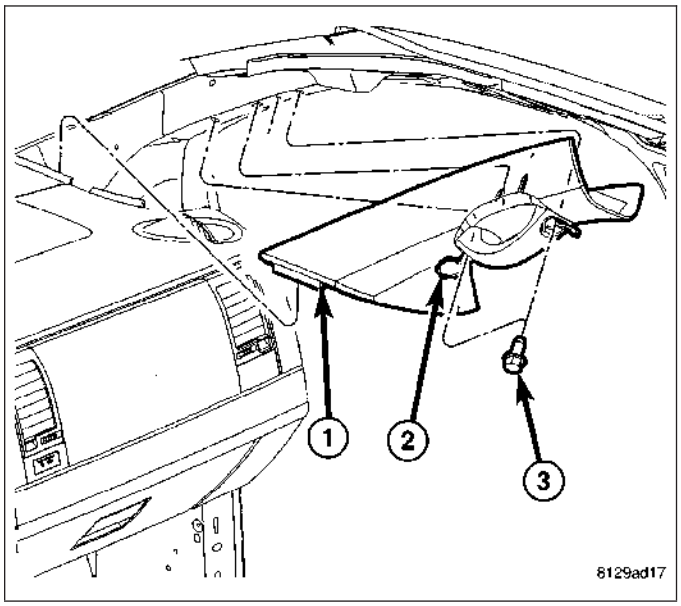
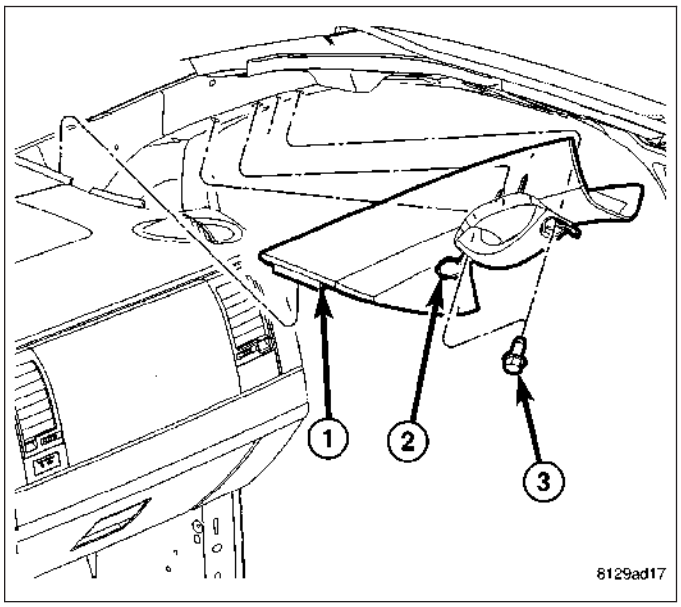
REMOVAL

1. Using a small flat bladed tool or equivalent open the trim plugs (2) in the a-pillar grab handle and remove the bolts (3).
2. Remove the a-pillar trim panel (1).



INSTALLATION

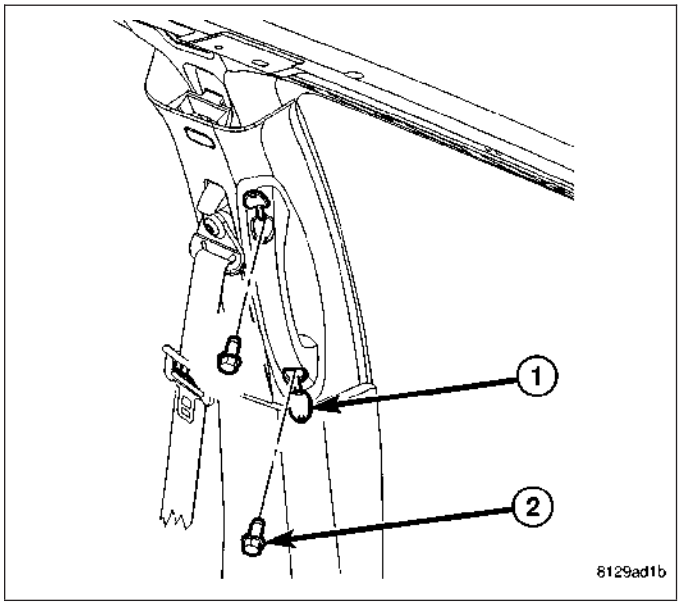
1. Position the a-pillar trim (1) into place and seat the retaining clips fully.
2. Install the bolts and tighten to 6 N·m (55 in. lbs.).



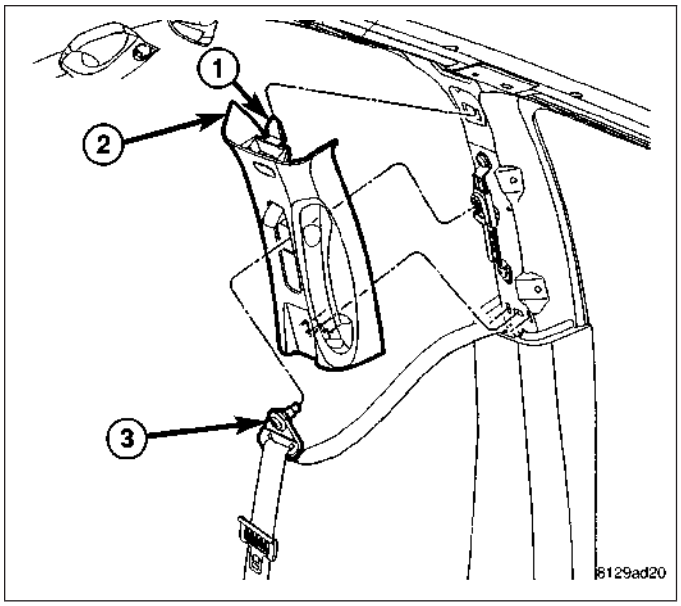
PANEL-B PILLAR TRIM

REMOVAL

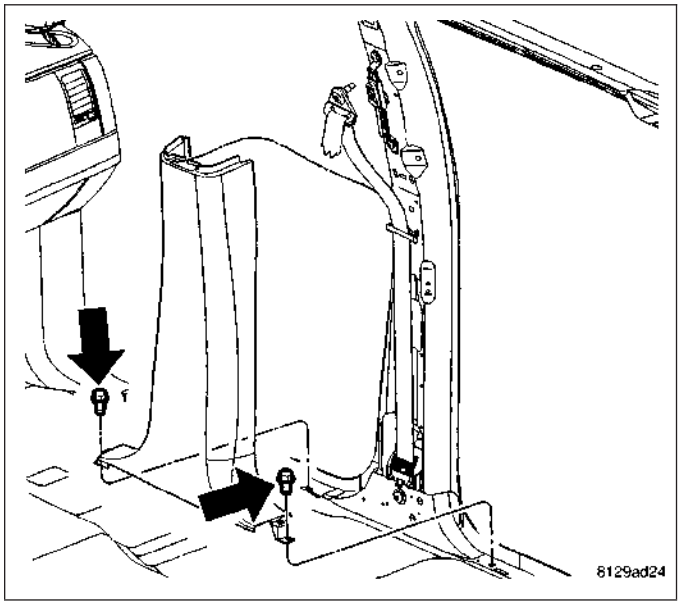
1. Using a small flat bladed tool or equivalent open the trim plugs (1) in the grab handle and remove the bolts (2).



2. Remove the shoulder belt anchor bolt (3) and separate the upper trim panel (2) at the bottom and off the hook (1) at the top.

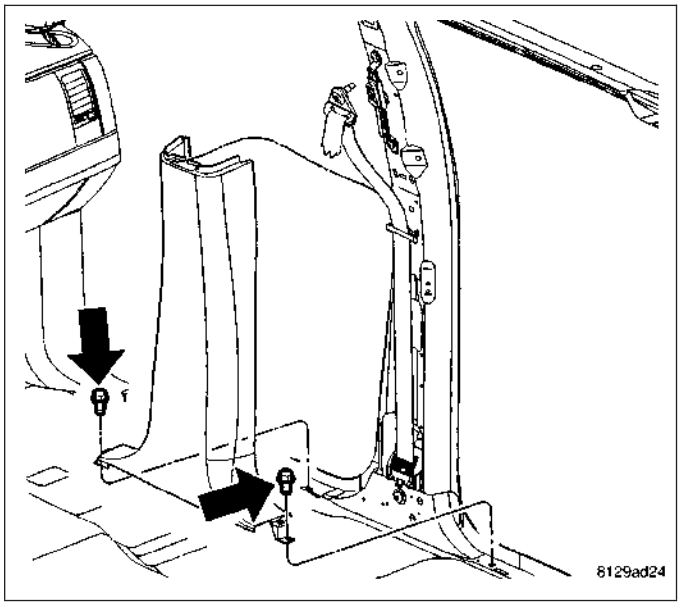


3. Using a trim stick C-4755 or equivalent, remove the door sill scuff plates. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - DESCRIPTION)
4. Remove the bolts and remove the lower b-pillar trim.

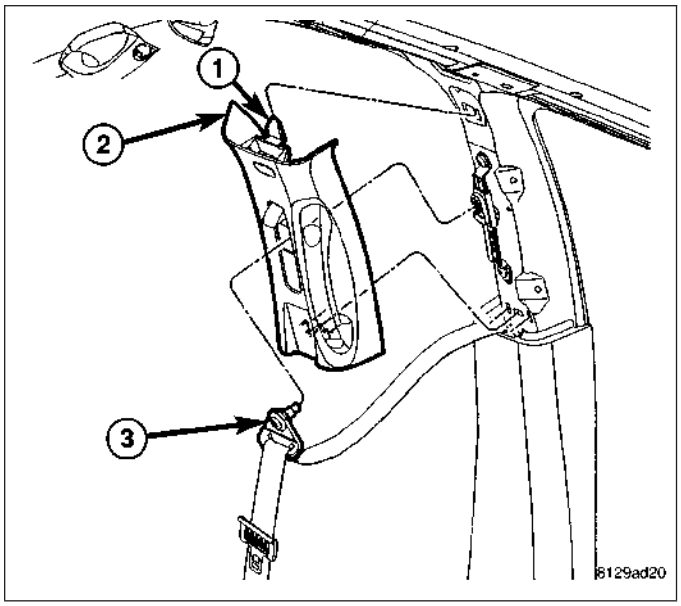


INSTALLATION

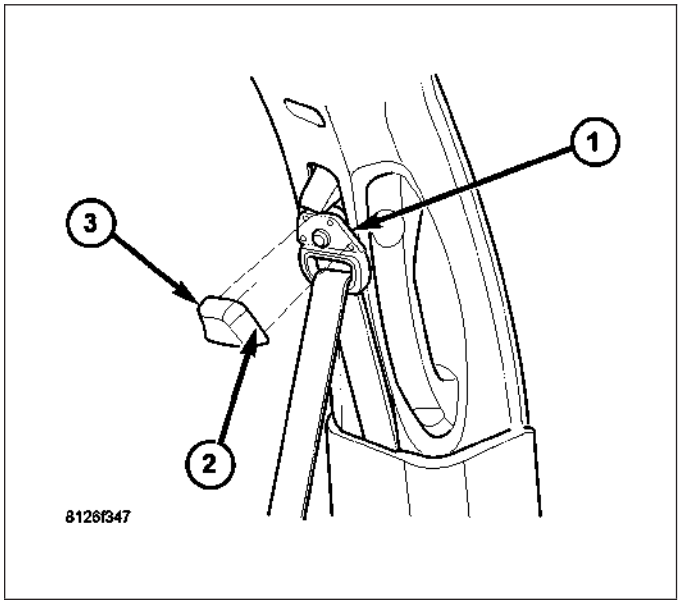
1. Position the shoulder belt through the upper slot in the trim.
2. Install the trim panel and install the bolts.
3. Position the door sill scuff plates and seat the clips fully. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - DESCRIPTION)



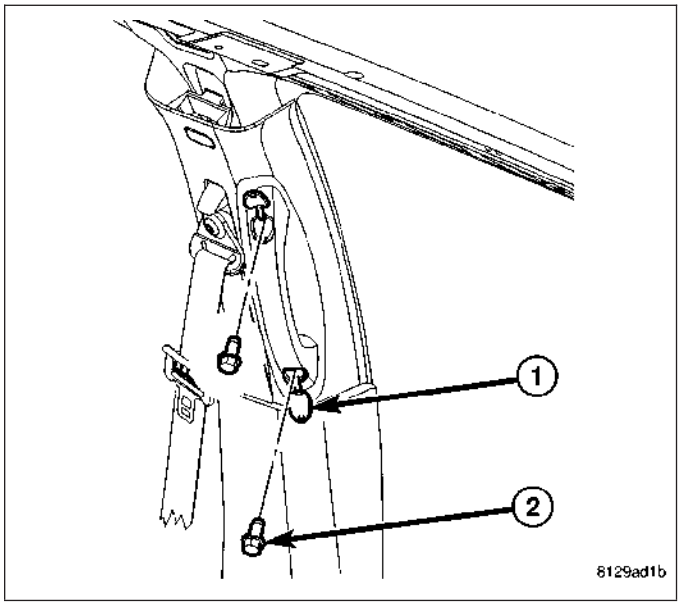
4. Position the upper trim panel tab (1) into the b-pillar and seat the lower side of the trim fully.
5. Install the shoulder belt anchor bolt (3) and tighten to 39 N·m (29 ft. lbs.).



6. Engage the tab (2) on the lower edge of the trim cover (3) in the slot below the screw in the turning loop (1). Then press the upper edge of the trim cover over the top of the turning loop until it snaps into place.



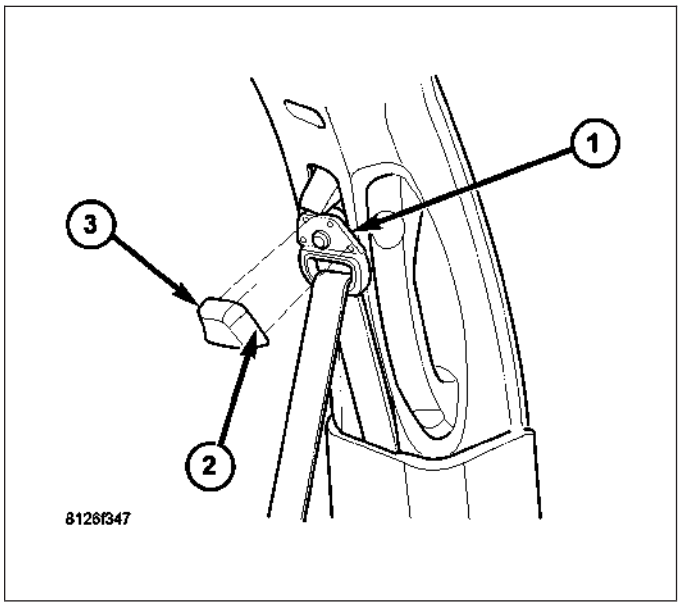
7. Install the grab handle bolts (2) and tighten to 6 N·m (55 in. lbs.).



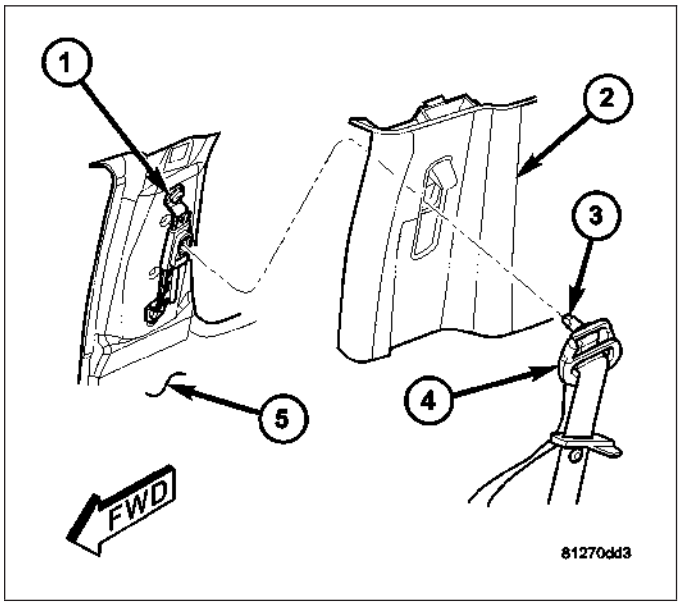
PANEL-C PILLAR TRIM

REMOVAL

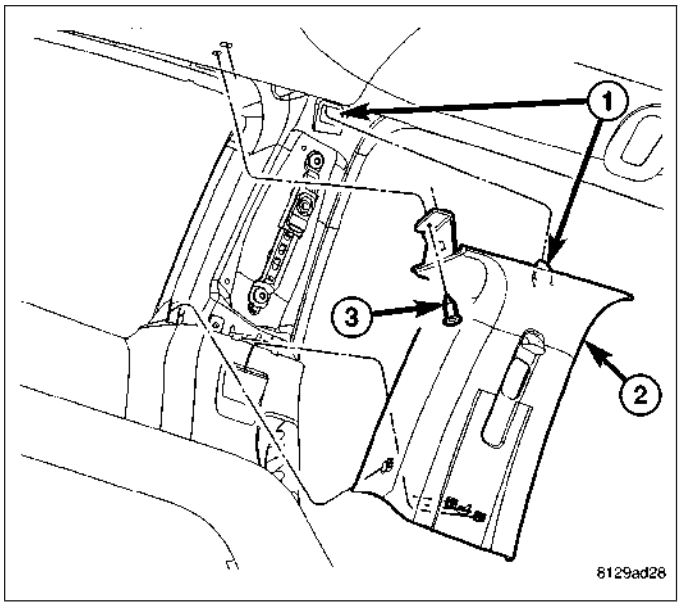
1. Remove the quarter glass trim panel. (Refer to 23 - BODY/INTERIOR/INTERIOR TRIM PANELS - QUARTER GLASS - REMOVAL)
2. Unsnap the upper edge of the trim cover (3) from the second row outboard seat belt turning loop (1) and disengage the tab (2) on the lower edge of the cover to access the turning loop screw.



3. Remove the screw (3) that secures the seat belt turning loop (4) to the height adjuster (1) on the upper C-pillar (5).

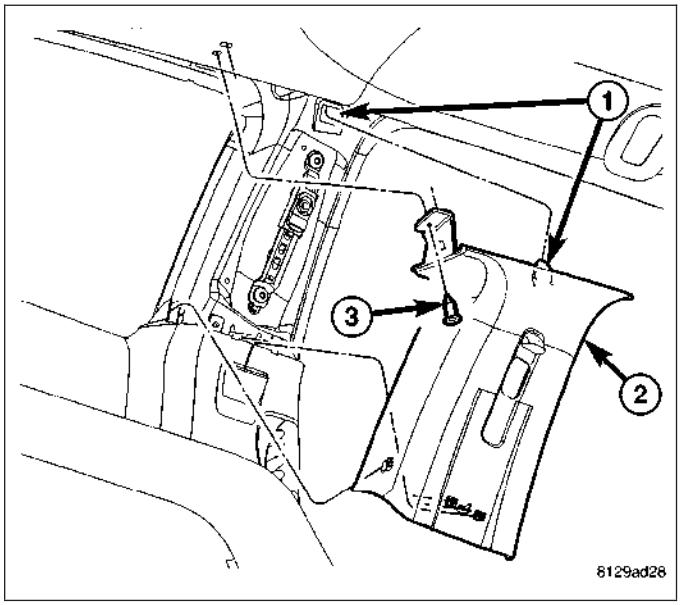


4. Remove the screw (3).
5. Using a trim stick C-4755 or equivalent, separate the bottom edge of the trim (2) from the pillar and remove off of the upper locating tab (1).

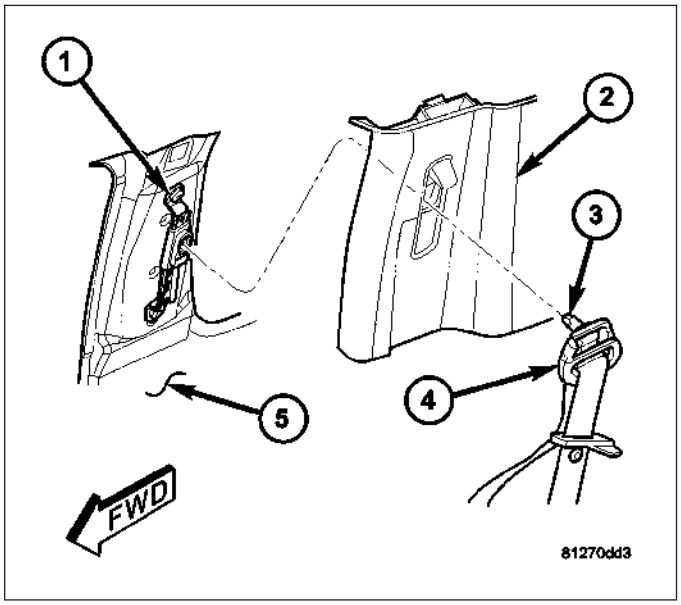


INSTALLATION

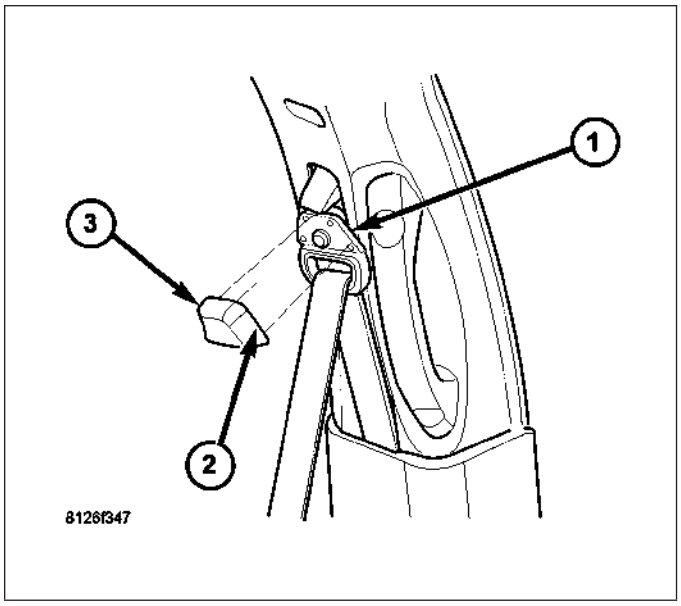
1. Position the upper trim panel tab (1) into the b-pillar and seat the lower side of the trim fully.
2. Install the screw (3).



3. Position the seat belt turning loop (4) to the height adjuster (1).
4. Install the screw (3) and tighten the to 39 N·m (29 ft. lbs.).



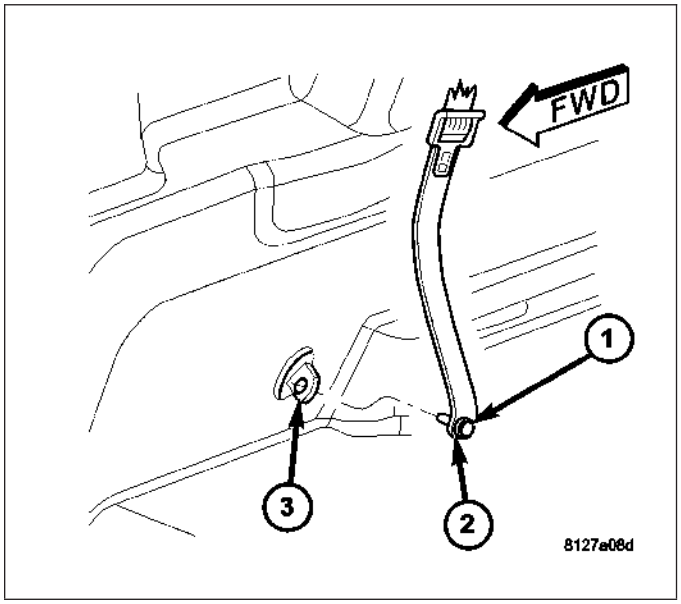
5. Engage the tab (2) on the lower edge of the trim cover (3) in the slot below the screw in the turning loop (1). Then press the upper edge of the trim cover over the top of the turning loop until it snaps into place.



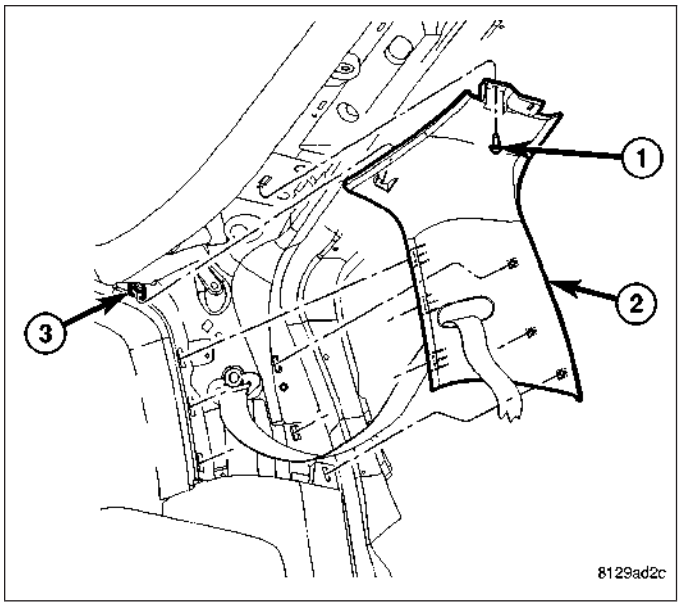
PANEL-D PILLAR TRIM

REMOVAL

1. Move the third row seat cushion to its storage position, but leave the third row seat back in its upright position for easiest access to the seat belt lower anchor (2) on the quarter inner panel (3).
2. Remove the screw (1) that secures the lower anchor to the tapping plate on the quarter inner panel.

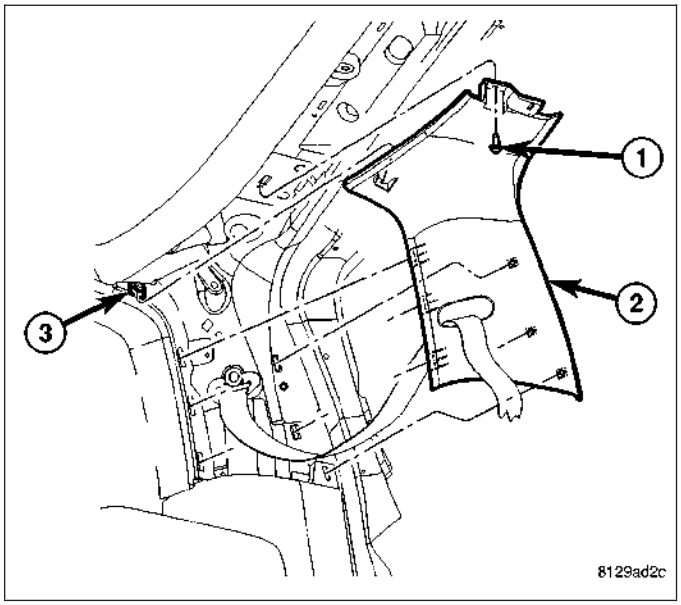


3. Using a trim stick C-4755 or equivalent, remove the upper rear headliner trim. (Refer to 23 - BODY/INTERIOR/REAR HEADER TRIM - DESCRIPTION)
4. Remove the screw (1).
5. Using a trim stick C-4755 or equivalent, separate the trim (2) and retaining clips and anchor (3).

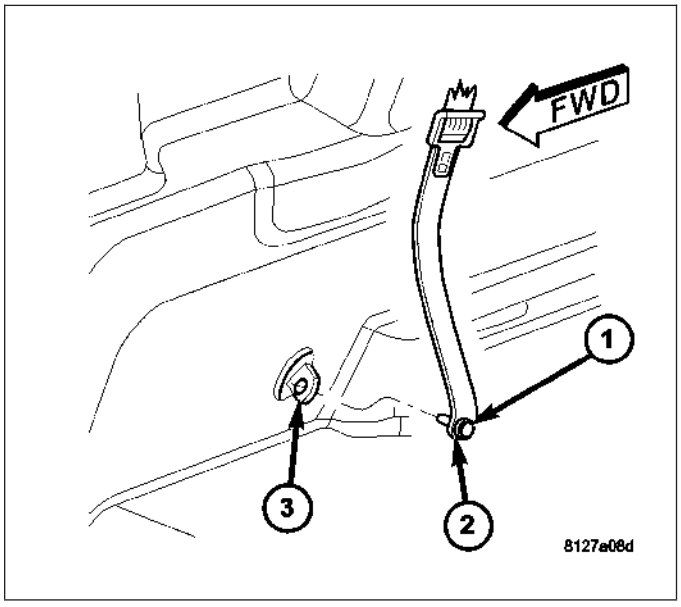


INSTALLATION

1. Position the shoulder belt through the slot in the trim.
2. Position the trim (2) in place on the b-pillar and anchor (3).
3. Seat the retaining clips fully and install the screw (1).
4. Position the rear header trim in place and seat the retaining clips fully.



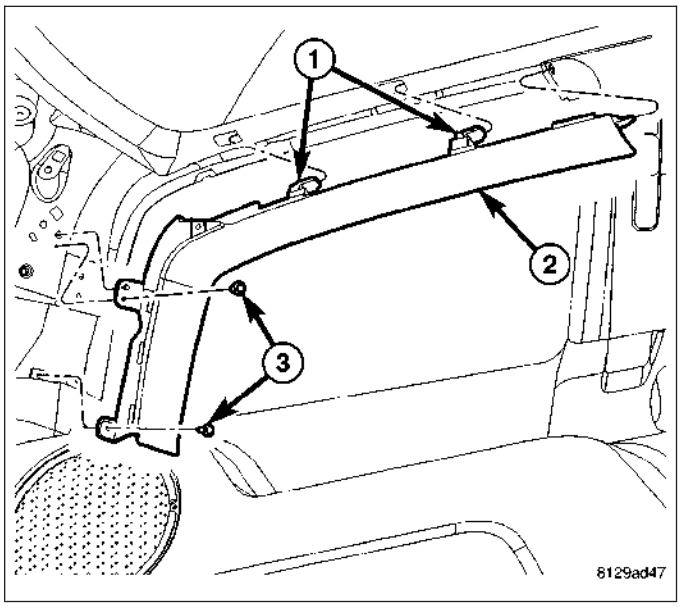
5. Position the seat belt lower anchor (2) to the tapping plate (3) on the quarter inner panel.
6. Install the screw (1) that secures the lower anchor to the tapping plate and tighten the to 39 N·m (29 ft. lbs.).



PANEL-QUARTER GLASS INTERIOR TRIM

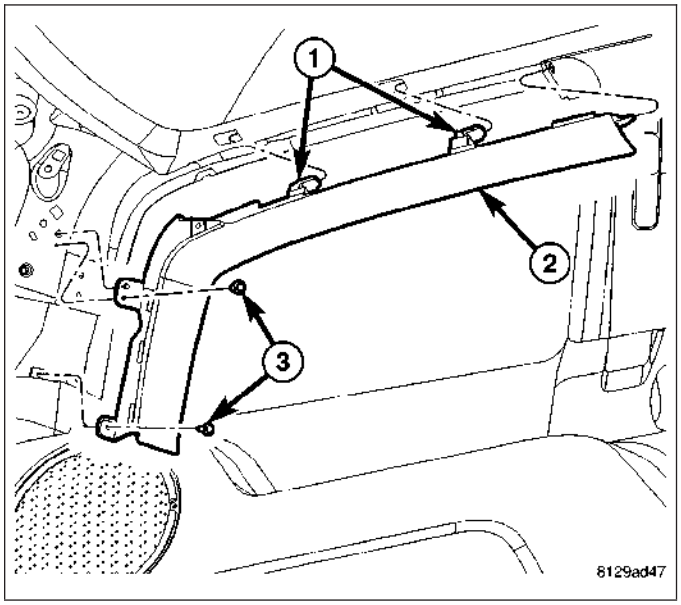
REMOVAL

1. Remove the d-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL)
2. Remove the screws (3).
3. Slide the trim panel (2) off the retaining tabs (1) and remove.



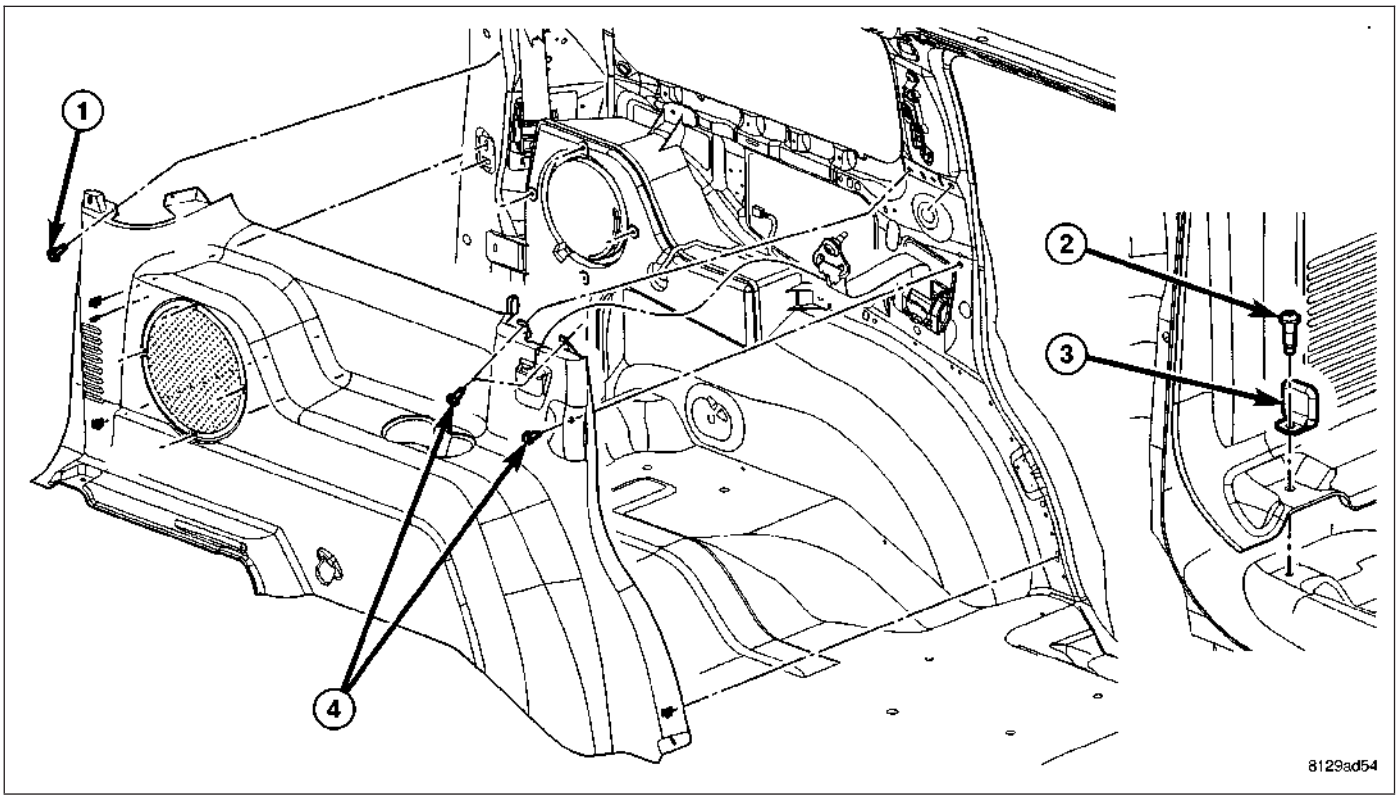
INSTALLATION

1. Position the trim panel (2) over the retaining tabs (1) and slide into place fully.
2. Install the screws (3).
3. Install the d-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION)



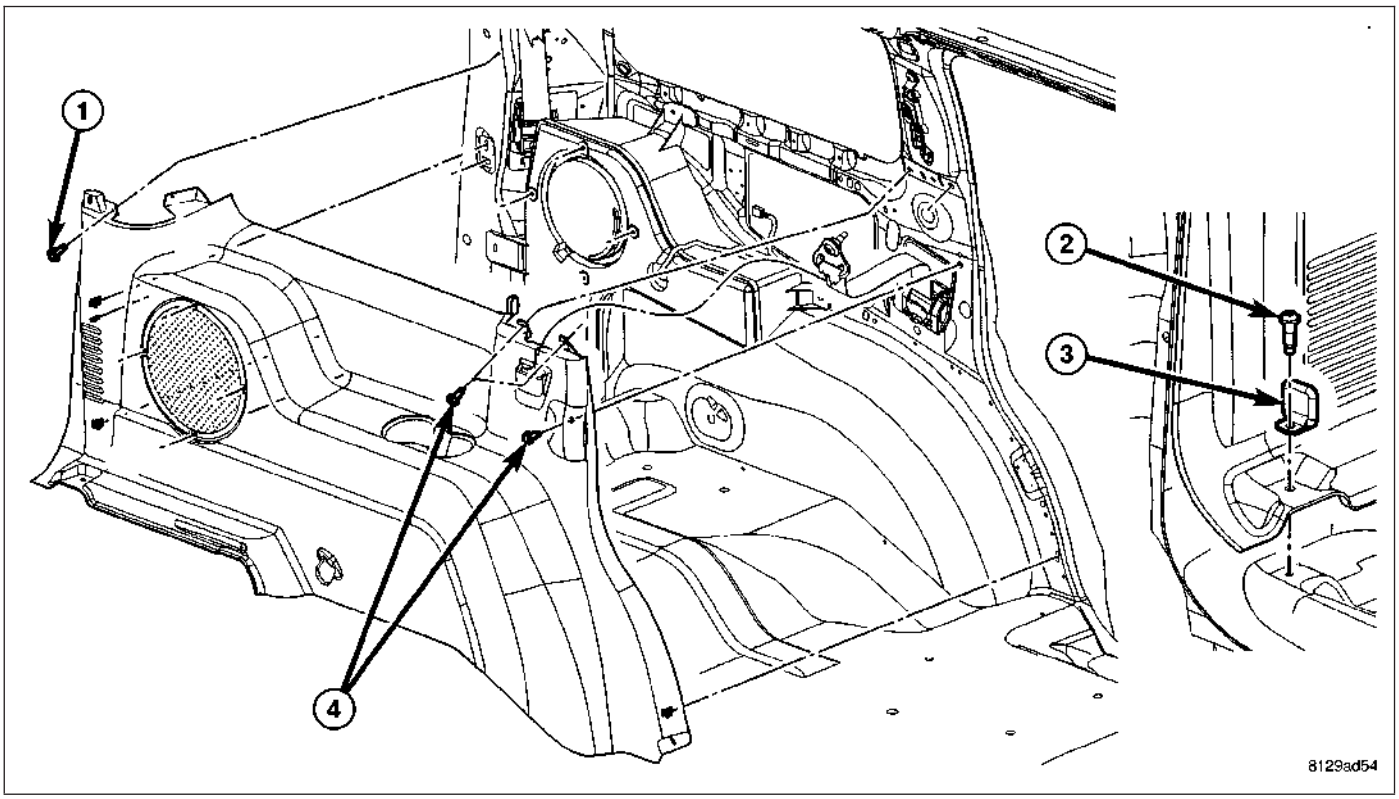
PANEL-QUARTER TRIM

REMOVAL



1. Remove the c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)
2. Remove the rear screw (1).
3. Remove the tie down anchor bolt (2) and tie down (3).
4. Remove the three front screws (4) and separate the trim panel.
5. Disconnect the power outlet electrical connector, if equipped.

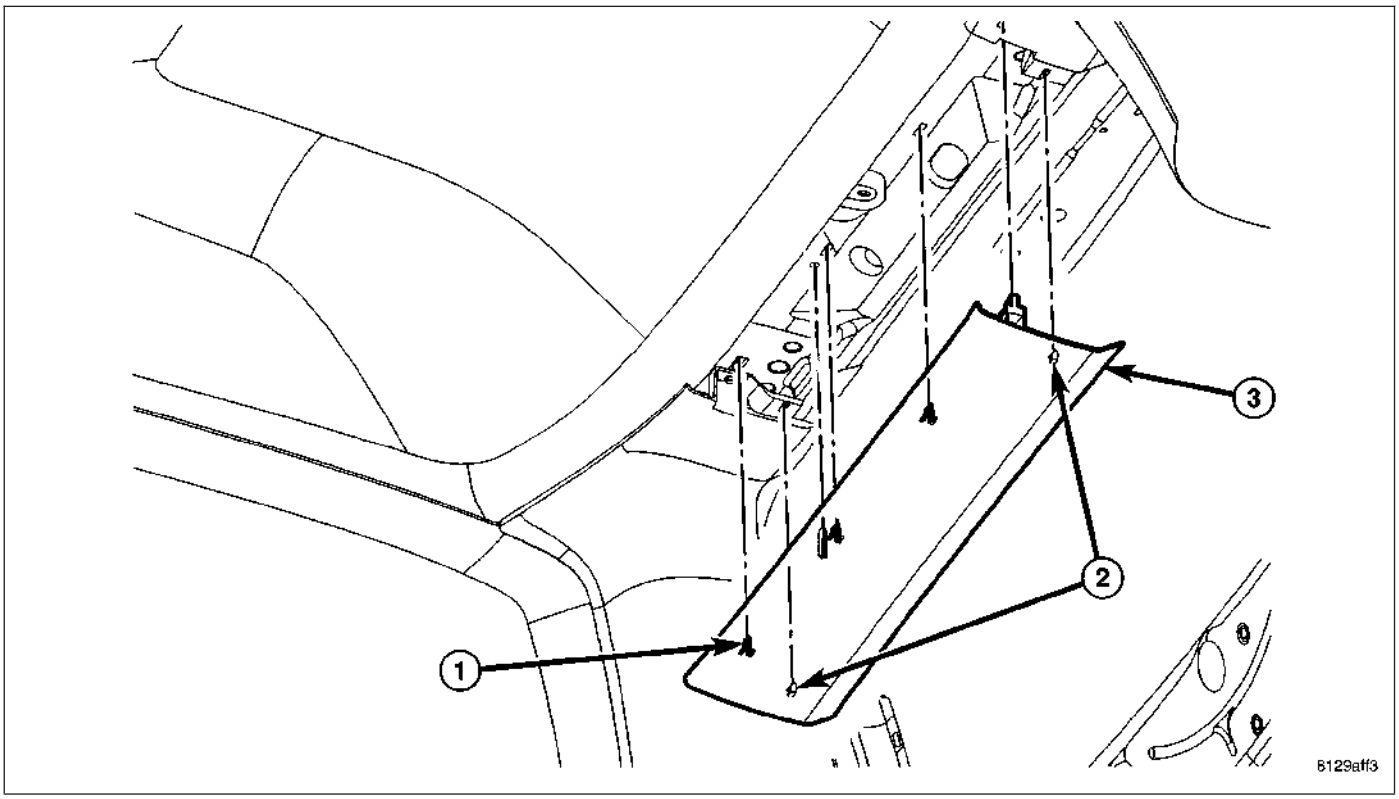
INSTALLATION



1. Connect the power outlet electrical connector, if equipped.
2. Position the trim panel onto the quarter panel and seat the retaining clips fully.
3. Install the three forward screws (4).
4. Install the rear screw (1).
5. Install the tie down (3) and tie down anchor bolt (2).
6. Tighten the bolt to 12 N·m (9 ft. lbs.)
7. Install the c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)

PANEL-REAR HEADER TRIM

DESCRIPTION

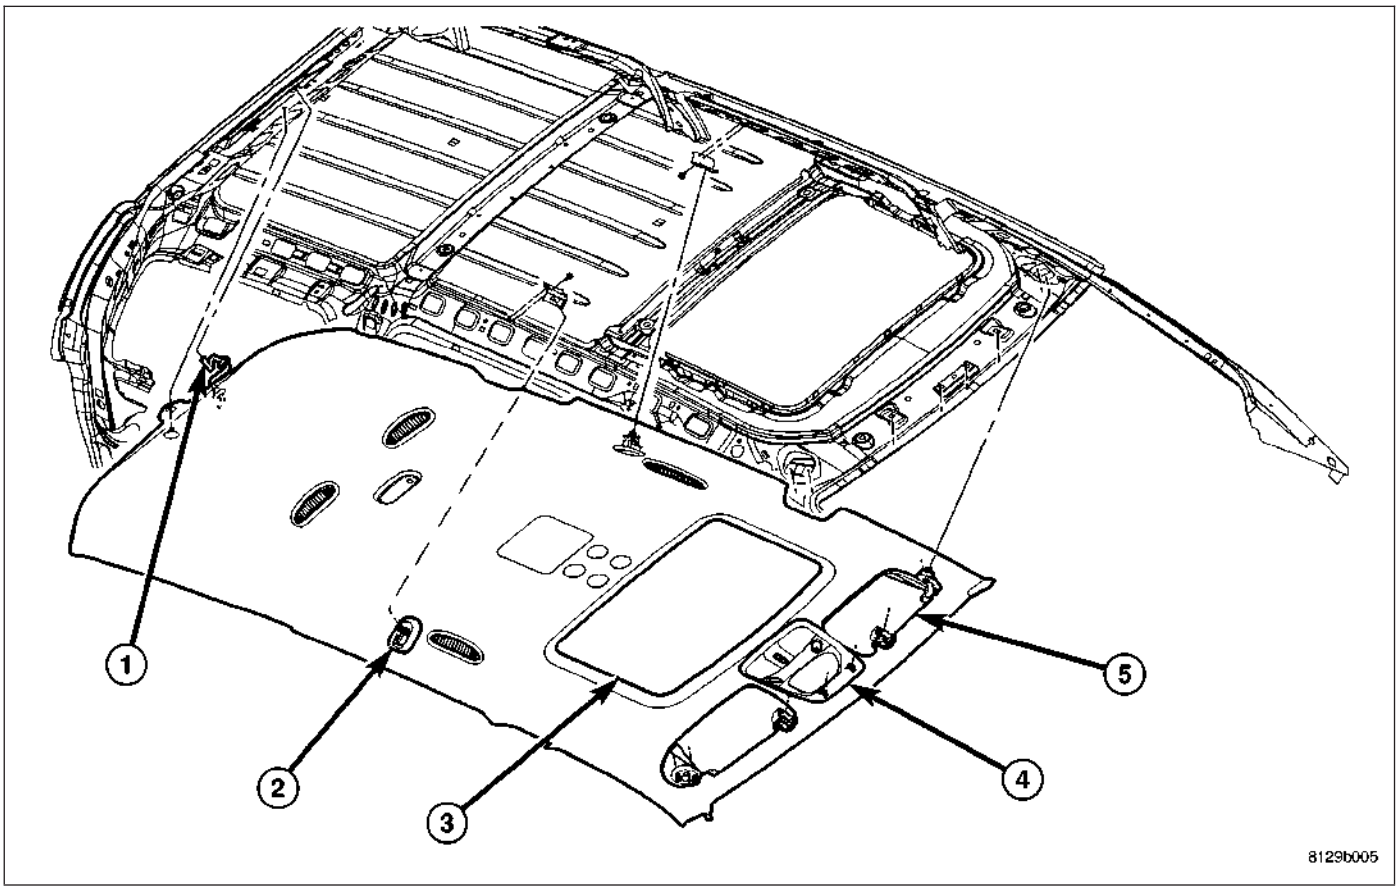


REAR HEADER TRIM

1 - RETAINING CLIPS
2 - ALIGNMENT PINS
3 - REAR HEADER TRIM

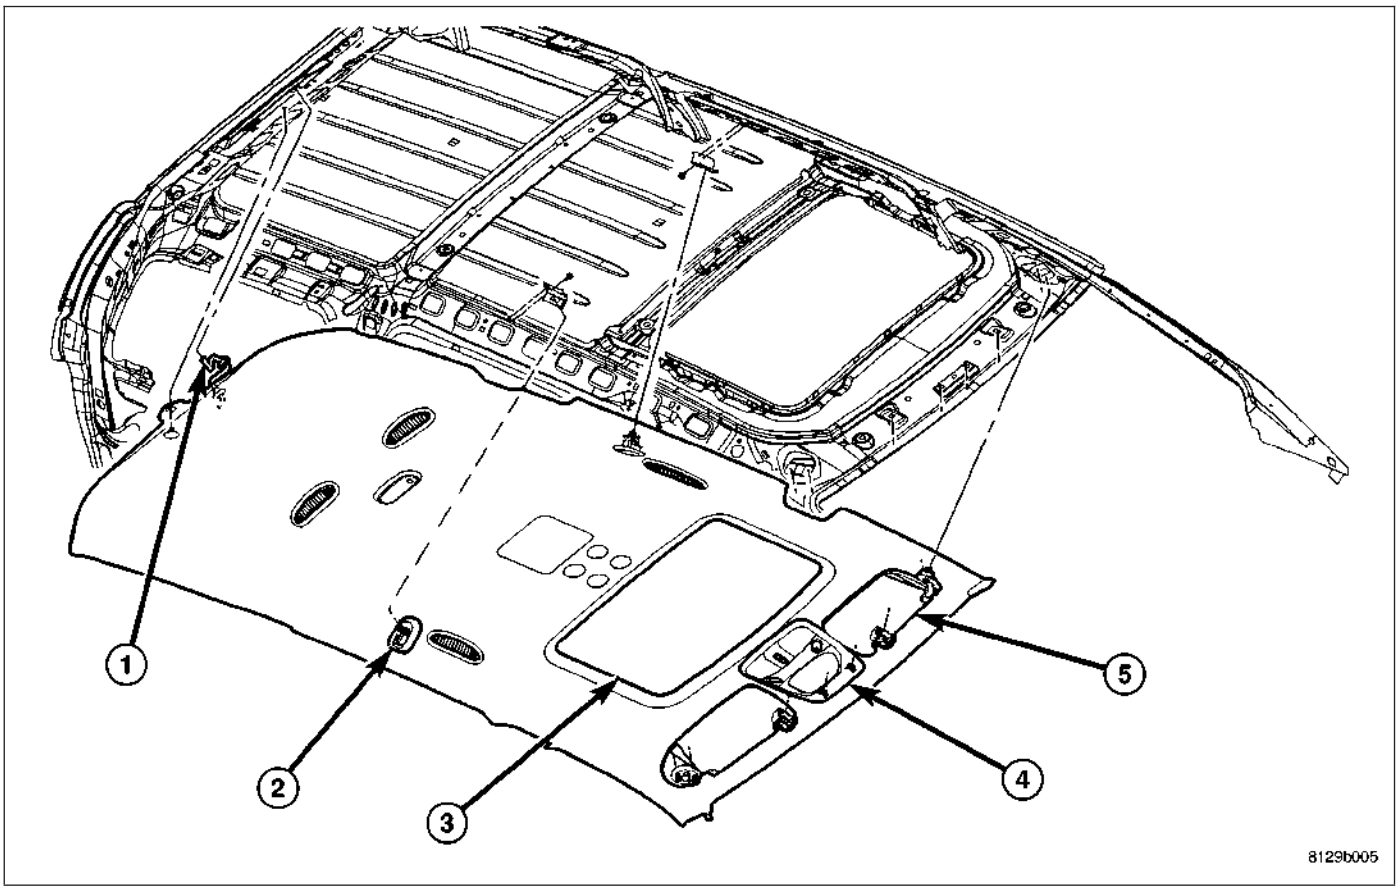
HEADLINER

REMOVAL



1. Disconnect and isolate battery negative cable.
2. Remove the sun visors (5) and disconnect the electrical connectors, if equipped.
3. Remove the a-pillar trim panels. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
4. Remove the overhead console (4). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL)
5. Remove the left upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
6. Remove the left c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL)
7. Remove the screws and remove the coat hooks (2).
8. Remove the front seat headrests.
9. Fold both second row seats forward.
10. Place the third row seat into the storage position, if equipped.
11. Remove the dome lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL)
12. Remove the DVD player. (Refer to 8 - ELECTRICAL/AUDIO/DVD PLAYER - REMOVAL)
13. Remove the push pin fastener at the rear of the headliner.
14. Remove the sunroof opening trim lace (3). (Refer to 23 - BODY/SUNROOF/OPENING TRIM LACE - REMOVAL)
15. Drop the headliner down and disconnect the electrical connectors.
16. Disconnect the front and rear washer hoses and remove the headliner through the liftgate opening.

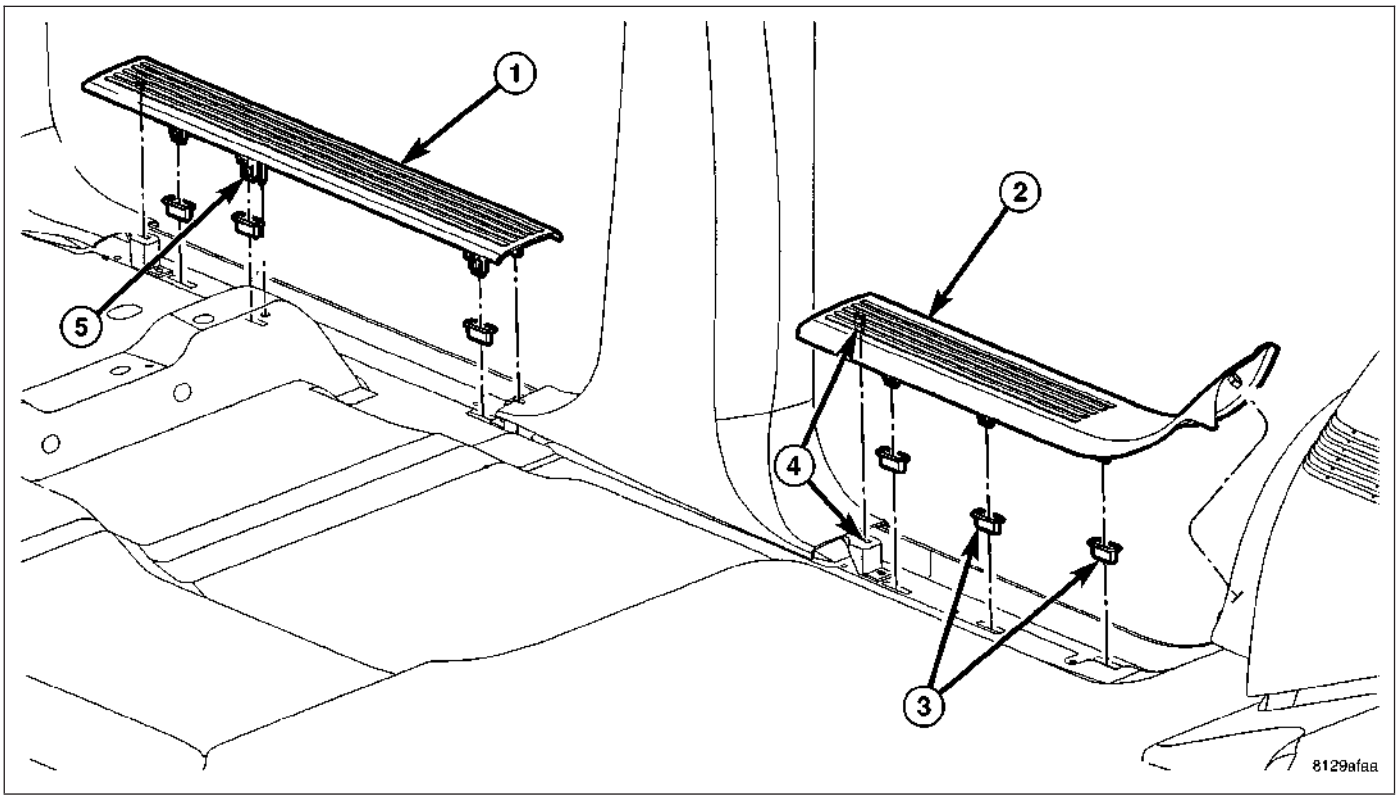
INSTALLATION



1. Place headliner into the vehicle through the liftgate opening and connect the front and rear washer hoses (1).
2. Connect the electrical connectors.
3. Install the sunroof opening trim lace (3), if equipped.
4. Install the push pin fastener at the rear of the headliner.
5. Install the DVD player. (Refer to 8 - ELECTRICAL/AUDIO/DVD PLAYER - INSTALLATION)
6. Install the dome lamps. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION)
7. Install the front seat headrests.
8. Install the screws and install the coat hooks (2).
9. Install the c-pillar trim. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION)
10. Install the upper b-pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)
11. Install the overhead console. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION)
12. Install the a-pillar trim panels. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)
13. Connect the electrical connectors and install the sun visors (5).
14. Connect battery negative cable.

PLATE-DOOR SCUFF

DESCRIPTION

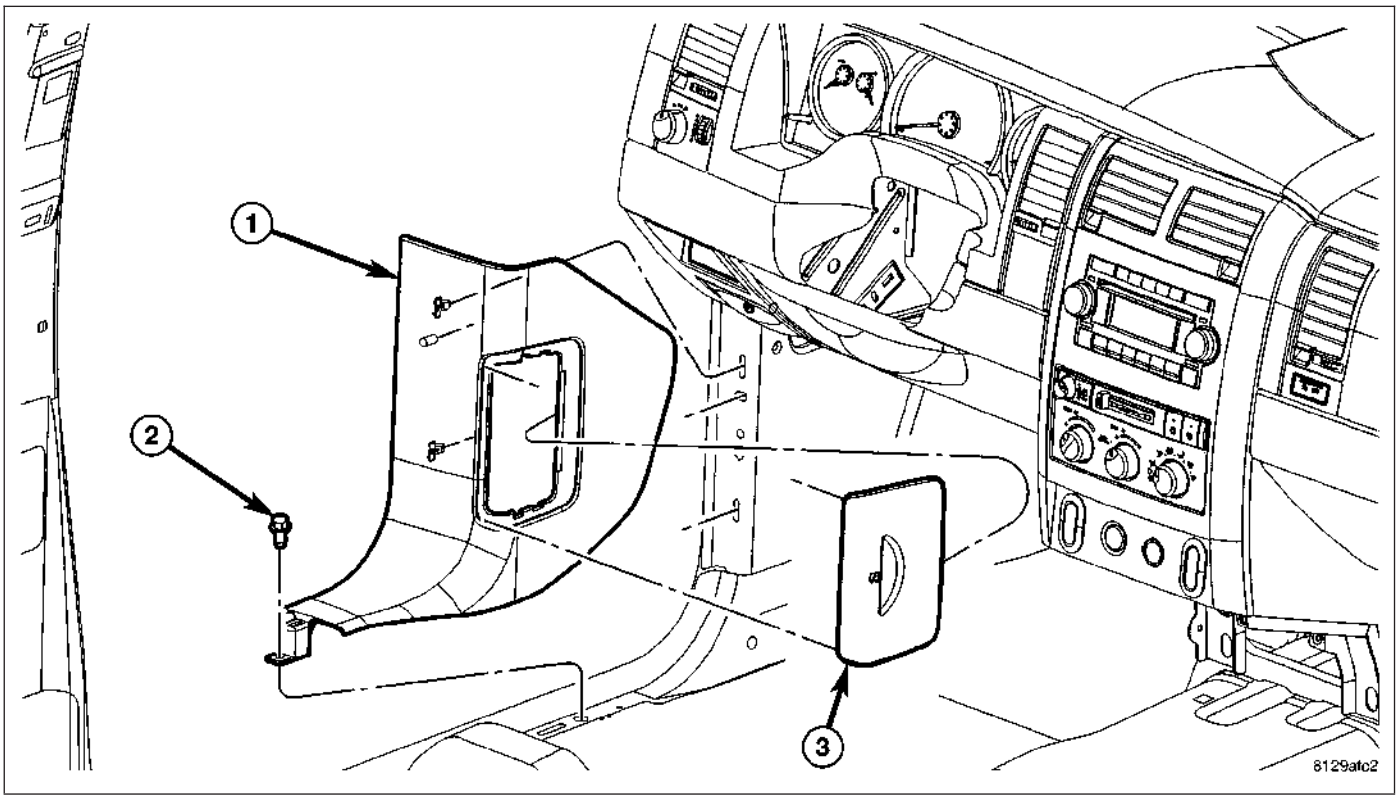


SCUFF PLATES

1 - FRONT DOOR SILL SCUFF PLATE
2 - REAR DOOR SILL SCUFF PLATE
3 - GROMMETS
4 - ALIGNMENT PINS
5 - RETAINING CLIPS

PANEL-COWL SIDE TRIM

DESCRIPTION

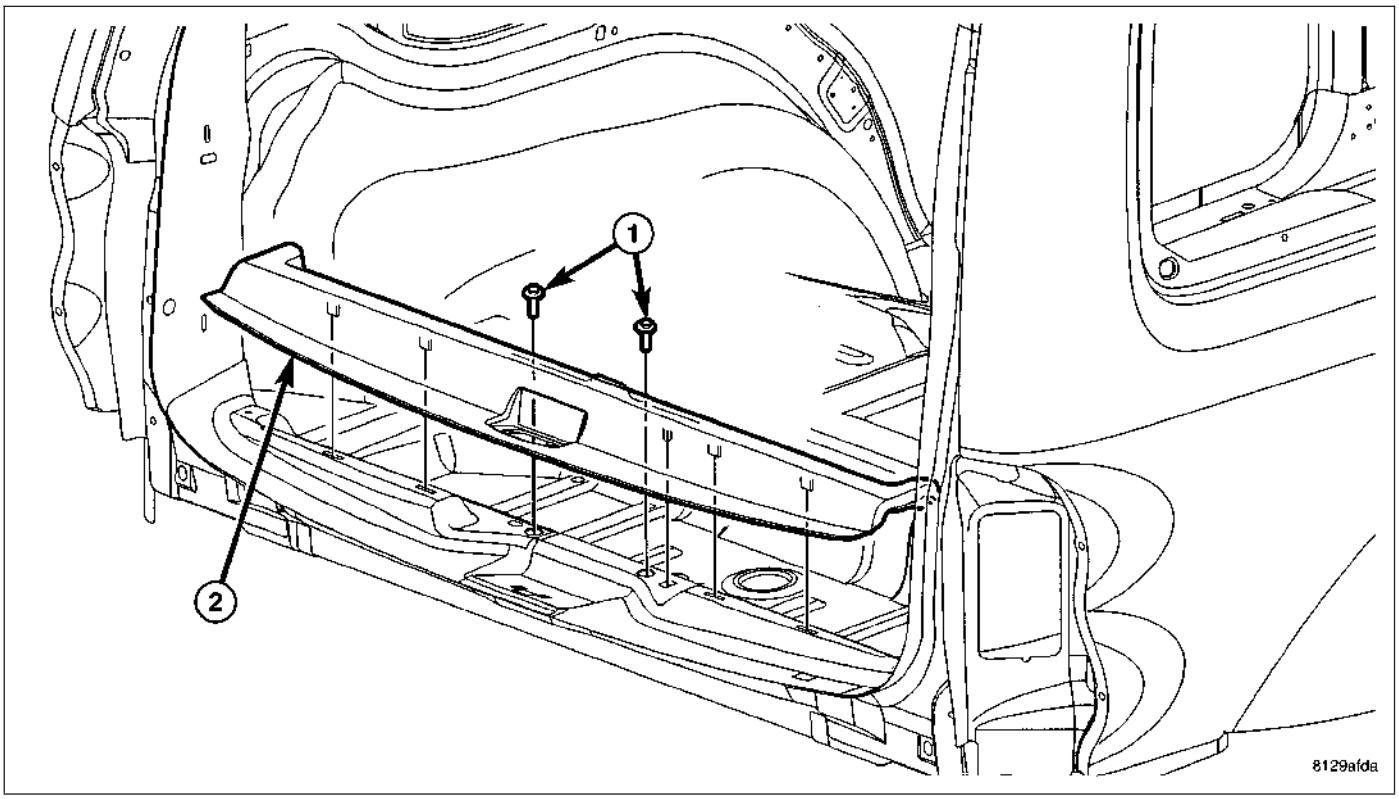


COWL TRIM PANEL

1 - COWL TRIM PANEL
2 - SCREW
3 - FUSE PANEL DOOR (LEFT SIDE)

PLATE-LIFTGATE SCUFF

DESCRIPTION



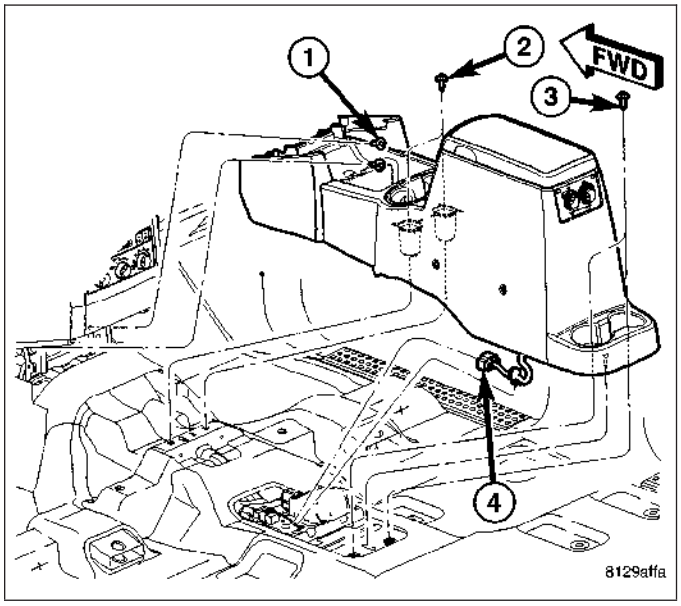
LIFTGATE SCUFF PLATE

1 - SCREWS (2)
2 - LIFTGATE SCUFF PLATE

CONSOLE-FLOOR

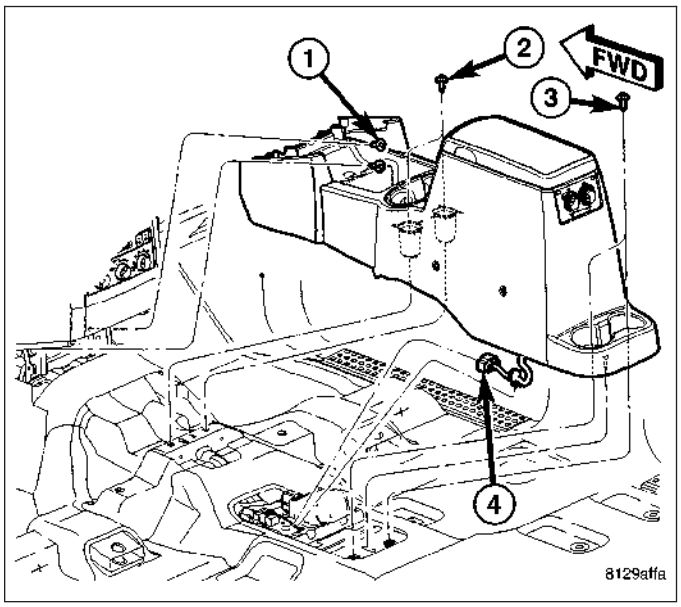
REMOVAL

1. Remove the rubber cup holder liners.
2. Remove the front (1), center (2) and rear screws (3).
3. Lift the floor console up and disconnect the electrical connector (4).
4. Slide the floor console back and remove.



INSTALLATION

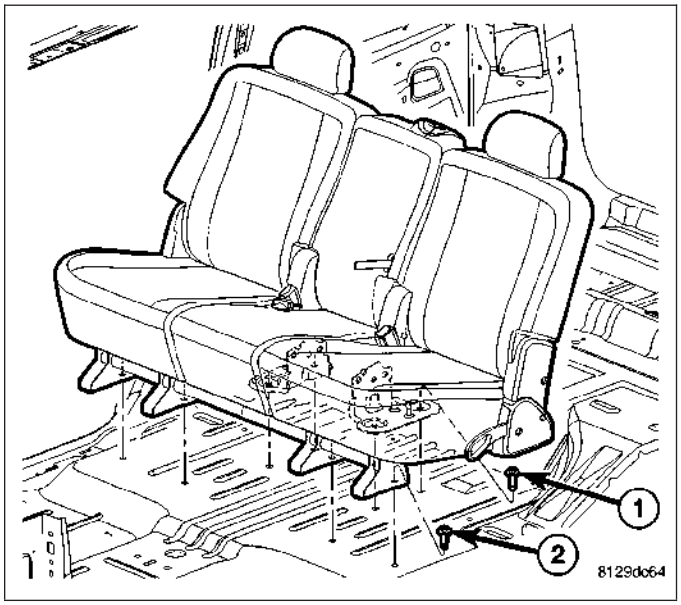
1. Position the floor console in the vehicle and connect the electrical connector (4).
2. Slide the console forward and engage the front with the instrument panel.
3. install the screws (3, 2 & 1).
4. Install the rubber cup holder liners.

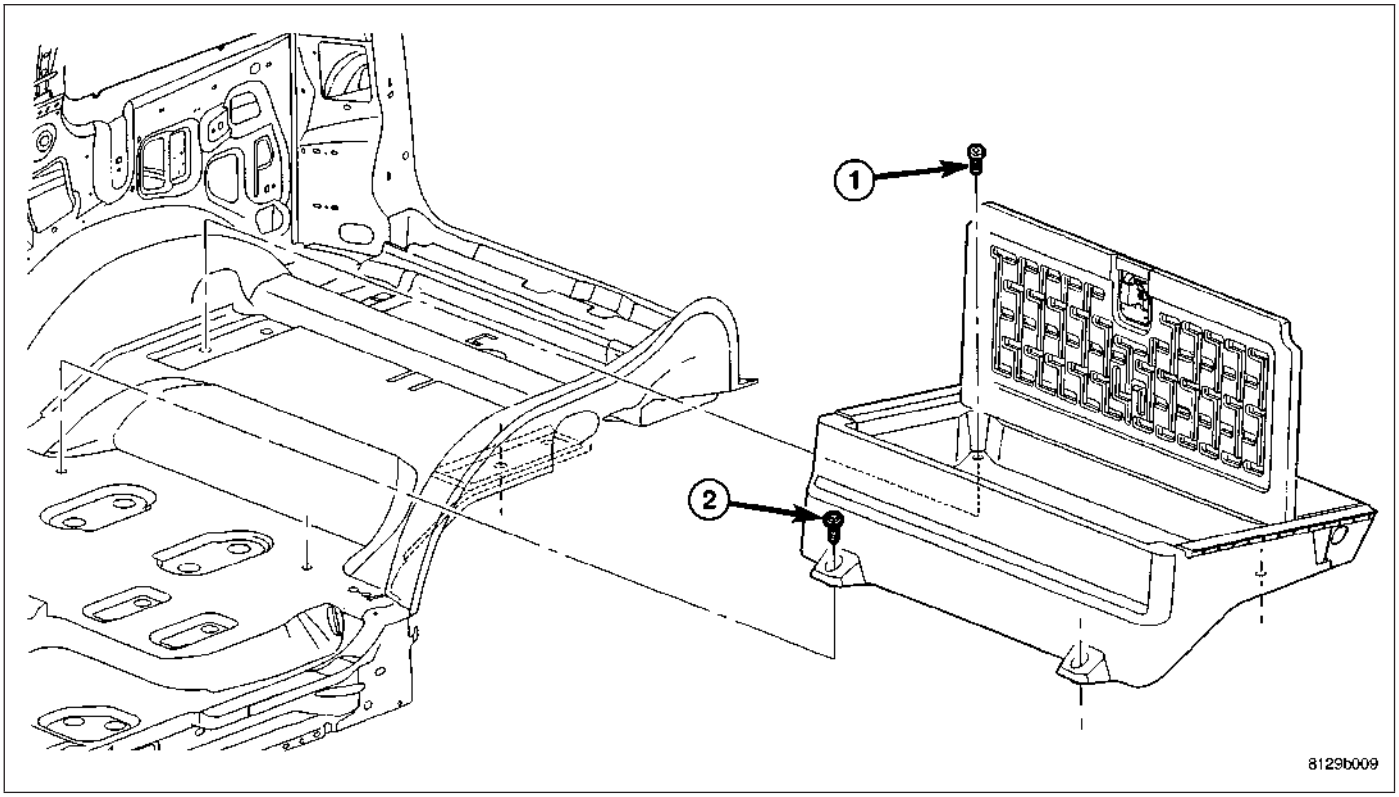


CARPET

REMOVAL

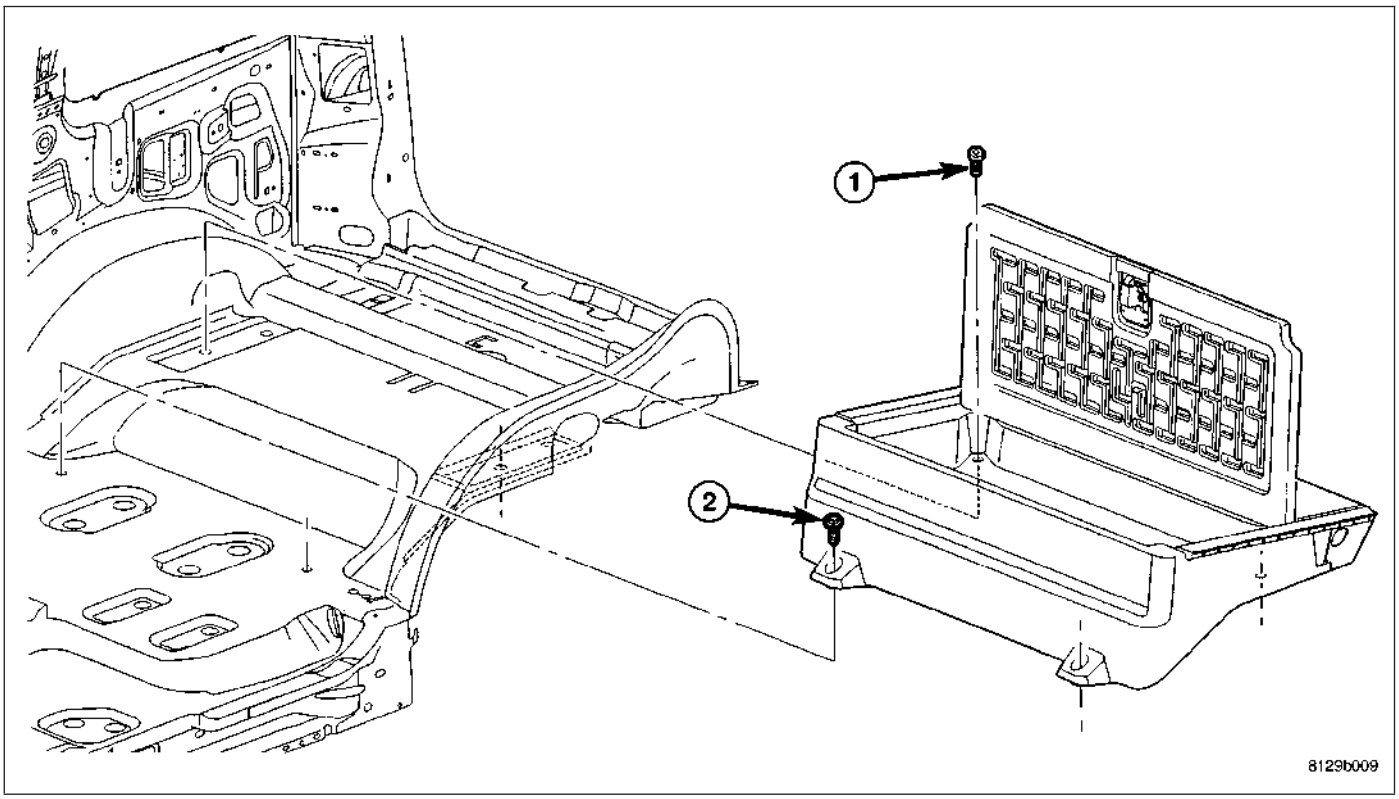
1. Remove the front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
2. Remove the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Using a trim stick C-4755 or equivalent, remove the door sill scuff plates. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - DESCRIPTION)
4. Remove the cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - DESCRIPTION)
5. Fold the second row seats forward and remove the right and left side bolts (1 & 2).
6. Remove the second row seat assembly.



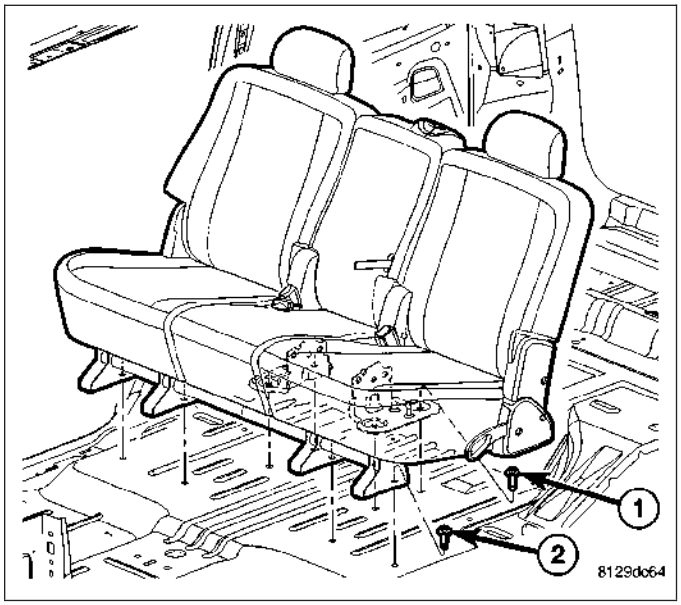


7. Remove the third row seat assembly, if equipped. (Refer to 23 - BODY/SEATS/SEAT - THIRD ROW - REMOVAL)
8. Remove the bolts (1 & 2) and remove storage bin, if equipped.
9. Remove the carpet from under the side trim panels.
10. Remove the carpet.

INSTALLATION



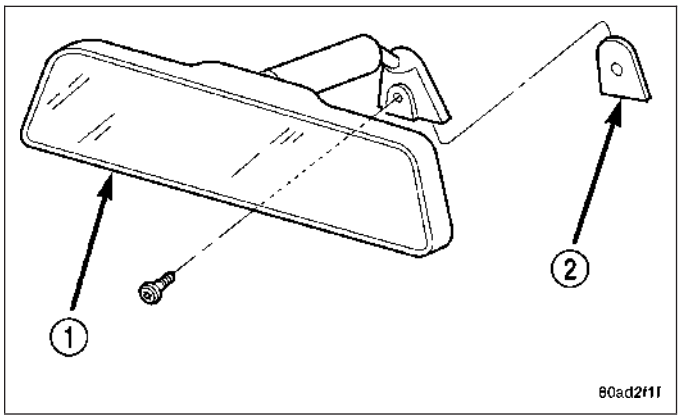
1. Position the carpet in vehicle and tuck up under the side trim panels.
2. Install the third row seat assembly, if equipped. (Refer to 23 - BODY/SEATS/SEAT - THIRD ROW - INSTALLATION)
3. Install the storage bin, if equipped, and screws and tighten the rear screws to 7 N·m (60 in. lbs.).
4. Install the second row seat assembly and install the bolts (1 & 2).
5. Tighten the front bolts (2) to 27 N·m (20 ft. lbs.).
6. Tighten the rear bolts (1) to 47 N·m (35 ft. lbs.).
7. Install the cowl trim panels. (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - DESCRIPTION)
8. Position the door sill scuff plates and seat the clips fully. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - DESCRIPTION)
9. Install the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)
10. Install the front seats. (Refer to 23 - BODY/SEATS/SEAT - FRONT - INSTALLATION)



MIRROR-INSIDE REARVIEW

REMOVAL

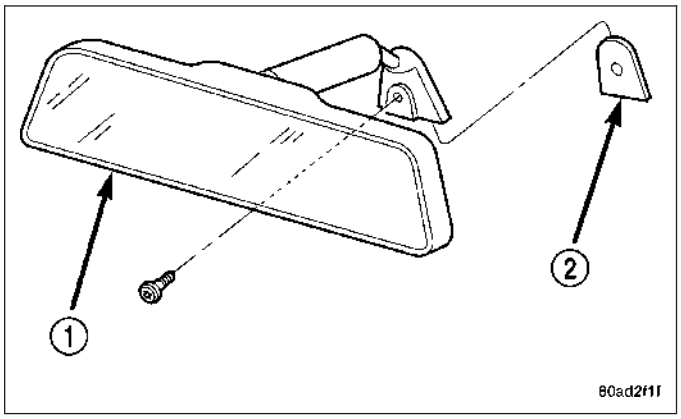
1. Loosen the mirror base set screw.
2. Slide the mirror base upward and off the bracket (2).



INSTALLATION

INSTALLATION - REARVIEW MIRROR

1. Position the mirror base at the bracket (2) and slide it downward onto the support bracket.
2. Tighten set screw to 1 N·m (9 in. lbs.).



INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

1. Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerator to the surface on the bracket according to the following instructions:
   - Crush the vial to saturate the felt applicator.
   - Remove the paper sleeve.
   - Apply accelerator to the contact surface on the bracket.
   - Allow the accelerator to dry for five minutes.
   - Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
6. Install the bracket according to the following instructions:
   - Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
   - Apply an even coat of adhesive to the contact surface on the bracket.
   - Align the bracket with the marked position on the windshield glass.
   - Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

The original equipment paint finish is a multi step process that involves cleaning, applying electro de-position (E-coat), anti-chip primer, basecoat, and clearcoat steps.

CAUTION: Do not use abrasive chemicals, abrasive compounds or harsh alkaline based cleaning solvents on the painted surfaces of a vehicle. Failure to follow this caution can result in damage to vehicle finish.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. A clear coat paint is then applied to protect the basecoat from ultraviolet light and to provide a durable high-gloss finish.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Certification Label (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION). The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. (Refer to 23 - BODY/PAINT - SPECIFICATIONS)

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat.

WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

STANDARD PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

CAUTION: Do not remove more than 0.5 mils of clearcoat finish when sanding, hand buffing or polishing. Basecoat paint must retain clearcoat for durability.

CAUTION: If the finish has been finesse sanded in the past, it cannot be repeated. Failure to follow this caution can result in damage to vehicle finish.

NOTE: Finesse sanding should only be performed by a trained automotive paint technician.

Minor acid etching, orange peel, or smudging in a clearcoat or single-stage finish can be reduced with light finesse sanding, hand buffing and polishing. Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine clearcoat or single-stage paint thickness before and after the repair.

SEATS

WARNING

RESTRAINT SYSTEM

WARNING: During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (acm). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.

WARNING: Replace all restraint system components only with parts specified in the DaimlerChrysler Mopar parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.

WARNING: The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with the occupant classification system (ocs) do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

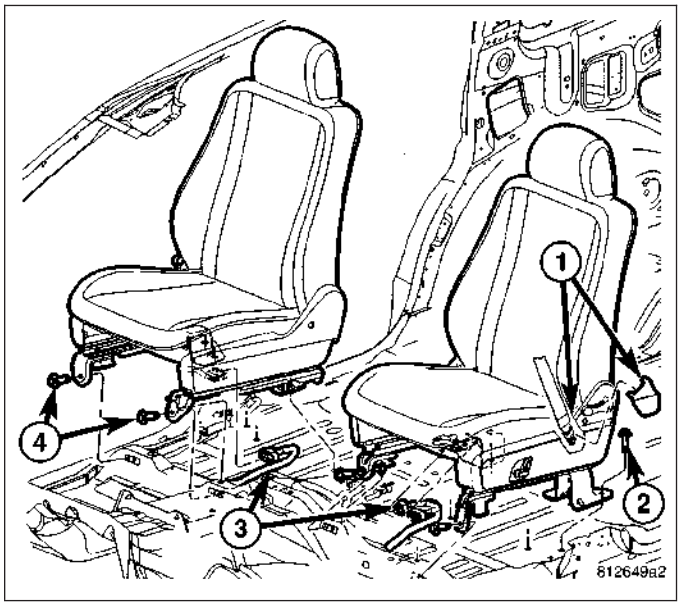
SEAT-FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

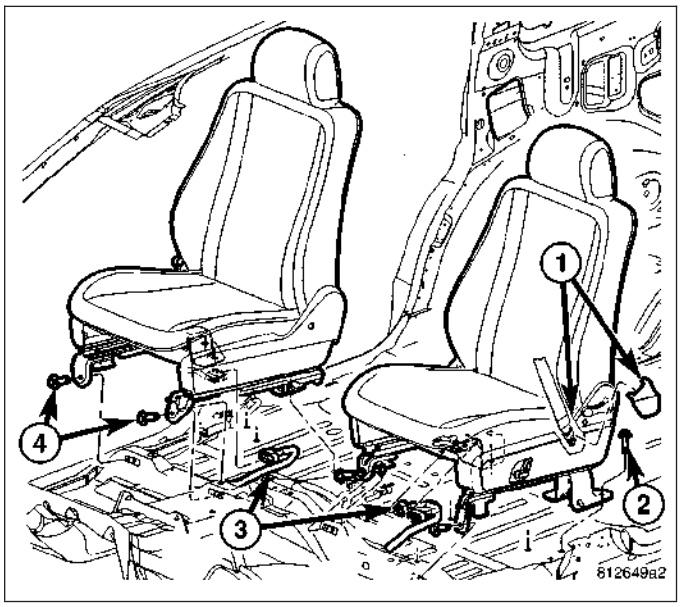


WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Move the seat forward to gain access to the rear bolts.
3. Disconnect and isolate battery negative cable.
4. Remove the cover and lower seat belt anchor (1).
5. Remove the two front (4) and three rear (2) bolts.
6. Disconnect the electrical connectors (3), if equipped, and remove the seat from the vehicle.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)



WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

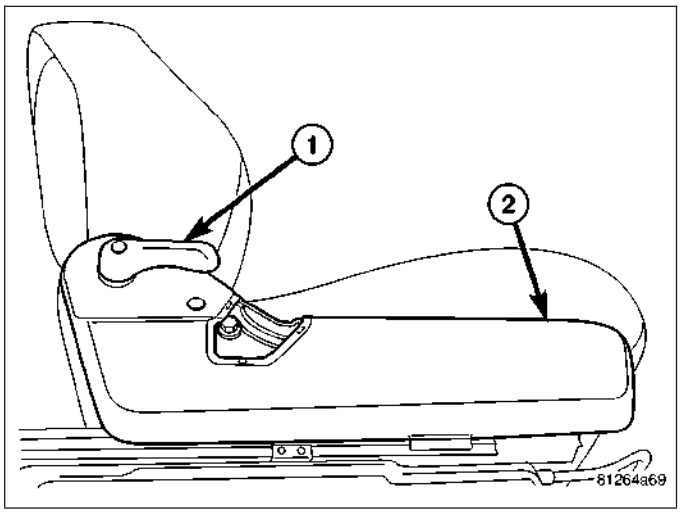
WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Position the seat into the vehicle and connect the electrical connectors (3), if equipped.
3. Install the two front bolts (4) and three rear bolts (2).
4. Tighten the front inner bolt to 27 N·m (20 ft. lbs.) then tighten the front outer bolt to 27 N·m (20 ft. lbs.).
5. Tighten the rear bolts to 47 N·m (35 ft. lbs.).
6. Install the lower seat belt anchor (1) and install the bolt.
7. Tighten the bolt to 39 N·m (29 ft. lbs.) and install the trim cover (1).
8. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
9. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a scan tool. (Refer to 8 - ELECTRICAL/RESTRAINTS - *OCS VERIFICATION TEST - VER 1)

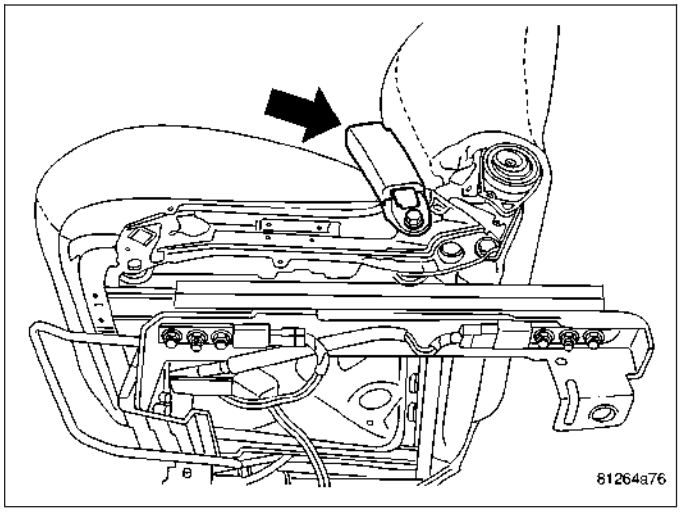
CUSHION/COVER-SEAT BACK - FRONT

REMOVAL

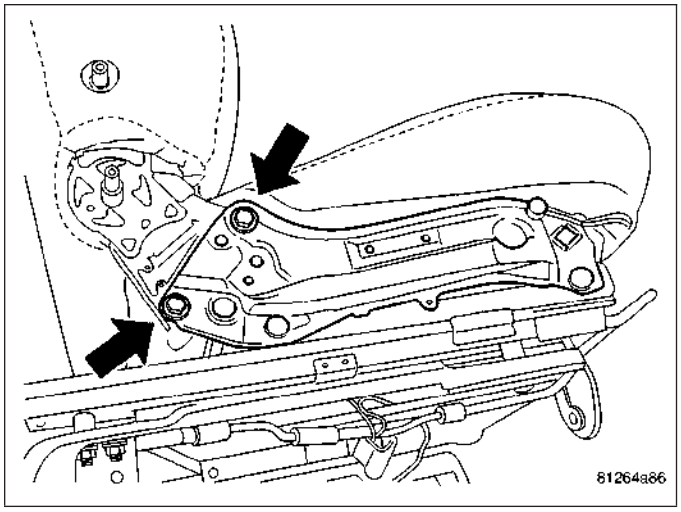
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).



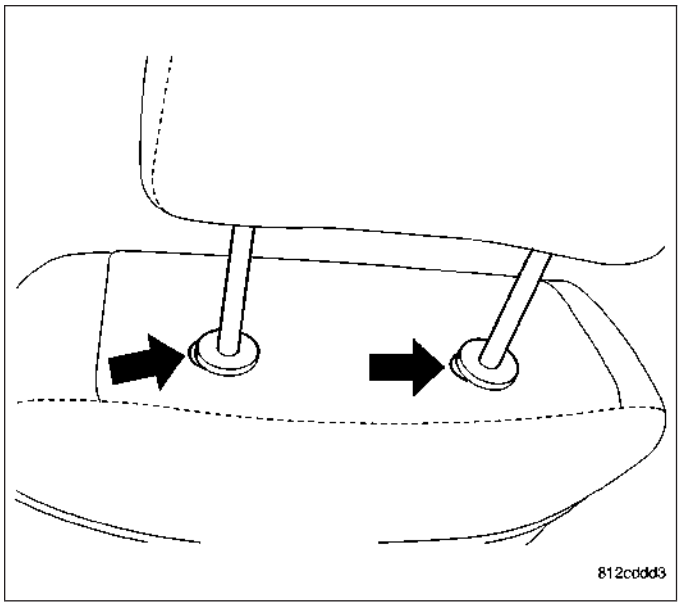
5. Remove the belt buckle.



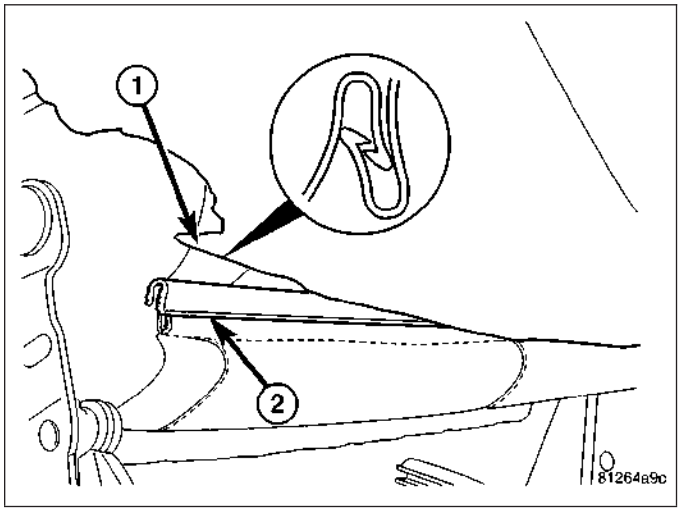
6. Remove the seat back bolts from both sides.



7. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

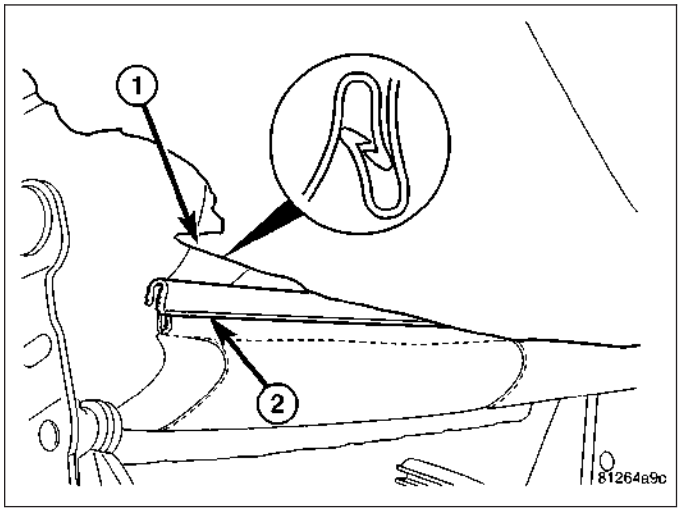


8. Separate the j-straps (1 & 2) and pull cover up over frame and remove cushion.
9. Pinch both headrest sleeve ribs from inside the seat back frame with pliers or equivalent.
10. Strike the bottom of the sleeve with a rubber mallet or equivalent, and remove the headrest sleeves.

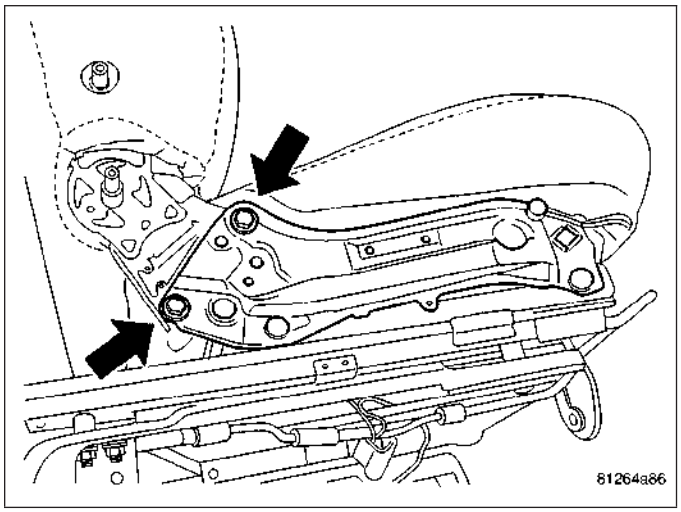


INSTALLATION

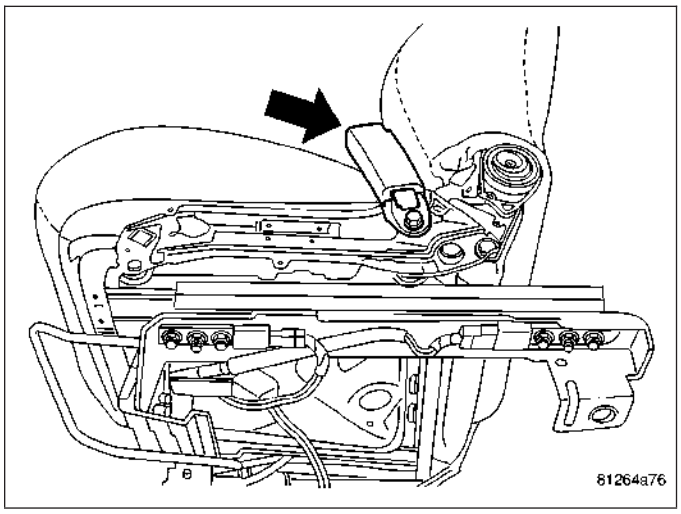
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the seat back cover over the seat back frame and install the headrest sleeves.
3. Position the seat back cushion on the frame and position the cover over the cushion.
4. Connect the j-straps (1 & 2).



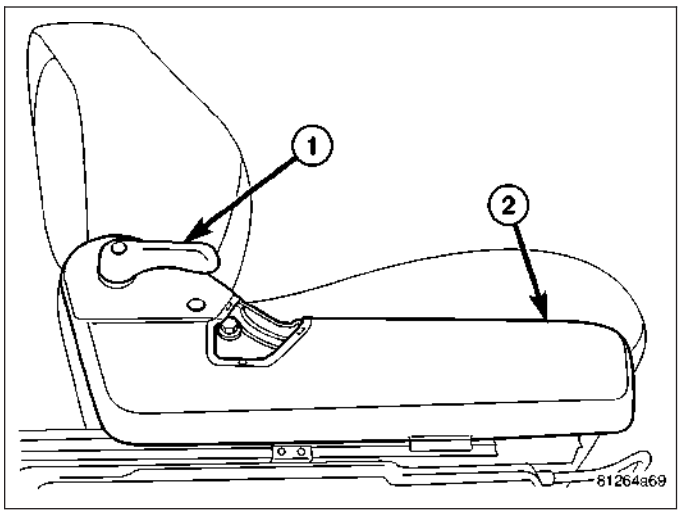
5. Install the seat back bolts and tighten to 40 N·m (30 ft. lbs.).



6. Position the front seat belt buckle lower anchor onto the stud near the rear of the inboard seat cushion frame. Be certain the anti-rotation tab on the anchor is engaged in the clearance hole of the frame.
7. Tighten the nut to 43 N·m (32 ft. lbs.)



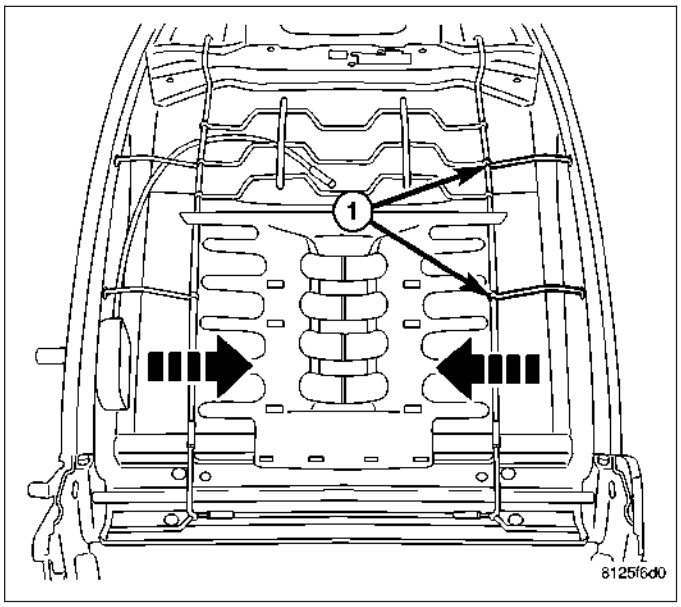
8. Install the side shields (2) and install the screws.
9. Install the lumbar and recliner handles (1 & 4).



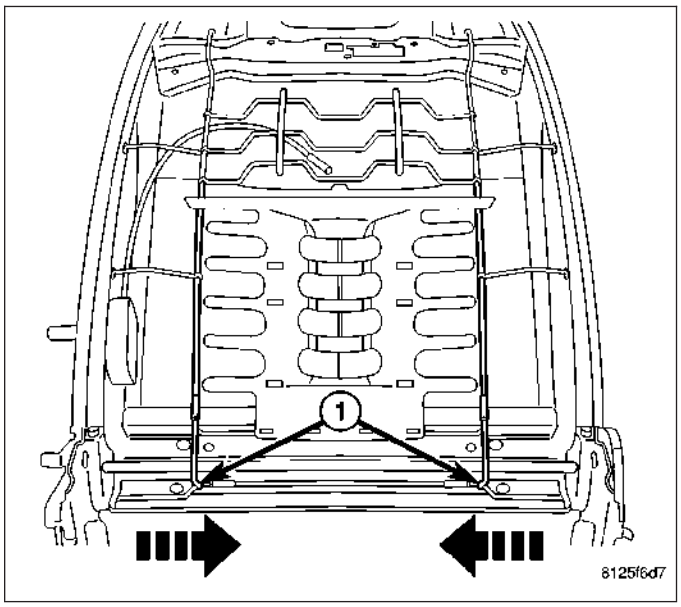
SUPPORT-LUMBAR

REMOVAL

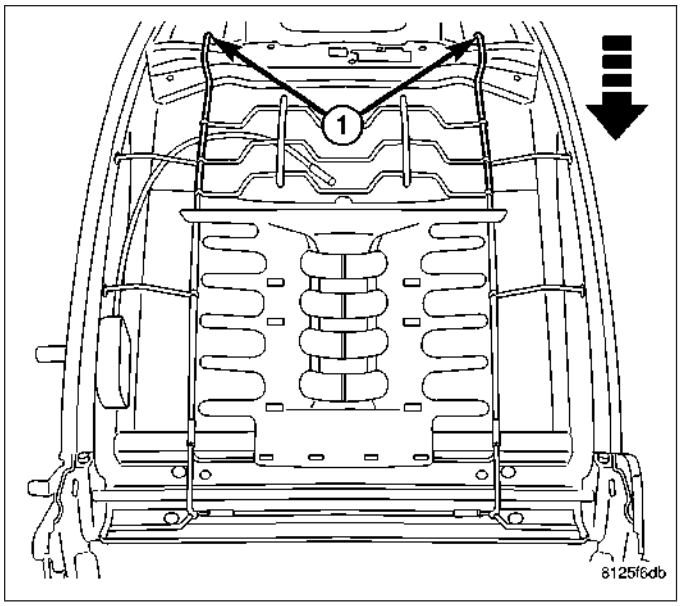
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - REMOVAL)
3. Release the lumbar mat side wires (1) by pulling out on the wire supports and then pulling them in.



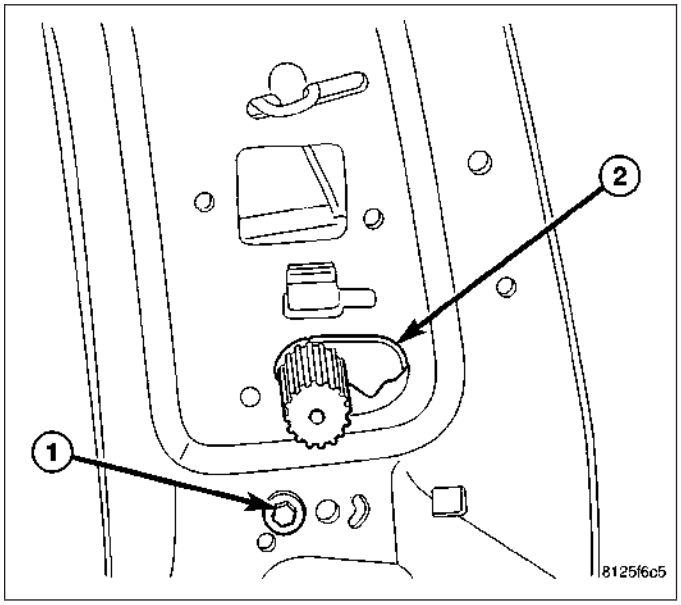
4. Squeeze the lower support wires (1) in and release the lower wires.



5. Pull the upper support wires (1) down and release the lumbar mat from the seat back frame.

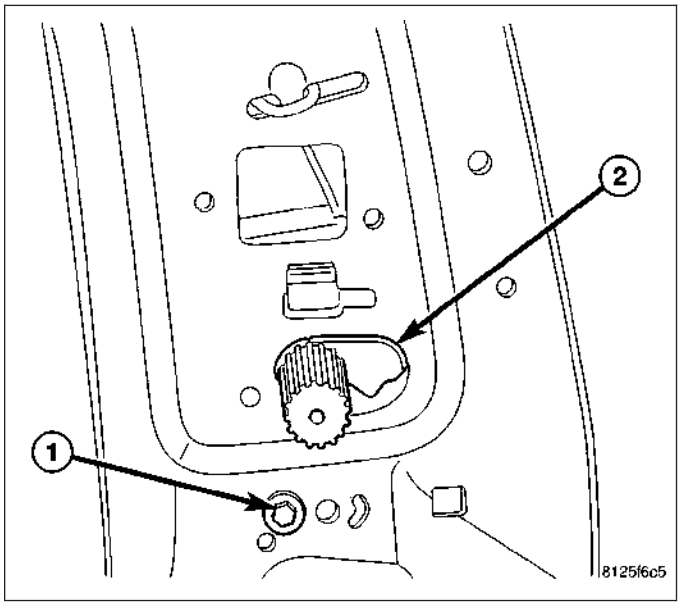


6. Remove the rivet (1) and remove the lumbar mechanism (2).

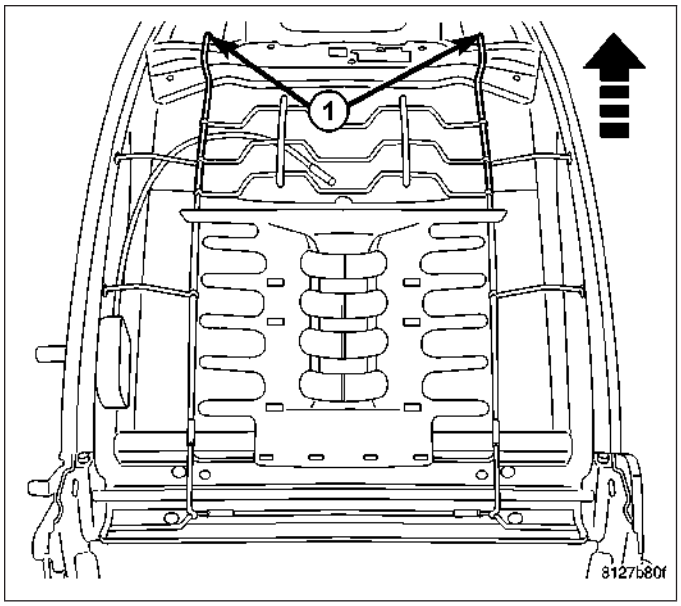


INSTALLATION

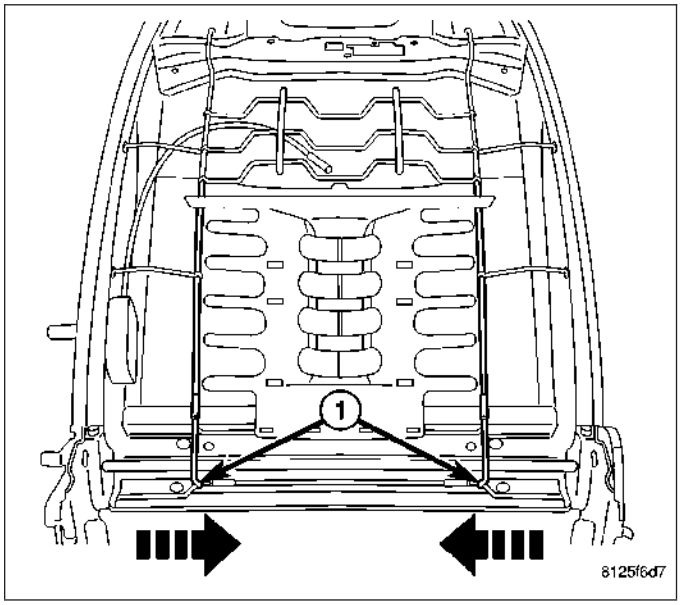
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Install the lumbar mechanism (2) and install a new rivet (1).



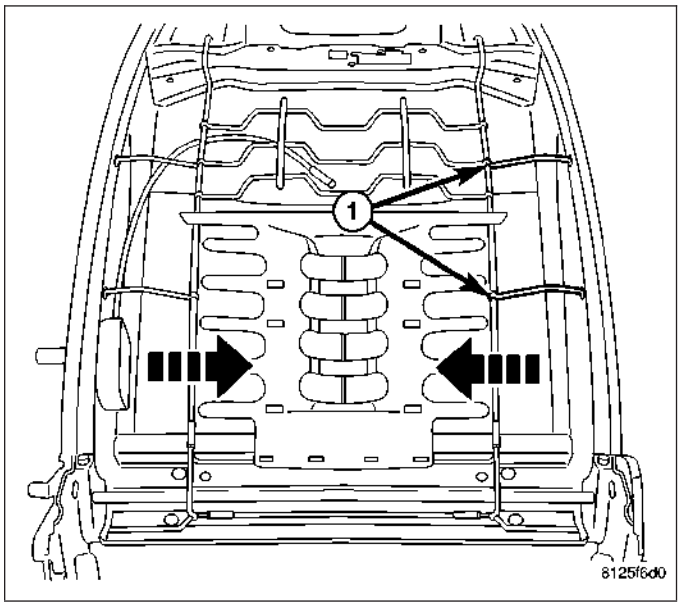
3. Place lumbar mat onto seat back frame and insert the upper support wires (1) into the frame.



4. Squeeze the lower support wires (1) together and insert into the lower frame.



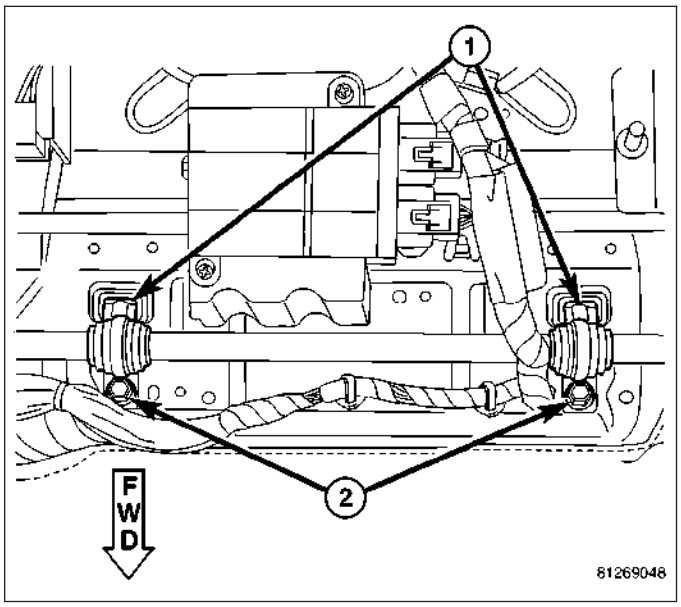
5. Squeeze the side support wires together and insert them into the sides of the seat back frame.
6. Install the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - INSTALLATION)



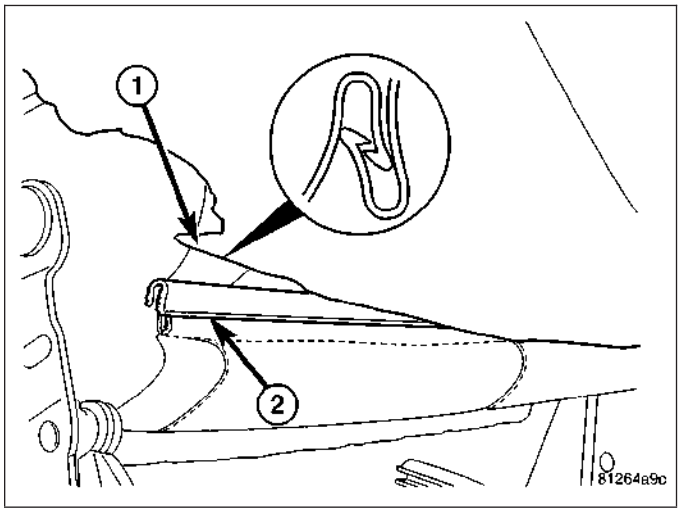
CUSHION/COVER-CUSHION - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Move the seat to the forward position and disconnect and isolate the batter negative cable.
3. Remove the bolts (2) and the clamps (1) and remove the seat cushion.
4. Disconnect the electrical connector, if equipped.

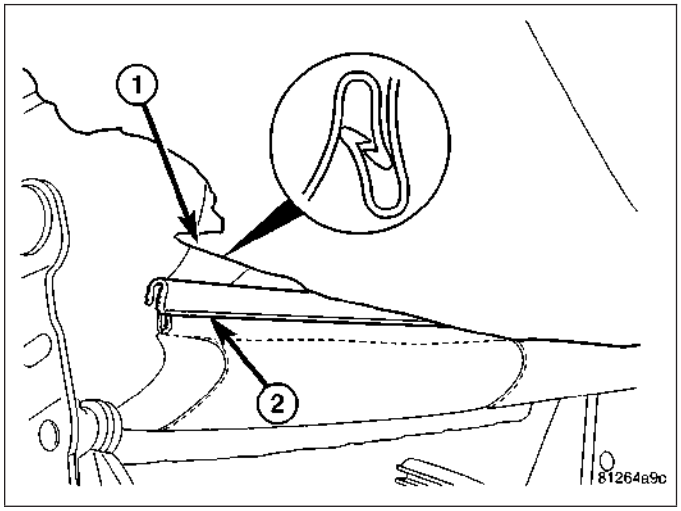


5. Separate the j-straps (1 & 2) and seat cushion cover and foam.

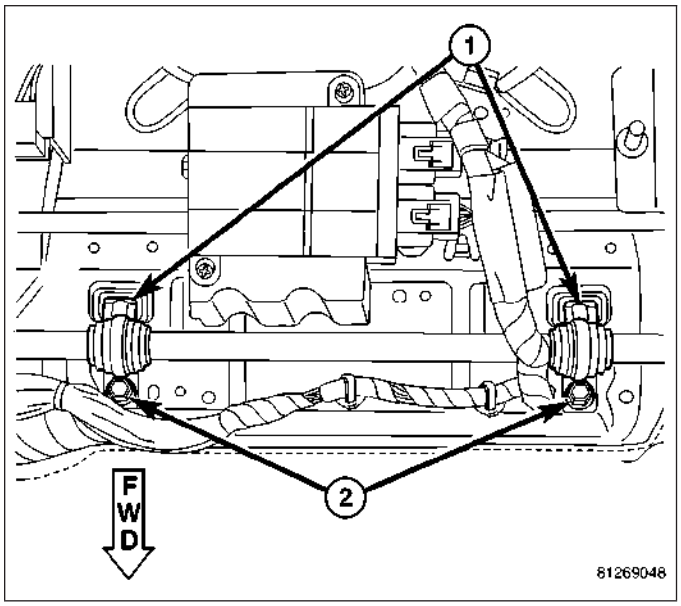


INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the cushion cover and foam over the seat pan and connect the j-straps (1 & 2).



3. Position the seat cushion assembly onto the seat frame and install the clamps (1).
4. Connect the wire harness to the seat cushion pan, if equipped.
5. Install the bolts (2) and tighten to 10 N·m (90 in. lbs.).
6. Connect battery negative cable.



ADJUSTERS-FRONT

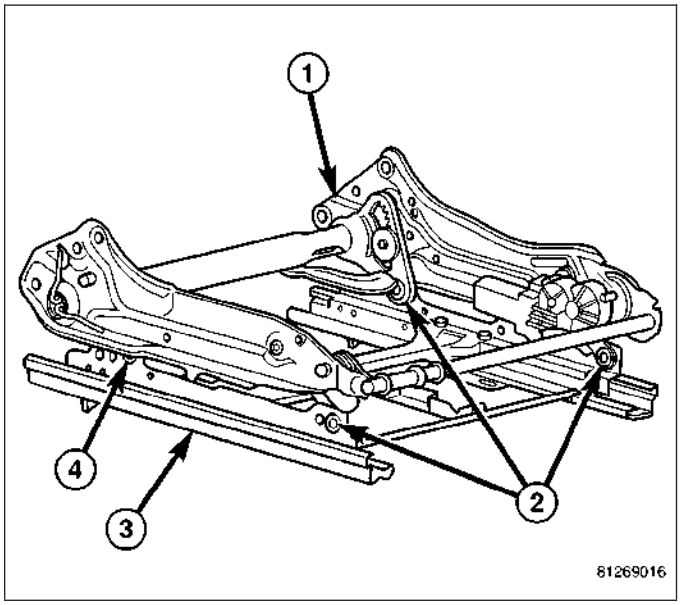
REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ SEATS - WARNING)
2. Remove the seat cushion as necessary. (Refer to 23 - BODY/SEATS/SEAT CUSHION / COVER - FRONT - REMOVAL)

Power

1. Remove the seat risers. (Refer to 23 - BODY/ SEATS/SEAT RISER - FRONT - REMOVAL)
2. Remove the bolts and nuts (2 & 4) and separate the height adjuster assembly from the length adjuster assembly (3).

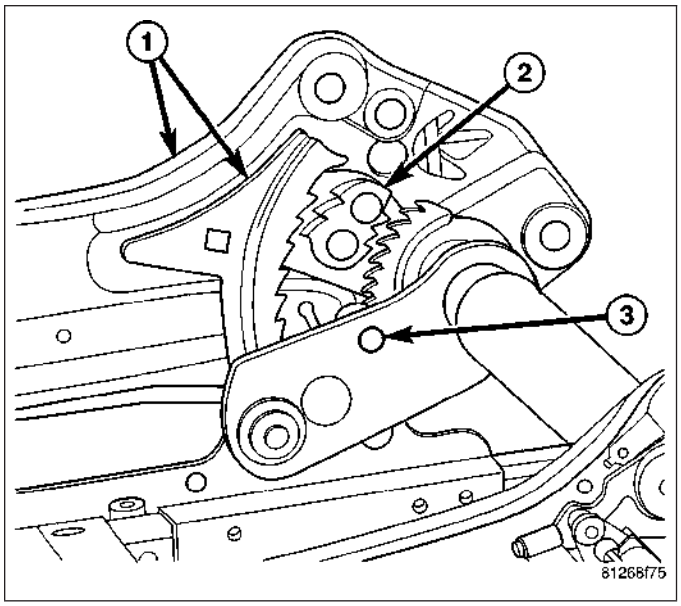
NOTE: Bolt (4) is a different size from the other three bolts (2). Note the location for proper installation.



WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:

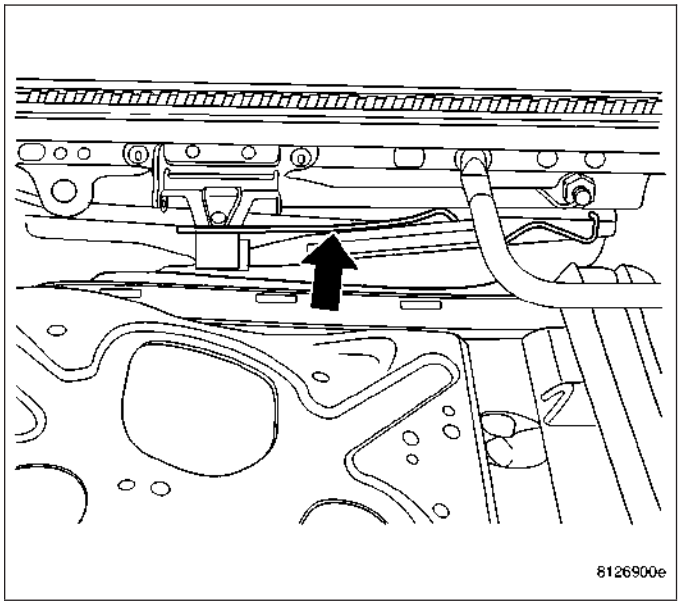
- **LOCKING PAWL (2) LOOSE**
- **LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDEMEMBER (1)**
- **HEIGHT ADJUSTER ONLY WORKS ON OUTBOARD SIDE**
- **BROKEN OR MISSING SHEAR PIN (3)**

IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.

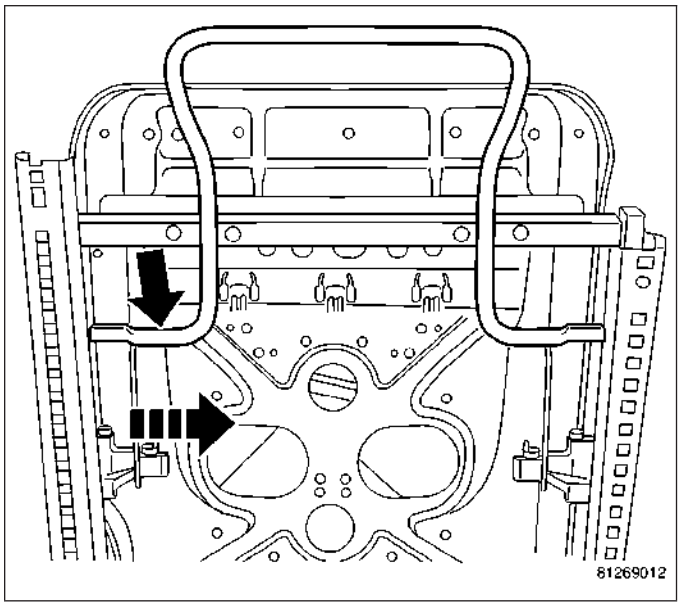


Manual

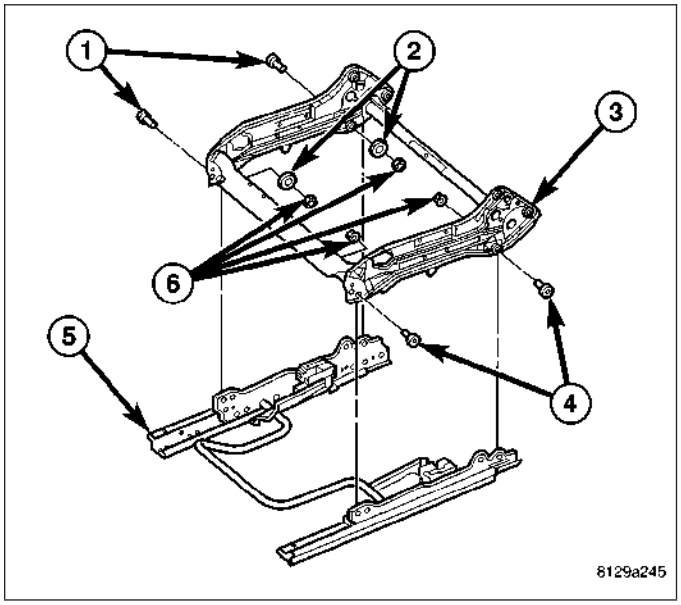
1. Remove the spring clip.



2. Squeeze the towel bar together and pull the towel bar out of the left and right seat tracks.



3. Remove the bolts (1 & 4), nuts (6) and spacers (2) and separate the side member assembly (3) from the length adjuster assembly (5).



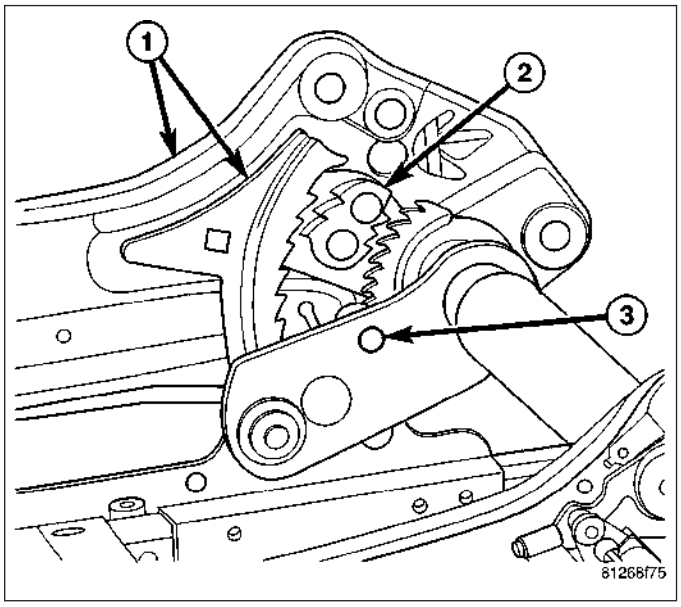
INSTALLATION

Power

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

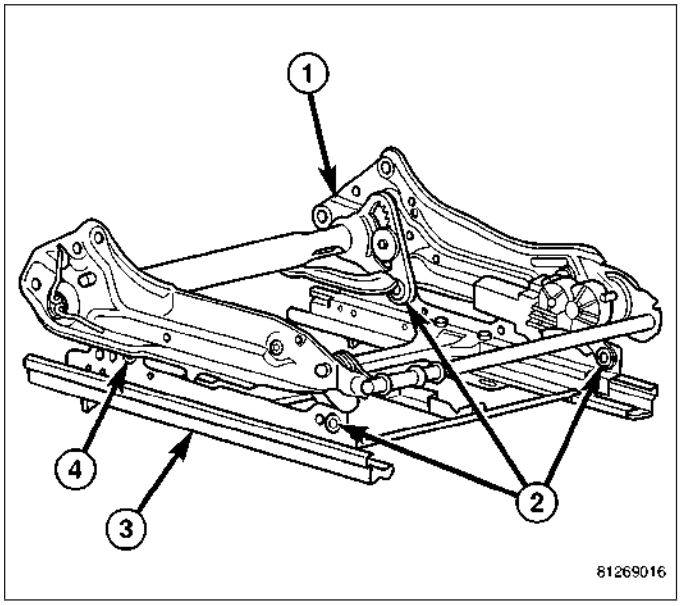
WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:
- **LOCKING PAWL (2) LOOSE**
- **LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDEMEMBER (1)**
- **HEIGHT ADJUSTER ONLY WORKS ON OUTBOARD SIDE**
- **BROKEN OR MISSING SHEAR PIN (3)**

IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.



2. Install the seat risers. (Refer to 23 - BODY/SEATS/SEAT RISER - INSTALLATION)
3. Position the height adjuster assembly (1) onto the length adjuster assembly (3) and install the nuts, bolts and spacers on the inboard side.

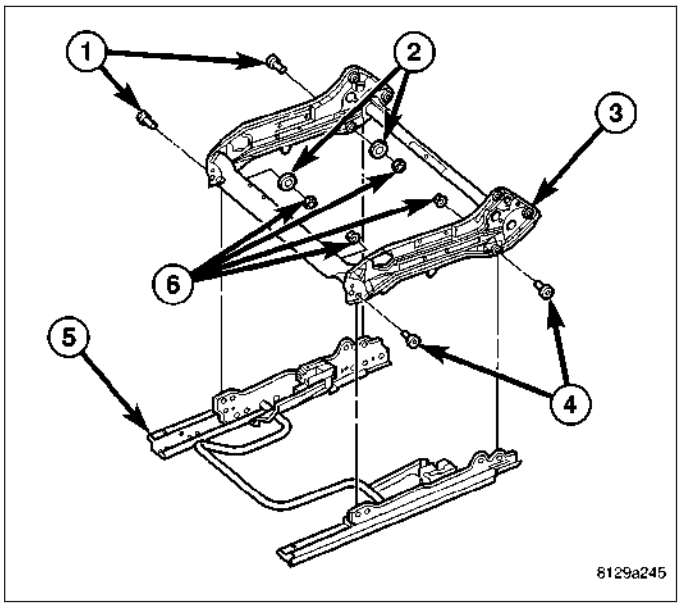
NOTE: Bolts (2) and (4) are different and need to be installed into the correct positions.



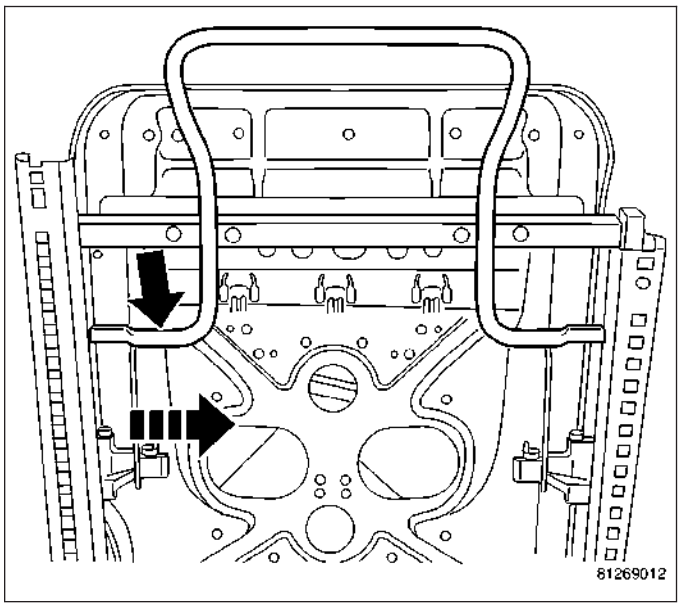
4. Tighten the bolts to 21 N·m (15 ft. lbs.).
5. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)

Manual

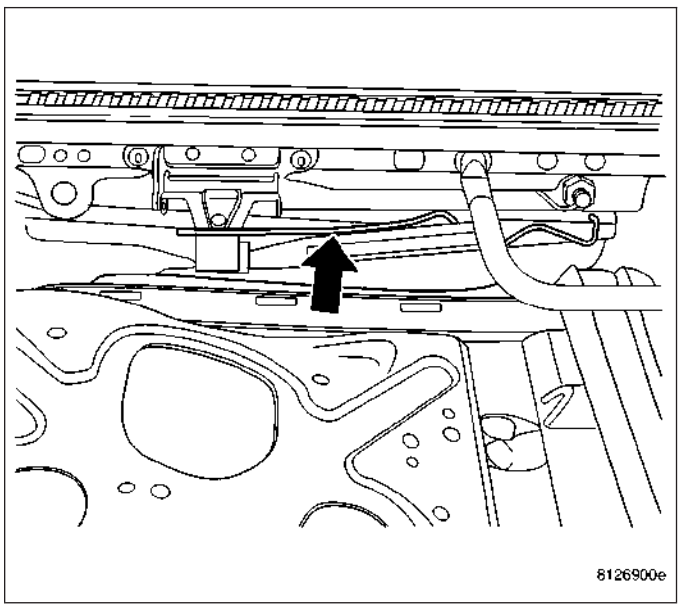
1. Install the seat risers. (Refer to 23 - BODY/SEATS/ SEAT RISER - INSTALLATION)
2. Position the side member assembly (3) onto the length adjuster assembly (5) and install the nuts (6), bolts (1 & 4) and spacers (2) on the inboard side.
3. Tighten the bolts to 42 N·m (31 ft. lbs.).



4. Squeeze the towel bar together and insert the ends into the bushings on both tracks.



5. Install the spring clip.
6. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)



RISER-FRONT

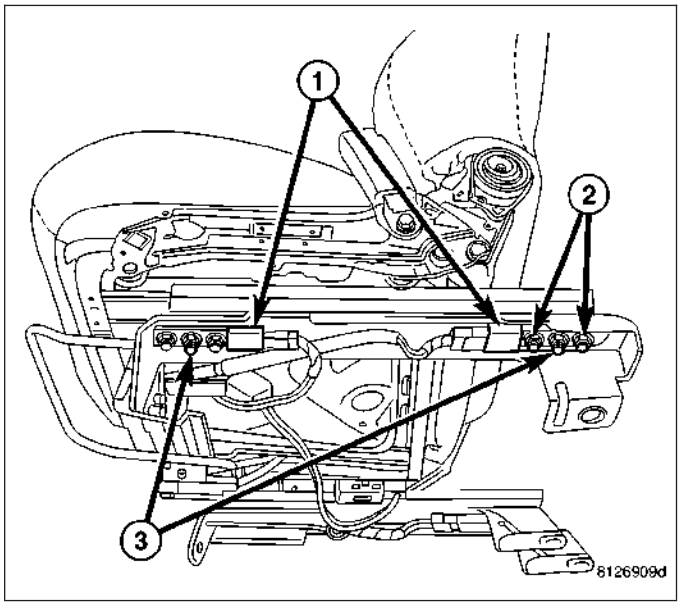
REMOVAL

Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

NOTE: Passenger seat with strain gauges shown, drivers side seat similar.

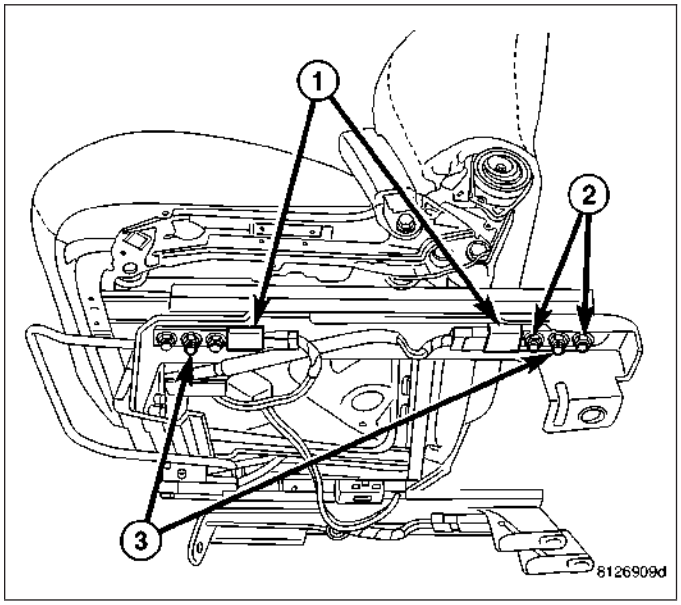
5. Disconnect strain gauge electrical connectors (1), if equipped.
6. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.



Power Length Adjuster

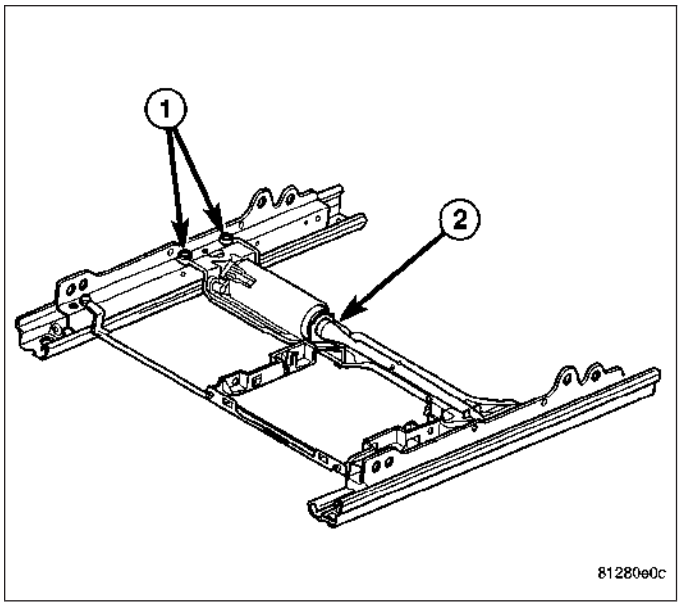
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Unbolt the seat from the floor as necessary to gain access to the riser bolts. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks, tip the seat backwards in vehicle and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

NOTE: Manual seat length adjuster shown, power similar.

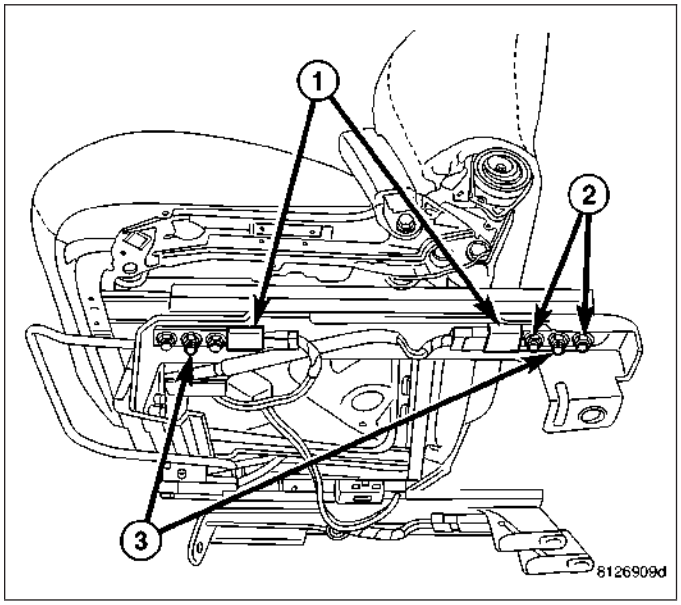


5. If the seat cannot be moved forward or backward, remove the seat cushion. (Refer to 23 - BODY/ SEATS/SEAT CUSHION COVER - REMOVAL)
6. Remove the four bolts (1) and remove the motor and cable assembly (2) from the length adjuster assembly.

CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.



7. Disconnect and isolate battery negative cable.
8. Remove the seat off of the risers and disconnect the electrical connectors.
9. Disconnect strain gauge electrical connectors (1), if equipped.
10. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

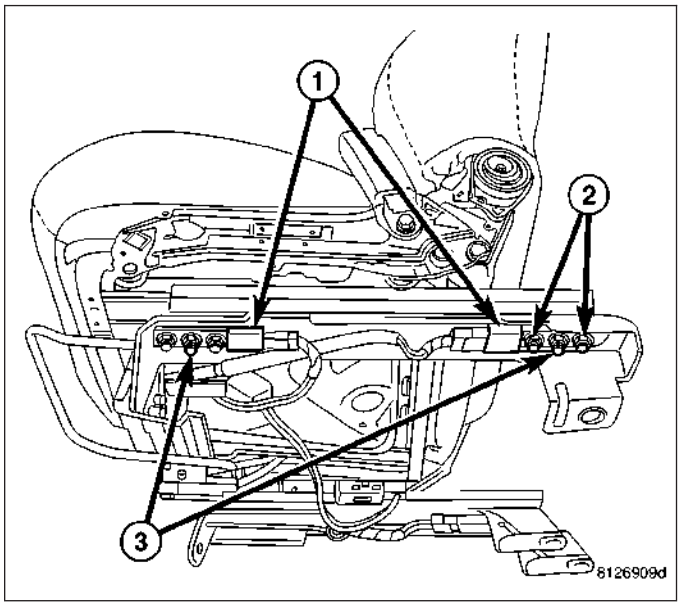


INSTALLATION

Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

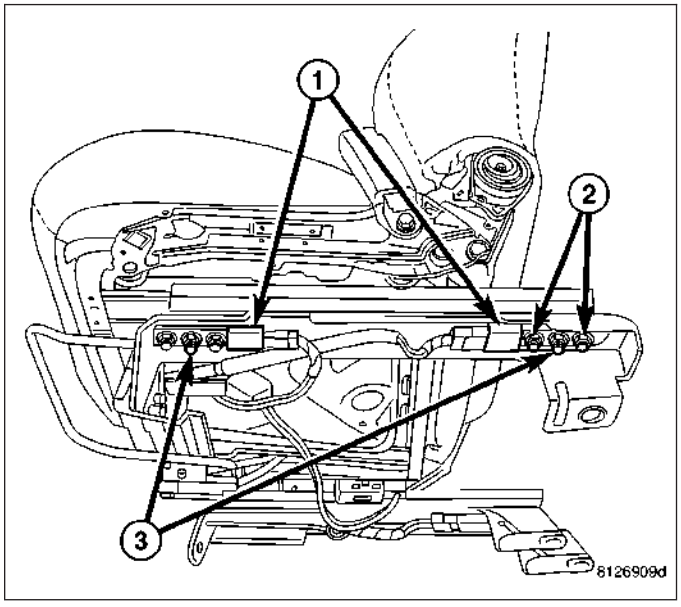
NOTE: Passenger seat with strain gauges shown, drivers side seat similar.



2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. If necessary, connect the electrical connections (1).
5. Move the seat to the forward position on the tracks and install the rear seat adjuster bolts/nuts (3).
6. Tighten the bolts to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts to 45 N·m (33 ft. lbs.).
9. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

Power Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. Position the seat into the vehicle onto the risers and connect the electrical connectors.
5. Move the seat to the forward position on the tracks and install the seat adjuster bolts/nuts (3).
6. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
9. If necessary, connect the strain gauge electrical connections (1).



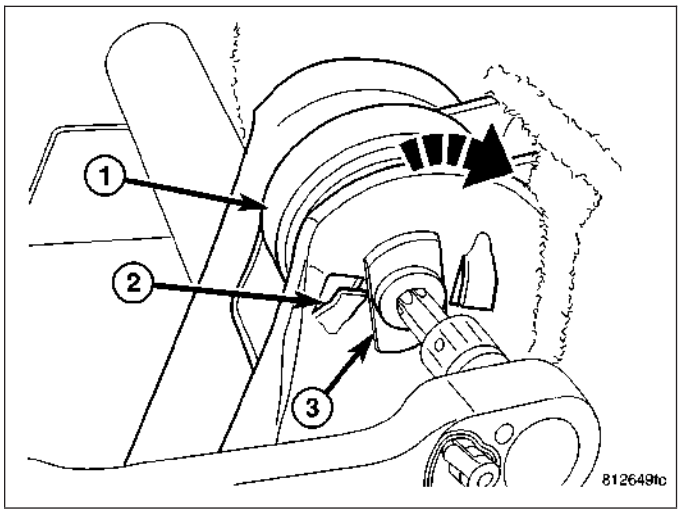
CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

10. Bolt the seat to the floor. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

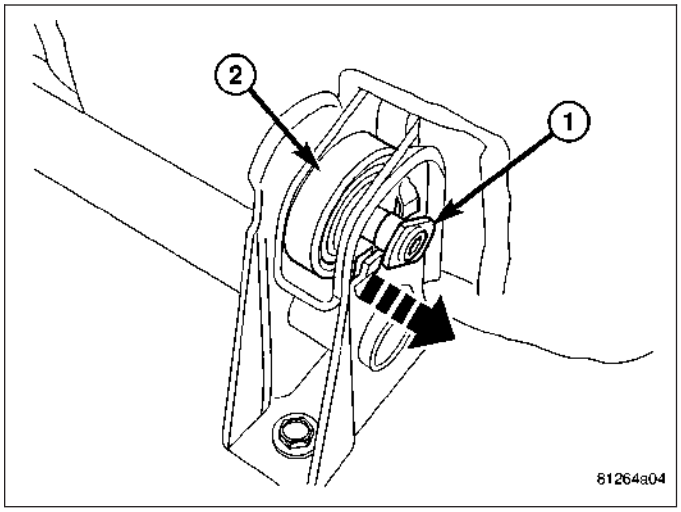
SEAT-SECOND ROW

REMOVAL

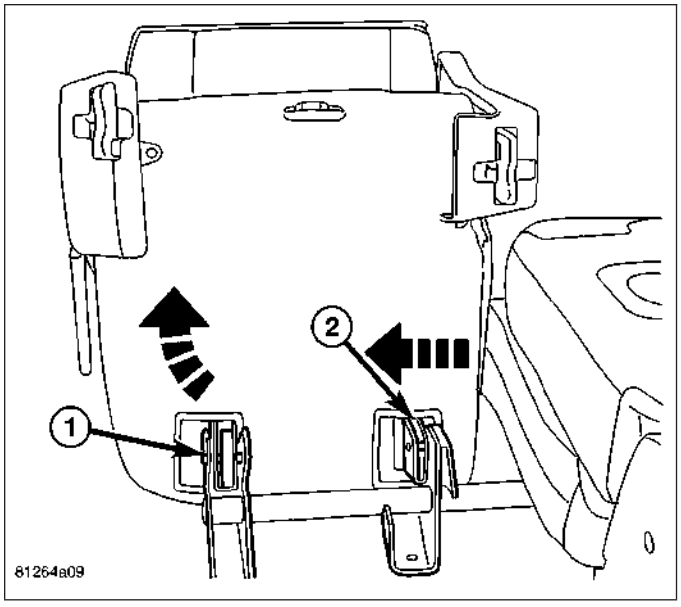
1. Position the front seat to the full forward position.
2. Release and fold seat forward.
3. Turn the hinge pin (3) clockwise and disengage from the retaining tabs (2).



4. With pin (1) released from the retaining tabs, tap pin out of the spring (2) and remove.

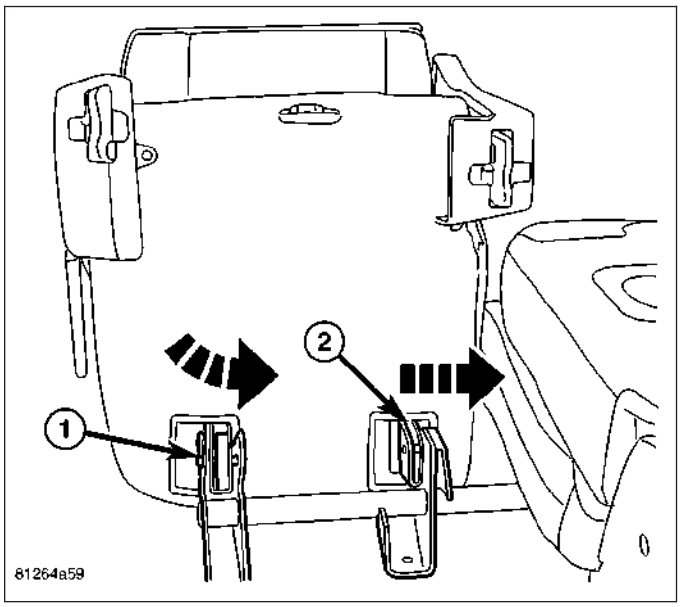


5. Twist the seat assembly up and out of the outboard hinge (1) and disengage from the inner hinge (2) and remove seat.

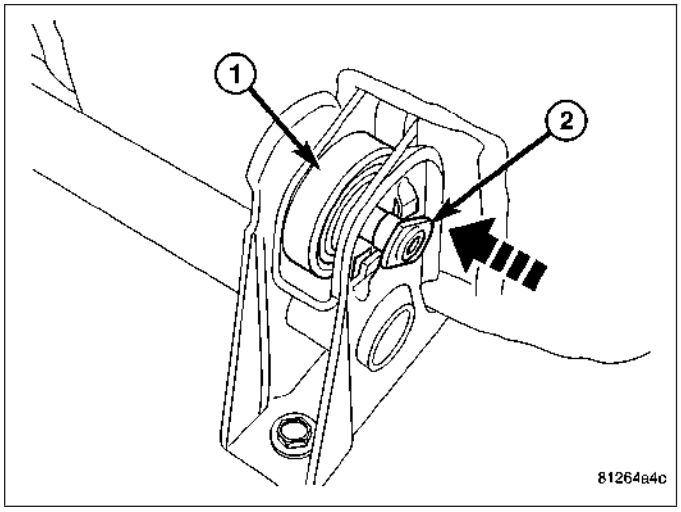


INSTALLATION

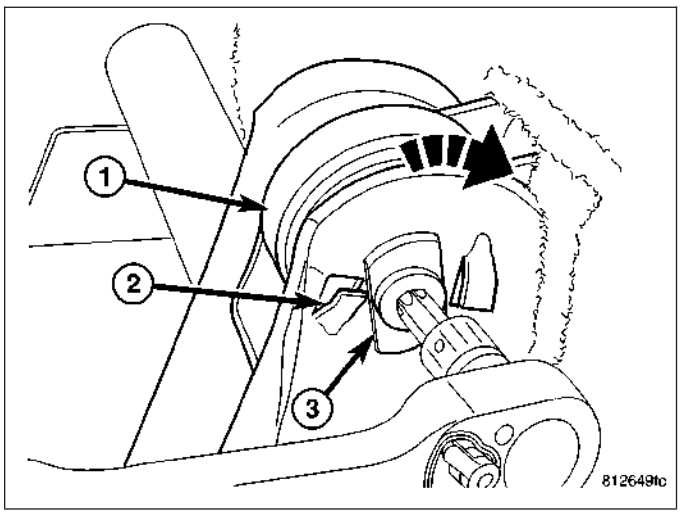
1. Position the seat into the vehicle and engage inboard hinge (2).
2. Rotate seat down and engage the outboard hinge (1).



3. Insert the hinge spring (1) and insert the pin (2).



4. Turn the hinge pin (3) and engage the pin into the retaining tabs (2).

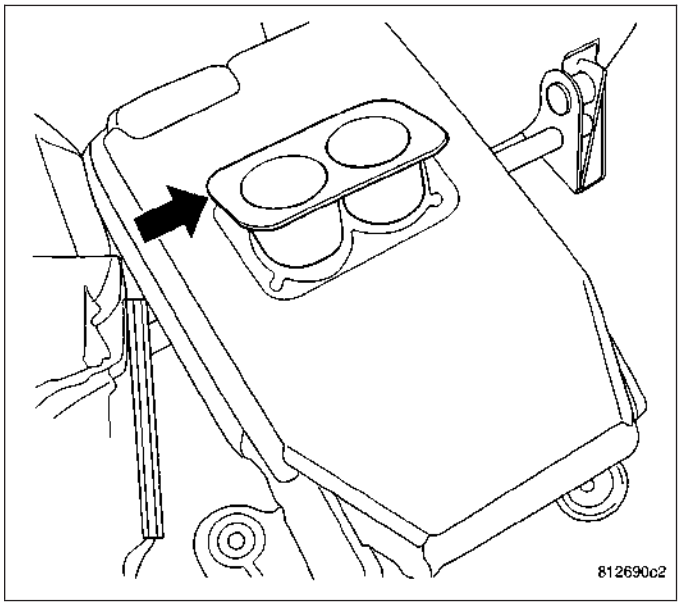


CUSHION/COVER-SEAT BACK - SECOND ROW

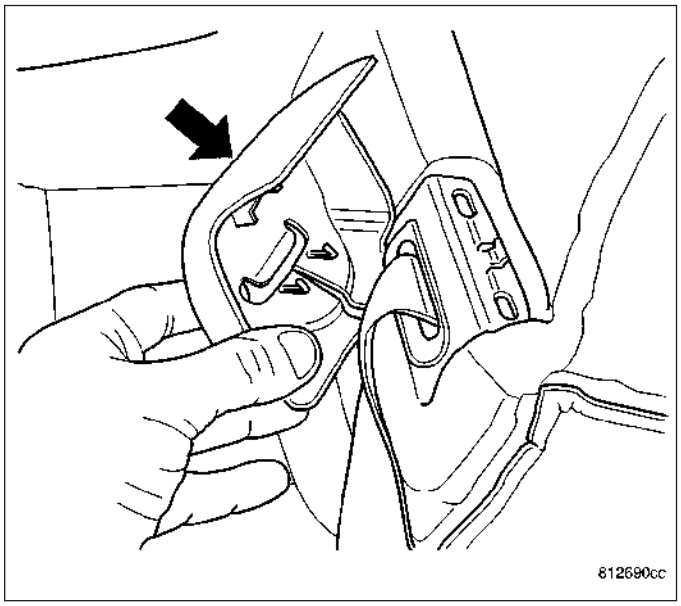
REMOVAL

Center

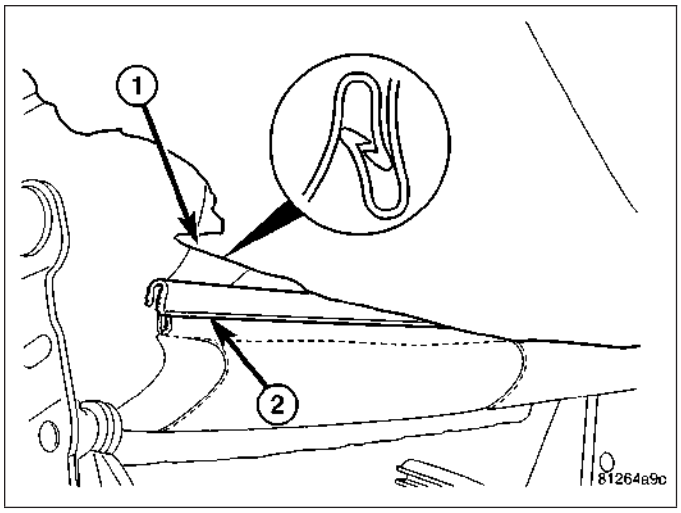
1. Using a trim stick C-4755 or equivalent, remove the cup holder.



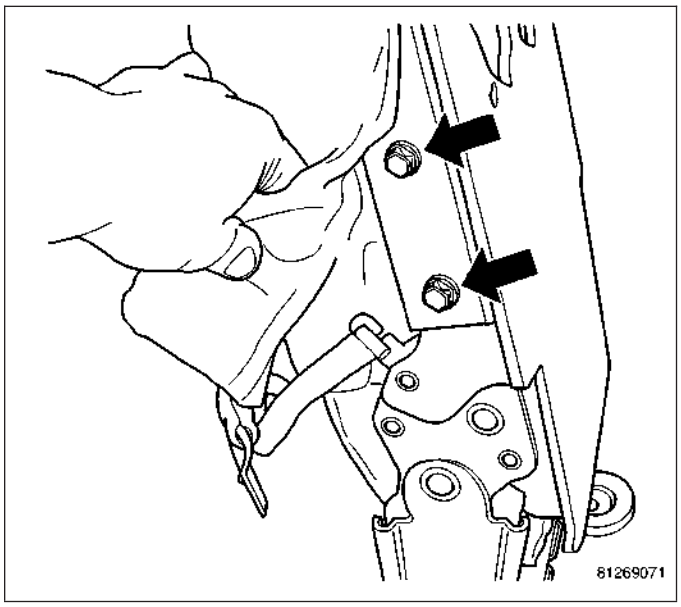
2. Using a trim stick C-4755 or equivalent, remove the seat belt bezel.



3. Remove the screws and remove the side shields.
4. Remove the bolt and remove the seat belt anchor.
5. Separate the j-straps (1 & 2) and pull cover up over frame.

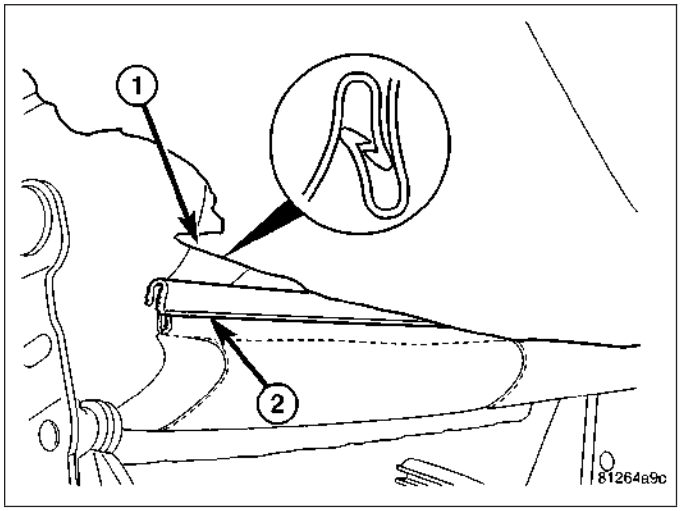


6. Remove the four seat back bolts and remove the seat back.
7. Remove the seat back cover and foam.

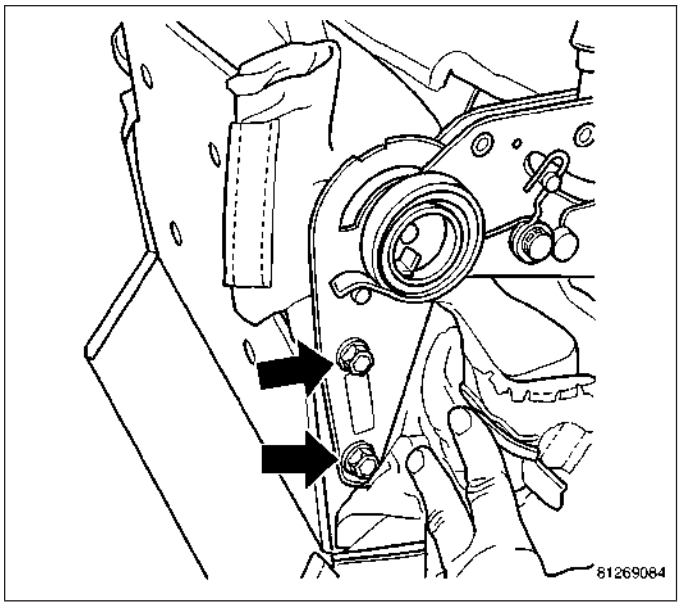


Outer

1. Fold the rear seat forward.
2. Remove the side shields.
3. Separate the j-straps (1 & 2) and pull cover up over frame.



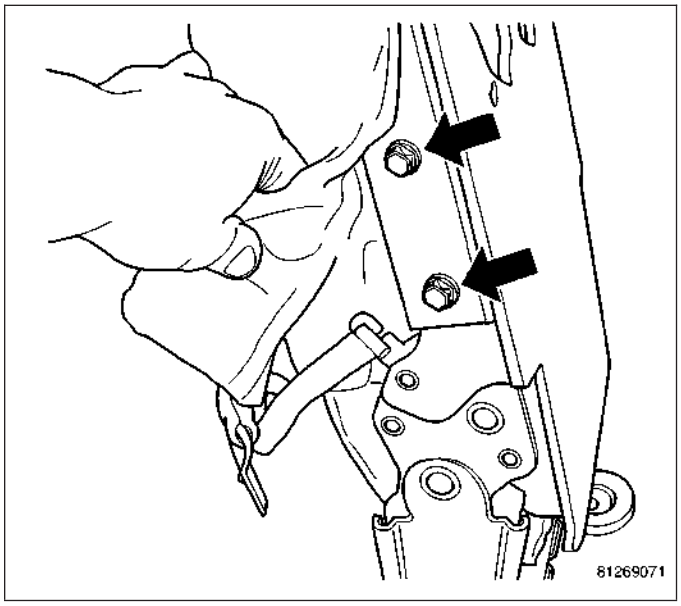
1. Remove the four bolts securing the seat back.
2. Remove the head rests and partially remove the seat back cover.
3. Remove the head rest sleeves and remove the cover and cushion.



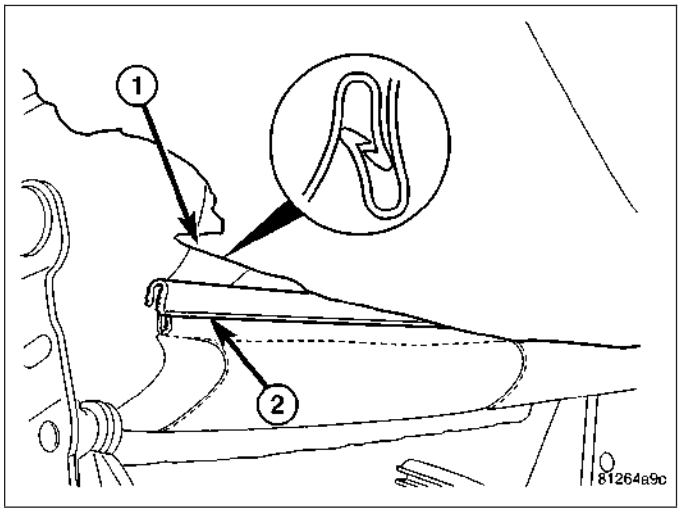
INSTALLATION

Center

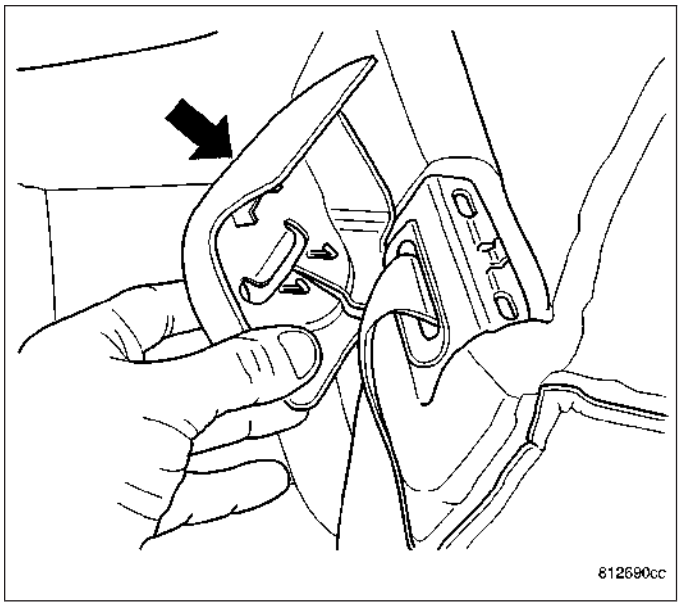
1. Position the seat back cover and foam over the seat back frame and install the seat back.
2. Install the bolts.



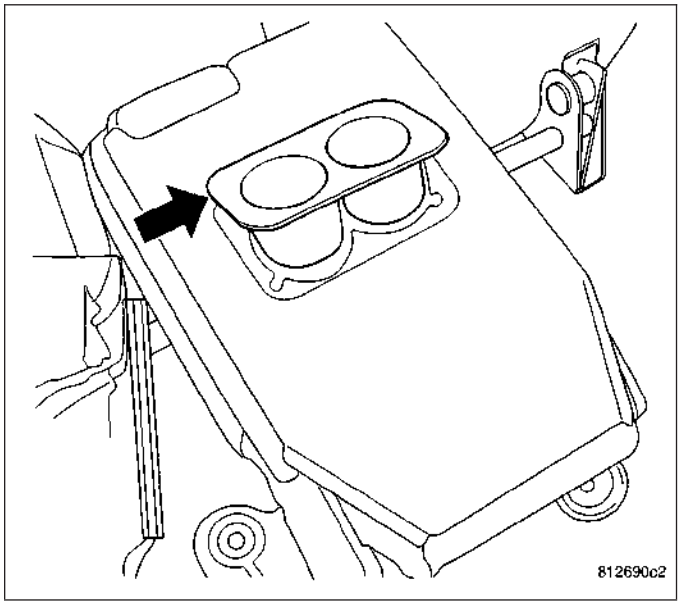
3. Connect the j-straps (1 & 2).
4. Install the seat belt anchor and tighten the bolt to 43 N·m (32 ft. lbs.).
5. Install the side shields.



6. Install the seat belt bezel.

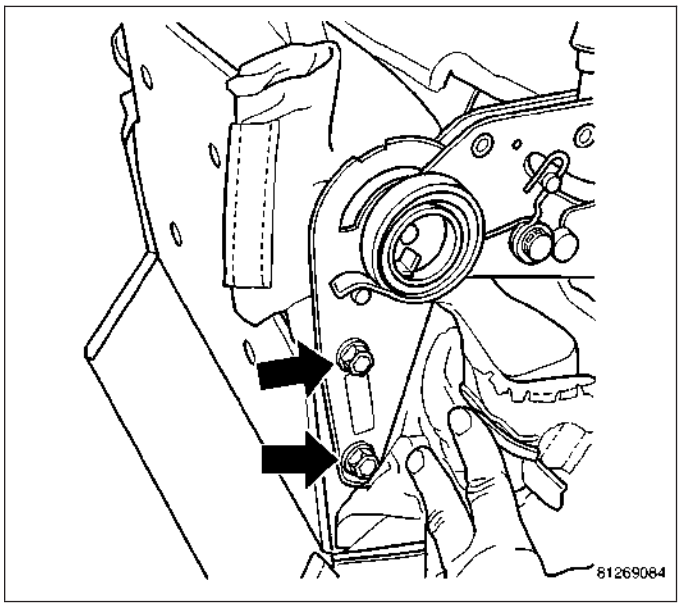


7. Install the cup holder.

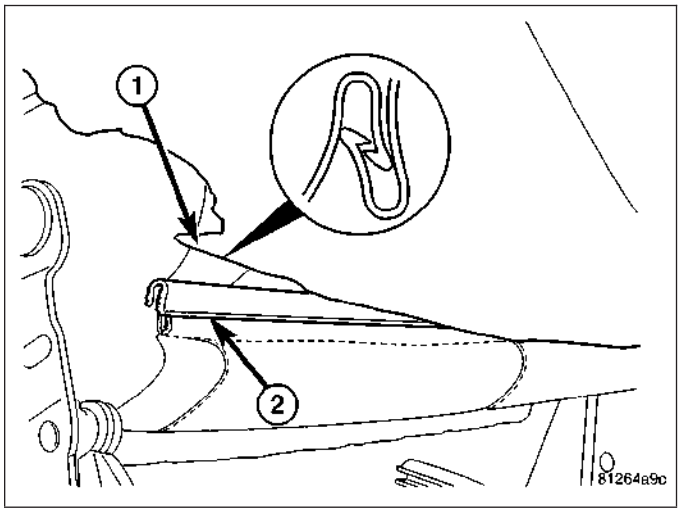


Outer

1. Position the seat back cover over the seat back frame and install the headrest sleeves.
2. Position the seat back cushion on the frame and position the cover over the cushion.
3. Install the seat back and install the bolts.



4. Connect the j-straps (1 & 2).
5. Install the side shields.

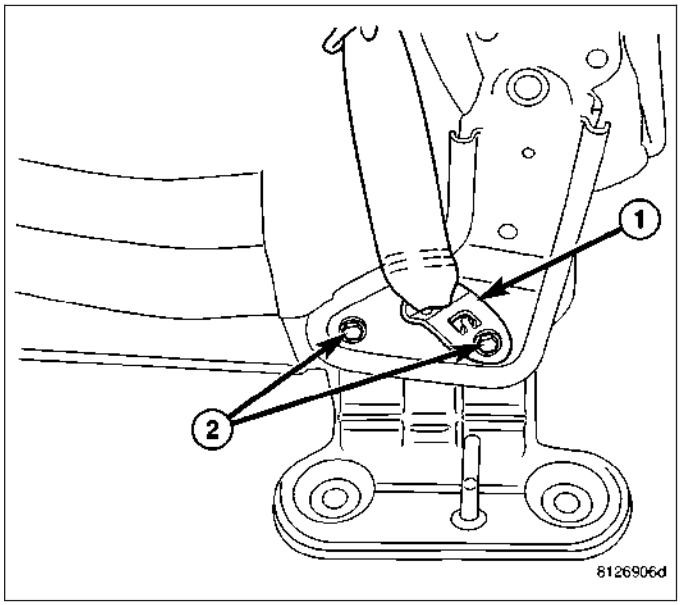


CUSHION/COVER-CUSHION - SECOND ROW

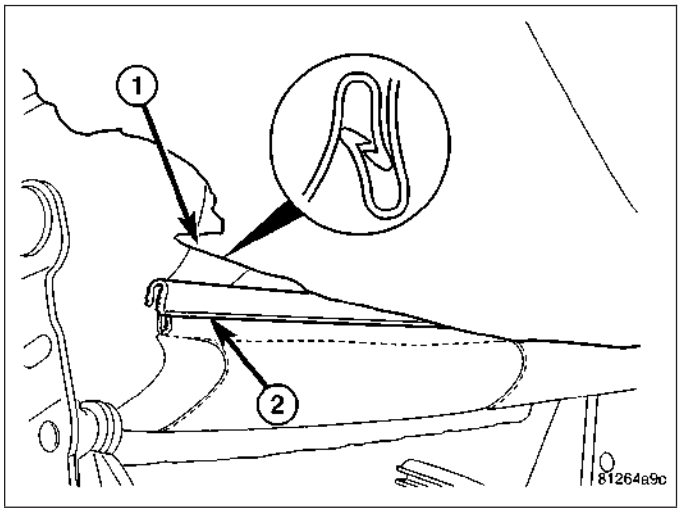
REMOVAL

Center

1. Fold both outer seats forward.
2. Remove the side shields.
3. Remove the four cushion bolts (2) and seat belt anchor (1) and remove the seat back assembly.

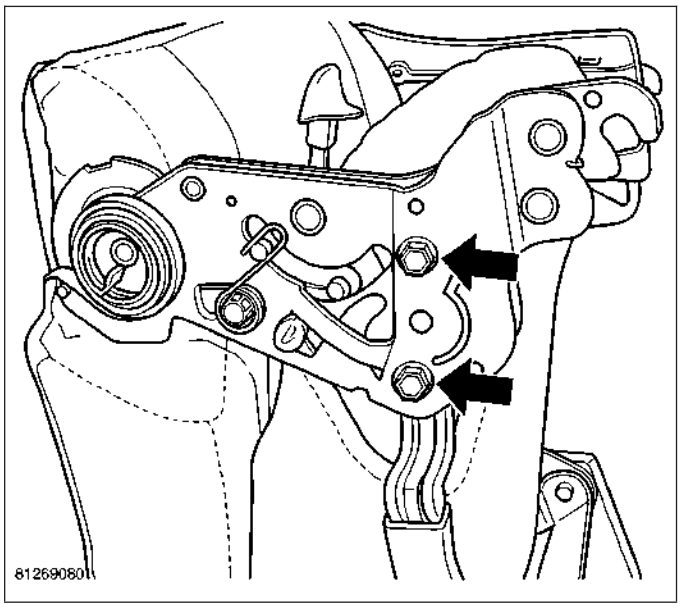


4. Separate the j-straps (1 & 2) and remove cover/ cushion from the frame.

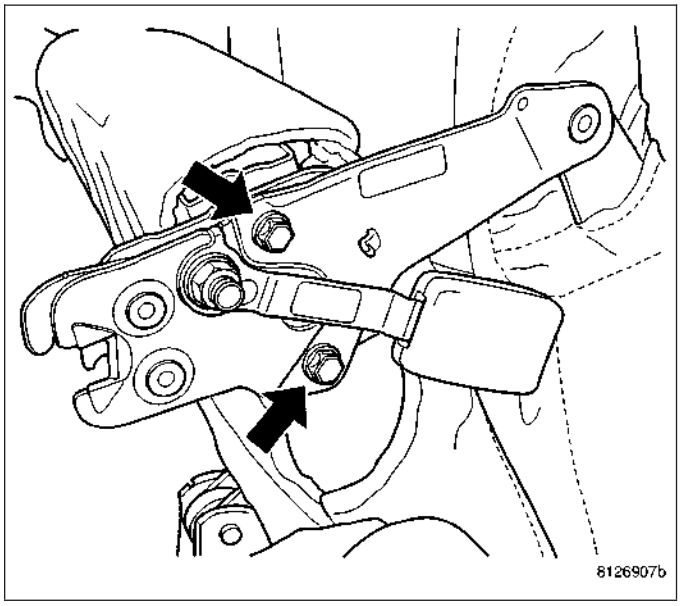


Outer

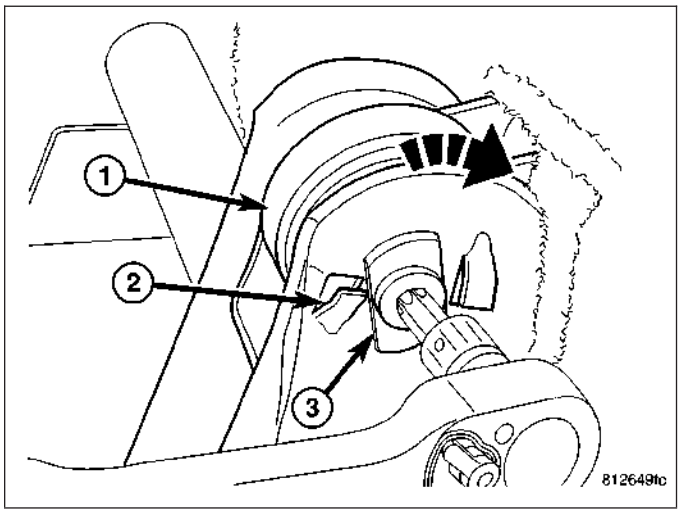
1. Remove the seat back. (Refer to 23 - BODY/ SEATS/SEAT BACK CUSHION / COVER - REMOVAL)
2. Remove the outboard hinge bolts and remove the connector tube and hinge from the seat.



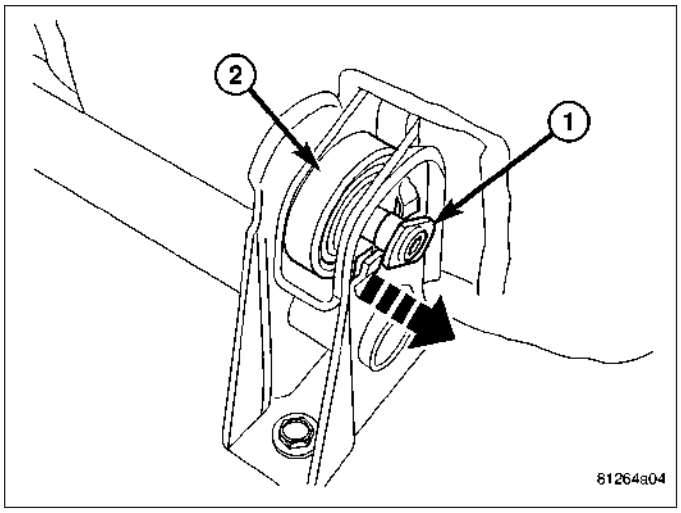
3. Remove the inboard hinges bolts and hinge.



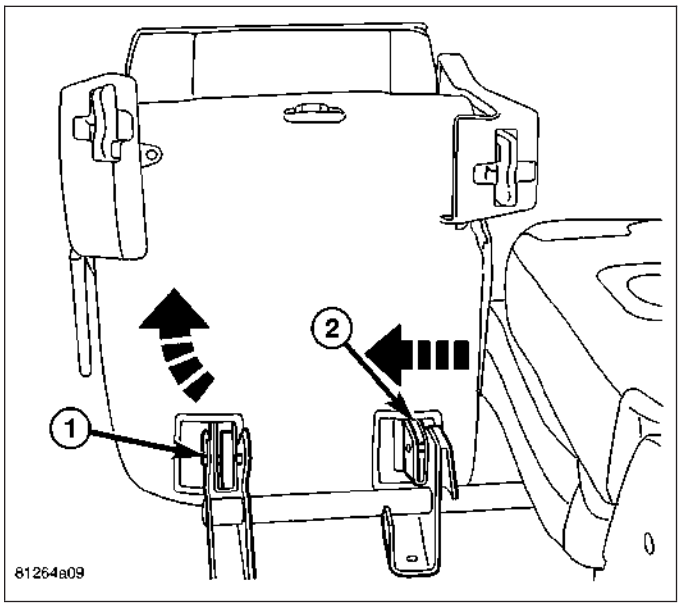
4. Turn the hinge pin (3) clockwise and disengage from the retaining tabs (2).



5. With pin (1) released from the retaining tabs, tap pin out of the spring (2) and remove.



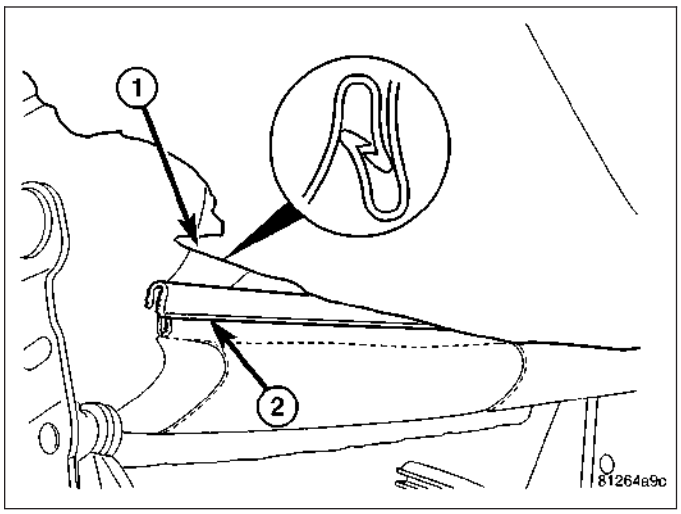
6. Twist the seat cushion assembly up and out of the outboard hinge (1) and disengage from the inner hinge (2) and remove seat.
7. Remove the seat cushion cover and foam from the seat frame.



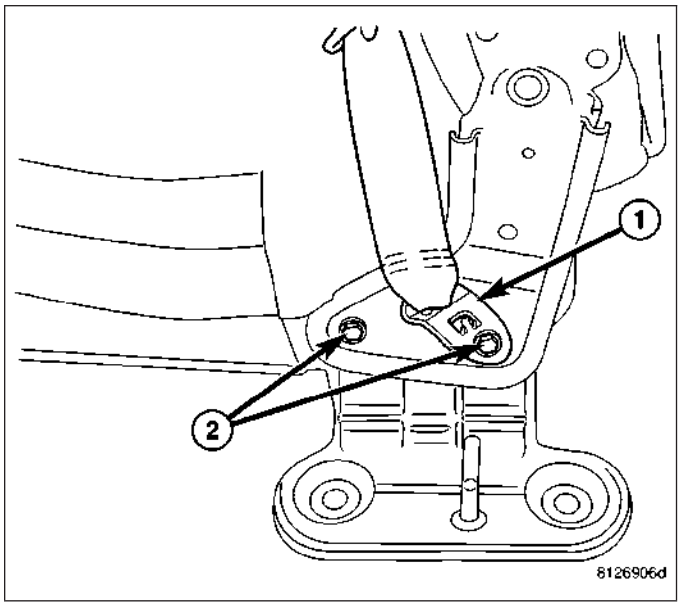
INSTALLATION

Center

1. Connect the j-straps (1 & 2).

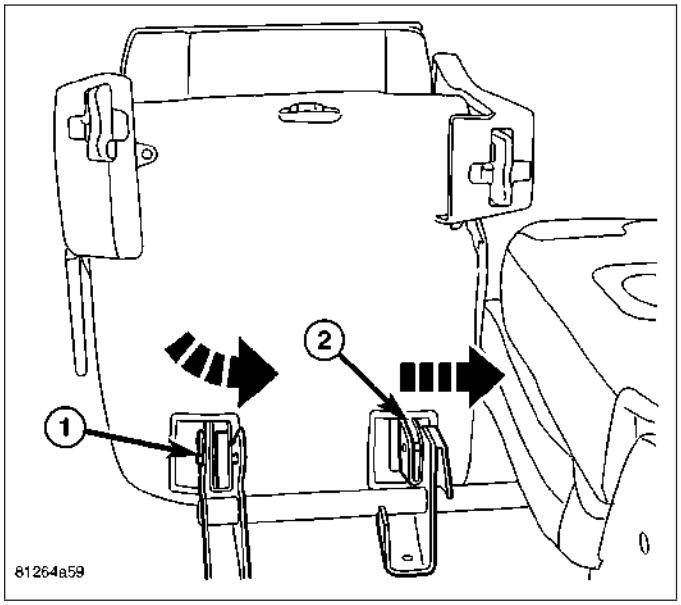


2. Install the seat belt anchor (1) and four cushion bolts (2).
3. Install the side shields.

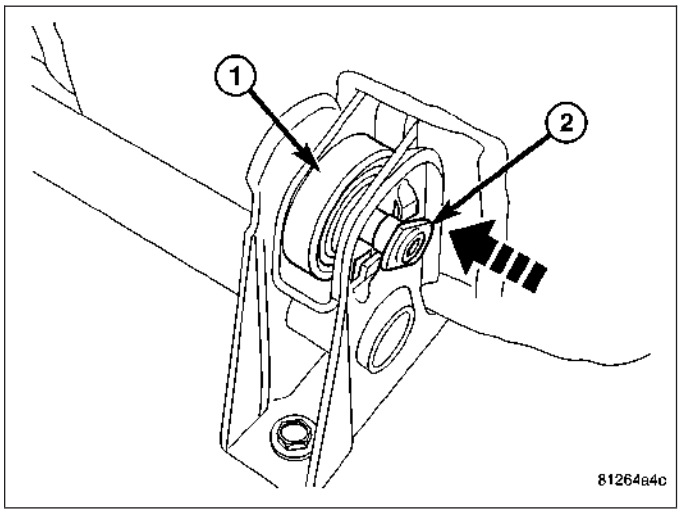


Outer

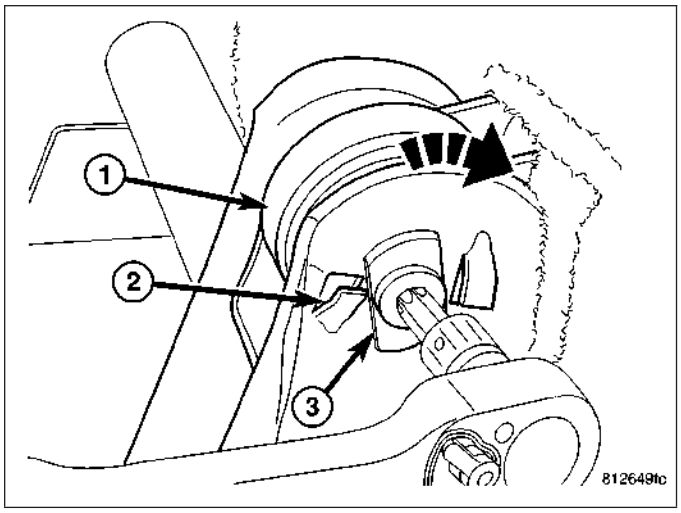
1. Install the seat cushion/cover over the seat frame.
2. Position the seat cushion assembly into the vehicle and engage inboard hinge (2).
3. Rotate seat down and engage the outboard hinge (1).



