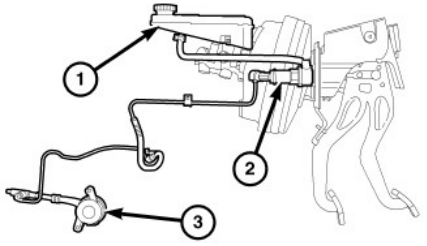
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The typical clutch hydraulic system consists of a clutch master cylinder (2), slave cylinder (3), and an interconnecting hydraulic line. Clutch hydraulic fluid is supplied by the brake system via the brake master cylinder reservoir (1).



8114a710

FLUID

CAUTION: **Never use any type of petroleum-based fluid (engine oil, transmission oil, power steering fluid, etc.) in the clutch hydraulic system. Use of such fluids will result in master/slave cylinder seal damage, and cause a failure of the hydraulic clutch release system.**

NOTE: Under normal operating conditions, the clutch hydraulic system does not require additional fluid for the life of the vehicle. Since the clutch shares the brake reservoir, the fluid level will be maintained whenever the brake system is checked.

The fluid required for use in the clutch hydraulic system is brake fluid conforming to DOT 3 specifications and J1703 standards. No other type of fluid is recommended or approved for use in the clutch hydraulic system. Use only MOPAR® brake fluid or equivalent from a tightly sealed container.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The clutch hydraulic system is responsible for engaging and disengaging the clutch. Depressing the clutch pedal develops fluid pressure in the clutch master cylinder. This pressure is transmitted to the integral release bearing which is in contact with the pressure plate diaphragm spring. As additional force is applied, the bearing depresses the diaphragm spring fingers inward on the fulcrums. The action moves the pressure plate rearward, relieving clamping force on the clutch disc.

CLEANING

Drain cooling system and refill with clean water. Refer to drain and fill procedures in this section. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty; fill, run, and drain system again, until water runs clear. Refill cooling system with a 50/50 mixture of the recommended ethylene-glycol and distilled water (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Description) .

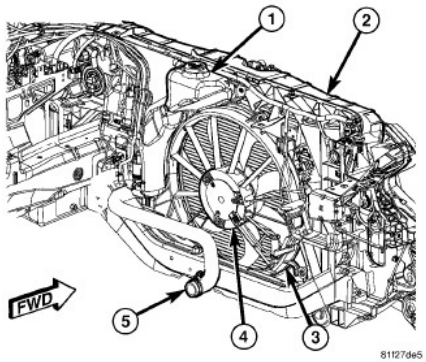
DESCRIPTION

The cooling system consists of an engine cooling module, thermostat, pressure coolant recovery container on the 3.6L engine and on the 2.0L Diesel engines, coolant, hoses, and a water pump to circulate the coolant. The engine cooling module consists of a radiator, electric fan, shroud, transmission oil cooler, and air conditioning condenser.



COOLING SYSTEM - OVERVIEW

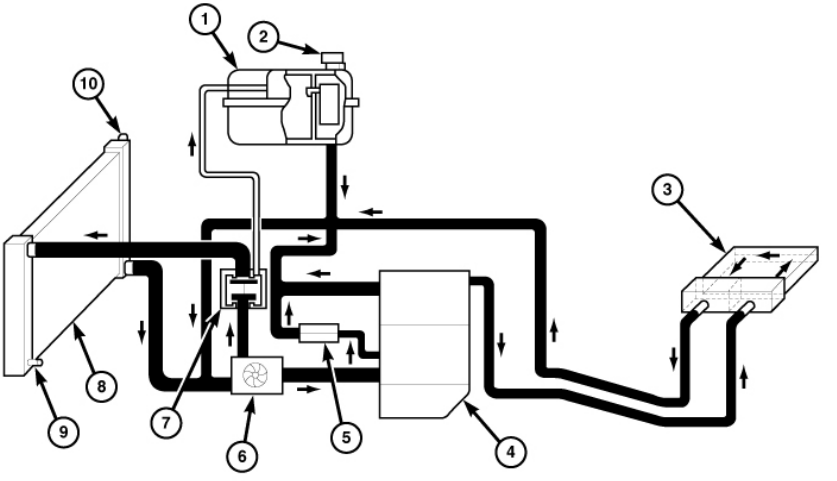
2.0L DIESEL



3699434

1 - COOLANT RECOVERY PRESSURE CONTAINER	6 - WATER PUMP
2 - PRESSURE CAP	7 - THERMOSTAT HOUSING
3 - HEATER CORE	8 - RADIATOR
4 - ENGINE	9 - COOLANT DRAIN VALVE
5 - OIL COOLER	10 - SERVICE FILL VENT VALVE

The water pump draws coolant from the radiator and delivers it to the engine block. The coolant travels through the engine block into the cylinder head. Coolant exits the engine at the thermostat. If the coolant temperature is less than 87°C (189°F) the thermostat directs all of the coolant back to the water pump. If the coolant temperature is between 87°C (189°F) and 102°C (216°F) the thermostat is in the mix mode and directs the coolant to the radiator and the water pump. If the coolant is greater than 102°C (216°F), the thermostat directs all of the coolant to the radiator.

The thermostat also feeds excess coolant and bleeds air from the system through a hose leading to the coolant reservoir. The reservoir returns coolant to the inlet side of the water pump. A port and hose at the rear of the engine block provides coolant to the heater core. This coolant is returned to the engine at the intake side of the water pump.

The oil cooler receives coolant directly from the engine block. A hose returns this coolant to the inlet side of the water pump.

DRAINING

When servicing the cooling system, it is essential that coolant does not drip onto the accessory drive belts and/or pulleys. Shield the belts with shop towels before working on the cooling system. If coolant contacts the belts or pulleys, flush both with clean water.

WARNING: **Make sure engine cooling system is cool before servicing. Do not remove any clamps or hoses , pressure cap, or open the radiator draincock. When the system is hot and under pressure serious burns from coolant can occur.**

1. Position a clean collecting container under draincock location.
2. Open radiator draincock located at the lower right side of radiator. Turn draincock counterclockwise until it stops.
3. Remove coolant pressure cap.
4. Raise vehicle on hoist.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

LEVEL CHECK

NOTE: Do not remove pressure cap for routine coolant level inspections.

The coolant bottle provides a quick visual method for determining the coolant level without removing the pressure cap. **With the engine cold and not running**, simply observe the level of the coolant in the coolant recovery container. The level should be between the MIN and MAX marks.

REVERSE FLUSHING

REVERSE FLUSHING DESCRIPTION

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator inlet and outlet. Attach a section of the radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: **Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.**

Allow the radiator to fill with water. When the radiator is filled, apply air in short blasts. Allow the radiator to refill between blasts. Continue this reverse flushing until clean water flows out through the rear of the radiator cooling tube passages.

REVERSE FLUSHING SYSTEM

Drain the cooling system. Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump and attach a lead-away hose to the water pump inlet fitting.

Connect the water supply hose and air supply hose to flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing and install the thermostat. Install the thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Description) . Refer to Refilling the Cooling System.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar® Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: **Follow manufacturers instructions when using these products.**

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

DESCRIPTION

VEHICLE CERTIFICATION LABEL - TYPICAL

A vehicle certification label is attached to every Chrysler LLC vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Vehicle Identification Number (VIN) plate is attached to the top left side of the instrument panel. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the decoding chart to determine the identification of a vehicle.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

FLUID TYPES

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler.

9400-9

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. Chrysler recommends the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as “reformulated” gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

Chrysler strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION:

DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. Chrysler recommends that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. Chrysler recommends that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION:

If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION:

Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of Chrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

STANDARD PROCEDURE - HOISTING

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING:

The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in personal injury or death.

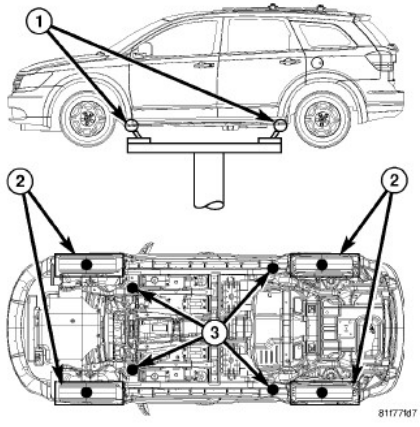
CAUTION:

Do not position hoisting device on suspension components, damage to vehicle can result.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands .

A floor jack or any lifting device, must never be used on any part of the underbody other then the described areas.



1 - FLOOR JACK, VEHICLE EMERGENCY JACK

2 - DRIVE ON HOIST

3 - CHASSIS LIFT (DUAL POST)

3 - OUTBOARD LIFT (DUAL LIFT)

STANDARD PROCEDURE - NEW VEHICLE PREPARATION

VEHICLE READINESS

DESCRIPTION	ACTION
Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days	Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days.
Place vehicle into Customer Mode	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into customer mode.
Inflate tire pressure to maximum side wall pressure	Increase the tire pressure to maximum sidewall pressure if vehicle is going into lot storage.
Install all "Shipped Loose" items	Install all "Shipped Loose" items
Install Front License Plate Bracket (if required)	Install Front License Plate Bracket
Install Roof Rack	Install Roof Rack
Install Antenna	Install Antenna
Install Wheel Center Caps	Install Wheel Center Caps

UNDERHOOD

DESCRIPTION	ACTION
Hood Latch and Safety Catch - Adjust as Needed	Verify the operation of the hood release system including the inside hood release lever and the outside hood secondary safety catch. Adjust if necessary. The safety catch prevents the hood from going to the full open position until it is manually released. To test the safety catch, unlatch the hood with the interior hood release lever and attempt to raise the hood without operating the safety catch.
Battery State-of-Charge - document voltage	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service manual procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Loose Attachments, Routing and Clearance	Inspect the following for routing, loose attachments, connections, and clearance. Reroute and tighten as required: Brake Lines, Fuel Lines, Power Steering Hoses, Vacuum Hoses, Clutch Lines, Refrigerant Lines, Wiring, Belts.
All Fluid Levels	Refer to the owner's manual or service information for proper fluid level inspection locations.
No Fluid Leaks present	Visually inspect the underhood area to make sure absence of fluid leaks. Check clamps for tightness an full engagement.

UNDER VEHICLE

DESCRIPTION	ACTION
No Fluid Leaks present	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.

DESCRIPTION	ACTION
Loose Attachments, Routing, Clearance, Damage	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.

ROAD TEST

DESCRIPTION	ACTION
Perform Road Test, Mileage: Before _____ After _____	Record mileage before and after road test.
Engine Starts with All Keys	Start vehicle with all sets of keys.
All Warning Lights and Gauges / No DTCs	Verify all warning lights and gauges are operating properly, and no fault codes exist.
Keyless Go (if equipped)	Make sure vehicle starts with push button, when key is inside vehicle.
Engine Starts Only in Park & Neutral	Verify engine will only start while automatic transmission is in park or neutral.
Service and Parking Brakes	Apply the service brakes while the car is in motion. Be sure the brake operation is smooth and positive. Make sure the vehicle stops in a straight line and without pulling to one side. Make sure there is no shudder or vibration when braking. Make sure that the parking brake is easy to operate. Make sure the parking brake does not drag.
Brake Transmission Shift Interlock	Make sure that the vehicle will only start when the brake is depressed on vehicles with automatic transmission.
Automatic Transmission Shifting	Make sure that the park lock mechanism holds the vehicle. With the vehicle on a grade, put the automatic transmission in park and slowly release the service brake to check the operation of the park mechanism. Make sure the shift lever operates easily and smoothly. Check for smooth shifting. Check for proper upshifting and downshifting.
Autostick	Verify that Autostick feature allows proper shifting through the gears.

ROAD TEST

DESCRIPTION	ACTION
Engine Performance - Cold	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Engine Performance - Warm	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Steering and Handling	Check that the power assist works properly. Make sure that the steering wheel does not vibrate abnormally at idle or road speed. Make sure that the steering wheel is centered when traveling in a straight line. Check that the vehicle does not drift to either side on flat road surfaces. Make sure that the vehicle does not vibrate or shake abnormally.
Noise, Vibration, Squeaks, or Rattles	Check that the vehicle is free of noise, vibrations, squeaks, or rattles. Tighten any loose fasteners.
Heater / Defrost - Front	Check the heater operation after the vehicle has reached operating temperature. Operate blower motor at all speeds. Operate the system in all modes. Check for hot air at all appropriate outlets. Check for temperature control operation.
Air Conditioning	Make sure that the A/C system cools properly. Operate blower motor at all speeds. Check for cool air at all temperature outlets. Operate the system in all modes.
Rear Heater and Air Conditioning (if equipped)	Check the rear heater and A/C for proper operation.
Defrost - Rear	Make sure that the electric heated rear defroster operates correctly. Turn on and feel for warmth.

DESCRIPTION	ACTION
Cruise Control (if equipped)	Check the "on/off" switch. Check the "set" operation. Check the "resume" function. Check the "accelerate" and "decelerate" function. Check the "cancel" button. Check the brake/clutch release function. If equipped, verify operation of Adaptive Cruise Control function.
Set Compass Variance / Calculation (if equipped)	Refer to the service information on TechCONNECT for information regarding compass setting procedures.
Tire Pressure Monitoring System	Verify that Tire Pressure Monitoring Indicator Light is not illuminated when tires are above minimum inflation recommendations. Make sure that indicator lamp is not flashing/chiming.
Park Assist (if equipped)	Put vehicle in reverse and slowly back up toward an object. Verify that Park Assist warning icon, lights and chimes operate properly as object is approached.
Back-Up Camera (if equipped)	Put vehicle in reverse, verify that screen provides a clear and visible image from rear of vehicle.

INTERIOR

DESCRIPTION	ACTION
Visually Inspect Interior Parts for Damage, Fit, etc.	From the interior of the vehicle, open and close all doors to make sure ease of operation. Fully open and close the glove box to make sure proper operation. Fully open and close the console door to make sure proper operation. Check interior panels for proper fit and free from damage.
All Interior Lamps and Horn	Operate and visually inspect all interior lights and switches, including: Dome/Map lamps, and if equipped the following: vanity mirror lamps, glove box lamps, ash tray lamp, cigar lighter lamp, radio lamps, door mounted lamps, illuminated entry system. Make sure that the horn operates properly.
Rear View Mirror	Check that the rearview mirror's day/night function Is operating properly.
Front and Rear Wipers and Washers	Activate front windshield wipers, and if equipped, rear window wipers and check for proper operation at all speeds. Activate the front and if equipped, the rear washer. Check the spray pattern for proper operation and aim. Check the intermittent wipe feature for proper operation.
All interior Door Locks including Child Locks	Check all interior door locks for proper operation, including rear child safety door locks if equipped. Place in the unlocked position.

INTERIOR

DESCRIPTION	ACTION
Steering Wheel Mounted Controls	Check all steering wheel controls for proper operation.
Cigar Lighter (if equipped)	Check cigar lighter for proper operation.
Power Windows and Window Lock Switch	Fully open and close all power windows to make sure proper operation and sealing. Make sure that the windows operate properly at each door. Verify that window lock button is operating properly.
Outside Power Mirrors	Check power mirrors for proper operation.
Power Heated Mirrors (if equipped)	Check power heated mirrors for proper operation.
Seats and Seat Belts - All Adjustments	Check for correct installation and operation of seat and shoulder belts, and retractors. Check that the restraint system safety labels regarding the use of seatbelts and airbags are in place. Fully cycle the seats for proper adjustments and verify that each seat is securely mounted. Fold down and latch the rear seats. Pull forward to check that the latches operate correctly. Check for proper head restraint operation.
Power Sunroof (if equipped)	Cycle sunroof. Make sure that the sunroof opens and closes easily. Verify proper operation of one touch open/close feature if equipped.
Set Clock(s)	Set all clocks to correct time. Refer to Owner's Manual for information regarding clock setting procedures.

DESCRIPTION	ACTION
Audio System	Turn the radio on and check reception in both AM and FM modes. Check that the CD player operates properly. Check for good sound quality from all speakers.
Satellite Radio (if equipped)	Turn on satellite radio and verify reception.
Video System (if equipped)	Test the DVD player to make sure that a DVD will load properly and display on the screen.
Heated Steering Wheel (if equipped)	Verify that heated steering wheel is functioning properly.
Power Outlet(s)	Check all the power outlets for proper operation.
Integrated Child Seat / Belt	Check the child restraints and child seats for proper operation.
Heated Seats (if equipped)	Check for proper operation of heated seats on all power levels, on all equipped seats.
Cargo Compartment Cover (if equipped)	Check the rear cargo compartment cover is operating properly.

EXTERIOR

DESCRIPTION	ACTION
Inspect Body and Paint for Damage and Fit/ Finish	Inspect the body exterior for damage, loose or missing items. During the inspection, make sure that no vehicle damage occurred from the time the vehicle was received and the beginning of the New Vehicle Preparation.
Exterior Lamps - Headlamps, Turn Signals, Hazards, Park/Tail /License Plate, Trunk Lights, etc.	Operate and visually inspect the following: Headlamps (High/Low Beams), turn signals, hazard warning flashers, parking/tail/license plate lamps, reverse/back up lamps, fog lamps, stop lamps including center mounted stop lamp, daytime running lamps (if equipped), clearance lamps, cargo bed lamps, any other lamps.
Lock and Unlock all doors with all mechanical keys	Verify all doors lock and unlock with all mechanical keys.
Doors, Liftgate - Adjust Strikers as Needed	Open each door/liftgate/tailgate from the outside to check outside door handle operation. Check the door detent. Partially close all doors to check the open-door detent. Close all doors/liftgates/tailgates to check the operation of latches and strikers. Adjust strikers as required. Verify liftgate/tailgate ease of operation.
Security Alarm Test (if equipped)	Lock doors using the Remote Keyless Entry Transmitter. Verify the operation of the Vehicle Security System warning lamp.
Passive Entry (if equipped)	Verify that the Keyless Enter-N-Go feature is operating properly, by grabbing the door handle of the locked vehicle, while the Remote Keyless Entry transmitter key is within 5 feet of the vehicle. The door should unlock automatically.
Remote Keyless Entry (if equipped)	Verify that doors unlock properly using all key FOBS.
Remote Start (if equipped)	Verify that engine starts with all keys when using Remote Keyless Entry Transmitter.

VEHICLE STORAGE

DESCRIPTION	ACTION
Remove all protective transit film from body of vehicle, and keep all wheel covers on vehicle until sold	Remove all protective transit film from body of vehicle, and keep all wheel covers on vehicle until sold.
Inflate tire pressure to maximum side wall pressure	Inflate tire pressure to maximum side wall pressure (except heavy duty trucks.)
Put Vehicle into Ship Mode	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into

DESCRIPTION	ACTION
	ship mode.

FINAL DETAIL & INSPECTION

DESCRIPTION	ACTION
Perform all incomplete recalls and RRTs	Perform all incomplete recalls and RRTs.
Remove interior and exterior Transportation Protective Covers that were not previously removed	Remove exterior protective coatings/coverings from vehicle, remove interior protective covers, grease markings on door jambs, unnecessary labels, etc.
Inspect paint and body, touch up as needed	Make sure that the body is free from paint chips or scratches. Touch up any chips/scratches using thin layers of paint. Make sure that the body is free from dings and dents.
Place vehicle into Customer Mode	Place vehicle into customer mode prior to delivery.
Test and record battery state of charge	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service manual procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Adjust tire pressures including spare to door placard	Adjust tire pressures including spare to door placard.
Wash and clean vehicle exterior	Wash the entire vehicle. Clean the tire sidewalls and wheel/wheel covers (use non - acidic wheel cleaner). Clean exterior/interior glass surfaces.
Clean vehicle interior	Inspect the interior trim, seats, carpeting, and moldings. Clean as necessary.

CLEANING

CAUTION: **When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.**

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

1. Remove all gasket material from cylinder head and block (Refer to 09 - Engine - Standard Procedure) . Be careful not to gouge or scratch the aluminum head sealing surface.

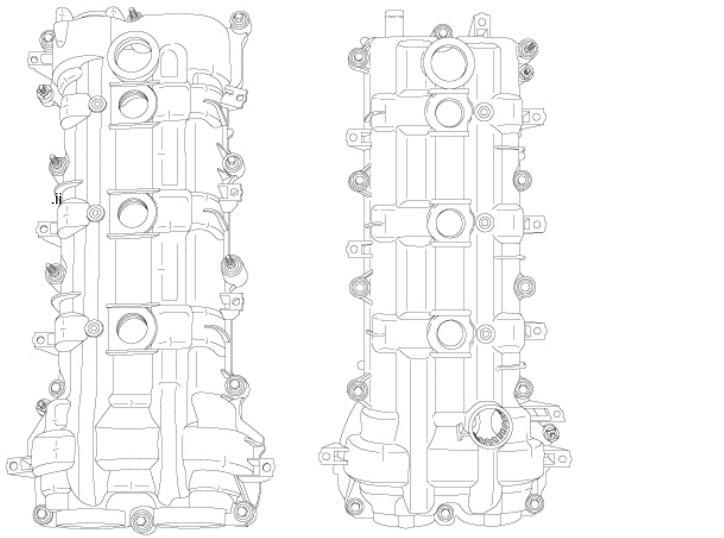
2. Clean all engine oil passages.

   CAUTION: **Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.**

3. Clean out the cylinder head bolt holes in the engine block. **DO NOT USE any adhesives when installing the MLS head gaskets. The use of adhesives may cause the gasket not to seal properly and may leak. MLS gaskets are to be installed on a surface free of debris and oils.**

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

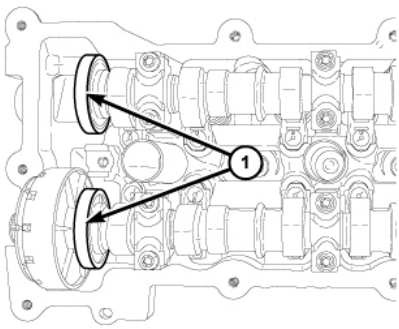


The cylinder head covers are made of a carbon and fiberglass composite. The cylinder head covers are not interchangable from side-to-side. The cylinder head covers are sealed with a press-in-place gasket that is designed to isolate the cover from the cylinder head for improved NVH. There are two dowel pins on the outboard side of the cover flange to locate the cover to holes in the cylinder head. RTV is used to seal the T-joint at the timing cover, cylinder head and cylinder head cover.

RIGHT

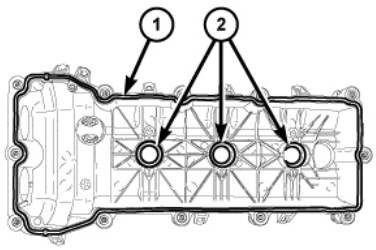
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



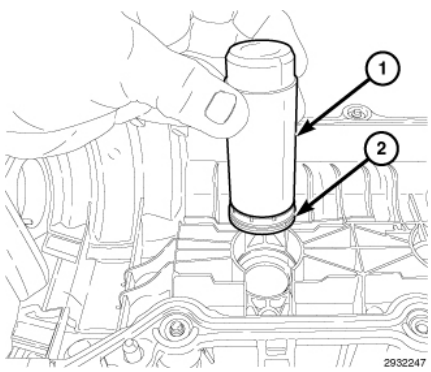
2691700

NOTE: The LH cylinder head cover is shown, the RH cylinder head cover is similar.



2776066

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.
3. If required, install new spark plug tube seals (2) in the cylinder head cover:



2932247

- Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
- Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer 10256 (1).
- Push the seal into the cylinder head cover until the base of the seal is seated.
- Remove the tool.

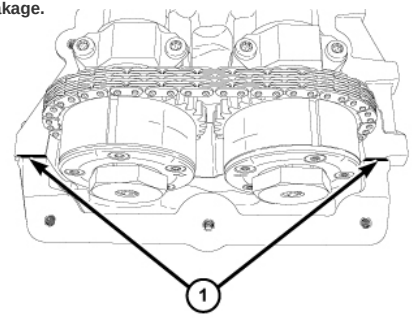
NOTE: The LH cylinder head cover T-joint is shown, the RH cylinder head cover T-joint is similar.

4. Clean the timing engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: **Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than**

Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: **Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.**

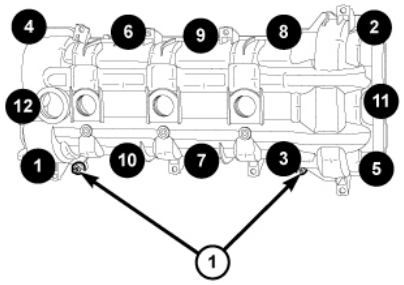


2776075

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown.

6. Align the locator pins (1) to the cylinder head and install the cylinder head cover.

7. Tighten the cylinder head cover bolts and double ended studs in the sequence shown to 12 N·m (106 in. lbs.).

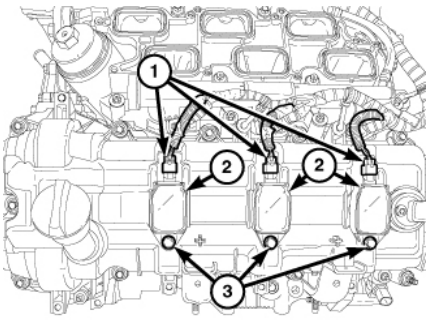


2719834

NOTE: The LH ignition coils are shown, the RH ignition coils are similar.

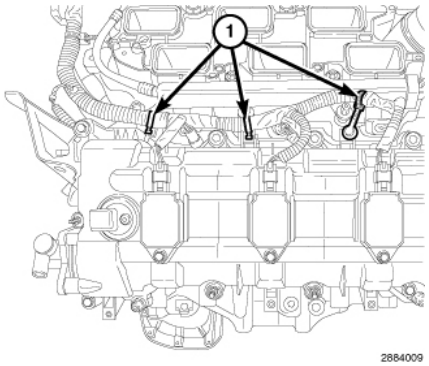
8. If removed, install the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation)

9. Install the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation)



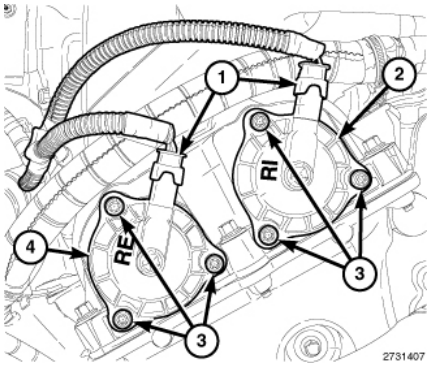
2726572

10. Engage three injection/ignition harness retainers (1) to the right cylinder head cover.

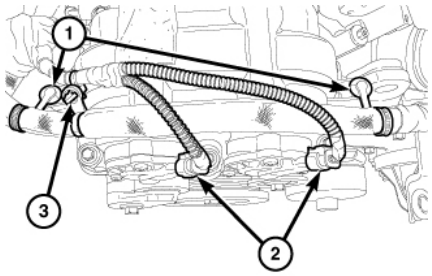


2884009

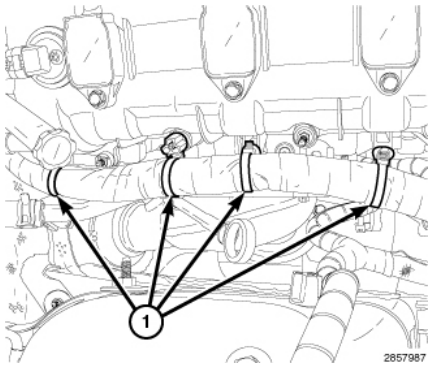
11. Refer to the markings made at disassembly and install the variable valve timing solenoids (2 and 4) in their original locations (Refer to 08 - Electrical/8I - Ignition Control/SOLENOID, Variable Valve Timing - Installation)



12. Connect the electrical connectors (2) to the variable valve timing solenoids on the right cylinder head.
13. Engage two starter wire harness retainers to the right cylinder head cover (1).
14. Engage the starter harness to main harness retainer (3).

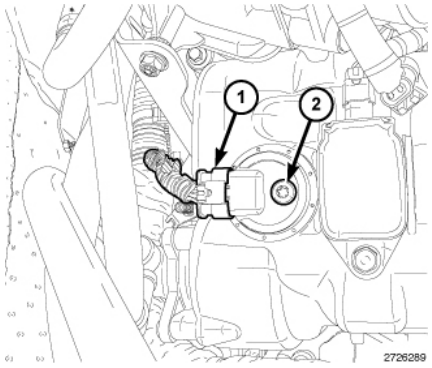


15. Engage four main wire harness retainers (1) to the right cylinder head cover.



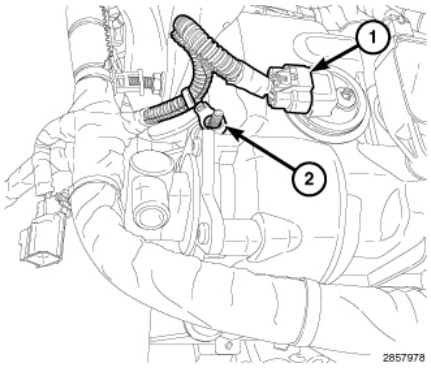
NOTE: If both RH and LH CMP sensors where removed, install them into their original locations.

16. Install the camshaft position sensor (Refer to 08 - Electrical/8I - Ignition Control/SENSOR, Camshaft Position - Installation)

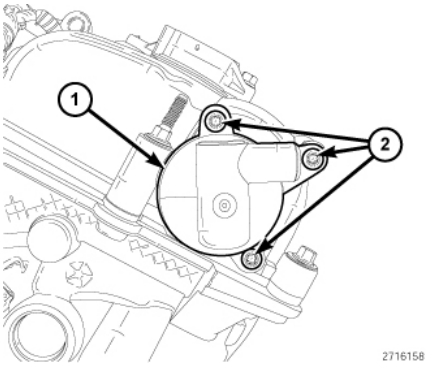


17. Connect the electrical connector (1) to the right Camshaft Position (CMP) sensor.

18. Engage the main wire harness retainer (2) to the right cylinder head cover mounting stud.

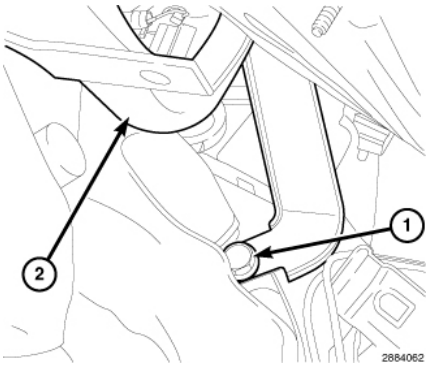


19. Install the PCV valve (1) (Refer to 25 - Emissions Control/Evaporative Emissions/VALVE, Positive Crankcase Ventilation (PCV) - Removal)

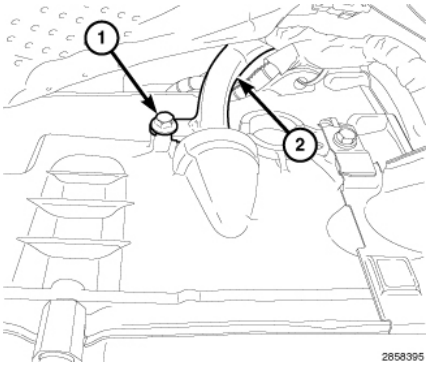


20. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .

21. Install the transmission oil level indicator tube (2) with the upper transmission to engine bolt (1) tightened to 55 N·m (41 ft. lbs.).

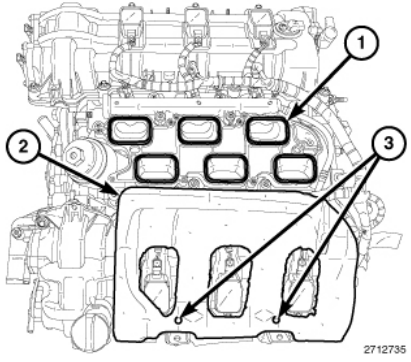


22. Install the bolt (1) securing the transmission fluid level indicator tube (2) to the transmission housing and tighten to 12 N·m (106 in. lbs.).



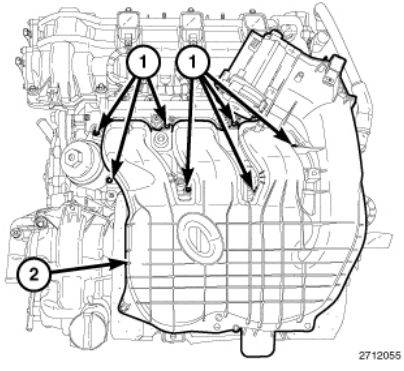
23. Lower the vehicle.

24. If removed, install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.



25. Install the upper intake manifold (1), support brackets and air inlet hose (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

26. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



NOTE:

The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

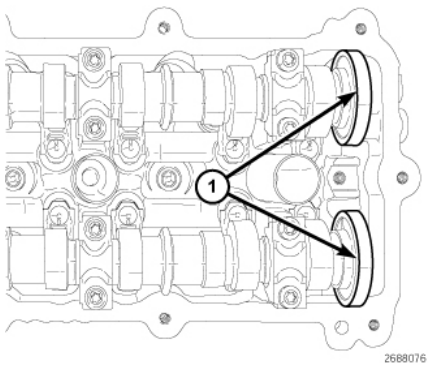
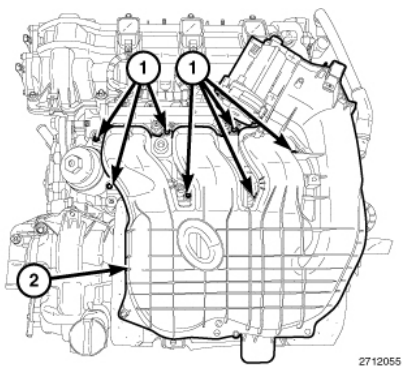
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure

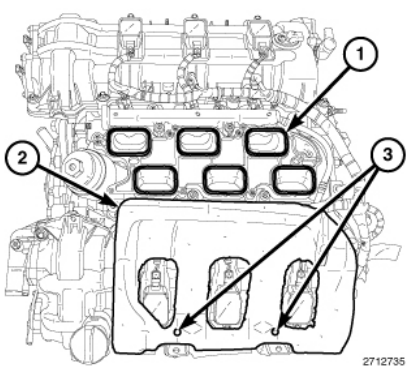
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



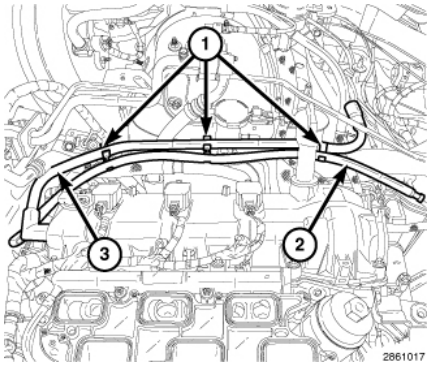
1. Disconnect and isolate the negative battery cable.
2. Remove the air inlet hose and upper intake manifold (2) (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Removal) .



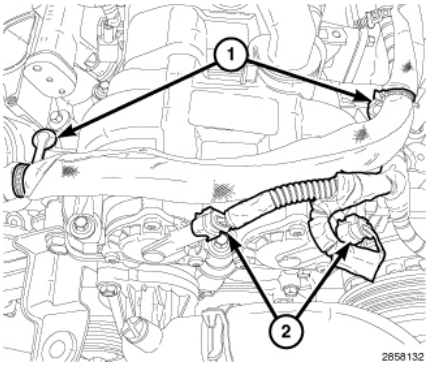
3. Cover the open intake ports (1) to prevent debris from entering the engine.
4. Remove the insulator (2) from the LH cylinder head cover.



5. Disengage the clips (1), remove the make-up air tube (3) from the left cylinder head cover and reposition the transmission breather hose (2).



NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

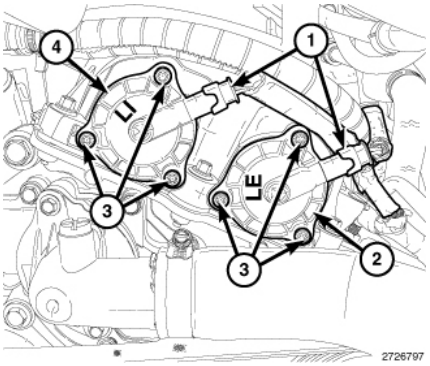


6. Disconnect the electrical connectors (2) from the left variable valve timing solenoids.

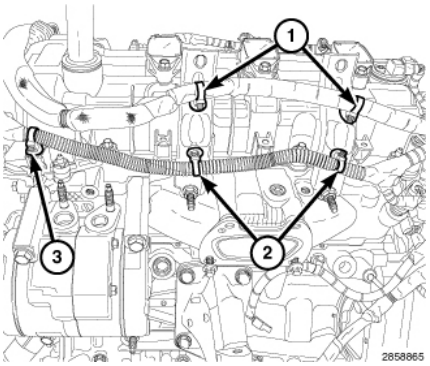
7. Disengage two starter wire harness retainers (1) from the left cylinder head cover.

8. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.

9. Remove the variable valve timing solenoids (Refer to 08 - Electrical/8I - Ignition Control/SOLENOID, Variable Valve Timing - Removal)

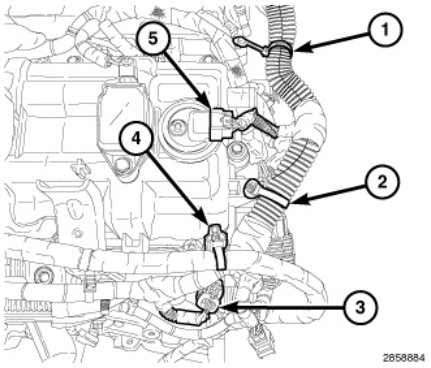


10. Disengage one main wire harness retainer (3) from the left cylinder head cover.

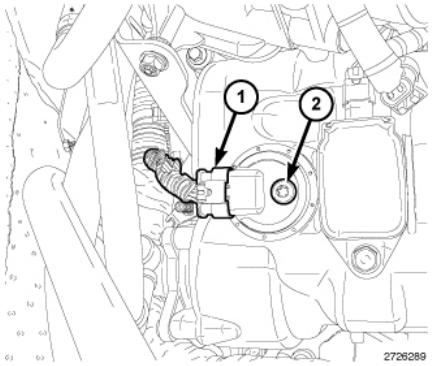


11. Disconnect the left Camshaft Position (CMP) sensor (5).

12. Disengage one main wire harness retainer (2) from the cylinder head cover and one main wire harness retainer (4) from the cylinder head cover mounting stud.

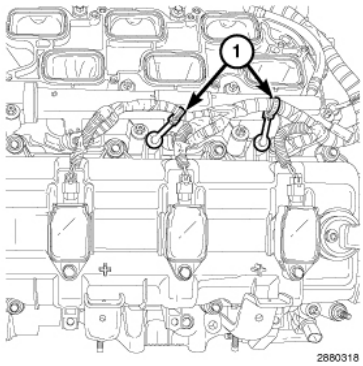


NOTE: The RH CMP sensor is shown, the LH CMP sensor is similar. If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

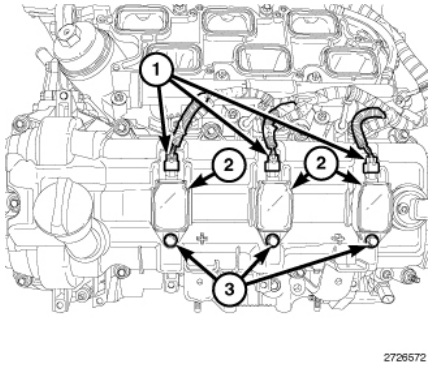


13. Remove the camshaft position sensor (Refer to 08 - Electrical/8I - Ignition Control/SENSOR, Camshaft Position - Removal)

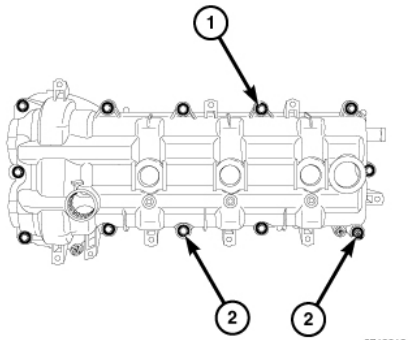
14. Disengage two injection/ignition harness retainers (1) from the left cylinder head cover.



15. Remove the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Removal)



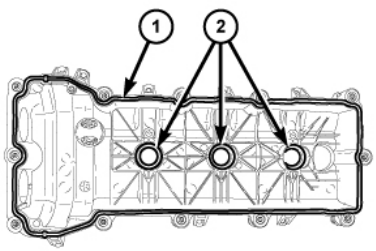
16. Loosen ten cylinder head cover mounting bolts (1) and two studbolts (2) and remove the cylinder head cover.



2719912

17. Remove and discard the cylinder head cover gasket (1).

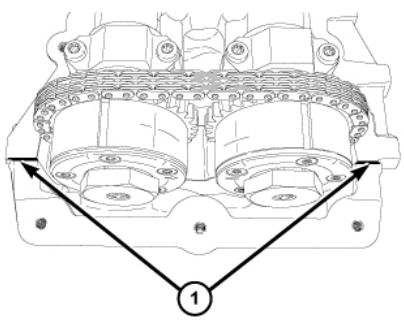
18. The spark plug tube seals (2) can be reused if not damaged.



2776066

CAUTION: **Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.**

19. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces (Refer to 09 - Engine - Standard Procedure)



2776075

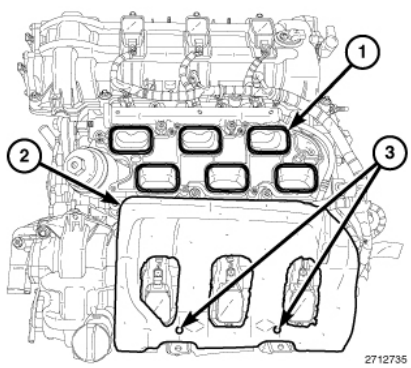
3. Cover the open intake ports (1) to prevent debris from entering the engine.

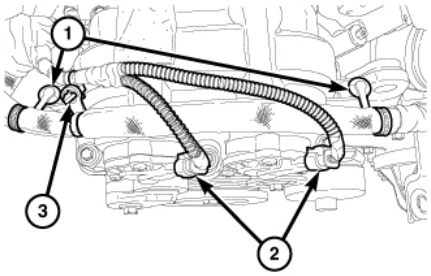


2712735

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

4. Disconnect the electrical connectors (2) from the variable valve timing solenoids on the right cylinder head.
5. Disengage the starter harness to main harness retainer (3).

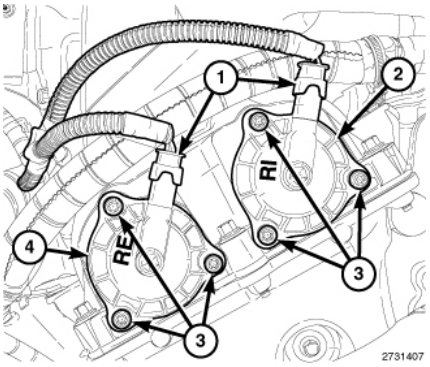
6. Disengage two starter wire harness retainers from the right cylinder head cover (1).



2858821

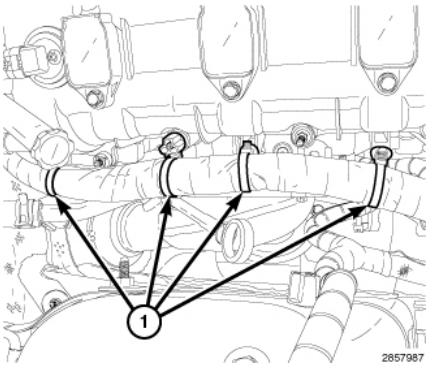
7. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.

8. Remove the variable valve timing solenoids (Refer to 08 - Electrical/8I - Ignition Control/SOLENOID, Variable Valve Timing - Removal)



2731407

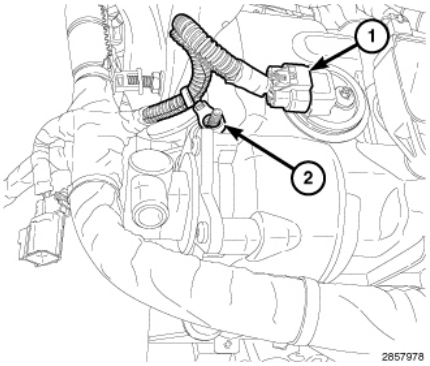
9. Disengage four main wire harness retainers (1) from the right cylinder head cover.



2857987

10. Disconnect the electrical connector (1) from the right Camshaft Position (CMP) sensor.

11. Disengage the main wire harness retainer (2) from the right cylinder head cover mounting stud.

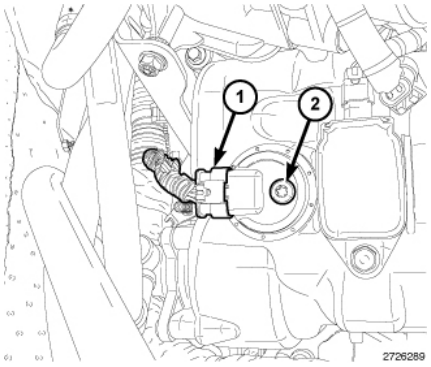


2857978

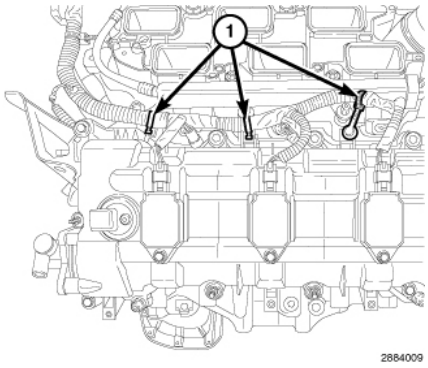
NOTE:

If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

12. Remove the camshaft position sensor (Refer to 08 - Electrical/8I - Ignition Control/SENSOR, Camshaft Position - Removal)

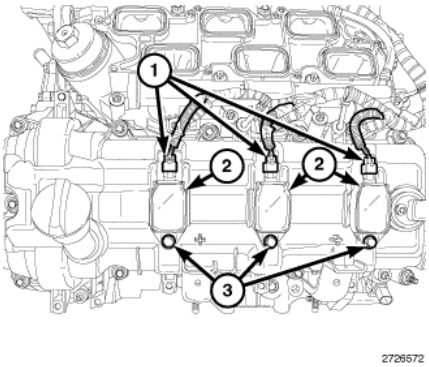


13. Disengage three injection/ignition harness retainers (1) from the right cylinder head cover.



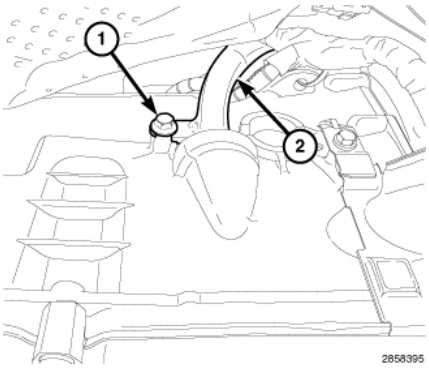
NOTE: The LH ignition coils are shown, the RH ignition coils are similar.

14. Remove the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Removal)

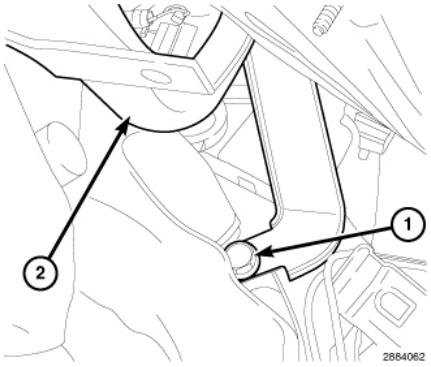


15. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .

16. Loosen the bolt (1) securing the transmission fluid level indicator tube (2) to the transmission housing.

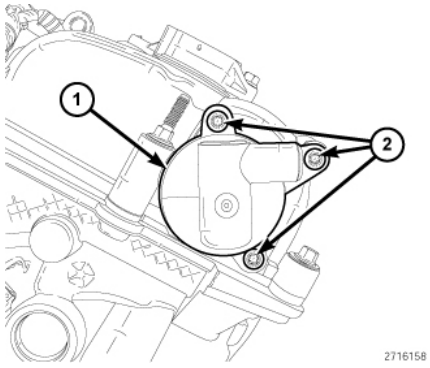


17. Remove the upper transmission to engine bolt (1) and reposition the transmission oil level indicator tube (2).

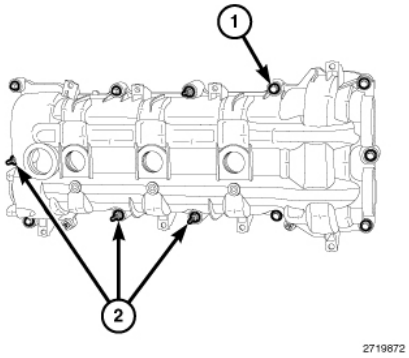


18. Lower the vehicle.

19. Remove the PCV valve (1) (Refer to 25 - Emissions Control/Evaporative Emissions/VALVE, Positive Crankcase Ventilation (PCV) - Removal)



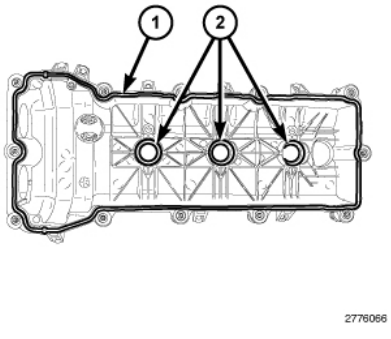
20. Loosen nine cylinder head cover mounting bolts (1) and three studbolts (2) and remove the cylinder head cover.



NOTE: The LH cylinder head cover is shown, the RH cylinder head cover is similar.

21. Remove and discard the cylinder head cover gasket (1).

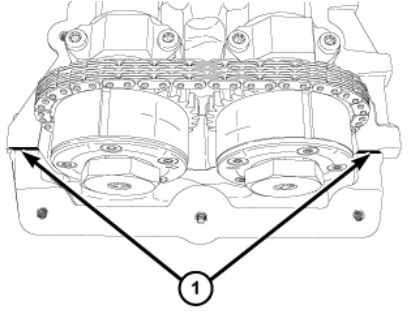
22. The spark plug tube seals (2) can be reused if not damaged.



NOTE: The LH cylinder head cover T-joints are shown, the RH cylinder head cover T-joints are similar.

CAUTION: **Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.**

23. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces (Refer to 09 - Engine - Standard Procedure)

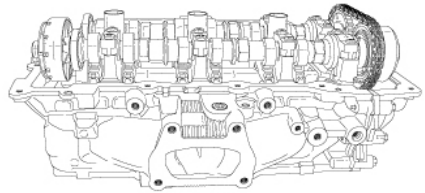


2776075

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

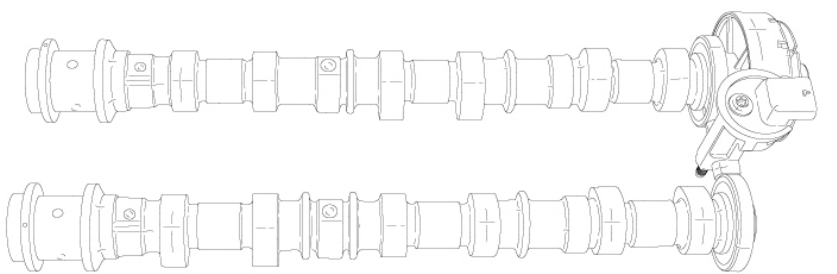
The aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. The cylinder head features four valves per cylinder with pressed in powdered metal valve guides. The valve guides are not serviceable. The DOHC valvetrain uses roller rocker arms with hydraulic lifters. The cylinder head's camshaft bearing caps are made of powdered metal and the location and direction of each cap is marked on the side of the caps. The spark plug tubes are pressed into the cylinder heads and sealed in place. The tubes are a thin wall design and caution must be taken when working in the spark plug tube area.



2793404

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



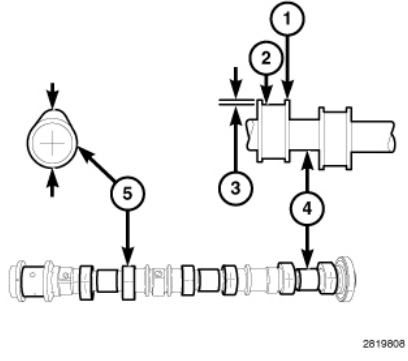
2820031

The Pentastar engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have a pressed on magnetic timing wheel that is magnetic encoded. The two Camshaft Position (CMP) sensors are located between the timing wheels. Attached to the rear of the right exhaust camshaft is a centrifuge which is part of the crankcase ventilation system. The centrifuge is used to separate oil droplets from the crankcase gases before they enter the PCV valve. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

NOTE: RH intake camshaft shown, other camshafts similar.



1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

2. Check the surface of the cam lobes (5) for abnormal wear (3). Measure and compare the unworn area (1) to the worn area (2). Replace camshafts that are not within specification (Refer to 09 - Engine - Specifications) .

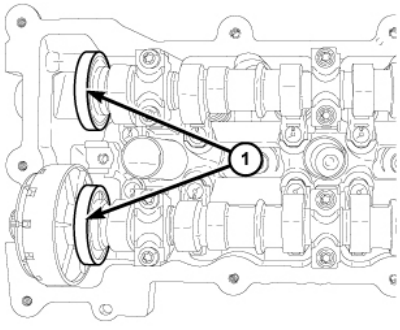
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

RIGHT

Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION:

The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

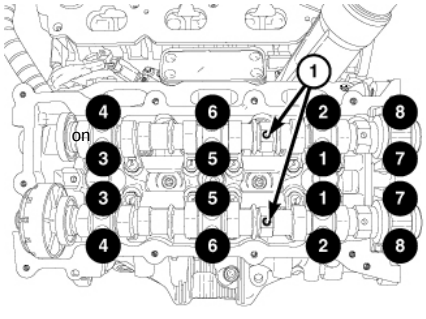


2691700

1. Lubricate camshaft journals with clean engine oil.

CAUTION:

Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.



2688733

2. Install the right side camshaft(s) at top-dead-center by positioning the alignment holes (1) vertically. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

NOTE:

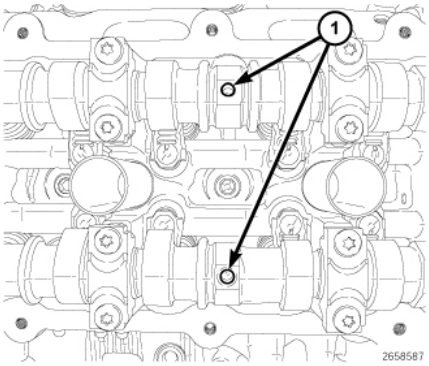
Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Install the camshaft bearing caps and hand tighten the retaining bolts to the proper) .

4. Verify the rocker arms are aligned to the cam lobe (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve/Installation) .

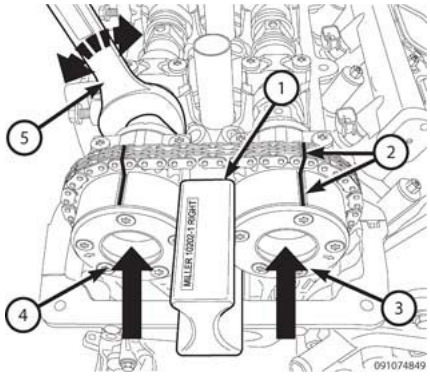
5. Tighten the bearing cap retaining bolts in the sequence shown to the proper) .

6. Verify the alignment holes are vertical to the cylinder head surface.

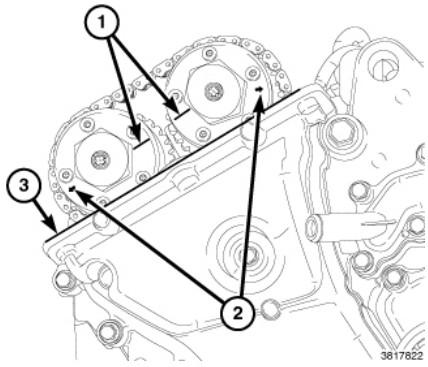


NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RT Camshaft/Phasers to the camshaft alignment pins.

7. Verify the cam phasers (3 and 4) are aligned to the marks (2) made on the timing chain.
8. Install the phasers (3 and 4) onto the camshafts.
9. Install the oil control valves. Tighten to the proper) .



10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft phaser timing mark alignment (1).

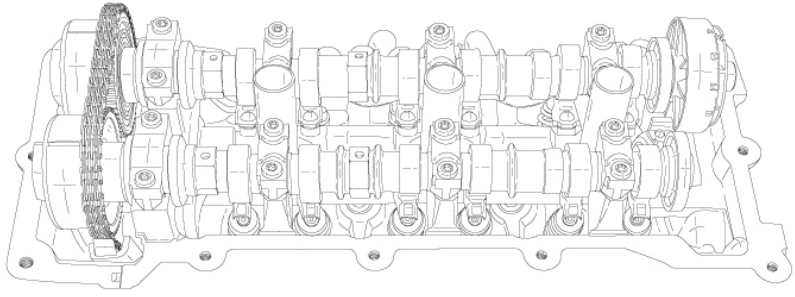


11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Installation)

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION



2820145

NOTE: RH camshafts shown, LH camshafts similar.

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

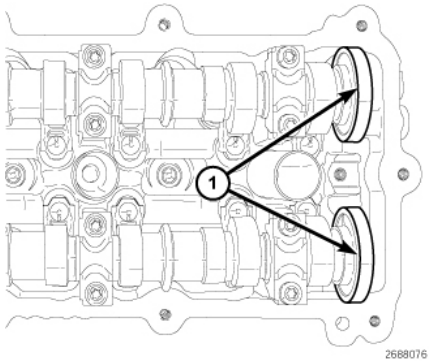
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

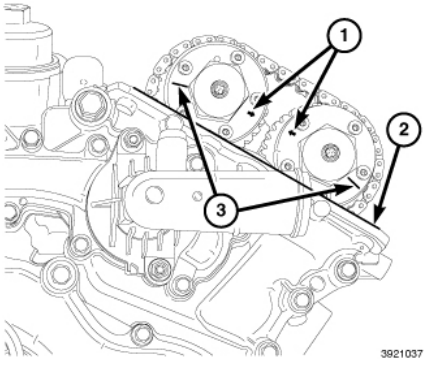
CAUTION: **When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.**

CAUTION: **DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**



1. Remove the upper intake manifold, all ignition coils, all spark plugs and left cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head/Removal) .

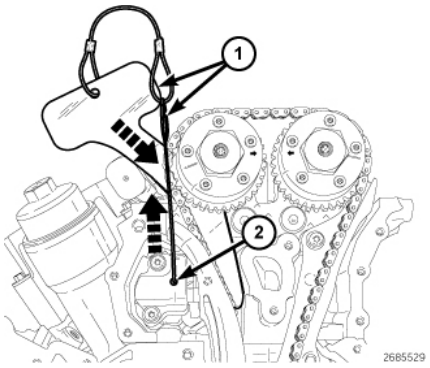
2. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2). The number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

NOTE: Graphic shows engine timing cover removed for clarity.

4. Using the Pin 10200-3 (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push Holder, Timing Chain, Left Side 10200-1 (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body.

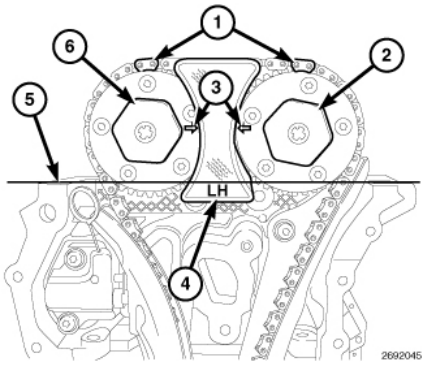


NOTE: The holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LH Camshaft/Phaser Lock.

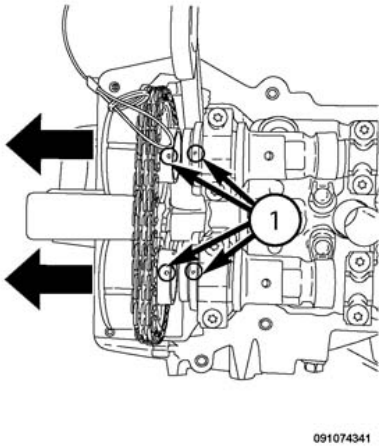
5. Install the Locks, Camshaft/Phaser 10202 (4).

6. Remove the exhaust oil control valve (2) and the intake oil control valve (6).



NOTE: The alignment marks located on the camshaft specifies the location of the drive pin in reference to the phaser alignment mark.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.



NOTE: DO NOT REMOVE THE PHASER LOCK.

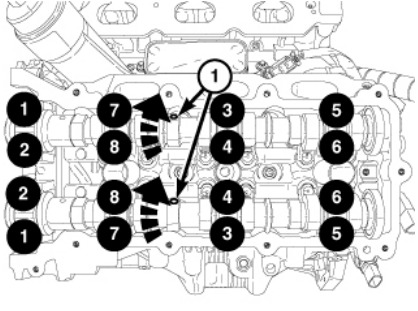
NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked “1E–>”. The caps should be installed with the notch forward.

8. Rotate the camshafts counterclockwise to position the alignment holes (1) **approximately 30° before top-dead-center**. This places the camshafts in the neutral position (no valve load).

9. Loosen the camshaft bearing cap bolts in the sequence shown.

NOTE:

When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.



2676491

10. Remove the camshaft bearing caps and the camshafts.

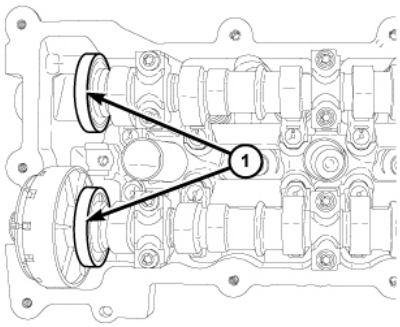
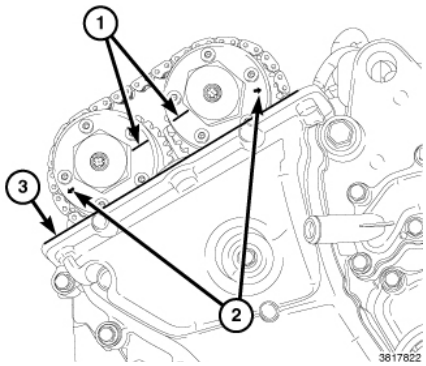
CAUTION: **When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.**

CAUTION: **DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**



2691700

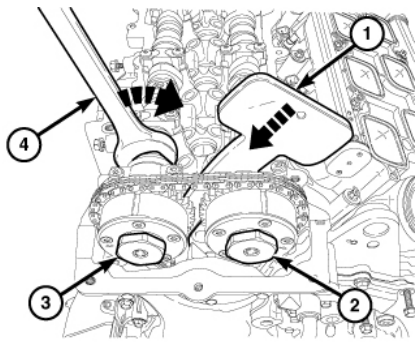
1. Remove the upper intake manifold, all ignition coils, all spark plugs, right cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head/Removal) .
2. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.



3617822

4. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert the Holder, Timing Chain 10369 (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

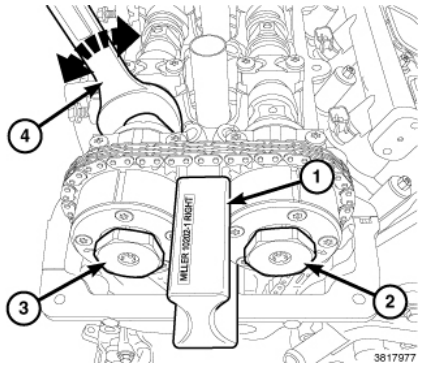
NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RH Camshaft/Phaser Lock.



3658638

5. Install Lock, Camshaft/Phaser, Right Side 10202-1 (1).

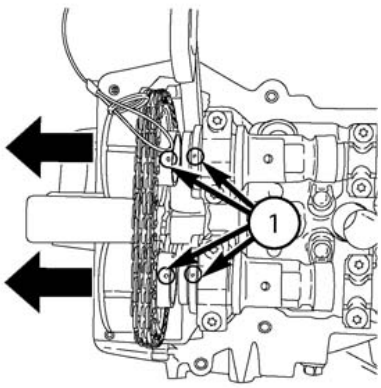
6. Remove both the intake (2) and exhaust (3) oil control valves.



NOTE: Left side shown. Right side similar.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

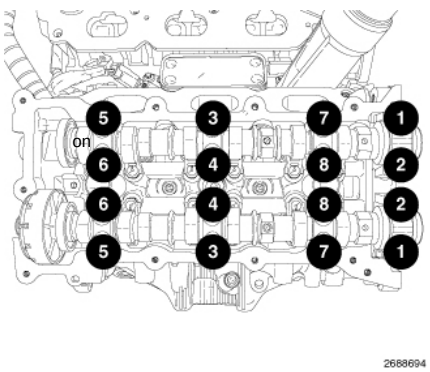
NOTE: DO NOT REMOVE THE PHASER LOCK



8. Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked “1E–>”. The caps should be installed with the notch forward.

NOTE: Loosen the camshaft bearing cap bolts in the sequence shown.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.



9. Remove the camshaft bearing caps and the camshafts.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

CAMSHAFT END PLAY

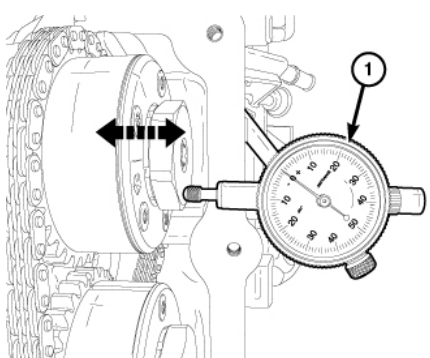
Special Tools: Click to display a list of tools used in this procedure

NOTE: Right intake camshaft shown, other camshafts similar.

1. Remove the cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal).

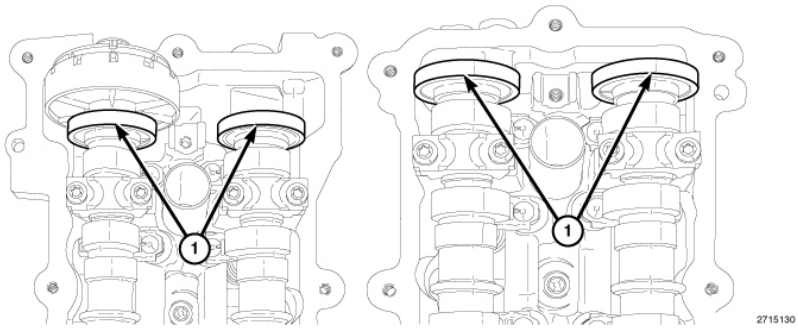
NOTE: Cylinder #1 or #4 must be used when checking for Top Dead Center (TDC).

2. Mount Dial Indicator Set C-3339A (1) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification (Refer to 09 - Engine - Specifications) .



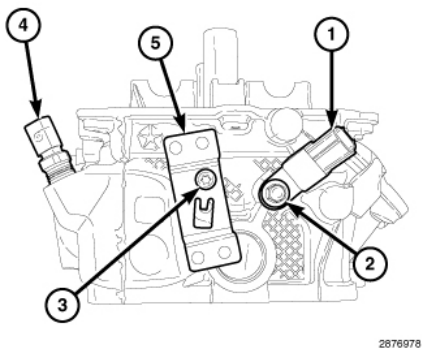
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

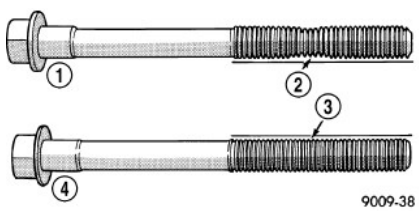


CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. If removed, install the Engine Coolant Temperature (ECT) sensor (4) and tighten to 11 N·m (97 in. lbs.).
2. If removed, install the ignition coil capacitor (1) with a M6 bolt (2) and tightened to 10 N·m (89 in. lbs.).
3. If removed, install the engine wire harness retainer bracket (5) with a T30 bolt (3) and tightened to 12 N·m (106 in. lbs.).



CAUTION: **The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**

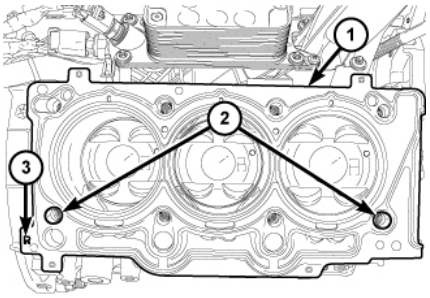


NOTE: Typical cylinder head bolt shown.

4. Check cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

NOTE: Right head gasket shown, left head gasket similar.

CAUTION: **When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.**



2800384

5. Clean and prepare the gasket sealing surfaces of the cylinder head and block (Refer to 09 - Engine - Standard Procedure) .

CAUTION: **Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.**

6. Clean out the cylinder head bolt holes in the engine block.

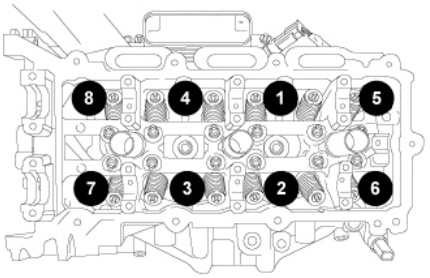
WARNING: **The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.**

CAUTION: **The installation of the cylinder head gaskets are not interchangeable between the left and right cylinder heads. They are clearly marked (3) with "R" for right and "L" for left. They must be applied on a dry surface, without the use of any adhesives.**

7. Position the new cylinder head gasket (1) onto the locating dowels (2).

8. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: Do not apply any additional oil to the bolt threads.



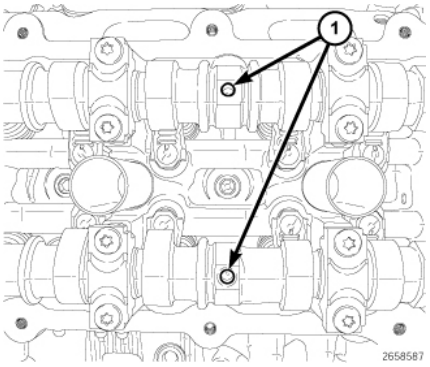
2692178

9. Install the eight cylinder head bolts finger tight.

10. Tighten the cylinder head bolts in the sequence shown, following this 9 step torque plus angle method. Tighten according to the following torque values:

- Step 1: All to 30 N·m (22 ft. lbs.)
- Step 2: All to 45 N·m (33 ft. lbs.)
- Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
- Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
- Step 5: Loosen all fasteners in reverse of sequence shown
- Step 6: All to 30 N·m (22 ft. lbs.)
- Step 7: All to 45 N·m (33 ft. lbs.)
- Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
- Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.**



2658587

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

11. If removed, install the hydraulic lifters (Refer to 09 - Engine/Cylinder Head/LIFTER(S) , Hydraulic - Installation).

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

12. Install the rocker arms and camshafts (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation) .

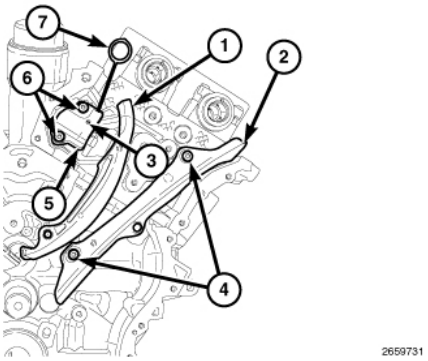
13. Rotate the camshafts clockwise to TDC by positioning the alignment holes (1) vertically.

14. Install the left cam chain guide (2) with two bolts (4) and tighten the T30 bolts (4) to 12 N·m (9 ft. lbs.).

15. Install the left cam chain tensioner (5) to the cylinder head with two bolts (6) and tighten the T30 bolts (6) to 12 N·m (9 ft. lbs.).

16. Reset the left cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin 8514 (7) (Refer to 09 - Engine/Valve Timing - Standard Procedure) .

17. Install the left tensioner arm (1).

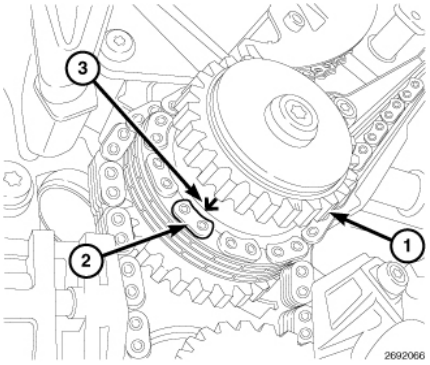


2659731

18. Press the left intake cam phaser onto the intake camshaft, install and hand tighten the oil control valve.

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

19. Drape the left side cam chain over the left intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

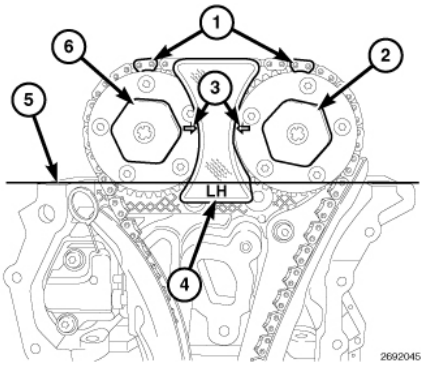


2692066

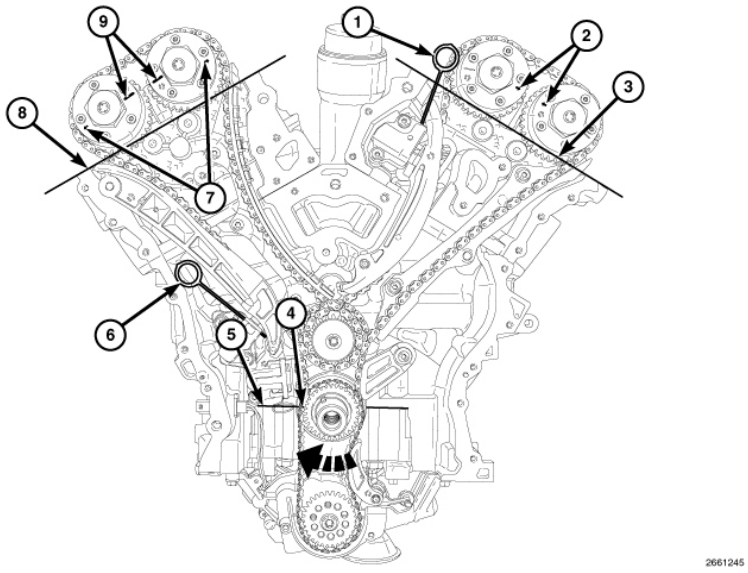
20. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the valve cover sealing surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

21. Install the LH Camshaft Phaser Lock 10202 (4) and tighten the oil control valves (2) and (6) to 150 N·m (110 ft. lbs.).



2692045

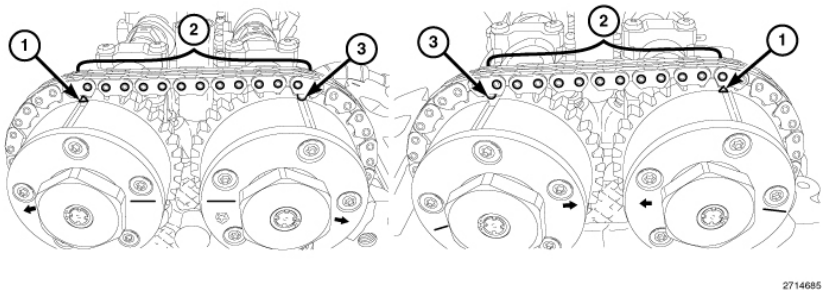


22. Remove the LH Camshaft Phaser Lock 10202 .

23. Remove the Tensioner Pin 8514 (1) from the left cam chain tensioner.

24. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned the with the block/bearing cap junction (5).

25. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).



26. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

27. If the engine timing is not correct, repeat this procedure.

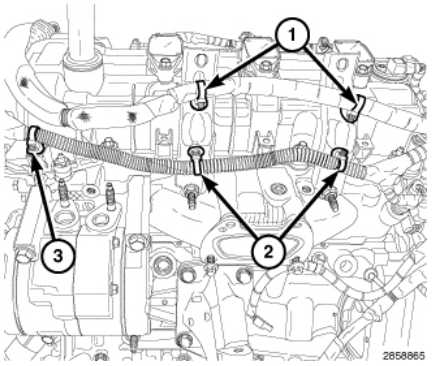
28. Install the engine timing cover, crankshaft vibration damper, upper and lower oil pans and cylinder head covers (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Installation).

29. Install the left upper intake manifold support brackets (1) and tighten the stud (2) finger tight.

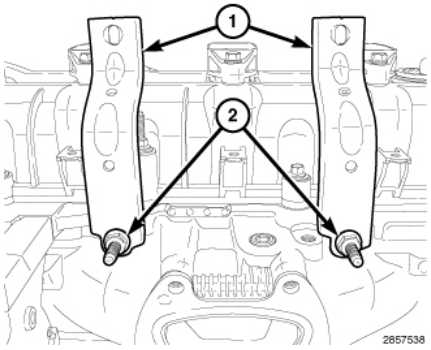
30. Fasten two starter wire harness retainers (1) to the upper intake manifold support brackets.

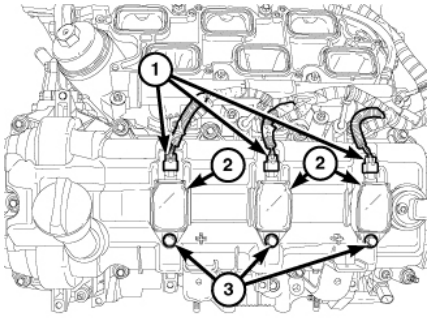
31. Fasten one main wire harness retainer (3) to the left cylinder head cover and two retainers (2) to the upper intake manifold support brackets.

32. Install the spark plugs and tighten to 18 N·m (13 ft. lbs.) (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .



33. Install the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation) .



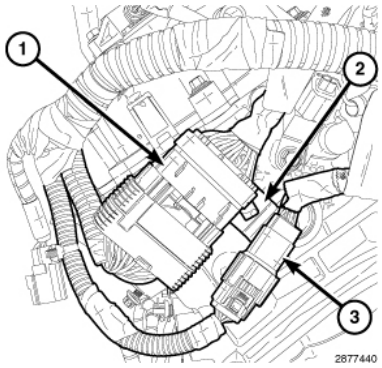


34. Connect the ignition coil capacitor electrical connector.

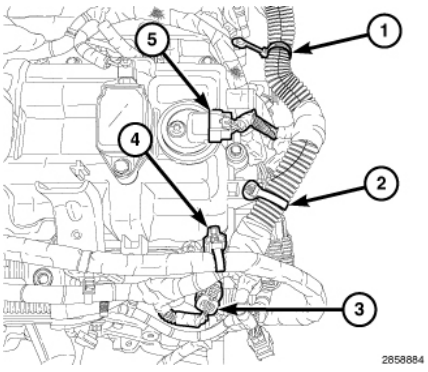
35. Connect the injection/ignition electrical connector (1).

36. Connect the engine oil pressure/temperature sensor electrical connector (3).

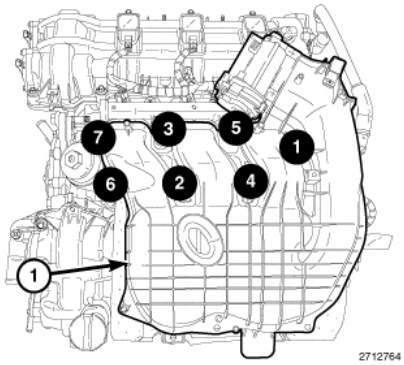
37. Fasten the injection/ignition wire harness and the oil pressure/temperature sensor wire harness from the retainer bracket (2) on the rear of the left cylinder head.



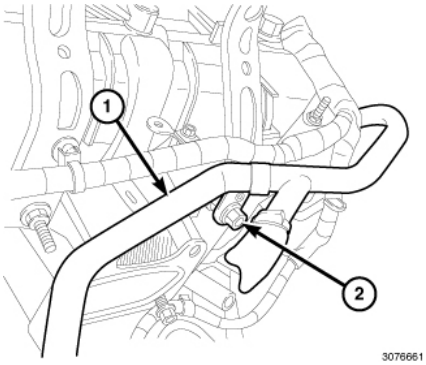
38. Connect the Engine Coolant Temperature (ECT) sensor electrical connector (3).



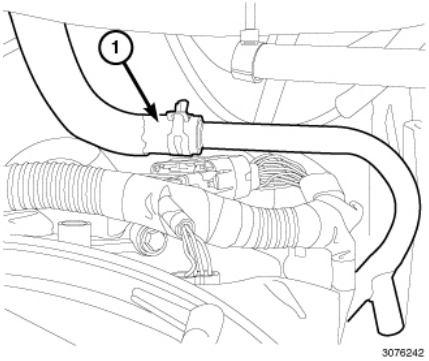
39. Install the upper and lower intake manifolds (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .



40. Position the heater core return tube (1) onto the upper support bracket, install the retaining nut (2) and tighten to 12 N·m (9 ft. lbs.).



41. Connect the heater core return hose (1).

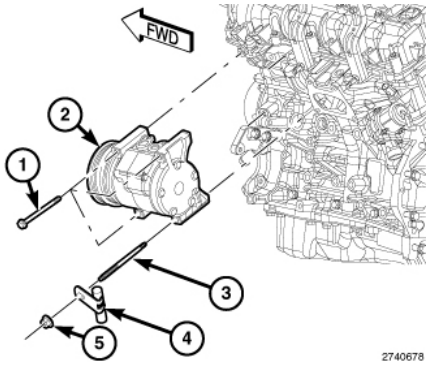


42. Position the A/C compressor (2), install the upper bolts (1) finger tight.

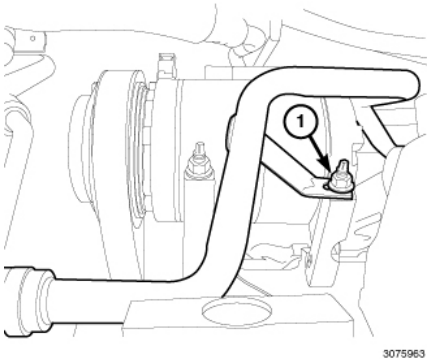
43. Install the lower A/C compressor retaining studs (3) finger tight

44. Tightened the A/C compressor upper bolts (1) to 25 N·m (18 ft. lbs.).

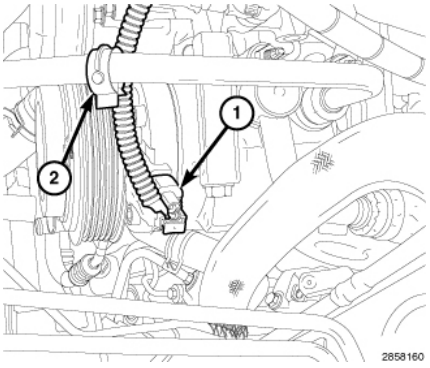
45. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .



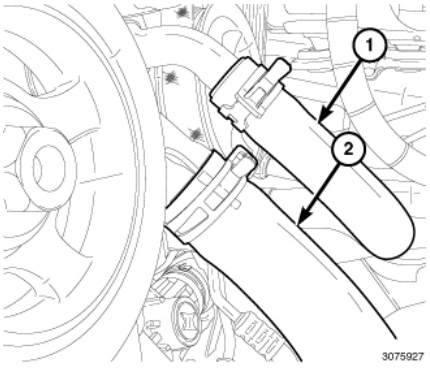
46. Position the heater core return tube lower support bracket onto the A/C compressor lower retaining stud, install the nut (1) and tighten both A/C compressor lower retaining nuts to 25 N·m (18 ft. lbs.).



47. Connect the A/C compressor electrical connector (1) and fasten the wire harness retainer (2) to the A/C compressor discharge line.



48. Connect the lower heater core return hose (1) to the engine coolant pump housing.

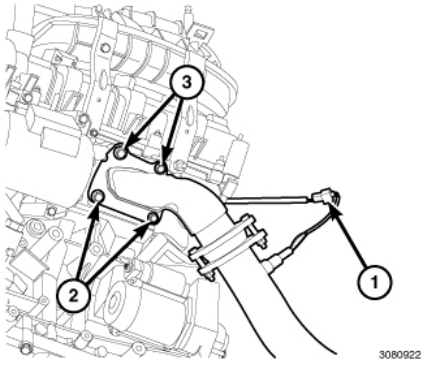


49. Position the left down pipe onto the partially installed lower flange bolts (2).

50. Install the upper down pipe flange bolts (1) and tighten to 23 N·m (17 ft. lbs.).

51. Tighten the lower down pipe flange bolts (2) to 23 N·m (17 ft. lbs.).

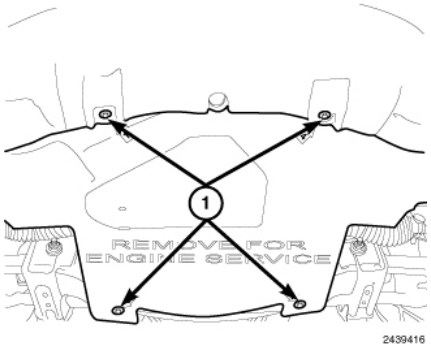
52. Connect the left upstream oxygen sensor electrical connector (4) to the main wire harness.



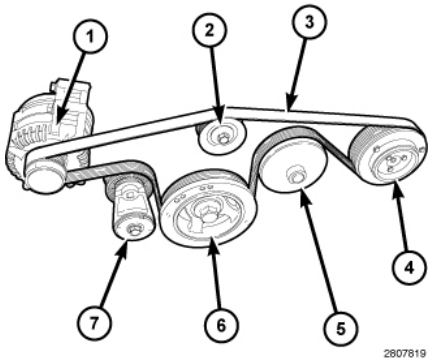
53. If removed, install the oil filter.

54. Position the belly pan and install the retainers (1).

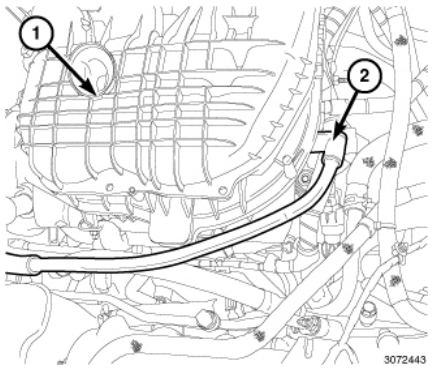
55. Lower the vehicle.



56. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (3), then slowly rotate the tensioner into position.



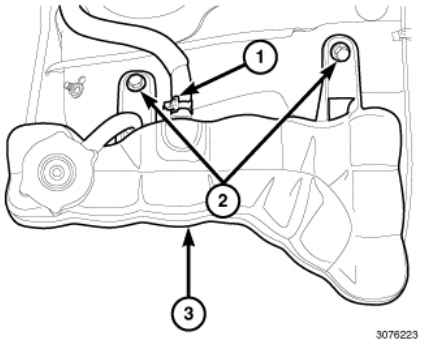
57. Connect the fresh air makeup hose (2) to the rear of the intake manifold (1).



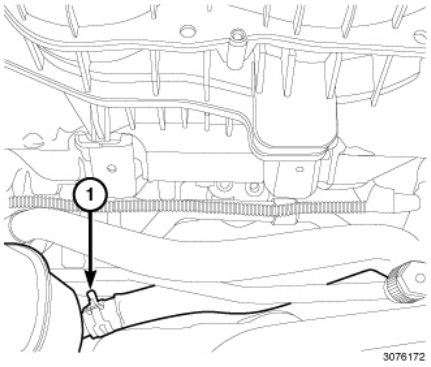
58. Position the coolant bottle (3) into the engine compartment.

59. Install the coolant bottle retaining bolts (2) and tighten to 12 N·m (9 ft. lbs.).

60. Connect the heater core purge hose (1) to the coolant bottle.



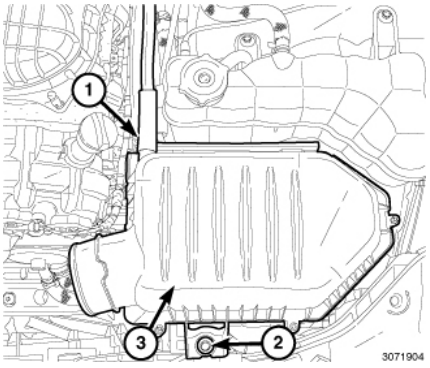
61. Connect the coolant bottle return hose (1).



62. Position the air cleaner housing (3) into the vehicle.

63. Install the air cleaner housing retaining bolt (2) and tighten to 12 N·m (9 ft. lbs.).

64. Connect the fresh air makeup hose (1) to the air cleaner housing.



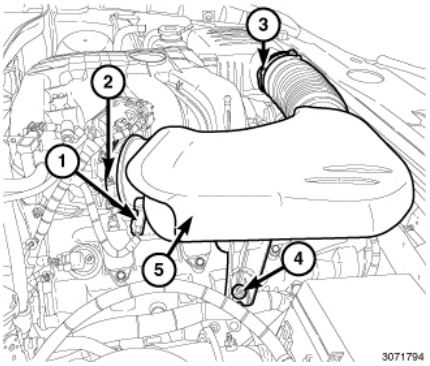
65. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

66. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

67. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

68. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

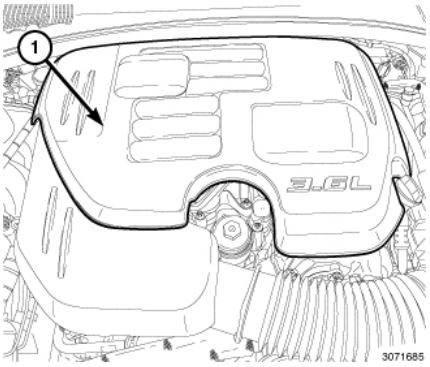
69. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



70. Fill the crankcase with the specified type and amount of engine oil (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .

71. Fill the cooling system with the specified type and amount of engine coolant (Refer to 07 - Cooling - Standard Procedure) .

72. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



73. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

74. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE:

The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

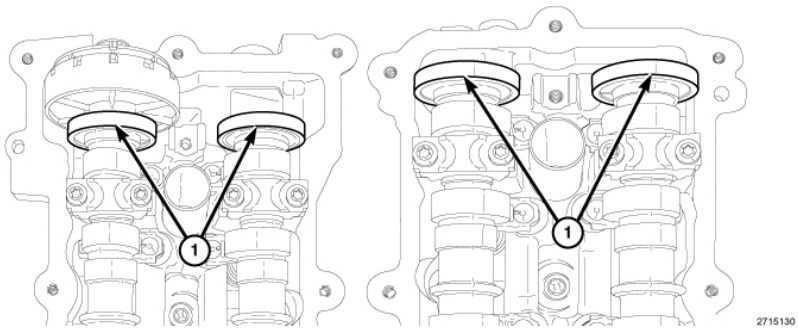
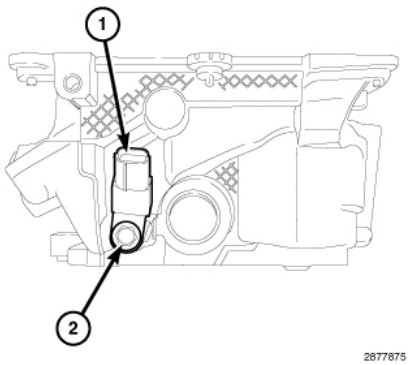
Special Tools: Click to display a list of tools used in this procedure

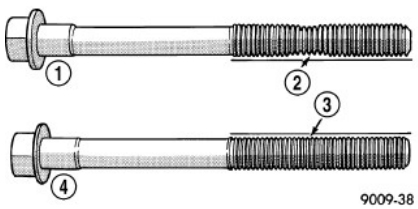


CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. If removed, install the ignition coil capacitor (1) with an M6 bolt (2) tightened to 10 N·m (89 in. lbs.).



CAUTION: **The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**

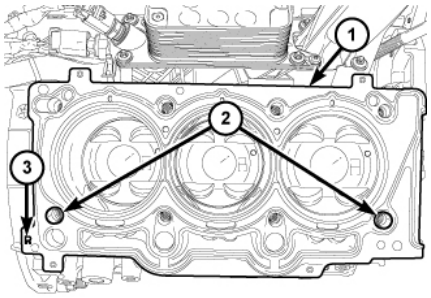


NOTE: Typical cylinder head bolt shown.

2. Check the cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

CAUTION: **When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper.**

3. Clean and prepare the gasket sealing surfaces of the cylinder head and block (Refer to 09 - Engine - Standard Procedure) .



2800384

CAUTION: **Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.**

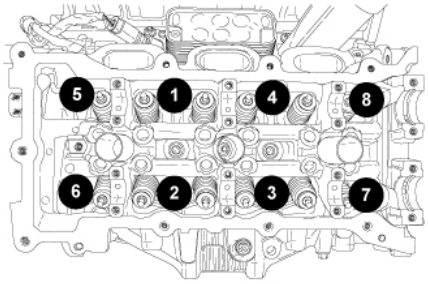
4. Clean out the cylinder head bolt holes in the engine block.

WARNING: **The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.**

CAUTION: **The installation of the cylinder head gaskets are not interchangeable between the left and right cylinder heads. They are clearly marked (3) with "R" for right and "L" for left. They must be applied on a dry surface, without the use of any adhesives.**

5. Position the new cylinder head gasket (1) on the locating dowels (2).

6. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.



2719043

NOTE: Do not apply any additional oil to the bolt threads.

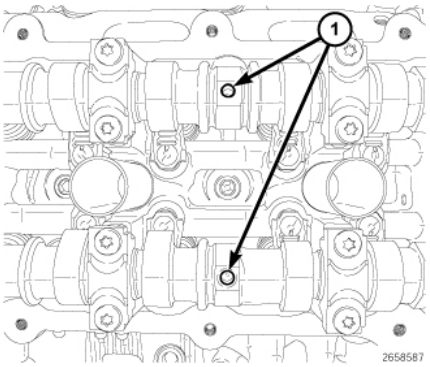
7. Install the eight cylinder head bolts finger tight.

8. Tighten the cylinder head bolts in the sequence shown, following this 9 step torque plus angle method. Tighten according to the following torque values:

- Step 1: All to 30 N·m (22 ft. lbs.)
- Step 2: All to 45 N·m (33 ft. lbs.)
- Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
- Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
- Step 5: Loosen all fasteners in reverse of sequence shown
- Step 6: All to 30 N·m (22 ft. lbs.)
- Step 7: All to 45 N·m (33 ft. lbs.)
- Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
- Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

9. If removed, install the hydraulic lifters (Refer to 09 - Engine/Cylinder Head/LIFTER(S) , Hydraulic - Installation).



2658587

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

10. Install the rocker arms and camshafts (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation) .

CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could**

occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

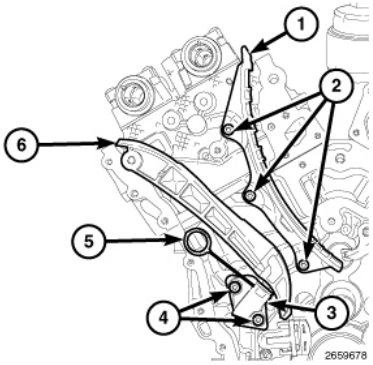
11. Verify that the camshafts are set at TDC by positioning the alignment holes (1) vertically.

12. Install the right cam chain guide (1) with three bolts (2). Tighten the T30 bolts (2) to 12 N·m (106 in. lbs.).

13. Install the right cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N·m (106 in. lbs.).

14. Reset the right cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin 8514 (5).

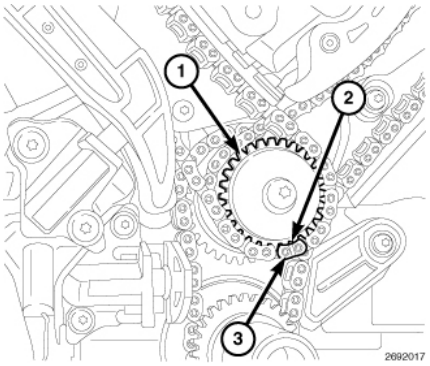
15. Install the right tensioner arm (6).



CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

16. Press the right exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve.

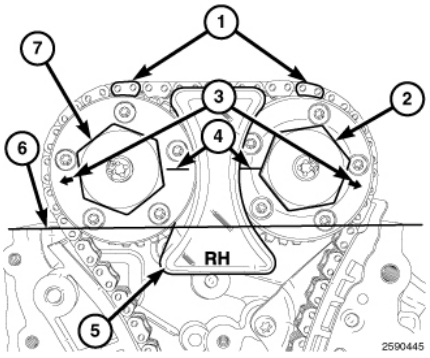
17. Drape the right side cam chain over the right exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.

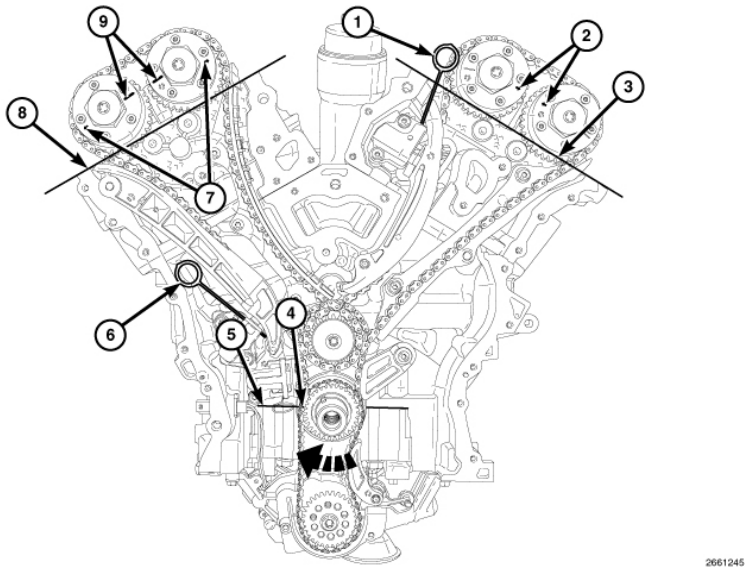


18. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the valve cover sealing surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

19. Install the RH Camshaft Phaser Lock 10202 (5) and tighten the oil control valves (2) and (7) to 150 N·m (110 ft. lbs.).



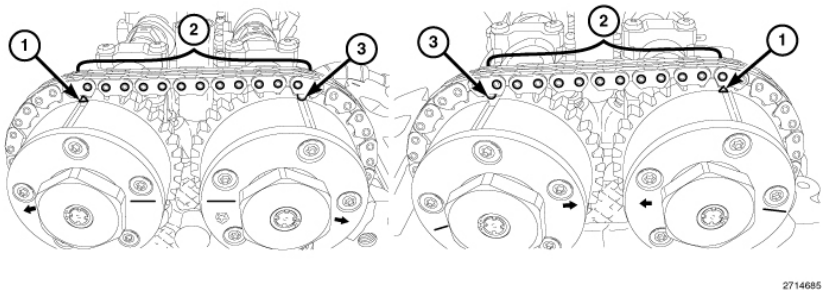


20. Remove the RH Camshaft Phaser Lock 10202 .

21. Remove the Tensioner Pin 8514 (6) from the RH cam chain tensioner.

22. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned the with the block/bearing cap junction (5).

23. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).



24. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

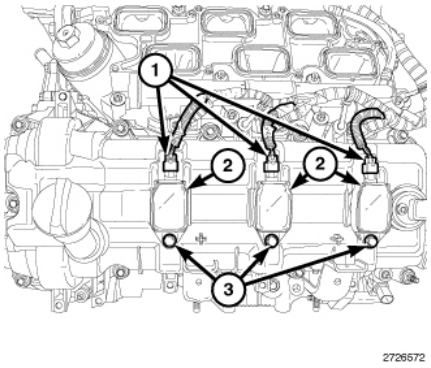
25. If the engine timing is not correct, repeat this procedure.

26. Install the engine timing cover, crankshaft vibration damper, upper and lower oil pans and cylinder head covers (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Installation).

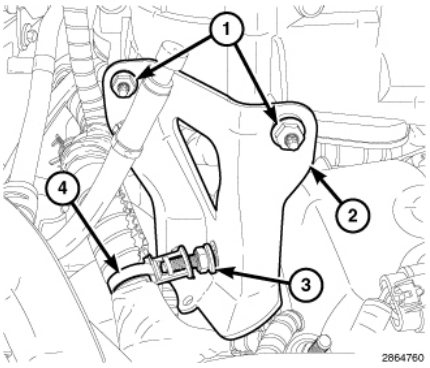
NOTE: The left side ignition coils are shown, the right side ignition coils are similar.

27. Install the spark plugs and tighten to 18 N·m (13 ft. lbs.) (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

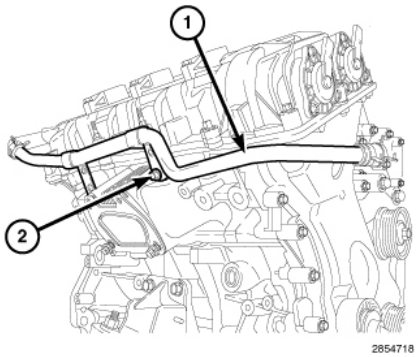
28. Install the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation) .



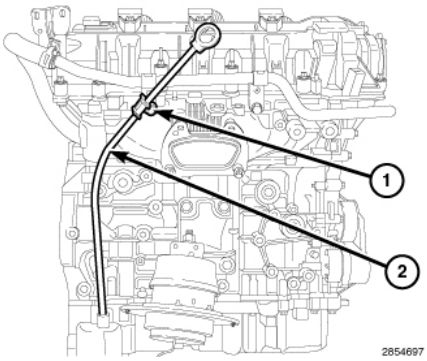
29. Position the upper intake manifold support bracket (2) and install the retaining stud (3) finger tight.



30. Install the heater core supply tube (1) with one bolt (2) tightened to 12 N·m (106 in. lbs.).

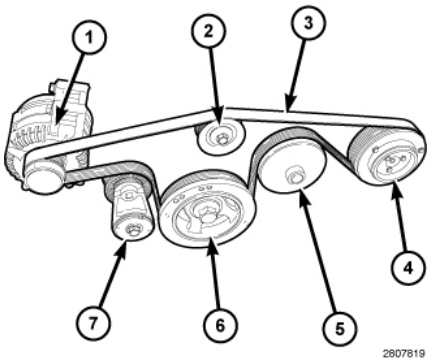


31. Position the oil level indicator (2), install the retaining bolt (1) and tighten to 12 N·m (106 in. lbs.).



32. Install the generator (1) (Refer to 08 - Electrical/8F - Engine Systems/Charging/GENERATOR - Installation) .

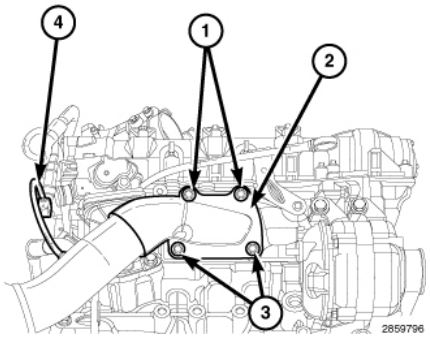
33. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (3), then slowly rotate the tensioner into position.



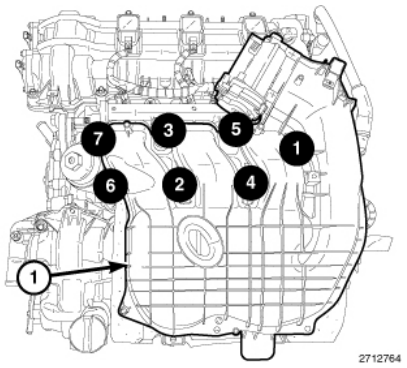
34. Install the right down pipe (2) onto the partially installed lower flange bolts (3).

35. Install the upper down pipe flange bolts (1) and tighten all M8 bolts to 23 N·m (17 ft. lbs.).

36. Connect the right upstream oxygen sensor connectors (4) to the main wire harness.



37. Install the upper and lower intake manifolds (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation) .



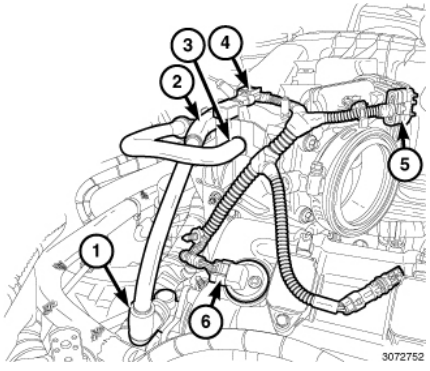
38. Connect the electrical connector at the Camshaft Position Sensor (CMP) (6).

39. Connect the electrical connector at the Electronic Throttle Control (ETC) (5).

40. Connect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).

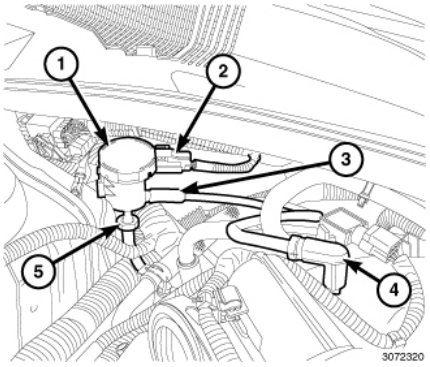
41. Connect the brake booster vacuum hose (3).

42. Connect the PCV hose to the PCV valve (1) and to the intake manifold (2).



43. Connect the EVAP purge solenoid vacuum line (4) to the intake manifold.

44. Connect the vacuum line (3) to the EVAP purge solenoid (1).

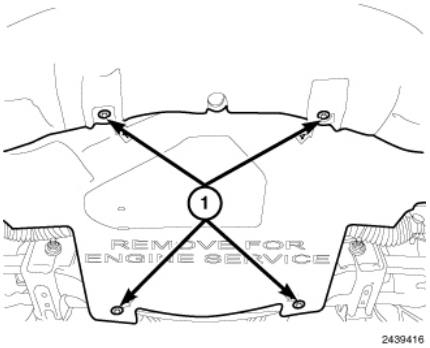


45. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .

46. If removed, install the oil filter.

47. Position the belly pan and install the retainers (1).

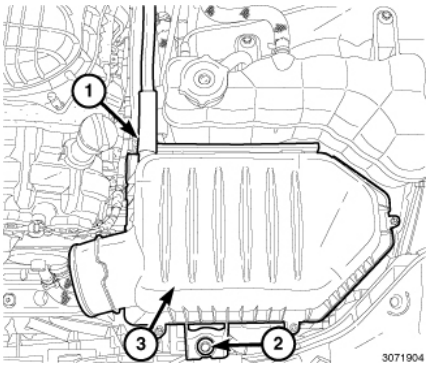
48. Lower the vehicle.



49. Position the air cleaner housing (3) into the vehicle.

50. Install the air cleaner housing retaining bolt (2) and tighten to 12 N·m (9 ft. lbs.).

51. Connect the fresh air makeup hose (1) to the air cleaner housing.



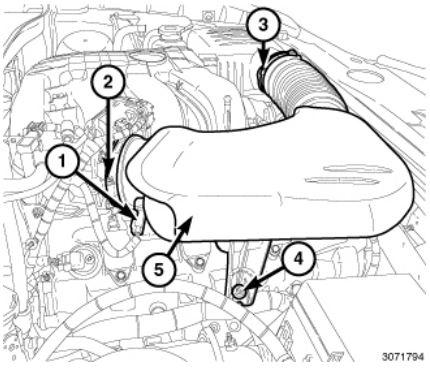
52. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

53. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

54. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

55. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

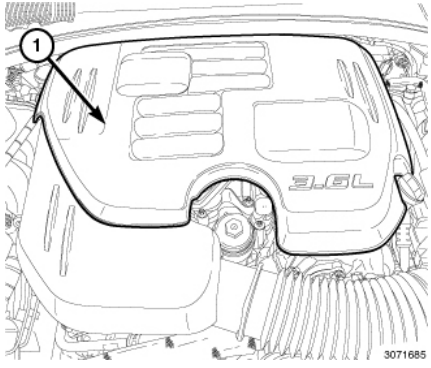
56. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



57. Fill the crankcase with the specified type and amount of engine oil (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .

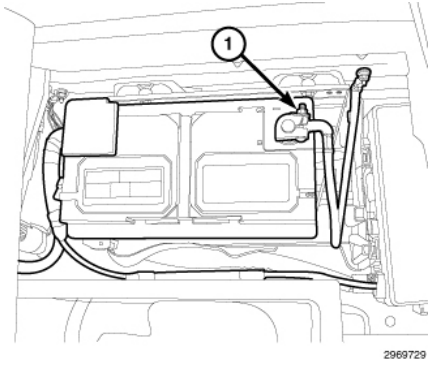
58. Fill the cooling system with the specified type and amount of engine coolant (Refer to 07 - Cooling - Standard Procedure) .

59. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



60. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

61. Run the engine until it reaches normal operating temperature and check for leaks.

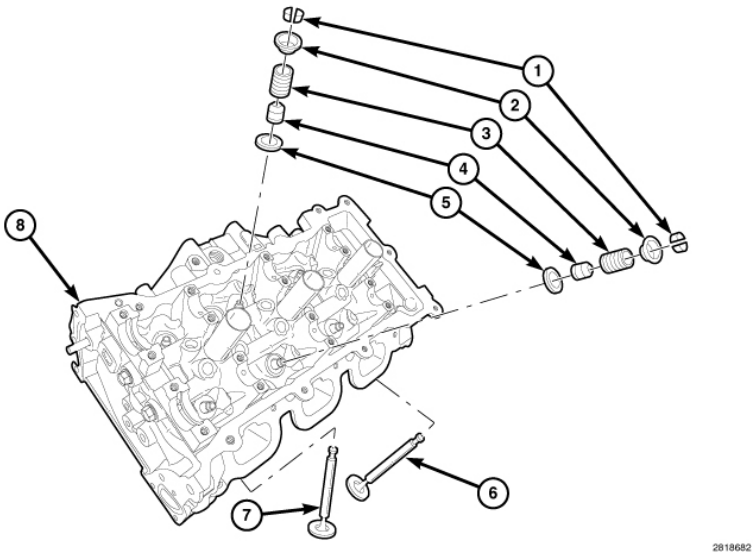


NOTE:

The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



The intake valve (6) is made from a one piece forged heat resistant (martensitic) steel. The exhaust valve (7) is a two piece construction with a forged (austenitic) head welded to the (martensitic) stem. Both valves have a nitrided surface treatment to prevent scuffing except at the tip and lock grooves. The four valves per cylinder are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

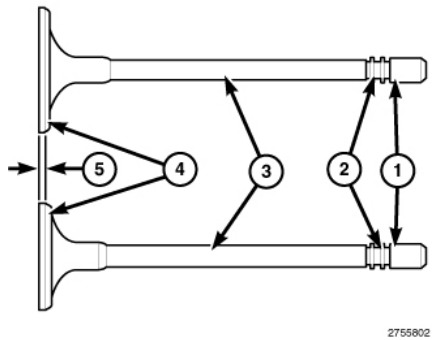
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Special Tools: Click to display a list of tools used in this procedure

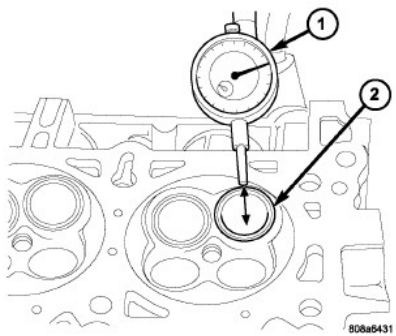
Valves

1. Clean and inspect the valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect the retainer lock grooves for wear or damage (2).
3. Inspect the valve face (4) for for wear and pitting.
4. Measure the valve stems (3) and margins (5) for wear (Refer to 09 - Engine - Specifications) .



Valve Guides

1. Remove carbon and varnish deposits from inside of the valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install the valve (2) into the cylinder head so that it is 15 mm (0.590 inch.) off of the valve seat. A small piece of hose may be used to hold the valve in place.
4. Attach the Dial Indicator Set C-3339A (1) to the cylinder head and set it at a right angle to the valve stem being measured.

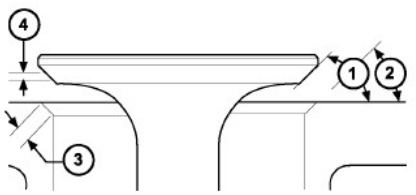


5. Move the valve to and from the indicator. Compare this reading to the specification (Refer to 09 - Engine - Specifications) .

NOTE: If stem-to-guide clearance exceeds specifications, you must measure the valve stem. If the valve stem is within specification or if the valve guide is loose in the cylinder head, replace the cylinder head.

REFACING INTAKE AND EXHAUST VALVES

Special Tools: Click to display a list of tools used in this procedure



809c3e96

1 - SEAT WIDTH

2 - FACE ANGLE

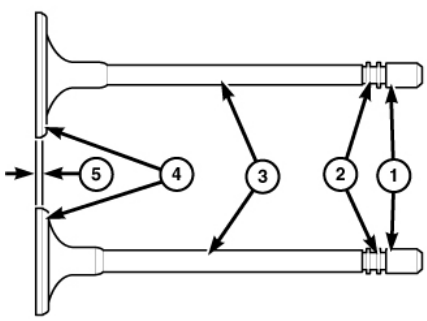
3 - SEAT ANGLE

4 - SEAT CONTACT AREA

The intake and exhaust valves have a 45.25 ± 0.25 degree face angle (1). The valve seats (2) have a 44.75 ± 0.25 degree face angle.

VALVES

Inspect the remaining margin (5) after the valves are refaced) .



2755802

VALVE SEATS

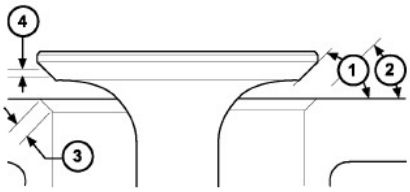
NOTE: When refacing the valve seats, it is important that the correct size valve guide pilot be used for the reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.050 mm (0.002 inch.) total indicator reading.

2. Inspect the valve seat (3) with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat (3) **LIGHTLY** with Prussian blue

then set the valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of the valve face (4), contact is satisfactory. If the blue is transferred to the top edge of the valve face, then lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, then raise the valve seat with a 65 degree stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.



809c3e98

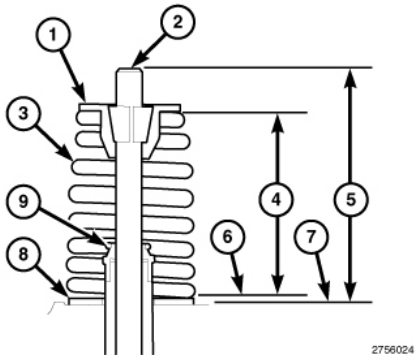
3. When the seat is properly positioned the width of the intake seat should be 1.0 - 1.2 mm (0.04 - 0.05 in.) and the exhaust seats should be 1.41 - 1.61 mm (0.055 - 0.063 in.).

VALVE AND SPRING INSTALLED HEIGHT

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within) . Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).



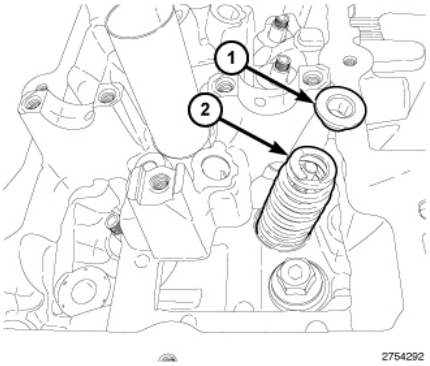
2756024

3. If removed, install the spring seat and valve guide seal over the valve guide (Refer to 09 - Engine/Cylinder Head/SEAL(S) , Valve Guide - Installation).

NOTE: Ensure that the garter spring is intact around the top of the valve guide seal.

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown, all other valves similar.

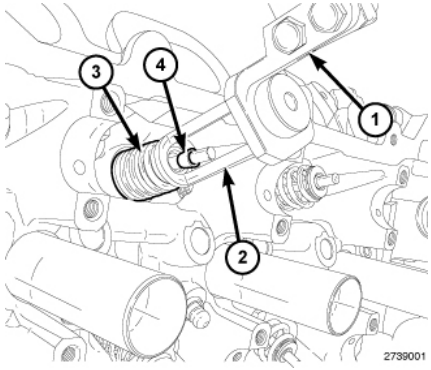
4. Install the valve spring (2) and valve spring retainer (1).



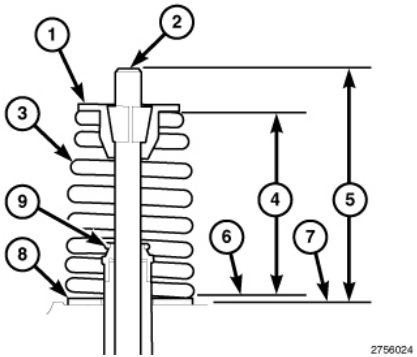
2754292

NOTE: Number 3 cylinder intake valve spring compression shown, all other valves similar.

5. Compress valve springs (3) with the Valve Spring Compressor Adapter 10224 (2) mounted in the Valve Spring Compressor C-3422-D (1). Install the retaining locks (4) and release the valve spring compression.



6. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install a second spring seat (8) in the head counter bore under the valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

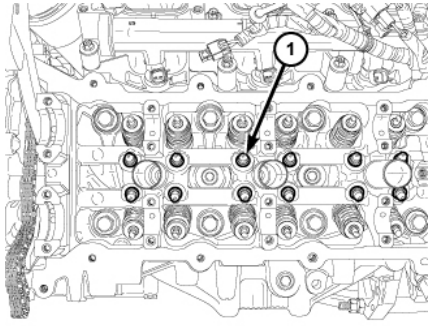


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: The LH cylinder head hydraulic lifters are shown, the RH cylinder head hydraulic lifters are similar. If the hydraulic lifters are being reused, reassemble them into their original locations.



2742108

1. Verify that the hydraulic lifters are at least partially full of oil. There should be little or no plunger travel when the hydraulic lifter is depressed.
2. Install the hydraulic lifter(s) (1).

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

3. Install the rocker arm(s) (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Installation) .
4. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation)
5. Connect the negative battery cable and tighten nut to the proper) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

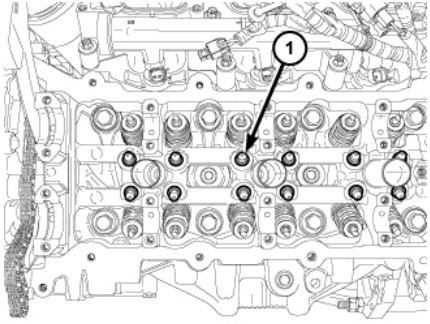
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: The LH cylinder head hydraulic lifters are shown, the RH cylinder head hydraulic lifters are similar.



2742108

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s) (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Removal)

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s) (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Removal)

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

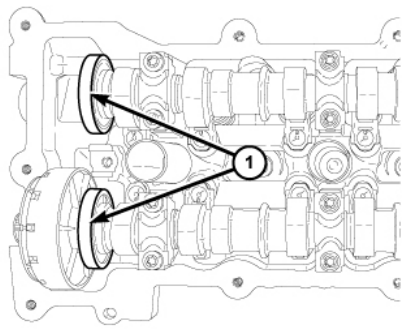
4. Remove the hydraulic lifter(s) (1).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

RIGHT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

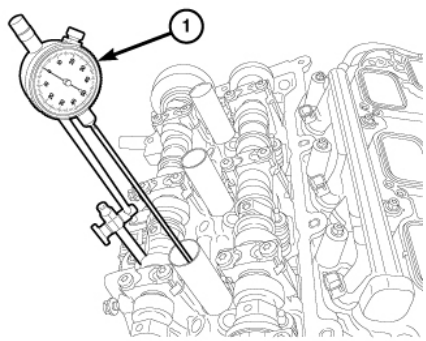
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



2691700

1. Remove the upper intake manifold, right ignition coils and right cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)

2. Remove the left ignition coils and all spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

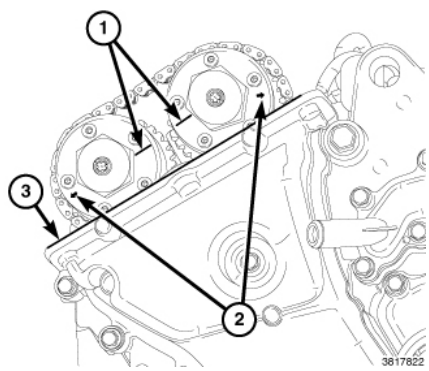


3822244

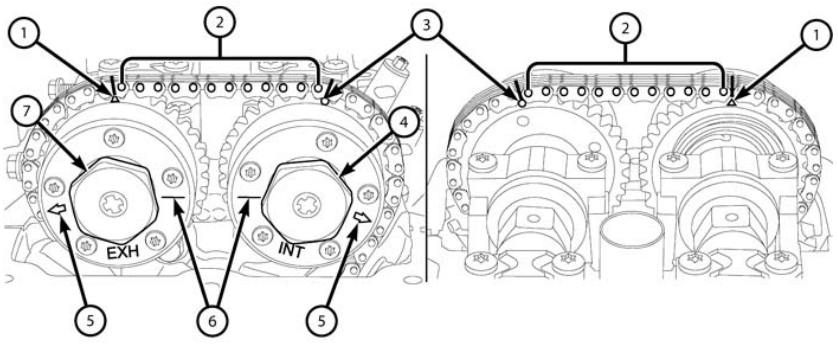
CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

3. Mount Dial Indicator Set C-3339A (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

4. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



3817822



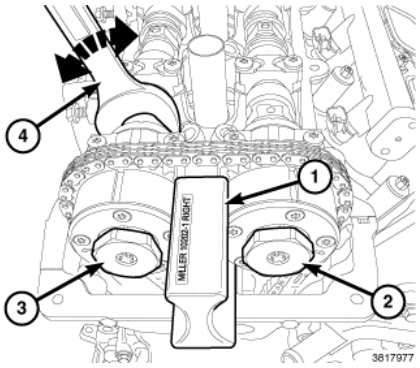
NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins (2) between the markings.

NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

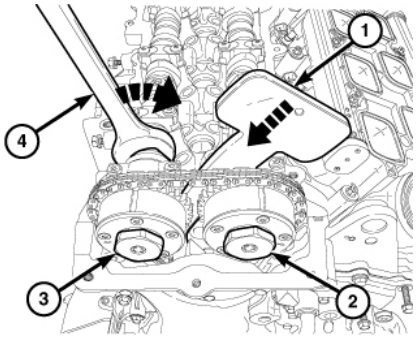


7. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (1) against the cylinder head cover mounting surface with the tool number facing up.

8. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).

9. Remove the Lock, Camshaft/Phaser, Right Side 10202-1 (1).

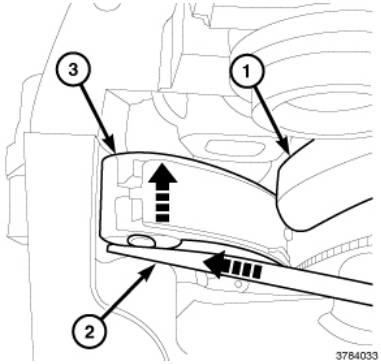
CAUTION: **Do not insert the Timing Chain Holder into position without first compressing the tensioner. The Timing Chain Holder is not designed to compress the tensioner and excessive force can damage the timing chain tensioner arm.**



10. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert Holder, Timing Chain 10369 (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

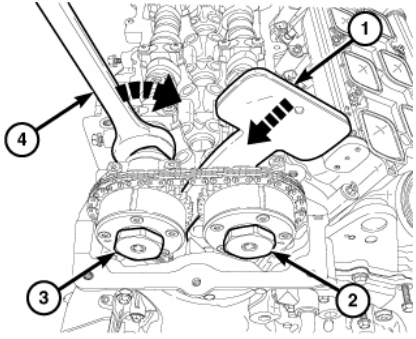
NOTE:

If the Timing Chain Holder (1) does not engage or slips from position, wedge a trim stick (2) or equivalent between the front cover and the tensioner arm (3) to push the tensioner arm towards the rear of the engine and then repeat the previous step.



11. Remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

12. Remove the oil control valve (2) and pull the right side intake cam phaser off of the camshaft.

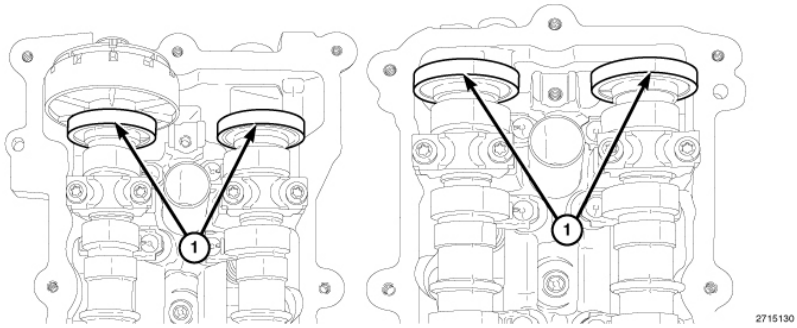


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

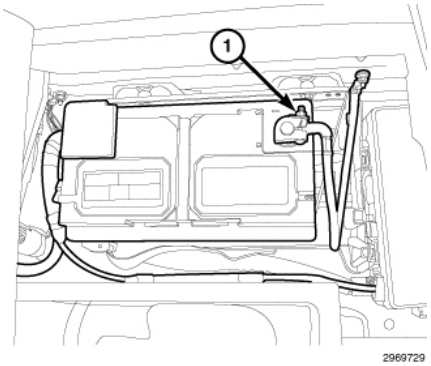
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

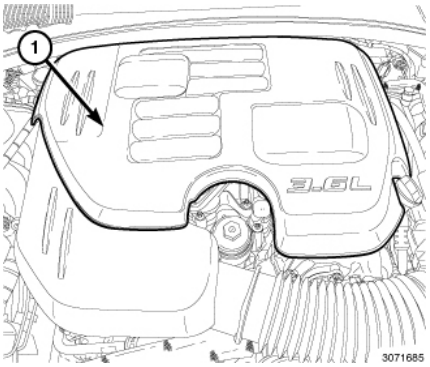
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



1. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect and isolate the negative battery cable (1).

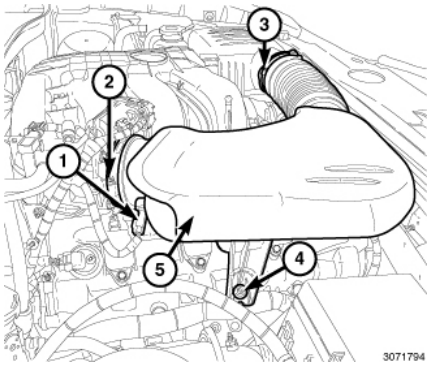


3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

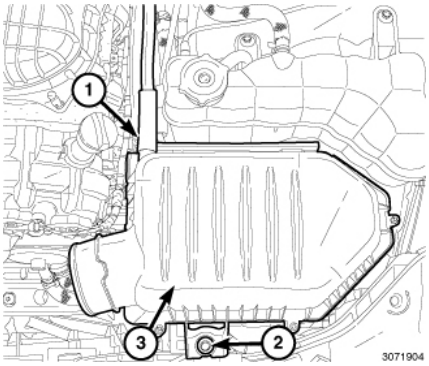


4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.

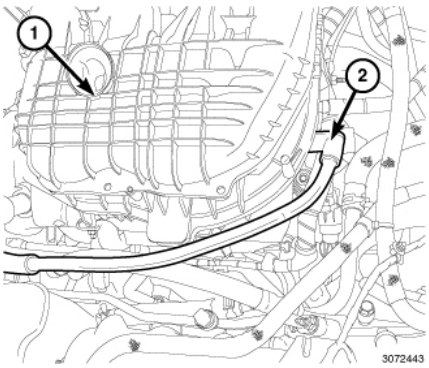
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).



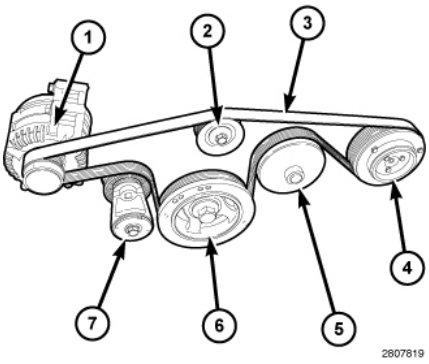
9. Disconnect the fresh air makeup hose (1) from the air cleaner housing.
10. Remove the air cleaner housing retaining bolt (2).
11. Remove the air cleaner housing (3).



12. Remove the fresh air makeup hose (2) from the rear of the intake manifold (1).



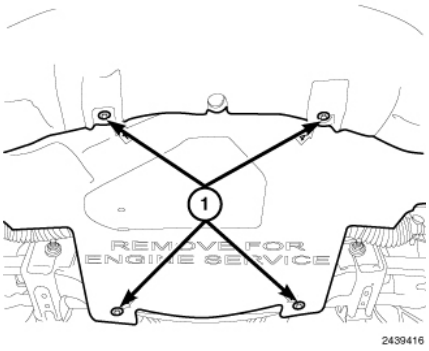
13. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and remove the accessory drive belt (3), then slowly rotate the tensioner into the freearm position.



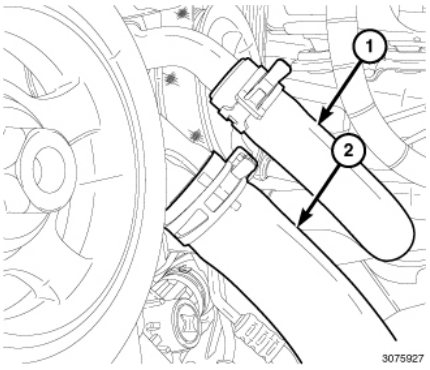
14. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
15. Remove the belly pan retainers (1) and remove the belly pan.

16. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .

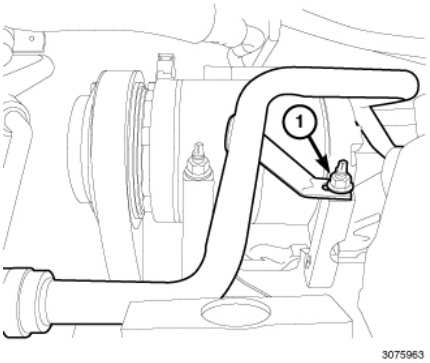
17. Drain the engine oil (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .



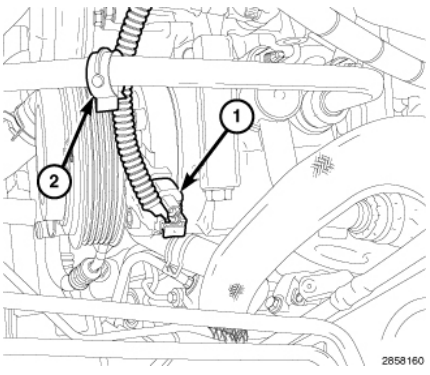
18. Remove the lower heater core return hose (1) from the engine coolant pump housing.



19. Remove the heater core return tube lower support bracket retaining nut (1).



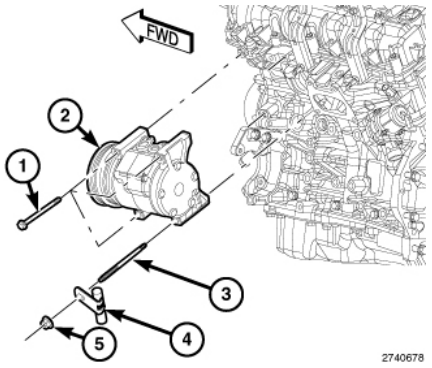
20. Disconnect the A/C compressor electrical connector (1) and disengage the wire harness retainer (2) from the A/C compressor discharge line.



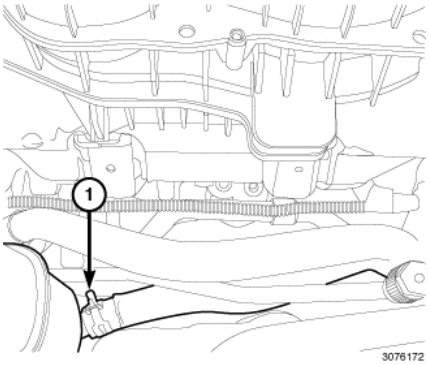
21. Remove the A/C compressor lower retaining studs (3).

22. Lower the vehicle.

23. Remove the A/C compressor upper retaining bolts (1) and reposition the A/C compressor aside (2).



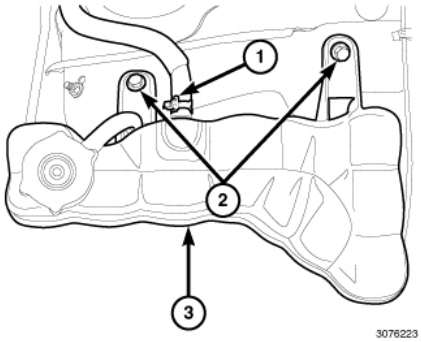
24. Remove the coolant bottle return hose (1).



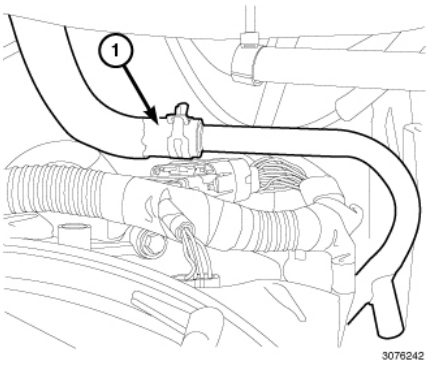
25. Remove the heater core purge hose (1) from the coolant bottle.

26. Remove the coolant bottle retaining bolts (2).

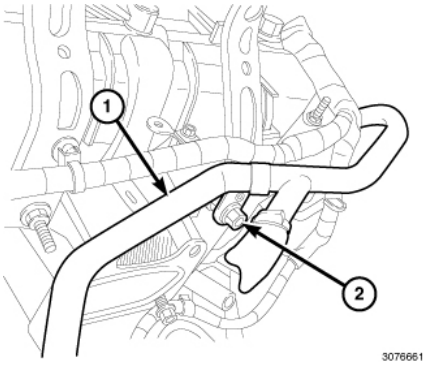
27. Remove the coolant bottle (3).



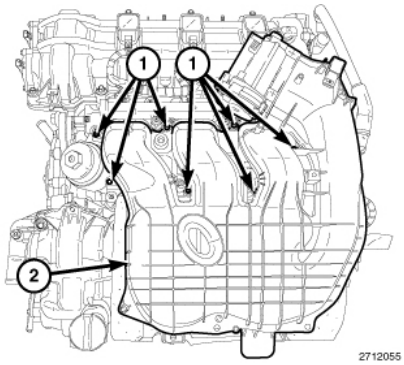
28. Disconnect the heater core return hose (1).



29. Remove the heater core return tube upper support bracket retaining nut (2) and remove the tube (1).



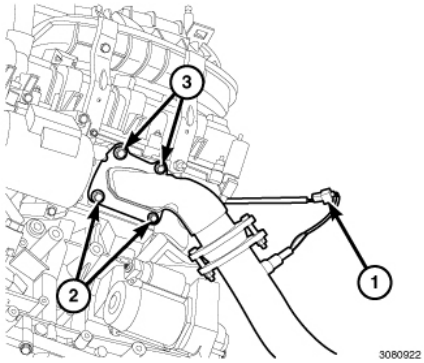
30. Remove the upper and lower intake manifolds (2) and insulator (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .



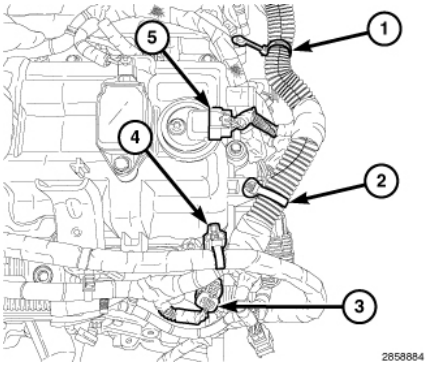
31. Disconnect the left upstream oxygen sensor electrical connector (1) from the main wire harness.

32. Loosen the lower down pipe flange bolts (2).

33. Remove the upper down pipe flange bolts (3) and position the down pipe and catalytic converter aside.



34. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector (3).

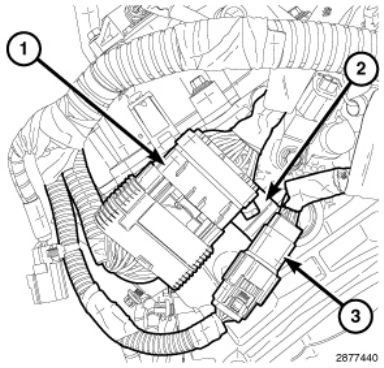


35. Disconnect the ignition coil capacitor electrical connector.

36. Disconnect the injection/ignition electrical connector (1).

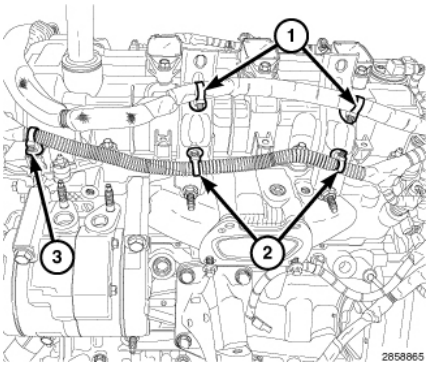
37. Disconnect the engine oil pressure/temperature sensor electrical connector (3).

38. Unfasten the injection/ignition wire harness and the oil pressure/temperature sensor wire harness from the retainer bracket (2) on the rear of the left cylinder head.

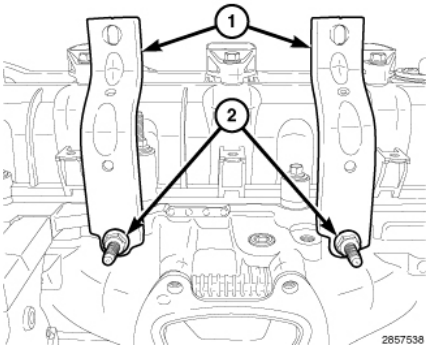


39. Unfasten two starter wire harness retainers (1) from the upper intake manifold support brackets.

40. Unfasten one main wire harness retainer (3) from the left cylinder head cover and two retainers (2) from the upper intake manifold support brackets.



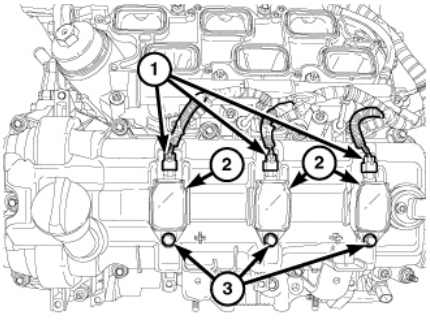
41. Remove the bolts (2) and remove the left upper intake manifold support brackets (1).

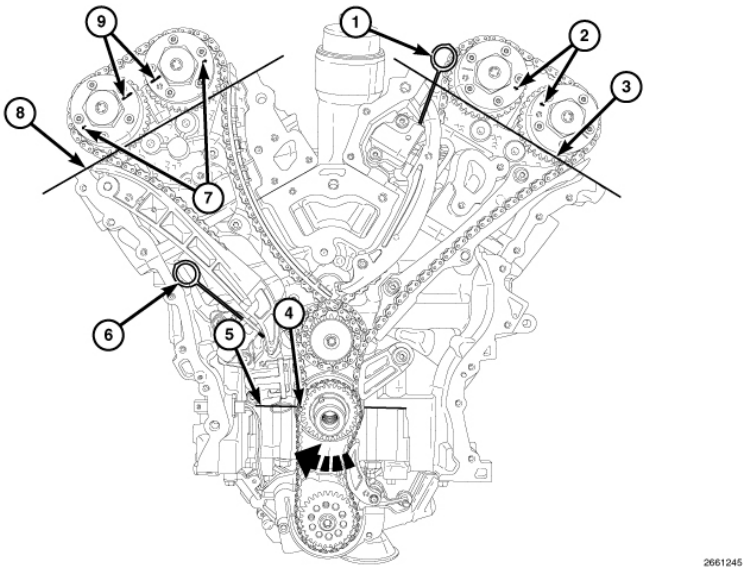


42. Remove the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Removal) .

43. Remove the cylinder head covers, lower and upper oil pans, crankshaft vibration damper and engine timing cover (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Removal)

NOTE: Take this opportunity to measure timing chain wear (Refer to 09 - Engine/Valve Timing - Standard Procedure) .





CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

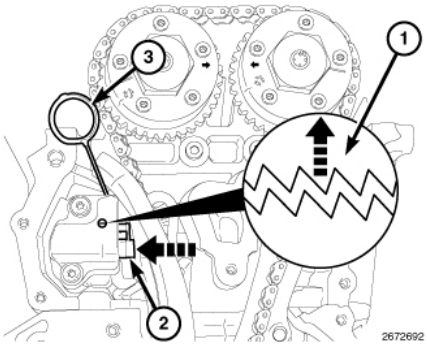
44. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

45. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

CAUTION: **When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.**

46. Reset the left cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin 8514 (3) (Refer to 09 - Engine/Valve Timing - Standard Procedure) .



NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

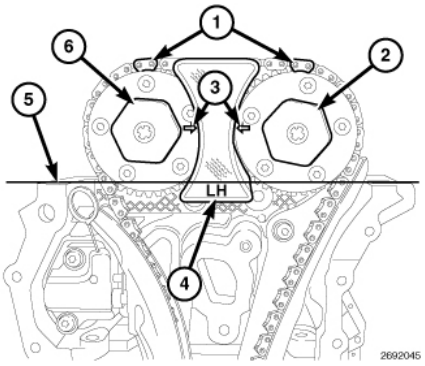
47. Install the LH Camshaft Phaser Lock 10202 (4).

48. Loosen both the intake oil control valve (6) and exhaust oil control valve (2).

49. Remove the LH Camshaft Phaser Lock 10202 (4).

50. Remove the oil control valve (2) from the left side exhaust cam phaser and pull the phaser off of the camshaft.

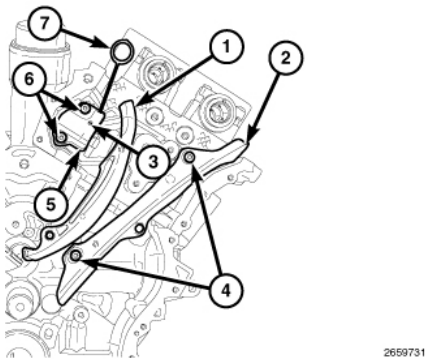
51. Remove the oil control valve (6) from the left side intake cam phaser and pull the phaser off of the camshaft.



52. Remove the left cam chain tensioner arm (1).

53. Remove two T30 bolts (6) and the left cam chain tensioner (5).

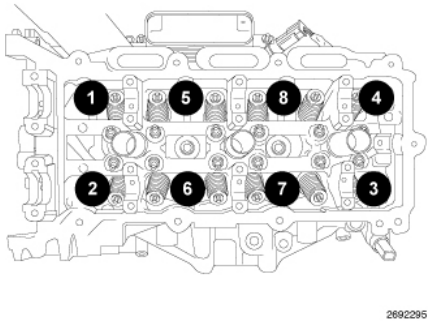
54. Remove two T30 bolts (4) and the left cam chain guide (2).



55. Remove the left camshafts (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Removal) .

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

56. Remove the rocker arms (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Removal) .



NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

57. If required, remove the hydraulic lifters (Refer to 09 - Engine/Cylinder Head/LIFTER(S) , Hydraulic - Removal).

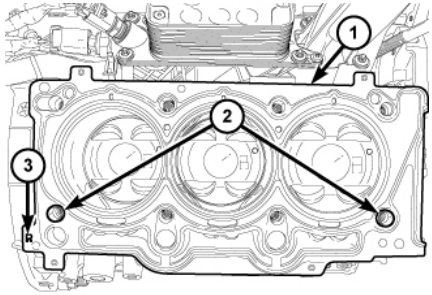
58. Using the sequence shown, remove the cylinder head retaining bolts.

NOTE: Right head gasket shown, left head gasket similar.

WARNING: **The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.**

CAUTION: **Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.**

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.



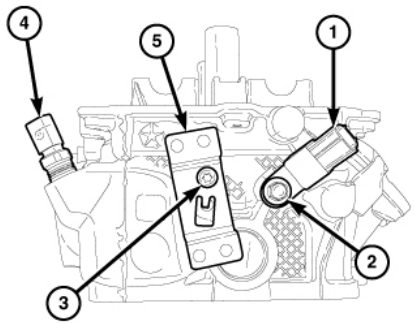
2800384

59. Remove the cylinder head and gasket (1) and discard the gasket.

60. If required, remove the Engine Coolant Temperature (ECT) sensor (4).

61. If required, remove the bolt (2) and the ignition coil capacitor (1).

62. If required, remove the bolt (3) and the engine wire harness retainer bracket (5).



2876978

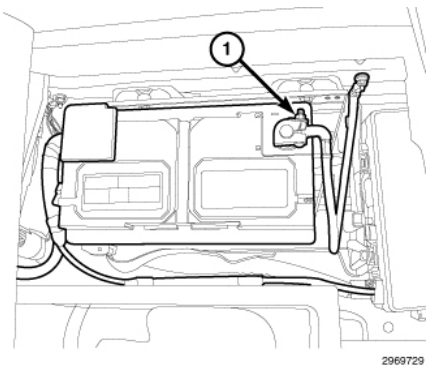
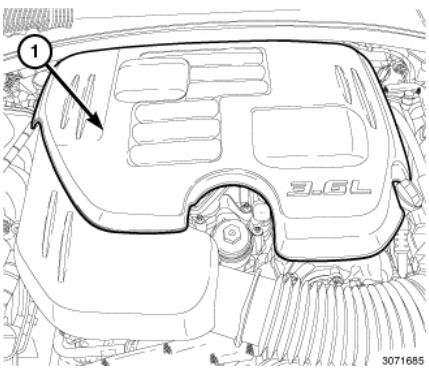
1. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect and isolate the negative battery cable (1).

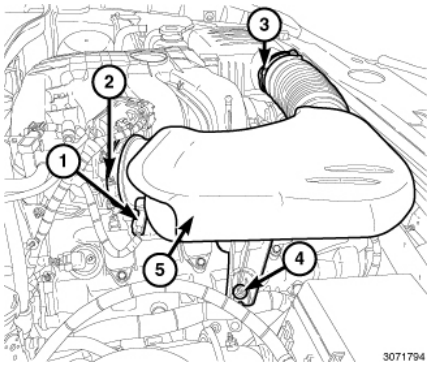


3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

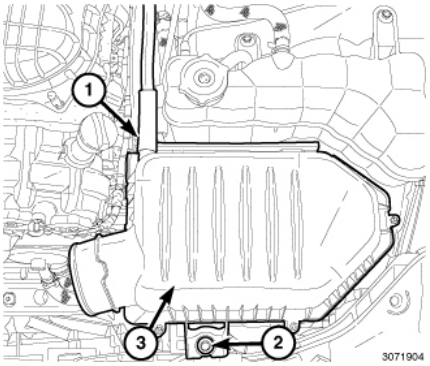


4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.

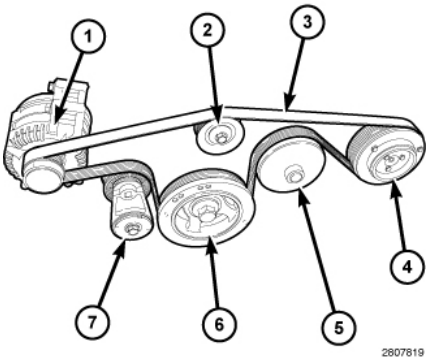
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).



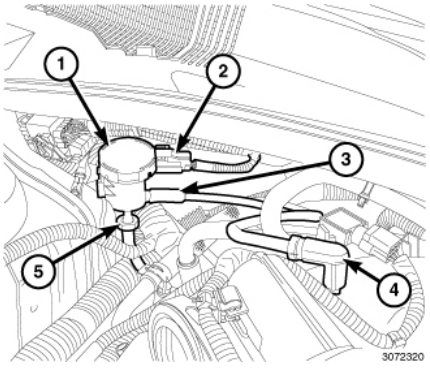
9. Disconnect the fresh air makeup hose (1) from the air cleaner housing.
10. Remove the air cleaner housing retaining bolt (2).
11. Remove the air cleaner housing (3).



12. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and remove the accessory drive belt (3), then slowly rotate the tensioner into the freearm position.
13. Remove the generator (1) (Refer to 08 - Electrical/8F - Engine Systems/Charging /GENERATOR - Removal) .

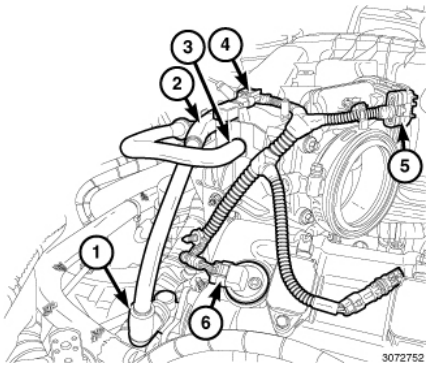


14. Disconnect the vacuum line (3) at the EVAP purge solenoid (1).
15. Disconnect the EVAP purge solenoid vacuum line (4) at the intake manifold and remove the vacuum line.

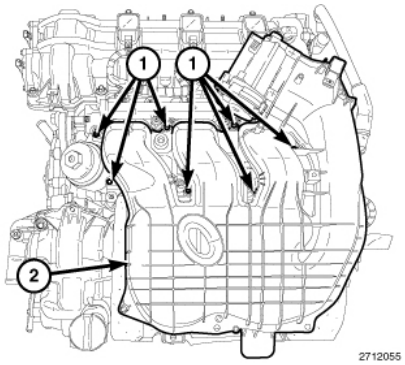


16. Disconnect the PCV hose from the PCV valve (1) and the intake manifold (2) and remove hose.
17. Disconnect the brake booster vacuum hose (3) and position aside.

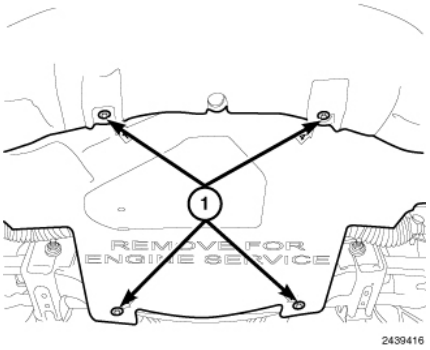
18. Disconnect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).
19. Disconnect the electrical connector at the Electronic Throttle Control (ETC) (5).
20. Disconnect the electrical connector at the Camshaft Position Sensor (CMP) (6) and position harness aside.



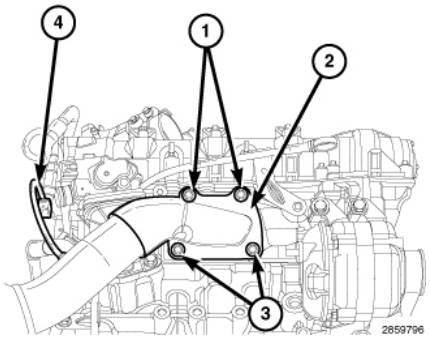
21. Remove the upper and lower intake manifolds (2) and insulator (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .



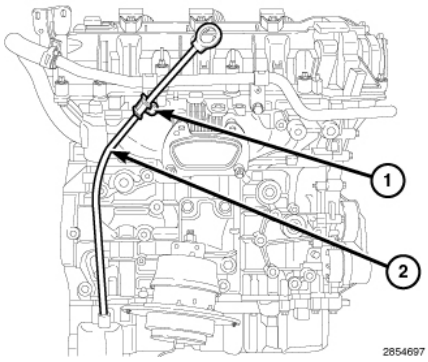
22. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
23. Remove the belly pan retainers (1) and remove the belly pan.
24. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .
25. Drain the engine oil (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .



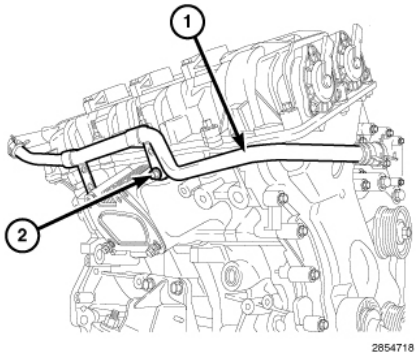
26. Disconnect the right upstream oxygen electrical sensor connector (4) from the main wire harness.
27. Loosen the lower down pipe flange bolts (3).
28. Remove the upper down pipe flange bolts (1) and position the down pipe and catalytic converter aside.



29. Remove the oil level indicator (2) retaining bolt (1) and remove the oil level indicator.



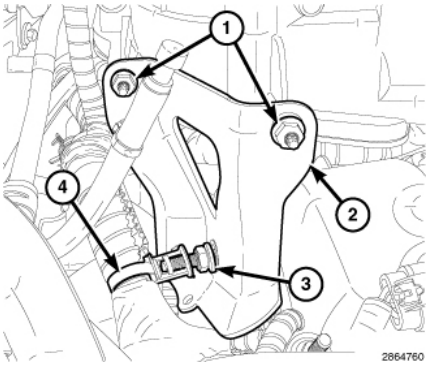
30. Remove the heater core supply tube (1) support bracket retaining bolt (2) and remove the heater core supply tube (1).



31. Disconnect the ignition coil capacitor electrical connector.

32. Remove the stud (3) and remove the upper intake manifold support bracket (2).

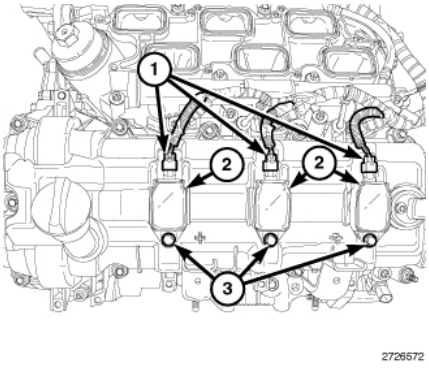
33. Remove the cylinder head covers, lower and upper oil pans, crankshaft vibration damper and engine timing cover (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Removal) .



NOTE: Take this opportunity to measure timing chain wear (Refer to 09 - Engine/Valve Timing - Standard Procedure) .

34. Lower the vehicle.

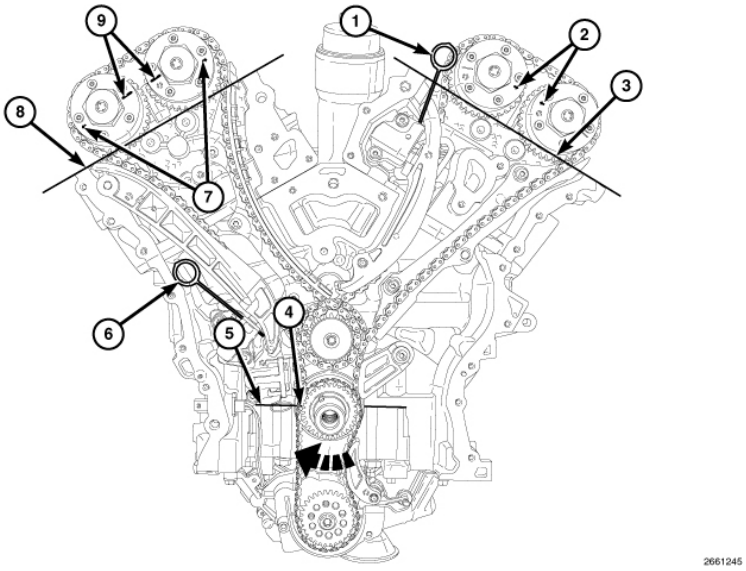
NOTE: The left side ignition coils are shown, the right side ignition coils are similar.



35. Remove the ignition coils (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Removal) .

CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

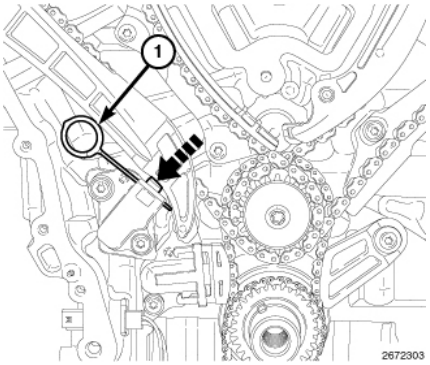


36. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

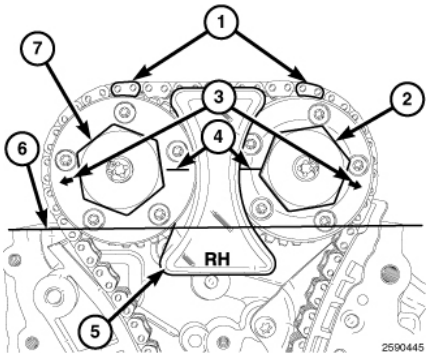
37. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

CAUTION: **When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.**

38. Reset the right cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin 8514 (1).



NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.



39. Install the RH Camshaft Phaser Lock 10202 (5).

40. Loosen both the intake oil control valve (2) and exhaust oil control valve (7).

41. Remove the RH Camshaft Phaser Lock 10202 (5).

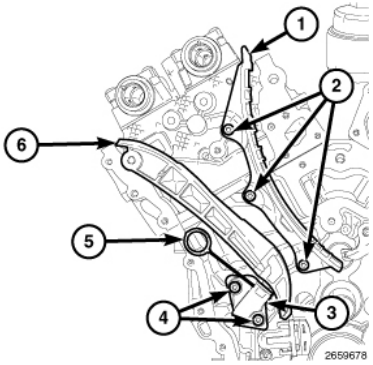
42. Remove the oil control valve (2) from the right side intake cam phaser and pull the phaser off of the camshaft.

43. Remove the oil control valve (7) from the right side exhaust cam phaser and pull the phaser off of the camshaft.

44. Remove the right cam chain tensioner arm (6).

45. Remove two T30 bolts (4) and the right cam chain tensioner (3).

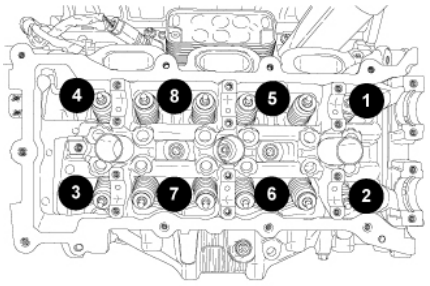
46. Remove three T30 bolts (2) and the right cam chain guide (1).



47. Remove the right camshafts (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Removal) .

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

48. Remove the rocker arms (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Removal) .



NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

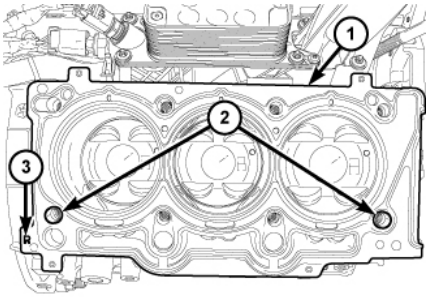
49. If required, remove the hydraulic lifters (Refer to 09 - Engine/Cylinder Head/LIFTER(S) , Hydraulic - Removal).

50. Using the sequence shown, remove the cylinder head retaining bolts.

WARNING: **The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.**

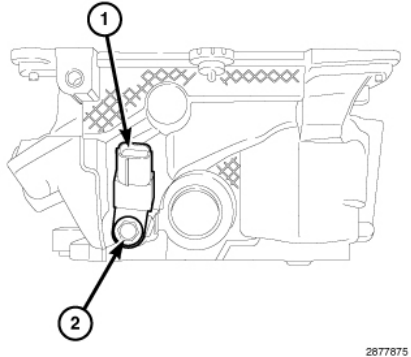
CAUTION: **Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.**

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.



51. Remove the cylinder head and gasket. Discard the gasket.

52. If required, remove the bolt (2) and the ignition coil capacitor (1).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil hole in the lash adjuster socket for roller and camshaft lubrication.

2804799

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

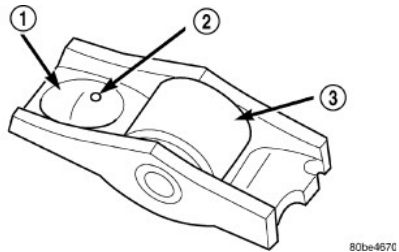
INSPECTION

Inspect the cam follower assembly for wear or damage. Replace as necessary.

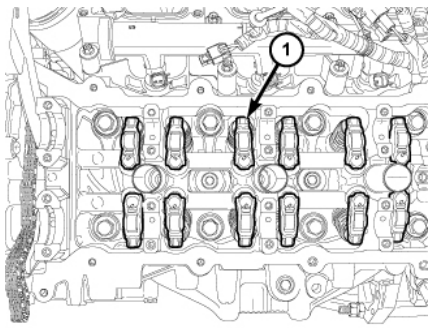


INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION: **Proper inspection of the rocker arms is required to ensure proper installation. Inspection from the top and also side view is critical to verify the proper seated position of each and every rocker arm. Failure to install the rocker arms correctly may cause severe engine damage.**

NOTE: The LH cylinder head rocker arms are shown, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.



2741091

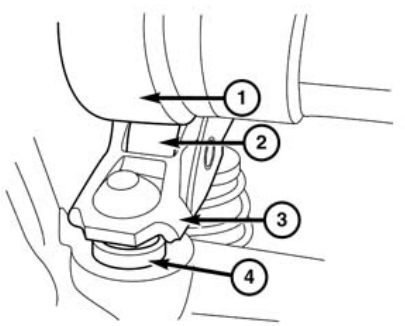
1. Lubricate the rocker arms with clean engine oil before installation.

NOTE: When placing the rocker arms. The valve stem should fit securely into the rocker arm guides.

2. Position the rocker arm(s) (1) onto the lifter(s) and valve stem(s).

3. Position the camshaft(s) onto the mounts and install the camshaft caps. Hand tighten the cap retaining bolts to the proper) .

NOTE: If any of the rocker arms are not installed properly. Loosen the camshaft caps and reposition the rocker arms.



210171394

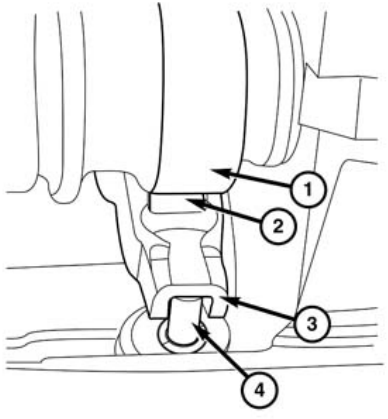
4. Verify that the rocker arm (3) is positioned over the lifter (4).

5. Verify that the rocker arm roller (2) is seated to the camshaft lobe (1).

6. Use a mirror to verify the valve stem (4) is centered between the rocker arm guides (3).

7. Verify the camshaft lobe (1) is centered over the rocker arm roller (2).

8. Tighten the camshaft caps (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation) .



091673879

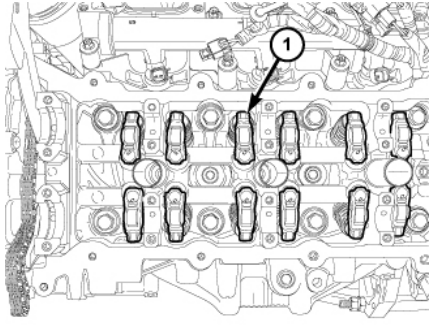
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: The LH cylinder head rocker arms are shown, the RH cylinder head rocker arms are similar.



2741091

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s) (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Removal)

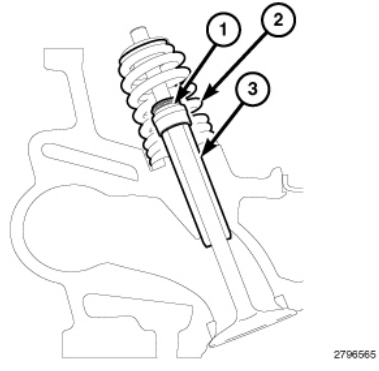
NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s) (1).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.



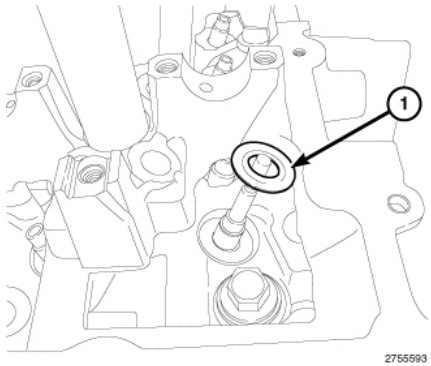
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. If removed, install the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Installation) .

NOTE:
Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification (Refer to 09 - Engine - Specifications) . Number 5 cylinder exhaust valve shown, all other valves similar.