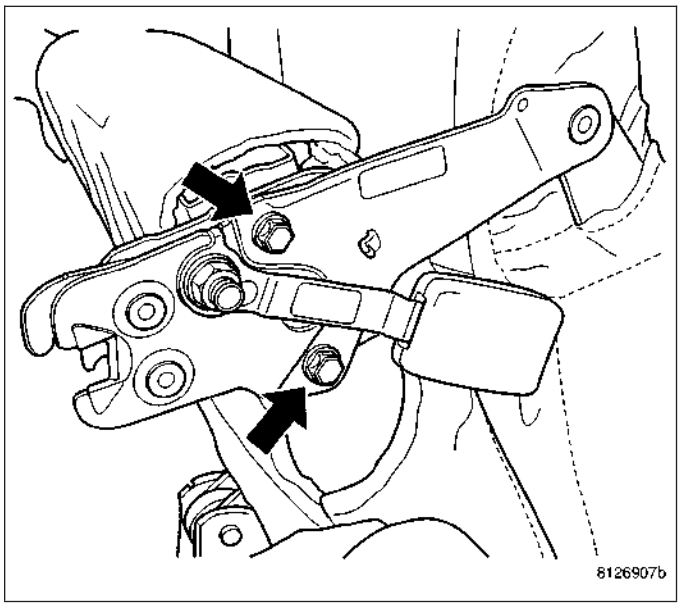
4. Insert the hinge spring (1) and insert the pin (2).



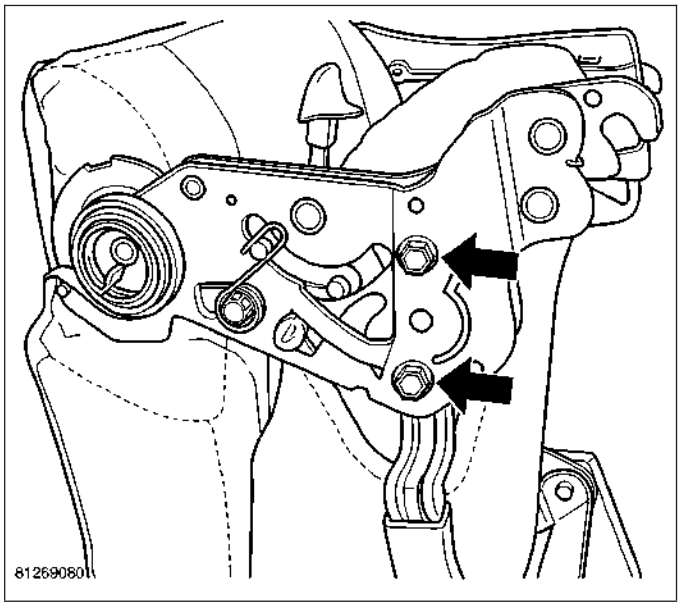
5. Turn the hinge pin (3) and engage the pin into the retaining tabs (2).



6. Install the inboard hinges and bolts.



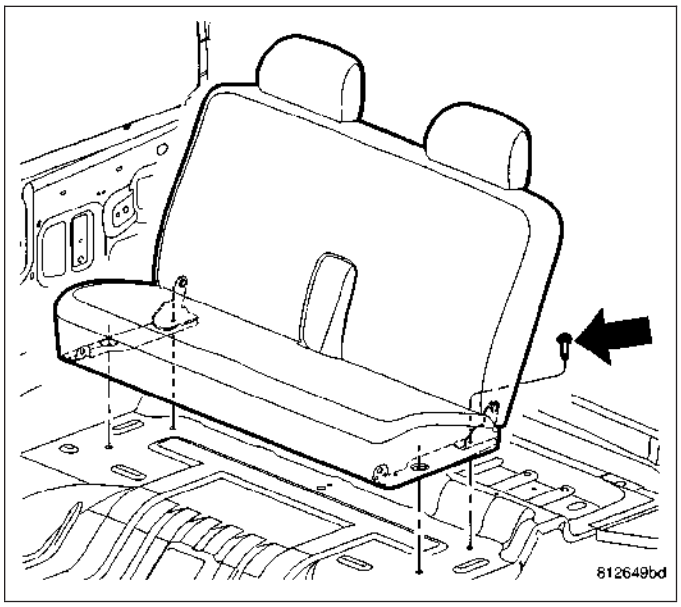
7. Install the connector tube/outboard hinge assembly into the seat cushion and install the bolts.
8. Install the seat back assembly. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - INSTALLATION)



SEAT-THIRD ROW

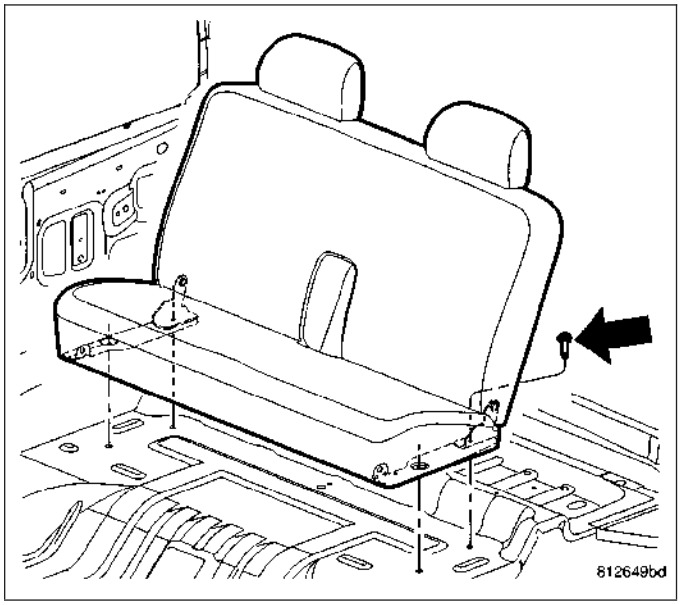
REMOVAL

1. Fold the third seat cushion forward and remove the bolts.
2. Remove the seat assembly from the vehicle.



INSTALLATION

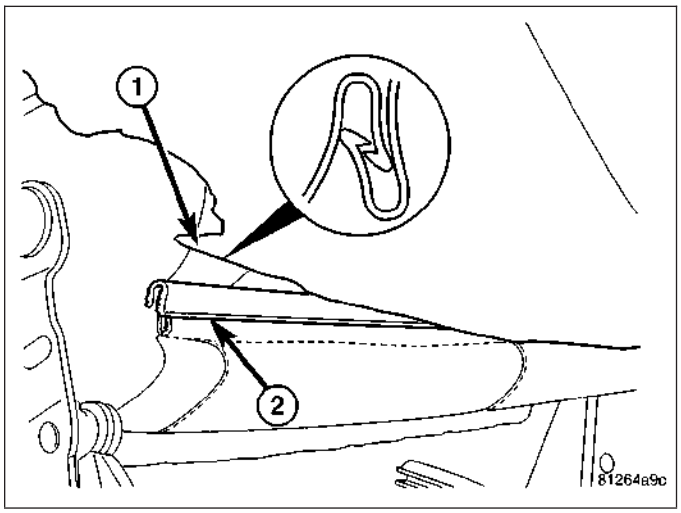
1. Install the seat and fold the seat cushion forward.
2. Install the front bolts and tighten to 40 N·m (25 ft. lbs.).
3. Install the rear bolts and tighten to 47 N·m (35 ft. lbs.).



CUSHION/COVER-SEAT BACK - THIRD ROW

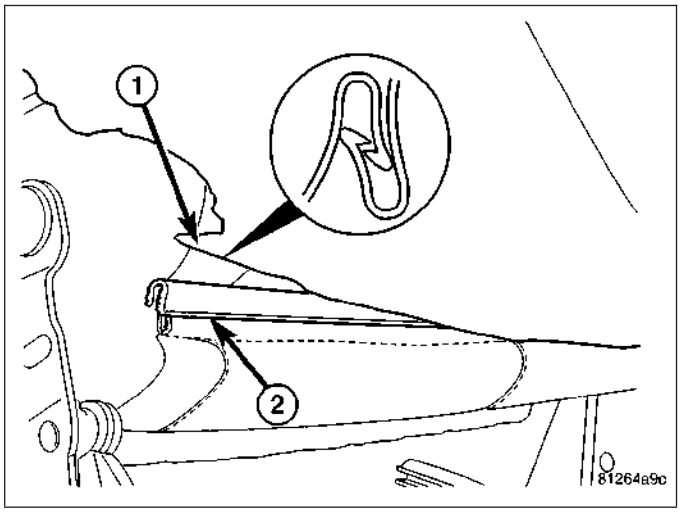
REMOVAL

1. Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
2. Remove the headrests.
3. Separate the j-straps (1 & 2) and position the cover/cushion aside.
4. Remove the headrest sleeves and remove the cushion/cover.



INSTALLATION

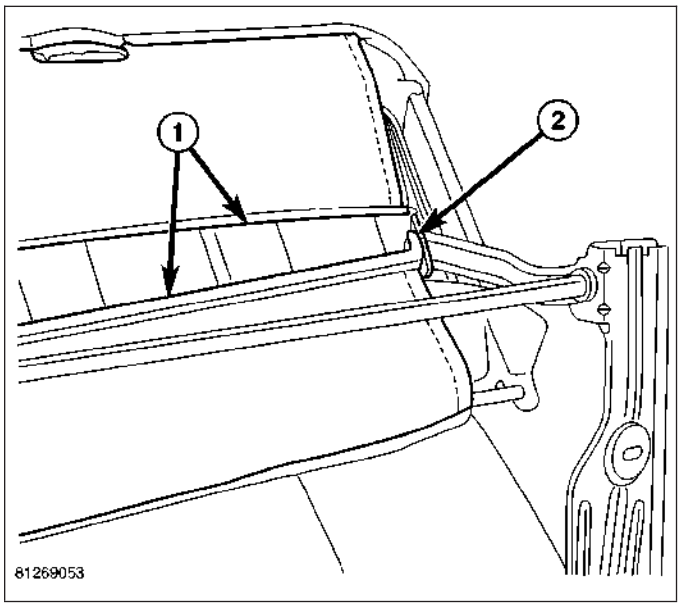
1. Position the seat back cushion/cover over the seat back frame and connect the j-straps (1 & 2).
2. Install the headrest sleeves.
3. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)



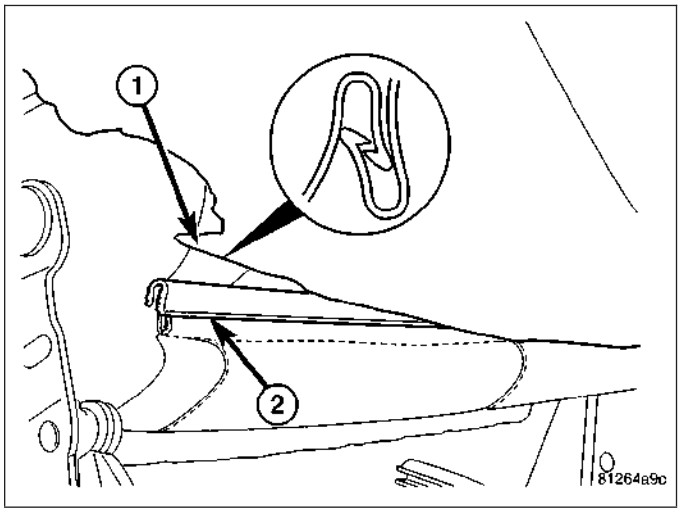
CUSHION/COVER-CUSHION - THIRD ROW

REMOVAL

1. Fold seat cushion forward to access the bolts.
2. Remove the bolts (2) and remove the cushion assembly from the vehicle.

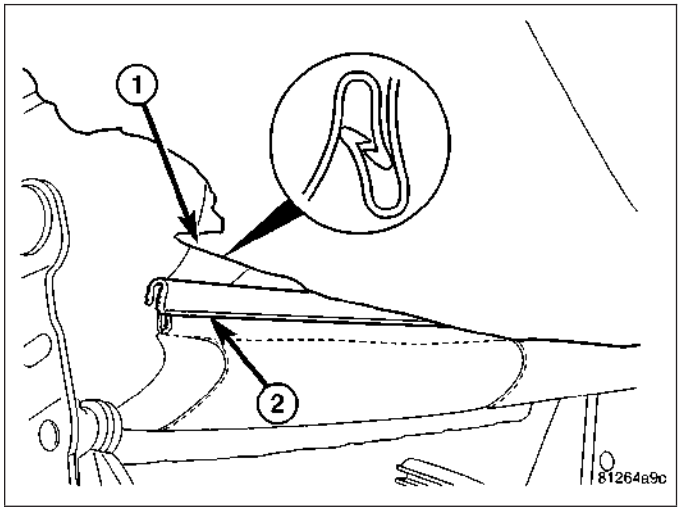


3. Separate the j-straps (1 & 2) and remove the cushion/cover from the frame.

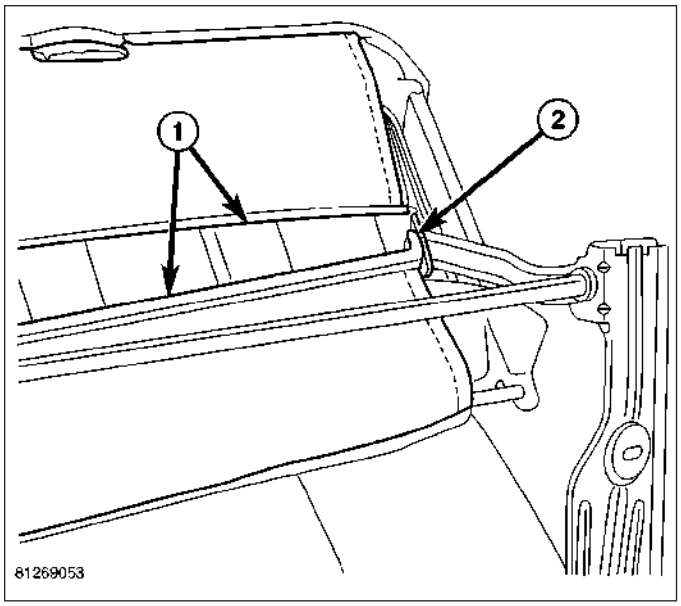


INSTALLATION

1. Position the cushion/cover over the frame and connect the j-straps (1 & 2).



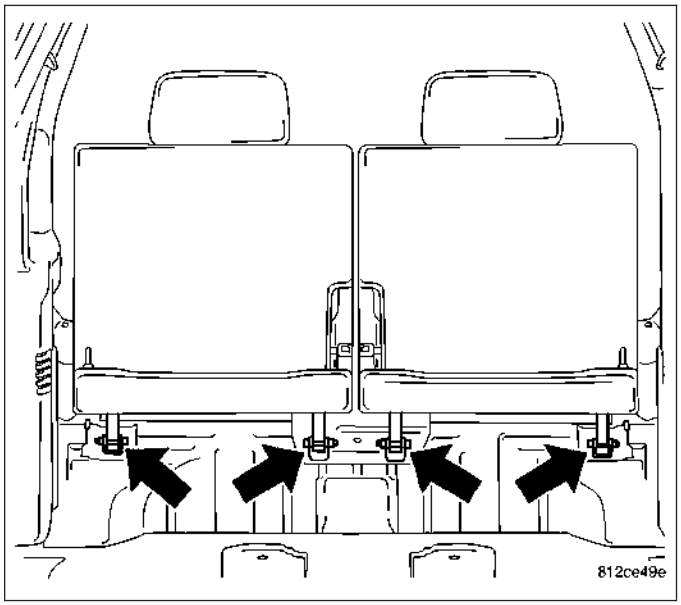
2. Install the cushion assembly onto the seat pivot assembly and install the bolts (2).



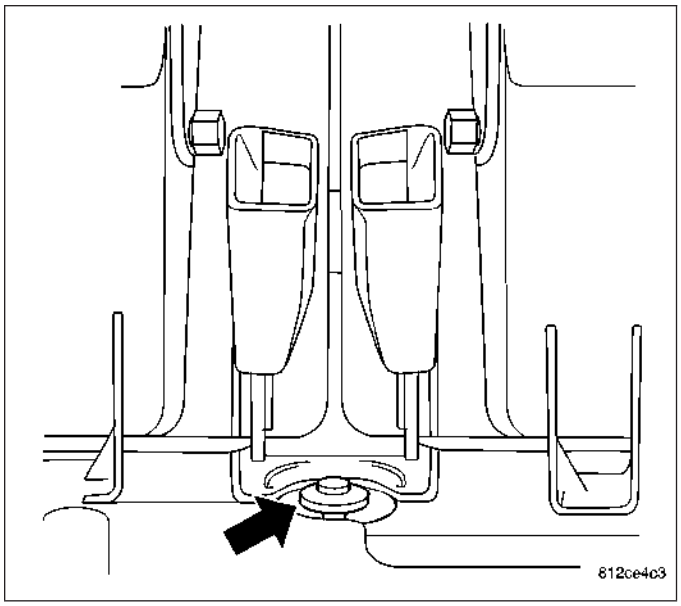
SEAT-THIRD ROW 50/50 SPLIT

REMOVAL

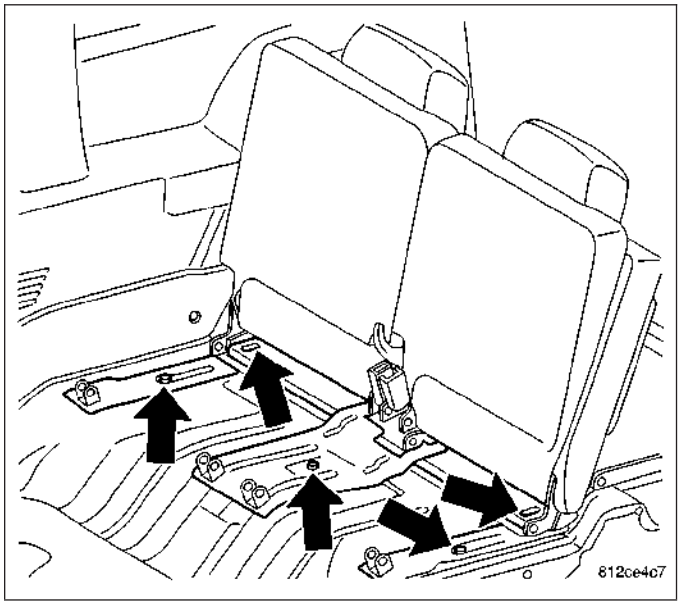
1. Remove the four bolts and nuts securing the front cushion pivots to the floor.



2. Remove the bolt between the center seat belt buckles.

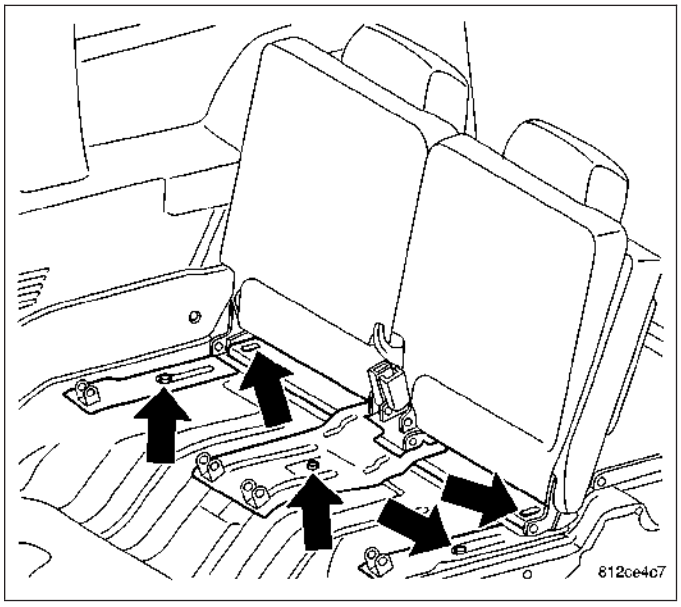


3. Remove the five assembly bolts and remove the seat assembly.

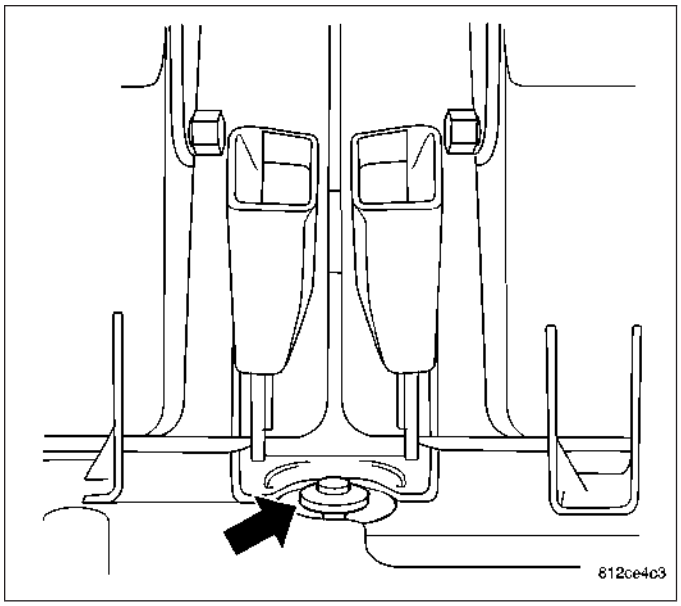


INSTALLATION

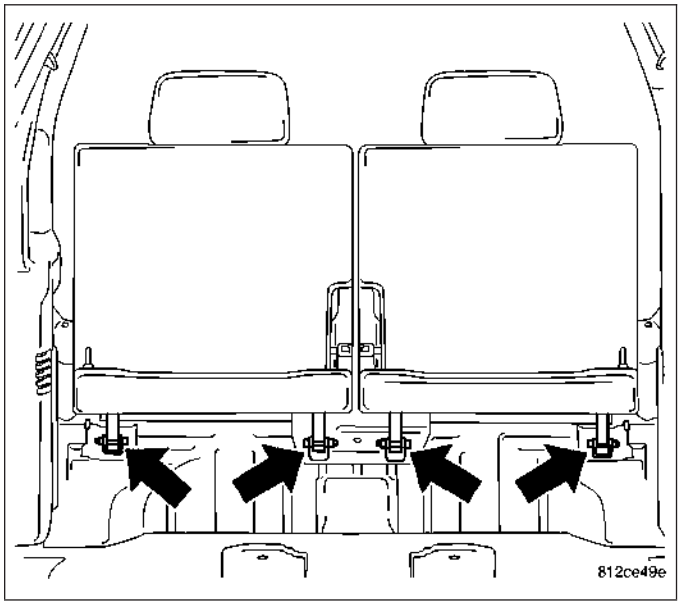
1. Install the seats and install the bolts.



2. Install the bolt between the belt buckles.
3. Tighten the three rear assembly bolts to 47 N·m (35 ft. lbs.).
4. Tighten the three front assembly bolts to 34 N·m (25 ft. lbs.).



5. Install the front seat cushion pivot bolts/nuts and tighten to 34 N·m (25 ft. lbs.).



STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

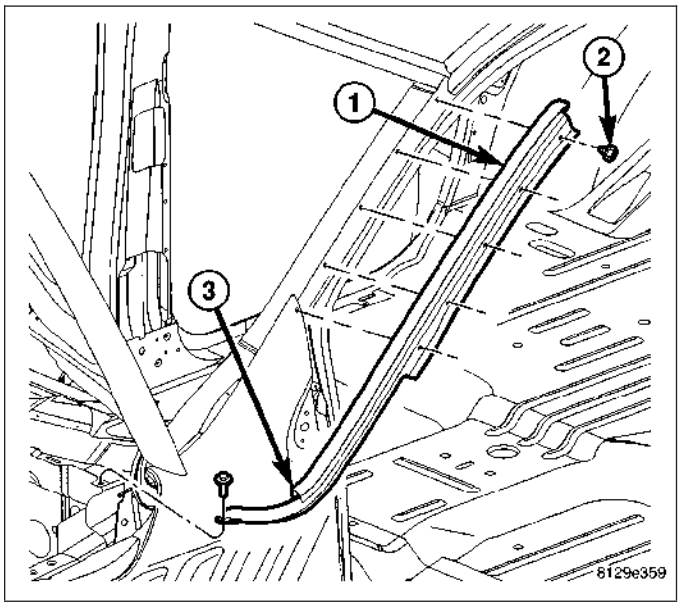
- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, pvc (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **Daimlerchrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of fmvss 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **Always wear eye and hand protection when working with glass.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

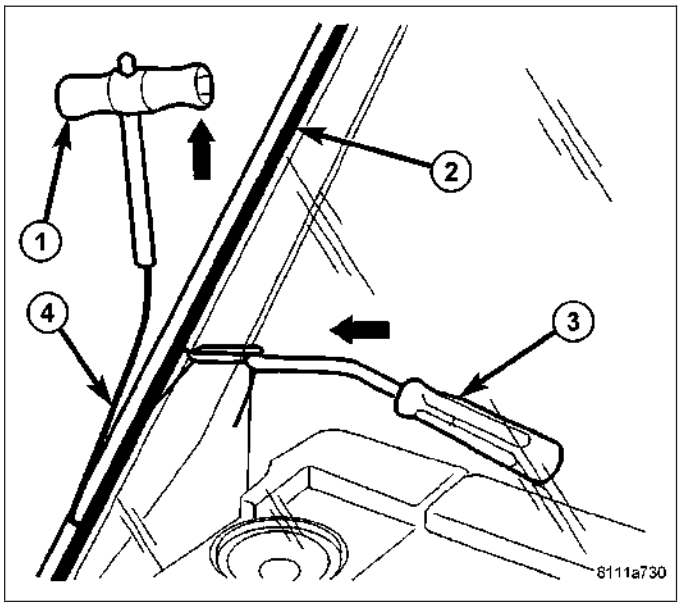
WINDSHIELD

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Remove the screws (2) attaching the side windshield molding (1) to the a-pillars and remove the molding.
3. Remove rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL)
4. Remove the cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - REMOVAL)



5. Using a windshield cut-out wire separate the adhesive.
6. Carefully remove windshield.



1 - T-HANDLE
2 - WINDSHIELD ADHESIVE
3 - COUNTER SUPPORT
4 - CUTTING WIRE

INSTALLATION

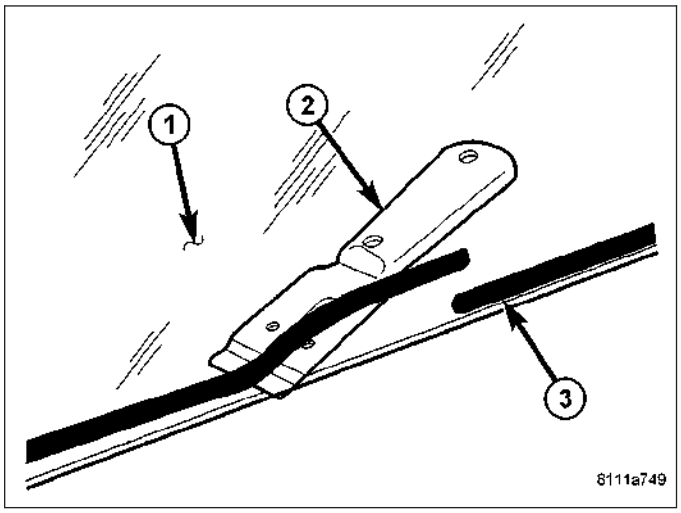
WARNING: ALLOW THE URETHANE AT LEAST 24 HOURS TO CURE BEFORE RETURNING THE VEHICLE TO USE.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located on the cowl at the bottom of the windshield opening should be replaced with new parts. Replace any missing or damaged spacers around the perimeter of the windshield opening.

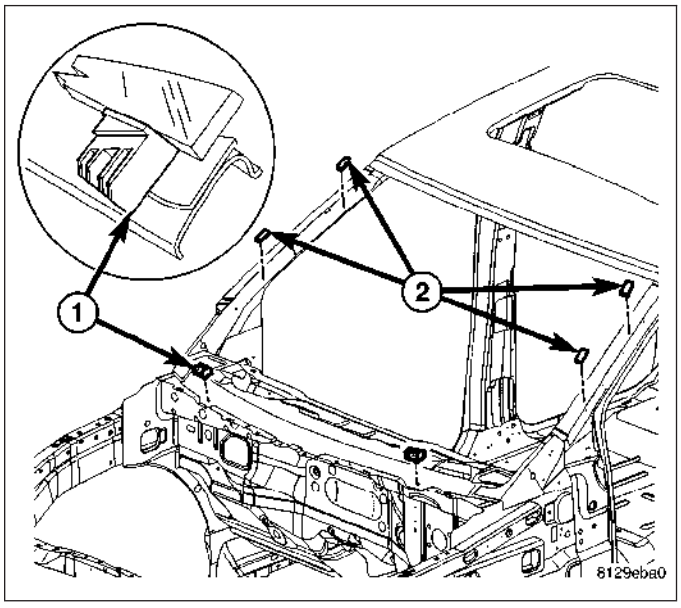
Windshield Preparation - Installing A Previously Installed Windshield

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Level old bead of windshield adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.

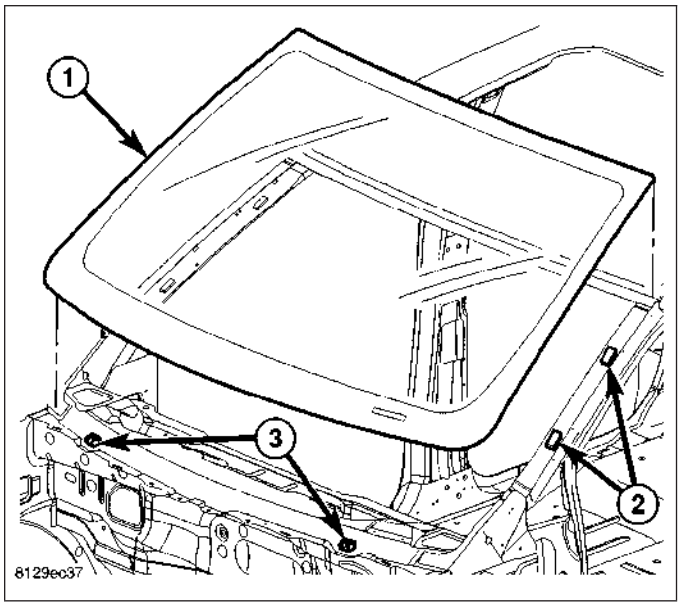


3. Apply four new spacers (2) to the a-pillars and place them evenly apart at the top and bottom.
4. Install the lower spacer assemblies (1) into the slotted holes and verify proper installation by pulling to make sure they are locked on.

NOTE: Lower spacers must be facing with the flat side upwards when installing into the slotted holes.



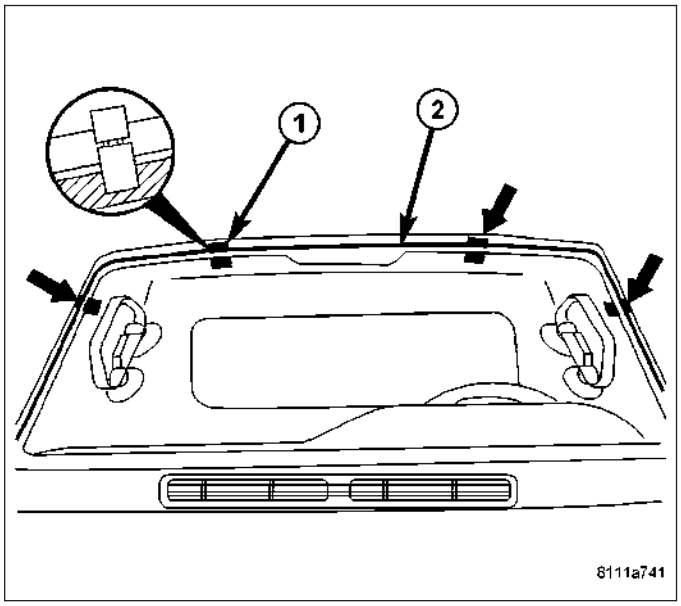
5. Position windshield (1) in center of windshield opening and resting on the side and lower spacers (2 & 3).
6. Adjust the lower spacers (3) as required, to obtain the specified roof gap tolerance by pushing on the side of the wedge and raising or lowering the glass as necessary. For roof gap specifications, refer to the table Roof Gap Tolerances .



Roof Gap Tolerances

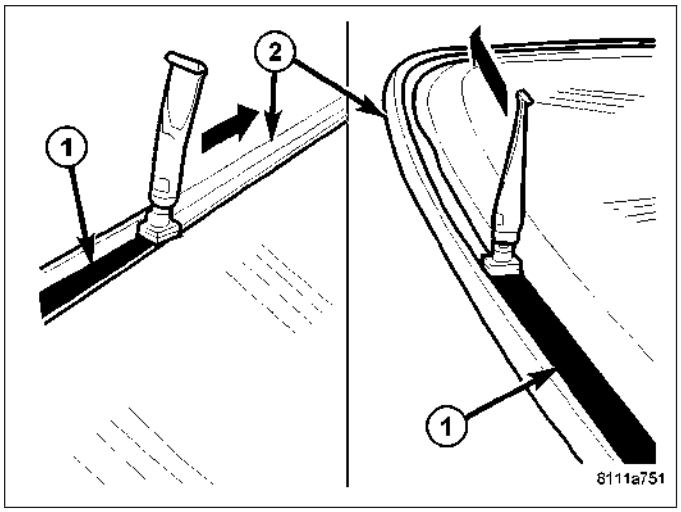
Roof Gap	Roof Flush
4.0 mm ± 1.5 mm Parallel within 2.0 mm	Underflush 2.0 mm ± 1.5 mm
(0.16 in ± 0.060 in) Parallel within (0.080 in)	(0.080 in ± 0.060 in)

7. Apply adhesive tape (1) to the locations shown to aid with final installation.
8. Verify windshield gap is parallel to with windshield.
9. Cut tape with a sharp knife and remove windshield.

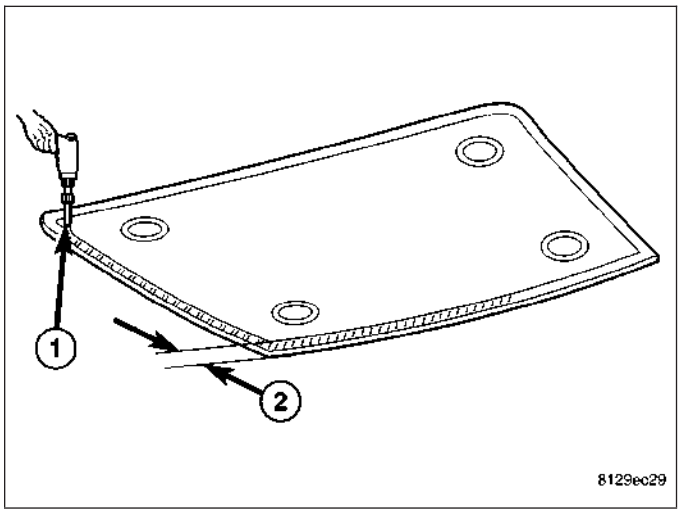


NOTE: Typical primer installation shown.

10. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
11. Using a flash light, verify that glass primer is without damage.
12. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.



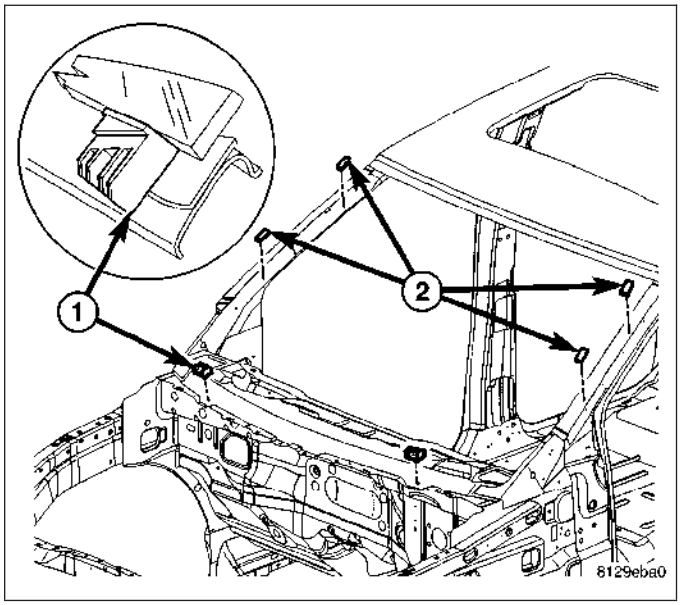
13. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (2).
14. Allow primer to air dry for at least 10 minutes.
15. Using a flash light, verify that glass primer is without damage.



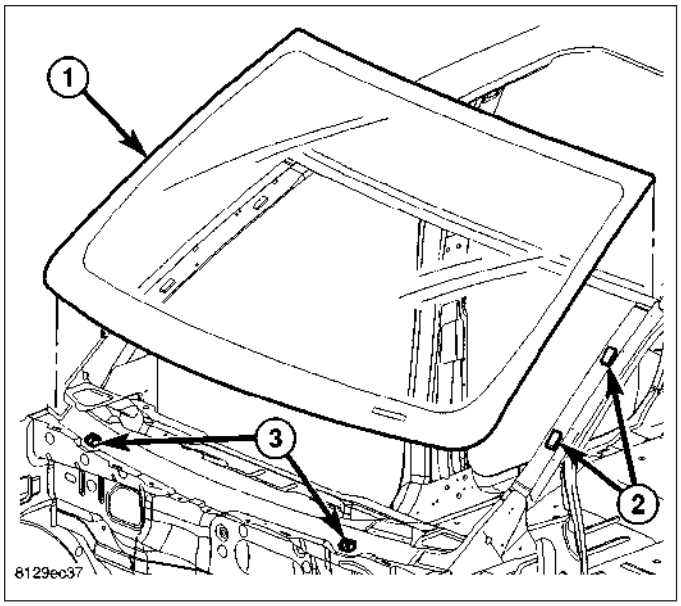
Windshield Preparation - Installing A New Windshield

1. Apply four new spacers (2) to the a-pillars and place them evenly apart at the top and bottom.
2. Install the lower spacer assemblies (1) into the slotted holes and verify proper installation by pulling to make sure they are locked on.

NOTE: Lower spacers must be facing with the flat side upwards when installing into the slotted holes.



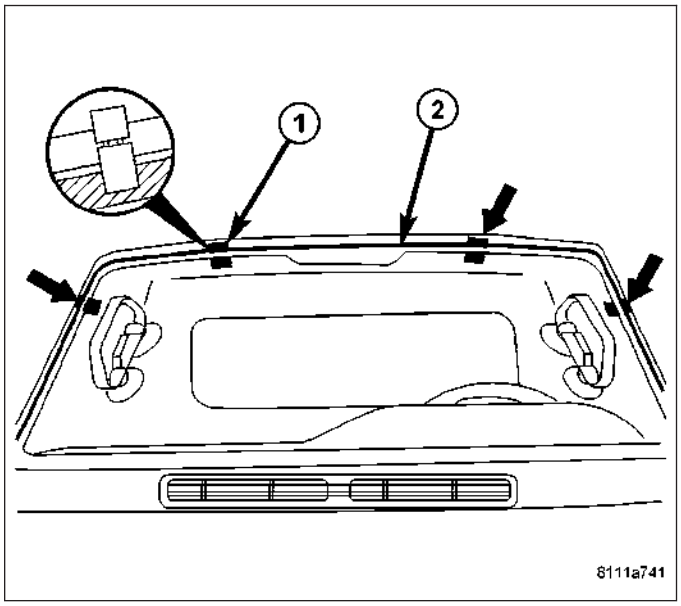
3. Position windshield (1) in center of windshield opening and resting on the side and lower spacers (2 & 3).
4. Adjust the lower spacers (3) as required, to obtain the specified roof gap tolerance by pushing on the side of the wedge and raising or lowering the glass as necessary. For roof gap specifications, refer to the table Roof Gap Tolerances .



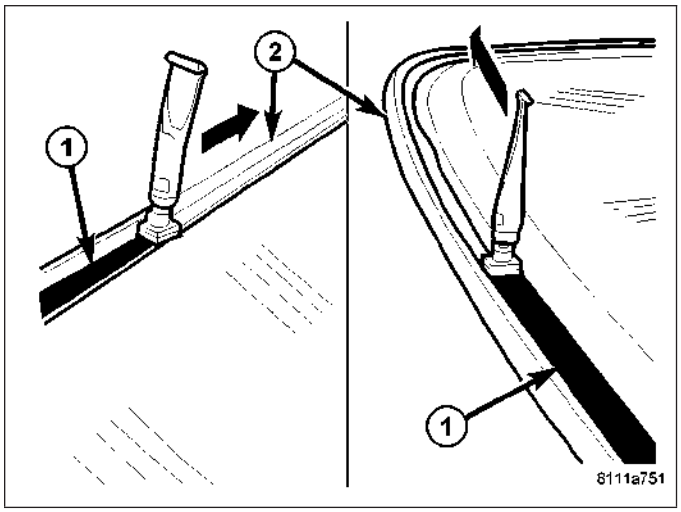
Roof Gap Tolerances

Roof Gap	Roof Flush
4.0 mm ± 1.5 mm Parallel within 2.0 mm	Underflush 2.0 mm ± 1.5 mm
(0.16 in ± 0.060 in) Parallel within (0.080 in)	(0.080 in ± 0.060 in)

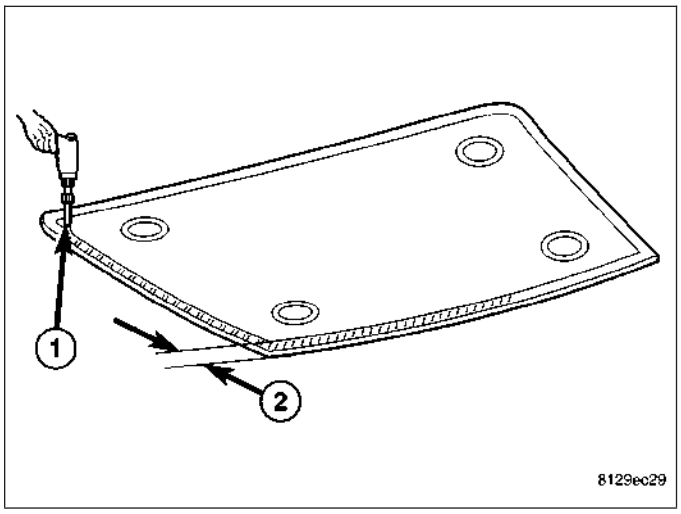
5. Clean and check windshield for damage.
6. Position windshield in center of windshield opening.
7. Apply adhesive tape to the locations shown to aid with final installation.
8. Verify windshield gap is parallel to with windshield.
9. Cut tape with a sharp knife and remove windshield.



10. Clean and dry area of glass to be glued with a suitable glass preparation solvent and rag.
11. Apply primer to gluing surface at windshield seal.

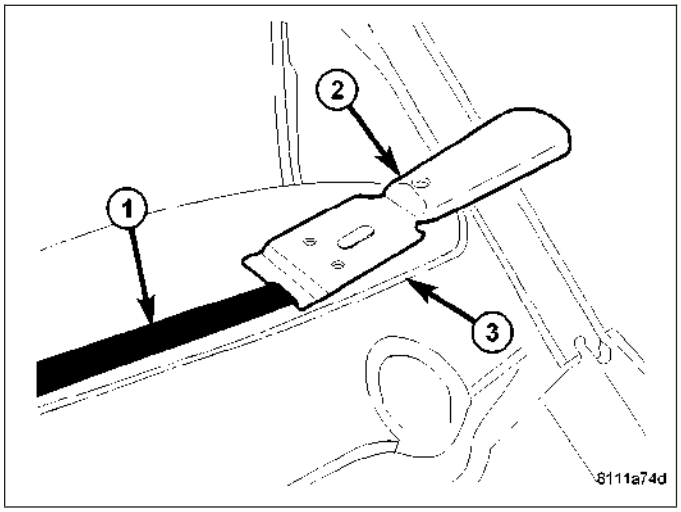


12. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (2).
13. Allow primer to air dry for at least 10 minutes.
14. Using a flash light, verify that glass primer is without damage.

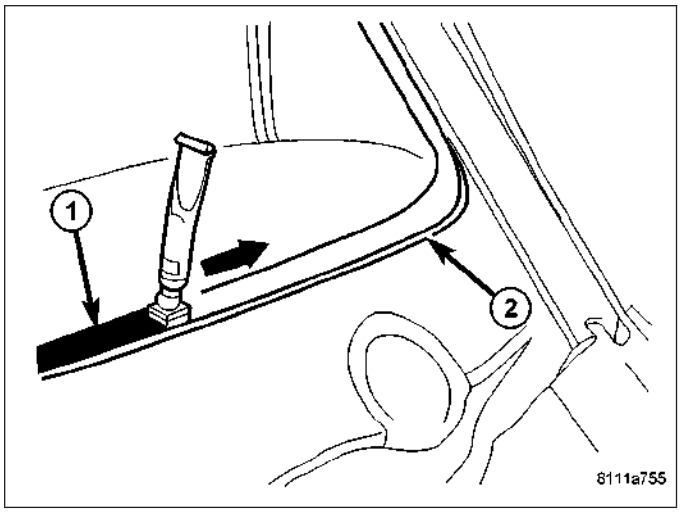


Windshield Opening Preparation

1. Clean and vacuum windshield opening.
2. Level old bead of windshield opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.



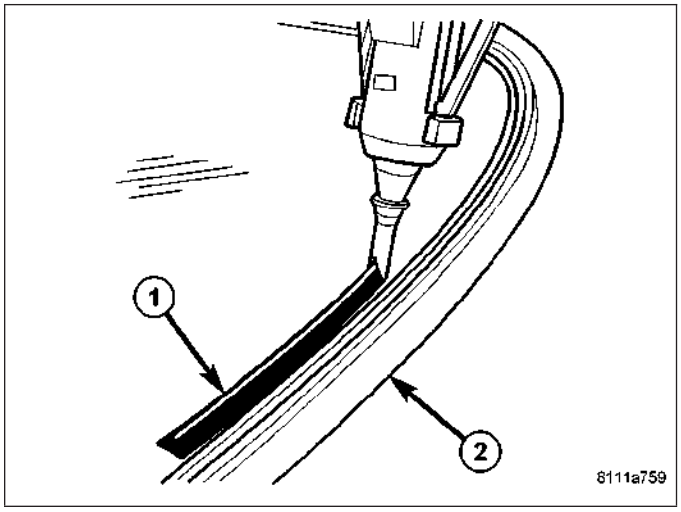
3. Clean and dry area of windshield opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
5. Allow primer to air dry for at least 10 minutes.



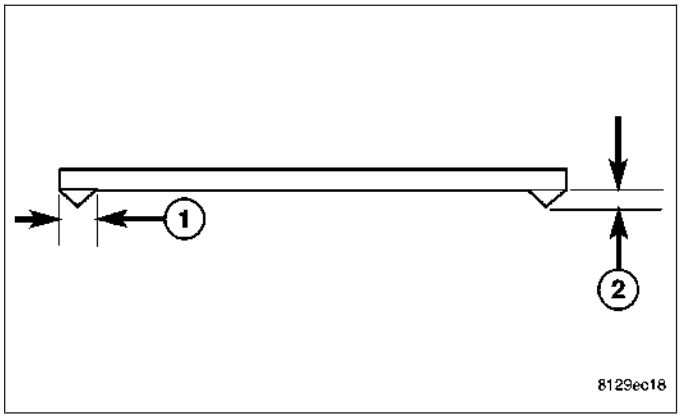
Windshield Installation

1. Apply bead of adhesive (1) with a triangular nozzle directly to the windshield seal starting at bottom in center of windshield.

CAUTION: Always apply bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying adhesive.

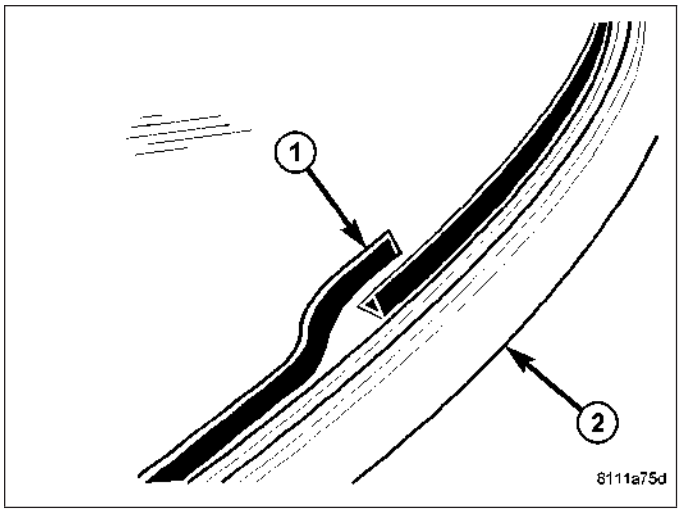


2. Bead dimensions should be approximately 9.5 - 12.0 mm wide (1) by 12.7 - 14.0 mm in height (2).



1 - ADHESIVE WIDTH 9.5 - 12.0 mm (0.375 - 0.470 in)
2 - ADHESIVE HEIGHT 12.7 - 14.0 mm (0.50 - 0.55 in)

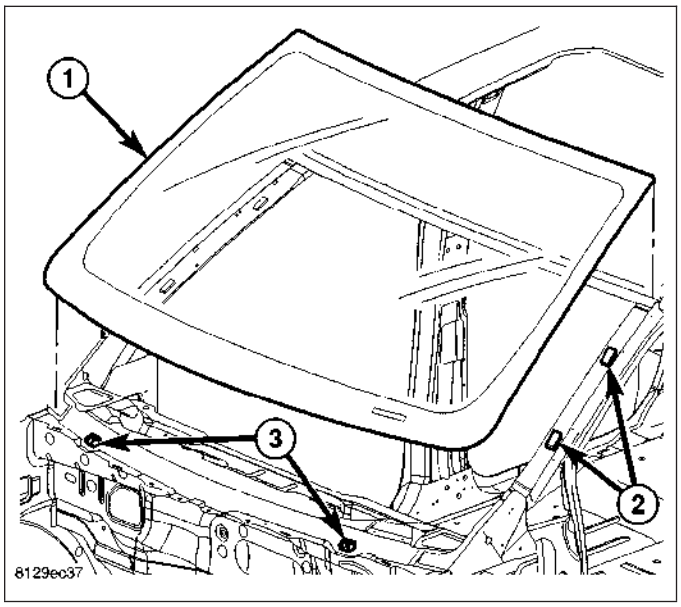
3. Allow end of adhesive bead to run out parallel to the start of the bead and smooth ends flush.



4. Lift windshield into place in the center of the windshield opening and use the tape as a guide to aid installation of the windshield into the center of the cutout.
5. Carefully lay down windshield and press on.

CAUTION: It is no longer possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.



6. Install cowl grille. (Refer to 23 - BODY/EXTERIOR/COWL GRILLE AND SCREEN - INSTALLATION)
7. Install rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)

GLASS-REAR DOOR

DESCRIPTION

The rear door quarter glass is seated within the rear glass run channel and glass run weatherstrip.

1. To remove the quarter glass, remove the rear glass run channel and remove the glass from the channel. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - REMOVAL)

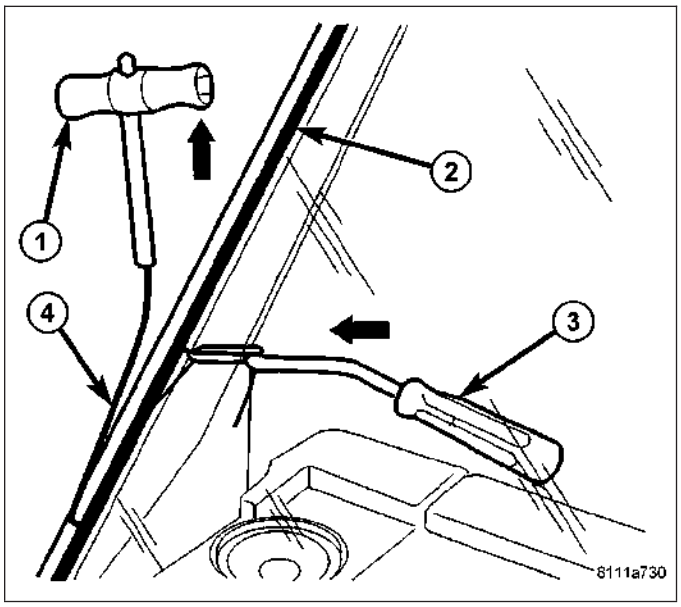
GLASS-QUARTER

REMOVAL

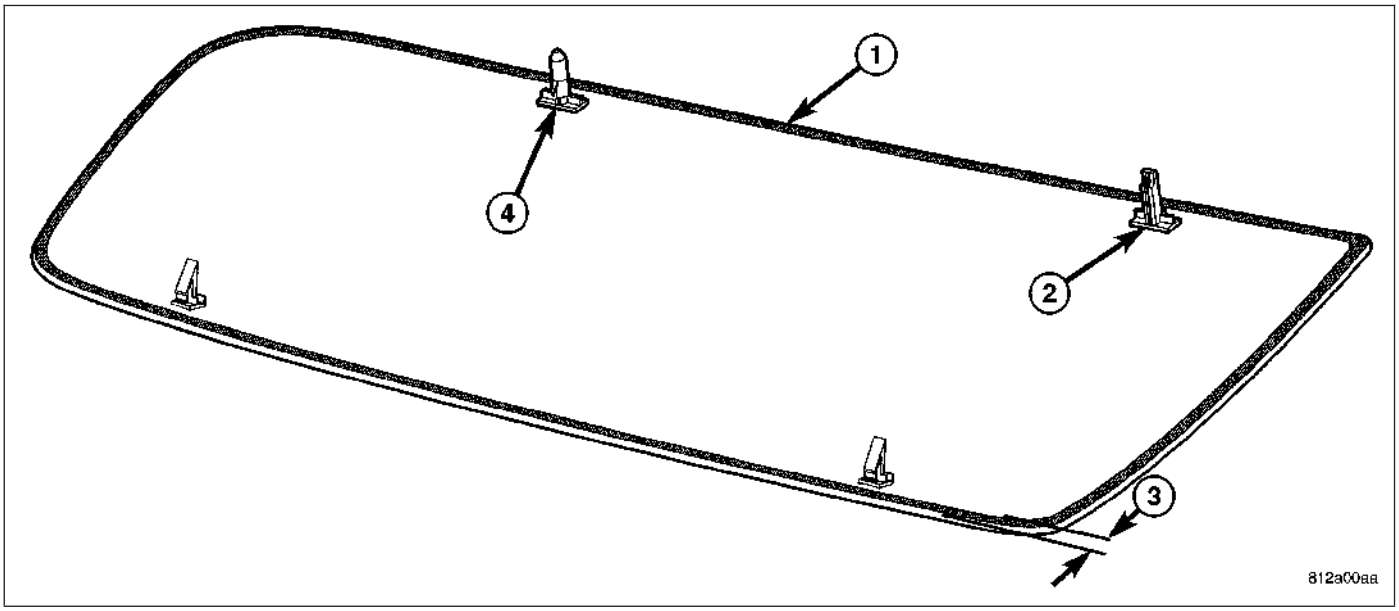
1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

NOTE: Windshield removal shown, quarter glass similar.

3. Using a windshield cut-out wire (4) or other suitable tool, separate the adhesive (2).



1 - T-HANDLE
2 - WINDSHIELD ADHESIVE
3 - COUNTER SUPPORT
4 - CUTTING WIRE



4. Release the tabs (2) and the tabs on the alignment pin (4) and carefully remove the quarter glass.

INSTALLATION

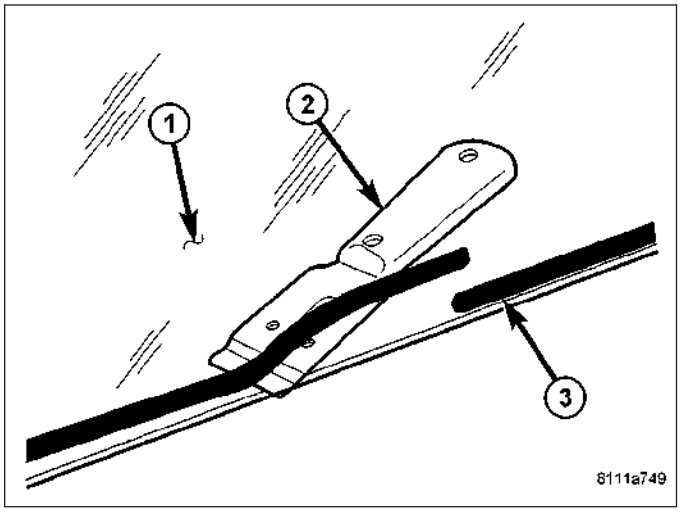
WARNING: ALLOW THE URETHANE AT LEAST 24 HOURS TO CURE BEFORE RETURNING THE VEHICLE TO USE.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The quarter glass fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

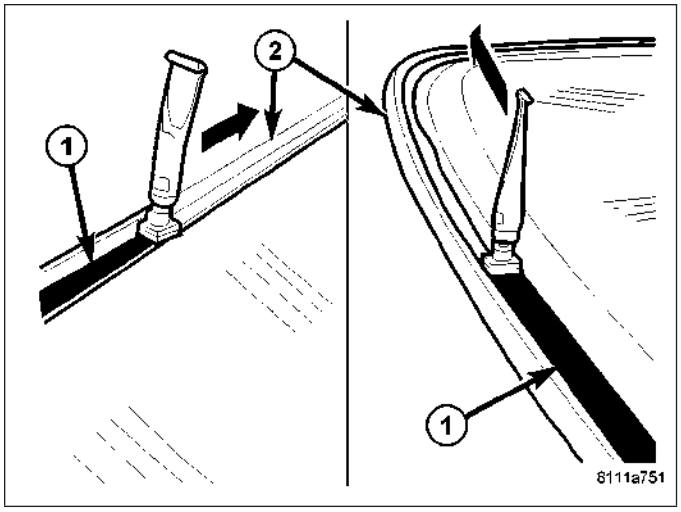
Glass Preparation - Installing A Previously Installed Quarter Glass

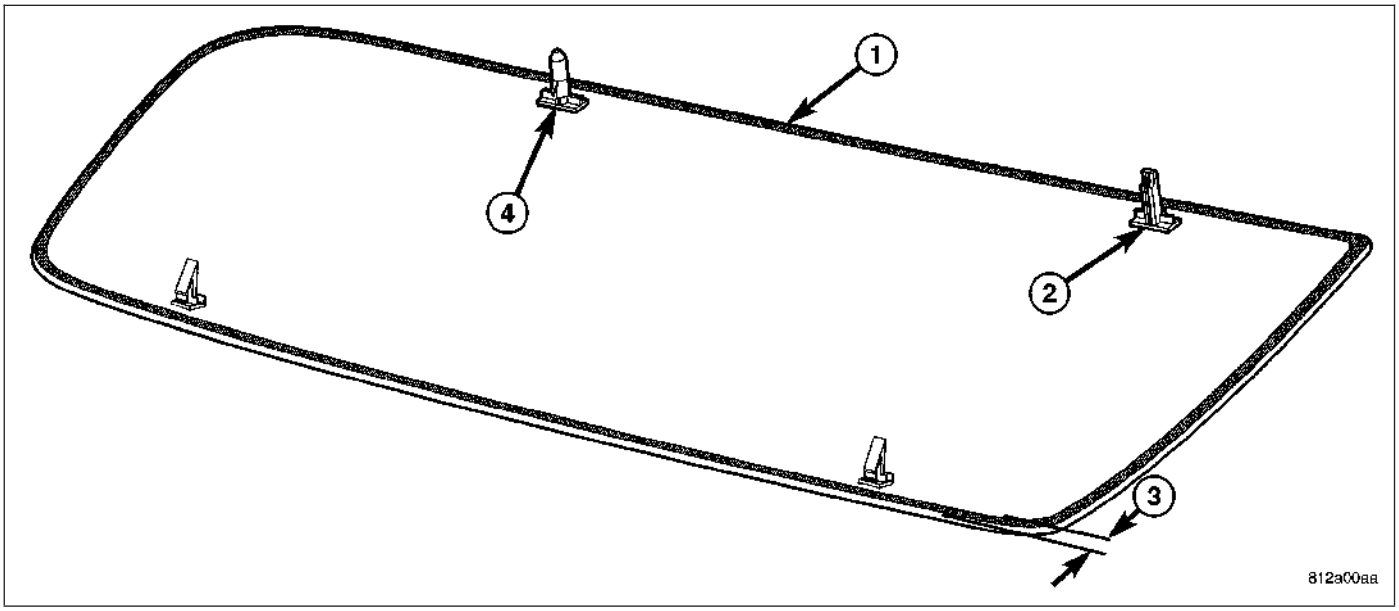
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Level old bead of quarter glass adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.



NOTE: Typical primer installation shown.

3. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
4. Using a flash light, verify that glass primer is without damage.
5. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.



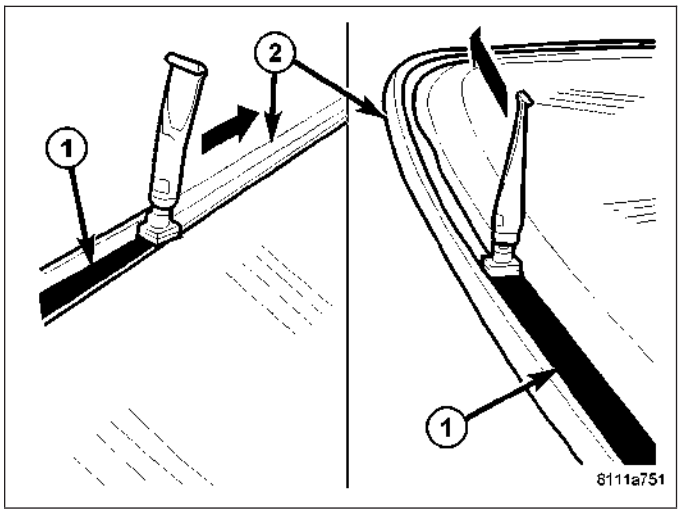


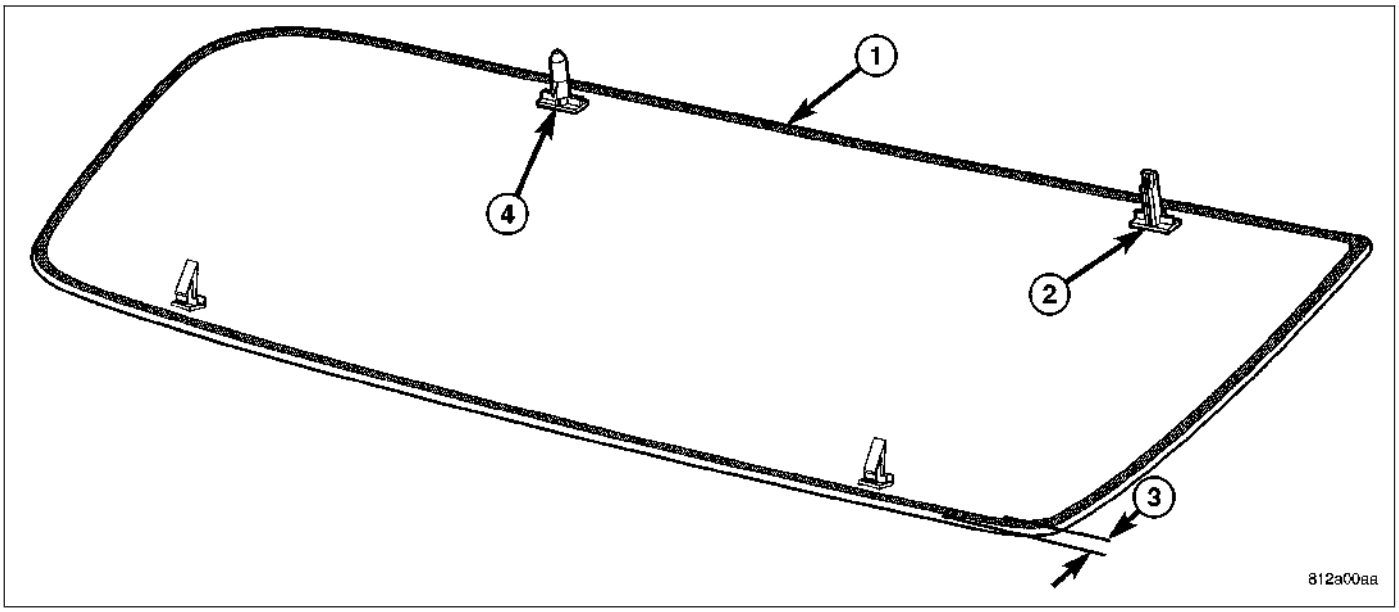
6. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (3).
7. Allow primer to air dry for at least 10 minutes.
8. Using a flash light, verify that glass primer is without damage.

Glass Preparation - Installing A New Quarter Glass

NOTE: Typical primer installation shown.

1. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
2. Apply primer to gluing surface at quarter glass seal.



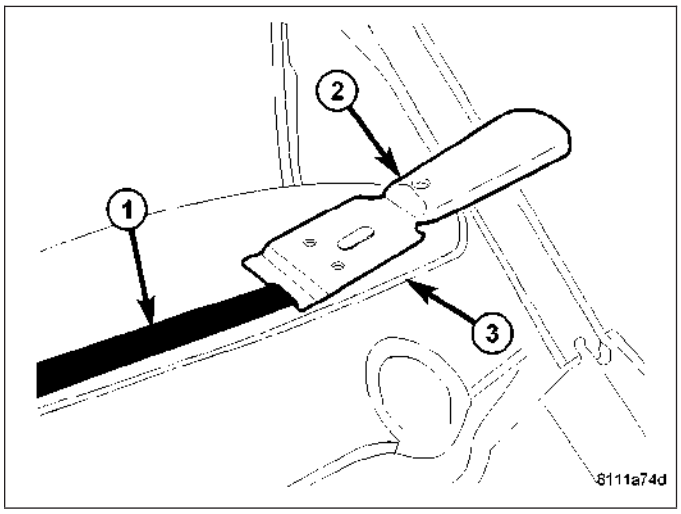


3. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (3).
4. Allow primer to air dry for at least 10 minutes.
5. Using a flash light, verify that glass primer is without damage.

Quarter Glass Opening Preparation

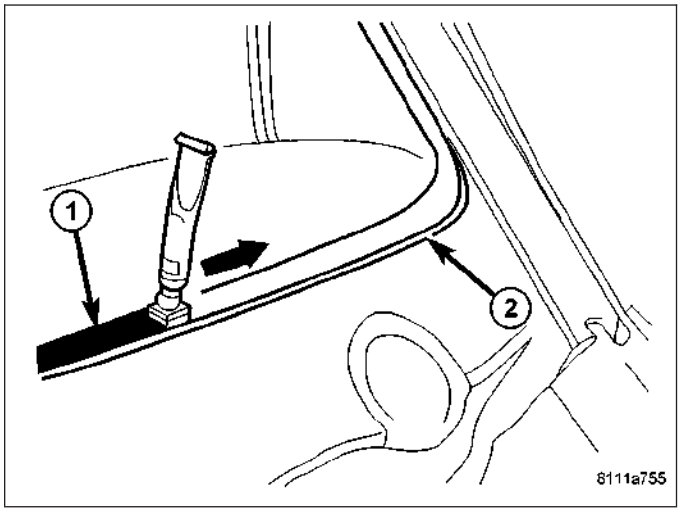
NOTE: Windshield opening shown, quarter glass opening similar.

1. Clean and vacuum quarter glass opening.
2. Level old bead of quarter glass opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.



NOTE: Windshield opening shown, quarter glass opening similar.

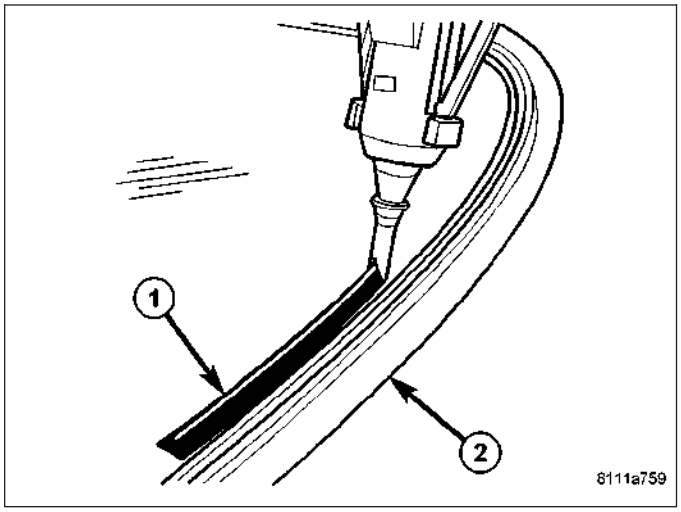
3. Clean and dry area of quarter glass opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
5. Allow primer to air dry for at least 10 minutes.



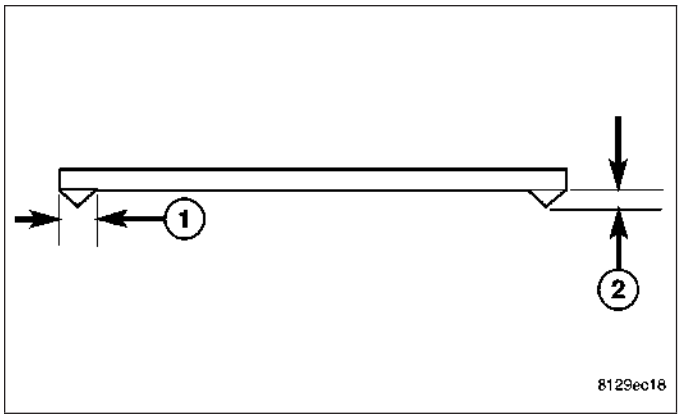
Quarter Glass Installation

1. Apply bead of adhesive (1) with a triangular nozzle directly to the quarter glass seal starting at bottom in center of the quarter glass.

CAUTION: Always apply bead of adhesive to the quarter glass. Always install the quarter glass within 5 minutes after applying adhesive.

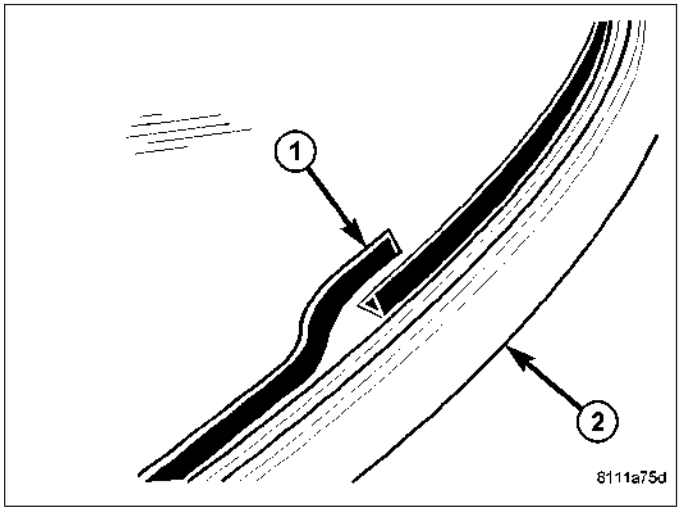


2. Bead dimensions should be approximately 9.5 mm wide (1) by 12.7 mm in height (2).



1 - ADHESIVE WIDTH 9.5 mm (0.375 in)
2 - ADHESIVE HEIGHT 12.7 mm (0.50 in)

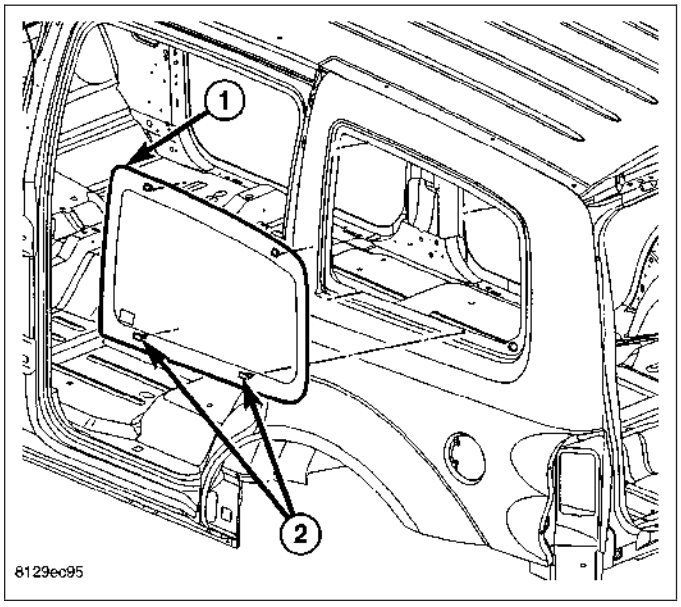
3. Allow end of adhesive bead (1) to run out parallel to the start of the bead and smooth ends flush.



4. Lift quarter glass into place in the center of the quarter glass opening and install over the alignment tabs and pin (2).
5. Carefully lay down the quarter glass and press on.

CAUTION: It is no longer possible to move the quarter glass after installation. The quarter glass should never be pressed into place by more than one person, because the quarter glass can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.



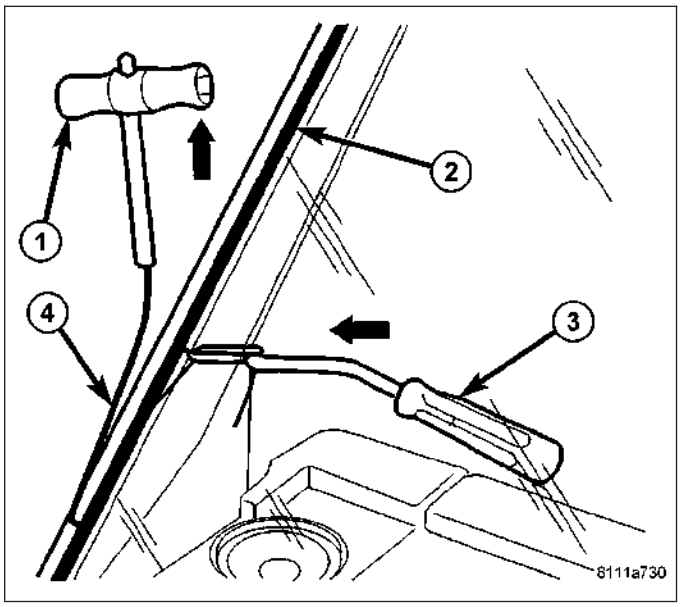
1. Install quarter panel trim. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)

GLASS-LIFTGATE

REMOVAL

NOTE: Windshield removal shown, backlite similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Remove liftgate trim panels. (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL)
3. Remove the center stop light. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/CENTER HIGH MOUNTED STOP LAMP - REMOVAL)
4. Remove rear window wiper arm, if equipped. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
5. Disconnect the heated backlite electrical connectors, if equipped.
6. Using a windshield cut-out wire or other suitable tool, separate the adhesive.
7. Carefully remove backlite.



1 - T-HANDLE
2 - WINDSHIELD ADHESIVE
3 - COUNTER SUPPORT
4 - CUTTING WIRE

INSTALLATION

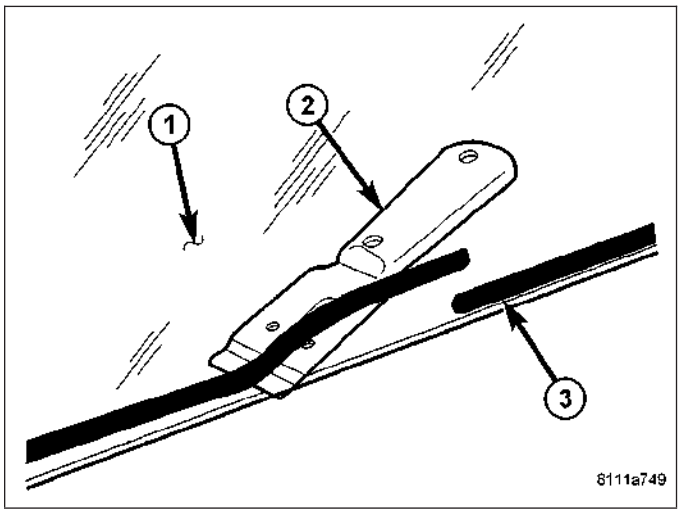
WARNING: ALLOW THE URETHANE AT LEAST 24 HOURS TO CURE BEFORE RETURNING THE VEHICLE TO USE.

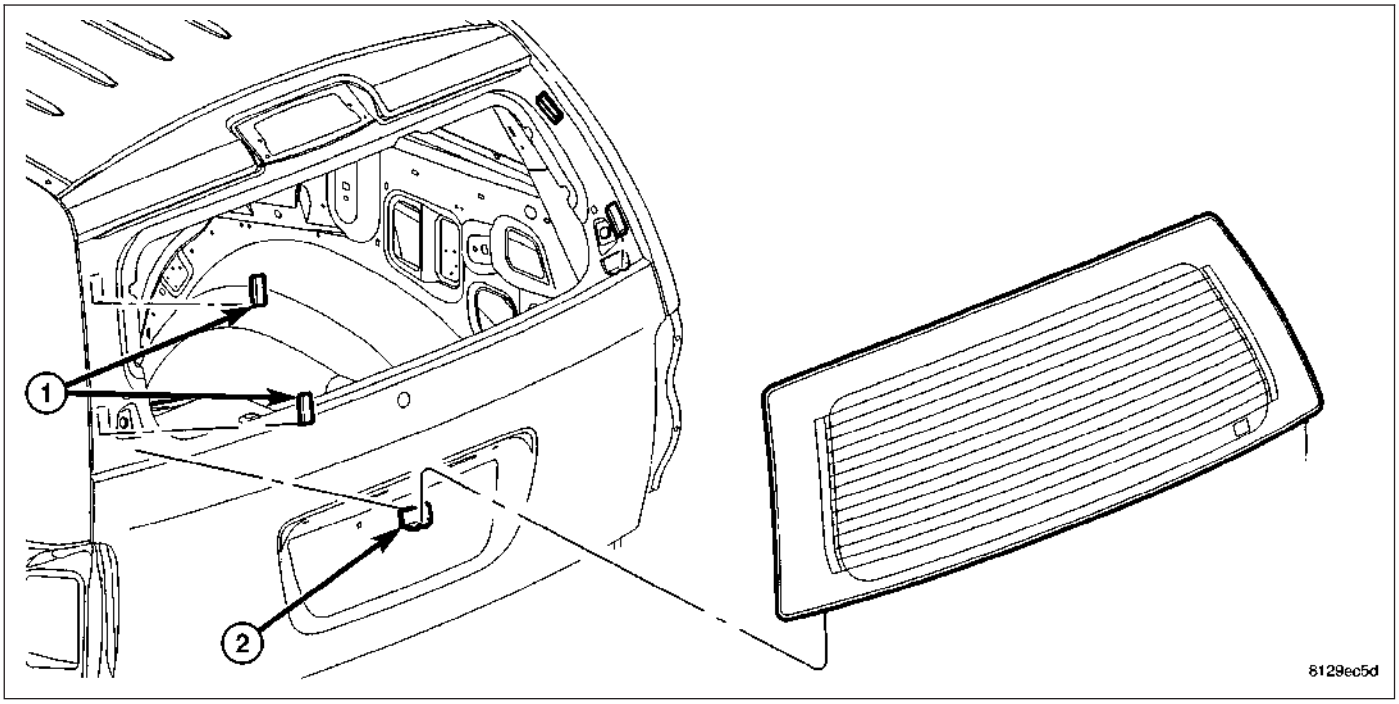
CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing backlite to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The backlite fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers should be replaced with new parts. Replace any missing or damaged spacers around the perimeter of the liftgate opening.

Glass Preparation - Installing A Previously Installed Backlite

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Level old bead of backlite adhesive (3) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.





3. Apply four new spacers (1) to the liftgate frame and place them 55 mm in from the window opening; 70 mm from the upper edge and 150 mm from the lower edge.
4. Install the lower spacers (2) to the backlite approximately 36 cm (1.0 in) from each side of the glass.

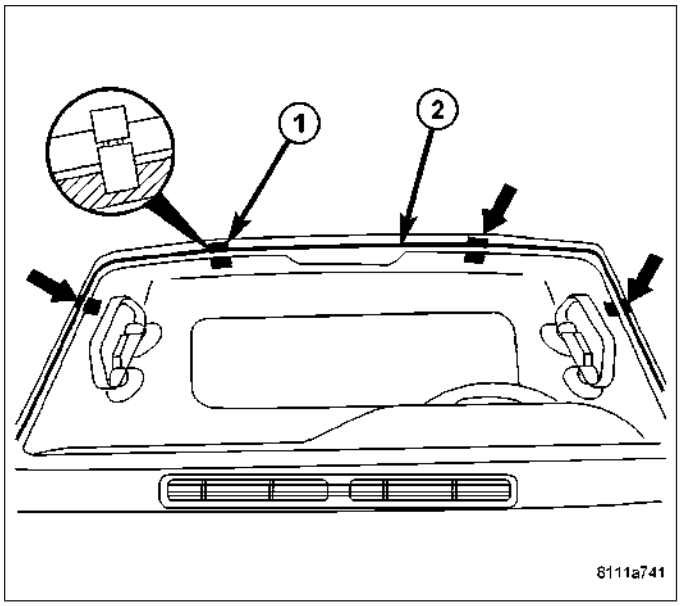
NOTE: Remove the lower spacers 2 hours after installation of the glass.

5. Position backlite in center of liftgate opening and resting on the side and lower spacers.

6. Apply adhesive tape strips (1) around the perimeter of the liftgate opening to aid in installation.

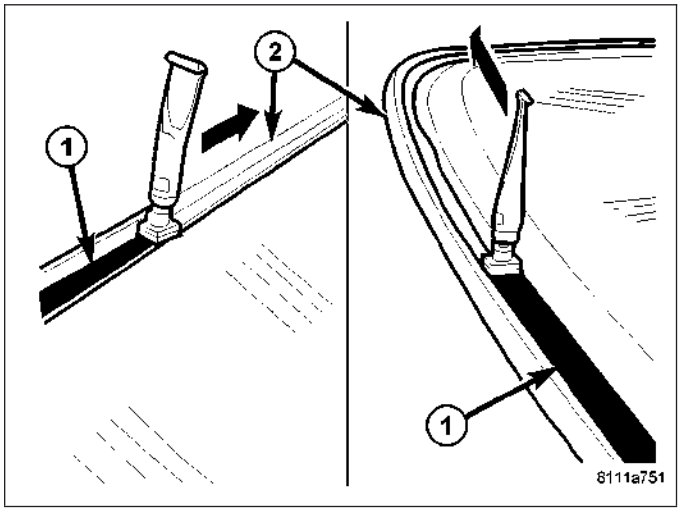
NOTE: Windshield installation shown, backlite similar.

7. Verify the backlite gap is parallel to with the liftgate opening.
8. Cut tape with a sharp knife and remove backlite.

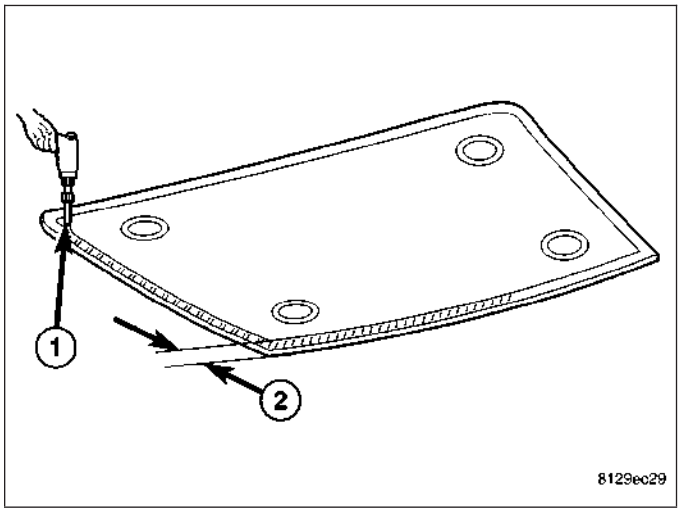


NOTE: Typical primer installation shown.

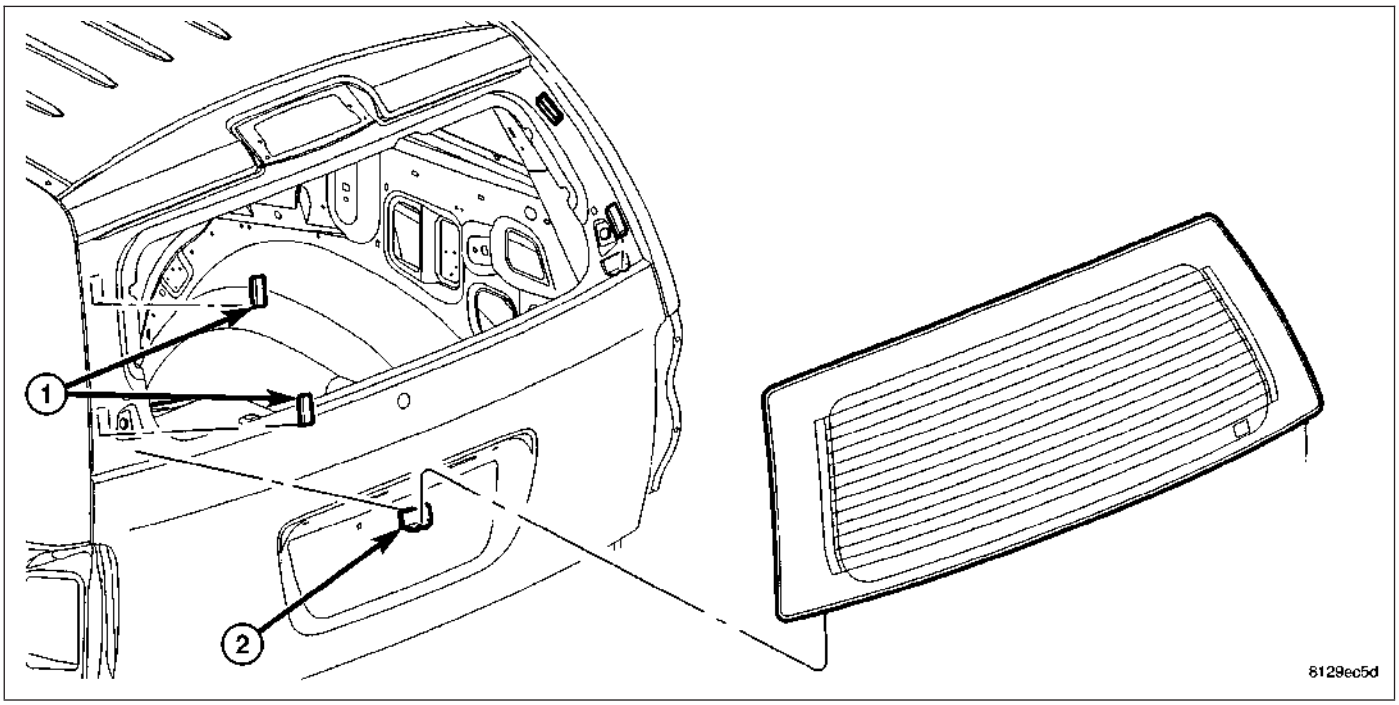
9. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
10. Using a flash light, verify that glass primer is without damage.
11. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.



12. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (2).
13. Allow primer to air dry for at least 10 minutes.
14. Using a flash light, verify that glass primer is without damage.



Glass Preparation - Installing A New Backlite



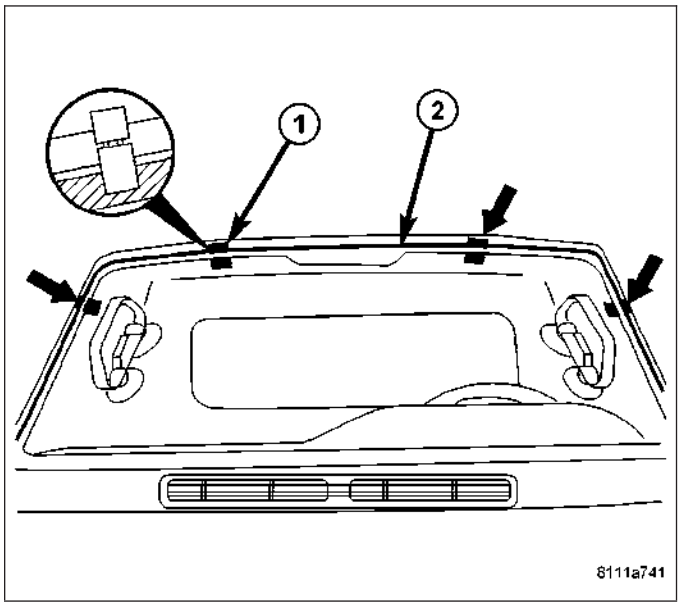
1. Apply four new spacers (1) to the liftgate frame and place them 55 mm in from the window opening; 70 mm from the upper edge and 150 mm from the lower edge.
2. Install the lower spacers (2) to the backlite approximately 36 cm (1.0 in) from each side of the glass.

NOTE: Remove the lower spacers 2 hours after installation of the glass.

3. Position backlite in center of liftgate opening and resting on the side and lower spacers.
4. Apply adhesive tape strips (1) around the perimeter of the liftgate opening to aid in installation.

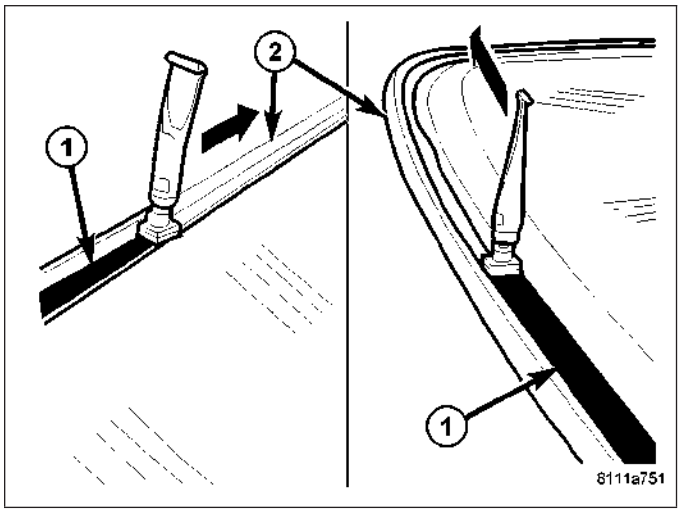
NOTE: Windshield installation shown, backlite similar.

5. Verify the backlite gap is parallel to with the liftgate opening.
6. Cut tape with a sharp knife and remove backlite.

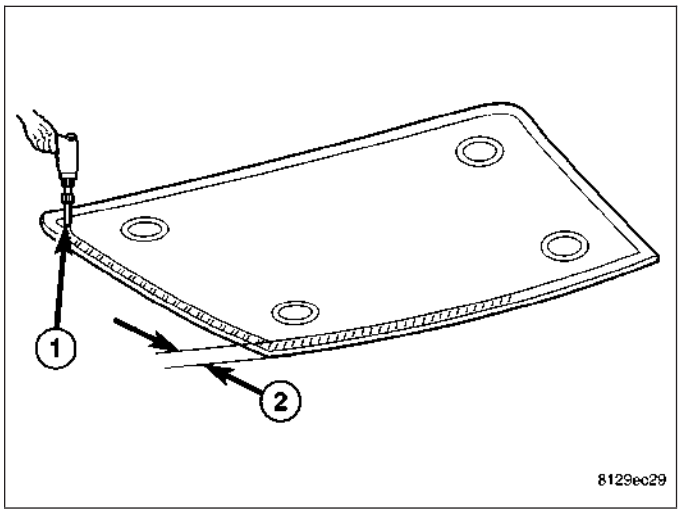


NOTE: Typical primer installation shown.

7. Clean and dry area of glass (2) to be re-glued with a suitable glass preparation solvent and rag.
8. Apply primer to gluing surface at backlite seal.



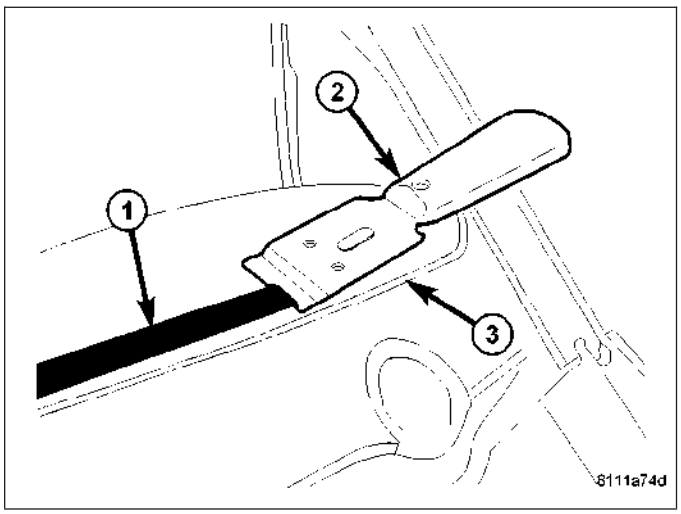
9. Apply primer (1) around the perimeter of the glass to a width of 15 mm (0.5 in.) (2).
10. Allow primer to air dry for at least 10 minutes.
11. Using a flash light, verify that glass primer is without damage.



Liftgate Opening Preparation

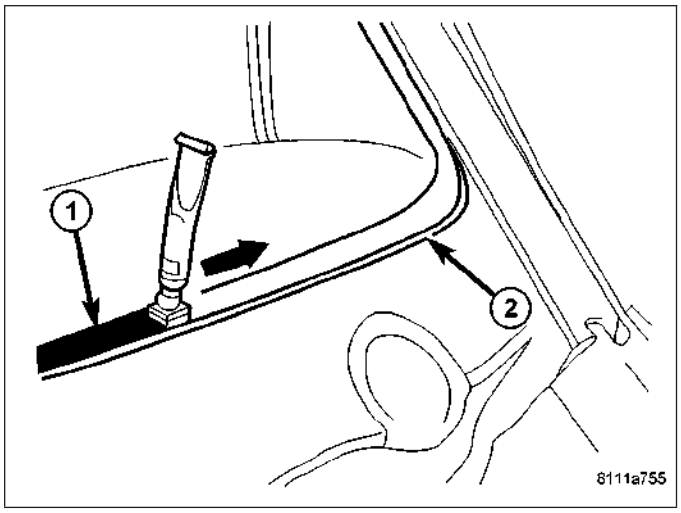
NOTE: Windshield opening shown, liftgate opening similar.

1. Clean and vacuum liftgate opening.
2. Level old bead of liftgate opening adhesive (1) to a thickness of approximately 1 mm (0.04 in.) and remove loose adhesive.



NOTE: Windshield opening shown, liftgate opening similar.

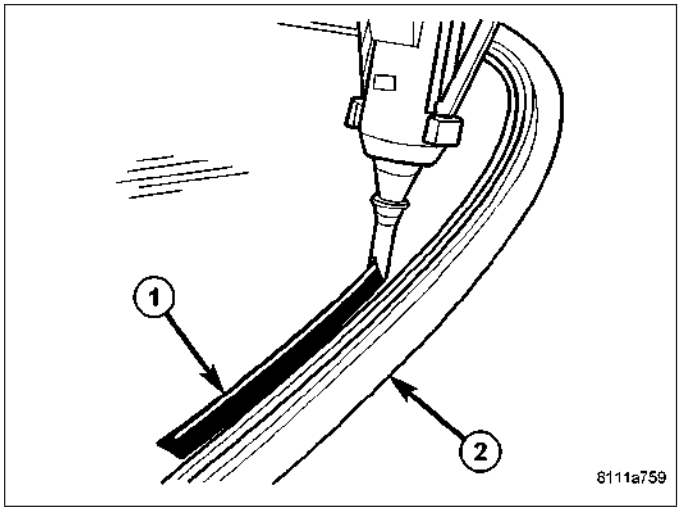
3. Clean and dry area of liftgate opening to be re-glued with a suitable glass preparation solvent and rag.
4. Re-prime any damaged area. If old adhesive has been exposed for more than 12 hours, entire adhesive area needs to be re-primed.
5. Allow primer to air dry for at least 10 minutes.



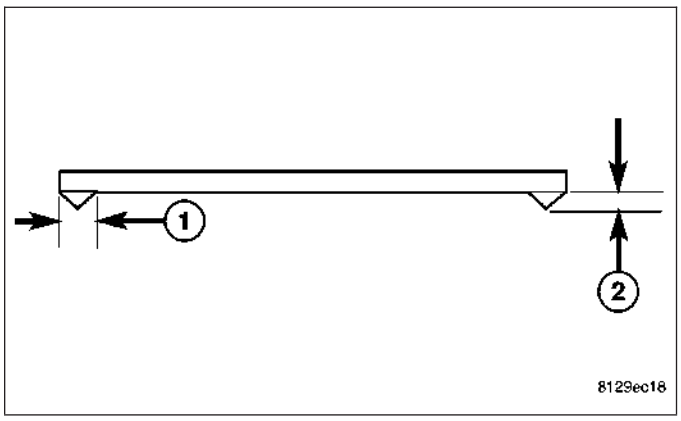
Backlite Installation

1. Apply bead of adhesive (1) with a triangular nozzle directly to the backlite seal starting at bottom in center of the backlite.

CAUTION: Always apply bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying adhesive.

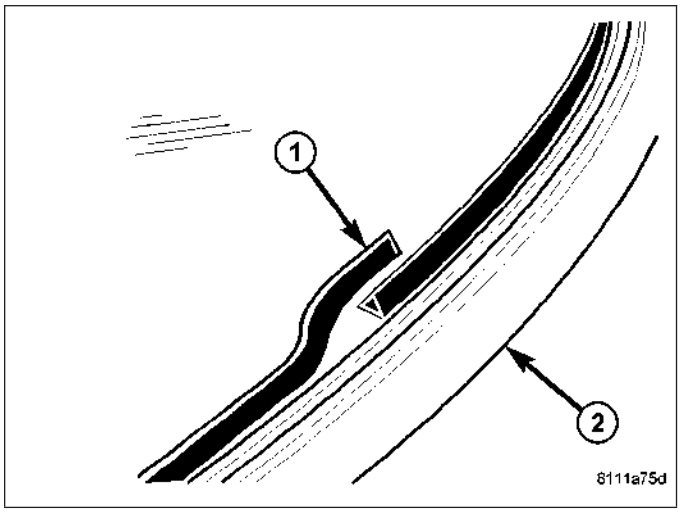


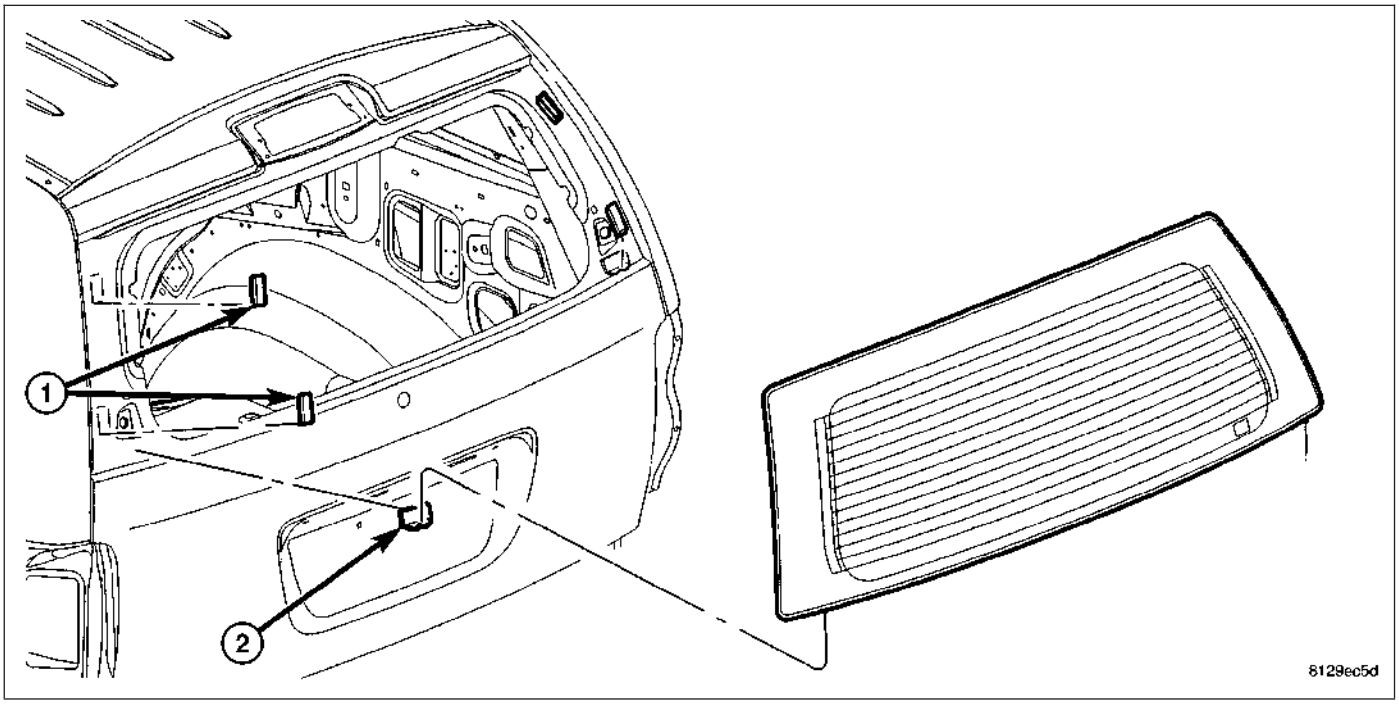
2. Bead dimensions should be approximately 9.5 mm wide (1) by 12.7 mm in height (2).



1 - ADHESIVE WIDTH 9.5 mm (0.375 in)
2 - ADHESIVE HEIGHT 12.7 mm (0.50 in)

3. Allow end of adhesive bead (1) to run out parallel to the start of the bead and smooth ends flush.





4. Lift backlite into place in the center of the liftgate opening and use the tape as a guide to aid installation of the backlite into the center of the cutout.
5. Carefully lay down the backlite and press on.

CAUTION: It is no longer possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing backlite to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

6. Install the rear wiper arm, if equipped. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION)
7. Install the liftgate trim panels.
8. Install the center stop light. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/CENTER HIGH MOUNTED STOP LAMP UN - INSTALLATION)

SUNROOF

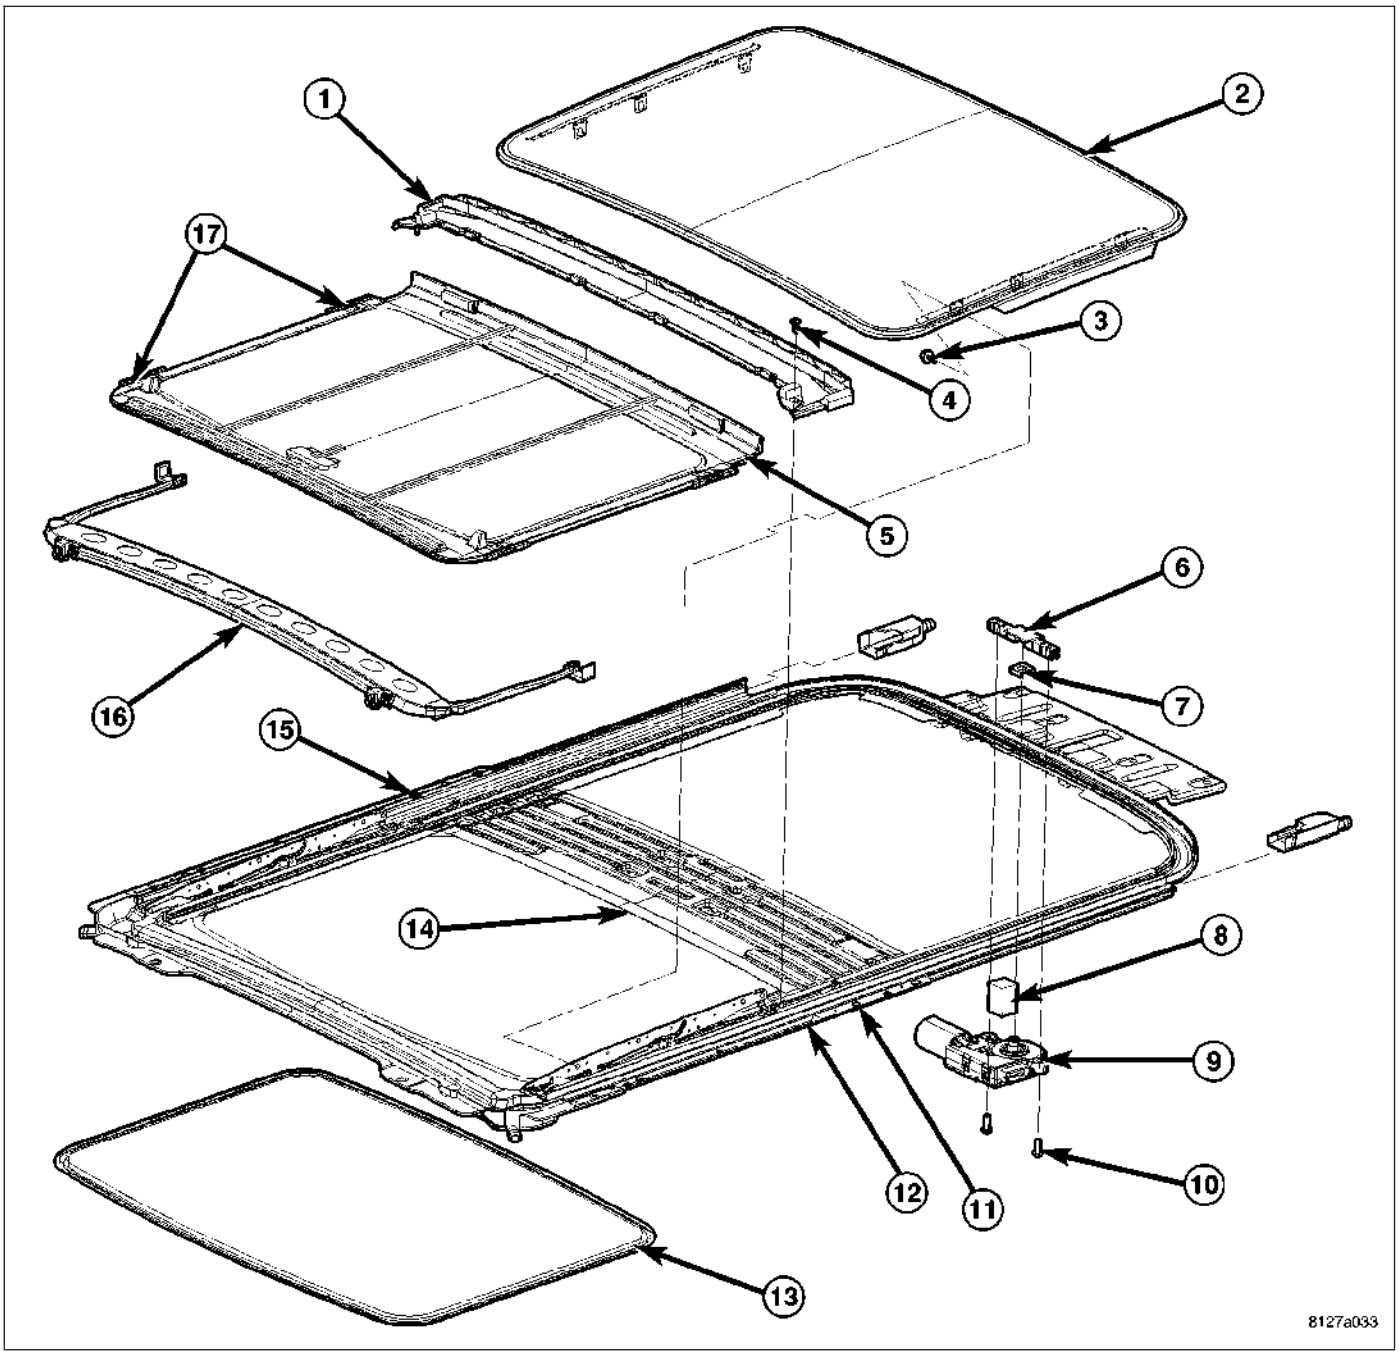
DESCRIPTION



SUN ROOF ASSEMBLY

1 - WATER CHANNEL
2 - GLASS ASSEMBLY
3 - SCREWS (3 PER SIDE) 3.5 N·m (31 in. lbs.)
4 - SCREWS (2)
5 - SUN SHADE
6 - MOTOR COVER
7 - MOTOR CLIP
8 - INSULATOR
9 - MOTOR
10 - SCREWS (2) 4 N·m (40 in. lbs.)
11 - LEFT SIDE ALIGNMENT HOLE
12 - SUNROOF ASSEMBLY FRAME
13 - OPENING TRIM LACE
14 - TRIM LACE BUT JOINT NOTCH
15 - RIGHT SIDE ALIGNMENT SLOT
16 - WIND DEFLECTOR
17 - SPRING FEET CLIPS

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sun roof features consists of:

- Sun roof glass
- Sun roof sun shade

The sunroof power sliding glass panel and sunshade can be positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from a switch located in the overhead console. To operate the sunroof the ignition switch must be in the Accessory or On/Run position. The open/close switch is a rocker style design that open or close the sunroof; the vent switch is a push-button design. The 'express-open' function of the motor is triggered by a single quick press-and-release of the 'open' button. This causes the glass panel to retract to the comfort-open position. The wind deflector will deploy as the glass panel retracts. Quickly pressing and releasing the 'open' button. a second time will cause the glass panel to retract fully under the roof. The operator can control the position of the glass panel by pressing and holding the open button until the glass panel has reached the desired position. Neither the close nor vent buttons have 'express' functionary. These buttons must be held until the glass panel has reached the desired position. The sunroof will also operate for up to fifteen minutes after the ignition key is turned off for customer comfort and convenience while parking.

DIAGNOSIS AND TESTING

SUNROOF

Refer to SUNROOF DIAGNOSIS CHART for possible causes. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

Every time the sunroof module loses power it must be initialized. To initialize the motor, connect power to the sunroof and press the close-button until the glass panel has reached the full-close position. There will be a slight “kick” of the glass panel when initialization occurs if the glass panel starts in the full-close position. The “kick” is accompanied by a soft tick noise. This is the indication that the sunroof module is initialized

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof module, control switch, and body harness. Faulty power circuit between sunroof module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.

SYMPTOM	POSSIBLE CAUSE
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Glass panel compression to the roof opening not consistent. Wind deflector not deploying properly. Glass not installed or adjusted properly. Faulty glass panel seal.
Buzz, Squeak, Rattles from sunroof	Loose or broken attaching hardware. No lubrication in track. Worn or broken mechanism. Cables bunched or kinked
Sunshade will not function or does not operate smoothly	Sunshade feet are missing, broken or loose. Track obstructions or interference.
Glass movement not consistent or glass does not operate smoothly	Glass and Track timing. Glass and Track alignment Cables and Guide alignment

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal the opening with a snug but not perfectly water tight fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled around the opening with the glass panel in the closed position. This check can only be complete when both the glass seal and the roof are dry. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

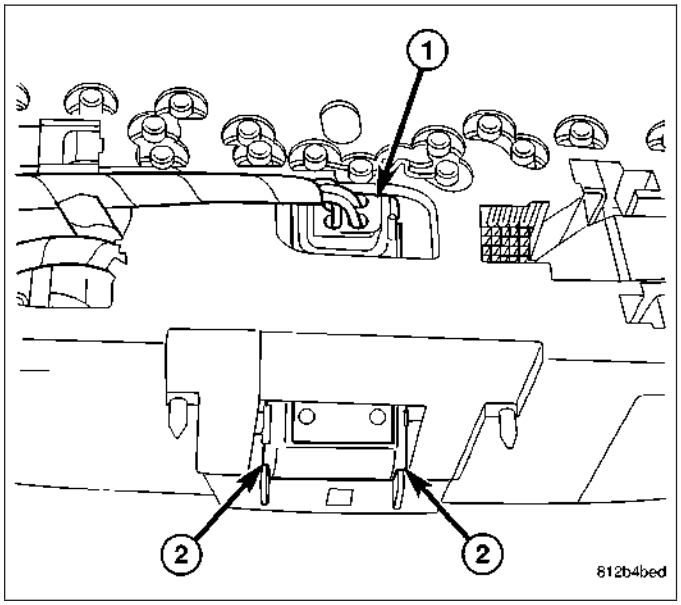
NOTE: Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Repair as necessary.

SWITCH-SUNROOF

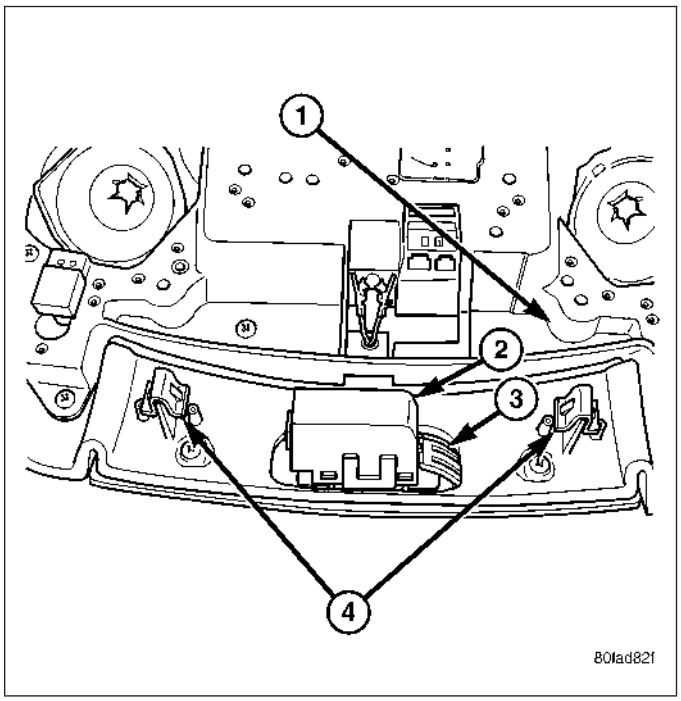
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Separate the overhead console from the headliner, by carefully pulling down on the front portion, toward the windshield, to release the retaining clips.
3. Release the sunroof switch retaining tab (2), disconnect the electrical connector (1) and remove the switch from the console.



INSTALLATION

1. Position the switch (2) against the overhead console (1) and push the switch to seat properly in retaining clip (3).
2. Install the overhead console and seat the retaining clips (4) fully.
3. Connect the negative battery cable.

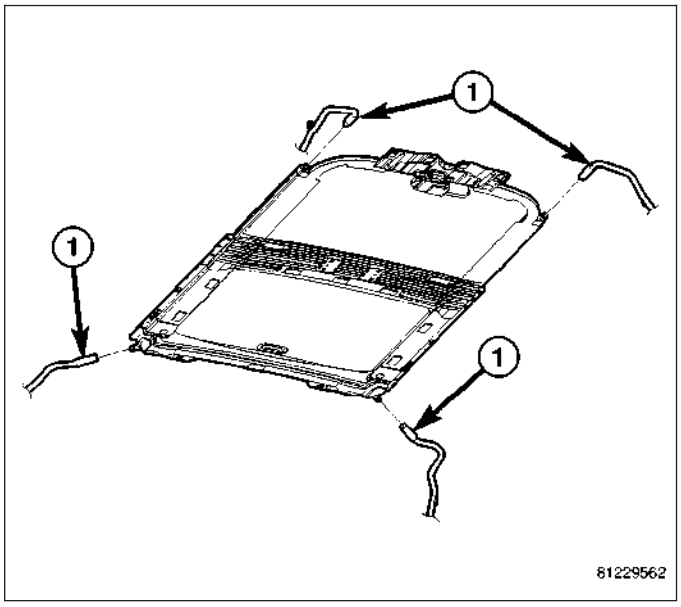


HOSE-DRAIN

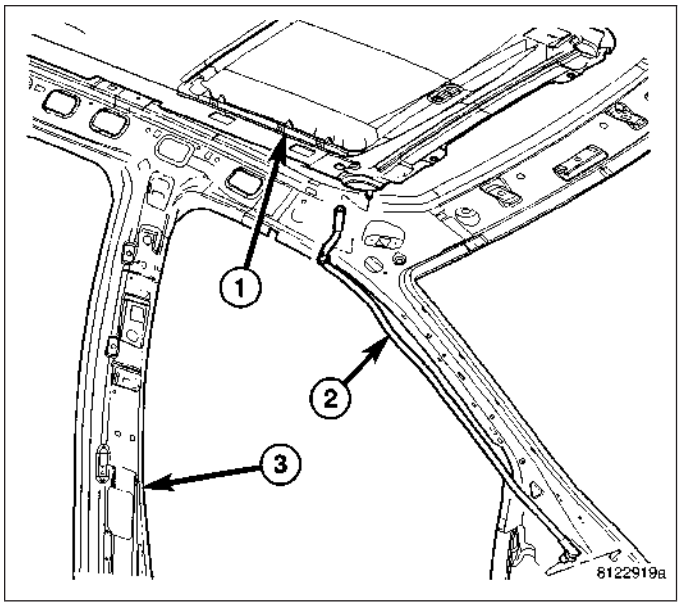
REMOVAL

FRONT HOSES

1. Move glass panel to the fully closed position.
2. Disconnect negative battery cable.
3. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
4. Disconnect the drain hose from the sunroof housing (1).
5. Drain any liquid from hose connection.

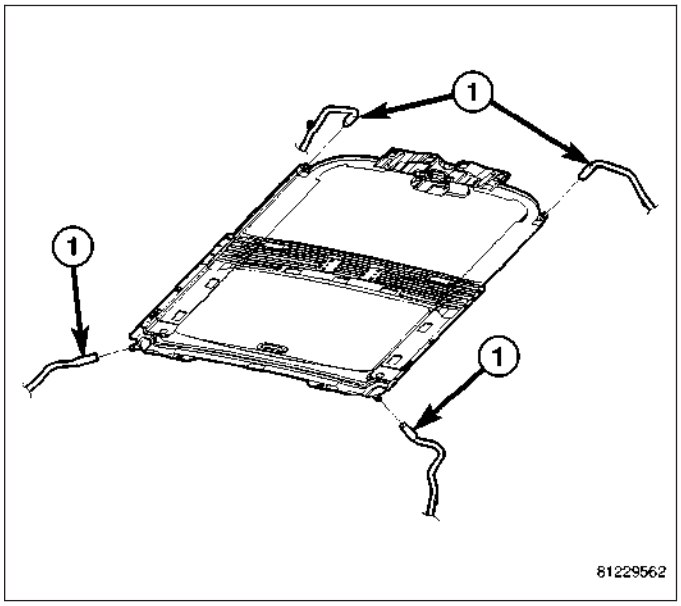


6. Remove tube (2), as necessary.

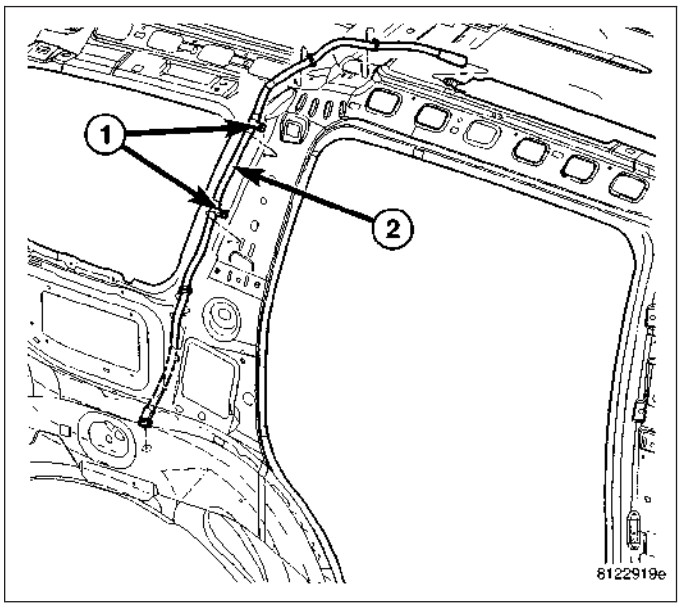


REAR HOUSING HOSE

1. Move glass panel to the fully closed position.
2. Disconnect negative battery cable.
3. Remove headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - REMOVAL).
4. Disconnect the drain hose from the sunroof housing (1).
5. Drain any liquid from hose connection, if necessary.



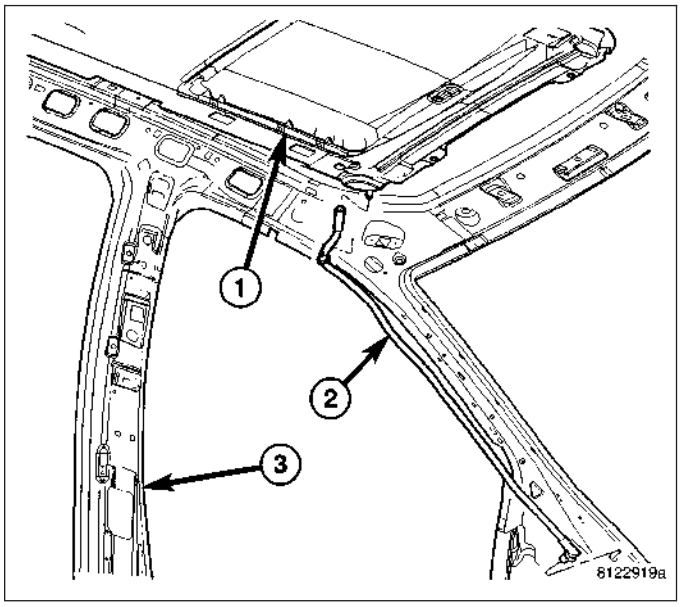
6. Release the push pin fasteners (1) and remove the tube (2).



INSTALLATION

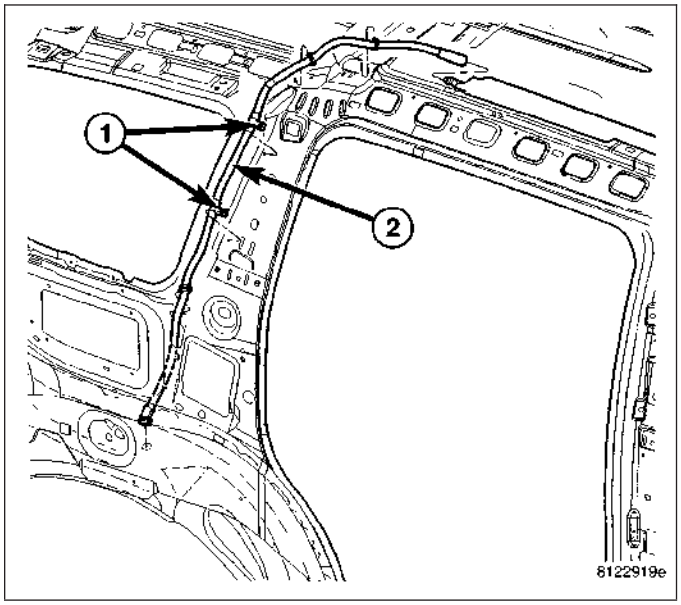
FRONT HOSES

1. Connect the new drain hose (2) to the sunroof housing (1) and test drainage.
2. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).
3. Verify sunroof operation and alignment.

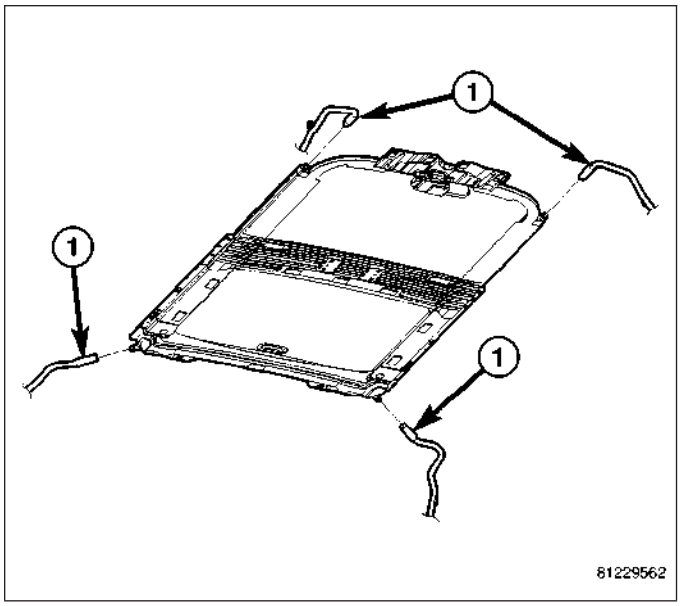


REAR HOUSING HOSE

1. Install the rear hose (2) and seat the push pin fasteners (1) fully.



2. Connect the new drain hose (1) to the sunroof housing and test drainage.
3. Install the quarter trim panels. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
4. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).
5. Connect the control switch wire connector and install control switch.
6. Verify sunroof operation and alignment.

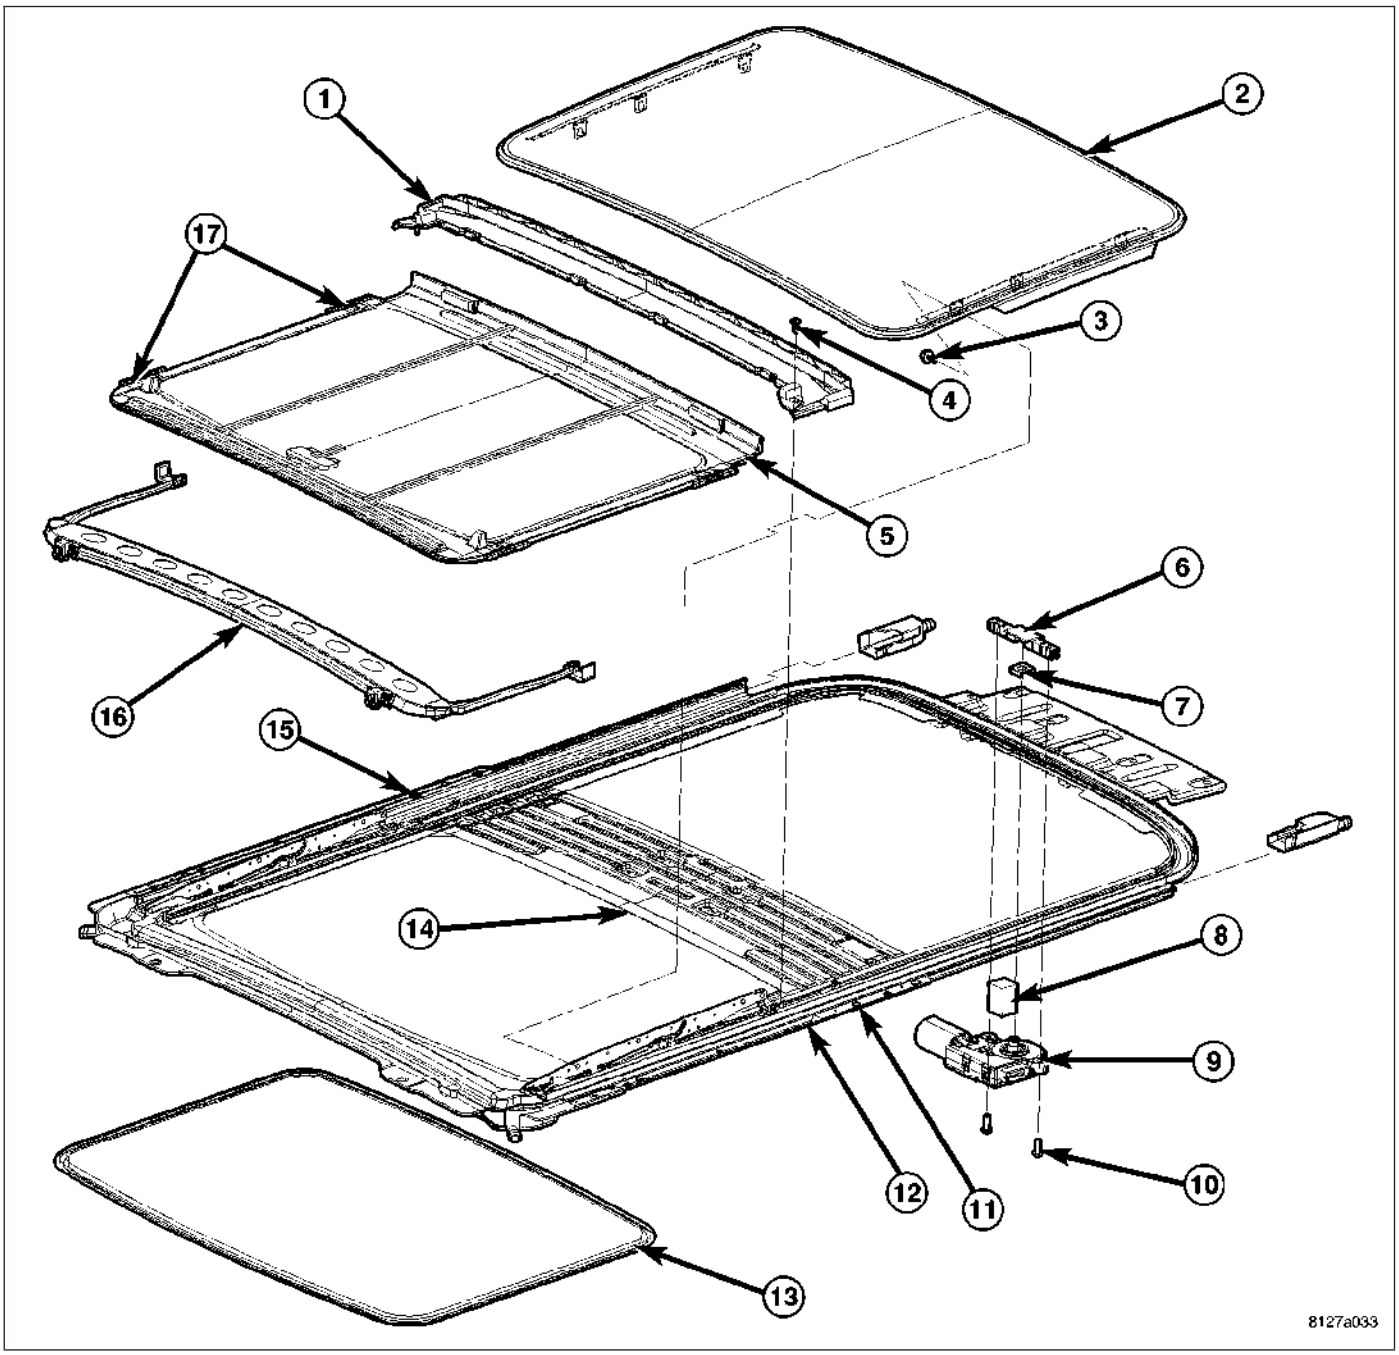


MOTOR

STANDARD PROCEDURE - INITIALIZATION

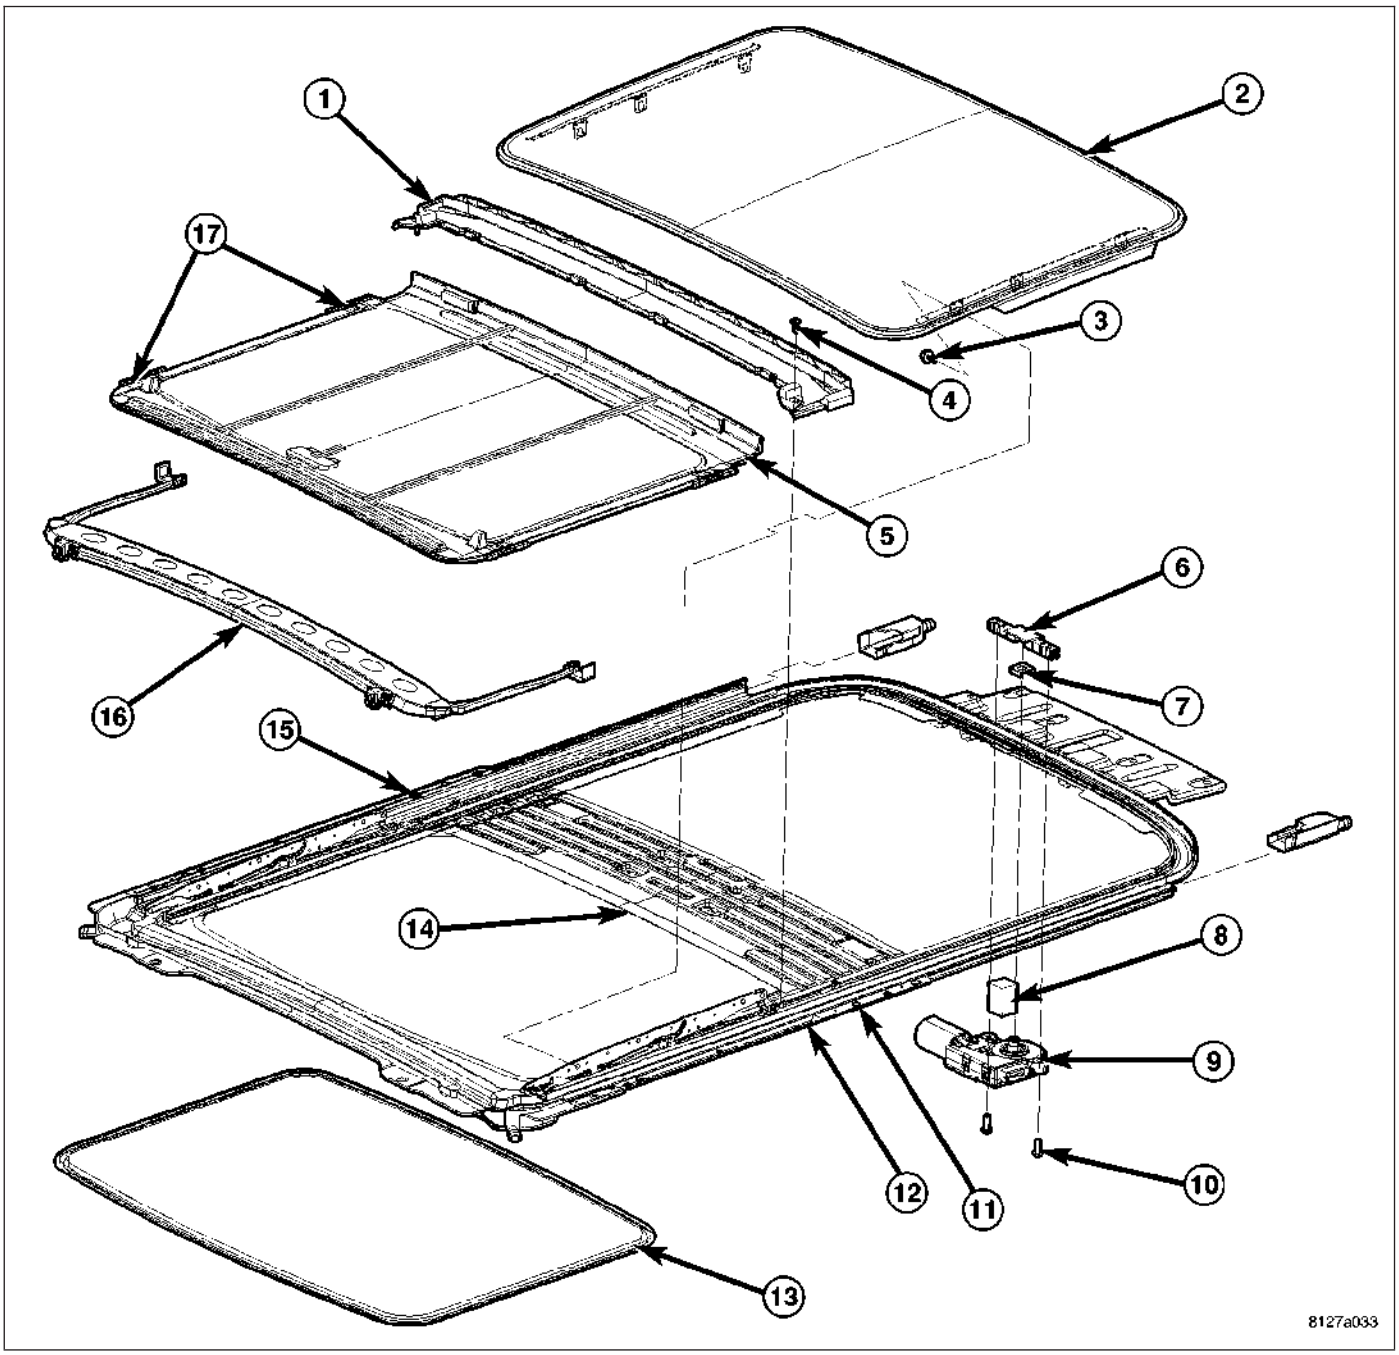
1. To initialize the motor, connect power to the sunroof.
2. Press the close-button until the glass panel has reached the full closed position.There will be a slight “kick” of the glass panel when initialization occurs if the glass panel starts in the full closed position.The “kick” is accompanied by a soft tick noise.

REMOVAL



1. Remove the sunroof (Refer to 23 - BODY/SUNROOF/MODULE ASSEMBLY - REMOVAL).
2. Remove the sunroof motor retaining screws (10) and remove motor (9).

INSTALLATION



CAUTION: THE SUNROOF MOTOR MUST BE TIMED WITH THE SUNROOF ASSEMBLY. FAILURE TO DO SO WILL RESULT IN IMPROPER SUNROOF OPERATION AND POSSIBLE LEAKAGE OR DAMAGE TO THE ASSEMBLY.

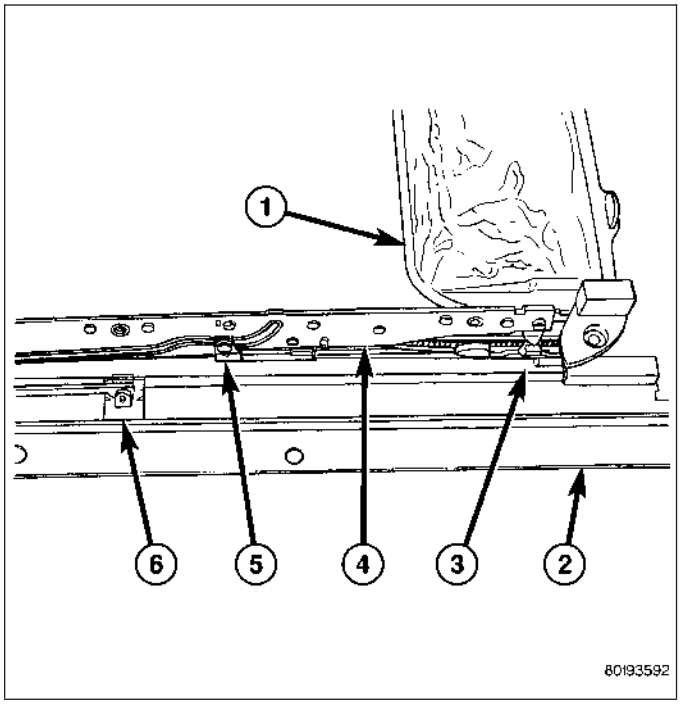
1. Assure proper sunroof motor timing before installation (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - ADJUSTMENTS).
2. Position the sunroof motor (9) to the sunroof assembly, install the retaining screws (10) and tighten to 4 N·m (40 in. lbs.).
3. Connect the timed sunroof assembly to a power source and initialize. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - INITIALIZATION)
4. Assure proper operation before installing the sunroof assembly into the vehicle.

ADJUSTMENTS

ADJUSTMENT

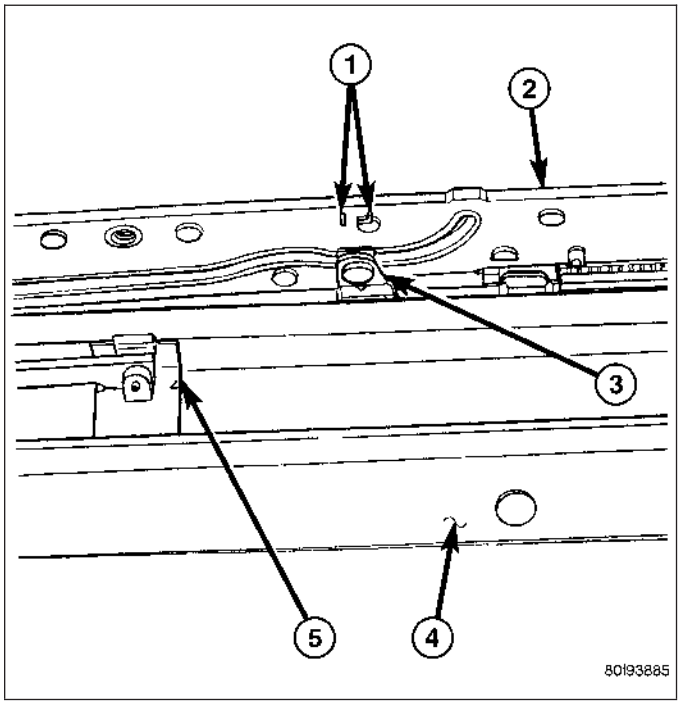
CAUTION: There is no adjustment available for a normally operating sunroof. This procedure is used to set sunroof motor to sunroof assembly timing before the motor is installed in the assembly.

1. Manually push the sunroof guide assembly (4) to the full forward position until it is locked into position. This is verified by attempting to push the guide assembly rearward.

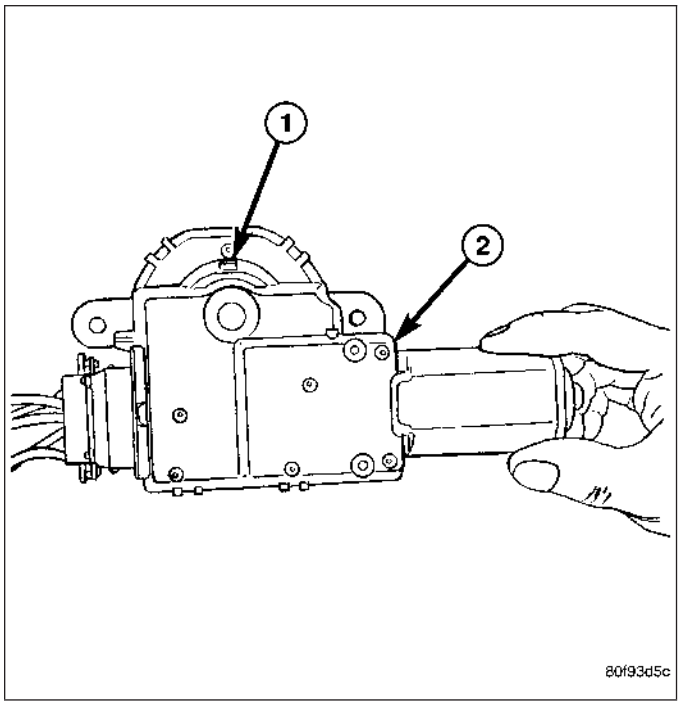


NOTE: The guide rail (2) will be raised above the U-frame assembly (4) when in the lock position.

2. Remove the sunroof glass (Refer to 23 - BODY/ SUNROOF/GLASS PANEL - REMOVAL).
3. Manually move the guide pivot (3) inside the guide cam slot until it is centered between the etched timing marks (1) on both rails on both the left hand and right hand side rails.

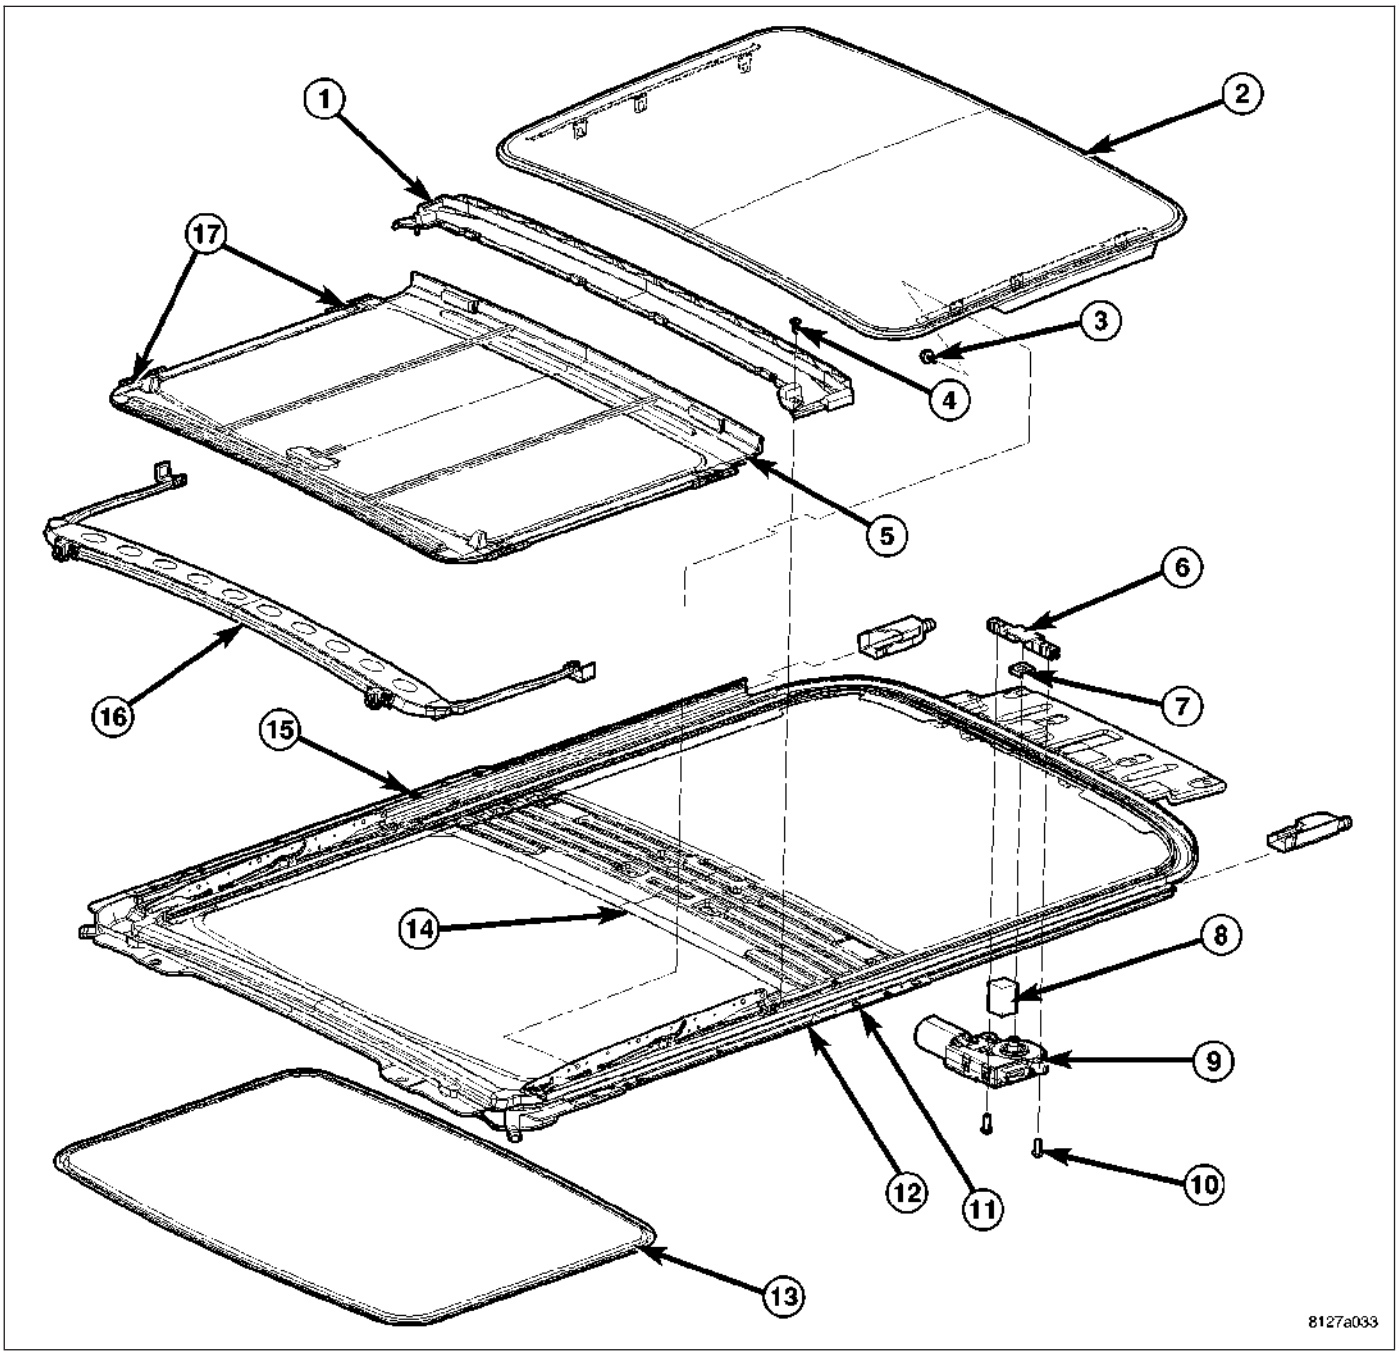


4. Verify that the white marking is visible in the new motor window (1). If the mark is not visible, connect a power source to the motor and cycle the 'close' button until the motor is in the closed position (indicated by the white mark in the window).
5. Install the sunroof motor and verify proper sunroof operation (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - INSTALLATION).
6. Install the sunroof glass, leaving the retaining bolts loose.
7. Install the sunroof assembly into the vehicle (Refer to 23 - BODY/SUNROOF/MODULE ASSEMBLY - INSTALLATION).
8. Flush the sunroof glass into the vehicle roof opening and check sunroof glass alignment (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).



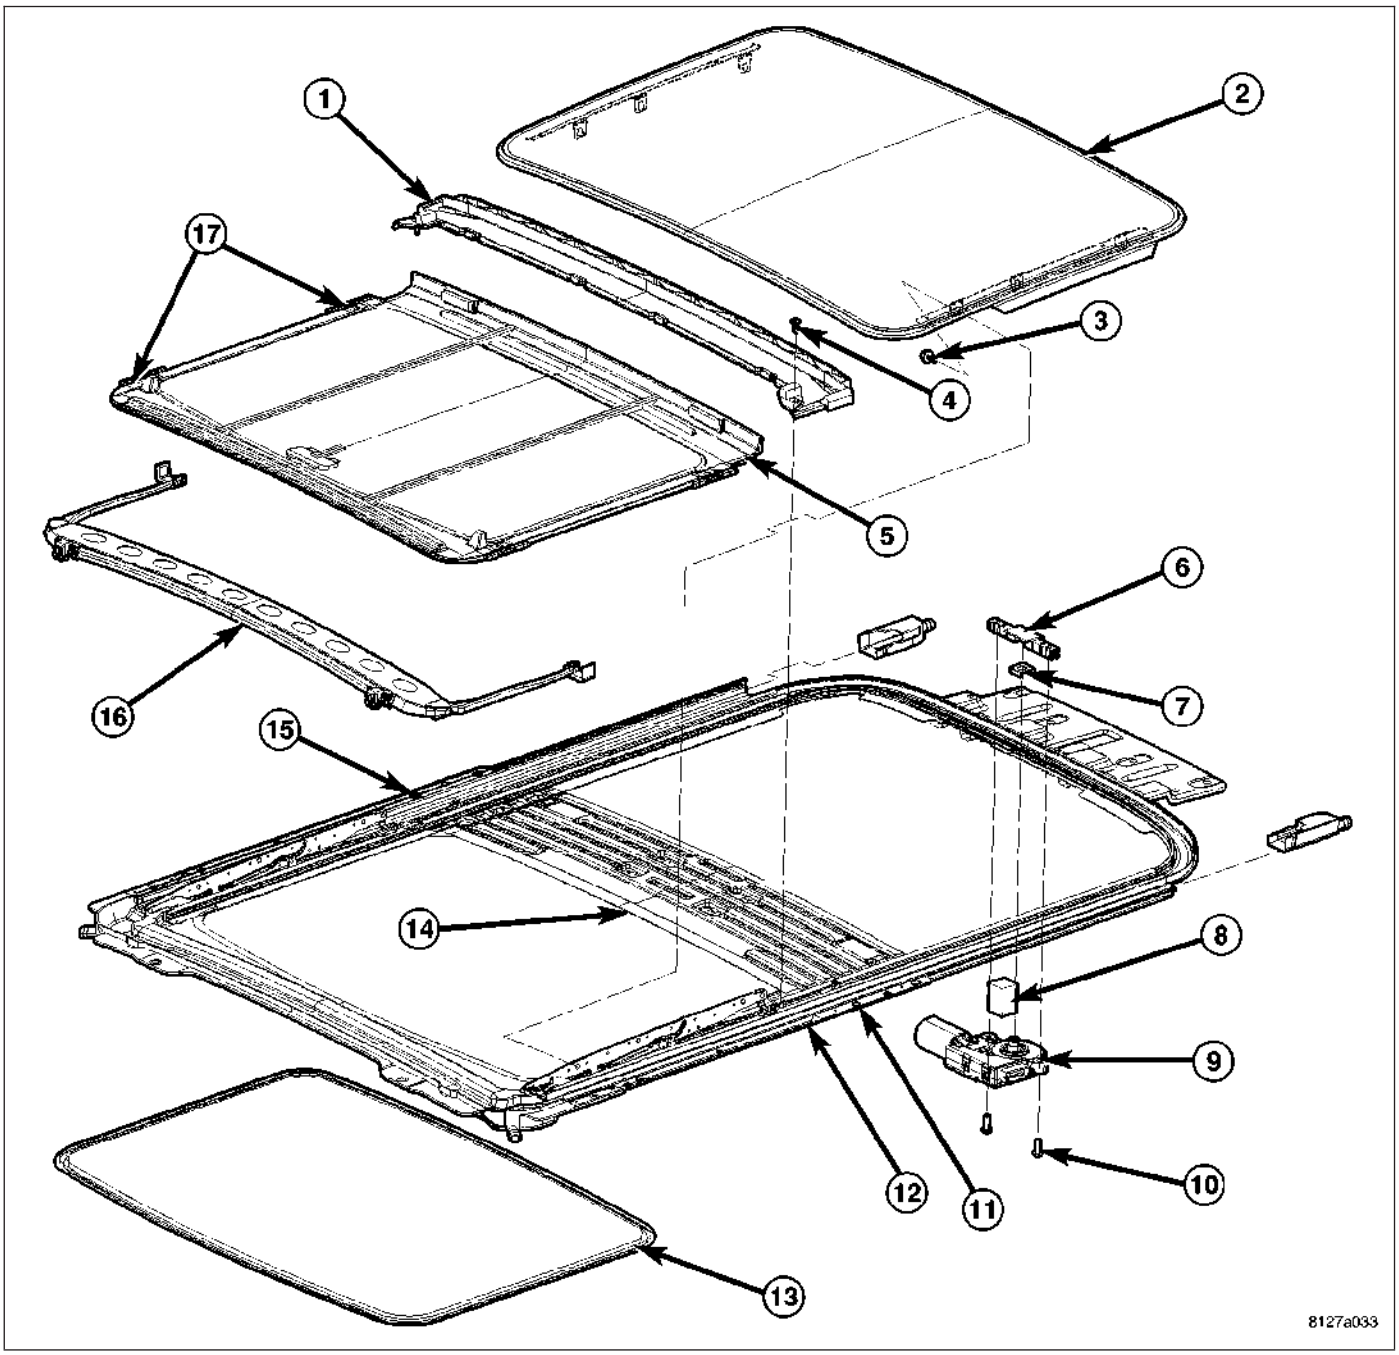
GLASS

REMOVAL



1. Move the glass panel (2) to the vent position.
2. Slide sunshade (5) rearward to the open position.
3. Remove the glass panel screws (3).
4. Lift off glass panel (2) and remove from vehicle.

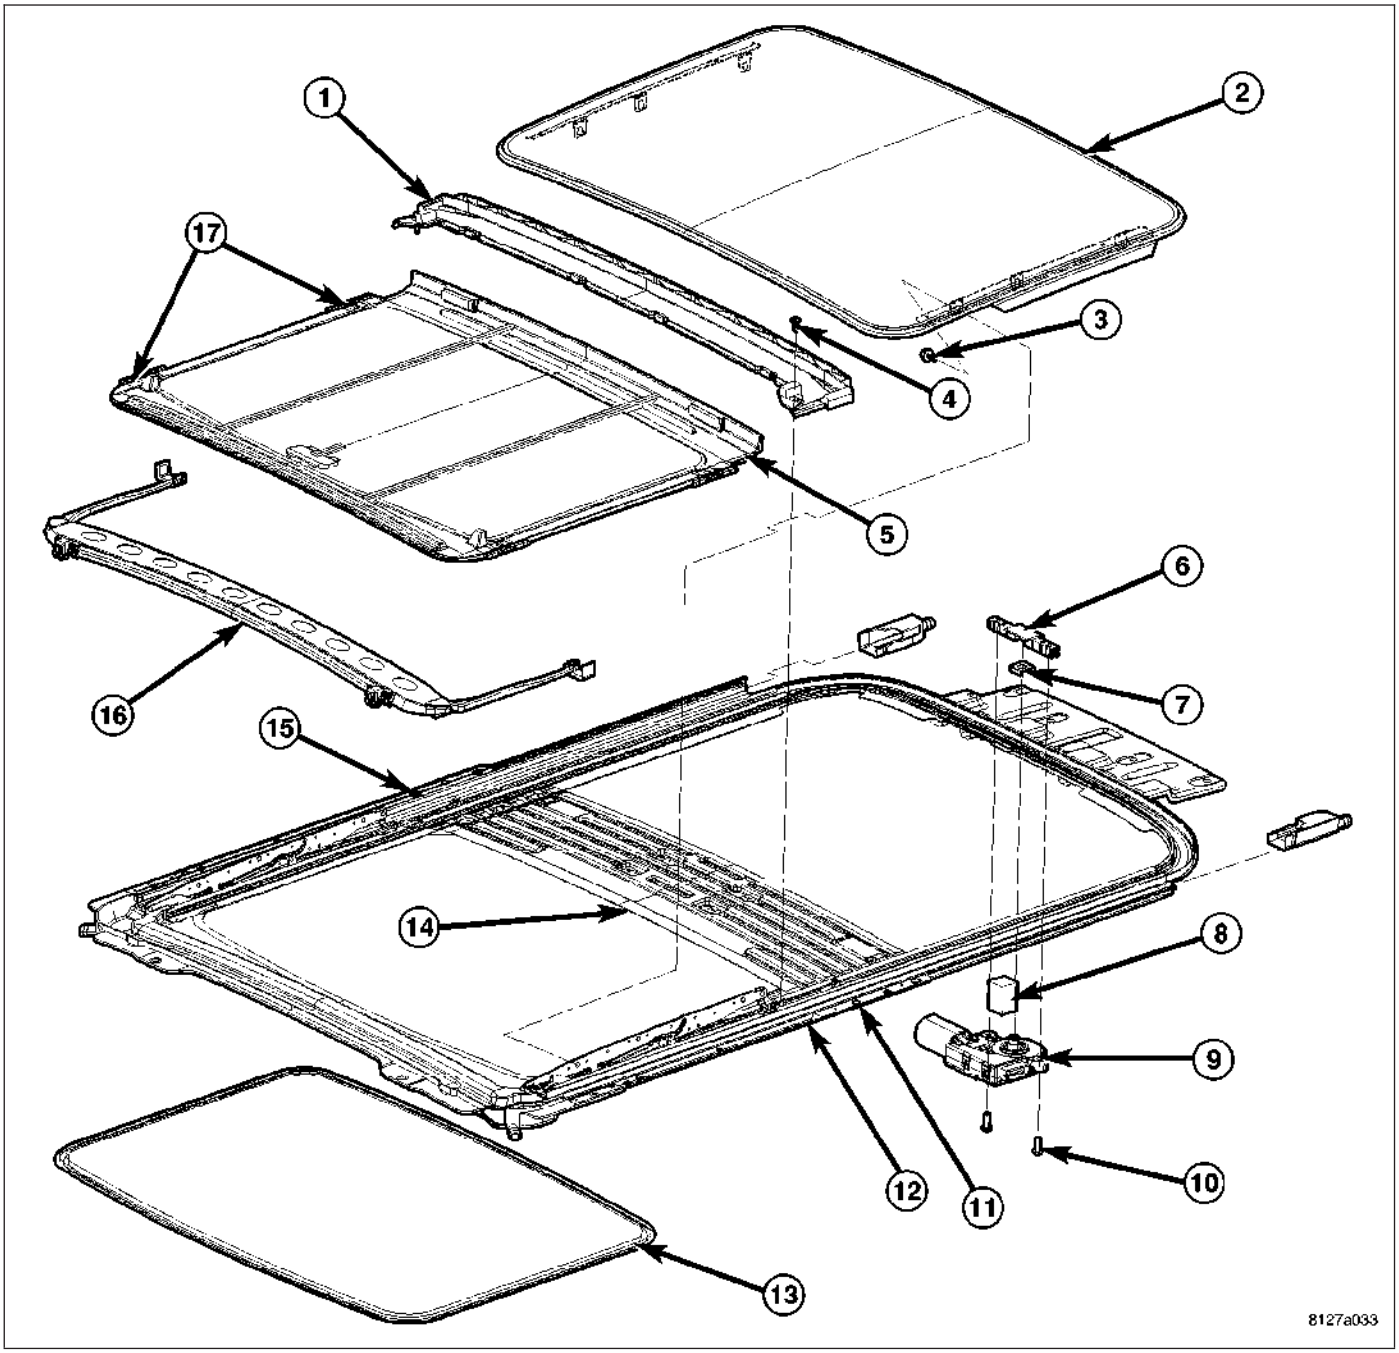
INSTALLATION



1. Position glass panel (2) on to mechanism lift arms.
2. Start the attaching screws (3).
3. Connect a 12v power supply and move the sunroof to the vent position then to the closed position.
4. Adjust sunroof glass (2) to fit flush with roof line (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
5. Tighten the screws (3).
6. Verify sunroof operation and alignment.

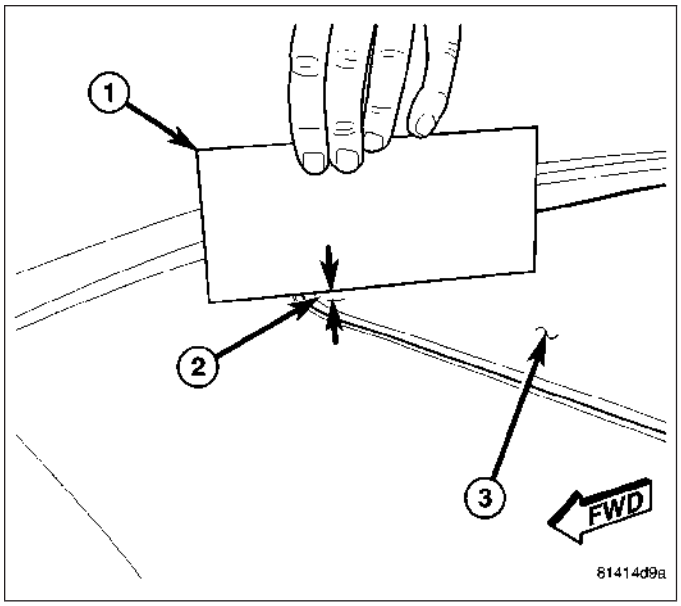
ADJUSTMENTS

SUNROOF GLASS PANEL ADJUSTMENT

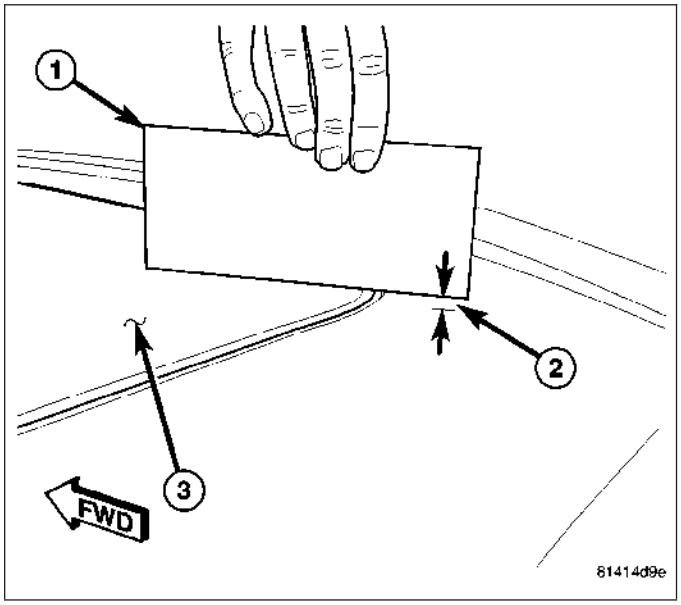


1. Move the sunshade (5) rearward to the open position.
2. Move the sunroof glass panel (2) to the fully closed position.
3. Loosen all glass attachment screws on both sides of the module such that the glass panel is adjustable in the vertical and fore-aft directions.
4. Cycle the sunroof open, closed, vent and closed again.

5. Standing outside the vehicle (one side at a time with one hand supporting the front corner of the glass panel) lift the front glass panel corner (3) until it is between flush and slightly under flush (0.00 to - 1.75 mm) with the front roof corner (2). User your free hand to snug up the glass bolt with sufficient force (finger tight) that the weight of the glass panel corner is supported. Repeat this process on the other side of the vehicle.



6. Move to the rear of the sunroof glass panel. Standing outside of the vehicle (one side at a time with one hand supporting the rear corner of the glass panel) lift the rear glass panel corner (3) until it is between flush and slightly over flush (0.00 to +1.75mm) with the rear roof corner (2). Use your free hand to snug up the glass bolt with sufficient force (finger tight) that the weight of the glass panel corner is supported. Repeat this process on the other side of the vehicle.
7. Check the flushness of the glass panel in the corners with a business card (1) (or other straight edged tool that won't scratch the glass or roof) held at a 45 degree angle to the vehicle's for/aft centerline. The preferred glass panel placement for blockage of wirer/air leaks is flush at all the corners. If this is not possible, adjust the glass panel's vertical placement within the tolerance ranges described above towards the flush position.

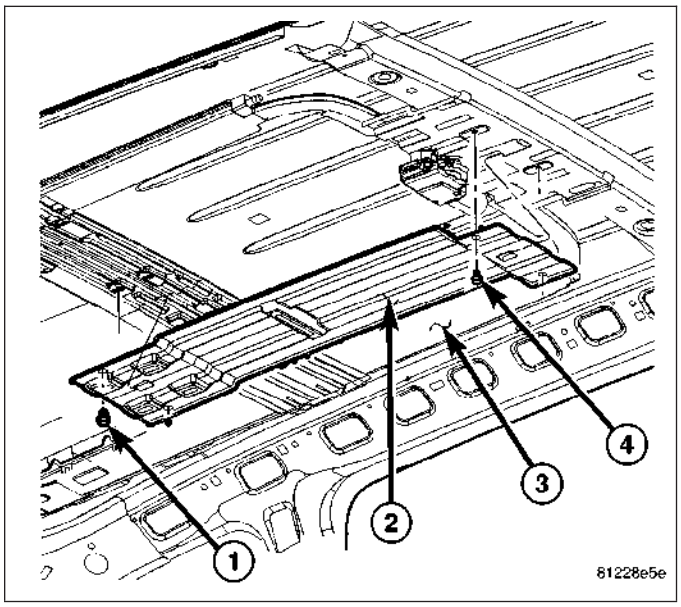


8. If the glass panel's vertical position needs to be adjusted, loosen the bolt at the corner and make the necessary adjustments. Tighten the bolt before moving onto the next corner.
9. Once the proper glass position has been achieved, tighten the six glass panel attaching screws to 3.5 N·m (31 in. lbs.).
10. Check for proper fit. If not OK, repeat glass panel adjustment.

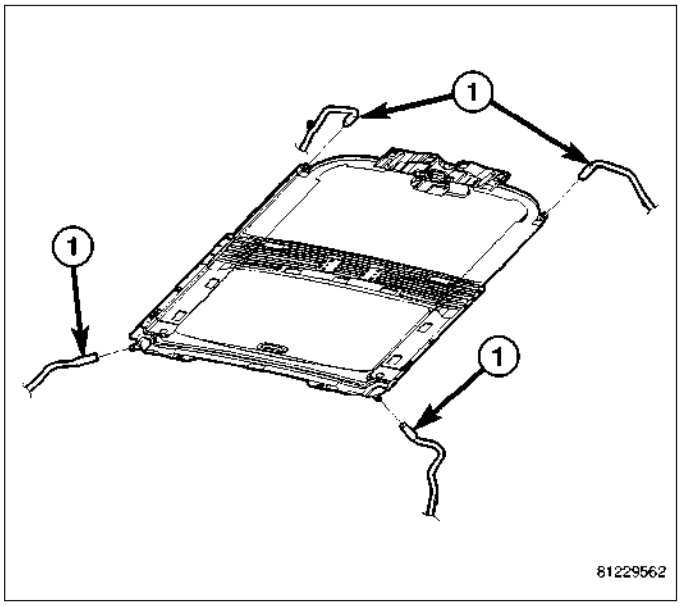
ASSEMBLY-MODULE

REMOVAL

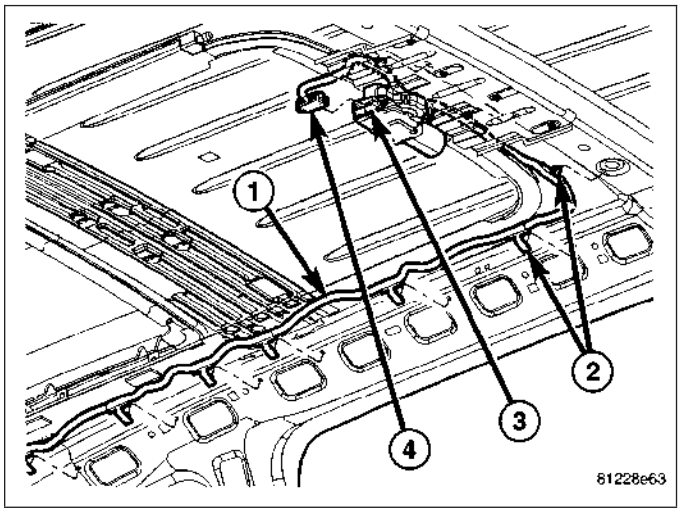
1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.
3. Remove headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - REMOVAL).
4. Remove the bolts (1 & 4) and remove the video display support bracket, if equipped.

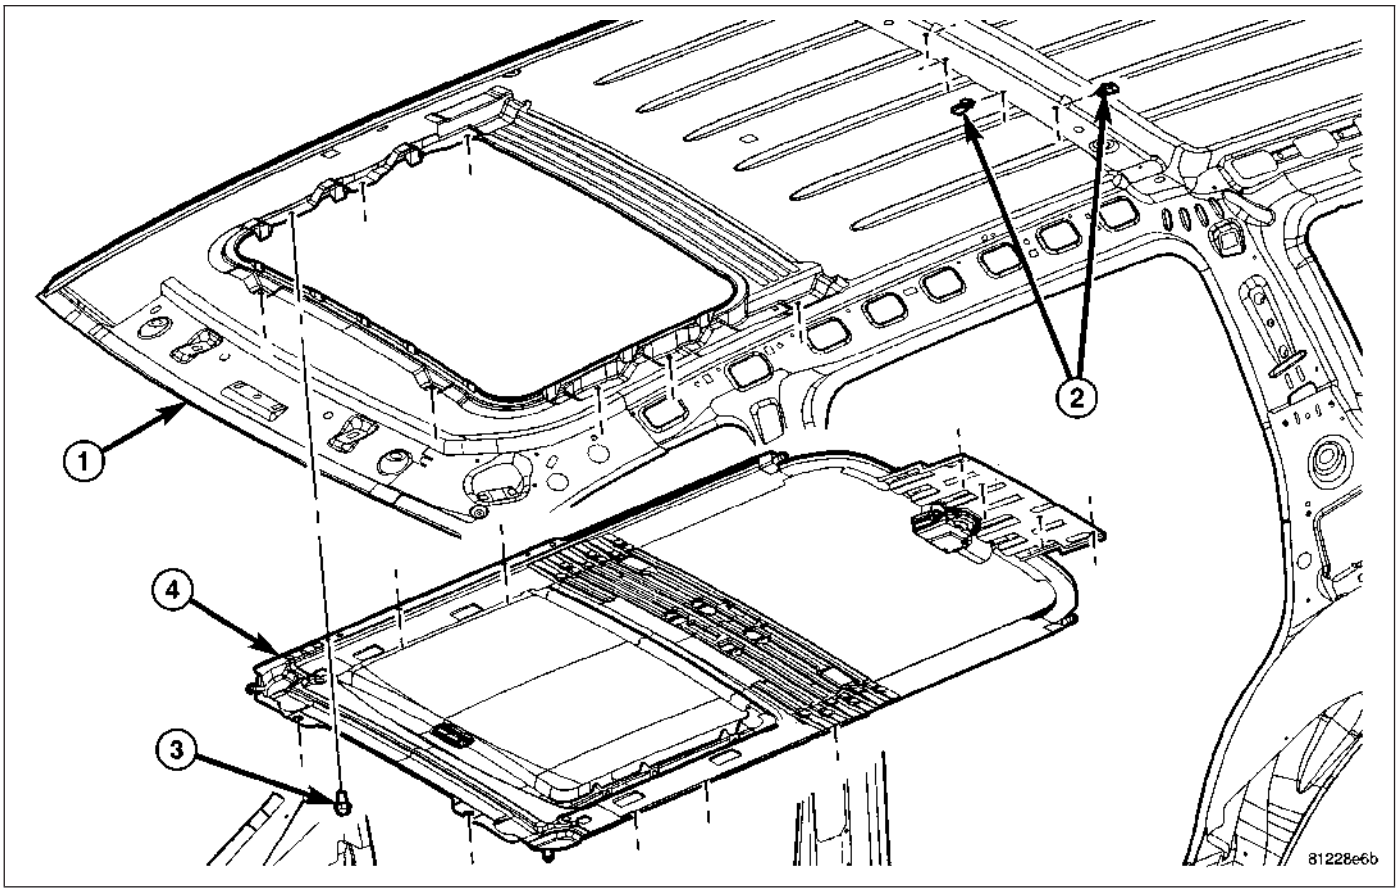


5. Disconnect the four drain tubes (1) from sunroof housing.



6. Disconnect the sunroof wire harness (1) electrical connector (3) and (4).

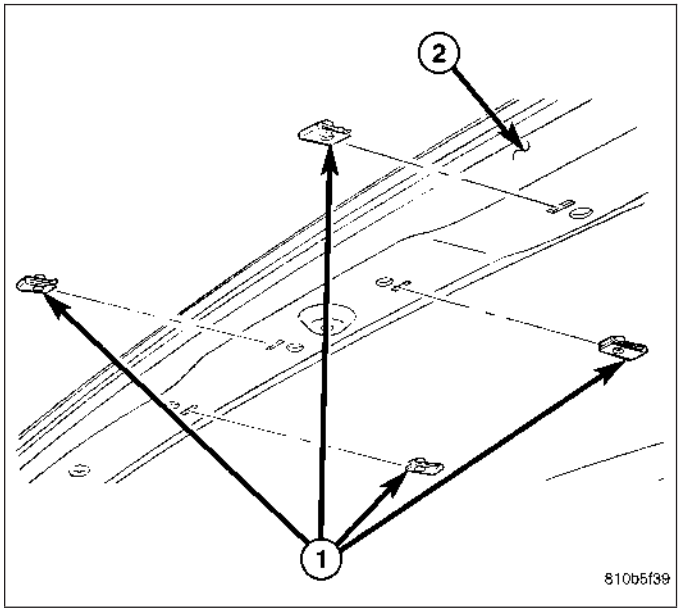


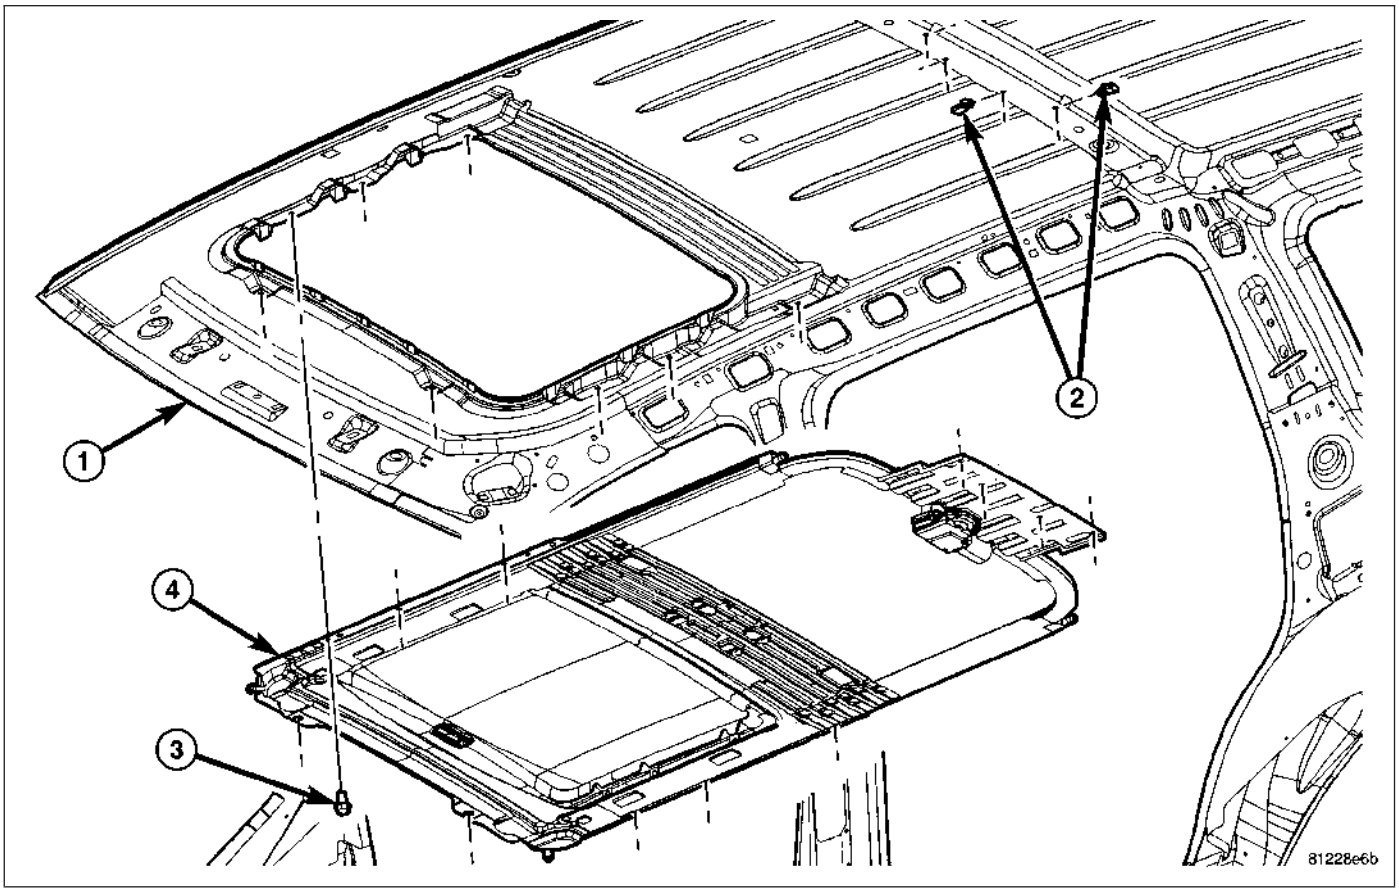


7. Loosen fasteners (3) attaching sunroof assembly.
8. With the aid of a helper, support the sunroof and remove the fasteners attaching sunroof assembly (4) to roof panel (1).
9. Remove the sunroof (4) from vehicle.

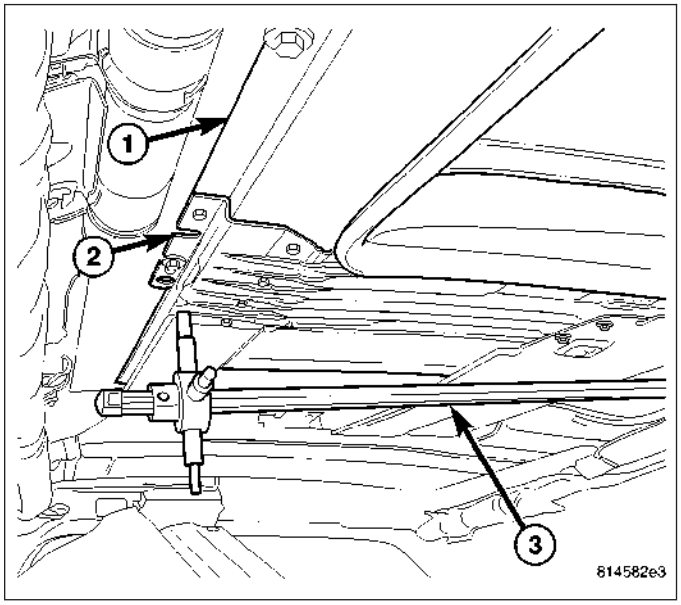
INSTALLATION

1. Verify that u-nuts (1) are in position in the roof bow #2 (2).
2. Verify that glass panel is loose and slightly retracted.

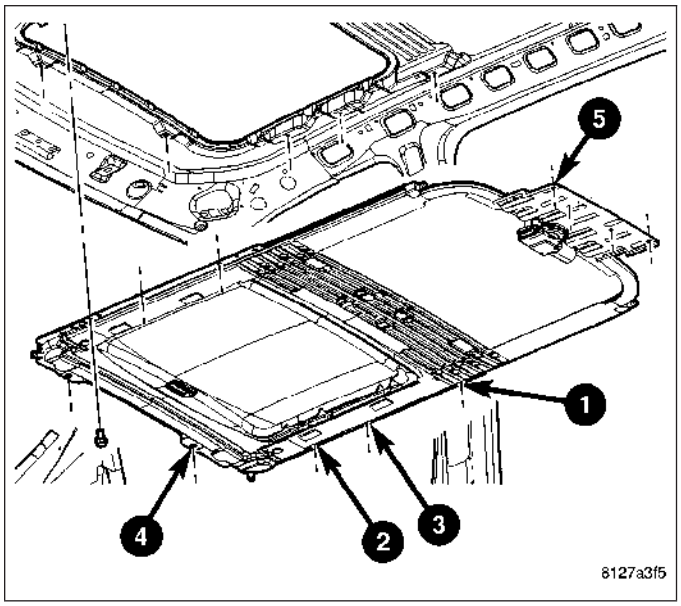




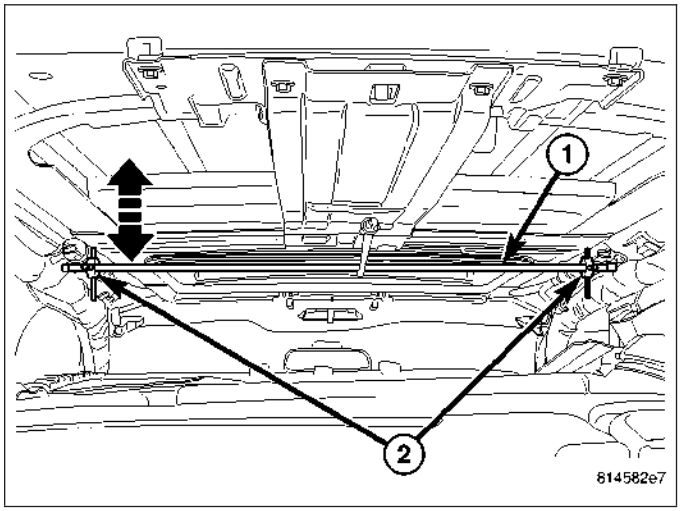
3. Raise sunroof module assembly (4) and guide it carefully into position.
4. While supporting the sunroof assembly, start the 12 attaching screws, three along each side rail, two along the front trough and four along the motor bracket.
5. Position special tool # 9582 pins (3) through the locating holes (2) and confirm the module assembly (1) is properly aligned.



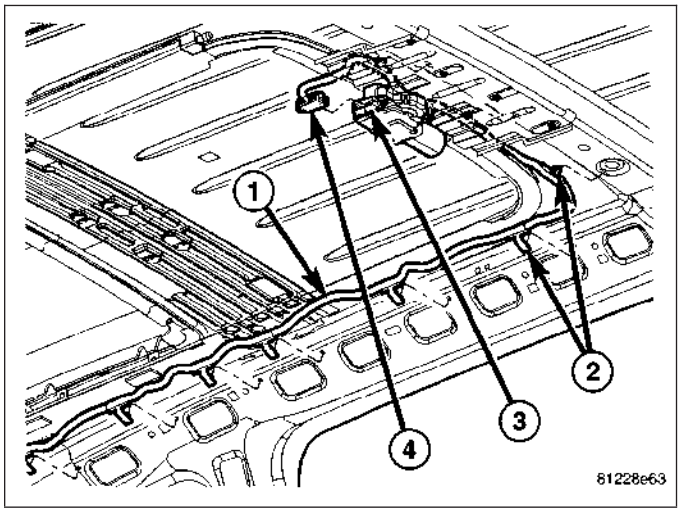
6. Tighten the attaching screws to 6 N·m (53 in. lbs.) using the sequence shown.



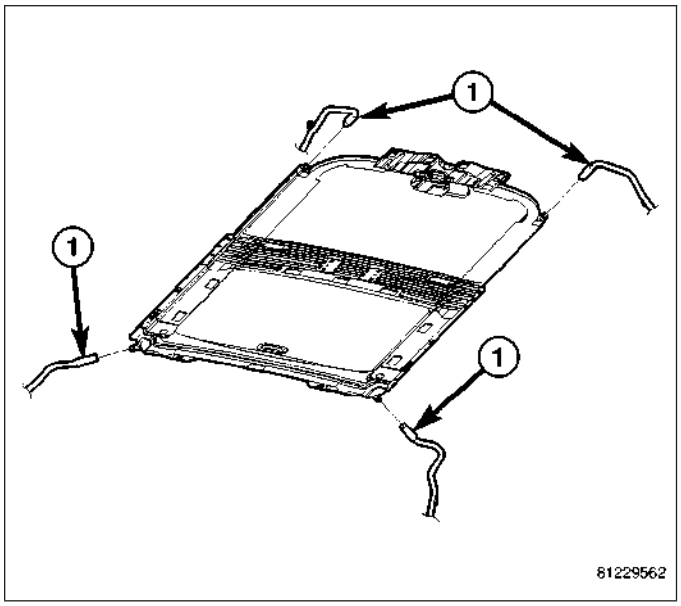
7. Remove the alignment tool (1) from the alignment holes (2).



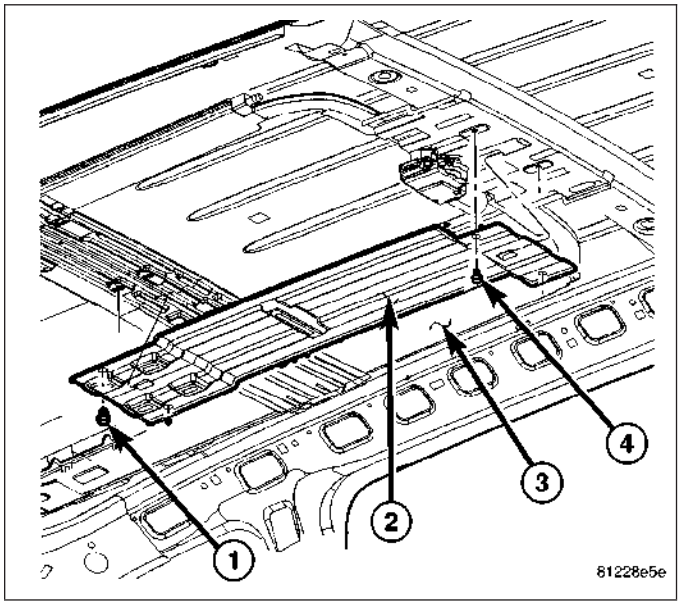
8. Connect the electrical connector (4).



9. Connect the drain tubes to the sunroof (1).



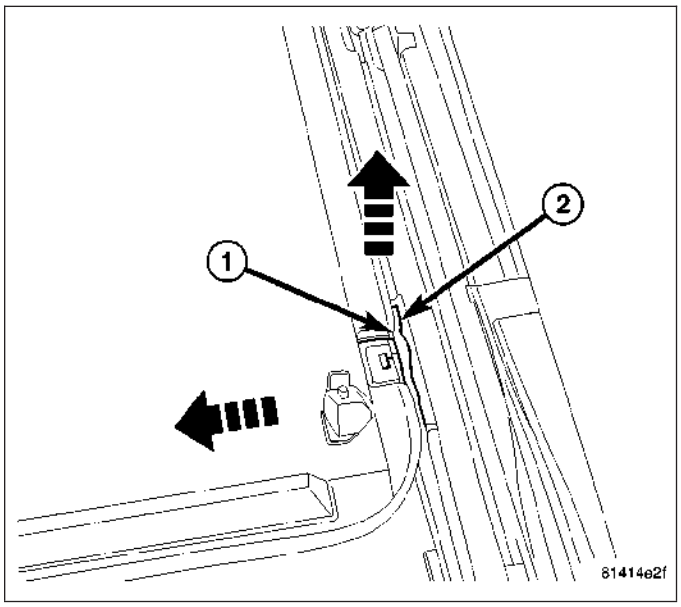
10. Position the video display support bracket (2), if equipped, and install the bolts (1 & 4). Tighten the bolts to 6 N·m (53 in. lbs.).
11. Connect battery negative cable.
12. Test sunroof operation, adjust if necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
13. Install headliner. (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION)



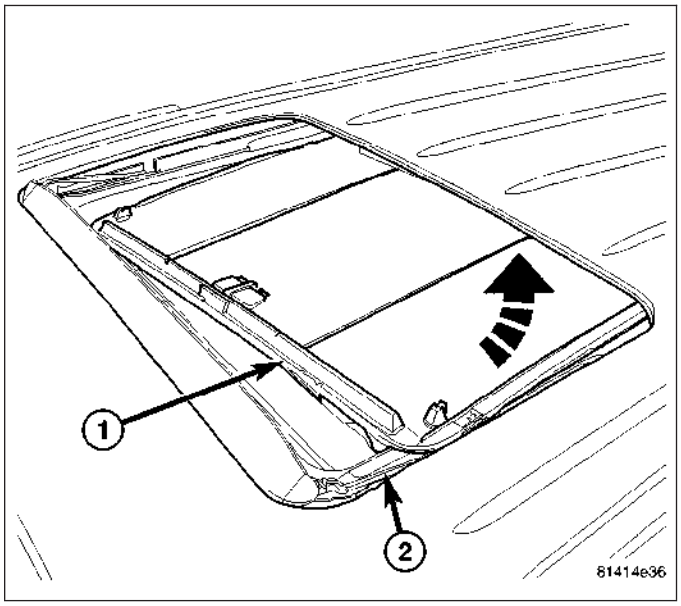
SUNSHADE

REMOVAL

1. Remove the water channel. (Refer to 23 - BODY/ SUNROOF/WATER CHANNEL - REMOVAL)
2. Cycle sunroof motor (9) to the open position.
3. Move sunshade (5) towards the closed position stopping three to four inches from the closed position.
4. Depress the spring feet clips (1) in the cross car direction on one side of the sunshade by applying a side-load to the shade while pulling up at the front centerline of the sunshade. This will cause one spring feet clip (1) to pop out of the track.

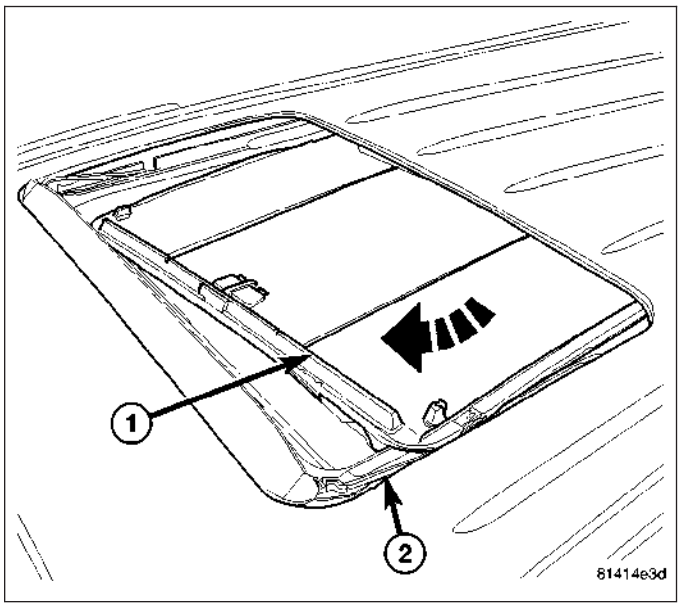


5. Remove the other front foot by rotating the shade (1) out and the foot resting on the top of the sunroof frame (2).
6. Pull the shade farther forward in the vehicle and repeat the previous step to remove the rear spring feet.
7. Remove the sunshade (2).

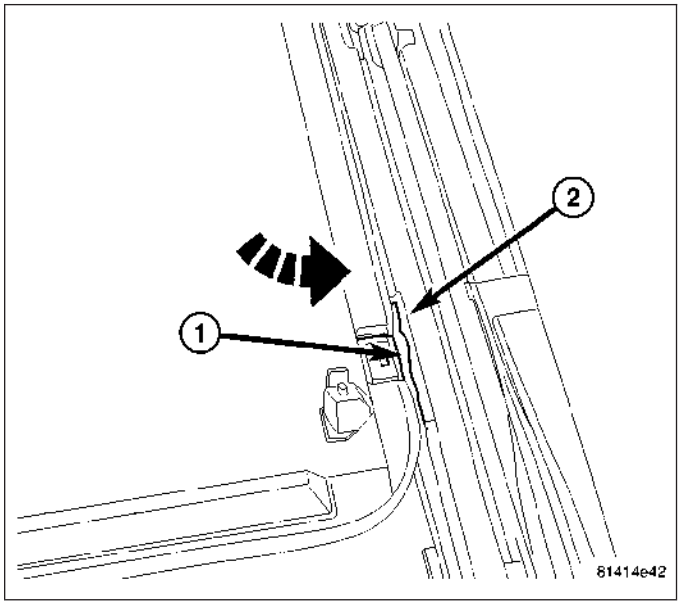


INSTALLATION

1. Place one side of the sunshade (1) spring feet clips into the top track U-frame (2).

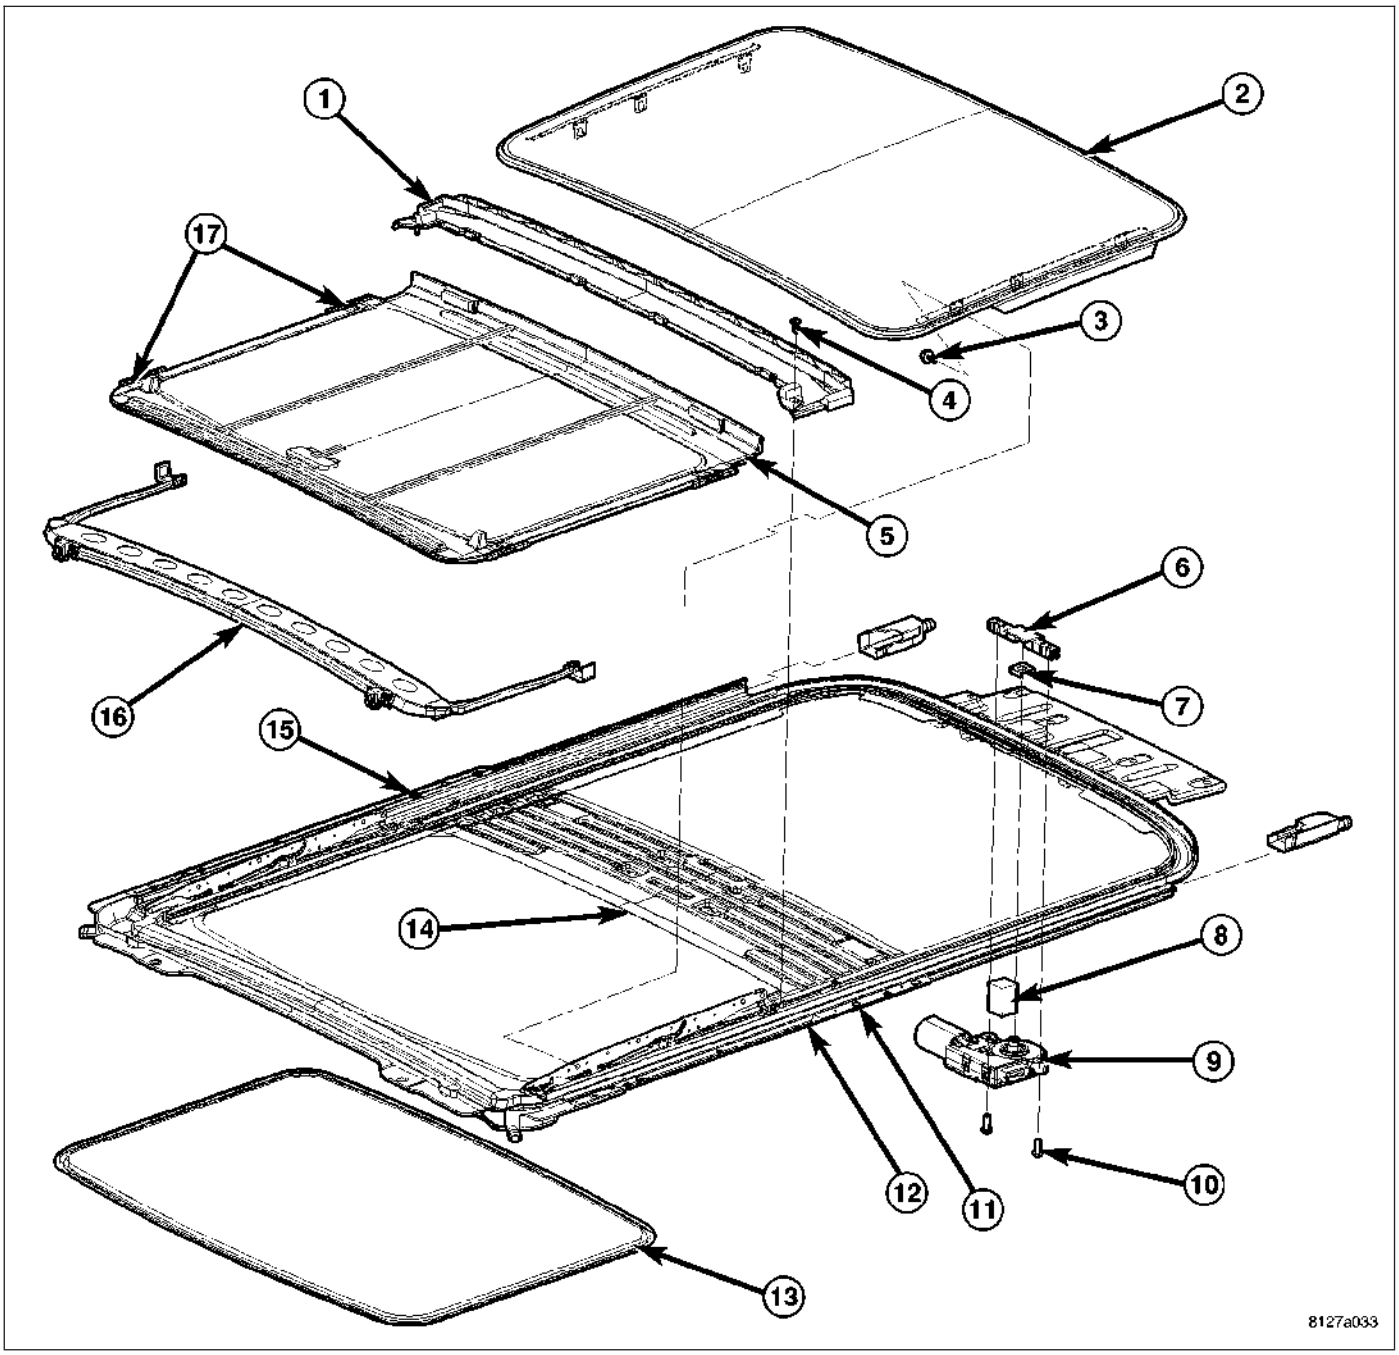


2. Depress the both releasing clips (1) on the other side to allow them to go into the top track of the U-frame (2).
3. Move sunshade to the open position.
4. Verify that the sunshade moves back and forth properly.
5. Cycle sunroof towards the closed position.
6. Position the sunshade so that the handle is in the center of the opening.
7. Install the water channel. (Refer to 23 - BODY/ SUNROOF/WATER CHANNEL - INSTALLATION)



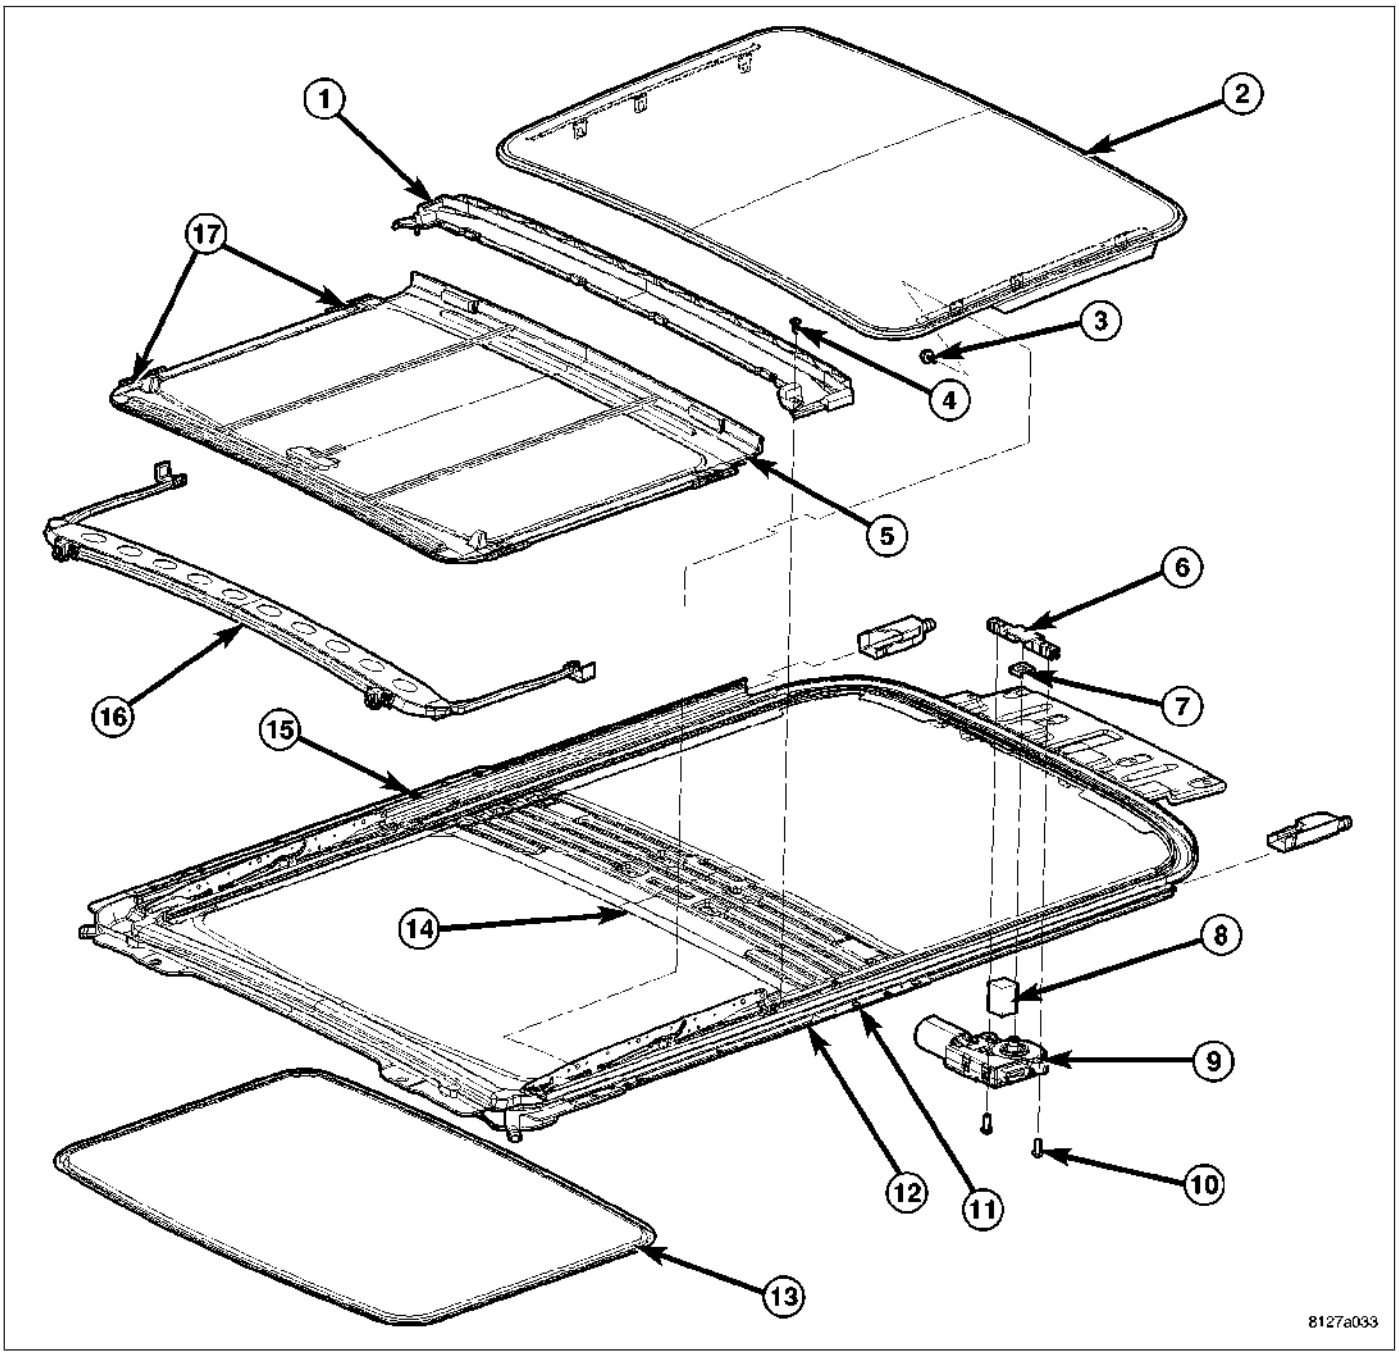
CHANNEL-DRAIN

REMOVAL



1. Remove glass panel (2). (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Remove the retaining screws (4).
3. Carefully slide water channel (1) forward to release tabs from U-frame (12) and remove from vehicle.

INSTALLATION



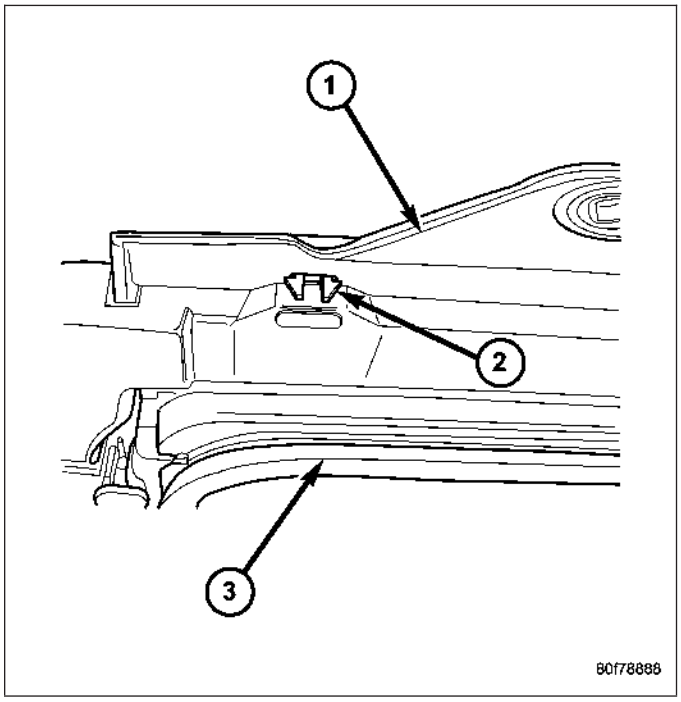
1. Carefully place water channel (1) onto U-frame (12) and slide it rearward to lock tabs.
2. Install the water channel attaching screws (4) drivers side first then passenger side.
3. Tighten the screws to 1.5 N·m (12 in. lbs.).
4. Position glass panel (1) on to mechanism lift arms.
5. Start the glass attaching screws (3), and hand tighten.
6. Adjust sunroof glass (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
7. Verify sunroof operation and alignment.

DEFLECTOR-WIND

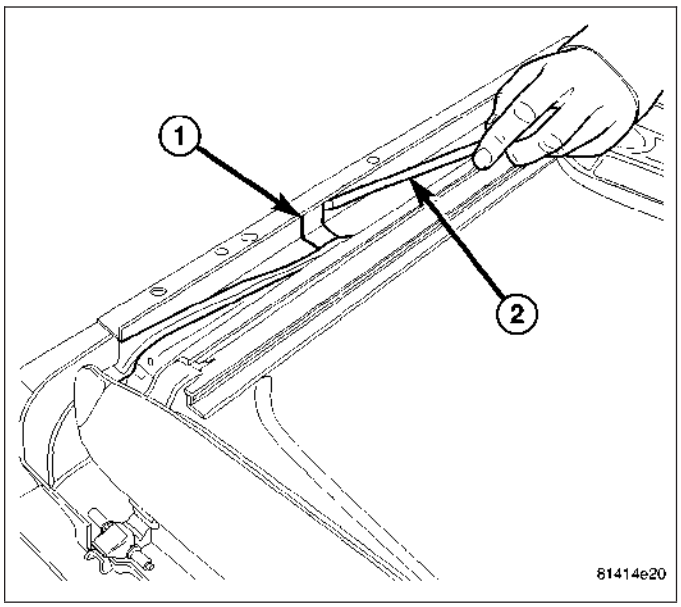
REMOVAL

Including front hinges:

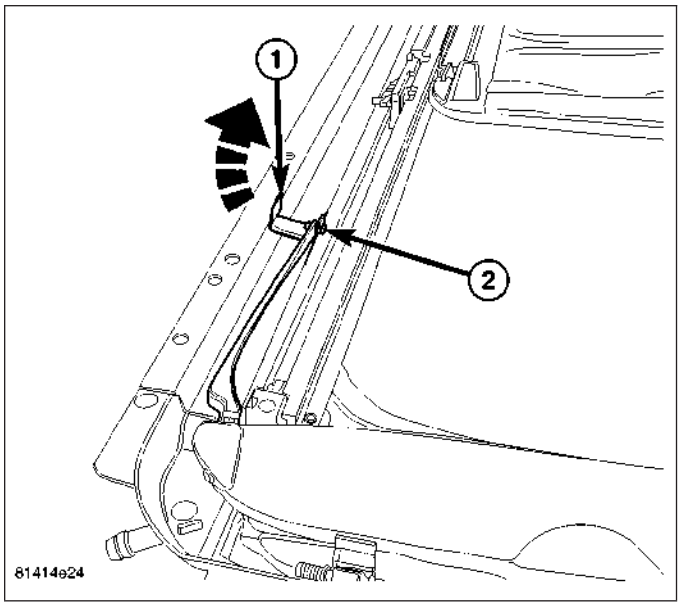
1. Fully open sunroof glass panel.
2. Remove sunroof assembly (1). (Refer to 23 - BODY/SUNROOF/MODULE ASSEMBLY - REMOVAL)
3. Depress the front deflector retaining tabs (2).



4. Using a small flat bladed tool (2) or equivalent, release the both hinges (1) from the u-frame track.*Right side hinge shown, left similiar.

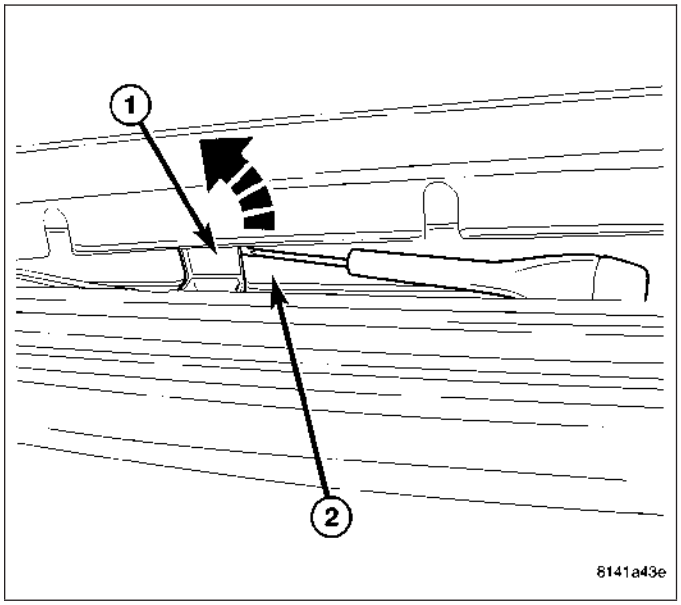


5. Rotate the hinge feet (1) up and out of the u-frame (2) and remove wind deflector.*Right side hinge shown, left similiar.

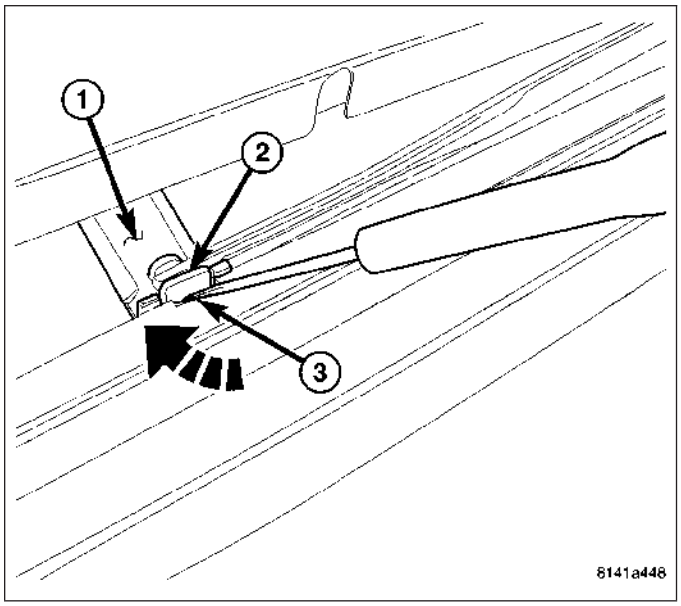


Without front hinges:

1. Using a small flat bladed tool (2) or equivalent, release the both hinges (1) from the u-frame track.*Right side hinge shown, left similiar.

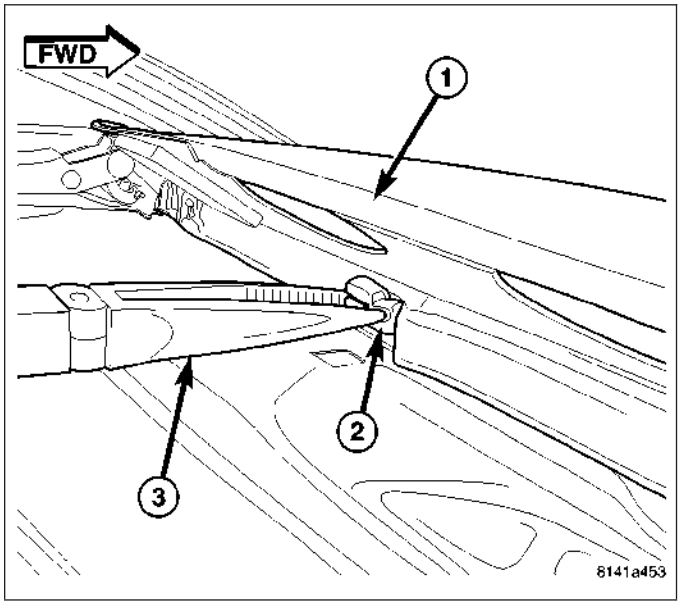


2. Using a small flat bladed tool or equivalent, release the inner locking tab (2) portion of the hinges from the u-frame tracks (3) and separate the hinges (1) from the track.

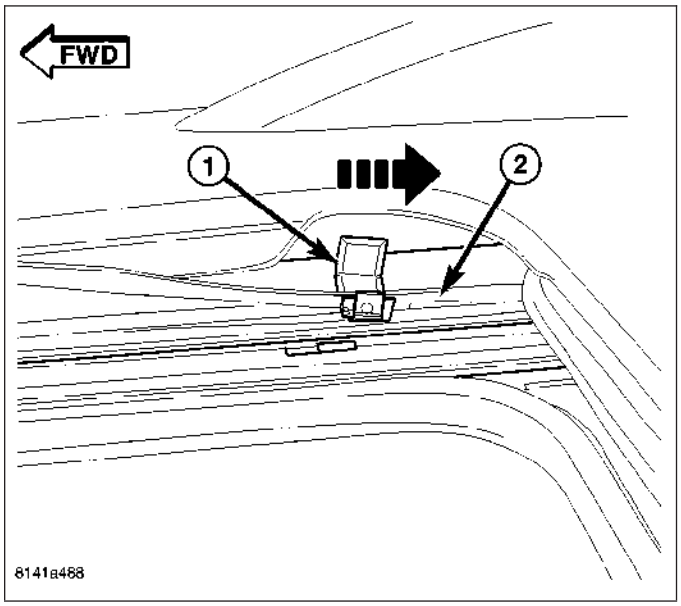


NOTE: Placing a small rolled up piece of paper or equivalent, between the hinge and the sunroof opening may aid installation of the wind deflector.

3. Using needle-nose pliers (3) squeeze the retaining tabs on the forward hinges (2) and separate the wind deflector (1) from the hinges.



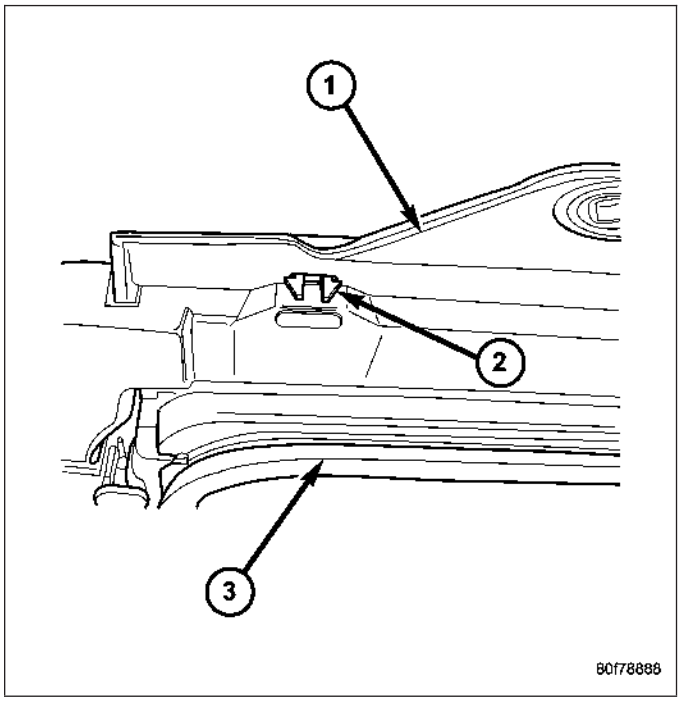
4. Slide the wind deflector assembly (1) rearward to the back of the roof opening (2) and remove.



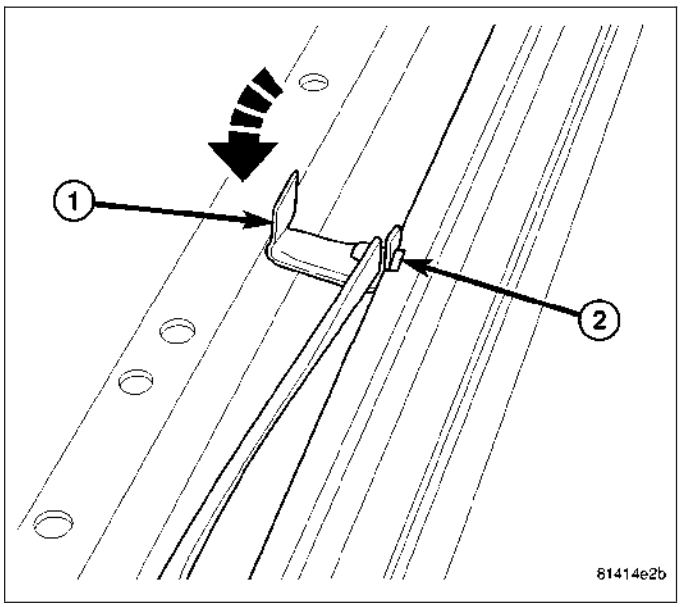
INSTALLATION

Including front hinges:

1. Position the spring arms down into the trough.
2. Place wind deflector arms in upward position engage the wind deflector blade into the u-frame.
3. Seat the retaining clips (2) fully.

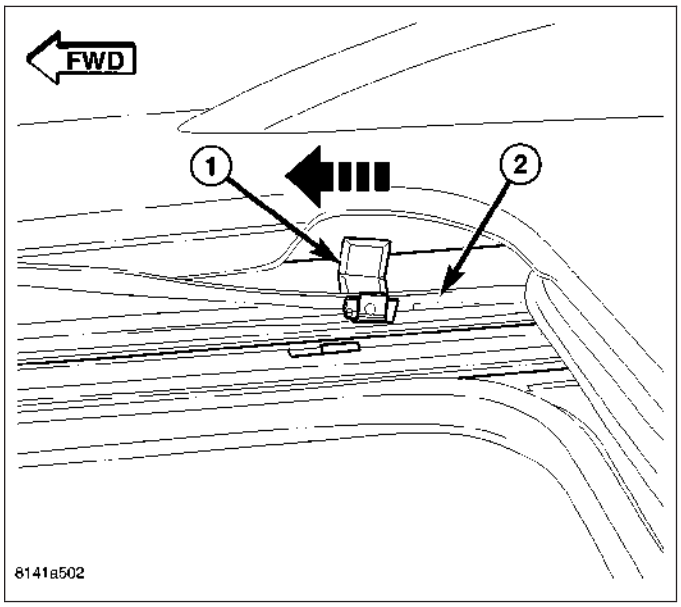


4. Position the wind deflector hinges (1) into the u-frame at the notch (2) and secure down into the channel fully.*Right side hinge shown, left side similar.
5. Verify wind deflector operation.
6. Install the sun roof assembly (Refer to 23 - BODY/ SUNROOF/MODULE ASSEMBLY - INSTALLATION).



Without front hinges:

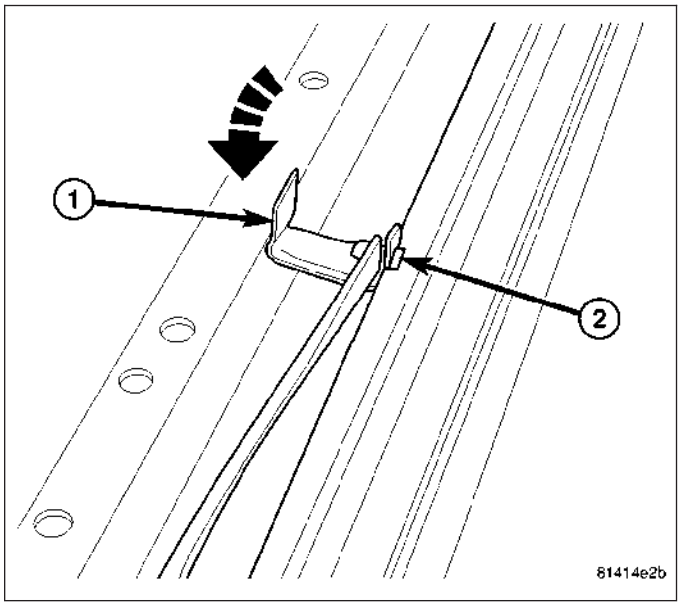
1. Position wind deflector assembly (1) into the roof opening (2) and slide forward to the mounting point in the u-frame.



2. Position the wind deflector hinges (1) into the u-frame at the notch (2) and secure down into the channel fully.*Right side hinge shown, left side similar.

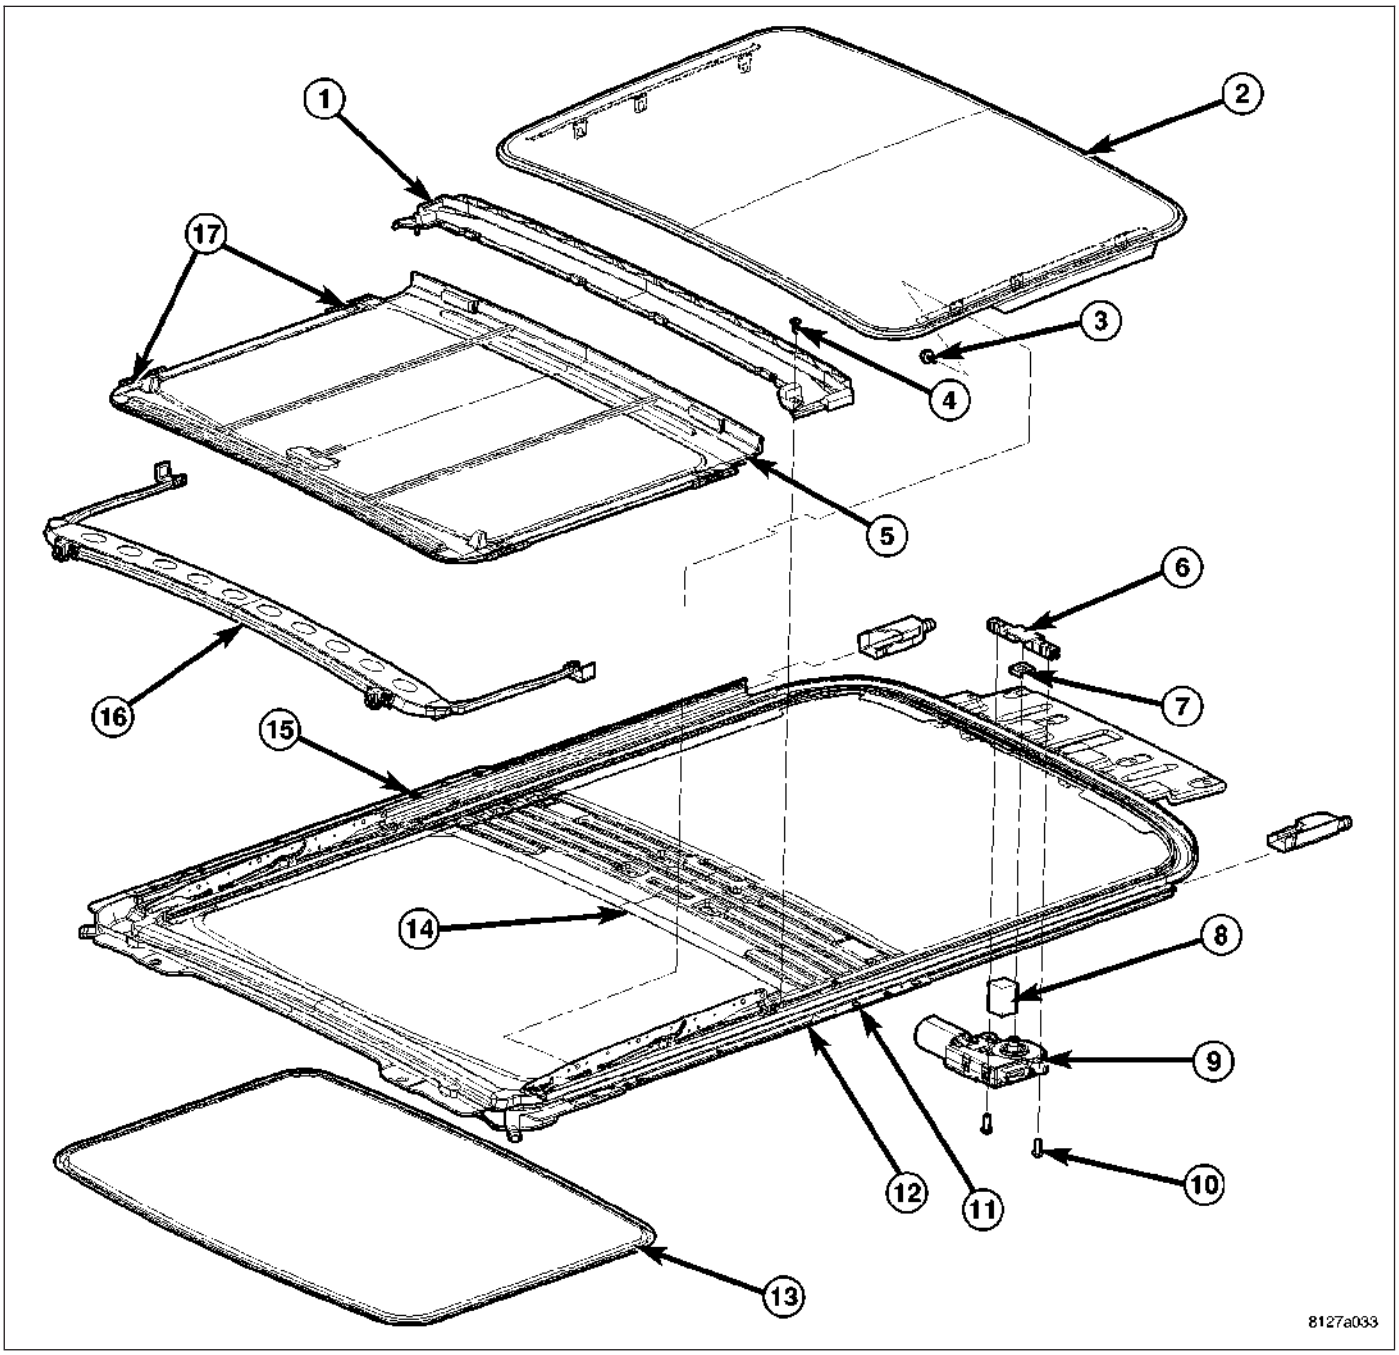
NOTE: Placing a small rolled up piece of paper or equivalent, between the hinge and the sunroof opening may aid installation of the wind deflector.

3. Position the front of the wind deflector over the front hinges and seat down onto the retaining clips fully.



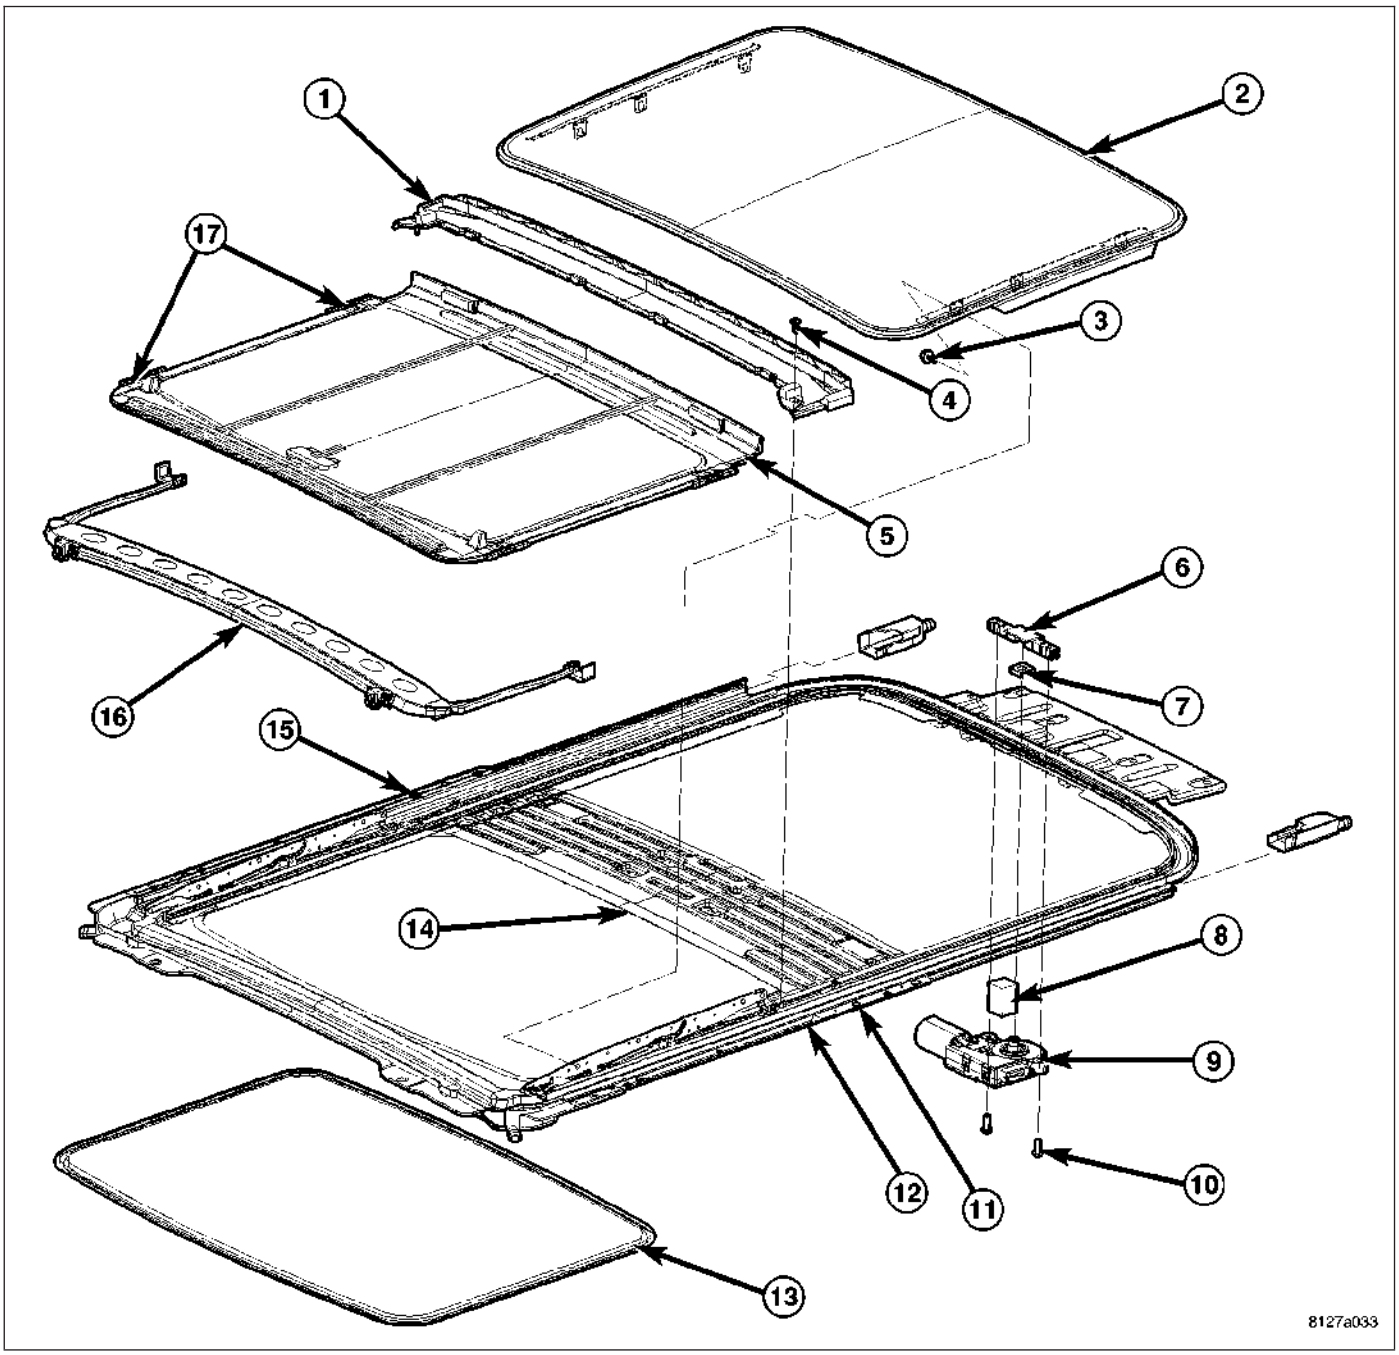
TRIM LACE

REMOVAL



1. Remove trim lace (13) by holding one end of the trim lace at the butt joint and pulling horizontally into the opening until lace is completely loose from the headliner/sunroof joint.

INSTALLATION



1. Place butt joint of trim lace into position starting at the rear of the opening at the butt joint notch (14) in the u-frame.
2. Push lace into position.
3. Ensure that the corner radii is fully engage.
4. Once the original trim lace is attached to sunroof module using a trim stick C-4755 or equivalent, begin tucking the headliner under the lip on the trim lace working all the way around the opening. When installing a new trim lace, begin tucking the headliner under the lip as the tear cord is removed working all the way around the opening.

WEATHERSTRIP-FRONT DOOR GLASS RUN

REMOVAL

1. Remove glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)
2. Pull the glass run weatherstrip and run channels from the window opening.
3. Pull the glass run weatherstrip from the run channels.

INSTALLATION

1. Install the glass run weatherstrip into the window opening and the run channels.
2. Install glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

WEATHERSTRIP-FRONT DOOR BELT INNER

REMOVAL

1. Remove trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL)
2. Peel seal from door pinch weld.

INSTALLATION

1. Slide seal into position on door.
2. Install the trim panel. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION)

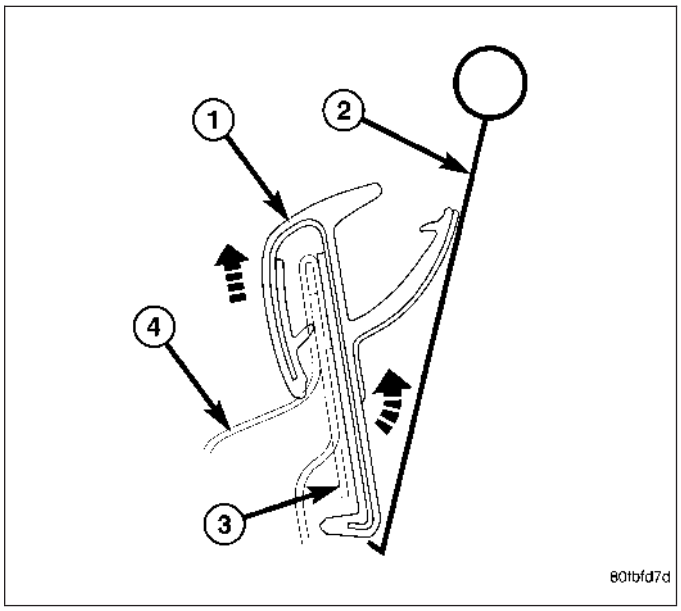
WEATHERSTRIP-FRONT DOOR BELT OUTER

REMOVAL

1. Insert special tool #9093 (2) between the outer belt molding (1) and glass at the rear.
2. Push down on outer belt molding (1) and rotate upper part of tool (2) outward from vehicle then lift up on molding (1) to disengage from locking tabs (3) working from back to front.

NOTE: Typical outer belt molding design shown.

3. Slide molding out from under the side view mirror and remove.



INSTALLATION

1. Position the outer belt molding onto the door and position forward under the side view mirror. Seat the molding fully.

WEATHERSTRIP-REAR DOOR GLASS RUN

REMOVAL

1. Remove the glass run channels. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - REMOVAL)
2. Separate the quarter glass from the weatherstrip.

INSTALLATION

1. Position the quarter glass into the weatherstrip and rear run channel.
2. Install the run channels. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION)

WEATHERSTRIP-REAR DOOR BELT INNER

REMOVAL

1. Remove trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
2. Pull weatherstrip from inner door panel.

INSTALLATION

1. Position weatherstrip on inner door panel.
2. Press into place.
3. Install trim panel. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)

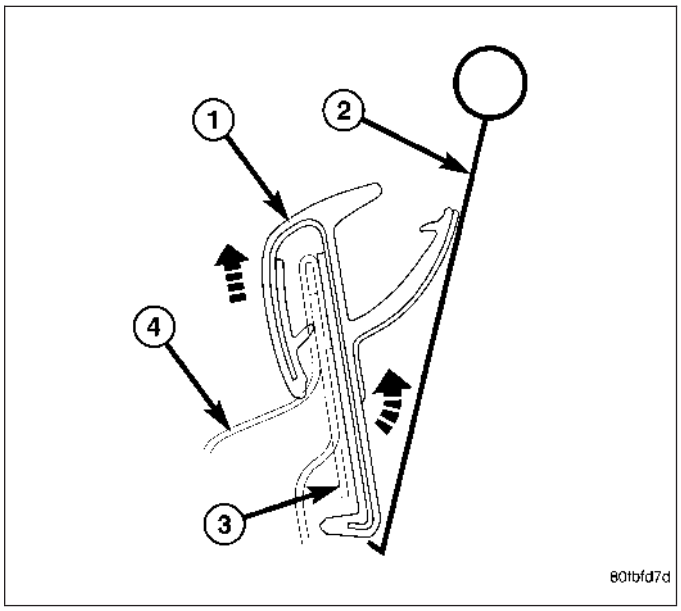
WEATHERSTRIP-REAR DOOR BELT OUTER

REMOVAL

1. Insert special tool #9093 (2) between the outer belt molding (1) and glass at the rear.
2. Push down on outer belt molding (1) and rotate upper part of tool (2) outward from vehicle then lift up on molding (1) to disengage from locking tabs (3) working from back to front.

NOTE: Typical outer belt molding design shown.

3. Slide molding out from under the side view mirror and remove.



INSTALLATION

1. Position the outer belt molding onto the door and seat the molding fully starting at the back of the door.

HVAC - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B100A–RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Recirculation mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B100A–RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B100D–FLOOR MODE SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Floor mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B100D–FLOOR MODE SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B101C–TEMP DOWN SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Temp mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B101C–TEMP DOWN SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B101F–POWER ON/OFF SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Power mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B101F–POWER ON/OFF SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B102B–REAR FUNCTION CONTROL SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Function mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

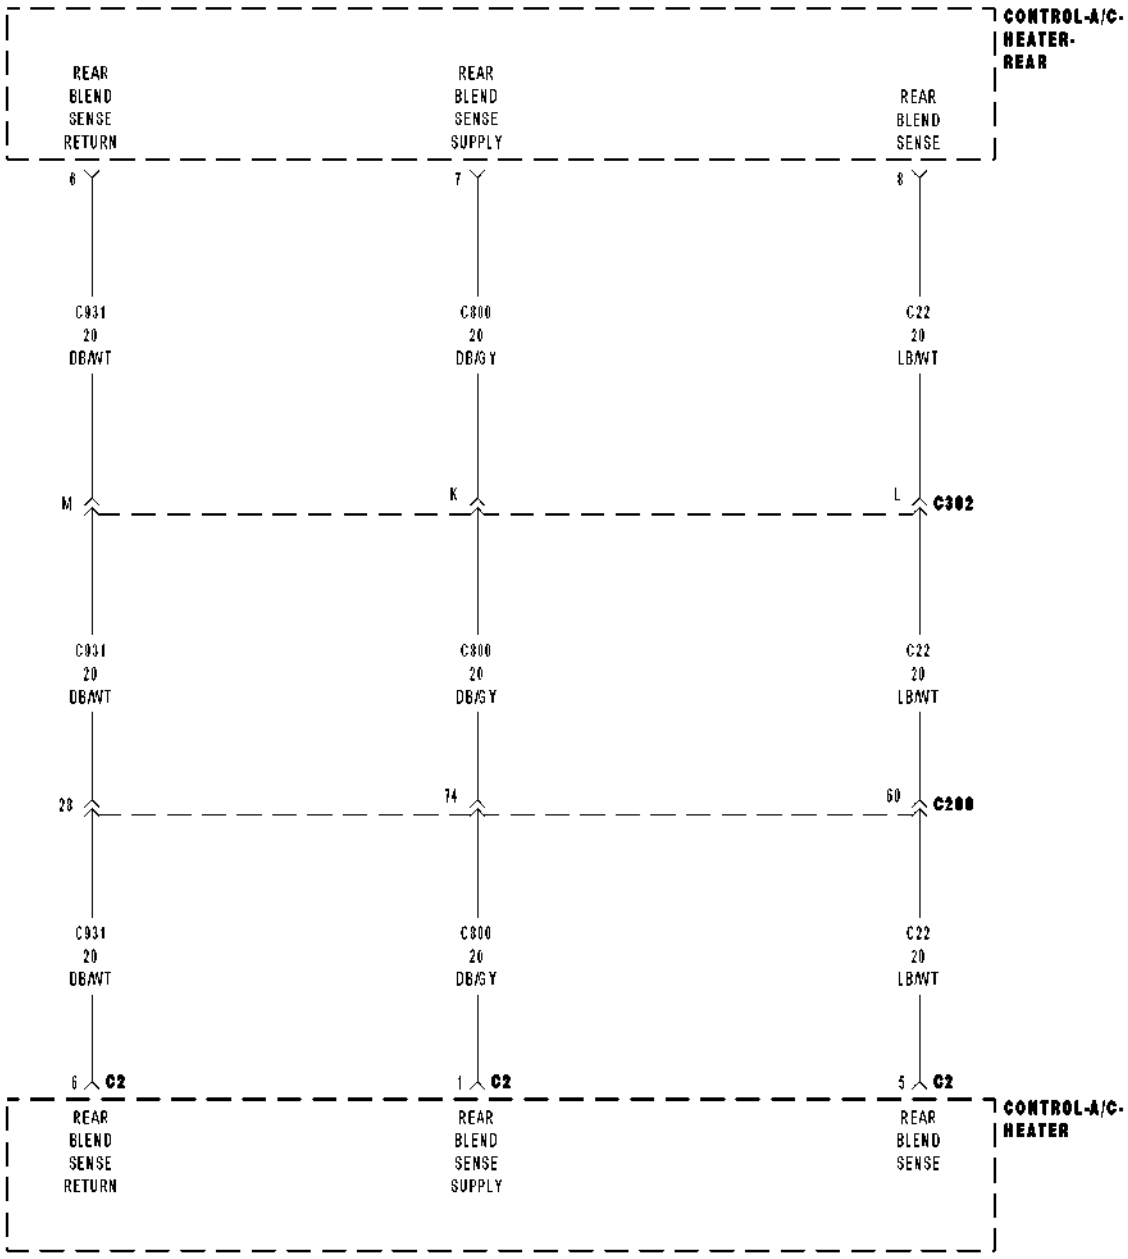
Wait two minutes, then with the scan tool, read HVAC DTCs.

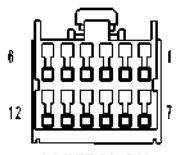
Does the scan tool display active: B102B–REAR FUNCTION CONTROL SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

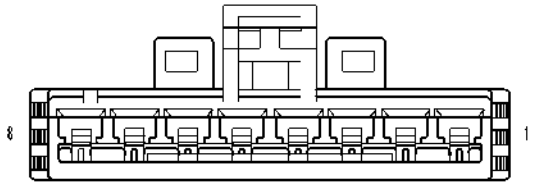
No >> Perform BODY VERIFICATION TEST – VER 1.

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (ATC)





CONTROL-A/C-HEATER C2 (ATC)



CONTROL-A/C-HEATER-REAR

81651967

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the rear blend pot is out of range towards the low voltage threshold. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

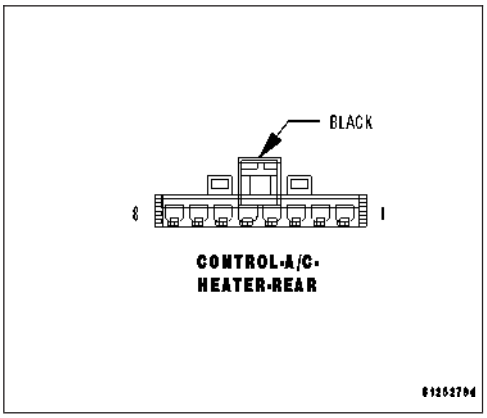
Possible Causes
(C800) REAR BLEND SENSE SUPPLY CIRCUIT SHORTED TO GROUND, TO (C931) REAR BLEND SENSE RETURN CIRCUIT, OR OPEN
(C22) REAR BLEND SENSE CIRCUIT SHORTED TO GROUND OR TO (C931) REAR BLEND SENSE RETURN CIRCUIT
REAR A/C HEATER CONTROL
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW WITH REAR A/C HEATER CONTROL DISCONNECTED

Turn the ignition off.
Disconnect the Rear A/C Heater Control harness connector.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
With the scan tool, read HAVC DTCs.



Does the scan tool display: B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW?

Yes >> Go To 2

No >> Replace the Rear A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)

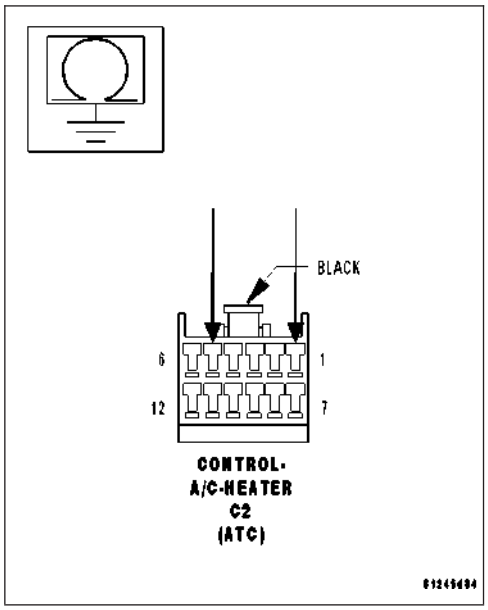
2. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C800) Rear Blend Sense Supply circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C22) Rear Blend Sense circuit between ground and the A/C Heater Control C2 harness connector.



Is the resistance below 10k ohms on either of the circuits?

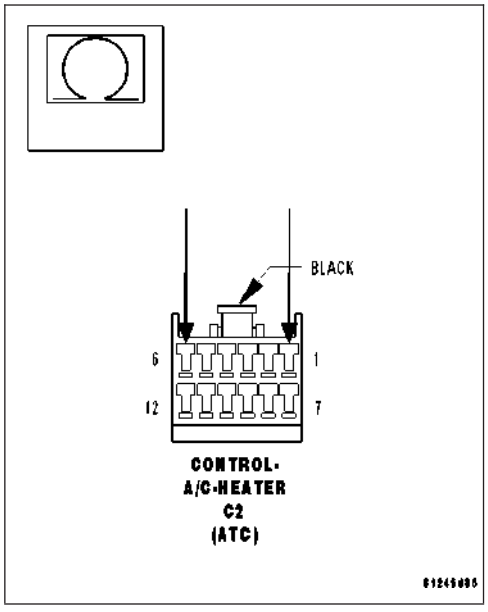
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR A SHORT TO (C931) REAR BLEND SENSE RETURN CIRCUIT

Measure the resistance between the (C800) Rear Blend Sense Supply circuit and the (C931) Rear Blend Sense Return circuit in the A/C Heater Control C2 harness connector.



Is the resistance below 10k ohms?

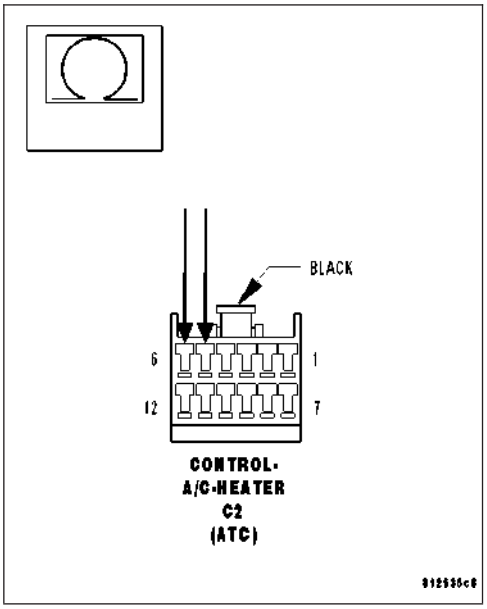
Yes >> Go To 4

No >> Go To 4

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO (C931) REAR BLEND SENSE RETURN CIRCUIT

Measure the resistance between the (C22) Rear Blend Sense circuit and the (C931) Rear Blend Sense Return circuit in the A/C Heater Control C2 harness connector.



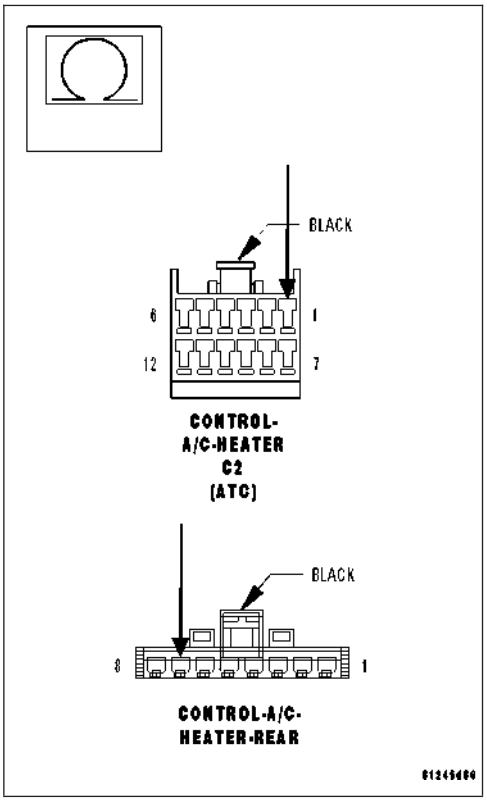
Is the resistance below 10k ohms on either of the circuits tested in Steps 3 & 4?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C931) Rear Blend Sense Return circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (C800) Rear Blend Sense Supply circuit between the A/C Heater Control C2 harness connector and the Rear A/C Heater Control harness connector.

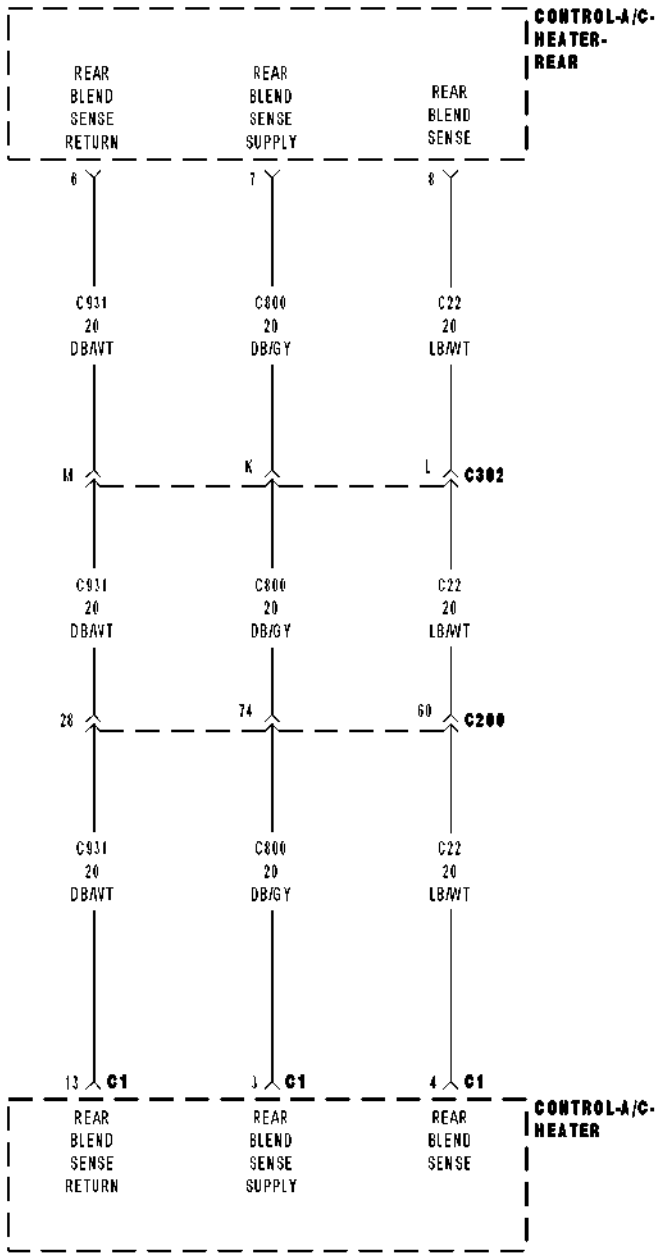


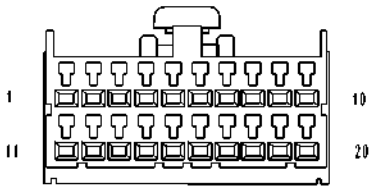
Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

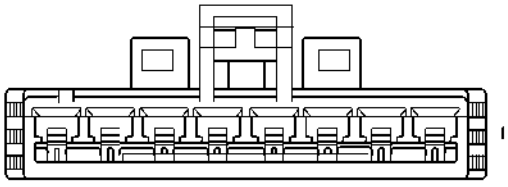
No >> Repair the (C800) Rear Blend Sense Supply circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (MTC)





CONTROL-A/C-HEATER C1 (MTC)



CONTROL-A/C-HEATER-REAR

816503ca

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the rear blend pot is out of range towards the low voltage threshold. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

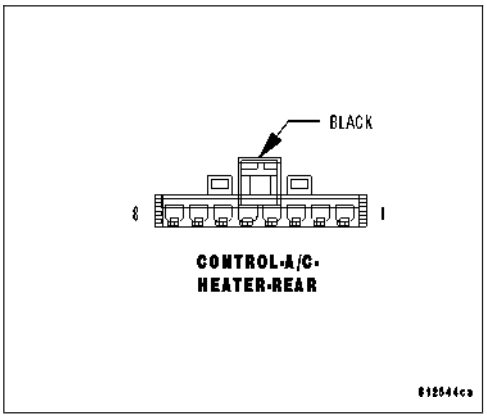
Possible Causes
(C800) REAR BLEND SENSE SUPPLY CIRCUIT SHORTED TO GROUND, TO (C931) REAR BLEND SENSE RETURN CIRCUIT, OR OPEN
(C22) REAR BLEND SENSE CIRCUIT SHORTED TO GROUND OR TO (C931) REAR BLEND SENSE RETURN CIRCUIT
REAR A/C HEATER CONTROL
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW WITH REAR A/C HEATER CONTROL DISCONNECTED

Turn the ignition off.
Disconnect the Rear A/C Heater Control harness connector.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
With the scan tool, read HAVC DTCs.



Does the scan tool display: B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW?

Yes >> Go To 2

No >> Replace the Rear A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (MTC) (CONTINUED)

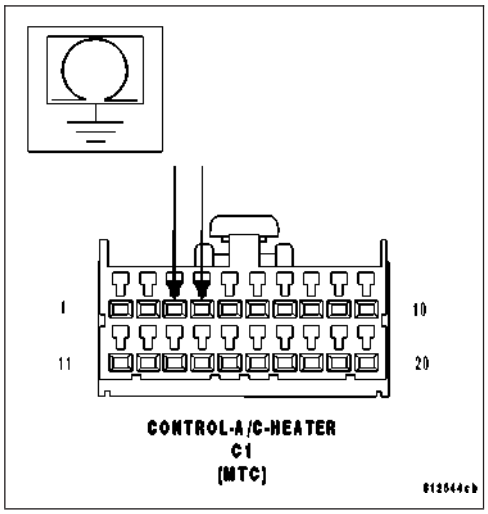
2. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C800) Rear Blend Sense Supply circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C22) Rear Blend Sense circuit between ground and the A/C Heater Control C1 harness connector.



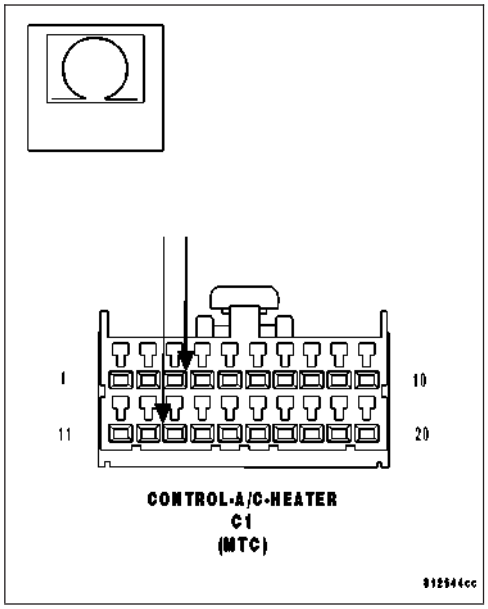
Is the resistance below 10k ohms on either of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR A SHORT TO (C931) REAR BLEND SENSE RETURN CIRCUIT

Measure the resistance between the (C800) Rear Blend Sense Supply circuit and the (C931) Rear Blend Sense Return circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

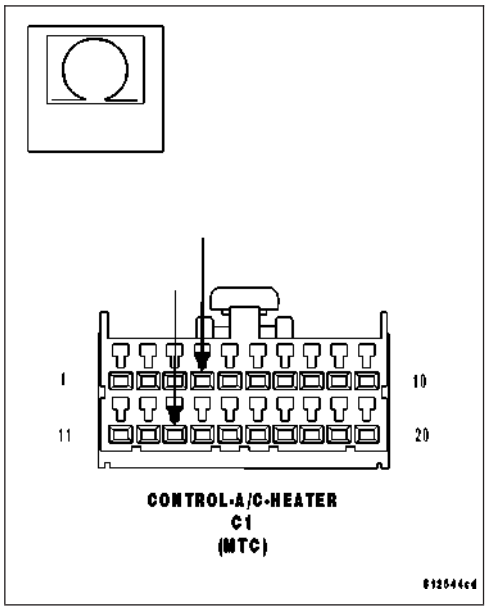
Yes >> Go To 4

No >> Go To 4

B102E–REAR BLEND REQUEST INPUT CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO (C931) REAR BLEND SENSE RETURN CIRCUIT

Measure the resistance between the (C22) Rear Blend Sense circuit and the (C931) Rear Blend Sense Return circuit in the A/C Heater Control C1 harness connector.



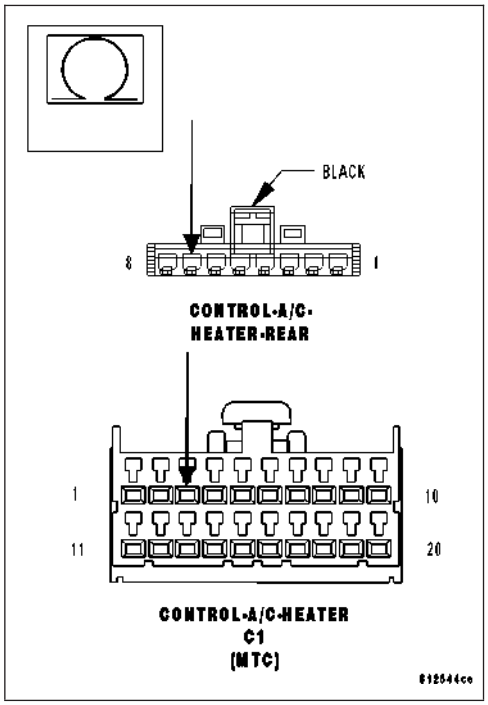
Is the resistance below 10k ohms on either of the circuits tested in Steps 3 & 4?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C931) Rear Blend Sense Return circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (C800) Rear Blend Sense Supply circuit between the A/C Heater Control C1 harness connector and the Rear A/C Heater Control harness connector.

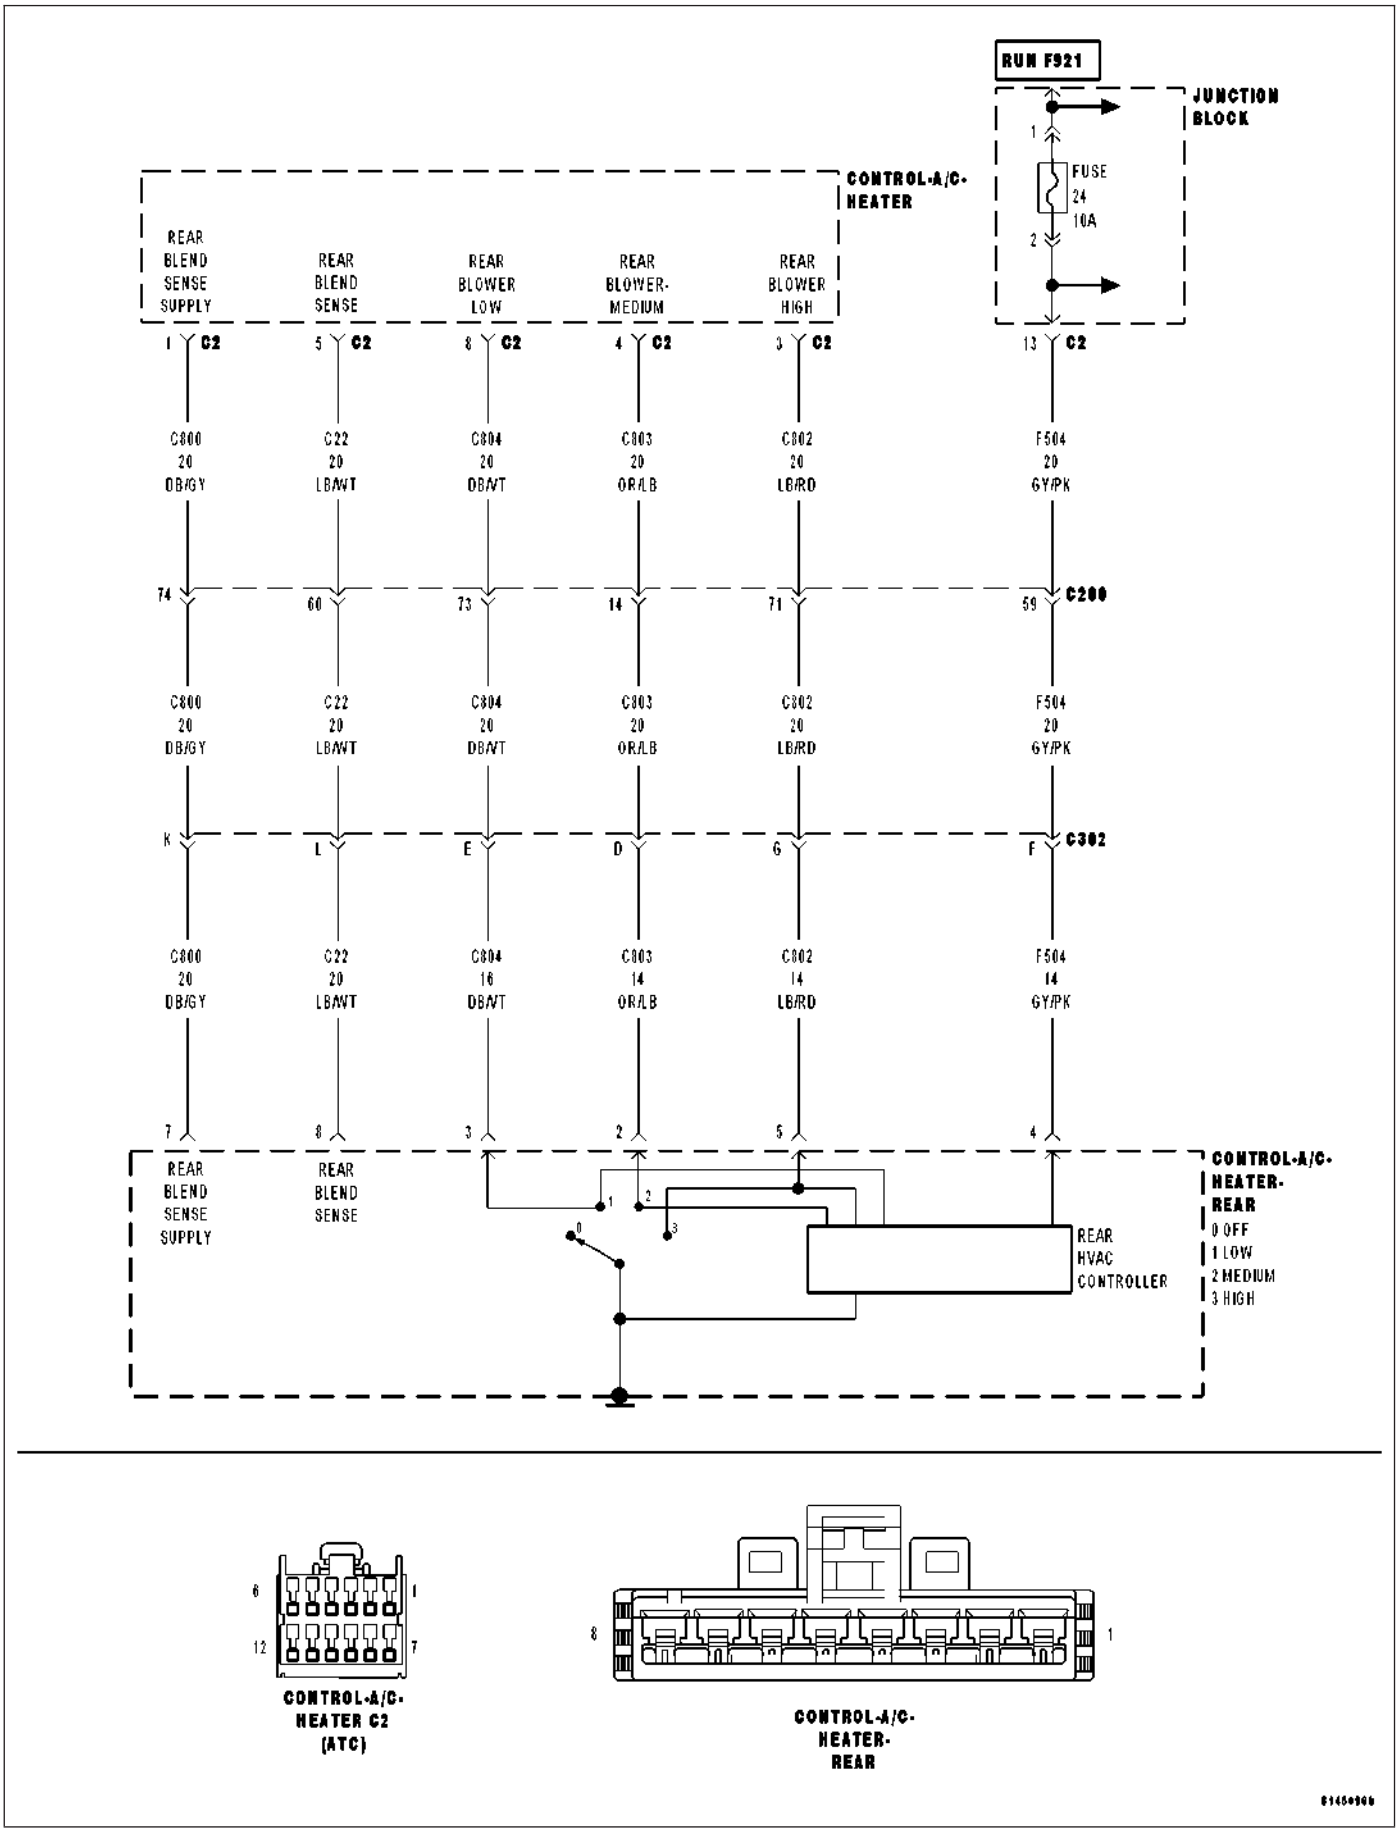


Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C800) Rear Blend Sense Supply circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (ATC)



B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the rear blend pot is out of range towards the high voltage threshold. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

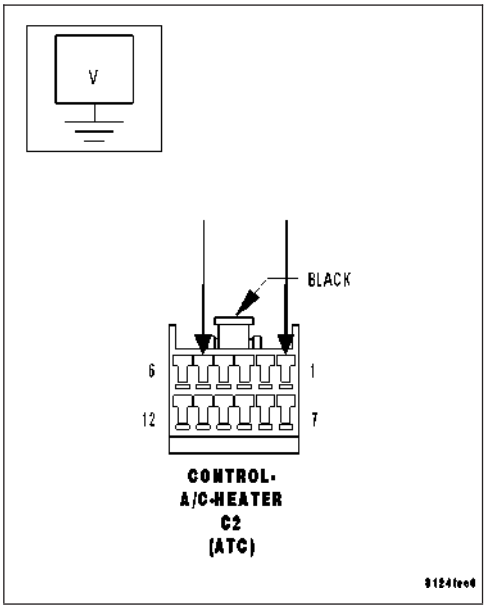
Possible Causes
(C800) REAR BLEND SENSE SUPPLY CIRCUIT SHORTED TO VOLTAGE
(C22) REAR BLEND SENSE CIRCUIT SHORTED TO VOLTAGE
(C800) REAR BLEND SENSE SUPPLY CIRCUIT SHORTED TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT, TO (C804) REAR BLOWER LOW CIRCUIT, TO (C803) REAR BLOWER MEDIUM CIRCUIT, OR TO (C802) REAR BLOWER HIGH CIRCUIT
(C22) REAR BLEND SENSE CIRCUIT SHORTED TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT, TO (C804) REAR BLOWER LOW CIRCUIT, TO (C803) REAR BLOWER MEDIUM CIRCUIT, OR TO (C802) REAR BLOWER HIGH CIRCUIT
(C22) REAR BLEND SENSE CIRCUIT OPEN
REAR A/C HEATER CONTROL
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK VOLTAGE OF (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Turn the ignition on.
Measure the voltage of the (C800) Rear Blend Sense Supply circuit.
Measure the voltage of the (C22) Rear Blend Sense circuit.



Is the voltage above 0.2 volts on either of the circuits?

Yes >> Go To 2

No >> Go To 5

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO VOLTAGE

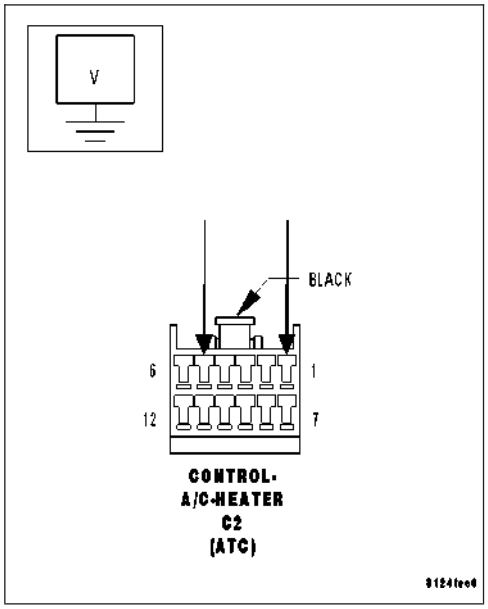
Turn the ignition off.

Remove Junction Block Fuse 24.

Turn the ignition on.

Measure the voltage of the (C800) Rear Blend Sense Supply circuit.

Measure the voltage of the (C22) Rear Blend Sense circuit.



Is the voltage above 0.2 volts on either of the circuits?

Yes >> Repair the circuit(s) with voltage above 0.2 volts for a short to voltage.

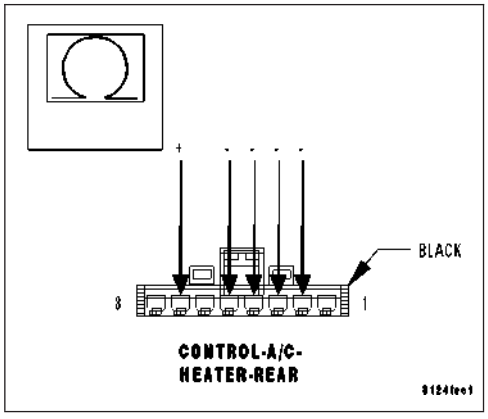
No >> Go To 3

3. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR A SHORT TO (C802) REAR BLOWER HIGH CIRCUIT, (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT, (C804) REAR BLOWER LOW CIRCUIT, & (C803) REAR BLOWER MEDIUM CIRCUIT

Turn the ignition off.

Disconnect the Rear A/C Heater Control harness connector.

Measure the resistance between the (C800) Rear Blend Sense Supply circuit and the (C802) Rear Blower High circuit, the (F504) Fused Ignition Switch Output (Run) circuit, the (C804) Rear Blower Low circuit, and the (C803) Rear Blower Medium circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms on any of the circuits?

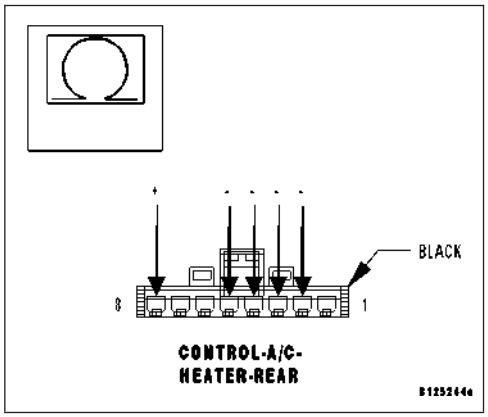
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C800) Rear Blend Sense Supply circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (ATC) (CONTINUED)

4. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO (C802) REAR BLOWER HIGH CIRCUIT, (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT, (C804) REAR BLOWER LOW CIRCUIT, & (C803) REAR BLOWER MEDIUM CIRCUIT

Measure the resistance between the (C22) Rear Blend Sense circuit and the (C802) Rear Blower High circuit, the (F504) Fused Ignition Switch Output (Run) circuit, the (C804) Rear Blower Low circuit, and the (C803) Rear Blower Medium circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C22) Rear Blend Sense circuit.
Perform BODY VERIFICATION TEST - VER 1.

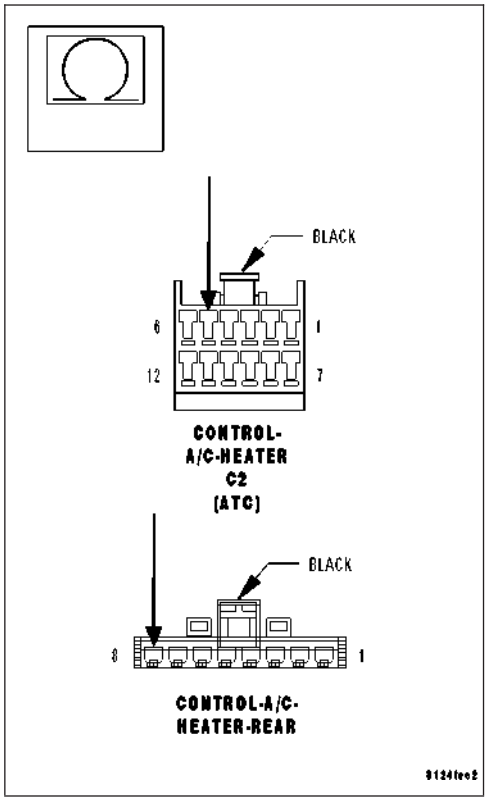
No >> Go To 5

5. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR AN OPEN

If not done so previously, turn the ignition off.

If not done so previously, disconnect the Rear A/C Heater Control harness connector.

Measure the resistance of the (C22) Rear Blend Sense circuit between the A/C Heater Control C2 harness connector and the Rear A/C Heater Control harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (C22) Rear Blend Sense circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (ATC) (CONTINUED)

6. CHECK REAR BLEND CONTROL

Check the Rear Blend control in the Rear A/C Heater Control as follows:

Turn the Rear Blend control on the Rear A/C Heater Control to the full hot position.

Measure the resistance between the Rear Blend Supply terminal and the Rear Blend Sense terminal in the Rear A/C Heater Control. The resistance should be approximately 2.5k ohms.

Slowly rotate the Rear Blend control from full hot to full cold while observing the DVOM. The reading should change fluidly from approximately 2.5k to 12k ohms.

Measure the resistance between the Rear Blend Supply terminal and the Rear Blend Return terminal in the Rear A/C Heater Control. The resistance should be approximately 10k ohms.

Slowly rotate the Rear Blend control from full cold to full hot while observing the DVOM. The reading should remain steady at approximately 10k ohms.

With the Rear Blend control in full hot, measure the resistance between the Rear Blend Sense terminal and the Rear Blend Return terminal in the Rear A/C Heater Control. The resistance should be approximately 11k ohms.

Slowly rotate the Rear Blend control from full hot to full cold while observing the DVOM. The reading should change fluidly from approximately 11k to 2.5k ohms.

Are the resistance readings as specified?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the rear blend pot is out of range towards the high voltage threshold. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C800) REAR BLEND SENSE SUPPLY CIRCUIT SHORTED TO VOLTAGE, TO (F504) IGNITION SWITCH OUTPUT (RUN) CIRCUIT, OR TO (C50) REAR BLOWER CONTROL FEED CIRCUIT
(C22) REAR BLEND SENSE CIRCUIT SHORTED TO VOLTAGE, TO (F504) IGNITION SWITCH OUTPUT (RUN) CIRCUIT, TO (C50) REAR BLOWER CONTROL FEED CIRCUIT, OR OPEN
REAR A/C HEATER CONTROL
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

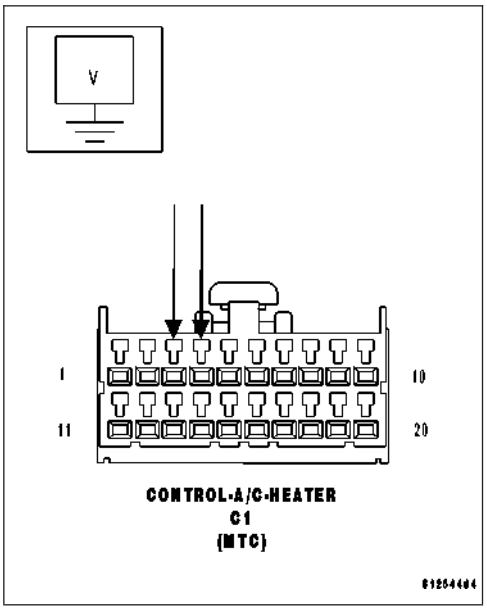
1. CHECK VOLTAGE OF (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT

Turn the ignition off.
Disconnect the A/C Heater Control C1 harness connector.
Turn the ignition on.
Measure the voltage of the (C800) Rear Blend Sense Supply circuit.
Measure the voltage of the (C22) Rear Blend Sense circuit.

Is the voltage above 0.2 volts on either of the circuits?

Yes >> Go To 2

No >> Go To 7



B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (MTC) (CONTINUED)

2. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT & (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO VOLTAGE

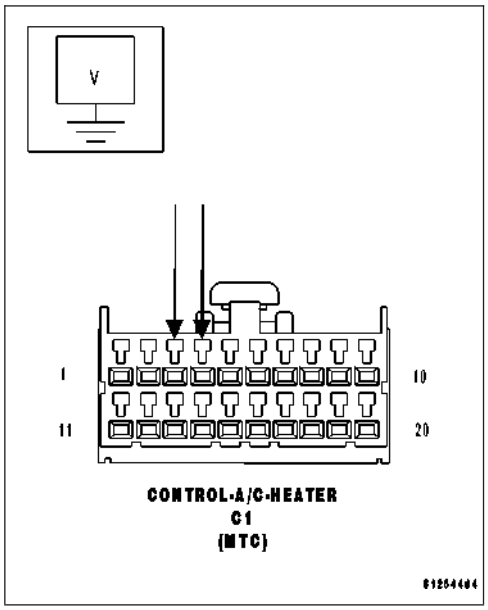
Turn the ignition off.

Remove Junction Block Fuse 24.

Turn the ignition on.

Measure the voltage of the (C800) Rear Blend Sense Supply circuit.

Measure the voltage of the (C22) Rear Blend Sense circuit.



Is the voltage above 0.2 volts on either of the circuits?

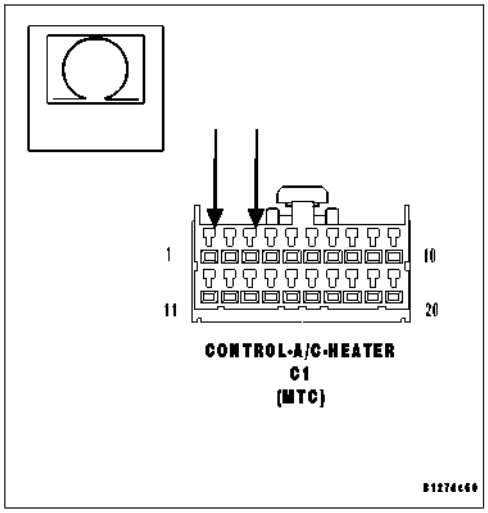
Yes >> Repair the circuit(s) with voltage above 0.2 volts for a short to voltage.

No >> Go To 3

3. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR A SHORT TO (F504) IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Turn the ignition off.

Measure the resistance between the (C800) Rear Blend Sense Supply circuit and the (F504) Ignition Switch Output (Run) circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

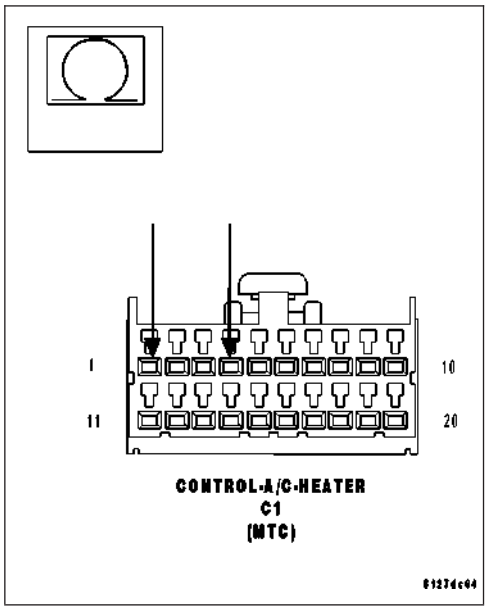
Yes >> Repair the (C800) Rear Blend Sense Supply circuit for a short to the (F504) Ignition Switch Output (Run) circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (MTC) (CONTINUED)

4. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO (F504) IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Measure the resistance between the (C22) Rear Blend Sense circuit and the (F504) Ignition Switch Output (Run) circuit the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C22) Rear Blend Sense circuit for a short to the (F504) Ignition Switch Output (Run) circuit.
Perform BODY VERIFICATION TEST - VER 1.

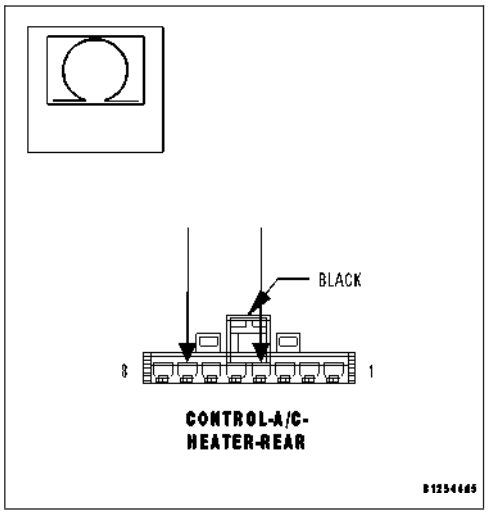
No >> Go To 5

5. CHECK (C800) REAR BLEND SENSE SUPPLY CIRCUIT FOR A SHORT TO (C50) REAR BLOWER CONTROL FEED CIRCUIT

Disconnect the A/C Heater Control C2 harness connector.

Disconnect the Rear A/C Heater Control harness connector.

Measure the resistance between the (C800) Rear Blend Sense Supply circuit and the (C50) Rear Blower Control Feed circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C800) Rear Blend Sense Supply circuit for a short to the (C50) Rear Blower Control Feed circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (MTC) (CONTINUED)

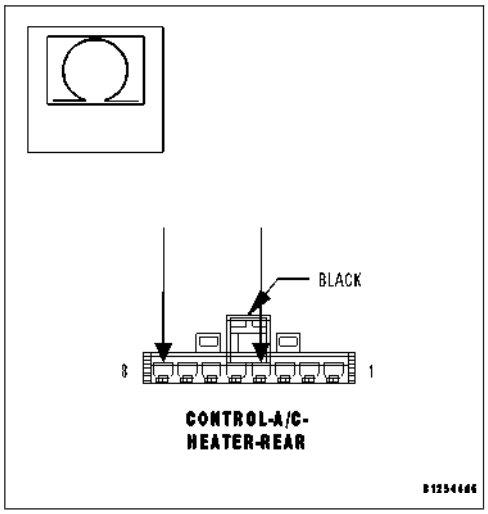
6. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR A SHORT TO (C50) REAR BLOWER CONTROL FEED CIRCUIT

Measure the resistance between the (C22) Rear Blend Sense circuit and the (C50) Rear Blower Control Feed circuit in the Rear A/C Heater Control harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C22) Rear Blend Sense circuit for a short to the (C50) Rear Blower Control Feed circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 7



7. CHECK (C22) REAR BLEND SENSE CIRCUIT FOR AN OPEN

If not done so previously, turn the ignition off.

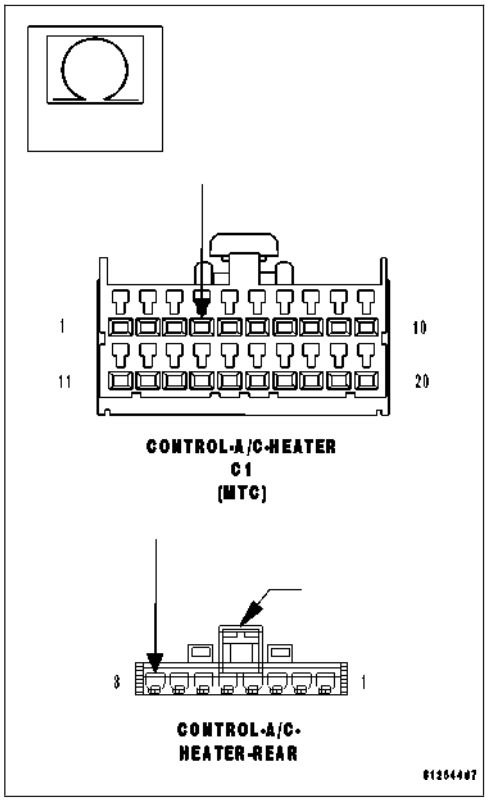
If not done so previously, disconnect the Rear A/C Heater Control harness connector.

Measure the resistance of the (C22) Rear Blend Sense circuit between the A/C Heater Control C1 harness connector and the Rear A/C Heater Control harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 8

No >> Repair the (C22) Rear Blend Sense circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B102F–REAR BLEND REQUEST INPUT CIRCUIT HIGH (MTC) (CONTINUED)

8. CHECK REAR BLEND CONTROL

Check the Rear Blend control in the Rear A/C Heater Control as follows:

Turn the Rear Blend control on the Rear A/C Heater Control to the full hot position.

Measure the resistance between the Rear Blend Supply terminal and the Rear Blend Sense terminal in the Rear A/C Heater Control. The resistance should be approximately 2.5k ohms.

Slowly rotate the Rear Blend control from full hot to full cold while observing the DVOM. The reading should change fluidly from approximately 2.5k to 12k ohms.

Measure the resistance between the Rear Blend Supply terminal and the Rear Blend Return terminal in the Rear A/C Heater Control. The resistance should be approximately 10k ohms.

Slowly rotate the Rear Blend control from full cold to full hot while observing the DVOM. The reading should remain steady at approximately 10k ohms.

With the Rear Blend control in full hot, measure the resistance between the Rear Blend Sense terminal and the Rear Blend Return terminal in the Rear A/C Heater Control. The resistance should be approximately 11k ohms.

Slowly rotate the Rear Blend control from full hot to full cold while observing the DVOM. The reading should change fluidly from approximately 11k to 2.5k ohms.

Are the resistance readings as specified?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B103A–REAR MODE DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C154) Rear Common Door Driver circuit, or the (C808) Common Door Driver 3 circuit while attempting to drive the Rear Mode Door Actuator, the Rear Blend Door Actuator, or the Mode Door 2 (Floor to Panel) Actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored, it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

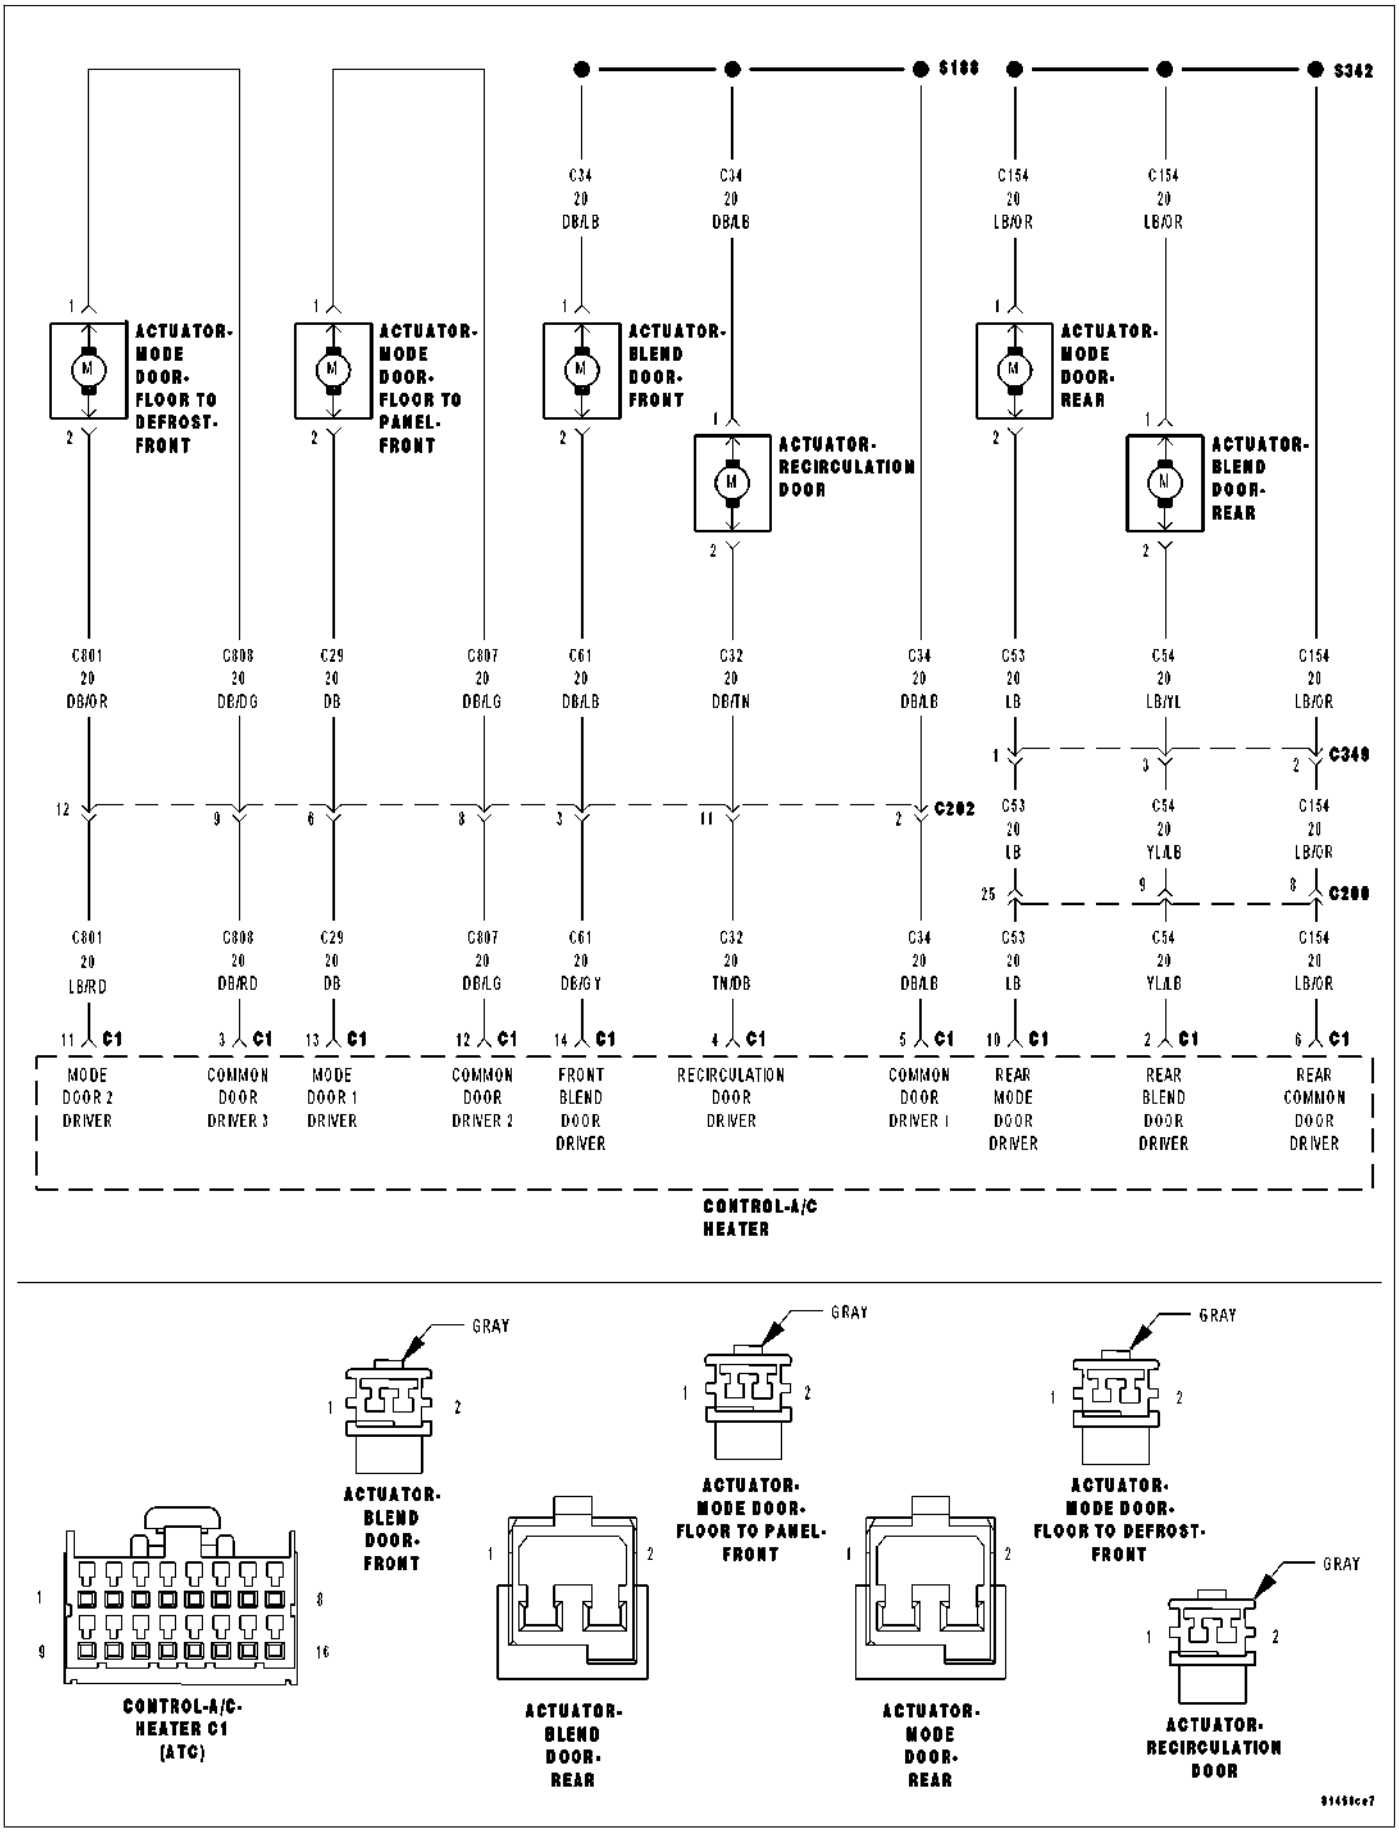
B103A–REAR MODE DOOR CONTROL CIRCUIT/PERFORMANCE (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (MTC) for stored DTC test procedures.

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC)



B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C154) Rear Common Door Driver circuit, or the (C808) Common Door Driver 3 circuit is shorted to ground.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C154) REAR COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C808) COMMON DOOR DRIVER 3 CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
REAR MODE DOOR ACTUATOR
REAR BLEND DOOR ACTUATOR
MODE DOOR 2 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. In addition, the Rear Mode Door Actuator, the Rear Blend Door Actuator, and the Mode Door 2 (Floor to Defrost) Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

Diagnostic Test

1. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT, (C54) REAR BLEND DOOR DRIVER CIRCUIT, (C808) COMMON DOOR DRIVER 3 CIRCUIT, (C154) REAR COMMON DOOR DRIVER CIRCUIT, & (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

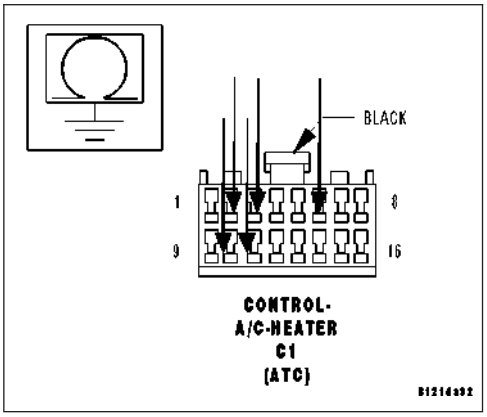
Measure the resistance of the (C53) Rear Mode Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C54) Rear Blend Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C808) Common Door Driver 3 Circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C154) Rear Common Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms on any of the circuits?

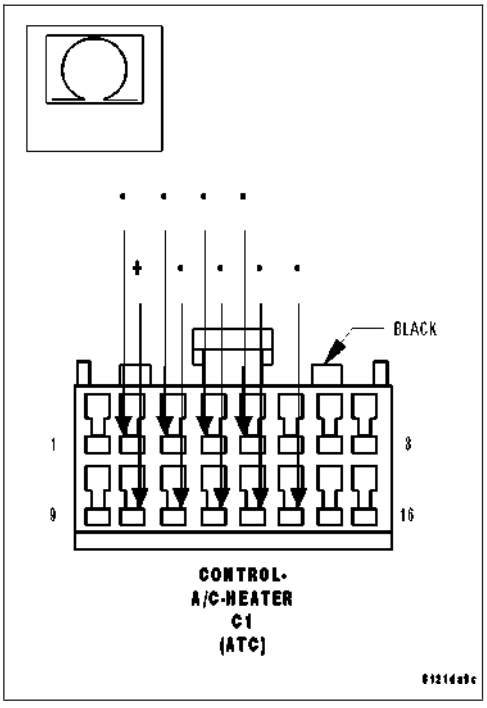
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

---

2. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

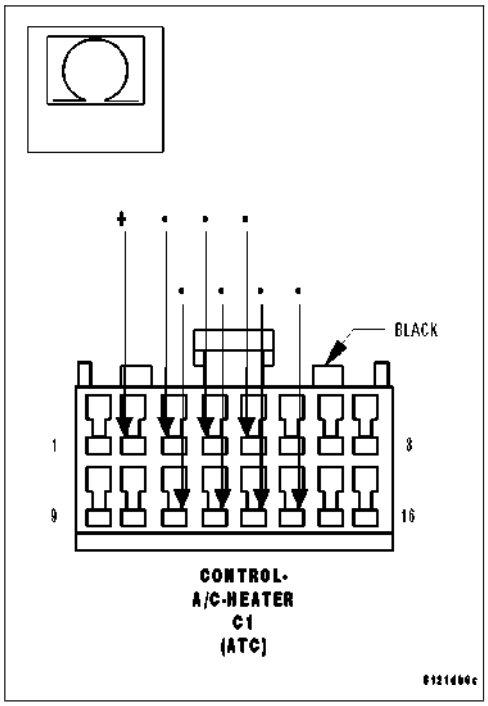
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

3. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



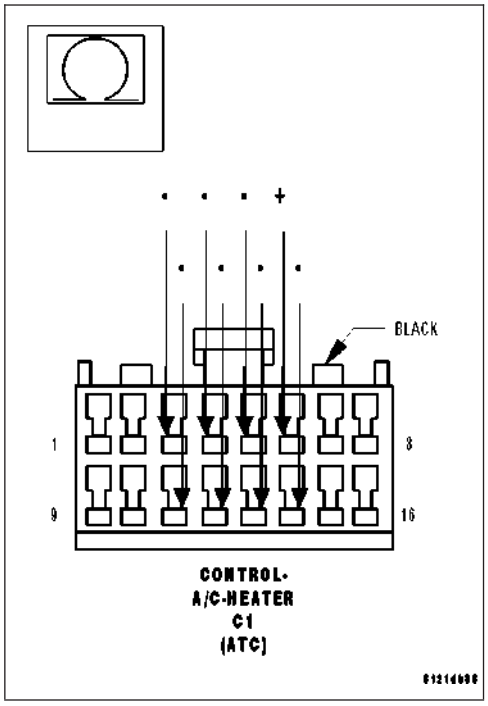
Is the resistance below 10k ohms between any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C154) Rear Common Door Driver circuit and the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

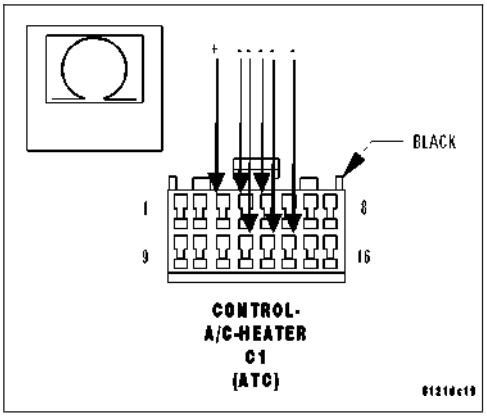
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

5. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C808) Common Door Driver 3 circuit and the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



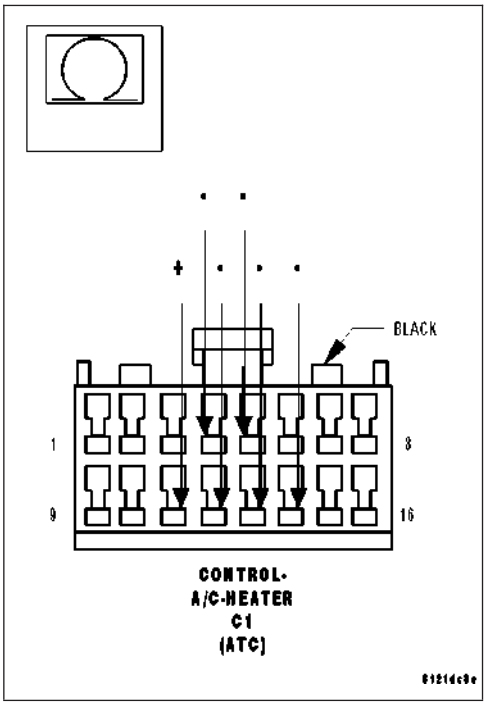
Is the resistance below 10k ohms between any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 7

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

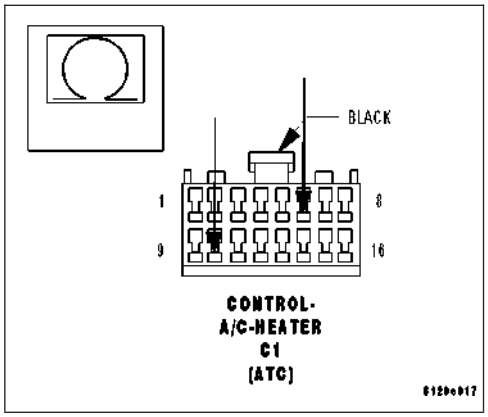
7. CHECK REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 30 ohms?

Yes >> Go To 8

No >> Go To 9



8. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

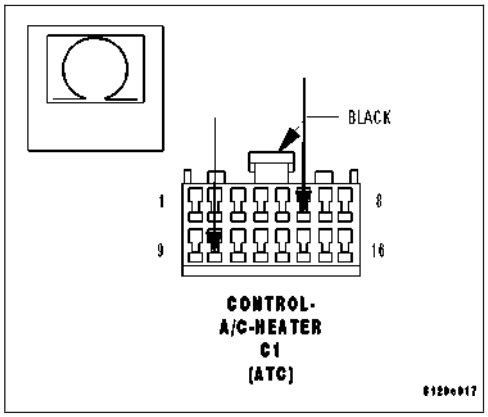
Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C53) Rear Mode Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



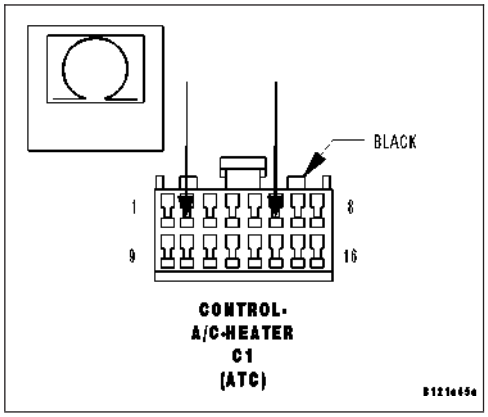
9. CHECK REAR BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 30 ohms?

Yes >> Go To 10

No >> Go To 11

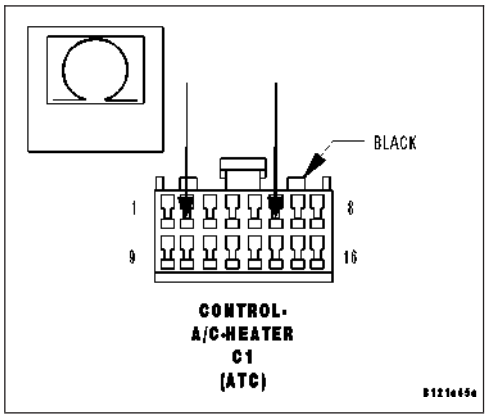


B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

10. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

Disconnect the Rear Blend Door Actuator harness connector.

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



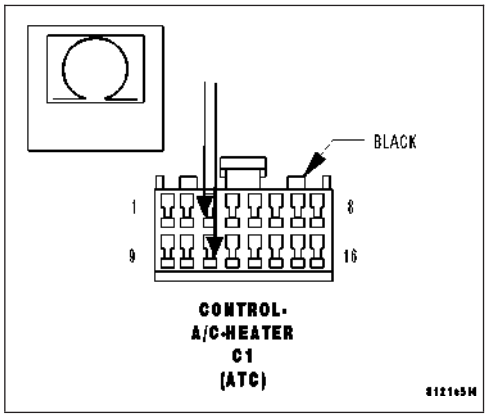
Is the resistance below 10k ohms?

Yes >> Repair the (C54) Rear Blend Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

11. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

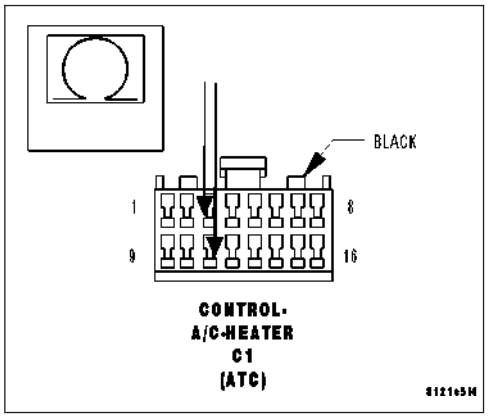
Yes >> Go To 12

No >> Go To 13

12. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C808) COMMON DOOR DRIVER 3 CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to the (C808) Common Door Driver 3 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

13. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

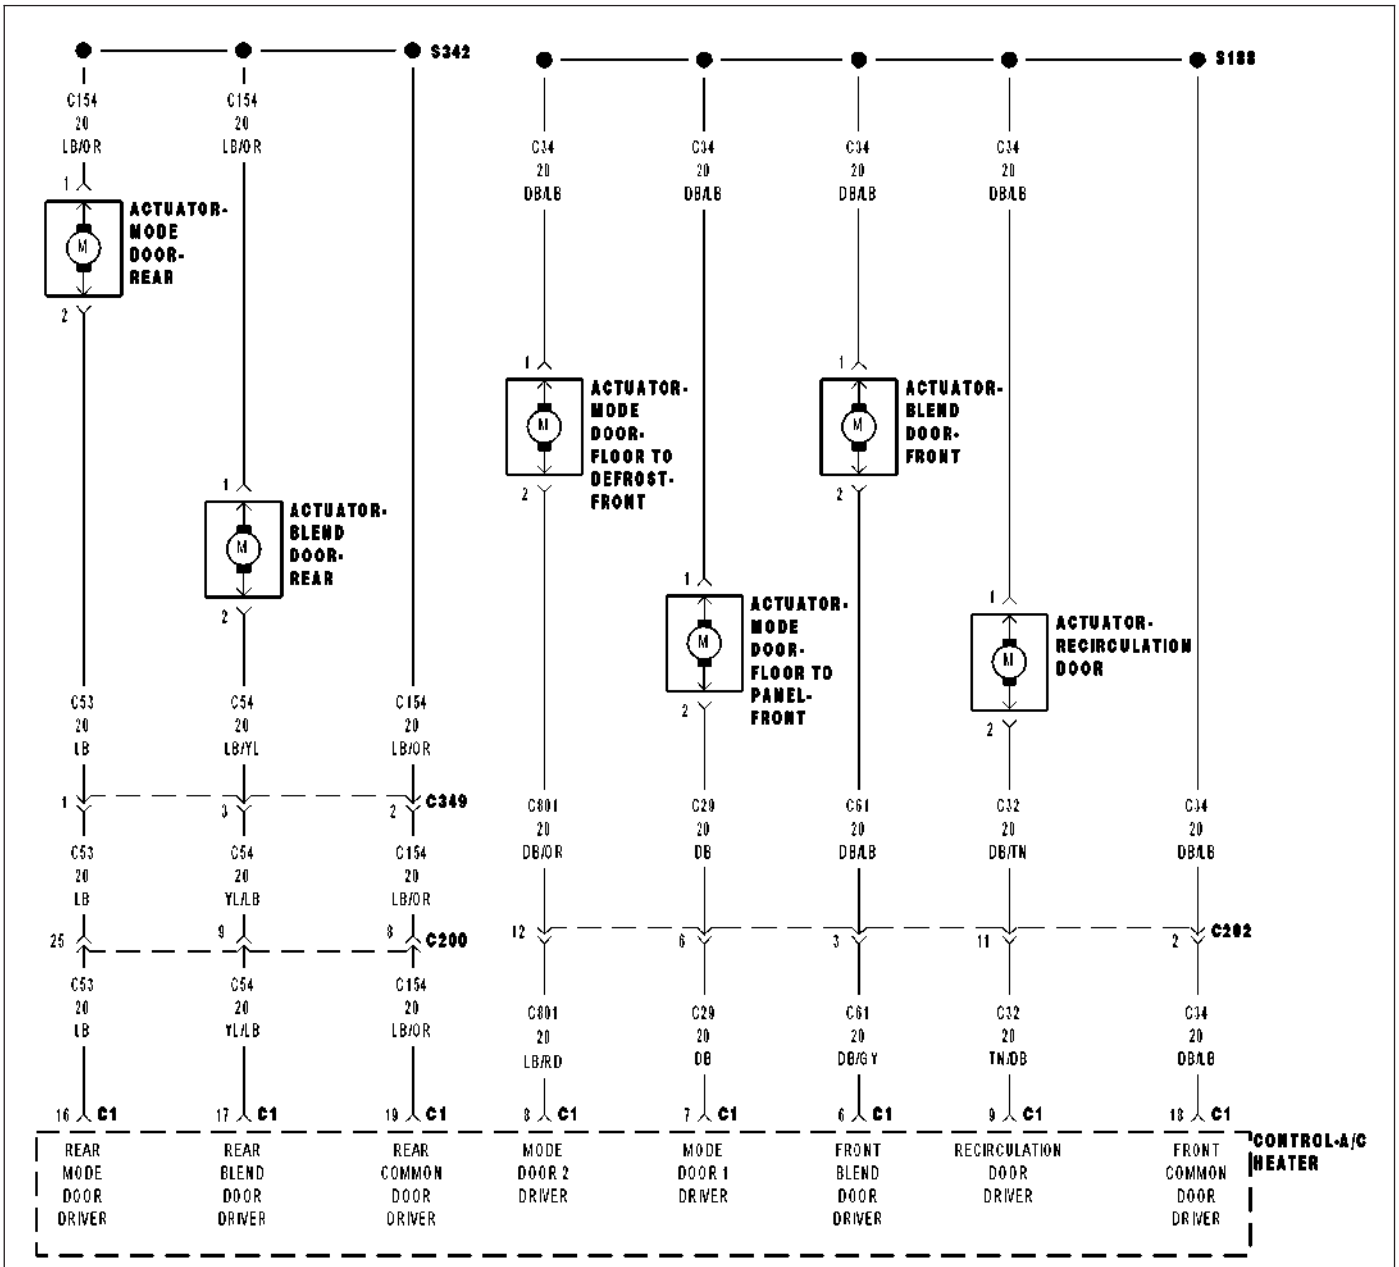
Does the scan tool only display: B103B–REAR MODE DOOR CONTROL CIRCUIT LOW?

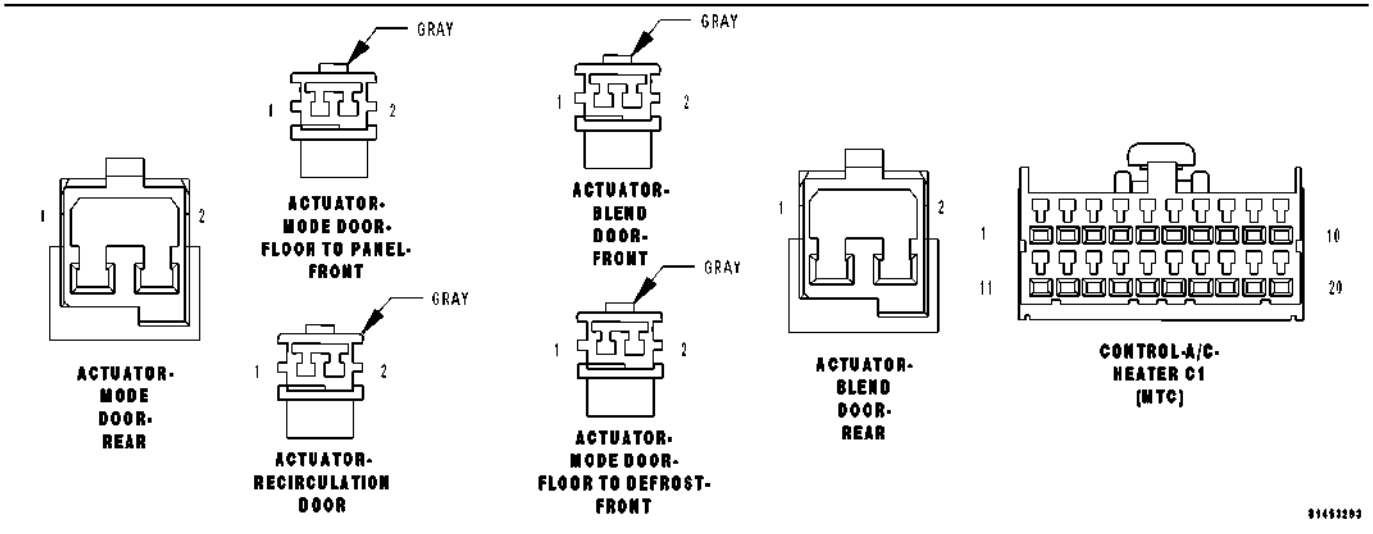
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (MTC)





B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C53) Rear Mode Door Driver circuit is shorted to ground.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C154) REAR COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C53) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C154) REAR COMMON DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

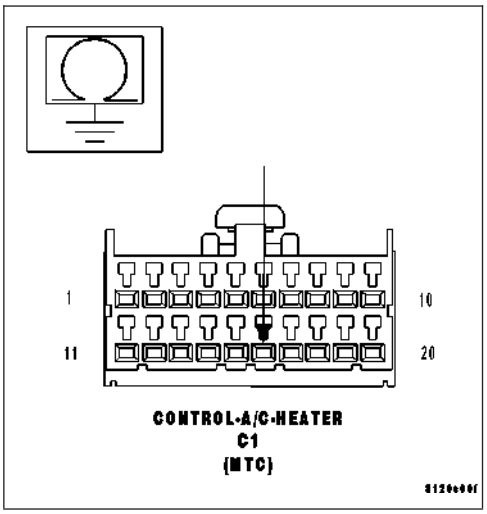
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C53) Rear Mode Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C53) Rear Mode Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

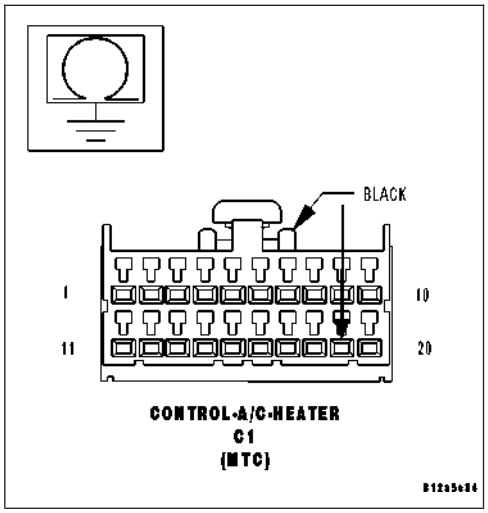
No >> Go To 2



B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Measure the resistance of the (C154) Rear Common Door Driver circuit between ground and the A/C Heater Control C1 harness connector.



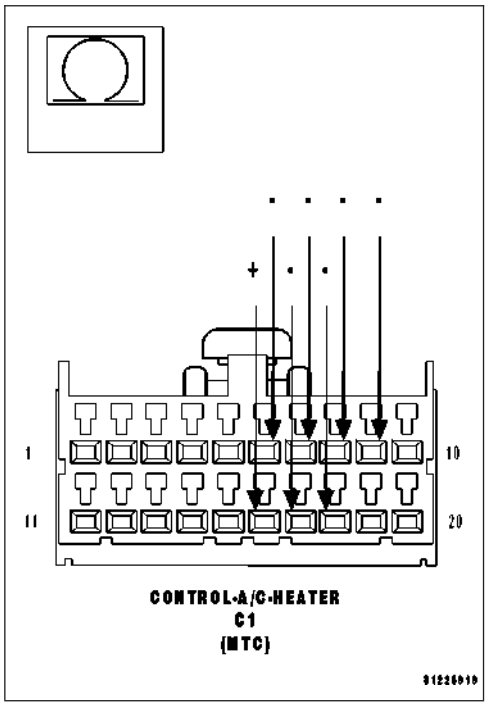
Is the resistance below 10k ohms?

Yes >> Repair the (C154) Rear Common Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C61) Front Blend Door Driver circuit, the (C29) Mode Door 1 Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C32) Recirculation Door Driver circuit, the (C54) Rear Blend Door Driver circuit, and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between the (C53) Rear Mode Door Driver circuit and any of the other door driver circuits?

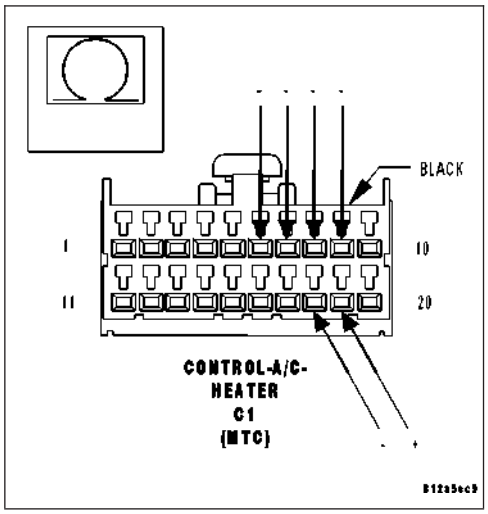
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C53) Rear Mode Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C154) Rear Common Door Driver circuit and the (C61) Front Blend Door Driver circuit, the (C29) Mode Door 1 Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C32) Recirculation Door Driver circuit, and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



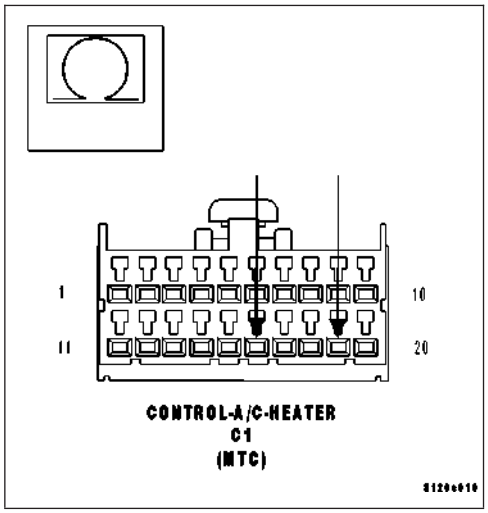
Is the resistance below 10k ohms between the (C154) Rear Common Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 6

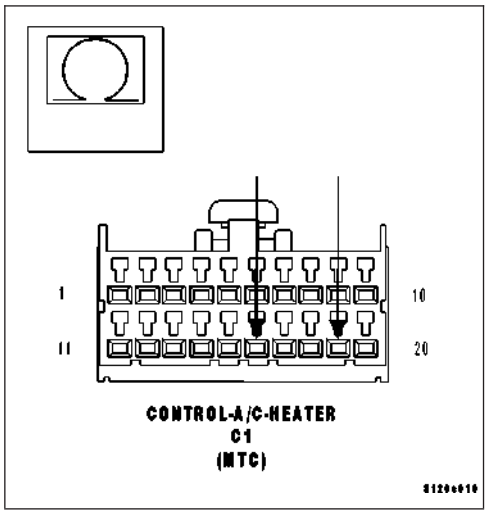
No >> Go To 7

B103B–REAR MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

6. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C53) Rear Mode Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

7. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B103B–REAR MODE DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B103C–REAR MODE DOOR CONTROL CIRCUIT HIGH (ATC)

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Mode Door Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT OPEN
(C154) REAR COMMON DOOR DRIVER CIRCUIT OPEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. In addition, the Rear Mode Door Actuator, the Rear Blend Door Actuator, and the Mode Door 2 (Floor to Defrost) Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B103D must be active for the results of this test to be valid. Do not perform this test if DTC B103D is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, then all other Control Circuit/Performance DTCs next. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

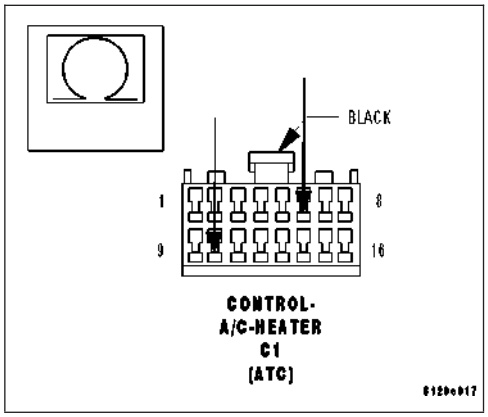
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR AN OPEN

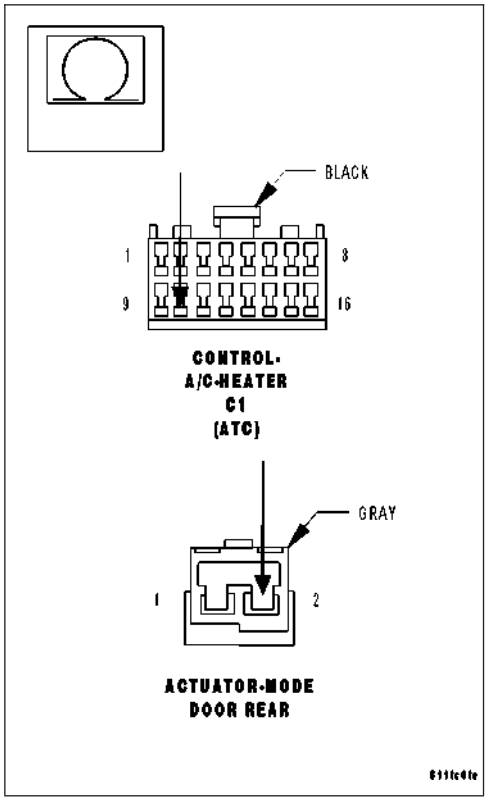
Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance of the (C53) Rear Mode Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

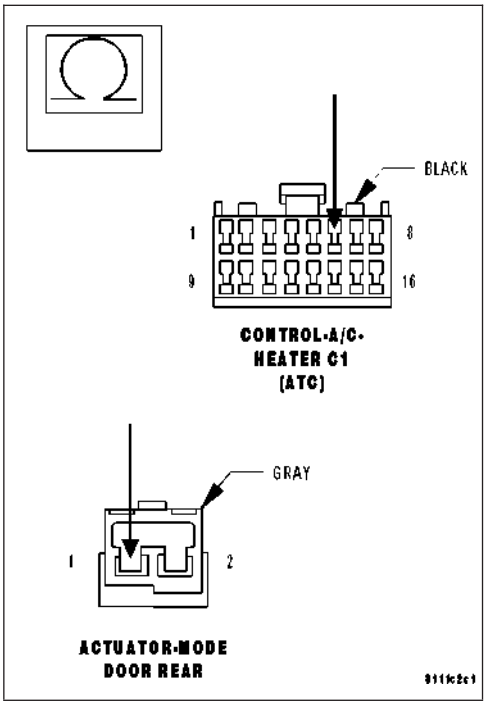
No >> Repair the (C53) Rear Mode Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C154) Rear Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Mode Door Actuator harness connector.

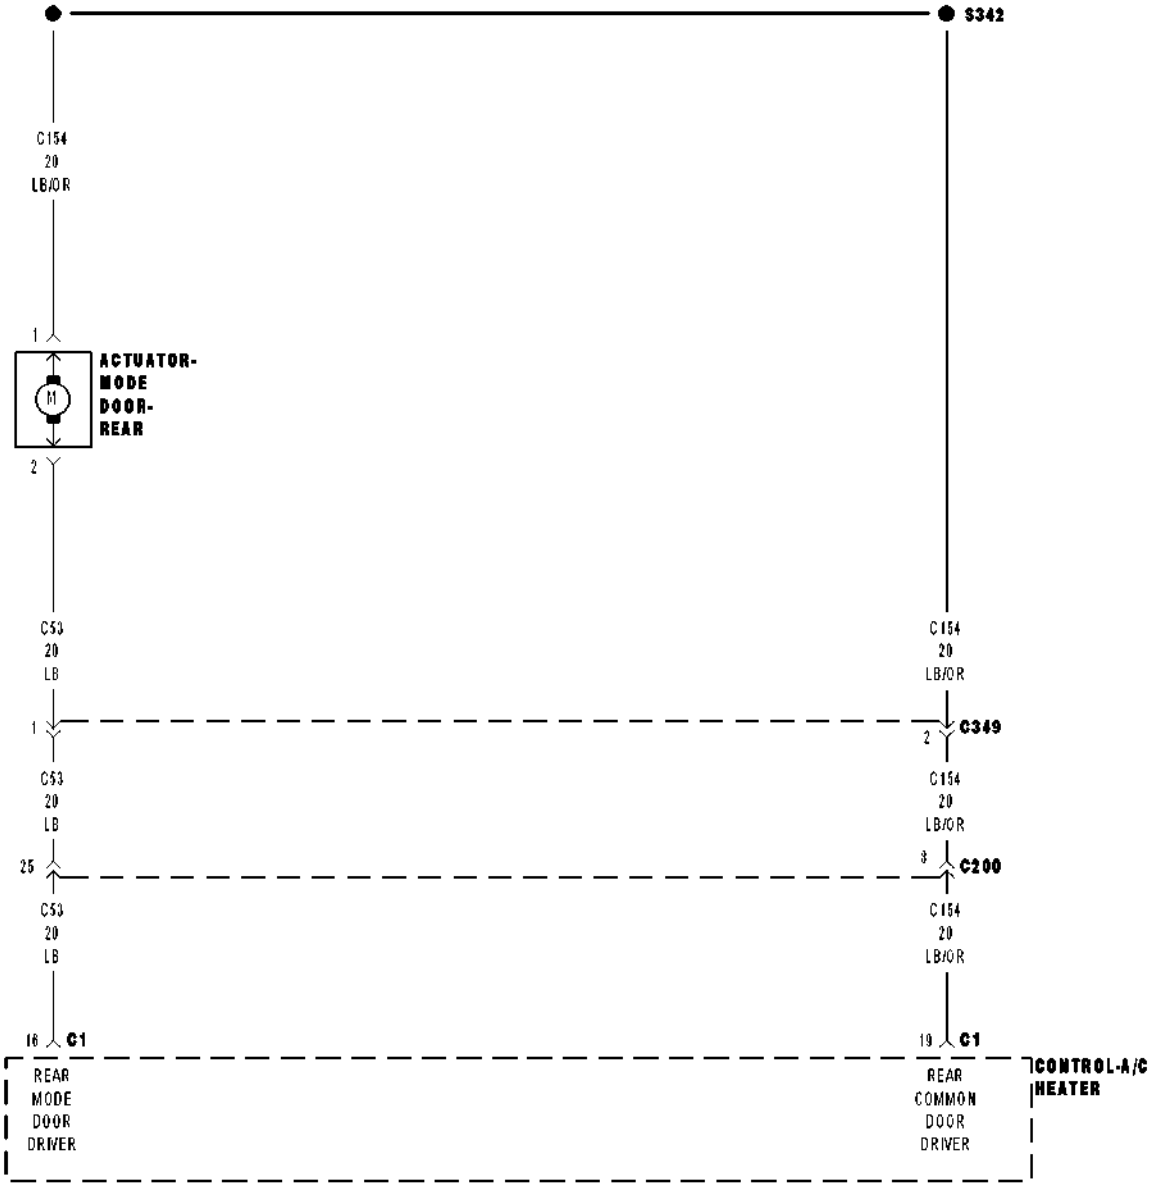


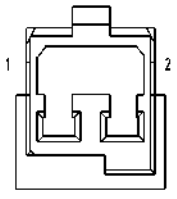
Is the resistance below 5.0 ohms?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

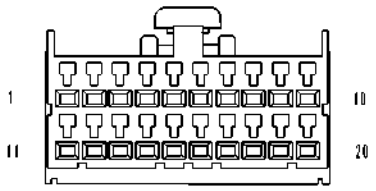
No >> Repair the (C154) Rear Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (MTC)





ACTUATOR-
MODE
DOOR-
REAR



CONTROL-A/C-
HEATER C1
(MTC)

81651856

B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Mode Door Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT OPEN
(C154) REAR COMMON DOOR DRIVER CIRCUIT OPEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B103D must be active for the results of this test to be valid. Do not perform this test if DTC B103D is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

2. CHECK REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

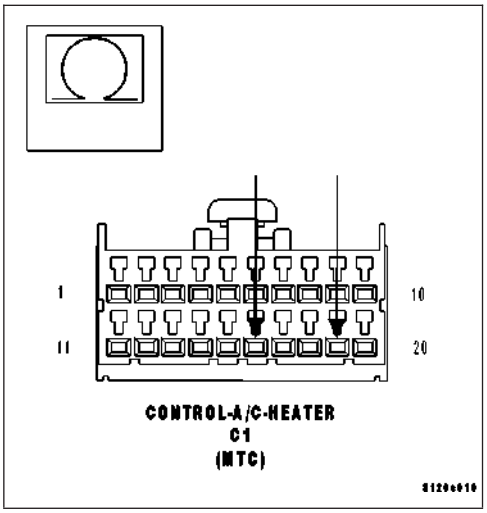
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR AN OPEN

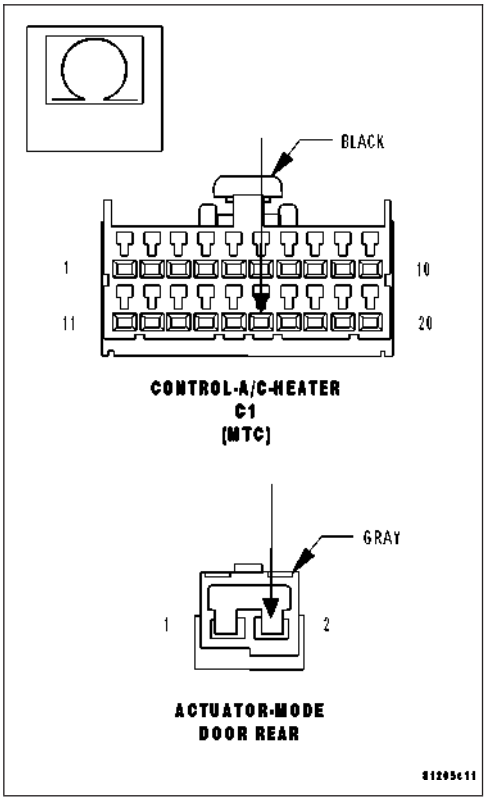
Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance of the (C53) Rear Mode Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

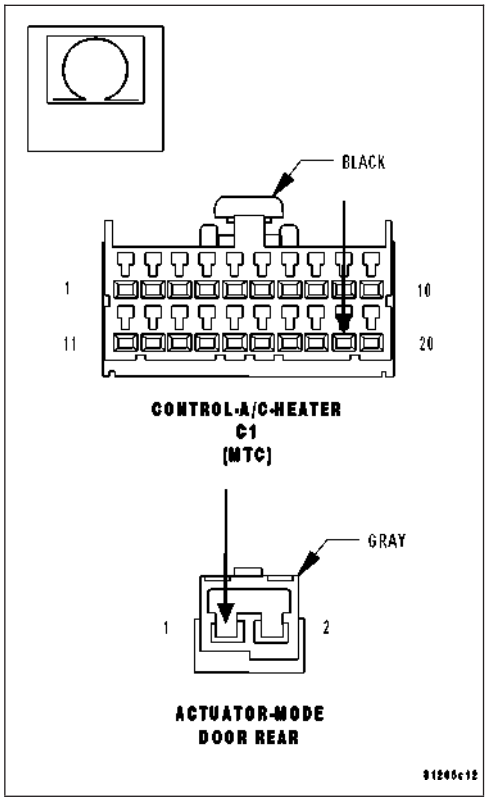
No >> Repair the (C53) Rear Mode Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B103D–REAR MODE DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C154) Rear Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Mode Door Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C154) Rear Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B103E–REAR MODE DOOR TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Rear Mode Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
REAR MODE DOOR SEIZED, BINDING, OBSTRUCTED
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B103E–REAR MODE DOOR TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator and the housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK REAR MODE DOOR TRAVEL

Remove the Rear Mode Door Actuator from the Rear A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 60 degrees of travel.

Does the door operate smoothly in both directions over approximately 60 degrees of travel?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B103E–REAR MODE DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B103F–REAR MODE DOOR TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Rear Mode Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
REAR MODE DOOR OR REAR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B103F–REAR MODE DOOR TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

---

3. CHECK FOR A BROKEN REAR MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Rear Mode Door Actuator from the Rear A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK REAR MODE DOOR & REAR A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for a damaged or broken Rear A/C Heater Housing Assembly, a warped, worn, or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 60 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B103F–REAR MODE DOOR TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B104A–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Mode 2 (Floor to Defrost) Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
MODE 2 (FLOOR TO DEFROST) DOOR SEIZED, BINDING, OBSTRUCTED
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B104A–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK MODE 2 (FLOOR TO DEFROST) DOOR TRAVEL

Remove the Mode Door 2 (Floor to Defrost) Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 100 degrees.

Does the door operate smoothly in both directions over approximately 100 degrees of travel?

Yes >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B104A–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B104B–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Mode 2 (Floor to Defrost) Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
MODE 2 (FLOOR TO DEFROST) DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B104B–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

---

3. CHECK FOR A BROKEN MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR

Turn the ignition off.

Remove the Mode Door 2 (Floor to Defrost) Actuator from the A/C Heater Housing assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK MODE 2 (FLOOR TO DEFROST) DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 100 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode 2 (Floor to Defrost) Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B104B–FLOOR/DEFROST MODE DOOR TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C61) Front Blend Door Driver circuit, the (C32) Recirculation Door Driver circuit, or the (C34) Common Door Driver 1 circuit while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ACTIVE) (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored, it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition on.

With the scan tool in HVAC, erase DTCs.

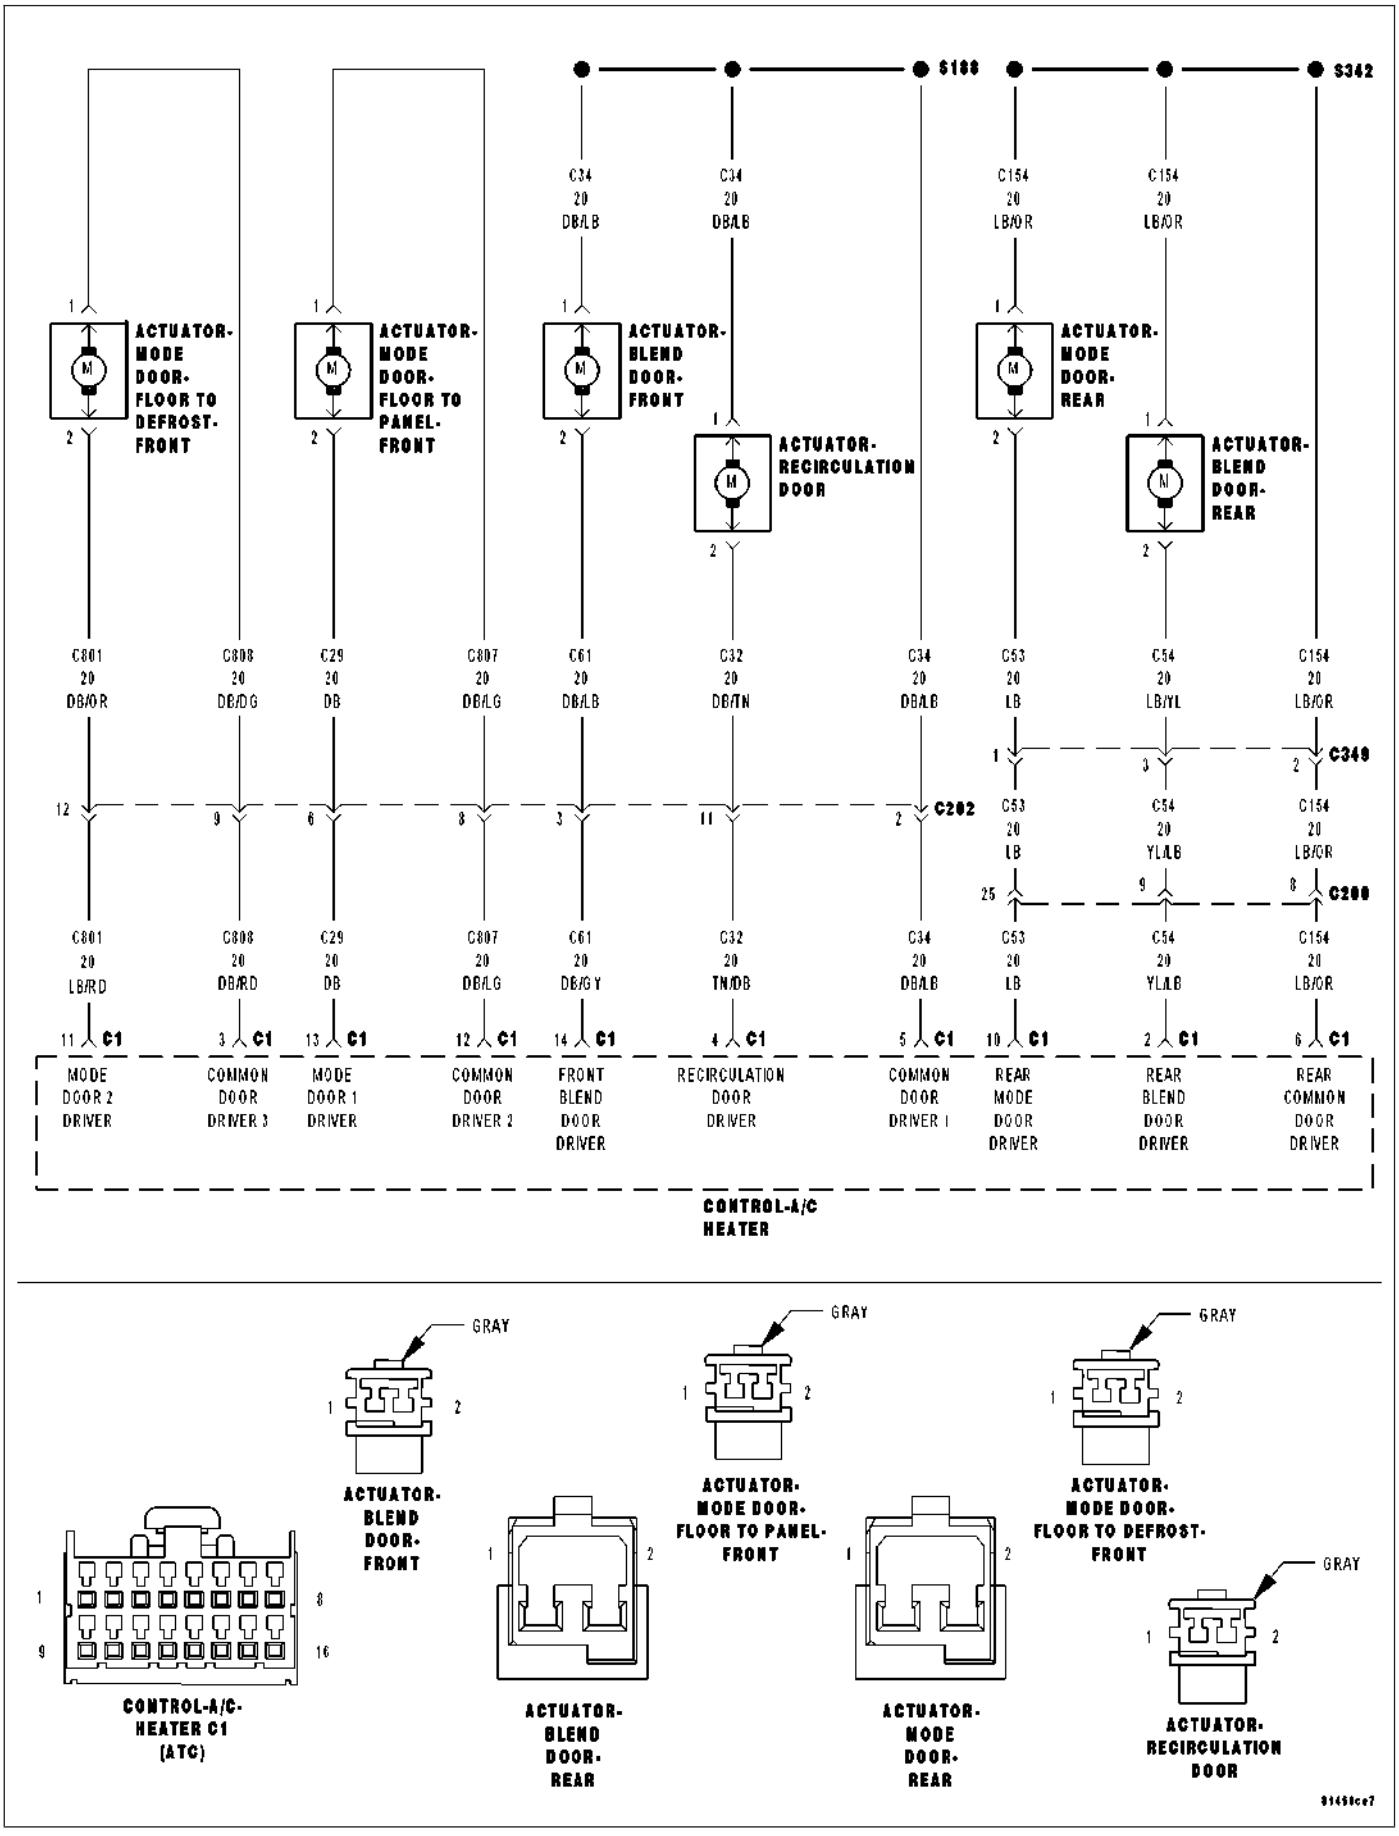
Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B104D–BLEND DOOR CONTROL CIRCUIT LOW (ATC)



B104D–BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C61) Front Blend Door Driver circuit is shorted to ground.

Possible Causes
(C61) FRONT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C61) FRONT BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Front Blend Door Actuator and the Recirculation Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

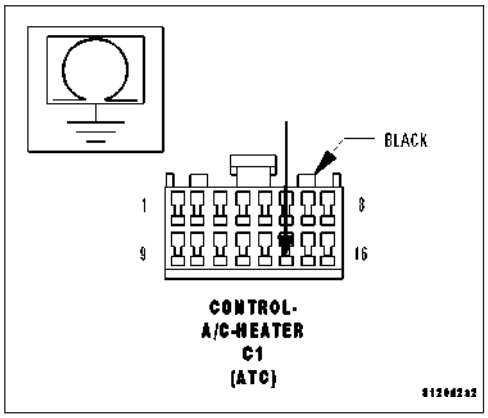
Diagnostic Test

1. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C61) Front Blend Door Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

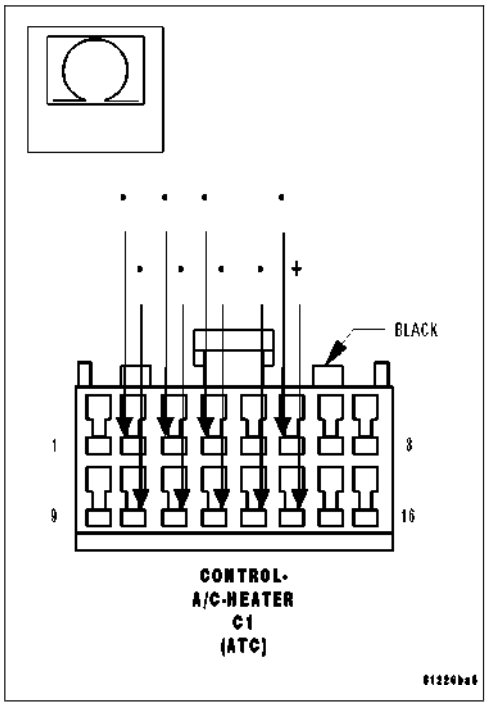
Yes >> Repair the (C61) Front Blend Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B104D–BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, and the (C29) Mode Door 1 Driver circuit in the A/C Heater Control C1 harness connector.



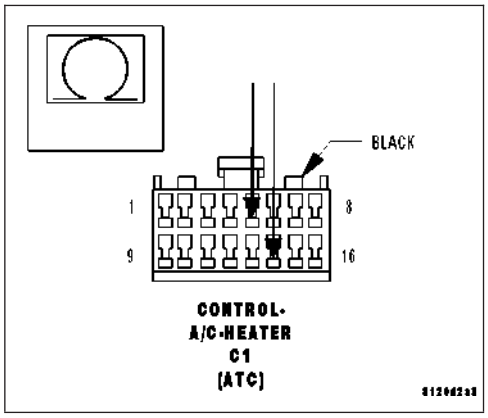
Is the resistance below 10k ohms between the (C61) Front Blend Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C61) Front Blend Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

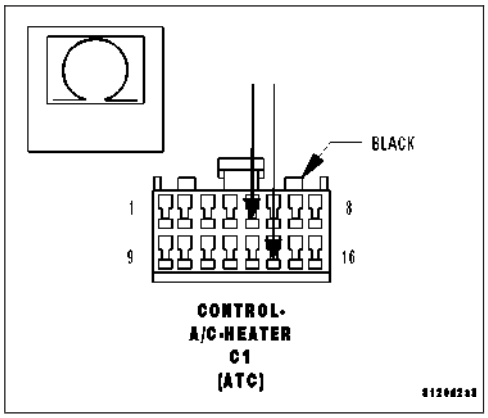
No >> Go To 5

B104D–BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) COMMON DOOR DRIVER 1 CIRCUIT

Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C61) Front Blend Door Driver Circuit for a short to the (C34) Common Door Driver 1 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

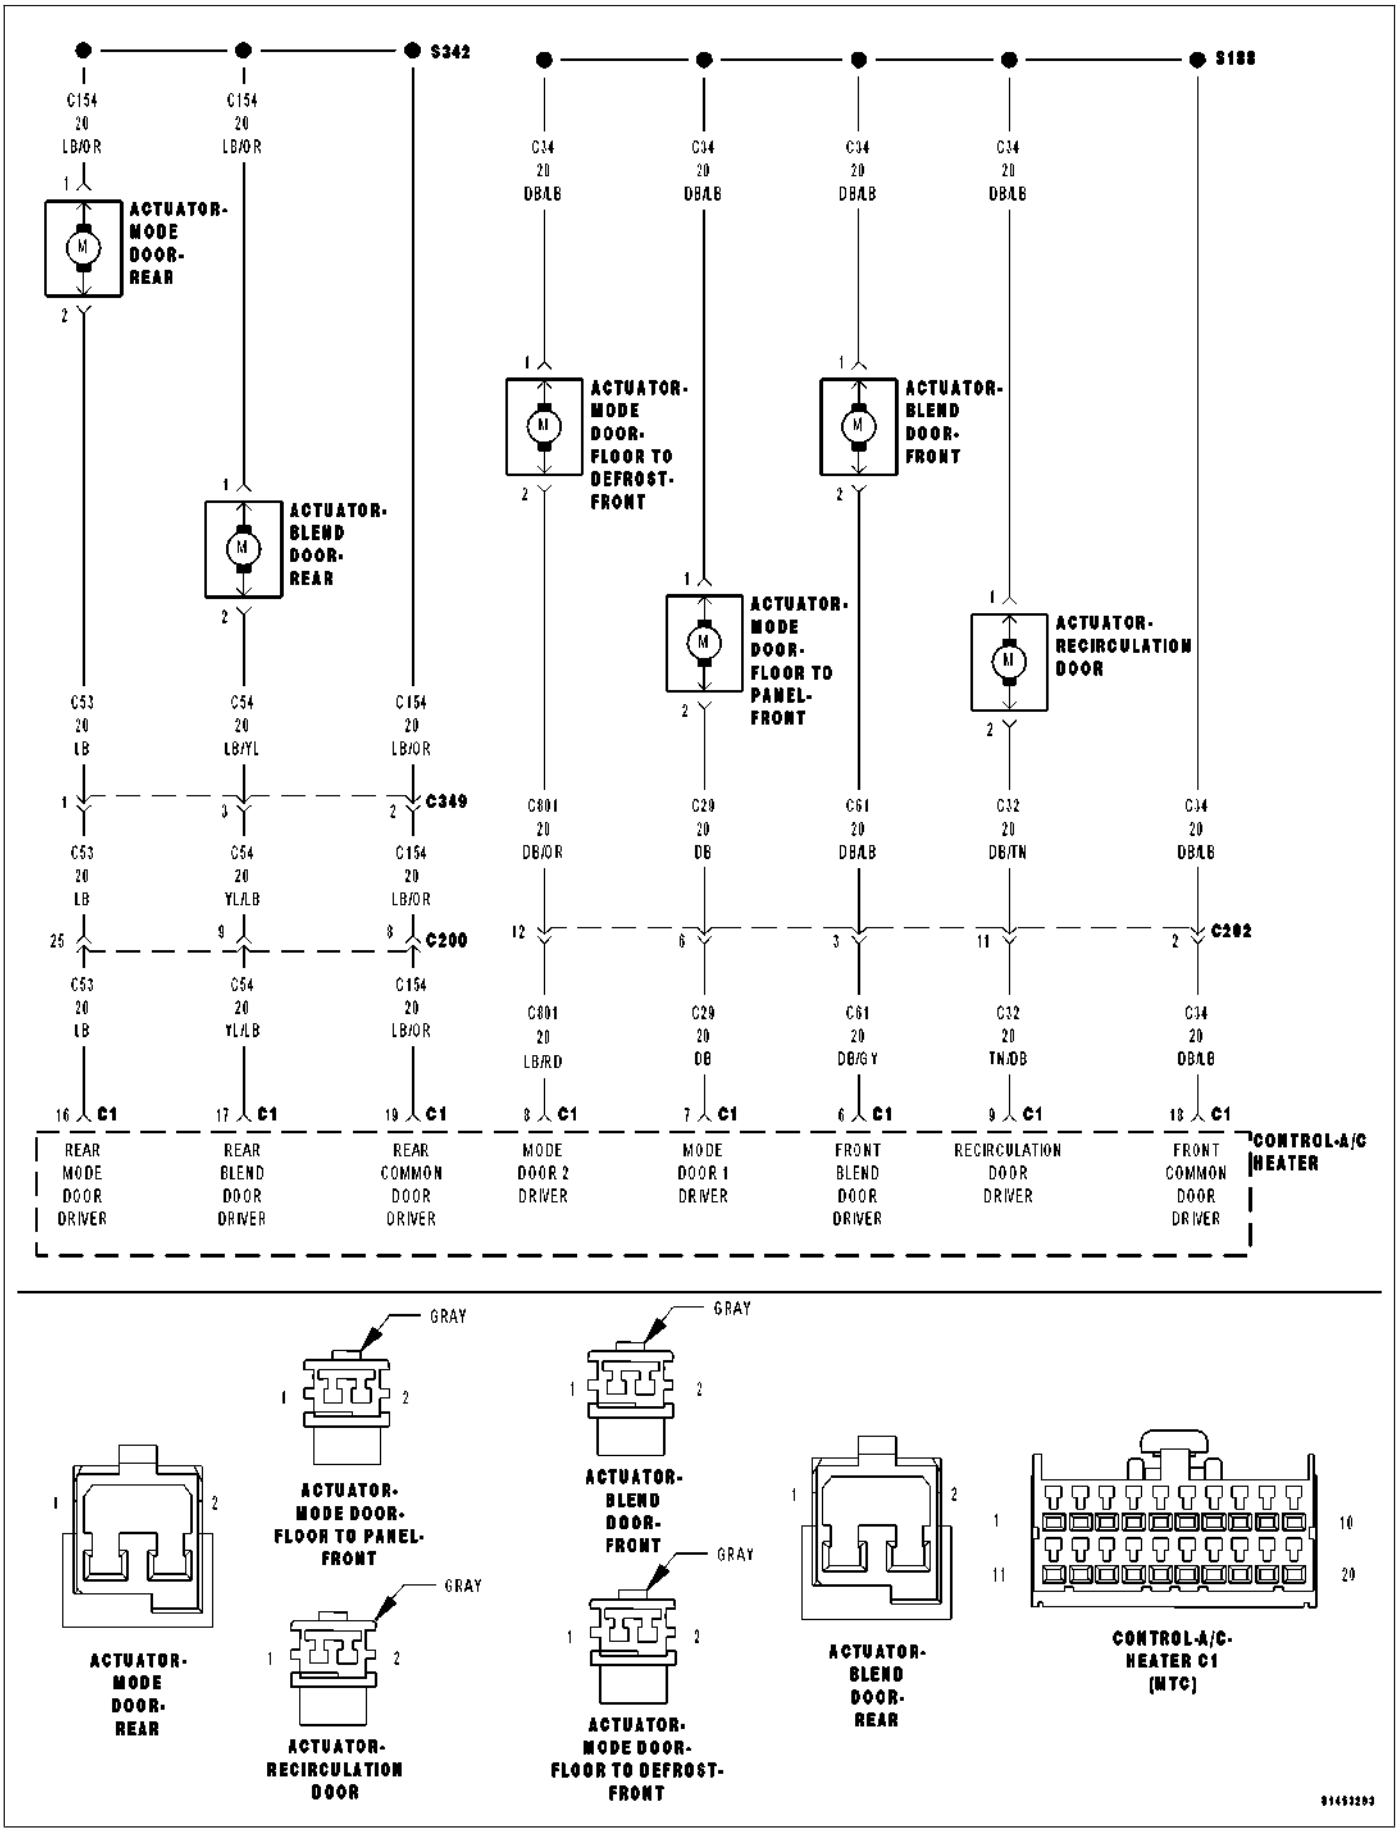
Does the scan tool only display: B104D–BLEND DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B104D–BLEND DOOR CONTROL CIRCUIT LOW (MTC)



B104D–BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C61) Front Blend Door Driver circuit is shorted to ground.