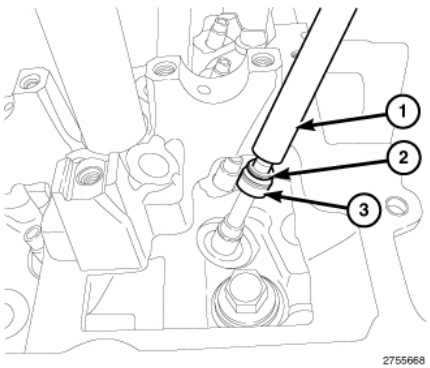


2. If removed, install the spring seat (1) over the valve guide.

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE:
Ensure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 5 cylinder exhaust valve guide seal shown, all other valves similar.

NOTE:
If the valve springs are being reused, reassemble them into their original locations.



4. Install the valve spring(s) (Refer to 09 - Engine/Cylinder Head/SPRING(S) , Valve - Installation).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

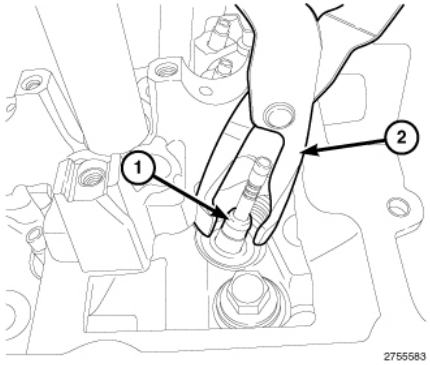
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations.

1. Remove the valve spring(s) (2) (Refer to 09 - Engine/Cylinder Head/SPRING(S) , Valve - Removal).

NOTE: Number 5 cylinder exhaust valve guide seal shown, all other valve guide seals similar.

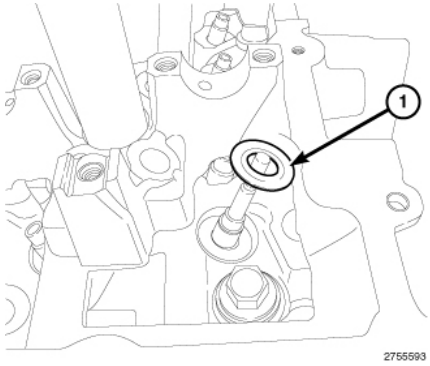
2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.



NOTE: Number 5 cylinder exhaust valve spring seat shown, all other valve spring seats similar.

3. If required, remove the valve spring seat (1).

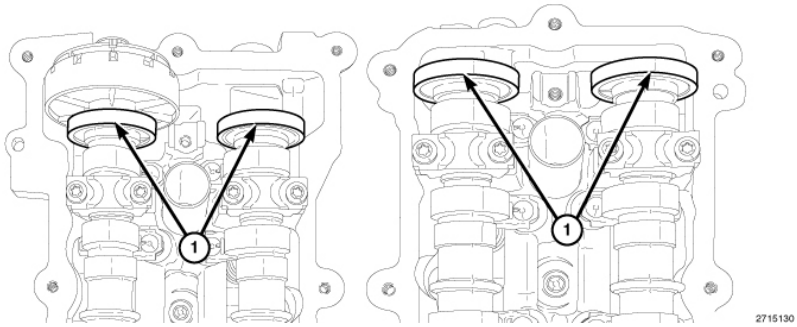
4. If required, remove the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Removal) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

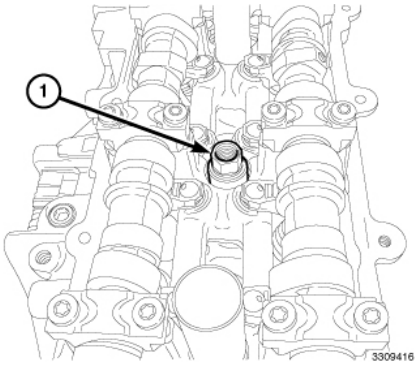
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

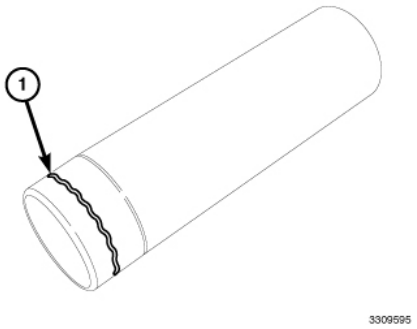


CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. Remove the spark plug (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .
2. Install the lower half of Spark Plug Tube Installer 10255 (1) into the cylinder head and tighten to 17.5 N·m (13 ft. lbs.).

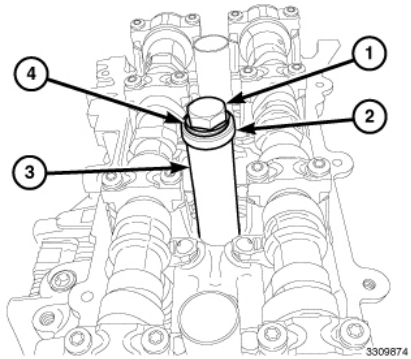


3. Apply Mopar® Stud and Bearing Mount to the new spark plug tube approximately 3 mm (0.118 in.) from the end of the tube, in a 2 mm (0.078 in.) wide bead (1).



4. Position the spark plug tube (3) on the top half of Spark Plug Tube Installer 10255 (2) and assemble the tool on the cylinder head. Make sure there are two thrust washers (4) installed.

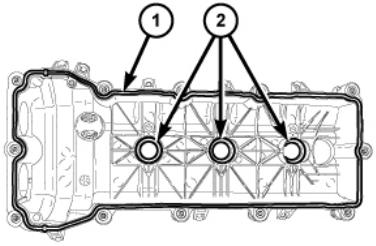
CAUTION: **Do not overtighten the bolt (1). Overtightening can damage the cylinder head spark plug threads.**



5. Tighten the bolt (1) to draw the spark plug tube into position. When the top half of the tool contacts the bottom half of the tool, the tube is installed.

NOTE: LH cylinder head cover shown, RH cylinder head cover similar.

CAUTION: **Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.**



6. Install the spark plug (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

7. If required, install a new spark plug tube seal (2).

8. Install the cylinder head cover(s) (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation). Connect the negative battery cable and tighten the nut to proper) .

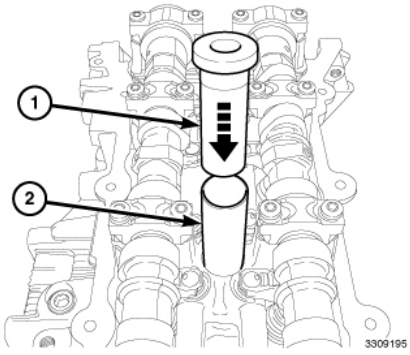
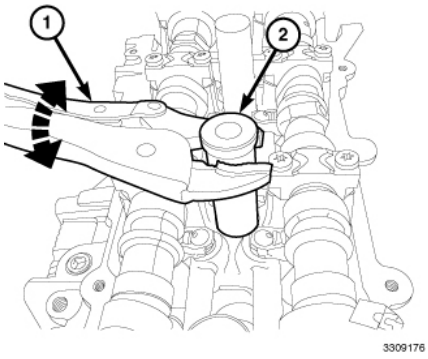
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. Disconnect and isolate the negative battery cable.
2. Remove the ignition coils (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Removal) .
3. Using compressed air, blow out any dirt or contaminates from around the top of the spark plugs.
4. Remove the cylinder head cover(s) (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal).
5. Install the top half of Spark Plug Tube Installer 10255 (1) into the spark plug tube to be removed (2).



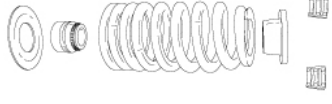
6. Using suitable locking pliers (1), remove the spark plug tube (2) from the cylinder head and discard the tube.
7. Clean the area around the spark plug tube mounting with Mopar® Parts Cleaner or equivalent.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The valve springs are a beehive design and made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. Valve guide seals are rubber overmolded on a steel support cylinder with a garter spring at the seal lip. The seals are not integrated with the valve spring seat. The valve spring seat is a flat steel washer. The steel valve spring retainers are designed for use with beehive springs and the valve spring retainer locks are a three bead Butt type design.

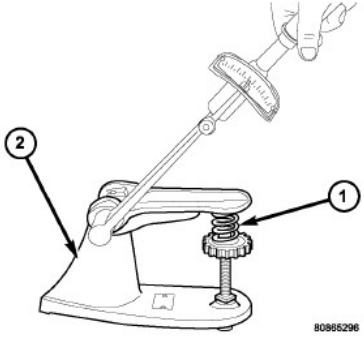


2814925

INSPECTION

When valves have been removed for inspection, reconditioning or replacement, valve springs should be checked against specifications for free-length, spring force and spring installed height (Refer to 09 - Engine - Specifications) .

Spring force can be measured with a test fixture (2). Follow the tool manufactures instructions. Replace any springs that do not meet specifications.



Installed height of the valve spring must be checked with the valve assembled into the cylinder head (Refer to 09 - Engine/Cylinder Head/SPRING(S) , Valve - Installation).

If the valves or valve seats have been refinished and the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

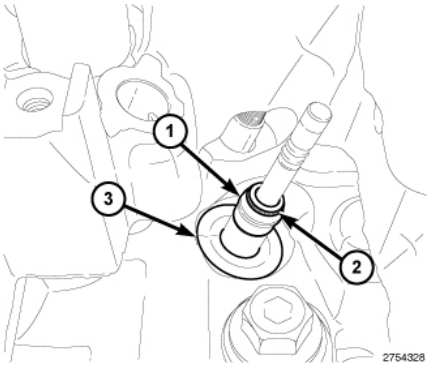
IN VEHICLE

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

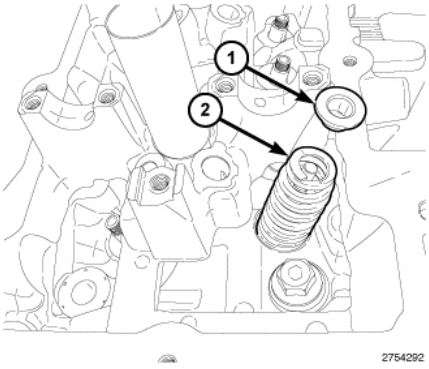
1. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide (Refer to 09 - Engine/Cylinder Head/SEAL(S) , Valve Guide - Installation)



NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown, all other valves similar.

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown, all other valves similar.

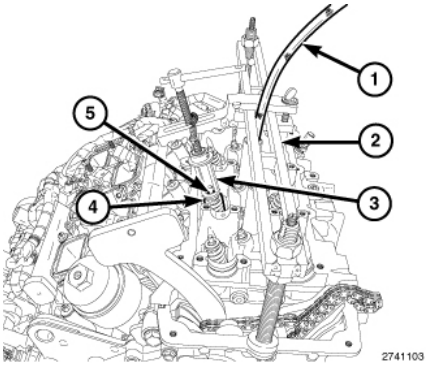
2. Install the valve spring (2) and valve spring retainer (1).



NOTE: Number 4 cylinder intake valve spring compression shown, all other valves similar.

3. Using Valve Spring Compressor Adapter 10224 (3) with Valve Spring Compressor MD998772A (2), compress the valve spring (4) **only enough** to install the valve retaining locks (5).

4. Relieve the air pressure and remove the spark plug adapter.

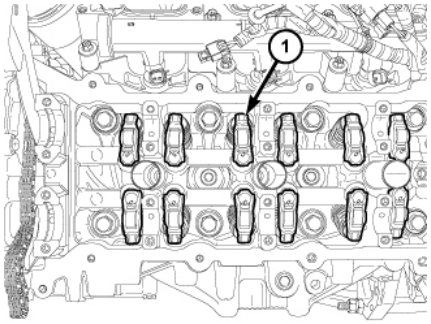


5. Install the spark plug and tighten to 17.5 N·m (13 ft. lbs.) (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

NOTE: The LH cylinder head rocker arms are shown, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

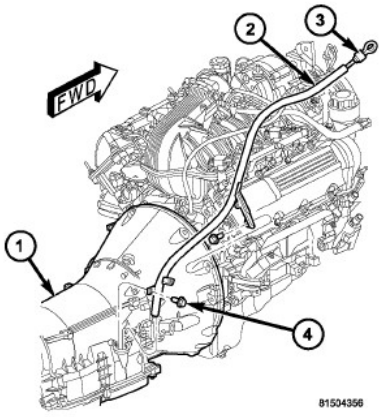
6. Install the rocker arm(s) (1) (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Installation) .

7. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation)



2741091

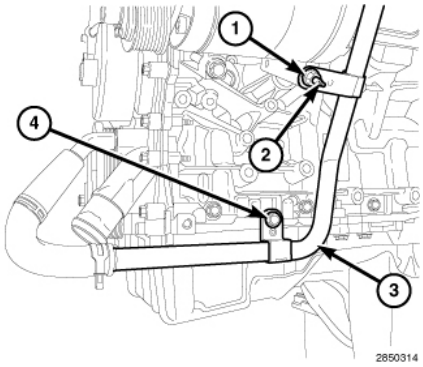
8. If removed, install the transmission fluid level indicator tube (2) (Refer to 21 - Transmission and Transfer Case/Automatic - NAG1/SEAL - Installation) .



81504356

NOTE: Power steering pump not shown.

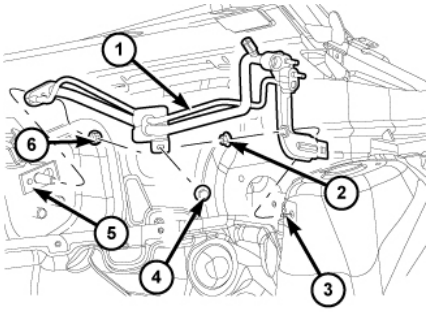
9. If removed, install the nut (1) and bolt (4) to the support brackets of the heater core return tube (3). Tighten the fasteners to 12 N·m (106 in. lbs.).



2850314

10. If removed, install the A/C suction and liquid line assembly (1) (Refer to 24 - Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Installation) .

11. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



2741556

OFF VEHICLE

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. If removed, install the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Installation) .

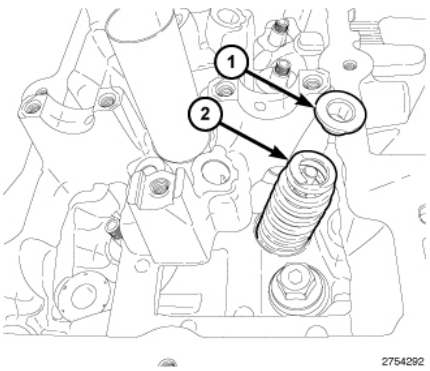
NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification (Refer to 09 - Engine - Specifications) .

2. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide (Refer to 09 - Engine/Cylinder Head/SEAL(S) , Valve Guide - Installation).

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown, all other valves similar.

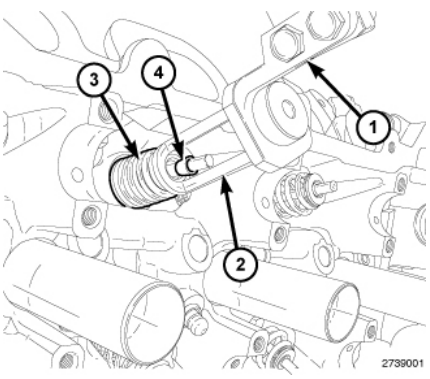
NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown, all other valves similar.

3. Install the valve spring (2) and valve spring retainer (1).



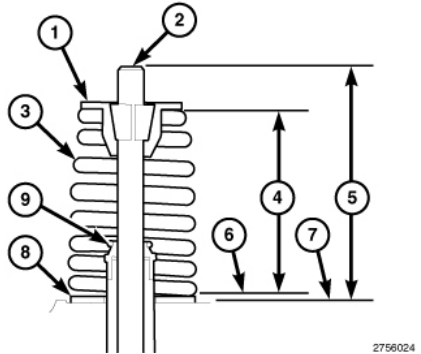
NOTE: Number 3 cylinder intake valve spring compression shown, all other valves similar.

4. Compress valve springs (3) with the Valve Spring Compressor Adapter 10224 (2) mounted in the Valve Spring Compressor C-3422-D (1). Install the retaining locks (4) and release the valve spring compression.



5. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

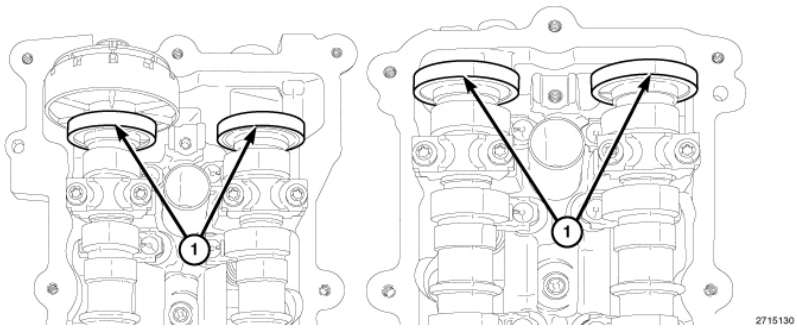
6. Install the cylinder head(s) (Refer to 09 - Engine/Cylinder Head - Installation)



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

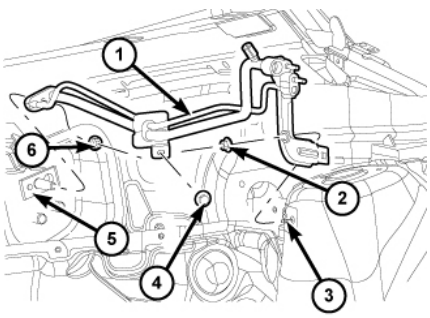
IN VEHICLE

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure



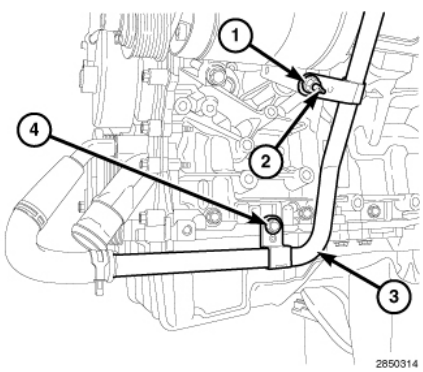
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. Disconnect and isolate the negative battery cable.
2. If removing the LH exhaust valve springs, recover the refrigerant from the refrigerant system and remove the A/C suction and liquid line assembly (1) (Refer to 24 - Heating and Air Conditioning/Plumbing/LINE, A/C Suction - Removal) .



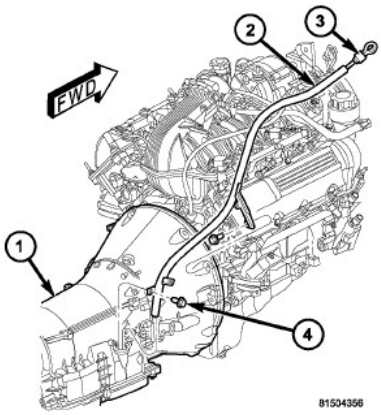
NOTE: Power steering pump not shown.

3. If removing the LH exhaust valve springs, remove the nut (1) and bolt (4) from the support brackets of the heater core return tube (3) and reposition the tube.



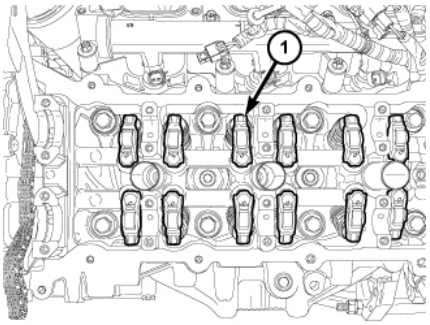
4. If removing the RH valve springs, remove the transmission fluid level indicator tube (2) (Refer to 21 - Transmission and Transfer Case/Automatic - NAG1/SEAL - Removal) .

5. Remove both cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)



NOTE: The LH cylinder head rocker arms are shown, the RH cylinder head rocker arms are similar.

NOTE: Only remove the camshafts from one head at a time. The opposite head must remain assembled in order to lock the crankshaft against rotation.



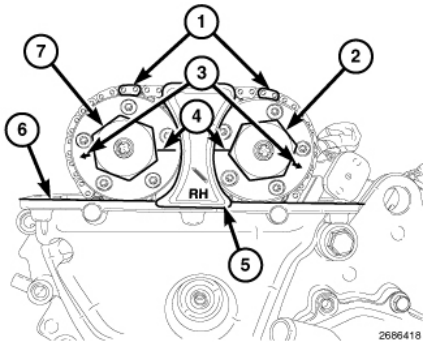
6. Remove the camshaft(s) (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Removal) .

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

7. Remove the rocker arm(s) (1) (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve - Removal) .

NOTE: RH camshaft phaser lock shown, LH camshaft phaser lock similar.

CAUTION: **Air pressure applied to the cylinder holds the valves in place. This air pressure also has a tendency to force the piston down and rotate the crankshaft. Do not allow the crankshaft to rotate. Crankshaft rotation may damage the timing chain or front timing cover and affect camshaft timing.**



8. If removing the LH camshafts, install the RH Camshaft Phaser Lock 10202 -1 (5) to lock the crankshaft against rotation. If removing the RH camshafts, install the LH Camshaft Phaser Lock 10202 -2 to lock the crankshaft against rotation.

NOTE: Number 4 cylinder intake valve spring compression shown, all other valves similar.

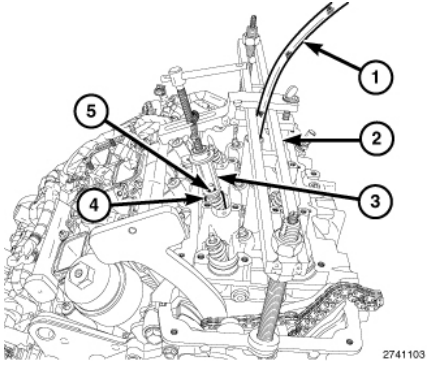
9. Remove the spark plug (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

10. Install Valve Spring Compressor MD998772A (2) onto the cylinder head.

11. Install a spark plug adapter attached to a regulated shop air supply (1). Pressurize the cylinder being serviced to 620.5 - 689 kPa (90 - 100 psi) to hold the valves in place.

CAUTION: **Air pressure must be maintained as long as the valve springs are removed to prevent the valves from dropping into the cylinders.**

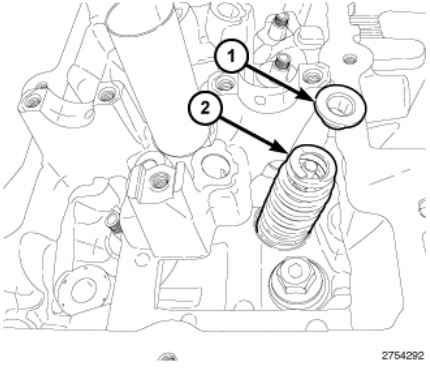
12. Using Valve Spring Compressor Adapter 10224 (3), compress valve spring (4) and remove valve retaining locks (5).



NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown, all other valve springs similar.

13. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).

14. If required, remove the valve guide seal and spring seat (Refer to 09 - Engine/Cylinder Head/SEAL(S) , Valve Guide - Removal).



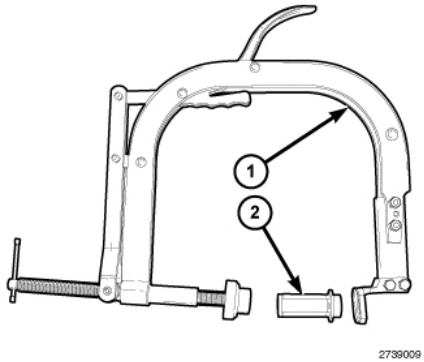
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OFF VEHICLE

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

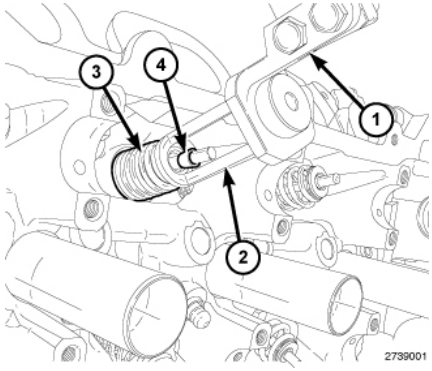
1. Remove the cylinder head(s) (Refer to 09 - Engine/Cylinder Head - Removal)

2. Position the Valve Spring Compressor Adapter 10224 (2) in the Valve Spring Compressor C-3422-D (1).



NOTE: Number 3 cylinder intake valve spring compression shown, all other valves similar.

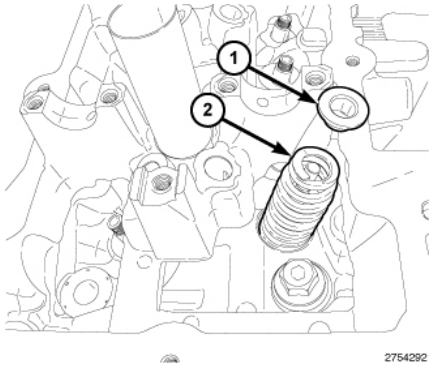
3. Compress the valve spring (3) and remove the valve retaining locks (4).



NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown, all other valves similar.

4. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).

5. If required, remove the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Removal)

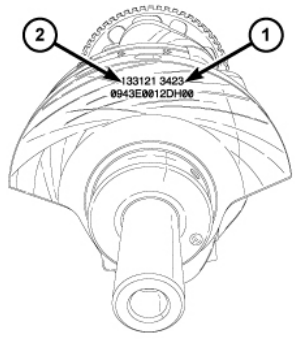


6. If required, remove the valve guide seal and spring seat (Refer to 09 - Engine/Cylinder Head/SEAL(S) , Valve Guide - Removal).

Connecting Rod Bearing Fitting

Bearing oil clearance can also be determined by using Plastigage or equivalent (Refer to 09 - Engine/Engine Block - Standard Procedure)

The connecting rod bearings are “select fit” to achieve proper oil clearance. Connecting rod bearing journal diameter grade markings (2) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4, 5, 6. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal.



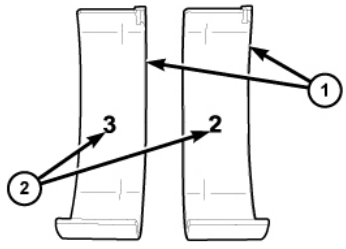
2787957

Connecting rod bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the three crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	58.9910 - 58.9969 mm (2.3225 - 2.3227 in.)
2	58.9970 - 59.0029 mm (2.3227 - 2.3229 in.)
3	59.0030 - 59.0090 mm (2.3229 - 2.3232 in.)

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

The connecting rod bearing shells (1) are marked with the bearing size (2) on the bearing lining surface. The bearings are available in three different sizes in order to achieve the desired oil clearance.



2789568

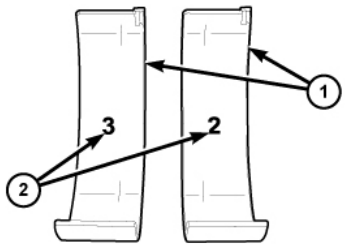
Rod bearing shells are available in three sizes. The chart below identifies the three bearing sizes.

Bearing Marking	Size mm (in.)
1	1.583 - 1.580 mm (0.0623 - 0.0622 in.)
2	1.580 - 1.577 mm (0.0622 - 0.0621 in.)
3	1.577 - 1.574 mm (0.0621 - 0.0620 in.)

Connecting Rod Bearing Replacement

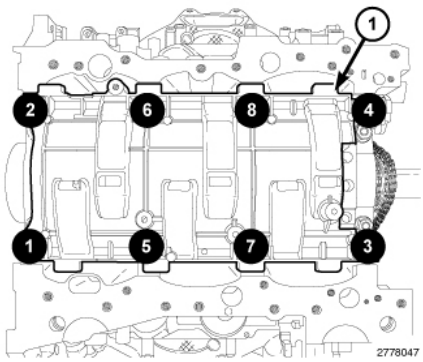
Special Tools: Click to display a list of tools used in this procedure

The connecting rod bearings (1) are serviced in-vehicle. They must be replaced one-at-a-time in order to prevent the pistons from contacting the valves. The connecting rod bearings are “select fit” to achieve proper oil clearances (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure).



2789568

1. Disconnect and isolate the negative battery cable.
2. Remove the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal)
3. Remove the oil pan, oil pump pick-up and engine oil pump (Refer to 09 - Engine/Lubrication /PUMP, Engine Oil - Removal)
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown and remove the windage tray (1).

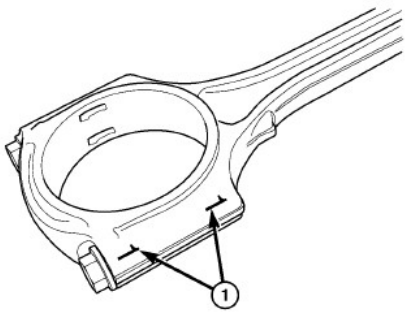


2778047

CAUTION: **DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur**

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

5. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

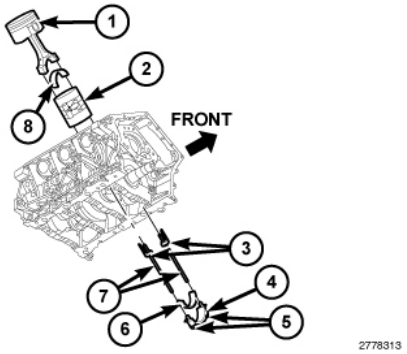


811318c8

NOTE: Typical V6 engine configuration shown.

CAUTION: **Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.**

CAUTION: **Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.**



6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins 8189 (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: **Care must be taken not to nick crankshaft journals, as engine damage may occur.**

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. If required, select and fit new bearings to the connecting rod (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure)
10. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
11. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

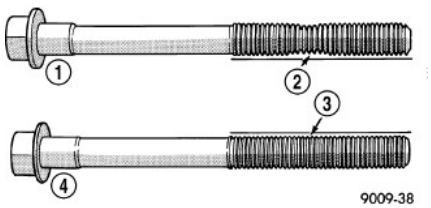
CAUTION: **The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.**

12. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

13. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to the proper) .
14. If required, check the connecting rod side clearance (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure)
15. Repeat the previous steps for each connecting rod bearing being replaced.

CAUTION: **The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**



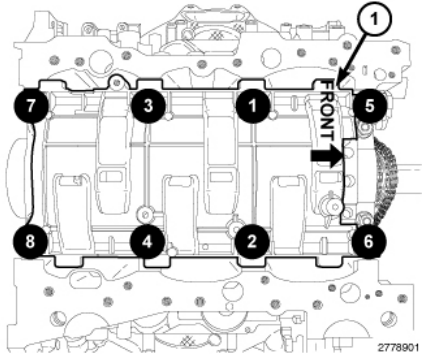
16. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.
17. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown to 21 N·m (16 ft. lbs.) plus 90°.
18. Install the engine oil pump, oil pump pick-up and oil pan (Refer to 09 - Engine/Lubrication/PUMP, Engine Oil - Installation)

19. Install the spark plugs and ignition coils (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation)

20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

21. Connect the negative battery cable and tighten nut to the proper) .

22. Operate the engine until it reaches normal operating temperature.

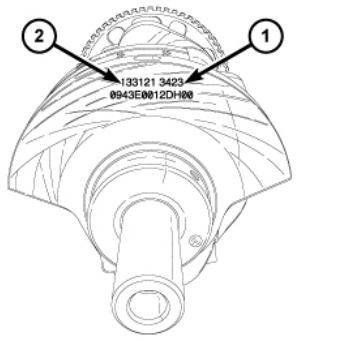


Main Bearing Fitting

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

Bearing oil clearance can also be determined by using Plastigage or equivalent (Refer to 09 - Engine/Engine Block - Standard Procedure)

The upper and lower main bearings are “select fit” to achieve proper oil clearances. Crankshaft main bearing journal diameter grade markings (1) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

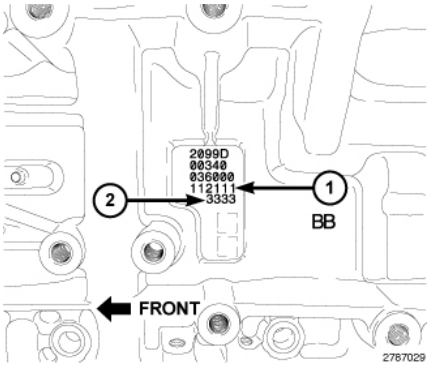


2767957

Crankshaft main bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the five crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	71.9870 - 71.9905 mm (2.8341 - 2.8343 in.)
2	71.9906 - 71.9941 mm (2.8343 - 2.8344 in.)
3	71.9942 - 71.9977 mm (2.8344 - 2.8345 in.)
4	71.9978 - 72.0013 mm (2.8346 - 2.8347 in.)
5	72.0014 - 72.0050 mm (2.8347 - 2.8348 in.)

Engine block main bearing journal diameter grade markings (2) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.



2767029

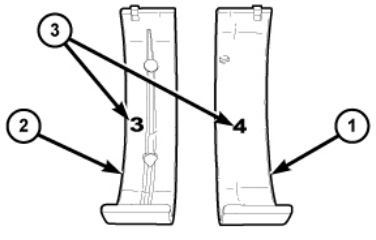
Engine block main bearing journal grade markings correspond to specific journal diameters. The chart below identifies the five engine block grade markings and their associated journal diameters.

Engine Block Marking	Journal Size mm (in.)
1	77.0055 - 77.0090 mm (3.0317 - 3.0318 in.)
2	77.0019 - 77.0054 mm (3.0316 - 3.0317 in.)
3	76.9983 - 77.0018 mm (3.0314 - 3.0316 in.)
4	76.9947 - 76.9982 mm (3.0313 - 3.0314 in.)
5	76.9910 - 76.9946 mm (3.0311 - 3.0313 in.)

For upper and lower main bearing selection, obtain the grade identification marks from the crankshaft and engine block. Main bearings are available in five sizes. Upper and lower sizes can be mixed on a journal in order to achieve the desired oil clearance. The chart below identifies the five sizes available and how they should be selected based on crankshaft and engine block grade markings.

	Crankshaft Marking				
Engine Block Marking	**1**	**2**	**3**	**4**	**5**
1	1/1	1/2	2/2	2/3	3/3
2	1/2	2/2	2/3	3/3	3/4
3	2/2	2/3	3/3	3/4	4/4
4	2/3	3/3	3/4	4/4	4/5
5	3/3	3/4	4/4	4/5	5/5
UPPER/LOWER Main Bearings to Achieve 0.024 - 0.050 mm (0.0009 - 0.0020 in.) Oil Clearance					

The upper main bearing shell (2) and lower main bearing shell (1) are marked with the bearing size (3) on the bearing lining surface. The upper and lower bearings are available in five different sizes and can be mixed on a journal in order to achieve the proper oil clearance.



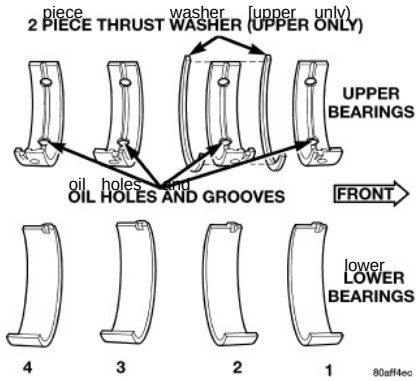
2787936

Upper and lower main bearing shells are available in five sizes. The chart below identifies the five bearing sizes.

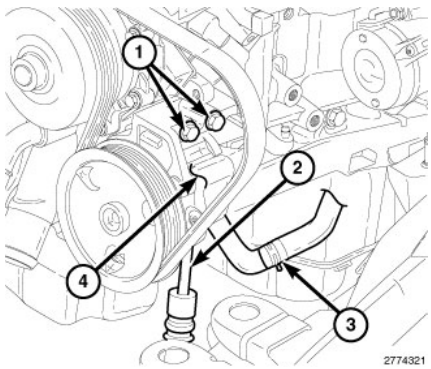
Bearing Marking	Size mm (in.)
1	2.4951 - 2.4987 mm (0.0982 - 0.0984 in.)
2	2.4915 - 2.4951 mm (0.0981 - 0.0982 in.)
3	2.4879 - 2.4915 mm (0.0979 - 0.0981 in.)
4	2.4843 - 2.4879 mm (0.0978 - 0.0979 in.)
5	2.4807 - 2.4843 mm (0.0977 - 0.0978 in.)

Main Bearing Replacement

The main bearings are serviced in-vehicle. They must be replaced one-at-a-time in order to properly support the crankshaft. The upper and lower main bearing shells are NOT interchangeable. The upper and lower main bearings are “select fit” to achieve proper oil clearances (Refer to 09 - Engine/Engine Block/BEARING(S) , Crankshaft - Standard Procedure).



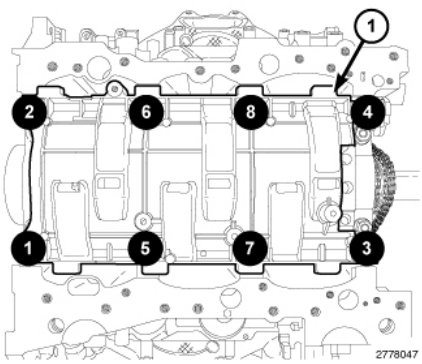
NOTE: Late production vehicles are equipped with Electro-Hydraulic Power Steering (EHPS) and do not have an engine mounted power steering pump.



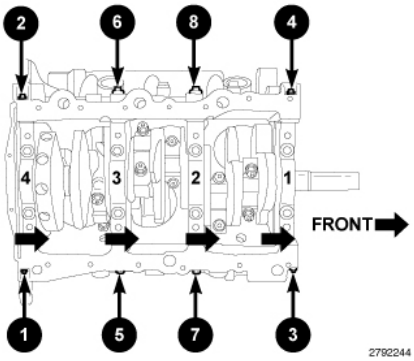
1. Disconnect and isolate the negative battery cable.
2. If equipped with an engine mounted power steering pump, remove the serpentine drive belt (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Removal) .

NOTE: Only two power steering pump mounting bolts are shown. Another bolt is on the lower end of the pump near the pulley.

3. Remove the three power steering pump mounting bolts (1) and reposition the power steering pump, if equipped .
4. Remove the oil pan, oil pump pick-up and engine oil pump (Refer to 09 - Engine/Lubrication /PUMP, Engine Oil - Removal)
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown and remove the windage tray (1).



NOTE: Typical V6 engine configuration shown.



6. Remove the eight main bearing tie bolts in the sequence shown.

CAUTION: **DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.**

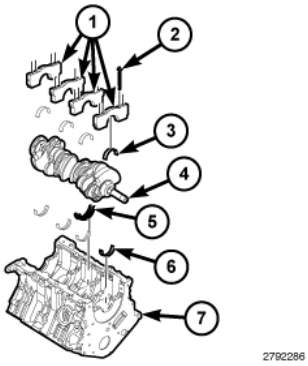
NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

7. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

NOTE: Typical V6 engine configuration shown.

CAUTION: **Replace only one main bearing at a time while all other main bearing caps remain properly tightened. If all main bearing caps are removed, the weight of the unsupported crankshaft will damage the crankshaft oil seals.**

NOTE: Replace the main bearings in the following order; 2, 3, 1, 4.



8. Remove the two cap bolts (2) and remove the main bearing cap (1).

9. When removing the No. 2 bearing cap, also remove the thrust washers (5).

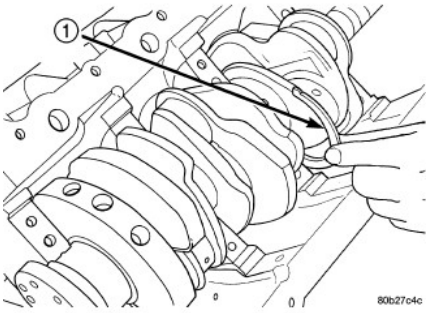
10. Slide the upper main bearing half (6) out from between the crankshaft and the engine block.

11. If required, select fit new main bearings to the engine block (Refer to 09 - Engine/Engine Block/BEARING(S) , Crankshaft - Standard Procedure)

12. Lubricate the upper main bearing half (6) with clean engine oil and slide the bearing into position.
.

NOTE: Typical V6 engine configuration shown.

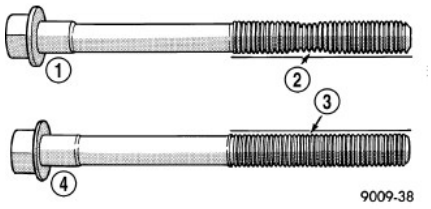
13. When installing thrust washers (1) at the No. 2 main bearing location, use the following procedure:



a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

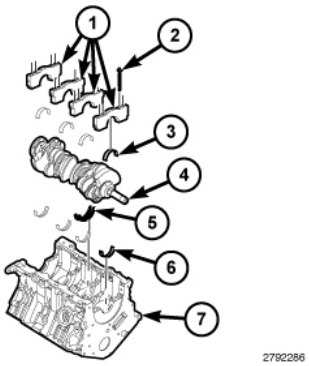
b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

CAUTION: **The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**

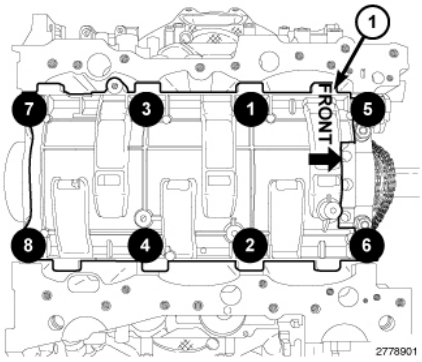


14. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

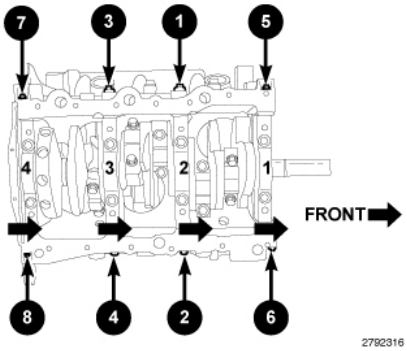
NOTE: Typical V6 engine configuration shown.



15. Lubricate and install the lower bearing half (3) onto the main cap (1).
16. Install the main bearing cap (1) with two inner main bearing cap bolts (2) tightened to 20 N·m (15 ft. lbs.) plus 90°.
17. Repeat the previous steps for main bearings 3, 1 and 4.
18. Measure crankshaft end play (Refer to 09 - Engine/Engine Block/CRANKSHAFT - Standard Procedure)
19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown to 21 N·m (16 ft. lbs.) plus 90°.



NOTE: Typical V6 engine configuration shown.



20. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown to 28 N·m (21 ft. lbs.).
21. Install the engine oil pump, oil pump pick-up and oil pan (Refer to 09 - Engine/Lubrication /PUMP, Engine Oil - Installation)

NOTE: Only two power steering pump mounting bolts are shown. Another bolt is on the lower end of the pump near the pulley.

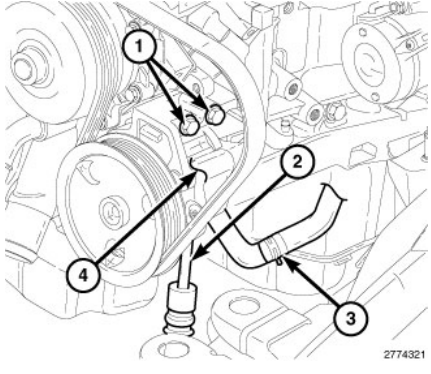
22. If removed, position the power steering pump (4) to the engine block. Install the three pump mounting bolts (1) and tighten to 25 N·m (18 ft. lbs.).
23. If removed, install the accessory drive belt (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Installation) .

24. Install the spark plugs and ignition coils (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation)

25. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

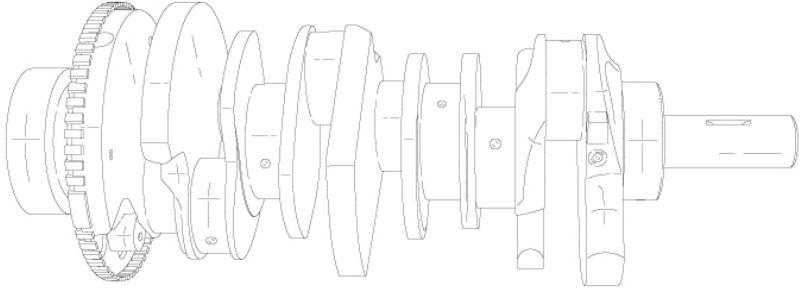
26. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

27. Operate the engine until it reaches normal operating temperature.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



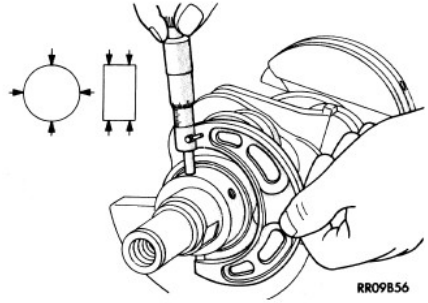
2824124

The crankshaft is a cast design and is constructed using ductile iron. The crankshaft is a three throw split pin design with counterweights for balancing purposes. The main journals are crossed drilled for rod bearing lubrication. The crankshaft is supported by four select fit main bearings with number 2 serving as the thrust washer location. The rear counterweight has provisions for crankshaft position sensor target wheel mounting. Both the front and rear seals are a single piece design and are mounted to the timing cover and cylinder block.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

NOTE: Typical crankshaft journal measurements shown.

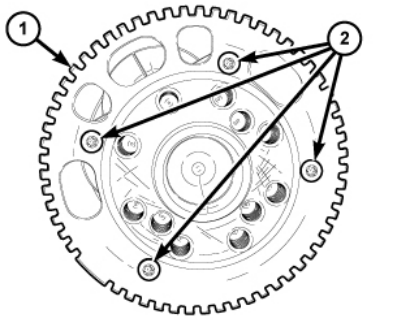


1. Clean the oil off the bearing journals.
2. Determine the maximum diameter of the journals with a micrometer. Measure at two locations 90° apart at each end of the journals.
3. Compare the measured rod journal diameter to the crankshaft connecting rod bearing journal diameter grade marking chart (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure). Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal that will provide the proper oil clearance.
4. Compare the measured main bearing journal diameter to the crankshaft main bearing journal diameter grade marking chart (Refer to 09 - Engine/Engine Block/BEARING(S) , Crankshaft - Standard Procedure). Obtain the main bearing journal grade identification marks from the engine block and select the upper and lower main bearing sizes that will provide the proper oil clearance.
5. For connecting rod journals, verify that the maximum taper and maximum out of round are within specifications) .
6. For main bearing journals, verify that the maximum taper and maximum out of round are within specifications) .

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. If required, select and fit new crankshaft main bearings to the engine block (Refer to 09 - Engine/Engine Block/BEARING(S) , Crankshaft - Standard Procedure)
2. If required, select and fit new bearings to the connecting rod (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure)
3. If removed, install the target wheel (1) to the crankshaft with four new bolts (2). Ensure the threaded holes in the crankshaft are free of residual thread lock adhesive. Tighten the bolts to 10 N·m (89 in. lbs.).



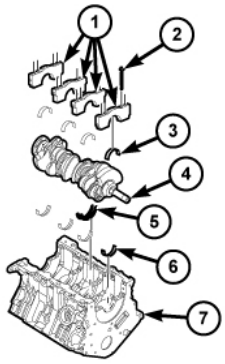
2792895

NOTE: Typical V6 engine configuration shown.

4. If removed, lubricate and install the upper main bearing halves (6) into the engine block (7).

CAUTION: **When installing the crankshaft, use care not to damage bearing surfaces on the crankshaft.**

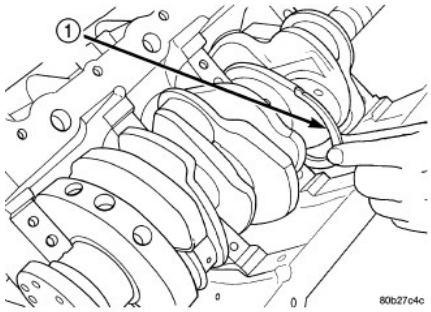
5. Install the crankshaft (4) into the engine block (7).



2792286

NOTE: Typical V6 engine configuration shown.

6. Installing thrust washers (1) at the No. 2 main bearing location, using the following procedure:

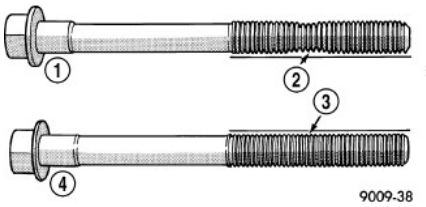


80b27c4c

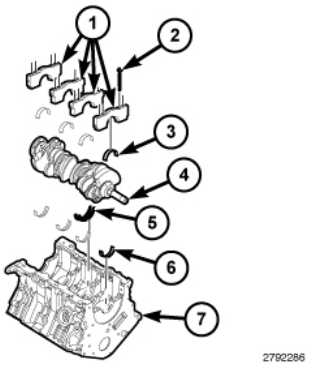
   a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
   b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

CAUTION: **The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**

7. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.



NOTE: Typical V6 engine configuration shown.

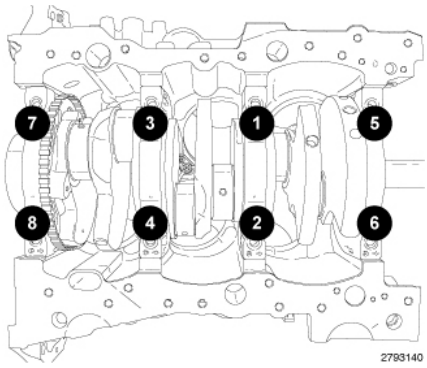


8. If removed, lubricate and install the lower main bearing halves (3) onto the main caps (1).

9. Install the main bearing caps (1) with two inner main bearing cap bolts (2).

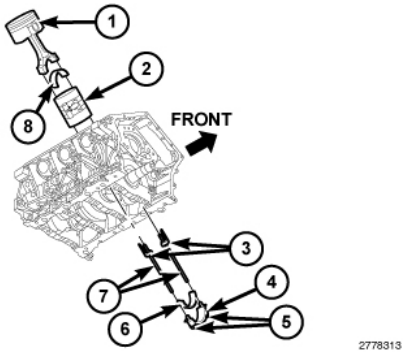
10. Tighten the inner main bearing cap bolts in the sequence shown to 20 N·m (15 ft. lbs.) plus 90°.

11. Measure crankshaft end play (Refer to 09 - Engine/Engine Block/CRANKSHAFT - Standard Procedure)



NOTE: Typical V6 engine configuration shown.

12. If removed, install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.



CAUTION: **Care must be taken not to nick crankshaft journals, as engine damage may occur.**

13. Remove the plastic guide plates (3) from the Guide Pins 8189 (7) and install the Guide Pins to the connecting rod.

CAUTION: **Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.**

14. Pull the connecting rod and piston toward the crankshaft until the connecting rod is seated on the crankshaft journal. Remove the guide pins.

CAUTION: **The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.**

15. If removed, install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

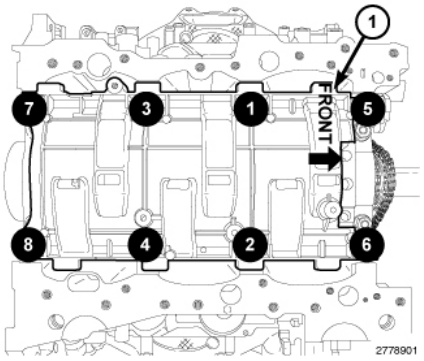
NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

16. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the the **NEW** connecting rod cap bolts (5) to 20 N·m (15 ft. lbs.) plus 90°.

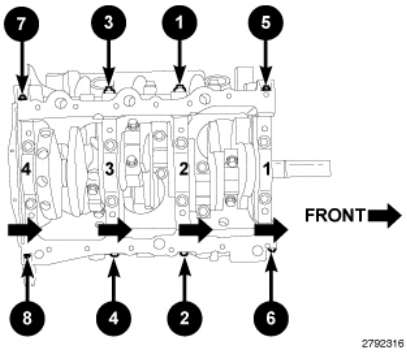
17. If required, check the connecting rod side clearance (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure)

18. Repeat the previous steps for the remaining connecting rods.

19. Install the windage tray (1) with eight main bearing cap bolts. Tighten the bolts in the sequence shown to 21 N·m (16 ft. lbs.) plus 90°.



NOTE: Typical V6 engine configuration shown.



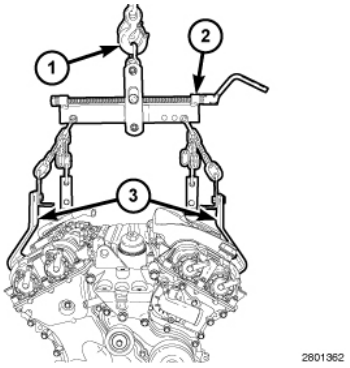
20. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown to 28 N·m (21 ft. lbs.).

21. Install the engine oil pump and oil pump pick-up (Refer to 09 - Engine/Lubrication/PUMP, Engine Oil - Installation)

22. Install the rear crankshaft oil seal and flexplate (Refer to 09 - Engine/Engine Block/SEAL, Crankshaft Oil - Installation)

23. Install the timing chain and sprockets, engine timing cover, oil pans, spark plugs and cylinder head covers (Refer to 09 - Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Installation)

24. Install the engine (Refer to 09 - Engine - Installation)



25. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

26. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

27. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .

28. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure)

NOTE:

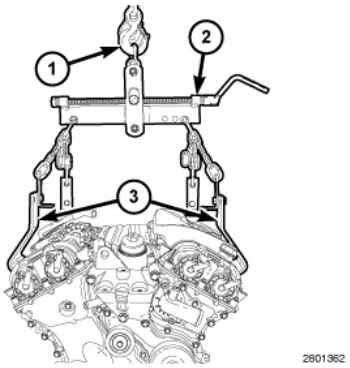
The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

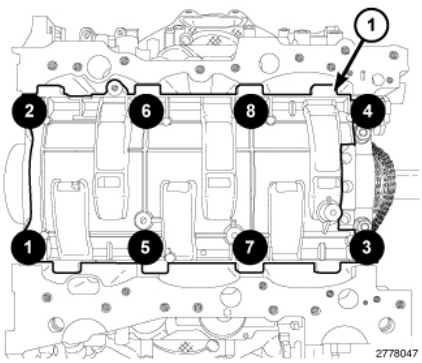
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.



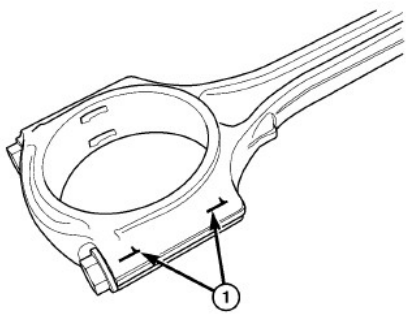
1. Remove the engine (Refer to 09 - Engine - Removal)



2. Remove the cylinder head covers, spark plugs, upper oil pan, engine timing cover, timing chain and sprockets (Refer to 09 - Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal)
3. Remove the flexplate and the rear crankshaft oil seal (Refer to 09 - Engine/Engine Block/SEAL, Crankshaft Oil - Removal)
4. Remove the oil pump pick-up and engine oil pump (Refer to 09 - Engine/Lubrication/PUMP, Engine Oil - Removal)
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown and remove the windage tray (1).

CAUTION: **DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur**

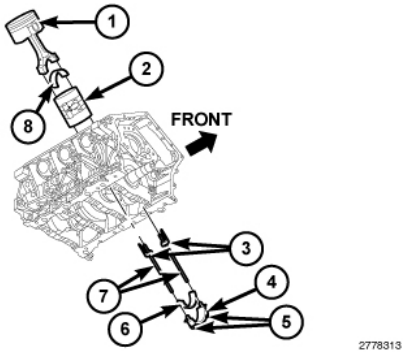
NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.



6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

NOTE: Typical V6 engine configuration shown.

CAUTION: **Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.**



7. Remove the connecting rod cap bolts (5) and the connecting rod caps (4). Discard the cap bolts.

CAUTION: **Care must be taken not to nick crankshaft journals, as engine damage may occur.**

8. Remove the plastic guide plates (3) from the Guide Pins 8189 (7) and install the Guide Pins to the connecting rod.

CAUTION: **Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.**

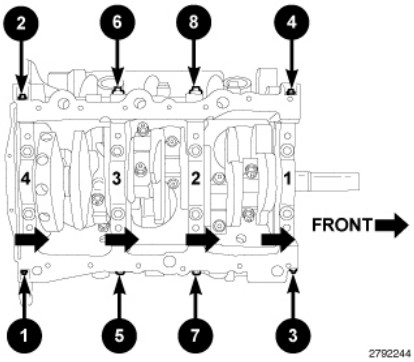
9. Push the connecting rod and piston into the cylinder until the connecting rod is clear of the crankshaft journal. Remove the guide pins. Repeat this procedure at each cylinder until all of the connecting rods are clear of the crankshaft.

NOTE: Typical V6 engine configuration shown.

Remove the main bearing cross bolts in the sequence shown.

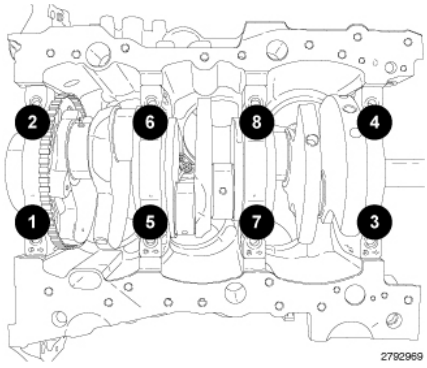
CAUTION: **DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.**

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.



10. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

11. Remove the eight main bearing cap bolts in the sequence shown and remove the main bearing caps.



CAUTION: **Do not rest the crankshaft on the target wheel (1). Damaged or bent target wheel teeth will destroy the target wheels ability to correctly relay crankshaft position to the crankshaft position sensor.**

12. Remove the crankshaft from the engine block.

13. If required, remove the four bolts (2) and the target wheel (1). Discard the four bolts.

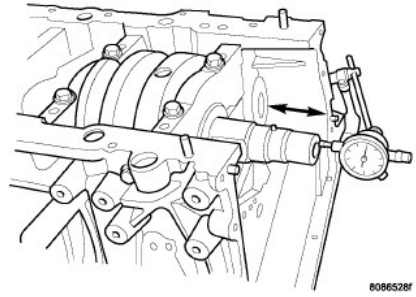
STANDARD PROCEDURE - END PLAY

Special Tools: Click to display a list of tools used in this procedure

NOTE: Typical V6 engine shown.

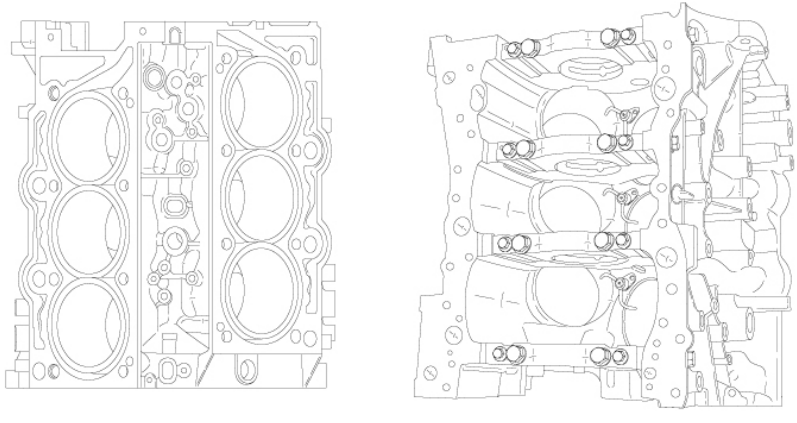


1. Mount Dial Indicator Set C-3339A to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the crankshaft.
2. Move the crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the crankshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification (Refer to 09 - Engine - Specifications) .

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



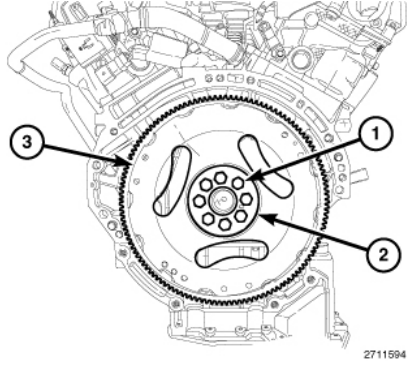
The cylinder block is a 60 degree high-pressure die cast aluminum design with cast steel cylinder liners. The leading side of the block is on the right side and houses cylinders 1, 3 and 5. The cylinder block is an open deck design with cut slots between each cylinder. Two knock sensors are located in the block valley. The cylinder block has three sets of piston cooling jets which are attached to the main oil gallery. The four powdered metal main bearing caps are a cross-bolted design and have directional arrows molded into the caps. The number 2 main bearing is the location for the two piece upper half thrust bearings. The thrust bearings are installed with the oil groves facing outward. The main bearing caps are a 6-bolt design and cross-bolted for improved lower end strength. There are three oil drain back drillings located on each of the cylinder banks.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the flexplate (3) onto the crankshaft.
2. Install the spacer (2) and the bolts (1) hand tight.
3. Tighten the flexplate retaining bolts (1) to 95 N·m (70 ft. lbs.) in a criss-cross pattern.
4. Install the transmission .

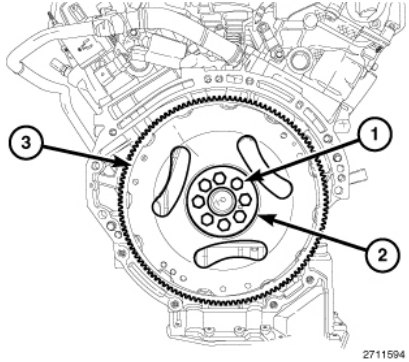


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Remove the transmission .
2. Remove the bolts (1) and the spacer plate (2).
3. Remove the flexplate (3).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

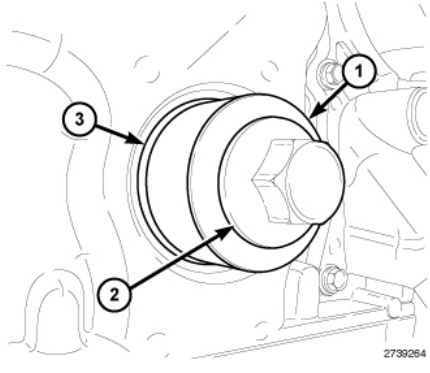
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. Position the front crankshaft oil seal (3) into place on the engine timing cover.

2. Align the Front Crankshaft Seal Installer 10199 (1) to the flywheel key on the crankshaft and against the front crankshaft oil seal (3).

CAUTION: **Only tighten the crankshaft vibration damper bolt until the oil seal is seated in the cover. Overtightening of the bolt can crack the front timing cover.**



3. Install and tighten the crankshaft vibration damper bolt (2) until the Crankshaft oil seal is seated in the engine timing cover.

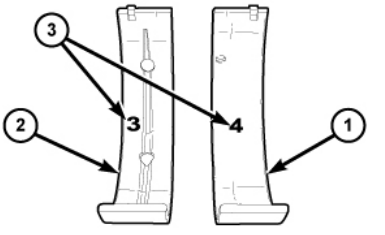
4. Install the crankshaft vibration damper and accessory drive belt (Refer to 09 - Engine/Engine Block/DAMPER, Vibration - Installation)

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

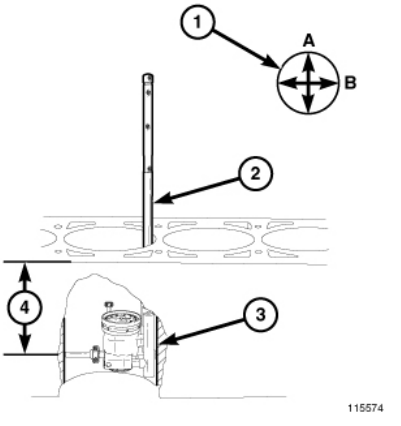
Special Tools: Click to display a list of tools used in this procedure

1. Wipe the main bearing inserts (1 and 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.



2787936

5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear (Refer to 09 - Engine/Engine Block/BEARING(S) , Crankshaft - Standard Procedure)
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage the engine block must be replaced.
9. Use Cylinder Indicator C-119 (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
12. Determine taper by subtracting the smaller diameter from the larger diameter.



115574

13. Rotate measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within) .
14. Determine out-of-roundness by comparing the difference between A and B at each of the three levels. Verify that the maximum out of round is within) .
15. If cylinder bore taper and out-of-roundness are within specification, the cylinder bore can be honed (Refer to 09 - Engine/Engine Block - Standard Procedure) . If the cylinder bore taper or out-of-round condition exceeds the maximum limits, the cylinder block must be replaced.

NOTE: A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

CLEANING

CAUTION: **DO NOT use a wire wheel or other abrasive cleaning devise to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.**

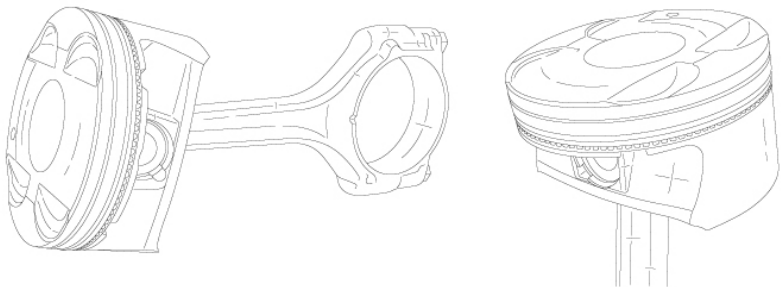
CAUTION: **Do not remove the piston pin from the piston and connecting rod assembly.**

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.

2. Use a wood or plastic scraper to clean the ring land grooves.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



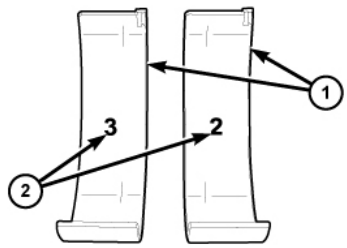
2824195

CAUTION: **Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.**

The pistons are a lightweight design with ultra low tension piston rings for improved fuel economy. The pistons are made of a high strength aluminum alloy and the piston skirt has a Moly® coating. The top piston ring land has an anodized coating for improved wear. The piston is connected to the rod using a full floating pin with two locking clips. The connecting rod is forged steel with a bolted cracked cap design. The connecting rod bolts are not reusable. Pistons are available in two different diameters with grade markings for each bore indicated on the side of the cylinder block. The upper compression ring is a 1.2 mm steel ring with a spray coating. The intermediate compression ring is 1.2 mm micro napier design. Both compression rings have a dot or a mark on the piston ring. The marked side of the ring must face the top of the piston. The 2 mm three piece oil control ring is very thin. These are chrome plated rings and have a stainless steel expander.

INSPECTION

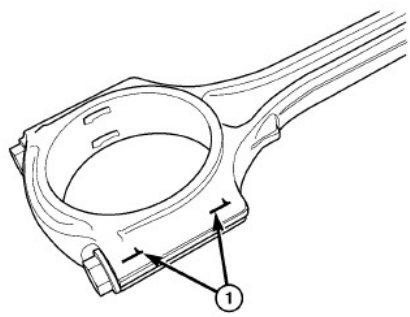
1. Wipe the inserts (1) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.



2789568

5. Replace any bearing that shows abnormal wear (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure)
6. Inspect the connecting rod bearing bores for signs of scoring, nicks and burrs.

NOTE: Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment.

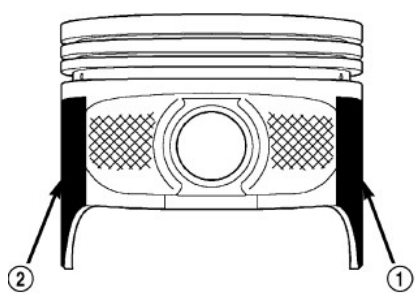


811318c8

7. Replace misaligned, bent or twisted connecting rods.

NOTE: Connecting rods are serviced with the piston pre-assembled. The pistons are "select fit" to achieve proper oil clearance (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure)

NOTE: Typical coated piston shown.



80aac2ac

8. Inspect the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.
9. Check the piston for taper and out of round shape.

NOTE: The coating material (1 and 2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is MANDATORY (Refer to 09 - Engine/Engine Block - Inspection) .

10. Compare the measured cylinder bore diameter to the engine block cylinder bore grade marking chart (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure) Select the piston size that corresponds to the engine block markings for each cylinder to provide the proper oil clearance.

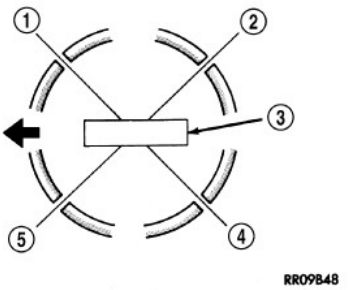
NOTE: Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

NOTE: The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

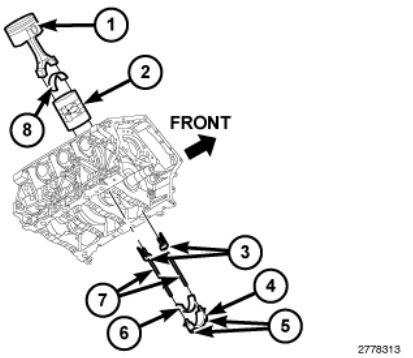
1. If required, select and fit new piston and connecting rod assemblies to the engine block (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure)
2. If required, select and fit new bearings to the connecting rod (Refer to 09 - Engine/Engine Block/BEARING(S) , Connecting Rod - Standard Procedure)
3. If required, hone the cylinder bores (Refer to 09 - Engine/Engine Block - Standard Procedure)
4. If removed, install the piston rings (Refer to 09 - Engine/Engine Block/RING(S) , Piston - Installation).
5. Position the piston ring end gaps as follows:



- Oil ring expander gap (5)
- Oil ring lower side rail end gap (4)
- Oil ring upper side rail end gap (1)
- No. 2 (intermediate) ring end gap (5)
- No. 1 (upper) ring end gap (2)

NOTE: Typical V6 engine configuration shown.

NOTE: Ensure the position of the ring end gaps does not change when installing the ring compressor.



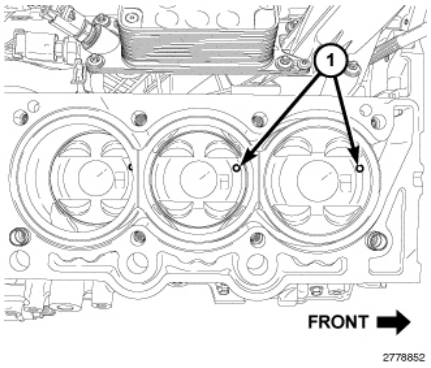
6. Lubricate the piston rings with clean engine oil. Position Piston Compressor C-385 (2) over the piston and rings. Tighten the compressor (2).

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

7. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
8. Remove the plastic guide plates (3) from the Guide Pins 8189 (7) and install the Guide Pins to the connecting rod being installed.

NOTE: Right cylinder bank shown, left cylinder bank similar.

9. The pistons crowns are stamped with a mark (1) indicating installation position. This mark must be positioned toward the front of engine on both cylinder banks.



10. Wipe the cylinder bore clean and lubricate with clean engine oil.

11. Rotate the crankshaft until the connecting rod journal is on the center of cylinder bore.

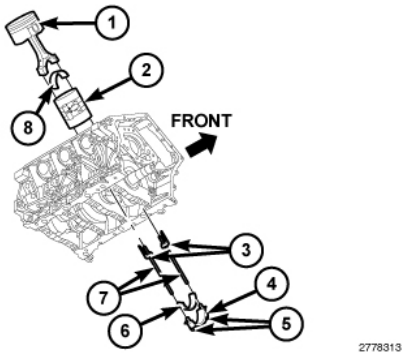
CAUTION: **Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.**

12. Insert the piston and connecting rod into the cylinder bore and carefully position the guide pins over the crankshaft journal.

13. Tap the piston down in the cylinder bore using a hammer handle while guiding the connecting rod into position over the rod journal.

NOTE: Typical V6 engine configuration shown.

CAUTION: **The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.**



14. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

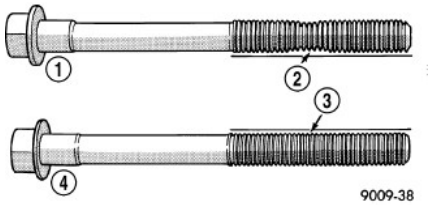
NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

15. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to the proper) .

16. If required, check the connecting rod side clearance (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure)

17. Repeat the previous steps for each piston being installed.

CAUTION: **The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.**



18. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown to the proper) .

20. Install the engine oil pump and oil pump pick-up (Refer to 09 - Engine/Lubrication/PUMP, Engine Oil - Installation)

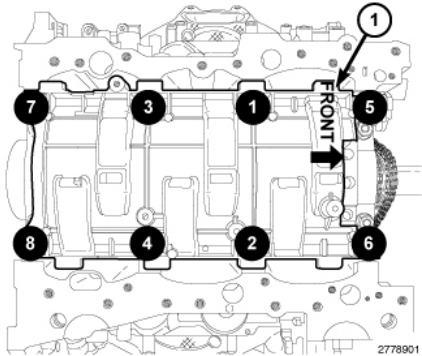
21. Install the cylinder heads, engine timing cover and oil pans (Refer to 09 - Engine/Cylinder Head - Installation)

22. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

23. Connect the negative battery cable and tighten the nut to the proper) .

24. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .

25. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure)

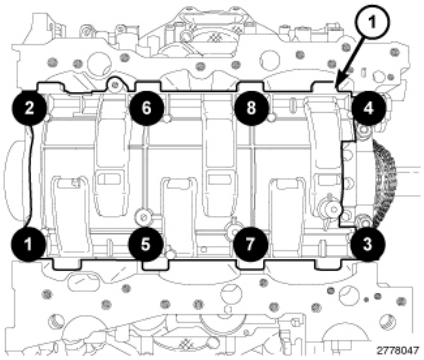


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

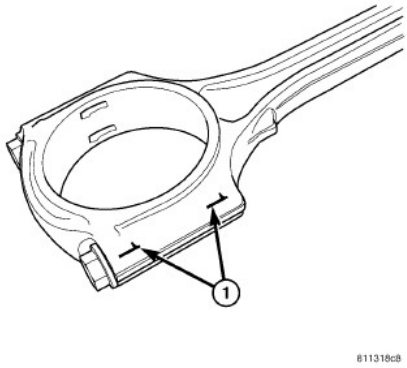
1. Disconnect and isolate the negative battery cable.
2. Remove the oil pans, engine timing cover and cylinder heads (Refer to 09 - Engine/Cylinder Head - Removal) .
3. Remove the engine oil pump (Refer to 09 - Engine/Lubrication/PUMP, Engine Oil - Removal) .
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown and remove the windage tray (1).



5. If necessary, remove the top ridge of the cylinder bores with a reliable ridge reamer before removing the pistons from the engine block. **Be sure to keep the tops of pistons covered during this operation.** Pistons and connecting rods must be removed from the top of the engine block. When removing piston and connecting rod assemblies from the engine, rotate the crankshaft clockwise so that each connecting rod is centered in the cylinder bore.

CAUTION: **DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur**

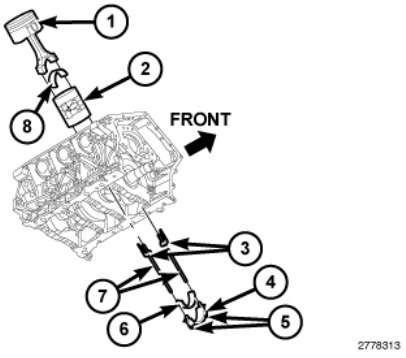
NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.



6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

NOTE: Typical V6 engine configuration shown.

CAUTION: **Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.**



7. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.

CAUTION: **Care must be taken not to nick crankshaft journals, as engine damage may occur.**

8. Remove the plastic guide plates (3) from the Guide Pins 8189 (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: **Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.**

9. Remove the piston and connecting rod (1) from cylinder bore.
10. Repeat the previous steps for each piston being removed.
11. Immediately after piston and connecting rod removal, reinstall the bearing cap (4) on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
12. If required, remove the piston rings (Refer to 09 - Engine/Engine Block/RING(S) , Piston - Removal).
13. Repeat the previous steps for each piston being removed.

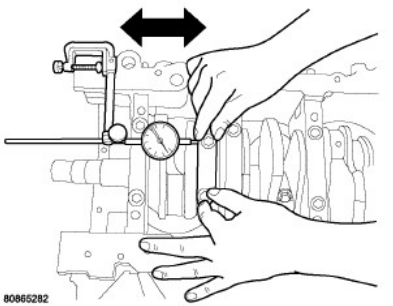
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

Connecting Rod Side Clearance

Special Tools: Click to display a list of tools used in this procedure

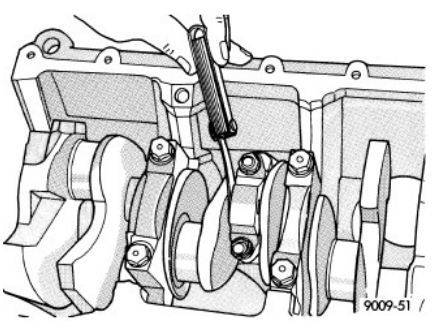
Dial Indicator

1. Mount Dial Indicator Set C-3339A to a stationary point on the engine. Locate the probe perpendicular to and resting against the connecting rod cap being checked.
2. Move the connecting rod all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the connecting rod forward to the limit of travel and read the dial indicator. Compare the measured side clearance to the) .
5. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.



Feeler Gauge

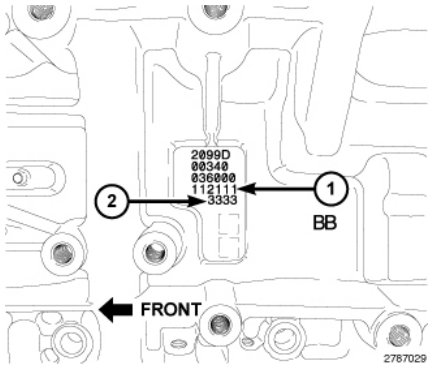
1. Slide a snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Compare the measured side clearance to the) .
2. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

Piston Fitting

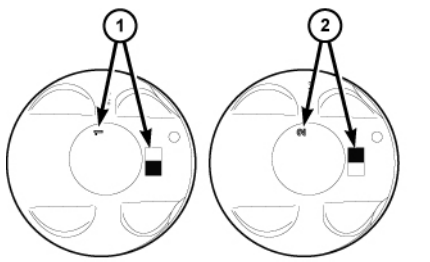
The pistons are “select fit” to achieve proper oil clearance. Engine block cylinder bore diameter grade markings (1) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with cylinder number 1, 2, 3, 4, 5, 6.



Engine block cylinder bore diameter grade markings correspond to specific cylinder bore diameters. The chart below identifies the two engine block grade markings and their associated cylinder bore diameters.

Engine Block Marking	Cylinder Bore Size mm (in.)
1	95.995 ± 0.005 mm (3.7793 ± 0.0002 in.)
2	96.005 ± 0.005 mm (3.7797 ± 0.0002 in.)

The piston is marked with the piston size (1 and 2) on the piston crown. The pistons are available in two different sizes in order to achieve the desired oil clearance. Select the piston size that corresponds to the engine block cylinder bore diameter grade markings for each cylinder.



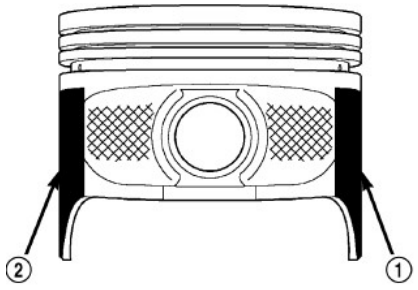
Pistons are available in two sizes. The chart below identifies the two piston sizes.

Piston Marking	Size mm (in.)	
	Metal to Metal	Metal to Coating
1	95.995 ± 0.005 mm (3.7793 ± 0.0002 in.)	95.970 - 96.000 mm (3.7783 - 3.7795 in.)
2	95.965 ± 0.005 mm (3.7781 ± 0.0002 in.)	95.980 - 96.010 mm (3.7787 - 3.7835 in.)

NOTE: Typical coated piston shown.

The coated pistons are serviced with the piston pin and connecting rod pre-assembled. The coating material (1 and 2) is applied to the piston after the final piston

machining process. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.



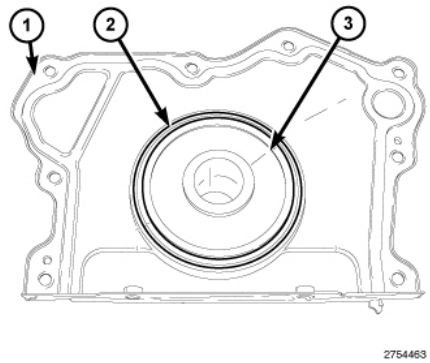
80aac2ao

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

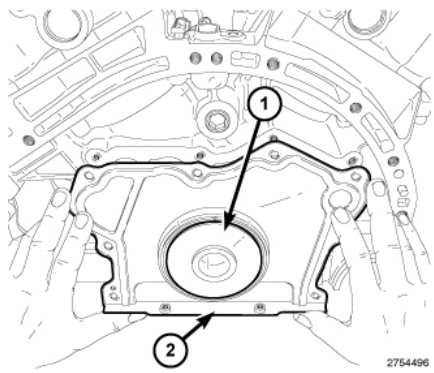
CAUTION: **The rear crankshaft oil seal (2) and retainer (1) are an assembly. To avoid damage to the seal lip, DO NOT remove the seal protector (3) from the rear crankshaft oil seal before installation onto the engine.**

CAUTION: **Whenever the crankshaft is replaced, the rear crankshaft oil seal must also be replaced. Failure to do so may result in engine fluid leakage.**

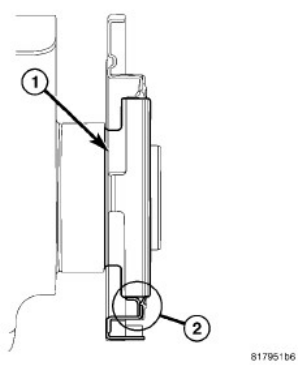


1. Inspect the crankshaft to make sure there are no nicks or burrs on the seal surface.
2. Clean the engine block sealing surfaces thoroughly.

NOTE: It is not necessary to lubricate the seal or the crankshaft when installing the seal retainer. Residual oil following installation can be mistaken for seal leakage.



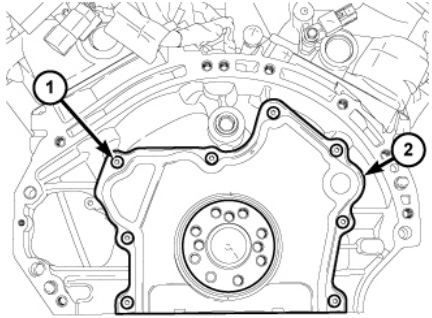
3. Carefully position the oil seal retainer assembly (2), and seal protector (1) on the crankshaft and push firmly into place on the engine block (during this step, the seal protector will be pushed from the rear oil seal assembly as a result of installing the rear oil seal).
4. Verify that the seal lip (2) on the retainer is uniformly curled inward toward the engine on the crankshaft (1).



5. Install the eight seal retainer bolts (1) and tighten to 12 N·m (106 in. lbs.).

NOTE: Make sure that the seal retainer flange is flush with the engine block oil pan sealing surface.

6. Install the upper oil pan (Refer to 09 - Engine/Lubrication/PAN, Oil - Installation) .
7. Install the flexplate (Refer to 09 - Engine/Engine Block/FLEXPLATE - Installation) .
8. Install the transmission (Refer to 21 - Transmission and Transfer Case/Automatic - NAG1 - Installation) .
9. Fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)



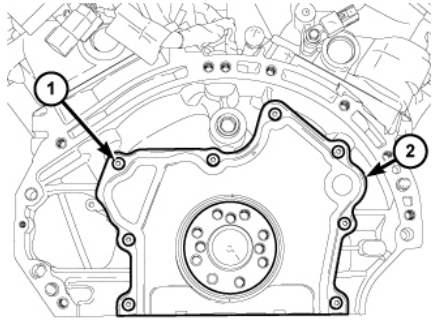
2711679

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

The rear crankshaft oil seal is incorporated into the seal retainer (2) and can not be removed from the retainer. The rear crankshaft oil seal and seal retainer (2) are serviced as an assembly.



2711679

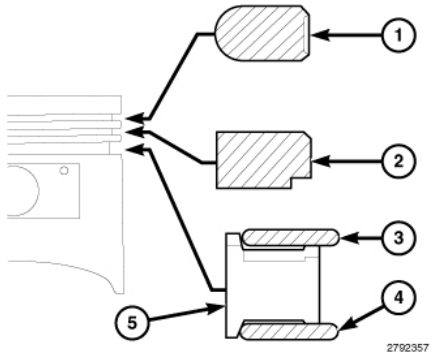
1. Remove the transmission (Refer to 21 - Transmission and Transfer Case/Automatic - NAG1 - Removal) .
2. Remove the flexplate (Refer to 09 - Engine/Engine Block/FLEXPLATE - Removal) .
3. Remove the upper oil pan (Refer to 09 - Engine/Lubrication/PAN, Oil - Removal) .
4. Remove the eight seal retainer attaching screws (1).
5. Remove and discard the seal retainer (2).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Typical piston shown.

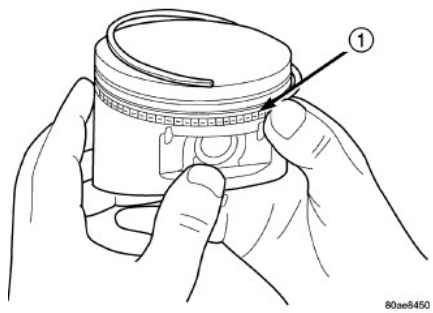


1. If required, fit new rings to the piston (Refer to 09 - Engine/Engine Block/RING(S) , Piston - Standard Procedure)

CAUTION: **To avoid damage to the piston rings, they must be installed in the following order:**

- **Oil ring expander (5)**
- **Oil ring lower side rail (4)**
- **Oil ring upper side rail (3)**
- **No. 2 (intermediate) piston ring (2)**
- **No. 1 (upper) piston ring (1)**

NOTE: Typical piston shown. Do not use a piston ring expander to install the oil ring side rails.

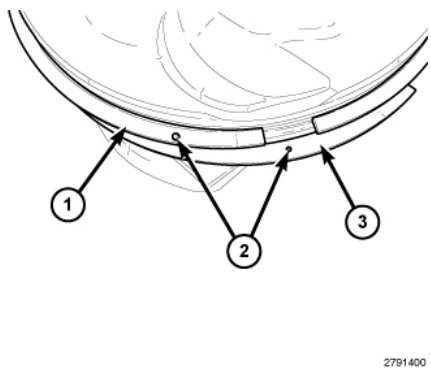


2. Install the oil ring expander (1).

3. Install the oil ring lower side rail by placing one end between the piston ring groove and the oil ring expander. Hold this end firmly and press down the portion to be installed until the side rail is in position.

4. Install the oil ring upper side rail in the same manner as the lower side rail.

NOTE: The No. 1 (upper) piston ring (1) and No. 2 (intermediate) piston ring (3) have a different cross section. Install the rings with manufacturers I.D. mark (dot) (2) facing up, towards the top of the piston.

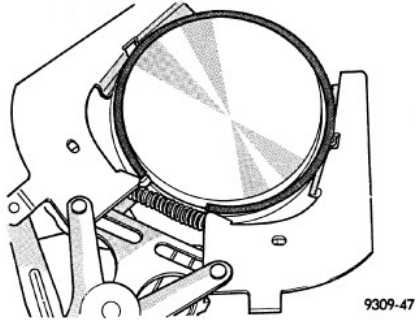


NOTE: Typical piston shown.

5. Install the No. 2 (intermediate) piston ring using a ring expander tool.

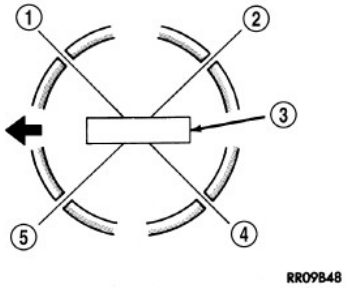
6. Install the No. 1 (upper) piston ring using a ring expander tool.

7. Rotate the rings around the piston, the rings must rotate in the grooves with out binding.



8. Position the piston ring end gaps as follows:

   - Oil ring expander gap (5)
   - Oil ring lower side rail end gap (4)
   - Oil ring upper side rail end gap (1)
   - No. 2 (intermediate) ring end gap (5)
   - No. 1 (upper) ring end gap (2)



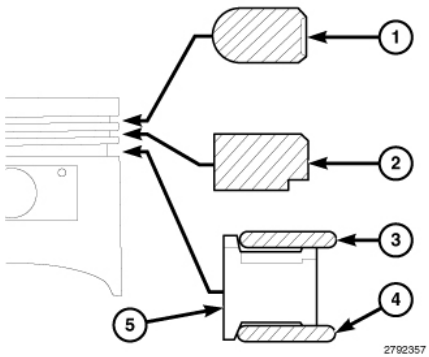
9. Install the piston and connecting rod(s) (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Installation) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Typical piston shown.

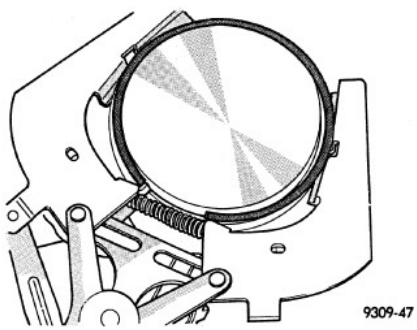


1. Remove the piston and connecting rod(s) (Refer to 09 - Engine/Engine Block/ROD, Piston and Connecting - Removal) .

CAUTION: **To avoid damage to the piston rings, they must be removed in the following order:**

- **No. 1 (upper) piston ring (1)**
- **No. 2 (intermediate) piston ring (2)**
- **Oil ring upper side rail (3)**
- **Oil ring lower side rail (4)**
- **Oil ring expander (5)**

NOTE: Typical piston shown.



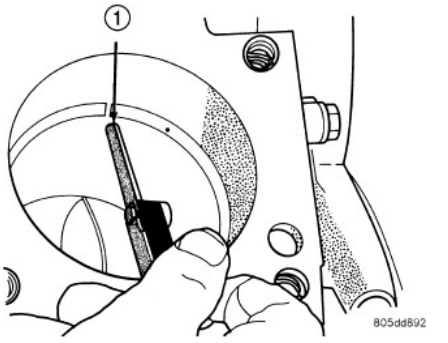
2. Remove the No. 1 (upper) piston ring using a ring expander tool.
3. Remove the No. 2 (intermediate) piston ring using a ring expander tool.

NOTE: Typical piston shown. Do not use a piston ring expander to remove the oil ring side rails.

4. Remove the oil ring upper side rail.
5. Remove the oil ring lower side rail.
6. Remove the oil ring expander (1).

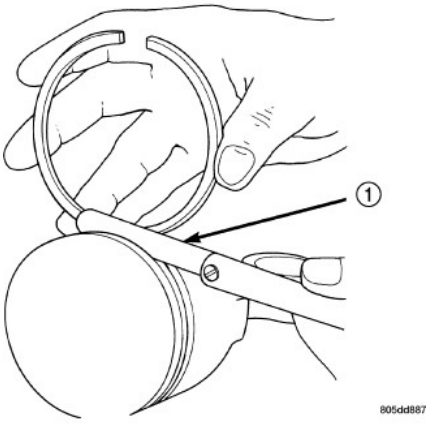
STANDARD PROCEDURE - PISTON RING FITTING

1. Wipe the cylinder bore clean.
2. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder to a position 12 mm (0.50 in.) from the bottom of the cylinder bore.
3. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.



Ring Position	Ring End Gap
No. 1 (top) Ring	0.25 - 0.40 mm (0.010 - 0.016 in.)
No. 2 (center) Ring	0.30 - 0.45 mm (0.012 - 0.018 in.)
Oil Control Ring (Steel Rail)	0.15 - 0.66 mm (0.006- 0.26 in.)

4. Clean the piston ring grooves. Remove any nicks or burrs.
5. Measure the ring side clearance as shown. Make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.

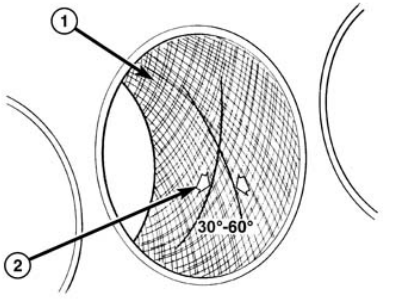


Ring Position	Ring Side Clearance
No. 1 (top) Ring	0.025 - 0.033 mm (0.0010 - 0.0013 in.)
No. 2 (center) Ring	0.030 - 0.078 mm (0.0012 - 0.0031 in.)
Oil Control Ring (Steel Rails)	0.007 - 0.173 mm (.0003 - 0.0068 in.)

CYLINDER BORE DEGLAZING

Before deglazing, mask the crankcase area to keep abrasive materials from entering the engine lower end. Tape off the water jacket and any openings to the oil circuit to prevent abrasive material from entering the coolant and oil circuits.

CAUTION: **DO NOT use rigid type hones to remove cylinder wall glaze.**



warm
80661041

1. Select an appropriate size flexible ball hone.

2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. About 20-60 strokes, depending on the condition of the cylinder bore, will be sufficient to provide a satisfactory surface. Use a light **honing** oil, available from major oil distributors.

CAUTION: **DO NOT use engine or transmission oil, mineral spirits, or kerosene.**

3. Deglazing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should intersect at 30° to 60° inclusive angle for proper seating of rings.

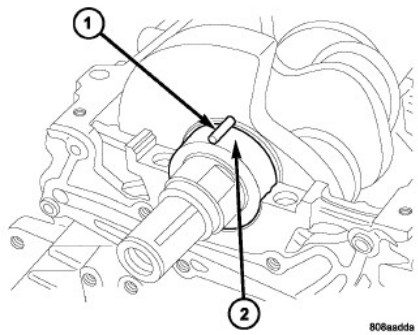
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle (1). The number of up and down strokes per minute can be regulated to get the desired 30° to 60° inclusive angle (2). Faster up and down strokes increase the crosshatch angle.

5. After deglazing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting. Upon completion, perform a visual inspection of the cylinder block passages to inspect for abrasive debris. If any debris is found , repeat the cleaning process.

NOTE: **Cylinder bore diameter should not increase more than 20 microns during deglazing process from original nominal bore diameter, if the maximum of 20 microns is exceeded, the cylinder block must be replaced. If deglazing the cylinder bore cannot remove the light scratches and scuffs the cylinder block should be replaced.**

MEASURING BEARING CLEARANCE USING PLASTIGAGE

NOTE: Typical crankshaft journal shown.

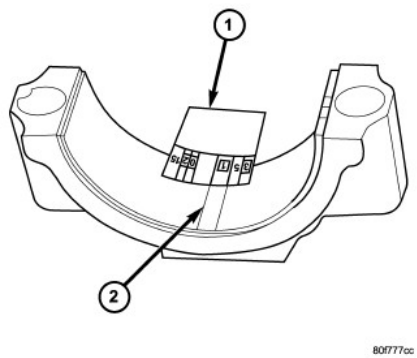


Engine crankshaft and connecting rod bearing clearances can be determined by the use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove the oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Plastigage must not crumble in use. If brittle, obtain fresh stock.
3. Torque the bearing cap bolts of the bearing being checked to the proper) .

NOTE: DO NOT rotate the crankshaft. Plastigage will smear, causing inaccurate results.

NOTE: Typical connecting rod cap shown.



4. Remove the bearing cap and compare the width of the flattened Plastigage (2) with the scale provided on the package (1). Locate the band closest to the same width. This band shows the amount of clearance. Differences in readings between the ends indicate the amount of taper present or the possibility of foreign material trapped under the bearing insert.
5. Record all readings taken. Compare clearance measurements to) .

NOTE: Typical connecting rod journal shown.

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking. Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.

6. Install the proper bearings to achieve the specified bearing clearances.

7. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

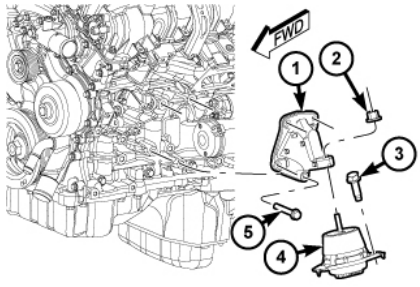
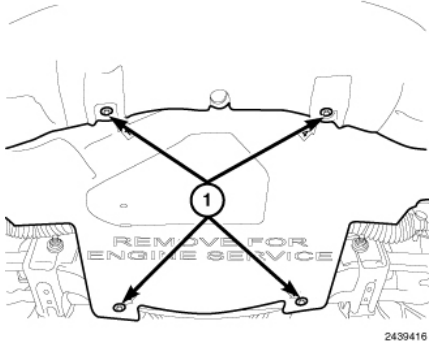
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure



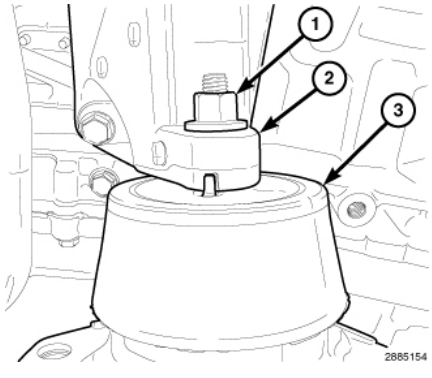
2797224

1. If removed, position the left engine mount bracket (1), install the four retaining bolts (5) and tighten to 61 N·m (45 ft. lbs.).
2. Position the left engine mount isolator (4) stud into the bracket, align the tab on the isolator with the notch in the engine mount bracket, install the retaining nut (2) finger tight.
3. Lower the screw jack until both engine mount isolators are in position.
4. Install both left and right engine mount isolator to frame bolts (3) finger tight.
5. Lower the engine so the weight is resting on the isolators and remove the screw jack.
6. Position the belly pan and install the retainers (1).
7. Lower the vehicle.



2439416

8. Tighten the left engine mount isolator (3) upper retaining nut (1) 61 N·m (45 ft. lbs.).

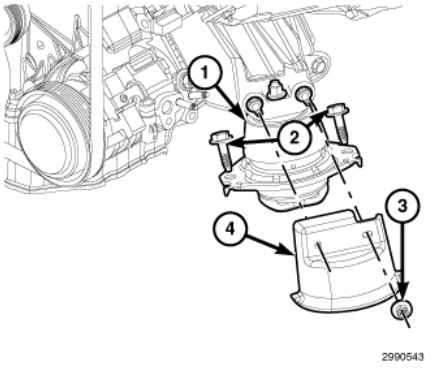


2885154

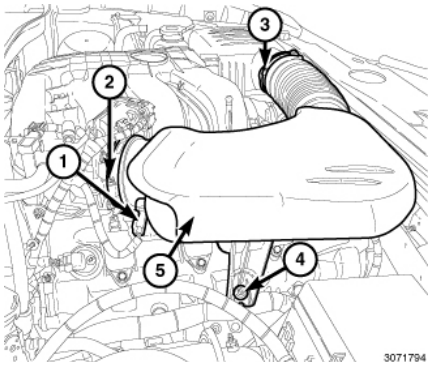
NOTE: Left engine mount shown, right engine mount similar.

9. Tighten both left and right engine mount isolator to frame bolts (2) to 61 N·m (45 ft. lbs.).

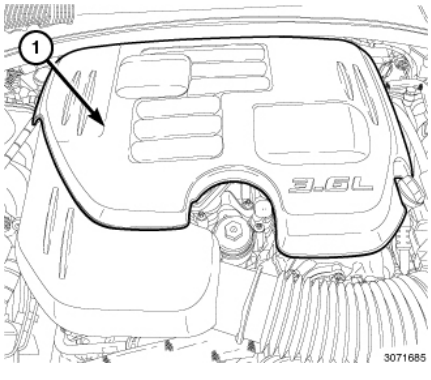
10. Position the left engine mount isolator heat shield (4), install the retaining nuts and tighten to 12 N·m (9 ft. lbs.).



11. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
12. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
13. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).
14. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).
15. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



16. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



17. Connect the negative battery cable and tighten nut (1) to 5 N·m (45 in. lbs.).

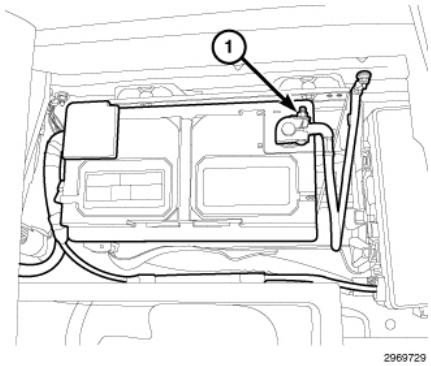
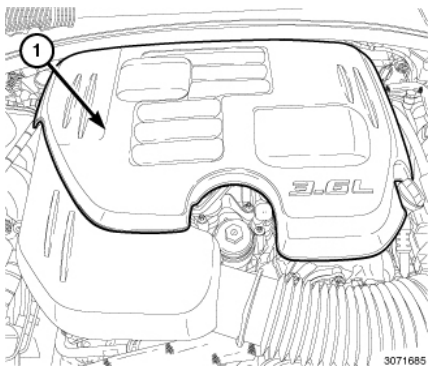
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

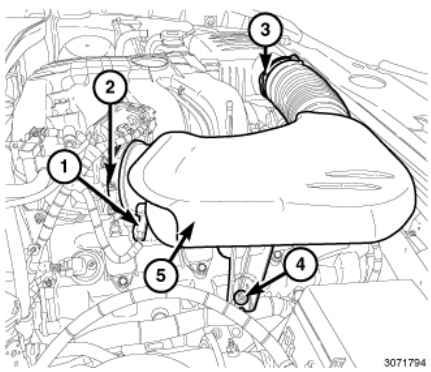
1. Disconnect and isolate the negative battery cable (1).



2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).



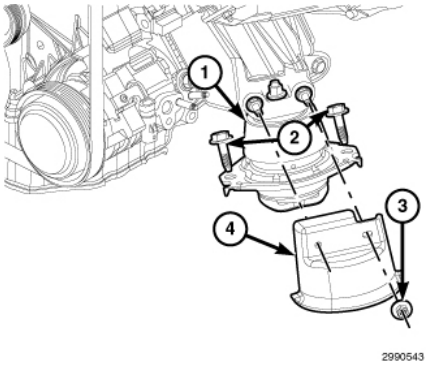
3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).



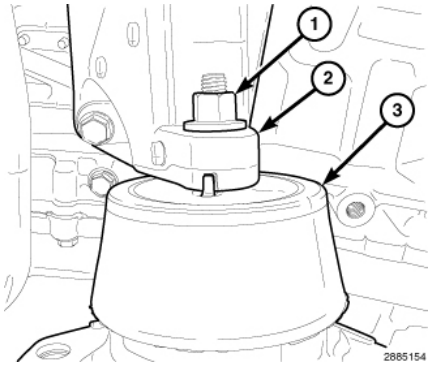
NOTE: Left engine mount shown, right engine mount similar.

8. Remove the left engine mount isolator heat shield retaining nuts (3) and remove the heat shield (4).

9. Remove both left and right engine mount isolator to frame retaining bolts (2).



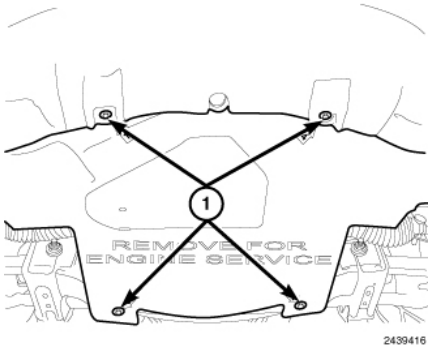
10. Remove the left engine mount isolator (3) upper retaining nut (1).



11. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .

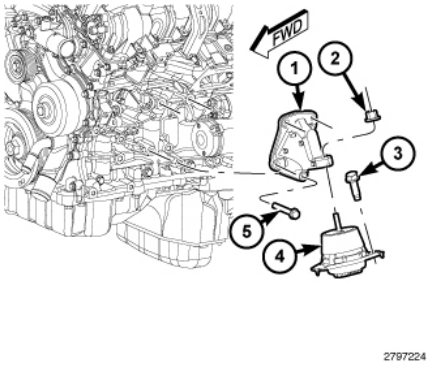
12. Remove the belly pan retainers (1) and remove the belly pan.

13. Using a suitable screw jack, raise the engine to gain clearance for engine mount isolator removal.



14. Remove the engine mount isolator (4) from the vehicle.

15. If required, remove the left engine mount bracket (1) four retaining bolts (5) and remove the left engine mount bracket.



INSTALLATION

Fuel Delivery: | **Fuel:**

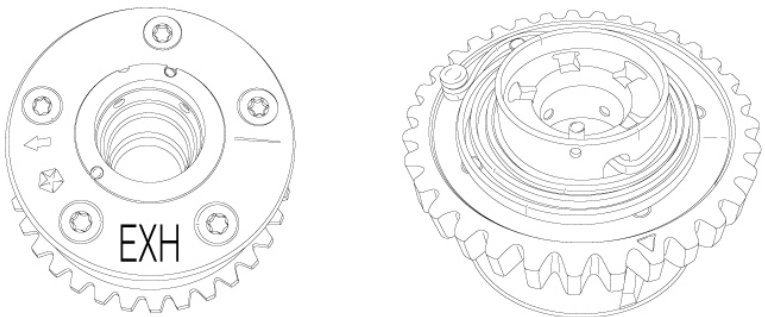
DESCRIPTION



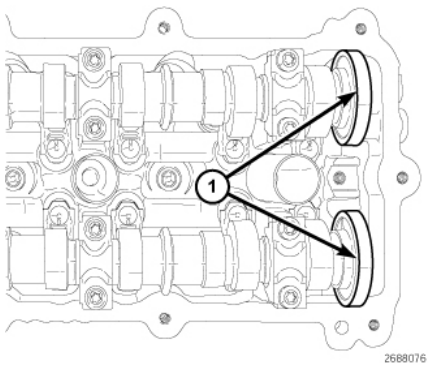
The engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four phasers are located on the front of the camshafts, behind the VVT solenoids, inside of the engine timing cover. The exhaust phasers are identified with EXH and the intake phasers are identified with INT. The exhaust phaser has a clockspring, the intake phaser does not. The camshaft sprockets are integrated with the camshaft phaser and are serviced as an assembly. Do not attempt to disassemble the phasers, they are not serviceable. Phasers are interchangeable between the right and left cylinder heads but should be installed in the same location as removed.

The engine has an Oil Control Valve (OCV) for each phaser. The OCV also acts as a bolt for mounting the Phaser to the camshaft. The OCVs spool valve is spring loaded and should move freely within the OCV body. The four OCVs are identical but should be installed in the same location as removed.

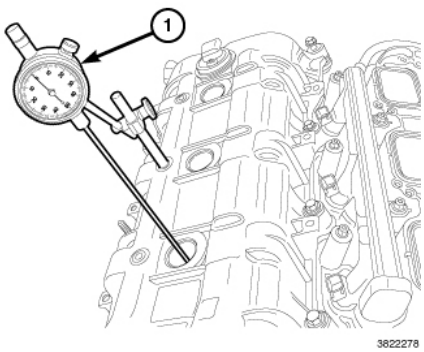
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



CAUTION: **Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts .**

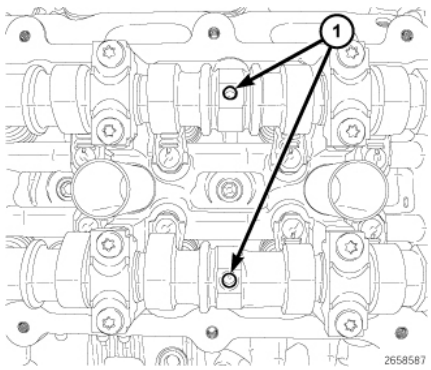


1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

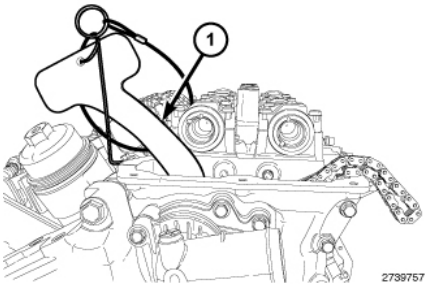
2.

CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.**

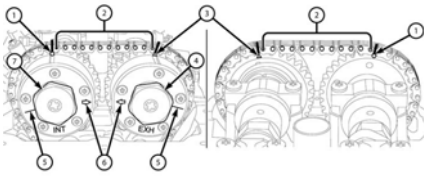
Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.



NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by repeating Step 10 of the Removal procedure (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Removal) .

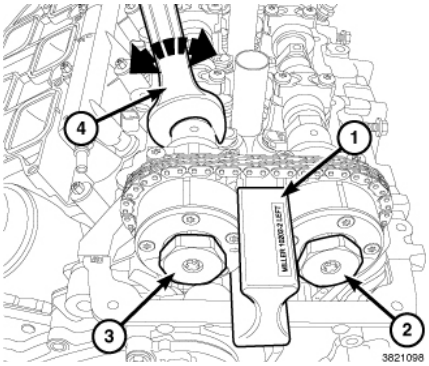


NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

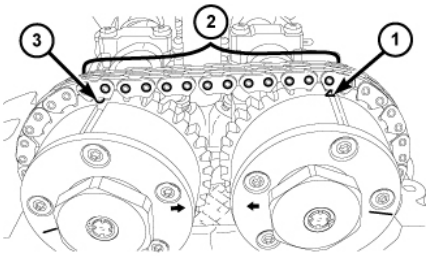


3. Route the cam chain around the left intake cam phaser while aligning the paint mark with the phaser timing mark (1). Press the left intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (7).
4. While maintaining this alignment, route the cam chain around the exhaust cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (4).
5. The **SCRIBE LINES** (5) on the cam phasers should face away from each other and the **ARROWS** (6) should point toward each other and be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1).

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.



6. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (1) against the cylinder head cover mounting surface with the tool number facing up.
7. Tighten the oil control valves (2) and (3) to 150 N·m (110 ft. lbs.).
8. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.
9. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;
   - The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
   - The **SCRIBE LINES** (3) on the left side cam phasers face away from each other.
   - The **ARROWS** (4) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface.
   - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).



10. If the engine timing is not correct, repeat this procedure.
11. Install the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

12. Install the right ignition coils (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation)

13. Install the left cylinder head cover and left ignition coils (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation)

14. Install the upper intake manifold and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

16. Start the engine and perform the following Powertrain Verification Tests (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure):

    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE: Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing) for any DTCs that reset.

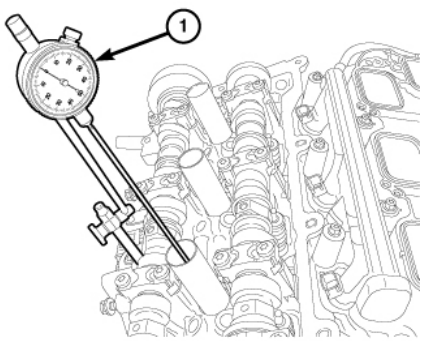
2691700

CAUTION: **Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts .**

1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

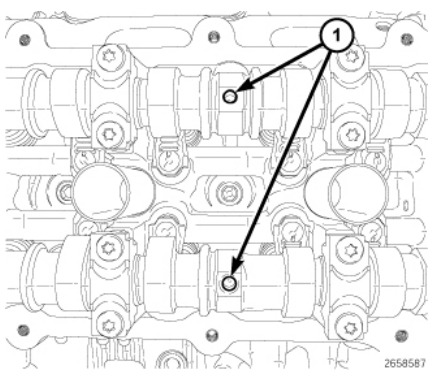


3822244

2.

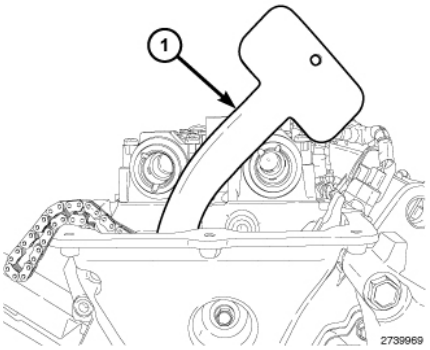
CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.**

Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

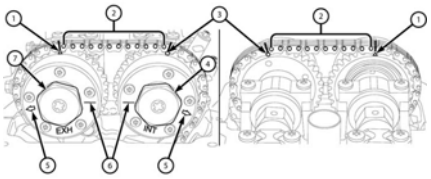


2658587

NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by installing the exhaust cam phaser and repeating Step 10 of the Removal procedure (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Removal) .



NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

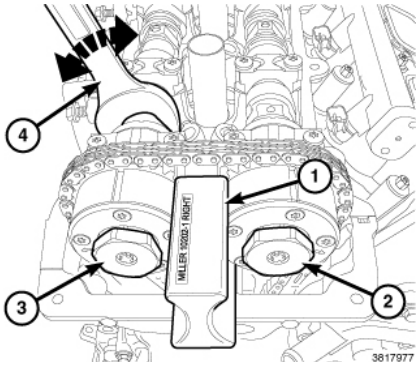


3. Route the cam chain around the right exhaust cam phaser while aligning the paint mark with the phaser timing mark (1). Press the right exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

4. While maintaining this alignment, route the cam chain around the intake cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (4).

5. The **ARROWS** (5) on the cam phasers should point away from each other and the **SCRIBE LINES** (6) should be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

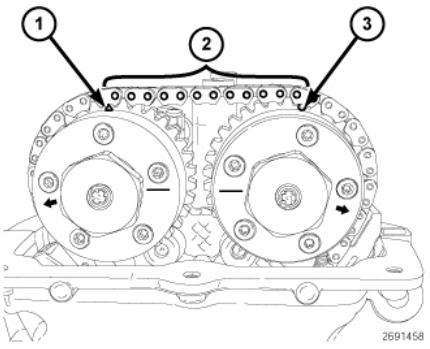


6. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (1) against the cylinder head cover mounting surface with the tool number facing up.

7. Tighten the oil control valves (2) and (3) to 150 N·m (110 ft. lbs.).

8. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.

9. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;



- The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
- The **ARROWS** (4) on the right side cam phasers point away from each other.
- The **SCRIBE LINES** (5) on the right side cam phasers are parallel to the cylinder head cover mounting surface.
- There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

10. If the engine timing is not correct, repeat this procedure.

11. Install the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

12. Install the left ignition coils (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation)

13. Install the right cylinder head cover and right ignition coils (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation)

14. Install the upper intake manifold and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

16. Start the engine and perform the following Powertrain Verification Tests (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure):

    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE:

Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing) for any DTCs that reset.

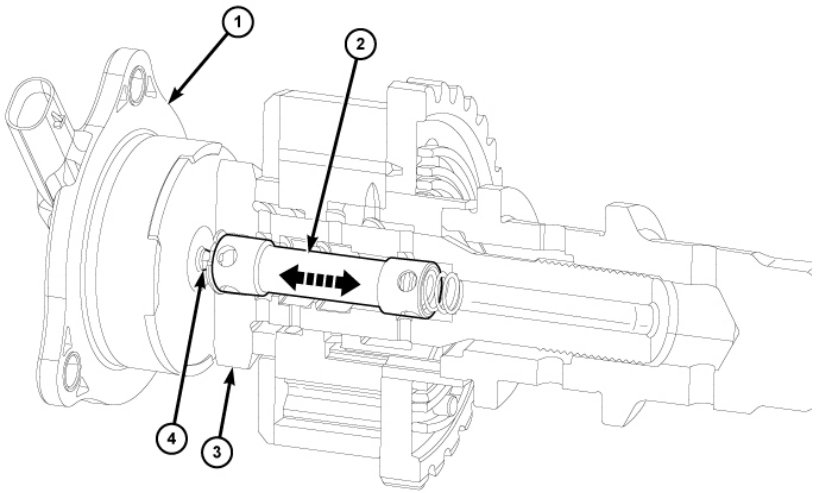
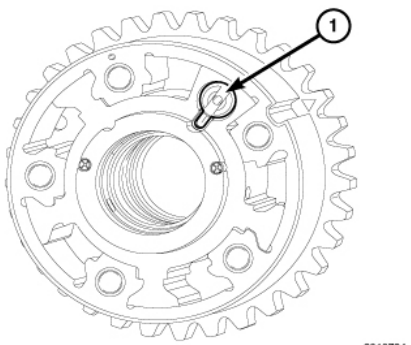
OPERATION



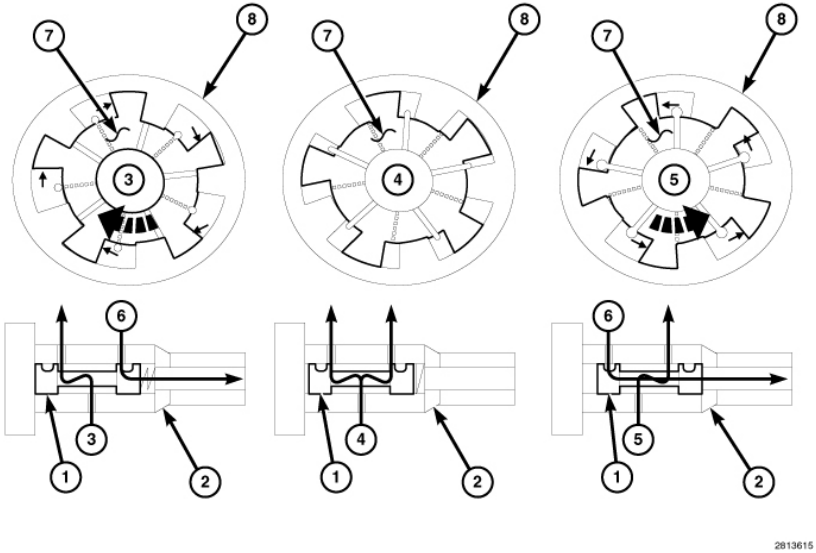
2811799

Each phaser position is adjusted using regulated oil pressure through the Oil Control Valve (OCV) (3). To begin phaser movement, a voltage signal is applied to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow.

At engine startup, system oil pressure overcomes spring pressure and unlocks the phaser lock-pin (1) in preparation for phasing. The phasers remain in this position until a PCM signal is given to pulse-width modulate the VVT solenoid. At engine shutdown, as oil pressure is reduced, both Phasers return to their lock-pin position (1). However, because the exhaust Phaser needs to travel to a position above and beyond the standard camshaft clockwise rotation, the assistance of a clock spring is required. The intake Phaser on the other hand, simply relies on the torsional resistance from the valvetrain to push it back towards lock-pin position.



2813724



The position of the spool valve (1) inside the OCV (2) determines which ports and chambers inside the phaser are being fed, either to advance (3), hold (4) or retard (5) the timing of the phaser sprocket relative to the camshaft. The spool valve also returns oil from the chambers to the sump (6). The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM. As oil pressure pushes against the vanes (6) of the phaser rotor, the rotor begins to move. Since this rotor is physically attached to the camshaft, rotor rotation causes the camshaft position to rotate relative to the standard sprocket (7) position.

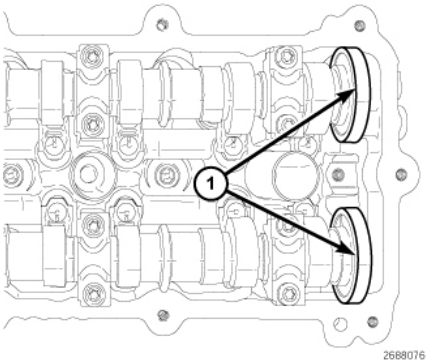
Fuel Delivery: | **Fuel:**

LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION:

The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

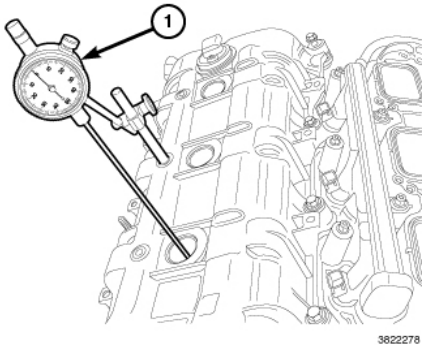


1. Remove the upper intake manifold, left ignition coils and left cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)

2. Remove the right ignition coils and all spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

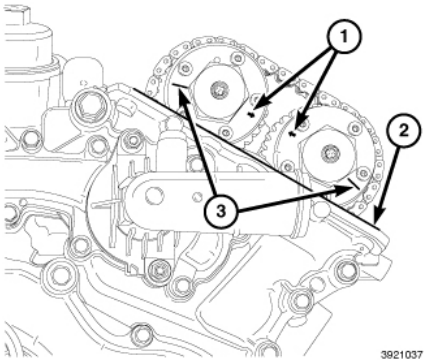
CAUTION:

When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.



3. Mount Dial Indicator Set C-3339A (1) to a stationary point on the engine, such as the number three cylinder ignition coil mount. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

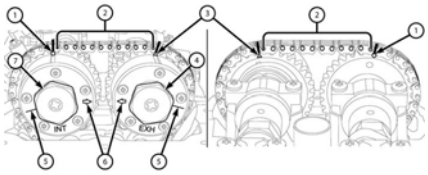
4. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2) when the number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



NOTE:

The cam phaser timing markings (1 and 3) could align with either an external or internal chain link. Either

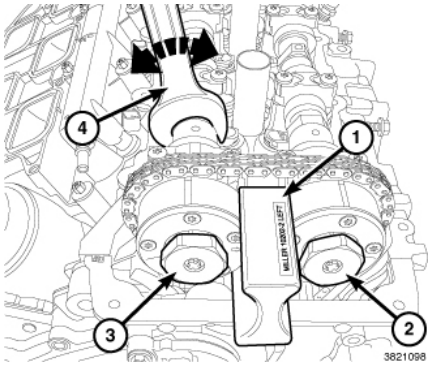
alignment is acceptable as long as there are twelve chain pins (2) between the markings.



NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1) as viewed from either the front or rear of the cam phasers.

6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

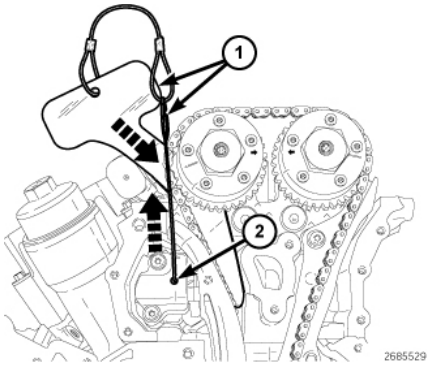


NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (1) against the cylinder head cover mounting surface with the tool number facing up.

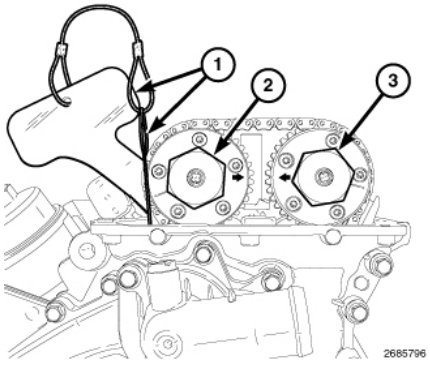
8. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).

9. Remove the Lock, Camshaft/Phaser, Left Side 10202-2 (1).



NOTE: Graphic shows engine timing cover removed for clarity.

10. Using Pin 10200-3 (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push Holder, Timing Chain, Left Side 10200-1 (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder remains in place while the phasers are removed (Refer to 09 - Engine/Valve Timing - Standard Procedure) .



11. Remove the oil control valve (4) and pull the left side exhaust cam phaser off of the camshaft.

12. Remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

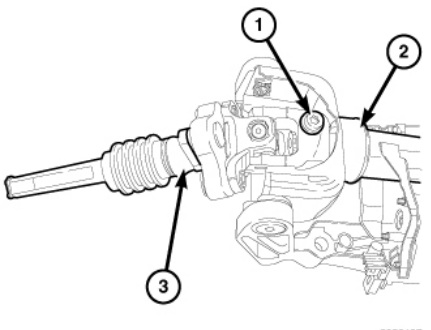
(Refer to 10 - Restraints/CLOCKSPRING/Standard Procedure) .

NOTE: When removing the column to service the upper intermediate shaft, it is not necessary to remove the steering wheel and Steering Column Control Module; the column can be removed as an assembly.



1. Remove the steering column from the vehicle (Refer to 19 - Steering/Column - Removal) .
2. Remove the coupler pinch bolt (1).
3. Slide the upper intermediate shaft (3) off the splines of the steering column.

Fuel Delivery: | **Fuel:**

DESCRIPTION

WARNING:

Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION:

Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

To find the coolant needed, (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

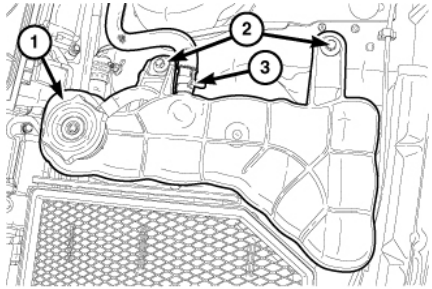
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure



2912996

1. Partially drain cooling system using the draincock only (Refer to 07 - Cooling - Standard Procedure) . Drain system below level of the coolant recovery pressure container.
2. Remove coolant recovery container pressure cap (1).
3. Remove and plug coolant recovery tube (3).
4. Remove mounting screws (2).
5. Pull the coolant recovery container away from the body.
6. Remove the coolant supply line from the coolant recovery container.
7. Remove coolant recovery container from vehicle.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

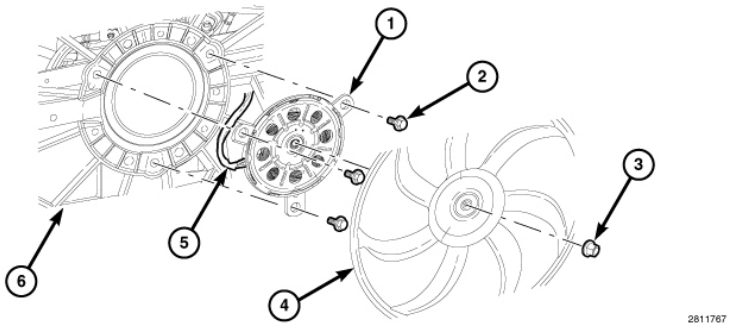
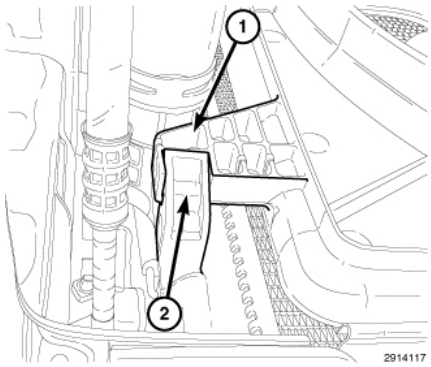
3.6L DUAL FAN

Labor Operations: Click to display a list of Labor Operations associated with this procedure

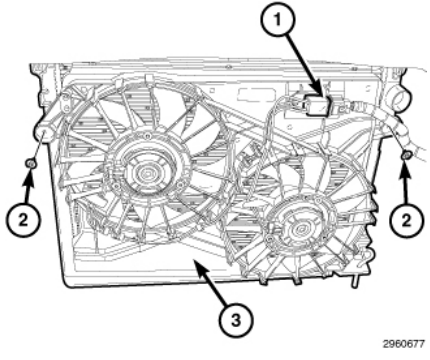


1. Install the fan blade (4) to the fan motor. Tighten the nut (3) to 6 N·M (50 in. lbs.).
2. Position the fan motor assembly to the shroud (6).
3. Install the bolts (2) that support the fan motor to the shroud. Tighten the nut (3) to 6 N·M (50 in. lbs.).
4. Route the fan motor wiring harness (5) through the fan shroud (6).
5. Position radiator cooling fan assembly (1) in vehicle.
6. Guide the fan (1) into the lower radiator mounts (2).



7. Install cooling fan mounting bolts (2). Tighten to 6 N·m (50 in. lbs.)
8. Connect cooling fan electrical connector (1).
9. Install the air filter housing (Refer to 09 - Engine/Air Intake System/BODY, Air Cleaner - Installation) .
10. Connect the negative battery cable.

11. Operate engine until it reaches normal operating temperature.



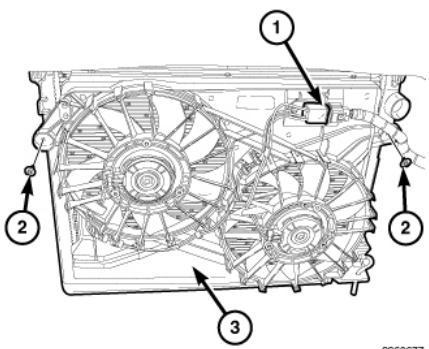
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

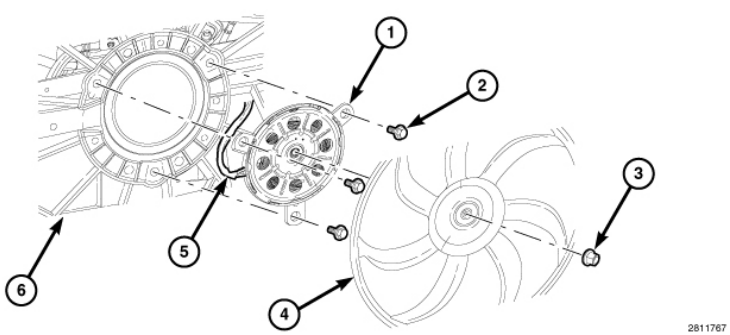
3.6L DUAL FAN

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect negative battery cable.
2. Remove the air filter housing assembly (Refer to 09 - Engine/Air Intake System/BODY, Air Cleaner - Removal)
3. Disconnect the cooling fan electrical connector (1).
4. Remove the cooling fan mounting bolts (2).
5. Using care. Remove the radiator cooling fan assembly (3) from vehicle.





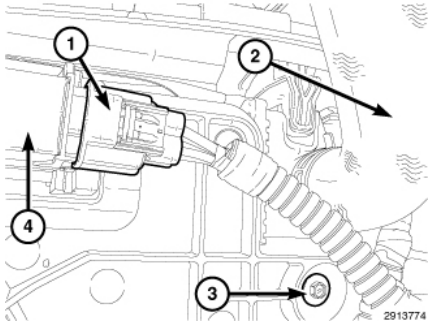
6. Removing the fan motor wiring harness (5) from the fan shroud (6).
7. Remove the fan blade (4) from the fan motor.
8. Remove the bolts (2) that support the fan motor to the shroud.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L SINGLE FAN

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.



1. Disconnect negative battery cable.
2. Remove the air filter housing assembly (Refer to 09 - Engine/Air Intake System/BODY, Air Cleaner - Removal)
3. Disconnect the cooling fan electrical connector (1).
4. Remove the upper cooling fan mounting bolts (3).
5. Remove the cooling fan assembly from the vehicle taking care not to damage the fins on the radiator.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

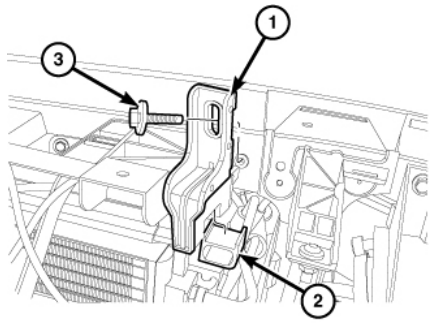
3.6L

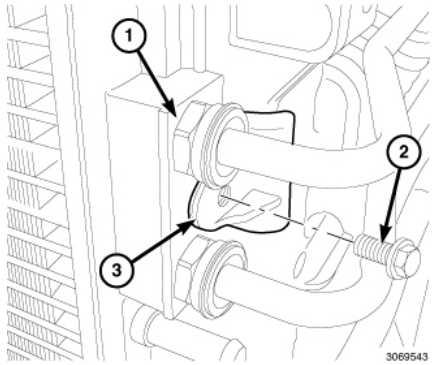
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the radiator into engine compartment. Seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support .
2. Install the radiator mounting bracket (1) and bolts (2). Tighten to 12 N·m (106 in. lbs.).



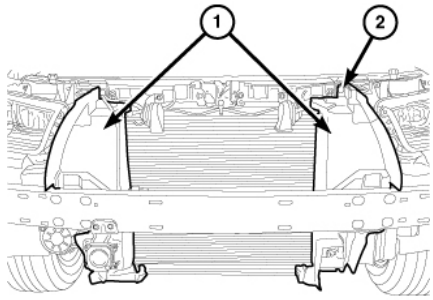
3069474

3. Position the condenser on radiator and loosely install the support bolt.
4. Install upper and lower mounting bolt. Tighten bolts to 10 N·m (88 in. lbs.).
5. Tighten the support bolt to 10 N·m (88 in. lbs.).



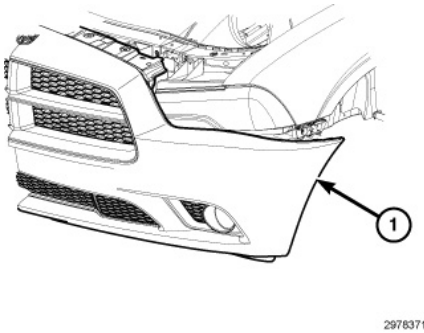
3069543

6. Install the air deflectors (1).
7. Position the hood latch release cable (2) through the notch in deflector.



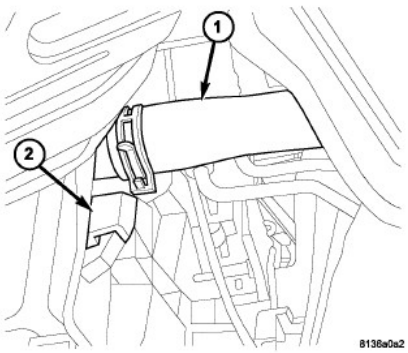
3069454

8. Install the front bumper fascia (Refer to 13 - Frame and Bumpers/Bumpers/FASCIA, Front - Installation) .

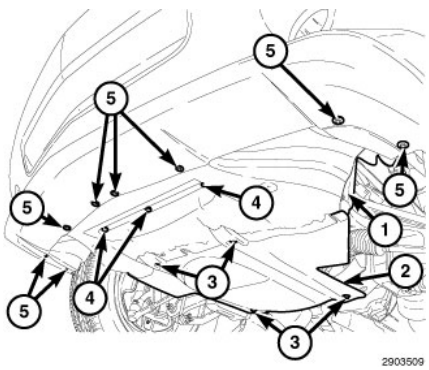


9. Raise the vehicle.

10. Install the lower radiator hose (1) and clamp.



11. Install the lower engine cover.



12. Lower vehicle.

13. Install the radiator fan (Refer to 07 - Cooling/Engine/FAN, Cooling - Installation) .

14. Install the upper radiator upper hose (2). Align hose so it does not interfere with the accessory drive belt or engine. Position hose clamp so it will not interfere with the hood.

15. Connect the negative cable.

16. Fill the cooling system with coolant (Refer to 07 - Cooling - Standard Procedure) .

17. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

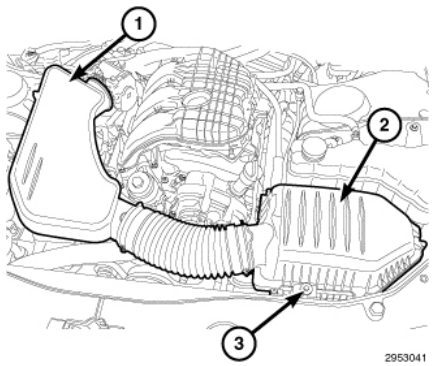
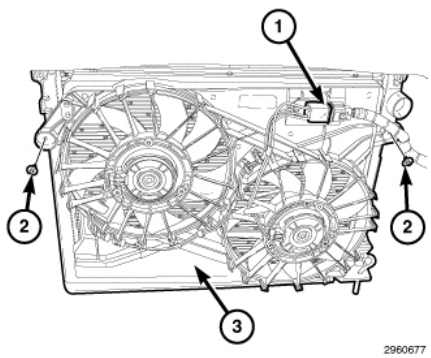
Labor Operations: Click to display a list of Labor Operations associated with this procedure

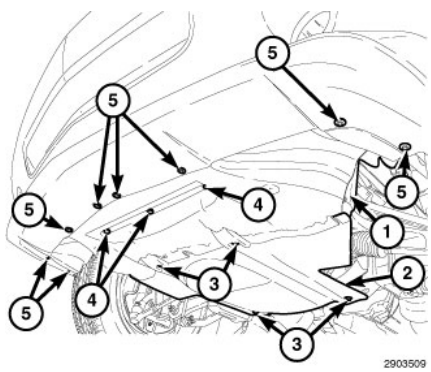
1. Disconnect negative battery cable.
2. Remove the air intake assembly.
3. Drain cooling system (Refer to 07 - Cooling - Standard Procedure) .
4. Remove upper radiator hose.



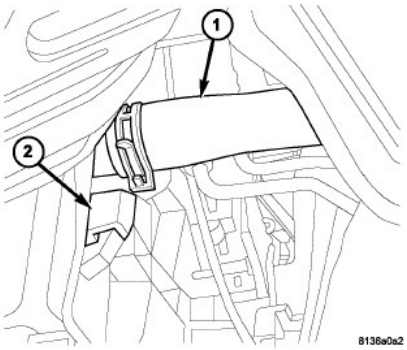
5. Remove radiator fan assembly (3) (Refer to 07 - Cooling/Engine/FAN, Cooling - Removal) .



6. Raise vehicle.
7. Remove the lower engine cover.

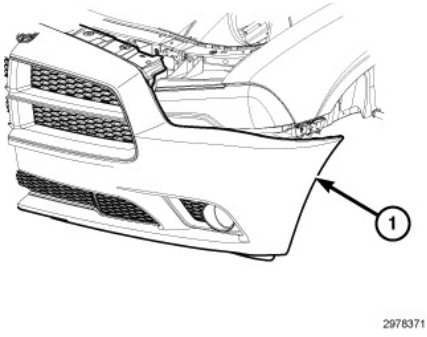


8. Remove lower radiator hose (1).

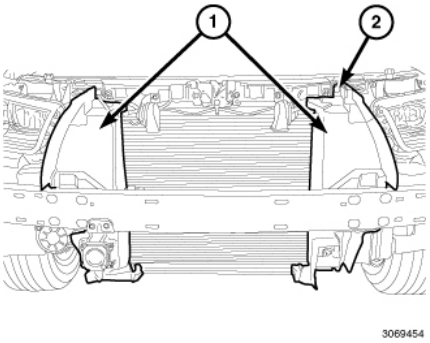


9. Lower vehicle.

10. Remove the front bumper fascia (Refer to 13 - Frame and Bumpers/Bumpers/FASCIA, Front - Removal) .



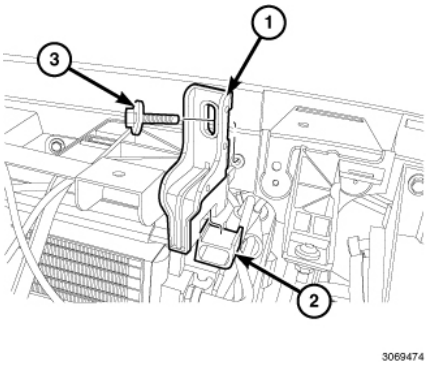
11. Remove the air deflectors (1).



CAUTION: **Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.**

12. Remove upper radiator mounting brackets bolts (3).

13. Remove the upper radiator brackets (1) from the radiator supports (2)



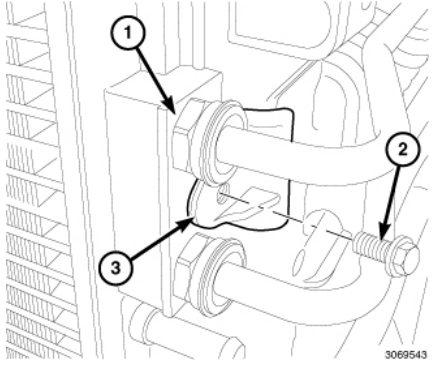
14. Remove the lower condenser mounting bolts.

15. Remove the support bolt (2) located between the cooler lines.

16. Using a suitable hanger. Support the condensor and remove the right side upper mounting bolt.

17. Separate condenser assembly from radiator.

18. Tilt radiator toward engine and remove radiator from vehicle.



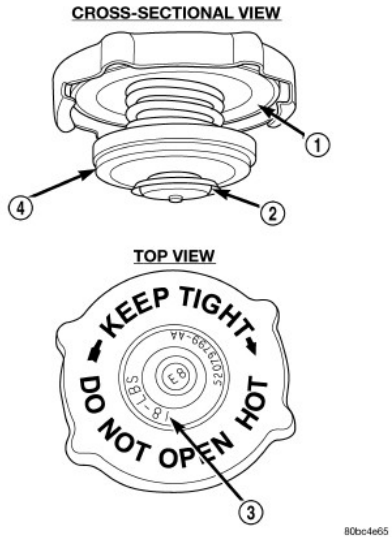
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

All cooling systems are equipped with a pressure cap on the radiator. This cap releases pressure at some point within a range of 110-144 kPa (16-21 psi). The pressure relief point (in pounds) is engraved on top of the cap (3).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve (4). This valve opens when system pressure reaches the release range of 110-144 kPa (16-21 psi).

A rubber gasket (2) seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

CAUTION: **Do not operate an engine without a thermostat, except for servicing or testing.**

A pellet-type thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warm-up time, unreliable warm-up performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

The thermostat is part of the housing.

Fuel Delivery: | **Fuel:**

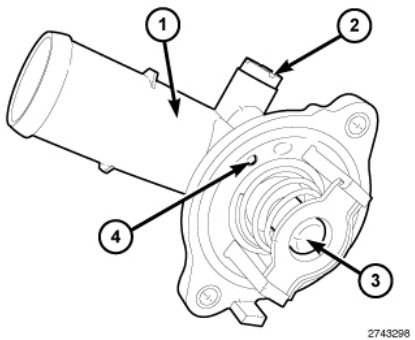
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION: **The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.**

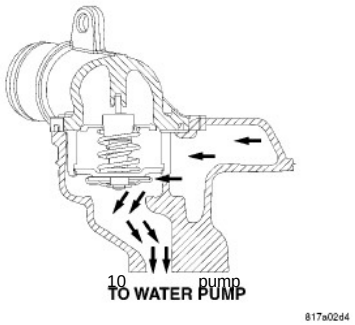


1. Clean mating areas of timing chain cover and thermostat housing (1).
2. Install a new gasket on to the thermostat housing.
3. Position thermostat housing (1) on the water crossover.
4. Install two thermostat housing bolts. Tighten bolts to 12 N·m (106 in. lbs.).
5. Install upper radiator hose on thermostat housing (1).
6. Fill cooling system (Refer to 07 - Cooling - Standard Procedure) .
7. Install the air intake system (Refer to 09 - Engine/Air Intake System/BODY, Air Cleaner - Installation) .
8. Connect negative battery cable to battery.
9. Start and warm the engine. Check for leaks.

OPERATION

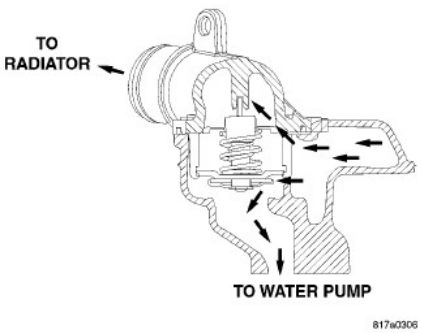
WARM-UP PHASE

Up to a coolant temperature of approximately 87° C (189° F), the main valve is closed and the bypass valve fully open. The flow through the radiator is interrupted and coolant flows through the bypass passage directly to the inlet side of the water pump.



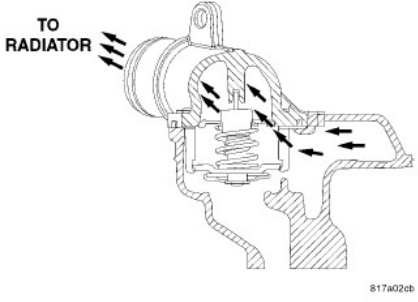
PARTIAL-LOAD PHASE

The main valve begins to open at a coolant temperature of 86° C (189° F), and a small amount of coolant flows through the radiator. As the engine temperature increases, the main valve opens further and the bypass valve gradually closes. More coolant flows through the radiator and less coolant flows through the bypass passage.



FULL-LOAD PHASE

The main valve is fully open at a coolant temperature above 102° C (216° F). The bypass plate seals off the bypass passage. The entire quantity of coolant flows through the radiator.

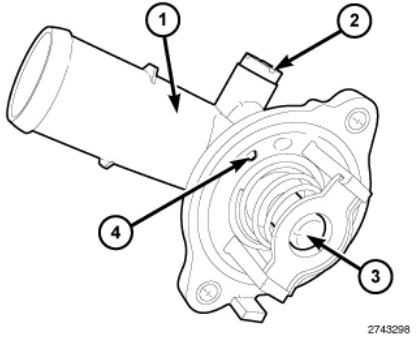


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L COOLANT CROSSOVER

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Remove the thermostat housing assembly (Refer to 07 - Cooling/Engine/THERMOSTAT - Removal) .



2. Remove the Heater supply hose from the coolant crossover (1).
3. Remove the coolant crossover mounting bolts. Take notice to the four bolts (2) that bolt directly to the timing cover.
4. Remove the coolant crossover and discard Gaskets.

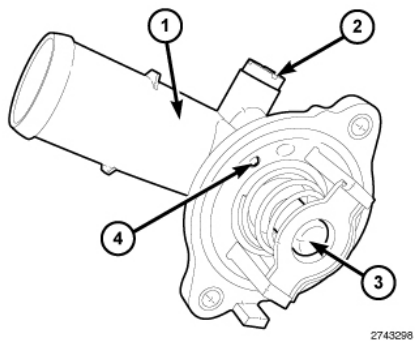
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.**

CAUTION: **The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.**



Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

1. Disconnect negative battery cable at battery.
2. Remove the air intake assembly (Refer to 09 - Engine/Air Intake System/BODY, Air Cleaner - Removal) .
3. Drain cooling system (Refer to 07 - Cooling - Standard Procedure) .
4. Remove upper radiator hose clamp and upper radiator hose at thermostat housing (1).
5. Remove thermostat housing mounting bolts, thermostat housing (1) and thermostat (3).

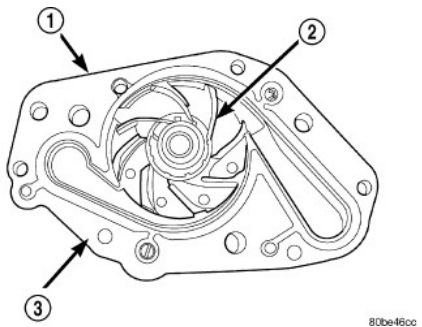
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

A centrifugal water pump (2) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine main drive belt.

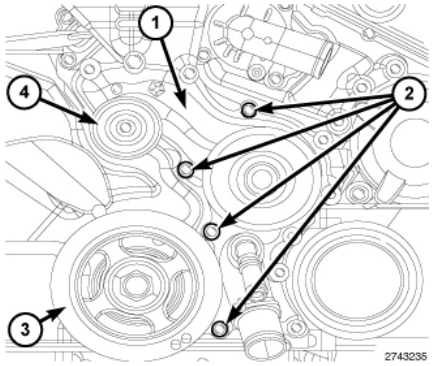
The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

The water pump (1) is mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.



3.6L

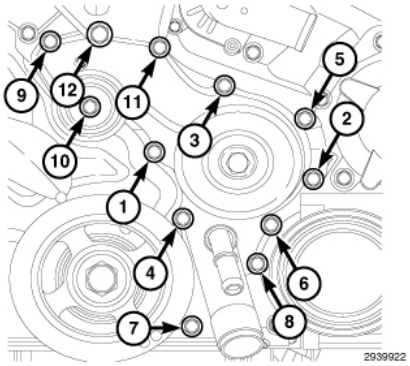
Labor Operations: Click to display a list of Labor Operations associated with this procedure



1. Clean mating surfaces.

NOTE: Take notice the lengths of the mounting bolts. Some M6 bolts mount directly to the timing cover (2).

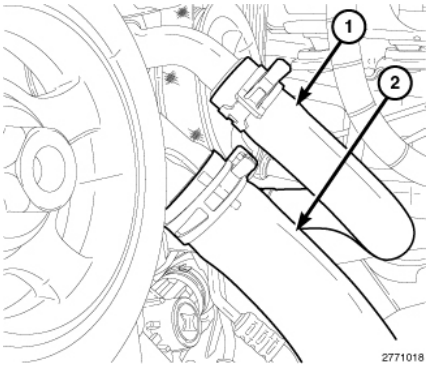
2. Using a new gasket, position water pump (1) and hand tighten the M6 mounting bolts.
3. Hand tighten the idler pulley (4) bolt.
4. Hand tighten the upper M8 and M10 water pump to engine block mounting bolts.



NOTE: Tightening the water pump fasteners in sequential order, will insure proper sealing surface.

5. Tighten the bolts 1 - 12 in the sequence shown. Tighten the bolts to their respective torque:
   - Tighten M6 mounting bolts to 12 N·m (9 ft. lbs.).
   - Tighten M8 bolts to 25 N·m (18 ft. lbs.).
   - Tighten M10 bolt to 55 N·m (41 ft. lbs.).
   - Repeat the tightening sequence until the proper torque has been met.
6. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.

CAUTION: **A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.**

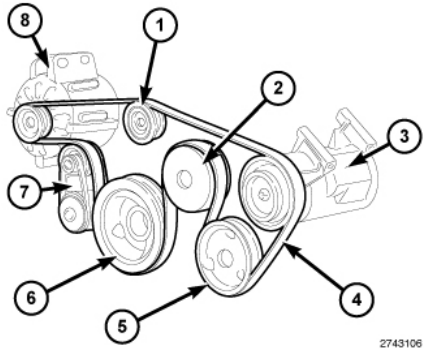


7. Install the lower radiator hose (2).
8. Install the lower return heater hose (1).

CAUTION: **When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction.**

9. Install accessory drive belt (4) (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Installation) .

10. Evacuate air and refill cooling system. (Refer to 07 - Cooling - Standard Procedure) .

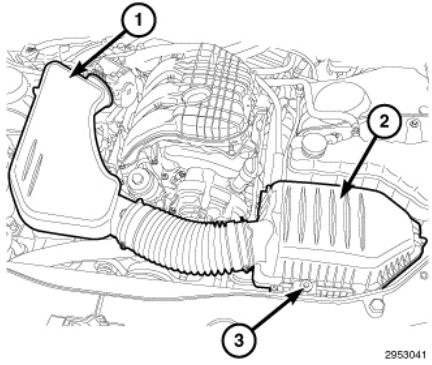


11. Install the air intake hose and resonator (1) assembly at the air filter housing.

12. Connect the intake air temperature sensor.

13. Connect negative battery cable.

14. Check the cooling system for leaks (Refer to 07 - Cooling - Diagnosis and Testing) .

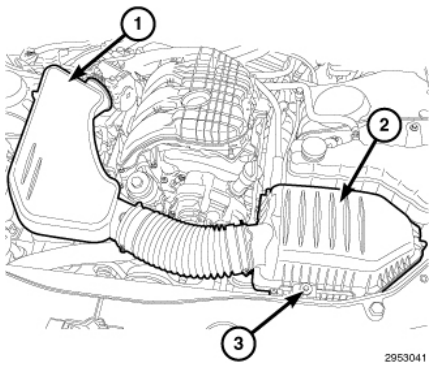


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

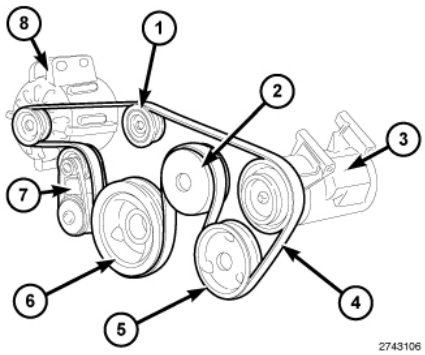
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: The water pump on 3.6L engines is bolted directly to the engine timing chain case cover.

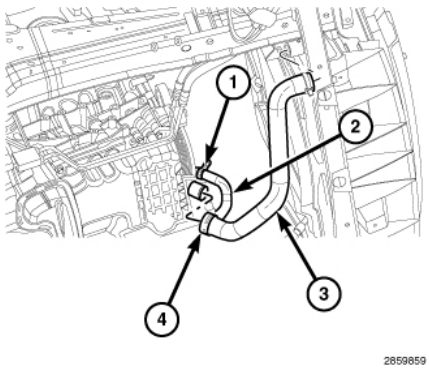


1. Disconnect negative battery cable from battery.
2. Remove the air intake system and the air filter box cover (2) as an assembly.
3. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .
4. Remove the accessory drive belt (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Removal) .



WARNING: **Constant tension hose clamps are used on most cooling system hoses. When removing or installing, use only tools designed for servicing this type of clamp. Always wear safety glasses when servicing constant tension clamps.**

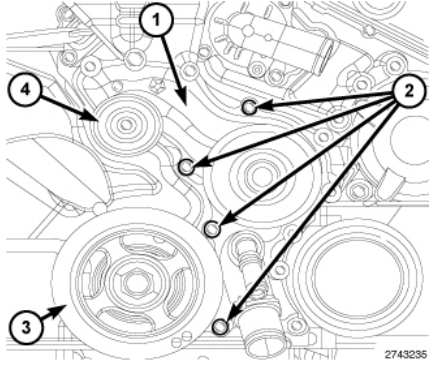
CAUTION: **A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.**



5. Remove the lower heater hose (1) at the water pump and position aside.
6. Remove the lower radiator hose (3) from the water pump and position aside.
7. Remove idler pulley (4) (Refer to 07 - Cooling/Accessory Drive/PULLEY, Idler - Removal) .
8. Remove the eleven water pump mounting bolts. Take notice to the four water pump bolts (2) that bolt directly to the timing cover.

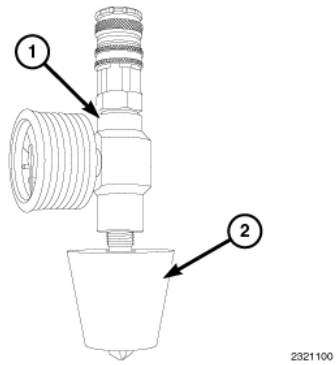
CAUTION: **Do not pry on the water pump at the timing chain case/cover. The machined surfaces may be damaged resulting in leaks.**

9. Remove water pump (1) and discard gasket.



STANDARD PROCEDURE - COOLANT AIR EVACUATION

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.



NOTE: To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.

WARNING: **ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.**

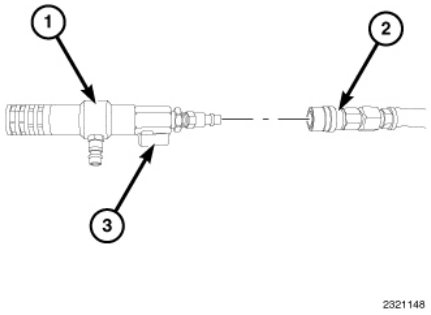
WARNING: **WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.**

NOTE: The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.

NOTE: For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).
4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).

5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

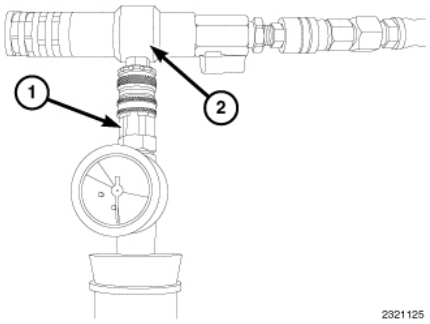


2321148

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).

7. Open the vacuum generator/venturi ball valve.

NOTE: Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.



2321125

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: If a strong vacuum is being created in the system, it is normal to see the radiator hoses to collapse.

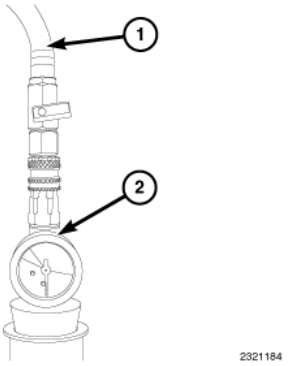
9. Close the vacuum generator/venturi ball valve.

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.

11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.

12. Place the tool's suction hose into the coolant's container.

NOTE: Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.



2321184

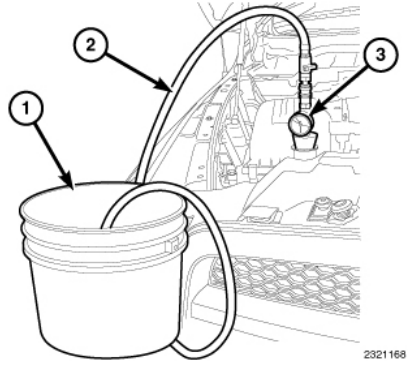
13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

NOTE: View typical

14. Open the suction hose's ball valve to begin refilling the cooling system.

15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.



16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.

17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.

18. With heater control unit in the HEAT position, operate engine with container cap in place.

19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.

20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.

21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: **Do not use coolant additives that are claimed to improve engine cooling.**

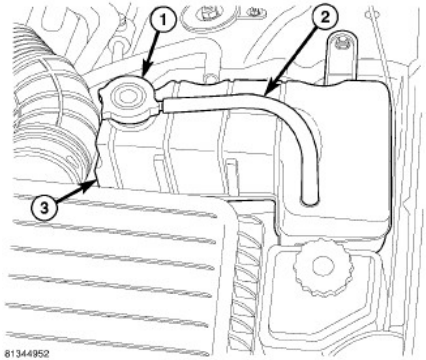
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

COOLANT LEVEL CHECK

NOTE:

Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).

The coolant reserve/overflow system provides a quick method for determining coolant level. With engine not running, the coolant level should be between MIN and MAX marks (3). If the coolant level is at or below the MIN mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

ENGINE COOLANT

WARNING:

Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION:

Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in sever engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

OAT coolant is purple in color. It cannot be mixed with other types of coolant including Chrysler's existing HOAT coolant and only should only be mixed with approved OAT coolant of the same color. Maintenance of the cooling system is not required unless a repair has been made with loss of coolant or the coolant has been contaminated.

CAUTION:

Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

CAUTION:

Do not use coolant additives that are claimed to improve engine cooling.

MONITORED COMPONENT

25-0000-00000-30-COMPREHENSIVE-COMPONENTS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Purge
- Misfire
- Natural Vacuum Leak Detection (NVLD)

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

1. Circuit Continuity
    - Open
    - Shorted high
    - Shorted to ground
2. Rationality or Proper Functioning

- Inputs tested for rationality
- Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1- trip.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the

input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Natural Vacuum Leak Detection (NVLD)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° C to 350° C (572° F to 662° F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 2.5 to 5 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporary and the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle
- Closed throttle speed

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical
- Intake Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanol content learn is taking place and the ethanol used once flag is set

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if an of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR (NGC)

DESCRIPTION—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300° C (572° F). Heating the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch
- Intake air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds

- Low fuel level
- Low ambient air temperature
- Ethanol content learn is taking place and the ethanol used once flag is set

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° C to 350° C (572° F to 662° F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° C to 350° C (572° F to 662° F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300° C (572° F). Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the Linear solenoid is de-energized to disable EGR and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy, use the scan tool to ensure that the Adaptive Numerator is learned.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

NATURAL VACUUM LEAK DETECTION (NVLD)

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

The NVLD seals the canister vent during engine off conditions. If the EVAP system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H2O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the Powertrain Diagnostic for more information.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

TRIP DEFINITION

A “Trip” means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40° F (4.5° C) in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160° F (71° C)
- A “driving cycle” that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1 good trip.

VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's model year and what regulations the vehicle conforms to also if the vehicle is OBD II compliant.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

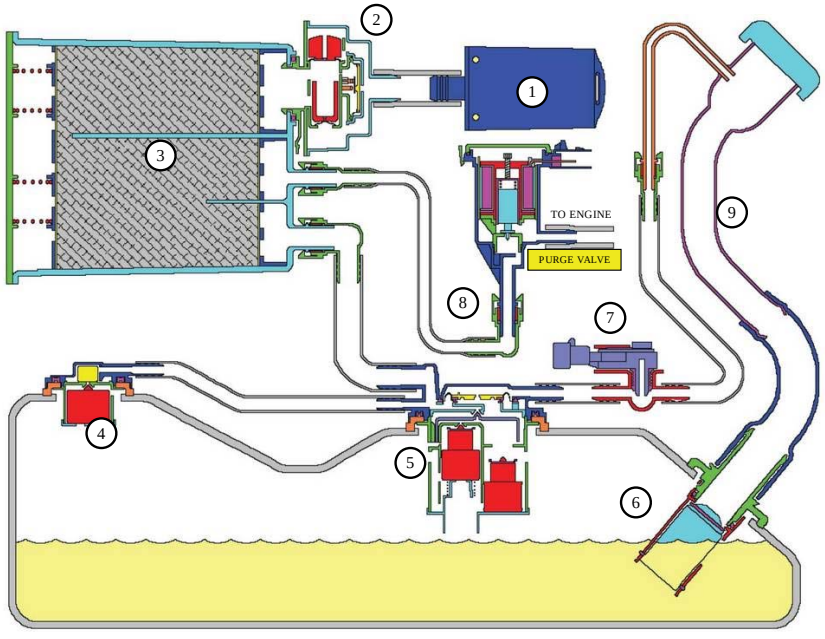
DESCRIPTION



CALL OUT	DESCRIPTION
1	Fresh Air Filter
2	Evaporative System Integrity Monitor (ESIM)
3	Evaporative Charcoal Canister
4	Fuel Tank Vent (Check Valve)
5	Control Valve
6	Inlet Check Valve
7	Fuel Tank Pressure Sensor
8	To Engine Purge Solenoid and Intake Manifold
9	Fuel Fill Tube

The evaporative emissions system is designed to control the release of fuel vapors into the atmosphere. The fuel tank check valve (4) and control valve (5) are used to reduce emissions due to the venting of vapor expansion within the fuel tank. When fuel evaporates from the fuel tank, vapors pass through a vent hose to the evaporative charcoal canister (3) where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold (8). In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hose to the evaporative charcoal canister (3) for temporary storage (prior to being drawn into the intake manifold). The fuel tank check valve (4) and control valve (5) are non-serviceable components of the fuel tank assembly. The system is equipped with self-diagnosing capability using an Evaporative System Integrity Monitor (2) (Refer to 25 - Emissions Control/Evaporative Emissions/SWITCH, Evaporative Emissions System Monitor - Operation) .

The fuel tank pressure sensor (7) provides the PCM with information on vapor pressure inside the fuel tank. Excessive fuel tank pressure could cause fuel vapors to vent out the fuel filler cap or damage system components while insufficient fuel tank pressure (vacuum) caused by lack of fresh air entering the tank (1) to take the place of consumed fuel could lead to collapsed tank, lines or loss of fuel pressure.

The inlet check valve (6) prevents fuel from splashing back on the customer during vehicle refueling. This valve is also a non-serviceable component of the fuel tank assembly.

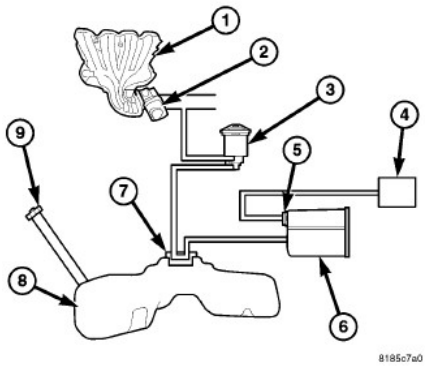
OPERATION

The ESIM (Evaporative System Integrity Monitor) is very similar to the NVLD. However, the design of the ESIM has been simplified and unlike the NVLD the ESIM does not require a solenoid. The ESIM mounts directly to the canister, eliminating the need for a mounting bracket. It is critical that the ESIM is mounted vertically. On vehicles where the canister is mounted on an angle, the ESIM requires an adaptor to maintain a vertical position. When the ESIM is installed vertically, the electrical connector is in the 3 o'clock position.



SYSTEM

4 - Filter

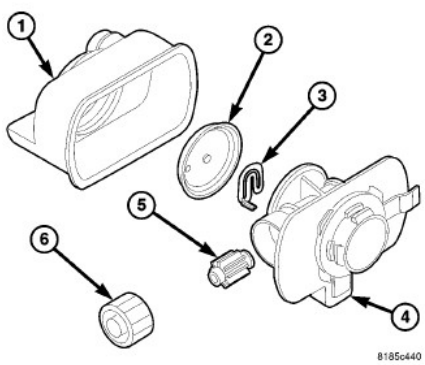
5 - ESIM

6 - Vapor Canister

7 - Control Valve

8 - Fuel Tank

9 - Gas Cap



EXPLODED VIEW

The ESIM assembly consists of a housing, a small weight and a large weight that serve as check valves, a diaphragm, a switch and a cover. There is one large weight and one small weight check valve in the ESIM assembly. A seal is attached at the end of each weighted check valve. The large weight check valve seals for pressure. The small weight check valve seals for vacuum. The weighted check valves are contained within the ESIM housing.

3 - Switch

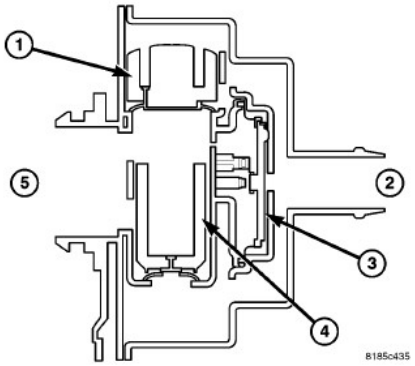
4 - Cover

5 - Small Check Valve

6 - Large Check Valve

The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does – controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM.

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.



CUT AWAY OF MODULE

1 - Large Check Valve

2 - Fresh Air Inlet

3 - Diagram

4 - Small Check Valve

5 - Vapor Canister

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately .5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools and the resulting vacuum lifts the small check valve from its seat and allows fresh air to enter the system and relieve the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

The ESIM weights seal the evap. system during engine off conditions. If the evap. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1” H20, the vacuum switch closes. The switch closure sends a signal to the NGC. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

- After the vehicle is started, the engine coolant temperature must be within 10° C (50°F) of ambient to indicate a cold start.
- The fuel level must be between 12% and 88%.
- The engine must be in closed loop.
- Manifold vacuum must be greater than a minimum specified value.
- Ambient temperature must be between 4° C and 37° C (39° F and 98° F) and the elevation level must be below 8500 feet.

The test is accomplished by the NGC activating the purge solenoid to create a vacuum in the evaporative system. The NGC then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the NGC activating the purge solenoid to create a vacuum in the evaporative system. The NGC then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak

matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. IF the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. NGC monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the GPEC commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the NGC sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds, venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.

The NGC also uses the ESIM to detect a loose or missing gas cap. The NGC controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the NGC, this is a three-trip fault before the code matures

DESCRIPTION

The fuel tank pressure sensor provides the PCM with information on vapor pressure inside the fuel tank. The sensor is a diaphragm-type pressure sensor and varies its voltage output depending on fuel tank pressure. When the fuel tank isolation valve is activated (closed), preventing fuel vapors from leaving the tank, the PCM will monitor the fuel tank pressure sensor to prevent pressure from increasing or decreasing to an unsafe level.

Excessive fuel tank pressure could cause fuel vapors to vent out the fuel filler cap or damage system components while insufficient fuel tank pressure (vacuum) caused by lack of air entering the tank to take the place of consumed fuel could lead to collapsed tank, lines or loss of fuel pressure.

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

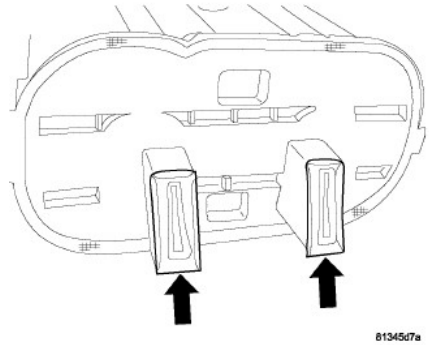
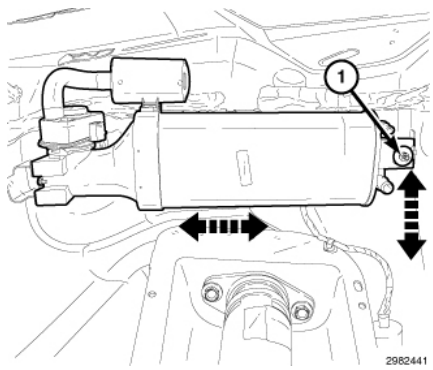
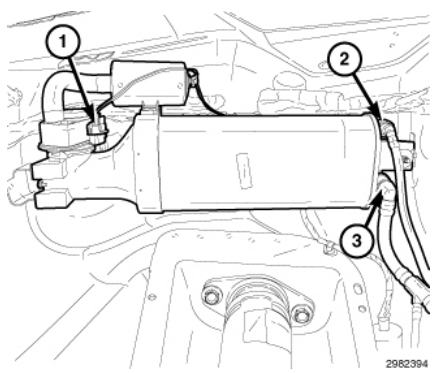
1. Install the rubber isolators into the vapor canister mounts.
2. Position the vapor canister, ESIM, and fresh air filter into the vehicle as an assembly.



3. Slide the vapor canister rubber isolators onto the mounting bracket.
4. Raise the front of the vapor canister onto the mounting stud.
5. Install the vapor canister retaining nut (1) and tighten to 9 N·m (80 in. lbs.).



6. Connect the vapor purge line (3) quick-connect fitting to the EVAP canister.
7. Connect the fuel tank vapor line (2) quick-connect fitting to the EVAP canister.
8. Connect the ESIM electrical connector (1).

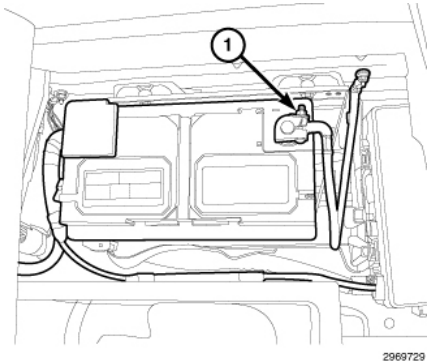


9. Install the right rear wheelhouse splash shield.
10. Install the right rear tire.
11. Lower the vehicle.

12. Install the fuel tank filler cap.

13. Connect the negative battery cable (1).

14. Start the engine and check for leaks.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

OPERATION

The following procedure has been established to assist technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE:

Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. EVAP Monitor runs after key off. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a scan tool into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for the MIL lamp illumination during the bulb check. MIL lamp must illuminate, if not, repair MIL lamp.
3. Using a scan tool check for Powertrain related DTCs.

- Verify that No Emissions Related DTCs are Present. If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
- The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.

Using the scan tool check the CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?

- YES - all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- NO - then the following procedure needs to be followed to run/complete all available monitors.

NOTE:

Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. Specific criteria need to be met for each monitor. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Evaporative Emission System Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. Criteria for EVAP monitor:

- Engine off time greater than one hour .
- Fuel Level between 15% and 85%.
- Start Up ECT and IAT within 10°C (18°F).
- Vehicle started and run until Purge Monitor reports a result.

NOTE:

If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small

leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

The Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (less than 50 mph) (73km/h) for a few minutes. Some vehicles run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria.

- Engine RPM between 1200 to 3000.
- Enginetemperature greater than 70°C (158°F)
- Engine run time greater than 92 seconds
- MAP between 10 - 20 kPa (7.5 - 15 Hg)
- Vehicle speed between 20 - 70 mph (29–103 km/h)

EGR Monitor

After the vehicle has reached the below conditions and during a throttle decel the EGR monitor will run.

- Engine RPM between 1375 - 2500
- Engine temperature greater than 70°C (158°F)
- Engine run time greater than 125 seconds
- Vehicle speed between 25 - 70 mph (37–103 km/h)

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down.

Mis-Fire Monitor

The Misfire Monitor is a continuous two-trip monitor. The monitor uses two different tests/counters:

NOTE:

The Adaptive Numerator must be learned before the PCM will run the Mis-Fire Monitor. The PCM updates the Adaptive Numerator at every key-ON, and is relearned after battery disconnect. The Misfire Monitor will not run until the Adaptive Numerator has updated since the last battery disconnect. If the Adaptive Numerator is equal to the default value then the PCM knows that the Adaptive Numerator has not been learned and does not permit the Misfire Monitor to run. If the Adaptive Numerator exceeds a calibrated percentage, the PCM sets a DTC for CKP NOT LEARNED and illuminates the MIL.

- 200 Revolution Counter - Looks for misfire that can cause immediate catalyst damage.
- 1000 Revolution Counter - Looks for misfire that can cause emissions to increase 1.5 times the Federal Test Procedure (FTP) standards. This test must also identify misfire percentages that might cause a “durability demonstration vehicle” to fail an Inspection and Maintenance Program tailpipe emissions test.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the “Task Manager”.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the thirdgood trip) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 1 One-Trip Failure of Non-Fuel or Non-Mis-Fire Fault (e.g., Cat Mon Failure)
- Priority 3 Matured Fault (either One-Trip or Two-Trip) Non-Fuel AND Non-Mis-Fire
- Priority 4 One-Trip Failure of Fuel System or Mis-Fire Fault
- Priority 6 Matured Fault for Fuel System or Mis-Fire (either One-Trip or Two-Trip)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±20% of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a scan tool. Erasing the DTC with the scan tool erases all OBD II information. The scan tool automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on scan tool)
-
    - Comprehensive Components
    - Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window

- 1000 engine revolutions with no misfire

Alternate Good Trip

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the scan tool. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F (71° C)
- Engine coolant temperature must rise by 40° F (4.5° C)
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: **Erasing DTCs, either with the scan tool, or by disconnecting the battery, also clears all Freeze Frame data.**

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** - A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

SCAN TOOL STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

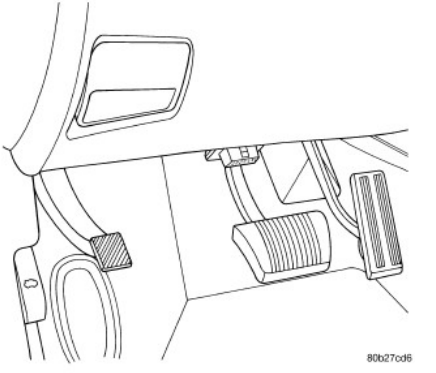
SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.



NOTE:

Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. For obtaining the DTC information, use the Data Link Connector with the scan tool .

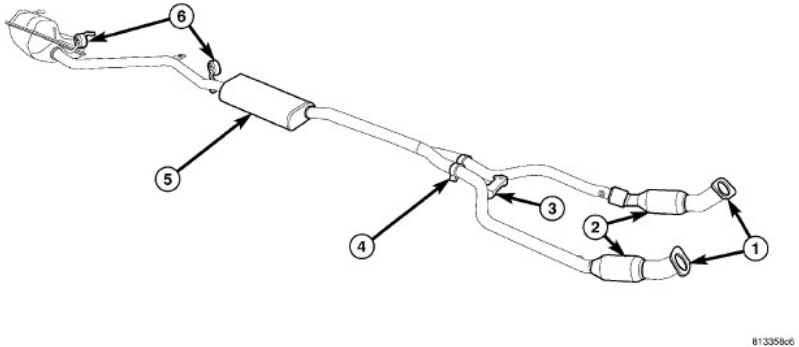
DESCRIPTION



The 5.7L close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of ball flange (1). The left and right side converter outlet pipe connects to the exhaust system. The 5.7L is bolted to the exhaust header. The 3.6L bolts directly to the integrated exhaust manifold (Refer to 09 - Engine/Manifolds /MANIFOLD, Exhaust - Description) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Check catalytic converter for a flow restriction. (Refer to 11 - Exhaust System - Diagnosis and Testing) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

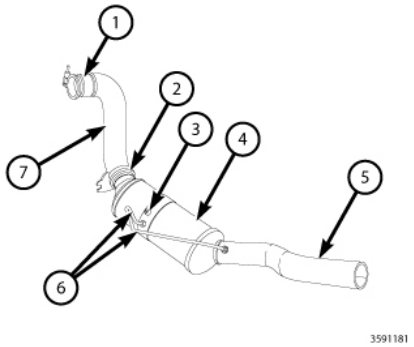
A diesel particulate filter (DPF) is installed for exhaust gas after-treatment. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO2 at exhaust temperatures over 600º C (1,112º F).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

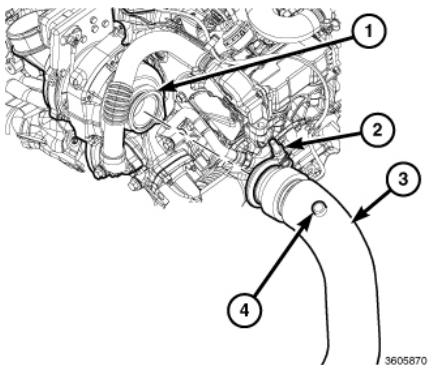
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install the steel differential pressure lines (6).
2. Position the Diesel Particulate Filter (DPF) (4) into the vehicle.
3. Loosely install the DPF outlet pipe (5) into the muffler/resonator pipe.



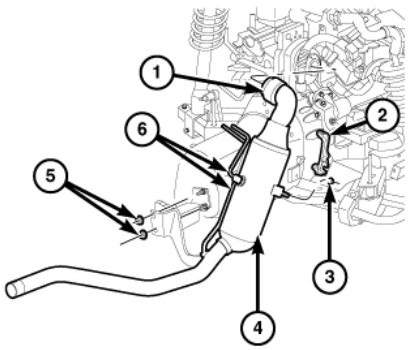
3591181

4. Lower the vehicle.
5. Position new steel gasket onto the downpipe (3).
6. Position the downpipe (3) to the turbocharger flange (1) and loosely tighten the clamp (2).



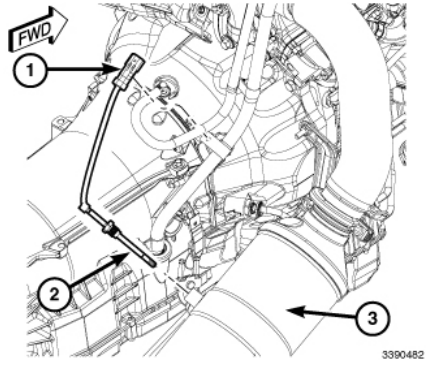
3605870

7. Raise and support the vehicle.
8. Install the front steady rest bracket (2) to the transmission. Tighten the nuts to 26 N·M (19 ft. lbs.).
9. Connect the differential pressure hoses to the steel lines (6).
10. Align the DPF to their respective mounts.
11. Tighten the front steady bracket retainer nut (3) for the DPF to 26 N·M (19 ft. lbs.).
12. Install the rear bracket support nuts (5). Tighten the nuts to 10 N·M (89 in. lbs.).
13. Tighten the muffler/resonator clamp.



3591143

14. Install the temperature sensor (2).



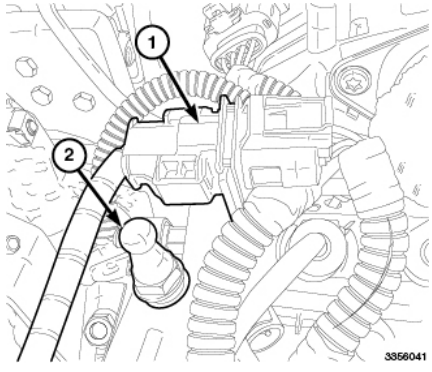
15. Lower vehicle.

16. Tighten the DPF to turbocharger outlet clamp (3) to 25 N·M (18 ft. lbs.).

17. Install the O2 sensor.

18. Reposition the transmission dipstick to the bracket and install the ball stud (2).

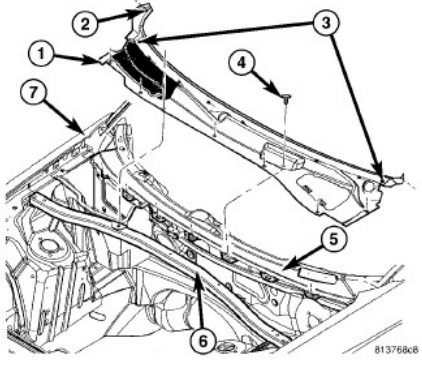
19. Connect the O2 sensor electrical connector (1) and mount it to the transmission fill tube support bracket.



20. Install the cowl assembly (1) (Refer to 23 - Body/Exterior/COVER, Cowl Panel - Installation) .

21. Install the engine cover.

22. Connect the negative battery cable.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF , which is passive regeneration. If the passive regeneration cannot keep up with the build up of soot in the DPF, the Powertrain Control Module (PCM) will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The PCM starts the regeneration of the DPF if the soot load exceeds a performance map value. The PCM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the PCM. During the regeneration process, the PCM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 ºC (1,022 ºF). After regeneration, the PCM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the PCM determines the ash quantity inside the DPF.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.

All models have a VECI Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

FUEL LEVEL SENDING UNIT and SENSOR

The fuel level sending units and sensors are integrated with both the main fuel pump module and the auxiliary fuel pump module and are not serviced separately. The appropriate fuel pump module must be replace if either fuel level sending unit is to be replaced.

For fuel pump module removal (Refer to 14 - Fuel System/Fuel Delivery/MODULE, Fuel Pump - Removal) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The fuel pressure regulator is integrated with the auxiliary fuel pump module and is not serviced separately. The auxiliary fuel pump module must be replace if the fuel pressure regulator is to be replaced.

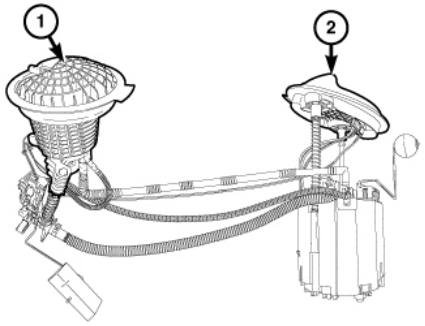
For auxiliary fuel pump module removal (Refer to 14 - Fuel System/Fuel Delivery/MODULE, Fuel Pump - Removal) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

This vehicle uses a saddle type tank that has a reservoir on both sides of the rear drive shaft. The main fuel pump module (2) is located on the left side of the vehicle and is a high flow fuel pump specifically designed for the 6.4L HEMI Engine. The auxiliary fuel pump module (1) is located the right side of the vehicle. The fuel outlet or fuel supply line is on the auxiliary fuel pump module (right side) and supplies fuel to the engine. The electrical connector is on the main fuel pump module (left side) and controls both modules. The fuel pressure regulator is integrated into the auxiliary fuel pump module and is not a serviceable component.

Both modules have fuel level sending cards. The fuel level sending cards are not serviceable components. There are 3 hoses that connect the main and auxiliary fuel pump modules together, one is the fuel supply line the other two are fuel return lines. These lines are removed from the main fuel pump module when servicing either unit. One fuel filter is used and is located at the bottom of the main fuel pump module and is designed for extended life. A separate frame mounted fuel filter is not used with any engine. The fuel filter is not a serviceable component.

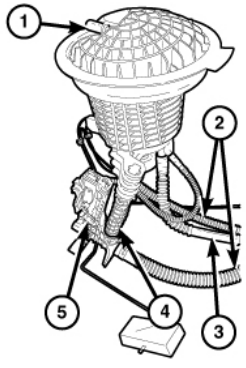


3032258

Left side main fuel pump module with electrical connector (1) and fuel level sending card (2).

3032668

Right side auxiliary fuel pump module with the fuel supply fitting (1), fuel return lines (2), fuel supply line (3), fuel pressure regulator (4) and fuel level sending card (5).



3032832

INSTALLATION

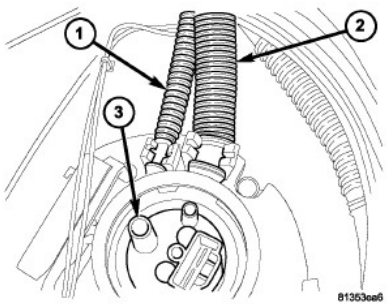
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

MAIN FUEL PUMP MODULE

WARNING: **No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.**

CAUTION: **Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

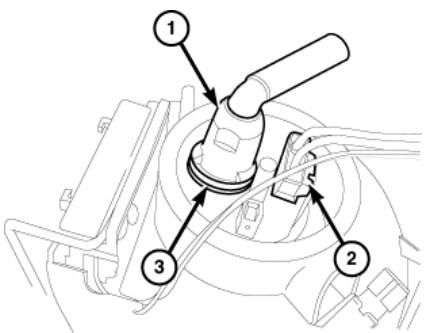
NOTE: The Auxiliary Fuel Pump Module must be installed before the Main Fuel Pump Module.



1. If the auxiliary fuel pump module is removed, see **AUXILIARY FUEL PUMP MODULE**.

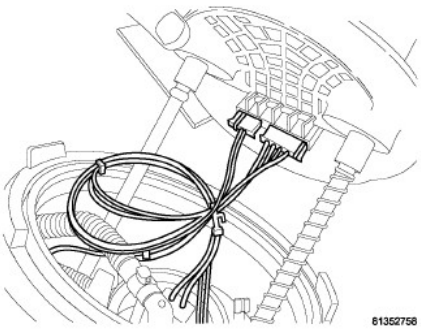
NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

2. Install a new rubber O-ring seal.
3. Using caution not to bend the float arm, lower the bottom section of the main fuel pump module into the fuel tank.
4. Connect the fuel return lines (1,2) to the main fuel pump module.
5. Connect the fuel supply line (1) to the main fuel pump module.



6. Connect the electrical connectors at the top section of the main fuel pump module.
7. Join the upper section and lower section of the main fuel pump module together.

8. Position the main fuel pump module as noted during removal.

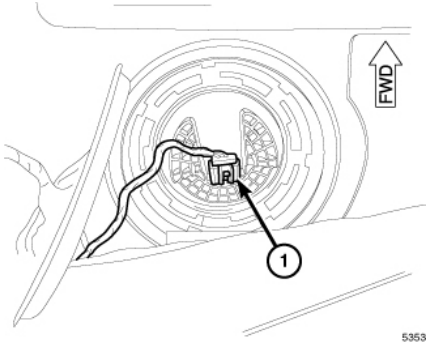


CAUTION: **Verify the electrical wires are tucked away into the fuel tank so they don't get pinched between the top of the fuel pump module and the rubber O-ring seal.**

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.**

9. Align the rubber O-ring seal and lower the main fuel pump module into position.

10. Verify the main fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

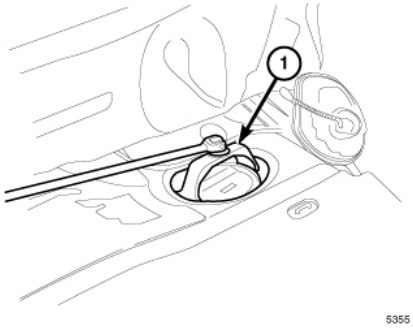


11. Position the lock ring over top of the main fuel pump module.

12. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring.

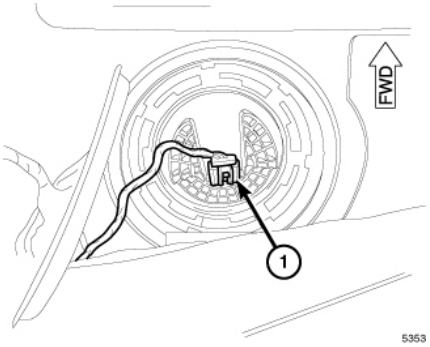
13. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench 9340 .

14. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

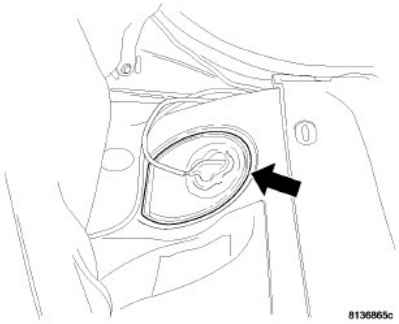


15. Connect the electrical connector (1) to the main fuel pump module.

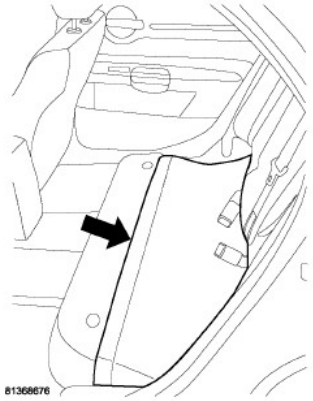
16. Fill the fuel tank and check for leaks around the rubber O-ring seal.



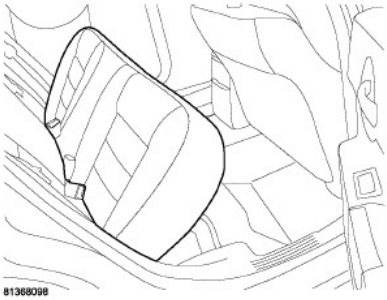
17. Install the main fuel pump module plastic access cover.



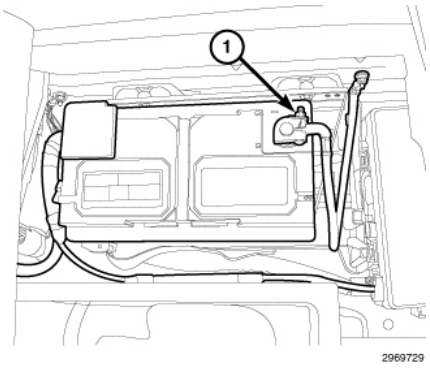
18. Lower the foam pad covering back into place.



19. Push the rear lower seat cushion back and down and install the seat cushion.



20. Connect the negative battery cable.

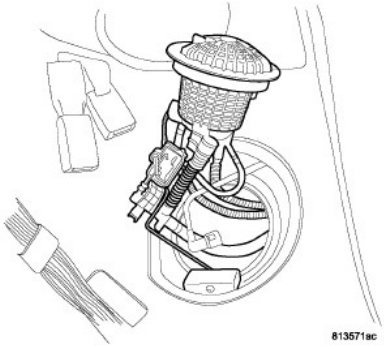


AUXILIARY FUEL PUMP MODULE

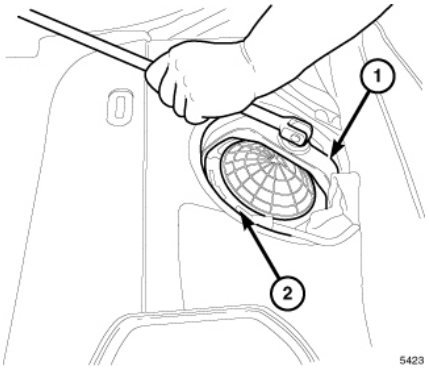
CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.**

CAUTION: **Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

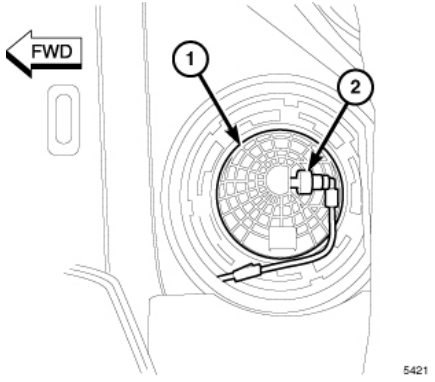
NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.



1. Install a new rubber O-ring seal.
2. Using caution not to bend the float arm, lower the auxiliary fuel pump module into the fuel tank while guiding the fuel return lines, fuel supply line and electrical connector over to the left side of the fuel tank.
3. Align the rubber O-ring seal and lower the auxiliary fuel pump module into position as noted during removal.
4. Position the lock ring over top of the auxiliary fuel pump module.
5. Verify the auxiliary fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.
6. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring (2).
7. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench 9340 (1).
8. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

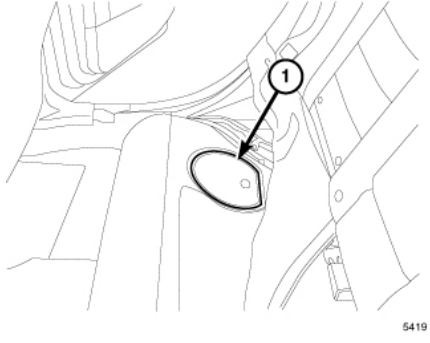


9. Connect the fuel supply line (2) to auxiliary fuel pump module (1).



10. Install the auxiliary fuel pump module plastic access cover (1).

11. Install the main fuel pump module, see MAIN FUEL PUMP MODULE.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

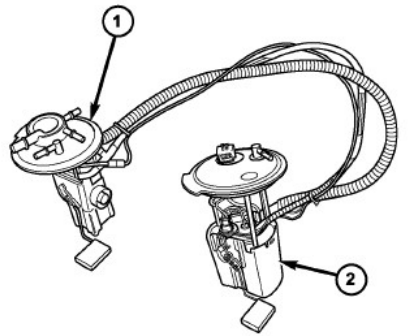
OPERATION

The way the fuel pumps work is as follows, fuel enters the reservoir of the main fuel pump module (driver side). The main fuel pump module (2) pumps the fuel through the filter to the auxiliary fuel pump module (1) (passenger side) through a supply line inside the fuel tank. The fuel pressure regulator inside the auxiliary fuel pump module regulates the pressure at 58 psi and sends fuel to the engine. All unused fuel that is not sent to the engine is fed through a venturi at the bottom of the auxiliary fuel pump module. This creates a low pressure siphoning effect and draws fuel from the passenger side of the tank and transfers it to the drivers side tank via siphon hose inside the tank. While the vehicle is running the fuel in the passenger side of tank is continuously transferred to the drivers side. Fuel will continue to fill the drivers side tank till it reaches the bridge section and then starts to spill over to the passenger side.

Both main and auxiliary fuel pumps have fuel level sender cards and the reading of these senders are averaged out to give us the fuel gauge reading. When diagnosing a fuel level sender concern, the passenger side reading should never be higher than the drivers side reading. However it is possible, depending on fuel level and driving habit before diagnosing, to spill fuel over to the passenger side that might indeed show a lower resistance value than the driver side.

The fuel gauge gives an indication to the vehicle operator the level of fuel in the fuel tank. This fuel gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired inputs received by the cluster from the fuel level sending units integrated into the fuel pump modules.

The instrument cluster continually monitors both fuel pump sender cards to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge (Refer to 08 - Electrical/8J - Instrument Cluster - Diagnosis and Testing) . The fuel gauge is serviced as a unit with the instrument cluster.



The technician needs to order the correct part when replacing the main fuel pump module, auxiliary fuel pump module and/or fuel tank as all are replaced individually.

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

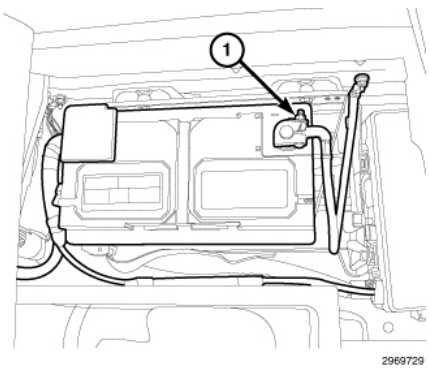
MAIN FUEL PUMP MODULE

WARNING: **The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.**

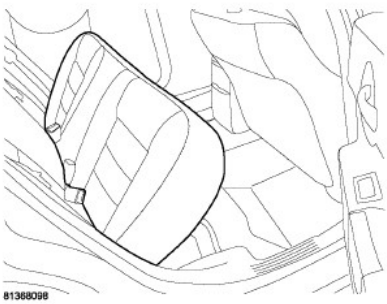
WARNING: **No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.**

CAUTION: **If the electric fuel pump module is not operating or the fuel level sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle**

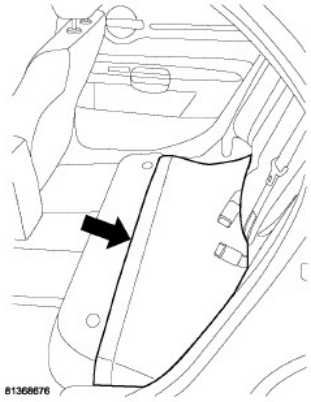
1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
3. If required, perform the draining fuel tank procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
4. Disconnect the negative battery cable.



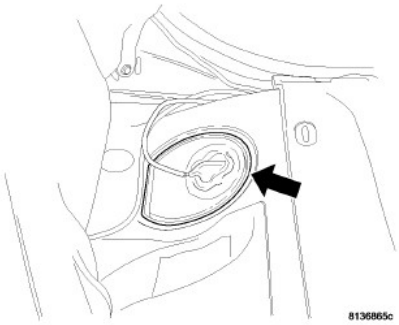
5. Push the rear lower seat cushion up and back and remove the seat cushion.



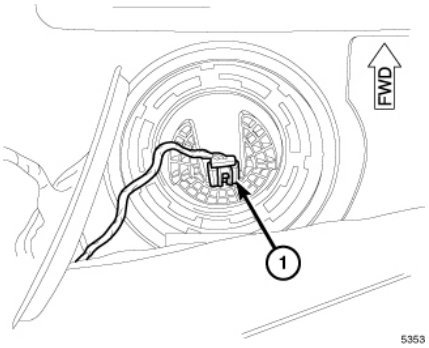
6. Fold back the foam pad covering the fuel pump module plastic access covers.



7. Remove the left side main fuel pump module plastic access cover.



8. Disconnect the electrical connector from the main fuel pump module.



CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.**

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

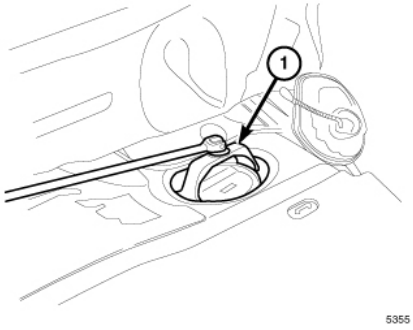
9. Mark the main fuel pump module orientation.

10. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring.

11. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench 9340 (1).

NOTE: The main fuel pump module will spring up slightly when the lock ring is removed.

12. Rotate the breaker bar counterclockwise and remove the lock ring.

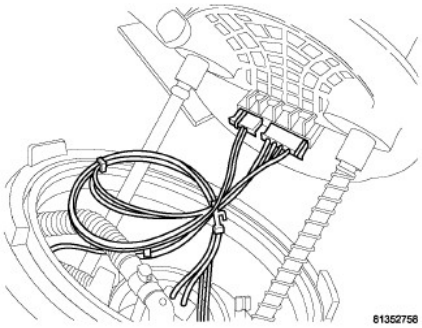


CAUTION: **Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

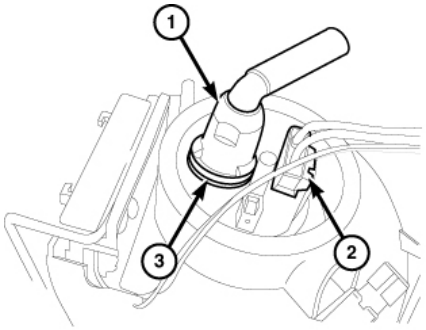
13. Raise and separate the top section from the bottom section of the main fuel pump module.

14. Disconnect the electrical connectors from under the top section of the main fuel pump module.

15. Remove the top section of the main fuel pump module from the vehicle.



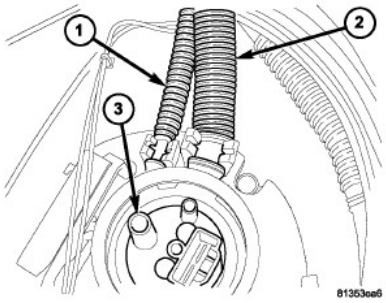
16. Press the quick connect release tab (3) and remove the fuel supply line (1) from the main fuel pump module.



17. Disconnect the fuel return lines (1,2) from the main fuel pump module.

NOTE: Do not spill fuel into the interior of the vehicle.

18. Carefully lift the bottom section of the main fuel pump module out of the fuel tank, tip the bottom section on its side and drain the remaining fuel from the bottom reservoir into the fuel tank and remove from vehicle.

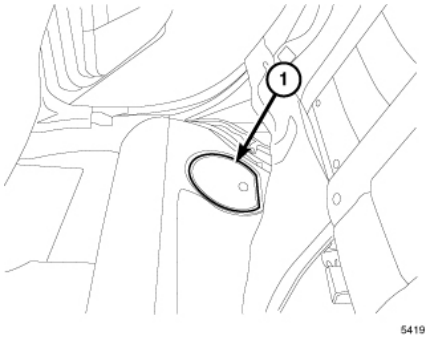


NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

19. Remove and discard the rubber O-ring seal.

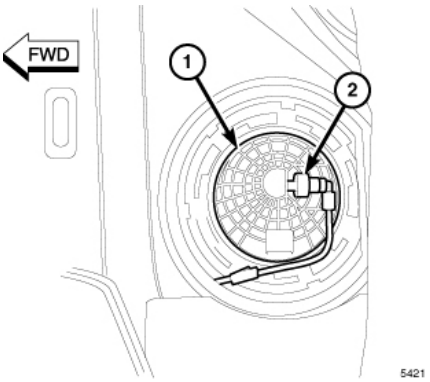
AUXILIARY FUEL PUMP MODULE

NOTE: The Main Fuel Pump Module must be removed for Auxiliary Fuel Pump Module removal.

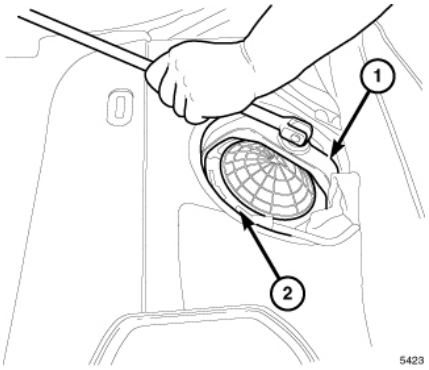


1. Remove the main fuel pump module, see **MAIN FUEL PUMP MODULE**.
2. Remove the auxiliary fuel pump module plastic access cover (1) from the floor pan.

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.



3. Disconnect the fuel supply line (2) from the auxiliary fuel pump module (1).
4. Mark the auxiliary fuel pump module orientation.



5. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring (2).
6. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench 9340 (1).
7. Rotate the breaker bar counterclockwise and remove the lock ring (2).

CAUTION: **Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

8. Lift the auxiliary fuel pump module up and out of fuel tank while guiding the fuel supply and return lines out from the left side of the fuel tank.

NOTE: Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.

9. Remove and discard the rubber O-ring seal.

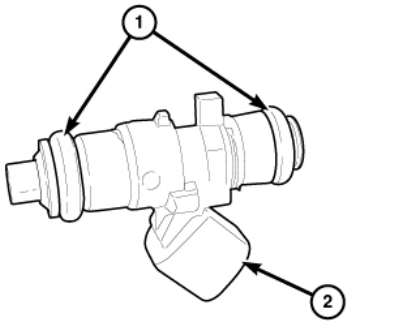
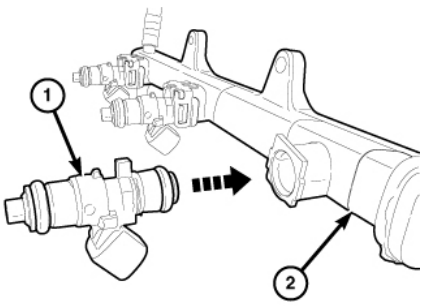
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Lightly lubricate the new O-ring seals (1) with clean engine oil and position the seals onto the fuel injector (2).



2756756

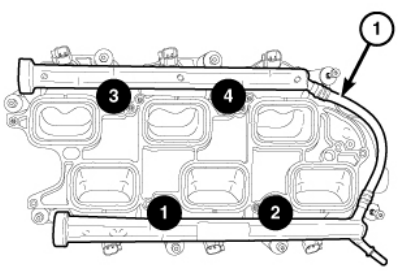
2. Install the six fuel injectors into the fuel rail.



2756853

3. Clean out the fuel injector bores in the lower intake manifold.

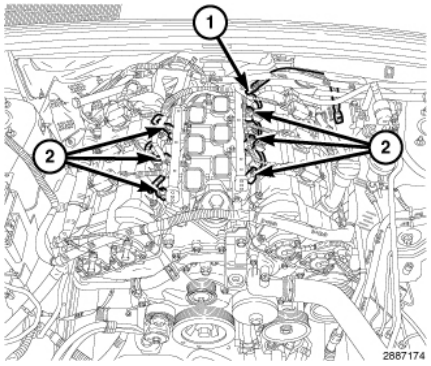
4. Position the fuel rail (1) onto the lower intake manifold, install the four retaining bolts and using the sequence shown, tighten to 7 N·m (62 in. lbs.).



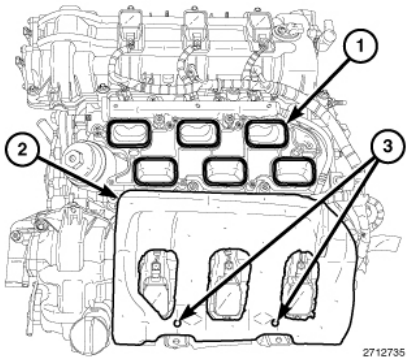
2756534

5. Connect the fuel injector electrical connectors (2).

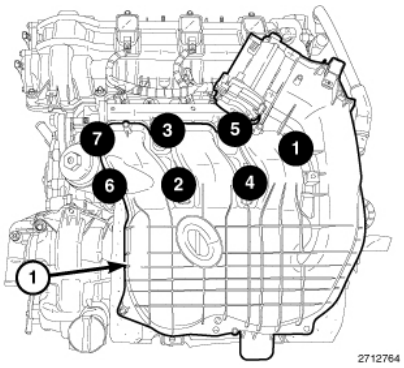
6. Connect the fuel supply hose to the fuel rail (1) (Refer to 14 - Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure) .



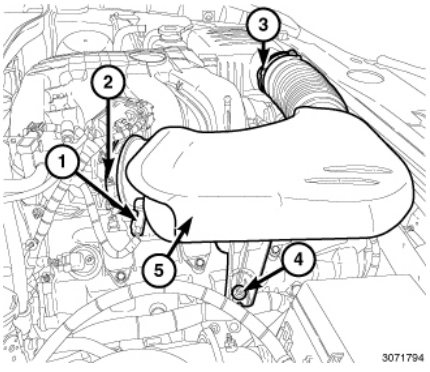
7. Install the insulator (2) to the two alignment posts (3) on top of the left cylinder head cover.



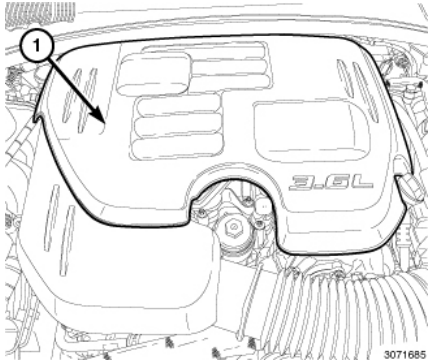
8. Install the upper intake manifold (1) and support brackets (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .



9. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
10. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
11. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).
12. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).
13. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

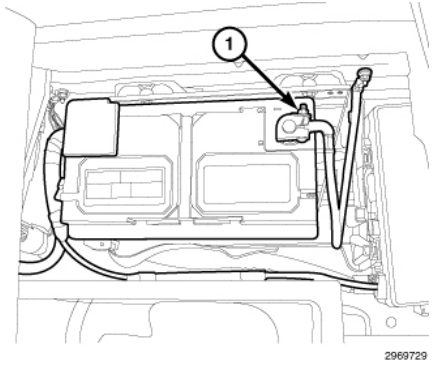


14. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

16. Start the engine and check for leaks.



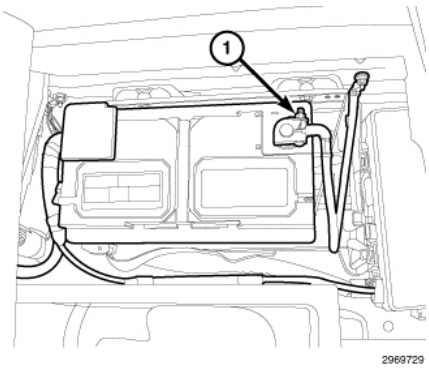
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L

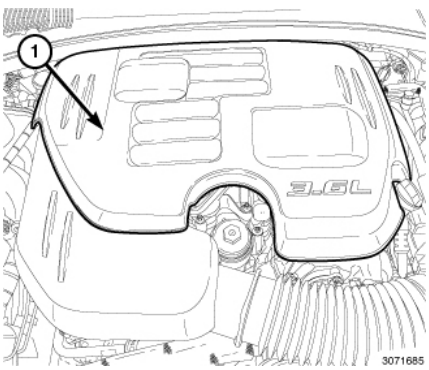
Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.**

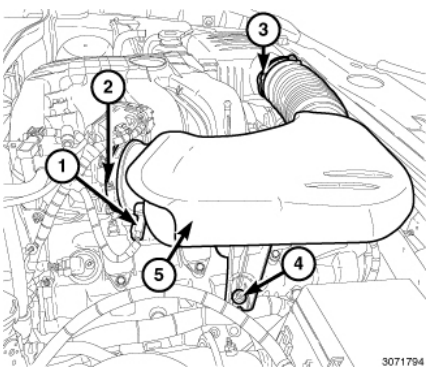
1. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect and isolate the negative battery cable (1).



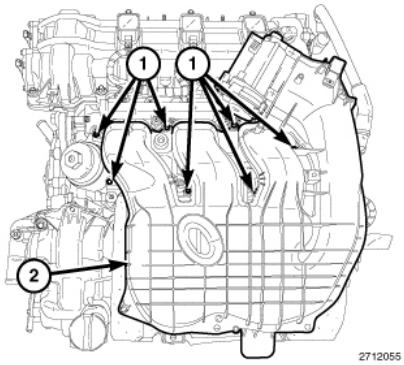
3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).



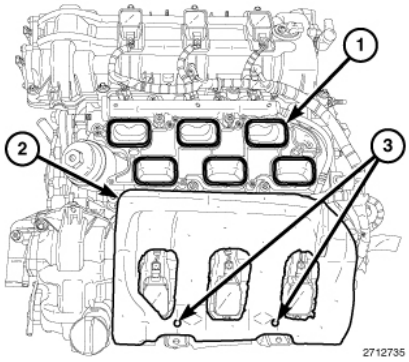
4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).



9. Remove the upper intake manifold (2) (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .

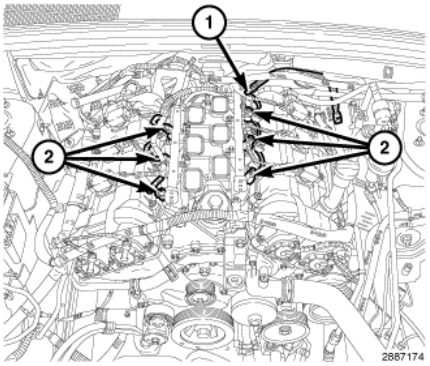


10. Remove the insulator (2) from the left cylinder head cover.



11. Disconnect the fuel injector electrical connectors (2).

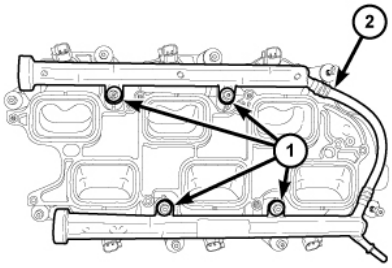
12. Disconnect the fuel supply hose (1) from the fuel rail (Refer to 14 - Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure) .



CAUTION: **The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connector tube. Due to the design of this tube, it does not use any clamps. Never attempt to install a clamping device of any kind on the tube. When removing the fuel rail assembly for any reason, be careful not to bend or kink the tube.**

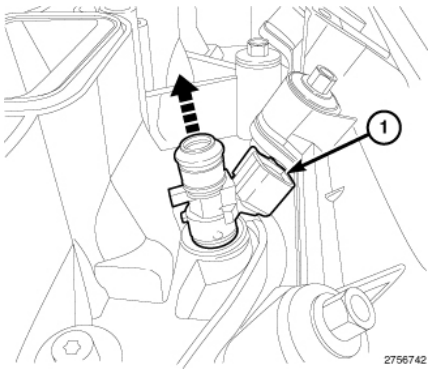
13. Remove the fuel rail (2) four retaining bolts (1).

14. Lift the fuel rail and the fuel injectors from the lower intake manifold.



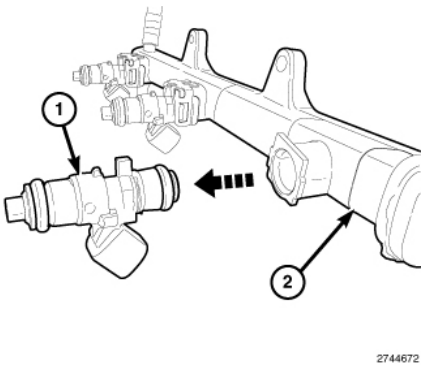
CAUTION: **When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.**

15. If required, remove any remaining fuel injectors (1) from the lower intake manifold.



NOTE: Number 2 fuel injector removal shown, all other fuel injectors similar.

16. If required, remove any remaining fuel injectors (1) from the fuel rail (2).



17. Remove and discard all fuel injector O-ring seals (1).

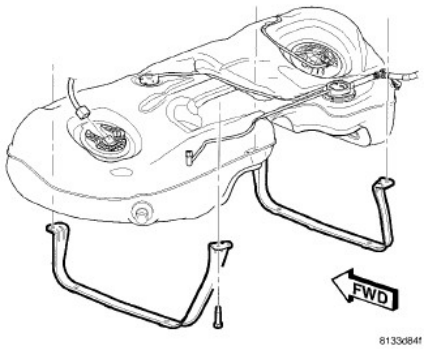
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

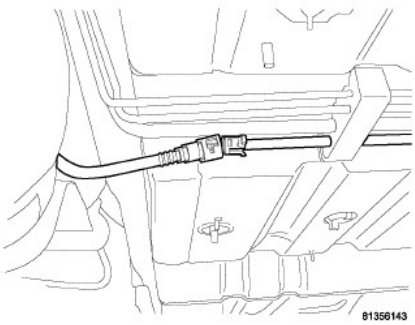
WARNING:

No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

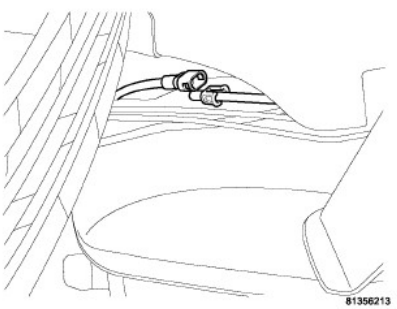
1. If removed, install the fuel pump modules (Refer to 14 - Fuel System/Fuel Delivery/MODULE, Fuel Pump - Installation) .
2. Using a suitable hydraulic jack with a fuel tank adapter, support the fuel tank.
3. Carefully raise the fuel tank into position while guiding the ORVR vent line through bracket.
4. Position the fuel tank support straps.
5. Install fuel tank support strap retaining bolts and tighten to 27 N·m (20 ft. lbs.).



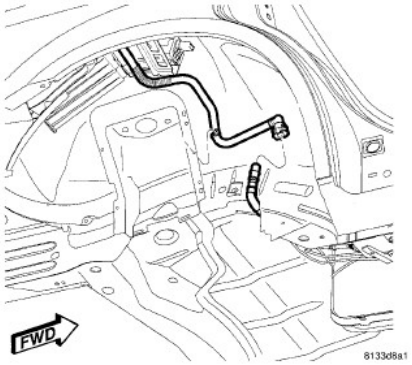
6. Connect the fuel supply line.



7. Connect the vapor line.

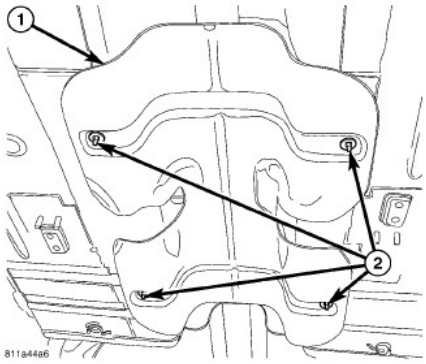


8. Connect the EVAP line in the right rear wheel well.

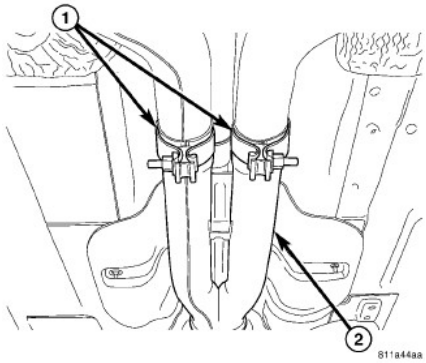


9. Position the heat shield (1) and install the heat shield retainers (2).

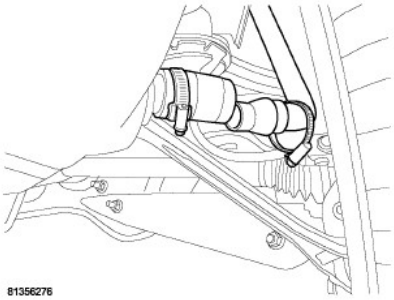
10. Install the propeller shaft (Refer to 03 - Differential and Driveline/Propeller Shaft - Installation) .



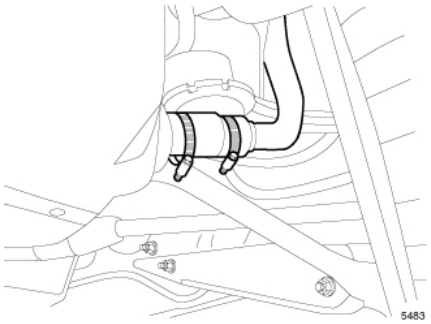
11. Install the muffler and tailpipe assembly (2) (Refer to 11 - Exhaust System/MUFFLER, Exhaust - Installation) .



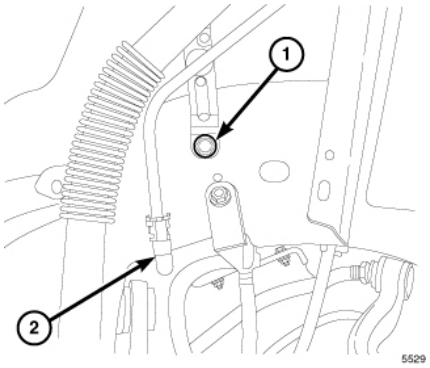
12. Connect the fuel filler tube to the rubber hose on the fuel tank.



13. Install the hose clamp to the rubber hose connecting the fuel filler tube to the fuel tank and tighten the clamp to 4 N·m (35 in. lbs.).



14. Connect the ORVR vent line (2).

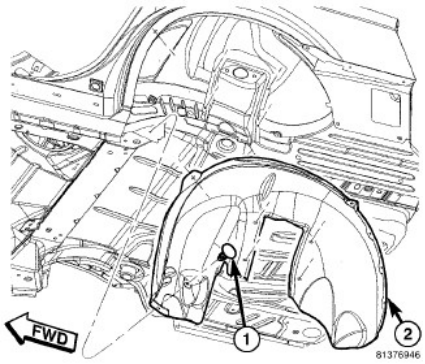


15. Install the fuel filler tube retaining bolt (1) and tighten to 7 N·m (62 in. lbs.).

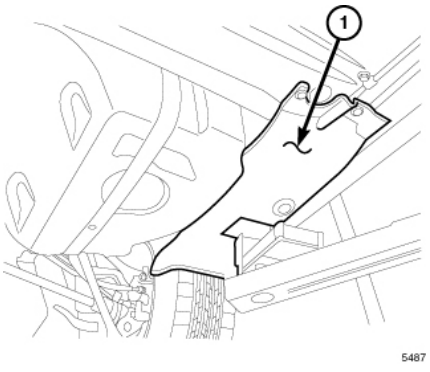
16. Position the left rear wheelhouse splash shield (2).

17. Install the push-pins (1) that secure the rear wheelhouse shield to the body.

18. Install the left rear tire.

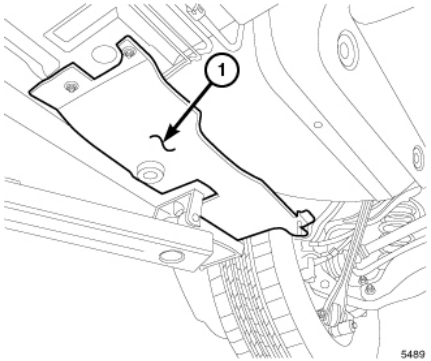


19. Install the left underbody splash shield (1).



20. Install the right underbody splash shield (1).

21. Lower the vehicle.



22. Fill the fuel tank.

23. Connect the negative battery cable (1).

24. Use the scan tool to pressurize the fuel system and check for leaks.

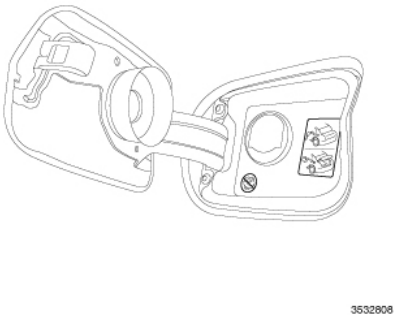
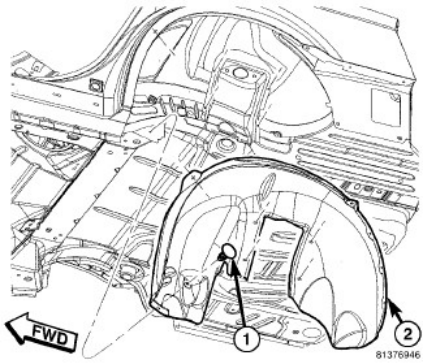
4. Partially raise and support vehicle.

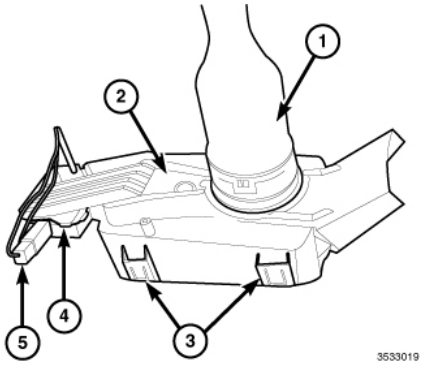


5. Remove the left rear tire.
6. Remove the push-pins (1) that secure the rear wheelhouse splash shield (2) to the body.
7. Remove the rear wheelhouse splash shield from the vehicle.



8. From behind the fender. Disconnect the fuel door release solenoid (4) electrical connector (5).

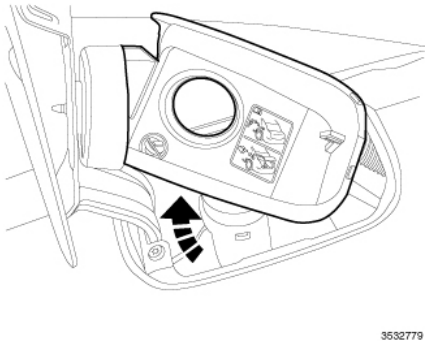
9. Press in the tabs (3) that hold the fuel filler tube housing (1) to the fender.



NOTE:

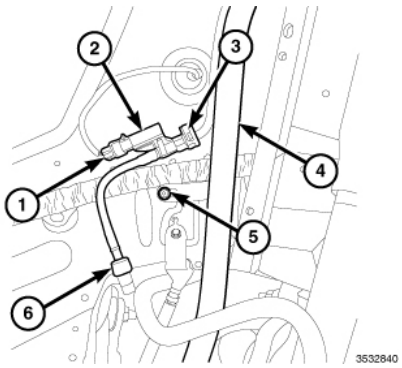
The manual release cable for the fuel door is routed through a rubber grommet into the trunk. Complete removal of the filler tube housing is not necessary for filler tube service.

10. Remove the fuel filler support housing and position aside.



11. Disconnect the ORVR line (3) at the filler tube.

12. Remove the fuel filler tube retaining nut (5).

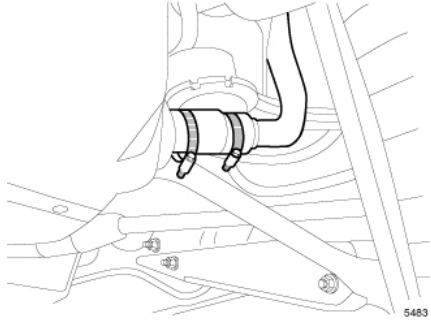


13. Raise and support the vehicle.

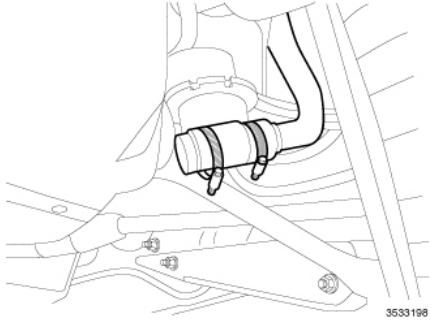
NOTE:

The filler tube connecting hose to the fuel tank is pressure fitted to the filler tube. To remove the hose. It must be removed from the fuel tank side.

14. Remove the hose clamp from the fuel tank. Leave the hose clamp tight at the fuel filler neck.



15. Remove the fuel filler tube from the fuel tank and remove the fuel filler tube from below the vehicle.



QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. Some quick-connect fittings require the use of a special tool for disconnection and removal.

These are the quick-connect fittings:

- Redundant Latch Single Button Type Fitting
- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

DISCONNECTING

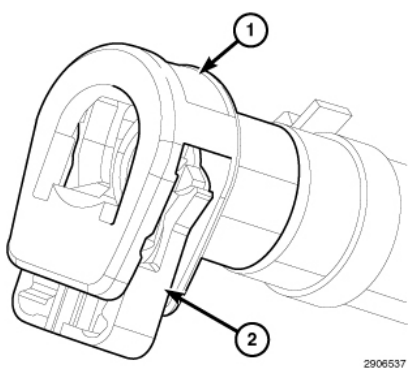
WARNING: **The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released.**

CAUTION: **Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used . This will prevent unnecessary fitting or fitting latch breakage.**

CAUTION: **The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.**

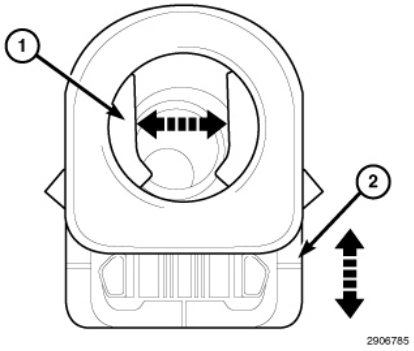
Redundant Latch Single Button Type Fitting:

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.



CAUTION: **Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.**

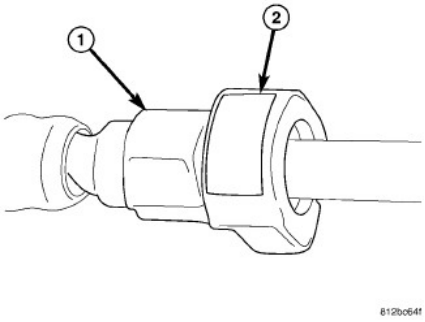
1. Pull the redundant latch (2) out away from the quick-connect fitting.
2. Press on the push button with your thumb, release the internal latches (1) and remove the quick-connect fitting from the fuel system component.



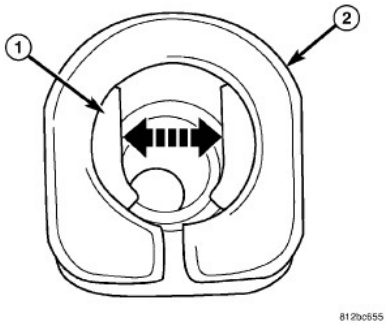
Single Button Type Fitting:

CAUTION: **Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.**

This type of quick-connect fitting is equipped with a single push button (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.



1. Press on the push button with your thumb, release the internal latches (1).
2. Remove the quick-connect fitting from the fuel system component.

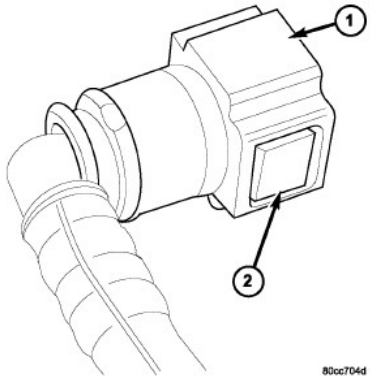


2 Button Type Fitting

This type of quick-connect fitting (1) is equipped with two push buttons (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

1. Press on both push buttons with your thumb, release the internal latches.

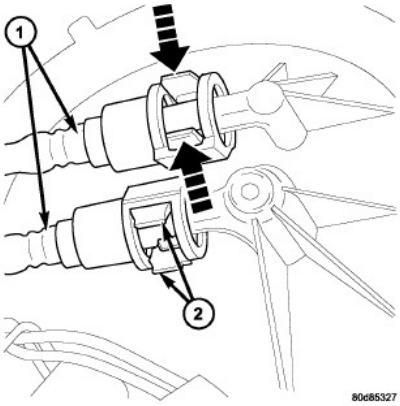
2. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.



Pinch Type Fitting

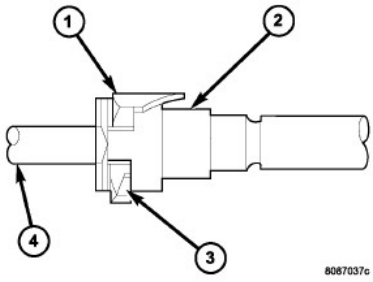
This type of quick-connect fitting (1) is equipped with two finger tabs (2). Special tools are not required for removal.

1. Pinch both tabs (2) together and release the quick-connect fitting.
2. Remove the quick-connect fitting from the fuel system component.



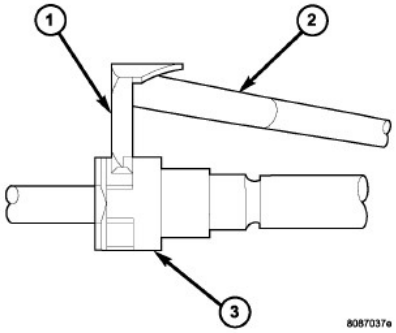
Single Tab Type Fitting

This type of quick-connect fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed the quick-connect fitting can be separated from the fuel system component. Special tools are not required for removal.



1. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

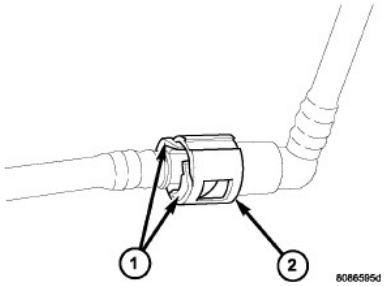
2. While pressing the release tab on the side of the quick-connect fitting use a screwdriver (2) to pry up the pull tab.
3. Raise the pull tab until it separates from the quick-connect fitting.
4. Remove the quick-connect fitting from the fuel system component.



Two Tab Type Fitting

This type of quick-connect fitting (2) is equipped with tabs located on both sides of the fitting (1). These tabs are integral to the fuel system component. The plastic tabs will remain on the component being serviced after the quick-connect fitting is removed. The O-ring and spacer will remain in the quick-connect fitting. Special tools are not required for removal.

1. Squeeze the plastic tabs (1) against the sides of component being serviced with your fingers.
2. Remove the quick-connect fitting from the fuel system component.

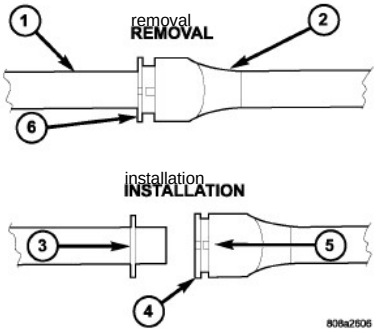


Plastic Retainer Ring Type Fitting

This type of fitting can be identified by the use of a round plastic retainer ring (4) usually black in color. Special tools are not required for removal.

NOTE: The round plastic retainer ring must be pressed squarely into the quick-connect fitting body. If this retainer is cocked during removal it will be difficult to disconnect the quick-connect fitting. Use an open-end wrench on the shoulder of the plastic retainer ring to aid in disconnection.

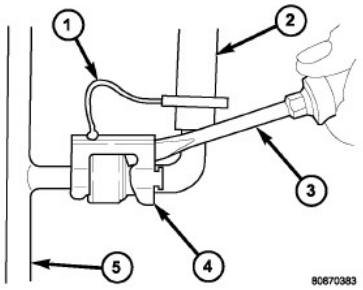
1. Firmly push the quick-connect fitting (5) towards the component being serviced while firmly pushing the round plastic retainer ring into the quick-connect fitting (6). With the round plastic ring depressed, remove the quick-connect fitting from the fuel system component.
2. After removal the plastic retainer ring will remain with the quick-connect fitting.



Latch Clip Type 1 Fitting

Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered (1) to fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

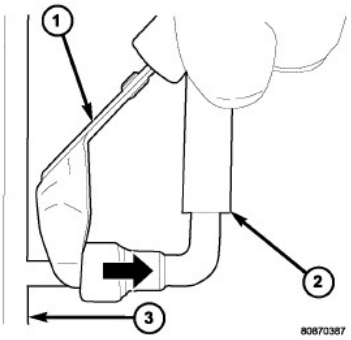
1. Pry up on the latch clip (4) with a screwdriver (3).
2. Slide the latch clip away from the quick-connect fitting while lifting the screwdriver and position aside.



3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: After removal the internal latches will remain in the quick-connect fitting.

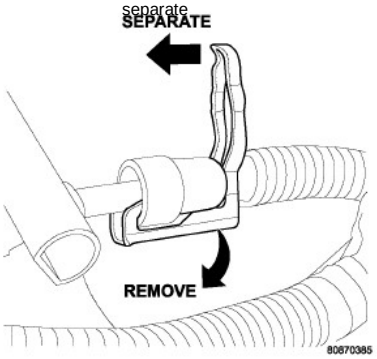
4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.



Latch Clip Type 2 Fitting

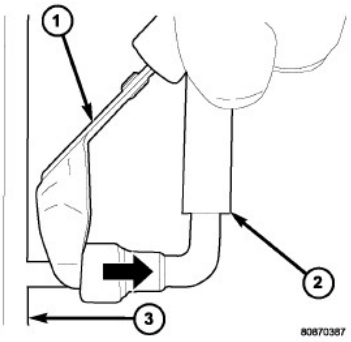
Depending on vehicle model and engine, 2 different types of safety latch clips are used. One is tethered to the fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after the latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Unlatch the small arms on the end of clip, swing away and separate from the fuel system component.
2. Slide the latch clip away from the quick-connect fitting while lifting with a screwdriver and position aside.



3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

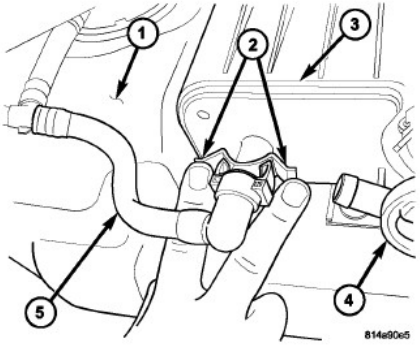
NOTE: After removal the internal latches will remain in the quick-connect fitting.



4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.

Wing Type Fitting

The wing type fitting is used on fuel system and emission components. The wing type fitting is most commonly used on the EVAP canister (3). Special tools are not required for removal.



1. Using two fingers, press both wings (2) and release the locking tabs.

NOTE: After removal the locking tabs will remain with the quick-connect fitting.

2. While holding the wings, remove the quick-connect fitting from the fuel system component.

CONNECTING

1. Inspect the quick-connect fitting body and fuel system components for damage. Replace as necessary.
2. Prior to connecting any quick-connect fitting to components, check condition of fitting and components. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert the quick-connect fitting onto the fuel tube or fuel system component until the built-in stop on the fuel tube or component rests against the back of fitting.
4. Continue pushing until a click is felt.
5. If Equipped:

- **Redundant Latch Single Button Type Fitting:** Push redundant latch until it locks into position in the quick-connect fitting.
- **Single Tab Type Fitting:** Push new tab down until it locks into position in the quick-connect fitting.
- **Latch Clip Type Fitting:** Install latch clip (snaps into position). **If latch clip will not snap into position, this indicates the quick-connect fitting is not properly installed onto fuel system component, recheck the connection.**

6. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The fuel level sending units and sensors are integrated with both the main fuel pump module and the auxiliary fuel pump module and are not serviced separately. The appropriate fuel pump module must be replace if either fuel level sending unit is to be replaced.

For fuel pump module removal (Refer to 14 - Fuel System/Fuel Delivery/MODULE, Fuel Pump - Removal) .

DRAINING FUEL TANK

Special Tools: Click to display a list of tools used in this procedure

Conventional Procedure

WARNING:

The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING:

No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION:

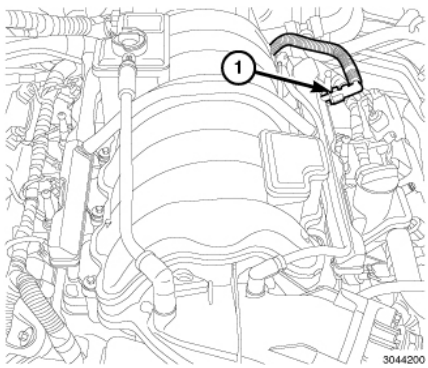
If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION:

If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

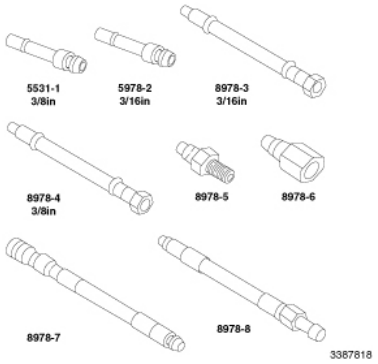
NOTE:

Due to a one-way check valve installed into the fuel fill fitting at the tank, the tank cannot be drained at the fuel filler tube.



1. Perform the fuel system pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect the fuel supply line (2) from the fuel rail (Refer to 14 - Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure)

NOTE: Tool number 8978-2 is used on 5/16" fuel lines while tool number 8531-1 is used on 3/8" fuel lines.



3. Install the appropriate fuel line adapter fitting from the Decay Tool, Fuel 8978A to the fuel supply line. Route the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.

NOTE: Due to a built in time out feature of the diagnostic scan tool, the fuel pump may need to be reactivated several times before the fuel tank evacuation is complete.

4. Using a diagnostic scan tool, activate the fuel pump until the fuel tank has been evacuated.

Alternative Procedure

WARNING: **The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.**

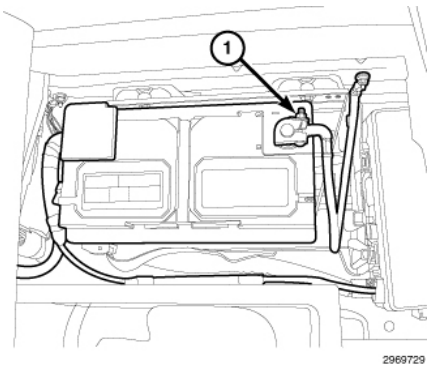
WARNING: **No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.**

CAUTION: **The fuel level of the vehicle must be below 5/8 of a tank before using the "Alternative Procedure". If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.**

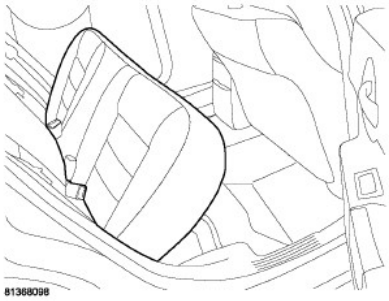
CAUTION: **If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.**

CAUTION: **If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.**

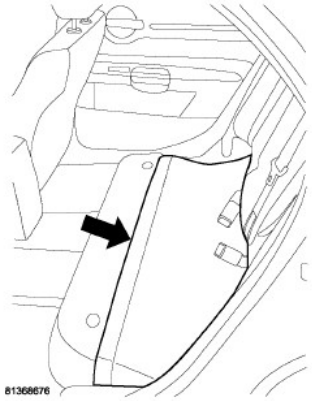
1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel system pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
3. Disconnect the negative battery cable (1).



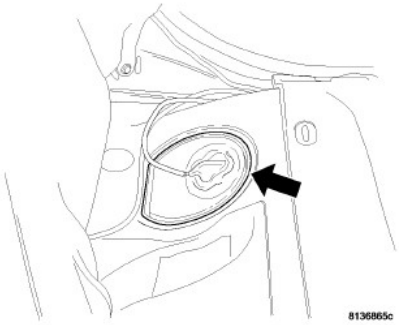
4. Push the rear lower seat cushion up and back and remove the seat cushion.



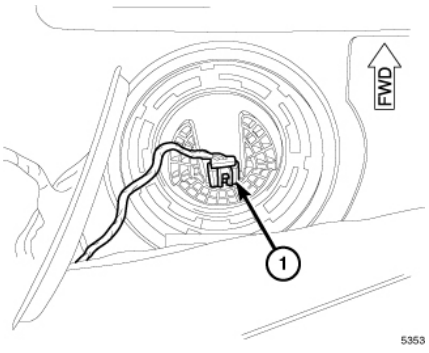
5. Fold back the foam pad covering the fuel pump module plastic access covers.



6. Remove the left side fuel pump module plastic access cover.



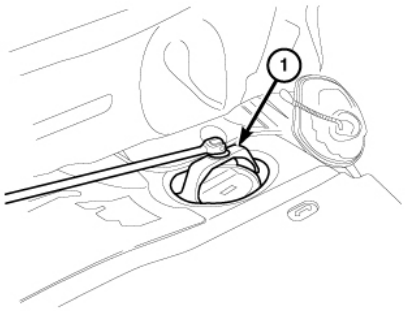
7. Disconnect the electrical connector from the fuel pump module.



CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for**

reassembly.

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

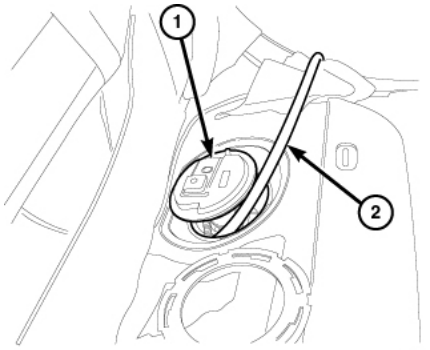


5355

8. Mark the fuel pump module orientation.
9. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring.
10. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (1).
11. Rotate the breaker bar counterclockwise and remove the lock ring.

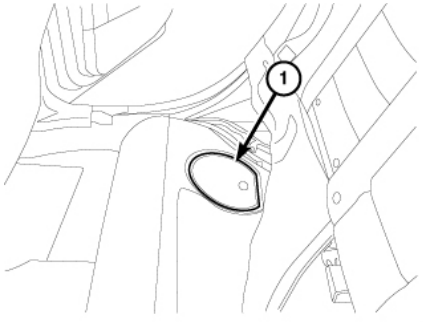
CAUTION: **Do not spill fuel into the interior of the vehicle.**

CAUTION: **The lower reservoir of the fuel pump module must be drained before removal or fuel can spill into the interior of the vehicle.**



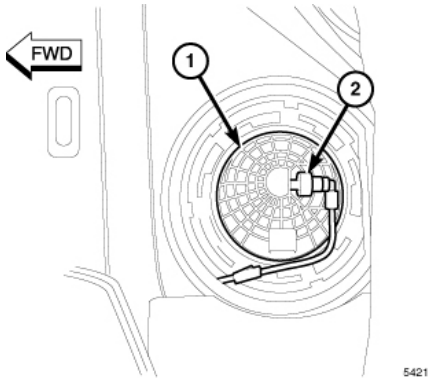
5357

12. Lift the fuel pump module up enough to push a 3/8 inch hose into the fuel tank.
13. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.
14. Using the gas caddy, evacuate the left side of the fuel tank.
15. Remove the right side auxiliary fuel pump module plastic access cover (1).



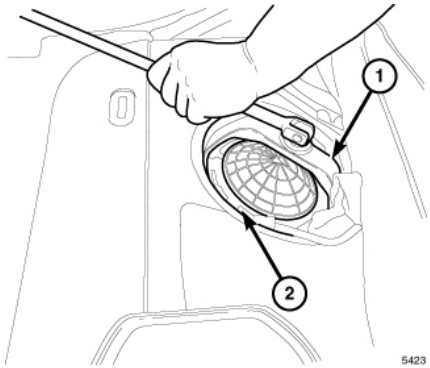
5419

16. Disconnect the fuel supply line (2) at the auxiliary fuel pump module (1).



CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.**

NOTE: Prior to removing the auxiliary fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.



17. Mark the auxiliary fuel pump module orientation.

18. Position the SAE Fuel Pump Lock Ring Wrench 9340 (1) into the notches on the outside edge of the lock ring (2).

19. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench 9340 (1).

20. Rotate the breaker bar counterclockwise and remove the lock ring.

21. Lift the auxiliary fuel pump module up enough to push a 3/8 inch hose (1) into the fuel tank.

22. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.

23. Using the gas caddy, evacuate the right side of the fuel tank.

FUEL SYSTEM PRESSURE RELEASE

WARNING: **The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.**

1. Remove the fuel pump relay from the Power Distribution Center (PDC) (Refer to 04 - Vehicle Quick Reference/Fuse Locations and Types - Specifications) . A relay location label can also be found on the underside of the PDC cover.
2. Start and run the engine until it stalls.
3. Attempt restarting engine until it will no longer run.
4. Turn ignition key to the OFF position.
5. Return fuel pump relay to the Power Distribution Center (PDC).

NOTE: After servicing the fuel system, one or more Diagnostic Trouble Codes (DTC's) may have been stored in the Powertrain Control Module (PCM) memory due to disconnecting the fuel pump module circuit. A diagnostic scan tool must be used to erase a DTC.

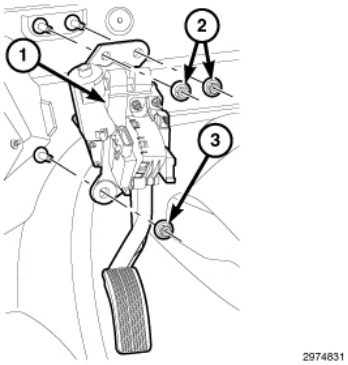
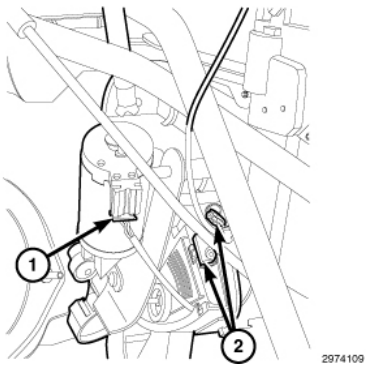
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

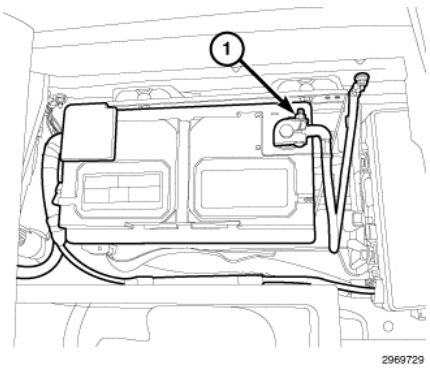
1. Position the pedal assembly (1) to the mounting studs.
2. Install the pedal assembly 3 retaining nuts (2,3) and tighten to 34 N·m (25 ft. lbs.).



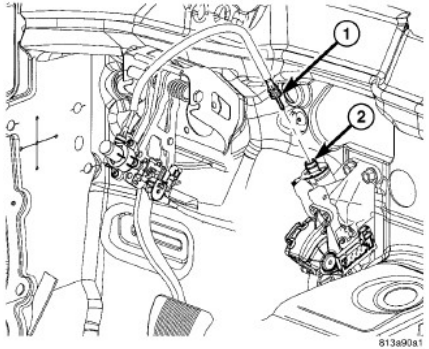
3. Connect both electrical connectors at the APPS (2).
4. Connect the electrical connector at the accelerator pedal adjuster motor (1).



5. Connect the negative battery cable (1).



6. If equipped with adjustable pedals, synchronize the accelerator pedal to the brake pedal and then connect the adjuster cable (1) to the accelerator pedal adjuster motor (2) (Refer to 05 - Brakes/Hydraulic/Mechanical/PEDAL(S) , Brake and/or Accelerator - Installation).

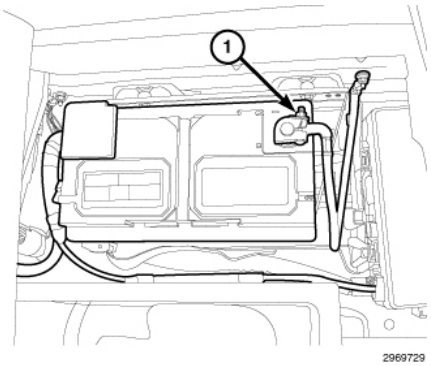


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

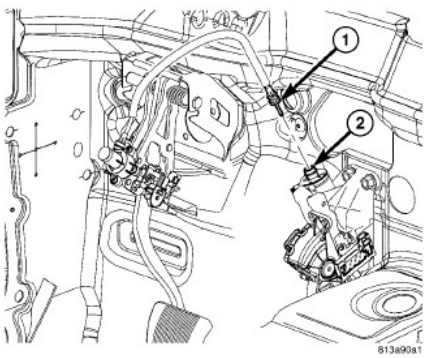
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

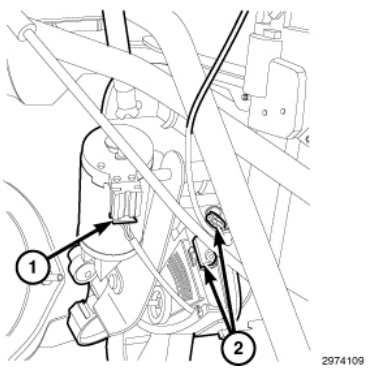
1. Disconnect the negative battery cable (1).



2. If equipped with adjustable pedals, remove the adjuster cable (1) at accelerator pedal adjuster motor (2).



CAUTION: **Do not attempt to separate or remove the Accelerator Pedal Position Sensor (APPS) from the accelerator pedal assembly. The APPS and the accelerator pedal is replaced as an assembly. If the sensor is removed from the pedal, the electronic calibration may be destroyed.**

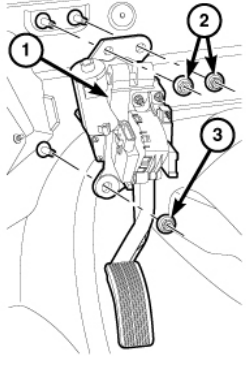


3. Disconnect the electrical connector at the accelerator pedal adjuster motor (1).

4. Disconnect both electrical connectors at the APPS (2).

5. Remove the pedal assembly 3 retaining nuts (2,3).

6. Remove the pedal assembly (1).

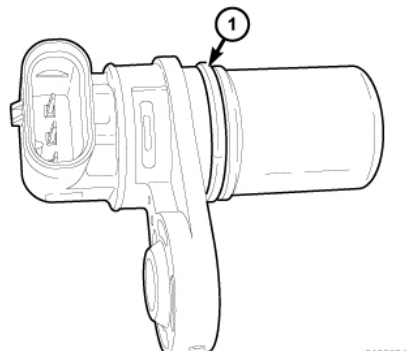


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Crankshaft Position (CKP) sensor (1) is a hall effect device combined with an internal magnet.

The CKP sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

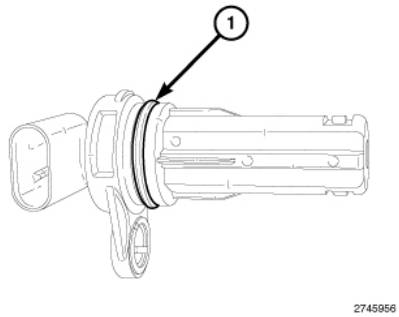


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

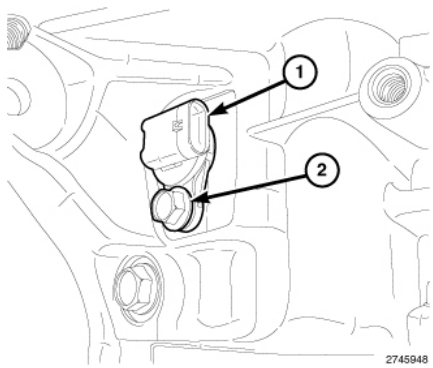
1. The crankshaft position (CKP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).



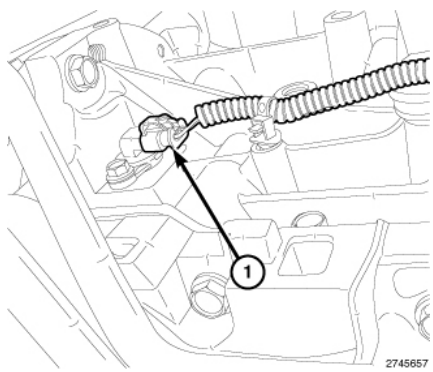
3. Clean out the CKP sensor mounting bolt hole in the engine block.
4. Install the sensor (1) into the engine block with a slight rocking and twisting motion.

CAUTION: **Before tightening the CKP sensor mounting bolt, be sure the sensor is completely flush to the cylinder block. If the CKP sensor is not flush, damage to the sensor mounting tang may result.**

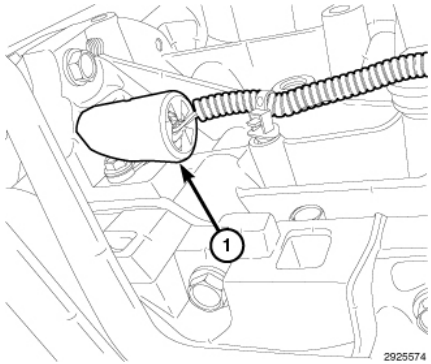
5. Install the mounting bolt (2) and tighten to 12 N·m (9 ft. lbs.).



6. Connect the CKP sensor electrical connector (1).

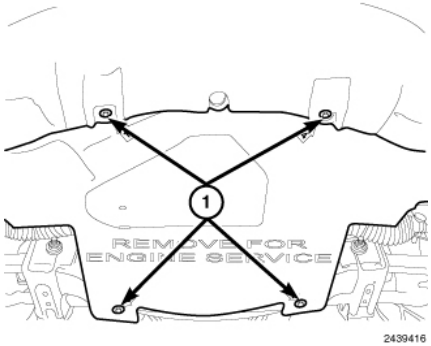


7. Position the heat shield (1) over the CKP sensor.

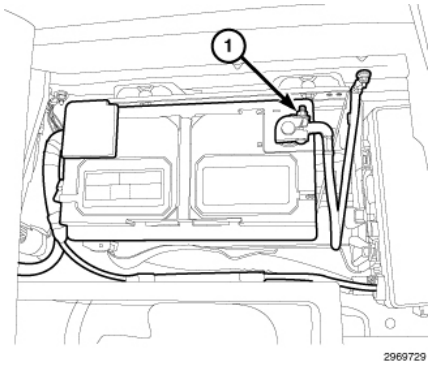


8. Position the belly pan and install the retainers (1).

9. Lower the vehicle.



10. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



NOTE:

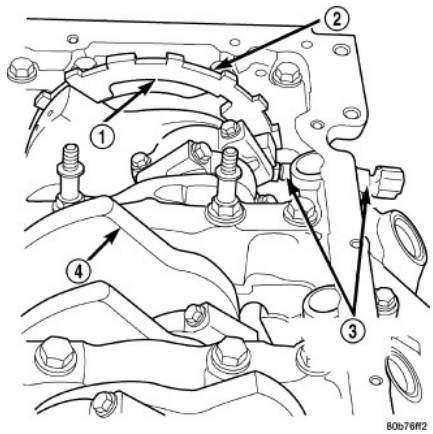
The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

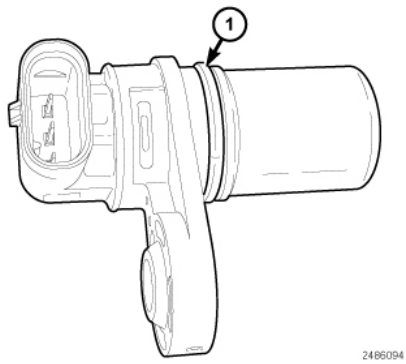
OPERATION

The engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor (3). The sensor generates pulses which sends an input signal to the Powertrain Control Module (PCM). The PCM interprets the sensor input signal to determine the crankshaft position. The PCM then uses this information, along with other inputs, to determine injector sequence and ignition timing.

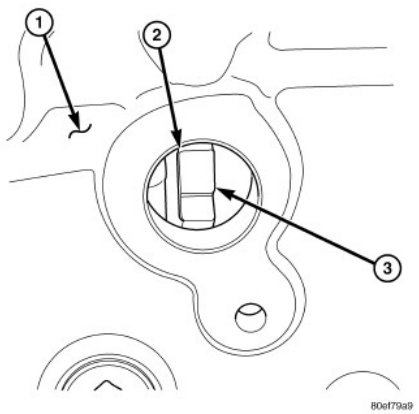
A tonewheel (targetwheel) is bolted to the engine crankshaft (1). This tonewheel has notches (2) on the outer edge.



The sensor (1) is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.



The notches (3) cause a pulse to be generated when they pass under the sensor. The generated pulses are the input signal to the PCM.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

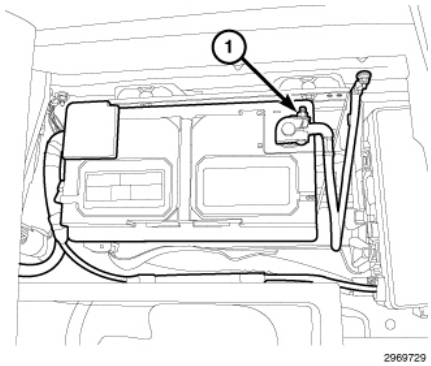
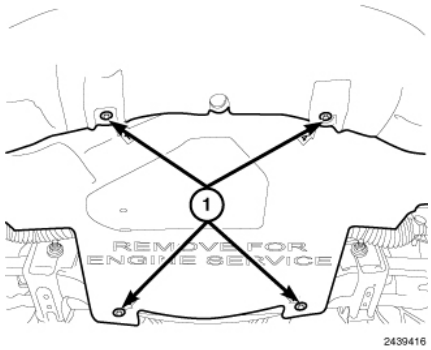
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect and isolate the negative battery cable (1).

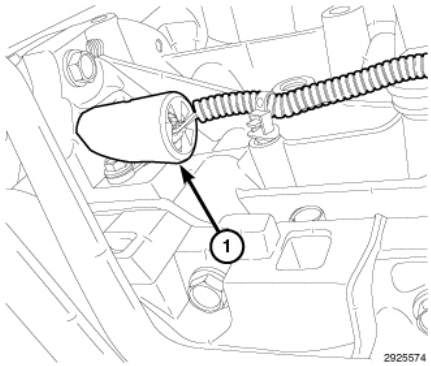


2. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
3. Remove the belly pan retainers (1) and remove the belly pan.

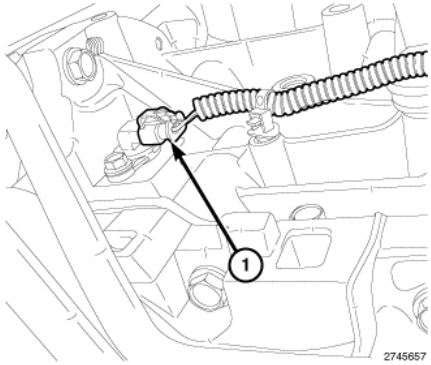


The crankshaft position (CKP) sensor is mounted into the right rear side of the cylinder block.

4. Push back the heat shield (1) from the crankshaft position (CKP) sensor.

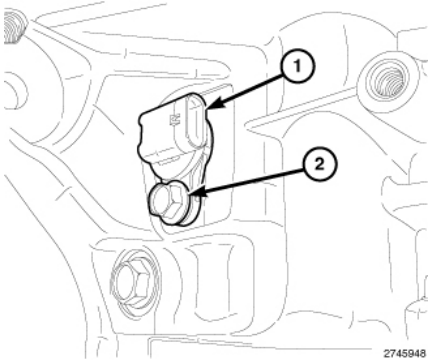


5. Disconnect the electrical connector (1) from the crankshaft position (CKP) sensor.



6. Remove the sensor mounting bolt (2).

7. Carefully twist the sensor (1) from the cylinder block.



8. The CKP sensor O-ring (1) can be reused if not damaged.

FUEL CORRECTION or ADAPTIVE MEMORIES

OPERATION

Short Term

Short Term Adaptive or Short Term Fuel Trim (STFT) is an immediate correction to fuel injector pulse width. During Closed Loop operation, Short Term Adaptive makes immediate adjustments to fuel delivery in direct response to the signal from the upstream O2 sensor. The PCM infers air/fuel ratio by monitoring oxygen content measured by the upstream O2 stream sensor.

This is an immediate response to the O2 sensor signal that is not switching or is consistently high or low. If the upstream oxygen sensor voltage is not consistently switching between 2.5 and 3.5 volts, the PCM knows that the base pulse width calculation needs to be modified by adjusting the injector pulse width until the correct O2 sensor voltage is achieved. The need to adjust the injector pulse width may be a result of vehicle operating conditions, engine wear, fuel quality, etc. The maximum range of authority for Short Term Adaptive is ±33%. Short Term Adaptive values are not stores when the ignition is off.

Long Term

The main function of Long Term Adaptive is to make fuel corrections that permit Short Term Adaptive to hover around zero. In order to maintain correct emissions throughout all operating ranges of the engines, a cell structure based on engine rpm and load (MAP) is used.

There are 26 cells used for the NGC. Two of the cells are used only during idle, as determined by throttle position and park/neutral switch input. The other cells each represent a given off-idle manifold pressure and rpm range.

After the vehicle has reached full operating temperature, short term correction factors will update Long Term Adaptive Memory cells based on vehicle load (RPM/MAP) to allow the Short Term Adaptive value to be brought back to near zero. Once this correction factor is updated in the memory, it will be used by the PCM under all operating conditions, open loop and closed loop. However, the values stored in the Long-term are updated only after the vehicle has entered long-term closed loop at full operating temperature. This is done to prevent any transition temperature or start-up compensation form corrupting long term fuel correction.

Long Term and Short Term Adaptive can each change the pulse width by as much as ±33% for a maximum total correction of ±66% from base pulse width calculation. Long Term Adaptive values are used during both Open Loop and Closed Loop operation.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide-Open-Throttle
- Ignition switch OFF

Within these modes of operation, there are two different types of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP operation the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP operation, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP operation the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F (1.7°C).
    - If the coolant is over 35°F (1.7°C) the PCM will wait 38 seconds.
    - If the coolant is over 50°F (10°C) the PCM will wait 15 seconds.
    - If the coolant is over 167°F (75°C) the PCM will wait 3 seconds.
    - For other temperatures the PCM will interpolate the correct waiting time.
2. O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

OPEN LOOP operation is used for engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle. Under most conditions, acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** occur in CLOSED LOOP operation.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Powertrain Control - Description) .

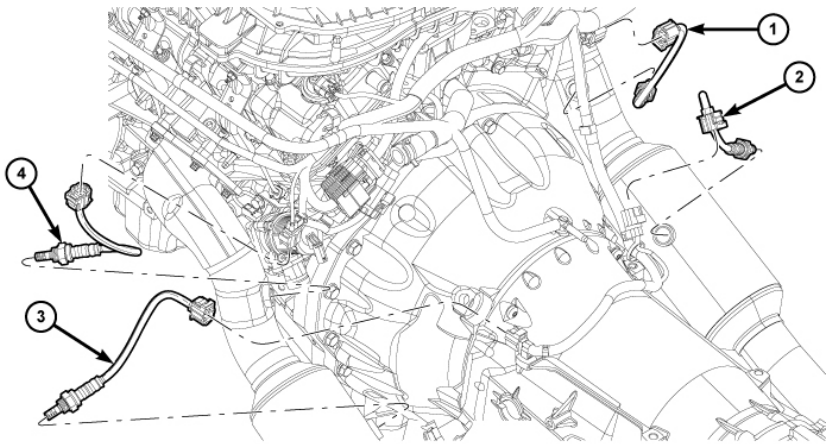
Labor Operations: Click to display a list of Labor Operations associated with this procedure



2797543

The engine is equipped with four heated oxygen sensors:

- The right upstream oxygen sensor (1) is referred to as the 1/1 sensor.
- The right downstream oxygen sensor (2) is referred to as the 1/2 sensor.
- The left upstream oxygen sensor (4) is referred to as the 2/1 sensor.
- The lefft downstream oxygen sensor (3) is referred to as the 2/2 sensor.

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**
2. Install the oxygen sensor and tighten to 43 N·m (32 ft. lbs.).

   CAUTION: **Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.**
3. Connect the heated oxygen sensor electrical connector.
4. Lower the vehicle.
5. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

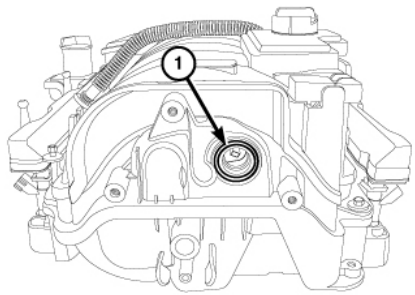
The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not present, the PCM sets the DTC.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

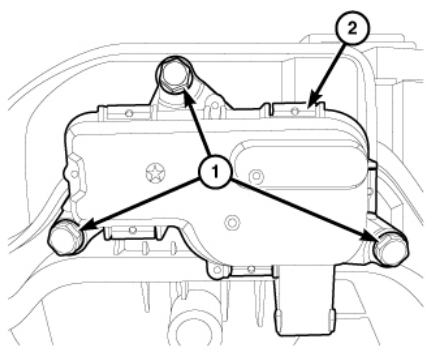
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.



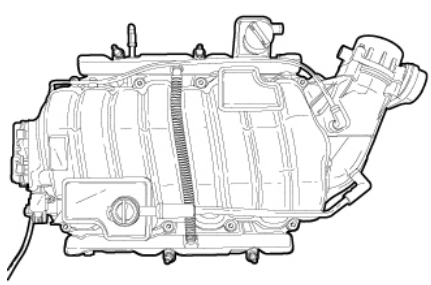
2979774

1. Install a new SRV actuator rubber O-ring seal (1).



2979559

2. Position the SRV actuator (2), install the retaining bolts (1) and tighten to 5 N·m (44 in. lb.).



2979729

3. Install the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .

4. Connect the negative battery cable (1).

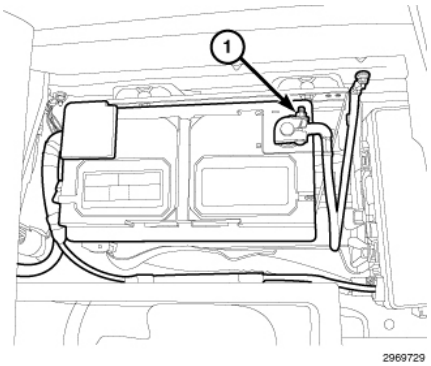
Fuel Delivery: | **Fuel:**

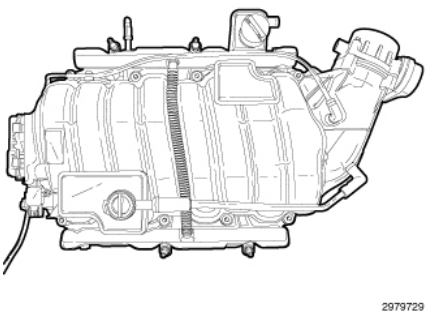
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

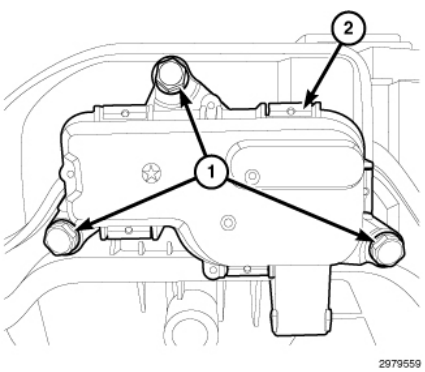
1. Disconnect the negative battery cable (1).



2. Remove the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .

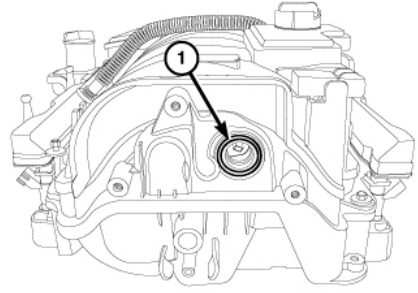


3. Remove the Short Runner Valve (SRV) actuator retaining bolts (1) and remove the SRV actuator (2).



NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.

4. Remove and discard the SRV actuator rubber O-ring seal (1).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The SRV system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If the spike is not present, the PCM sets the DTC.

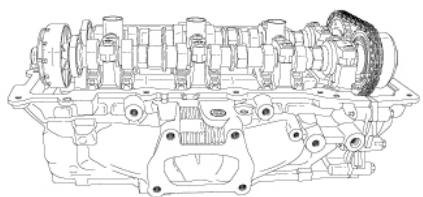
DESCRIPTION

The 3.6L aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. If any damaged is found to the exhaust manifold portion, the cylinder head must be removed for repair or replacement (Refer to 09 - Engine/Cylinder Head - Removal) .



2793404

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

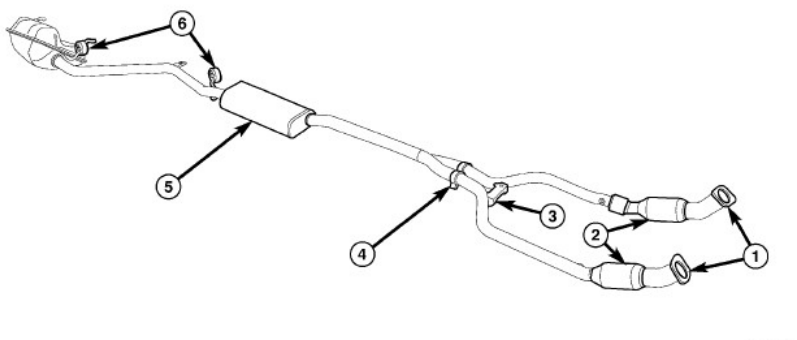
1. Loosen clamps and support brackets.

2. Align the exhaust system starting at the front, working rearward.

3. Tighten all clamps and brackets once alignment and clearances are achieved.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



The 5.7L close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of ball flange (1). The left and right side converter outlet pipe connects to the exhaust system. The 5.7L is bolted to the exhaust header. The 3.6L bolts directly to the integrated exhaust manifold (Refer to 09 - Engine/Manifolds /MANIFOLD, Exhaust - Description) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Check catalytic converter for a flow restriction. (Refer to 11 - Exhaust System - Diagnosis and Testing) Exhaust System Restriction Check for procedure.

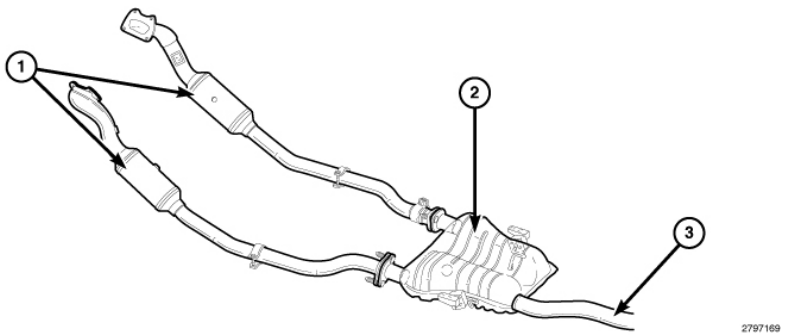
Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

DESCRIPTION

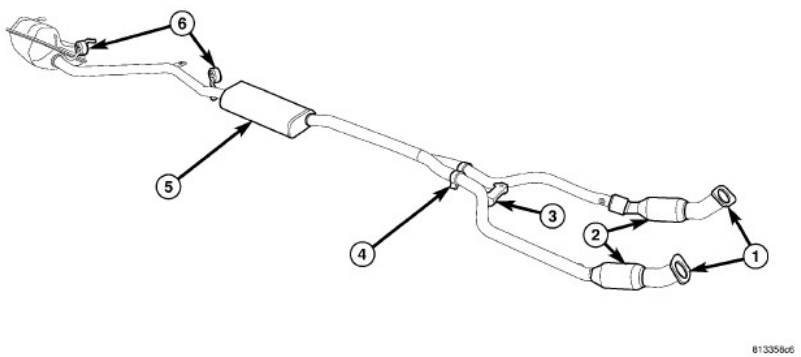
WARNING: **The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.**

CAUTION: **Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.**



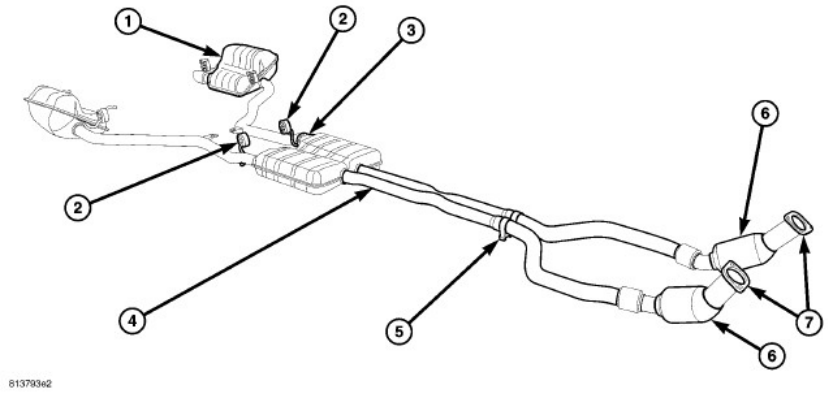
The 3.6L converters are mounted to an integrated exhaust manifold (Refer to 09 - Engine/Manifolds/MANIFOLD, Exhaust - Description)

The 3.6L exhaust system uses two catalytic converters (1) located in the front exhaust pipe and a single muffler (2), with a single resonator/tailpipe assembly.



The exhaust system consists of two front close coupled catalytic converters, a RH rear muffler and resonator assembly, and on vehicles equipped with dual exhaust, LH resonator and tailpipe assembly.

For the single exhaust systems, the RH muffler, resonator and tailpipe (4) are one single unit .



EXHAUST SYSTEM - V8 DUAL SYSTEM

1 - LH REAR RESONATOR AND TAIL PIPE

2 - ISOLATOR

3 - BALL FLARE FLANGE 5.7L/6.4L

4 - RH REAR MUFFLER AND RESONATOR

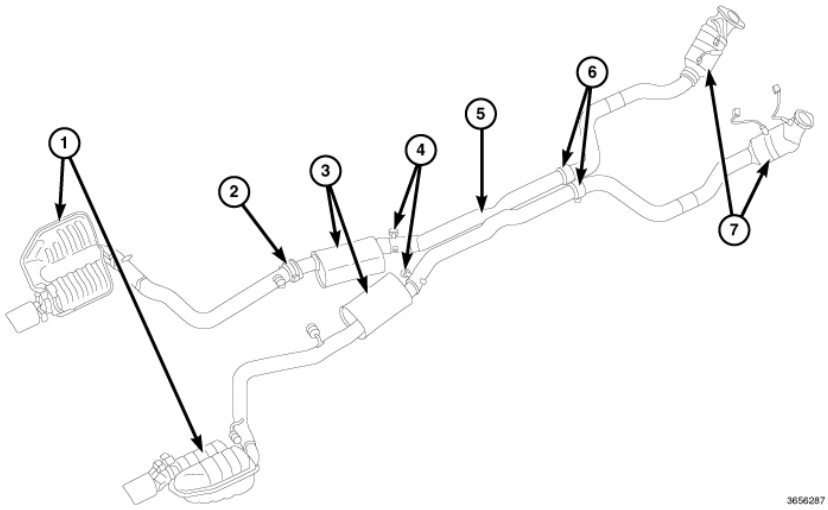
5 - BAND CLAMPS

6 - CATALYTIC CONVERTER ASSEMBLY

7 - BALL FLANGE

On a 5.7L/6.4L, both catalytic converters attach directly to the exhaust manifold using studs and nuts.

The exhaust down pipes exit the converters and connect into the rear muffler and resonator (s).



Performance exhaust systems use two catalytic converters (7) located in the front exhaust pipe, and dual mufflers (3), a dual resonator/tailpipe assembly (1), and an active exhaust valve (4) located at the exhaust pipes (5).

The front exhaust pipe/catalytic converter assembly is a hydra-form thin wall air gap design. This design is used to reduce heat, noise and improve emissions. When replacement is required, use original equipment parts (or their equivalent).

The exhaust manifolds are equipped with ball flange outlets to assure a tight seal and strain free connections.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises originating from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

The exhaust system consists of exhaust manifold(s), exhaust pipe with active exhaust valves, differential pressure sensor, catalytic converter(s) with oxygen sensors,

muffler and tailpipe.

DESCRIPTION

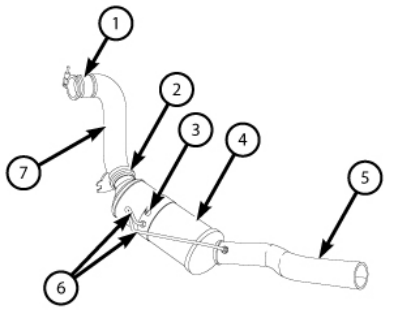
A diesel particulate filter (DPF) is installed for exhaust gas after-treatment. The DPF filters, stores and burns particulate matter (soot) that is generated during the combustion process. The soot is oxidized to carbon dioxide CO_2 at exhaust temperatures over 600º C (1,112º F).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

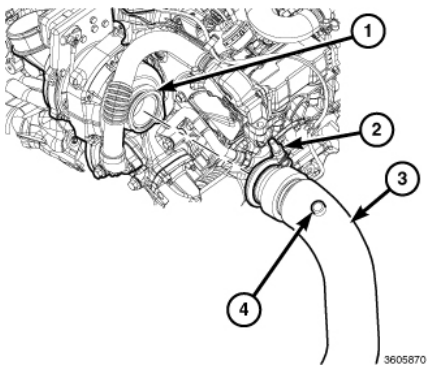
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install the steel differential pressure lines (6).
2. Position the Diesel Particulate Filter (DPF) (4) into the vehicle.
3. Loosely install the DPF outlet pipe (5) into the muffler/resonator pipe.



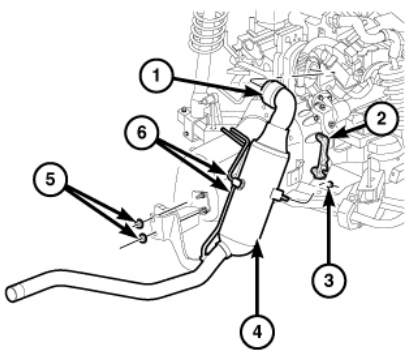
3591181

4. Lower the vehicle.
5. Position new steel gasket onto the downpipe (3).
6. Position the downpipe (3) to the turbocharger flange (1) and loosely tighten the clamp (2).



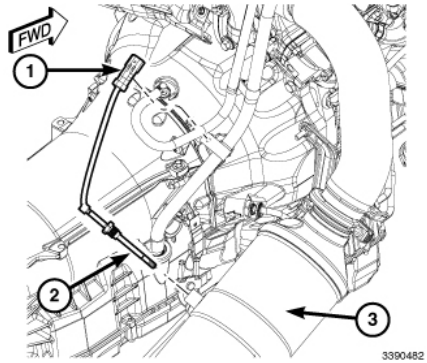
3605870

7. Raise and support the vehicle.
8. Install the front steady rest bracket (2) to the transmission. Tighten the nuts to 26 N·M (19 ft. lbs.).
9. Connect the differential pressure hoses to the steel lines (6).
10. Align the DPF to their respective mounts.
11. Tighten the front steady bracket retainer nut (3) for the DPF to 26 N·M (19 ft. lbs.).
12. Install the rear bracket support nuts (5). Tighten the nuts to 10 N·M (89 in. lbs.).
13. Tighten the muffler/resonator clamp.



3591143

14. Install the temperature sensor (2).



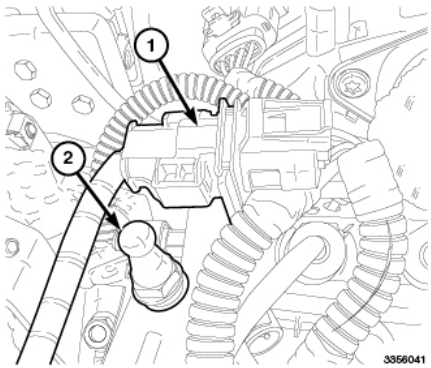
15. Lower vehicle.

16. Tighten the DPF to turbocharger outlet clamp (3) to 25 N·M (18 ft. lbs.).

17. Install the O2 sensor.

18. Reposition the transmission dipstick to the bracket and install the ball stud (2).

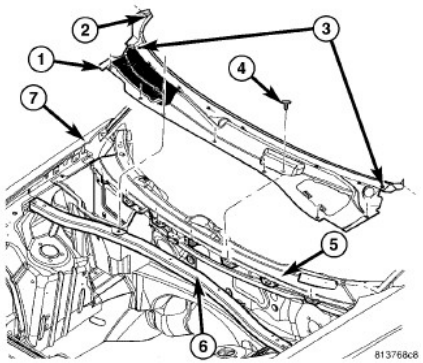
19. Connect the O2 sensor electrical connector (1) and mount it to the transmission fill tube support bracket.



20. Install the cowl assembly (1) (Refer to 23 - Body/Exterior/COVER, Cowl Panel - Installation) .

21. Install the engine cover.

22. Connect the negative battery cable.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The oxidation catalysts raise the exhaust gas temperatures to regenerate the DPF , which is passive regeneration. If the passive regeneration cannot keep up with the build up of soot in the DPF, the Powertrain Control Module (PCM) will actively regenerate the DPF to burn off the soot. Residue remains inside the DPF in the form of non burnable ash. Ash comes from the oils and other materials that are trapped in the oils and are present in the soot. Ash is not eliminated by the regeneration cycle. Excessive ash accumulation requires the replacement of the DPF. The DPF uses a silicon carbide wall-flow monolith with a platinum coating to trap particulates. The monolith contains a large number of square parallel channels, which run in the axial direction and are separated by thin porous walls. The channels are alternatively open at one end, but plugged at the other. The exhaust gases flow through the walls and escape through the pores in the wall material. Particulates, however, are too large to escape and are trapped in the monolith walls. The PCM starts the regeneration of the DPF if the soot load exceeds a performance map value. The PCM determines the load condition of the DPF based upon the exhaust gas pressure upstream and downstream of the DPF. A pressure differential sensor provides the pressure input to the PCM. During the regeneration process, the PCM raises the temperature in the DPF to burn off the soot accumulated. Under normal operation, the engine does not produce enough heat to oxidize the soot inside the DPF. This process requires temperatures above 550 ºC (1,022 ºF). After regeneration, the PCM reads the actual pressure difference at the DPF and compares it with a reference value. From this comparison, the PCM determines the ash quantity inside the DPF.

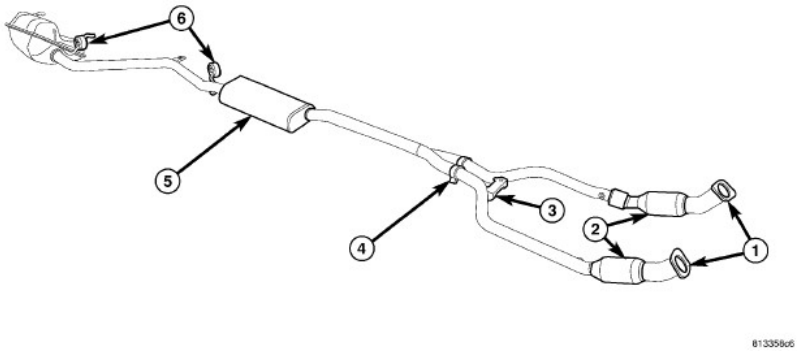
DESCRIPTION

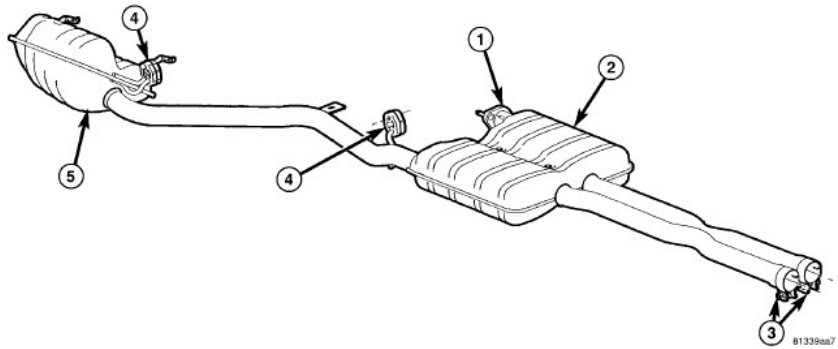


The 3.6L exhaust pipe assembly consists of:

- Muffler and resonator assembly module (5)
- Isolators (6)

The muffler and resonator assembly is serviced as an assembly.

The 5.7L/6.4L RH muffler and tailpipe assembly consists of:



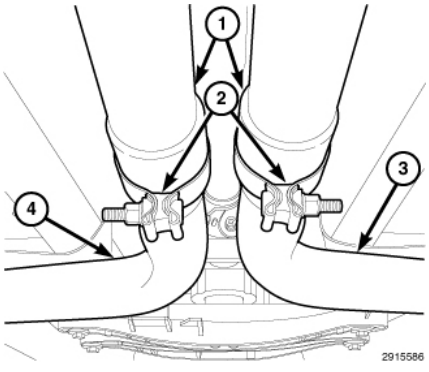
- Front exhaust pipe and muffler (2) and resonator (5)
- Ball flange (1)
- Isolators (4)
- Band clamps (3)

The muffler and resonator assembly is serviced as an assembly.

DUAL MUFFLER

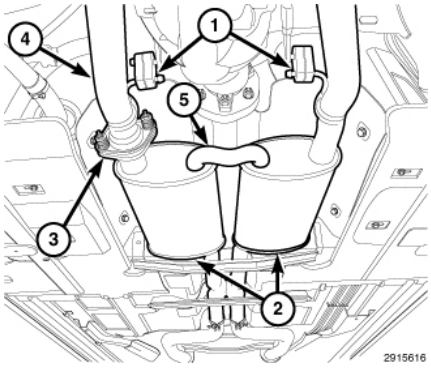
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: When replacement is required on any component of the exhaust system, it is most important that original equipment parts (or their equivalent) be used.

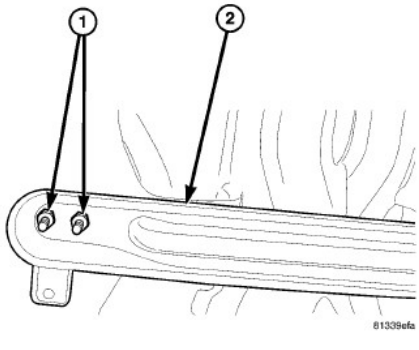


1. Position the front exhaust pipe module clamps (2) on exhaust pipe assembly.
2. Install the exhaust pipe assembly into catalytic converters (3 and 4).

NOTE: Isolators will have an approximately 10° forward angle when installed.



3. Install the isolators (1).
4. 5.7L/6.4L Engines - If equipped, install LH rear resonator and tailpipe assembly (Refer to 11 - Exhaust System/RESONATOR, Exhaust - Installation) .
5. Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.
6. Tighten the band clamps to 61 N·m (45 ft. lbs.).
7. Install both tunnel reinforcement brackets (2) and nuts (1). Tighten nuts to 25 N·m (215 in. lbs.)



8. Check the clearance between muffler and resonator assembly and fuel tank. Clearance is 14mm (.55 in.) for V8 engine.
9. Check the clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
10. The tailpipe should be centered in the rear fascia opening.
11. Adjust clearance as necessary.
12. Lower the vehicle.
13. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

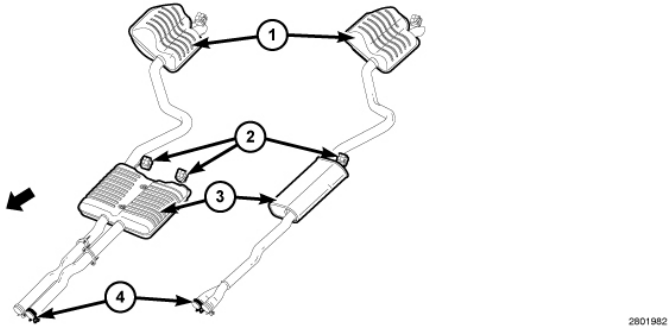
SINGLE MUFFLER/RESONATOR

Labor Operations: Click to display a list of Labor Operations associated with this procedure



NOTE: NOTE: Always work from the front to rear of exhaust system when aligning and tightening exhaust system components.

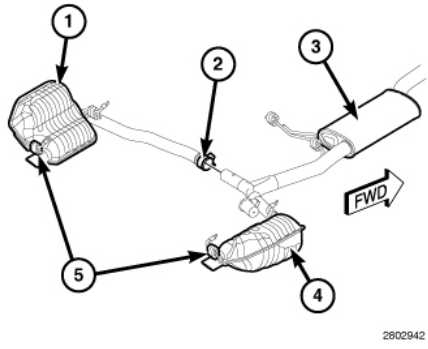
1. Position muffler/resonator assembly (2) onto the catalytic exhaust pipes.
2. Install support isolators.
3. Align muffler/resonator assembly to maintain position and proper clearance with underbody parts. All support isolators should have equal load on them.
4. Tighten the exhaust clamps (4) to 50 N·m (37 ft. lbs.).
5. Connect the ground straps.
6. Lower vehicle.
7. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DUAL MUFFLER/RESONATOR

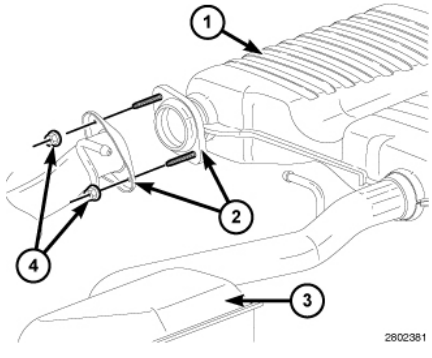
Labor Operations: Click to display a list of Labor Operations associated with this procedure

3.6L



1. Raise the vehicle.
2. Loosen the pipe strap clamp (2) for the left side resonator pipe.
3. Remove the isolators (5) at the left side resonator.
4. Remove the left side resonator and tailpipe assembly (1).
5. Loosen the front strap clamps at the catalytic convertor down pipes.
6. Remove the isolator to the muffler/resonator assembly.
7. Remove the right side muffler/resonator assembly.

5.7L/6.4L

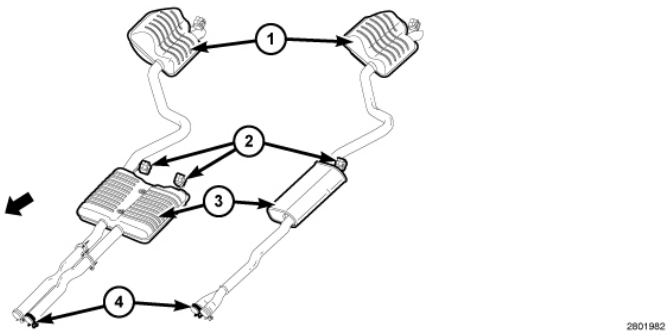


1. Raise the vehicle.
2. Remove the two mounting nuts (4) at the muffler flange (2).
3. Remove the isolators to the left side resonator.
4. Remove left side resonator/tailpipe assembly from the muffler flange (2).
5. Loosen the front strap clamps at the catalytic convertor down pipes.
6. Remove the isolators to the muffler/resonator assembly.
7. Remove the right side muffler/resonator (1) assembly.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

SINGLE MUFFLER/RESONATOR

Labor Operations: Click to display a list of Labor Operations associated with this procedure



NOTE: On single exhaust systems, the muffler, resonator and tailpipe (4) are one single unit .

1. Apply penetrating oil to band clamp nut and bolt (4).
2. Remove ground straps.
3. Support the exhaust system with a stand.
4. Remove the muffler/resonator assembly from the catalytic converter down pipes at the clamps (4).

CAUTION: **Do not use any tools to remove the rubber isolators–remove by hand only. Soapy water or silicone based lubricant spray may be used to assist removal/installation of isolators. DO NOT use a petroleum based lubricant on the isolators, as damage to the rubber material can occur.**

5. Remove the isolators (2).
6. Remove the muffler/resonator assembly.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

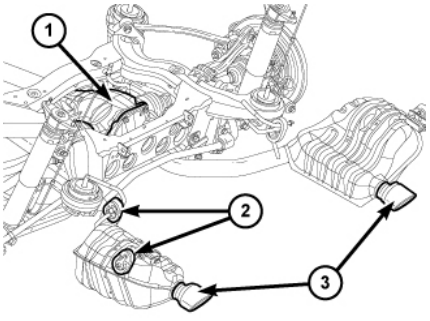
NOTE:

Muffler installation is a two-man operation. Never allow the muffler to hang from the isolators. A helper is required so no damage will come to the isolators or to the tailpipe/muffler assembly.

NOTE:

Some exhaust systems are equipped with adjustable tail pipes and can be removed without removing the resonator assembly.

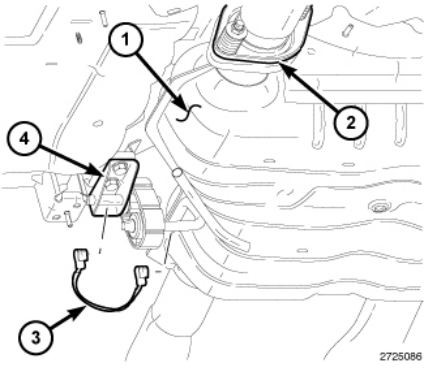
1. If equipped with adjustable tail pipes. Install the tailpipe to the resonator outlet pipe and tighten clamp.
2. If equipped with non adjustable tailpipes, position the tailpipe/resonator (3) assembly in vehicle.
3. If equipped, install the left side tailpipe/resonator at the flange. Tighten the nuts to 28 N·M (21 ft. lbs.).
4. Install tailpipe/resonator insulators (2).
5. Install the tailpipe into the exhaust pipe.



2740253

WITH MUFFLER

1. Install muffler insulators (4) and ground straps (3)
2. Align muffler (1) to the catalytic convertor pipe flange. Install and Tighten flange (2) nuts to 47 N·m (35 ft. lbs.).
3. Make sure the tailpipe/resonator assembly is correctly positioned and the properly aligned. The minimum clearance between components is 25mm (1 inch).
4. Lower the vehicle.
5. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.



2725086

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

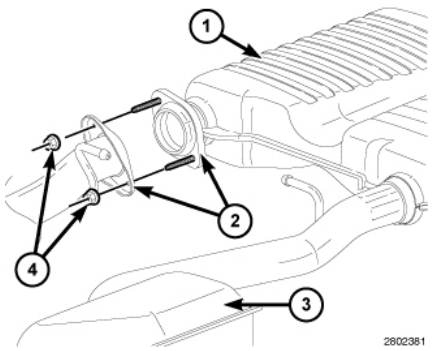
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

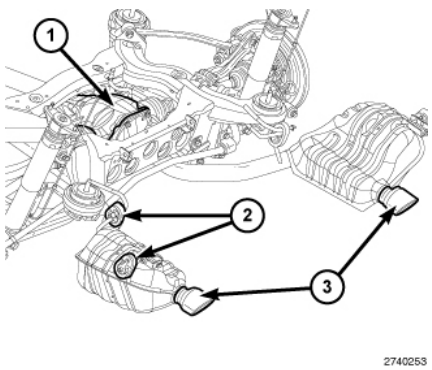
NOTE: Assistance in removal is recommended. Never allow the muffler to hang from the isolators this may cause damage to either the isolators or the tailpipe/muffler assembly.

NOTE: Some exhaust systems are equipped with adjustable tail pipes and can be removed without removing the resonator assembly.

1. Raise and support the vehicle.
2. Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
3. If equipped with adjustable tail pipes. Separate the tailpipe from the resonator outlet pipe.
4. If equipped with non adjustable tailpipes, separate the left side tailpipe/resonator at the flange (2).



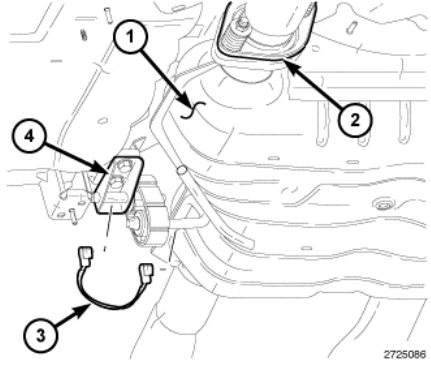
5. Remove the rear isolators (2).
6. Remove the tailpipe/resonator assembly.



WITH MUFFLER

1. Remove the tailpipe/resonator to muffler assembly flange (2) nuts.

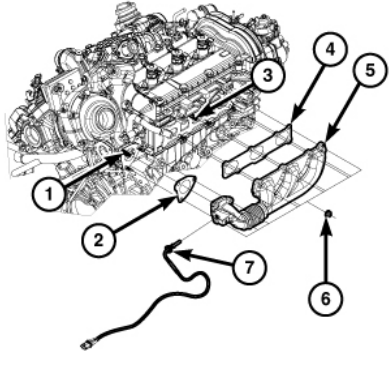
2. Remove tailpipe/resonator and muffler as an assembly from vehicle.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Exhaust Gas Temperature Sensor (7) 1/1 is located the outlet of the Exhaust Manifold and is accessible from the top of the engine compartment. The Exhaust Gas Temperature Sensor 1/1 operates as a typical two wire 5-Volt sensor. It sends a signal to the Powertrain Control Module (PCM) indicating the temperature of the exhaust gases entering the Diesel Particulate Filter.

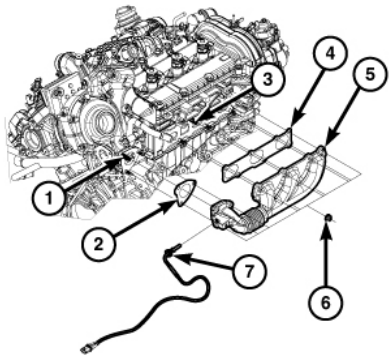


EXHAUST TEMPERATURE SENSOR 1/1

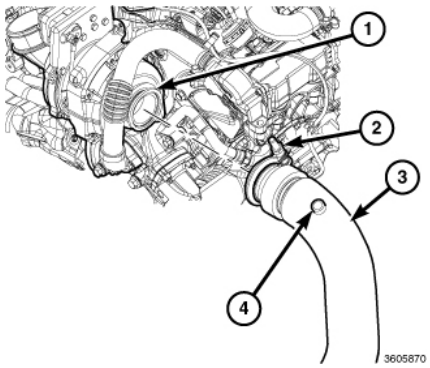
Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION:

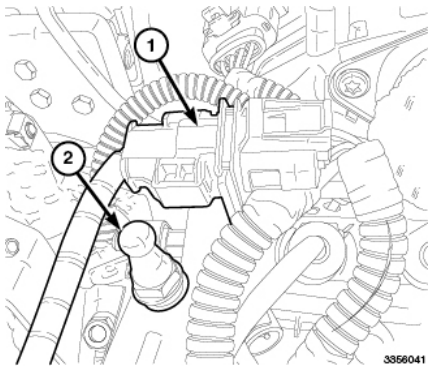
The exhaust gas temperature sensor requires care when handling and installing. The exhaust gas temperature sensor is sensitive to knocks and bending. For this reason if the exhaust gas temperature sensor has been dropped, it must not be installed as damage to the sensor may have occurred. Do not remove from packaging until ready to install. Failure to follow these instructions may result in damage to the exhaust gas temperature sensor.



1. Install the exhaust temperature sensor (7) and tighten to 45 N·m (33 ft. lbs.).



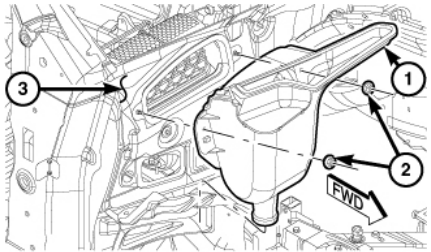
2. Align the Diesel Particulate Filter (DPF) pipe to the turbocharger. Tighten the clamp (2) to 25 N·m (18 ft. lbs.)



3. Connect the upstream exhaust temperature sensor wire harness connector.

4. Connect the oxygen sensor wire harness connector (1).

5. Install the HVAC air inlet housing (1) and securely tighten nuts.



2824799

6. Install the cowl extension and the side extensions (Refer to 23 - Body/Exterior/COVER, Cowl Panel - Installation) .

7. Install the engine cover (1).

8. Connect the negative battery cable.

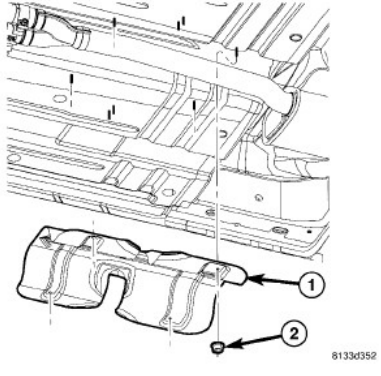
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the heat shields (1).
2. Install the nuts (2). Tighten the nuts (2) to 10 N·m (98 in. lbs.).
3. Install the floor pan mid support bracket.
4. Lower the vehicle.

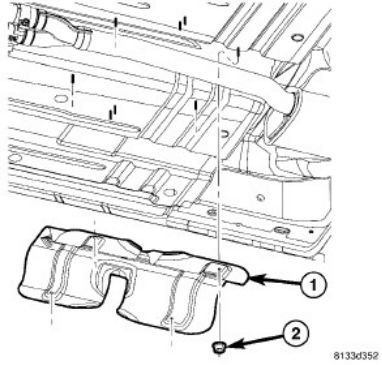


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.**



1. Raise and secure the vehicle.
2. Remove the floor pan mid support bracket.
3. Remove the nuts (2).
4. Remove the heat shields (1).

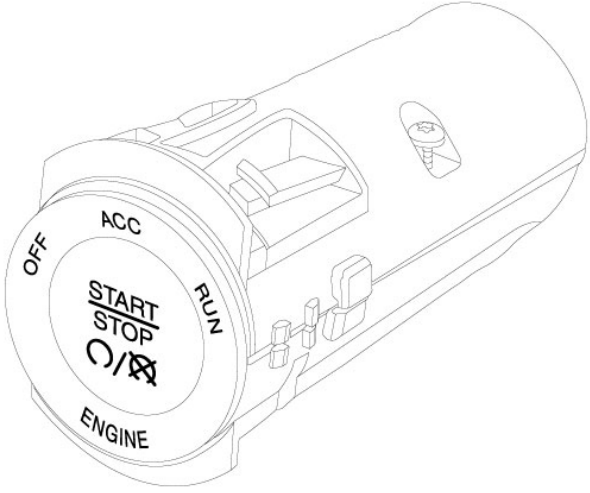
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



Keyless Ignition Node (KIN) is part of the new ignition system.

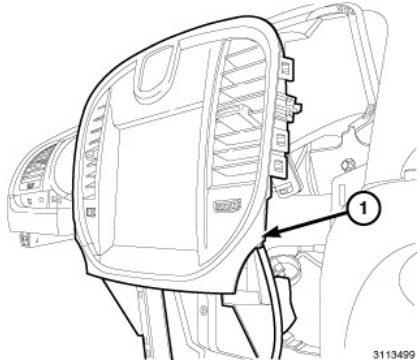
The KIN module is located in the instrument panel to the left of the center stack.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Push the Keyless Ignition Node (KIN) into the instrument panel until it snaps into place.
2. Reach through the Integrated Center Stack (ICS) screen opening and connect the KIN electrical connector.
3. Install the instrument cluster bezel (1) (Refer to 23 - Body/Instrument Panel/BEZEL, Instrument Cluster - Installation) .
4. Connect the negative battery cable.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

This new ignition system operation begins when an owner approaches their vehicle with a FOB somewhere on their person or belongings, i.e., in their gym bag. When the owner KIN's SSB (Keyless Ignition Node's Start/Stop Button), the RF HUB is signalled with "request to start". The RF HUB then uses all of the 5 LF (low frequency) antennas to communicate with the FOB and confirm the FOB is located inside the vehicle. Once located, the FOB's response is evaluated by the RF HUB to determine if the pushing on the SSB is in fact the owner. This process completes 'FOB authentication'. Once successfully completed, the RF HUB next sends the BCM the ignition switch position, which equates to a 'request to start' command. The process of starting a vehicle without the act of using a bladed key or FOB is called 'Keyless Go'.

Keyless go only operates when the RF HUB can locate the FOB inside the vehicle. Please refer to the owner's manual for more information on authentication zones.

After putting the vehicle into park, pushing the KIN's SSB allows the vehicle's engine to be shut off. In an emergency, pressing the SSB continuously for 2 seconds or repeatedly (one hit every 30- 500msec) shuts off the engine.

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition in the **OFF** position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition in the **OFF** position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), the vehicle should be but into **SHIPPING MODE**. This will reduce battery discharging. On CTP base vehicles, putting the vehicle in **SHIPPING MODE** has the same effect as pulling the IOD fuse as non CTP vehicles.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to ten minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE

Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
TGW	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

3. Turn off all electrical accessories.

4. Disconnect the battery negative cable.

CAUTION: **Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.**

5. Connect a 10 amp fused jumper wire between the negative battery cable and the negative battery post.

6. Turn the ignition **ON** and then **OFF** and wait 10 minutes for all systems to enter sleep mode.

NOTE: Do not break the connection between the 10 amp fused jumper wire and the battery. If the connection between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

7. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter to the battery negative cable terminal clamp and the battery negative terminal post, but not on the jumper connection.

8. Remove the 10 amp jumper wire without breaking the digital multi-meter connection.

9. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post, but not the 10 amp jumper wire.

10. The high-amperage IOD reading on the multi-meter should be very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the BCM, front and rear PDC or junction block (Refer to 04 - Vehicle Quick Reference/Fuse Locations and Types - Specifications) , one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete Body Control Module (BCM), circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

11. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in **Step #10**. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

DESCRIPTION

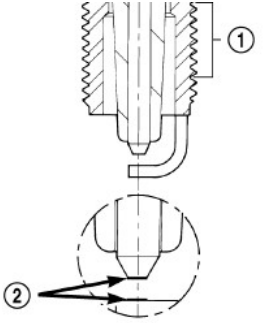
CAUTION: **Cleaning platinum plugs may damage the platinum center electrode or the thin platinum pad.**

The spark plugs are platinum resistor design. They have resistance values of 3,500 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications (Refer to 08 - Electrical/8I - Ignition Control - Specifications) .

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips, they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad (2) is welded to both or just the center electrode end(s). Extreme care must be used to prevent spark plug cross threading, incorrect gapping and ceramic insulator damage during plug removal and installation.

Mopar® Nickel-Graphite Anti-Seize compound is applied to the thread area (1) to prevent damage to the spark plug during removal and installation.

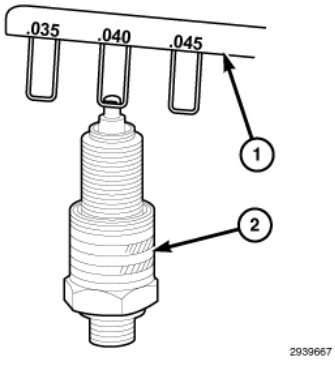


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L

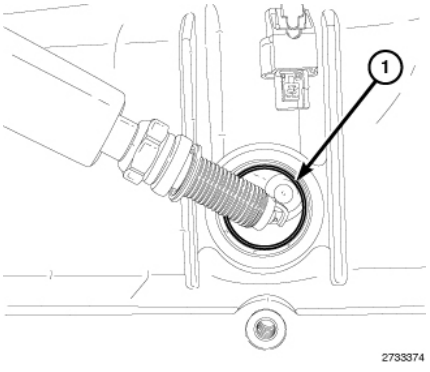
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Check and adjust the spark plug gap with a gap gauging tool (1) (Refer to 08 - Electrical/8I - Ignition Control - Specifications) .



CAUTION: **Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.**

CAUTION: **The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.**



2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: **Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.**

3. Tighten the spark plugs to 17.5 N·m (13 ft. lbs.).

NOTE: The left side ignition coils are shown, the right side ignition coils are similar.

4. Install the ignition coil (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation) .

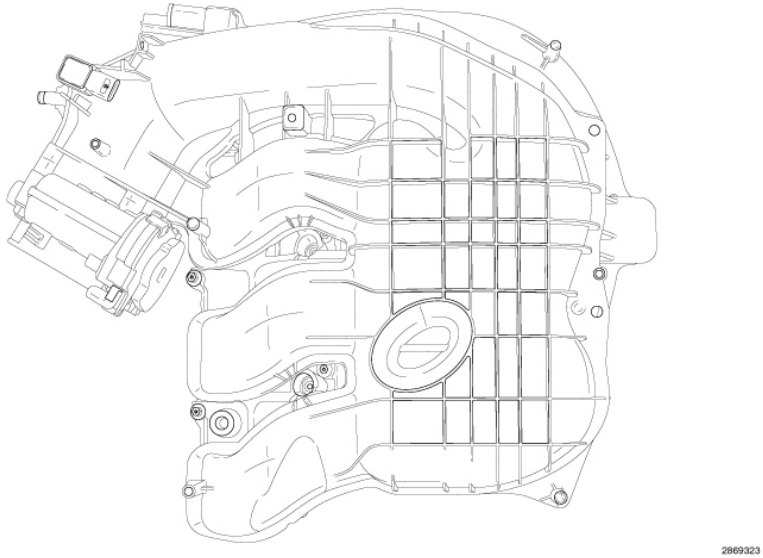
DESCRIPTION

Upper Intake Manifold

CAUTION: **If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!**

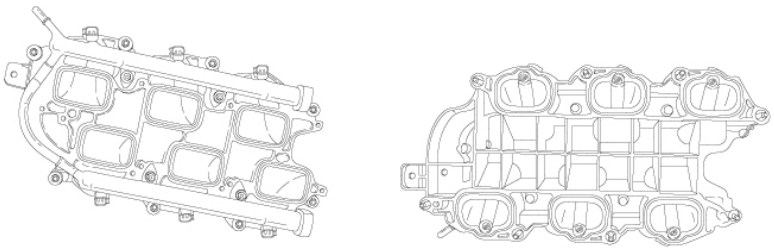


The upper intake manifold is an injection molded nylon composite design. The upper intake manifold is sealed to the lower intake manifold using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the upper intake manifold is removed from the engine. There is a silencer pad positioned between the upper and lower intake manifolds for improved noise, vibration and harshness (NVH). The left cylinder head cover has two alignment posts to aid proper installation of the silencer pad. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design. If the upper intake manifold is damaged or cracked, it must be replaced.

The Electronic Throttle Control (ETC) and Manifold Air Pressure (MAP) sensor are attached directly to the upper intake manifold. The upper intake manifold also provides vacuum ports for brake booster, positive crankcase ventilation (PCV) and emissions control.

Lower Intake Manifold

CAUTION: **If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!**



2869336

The lower intake manifold is an injection molded nylon composite design. The lower intake manifold is sealed to the cylinder heads using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the lower intake manifold is removed from the engine. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design.

The fuel injection fuel rail is also a composite design. The four fuel rail fasteners thread directly into the composite lower intake manifold and are a self-taping design. The lower intake manifold can be serviced without removing the fuel injector rail. The fuel rail and fuel injectors must be installed into the lower intake manifold as an assembly. Do not attempt to install the fuel rail when the injectors are in the manifold. Always install new O-rings on the fuel injectors.

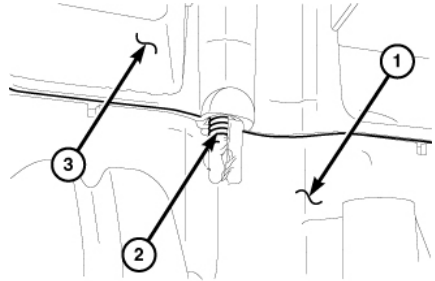
If the lower intake manifold is damaged or cracked, it must be replaced.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

NOTE:

When the upper intake manifold (3) and lower intake manifold (1) are not aligned properly, cross threading of the upper intake manifold attaching bolts can occur. The graphic shows non-repairable damage to the lower intake manifold (1) due to cross threading of an upper intake manifold attaching bolt (2).



2869717

Check both the upper and lower intake manifolds for:

- Damage and cracks
- Gasket surface damage or warping

Check the lower intake manifold for:

- Damaged fuel injector ports

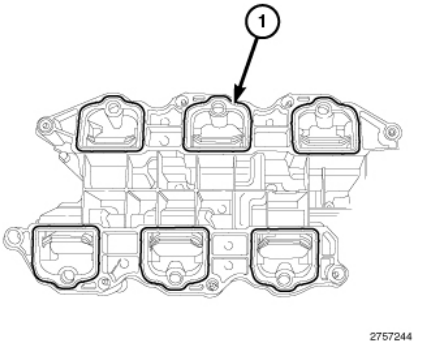
If either the upper or lower manifold exhibits any damaged or warped conditions, replace the manifold.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

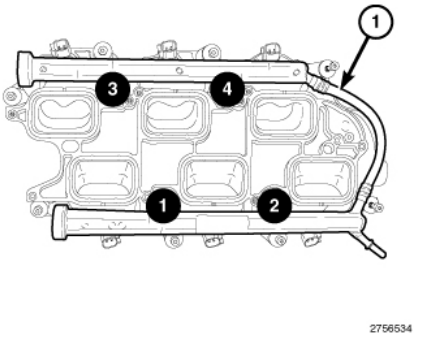
LOWER

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Clean and inspect the sealing surfaces. Install new lower intake manifold to cylinder head seals (1).

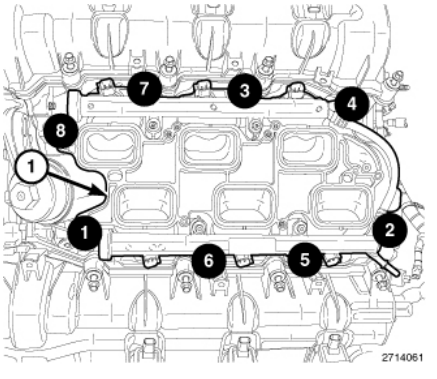


2. If removed, install the fuel injectors and the fuel rail (1) to the lower intake manifold. Tighten the four bolts in the sequence shown to 7 N·m (62 in. lbs.) (Refer to 14 - Fuel System/Fuel Delivery/RAIL, Fuel - Installation) .



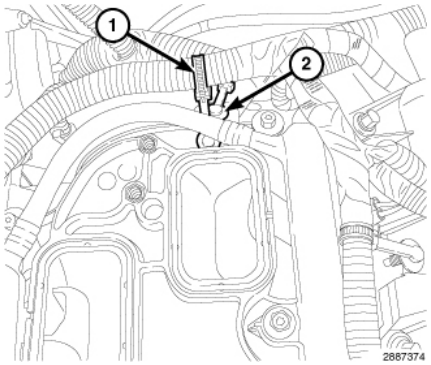
3. Position the lower intake manifold (1) onto the cylinder head surfaces.

4. Install the intake manifold retaining bolts and tighten in the sequence shown to 12 N·m (106 in. lbs.).



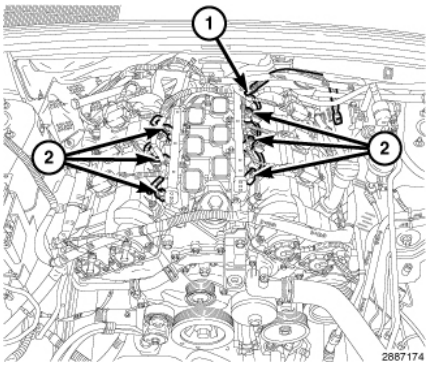
5. Fasten the main wire harness retainer (2) to the rear of the lower intake manifold.

6. Fasten the injection/ignition harness retainer (1) to the rear of the lower intake manifold.

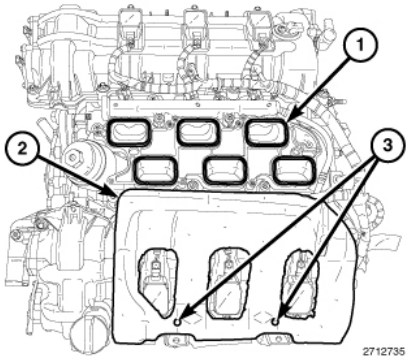


7. Connect the fuel injector electrical connectors (2).

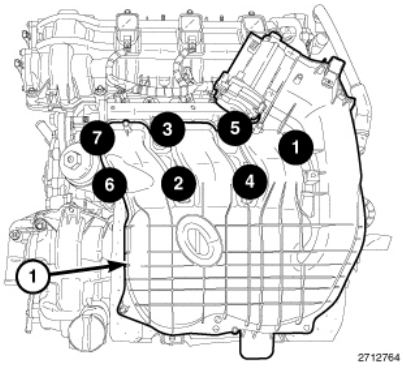
8. Connect the fuel supply hose to the fuel rail (1) (Refer to 14 - Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure) .



9. Install the insulator (2) to the two alignment posts (3) on top of the left cylinder head cover.



10. Install the upper intake manifold (1) and support brackets (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .



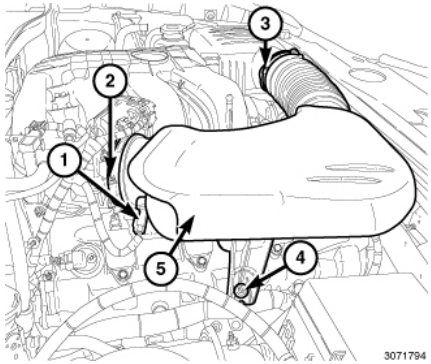
11. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

12. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

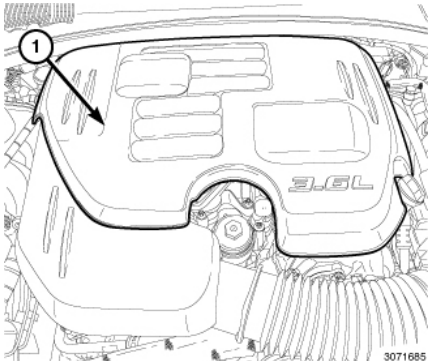
13. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

14. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

15. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

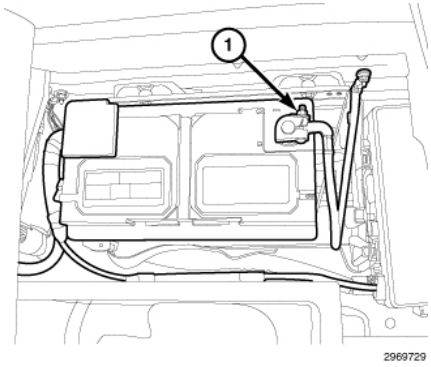


16. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



17. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

18. Start the engine and check for leaks.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

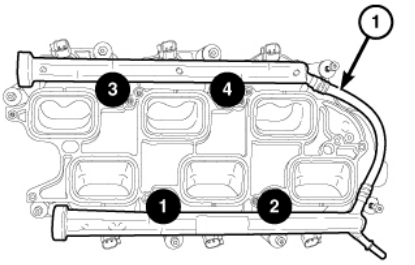
UPPER

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Prior to installing the upper intake manifold, verify that the four fuel rail bolts were not inadvertently loosened. The bolts must tightened in the sequence shown to 7 N·m (62 in. lbs.) (Refer to 14 - Fuel System/Fuel Delivery/RAIL, Fuel - Installation) .

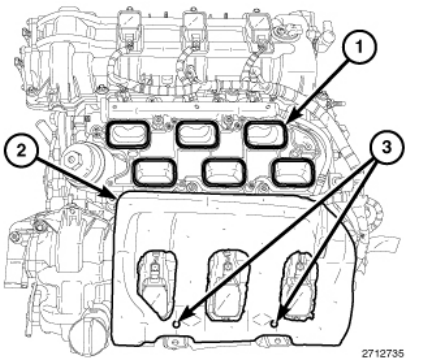


2756534

1. Clean and inspect the sealing surfaces. Install new upper to lower intake manifold seals (1).

NOTE: Make sure the fuel injectors and wiring harnesses are in the correct position so that they don't interfere with the upper intake manifold installation.

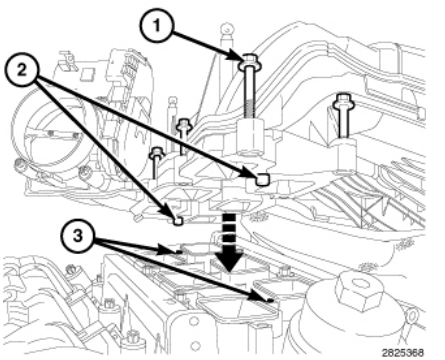
2. If removed, position the insulator (2) onto the two alignment posts (3) on top of the left cylinder head cover.



2712735

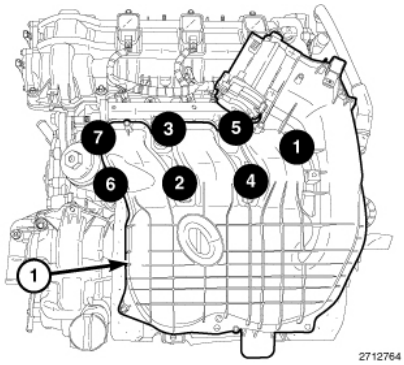
3. Lift and hold the seven upper intake attaching bolts (1) clear of the mating surface. Back the bolts out slightly or if required, use an elastic band to hold the bolts clear of the mating surface.

4. Position the upper intake manifold (1) onto the lower intake manifold so that the two locating posts (2) on the upper intake manifold align with corresponding holes (3) in the lower intake manifold.



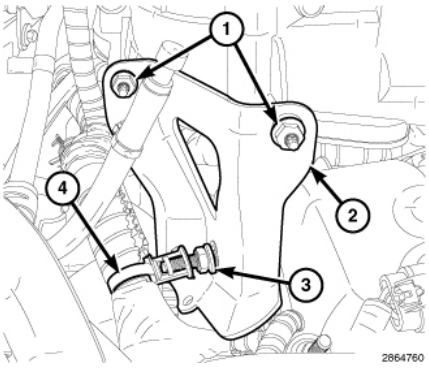
2825368

5. Install the seven upper intake manifold attaching bolts. Tighten the bolts in the sequence shown to 10 N·m (89 in. lbs.).

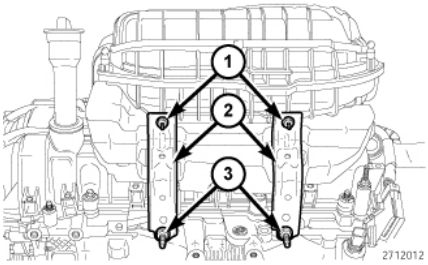


6. Install two nuts (1) to the upper intake manifold support bracket (2). Tighten the nuts (1) to 10 N·m (89 in. lbs.) and tighten the stud (3) to 20 N·m (15 ft. lbs.)

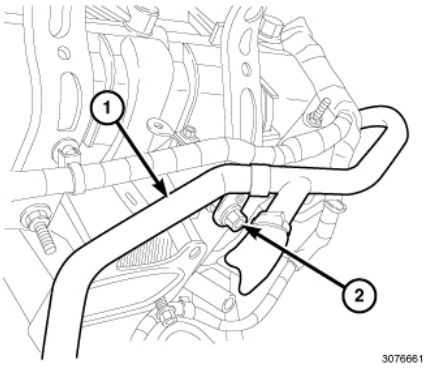
7. Engage the wire harness retainer (4) to the stud (3).



8. Install the two upper intake manifold support brackets (2) with two stud retainers (3) and two nuts (1). Tighten the stud retainers (3) to 20 N·m (15 ft. lbs.) and tighten the nuts (1) to 10 N·m (89 in. lbs.).



9. Position the heater core return tube (1), install the retaining nut (2) and tighten to 12 N·m (9 ft. lbs.).



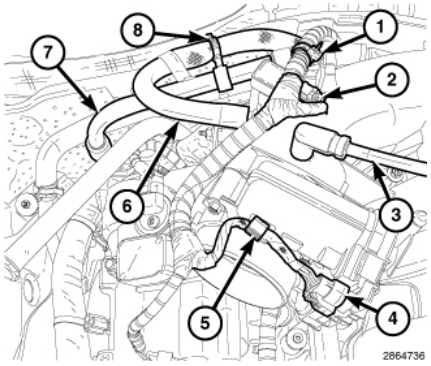
10. Connect the following hoses to the upper intake manifold:

- Positive Crankcase Ventilation (PCV) (7)

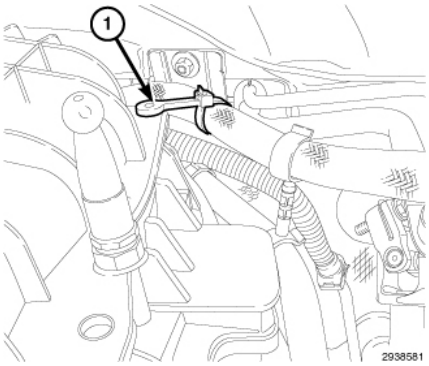
- Brake booster vacuum hose (6)
- EVAP vapor purge line (3)

11. Connect the electrical connectors to the Manifold Absolute Pressure (MAP) sensor (2) and the Electronic Throttle Control (ETC) (4).

12. Secure the ETC harness to the clip (5) on the throttle body and fasten the wire harness retainer (1) to the upper intake manifold near the MAP sensor.



13. Fasten the brake booster vacuum hose retainer (1) to the upper intake manifold.



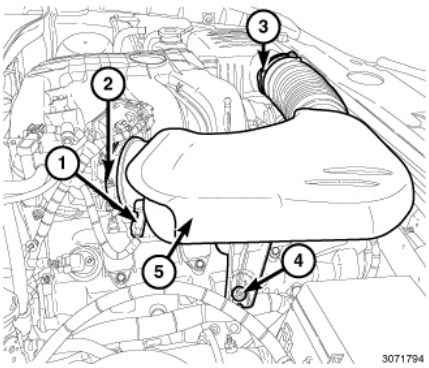
14. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

15. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

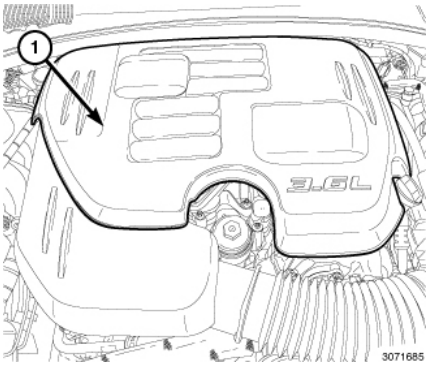
16. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

17. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

18. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



19. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



20. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

21. Start the engine and check for leaks.

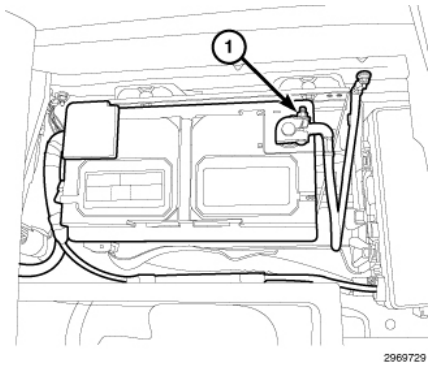
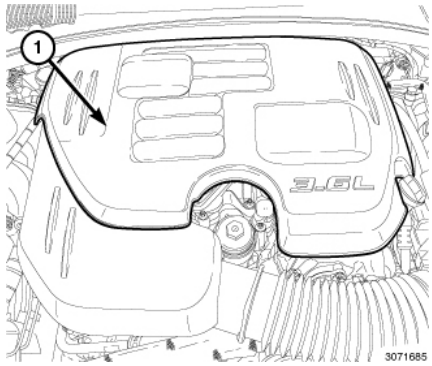
LOWER

Labor Operations: Click to display a list of Labor Operations associated with this procedure

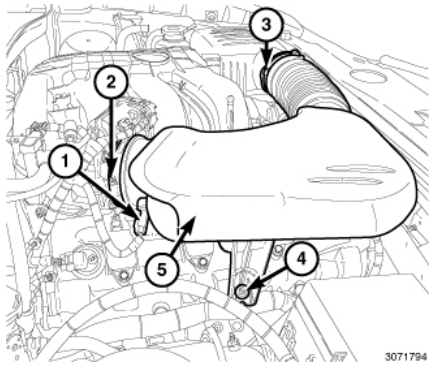
1. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect and isolate the negative battery cable (1).