Possible Causes
(C61) FRONT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C61) FRONT BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

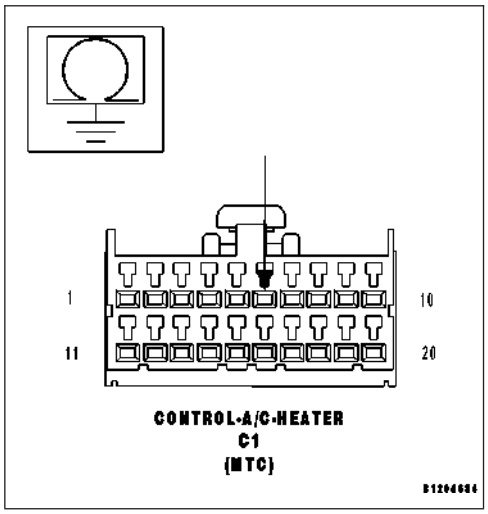
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C61) Front Blend Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C61) Front Blend Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

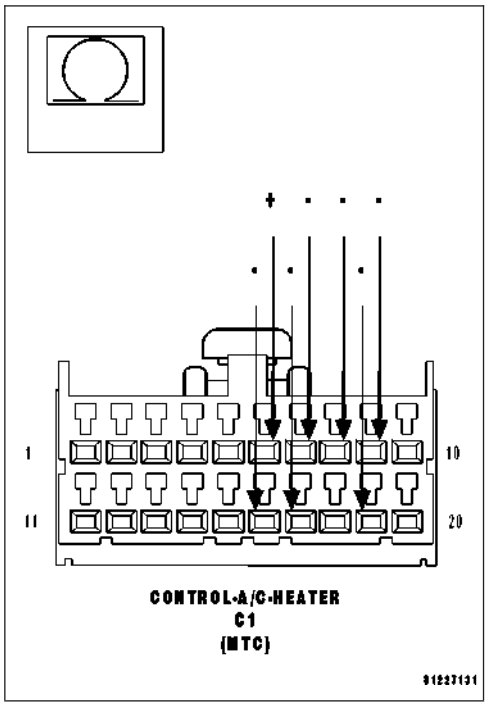
No >> Go To 2



B104D–BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C29) Mode Door 1 Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C32) Recirculation Door Driver circuit, and, if equipped, the (C53) Rear Mode Door Driver circuit, the (C154) Rear Common Door Driver circuit, and the (C54) Rear Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



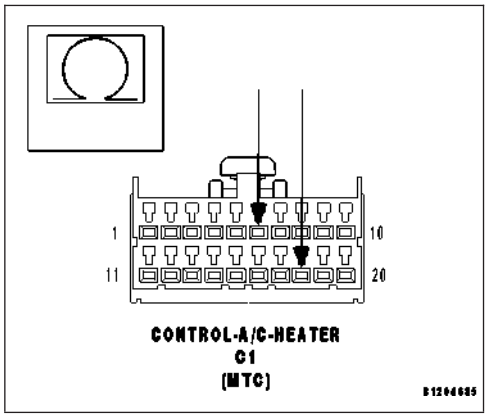
Is the resistance below 10k ohms between the (C61) Front Blend Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C61) Front Blend Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

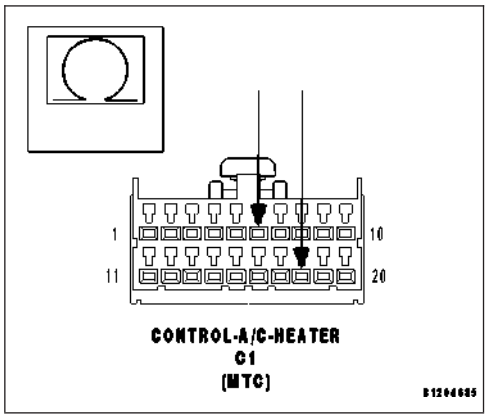
No >> Go To 5

B104D–BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C61) Front Blend Door Driver circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

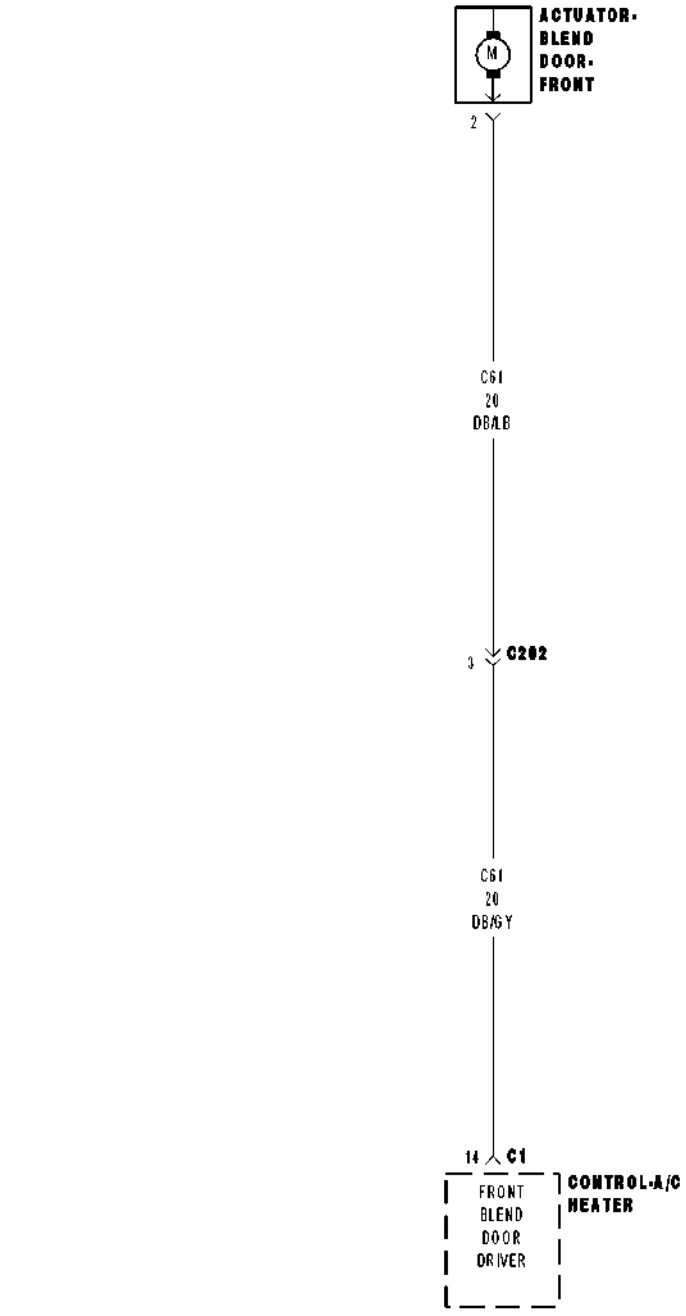
Does the scan tool only display: B104D–BLEND DOOR CONTROL CIRCUIT LOW ?

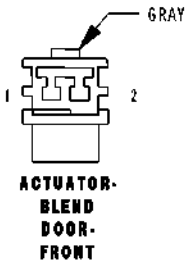
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

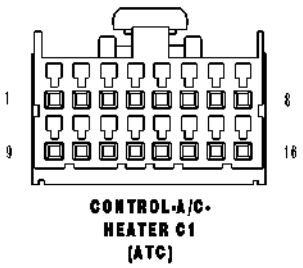
No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B104E–BLEND DOOR CONTROL CIRCUIT HIGH (ATC)







81653944

B104E–BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C61) Front Blend Door Driver circuit is shorted to voltage.

Possible Causes
(C61) FRONT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Front Blend Door Actuator and the Recirculation Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

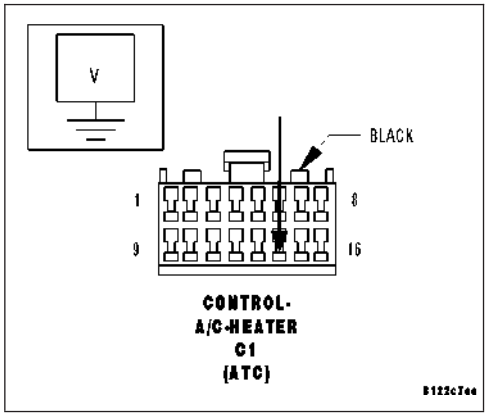
1. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C61) Front Blend Door Driver circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C61) Front Blend Door Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B104E–BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B104E–BLEND DOOR CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

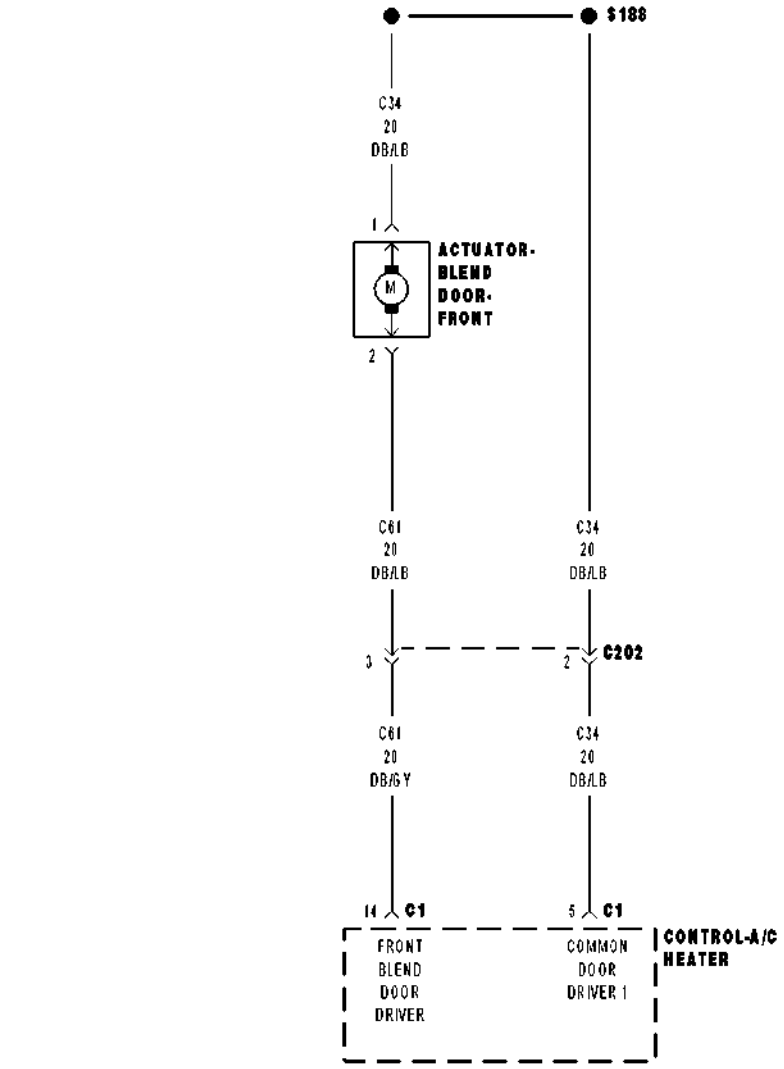
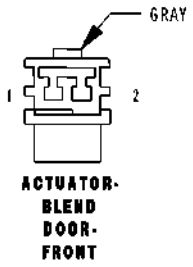
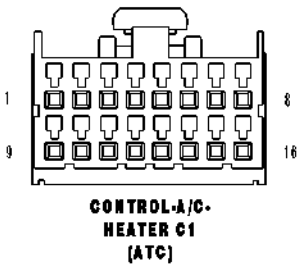
B104F–BLEND DOOR CONTROL CIRCUIT OPEN (ATC)







B1653a06

B104F–BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Front Blend Door Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C61) FRONT BLEND DOOR DRIVER CIRCUIT OPEN
(C34) COMMON DOOR DRIVER 1 CIRCUIT OPEN
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Front Blend Door Actuator and the Recirculation Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B104F must be active for the results of this test to be valid. Do not perform this test if DTC B104F is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, then all other Control Circuit/Performance DTCs next. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

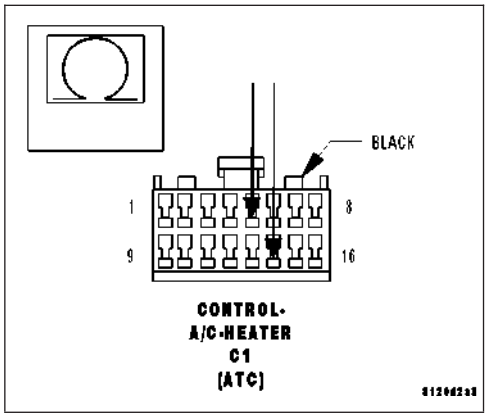
B104F–BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance above 70 ohms?

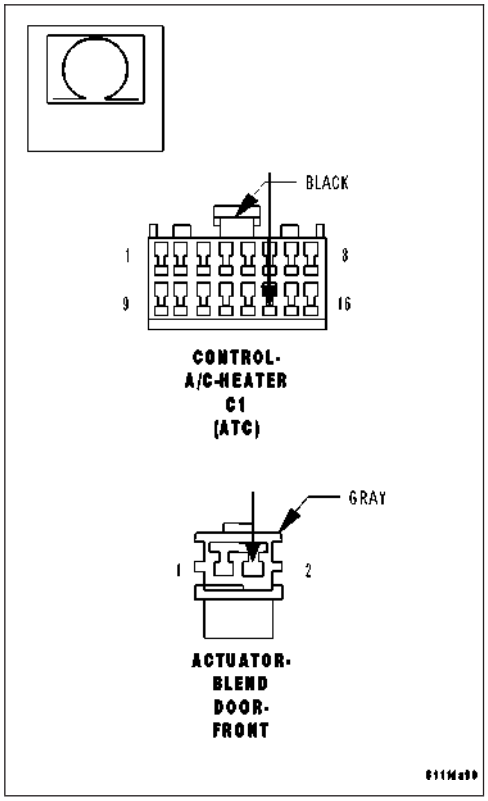
Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

3. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance of the (C61) Front Blend Door Driver circuit between the A/C Heater Control C1 harness connector and the Front Blend Door Actuator harness connector.



Is the resistance below 5.0 ohms?

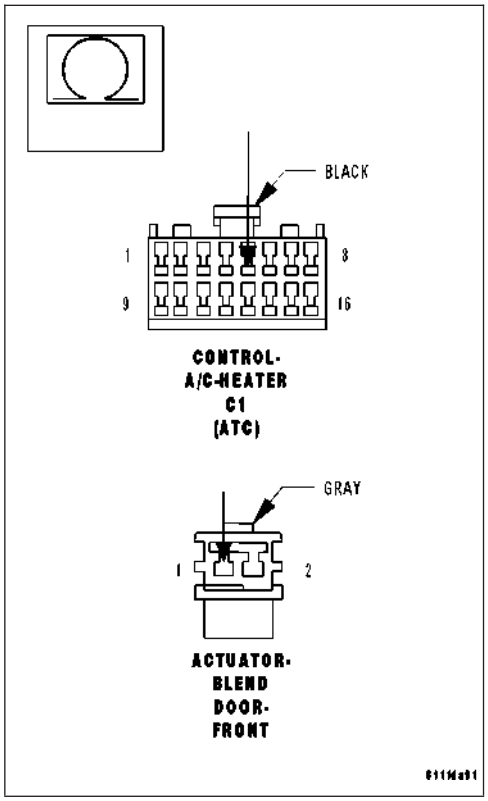
Yes >> Go To 4

No >> Repair the (C61) Front Blend Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B104F–BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C34) COMMON DOOR DRIVER 1 CIRCUIT FOR AN OPEN

Measure the resistance of the (C34) Common Door Driver 1 circuit between the A/C Heater Control C1 harness connector and the Front Blend Door Actuator harness connector.

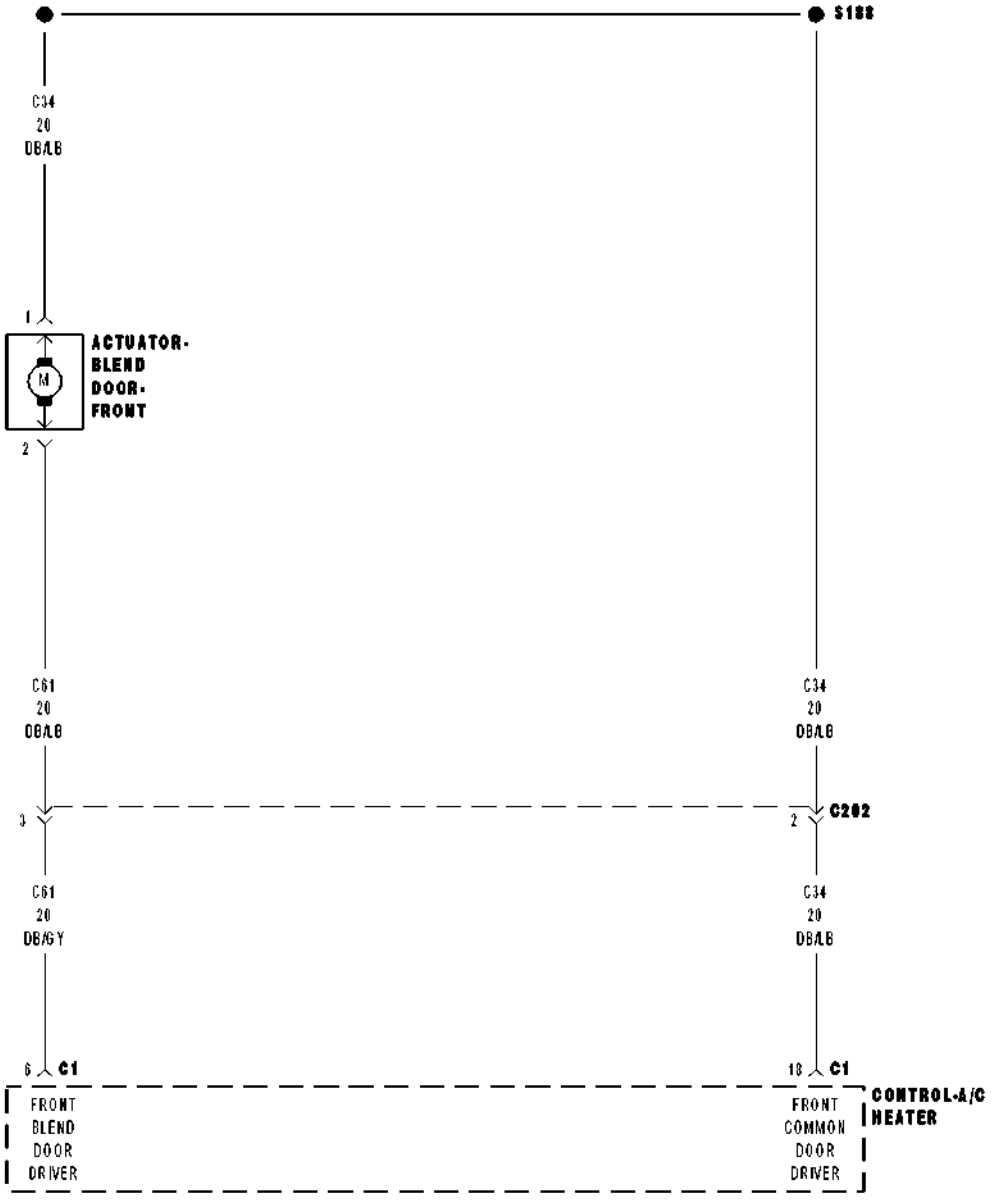


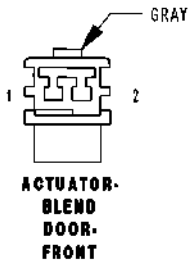
Is the resistance below 5.0 ohms?

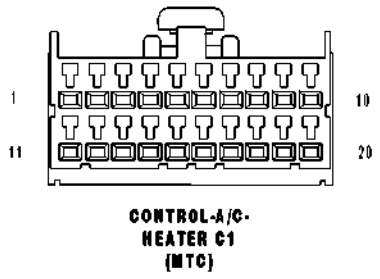
Yes >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C34) Common Door Driver 1 circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B104F–BLEND DOOR CONTROL CIRCUIT OPEN (MTC)







B1453a67

B104F–BLEND DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If Front Blend Door Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C61) FRONT BLEND DOOR DRIVER CIRCUIT OPEN
(C34) FRONT COMMON DOOR DRIVER CIRCUIT OPEN
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B104F must be active for the results of this test to be valid. Do not perform this test if DTC B104F is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B104F–BLEND DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

2. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

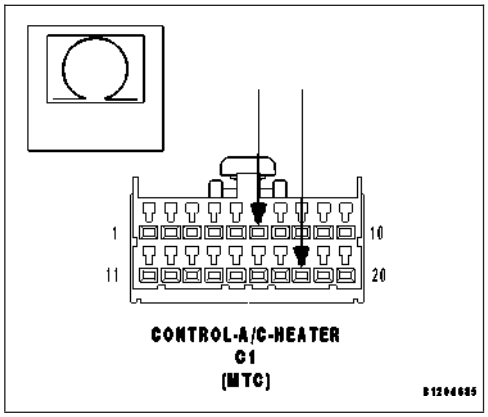
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance of the (C61) Front Blend Door Driver circuit between the A/C Heater Control C1 harness connector and the Front Blend Door Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C61) Front Blend Door Driver circuit for an open.

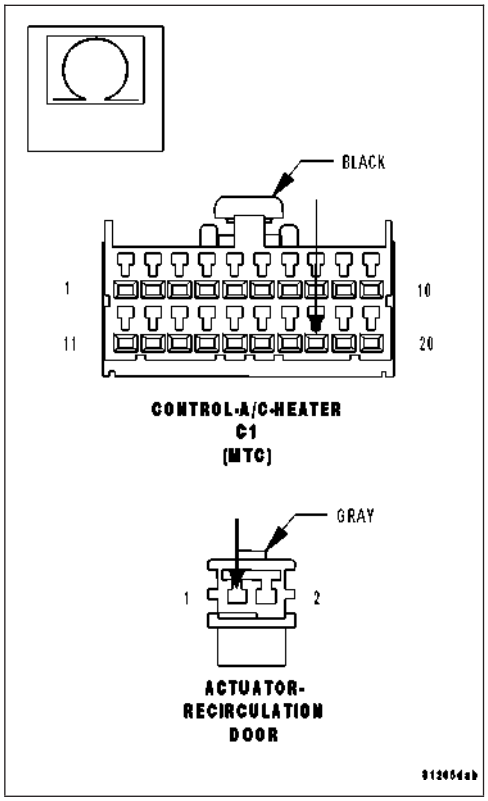
Measure the resistance of the (C34) Front Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Recirculation Door Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C34) Front Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Recirculation Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
RECIRCULATION DOOR SEIZED, BINDING, OBSTRUCTED
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator and the housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK RECIRCULATION DOOR TRAVEL

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 70 degrees of travel.

Does the door operate smoothly in both directions over approximately 70 degrees of travel?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 5

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Recirculation Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
RECIRCULATION DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

3. CHECK FOR A BROKEN RECIRCULATION DOOR ACTUATOR

Turn the ignition off.

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK RECIRCULATION DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for a damaged or broken A/C Heater Housing Assembly, a warped, worn, or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 70 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

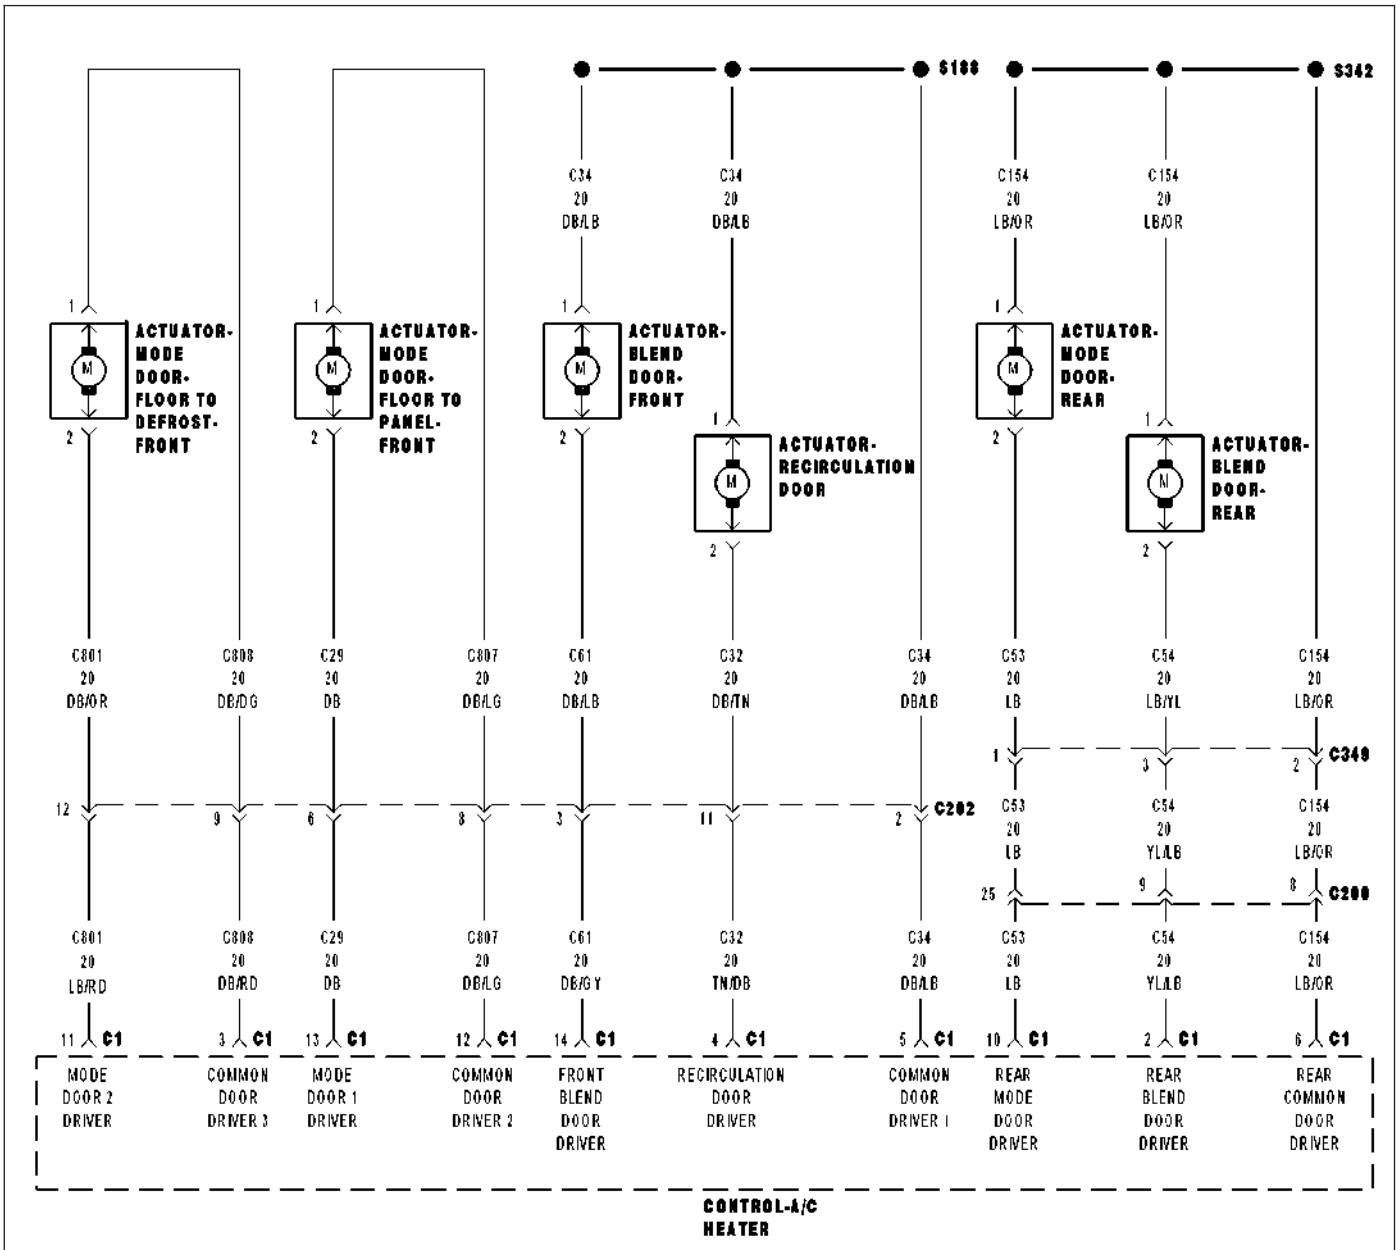
With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

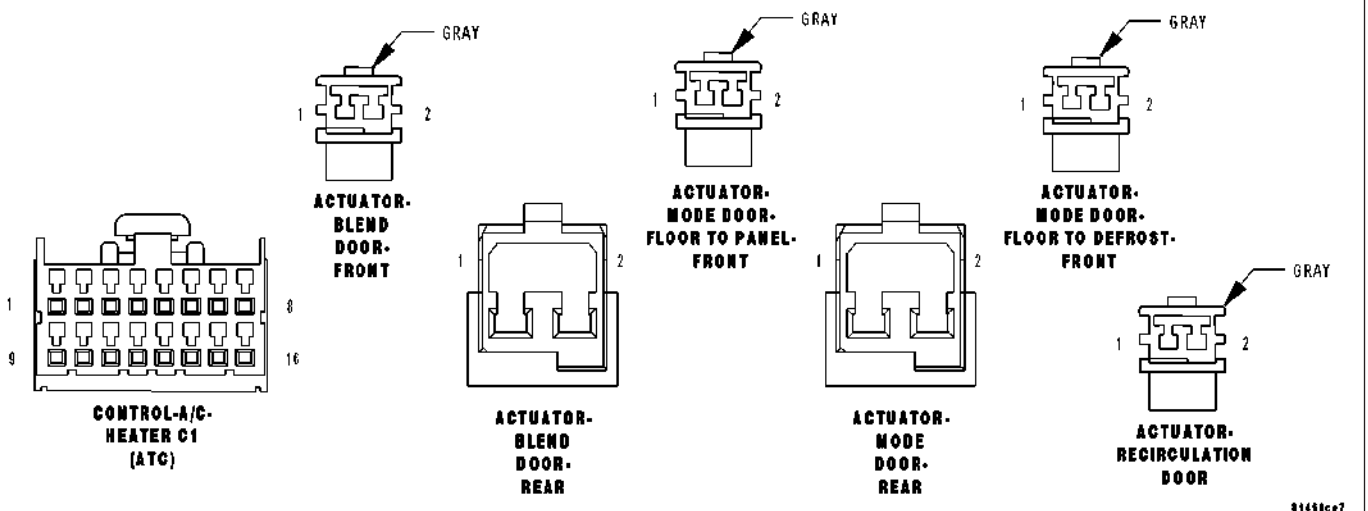
Does the scan tool display: B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (ATC)





B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C34) Common Door Driver 1 circuit is shorted to ground.

Possible Causes
(C34) COMMON DOOR DRIVER 1 CIRCUIT SHORTED TO GROUND
(C34) COMMON DOOR DRIVER 1 CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit. The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Front Blend Door Actuator and the Recirculation Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

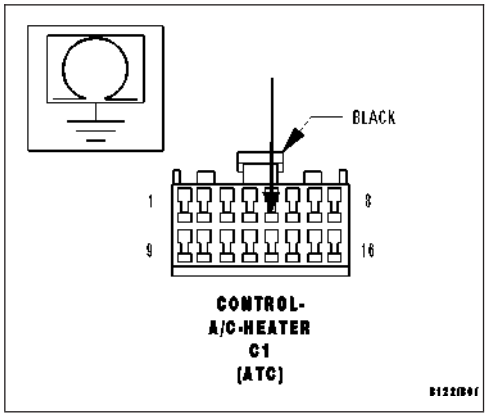
Diagnostic Test

1. CHECK (C34) COMMON DOOR DRIVER 1 CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C34) Common Door Driver 1 circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

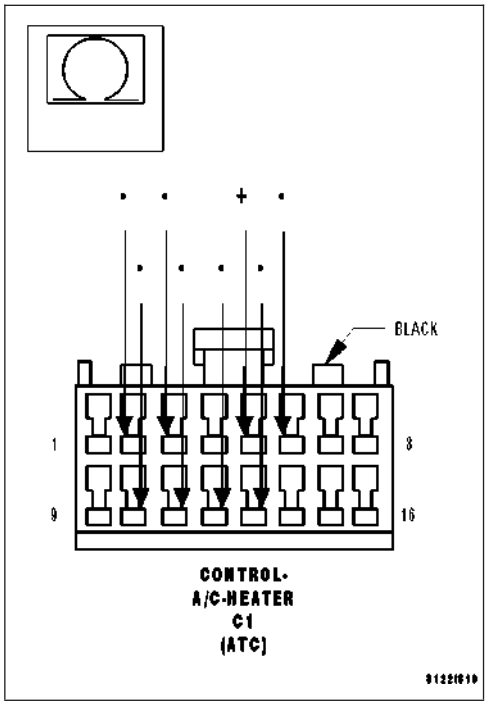
Yes >> Repair the (C34) Common Door Driver 1 circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C34) COMMON DOOR DRIVER 1 CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C34) Common Door Driver 1 circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door Driver 3 circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, and the (C29) Mode Door 1 Driver circuit in the A/C Heater Control C1 harness connector.



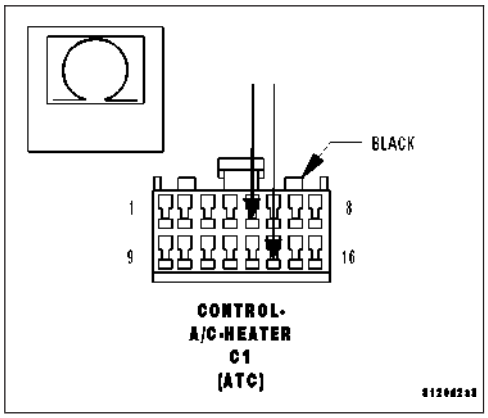
Is the resistance below 10k ohms between the (C34) Common Door Driver 1 circuit and any of the other door driver circuits?

Yes >> Repair the circuits with a resistance below 10k ohms for a short to the (C34) Common Door Driver 1 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

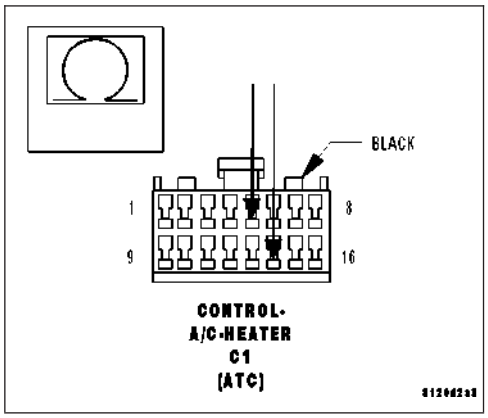
No >> Go To 5

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) COMMON DOOR DRIVER 1 CIRCUIT

Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

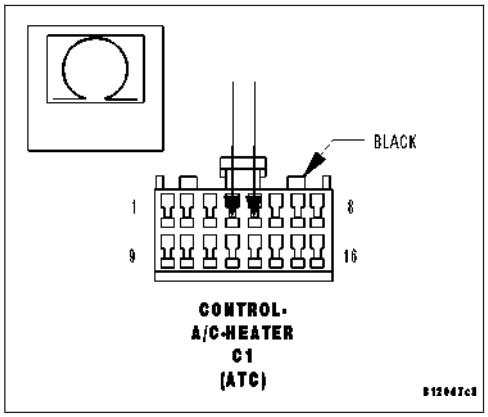
Yes >> Repair the (C61) Front Blend Door Driver Circuit for a short to the (C34) Common Door Driver 1 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 6

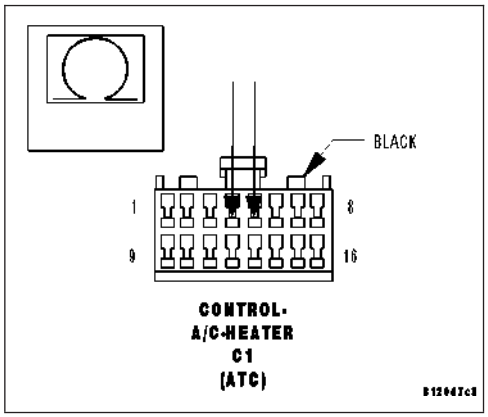
No >> Go To 7

---

6. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) COMMON DOOR DRIVER 1 CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to the (C34) Common Door Driver 1 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

7. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

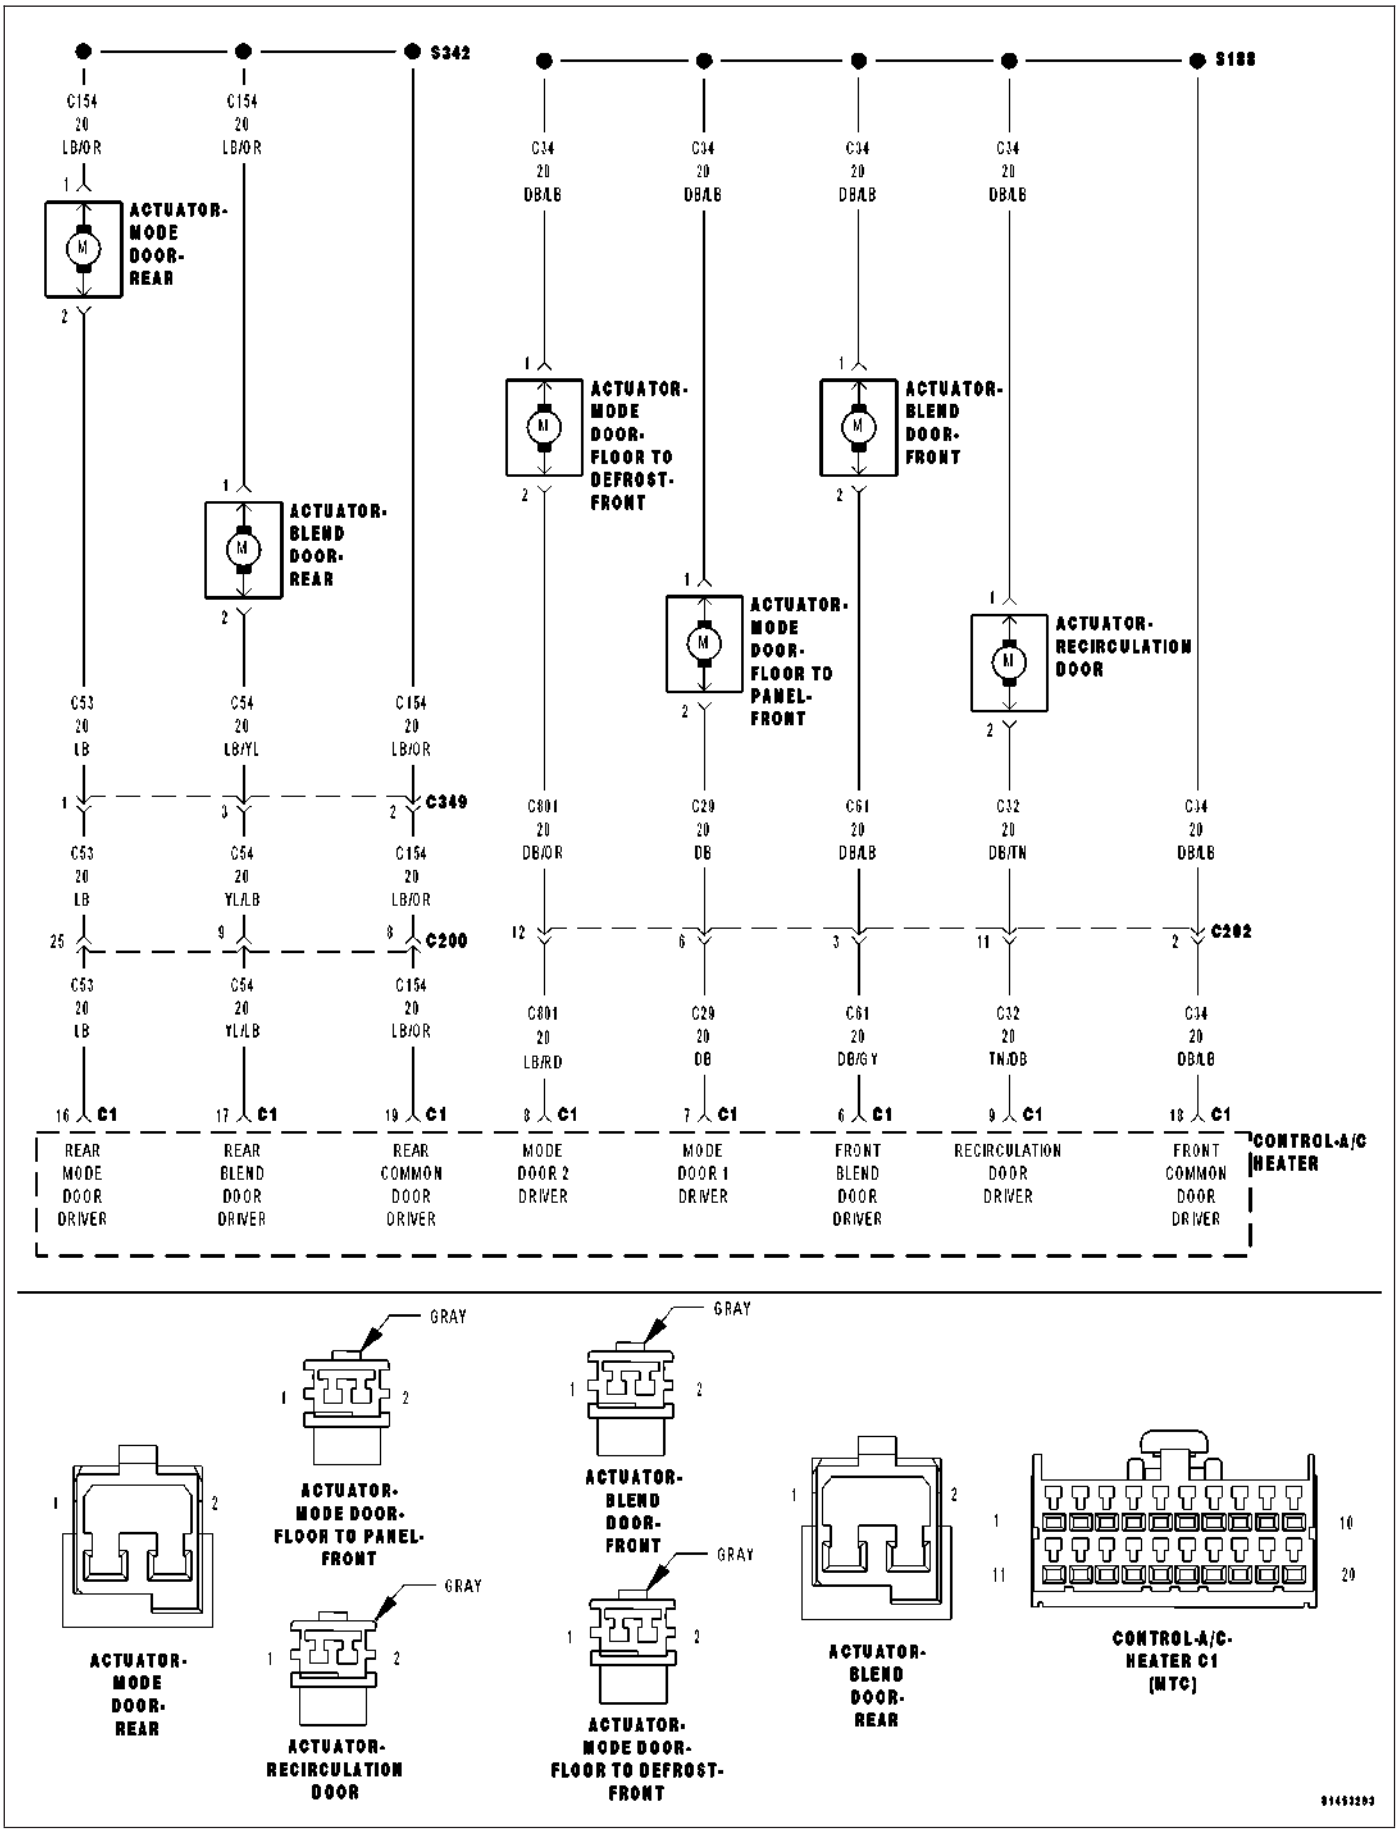
Does the scan tool only display: B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC)



B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C34) Front Common Door Driver circuit is shorted to ground.

Possible Causes
(C34) FRONT COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C34) FRONT COMMON DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT BLEND DOOR ACTUATOR
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit. The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit. The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit. The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

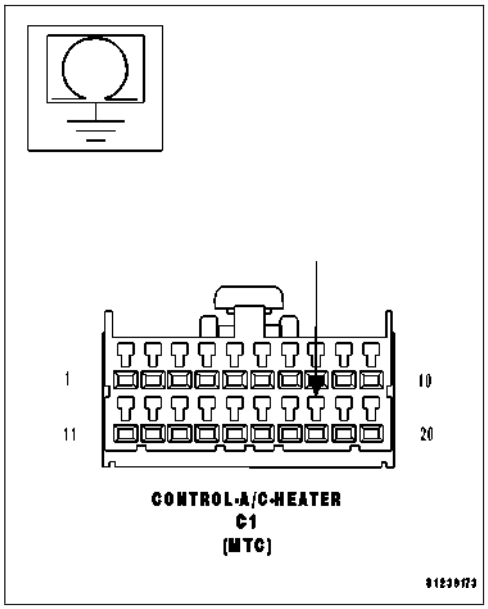
Diagnostic Test

1. CHECK (C34) FRONT COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C34) Front Common Door Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

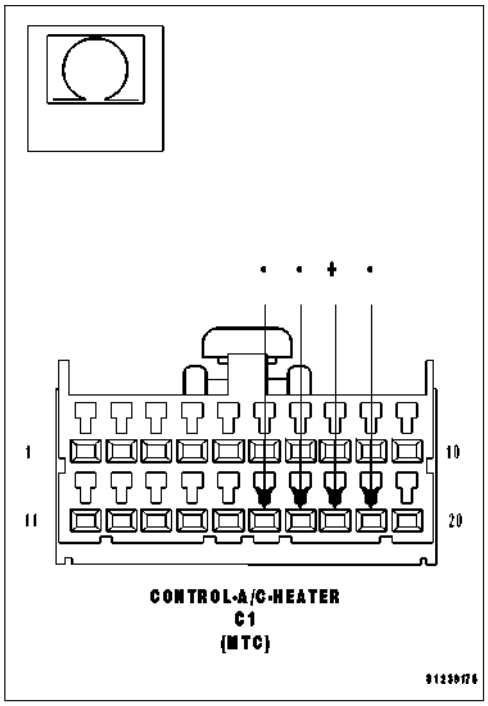
Yes >> Repair the (C34) Front Common Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No, Vehicles With Rear HVAC
Go To 2

No, Vehicles Without Rear HVAC
Go To 3

2. CHECK (C34) FRONT COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C34) Front Common Door Driver 1 circuit and the (C53) Rear Mode Door Driver circuit, the (C154) Rear Common Door Driver circuit, and the (C54) Rear Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between the (C34) Front Common Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuits with a resistance below 10k ohms for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

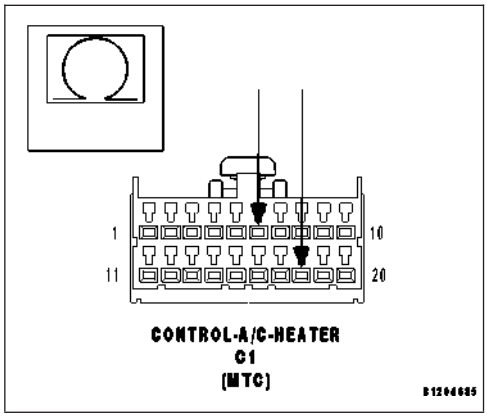
3. CHECK FRONT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 30 ohms?

Yes >> Go To 4

No >> Go To 5



4. CHECK (C61) FRONT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

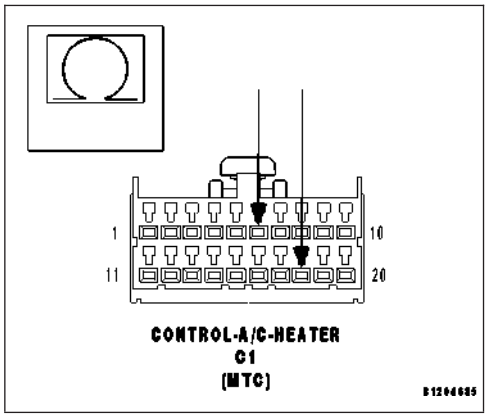
Disconnect the Front Blend Door Actuator harness connector.

Measure the resistance between the (C61) Front Blend Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C61) Front Blend Door Driver Circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



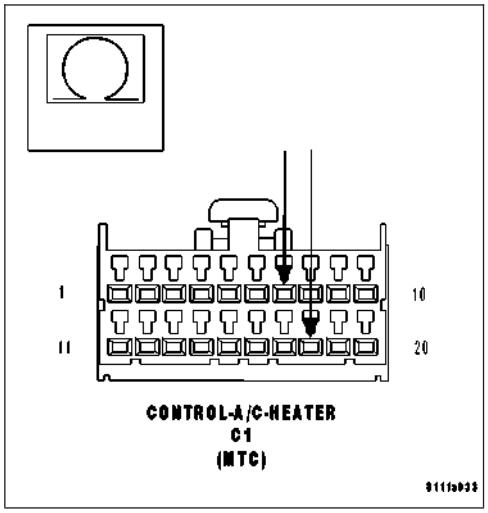
5. CHECK MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 30 ohms?

Yes >> Go To 6

No >> Go To 7

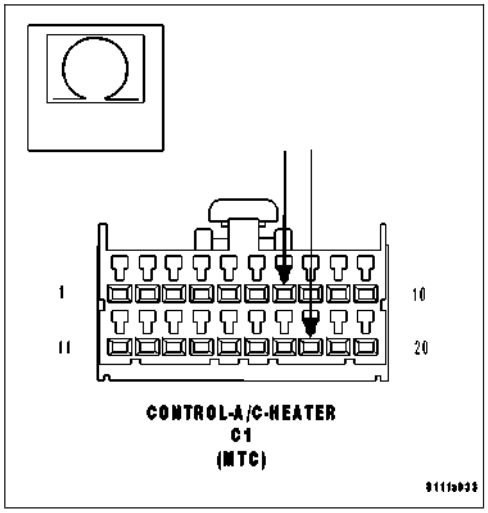


B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

6. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Mode Door 1 (Floor to Panel) Actuator harness connector.

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



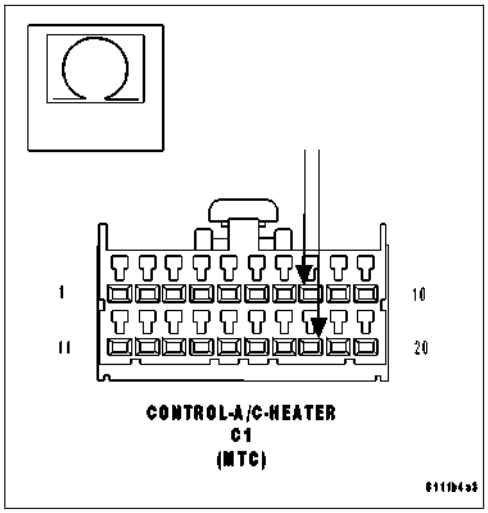
Is the resistance below 10k ohms?

Yes >> Repair the (C29) Mode Door 1 Driver Circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

7. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 8

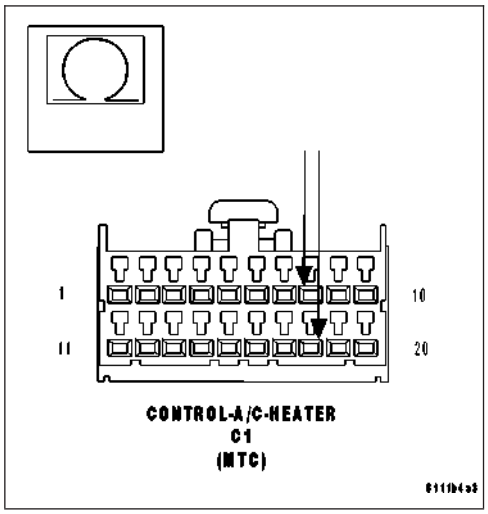
No >> Go To 9

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

8. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



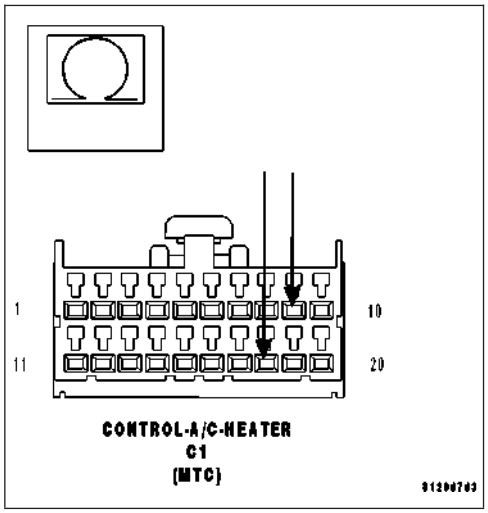
Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver Circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

9. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 10

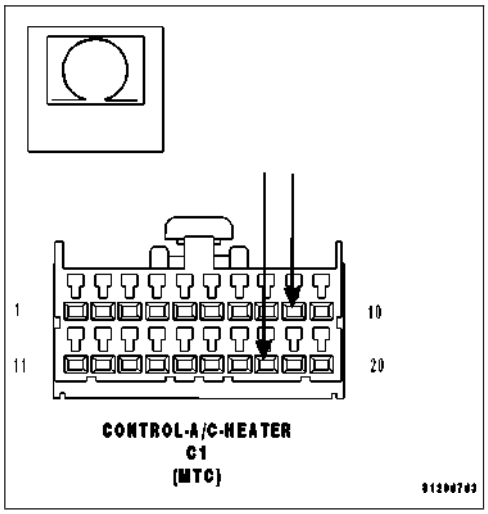
No >> Go To 11

B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

10. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

11. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

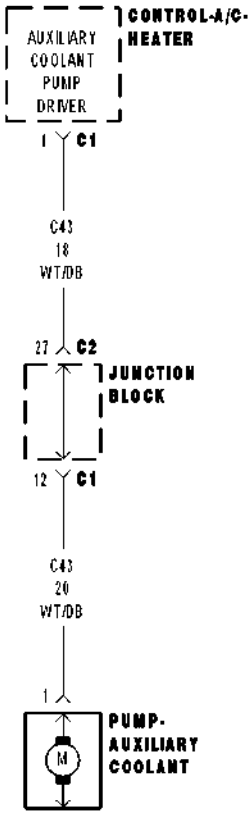
Does the scan tool only display: B105F–CLIMATE CONTROL MOTOR(S) COMMON 1 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

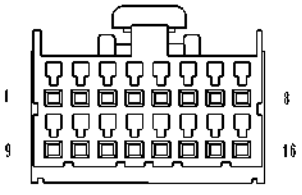
No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (ATC)



PUMP-AUXILIARY COOLANT



CONTROL-A/C-HEATER C1 (ATC)

81651c52

B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When Auxiliary Coolant Pump operation is requested.
- **Set Condition:**
  If the (C43) Auxiliary Coolant Pump Driver circuit is shorted to ground. This DTC has a maturing time of 10 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT SHORTED TO GROUND
AUXILIARY COOLANT PUMP
A/C HEATER CONTROL

Theory of Operation

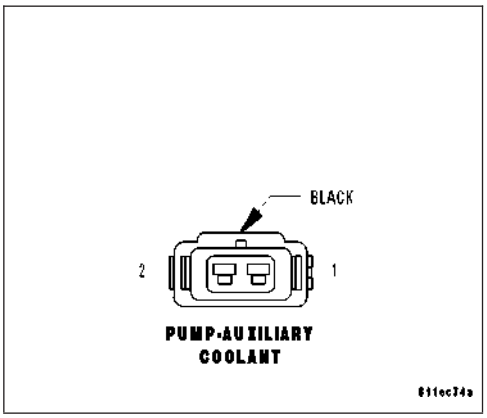
The protected Auxiliary Coolant Pump Driver is set low when turned off and set high when turned on. The Auxiliary Coolant Pump Driver will go low if the driver circuit is shorted to ground.

NOTE: DTC B107E must be active for the results of this test to be valid. Do not perform this test if DTC B107E is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW WITH AUXILIARY COOLANT PUMP DISCONNECTED

Turn the ignition on.
Set the blend control to full cold.
With the scan tool, erase HVAC DTCs.
Turn the ignition off.
Disconnect the Auxiliary Coolant Pump harness connector.
Turn the ignition on.
With the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On. Allow the actuator to run for approximately one minute.
With the scan tool, read HVAC DTCs.



Does the scan tool display: B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN?

Yes >> Replace the Auxiliary Coolant Pump in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

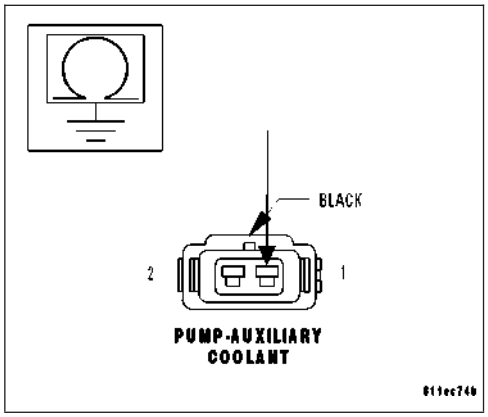
B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C43) Auxiliary Coolant Pump Driver circuit between ground and the Auxiliary Coolant Pump harness connector.

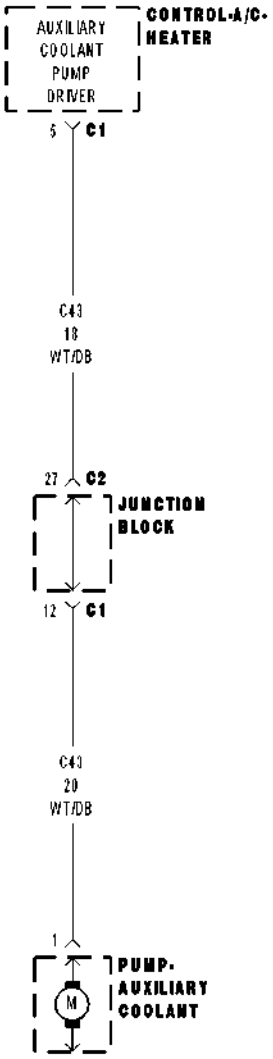


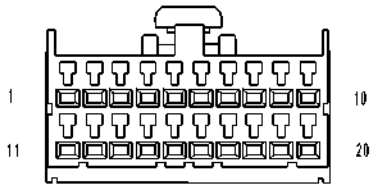
Is the resistance below 10K ohms?

Yes >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (MTC)





CONTROL-A/C-HEATER C1 (MTC)

PUMP-AUXILIARY COOLANT

81651cBc

B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When Auxiliary Coolant Pump operation is requested.
- **Set Condition:**
  If the (C43) Auxiliary Coolant Pump Driver circuit is shorted to ground. This DTC has a maturing time of 10 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT SHORTED TO GROUND
AUXILIARY COOLANT PUMP
A/C HEATER CONTROL

Theory of Operation

The protected Auxiliary Coolant Pump Driver is set low when turned off and set high when turned on. The Auxiliary Coolant Pump Driver will go low if the driver circuit is shorted to ground.

NOTE: DTC B107E must be active for the results of this test to be valid. Do not perform this test if DTC B107E is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW WITH AUXILIARY COOLANT PUMP DISCONNECTED

Set the blend control to the full cold position.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

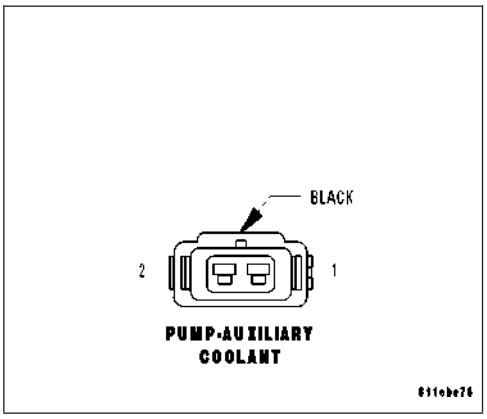
Turn the ignition off.

Disconnect the Auxiliary Coolant Pump harness connector.

Turn the ignition on.

With the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On. Allow the actuator to run for approximately one minute.

With the scan tool, read HVAC DTCs.



Does the scan tool display: B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN?

Yes >> Replace the Auxiliary Coolant Pump in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

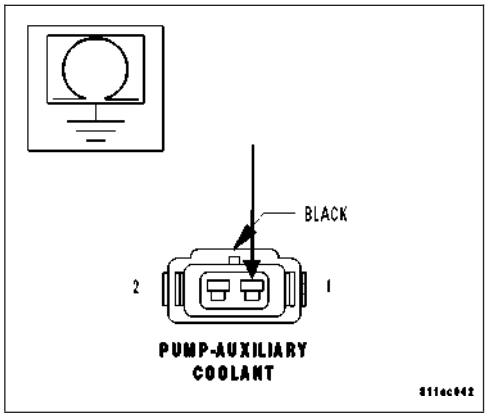
B107E–AUXILIARY COOLANT PUMP CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C43) Auxiliary Coolant Pump Driver circuit between ground and the Auxiliary Coolant Pump harness connector.

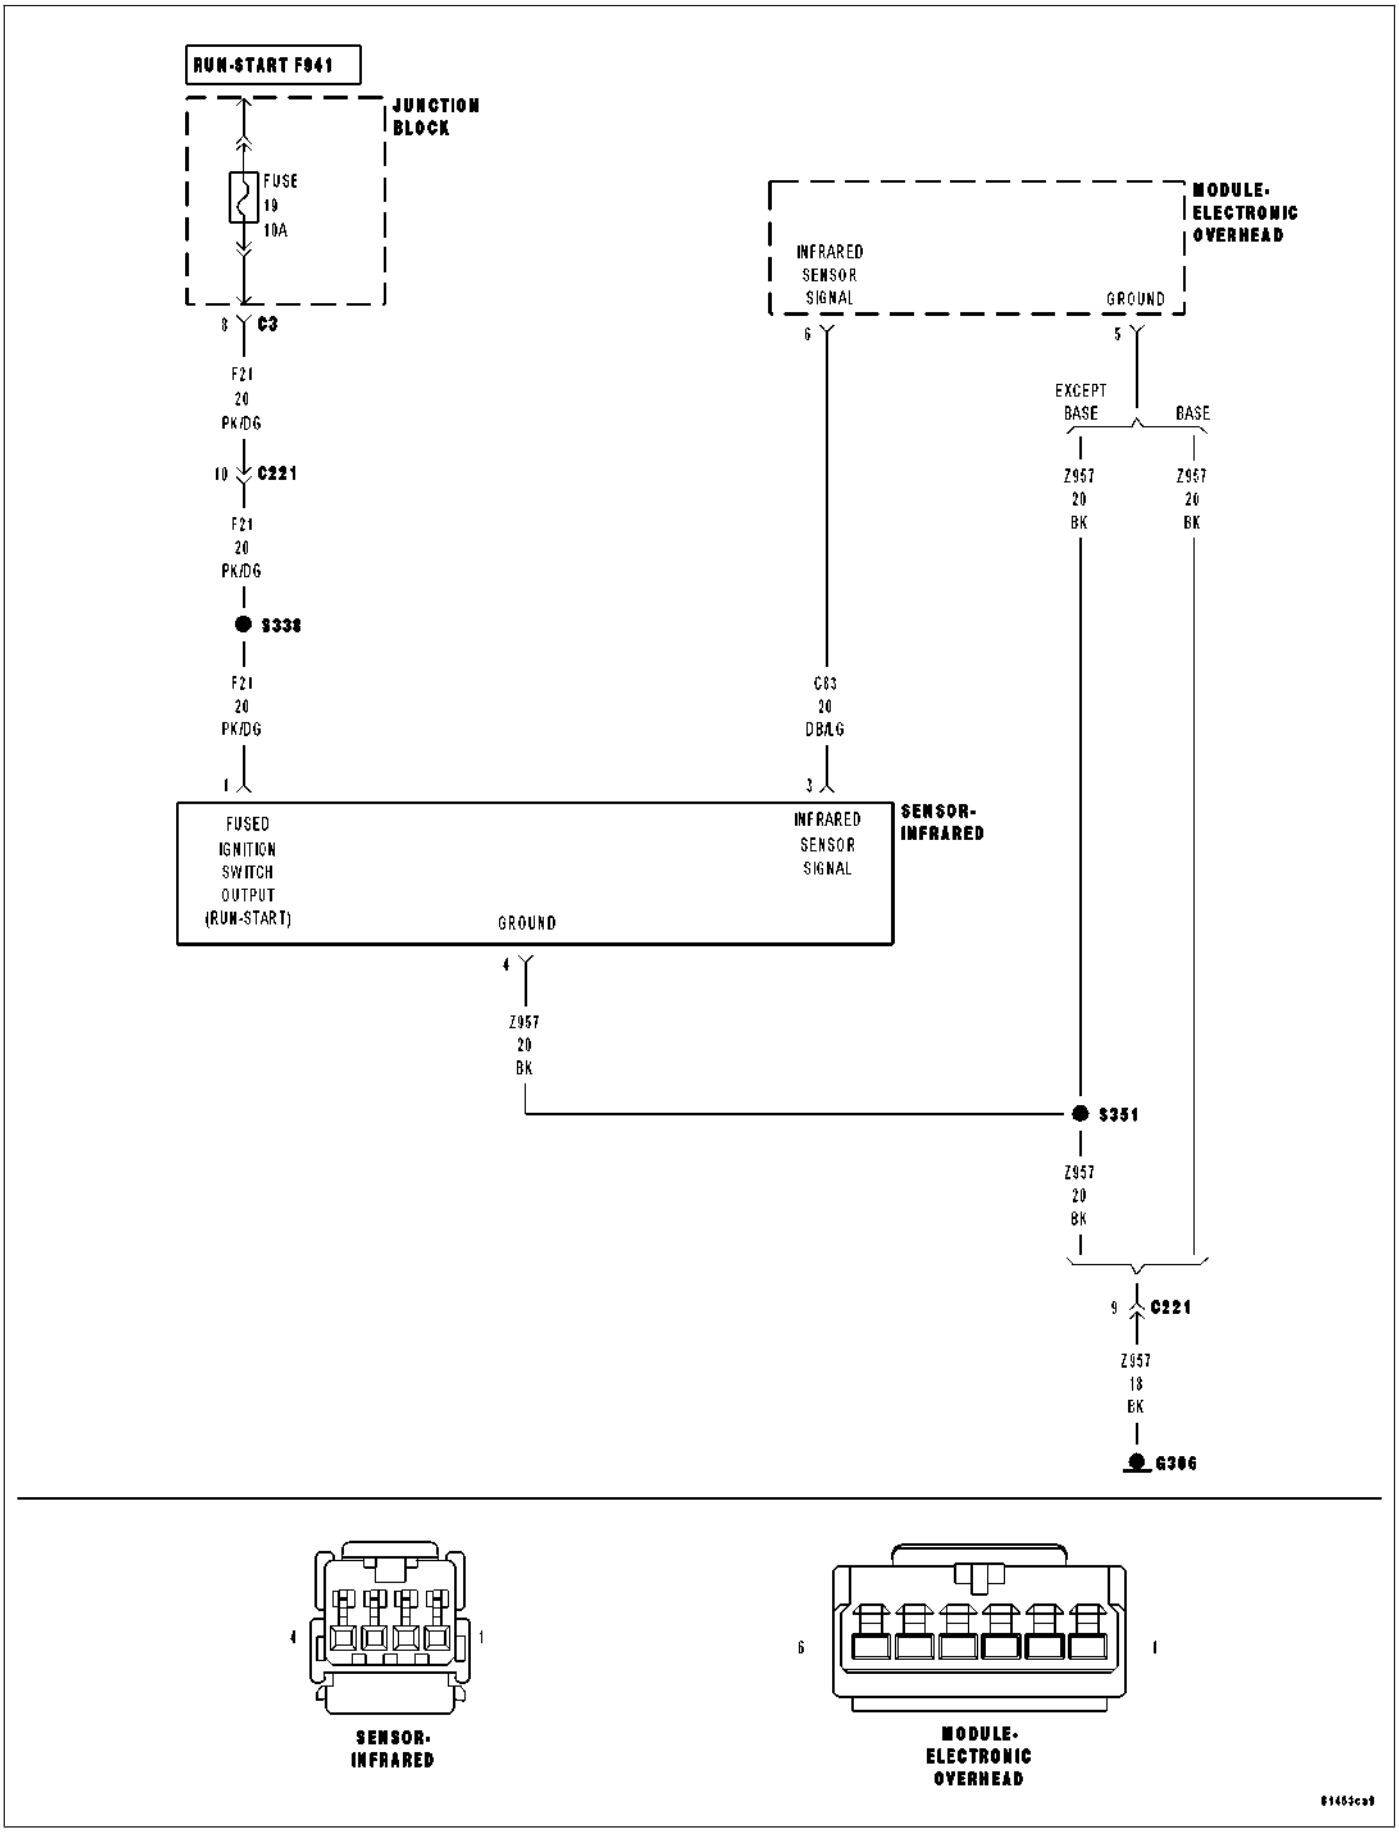


Is the resistance below 10K ohms?

Yes >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B108E–INFRARED TEMPERATURE SENSOR INTERNAL (ATC)



B108E–INFRARED TEMPERATURE SENSOR INTERNAL (ATC) (CONTINUED)
For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition in run.
- **Set Condition:**
  This DTC will set if any of the following occur:
  - If the total combined Infrared (IR) Sensor signal on and off time is ≤ 88.79 ms or ≥ 116.01 ms.
  - If the IR Sensor duty cycle is ≤ or equal to 9.5%.
  - If the IR Sensor duty cycle is in the range of 65.5% up to and including 65.8%.
  - If the IR Sensor duty cycle is in the range of 71.8% up to and including 72%.
  - If the IR Sensor duty cycle is in the range of 78% up to and including 78.3%.
  - If the IR Sensor duty cycle is in the range of 78.3% up to and including 84.3% (this indicates and IR EEPROM fatal error).
  - If the IR Sensor duty cycle is in the range of 84.3% up to and including 100%.

Possible Causes
IR SENSOR CIRCUIT(S)
IR SENSOR
COMPASS MINI-TRIP COMPUTER (CMTC)

Theory of Operation

The IR Sensor is hard wired to the CMTC. The CMTC busses the IR Sensor data to the A/C Heater Control over the Controller Area Network (CAN) B Bus. This DTC has a maturing time of 10 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

NOTE: DTC B108E must be active for the results of this test to be valid. Do not perform this test if DTC B108E is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK THE CMTC FOR DTCs

Turn the ignition on.
With the scan tool, check the Compass Temperature Module (EOM) for DTCs.

Are any DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - DIAGNOSIS AND TESTING) for the related symptom(s).
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the IR Sensor in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

B108F–AUTOMATIC TEMPERATURE CONTROL SYSTEM PERFORMANCE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control either fails to receive Engine Coolant Temperature Sensor data, Ambient Temperature Sensor data, or Infrared Sensor data, or if the data from any of these sensors is out of range. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
POWERTRAIN CONTROL MODULE (PCM), FRONT CONTROL MODULE (FCM), OR COMPASS TEMPERATURE MODULE (EOM) NOT ACTIVE ON THE BUS
CAN B BUS CIRCUITS OPEN OR SHORTED, CAN C BUS CIRCUITS OPEN OR SHORTED, AMBIENT TEMPERATURE SENSOR CIRCUITS, ENGINE COOLANT TEMPERATURE SENSOR CIRCUITS, OR INFRARED SENSOR CIRCUITS SHORTED OR OPEN
AMBIENT TEMPERATURE SENSOR, ENGINE COOLANT TEMPERATURE SENSOR, OR INFRARED SENSOR INOPERATIVE
POWERTRAIN CONTROL MODULE (PCM), FRONT CONTROL MODULE (FCM), OR COMPASS TEMPERATURE MODULE (EOM) FAILING TO TRANSMIT DATA ON THE BUS
A/C HEATER CONTROL MODULE FAILING TO RECEIVE TRANSMITTED DATA FROM THE BUS

Theory of Operation

The Powertrain Control Module (PCM) transmits Engine Coolant Temperature Sensor data to modules wired to the CAN C bus. The Front Control Module (FCM) in turn transmits the Engine Coolant Temperature Sensor data to modules wired to the CAN B bus. The FCM also transmits Ambient Temperature Sensor data to modules wired to the CAN B bus. The Compass Temperature Module (EOM) transmits Infrared Sensor data to modules wired to the CAN B bus. The A/C Heater Control requires all of this data in order to provide automatic temperature control operation.

Diagnostic Test

1. VERIFY THAT DTC B108F–AUTOMATIC TEMPERATURE CONTROL SYSTEM PERFORMANCE IS ACTIVE

With the scan tool, read HVAC DTCs.

Is DTC B108F–AUTOMATIC TEMPERATURE CONTROL SYSTEM PERFORMANCE active?

Yes >> Go To 2

No >> A technician may not have erased this DTC following a module or CAN Bus repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1.

B108F–AUTOMATIC TEMPERATURE CONTROL SYSTEM PERFORMANCE (ATC) (CONTINUED)

2. CHECK FOR ACTIVE DTC U0019-CAN B BUS CIRCUIT

With the scan tool, read active HVAC DTCs.

Does the scan tool display active: U0019-CAN B BUS CIRCUIT?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC symptoms.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

---

3. VERIFY THAT THE PCM, FCM, & EOM ARE ACTIVE ON THE BUS

Turn the ignition on.
With the scan tool, select ECU View.
Verify that the PCM, FCM, & EOM are active on the bus.

Are all of the modules active on the bus?

Yes >> Go To 4

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

---

4. CHECK FOR DTCs IN THE PCM, FCM, & EOM

With the scan tool, select ECU View.
Check for DTCs in the PCM, FCM, and EOM.

Are DTCs present in any of the modules?

Yes >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - DIAGNOSIS AND TESTING) for EOM DTCs, (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs, and refer to the appropriate category for FCM DTCs.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to either HVAC System Test (ATC) or to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1004–PANEL MODE SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Panel mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1004–PANEL MODE SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1007–BI-LEVEL SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Bi-Level mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1007–BI-LEVEL SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1010–MIX SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Mix mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1010–MIX SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1013–DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Front Defrost mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1013–DEFROST SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Defrost mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to either HVAC System Test (ATC) or HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1019–TEMP UP SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Temp mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1019–TEMP UP SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1022–BLOWER SPEED UP SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Blower mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1022–BLOWER SPEED UP SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1025–BLOWER SPEED DOWN SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Blower mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

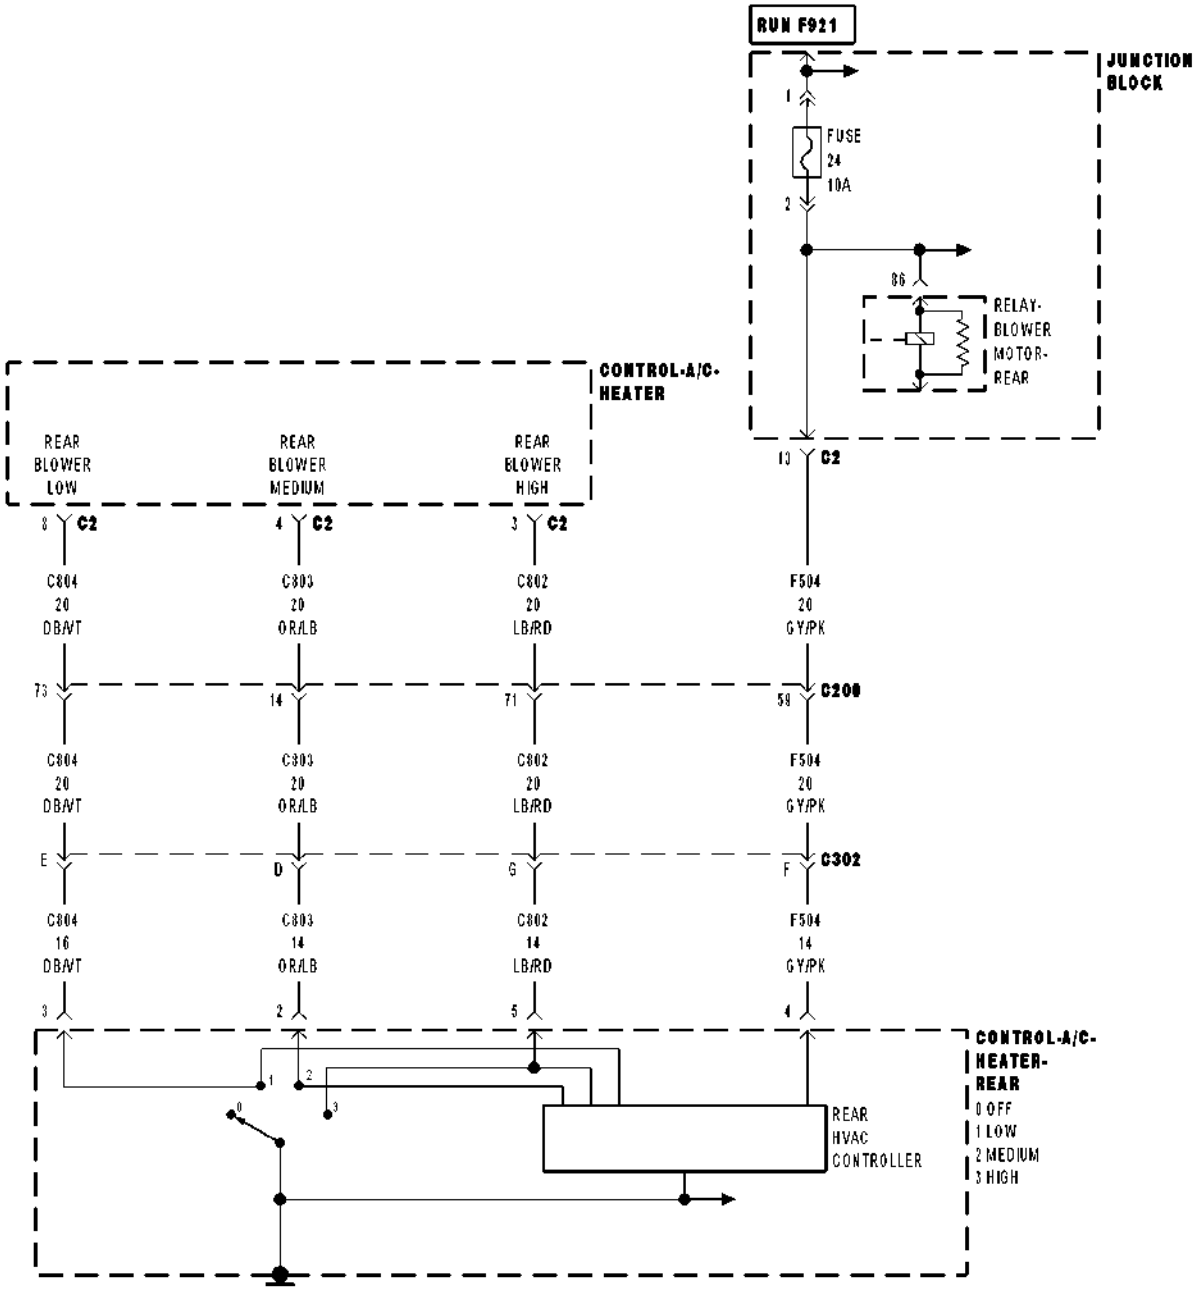
Wait two minutes, then with the scan tool, read HVAC DTCs.

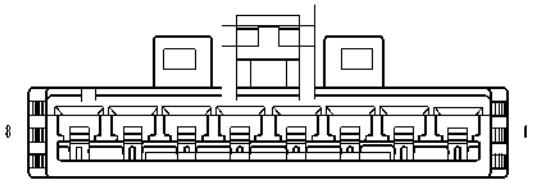
Does the scan tool display active: B1025–BLOWER SPEED DOWN SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

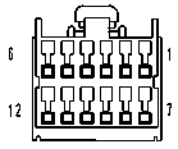
No >> Perform BODY VERIFICATION TEST – VER 1.

B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC)





CONTROL-A/C-HEATER-REAR



CONTROL-A/C-HEATER C2 (ATC)

81453cc7

B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If low and high rear blower speeds are requested simultaneously. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

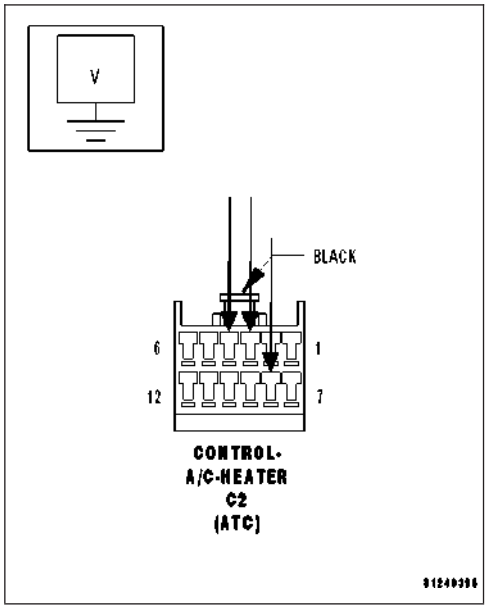
Possible Causes
(C804) REAR BLOWER LOW CIRCUIT, (C803) REAR BLOWER MEDIUM CIRCUIT, (C802) REAR BLOWER HIGH CIRCUIT SHORTED TO VOLTAGE
(C804) REAR BLOWER LOW CIRCUIT, (C803) REAR BLOWER MEDIUM CIRCUIT, (C802) REAR BLOWER HIGH CIRCUIT SHORTED TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT
(C804) REAR BLOWER LOW CIRCUIT, (C803) REAR BLOWER MEDIUM CIRCUIT, (C802) REAR BLOWER HIGH CIRCUIT SHORTED TOGETHER
REAR A/C HEATER CONTROL
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK VOLTAGE OF (C804) REAR BLOWER LOW CIRCUIT, (C803) REAR BLOWER MEDIUM CIRCUIT, & (C802) REAR BLOWER HIGH CIRCUIT

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Turn the ignition on.
Measure the voltage of the (C804) Rear Blower Low circuit.
Measure the voltage of the (C803) Rear Blower Medium circuit.
Measure the voltage of the (C802) Rear Blower High circuit.



Is the voltage above 0.2 volts on any of the circuits?

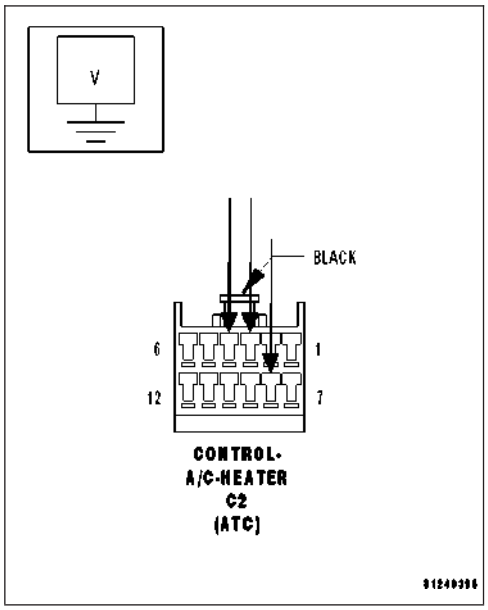
Yes >> Go To 2

No >> Go To 6

B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC) (CONTINUED)

2. CHECK (C804) REAR BLOWER LOW CIRCUIT, (C803) REAR BLOWER MEDIUM CIRCUIT, & (C802) REAR BLOWER HIGH CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
Remove Junction Block Fuse 24.
Turn the ignition on.
Measure the voltage of the (C804) Rear Blower Low circuit.
Measure the voltage of the (C803) Rear Blower Medium circuit.
Measure the voltage of the (C802) Rear Blower High circuit.



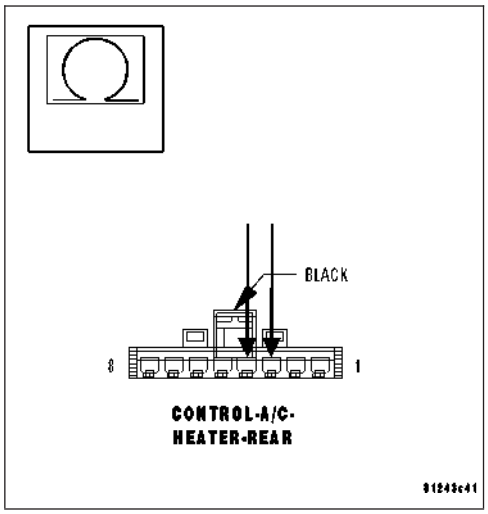
Is the voltage above 0.2 volts on any of the circuits?

Yes >> Repair the circuit(s) with voltage above 0.2 volts for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C804) REAR BLOWER LOW CIRCUIT FOR A SHORT TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Turn the ignition off.
Disconnect the Rear A/C Heater Control harness connector.
Measure the resistance between the (C804) Rear Blower Low circuit and the (F504) Fused Ignition Switch Output (Run) circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms?

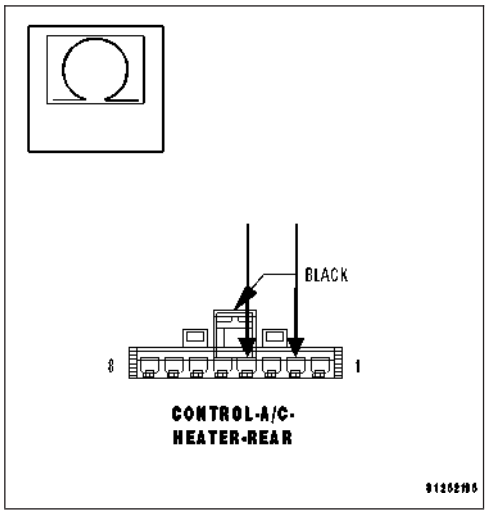
Yes >> Go To 4

No >> Go To 4

B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC) (CONTINUED)

4. CHECK (C803) REAR BLOWER MEDIUM CIRCUIT FOR A SHORT TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Measure the resistance between the (C803) Rear Blower Medium circuit and the (F504) Fused Ignition Switch Output (Run) circuit in the Rear A/C Heater Control harness connector.



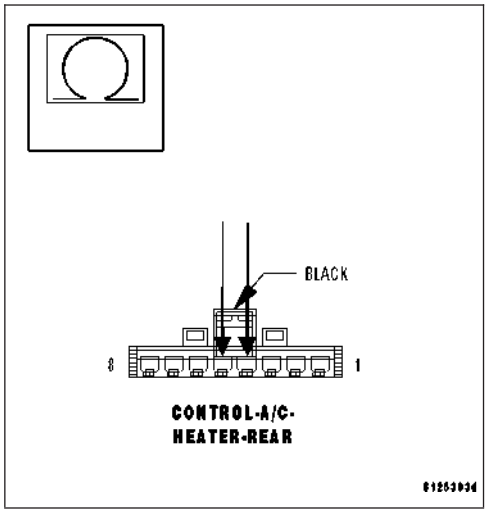
Is the resistance below 10k ohms?

Yes >> Go To 5

No >> Go To 5

5. CHECK (C802) REAR BLOWER HIGH CIRCUIT FOR A SHORT TO (F504) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT

Measure the resistance between the (C802) Rear Blower High circuit and the (F504) Fused Ignition Switch Output (Run) circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms on any of the circuits tested in Steps 3, 4, & 5?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (F504) Fused Ignition Switch Output (Run) circuit.

Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

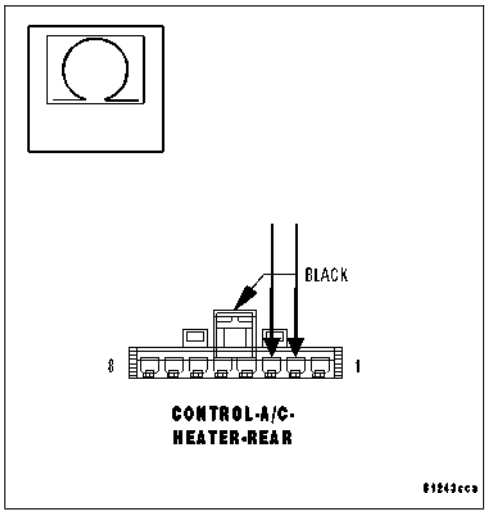
B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC) (CONTINUED)

6. CHECK (C804) REAR BLOWER LOW CIRCUIT FOR A SHORT TO (C803) REAR BLOWER MEDIUM CIRCUIT

If not done so previously, turn the ignition off.

If not done so previously, disconnect the Rear A/C Heater Control harness connector.

Measure the resistance between the (C804) Rear Blower Low circuit and the (C803) Rear Blower Medium circuit in the Rear A/C Heater Control harness connector.



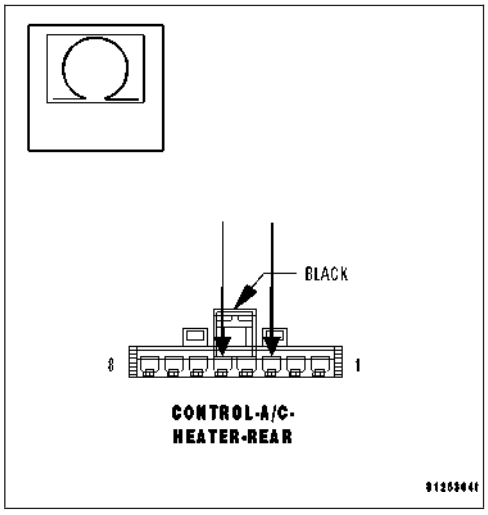
Is the resistance below 10k ohms?

Yes >> Go To 7

No >> Go To 7

7. CHECK (C804) REAR BLOWER LOW CIRCUIT FOR A SHORT TO (C802) REAR BLOWER HIGH CIRCUIT

Measure the resistance between the (C804) Rear Blower Low circuit and the (C802) Rear Blower High circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms?

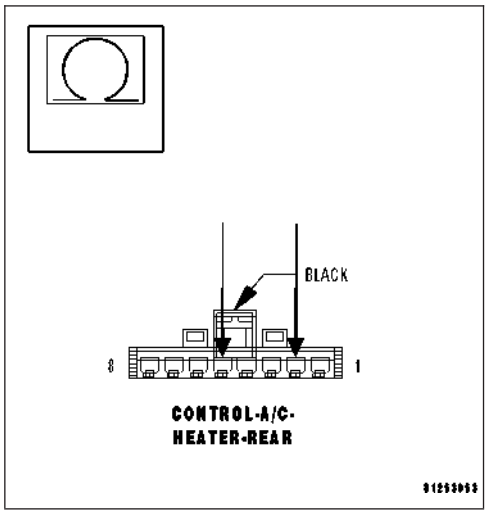
Yes >> Go To 8

No >> Go To 8

B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE (ATC) (CONTINUED)

8. CHECK (C803) REAR BLOWER MEDIUM CIRCUIT FOR A SHORT TO (C802) REAR BLOWER HIGH CIRCUIT

Measure the resistance between the (C803) Rear Blower Medium circuit and the (C802) Rear Blower High circuit in the Rear A/C Heater Control harness connector.



Is the resistance below 10k ohms on any of the circuits tested in Steps 6, 7, & 8?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the other rear blower circuit(s).
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 9

---

9. CHECK FOR DTC B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE WITH REAR A/C HEATER CONTROL DISCONNECTED

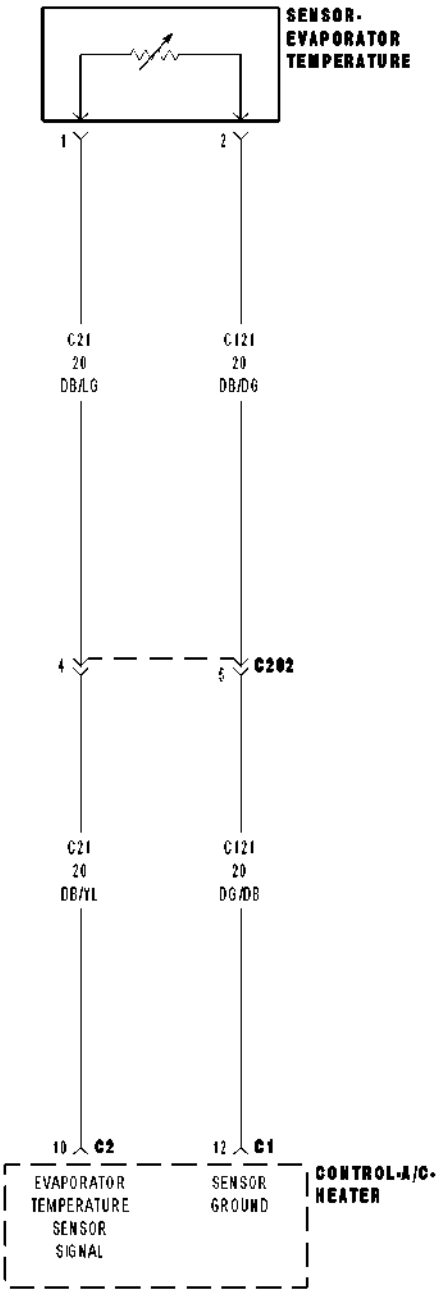
NOTE: Make sure that the Rear A/C Heater Control is disconnected.
Reconnect the A/C Heater Control C2 harness connector.
If removed, reinstall Junction Block Fuse 24.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
Set the Rear Function mode switch to Control In Rear.
With the scan tool, read HAVC DTCs.

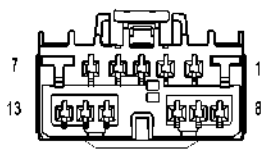
Does the scan tool display: B1027–REAR BLOWER CONTROL REQUEST INPUT CIRCUIT/PERFORMANCE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

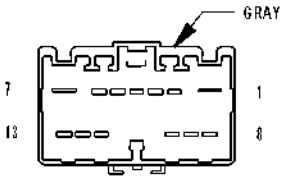
No >> Replace the Rear A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC)

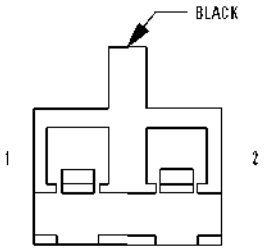




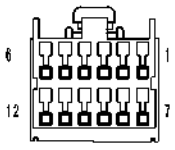
C202



C202



SENSOR-
EVAPORATOR
TEMPERATURE



CONTROL-A/C-
HEATER C2
(ATC)

B1653c48

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold, (A/D counts reach low threshold of 16). This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: DTC B1031 must be active for the results of this test to be valid. Do not perform this test if DTC B1031 is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

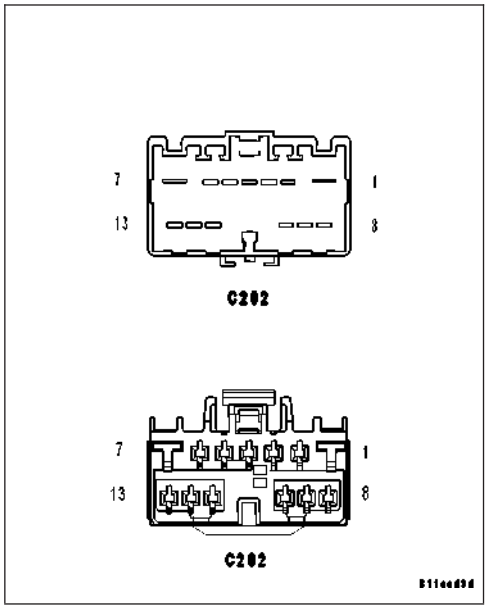
1. CHECK FOR DTC B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW WITH IN-LINE C202 HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
Disconnect the in-line C202 harness connector.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read HVAC DTCs.

Does the scan tool display: B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> Go To 4



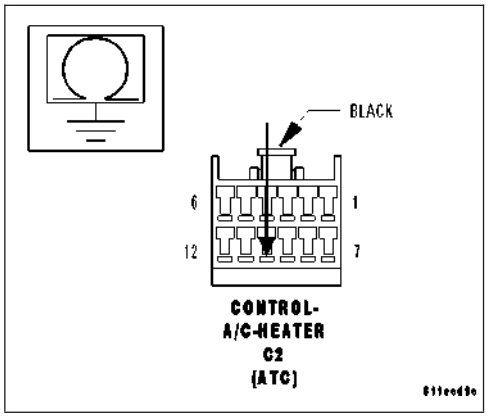
B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C2 harness connector.



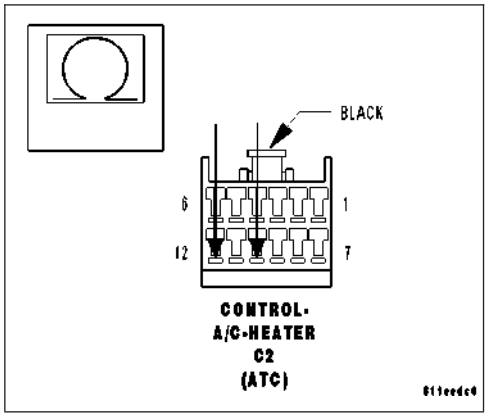
Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.

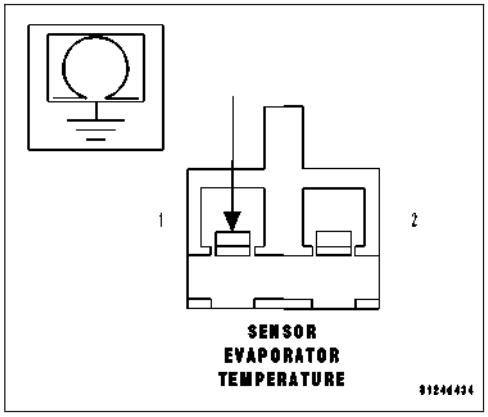
No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

4. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the Evaporator Temperature Sensor harness connector.



Is the resistance below 10k ohms?

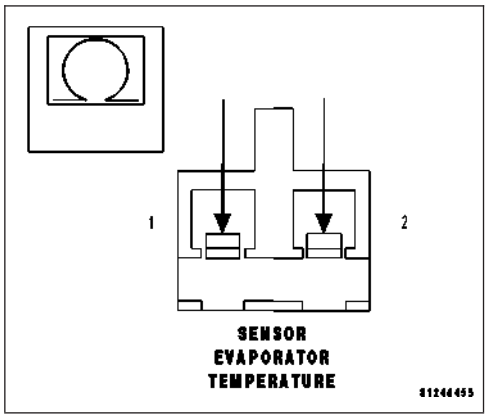
Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)

5. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.



Is the resistance below 10k ohms?

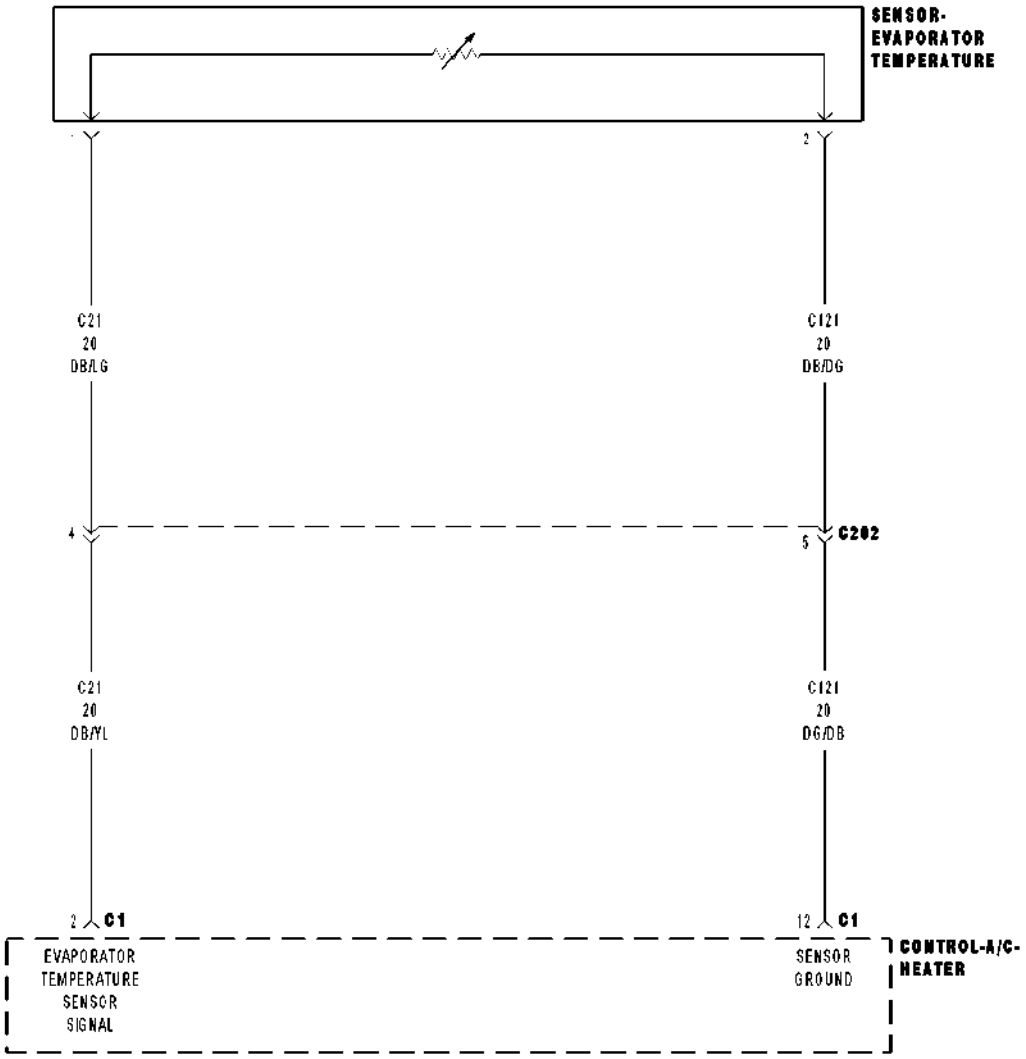
Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

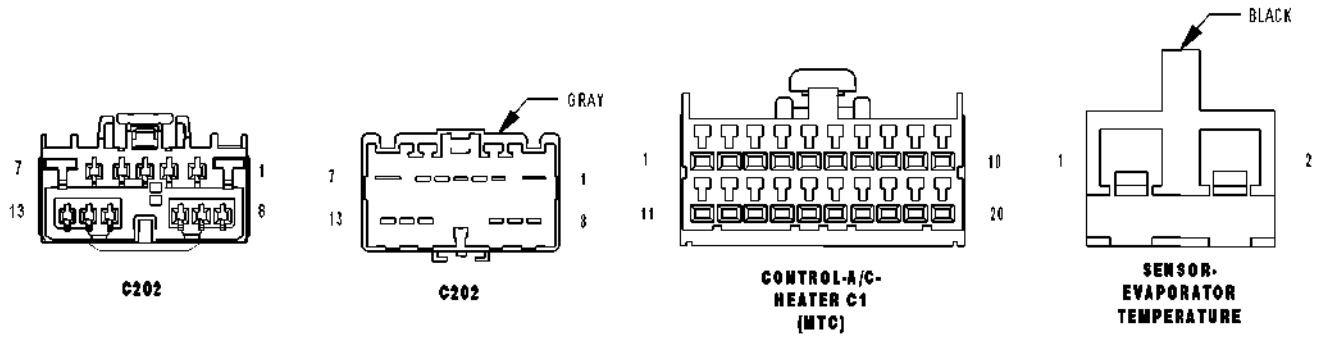
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (MTC)





B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold, (A/D counts reach low threshold of 16). This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: DTC B1031 must be active for the results of this test to be valid. Do not perform this test if DTC B1031 is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

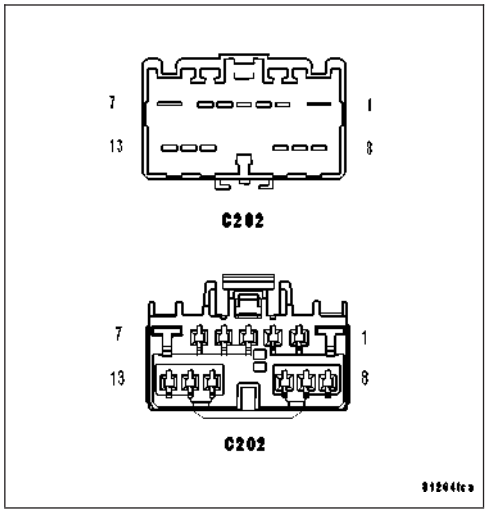
1. CHECK FOR DTC B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW WITH IN-LINE C202 HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
Disconnect the in-line C202 harness connector.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read HVAC DTCs.

Does the scan tool display: B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> Go To 4



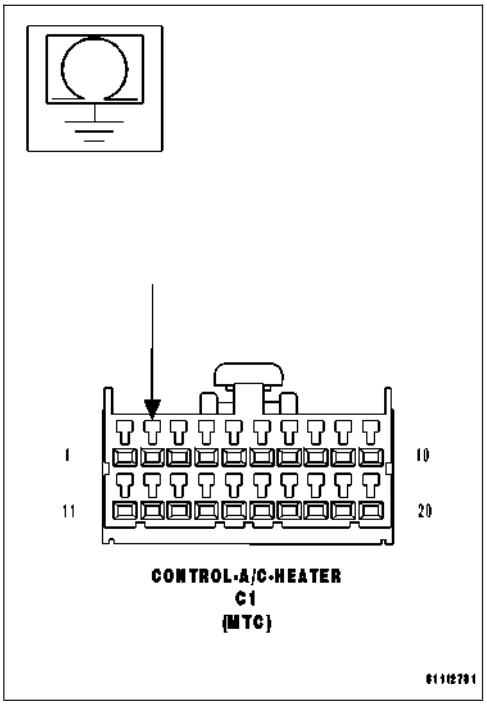
B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

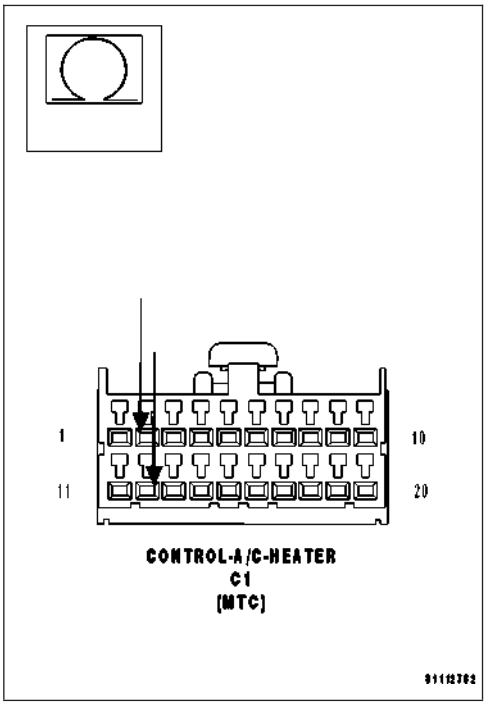
Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.

Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.

Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

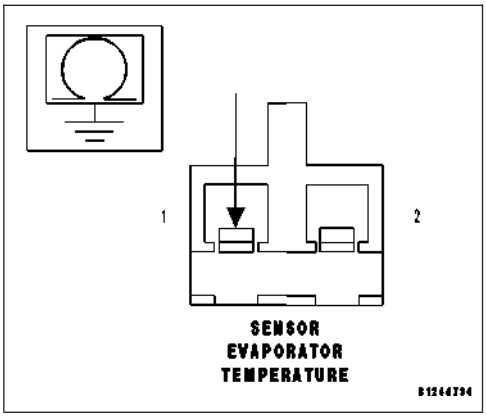
B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the Evaporator Temperature Sensor harness connector.



Is the resistance below 10k ohms?

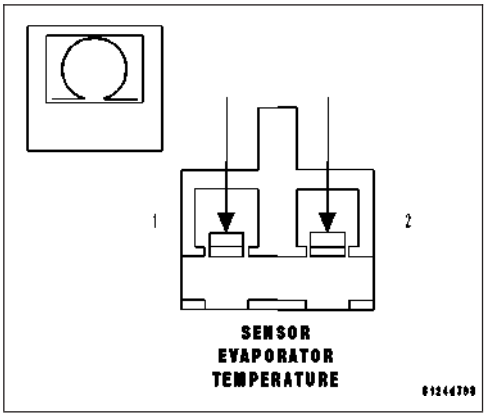
Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.



Is the resistance below 10k ohms?

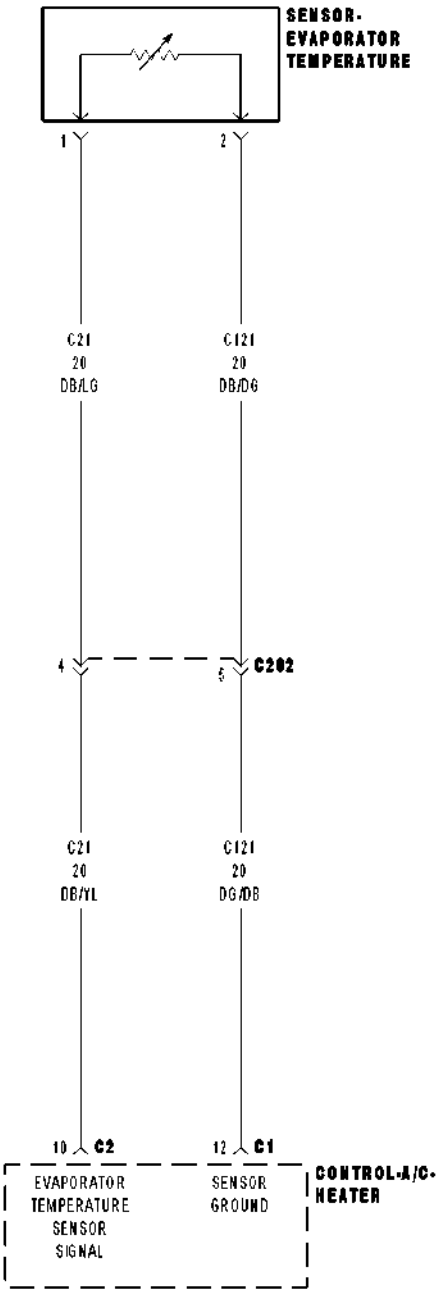
Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

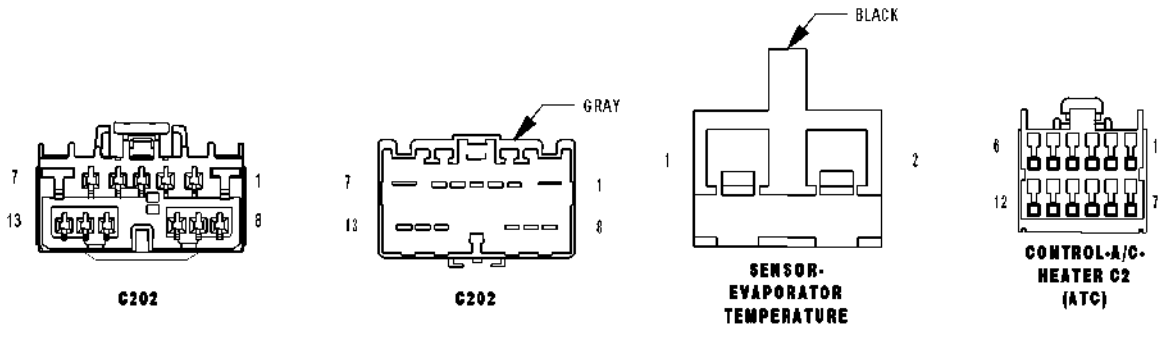
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC)





B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold, (A/D counts reach high threshold of 240). This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

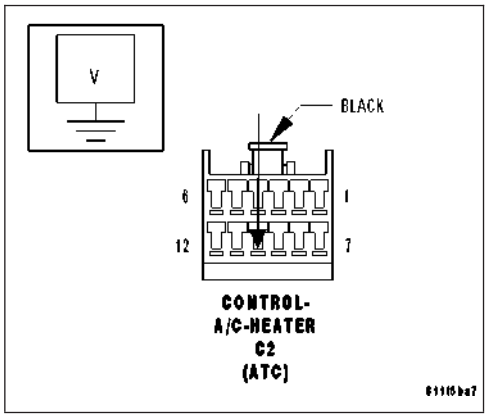
1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

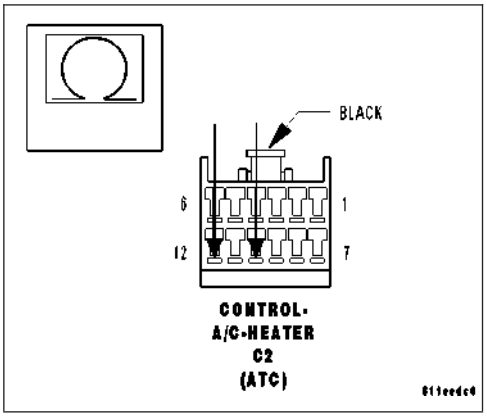
B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector. The approximate circuit resistance should be as follows:

- 1468 ohms @ 40°C (104°F)
- 1800 ohms @ 35°C (95°F)
- 2221 ohms @ 30°C (86°F)
- 2757 ohms @ 25°C (77°F)
- 3443 ohms @ 20°C (68°F)
- 4330 ohms @ 15°C (59°F)
- 5485 ohms @ 10°C (50°F)
- 6998 ohms @ 5°C (41°F)
- 7354 ohms @ 4°C (39°F)
- 7731 ohms @ 3°C (37°F)
- 8130 ohms @ 2°C (36°F)
- 8553 ohms @ 1°C (34°F)
- 9000 ohms @ 0°C (32°F)



Is the resistance within the specifications?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

---

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

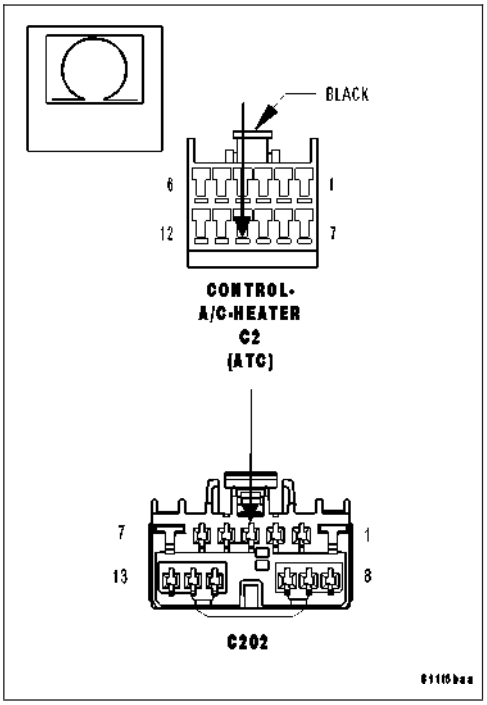
Disconnect the in-line C202 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

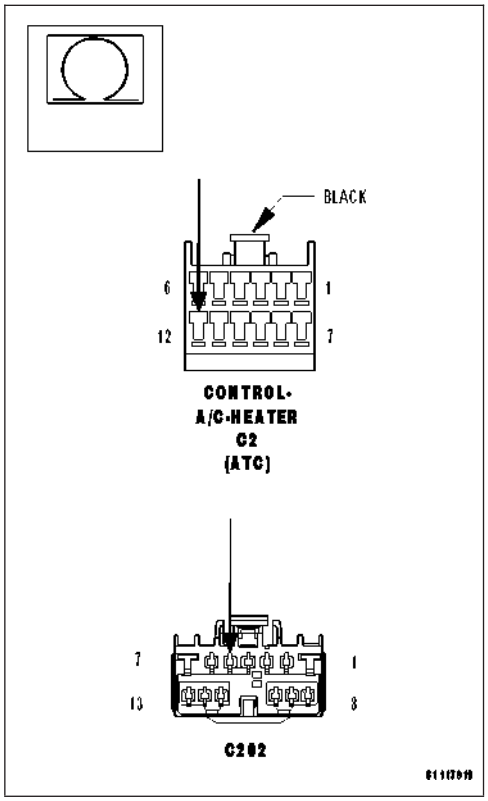
No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.



B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (C121) Sensor Ground circuit for an open between the A/C Heater Control C2 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.

B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

5. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the Evaporator Temperature Sensor harness connector.

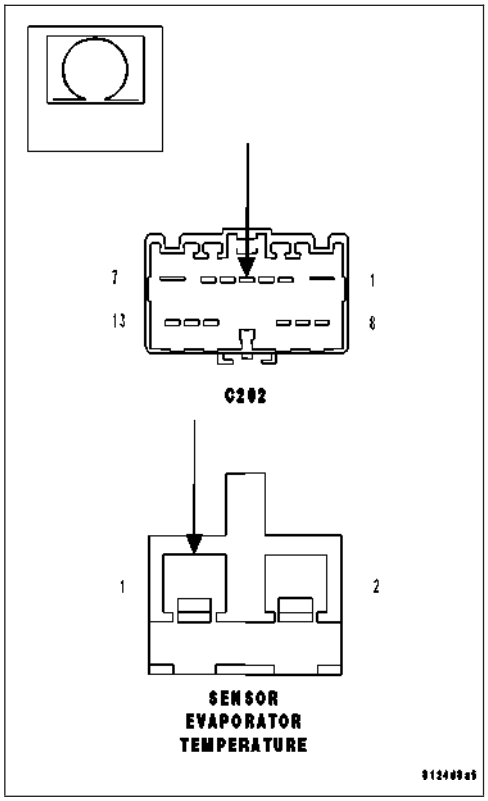
Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Perform BODY VERIFICATION TEST - VER 1.



6. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

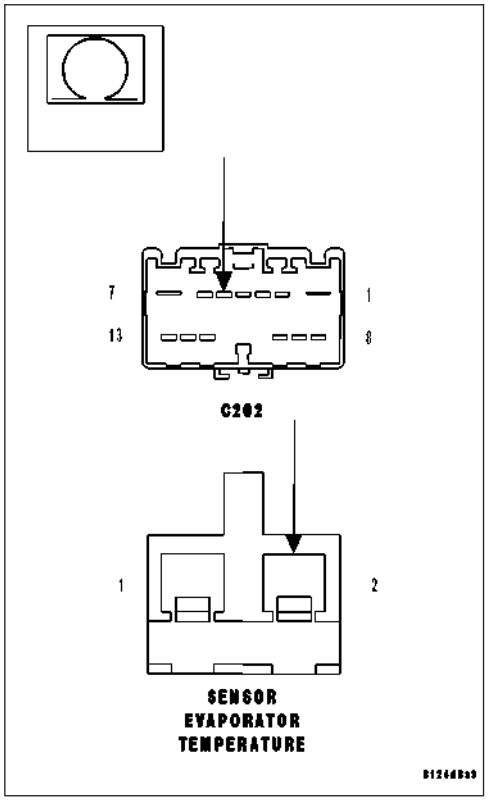
Is the resistance below 5.0 ohms?

Yes >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.

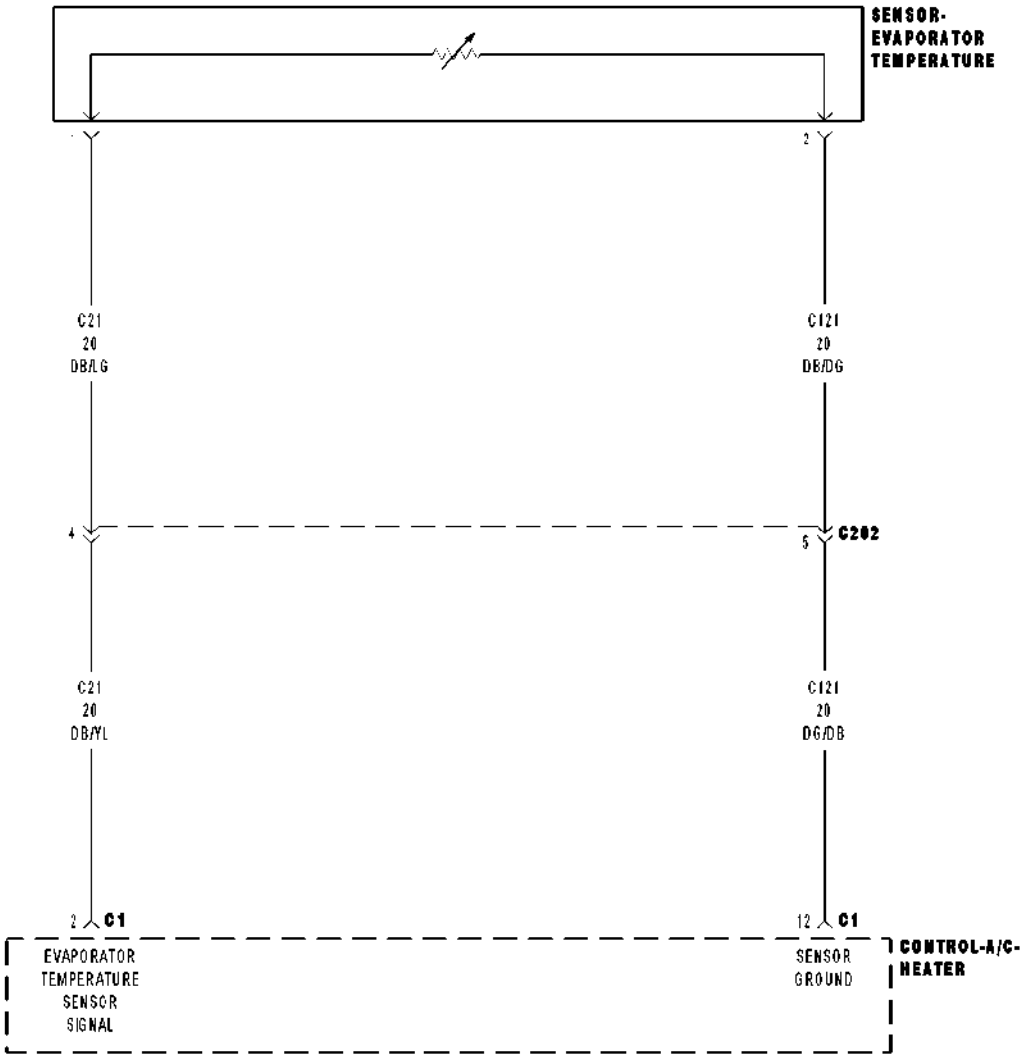
Perform BODY VERIFICATION TEST - VER 1.

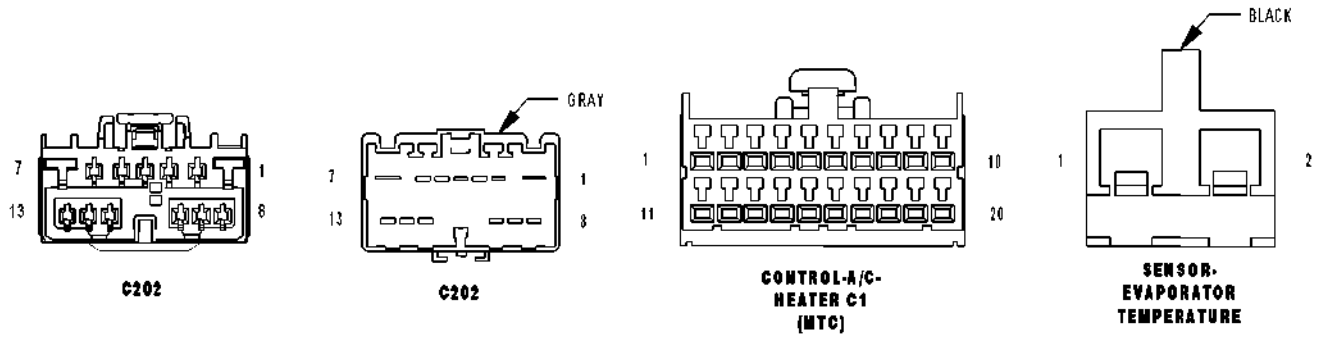
No >> Repair the (C121) Sensor Ground circuit for an open between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Perform BODY VERIFICATION TEST - VER 1.



B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (MTC)





B1653419

B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold, (A/D counts reach high threshold of 240). This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

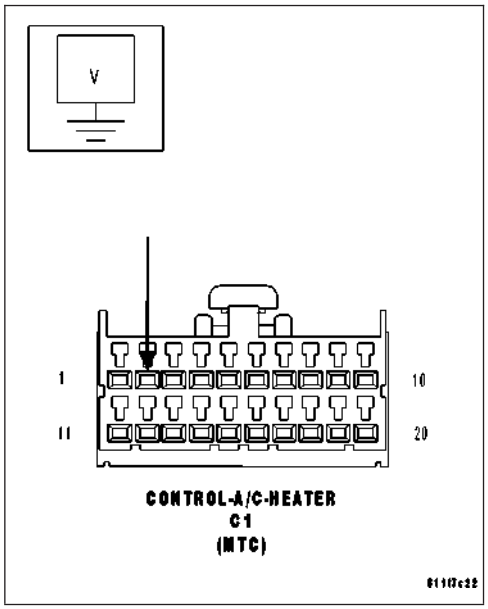
Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2



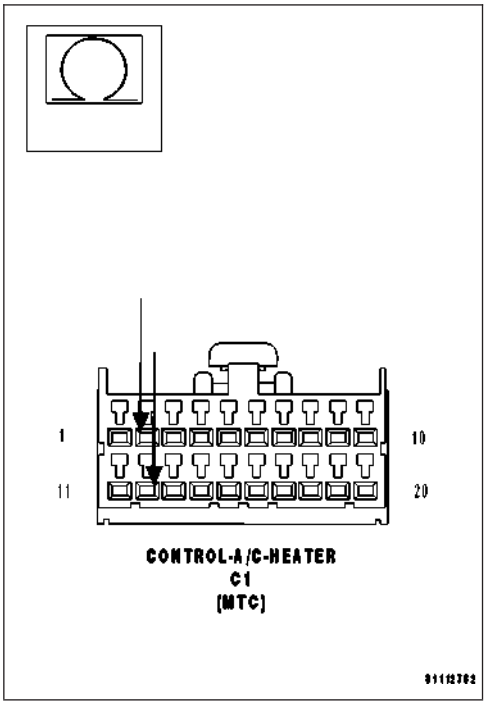
B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (MTC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C1 harness connector. The approximate circuit resistance should be as follows:

- 1468 ohms @ 40°C (104°F)
- 1800 ohms @ 35°C (95°F)
- 2221 ohms @ 30°C (86°F)
- 2757 ohms @ 25°C (77°F)
- 3443 ohms @ 20°C (68°F)
- 4330 ohms @ 15°C (59°F)
- 5485 ohms @ 10°C (50°F)
- 6998 ohms @ 5°C (41°F)
- 7354 ohms @ 4°C (39°F)
- 7731 ohms @ 3°C (37°F)
- 8130 ohms @ 2°C (36°F)
- 8553 ohms @ 1°C (34°F)
- 9000 ohms @ 0°C (32°F)



Is the resistance within the specifications?

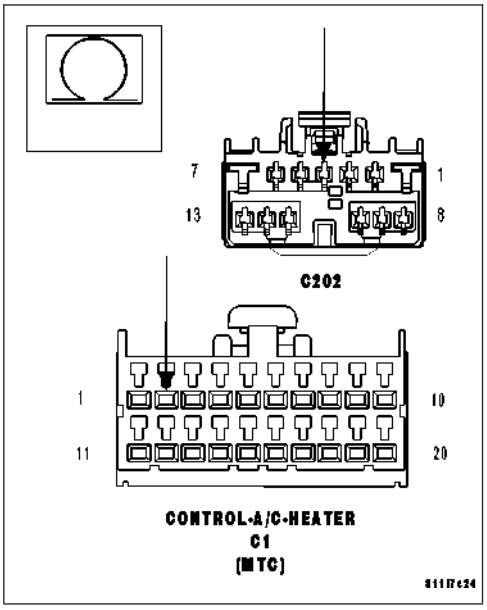
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the in-line C202 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.

B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (MTC) (CONTINUED)

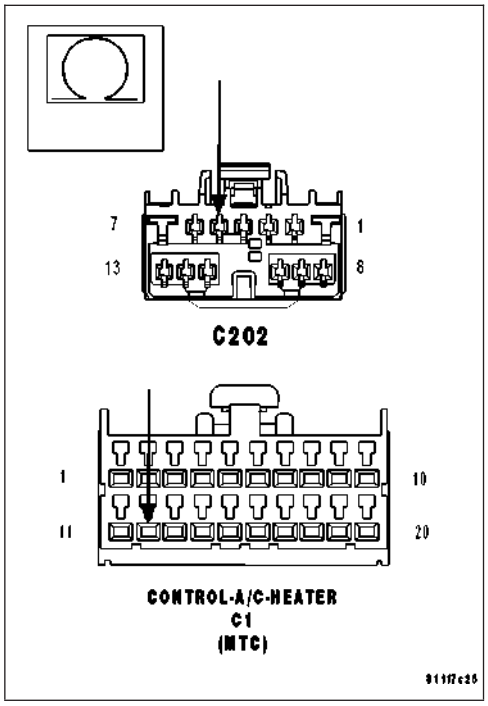
4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (C121) Sensor Ground circuit for an open between the A/C Heater Control C1 harness connector and the in-line C202 (IP SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.



5. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

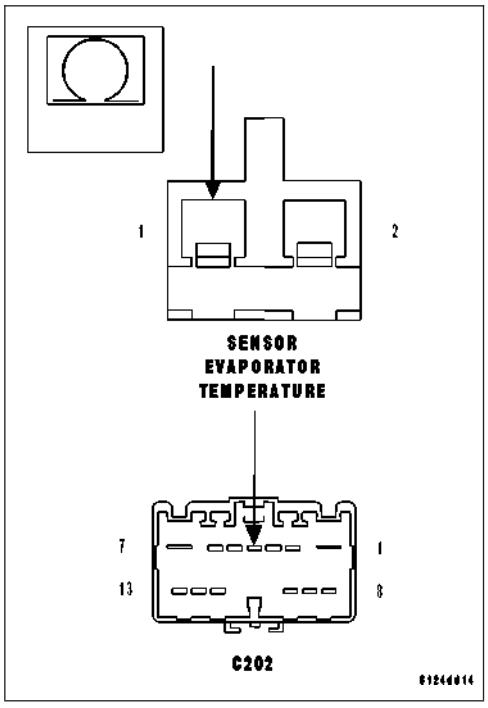
Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.



B1032–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (MTC) (CONTINUED)

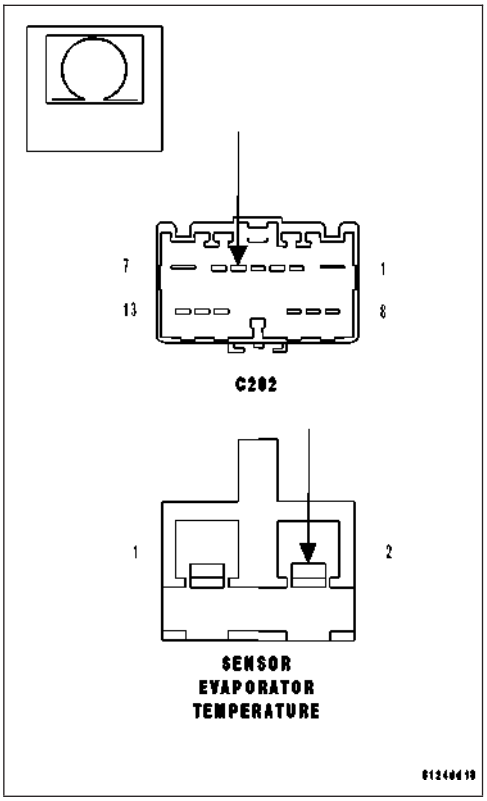
6. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C121) Sensor Ground circuit for an open between the Evaporator Temperature Sensor harness connector and the in-line C202 (HVAC SIDE) harness connector.
Perform BODY VERIFICATION TEST - VER 1.



B1034–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Compass Temperature Module (EOM) detects a short to ground on the (C38) Infrared Sensor Signal circuit.

POSSIBLE CAUSES
(C83) INFRARED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
INFRARED TEMPERATURE SENSOR
COMPASS TEMPERATURE MODULE (EOM)

Theory of Operation

The A/C Heater Control requires IR Sensor data to function in an automatic mode. The IR Sensor is hard wired to the Compass Temperature Module (EOM). The EOM broadcasts the IR Sensor data on the Controller Area Network (CAN) B Bus where it is received and then processed by the A/C Heater Control.

Diagnostic Test

1. PERFORM B1034–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT LOW TEST

Repair

Perform test B1034–Infrared Temperature Sensor Input Circuit Low test. (Refer to 8 - ELECTRICAL/ OVERHEAD CONSOLE - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1.

B1035–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Compass Temperature Module (EOM) detects a short high or open on the (C83) Infrared Sensor Signal circuit.

POSSIBLE CAUSES
(C83) INFRARED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(Z957) INFRARED SENSOR GROUND CIRCUIT OPEN
(C83) INFRARED SENSOR SIGNAL CIRCUIT OPEN
INFRARED TEMPERATURE SENSOR
COMPASS TEMPERATURE MODULE (EOM)

Theory of Operation

The A/C Heater Control requires IR Sensor data to function in an automatic mode. The IR Sensor is hard wired to the Compass Temperature Module (EOM). The EOM broadcasts the IR Sensor data on the Controller Area Network (CAN) B Bus where it is received and then processed by the A/C Heater Control.

Diagnostic Test

1. PERFORM B1035–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT HIGH TEST

Repair

Perform test B1035–Infrared Temperature Sensor Input Circuit High test. (Refer to 8 - ELECTRICAL/ OVERHEAD CONSOLE - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1.

B1038–AUTO SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Auto mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

Does the scan tool display active: B1038–AUTO SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Perform BODY VERIFICATION TEST – VER 1.

B1040–PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C29) Mode Door 1 Driver circuit or the (C807) Common Door Driver 2 circuit while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

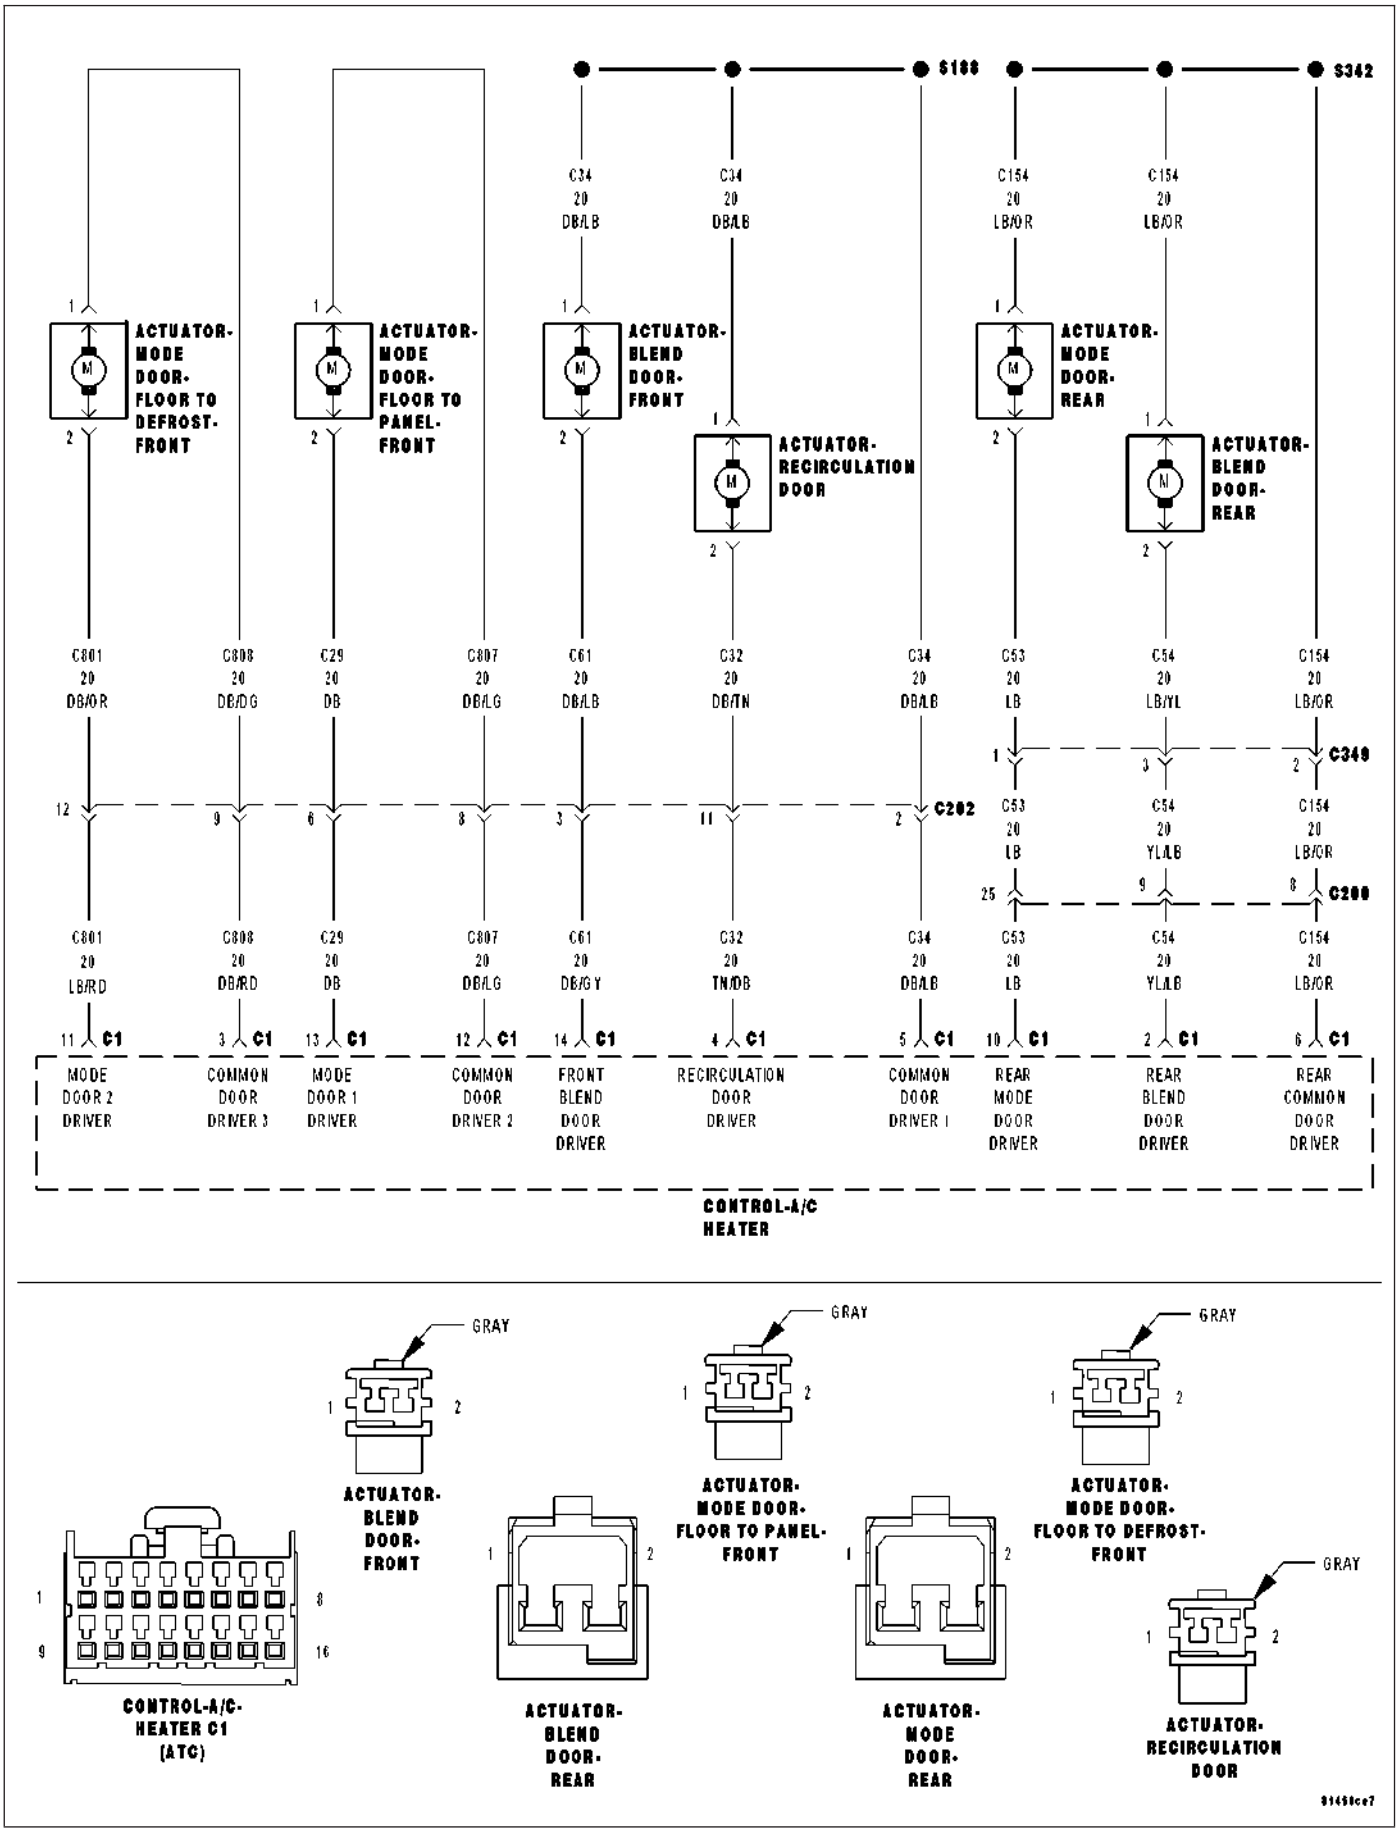
B1040–PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (MTC) for stored DTC test procedures.

B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC)



B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C29) Mode Door 1 Driver circuit is shorted to ground.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO GROUND
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit. The Mode Door 1 (Floor to Panel) Actuator does not share the (C807) Common Door Driver 2 circuit or its driver inside the A/C Heater Control with any other actuator.

Diagnostic Test

1. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

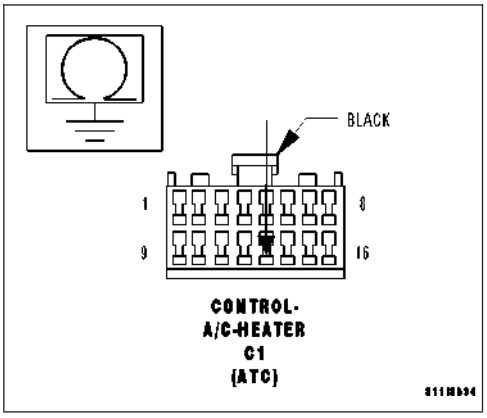
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C29) Mode Door 1 Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

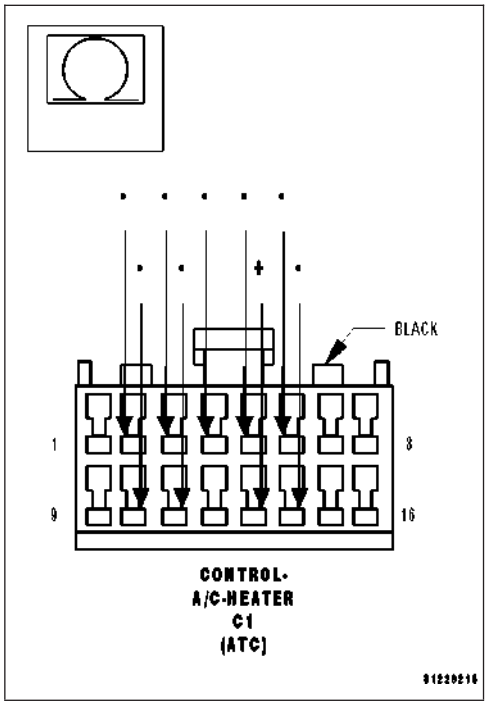
No >> Go To 2



B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door 1 Driver circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C801) Mode Door 2 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



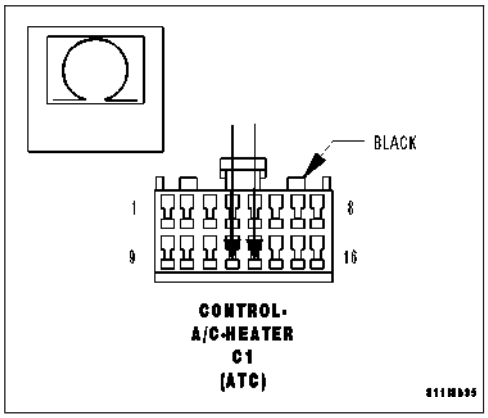
Is the resistance below 10k ohms between the (C29) Mode Door 1 Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C29) Mode Door 1 Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

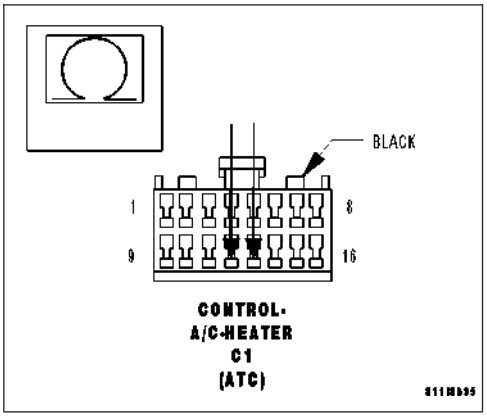
No >> Go To 5

B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO (C807) COMMON DOOR DRIVER 2 CIRCUIT

Disconnect the Mode Door 1 (Floor to Panel) Actuator harness connector.

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to the (C807) Common Door Driver 2 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

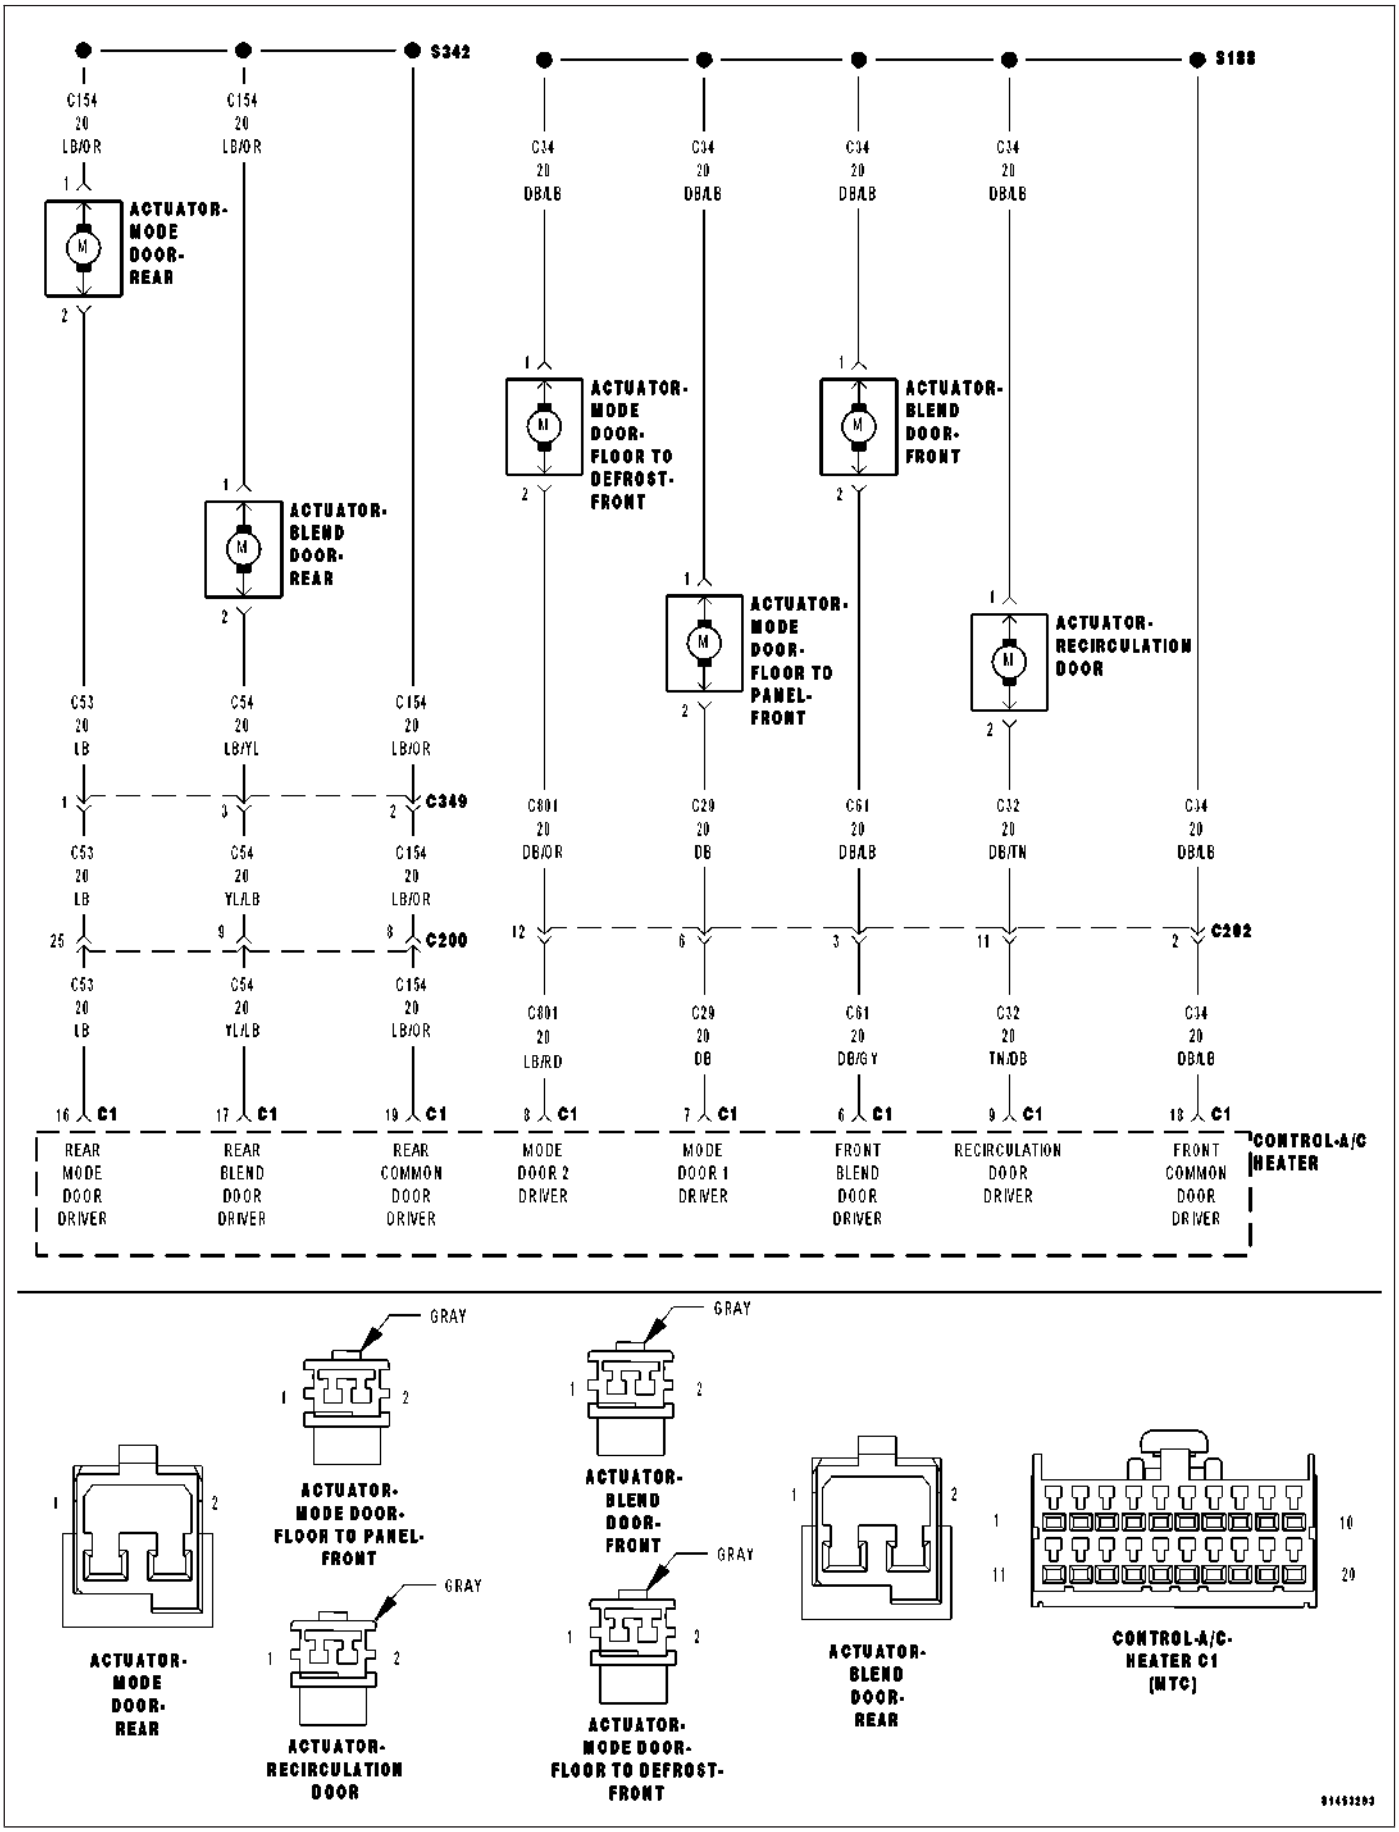
Does the scan tool only display: B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (MTC)



B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C29) Mode Door 1 Driver circuit is shorted to ground.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO GROUND
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

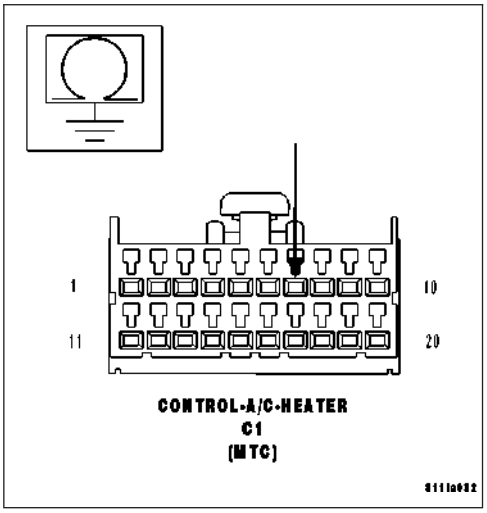
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C29) Mode Door 1 Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

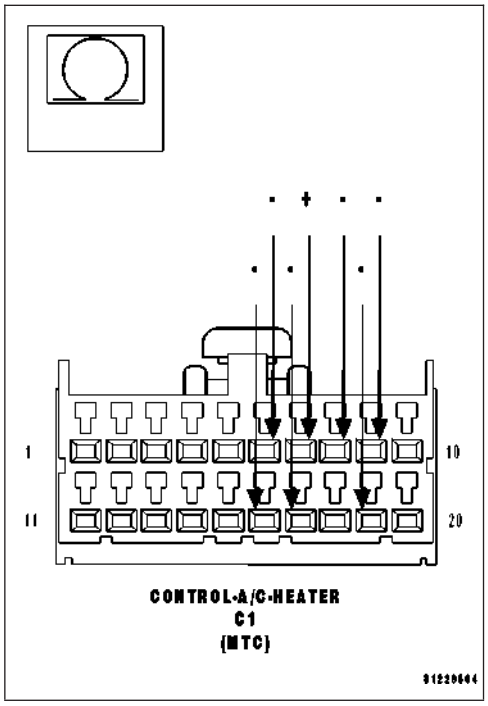
No >> Go To 2



B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C61) Front Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C32) Recirculation Door Driver circuit, and, if equipped, the (C53) Rear Mode Door Driver circuit, the (C154) Rear Common Door Driver circuit, and the (C54) Rear Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



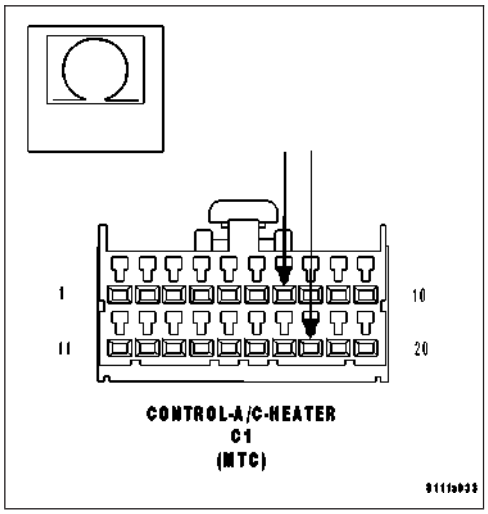
Is the resistance below 10k ohms between the (C29) Mode Door 1 Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C29) Mode Door 1 Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

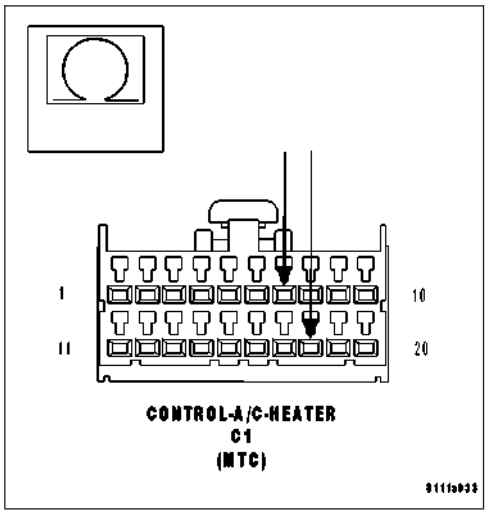
No >> Go To 5

B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Mode Door 1 (Floor to Panel) Actuator harness connector.

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C29) Mode Door 1 Driver circuit is shorted to voltage.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit. The Mode Door 1 (Floor to Panel) Actuator does not share the (C807) Common Door Driver 2 circuit or its driver inside the A/C Heater Control with any other actuator.

Diagnostic Test

1. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

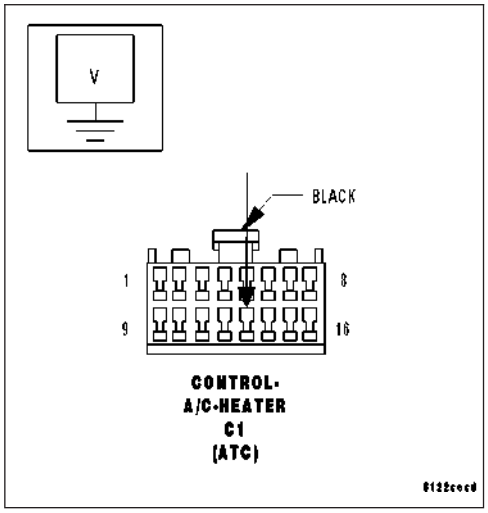
Turn the ignition on.

Measure the voltage of the (C29) Mode Door 1 Driver circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2



B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

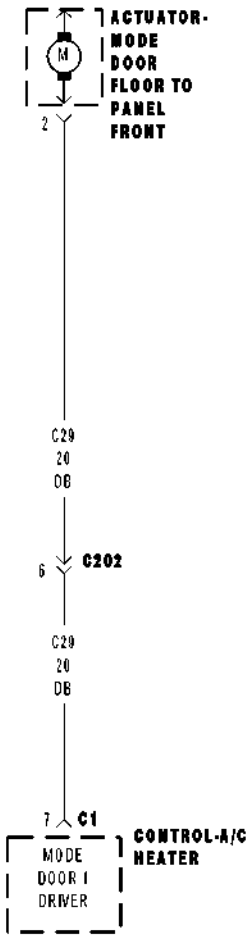
Does the scan tool only display: B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH?

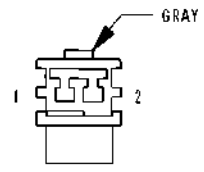
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

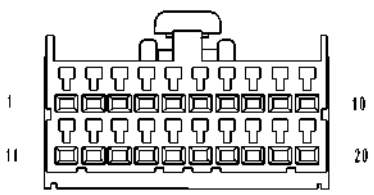
No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (MTC)





ACTUATOR-
MODE DOOR-
FLOOR TO PANEL-
FRONT



CONTROL-A/C-
HEATER C1
(MTC)

B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C29) Mode Door 1 Driver circuit is shorted to voltage.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Note that due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

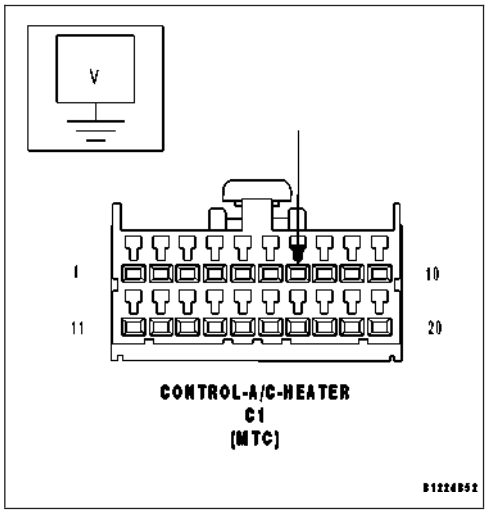
1. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C29) Mode Door 1 Driver circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C29) Mode Door 1 Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (MTC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If Mode Door 1 (Floor to Panel) Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT OPEN
(C807) COMMON DOOR DRIVER 2 CIRCUIT OPEN
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit. The Mode Door 1 (Floor to Panel) Actuator does not share the (C807) Common Door Driver 2 circuit or its driver inside the A/C Heater Control with any other actuator.

NOTE: DTC B1043 must be active for the results of this test to be valid. Do not perform this test if DTC B1043 is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, then all other Control Circuit/Performance DTCs next. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B1043–PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

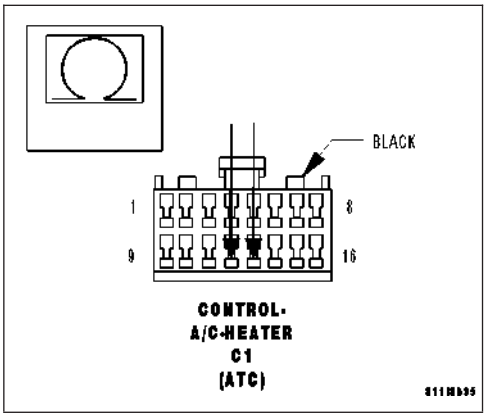
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C807) Common Door Driver 2 circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR AN OPEN

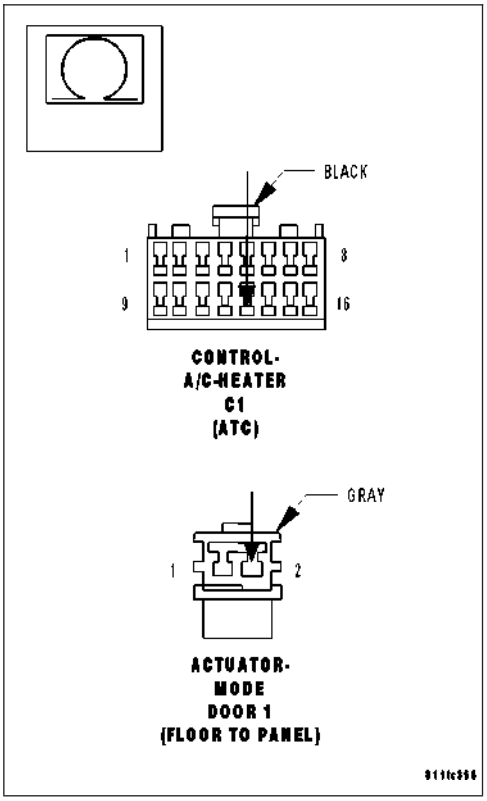
Disconnect the Mode Door 1 (Floor to Panel) Actuator harness connector.

Measure the resistance of the (C29) Mode Door 1 Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 1 (Floor to Panel) Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

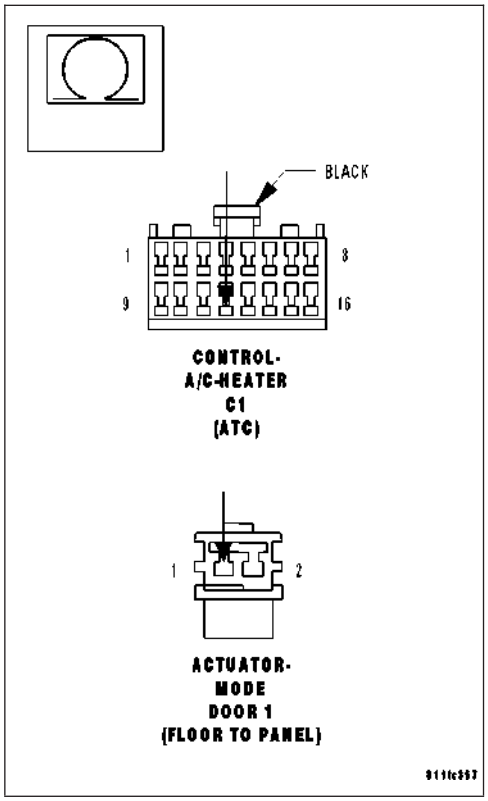
No >> Repair the (C29) Mode Door 1 Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1043–PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C807) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN

Measure the resistance of the (C807) Common Door Driver 2 circuit between the A/C Heater Control C1 harness connector and the Mode Door 1 (Floor to Panel) Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C807) Common Door Driver 2 circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Mode Door 1 (Floor to Panel) Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C29) MODE DOOR 1 DRIVER CIRCUIT OPEN
(C34) FRONT COMMON DOOR DRIVER CIRCUIT OPEN
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 1 (Floor to Panel) Actuator via the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Note that due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B1043 must be active for the results of this test to be valid. Do not perform this test if DTC B1043 is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B1043–PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

2. CHECK MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

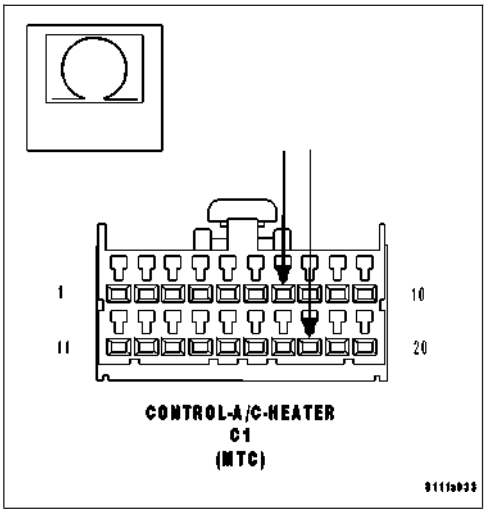
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C29) Mode Door 1 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C29) MODE DOOR 1 DRIVER CIRCUIT FOR AN OPEN

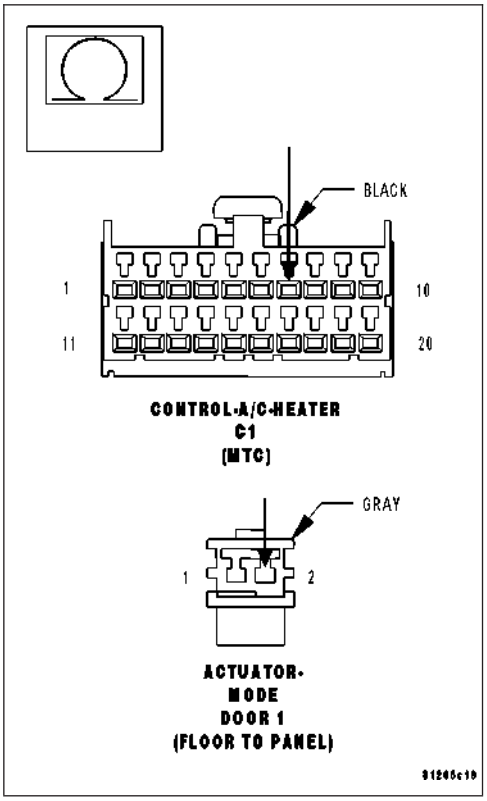
Disconnect the Mode Door 1 (Floor to Panel) Actuator harness connector.

Measure the resistance of the (C29) Mode Door 1 Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 1 (Floor to Panel) Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

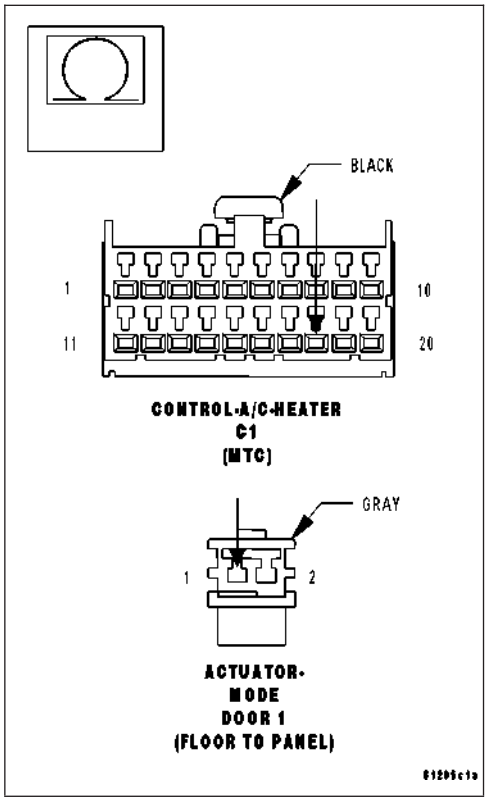
No >> Repair the (C29) Mode Door 1 Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1043–PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

4. CHECK (C34) FRONT COMMON DOOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C34) Front Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 1 (Floor to Panel) Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C34) Front Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B1044–PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Mode 1 (Floor to Panel) Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
MODE 1 (FLOOR TO PANEL) DOOR SEIZED, BINDING, OBSTRUCTED
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1044–PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK MODE 1 (FLOOR TO PANEL) DOOR TRAVEL

Remove the Mode Door 1 (Floor to Panel) Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 90 degrees of travel.

Does the door operate smoothly in both directions over approximately 90 degrees of travel?

Yes >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1044–PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Mode 1 (Floor to Panel) Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
MODE 1 (FLOOR TO PANEL) DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

3. CHECK FOR A BROKEN MODE DOOR 1 (FLOOR TO PANEL) ACTUATOR

Turn the ignition off.

Remove the Mode Door 1 (Floor to Panel) Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK MODE 1 (FLOOR TO PANEL) DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 1 (Floor to Panel) Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1046–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C801) Mode Door 2 Driver circuit, the (C808) Common Door Driver 3 circuit , the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, or the (C154) Rear Common Door Driver circuit while attempting to drive the Rear Mode Door Actuator, the Rear Blend Door Actuator, or the Mode Door 2 (Floor to Panel) Actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored, it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

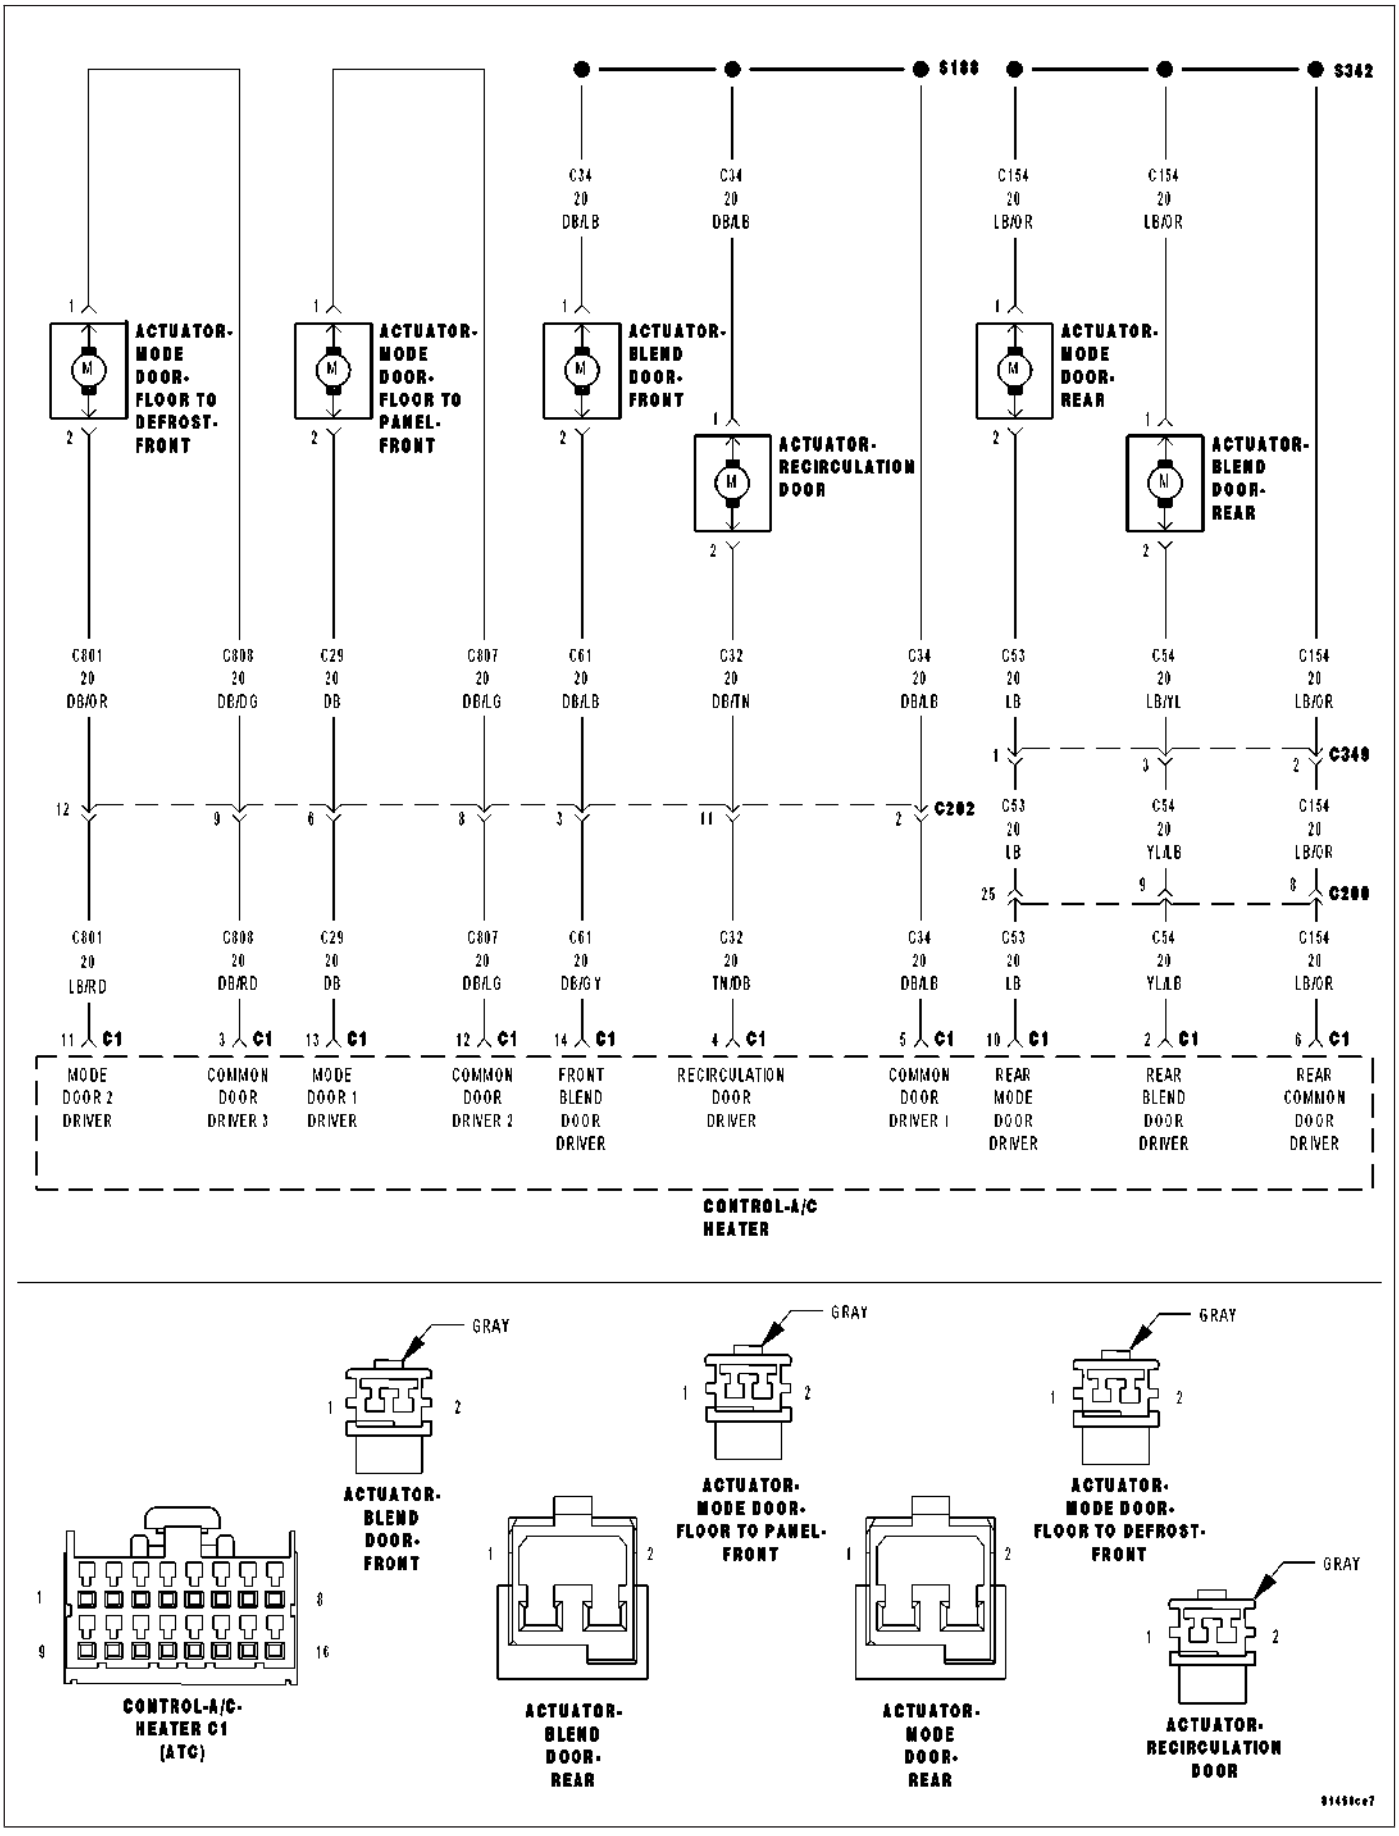
B1046–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT/PERFORMANCE (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B104C-BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (MTC) for stored DTC test procedures.

B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (ATC)



B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C801) Mode Door 2 Driver circuit is shorted to ground.