3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

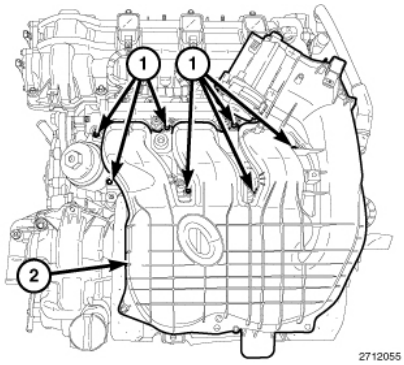


4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

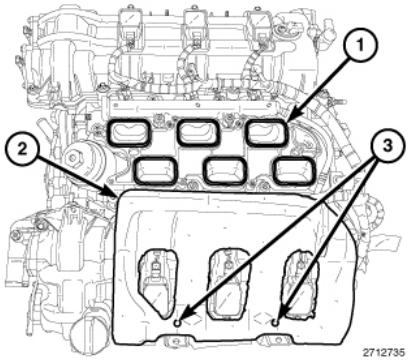


WARNING: **The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.**

9. Remove the upper intake manifold (2) and support brackets (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .

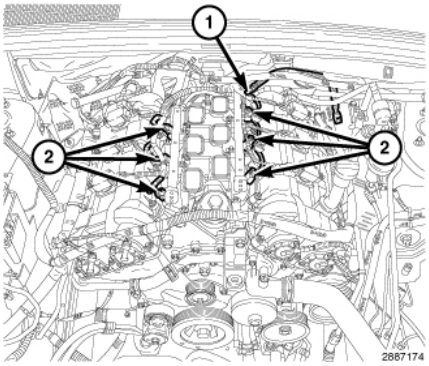


10. Remove the insulator (2) from the left cylinder head cover.



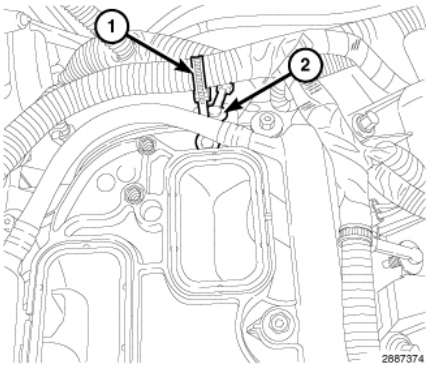
11. Disconnect the fuel supply hose (1) from the fuel rail (Refer to 14 - Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure) .

12. Disconnect the fuel injector electrical connectors (2).



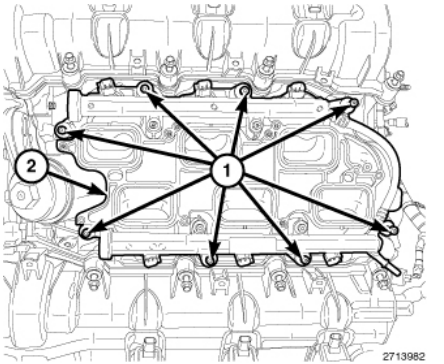
13. Unfasten the injection/ignition harness retainer (1) from the rear of the lower intake manifold.

14. Disengage the main wire harness retainer (2) form the rear of the lower intake manifold.

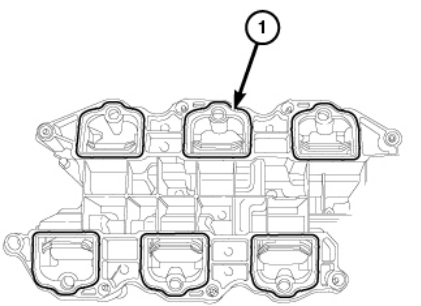


15. Remove the eight lower intake manifold attaching bolts (1).

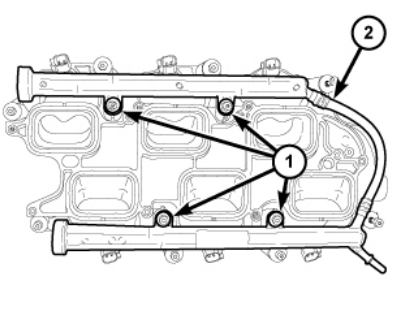
16. Remove the lower intake manifold (2) with the fuel injectors and fuel rail as an assembly.



17. Remove and discard the six lower intake manifold to cylinder head seals (1).



18. If required, remove the fuel rail (2) and fuel injectors from the lower intake manifold (Refer to 14 - Fuel System/Fuel Delivery/RAIL, Fuel - Removal) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

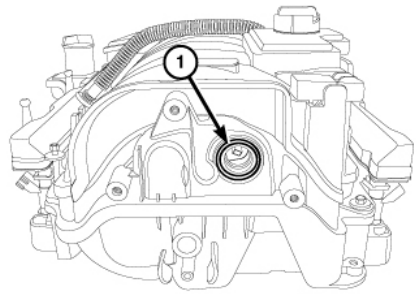
The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not present, the PCM sets the DTC.

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

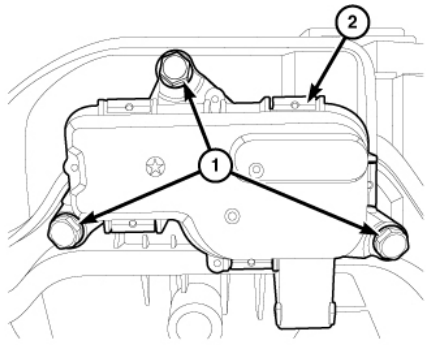
NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.

1. Install a new SRV actuator rubber O-ring seal (1).



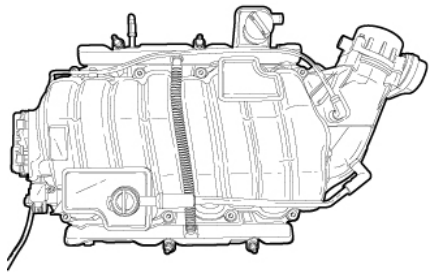
2979774

2. Position the SRV actuator (2), install the retaining bolts (1) and tighten to 5 N·m (44 in. lb.).



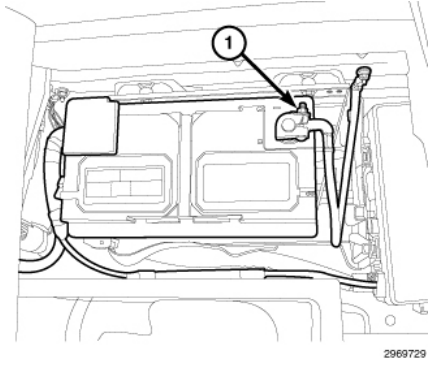
2979559

3. Install the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .



2979729

4. Connect the negative battery cable (1).

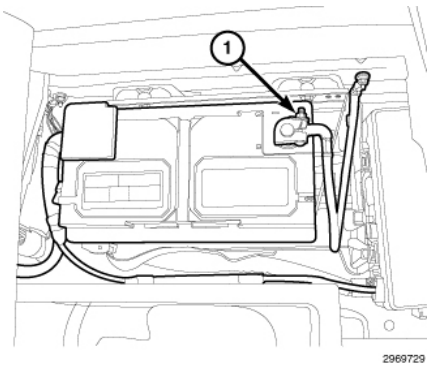


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

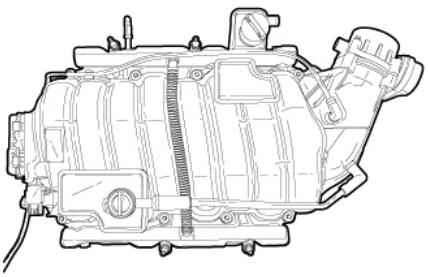
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect the negative battery cable (1).



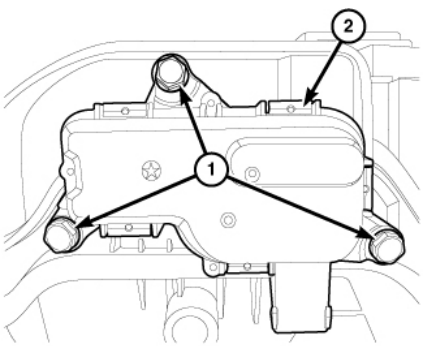
2969729

2. Remove the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .



2979729

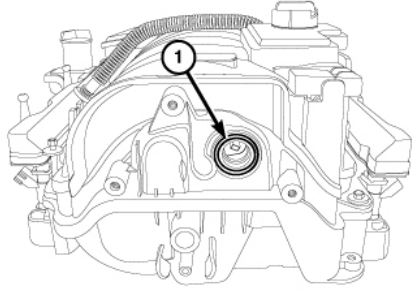
3. Remove the Short Runner Valve (SRV) actuator retaining bolts (1) and remove the SRV actuator (2).



2979559

NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.

4. Remove and discard the SRV actuator rubber O-ring seal (1).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The SRV system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If the spike is not present, the PCM sets the DTC.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

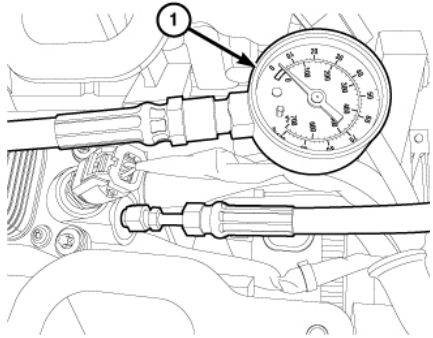
CHECKING ENGINE OIL PRESSURE

Special Tools: Click to display a list of tools used in this procedure

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pressure sensor from the oil filter housing (Refer to 09 - Engine/Lubrication/SENSOR, Oil Pressure - Removal) .
3. Install Pressure Gauge C-3292A (1) to the oil pressure port. Tighten to 20 N·m (177 in. lbs.).
4. Install the upper and lower intake manifolds and air inlet hose (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation) .
5. Start and idle the engine. If oil pressure is 0 at idle, shut off the engine and consult the Engine Lubrication and Diagnostic Table (Refer to 09 - Engine - Diagnosis and Testing) .
6. Run the engine until it reaches normal operating temperature.
7. Verify that the engine has acceptable oil pressure) .



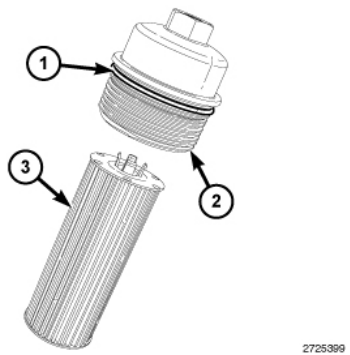
2939846

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

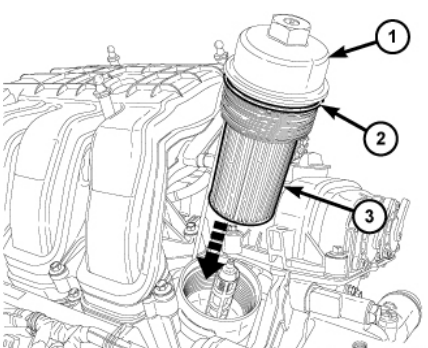
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.



1. Lightly lubricate the new O-ring seal (1) with clean engine oil.
2. Install the O-ring seal (1) on the filter cap (2).
3. Install the new oil filter (3) into the oil filter cap (2).
4. Thread the oil filter cap (1) into the oil filter housing and tighten to the proper) .
5. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .



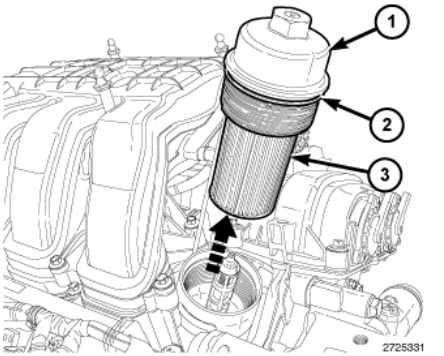
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

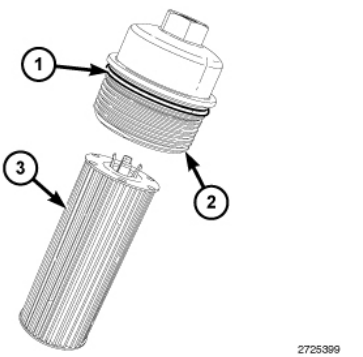
CAUTION: **When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.**



1. Place an oil absorbant cloth around the oil filter housing at the base of the oil filter cap.

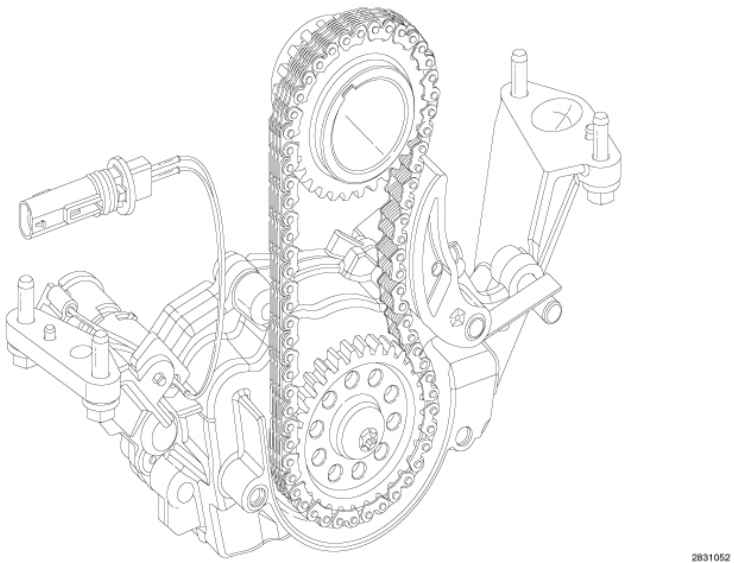
NOTE: The oil filter (3) is attached to the oil filter cap (2).

2. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.
3. Remove the oil filter (3) from the oil filter cap (2).
4. Remove and discard the O-ring seal (1).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



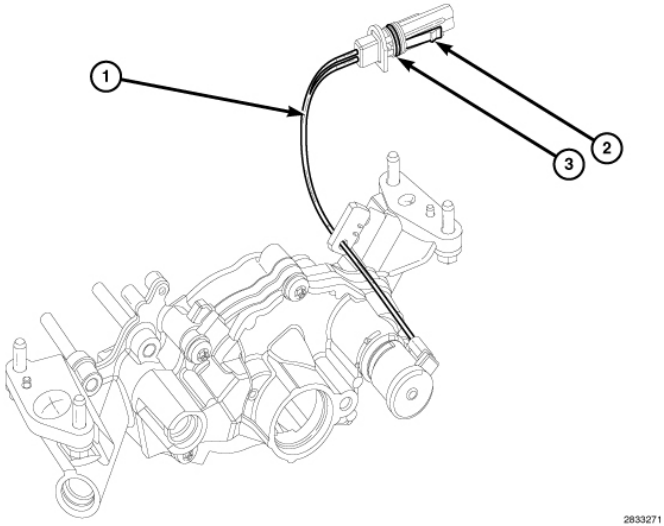
The vane type engine oil pump is mounted to the underside of the cylinder block and is driven by the oil pump chain off the crankshaft at a 1:1 drive ratio. This pump location improves efficiency compared to an on-crankshaft location. The pump is driven with a silent chain which is tensioned using a spring loaded tensioner. The pump is not timed to the engine.

An internal mechanical ball and spring type relief valve prevents excess pressure in the engine by dumping oil into the sump and provides emergency protection at conditions such as a cold start with high engine speed.

The pump has a moving slide mechanism for variable displacement capability and an on-off solenoid for two-stage pressure regulation. The pump and the solenoid are not to be disassembled. Both are non-serviceable items and are to be replaced as a complete assembly.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION



NOTE:

The Oil pump is released as an assembly. The assembly includes both the pump and the solenoid. There are no serviceable sub-assembly components. In the event the oil pump or solenoid are not functioning or out of specification they must be replaced as an assembly.

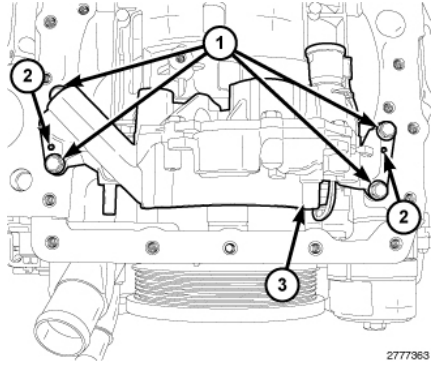
1. Inspect the solenoid wires (1) for cuts or chaffing.

2. Inspect the condition of the connector O-ring seal (3).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

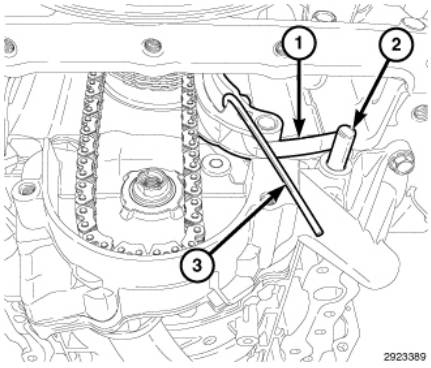


1. Align the locator pins (2) to the engine block and install the oil pump (3) with four bolts (1). Tighten the bolts to 12 N·m (106 in. lbs.).

2. Install the oil pump chain tensioner on the oil pump.

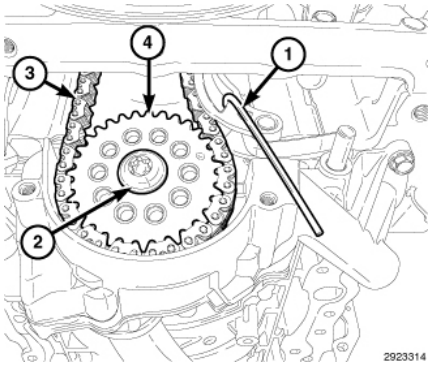
3. Position the oil pump chain tensioner spring (1) above the dowel pin (2).

4. Push back the oil pump chain tensioner and insert a suitable retaining pin (3) such as a 3 mm Allen wrench.



NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

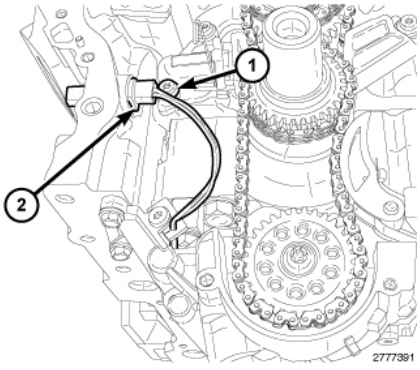


5. Place the oil pump sprocket (4) into the oil pump chain (3). Align the oil pump sprocket with the oil pump shaft and install the sprocket. Install the T45 retaining bolt (2) and tighten to 25 N·m (18 ft. lbs.).

6. Remove the retaining pin (1). Verify that the oil pump chain is centered on the tensioner and crankshaft sprocket.

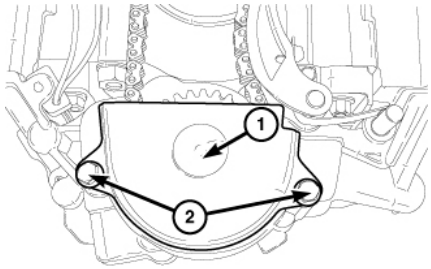
7. Rotate the crankshaft CW one complete revolution to verify proper oil pump chain installation.

NOTE: Graphic shows the engine timing cover removed for clarity.

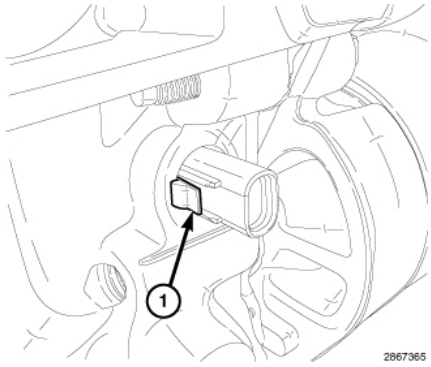


8. Position the oil pump solenoid electrical connector (2) into the engine block. Rotate the connector so that it can be pushed past the primary chain tensioner mounting bolt (1). Then rotate the connector slightly CCW and push it into the engine block until it locks in place.

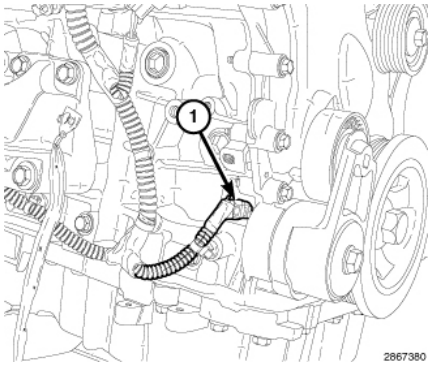
9. Install the timing gear splash shield (1). Tighten bolts (2) to 5 N·m (35 in. lbs.).



10. Verify that the oil pump solenoid electrical connector retention lock tab (1) is engaged to the engine block.



11. Connect the engine wire harness to the oil pump solenoid electrical connector (1).

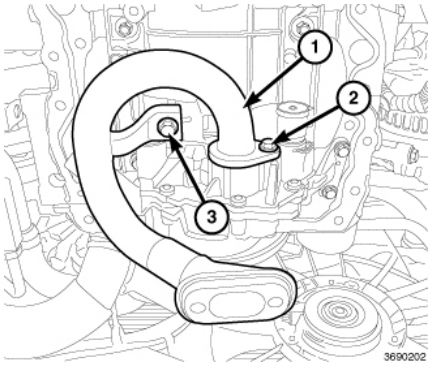


12. Install the oil pump pick-up (1) (Refer to 09 - Engine/Lubrication/PICK-UP, Oil Pump - Installation)

13. Install the oil pan (Refer to 09 - Engine/Lubrication/PAN, Oil - Installation)

14. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

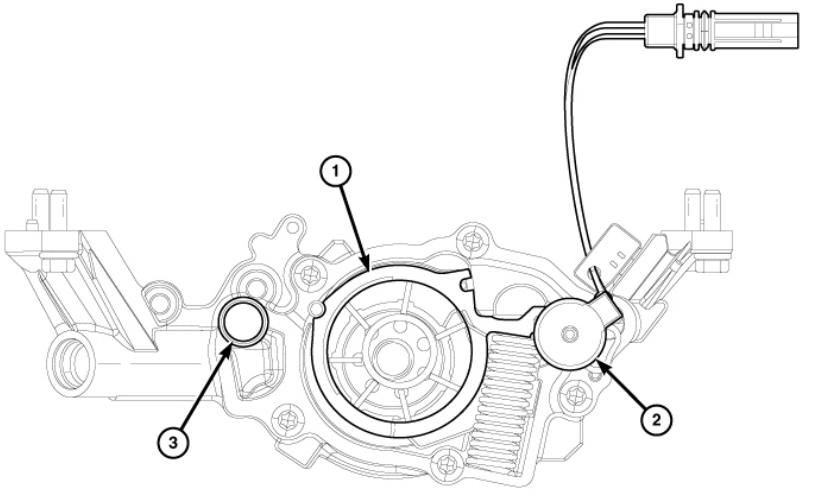


CAUTION: **A MIL or low oil pressure indicator that remains illuminated for more than 2 seconds may indicate low or no engine oil pressure. Stop the engine and investigate the cause of the indication.**

16. Start and run the engine until it reaches normal operating temperature.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

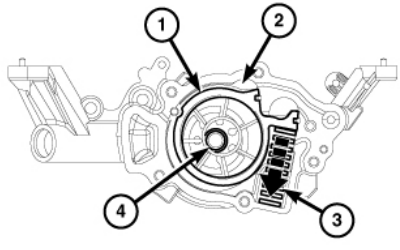


2832737

The engine oil pump features seven vanes and a moving element (1) that continuously adjusts to maintain a regulated oil pressure supply by varying the displacement of the pump. The pump has two regulated pressure stages of operation controlled by an on/off solenoid (2). Low pressure mode regulation (solenoid on) is approximately 200 kPa (29 psi) and high pressure mode regulation (solenoid off) is approximately 450 kPa (65 psi). The Powertrain Control Module (PCM) switches the pump between stages based on engine operating conditions, oil and coolant temperatures, speed and load. Under most typical conditions, the pump will run in low mode from idle up to around 3000 rpm, and switch from low to high mode between 3000 and 4000 rpm.

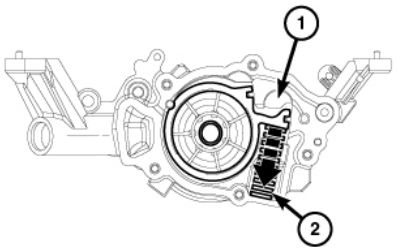
The maximum oil pressure in the engine is limited to 1000 kPa (145 psi) by the relief valve (3). Pressure in the main oil gallery of the engine can be monitored with diagnostic equipment through the oil pressure sensor mounted on the rear of the oil filter module. The minimum pressure for the engine is 41 kPa (6 psi) at any operating condition. Anything under this pressure could result in damage to critical moving parts.

In high pressure mode regulation (solenoid off) main gallery oil pressure (2) is applied to the moving element (1). The main gallery oil pressure works against spring pressure (3) to move the element to a more concentric location about the pump driveshaft (4) thus reducing displacement and pump output.



2832771

In low pressure mode regulation (solenoid on) the energized solenoid opens an additional chamber (1) to main gallery oil pressure increasing the force on the spring (2) to further reduce displacement and output pressure.



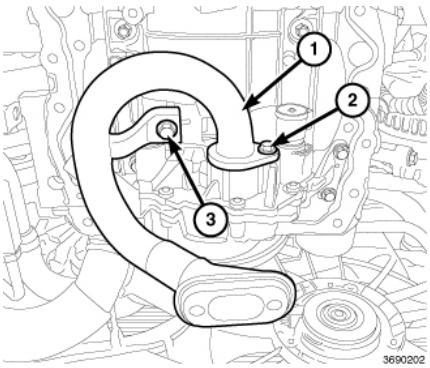
2832798

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

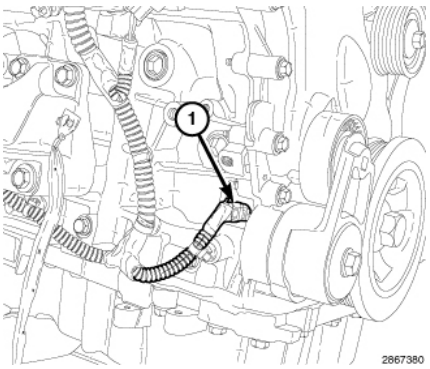
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

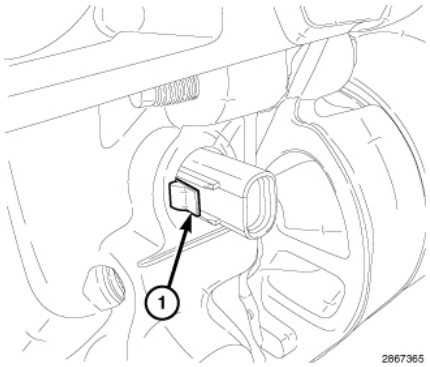
1. Disconnect and isolate the negative battery cable.
2. Remove the upper oil pan (Refer to 09 - Engine/Lubrication/PAN, Oil - Removal)
3. Remove the oil pump pick-up (1) (Refer to 09 - Engine/Lubrication/PICK-UP, Oil Pump - Removal) .



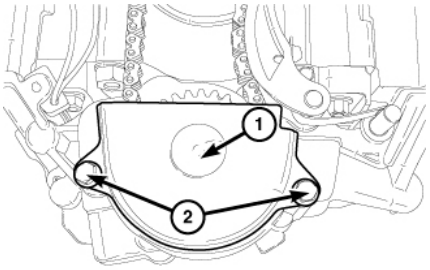
4. Disconnect the engine wire harness from the oil pump solenoid electrical connector (1).



5. Depress the connector retention lock tab (1) to disengage the oil pump solenoid electrical connector from the engine block.

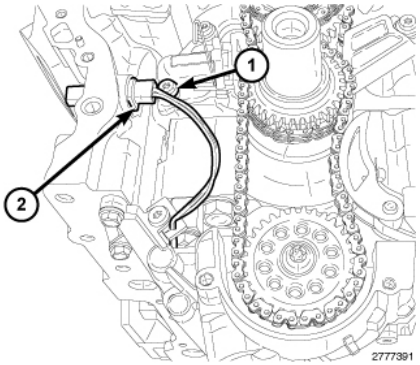


6. Remove bolts (2) and the timing gear splash shield (1).



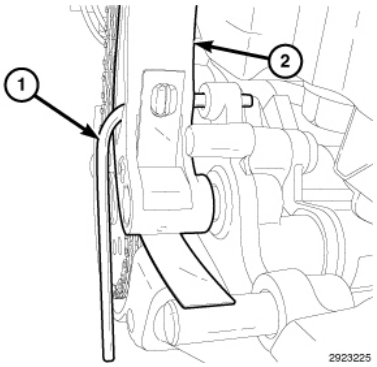
3090017

NOTE: Graphic shows the engine timing cover removed for clarity.



2777391

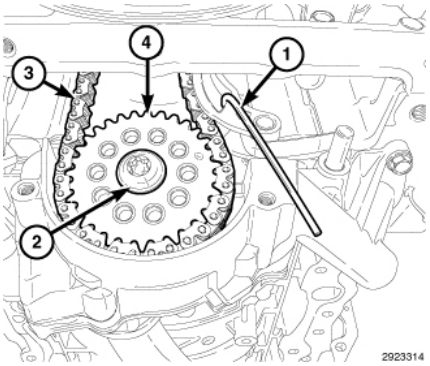
7. Push the oil pump solenoid electrical connector into the engine block, rotate the connector slightly CW, push it past the primary chain tensioner mounting bolt (1) and into the engine.



2923225

8. Push back the oil pump chain tensioner (2) and insert a suitable retaining pin (1) such as a 3 mm Allen wrench.

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**



2923314

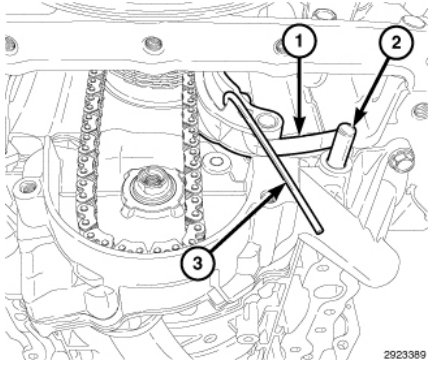
9. Mark the direction of rotation on the oil pump chain (3) and sprocket (4) using a paint pen or equivalent to aid in reassembly.

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

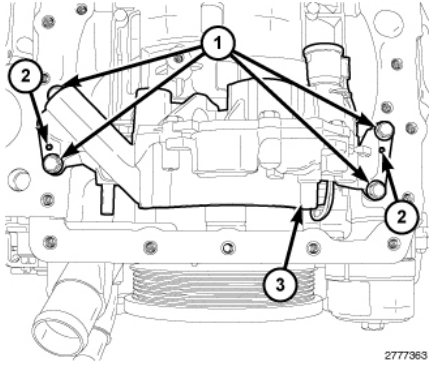
10. Remove the oil pump sprocket T45 retaining bolt (2) and remove the oil pump sprocket (4).

11. Remove the retaining pin (3) and disengage the oil pump chain tensioner spring (1) from the dowel pin (2).

12. Remove the oil pump chain tensioner from the oil pump.



13. Remove the four oil pump bolts (1) and remove the oil pump (3).

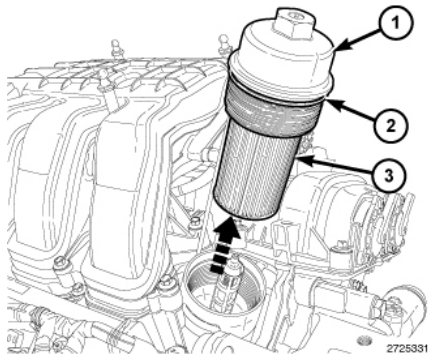


STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: **New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

Change the engine oil and filter at mileage and time intervals described in the Maintenance Schedule (Refer to 04 - Vehicle Quick Reference/Maintenance Schedules - Description) .

NOTE: Graphic shows engine cover removed for clarity.

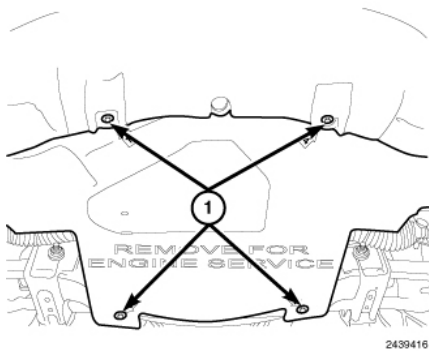


CAUTION: **When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.**

1. Run the engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn the engine off.
3. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter (3) is attached to the oil filter cap (2).

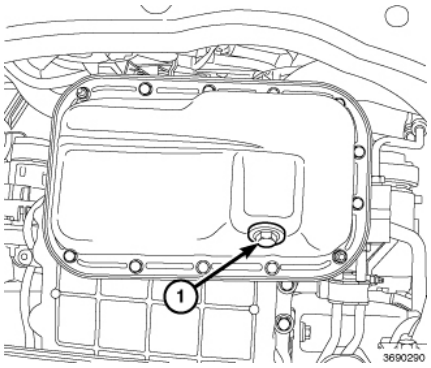
4. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.
5. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
6. Remove the belly pan retainers (1) and remove the belly pan.



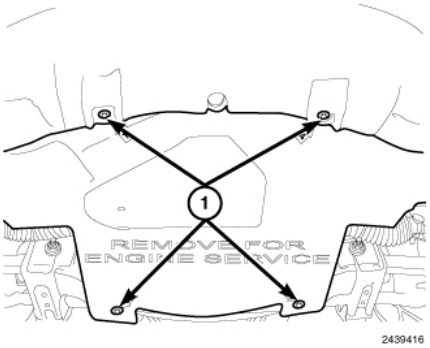
7. Place a suitable drain pan under the crankcase drain plug (1).

8. Remove the drain plug (1) from oil pan and allow the oil to drain into the pan. Inspect the drain plug threads for stretching or other damage. Replace the drain plug and gasket if damaged.

9. Install the drain plug (1) in the oil pan and tighten to 27 N·m (20 ft. lbs.).



10. Position the belly pan and install the retainers (1).



11. Lower the vehicle.

12. Remove the oil filter (3) from the oil filter cap (2).

13. Remove and discard the O-ring seal (1).

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

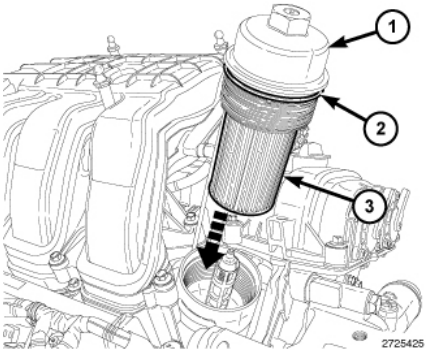
14. Lightly lubricate the new O-ring seal (1) with clean engine oil.

15. Install the O-ring seal (1) on the filter cap (2).

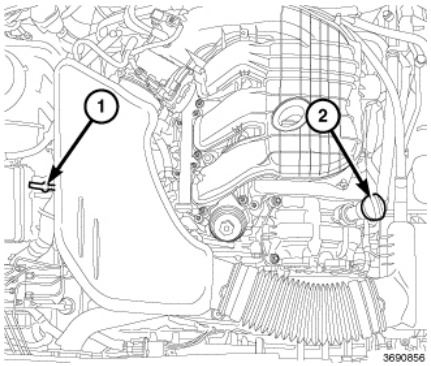
16. Install the new oil filter (3) into the oil filter cap (2).

NOTE: Graphic shows engine cover removed for clarity.

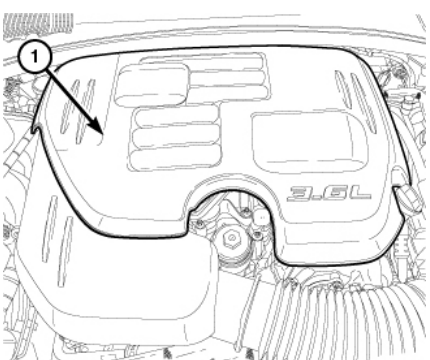
17. Thread the oil filter cap (1) into the oil filter housing and tighten to 25 N·m (18 ft. lbs.).



18. Remove the oil fill cap (2). Fill the crankcase with the specified type and amount of engine oil (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .
19. Install the oil fill cap (2).
20. Start the engine and inspect for leaks.
21. Stop the engine and check the oil level (1).



22. Install the engine cover (1), if removed.



OIL FILTER SPECIFICATION

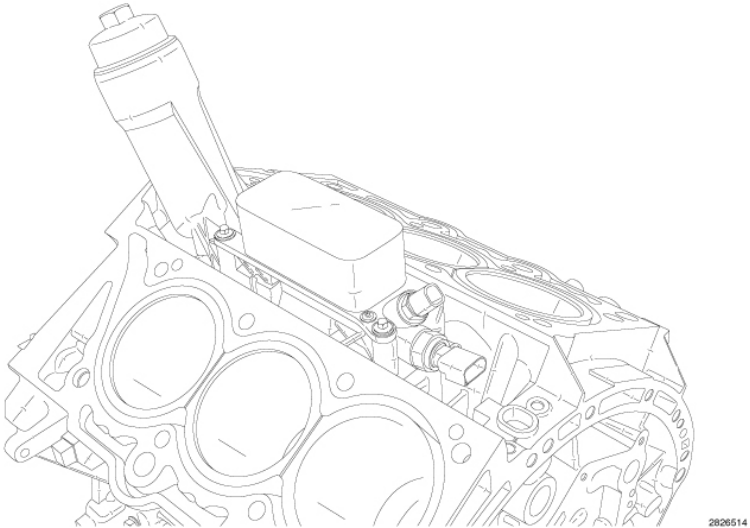
All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



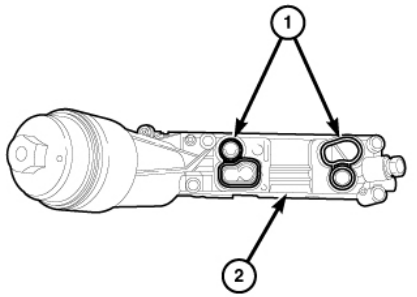
The oil cooler is attached to the top of the oil filter housing which is located in the V of the cylinder block. The oil cooler is a plate style coolant-to-oil heat exchanger.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Always use new dry seals (1) when installing the oil cooler. Do not lubricate the seals.



2710718

1. Install the new oil cooler seals (1) onto the oil filter housing (2).
2. Position the oil cooler (4) on the oil filter housing.
3. Install two screws (1) and (3). Tighten the screws to the proper) .
4. Install four bolts (2) and tighten to the proper) .
5. Install the upper and lower intake manifolds and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation) .
6. Fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .
7. Connect the negative battery cable and tighten nut to the proper) .
8. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .
9. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure) .

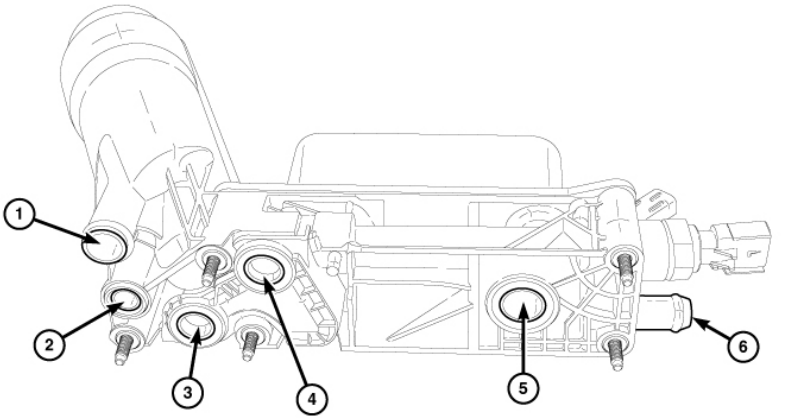
OPERATION



2826564

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered it travels internally through the engine oil cooler and then to the main oil gallery (5).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

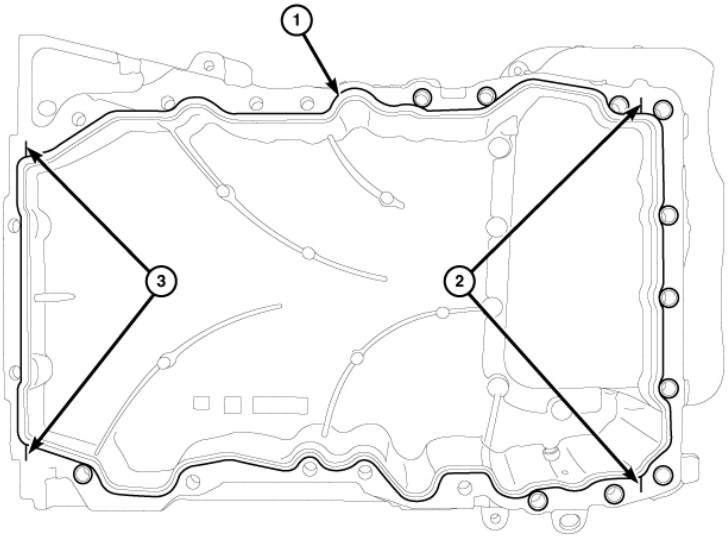
CLEANING

CAUTION: **Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.**

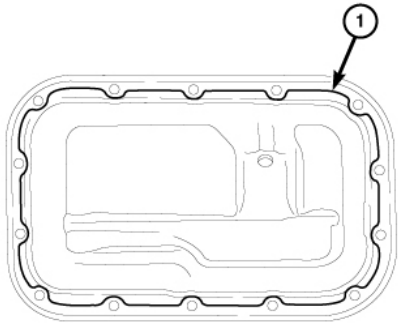


3515756

1. Clean the oil pan in solvent and wipe dry with a clean cloth.

CAUTION: **Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.**

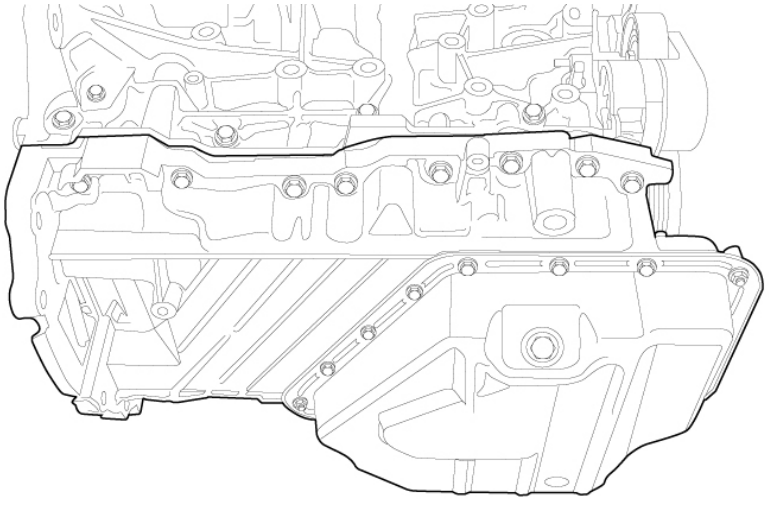
2. Remove all residual sealant (1) from the upper and lower oil pans (Refer to 09 - Engine - Standard Procedure)



3515720

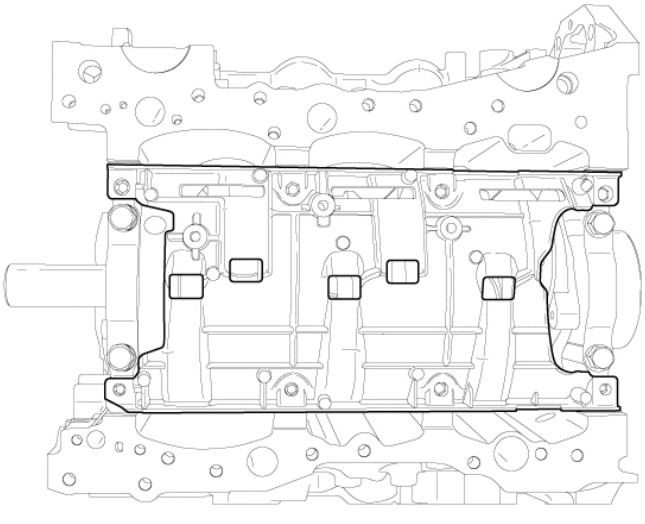
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



3515588

There is an upper and lower oil pan. The upper oil pan is cast aluminum and also serves as the lower end structural support. The lower pan is a stamped steel design. Both upper and lower oil pans are sealed using Mopar® Threebond Engine RTV Sealant. The lower oil pan must be removed in order to access all of the upper oil pan attaching bolts.



2830423

CAUTION: **Do not attempt to support the weight of the engine on the windage tray. The windage tray is a thin cast aluminum construction and can be easily damaged.**

The high pressure die cast aluminum windage tray is mounted to the main bearing caps and is designed to keep oil off of the connecting rods as the crankshaft rotates. When the oil is kept off the connecting rods, the engine rotates easier and oil foaming decreases. Like the oil pan, the windage tray is designed to stiffen the lower end of the engine. The tray is directional and the main bearing cap bolts hold it in place.

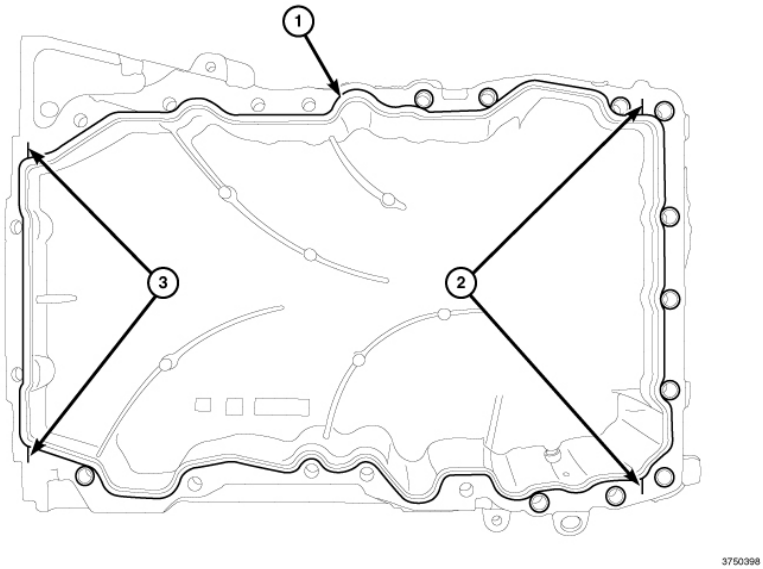
Labor Operations: Click to display a list of Labor Operations associated with this procedure



CAUTION: **Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.**

CAUTION: **Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.**

CAUTION: **Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.**

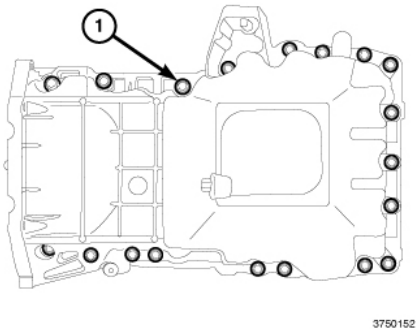
1. Clean the oil pan, timing chain cover, rear seal retainer and engine block mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the oil pan as shown in the following locations:

   - Oil pan to engine block flange (1)
   - Two timing cover to engine block T-joints (2)
   - Two rear seal retainer to engine block T-joints (3)

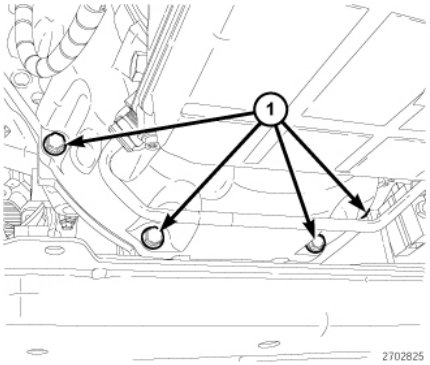
   CAUTION: **Make sure that the rear face of the oil pan is flush to the transmission bell housing before tightening any of the oil pan mounting bolts. A gap between the oil pan and the transmission could crack the oil pan or transmission casting.**

3. Install the oil pan to the engine block making sure the oil pan is flush to the transmission bell housing. Secure the oil pan to the engine block with nineteen M8

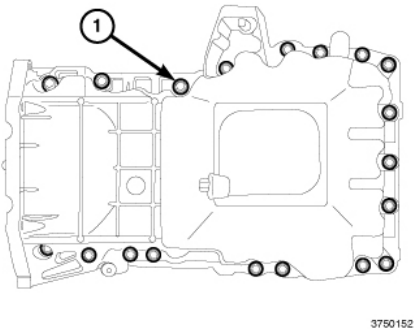
oil pan mounting bolts (1) finger tight.



4. Install the four transmission to the engine oil pan bolts (1) and tighten to 55 N·m (41 ft. lbs.).

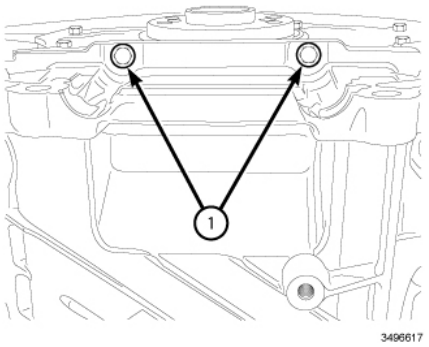


5. Tighten the nineteen previously installed M8 oil pan mounting bolts (1) to 25 N·m (18 ft. lbs.).

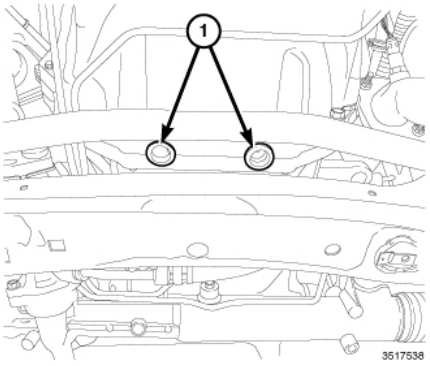


NOTE: Shown with transmission removed for clarity.

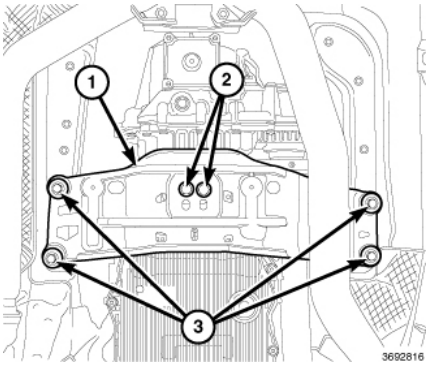
6. Install the two M6 bolts (1) to the rear oil seal retainer flange and tighten to 10 N·m (89 in. lbs.).



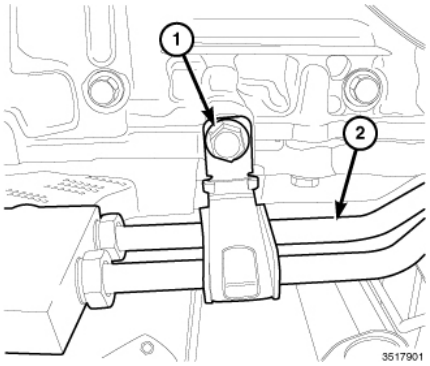
7. Install the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

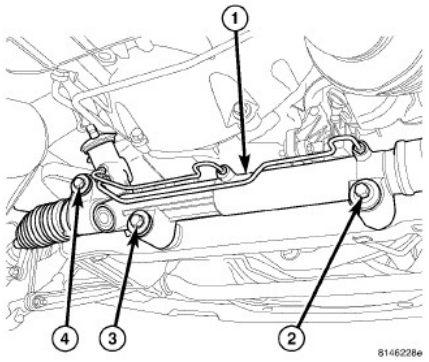


8. Lower the rear of the engine and install the two bolts (2) to the rear engine mount isolator. Tighten the bolts to 65 N·m (48 ft. lbs.).



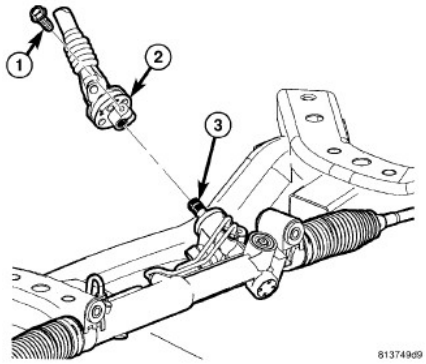
9. Install the transmission cooling lines (2) and tighten the bolt (1) to 12 N·m (106 in. lbs.).





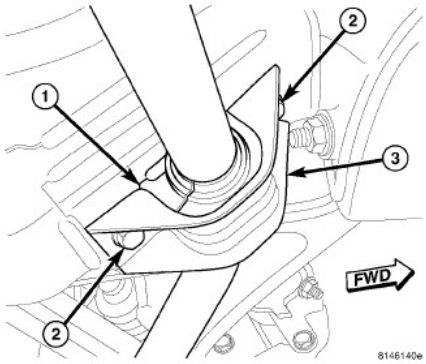
10. Lift the steering gear (1) into the mounted position and install the steering gear lower mounting bolts (2 and 3). Install the upper mounting bolt (4) and nut. Tighten all bolts to 102 N·m (75 ft. lbs.).

    Align splines and install the lower intermediate shaft coupling (2) to the steering gear shaft (3). Install a **NEW** pinch bolt and tighten to 45 N·m (33 ft. lbs.).



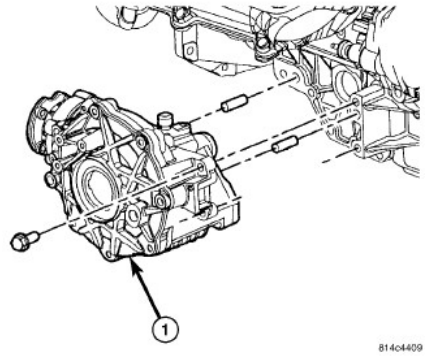
11. Raise the stabilizer bar to the engine cradle, placing bushings (1) into the mounted position.

12. Install the bolts (2) securing each stabilizer bar isolator retainer (3) to the cradle. Tighten the bolts to 60 N·m (44 ft. lbs.).



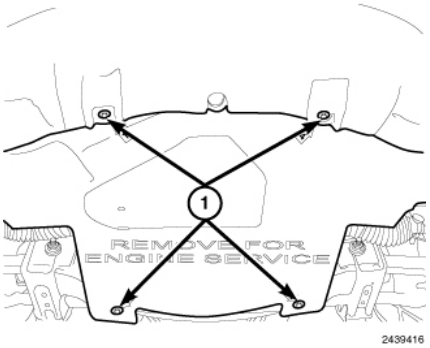
13. Install the front axle assembly (1) with propeller shaft, intermediate shaft, halfshafts, wheels, tires and exhaust pipe (Refer to 03 - Differential and Driveline/Front Axle - Installation) .

14. If required, fill the front axle with the specified type and amount of gear lubricant.



15. Position the belly pan and install the retainers (1).

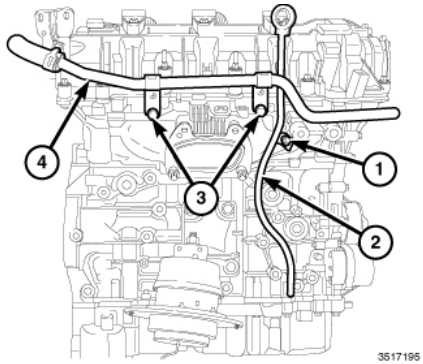
16. Lower the vehicle.



17. Install the oil level indicator (2) with bolt (1) tightened to 12 N·m (106 in. lbs.).

18. Position the heater core inlet tube (4) and install two bolts (3) tightened to 12 N·m (106 in. lbs.).

19. Fill the crankcase with the specified type and amount of engine oil (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .



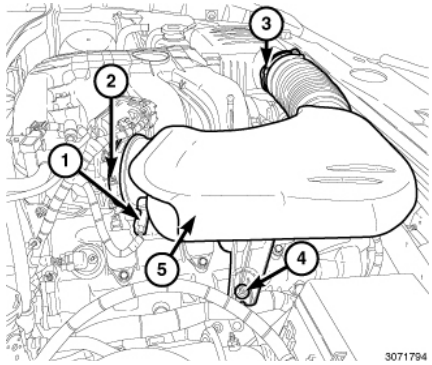
20. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

21. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

22. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

23. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

24. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



25. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

26. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

27. Start and run the engine until it reaches normal operating temperature and check for leaks.

Labor Operations: Click to display a list of Labor Operations associated with this procedure

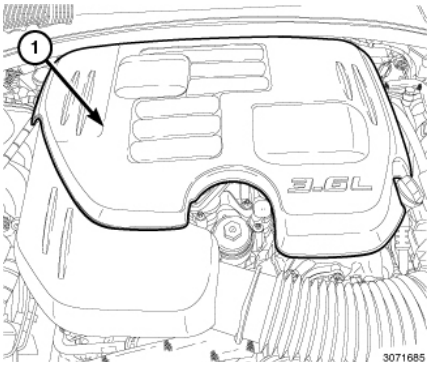
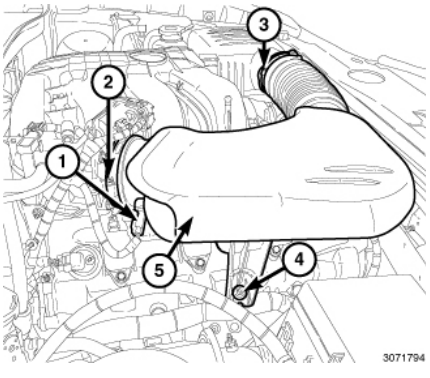
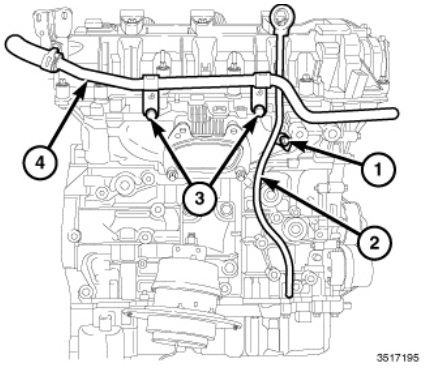
1. Disconnect and isolate the negative battery cable.
2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).



3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

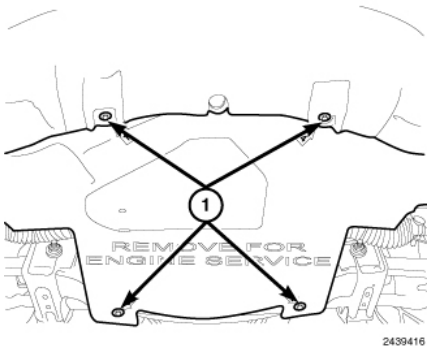


8. Remove two bolts (3) from the heater core inlet tube (4) and reposition the tube.
9. Remove the bolt (1) and remove the oil level indicator (2).

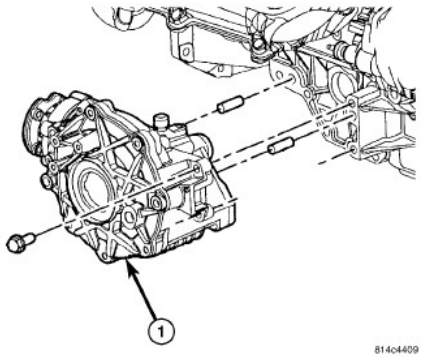


10. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
11. Remove the belly pan retainers (1) and remove the belly pan.

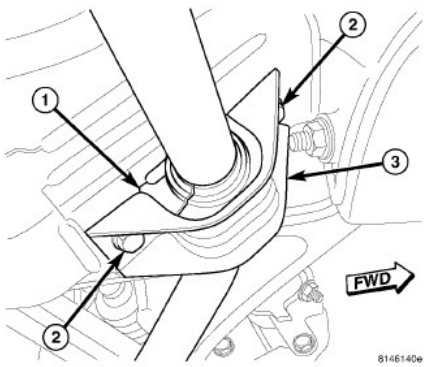
12. Drain the engine oil (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .



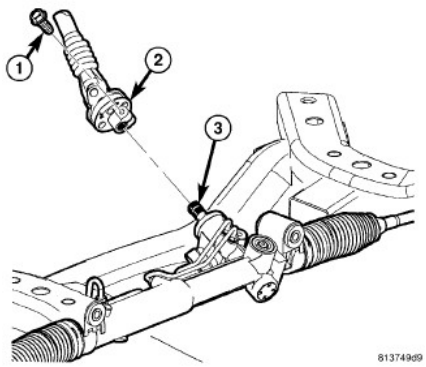
13. Remove the front axle assembly (1) (Refer to 03 - Differential and Driveline/Front Axle - Removal) .



14. Remove the front stabilizer bar with isolators and retainers (Refer to 02 - Front Suspension/Front/STABILIZER BAR, Front - Removal) .

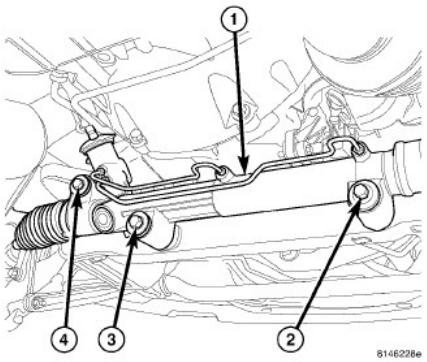


15. Remove the lower intermediate shaft coupling pinch bolt (1) from the lower intermediate shaft (2). Separate the lower intermediate shaft (2) from the steering gear shaft (3).

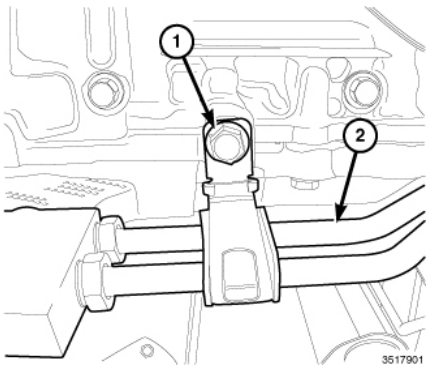


16. Remove the steering gear upper mounting bolt (4) and nut.

17. Remove the steering gear lower mounting bolts (2 and 3) and reposition the steering gear (1).

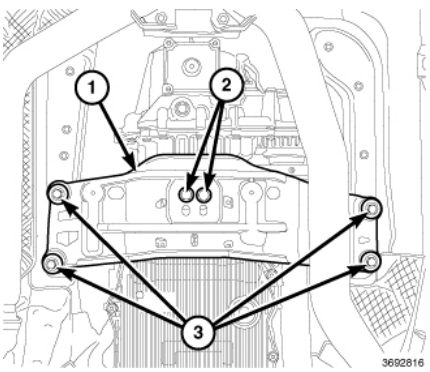


18. Remove the bolt (1) and reposition the transmission cooling lines (2).

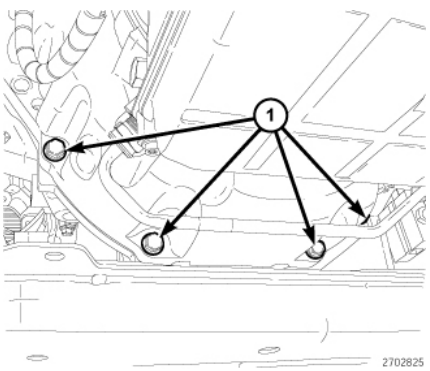


19. Remove the two bolts (2) from the rear engine mount isolator.

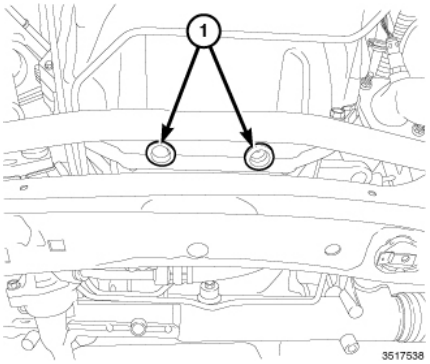
20. Using a suitable jack stand and a block of wood positioned under the transfer case, raise the rear of the engine.



21. Remove the four transmission to the engine oil pan bolts (1).



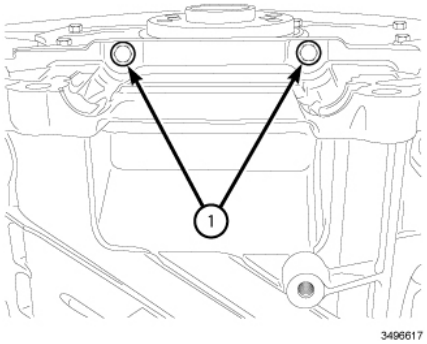
22. Remove the two rubber plugs (1) covering the rear oil seal retainer flange bolts.



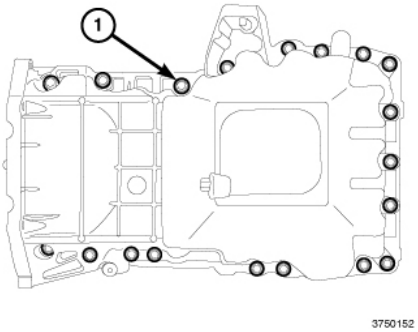
NOTE: Shown with transmission removed for clarity.

CAUTION: **There are two hidden M6 bolts that must be removed from the rear of the upper oil pan flange. If these bolts are not removed, the rear oil seal retainer flange will be severely damaged.**

23. Remove two M6 bolts (1) from the rear oil seal retainer flange.

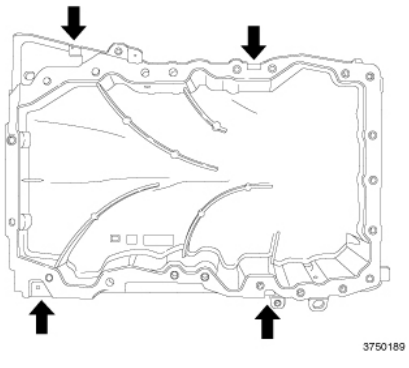


24. Remove nineteen M8 oil pan mounting bolts (1).



25. Using the four indicated pry points, carefully remove the oil pan.

26. Remove all residual sealant from the oil pan, timing chain cover, rear seal retainer and engine block mating surfaces (Refer to 09 - Engine/Lubrication/PAN, Oil - Cleaning) .



.

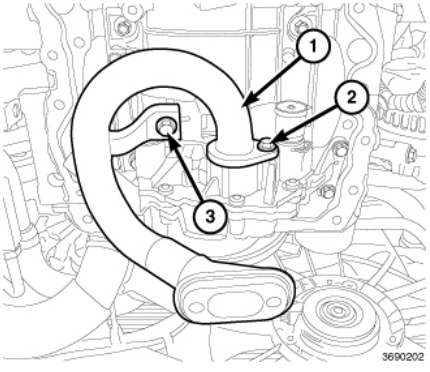
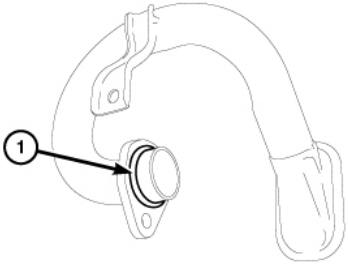
3. Remove the oil pump pick-up tube support bracket retaining bolt (3).
4. Remove the oil pump pick-up tube retaining bolt (2) and remove the pick-up tube (1) from the oil pump.

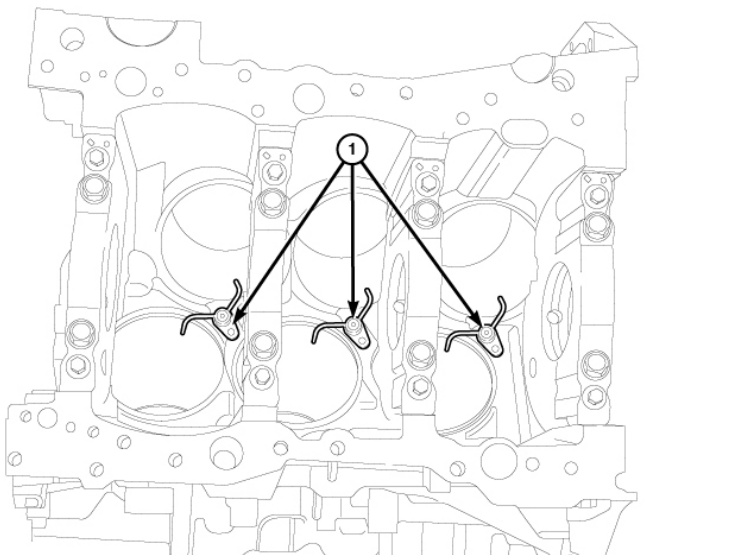


5. Remove and discard the O-ring seal (1) from the oil pump pick-up tube.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



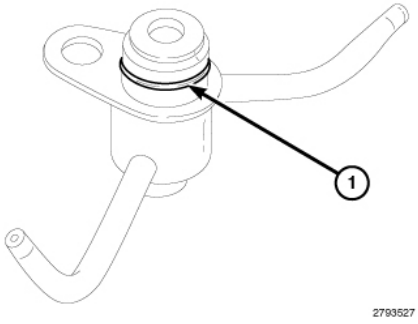
There are three engine blocked-mounted oil jets (1) installed to cool the underside of each piston. The oil jets are fed by the main oil gallery, and spray upward on the bottom of the pistons and cylinder walls. Each set of jets has a check valve which closes below 2.5 bar (35 psi) to maintain ample oil pressure at idle. All three sets of oil jets are identical and seal to the engine block using an o-ring and fastener.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

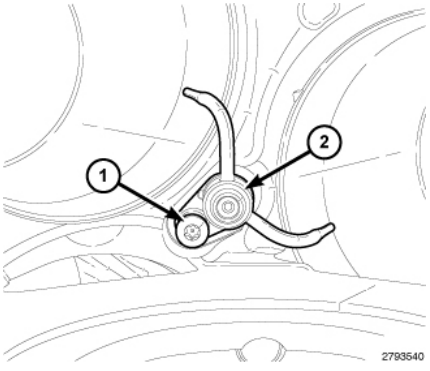
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Lubricate a new O-ring seal (1) with engine oil and install on the piston oil cooler jet(s).



NOTE: Piston oil cooler jet for cylinders one/two shown. Piston oil cooler jets for cylinders three/four and five/six are similar.



2. Install the piston oil cooler jet(s) (2) into the engine block and tighten the retaining bolt (1) to the proper) .
3. Install the crankshaft (Refer to 09 - Engine/Engine Block/CRANKSHAFT - Installation) .
4. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .
5. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .
6. Connect the negative battery cable and tighten the nut to the proper) .
7. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure) .

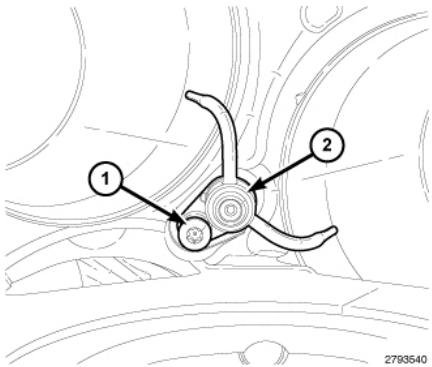
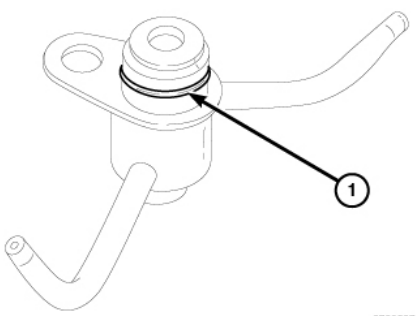
NOTE: Piston oil cooler jet for cylinders one/two shown. Piston oil cooler jets for cylinders three/four and five/six are similar.



1. Remove the crankshaft (Refer to 09 - Engine/Engine Block/CRANKSHAFT - Removal) .
2. Remove the bolt (1) and the piston oil cooler jet(s) (2) from the engine block.
3. Remove and discard the O-ring seal (1) from the piston oil cooler jet(s).



ENGINE OIL - DIESEL ENGINES

WARNING: **New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY GRADE

An SAE engine oil that conforms to ACEA A3/B4/C3 that is approved to MB 229.31 is recommended for all operating temperatures. This engine oil is a low ash product that improves low temperature starting and vehicle fuel economy.

The viscosity grade is listed in the vehicle quick reference specifications (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids/Specifications)

DISPOSING OF USED ENGINE OIL

Care should be taken in disposing of the used engine oil from your vehicle. Used oil, indiscriminately discarded, can present a problem to the environment. Contact your local authorized dealer, service station, or governmental agency for advice on how and where used oil can be safely discarded in your area.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

ENGINE OIL

WARNING: **New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.**

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. Mopar® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

9400-9

SAE VISCOSITY

Vehicles with 5.7L engines equipped with Multiple Displacement System (MDS) must use SAE 5W-20 oil. Failure to do so may result in improper operation of the Multiple Displacement System (MDS). Refer to Multi Displacement System under Starting and Operating for details. Refer to the engine oil filler cap for the recommened engine oil viscosity for each vehicle. An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-20 or 5W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range.

NOTE: 6.4L engines. For best performance and maximum protection under all types of operating conditions, the manufacturer only recommends full synthetic engine oils SAE 0W-40 that meet the American Petroleum Institute (API) categories of SM or SM/CF. meeting the requirements of Chrysler Group LLC Material Standard MS-10725.

The viscosity grade is also listed in the vehicle quick reference specifications (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids/Specifications) .

ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Chrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar® or an equivalent oil meeting the specification MS-6395.

9400-9

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

9400-9

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

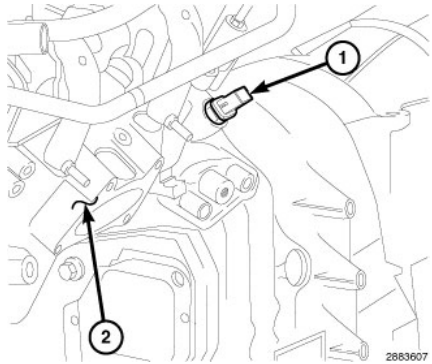
The Engine Coolant Temperature (ECT) sensor on the 3.6L engine is installed into a water jacket at rear of the cylinder head on the left side of the engine.



WARNING: **Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.**

NOTE: Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Partially drain the cooling system. (Refer to 07 - Cooling - Standard Procedure)
2. Disconnect the electrical connector from the sensor.
3. Remove the sensor from the cylinder head.

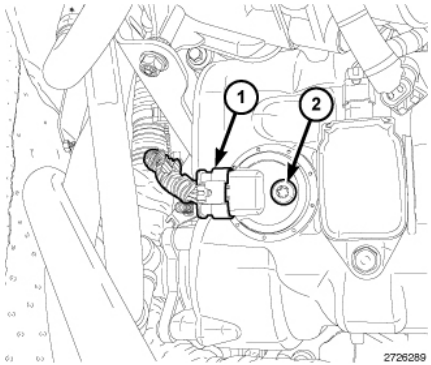
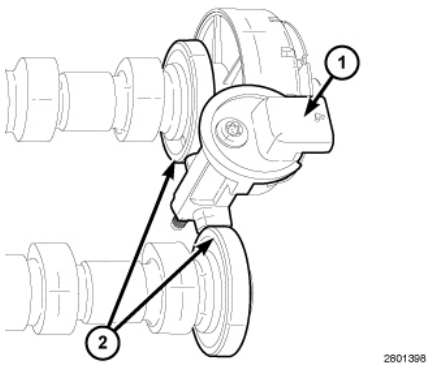
3.6L

The two Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers. The sensors are bolted to the cylinder head and utilize a radial lip seal where they protrude through the covers. The attaching bolt (2) has an O-ring seal and is captured in the sensor.



CAUTION: **The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

The Camshaft Position Sensors (CMP) sensors (1) are dual read, single element hall effect sensors mounted between the magnetic encoded timing wheels (2). The magnetic timing wheels are used because of their small diameter allowing for a compact cylinder head design.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Camshaft Position (CMP) sensor is mounted on the left upper timing cover. The hall effect sensor supplies a signal to the Powertrain Control Module (PCM). The PCM uses the signals sent by the CMP and the Crankshaft Position (CKP) sensor to determine injection timing.

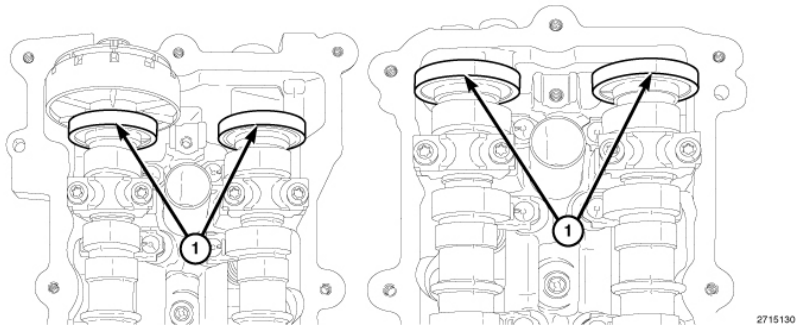
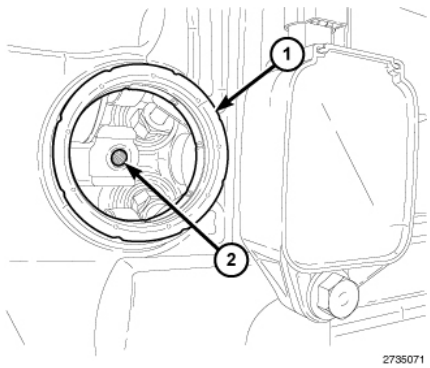
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

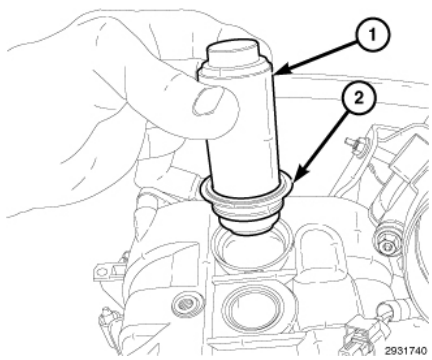
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



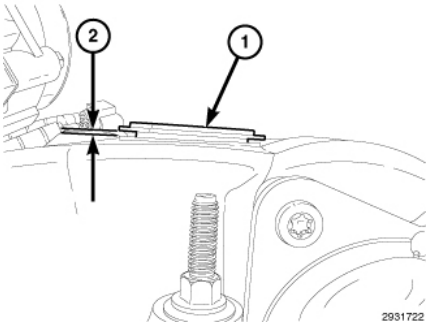
1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.



3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
   - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
   - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer 10256 (1).
   - Push the seal into the cylinder head cover until the base of the seal is seated.
   - Remove the tool.

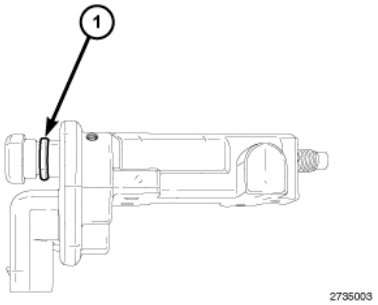


NOTE: A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.

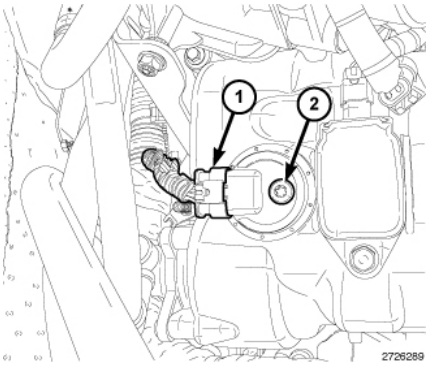


4. The sensor mounting bolt O-ring (1) can be reused if not damaged.

5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).



NOTE: The right CMP sensor is shown, the left CMP sensor is similar. If both right and left CMP sensors where removed, install them into their original locations.

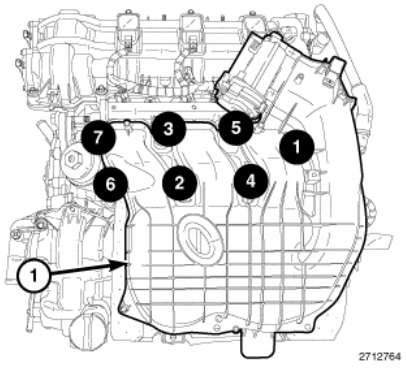


6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to 9 N·m (80 in. lbs.).

7. Connect the electrical connector (1) to the sensor.

8. If required, install the upper intake manifold (1) and air inlet hose (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation) .

9. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

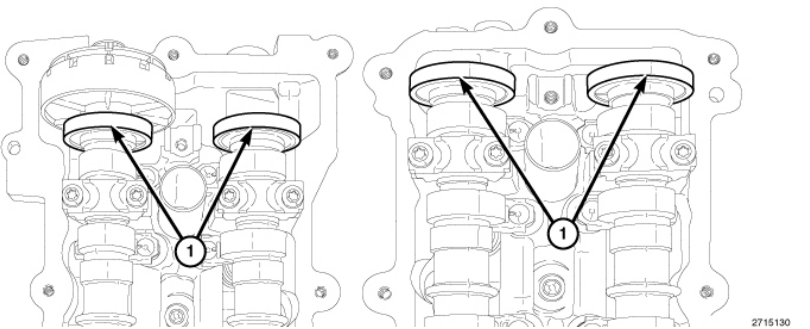
3.6L



CAUTION: **The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

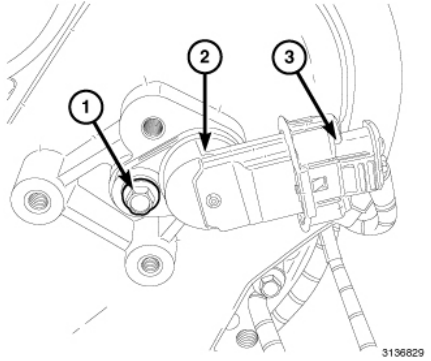
The 3.6 liter engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have two pressed on magnetic timing wheels (1) that are magnetically encoded.

The Camshaft Position Sensors (CMP) are mounted between the timing wheels (1).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The signal circuit of the camshaft sensor has a voltage of approximately 5V. The camshaft has a reluctor wheel bolted to the front of left exhaust camshaft, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

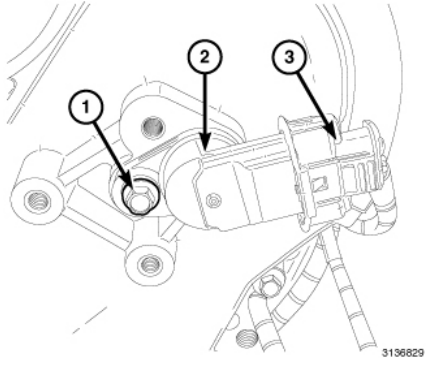
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect the negative battery cable.
2. Disconnect Camshaft Position (CMP) sensor wire harness connector (3).
3. Remove bolt (1) and the CMP sensor (2).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensors. The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

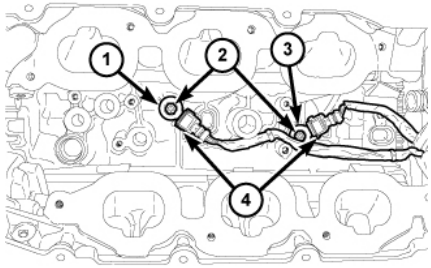
NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.



2726041

1. Thoroughly clean the knock sensor mounting holes.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3) and retaining bolt (2). Tighten the retaining bolt to 22 N·m (16 ft. lbs.).
3. Connect the electrical connector (4).
4. Install the oil filter housing, upper and lower intake manifolds and air cleaner housing assembly (Refer to 09 - Engine/Lubrication/HOUSING, Oil Filter - Installation) .
5. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .
6. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).
7. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .
8. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric crystal which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.

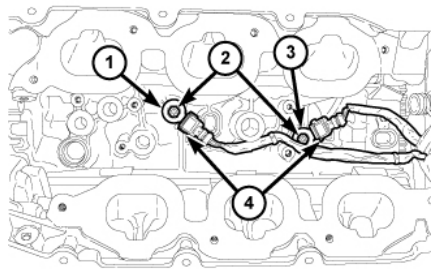
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.



2726041

1. Perform the fuel pressure release procedure (Refer to 14 - Fuel System/Fuel Delivery - Standard Procedure) .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds and the oil filter housing (Refer to 09 - Engine/Lubrication/HOUSING, Oil Filter - Removal)
5. Remove the knock sensor electrical connector (4).

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

6. Remove the retaining bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the Powertrain Control Module (PCM). The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

CAUTION: **Cleaning platinum plugs may damage the platinum center electrode or the thin platinum pad.**

The spark plugs are platinum resistor design. They have resistance values of 3,500 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications (Refer to 08 - Electrical/8I - Ignition Control - Specifications) .

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

When the spark plugs use a single or double platinum tips, they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad (2) is welded to both or just the center electrode end(s). Extreme care must be used to prevent spark plug cross threading, incorrect gapping and ceramic insulator damage during plug removal and installation.

Mopar® Nickel-Graphite Anti-Seize compound is applied to the thread area (1) to prevent damage to the spark plug during removal and installation.

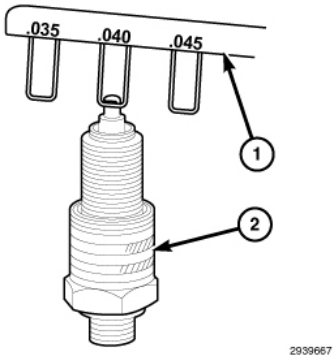
3.6L

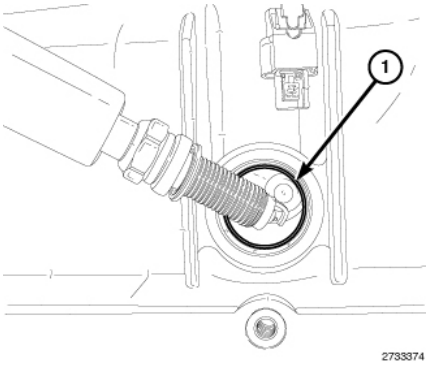
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Check and adjust the spark plug gap with a gap gauging tool (1) (Refer to 08 - Electrical/8I - Ignition Control - Specifications) .



CAUTION: **Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.**

CAUTION: **The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.**



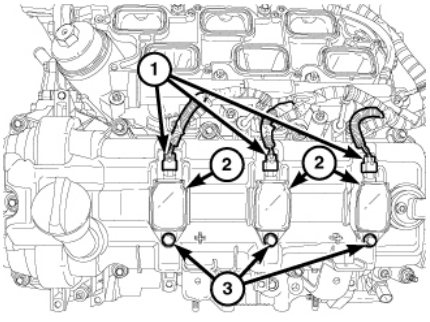
2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: **Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.**

3. Tighten the spark plugs to 17.5 N·m (13 ft. lbs.).

NOTE: The left side ignition coils are shown, the right side ignition coils are similar.

4. Install the ignition coil (2) (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

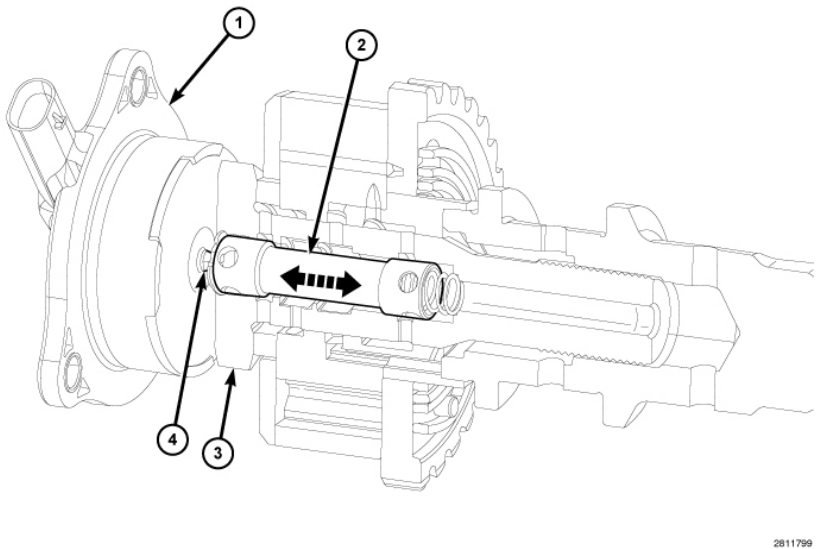
OPERATION



Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Operation) .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this instance the procedure will be performed at the next key off cycle.

DESCRIPTION

The fuel tank pressure sensor provides the PCM with information on vapor pressure inside the fuel tank. The sensor is a diaphragm-type pressure sensor and varies its voltage output depending on fuel tank pressure. When the fuel tank isolation valve is activated (closed), preventing fuel vapors from leaving the tank, the PCM will monitor the fuel tank pressure sensor to prevent pressure from increasing or decreasing to an unsafe level.

Excessive fuel tank pressure could cause fuel vapors to vent out the fuel filler cap or damage system components while insufficient fuel tank pressure (vacuum) caused by lack of air entering the tank to take the place of consumed fuel could lead to collapsed tank, lines or loss of fuel pressure.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The oil pressure sensor is a silicon based sensing unit that measures the pressure of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensor. The input to the PCM occurs on the signal return circuit. The oil pressure sensor is a linear sensor; as pressure changes, voltage changes proportionately and returns a voltage signal to the PCM that reflects oil pressure. The zero pressure reading is 0.5 volt and full scale is 4.5 volt.

Labor Operations: Click to display a list of Labor Operations associated with this procedure

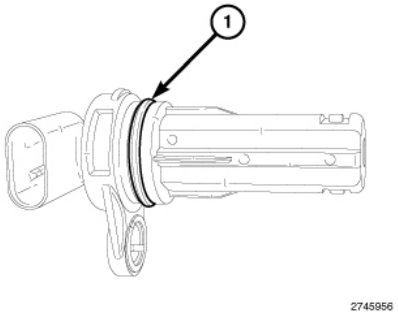
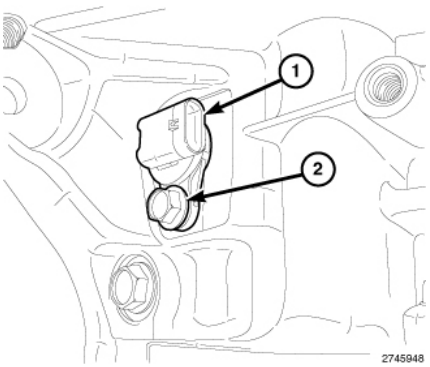
1. The crankshaft position (CKP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the sensor O-ring (1).



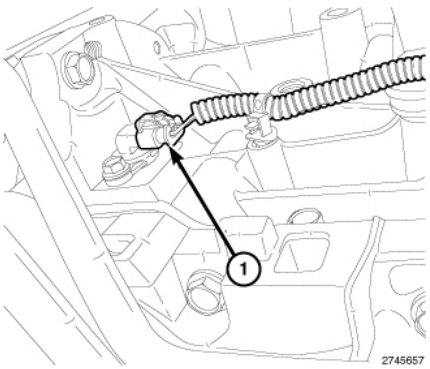
3. Clean out the CKP sensor mounting bolt hole in the engine block.
4. Install the sensor (1) into the engine block with a slight rocking and twisting motion.

CAUTION: **Before tightening the CKP sensor mounting bolt, be sure the sensor is completely flush to the cylinder block. If the CKP sensor is not flush, damage to the sensor mounting tang may result.**

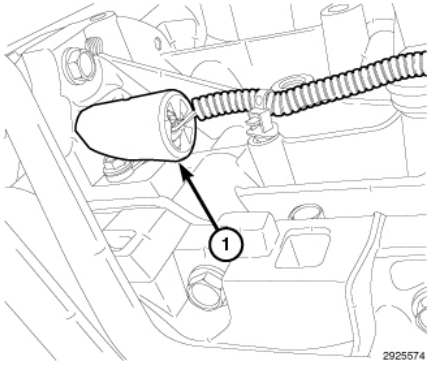
5. Install the mounting bolt (2) and tighten to 12 N·m (9 ft. lbs.).



6. Connect the CKP sensor electrical connector (1).

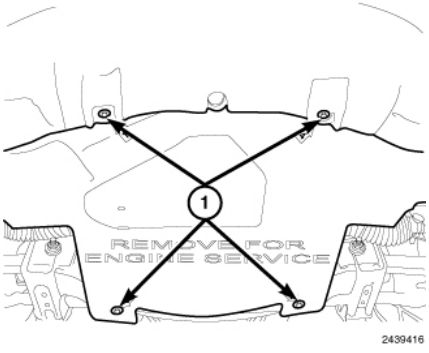


7. Position the heat shield (1) over the CKP sensor.

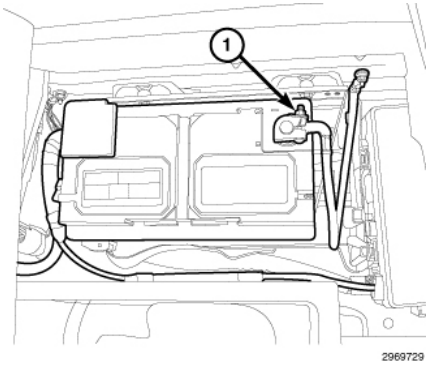


8. Position the belly pan and install the retainers (1).

9. Lower the vehicle.



10. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



NOTE:

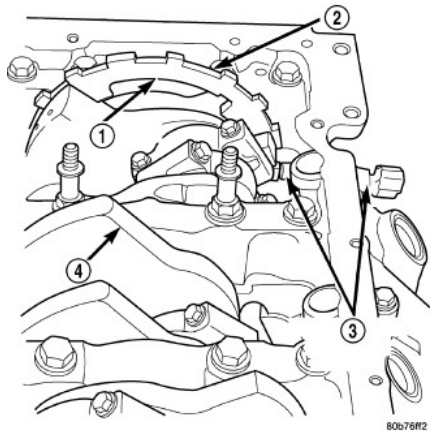
The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

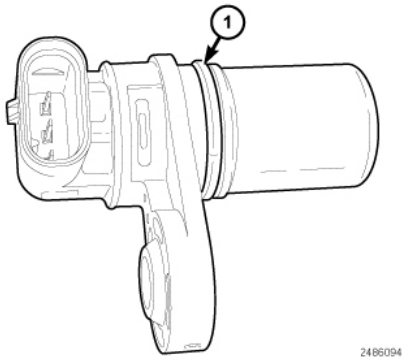
OPERATION

The engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor (3). The sensor generates pulses which sends an input signal to the Powertrain Control Module (PCM). The PCM interprets the sensor input signal to determine the crankshaft position. The PCM then uses this information, along with other inputs, to determine injector sequence and ignition timing.

A tonewheel (targetwheel) is bolted to the engine crankshaft (1). This tonewheel has notches (2) on the outer edge.



The sensor (1) is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.



The notches (3) cause a pulse to be generated when they pass under the sensor. The generated pulses are the input signal to the PCM.

FUEL CORRECTION or ADAPTIVE MEMORIES

OPERATION

Short Term

Short Term Adaptive or Short Term Fuel Trim (STFT) is an immediate correction to fuel injector pulse width. During Closed Loop operation, Short Term Adaptive makes immediate adjustments to fuel delivery in direct response to the signal from the upstream O2 sensor. The PCM infers air/fuel ratio by monitoring oxygen content measured by the upstream O2 stream sensor.

This is an immediate response to the O2 sensor signal that is not switching or is consistently high or low. If the upstream oxygen sensor voltage is not consistently switching between 2.5 and 3.5 volts, the PCM knows that the base pulse width calculation needs to be modified by adjusting the injector pulse width until the correct O2 sensor voltage is achieved. The need to adjust the injector pulse width may be a result of vehicle operating conditions, engine wear, fuel quality, etc. The maximum range of authority for Short Term Adaptive is ±33%. Short Term Adaptive values are not stores when the ignition is off.

Long Term

The main function of Long Term Adaptive is to make fuel corrections that permit Short Term Adaptive to hover around zero. In order to maintain correct emissions throughout all operating ranges of the engines, a cell structure based on engine rpm and load (MAP) is used.

There are 26 cells used for the NGC. Two of the cells are used only during idle, as determined by throttle position and park/neutral switch input. The other cells each represent a given off-idle manifold pressure and rpm range.

After the vehicle has reached full operating temperature, short term correction factors will update Long Term Adaptive Memory cells based on vehicle load (RPM/MAP) to allow the Short Term Adaptive value to be brought back to near zero. Once this correction factor is updated in the memory, it will be used by the PCM under all operating conditions, open loop and closed loop. However, the values stored in the Long-term are updated only after the vehicle has entered long-term closed loop at full operating temperature. This is done to prevent any transition temperature or start-up compensation form corrupting long term fuel correction.

Long Term and Short Term Adaptive can each change the pulse width by as much as ±33% for a maximum total correction of ±66% from base pulse width calculation. Long Term Adaptive values are used during both Open Loop and Closed Loop operation.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide-Open-Throttle
- Ignition switch OFF

Within these modes of operation, there are two different types of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP operation the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP operation, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP operation the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F (1.7°C).
    - If the coolant is over 35°F (1.7°C) the PCM will wait 38 seconds.
    - If the coolant is over 50°F (10°C) the PCM will wait 15 seconds.
    - If the coolant is over 167°F (75°C) the PCM will wait 3 seconds.
    - For other temperatures the PCM will interpolate the correct waiting time.
2. O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

OPEN LOOP operation is used for engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle. Under most conditions, acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** occur in CLOSED LOOP operation.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Powertrain Control - Description) .

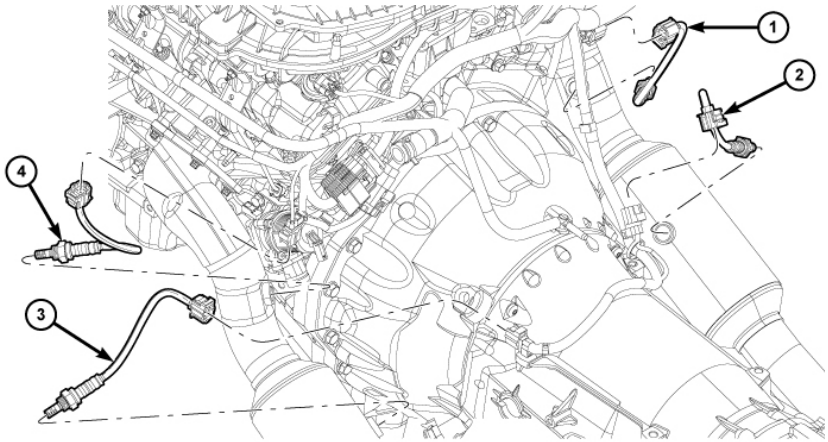
Labor Operations: Click to display a list of Labor Operations associated with this procedure



2797543

The engine is equipped with four heated oxygen sensors:

- The right upstream oxygen sensor (1) is referred to as the 1/1 sensor.
- The right downstream oxygen sensor (2) is referred to as the 1/2 sensor.
- The left upstream oxygen sensor (4) is referred to as the 2/1 sensor.
- The lefft downstream oxygen sensor (3) is referred to as the 2/2 sensor.

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**
2. Install the oxygen sensor and tighten to 43 N·m (32 ft. lbs.).

   CAUTION: **Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.**
3. Connect the heated oxygen sensor electrical connector.
4. Lower the vehicle.
5. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

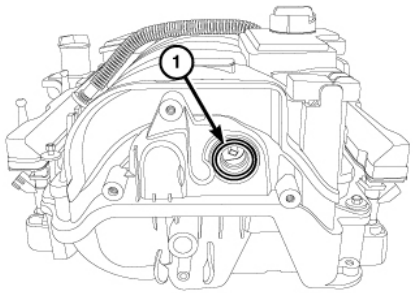
The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not present, the PCM sets the DTC.

INSTALLATION

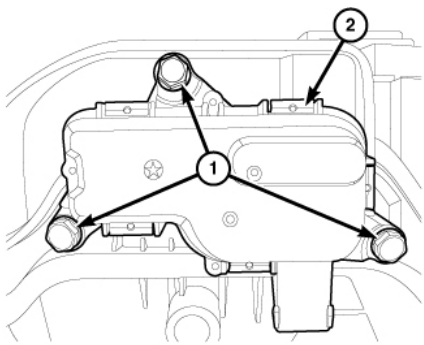
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.



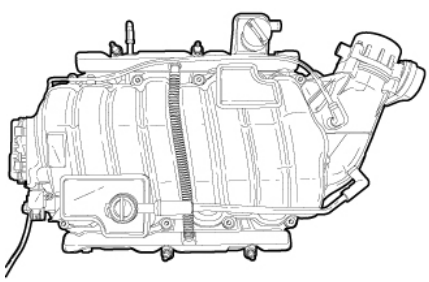
2979774

1. Install a new SRV actuator rubber O-ring seal (1).



2979559

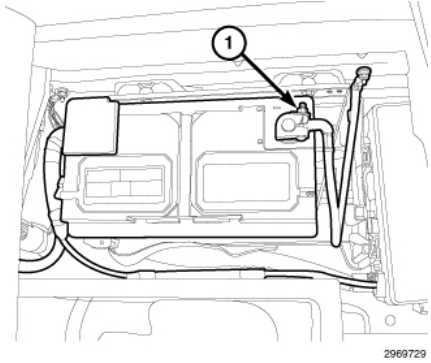
2. Position the SRV actuator (2), install the retaining bolts (1) and tighten to 5 N·m (44 in. lb.).



2979729

3. Install the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds /MANIFOLD, Intake - Installation) .

4. Connect the negative battery cable (1).

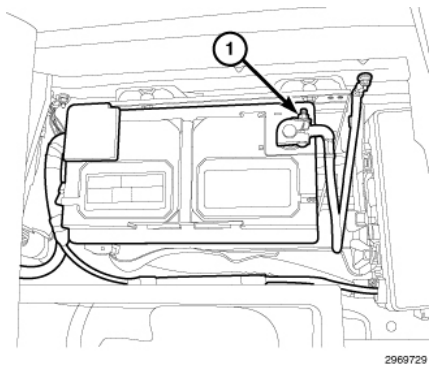


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

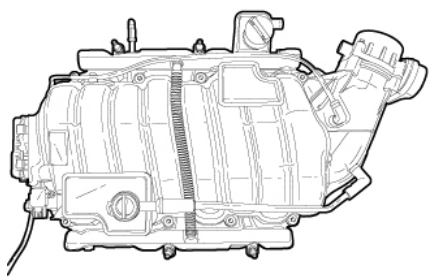
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect the negative battery cable (1).



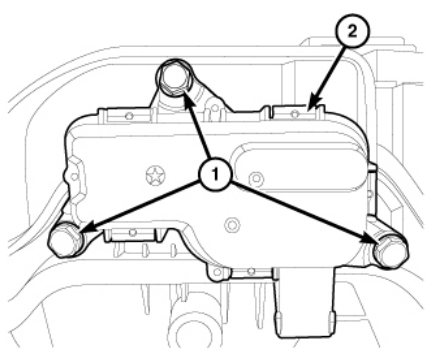
2969729

2. Remove the intake manifold and throttle body as an assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal) .



2979729

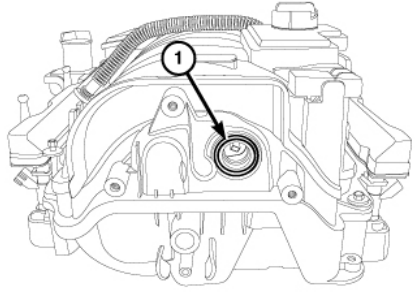
3. Remove the Short Runner Valve (SRV) actuator retaining bolts (1) and remove the SRV actuator (2).



2979559

NOTE: When the SRV actuator is removed, a new rubber O-ring seal must be installed. The old O-ring cannot be reused.

4. Remove and discard the SRV actuator rubber O-ring seal (1).



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

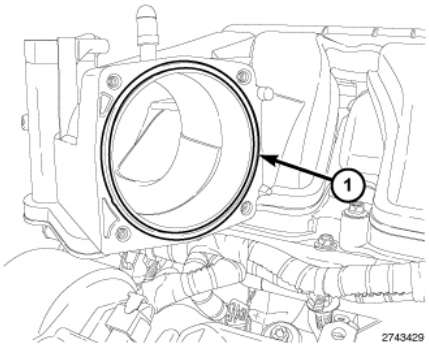
OPERATION

The SRV system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If the spike is not present, the PCM sets the DTC.

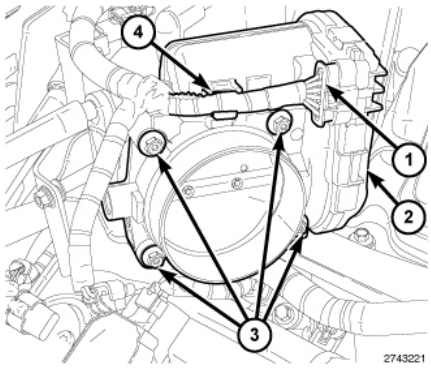
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

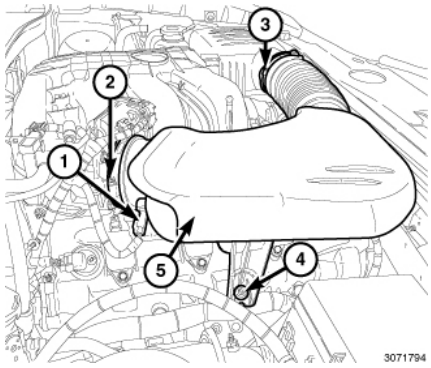
1. Check the condition of the throttle body-to-intake manifold seal (1). The seal can be reused if not damaged.
2. Clean the mating surfaces of the throttle body and intake manifold.



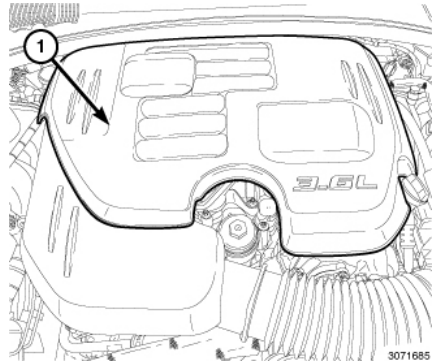
3. Position the throttle body (2) to the intake manifold.
4. Install the throttle body mounting bolts (3) and tighten in a crisscross pattern sequence to 6 N·m (53 in. lbs.).
5. Connect the electrical connector (1) to the Electronic Throttle Control (ETC) (2) and secure the ETC harness to the clip (4) on the throttle body.



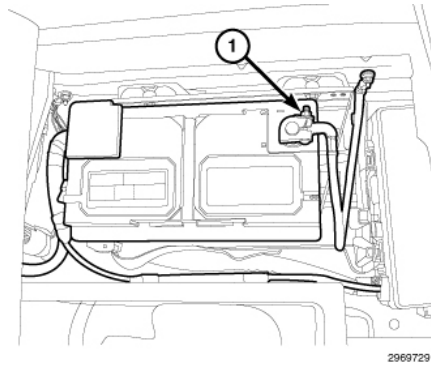
6. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
7. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
8. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).
9. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).
10. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



11. Position the engine cover (1) and secure the retaining grommets onto the ball studs.



12. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

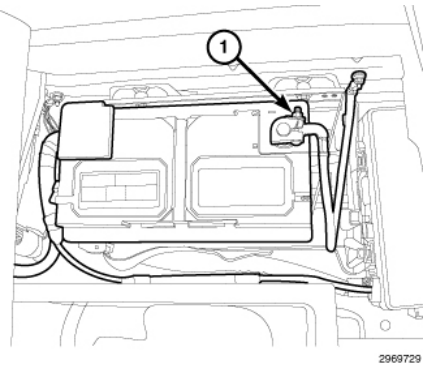


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

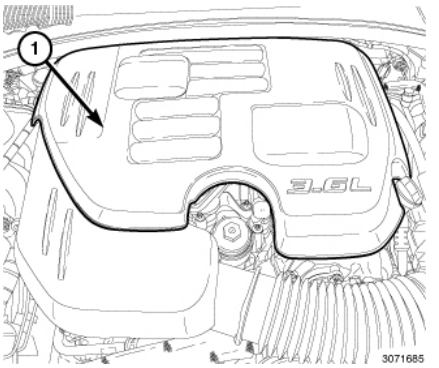
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

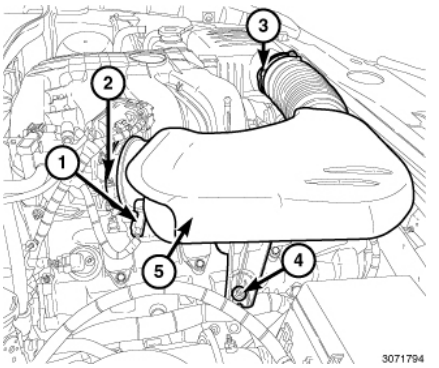
1. Disconnect and isolate the negative battery cable (1).



2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).



3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

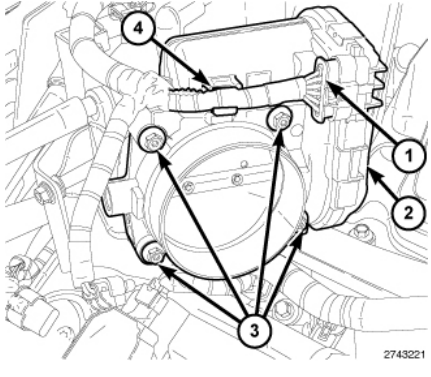


CAUTION: **Never have the ignition key in the ON position when checking the throttle body shaft for a binding condition. This may set DTC's.**

8. Disconnect the electrical connector (1) from the Electronic Throttle Control (ETC) (2) and unfasten the ETC harness from the clip (4) on the throttle body.
9. Remove four throttle body mounting bolts (3).

10. Remove the throttle body from the upper intake manifold.

11. Check the condition of the throttle body-to-intake manifold seal. The seal can be reused if not damaged.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

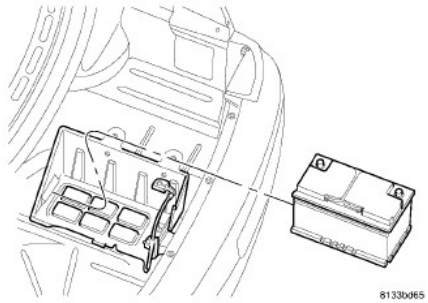
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

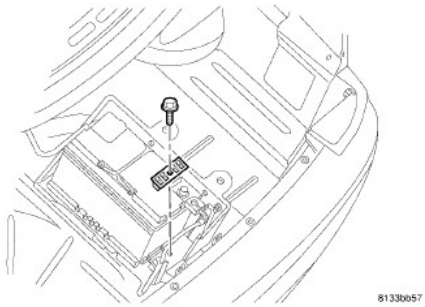
WARNING: **A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.**

WARNING: **Remove metallic jewelry to avoid injury by accidental arcing of battery current.**

1. Position the battery in the battery tray.

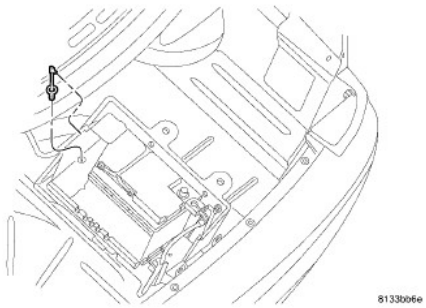


2. Install the battery hold down clamp and bolt. Tighten the bolt to 4 N·m (35 in. lbs.).



CAUTION: **Use care when connecting the battery vent tube to the battery. The vent tube nipple is made of plastic and is easily damaged if not connected properly.**

NOTE: Before installing the vent tube verify that the vent tube is not broke or plugged and that there is no cuts, cracks or tears.



3. Gently connect the battery vent tube to the battery nipple.
4. Latch the battery retention strap.
5. Connect the battery positive cable.

6. Connect the intelligent battery sensor (IBS) to the negative battery post.

7. Install the rear compartment floor trim panel.

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.**

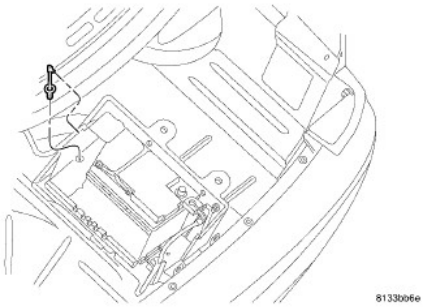
WARNING: **Remove metallic jewelry to avoid injury by accidental arcing of battery current.**

NOTE: **If the vehicle is equipped with the 8HP45 transmission, the manual park release procedure must be used to place the vehicle in neutral with the engine off. (Refer to 21 - Transmission and Transfer Case/Automatic - 8HP45/SHIFTER, Transmission/Standard Procedures)**

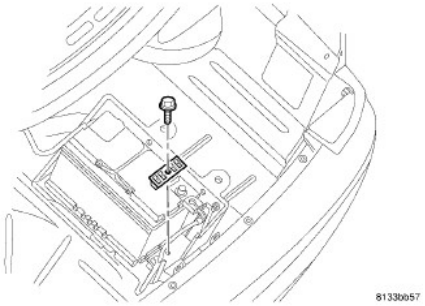
1. Make sure ignition switch is in OFF position and all accessories are turned OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect the intelligent battery sensor (IBS) and cable from the negative battery post.
4. Disconnect the battery positive cable from the battery terminal.
5. Unlatch the battery retention strap.

CAUTION: **Use care when disconnecting the battery vent tube from the battery. The vent tube nipple is made of plastic and is easily damaged if not disconnected properly.**

6. Gently disconnect the battery vent tube from the battery nipple.



7. Remove the battery hold down clamp and remove the battery from the vehicle.



BATTERY CHARGING

Special Tools: Click to display a list of tools used in this procedure

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Midtronics GR8-1220KIT-CHRY tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: **Never exceed twenty amperes when charging a cold (-1° C [30° F] or lower) battery. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

WARNING: **If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

WARNING: **EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

WARNING: **THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.**

WARNING: **If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and possible vehicle damage may result from loose or missing cell caps.**

CAUTION: **Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.**

CAUTION: **Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.**

CAUTION: **The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.**

After the battery has been charged to 12.65 volts or greater, perform a load test to determine the battery cranking capacity, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Standard Procedure) for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery holddown, tray, terminals, posts, and top before completing battery service. (Refer to 08 - Electrical/8F - Engine Systems/Battery System - Cleaning) and (Refer to 08 - Electrical/8F - Engine Systems/Battery System - Inspection) for the proper battery system cleaning and inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.

2. Disconnect and isolate the battery negative cable. Connect the Midtronics GR8-1220KIT-CHRY .

NOTE: Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	**Hours**
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	**5 Amps**	**10 Amps**	**20 Amps**
Open Circuit Voltage	**Hours Charging @ 21° C (70° F)**		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

GR8 BATTERY TESTER / CHARGER

Always use the Midtronics GR8 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: **Always wear appropriate eye protection and use extreme caution when working with batteries.**

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing, (Refer to 08 - Electrical/8F - Engine Systems/Battery System - Cleaning) . If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.

2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. Connect the Midtronics GR8 directly to the battery posts.

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

3. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.

4. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

5. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

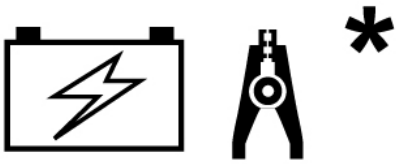
Quick Reference Guide

Inspect the battery for damages and check the electrolyte level. Always use the necessary safety precautions when working with batteries to prevent severe injury or death. Follow all manufacturers' instructions and BCI (Battery Council International) safety recommendations, which include the following precautions:

Main Menu

The Main Menu is the starting point for all tools and utilities, which are depicted as icons. Some icons lead directly to the function they represent, while others are menu icons that lead to two or more options.

Automatically tests, charges, and provides battery decision using the information you select in a series of screens. Start here to generate warranty codes.



2906815

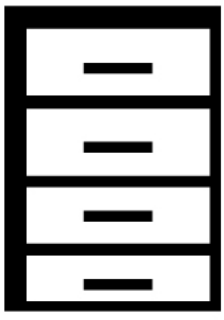
Tests the starting and charging systems.

2907015

Maintains battery voltage at 13.5 volts to provide uninterrupted reprogramming of ECUs and retain vehicle system settings.

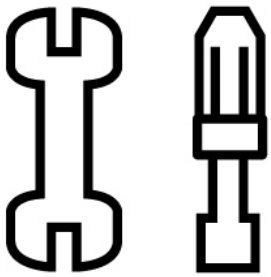
2906976

Includes a utility to view and print a test counter, a data transfer utility, the software version and date, the Midtronics GR8 serial number for the control module, and current wireless channel.



2906894

The Setup Menu lets you customize options in the Midtronics GR8 to suit your needs.



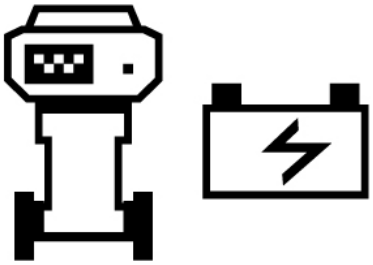
2907001

Provides a list of topics and definitions. Also includes Midtronics Customer Service phone numbers.

2906883

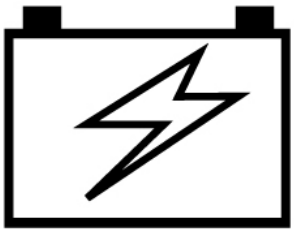
Charge/Test Menu

Automatically tests and charges battery, starting, and charging system. Generates a warranty code for Replace and Bad Cell decisions.



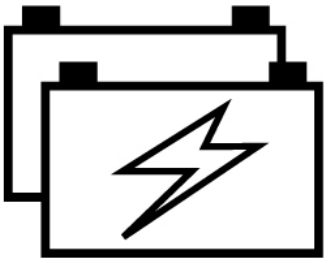
2906844

Pre Delivery Inspection (PDI): For testing delivered vehicles and lot maintenance. Uses the same inputs as a diagnostic charge.



2906961

Dual Battery Charge mode allows the charger to be used with dual battery systems.

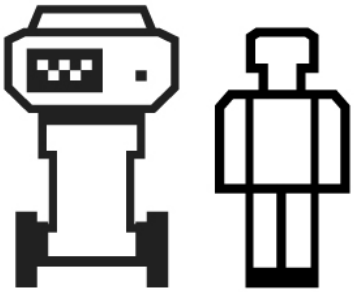


2906860

Makes high output current available to boost charge an in-vehicle battery and assist in starting the engine.

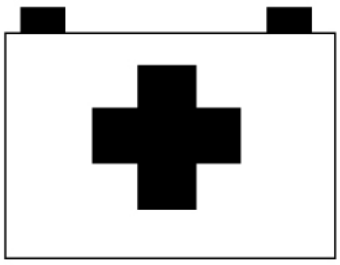
2906906

Provides a timed charge that ranges from 5 to 120 minutes or a continuous charge that ends when you press the STOP key.



2906933

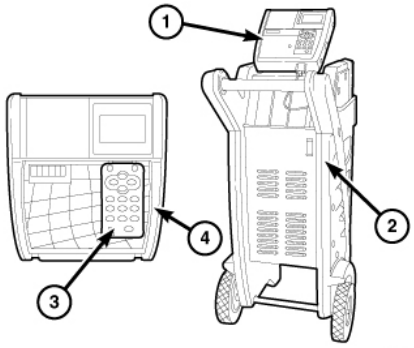
In this mode the charger can provide a trickle charge for long term, low amp battery charging.



2906991

Generates 15-digit warranty codes for physically defective batteries or customer good will.

2906871

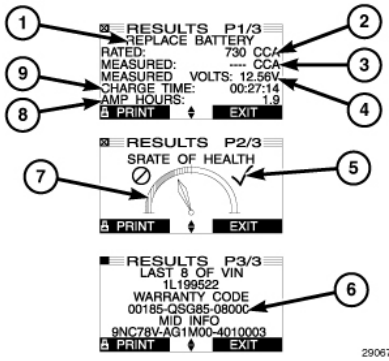


2906919

1. **Control module:** Backlit graphical display and keypad for data entry.
2. **ON/OFF switch:** ON/OFF switch Turns power on and off to the GR8.
3. **STATUS light:** Lights in conjunction with beeping alarm to indicate transitions and warnings.
4. **Data card slot:** For future upgrades via a data card. The slot contains a plastic filler card for protection.

Replace Battery Decisions

Battery Decisions



2906702

1. Battery Decisions
2. Select Rating
3. Measured capacity
4. Measured voltage
5. Good Range

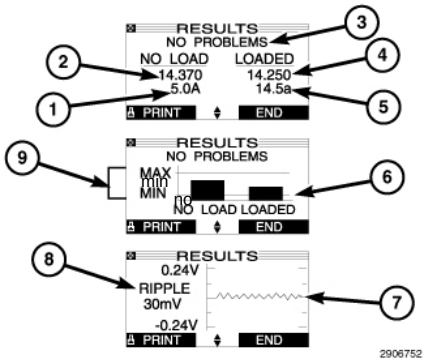
NOTE: The warranty code screen will only be displayed for REPLACE BATTERY and BAD CELL-REPLACE decisions.

6. Enter this number into wiTech
7. Replace range

8. Replaced AMP Hours
9. Charging Time

Test Results-Charging System

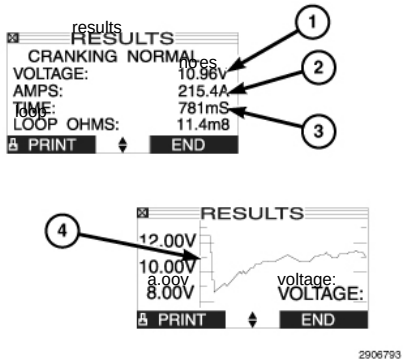
A REPLACE BATTERY or BAD CELL-REPLACE decision gives you the option of generating a warranty code. For Chrysler vehicles model year 2011 or later, enter that warranty code into your wiTECH in the Midtronics warranty code validation routine.



2906752

1. Loads-off current at rev if amp clamp is used
2. Loads-off DC voltage at rev
3. Decision
4. Loads-on DC voltage at rev
5. Loads-on current at rev if amp clamp is used
6. Bar graph of DC voltage within normal range (loads on and off)
7. Graph of diode waveform
8. Peak-to-peak AC voltage
9. Normal DC voltage range

Test Results-Starter System



2906793

1. Average cranking voltage
2. Average cranking current if amp clamp is used
3. Cranking time in seconds
4. Y axis = System performance: cranking voltage

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition in the **OFF** position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition in the **OFF** position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), the vehicle should be but into **SHIPPING MODE**. This will reduce battery discharging. On CTP base vehicles, putting the vehicle in **SHIPPING MODE** has the same effect as pulling the IOD fuse as non CTP vehicles.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to ten minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	**Time Out? (If Yes, Interval And Wake-Up Input)**	**IOD**	**IOD After Time Out**
TGW	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

3. Turn off all electrical accessories.

4. Disconnect the battery negative cable.

CAUTION: **Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.**

5. Connect a 10 amp fused jumper wire between the negative battery cable and the negative battery post.

6. Turn the ignition **ON** and then **OFF** and wait 10 minutes for all systems to enter sleep mode.

NOTE: Do not break the connection between the 10 amp fused jumper wire and the battery. If the connection between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

7. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter to the battery negative cable terminal clamp and the battery negative terminal post, but not on the jumper connection.

8. Remove the 10 amp jumper wire without breaking the digital multi-meter connection.

9. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post, but not the 10 amp jumper wire.

10. The high-amperage IOD reading on the multi-meter should be very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the BCM, front and rear PDC or junction block (Refer to 04 - Vehicle Quick Reference/Fuse Locations and Types - Specifications) , one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete Body Control Module (BCM), circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

11. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in **Step #10**. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Standard Procedure) .

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts, measure the open-circuit voltage.

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Standard Procedure) .

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	**Charge Percentage**
11.7 volts or less	0%
12.0 volts	25%
12.3 volts	50%
12.6 volts	75%
12.8 volts or more	100%

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

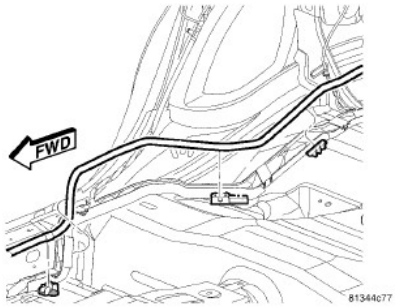
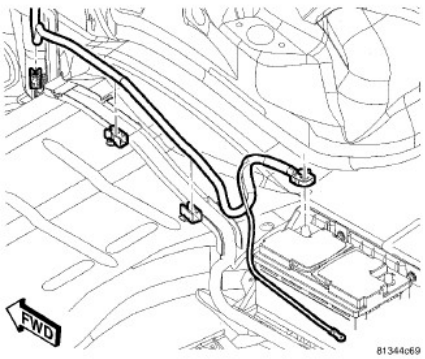
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. One at a time, secure the battery positive cable to the routing clips located in the rear seat area.

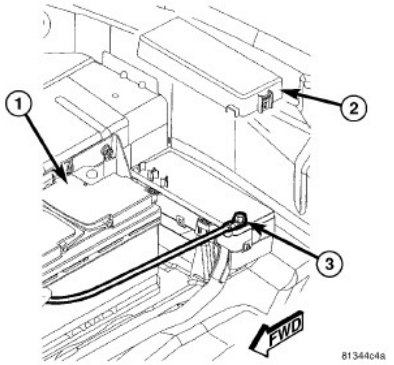


2. One at a time, secure the battery positive cable to the routing clips located in the rear compartment area.

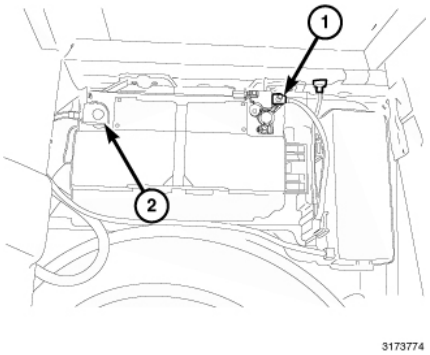


3. Position the carpet back to the normal position.
4. Install the right, B - pillar lower trim panel, (Refer to 23 - Body/Interior/PANEL, B-Pillar Trim - Installation) .
5. Install the right, front and rear door sill trim panels.
6. Install the right, rear seat cushion. Engage retainer loops into cup on floor kick up. Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.
7. Install the right, front seat (Refer to 23 - Body/Seats/SEAT - Installation) .

8. Install the battery positive cable to rear Power Distribution Center (PDC) fastener (3).

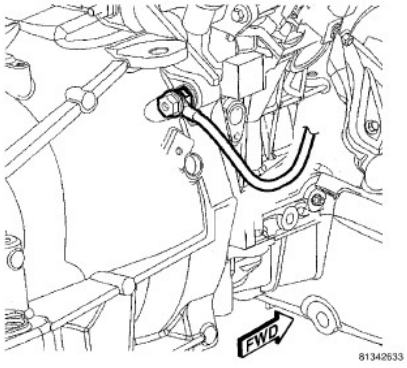


9. Install the PDC cover.
10. Connect the battery positive cable (2).
11. Connect the battery negative cable (1) to the IBS.
12. Install the spare tire cover.



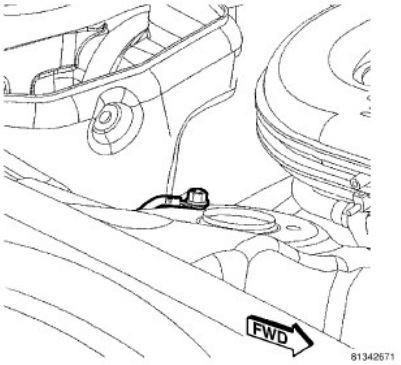
NEGATIVE - ENGINE COMPARTMENT

1. Position the battery negative cable in the engine compartment.
2. Raise vehicle on hoist, (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
3. Install the fastener securing the battery negative cable to the transmission housing. Torque the bolt to 11 N·m (8 ft. lbs.).



4. One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cable is installed exactly where it was in the vehicle.
5. Lower vehicle.

6. Install the fastener securing the battery negative cable to the right front strut tower.



7. Connect the battery negative cable.

8. Install the spare tire cover.

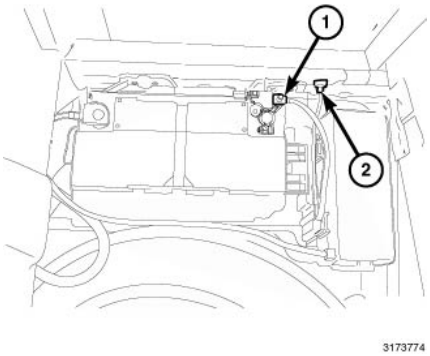
NEGATIVE - REAR COMPARTMENT

1. Position the battery negative cable in the vehicle.

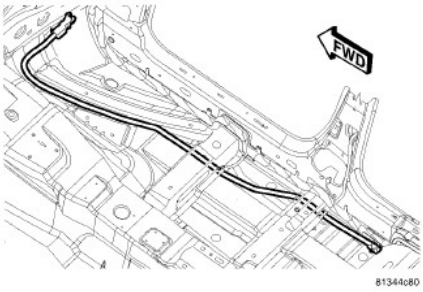
2. Install the fastener (2) securing the battery negative cable to the body.

3. Connect the battery negative cable (1) to the IBS.

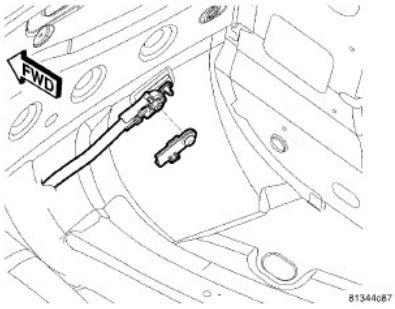
4. Install the spare tire cover.



POSITIVE - BATTERY TO BULKHEAD

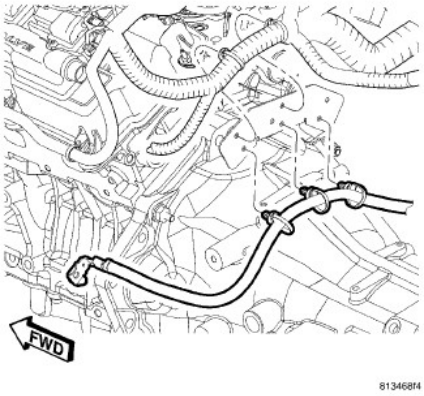


1. Position the battery positive cable in the vehicle taking care to route the cable under the floor cross members.
2. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.
3. Install the battery positive cable to bulkhead fastener.
4. Position the bulkhead insulator back to the normal position.

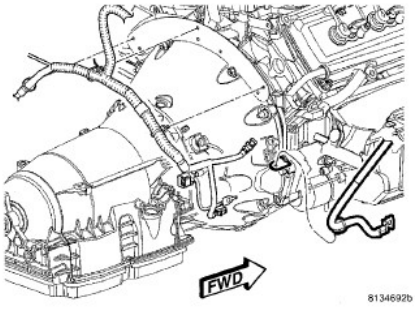


POSITIVE - ENGINE COMPARTMENT

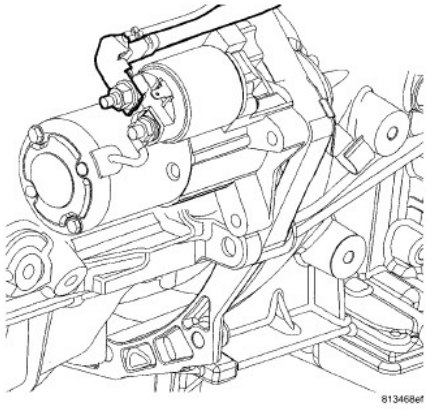
1. Position the battery positive cable in the engine compartment.
2. On the 3.6L and 5.7L secure the battery positive cable to the routing clips located at the back of the engine.



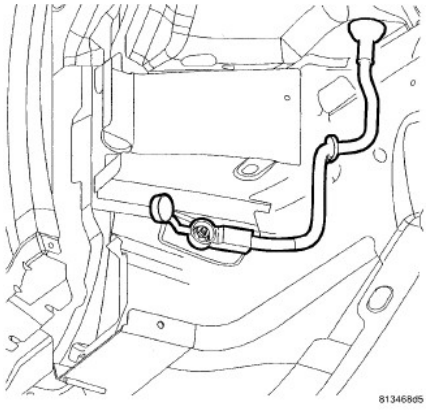
3. On the 5.7L secure the battery positive cable to the routing clip located at the back of the starter.



4. Install the battery positive cable to starter fastener.



5. Install the battery positive cable to bulkhead fastener.

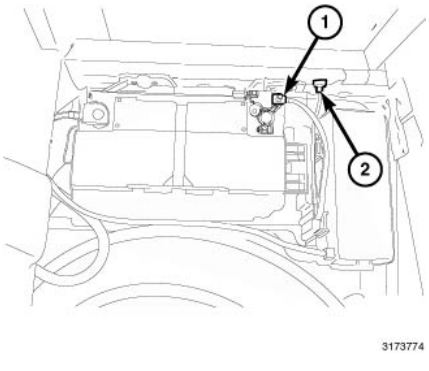


6. Install the right front wheelhouse splash shield, (Refer to 23 - Body/Exterior/SHIELD, Splash - Installation) .

7. Lower vehicle.

8. Connect the battery negative cable (1).

9. Install the spare tire cover.



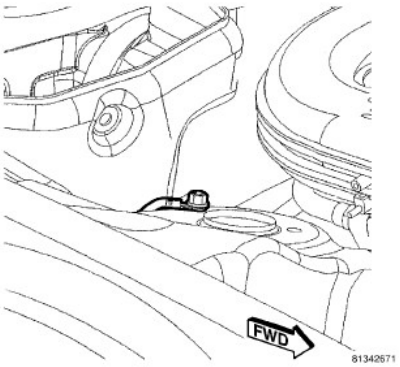
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

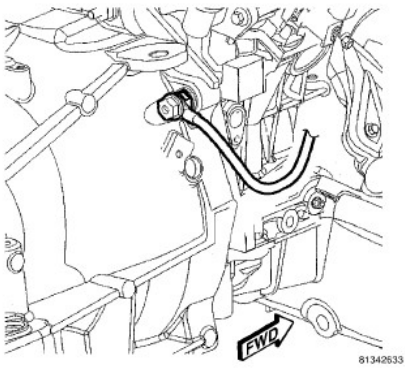
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NEGATIVE - ENGINE COMPARTMENT

1. Turn the ignition to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the fastener securing the battery negative cable to the right front strut tower.



5. Raise vehicle on hoist, (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
6. Remove the fastener securing the battery negative cable to the transmission housing.

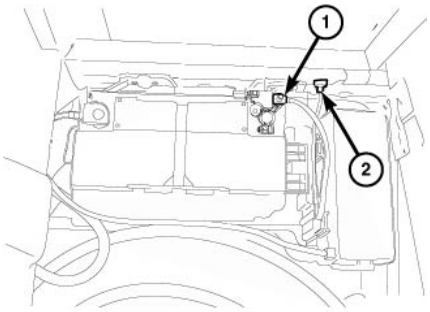


7. One at a time, remove the battery cable retaining pushpins, fasteners and routing clips until the cable is free from the vehicle.
8. Remove the battery cable from the engine compartment.

NEGATIVE - REAR COMPARTMENT

1. Turn the ignition to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.

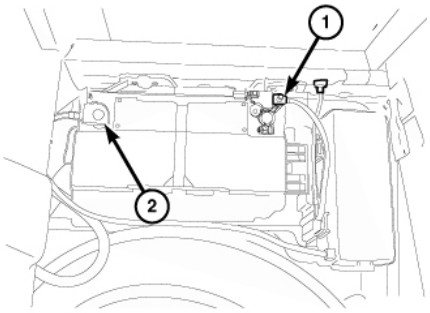
3. Disconnect and isolate the battery negative cable (1).
4. Remove the fastener (2) securing the battery negative cable to the body.
5. Remove the cable from the vehicle.



3173774

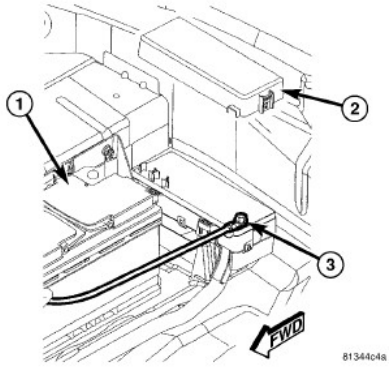
POSITIVE - BATTERY TO BULKHEAD

1. Turn the ignition to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (1) from the IBS.
4. Disconnect the battery positive cable (2).

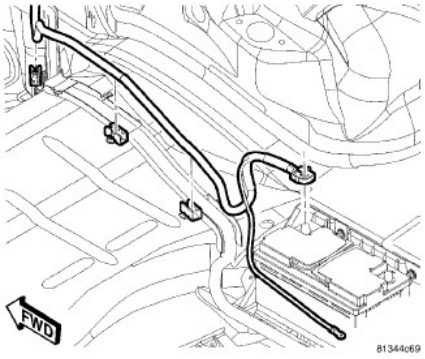


3173774

5. Remove the Power Distribution Center (PDC) cover (2).
6. Remove the battery positive cable to the rear PDC fastener (3).

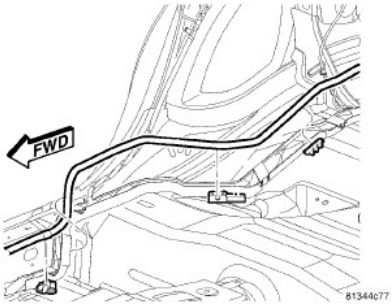


81344c48

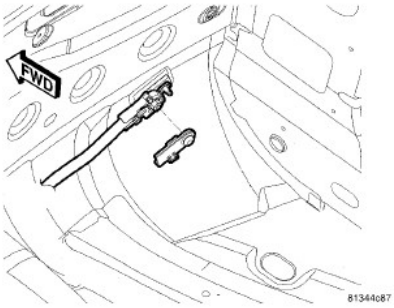


81344c69

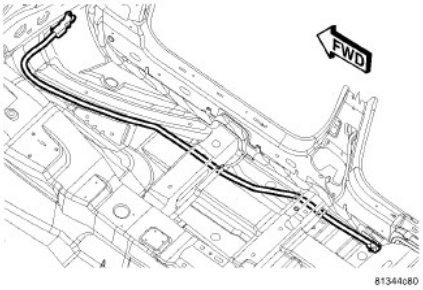
7. One at a time, free the battery positive cable from the routing clips located in the rear compartment area.
8. Remove the right, front seat, (Refer to 23 - Body/Seats/SEAT - Removal) .
9. Remove the right, rear seat cushion. Pull upward at forward edge of each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor.
10. Remove the right, front and rear door sill trim panels.
11. Remove the right, B - pillar lower trim panel, (Refer to 23 - Body/Interior/PANEL, B-Pillar Trim - Removal) .
12. Position carpet aside to gain access to the battery positive cable.
13. One at a time, free the battery positive cable from the routing clips located in the rear seat area.



14. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.
15. Remove the battery positive cable to bulkhead fastener.



16. Remove the battery positive cable from the vehicle making note of the cable routing under the floor cross members.

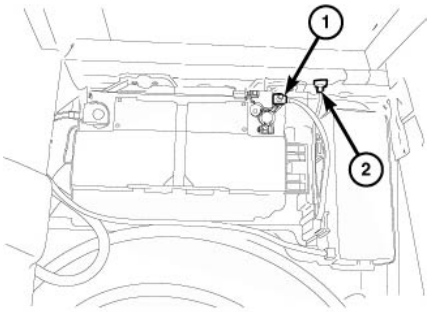


POSITIVE - ENGINE COMPARTMENT

1. Turn the ignition to the Off position. Be certain that all electrical accessories are turned off.

2. Remove the spare tire cover to gain access to the battery.

3. Disconnect and isolate the battery negative cable (1) from the IBS.

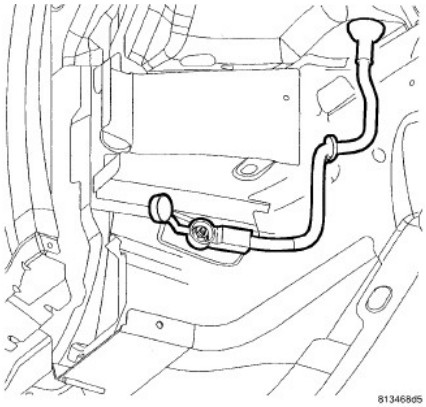


3173774

4. Raise vehicle on hoist, (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .

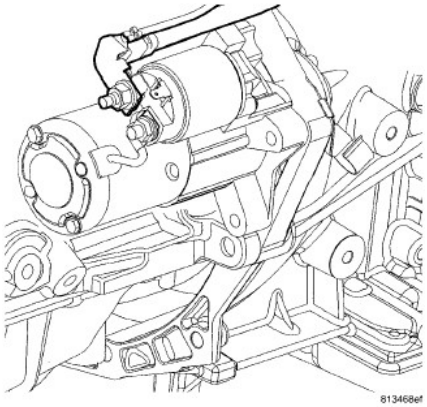
5. Remove the right front wheelhouse splash shield to gain access to the battery positive cable bulkhead outside terminal, .

6. Remove the battery positive cable to bulkhead fastener.



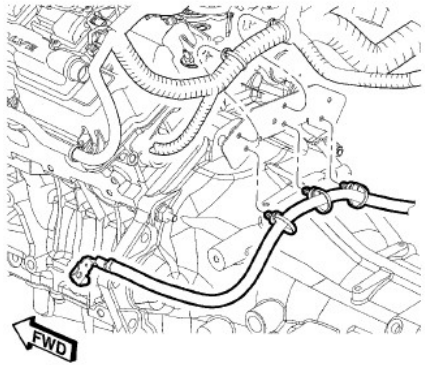
813468d5

7. Remove the battery positive cable to starter fastener.



813468ef

8. On the 3.6L and 5.7L free the battery positive cable from the routing clips located at the back of the engine.



9. On the 5.7L free the battery positive cable from the routing clip located at the back of the starter.

10. Remove the battery positive cable from the vehicle making note of the cable routing.

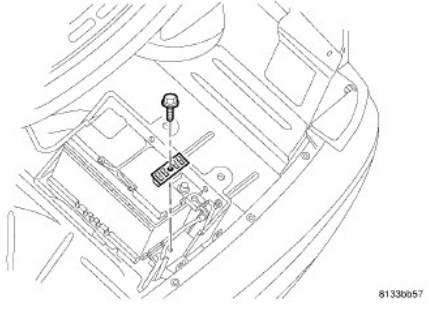
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install the battery holddown clamp and bolt. Tighten the bolt to 4 N·m (35 in. lbs.).
2. Connect the battery negative cable. Follow the battery reconnection procedure. (Refer to 08 - Electrical/8F - Engine Systems/Battery System - Standard Procedure)
3. Install the rear compartment floor trim panel.

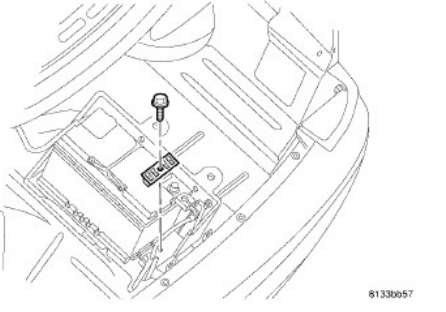


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Verify that the ignition switch and all accessories are OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the bolt from the battery holddown and remove the holddown.

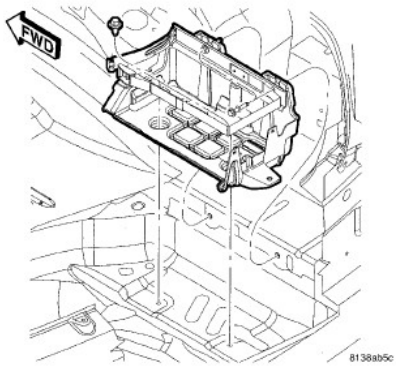


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

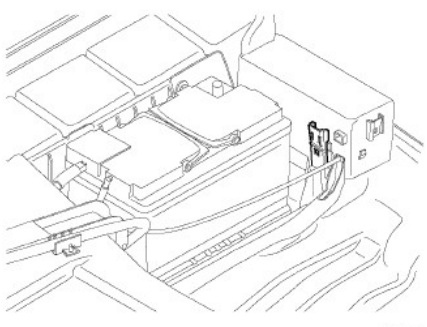
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the battery tray in the vehicle and install the mounting fasteners.



2. Position the Power Distribution Center (PDC) onto the battery tray mounting tabs. Gently apply downward pressure on the PDC until it snaps into place.



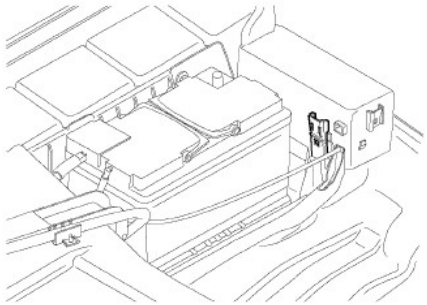
3. Install the battery, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Installation) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

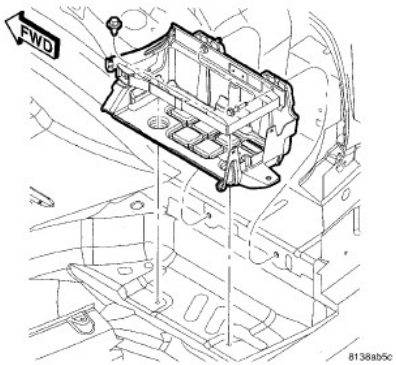
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Remove the battery, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Removal) .
2. Using a small flat bladed tool, gently release the two mounting tabs that secure the Power Distribution Center (PDC) to the battery tray. Position the PDC aside.



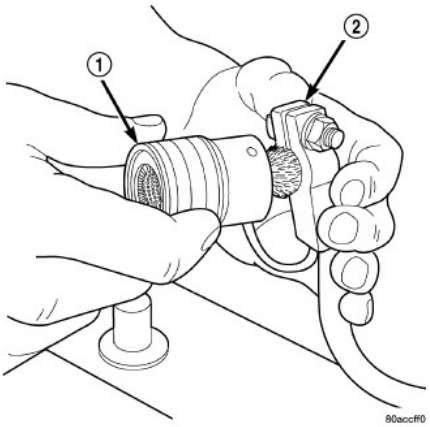
3. Remove the battery tray mounting fasteners and remove the battery tray from the vehicle.



CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual, (Refer to 04 - Vehicle Quick Reference/Maintenance Schedules - Description) it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

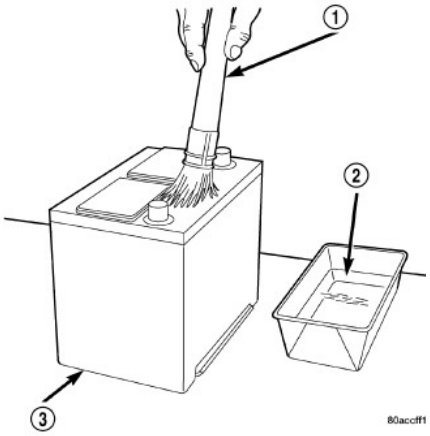
1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.



2. Clean the battery tray and battery hold down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution (2). Paint any exposed bare metal.

3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film.



5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner (1) and a sodium bicarbonate (baking soda) and warm water cleaning solution.

Fuel Delivery: | **Fuel:**

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules, (Refer to 04 - Vehicle Quick Reference/Maintenance Schedules - Description) , it is recommended that these procedures be performed any time the battery or related components are removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.

2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.

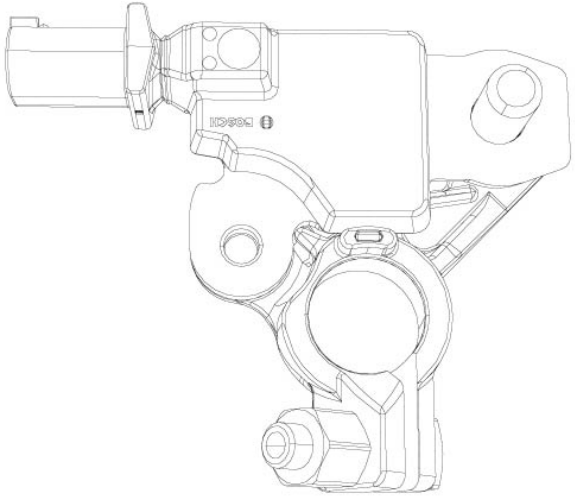
3. Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.

4. Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.

5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required, (Refer to 08 - Electrical/8F - Engine Systems/Battery System/BATTERY - Standard Procedure) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



The Intelligent Battery Sensor (IBS) serves to record and process measured battery variable values (current, voltage, temperature) for the vehicle power net management system. The Intelligent Battery Sensor (IBS) will calculate the Battery ‘state of charge’, ‘state of health’, and ‘state of function’.

The mechanical part of the IBS is comprised of the battery clamp for the negative terminal and a captured bolt to attach the ground cable to. The functional tasks include establishing the electrical contact between the body and the negative battery post, housing the electronic module (actual sensor element) and the provision of an adequate thermal contact between the sensor system temperature sensor and the negative battery post. The mechanical part of the IBS also protects the sensitive electronic components from external influences.

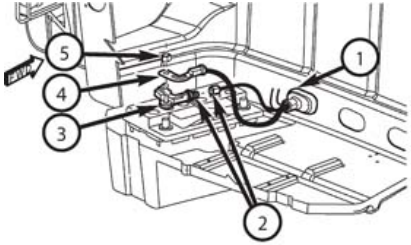
The IBS is mounted directly on the 12 VDC battery’s negative post. The battery post clamp nut is a captive nut and the stud will break if the nut is removed.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Connecting the battery negative cable to the Intelligent Battery Sensor (IBS) must be done before installing on the battery post.



1. Connect the battery negative cable (4) to the IBS (3). Tighten the nut (5) to 16 N·m (142 in. lbs.).
2. Install the IBS on the negative battery post.
3. Tighten the captive nut to 7 N·m (62 in. lbs.).
4. Connect the IBS electrical harness (2) to the IBS.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The battery sensor measures, calculates and reports battery: voltage, current, temperature, state of charge and other parameters via a LIN (Local Interconnect Network) bus to a master control module (engine controller, body controller etc). The battery sensor is used to optimize vehicle performance (maintain battery charge, fuel economy etc) via the vehicles electrical system

The battery sensor is readable/diagnosable via a “scan tool” that can display all of the available parameters needed for vehicle servicing or trouble shooting.

Information the Intelligent Battery Sensor (IBS) send out on the CAN Bus is

- SOC = Battery State of Charge: Percentage the residual charge of the battery in respect to its nominal capacity. In few words represents how much the battery is charged.
- SOH = Battery State of Health: Send a percentage of the real capacity of the battery in respect to the nominal capacity of the battery. It’s so called because during the functioning, the battery is subject to irreversible processes that reduce its capacity to be recharged and to give energy (battery ageing).
- SOF = Battery State of Function: The prediction of the minimum voltage that will be reached during a cranking phase

When the IBS is powered up for the first time or is powered after a power disconnection, it goes into a so called “recalibration” phase, where the IBS must recognize the type of battery and its characteristics and state. So in this phase the tolerances on the state functions (SOC, SOF, SOH) are greater than in normal working condition.

STANDARD PROCEDURE - SHIPPING MODE

The new Chrysler Telematics Platform (CTP) vehicles no longer have a IOD fuse to use when transporting or storing for a long period of time. The BCM has a mode that takes the place of pulling the IOD fuse called **"Shipping Mode"**.

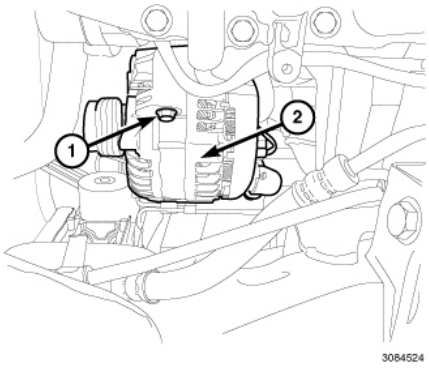
The new CTP vehicles will come from the factory in **"Shipping Mode"**.

To enable/disable the **"Shipping Mode"** function press and hold the **"Front Defrost and Enter/Browse"** for 5 seconds. You can also enable/disable the vehicle from **"Shipping Mode"** by using the scan tool, go to BCM then Misc. function.

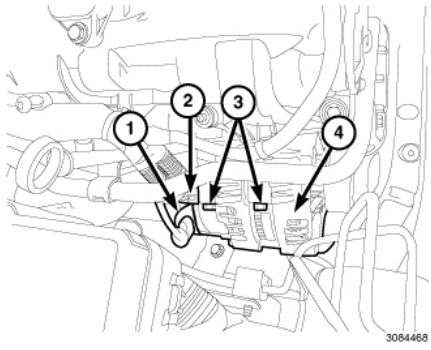
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

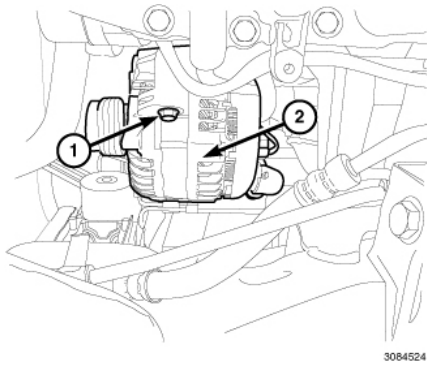
NOTE: Position the generator, install all bolts to engine finger tight, then tighten fasteners to specification.



1. Position the generator (2) to the engine and install the lower retaining bolt (1) finger tight.
2. Lower the vehicle.

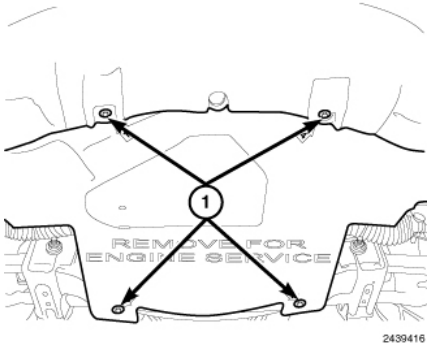


3. Install the upper generator retaining bolts (3) and tighten to 25 N·m (16 ft. lbs.).
4. Snap the field wire connector (2) into the rear of the generator.
5. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut (1) and tighten to 14 N·m (10 ft. lbs.).
6. Install the insulator cover onto the B+ output terminal.
7. Raise and support the vehicle.



8. Tighten the lower generator retaining bolt (1) to 25 N·m (18 ft. lbs.).
9. Position the belly pan and install the belly pan retainers (1).

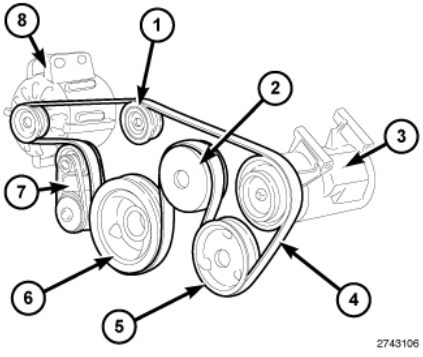
10. Lower the vehicle.



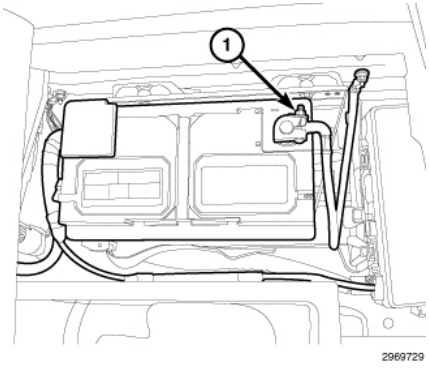
CAUTION: **When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.**

CAUTION: **Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.**

11. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (4) onto the pulleys and slowly release the tensioner.



12. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).



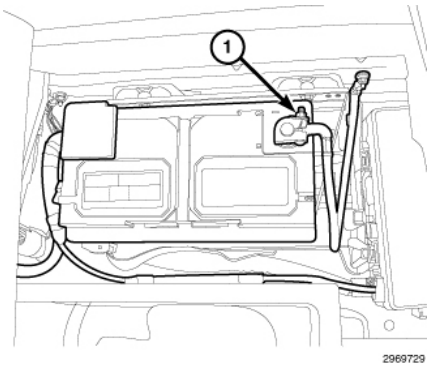
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

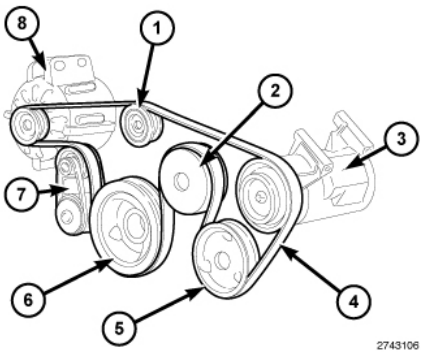
WARNING: **Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.**

1. Disconnect and isolate the negative battery cable (1).

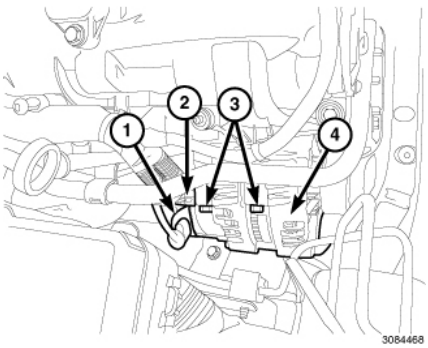


CAUTION: **Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.**

2. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner into the freearm position.



3. Remove the upper generator retaining bolts (3).



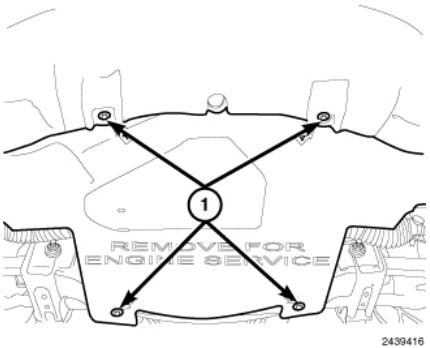
4. Remove the insulator cover (1) from the B+ output terminal at the rear of the generator (4).

5. Remove the B+ terminal retaining nut at the rear of the generator and remove the B+ terminal.

6. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector (2).

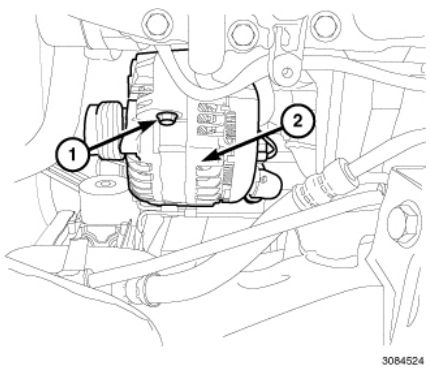
7. Raise and support the vehicle.

8. Remove the belly pan retainers (1) and remove the belly pan.



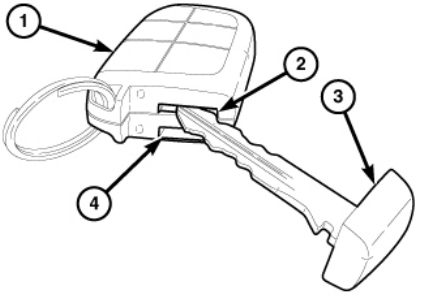
9. Remove the lower generator retaining bolt (1).

10. Remove the generator (2) from below the engine compartment.



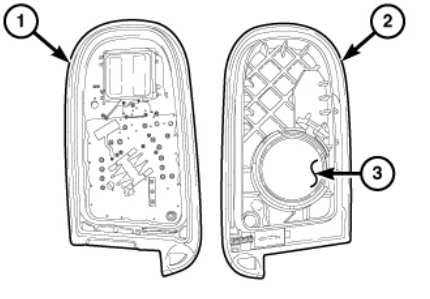
BATTERY REPLACEMENT

CAUTION: **Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.**



3068797

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the front of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.



3068870

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (2).
4. Replace the battery with a recommended replacement battery. (Refer to 08 - Electrical/8N - Power Systems/Power Locks/TRANSMITTER, Integrated Key FOB - Specifications) .
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (1) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

DESCRIPTION

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension. All engines are equipped with an automatic belt tensioner. The tensioner maintains correct accessory drive belt tension at all times.

DESCRIPTION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, coolant bottle is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Electric cooling fan
- Radiator
- A coolant recovery system
- Thermostat
- Water pump
- Radiator pressure cap
- Coolant
- Water pump
- Hoses and hose clamps

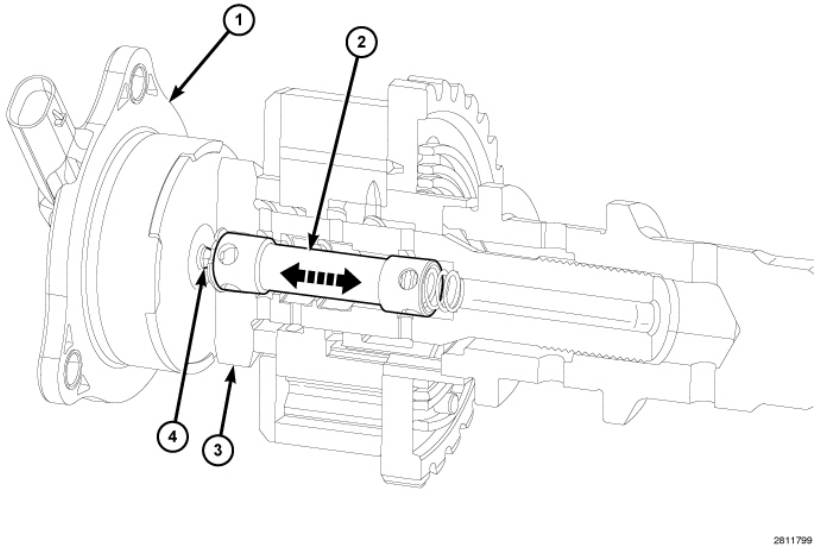
OPERATION



Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Operation) .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this instance the procedure will be performed at the next key off cycle.

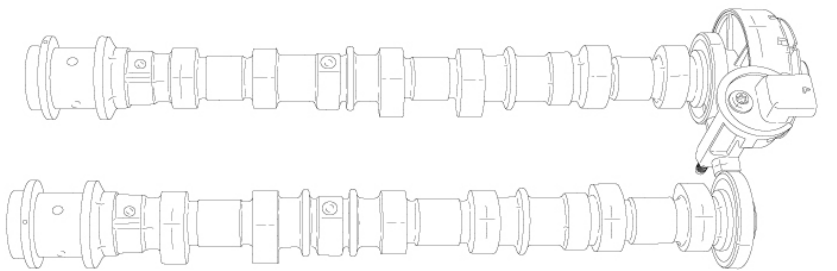
DESCRIPTION



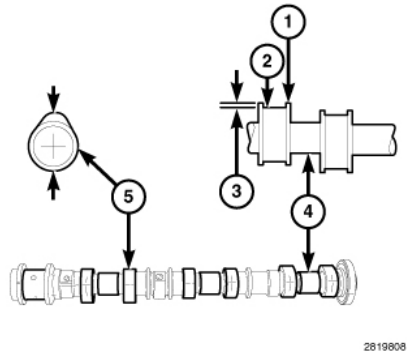
2820031

The Pentastar engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have a pressed on magnetic timing wheel that is magnetic encoded. The two Camshaft Position (CMP) sensors are located between the timing wheels. Attached to the rear of the right exhaust camshaft is a centrifuge which is part of the crankcase ventilation system. The centrifuge is used to separate oil droplets from the crankcase gases before they enter the PCV valve. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

NOTE: RH intake camshaft shown, other camshafts similar.



1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.

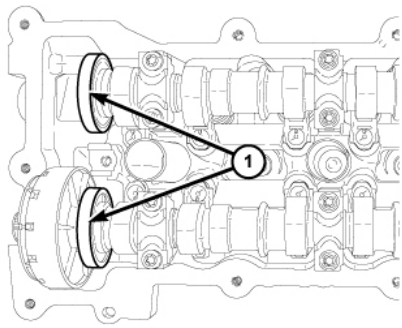
2. Check the surface of the cam lobes (5) for abnormal wear (3). Measure and compare the unworn area (1) to the worn area (2). Replace camshafts that are not within specification (Refer to 09 - Engine - Specifications) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

RIGHT

Labor Operations: Click to display a list of Labor Operations associated with this procedure

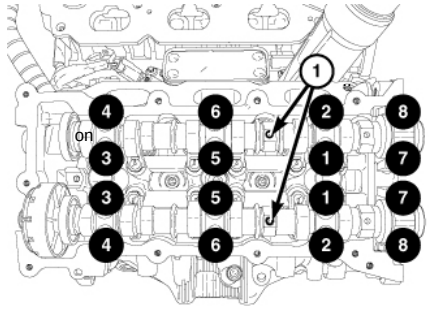
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



2691700

1. Lubricate camshaft journals with clean engine oil.

CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.**



2688733

2. Install the right side camshaft(s) at top-dead-center by positioning the alignment holes (1) vertically. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

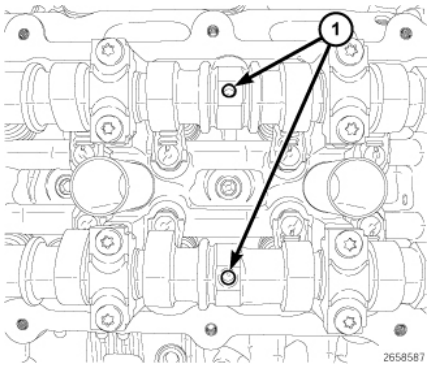
NOTE: Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Install the camshaft bearing caps and hand tighten the retaining bolts to the proper) .