Possible Causes
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO GROUND
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit. The Mode Door 2 (Floor to Defrost) Actuator does not share the (C808) Common Door Driver 3 circuit with any other actuator. However, the Mode Door 2 (Floor to Defrost) Actuator, the Rear Mode Door Actuator, and the Rear Blend Door Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

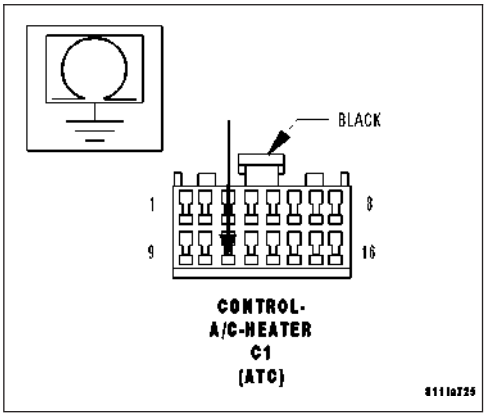
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

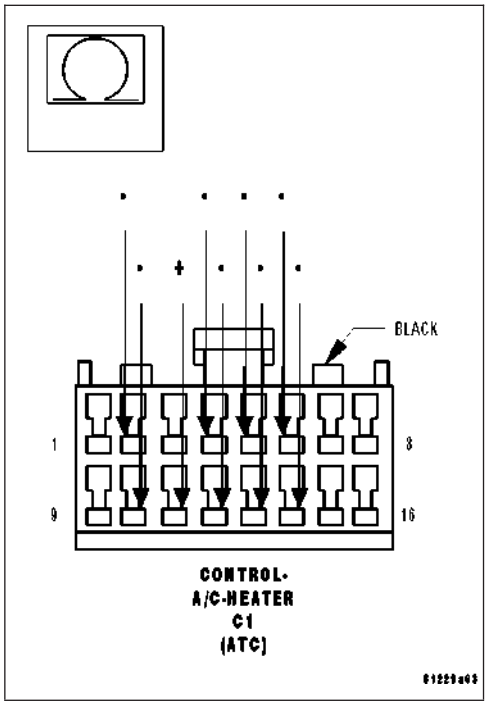
No >> Go To 2



B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door 1 Driver circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



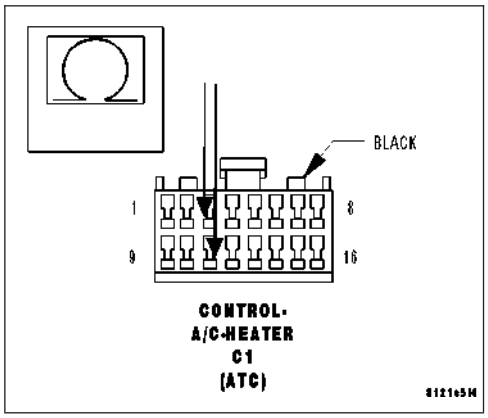
Is the resistance below 10k ohms between the (C801) Mode Door 2 Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C801) Mode Door 2 Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

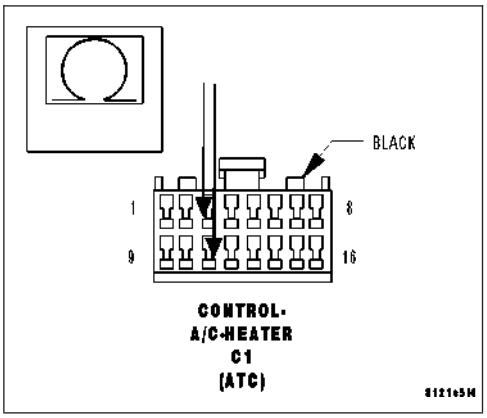
No >> Go To 5

B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C808) COMMON DOOR DRIVER 3 CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to the (C808) Common Door Driver 3 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

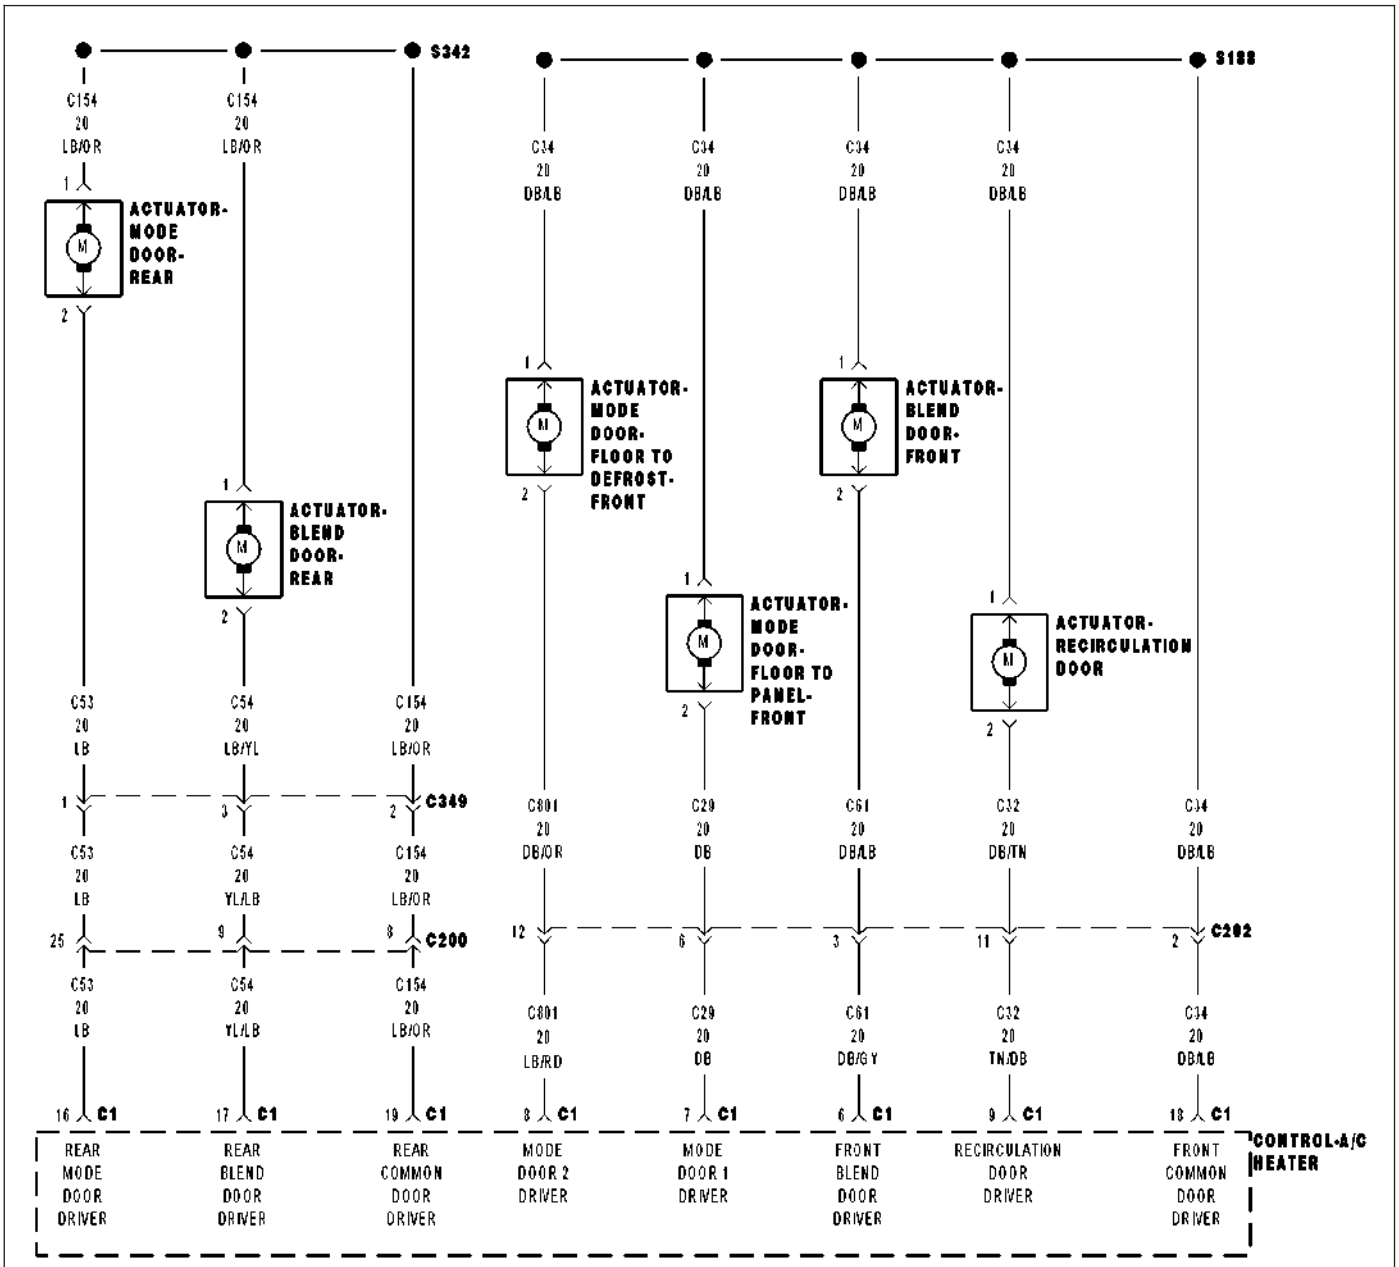
Does the scan tool only display: B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW?

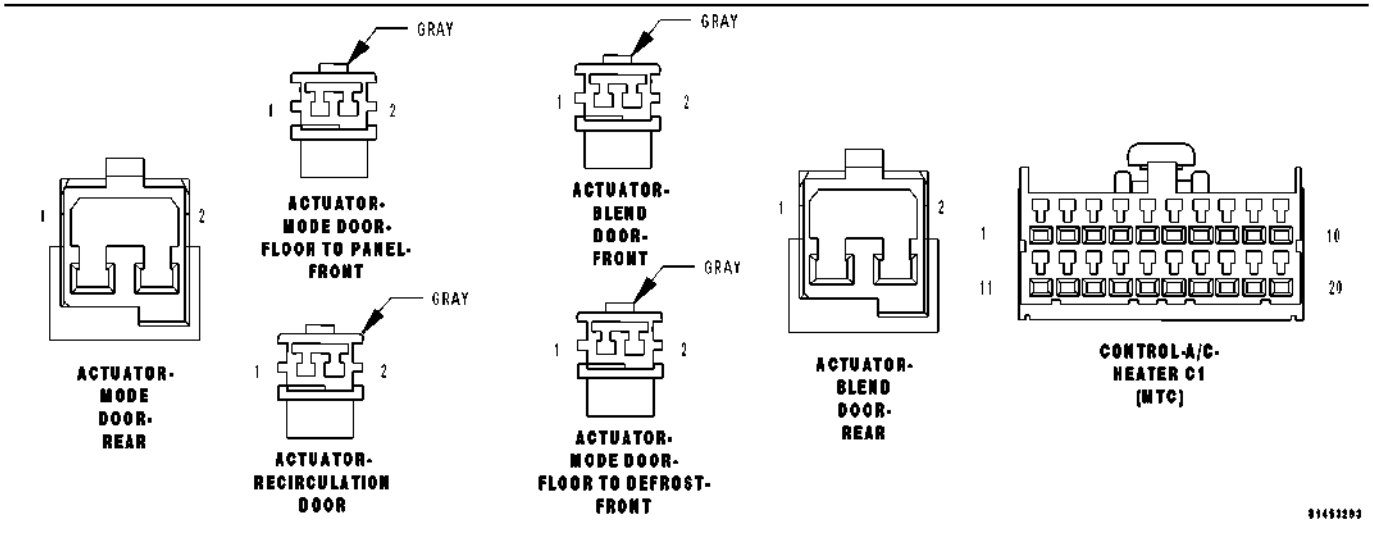
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (MTC)





B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C801) Mode Door 2 Driver circuit is shorted to ground.

Possible Causes
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO GROUND
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

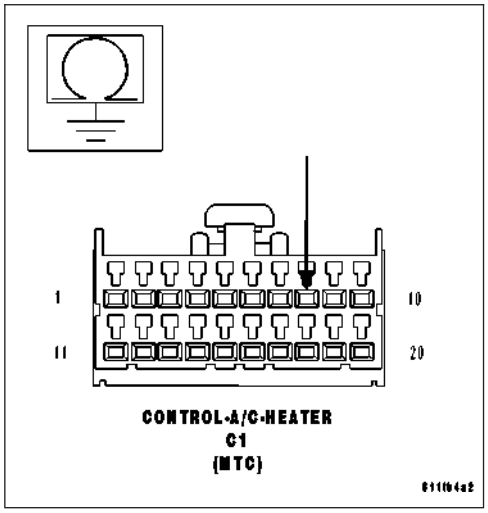
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

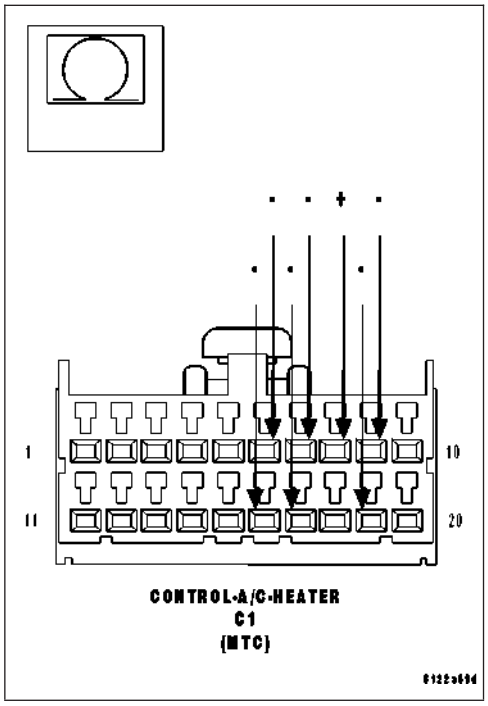
No >> Go To 2



B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C32) Recirculation Door Driver circuit, the (C29) Mode Door 1 Driver circuit, the (C61) Front Blend Door Driver circuit, and, if equipped, the (C53) Rear Mode Door Driver circuit, the (C154) Rear Common Door Driver circuit, and the (C54) Rear Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



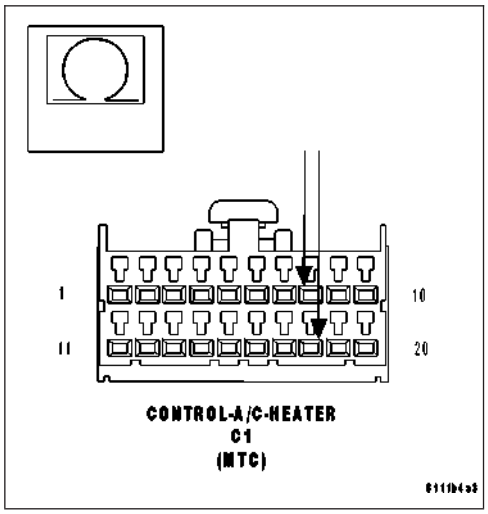
Is the resistance below 10k ohms between the (C801) Mode Door 2 Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C801) Mode Door 2 Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

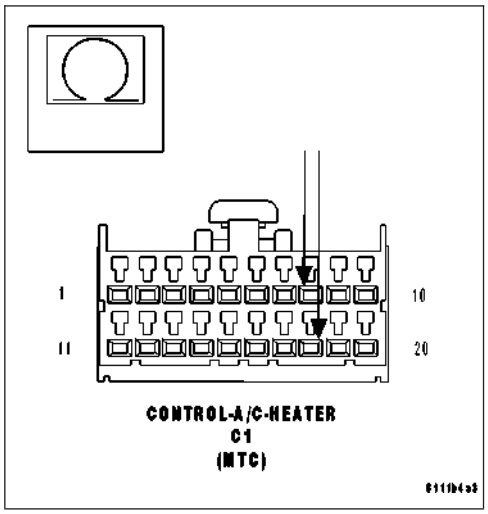
No >> Go To 5

B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1047–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C801) Mode Door 2 Driver circuit is shorted to voltage.

Possible Causes
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit. The Mode Door 2 (Floor to Defrost) Actuator does not share the (C808) Common Door Driver 3 circuit with any other actuator. However, the Mode Door 2 (Floor to Defrost) Actuator, the Rear Mode Door Actuator, and the Rear Blend Door Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

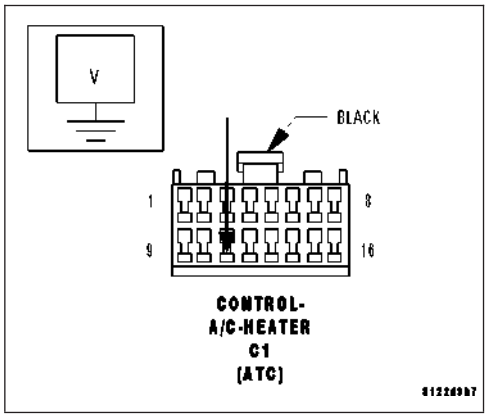
1. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C801) Mode Door 2 Driver circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1048–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1048–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

B1049–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Mode Door 2 (Floor to Defrost) Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C801) MODE DOOR 2 DRIVER CIRCUIT OPEN
(C808) COMMON DOOR DRIVER 3 CIRCUIT OPEN
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit. The Mode Door 2 (Floor to Defrost) Actuator does not share the (C808) Common Door Driver 3 circuit with any other actuator. However, the Mode Door 2 (Floor to Defrost) Actuator, the Rear Mode Door Actuator, and the Rear Blend Door Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B1049 must be active for the results of this test to be valid. Do not perform this test if DTC B1049 is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, then all other Control Circuit/Performance DTCs next. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B1049–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

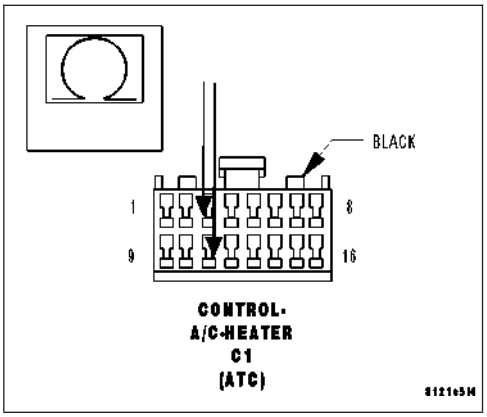
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR AN OPEN

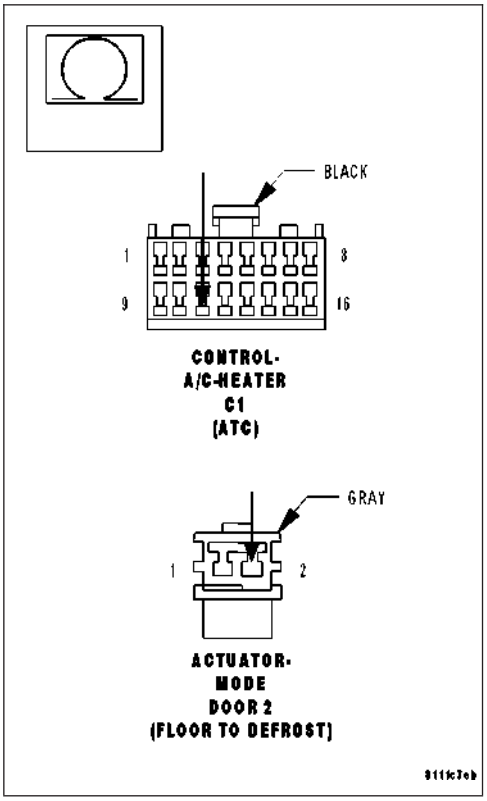
Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

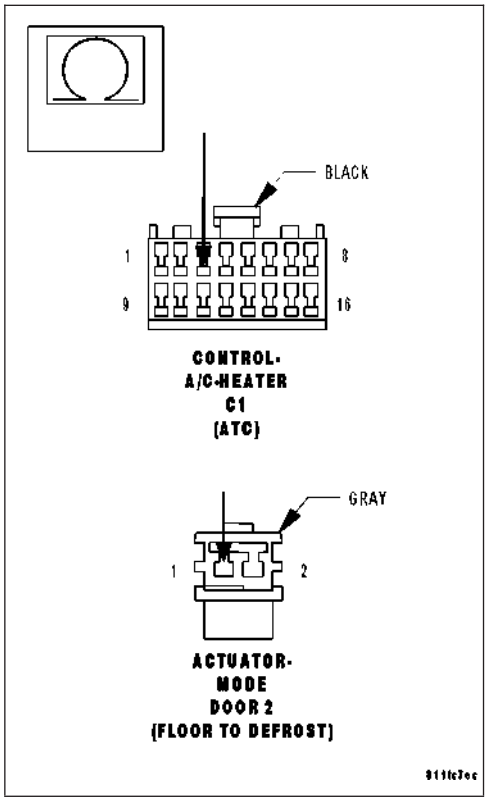
No >> Repair the (C801) Mode Door 2 Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1049–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR AN OPEN

Measure the resistance of the (C808) Common Door Driver 3 circuit between the A/C Heater Control C1 harness connector and the Mode Door 2 (Floor to Defrost) Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C808) Common Door Driver 3 circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Mode Door 2 (Floor to Defrost) Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C801) MODE DOOR 2 DRIVER CIRCUIT OPEN
(C34) FRONT COMMON DOOR DRIVER CIRCUIT OPEN
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B1049 must be active for the results of this test to be valid. Do not perform this test if DTC B1049 is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B1049–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

2. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

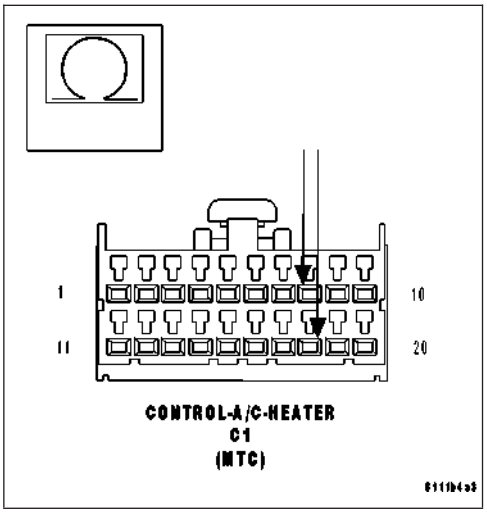
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.

Is the resistance above 70 ohms?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.



3. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR AN OPEN

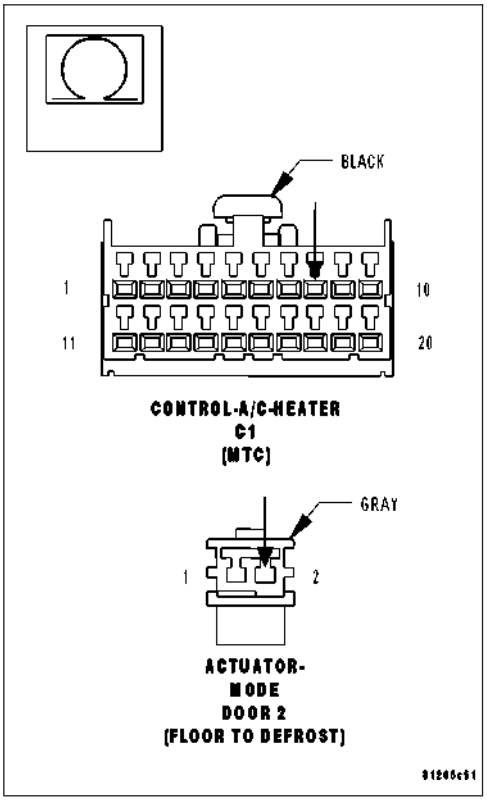
Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

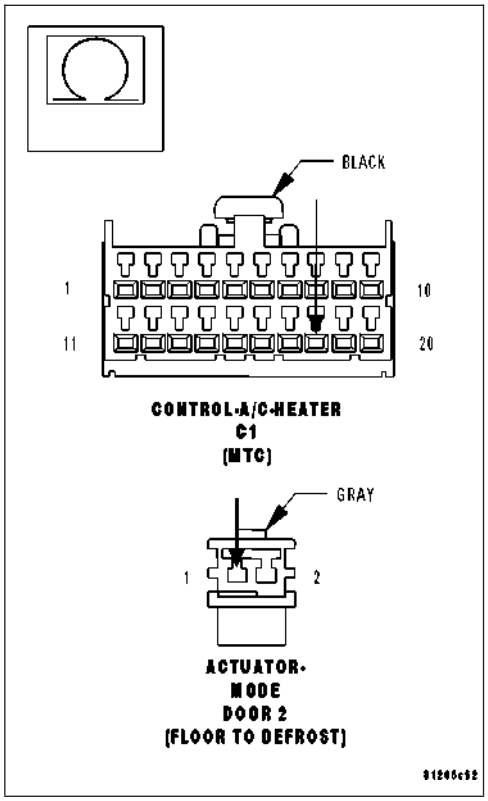
No >> Repair the (C801) Mode Door 2 Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1049–FLOOR/DEFROST MODE DOOR CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

4. CHECK (C34) FRONT COMMON DOOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C34) Front Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Mode Door 2 (Floor to Defrost) Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C34) Front Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B1050–BLEND DOOR TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Front Blend Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
FRONT BLEND DOOR SEIZED, BINDING, OBSTRUCTED
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1050–BLEND DOOR TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK FRONT BLEND DOOR TRAVEL

Remove the Front Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 65 degrees of travel.

Does the door operate smoothly in both directions over approximately 65 degrees of travel?

Yes >> Replace the Front Blend Door Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1050–BLEND DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1051–BLEND DOOR TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Front Blend Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
FRONT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
FRONT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1051–BLEND DOOR TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

3. CHECK FOR A BROKEN FRONT BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Front Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Front Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK FRONT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 65 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Front Blend Door Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1051–BLEND DOOR TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1052–REAR BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C154) Rear Common Door Driver circuit, or the (C808) Common Door Driver 3 circuit while attempting to drive the Rear Mode Door Actuator, the Rear Blend Door Actuator, or the Mode Door 2 (Floor to Panel) Actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored, it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B103A–REAR MODE DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (ATC) for stored DTC test procedures.

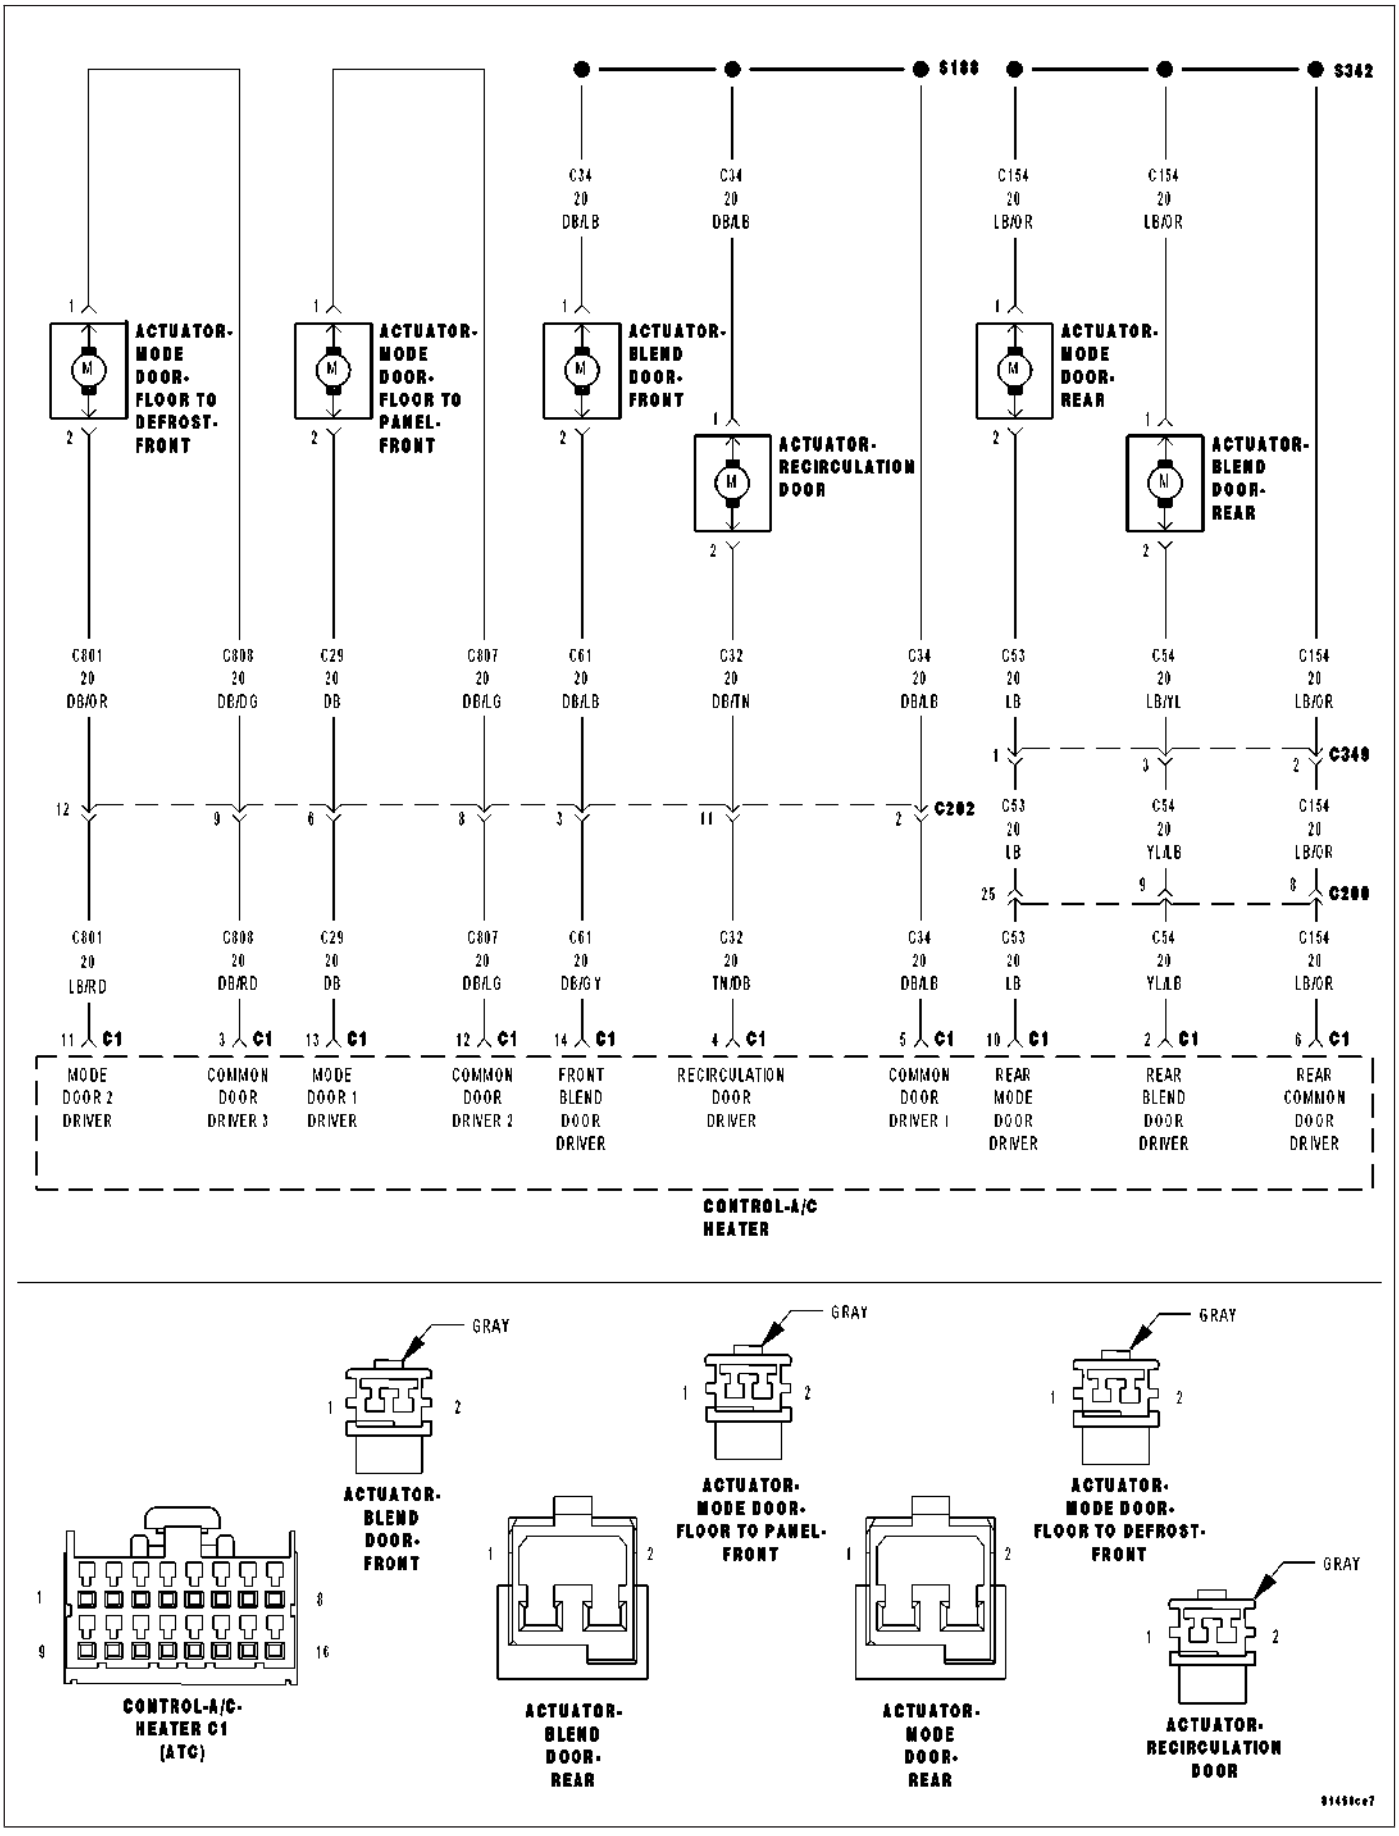
B1052–REAR BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (MTC) for stored DTC test procedures.

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC)



B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C154) Rear Common Door Driver circuit, or the (C808) Common Door Driver 3 circuit is shorted to ground.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C154) REAR COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
(C808) COMMON DOOR DRIVER 3 CIRCUIT SHORTED TO GROUND OR TO OTHER DOOR DRIVER CIRCUIT(S)
REAR MODE DOOR ACTUATOR
REAR BLEND DOOR ACTUATOR
MODE DOOR 2 (FLOOR TO PANEL) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. In addition, the Rear Mode Door Actuator, the Rear Blend Door Actuator, and the Mode Door 2 (Floor to Defrost) Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

Diagnostic Test

1. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT, (C54) REAR BLEND DOOR DRIVER CIRCUIT, (C808) COMMON DOOR DRIVER 3 CIRCUIT, (C154) REAR COMMON DOOR DRIVER CIRCUIT, & (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

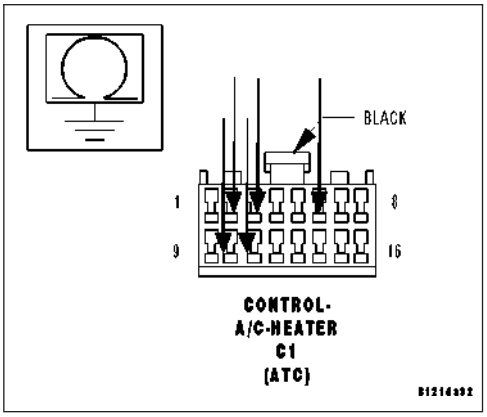
Measure the resistance of the (C53) Rear Mode Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C54) Rear Blend Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C808) Common Door Driver 3 Circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C154) Rear Common Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Measure the resistance of the (C801) Mode Door 2 Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms on any of the circuits?

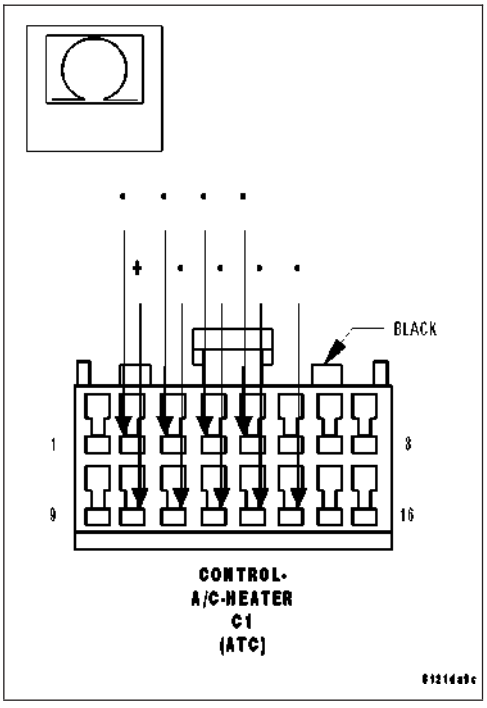
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

---

2. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

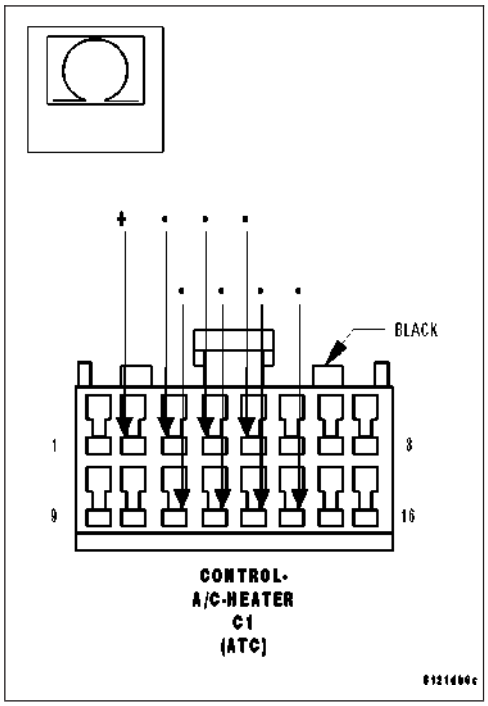
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

3. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



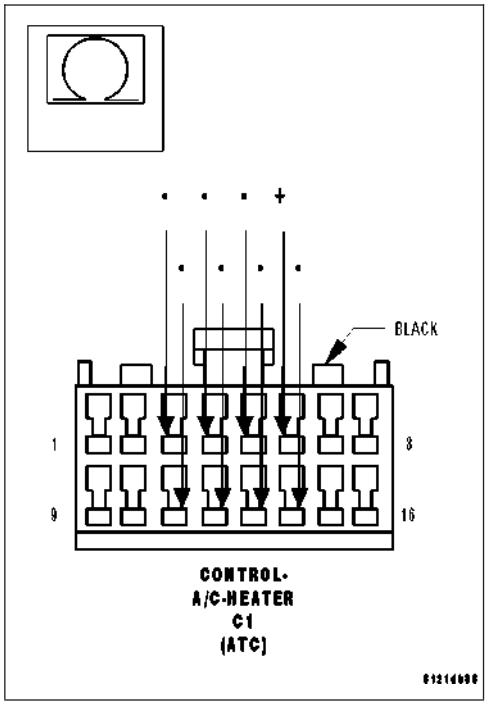
Is the resistance below 10k ohms between any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C154) Rear Common Door Driver circuit and the (C808) Common Door Driver 3 circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

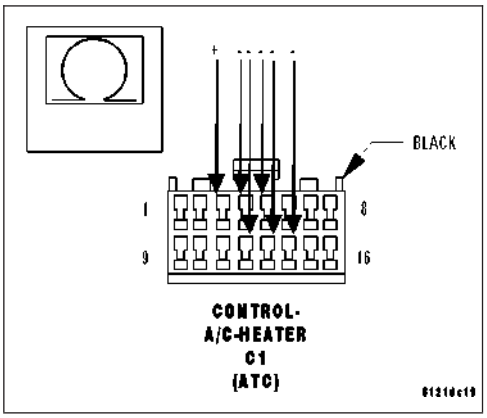
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 5

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

5. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C808) Common Door Driver 3 circuit and the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



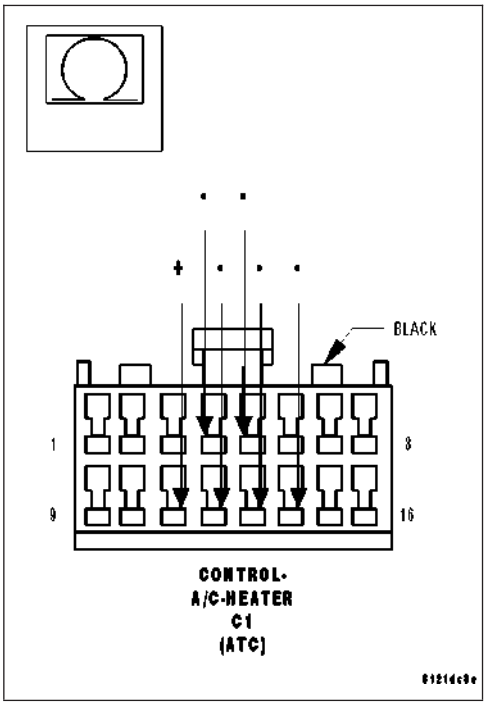
Is the resistance below 10k ohms between any of the circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms between any of the circuits?

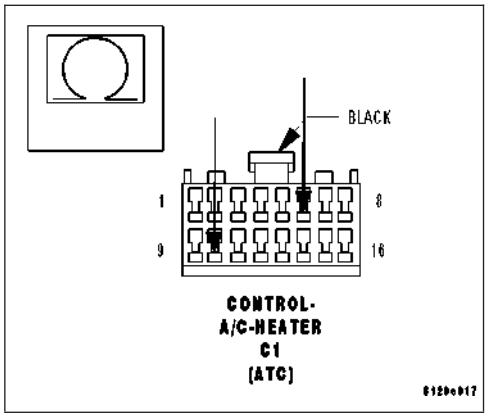
Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short together.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 7

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

7. CHECK REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

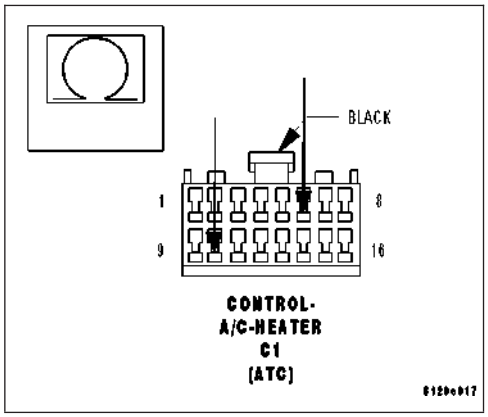
Yes >> Go To 8

No >> Go To 9

8. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



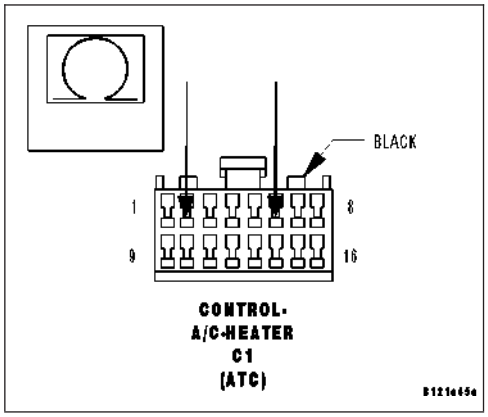
Is the resistance below 10k ohms?

Yes >> Repair the (C53) Rear Mode Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

9. CHECK REAR BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 10

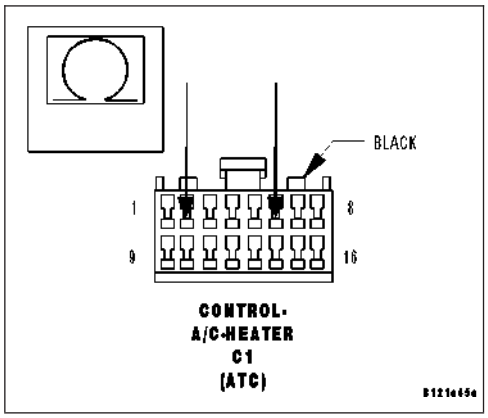
No >> Go To 11

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

10. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

Disconnect the Rear Blend Door Actuator harness connector.

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



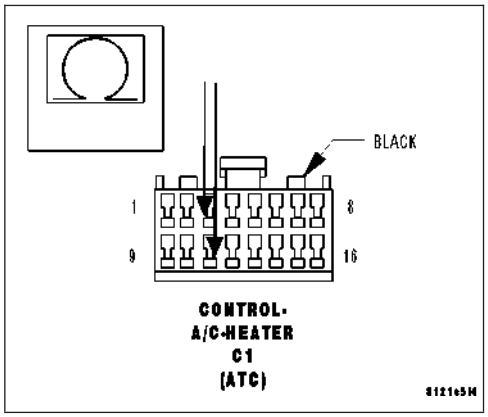
Is the resistance below 10k ohms?

Yes >> Repair the (C54) Rear Blend Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

11. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

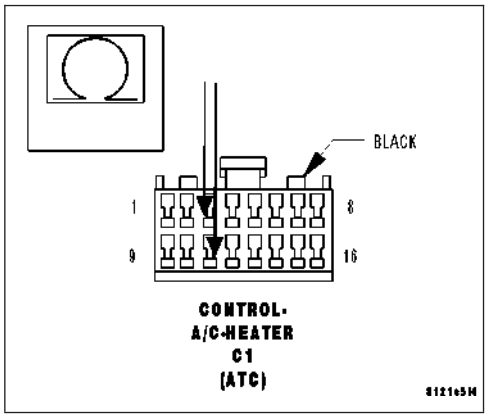
Yes >> Go To 12

No >> Go To 13

12. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C808) COMMON DOOR DRIVER 3 CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to the (C808) Common Door Driver 3 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

13. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

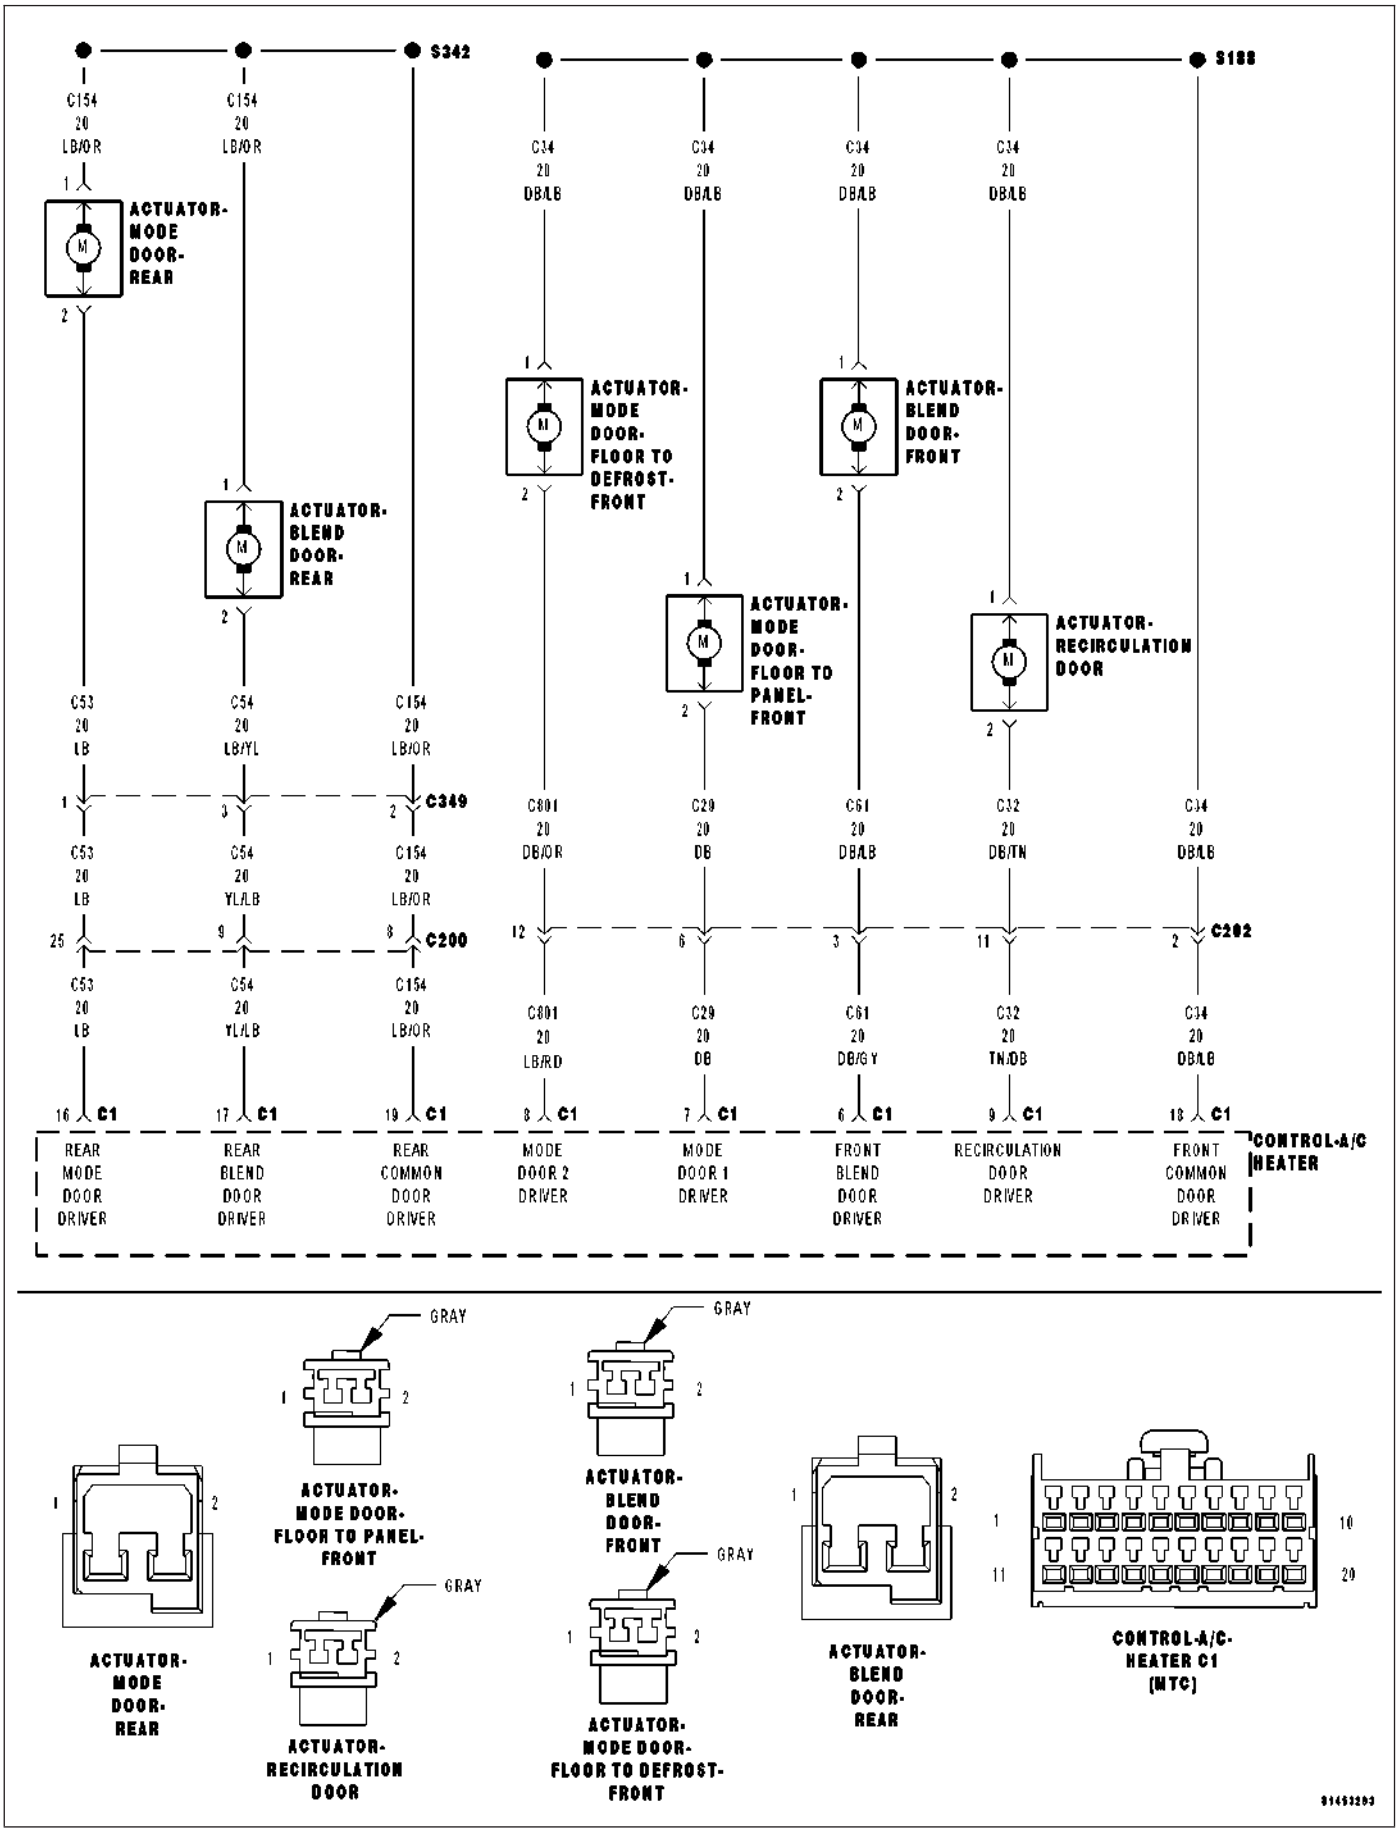
Does the scan tool only display: B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (MTC)



B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C54) Rear Blend Door Driver circuit is shorted to ground.

Possible Causes
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
REAR BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

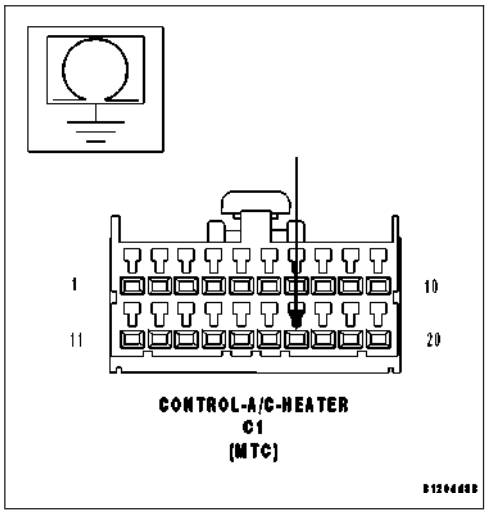
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C54) Rear Blend Door Driver circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C54) Rear Blend Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

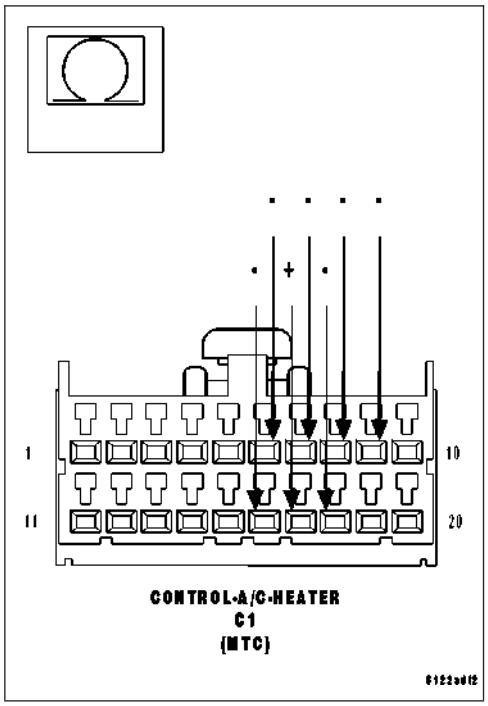
No >> Go To 2



B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between (C54) Rear Blend Door Driver circuit and the (C61) Front Blend Door Driver circuit, the (C29) Mode Door 1 Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C32) Recirculation Door Driver circuit, the (C53) Rear Mode Door Driver circuit, and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



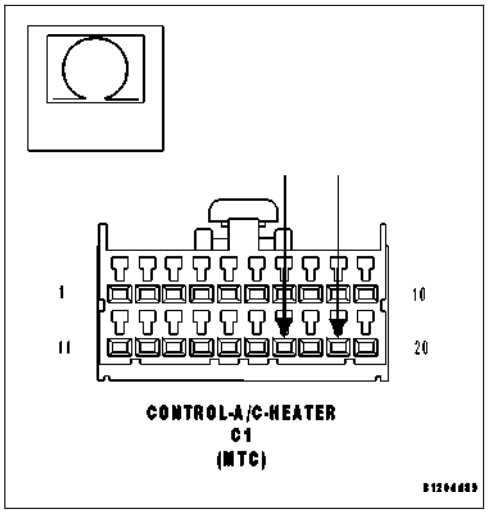
Is the resistance below 10k ohms between the (C54) Rear Blend Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C54) Rear Blend Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK REAR BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

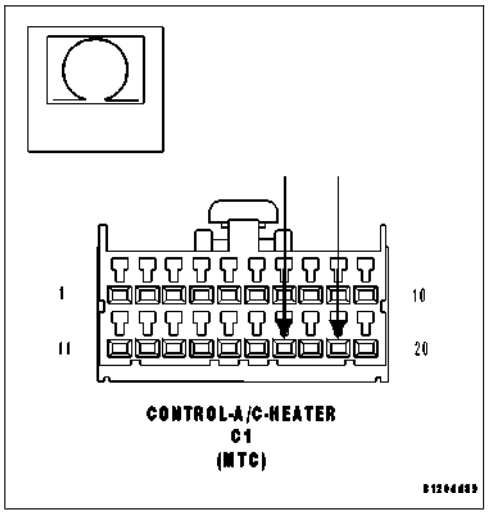
No >> Go To 5

B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO (C154) REAR COMMON DOOR DRIVER CIRCUIT

Disconnect the Rear Blend Door Actuator harness connector.

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C54) Rear Blend Door Driver circuit for a short to the (C154) Rear Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

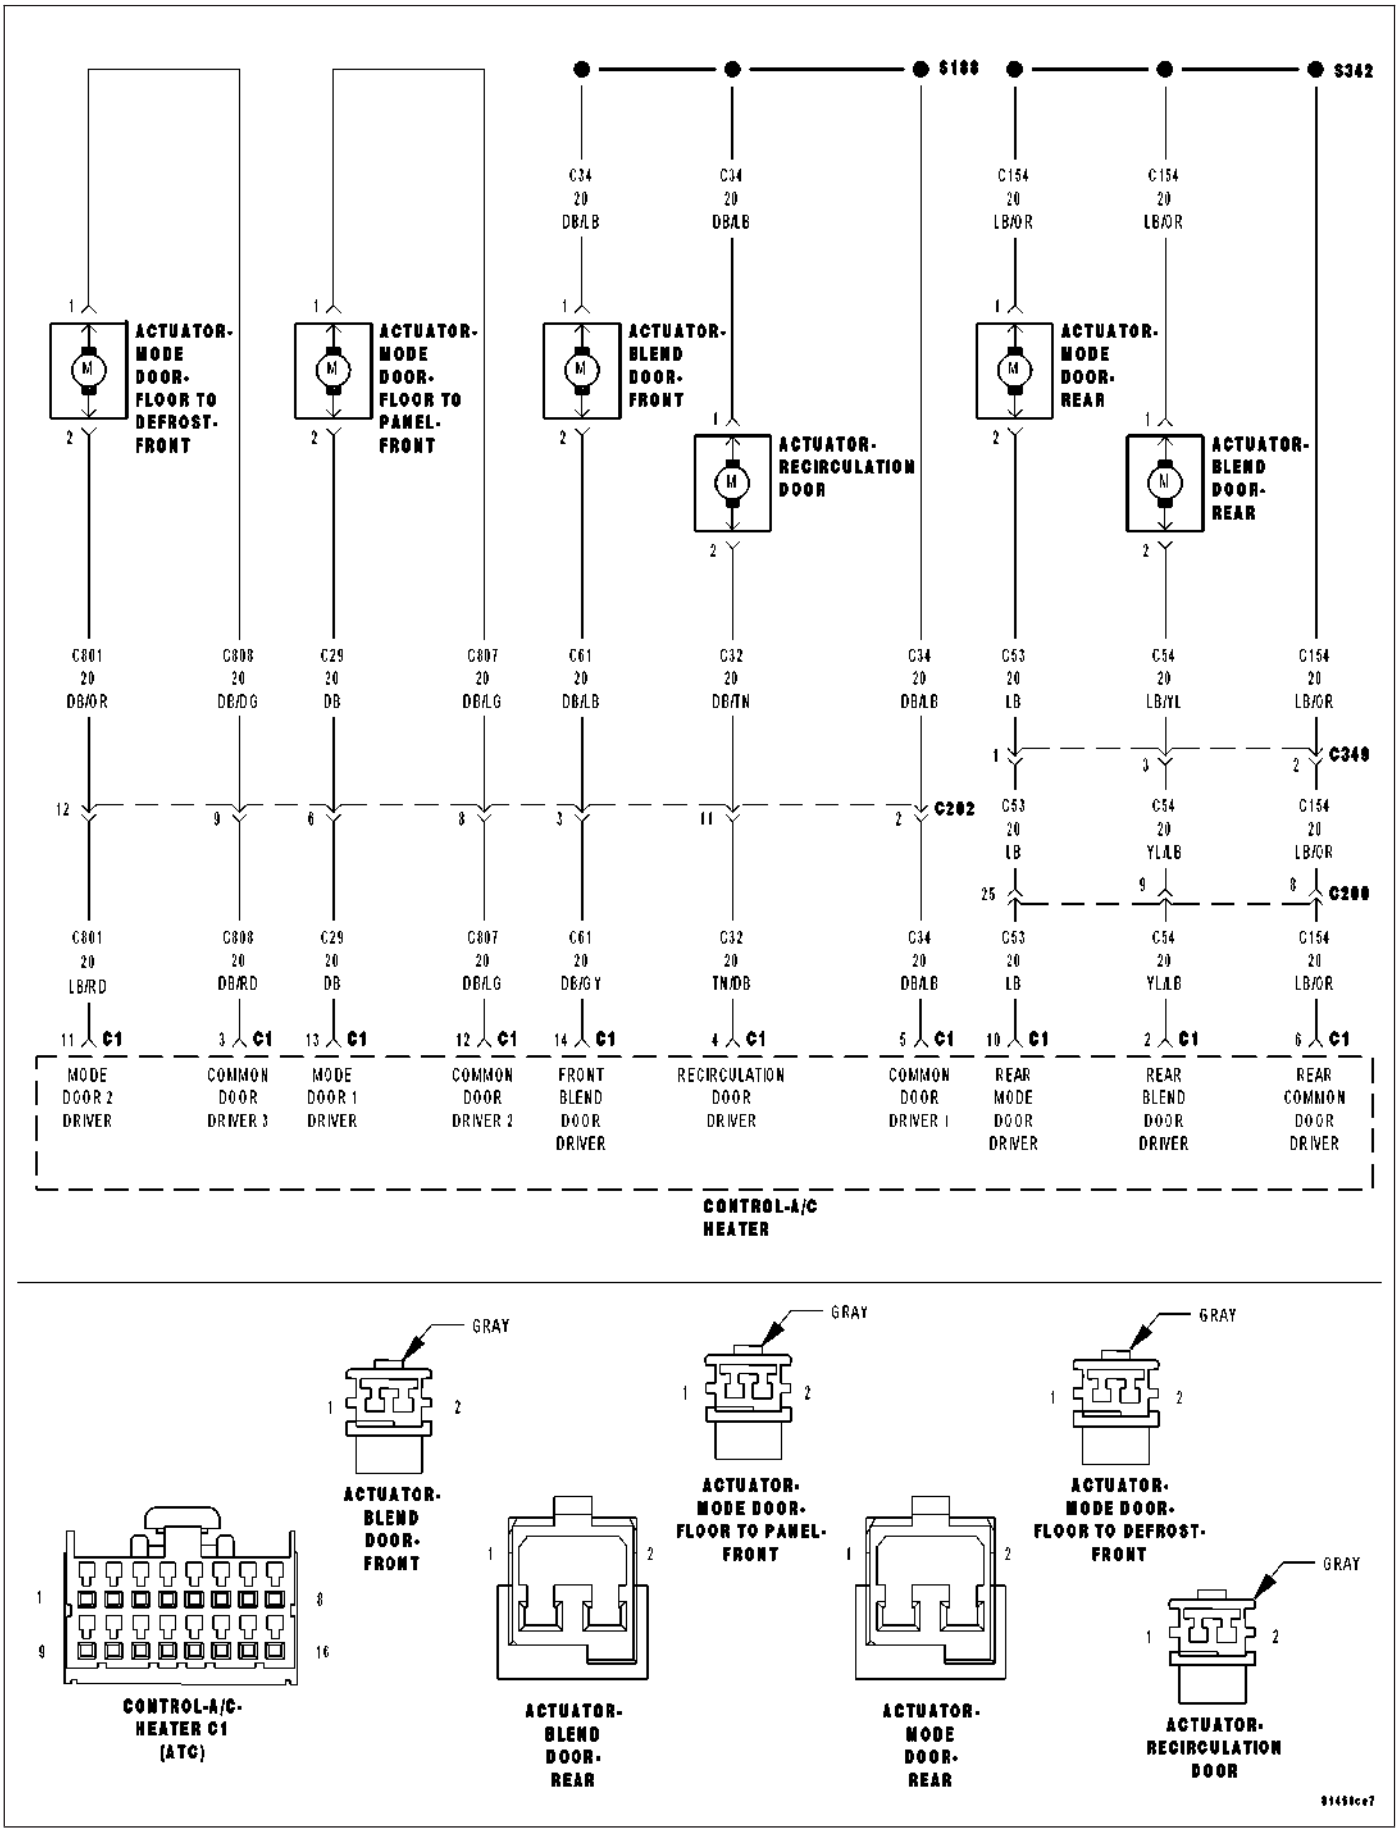
Does the scan tool only display: B1053–REAR BLEND DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (ATC)



B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C53) Rear Mode Door Driver circuit, the (C54) Rear Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C154) Rear Common Door Driver circuit, or the (C808) Common Door Driver 3 circuit is shorted to voltage.

Possible Causes
(C53) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C801) MODE DOOR 2 DRIVER CIRCUIT SHORTED TO VOLTAGE
(C154) REAR COMMON DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C808) COMMON DOOR DRIVER 3 CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

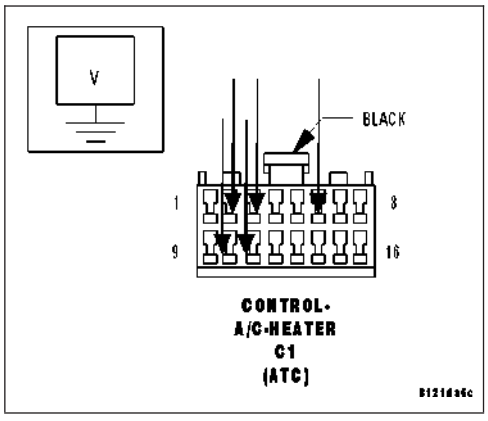
Theory of Operation

The A/C Heater Control drives the Rear Mode Door Actuator via the (C53) Rear Mode Door Driver circuit and the (C154) Rear Common Door Driver circuit. The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. In addition, the Rear Mode Door Actuator, the Rear Blend Door Actuator, and the Mode Door 2 (Floor to Defrost) Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C53) REAR MODE DOOR DRIVER CIRCUIT, (C54) REAR BLEND DOOR DRIVER CIRCUIT, (C808) COMMON DOOR DRIVER 3 CIRCUIT, (C154) REAR COMMON DOOR DRIVER CIRCUIT, & (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the A/C Heater Control C1 harness connector.
Turn the ignition on.
Measure the voltage of the (C53) Rear Mode Door Driver circuit.
Measure the voltage of the (C54) Rear Blend Door Driver circuit.
Measure the voltage of the (C808) Common Door Driver 3 Circuit.
Measure the voltage of the (C154) Rear Common Door Driver circuit.
Measure the voltage of the (C801) Mode Door 2 Driver circuit.



Is the voltage above 0.2 volts on any of the circuits?

Yes >> Repair the circuit(s) with voltage above 0.2 volts for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

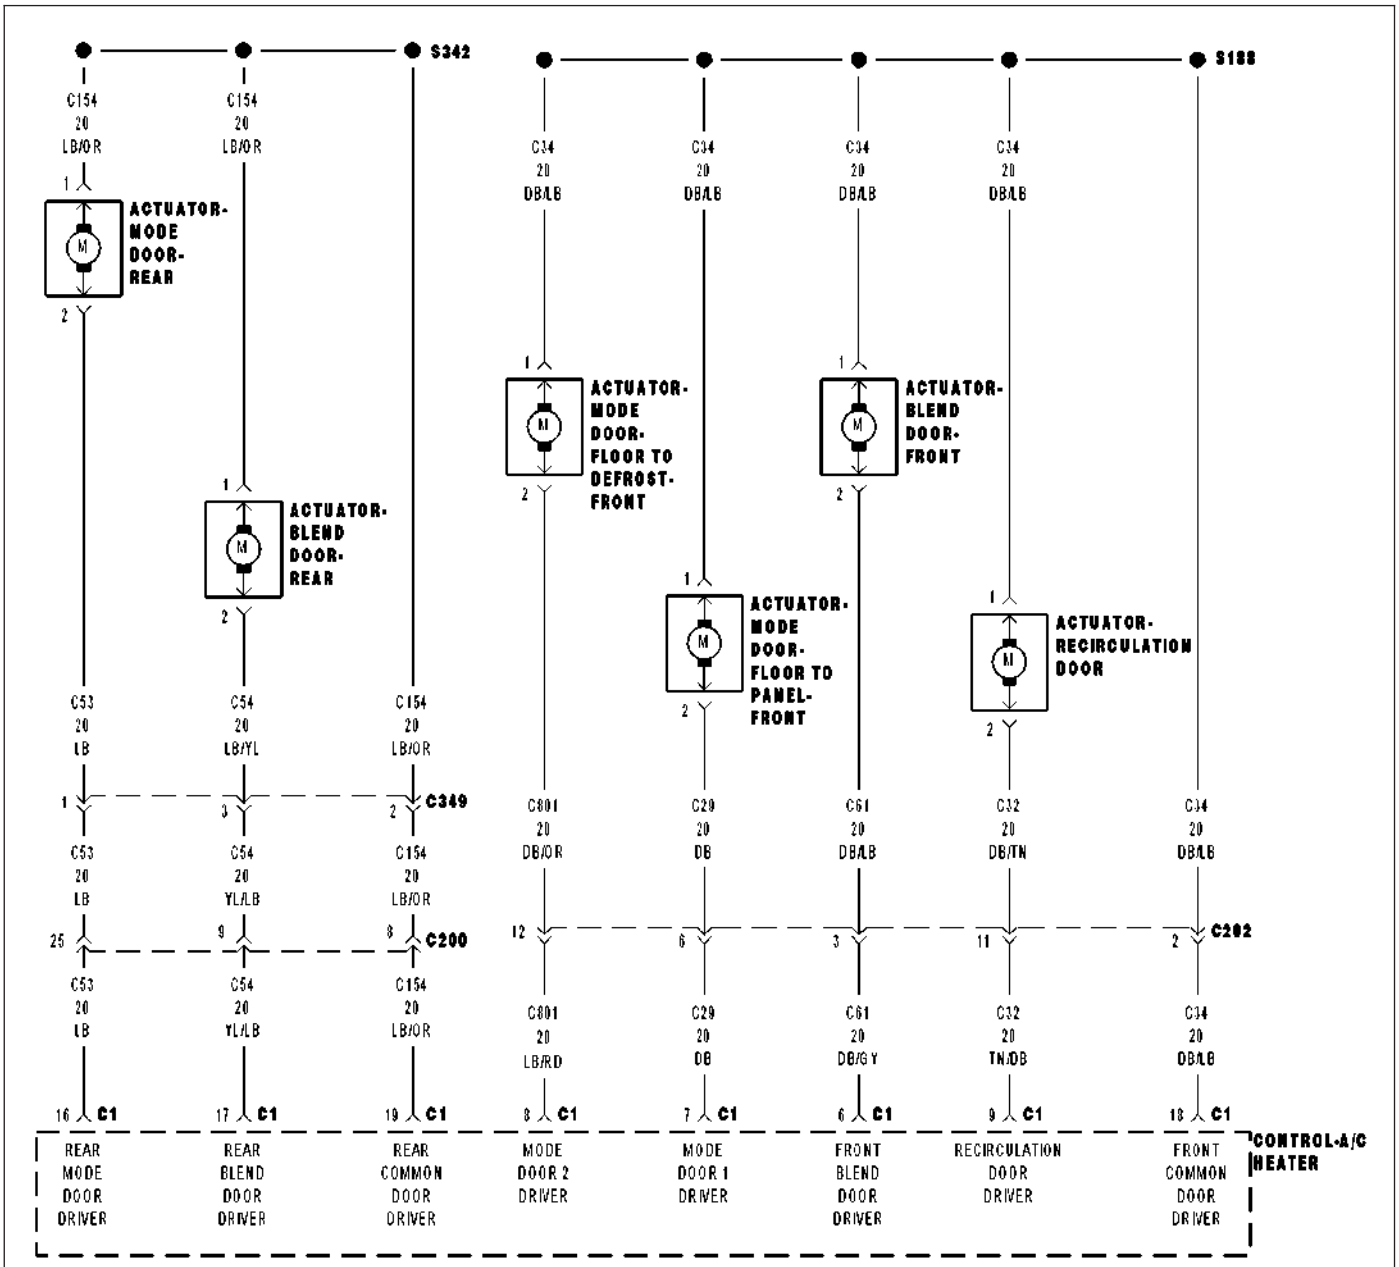
Does the scan tool display: B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH?

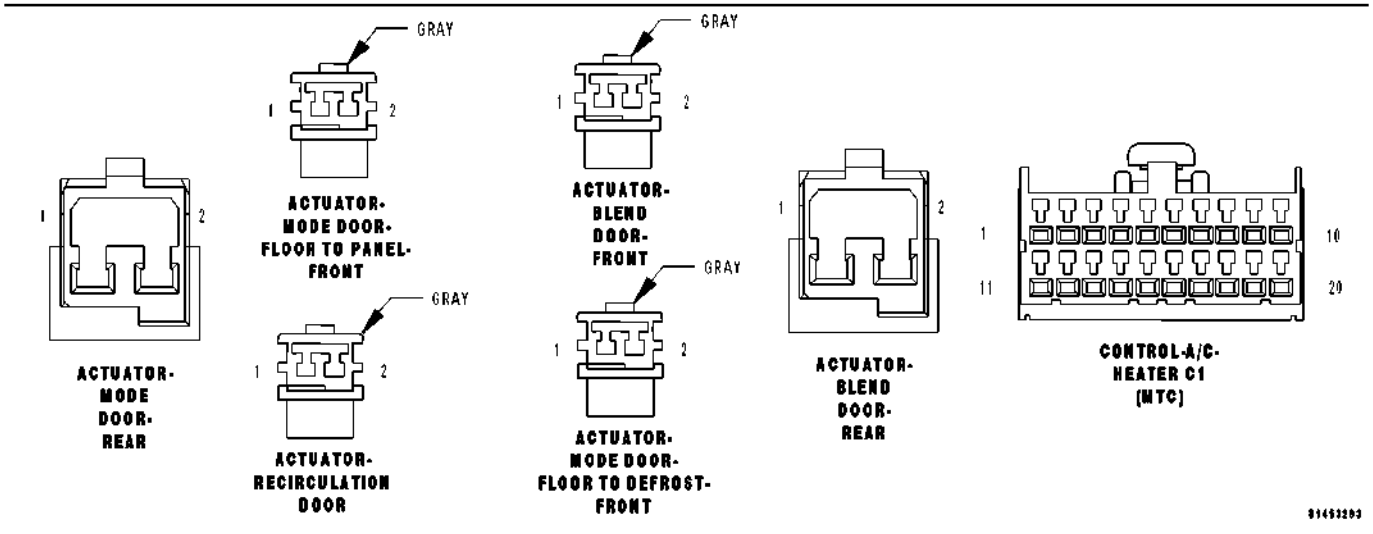
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (MTC)





B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C54) Rear Blend Door Driver circuit is shorted to voltage.

Possible Causes
(C54) REAR BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

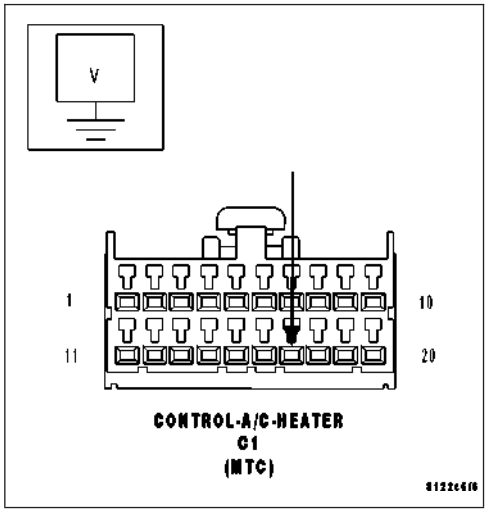
Turn the ignition on.

Measure the voltage of the (C54) Rear Blend Door Driver circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C54) Rear Blend Door Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2



B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH (MTC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1054–REAR BLEND DOOR CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

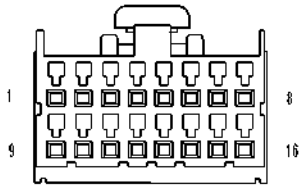
ACTUATOR-
BLEND
DOOR-
REAR



CONTROL-A/C-
HEATER C1
(ATC)

B1055–REAR BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Blend Door Actuator's electrical circuit is open. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C54) REAR BLEND DOOR DRIVER CIRCUIT OPEN
(C154) REAR COMMON DOOR DRIVER CIRCUIT OPEN
REAR BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Rear Blend Door Actuator via the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit. Both of the rear door actuators share the (C154) Rear Common Door Driver circuit. In addition, the Rear Blend Door Actuator, the Rear Mode Door Actuator, and the Mode Door 2 (Floor to Defrost) Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the location of the open circuit and the direction the actuator is moving when the open is present.

NOTE: DTC B1055 must be active for the results of this test to be valid. Do not perform this test if DTC B1055 is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, then all other Control Circuit/Performance DTCs next. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

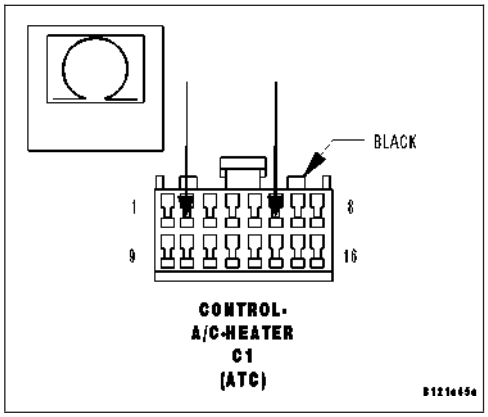
B1055–REAR BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK REAR BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance between the (C54) Rear Blend Door Driver circuit and the (C154) Rear Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance above 70 ohms?

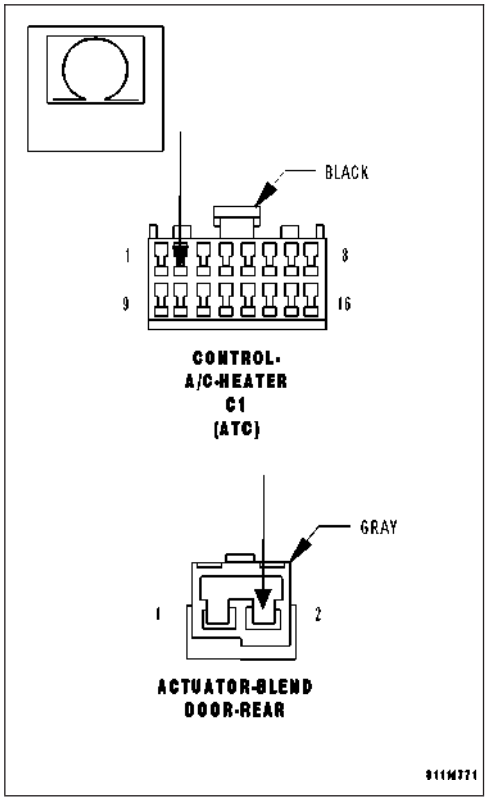
Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

3. CHECK (C54) REAR BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Rear Blend Door Actuator harness connector.

Measure the resistance of the (C54) Rear Blend Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Blend Door Actuator harness connector.



Is the resistance below 5.0 ohms?

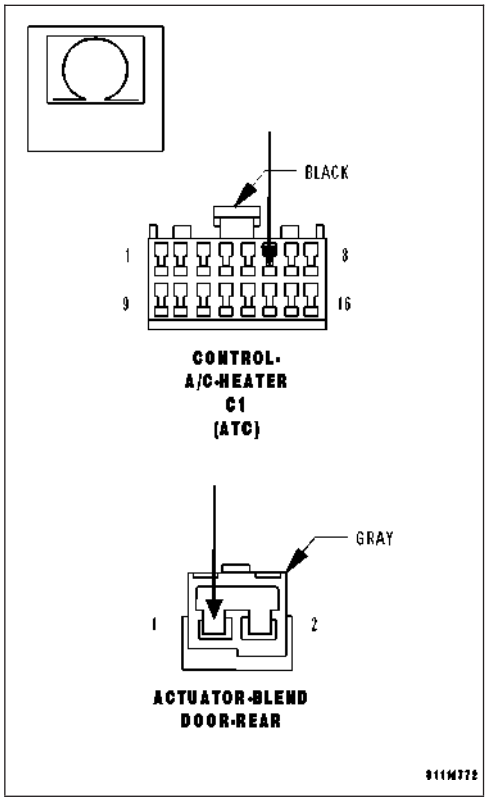
Yes >> Go To 4

No >> Repair the (C54) Rear Blend Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B1055–REAR BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C154) REAR COMMON DOOR DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C154) Rear Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Blend Door Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Rear Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C154) Rear Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

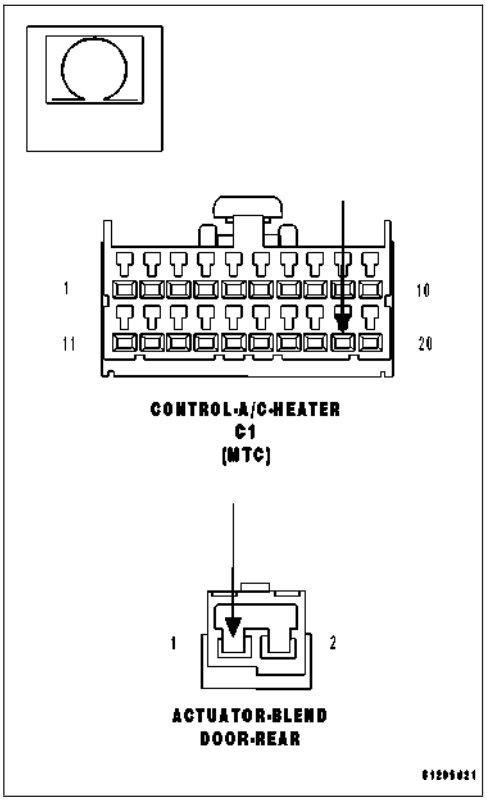
Measure the resistance of the (C154) Rear Common Door Driver circuit between the A/C Heater Control C1 harness connector and the Rear Blend Door Actuator harness connector.



Is the resistance below 5.0 ohms?

Yes >> Replace the Rear Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C154) Rear Common Door Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

B1056–REAR BLEND DOOR TRAVEL RANGE TOO SMALL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Rear Blend Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
REAR BLEND DOOR SEIZED, BINDING, OBSTRUCTED
REAR BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1056–REAR BLEND DOOR TRAVEL RANGE TOO SMALL (ATC & MTC) (CONTINUED)

3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator and the housing assembly for a condition causing the door to seize or bind.

Are there any physical or mechanical problems with the door, housing, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK REAR BLEND DOOR TRAVEL

Remove the Rear Blend Door Actuator from the Rear A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 70 degrees of travel.

Does the door operate smoothly in both directions over approximately 70 degrees of travel?

Yes >> Replace the Rear Blend Door Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1056–REAR BLEND DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1057–REAR BLEND DOOR TRAVEL RANGE TOO LARGE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During actuator calibration.
- **Set Condition:**
  If the total span of the Rear Blend Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S)
REAR BLEND DOOR OR REAR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, BROKEN
REAR BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

---

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1057–REAR BLEND DOOR TRAVEL RANGE TOO LARGE (ATC & MTC) (CONTINUED)

3. CHECK FOR A BROKEN REAR BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Rear Blend Door Actuator from the Rear A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Rear Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK REAR BLEND DOOR & REAR A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for a damaged or broken Rear A/C Heater Housing Assembly, a warped, worn, or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 70 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Blend Door Actuator in accordance with the Service Information. Then, Go To 5.

---

5. RUN ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1057–REAR BLEND DOOR TRAVEL RANGE TOO LARGE?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1.

No >> Perform BODY VERIFICATION TEST - VER 1.

B1058–RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on the (C61) Front Blend Door Driver circuit, the (C32) Recirculation Door Driver circuit, or the (C34) Common Door Driver 1 circuit while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

NOTE: The DTC must be active for the results of this test to be valid. Do not perform this test if the DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

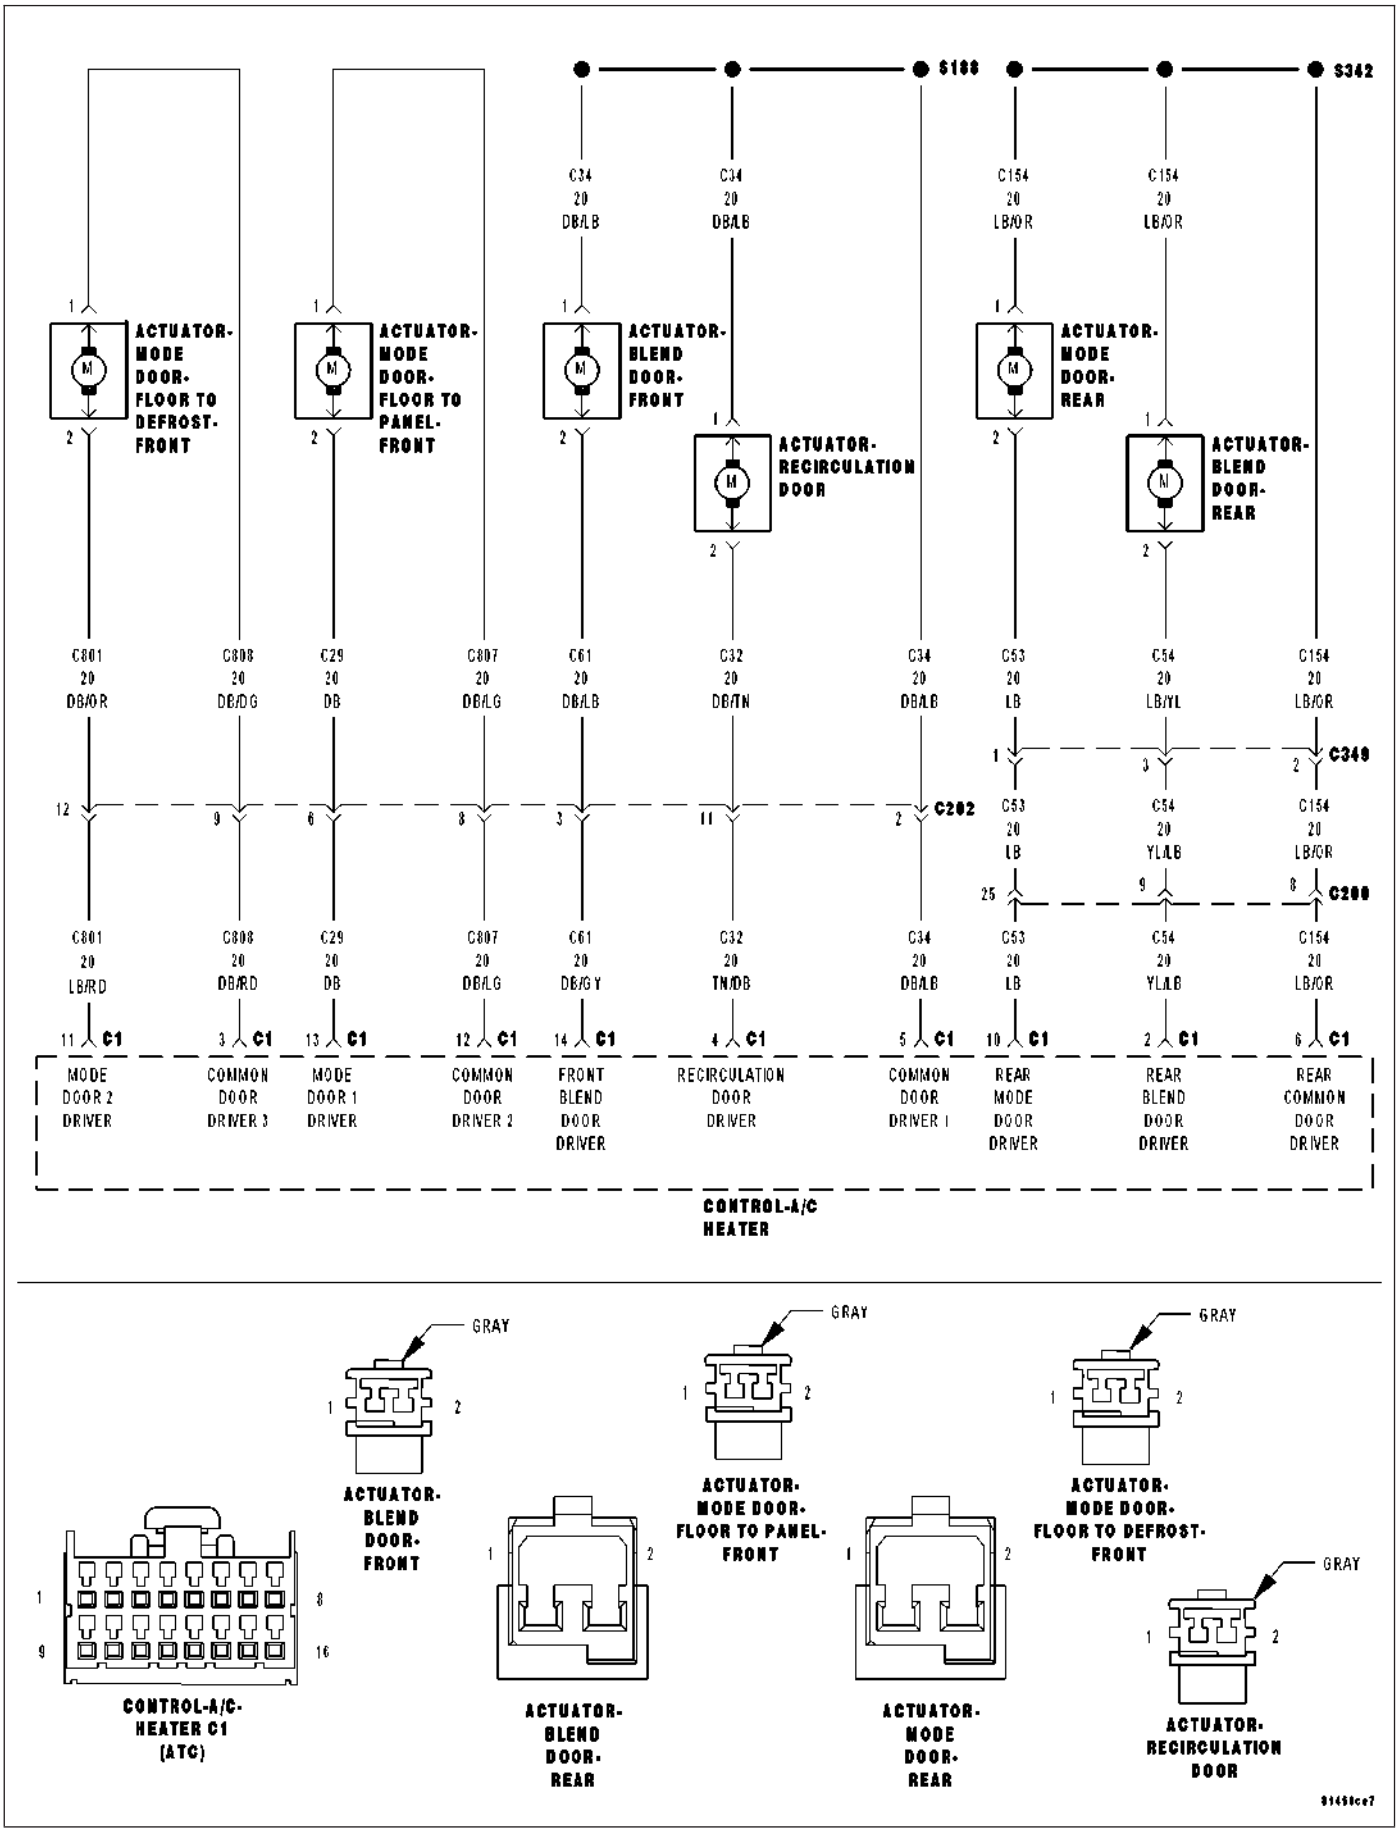
B1058–RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

If this DTC is active, refer to B104C–BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (MTC) for the diagnostic test procedure. If this DTC is stored, refer to HVAC System Test (MTC) for stored DTC test procedures.

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC)



B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C32) Recirculation Door Driver circuit is shorted to ground.

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Recirculation Door Actuator and the Front Blend Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

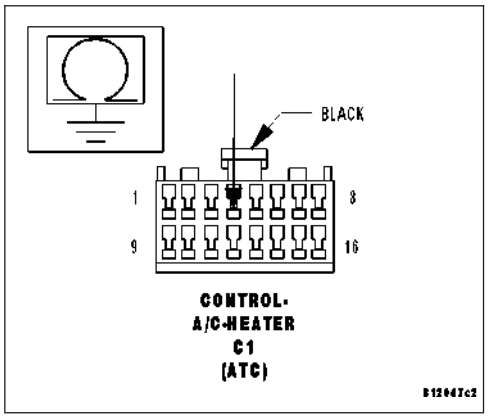
Diagnostic Test

1. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C32) Recirculation Door Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

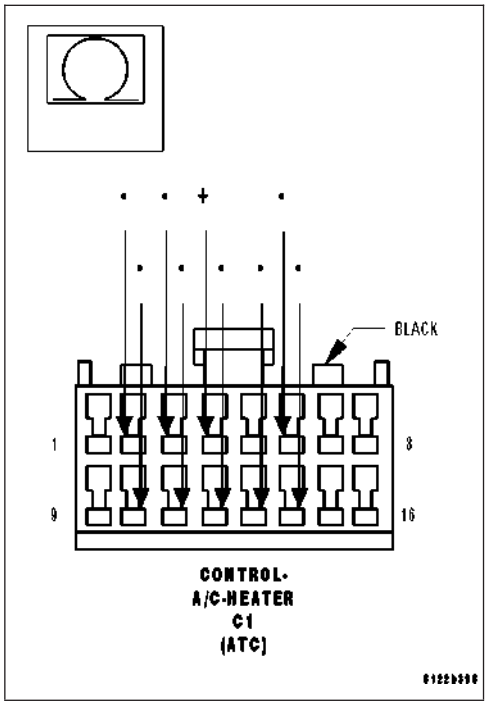
Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C32) RECIRCULATION DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C54) Rear Blend Door Driver circuit, the (C808) Common Door 3 Driver circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C801) Mode Door 2 Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



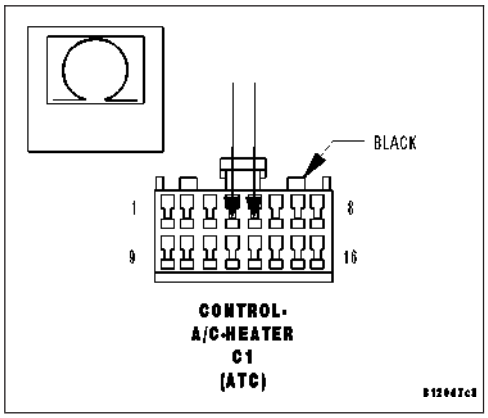
Is the resistance below 10k ohms between the (C32) Recirculation Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C32) Recirculation Door Driver circuit. Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

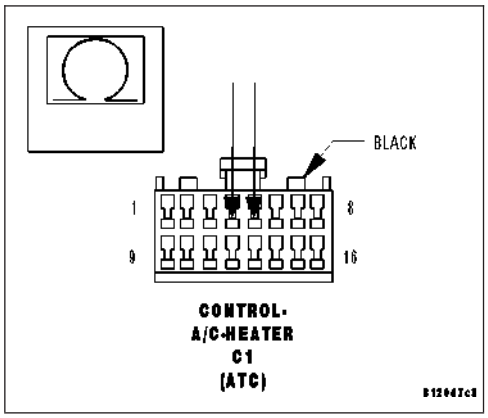
No >> Go To 5

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) COMMON DOOR DRIVER 1 CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to the (C34) Common Door Driver 1 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

---

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

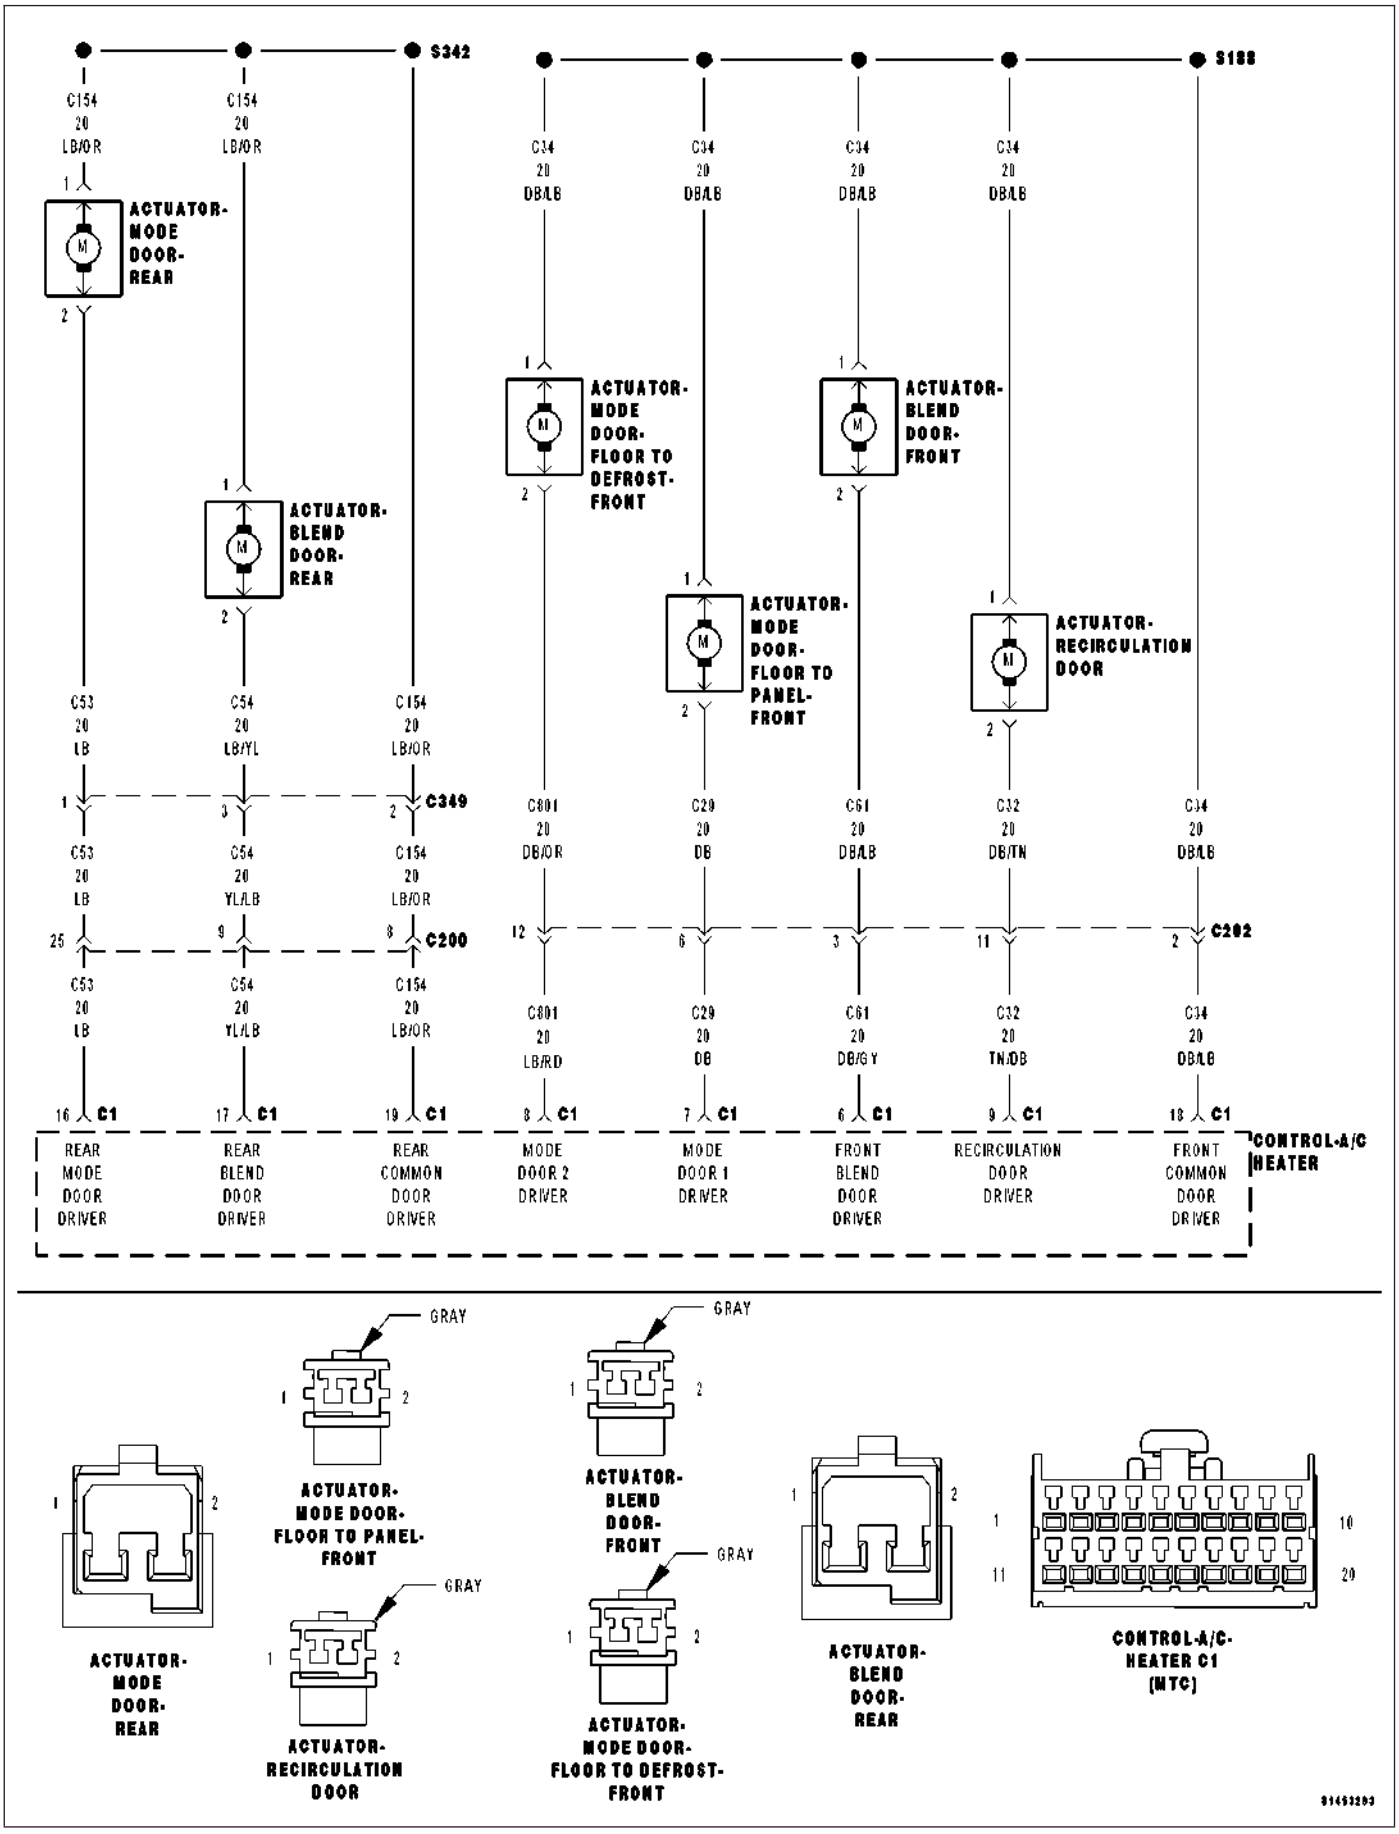
Does the scan tool only display: B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (MTC)



B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C32) Recirculation Door Driver circuit is shorted to ground.

Possible Causes
(C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
C32) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit. All of the front door actuators share the (C34) Front Common Door Driver circuit. Inside the A/C Heater Control, each door actuator has its own unique driver, but all share a single common door driver circuit. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

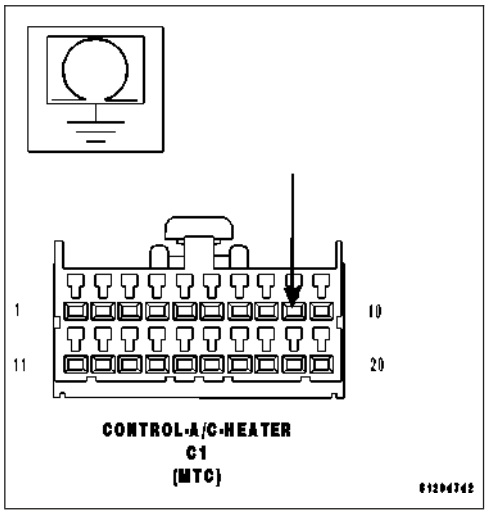
Diagnostic Test

1. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C32) Recirculation Door Driver circuit between ground and the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

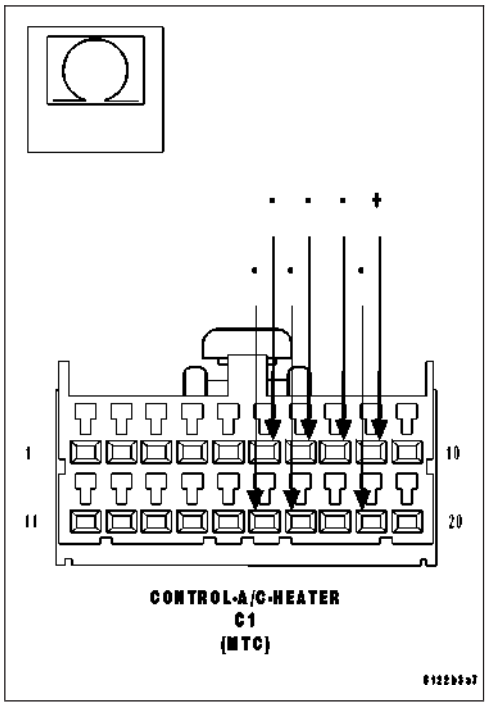
Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

2. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C29) Mode Door 1 Driver circuit, the (C61) Front Blend Door Driver circuit, the (C801) Mode Door 2 Driver circuit, and, if equipped, the (C53) Rear Mode Door Driver circuit, the (C154) Rear Common Door Driver circuit, and the (C54) Rear Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



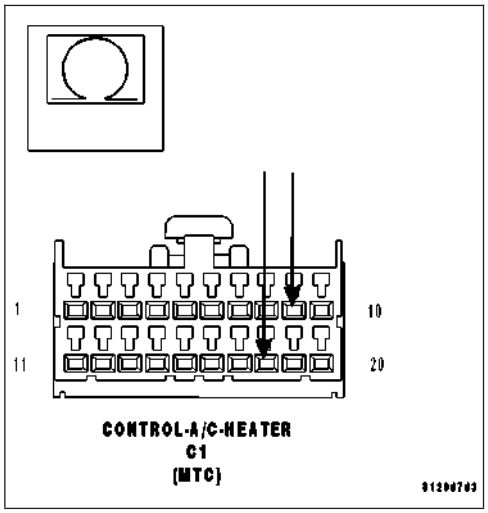
Is the resistance below 10k ohms between the (C32) Recirculation Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C32) Recirculation Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

Yes >> Go To 4

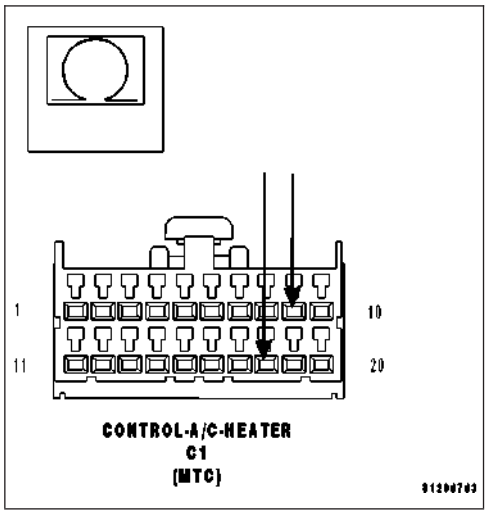
No >> Go To 5

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (MTC) (CONTINUED)

4. CHECK (C32) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO (C34) FRONT COMMON DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C32) Recirculation Door Driver circuit and the (C34) Front Common Door Driver circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C32) Recirculation Door Driver circuit for a short to the (C34) Front Common Door Driver circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C34) Common Door Driver 1 circuit is shorted to voltage.

Possible Causes
(C34) COMMON DOOR DRIVER 1 CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Front Blend Door Actuator via the (C61) Front Blend Door Driver circuit and the (C34) Common Door Driver 1 circuit. The A/C Heater Control drives the Recirculation Door Actuator via the (C32) Recirculation Door Driver circuit and the (C34) Common Door Driver 1 circuit. The Front Blend Door Actuator and the Recirculation Door Actuator share the (C34) Common Door Driver 1 circuit and they share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

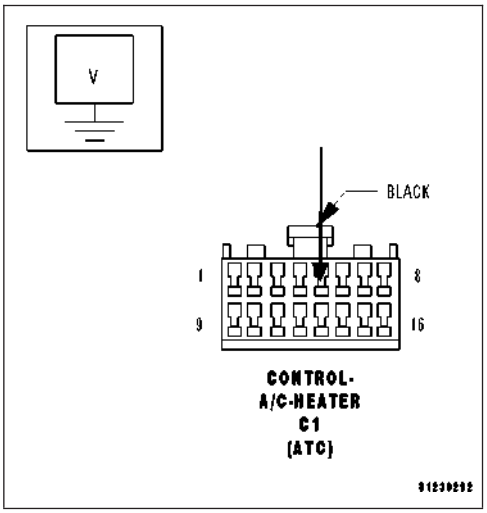
1. CHECK (C34) COMMON DOOR DRIVER 1 CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C34) Common Door Driver 1 circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C34) Common Door Driver 1 circuit for a short to voltage.

(C808) COMMON DOOR DRIVER 3 CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit. The Mode Door 2 (Floor to Defrost) Actuator does not share the (C808) Common Door Driver 3 circuit with any other actuator. However, the Mode Door 2 (Floor to Defrost) Actuator, the Rear Mode Door Actuator, and the Rear Blend Door Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

1. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C808) Common Door Driver 3 circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C808) Common Door Driver 3 circuit for a short to ground.

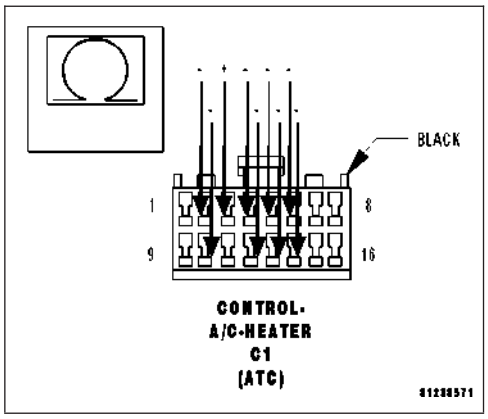
B1067–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C808) Common Door Driver 3 circuit and the (C54) Rear Blend Door Driver circuit, the (C32) Recirculation Door Driver circuit, the (C34) Common Door Driver 1 circuit, the (C154) Rear Common Door Driver circuit, the (C53) Rear Mode Door Driver circuit, the (C807) Common Door Driver 2 circuit, the (C29) Mode Door 1 Driver circuit, and the (C61) Front Blend Door Driver circuit in the A/C Heater Control C1 harness connector.



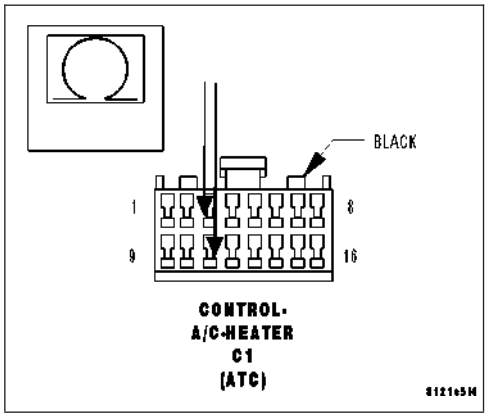
Is the resistance below 10k ohms between the (C808) Common Door Driver 3 circuit and any of the other door driver circuits?

Yes >> Repair the circuits with a resistance below 10k ohms for a short to the (C808) Common Door Driver 3 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK MODE DOOR 2 (FLOOR TO DEFROST) ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 30 ohms?

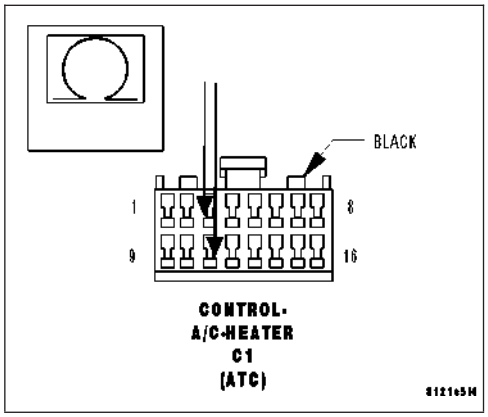
Yes >> Go To 4

No >> Go To 5

4. CHECK (C801) MODE DOOR 2 DRIVER CIRCUIT FOR A SHORT TO (C808) COMMON DOOR DRIVER 3 CIRCUIT

Disconnect the Mode Door 2 (Floor to Defrost) Actuator harness connector.

Measure the resistance between the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit in the A/C Heater Control C1 harness connector.



Is the resistance below 10k ohms?

Yes >> Repair the (C801) Mode Door 2 Driver circuit for a short to the (C808) Common Door Driver 3 circuit.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Mode Door 2 (Floor to Defrost) Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B1067–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

5. RUN THE ACTUATOR DTC DETECTION TEST

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

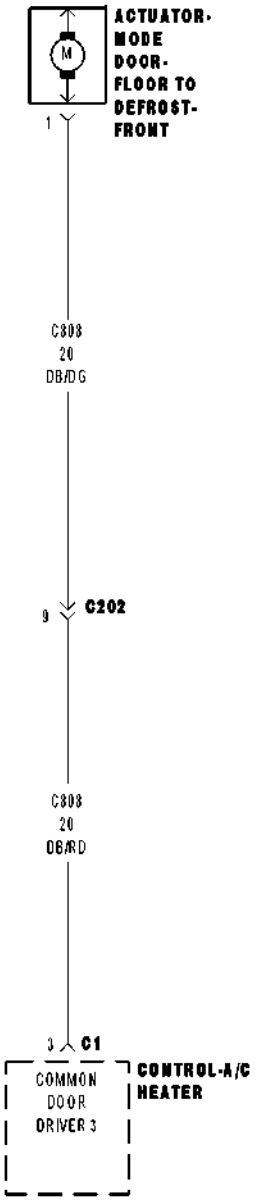
Does the scan tool only display: B1067–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT LOW?

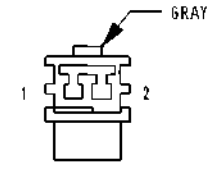
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

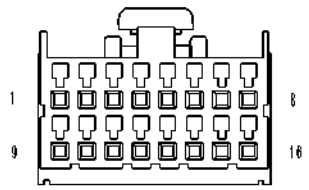
No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1068–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT HIGH (ATC)





ACTUATOR-
MODE DOOR-
FLOOR TO DEFROST-
FRONT



CONTROL-A/C-
HEATER C1
(ATC)

81654e04

B1068–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Actuator DTC Detection Test is executed.
- **Set Condition:**
  If the (C808) Common Door Driver 3 circuit is shorted to voltage.

Possible Causes
(C808) COMMON DOOR DRIVER 3 CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control drives the Mode Door 2 (Floor to Defrost) Actuator via the (C801) Mode Door 2 Driver circuit and the (C808) Common Door Driver 3 circuit. The Mode Door 2 (Floor to Defrost) Actuator does not share the (C808) Common Door Driver 3 circuit with any other actuator. However, the Mode Door 2 (Floor to Defrost) Actuator, the Rear Mode Door Actuator, and the Rear Blend Door Actuator share a driver inside the A/C Heater Control. Due to the shared circuitry similar DTCs can set at the same time for multiple actuators depending upon the type of short, its location, and the direction the actuator is moving when the short is present.

Diagnostic Test

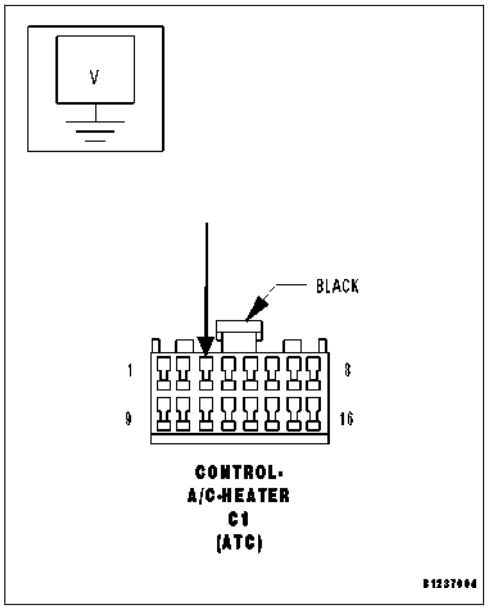
1. CHECK (C808) COMMON DOOR DRIVER 3 CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C808) Common Door Driver 3 circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C808) Common Door Driver 3 circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1068–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

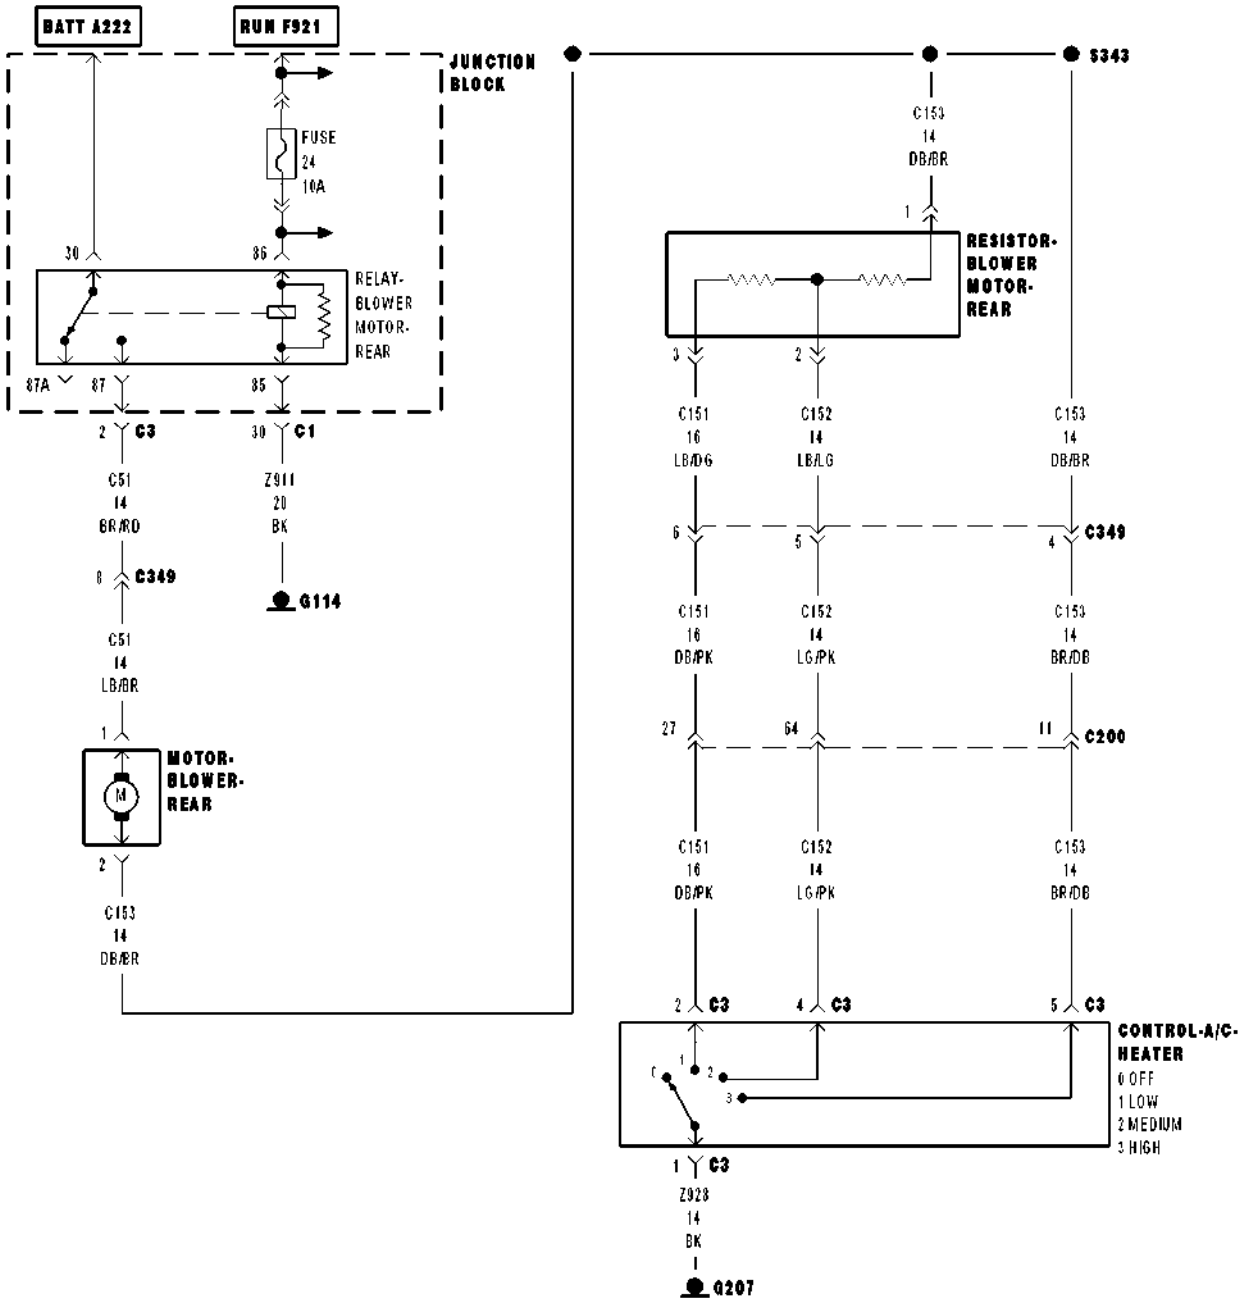
Does the scan tool only display: B1068–CLIMATE CONTROL MOTOR(S) COMMON 3 CONTROL CIRCUIT HIGH?

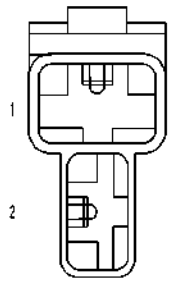
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No, Other DTC(s) Displayed
Diagnose and repair the other DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

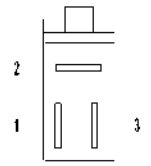
No, And No Other DTCs Displayed
Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

B1070–REAR BLOWER CONTROL CIRCUIT HIGH (ATC)

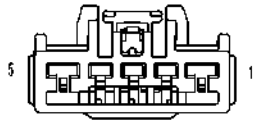




MOTOR-BLOWER-REAR



RESISTOR-BLOWER MOTOR-REAR



CONTROL-A/C-HEATER C3 (ATC)

91491e01

B1070–REAR BLOWER CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When rear blower speed is set to Low, M1, or High with the ignition on.
- **Set Condition:**
  If the ATC detects an excessive draw on any of the rear blower outputs.

Possible Causes
HIGH RESISTANCE ON (Z928) GROUND CIRCUIT
(C151) REAR BLOWER LOW SPEED CIRCUIT, (C152) REAR BLOWER MEDIUM SPEED CIRCUIT, OR (C153) REAR BLOWER HIGH SPEED CIRCUIT SHORTED TO VOLTAGE
BLOCKAGE STALLING REAR BLOWER MOTOR
REAR BLOWER MOTOR RESISTOR BLOCK
REAR BLOWER MOTOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (Z928) GROUND CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off.

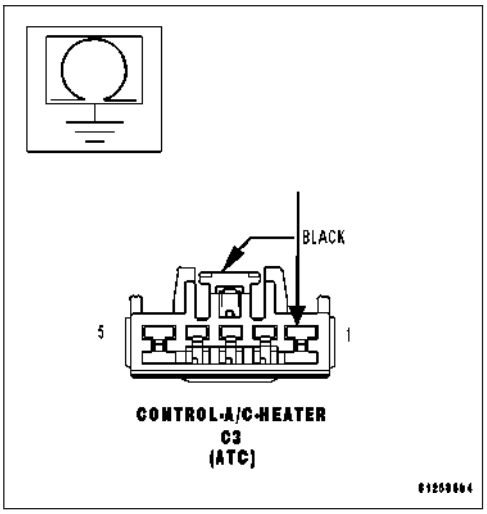
Disconnect the A/C Heater Control C3 harness connector.

Measure the resistance of the (Z928) Ground circuit between ground and the A/C Heater Control C3 harness connector.

Is resistance below 5.0 ohms?

Yes >> Go To 2

No >> Repair the (Z928) Ground circuit for high resistance. Perform BODY VERIFICATION TEST - VER 1.



B1070–REAR BLOWER CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (C151) REAR BLOWER LOW SPEED CIRCUIT, (C152) REAR BLOWER MEDIUM SPEED CIRCUIT, & (153) REAR BLOWER HIGH SPEED CIRCUIT FOR SHORT TO VOLTAGE

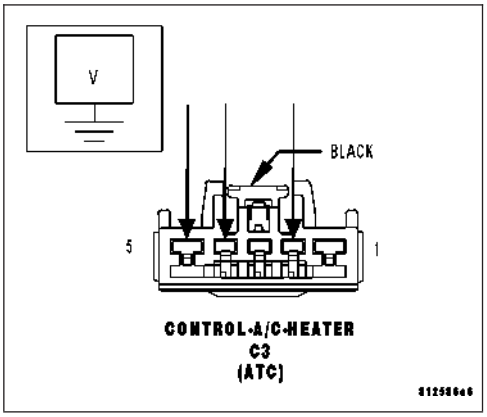
Disconnect the Rear Blower Motor harness connector.

Turn the ignition on.

Measure the voltage of the (C151) Rear Blower Low Speed circuit in the A/C Heater Control C3 harness connector.

Measure the voltage of the (C152) Rear Blower Medium Speed circuit in the A/C Heater Control C3 harness connector.

Measure the voltage of the (C153) Rear Blower High Speed circuit in the A/C Heater Control C3 harness connector.



Is voltage above 0.2 volts on any of the circuits.

Yes >> Repair the circuit(s) with voltage above 0.2 volts for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 3

---

3. CHECK FOR BLOCKAGE PREVENTING REAR BLOWER MOTOR OPERATION

Turn the ignition off.

Remove the Rear Blower Motor from the Rear A/C Heater Housing in accordance with the Service Information.

Look for anything on the Rear Blower Motor and in the Rear A/C Heater Housing that is physically preventing rear blower operation.

Is anything physically preventing rear blower operation?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 4

---

4. CHECK REAR BLOWER MOTOR FOR CAUSE OF HIGH AMPERAGE DRAW

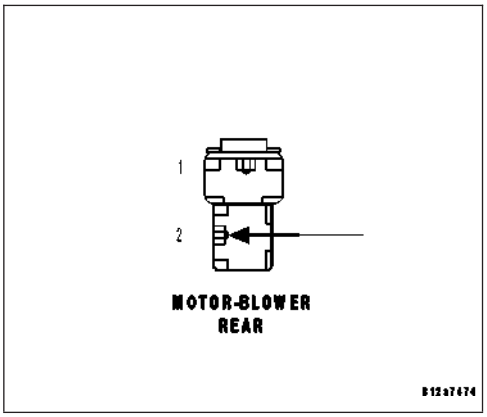
Reinstall the Rear Blower Motor in the Rear A/C Heater Housing in accordance with the Service Information.

Reconnect the Rear Blower Motor harness connector.

Disconnect the Rear Blower Motor Resistor Block harness connector.

Connect a 20 amp fused jumper wire between ground and the (C153) Rear Blower High Speed circuit in the Rear Blower Motor Harness connector.

Start the engine. The rear blower motor should run with out blowing the fuse.



Does the rear blower motor run with out blowing the fuse?

Yes >> Go To 5

No >> Replace the Rear Blower Motor in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B1070–REAR BLOWER CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

5. CHECK REAR BLOWER MOTOR RESISTOR BLOCK FOR CAUSE OF HIGH AMPERAGE DRAW

Turn the ignition off.

Remove the 20 amp fused jumper wire from the (C153) Rear Blower High Speed circuit in the Rear Blower Motor Harness connector.

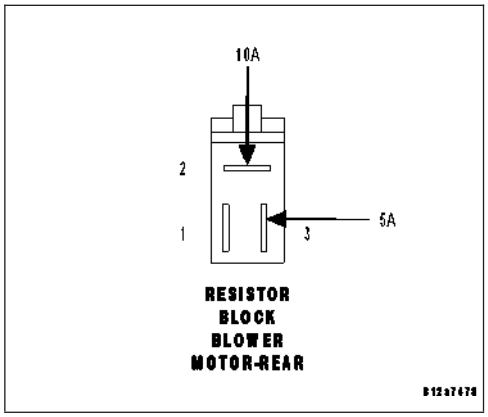
Reconnect the Rear Blower Motor Resistor Block harness connector.

Connect a 10 amp fused jumper wire between ground and the (C152) Rear Blower Medium Speed circuit in the Rear Blower Motor Resistor Block harness connector.

Start the engine. The rear blower motor should run with out blowing the fuse.

Turn the ignition off.

Remove the 10 amp fused jumper wire from the (C152) Rear Blower Medium Speed circuit in the Rear Blower Motor Resistor Block harness connector.



Connect a 5 amp fused jumper wire between ground and the (C151) Rear Blower Low Speed circuit in the Rear Blower Motor Resistor Block harness connector.

Start the engine. The rear blower motor should run with out blowing the fuse.

Does the rear blower motor run with out blowing either of the fuses?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Replace the Rear Blower Motor Resistor Block in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Cooldown Test is executed.
- **Set Condition:**
  If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F) within one minute.

Possible Causes
EVAPORATOR TEMPERATURE SENSOR CIRCUITS
EVAPORATOR TEMPERATURE SENSOR
OTHER HVAC SYSTEM FAULTS PRESENT
POWERTRAIN SYSTEM FAULTS PRESENT

Theory of Operation

The Cooldown Test checks A/C system performance based on Evaporator Temperature Sensor input. The main criteria is to lower evaporator temperature 11.11°C (20°F) within one minute. Before starting the test, the evaporator temperature must be above 18.3°C (65°F) and for Manual Temperature Control systems the front blower speed must be set to high speed. When the test is running, A/C Select and A/C Request will be on and the A/C status indicator will flash. When the test is complete, the scan tool will display one or more test status messages to indicate the outcome of the Cooldown Test. A Successful Cooldown – Test Passed status message indicates that the main test criteria was met. A DTC Set During Routine – Test Not Passed status message indicates that the A/C system is unable to lower the evaporator temperature 11.11°C (20°F) within one minute. A Conditions Too Cold – Test Not Run status message indicates that the evaporator temperature was below 18.3°C (65°F) when starting the Cooldown Test. A Blowers Not On High – Test Not Run status message indicates that either the front blower speed was not set to high speed prior to starting the Cooldown Test or the front blower speed was changed from high speed to another setting after starting the Cooldown test. A Refrigerant Temperature Sensor Error status message indicates that a fault occurred with the Evaporator Temperature Sensor/sensor circuits. A No Results Stored/Test Not Complete status message indicates that the power was cycled while the test was running.

Diagnostic Test

1. CHECK FOR DTCs IN THE A/C HEATER CONTROL MODULE

Turn the ignition on.
With the scan tool, select ECU View.
With the scan tool, select HVAC.

Are any DTCs present in the A/C Heater Control Module?

Yes >> Diagnose and Repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms. Rerun the Cooldown Test after the repair is complete.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 2

B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) (CONTINUED)

2. CHECK FOR DTCs IN THE PCM

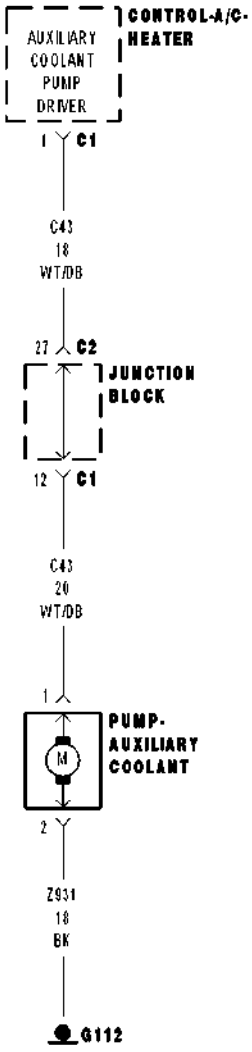
With the scan tool, select PCM.

Are any DTCs present in the PCM?

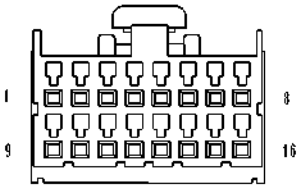
Yes >> Diagnose and repair the DTC(s). (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs. Rerun the Cooldown Test after the repair is complete.
Perform BODY VERIFICATION TEST – VER 1.

No >> Refer to the Service Information for additional Cooldown Test related diagnostic information and testing procedures. Rerun the Cooldown Test after the repair is complete.
Perform BODY VERIFICATION TEST – VER 1.

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (ATC)



PUMP-AUXILIARY COOLANT



CONTROL-A/C-HEATER C1 (ATC)

B1654ab5

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When Auxiliary Coolant Pump operation is requested.
- **Set Condition:**
  If the (C43) Auxiliary Coolant Pump Driver circuit is open or shorted to voltage. This DTC has a maturing time of 10 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT OPEN
(Z931) GROUND CIRCUIT OPEN
AUXILIARY COOLANT PUMP
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

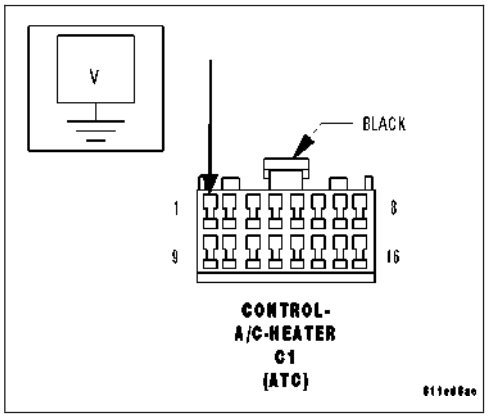
1. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C43) Auxiliary Coolant Pump Driver circuit.



Is the voltage above 0.2 volts?

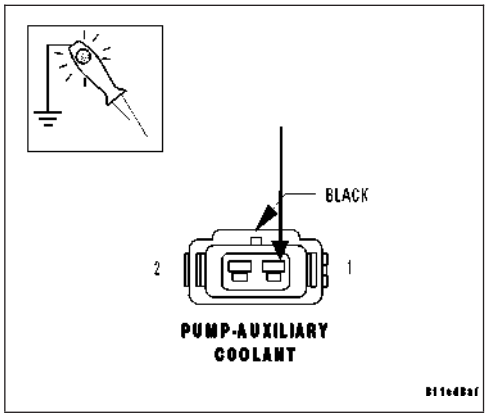
Yes >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

2. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT OPERATION

Turn the ignition off.
Reconnect the A/C Heater Control C1 harness connector.
Turn the ignition on.
Set the blend control to full cold.
With the scan tool, erase HVAC DTCs.
Turn the ignition off.
Disconnect the Auxiliary Coolant Pump harness connector.
Using a 12-volt test light connected to ground, back probe the (C43) Auxiliary Coolant Pump Driver circuit.
Turn the ignition on.
With the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On.



NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 4

---

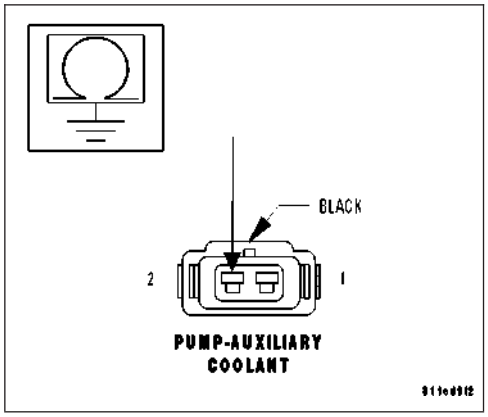
3. CHECK (Z931) GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.
Measure the resistance of the (Z931) Ground circuit between ground and the Auxiliary Coolant Pump harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Auxiliary Coolant Pump in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (Z931) Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



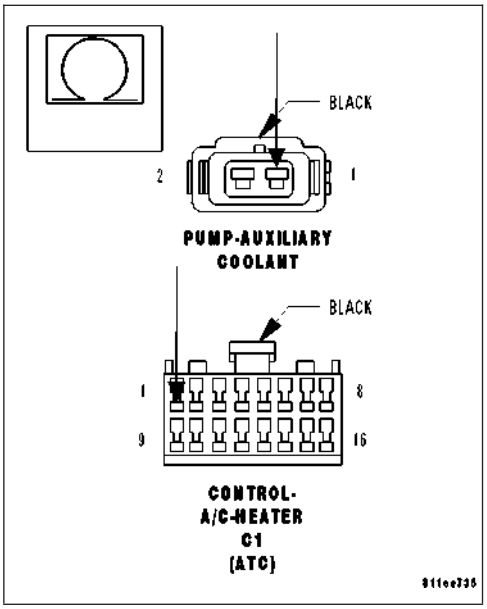
B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

4. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C43) Auxiliary Coolant Pump Driver circuit between the A/C Heater Control C1 harness connector and the Auxiliary Coolant Pump harness connector.



Is the resistance below 5.0 ohms?

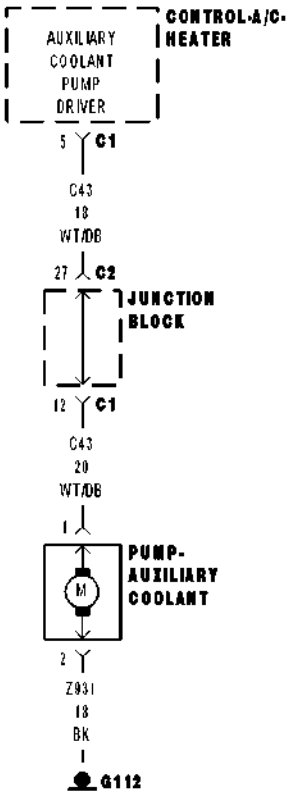
Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1.

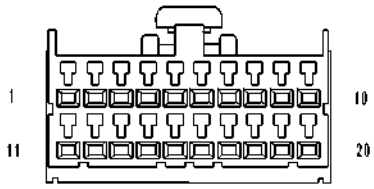
No >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (MTC)



PUMP-AUXILIARY COOLANT



CONTROL-A/C-HEATER C1 (MTC)

81454e11

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When Auxiliary Coolant Pump operation is requested.
- **Set Condition:**
  If the (C43) Auxiliary Coolant Pump Driver circuit is open or shorted to voltage. This DTC has a maturing time of 10 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT OPEN
(Z931) GROUND CIRCUIT OPEN
AUXILIARY COOLANT PUMP
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

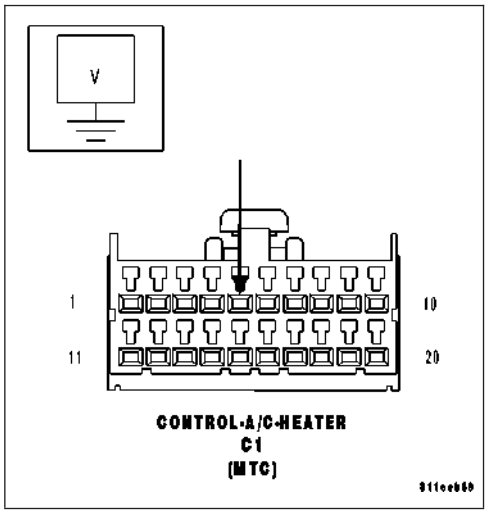
1. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C43) Auxiliary Coolant Pump Driver circuit.



Is the voltage above 0.2 volts?

Yes >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 2

B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

2. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT OPERATION

Turn the ignition off.

Reconnect the A/C Heater Control C1 harness connector.

Set the blend control to the full cold position.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

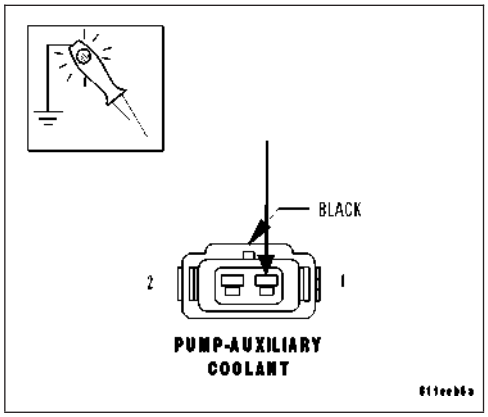
Turn the ignition off.

Disconnect the Auxiliary Coolant Pump harness connector.

Using a 12-volt test light connected to ground, back probe the (C43) Auxiliary Coolant Pump Driver circuit.

Turn the ignition on.

With the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On.



NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 4

---

3. CHECK (Z931) GROUND CIRCUIT FOR AN OPEN

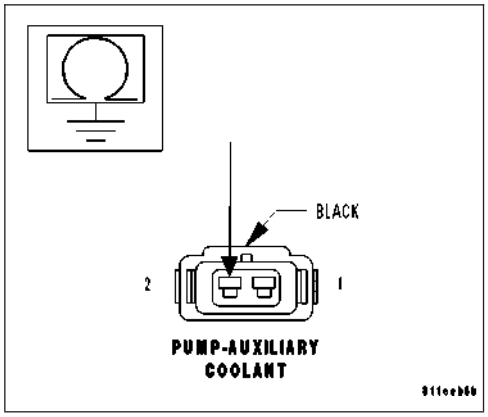
Turn the ignition off.

Measure the resistance of the (Z931) Ground circuit between ground and the Auxiliary Coolant Pump harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Auxiliary Coolant Pump in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (Z931) Ground circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1080–AUXILIARY COOLANT PUMP CONTROL CIRCUIT OPEN (MTC) (CONTINUED)

4. CHECK (C43) AUXILIARY COOLANT PUMP DRIVER CIRCUIT FOR AN OPEN

Turn the ignition off.

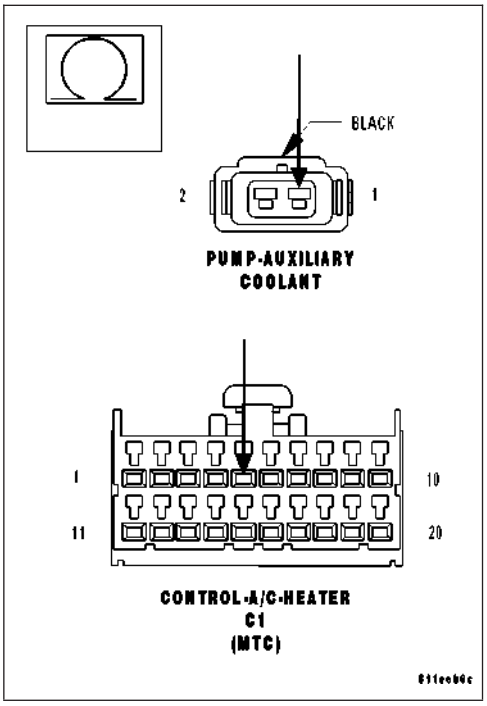
Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C43) Auxiliary Coolant Pump Driver circuit between the A/C Heater Control C1 harness connector and the Auxiliary Coolant Pump harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (C43) Auxiliary Coolant Pump Driver circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



B1090–ACTUATOR PULSE COUNT PERFORMANCE (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control detects a pulse count error while attempting to drive a door actuator. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored, it will stay in memory for 100 ignition cycles.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED HIGH, SHORTED LOW, SHORTED TOGETHER, OPEN
DOOR ACTUATOR(S) BINDING, BROKEN
DOOR ACTUATOR(S) LINKAGE BINDING, DISCONNECTED, MISSING, BROKEN
A/C HEATER CONTROL

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for conditions that prevent proper door operation. If a pulse count error is detected the A/C Heater Control reports the fault as B1090–Actuator Pulse Count Performance. It is important to note that this DTC only indicates that a fault occurred while driving a door actuator and that additional testing is necessary to provide more details about the reported fault.

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes (ATC)
Diagnose and repair the DTC(s). If present, diagnose and repair all Rear Blend and Rear Mode Door Control Circuit/Performance DTCs first, all other Control Circuit/Performance DTCs second, and all Control Circuit Open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Yes (MTC)
Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

B1090–ACTUATOR PULSE COUNT PERFORMANCE (ATC & MTC) (CONTINUED)

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

---

3. RUN ACTUATOR CALIBRATION TEST

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 4

---

4. CHECK MODE, BLEND & RECIRCULATION DOOR OPERATION

Start the engine.

Set the blower to high speed.

Operate each door in all positions in one direction and then in the opposite direction while monitoring the following:

- For the Mode Doors, verify that air flows from each vent accordingly for the position selected on the A/C Heater Control.
- For the Blend Doors, verify that the airflow air temperature changes accordingly for the temperature range selected on the A/C Heater Control.
- For the Recirculation Door, verify that the sound of the air flow get louder as the recirculation door opens to bring in recirculated air or gets softer as the recirculation door closes to bring in fresh air.

Does each door operate properly?

Yes >> The condition causing the fault has cleared at this time.
Perform BODY VERIFICATION TEST - VER 1.

No >> Remove the door actuator of the affected door from the A/C Heater Housing Assembly. By hand, attempt to rotate the actuator in both directions. Inspect the A/C Heater Housing for damage, for disconnected, missing, or broken linkage, and for broken or binding doors. Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

B2214–(HVAC) CLIMATE CONTROL INTERNAL (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control has an internal fault. This DTC has a maturing time of 5 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to either HVAC System Test (ATC) or to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

B2310–REAR WASHER SWITCH INPUT CIRCUIT LOW (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Rear Washer mode switch is stuck in a pushed position for more than two minutes. This DTC has a maturing time of two minutes and a de-maturing time of two seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to either HVAC System Test (ATC) or to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION

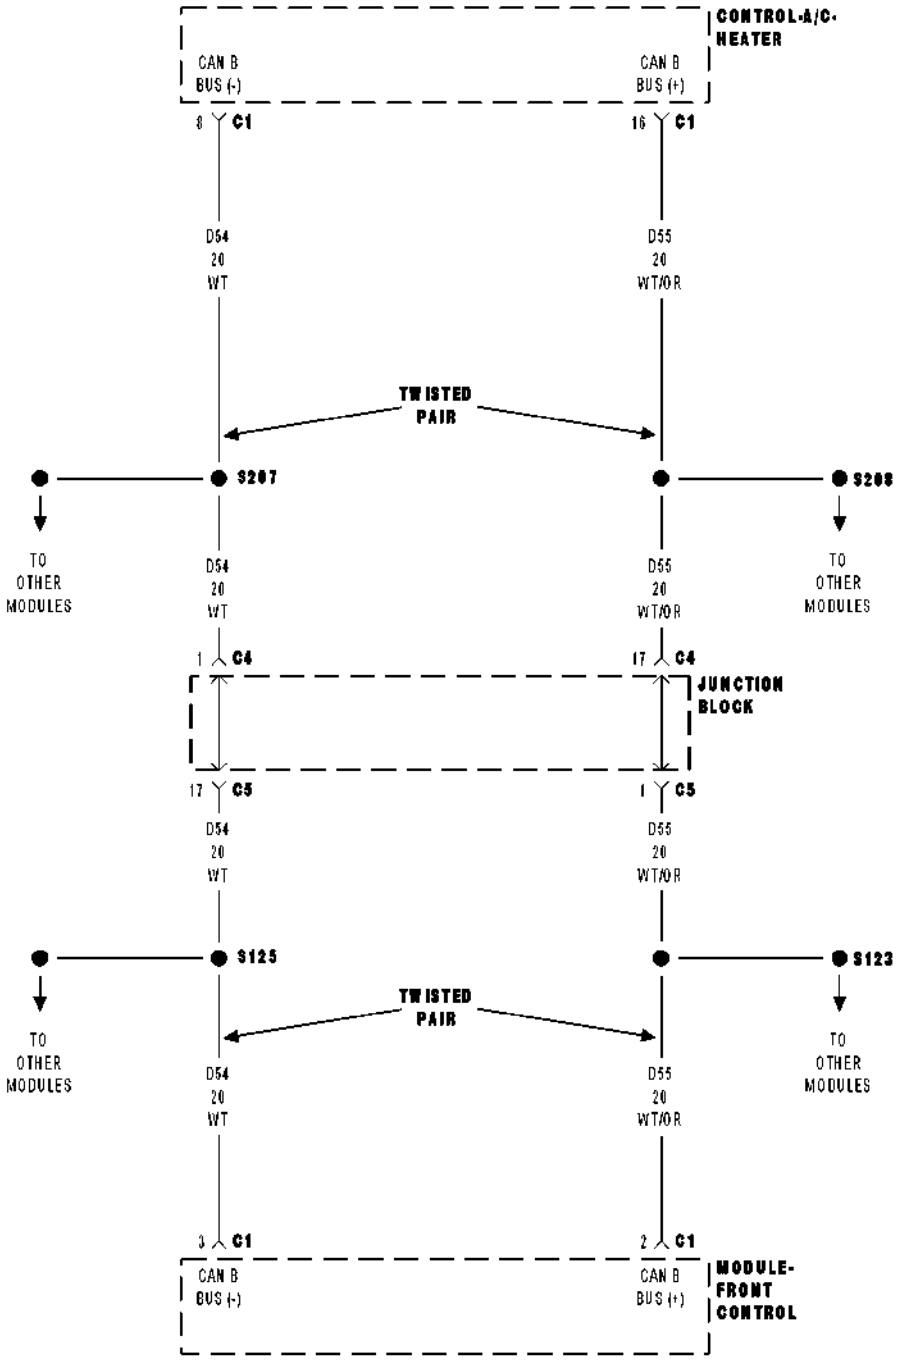
Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object.
Turn the ignition on.
With the scan tool, erase HVAC DTCs.
Turn the ignition off, wait 10 seconds, and then turn the ignition on.
Wait two minutes, then with the scan tool, read HVAC DTCs.

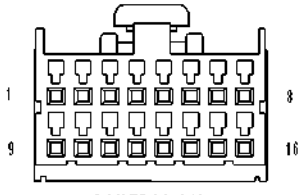
Does the scan tool display active: B2310–REAR WASHER SWITCH INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1.

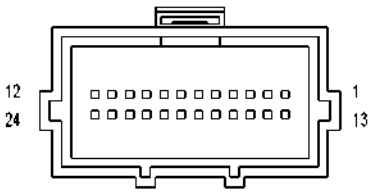
No >> Perform BODY VERIFICATION TEST – VER 1.

U0019–CAN B BUS (ATC)





CONTROL-A/C-HEATER C1 (ATC)



MODULE-FRONT CONTROL C1

81454175

U0019–CAN B BUS (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  If the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0019 CAN B BUS DTC IN FRONT CONTROL MODULE
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY DTC U0019–CAN B BUS IS ACTIVE

Turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display active: U0019–CAN B BUS?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ACTIVE CAN B BUS RELATED DTCS IN THE FRONT CONTROL MODULE (FCM)

With the scan tool, read Front Control Module (FCM) DTCs

Does the scan tool display any active CAN B BUS related DTCs?

Yes >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

No >> Go To 3

U0019–CAN B BUS (ATC) (CONTINUED)

3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the A/C Heater Control C1 harness connector.

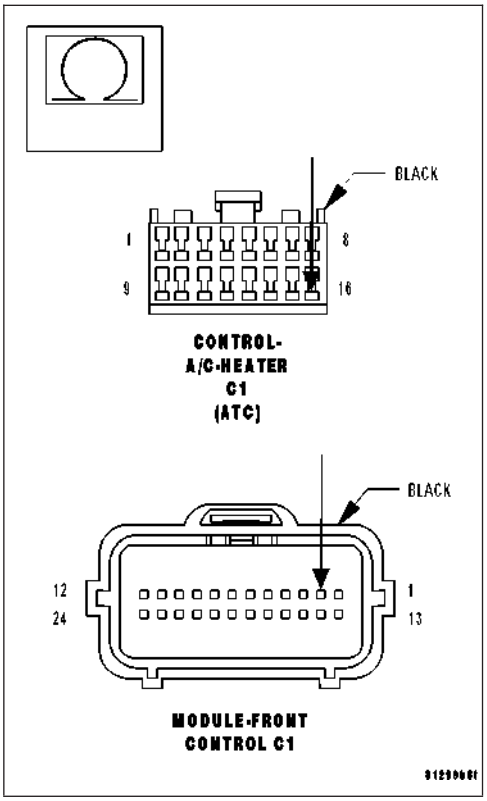
Disconnect the Front Control Module (FCM) C1 harness connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the (D55) CAN B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



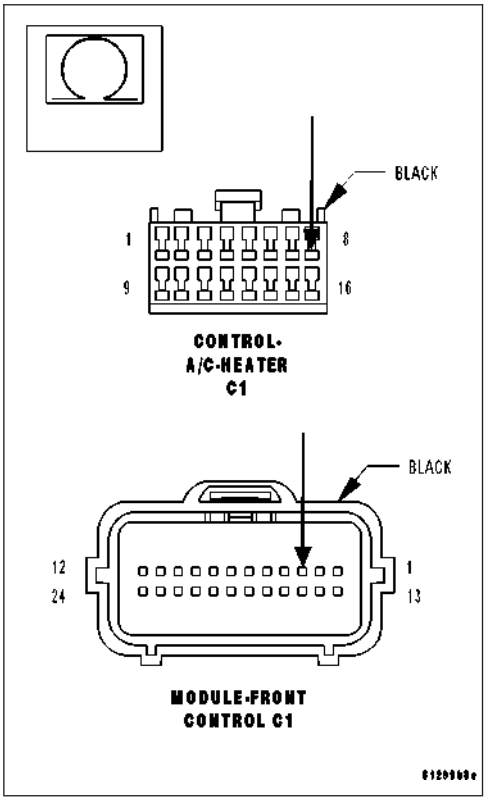
4. CHECK (D54) CAN B BUS (–) CIRCUIT FOR AN OPEN

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module C1 connector and the A/C Heater Control C1 harness connector.

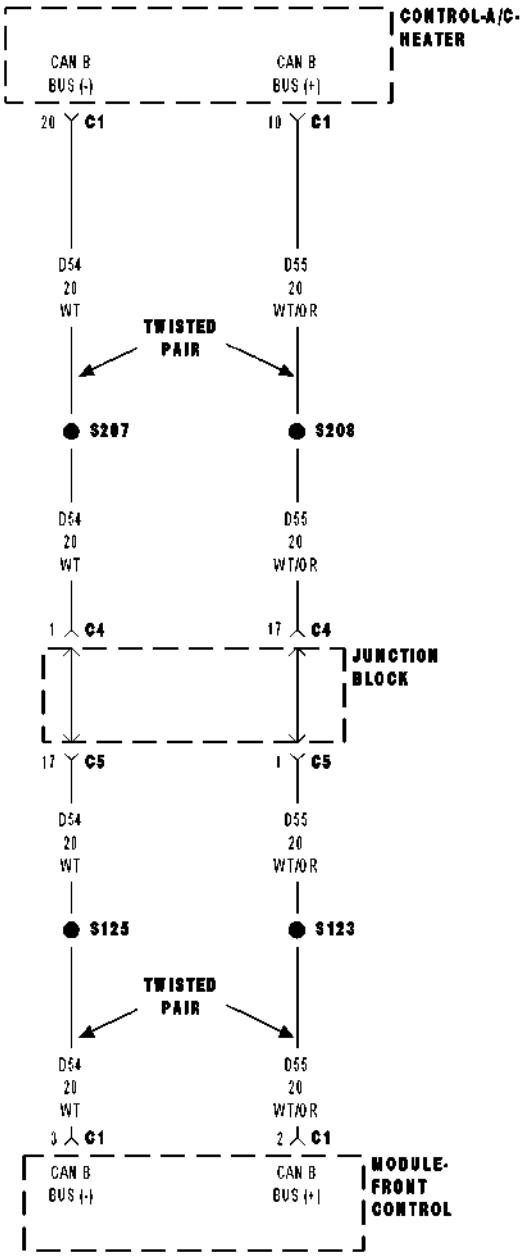
Is the resistance below 2.0 ohms?

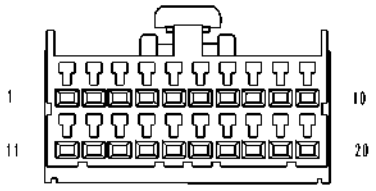
Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D54) CAN B Bus (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

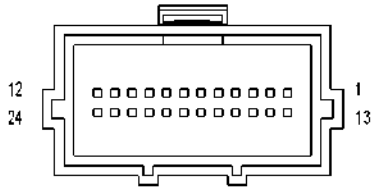


U0019–CAN B BUS (MTC)





CONTROL-A/C-HEATER C1 (MTC)



MODULE-FRONT CONTROL C1

91454fco

U0019–CAN B BUS (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously
- **Set Condition:**
  If the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0019 CAN B BUS DTC IN FRONT CONTROL MODULE
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY DTC U0019–CAN B BUS IS ACTIVE

Turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display active: U0019–CAN B BUS?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST – VER 1.

---

2. CHECK FOR ACTIVE CAN B BUS RELATED DTCS IN THE FRONT CONTROL MODULE (FCM)

With the scan tool, read Front Control Module (FCM) DTCs

Does the scan tool display any active CAN B BUS related DTCs?

Yes >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

No >> Go To 3

U0019–CAN B BUS (MTC) (CONTINUED)

3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the A/C Heater Control C1 harness connector.

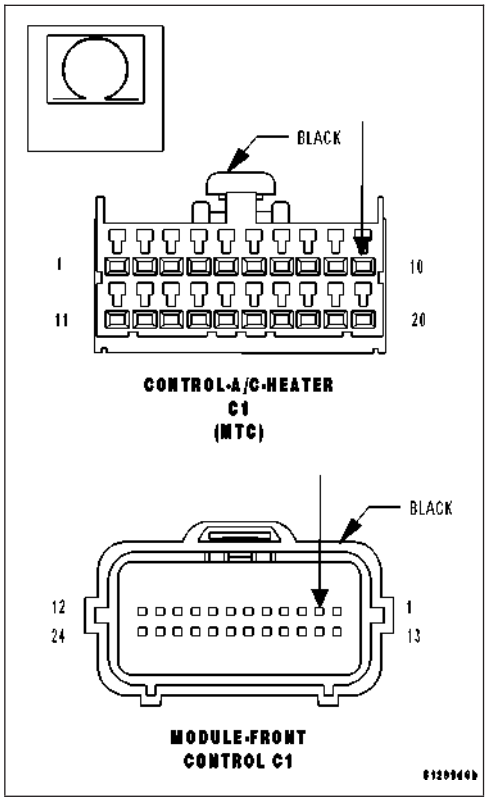
Disconnect the Front Control Module (FCM) C1 harness connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the (D55) CAN B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



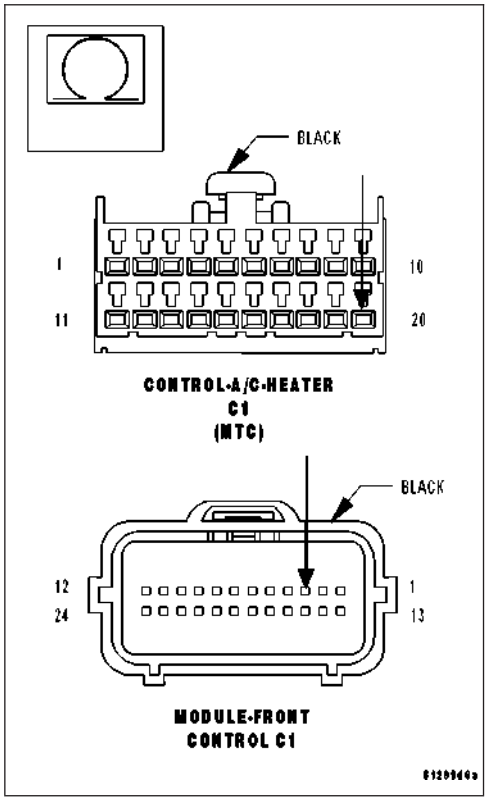
4. CHECK (D54) CAN B BUS (–) CIRCUIT FOR AN OPEN

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module C1 connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the (D54) CAN B Bus (–) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.



U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (ATC & MTC)

For the Automatic or Manual Temperature Control (ATC or MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control looses communication with the Front Control Module (FCM). This DTC has a maturing time of 30 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0155–LOST COMMUNICATION WITH CLUSTER/CCN (ATC & MTC)

For the Automatic or Manual Temperature Control (ATC or MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control looses communication with the Cluster (CCN). This DTC has a maturing time of 30 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0156–LOST COMMUNICATION WITH EOM (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the A/C Heater Control looses communication with the Compass Temperature Module (EOM). This DTC has a maturing time of 30 seconds and a de-maturing time of 10 seconds. If the DTC's status changes from active to stored it will stay in memory for 100 ignition cycles.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

DTC SET DURING ROUTINE - TEST NOT PASSED (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Cooldown Test is executed.
- **Set Condition:**
  If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F) within one minute.

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

BLOWERS NOT ON HIGH - TEST NOT RUN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Cooldown Test is executed.
- **Set Condition:**
  If either the front blower speed was not set to high speed prior to starting the Cooldown Test or the front blower speed was changed from high speed to another setting after starting the Cooldown test.

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

REFRIGERANT TEMPERATURE SENSOR ERROR (ATC & MTC)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  When the Cooldown Test is executed.
- **Set Condition:**
  If a fault occurred with the Evaporator Temperature Sensor/sensor circuits.

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

*HVAC SYSTEM TEST (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. HVAC SYSTEM TEST

NOTE: The HVAC System Test consists of four tests. Test 2 tests A/C system performance, Test 3 tests for mode switch, door actuator circuit, auxiliary coolant pump circuit, and rear blower control circuit faults, Test 4 tests for shorted door actuator circuits, and Test 5 tests for door actuator calibration faults. Either perform all four tests for a complete system test or perform an individual test if diagnosing a specific symptom.

NOTE: Active DTCs must be resolved before diagnosing stored DTCs.

Start the engine.

With the scan tool, erase HVAC DTCs.

Press the ATC's POWER switch on.

Choose a diagnostic test to perform

Actuator Calibration Test
Go To 5

***HVAC SYSTEM TEST (ATC) (CONTINUED)**

2. A/C SYSTEM PERFORMANCE TEST

NOTE: The work area ambient temperature must be above 15.6°C (60°F) and the evaporator temperature must be above 18.3°C (65°F) in order to test A/C system performance.

NOTE: Before actuating the Cooldown Test, verify that the A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding with the test.

NOTE: Running the Cooldown test will cause the A/C status indicator to flash.

NOTE: One or more status messages will display on the scan tool after running the Cooldown Test. These messages will clear after paging back out of this test function. Therefore, it is important to note all messages before doing so.

Verify that the front blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding with this test.

With the scan tool in HVAC, select System Tests and then select Cooldown test. Allow the test to run to completion.

Does the scan tool display a status message that indicates a fault has occurred?

Yes, Conditions Too Cold - Test Not Run

If running, turn the A/C compressor off. Verify that the work area ambient temperature is above 15.6°C (60°F). If not, move the vehicle to a warmer work area. Verify that the evaporator temperature is above 18.3°C (65°F). If not, set the front blower to high speed and allow the blower to run for five minutes. Then, rerun the Cooldown Test.

Yes, No Results Stored/Test Not Complete

Verify that power is not interrupted while rerunning the Cooldown Test.

Yes, Refrigerant Temperature Sensor Error

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

Yes, DTC Set During Routine - Test Not Passed

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

No >> As necessary, either Go To 3, 4, or 5, or Perform BODY VERIFICATION TEST - VER 1.

***HVAC SYSTEM TEST (ATC) (CONTINUED)**

3. MODE SWITCH, DOOR ACTUATOR CIRCUIT, AUXILIARY COOLANT PUMP CIRCUIT, & REAR BLOWER CONTROL CIRCUIT TEST

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question.

NOTE: If multiple DTCs become active, diagnose those that relate to a short circuit first.

Set the front blower speed to low.

Set the Rear Fan switch on the Rear A/C Heater Control to off.

Set the Rear Blend switch on the Rear A/C Heater Control to full cold.

Monitor the scan tool for active HVAC DTCs while performing the following test steps.

Press the AUTO mode switch, wait 30 seconds and then proceed to the next step.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the RECIRC mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the TEMP + mode switch until the temperature is set to the max heat setting, wait 30 seconds and then proceed to the next step.

Press the TEMP - mode switch until the temperature is set to the max cool setting, wait 30 seconds and then proceed to the next step.

Press the FLOOR mode switch, wait 30 seconds and then proceed to the next step.

Press the PANEL mode switch, wait 30 seconds and then proceed to the next step.

Press the BI-LEVEL mode switch, wait 30 seconds and then proceed to the next step.

Press the MIX mode switch, wait 30 seconds and then proceed to the next step.

Press the REAR DEFROST mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the FRONT DEFROST mode switch, wait 30 seconds and then proceed to the next step.

Press and hold the REAR WASHER mode switch for several seconds, release it, and then proceed to the next step.

Press the FAN - mode switch until the front blower speed is set to low, wait 30 seconds and then proceed to the next step.

Press the FAN + mode switch until the front blower speed is set to the high, wait 30 seconds and then proceed to the next step.

Press the FAN - mode switch until the front blower speed is set to low and then proceed to the next step.

Press the REAR FUNCTION mode switch. The rear-blower speed settings should display on the ATC display panel. Then, within 7 seconds, press the FAN + mode switch until the rear blower speed is set to high, wait 30 seconds and then proceed to the next step.

Press the REAR FUNCTION mode switch. The rear-blower speed settings should display on the ATC display panel. Then, within 7 seconds, press the FAN - mode switch until the rear blower speed is set to low, wait 30 seconds and then proceed to the next step.

Press the REAR FUNCTION mode switch. The words ″CONTROL IN REAR″ should display on the ATC display panel.

Slowly turn the Rear Fan switch on the Rear A/C Heater Control to high speed.

Slowly turn the Rear Blend switch on the Rear A/C Heater Control to full hot, wait 30 seconds and then turn it back to full cold.

Slowly turn the Rear Fan switch on the Rear A/C Heater Control to off.

With the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On. Allow the pump to run for approximately one minute.

Does the scan tool display any active DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

No >> As necessary, either Go To 4 or 5, or Perform BODY VERIFICATION TEST - VER 1.

***HVAC SYSTEM TEST (ATC) (CONTINUED)**

4. ACTUATOR DTC DETECTION TEST

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> As necessary, either Go To 5 or Perform BODY VERIFICATION TEST - VER 1.

---

5. ACTUATOR CALIBRATION TEST

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> No problem found.
Perform BODY VERIFICATION TEST - VER 1.

---

*HVAC SYSTEM TEST (MTC)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

2. A/C SYSTEM PERFORMANCE TEST

NOTE: The work area ambient temperature must be above 15.6°C (60°F) and the evaporator temperature must be above 18.3°C (65°F) in order to test A/C system performance.

NOTE: Before actuating the Cooldown Test, verify that the mode setting is not in a defrost position and that the A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding with the test.

NOTE: Running the Cooldown test will cause the A/C status indicator to flash.

NOTE: One or more status messages will display on the scan tool after running the Cooldown Test. These messages will clear after paging back out of this test function. Therefore, it is important to note all messages before doing so.

Set the mode to the Panel position.

Verify that the front blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding with this test.

Set the front blower speed to high.

With the scan tool in HVAC, select System Tests and then select Cooldown test. Allow the test to run to completion.

Does the scan tool display a status message that indicates a fault has occurred?

Yes, Conditions Too Cold - Test Not Run

If running, turn the A/C compressor off. Verify that the work area ambient temperature is above 15.6°C (60°F). If not, move the vehicle to a warmer work area. Verify that the evaporator temperature is above 18.3°C (65°F). If not, set the front blower to high speed and allow the blower to run for five minutes. Then, rerun the Cooldown Test.

Yes, Blowers Not On High - Test Not Run

Set the front blower speed to high speed and then rerun the Cooldown Test.

Yes, No Results Stored/Test Not Complete

Verify that power is not interrupted while rerunning the Cooldown Test.

Yes, Refrigerant Temperature Sensor Error

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

Yes, DTC Set During Routine - Test Not Passed

Refer to B1079–CLIMATE CONTROL COOL DOWN TEST EXCESSIVE TIME (ATC & MTC) for the diagnostic test procedure.

No >> As necessary, either Go To 3, 4, or 5, or Perform BODY VERIFICATION TEST - VER 1.

***HVAC SYSTEM TEST (MTC) (CONTINUED)**

3. MODE SWITCH, DOOR ACTUATOR CIRCUIT, & AUXILIARY COOLANT PUMP CIRCUIT TEST

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question.

NOTE: If multiple DTCs become active, diagnose those that relate to a short circuit first.

Set the front blower speed to low.

Set the Blend control to full cold.

Set the Mode control to Bi-Level/Recirc.

If equipped, set the Rear Fan switch on the Rear A/C Heater Control to off.

If equipped, set the Rear Blend switch on the Rear A/C Heater Control to full cold.

Monitor the scan tool for active HVAC DTCs while performing the following test steps.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Rear Defrost mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press and hold the Rear Washer mode switch for several seconds, release it, and then proceed to the next step.

Set the Blend control to full hot, wait 30 seconds and then set it to full cold.

Turn the Mode control to every door position. Leave it in each position for 30 seconds.

If equipped, set the Rear Blower control to Rear Control.

If equipped, set the Rear Fan switch on the Rear A/C Heater Control to high speed.

If equipped, slowly turn the Rear Blend switch on the Rear A/C Heater Control to full hot, wait 30 seconds and then turn it back to full cold.

If equipped, turn the Rear Fan switch on the Rear A/C Heater Control to off.

If equipped with rear HVAC, with the scan tool, select the following: Actuators, Auxiliary Coolant Pump, Start, and Constant On. Allow the pump to run for approximately one minute.

Does the scan tool display any active DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

No >> As necessary, either Go To 4 or 5, or Perform BODY VERIFICATION TEST - VER 1.

---

4. ACTUATOR DTC DETECTION TEST

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> As necessary, either Go To 5 or Perform BODY VERIFICATION TEST - VER 1.

---

5. ACTUATOR CALIBRATION TEST

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> No problem found.
Perform BODY VERIFICATION TEST - VER 1.

HVAC - SERVICE INFORMATION

DESCRIPTION

HEATING AND AIR CONDITIONING SYSTEMS

A manual temperature control (MTC) single zone type heating-A/C system, MTC front and rear heating-A/C system or a fully adjustable automatic temperature control (ATC) front and rear heating-A/C system is available on this vehicle.

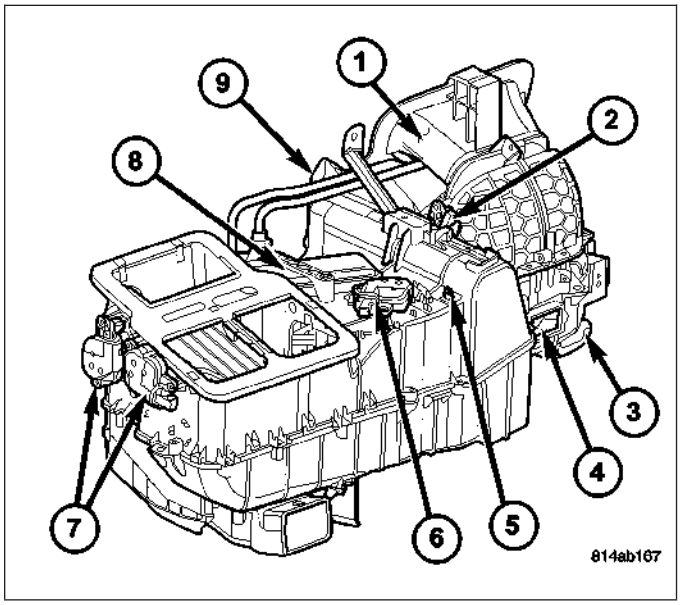
To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

FRONT HEATING AND A/C SYSTEM

All vehicles are equipped with a common front heater, ventilation and air conditioning (HVAC) housing (1). The front heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment under the instrument panel. The front HVAC housing includes:

- Recirculation-air door and actuator (2)
- Blower motor (3)
- Blower motor resistor (MTC) or blower motor power module (ATC) (4)
- Evaporator temperature sensor (5)
- Blend-air door and actuator (6)
- Mode-air doors and actuators (7)
- Heater core (8)
- A/C evaporator (9)



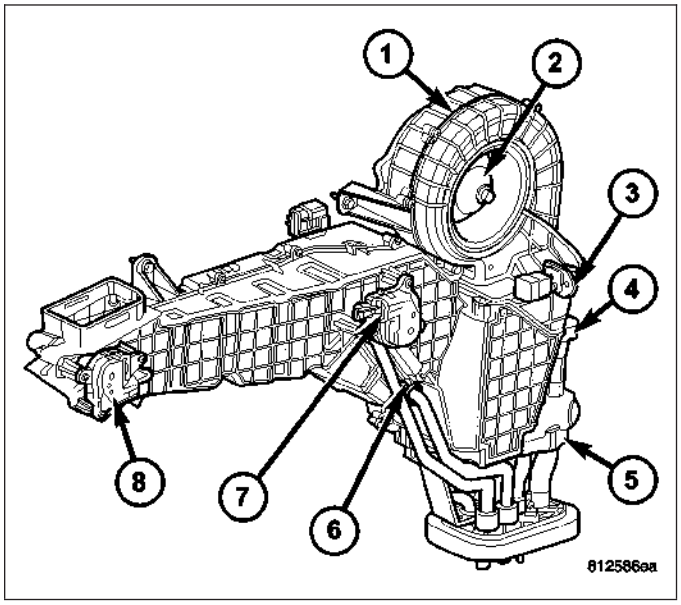
Based upon the mode selected, conditioned air can exit the front HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost outlet is located on the top of the HVAC housing, the panel outlet is located on the top of the HVAC housing and the floor outlet is located on the bottom of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single large defroster outlet is located in the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are six panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located at each side of the instrument panel center bezel.
- **Floor Outlets** - There are four floor outlets, one located above each side of the floor panel center tunnel near the dash panel and one behind each front seat.

REAR HEATING AND A/C SYSTEM

The manual temperature control (MTC) front and rear heating-A/C system, and the automatic temperature control (ATC) front and rear heating-A/C system are equipped with a common rear heater and A/C housing (1) that combines A/C and heating capabilities into a single unit mounted within the passenger compartment behind the right quarter interior trim panel. The rear HVAC housing includes:

- Blower motor (2)
- Blower motor resistor (3)
- A/C evaporator (4)
- A/C expansion valve (5)
- Heater core (6)
- Blend door and actuator (7)
- Mode door and actuator (8)



Based upon the rear temperature selected, conditioned air can exit the rear HVAC housing through one or a combination of the two rear HVAC housing outlets: ceiling or floor. The ceiling outlet is located at the top-front of the HVAC housing and the floor outlet is located at the front of the HVAC housing. Once the conditioned air exits the rear HVAC housing, it is further directed through molded plastic ducts to the outlets at the rear of the passenger compartment. These outlets and their locations are as follows:

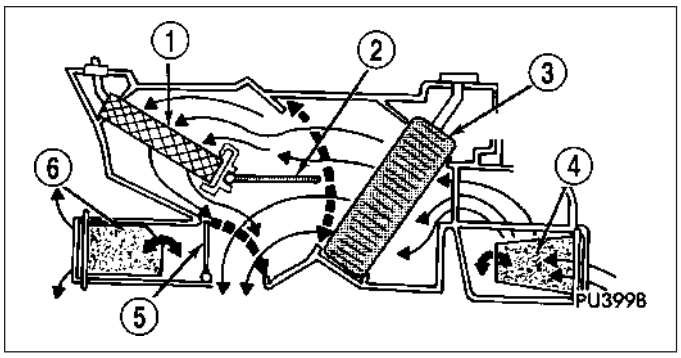
- **Ceiling Outlets** - There are four ceiling outlets in the headliner. One located at each outboard side of the intermediate seat position and one located in front of each rear seat postion.
- **Floor Outlet** - There is one floor outlet in the right quarter interior trim panel located behind the right rear door area.

OPERATION

The standard front and the optional rear heating-A/C systems used in this vehicle are blend-air type systems. In a blend-air heating-A/C system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. A temperature control determines the discharge air temperature by operating an electric actuator, which operates the blend-air door. This allows an almost immediate control of the output air temperature of the systems. Both the front and rear A/C systems are designed for the use of non-CFC, R-134a refrigerant and use an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air.

FRONT SYSTEM

The standard front heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the air inlet housing and through the A/C evaporator (3). Air flow can be directed either through or around the heater core (1). This is done by adjusting the blend-air doors (2) with the temperature controls located on the A/C-heater control in the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed control located on the A/C-heater control.



The outside (fresh) air intake can be shut off by selecting the Recirculation Mode with the mode control. This will operate an electrically actuated recirculation-air door (4) that closes off the fresh air intake and recirculates the air that is already inside the vehicle.

The A/C compressor can be engaged in any mode by pressing the snowflake, A/C on/off button. It can also be engaged by placing the mode control in the mix to defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to also direct the conditioned air to the selected system outlets. The mode control uses two electric actuators to control the mode-air doors (5 and 6).

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which connects to the HVAC housing defroster outlet. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted. The defroster outlet grille is integral to the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic demister ducts. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are serviceable from the instrument panel. The demisters operate when the mode control is positioned in the bi-level, floor, floor-defrost and defrost settings.

The instrument panel outlets receive airflow from the HVAC housing through a molded plastic main panel duct, center panel duct and two end panel ducts. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the four center panel outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts. The front floor outlets are integral to the molded plastic floor distribution duct, which is secured to the bottom of the HVAC housing. Two plastic rear floor distribution ducts attach to the floor distribution duct and provide conditioned air to the intermediate seating positions. The floor outlets cannot be adjusted.