4. Verify the rocker arms are aligned to the cam lobe (Refer to 09 - Engine/Cylinder Head/ROCKER ARM, Valve/Installation) .

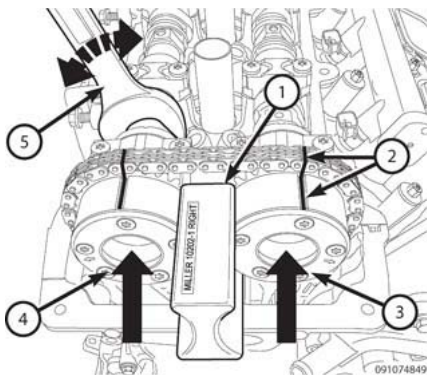
5. Tighten the bearing cap retaining bolts in the sequence shown to the proper) .

6. Verify the alignment holes are vertical to the cylinder head surface.

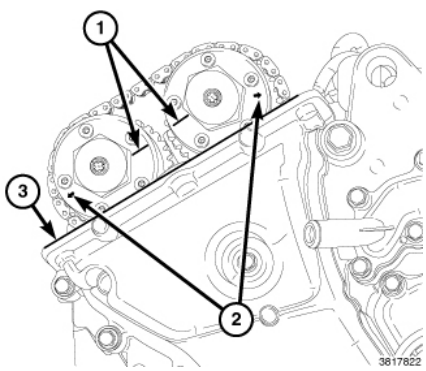


NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RT Camshaft/Phasers to the camshaft alignment pins.

7. Verify the cam phasers (3 and 4) are aligned to the marks (2) made on the timing chain.
8. Install the phasers (3 and 4) onto the camshafts.
9. Install the oil control valves. Tighten to the proper) .



10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft phaser timing mark alignment (1).



11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Installation)

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

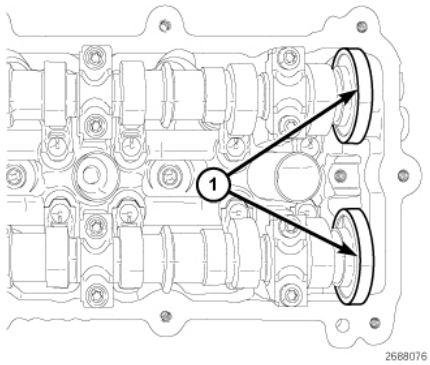
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

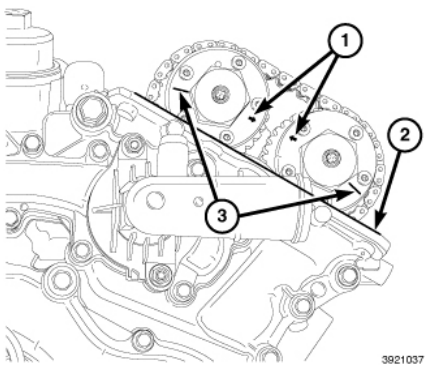
CAUTION: **When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.**

CAUTION: **DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**



1. Remove the upper intake manifold, all ignition coils, all spark plugs and left cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head/Removal) .

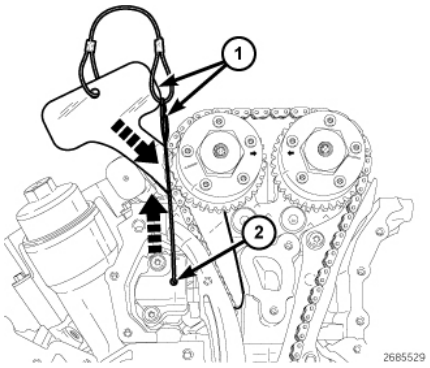
2. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2). The number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

NOTE: Graphic shows engine timing cover removed for clarity.

4. Using the Pin 10200-3 (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push Holder, Timing Chain, Left Side 10200-1 (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body.

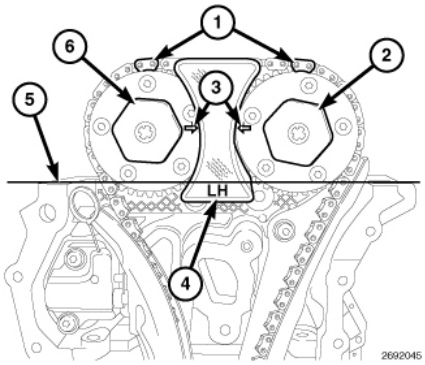


NOTE: The holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LH Camshaft/Phaser Lock.

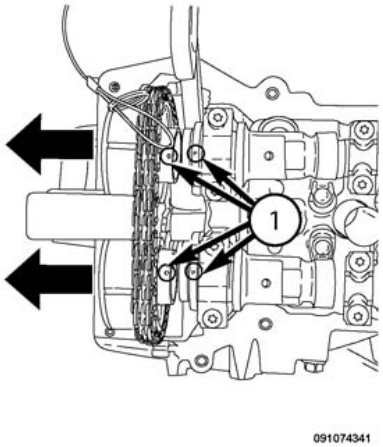
5. Install the Locks, Camshaft/Phaser 10202 (4).

6. Remove the exhaust oil control valve (2) and the intake oil control valve (6).



NOTE: The alignment marks located on the camshaft specifies the location of the drive pin in reference to the phaser alignment mark.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.



NOTE: DO NOT REMOVE THE PHASER LOCK.

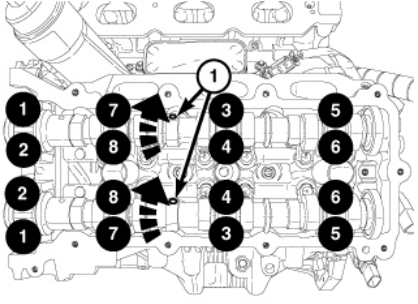
NOTE: Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked “1E–>”. The caps should be installed with the notch forward.

8. Rotate the camshafts counterclockwise to position the alignment holes (1) **approximately 30° before top-dead-center**. This places the camshafts in the neutral position (no valve load).

9. Loosen the camshaft bearing cap bolts in the sequence shown.

NOTE:

When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.



2676491

10. Remove the camshaft bearing caps and the camshafts.

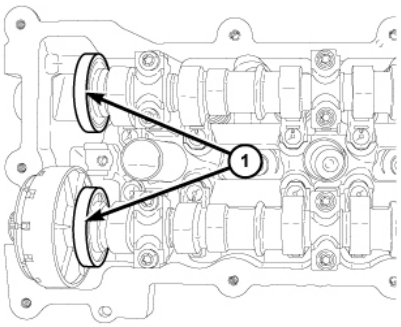
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

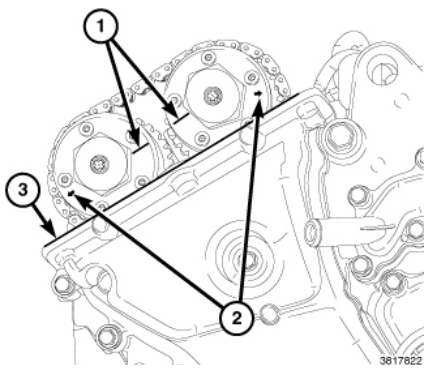
CAUTION: **When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.**

CAUTION: **DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.**



2691700

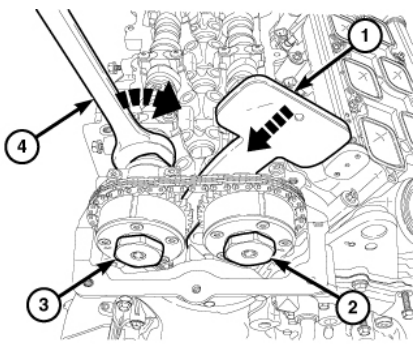
1. Remove the upper intake manifold, all ignition coils, all spark plugs, right cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head/Removal) .
2. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.



3817822

4. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert the Holder, Timing Chain 10369 (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

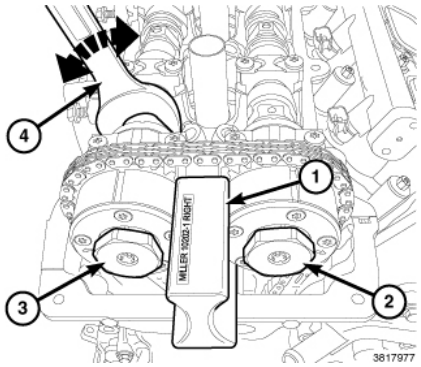
NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RH Camshaft/Phaser Lock.



3658638

5. Install Lock, Camshaft/Phaser, Right Side 10202-1 (1).

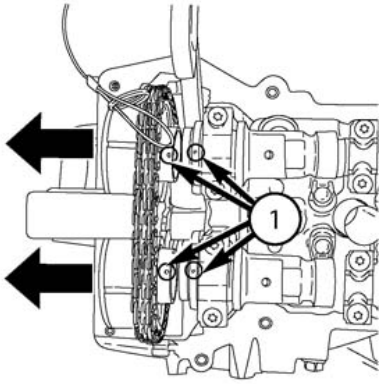
6. Remove both the intake (2) and exhaust (3) oil control valves.



NOTE: Left side shown. Right side similar.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

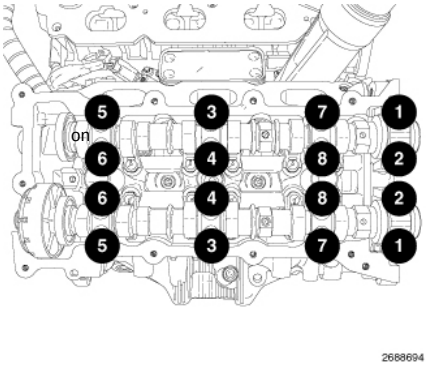
NOTE: DO NOT REMOVE THE PHASER LOCK



8. Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked “1E–>”. The caps should be installed with the notch forward.

NOTE: Loosen the camshaft bearing cap bolts in the sequence shown.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.



9. Remove the camshaft bearing caps and the camshafts.

CAMSHAFT END PLAY

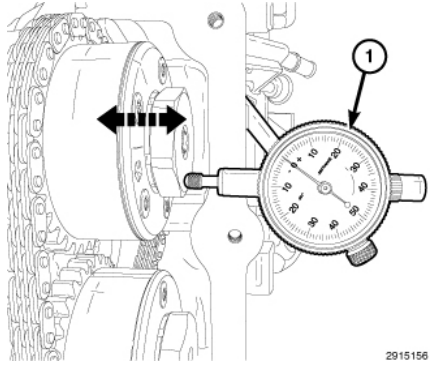
Special Tools: Click to display a list of tools used in this procedure

NOTE: Right intake camshaft shown, other camshafts similar.

1. Remove the cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal).

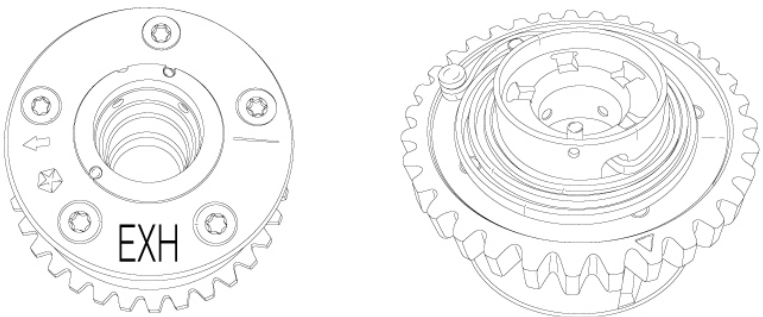
NOTE: Cylinder #1 or #4 must be used when checking for Top Dead Center (TDC).

2. Mount Dial Indicator Set C-3339A (1) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification (Refer to 09 - Engine - Specifications) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



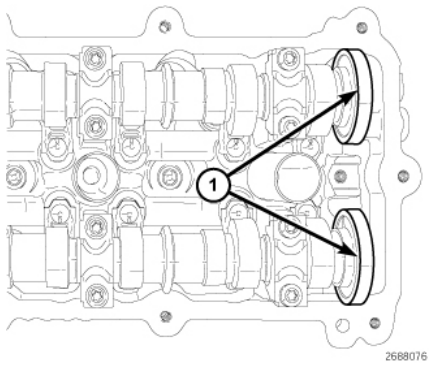
The engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four phasers are located on the front of the camshafts, behind the VVT solenoids, inside of the engine timing cover. The exhaust phasers are identified with EXH and the intake phasers are identified with INT. The exhaust phaser has a clockspring, the intake phaser does not. The camshaft sprockets are integrated with the camshaft phaser and are serviced as an assembly. Do not attempt to disassemble the phasers, they are not serviceable. Phasers are interchangeable between the right and left cylinder heads but should be installed in the same location as removed.

The engine has an Oil Control Valve (OCV) for each phaser. The OCV also acts as a bolt for mounting the Phaser to the camshaft. The OCVs spool valve is spring loaded and should move freely within the OCV body. The four OCVs are identical but should be installed in the same location as removed.

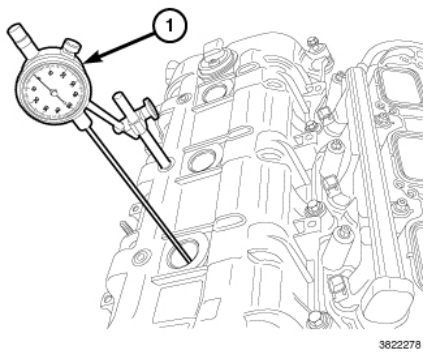
LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



CAUTION: **Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts .**

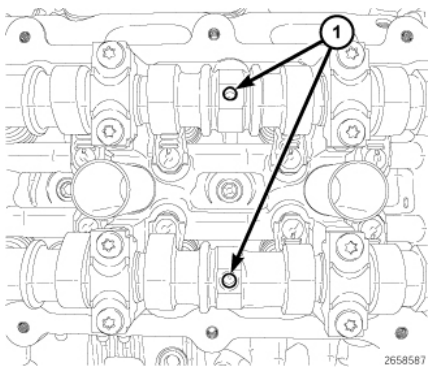


1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

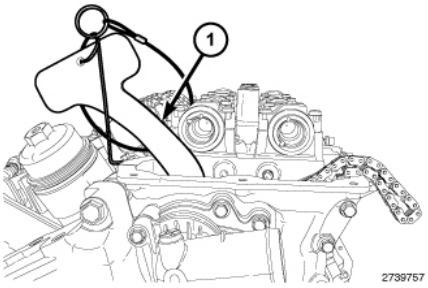
2.

CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.**

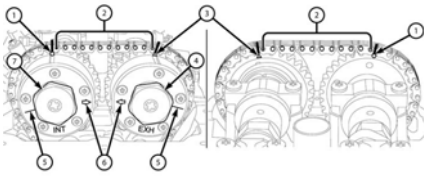
Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.



NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by repeating Step 10 of the Removal procedure (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Removal) .

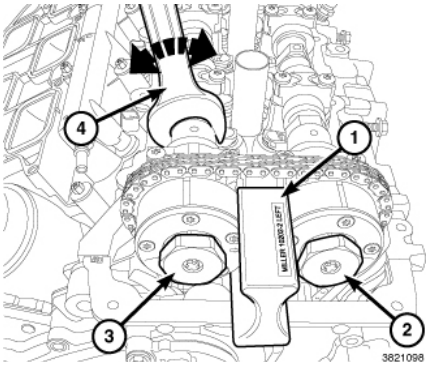


NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

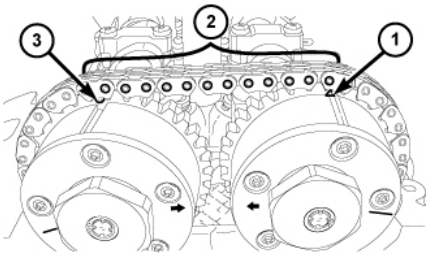


3. Route the cam chain around the left intake cam phaser while aligning the paint mark with the phaser timing mark (1). Press the left intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (7).
4. While maintaining this alignment, route the cam chain around the exhaust cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (4).
5. The **SCRIBE LINES** (5) on the cam phasers should face away from each other and the **ARROWS** (6) should point toward each other and be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1).

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.



6. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (1) against the cylinder head cover mounting surface with the tool number facing up.
7. Tighten the oil control valves (2) and (3) to 150 N·m (110 ft. lbs.).
8. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.
9. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;
   - The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
   - The **SCRIBE LINES** (3) on the left side cam phasers face away from each other.
   - The **ARROWS** (4) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface.
   - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).



10. If the engine timing is not correct, repeat this procedure.
11. Install the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

12. Install the right ignition coils (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation)

13. Install the left cylinder head cover and left ignition coils (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation)

14. Install the upper intake manifold and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

16. Start the engine and perform the following Powertrain Verification Tests (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure):

    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE: Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing) for any DTCs that reset.

RIGHT

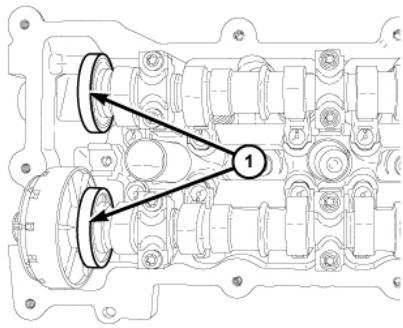
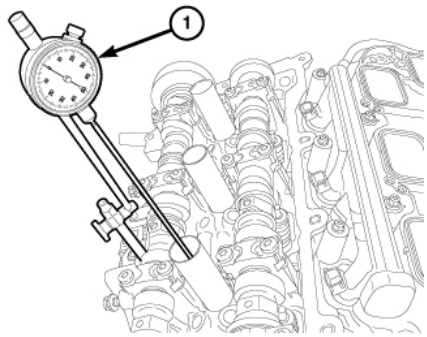
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



2691700

CAUTION: **Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts .**

1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

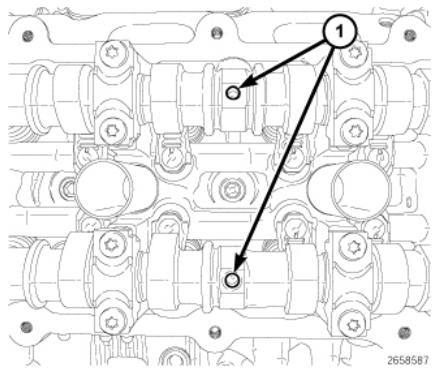


3822244

2.

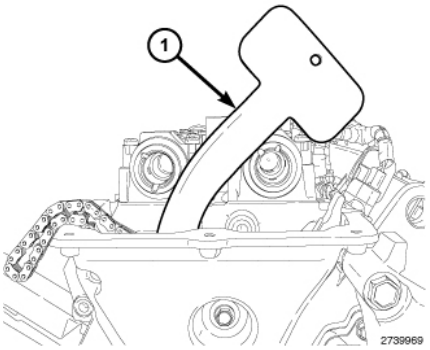
CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.**

Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

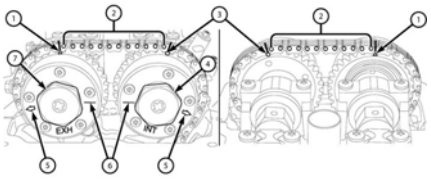


2658587

NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by installing the exhaust cam phaser and repeating Step 10 of the Removal procedure (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Removal) .



NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

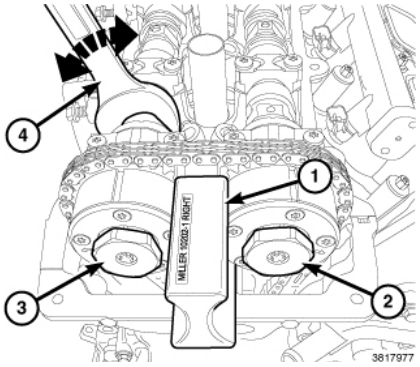


3. Route the cam chain around the right exhaust cam phaser while aligning the paint mark with the phaser timing mark (1). Press the right exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

4. While maintaining this alignment, route the cam chain around the intake cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (4).

5. The **ARROWS** (5) on the cam phasers should point away from each other and the **SCRIBE LINES** (6) should be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

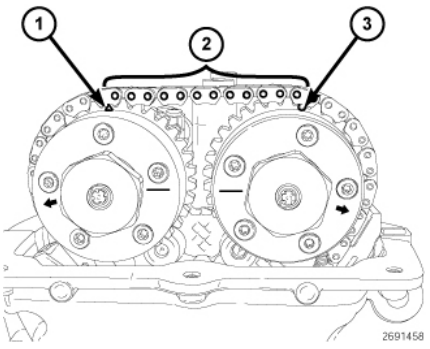


6. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (1) against the cylinder head cover mounting surface with the tool number facing up.

7. Tighten the oil control valves (2) and (3) to 150 N·m (110 ft. lbs.).

8. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.

9. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;



- The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
- The **ARROWS** (4) on the right side cam phasers point away from each other.
- The **SCRIBE LINES** (5) on the right side cam phasers are parallel to the cylinder head cover mounting surface.
- There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).

10. If the engine timing is not correct, repeat this procedure.

11. Install the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

12. Install the left ignition coils (Refer to 08 - Electrical/8I - Ignition Control/COIL, Ignition - Installation)

13. Install the right cylinder head cover and right ignition coils (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation)

14. Install the upper intake manifold and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

15. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

16. Start the engine and perform the following Powertrain Verification Tests (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure):

    - Cam/Crank Variation Relearn
    - Target Coefficient Relearn

NOTE: Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. (Refer to 28 - DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing) for any DTCs that reset.

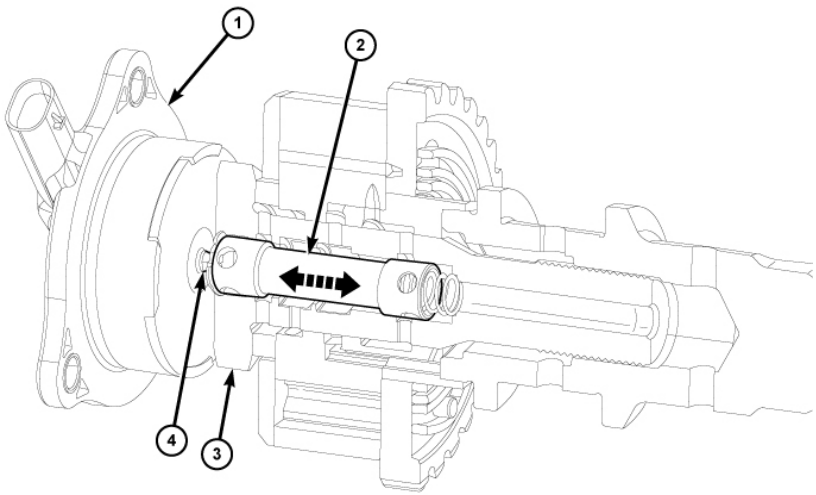
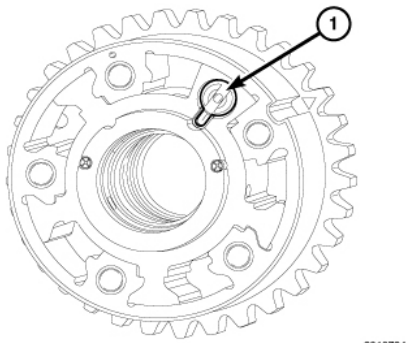
OPERATION



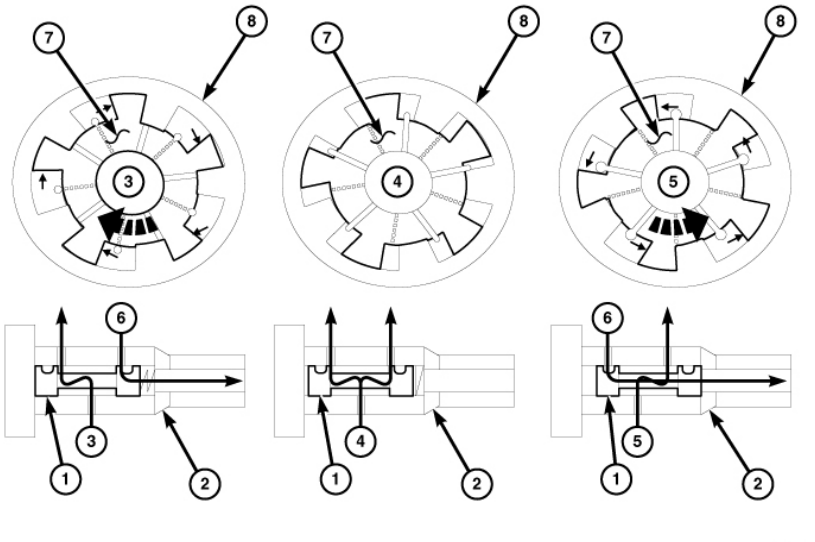
2811799

Each phaser position is adjusted using regulated oil pressure through the Oil Control Valve (OCV) (3). To begin phaser movement, a voltage signal is applied to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow.

At engine startup, system oil pressure overcomes spring pressure and unlocks the phaser lock-pin (1) in preparation for phasing. The phasers remain in this position until a PCM signal is given to pulse-width modulate the VVT solenoid. At engine shutdown, as oil pressure is reduced, both Phasers return to their lock-pin position (1). However, because the exhaust Phaser needs to travel to a position above and beyond the standard camshaft clockwise rotation, the assistance of a clock spring is required. The intake Phaser on the other hand, simply relies on the torsional resistance from the valvetrain to push it back towards lock-pin position.



2813724

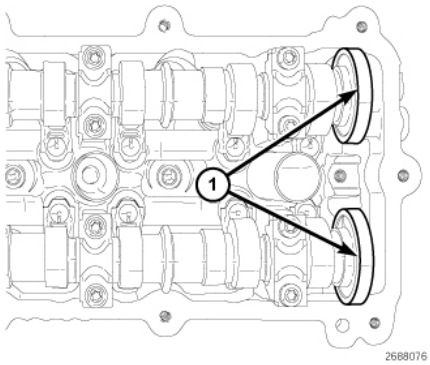


The position of the spool valve (1) inside the OCV (2) determines which ports and chambers inside the phaser are being fed, either to advance (3), hold (4) or retard (5) the timing of the phaser sprocket relative to the camshaft. The spool valve also returns oil from the chambers to the sump (6). The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM. As oil pressure pushes against the vanes (6) of the phaser rotor, the rotor begins to move. Since this rotor is physically attached to the camshaft, rotor rotation causes the camshaft position to rotate relative to the standard sprocket (7) position.

LEFT

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

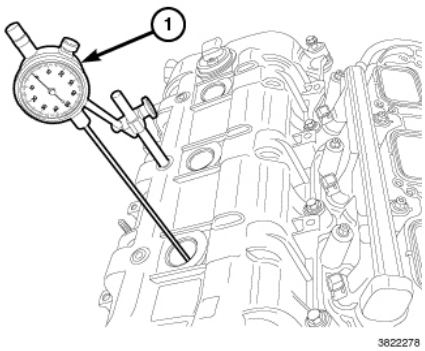
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



1. Remove the upper intake manifold, left ignition coils and left cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)

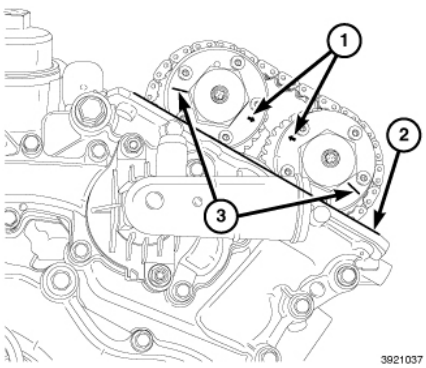
2. Remove the right ignition coils and all spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**



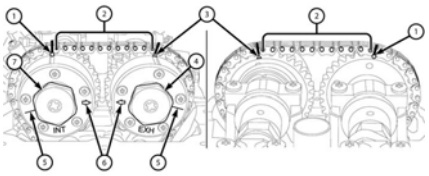
3. Mount Dial Indicator Set C-3339A (1) to a stationary point on the engine, such as the number three cylinder ignition coil mount. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

4. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2) when the number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



NOTE: The cam phaser timing markings (1 and 3) could align with either an external or internal chain link. Either

alignment is acceptable as long as there are twelve chain pins (2) between the markings.

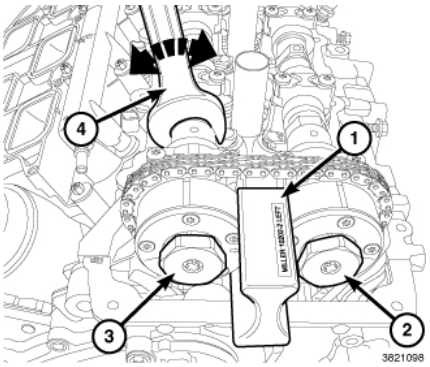


NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1) as viewed from either the front or rear of the cam phasers.

6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

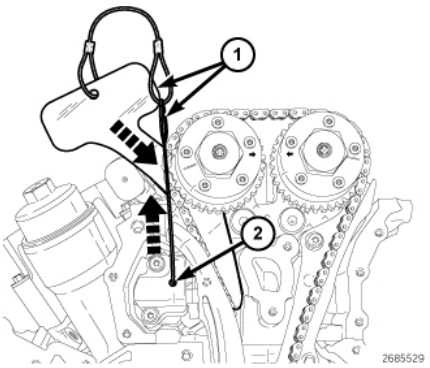


7. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (1) against the cylinder head cover mounting surface with the tool number facing up.

8. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).

9. Remove the Lock, Camshaft/Phaser, Left Side 10202-2 (1).

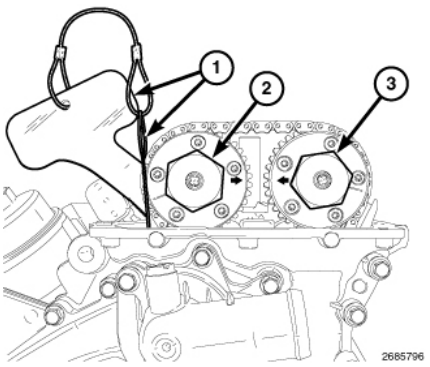
NOTE: Graphic shows engine timing cover removed for clarity.



10. Using Pin 10200-3 (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push Holder, Timing Chain, Left Side 10200-1 (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder remains in place while the phasers are removed (Refer to 09 - Engine/Valve Timing - Standard Procedure) .

11. Remove the oil control valve (4) and pull the left side exhaust cam phaser off of the camshaft.

12. Remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

RIGHT

Labor Operations: Click to display a list of Labor Operations associated with this procedure

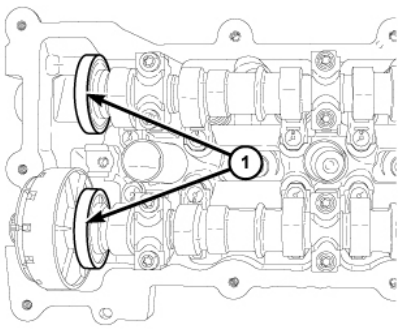
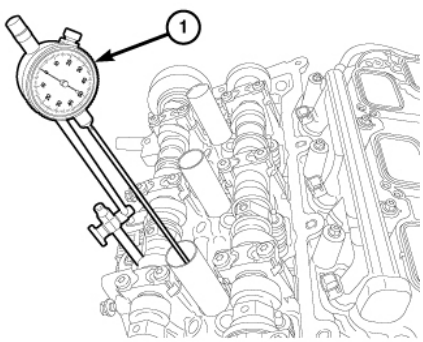
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**



2691700

1. Remove the upper intake manifold, right ignition coils and right cylinder head cover (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)



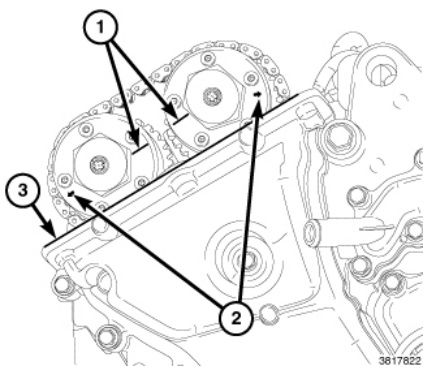
3822244

2. Remove the left ignition coils and all spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

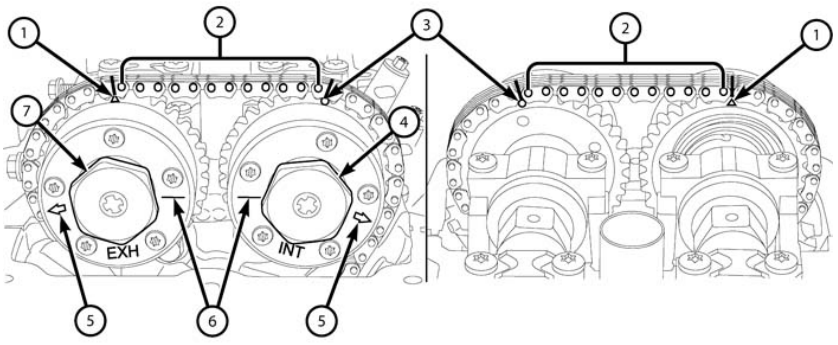
CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

3. Mount Dial Indicator Set C-3339A (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

4. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.



3817822



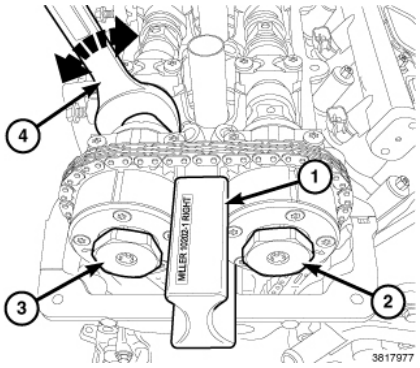
NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins (2) between the markings.

NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

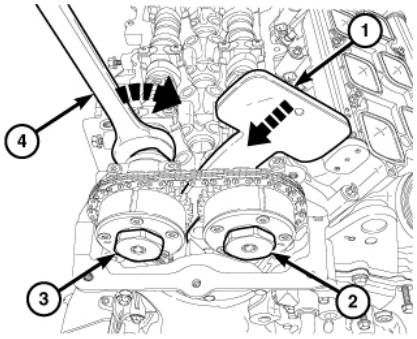


7. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (1) against the cylinder head cover mounting surface with the tool number facing up.

8. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).

9. Remove the Lock, Camshaft/Phaser, Right Side 10202-1 (1).

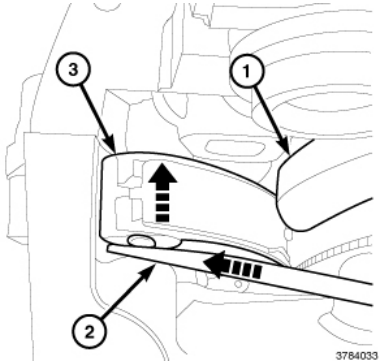
CAUTION: **Do not insert the Timing Chain Holder into position without first compressing the tensioner. The Timing Chain Holder is not designed to compress the tensioner and excessive force can damage the timing chain tensioner arm.**



10. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert Holder, Timing Chain 10369 (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

NOTE:

If the Timing Chain Holder (1) does not engage or slips from position, wedge a trim stick (2) or equivalent between the front cover and the tensioner arm (3) to push the tensioner arm towards the rear of the engine and then repeat the previous step.



11. Remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

12. Remove the oil control valve (2) and pull the right side intake cam phaser off of the camshaft.

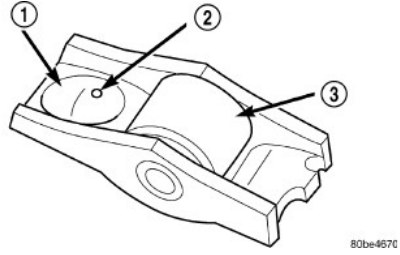
INSPECTION

Inspect the cam follower assembly for wear or damage. Replace as necessary.

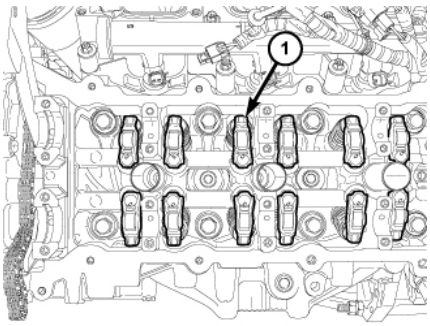


INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION: **Proper inspection of the rocker arms is required to ensure proper installation. Inspection from the top and also side view is critical to verify the proper seated position of each and every rocker arm. Failure to install the rocker arms correctly may cause severe engine damage.**

NOTE: The LH cylinder head rocker arms are shown, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.



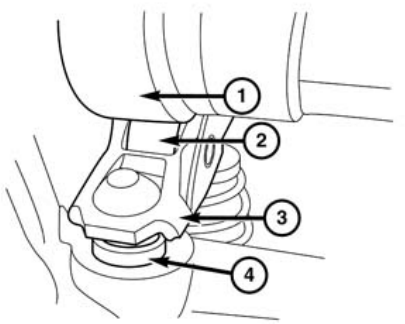
2741091

1. Lubricate the rocker arms with clean engine oil before installation.

NOTE: When placing the rocker arms. The valve stem should fit securely into the rocker arm guides.

2. Position the rocker arm(s) (1) onto the lifter(s) and valve stem(s).
3. Position the camshaft(s) onto the mounts and install the camshaft caps. Hand tighten the cap retaining bolts to the proper) .

NOTE: If any of the rocker arms are not installed properly. Loosen the camshaft caps and reposition the rocker arms.



210171394

4. Verify that the rocker arm (3) is positioned over the lifter (4).
5. Verify that the rocker arm roller (2) is seated to the camshaft lobe (1).
6. Use a mirror to verify the valve stem (4) is centered between the rocker arm guides (3).
7. Verify the camshaft lobe (1) is centered over the rocker arm roller (2).

8. Tighten the camshaft caps (Refer to 09 - Engine/Cylinder Head/CAMSHAFT, Engine - Installation) .

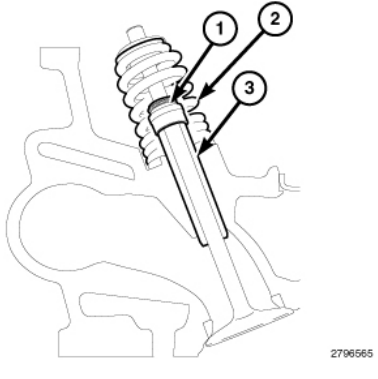
DESCRIPTION

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.



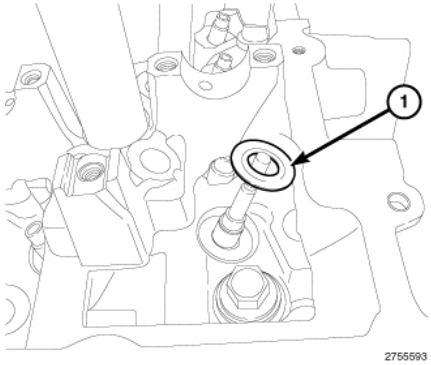
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. If removed, install the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Installation) .

NOTE:
Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification (Refer to 09 - Engine - Specifications) . Number 5 cylinder exhaust valve shown, all other valves similar.

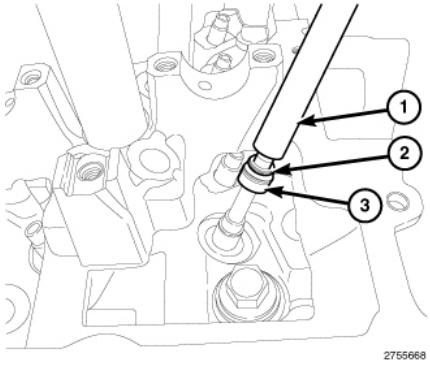


2. If removed, install the spring seat (1) over the valve guide.

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE:
Ensure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 5 cylinder exhaust valve guide seal shown, all other valves similar.

NOTE:
If the valve springs are being reused, reassemble them into their original locations.



4. Install the valve spring(s) (Refer to 09 - Engine/Cylinder Head/SPRING(S) , Valve - Installation).

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

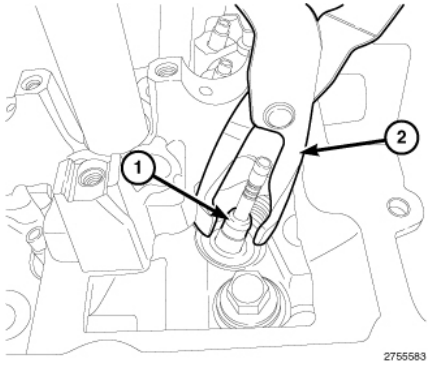
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations.

1. Remove the valve spring(s) (2) (Refer to 09 - Engine/Cylinder Head/SPRING(S) , Valve - Removal).

NOTE: Number 5 cylinder exhaust valve guide seal shown, all other valve guide seals similar.

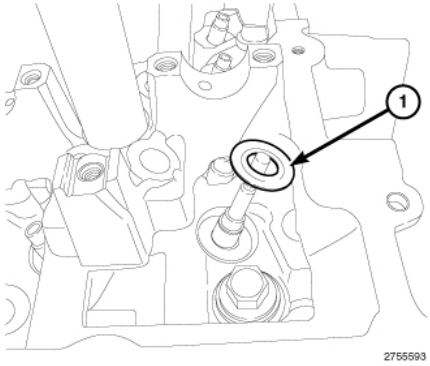
2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.



NOTE: Number 5 cylinder exhaust valve spring seat shown, all other valve spring seats similar.

3. If required, remove the valve spring seat (1).

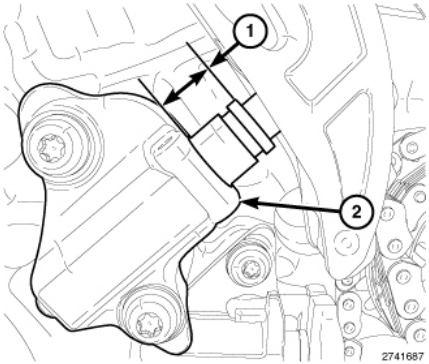
4. If required, remove the valve(s) (Refer to 09 - Engine/Cylinder Head/VALVES, Intake and Exhaust - Removal) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSPECTION

Prior to disassembly of the timing chains and sprockets, measure the timing chain wear (1) (Refer to 09 - Engine/Valve Timing - Standard Procedure) .



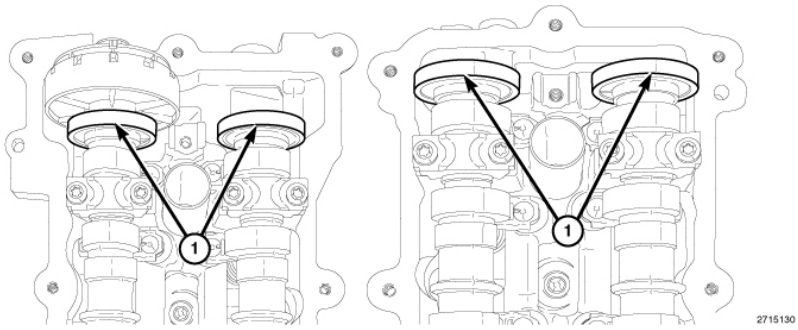
Inspect the following valve timing components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

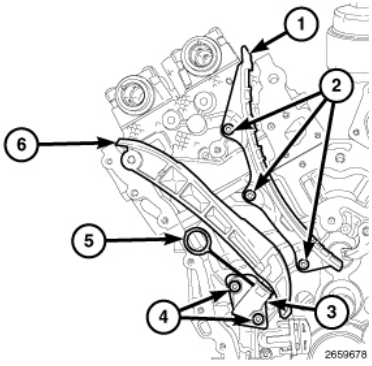
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

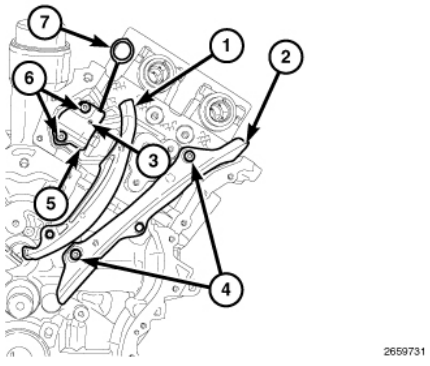


CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

1. Inspect all sprockets and chain guides. Replace if damaged.
2. If removed, install the right side cam chain guide (1) and tensioner arm (6). Tighten attaching T30 bolts (2) to 12 N·m (106 in. lbs.).
3. If removed, install the right side cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N·m (106 in. lbs.).
4. Reset the right side cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin 8514 (5).

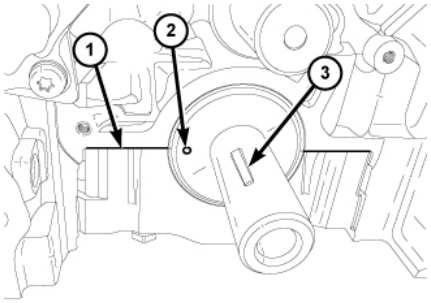


5. If removed, install the left side cam chain guide (2) and tensioner arm (1). Tighten attaching T30 bolts (4) to 12 N·m (106 in. lbs.).
6. If removed, install the left side cam chain tensioner (5) to the cylinder head with two bolts (6). Tighten the T30 bolts (6) to 12 N·m (106 in. lbs.).
7. Reset the left side cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin 8514 (7) (Refer to 09 - Engine/Valve Timing - Standard Procedure) .



8. Verify that the key (3) is installed in the crankshaft.

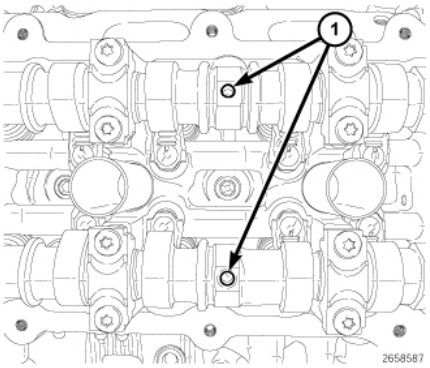
CAUTION: **Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts .**



2605347

9. Verify that the number one cylinder piston is positioned at top-dead-center by aligning the dimple (2) on the crankshaft with the block/bearing cap junction (1).

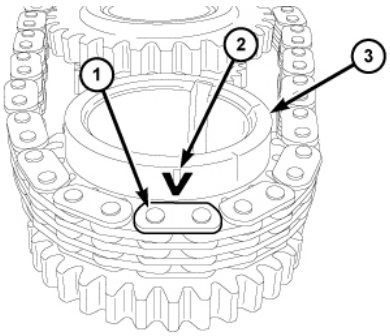
CAUTION: **Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.**



2658587

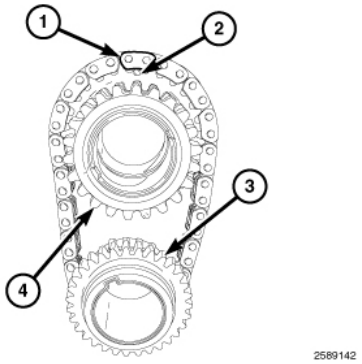
10. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**



2588864

11. Place the primary chain onto the crankshaft sprocket (3) so that the arrow (2) is aligned with the plated link (1) on the timing chain.

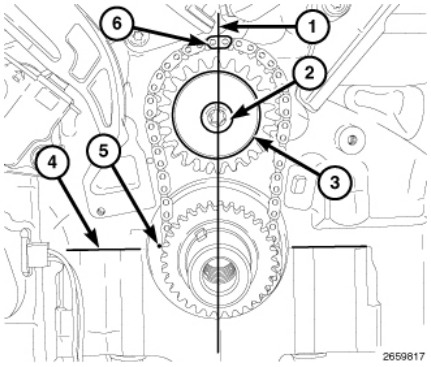


2589142

12. While maintaining this alignment, invert the crankshaft sprocket and timing chain and place the idler sprocket (4) into the timing chain so that the dimple (2) is aligned with the plated link (1) on the timing chain.

13. While maintaining this alignment, lubricate the idler sprocket bushing with clean engine oil and install the sprockets and timing chain on the engine. To verify that the timing is still correct, the timing chain plated link (6) should be located at 12:00 (1) when the dimple (5) on the crankshaft is aligned with the block/bearing cap junction (4).

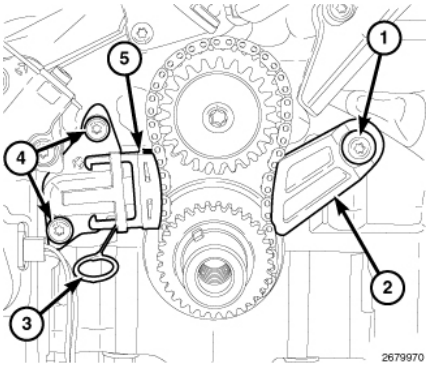
14. Install the idler sprocket retaining bolt (2) and washer (3). Tighten the T45 bolt (2) to 25 N·m (18 ft. lbs.).



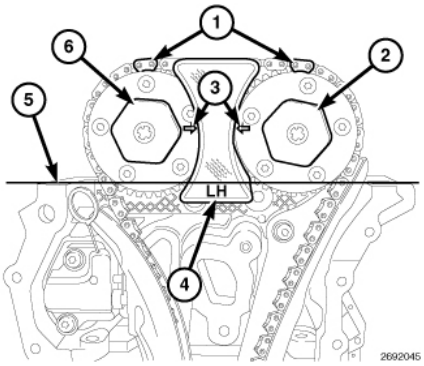
15. Install the primary chain guide (2). Tighten attaching T30 bolt (1) to 12 N·m (106 in. lbs.).

16. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin 8514 (3).

17. Install the primary chain tensioner (5) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N·m (106 in. lbs.) and remove the Tensioner Pin 8514 (3).

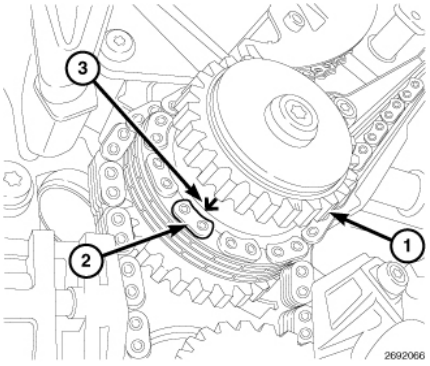


18. Press the left side intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (6).



NOTE: The left side and right side cam chains are identical.

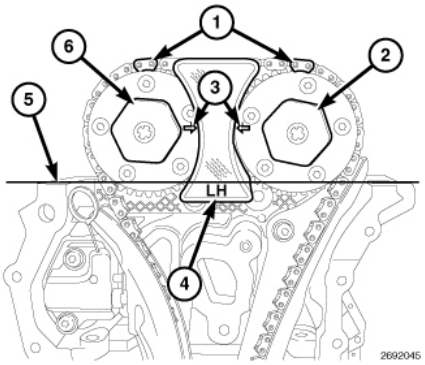
CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**



19. Drape the left side cam chain over the left side intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

20. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the cylinder head cover mounting surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

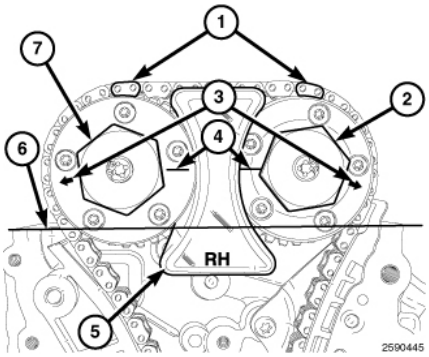
NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.



21. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (4) with the tool number facing up.

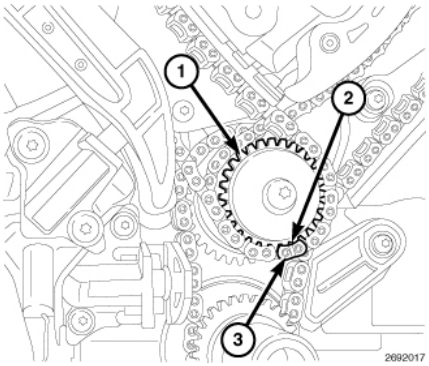
22. Tighten the oil control valves (2) and (6) to 150 N·m (110 ft. lbs.).

23. Remove the Camshaft Phaser Lock (4).

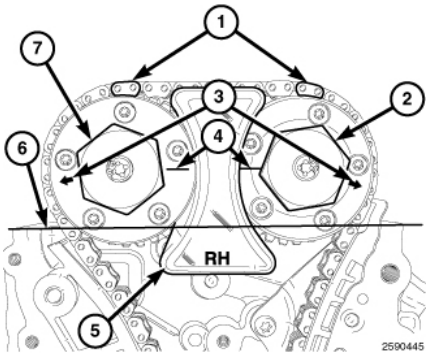


24. Press the right side exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**



25. Drape the right side cam chain over the right side exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.



26. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the cylinder head cover mounting surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

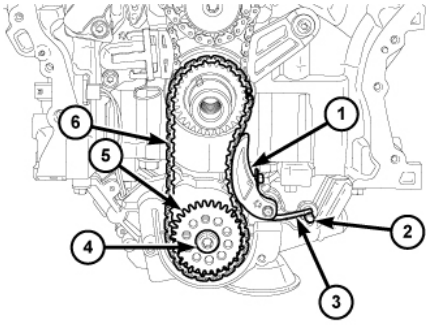
27. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (5) with the tool number facing up.

28. Tighten the oil control valves (2) and (7) to 150 N·m (110 ft. lbs.).

29. Remove the Camshaft Phaser Lock (5).

NOTE: There are no timing marks on the oil pump gear or chain.

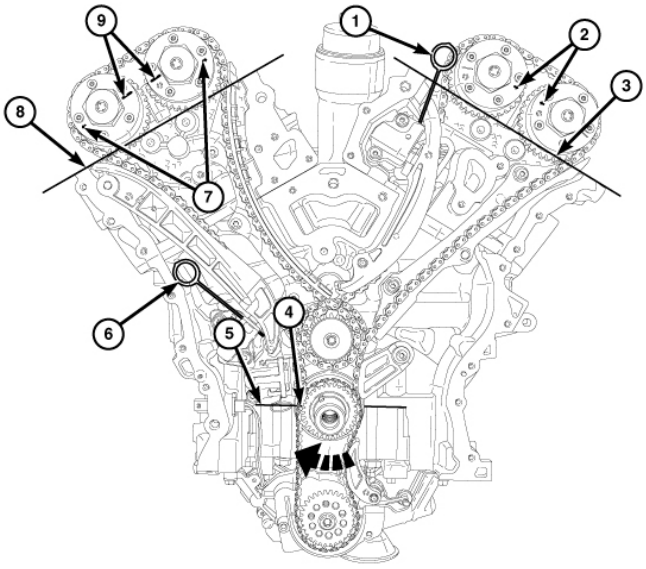
CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**



2682471

30. Place the oil pump sprocket (5) into the oil pump chain (6). Place the oil pump chain onto the crankshaft sprocket while aligning the oil pump sprocket with the oil pump shaft. Install the oil pump sprocket T45 retaining bolt (4) and tighten to 25 N·m (18 ft. lbs.).

31. Install the oil pump chain tensioner (1). Make sure that the spring (3) is positioned above the dowel pin (2).



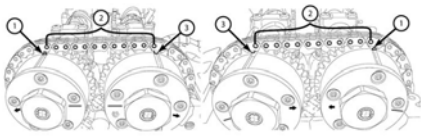
2661245

32. Remove the Tensioner Pins 8514 (1) and (6) from the right side and left side cam chain tensioners.

33. Rotate the crankshaft clockwise (as viewed from the front) two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).

34. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

35. There should be 12 chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.



36. If the engine timing is not correct, repeat this procedure.

37. Install the engine timing cover, crankshaft vibration damper, accessory drive belts and oil pan (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Installation)

38. Install the spark plugs. Tighten to 17.5 N·m (13 ft. lbs.) (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Installation) .

39. Install the cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation)

40. Install the upper intake manifold and air cleaner housing assembly (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Installation)

41. Fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

42. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

43. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .

44. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure)

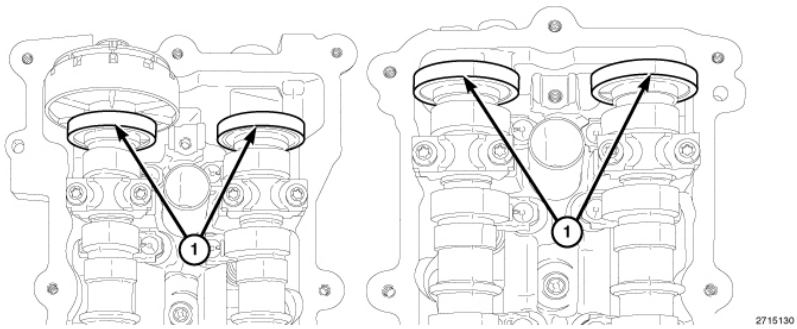
NOTE:

The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure



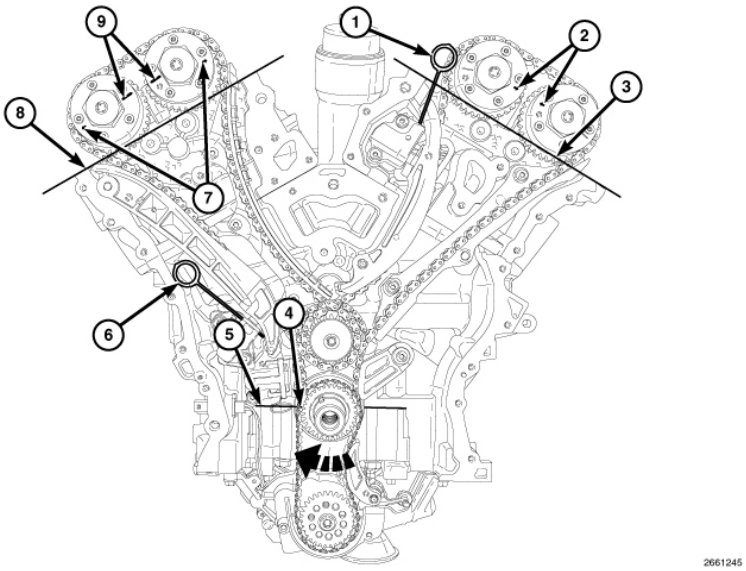
CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

CAUTION: **When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.**

NOTE: The Variable Valve Timing (VVT) assemblies (Phasers) and Oil Control Valves (OCVs) can be serviced without removing the engine timing cover (Refer to 09 - Engine/Cylinder Head/ASSEMBLY, Variable Valve Timing - Removal) .

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner housing assembly and upper intake manifold (Refer to 09 - Engine/Manifolds/MANIFOLD, Intake - Removal)
3. Remove both cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)
4. Remove the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .
5. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
6. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .
7. Remove the oil pan, accessory drive belts, crankshaft vibration damper and engine timing cover (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Removal)

NOTE: Take this opportunity to measure timing chain wear (Refer to 09 - Engine/Valve Timing - Standard Procedure) .

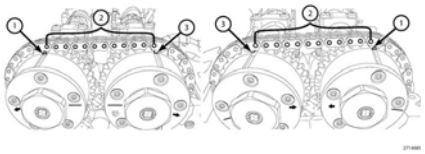


CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

8. Rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5).

9. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.



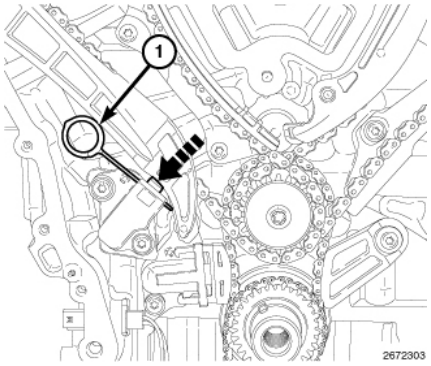
10. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

CAUTION: **Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.**

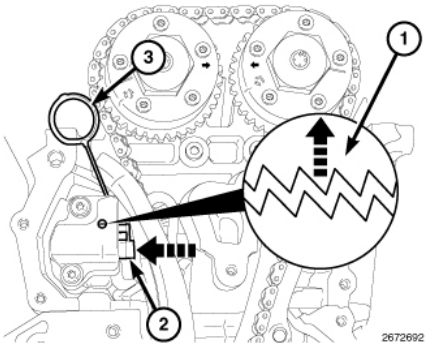
11. Mark the direction of rotation on the following timing chains using a paint pen or equivalent to aid in reassembly:

- Left side cam chain
- Right side cam chain
- Oil pump chain
- Primary chain

12. Reset the right side cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin 8514 (1).

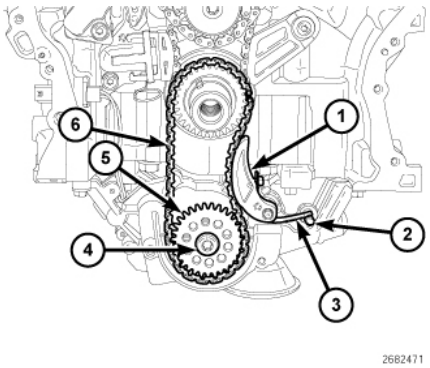


13. Reset the left side cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin 8514 (3) (Refer to 09 - Engine/Valve Timing - Standard Procedure) .

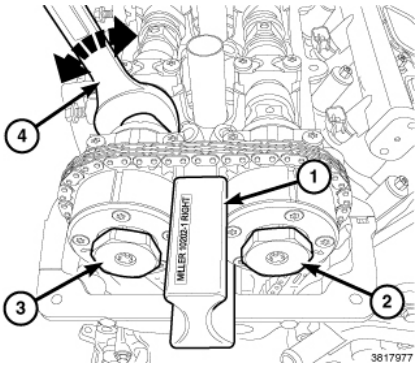


14. Disengage the oil pump chain tensioner spring (3) from the dowel pin (2) and remove the oil pump chain tensioner (1).

15. Remove the oil pump sprocket T45 retaining bolt (4) and remove the oil pump sprocket (5) and oil pump chain (6).



NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.



16. Install the Lock, Camshaft/Phaser, Right Side 10202-1 (1) with the tool number facing up.

17. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).

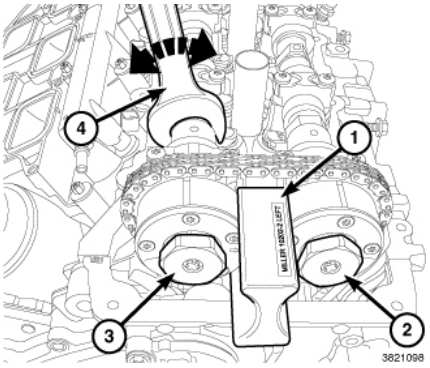
18. Remove the Lock, Camshaft/Phaser, Right Side 10202-1 (1).

19. Remove the oil control valve (2) from the right side intake cam phaser.

20. Pull the right side intake cam phaser off of the camshaft and remove the right side cam chain.

21. If required, remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.



22. Install the Lock, Camshaft/Phaser, Left Side 10202-2 (1) with the tool number facing up.

23. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).

24. Remove the Lock, Camshaft/Phaser, Left Side 10202-2 (1).

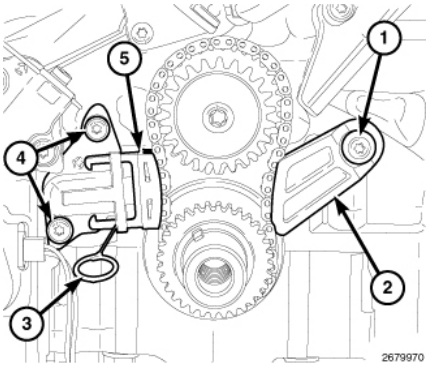
25. Remove the oil control valve (2) from the left side exhaust cam phaser.

26. Pull the left side exhaust cam phaser off of the camshaft and remove the left side cam chain.

27. If required, remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

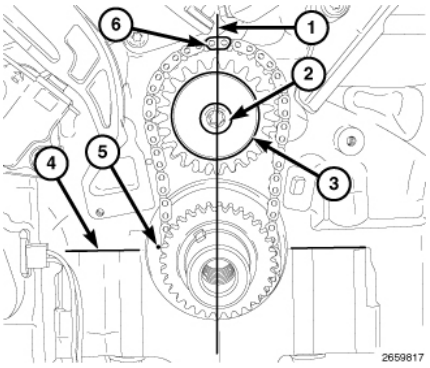
28. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin 8514 (3). Remove two T30 bolts (4) and remove the primary chain tensioner.

29. Remove the T30 bolt (1) and the primary chain guide (2).



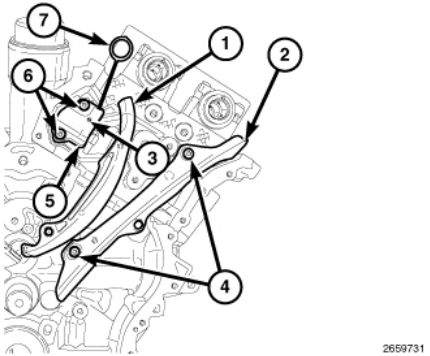
30. Remove the idler sprocket T45 retaining bolt (2) and washer (3).

31. Remove the primary chain, idler sprocket and crankshaft sprocket as an assembly.



32. If required, remove two T30 bolts (6) and the left side cam chain tensioner (5).

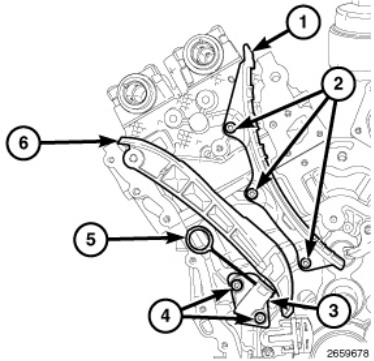
33. If required, remove two T30 bolts (4) and the left side cam chain guide (2) and tensioner arm (1).



34. If required, remove two T30 bolts (4) and the right side cam chain tensioner (3).

35. If required, remove three T30 bolts (2) and the right side cam chain guide (1) and tensioner arm (6).

36. Inspect all sprockets and chain guides. Replace if damaged.

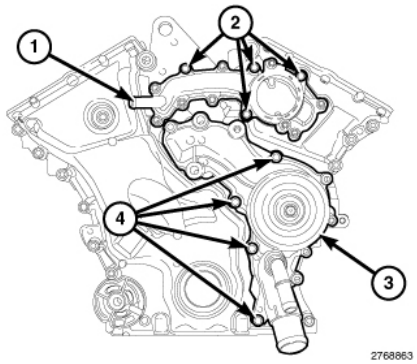


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

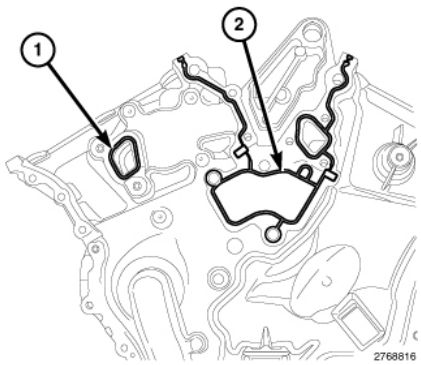
Labor Operations: Click to display a list of Labor Operations associated with this procedure

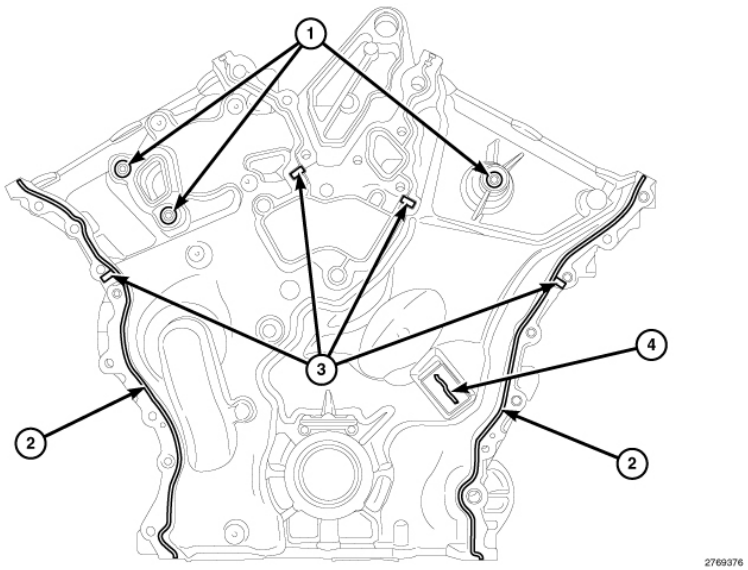
1. If removed, install the coolant outlet housing (1) to the timing cover with a new gasket using only the four bolts (2) shown tightened to 12 N·m (106 in. lbs.).



2. If removed, install the water pump (3) to the timing cover using only the four bolts (4) shown tightened to 12 N·m (106 in. lbs.) (Refer to 07 - Cooling/Engine/PUMP, Water - Installation) .

3. Install the coolant outlet housing gasket (1) and the water pump gasket (2).





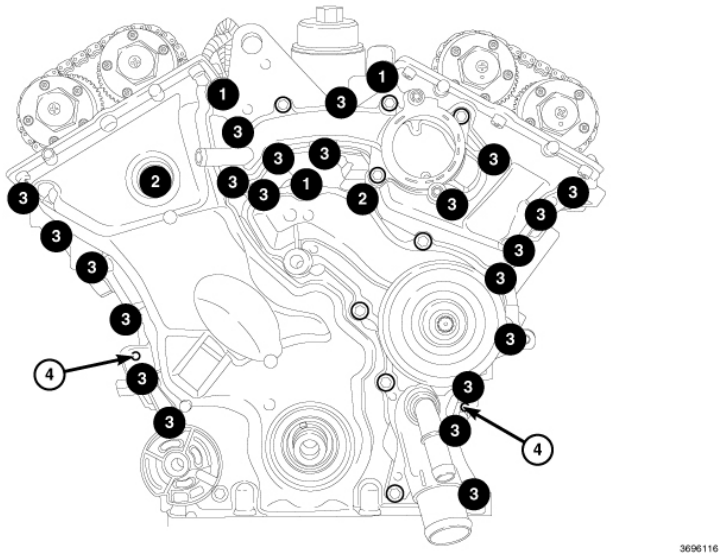
4. Clean the engine timing cover, cylinder head and block mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: **Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.**

CAUTION: **Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.**

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the front cover as shown in the following locations:

   - Three cylinder head bosses (1)
   - Right and left flanges (2)
   - Four cylinder head to engine block T-joints (3)
   - Cover to right cam chain tensioner gap (4)



6. Align the locator pins (4) on the engine block to the engine timing cover and install the cover.

7. Install and tighten the timing cover attaching bolts:

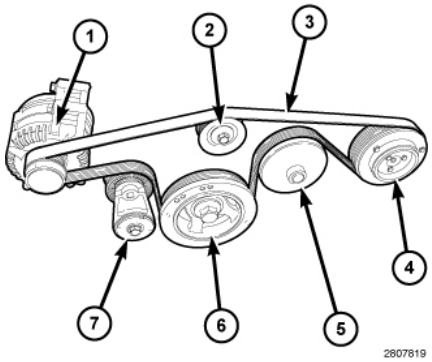
   - Twenty-two M6 bolts (3) to 12 N·m (106 in. lbs.).
   - Two M8 bolts (2) to 25 N·m (18 ft. lbs.).
   - Three M10 bolts (1) to 55 N·m (41 ft. lbs.)

8. Install the upper and lower oil pans (Refer to 09 - Engine/Lubrication/PAN, Oil - Installation)

9. Install the right and left cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Installation).

10. Install the crankshaft vibration damper (6) (Refer to 09 - Engine/Engine Block/DAMPER, Vibration - Installation)

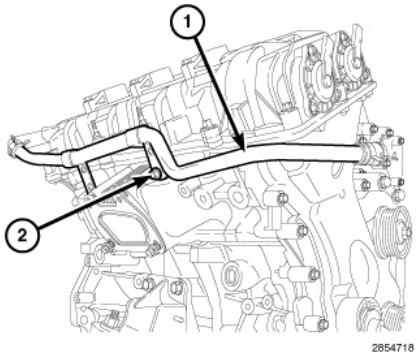
11. Install the accessory idler pulley (2) (Refer to 07 - Cooling/Accessory Drive/PULLEY, Idler - Installation)



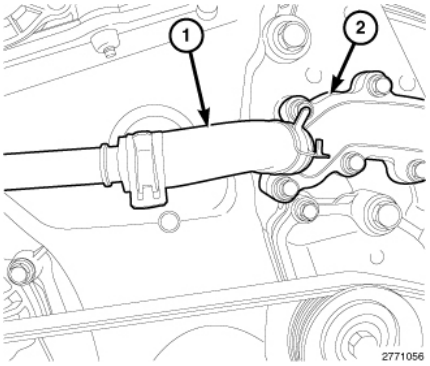
12. Install accessory drive belt tensioner (7) (Refer to 07 - Cooling/Accessory Drive/TENSIONER, Belt - Installation)

13. Install the accessory drive belt (3) (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Removal)

14. Install the heater core supply tube (1) with one bolt (2) tightened to 12 N·m (106 in. lbs.).

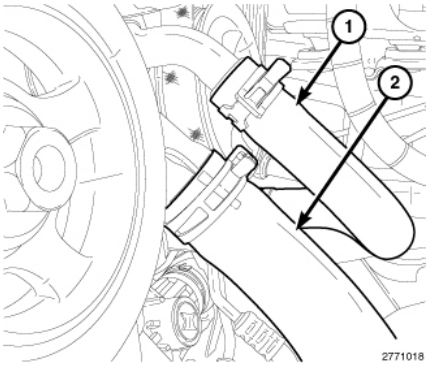


15. Install the heater core supply hose (1) to the coolant outlet housing (2).



16. Install the lower radiator hose (2) to the water pump housing.

17. Install the heater core return hose (1) to the water pump housing.



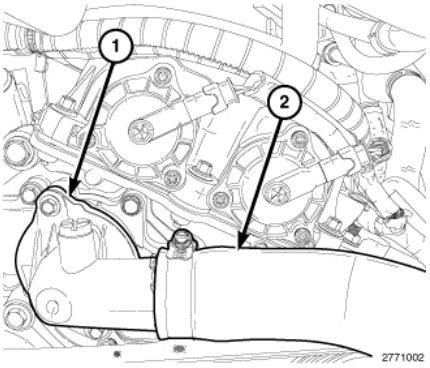
18. Install the thermostat housing (1) and upper radiator hose (2) (Refer to 07 - Cooling/Engine /THERMOSTAT - Removal)

19. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure)

20. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

21. Fill the cooling system (Refer to 07 - Cooling - Standard Procedure) .

22. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level (Refer to 07 - Cooling - Standard Procedure)

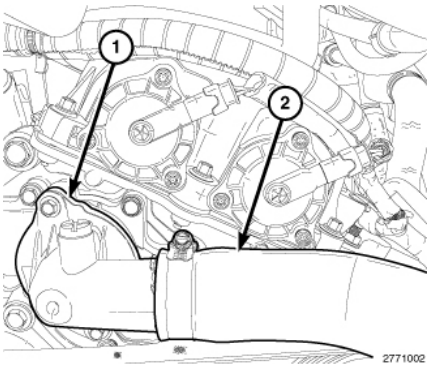


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

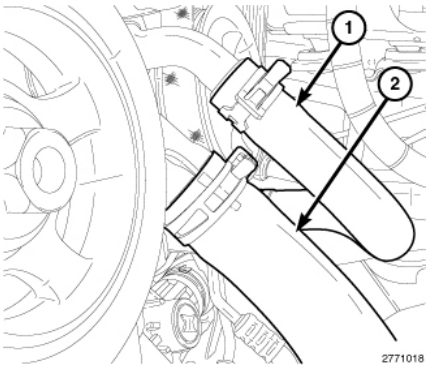
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

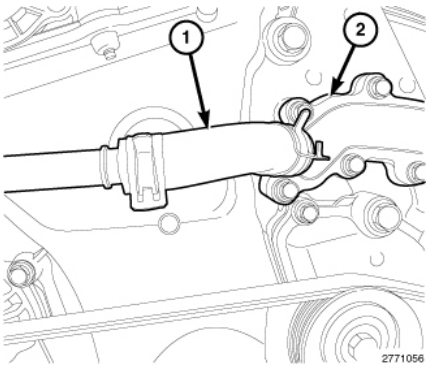
1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system (Refer to 07 - Cooling - Standard Procedure) .
3. Remove the upper radiator hose (2) and thermostat housing (1) (Refer to 07 - Cooling/Engine /THERMOSTAT - Removal)



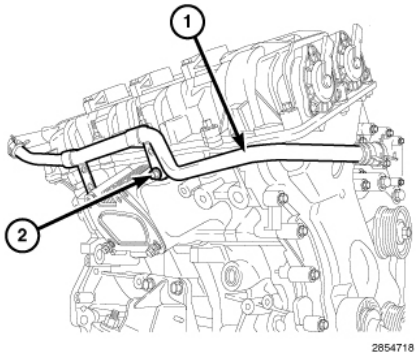
4. Remove the heater core return hose (1) from the water pump housing.
5. Remove the lower radiator hose (2) from the water pump housing.



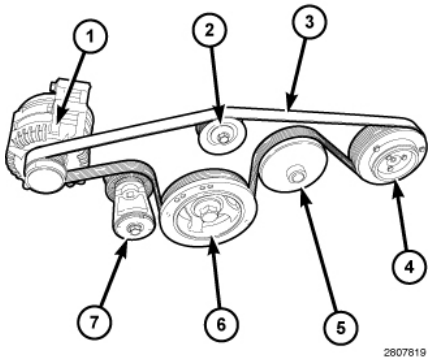
6. Remove the heater core supply hose (1) from the coolant outlet housing (2).



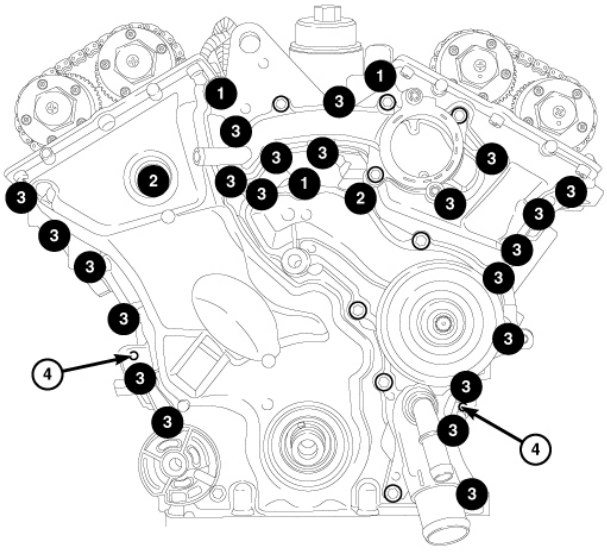
7. Remove the bolt (2) and reposition the heater core supply tube (1).



8. Remove the accessory drive belt (3) (Refer to 07 - Cooling/Accessory Drive/BELT, Serpentine - Removal)
9. Remove the accessory drive belt tensioner (7) (Refer to 07 - Cooling/Accessory Drive/TENSIONER, Belt - Removal) .
10. Remove the accessory idler pulley (2) (Refer to 07 - Cooling/Accessory Drive/PULLEY, Idler - Removal)
11. Remove the crankshaft vibration damper (6) (Refer to 09 - Engine/Engine Block/DAMPER, Vibration - Removal) .



12. Remove the right and left cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal).
13. Remove the upper and lower oil pans (Refer to 09 - Engine/Lubrication/PAN, Oil - Removal)

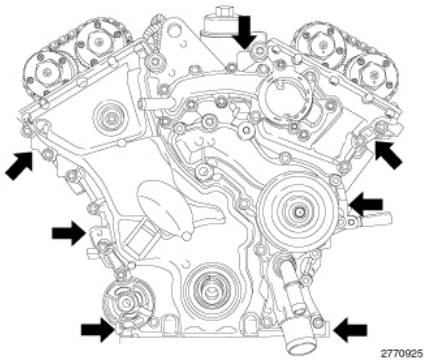


NOTE: It is not necessary to remove the water pump or the coolant outlet housing for engine timing cover removal.

14. Remove the following timing cover attaching bolts:

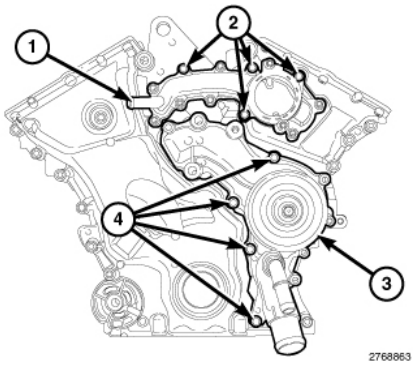
- Three M10 bolts (1)
- Two M8 bolts (2)
- Twenty-two M6 bolts (3)

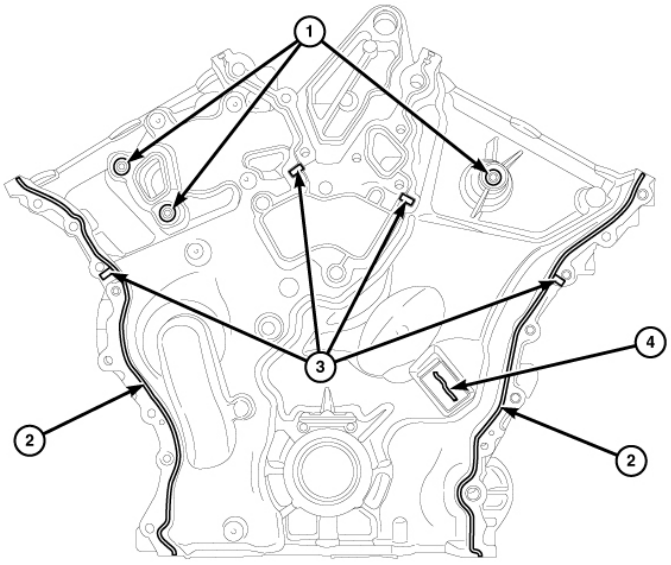
15. Using the seven indicated pry points, carefully remove the timing cover.



16. If required, remove the remaining four M6 bolts (2) and the coolant outlet housing (1) from the engine timing cover.

17. If required, remove the remaining four M6 bolts (4) and the water pump (3) from the engine timing cover.

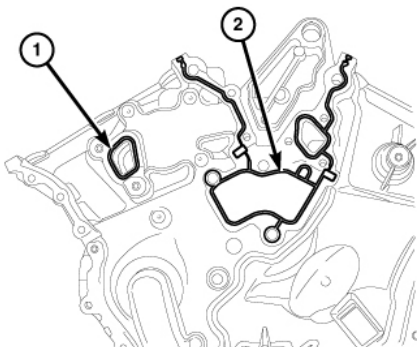




CAUTION: **Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.**

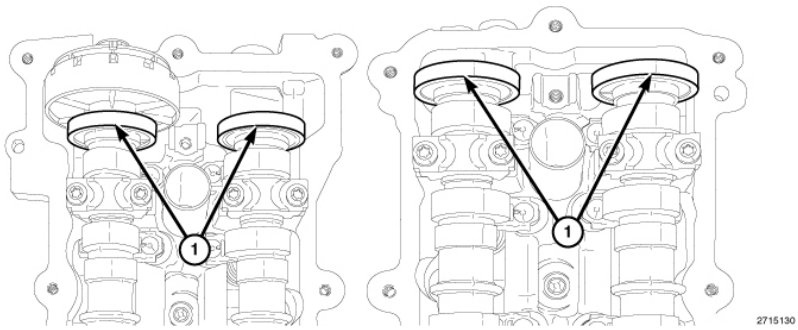
18. Remove all residual sealant from the timing chain cover, cylinder head and engine block mating surfaces (Refer to 09 - Engine - Standard Procedure)

19. Remove and discard the coolant outlet housing gasket (1) and the water pump gasket (2).



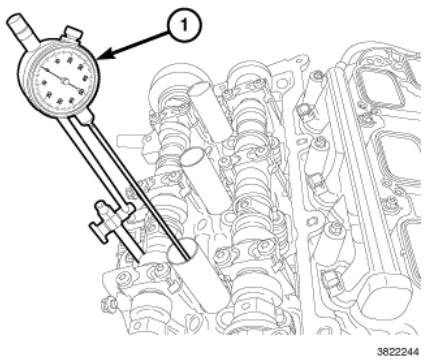
ENGINE TIMING VERIFICATION

Special Tools: Click to display a list of tools used in this procedure



CAUTION: **The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.**

Correct timing is critical for the NON free-wheeling designed, 3.6L engine. Engine timing can be verified by using the following procedures:

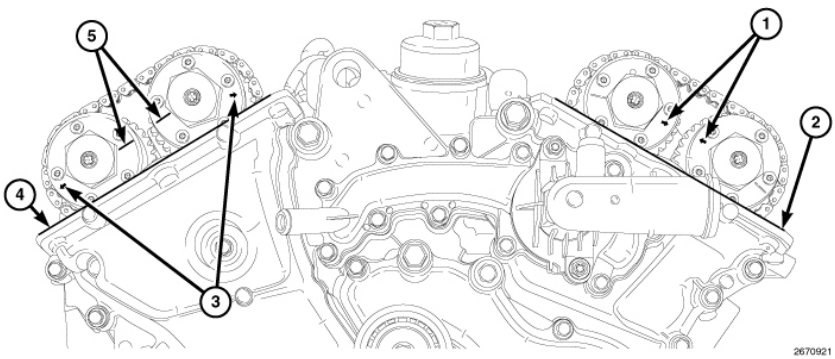


1. Remove the upper intake manifold and both cylinder head covers (Refer to 09 - Engine/Cylinder Head/COVER(S) , Cylinder Head - Removal)

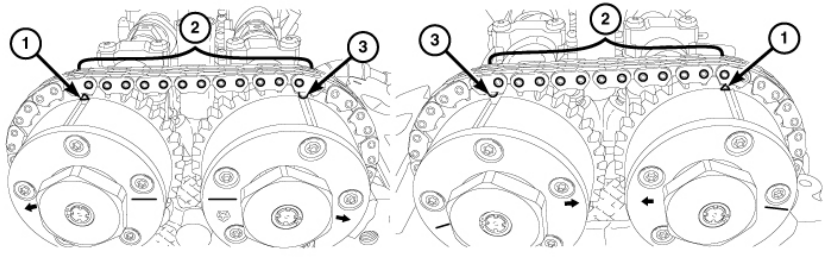
2. Remove the spark plugs (Refer to 08 - Electrical/8I - Ignition Control/SPARK PLUG - Removal) .

CAUTION: **When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

3. Mount Dial Indicator Set C-3339A (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to **ZERO**.



4. While maintaining this alignment, verify that the **ARROWS** (1) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (2) and that the right side cam phaser **ARROWS** (3) point away from each other and the **SCRIBE LINES** (5) are parallel to the cylinder head cover mounting surface (4).



2714685

NOTE:

The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

6. If the engine timing is not correct, proceed to Timing Chain and Sprockets for service procedures (Refer to 09 - Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal)

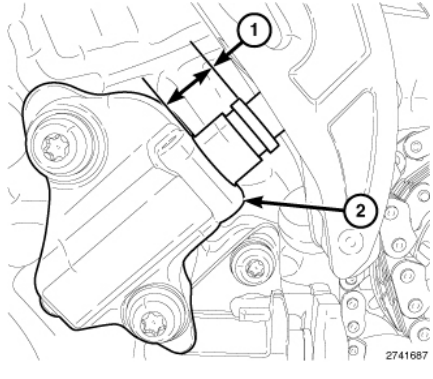
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

MEASURING TIMING CHAIN WEAR

1. Remove the engine timing chain cover (Refer to 09 - Engine/Valve Timing/COVER(S) , Engine Timing - Removal).

2. To determine if the timing chains are worn, rotate the crankshaft clockwise until maximum tensioner piston extension (1) is obtained on the RH cam chain tensioner (2). Measure the distance between the secondary timing chain tensioner housing and the step ledge on the tensioner piston (1). Piston extension (1) must be less than 16 mm (0.630 in.).

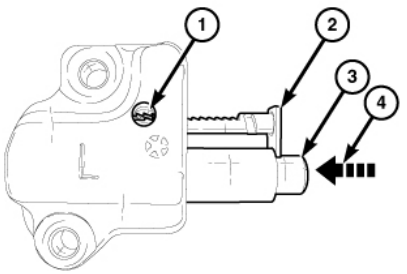
3. Piston extension greater than 16 mm (0.630 in.) indicates that all timing chains are worn and require replacement (Refer to 09 - Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal) .



RESETTING LEFT CAM CHAIN TENSIONER

Special Tools: Click to display a list of tools used in this procedure

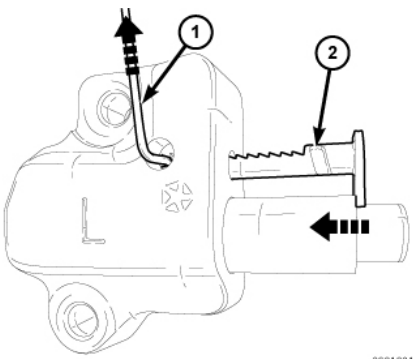
The left side can chain tensioner used on the 3.6L engine is equipped with a ratchet. The ratchet consists of a rack (2) and a pawl (1). In use, the rack (2) extends with the piston (3) from the tensioner body. The pawl (1) will not allow the rack (2) to retract back into the tensioner body. In order to reset the tensioner, the pawl (1) must be disengaged from the rack (2) so that the piston (3) and rack (2) can be pushed back (4) into the tensioner body.



2681778

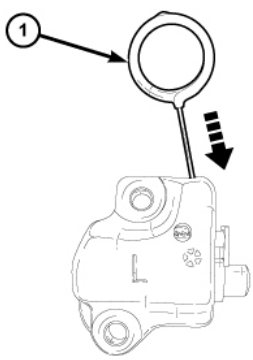
WITH ENGINE TIMING COVER REMOVED

NOTE: The slot (2) in the rack provides an anchor point for a pin that holds the rack in the retracted position.



2681831

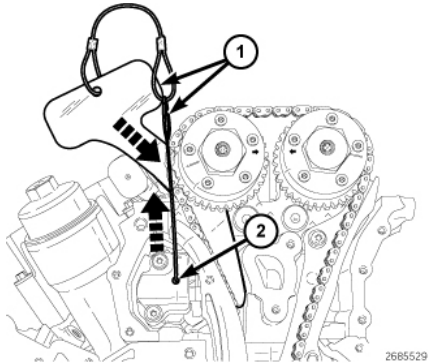
1. Using a suitable tool, such as an allen wrench (1), lift the pawl off of the rack.
2. While holding the pawl off of the rack, push the rack and the piston into the tensioner body.
3. When the slot is aligned with the hole in the tensioner body, insert Tensioner Pin 8514 (1) to hold the rack and piston in the retracted position.



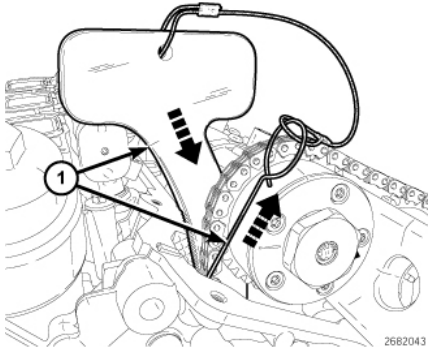
2681934

WITH ENGINE TIMING COVER INSTALLED

NOTE: Graphic shows timing cover removed for clarity.



1. Using Pin 10200-3 (2), lift the pawl off of the rack (3).



2. While holding the pawl off of the rack, push Holder, Timing Chain, Left Side 10200-1 (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder must remain in place during service to keep the rack and piston in the retracted position.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

STANDARD STARTING SYSTEM

When you press the Keyless Go button (KIN Button), a request is sent to RF-Hub via the private LIN. Once the RF-Hub receives the request from the KIN it then looks for the valid key via the Passive Entry Module (PEM) antennas. If the RF-Hub detects a valid key, then the RF-Hub sets the ignition position to START/CRANK. The BCM then turns the Ignition status to START/CRANK.

Then the BCM sends a command to turn the vehicle to the "RUN/CRANK" If conditions are correct to start, the PCM turn on the high side of the relay and holds the high side until the PCM turns off the signal allowing the engine to crank.

If the BCM is still in crank and the crank hold signal is true then the BCM turns on the Low side of the relay and the engine will start cranking.

Once the engine has started the PCM deactivates the double start over ride. The BCM will then deactivate the starter either when the engine starts or the maximum time has been reach for the tip start (10 sec for Gas and 25 sec for diesel).

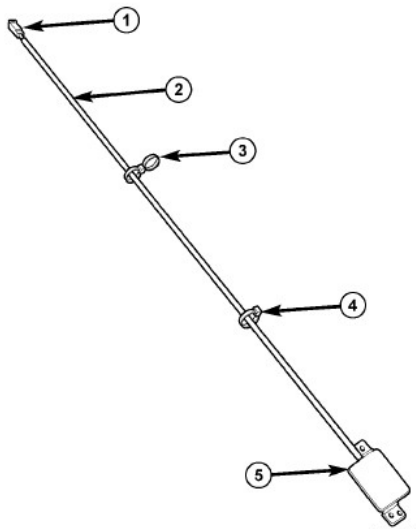
At the same time the engine starts the RF-Hub will put the ignition from "Crank" to "RUN" if the start type is “TIP Start” or the 2 second time expires or the engine controller indicates the vehicle is not in park or neutral

The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Remote Start Antenna Module Assembly consists of an electrical connection to the Radio Frequency (RF Hub) - RF Hub (1), a length of coaxial cable (2), two mounting clips (3) and (4), and a control module/antenna (5).

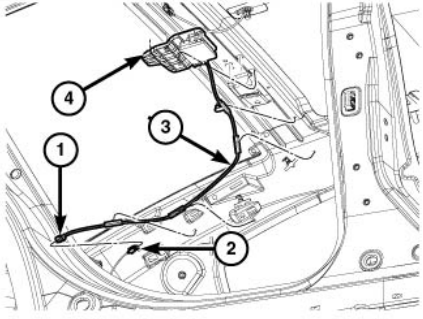


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Mount the remote start antenna (4) to the mounting bracket.
2. Install the antenna and mounting bracket into the structural support rib.
3. Install the remote start harness (3) to the driver side D-pillar.
4. Connect the remote start antenna (1) to the RF Hub module jumper wire (2) located on the D-pillar.
5. Install the headliner (Refer to 23 - Body/Interior/HEADLINER - Installation) .
6. Connect the negative battery cable.



3109755

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

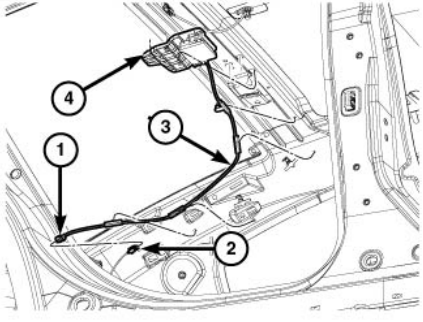
The remote start antenna is located on the roof structure rib above the rear windshield. The antenna interfaces with the Radio Frequency (RF Hub) module through a coaxial electrical cable and electrical connector. The antenna helps to amplify the signal for the Remote Keyless Entry (RKE) key FOBIK.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect the negative battery cable.
2. Remove the headliner (Refer to 23 - Body/Interior/HEADLINER - Removal) .
3. Disconnect the remote start antenna (1) from the RF Hub module jump wire (2) located on the driver side D-pillar..
4. Remove the remote start harness (3) from the D-pillar.
5. Gently pull down on the antenna mounting bracket to remove from the structural support rib.
6. Remove the remote start antenna from the mounting bracket.



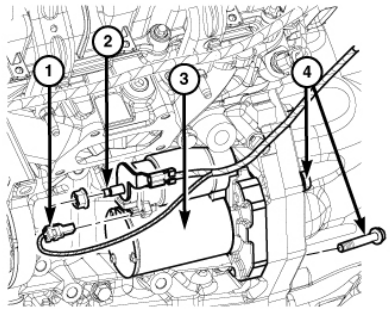
3109755

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

3.6L

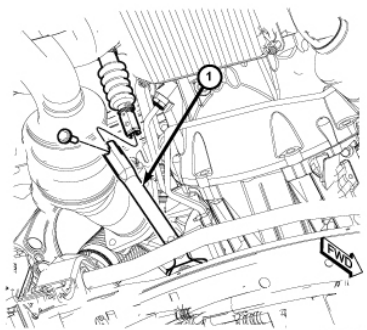
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the starter (3) inside the transmission.
2. Install the starter mounting bolts (4) and tighten to 54 N·m (40 ft. lbs.).
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten the nut to 11 N·m (97 in. lbs.).
5. Install the starter solenoid heat shield. Tighten the bolt to 30 N·m (22 ft. lbs.).



3074731

6. Install the steering gear lower intermidiate shaft (1). (Refer to 19 - Steering/Column/SHAFT, Intermediate - Installation) .
7. Remove the steering wheel holder.
8. Connect the negative battery cable and tighten nut to 11 N·m (97 in. lbs.).



3074430

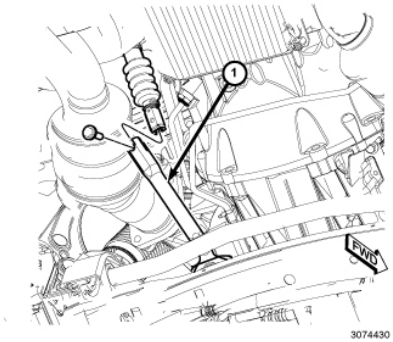
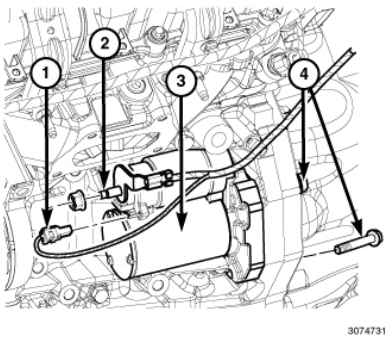
3.6L

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect and isolate the negative battery cable at the battery.
2. Secure the steering wheel.
3. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
4. Disconnect the steering gear intermidiate shaft (1). (Refer to 19 - Steering/Column/SHAFT, Intermediate - Removal) .



5. Remove the starter solenoid heat shield.
6. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
7. Remove the battery cable nut and battery cable from the solenoid stud (2).
8. Remove the starter mounting bolts (4), the electrical harness mounting bracket should remain in position.
9. Rotate and remove the starter assembly (3) from the transmission.



STANDARD PROCEDURE - JUMP STARTING

WARNING: **Review all safety precautions and warnings in the battery system section of the service manual.**

- **Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is ON. You can be hurt by the fan.**
- **Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transmission cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.**
- **Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin, or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.**
- **A battery generates hydrogen gas, which is flammable and explosive. Keep flame or spark away from the vent holes.**
- **Do not use a booster battery or any other booster source with an output that exceeds 12 Volts.**
- **The battery in this vehicle has a vent hose that should not be disconnected and should only be replaced with a battery of the same type (vented).**

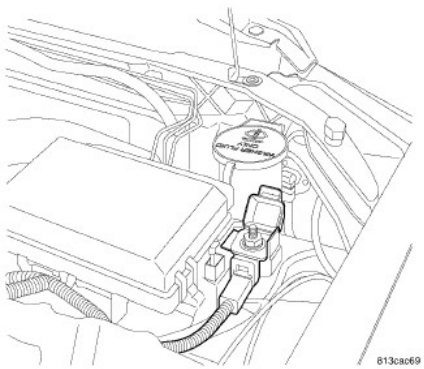
Failure to follow these instructions may result in serious or fatal injury.

CAUTION: **When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.**

NOTE: The battery is stored under an access cover in the trunk. Remote battery terminals are located in the engine compartment for jump starting.

TO JUMP START A DISABLED VEHICLE:

1. Wear eye protection and remove any metal jewelry, such as watchbands or bracelets, that might make an inadvertent electrical contact.
2. When boost is provided by a battery in another vehicle, park that vehicle within booster cable reach, but do not allow the vehicles to touch one another.
3. Set the parking brake, place the automatic transmission in PARK, and turn the ignition switch to the LOCK position on both vehicles.
4. Turn off the heater, radio, and all unnecessary electrical loads.



5. Connect one end of the jumper cable to the remote jump-start positive battery post (+) in the engine compartment. Connect the other end of the same cable to the positive terminal of the booster battery. Refer to the following illustration for jump-starting connections.
6. Connect the other cable, first to the negative terminal of the booster battery and then to the engine ground (-) of the vehicle with the discharged battery. Make sure you have a good contact on the engine ground. Refer to the following illustration for jump-starting connections.
7. Start the engine in the vehicle that has the booster battery. Let the engine idle a few minutes. Then, start the engine in the vehicle with the discharged battery.

NOTE: (Refer to 08 - Electrical/8F - Engine Systems/Battery System - Standard Procedure) if the ESP/BAS light (in the instrument cluster) remains on continuously after starting the engine of the vehicle with the discharged battery.

8. When removing the jumper cables, reverse the above sequence exactly. Be careful of the moving belts and fan.

WARNING:

- **You should not try to start your vehicle by pushing or towing.**
- **Do not connect the cable to the negative post of the discharged battery. The resulting electrical spark could cause the battery to explode.**
- **During cold weather when temperatures are below the freezing point, electrolyte in a discharged battery may freeze. Do not attempt jump-starting because the battery could rupture or explode. The battery temperature must be brought above the freezing point before attempting jump-start.**
- **Failure to follow these instructions may result in serious or fatal injury.**

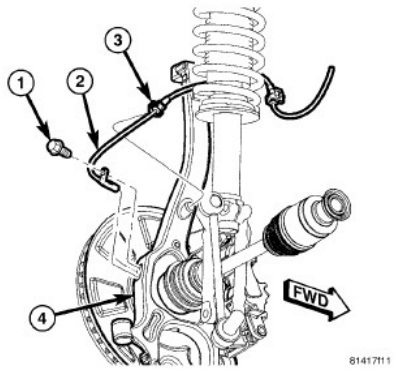
ALL-WHEEL-DRIVE

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install wheel speed sensor (2) head into knuckle (4) and install mounting screw (1). Tighten screw to 11 N·m (97 in. lbs.).
2. Attach wheel speed sensor cable and a **NEW** routing clip (3) to knuckle (4).



3. Attach the sensor cable into the routing clip at the brake hose bracket.
4. Connect sensor connector (1) to the body. When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Install inner wheel liner
6. Lower vehicle.
7. Perform Verification Test and clear any faults (Refer to 28 - DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure).

Fuel Delivery: | **Fuel:**

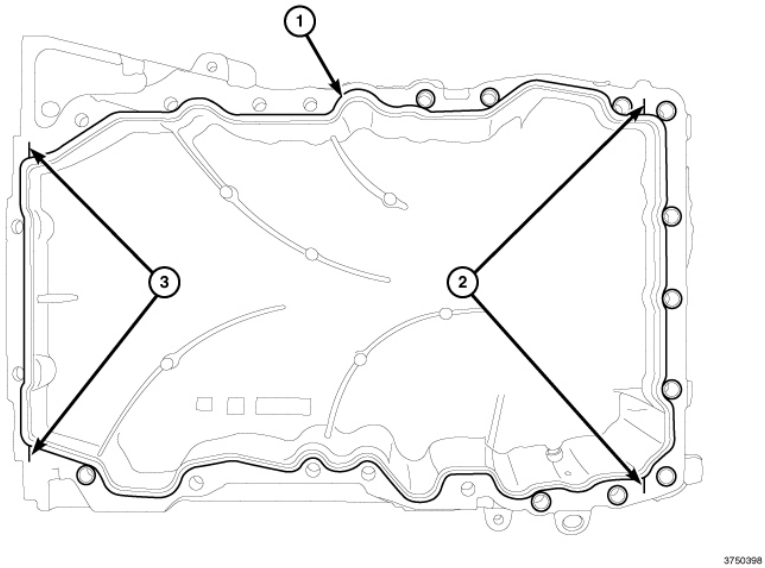
AWD

Labor Operations: Click to display a list of Labor Operations associated with this procedure



CAUTION: **Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.**

CAUTION: **Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.**

CAUTION: **Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.**

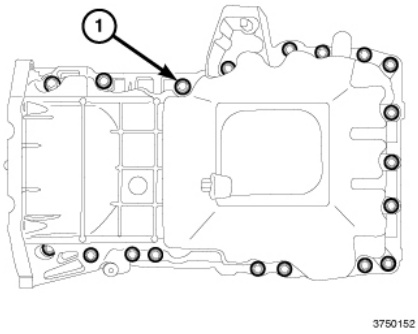
1. Clean the oil pan, timing chain cover, rear seal retainer and engine block mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the oil pan as shown in the following locations:

   - Oil pan to engine block flange (1)
   - Two timing cover to engine block T-joints (2)
   - Two rear seal retainer to engine block T-joints (3)

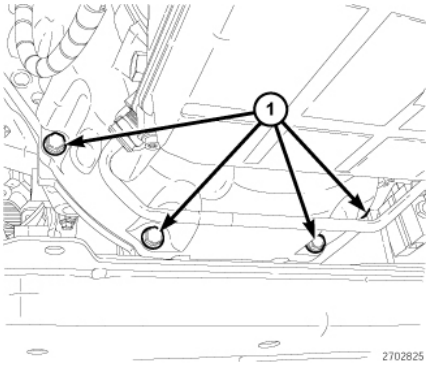
   CAUTION: **Make sure that the rear face of the oil pan is flush to the transmission bell housing before tightening any of the oil pan mounting bolts. A gap between the oil pan and the transmission could crack the oil pan or transmission casting.**

3. Install the oil pan to the engine block making sure the oil pan is flush to the transmission bell housing. Secure the oil pan to the engine block with nineteen M8

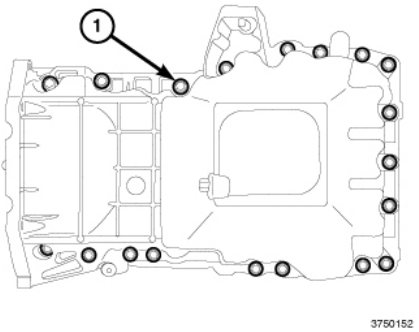
oil pan mounting bolts (1) finger tight.



4. Install the four transmission to the engine oil pan bolts (1) and tighten to 55 N·m (41 ft. lbs.).

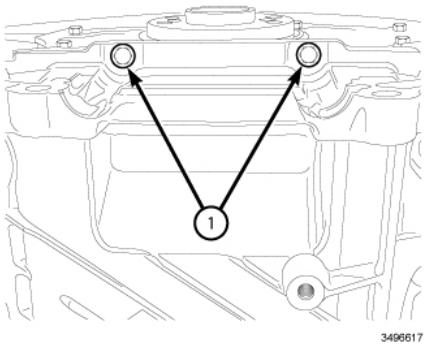


5. Tighten the nineteen previously installed M8 oil pan mounting bolts (1) to 25 N·m (18 ft. lbs.).

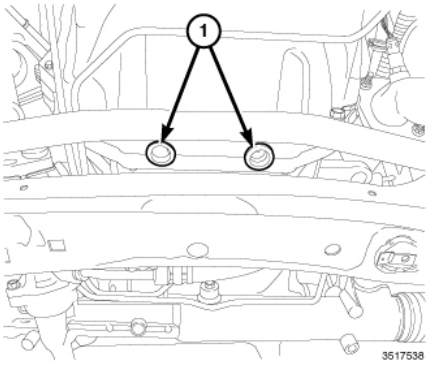


NOTE: Shown with transmission removed for clarity.

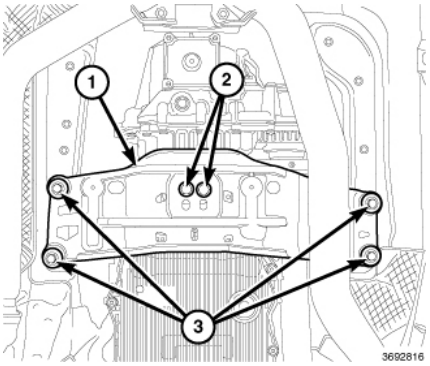
6. Install the two M6 bolts (1) to the rear oil seal retainer flange and tighten to 10 N·m (89 in. lbs.).



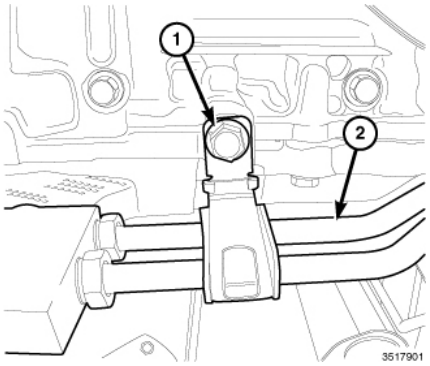
7. Install the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

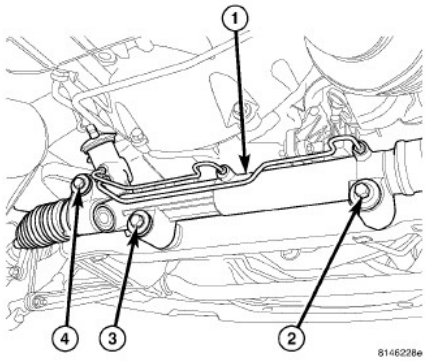


8. Lower the rear of the engine and install the two bolts (2) to the rear engine mount isolator. Tighten the bolts to 65 N·m (48 ft. lbs.).



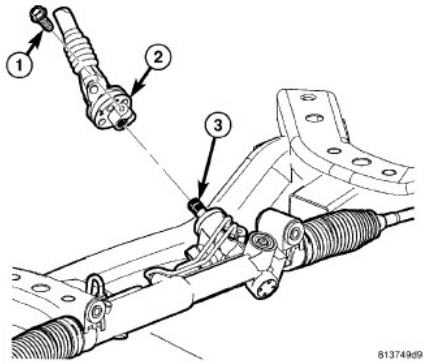
9. Install the transmission cooling lines (2) and tighten the bolt (1) to 12 N·m (106 in. lbs.).





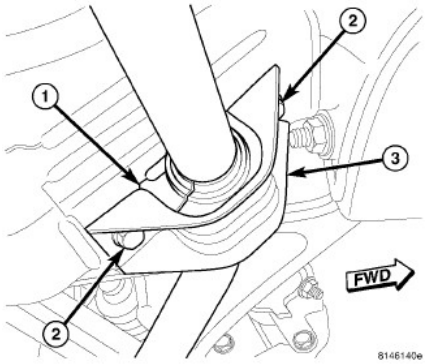
10. Lift the steering gear (1) into the mounted position and install the steering gear lower mounting bolts (2 and 3). Install the upper mounting bolt (4) and nut. Tighten all bolts to 102 N·m (75 ft. lbs.).

    Align splines and install the lower intermediate shaft coupling (2) to the steering gear shaft (3). Install a **NEW** pinch bolt and tighten to 45 N·m (33 ft. lbs.).



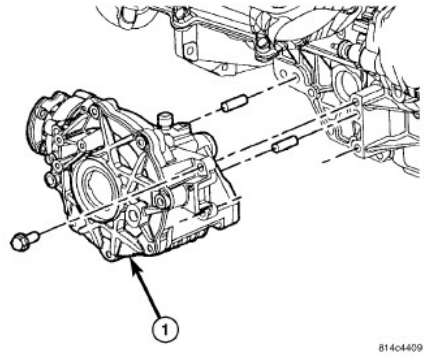
11. Raise the stabilizer bar to the engine cradle, placing bushings (1) into the mounted position.

12. Install the bolts (2) securing each stabilizer bar isolator retainer (3) to the cradle. Tighten the bolts to 60 N·m (44 ft. lbs.).



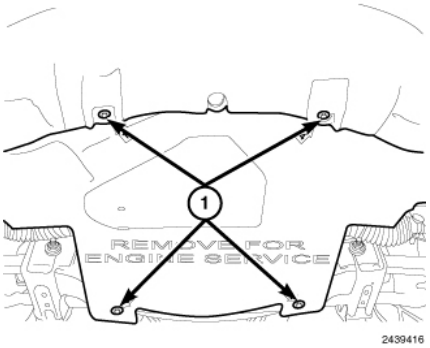
13. Install the front axle assembly (1) with propeller shaft, intermediate shaft, halfshafts, wheels, tires and exhaust pipe (Refer to 03 - Differential and Driveline/Front Axle - Installation) .

14. If required, fill the front axle with the specified type and amount of gear lubricant.



15. Position the belly pan and install the retainers (1).

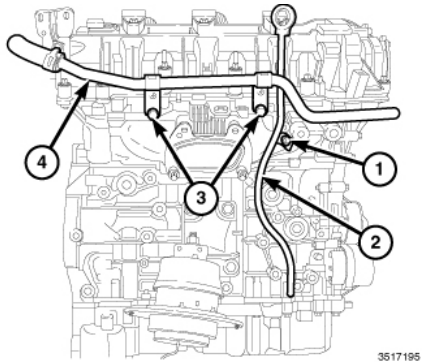
16. Lower the vehicle.



17. Install the oil level indicator (2) with bolt (1) tightened to 12 N·m (106 in. lbs.).

18. Position the heater core inlet tube (4) and install two bolts (3) tightened to 12 N·m (106 in. lbs.).

19. Fill the crankcase with the specified type and amount of engine oil (Refer to 04 - Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications) .



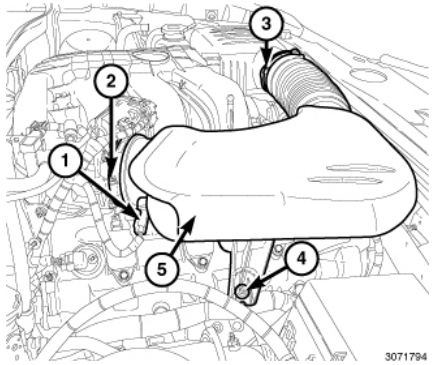
20. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.

21. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).

22. Tighten the clamp at the air cleaner housing (3) to 5 N·m (44 in. lbs.).

23. Tighten the clamp (2) at the throttle body to 5 N·m (44 in. lbs.).

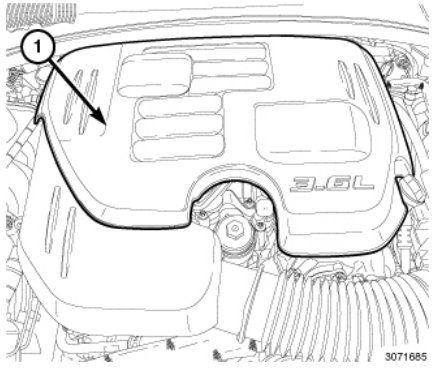
24. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).



25. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

26. Connect the negative battery cable and tighten nut to 5 N·m (45 in. lbs.).

27. Start and run the engine until it reaches normal operating temperature and check for leaks.

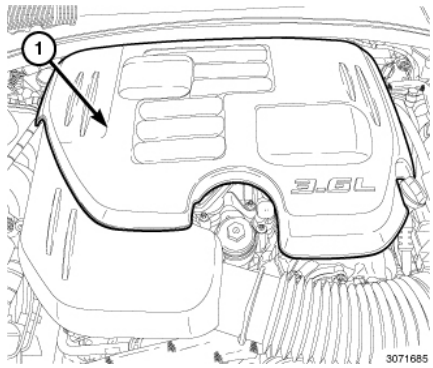


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

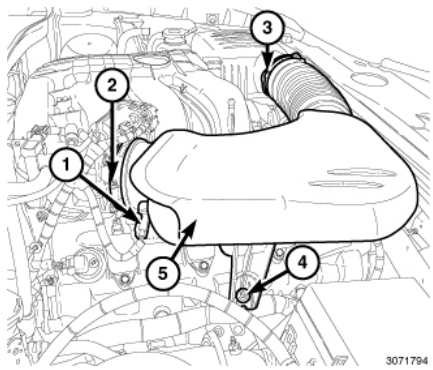
AWD

Labor Operations: Click to display a list of Labor Operations associated with this procedure

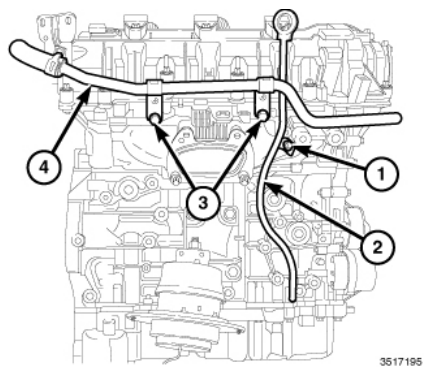
1. Disconnect and isolate the negative battery cable.
2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).



3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

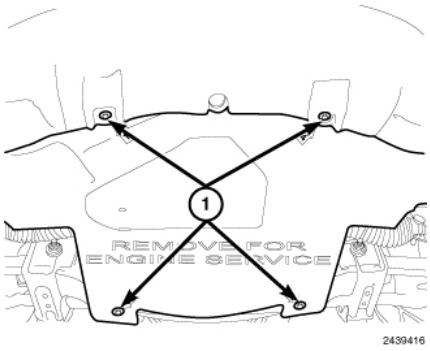


8. Remove two bolts (3) from the heater core inlet tube (4) and reposition the tube.
9. Remove the bolt (1) and remove the oil level indicator (2).

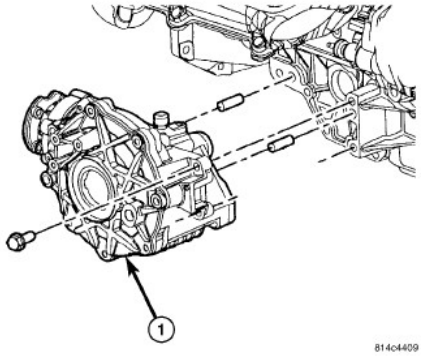


10. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
11. Remove the belly pan retainers (1) and remove the belly pan.

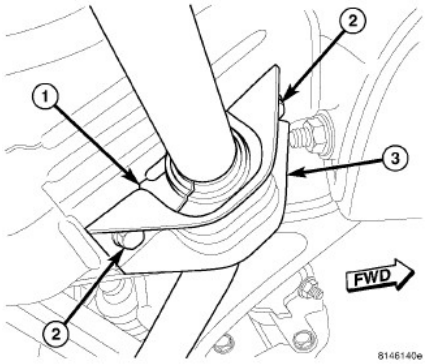
12. Drain the engine oil (Refer to 09 - Engine/Lubrication/OIL - Standard Procedure) .



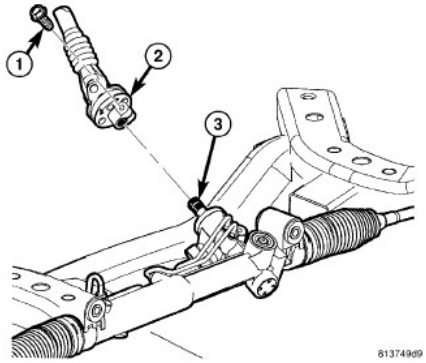
13. Remove the front axle assembly (1) (Refer to 03 - Differential and Driveline/Front Axle - Removal) .



14. Remove the front stabilizer bar with isolators and retainers (Refer to 02 - Front Suspension/Front/STABILIZER BAR, Front - Removal) .

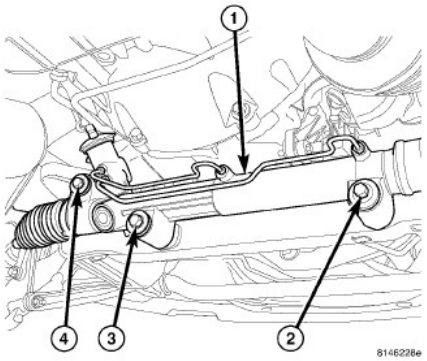


15. Remove the lower intermediate shaft coupling pinch bolt (1) from the lower intermediate shaft (2). Separate the lower intermediate shaft (2) from the steering gear shaft (3).

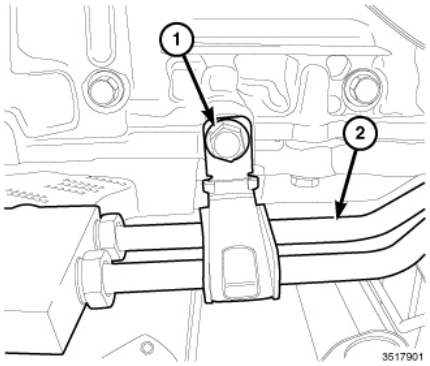


16. Remove the steering gear upper mounting bolt (4) and nut.

17. Remove the steering gear lower mounting bolts (2 and 3) and reposition the steering gear (1).

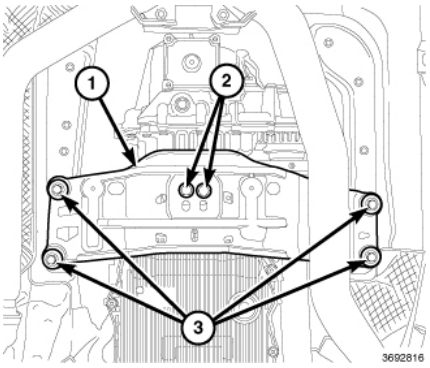


18. Remove the bolt (1) and reposition the transmission cooling lines (2).

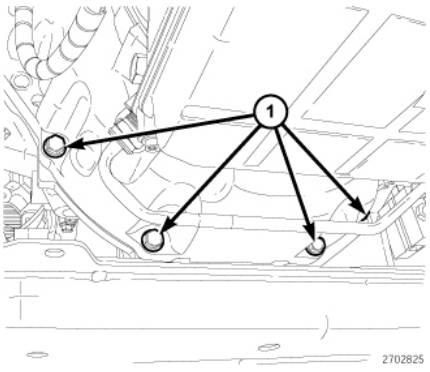


19. Remove the two bolts (2) from the rear engine mount isolator.

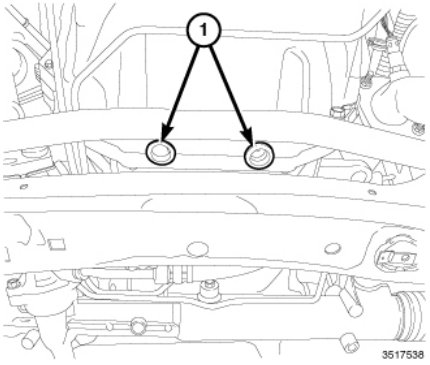
20. Using a suitable jack stand and a block of wood positioned under the transfer case, raise the rear of the engine.



21. Remove the four transmission to the engine oil pan bolts (1).



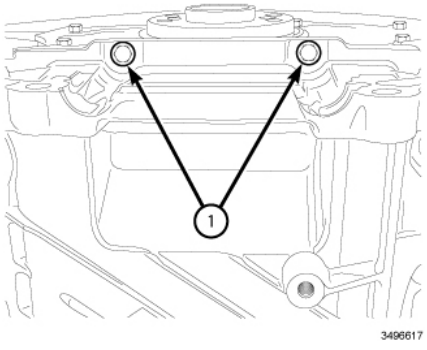
22. Remove the two rubber plugs (1) covering the rear oil seal retainer flange bolts.



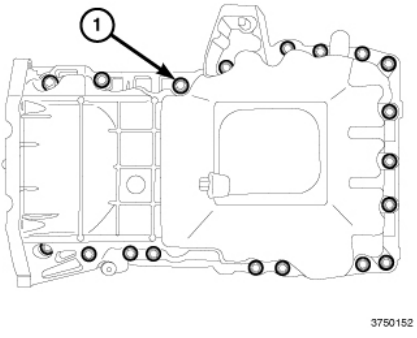
NOTE: Shown with transmission removed for clarity.

CAUTION: **There are two hidden M6 bolts that must be removed from the rear of the upper oil pan flange. If these bolts are not removed, the rear oil seal retainer flange will be severely damaged.**

23. Remove two M6 bolts (1) from the rear oil seal retainer flange.

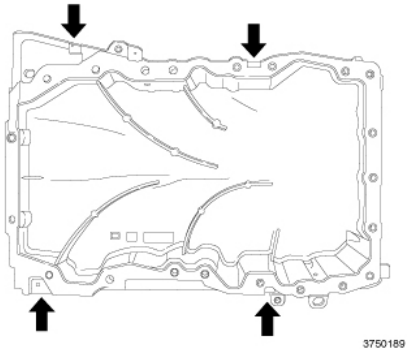


24. Remove nineteen M8 oil pan mounting bolts (1).



25. Using the four indicated pry points, carefully remove the oil pan.

26. Remove all residual sealant from the oil pan, timing chain cover, rear seal retainer and engine block mating surfaces (Refer to 09 - Engine/Lubrication/PAN, Oil - Cleaning) .



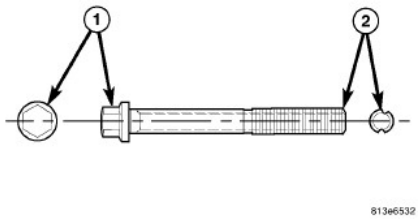
.

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE:

If installing a lower control arm engine cradle bolt that is a wheel alignment adjustment bolt (1) (identifying lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt, (Refer to 02 - Front Suspension/Wheel Alignment - Standard Procedure) .

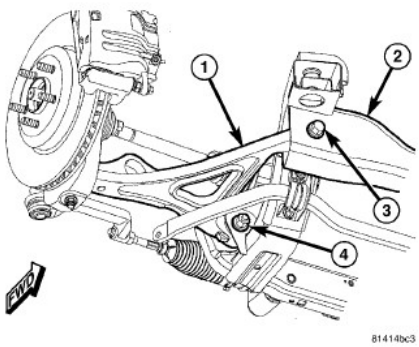


1. Slide lower control arm (1) into position in engine cradle (2) and place ball joint stem into mounting hole in knuckle.

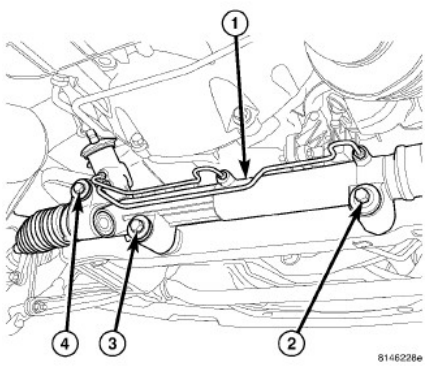
NOTE:

When installing lower control arm engine cradle bolts, it important to note that the forward bolt is installed front-to-rear and the rearward bolt is installed rear-to-front.

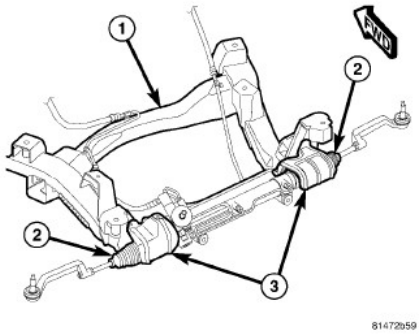
2. Install lower control arm mounting bolts and nuts (3 and 4). **Do not tighten bolts at this time.**



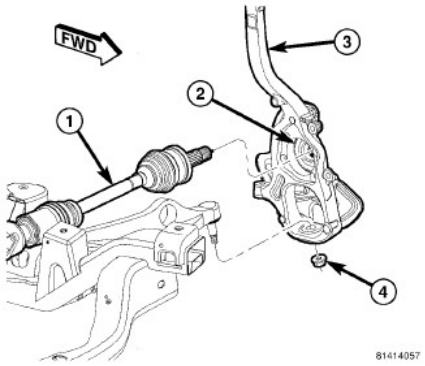
3. Raise steering gear to mounted position and install lower mounting bolts (2 and 3). Install upper mounting bolt (4) and nut. Tighten all mounting bolts to 122 N·m (90 ft. lbs.).



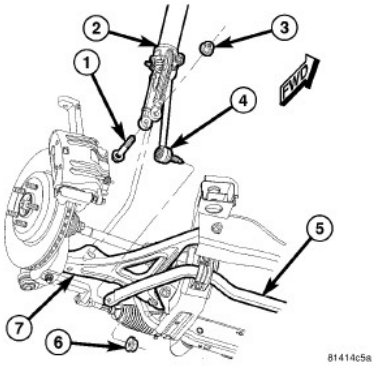
4. Install heat shields (3) above both inner tie rod bellows (2). Tighten mounting screws to 7 N·m (62 in. lbs.).



5. Pull downward on control arm and guide ball joint stud into knuckle (3). Install NEW nut (4) on ball joint stud. Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn).



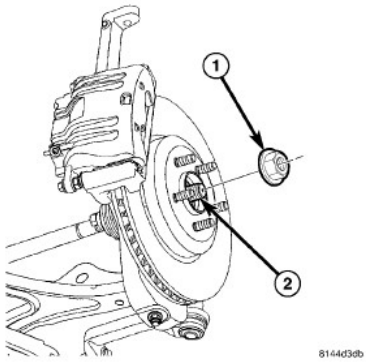
6. Align shock clevis bracket (2) with lower control arm (7) bushing and install mounting bolt (1) and nut (3). **Do not tighten nut at this time.**



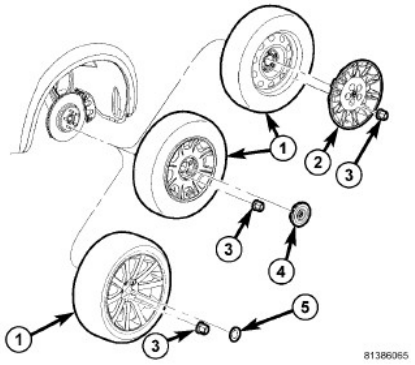
NOTE:

Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

7. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N·m (157 ft. lbs.).

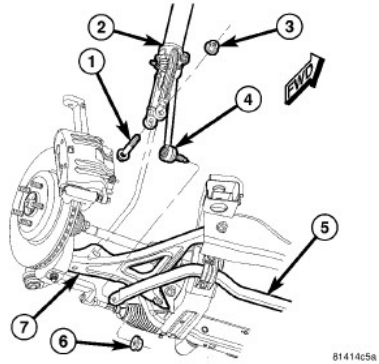


8. Install tire and wheel assembly (1) (Refer to 22 - Tires and Wheels - Installation) .
9. Lower vehicle.
10. Position vehicle on an alignment rack/drive-on lift.



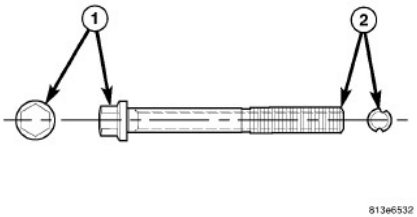
NOTE: When tightening lower shock clevis mounting bolt, do not attempt rotating bolt. Bolt shaft is serrated. Turn nut only.

11. Tighten lower shock clevis bracket bolt nut (3) to 170 N·m (125 ft. lbs.).
12. Perform wheel alignment. (Refer to 02 - Front Suspension/Wheel Alignment - Standard Procedure)



CAUTION: **If lower control arm engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten nut. Do not rotate bolt or damage to cradle will occur.**

13. Once camber is found to be within specifications, tighten lower control arm cradle bolt nuts to 176 N·m (130 ft. lbs.) while holding the bolts stationary.

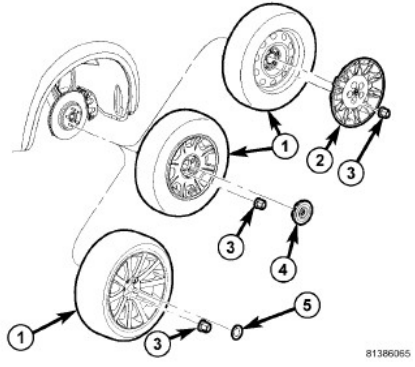


14. Install belly pan (Refer to 13 - Frame and Bumpers/Under Body Protection/BELLY PAN - Installation)

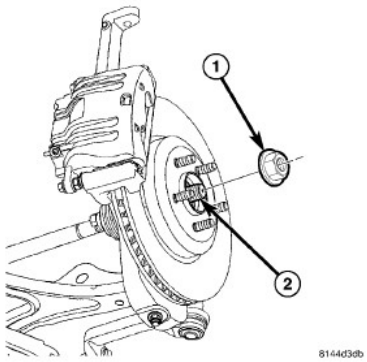
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

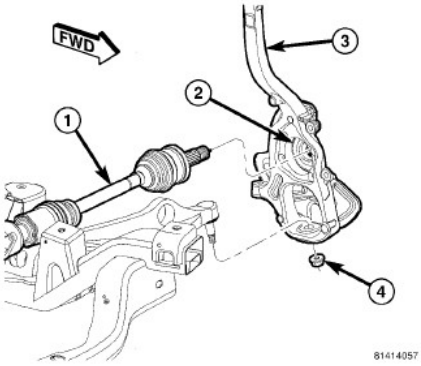
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure



1. Raise and support vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the axle half shaft (2).
4. Remove belly pan (Refer to 13 - Frame and Bumpers/Under Body Protection/BELLY PAN - Removal)

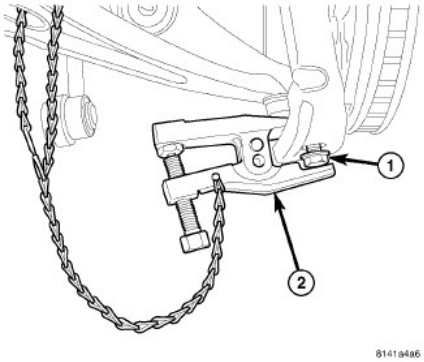


5. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**



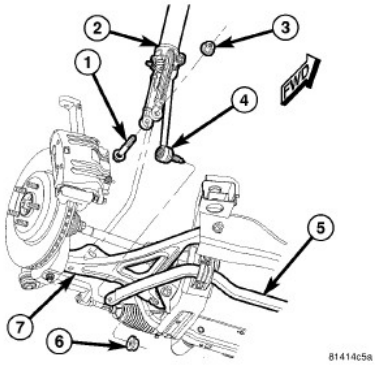
CAUTION: **In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool , into place past seal boot.**

6. Using Puller (2), Special Tool 9360 , separate ball joint stud from knuckle.
7. Remove tool.
8. Remove nut (1) from end of ball joint stud.

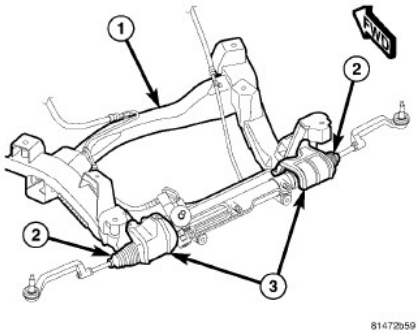


9. Back off nut (3) from bolt (1) attaching shock clevis bracket (2) to lower control arm (7) until it is flush with end of bolt.
10. Using a brass drift punch, tap the bolt out of the clevis bracket until bolt serrations clear bracket.

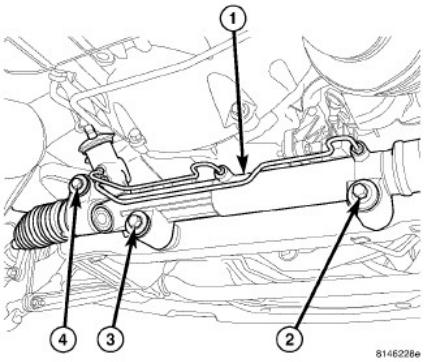
11. Remove nut (3) and bolt (1) for clevis bracket and control arm.



12. Remove mounting screws, then heat shields (3) above both inner tie rod bellows (2).



CAUTION: **While steering gear bolts are removed, it important to avoid putting downward force on steering gear.**

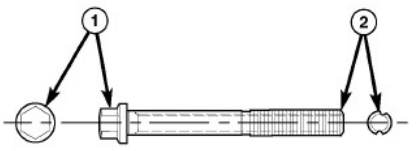


13. Remove steering gear mounting bolts as listed:

    a. Left side arm - Remove bolts (3) and (4). Loosen, but do not remove, bolt (2). It is important leave bolt (2) installed to avoid dropping gear too far, putting excessive force on steering coupling.

    b. Right side arm - Remove bolts (2) and (3). Loosen, but do not remove, bolt (4). It is important to leave bolt (4) installed to avoid dropping gear too far, putting excessive force on steering coupling.

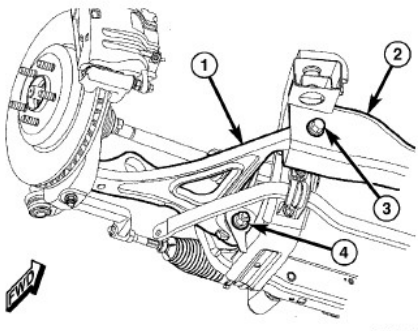
CAUTION: **If the lower control arm bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in engine cradle for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.**



14. Remove bolt (3) and nut securing forward end of lower control arm (1) to engine cradle (2). If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding bolt stationary with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in engine cradle for reassembly purposes.

15. Remove bolt and nut (4) securing rearward end of lower control arm (1) to engine cradle (2). If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding bolt stationary with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in engine cradle for reassembly purposes.

16. Slide lower control arm (1) from engine cradle (2) and knuckle, and remove from vehicle.



INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

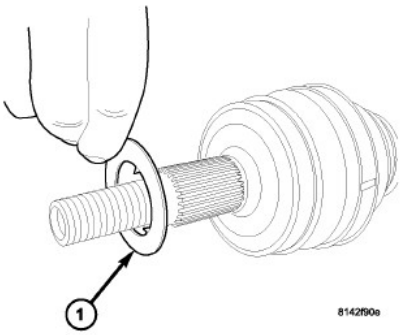
1. If hub and bearing and dust shield needs to be installed on knuckle, perform following:

   a. Slide shield onto rear of hub and bearing.

   b. Slide hub and bearing into knuckle, lining up mounting holes in hub and bearing with those in shield and knuckle

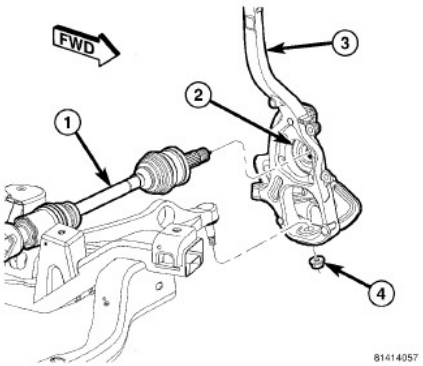
   c. Install four bolts (3) fastening hub and bearing in place. Tighten mounting bolts to 68 N·m (50 ft. lbs.).

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.



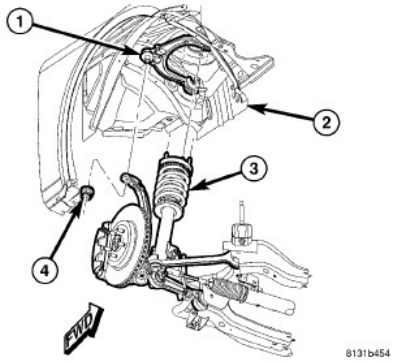
2. Place knuckle (3) over lower ball joint stud and guide hub and bearing (2) onto axle half shaft (1).

3. Start NEW nut (4) on lower ball joint stud. **Do not tighten at this time.**



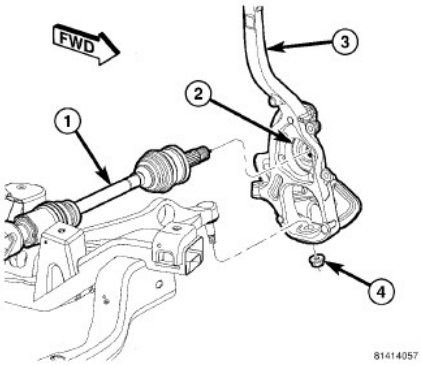
CAUTION: **It is important to tighten nut as described in following step to avoid damaging ball stud joint.**

4. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N·m + 90° turn (35 ft. lbs. + 90° turn).



CAUTION: **It is important to tighten nut as described in following step to avoid damaging ball stud joint.**

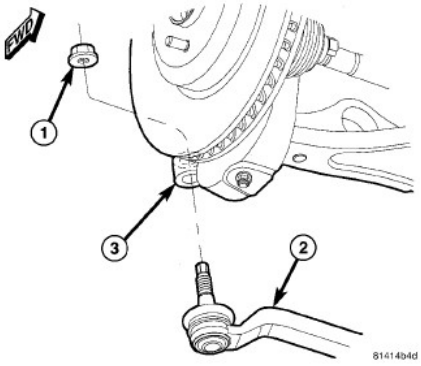
5. Tighten lower ball joint nut (4) by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn).



CAUTION: **It is important to tighten nut as described in following step to avoid damaging ball stud joint.**

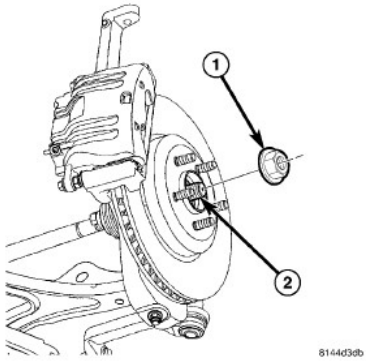
6. Place outer tie rod stud through hole in knuckle (3) and install nut (1). Tighten nut by holding stud with a wrench while turning nut with another wrench. Tighten nut using crow foot wrench on torque wrench to 35 N·m + 90° turn (26 ft. lbs. + 90° turn).

7. Install brake rotor, then disc brake caliper and adapter assembly (Refer to 05 - Brakes/Hydraulic/Mechanical/ROTOR, Brake - Installation) .



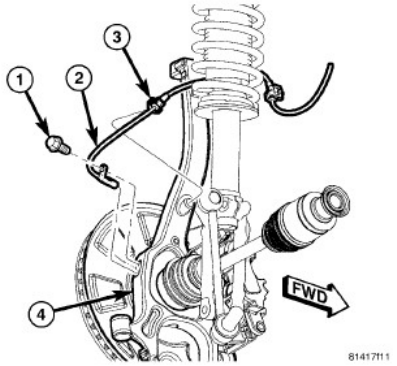
NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

8. Install hub nut (1) on end of axle half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N·m (157 ft. lbs.).



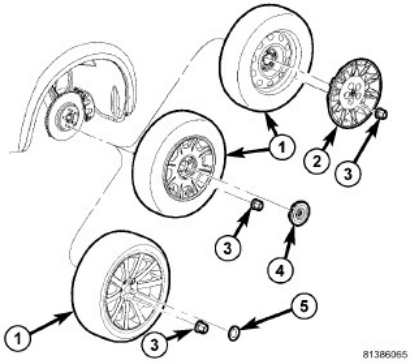
9. Install wheel speed sensor (2) head into knuckle (4) and install mounting screw (1). Tighten screw to 11 N·m (95 in. lbs.).

10. Attach wheel speed sensor cable routing clip (3) at knuckle (4).



11. Install tire and wheel assembly (1) (Refer to 22 - Tires and Wheels - Installation) .

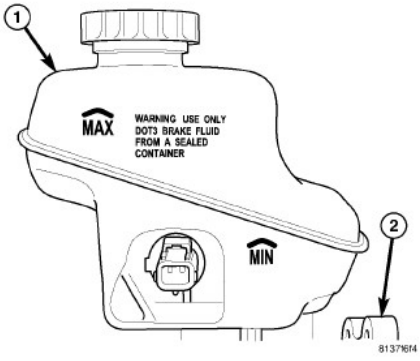
12. Lower vehicle.



13. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

14. Check and adjust brake fluid level in reservoir (1) as necessary.

15. Perform wheel alignment (Refer to 02 - Front Suspension/Wheel Alignment - Standard Procedure) .



Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

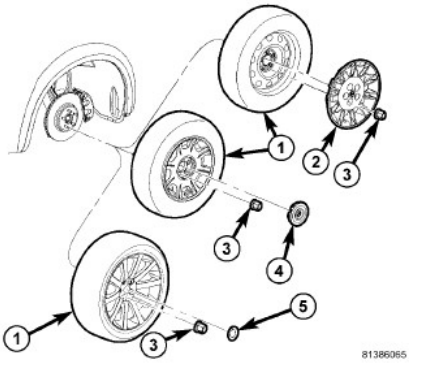
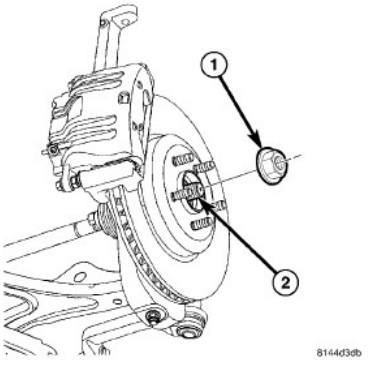
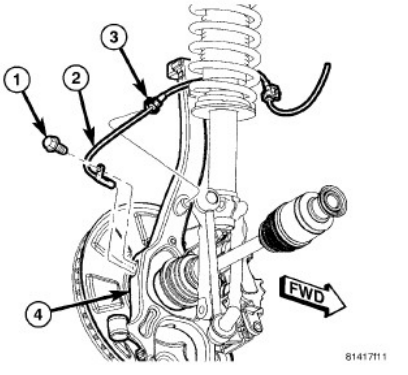
1. Raise and support vehicle. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure)
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).



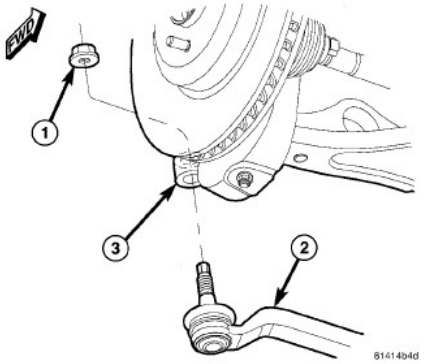
3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from axle half shaft (2).



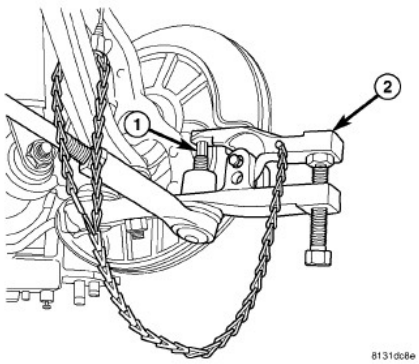
4. Remove clip (3) fastening wheel speed sensor (2) to knuckle (4).
5. Remove screw (1) fastening wheel speed sensor (2) to knuckle (4). Pull sensor head (4) out of knuckle.
6. Access and remove front brake rotor. (Refer to 05 - Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal)



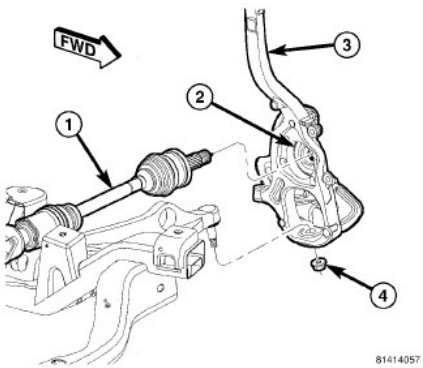
7. Remove nut (1) from outer tie rod end (2) stud.



8. Using Puller (2), Special Tool 9360 , separate tie rod stud (1) from knuckle.



9. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

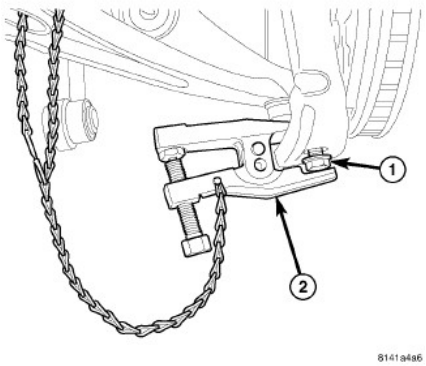


CAUTION: **In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool , into place past seal boot.**

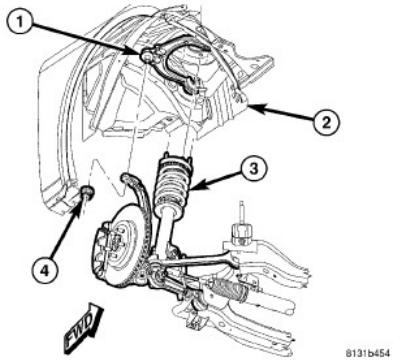
10. Using Puller (2), Special Tool 9360 , separate ball joint stud from knuckle.

11. Remove tool.

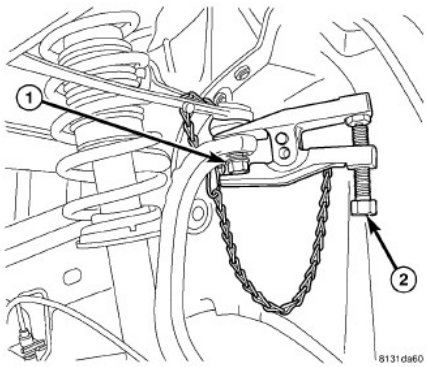
12. Remove nut (1) from end of ball joint stud.



13. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**



CAUTION: **In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool , into place past seal boot.**

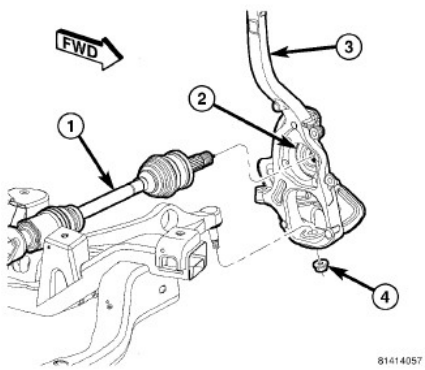


14. Using Puller (2), Special Tool 9360 , separate upper ball joint stud (1) from knuckle.

15. Remove tool.

16. Remove nut (1) from end of upper ball joint stud.

17. Slide knuckle (3) off half shaft (1) and remove from vehicle.



18. If hub and bearing and dust shield need to be removed:

    a. Remove four bolts (3) fastening hub and bearing (2) to knuckle.

    b. Slide hub and bearing out of knuckle along with shield.

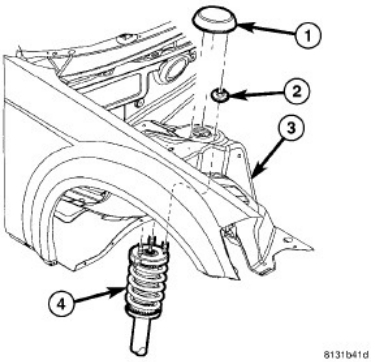
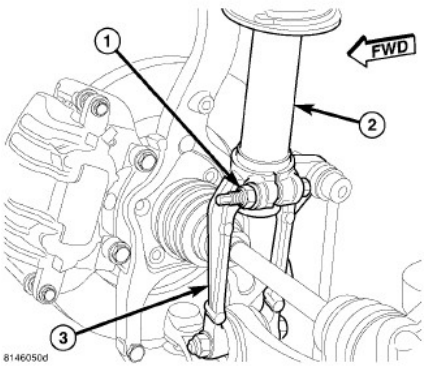
ALL-WHEEL-DRIVE

Labor Operations: Click to display a list of Labor Operations associated with this procedure

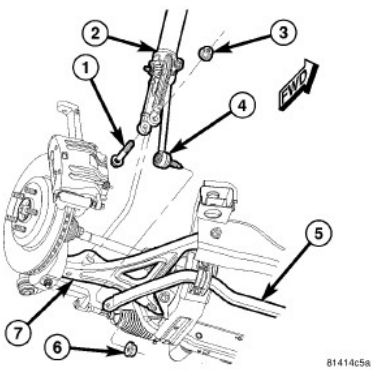
1. Guide shock assembly up into shock tower (3) and into mounting holes.
2. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N·m (20 ft. lbs.).
3. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.



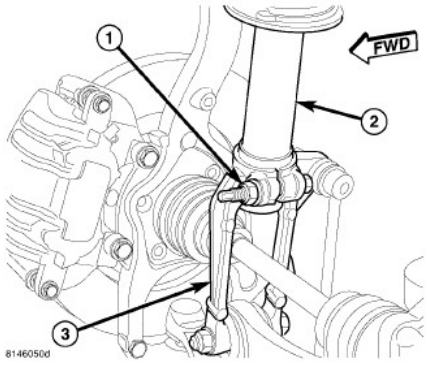
4. Raise and support vehicle.
5. Pull lower end of shock assembly outward, then slide clevis bracket (3) onto lower end. Slide clevis bracket onto shock assembly until bracket contacts collar on shock housing (2).
6. Install pinch bolt and nut (1) fastening clevis bracket (3) to bottom of shock assembly (2). Install pinch bolt from rear. **Do not tighten at this time.**



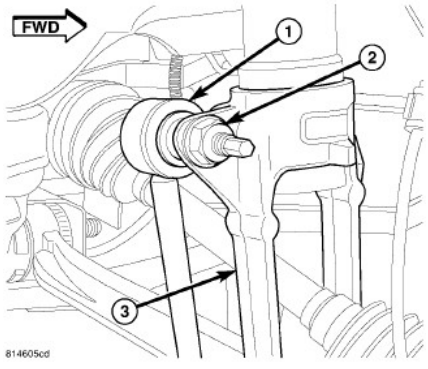
7. Slide clevis bracket (2) over bushing mounted in lower control arm (7).
8. Install bolt (1) and nut (3) attaching shock clevis bracket (2) to lower control arm (7). **Do not tighten at this time.**



9. Tighten pinch bolt (1) attaching clevis bracket to shock assembly to 61 N·m (45 ft. lbs.).

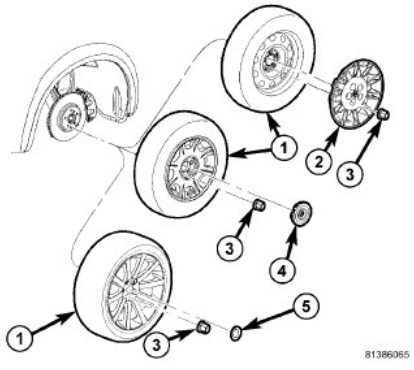


10. Slide stabilizer link ball joint stem into clevis bracket. Install nut (2) fastening link to clevis bracket (3). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 100 N·m (74 ft. lbs.).



11. Install tire and wheel assembly (1) (Refer to 22 - Tires and Wheels - Installation) .

12. Lower vehicle.



NOTE: When tightening lower shock clevis mounting bolt, do not attempt rotating bolt. Bolt shaft is serrated. Turn nut only.

13. Tighten lower shock clevis bracket bolt nut (3) to 174 N·m (128 ft. lbs.).

ALL-WHEEL-DRIVE

Labor Operations: Click to display a list of Labor Operations associated with this procedure

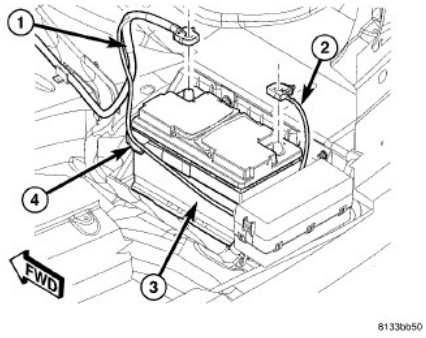
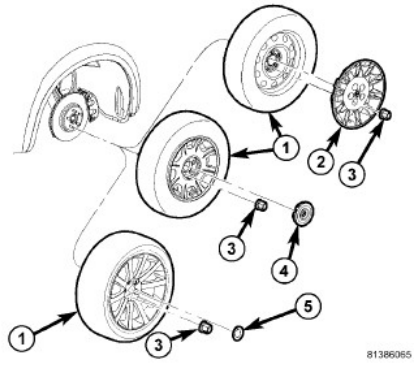
NOTE: Before proceeding, (Refer to 05 - Brakes - Warning) (Refer to 05 - Brakes - Caution) .

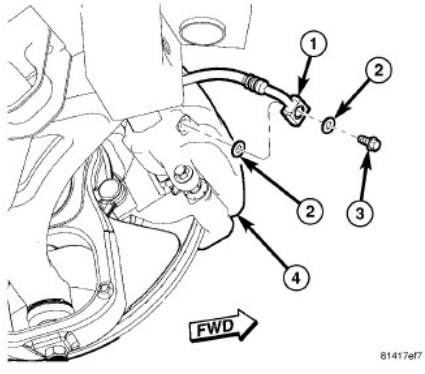
1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure)



4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).



5. Remove banjo bolt (3) connecting flexible brake hose (1) to caliper (4). There are two sealing washers (2) (one one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.



6. While holding guide pins from turning, remove caliper guide pin bolts (1).

7. Remove brake caliper (3) from brake adapter (2) and pads.

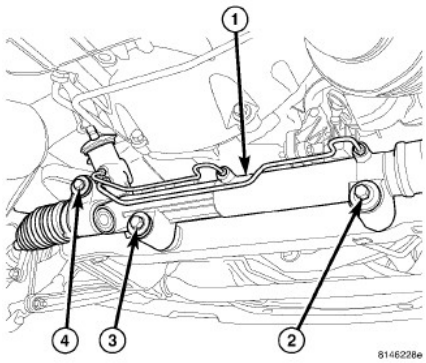
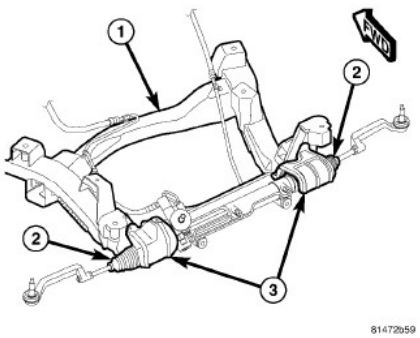
ALL-WHEEL-DRIVE

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. If necessary, install outer tie rods from original gear to replacement inner tie rods. Install each outer tie rod same amount of threads as it was installed on original gear. This will get toe setting close, saving some time when toe is set later in this procedure.
2. Lift steering gear (1) into mounted position and install steering gear lower mounting bolts (2 and 3). Install upper mounting bolt (4) and nut. Tighten all bolts to 102 N·m (75 ft. lbs.).

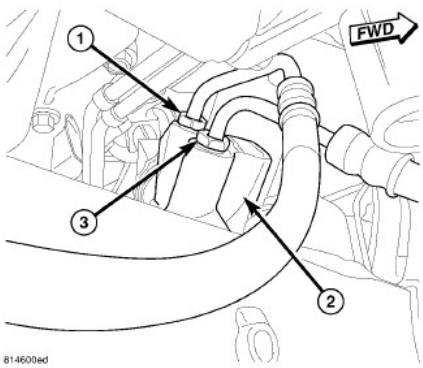


3. Install heat shield (3) above each inner tie rod bellows (2). Tighten screws to 10 N·m (89 in. lbs.).

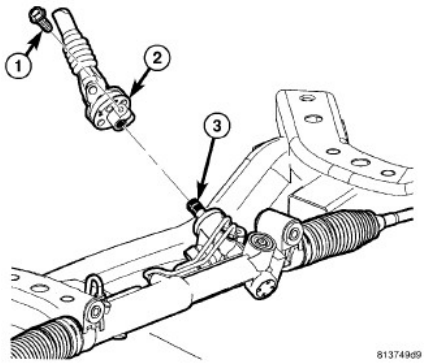


NOTE: Always use a NEW O-ring on the ends of the steering hoses.

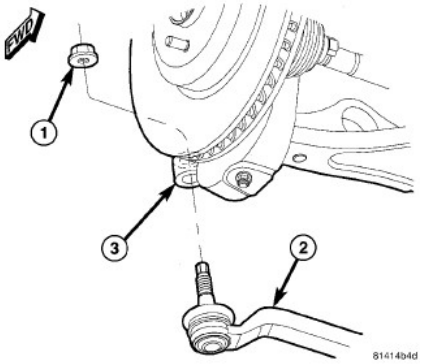
4. Lubricate NEW O-ring on end of pressure hose with clean power steering fluid.
5. Install pressure hose (3) to steering gear (2). Tighten tube nut to 47 N·m (35 ft. lbs.).
6. Lubricate NEW O-ring on end of return hose with clean power steering fluid.
7. Install return hose (1) to steering gear (2). Tighten tube nut to 47 N·m (35 ft. lbs.).



8. Align splines and install lower intermediate shaft coupling (2) to steering gear shaft (3). Install **NEW** pinch bolt and tighten bolt to 45 N·m (33 ft. lbs.).

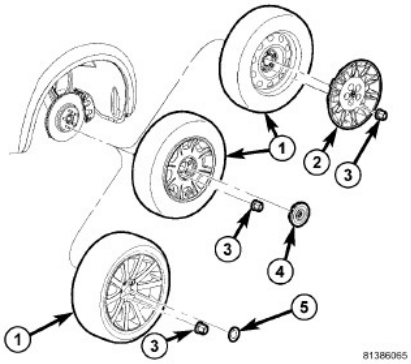


9. Install each outer tie rod (2) end to its knuckle (3). Install nut (1) and tighten to 35 N·m + 90° turn (26 ft. lbs. + 90° turn).



10. Install tire and wheel assemblies (1) (Refer to 22 - Tires and Wheels - Installation) .

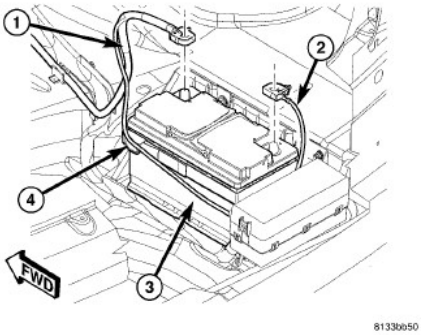
11. Lower vehicle.



12. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

13. Fill and bleed power steering system (Refer to 19 - Steering - Standard Procedure) .

14. Perform wheel alignment setting toe to specifications (Refer to 02 - Front Suspension/Wheel Alignment - Standard Procedure) .



15. Tighten tie rod jam nuts (1) to 75 N·m (55 ft. lbs.).

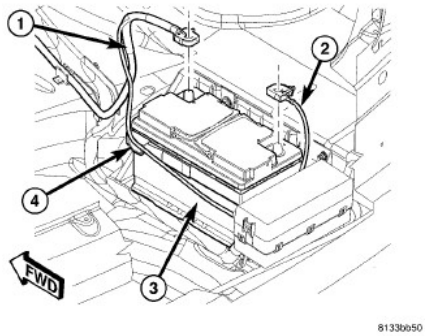
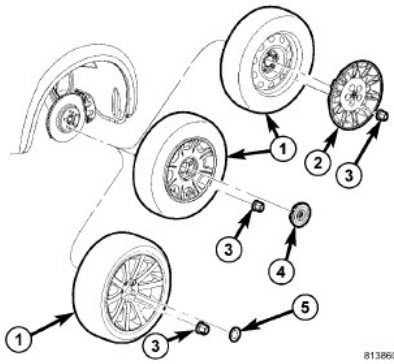
1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure)



8133bb50

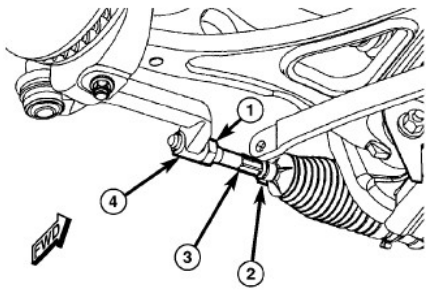
4. Remove wheel mounting nuts (3), then both front tire and wheel assemblies (1).



81386065

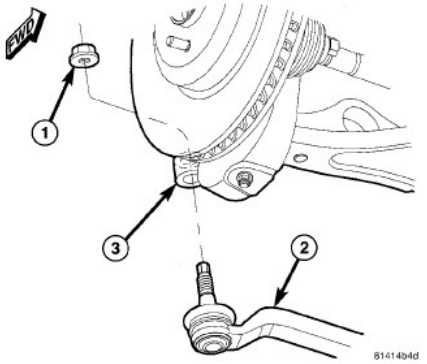
CAUTION: **When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp (2) at inner tie rod and make sure bellows moves freely before rotating inner tie rod.**

5. Loosen tie rod jam nut (1) at each outer tie rod (4).

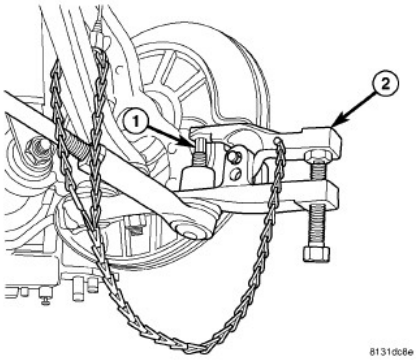


81414c6b

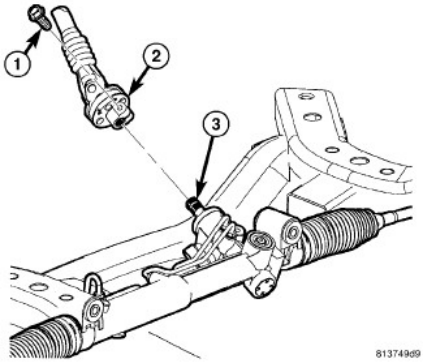
6. Remove outer tie rod (2) end nut (1) at each knuckle (3).



7. Using Remover 9360 (2), separate outer tie rod (1) from each knuckle.

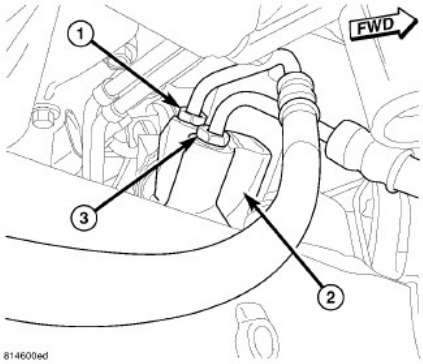


8. Remove lower intermediate shaft coupling pinch bolt (1) at steering gear (3). Separate lower intermediate shaft (2) from steering gear shaft (3).

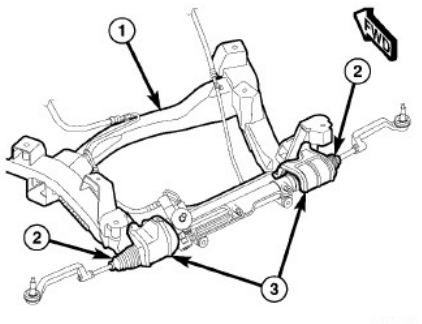


9. Unthread return hose tube nut (1) from steering gear (2). Remove return hose from steering gear.

10. Unthread pressure hose tube nut (3) from steering gear (2). Remove pressure hose from steering gear.



11. Remove mounting screws, then heat shield (3) above each inner tie rod bellows (2).



12. Remove steering gear upper mounting bolt (4) and nut.

13. Remove steering gear lower mounting bolts (2 and 3).

14. Remove steering gear (1).

15. If necessary, remove outer tie rods from gear. Count number of revolutions off for each tie rod for reference upon installation to replacement gear.

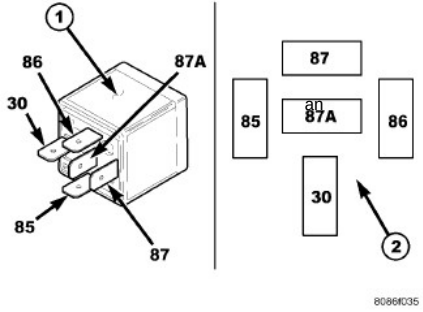
DESCRIPTION

The relay (1) for the rear window defogger system, also known as the Electric Back Light (EBL), is an International Standards Organization (ISO) type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is a electromechanical device that switches battery current through a fuse in the Power Distribution Center (PDC) to the rear window defogger grid and to the heated outside rear view mirrors, when equipped.

The EBL relay is located in the PDC, in the luggage compartment, near the spare tire.

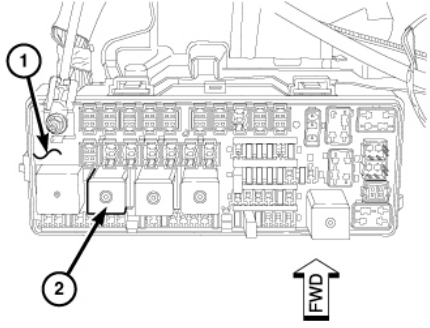


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the EBL relay (2) into the proper receptacle of the Power Distribution Center (PDC) (1).
2. Align the EBL relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.



3068030

DESCRIPTION

A Body Control Module (BCM) is an electronic control unit with a microcontroller that controls and integrates many of the main body electronic functions and features of the vehicle. Many of the functions and features provided by the BCM are possible because of numerous hard wired inputs and outputs, but most of these features are only possible or are enhanced because the BCM communicates electronically with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus.

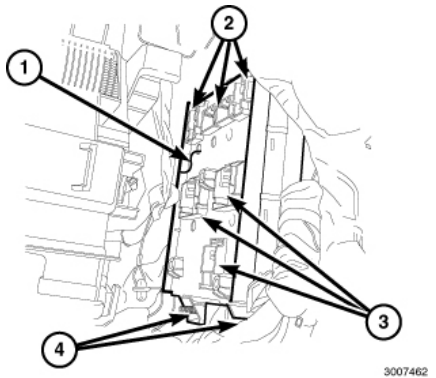
The BCM is a gateway between the high and low speed CAN data bus networks as well as a Local Interface Network (LIN) master node. This method of communication allows the sharing of sensor information, which reduces wire harness complexity, internal controller hardware and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics and allows the addition of many new feature capabilities. This method of communication is used by the BCM to acquire vehicle configuration data, including customer programmable features.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

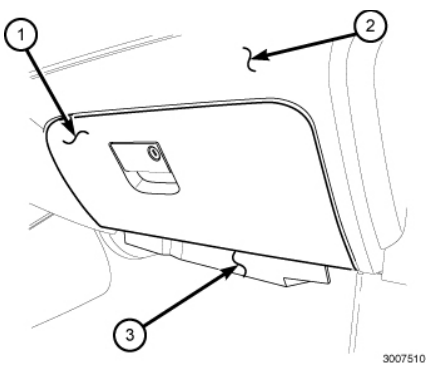
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position the BCM in the vehicle.
2. Install the fasteners (4), two at the bottom, and one at the top, and tighten the securely.
3. Connect the electrical connectors to the Body Control Module (BCM) (1) receptacles (2 and 3) as needed.



4. Install the glove box assembly (1). (Refer to 23 - Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation) .
5. Install the lower hush panel (3) and install the two push-pin type retainers.
6. Connect the negative battery cable.



NOTE:

Program the BCM in accordance with the module replacement and programming guide. (Refer to 08 - Electrical/8E - Electronic Control Modules - Standard Procedure) .

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

A Body Control Module (BCM) is an electronic control unit with a microcontroller that controls and integrates many of the main body electronic functions and features of the vehicle. Many of the functions and features provided by the BCM are possible because of numerous hard wired inputs and outputs, but most of these features are only possible or are enhanced because the BCM communicates electronically with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus.

The BCM is a gateway between the high and low speed CAN data bus networks as well as a Local Interface Network (LIN) master node. This method of communication allows the sharing of sensor information, which reduces wire harness complexity, internal controller hardware and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics and allows the addition of many new feature capabilities. This method of communication is used by the BCM to acquire vehicle configuration data, including customer programmable features.

Software programming allows the BCM microcontroller to monitor all of these inputs and provide the appropriate outputs through high side drivers, low side drivers, on-board relays, Pulse-Width Modulation (PWM) and electronic messages to other modules in the vehicle. Some of the functions and features that the BCM supports or controls include:

</table>

BCM INPUTS AND OUTPUT MANAGEMENT QUICK REFERENCE

Courtesy/Convenience with Timed and Dimming Management

Timing control

- **Brake Fluid Level** - The BCM continuously monitors the brake fluid level sensor through a hard-wired input to monitor the brake fluid level. The BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Fluid indicator based on the input signal received from the fluid level sensor.
- **Enhanced Accident Response Support** - The BCM monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment, will immediately disable the power lock output, unlock all doors by activating the power unlock output, then enables the power lock output if the power lock switch input remains inactive for two seconds. The BCM also monitors an input from the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the OFF position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Switch Support** - The BCM continuously monitors the headlamp switch position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output hardwired to the BCM. The BCM reads and responds to this input by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal High Side Drivers (HSD) and by sending an electronic confirmation message back to the IC, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **A** (Automatic) position is selected, the BCM also monitors an electronic **ambient light level** message received over the CAN data bus from the Heat, Ventilation and Air Conditioning (HVAC) control module based upon a hard wired input from the rain sensor to turn the exterior lighting ON and OFF automatically while the ignition switch is in the ON position.The BCM also controls the fog lamps, cargo lamp, CHMSL, tail/stop lamps, reverse lamps and turn signals.
- **Fuel Level Data Support** - The BCM provides a current source for and receives a hard-wired analog input from the fuel level sending unit located on the fuel pump module in the fuel tank. Based upon this input, the BCM uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle. The IC calculates the proper fuel gauge needle position and to control low fuel indicator operation based on these messages.
- **Hazard Lamp Circuit Control** - The BCM monitors an input from the hazard switch and receives a hard-wired analog input from the switch. The BCM reads and responds to this input by energizing or de-energizing the right and left park lamp feed circuits through internal HSD units and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the hazard light indicators as appropriate.
- **Headlamp Washer Control** - On vehicles equipped with headlamp washers, the BCM controls a relay in the Power distribution Center (PDC) based on electronic messages received over the Can data bus.
- **Ignition On and Ignition Accessory/On Relay Control** - The BCM monitors electronic **ignition switch status** messages received over the CAN bus from the RF hub and a hard-wired input from the ignition switch on the instrument panel, and provides high side driver outputs to control both the ignition ON and ignition ACCESSORY/ON relays in the Power Distribution Center (PDC) as appropriate.
- **Interior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all interior lamps if they remain ON after a timed interval of about eight minutes.
- **Interior Lighting Control** - The BCM monitors electronic messages and hard-wired inputs from the interior lighting switch, the door ajar switches, the liftgate ajar, and liftgate flip-up glass ajar switches (where applicable), the reading lamp switches and the RF hub to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.
- **Local Interface Network Master Module** - The BCM is the master module for the LIN data bus. In this role it gathers information from the compass sensor, and the Intelligent Battery Sensor (IBS), then either acts on that information directly or places electronic messages on the CAN data bus for use by other modules
- **Power Inverter Support** - The BCM monitors a hard-wired input from the power inverter to determine the inverter status, then transmits electronic **inverter status** messages to other electronic modules in the vehicle over the CAN data bus.
- **Power Lock System Control** - The BCM monitors inputs from the power lock switches and the RF hub to provide control of the power lock motors through high side and low side driver outputs. This includes support for rolling door locks (also known as automatic door locks), automatic door unlock, and a door lock inhibit mode.
- **Remote Radio Switch Support** - The BCM receives electronic message inputs from the remote radio switches on the steering wheel over the CAN data bus, then provides electronic **radio request** messages over the CAN data bus to support the remote radio switch function.
- **Remote Start System Support** - The BCM receives electronic message inputs from the RF hub and then displays the appropriate remote start system textual reminder messages to the vehicle operator within the EVIC display.
- **Shipping Mode** - The new Chrysler Telematics Platform (CTP) vehicles no longer have a IOD fuse to use when transporting or storing for a long period of time. The BCM has a mode that takes the place of pulling the IOD fuse called **"Shipping Mode"** that is easily enabled or disabled.
- **Steering Wheel Switch Support** - The SCM receives electronic message inputs from the steering wheel switches on the steering wheel over the CAN data bus to control and configure many of the EVIC displays and functions.
- **Vehicle Theft Security System Control** - The BCM monitors inputs from the door ajar switches, and the RF hub, on vehicles so equipped. The intrusion module provides electronic **horn** and **lighting request** messages to the BCM for the appropriate VTSS alarm output features.
- **Washer Fluid Level** - The continuously monitors the washer fluid level sensor through a hard-wired input to monitor washer fluid level. the BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Washer Fluid indicator based on the input signal received from the fluid level sensor.

The BCM stores and compares vehicle configuration data with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a Diagnostic Trouble Code (DTC). A configuration mismatch will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The BCM uses On-Board Diagnostics (OBD) to monitor all of the systems and circuits it controls, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects. The BCM will also send electronic message requests to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) for the display of certain textual warning messages related to some detected system conditions or faults.

The hard wired inputs and outputs of the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM electronic controls or the communication between modules and other devices that provide some features of the BCM-controlled systems. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled systems operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Battery Saver Mode/Battery Saver On Message — If Equipped

When the "Battery Saver Mode" or “Battery Saver On" message is displayed, the vehicle will turn off certain electrical functions to reduce battery energy consumption. This will occur during periods when the battery is not being adequately charged. During this time, the following features (if equipped) may be turned off or will operate at a reduced power level: heated seats and heated steering wheel, heated or cooled cup-holder, rear defroster and heated mirrors, heating and air conditioning, power inverter, audio and telematics system. This condition is temporary and recoverable.

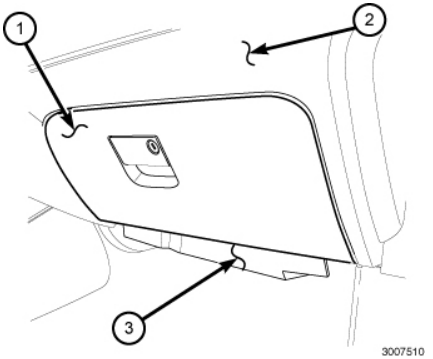
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box assembly (1). (Refer to 23 - Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal) .
3. Remove the Instrument Panel lower hush panel (3).



4. Disconnect the electrical connectors from the Body Control Module (BCM) (1) receptacles (2 and 3) as needed.
5. Remove the fasteners (4) that secure the module, two at the bottom, and one at the top.
6. Pull the module away from the side bulk head and down and remove the module.
7. Remove the BCM from the vehicle.

DESCRIPTION

The horn relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The horn relay for this vehicle is soldered in place on the Printed Circuit Board (PCB) internal to the front Power Distribution Center (PDC), which is located in the right front corner of the engine compartment.

The horn relay cannot be repaired or adjusted and, if ineffective or damaged, the entire front PDC unit must be replaced.

OPERATION

The horn relay within the front Power Distribution Center (PDC) switches battery current to the horns when the Body Control Module (BCM) (also known as the Common Body Controller/CBC) energizes the electromagnetic coil of the relay using a High Side Driver (HSD). When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. The closed relay contacts supply fused battery current from the front PDC to energize the horns.

When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position, which de-energizes the horns. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired inputs and outputs of the horn relay in the front PDC and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

The horn relay used in this vehicle is soldered onto a Printed Circuit Board (PCB) internal to the front Power Distribution Center (PDC) located in the right front corner of the engine compartment. The horn relay is integral to and serviced only as a unit with the front PDC.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The power distribution system for this vehicle consists of the following components:

- Front Power Distribution Center (PDC) - located in the engine compartment
- Rear Power Distribution Center (PDC) - located in trunk
- Power Outlets

Refer to Wiring Diagrams for complete circuit schematics.

The power distribution system also incorporates various types of circuit control and protection features, including:

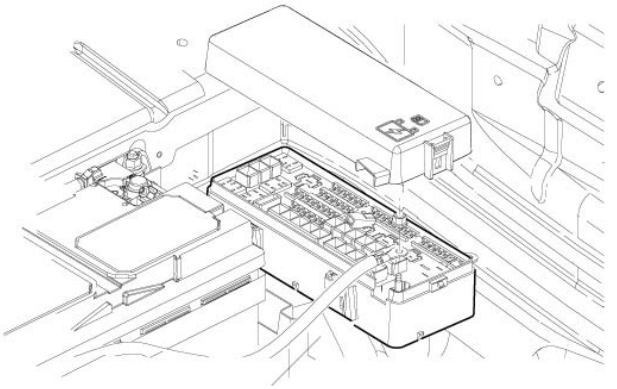
- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays
- Mini fuses

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

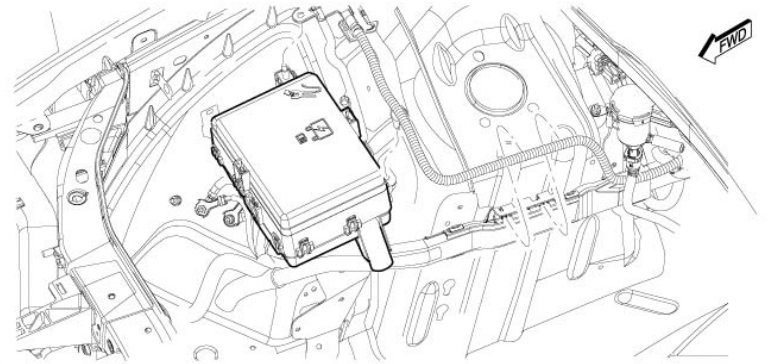
The majority of electrical system fuses and relays are housed in the two Power Distribution Centers (PDC). One is located in the engine compartment, the Front Power Distribution Centers (PDC). The PDC is located next to the battery in the rear of the vehicle. Both of the PDC are replaced only as part of the body wiring harness.

For fuse description and layout (Refer to 04 - Vehicle Quick Reference/Fuse Locations and Types - Specifications) .



3129476

Rear PDC located in the truck next to the battery.



3129265

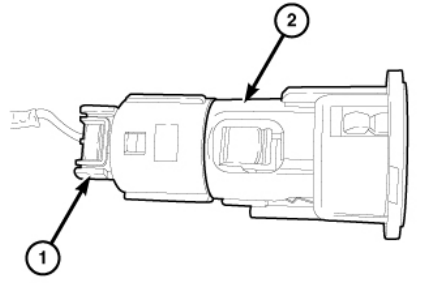
Front PDC located in the engine compartment on the passenger side fender.

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Connect the wire connector (1) to the power outlet receptacle (2).
2. Install the power outlet mount into the panel.
3. Align the splines on the outside of the power outlet receptacle base connector receptacle with the grooves on the inside of the mount.
4. Press firmly on the power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.
5. Connect the battery negative cable.



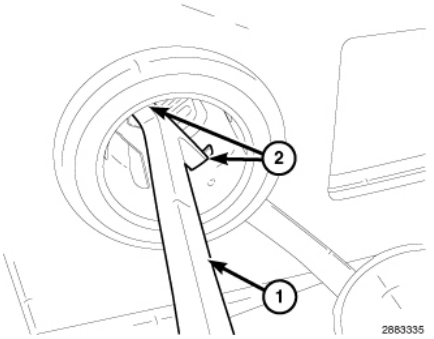
2883346

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

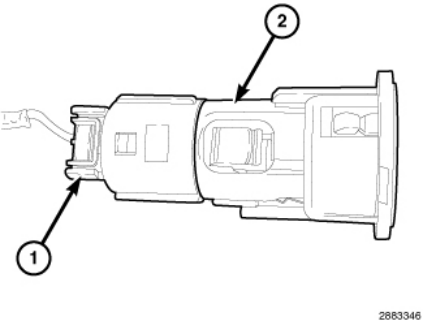
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. Disconnect and isolate the battery negative cable.
2. Look inside and note position of the retaining bosses (2).
3. Insert Remover, Power Outlet 10246 (1) into the retaining bosses (2) of the power outlet.
4. Pull out the base through the mounting ring by gently rocking the tool.



5. Disconnect the harness (1) from the power outlet (2).
6. Set the base aside and remove the base mount ring.

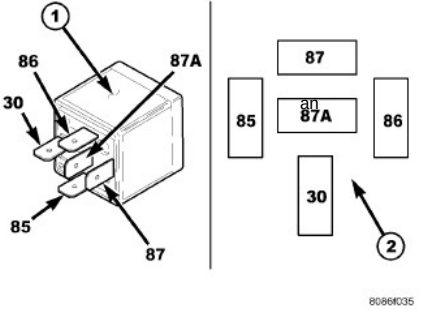


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

Three relays (1) are used for the electric Positive Temperature Coefficient (PTC) heater unit. The relays are International Standards Organization (ISO) type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit as determined by the Powertrain Control Module (PCM).

The three PTC relays are located in the diesel accessory fuse/relay block in the engine compartment.



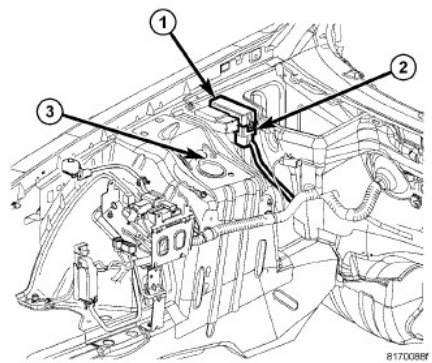
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: LHD model shown. RHD model similar.

1. Position the positive temperature coefficient (PTC) relays as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located behind the right side shock tower (3).
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Close the cover (1) of the diesel accessory fuse/relay block.
4. Reconnect the negative battery cable.

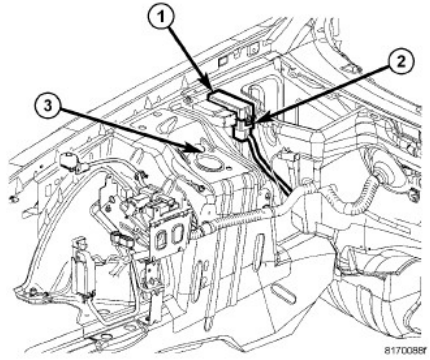


Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: LHD model shown. RHD model similar.



1. Disconnect and isolate the negative battery cable.
2. Open the cover (1) of the diesel accessory fuse/relay block (2) located in the engine compartment behind the right side shock tower (3).
3. Remove the positive temperature coefficient (PTC) relays as necessary from the fuse/relay block.

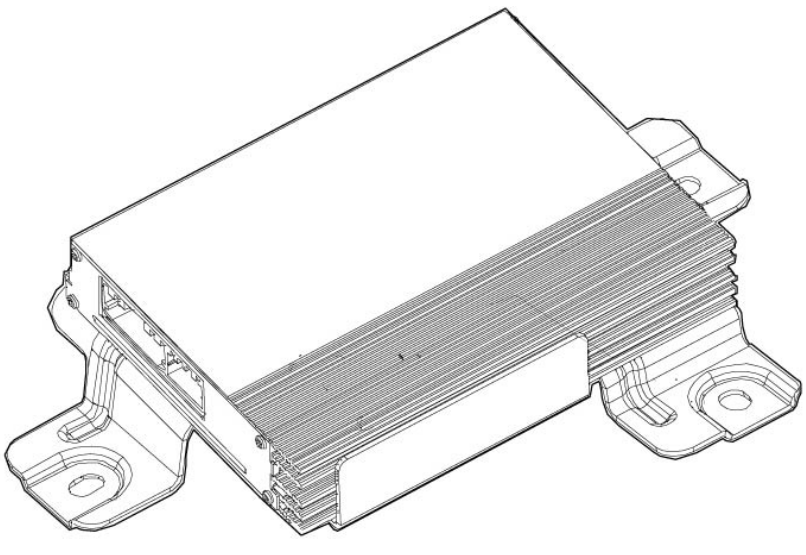
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



The optional premium speaker system includes a separate audio power amplifier. The amplifier is an eight channel unit. The amplifier is located under the front passenger seat.

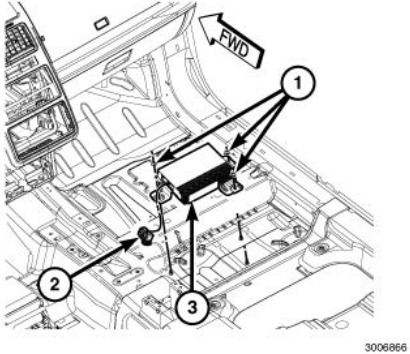
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install the amplifier to the mounting bracket.
2. Position the amplifier (3) and bracket assembly to the floor and install the retainers (1)..
3. Connect the electrical connectors (2).
4. Position the seat to original position.
5. Connect the battery negative cable.



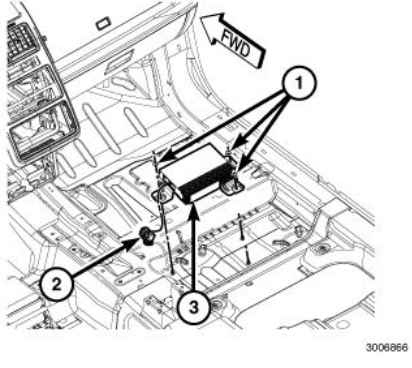
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Passenger seat removed for clarity.



1. Disconnect and isolate the battery negative cable.
2. Position the passenger front seat forward.
3. Disconnect the electrical connectors (2).
4. Remove the amplifier bracket retainers (1).
5. Remove the amplifier from the bracket.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

Special Tools: Click to display a list of tools used in this procedure

The AM/FM coaxial antenna cables run from the radio to the roof mounted AM/FM Satellite antenna.

There are two coaxial cables that run in series. The first cable runs from the back of the radio through the instrument panel harness and up the left A-Pillar to the white fakra connector. The second coaxial runs from the left A-Pillar into the headliner and goes to the rear center of the headliner and connects to the white fakra connector at the antenna.

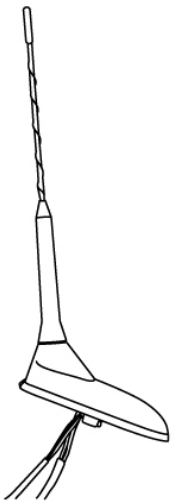
For more information on testing the coaxial cables using the Kit, Radio Antenna Diagnostic 9977-6 (Refer to 29 - Non-DTC Diagnostics/Audio/Video - Diagnosis and Testing) and perform the "Poor or No AM/FM Audio Reception.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

Special Tools: Click to display a list of tools used in this procedure



2445572

If the vehicle is equipped with satellite audio, a combined antenna for AM/FM and satellite and navigation is used. For AM/FM only, the antenna looks similar and is mounted in the same location. For more information (Refer to 08 - Electrical/8A - Audio and Video/ANTENNA, Satellite - Removal) .

For information on how to use the Kit, Radio Antenna Diagnostic 9977-6 (Refer to 29 - Non-DTC Diagnostics/Audio/Video - Diagnosis and Testing) and perform the "Poor or No AM/FM Reception.

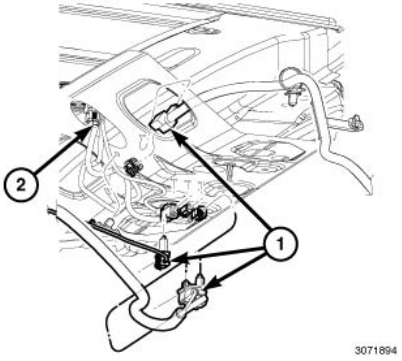
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

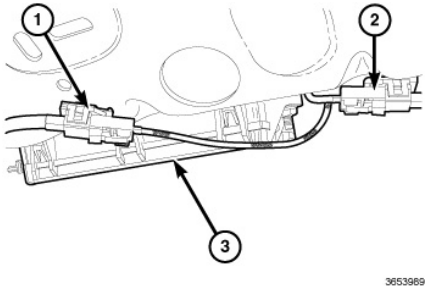
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Insert the antenna electrical connector through the hole in the roof panel.
2. Press the antenna into position until both retainers snap into place. Install the retainer and nut and tighten to 9 N·m (80 in. lbs.) (2).



3. Install and connect the RF-Hub (3).
4. Connect the antenna electrical connectors to the antenna (1 and 2).
5. Install the headliner sections that were removed. (Refer to 23 - Body/Interior/HEADLINER - Installation) .
6. Connect the negative battery cable.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

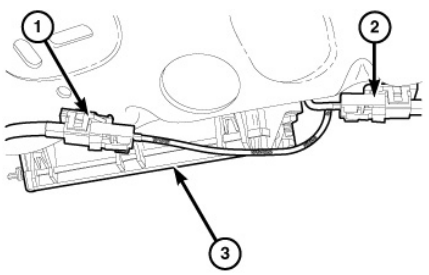
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Disconnect the negative battery cable.
2. Pull down and remove the headliner rear center header trim panel.
3. Remove the third row turning loop bracket on both sides. (Refer to 10 - Restraints/RETRACTOR, Seat Belt - Removal) .
4. Remove the left and right D-Pillar trim panels. (Refer to 23 - Body/Interior/PANEL, D-Pillar Trim - Removal) .
5. Remove the left and right C-Pillar trim panels. (Refer to 23 - Body/Interior/PANEL, C-Pillar Trim - Removal) .
6. Disconnect the antenna electrical connectors (1 and 2).

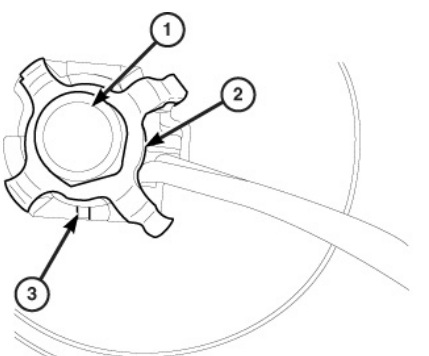
NOTE: Be extremely careful not to pull too hard on the headliner which could cause it to damage.

7. Gently pull down on the rear of the headliner and disconnect and remove the RF-Hub (3).



3653989

8. Gently pull down on the rear of the headliner and remove the antenna fastener and retainer (1 and 2).
9. From inside the vehicle, using a flat bladed tool, depress one of the retaining tabs on the antenna (3). Push one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.



3655694

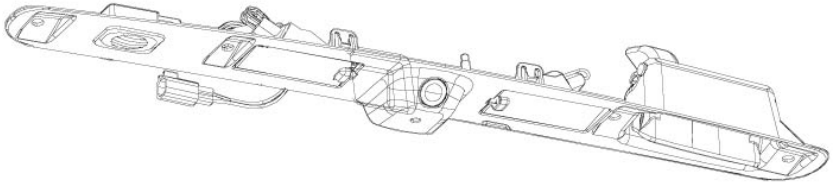
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



3095184

The Rear View Camera (RVC) (also known as ParkView™), is a camera on chip device utilizing Complementary Metal Oxide Semiconductor (CMOS) technology. CMOS technology is used for a wide variety of digital or analog circuits. In this application, it supports the analog image sensor of the RVC. The RVC function is to provide a wide angle video image of the area behind the vehicle, including areas that might not be normally visible from the seated position of the vehicle operator, only while the transaxle gear selector is in the Reverse position. This video image then displays to the vehicle operator within the display screen of the audio system receiver unit near the center of the instrument panel.

The RVC is intended to be an auxiliary viewing aid and is not promoted as an obstacle detection or safety device. It does not remove vehicle operator responsibility to recognize and obey official traffic laws or regulations or to take sensible precautions and care to avoid pedestrians, other vehicle traffic or both fixed and moving obstacles through the habitual use of safe and defensive driving techniques.

The RVC is located on the underside of the light bar mounted above the license plate tub on the vehicle liftgate. The camera lens is visible to the vehicle center line, while the body of the camera and the camera connections are concealed within the light bar above a camera mounting bracket.. The camera mounting bracket secures to the light bar assembly to the left of the left license plate lamp (2) with two additional screws. A light bar wire harness routes through a rubber grommet into the interior of the liftgate where it connects the RVC and both license plate lamps to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

Hardwired circuitry connects the RVC to the electrical system of the vehicle. These hardwired circuits are integral to several wire harnesses, which routes throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The RVC cannot be adjusted or repaired. If the RVC is damaged or ineffective, it must be replaced.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L

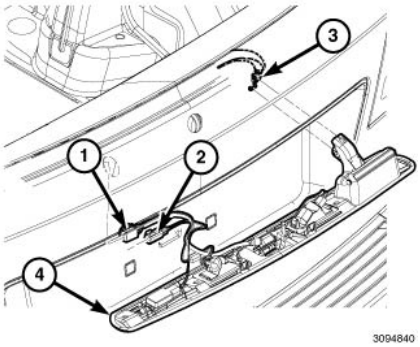
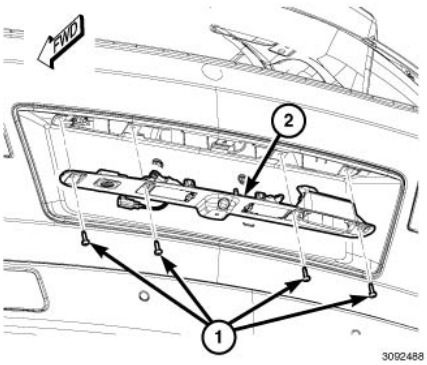
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

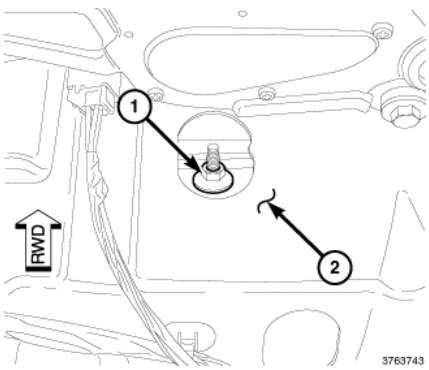
1. Install the backup camera onto the liftgate handle.
2. Position the liftgate handle and backup camera assembly (4) to the liftgate and connect the liftgate handle latch cable (3).
3. Connect the electrical connectors (1 and 2).



4. Install the liftgate handle and backup camera assembly (2) onto the liftgate and install the four screws (1). Tighten the screws securely.



5. Install the nut (1) that secures the liftgate handle assembly to the inside of the liftgate (2). Tighten the nut securely.
6. Install the liftgate trim panel (Refer to 23 - Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Installation) .
7. Reconnect the negative battery cable.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The output of the camera is a video signal compatible to the National Television System Committee (NTSC) standard composite video M format, or NTSC-M. The video signal is delivered to the Integrated Center Stack screen (ICS) through the Telematics Gate Way (TGW). The camera signal and the camera return circuits that are arranged as a twisted pair, with an additional grounded foil jacket to protect the video signal from corruption due to stray radiated signals within the vehicle environment. Portions of these video signal wires are contained within the liftgate lightbar wire harness, the liftgate wire harness.

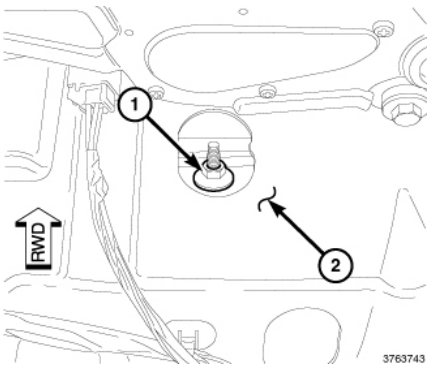
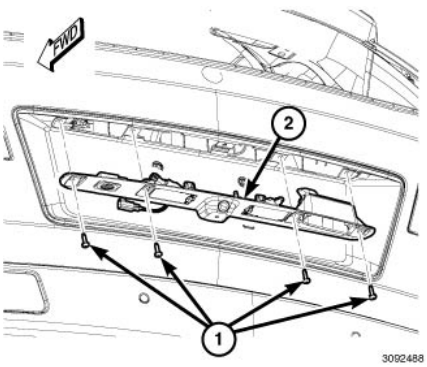
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

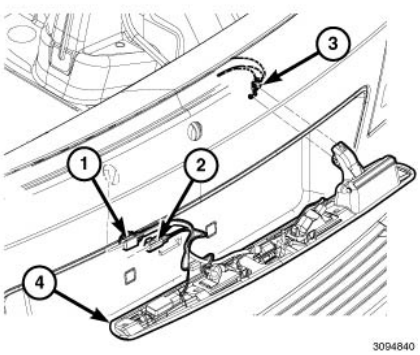
1. Disconnect and isolate the negative battery cable.
2. Remove the liftgate trim panel (Refer to 23 - Body/Decklid/Hatch/Liftgate/Tailgate/PANEL, Trim - Removal) .
3. Remove the nut (1) that secures the liftgate handle and backup camera assembly to the inside of the liftgate (2).



4. Remove the four screws (1) that secure the liftgate handle and backup camera assembly (2) to the outside of the liftgate.



5. Partially remove the liftgate handle and backup camera assembly (4) from the liftgate and disconnect the electrical connectors (1 and 2).
6. Disconnect the liftgate handle latch cable (3) and remove the liftgate handle and backup camera assembly.
7. Remove the backup camera from the liftgate handle.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered. The audio system uses an ignition switched source of battery current so that the system will only operate when the ignition switch is in the RUN or ACCESSORY positions.

The audio system includes the following components:

- ISC Screen Module
- Telematics Gateway Module (TGW)
- Antenna (AM/FM and Satellite Audio and navigation)
- Power amplifier (with premium speaker system only)
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Satellite Receiver (integrated within the TGW)
- Speakers

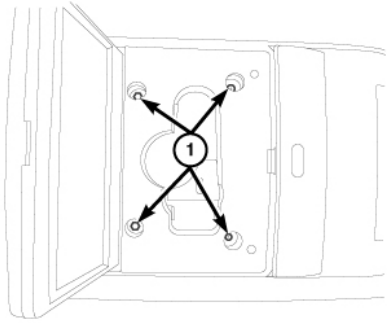
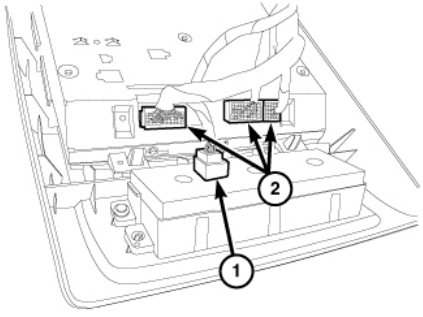
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

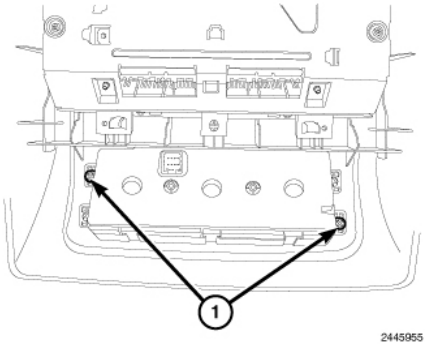
1. Disconnect and isolate the battery negative cable.
2. Open the video screen to access the mounting fasteners.
3. Remove the mounting fasteners.



4. If equipped, disconnect the rear heat control connector (1).
5. Disconnect the video monitor connectors (2) and remove the assembly from the vehicle.



6. Remove the fasteners (1) and remove the rear A/C and heater control.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The Navigation antenna is now part of the SDAR antenna. For service, perform the Poor or No Satellite Audio Reception procedure. (Refer to 29 - Non-DTC Diagnostics/Audio/Video - Diagnosis and Testing) .

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in both the Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

The audio system components operate on battery current received through a fuse in the Power Distribution Center (PDC) on a fused ignition switch output (run-acc) circuit so that the system will only operate when the ignition switch is in the Run or Accessory positions.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

The radio features have been incorporated into the Telematics Gateway Module (TGW). Interaction with the radio features is done through the ISC screen module and switch bank located in the center stack of the instrument panel. For more information (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Telematics Gateway - Description) and (Refer to 08 - Electrical/8J - Instrument Cluster/POD, Switch Bank - Description) .

RADIO ANTI-THEFT CODE PROCEDURE For the vehicles that are equiped with power net or NTG4 radios. If the TGW or the radio have been removed or replaced. A four digit security code is required in order for the radio to function:

1. The key must be in the "RUN" position.
2. Press the "ON/VOL" control button.
3. The word "CODE" or " Please enter Anti-Theft Code" will appear on the display.
4. Enter the 4-digit code by pressing the corresponding preset buttons in sequence.

NOTE:

If three consecutive attempts are made to enter an invalid anti-theft code the radio will enter a ‘WAIT’ state. While in this state the radio display will read ‘WAIT’. To exit the ‘WAIT’ state the radio must remain powered with the ignition in the run position for a continuous 30 minutes (the vehicle may be driven during this time). After exiting the ‘WAIT’ state the radio will again display ‘CODE’ and a valid anti-theft code may be entered.

2014 Dodge JC - DODGE JOURNEY

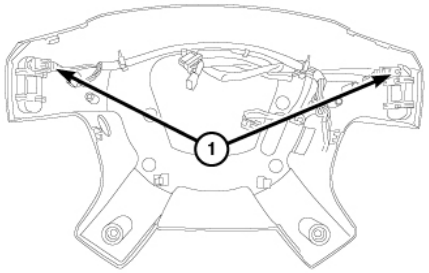
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

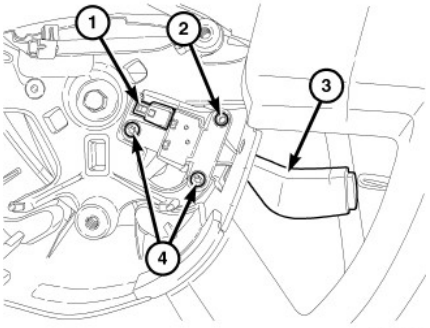
WARNING: **Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

1. Position the remote radio switch to the mounting hole on the outside of the steering wheel rear trim cover. Be certain that the connector receptacle is oriented toward the bottom of the switch and pointed toward the center of the steering wheel.
2. Press firmly and evenly on the remote radio switch until each of the switch snap features is fully engaged in the mounting hole of the steering wheel rear trim cover.
3. Reconnect the steering wheel wire harness connector to the connector receptacle of the remote radio switch (1).



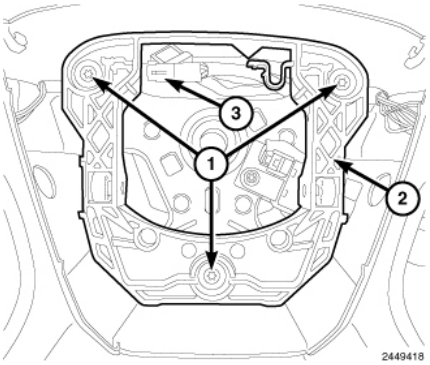
2449431

4. Install the speed control switch (3) (Refer to 08 - Electrical/8P - Speed Control/SWITCH, Speed Control - Installation) .



81d1b1a9

5. Install the horn button assembly (2) and install the three retainers (1).
6. Connect the horn connector (3).



2449418

7. Install the driver side airbag module to the steering wheel (Refer to 10 - Restraints/AIR BAG, Driver - Installation) .

8. Connect the battery negative cable.

STANDARD PROCEDURE - USER DATA BACKUP AND RESTORE

The radio's internal hard disk drive (HDD) can be backed up and restored using a USB memory stick to save customer data in the event that a radio replacement is required. **This procedure can only be performed with radios equipped with a hard disk drive (RER, REN, RHR, RHB, RBZ, REU, RHP, RHW & RB2).**

1. Turn the ignition to RUN, engine OFF.
2. Connect the scan tool to the vehicle connector and perform the following steps:
    a. Go to the “Vehicle View”
    b. Click on the “Radio” icon button from the topology view
    c. Select the “System Tests” folder
    d. Click on the “Radio Hard-drive Back-up” option, and then click “Continue”
    e. When prompted to “Please connect portable Back-up Hard-drive to the radio before continuing” insert a blank USB memory stick with sufficient space into the radio USB port and click “Continue”.
    f. On the radio screen, select the “HDD Backup” option and follow the instructions on the radio screen. Once complete, remove the USB memory stick, select the back arrow on the radio screen and then select “Exit”.

        NOTE: **Hard drive back up times can vary based on radio hard drive used space. Ensure that the vehicle has the proper battery voltage to complete the entire download.**

    g. On the scan tool, click “Complete” and disconnect from the vehicle.
3. With the ignition in the RUN position, engine OFF and the scan tool connected to the vehicle, perform the following steps to restore the data:
    a. Go to “Vehicle View”.
    b. Click on the “Radio” icon button.
    c. Select the “System Tests” folder.
    d. Click on the “Radio Hard-drive Back-up” option, and then click “Continue”.
    e. When prompted to “Please connect portable Backup hard-drive to the radio before continuing” plug in the USB memory stick that was used in the Back Up procedure, into the USB radio port, and click “Continue”.
    f. On the radio screen, select the “HDD Restore” option and follow the instructions on the radio screen. Once complete, select the back arrow and then select “Exit”.

g. On the scan tool, click “Complete” and disconnect it from the vehicle.

h. Remove the USB memory stick from the radio and turn the ignition to the OFF position.

i. Open the driver door and the close all doors. Wait for a minimum of two minutes to allow the vehicle communication bus to go to sleep.

j. Turn the ignition on, and turn on the radio. If you do not see the personal files on the hard drive, repeat step **“h”** above and wait a minute longer.

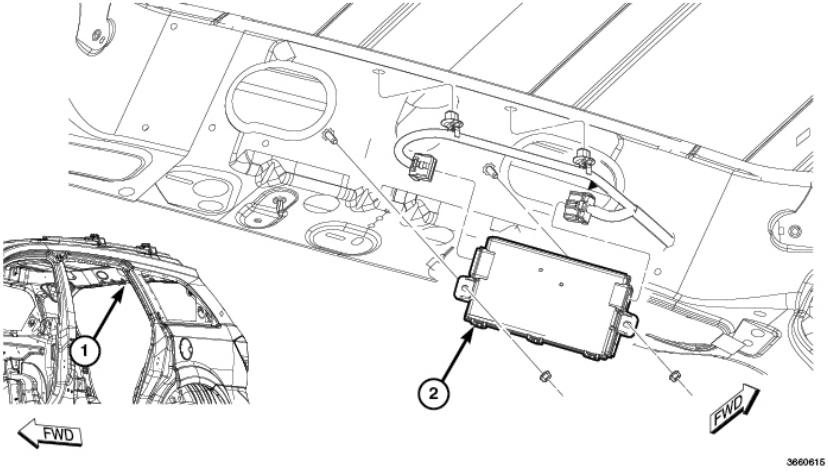
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION



The RF Hub (2) is located above the headliner at the tailgate opening (1). The Remote Start Antenna (if equipped) is connected directly to it.

The electronic functions of the Radio Frequency Hub (RF-Hub) supports or controls the following:

- **Immobilizer** - Kills the engine when there is an unauthorized attempt to steal the vehicle.
- **Remote Keyless Entry** - This feature allows the FOBIK to lock, unlock or activate the Panic alert. If the vehicle is equipped with the Remote Start feature the operating distance is approximately 91.5 meters (300 feet). If it is not equipped with Remote Start the operating distance is approximately 20 meters (66 ft.).
- **Keyless Go** - With an authorized FOBIK in the vehicle this allows the operator to start and run the vehicle by pressing the Start/Stop Button (SSB) on the Keyless Ignition Node (KIN).
- **Passive Entry** - The Passive Entry feature of the RF-Hub allows the operator, with an authorized FOBIK in their possession, to open a locked front door or liftgate by simply lifting the handle. The FOBIK must be within approximately 1.5 meters (5 ft.) of the door/liftgate. Once all the doors and the liftgate are closed, the operator can lock the vehicle by pressing the lock switch on the door handle.
- **Electronic Steering Column Lock** - The ELV/ESCL is only used on some export vehicles. When there is an authorized FOBIK in the front seat area, the Steering Column Lock will unlock the column when the Start/Stop button on the KIN is pressed to the Run position and will lock the column when the button is pressed to the Stop position.
- **Keyless Ignition Node (KIN) dimming control** - The RF-Hub controls the illumination to the Keyless Ignition Node (KIN).
- **Remote Start** - This feature allows the operator to start or stop the engine from outside the vehicle. The FOBIK cannot be farther from the vehicle than approximately 91.5 meters (300 ft.).

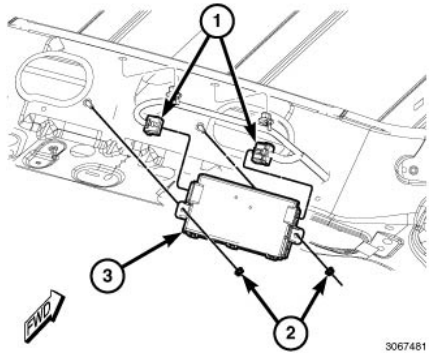
INSTALLATION

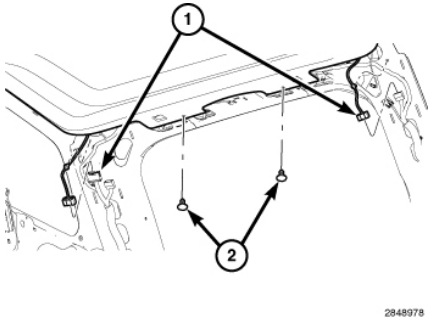
Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE: Replace and Program the module(s) per the RF-Hub, BCM, PCM FOBik and ELV Replacement and Programming Order Guide (Refer to 08 - Electrical/8E - Electronic Control Modules - Standard Procedure) .

1. Position the RF Hub (3) to the vehicle and install the retainers (2).
2. If equipped, connect the remote start antenna connector.
3. Connect the electrical connectors (1).



4. Install the headliner (Refer to 23 - Body/Interior/HEADLINER - Installation)
5. Connect the Intelligent Battery Sensor (IBS) to the negative battery post.



NOTE: Program the RF-Hub (Refer to 08 - Electrical/8E - Electronic Control Modules - Standard Procedure) .

OPERATION

The Radio Frequency Hub Module (RFHM) (also known as the RF Hub/RFH) is an integrated receiver (or base station) in the vehicle that communicates with other electronic modules in the vehicle over either the Controller Area Network (CAN) data bus or a private serial bus to support the following standard and optional vehicle features or systems.

- **Brake Transmission Shift Interlock System (for automatic Transmission only)** - The RFHM contains the controlling logic for the Brake Transmission Shift Interlock (BTSI) solenoid. The RFHM monitors the key postion from the IGnition Node Module (IGNM) received over a private serial bus, hard wires brake input as well as inputs received over the CAN data bus to perform the BTSI solenoid control functions.
- **Ignition Systems** - Depending upon how the vehicle is equipped, Rotary Switch system or Keyess GO system. For rotary system, IGnition Node Module IGNM coil communicate with FOBIK through LF signals (125 KHz) then communicates it to RFHM through a private serial bus, then RFHM sends CAN data bus to BCM for IGNTION status after valid key is verified. The RFHM also contains the controlling logic for the KG (KIN) back lighting features.
- **Passive Entry** - If Smart door handles or exterior deck lid release switch is activated, RFHM fires and monitors LF signals from five Low Frequency (LF) antennas which wake up and communicate with the FOBIK, and RF signals from FOBIK to verify the key, , if valid key is recognized by RFHM then RFHM sends CAN data bus to BCM to lock or unlock the vehicle.
- **Remote Keyless Entry** - The RFHM is an RF receiver that monitors RF signals from Remote Keyless Entry (RKE) transmitter (FOBIK) and relays the appropriate electronic messages BCM module over the CAN data bus to support the features of RKE functions.
- **Remote Start System** - The RFHM is an RF receiver that monitors RF signals received through the remote start antenna (longer range) from the Remote Keyless Entry (RKE) transmitter or the Passive Entry Keyless Go (PEKG) FOBIK and relays the appropriate electronic messages to BCM over the CAN data bus to support all RKE functions including optional remote start function.
- **Sentry Key Immobilizer System** - RFHM uses a new high security encryption system called “Advanced Encryption Stanandard –AES” for Sentry Key Immobilizer System (SKIS). The new system marries FOBIKs, RFHM, BCM, ELV (if so equipped” and ECM with unique secret keys for each vehicle. Swapping parts ARE NOT ALLOWED in the new system, FOBIK are not allow to program for more than one Vehicle. Replacing any part of the system shall be done only in Chrysler authorize dealers using Chrysler diagnostic tool.
- **Vehicle Theft Alarm System** - The RFHM is an RF receiver that monitors RF signals received from the Remote Keyless Entry (RKE) transmitter or the Passive Entry Keyless Go (PEKG) FOB with Integrated Key (FOBIK) and relays the appropriate electronic messages to other electronic modules in the vehicle over the CAN data bus to support the features of the optionnal VTA system.

The RFHM is connected to a fused B(+) circuit and has a path to a clean ground at all times. These connections allow it to remain functional regardless of the ignition switch status. Any input to the RFHM that controls a vehicle system function that does not require that the ignition switch status be ON such as depressing a button on an RKE or FOBIK transmitter, prompts the RFHM to wake up and transmit on the CAN data bus.

The Body Control Module (BCM) stores and compares vehicle configuration data with the RFHM as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

RFHM uses On-Board Diagnostics (OBD) to monitor all of the Functions and circuits it controls, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored function faults it detects. RFHM will also send electronic message requests to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) through the gate way module (BCM) for the display of certain textual warning messages related to some detected functions conditions or faults.

The hard wired inputs and outputs of the RFHM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RFHM electronic controls or the communication between modules and other devices that provide some features of the RFHM-controlled systems. The most reliable, efficient and accurate means to diagnose the RFHM or the electronic controls and communication related to RFHM-controlled systems operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

RADIO FREQUENCY HUB MODULE INITIALIZATION - EXPORT WITH COLUMN LOCK MODULE

CAUTION: **On vehicles equipped with the optional export premium Vehicle Theft System, when either the Radio Frequency Hub RF-Hub) or the shaft lock module (also known as Elektrische Lenksäulen Verriegelung/ELV or Electric Steering Column Lock/ESCL) is replaced with a new unit, the existing RF-Hub or ELV/ESCL MUST also be replaced with a new unit. In other words, any time either the RF-Hub or the ELV/ESCL is replaced with a new unit, BOTH the RF-Hub and the ELV/ESCL MUST be replaced with new units, WITHOUT EXCEPTION. Following replacement of BOTH the RF-Hub and the column lock module/ELV/ESCL, the two modules MUST be initialized using diagnostic scan tool routines in the EXACT SEQUENCE that follows. Failure to follow this sequence may result in BOTH the new RF-Hub and the new ELV/ESCL being rendered unusable, requiring BOTH units to be replaced a second time.**

NOTE: Do not put a laptop or any wireless device (cell phones, audio devices etc.) near the top of the center console (the RKE antenna is located below the center console).

1. After both the RF Hub and the ELV/ESCL have been replaced with new units, connect the diagnostic scan tool to the Data Link Connector (DLC).
2. Turn the ignition ON.
3. Navigate to the RF Hub in the ECU View of the diagnostic scan tool.
4. Turn the ignition OFF.
5. Put all the FOBIKs used in this vehicle on the front seat away from the console.
6. With the scan tool select: **Program Ignition FOBIKs** in the **Miscellaneous Functions** menu and follow the instructions on the screen.

   NOTE: When programming a FOBIK, have it in your hand resting on the console.

7. After all of the FOBIKs have been programmed, run the **RF Hub Replace** routine.
8. Turn the ignition ON.
9. Run the **ELV Replaced** routine, also found under the **Miscellaneous Functions** menu item of the **RF Hub** in the **ECU View** of the diagnostic scan tool.
10. Turn the ignition to the OFF position, wait 30 seconds, then cycle the ignition back to the ON/RUN position.
11. Verify that the ELV locks the steering column when the ignition is turned OFF and unlocks the steering column when the ignition is turned ON.

OPERATION

The remote start antenna is an external hidden antenna located between the headliner and the roof on the first support rib from the back of the vehicle. The antenna interfaces with the Radio Frequency Hub (RF Hub) through a coaxial cable. The antenna helps to amplify the signal for the Remote Keyless Entry (RKE) key fob.

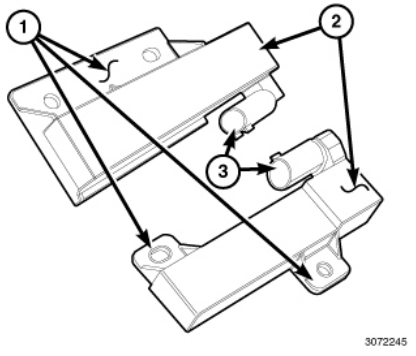
DESCRIPTION

Vehicles equipped with the optional Passive Entry (PE) and Keyless Go (KG) systems have several Low Frequency (LF), ferrite antenna units (2) located within the vehicle. Each ferrite PE antenna unit is contained within a molded black plastic housing with an integral connector receptacle (3) molded into one end. The connector receptacle contains terminal pins that connect the antenna to the vehicle electrical system through a twisted pair of conductors and a connector that are part of the adjacent body or instrument panel wire harness.

Each antenna housing also includes an integral mounting flange or flanges (1) which can be used to mount the unit with screws. This vehicle platform uses five PE antenna units. One is secured to the outside of the liftgate opening lower cross member concealed by the rear fascia, one is secured to each rear door inner panel concealed by the inside door trim panels, one is secured to the rear floor panel cross member just forward of the cargo or third row seating area and one is located on the underside of the shifter bracket beneath the center floor console.

The antennas are each connected to the Radio Frequency Hub (also known as the RF Hub) on dedicated and sequentially numbered circuits. The left rear door antenna is connected through the antenna 1 circuits, the right rear door antenna is connected through the antenna 2 circuits, the cargo or third row seating area antenna is connected through the antenna 3 circuits, the center floor console area antenna is connected through the antenna 4 circuits and the liftgate opening antenna is connected through the antenna 5 circuits.



JC LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	Antenna And Circuit Number
Left Rear Door	1
Right Rear Door	2
Cargo or Third Row Seating Area	3
Center Floor Console Area	4
Liftgate Opening	5

An LF antenna unit cannot be adjusted or repaired. If ineffective or damaged, it must be replaced with a new unit. For applications where it is used, the antenna unit adapter or retainer may be serviced only as a unit with the LF antenna.

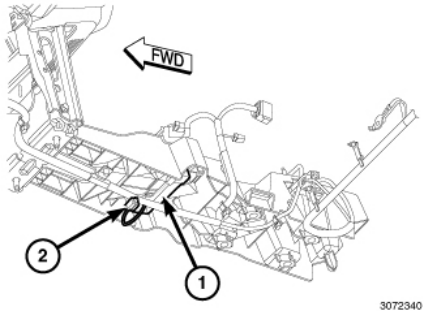
CENTER FLOOR CONSOLE

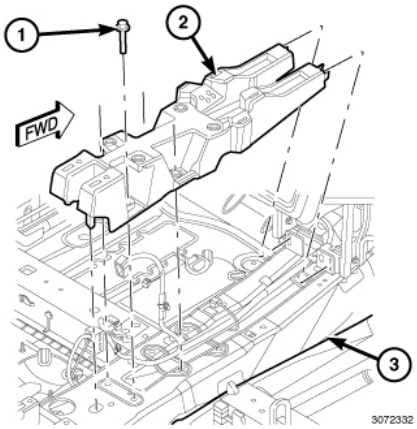
Labor Operations: Click to display a list of Labor Operations associated with this procedure

AUTOMATIC TRANSMISSION

1. Position the Low Frequency (LF) antenna (1) to the underside of the console floor shift bracket.
2. Install and tighten the two screws that secure the LF antenna to the underside of the shift bracket. Tighten the screws securely.
3. Position the shift bracket close enough to the floor panel transmission tunnel to access and reconnect the wire harness connector (2) to the connector receptacle for the LF antenna.



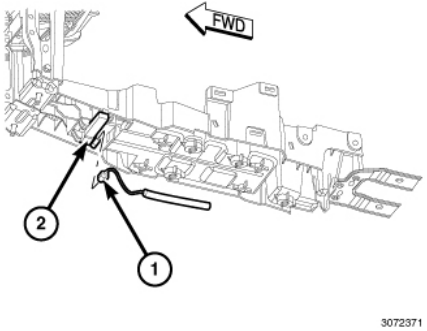
4. Engage the alignment pin and the two snap clips at the front of the shift bracket (2) into the holes in the instrument panel center support bracket, then lower the rear of the shift bracket far enough to engage the alignment pin into the hole in the floor panel transmission tunnel (3).
5. Install and tighten the four screws (1) that secure the shift bracket to the tunnel. Tighten the screws to 8 N·m (71 in. lbs.).
6. Reinstall the automatic transmission floor shift assembly onto the shift bracket. Refer to 21 - Transaxle for the procedures covering the transaxle model and shifter type found in the vehicle.
7. Reconnect the battery negative cable.



MANUAL TRANSMISSION

1. Position the Low Frequency (LF) antenna (2) to the underside of the console floor shift bracket.
2. Install and tighten the two screws that secure the LF antenna to the underside of the shift bracket. Tighten the screws securely.

3. Position the shift bracket close enough to the floor panel transmission tunnel to access and reconnect the wire harness connector (1) to the connector receptacle for the LF antenna.

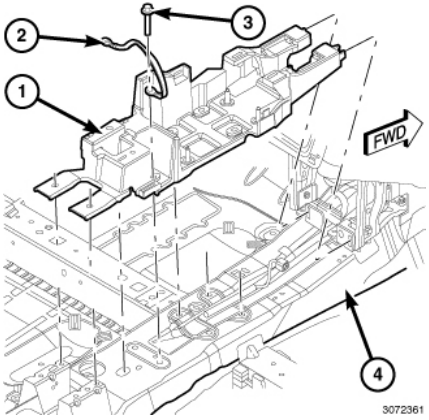


4. Engage the alignment pin and the two snap clips at the front of the shift bracket (1) into the holes in the instrument panel center support bracket, then lower the rear of the shift bracket far enough to engage the alignment pin into the hole in the floor panel transmission tunnel (4).

5. Position the ground strap (2) to the shift bracket mounting hole.

6. Install and tighten the four screws (3) that secure the shift bracket to the tunnel. Tighten the screws to 8 N·m (71 in. lbs.).

7. Reinstall the manual transmission floor shift assembly onto the shift bracket. Refer to 21 - Transaxle for the procedures covering the transaxle model and shifter type found in the vehicle.



8. Reconnect the battery negative cable.

OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communication with the FOBIK is on 20 kilohertz using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microprocessor continuously monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DESCRIPTION

In vehicles equipped with the navigation system and the optional satellite audio feature the navigation antenna has been integrated into the satellite antenna on the roof of the vehicle. (Refer to 08 - Electrical/8A - Audio and Video/ANTENNA, Satellite - Description) . In vehicles equipped with the navigation system, but not equipped with the optional satellite audio feature, a dedicated navigation antenna module (1) is used.

The dedicated navigation antenna module is located on the top of the instrument panel base trim near the windshield and adjacent to the sun load sensor. The navigation antenna module has a stamped metal mounting flange (2) that is secured to the instrument panel base trim by two screws. A single pigtail cable (3) with an integral connector (4) exits the antenna module and is routed down through the instrument panel to the navigation unit, which is integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit). The antenna module, its mounting and the cable are all concealed beneath the defroster grille on the top of the instrument panel.

The dedicated navigation antenna module cannot be adjusted or repaired. If damaged or ineffective the entire unit must be replaced.

OPERATION

The navigation module acquires Global Positioning System (GPS) position data through a navigation antenna module. Vehicles equipped with the optional satellite radio system have a roof-mounted combination antenna that also receives satellite audio and cellular signals. (Refer to 08 - Electrical/8A - Audio and Video/ANTENNA, Satellite/Description) . Vehicles not equipped with the optional satellite radio system have a dedicated navigation antenna module mounted on the top of the instrument panel near the windshield.

The navigation antenna module is used to provide satellite information for route calculation and vehicle positioning purposes to the navigation unit, which is integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit). The antenna module receives time pulse information from the GPS satellites, then calculates and transmits altitude, latitude, longitude, number of satellites, satellite direction, satellite angle of elevation, direction, signal to noise ratio and accuracy information.

The hard wired circuits between components related to the navigation antenna module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the navigation antenna module or the electronic controls and communication between modules and other devices that provide some features of the navigation system. The most reliable, efficient and accurate means to diagnose the navigation antenna module or the electronic controls and communication related to navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

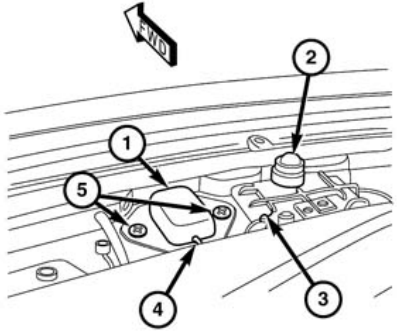
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

NOTE:

In vehicles equipped with the optional satellite radio system, the navigation antenna is serviced as a unit with the combination antenna located on the roof panel. (Refer to 08 - Electrical/8A - Audio and Video/ANTENNA, Satellite/Removal) .



0819003723

1. Disconnect and isolate the negative cable from the battery.
2. Remove the Radio Receiver Module (RRM) (also known as the radio or the head unit) from the instrument panel in order to access and disconnect the cable (4) of the navigation antenna module (1) from the RRM. (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Telematics Gateway/Removal) .
3. Remove the defroster grille from the top of the instrument panel base trim (3). (Refer to 23 - Body/Instrument Panel/GRILLE, Defroster/Removal) .
4. Remove the two screws (5) that secure the navigation antenna module mounting flange to the top of the instrument panel base trim adjacent to the sun load sensor (2).
5. Remove the navigation antenna module from the instrument panel.

DESCRIPTION

DESCRIPTION

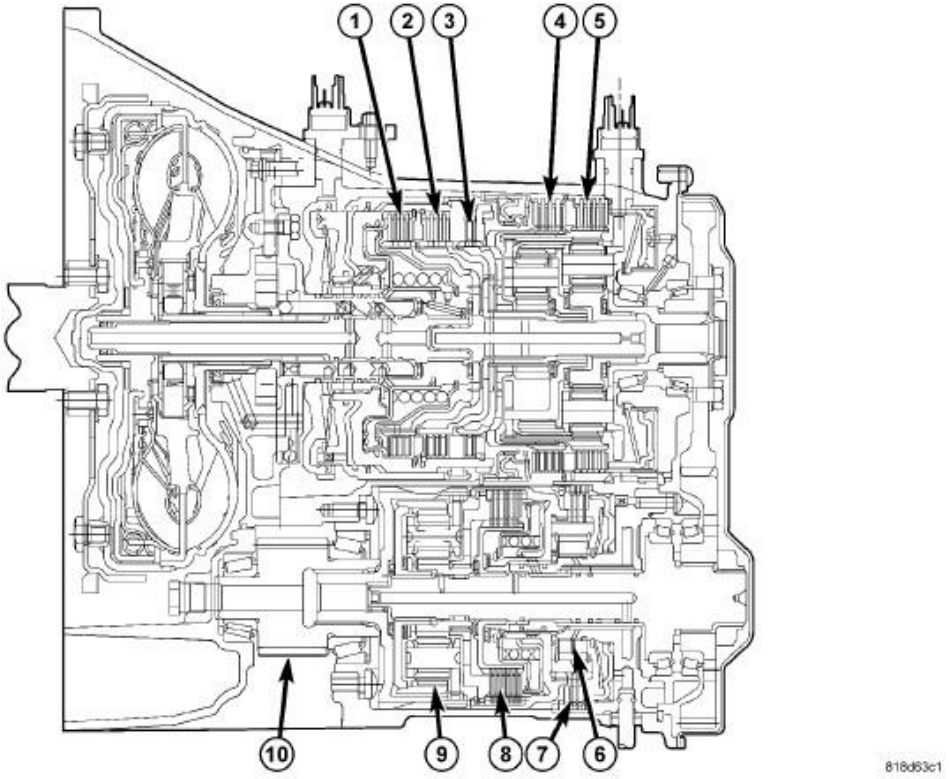


Fig. 1: 62TE Transmission
Courtesy of CHRYSLER LLC

1 - Underdrive Clutch (UD)	6 - Overrunning Clutch (ORC)
2 - Overdrive Clutch (OD)	7 - Low Clutch (LC)
3 - Reverse Clutch (R)	8 - Direct Clutch (DC)
4 - 2/4 Clutch	9 - Planetary Gear Set
5 - L/R Clutch	10 - Remote Pinion Gear

The planetary gear train for the 62TE transaxle provides six forward gear ratios, including two fourth gear ratios. One reverse gear ratio is also provided.

Underdrive (UD) Compounder Assembly

- Low Clutch (LC)
- Direct Clutch (DC)

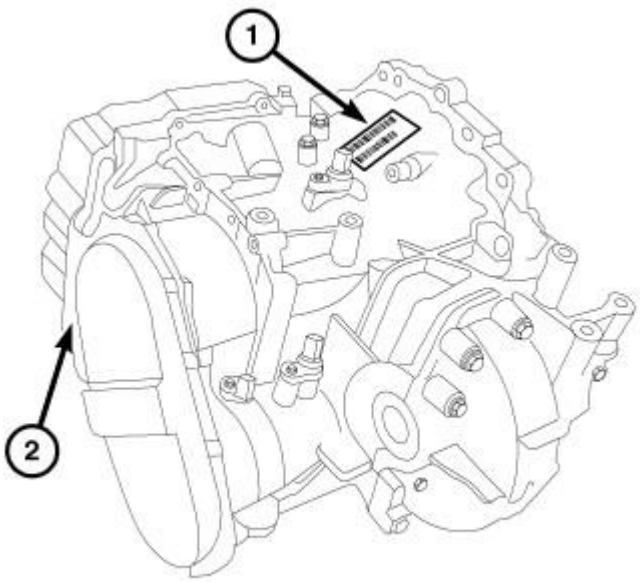
- Overrunning Clutch (ORC)
- Planetary gear set

Fore-Mounted Valve Body/Solenoid/Pressure Switch Assembly

- DC solenoid
- LC solenoid
- DC pressure switch
- LC pressure switch
- Torque Converter Clutch (TC) and pressure control Solenoids
- Line Pressure Sensor (LPS)
- An additional (third) speed sensor
- A "squashed," or flatter, torque converter
- A flatter oil pump
- A new cover for valve body access
- 23-way connector for the Solenoid/Pressure Switch Assembly
- Redesigned transfer gears with an oil scavenger
- A remote pinion gear
- A 2-piece, closed differential case with structural clamshell housing.

The addition of the underdrive compounder assembly components improves low-end torque multiplication, enhancing low-end power capability.

TRANSAXLE IDENTIFICATION



818d63d7

Fig. 2: Case Stamp & Bar Code Label Location
Courtesy of CHRYSLER LLC

The 62TE transaxle is identified by a barcode label (1) that is fixed to the transaxle or the "PK" number (2).

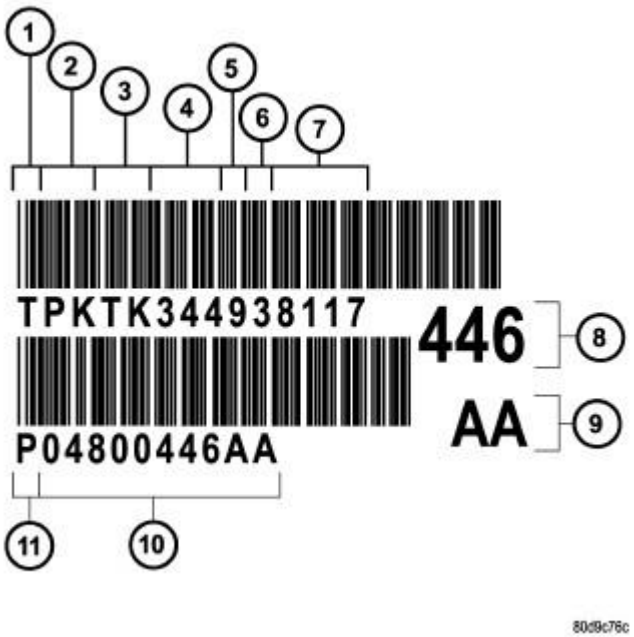


Fig. 3: Identification Label Breakdown
Courtesy of CHRYSLER LLC

1 - T=TRACEABILITY
2 - SUPPLIER CODE (PK=KOKOMO)
3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION)
4 - BUILD DAY (344=DEC. 9)
5 - BUILD YEAR (9=1999)
6 - LINE/SHIFT CODE (3=3RD SHIFT)
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - ALPHA
10 - TRANSAXLE PART NUMBER
11 - P=PART NUMBER

The label contains a series of digits that can be translated into useful information such as transaxle part number, date of manufacture, manufacturing origin, plant shift number, build sequence number, etc. Refer to for identification label breakdown.

If the tag is not legible or missing, the "PK" number, which is stamped into the transaxle case behind the transfer gear cover, can be referred to for identification. This number differs slightly in that it contains the entire

transaxle part number, rather than the last three digits.

OPERATION

OPERATION

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

62TE		ELEMENTS APPLIED							
GEAR	RATIO	UD	OD	R	2-4	L-R	LC	DC	ORC
1	4.127	A	-	-	-	A	A ^	-	H
2	2.842	A	-	-	-	A	-	A	-
3*	2.284	A	-	-	A	-	A ^	-	H
4	1.573	A	-	-	A	-	-	A	-
4	1.452	A	A	-	-	-	A ^	-	H
5	1.000	A	A	-	-	-	-	A	-
6	0.689	-	A	-	A	-	-	A	-
R	3.215	-	-	A	-	A	A	-	-

- A = Applied
- H = Holding
- * = Limp-in Mode
- ^ = Applied in coast only

In total, the 62TE provides seven forward ratios and one reverse.

The underdrive compounder assembly has two modes of operation: direct and reduction.

Notice in the "What's On When" chart, the 2-3, 3-2, and 4-2 shifts require a "double swap" shift. This occurs when two elements are turned off while two different elements are engaged.

This clutch-to-clutch synchronization takes place within 40 - 70 milliseconds, producing a smooth shift. If the underdrive compounder assembly shifts too early (in relation to the shifts taking place in the main centerline), a shudder or harsh shift results. If the underdrive assembly shifts too late, the driver experiences a "double bump" sensation.

To avoid a double swap shift in a 6-4 downshift, the transaxle shifts into 4th prime, which requires the deactivation of the OD clutch and the simultaneous application of the UD clutch.

REVERSE GEAR

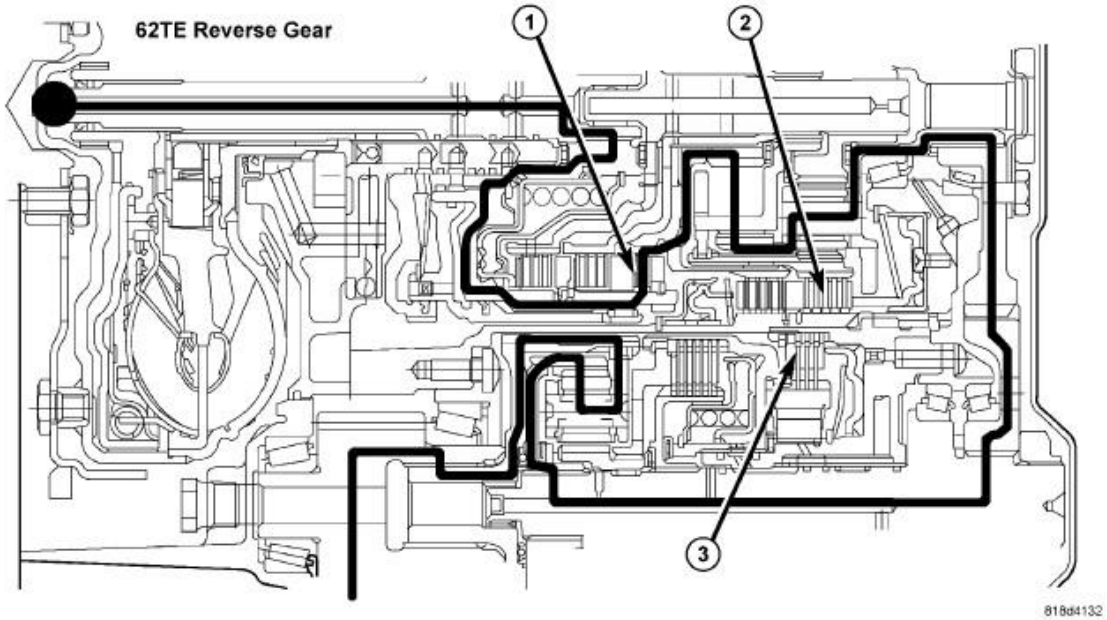

Fig. 4: Reverse Gear Power Flow
Courtesy of CHRYSLER LLC

In Reverse, the Reverse Clutch (R) (1) is applied to provide input torque. The reverse clutch drives the front sun gear. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. The rear carrier/front annulus assembly rotates as an output member in reverse with a reduction gear ratio of 2.21:1.

Power from the main centerline transfers to the underdrive compounder annulus by way of the transfer gears and the underdrive shaft. The Low Clutch (LC) (3) is applied to hold the underdrive compounder sun gear. With the sun gear held, the annulus drives the underdrive compounder carrier, and a reduction gear ratio of 1.45:1 is achieved

The main centerline ratio of 2.21:1 is multiplied by the underdrive compounder centerline ratio of 1.45:1. As a result, the ratio through the entire gear train to the final drive in Reverse is 3.215:1.

FIRST GEAR

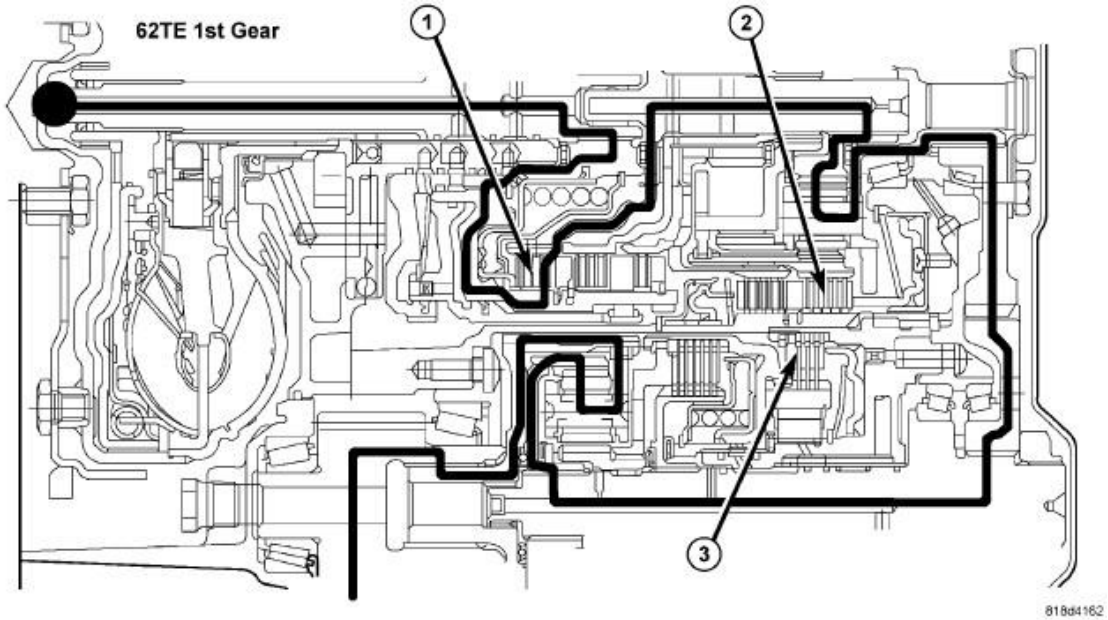

Fig. 5: 1st Gear Power Flow
Courtesy of CHRYSLER LLC

In First gear, the UD clutch (1) is applied to provide input torque. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. By doing so, the rear planet gears are forced to rotate around the inside of the stationary rear annulus. The rear carrier/front annulus assembly rotates as an output member with a reduction gear ratio of 2.84:1.

Power from the main centerline transfers to the underdrive compounder annulus by way of the transfer gears and the underdrive shaft. The Overrunning Clutch (ORC) holds the underdrive sun gear. The LC (3) is also applied during coast in first gear. With the sun gear held, the annulus drives the underdrive compounder carrier, and a reduction gear ratio of 1.45:1 is achieved by the underdrive compounder gear set.

The main centerline ratio of 2.84:1 is multiplied by the underdrive compounder centerline ratio of 1.45:1. As a result, the ratio through the entire gear train to the final drive in First gear is 4.127:1.

SECOND GEAR

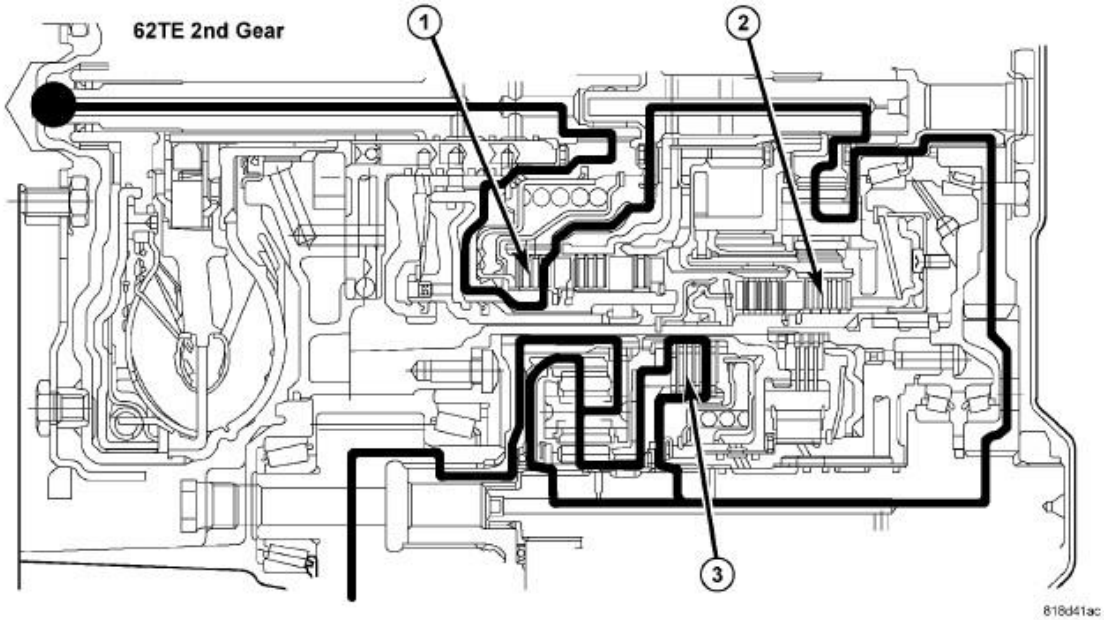

Fig. 6: 2nd Gear Power Flow
Courtesy of CHRYSLER LLC

In Second gear, the UD clutch (1) is applied to provide input torque. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. By doing so, the rear planet gears are forced to rotate around the inside of the stationary rear annulus. The rear carrier/front annulus assembly rotates as an output member with a reduction gear ratio of 2.84:1.

Power from the main centerline transfers to the underdrive compounder gear set annulus by way of the transfer gears and the underdrive shaft. The direct clutch (3) is applied to drive the underdrive compounder sun gear at the same speed as the underdrive annulus. With two members driven, the underdrive compounder gear set operates in direct, or 1:1.

The main centerline ratio of 2.84:1 is multiplied by the underdrive compounder centerline ratio of 1:1. As a result, the ratio through the entire gear train to the final drive in Second gear is 2.84:1.

THIRD GEAR

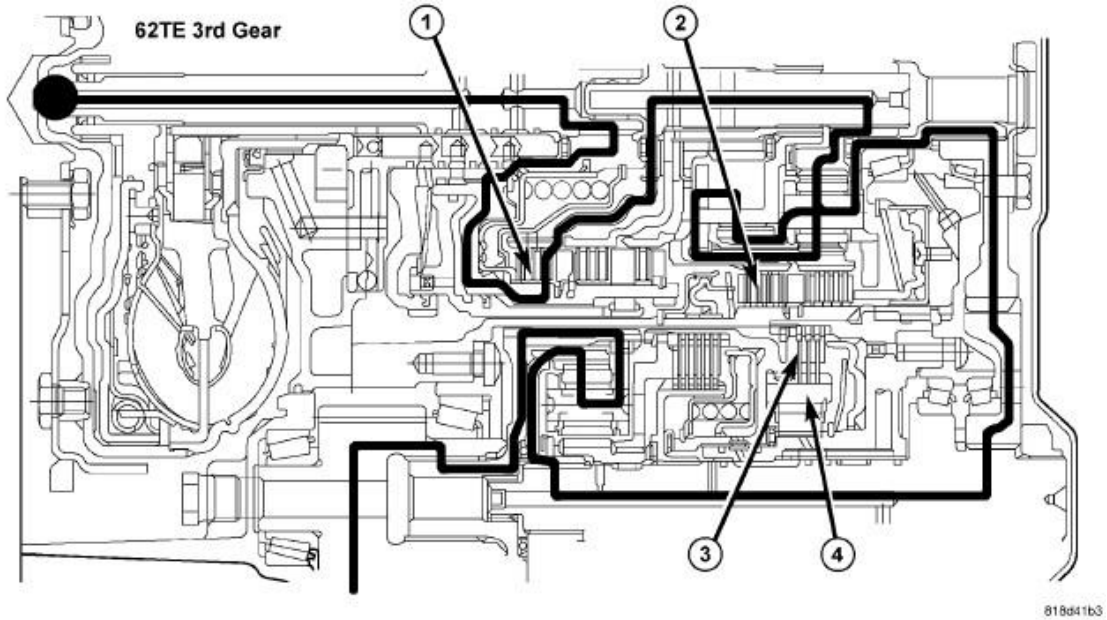

Fig. 7: 3rd Gear Power Flow
Courtesy of CHRYSLER LLC

In Third gear, the UD clutch (1) is applied to drive the rear sun gear. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The 2/4 clutch (2) is applied to hold the front sun gear. The rear carrier/front annulus rotates as an output member with a reduction gear ratio of 1.573:1.

Power from the main centerline transfers to the underdrive compounder annulus by way of the transfer gears and the underdrive shaft. The Overrunning Clutch (ORC) holds (4) the underdrive sun gear. The LC (3) is also applied during coast in first gear. With the sun gear held, the annulus drives the underdrive compounder carrier, and a reduction gear ratio of 1.45:1 is achieved by the underdrive compounder gear set.

The main centerline ratio of 1.57:1 is multiplied by the underdrive compounder centerline ratio of 1.45:1. As a result, the ratio through the entire gear train to the final drive in Third gear is 2.28:1.

Third gear is also the default (limp-in) gear position.

FOURTH GEAR PRIME

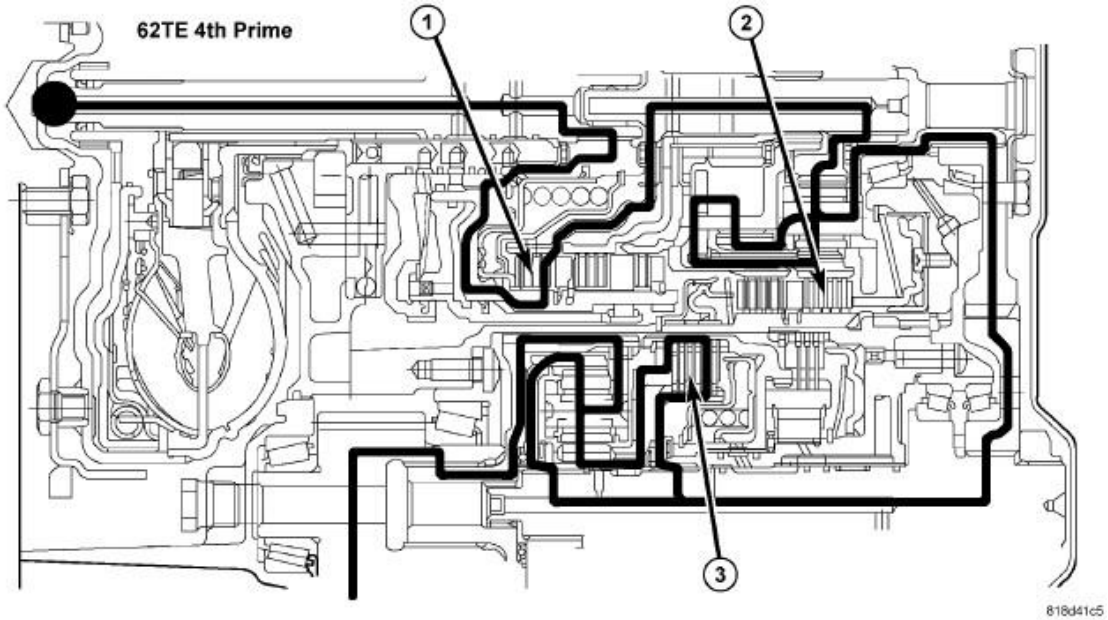

Fig. 8: 4th Gear Prime Power Flow
Courtesy of CHRYSLER LLC

In Fourth Prime, the UD clutch (1) is applied to drive the rear sun gear. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The 2/4 clutch (2) is applied to hold the front sun gear. The rear carrier/front annulus rotates as an output member with a reduction gear ratio of 1.57:1.

Power from the main centerline transfers to the underdrive compounder gear set annulus by way of the transfer gears and the underdrive shaft. The direct clutch (3) is applied to drive the underdrive compounder sun gear at the same speed as the underdrive annulus. With two members driven, the underdrive compounder gear set operates in direct, or 1:1.

The main centerline ratio of 1.57:1 is multiplied by the underdrive compounder centerline ratio of 1:1. As a result, the ratio through the entire gear train to the final drive in Fourth Prime is 1.573:1.

FOURTH GEAR

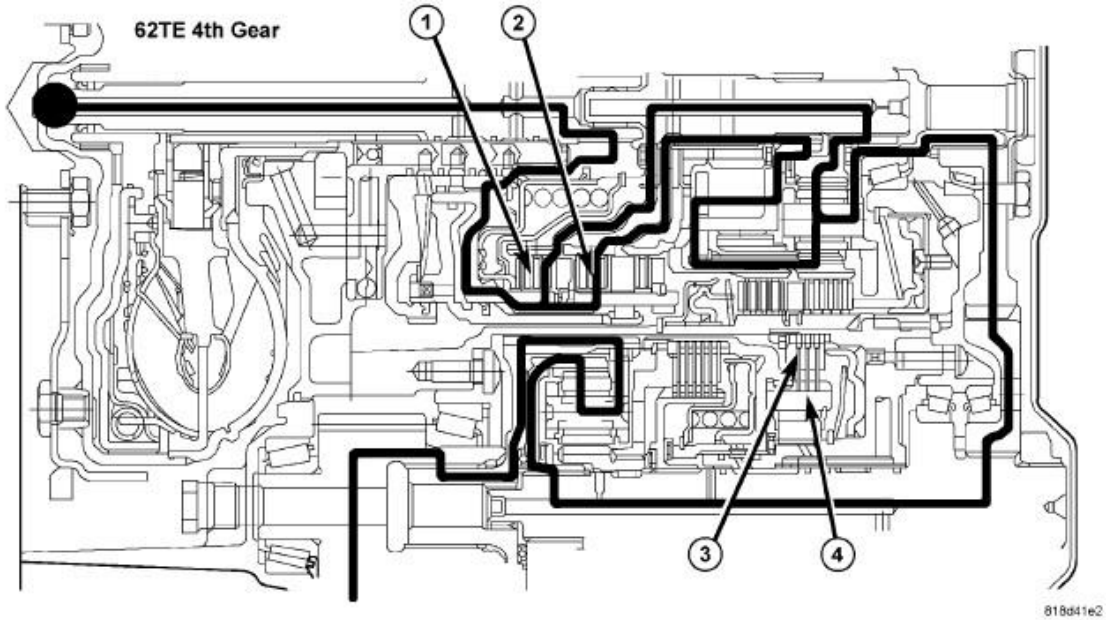

Fig. 9: 4th Gear Power Flow
Courtesy of CHRYSLER LLC

In Fourth gear, the UD (1) and OD clutches (2) are applied to provide input torque. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The OD hub assembly is splined to the front carrier/rear annulus assembly. When the OD clutch is applied, the OD hub and front carrier/rear annulus assembly are also driven. With the rear sun gear and the rear annulus driven at the same speed and in the same direction, the entire front/rear planetary gear train is locked and rotating as one unit. The rear carrier/front annulus rotates as an output member in direct, or 1:1.

Power from the main centerline transfers to the underdrive compounder annulus by way of the transfer gears and the underdrive shaft. The Overrunning Clutch (ORC) (4) holds the underdrive sun gear. The LC (3) is also applied during coast in first gear. With the sun gear held, the annulus drives the underdrive compounder carrier, and a reduction gear ratio of 1.45:1 is achieved by the underdrive compounder gear set.

The main centerline ratio of 1:1 is multiplied by the underdrive compounder centerline ratio of 1:45. As a result, the ratio through the entire gear train to the final drive in Fourth gear is 1.45:1.

FIFTH GEAR

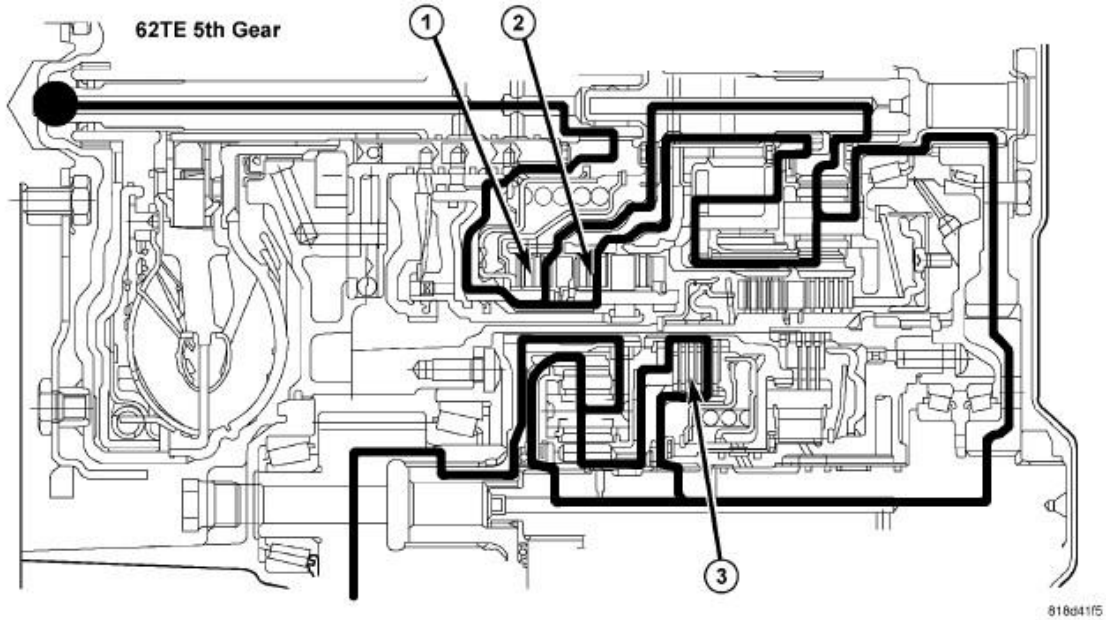

Fig. 10: 5th Gear Power Flow
Courtesy of CHRYSLER LLC

In Fifth gear, the UD (1) and OD clutches (2) are applied to provide input torque. The UD hub is splined to the rear sun gear. When the UD clutch is applied, the UD hub and rear sun gear are driven. The OD hub assembly is splined to the front carrier/rear annulus assembly. When the OD clutch is applied, the OD hub and front carrier/rear annulus assembly are also driven. With the rear sun gear and the rear annulus driven at the same speed and in the same direction, the entire planetary gear set is locked and rotating as one unit. The rear carrier/front annulus assembly rotates as an output member in direct drive, or 1:1.

Power from the main centerline transfers to the underdrive compounder gear set annulus by way of the transfer gears and the underdrive shaft. The direct clutch (3) is applied to drive the underdrive compounder sun gear at the same speed as the underdrive annulus. With two members driven, the underdrive compounder gear set operates in direct, or 1:1.

The main centerline ratio of 1:1 is multiplied by the underdrive compounder centerline ratio of 1:1. As a result, the ratio through the entire gear train to the final drive in Fifth gear is 1.00:1.

SIXTH GEAR

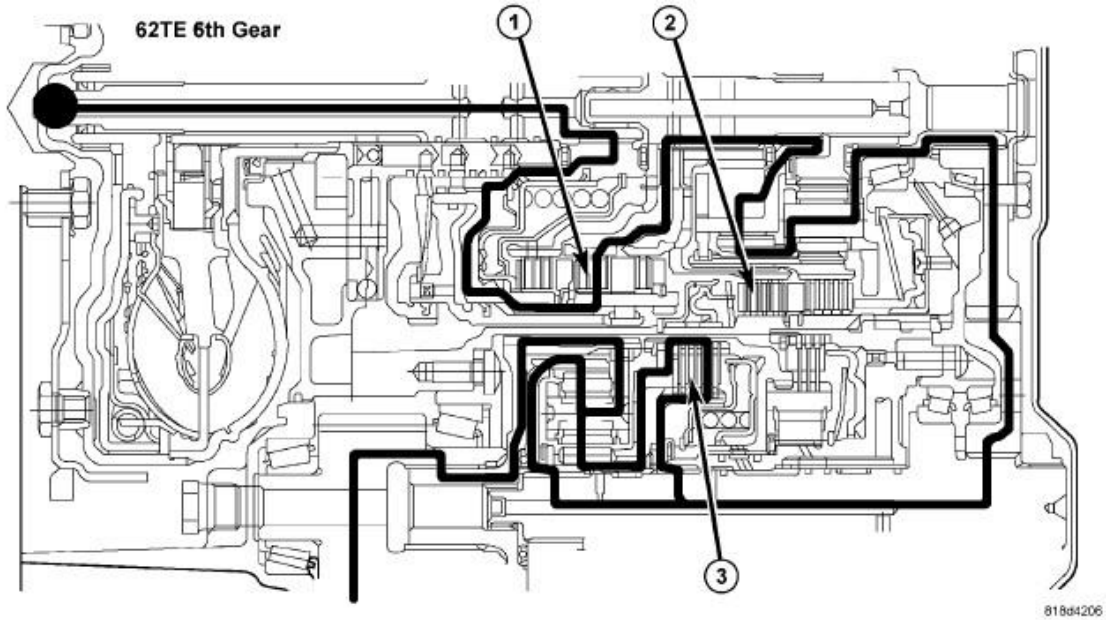

Fig. 11: 6th Gear Power Flow
Courtesy of CHRYSLER LLC

In Sixth gear, the OD clutch (1) is applied to drive the front carrier/rear annulus assembly. The OD hub is splined to the front carrier/rear annulus assembly. When the OD clutch is applied, the OD hub and front carrier/rear annulus assembly are driven. The 2/4 clutch (2) is applied to hold the front sun gear. Overdrive can be achieved using the front gear set. The rear carrier/front ring gear/annulus rotates as an output member with an overdrive gear ratio of 0.69:1.

Power from the main centerline transfers to the underdrive compounder annulus by way of the transfer gears and the underdrive shaft. The direct clutch (3) is applied to drive the underdrive compounder sun gear at the same speed as the underdrive annulus. With two members driven, the underdrive compounder carrier rotates with a direct drive.

The main centerline ratio of 0.69:1 is multiplied by the underdrive compounder centerline ratio of 1:1. As a result, the ratio through the entire gear train to the final drive in Sixth gear is 0.69:1.

DIAGNOSIS AND TESTING

TORQUE CONVERTER HOUSING FLUID LEAKAGE

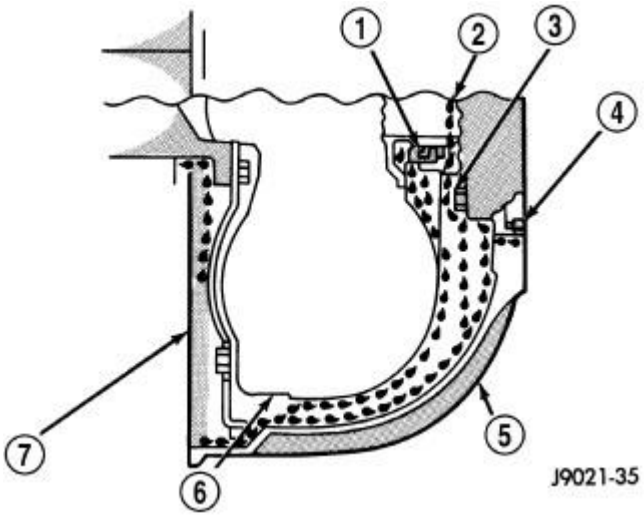

Fig. 12: Converter Housing Leak Paths
Courtesy of CHRYSLER LLC

1 - PUMP SEAL
2 - PUMP VENT
3 - PUMP BOLT
4 - PUMP GASKET
5 - CONVERTER HOUSING
6 - CONVERTER
7 - REAR MAIN SEAL LEAK

When diagnosing converter housing fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak. The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources inspect pump seal (1), pump vent (2), pump bolts (3), pump gasket (4), converter housing (5), converter (6) and a rear main seal leak (7). Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself. Pump seal or gasket leaks usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

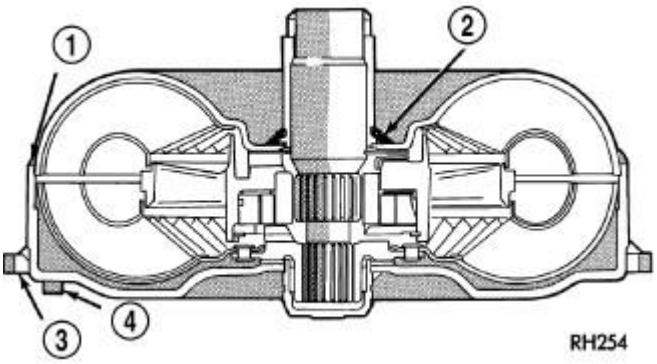

Fig. 13: Converter Leak Points - Typical
Courtesy of CHRYSLER LLC

1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

CLUTCH AIR PRESSURE TESTS

Fig. 14: Air Pressure Test Plate 9741
Courtesy of CHRYSLER LLC

1 - OVERDRIVE CLUTCH	5 - LOW/REVERSE CLUTCH
2 - REVERSE CLUTCH	6 - LOW CLUTCH
3 - UNDERDRIVE CLUTCH	7 - DIRECT CLUTCH
4 -2/4 CLUTCH	

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using Air Pressure Test Plate 9741.

The clutches may be tested by applying air pressure to their respective passages. The valve body and oil filter must be removed and Air Pressure Test Plate 9741 installed. To make air pressure tests, proceed as follows:

NOTE: The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

Remove oil pan and valve body, Install Test Plate 9741 and tighten bolts to 6 N.m (50 in. lbs.). When testing is finished install valve body and tighten bolts to 6 N.m (50 in. lbs.), Install the oil pan bolts and tighten to 6 N.m (50 in. lbs.) and fill transmission. See **Transmission and Transfer Case/Automatic - 62TE/FLUID - Standard Procedure**.

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch feed hole located on the test plate marked OD, listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch feed hole located on the test plate marked REV, listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

2/4 CLUTCH

Apply air pressure to the feed hole located on the test plate marked 2/4 clutch. listen for an audible thud. The piston should return to its original position after the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole located on the test plate marked LR. Then, listen for an audible thud. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Air pressure is applied to the feed hole located on the test plate marked UD. This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

DIRECT CLUTCH

Apply air pressure to the feed hole located on the test plate marked DC, listen for an audible thud.

LOW CLUTCH

Apply air pressure to the feed hole located on the test plate marked LC, listen for an audible thud.

ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transaxle should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transaxle cleaning.

Slipping clutches can be isolated by comparing the clutch application table with clutch operation encountered on a road test. This table identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transaxle in all selector positions.

CLUTCH APPLICATION

62TE		**ELEMENTS APPLIED**							
GEAR	RATIO	UD	OD	R	2-4	L-R	LC	DC	ORC
1	4.127	A	-	-	-	A	A ^	-	H
2	2.842	A	-	-	-	A	-	A	-
3*	2.284	A	-	-	A	-	A ^	-	H
4	1.573	A	-	-	A	-	-	A	-
4	1.452	A	A	-	-	-	A ^	-	H
5	1.000	A	A	-	-	-	-	A	-
6	0.689	-	A	-	A	-	-	A	-
R	3.215	-	-	A	-	A	A	-	-

- A = Applied
- H = Holding
- * = Limp-in Mode
- ^ = Applied in coast only

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

REMOVAL

REMOVAL

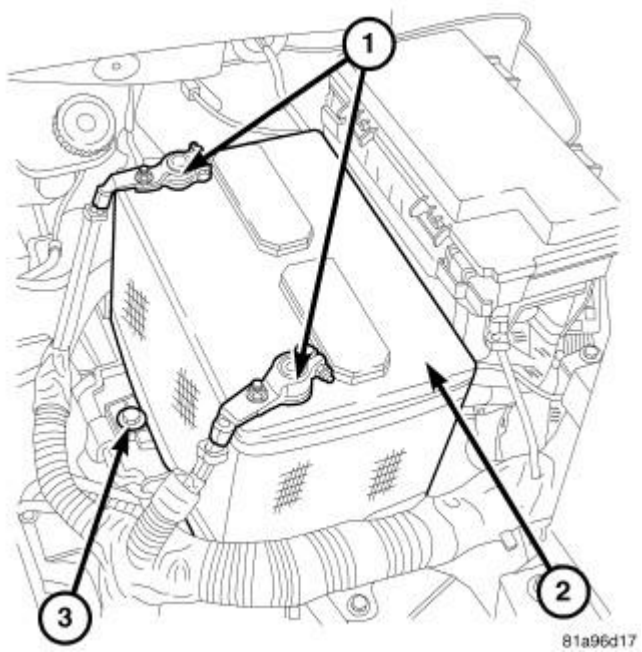

Fig. 15: Battery
Courtesy of CHRYSLER LLC

1. Open hood.
2. Disconnect the battery cables (1).
3. Remove the battery hold down bolt (3) and remove the battery (2).
4. Remove the clips holding harness and ground cable to the battery tray.
5. Remove the battery tray.

1 - END PLAY FIXTURES 8266A
2 - DIAL INDICATOR C-3339A

21. Measure input shaft end play. Place transaxle so input shaft is vertical. Set up end play fixtures 8266A (1, 2) and dial indicator (3). **Input shaft end play should be within 0.13-0.64 mm (0.005-0.025 in.)** Record indicator reading for reference upon reassembly.

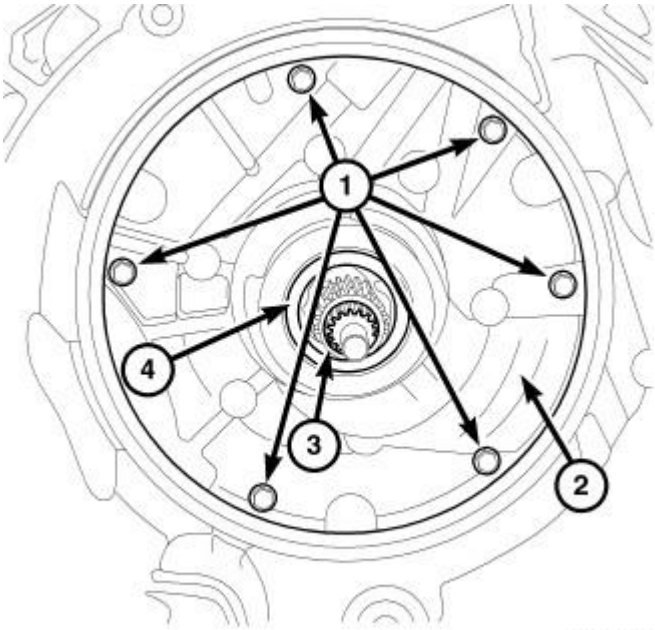

Fig. 52: Front Pump 62TE
Courtesy of CHRYSLER LLC

22. Remove the front pump bolts (1).

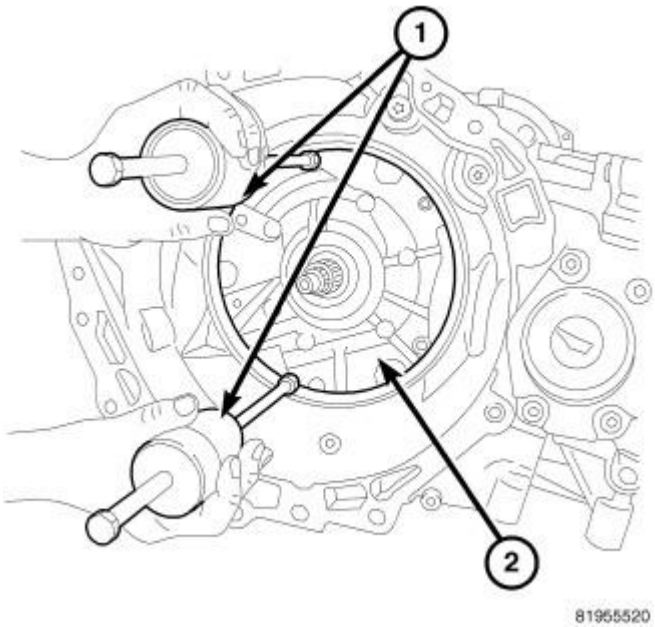

Fig. 53: Pullers C-3752
Courtesy of CHRYSLER LLC

CAUTION: Be sure input speed sensor is removed before removing oil pump.

23. Install slide hammers C-3752 (1) on oil pump.

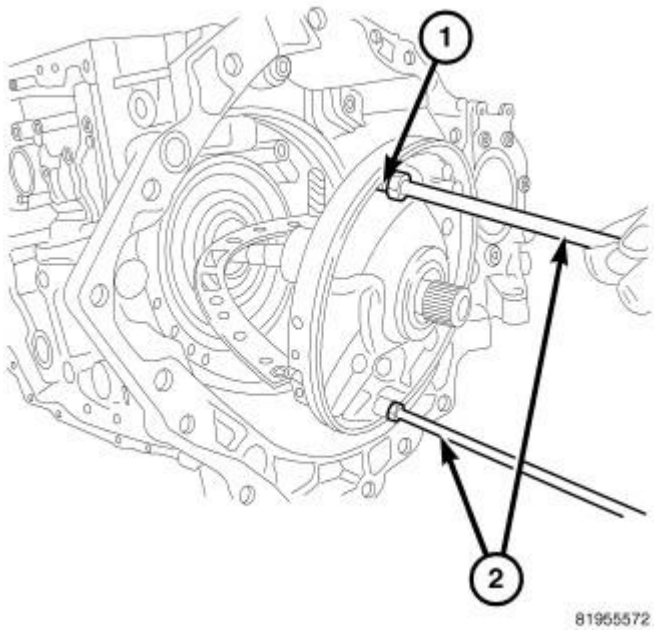

Fig. 54: Oil Pump Assembly
Courtesy of CHRYSLER LLC

24. Remove oil pump assembly (1).

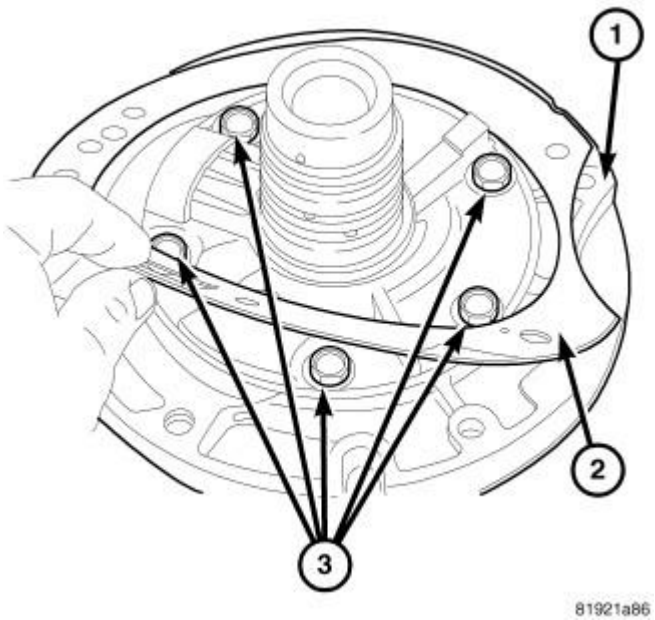

Fig. 55: Oil Pump Gasket
Courtesy of CHRYSLER LLC

25. Remove oil pump gasket (2).

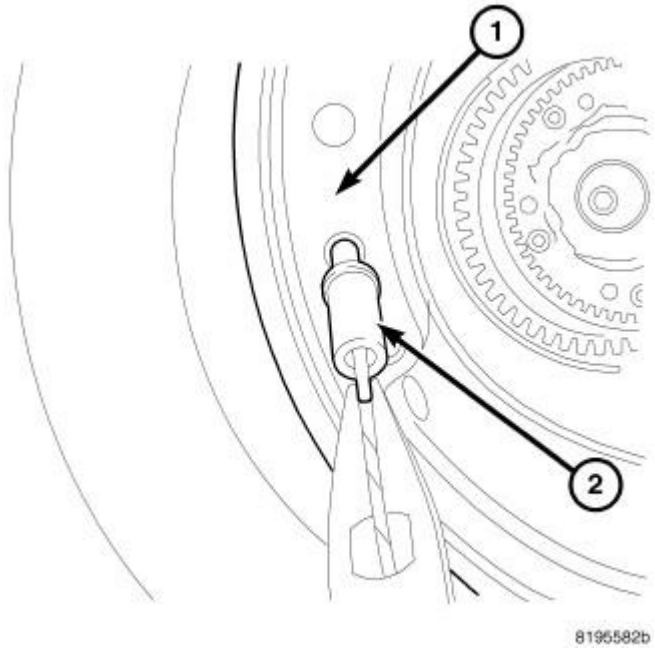

Fig. 56: Bypass Valve 62TE
Courtesy of CHRYSLER LLC

CAUTION: If transaxle failure has occurred, the cooler bypass valve must be replaced. Do not re-use or attempt to clean valve.

26. Remove cooler bypass valve (2).

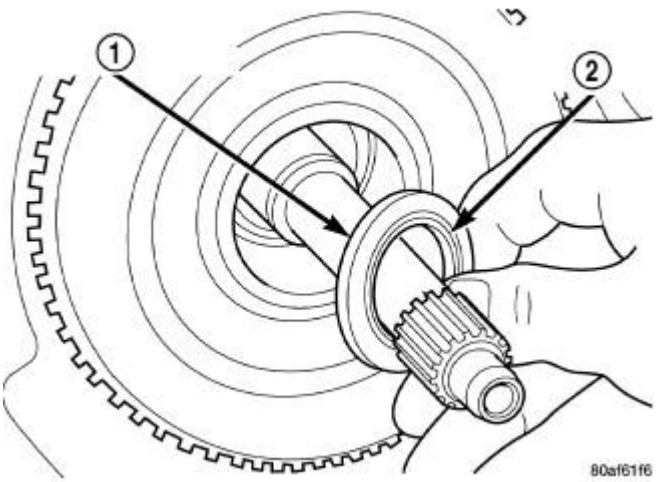

Fig. 57: Caged Needle Bearing

92. Remove the park pawl (1) and the park pawl spring (2).

ASSEMBLY

ASSEMBLY

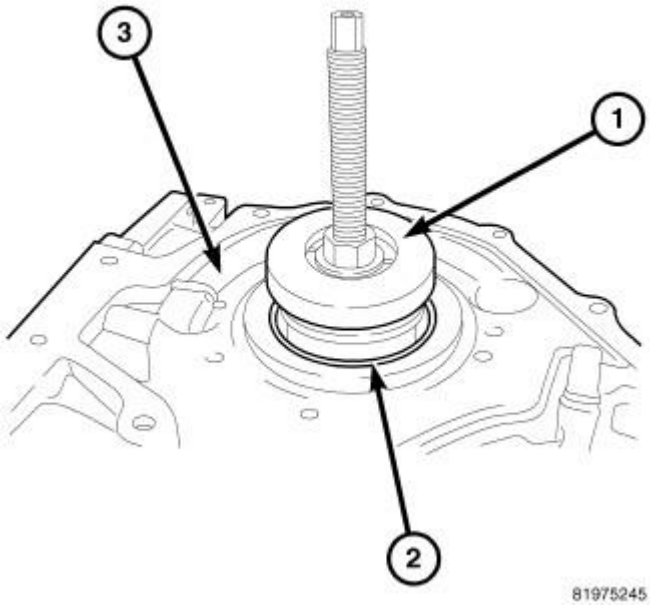

Fig. 113: Output Transfer Gear Cups
Courtesy of CHRYSLER LLC

CAUTION: The cooler bypass valve must be replaced if transaxle failure has occurred. Do not attempt to reuse or clean old valve.

NOTE: If transaxle is being overhauled (clutch and/or seal replacement), the TCM/PCM Quick Learn procedure must be performed. Refer to Electrical/Electronic Control Modules/MODULE, Powertrain Control - Standard Procedure .

1. Install both output bearing cups (2) using Installer 5050A (1).

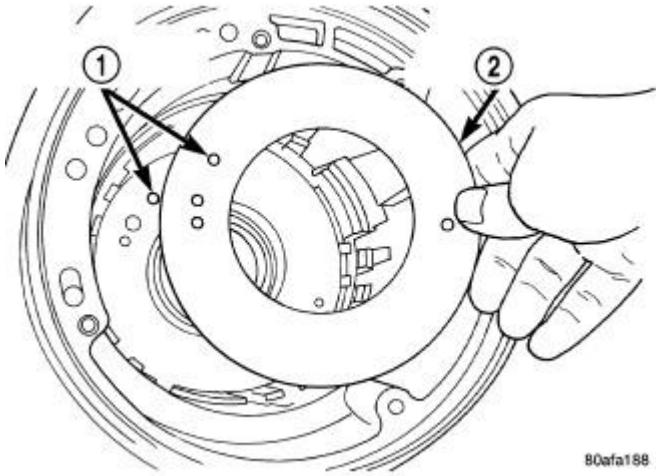

Fig. 114: Piston Retainer Gasket
Courtesy of CHRYSLER LLC

1 - GASKET HOLES MUST LINE UP
2 - LOW/REVERSE CLUTCH PISTON RETAINER GASKET

2. Install low/reverse piston retainer gasket (2). Make sure gasket holes line up with case (1).

Courtesy of CHRYSLER LLC

1 - GEAR CHECKING PLATE L-4432
2 - DIAL INDICATOR
3 - SPECIAL SCREWS 6260
4 - OUTPUT GEAR

13. **OUTPUT GEAR BEARING ADJUSTMENT:**
    a. With output gear removed, install a 4.50 mm (0.177 in.) gauging shim on the rear carrier assembly hub, using grease to hold the shim in place.
    b. Using Holder 6259, install output gear, bearing assembly and bolt. Tighten to 271 N.m (200 ft. lbs.).
    c. Measure bearing end play. Attach Gear Checking Plate L-4432 (1) to the gear.
    d. Push and pull the gear while rotating back and forth to ensure seating of bearing rollers.
    e. Using a dial indicator mounted to the transaxle case, measure output gear end play.
    f. Refer to the OUTPUT GEAR BEARING SHIM chart for the required shim to obtain proper bearing setting.
    g. Use Holder 6259 to remove the output gear retaining bolt and washer. To remove the output gear, use Gear Puller L-4407A.
    h. Remove the gauging shim and install the proper shim determined by the OUTPUT GEAR BEARING SHIM chart. Use grease to hold the shim in place.

OUTPUT GEAR BEARING SHIM

End Play	Shim Needed	Part Number
0.05 mm (0.002 in.)	4.42 mm (0.174 in.)	4412830AB

0.86 mm (0.034 in.)	3.62 mm (0.143 in.)	4412810AB
0.89 mm (0.035 in.)	3.58 mm (0.141 in.)	4412809AB
0.91 mm (0.036 in.)	3.54 mm (0.139 in.)	4412808AB
0.94 mm (0.037 in.)	3.54 mm (0.139 in.)	4412808AB
0.97 mm (0.038 in.)	3.50 mm (0.138 in.)	4412807AB

14. Install the output transfer gear (3) and bearing assembly using Installer 6261 (2).

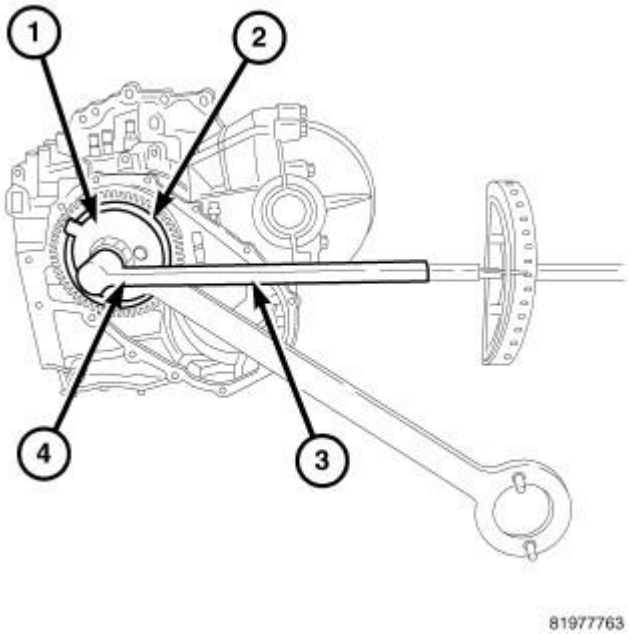

Fig. 126: Torque Output Transfer Gear Nut
Courtesy of CHRYSLER LLC

15. Install NEW output transfer gear retaining bolt and washer.
16. Install Holder 9739 (1) onto the output transfer gear (2).
17. Tighten output transfer gear retaining bolt to 271 N.m (200 ft. lbs.).

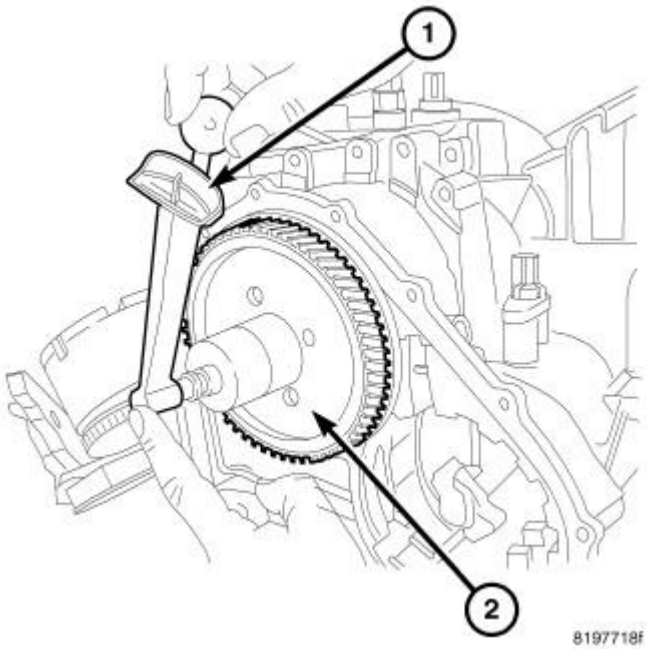

Fig. 127: Turning Torque Output Gear
Courtesy of CHRYSLER LLC

18. Using an inch pound torque wrench, check output shaft turning torque. **Output shaft turning torque should be within 3-8 in. lbs.** If the turning torque is too high, install a 0.04 mm (0.0016 in.) thicker shim. If the turning torque is too low, install a 0.04 mm (0.0016 in.) thinner shim. Repeat until the proper turning torque of 3-8 in. lbs. is obtained.

ILLUSTRATION)

24. Install tapered snap ring (with tapered side up) (2).

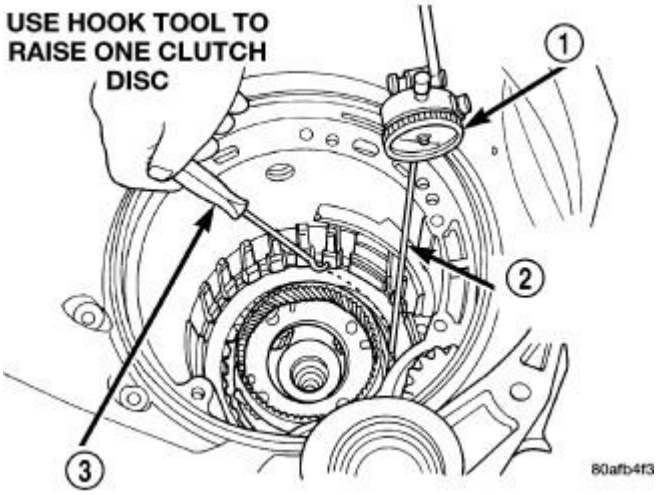

Fig. 134: Check Low/Reverse Clutch Clearance
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - DIAL INDICATOR TIP TOOL 6268
3 - HOOK TOOL

25. Set up dial indicator (1) to measure low/reverse clutch clearance. Press down on clutch pack with finger and zero dial indicator. **Low/Reverse clutch pack clearance is 0.89-1.47 mm (0.035-0.058 in.)** . Set up indicator and record measurement in four places. Take average of readings and select the proper low/reverse reaction plate to achieve specifications.

LOW/REVERSE REACTION PLATE

PART NUMBER	THICKNESS
4799846AA	5.88 mm (0.232 in.)
4799847AA	6.14 mm (0.242 in.)
4799848AA	6.40 mm (0.252 in.)
4799849AA	6.66 mm (0.262 in.)
4799855AA	6.92 mm (0.273 in.)

26. Install 2/4 clutch pack (1, 2).

3 - SNAP RING
4 - 2/4 CLUTCH RETAINER

29. Using Compressing Tool 5058A (1), compress 2/4 clutch return spring just enough to install snap ring (3).
30. Install snap ring.

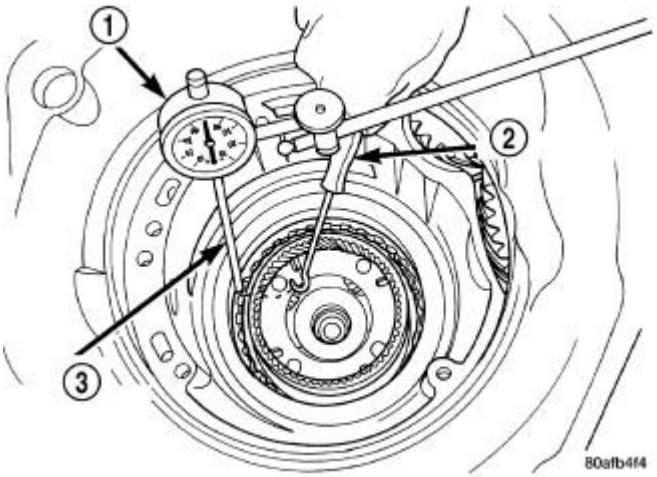

Fig. 138: Check 2/4 Clutch Clearance

Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - HOOK TOOL
3 - DIAL INDICATOR TIP 6268

31. Set up dial indicator (1) and measure 2/4 clutch clearance. Press down on clutch pack with finger and zero dial indicator. **2/4 clutch pack clearance is 0.76-2.64 mm (0.030-0.104 in.).** Set up indicator and record measurement in four places. Take average of readings. If clearance is outside this range, the clutch is assembled improperly. **There is no adjustment for 2/4 clutch clearance.**

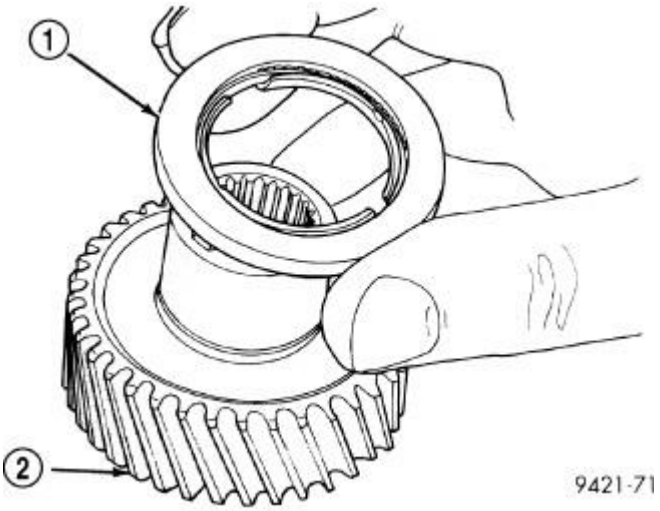

Fig. 139: Number 7 Bearing
Courtesy of CHRYSLER LLC

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

NOTE: The number seven needle (1) bearing has three anti-reversal tabs and is common with the number five position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear (2).

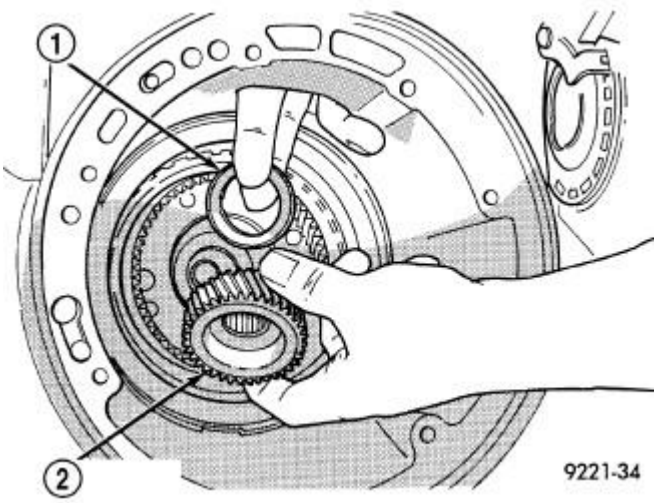

Fig. 140: Rear Sun Gear & #7 Needle Bearing
Courtesy of CHRYSLER LLC

1 - #7 NEEDLE BEARING
2 - REAR SUN GEAR

32. Install rear sun gear (2) and number seven needle bearing (1).

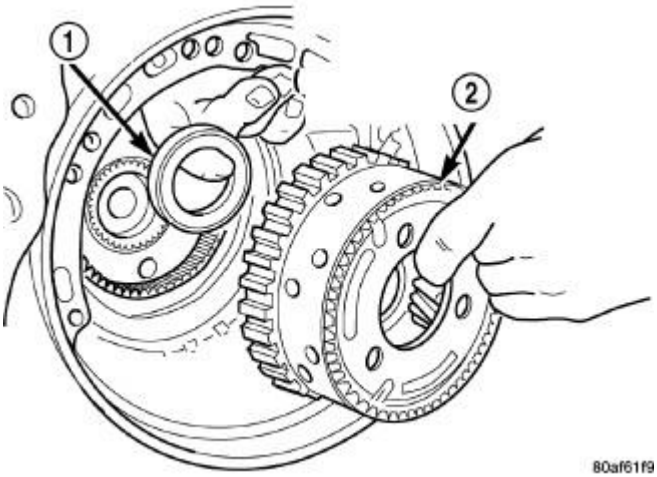

Fig. 141: Front Carrier & Rear Annulus Assembly
Courtesy of CHRYSLER LLC

1 - #6 NEEDLE BEARING
2 - FRONT CARRIER AND REAR ANNULUS ASSEMBLY (TWIST AND PULL OR PUSH TO REMOVE OR INSTALL).

33. Install front carrier/rear annulus assembly (2) and number six needle bearing (1).

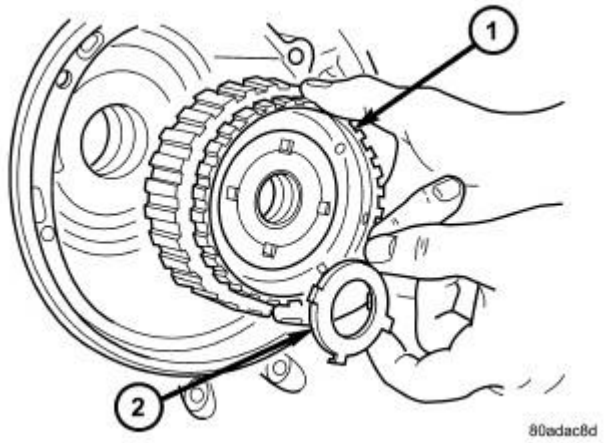

Fig. 142: Front Sun Gear Assembly
Courtesy of CHRYSLER LLC

1 - FRONT SUN GEAR ASSEMBLY
2 - #4 THRUST WASHER (FOUR TABS)

34. Install front sun gear assembly (1) and number four thrust washer (2).

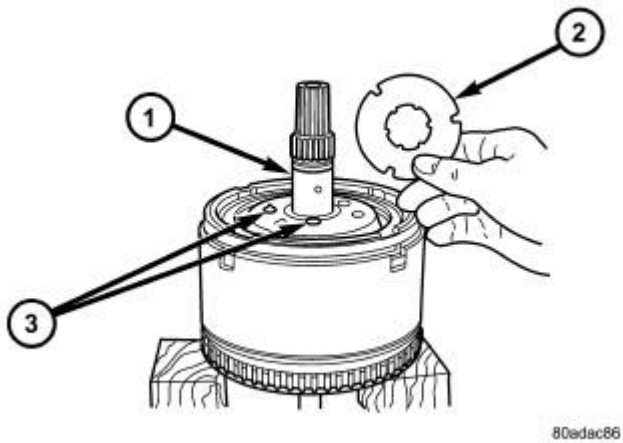

Fig. 143: Select Thinnest No. 4 Thrust Plate
Courtesy of CHRYSLER LLC

1 - OVERDRIVE SHAFT ASSEMBLY
2 - #4 THRUST PLATE (SELECT)
3 - 3 DABS OF PETROLATUM FOR RETENTION

35. Select the thinnest number four thrust plate thickness (2) and install to input clutch assembly. Use petrolatum to retain (3).

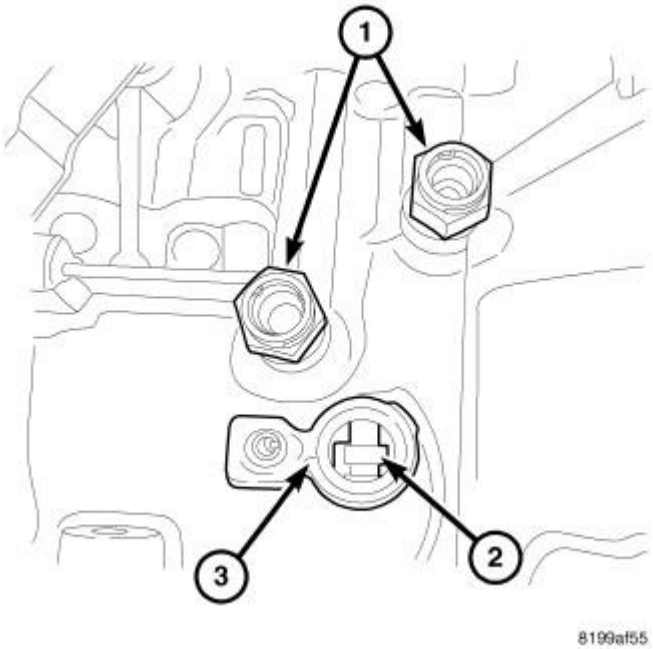

Fig. 144: 62TE View Through Input Speed Sensor Hole
Courtesy of CHRYSLER LLC

36. Install input clutch assembly into position and verify that it is completely seated by viewing through input speed sensor hole (3). If view through input speed sensor hole is not as shown in illustration, the input clutch assembly (2) is not seated properly.

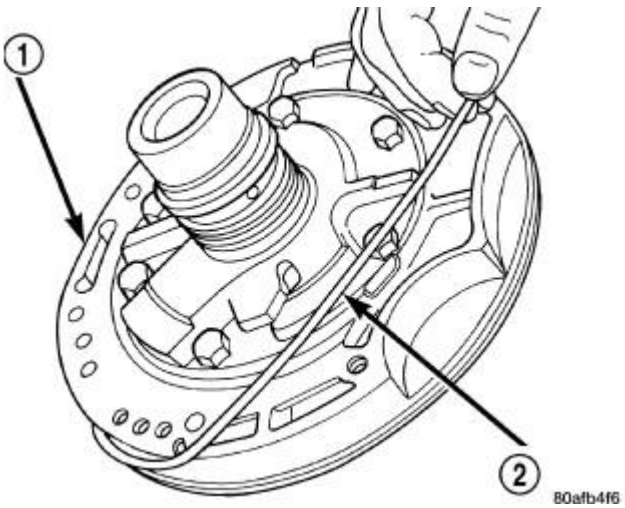

Fig. 145: Oil Pump O-Ring
Courtesy of CHRYSLER LLC

1 - OIL PUMP ASSEMBLY
2 - O-RING

37. Remove oil pump O-ring (2). **Be sure to reinstall oil pump O-ring after selecting the proper number**

four thrust plate.

38. Install pump and gasket to transmission. Install and torque bolts.

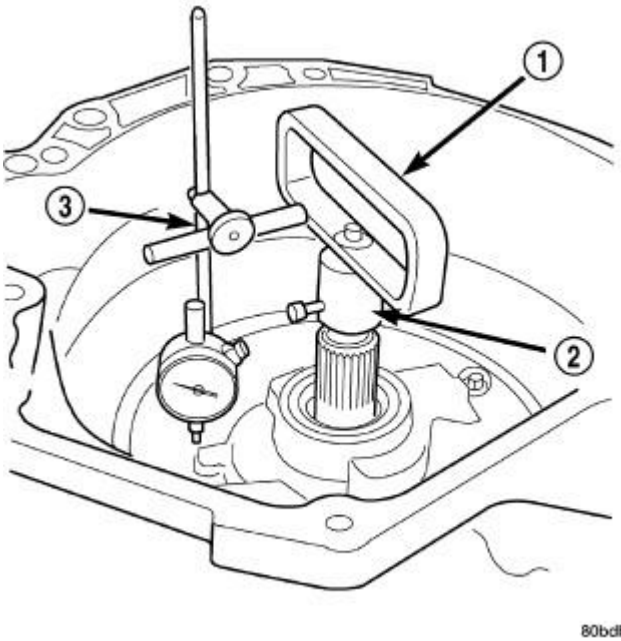

Fig. 146: Measure Input Shaft End Play Using End Play Set 8266A
Courtesy of CHRYSLER LLC

1 - END PLAY SOCKET SET 8266A
2 - DIAL INDICATOR C-3339A
-

39. Set up input shaft for measurement with Indicator Set C-3339A (3) and End Play Set 8266A (1, 2).
40. Measure the input shaft end play with the transaxle in the vertical position. **Input shaft end play must be within 0.13-0.64 mm (0.005 to 0.025 in.)** For example, if end play reading is 0.055 in. select number four Thrust Plate which is 0.071-0.074 in. thick. This should provide an input shaft end play reading of 0.020 in. which is within specifications.
41. Refer to **NO. 4 THRUST PLATE TABLE** to select the proper number four thrust plate.

NO. 4 THRUST PLATE TABLE

PART NUMBER	THICKNESS
4431665AB	1.60 mm (0.063 in.)
3836237AB	1.73 mm (0.068 in.)
4431666AB	1.80 mm (0.071 in.)
3836238AB	1.96 mm (0.077 in.)
4431667AB	2.03 mm (0.080 in.)
3836239AB	2.16 mm (0.085 in.)
4431668AB	2.24 mm (0.088 in.)

3836240AB	2.39 mm (0.094 in.)
4431669AB	2.46 mm (0.097 in.)
3836241AB	2.62 mm (0.103 in.)
4446670AB	2.67 mm (0.105 in.)
4446671AB	2.90 mm (0.114 in.)

42. Install input clutch assembly (1).

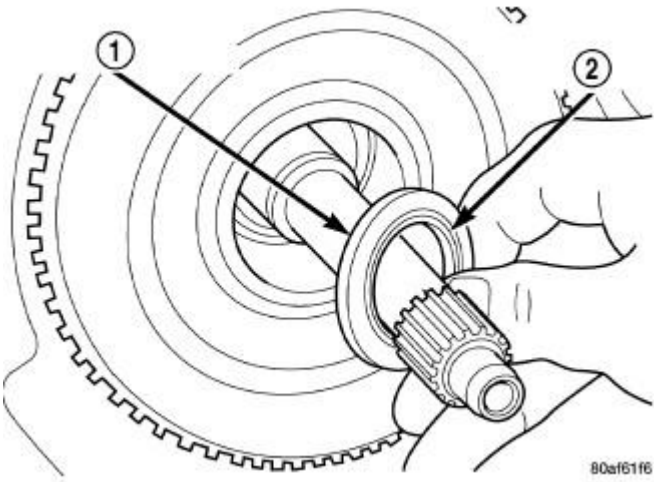

Fig. 147: Caged Needle Bearing
Courtesy of CHRYSLER LLC

1 - #1 CAGED NEEDLE BEARING
2 - NOTE: TANGED SIDE OUT

43. Install number one caged needle bearing (1) note: tanged side out (2).

CAUTION: The cooler bypass valve must be replaced if transaxle failure has occurred. Do not attempt to reuse or clean old valve.

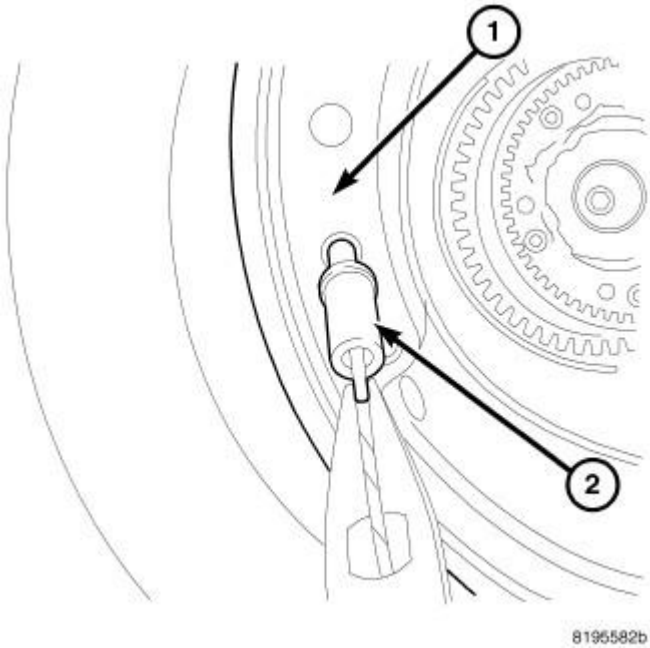

Fig. 148: Bypass Valve 62TE
Courtesy of CHRYSLER LLC

44. Install cooler bypass valve (1) with O-ring end towards rear of case.

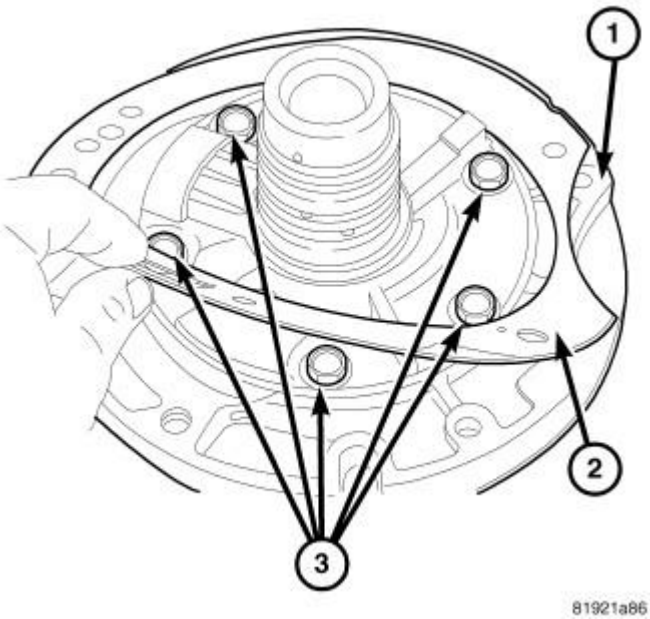

Fig. 149: Oil Pump Gasket
Courtesy of CHRYSLER LLC

45. Install oil pump gasket (1).

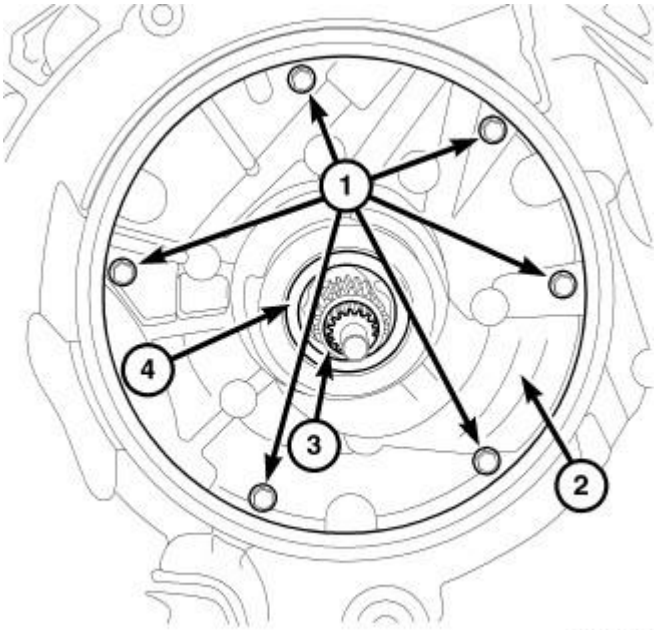

Fig. 150: Front Pump 62TE
Courtesy of CHRYSLER LLC

46. Install oil pump (2).
47. Install oil pump-to-case bolts (1) and tighten 30 N.m (265 in. lbs.).

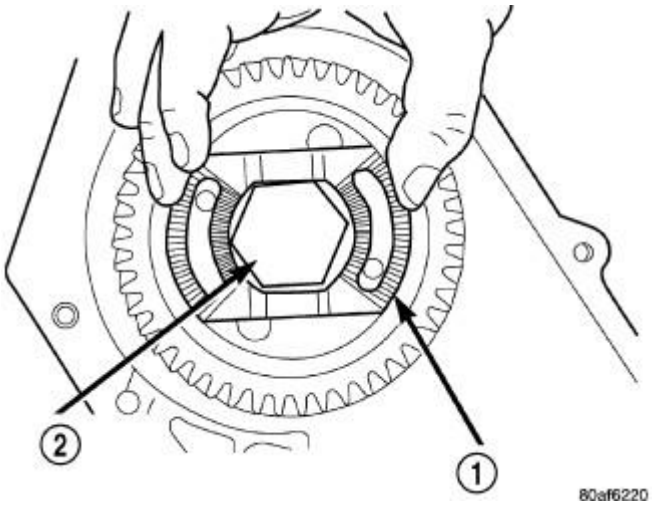

Fig. 151: Output Gear Stirrup
Courtesy of CHRYSLER LLC

1 - STIRRUP
2 - OUTPUT GEAR RETAINING BOLT

48. Install output gear stirrup (1) with serrated side out.

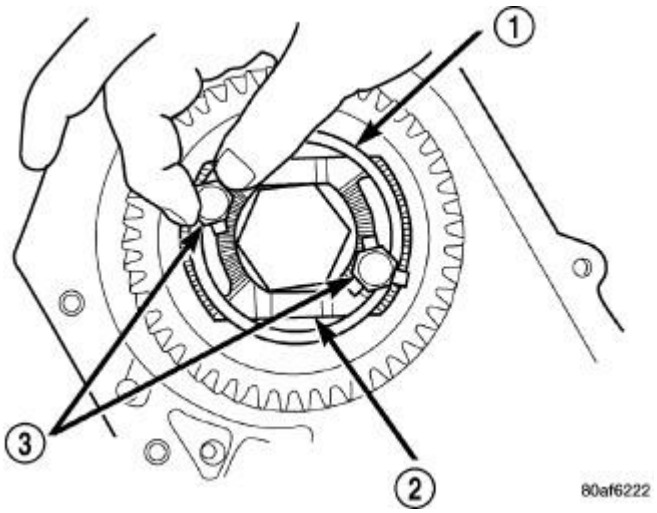

Fig. 152: Strap Bolts
Courtesy of CHRYSLER LLC

1 - RETAINING STRAP
2 - STIRRUP
3 - RETAINING STRAP BOLTS

49. Install retaining strap (1).
50. Install strap bolts (3) but do not tighten at this time.

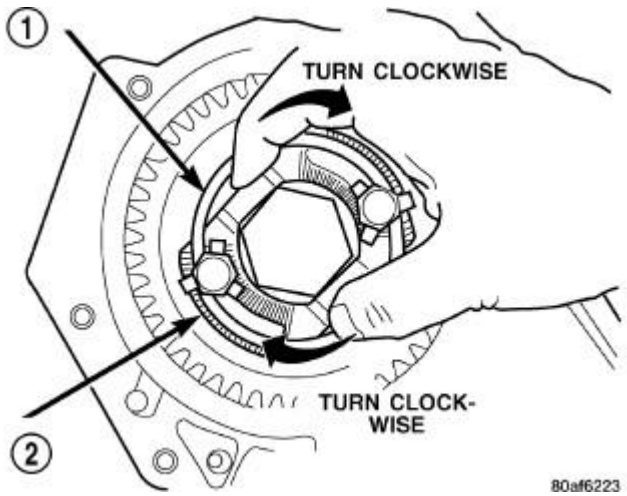

Fig. 153: Turn Stirrup Clockwise Against Bolt Flats
Courtesy of CHRYSLER LLC

1 - RETAINING STRAP
2 - STIRRUP

51. Rotate stirrup (2) clockwise against flats of retaining bolt.

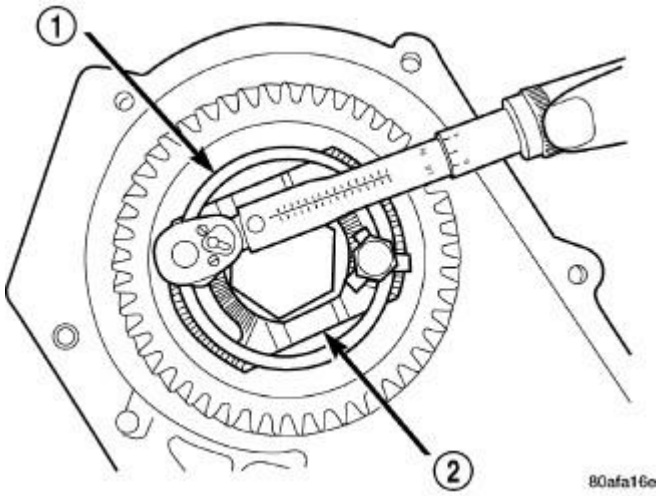

Fig. 154: Torque Stirrup Strap Bolts
Courtesy of CHRYSLER LLC

1 - RETAINING STRAP
2 - STIRRUP

52. Tighten stirrup strap bolts to 23 N.m (200 in. lbs.).

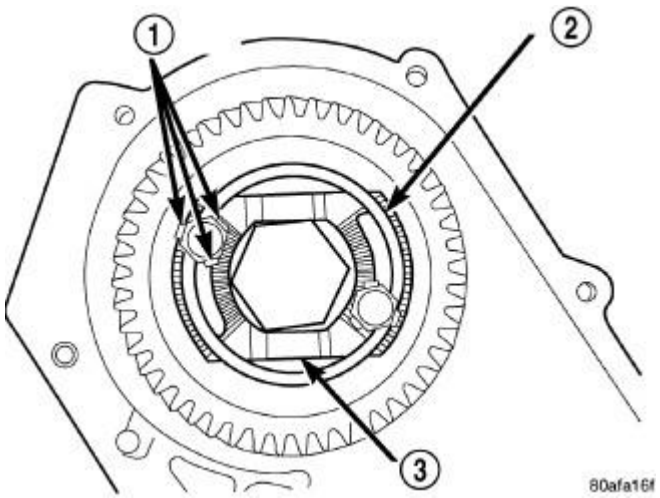

Fig. 155: Bend Tabs On Strap Up Against Flats Of Bolts
Courtesy of CHRYSLER LLC

1 - RETAINING STRAP TABS
2 - RETAINING STRAP
3 - STIRRUP

53. Bend tabs (1) on strap up against flats of bolts.

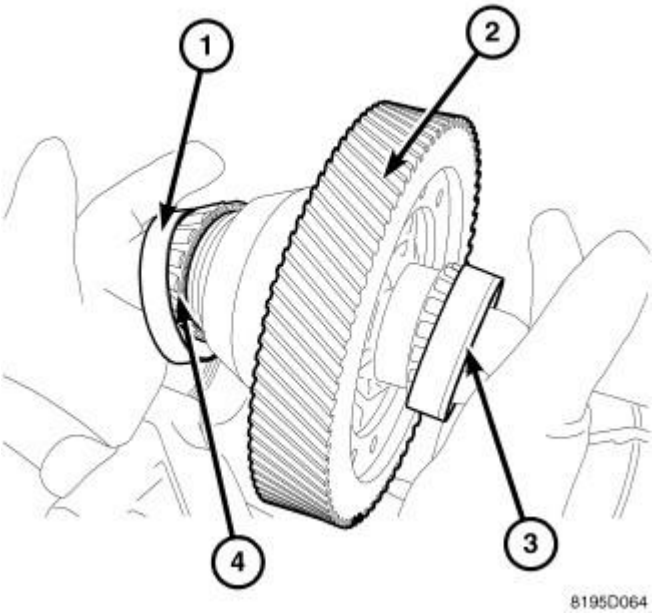

Fig. 156: Differential Out And In
Courtesy of CHRYSLER LLC

54. Install the differential, bearing cups, shim, seals and oil slinger into case.

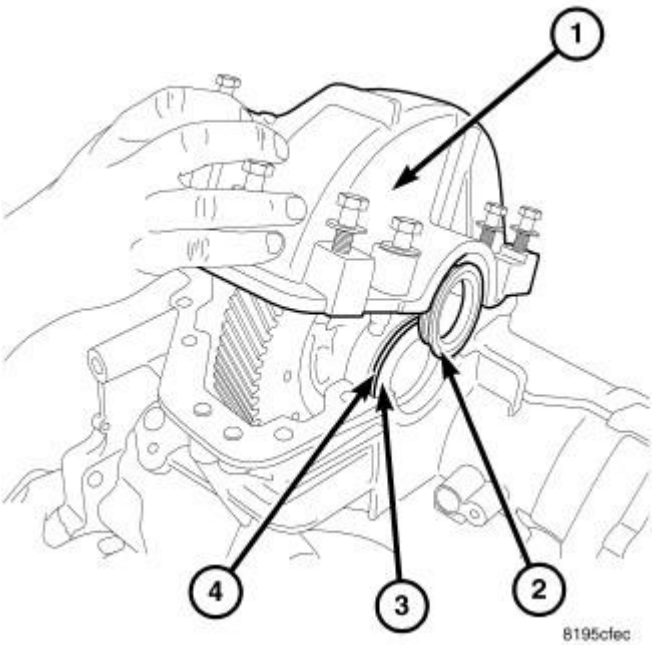

Fig. 157: Differential Cover
Courtesy of CHRYSLER LLC

55. Install the differential cover.

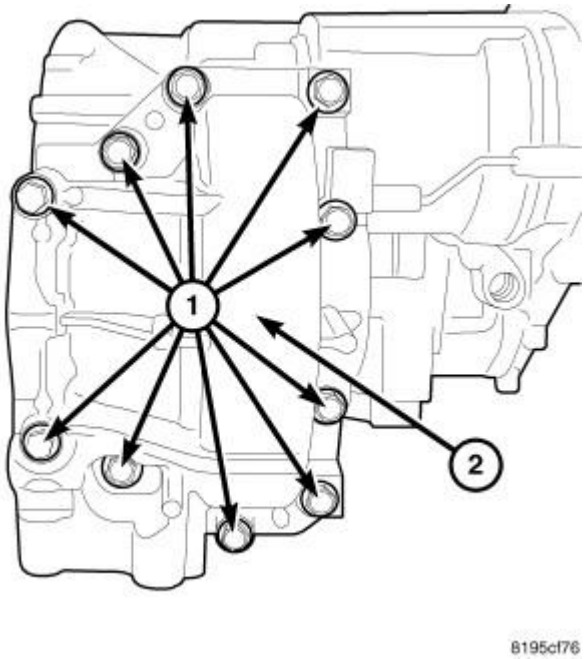

Fig. 158: Differential Cover Bolts
Courtesy of CHRYSLER LLC

56. Install the differential cover bolts (1) and tighten to 61 N.m (45 ft. lbs.).

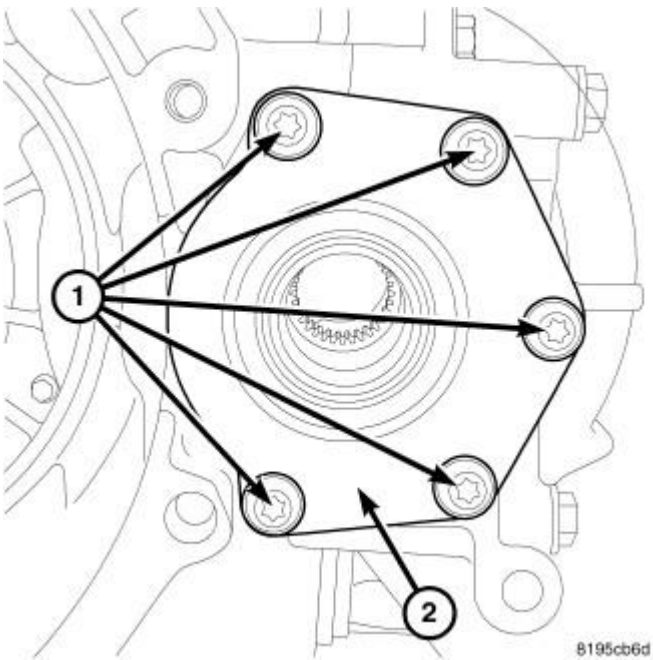

Fig. 159: Differential Output Bearing Cover Bolts
Courtesy of CHRYSLER LLC

57. Install the differential output bearing cover (2).
58. Install the differential output bearing cover bolts (1) and tighten to 12 N.m (105 in. lbs.).

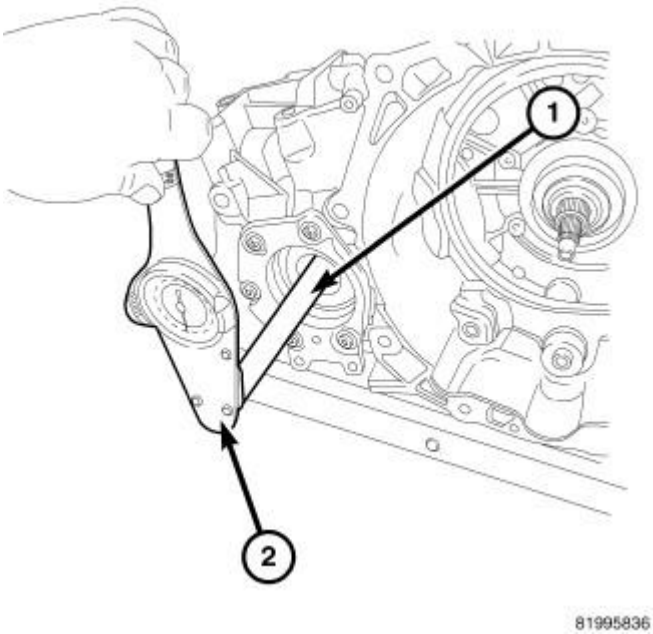

Fig. 160: Differential Turning Torque
Courtesy of CHRYSLER LLC

NOTE: Remote pinion gear must NOT be installed while checking turning torque.

59. Using the Turning Torque Tool 9735 (1) and an inch pound torque wrench (2) check the differential turning torque, it should be 10 to 22 in-lbs (drag). If turning torque is more than 22 in-lbs (drag) decrease shim size behind the end cover and recheck. If turning torque is less than 10 in-lbs (drag) increase shim size.
60. After proper turning torque is achieved for the differential remove the differential from the case and set aside keeping the correct shim with the differential.

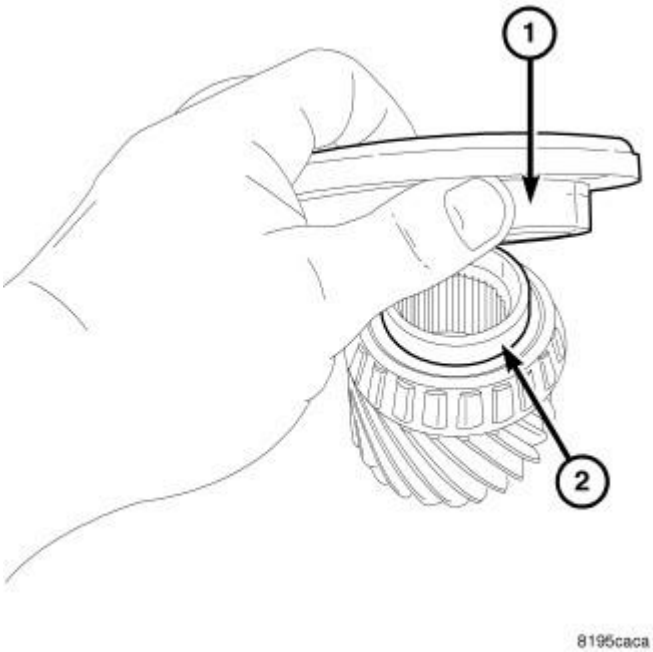

Fig. 161: Cover At Remote Pinion
Courtesy of CHRYSLER LLC

61. Install the remote pinion bearing cup in the case (small cup) using Installer 9730 and Handle C-4171.
62. Install the remote pinion bearing cup in the cover using Installer 9729 and Handle C-4171.
63. Install the remote pinion (2) into the transaxle case.

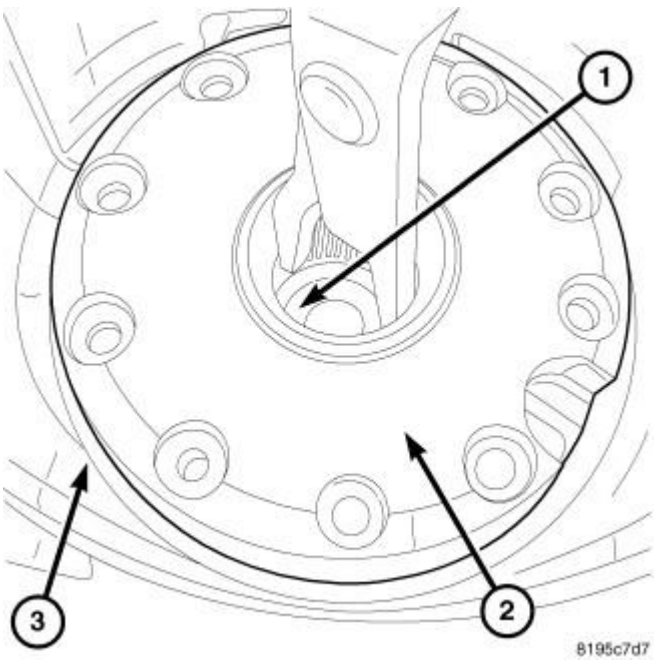

Fig. 162: Remote Pinion Cover
Courtesy of CHRYSLER LLC

64. Install the remote pinion cover (2) into transaxle case.

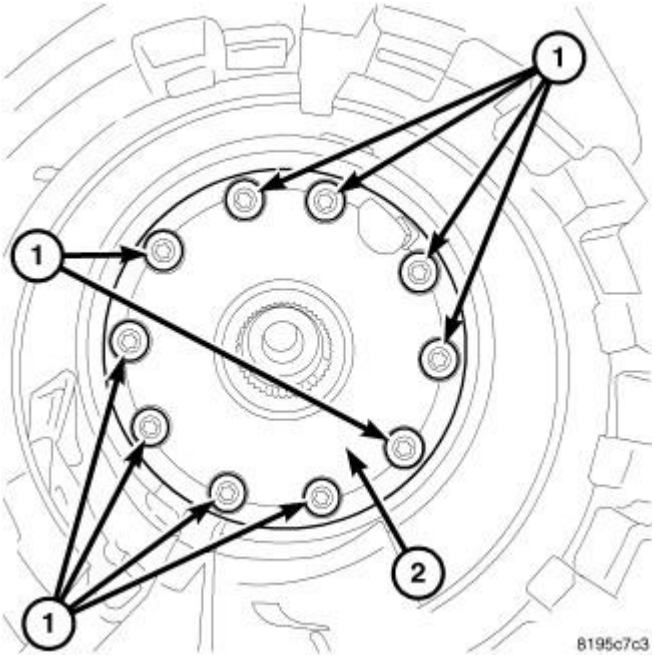

Fig. 163: Bolts At Remote Pinion Cover
Courtesy of CHRYSLER LLC

65. Install the bolts (1) at the remote pinion cover (2) and tighten to 12 N.m (105 in. lbs.).

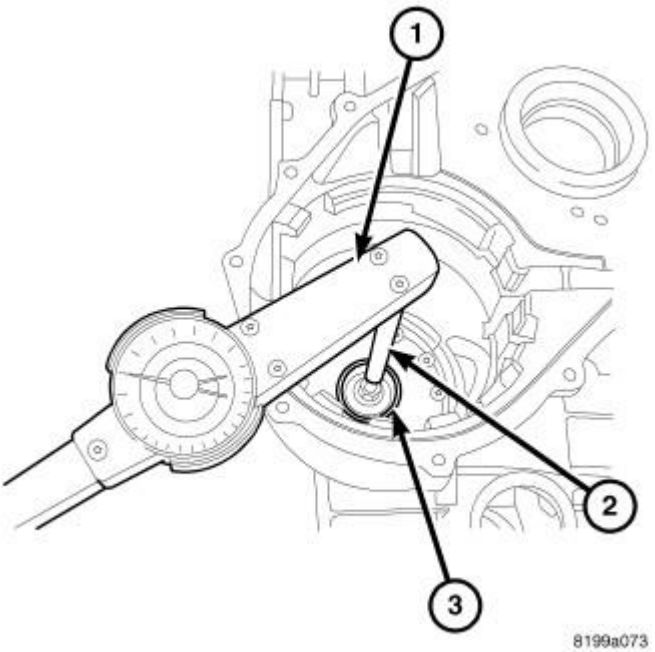

Fig. 164: Pinion Turning Torque
Courtesy of CHRYSLER LLC

NOTE: Differential assembly must not be installed when checking for pinion drag torque.