NOTE: It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

This A/C system uses an A/C expansion valve (TXV) to meter the flow of refrigerant to the A/C evaporator. To maintain minimum evaporator temperature and prevent evaporator freezing, an evaporator temperature sensor input is supplied to the A/C-heater control. In turn, the powertrain control module (PCM) cycles the A/C compressor clutch off and on as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

REAR SYSTEM

The rear heating-A/C system pulls interior air through the opening in the rear quarter interior trim panel and into the rear blower motor in the rear HVAC housing, then through the rear A/C evaporator. Air flow can be directed either through or around the rear heater core. This is done by adjusting the blend-air door with either the front or the rear temperature control (depending on the front A/C-heater control setting). The air flow is then automatically directed to the floor or ceiling outlets depending on the conditioned air temperature selected by the rear mode-air door. Air flow velocity can be adjusted with the blower speed control located on either the front A/C-heater control or the rear A/C-heater control (depending on the front A/C-heater control setting).

The headliner air outlets receive airflow from the rear HVAC housing through the molded plastic ceiling duct, which connects to the headliner duct and headliner air outlets. Airflow direction from the headliner air outlets can be adjusted by moveable vanes and the headliner air outlets can be serviced separately.

The rear floor outlet receives airflow from the rear HVAC housing through the molded plastic floor distribution duct, which connects to the rear floor outlet located in the rear quarter interior trim panel. The airflow from the rear floor outlet is directed by fixed vanes in the outlet and air flow direction cannot be adjusted. The rear floor outlet is integral to the rear quarter interior trim panel.

This rear A/C system uses an “H” valve-type thermal expansion valve (TXV) to meter the flow of refrigerant to the rear A/C evaporator.

DIAGNOSIS AND TESTING

HEATING-A/C SYSTEM DIAGNOSTICS

ON-BOARD DIAGNOSTICS

CAUTION: Do not exchange A/C Heater Controls from vehicle to vehicle. Software versions differ between models and model years. Installing an A/C Heater Control with software that is incompatible for a given vehicle can result in either improper or failed HVAC system operation.

The A/C-heater control communicates on the controller area network (CAN) B bus and is fully addressable with a scan tool.

The A/C-heater control’s primary means of fault detection is through active and stored diagnostic trouble codes (DTCs). Active DTCs are those which currently exist in the system. The condition causing the fault must be repaired in order to clear this type of DTC. Stored DTCs are those which occurred in the system since the A/C-heater control received the last clear diagnostic info message. All DTCs must be read with a scan tool. Refer to 24 - HVAC - Electrical Diagnostics for the diagnostic test procedures.

The A/C-heater control’s secondary means of fault detection is through system tests. These tests include the HVAC System Test, the A/C Cooldown Test, the Actuator Calibration Function, the Actuator DTC Detection Test. Refer to System Tests in this Section for a detailed description of each test.

SYSTEM TESTS

HVAC System Test

The HVAC System Test, found in 24 - HVAC - Electrical Diagnostics, provides a starting point in the diagnostic process by identifying the appropriate system test to perform when diagnosing a given condition or DTC. It also provides a means for testing the entire HVAC system by utilizing the A/C-heater control’s On-Board System Tests. The On-Board System Tests can also assist in diagnosing stored DTCs.

A/C Cooldown Test

The A/C Cooldown Test:

- is actuated with a scan tool.
- tests A/C system performance based on evaporator temperature sensor input.
- will fail if evaporator temperature is below 18.3° C (65° F) when initiating the test.
- will pass if the evaporator temperature drops 11.1° C (20° F).

- indicates test outcome by displaying one or more test status messages on the scan tool. These messages will clear after paging back out of this test function. Therefore, is it important to note all of the messages before doing so.
- will cause the A/C status indicator to flash while the test is running.

Actuator Calibration Function

The Actuator Calibration function:

- is actuated with a scan tool.
- homes and repositions door actuators.
- monitors for door span faults. Door span faults (XXX Door Travel Range Too Large or XXX Door Travel Range Too Small) will only display after calibration.
- will cause the electric backlight (EBL) status indicator to flash while the test is running.

Actuator DTC Detection Test

The Actuator DTC Detection Test:

- is actuated with a scan tool.
- supplements the continuous diagnostics on the actuator drive system.
- monitors for shorted actuator circuits allowing service to easily diagnose and troubleshoot up to three simultaneous shorts. Shorted actuator circuit faults (XXX Control Circuit High or XXX Control Circuit Low) will only display after running the Actuator DTC Detection Test.

After repairing each DTC, cycle the ignition switch, and then rerun the test to ensure that no new DTCs exist. If multiple DTCs are present, beginning with the common circuits, diagnose and repair all short high faults and then short low faults. When the test returns passed, then troubleshooting should proceed to clearing faults and running the Actuator Calibration function as a final check of proper system operation.

SYSTEM REVISIONS

The 2005 ATC and MTC HVAC systems remain mostly carryover from 2004. Revisions for 2005 include a new evaporator temperature sensor which is mounted downstream of the evaporator and revised control software.

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature of the vehicle and the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test. Also the evaporator temperature sensor probe (located between the evaporator fins) must be a minimum of 18° C (65° F) for this test as well.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Perform the A/C System Performance Test, which is found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Connect a tachometer and a manifold gauge set.

NOTE: The ambient air temperature of the vehicle and the location where the vehicle will be tested must be a minimum of 21° C (70° F) before performing this test. Also the evaporator temperature sensor probe (located between the evaporator fins) must be a minimum of 18° C (65° F) for this test as well. If the vehicle has been sitting in the sun prior to testing, place the vehicle in the testing area until the temperature within the vehicle reaches a minimum of 18° C (65° F).

3. Set the A/C-heater control to the Recirculation mode (max-A/C) position, the temperature control to the full cool position, and the blower motor control to the highest speed position.
4. Start the engine and hold the idle at 1,000 rpm with the compressor clutch engaged. If the A/C compressor does not engage, see the A/C Diagnosis chart.
5. The engine should be at operating temperature and the doors and the windows closed.
6. Insert a thermometer in the driver side center panel outlet for front A/C system or insert the thermometer in the drivers side second row outlet in the headliner for the rear A/C system. Operate the A/C system until it stabilizes.
7. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the compressor discharge pressure (high side) to the A/C Performance and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Maximum Allowable Air Temperature at Center Panel Outlet	9°C (48°F)	9°C (48°F)	12°C (54°F)	15°C (59°F)	18°C (65°F)
Maximum Allowable Air Temperature at Driver side 2nd Row Headliner Outlet	10° C (50° F)	13° C (55° F)	15° C (59° F)	17° C (63° F)	19° C (67° F)
Suction Pressure at Service Port (Low Side)	138 to 310 kPa (20 to 45 psi)	138 to 345 kPa (20 to 50 psi)	207 to 365 kPa (30 to 55 psi)	207 to 414 kPa (30 to 60 psi)	241 to 448 kPa (35 to 65 psi)
Discharge Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1551 to 2241 kPa (225 to 325 psi)	1724 to 2413 kPa (250 to 350 psi)	2068 to 2758 kPa (300 to 400 psi)

8. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the compressor discharge pressure is high, refer to the A/C Pressure Diagnosis chart.

A/C PRESSURE DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling with poor panel oulet temperatures.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Faulty fuse.	2. Check the fuses in the Integrated Power Module. Repair the shorted circuit or component and replace the fuses, if required. Refer to Group 8.
	3. Faulty A/C compressor clutch coil.	3. See A/C Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required.
	4. Faulty A/C compressor clutch relay.	4. See A/C Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required.
	5. Improperly installed or faulty evaporator temperature sensor.	5. See Evaporator Temperature Sensor in this group. Test the sensor and replace, if required.
	6. Faulty A/C pressure transducer.	6. See A/C Pressure Transducer in this group. Test the sensor and replace, if required.
	7. Faulty Powertrain Control Module (PCM).	7. Refer to Group 9 - Engine Electrical Diagnostics for testing of the PCM. Test the PCM and replace, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator improperly installed or faulty.	2. See Blend Door Actuator in this group. Inspect the actuator for proper operation and replace, if required.
	3. Blend door inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend door for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.

Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the receiver/drier is restricted.	2. See Receiver/Drier in this group. Replace the restricted receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace, if required. Refer to Group 7.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. Test the engine cooling system and repair, if required. Refer to Group 7.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. Refer to Group 7.
	2. Faulty A/C expansion valve.	2. See A/C Expansion Valve in this group. Replace the valve, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See A/C Expansion Valve in this group. Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling System for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If any diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), repair as necessary.

MAXIMUM HEATER OUTPUT: TEST AND ACTION

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front HVAC housing floor outlets or the rear outlet in the passenger side rear quarter interior trim panel. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Heater System Air Outlet Temperature	52.2° C (126° F)	56.1° C (133° F)	59.4° C (139° F)	62.2° C (144° F)

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling System. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling System for more information.

If the heater outlet air temperature degrades significanly at an idle, check for proper operation of the auxilary electric coolant pump (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/PUMP-COOLANT-ELECTRIC - OPERATION).

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Blend-air door(s) or actuator(s) not functioning properly.
- Faulty blower motor system
- Faulty A/C-heater control

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Faulty A/C-heater control.
- Faulty blend door actuator.
- Faulty, obstructed or improperly installed blend-air door.
- Faulty related wiring harness or connectors.
- Improper engine coolant temperature.

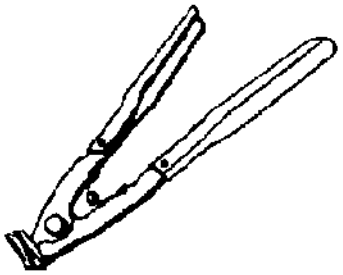
SPECIFICATIONS

A/C SYSTEM

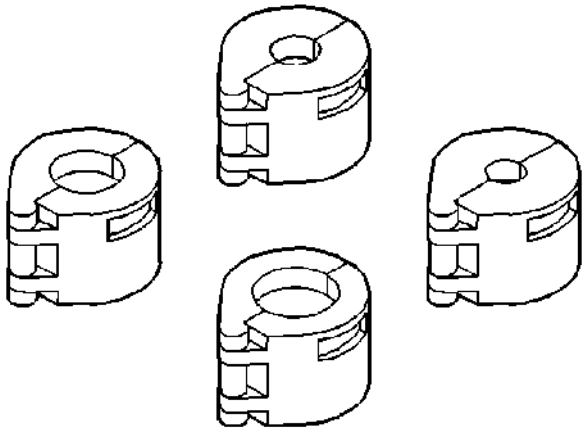
Item	Description	Notes
A/C Compressor	Denso 10S20	ND-8 PAG oil
Freeze–up Control	Evaporator Temperature Sensor	HVAC housing mounted (front) - input to A/C-heater control
Low psi Control	A/C Pressure Transducer	Liquid line mounted - input to FCM - opens below 28 psi, closes above 34 psi
High psi Control	A/C Pressure Transducer	Liquid line mounted - input to FCM - opens above 460 psi, closed below 290 psi
Refrigerant Charge Capacity	Refer to the A/C Underhood Specification Label located in the engine compartment	R-134a refrigerant
A/C Clutch Coil Draw	2.2 amps @ 12V ± 0.5V @ 21° C (70° F)	
A/C Clutch Air Gap	0.35 - 0.65 mm (0.014 - 0.025 in.)	

SPECIAL TOOLS

A/C SYSTEM

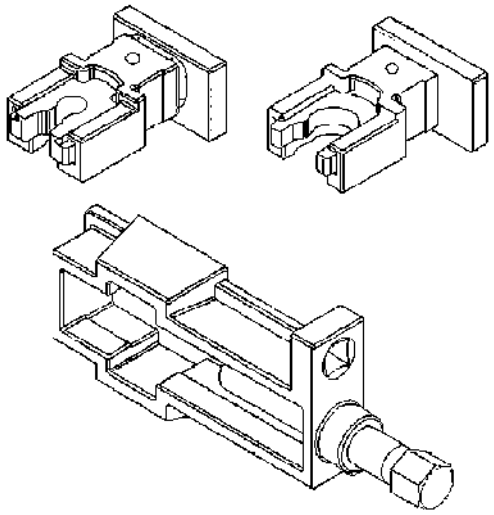


Snap Ring Pliers C-4574 are required to service the A/C clutch and field coil.



A/C Line Disconnect Tools 7193

A/C Line Disconnect Tools 7193 are required to service the A/C liquid and suction lines, A/C accumulator and the A/C evaporator.



A/C Line Repair Tools 8456-A

A/C Line Repair Tools 8456-A are required to repair the A/C underbody lines.

ACTUATOR-BLEND DOOR

DESCRIPTION

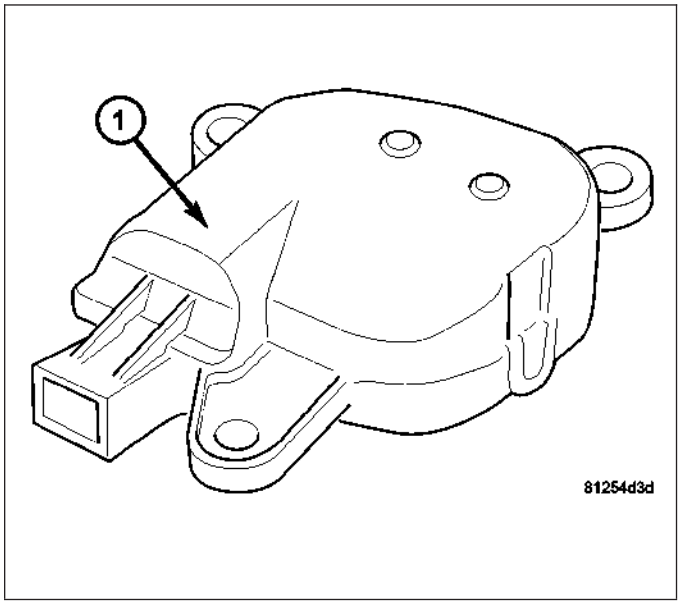
The blend door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The blend door actuator is located on the top of the HVAC housing. The blend door actuator is interchangeable with the actuators for both mode-air doors and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Three integral mounting tabs allow the actuator to be secured to the HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the blend-air door. The blend door actuator does require mechanical indexing to the blend-air door, as it is electronically calibrated by the A/C-heater control.



OPERATION

The blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

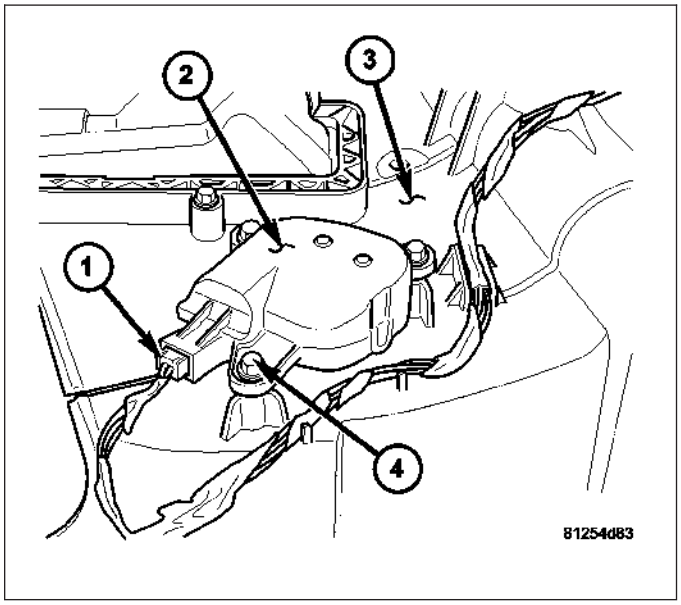
When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuator and the blend-air door. The A/C-heater control learns the blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuit.

The blend door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The blend door actuator is diagnosed using the scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

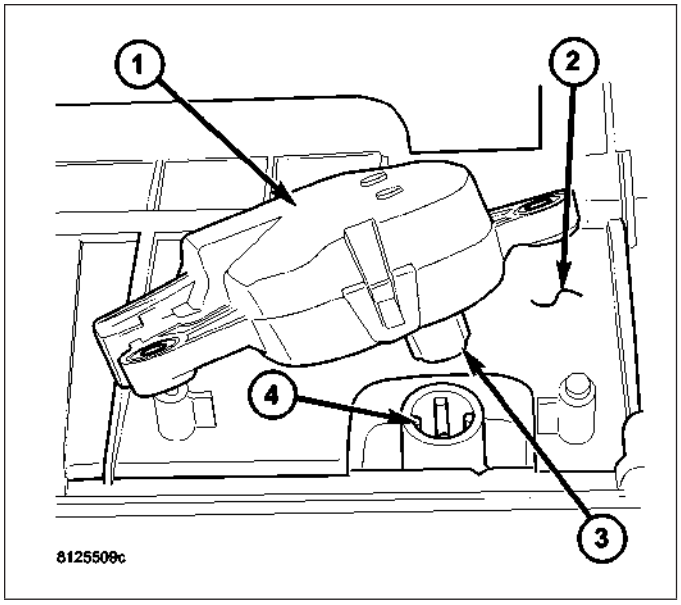
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
3. Remove the screws (4) that secure the blend door actuator (2) to the top of the HVAC housing (3).
4. Disconnect the HVAC wire harness connector (1) from the blend door actuator.
5. Remove the blend door actuator from the HVAC housing.

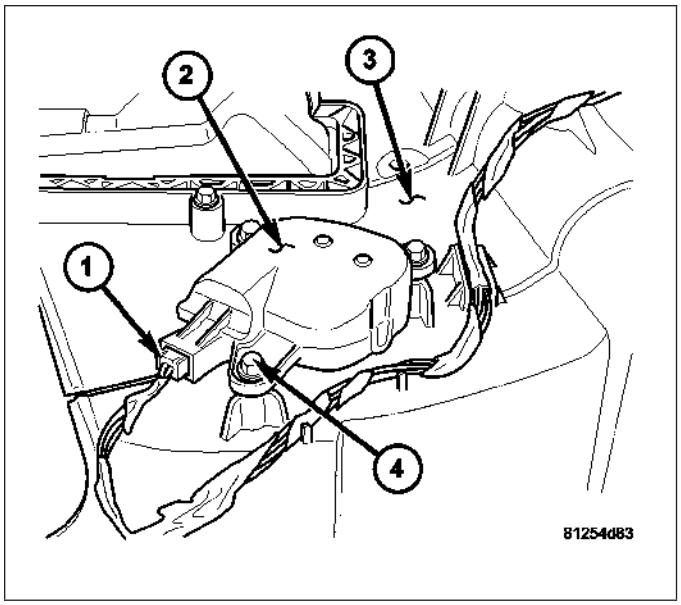


INSTALLATION

1. Position the blend door actuator (1) onto the top of the HVAC housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend-air door linkage (4).



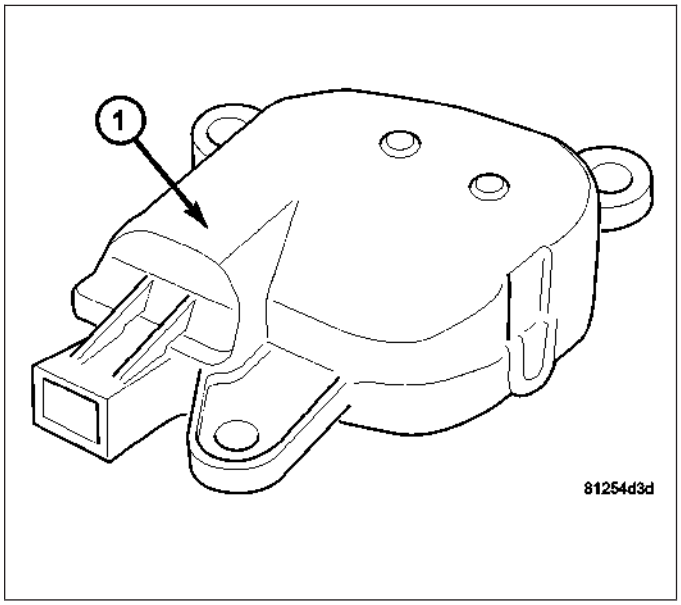
2. Install the screws (4) that secure the blend door actuator (2) to the HVAC housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the HVAC wire harness connector (1) to the blend door actuator.
4. Install the instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to HVAC System Test, found in 24 - HVAC - Electrical Diagnostics.



ACTUATOR-MODE DOOR

DESCRIPTION

The two mode door actuators (floor/defrost and panel door) (1) are reversible, 12–volt direct current (DC), servo motors. Both mode door actuators are located near the drivers side end of the HVAC housing. The mode door actuators are mechanically connected to the floor/defrost and the panel-air door. Both mode door actuators are interchangeable with each other and with the actuators for the blend-air door and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Three integral mounting tabs allow the actuator to be secured to the top of the HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the mode-air doors. The mode door actuators do not require mechanical indexing to the mode-air doors, as they are electronically calibrated by the A/C-heater control.



OPERATION

The floor/defrost and panel (mode) door actuators are connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The mode door actuators can move the floor/defrost and the panel-air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air door(s) will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air door(s) moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air door(s) stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the floor/defrost and panel door actuators and the mode-air doors. The A/C-heater control learns the mode-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits.

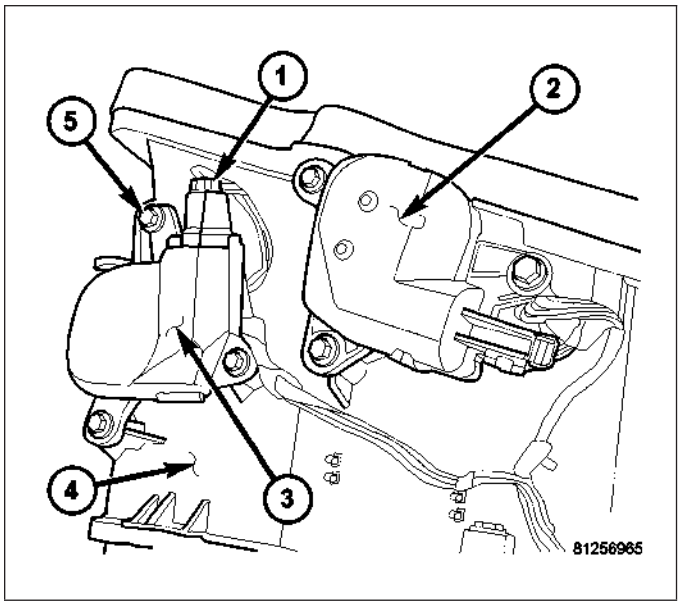
The mode door actuators cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

The mode door actuators are diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

REMOVAL

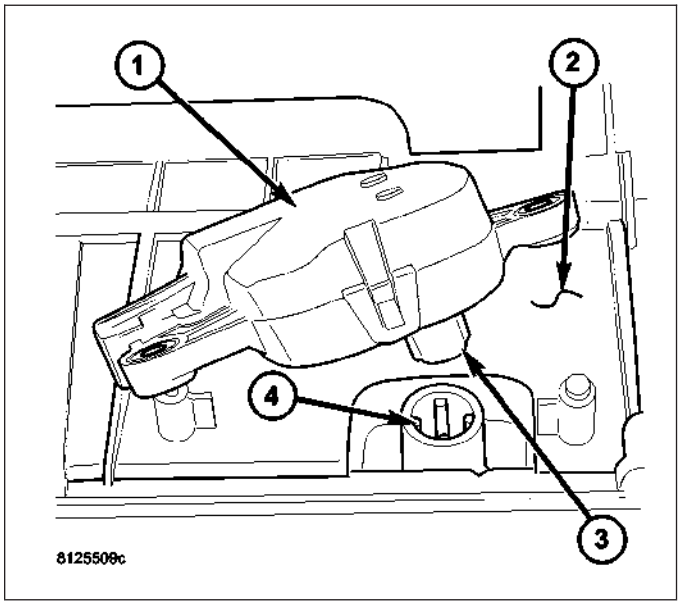
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the screws (5) that secure the panel door actuator (2) and the floor/defrost door actuator (3) located on the driver side end of the HVAC housing (4) as required.
3. Disconnect the HVAC wire harness connector (1) from the panel door actuator and the floor/defrost door actuator as required.
4. Remove the mode door actuator(s) from the HVAC housing.

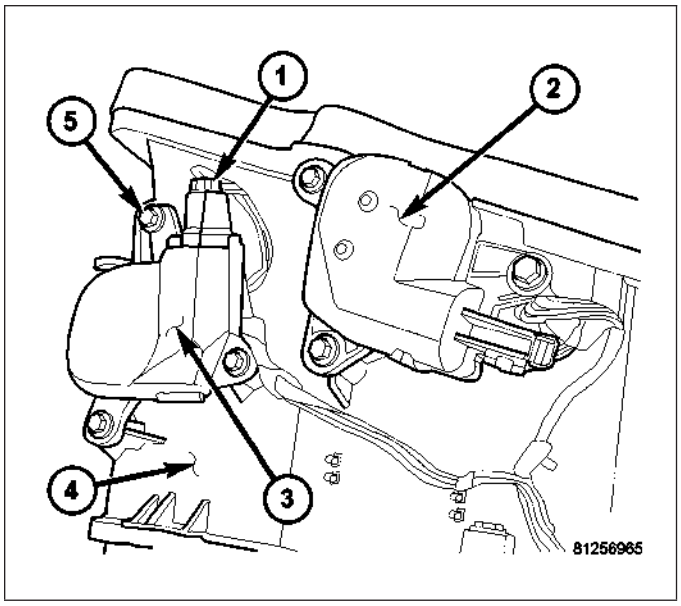


INSTALLATION

1. Position the mode door actuator(s) (1) onto the driver side end of the HVAC housing as required. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the mode-air door linkage.



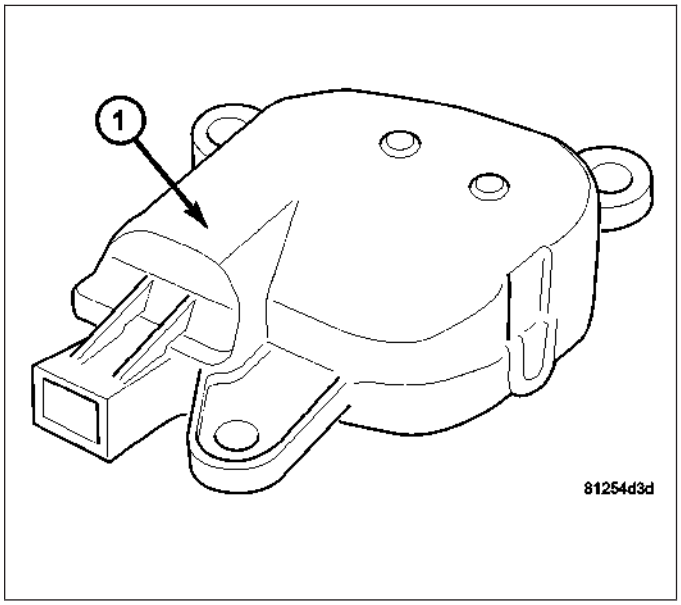
2. Install the screws (5) that secure the panel door actuator (2) and the floor/defrost door actuator (3) to the HVAC housing (4) as required. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the HVAC wire harness connector (1) to the mode door actuator(s) as required.
4. Reconnect the negative battery cable.
5. Initiate the Actuator Calibration function using a scan tool. Refer to HVAC System Test, found in 24 - HVAC - Electrical Diagnostics.



ACTUATOR-RECIRCULATION DOOR

DESCRIPTION

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The recirculation door actuator is located on the left side of the HVAC air inlet housing. The recirculation door actuator is interchangeable with the actuators for the blend-air door and the mode-air doors. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Three integral mounting tabs allow the actuator to be secured to the air inlet housing. Each actuator also has an identical output shaft with splines that connects it to the recirculation-air door. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.



OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction.

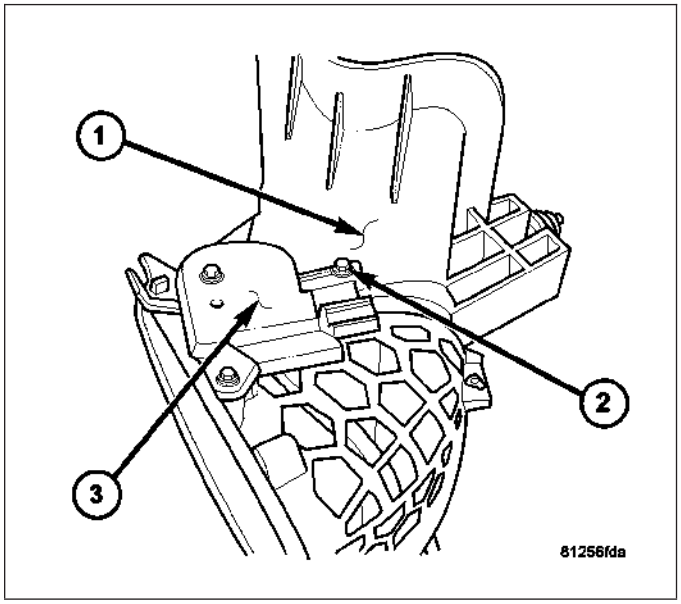
When the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The recirculation door actuator is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

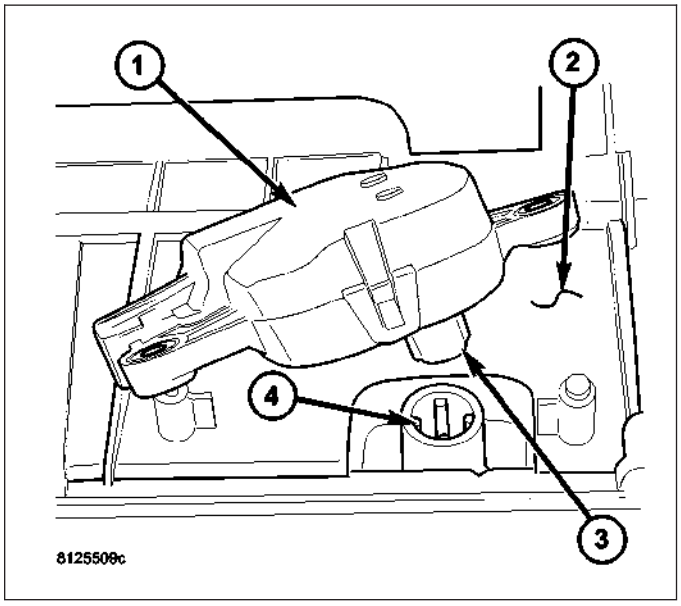
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - REMOVAL).
3. Remove the air inlet housing (1) from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - DISASSEMBLY).
4. Remove the screws (2) that secure the recirculation door actuator (3) to the HVAC air inlet housing.
5. Remove the recirculation door actuator from the HVAC air inlet housing.

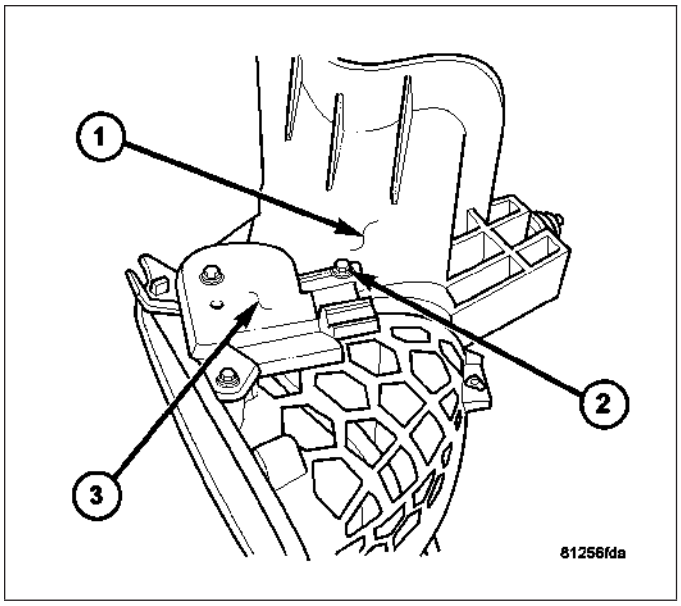


INSTALLATION

1. Position the recirculation door actuator (1) to the HVAC air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those in the recirculation-air door linkage.



2. Install the screws (2) that secure the recirculation door actuator (3) to the HVAC air inlet housing (1). Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the air inlet housing to the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/ DISTRIBUTION - FRONT/HOUSING-HVAC - ASSEMBLY).
4. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ HOUSING-HVAC - INSTALLATION).
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to HVAC System Test, found in 24 - HVAC - Electrical Diagnostics.

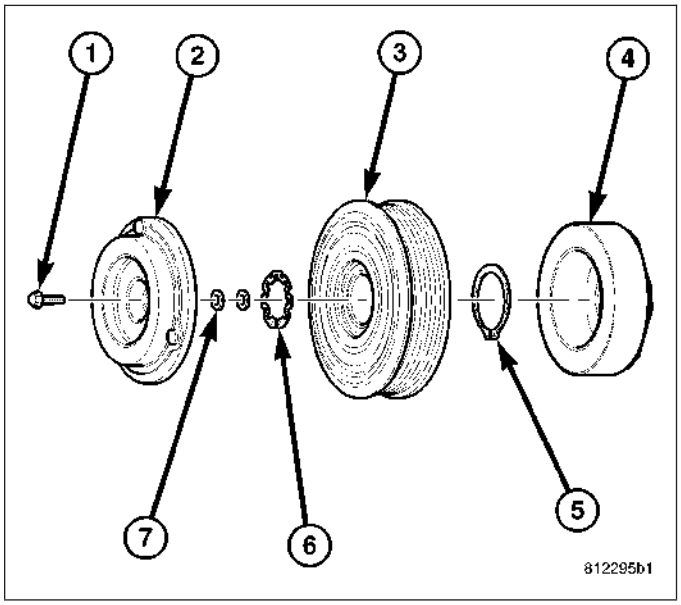


CLUTCH-A/C COMPRESSOR

DESCRIPTION

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).



OPERATION

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

The A/C compressor clutch engagement is controlled by the following components:

- A/C-heater control in the passenger compartment
- A/C pressure transducer on the A/C discharge line
- Powertrain control module (PCM) in the engine compartment
- A/C clutch relay in the power distribution center (PDC)

The A/C compressor clutch components cannot be repaired and, if faulty or damaged, they must be replaced.

DIAGNOSIS AND TESTING

A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the A/C compressor clutch relay, which is located in the power distribution center (PDC) in the engine compartment. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. If the compressor clutch will not engage, refer to 24 - HVAC Electrical Diagnostics to perform the A/C System Performance Test, which is found within the HVAC System Test. If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required.
2. If the compressor clutch still will not engage, verify the refrigerant charge level (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to TESTS . If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

TESTS

1. Verify the battery state of charge (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the heater-A/C control in the A/C mode and the blower at low speed, start the engine and allow it to run at a normal idle speed.
4. The compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to Step 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. Refer to the A/C Clutch Coil Current Draw chart for the acceptable A/C clutch coil current draw specifications. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
   a. If the compressor clutch coil current reading is zero, the coil is open and must be replaced.
   b. If the compressor clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH COIL CURRENT DRAW

Compressor	Current Draw
Denso 10S20	2.2 amps @ 11.5 - 12.5 volts

STANDARD PROCEDURE

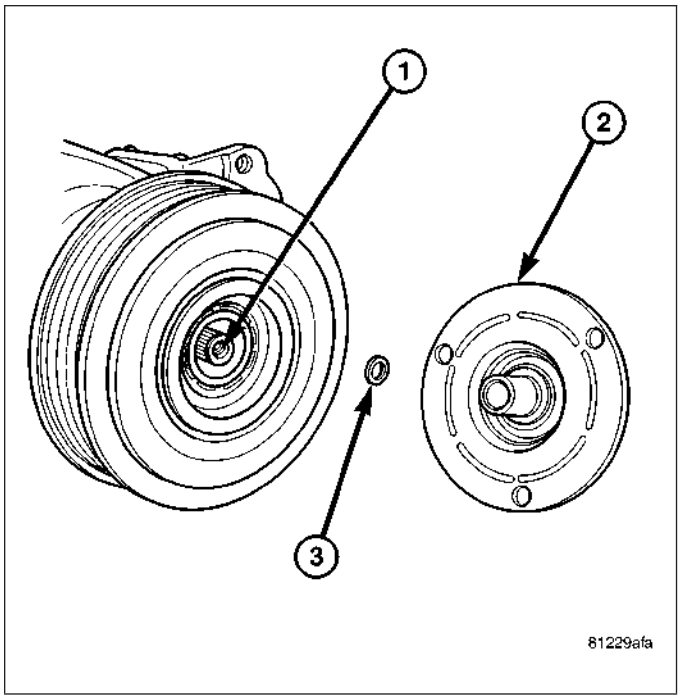
A/C CLUTCH PLATE INSPECTION

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.



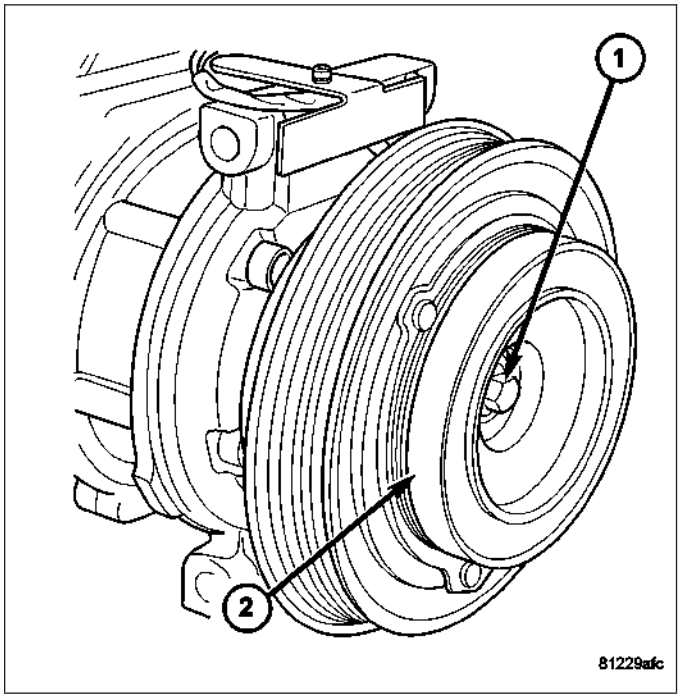
A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

NOTE: The A/C compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

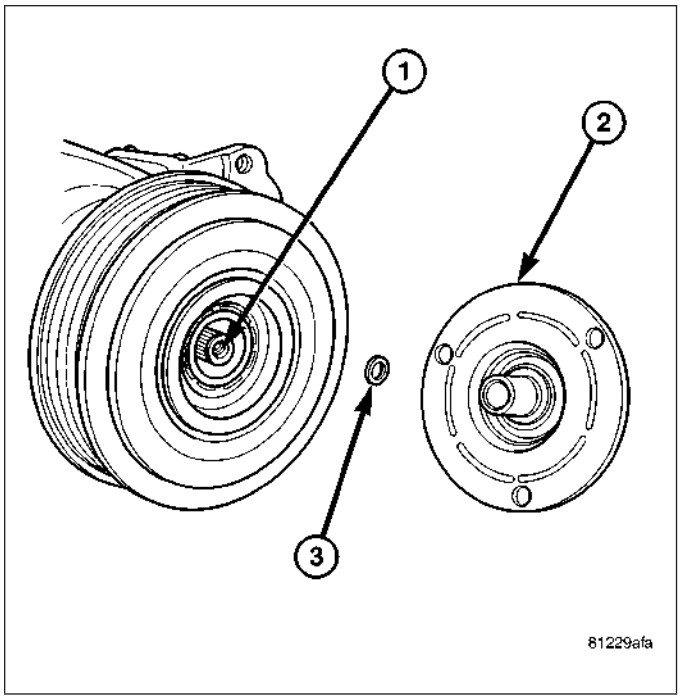
1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
3. Disconnect the engine wire harness connector for the A/C compressor clutch coil from the clutch field coil wire harness connector on the top of the A/C compressor.
4. Remove the bolts that secure the A/C compressor to the engine and support the A/C compressor.
5. Remove the compressor shaft bolt (1). A band-type oil filter wrench or a strap wrench may be used to secure the clutch plate (2) during bolt removal.



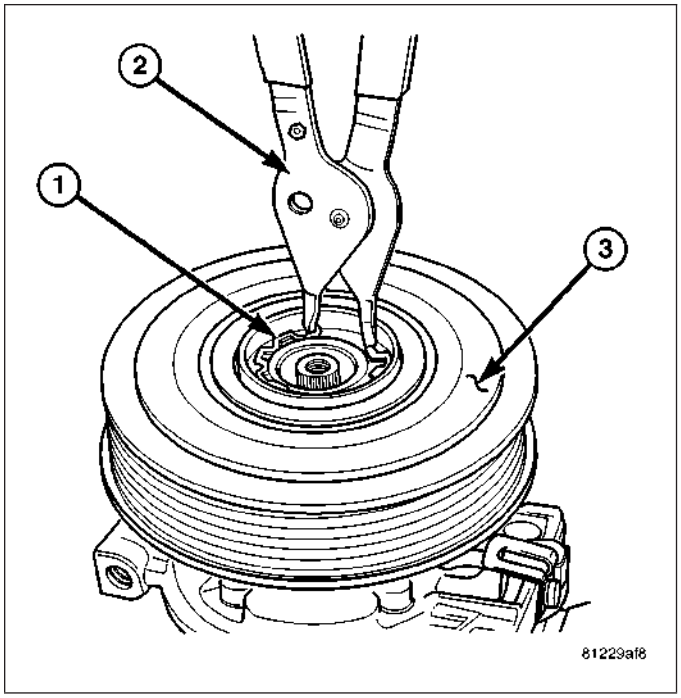
CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

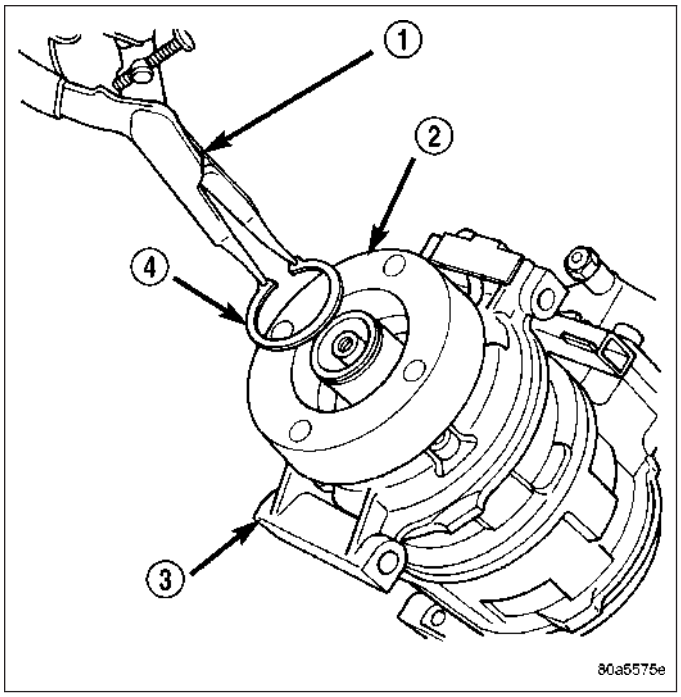
6. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1). Remove the clutch plate and shim(s) (3) from the compressor shaft.



7. Using snap ring pliers (Special Tool C-4574 or equivalent) (2), remove the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor, then slide the pulley and bearing assembly off of the A/C compressor.



8. Remove the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing (3).
9. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), remove the external snap ring (4) that secures the clutch field coil (2) to the front cover of the compressor housing, then slide the clutch field coil off of the A/C compressor.

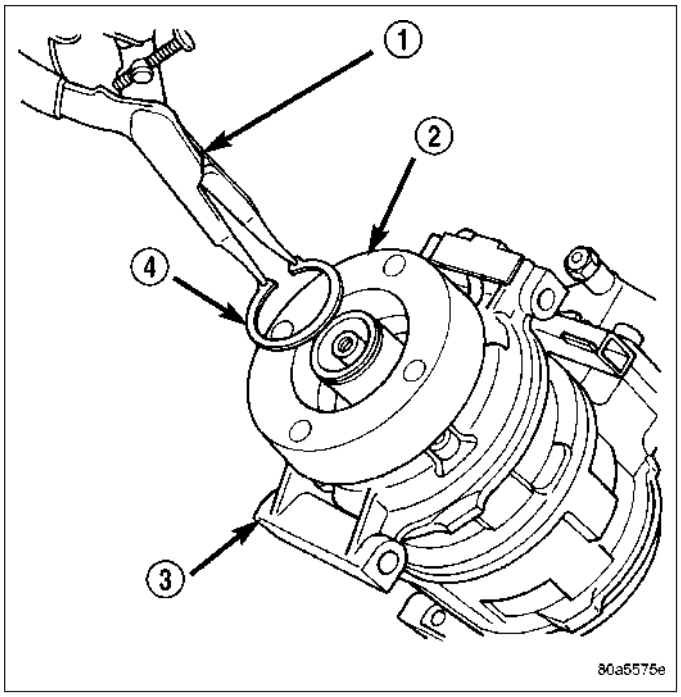


INSTALLATION

1. Align the dowel pin on the back of the clutch field coil (2) with the hole in the compressor front cover (3) and position the clutch field coil onto the A/C compressor. Be certain that the clutch coil wire harness is properly oriented and routed so that it is not pinched between the compressor front cover and the clutch field coil.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

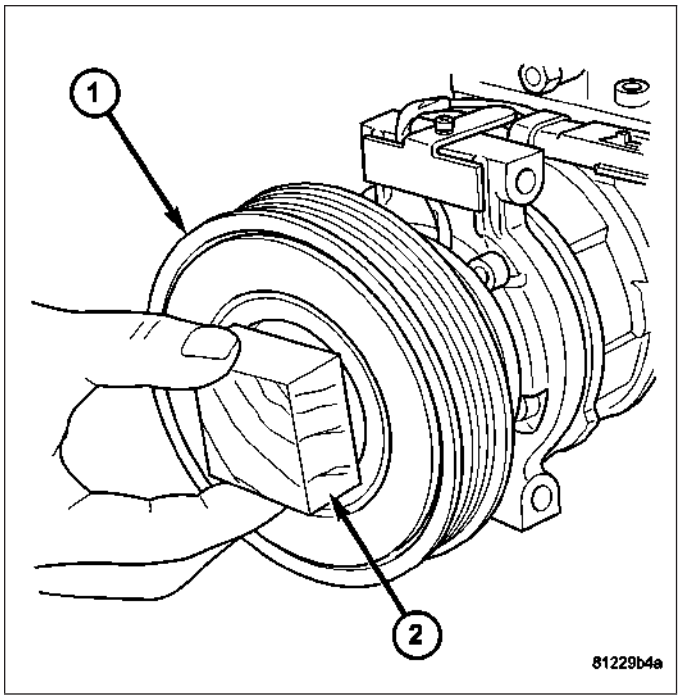
NOTE: A new snap ring must be used to secure the clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the clutch field coil dowel pin location on the A/C compressor.



2. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), install the external snap ring (4) that secures the clutch field coil to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.
3. Install the screw that secures the clutch field coil wire harness connector bracket and ground clip to the top of the compressor housing. Tighten the screw securely.

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.

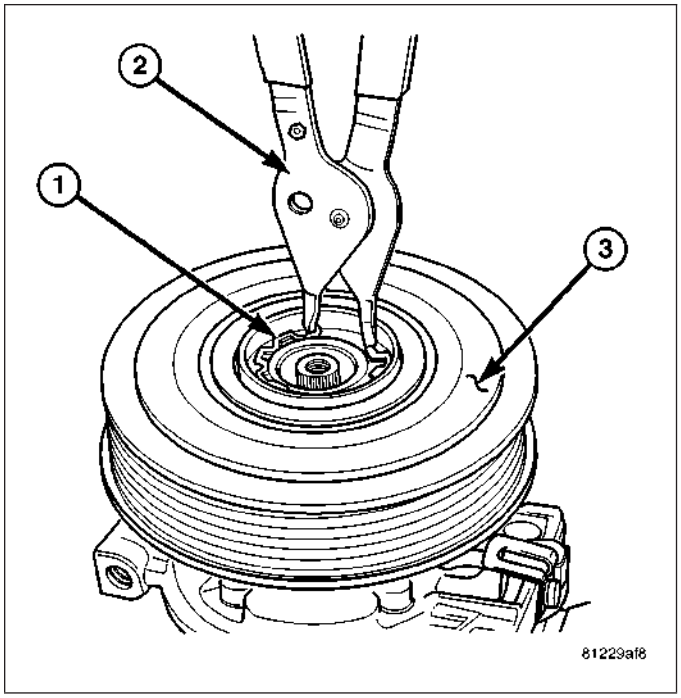
4. Install the pulley and bearing assembly (1) onto the front cover of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.



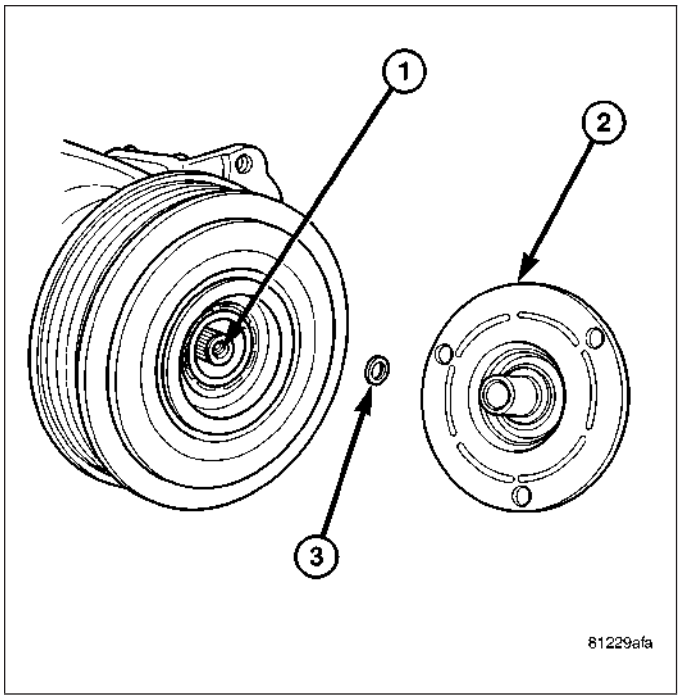
CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

5. Using snap ring pliers (Special Tool C-4574 or equivalent) (2), install the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.



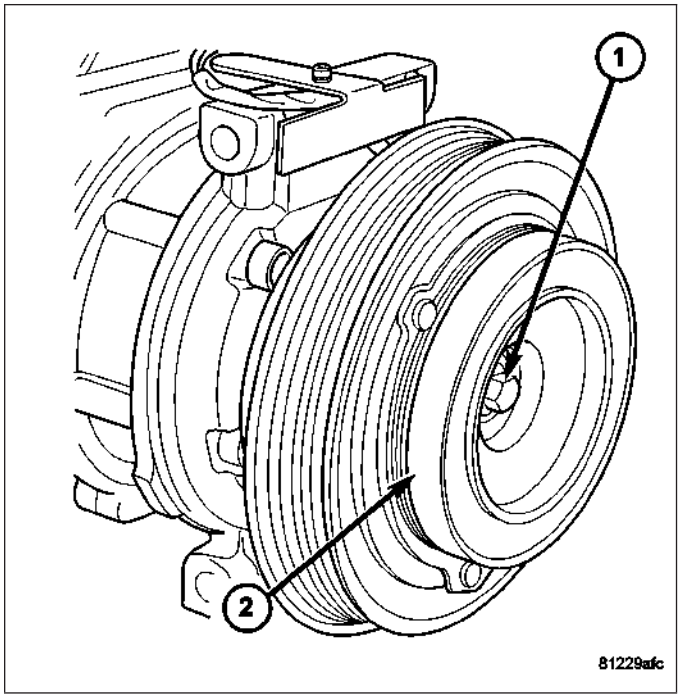
6. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) on the compressor shaft (1) against the shoulder. If a new clutch plate and/or pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick on the compressor shaft against the shoulder.



7. Install the clutch plate (2) onto the compressor shaft.
8. Install the compressor shaft bolt (1). Tighten the bolt to 19 N·m (168 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

9. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly faces with a feeler gauge. The air gap should be between specifications (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.
10. Install the bolts that secure the A/C compressor to the engine (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - INSTALLATION).



11. Connect the engine wire harness connector to the A/C compressor clutch coil.
12. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
13. Reconnect the negative battery cable.

CONTROL-A/C HEATER

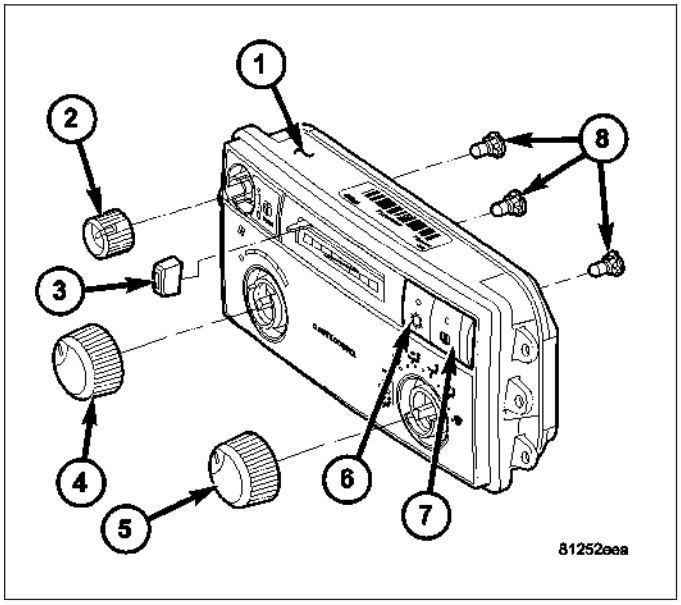
DESCRIPTION

MANUAL SINGLE ZONE

The A/C-heater control (1) for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control knob for rear window washer operation and rear window wiper speed selection (2).
- a slider control knob for temperature control of the discharged air (3).
- a rotary control knob for fan speed selection and turning the heater-A/C system off (4).
- a rotary control knob for mode control of the discharged air (5).
- a push button A/C on/off control (6). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a push button rear window defogger on/off control (7). The button contains an LED that illuminates when the rear window defogger system is in operation.



The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The illumination lamps (8) and control knobs are available for service replacement.

The A/C-heater control for the manual single zone heating and A/C system is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control utilizes integrated circuitry and information carried on the controller area network (CAN) B bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control electronic functions and features of the MTC heating-A/C system.

The inputs received by the A/C-heater control of the MTC heating-A/C system on the CAN B bus are as follows:

- Dimming
- Refrigerant Pressure
- Vehicle Identification Number
- Vehicle Odometer
- Engine Coolant Temperature
- Ambient Air Temperature
- Vehicle Speed

The messages broadcasted by the A/C-heater control of the MTC heating-A/C system on the CAN B bus are as follows:

- A/C Request
- A/C Select
- Rear Window Defogger (EBL) Request
- Rear Washer Request
- Rear Wiper Request

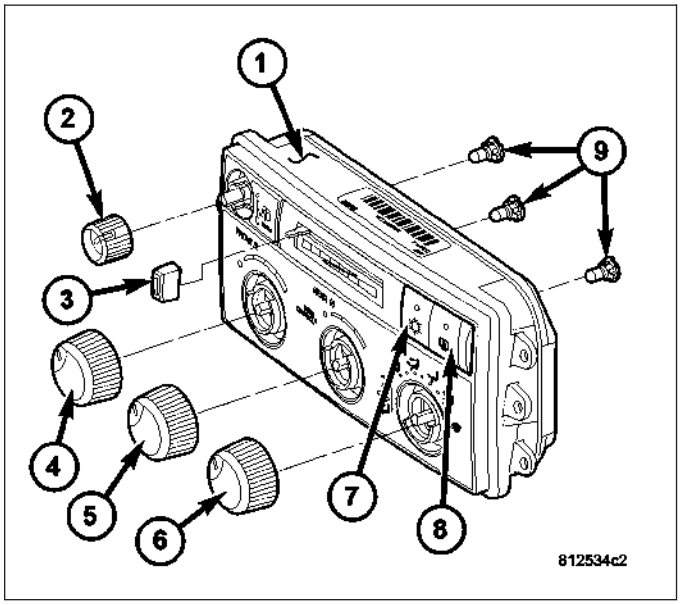
MANUAL SINGLE ZONE WITH REAR HEAT AND A/C

The A/C-heater control (1) for the manual temperature control (MTC) single zone front and rear heating-A/C system allows both the front and intermediate seat passengers the ability to regulate air temperature as well as fan speed and provides floor outlets near the right rear door and overhead outlets at each intermediate outboard seating position. Primary control for the rear blower motor is on the front A/C-heater control. All controls are identified by ISO graphic symbols.

FRONT CONTROL PANEL

The front A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control knob for rear window washer operation and rear window wiper speed selection (2).
- a slider control knob for temperature control of the discharged air (3).
- a rotary control knob for fan speed selection and turning the heater-A/C system off (4).
- a rotary control knob for rear fan speed selection and turning the rear heater-A/C system off (5).
- a rotary control knob for mode control of the discharged air (6).
- a push button A/C on/off control (7). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a push button rear window defogger on/off control (8). The button contains an LED that illuminates when the rear window defogger system is in operation.



The front A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The illumination lamps (9) and control knobs are available for service replacement.

The A/C-heater control for the MTC single zone heating-A/C system is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control utilizes integrated circuitry and information carried on the controller area network (CAN) B bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control electronic functions and features of the MTC heating-A/C system.

The inputs received by the A/C-heater control of the MTC heating-A/C system on the CAN B bus are as follows:

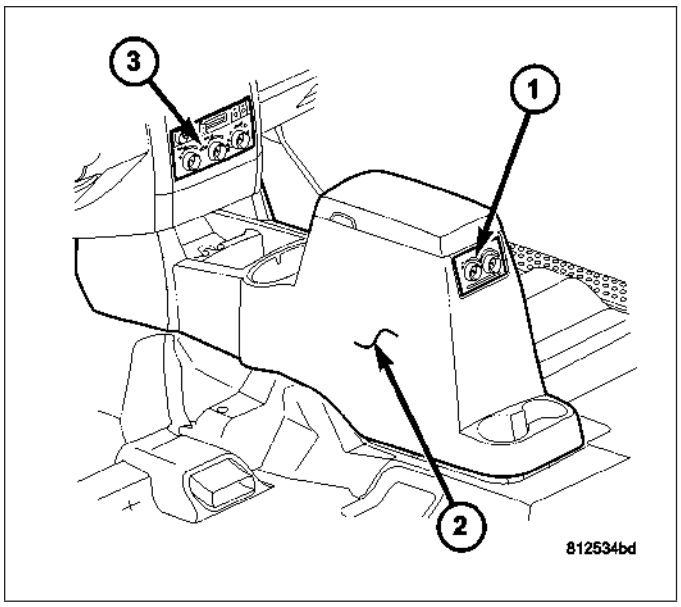
- Dimming
- Refrigerant Pressure
- Vehicle Identification Number
- Vehicle Odometer
- Engine Coolant Temperature
- Ambient Air Temperature
- Vehicle Speed

The messages broadcasted by the A/C-heater control of the MTC heating-A/C system on the CAN B bus are as follows:

- A/C Request
- A/C Select
- Rear Window Defogger (EBL) Request
- Rear Washer Request
- Rear Wiper Request

REAR CONTROL PANEL

The rear A/C-heater control (1) is located at the rear of the center floor console (2) and allows intermediate seat passengers to adjust rear air distribution, temperature and blower motor speed when the center control knob on the front A/C-heater control (3) is set to the Rear position (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/CONTROL-A/C HEATER - DESCRIPTION).

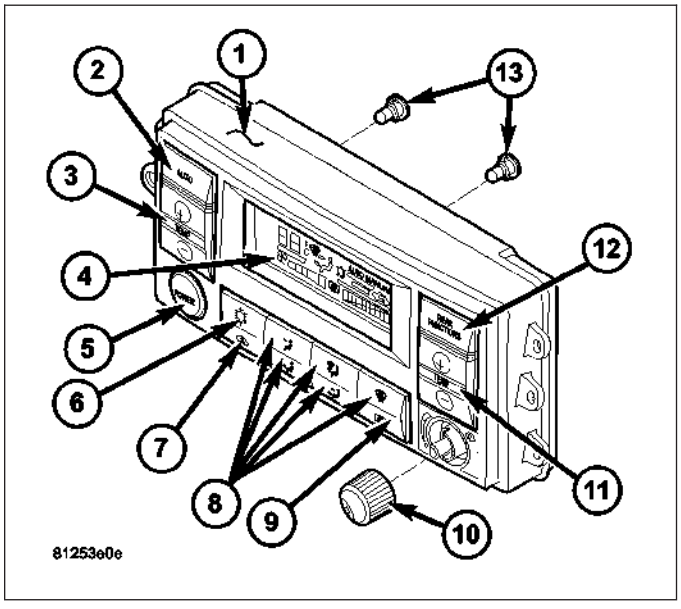


AUTOMATIC SINGLE ZONE WITH REAR HEAT AND A/C

The A/C-heater control (1) for the automatic temperature control (ATC) single zone front and rear heating-A/C system allows both the front and intermediate seat passengers the ability to automatically or manually regulate air temperature as well as fan speed and provides floor outlets near the right rear door and overhead outlets at each rear intermediate outboard seating position. Primary control for the rear blower motor is on the front A/C-heater control. All controls are identified by ISO graphic symbols.

FRONT CONTROL PANEL

The front A/C-heater control and integral computer is located in the instrument panel and contains:



- a push button Auto mode control (2).
- a rocker switch control that selects comfort temperatures from 15° to 29° C (60° to 85° F) (3). Comfort temperatures are shown in the vacuum-flourescent (VF) digital display (4). If the set temperature is 15° C (60° F) and down (–) is pressed, the A/C-heater control will attempt to achieve the lowest temperature possible, but the display will show LO. If the set temperature is 29° C (85° F) and up (+) is pressed, the A/C-heater control will attempt to achieve the highest temperature possible, but the display will show HIGH. Temperatures can be displayed in either Metric or Fahrenheit, which is selected from the overhead console.
- a push button on/off control which allows the system to be completely turned off (5). The display is blank when the heater-A/C system is off, except for the electric backlight (EBL) symbol, if EBL is on.
- a push button A/C on/off control (6). An ISO Snowflake symbol appears in the display when the A/C system is in operation, whether under manual or automatic control.
- a push button air recirculation control (7). A ISO Recirculation symbol appears in the display when the button is pressed, or when the system exceeds 80 percent circulated air under automatic control due to high A/C demand.

- five push button mode controls (8). An ISO mode symbol appears in the display to show the current mode setting when each button is manually pressed or selected by Auto mode.
- a push button rear window defogger on/off control (9). An ISO symbol appears in the display when the rear window defogger system is in operation. The ISO symbol will appear on the display even with the heating-A/C system turned off.
- a rotary control knob for rear window washer operation and rear window wiper speed selection (10).
- a rocker switch control for front fan speed selection that can override the automatic controls (11).
- a push button control for the rear heating-A/C system (12).
- computer logic that remembers the settings of the controls when the ignition is turned off and retains those settings after a restart. If the system is off when the ignition is turned off it will be off when the engine is restarted, etc.
- computer logic that provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air gradually approaches full recirculation over a broad temperature range.

The front A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The illumination lamps (13) and the wiper/wash control knob are available for service replacement.

The A/C-heater control for the ATC single zone front and rear heating-A/C system is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control utilizes integrated circuitry and information carried on the controller area network (CAN) B bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control electronic functions and features of the ATC heating-A/C system.

The inputs received by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

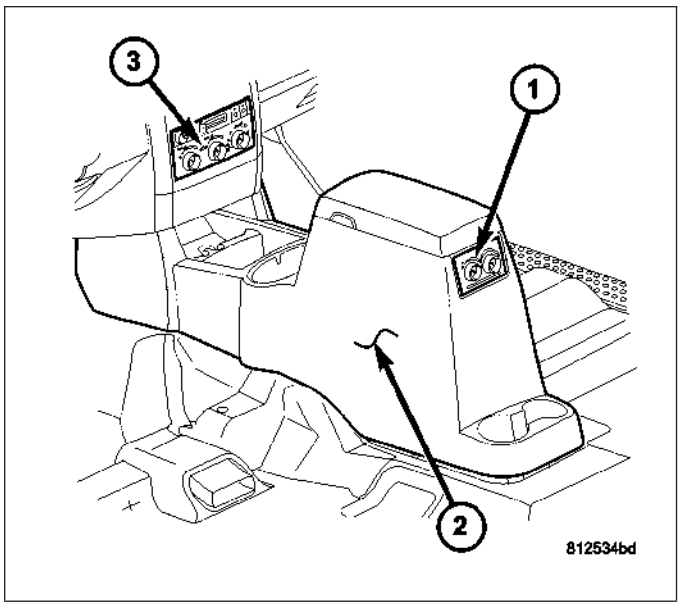
- Dimming
- Refrigerant Pressure
- Vehicle Identification Number
- Vehicle Odometer
- Engine Coolant Temperature
- Ambient Air Temperature
- Infrared Temperature Sensor
- Ignition Voltage
- Vehicle Speed

The messages broadcasted by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

- A/C Request
- A/C Select
- Rear Window Defogger (EBL) Request
- Rear Washer Request
- Rear Wiper Request

REAR CONTROL PANEL

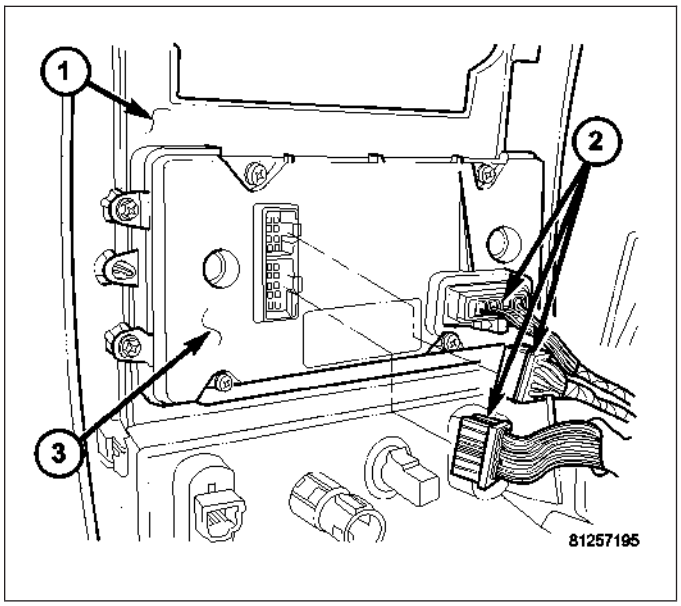
The rear A/C-heater control (1) is located at the rear of the center floor console (2) and allows intermediate seat passengers to adjust rear temperature and blower motor speed when the center control knob on the front A/C-heater control (3) is set to the Rear position (Refer to 24 - HEATING & AIR CONDITIONING/ CONTROLS - REAR/CONTROL-A/C HEATER - DESCRIPTION).



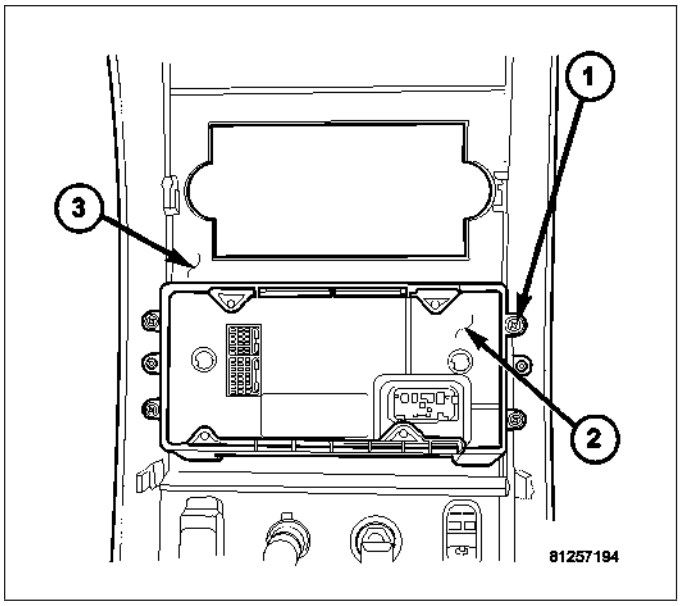
REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (1) from the instrument panel, disconnect the wire harness connector(s) (2) from the A/C-heater control (3) and place the center bezel on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

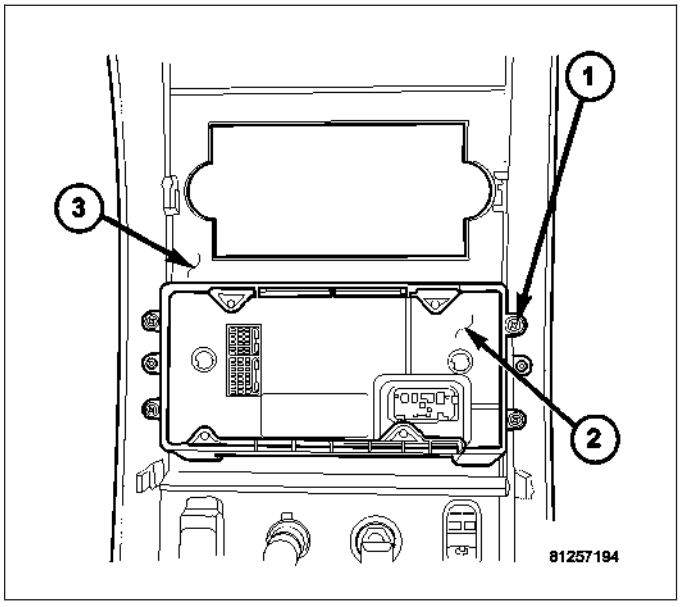


3. Remove the four screws (1) that secure the A/C-heater control (2) to the instrument panel center bezel (3).
4. Remove the A/C-heater control from the instrument panel center bezel.

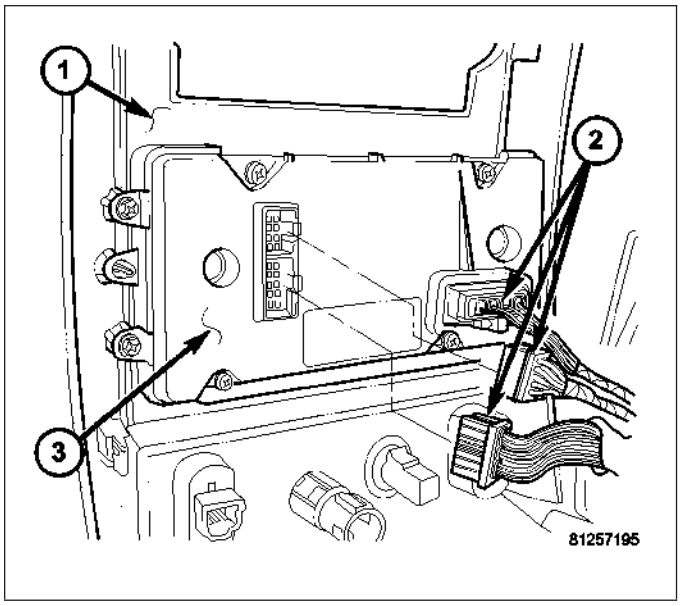


INSTALLATION

1. Position the A/C-heater control (2) into the instrument panel center bezel (3).
2. Install the screws (1) that secure the A/C-heater control to the instrument panel center bezel. Tighten the screws to 2 N·m (17 in. lbs.).



3. Connect the wire harness connector(s) (2) to the A/C-heater control (3) and install the instrument panel center bezel (1) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Reconnect the negative battery cable.

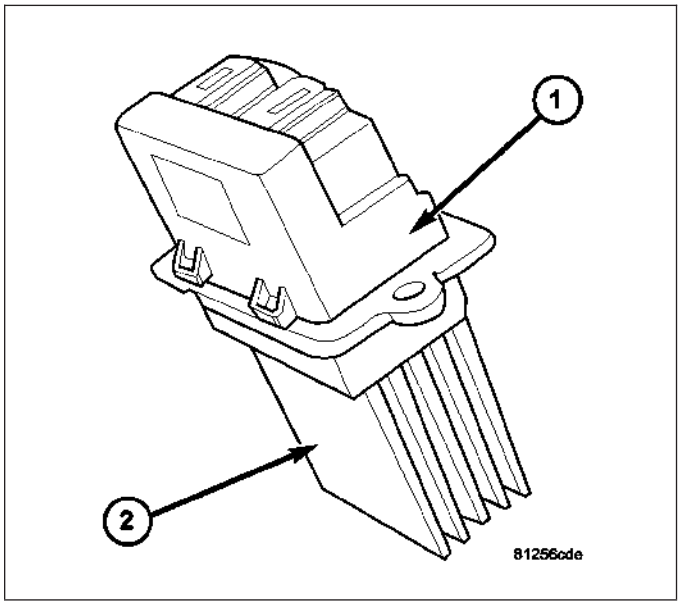


MODULE-POWER-BLOWER MOTOR

DESCRIPTION

A blower motor power module is used on this model when it is equipped with the automatic temperature control (ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor block, instead of the blower motor power module (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/RESISTOR BLOCK-BLOWER MOTOR - DESCRIPTION).

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate with two integral connector receptacles (1). Concealed behind the mounting plate is the power module electronic circuitry and a large finned heat sink (2). The blower motor power module is accessed for service from beneath the right side of the instrument panel.



OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the HVAC wire harness. A second connector receptacle receives the wire harness connector from the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module can be diagnosed using a scan tool.

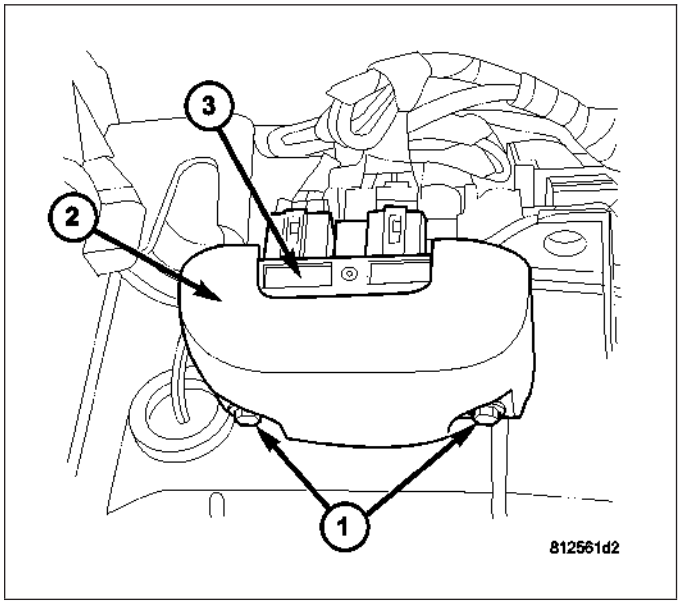
The blower motor power module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

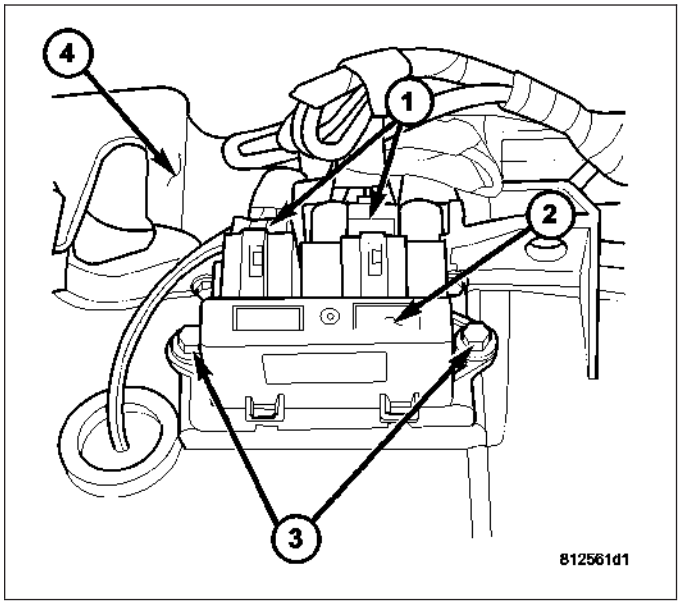
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the two screws (1) that secure the trim cover (2) over the blower motor power module (3) located below the right side of the instrument panel.
3. Remove the trim cover.

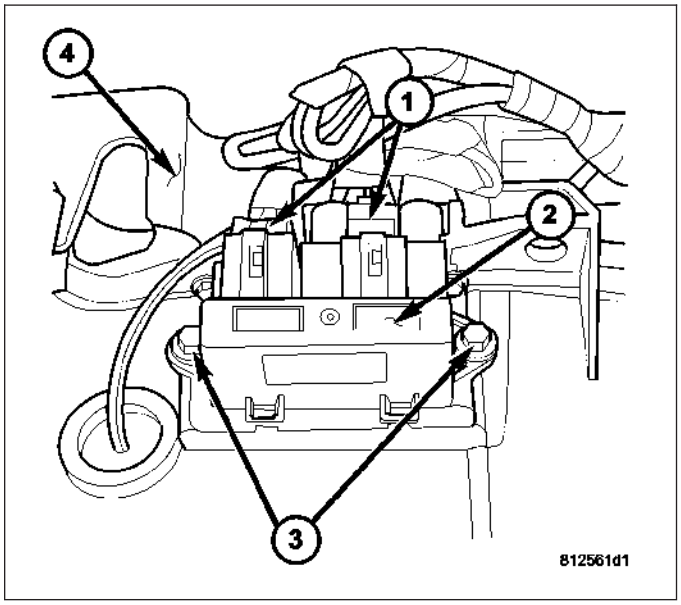


4. Disconnect the two wire harness connectors (1) from the blower motor power module (2).
5. Remove the two screws (3) that secure the blower motor power module to the front HVAC housing (4).
6. Remove the blower motor power module from the front HVAC housing.

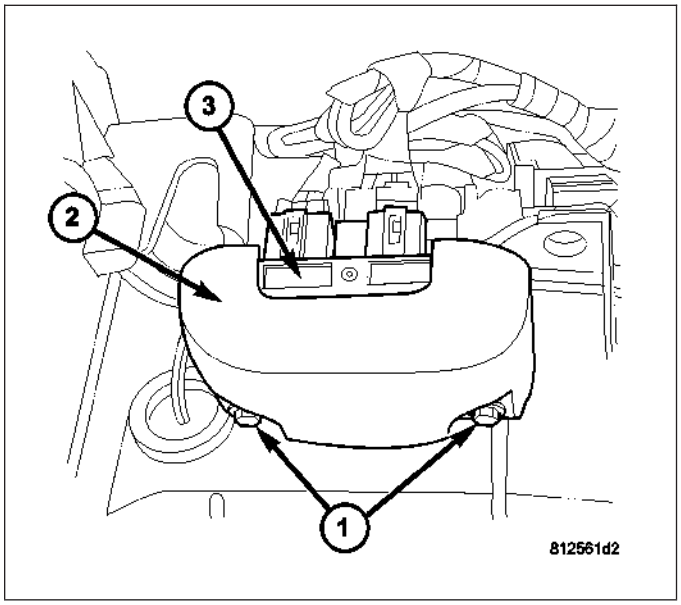


INSTALLATION

1. Position the blower motor power module (2) into the front HVAC housing (4).
2. Install the two screws (3) that secure the blower motor power module to the front HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the two wire harness connectors (1) to the blower motor power module.



4. Install the trim cover (2) over the blower motor power module (3).
5. Install the two screws (1) that secure the trim cover to the front HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
6. Reconnect the negative battery cable.

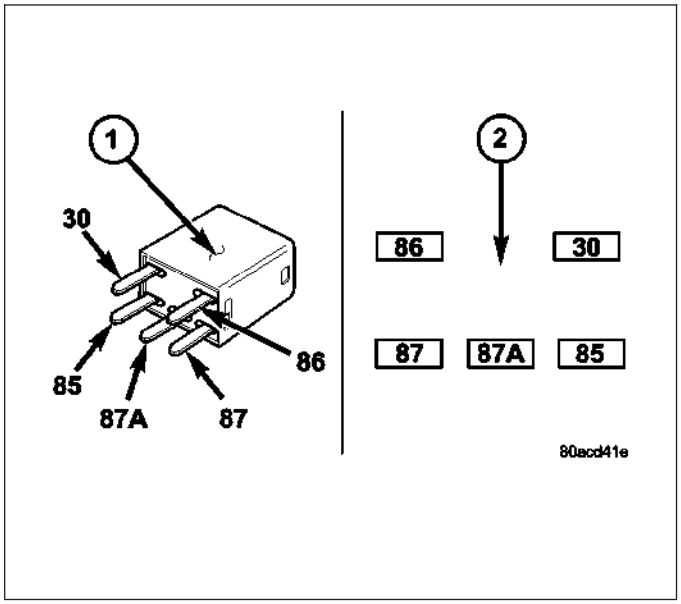


RELAY-A/C CLUTCH

DESCRIPTION

The A/C clutch relay (1) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The A/C clutch relay is located in the power distribution center (PDC) in the engine compartment.



OPERATION

The ISO-standard A/C clutch micro-relay is an electromechanical switch that uses a low current input controlled by the powertrain control module (PCM) to control the high current output to the A/C clutch field coil. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the A/C clutch field coil.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C clutch relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the A/C clutch relay include:

- The common feed terminal (30) receives fused battery current at all times.
- The coil ground terminal (85) receives a ground input from the PCM through the A/C clutch relay control circuit only when the PCM electronically pulls the control circuit to ground.
- The coil battery terminal (86) receives fused battery current through a ignition switch output (run-start) circuit only when the ignition switch is in the On or Start positions.
- The normally open terminal (87) provides a battery current output to the A/C clutch coil through the A/C clutch relay output circuit only when the compressor clutch relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C clutch relay coil is de-energized.

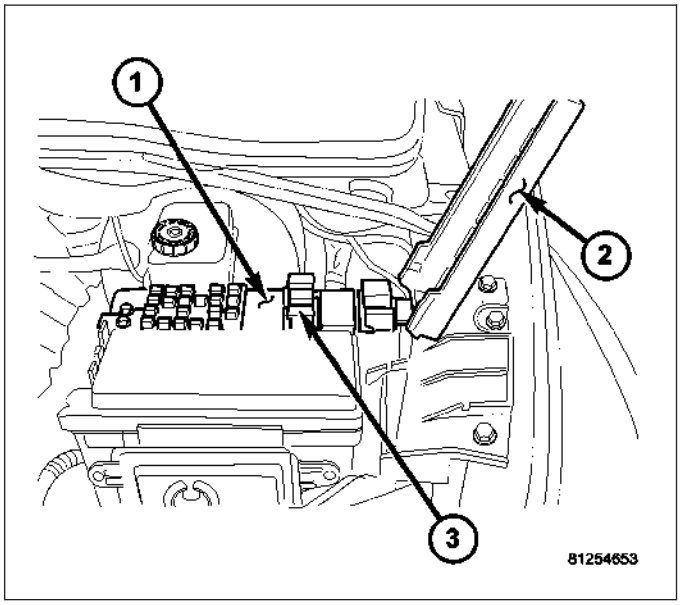
The A/C clutch relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard micro-relay and for complete HVAC wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Locate the power distribution center (PDC) (1).
3. Open the PDC cover (2).

NOTE: Refer to the fuse and relay map on the inside of the PDC cover for A/C clutch relay location.

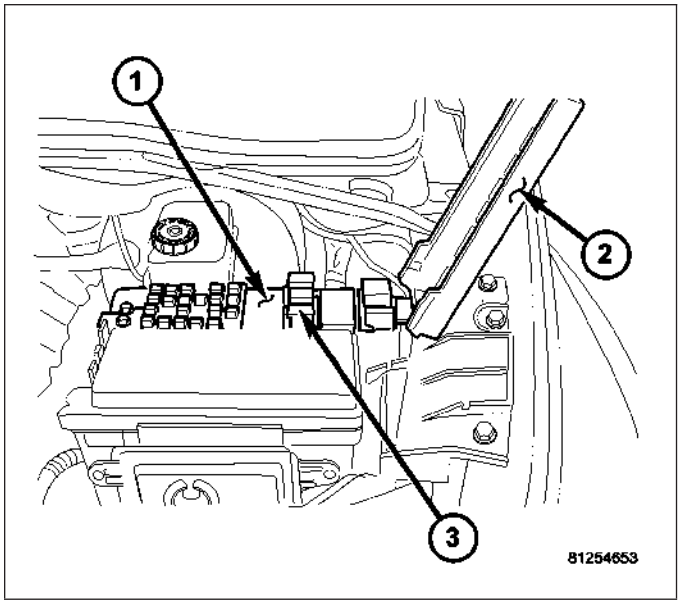
4. Remove the A/C clutch relay (3) from the PDC.



INSTALLATION

NOTE: Refer to the fuse and relay map on the inside of the PDC cover for A/C clutch relay location.

1. Position the A/C clutch relay (3) into the proper receptacle of the PDC (1).
2. Align the A/C clutch relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the PDC cover (2).
4. Reconnect the negative battery cable.

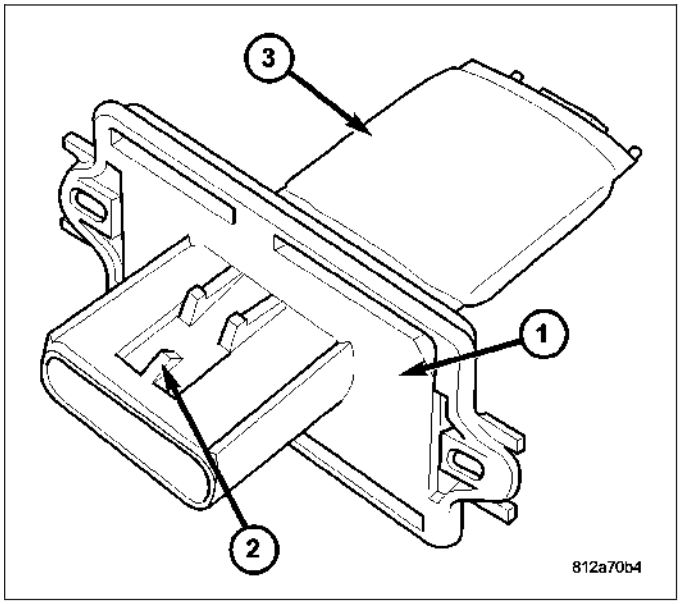


RESISTOR-BLOWER MOTOR

DESCRIPTION

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - DESCRIPTION).

The front blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are coiled resistor wires contained within a ceramic heat sink (3). The front blower motor resistor is accessed for service from beneath the right side of the instrument panel.



OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor switch in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor wires. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

FRONT BLOWER MOTOR RESISTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS-FRONT/RESISTOR-BLOWER MOTOR - REMOVAL).

3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

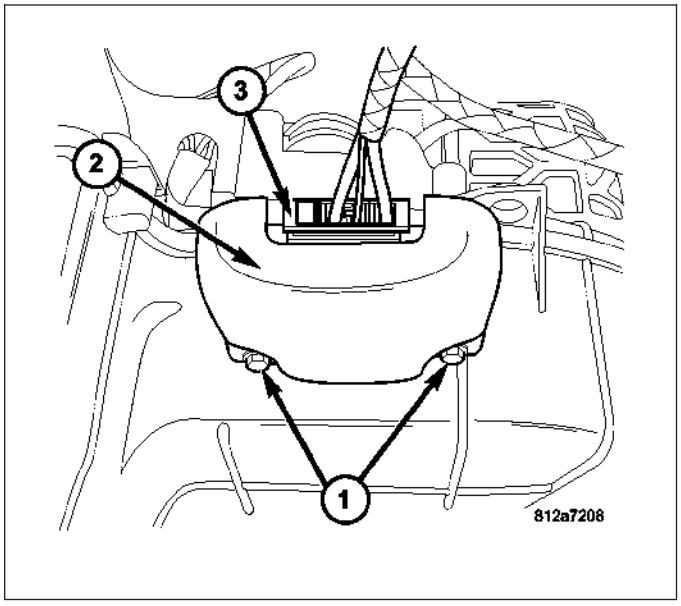
REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

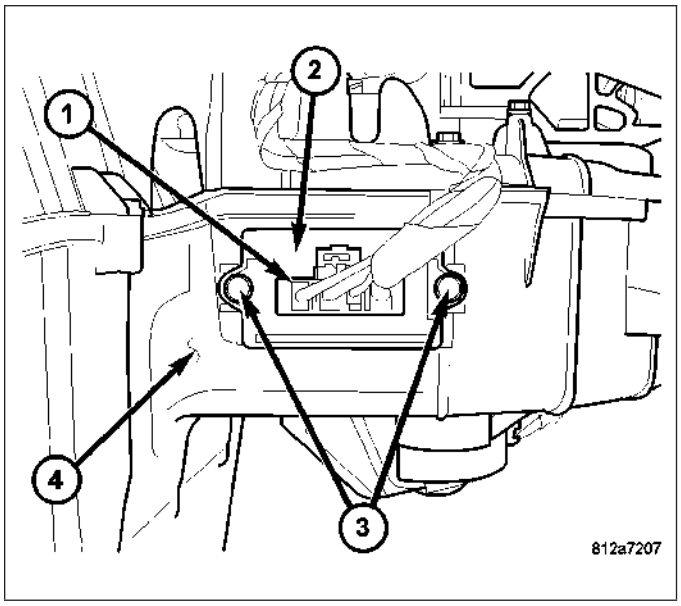
WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor , wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

1. Disconnect and isolate the negative battery cable.
2. Remove the two screws (1) that secure the trim cover (2) over the blower motor resistor (3) located below the right side of the instrument panel.
3. Remove the trim cover.

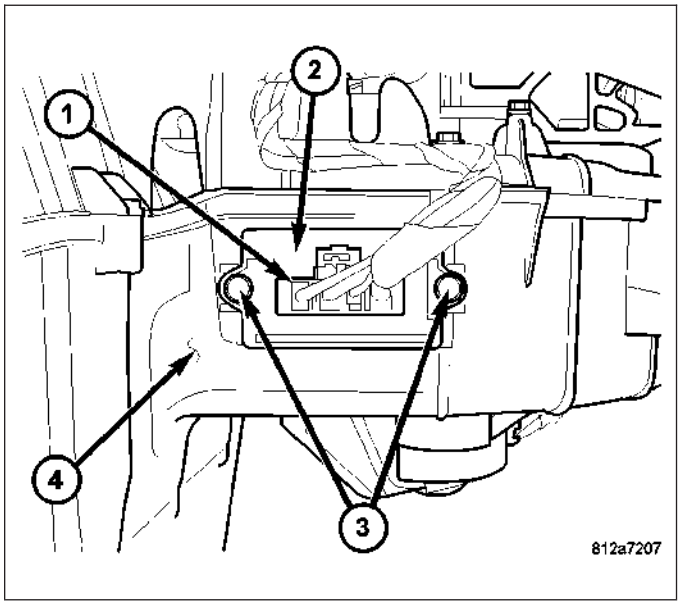


4. Disconnect the wire harness connector (1) from the blower motor resistor (2).
5. Remove the two screws (3) that secure the blower motor resistor to the front HVAC housing.
6. Remove the blower motor resistor from the front HVAC housing.

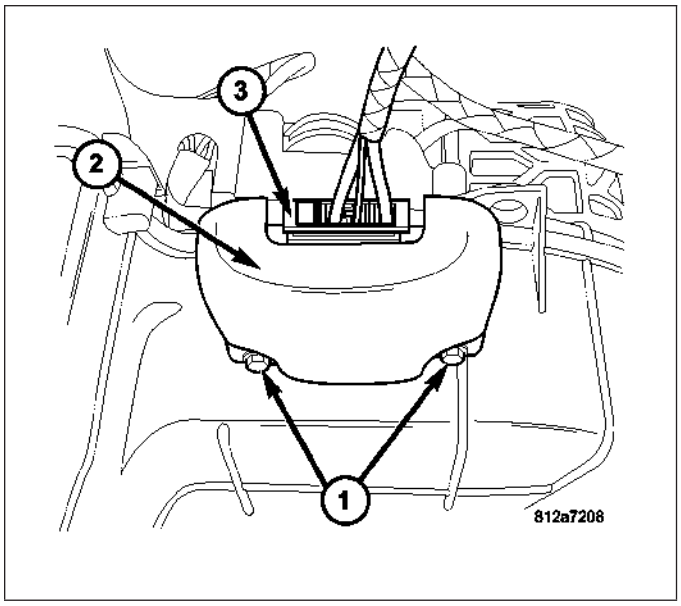


INSTALLATION

1. Position the blower motor resistor (2) into the front HVAC housing (4).
2. Install the two screws (3) that secure the blower motor resistor to the front HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor resistor.



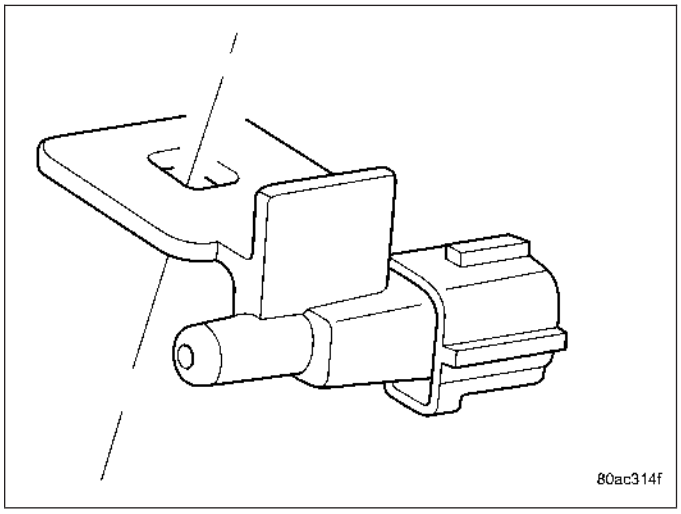
4. Install the trim cover (2) over the blower motor resistor.
5. Install the two screws (1) that secure the trim cover to the front HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
6. Reconnect the negative battery cable.



SENSOR-AMBIENT AIR TEMPERATURE

DESCRIPTION

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The ambient air temperature sensor is mounted onto the inside of the front bumper beam and its data is used by the heating-A/C system to maintain optimum cabin temperature levels.



OPERATION

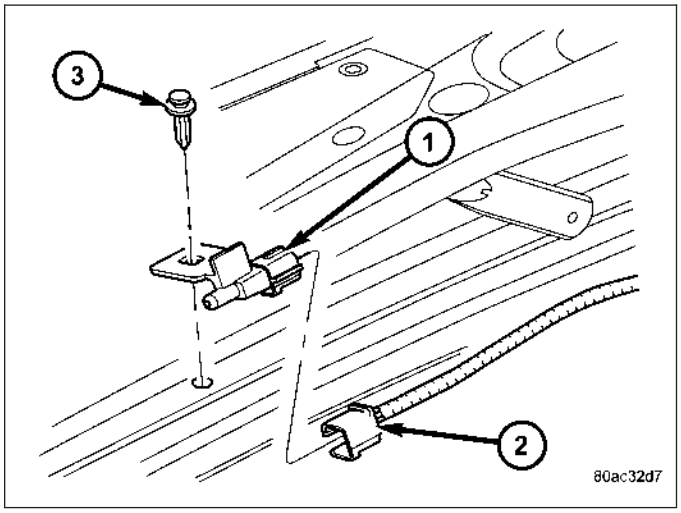
The ambient air temperature sensor is a variable resistor that operates on a ground circuit and a 5-volt reference signal circuit sent by the front control module (FCM) through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the FCM. The FCM converts and broadcasts the sensor data over the controller area network (CAN) B bus, where it is read by the A/C-heater control and other various vehicle control modules.

The ambient air temperature sensor is diagnosed using the scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The ambient air temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

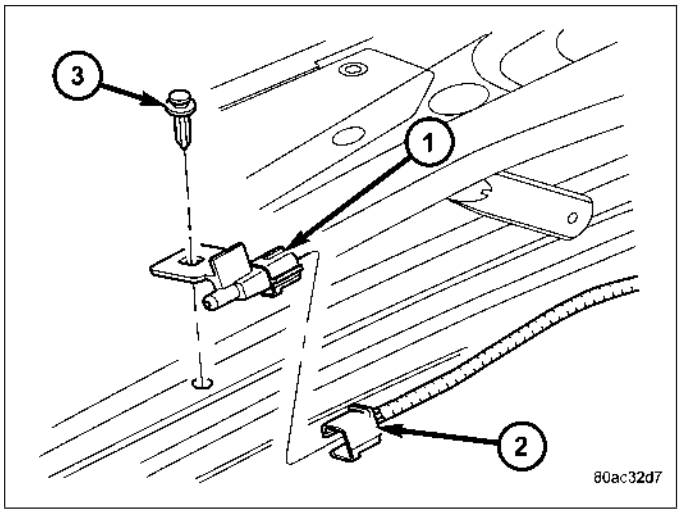
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the push pin (3) that secures the ambient air temperature sensor (1) to the inside of the front bumper beam.
3. Disconnect the wire harness connector (2) from the ambient air temperature sensor and remove the sensor from the vehicle.



INSTALLATION

1. Connect the wire harness connector (2) to the ambient air temperature sensor (1).
2. Position the ambient air temperature sensor to the inside of the front bumper beam.
3. Install the push pin (3) that secures the ambient air temperature sensor to the front bumper beam.
4. Reconnect the negative battery cable.



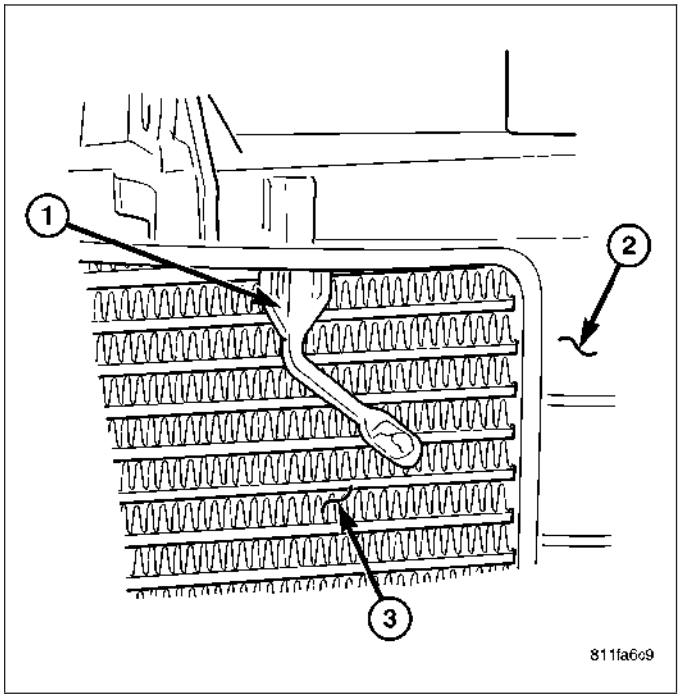
SENSOR-EVAPORATOR TEMPERATURE

DESCRIPTION

The evaporator temperature sensor (1) is an electrical thermistor located within a molded plastic case that is inserted into the HVAC housing (2) to measure the temperature of the conditioned air downstream of the A/C evaporator (3). Two terminals within the connector receptacle connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

NOTE: Cutaway of typical HVAC housing shown for clarity in illustration.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.



OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the resistance reading as an indication that conditions are correct to broadcast an A/C request message on the controller area network (CAN) B bus, where it is read by the front control module (FCM). The FCM then requests the powertrain control module (PCM) to cycle the A/C compressor clutch as necessary over the CAN C bus.

The evaporator temperature sensor is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

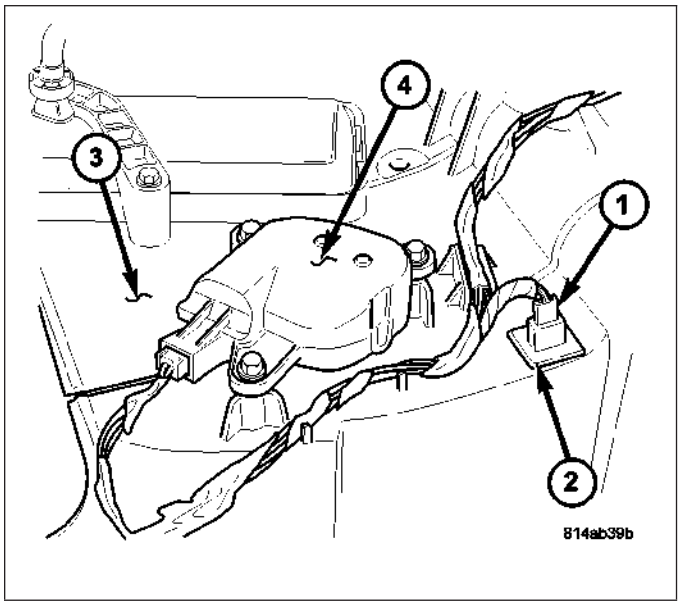
The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

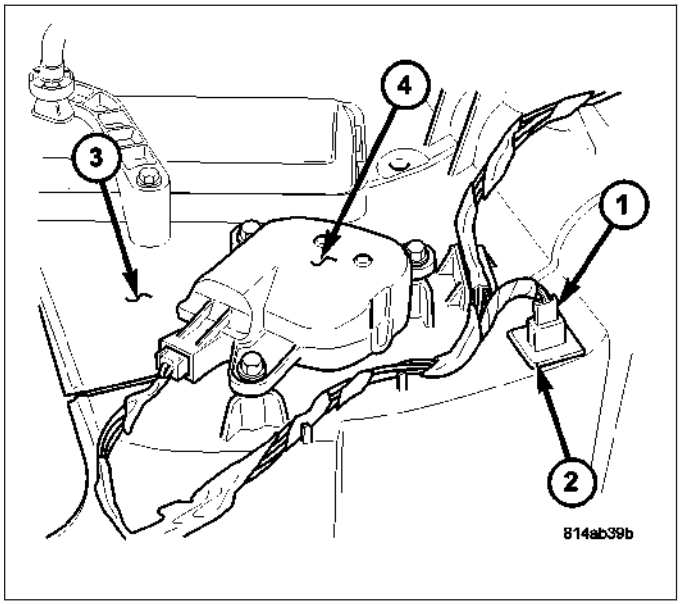
NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage during this service procedure.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
3. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2) located on the top of the HVAC housing (3) near the blend door actuator (4).
4. Remove the evaporator temperature sensor from the HVAC housing.



INSTALLATION

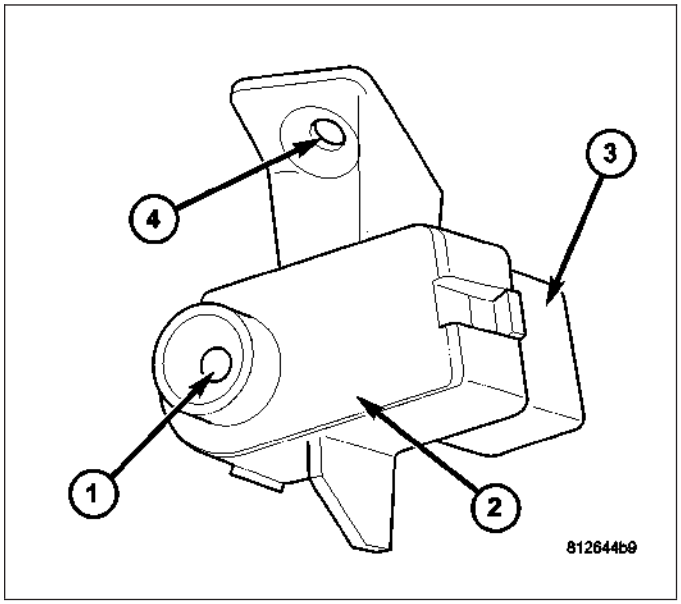
1. Install the evaporator temperature sensor (2) into the opening in the HVAC housing (3) near the blend door actuator (4).
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor.
3. Install the instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
4. Reconnect the negative battery cable.



SENSOR-INFRARED

DESCRIPTION

The infrared sensor consists of an infrared transducer (1) located on the driver side of the overhead console. The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heater-A/C system. The infrared transducer is contained within a black molded plastic housing (2) with an integral wire connector receptacle (3). The integral mounting tab (4) allows the infrared sensor to be secured with one screw to the overhead console.



OPERATION

The infrared sensor detects thermal radiation emitted by the driver seat occupant and its surroundings and converts its data into a linear pulse width modulated (PWM) output signal, which is sent to the compass temperature module (EOM) through a two-wire lead and connector of the vehicle wire harness. The EOM sends a message over the controller area network (CAN) B bus where it is read by the automatic temperature control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature level. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the occupant. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

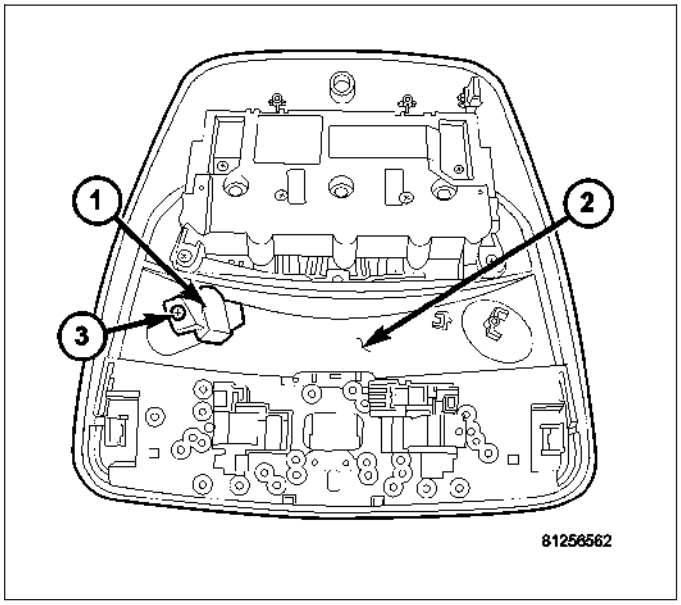
The ATC system logic responds to the infrared sensor message from the EOM by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The EOM continually monitors the infrared sensor circuits, and will store a diagnostic trouble code (DTC) for any problem it detects.

The infrared sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The infrared sensor is diagnosed using a scan tool. Refer to 8 - Electrical Overhead Console Electrical Diagnostics for more information.

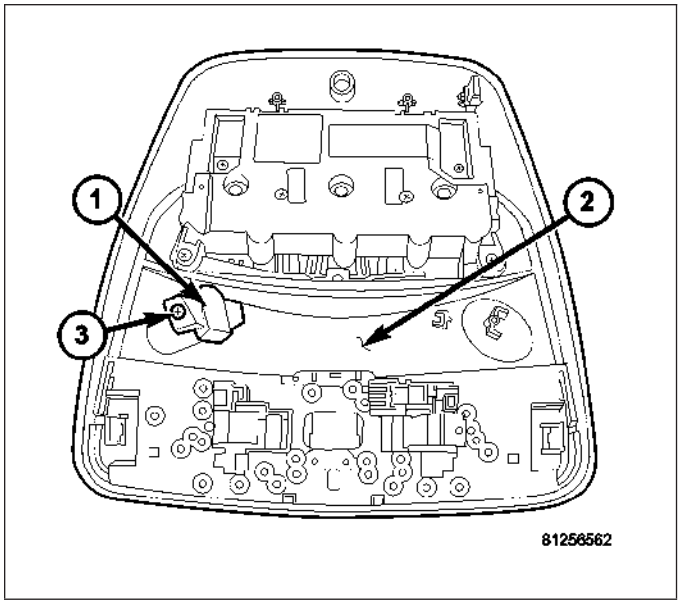
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console (2) and place it on a workbench (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Remove the screw (3) that secures the infrared sensor (1) to the overhead console.
4. Remove the infrared sensor from the overhead console.



INSTALLATION

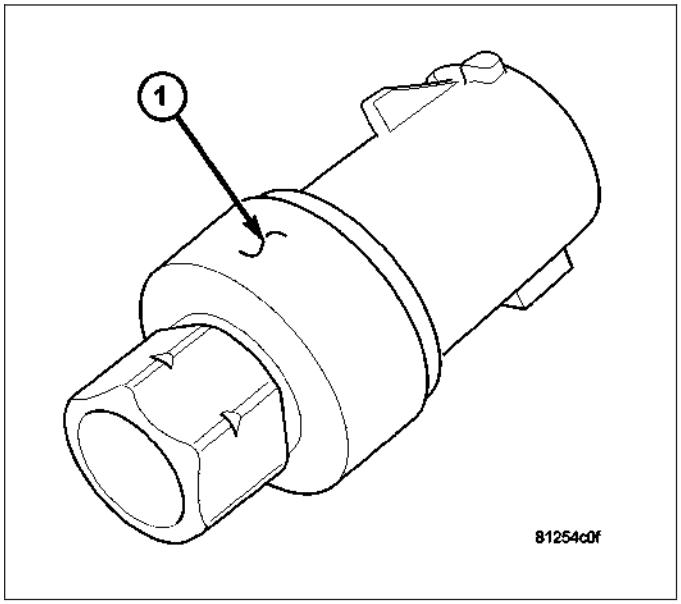
1. Position the infrared sensor (1) onto the overhead console (2).
2. Install the screw (3) that secures the infrared sensor to the overhead console. Tighten the screw to 2 N·m (17 in. lbs).
3. Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
4. Reconnect the negative battery cable.



TRANSDUCER-A/C PRESSURE

DESCRIPTION

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C discharge line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C discharge line. A rubber O-ring seals the connection between the A/C pressure transducer and the discharge line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.



OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the discharge line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The front control module (FCM) provides a five volt reference signal to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The FCM broadcasts a refrigerant pressure message to the PCM, which is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM will disengage the A/C compressor clutch when high side pressure rises above 3172 kPa (460 psi) and re-engage the clutch when high side pressure drops below 1999 kPa (290 psi). The A/C pressure transducer will also disengage the A/C compressor clutch if the high side pressure drops below 193 kPa (28 psi) and will re-engage the clutch when the high side pressure rises above 234 kPa (34 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer message to the PCM will also prevent the A/C compressor clutch from engaging when ambient temperatures are below about 4.5° C (40° F) due to the pressure/temperature relationship of the refrigerant. Refer to the Electric A/C Condenser Cooling Fan Switch Point chart for condenser cooling fan on/off pressures.

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The A/C pressure transducer is diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

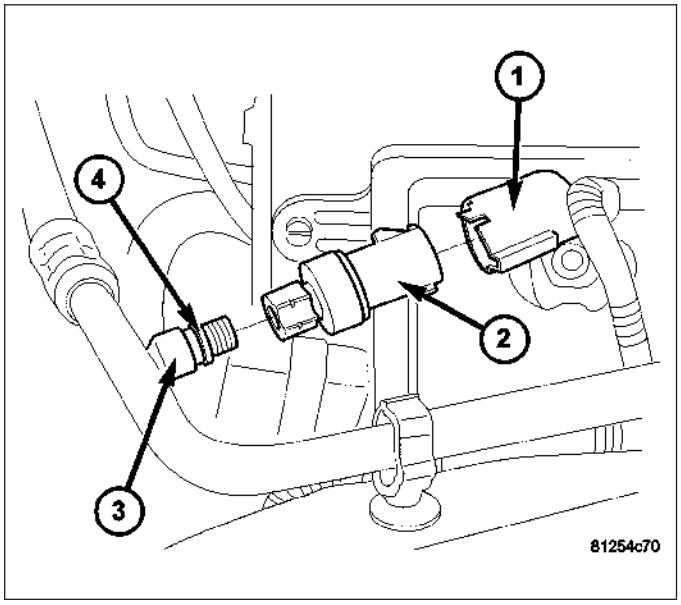
ELECTRIC A/C CONDENSER COOLING FAN SWITCH POINT

Fan State	Switch Point
Off to Low speed	1896 kPa (275 psi)
Low to High speed	2103 kPa (305 psi)
High to Low speed	1620 kPa (235 psi)
Low speed to Off	1344 kPa (195 psi)
Off to Low, Low to Off hysterisis	5552 kPa (80 psi)
Low to High, High to low hysterisis	483 kPa (70 PSI)

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2).
3. Remove the A/C pressure transducer from the A/C discharge line (3).
4. Remove the O-ring seal (4) from the discharge line fitting and discard.



INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the discharge line fitting (3).
2. Install the A/C pressure transducer (2) onto the discharge line fitting. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

ACTUATOR-BLEND DOOR

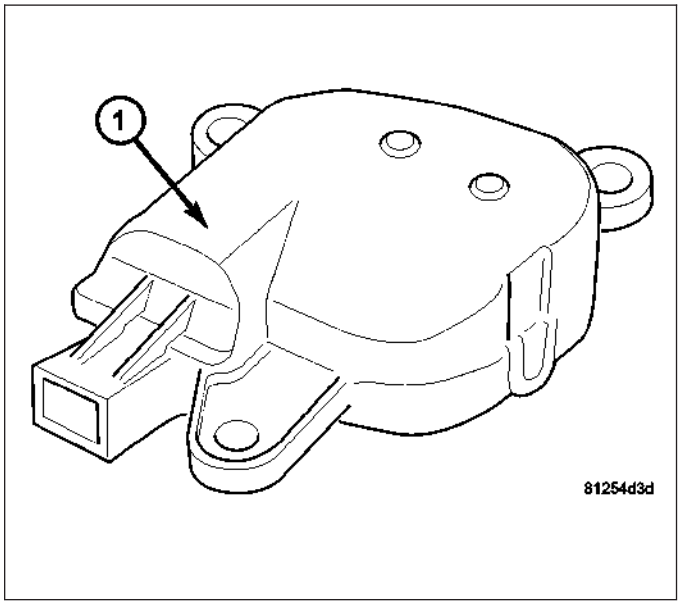
DESCRIPTION

The rear blend door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The rear blend door actuator is located on the side of the rear HVAC housing. The rear blend door actuator is interchangeable with the actuator for the mode-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Three integral mounting tabs allow the actuator to be secured to the rear HVAC housing. Each actuator also has an identical output shaft with splines that connects it to the rear blend-air door. The rear blend door actuator does require mechanical indexing to the rear blend-air door, as it is electronically calibrated by the A/C-heater control.



OPERATION

The rear blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the rear HVAC wire harness. The reawr blend door actuator can move the rear blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the rear blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the rear blend-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the rear blend-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the rear blend door actuator and the rear blend-air door. The A/C-heater control learns the

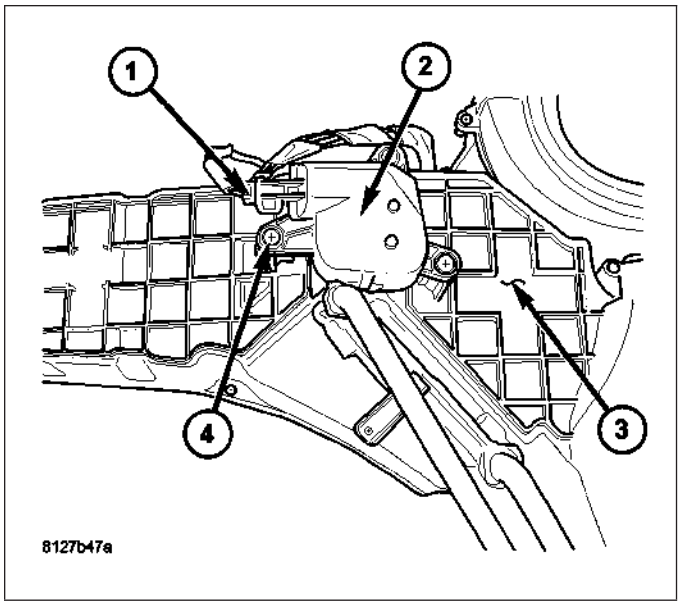
rear blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the rear blend door actuator circuit.

The rear blend door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The rear blend door actuator is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

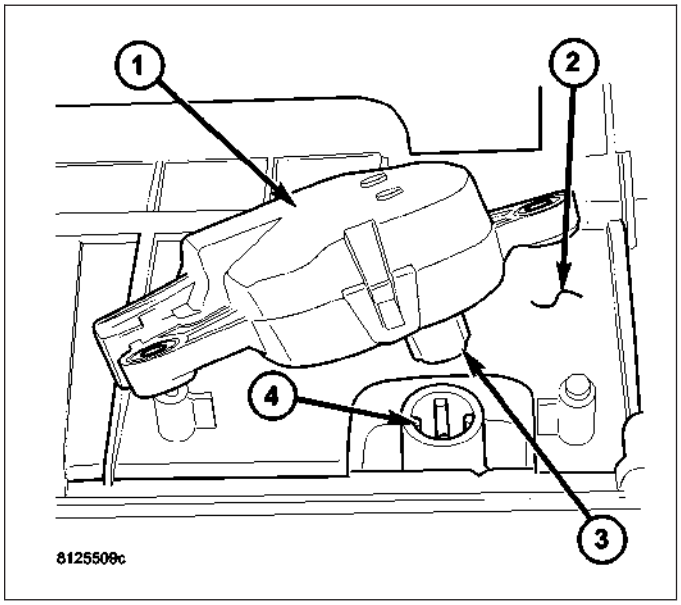
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Remove the screws (4) that secure the rear blend door actuator (2) to the side of the rear HVAC housing (3).
4. Disconnect the rear HVAC wire harness connector (1) from the rear blend door actuator.
5. Remove the rear blend door actuator from the rear HVAC housing.

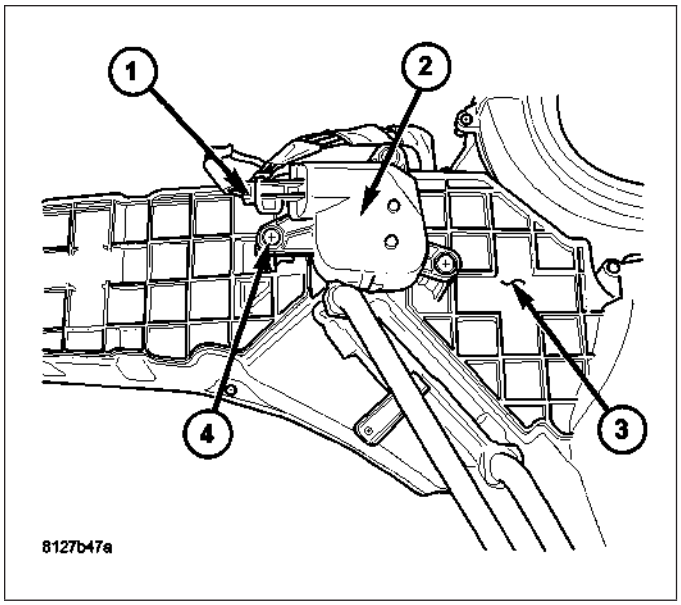


INSTALLATION

1. Position the rear blend door actuator (1) onto the side of the rear HVAC housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the rear actuator coupler (4).



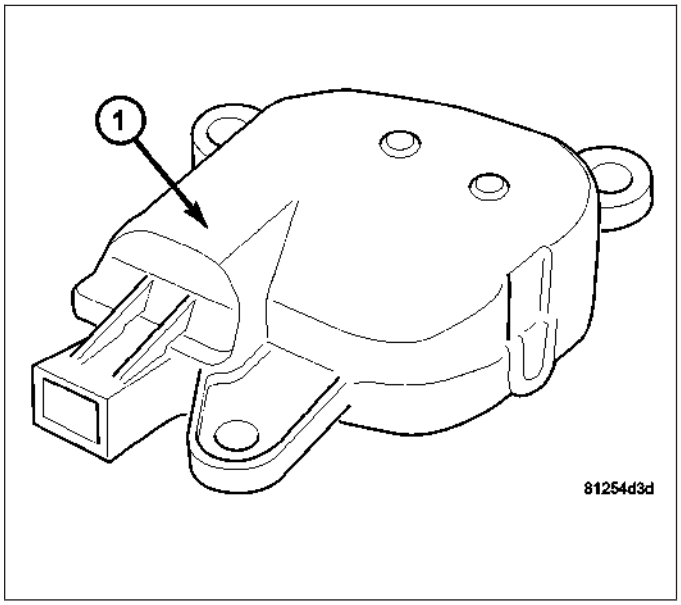
2. Install the screws (4) that secure the rear blend door actuator (2) to the rear HVAC housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the rear HVAC wire harness connector (1) to the rear blend door actuator.
4. Install the right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).
5. Reconnect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to HVAC System Test, found in 24 - HVAC - Electrical Diagnostics.



ACTUATOR-MODE DOOR

DESCRIPTION

The rear mode door actuator (1) is a reversible, 12–volt direct current (DC), servo motor. The rear mode door actuator is located near the front end of the rear HVAC housing. The rear mode door actuator is mechanically connected to the rear mode-air door. The rear mode door actuator is interchangeable with the actuator for the rear blend-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle. Three integral mounting tabs allow the actuator to be secured to the side of the rear HVAC housing. The rear mode door actuator also has an identical output shaft with splines that connects it to the mode-air door. The rear mode door actuator does not require mechanical indexing to the mode-air door, as it is electronically calibrated by the A/C-heater control.



OPERATION

The rear mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the rear HVAC wire harness. The rear mode door actuator can move the rear model-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the rear mode-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the rear mode-air door moves in the opposite direction.

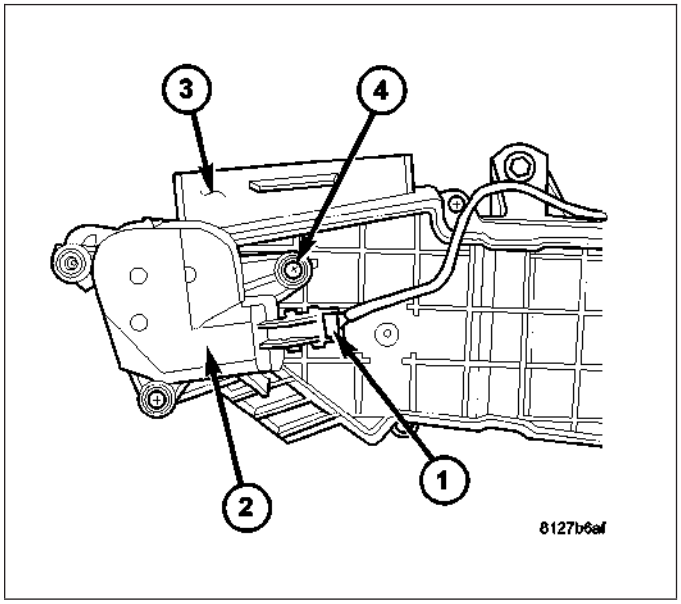
When the A/C-heater control makes the voltage to both connections high or both connections low, the rear mode-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the rear mode door actuator and the rear mode-air door. The A/C-heater control learns the rear mode-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the rear mode door actuator circuit.

The rear mode door actuator cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

The rear mode door actuators are diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

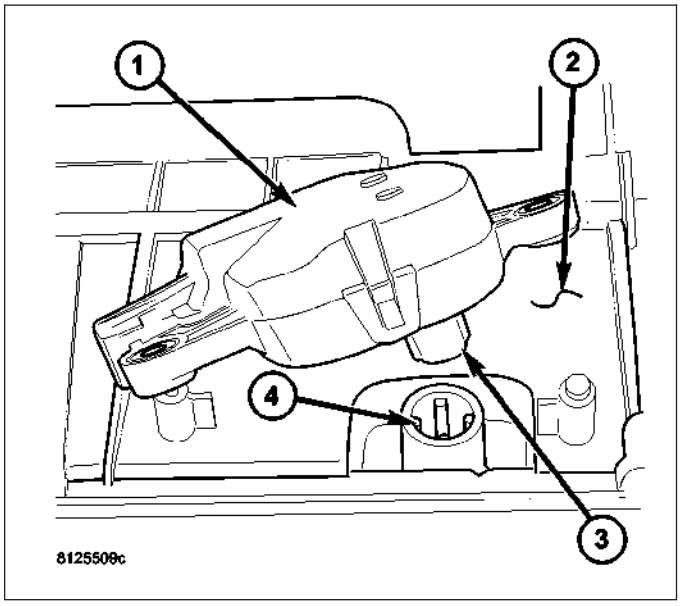
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Disconnect the rear HVAC wire harness connector (1) from the rear mode door actuator (2) located on the side of the rear HVAC housing (3).
4. Remove the screws (4) that secure the rear mode door actuator to the rear HVAC housing.
5. Remove the rear mode door actuator from the rear HVAC housing.

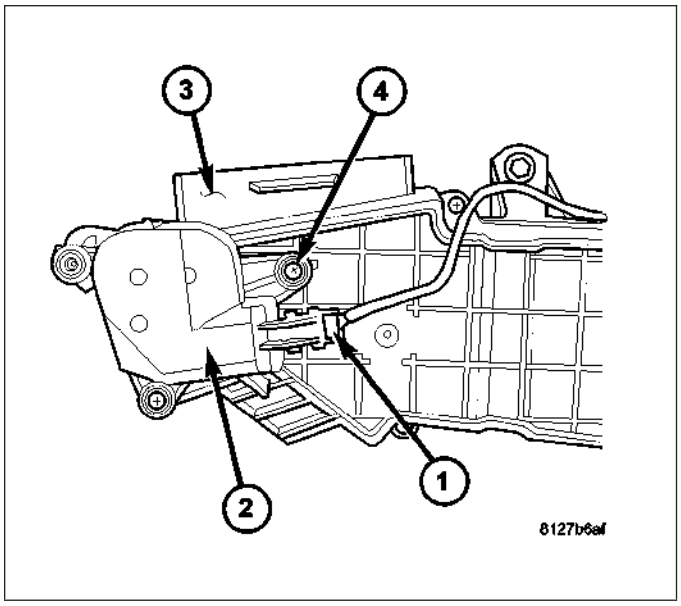


INSTALLATION

1. Position the rear mode door actuator (1) onto the side of the rear HVAC housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those in the actuator coupler (4).



2. Install the screws (4) that secure the rear mode door actuator (2) to the rear HVAC housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the rear HVAC wire harness connector (1) to the rear mode door actuator.
4. Reconnect the negative battery cable.
5. Initiate the Actuator Calibration function using a scan tool. Refer to HVAC System Test, found in 24 - HVAC - Electrical Diagnostics.



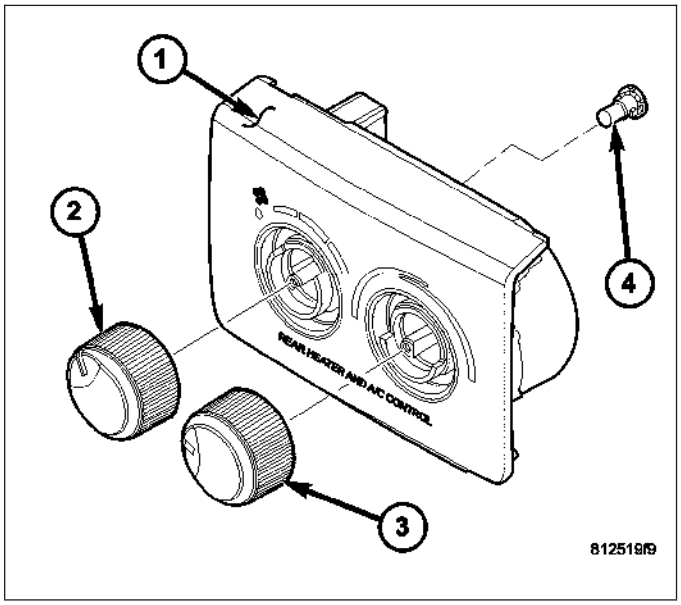
CONTROL-A/C-HEATER

DESCRIPTION

The rear A/C-heater control (1) for the rear heater-A/C system is located at the rear of the center floor console and allows intermediate seat passengers to adjust rear temperature and blower motor speed when the front A/C-heater control is set to the Rear position, otherwise the front A/C-heater control operates both the front and the rear heater-A/C systems. The rear A/C-heater control contains:

- a rotary control knob (2) for rear fan speed selection and turning the rear heater-A/C system off.
- a rotary control knob (3) for rear temperature control.

The rear A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The illumination lamp (4) and the control knobs are available for service replacement.



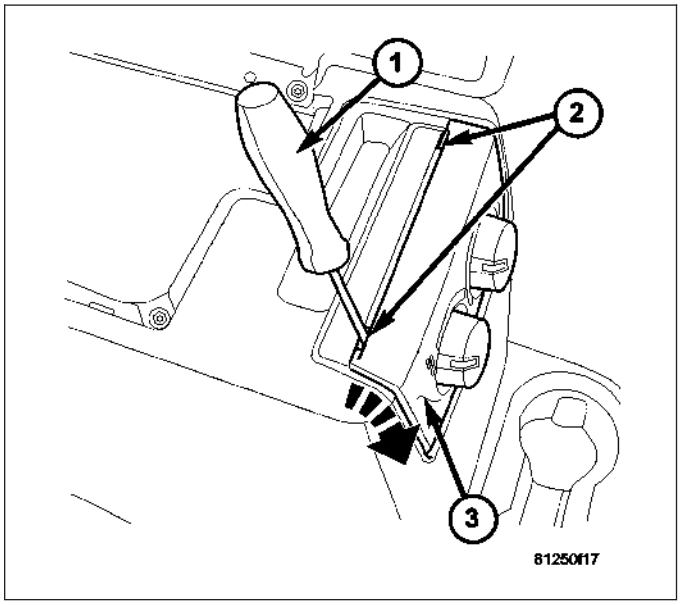
OPERATION

With the rear A/C-heater control active, temperature selection dictates the air distribution mode (floor or overhead air) of the rear heater-A/C system. A cool temperature setting directs flow to the overhead outlets and a warm temperature setting to the floor.

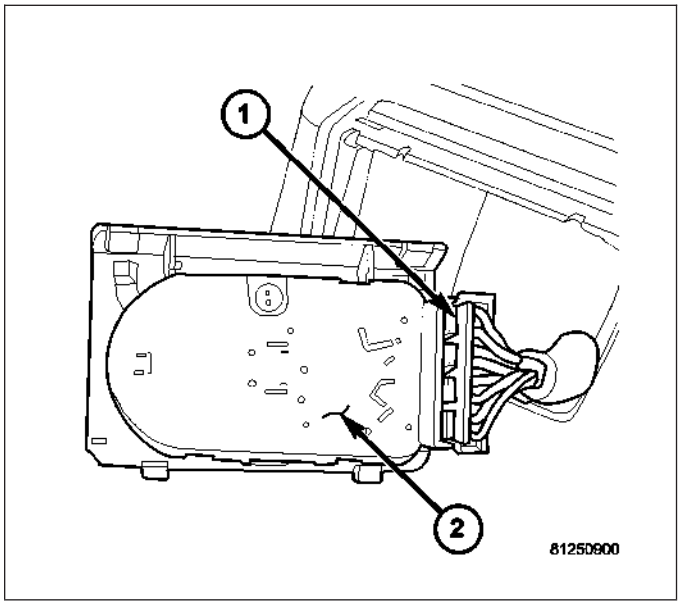
The rear A/C-heater control is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Using a small screwdriver or similar flat blade tool (1), gently push down on the clip retainer (2) located at each top corner of the rear A/C-heater control (3). Rotate the top of rear A/C-heater control downwards to release the two bottom retaining tabs from the slots in the center floor console.

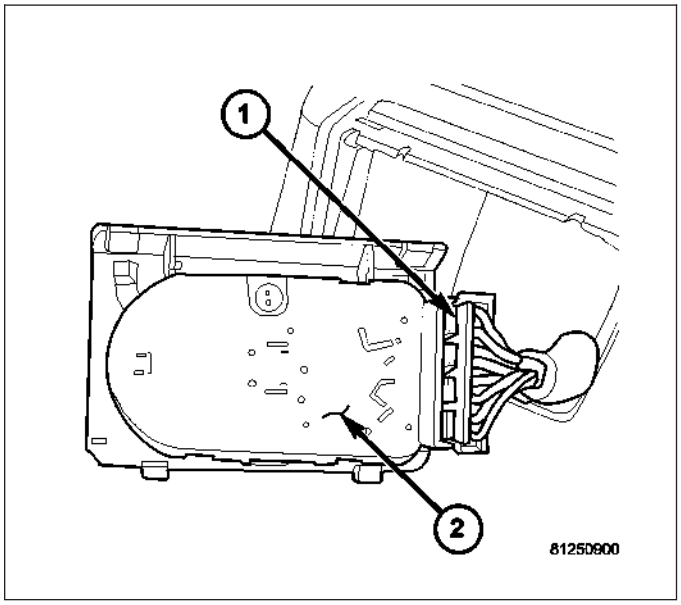


3. Disconnect the wire harness connector (1) from the rear A/C-heater control (2).
4. Remove the rear A/C-heater control from the vehicle.

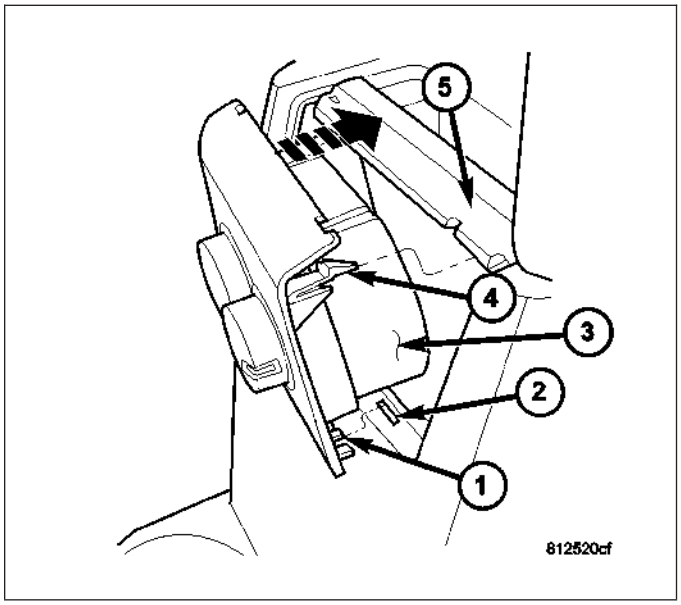


INSTALLATION

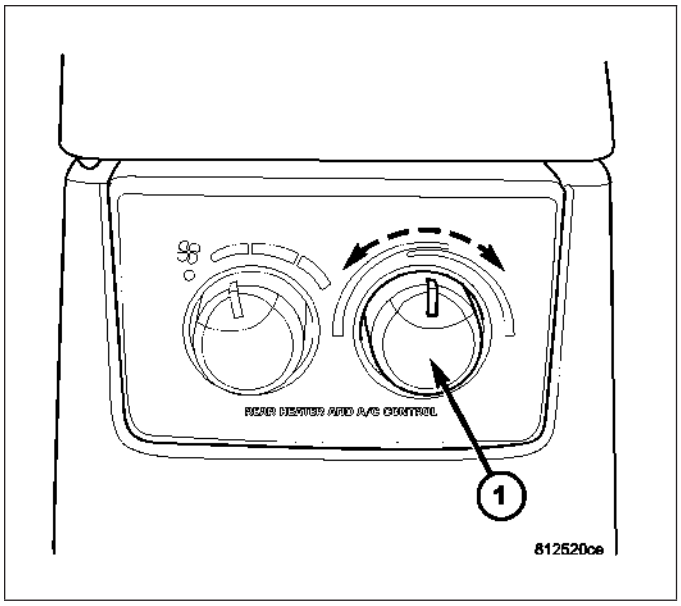
1. Position the rear A/C-heater control (2) near the center floor console.
2. Connect the wire harness connector (1) to the back of the rear A/C-heater control.



3. Insert the two locator tabs on the bottom of the rear A/C-heater control (1) into the two slots on the bottom edge of the floor console opening (2).
4. Rotate the rear A/C-heater control (3) forward far enough to align the two snap clips on the top of the rear A/C-heater control (4) with the receptacles in the top edge of the floor console opening (5).
5. Using hand pressure, press the top edge of the rear A/C-heater control forward until the two snap clips are fully seated in into the receptacles.
6. Reconnect the negative battery cable.



7. Using a scan tool, calibrate the Rear Temperature Selector potentiometer calibration values.
8. Verify that the Actuator Calibration of the front A/C-heater control has passed. If an Actuator Calibration has not passed correct any errors before proceeding.
9. Rotate the Rear Temperature Selector counter (1) clockwise to the Cold Position, allow the Selector to remain in the Cold Position for 5 seconds.
10. Rotate the Rear Temperature Selector Clockwise to the Hot Position, allow the Selector to remain in the Cold Position for 5 seconds.
11. Calibration is now complete.

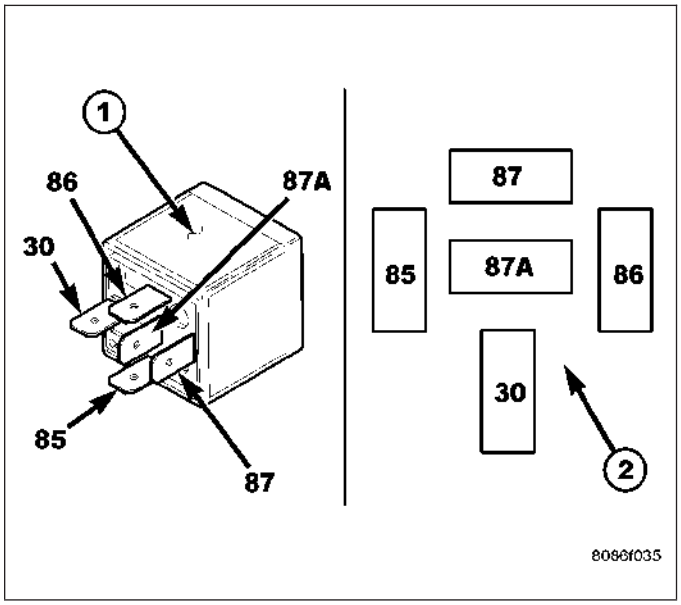


RELAY-BLOWER MOTOR

DESCRIPTION

The blower motor relay for the rear heating-A/C system is a International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions. The rear blower motor relay is a electromechanical device that switches battery current from a fuse in the power distribution center (PDC) directly to the rear blower motor. The rear blower motor relay is energized when the relay coil is provided a voltage signal by the ignition switch.

The rear blower motor relay is located in the power distribution center (PDC) in the engine compartment. Refer to the PDC label for rear blower motor relay identification and location.



The black, molded plastic case is the most visible component of the rear blower motor relay. Five male spade-type terminals extend from the bottom of the base to connect the relay to the vehicle electrical system, and the ISO designation for each terminal is molded into the base adjacent to each terminal. The ISO terminal designations are as follows:

- **30 (Common Feed)** - This terminal is connected to the movable contact point of the relay.
- **85 (Coil Ground)** - This terminal is connected to the ground feed side of the relay control coil.
- **86 (Coil Battery)** - This terminal is connected to the battery feed side of the relay control coil.
- **87 (Normally Open)** - This terminal is connected to the normally open fixed contact point of the relay.
- **87A (Normally Closed)** - This terminal is connected to the normally closed fixed contact point of the relay.

OPERATION

The The ISO-standard rear blower motor relay is an electromechanical switch that uses a low current input from the ignition switch to control the high current output to the rear blower motor. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the rear blower motor.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The rear blower motor relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the rear blower motor relay include:

- The common feed terminal (30) receives a battery current input from a fuse in the PDC through a fused B(+) circuit at all times.
- The coil ground terminal (85) is connected to a ground at all times.
- The coil battery terminal (86) receives a battery current input from a fuse in the junction block (JB) through a fused ignition switch output (run) circuit only when the ignition switch is in the On position.
- The normally open terminal (87) provides a battery current output to the rear blower motor through the rear blower motor relay output circuit only when the rear blower motor relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the rear blower motor relay coil is de-energized.

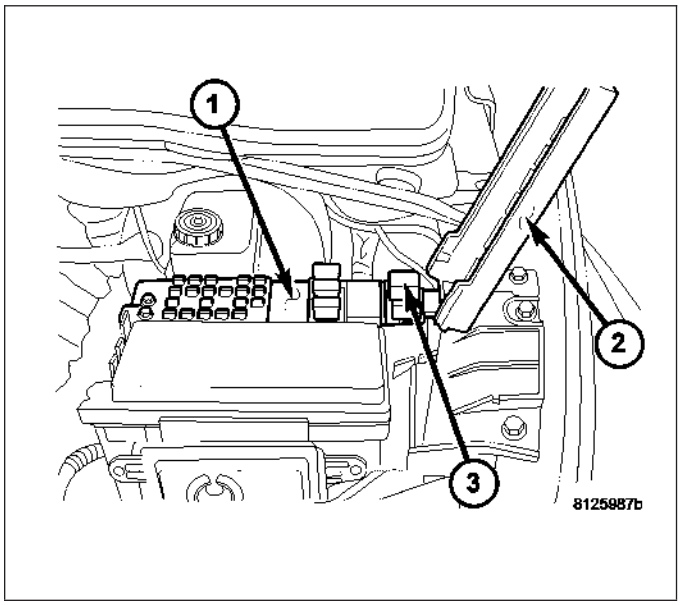
The rear blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relay and for complete HVAC wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Locate the power distribution center (PDC) (1).
3. Open the PDC cover (2).

NOTE: Refer to the fuse and relay layout map on the inner surface of the PDC cover for rear blower motor relay identification and location.

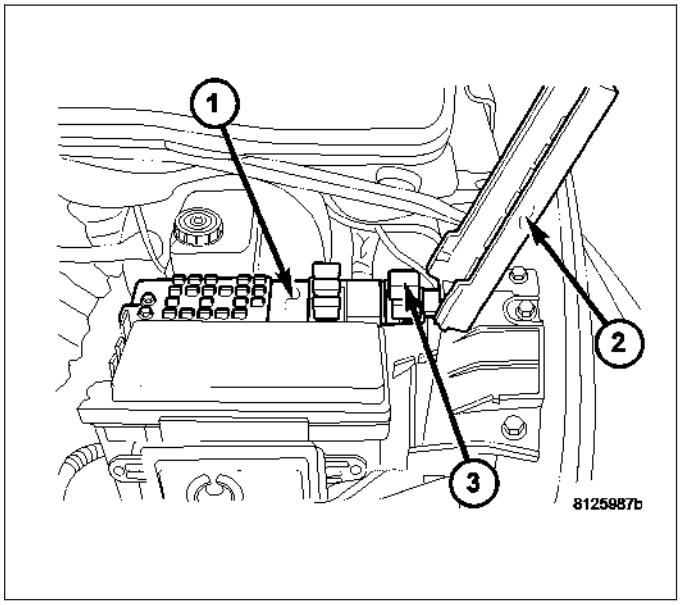
4. Remove the rear blower motor relay (3) from the PDC.



INSTALLATION

NOTE: Refer to the fuse and relay layout map on the inner surface of the PDC cover for rear blower motor relay identification and location.

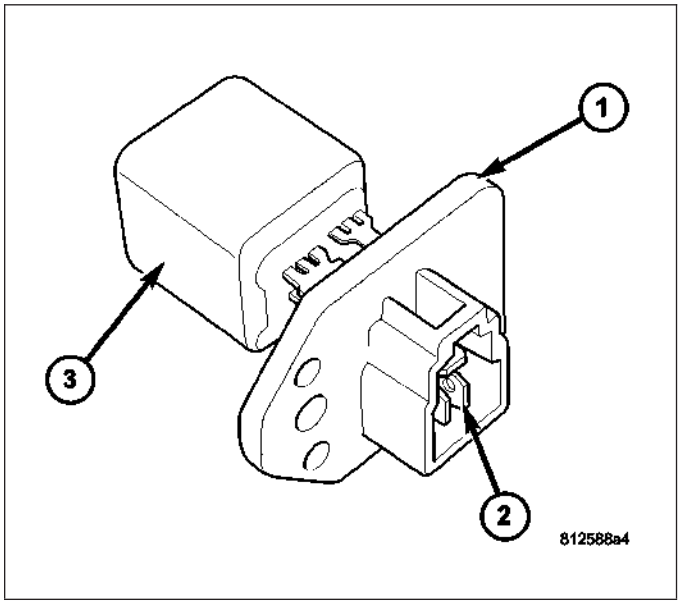
1. Position the rear blower motor relay (3) into the proper receptacle of the PDC (1).
2. Align the rear blower motor relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the PDC cover (2).
4. Reconnect the negative battery cable.



RESISTOR-BLOWER MOTOR

DESCRIPTION

A rear blower motor resistor is used on this model when it is equipped with the rear heater-A/C system. The rear blower motor resistor is mounted to the rear HVAC housing, directly below the rear blower motor. The rear blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are coiled resistor wires contained within a ceramic heat sink (3). The rear blower motor resistor is accessed for service by removing the rear quarter interior trim panel from the right side of the vehicle.



OPERATION

The blower motor resistor for the rear heating-A/C system is connected to the vehicle electrical system through a dedicated wire lead and connector of the rear HVAC wire harness. The rear blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor switch in the rear heater-A/C system directs the ground path for the rear blower motor through the correct resistor wire to obtain the selected speed. With the rear blower motor control in the lowest speed position, the ground path for the rear blower motor is applied through all of the resistor wires. Each higher speed selected with the rear blower motor control applies the blower motor ground path through fewer of the resistor wires, increasing the rear blower motor speed.

The rear blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

REAR BLOWER MOTOR RESISTOR

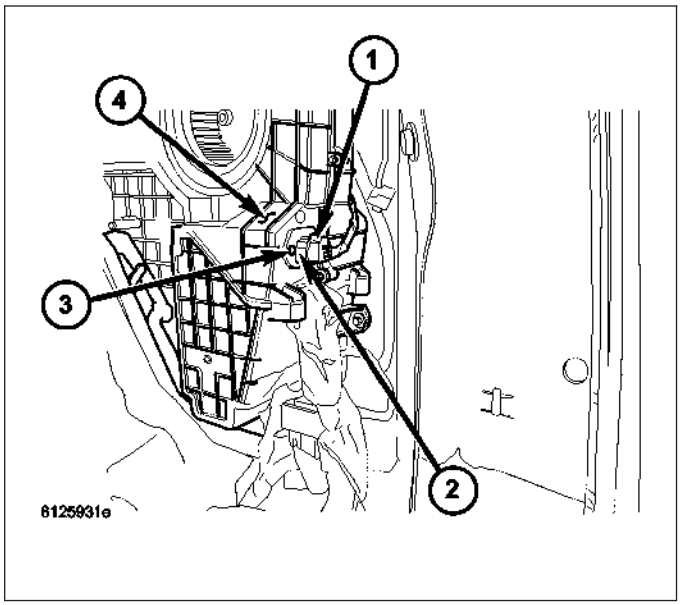
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS-REAR/RESISTOR-BLOWER MOTOR - REMOVAL).
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or the blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the right rear quarter interior trim panel (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Disconnect the rear HVAC wire harness connector (1) from the rear blower motor resistor (2).
4. Remove the screw (3) that secures the rear blower motor resistor to the rear HVAC housing (4).
5. Remove the rear blower motor resistor from the rear HVAC housing.



INSTALLATION

1. Position the rear blower motor resistor (2) into the rear HVAC housing (4).
2. Install the screw (3) that secures the rear blower motor resistor to the rear HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).
3. Connect the rear HVAC wire harness connector (1) to the rear blower motor resistor.
4. Install the right rear quarter interior trim panel (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).
5. Reconnect the negative battery cable.

DUCT-DEFROSTER

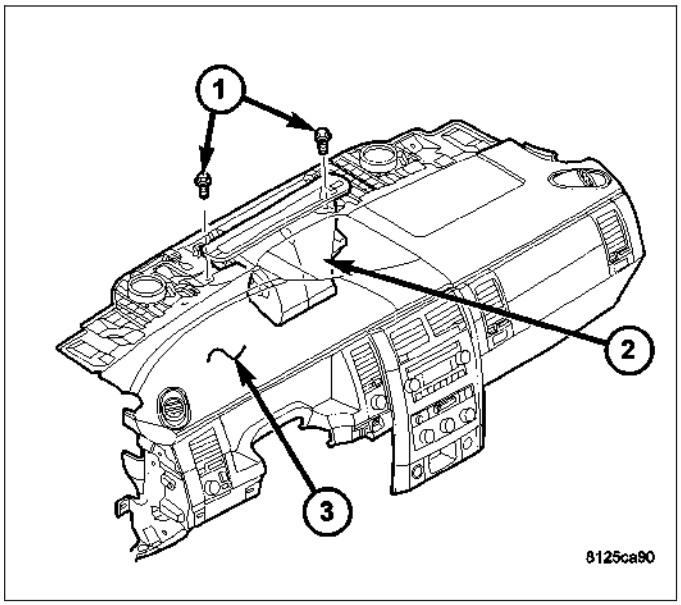
REMOVAL

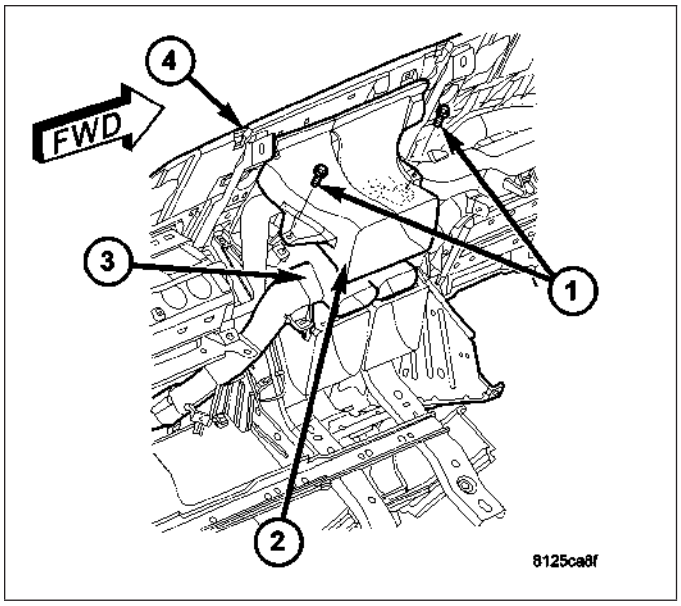
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the two screws (1) that secure the defroster duct (2) to the top of the instrument panel (3).

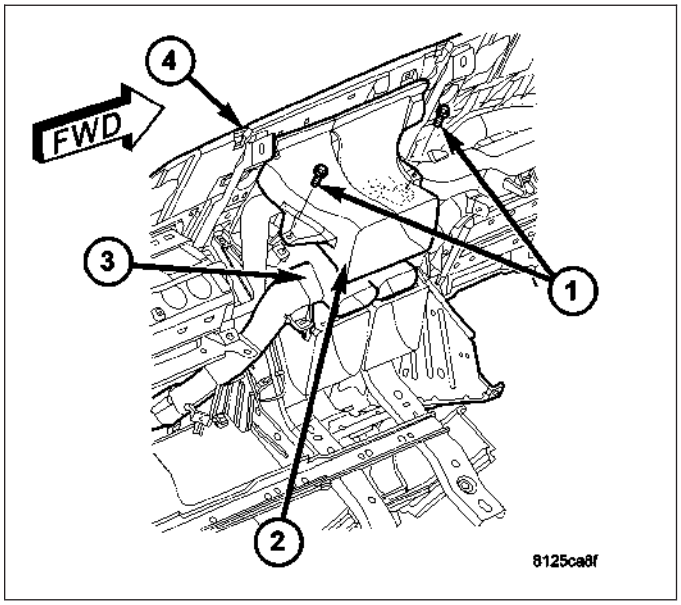


3. Remove the two screws (1) that secure the defroster duct (2) to the demister center duct (3).
4. Remove the defroster duct from the instrument panel (4).

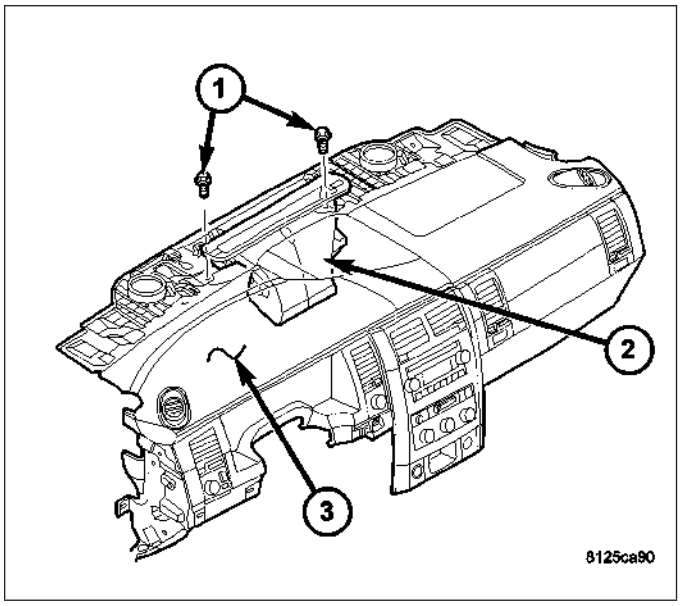


INSTALLATION

1. Position the defroster duct into the instrument panel.
2. Install the two screws that secure the defroster duct to the demister center duct. Tighten the screws to 2 N·m (17 in. lbs.).



3. Install the two screws that secure the defroster duct to the top of the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).
4. Install the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

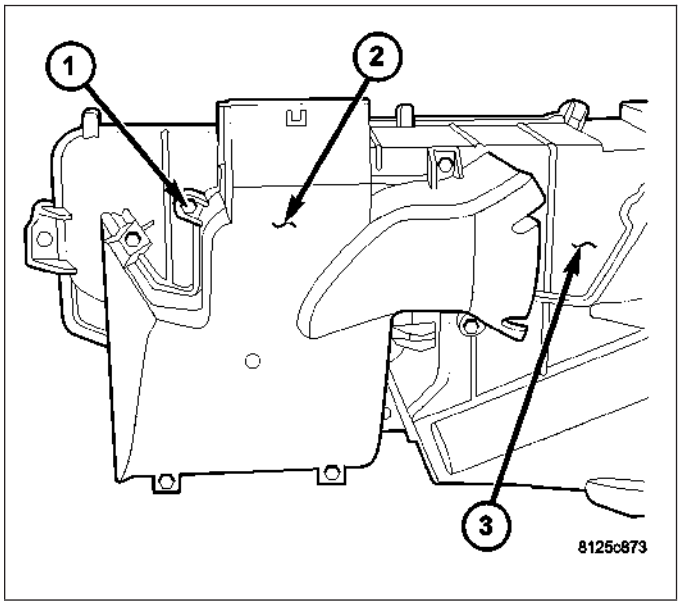


DUCT-FLOOR DISTRIBUTION

REMOVAL

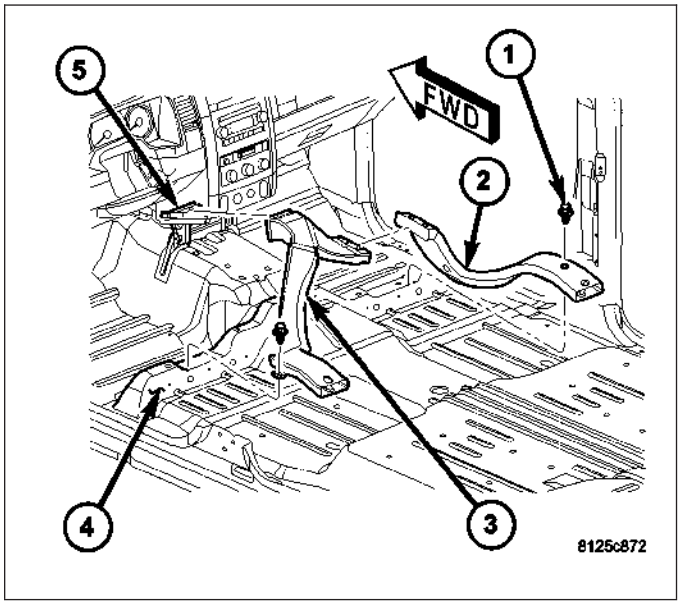
FRONT FLOOR DISTRIBUTION DUCT

1. Remove the HVAC Housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HOUSING-HVAC - REMOVAL).
2. Remove the six screws (1) that secure the front floor distribution duct (2) to the bottom of the HVAC housing (3).
3. Remove the front floor distribution duct from the HVAC housing.



INTERMEDIATE FLOOR DISTRIBUTION DUCTS

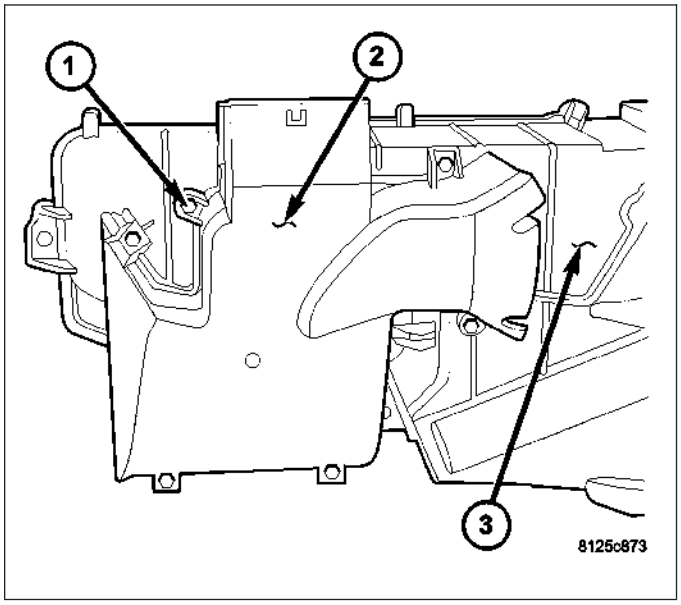
1. Remove the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Remove the front seats (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
3. Roll back the front floor carpet from under the instrument panel toward the rear of the vehicle (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL).
4. Remove the two push pin fasteners (1) that secure the right intermediate floor distribution duct (2) and the left intermediate floor distribution duct (3) to the floor support (4).
5. Disconnect the left intermediate floor distribution duct from the front floor distribution duct (5).
6. If required, disconnect the right intermediate floor distribution duct from the left intermediate floor distribution duct.



INSTALLATION

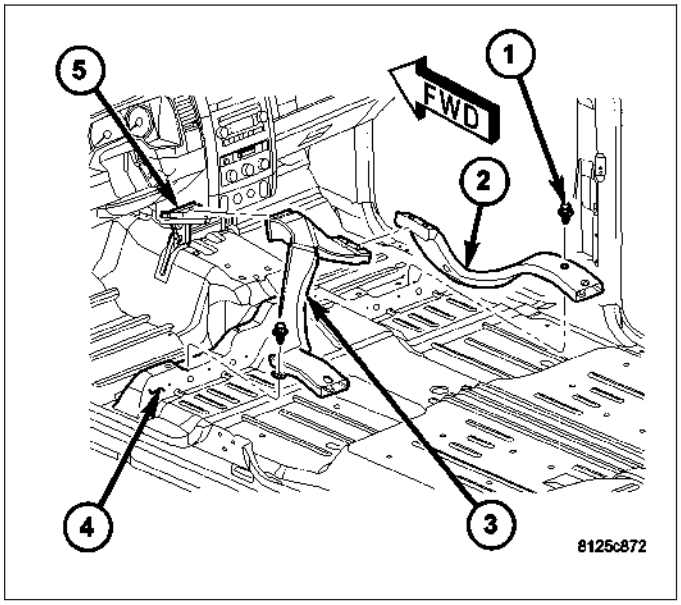
FRONT FLOOR DISTRIBUTION DUCT

1. Position the front floor distribution duct (2) to the bottom of the HVAC housing (3).
2. Install the six screws (1) that secure the front floor distribution duct to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).



INTERMEDIATE FLOOR DISTRIBUTION DUCTS

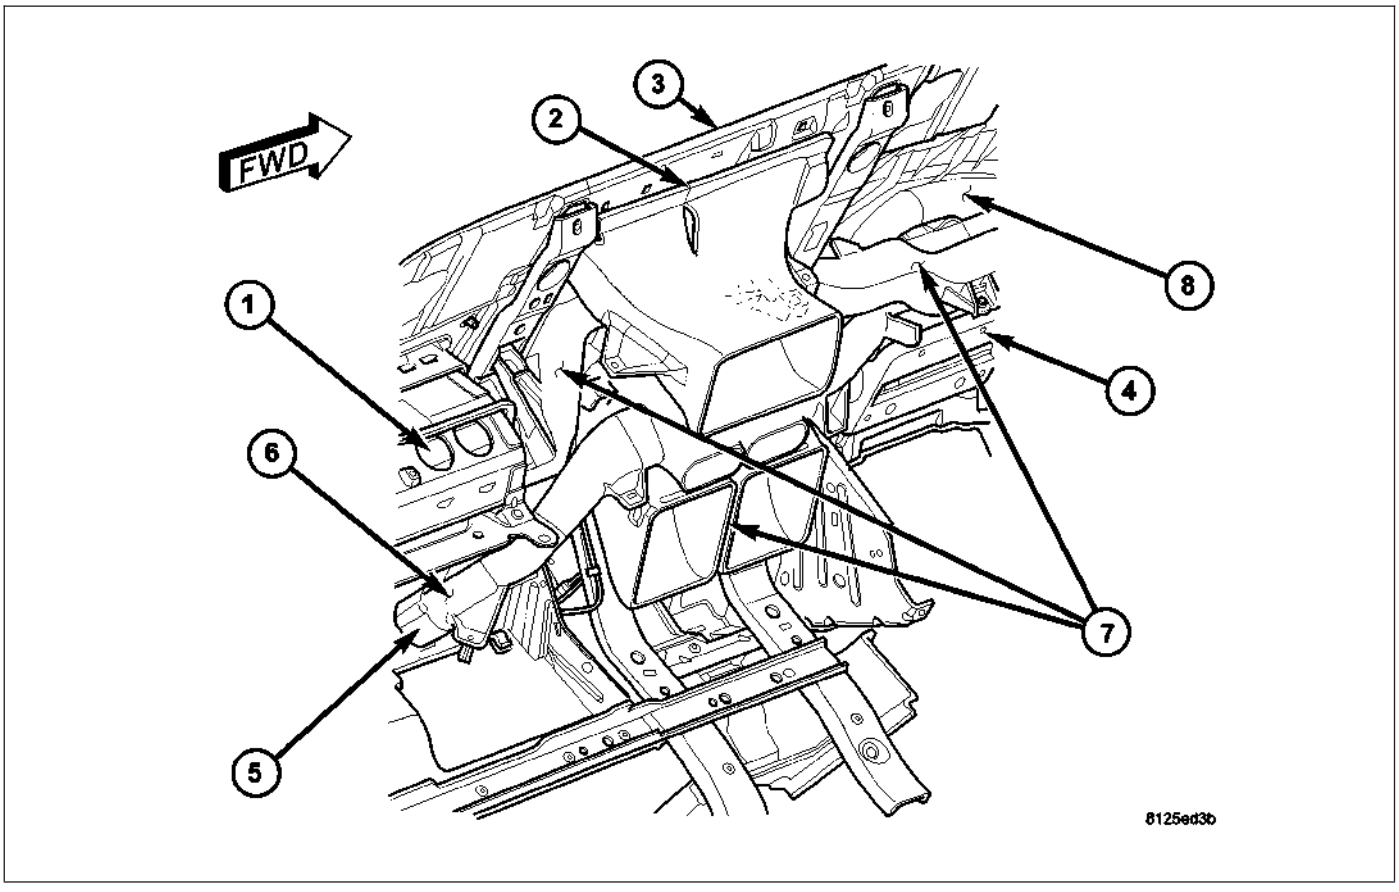
1. If removed, connect the right intermediate floor distribution duct to the left intermediate floor distribution duct.
2. Connect the left intermediate floor distribution duct to the front floor distribution duct.
3. Install the two push-pin fasteners that secure the intermediate floor distribution ducts to the floor support.
4. Install the carpet onto the front floor panel and under the instrument panel (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).
5. Install the front seats (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).
6. Install the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).



DUCT-INSTRUMENT PANEL

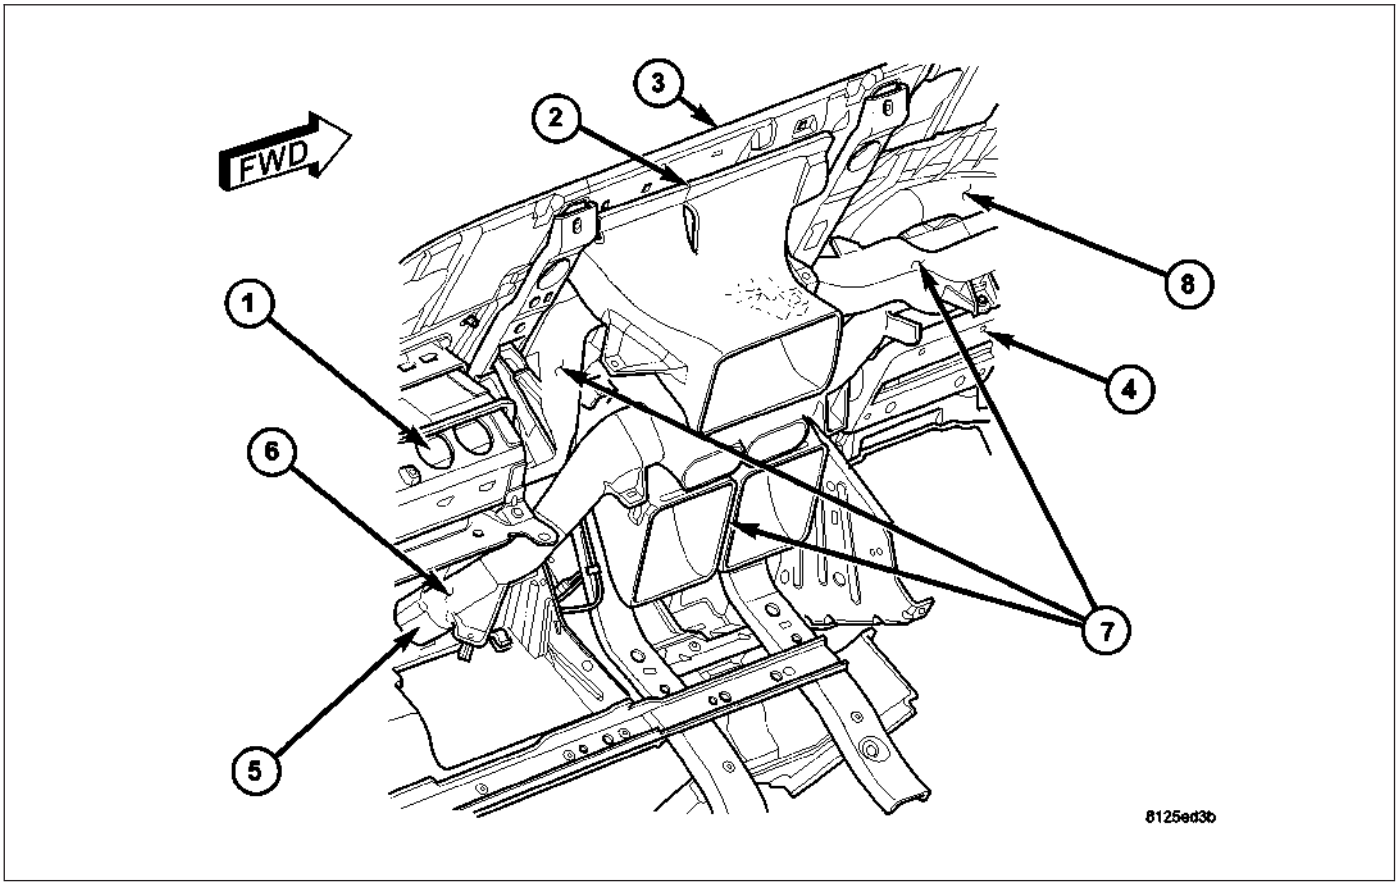
REMOVAL

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.



1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. Remove the radio and reinforcement bracket (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
4. Remove the instrument panel speakers (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
5. Remove the passenger side air bag (1) (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).
6. Remove the defroster duct (2) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ DUCTS-DEFROSTER - REMOVAL).
7. Remove the demister air outlets (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ OUTLETS-AIR - REMOVAL).
8. Remove the instrument panel top cover (3) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
9. Remove the park brake release handle assembly from the instrument panel.
10. Remove the instrument panel reinforcement (4).
11. Remove the passenger side demister outlet duct (5).
12. Remove the passenger side demister duct (6).
13. Remove the instrument panel ducts (7) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-INSTRUMENT PANEL - REMOVAL).

INSTALLATION



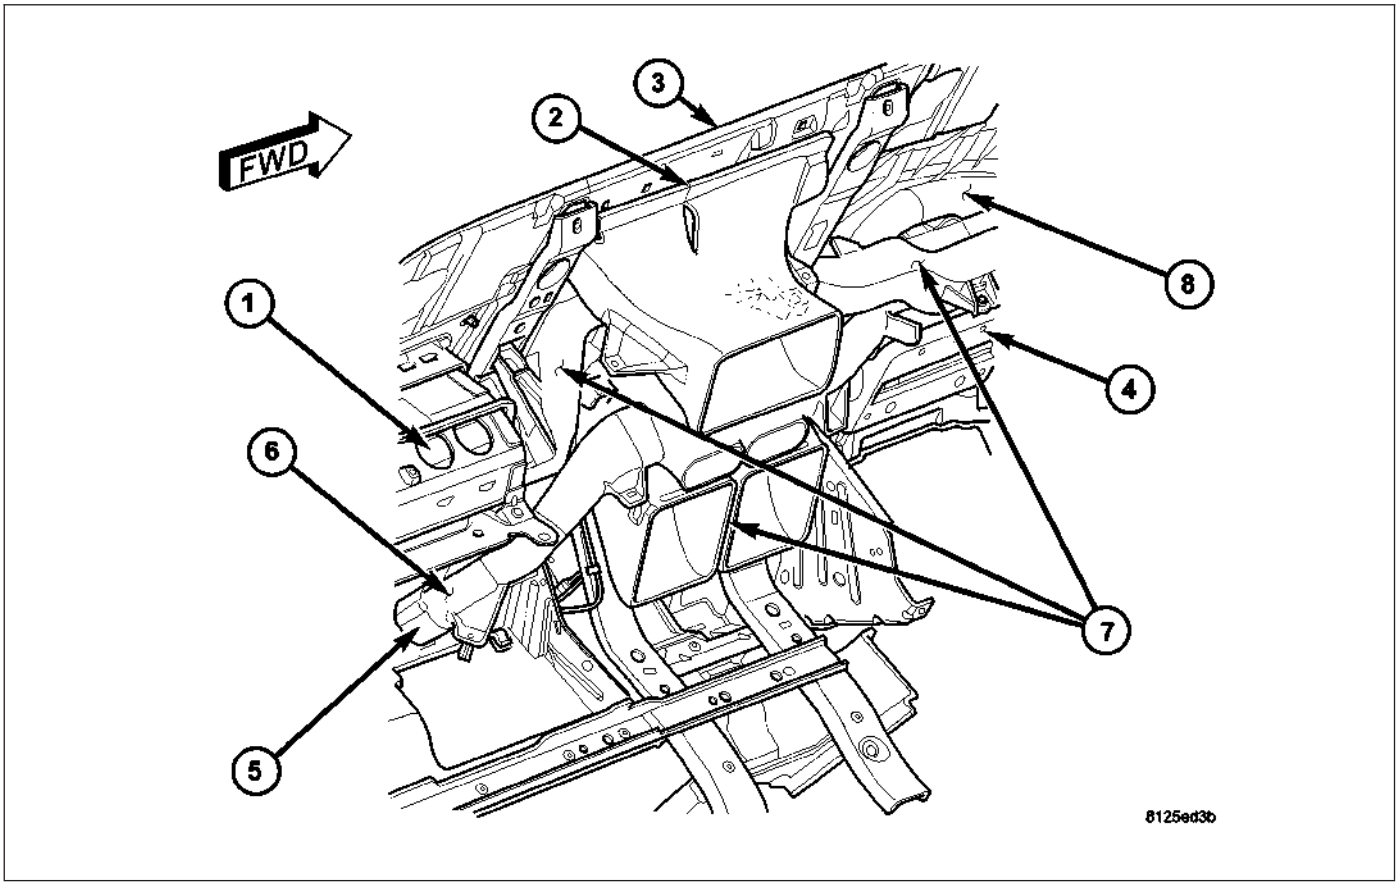
1. Install the instrument panel ducts (7)
2. Install the passenger side demister duct (6).
3. Install the passenger side demister outlet duct (5).
4. Install the instrument panel reinforcement (4).

5. Install the park brake release handle assembly.
6. Install the instrument panel top cover (3) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
7. Install the demister air outlets (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/OUTLETS-AIR - INSTALLATION)..
8. Install the defroster duct (2) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-DEFROSTER - INSTALLATION).
9. Install the passenger side air bag (1) (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).
10. Install the instrument panel speakers (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
11. Install the radio and reinforcement bracket (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
12. Install the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
13. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

DUCT-INSTRUMENT PANEL DEMISTER

REMOVAL

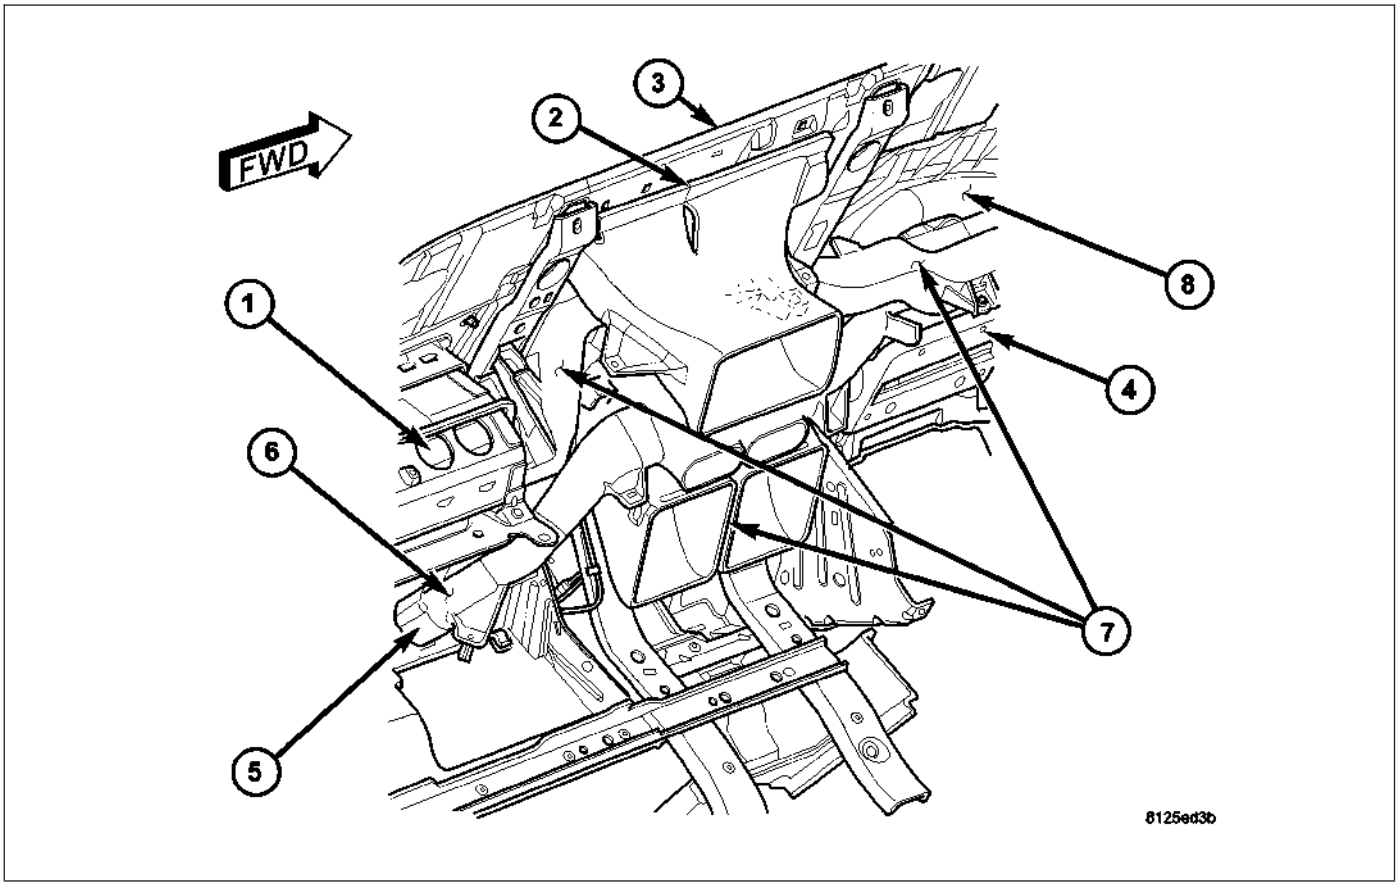
NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.



1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).
3. Remove the radio and reinforcement bracket (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
4. Remove the instrument panel speakers (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).

5. Remove the passenger side air bag (1) (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - REMOVAL).
6. Remove the defroster duct (2) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-DEFROSTER - REMOVAL).
7. Remove the demister air outlets (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/OUTLETS-AIR - REMOVAL).
8. Remove the instrument panel top cover (3) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
9. Remove the park brake release handle assembly from the instrument panel.
10. Remove the instrument panel reinforcement (4).
11. Remove the passenger side demister outlet duct (5).
12. Remove the passenger side demister duct (6).
13. Remove the instrument panel ducts (7) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-INSTRUMENT PANEL - REMOVAL).
14. Remove the driver side demister duct (8).