66. Check turning torque using Differential Bearing Torque Tool C-4995A (2) and an inch pound torque wrench (1). Turning torque for the remote pinion gear should be 2 to 8 in-lbs (drag). If more than 8 in-lbs (drag) decrease shim size under the remote pinion bearing cover cup. If turning torque is less than 2 in-lbs (drag) increase the shim size under the remote pinion bearing cover cup.

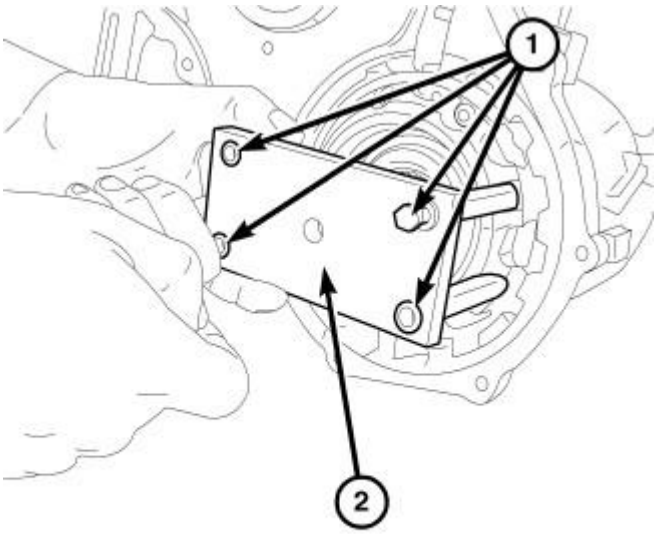

Fig. 165: Tool 9908 Bearing Retainer Assembly
Courtesy of CHRYSLER LLC

67. Install Holder 9908 (2) onto the compounder bearing retainer to help in installation.
68. Install the compounder bearing retainer into the transaxle case.

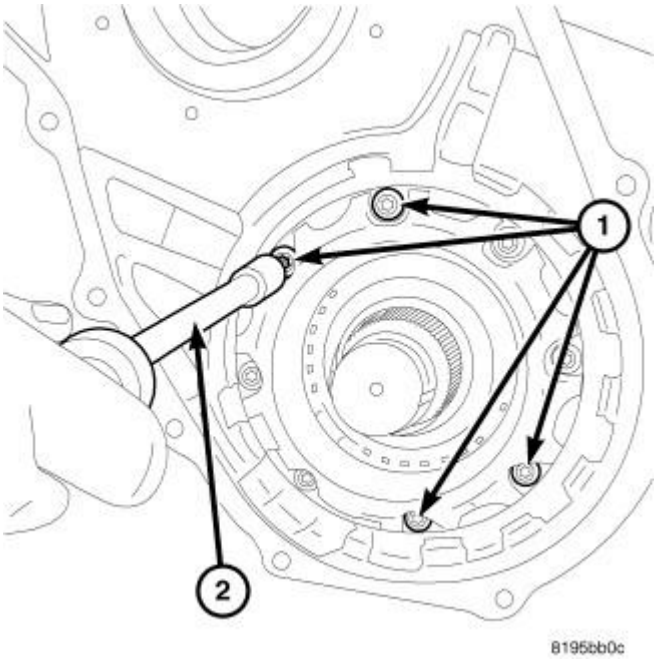

Fig. 166: Bolts At Compounder
Courtesy of CHRYSLER LLC

69. Remove Holder 9908 from the compounder bearing retainer.
70. Install all the bolts at the compounder bearing retainer and tighten to 12 N.m (105 in. lbs.).

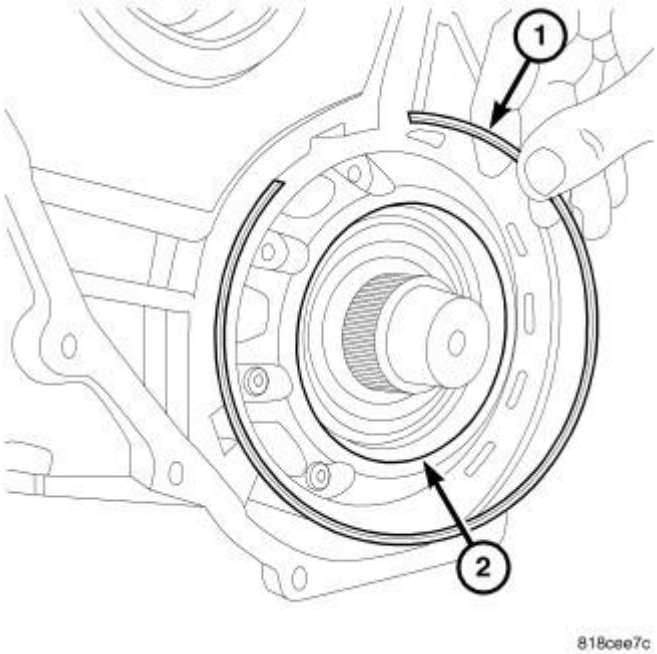

Fig. 167: Snap Ring Underdrive Compounder
Courtesy of CHRYSLER LLC

71. Install snap ring (1) at top of the compounder bearing retainer.

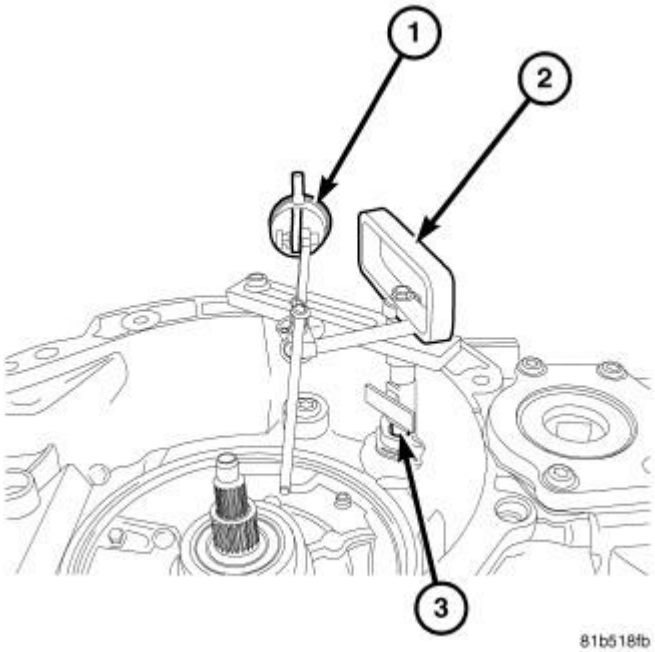

Fig. 168: End Play Tool 9951
Courtesy of CHRYSLER LLC

NOTE: Insure End Play Tool 9951 is not binding in support plate that is bolted to the case.

NOTE: Always use original shim to determine end play.

72. Remove plug at case (3).
73. Install compounder End Play Tool 9951 (2) through the hole in the front case.
74. Install Dial Indicator C-3339A (1) onto End Play Tool 9951.
75. Use moderate downward pressure on End Play Tool 9951 and zero Dial Indicator C-3339A.
76. Use moderate upward pressure on End Play Tool 9951 and take reading from Dial Indicator C-3339A.
77. Remove End Play Tool 9951 and zero Dial Indicator C-3339A.
78. Adjust shim thickness in the underdrive unit to 0.010 to 0.020.
79. Install the correct (select) helical shim and assemble the underdrive compounder. See **Transmission and Transfer Case/Automatic - 62TE/ASSEMBLY, Underdrive Compounder - Assembly** and retest.
80. Using Mopar lock and seal adhesive install plug back into case and tighten to 24 N.m (18 ft. lbs.).

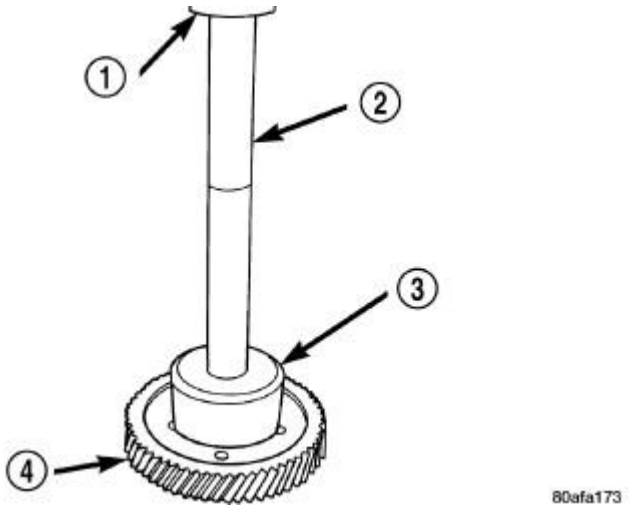

Fig. 169: Output Gear Bearing Cone
Courtesy of CHRYSLER LLC

1 - ARBOR PRESS RAM
2 - HANDLE C-4171
3 - INSTALLER 5052
4 - OUTPUT GEAR

81. Install the transfer gear (underdrive compounder side) cone using Installer 6756 (3).

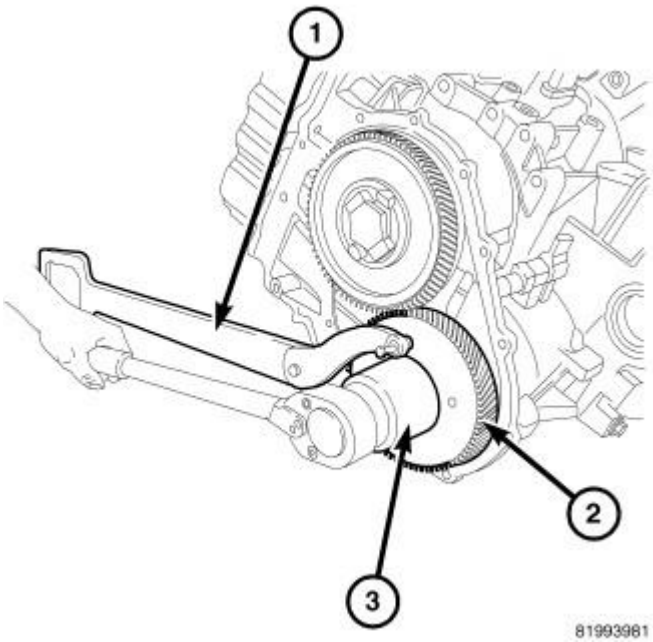

Fig. 170: Holder 9739
Courtesy of CHRYSLER LLC

82. Install Holder 9739 (1) onto the transfer gear (underdrive compounder side) (2).

83. Install a **new** transfer gear (underdrive compounder side) nut and tighten to 271 N.m (200 ft. lbs.).
84. Use Staking Tool 9721 and stake the new nut.

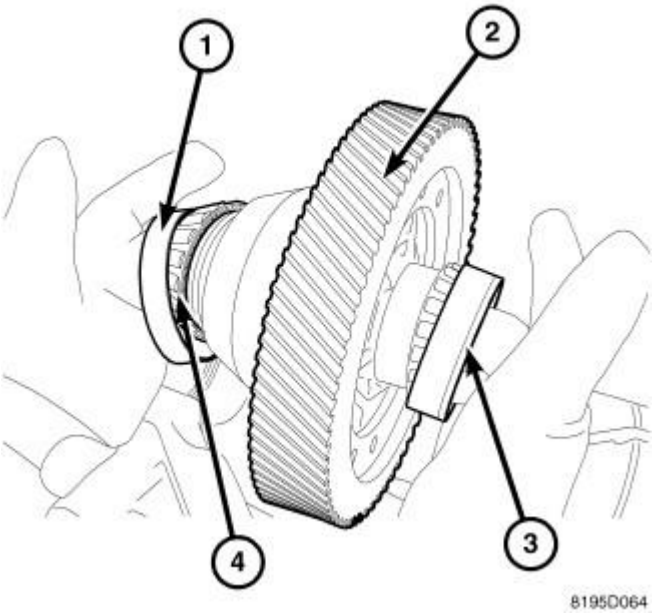

Fig. 171: Differential Out & In
Courtesy of CHRYSLER LLC

85. Install the differential, bearing cups, shim and oil slinger into case.

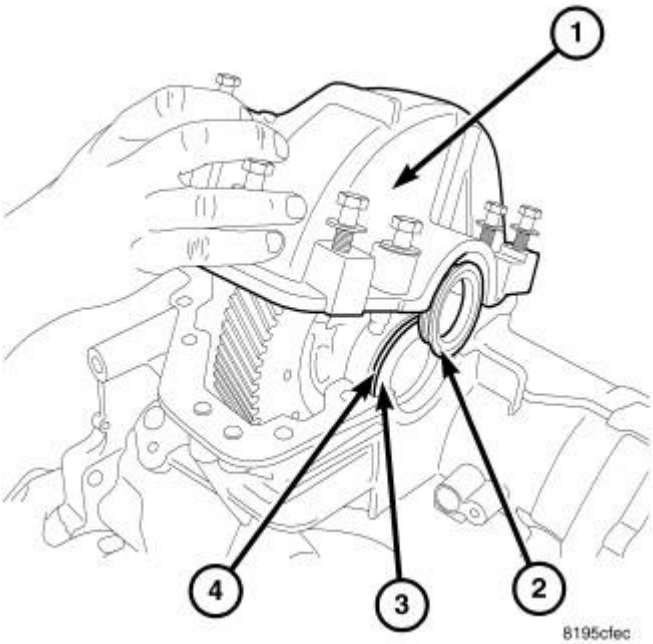

Fig. 172: Differential Cover
Courtesy of CHRYSLER LLC

86. Use a bead of MOPAR® ATF RTV (MS-GF41).
87. Install the differential cover.

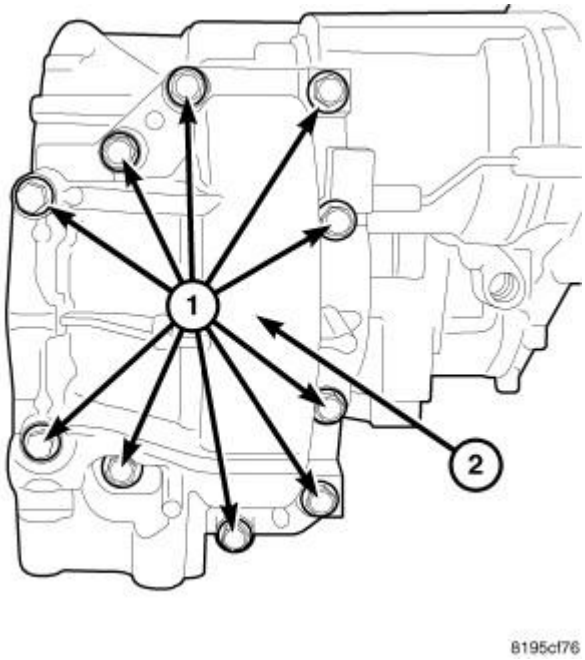

Fig. 173: Differential Cover Bolts
Courtesy of CHRYSLER LLC

88. Install the differential cover bolts (1) and tighten to 61 N.m (45 ft. lbs.).

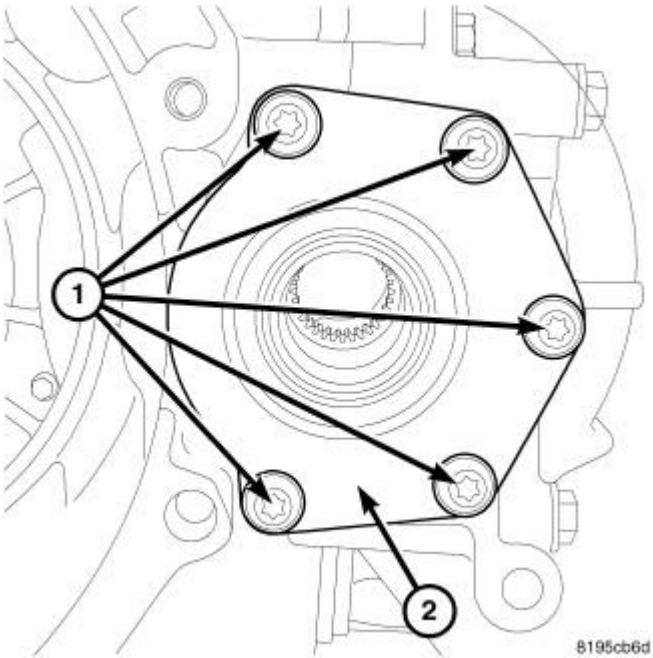

Fig. 174: Differential Output Bearing Cover
Courtesy of CHRYSLER LLC

89. Use a bead of MOPAR® ATF RTV (MS-GF41).
90. Install the differential output bearing cover (2) and tighten bolts to 12 N.m (105 in. lbs.).
91. Install differential oil seals into the case using installer MD998334-01.

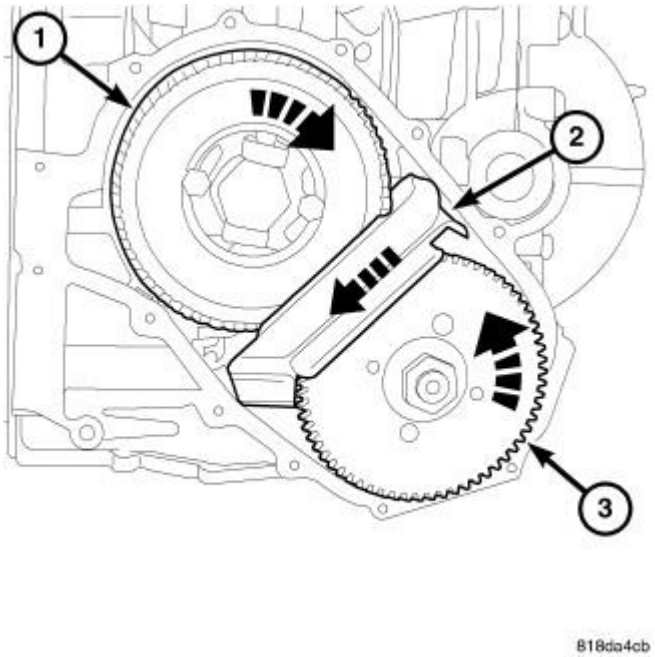

Fig. 175: Oil Scavenger
Courtesy of CHRYSLER LLC

92. Install the oil scavenger (2).

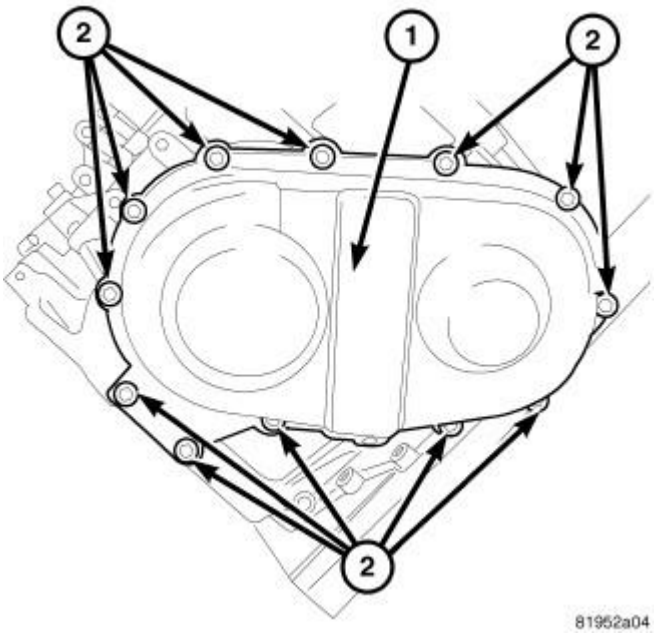

Fig. 176: Transfer Gear Cover
Courtesy of CHRYSLER LLC

93. Install the transfer gear cover (1), use a bead of MOPAR® ATF RTV (MS-GF41).
94. Install transfer gear cover-to-case bolts (2) and tighten to 12 N.m (105 in. lbs.).

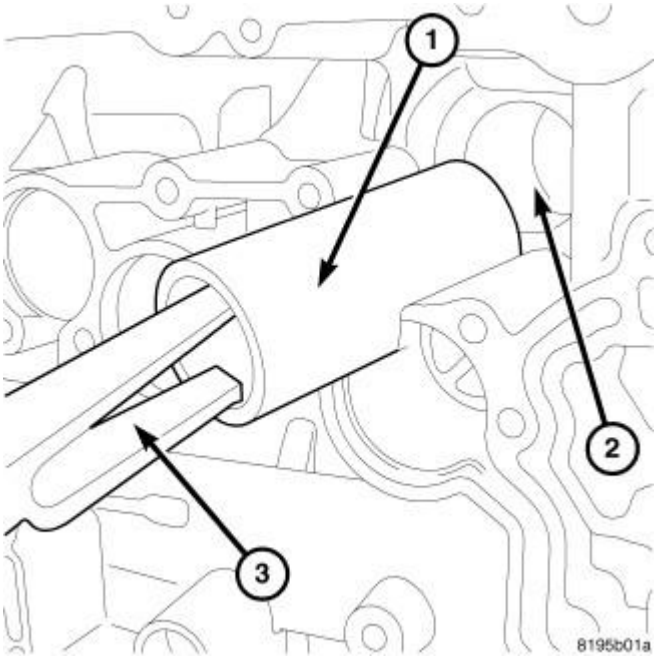

Fig. 177: Park Pawl Tube
Courtesy of CHRYSLER LLC

95. Install the park pawl tube (1) into case (2) making sure guide pin aligns with hole in case.

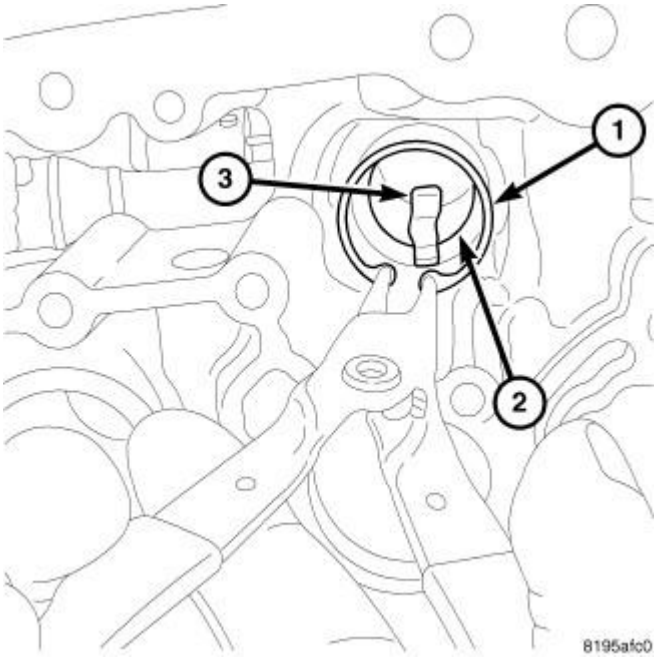

Fig. 178: Park Pawl Tube Snap Ring
Courtesy of CHRYSLER LLC

96. Install the snap ring (1) for the park pawl tube.

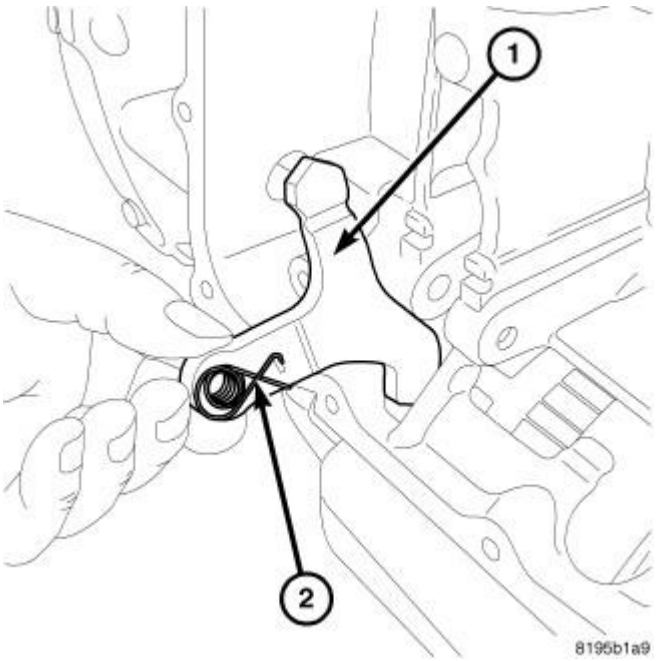

Fig. 179: Park Pawl
Courtesy of CHRYSLER LLC

97. Install the park pawl (1) and the park pawl spring (2).

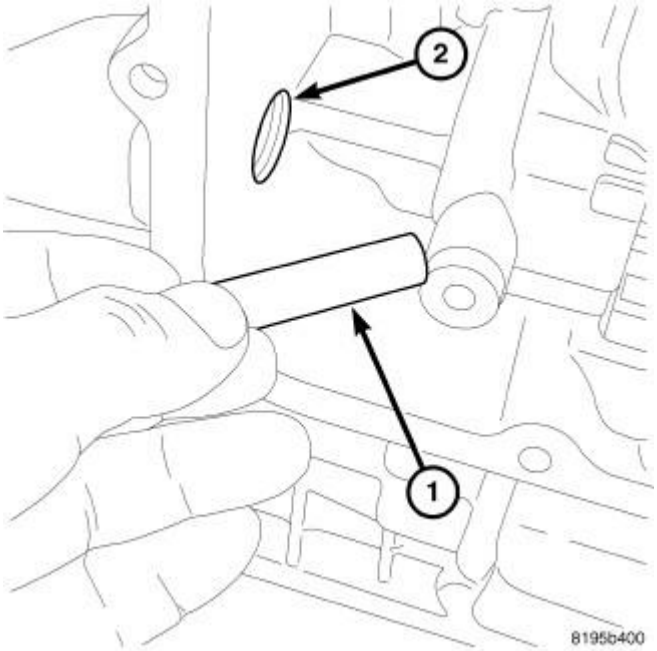

Fig. 180: Park Pawl Shaft
Courtesy of CHRYSLER LLC

98. Install the park pawl shaft (1).

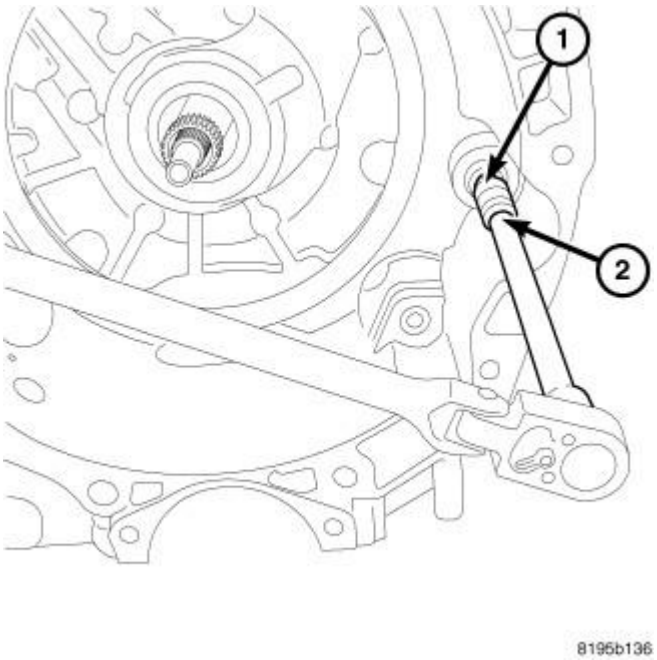

Fig. 181: Park Pawl Shaft Plug
Courtesy of CHRYSLER LLC

99. Install the park pawl shaft and park pawl pipe plug tighten to 27 N.m (20 ft. lbs.).

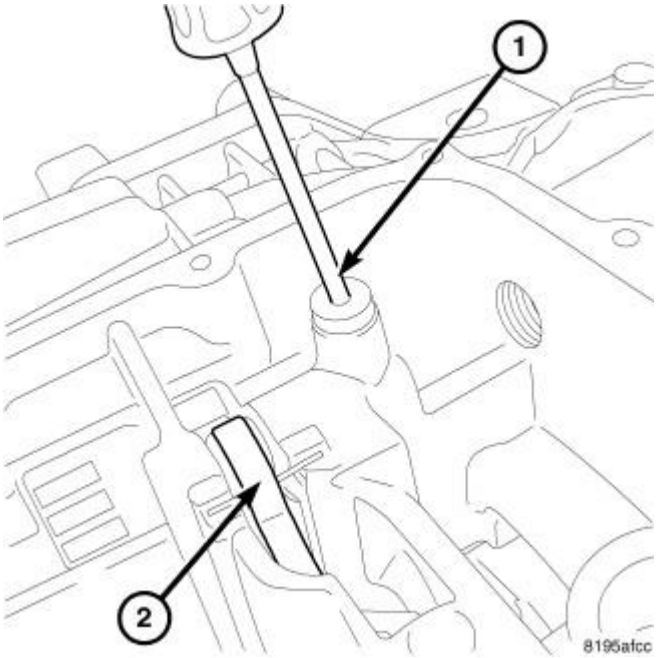

Fig. 182: Set Screw At Park Pawl Shaft
Courtesy of CHRYSLER LLC

100. Install the set screw (1) for the park pawl shaft and tighten to 1 N.m (10 in. lbs.).
101. Install the manual lever, TRS and seal. See **Transmission and Transfer Case/Automatic - 62TE/SENSOR, Transmission Range - Installation**.

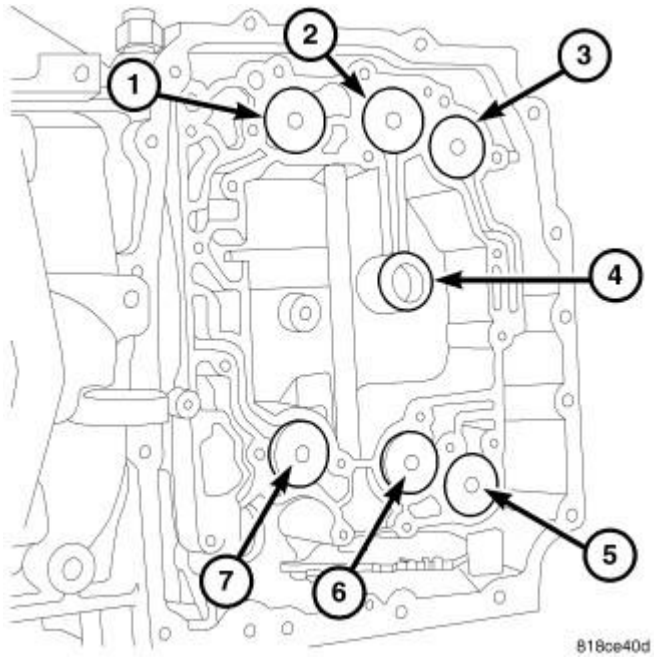

Fig. 183: Accumulators
Courtesy of CHRYSLER LLC

1 - UD ACCUMULATOR	5 - LC ACCUMULATOR
2 - 2/4 ACCUMULATOR	6 - DC ACCUMULATOR
3 - LR ACCUMULATOR	7 - OD ACCUMULATOR
4 - 2/4 CLUTCH OIL SUPPLY SEAL	-

102. Install all six accumulators (1, 2, 3, 5, 6 and 7) into case along with the accumulator return springs.
103. Install a **new** 2/4 clutch oil supply seal (4) into the case.

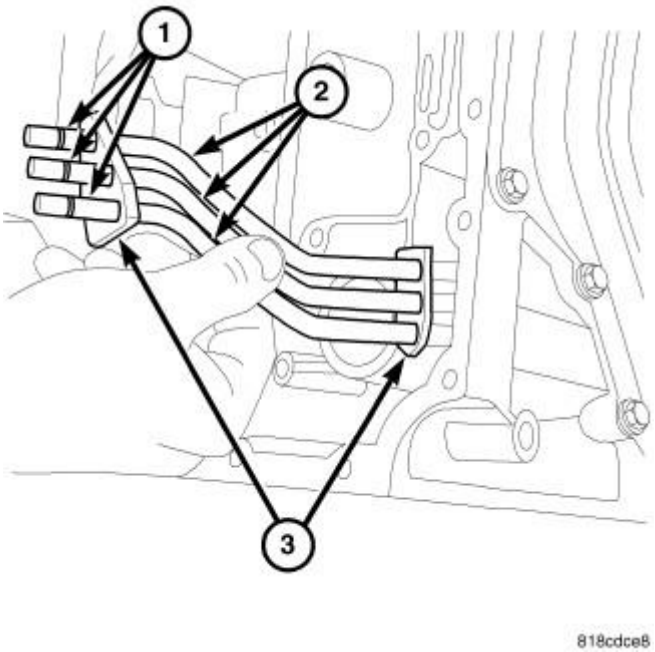

Fig. 184: Transfer Tube O-Rings
Courtesy of CHRYSLER LLC

NOTE: Install transmission oil on the oil transfer tubes O-rings.

104. Install the oil transfer tubes (2) into the case/compounder.

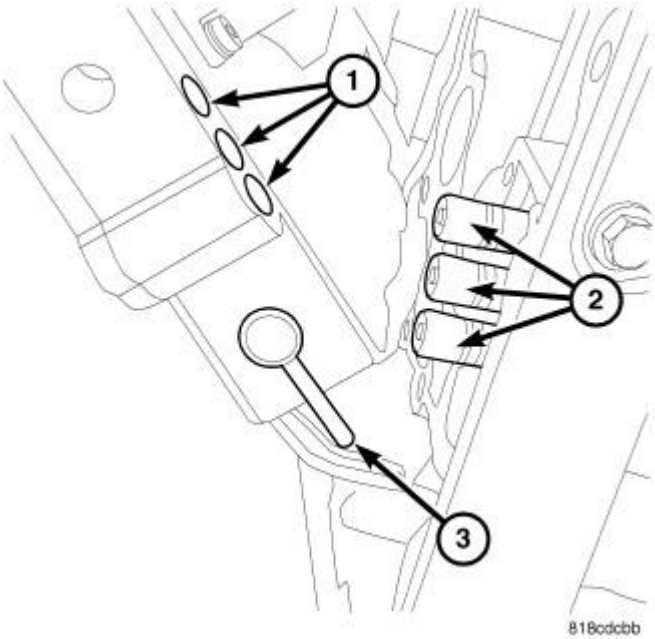

Fig. 185: Oil Transfer Tubes
Courtesy of CHRYSLER LLC

105. Install valve body (1) onto the oil transfer tubes and manual valve (3) at the rooster comb.

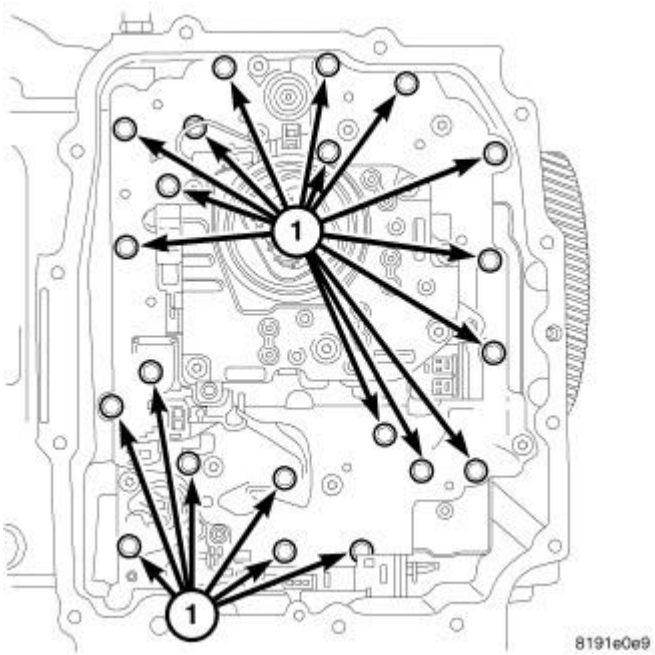

Fig. 186: Valve Body Bolts
Courtesy of CHRYSLER LLC

106. Install the valve body bolts (1) and tighten to 7 N.m (50 in. lbs.).

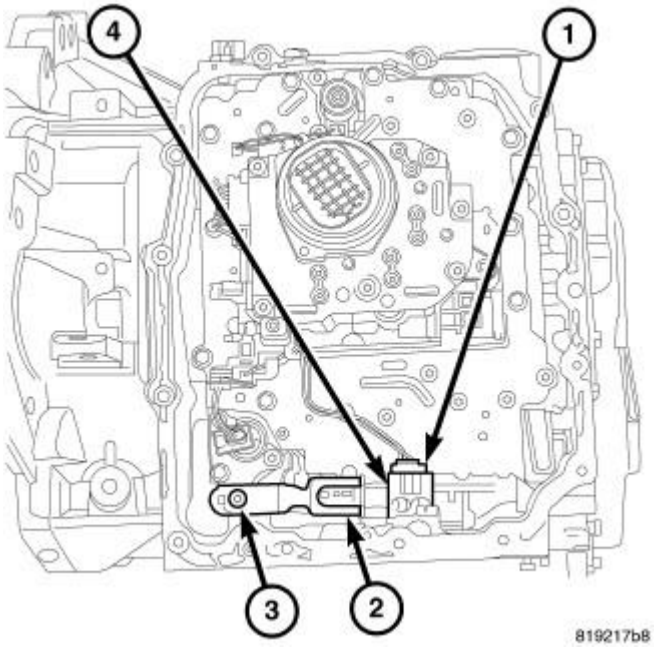

Fig. 187: Connector At Transmission
Courtesy of CHRYSLER LLC

107. Install the detent spring (2).
108. Install the bolt (3) holding the detent spring and tighten to 7 N.m (50 in. lbs.).
109. Install the electrical connector (1) at the range sensor (4).

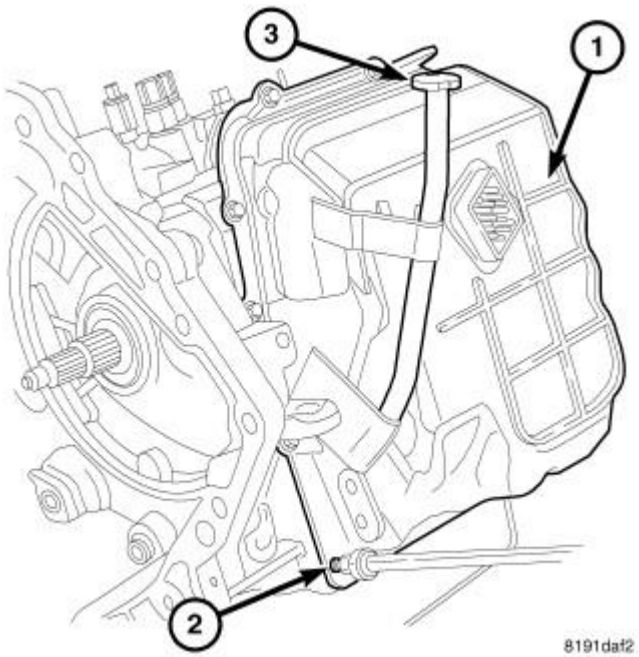

Fig. 188: Valve Body Pan
Courtesy of CHRYSLER LLC

110. Install the valve body oil pan, use a bead of MOPAR® ATF RTV (MS-GF41).
111. Install the valve body oil pan bolts and tighten to 6 N.m (53 in. lbs.).

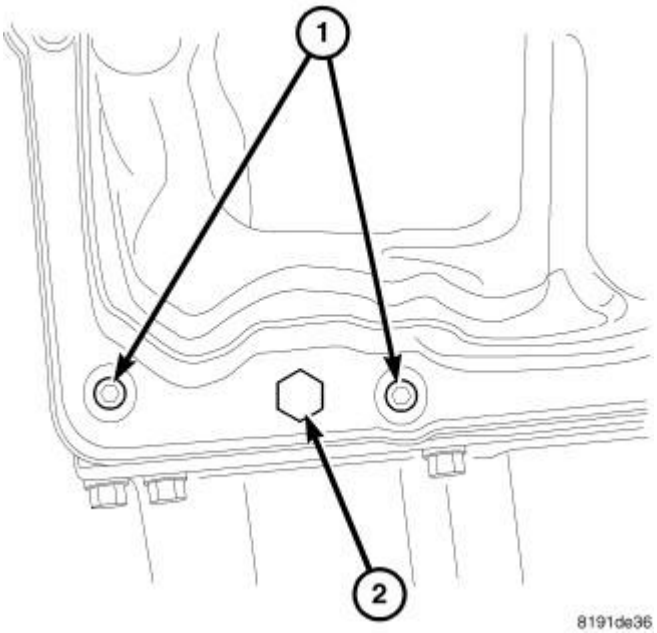

Fig. 189: Pressure Tap Plug
Courtesy of CHRYSLER LLC

112. Install the pressure tap plug (2) at valve body pan and tighten to 9 N.m (45 in. lbs.).

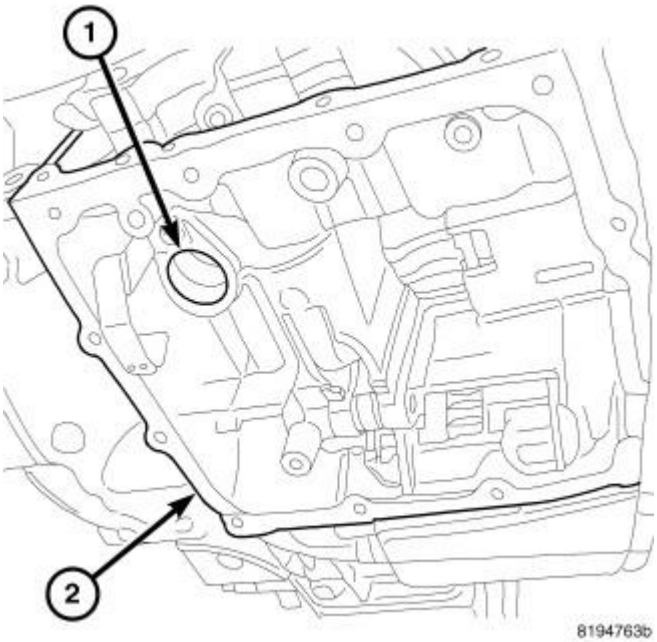

Fig. 190: Oil Filter Seal At Case
Courtesy of CHRYSLER LLC

113. Install the fluid filter seal (1) at the case.

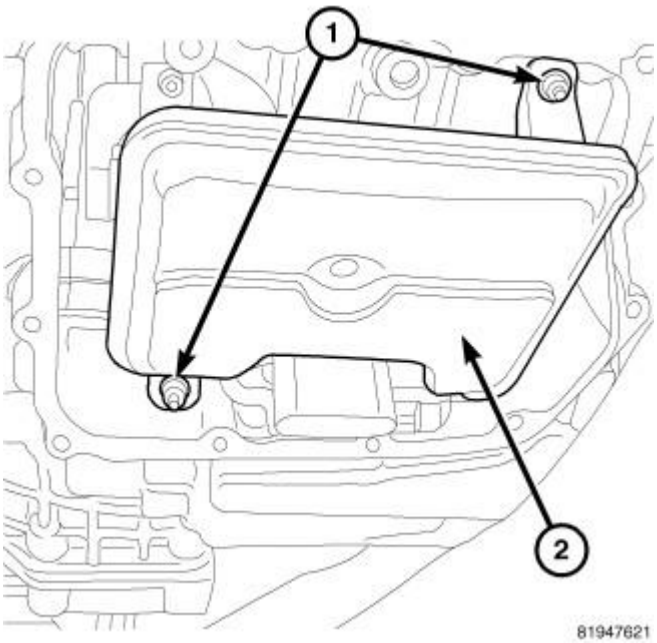

Fig. 191: Fluid Filter
Courtesy of CHRYSLER LLC

114. Install the fluid filter (2).
115. Install the fluid filter mounting nuts and tighten to 5 N.m (40 in. lbs.).

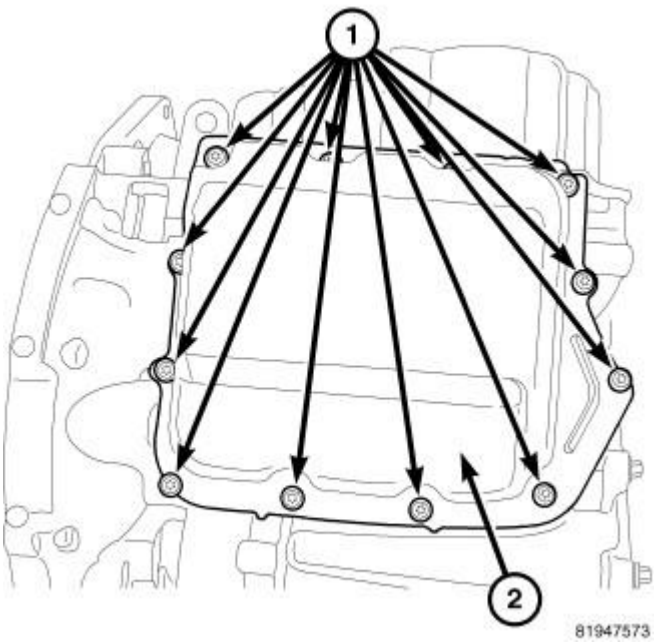

Fig. 192: Filter Oil Pan
Courtesy of CHRYSLER LLC

116. Install the fluid filter oil pan, use a bead of MOPAR® ATF RTV (MS-GF41).
117. Install the fluid filter oil pan bolts and tighten to 6 N.m (53 in. lbs.).

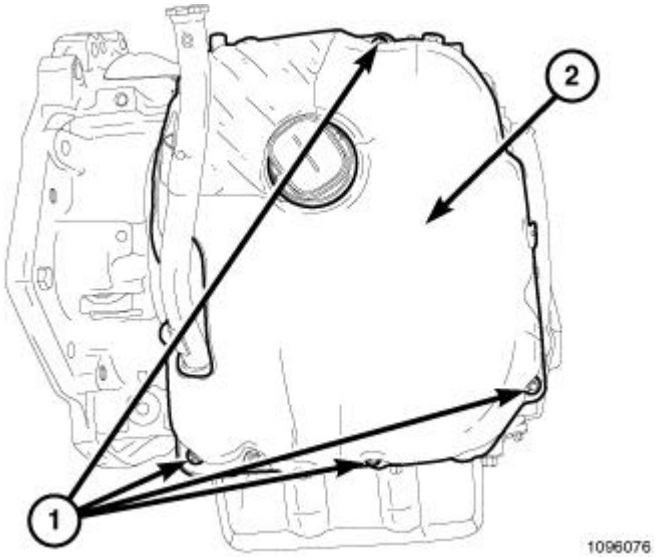

Fig. 193: Fasteners And Front Sound Dampener Cover
Courtesy of CHRYSLER LLC

118. If equipped install the Front Sound Dampener Cover (2) and the fasteners (1).

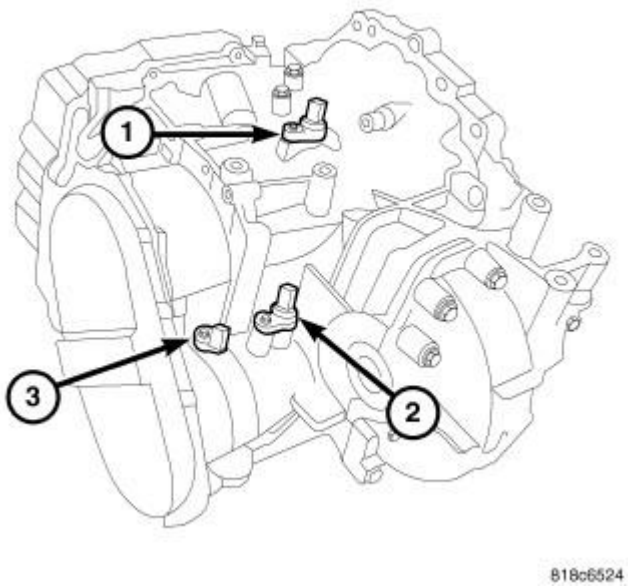

Fig. 194: Speed Sensors
Courtesy of CHRYSLER LLC

119. Install the speed sensors (1, 2 and 3) and tighten bolts to 12 N.m (105 in. lbs.).

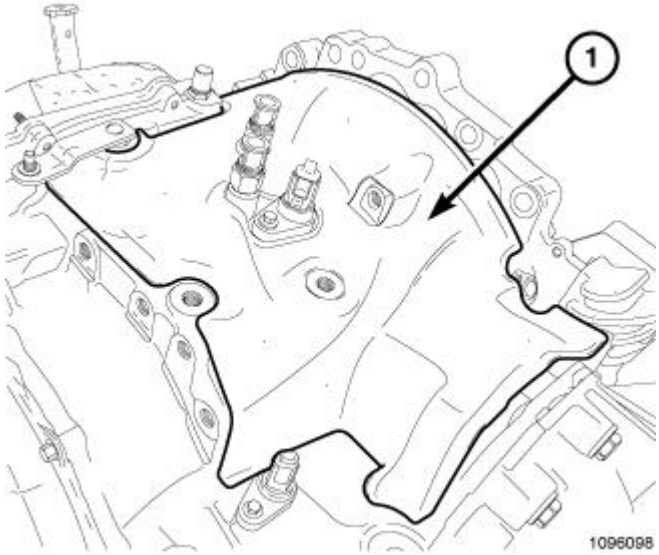

Fig. 195: Top Sound Dampener Cover
Courtesy of CHRYSLER LLC

120. If equipped, install the Top Sound Dampener Cover (1).

INSTALLATION

INSTALLATION

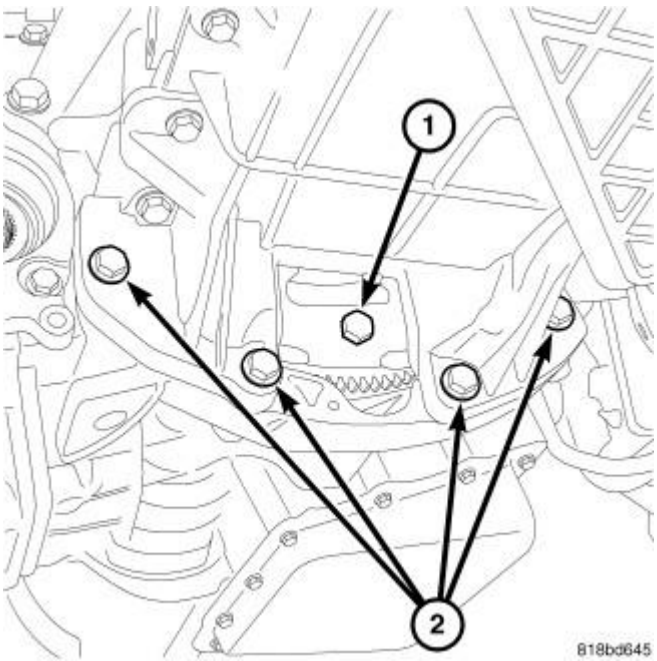

Fig. 196: Torque Converter Bolts
Courtesy of CHRYSLER LLC

1. Install transaxle into position.

NOTE: The two transaxle-to-engine bolts next to the inspection cover will have a exhaust bracket under them.

2. On 4.0L engines, install the transaxle-to-engine two outer lower bolts and torque to 60 N.m (44 ft. lbs.).
3. Install torque converter-to-driveplate bolts (1) and tighten to 88 N.m (65 ft. lbs.).

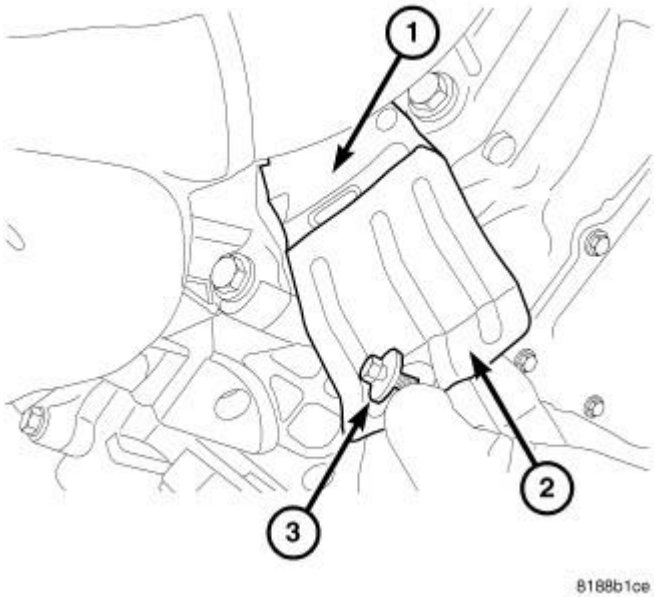

Fig. 197: Dust Shield
Courtesy of CHRYSLER LLC

4. Install torque converter dust shield and bolt tighten to 10 N.m (88 in. lbs.).

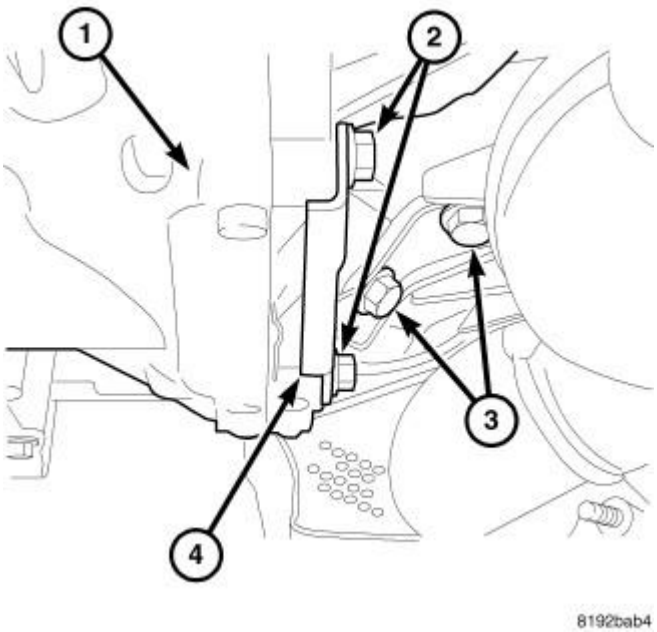

Fig. 198: Exhaust Bracket Bolts
Courtesy of CHRYSLER LLC

5. Install bolts (2) to stand off bracket (4) and tighten to 95 N.m (70 ft. lbs.).
6. Install the remaining transaxle-to-engine lower bolts and torque to 60 N.m (44 ft. lbs.).
7. Install the cross under exhaust pipe (If equipped). Refer to **Exhaust System/PIPE, Exhaust Crossunder - Installation** .
8. Install bolts (3) to exhaust bracket.

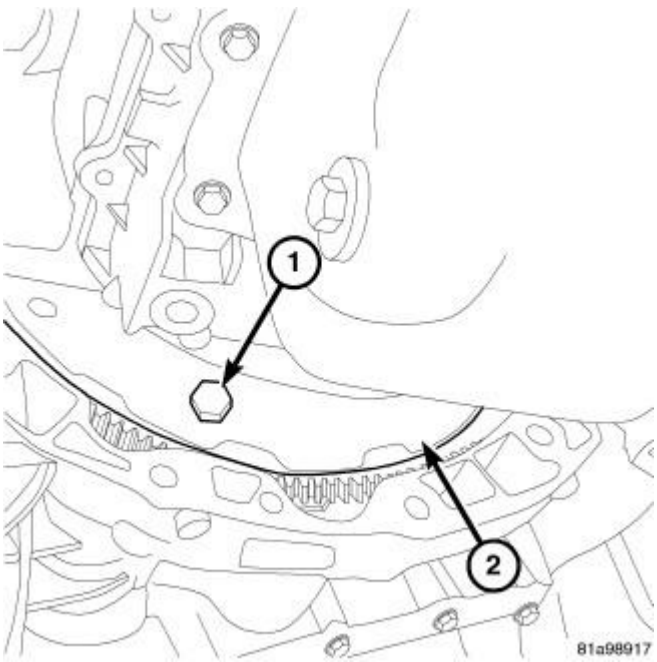

Fig. 199: Torque Converter Bolts
Courtesy of CHRYSLER LLC

9. On 3.8L engines Install transaxle into position
10. Install the two lower transaxle-to-engine bolts and torque to 60 N.m (44 ft. lbs.).
11. Install torque converter-to-driveplate bolts (1) and tighten to 88 N.m (65 ft. lbs.).

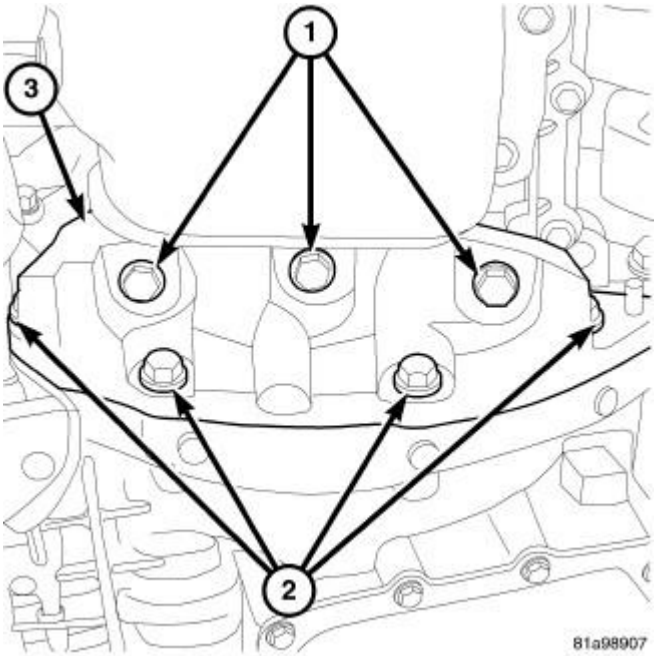

Fig. 200: Structural Collar
Courtesy of CHRYSLER LLC

12. Install the bolts holding structural collar to the oil pan (1) and transmission (2) tighten to 75 N.m (55 ft. lbs.). Refer to **Engine/Engine Block/COVER, Structural Dust - Installation** .

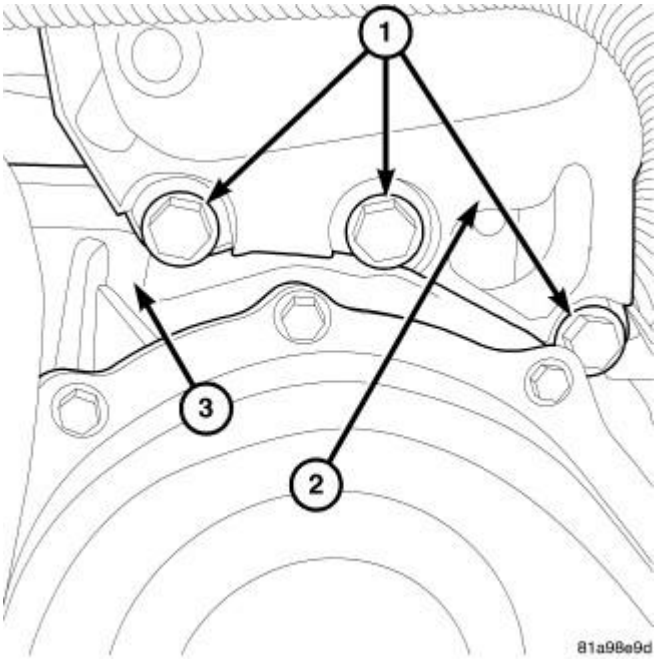

Fig. 201: Left Side Transaxle Mount Bracket & Bolts
Courtesy of CHRYSLER LLC

13. Install the left side transaxle mount bracket and bolts tighten to 75 N.m (55 ft. lbs.).
14. Lift transaxle into place.

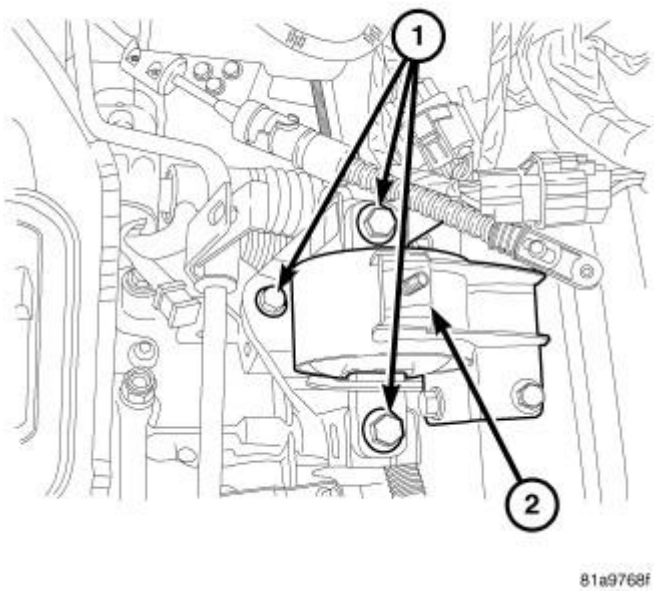

Fig. 202: Left Motor Mount Bolts
Courtesy of CHRYSLER LLC

15. Install left motor mount bolts (1) and tighten to 100 N.m (74 ft. lbs.)

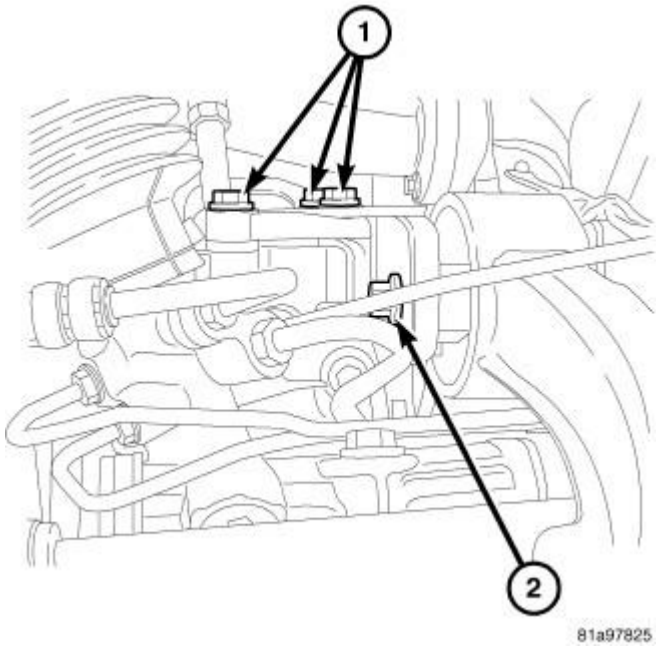

Fig. 203: Rear Mount & Bolts
Courtesy of CHRYSLER LLC

16. Install the rear mount and bolts, tighten to 100 N.m (74 ft. lbs.).

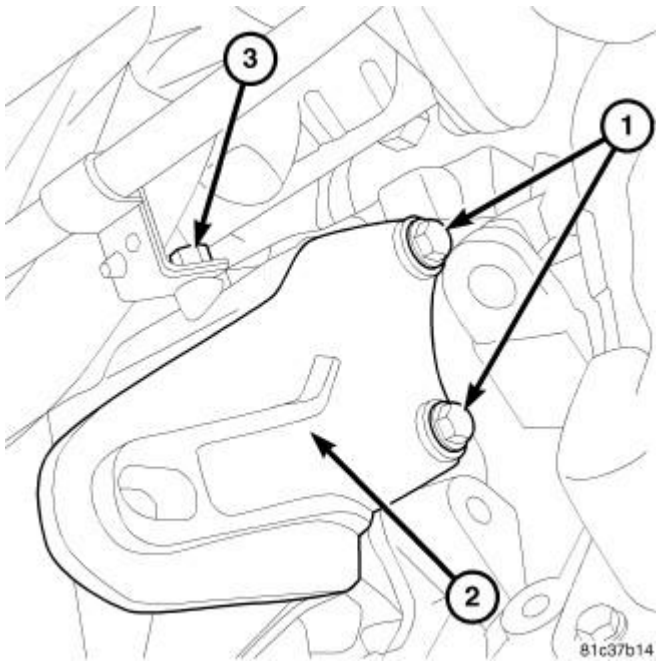

Fig. 204: Front Mount Bracket Bolts
Courtesy of CHRYSLER LLC

17. Install the starter motor along with the front mount bracket.
18. Install the front mount bracket bolts (1) and tighten to 100 N.m (74 ft. lbs.).

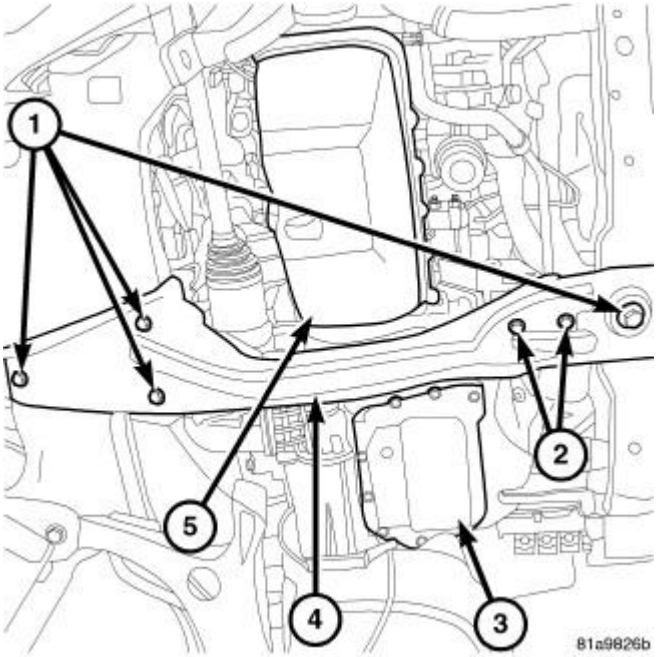

Fig. 205: Transmission Crossmember
Courtesy of CHRYSLER LLC

19. Install the transmission crossmember and tighten to 50 N.m (37 ft. lbs.).

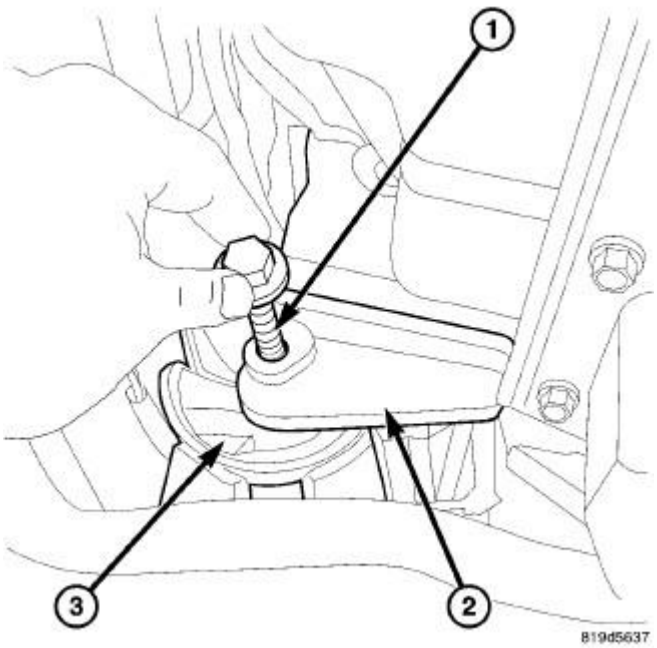

Fig. 206: Crossmember Through Bolt
Courtesy of CHRYSLER LLC

20. Install front mount through bolt and tighten to 50 N.m (37 ft. lbs.)

21. the front and both side splash shields (if equipped). Refer to **Body/Exterior/SHIELD, Splash - Installation**

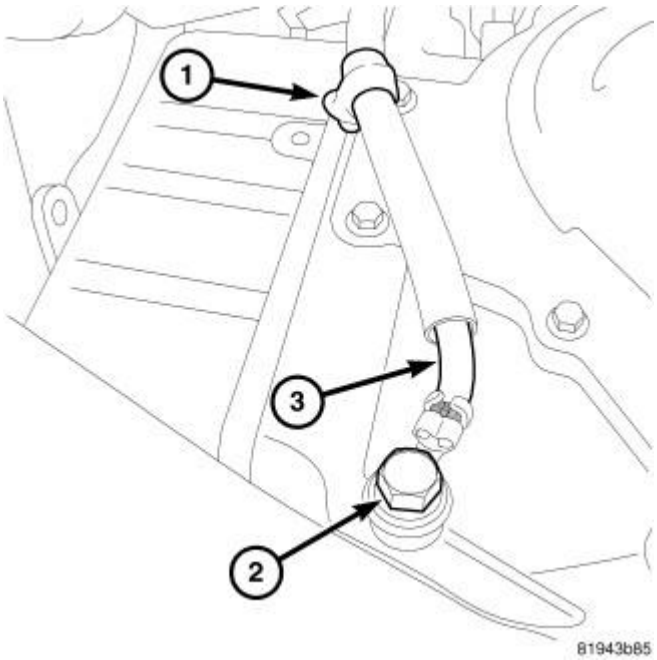

Fig. 207: Ground Cable
Courtesy of CHRYSLER LLC

22. Install the ground cable bolt and tighten to 54 N.m (40 ft. lbs.).
23. Install halfshaft assemblies. Refer to **Differential and Driveline/Half Shaft - Installation** .

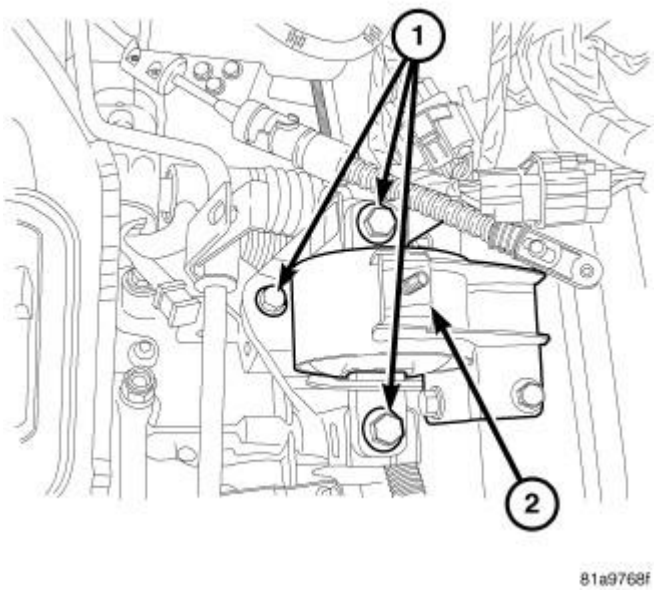

Fig. 208: Left Side Mount Bolts

Courtesy of CHRYSLER LLC

24. Lower the vehicle.
25. Install the left side mount bolts along with the heater tube bracket and tighten to 100 N.m (74 ft. lbs.).

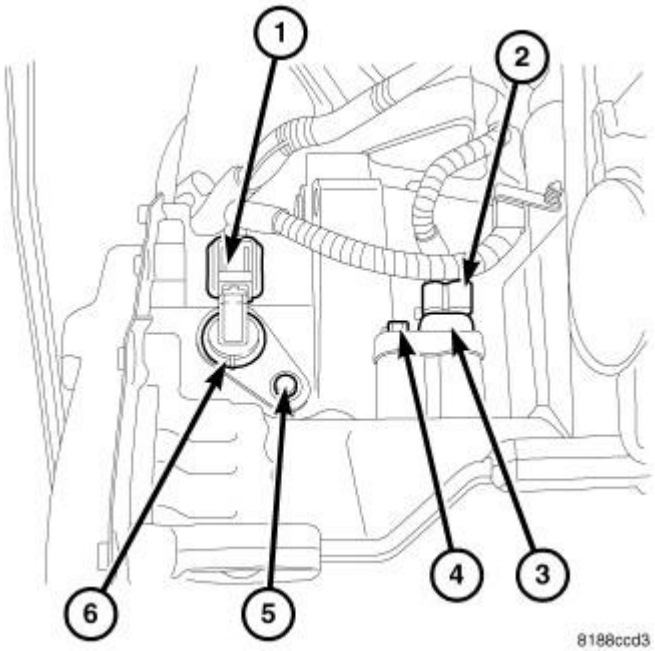

Fig. 209: Output Speed Sensors
Courtesy of CHRYSLER LLC

26. Connect input speed sensor connector.
27. Connect both output speed sensor connectors (1, 2).

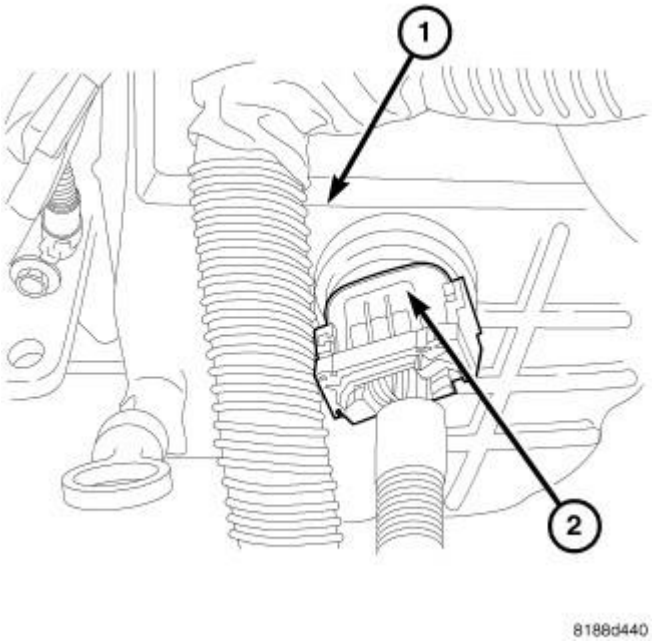

Fig. 210: Solenoid Connector At Transmission
Courtesy of CHRYSLER LLC

28. Connect solenoid/pressure switch assembly connector (2).

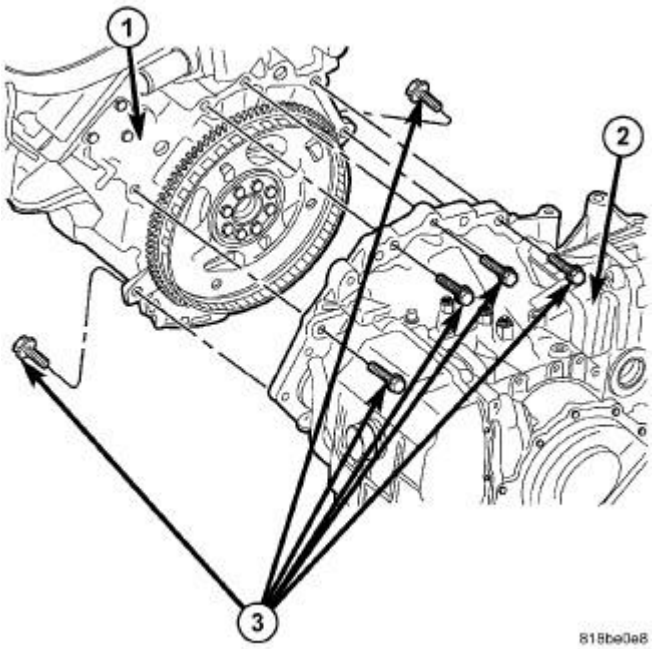

Fig. 211: Upper Transmission Bolts
Courtesy of CHRYSLER LLC

29. Install the transaxle-to-engine upper bolts and tighten to 95 N.m (70 ft. lbs.).

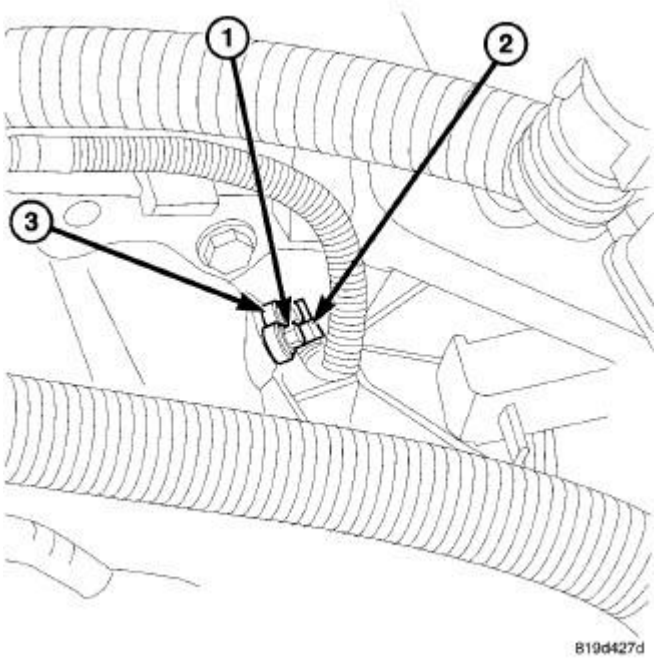

Fig. 212: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

30. Install and connect crankshaft position sensor (1) and tighten to 12 N.m (105 in. lbs.).

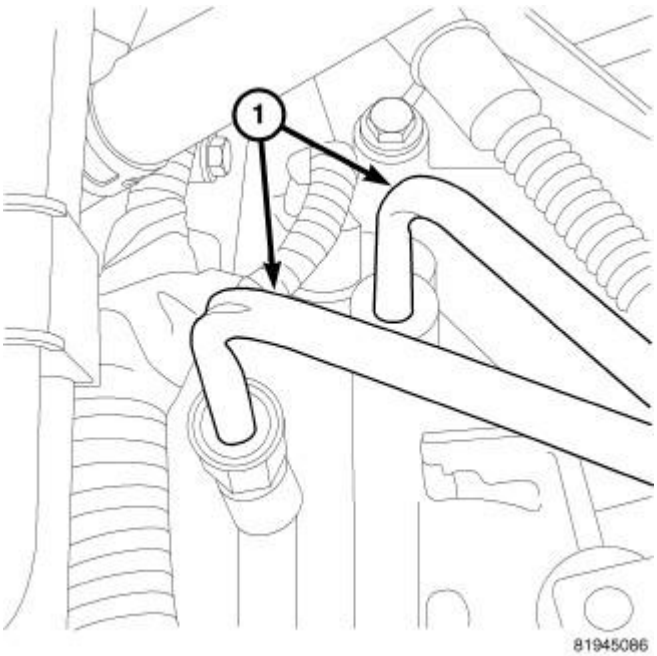

Fig. 213: Cooler Lines At Transaxle
Courtesy of CHRYSLER LLC

31. Connect oil cooler lines to transaxle. An audible 'click' should be heard. Verify connection by pulling

outward.

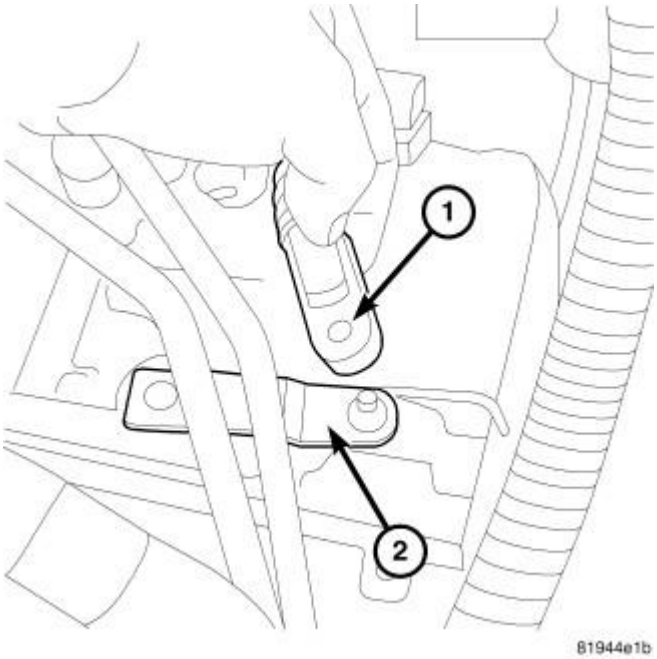

Fig. 214: Shift Cable From/To Manual Lever
Courtesy of CHRYSLER LLC

32. Connect gearshift cable to the bracket.
33. Connect gearshift cable to transaxle manual valve lever. Verify adjustment.

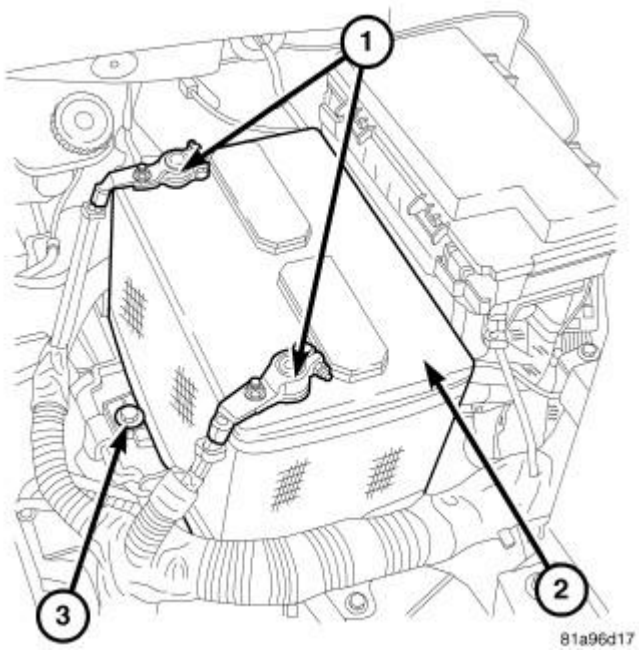

Fig. 215: Battery
Courtesy of CHRYSLER LLC

34. Install the battery tray.
35. Install the tie straps holding harness and ground cable to the battery tray.
36. Install the battery (2) and battery hold down bolt (3).
37. Connect battery cables.
38. Fill transaxle. See **Transmission and Transfer Case/Automatic - 62TE/FLUID - Standard Procedure**.

ACCUMULATOR

DESCRIPTION

DESCRIPTION

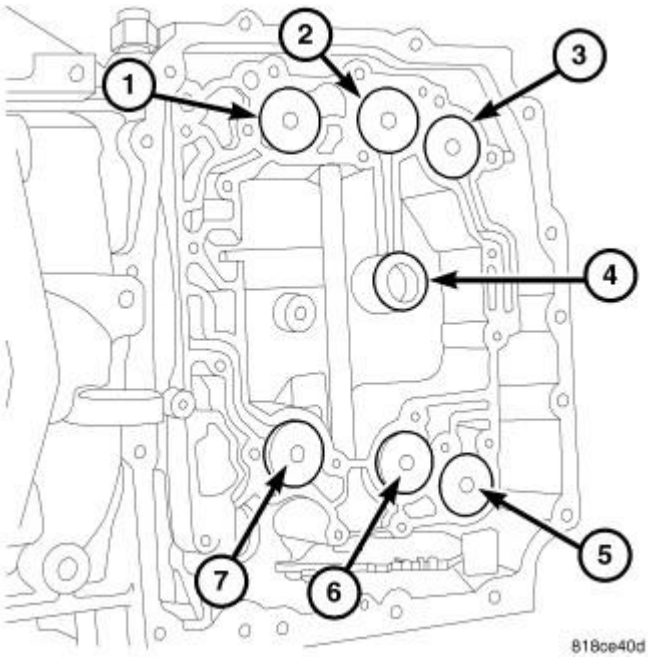

Fig. 300: Accumulators
Courtesy of CHRYSLER LLC

1 - UD ACCUMULATOR	5 - LC ACCUMULATOR
2 - 2/4 ACCUMULATOR	6 - DC ACCUMULATOR
3 - LR ACCUMULATOR	7 - OD ACCUMULATOR
4 - 2/4 CLUTCH OIL SUPPLY SEAL	-

The 62TE has six accumulators and are all located in the case under the valve body.

OPERATION

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and spring(s). The intended result is a smooth, firm clutch application.

REMOVAL

REMOVAL

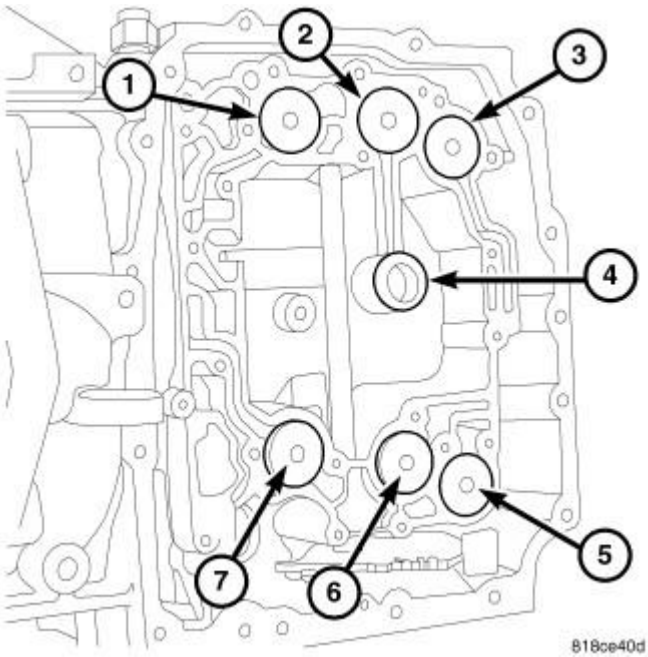

Fig. 301: Accumulators
Courtesy of CHRYSLER LLC

1 - UD ACCUMULATOR	5 - LC ACCUMULATOR
2 - 2/4 ACCUMULATOR	6 - DC ACCUMULATOR
3 - LR ACCUMULATOR	7 - OD ACCUMULATOR
4 - 2/4 CLUTCH OIL SUPPLY SEAL	-

1. Remove the valve body. See **Transmission and Transfer Case/Automatic - 62TE/VALVE BODY - Removal**.
2. Remove the accumulator as needed.

INSTALLATION

INSTALLATION

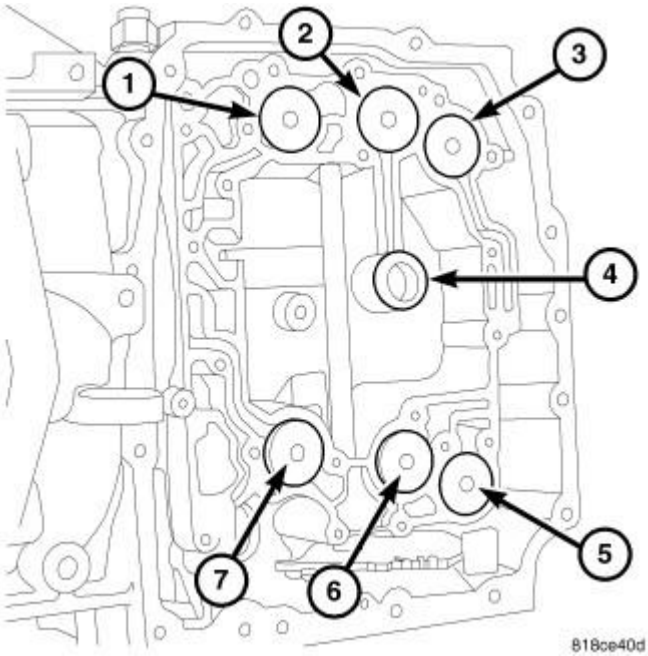

Fig. 302: Accumulators
Courtesy of CHRYSLER LLC

1 - UD ACCUMULATOR 2 - 2/4 ACCUMULATOR	5 - LC ACCUMULATOR 6 - DC ACCUMULATOR
3 - LR ACCUMULATOR	7 - OD ACCUMULATOR
4 - 2/4 CLUTCH OIL SUPPLY SEAL	-

1. Install the accumulator as needed.
2. Install the valve body. See **Transmission and Transfer Case/Automatic - 62TE/VALVE BODY - Installation**.

ASSEMBLY, INPUT CLUTCH

DISASSEMBLY

DISASSEMBLY

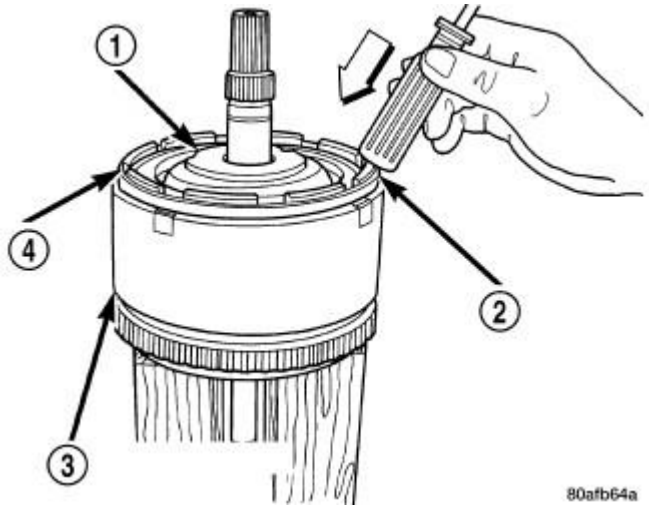

Fig. 303: Tapping Reaction Plate

1 - INPUT CLUTCH ASSEMBLY
2 - INPUT CLUTCH PRESSURE FIXTURE 8391

21. Install input clutch assembly (1) to the Input Clutch Pressure Fixture 8391 (2).

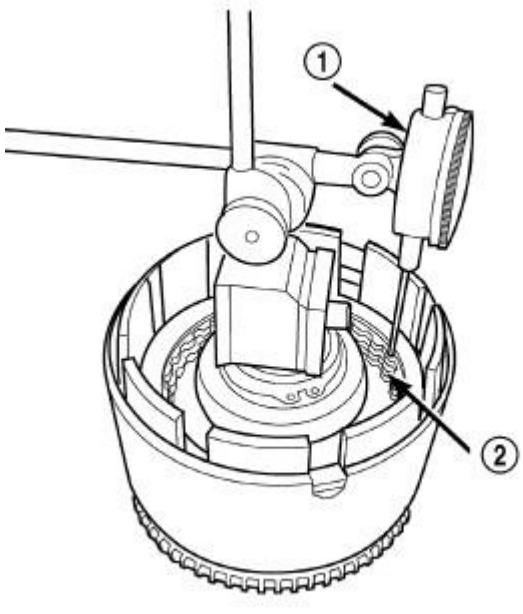

Fig. 340: Set Up Dial Indicator To Measure UD Clutch Clearance
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

22. Set up dial indicator (1) on the UD clutch pack (2).

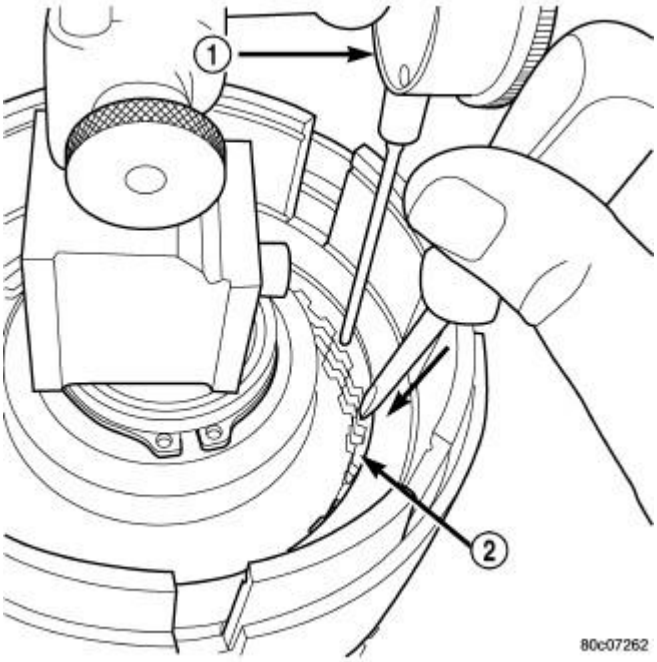

Fig. 341: Press Down On UD Clutch Pack & Zero Dial Indicator
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - UNDERDRIVE CLUTCH

23. Using moderate pressure, press down and hold (near indicator) the UD clutch pack (2) with screwdriver or suitable tool and zero dial the indicator. When releasing pressure on clutch pack, indicator reading should advance (0.005-0.010 in.).

CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.

24. Apply 30 psi (206 kPa) to the underdrive hose on Input Clutch Pressure Fixture 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four places, 90° apart.
25. Take average of four measurements and compare with UD clutch pack (2) clearance specification. **Underdrive clutch pack clearance must be 0.91-1.47 mm (0.036 - 0.058 in.).**

26. If necessary, select the proper reaction plate to achieve specifications:

UNDERDRIVE REACTION PLATE THICKNESS	
4659939AB	5.837-5.937 mm (0.230-0.234 in.)
4659940AB	6.147-6.248 mm (0.242-0.246 in.)
4659941AB	6.457-6.557 mm (0.254-0.258 in.)

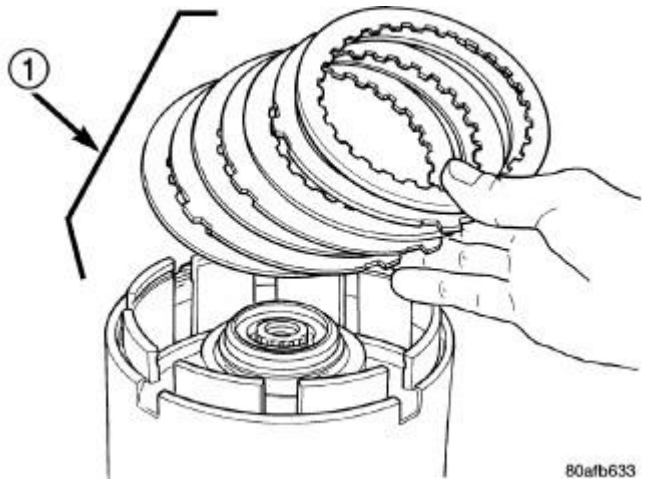

Fig. 342: OD Clutch Pack

6 - INPUT CLUTCH ASSEMBLY

30. Refer to the illustration as necessary when performing the following steps.

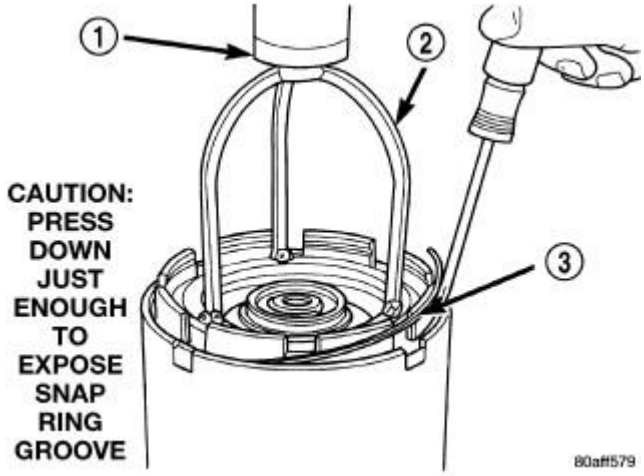

Fig. 346: Flat Snap Ring
Courtesy of CHRYSLER LLC

1 - ARBOR PRESS RAM
2 - COMPRESSOR 5059-A
3 - FLAT SNAP RING

31. Install OD pressure plate flat snap ring (3).

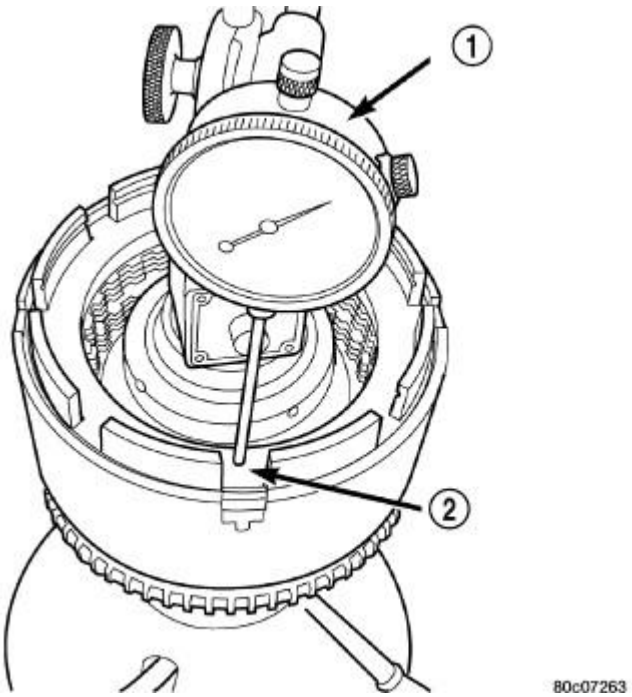

Fig. 347: Measure OD Clutch Pack Clearance
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR

2 - OD/REVERSE REACTION PLATE

32. Measure OD clutch pack clearance. Set up dial indicator (1) on top of the OD/Reverse pressure plate.
33. Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.
34. Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 0.491 - 2.345 mm (0.019 - 0.092 in.).**

    If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

35. Install reverse clutch pack (two frictions/one steel) (1, 2).

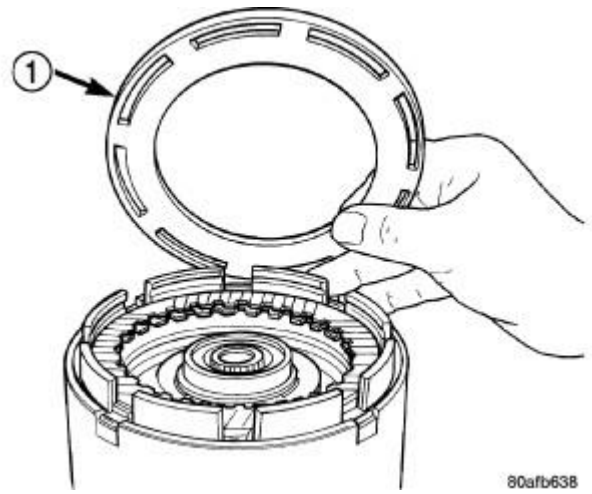

Fig. 348: Reverse Clutch Reaction Plate
Courtesy of CHRYSLER LLC

1 - REVERSE CLUTCH REACTION PLATE (FLAT SIDE DOWN)

36. Install reverse clutch reaction plate with the flat side down towards reverse clutch.

4 - MUST RAISE REVERSE REACTION PLATE TO RAISE SNAP RING

39. Pry up reverse reaction plate (4) to seat against snap ring (2).

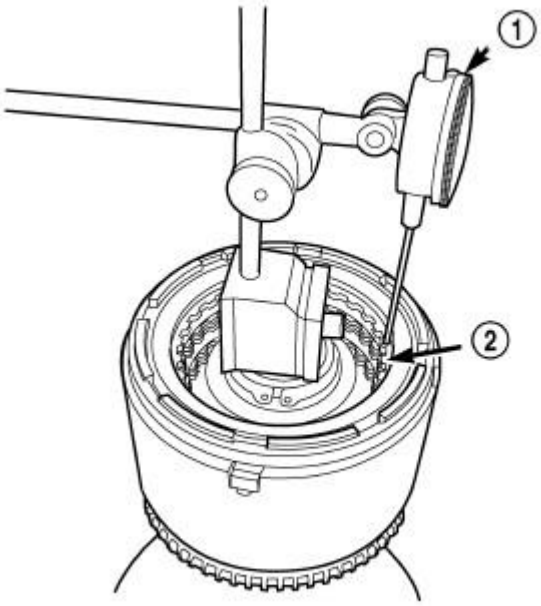

Fig. 352: Measure Reverse Clutch Pack Clearance
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - REVERSE CLUTCH

40. Set up a dial indicator (1) on the reverse clutch pack (2).

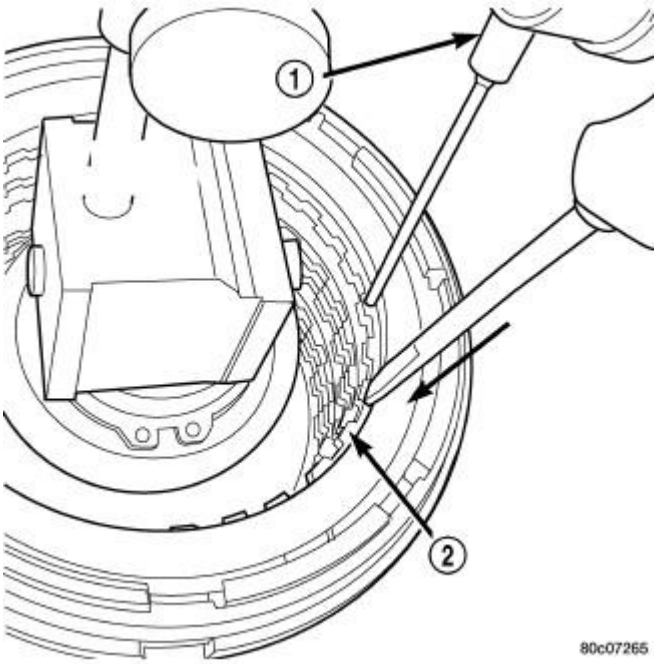

Fig. 353: Press Down On Reverse Clutch & Zero Indicator
Courtesy of CHRYSLER LLC

1 - DIAL INDICATOR
2 - REVERSE CLUTCH

41. Using moderate pressure, press down and hold (near indicator) reverse clutch disc (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure, indicator should advance (0.005-0.010 in.) as clutch pack relaxes.
42. Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Input Clutch Pressure Fixture 8391. Measure and record reverse clutch pack measurement in four places, 90° apart.
43. Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.76 - 1.245 mm (0.030 - 0.049 in.).** Select the proper reverse clutch snap ring to achieve specifications:

REVERSE CLUTCH SNAP RING THICKNESS	
4377195	1.53-1.58 mm (0.060-0.062 in.)
4412871	1.77-1.83 mm (0.070-0.072 in.)
4412872	2.02-2.07 mm (0.080-0.082 in.)
4412873	2.27-2.32 mm (0.090-0.091 in.)

44. To complete the assembly, reverse clutch and overdrive clutch must be removed.
45. Install the number two needle bearing (1).

1 - OVERDRIVE SHAFT ASSEMBLY
2 - #3 THRUST PLATE
3 - #3 THRUST WASHER

50. Install the overdrive shaft assembly (1).
51. Reinstall overdrive and reverse clutch as shown in illustration. **Rechecking these clutch clearances is not necessary.**

ASSEMBLY, TRANSMISSION SOLENOID AND PRESSURE SWITCH

REMOVAL

REMOVAL

1. Remove valve body. See **Transmission and Transfer Case/Automatic - 62TE/VALVE BODY - Removal**.

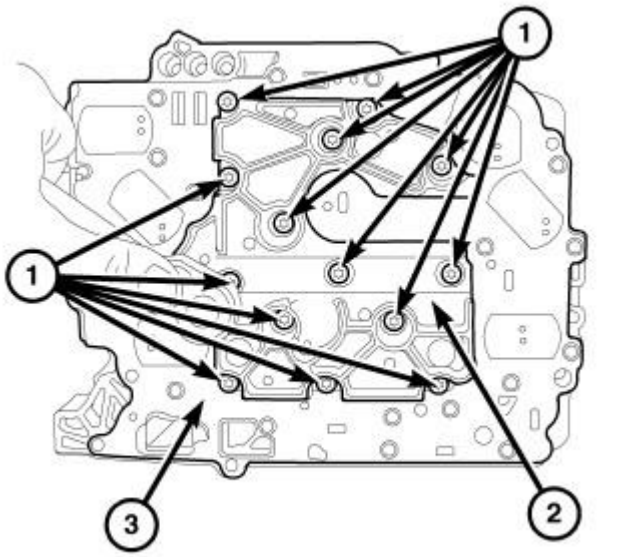

Fig. 359: Bolts At Clamp Plate
Courtesy of CHRYSLER LLC

2. Remove the clamp plate bolts and clamp plate.

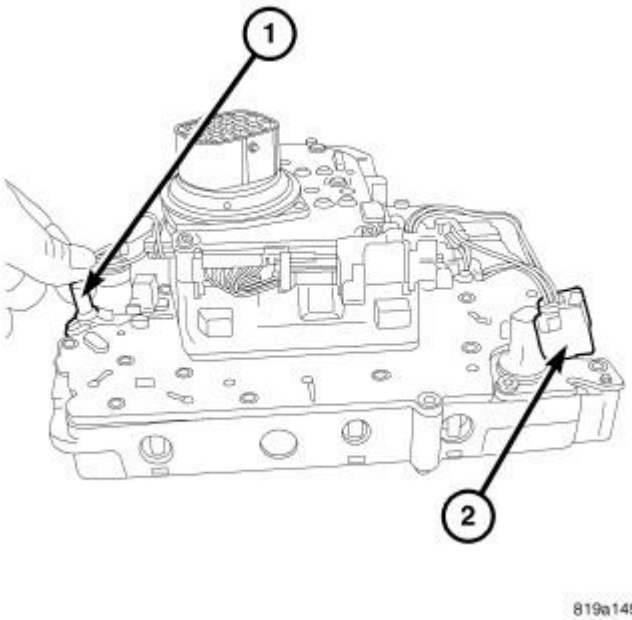

Fig. 360: Solenoid Pack Electrical Connect
Courtesy of CHRYSLER LLC

3. Remove the electrical connectors to the pressure control solenoid and line pressure sensors.
4. Remove the solenoid/pressure switch assembly.

INSTALLATION

INSTALLATION

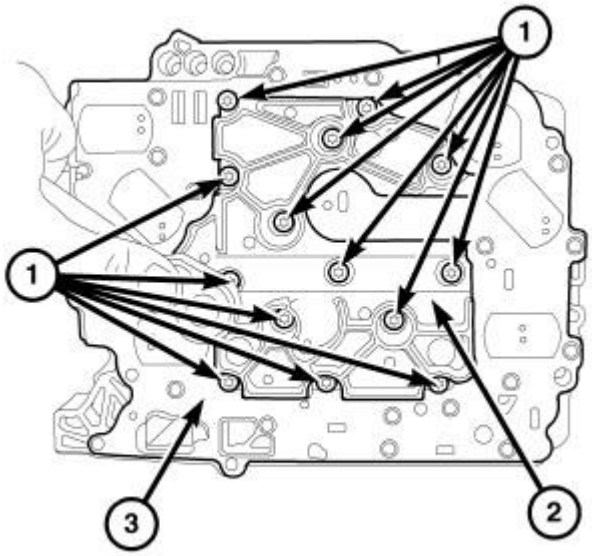

Fig. 361: Bolts At Clamp Plate
Courtesy of CHRYSLER LLC

1. Install the solenoid/pressure switch assembly.
2. Install mounting bolts (1) at clamp plate (2) and tighten to 6 N.m (50 in. lbs.).

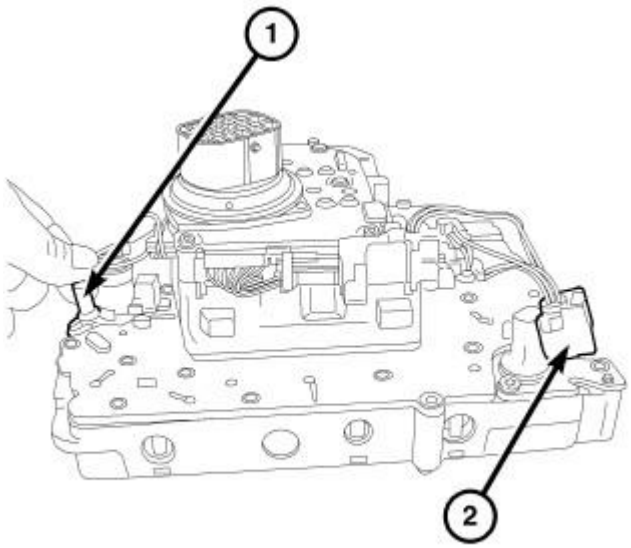

Fig. 362: Solenoid Pack Electrical Connect
Courtesy of CHRYSLER LLC

3. Connect the electrical connectors (1, 2) to the pressure control solenoid and line pressure sensors.
4. Install valve body. See **Transmission and Transfer Case/Automatic - 62TE/VALVE BODY - Installation**.

ASSEMBLY, UNDERDRIVE COMPOUNDER

DESCRIPTION

DESCRIPTION

The underdrive compounder assembly replaces the 41TE transfer shaft. The transaxle case is modified to accommodate the additional components. The main components of the underdrive compounder assembly are the low clutch (LC), direct clutch (DC), overrunning clutch (ORC), simple planetary gear set and bearing retainer transfer/underdrive shaft.

DISASSEMBLY

DISASSEMBLY

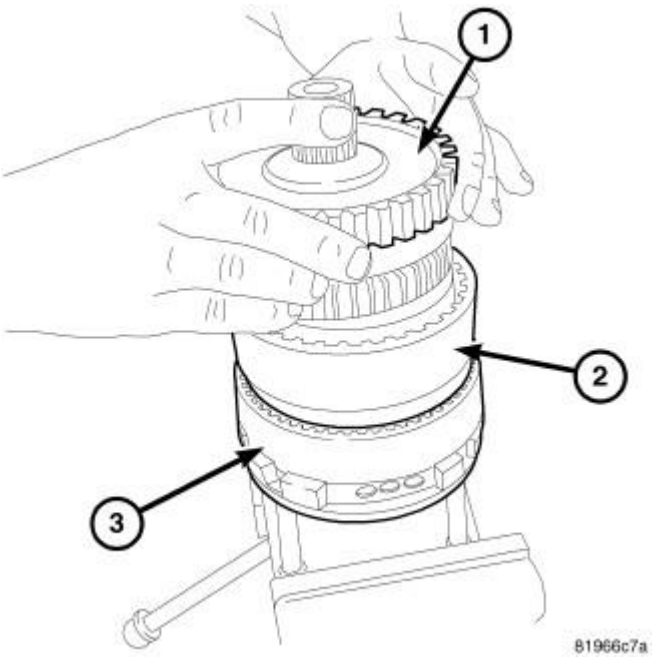

Fig. 363: Planetary Gear Set - Output Hub
Courtesy of CHRYSLER LLC

1. Remove the planetary gear set/output hub (1).

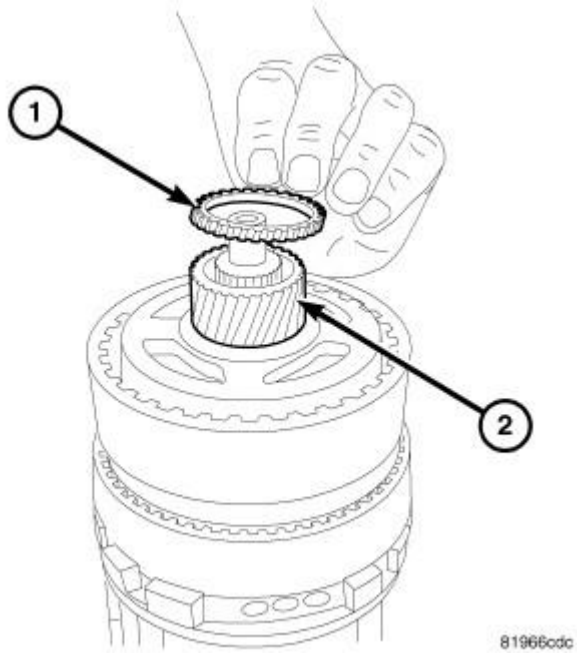

Fig. 364: Helical Shim
Courtesy of CHRYSLER LLC

2. Remove the helical shim (1).

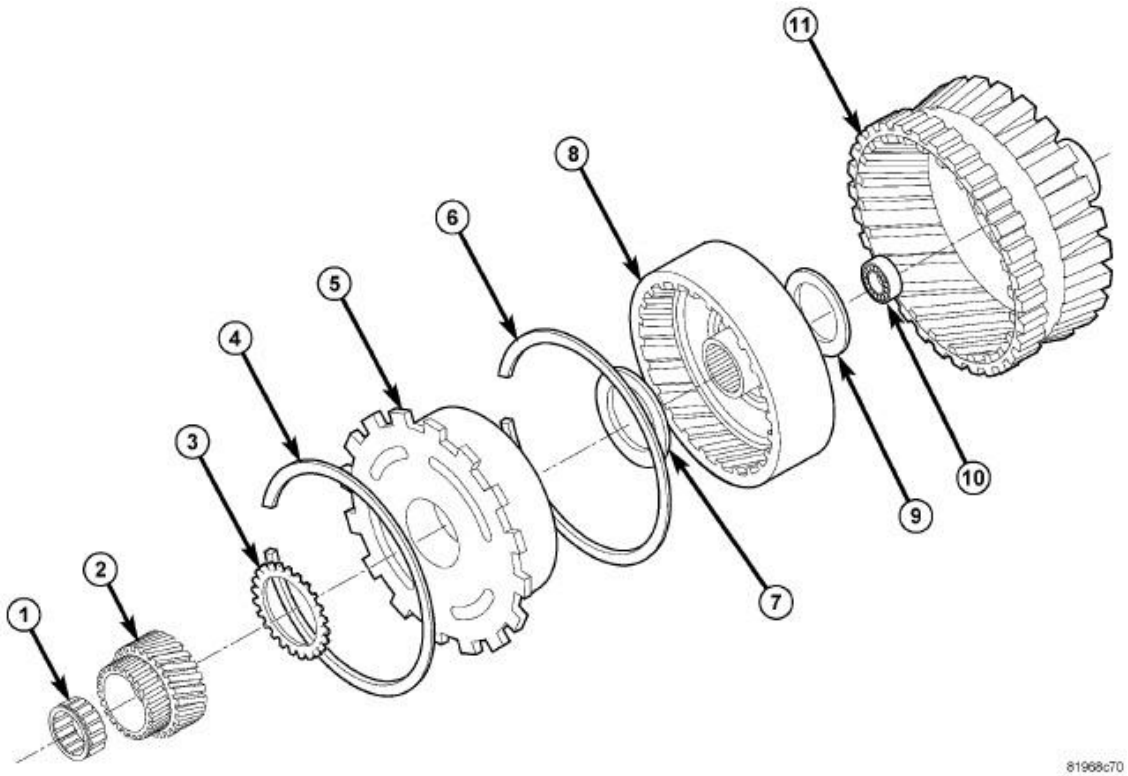

Fig. 365: Planetary Gear Set
Courtesy of CHRYSLER LLC

1 - NEEDLE BEARING	5 - PLANETARY CARRIER	9 - #2 NEEDLE BEARING
2 - SUN GEAR	6 - #2 SNAP RING	10 - NEEDLE BEARING
3 - HELICAL SHIM (SELECT)	7 - #1 NEEDLE BEARING	11 - OUTPUT HUB
4 - #1 SNAP RING	8 - ANNULUS GEAR	-

3. Remove the snap ring (4) holding the planetary carrier.
4. Remove the planetary carrier (5).
5. Remove the snap ring (6) holding the annulus gear.
6. Remove the needle bearing (7) on the front side of the annulus gear.
7. Remove the annulus gear (8).
8. Remove the needle bearing (9) on the back side of the annulus gear/on the front side of the output hub.
9. Inspect the needle bearing in the output hub for any damage.

Fig. 366: Clip At Transfer Shaft-Out
Courtesy of CHRYSLER LLC

10. Using two small picks, remove retaining clip from transfer/underdrive shaft

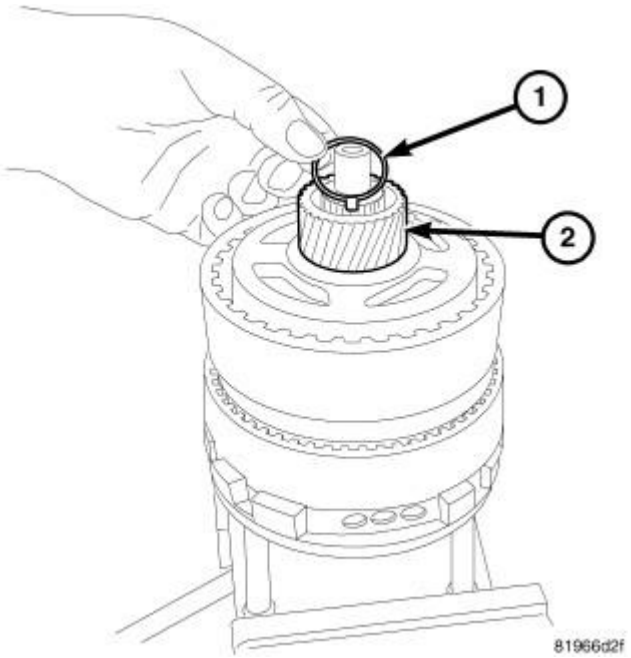

Fig. 367: Clip At Transfer Shaft
Courtesy of CHRYSLER LLC

NOTE: A new retaining clip will be used during assembly.

11. Discard the retaining clip (that was removed from the transfer/underdrive shaft.
12. Remove the sun gear (2) from the shaft.

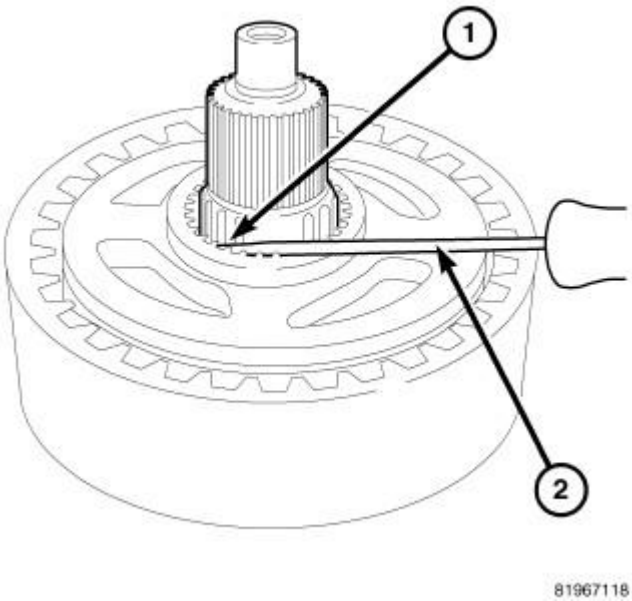

Fig. 368: Split Bearing

38. Remove the seal rings (1) from the low clutch retainer (2).

ASSEMBLY

ASSEMBLY

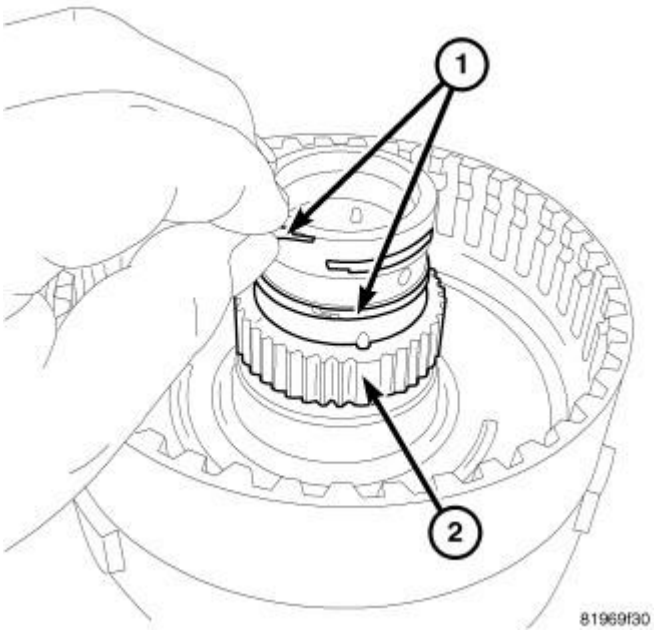

Fig. 383: Seal Rings

Courtesy of CHRYSLER LLC

CAUTION: Lube seal lips with ATF during installation, Use a twisting motion during installation to prevent seal lips from rolling over.

CAUTION: Do not over stretch. Can cause breakage.

1. Install **new** seal rings (1) on the low clutch retainer (2).

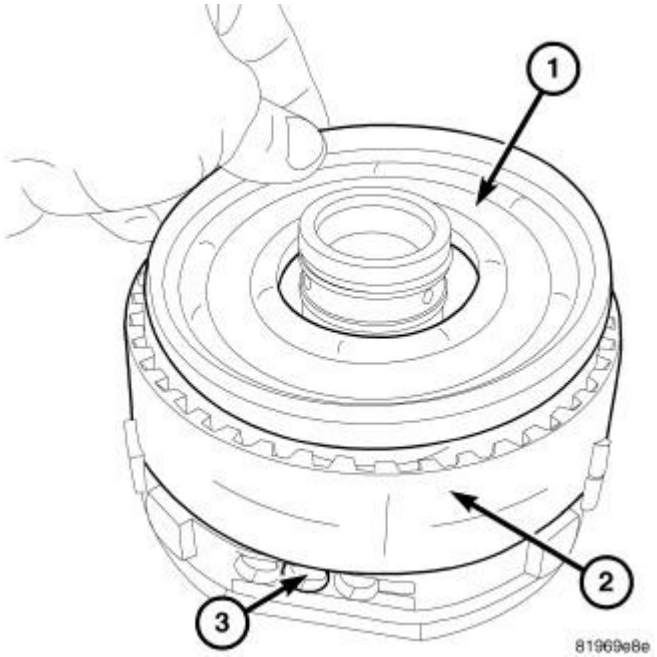

Fig. 384: Low Clutch Piston
Courtesy of CHRYSLER LLC

2. Install the low clutch piston (1) into low clutch retainer.

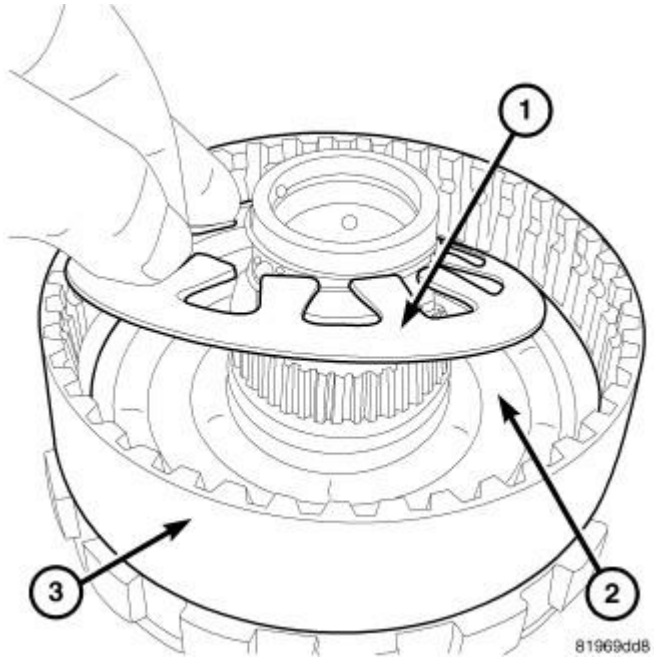

Fig. 385: Low Clutch Return Spring
Courtesy of CHRYSLER LLC

3. Install the low clutch return spring (1) over the low clutch retainer (2).

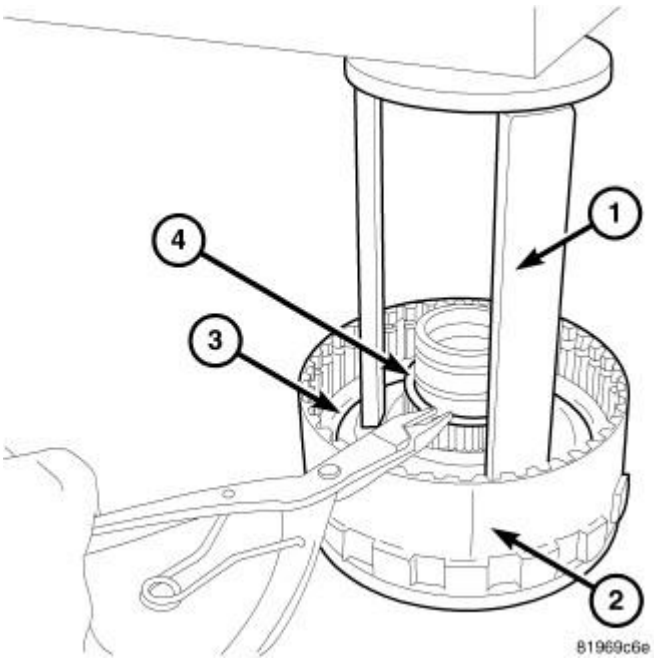

Fig. 386: Low Clutch Compressed
Courtesy of CHRYSLER LLC

4. Install compressor 9725 (1) on return spring (3) and slightly compress.
5. Install the snap ring (4) onto low clutch retainer (2).

6. Release pressure on press, remove Compressor 9725.

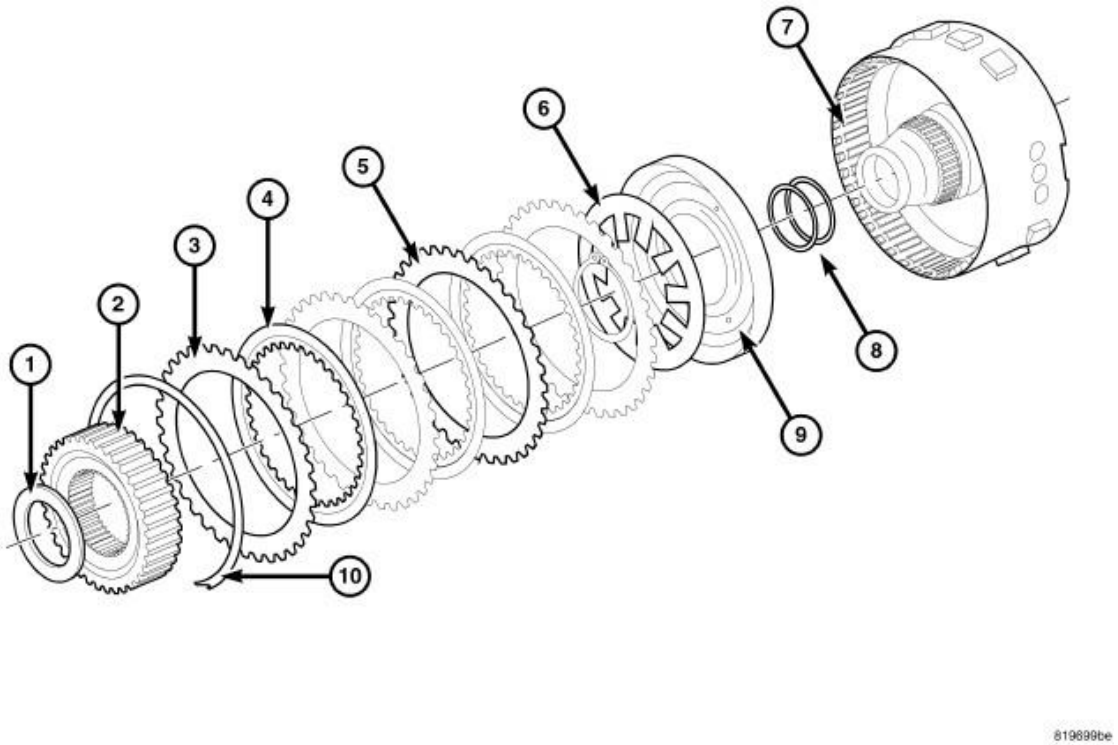

Fig. 387: Exploded View Of Low Clutch
Courtesy of CHRYSLER LLC

1 - SNAP RING (SELECTABLE) 2 - CLUTCH HUB	6 - RETURN SPRING 7 - RETAINER
3 - REACTION PLATE	8 - SEALS
4 - FRICTION DISC	9 - PISTON
5 - SEPARATOR PLATE	10 - SNAP RING

7. Install the friction disc's (4) and the separator plates (5).
8. Install the reaction plate (3).
9. Install the snap ring (10).

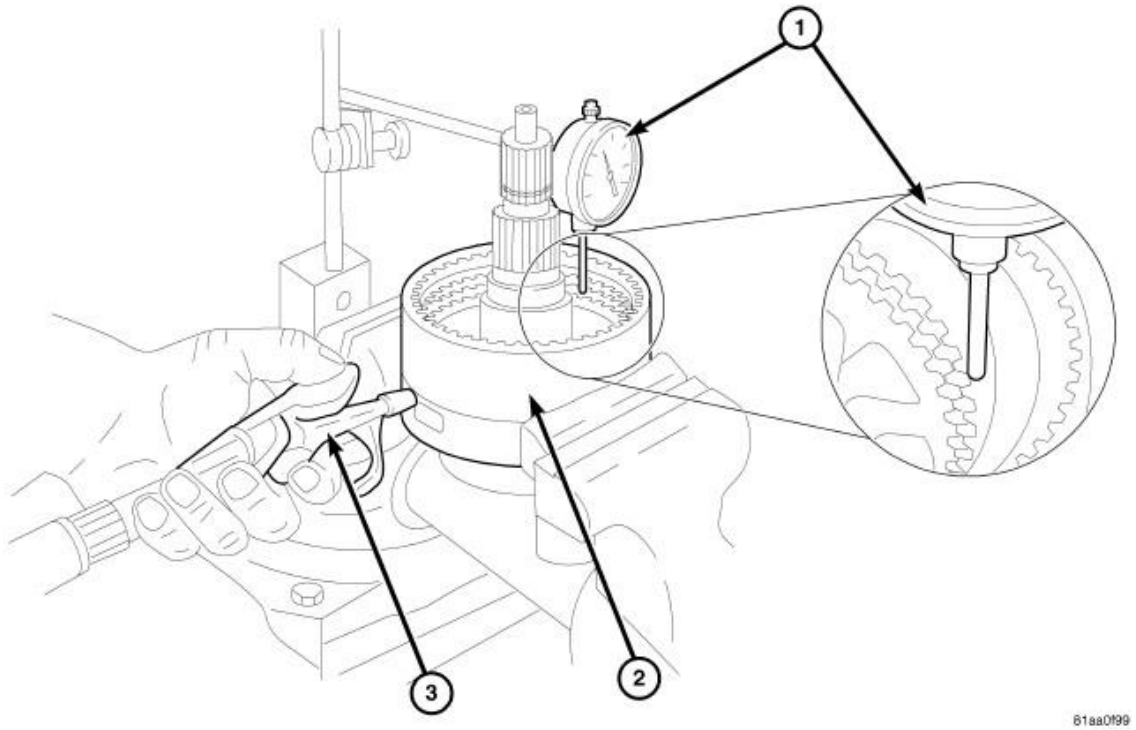

Fig. 388: Low Clutch Measurement
Courtesy of CHRYSLER LLC

10. Using a Dial Indicator and air pressure measure the low clutch clearance, the clearance should be 0.48 - 0.76 mm (0.019 - 0.030 in.). Install desired selectable snap ring to achieve correct clearance.

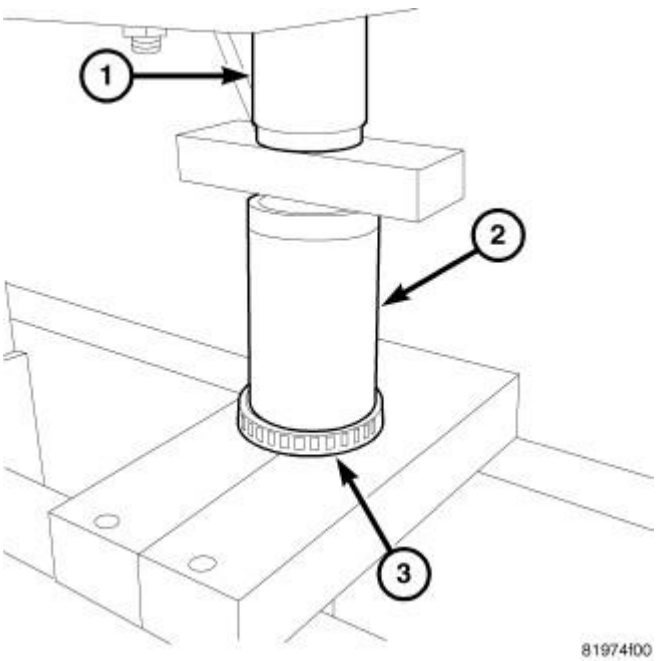

Fig. 389: Underdrive Compounder Bearing

Courtesy of CHRYSLER LLC

11. Using Installer 6756 (2) and a Press (1), install the underdrive compounder bearing (3) to transfer shaft.

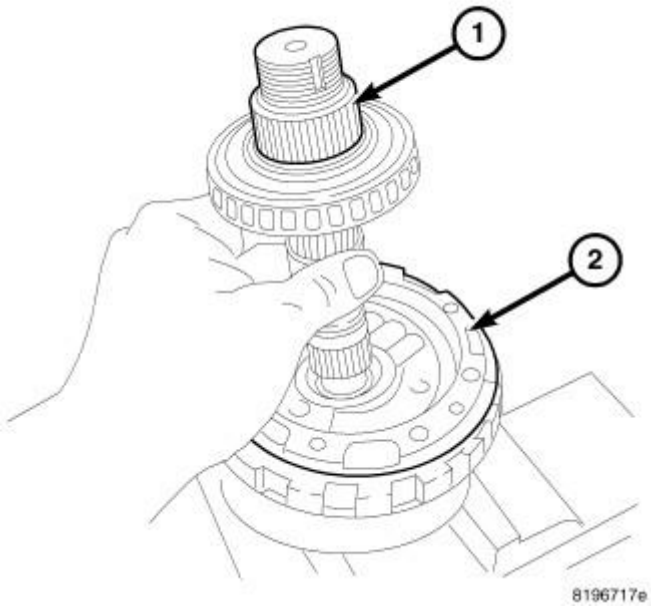

Fig. 390: Transfer Shaft
Courtesy of CHRYSLER LLC

12. Install **new** seal rings on the transfer shaft.
13. Install the transfer shaft (1) onto the low clutch (2).

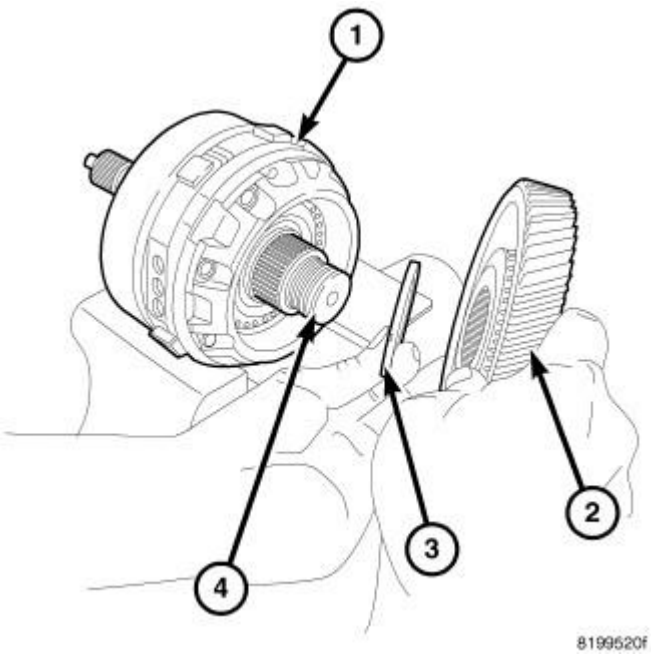

Fig. 391: Selectable Shim & Transfer Gear
Courtesy of CHRYSLER LLC

NOTE: The selectable shim will determine turning torque.

14. Install the selectable shim (3), transfer gear (2) and the transfer gear nut.

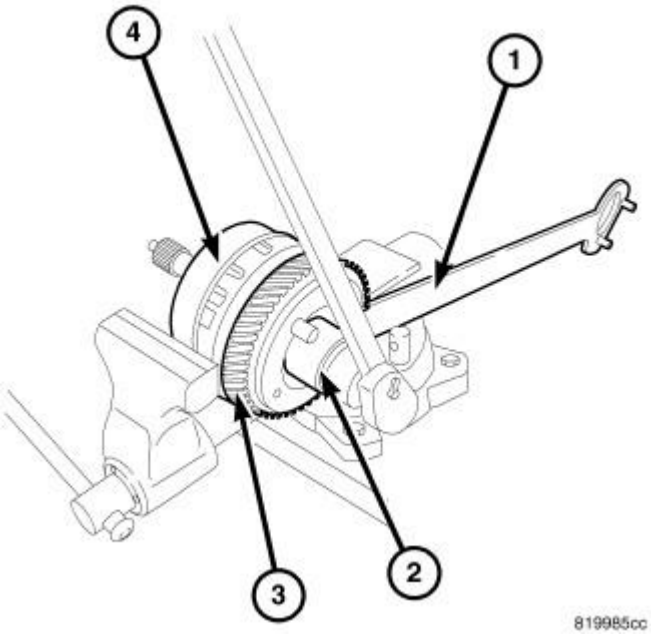

Fig. 392: Torque Transfer Gear Nut
Courtesy of CHRYSLER LLC

15. Using Holder 9739 (1) tighten transfer gear nut to 271 N.m (200 ft. lbs.).

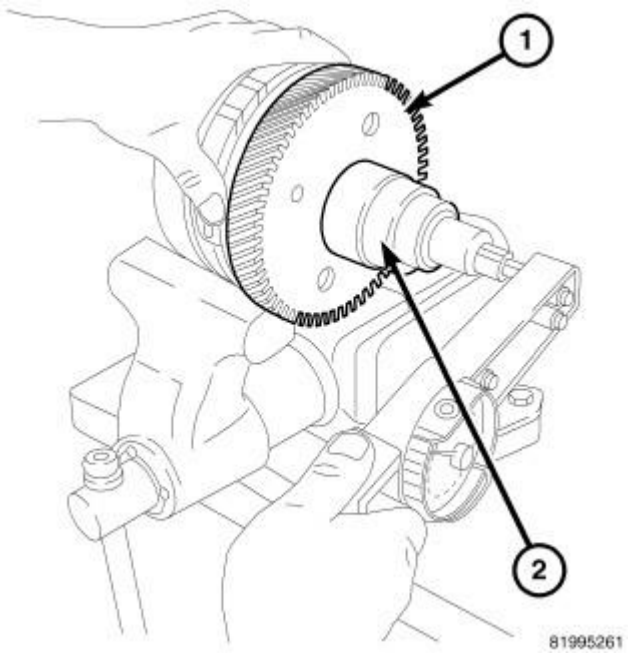

Fig. 393: LC Turning Torque
Courtesy of CHRYSLER LLC

16. Check turning torque using an inch pound torque wrench. Turning torque should be between 8.0 to 18.0 in-lbs (drag), If more than 18.0 in-lbs (drag) choose a larger shim and recheck turning torque. If less than 8.0 in-lbs (drag) choose a smaller shim and recheck turning torque.
17. Remove transfer gear nut and gear.

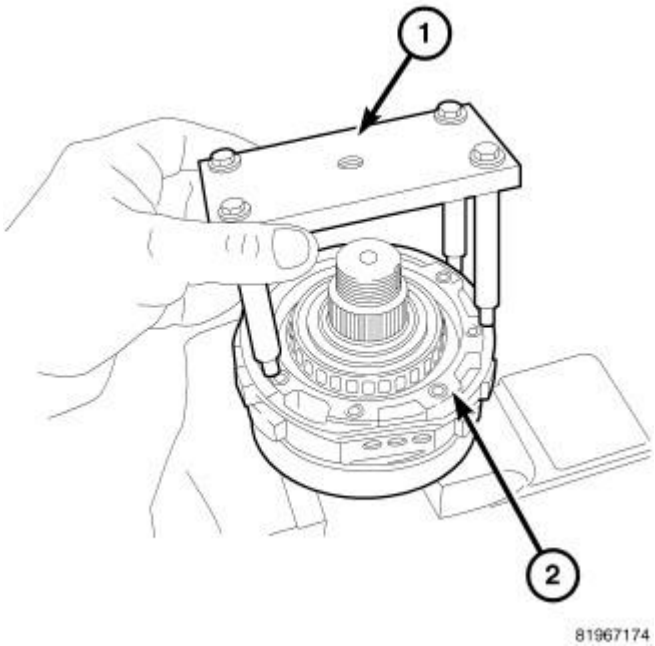

Fig. 394: Tool 9908
Courtesy of CHRYSLER LLC

18. Install the Bearing Retainer Assembly Remover 9908 (1) onto the low clutch (2).

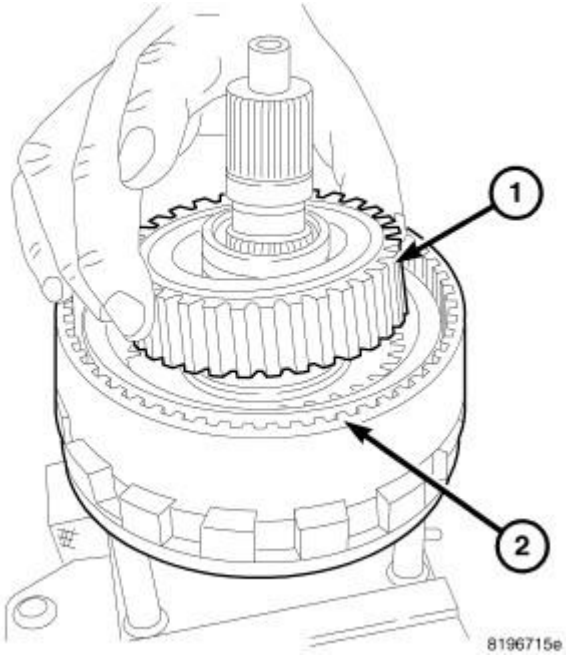

Fig. 395: Overrunning Clutch
Courtesy of CHRYSLER LLC

19. Install the overrunning clutch (1) into the low clutch (2).

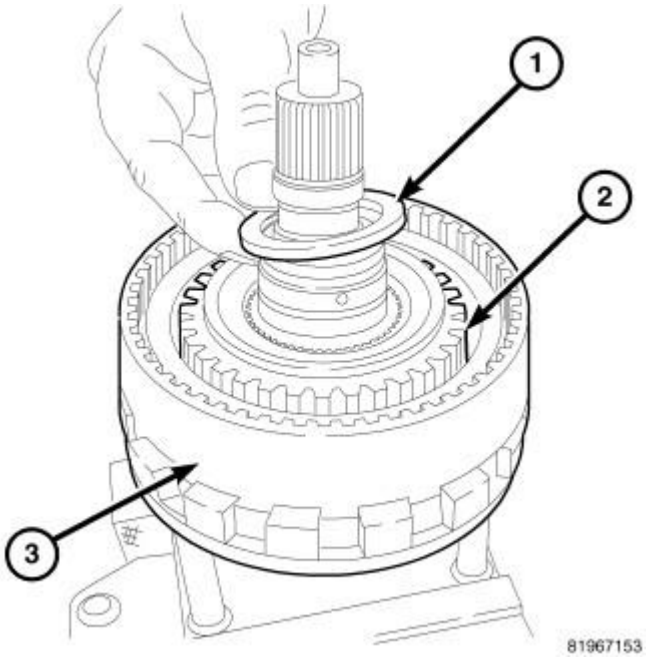

Fig. 396: Needle Bearing
Courtesy of CHRYSLER LLC

20. Install the needle bearing (1) onto the transfer shaft.

2 - FRICTION (INNER SPLINE)	6 - RETAINER	10 - HUB
3 - FRICTION (OUTER SPLINE)	7 - PISTON	11 - #1 THRUST BEARING
4 - RETAINER SNAP RING	8 - BALANCE PISTON	12 - REACTION PLATE (SELECTABLE)

21. Install the direct clutch retainer (8) onto the retainer (7).
22. Install the return coil spring (5) onto the balance piston (8).
23. Install the direct clutch piston (7) into the balance piston (8) using the Direct Clutch Piston Guide 9727.

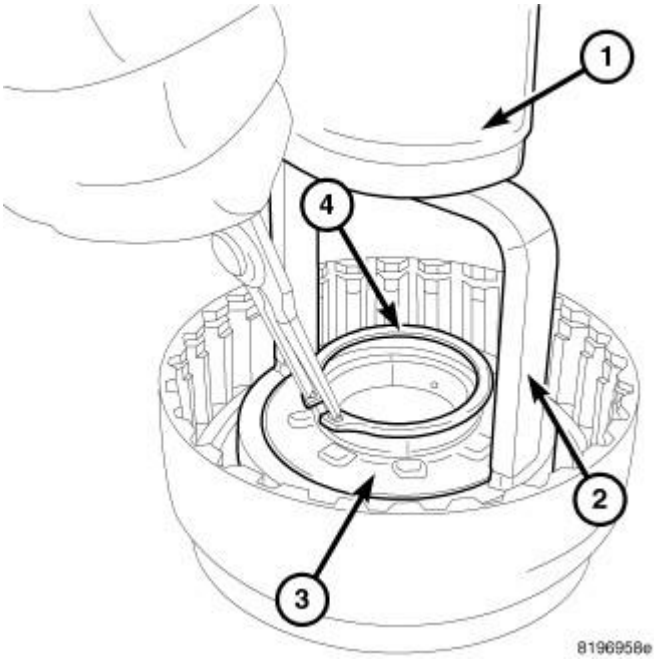

Fig. 398: Direct Clutch Compressed
Courtesy of CHRYSLER LLC

24. Install compressor 8250 (2) over the direct clutch balance piston (3) and place onto a press (1).
25. Compress spring to install the snap ring (4) at the direct clutch balance piston.
26. Install the inner and outer spline frictions (2, 3).
27. Install the number two thrust bearing (9).
28. Install the hub (10).
29. Install the number one thrust bearing (11).
30. Install the selectable reaction plate (12).
31. Install the internal snap ring (1).

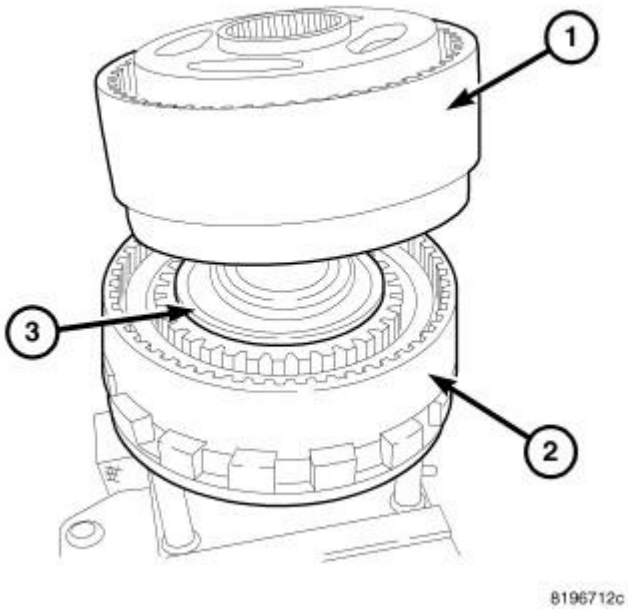

Fig. 399: Direct Clutch
Courtesy of CHRYSLER LLC

32. Install the direct clutch (1) onto the low clutch.

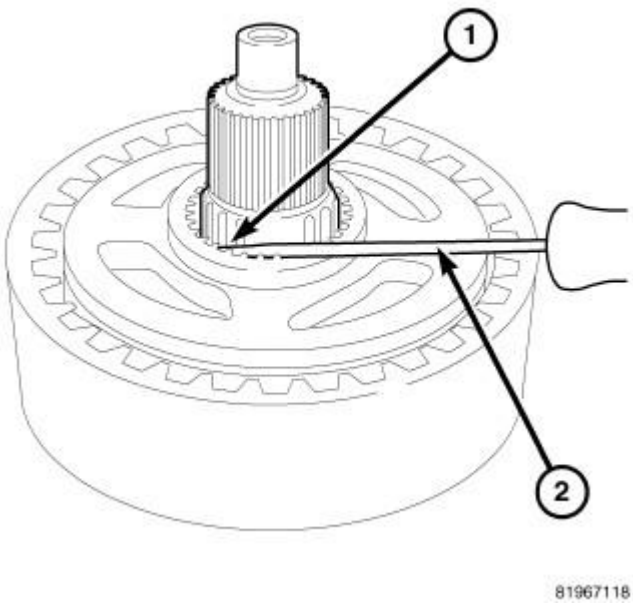

Fig. 400: Split Bearing
Courtesy of CHRYSLER LLC

33. Install the split bearing (1) using a small pick (2).

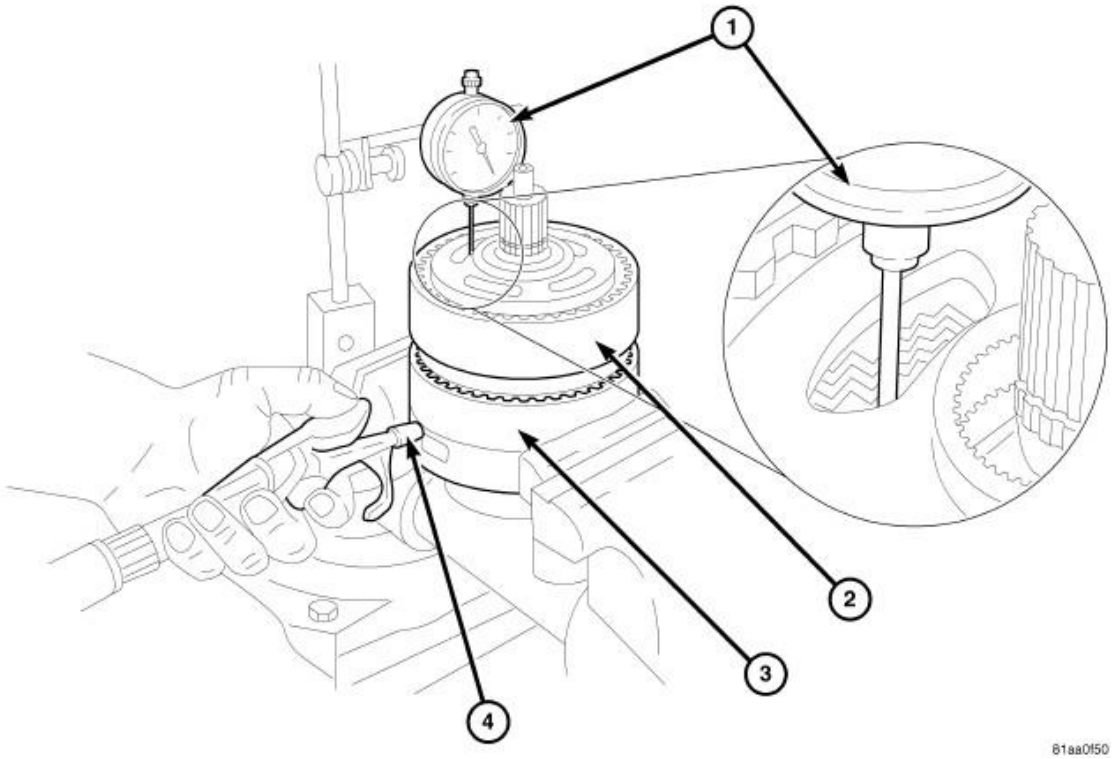

Fig. 401: Direct Clutch Measurement
Courtesy of CHRYSLER LLC

34. Using a Dial Indicator and air pressure measure the direct clutch clearance, the clearance should be 0.95 - 1.41 (0.037 - 0.056 in). Install desired selectable reaction plate to achieve correct clearance.

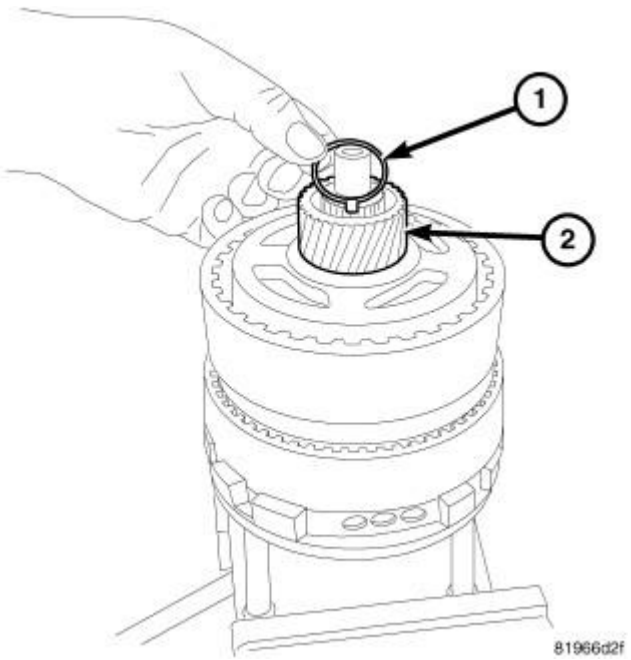

Fig. 402: Clip At Transfer Shaft

Courtesy of CHRYSLER LLC

35. Install the sun gear (2) onto the shaft.
36. Install the **new** retaining clip onto the transfer/underdrive shaft.

CABLE, SHIFT

REMOVAL

REMOVAL

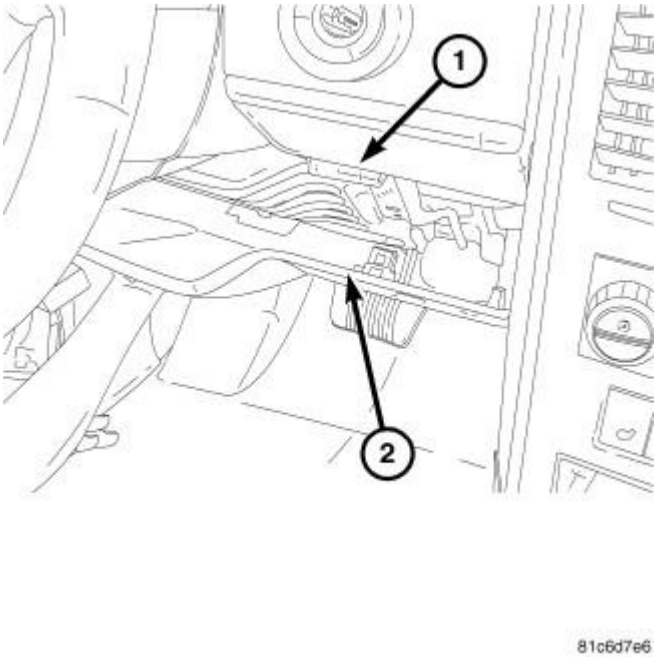

Fig. 406: Knee Blocker
Courtesy of CHRYSLER LLC

1. Remove the battery. Refer to **Electrical - Engine Systems/Battery System/BATTERY - Removal** .
2. Remove the battery tray. Refer to **Electrical - Engine Systems/Battery System/TRAY, Battery - Removal** .
3. Remove the knee blocker (2). Refer to **Body/Instrument Panel/KNEEBLOCKER - Removal** .

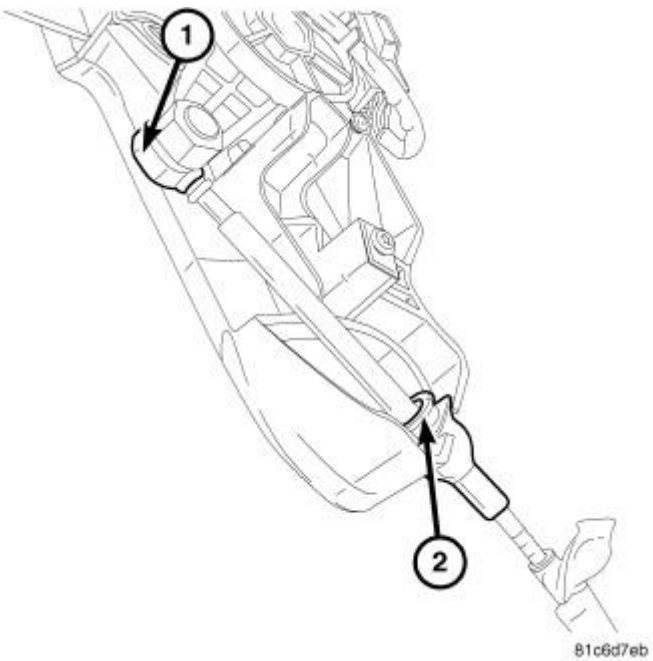

Fig. 407: Gearshift Cable
Courtesy of CHRYSLER LLC

NOTE: Make sure the lock tab on the gearshift cable is pressed before pulling the cable from the shifter housing.

4. Press the lock tab (2) on the gearshift cable (1) and pull the cable out of the shifter.

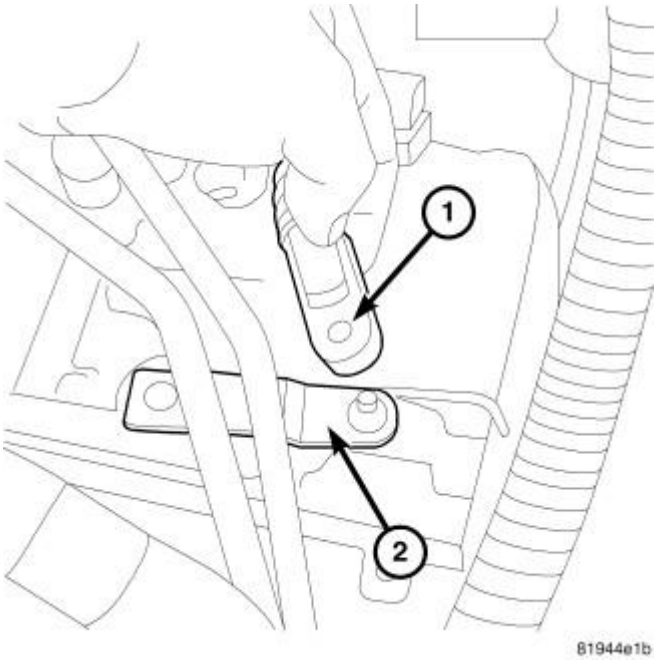

Fig. 408: Shift Cable From/To Manual Lever
Courtesy of CHRYSLER LLC

5. Disconnect the gearshift cable (1) from the transaxle manual valve lever (2).
6. Disconnect the gearshift cable from the bracket.

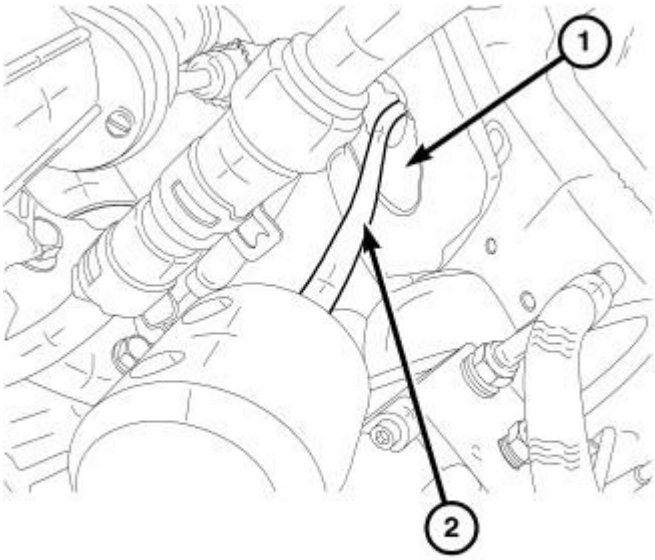

Fig. 409: Cable At Bulkhead
Courtesy of CHRYSLER LLC

7. Disengage the grommet for the gearshift cable (2) from the bulkhead (1).
8. Pull the gearshift cable through the bulkhead into the passenger compartment.

INSTALLATION

INSTALLATION

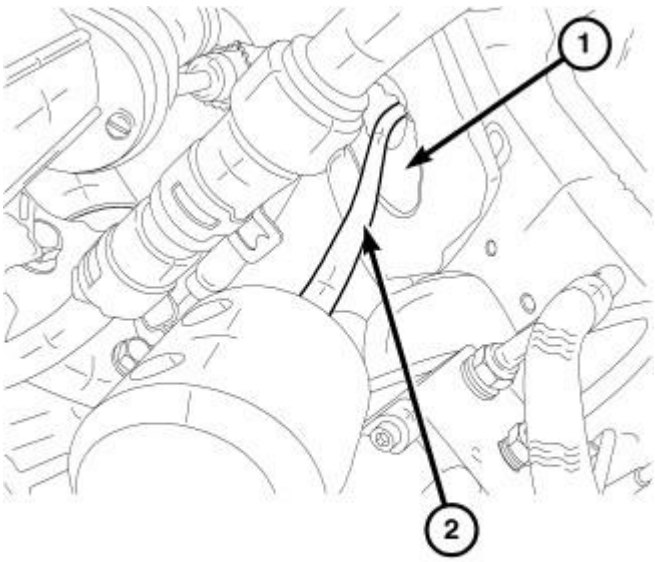

Fig. 410: Cable At Bulkhead
Courtesy of CHRYSLER LLC

NOTE: Make sure the rubber grommet in the bulkhead is fully seated to prevent water leaking into the passenger compartment.

1. Install the gearshift cable (2) through the bulkhead (1) from the passenger compartment.
2. Seat the rubber grommet onto the bulkhead. Make sure the grommet is fully engage to the bulkhead.

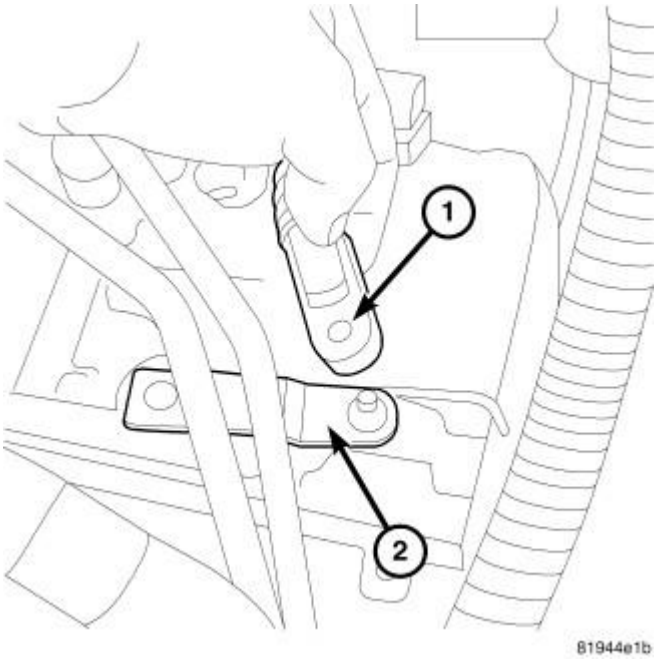

Fig. 411: Shift Cable From/To Manual Lever
Courtesy of CHRYSLER LLC

3. Connect the gearshift cable (1) to the bracket.
4. Connect the gearshift cable to the transaxle manual valve lever (2).

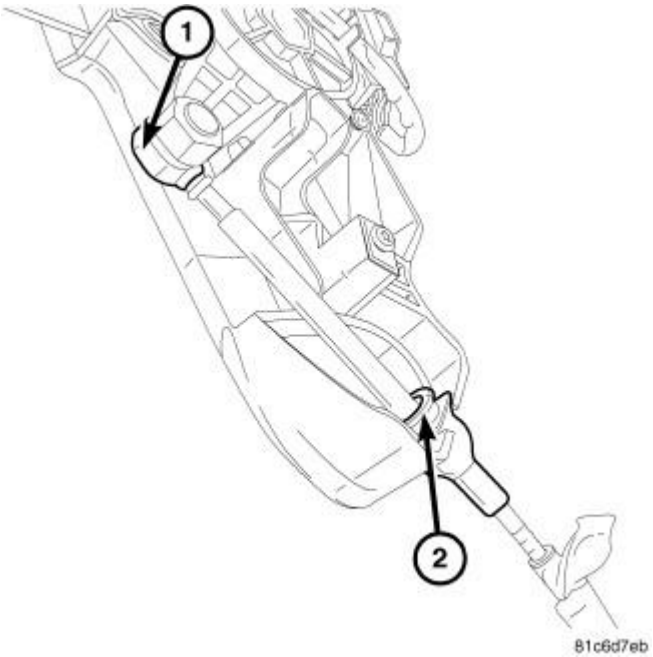

Fig. 412: Gearshift Cable
Courtesy of CHRYSLER LLC

NOTE: Make sure the lock tab on the gearshift cable is fully seated after the gearshift cable is installed to the shifter housing.

5. Install the gearshift cable (1) to the shifter. Make sure the lock tab (2) on the gearshift cable is fully seated.
6. Install the knee blocker (2). Refer to **Body/Instrument Panel/KNEEBLOCKER - Removal** .
7. Install the battery tray. Refer to **Electrical - Engine Systems/Battery System/TRAY, Battery - Installation** .
8. Install the battery. Refer to **Electrical - Engine Systems/Battery System/BATTERY - Installation** .

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT

1. Park the vehicle on level ground and set the parking brake.
2. Place the gearshift lever in gated park (P) and remove ignition key.
3. Loosen the cable adjustment screw at the transaxle manual valve lever.
4. Pull the gearshift lever fully forward to the park detent position.
5. Release the park brake, then rock the vehicle to assure it is in park. Reset the park brake.
6. Tighten the cable adjustment screw to 8 N.m (70 in. lbs.). Gearshift cable should now be properly adjusted.