INSTALLATION

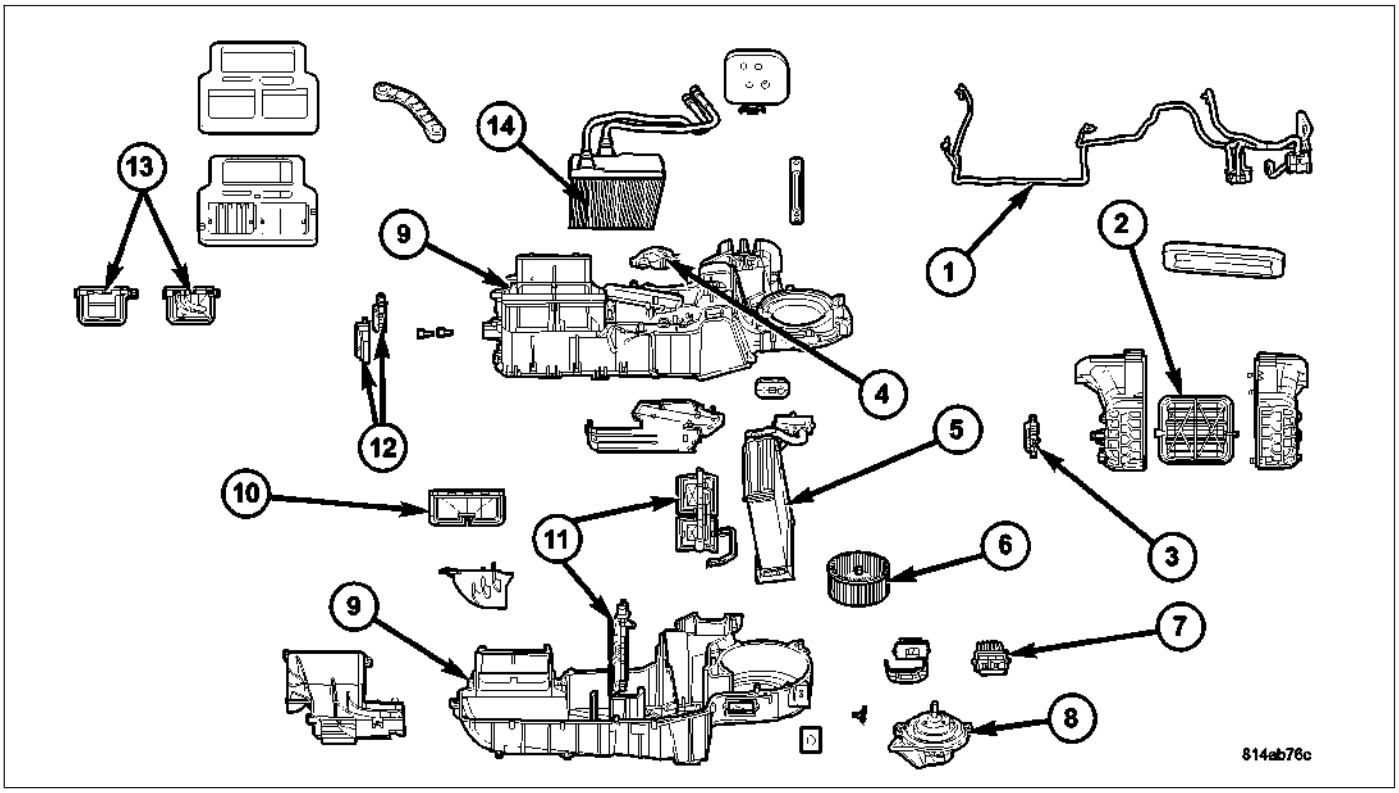


1. Install the driver side demister duct (8).
2. Install the instrument panel ducts (7)
3. Install the passenger side demister duct (6).
4. Install the passenger side demister outlet duct (5).
5. Install the instrument panel reinforcement (4).
6. Install the park brake release handle assembly.
7. Install the instrument panel top cover (3) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

8. Install the demister air outlets (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/OUTLETS-AIR - INSTALLATION)..
9. Install the defroster duct (2) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-DEFROSTER - INSTALLATION).
10. Install the passenger side air bag (1) (Refer to 8 - ELECTRICAL/RESTRAINTS/PASSENGER AIRBAG - INSTALLATION).
11. Install the instrument panel speakers (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
12. Install the radio and reinforcement bracket (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
13. Install the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).
14. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

HOUSING-HVAC

DESCRIPTION



All models are equipped with a common HVAC housing (9) that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The heating-A/C system is a blend-air type system. The blend-air doors (11) control the amount of conditioned air that is allowed to flow through, or around, the heater core (14). The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator (5) to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator (4) , which moves the blend-air doors. This allows an almost immediate control of the output air temperature of the system. The mode door actuators (12) operates the mode-air doors (10 and 13) which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator (3) operates the recirculation-air door (2) which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric actuators are connected to the vehicle electrical system by the HVAC wire harness (1). The blower motor (8) controls the velocity of air flowing through the HVAC housing by spinning the blower wheel (6) within the HVAC housing at the selected speed by use of the blower motor resistor block or power model (7), depending on application.

The front HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, recirculation-air door, mode-air doors, blend-air doors and linkage.

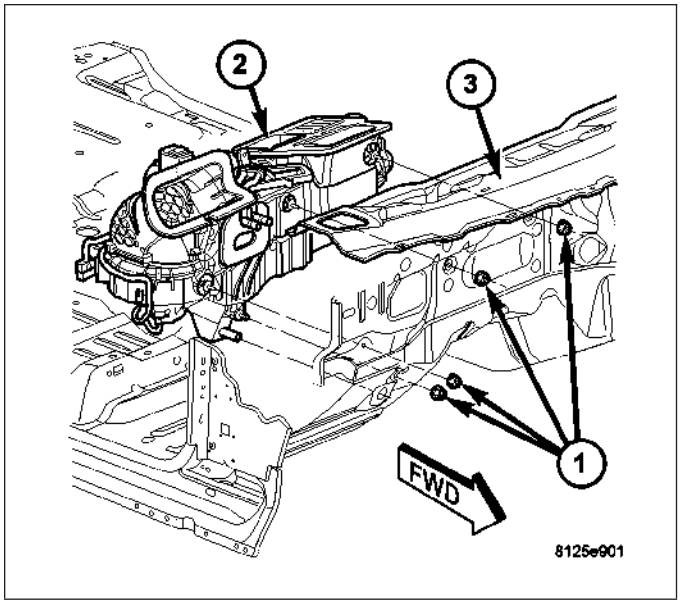
REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

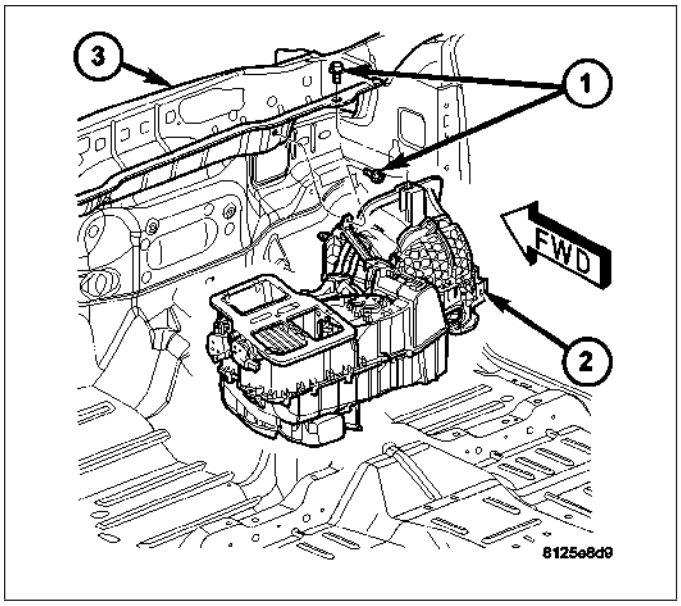
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The front HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, recirculation-air door, mode-air doors, blend-air doors and linkage.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Disconnect the liquid line and suction line from the expansion valve and install plugs or caps over the fittings and expansion valve ports (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - REMOVAL).
5. Disconnect the heater hoses from the heater core tubes and install plugs or caps over the heater core tube openings.
6. Remove the four nuts (1) that secure the HVAC housing (2) to the engine compartment side of the dash panel (3).



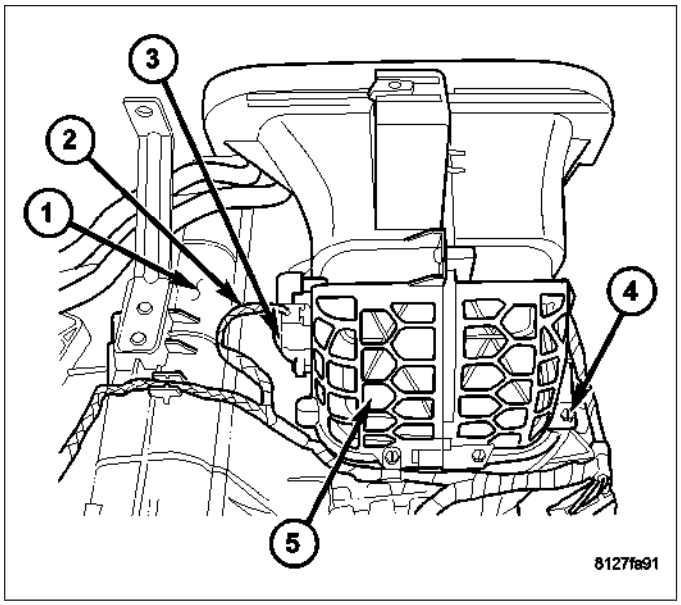
7. Remove the instrument panel from the passenger compartment (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
8. Disconnect the intermediate floor distribution duct from the front floor distribution duct.
9. Remove the two bolts (1) that secure the HVAC housing (2) to the passenger compartment side of the dash panel (3).
10. Pull the HVAC housing rearward so that the mounting studs and condensate drain tube clear the dash panel and remove the front HVAC housing from the passenger compartment.



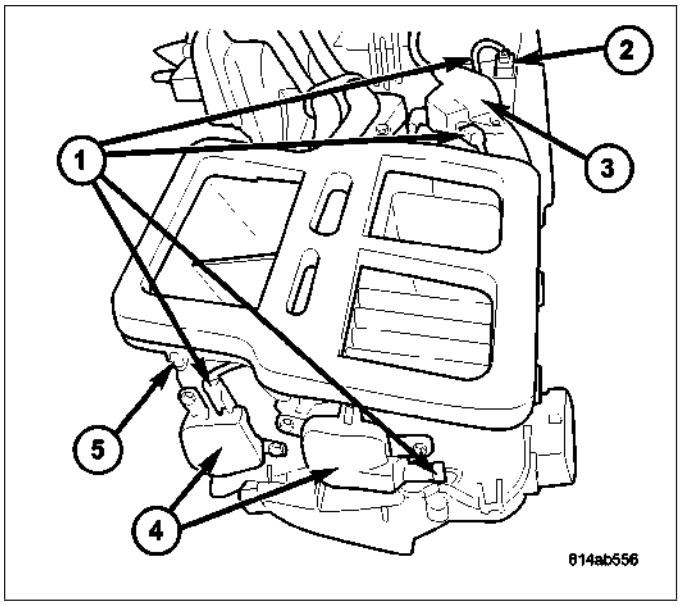
DISASSEMBLY

NOTE: The front HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, recirculation-air door, mode-air doors, blend-air doors and linkage.

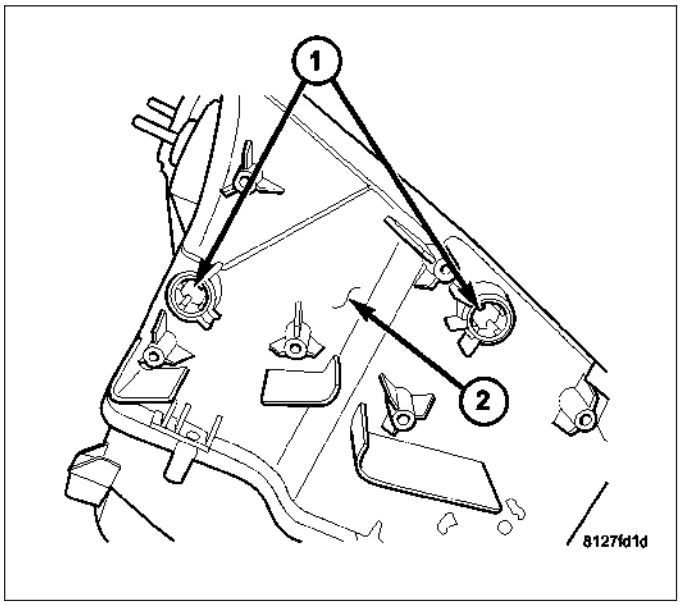
1. Remove the front HVAC housing (1) and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - REMOVAL).
2. Disconnect the HVAC wire harness (2) from the recirculation door actuator (3).
3. Remove the screws (4) that secure the air inlet housing (5) to the HVAC housing.
4. Remove the air inlet housing from the HVAC housing.
5. If required, remove the recirculation door actuator from the air inlet housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/ACTUATOR-RECIRCULATION DOOR - REMOVAL).



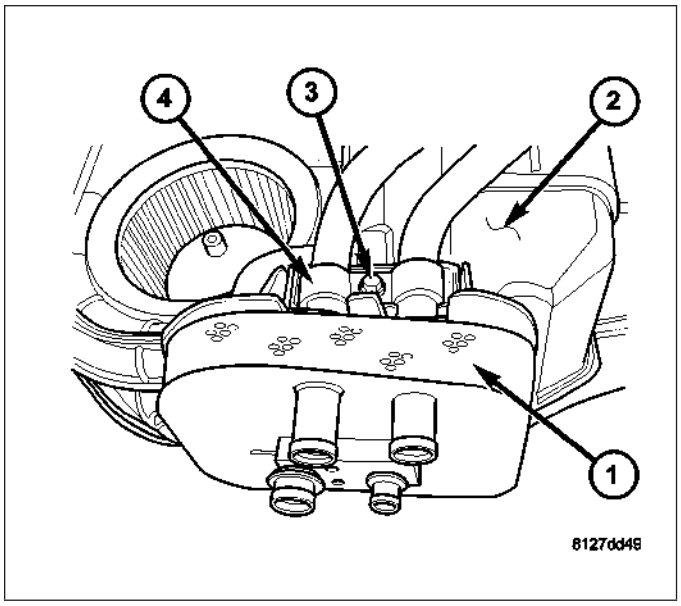
6. Disconnect the HVAC wire harness (1) from the evaporator temperature senseor (2), blend door actuator (3) and the two mode door actuators (4).
7. Remove the the evaporator temperature sensor from the top of the HVAC housing (5).
8. Remove the blend door actuator and the mode door actuators from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/ACTUATOR-BLEND DOOR - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/ACTUATOR-MODE DOOR - REMOVAL).



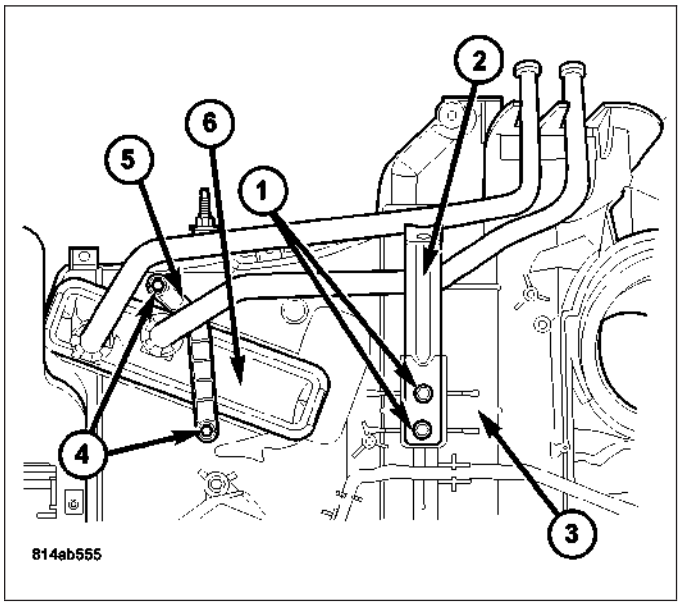
9. Remove the two actuator couplers (1) from the left end of the HVAC housing (2).



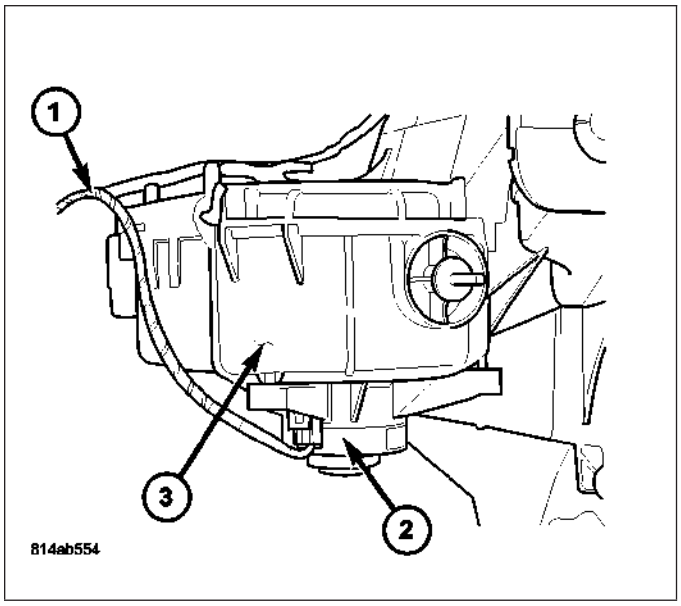
10. Carefully remove the foam seal (1) from the flange on the HVAC housing (2). If the seal is deformed or damaged, it must be replaced.
11. Remove the screw (3) that secures the heater core tube retaining bracket (4) to the top of the HVAC housing.
12. Remove the heater core tube retaining bracket from the HVAC housing.



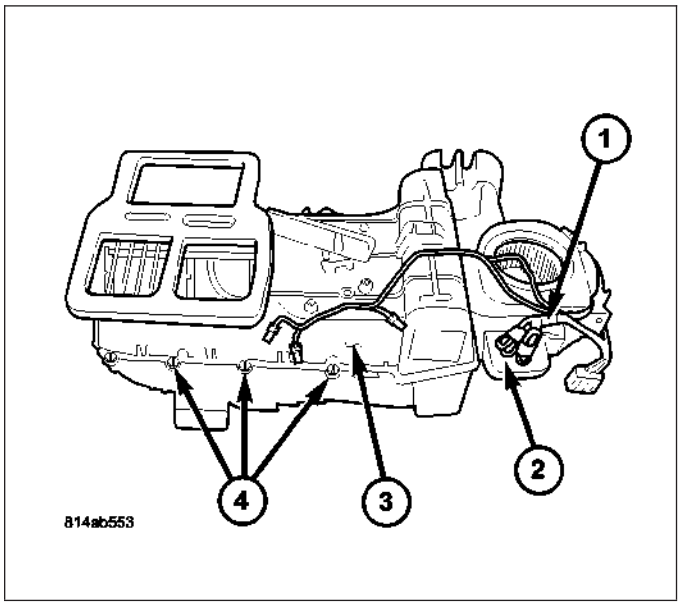
13. Remove the two screws (1) that secure the HVAC housing retaining bracket (2) to the top of the HVAC housing (3).
14. Remove the HVAC housing retaining bracket from the HVAC housing.
15. Remove the two screws (4) that secure the heater core retaining bracket (5) to the top of the HVAC housing.
16. Carefully remove the heater core (6) from the HVAC housing.



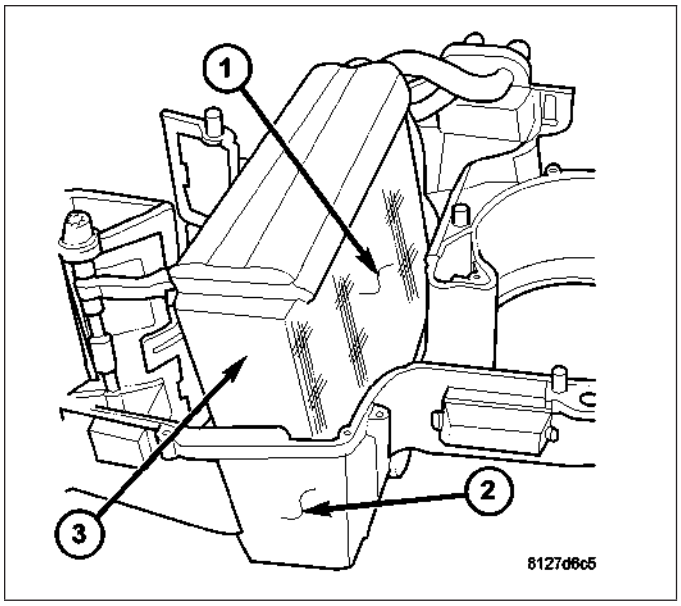
17. Disconnect the HVAC wiring harness (1) from the blower motor (2).
18. Remove the blower motor from the HVAC housing (3) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/MOTOR-BLOWER - REMOVAL).
19. Remove the evaporator temperature sensor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/SENSOR-EVAPORATOR TEMPERATURE - REMOVAL).



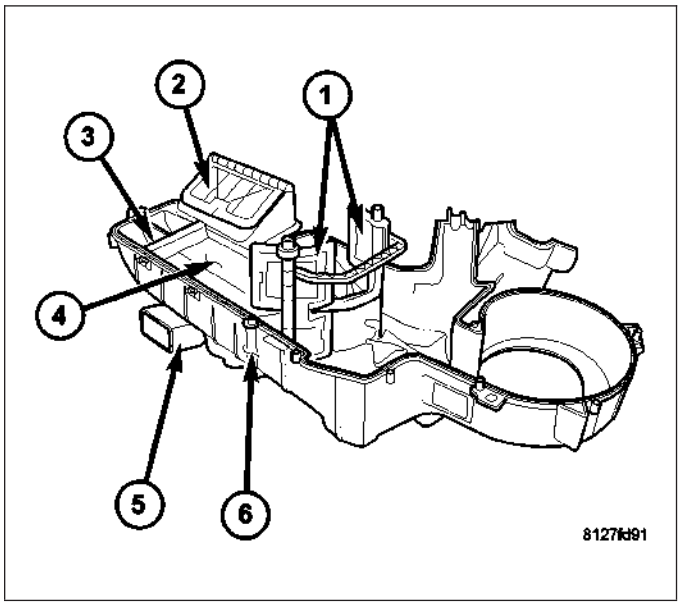
20. Disconnect the HVAC wiring harness (1) from the blower motor resistor or power module (2), depending on application.
21. If necessary, remove the blower motor resistor or power module, depending on application (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/RESISTOR-BLOWER MOTOR - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/MODULE-POWER-BLOWER MOTOR - REMOVAL).
22. Remove the HVAC wiring harness from the HVAC housing (3).
23. Remove the screws (4) that secure the two halves of the HVAC housing together.
24. Separate the two halves of the HVAC housing.
25. If necessary, remove the mode-air doors from the upper half of the HVAC housing.



26. Carefully lift the A/C evaporator (1) and insulator (3) out of the top of the HVAC housing (2).

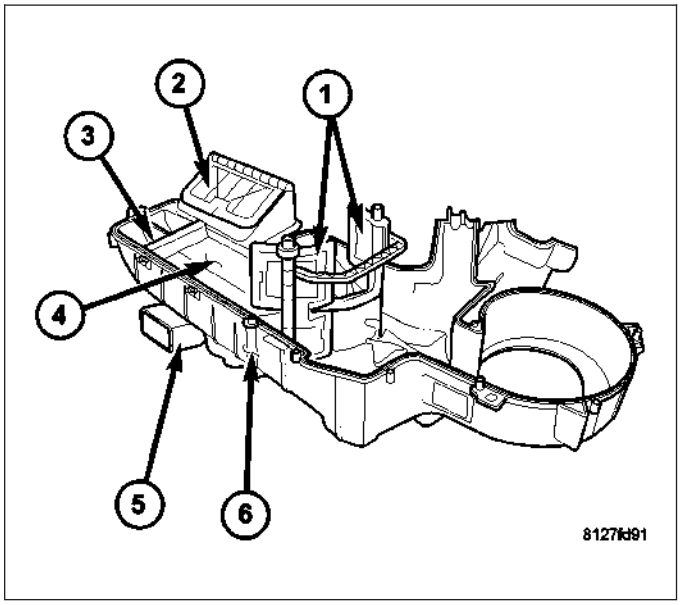


27. Remove the blend-air doors and linkage (1), mode-air door (2), baffle (3) and the duct plate (4) from the lower half of the HVAC housing (6).
28. If necessary, remove the floor distribution duct (5) from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ DUCTS-FLOOR DISTRIBUTION - REMOVAL).

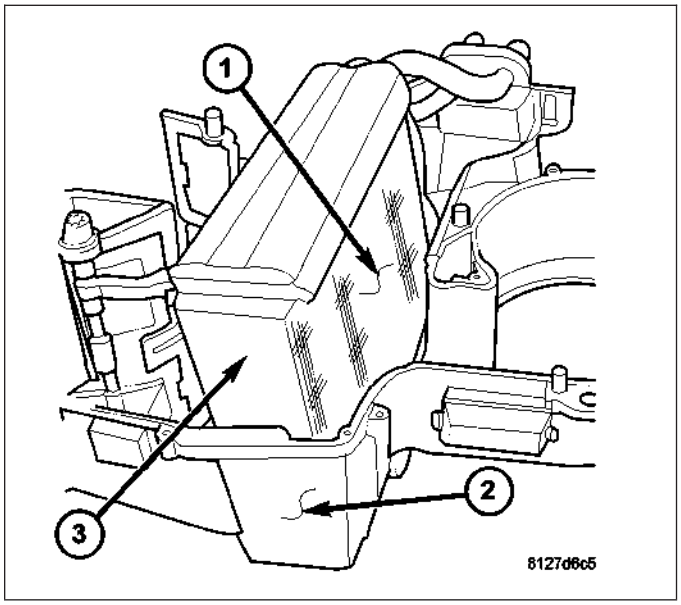


ASSEMBLY

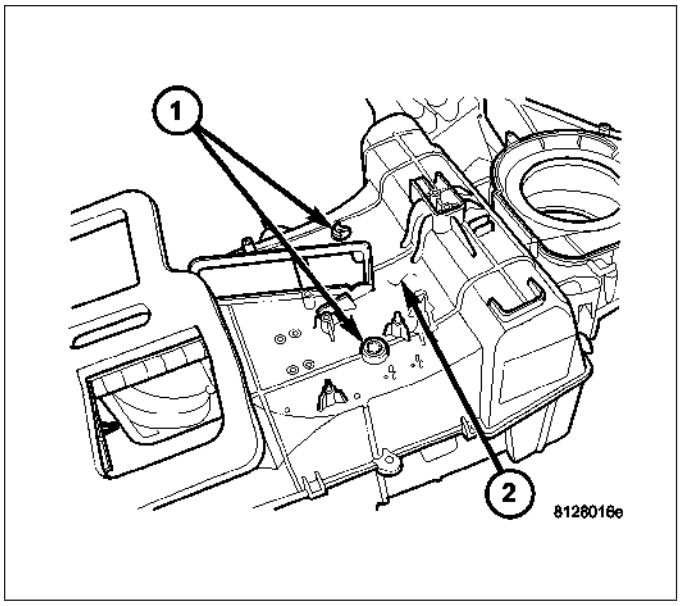
1. If removed, install the floor distribution duct (5) to the HVAC housing (6) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/ DUCTS-FLOOR DISTRIBUTION - INSTALLATION).
2. Install the blend-air doors and linkage (1), mode-air door (2), baffle (3) and the duct plate (4) into the lower half of the HVAC housing.



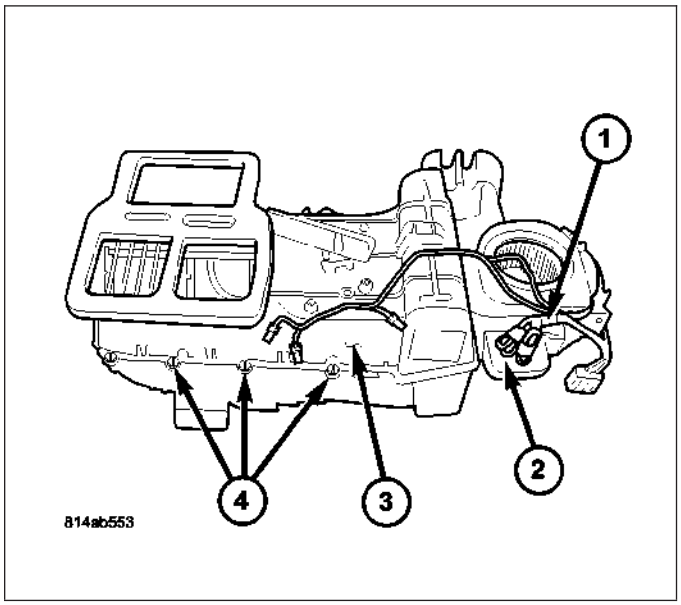
3. Install the A/C evaporator (1) into the lower half of the HVAC housing (2). Make sure that the evaporator drain is clean and unrestricted and that the evaporator insulator (3) is properly installed.



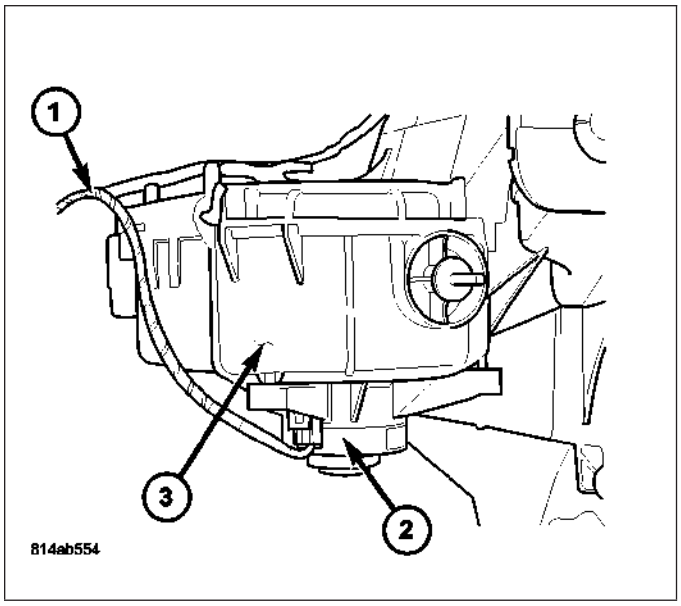
4. If removed, install the mode-air doors into the upper half of the HVAC housing (2).
5. Align the ends of the blend-air door pivot shafts (1) to the openings in the upper half of the HVAC housing and install the upper housing half to the lower housing half.



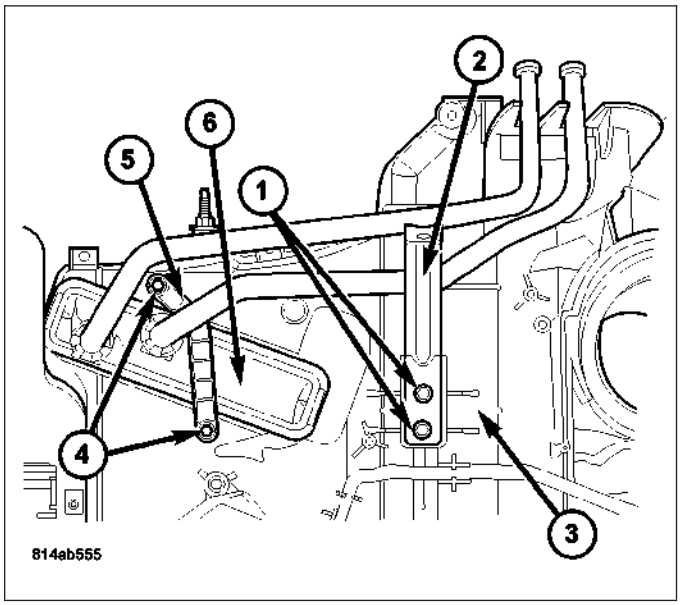
6. Install the screws (4) that secure the two halves of the HVAC housing (3) together. Tighten the screws to 2.2 N·m (20 in lbs.).
7. Install the HVAC wiring harness (1). Make sure the harness is routed through all wiring retainers.
8. If removed, install the blower motor resistor or power module (2), depending on application.
9. Connect the HVAC wire harness to the blower motor resistor or power module, depending on application.



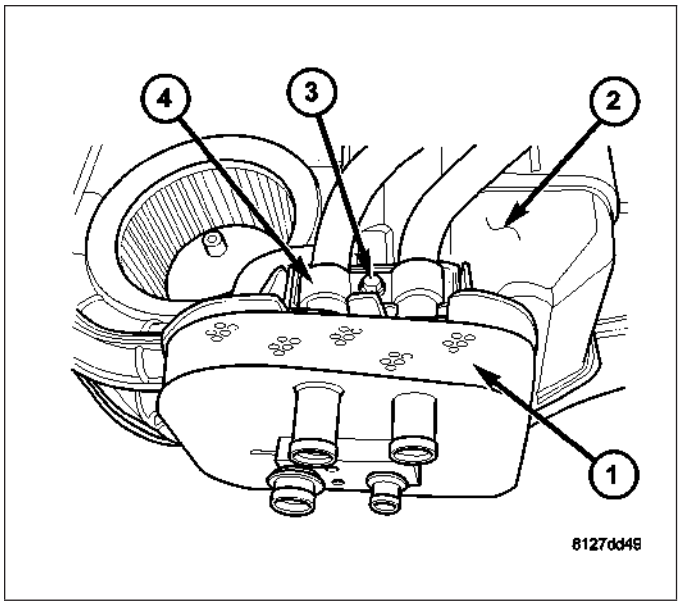
10. Install the blower motor (2) to the HVAC housing (3) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/MOTOR-BLOWER - INSTALLATION).
11. Connect the HVAC wire harness (1) to the blower motor.



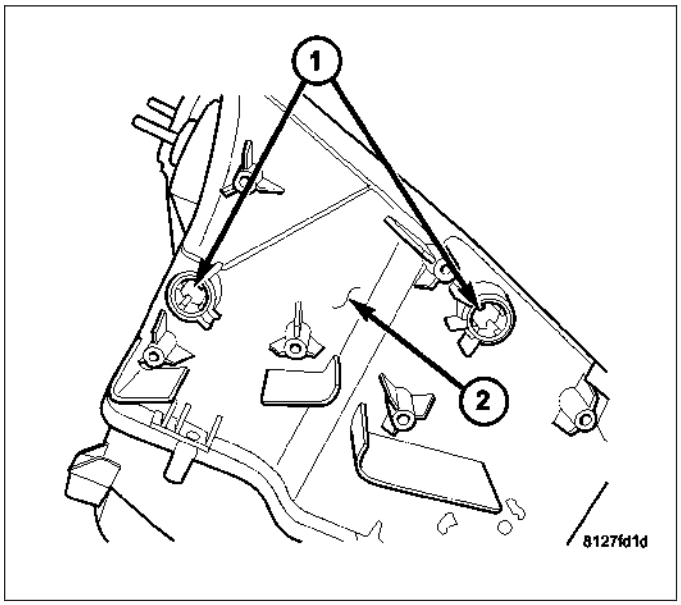
12. Carefully install the heater core (6) into the top of the HVAC housing (3). Make sure that the heater core insulator is properly positioned.
13. Install the two screws (4) that secure the heater core retaining bracket (5) to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
14. Install the HVAC housing bracket (2) to the top of HVAC housing.
15. Install the two screws (1) that secure the HVAC housing bracket to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).



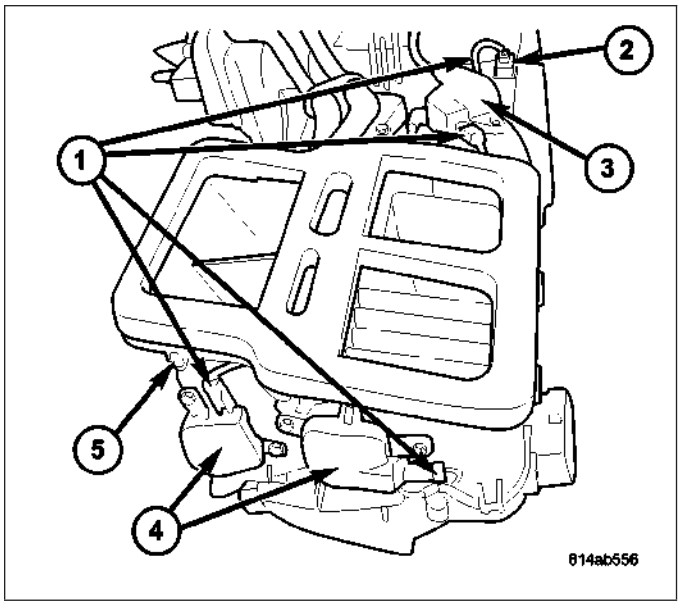
16. Install the heater core tube retaining bracket (4) to the top of the HVAC housing (2).
17. Install the screw (3) that secures the heater core tube retaining bracket to the HVAC housing. Tighten the screw to 2.2 N·m (20 in. lbs.).
18. Install the foam seal (1) to the flange on the HVAC housing.



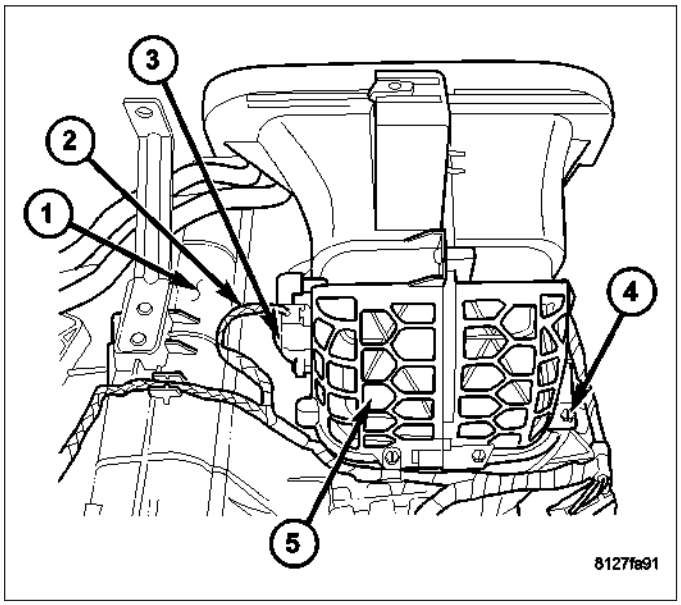
19. Align the two actuator couplers (1) with the mode-air door pivot shafts and install the couplers into the left side of the HVAC housing. Be sure to install the couplers with the coupler arm located between the two stop tabs on the HVAC housing.



20. Install the blend door actuator (3) and the mode door actuators (4) to the HVAC housing (5) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/ACTUATOR-BLEND DOOR - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/ACTUATOR-MODE DOOR - INSTALLATION).
21. Install the evaporator temperature sensor (2) into the top of the HVAC housing.
22. Connect the HVAC wire harness (1) to the evaporator temperature sensor, blend door actuator and the mode door actuators.

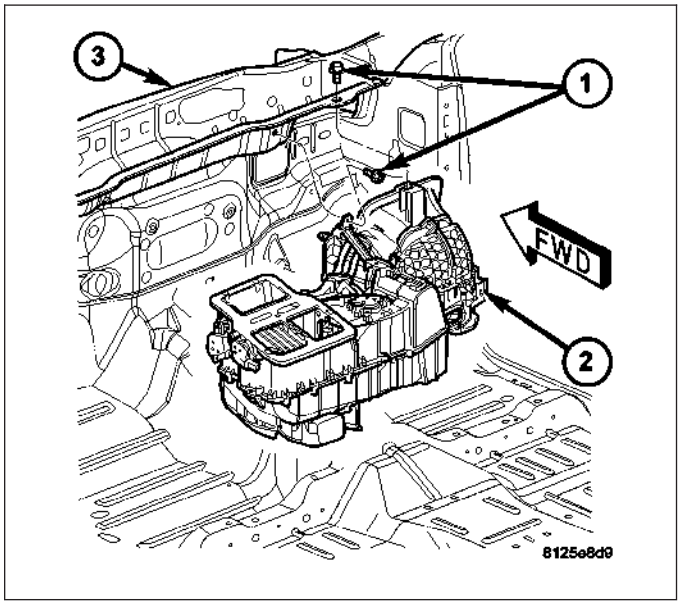


23. If removed, install the recirculation door actuator (3) to the air inlet housing (5).
24. Install the air inlet housing onto the top of the HVAC housing (1).
25. Install the screws (4) that secure the air inlet housing to the HVAC housing. Make sure the HVAC wire harness retainer is properly installed.
26. Connect the HVAC wire harness to the recirculation door actuator (3).
27. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - INSTALLATION).

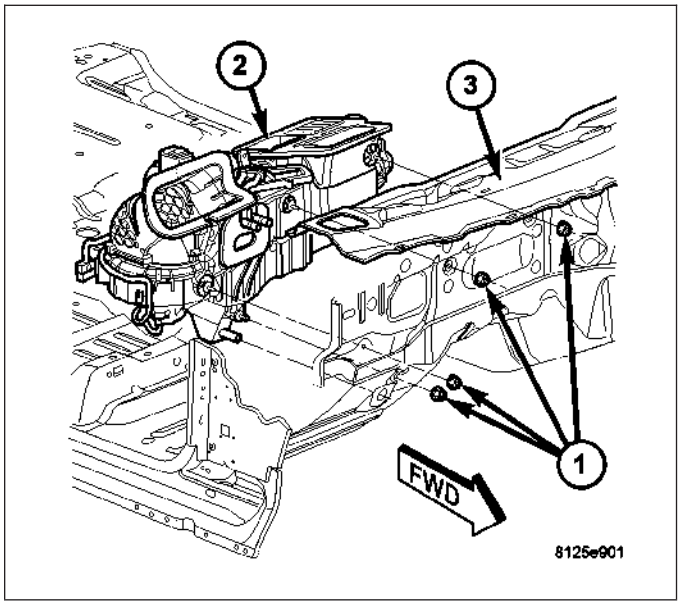


INSTALLATION

1. Position the HVAC housing (2) into the passenger compartment with the mounting studs and the condensate drain tube in their proper mounting locations in the dash panel (3).
2. Loosely install the two bolts (1) that secure the HVAC housing to the passenger compartment side of the dash panel.



3. Install the four nuts (1) that secure the HVAC housing (2) to the engine compartment side of the dash panel (3). Tighten the nuts to 7 N·m (62 in. lbs.).
4. Tighten the two bolts that secure the HVAC housing to the passenger compartment side of the dash panel. Tighten the bolt(s) to 3 N·m (26 in. lbs.).
5. Connect the intermediate floor distribution duct to front floor distribution duct.
6. Install the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
7. Remove previously installed plugs or caps and reconnect the heater hoses to the heater core tubes.
8. Remove previously installed plugs or caps and reconnect the suction line and liquid line to the expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - INSTALLATION).

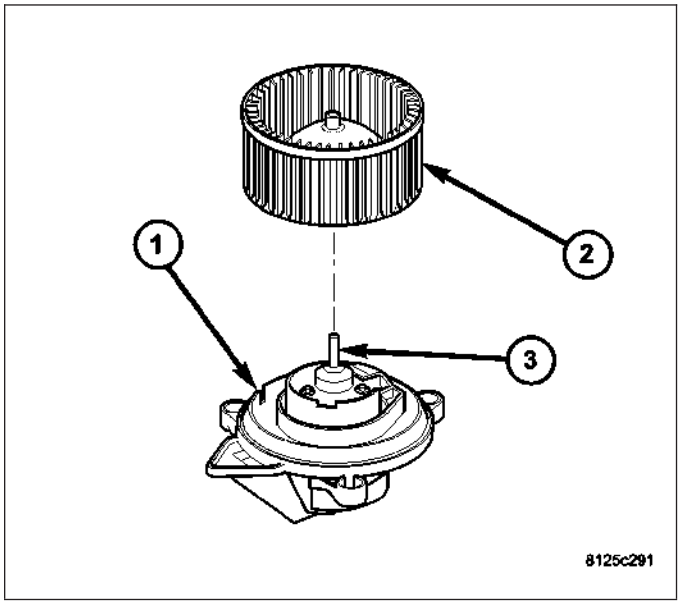


9. Reconnect the negative battery cable.
10. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
11. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

MOTOR-BLOWER

DESCRIPTION

The blower motor (1) is a 12-volt, direct current (DC) motor with a squirrel cage-type blower wheel (2) that is secured to the blower motor shaft (3). The blower motor and wheel are located near the passenger side end of the HVAC housing in the passenger compartment below the instrument panel.



OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the housing at the selected speed whenever the ignition switch is in the On position and the blower control switch is in any position except Off.

Blower motor speed is controlled by regulating the path to ground through the blower motor control switch and the blower motor resistor. The blower motor receives battery current whenever the blower motor relay is energized. The blower motor relay output circuit is protected by a fuse in the integrated power module (IPM) located in the engine compartment.

The blower motor and blower motor wheel are factory balanced and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as an assembly.

DIAGNOSIS AND TESTING

BLOWER MOTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams. Possible causes of an inoperative front or rear blower motor include:

- Faulty fuse (the rear blower motor fuse is located in the relay and fuse block located on the back of the junction block)
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor resistor block
- Faulty blower motor relay (Voltage Reduction Relay or VRR) (front only)
- Faulty blower motor switch
- Faulty heater-A/C mode control switch (front only)
- Faulty blower motor.

Possible causes of the front or rear blower motor not operating in all speeds include:

- Faulty fuse (the rear blower motor fuse is located in the relay and fuse block located on the back of the junction block)
- Faulty blower motor switch
- Faulty blower motor resistor block
- Faulty blower motor relay (front only)
- Faulty blower motor circuit wiring or wire harness connectors

VIBRATION

Possible causes of front or rear blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or deformed
- Foreign material in blower wheel causing out of balance condition
- Blower motor faulty.

NOISE

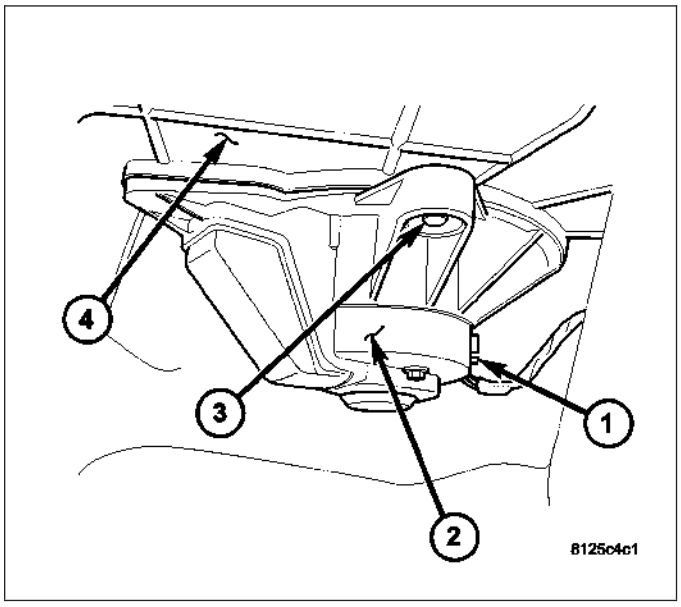
To determine if the front or rear blower motor is the source of the noise, simply switch the front or rear blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

REMOVAL

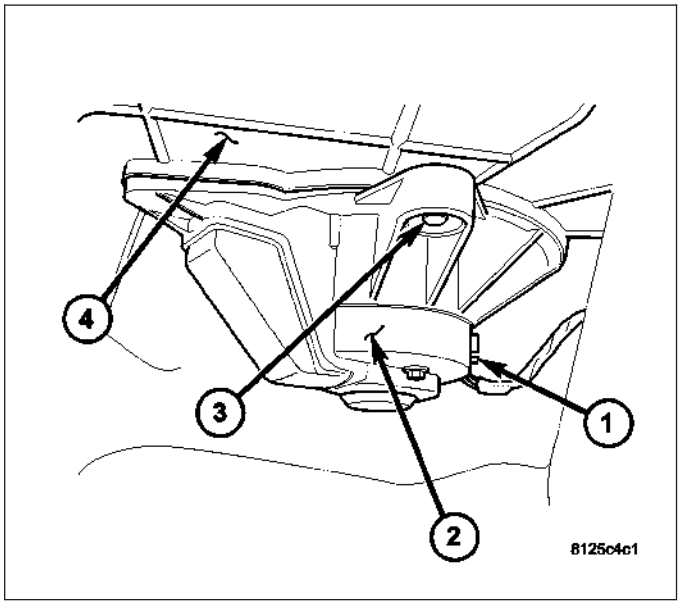
WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the right front door sill trim panel (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
3. Remove the right side interior cowl trim cover (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
4. Disconnect the wire harness connector (1) from the blower motor (2).
5. Remove the three screws (3) that secure the blower motor and blower wheel assembly to the HVAC housing (4).
6. Remove the blower motor and blower wheel assembly from the HVAC housing.



INSTALLATION

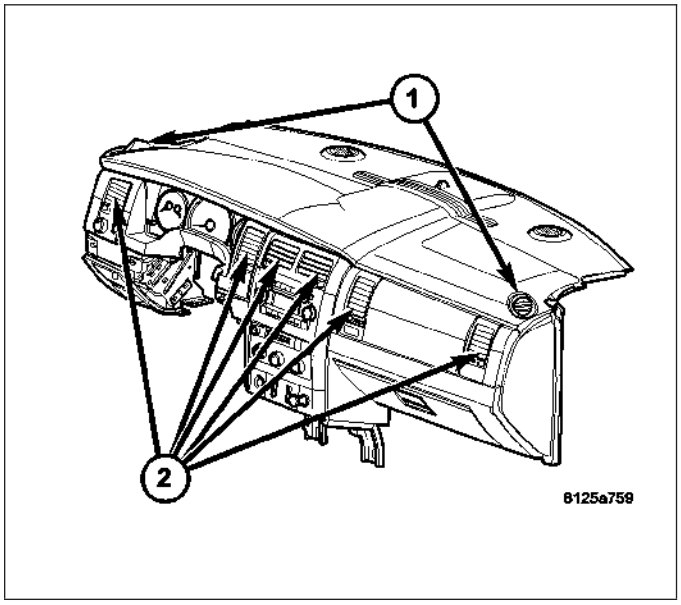
1. Position the blower motor and blower wheel assembly (2) into the HVAC housing (4).
2. Install the three screws (3) that secure the blower motor and blower wheel assembly to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor.
4. Install the right side interior cowl trim cover (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).
5. Install the right front door sill trim panel (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).
6. Reconnect the negative battery cable.



OUTLET-AIR

DESCRIPTION

There are two side window demister air outlets (1). One located on each end of the instrument panel top pad. The airflow from the side window demister air outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister air outlets are serviceable from the instrument panel top pad.

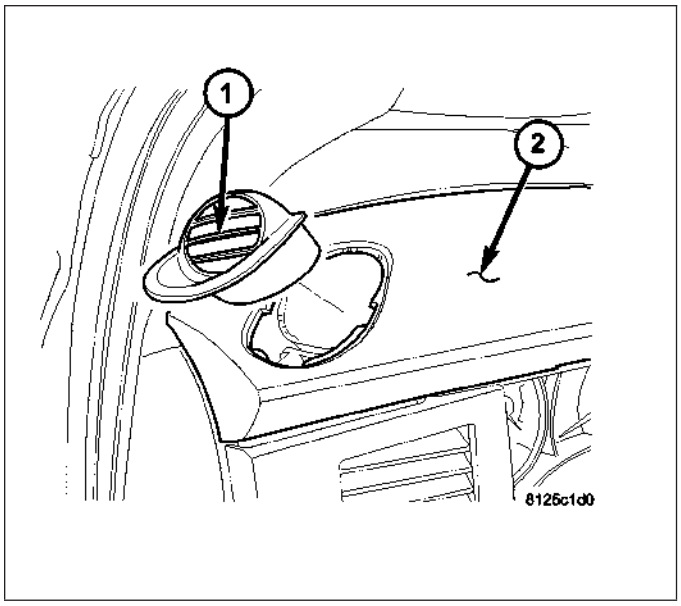


There are six instrument panel air outlets (2). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle, one air outlet is located on each side of the instrument panel center bezel, and two air outlets are located on the top of the instrument panel center bezel. Each of the instrument panel air outlets contain a grille with movable vanes that are used to direct or shut off the flow of the conditioned air leaving the instrument panel outlets. The instrument panel air outlets and grilles cannot be serviced separately (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL), (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL) and (Refer to 23 - BODY/INSTRUMENT PANEL/IP PASSENGER SIDE BEZEL - REMOVAL).

REMOVAL - DEMISTER OUTLETS

NOTE: The instrument panel demister outlets are retained into the instrument panel top pad by a light snap fit.

1. Using a trim stick or another suitable wide flat-bladed tool, gently pry the instrument panel demister outlet(s) (1) out of the instrument panel top pad (2) as required.



INSTALLATION - DEMISTER OUTLETS

1. Position the instrument panel demister outlet(s) (1) onto the instrument panel top pad (2).
2. Gently push the demister outlet(s) into the top pad until it snaps into place.

DUCT-DISTRIBUTION

REMOVAL

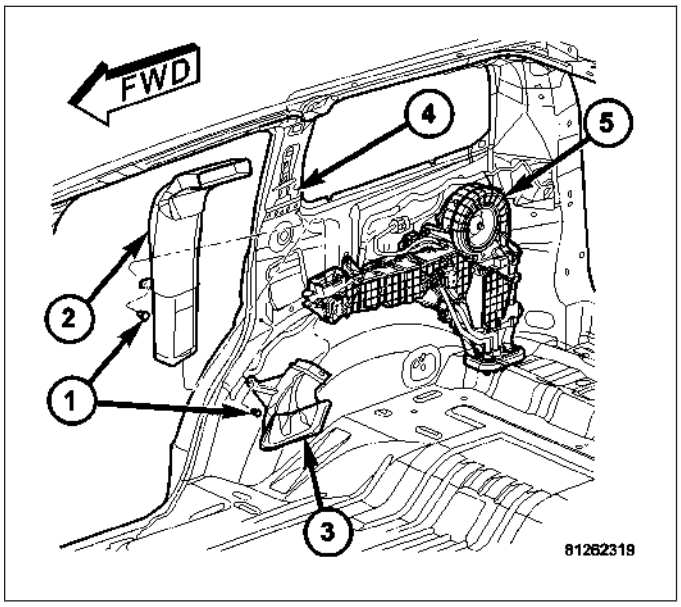
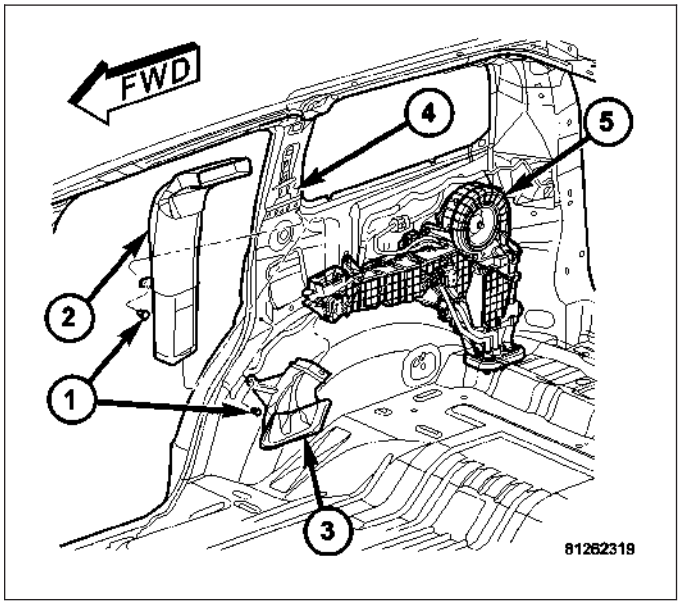
1. Remove the right interior quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
2. Remove the push-pin fasteners (1) that secure the rear ceiling distribution duct (2) and the rear floor distribution duct (3) to the right interior quarter panel (4).
3. Disconnect the rear ceiling distribution duct from the rear HVAC housing (5) by sliding the lower half of the ceiling distribution duct into the upper half of the ceiling distribution duct.
4. Disconnect the rear ceiling distribution duct from the headliner duct and remove the ceiling distribution duct from the vehicle.
5. Disconnect the rear floor distribution duct from the rear HVAC housing and remove the floor distribution duct from the vehicle.



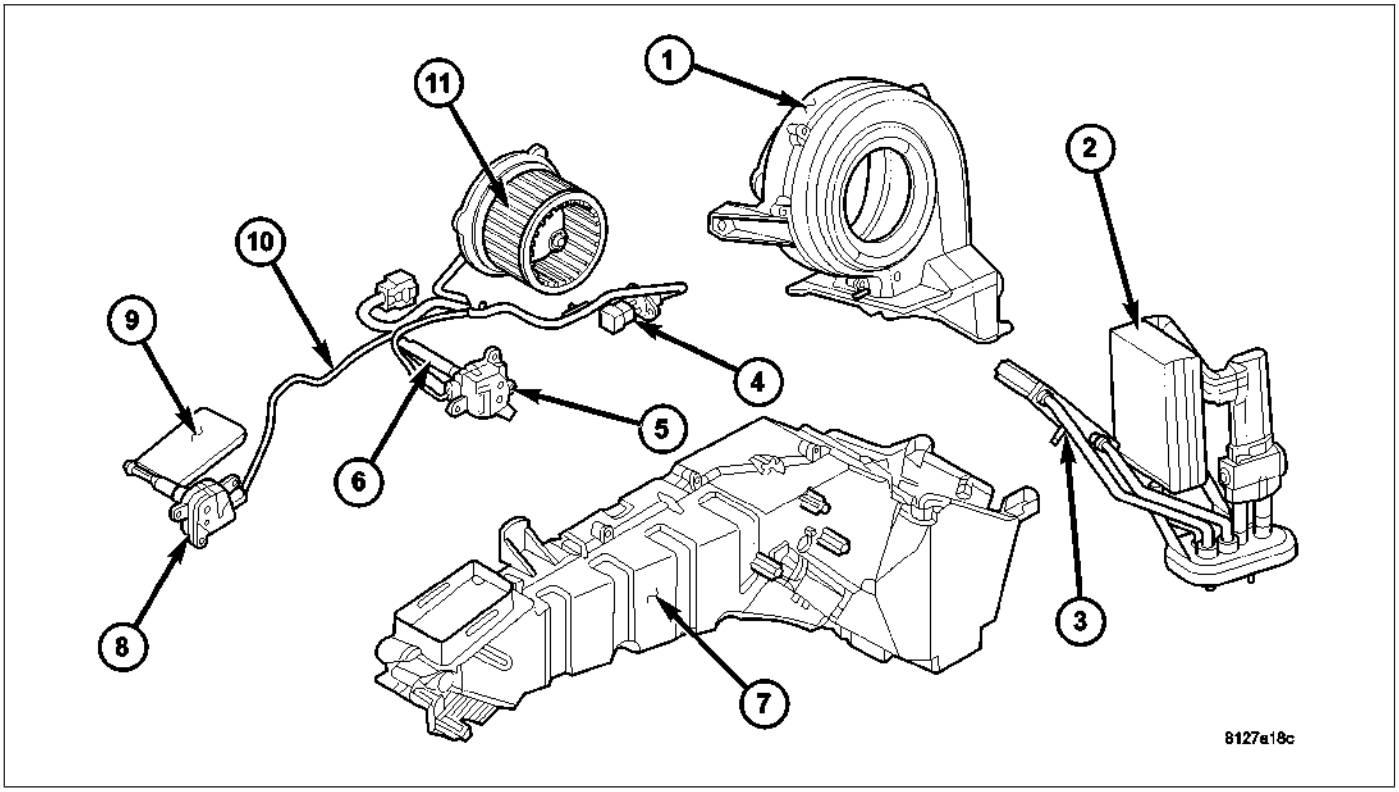
INSTALLATION

1. Connect the rear floor distribution duct (3) to the rear HVAC housing (5).
2. Connect the rear ceiling distribution duct (2) to the headliner duct and the rear HVAC housing. Make sure that the rear ceiling distribution duct is fully installed to ensure a good seal.
3. Install the push-pin fasteners (1) that secure the rear ceiling distribution duct and the rear floor distribution duct to the right interior quarter panel (4).
4. Install the right interior quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).



HOUSING-HVAC

DESCRIPTION



Models equipped with the rear heating-A/C system are equipped with a common rear heater and A/C housing (7) that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The rear heating-A/C system is a blend-air type system. A blend-air door (6) controls the amount of conditioned air that is allowed to flow through, or around, the heater core (3). The rear A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator (2) to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator

(5) , which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door actuator (8) operates the mode-air door (9) which directs the flow of the conditioned air out the upper or lower air outlets, depending on the discharge air temperature selected. Both electric actuators are connected to the vehicle electrical system by the HVAC wire harness (10). The rear blower motor (11) controls the velocity of air flowing through the rear HVAC housing by spinning the blower wheel within the rear blower motor housing (1) at the selected speed by use of the rear blower motor resistor block (4).

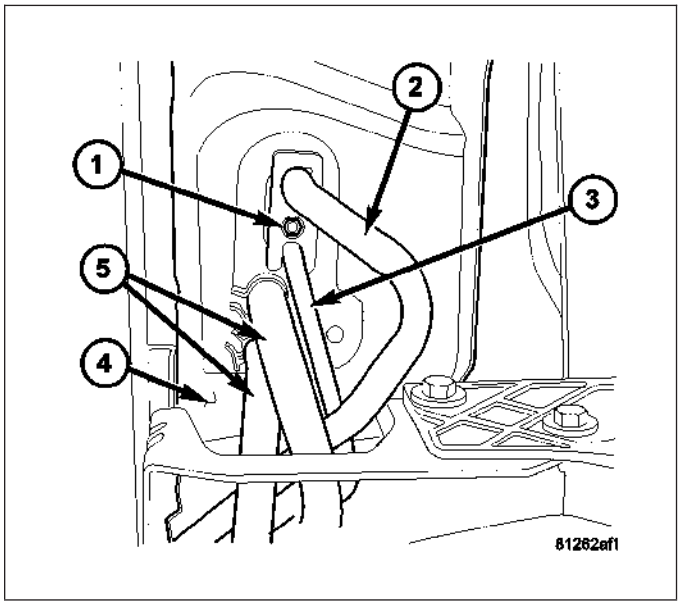
The rear HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, heater core, mode-air door, blend-air door and blower motor.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

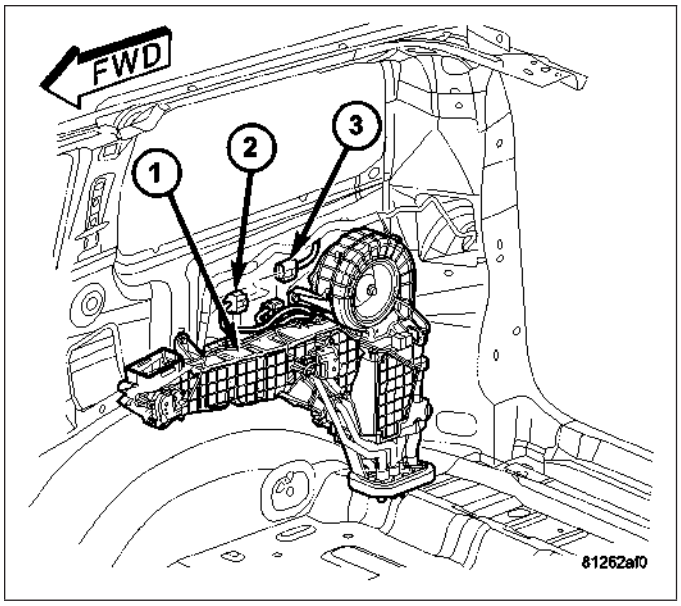
NOTE: The rear HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, heater core, mode-air door, blend-air door and blower motor.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Raise and support the vehicle.
5. Remove the nut (1) that secures the rear suction line (2) and the rear liquid line (3) to the rear evaporator extension line tapping plate that extends through the rear floor panel (4) behind the right rear wheel housing.
6. Disconnect the rear suction line and liquid line from the rear evaporator extension line tapping plate.
7. Remove the O-ring seals from the rear suction line and liquid line fittings and discard.

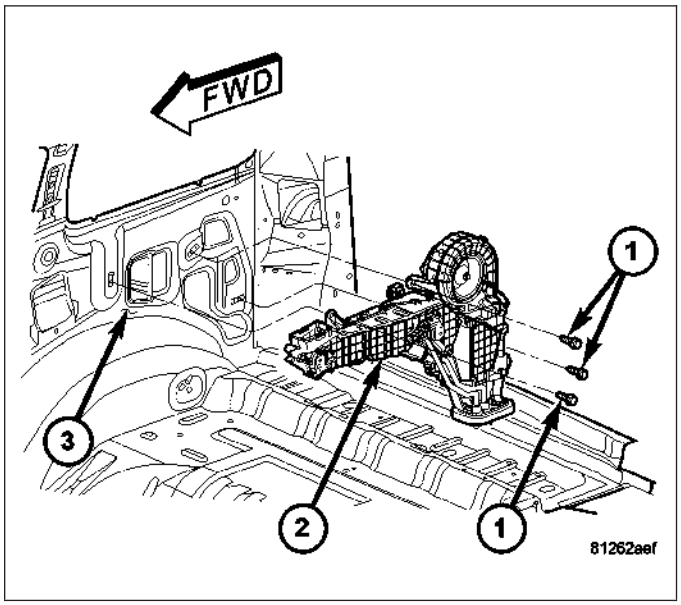


8. Install plugs in, or tape over the opened refrigerant lines and tapping plate ports.
9. Disconnect the rear heater hoses (5) from the rear heater core tubes that extend through the rear floor panel behind the right rear wheel housing.

10. Lower the vehicle.
11. Remove right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
12. Remove the rear distribution ducts from the rear HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/DUCTS-DISTRIBUTION - REMOVAL)
13. Disconnect the body wire harness connector (2) from the rear HVAC wire harness connector (3).



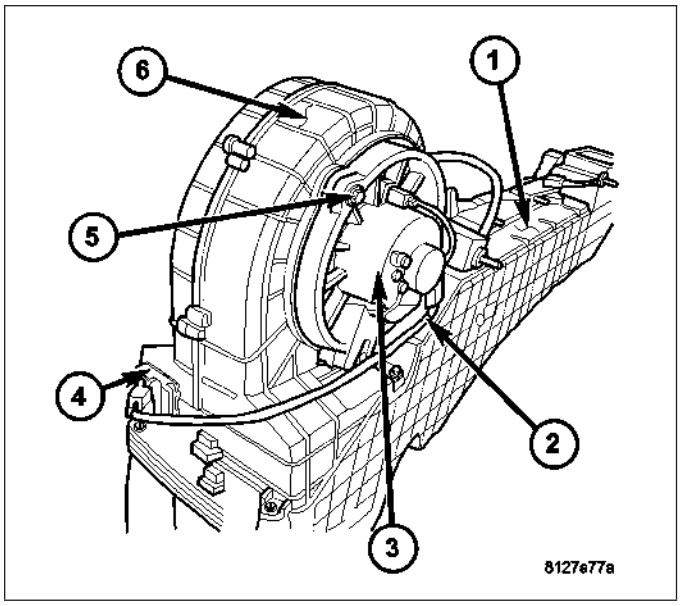
14. Remove the three bolts (1) that secure the rear HVAC housing (2) to the rear interior quarter panel (3).
15. Remove the rear HVAC housing from the vehicle.



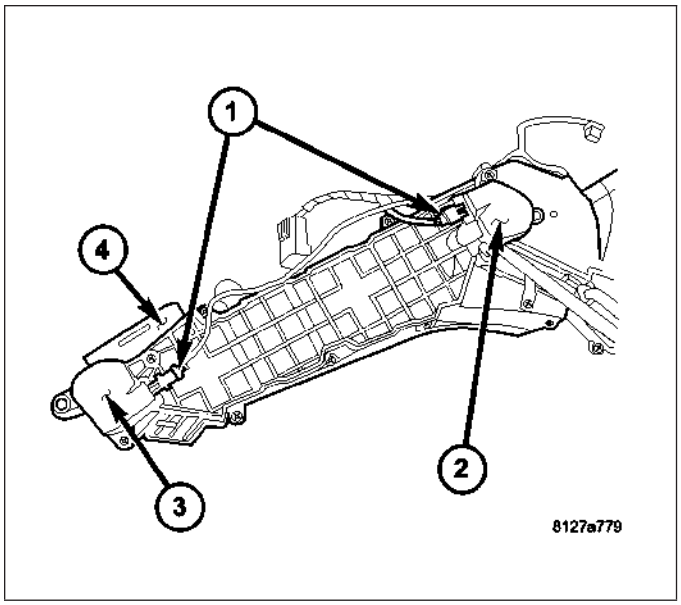
DISASSEMBLY

NOTE: The rear HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator, heater core, mode-air door, blend-air door and blower motor.

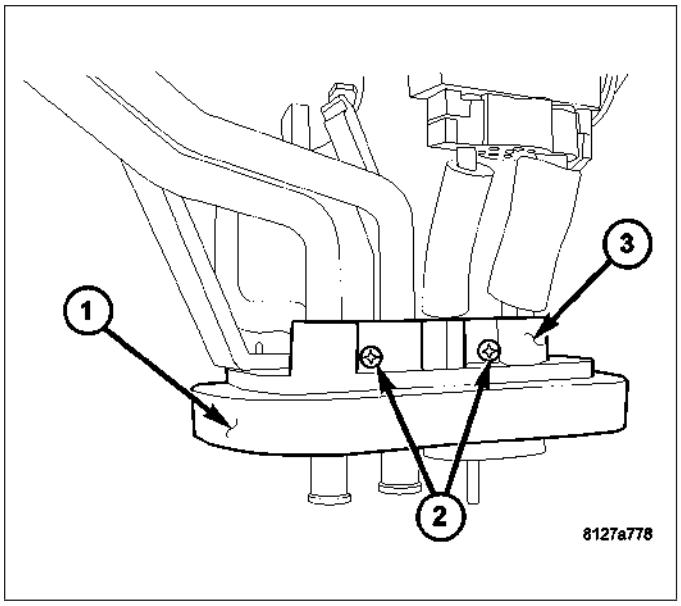
1. Remove the rear HVAC housing (1) and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - REMOVAL).
2. Disconnect the rear HVAC wire harness (2) from the rear blower motor (3) and the rear blower motor resistor (4).
3. If necessary, remove the rear blower motor (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/MOTOR-BLOWER - REMOVAL).
4. If necessary, remove the rear blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/RESISTOR-BLOWER MOTOR - REMOVAL).
5. Remove the screws (5) that secure the rear air inlet housing (6) to the rear HVAC housing.
6. Remove the rear air inlet housing from the rear HVAC housing.



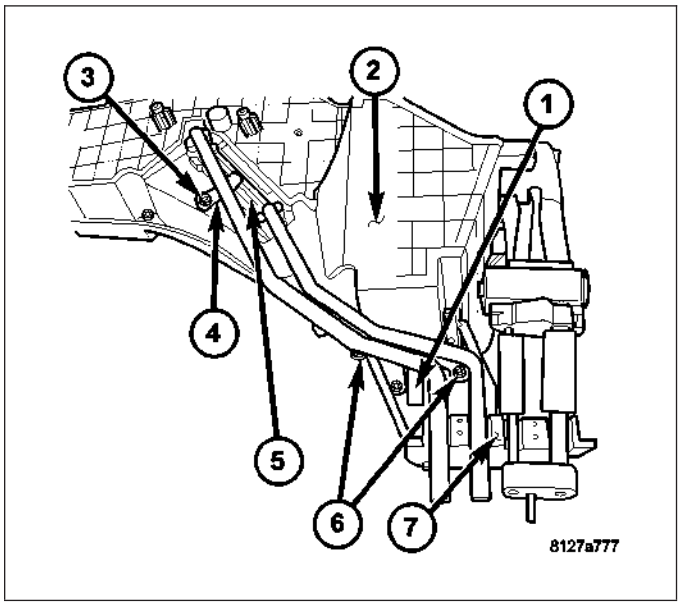
7. Disconnect the rear HVAC wire harness (1) from rear blend door actuator (2) and mode door actuator (3).
8. Remove the rear blend door actuator and mode door actuator from the rear HVAC housing (4) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS -REAR/ACTUATOR-BLEND DOOR - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/ACTUATOR-MODE DOOR - REMOVAL).



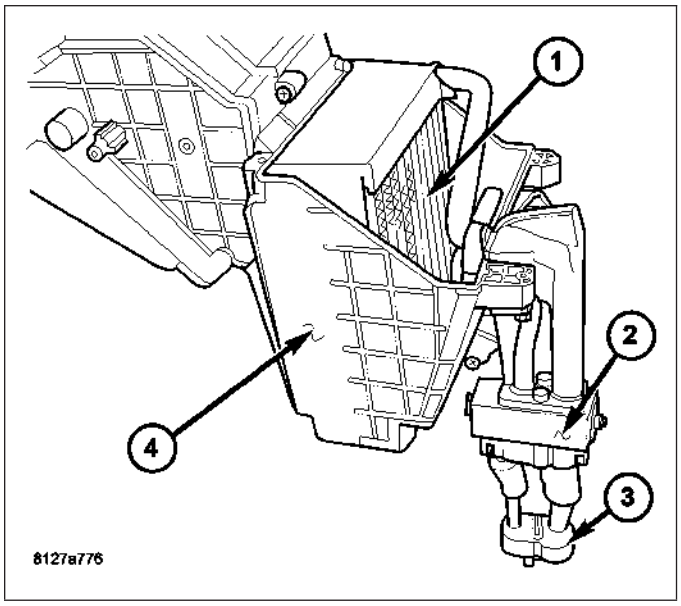
9. Carefully remove the foam seal (1) from the rear heater core and evaporator extension line flange (3). If the seal is deformed or damaged, it must be replaced.
10. Remove the screws (2) that secure the two halves of the rear heater core and evaporator extension line flange together.
11. Remove the outer half of the rear heater core and evaporator extension line flange.



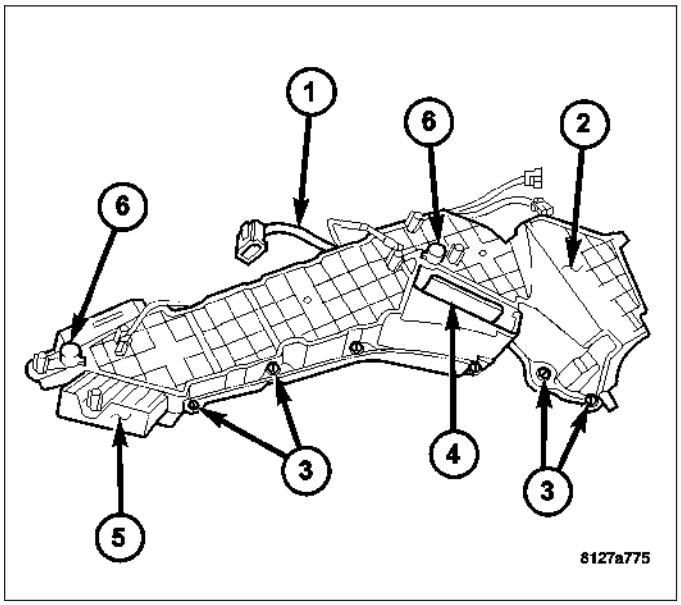
12. Disconnect the condensate drain tube (1) from the rear HVAC housing (2).
13. Remove the screw (3) that secures the rear heater core tube retaining bracket (4) to the rear HVAC housing.
14. Remove the rear heater core tube retaining bracket.
15. Carefully pull the rear heater core (5) out of the side of the rear HVAC housing.
16. Remove the two screws (6) that secure the rear extension line flange bracket (7) to the bottom of the rear HVAC housing.



17. Carefully lift the rear A/C evaporator (1), rear expansion valve (2) and the rear extension line bracket (3) as an assembly out of the top of the rear HVAC housing (4).

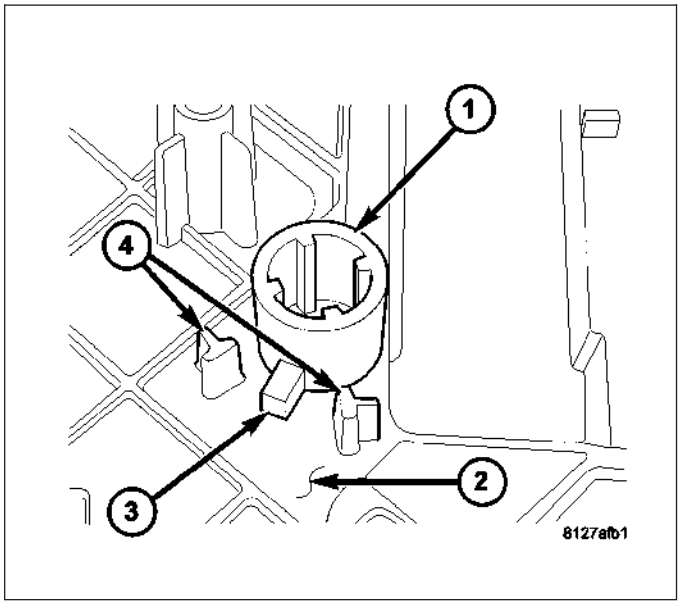


18. Remove the rear HVAC wiring harness (1) from the rear HVAC housing (2).
19. Remove the screws (3) that secure the two halves of the rear HVAC housing together.
20. Separate the two halves of the rear HVAC housing.
21. Remove the blend-air door (4) and mode-air door (5) from the rear HVAC housing.
22. If necessary, remove the actuator couplers (6) from the rear HVAC housing.

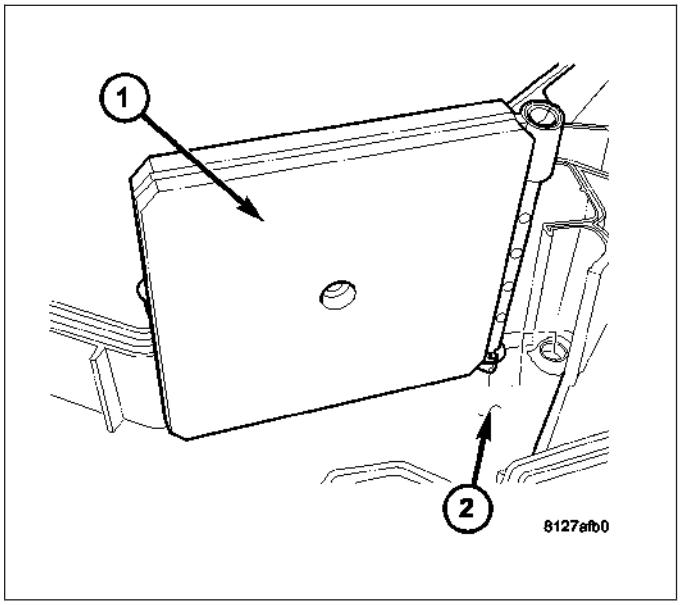


ASSEMBLY

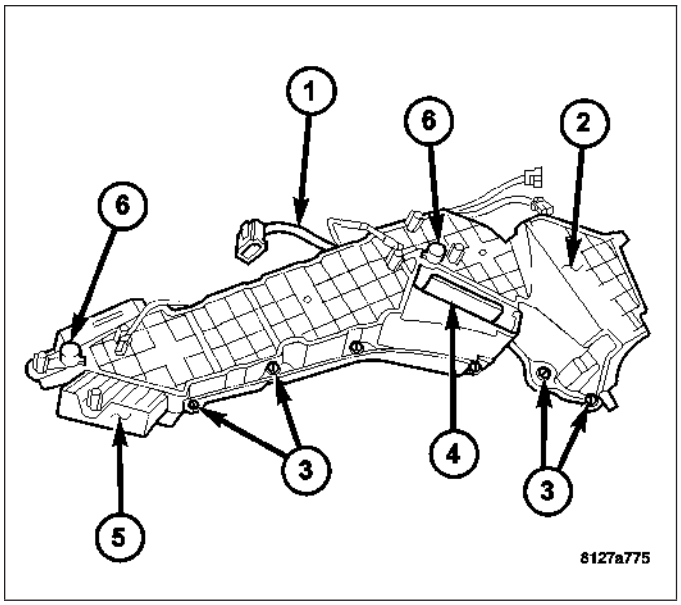
1. If removed, install the two actuator couplers (1) into the rear HVAC housing. Be sure to install the couplers with the coupler arm (3) located between the two stop tabs (4) on the HVAC housing.



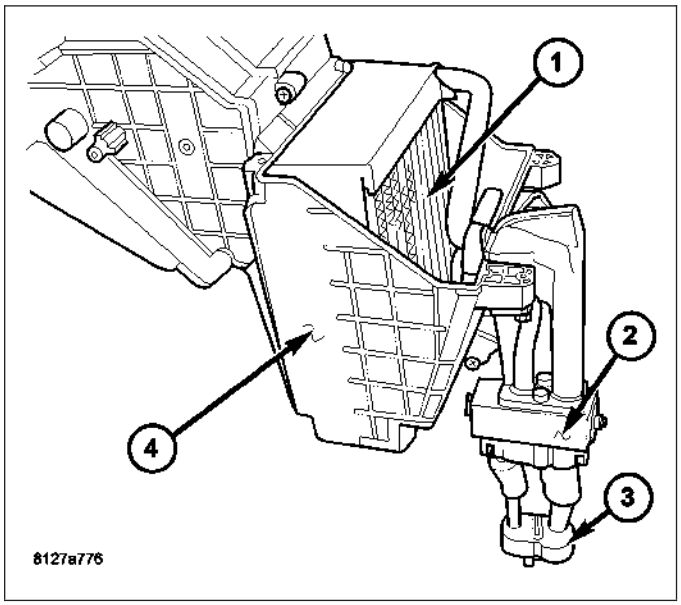
2. Install the blend-air door (1) and the mode-air door into the rear HVAC housing (2).



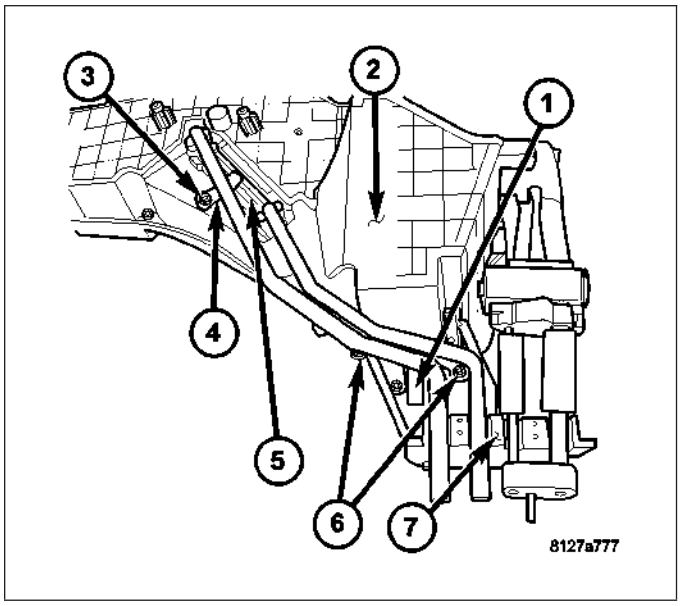
3. Align the pivot shafts of the blend-air door (4) and the mode-air door (5) to the actuator couplers (6) and install the two halves of the rear HVAC housing (2) together.
4. Install the screws (3) that secure the two halves of the rear HVAC housing together. Tighten the screws to 2 N·m (17 in. lbs.).
5. Install the HVAC wire harness (1). Make sure the harness is routed through all wiring retainers.



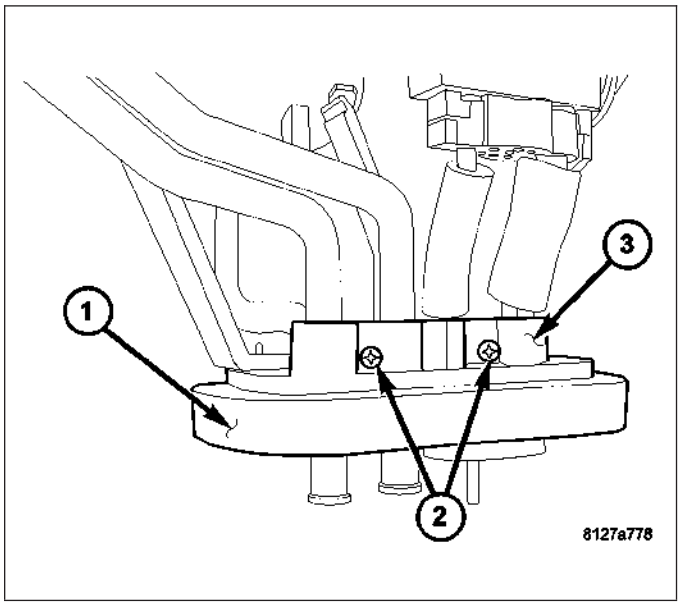
6. Install the rear A/C evaporator (1), rear expansion valve (2) and the rear extension line bracket (3) as an assembly into the top of the rear HVAC housing (4). Make sure that the evaporator drain is clean and unrestricted and that the evaporator insulator is properly installed.



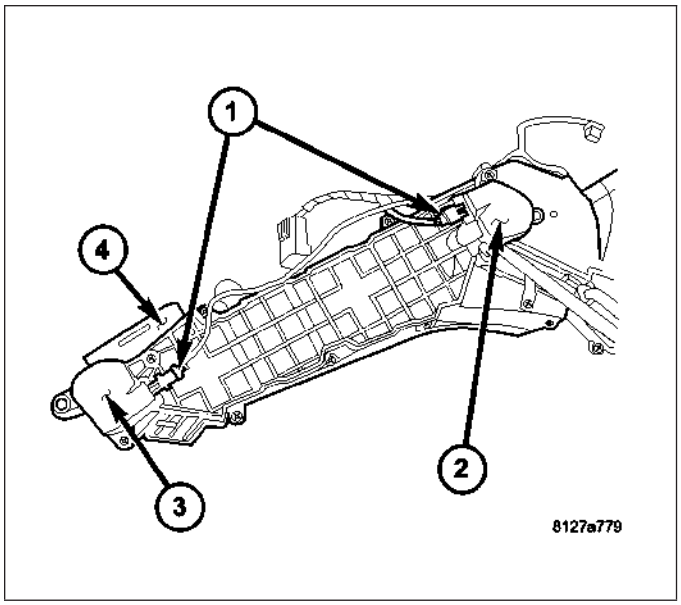
7. Install the two screws (6) that secure the rear extension line flange bracket (7) to the bottom of the rear HVAC housing (2). Tighten the screws to 2 N·m (17 in. lbs.).
8. Install the rear heater core (5) into the side of the rear HVAC housing. Make sure that the insulator is properly installed.
9. Install the rear heater core retaining bracket (4).
10. Install the screw (3) that secures the rear heater core retaining bracket to the rear HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).
11. Connect the condensate drain tube (1) to the rear HVAC housing.



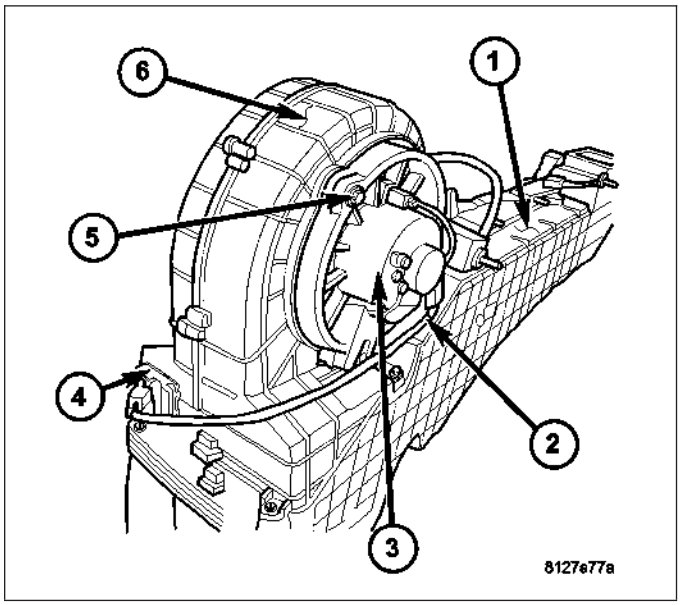
12. Install the outer halve of the rear heater core and evaporator extension line flange (3).
13. Install the screws (2) that secure the two halves of the rear heater core and evaporator extension line flange together. Tighten the screws to 2 N·m (17 in. lbs.).
14. Install the foam seal (1) to the rear heater core and evaporator extension line flange.



15. Install the blend door actuator (2) and the mode door actuator (3) to the rear HVAC housing (4) (Refer to 24 - HEATING & AIR CONDITIONING/ CONTROLS - REAR/ACTUATOR-BLEND DOOR - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/ACTUATOR-MODE DOOR - INSTALLATION).
16. Connect the rear HVAC wire harness (1) to the rear blend door actuator and mode door actuator.

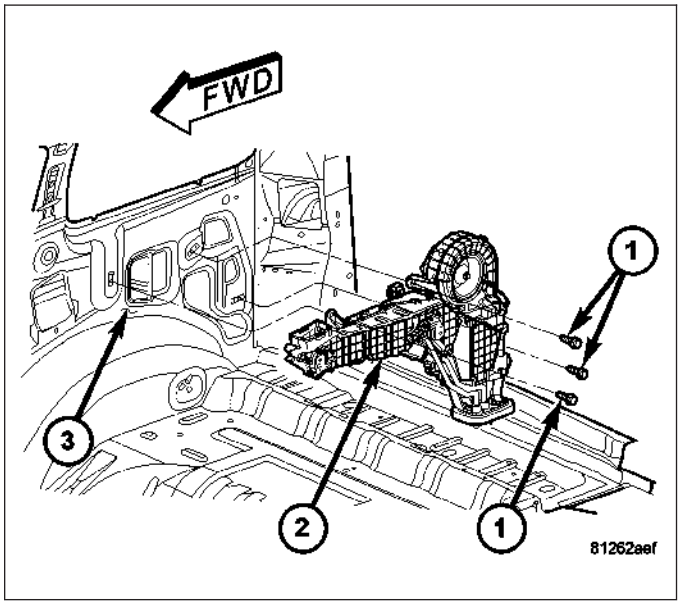


17. Install the rear air inlet housing (6) onto the rear HVAC housing (1).
18. Install the screws (5) that secure the rear air inlet housing to the rear HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
19. If removed, install the rear blower motor resistor (4) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/RESISTOR-BLOWER MOTOR - INSTALLATION).
20. If removed, install the rear blower motor (3) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/MOTOR-BLOWER - INSTALLATION).
21. Connect the rear HVAC wire harness (2) to the rear blower motor and the rear blower motor resistor.
22. Install the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - INSTALLATION).

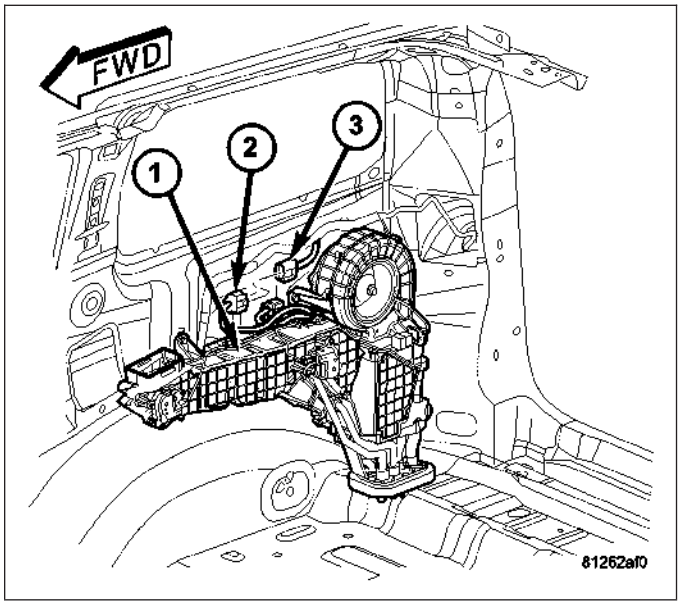


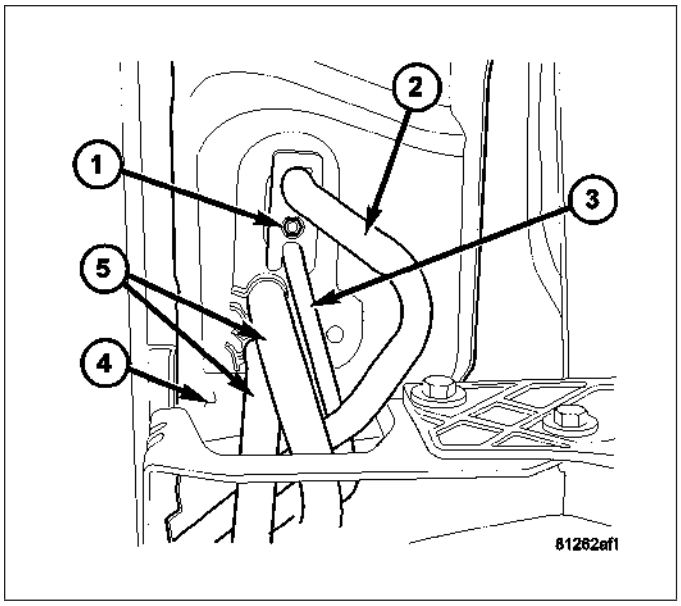
INSTALLATION

1. Position the rear HVAC housing (2) into the vehicle.
2. Install the three bolts (1) that secure the rear HVAC housing to the rear interior quarter panel (3). Tighten the bolts to 3 N·m (26 in. lbs.).



3. Connect the body wire harness connector (2) to the rear HVAC wire harness connector (3).
4. Install the rear distribution ducts to the rear HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/DUCTS-DISTRIBUTION - INSTALLATION).
5. Install the right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).



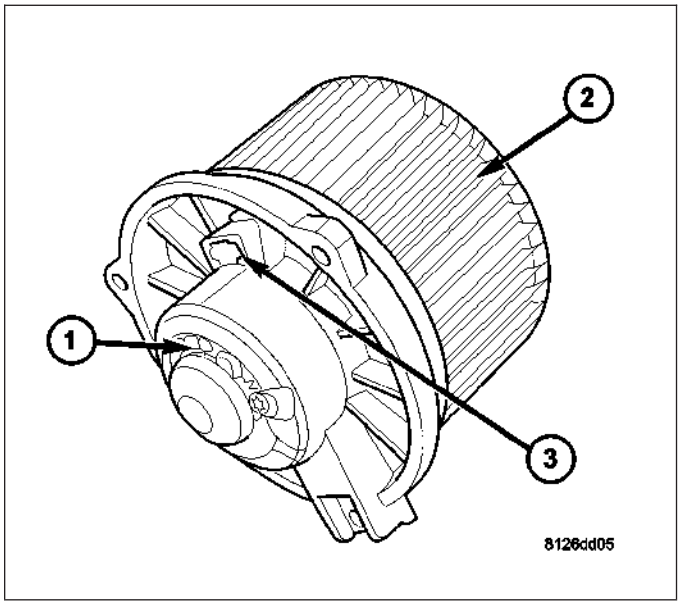


6. Raise and support the vehicle.
7. Connect the rear heater hoses (5) to the rear heater core tubes that extend through the rear floor panel (4) behind the right rear wheel housing.
8. Remove the tape or plugs from fittings on the rear suction line (2) and the rear liquid line (3) and the rear evaporator extension line tapping plate ports.
9. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the rear suction and liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the rear suction and liquid line fittings to the rear evaporator extension line tapping plate.
11. Install the nut (1) that secures the rear suction and liquid lines to the rear evaporator extension line tapping plate. Tighten the nut to 23 N·m (17 ft. lbs.).
12. Lower the vehicle.
13. Reconnect the negative battery cable.
14. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
15. Fill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILL).
16. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
17. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

MOTOR-BLOWER

DESCRIPTION

The rear blower motor (1) and blower wheel (2) is located in the rear HVAC housing behind the right interior quarter panel trim and is connected to rear HVAC wire harness by a integral wire harness connector (3). The rear blower motor controls the velocity of air flowing through the rear HVAC housing by spinning the wide squirrel cage-type blower wheel within the HVAC housing at the selected speed. Rear blower motor speed is controlled by regulating the ground path through the rear blower motor switch and the rear blower motor resistor block.



OPERATION

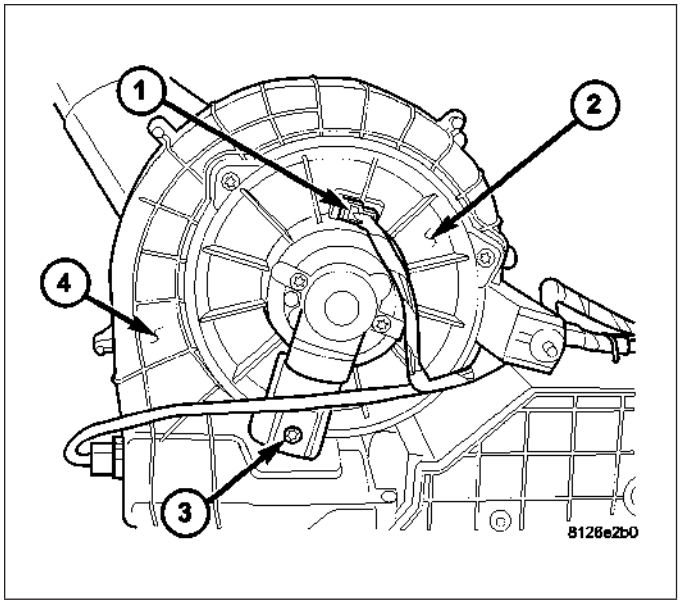
The rear blower motor will only operate when the ignition switch is in the On position and the front A/C-heater control is set to either front control of rear heating-A/C system or to the rear control of the rear heating-A/C system. The rear blower motor receives a battery feed through the rear blower motor relay located in the power distribution center (PDC), whenever the ignition switch is in the On position.

For diagnosis and testing of the rear blower motor, refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/MOTOR-BLOWER - DIAGNOSIS AND TESTING.

The rear blower motor, blower wheel, and blower wheel housing cannot be repaired and, if faulty or damaged, they must be replaced as an assembly.

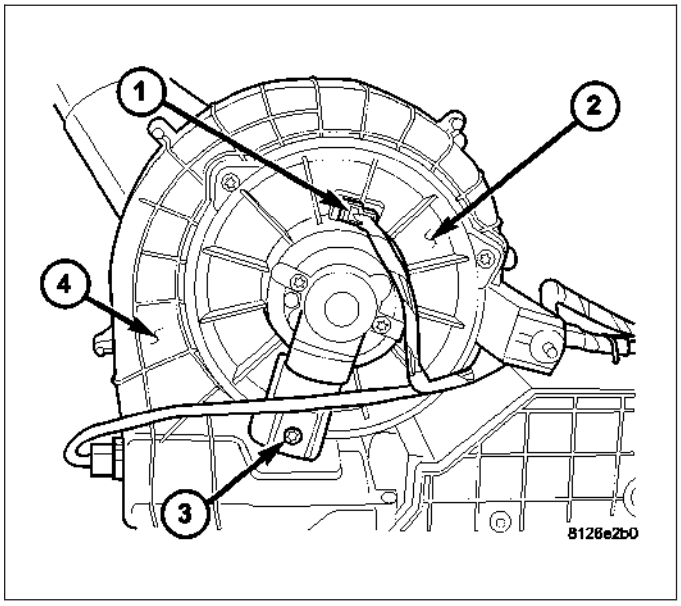
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - REMOVAL).
3. Disconnect the rear HVAC wire harness connector (1) from the rear blower motor (2).
4. Remove the three screws (3) that secure the rear blower motor to the rear air inlet housing (4).
5. Remove the rear blower motor from the rear air inlet housing.



INSTALLATION

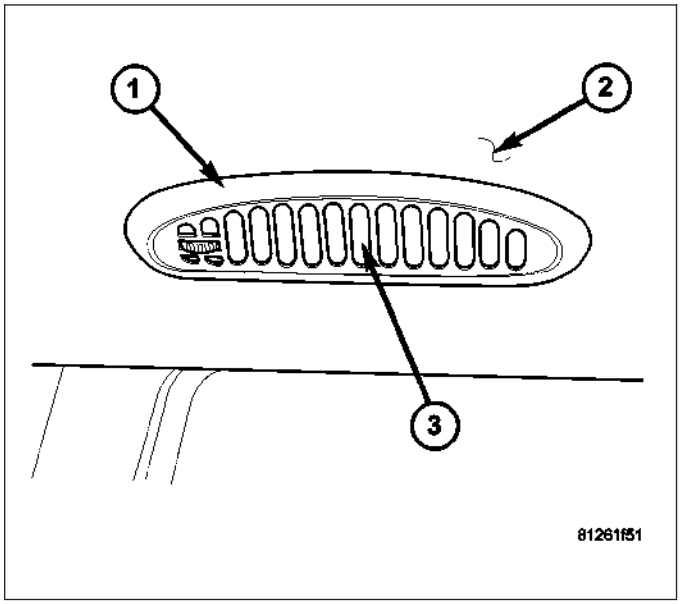
1. Position the rear blower motor (2) into the rear air inlet housing (4).
2. Install the three screws (3) that secure the rear blower motor to the rear air inlet housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Connect the rear HVAC wire harness connector (1) to the rear blower motor.
4. Install the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - INSTALLATION).
5. Reconnect the negative battery cable.



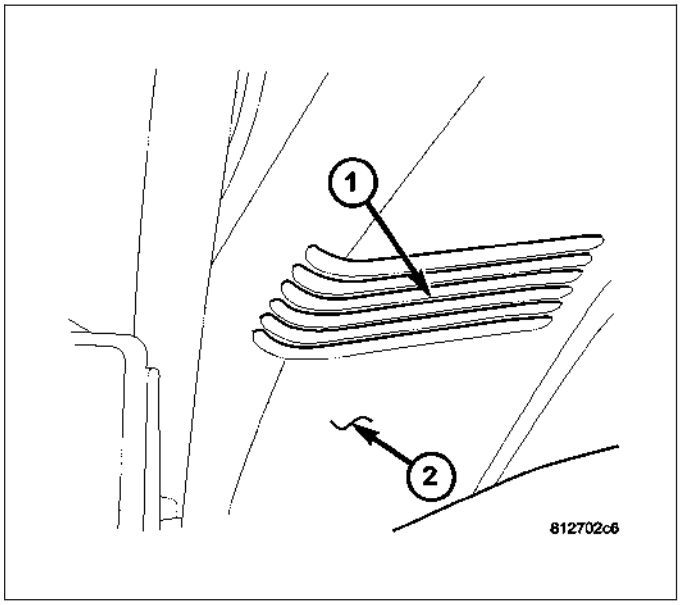
OUTLET-AIR

DESCRIPTION

There are four rear ceiling air outlets (1) located in the headliner (2). One air outlet is located at each outboard side of the intermediate seat position facing the center of the vehicle, and one located in front of each rear seat position facing the rear of the vehicle. Each of the rear ceiling air outlets contain a grille with movable vanes (3) that are used to direct or shut off the flow of the conditioned air leaving the rear ceiling air outlets. The rear ceiling air outlets and grilles can each be serviced seperately.



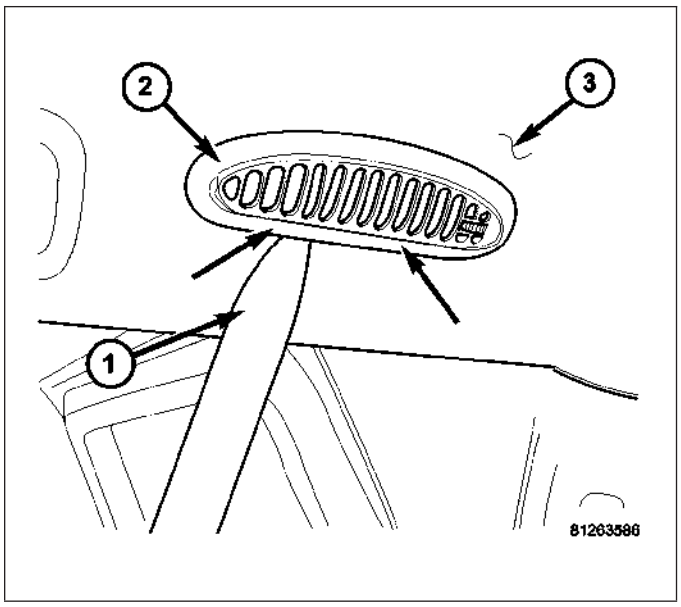
There is one rear floor air outlet (1) located behind the right rear door area in the right quarter interior trim panel (2). The airflow from the rear floor air outlet is directed by fixed vanes in the right quarter interior trim panel and cannot be adjusted. The rear floor air outlet is not serviceable.



REMOVAL

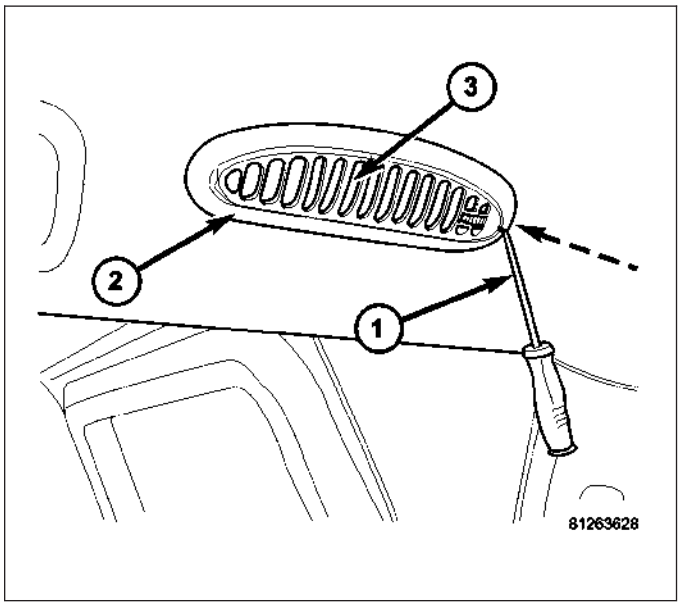
REAR CEILING AIR OUTLET

1. Using a trim stick or another suitable wide flat-blade tool (1), gently pry between both bottom ends of the rear ceiling air outlet bezel (2) and the headliner (3) to release the snap clip retainers that secure the air oulet bezel to the headliner.
2. Remove the rear ceiling air outlet(s) from the headliner.

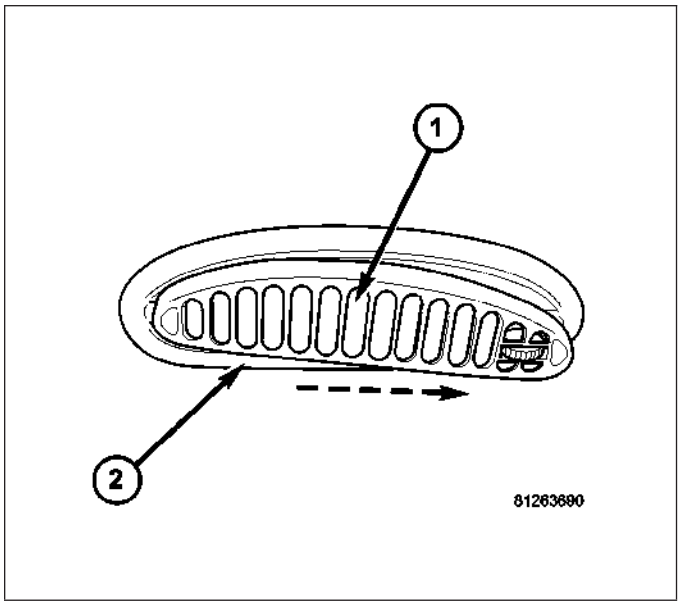


REAR CEILING AIR OUTLET GRILLE

1. Using a pick or another suitable tool (1), gently pry between the right end of the rear ceiling air outlet bezel (2) and the air outlet grille (3) to release the snap clip retainer that secures the grille to the pivot on the right side of the bezel.



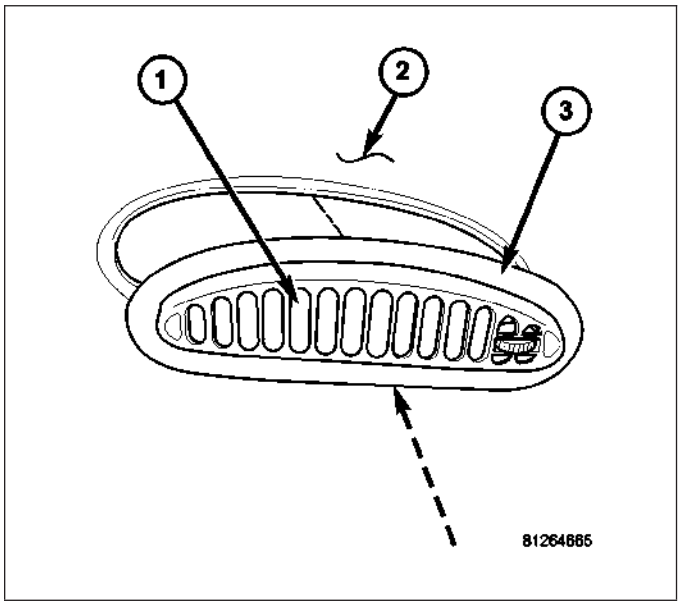
2. Remove the rear ceiling air outlet grille (1) from the pivot on the left side of the air outlet bezel (2) by moving the grille out and to the right of the bezel.



INSTALLATION

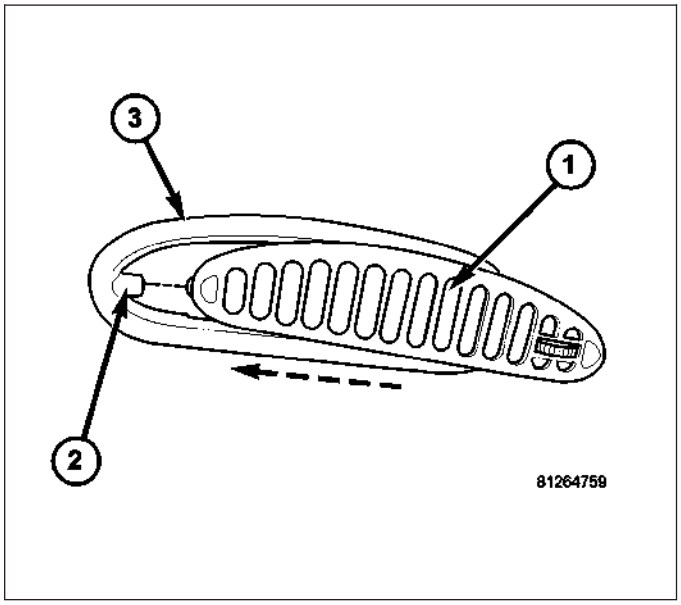
REAR CEILING AIR OUTLET

1. Position the rear ceiling air outlet(s) (1) into the headliner (2).
2. Gently push the air outlet bezel (3) into the headliner until the snap clips in the headliner duct fully engage the slots in the bezel.

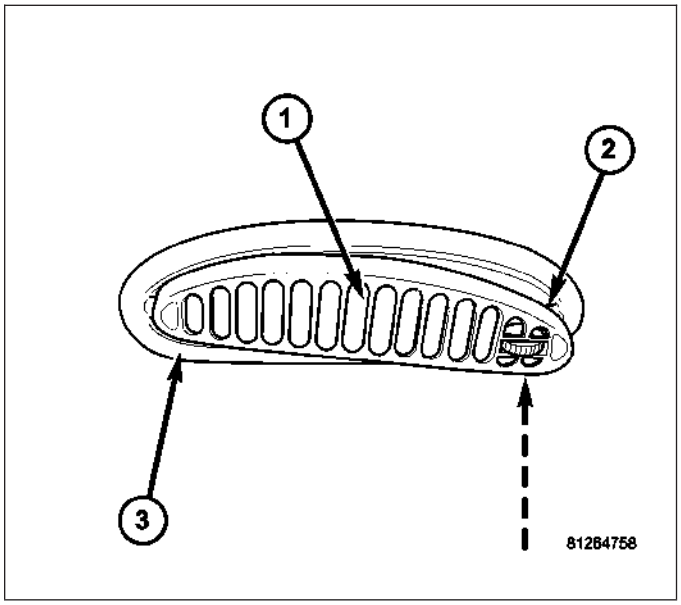


REAR CEILING AIR OUTLET GRILLE

1. Install the rear ceiling air outlet grille (1) onto the pivot shaft (2) on the left side of the air outlet bezel (3).



2. Gently push the air outlet grille (1) onto the pivot shaft (2) on the right side of the air outlet bezel (3).



PLUMBING - FRONT

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should

be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled to other A/C system components with block-type and quick-connect type fittings. Flat gaskets and O-rings are used to mate the refrigerant line fittings with A/C system components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING

WARNINGS

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Severe personal injury or death may result from improper service procedures.

WARNING: If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.

WARNING: The engine cooling system is designed to develop internal pressures of 97 to 123 kilopascals (14 to 18 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTIONS

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on a R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in a A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.
Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

If the A/C system is not cooling properly, determine if the refrigerant system is fully charged with R-134a. This is accomplished by performing a system Charge Level-Check or Fill. If while performing this test A/C liquid line pressure is less than 345 kPa (50 psi) proceed to System Empty procedure. If liquid line pressure is greater than 345 kPa (50 psi) proceed to System Low procedure. If the refrigerant system is empty or low in refrigerant charge, a leak at any line fitting or component seal is likely. A review of the fittings, lines and components for oily residue is an indication of the leak location. To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the symptoms.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately 28 in Hg.). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to Step 2.
2. Prepare a 0.284 Kg. (10 oz.) refrigerant charge to be injected into the refrigerant system.
3. Connect and dispense 0.284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.
4. Proceed to Step 2 of System Low procedure.

SYSTEM LOW

1. Determine if there is any R-134a refrigerant in the system.
2. Position the vehicle in a wind free work area. This will aid in detecting small leaks.
3. Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the A/C system set to the following:
   - Transmission in Park or Neutral with parking brake set
   - Engine idling
   - Mode control set to the outside air position
   - Blower control set to the high speed position
   - A/C set to the ON position
   - All windows open

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in a R-134a refrigerant system.

4. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.

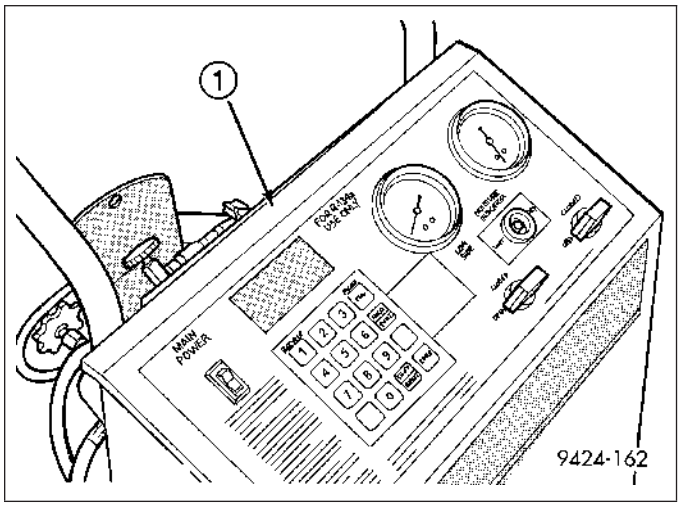
STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

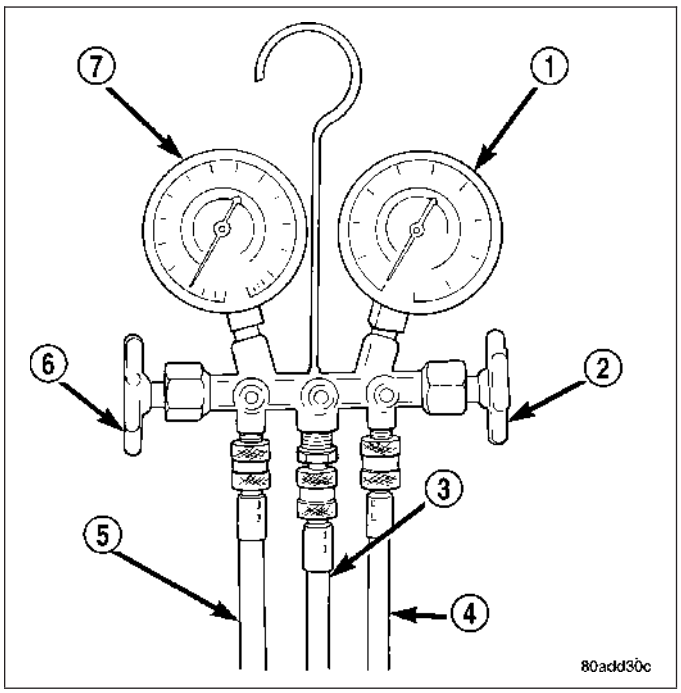
WARNING: Eye protection must be worn when servicing an A/C refrigerant system. Turn all valves off (rotate clockwise) on the equipment being used before connecting or disconnecting service equipment from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.



A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.



MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) (3) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) (4) attaches to the high side service port. This service port is located on the liquid line near the receiver/drier outlet. On this model, an A/C pressure transducer is installed on the discharge line. A/C high-side pressures can be read using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

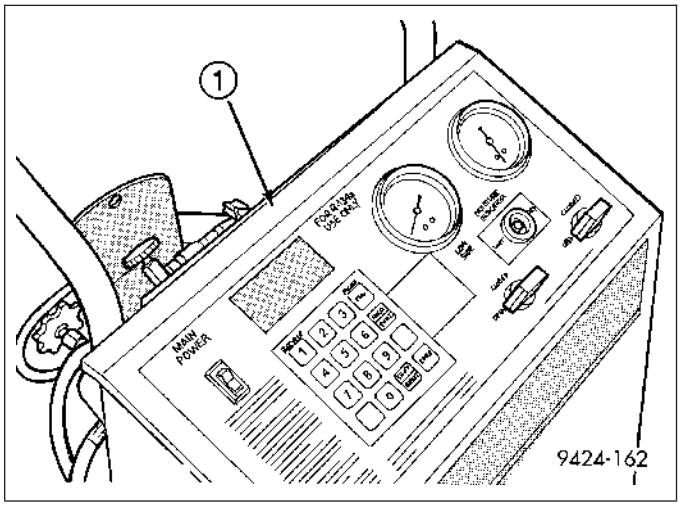
LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) (5) attaches to the low side service port. This service port is located on the suction line near the A/C compressor inlet.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: If equipped with the rear heating-A/C system, use a heat gun to heat the underbody lines to help remove any trapped refrigerant from the rear A/C system.

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.



REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If a compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads -88 kPa (- 26 in. Hg) vacuum or greater for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Always refer to the underhood HVAC Specification Label for the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to the underhood HVAC Specification Label.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch control circuit and repair as required.
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.

8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

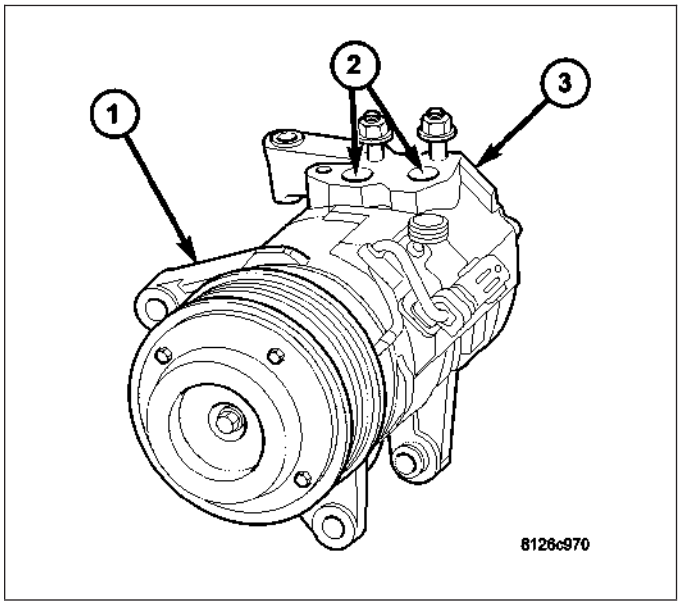
COMPRESSOR-A/C

DESCRIPTION

A/C COMPRESSOR

The A/C system uses a Denso 10S20, five double-acting piston, reciprocating swash plate-type A/C compressor (1) on all models. This A/C compressor has a fixed displacement of 200 cubic centimeters (12.2 cubic inches) and has both the suction and discharge ports (2) located at the rear of the compressor on the cylinder head (3).

A label identifying the use of R-134a refrigerant is located on the A/C compressor.



HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

The A/C compressor cannot be repaired and, if faulty or damaged, it must be replaced. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

A/C COMPRESSOR

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

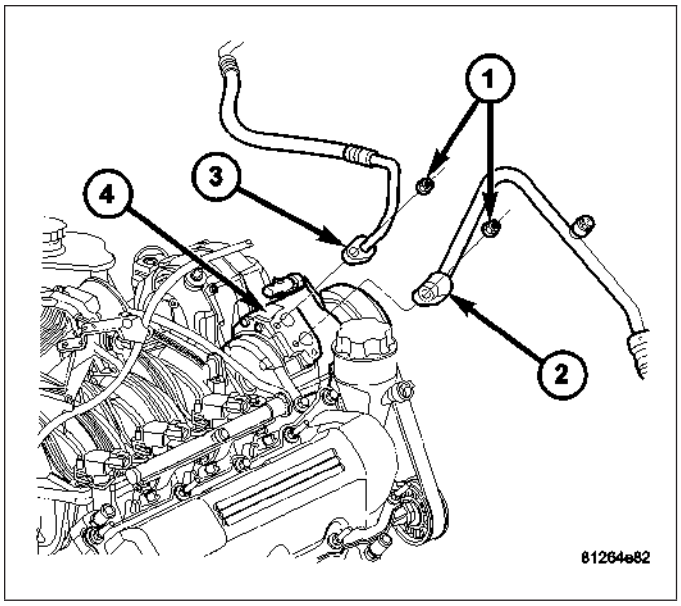
1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/CLUTCH-A/C COMPRESSOR - INSTALLATION).
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - DESCRIPTION)
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/COMPRESSOR-A/C - REMOVAL).
6. If the noise is from liquid refrigerant slugging on the suction line, replace the receiver/drier (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/RECEIVER / DRIER - REMOVAL) and check the refrigerant oil level and the refrigerant system charge (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/ REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
7. If a slugging condition still exists after replacing the receiver/drier, then replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/COMPRESSOR-A/C - REMOVAL) and repeat Step 1.

REMOVAL

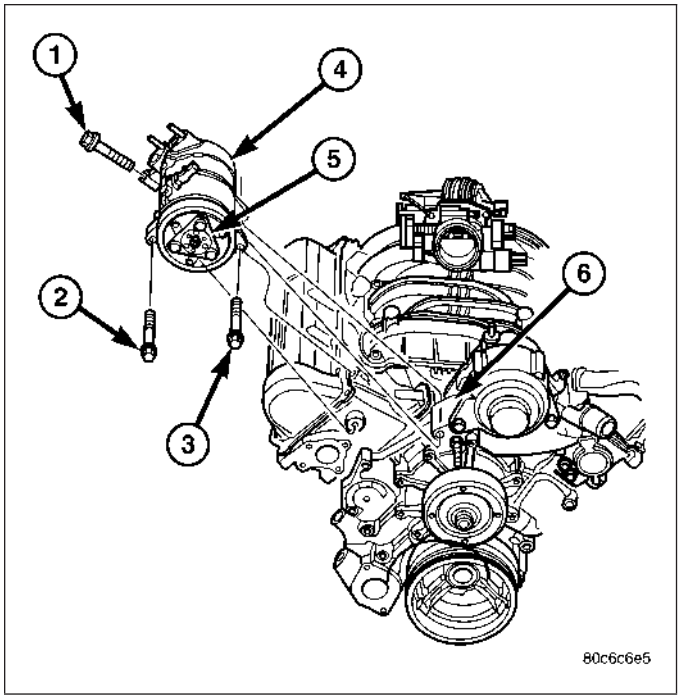
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

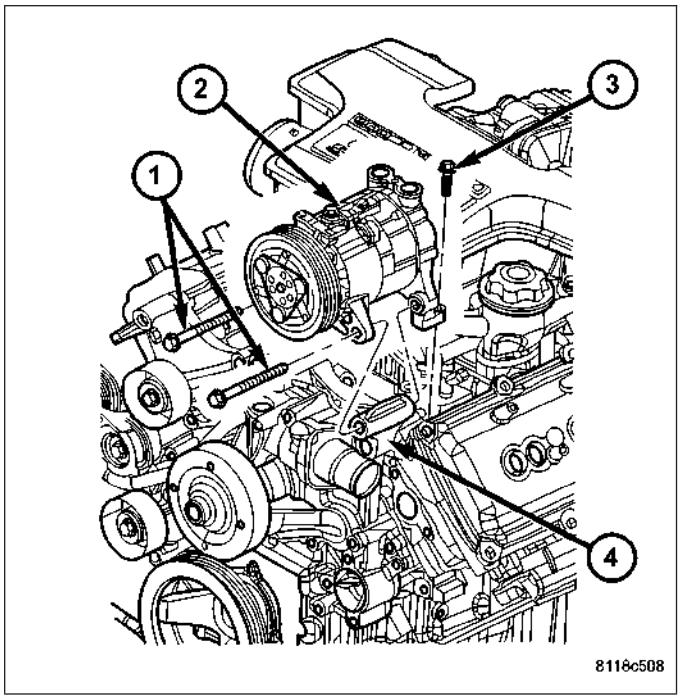
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
4. Disconnect the wire harness connector from the A/C compressor clutch coil.
5. Remove the nuts (1) that secure the A/C suction line (2) and A/C discharge line (3) to the A/C compressor (4).
6. Disconnect the A/C suction and discharge lines from the A/C compressor and remove and discard the O-ring seals and gaskets.
7. Install plugs in, or tape over the opened refrigerant line fittings and compressor ports.



8. If equipped with the 3.7L or 4.7L engine, remove the bolts (1, 2 and 3) that secure the A/C compressor (4) to the mounting bracket (6).
9. Remove the A/C compressor from the engine compartment.



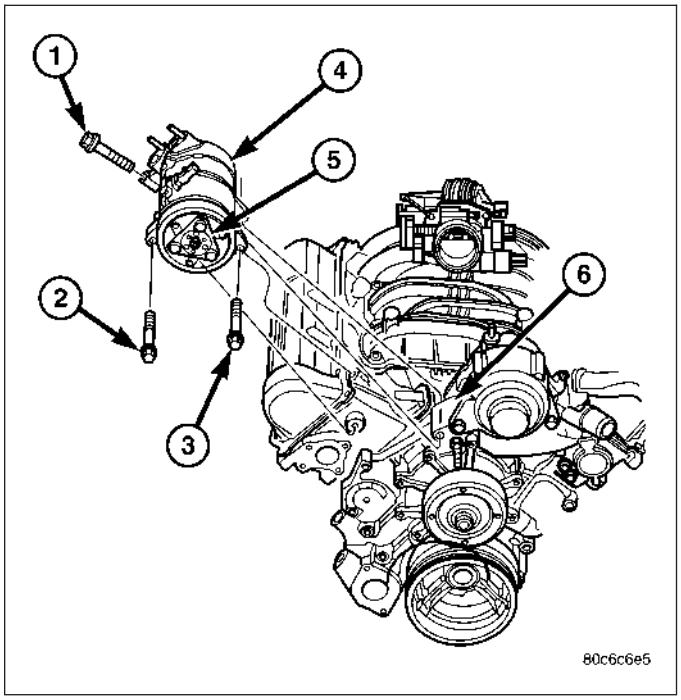
10. If equipped with the 5.7L Hemi engine, remove the nuts and bolts that secure the generator and A/C compressor support bracket and remove the bracket from the engine.
11. Remove the bolts (1 and 3) that secure the A/C compressor (2) to the mounting bracket (4).
12. Remove the A/C compressor from the engine compartment.



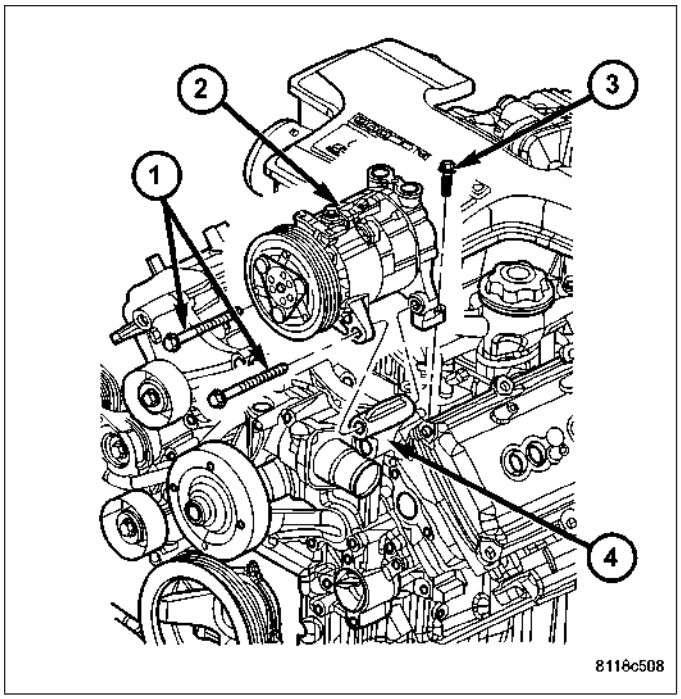
INSTALLATION

NOTE: Be certain to check the refrigerant oil level if the A/C compressor is being replaced. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

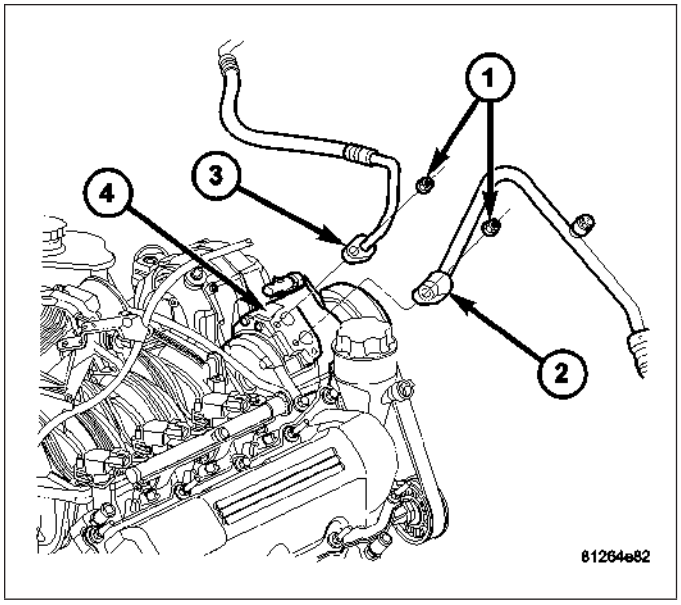
1. Position the A/C compressor (4) onto the mounting bracket (6) in the engine compartment.
2. On the 3.7L and 4.7L engines, install and tighten the bolts in the following sequence:
   - Install bolt (3) and hand tightened.
   - Install bolt (2) and hand tightened.
   - Install bolt (1) and hand tightened.
   - Tightened bolt (3) to 40 N·m (30 ft. lbs.).
   - Tightened bolt (2) to 55 N·m (41 ft. lbs.).
   - Tightened bolt (1) to 55 N·m (41 ft. lbs.).



3. For the 5.7L Hemi engine, install and tighten the bolts in the following sequence:
   - Install bolts (1) and hand tightened.
   - Install bolt (3) and hand tightened.
   - Tightened bolts (1) to 40 N·m (30 ft. lbs.).
   - Tightened bolt (3) to 55 N·m (41 ft. lbs.).
4. For the 5.7L Hemi engine, install the generator and A/C compressor support bracket and retaining nuts and bolts. Tighten the nuts and bolts securely.



5. Remove the tape or plugs from the opened suction line fitting (2) and the discharge line fitting (3) and the compressor ports (4).
6. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the suction and the discharge line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C suction and discharge lines onto the A/C compressor.
8. Install the nuts (1) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).
9. Connect the wire harness connector to the A/C compressor clutch coil.
10. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).



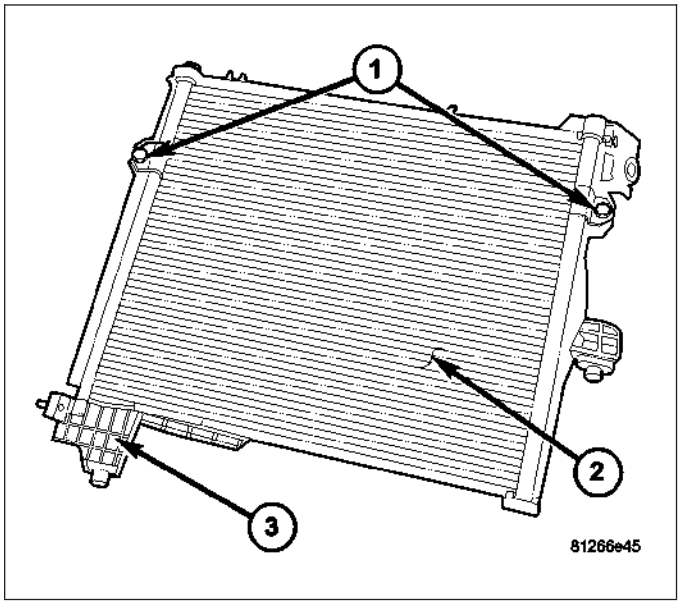
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CONDENSER-A/C

DESCRIPTION

The A/C condenser (2) is located in the front of the engine compartment inside of the condenser fan shroud (3). The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to change to a liquid state.

The A/C condenser is retained within the condenser fan shroud by two bolts (1).



OPERATION

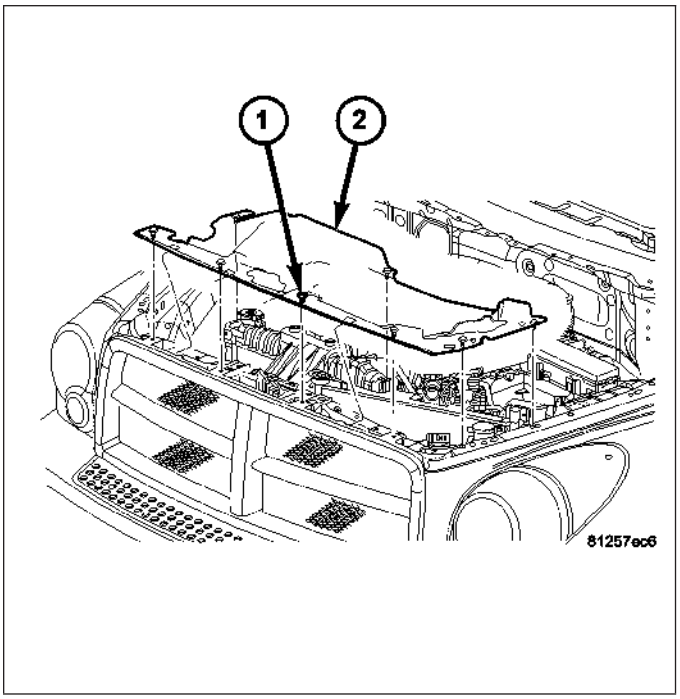
When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

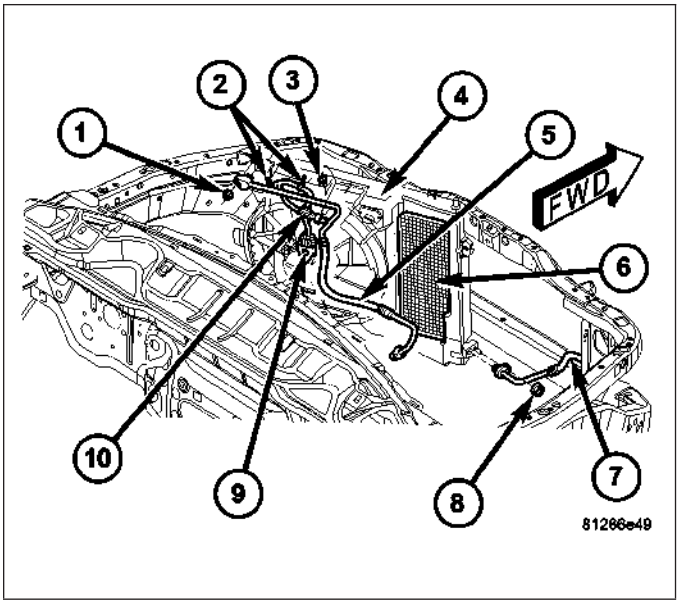
REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

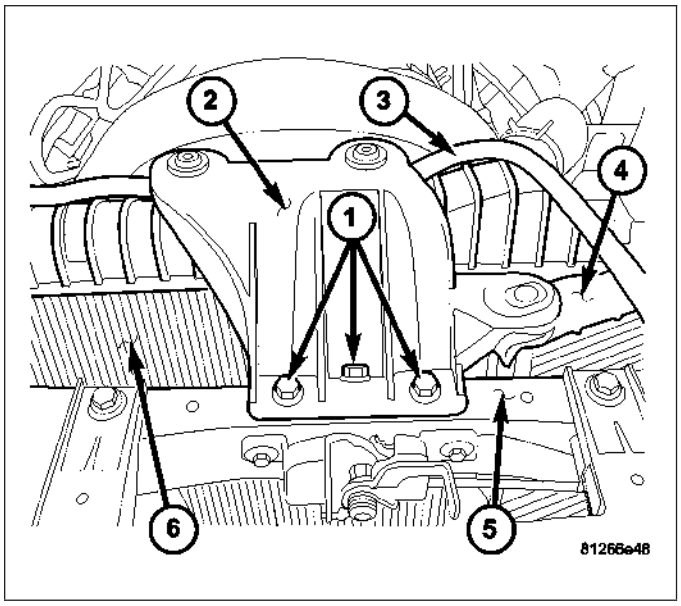
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the push-pin retainers (1) and the upper condenser/radiator seal (2).



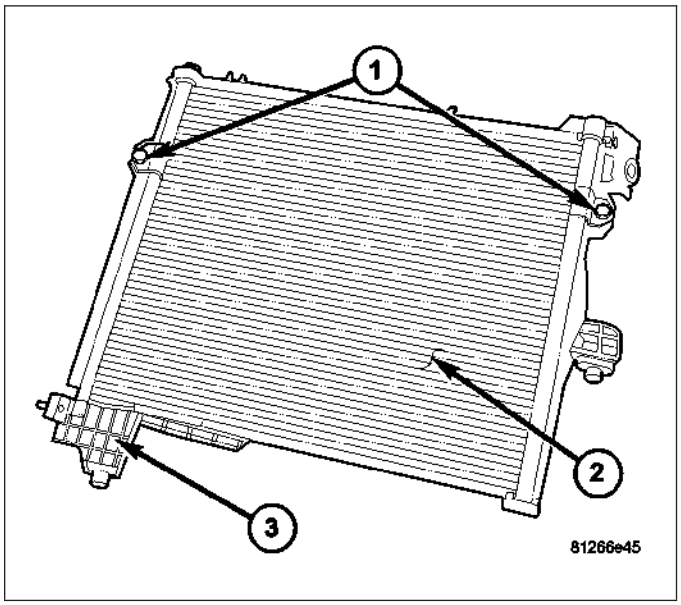
4. Disconnect the wire harness connectors from the condenser cooling fan motor (9) and the A/C pressure transducer (10).
5. Remove the two wire harness retainers (2) from the condenser fan shroud (4) and position the wire harness out of the way.
6. Remove the nuts (1 and 8) that secure the A/C discharge line (5) and A/C liquid line (7) to the A/C condenser (6).
7. Disconnect the A/C discharge and liquid lines from the A/C condenser and remove and discard the O-ring seals and gaskets.
8. Remove the A/C discharge line from the retainer (3) located on the condenser fan shroud (4).
9. Install plugs in, or tape over the opened discharge and liquid line fitting and condenser ports.



10. Remove the three bolts (1) that secure the upper radiator support (2) to the upper front crossmember (5).
11. Remove the upper radiator support and position the radiator overflow hose (3) out of the way.
12. Remove the bolt that secures the condenser/cooling fan assembly (4) to the upper left fender rail.
13. Carefully push back the radiator (6) for clearance and remove the condenser/cooling fan assembly from the engine compartment.



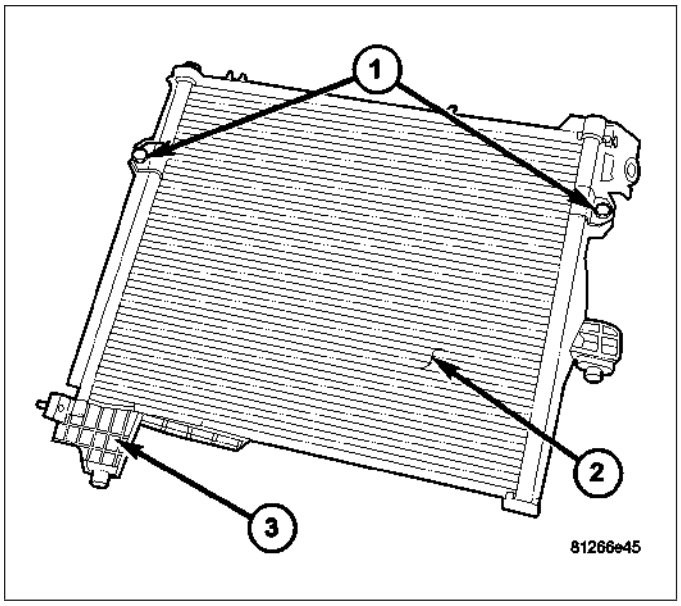
14. Place the condenser/cooling fan assembly on a workbench and remove the two screws (1) that secure the A/C condenser (2) to the condenser fan shroud (3).
15. Remove the A/C condenser from the condenser fan shroud.



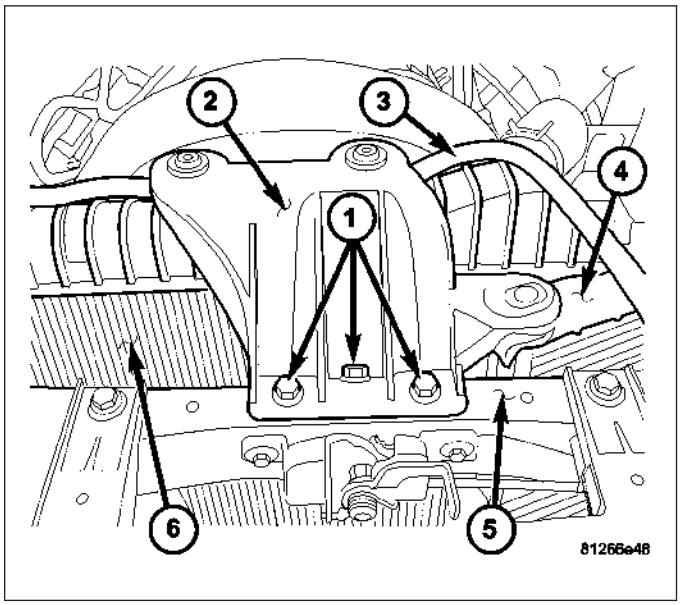
INSTALLATION

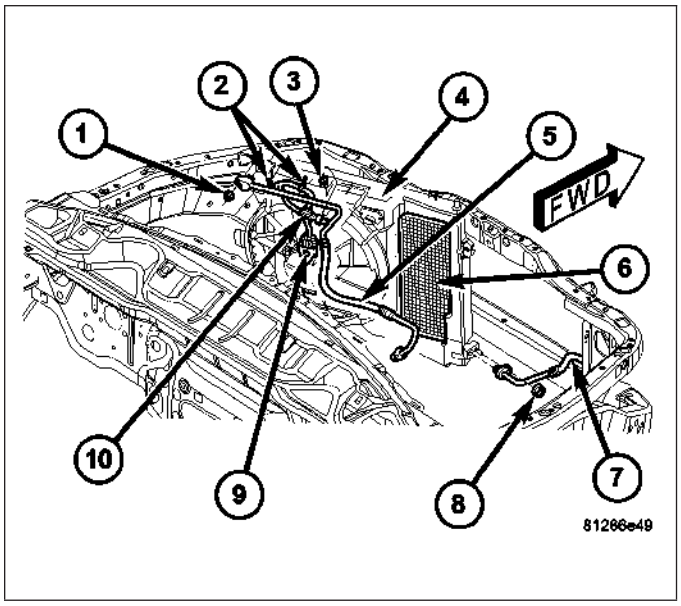
NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C condenser (2) into the condenser fan shroud (3).
2. Install the two bolts (1) that secure the A/C condenser to the condenser fan shroud. Tighten the bolts to 5 N·m (45 in. lbs.).

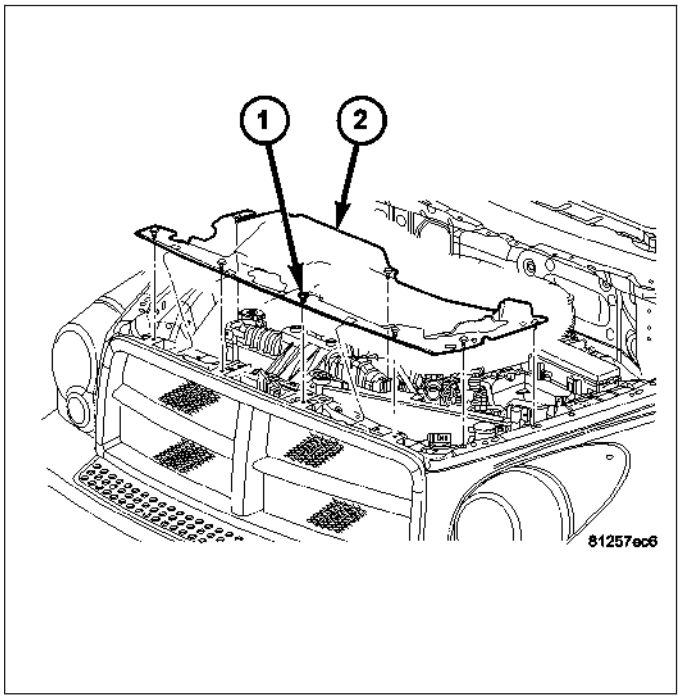


3. Carefully push back the radiator (6) for clearance and install the condenser/cooling fan assembly (4). Insert the two lower condenser fan shroud mounting tabs into the holes in the lower front crossmember.
4. Install the bolt that secures the condenser/cooling fan assembly to the upper left fender rail. Tighten the bolt to 5 N·m (45 in. lbs.).
5. Position the radiator overflow hose (3) to it's installed location
6. Align the upper mounting tab of the condenser/cooling fan assembly to the hole in the upper radiator support (2) and install the upper radiator support.
7. Install the three bolts (1) that secure the upper radiator support to the upper front crossmember (5). Tighten the bolts to 23 N·m (17 ft. lbs.).





8. Remove the tape or plugs from the discharge and liquid line fittings and condenser ports.
9. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the discharge and liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the A/C discharge line (5) and the A/C liquid line (7) to the A/C condenser (6).
11. Install the nuts (1 and 8) that secure the A/C discharge and liquid lines to the A/C condenser. Tighten the nuts to 22 N·m (16 ft. lbs.).
12. Install the A/C discharge line into the retainer (3) located on the condenser fan shroud.
13. Install the wire harness and the two wire harness retainers (2) to the condenser fan shroud (4).
14. Connect the wire harness connectors to the condenser cooling fan motor (9) and the A/C pressure transducer (10).



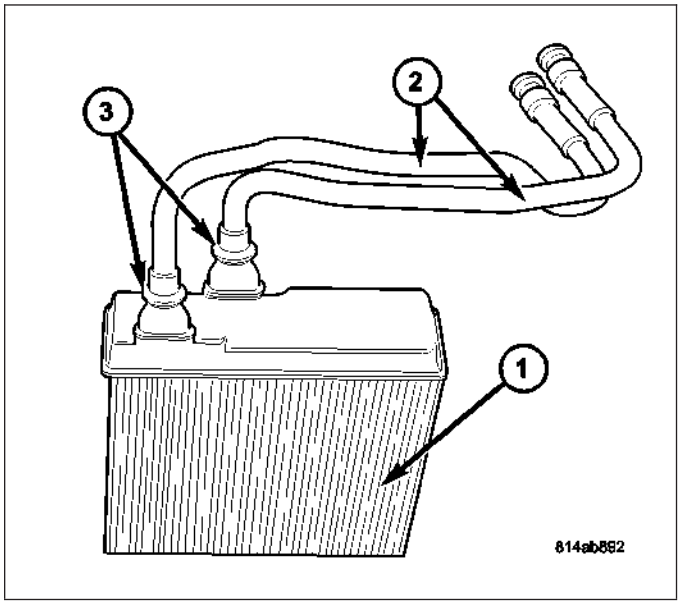
15. Position the upper condenser/radiator seal and install the push-pin retainers.
16. Reconnect the negative battery cable.
17. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
18. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CORE-HEATER

DESCRIPTION

The heater core (1) for the front heating-A/C system is located in the front HVAC housing, behind the instrument panel. It is a heat exchanger made of rows of tubes and fins. The heater core is secured to the HVAC housing by a plastic retaining bracket and screws. The heater core tubes (2) are attached to the top of the heater core by metal retaining clips (3) and O-ring seals.

The heater core for the front heating-A/C system can be serviced in the vehicle without removing the HVAC assembly.



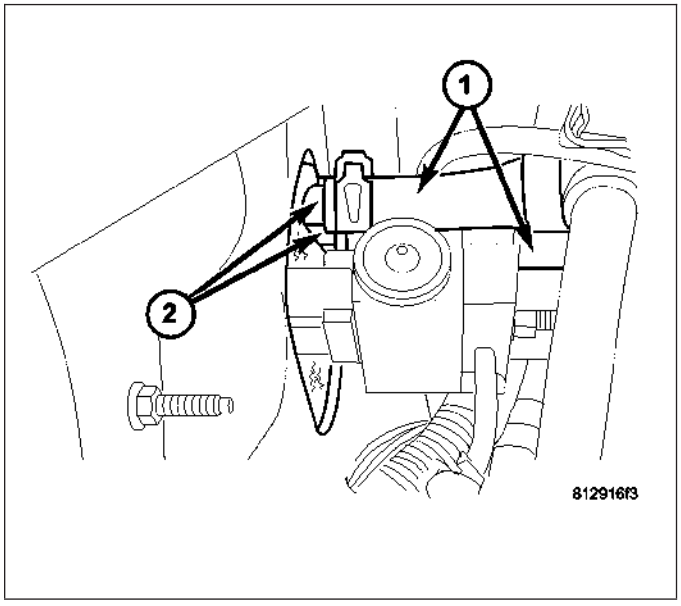
OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core within the HVAC housing. The blower motor speed controls the volume of air flowing through the HVAC housing.

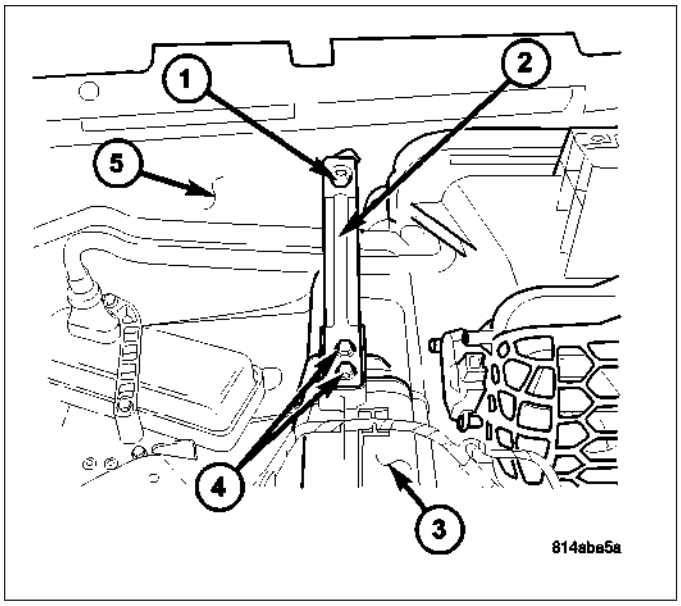
The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

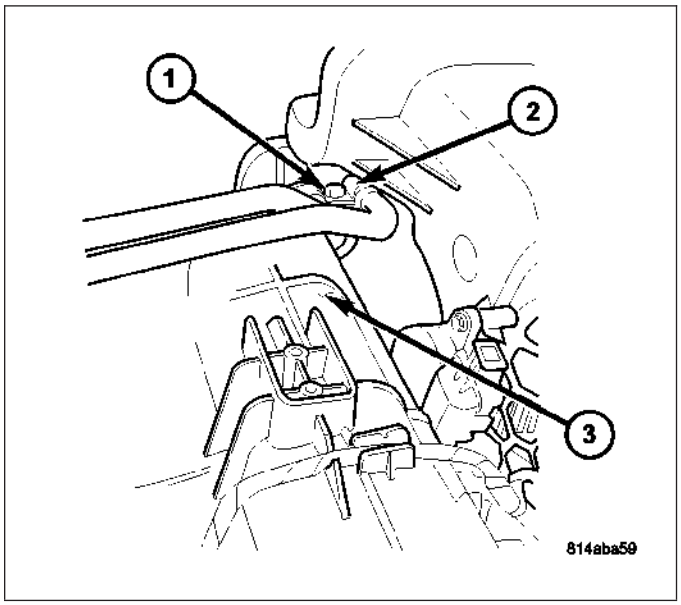
1. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
2. Raise and support the vehicle.
3. Remove the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
4. Remove the heater hoses (1) from the heater core tubes (2) in the engine compartment.



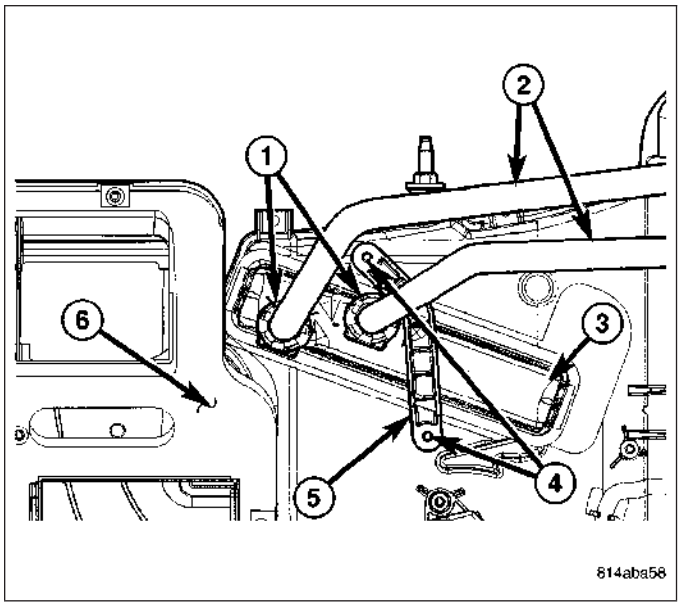
5. Lower the vehicle and remove the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
6. Remove the bolt (1) that secures the HVAC housing bracket (2) to the dash panel (5).
7. Remove the two screws (4) that secure the HVAC housing bracket to the top of the HVAC housing (3).
8. Remove the HVAC housing bracket from the vehicle.



9. Remove the screw (1) that secures the heater core tube retaining bracket (2) to the top of the HVAC housing (3).
10. Remove the heater core tube retaining bracket from the HVAC housing.

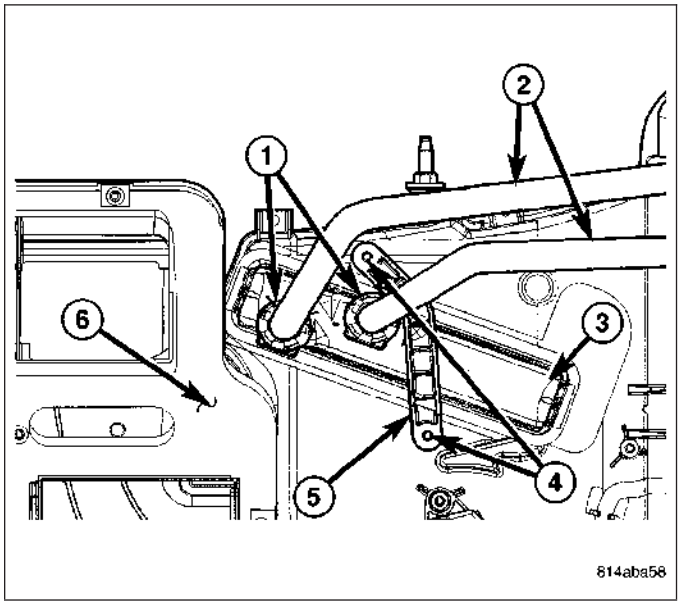


11. Remove the retaining clips (1) that secure the heater core tubes (2) to the heater core (3).
12. Remove the heater core tubes from the heater core and the dash panel. Remove the O-ring seals from the heater core tube fittings and discard.
13. Remove the two screws (4) that secure the heater core retaining bracket (5) to the top of the HVAC housing (6).
14. Remove the heater core retaining bracket and carefully lift the heater core out of the HVAC housing.

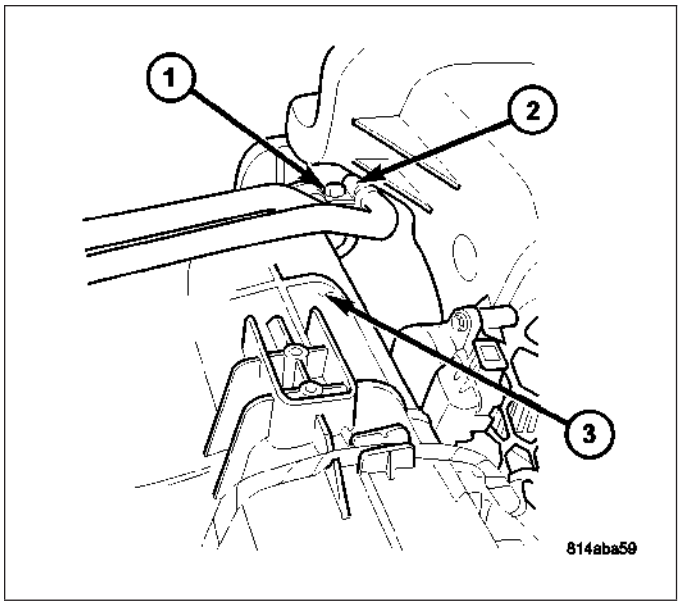


INSTALLATION

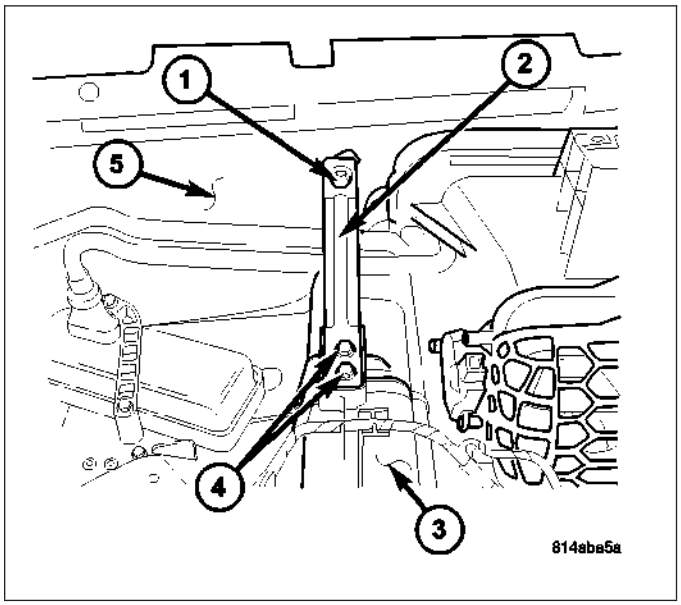
1. Carefully install the heater core (3) and the heater core retaining bracket (5) to the top of the HVAC housing (6). Make sure that the heater core insulator is properly positioned.
2. Install the two screws (4) that secure the heater core and retaining bracket to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Lubricate new rubber O-ring seals with clean engine coolant and install them onto the heater core tube fittings. Use only the specified O-rings as they are made of a special material for the engine cooling system.
4. Install the heater core tubes (2) through the dash panel and to the heater core.
5. Install the retaining clips (1) that secure the heater core tubes to the heater core. Make sure that the retaining clips are fully engaged to the flanges on the heater core and the heater core tubes.



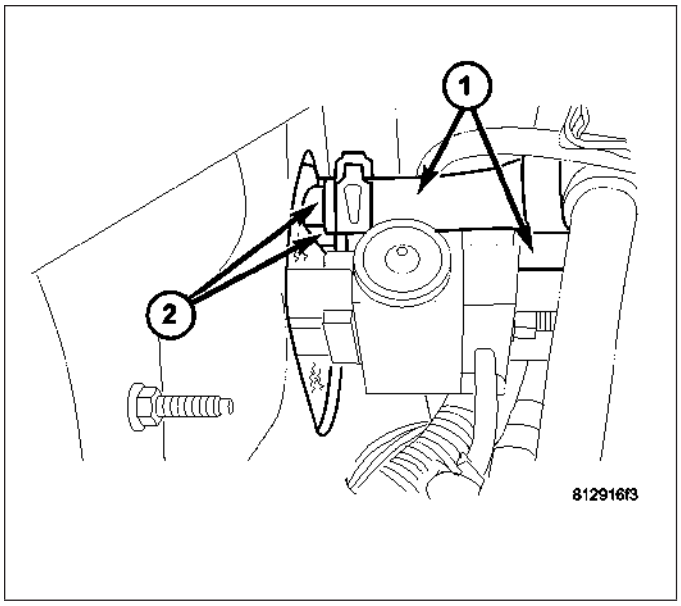
6. Install the heater core tube retaining bracket (2) to the top of the HVAC housing (3).
7. Install the screw (1) that secures the heater core tube retaining bracket to the HVAC housing. Tighten the screw to 2.2 N·m (20 in. lbs.).



8. Install the HVAC housing bracket (2) to the top of HVAC housing (3) and to the dash panel (5).
9. Install the two screws (4) that secure the HVAC housing bracket to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
10. Install the bolt (1) that secures the HVAC housing bracket to the dash panel. Tighten the bolt to 3 N·m (26 in. lbs.).
11. Install the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).



12. Raise the vehicle and install the heater hoses (1) to the heater core tubes (2) in the engine compartment
13. Install the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
14. Lower the vehicle.
15. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
16. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).



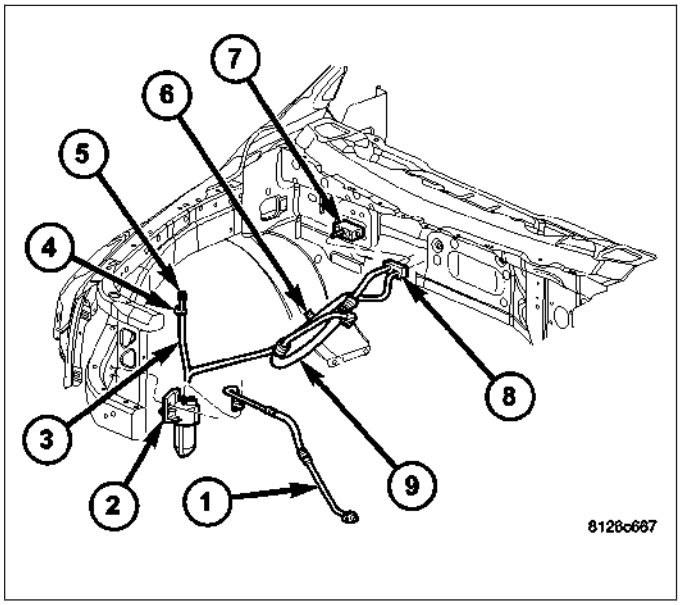
CORE-VALVE-SERVICE PORT

DESCRIPTION

Two refrigerant system service ports are used to recover/recycle/evacuate/charge and test the A/C refrigerant system. Unique sizes are used on the service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or service equipment used for R-12 refrigerant.

The high side service port (5) is located on the liquid line (3) above the receiver/drier (2). The low side service port (6) is located on the suction line (9) at the top of the engine. Both the high side and low side A/C service port valve cores are serviceable.

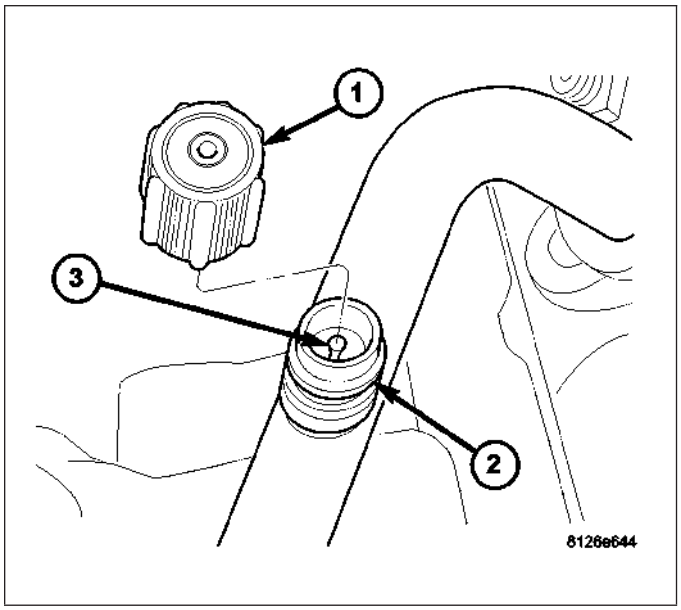
Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.



REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

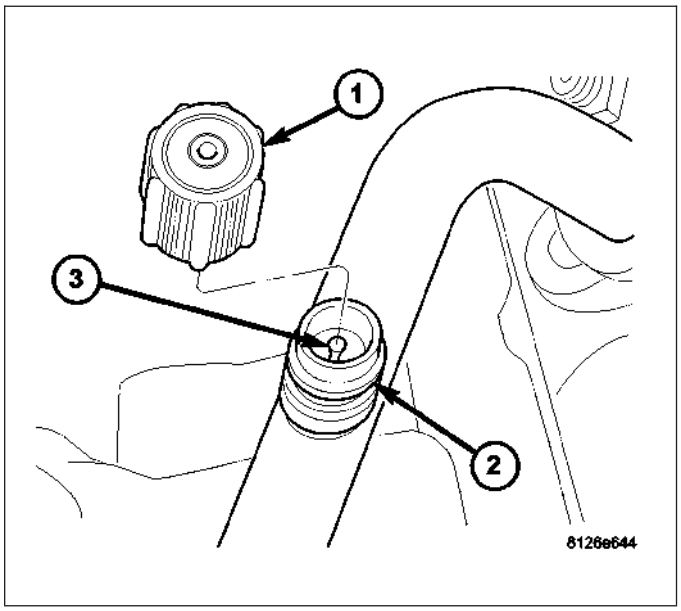
1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in or tape over the opened service port(s).



INSTALLATION

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.



3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

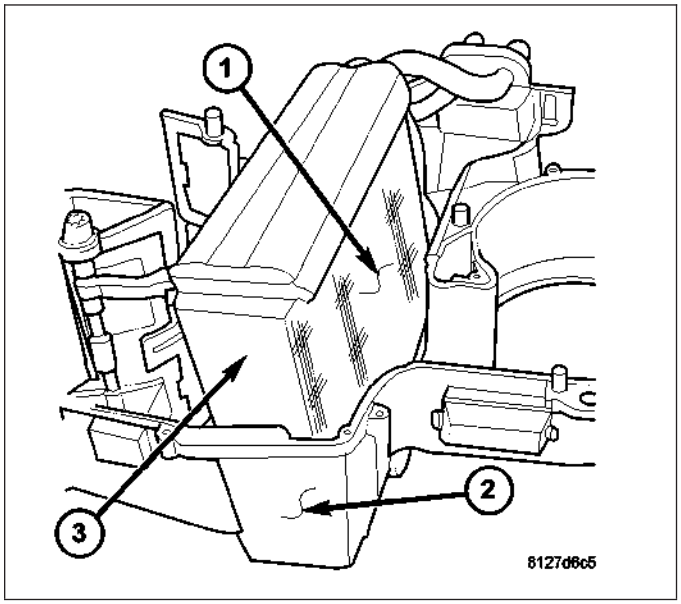
NOTE: The protective cap helps aid in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

EVAPORATOR-A/C

DESCRIPTION

The A/C evaporator (1) for the front heating-A/C system is located within the front HVAC housing (2), behind the instrument panel. The A/C evaporator and insulator (3) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.



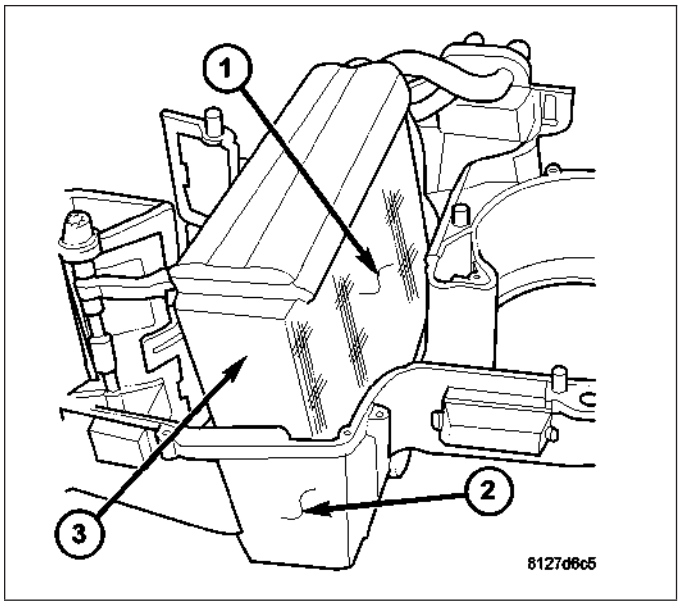
OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

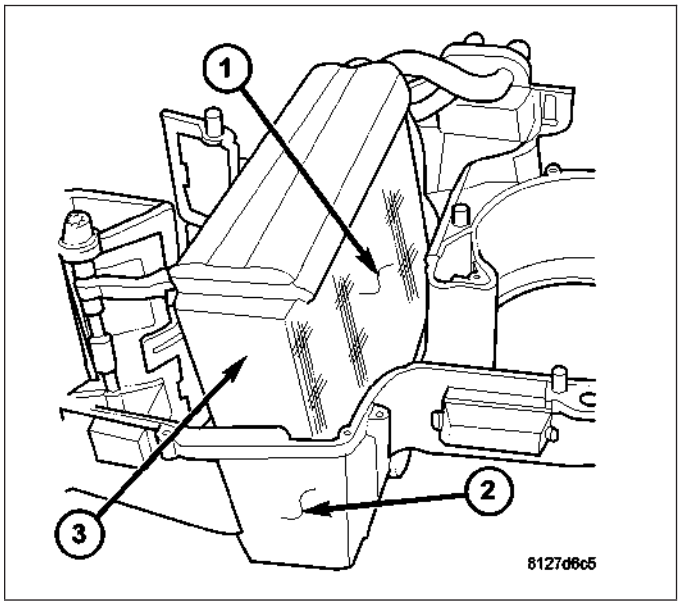
1. Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - REMOVAL).
2. Disassemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - DISASSEMBLY).
3. Remove the probe of the evaporator temperature sensor from the fins of the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/SENSOR-EVAPORATOR TEMPERATURE - REMOVAL).
4. Carefully lift the A/C evaporator (1) out of the lower half of the HVAC housing (2).
5. If required, remove the evaporator insulator (3) from around the A/C evaporator.



INSTALLATION

NOTE: If the front A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Install the A/C evaporator (1) into the lower half of the HVAC housing (2). Make sure that the evaporator drain is clean and unrestricted and that the evaporator insulator (3) is properly installed.
2. Install the probe for the evaporator temperature sensor into the fins of the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/SENSOR-EVAPORATOR TEMPERATURE - INSTALLATION.)
3. Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - ASSEMBLY).
4. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/HOUSING-HVAC - INSTALLATION).



LINE-A/C DISCHARGE

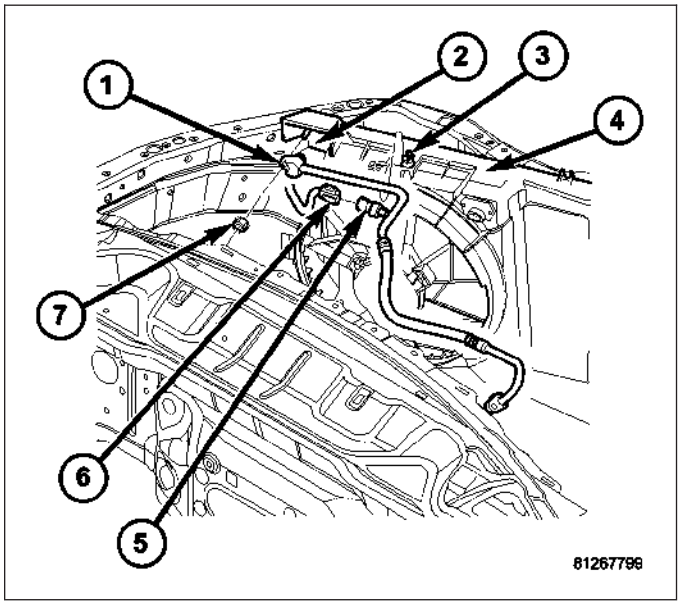
DESCRIPTION

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser (2) and is secured to the condenser fan shroud (4) by a plastic retainer (3). The A/C discharge line has an integral fitting for the A/C pressure transducer (5) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS -FRONT/TRANSDUCER-A/C PRESSURE - DESCRIPTION).

CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

The A/C discharge line has no serviceable parts except for the rubber O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C discharge line is removed and installed.

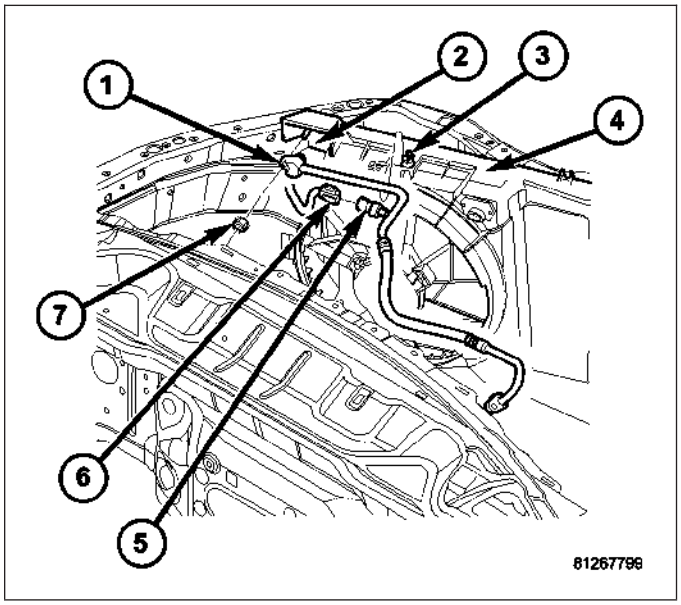
If the A/C discharge line is found to be leaking or is damaged, it must be replaced.



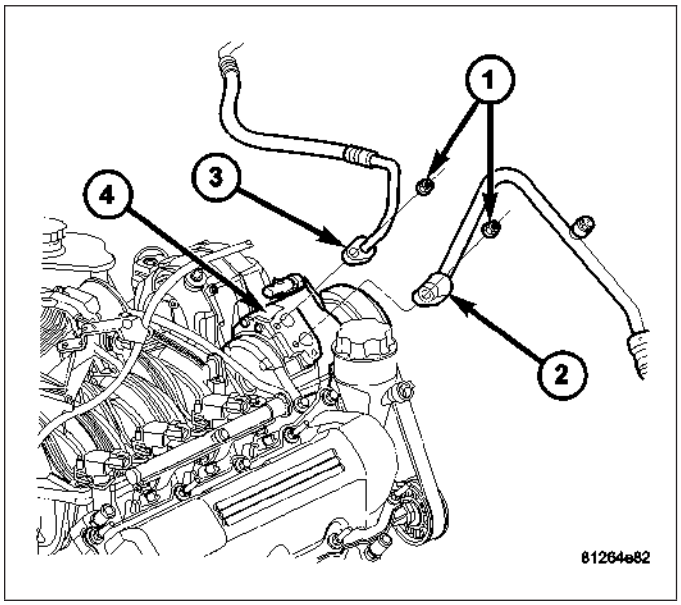
REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Disconnect the wire harness connector (6) from the A/C pressure transducer (5).
4. If required, remove the A/C pressure transducer from the A/C discharge line (1).
5. Remove the nut (7) that secures the A/C discharge line to the A/C condenser (2).
6. Disconnect the A/C discharge line from the A/C condenser and the retainer (3) located on the condenser fan shroud (4).
7. Remove the O-ring seal and gasket from the discharge line fitting and discard.
8. Install plugs in, or tape over the discharge line fitting and condenser port.

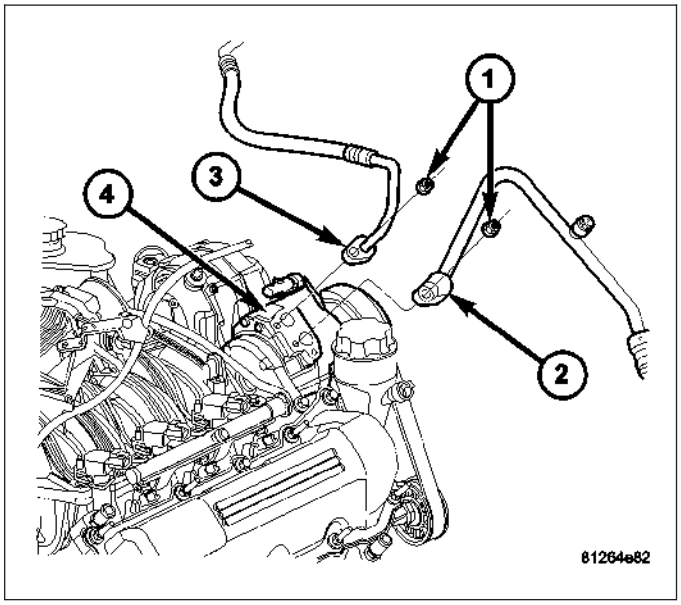


9. Remove the nut (1) that secures the A/C discharge line (3) to the A/C compressor (4).
10. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.
11. Install plugs in, or tape over the opened refrigerant line fitting and the compressor port.
12. Remove the A/C discharge line from the engine compartment.

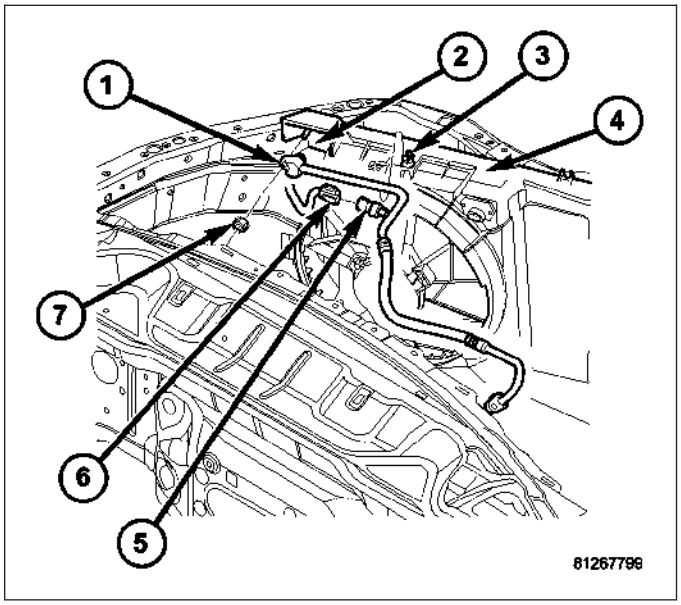


INSTALLATION

1. Position the A/C discharge line into the engine compartment.
2. Remove the tape or plugs from the opened discharge line fitting and the compressor port.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge (3) line onto the A/C compressor (4).
5. Install the nut (1) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 23 N·m (17 ft. lbs.).



6. Remove the tape or plugs from the opened discharge line fitting (1) and the condenser port (2).
7. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C discharge line to the A/C condenser and the retainer (3) located on the condenser fan shroud.
9. Install the nut (7) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22 N·m (16 ft. lbs.).
10. If removed, install the A/C pressure transducer (5) onto the A/C discharge line.
11. Connect the wire harness connector (6) to the A/C pressure transducer.

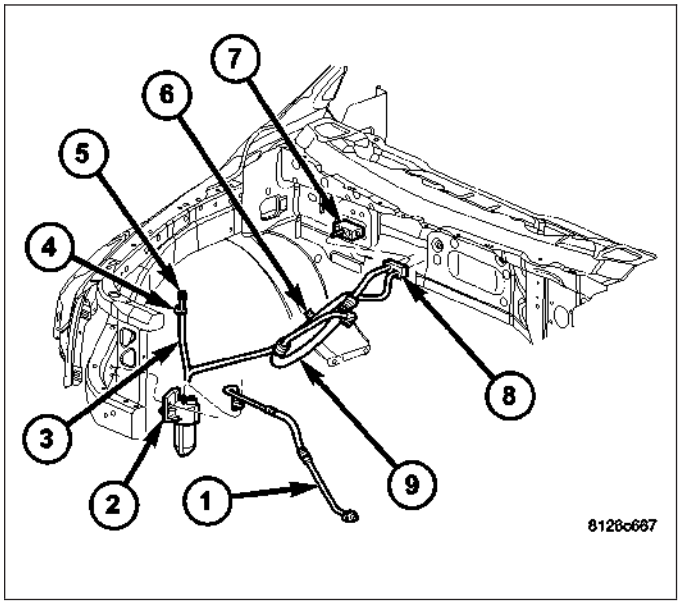


12. Connect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C LIQUID

DESCRIPTION

The liquid line is the refrigerant line that carries refrigerant from the A/C condenser to the A/C evaporator. The liquid line is serviced in two sections. The front section of the liquid line (1) connects between the A/C condenser and the receiver/drier (2). The rear section of the liquid line (3) connects between the receiver/drier and the A/C expansion valve (7) and includes the high side service port (5) and a tapping plate (8) that secures the suction line (9) to the A/C expansion valve. On models equipped with the rear heating-A/C system, the rear section of the liquid line also includes an extension tube that connects the liquid line to the underbody lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINE-A/C LIQUID - DESCRIPTION).



CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

The liquid line has no serviceable parts except for the rubber O-ring seals, high-side service port valve, cap and retainer clip (4). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the liquid line is removed and installed.

If the liquid line is found to be leaking or is damaged, it must be replaced.

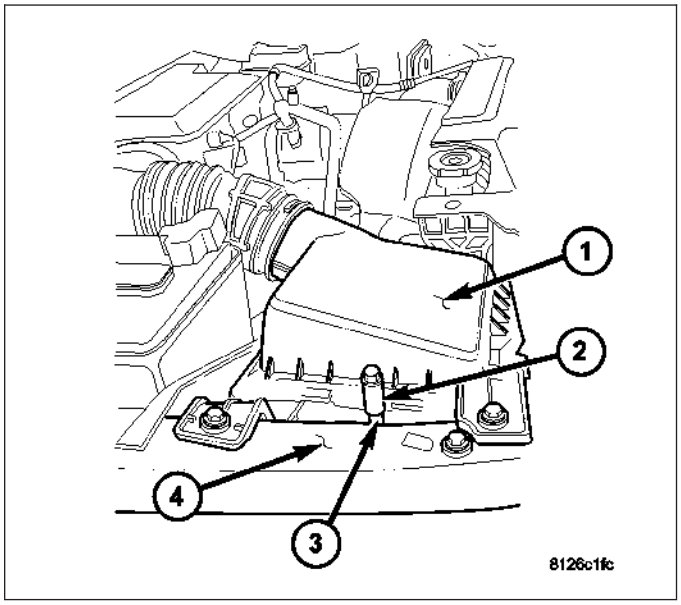
REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

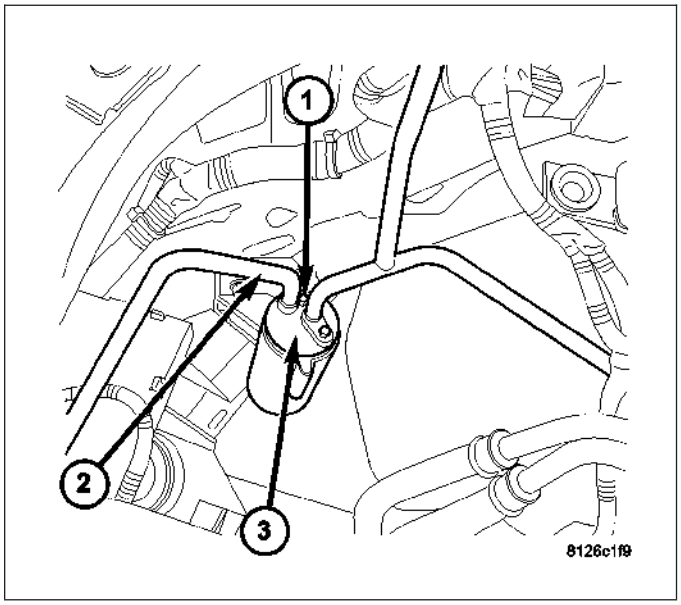
NOTE: The A/C liquid line is serviced in two sections. The front section connects between the A/C condenser and the receiver/drier. The rear section connects between the receiver/drier and the A/C expansion valve. On models equipped with the rear heating-A/C system, the rear section of the A/C liquid line also includes an extension tube that connects the liquid line to the underbody lines.

FRONT SECTION

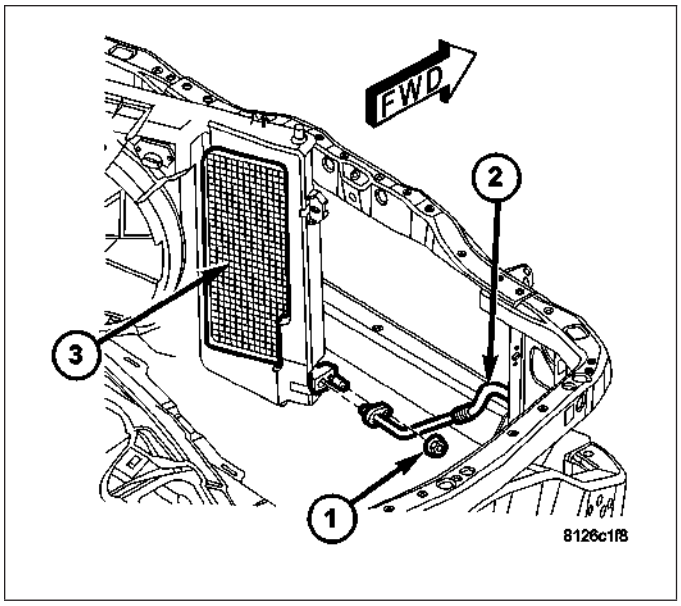
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING -FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (1) from the right side of the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).



4. Remove the bolt (1) that secures the front section of the A/C liquid line (2) to the receiver/drier (3).
5. Disconnect the front section of the A/C liquid line from the receiver/drier and remove and discard the O-ring seal.
6. Install plugs in, or tape over the opened liquid line fitting and receiver/drier port.

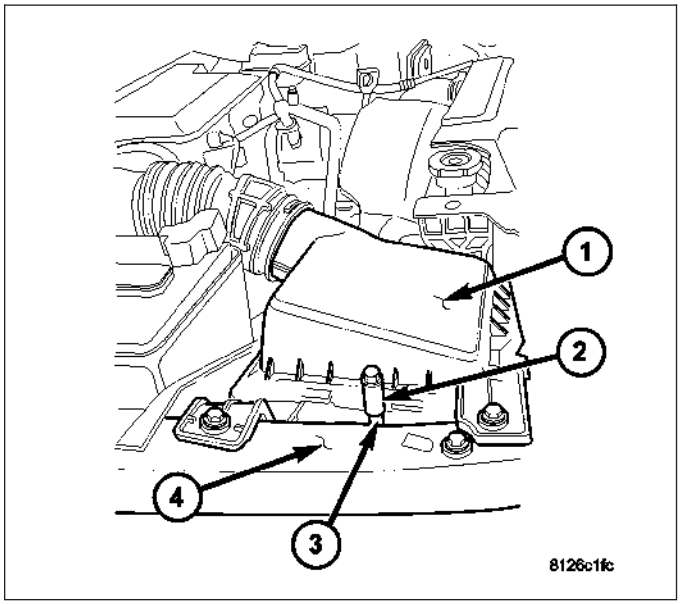


7. Remove the nut (1) that secures the front section of the A/C liquid line (2) to the A/C condenser (3).
8. Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal and gasket.
9. Install plugs in, or tape over the opened liquid line fitting and condenser port.
10. Remove the front section of the A/C liquid line from the engine compartment.

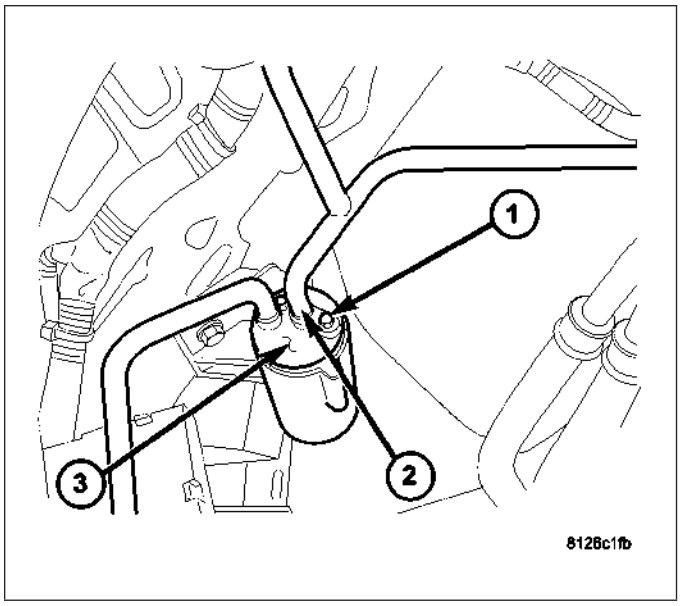


REAR SECTION

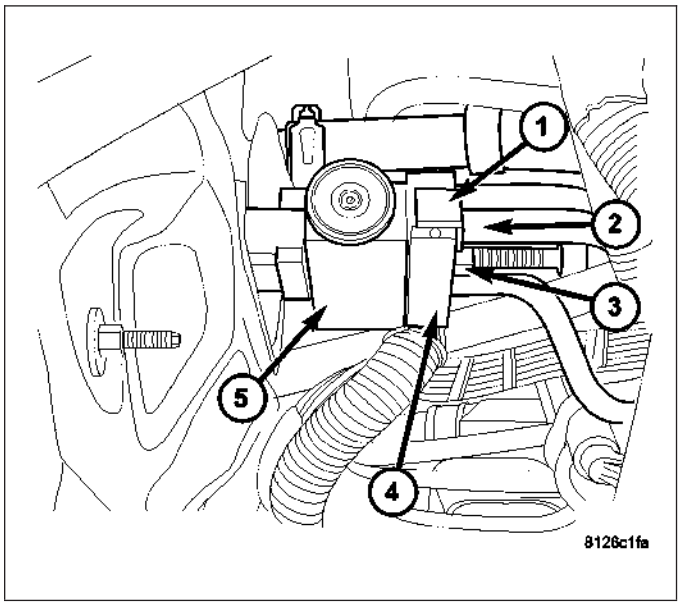
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (1) from the right side of the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the rear section of the A/C liquid line (2) from the plastic retainer (3) located on the right inner fender (4).



5. Remove the bolt (1) that secures the rear section of the A/C liquid line (2) to the receiver/drier (3).
6. Disconnect the rear section of the A/C liquid line from the receiver/drier and remove and discard the O-ring seal.
7. Install plugs in, or tape over the opened liquid line fitting and the receiver/drier port.



8. Raise and support the vehicle.
9. Remove the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
10. Remove the plastic retainer (1) that secures the A/C suction line (2) to the liquid line tapping block (4).
11. Remove the nut (3) that secures the liquid line tapping block to the A/C expansion valve (5).
12. Disconnect the A/C suction line and the rear section of the A/C liquid line from the A/C expansion valve and remove and discard the O-ring seals and gaskets.
13. Install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.
14. Separate the A/C suction line from the liquid line tapping block.



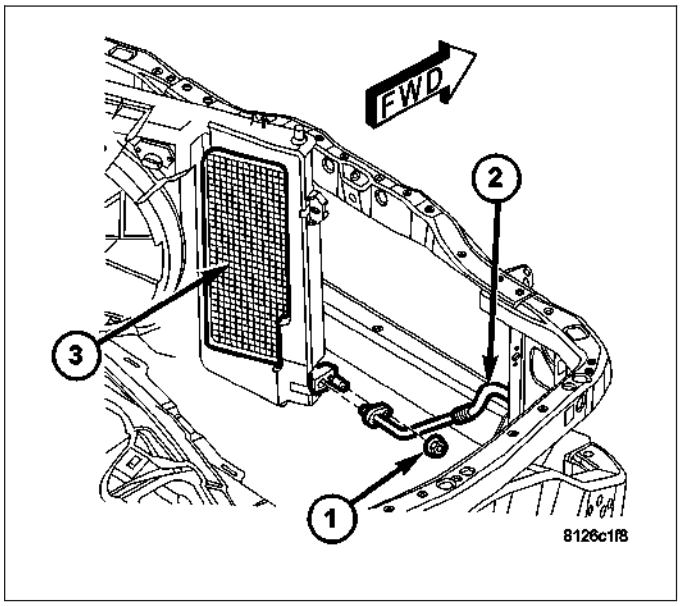
15. On models equipped with the rear heating-A/C system, disconnect the underbody liquid line from the liquid line tapping block (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -REAR/COUPLER-REFRIGERANT LINE - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINE-A/C LIQUID - REMOVAL).
16. Remove the rear section of the A/C liquid line from the engine compartment.

INSTALLATION

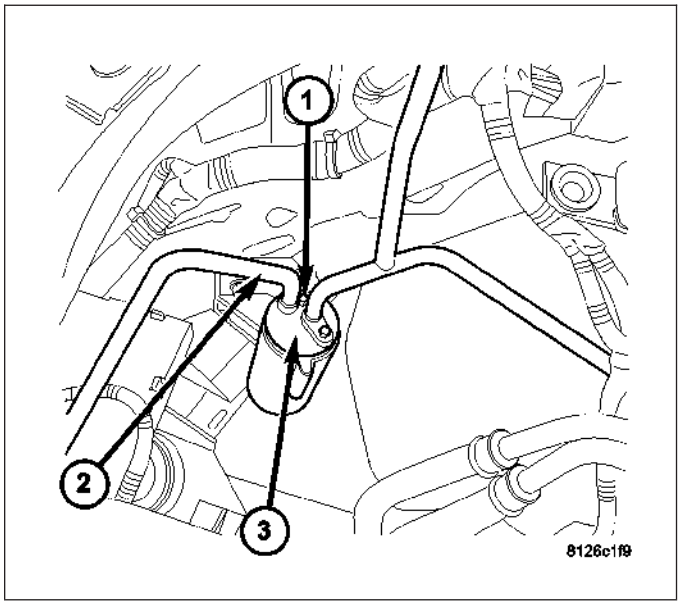
NOTE: TheA/C liquid line is serviced in two sections. The front section connects between the A/C condenser and the receiver/drier. The rear section connects between the receiver/drier and the A/C expansion valve. On models equipped with the rear heating-A/C system, the rear section of the A/C liquid line also includes an extension tube that connects the liquid line to the underbody lines.

FRONT SECTION

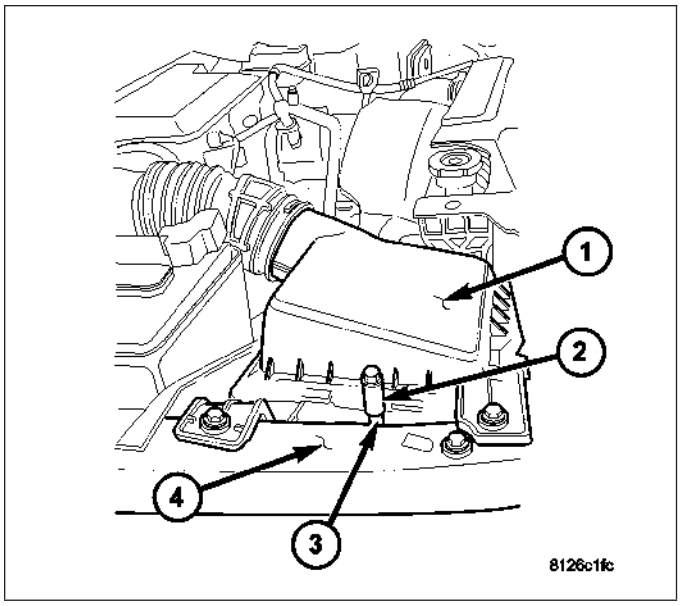
1. Position the front section of theA/C liquid line (2) into the engine compartment.
2. Remove the tape or plugs from the liquid line fitting and the condenser port.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line to the A/C condenser (3).
5. Install the nut (1) that secures the A/C liquid line to the A/C condenser. Tighten the nut to 22 N·m (16 ft. lbs.).



6. Remove the tape or plugs from the liquid line fitting and the receiver/drier (3).
7. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the front section of the A/C liquid line (2) to the receiver/drier.
9. Install the bolt (1) that secures the front section of theA/C liquid line to the receiver/drier. Tighten the bolt to 11 N·m (100 in. lbs.).

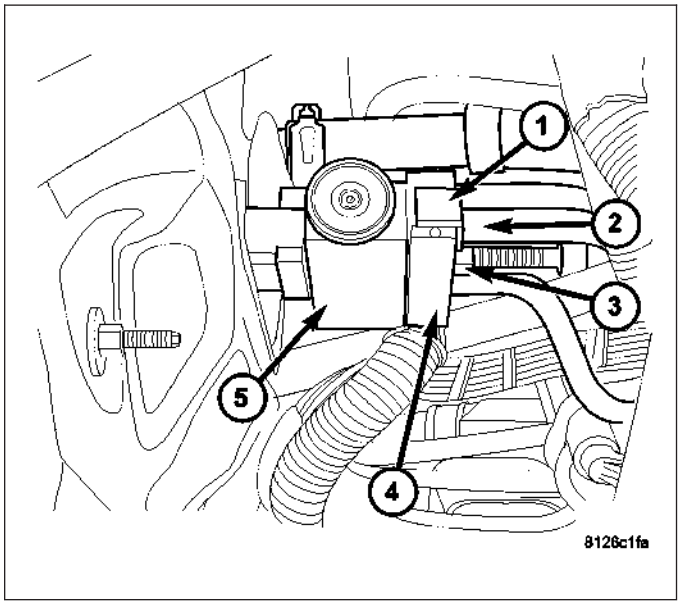


10. Install the air cleaner housing (1) to the right side of the engine compartment (Refer to 9 - ENGINE/ AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

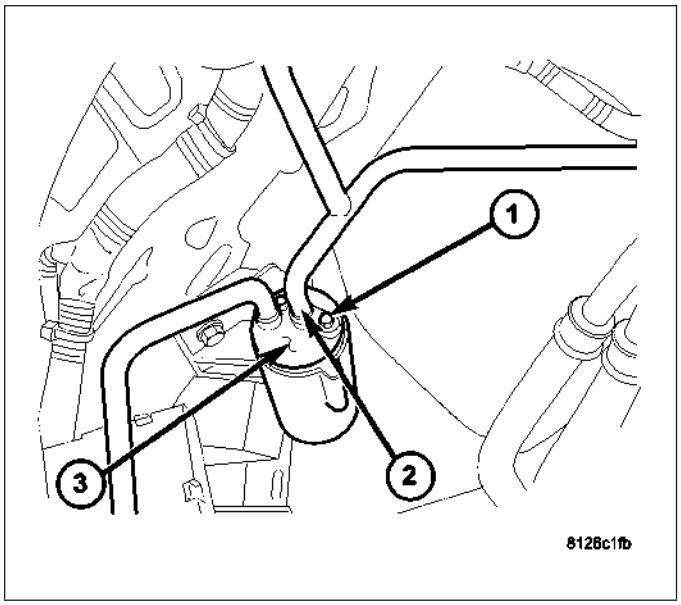


REAR SECTION

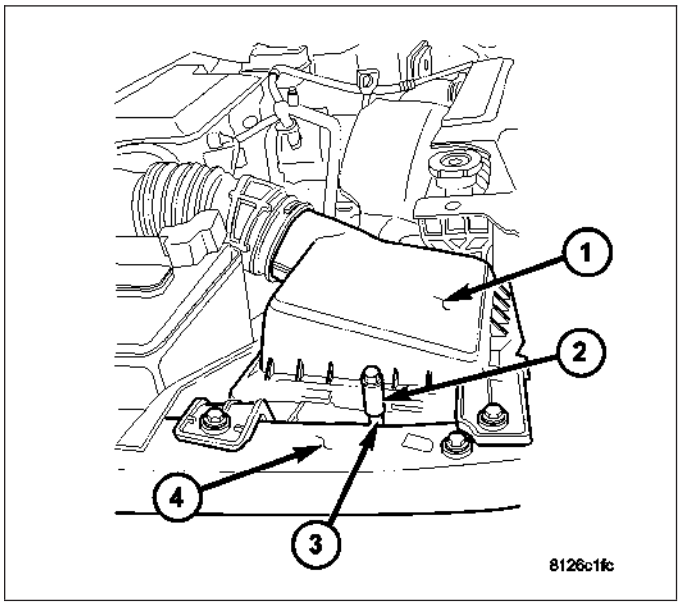
1. Position the rear section of the A/C liquid line into the engine compartment.
2. Install the A/C suction line (2) into the liquid line tapping block (4).
3. Install the plastic retainer (1) that secures the A/C suction line to the liquid line tapping block.
4. Remove the tape or plugs from the suction and liquid line fittings and the A/C expansion valve (5).
5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the A/C expansion valve. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C suction line and the rear section of the A/C liquid line to the A/C expansion valve.
7. Install the nut (3) that secures the liquid line tapping block to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
8. On models equipped with the rear heating-A/C system, connect the underbody liquid line to the liquid line tapping block (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINE-A/C LIQUID - INSTALLATION) or (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/COUPLER-REFRIGERANT LINE - INSTALLATION).
9. Install the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
10. Lower the vehicle.



11. Remove the tape or plugs from the liquid line fitting and the receiver/drier (3).
12. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
13. Connect the rear section of the A/C liquid line (2) to the receiver/drier.
14. Install the bolt (1) that secures the rear section of the A/C liquid line to the receiver/drier. Tighten the bolt to 11 N·m (100 in. lbs.).



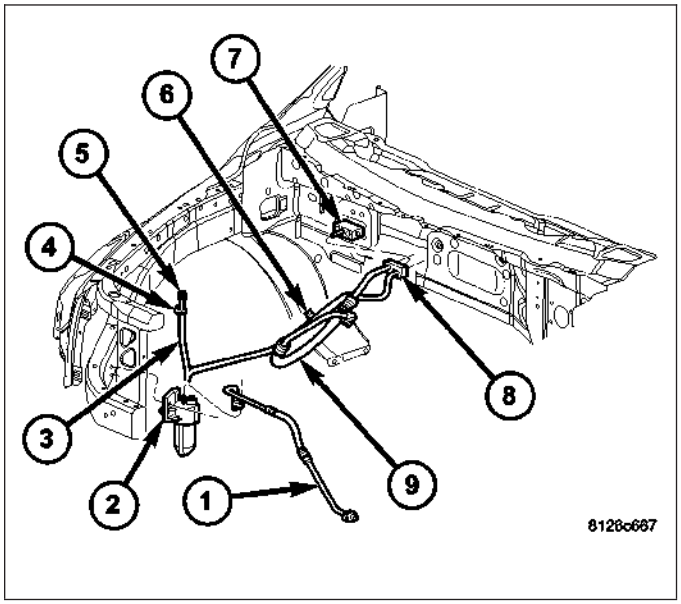
15. Install the rear section of the liquid line (2) into the plastic retainer (3) located on the right inner fender (4).
16. Install the air cleaner housing (1) to the right side of the engine compartment (Refer to 9 - ENGINE/ AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
17. Reconnect the negative battery cable.
18. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
19. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



LINE-A/C SUCTION

DESCRIPTION

The suction line (9) is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The suction line includes the low side service port (6) and is secured to the A/C expansion valve (7) by the liquid line tapping plate (8). On models equipped with the rear heating-A/C system, the suction line also includes an extension tube that connects the suction line to the underbody lines (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/ LINE-A/C SUCTION - DESCRIPTION).



CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

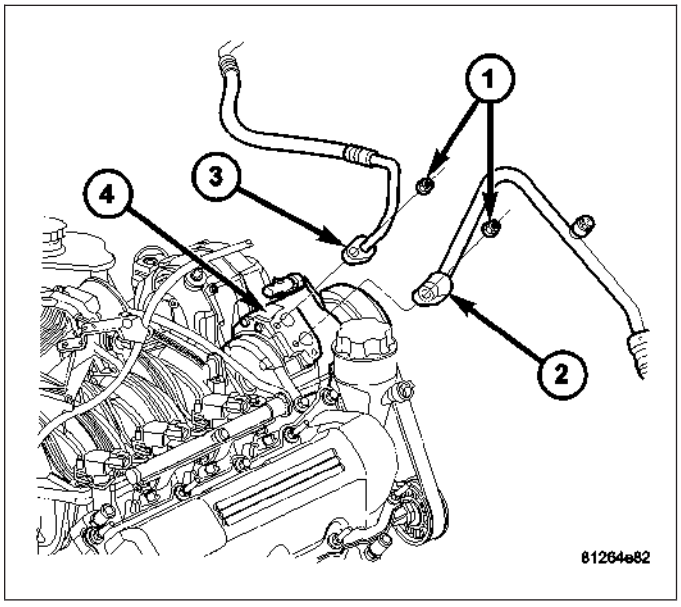
The suction line has no serviceable parts except for the rubber O-ring seals, low-side service port valve and cap.The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the suction line is removed and installed.

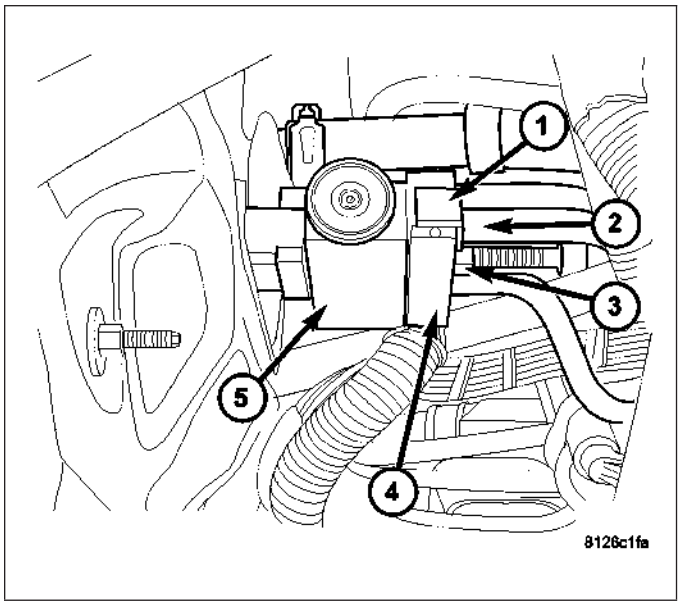
If the suction line is found to be leaking or is damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

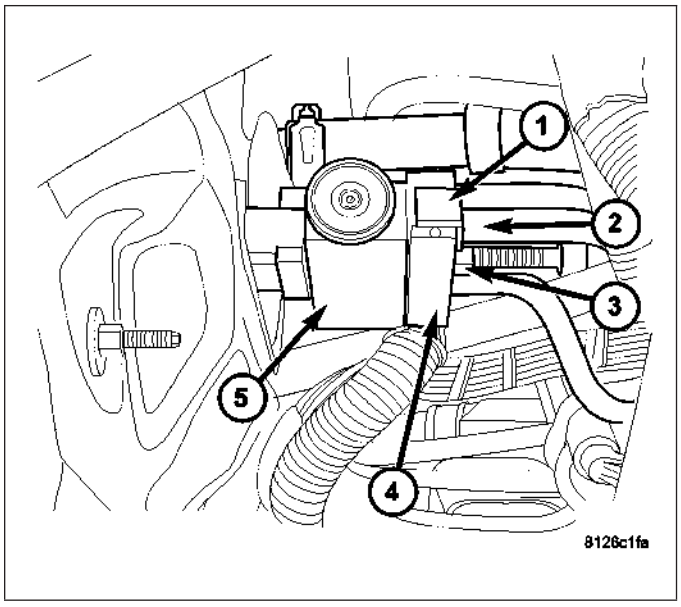
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the nut (1) that secure the A/C suction line (2) to the A/C compressor (4).
4. Disconnect the A/C suction line from the A/C compressor and remove and discard the O-ring seal and gasket.
5. Install plugs in, or tape over the opened suction line fitting and the compressor port.



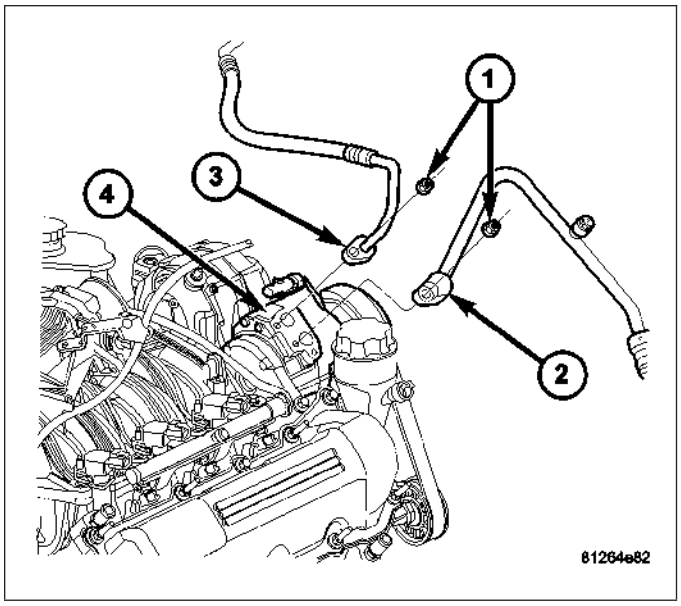


6. Raise and support the vehicle.
7. Remove the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
8. Remove the plastic retainer (1) that secures the A/C suction line (2) to the liquid line tapping block (4).
9. Remove the nut (3) that secures the liquid line tapping block to the A/C expansion valve (5).
10. Disconnect the A/C suction line and the rear section of the A/C liquid line from the A/C expansion valve and remove and discard the O-ring seals and gaskets.
11. Install plugs in, or tape over the opened refrigerant line fittings and the expansion valve ports.
12. Separate the A/C suction line from the liquid line tapping block.
13. On models equipped with the rear heating-A/C system, disconnect the underbody refrigerant line from the A/C suction line (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -REAR/COUPLER-REFRIGERANT LINE - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINE-A/C LIQUID - REMOVAL).
14. Remove the A/C suction line from the engine compartment.

INSTALLATION



1. Position the A/C suction line (2) into the engine compartment.
2. Install the A/C suction line into the liquid line tapping block (4).
3. Install the plastic retainer (1) that secures the A/C suction line to the liquid line tapping block.
4. Remove the tape or plugs from the suction and liquid line fittings and the A/C expansion valve (5).
5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and a new gasket onto the suction and liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C suction line and A/C liquid line to the A/C expansion valve.
7. Install the nut (3) that secures the liquid line tapping block to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
8. On models equipped with the rear heating-A/C system, connect the underbodyrefrigerant line to the A/C suction line (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINE-A/C LIQUID - INSTALLATION) or (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/COUPLER-REFRIGERANT LINE - INSTALLATION).
9. Install the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
10. Lower the vehicle.



11. Remove the tape or plugs from the opened suction line fitting and the compressor port.
12. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
13. Install the A/C suction line (2) onto the A/C compressor (4).
14. Install the nut (1) that secures the A/C suction line to the A/C compressor. Tighten the nut to 23 N·m (17 ft. lbs.).
15. Reconnect the negative battery cable.
16. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
17. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

OIL-A/C REFRIGERANT

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The Denso 10S20 A/C compressor used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil in the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The oil used in the Denso 10S20 A/C compressor is ND-8 PAG R-134a refrigerant oil. Only refrigerant oil of the same type should be used to service the A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a receiver/drier, A/C evaporator or A/C condenser is replaced. See the Refrigerant Oil Capacities chart. When an A/C compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new A/C compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

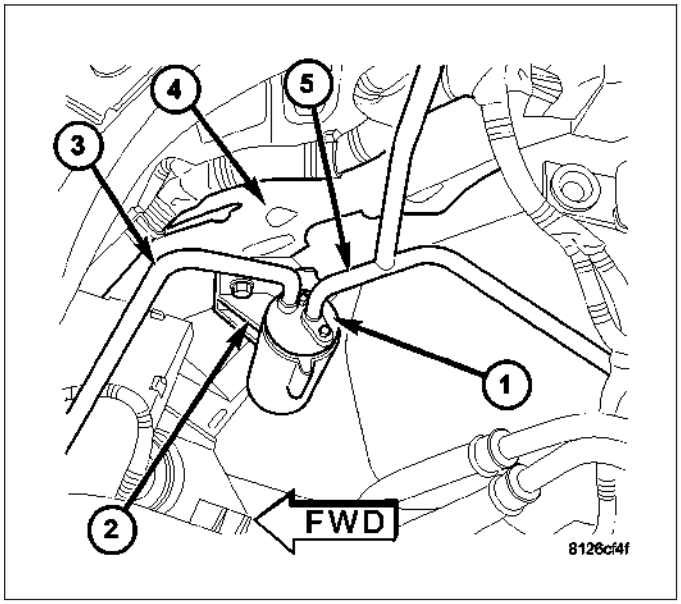
REFRIGERANT OIL CAPACITIES

Component	ml	fl oz
Total System Fill - Front A/C only	150	5.07
Total System Fill - Front and Rear A/C	220	7.4
Receiver/drier	30	1
Front Evaporator	60	2
Rear Evaporator	30	1
A/C Condenser	30	1
A/C Compressor	Drain and measure the oil from the old compressor - see text.	

RECEIVER/DRIER-A/C

DESCRIPTION

The receiver/drier (1) is mounted in a bracket (2) secured to the right front frame rail (4) in the engine compartment. The receiver/drier is connected between the front section of the liquid line (3) and the rear section of the liquid line (5) between the condenser outlet and the evaporator inlet.



OPERATION

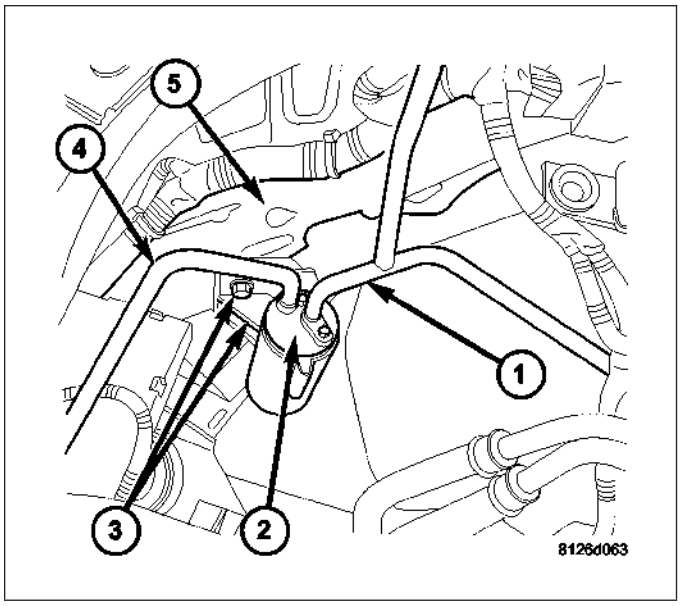
The receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the receiver/drier acts as a reservoir to store surplus refrigerant.

The receiver/drier cannot be repaired. If the receiver/drier is faulty or damaged, or if the refrigerant system has been contaminated or left open to the atmosphere for an indeterminable period or if the A/C compressor has failed, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

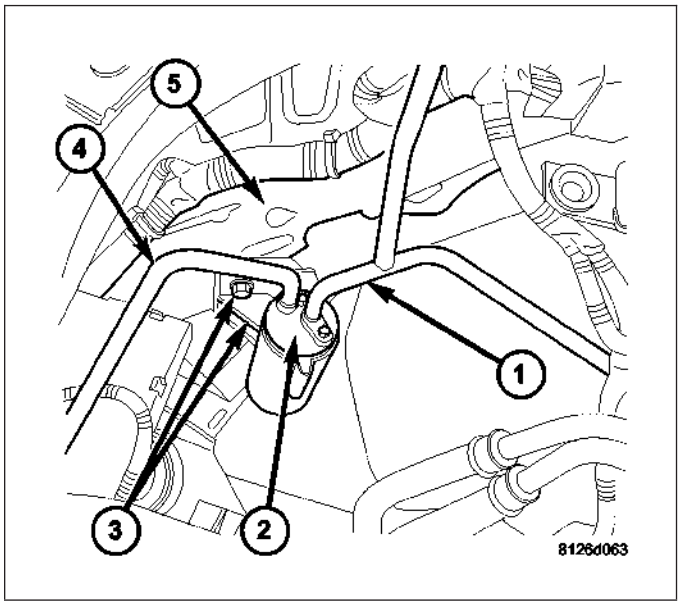
1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Remove the front and the rear sections of the liquid line (1 and 4) from the receiver/drier (2) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - REMOVAL).
3. Remove the two bolts (3) that secure the receiver/ drier and bracket to the right front frame rail (5).
4. Remove the receiver/drier from the engine compartment.



INSTALLATION

NOTE: If the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only the refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the receiver/drier and bracket (2) into the engine compartment.
2. Install the two bolts (3) that secure the receiver/ drier to the right front frame rail (5). Tighten the bolts to 6.8 N·m (60 in. lbs.).
3. Install the front and rear sections of the liquid line (1 and 4) to the receiver/drier (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/ LINE-A/C LIQUID - INSTALLATION).
4. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



REFRIGERANT-A/C

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

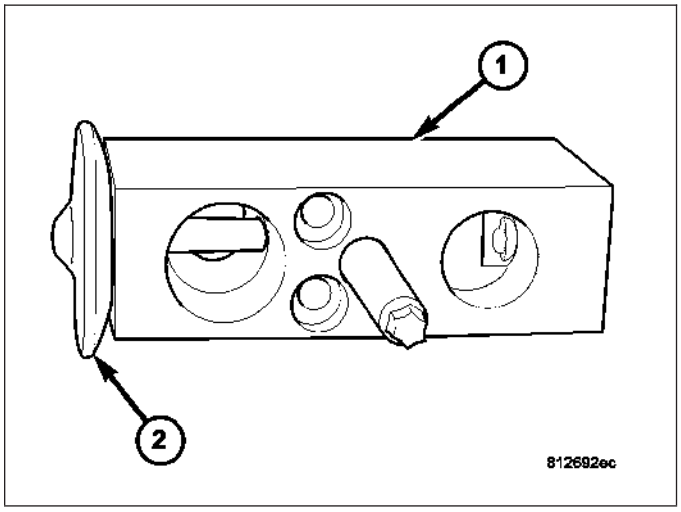
R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

VALVE-A/C EXPANSION

DESCRIPTION

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator and is of a thermostatic expansion valve (TXV) design. The A/C expansion valve consists of an aluminum H-valve type body (1) with an integral thermal sensor (2) and is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.



OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the A/C evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

A/C EXPANSION VALVE - FRONT

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO^2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to Step 6. If not OK, replace the faulty A/C expansion valve.

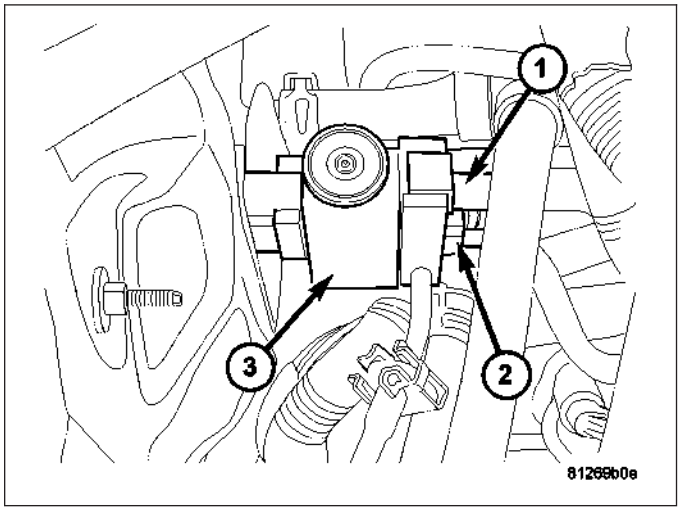
WARNING:
Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to Step 7 If not OK, replace the faulty A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the faulty A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST).

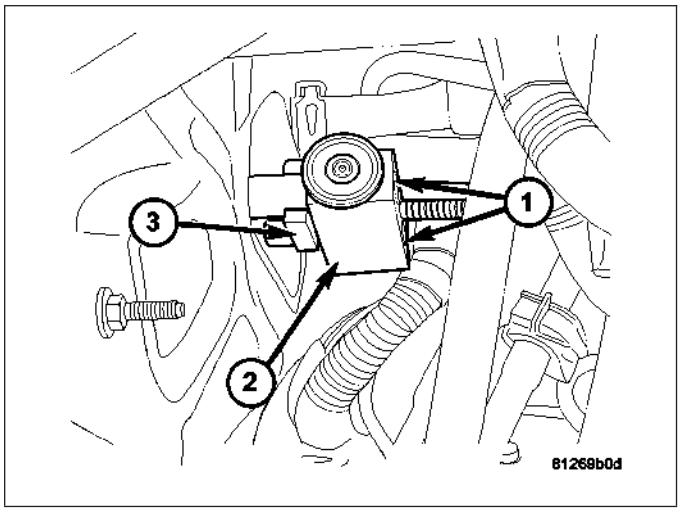
REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the A/C suction line (1) and the A/C liquid line (2) from the A/C expansion valve (3) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C SUCTION - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/LINE-A/C LIQUID - REMOVAL).

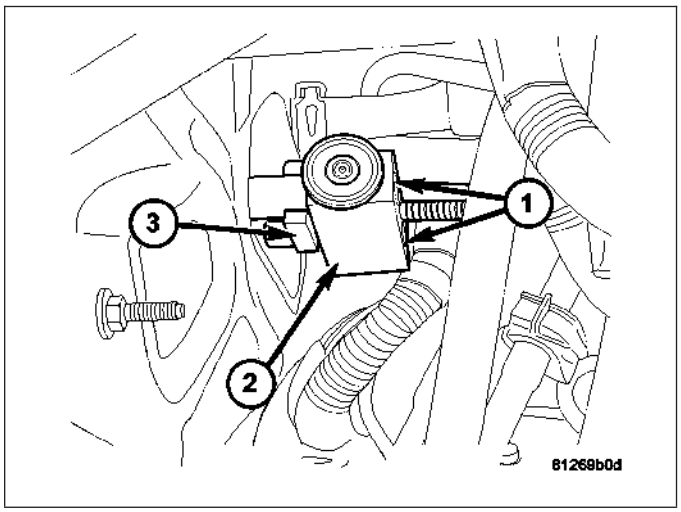


4. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3).
5. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.



INSTALLATION

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).



5. Install the A/C suction line (1) and the A/C liquid line (2) to the A/C expansion valve (3) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C SUCTION - INSTALLATION) or (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/LINE-A/C LIQUID - INSTALLATION).
6. Reconnect the negative battery cable.
7. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
8. Recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CORE-HEATER

DESCRIPTION

The rear heater core (1) is located in the rear HVAC housing (2), behind the right interior quarter panel trim. The rear heater core is a heat exchanger made of rows of tubes and fins.

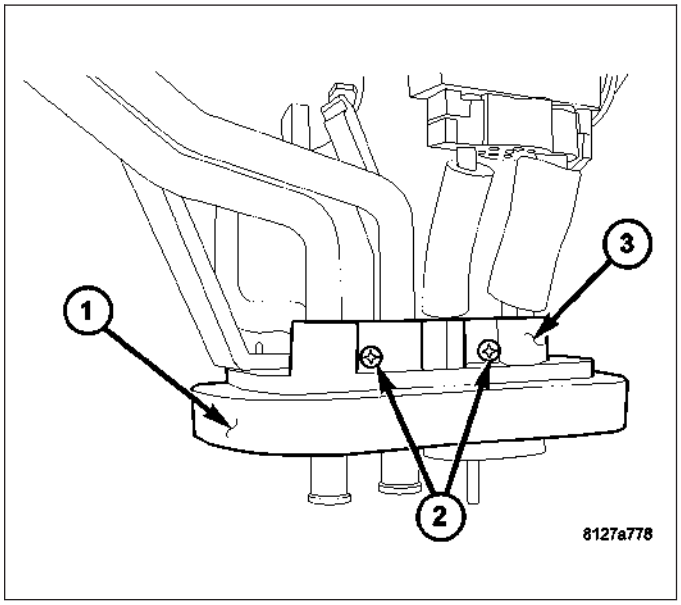
If the rear heater core is found to be leaking or is damaged, it must be replaced.

OPERATION

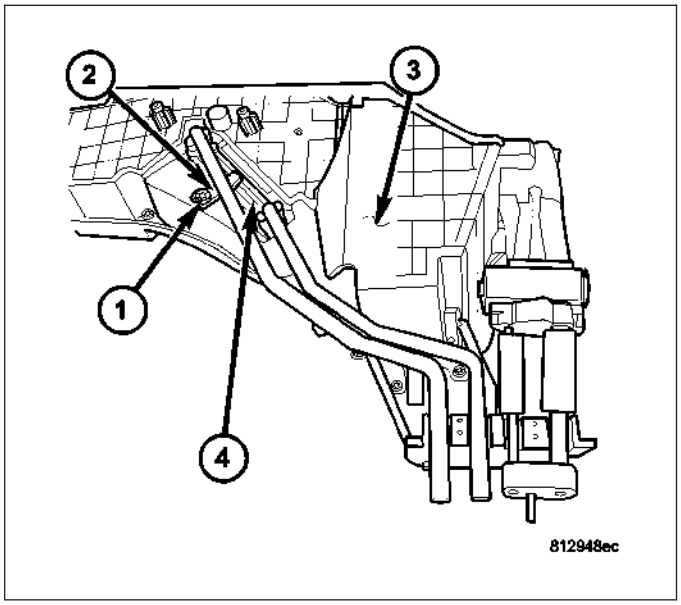
Engine coolant is circulated through heater hoses/tubes to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend air door allows control of the heater output air temperature by controlling how much of the air flowing through the heater-A/C housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the heater-A/C housing. The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Cooling System for more information on the engine cooling system, the engine coolant and the heater hoses.

REMOVAL

1. Remove the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - REMOVAL).
2. Remove the rear blend door actuator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/ACTUATOR-BLEND DOOR - REMOVAL).
3. Carefully remove the foam seal (1) from the rear heater core and evaporator extension line flange (3). If the seal is deformed or damaged, it must be replaced.
4. Remove the screws (2) that secure the two halves of the rear heater core and evaporator extension line flange together.
5. Remove the outer half of the rear heater core and evaporator extension line flange.

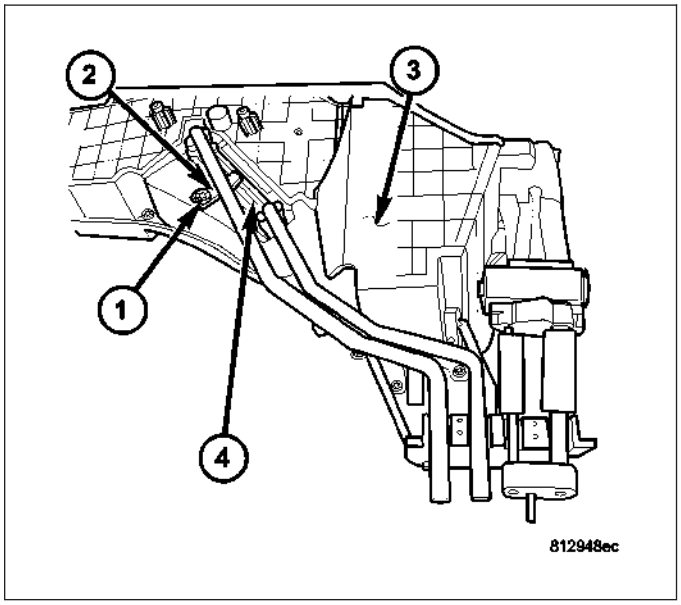


6. Remove the screw (1) that secures the rear heater core tube retaining bracket (2) to the rear HVAC housing (3).
7. Remove the rear heater core tube retaining bracket.
8. Carefully pull the rear heater core (4) out of the side of the rear HVAC housing.



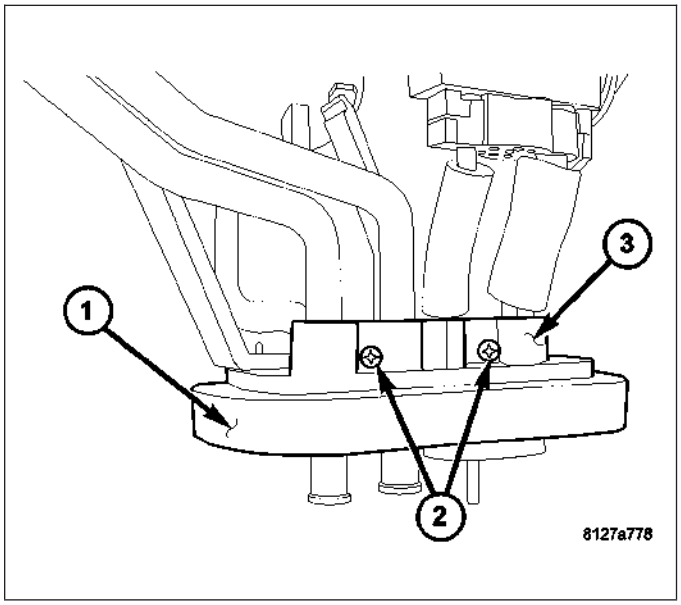
INSTALLATION

1. Install the rear heater core (4) into the side of the rear HVAC housing (3). Make sure that the insulator is properly installed.
2. Install the rear heater core retaining bracket (2).
3. Install the screw (1) that secures the rear heater core retaining bracket to the rear HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).



4. Install the outer halve of the rear heater core and evaporator extension line flange (3).
5. Install the screws (2) that secure the two halves of the rear heater core and evaporator extension line flange together. Tighten the screws to 2 N·m (17 in. lbs.).
6. Install the foam seal (1) to the rear heater core and evaporator extension line flange.
7. Install the rear blend door actuator (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - REAR/ACTUATOR-BLEND DOOR - INSTALLATION).

NOTE: If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).



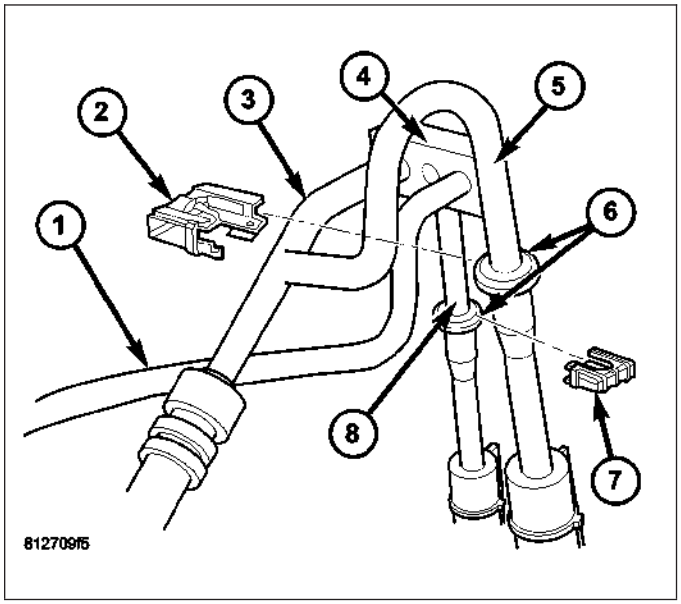
8. Install the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - INSTALLATION).

COUPLER- REFRIGERANT LINE

DESCRIPTION

Spring-lock type refrigerant line couplers (6) are used to connect the liquid line (1) and the suction line (3) to the underbody refrigerant lines for the rear heating-A/C system. Secondary retaining clips (2 and 7) are installed over the connected couplers for added protection.

The spring-lock refrigerant line couplers require special disconnect tools for disengaging the two coupler halves.

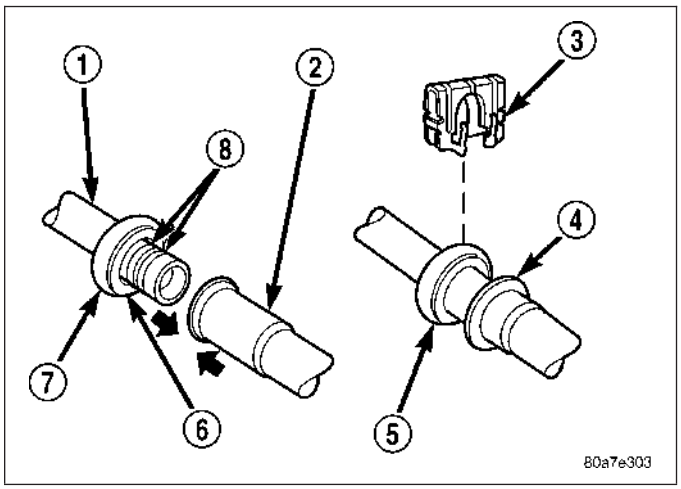


OPERATION

The spring-lock type refrigerant line coupler is held together by a garter spring (6) inside a circular cage (7) on the male half of the fitting (1). When the two coupler halves are connected, the flared end of the female fitting (2) slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage. Some applications use a connection indicator ring (4) to help indicate when the two coupler halves are fully connected.

Two O-rings (8) are used to seal the coupler connections. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

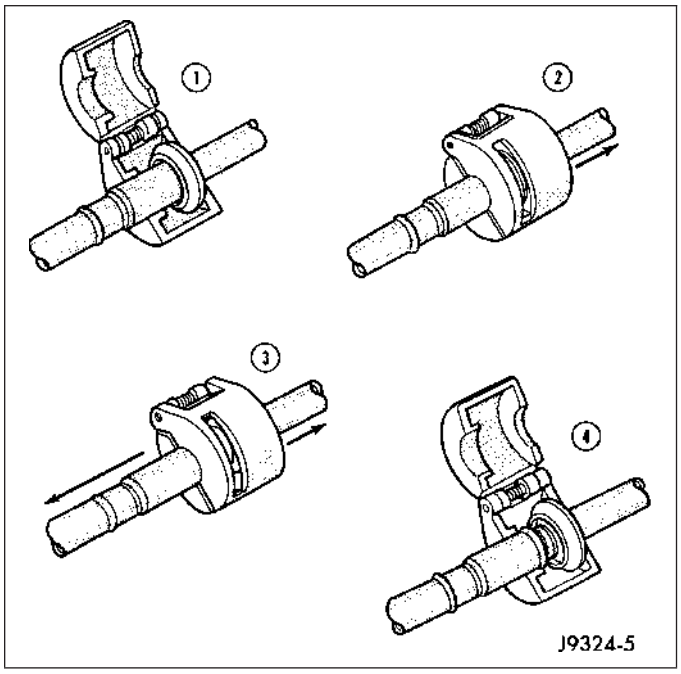
A secondary retaining clip (3) is installed over the connected coupler (5) for added protection.



REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGSG) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Remove the secondary retaining clip from the spring-lock type refrigerant line coupler.
3. Fit the proper size A/C line disconnect tool (Special Tool Kit 7193 or equivalent) over the coupler cage (1).
4. Close the two halves of the A/C line disconnect tool around the coupler (2).

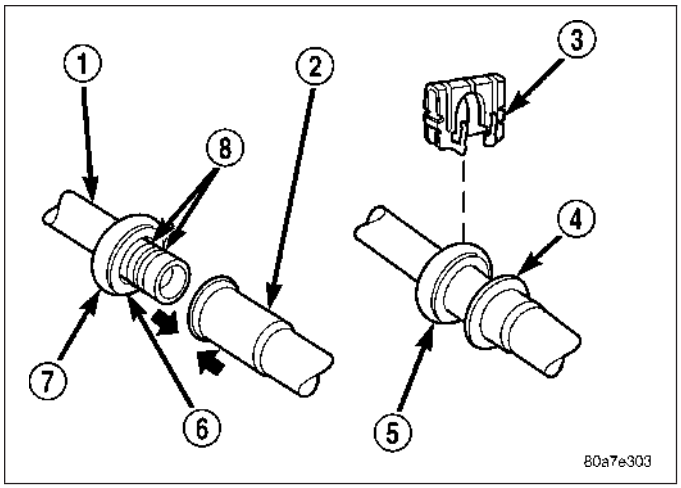


NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

5. Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring (3). Once the garter spring is expanded, pull on the refrigerant line attached to the female half of the coupler until the flange on the female fitting is separated from the garter spring and cage on the male fitting.
6. Open and remove the A/C line disconnect tool from the refrigerant line coupler (4).

INSTALLATION

1. Clean any dirt or foreign material from the spring-lock type refrigerant line coupler.
2. Check to make sure that the garter spring (6) is located within the cage (7) of the male half of the refrigerant line coupler (1), and that the garter spring is not damaged.
   a. If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.
   b. If the garter spring is damaged, remove it from the coupler cage with a small hook (DO NOT use a screwdriver) and install a new garter spring.



CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak.

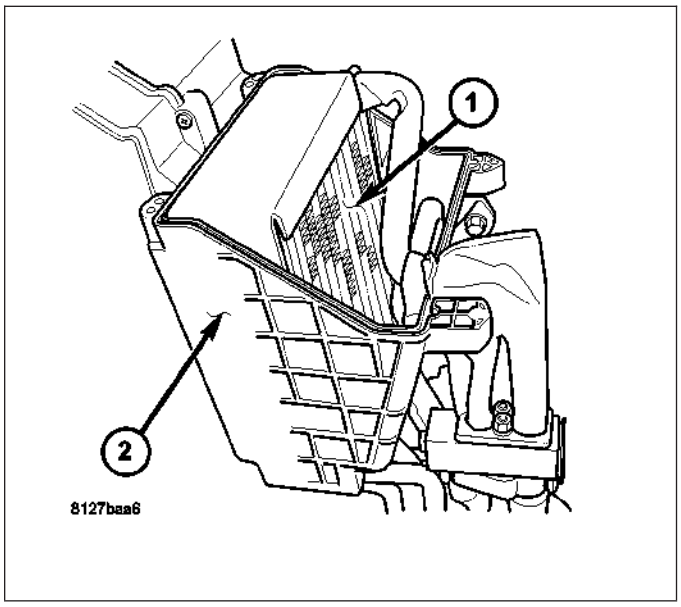
3. Install new O-rings (8) on the male half of the refrigerant line coupler.
4. Lubricate the O-rings, and the inside of the female half of the refrigerant line coupler (2) with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Position the female half of the coupler over the male half of the coupler.
6. Push together firmly on the two halves of the refrigerant line coupler until the garter spring in the cage on the male half of the coupler snaps over the flanged end on the female half of the coupler.
7. Make sure that the refrigerant line coupler is fully engaged by firmly pulling the refrigerant lines away from each other on both sides of the coupler.
8. Install the secondary retaining clip (3) over connected coupler cage (5).
9. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

10. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

EVAPORATOR-A/C

DESCRIPTION

The rear A/C evaporator (1) is located within the rear HVAC housing (2), behind the right interior quarter panel trim. The rear A/C evaporator is positioned in the rear HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the rear heating-A/C system ducts and outlets. However, air passing over the rear evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.



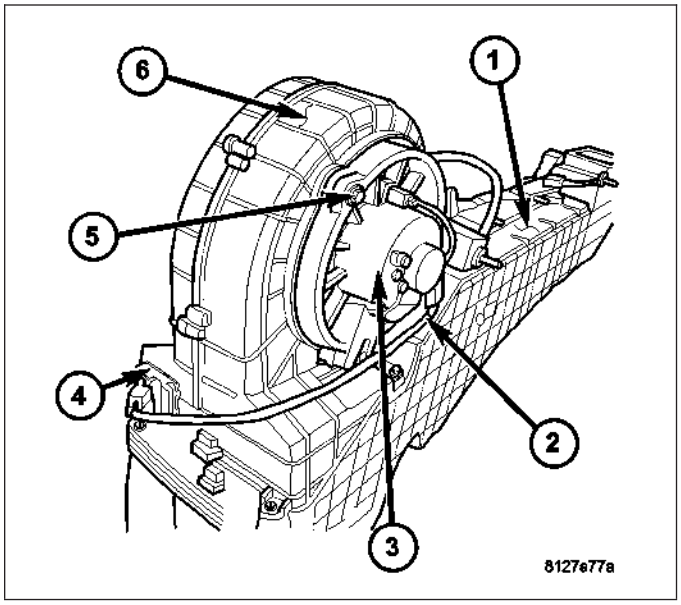
OPERATION

Refrigerant enters the rear A/C evaporator from the rear A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the rear A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the rear A/C evaporator.

The rear A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

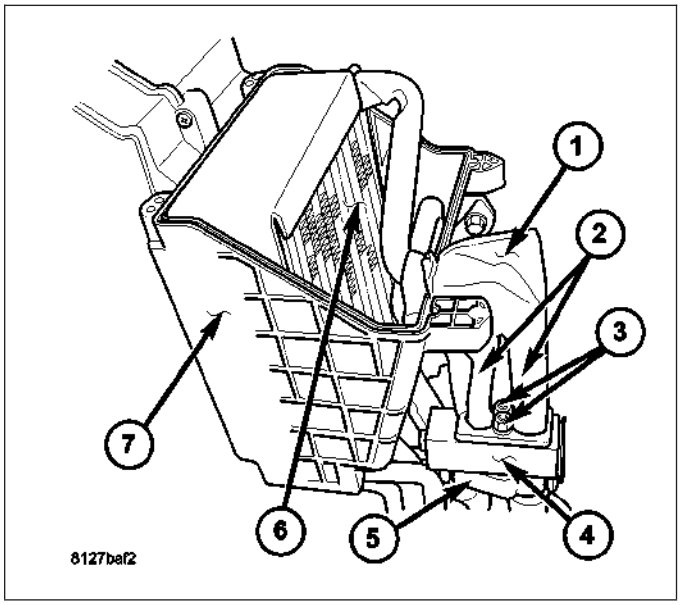
REMOVAL

1. Remove the rear HVAC housing (1) and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - REMOVAL).
2. Disconnect the rear HVAC wire harness (2) from the rear blower motor (3) and the rear blower motor resistor (4).
3. Remove the screws (5) that secure the rear air inlet housing (6) to the rear HVAC housing.



4. Remove the rear air inlet housing from the rear HVAC housing.

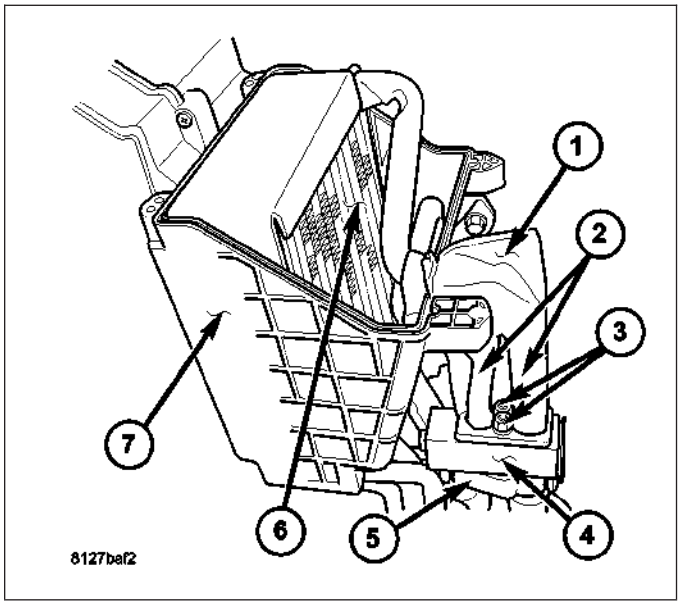
5. Remove the insulator (1) from around the rear A/C evaporator tubes (2) to gain access the two rear A/C expansion valve bolts (3).
6. Remove the two bolts that secure the rear A/C evaporator tubes to the rear A/C expansion valve (4) and the rear evaporator extension tube tapping block (5).
7. Carefully lift the rear A/C evaporator (6) out of the top of the rear HVAC housing (7).
8. Remove the rear A/C expansion valve from the rear evaporator extension tube tapping block and remove and discard the O-ring seals.
9. Install plugs in, or tape over the opened rear evaporator and extension tube fittings and all rear expansion valve ports.



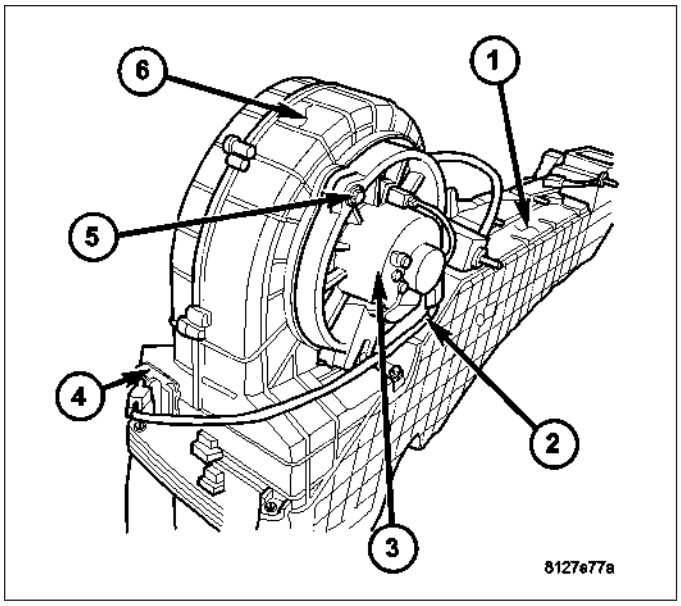
INSTALLATION

NOTE: If the rear A/C evaporator is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Carefully position the rear A/C evaporator (6) into the top of the rear HVAC housing (7).
2. Remove the tape or plugs from the opened rear evaporator and extension tube fittings and all rear expansion valve ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube and extension tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the rear A/C expansion valve (4) between the rear A/C evaporator tubes (2) and the rear extension tube tapping block (5).
5. Install the two bolts (3) that secure the rear A/C expansion valve between the rear A/C evaporator tubes and the rear extension tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).
6. Install a new insulator (1) around the rear A/C evaporator tubes.



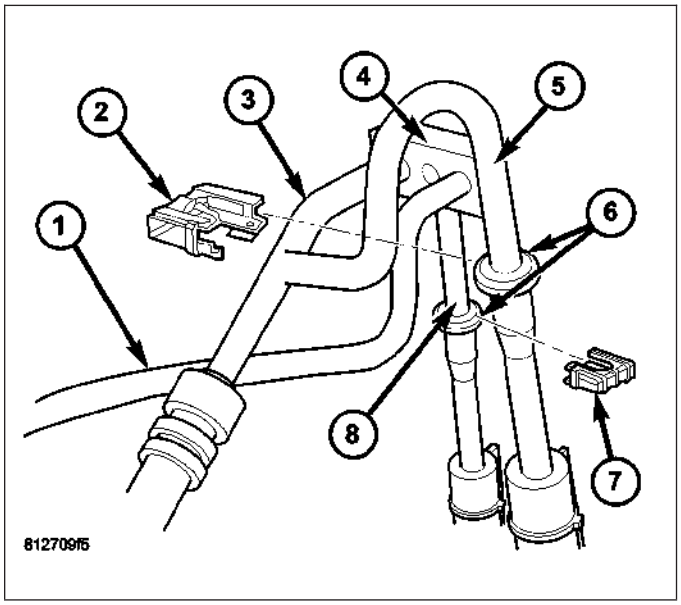
7. Position the rear air inlet housing (6) onto the rear HVAC housing (1).
8. Install the screws (5) that secure the rear air inlet housing to the rear HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
9. Connect the rear HVAC wire harness (2) to the rear blower motor (3) and the rear blower motor resistor (4).
10. Install the rear HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - REAR/HOUSING-HVAC - INSTALLATION).



LINE-A/C LIQUID

DESCRIPTION

The liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser to the rear A/C evaporator. The liquid line serviced in two sections and includes a tapping plate (4) that retains the suction line (3) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - DESCRIPTION). Models equipped with the rear heating-A/C system include an extension tube (8) that connects the liquid line to the underbody line by use of a spring-lock type refrigerant line coupler (6) and a secondary retaining clip (7).



CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

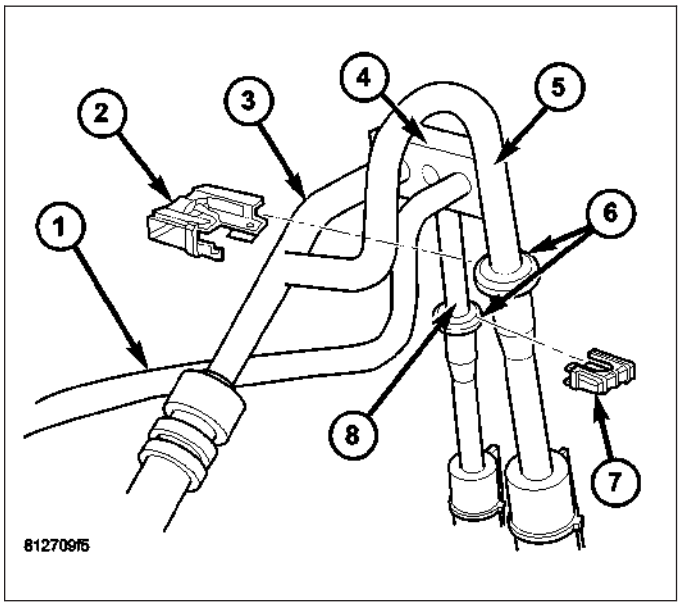
The liquid line has no serviceable parts except for the rubber O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the liquid line is removed and installed.

If the liquid line is found to be leaking or is damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

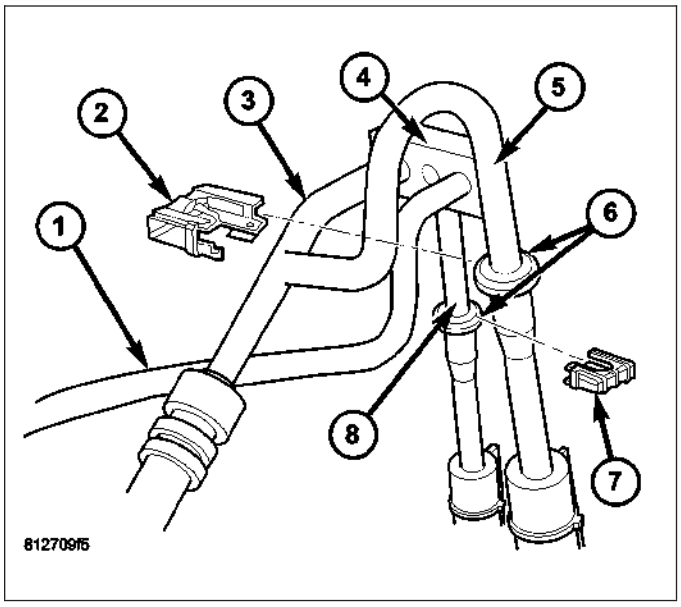
NOTE: The A/C liquid line is serviced in two sections. The front section connects between the A/C condenser and the receiver/drier. The rear section connects between the receiver/drier and the front A/C expansion valve. On models equipped with the rear heating-A/C system, the rear section of the A/C liquid line also includes an extension tube that connects the liquid line to the underbody lines.



1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Disconnect the A/C liquid line (1) from the receiver/ drier and the front A/C expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - REMOVAL).
4. Remove the secondary retaining clip (7) from the refrigerant line coupler (6) on the liquid line extension tube (8)
5. Disconnect the underbody liquid line from the liquid line extension tube and remove and discard the O-ring seal (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -REAR/COUPLER-REFRIGERANT LINE - REMOVAL).
6. Install plugs in, or tape over the refrigerant line coupler and the underbody liquid line.
7. Remove the A/C liquid line from the engine compartment.

INSTALLATION

NOTE: The A/C liquid line is serviced in two sections. The front section connects between the A/C condenser and the receiver/drier. The rear section connects between the receiver/drier and the front A/C expansion valve. On models equipped with the rear heating-A/C system, the rear section of the A/C liquid line also includes an extension tube that connects the liquid line to the underbody lines.



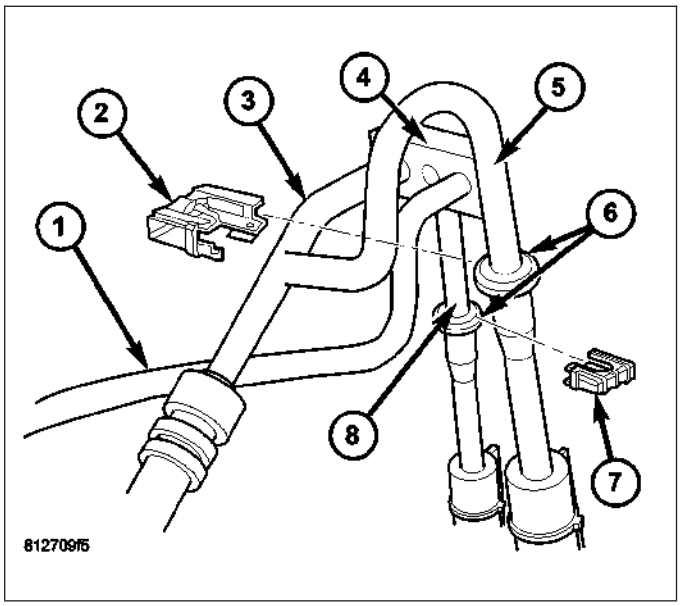
1. Install the A/C liquid line (1) to the receiver/drier and the front A/C expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C LIQUID - INSTALLATION.
2. Remove the tape or plugs from the refrigerant line coupler (6) and the underbody liquid line.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the refrigerant line coupler. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the underbody liquid line to liquid line extension tube (8) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/COUPLER-REFRIGERANT LINE - INSTALLATION).
5. Install the secondary retaining clip (7) onto the refrigerant line coupler.
6. Reconnect the negative battery cable.
7. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

8. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C SUCTION

DESCRIPTION

The suction line (3) is the refrigerant line that carries refrigerant from the rear A/C evaporator to the A/C compressor. The suction line is retained into the liquid line tapping block (4) by a plastic retainer (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C SUCTION - DESCRIPTION). Models equipped with the rear heating-A/C system include an extension tube (5) that connects the suction line to the underbody line by use of a spring-lock type refrigerant line coupler (6) and a secondary retaining clip (2).



CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

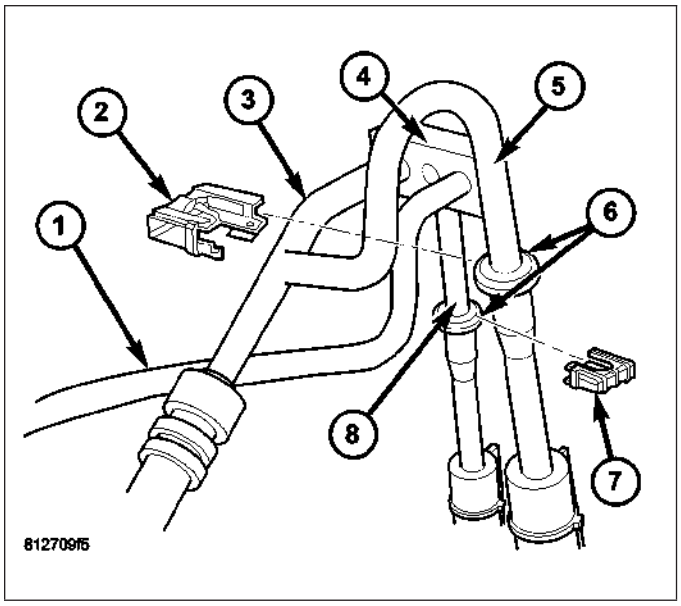
The suction line has no serviceable parts except for the rubber O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the suction line is removed and installed.

If the suction line is found to be leaking or is damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

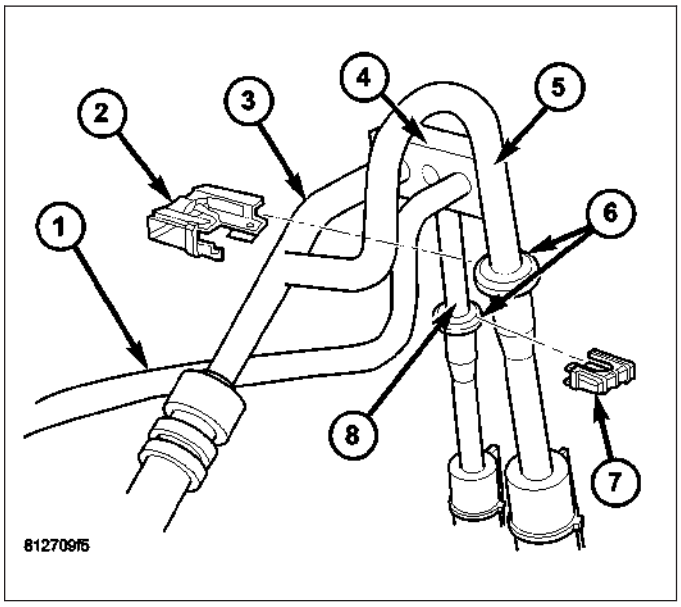
NOTE: The A/C suction line connects between the A/C evaporator and the A/C compressor. On models equipped with the rear heating-A/C system, the A/C suction line also includes an extension tube that connects the suction line to the underbody lines.



1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Disconnect the A/C suction line (3) from the A/C compressor and the front A/C expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT/LINE-A/C SUCTION - REMOVAL)
4. Remove the secondary retaining clip (2) from the refrigerant line coupler (6) on the suction line extension tube (5)
5. Disconnect the underbody suction line from the suction line extension tube and remove and discard the O-ring seal (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -REAR/COUPLER-REFRIGERANT LINE - REMOVAL).
6. Install plugs in, or tape over the refrigerant line coupler and the underbody suction line.
7. Remove the A/C suction line from the engine compartment.

INSTALLATION

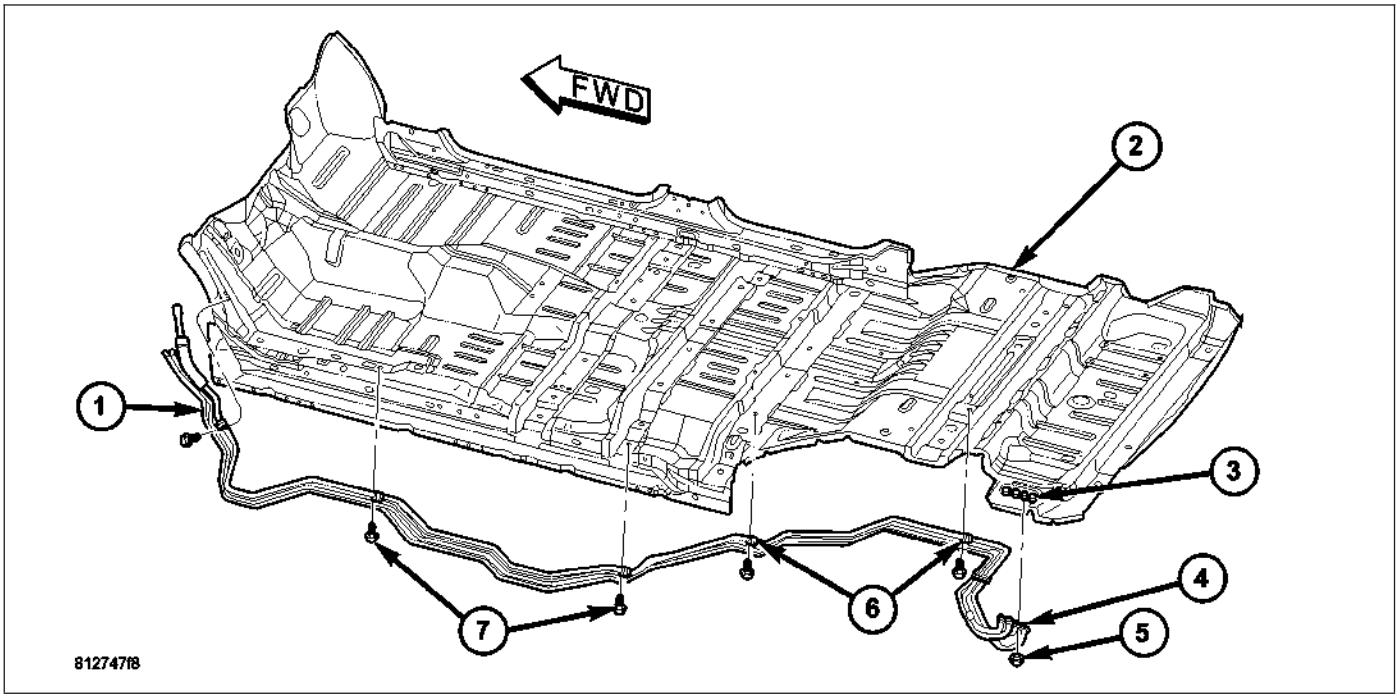
NOTE: The A/C suction line connects between the A/C evaporator and the A/C compressor. On models equipped with the rear heating-A/C system, the A/C suction line also includes an extension tube that connects the suction line to the underbody lines.



1. Install the A/C suction line (3) to the A/C compressor and the front A/C expansion valve (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT/LINE-A/C SUCTION - INSTALLATION).
2. Remove the tape or plugs from the refrigerant line coupler (6) and the underbody suction line.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the refrigerant line coupler. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the underbody suction line to the suction line extension tube (5) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/COUPLER-REFRIGERANT LINE - INSTALLATION).
5. Install the secondary retaining clip (2) onto the refrigerant line coupler.
6. Reconnect the negative battery cable.
7. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
8. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-UNDERBODY

DESCRIPTION



Models equipped with the rear heating-A/C system use metal lines (1) attached to the vehicle underbody (2) to carry refrigerant and engine coolant to/and from the rear A/C evaporator and heater core. The underbody A/C lines are connected to the front suction and liquid lines by spring-lock type couplers and secondary retaining clips (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -REAR/COUPLER-REFRIGERANT LINE - DESCRIPTION) and to the rear HVAC housing (3) by a tapping plate (4) and nut (5). The metal underbody heater lines have rubber hose ends that are connected to the front heater hoses and the rear HVAC housing by use of spring-clamp type heater hose clamps. The underbody lines are retained by plastic mounting brackets (6) and screws (7) and can be repaired (depending on the amount of damage) by using Miller Special Tool Kit 8456-A or equivalent (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINES-UNDERBODY - REMOVAL).

CAUTION: Use only O-ring seals specified for the vehicle. Failure to use the correct O-ring seal will cause the refrigerant system connections to leak.

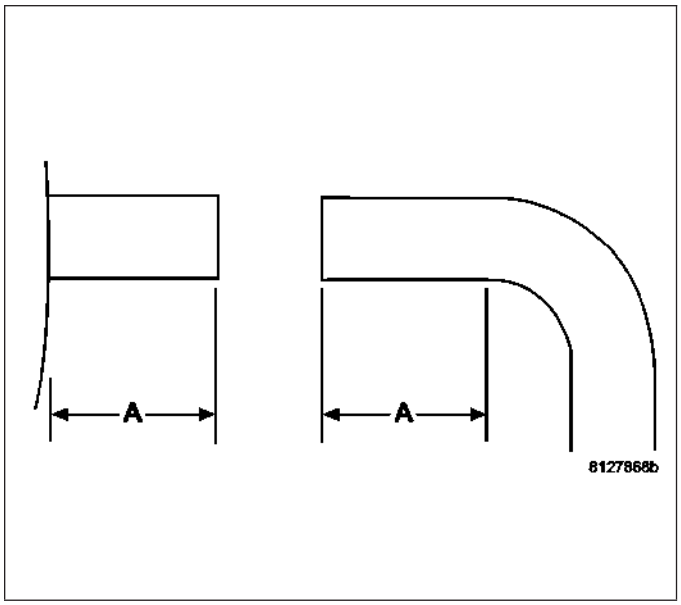
The underbody lines can only be removed by lifting the body off of the frame and have no serviceable parts except for the refrigerant line rubber O-ring seals and the mounting brackets. The O-ring seals used on the refrigerant line connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the underbody refrigerant lines are disconnected or removed.

REMOVAL

UNDERBODY LINE REPAIR

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: This procedure is intended for underbody line repair only. Use of the connector fittings and Repair Kit 8456-A on any other type of vehicle tubing could cause tube failure resulting in possible personal injury or death.



1. If repairing an underbody refrigerant line, recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. If repairing an underbody coolant line, drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Raise and support the vehicle.
5. Remove the underbody mounting brackets as necessary to gain access to the underbody line(s) needing repair (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINES-UNDERBODY - REMOVAL).
6. Mark the cut location(s) on the underbody line(s) needing repair. Check the Tube Length chart for the minimum amount of straight tube required (dimension A) for proper connector fitting installation.
7. Using a small pipe cutter or another suitable tool, carefully cut the underbody line(s) needing repair at the location(s) previously marked.

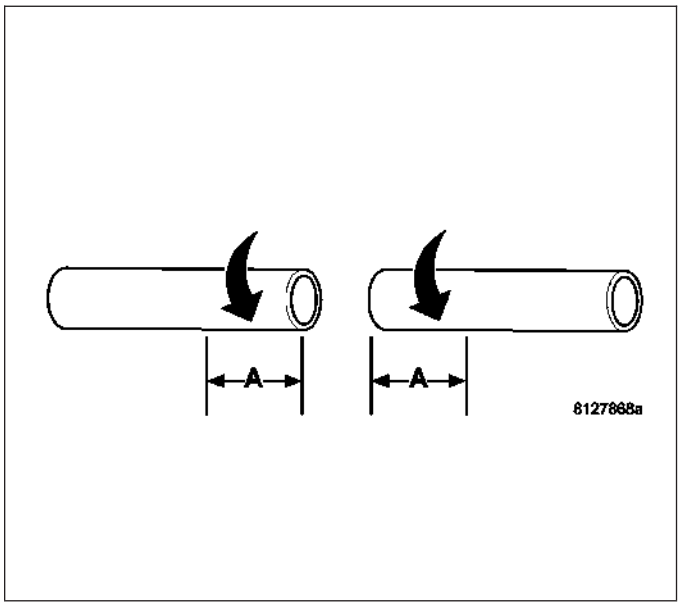
TUBE LENGTH

Tube Size	Minimum Tube Length Required	
	Dimension A Standard Installation	Dimension A Jaw Reversed Installation
3/8 in	28.5 mm (1 1/8 in)	19 - 28.5 mm (3/4 - 1 1/8 in)
1/2 in	28.5 mm (1 1/8 in)	19 - 28.5 mm (3/4 - 1 1/8 in)
5/8 in	31.7 mm (1 1/4 in)	22.2 - 31.7 mm (7/8 - 1 1/4 in)

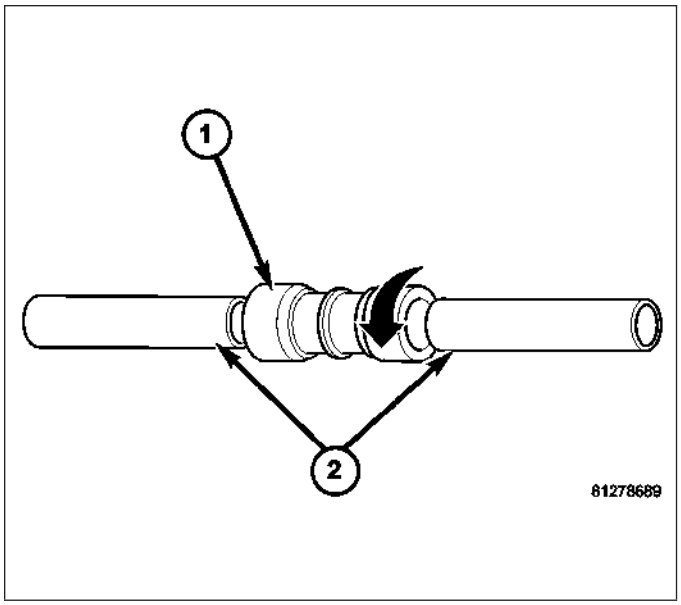
8. Size a replacement line, same size diameter and length as the portion of the line(s) removed.

NOTE: A minimum of 28.5 mm (3/4 in) of the line end must be cleaned in order for the connector fitting to properly seal the repair area.

9. Clean the ends of the line(s) a minimum of 28.5 mm (3/4 in) (dimension A) using the Scoth-Bright pad provided in special tool Kit 8456-A. Clean the line end(s) with a rotational motion around the line to avoid longitudinal scratches in the line.



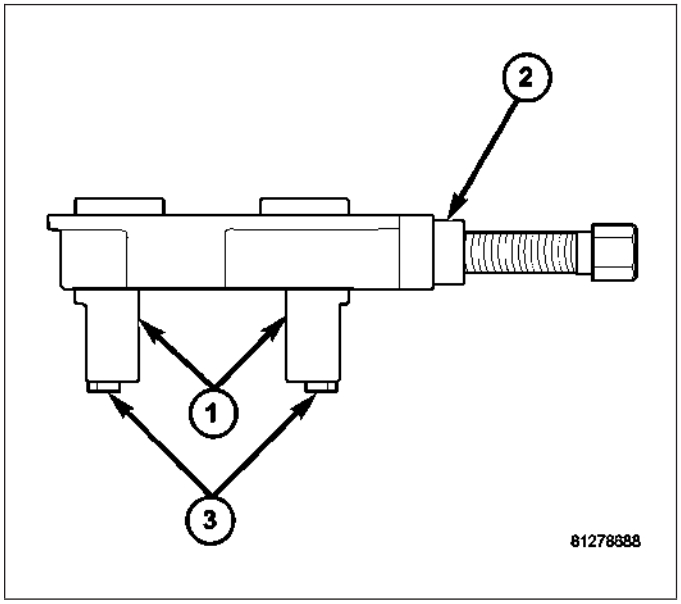
10. Select the proper connector fitting (1) for the size of the underbody line being repaired. Refer to the Connector Fitting chart.
11. Apply one drop of Lokprep sealing compound provided in special tool Kit 8456-A onto each line end (2).
12. Insert the line ends into the selected connector fitting and rotate the connector fitting a complete turn to evenly distribute the sealing compound.



CONNECTOR FITTING

Description	Mopar Part Number
3/8 in	5069 002AA
1/2 in	5069 003AA
5/8 in	5069 004AA

13. Select the proper size jaws (1) for the line being repaired from special tool Kit 8456-A. Refer to the Jaw Size chart.
14. Assemble the jaws into the tool body (Special Tool 8456-3 in Kit 8456-A) (2).
    a. For standard installation, install the jaws with the rubber gripping pads (3) facing outward. Refer to Tube Length chart.
    b. For reversed installation, remove the rubber gripping pads and install the jaws with the rubber gripping pad area facing inward. Refer to Tube Length chart.

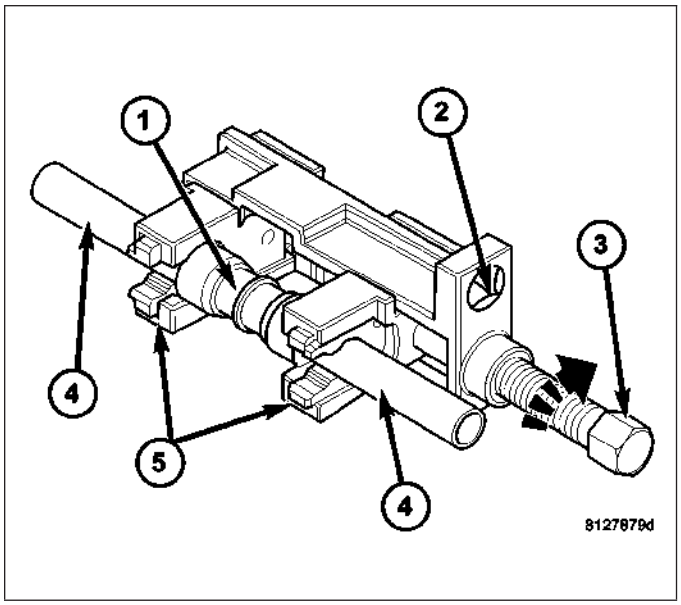


JAW SIZE

Description	Miller Part Number
3/8 in	8456-1
1/2 in	8456-4
5/8 in	8456-2

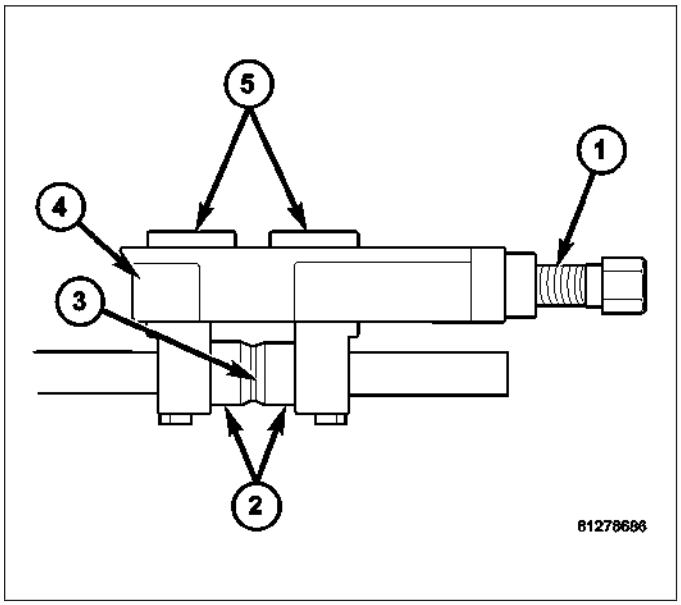
NOTE: The connector fitting ends must be positioned into the counterbore of the jaws in order for the connector fitting to properly seal the repair area.

15. Install the connector fitting (1) and the line ends (4) into the counterbore of the jaws (5).
16. Hold the tool body (Special Tool 8456-3 in Kit 8456-A) (2) with a 3/8 inch breaker bar and turn the forcing screw (3) clockwise.



NOTE: The lines must be kept fully inserted into the connector fitting to obtain a leak free joint.

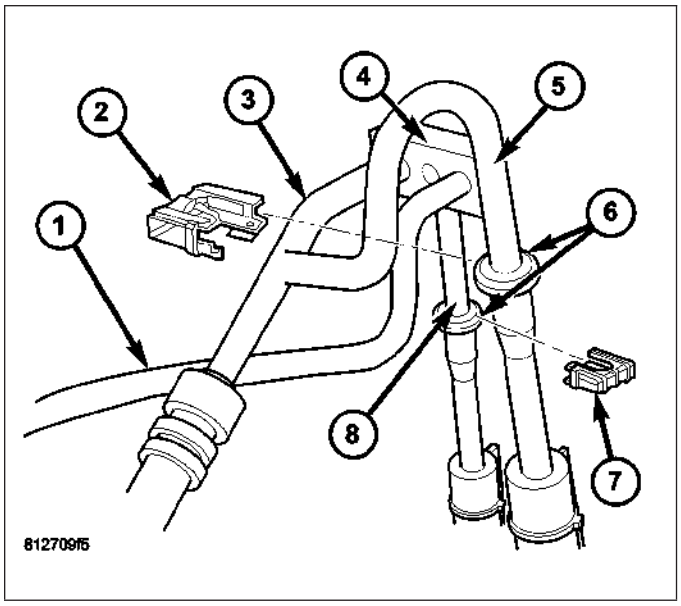
17. Turn the forcing screw (1) clockwise until both connector fitting collars (2) have bottomed out on the center shoulder of the connector (3).
18. Loosen the forcing screw and remove the tool body (Special Tool 8456-3 in Kit 8456-A) (4) and the jaws (5) from the repaired line(s).
19. Install the underbody mounting brackets as necessary (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - REAR/LINES-UNDERBODY - INSTALLATION).
20. Lower the vehicle.
21. Reconnect the negative battery cable.
22. If repairing an underbody coolant line, refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).



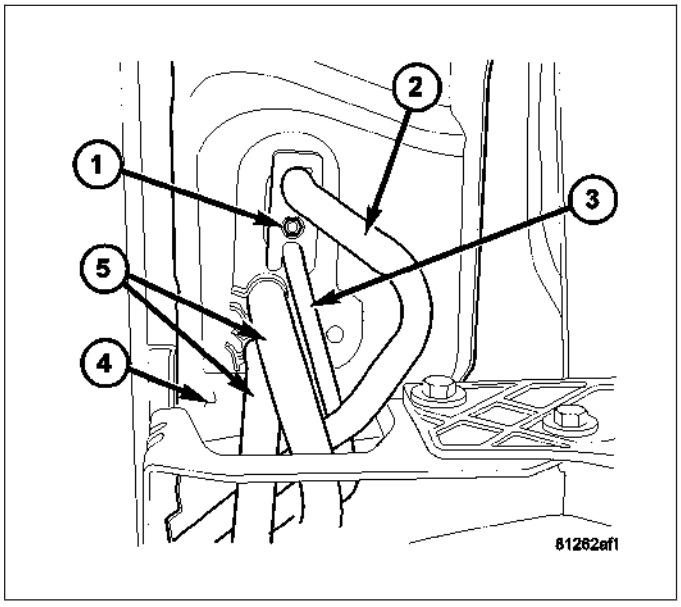
23. If repairing an underbody refrigerant line, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

UNDERBODY LINE ASSEMBLY

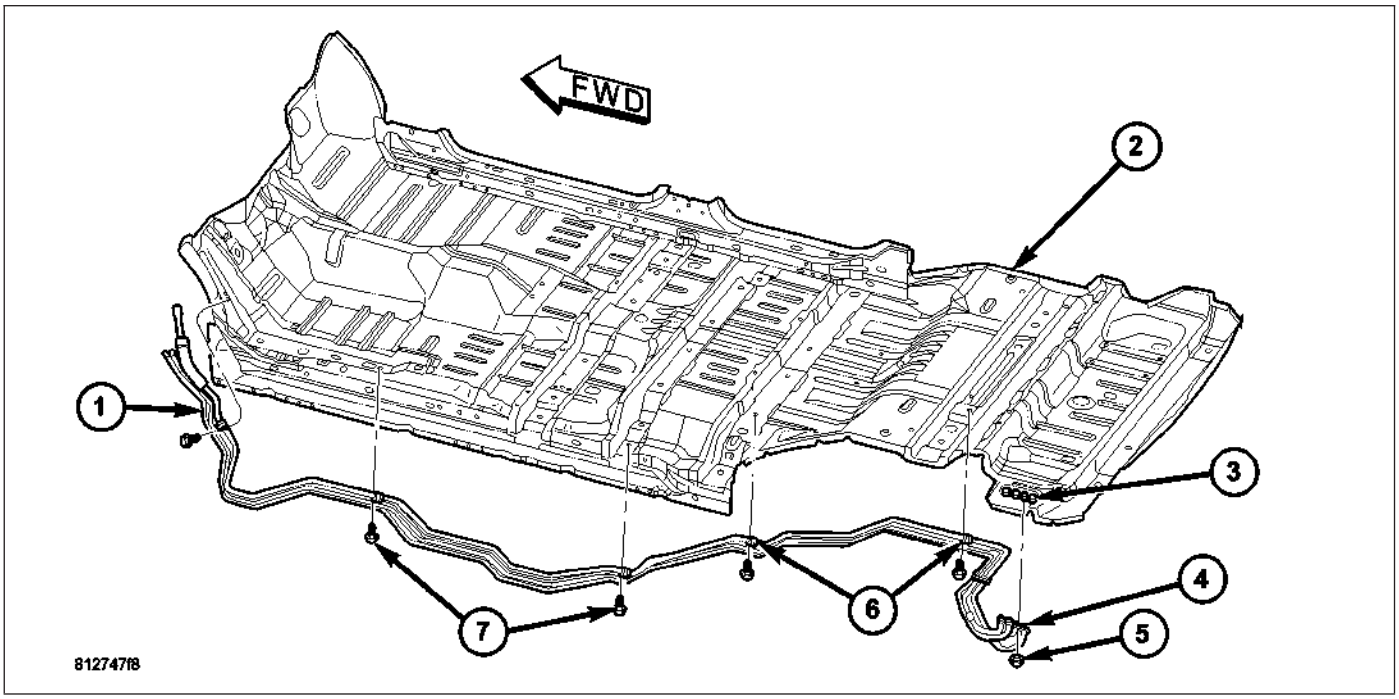
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.



1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Raise and support the vehicle.
5. Remove the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
6. Remove the secondary retaining clips (2 and 7) from the refrigerant line couplers (6) located on the suction line extension tube (5) and the liquid line extension tube (8).
7. Disconnect the underbody liquid and suction lines from the liquid line extension tube and the suction line extension tube and remove and discard the O-ring seals (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING -REAR/COUPLER-REFRIGERANT LINE - REMOVAL).
8. Install plugs in, or tape over the refrigerant line couplers and the underbody refrigerant lines.
9. Disconnect the underbody heater hoses from the front heater hoses.

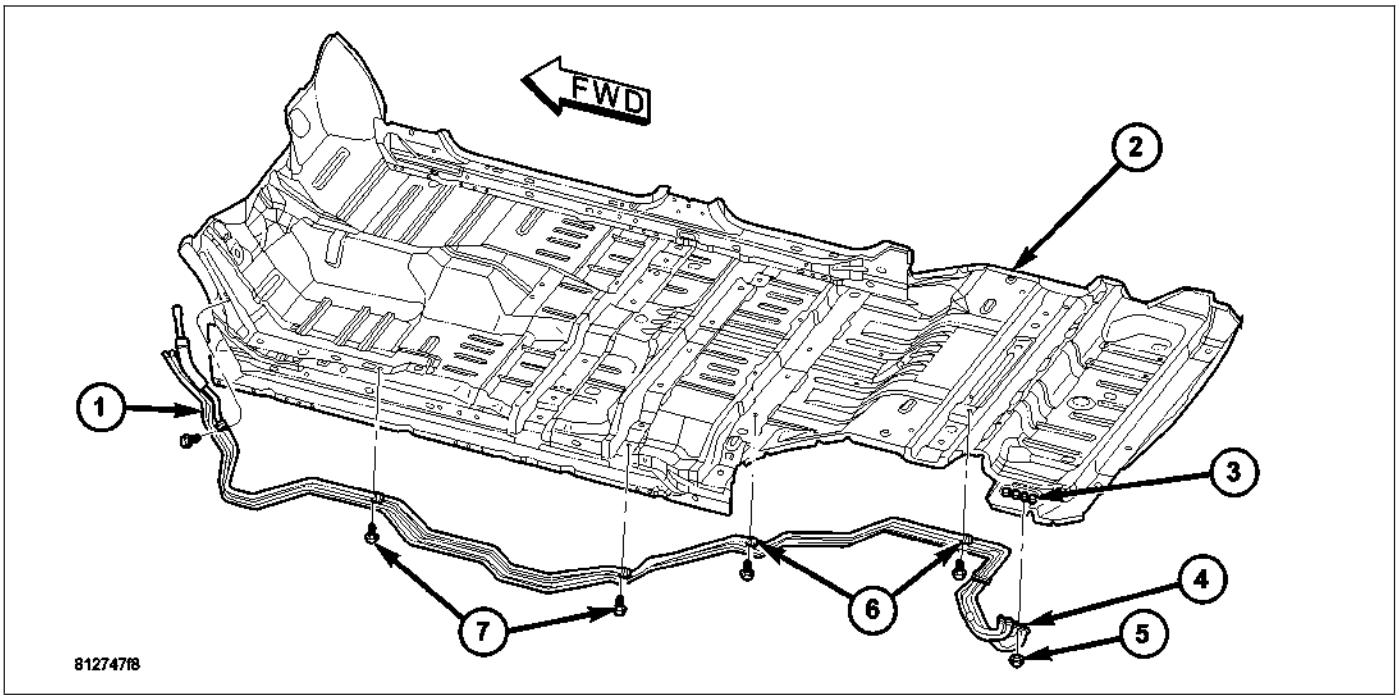


10. Remove the nut (1) that secures the rear suction line (2) and the rear liquid line (3) to the rear evaporator extension line tapping plate that extends through the rear floor panel (4) behind the right rear wheel housing.
11. Disconnect the rear suction line and liquid line from the rear evaporator extension line tapping plate and remove and discard the O-ring seals.
12. Install plugs in, or tape over the opened refrigerant lines and tapping plate ports.
13. Disconnect the rear heater hoses (5) from the rear heater core tubes that extend through the rear floor panel behind the right rear wheel housing.



14. Remove all body mount bolts on the passenger side of the vehicle and loosen the body mount bolts on the drivers side.
15. Place a jackstand at the front and rear of the vehicle on the passenger side so that the stands will safely support the body.
16. Remove the five screws (7) that secure the underbody lines (1) to the vehicle underbody (2).
17. Carefully lower the hoist until the right side of the body (supported by the stands) is approximately 76-101 mm (3-4 in.) above the frame. This will gain access to remove the underbody line assembly.
18. Remove the underbody line assembly from the underneath of the vehicle body.

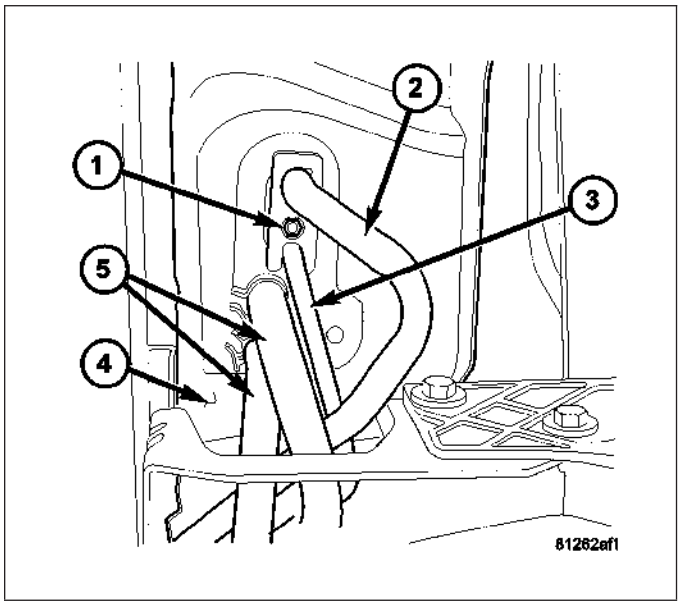
INSTALLATION



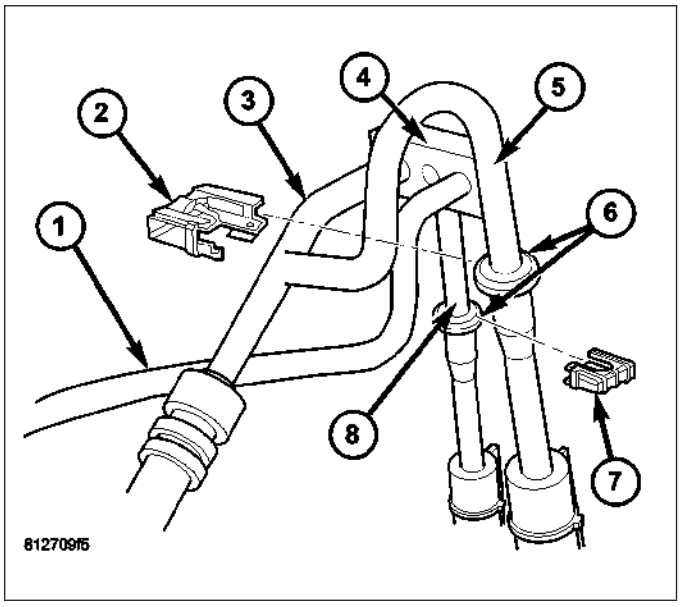
1. Position the underbody line assembly underneath the vehicle body.
2. Carefully raise the hoist until the frame and body mounts line up together.

3. Install the five screws that secure the underbody lines (1) to the vehicle underbody (2).
4. Install all body mount bolts to the passenger side of the vehicle. Tighten all passenger and driver side mount bolts securely.
5. Raise the hoist and remove the jack stands from under the vehicle.

6. Connect the rear heater hoses (5) to the rear heater core tubes that extend through the rear floor panel (4) behind the right rear wheel housing and install the heater hose clamps.
7. Remove the tape or plugs from fittings on the rear suction line (2) and the rear liquid line (3) and the rear evaporator extension line tapping plate ports.
8. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the rear suction and liquid line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the rear suction and liquid line fittings to the rear evaporator extension line tapping plate.
10. Install the nut (1) that secures the rear suction and liquid lines to the rear evaporator extension line tapping plate. Tighten the nut to 23 N·m (17 ft. lbs.).



11. Connect the underbody heater hoses to the front heater hoses and install the heater hose clamps.
12. Remove the tape or plugs from the refrigerant line couplers (6) and the underbody refrigerant lines.
13. Lubricate a new rubber O-ring seal with clean refrigerant oil and install them onto the refrigerant line couplers. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Connect the underbody liquid and suction lines to the liquid line extension tube (8) and the suction line extension tube (5) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COUPLER-REFRIGERANT LINE - INSTALLATION).
15. Install the secondary retaining clips (2 and 7) onto the refrigerant line couplers.
16. Install passenger side tires (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).



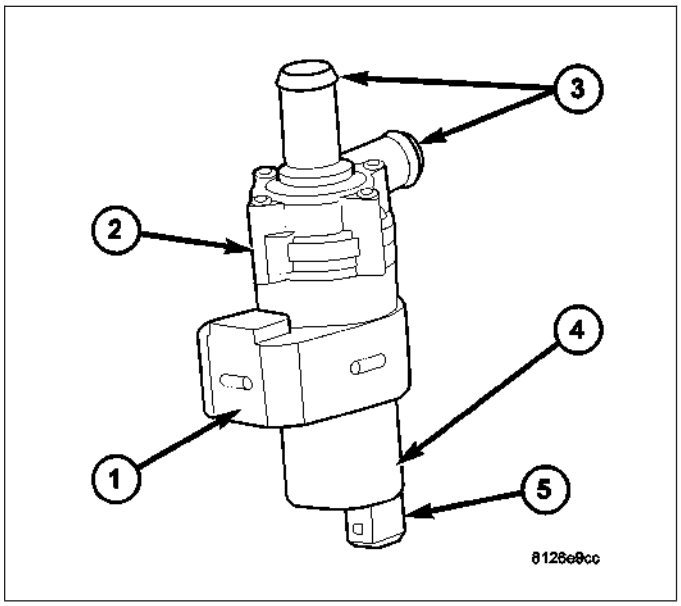
17. Install the right front wheelhouse splash shield (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
18. Lower the vehicle.
19. Reconnect the negative battery cable.
20. Fill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM FILL).
21. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

22. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

PUMP-WATER-AUXILIARY

DESCRIPTION

An electric auxiliary water pump is used on all models to aid in circulating the engine coolant through the front and rear heater core (depending on application). The auxiliary water pump is mounted to the right front frame rail by a rubber isolator (1) and consists of a molded plastic housing (2) with two heater hose connections (3), a 12 volt direct current (DC) motor and impeller assembly (4) with an integral wire connector receptacle (5).



OPERATION

The A/C-heater control operates the auxiliary water pump when all of the following conditions have been met.

- Vehicle speed below 48 km/h (30 mph)
- Coolant temperature between 10° C (50° F) and 110° C (230° F)
- Front blower motor turned On
- Rear temperature heat setting above the halfway setting (60% heat)
- No fault conditions detected

The A/C-heater control turns the auxiliary water pump Off when any of the following conditions occur.

- Vehicle speed above 48 km/h (30 mph)
- Coolant temperature above 110° C (230° F)
- Front blower motor turned Off

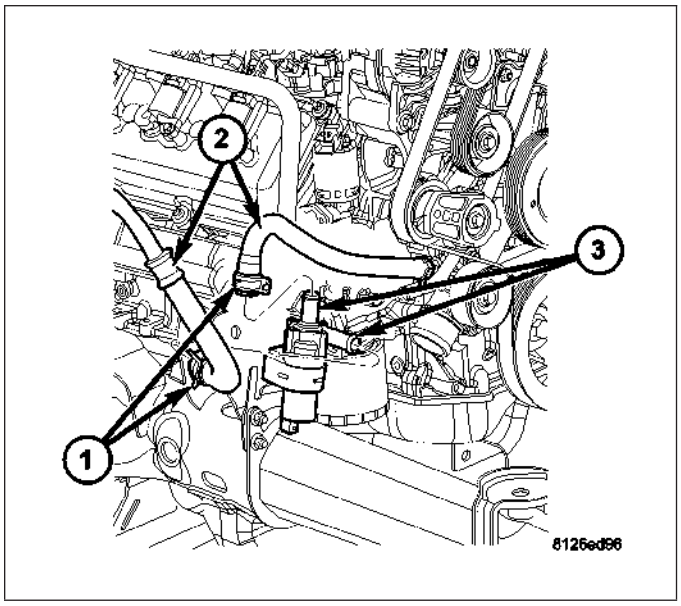
The auxiliary water pump cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The auxiliary water pump is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

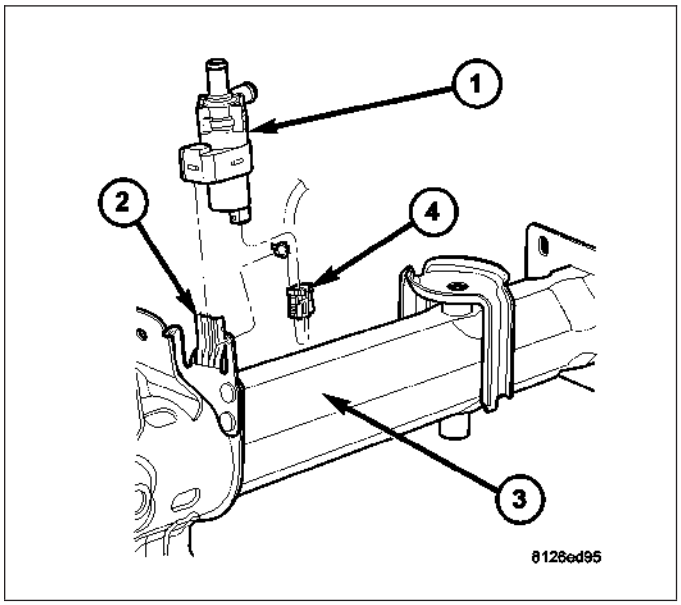
REMOVAL

CAUTION:
DO NOT apply excessive pressure on the auxiliary water pump tubes when removing the heater hoses. Excessive pressure may damage the tubes, causing an engine coolant leak.

1. Disconnect and isolate the negative battery cable.
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Remove the air cleaner housing from the right side of the engine compartment (Refer to 9 - ENGINE/ AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Using spring tension clamp pliers, compress and slide the hose clamps (1) off of the end of each heater hose.
5. Disconnect each heater hose (2) by carefully twisting the hose back and forth on the auxiliary water pump tube (3), while gently pulling it off of the tube.

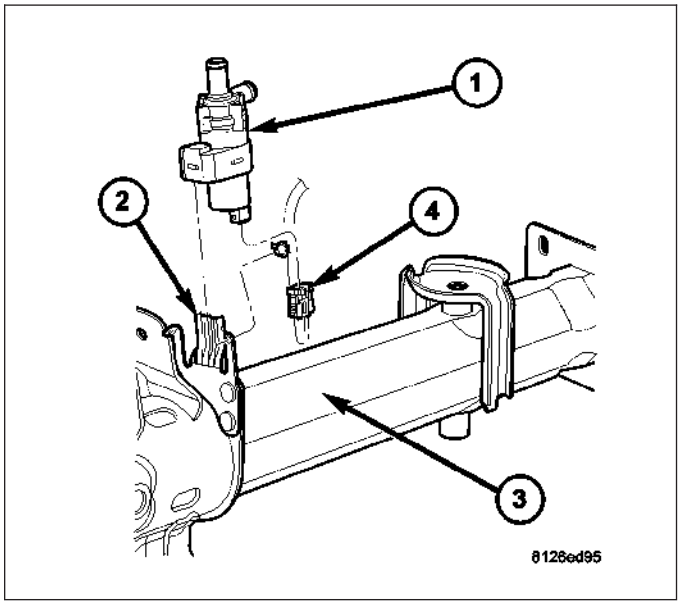


6. Remove the auxiliary water pump (1) from the mounting bracket (2) located on the right front frame rail (3).
7. Disconnect the wire harness connector (4) from the auxiliary water pump and remove the pump from the engine compartment.

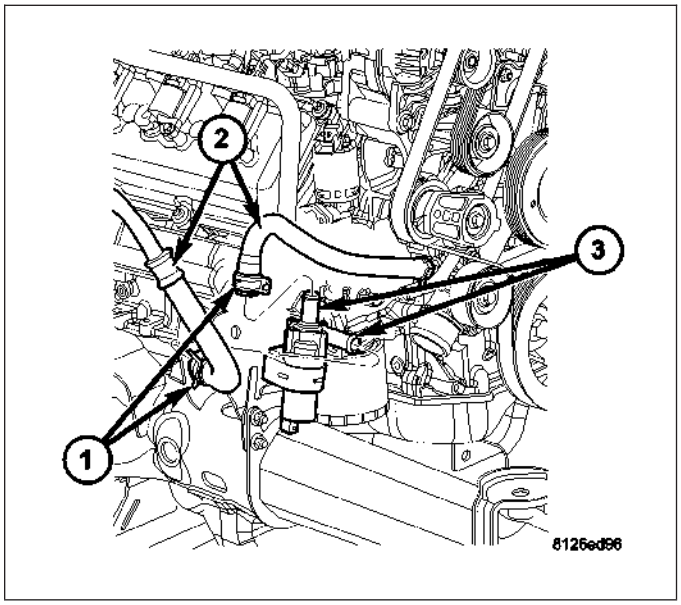


INSTALLATION

1. Position the auxiliary water pum (1) into the engine compartment and connect the wire harness connector (4) to the pump.
2. Install the auxiliary water pum onto the mounting bracket (2) located on the frame rail (3).



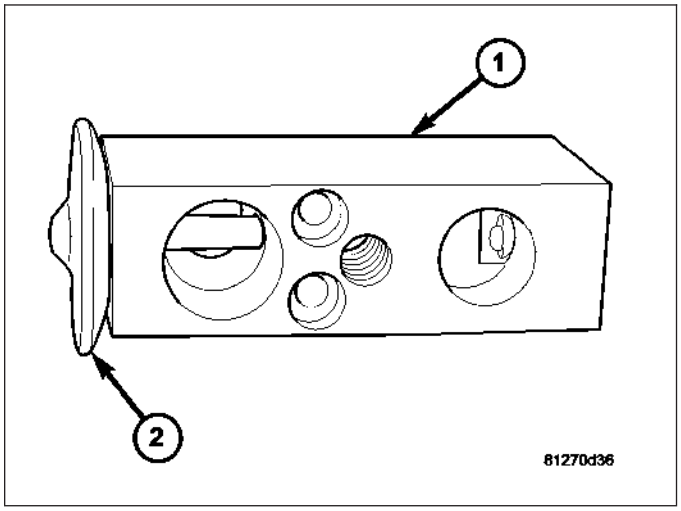
3. Using spring tension clamp pliers, compress and slide the hose clamp (1) away from the end of the heater hoses (2).
4. Install each heater hose by carefully twisting the hose back and forth onto the auxiliary water pump tubes (3), while gently pushing it onto the tube.
5. Using spring tension clamp pliers, compress and slide the hose clamps onto the end of the heater hoses.
6. Install the air cleaner housing to the right side of the engine compartment (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
7. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).
8. Reconnect the negative battery cable.



VALVE-A/C EXPANSION

DESCRIPTION

The rear A/C expansion valve is of a thermostatic expansion valve (TXV) design and controls the amount of refrigerant entering the rear A/C evaporator. The rear A/C expansion valve consists of an aluminum H-valve type body (1) with an integral thermal sensor (2) and is located on the rear HVAC housing between the rear evaporator extension tubes and the rear evaporator.



OPERATION

The rear A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the rear liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the rear A/C evaporator. A mechanical sensor in the rear A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the rear A/C evaporator through the rear suction line, and adjusts the orifice size at the rear liquid line port to let the proper amount of refrigerant into the rear A/C evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the rear A/C evaporator ensures that none of the refrigerant leaving the rear A/C evaporator is still in a liquid state, which could damage the A/C compressor.

The rear A/C expansion valve is factory calibrated and cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

A/C EXPANSION VALVE - REAR

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury.

NOTE: The rear A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO^2 is required to test the rear A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.

When testing the rear A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls for the rear heating-A/C system so that the A/C compressor is operating, the rear temperature control is in the highest temperature position, and the blower motor is operating at the highest speed.

4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the rear A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to Step 6. If not OK, replace the faulty rear A/C expansion valve.

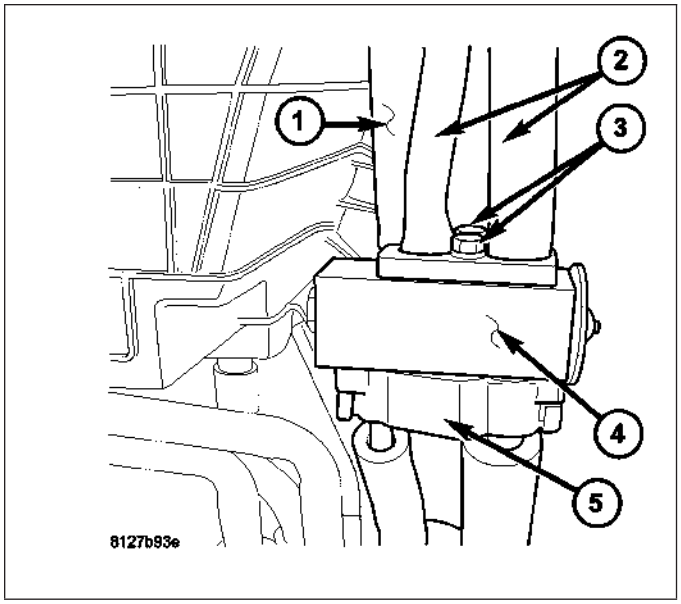
WARNING:
Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the rear A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material.**Do not spray R-134a or R-12 refrigerant on the rear A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to Step 7 If not OK, replace the faulty rear A/C expansion valve.
7. Allow the rear expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the faulty rear A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST).

REMOVAL

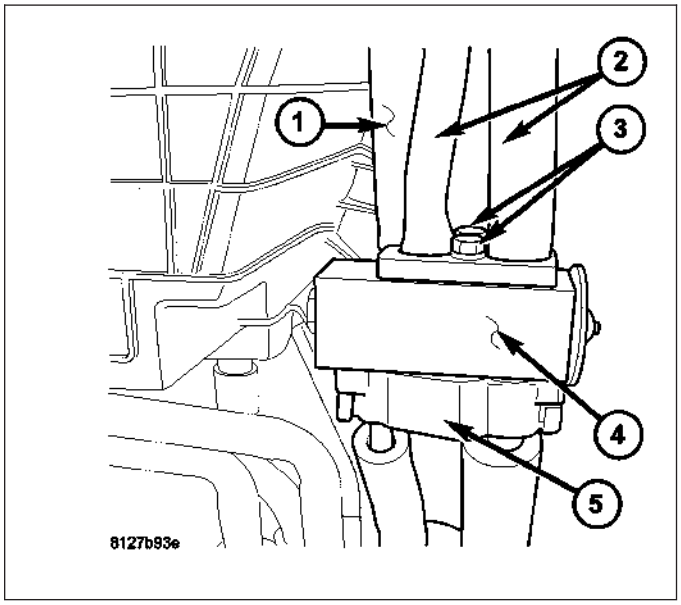
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Remove right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Remove the insulator (1) from around the rear A/C evaporator tubes (2) to gain access the two rear A/C expansion valve bolts (3).
4. Remove the two bolts that secure the rear A/C expansion valve (4) between the rear A/C evaporator tubes and the rear evaporator extension tube tapping block (5).
5. Remove the rear A/C expansion valve from between the rear A/C evaporator tubes and the rear evaporator extension tube tapping block and remove and discard the O-ring seals.



6. Install plugs in, or tape over the opened evaporator tubes and extension tube fittings and all rear expansion valve ports.

INSTALLATION



1. Remove the tape or plugs from the opened evaporator tube and extension tube fittings and all rear expansion valve ports.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube and extension tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the rear A/C expansion valve (4) between the rear A/C evaporator tubes (2) and the rear extension tube tapping block (5).
4. Install the two bolts (3) that secure the rear A/C expansion valve between the rear A/C evaporator tubes and the rear extension tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).
5. Install a new insulator (1) around the rear A/C evaporator tubes.
6. Install the right rear quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).
7. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
8. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

EMISSIONS

DESCRIPTION

STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect a scan tool to the data link connector and access the Actuators screen.

DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

OBTAINING DTC'S USING A SCAN TOOL

1. Obtain the applicable Powertrain Diagnostic Manual.
2. Obtain a scan tool.
3. Connect the scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

4. Turn the ignition switch on and access the “Read Fault” screen.
5. Record all the DTC’s and “freeze frame” information shown on the scan tool.
6. To erase DTC’s, use the “Erase Trouble Code” data screen on the scan tool. **Do not erase any DTC’s until problems have been investigated and repairs have been performed.**

TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the ’Task Manager’.

TRIP DEFINITION

The term “Trip” has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a “Trip” is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the “Similar Condition Window” for a specified amount of time to be considered a Good Trip.

If a Non-Contiuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater, and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks, or any component that has an associated limp-in, will set a fault after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

OPERATION

TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are know as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending
  Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.
  For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.
- Conflict
  There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.
  For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.
- Suspend
  Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precis diagnosis.
  For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MILL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±10% of when the fault occurred.

Note: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a diagnostic scan tool. Erasing the DTC with the scan tool erases all OBD II information. The scan tool automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on a scan tool)
  - Comprehensive Components

- Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.
- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with a scan tool or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
- **Misfire Data**— Data collected during test.
- **Test Done This Trip**— Indicates YES when the test is done.

NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. **EXAMPLE:** a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

EVAPORATIVE EMISSIONS

DESCRIPTION

HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

DIAGNOSIS AND TESTING

OBD II Monitor Information

Comprehensive Components Monitor (Includes All Engine Hardware Sensor, Switches, Solenoids, etc.)	Major Monitors Non Fuel Control & Non Misfire (Monitors Entire Emission System)	Major Monitors Fuel Control & misfire (Monitors Entire System)
Most are one trip Faults	Most are Two Trips Faults	Two Trip Faults
Usually Turns on The Mill and Sets DTC After One Failure	Turns On The Mil and Sets DTC after Two Consecutive Failure	The Mil and Sets DTC After Two Consecutive Failure
Priority 3	**Priority 1 or 3**	**Priority 2 or 4**
All Checked For Continuity	Done Stop Test = Yes	**Fuel Control Monitor**
Open Short To Ground Short To Voltage	Oxygen Sensor Heater Oxygen Sensor Response Catalytic Converter	Monitors Fuel Control System For: Fuel System Lean
Inputs Checked For Rationality	Efficiency Except EWMA	Fuel System Rich
Outputs Checked For Functionality	up to 6 test per trip and a one trip fault (SBEC) and two trip fault on (JTEC)	Requires 3 Consecutive Fuel System Good Trips to Extinguish the MIL
	EGR System	**Misfire Monitor**
	Evaporative Emission System (purge and leak) Non-LDP LDP	Monitors for Engine Misfire At: 4 X 1000 RPM Counter (4000 Revs) (Type B) **200 X 3 (600) RPM counter (Type A)
Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL
*40 Warm Up Cycles are required to erase DTCs after the MIL has been extinguished		** Type A misfire is a one trip failure on pre-1999, 2 trip failure on 1999 and later. The MIL will illuminate at the first or second failure, based on MY.

OBD II MONITOR RUN PROCESS

The following procedure has been established to assist Chrysler Dealer Technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

Note: A. Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. NVLD Monitor runs after key off.B. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a SCAN TOOL into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. On the SCAN TOOL Select #1Stand-alone.
4. Select #1 1998-2004 Diagnostics.
5. Select #1 Engine.
6. Select #2 DTCs and Related Functions.
7. Select #1 Read DTCs.
   - Verify that No Emissions Related DTCs are Present.
   - * If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
   - The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.
8. Return to Engine Select Function Menu and Select #9, OBD II Monitors.
9. Select #3 CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?.

- *YES, then all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- *NO, then the following procedure needs to be followed to run/complete all available monitors.

Note: A. Only the monitors, which are not YES in the CARB Readiness Status, need to be completed.B. Specific criteria need to be met for each monitor. Each monitor has a Pre-Test screen to assist in running the monitor. For additional information, refer to the DaimlerChrysler Corporation Technical Training Workbook titled On Board Diagnostics: OBD II/EOBD, part number 81-699-01050.C. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Natural Vacuum Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. For the monitor run conditions select the EVAP MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.The Purge monitor will run if the small leak test reports a pass. Criteria for NVLD monitor:

- Engine off time greater than @ one hour.
- Fuel Level between 15% and 85 %.
- Start Up ECT and IAT within 10 C (18 F).
- Vehicle started and run until Purge Monitor reports a result.

Note: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

With NGC, Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (< 50 mph) for a few minutes.Some trucks run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria. For the monitor run conditions, select the BANK 1 CAT MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

EGR Monitor

The EGR monitor now runs in a closed throttle decel or at idle on a warm vehicle. However, it is necessary to maintain the TPS, Map and RPM ranges to allow the monitor to complete itself. For the monitor run conditions, select the EGR PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down. For the monitor run conditions, select the O2S HEATER MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

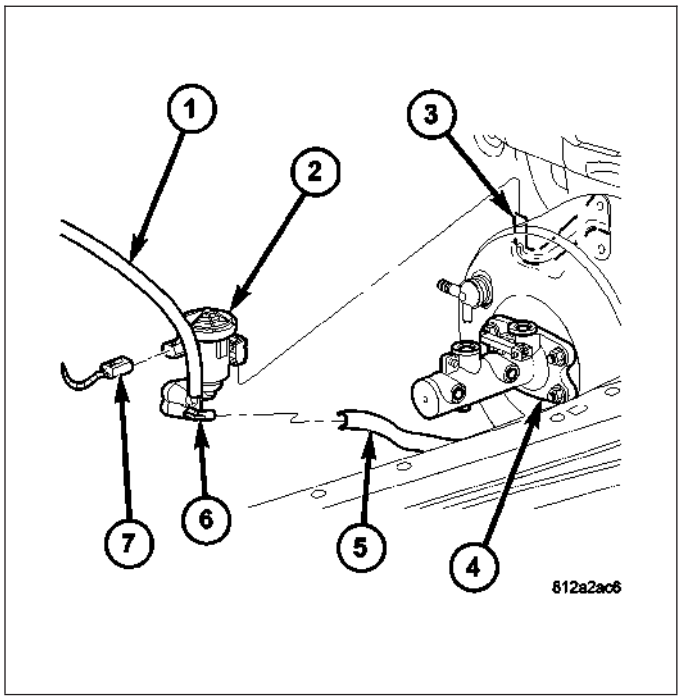
SOLENOID-EVAP/PURGE

DESCRIPTION

The duty cycle EVAP canister purge solenoid (2) is located in the engine compartment. It is attached to a bracket (3) near the brake power booster (4).



OPERATION

The Powertrain Control Module (PCM) operates the solenoid.

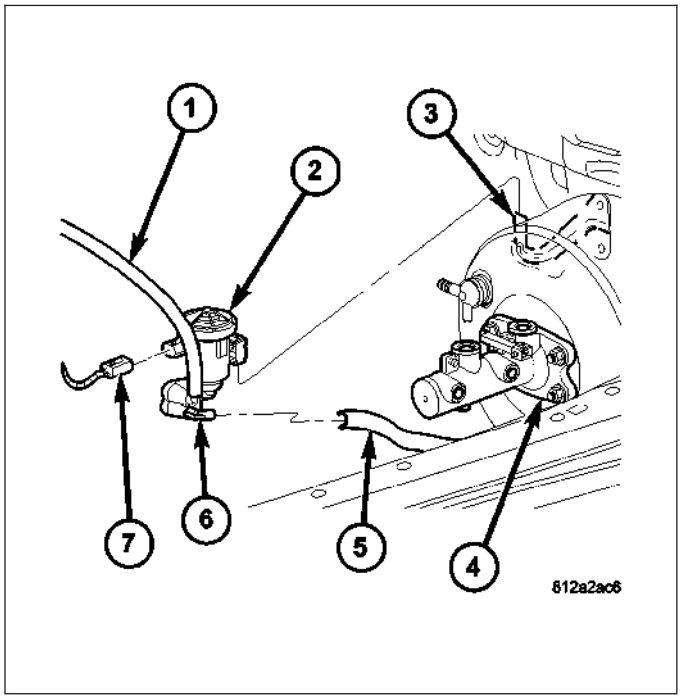
During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

REMOVAL

The duty cycle EVAP canister purge solenoid (2) is located in the engine compartment. It is attached to a bracket (3) near the brake power booster (4).

1. Disconnect electrical wiring connector (7) at solenoid.
2. Disconnect vacuum lines (1) and (5) at solenoid.
3. Remove solenoid (4) from mounting bracket (3) by lifting straight up.



INSTALLATION

1. Install solenoid assembly to mounting bracket.
2. Connect vacuum harness.
3. Connect electrical connector.

CAP-FUEL FILLER

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a Leak Detection Pump (LDP), or NVLD system, the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL

REMOVAL/INSTALLATION

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

ORVR

DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister.

OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spiting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

PUMP-NATURAL VAC LEAK DETECTION

DESCRIPTION

Vehicles equipped with an NGC Powertrain Control Module (PCM) use a Natural Vacuum Leak Detection (NVLD) pump and system. Vehicles equipped with a JTEC PCM use an LDP (Leak Detection Pump). Refer to Leak Detection Pump (LDP) for additional information.

The NVLD pump is located in the same area as the leak detection pump. Refer to NVLD Removal / Installation for additional information.

OPERATION

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020″ (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the ″Gas Law″. This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1″ H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies, utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1″ H2O (0.25 KPA) vacuum in the

evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

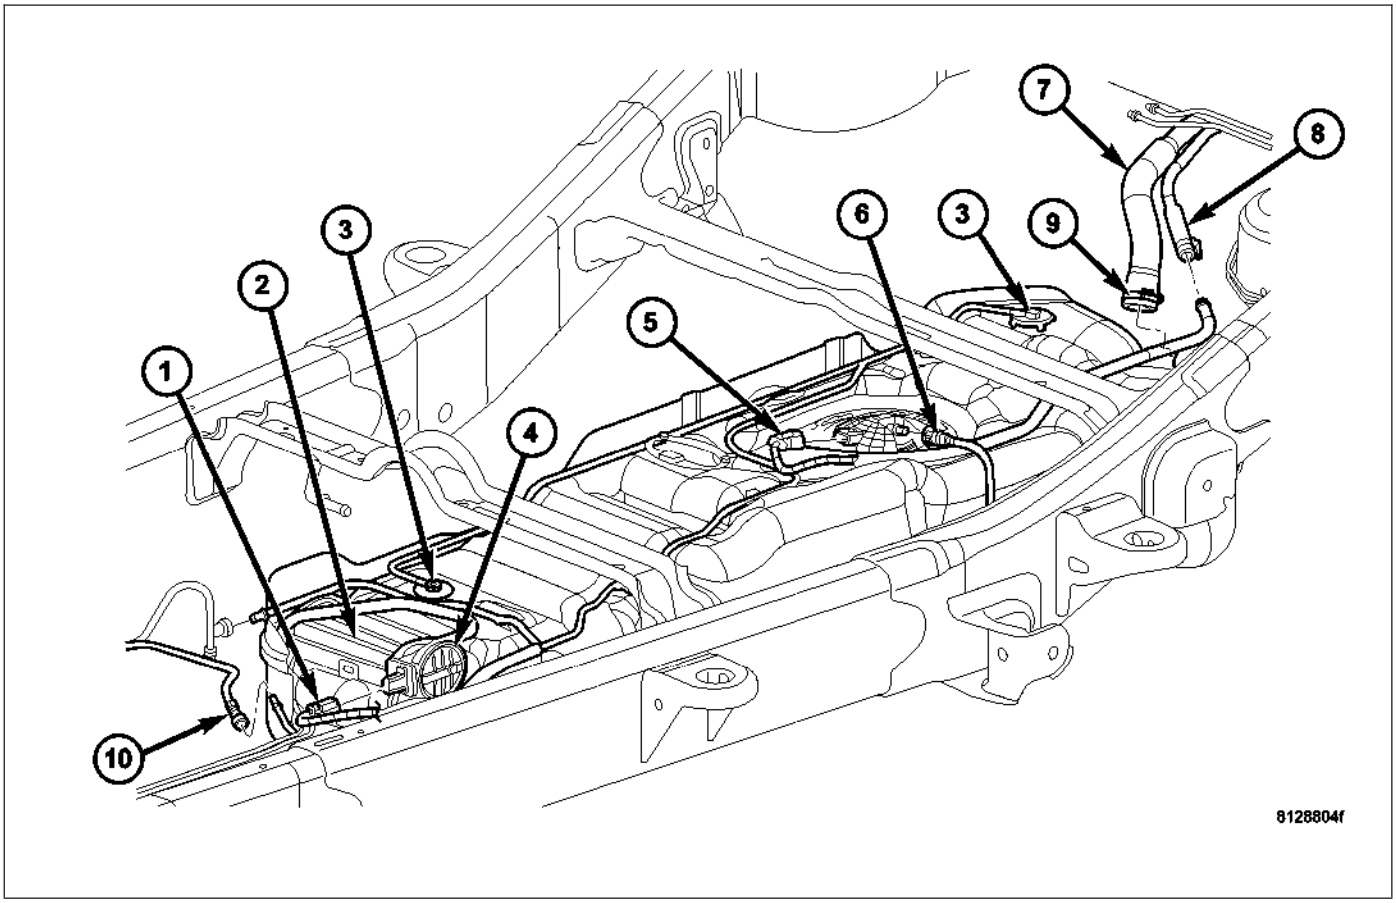
The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3″ to 6″ H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires an initial 1.5 amps of current to pull the valve open, but after 100 mili-seconds, will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will ″blow off″ at about 0.5″ H2O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to ″breathe″ during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

REMOVAL

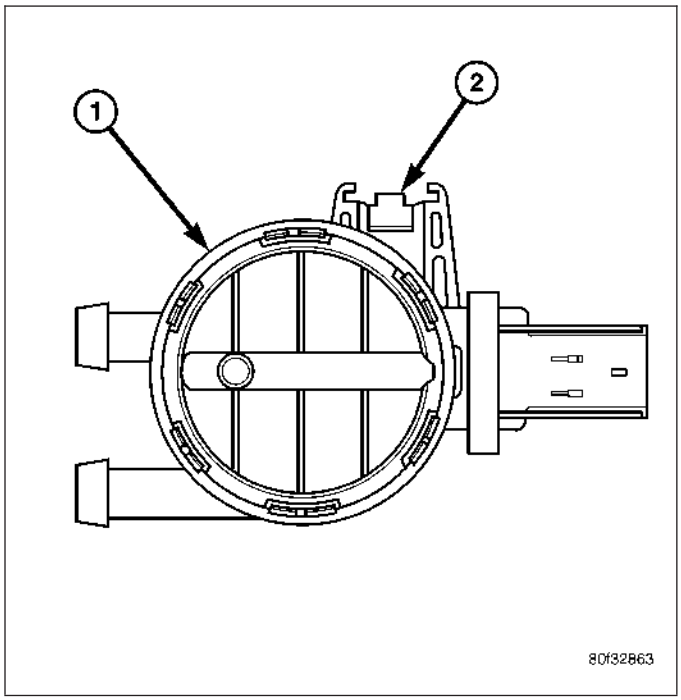


The NVLD pump (4) is located at the front of the fuel tank.

1. Raise and support vehicle.

2. If equipped, remove fuel tank skid plate.
3. Disconnect electrical connector at pump.
4. Carefully remove vapor/vacuum hoses at pump.

5. The NVLD pump snaps on to a mounting bracket. Press on release tab (2) while sliding pump from bracket.



INSTALLATION

1. Install NVLD pump to mounting bracket (snaps on).
2. Carefully install vapor/vacuum lines to NVLD pump. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
3. Connect electrical connector to pump.
4. If equipped, install fuel tank skid plate.

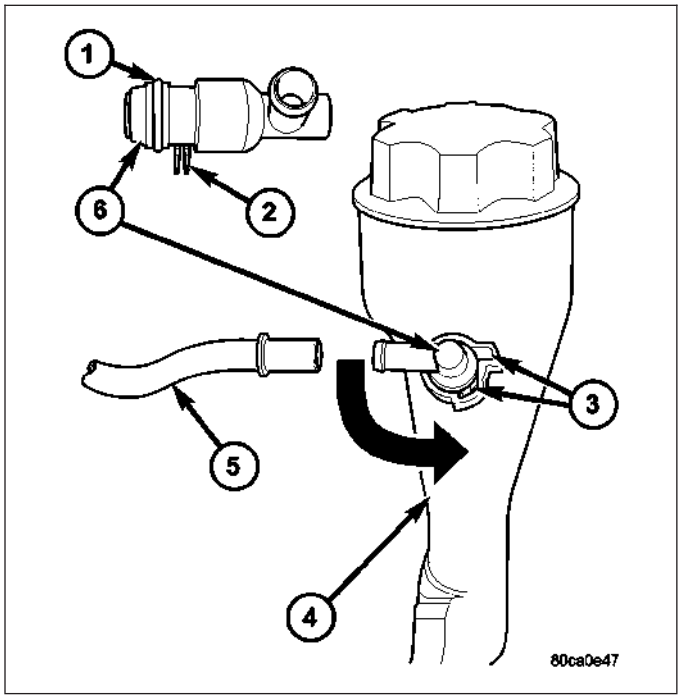
VALVE-PCV

DESCRIPTION

3.7L V-6 / 4.7L V-8

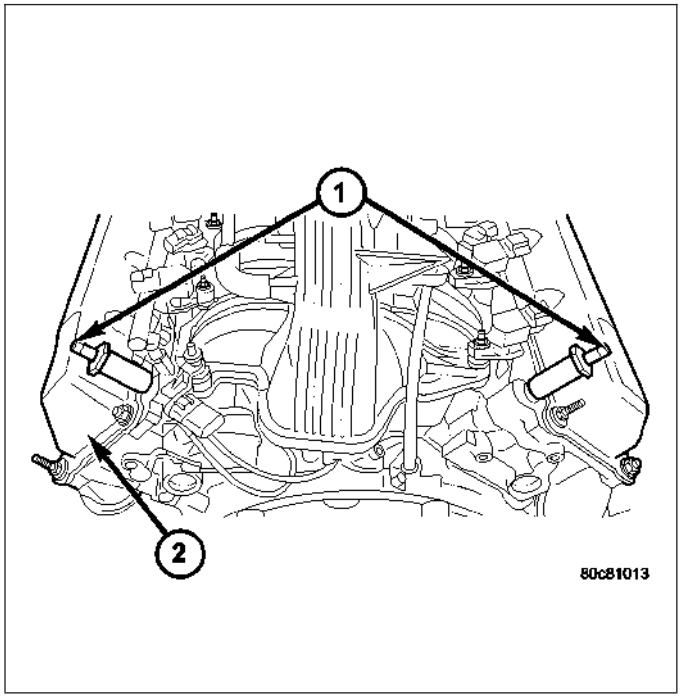
The 3.7L V-6 and 4.7L V-8 engines are equipped with a closed crankcase ventilation system. The Positive Crankcase Ventilation (PCV) valve (6) is mounted to the oil filler housing (4).

The PCV valve is sealed to the oil filler housing with an o-ring (1).



Two interconnected breathers (1) threaded into the rear of each cylinder head are used with the system.

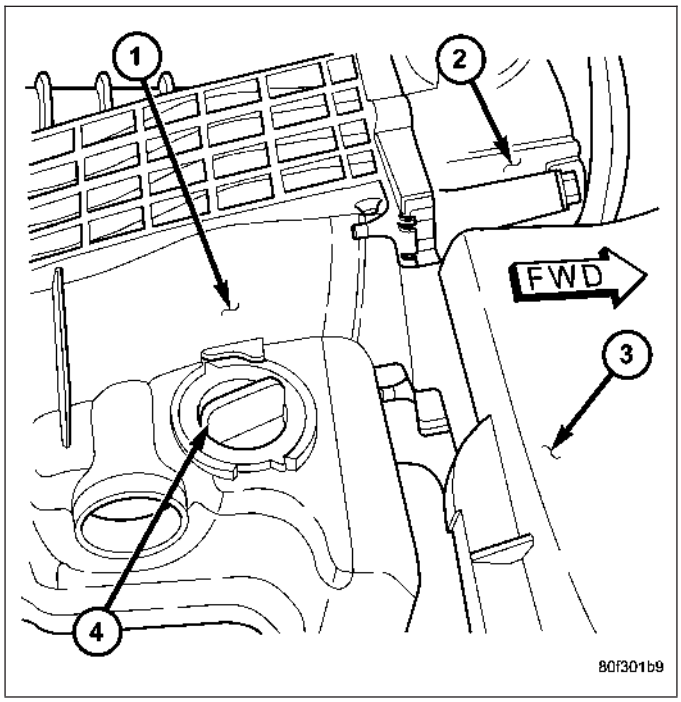
The system also includes the air cleaner housing and various tubes and hoses to connect the system components.



5.7L V-8

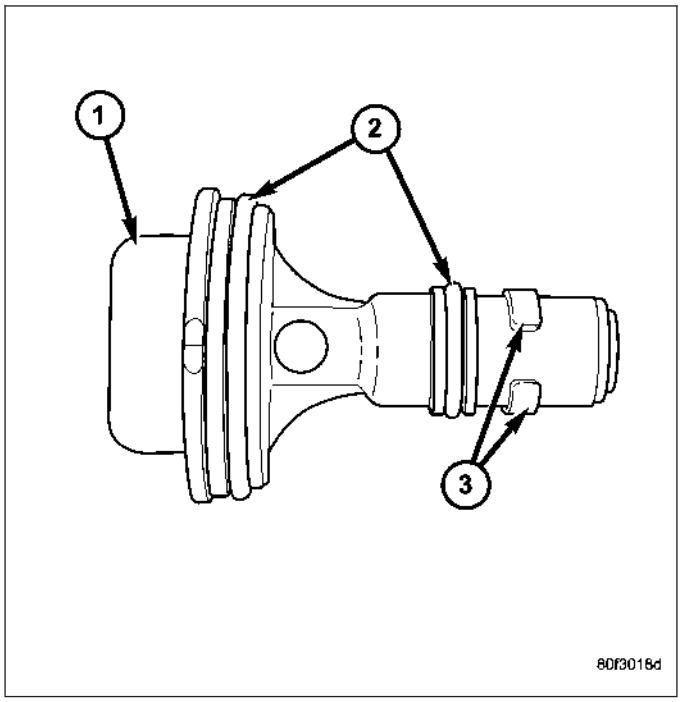
The 5.7L V-8 engine is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

A PCV valve (4) mounted into the top of the intake manifold (1), located to the right / rear of the throttle body (2) is used.



The PCV valve (1) is sealed to the intake manifold with two o-rings (2).

The system also consists of passages in the intake manifold, and various tubes and hoses to connect the system components.

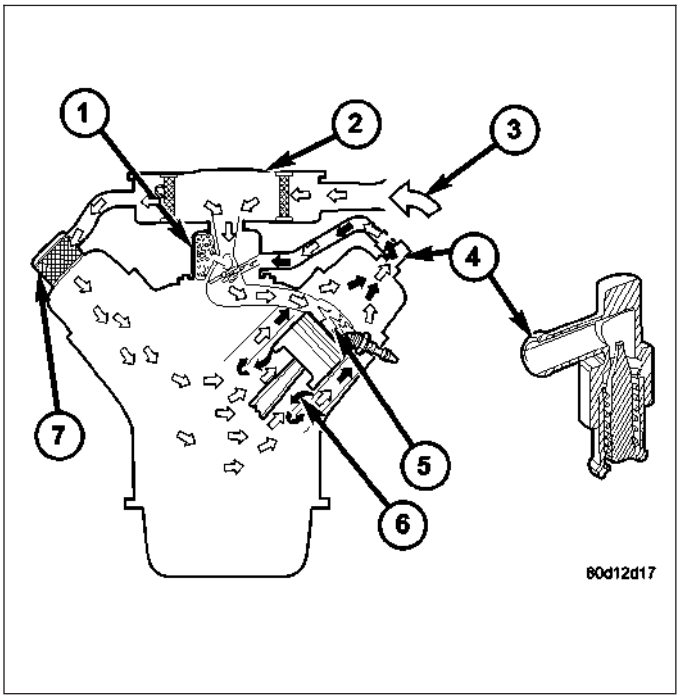


OPERATION

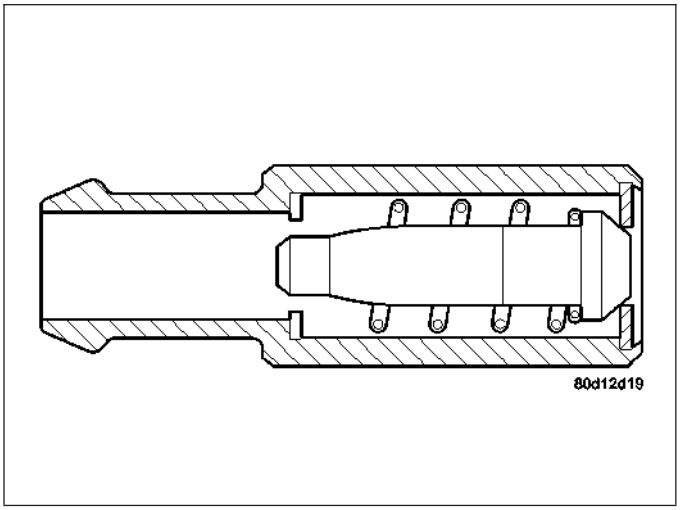
A typical enclosed crankcase ventilation system is shown in the graphic.

The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve (4) and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

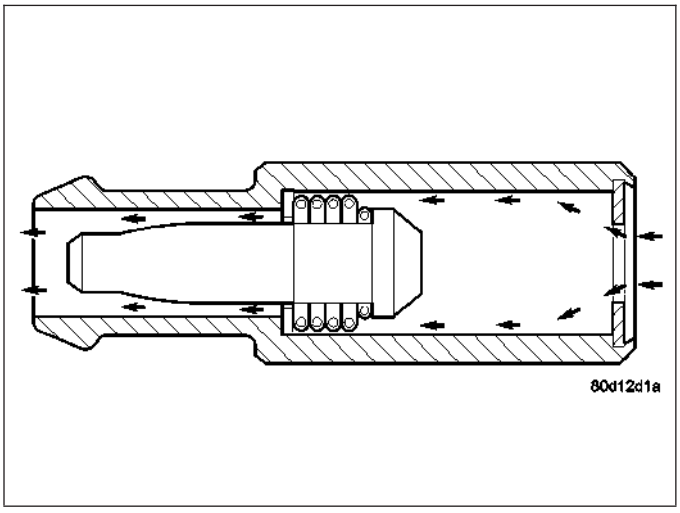
The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.



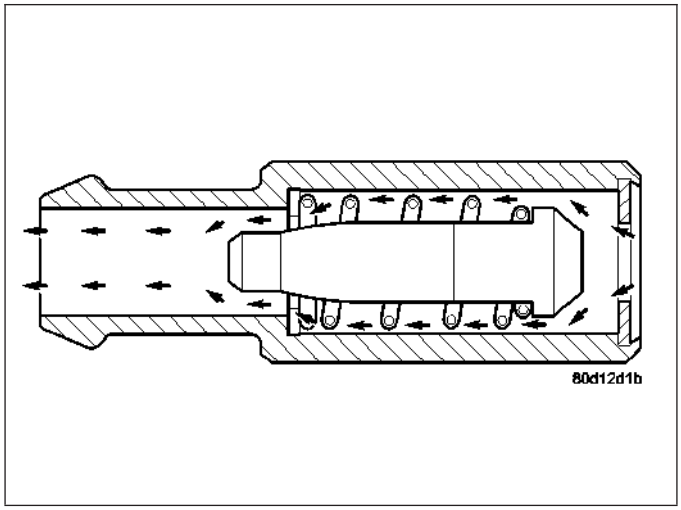
When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat. This will prevent vapors from flowing through the valve.



During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve. In this position there is minimal vapor flow through the valve.



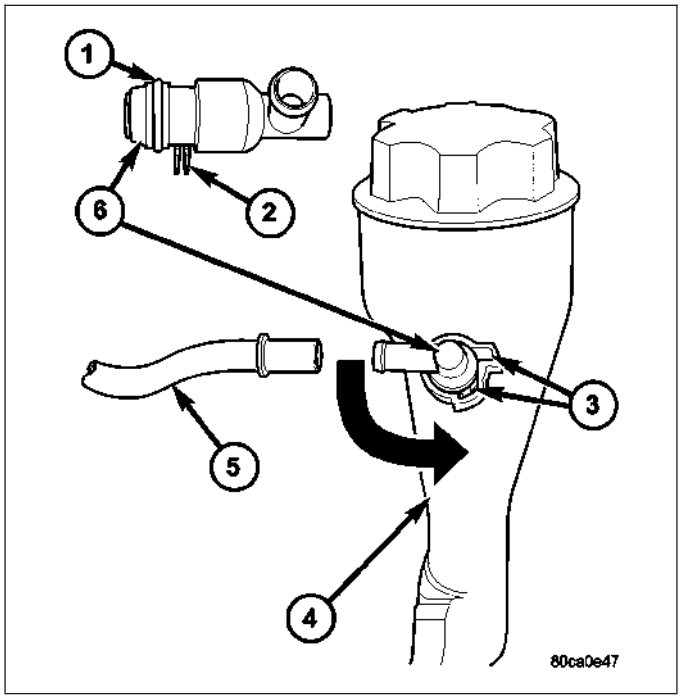
During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve.



DIAGNOSIS AND TESTING

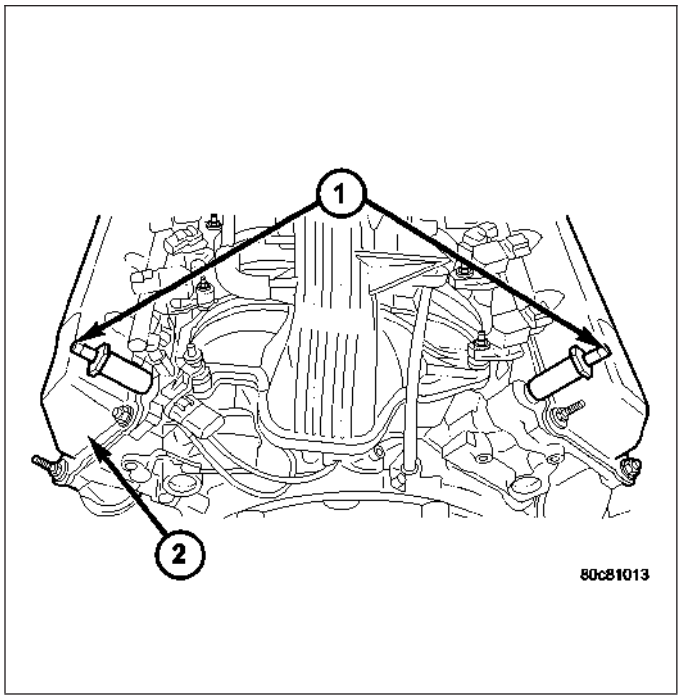
PCV VALVE - 3.7L V-6/ 4.7L V-8

1. Disconnect PCV line/hose (5) by disconnecting rubber connecting hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs (2) have been freed at cam lock (3). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**
3. After valve is removed, check condition of valve o-ring (1). Also, PCV valve should rattle when shaken.
4. Reconnect PCV valve to its connecting line/hose.
5. Start engine and bring to idle speed.
6. If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.
7. If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.
8. **Do not attempt to clean the old PCV valve.**
9. Return PCV valve back to oil filler tube by placing valve locating tabs (2) into cam lock (3). Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
10. Connect PCV line/hose (5) and connecting rubber hose to PCV valve.

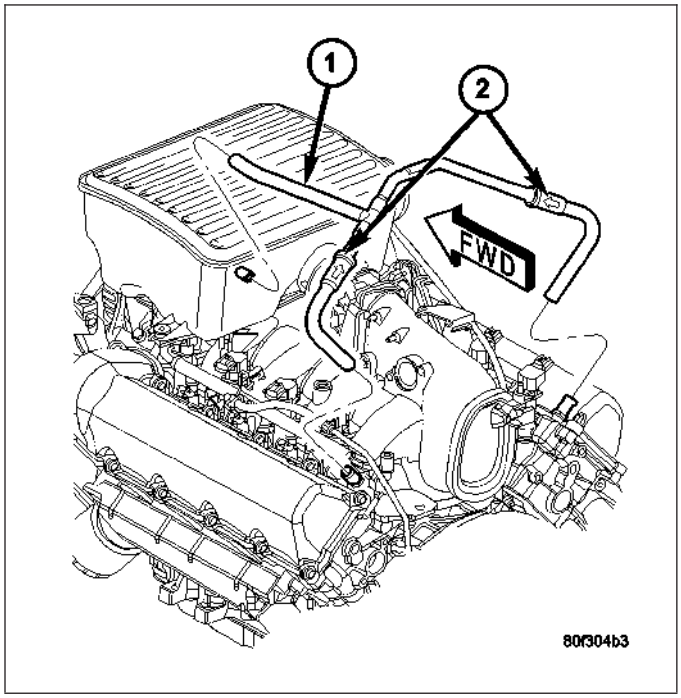


11. Disconnect rubber hose from fresh air fitting at air cleaner resonator box. Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.
12. The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

13. If vacuum is not present, disconnect each PCV system hose at top of each crankcase breather (1). Check for obstructions or restrictions.
14. If vacuum is still not present, remove each PCV system crankcase breather (1) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather.



15. If vacuum is still not present, disconnect each PCV system hose (1) at each fitting, and at each check valve (2). Check for obstructions or restrictions.

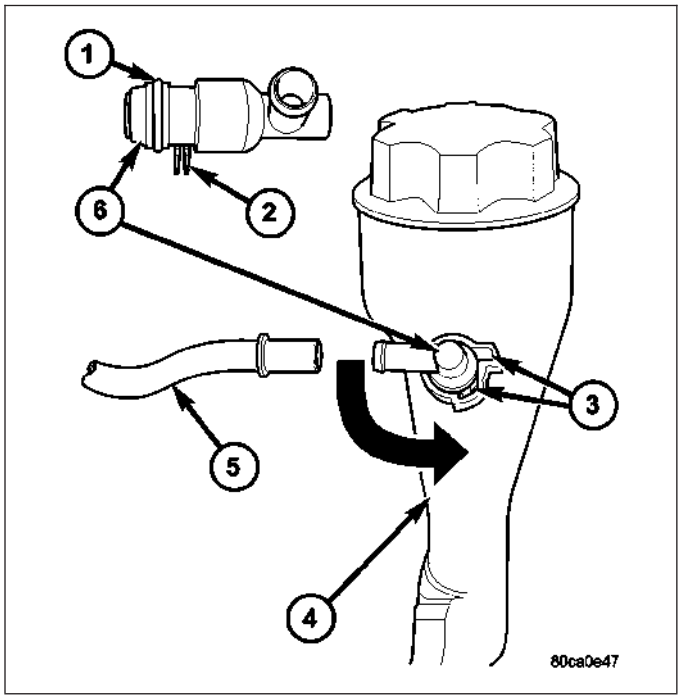


REMOVAL

3.7L V-6 / 4.7L V-8

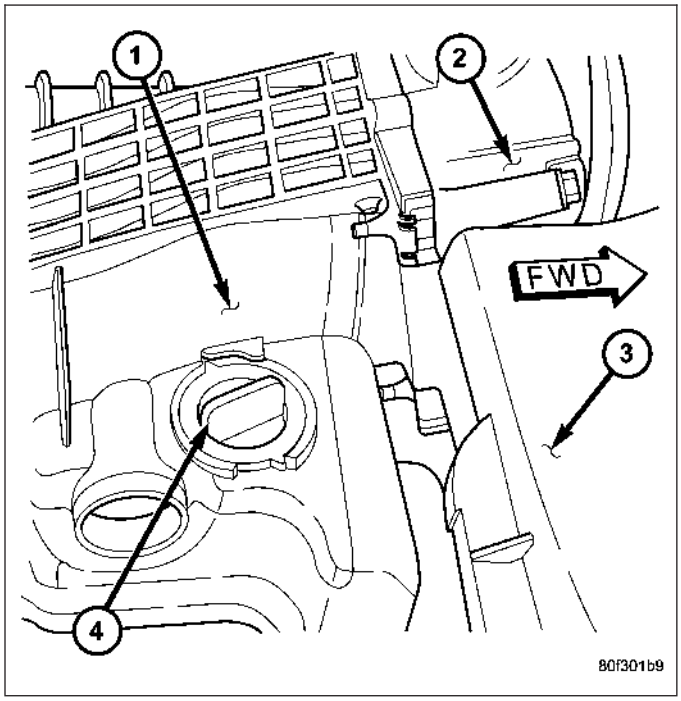
The PCV valve (6) is located on the oil filler tube (4). Two locating tabs are located on the side of the valve (2). These 2 tabs fit into a cam lock (3) in the oil filler tube. An o-ring (1) seals the valve to the filler tube.

1. Disconnect PCV line/hose (5) by disconnecting rubber hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward (counter-clockwise) until locating tabs (2) have been freed at cam lock (3). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**
3. After valve is removed, check condition of valve o-ring (1).

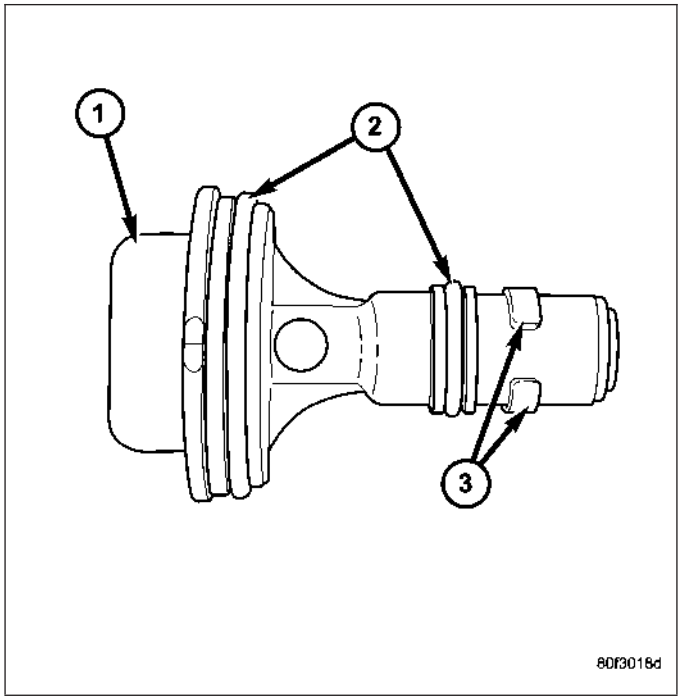


5.7L V-8

The PCV valve (4) is mounted into the top of the intake manifold (1). This is located to the right / rear of the throttle body (2).



1. The PCV valve is sealed to the intake manifold with 2 O-rings (2).
2. Remove PCV valve by rotating counter-clockwise 90 degrees until locating tabs (3) have been freed. After tabs have cleared, pull valve straight up from intake manifold.
3. After valve is removed, check condition of 2 valve O-rings (2).



INSTALLATION

3.7L V6 / 4.7L V-8

The PCV valve is located on the oil filler tube. Two locating tabs are located on the side of the valve. These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

1. Return PCV valve back to oil filler tube by placing valve locating tabs into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
2. Connect PCV line/hose and rubber hose to PCV valve.

5.7L V-8

1. Clean out intake manifold opening.
2. Check condition of 2 o-rings on PCV valve.
3. Apply engine oil to 2 o-rings.
4. Place PCV valve into intake manifold and rotate 90 degrees clockwise for installation.

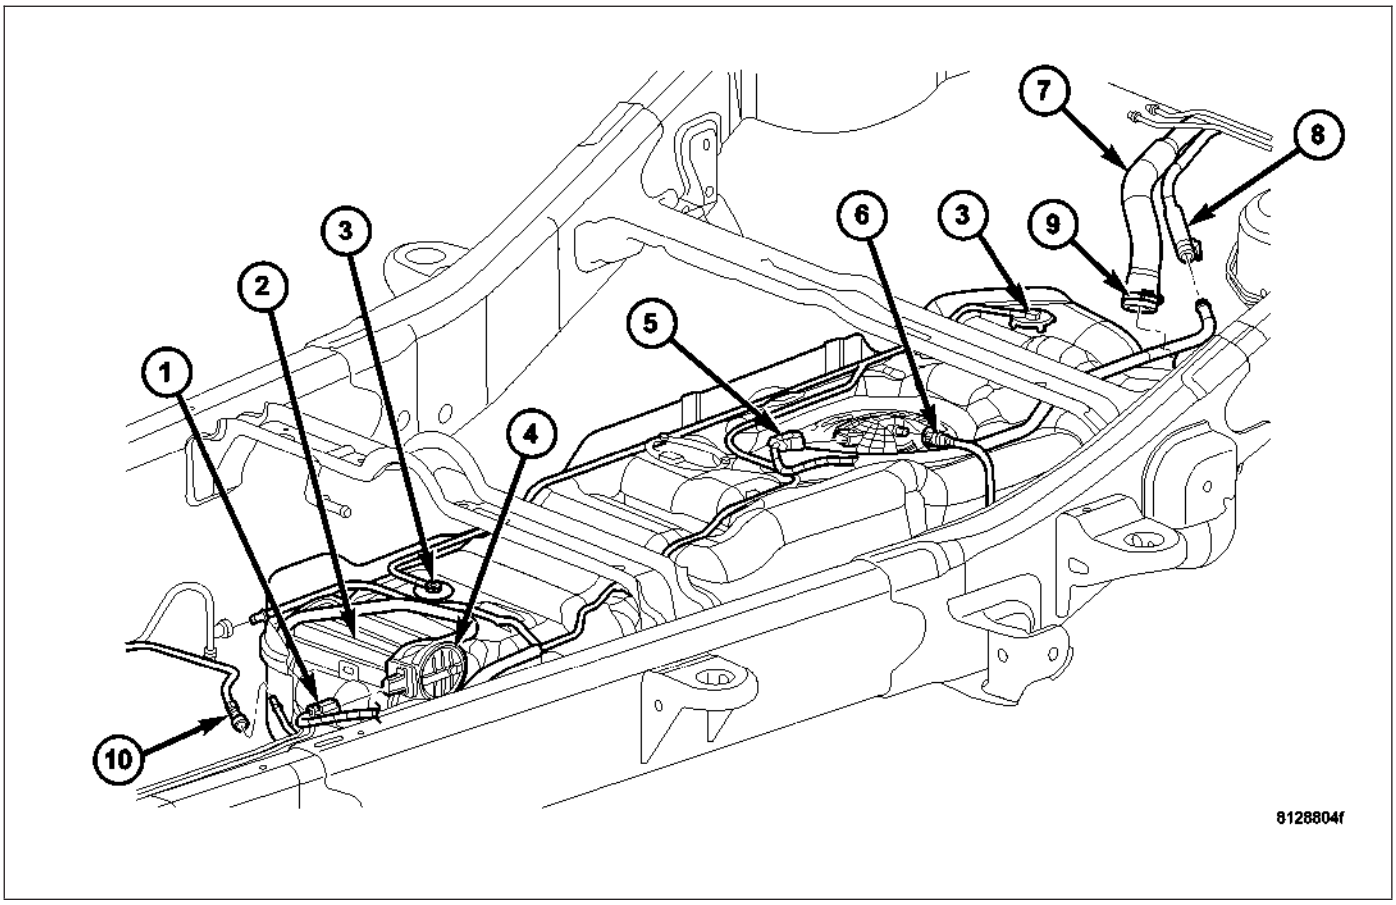
LINES-VACUUM

DESCRIPTION

A vacuum schematic for emission related items can be found on the vehicles VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

CANISTER-VAPOR

DESCRIPTION



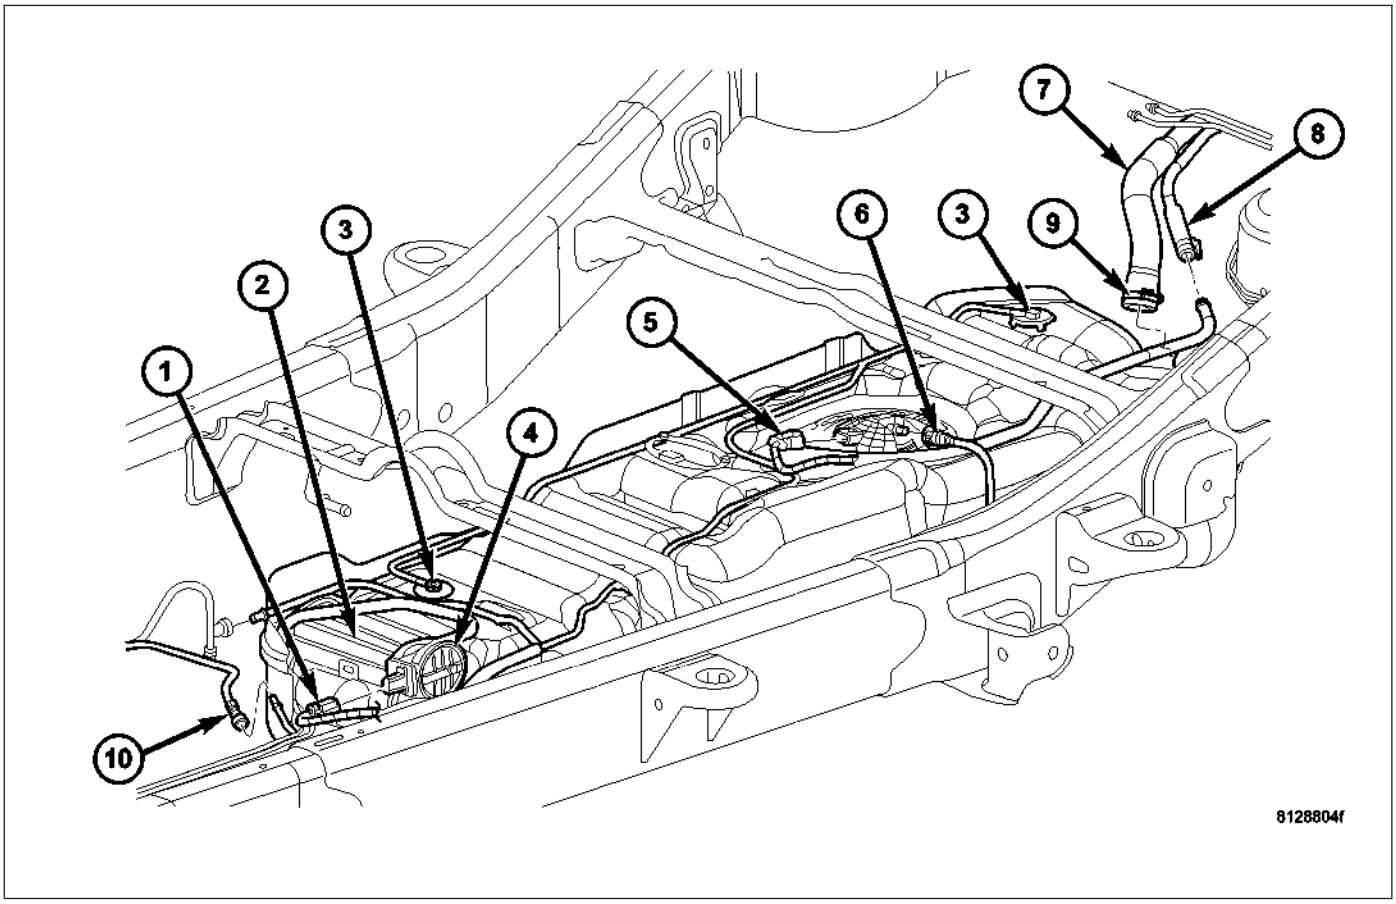
The EVAP canister (2) is located at the front of the fuel tank.

OPERATION

The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister is absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

REMOVAL



THE EVAP canister (2) is at the front of the fuel tank.

1. Raise and support vehicle.
2. If equipped, remove fuel tank skid plate.
3. Remove electrical connector (1) at NVLD pump.
4. Disconnect fresh air line at vehicle frame.
5. Remove fuel tubes/lines at EVAP canister. Note location of tubes/lines before removal for easier installation.
6. Remove filter bracket nuts and filter bracket.
7. Unclip NVLD pump from canister.
8. Remove canister from support bracket.

INSTALLATION

1. Install canister to support bracket.
2. Clip NVLD pump to canister.
3. Install filter bracket and mounting nuts.
4. Connect fresh air line at vehicle frame.
5. Carefully install remaining vapor/vacuum lines. **The vapor/vacuum lines and hoses must be firmly connected. Also check the vapor/vacuum lines at the NVLD pump, filter, EVAP canister, and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
6. Install electrical connector to NVLD pump.
7. If equipped, install fuel tank skid plate.

EXHAUST GAS RECIRCULATION

TABLE OF CONTENTS

page

VALVE-EGR
DESCRIPTION 26
OPERATION 26
REMOVAL – 5.7L 26
INSTALLATION — 5.7L 28

VALVE-EGR

DESCRIPTION

The electronic EGR valve and solenoid assembly is attached to the front of the right cylinder head. An exhaust gas routing tube connects the EGR valve to the intake manifold.

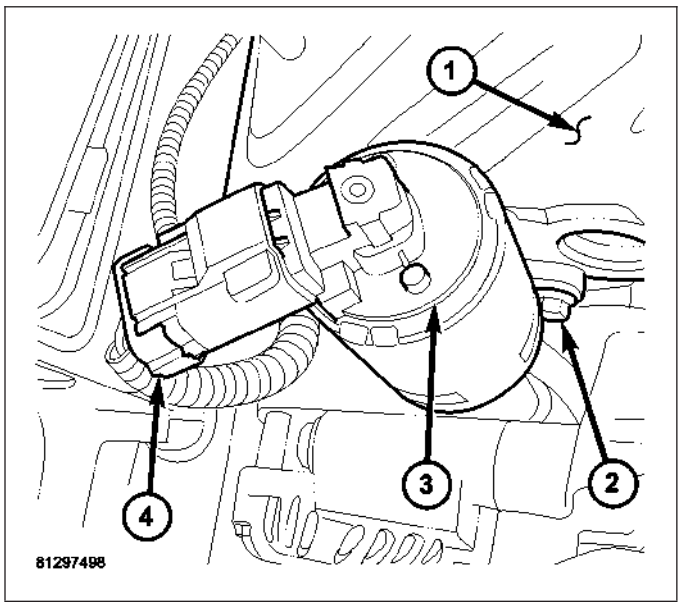
OPERATION

Exhaust gas recirculation flow is determined by the Powertrain Control Module (PCM) and is controlled by an electronic EGR valve assembly. For a given set of conditions, the PCM knows the ideal exhaust gas recirculation flow to optimize NOx and fuel economy as a function of the pintle position. Pintle position is obtained from the position sensor. The PCM adjusts the duty cycle of 128 Hz power supplied to the solenoid coil to obtain the correct position.

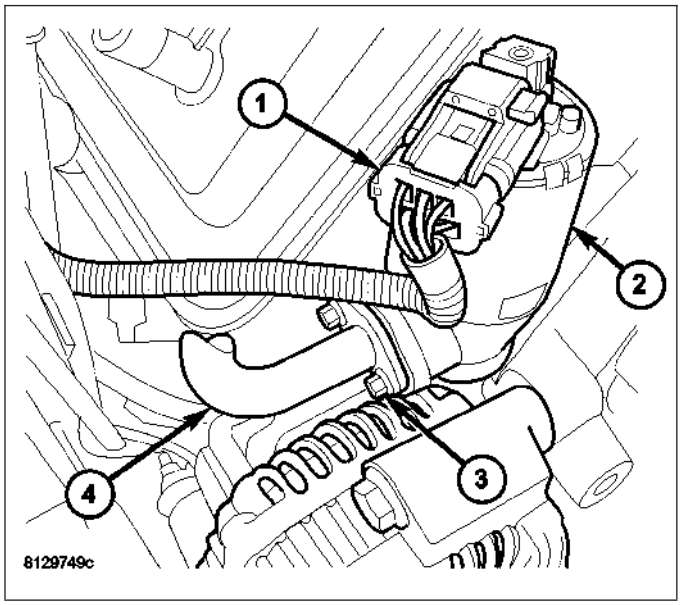
The electronic EGR valve assembly consists of a pintle, valve seat, and housing which contains and regulates exhaust gas flow. An armature, return spring, and solenoid coil provide the operating force to regulate exhaust gas flow by changing the pintle position. The solenoid coil assembly is wired in parallel with a diode that connects two internal connectors.

REMOVAL – 5.7L

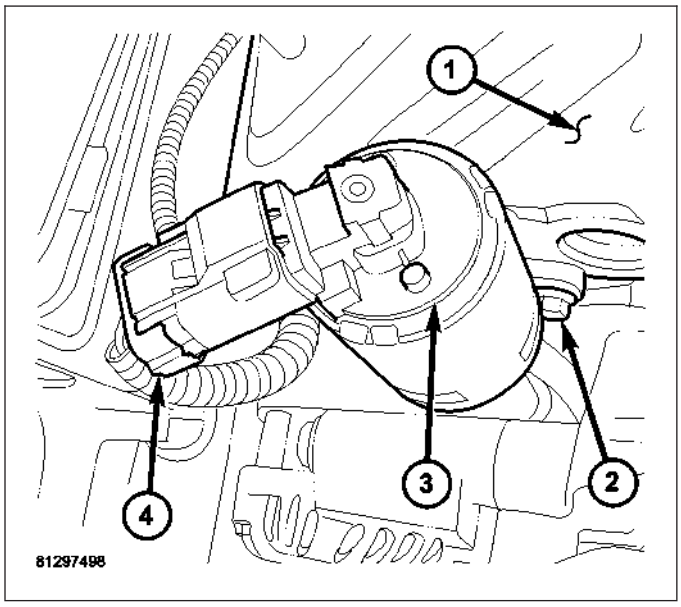
The electronic EGR valve and solenoid assembly (3) is attached to the front of the right cylinder head (1). An exhaust gas routing tube connects the EGR valve to the intake manifold.



1. Disconnect electrical connector (1) from EGR solenoid (2).
2. Remove two bolts (3) connecting EGR tube (4) to valve assembly.
3. Remove gasket located between EGR tube flange and EGR valve assembly.

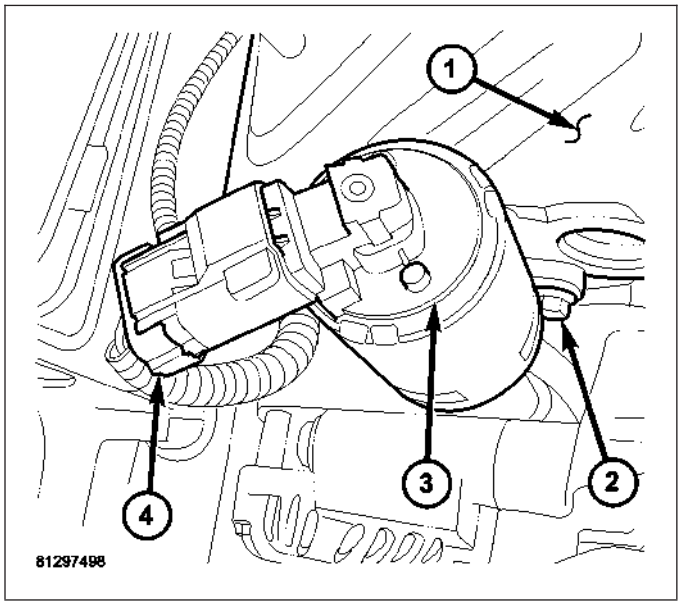


4. Remove two mounting bolts (2).
5. Separate valve assembly (3) from cylinder head (1).
6. Remove and discard metal gasket located between cylinder head and valve assembly.



INSTALLATION — 5.7L

1. Position a new metal gasket between cylinder head (1) and valve assembly (3).
2. Install two mounting bolts (2) and tighten. Refer to Torque Specifications.



3. Clean EGR tube where it joins EGR valve.
4. Position new gasket between EGR tube flange and EGR valve assembly.
5. Install two bolts (3) connecting EGR tube (4) to valve assembly (2). Tighten bolts. Refer to Torque Specifications.
6. Connect electrical connector (1) to EGR solenoid (2).