7. Verify adjustment by using the verification procedure.

VERIFICATION

1. Place gearshift lever in gated park (P).
2. Attempt to move vehicle by rocking back and forth on level ground. If vehicle does not move, attempt to start engine. If engine starts, the park position is correct.
3. Set parking brake.
4. Turn key to on/run and depress brake pedal. Place gearshift lever in neutral (N).
5. Attempt to start engine. If engine starts in both neutral (N) or park (P), gearshift cable is adjusted properly. No adjustment is required.
6. If engine does not start in either park (P) or neutral (N), perform adjustment procedure.

DRIVE, FINAL

DESCRIPTION

DESCRIPTION

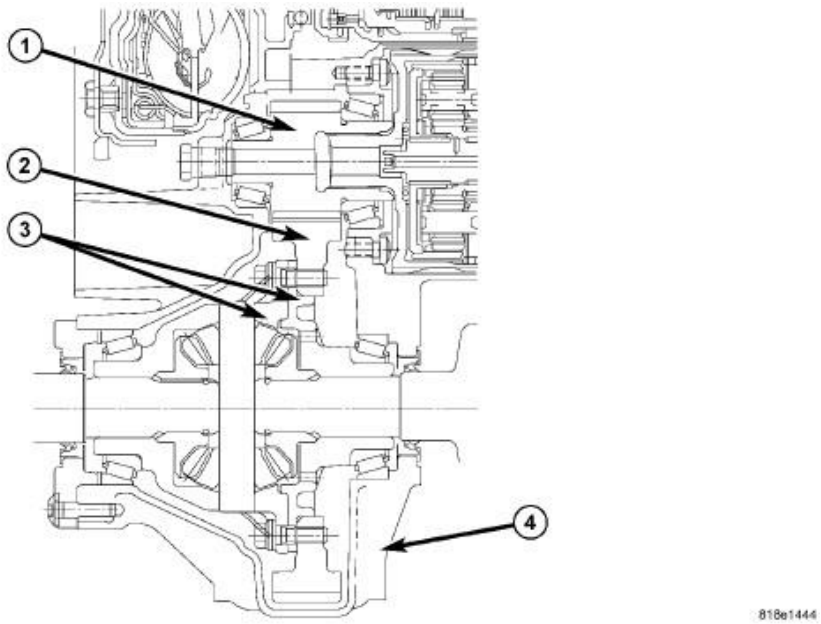

Fig. 413: Final Drive Assembly
Courtesy of CHRYSLER LLC

The 62TE's final drive system is driven by the underdrive compounder's output hub/carrier assembly. The final drive consists of the remote pinion gear, a ring gear, and a conventional differential assembly. A 23-tooth pinion gear in mesh with a 79-tooth ring gear results in a final drive ratio of 3.43:1.

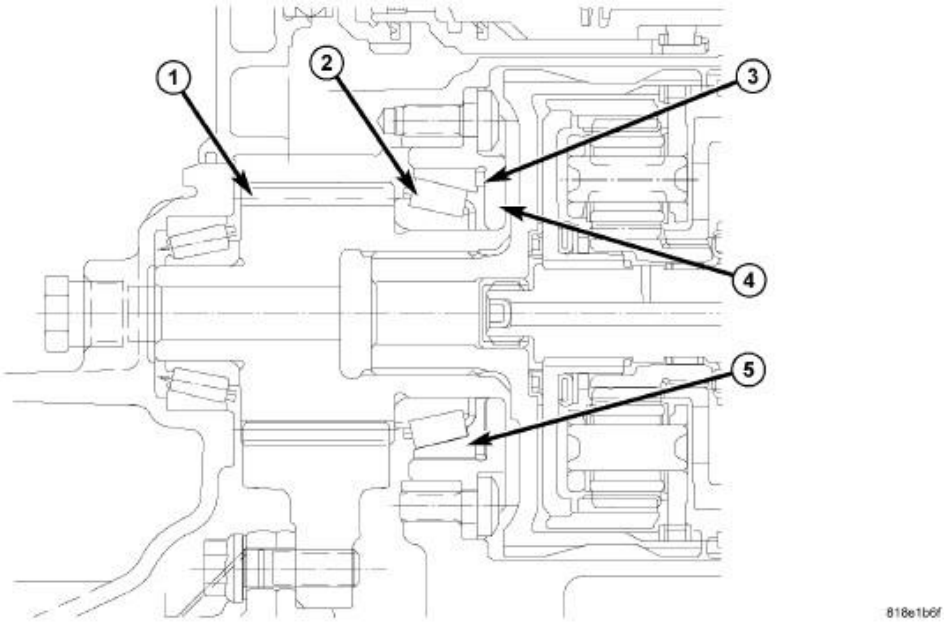

Fig. 414: Remote Pinion
Courtesy of CHRYSLER LLC

1 - REMOTE PINION GEAR	4 - BEARING RETAINER
2 - BEARING ROLLER (CONE)	5 - BEARING RACE (CUP)
3 - SELECTABLE SHIM	-

The 23-tooth remote pinion is a helical gear driven by the output hub/carrier assembly. It is supported by a bearing retainer and two tapered roller bearings, which centers the gear on its axis. The bearing preload is adjusted with a selectable shim, located between the outer bearing race and the bearing retainer. The preload measurement and adjustment must be made with the differential assembly removed.

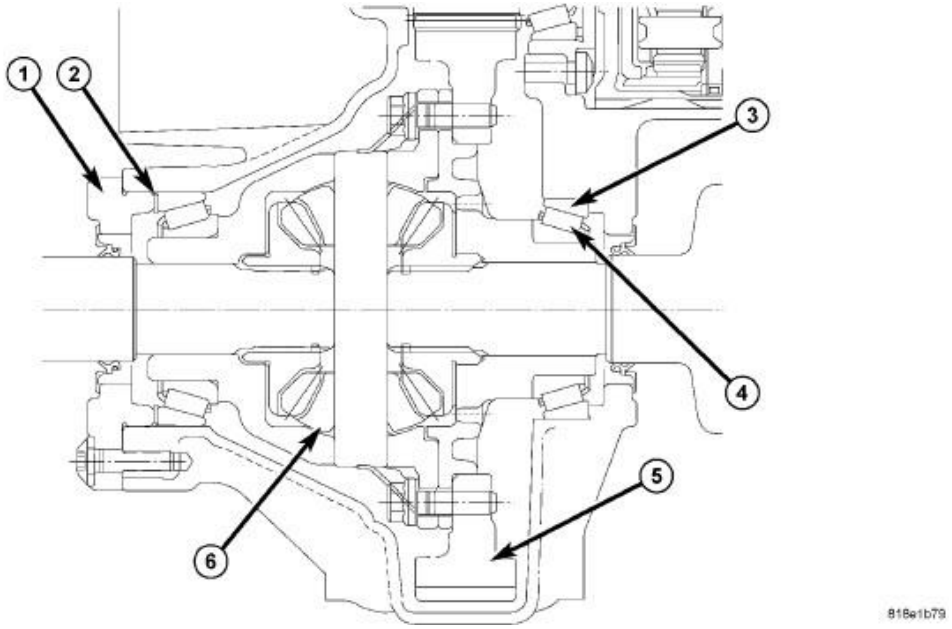

Fig. 415: Differential Assembly
Courtesy of CHRYSLER LLC

1 - BEARING RETAINER	4 - BEARING ROLLER (CONE)
2 - SELECTABLE SHIM	5 - RING GEAR
3 - BEARING ROLLER (CUP)	6 - SIDE GEAR

The differential assembly is supported by two tapered roller bearings and contained in a structural "clamshell" housing. It is a conventional, open type (non-locking) and is contained in a two-piece, closed case. Differential bearing preload is set with a selectable shim, with the pinion gear removed. The preload for the internal/spider gears is set with shims, as well. The 224 mm (8.82 in.) ring gear is bolted to the differential case.

OPERATION

OPERATION

The 62TE's final drive system is driven by the underdrive compounder's output hub/carrier assembly. The final drive consists of the remote pinion gear, a ring gear, and a conventional differential assembly. A 23-tooth pinion gear in mesh with a 79-tooth ring gear results in a final drive ratio of 3.43:1.

DISASSEMBLY

DISASSEMBLY

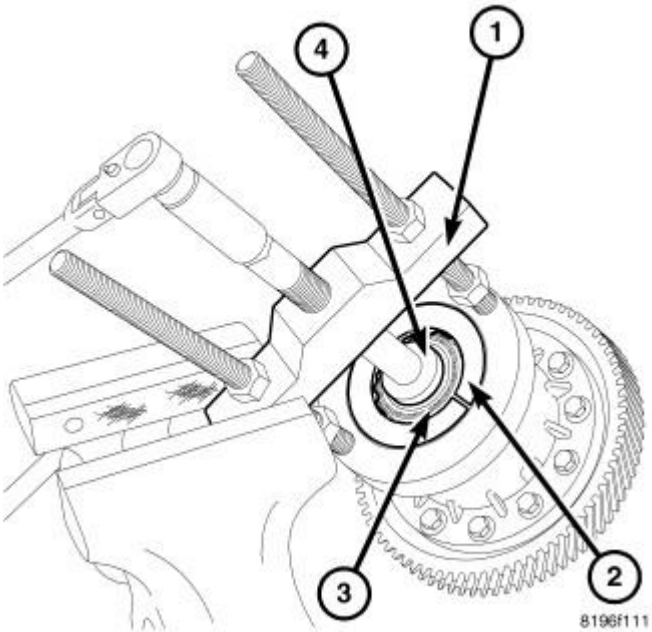

Fig. 416: Pinion Side Bearing Cone

14. Using Installer 9723 (1) and a press, install the small pinion bearing to the pinion shaft.

FLUID

STANDARD PROCEDURE

FLUID LEVEL AND CONDITION CHECK

FLUID LEVEL CHECK USING THE SCAN TOOL

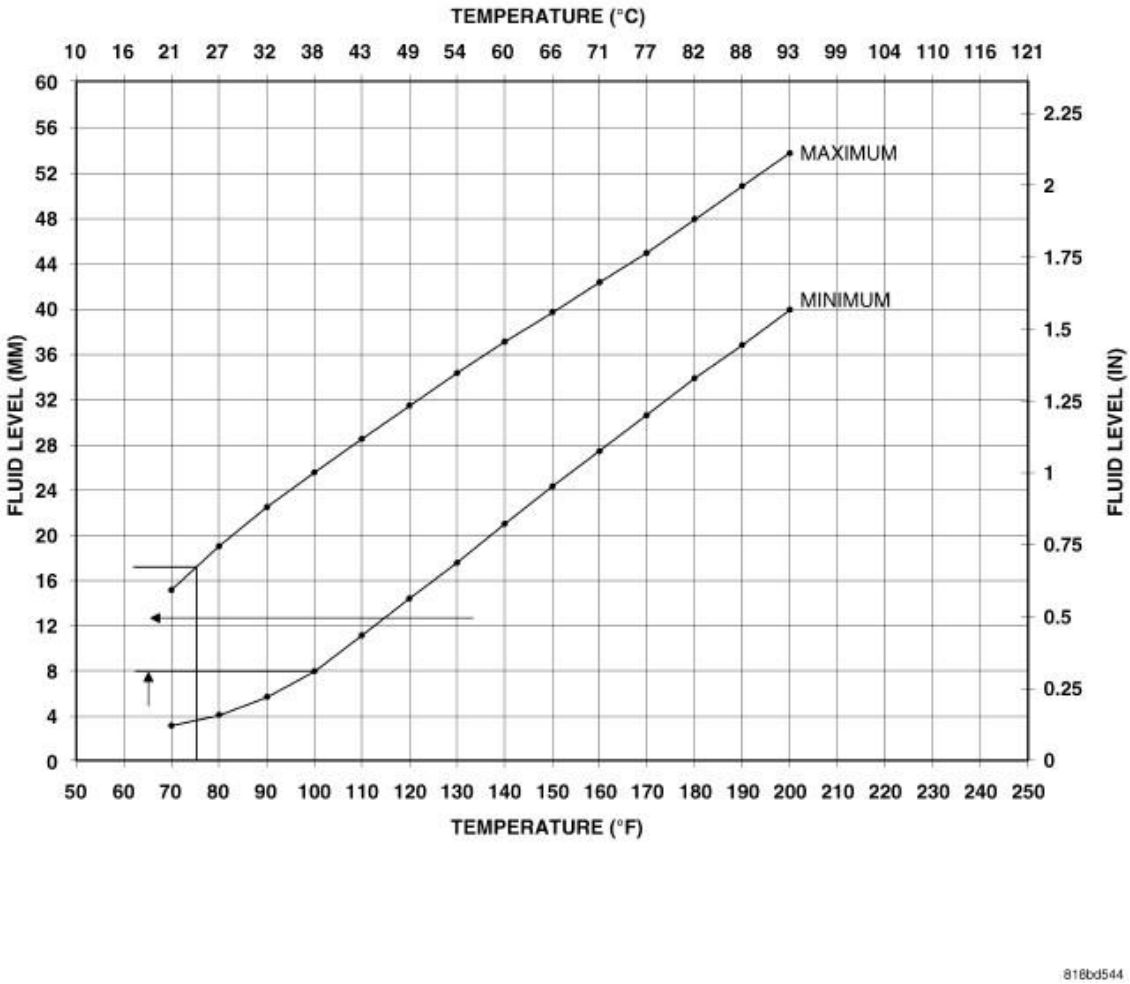

Fig. 443: Fluid Level To Temperature Chart
Courtesy of CHRYSLER LLC

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

> **WARNING: There is a risk of accident from vehicle starting off by itself when engine is running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.**

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling.

NOTE: When inserting dipstick special tool 9336A, excess insertion force may cause the dipstick to slip past the stop on the bracket in the transmission oil pan. An approximate distance that the dipstick should be inserted into the fill tube is 424 mm (16.69 in.).

5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336A into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick will protrude from the fill tube when installed.

6. Check transmission oil temperature using the appropriate scan tool.
7. The transmission Oil Dipstick 9336A has indicator marks every 10 mm. Determine the height of the oil level on the dipstick and using the height, the Transmission Fluid Temperature (TFT) as viewed with the scan too, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

FLUID CONDITION

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transaxle recondition is probably required. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

MOPAR® ATF+4 (Automatic Transmission Fluid) when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, **odor and color cannot be used to indicate the fluid condition or the need for a fluid change.**

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

FLUID AND FILTER SERVICE

FLUID/FILTER SERVICE (RECOMMENDED)

NOTE: Refer to the maintenance schedules in VEHICLE QUICK REFERENCE , or the vehicle owner's manual, for the recommended maintenance (fluid/filter change) intervals for this transaxle.

NOTE: Only fluids of the type labeled MOPAR® ATF+4 should be used. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transaxle is disassembled for any reason, the fluid and filter should be changed.

1. Raise vehicle on a hoist. Refer to **VEHICLE QUICK REFERENCE** for proper procedures. Place a drain container with a large opening, under transaxle oil pan.
2. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
3. Remove nuts at the oil filter.
4. Install a new filter and nuts, tighten to 5 N.m (40 in. lbs.).
5. Install the fluid filter oil pan, use a bead of MOPAR® ATF RTV (MS-GF41).
6. Clean the oil pan and magnet. Reinstall pan using new MOPAR® Silicone Adhesive sealant. Tighten oil pan bolts to 6 N.m (50 in. lbs.).
7. Pour four Quarts of MOPAR® ATF+4 through the dipstick opening.
8. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
9. Check the transaxle fluid level and add an appropriate amount to bring the transaxle fluid level to 3 mm (1/8 in.) below the lowest mark on the dipstick.
10. Recheck the fluid level after the transaxle has reached normal operating temperature 82°C (180°F). Refer to Fluid Level and Condition Check for the proper fluid fill procedure. See **Transmission and Transfer Case/Automatic - 62TE/FLUID - Standard Procedure**.
11. To prevent dirt from entering transaxle, make certain that dipstick is fully seated into the dipstick opening.

GEARTRAIN, PLANETARY

DESCRIPTION

DESCRIPTION

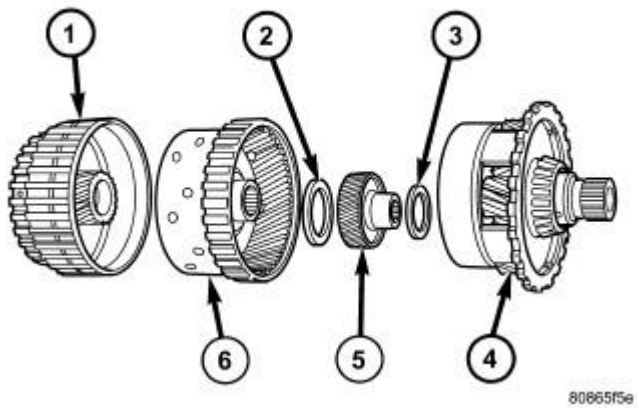

Fig. 444: Planetary Gear Train

Courtesy of CHRYSLER LLC

1 - FRONT SUN GEAR ASSEMBLY
2 - #6 THRUST BEARING
3 - #7 THRUST BEARING
4 - REAR CARRIER/FRONT ANNULUS ASSEMBLY
5 - REAR SUN GEAR
6 - FRONT CARRIER/REAR ANNULUS ASSEMBLY

The planetary gear train is located between the input clutch assembly and the rear of the transaxle case. The planetary gear train consists of two sun gears (1,5), two planetary carriers, two annulus (ring) gears (4,6), and one output shaft.

OPERATION

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

HOLDING CLUTCHES

DESCRIPTION

DESCRIPTION

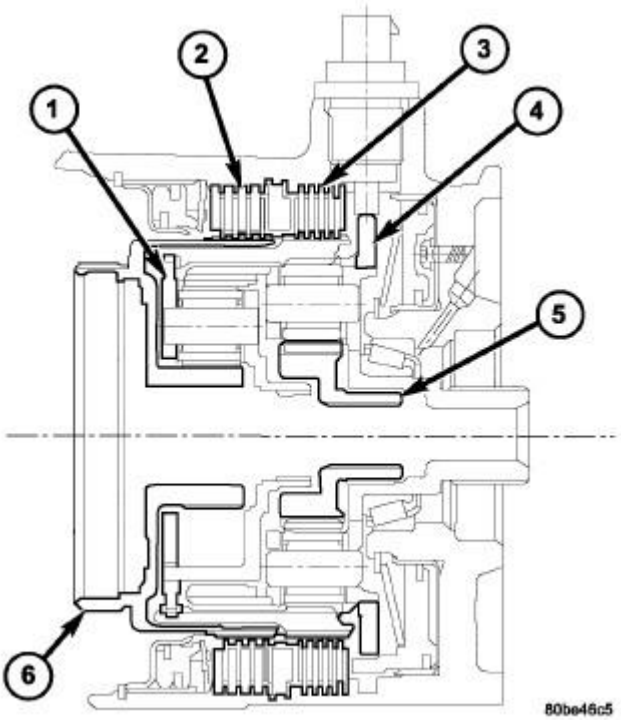

Fig. 445: 2/4 & Low/Reverse Clutches
Courtesy of CHRYSLER LLC

1 - FRONT PLANET CARRIER/REAR ANNULUS
2 - 2/4 CLUTCH
3 - L/R CLUTCH
4 - REAR PLANET CARRIER/FRONT ANNULUS
5 - REAR SUN GEAR
6 - FRONT SUN GEAR ASSEMBLY

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components (1, 4) stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transaxle case.

OPERATION

OPERATION

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transaxle case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transaxle case.

KNOB, GEARSHIFT

REMOVAL

REMOVAL

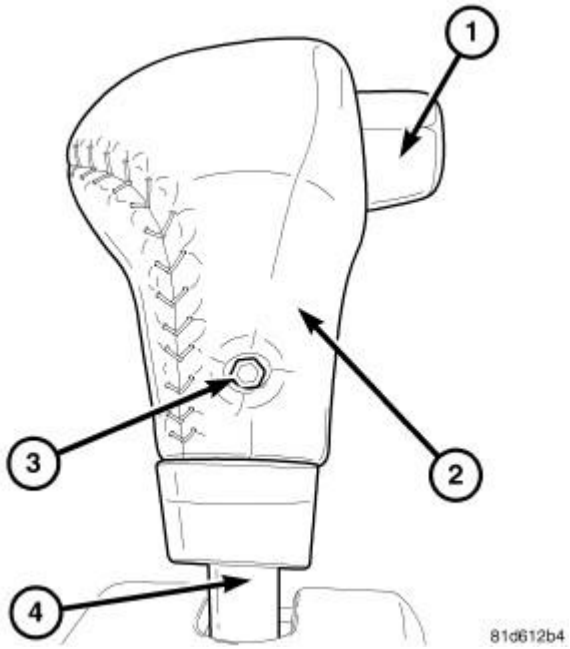

Fig. 446: Shift Knob
Courtesy of CHRYSLER LLC

1. Loosen the set screw (3) on the shift knob (2).
2. Hold in the shift knob button (1).
3. Pull up on the shift knob (2) while holding the shift knob button (1) in.

INSTALLATION

INSTALLATION

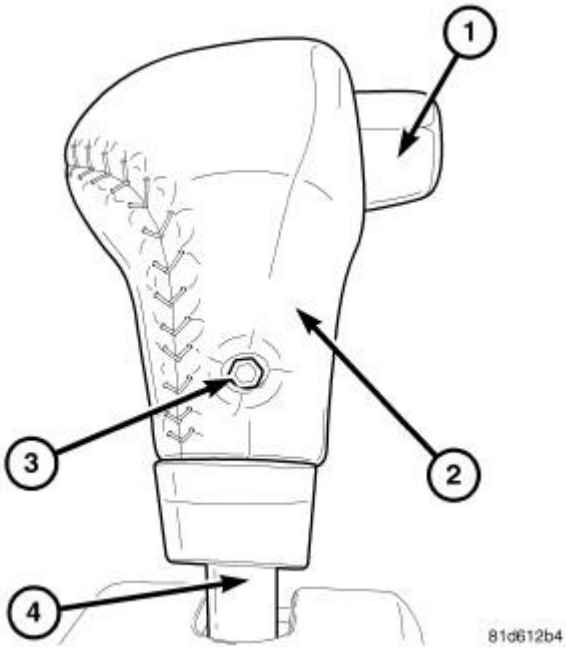

Fig. 447: Shift Knob

1. While holding the shift knob button (1) in install the shift knob (1) onto the shift mechanism shaft (4).
2. Tighten the set screw (3).

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

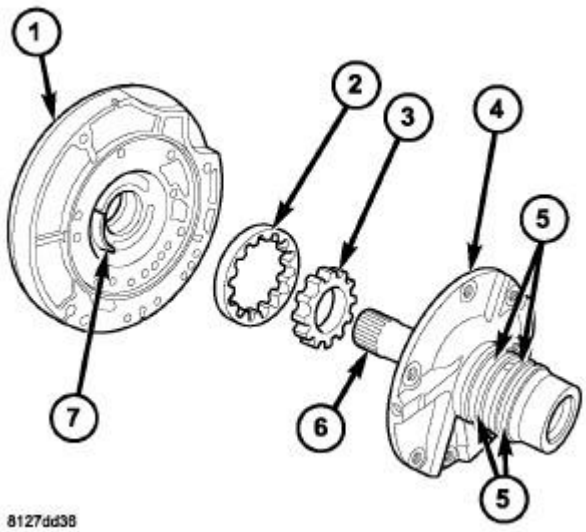

Fig. 448: Oil Pump Assembly
Courtesy of CHRYSLER LLC

1 - PUMP BODY
2 - OUTER GEAR
3 - INNER GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

The oil pump is located in the pump housing inside the bell housing of the transaxle case. The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

OPERATION

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DISASSEMBLY

DISASSEMBLY

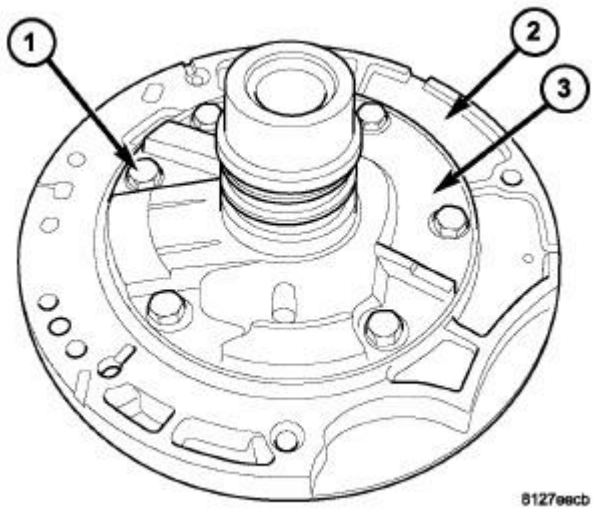

Fig. 449: Reaction Support-to-Pump Body Bolts
Courtesy of CHRYSLER LLC

1 - BOLT (6) 2 - PUMP BODY 3 - REACTION SHAFT SUPPORT

When disassembling the transaxle it is necessary to inspect the oil pump for wear and damage.

1. Remove the six reaction shaft support-to-pump body bolts (1).

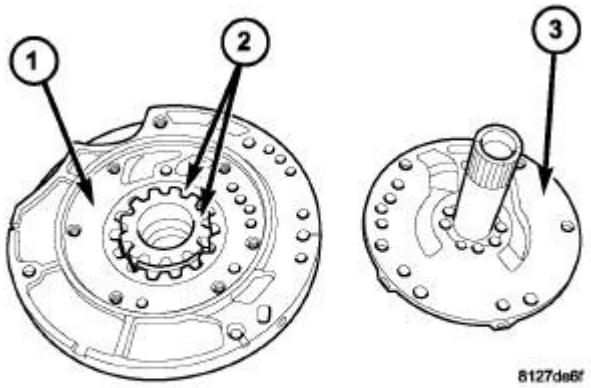

Fig. 450: Reaction Shaft Support
Courtesy of CHRYSLER LLC

1 - PUMP BODY 2 - PUMP GEARS 3 - REACTION SHAFT SUPPORT

2. Remove reaction shaft support (3) from pump body (1).

2 - OUTER GEAR
3 - INNER GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT

3. Remove the pump gears (2, 3) and check for wear and damage on pump body (1) and gears.

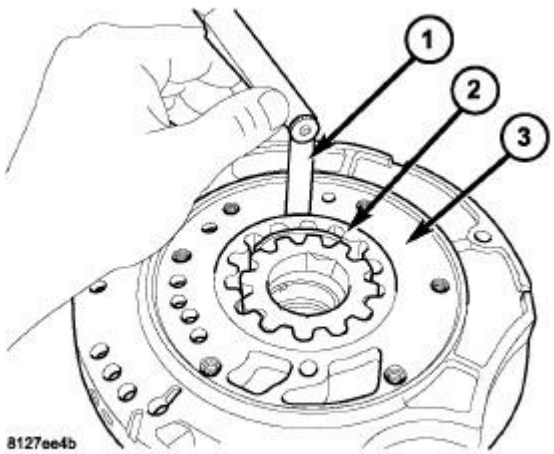

Fig. 452: Measuring Outer Gear-To-Pocket
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE
2 - OUTER GEAR
3 - PUMP BODY

4. Re-install the gears (2) and check clearances.
5. Measure the clearance between the outer gear and the pump pocket (1). Clearance should be 0.089 - 0.202 mm (0.0035 - 0.0079 in.).

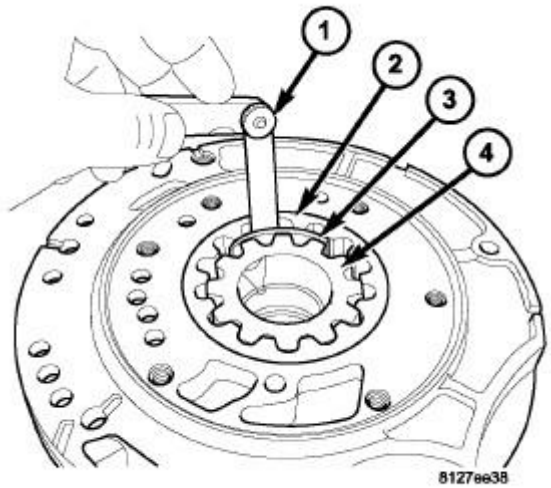

Fig. 453: Measuring Outer Gear-To-Crescent
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE
2 - OUTER GEAR
3 - CRESCENT
4 - INNER GEAR

6. Measure clearance between outer gear (2) and crescent (3). Clearance should be 0.060 - 0.298 mm (0.0023 - 0.0117 in.).

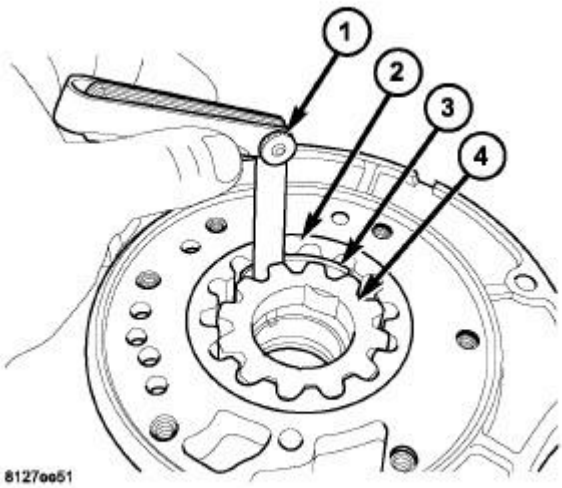

Fig. 454: Measuring Inner Gear-to-Crescent
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE
2 - OUTER GEAR
3 - CRESCENT
4 - INNER GEAR

7. Measure clearance between inner gear (4) and crescent (3). Clearance should be 0.093 - 0.385 mm (0.0036 - 0.0151 in.).
8. Position an appropriate piece of Plastigage across both pump gears.
9. Align the Plastigage to a flat area on the reaction shaft support housing.
10. Install the reaction shaft to the pump housing. Tighten the bolts to 27 N.m (20 ft. lbs.).
11. Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.
12. Clearance between both gear end faces and the reaction shaft support should be 0.020 - 0.046 mm (0.0008 - 0.0018 in.).

ASSEMBLY

20. Install the relay (1) at the core support.
21. Install the battery and battery tray. Refer to **Electrical - Engine Systems/Battery System/BATTERY - Installation** .
22. Install the battery cables.
23. Fill transmission and road test. See **Transmission and Transfer Case/Automatic - 62TE/FLUID - Standard Procedure**.

SWITCH, AUTOSTICK

DESCRIPTION

DESCRIPTION

Autostick is a driver-interactive transmission feature that offers manual gear shifting capability to provide you with more control. Autostick allows you to maximize engine braking, eliminate undersirable upshifts and downshifts, and improve overall vehicle performance. This system can also provide you with more control during passing, city driving, cold slippery conditions, mountain driving, trailer towing, and many other situations.

OPERATION

OPERATION

Autostick is a driver interactive transaxle feature that offers manual gear shifting capability. When the shifter is moved into the Autostick position, the transaxle remains in whatever gear it was using before Autostick was activated. Moving the shifter to the left (towards the driver) causes a downshift and moving to the right (towards the passenger) causes an upshift. The instrument cluster will illuminate the selected gear. The vehicle can be launched in 1st, 2nd, or 3rd gear while in the Autostick mode. The speed control is operable in 3rd and 4th gear Autostick mode. Speed control will be deactivated if the transaxle is shifted to 2nd gear. Shifting into OD position cancels the Autostick mode, and the transaxle resumes the OD shift schedule.

SYSTEM, SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

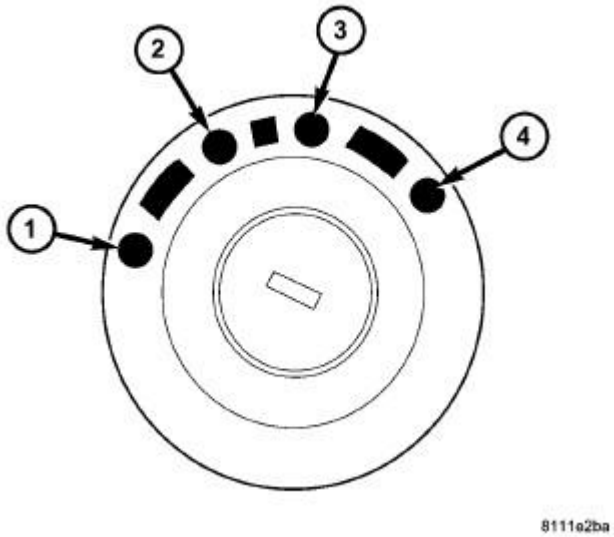

Fig. 568: Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

1 - LOCK
2 - ACC
3 - ON
4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a solenoid operated system that prevents the transmission gear shifter from being moved out of PARK without a driver in place.

OPERATION

OPERATION

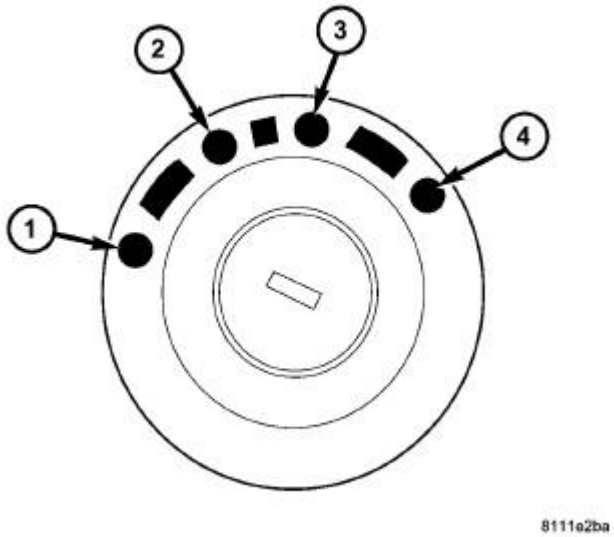

Fig. 569: Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

1 - LOCK
2 - ACC
3 - ON
4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK or ACC position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position.

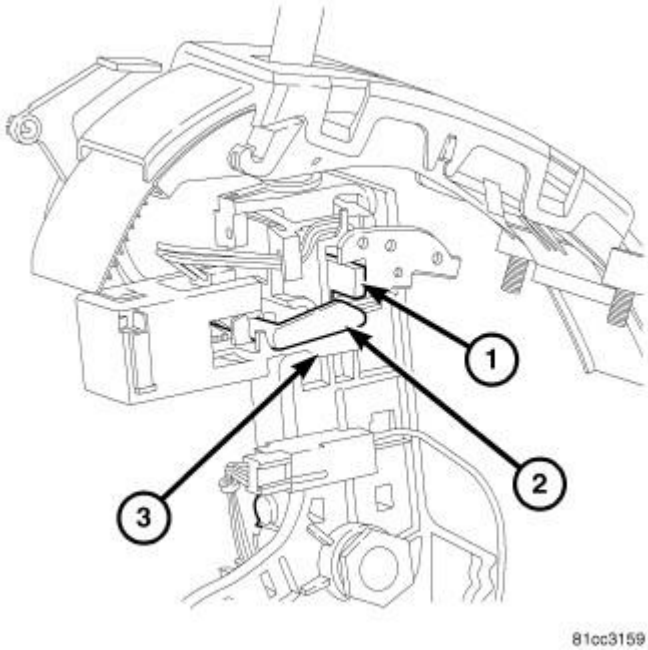

Fig. 570: Shift Interlock
Courtesy of CHRYSLER LLC

When service brake pedal is not depressed the solenoid rotating arm (2) is free to rotate. The shifter gate pin (1) hits the blocking arm (3) and is prevented from moving from park.

When service brake is applied the rotating arm (2) is prevented from rotating by magnetic force within the solenoid. The shifter gate pin (1) pushes the rotating arm (2) and blocker arm (3) allowing the shifter to move out of park.

DIAGNOSIS AND TESTING

SHIFT INTERLOCK SYSTEM

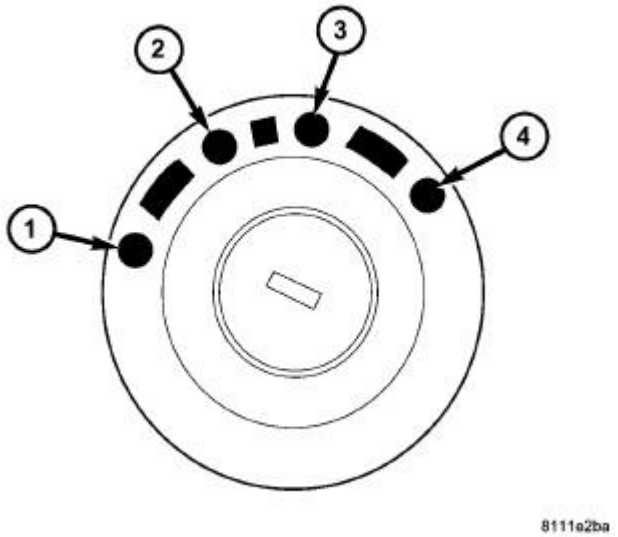

Fig. 571: Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

1 - LOCK 2 - ACC 3 - ON 4 - START

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair is necessary.

Refer to the following chart that expected shifter response, depending on ignition key/switch and brake pedal positions.

If the shifter cannot be moved out of the PARK position, refer to **SHIFTER LOCKED IN PLACE** below. If the shift lever can be shifted out of PARK without the brake pedal depressed, refer to CIRCUIT TEST chart.

SHIFTER LOCKED IN PLACE

1. Gain access to the brake transmission shift interlock (BTSI) solenoid. The solenoid is part of the shifter assembly.
2. Disconnect the wire connector from the rear of the BTSI solenoid.
3. Insert the ignition key and turn it to the ON position.
4. With the brakes applied, try moving the shifter out of the PARK position.

- If the lever now moves freely in and out of PARK, perform the CIRCUIT TEST.

If the shift lever now moves freely in and out of the park position, the BTSI solenoid is faulty and the shifter must be replaced. If the shift lever still does not move from the park position, the problem is in the shift lever

assembly.

If the above test pass and the shifter can still be moved freely in and out of PARK without the brake pedal depressed, replace shifter assembly.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
Insert the key into the ignition cylinder and leave it at "LOCK." Try to move the transmission out of "Park".	Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system repair.	

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

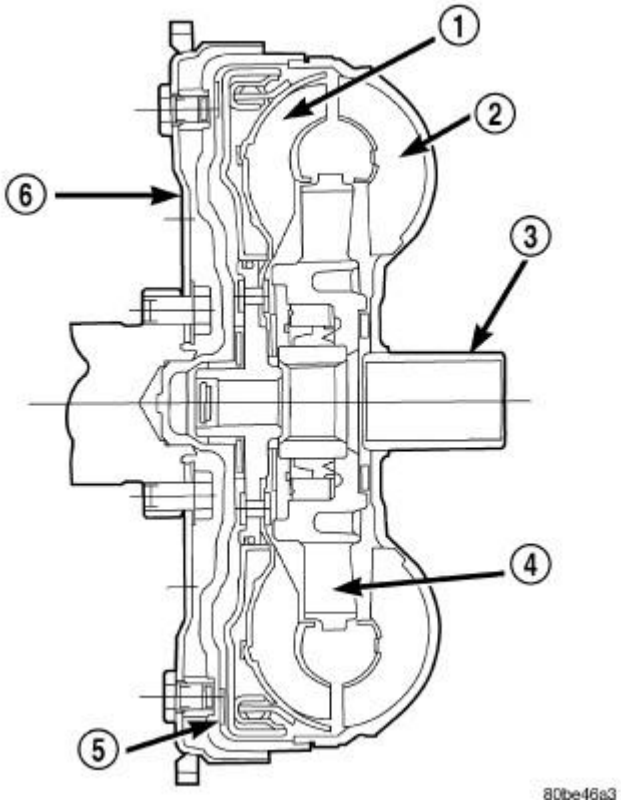

Fig. 572: Torque Converter Assembly
Courtesy of CHRYSLER LLC

1 - TURBINE
2 - IMPELLER
3 - HUB
4 - STATOR
5 - CONVERTER CLUTCH DISC
6 - DRIVE PLATE

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (4), an over-running clutch, an impeller (2) and an electronically applied converter clutch (5). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub (3) drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

Fig. 573: Impeller
Courtesy of CHRYSLER LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine (4,5), so is the impeller, because they are one and the same and are the driving member of the system.

TURBINE

Fig. 574: Turbine
Courtesy of CHRYSLER LLC

1 - TURBINE VANE
2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft (3) is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

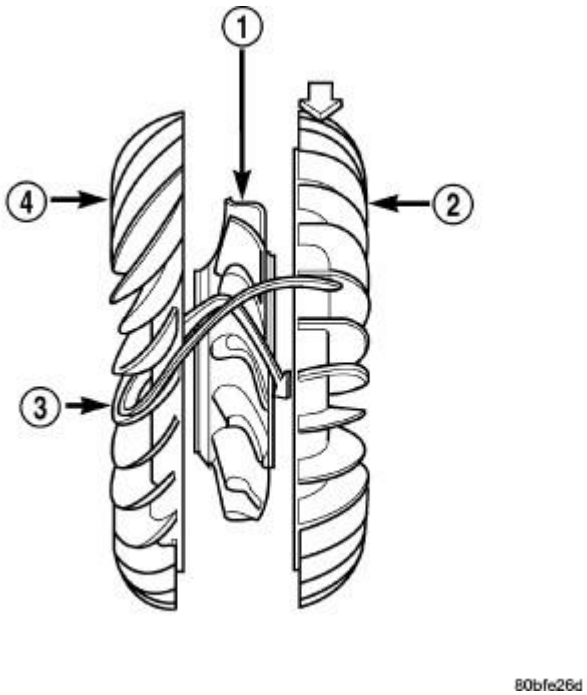

Fig. 575: Stator Location
Courtesy of CHRYSLER LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW
4 - TURBINE

The stator assembly (1) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

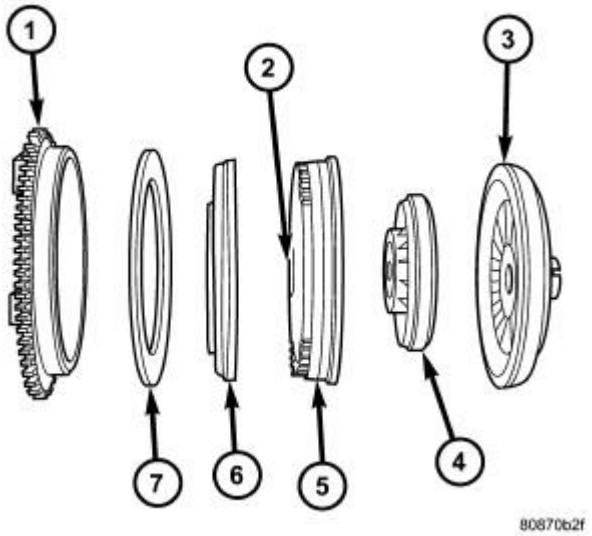

Fig. 576: Torque Converter Clutch (TCC)
Courtesy of CHRYSLER LLC

1 - IMPELLER FRONT COVER
2 - THRUST WASHER ASSEMBLY
3 - IMPELLER
4 - STATOR
5 - TURBINE
6 - PISTON
7 - FRICTION DISC

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) was added to the turbine (5), and a friction material (7) was added to the inside of the front cover (1) to provide this mechanical lock-up.

OPERATION

OPERATION

Fig. 577: Torque Converter Fluid Operation
Courtesy of CHRYSLER LLC

1 - APPLY PRESSURE	3 - RELEASE PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD	4 - THE PISTON MOVES SLIGHTLY REARWARD

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades, it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

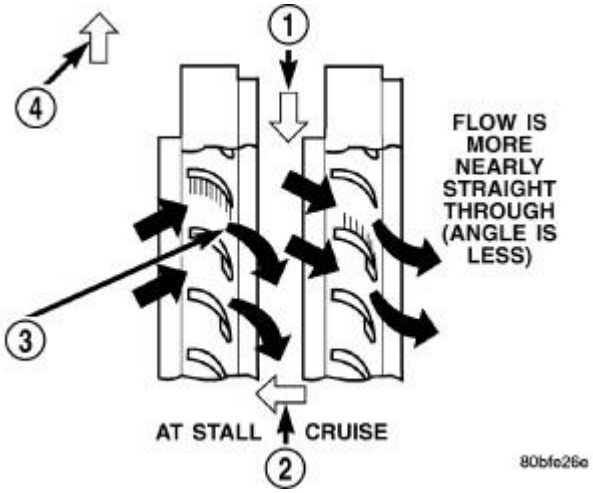

Fig. 578: Stator Operation
Courtesy of CHRYSLER LLC

1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
2 - FRONT OF ENGINE
3 - INCREASED ANGLE AS OIL STRIKES VANES
4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. See **Transmission and Transfer Case/Automatic - 62TE - Removal**.
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

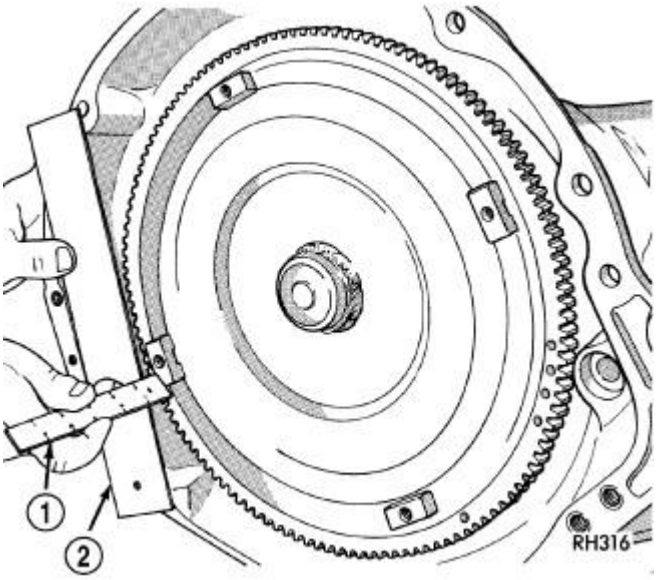

Fig. 579: Checking Torque Converter Seating
Courtesy of CHRYSLER LLC

1 - SCALE 2 - STRAIGHTEDGE

NOTE: Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate converter hub and oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. See **Transmission and Transfer Case/Automatic - 62TE - Installation**.
9. Fill the transmission with the recommended fluid. See **Transmission and Transfer Case/Automatic - 62TE/FLUID - Standard Procedure**.

VALVE BODY

OPERATION

OPERATION

REGULATOR VALVE

The regulator valve controls hydraulic pressure in the transaxle. It receives unregulated pressure from the pump, which works against spring tension to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as "line pressure."

SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid. In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves.

MANUAL VALVE

The manual valve is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve is fed to the torque converter regulator valve, where it passes through the valve, and is slightly regulated. The pressure is then directed to the converter clutch switch valve and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve controls the back (on) side of the torque converter clutch. When the PCM/TCM energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under all operating conditions.

REMOVAL

REMOVAL

INTRODUCTION

1st Printing
August, 2012

CHRYSLER, DODGE
62TE Transaxle

The new 62TE transaxle by the Chrysler Group is fitted behind a 3.5L V6 engine in the Avenger, Sebring and Sebring Convertibles (JS Body), the 4.0L V6 engines in Pacifica (CS Body) and the 3.3L, 3.8L, 4.0L Caravan and Grand Caravan vehicles. It has 6 forward speeds with a 7th forward gear used in a specific downshift sequence known as the “4th prime". Fourth prime ratio is 1.573:1 which is a ratio between third gear (2.284:1) and fourth gear (1:452:1). Refer to the Component Application Chart. Fourth prime is used for a smoother highway speed kick-down from sixth gear and to provide a better ratio for climbing grades under certain conditions.

This transaxle has another technical first for Chrysler in that this transaxle introduces the "double-swap" shifts on the 2-3, 3-2 and 4-2 shifts. This occurs when two components are turned off while two different components are turned on. This clutch to clutch syncronization takes place within 40-70 milliseconds, producing a very smooth shift.

To avoid a "Double-Swap" shift on a 6-4 downshift, the transaxle shifts into "4th Prime" instead of 4th gear, which requires only the OD clutch to be turned off and simultaneous application of the UD clutch. A freewheel device (sprag) is used to assist in smoother shifts with its nonsynchronous application and release properties. The sprag holds in first, third and fourth assisting in smoother 1-2, 2-1, 4-5 and 5-4 shifts.

GENERAL DESCRIPTION

The new 62TE transaxle by the Chrysler Group is fitted behind a wide variety of engine sizes and across various vehicle lines, as shown in Figure 1. The 62TE replaces the 41TE but retained a large percentage of parts from the 4 speed design so many of the internal parts will be very familiar.

The new 62TE consists of a main centerline that includes two planetary gear sets, 2 brake clutch packs (L/R and 2/4), 3 driving clutch packs in the input housing (UD/OD/Rev), and in the same arrangement as the 41TE transaxle. Refer to Figure 2.

The addition of the underdrive centerline, which replaces the previous pinion shaft, consists of one planetary gear set, two clutch packs (Direct & Low) and a freewheel (Sprag), tied together via the transfer gears and creates the ability to achieve the seven forward ratios of the 62TE. Refer to Figure 2. The freewheel (Sprag) was considered necessary for control of "double-swap" shifts, which was required to achieve seven forward ratios. In a "double-swap" shift, four shift elements must be coordinated from the initiation to the completion of the shift. In a customary upshift or downshift only two elements are involved, one applying and one releasing.

The 62TE has 6 forward speeds with a 7th forward gear used in a specific downshift sequence known as "4th prime". Fourth prime ratio is 1.573:1 which is a ratio between third gear (2.284:1) and fourth gear (1:452:1). Refer to the Component Application Chart shown in Figure 3. Fourth prime is used for a smoother highway speed kick-down from sixth gear to fourth gear to provide a better ratio for climbing grades under certain conditions.

This transaxle has another technical first for Chrysler in that this transaxle introduces the "double-swap" shifts on the 2-3, 3-2 and 4-2 shifts. This occurs when two components are released while two different components are applied. This clutch to clutch syncronization takes place within 40-70 milliseconds with the help of the freewheel (sprag), producing a very smooth shift.

To avoid a "Double-Swap" shift on a 6-4 downshift, the transaxle shifts into "4th Prime" instead of 4th gear, which requires only the OD clutch to be released and simultaneous application of the UD clutch. A freewheel device (sprag) is used to assist in smoother shifts with its nonsynchronous application and release properties. The sprag holds in first, third and fourth assisting in a smoother 1-2, 2-1, 4-5 and 5-4 shifts.

In all gears, except normal operation of 1st gear above a predetermined vehicle speed, three friction elements are always applied to retain engine braking.

In normal 1st gear operation, the Low Clutch is applied for launch and released after 150 RPM of output speed is reached. Refer to the Component Application Chart in Figure 3.

A third speed sensor was required on the underdrive centerline for shift control.

VEHICLE APPLICATION CHART

VEHICLE	YEAR	ENGINE	COUNTRY	TRANSAXLE

Figure 3

DESCRIPTION OF OPERATION AND POWERFLOW

Powerflow through the 62TE transaxle is similar to the 41TE transaxle. This is due to the addition of the new underdrive compounder assembly, as shown in Figure 2, and the new TCM strategy required to achieve the new ratios. The 62TE retains all of the 41TE ratios, as shown in the Component Application Chart above and adds the new ratios, which are achieved by multiplying main centerline ratios by the underdrive compounder carrier ratio of 1.452. In total, the 62TE provides seven forward ratios and one reverse.

The underdrive compounder assembly has basically two modes of operation, direct and reduction. Direct provides the original 41TE ratios, and reduction provides the four new ratios added in the 62TE.

Notice in the Component Application Chart above, the 2-3, 3-2, and 4-2 shifts require a "Double-Swap" shift. This occurs when two components are released while two different components are applied. This clutch to clutch syncronization takes place within 40-70 milliseconds, producing a smooth shift.

To avoid a "Double-Swap" shift on a 6-4 downshift, the transaxle shifts into "4th Prime" instead of 4th gear, which requires only the OD clutch to be released and simultaneous application of the UD clutch.

In normal 1st gear operation, the Low Clutch is applied for launch and released after 150 RPM of output speed is reached. Refer to the Component Application Chart in Figure 3.

IDENTIFICATION TAG LOCATION

The "Bar Code Label" is located on the top of the transaxle case, as shown in Figure 4, and contains useful information such as, transaxle part number, date of manufacture, serial number, etc.

If the label is not legible, transaxle identification numbers are also etched into the case next to the transfer gear cover, in the location shown in Figure 4.

Always refer to this information when replacement parts are required.

FLUID FILL AND FLUID REQUIREMENTS

Vehicles manufactured by Chrysler and equipped with the 62TE transaxle do not come equipped with a dipstick. There will be a locking cap, equipped with an "O" ring seal, found in the top of the filler tube, as shown in Figure 5.

The dipstick is considered a tool and must be purchased seperately under Miller Tool No. 9336A, as shown in Figure 5.

Refer to Figure 5 for information on checking transmission fluid levels.

The 62TE Transaxle ***requires*** Mopar® "ATF+4" fluid.

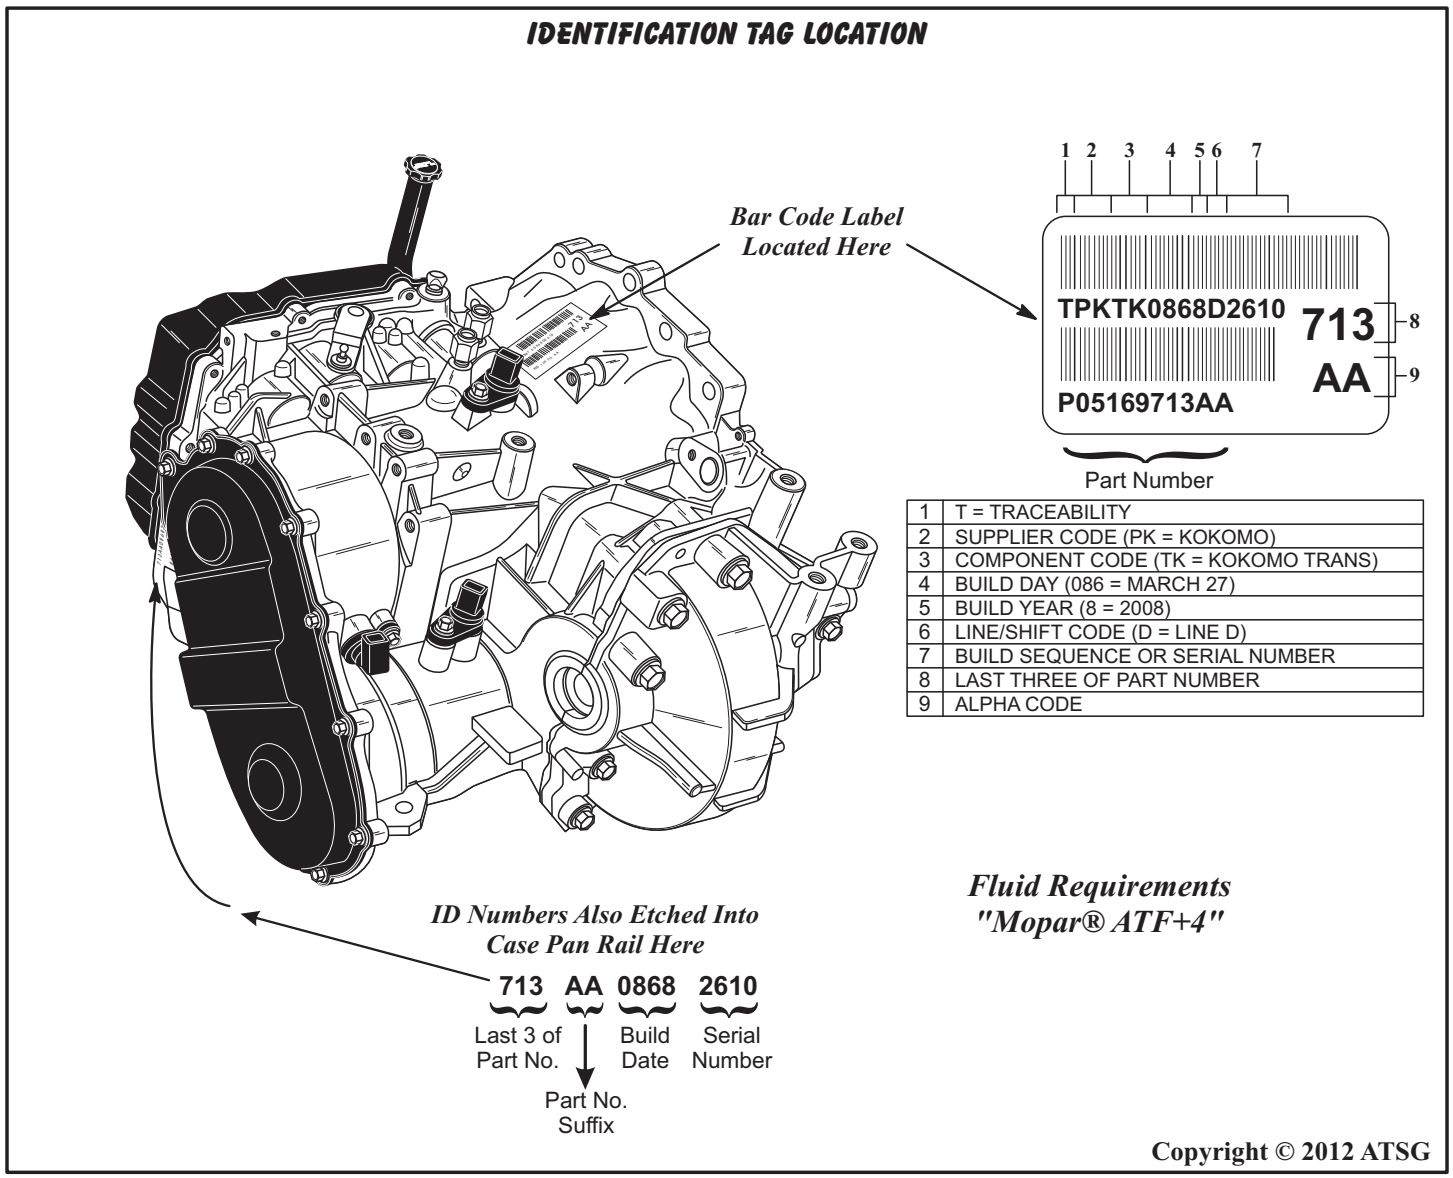

Figure 4

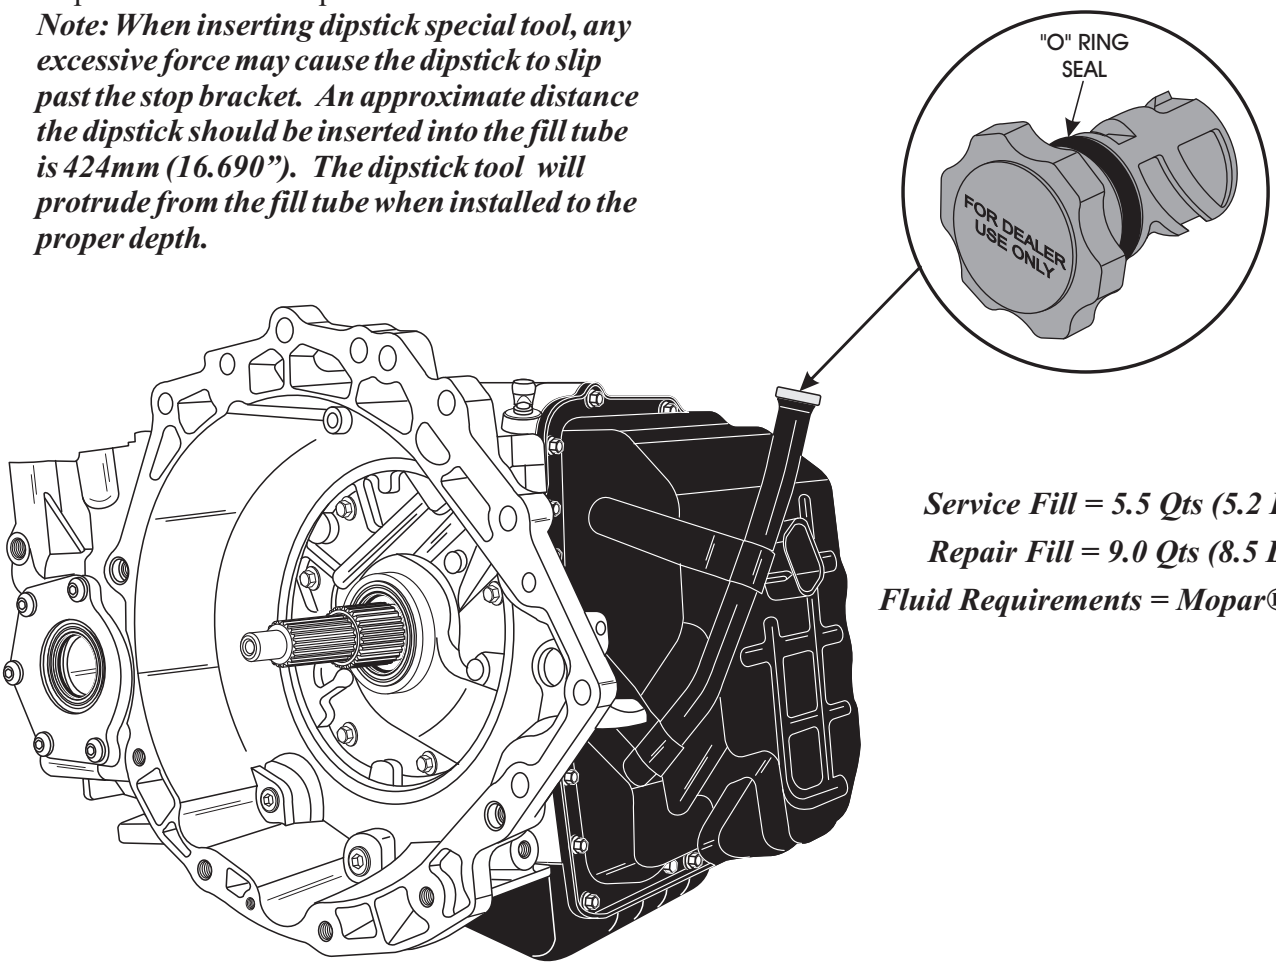
FLUID CHECKING PROCEDURE

1. The vehicle must be parked on a level surface.
2. Apply the service (emergency) brake.
3. Shift through the transaxle modes several times with the vehicle stationary and the engine at idle. Wait at least 2 minutes and check the fluid level with the engine running in Park.
4. Remove the dipstick tube cap.
5. Install the ***required*** Miller Tool No. 9336A into the fill tube until the dipstick tip contacts dipstick stop bracket in bottom pan.
   Note: When inserting dipstick special tool, any excessive force may cause the dipstick to slip past the stop bracket. An approximate distance the dipstick should be inserted into the fill tube is 424mm (16.690"). The dipstick tool will protrude from the fill tube when installed to the proper depth.
6. Add or remove fluid as necessary and recheck the fluid level using chart shown below and Miller tool 9336A.
   Note: Fluid temperature can be checked using proper scan tool.
7. The 62TE transaxle uses Mopar® ATF+4 fluid.
8. Once the fluid level is correct, install the dipstick tube cap.



Service Fill = 5.5 Qts (5.2 Litre)
Repair Fill = 9.0 Qts (8.5 Litre)
Fluid Requirements = Mopar® ATF+4

Fluid Temperature	*Minimum*	*Maximum*
77°F (25°C)	*25mm*	*38mm*
138°F (59°C)	*29mm*	*42mm*
191°F (88°C)	*34mm*	*46mm*

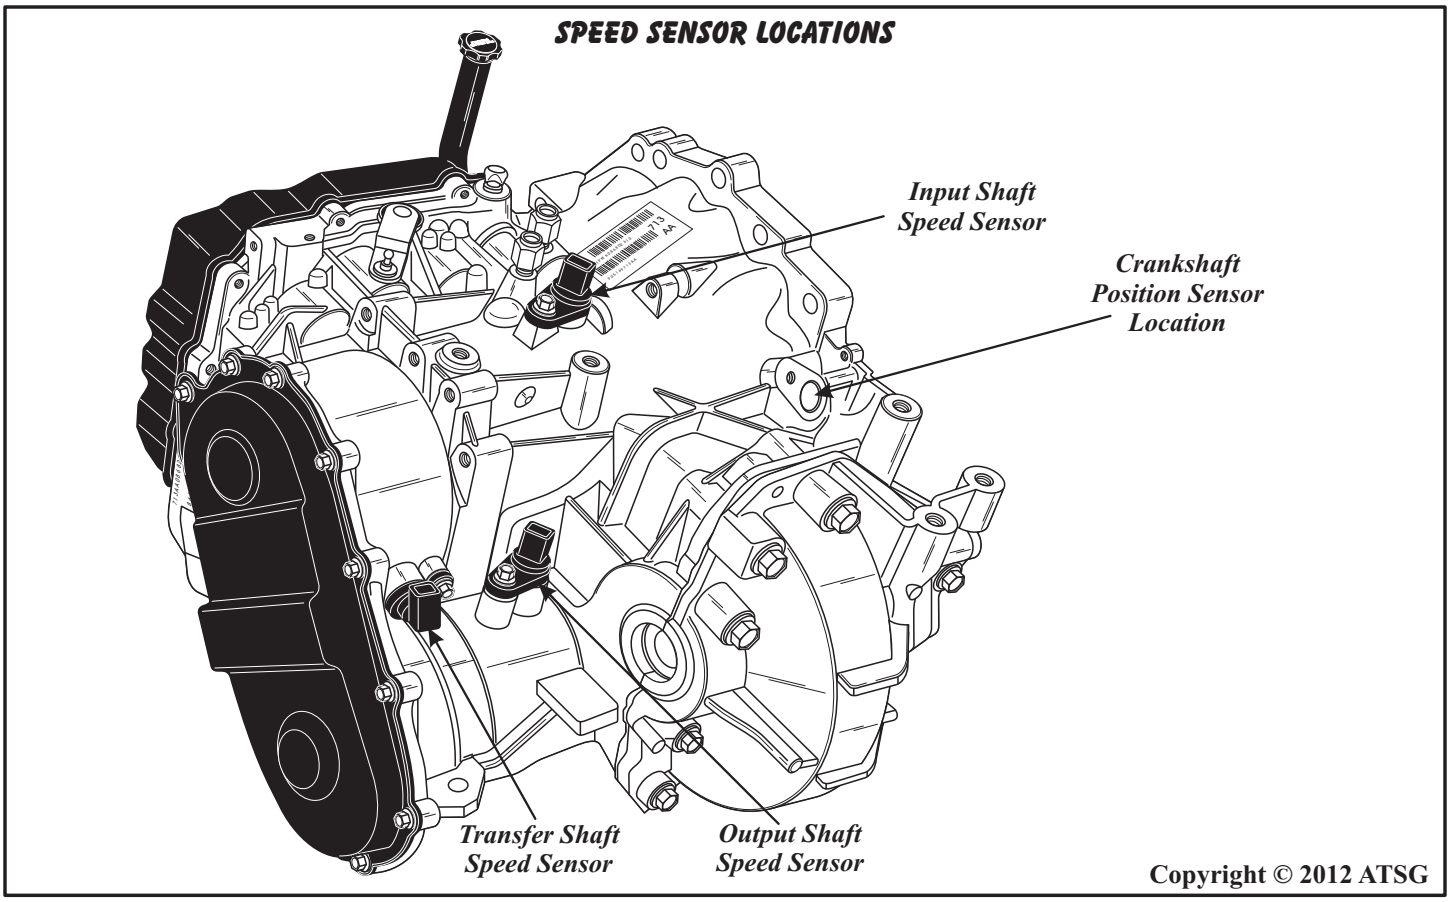

Figure 6

EXTERNAL ELECTRONIC COMPONENTS

SPEED SENSORS

The speed sensors are no longer threaded into the case, but are similar to those used in the RFE and RLE series transmissions. Each of them are held in place with one bolt and an "O" ring seals the sensor to the case bore. The 62TE is equipped with three speed sensors and their new locations are shown in Figure 6.

With a total of three speed sensors, the 62TE can monitor three different ratios. One is the ratio check of the Input Shaft Speed Sensor (Nt) versus the Output Shaft Speed Sensor (No). This measures the overall transmission ratio.

A second ratio check is made between the Input Shaft Speed Sensor (Nt) and the Transfer Shaft Speed Sensor (Nc), which checks the main transmission centerline ratio.

A third ratio check is made between the Transfer Shaft Speed Sensor (Nc) and the Output Shaft Speed Sensor (No), which checks the underdrive centerline ratio.

The control logic is to continuously check the three ratios while in gear. Should any of the three ratios fall outside of the programmed parameters, due to clutch slippage or clutch failure for a given period of time, the transmission is intelligently put into 3rd gear failsafe.

Input Shaft Speed Sensor (ISS)

The Input Speed Sensor (ISS) has been relocated to the top of the case, as shown in Figure 6, and continues to read turbine speed from the input clutch housing. The ISS is no longer threaded into the case but is held in place with one bolt and an "O" ring seals the sensor body to the transaxle case bore, as shown in Figure 7. The ISS is a two wire magnetic pickup device that generates AC signals as rotation of the input clutch housing occurs.

Continued on Page 9

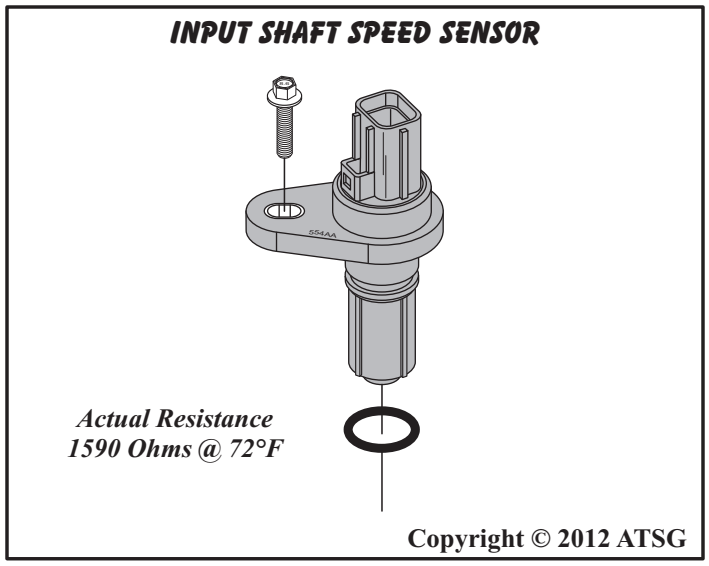

Figure 7

Transfer Shaft Speed Sensor (TSS)

The Transfer Shaft Speed Sensor (TSS) has been relocated to the side of the case, as shown in Figure 6, and continues to read transfer shaft speed from the rear planetary carrier/front ring gear assembly. The TSS is held in place with one bolt and an "O" ring seals the sensor body to the transaxle case bore, as shown in Figure 8. The TSS is a two wire magnetic pickup device that generates AC signals as rotation of the rear planetary carrier occurs.

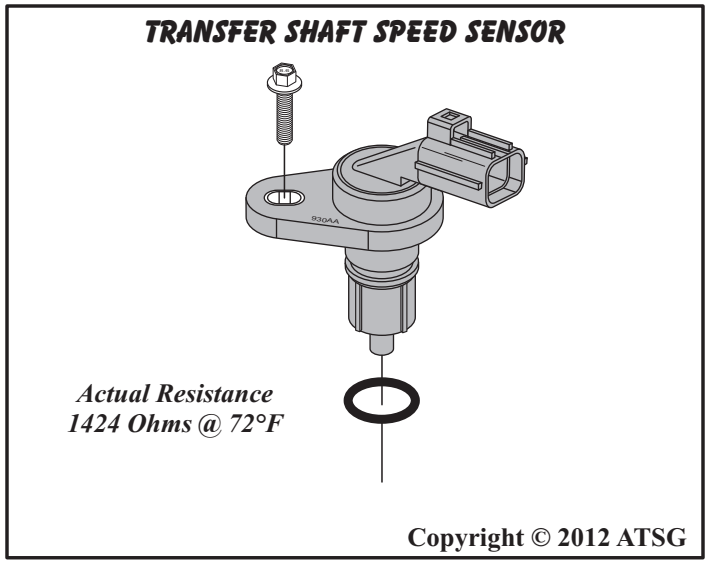

Figure 8

Output Shaft Speed Sensor (OSS)

The Output Speed Sensor (OSS) has been relocated to the underdrive centerline side of the case, as shown in Figure 6, and reads output shaft speed from the output planetary carrier assembly. The OSS is held in place with one bolt and an "O" ring seals the sensor body to the transaxle case bore, as shown in Figure 9. The OSS is a two wire magnetic pickup device that generates AC signals as rotation of the output planetary carrier occurs.

Speed sensor harness connectors and wire colors for a 2009 Grand Caravan, 3.8L, are shown in Figure 10.

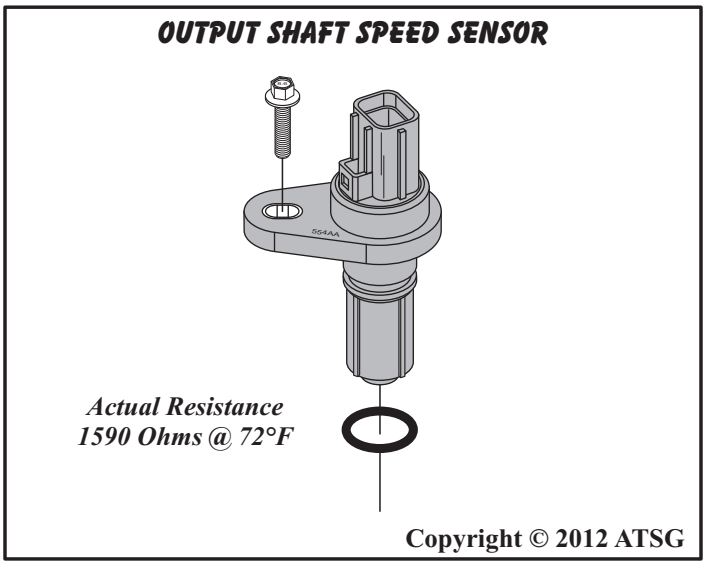

Figure 9

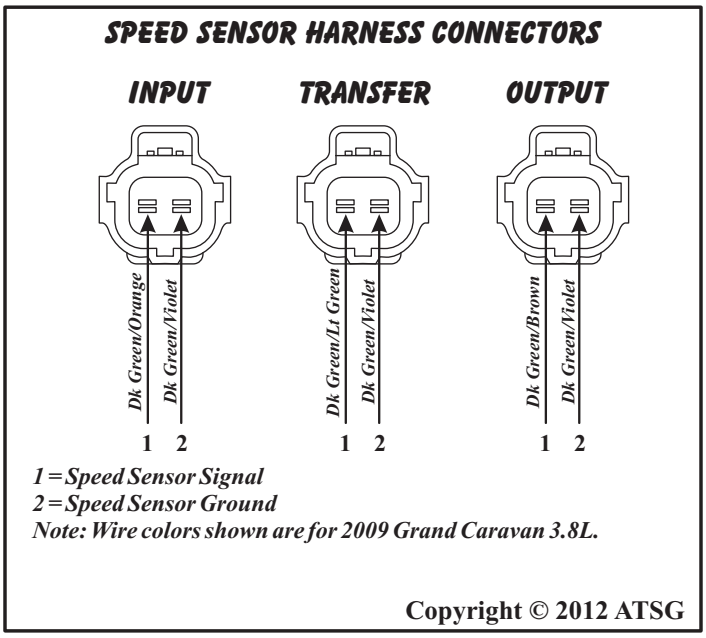

Figure 10

EXTERNAL ELECTRONIC COMPONENTS (CONT'D)

Transmission Control Relay

The Transmission Control Relay is located in the Totally Integrated Power Module (TIPM), as shown in Figure 11, and receives a ground signal from terminal (C4) 18 at the PCM/NGC to close the relay. Refer to the wiring schematic in Figure 14.

LIMP-IN MODE OPERATION

The PCM has the ability to monitor all transaxle related electrical components and if it detects a problem, takes appropriate action, and most of the time results in the PCM setting a Diagnostic Trouble Code (DTC). Whether this results in MIL illumination, or Limp-in Mode operation, depends on the type of DTC that was set.

If the PCM determines that transaxle damage may result from the DTC type that was set, the PCM will shut off the ground signal to the transaxle control relay which will shut off all power to the transaxle and the vehicle will be in Limp-in Mode Operation.

When in Limp-in Mode Operation, with the shift lever in the "Drive" position the transmission will be in 3rd gear. The Underdrive and 2/4 Solenoids are "Normally Applied" solenoids while the remaining clutch control solenoids are "Normally Vented". As a result of this, when the electrical system shuts down, failsafe or limp-in mode is 3rd gear.

The hydraulic control system design, without any electronic assist, provides the 62TE transaxle with PARK, REVERSE, NEUTRAL, and THIRD gears based solely on driver selection. This design allows the vehicle to be driven in "limp-in" mode (3rd gear) in the event of a total electronic control system failure, or a situation that the PCM recognizes as potentially damaging to the transaxle (DTC Stored).

ADAPTIVE LEARNING

The 62TE transaxle uses an "Adaptive Learning" feature which allows the PCM to modify the clutch apply rate to maintain consistant shift quality. This is done based on the amount of wear on the friction elements. The PCM then adjusts the duty cycle of the shift solenoids to achieve the smoothest possible upshifts and downshifts.

TYPICAL CONTROL RELAY LOCATION

Figure 11

EXTERNAL ELECTRONIC COMPONENTS (CONT'D)

Transmission Control Module (TCM)

Vehicles equipped with the 62TE transaxle use a Powertrain Control Module (PCM) housed in the New Generation Controller (NGC) utilizing the C1, C2, C3 and C4 connectors for transaxle functions. The PCM/NGC controls ***all*** of the transaxle functions. The controller locations vary depending on vehicle model, as shown in Figure 13. Location for the Van models is illustrated in Figure 12.

The electronic components of the 62TE transaxle consist of various sensors and switches as input information to the PCM, that the PCM uses to determine the appropriate gear ratio and shift schedule points. There is also the associated wiring, fuses, relays, connectors, splices and grounds for the transaxle to function as designed. A typical transmission wiring schematic has been provided for you in Figure 14.

The final output from the PCM is to the six shift solenoids, line pressure control solenoid and the EMCC (Converter Clutch) solenoid located in the Solenoid Body/Transaxle Range Sensor assembly and bolted on the valve body as shown in Figure 21. The solenoids in this transmission are unique in that some are normally vented and some are normally applied and this is also illustrated in Figure 22. The PCM also communicates with other control modules via data comunication lines. The New Generation Controller (NGC) modules currently use CAN C bus.

EXTERNAL ELECTRONIC COMPONENTS (CONT'D)

Auto-Stick

The appearance of the selector lever, as shown in Figure 19, will vary between the different vehicle applications. However, the operation and function remains the same with the use of the 62TE.

These vehicles are equipped with an LED display on the instrument panel that will display the gear selected with the selector lever "P", "R", "N", "D".

If the selector lever is moved to the Auto-Stick position the gear that the transaxle is currently in will be displayed on the instrument panel. If you were sitting still when Auto-Stick is selected, "1" will be displayed. Second gear starts can be achieved by tapping the shift lever towards the (+) symbol for starting on snow or ice conditions. Upshifts and downshifts occur by tapping the shift lever in the appropriate direction. The shift signals are an input to the PCM/NGC, which in turn carries out the request. When the shift lever is returned to the "D" position, normal operation resumes.

Refer to Figure 20 for the Auto-Stick switch wire schematic.

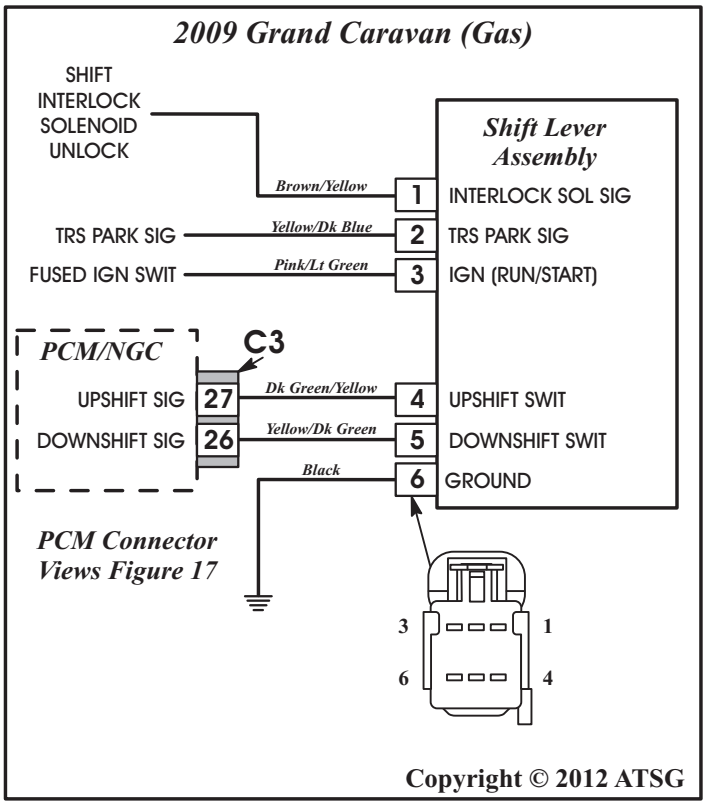

Figure 20

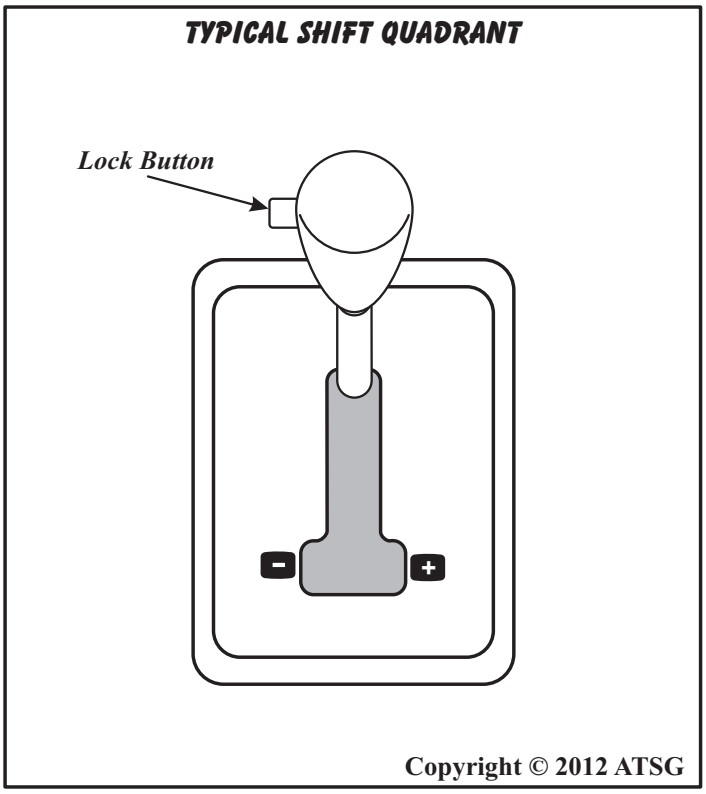

Figure 19

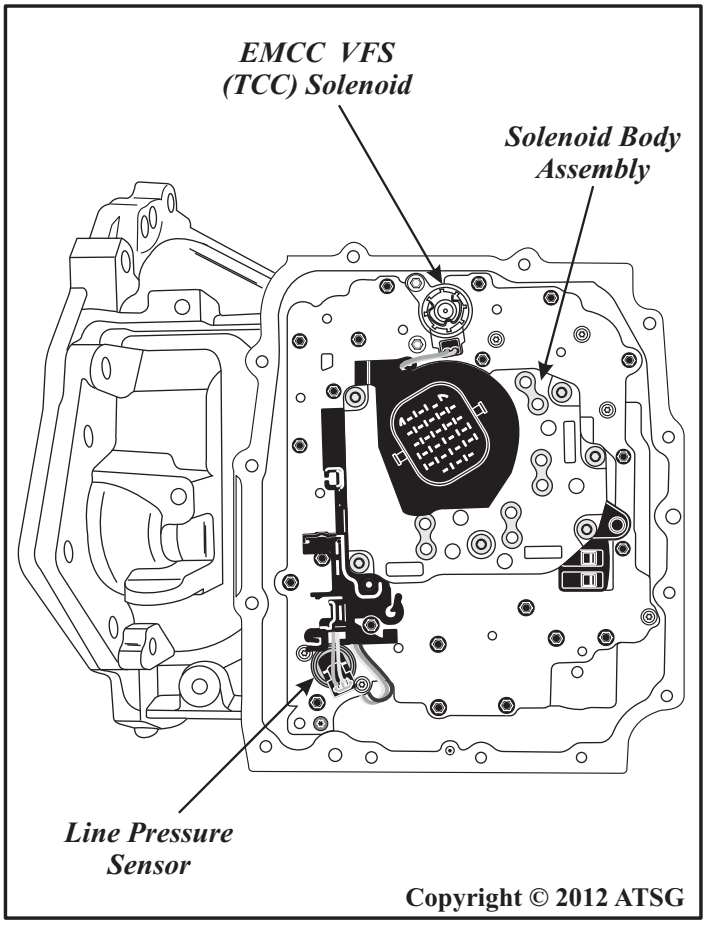

Figure 21

INTERNAL ELECTRONIC COMPONENTS

Solenoids

The 41TE transmission was operated using only four clutch control solenoids; the UD, L/R, 2/4 and OD. The 62TE uses the same 4 solenoids, as well as four additional solenoids. Direct Clutch Solenoid (DC), Low Clutch Solenoid (LC), a Pressure Control (PC) VFS Solenoid and an Electronically Modulated Converter Clutch (EMCC) VFS Solenoid were added. Solenoid description and function has been provided here, and notice that the 2/4 solenoid is a "Double Duty" solenoid. The EMCC solenoid, bolted directly to the valve body, is the only one that is serviced seperately. The remainder are serviced only with a complete solenoid body, as shown in Figure 21.

The Underdrive and 2/4 Solenoids are "Normally Applied" solenoids while the remaining clutch control solenoids are "Normally Vented" (See Figure 22).

A solenoid, pressure switch and clutch application chart has been provided for you in Figure 23.

Solenoid resistance checks and terminal information are found on Page 20.

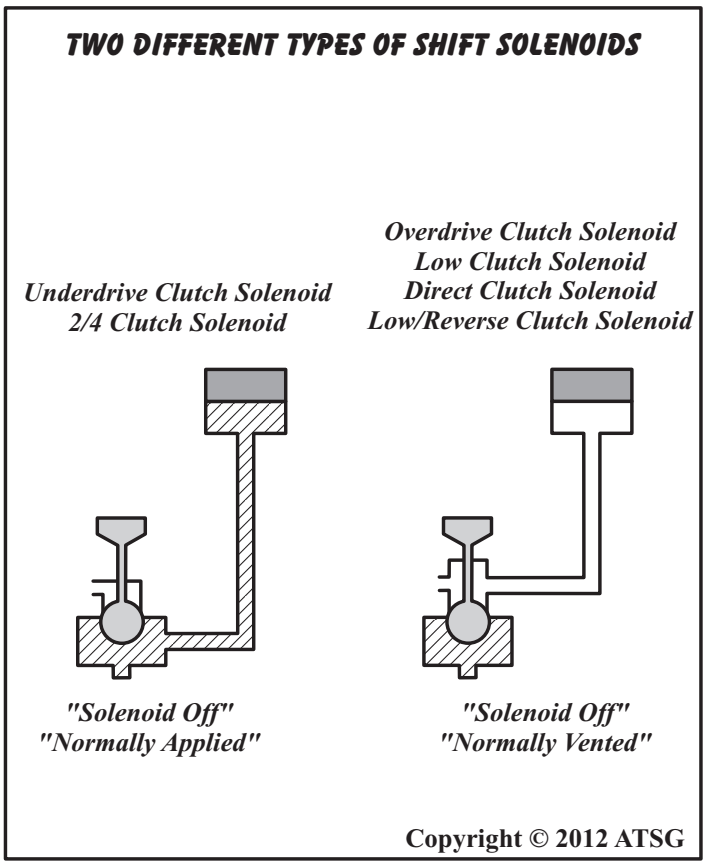

Figure 22

Solenoid Description and Function

Underdrive Clutch Solenoid - is ***normally applied*** and controls oil to the Underdrive Clutch in 1st, 2nd, 3rd, 4th and 5th gears of the transaxle.

2-4 Clutch Solenoid - is ***normally applied*** and when in the Drive position, controls oil to the 2/4 clutch in 3rd, 4th prime and 6th gears of the transaxle.

Note: The 2-4 Clutch Solenoid is also used for reverse inhibit.

When the selector lever is placed into Reverse, line pressure from this solenoid is directed through the manual valve and L/R switch valve one, in the valve body, to apply the Low/Reverse clutch.

Overdrive Clutch Solenoid - is ***normally vented*** and controls oil to the Overdrive Clutch in 4th, 5th, and 6th gears in the transaxle.

Direct Clutch Solenoid - is ***normally vented*** and controls oil to the Direct Clutch in 2nd, 4th, 5th, and 6th gears in the transaxle.

Low Clutch Solenoid - is ***normally vented*** and controls oil to the Low Clutch in 1st, 3rd, and 4th gears in the transaxle.

Low/Reverse Clutch Solenoid - is ***normally vented*** and is used to apply the Low/Reverse clutch in 1st and 2nd gear from Park or Neutral, or a coast down to 1st and 2nd gear.

Line Pressure VFS Solenoid - is ***normally vented*** and is used to control line pressure in the transaxle. It provides a pressure output to the regulator valve that brings regulated pressure to a specified value. Refer to the chart in Figure 23 for specified values.

EMCC VFS Solenoid - is ***normally vented*** and is a variable force solenoid used to control the torque converter clutch application, release and the force with which it is applied or released. This new converter allows the use of precise Electronically Modulated Converter Clutch (EMCC) lockup strategy, that allows the clutch to slip continuously under certain driving combinations. Converter clutch is available in 3rd, 4th, 5th, and 6th gear.

Refer to Page 31 for additional EMCC operation.

Figure 23

INTERNAL TRANSAXLE COMPONENTS (CONT'D)

Line Pressure Sensor

Line pressure is electronically controlled by the PCM/NGC and is measured by the Line Pressure Sensor (transducer). LP sensor is bolted on the valve body assembly, as shown in Figure 21.

The desired line pressure is continuously being compared to the actual line pressure and is regulated by changing the duty cycle of the Pressure Control Solenoid located ***inside*** the solenoid body, as shown in Figure 21.

The monitored Line Pressure Sensor voltage should always be between 0.35 and 4.75 volts and operates much like a TPS/APPS. (See Figure 24). Outside of these parameters will cause either DTC P0934 or DTC P0935 to be stored in PCM/NGC.

Figure 26

INTERNAL TRANSAXLE COMPONENTS (CONT'D)

Solenoid & Pressure Switch Resistance Check

Solenoid resistance ***must*** be checked through the 38-Way transaxle case connector, shown in Figure 25, and using the resistance chart shown in Figure 26.

The EMCC VFS (TCC) Solenoid is bolted on the valve body, external from the solenoid body, as shown in Figure 27. This solenoid ***must*** be connected if you are going to check it through the 38-Way transaxle case connector, which is the best way as it also checks the wire harness to the solenoid. You may also disconnect it and check it across the two terminals directly at the solenoid.

Pressure switches ***must*** also be checked through the 38-Way transaxle case connector, using the resistance chart in Figure 26.

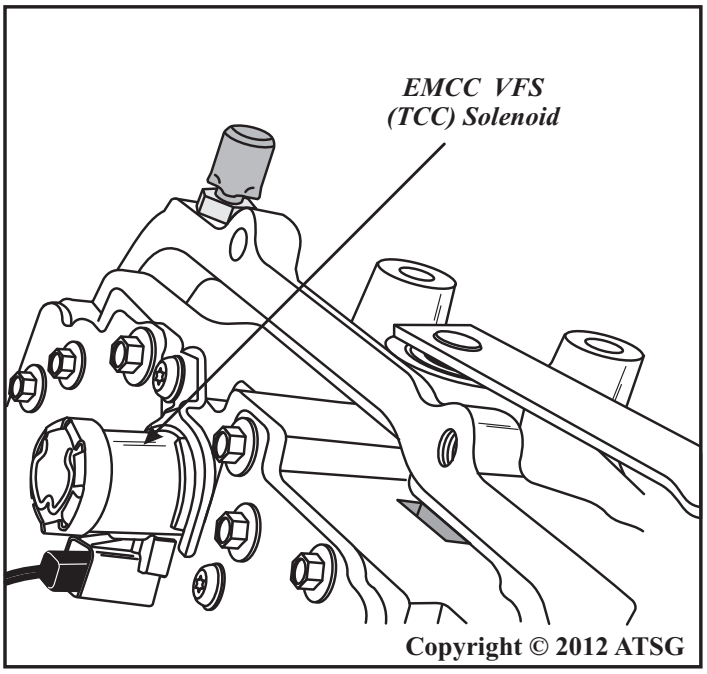

Figure 27

INTERNAL TRANSAXLE COMPONENTS (CONT'D)

Transaxle Range Sensor

The Transaxle Range Sensor (TRS) is a series of four switches that open or close depending on selector lever position, and informs the PCM of the selector lever position chosen by the operator. The TRS is held in position to the inside detent lever by the detent roller and spring assembly, as shown in Figure 28.

The Transmission Range Sensor can be bench tested using a DVOM set to ohms. Place the negative lead anywhere on the valve body as close to the detent plate as possible. With the positive lead, check each circuit one at a time through all of its ranges, either through the main transaxle 38-Way case connector if unit is still in the vehicle, or at the sensor itself. Refer to the chart in Figure 28.

C = Closed or "Continuity"
O = Open or "No Continuity"

Figure 29

INTERNAL ELECTRONIC COMPONENTS (CONT'D)

Pressure Switches

The transaxle system uses five pressure switches to monitor the fluid pressure in five elements, as shown in Figure 29. The pressure switches are part of the complete solenoid body assembly and are not serviced seperately. The pressure switches are continuously monitored for correct states in each gear.

The pressure switches are normally off or open (no pressure applied) and read "high" (+12 volts). When an element is applied, the corresponding pressure switch closes to ground and reads "low" (0 volts).

Refer to the Open/Closed switch chart and wiring schematic in Figure 29.

The PCM tests the OD and 2/4 pressure switches when they are off, or when the corresponding friction element is not applied, by briefly applying the OD and 2/4 elements which will cause the corresponding pressure switch to close. This test verifies that these switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is retested. If the repeat test also fails, the MIL is illuminated and the system will default to Limp-in mode and store DTC P0992 in the PCM/NGC.

CHECKING LINE PRESSURE

The 62TE transaxle has an "upgraded" oil pump assembly with pump gears that are 2mm (.080") thicker and reduction of the inner and outer pump gear tooth clearance to the cresent. The pump pressure regulation system also includes a Variable Force (Line Pressure) Solenoid located inside the solenoid body. Line pressure is monitored by the line pressure sensor (transducer). Refer to Page 19. Use of the line pressure sensor permits a further pressure reduction since the actual value of line pressure is known.

Regulation is achieved by changing the duty cycle of the Line Pressure VFS Solenoid and is controlled by the PCM. 5% duty cycle = solenoid OFF which equals maximum line pressure. 62% duty cycle = solenoid ON which equals minimum line pressure. The PCM calculates the desired line pressure based on inputs from both engine and transaxle load.

With conventional pump systems under most driving conditions, pump output pressure used to engage the clutches greatly exceeds the need and is wasting considerable power. This pump pressure control system monitors clutch torque requirements and adjusts the pump pressure accordingly, using only what is necessary to prevent clutch slip.

The Transmission Control System calculates torque input to the transaxle and uses it as the primary input to the desired pressure calculation. This is called Torque Based Line Pressure. In addition, the line pressure is set to a preset level 827 or 931 kPa (120 or 135 psi) during shifts and in Park and Neutral to ensure consistent shift quality. The desired line pressure is continuously being compared to the actual line pressure. If the actual line pressure is consistently lower than the target while driving, the line pressure low DTC P0868 will set.

The only pressure tap available on the 62TE is for line pressure and is located, as shown in Figure 30.

We have provided you with a line pressure chart in Figure 31, that provides "Base Line Pressure" and "Observed Line Pressure" in actual road test in the vehicle. Keep in mind that any increase in throttle pressure will increase line pressure.

Figure 39

CONVERTER CLUTCH OPERATION

The Torque Converter has been redesigned from a circular geometry to an elliptical geometry of the torus, making the converter dimensionally shorter longitudinally by 12 mm and weighing less, as shown in Figure 40.

The apply and release of the TCC are automatic and controlled by the PCM which signals the variable force EMCC (VFS) Solenoid that is mounted on the valve body. The TCC will engage at approximately 35 mph at light throttle, after the shift to third gear.

This new converter allows the use of precise Electronically Modulated Converter Clutch (EMCC) lockup strategy that will allow the converter clutch to slip continuously under certain driving combinations.

With the EMCC there are four different converter clutch operational modes.

- ***No EMCC***
- ***Partial EMCC***
- ***Full EMCC***
- ***Gradual EMCC Release***

NO EMCC Under No EMCC conditions, the EMCC (VFS) Solenoid is Off. There are several things that can result in No EMCC operations. No EMCC can be initiated due to a fault in the transaxle or because the PCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC Partial EMCC operation will modulate the EMCC (VFS) Solenoid duty cycle to obtain partial converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC During Full EMCC operation, the PCM increases the EMCC (VFS) Solenoid duty cycle to full On, after Partial EMCC control brings the engine speed within the desired slip range of transaxle input speed relative to engine RPM.

GRADUAL EMCC RELEASE This operation is to soften the change from Full or Partial EMCC down to No EMCC. This is done at mid-throttle by slowly decreasing the Emcc (VFS) Solenoid duty cycle.

Electronically Modulated Converter Clutch

SAFETY PRECAUTIONS

Service information provided in this manual by ATSG is intended for use by professional, qualified technicians. Attempting repairs or service without the appropriate training, tools and equipment could cause injury to you or others.

The service procedures we recommend and describe in this manual are effective methods of performing service and repair on this unit. Some of the procedures require the use of special tools that are designed for specific purposes.

This manual contains CAUTIONS that you must observe carefully in order to reduce the risk of injury to yourself or others. This manual also contains NOTES that must be carefully followed in order to avoid improper service that may damage the vehicle, tools and/or equipment.

TRANSAXLE DISASSEMBLY

1. Drain all fluid from the transaxle.
2. Clean exterior of the transaxle thoroughly with a suitable solvent or pressure washer.
3. Remove the torque converter from the transaxle, as shown in Figure 41.
   Caution: Use care removing torque converter to prevent injury or damage, as it is heavy.
4. Remove the 3 sound cover retainers from the stud type retaining bolts, as shown in Figure 42.
5. Remove the front sound cover, as shown in Figure 42.
6. Remove all three of the speed sensors, as shown in Figure 43.
7. Remove and discard the "O" ring seals.

TRANSAXLE DISASSEMBLY (CONT'D)

8. Remove the 12 bottom pan bolts, using an 8 mm socket, as shown in Figure 44.
9. Remove the bottom pan, as shown in Figure 44.
10. Remove the two main filter bolts, using a 25 torx bit, as shown in Figure 44.
11. Remove and discard the main oil filter, as shown in Figure 44.
12. Remove and discard the main filter seal from the case bore, as shown in Figure 45.
13. Remove the dipstick stop from the case using a 25 torx bit, as shown in Figure 45.
    Note: This is done to prevent damage while maneuvering the transaxle during disassembly.

Figure 45

TRANSAXLE DISASSEMBLY (CONT'D)

14. Before removing valve body side cover bolts check the style of line pressure plug in the unit you are working on, as shown in Figure 46.
    Note: If your unit has the Hex-Head style line pressure plug it must be removed to remove the side cover. If your unit has Allen-Head style, it can be left in place (See Figure 46).
15. Remove the 13 valve body side cover bolts, as shown in Figure 47, using 8 mm socket on the regular style bolts and 10 mm on the stud style bolts.
    Note: Record the locations of the 3 stud style retaining bolts (See Figure 46).
16. Remove the valve body side cover from the transaxle, as shown in Figure 47.

Figure 86

TRANSAXLE DISASSEMBLY (CONT'D)

85. Remove the 10 bolts retaining the pinion gear cover in the case using a T30 Torx bit, as shown in Figure 87.
Note: These 10 bolts are same size thread and length as driven transfer gear roller bearing support bolts, but "will not" interchange. The driven transfer gear bearing support have T25 Torx head and pinion gear cover use T30 Torx.
86. After removing retaining bolts, the cover and pinion gear can be removed as an assembly with snap ring pliers.
87. Remove the 5 differential output bearing cover bolts, as shown in Figure 88, using a T45 Torx bit.
88. Remove the differential output bearing cover, as shown in Figure 88.
89. Remove the differential output bearing selective shim, as shown in Figure 88.
Note: This shim is used to set the differential bearing pre-load.

Figure 90

COMPONENT REBUILD

Transaxle Case And Differential

CAUTION: The rotational torque on the pinion and differential must be checked individually. We will install and check the pinion gear first, to verify we have the proper selective shim, and then remove it, so that the differential can be checked.

1. Install new large & small tapered roller bearings on the pinion gear, as shown in Figure 91, using proper adapters and hydraulic shop press.
2. Install new large tapered roller bearing cup into pinion gear cover along with selective shim, as shown in Figure 91, using proper adapters and hydraulic shop press.
3. Use the two special tools shown in Figure 92 to remove the small tapered roller bearing cup from the case.
   Note: Very difficult to remove without special tools that are shown.
4. Install new small tapered roller bearing cup into case using the proper drivers until fully seated.

Continued on Page 57

Figure 92

COMPONENT REBUILD

Transaxle Case And Differential (Cont'd)

5. Install the completed pinion gear and bearings into case, as shown in Figure 93.
6. Install the completed pinion gear cover and race assembly into the case, as shown in Figure 93.
7. Install the 10 retaining bolts for the pinion gear cover, as shown in Figure 93.
   Note: Remember, these bolts are 30 Torx head.
8. Torque the pinion gear cover retaining bolts to 12 N·m (105 in.lb.).
9. Check rotating torque using pinion gear torque tool C-4995A and an inch pound, dial type torque wrench, as shown in Figure 94.
   Note: The differential assembly must not be installed when checking pinion pre-load torque.
10. Rotating torque for the pinion gear should be 2 to 8 in.lb. If more than 8 in.lb., decrease shim thickness under pinion gear cover race. If less than 2 in.lb., increase shim thickness.
    Note: Shims available from local OEM dealer.
11. Once you have verified proper shim thickness remove the pinion gear cover and gear assembly.

Continued on Page 58

Figure 94

COMPONENT REBUILD

Transaxle Case And Differential (Cont'd)

12. Disassemble the differential assembly using Figure 97 as a guide.
13. Clean and inspect all of the differential parts thoroughly. Replace as necessary.
14. If bearing service is required, the tools shown in Figure 95, or their equivalent, and suitable hydraulic shop press will be necessary.
    Note: Always replace tapered roller bearings and cups in sets.
15. Install one oil weir into back side of the output bearing cover with lip facing up, as shown in Figure 96.
    Note: Not necessary to remove oil weir unless it is damaged.
16. Install new axle seal into front side of the output bearing cover, as shown in Figure 96.
17. Install one side gear and washer into differential case housing, using Figure 97 as a guide.
18. Install both pinion gears and washers into the differential case housing, while orientating the washer tabs to notch in housing (See Figure 97).
19. Install the differential pinion gear cross shaft using Figure 97 as a guide.
20. Install remaining side gear and then side gear washer using Figure 97 as a guide.
21. Install differential case cover on top of housing while aligning through the holes (See Figure 97).
22. Install the differential ring gear to the differential case housing, as shown in Figure 97.
23. Install the 12 retaining bolts along with pinion cross shaft retainers, as shown in Figure 97.
    Note: Use red Loc-tite® on all ring gear bolts.
24. Torque the 12 ring gear retaining bolts to 95 N·m (70 ft.lb.).
25. Install new tapered roller bearings as necessary using the proper adapters and hydraulic shop press.

Figure 103

COMPONENT REBUILD

Transaxle Case And Differential (Cont'd)

34. Check the rotating torque of differential assembly using tool L4436-A and an inch pound, dial type torque wrench, as shown in Figure 104.
    Note: The pinion gear assembly must not be installed when checking differential pre-load.
35. Rotating torque for differential assembly should be 10 to 20 inch pounds. If more than 20 in.lb., decrease shim thickness under output bearing cover. If less than 10 in.lb., increase the shim thickness under output bearing cover.
    Note: Shims available from local OEM Dealer.
36. Install new left hand axle seal using the proper driver, as shown in Figure 105.
37. Now you can re-install the pinion gear assembly, pinion gear cover and the retaining bolts, as shown in Figure 106.
38. Torque the pinion gear cover retaining bolts to 12 N·m (105 in.lb.).

Figure 106

COMPONENT REBUILD

Transaxle Case And Differential (Cont'd)

39. If bearing service is necessary, replace the two tapered roller bearing cups for rear planetary carrier and drive transfer gear, as shown in Figure 107, using the proper drivers.
Note: If rear planetary carrier replacement is necessary (common concern) because of the number 7 thrust bearing failure, ensure that you have the proper replacement part. Some technicians have mistakenly installed the late 5 pinion "604" carrier and spoiled their day. Even though the gear ratio is the same, the speed sensor reluctor tooth count is different and they "will not" interchange, as shown in Figure 108.
40. Install new tapered roller bearings on the rear planetary carrier and the drive transfer gear, as shown in Figure 109, using the proper adapters and hydraulic shop press.

Continued on Page 64

Figure 115

COMPONENT REBUILD

Transaxle Case And Differential (Cont'd)

49. Install the selective shim onto the rear planetary shaft, as shown in Figure 115.
    Note: These steps should be done with the transaxle centerline in a horizontal position, as shown in Figure 115, to prevent any damage to the rear planetary carrier.
50. Install the transfer drive gear onto the planetary shaft, as shown in Figure 115.
51. Use the convex washer and retaining bolt to pull and seat the transfer drive gear, as shown in Figure 115.
    Note: Transfer gear retaining bolt should be installed with Blue Loc-tite® on threads.
52. Torque the transfer gear retaining bolt to 271 N·m (200 ft.lb.).
53. Check the rotating torque of the transfer drive gear using a 1-1/2" socket and inch pound, dial type torque wrench, as shown in Figure 116.
54. Rotating torque should be 3-8 inch pounds. If the rotating torque is too high, install a thicker shim. If the rotating torque is too low, install a thinner shim. Available selective shims and their part numbers are provided in Figure 117.
55. Set completed case aside for final assembly.

Continued on Page 67

Figure 123

COMPONENT REBUILD

Underdrive Compounder Assembly

CAUTION:

The addition of the underdrive centerline, which replaces the previous pinion shaft, consists of the output planetary gear set, two new clutch packs (Direct & Low) and a freewheel (Sprag), tied together via the transfer gears. This creates the ability to achieve the seven forward ratios of the 62TE.

The underdrive section is sometimes difficult and confusing to disassemble and reassemble. We are going to provide a detailed description of the disassembly and the reassembly procedure to make it easier to understand.

We have provided you with detailed exploded views of the underdrive compounder assembly in Figure 124 and 125, for reference.

Figure 125

COMPONENT REBUILD

Underdrive Section Disassembly

1. Place underdrive gear train on a set of blocks, as shown in Figure 126, and remove adapter 9908.
2. Turn the underdrive geartrain over and place on the blocks, as shown in Figure 127.
   Note: You must turn the assembly over several times during this process.
3. Remove the small "tabbed" snap ring from the underdrive center shaft that retains the output sun gear, as shown in Figure 127.
   Note: You must go down inside the output sun gear to reach the small "tabbed" snap ring and is difficult to remove. It requires a small set of snap ring pliers and sometimes the assistance of a pick.
4. After you have the snap ring released and up on the splines, you can use the sun gear to remove snap ring by pulling straight up.

Continued on Page 73

COMPONENT REBUILD

Underdrive Section Disassembly (Cont'd)

5. Turn the assembly over again and remove the 4 remaining roller bearing race support retaining bolts, as shown in Figure 128.
6. Remove the roller bearing race support and the transfer gear selective shim, as shown in Figure 128.
   Note: This is the selective shim that sets the pre-load for transfer gear bearings.
7. Turn the assembly over again and remove the direct clutch backing plate tapered snap ring, as shown in Figure 129.
8. Remove direct clutch backing plate, as shown in Figure 129.
9. Remove the small "split" caged needle bearing from the underdrive center shaft, as shown in Figure 129.
   Note: Direct clutch housing cannot be removed until the "split" needle bearing is removed.
10. Remove the number 10 thrust bearing, as shown in Figure 129.

Continued on Page 74

Figure 135

COMPONENT REBUILD

Low Sprag Assembly

1. Disassemble the low sprag by removing the snap ring and using Figure 135 as a guide.
   Caution: The low sprag can be mis-assembled very easily. Figure 135 shows sprag assembly the correct way that it goes into Low Clutch Housing. There are however, three pieces that are directional
   Notice in Figure 136 that the outer race has a step and is chamfered on the bottom side and the top side is flat.
   Notice in Figure 137 that the inner sprag race is blackened (heat treating) on top side and has two blind splines, one male and one female. Since the blind splines are also off-set, it makes the inner race directional and will not install on the low clutch housing if upside down.
   Notice in Figure 138 that the sprag cage and element assembly has "channels" cut on the top side and none on the bottom side.
   We will assemble the low sprag assembly from the bottom side, that has the step and chamfer, as it is easier to assemble from this side.

Continued on Page 77

LOW SPRAG OUTER RACE

Top Side *Bottom Side*

Figure 136

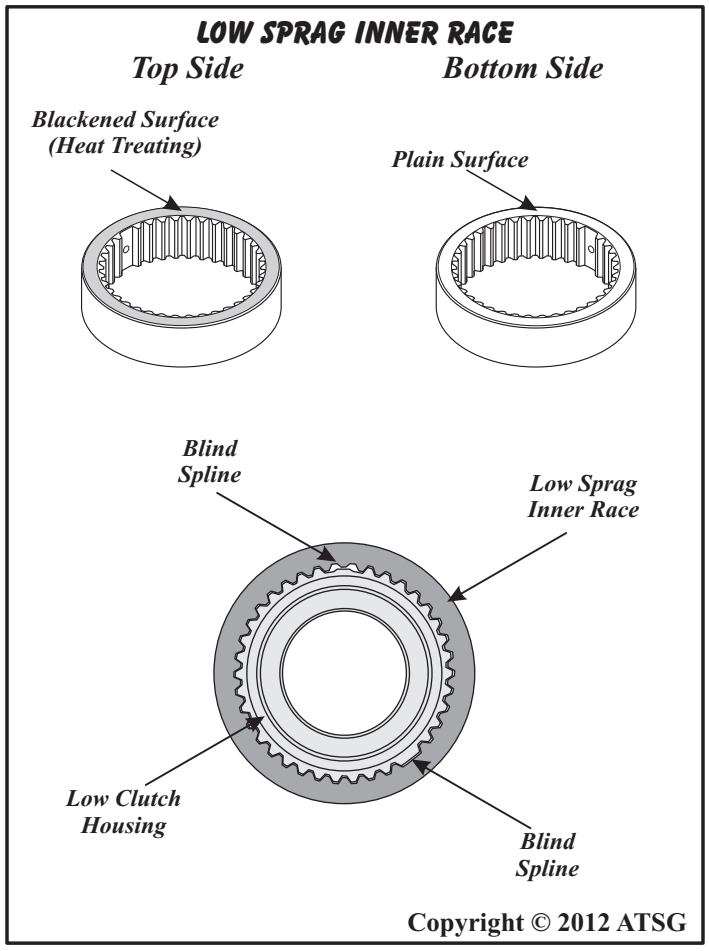

Figure 137

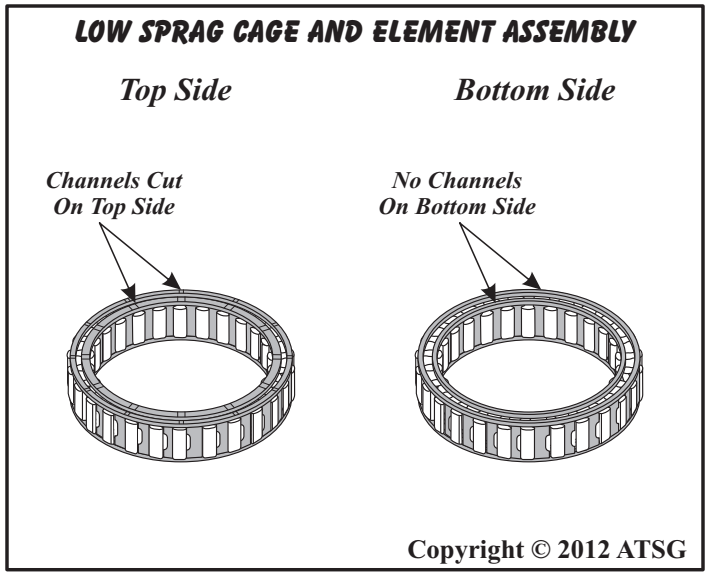

Figure 138

COMPONENT REBUILD

Low Sprag Assembly (Cont'd)

2. Place the outer race on flat work surface with one snap ring installed and ***stepped side facing up,*** as shown in Figure 139.
   Note: Stepped side must be facing up.
3. Install the first end bearing thrust plate and the first sprag end bearing in the direction shown in Figure 140.
4. Push them all the way down against snap ring.

Continued on Page 78

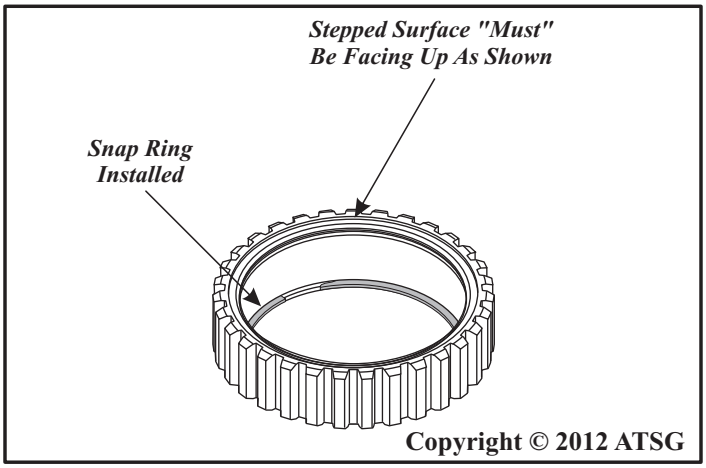

Figure 139

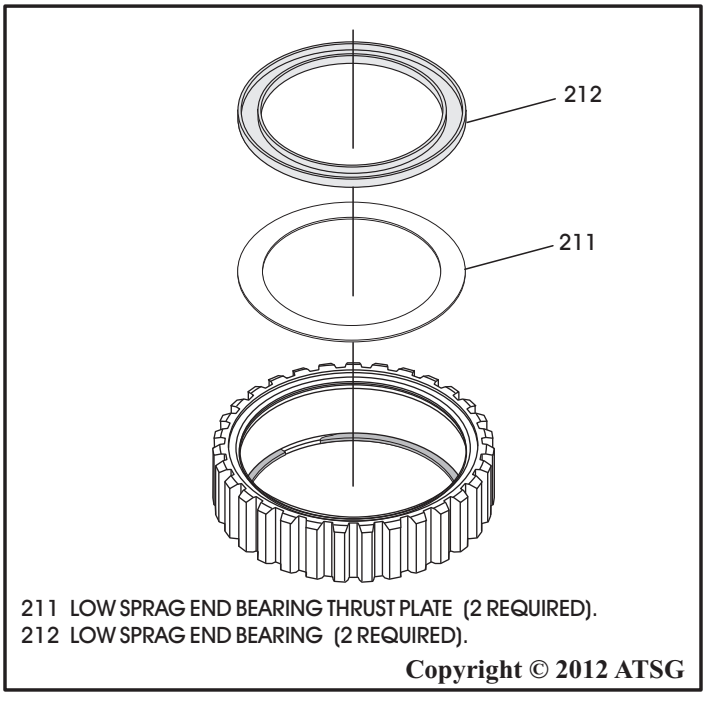

Figure 140

COMPONENT REBUILD

Low Sprag Assembly (Cont'd)

5. Install the sprag cage and element assembly into outer race, as shown in Figure 141.
   Note: The "channels" in plastic sprag cage (See Figure 138) must be facing down and the "windows" facing left, as shown in Figure 141.
6. Lubricate and install the sprag inner race into the cage and elements, as shown in Figure 141, using a counter-clockwise motion.
   Note: Inner race must be installed with the blackened side facing down so the blind splines will be aligned for assembly (See Figure 137).
7. Install second sprag end bearing in the direction shown in Figure 141 and push it down against the sprag cage and element assembly.
8. Install the second end bearing thrust plate and snap ring, as shown in Figure 142.
   Note: If there is an etched number on thrust plate, install with number facing up, as shown in Figure 142.
9. Install completed low sprag assembly into the empty low clutch housing (See Figure 143).
   Note: The sprag outer race should freewheel in a counter-clockwise direction and lock in a clockwise direction (See Figure 143).

Figure 144

COMPONENT REBUILD

Low Clutch Housing Assembly

1. Dissassemble the low clutch housing assembly using Figure 144 as a guide.
2. Clean all low clutch housing parts thoroughly and dry with compressed air.
3. Inspect all low clutch housng parts thoroughly for any wear and/or damage.
   Note: This unit is known for extreme sealing ring groove wear on the low clutch housing, as shown in Figure 145. These rings actually seal direct clutch oil.
   Measure with new seal rings in place in their grooves, maximum clearance is .010" and most will require replacement low clutch housing. Also check to ensure screen/orifice is still in place after cleaning, as shown in Figure 145.

Continued on Page 80

Figure 154

COMPONENT REBUILD

Underdrive Section Final Assembly

1. Install the 3 white scarf-cut sealing rings into their proper positions on the underdrive center shaft, as shown in Figure 156.
2. Install the large, "split", caged needle bearing in the proper position on underdrive center shaft, as shown in Figure 156.
3. Install the green scarf-cut sealing ring into the proper groove on the underdrive center shaft, as shown in Figure 156.
4. Ensure that orificed cup plug is in position in the underdrive center shaft (See Figure 156).
5. Place the underdrive center shaft into low clutch housing and place on the blocks, as shown in Figure 157.
6. Install the driven transfer gear selective shim, as shown in Figure 157.
7. Install the completed roller bearing race support and retaining bolts, as shown in Figure 157.
8. Torque the 8 bolts to 12 N·m (105 in.lb.).

Figure 161

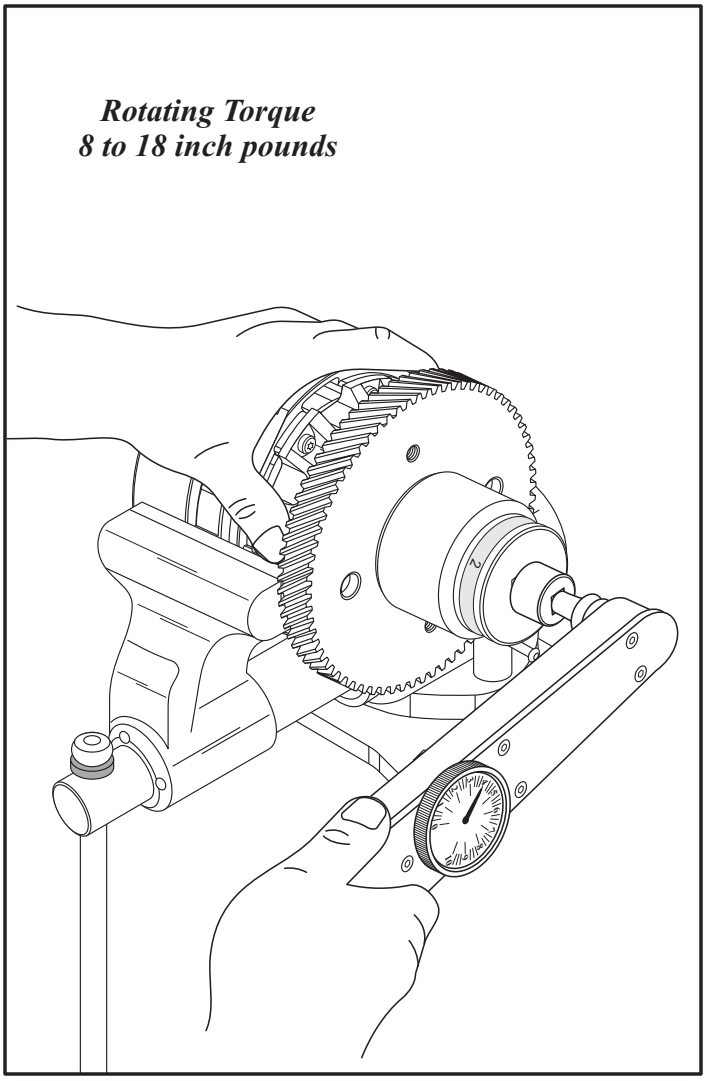

Figure 162

COMPONENT REBUILD

Underdrive Section Final Assembly (Cont'd)

16. After removing the driven transfer gear, place the underdrive center shaft on the blocks, as shown in Figure 163.
17. Install the completed low clutch housing onto the underdrive center shaft, as shown in Figure 163 and ensure sprag is still fully seated.
18. Install the number 8 thrust bearing in the direction shown in Figure 164.
19. Install partially assembled direct clutch housing, as shown in Figure 164, and ensure that it is engaged onto the outer sprag race.
    Note: Once again, check low sprag for proper freewheel. The direct clutch housing should freewheel counter-clockwise & lock clockwise.

25. Install the "selective" direct clutch backing plate as shown in Figure 166.
26. Install the direct clutch backing plate ***tapered*** snap ring, with tapered side facing up, as shown in Figure 166.
27. Mount dial indicator with probe against backing plate, as shown in Figure 167, and zero indicator.
28. Apply air pressure, as shown in Figure 167, and measure direct clutch clearance.
29. Direct clutch clearance should measure between 0.95-1.41mm (.037"- .056").
30. Change "selective" direct clutch backing plate as necessary to obtain the proper direct clutch clearance.
    Note: Selective backing plates available from local OEM dealer.
31. Install the output planetary sun gear, as shown in Figure 168.
32. Install a new "tabbed" snap ring with the tabs facing down and just start over the splines, as shown in Figure 168.
33. Push the "tabbed" snap ring down using a piece of one inch conduit or 2 small screwdrivers until it snaps into place below the splines.

COMPONENT REBUILD

Input Housing Assembly

1. Disassemble the input clutch housing using the illustrations in Figures 173 and 174 as a guide.
2. Clean all input housing parts thoroughly and dry with compressed air.
3. Inspect all input housing parts thoroughly for any wear and/or damage, replace as necessary.
4. Install 3 new sealing rings in their grooves in the input shaft, as shown in Figure 176.
5. Install the input shaft into the input clutch hub, as shown in Figure 176, and install cir-clip.
6. Install new "inside" lip seal (103) into input clutch hub in position shown in Figure 176, with lip facing down and lube with a small amount of Trans-Jel®.
7. Install new "outside" lip seal (104) into input clutch hub in position shown in Figure 177, with lip facing down and lube with a small amount of Trans-Jel®.
8. The "O" rings on the input clutch hub are color coded. Install Blue and Red colored "O" rings in the positions shown in Figure 177, and lube with a small amount of TransJel®.

COMPONENT REBUILD

Input Housing Assembly (Cont'd)

9. Install the overdrive/reverse piston "bellville" plate and the snap ring in the direction shown in Figure 178.
10. Install overdrive outer lip seal (inside lip) into groove on the inside of the overdrive/reverse piston, with the lip facing down, as shown in Figure 179.
11. Install the overdrive/reverse inner "O" ring seal into the groove in the overdrive/reverse piston, as shown in Figure 179.
12. Ensure the orifice/screen in the overdrive/reverse piston is still in place, as shown in Figure 180.

Figure 182

14. Lubricate all seals and install the input clutch retainer into the overdrive/reverse piston by rotating into position, as shown in Figure 182, until fully seated.
15. Lubricate the "O" rings and lip seal on the input clutch hub and install overdrive/reverse & input clutch retainer assembly onto the input clutch hub, as shown in Figure 183.
16. Push down to install and rotate to align splines of the input clutch retainer.
17. Install the tapered snap ring with inside bevel facing up, as shown in Figure 183, and eyelets in cavity of the input clutch retainer.

Special Note: We have provided you with a snap ring identification chart to identify the snap rings, and identify their locations, in Figure 175 on Page 94. This chart will identify all snap rings in the input housing.

Input Housing Assembly (Cont'd)

18. Lubricate the seal surfaces of underdrive clutch piston and install into the input clutch retainer, as shown in Figure 184.
19. Install the underdrive clutch piston return spring, as shown in Figure 184.
20. Lubricate the bonded seal of the return spring retainer/balance piston and install, as shown in Figure 184.
21. Using a suitable shop press, compress the return spring assembly and install the flat snap ring into the groove, as shown in Figure 184.

Special Note: We have provided you with a snap ring identification chart to identify the snap rings, and identify their locations, in Figure 175 on Page 94. This chart will identify all snap rings in the input housing.

Figure 185

COMPONENT REBUILD

Input Housing Assembly (Cont'd)

22. Install the underdrive clutch pack beginning with a steel plate and alternating with a friction plate, as shown in Figure 186, until you have installed four of each.
    Note: Ensure that you are installing the proper clutches. Refer to Figure 187 for differences between the underdrive and overdrive clutches.
    Note: All clutches should be soaked in proper fluid for 1 hour, prior to assembly.
23. To prevent damage to the clutch plate, remove the last friction plate installed and install the underdrive backing plate ***flat*** snap ring, as shown in Figure 186, into bottom groove.
24. Re-install the last friction plate.
25. Install the underdrive/overdrive selective backing plate on top of the flat snap ring, as shown in Figure 186.
    Note: Widest clutch surface faces down and is selective on the underdrive side only.
26. Install the underdrive/overdrive backing plate ***"tapered"*** snap ring with the taper facing up, as shown in Figure 186, and ensure fully seated.

Special Note: We have provided you with a snap ring identification chart to identify the snap rings, and identify their locations, in Figure 175 on Page 94. This chart will identify all snap rings in the input housing.

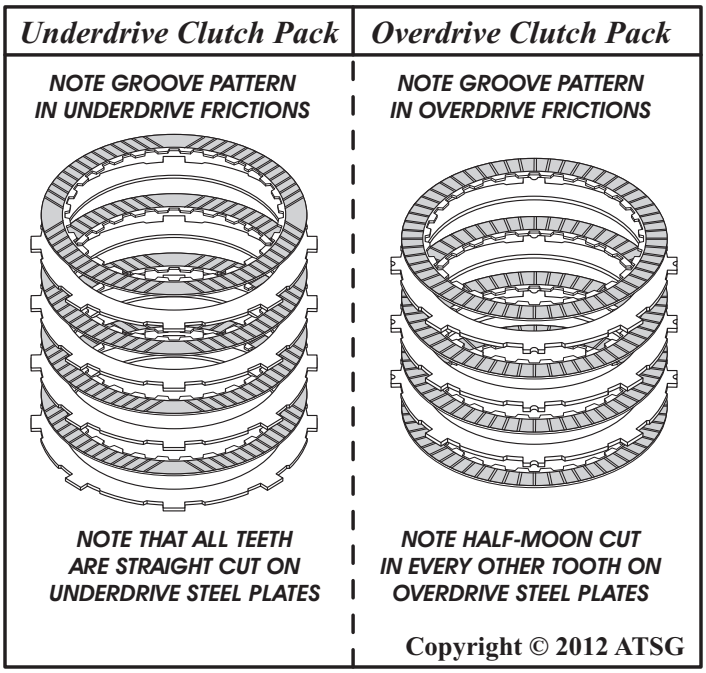

Figure 187

COMPONENT REBUILD

Input Housing Assembly (Cont'd)

27. Mount a dial indicator to the input housing and zero the indicator against tooth of the underdrive friction plate, as shown in Figure 188.
28. Apply 20 psi of air pressure or lift with picks and record the dial indicator reading.
29. The correct underdrive clutch clearance should be 0.91-1.47mm (.036"- .058").
30. Change the selective backing plate as necessary using the chart in Figure 188, to obtain proper underdrive clutch clearance.
31. Install the overdrive clutch pack beginning with a friction plate and alternating with steel plates until you have installed 4 friction and 3 steel plates, as shown in Figure 189.
    Note: Ensure that you are installing the proper clutches. Refer to Figure 187 for differences between the underdrive and overdrive clutches. Note: All clutches should be soaked in proper fluid for 1 hour, prior to assembly.
32. Install the overdrive/reverse backing plate ***wave*** snap ring into the wide groove of the overdrive and reverse piston and push snap ring to bottom of the groove, as shown in Figure 189.
33. Install the overdrive/reverse backing plate into the retainer, as shown in Figure 189, with the stepped side facing down.
34. Install the overdrive/reverse backing plate ***flat*** snap ring on top of the backing plate and into the wide groove in piston, by pushing down on the backing plate to pre-load the wave snap ring.

Special Note: We have provided you with a snap ring identification chart to identify the snap rings, and identify their locations, in Figure 175 on Page 94. This chart will identify all snap rings in the input housing.

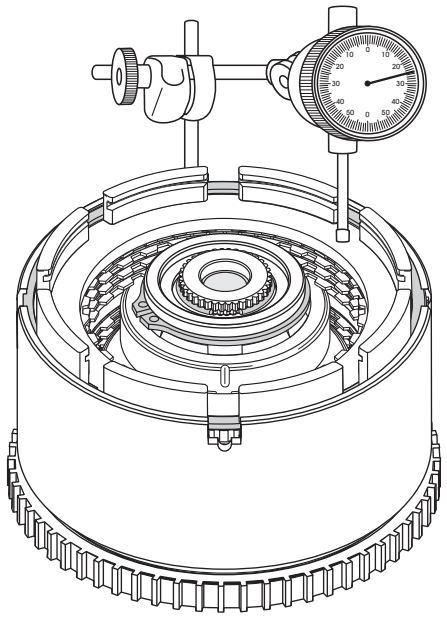
COMPONENT REBUILD

Input Housing Assembly (Cont'd)

35. Mount a dial indicator to the input housing and zero the indicator against the backing plate, as shown in Figure 190.
36. Apply 30 psi of air pressure (wave snap ring) and record the dial indicator reading.
37. The correct overdrive clutch clearance should be 1.10-2.34mm (.043"- .092").
38. There are no selectives for the overdrive clutch. ***Note: If the overdrive clutch clearance is not correct, you have something mis-assembled.***
39. Install the reverse clutch pack beginning with a friction plate and alternating with steel plate until you have installed 2 ***"pre-soaked"*** frictions and 1 steel plate, as shown in Figure 191.
40. Install the reverse clutch backing plate with the flat side facing down, as shown in Figure 191.
41. Install reverse clutch backing plate ***selective*** snap ring, as shown in Figure 191.
42. Tap reverse clutch backing plate down to allow installation of the selective snap ring.
43. Pry the reverse backing plate up to seat the snap ring in the groove and free the reverse clutch, as shown in Figure 192.

Continued on Page 102

Overdrive Clutch Clearance Should Be 1.1-2.3mm (.043"- .092")



There are no selectives for the Overdrive Clutch.

44. Mount a dial indicator to the input housing and zero the indicator against a tooth of the reverse friction plate, as shown in Figure 193.
45. Apply 30 psi of air pressure or lift with picks and record the dial indicator reading,
46. The correct reverse clutch clearance should be 0.76-1.24mm (.030"- .049") (See Figure 193).
47. Change selective snap ring as necessary using the chart in Figure 193, to obtain proper reverse clutch clearance.
48. To complete the input housing, reverse clutch and overdrive clutch must now be removed to install the 2 clutch hubs and shafts, as shown in Figure 194 and 195.
49. Install number 2 thrust bearing into the clutch hub and shaft, in direction shown in Figure 194. ***Note: Number 2 thrust bearing is a light press fit into housing assembly. There are 5 dimples that can be pressed in by hand.***
50. Install the underdrive clutch hub and shaft into input housing, as shown in Figure 194, by rotating until all underdrive clutches are engaged and fully seated on number 2 thrust bearing.
51. Install the number 3 thrust washer onto the underdrive clutch hub and shaft, as shown in Figure 194, and retain with Trans-Jel®.

Figure 214

COMPONENT REBUILD

Valve Body Assembly (Cont'd)

16. Disassemble the valves, springs, bore plugs and retainers, using Figure 214 as a guide, and place on trays exactly as they are removed.
17. Clean all valve body parts thoroughly and dry with compressed air.
18. Inspect all valve body parts thoroughly for any wear and/or damage and replace as necessary.
19. Assemble the valves, springs, bore plugs and retainers ***exactly***, as shown in Figure 214, and lube with ATF+4 fluid as they are installed.
    Note: Use small amount of Trans-Jel® to keep the 3 black plastic retainers in place, as their valve line ups are not spring loaded.
20. ***"Do Not"*** remove the six screws on top of the Solenoid Body assembly (See Figure 215).
    Note: There is nothing on the inside of the Solenoid Body that is serviced, including the line pressure solenoid. It must be replaced as a complete assembly.
21. Install new solenoid body to side cover seal over and onto the solenoid connector, as shown in Figure 216.
22. Install new solenoid body screen/gasket onto the bottom of solenoid body (See Figure 216).
23. The solenoid body assembly is serviced ***only*** as a complete unit, which is why we told you not to remove the six screws on top that retain the the cover plate.
24. However, if someone has disassembled it, we have provided you with an exploded view of the solenoid body in Figure 217.
    Caution: The illustrations in Figure 217 are provided for reference only. We recommend that the solenoid body NOT be disassembled as no internal parts are serviced separately.

Valve Body Assembly (Cont'd)

25. Place the completed valve body on a flat work surface, as shown in Figure 218.
26. Install the outer valve body spacer plate over the alignment dowels and onto the valve body, as shown in Figure 218.
27. Install new support plate to outer spacer plate gasket over the alignment dowels and onto the spacer plate, as shown in Figure 218.
28. Install the valve body support plate over the alignment dowels and onto the outer spacer plate gasket, as shown in Figure 218.
29. Install the 5 support plate retaining screws in the positions shown in Figure 218.
30. Torque the 5 support plate retaining screws to 6 N·m (53 in.lb.), as shown in Figure 219.

COMPONENT REBUILD

Valve Body Assembly (Cont'd)

31. Install new "O" rings on EMCC (TCC) solenoid, as shown in Figure 220, and lube with a small amount of Trans-Jel®.
32. Install EMCC (TCC) solenoid into valve body, as shown in Figure 220.
33. Install the retaining screw and torque screw to 6 N·m (53 in.lb.) (See Figure 220).
34. Install new "O" ring on the line pressure sensor, as shown in Figure 220, and lube with a small amount of Trans-Jel®.
35. Install the line pressure sensor into valve body, as shown in Figure 220.
36. Install the 2 retaining screws and torque both to 6 N·m (53 in.lb.) (See Figure 220).
37. Install the completed solenoid body along with the screen/gasket onto the valve body, as shown in Figure 221, and ensure alignment dowels are engaged into support plate.
38. Connect the line pressure sensor harness and the EMCC (TCC) solenoid harness to the respective components.

COMPONENT REBUILD

Valve Body Assembly (Cont'd)

39. Very carefully turn the assembly over and place on flat work surface, as shown in Figure 222.
Note: Use blocks as necessary to maintain a level valve body and also maintain pressure to hold solenoid body in place.
40. Install the 3, or 4, check balls in their positions, as shown in Figure 222 and 223.
Note: The large arrows in Figure 222 show the locations of nine "Non-Removeable" check balls (See Page 156).

Figure 224

COMPONENT REBUILD

Valve Body Assembly (Cont'd)

41. Install the inner spacer plate over the alignment dowels and onto the valve body, as shown in Figure 224.
42. Install new inner spacer plate gasket over the alignment dowels and onto inner spacer plate, as shown in Figure 224.
43. Install the valve body transfer plate onto the gasket, as shown in Figure 224.
    Note: The transfer plate also is equipped with two split roll pins that serve as alignment dowels, as shown in Figure 225.
44. Ensure that the transfer plate is fully seated and alignment dowels are engaged into the inner spacer plate.
45. Install the 14 transfer plate to solenoid body retaining bolts, as shown in Figure 224, using a T-25 Torx bit.

Continued on Page 119

Figure 225

COMPONENT REBUILD

Valve Body Assembly (Cont'd)

46. Torque the 14 transfer plate to solenoid body retaining bolts to 6 N·m (53 in.lb.), as shown in Figure 226.
47. Set the completed valve body assembly aside for final assembly, as shown in Figure 227.

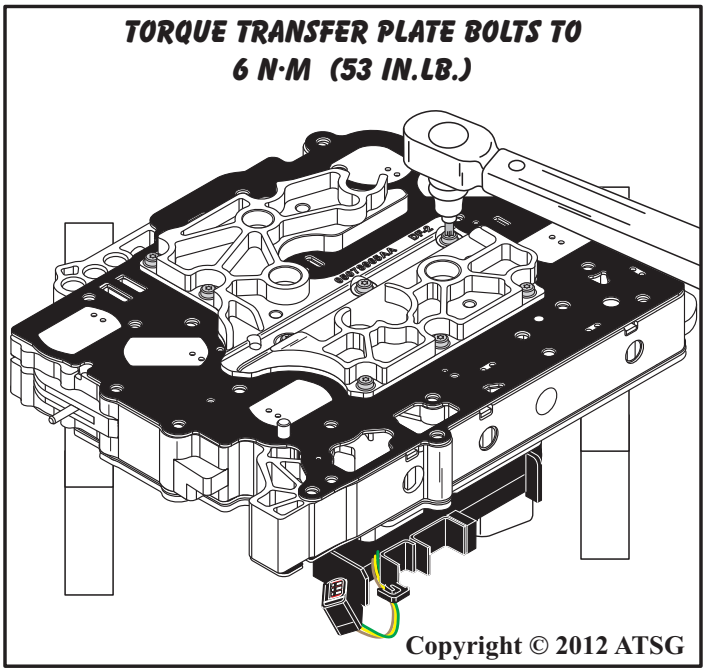

Figure 226

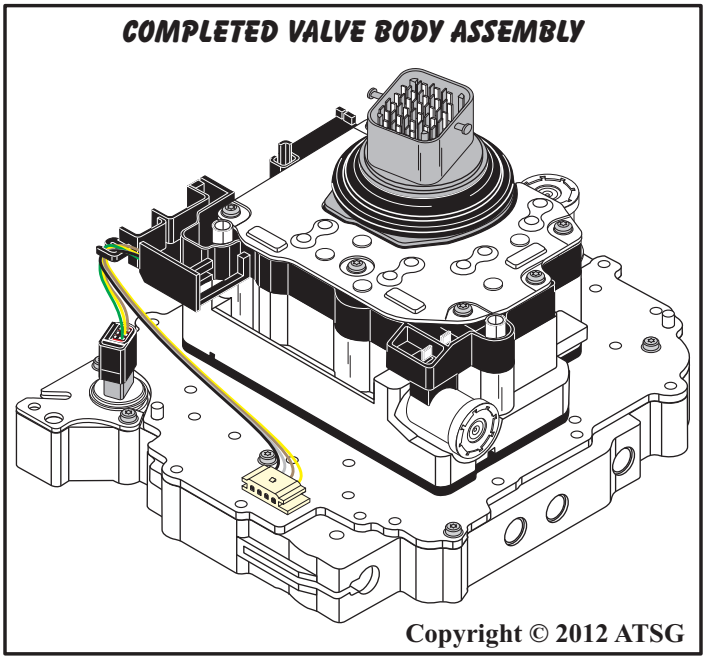

Figure 227

FINAL TRANSAXLE ASSEMBLY

1. Set the pre-assembled transaxle case assembly up on the bell housing, as shown in Figure 228.
   Note: Rear planetary carrier, final drive and the pinion gear pre-loads were all set during the case sub-assembly process.
2. Install the output planetary carrier assembly, as shown in Figure 228, using a pair of snap ring pliers and ensure it is fully seated.
   Note: Now is when we must check for proper compounder section end-play.

Final Assembly
Continued on Page 120

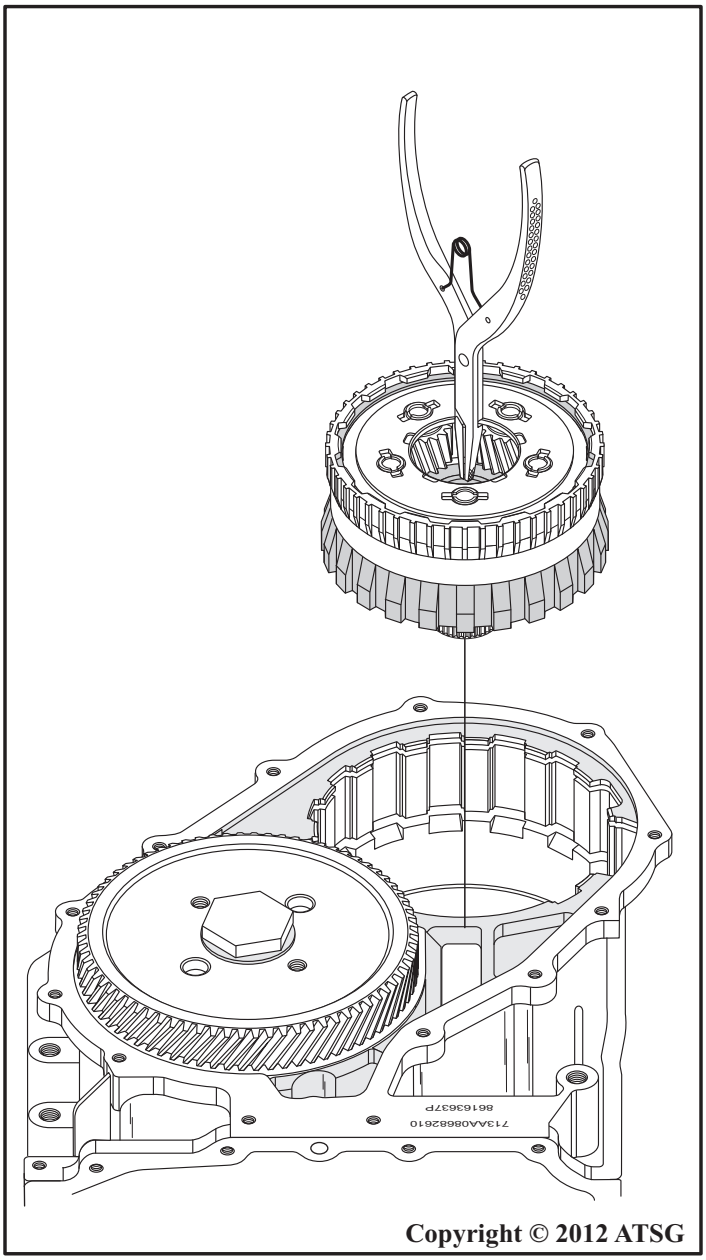

Figure 228

FINAL TRANSAXLE ASSEMBLY (CONT'D)

3. Install "H" gage into transaxle case against the surface where the low clutch housing rests, as shown in Figure 229 and 230.
4. Lower the adjustment rod to the surface of the helical cut shim in the output planetary carrier, as shown in Figure 230, and tighten adjustment rod locking knob.
5. Remove the "H" gage from case, turn it over and place on pre-assembled compounder assembly as shown in Figure 231.
6. Measure with feeler gauge between output sun gear and the adjustment rod, as shown in Figure 231.
7. The compounder end-play should measure 0.25-0.50mm (.010"- .020").
8. Change helical cut shim in the output planetary carrier as necessary to obtain proper clearance, as shown on Page 68.

Figure 231

FINAL TRANSAXLE ASSEMBLY (CONT'D)

9. Install the pre-assembled compounder assembly using adapter/puller tool 9908, as shown in Figure 232.
   Note: Feed tube holes must face valve body.
   Note: The output sun gear must be rotated to engage the output planetary carrier.
10. Remove the special tool and re-install the four compounder bearing retainer bolts, as shown in Figure 233, and torque to 12 N·m (105 in.lb.).

Continued on Page 122

Figure 241

FINAL TRANSAXLE ASSEMBLY (CONT'D)

24. Torque the thirteen transfer gear cover bolts to 12 N·m (105 in.lb.) as shown in Figure 242.
25. Installing the low/reverse clutch pack and the 2-4 clutch pack is the next step and you must ensure that you are installing the proper clutches in the proper place, as they ***will not*** interchange.
26. The Low/Reverse friction plates are a different thickness and have different groove pattern than 2-4 friction plates, as shown in Figure 243.
27. The Low/Reverse steel plates are a different thickness than the 2-4 steel plates, as shown in Figure 243.

Figure 244

FINAL TRANSAXLE ASSEMBLY (CONT'D)

28. Install the low/reverse clutch plates beginning with a steel plate and alternating with a friction plate, as shown in Figure 244, until you have installed 5 of each, leaving out the last friction until the flat snap ring is installed.
Note: All clutch plates should be soaked in the proper fluid for 1 hour, prior to assembly.
29. Install the low/reverse clutch pressure plate flat snap ring (148) into the case groove, as shown in Figure 244.
Note: Flat snap ring with opening between the 2:00 and 3:00 O'clock position.
30. Now, you can install the last friction plate.
31. Install the low/reverse clutch pressure plate with the flat side facing up, as shown in Figure 244.
32. Install the low/reverse clutch pressure plate "tapered" snap ring with the tapered side facing up, as shown in Figure 244.
Note: Tapered snap ring with opening between the 9:00 and 10:00 O'clock position.
33. Tap the tapered snap ring into the groove with large screwdriver around the perimeter until it is fully seated.

Figure 246

FINAL TRANSAXLE ASSEMBLY (CONT'D)

34. Mount a dial indicator to the case and zero the indicator against tooth of the low/reverse friction plate, as shown in Figure 246.
Note: Requires longer dial indicator actuating rod, Tool No. 6268.
35. Apply 30 psi of air pressure or lift with picks and record the dial indicator reading.
36. The correct low/reverse clutch clearance should be 0.89-1.47mm (.035"- .058").
37. Change the selective pressure plate as necessary using the chart in Figure 247, to obtain proper low/reverse clutch clearance.

Alternatives To Dial Indicator With Long Actuating Rod

A. Feeler gauge bent at 90 degrees to access the clutches past the front planetary ring gear.
B. Using small distributor point feeler gauge thru small access slot in bottom of case, as shown in Figure 245.
C. Loading case with the L/R clutches and the 2-4 clutch assembly, after L/R piston is installed and "before" rear planetary carrier is installed, checking clutch clearance and then removing them for final assembly. This way clearance can be checked easily with feeler gauge.

Figure 247

FINAL TRANSAXLE ASSEMBLY (CONT'D)

38. Lubricate new 2-4 clutch piston with a small amount of Trans-Jel® and install it into the 2-4 clutch retainer, as shown in Figure 248.
Note: Rotate the piston in the retainer until the slot for one of the legs of the bellville return spring is "perfectly" aligned with the locating tab on the retainer, as shown in Figure 248.
39. Install the 2-4 clutches into the case beginning with a friction plate and alternating with steel plates, as shown in Figure 249, until you have installed 4 of each.
Note: All clutch plates should be soaked in the proper fluid for 1 hour, prior to assembly.
40. Install the 2-4 clutch bellville return spring on top of the last steel plate in the direction shown in Figure 249.
Note: Rotate the bellville spring so that center of one leg is on same centerline as the slot in case for the 2-4 retainer locating tab, as shown in Figure 249.

Figure 249

FINAL TRANSAXLE ASSEMBLY (CONT'D)

41. Install 2-4 clutch retainer with piston assembly, as shown in Figure 250.
    Note: It should fall right into place, if you have followed the alignment instructions on the previous page.
42. Compress the retainer and install the 2-4 clutch retainer snap ring, as shown in Figure 250.
43. Mount a dial indicator to the case and zero the indicator against tooth of the 2-4 friction plate, as shown in Figure 251.
    Note: Requires longer dial indicator actuating rod, Tool No. 6268.
    Note: Refer to Page 127 for alternatives.
44. Apply 30 psi of air pressure or lift with picks and record the dial indicator reading.
45. The correct 2-4 clutch clearance should be 0.76-2.64mm (.030"- .104").
46. If clearance is outside this range, the 2-4 clutch is assembled improperly.
    Note: There are no selectives for 2-4 clutch.

Figure 256

FINAL TRANSAXLE ASSEMBLY (CONT'D)

54. Install pre-assembled input housing assembly, as shown in Figure 257, by rotating back and forth until it is fully seated.
    Note: The input housing is fully seated when the teeth on input clutch hub are centered in the input speed sensor bore (See Figure 258).
55. Install the number 1 thrust bearing over input shaft and into housing in the direction shown in Figure 257.
56. Install "H" gage on transaxle case pump surface, as shown in Figure 259, and lower adjustment rod down inside the housing to the surface of the number 1 thrust bearing and tighten adjustment rod locking knob.
    Note: Adjustment rod "must" be resting on the number 1 thrust bearing.

Continued on Page 131

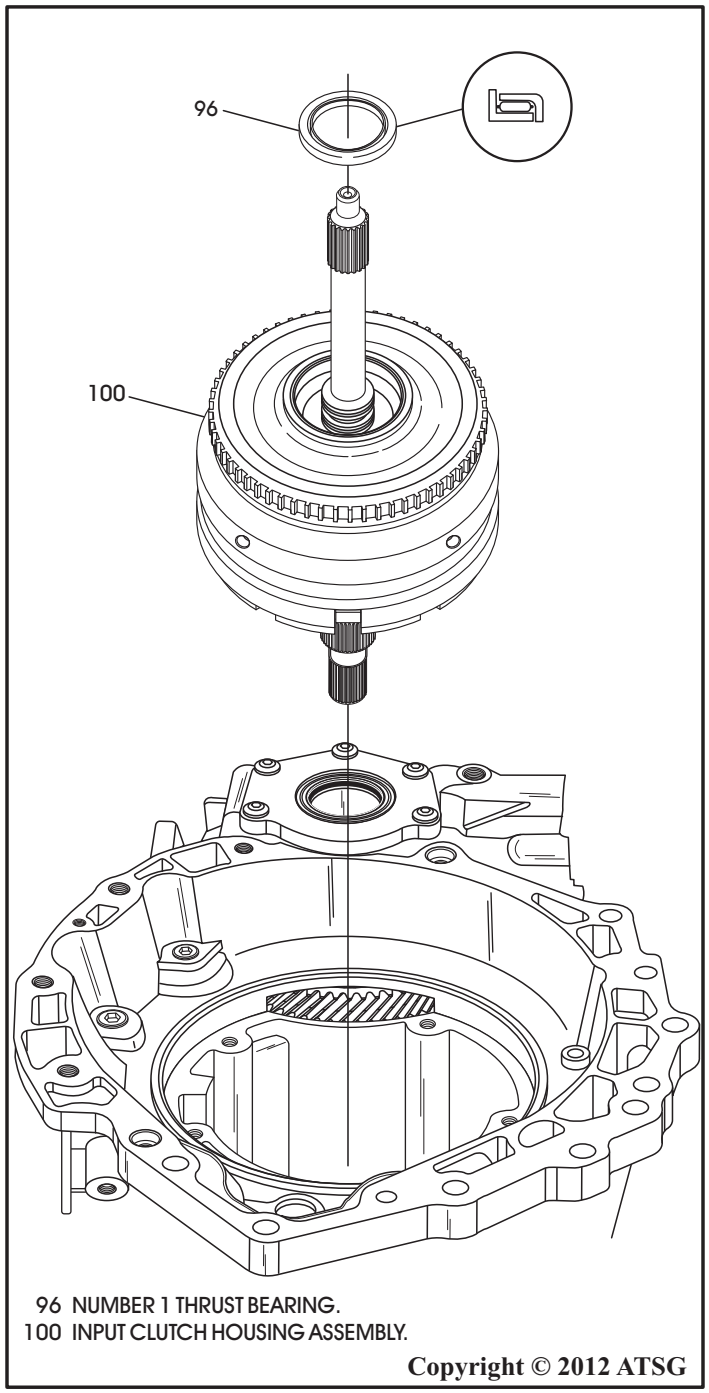

Figure 257

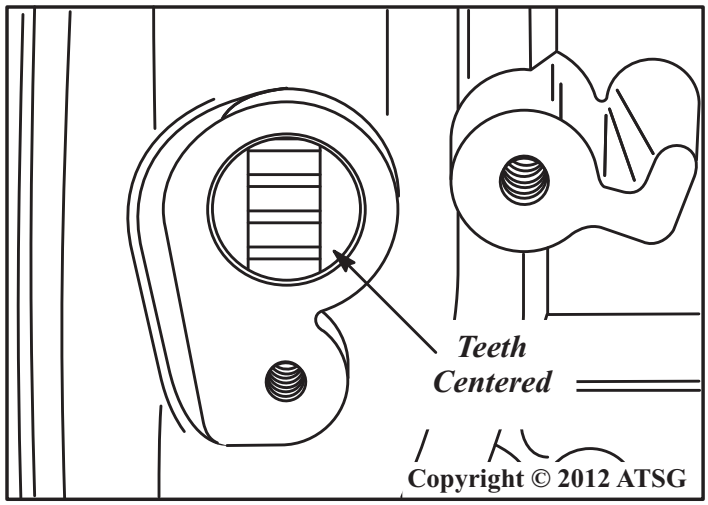

Figure 258

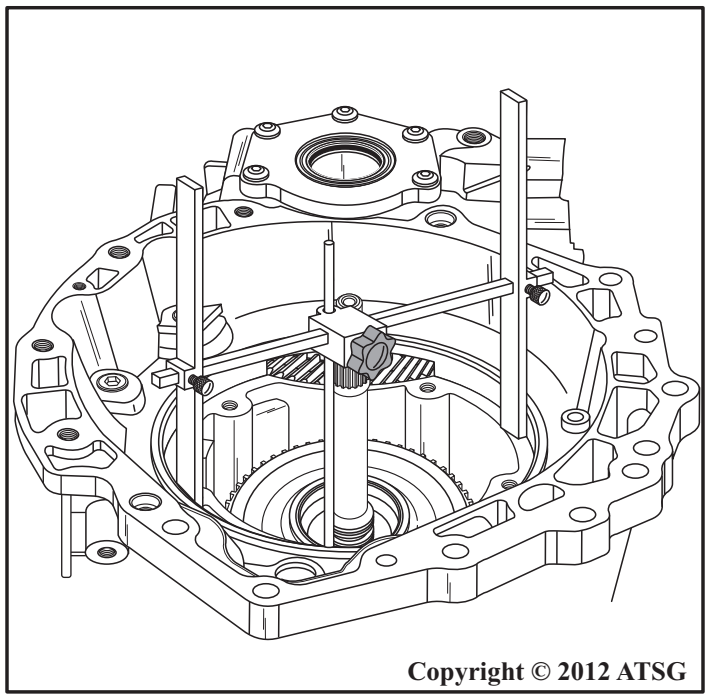

Figure 259

FINAL TRANSAXLE ASSEMBLY (CONT'D)

57. Now turn "H" gage over and set it on completed oil pump assembly, as shown in Figure 260, with adjustment rod over the pump tower and pump gasket in place.
    Note: Oil pump to case gasket "must" be in place for this measurement.
58. Measure between adjustment rod and oil pump tower to determine transaxle end-play, as shown in Figure 260.
59. Transaxle end-play for this unit should be 0.13-0.64mm (.005"- .025").
60. Change the number 4 thrust plate as necessary using the chart in Figure 261.
61. Install ***new*** cooler by-pass valve, as shown in Figure 262, with "O" ring end towards the rear of case.
    Note: If transaxle failure has occurred, it is mandatory that the cooler by-pass valve be replaced. Do not re-use or attempt to clean the cooler by-pass valve.

FINAL TRANSAXLE ASSEMBLY (CONT'D)

90. Install the detent spring and roller assembly, as shown in Figure 281, and ensure it is in proper position over transaxle range switch and on the inside detent lever.
Note: The detent spring and roller assembly is used to align Transaxle Range Switch with the inside detent lever (See Figure 280).
91. Install the "shouldered" bolt retaining the detent spring and roller assembly, as shown in Figure 281, using a T-25 Torx bit and torque to 7 N·m (62 in.lb.).

Continued on Page 142

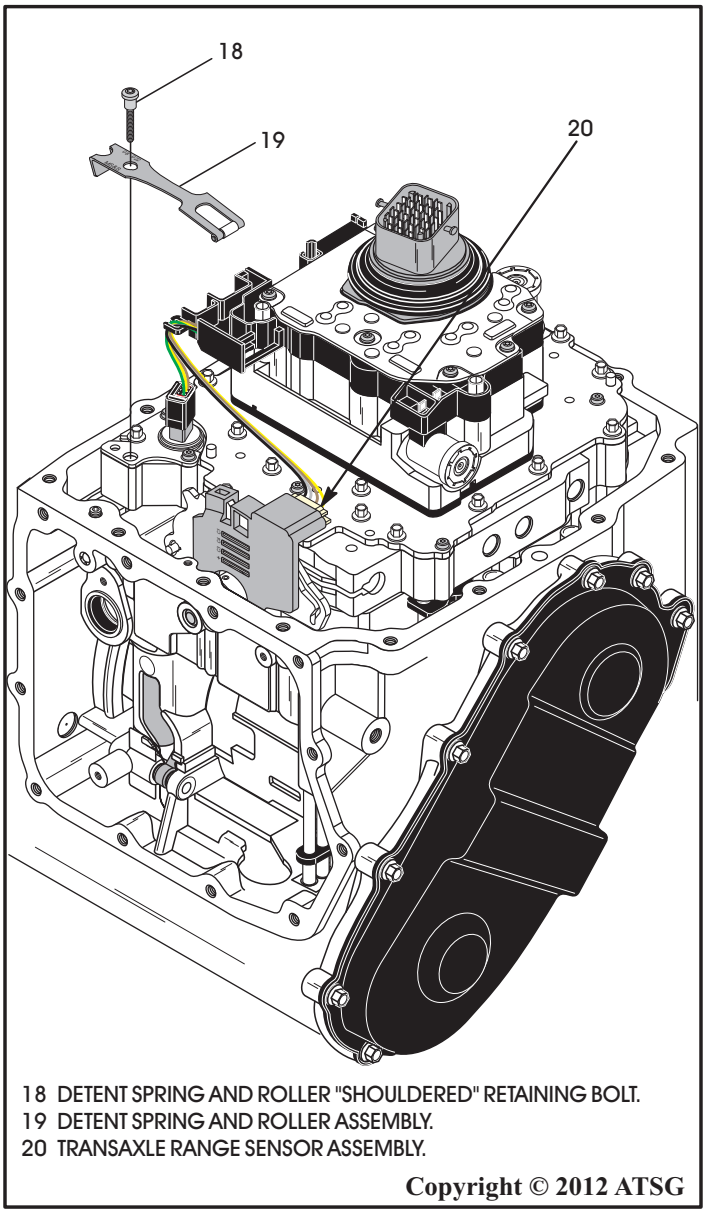

Figure 281

FINAL TRANSAXLE ASSEMBLY (CONT'D)

92. Install a bead of Mopar® RTV, or equivalent, on valve body side cover, as shown in Figure 282.
Note: Install RTV 360 degrees around the L/R passage and line pressure tap to ensure good seal in these areas.
93. Install the valve body side cover to the case, as shown in Figure 283.
Note: This would be a good time to ensure all electrical connectors have been fastened and the manual valve is in place in the inside detent lever.
94. Install the 13 valve body side cover retaining bolts, as shown in Figure 283, using an 8mm socket on the regular style bolts and 10mm on the stud style bolts.
Note: Ensure the stud style bolts are back in the proper locations as these are what retain the sound cover (See Figure 284).

CLUTCH PRESSURE TAPS ELIMINATED

The expense of machined pressure taps and the cost of inserting the plug, combined with potential areas for leaks, gave way to the decision of eliminating all Clutch Pressure Taps in the valve body.

However, the ability to perform clutch circuit pressure testing on the assembly line was necessary to ensure correct assembly and consistent quality. The engineers decided to use a series of nine check ball capsules positioned in specific tapered ports in the valve body, as shown in Figure 304.

This allowed a test machine to come in with a probe and unseat the check balls in the capsules so that measurement of clutch pressures could be verified. Once the test has been completed and the test machine retracts, the check balls are then used to seal their respective clutch circuit. The nine check balls, shown in Figure 304, are the check balls used during the assembly line clutch testing procedure.

Note: Do not attempt to remove these balls or capsules, but ensure that they seal pressure.

There are 4 hydraulic shift control balls that are not used for assembly line testing and they do fall out of the valve body. Refer to Page 27, Figure 35 for their locations and function.

Although there are no Clutch Pressure Taps, there is a Main Line Pressure Tap, located at the bottom left side of the valve body cover pan rail, as shown on Page 23 in Figure 30.

PRESSURE SEALING CHECK BALL CAPSULES - PRESSURE TAPS ELIMINATED

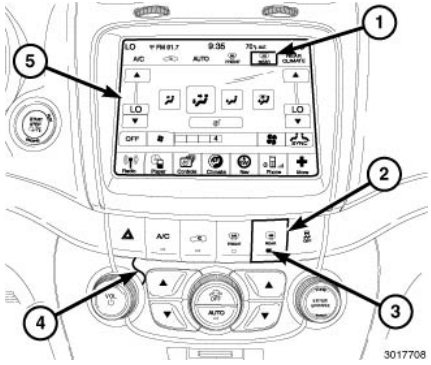
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

DESCRIPTION

NOTE: Automatic Temperature Control (ATC) shown. Manual Temperture Control (MTC) similar.

The controls (1 and 2) for the rear window defogger (Electric Back Light) (EBL) system are located in the switchbank (4) and in the U-Connect Touch ™ screen module (5), at the center of the instrument panel. An amber indicator lamp (3) in the switchbank illuminates when the EBL system is on.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the A/C heater module energizes the EBL relay in the Power Distribution Center (PDC) and fused battery current is directed to the rear window defogger grid lines and the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator lamp in the switchbank illuminates when the EBL system is on. The A/C heater module contains the EBL system control circuitry, including the timer logic.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is turned to any position other than run, or by manually pressing the rear window defogger switch a second time.

The individual rear window defogger switch located in the switchbank cannot be adjusted or repaired. If a rear window defogger switch or indicator lamp is inoperative or damaged, the entire switchbank pod must be replaced (Refer to 08 - Electrical/8J - Instrument Cluster/POD, Switch Bank - Removal) .

The individual rear window defogger switch located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a rear window defogger switch is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced (Refer to 08 - Electrical/8E - Electronic Control Modules/Electronic Control Modules/MODULE, U-Connect Touch ™ screen - Removal).

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

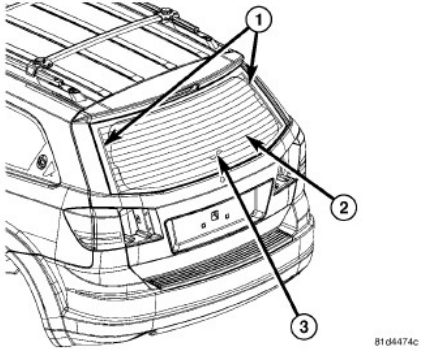
DESCRIPTION

CAUTION: **Grid lines can be damaged or scraped off with sharp instruments. Care should be taken when cleaning or removing foreign materials, decals or stickers from the rear glass. Normal glass cleaning solvents or hot water used with soft toweling is recommended.**

The rear window defogger system, also known as the Electric Back Light (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned on or off by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module (Refer to 08 - Electrical/8G - Heated/Cooled Systems/Heated Seats/SWITCH, Heated Seat - Description) .

Circuit protection is provided by a fuse in the Power Distribution Center (PDC).



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the A/C heater module energizes the EBL relay in the Power Distribution Center (PDC), and fused battery current is directed to the rear window defogger grid lines, and to the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator lamp in the switchbank illuminates when the EBL system is on. The A/C heater module contains the EBL system control circuitry, including the timer logic.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is set to any position other than Run, or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (Refer to 08 - Electrical/8G - Heated/Cooled Systems/Heated Glass/GRID, Defogger - Standard Procedure) .

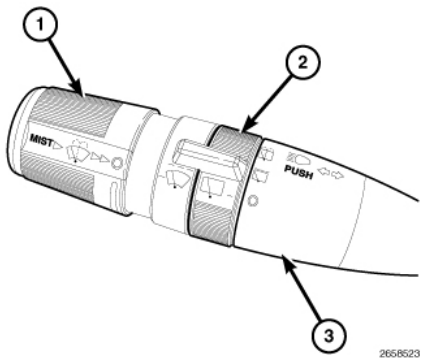
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

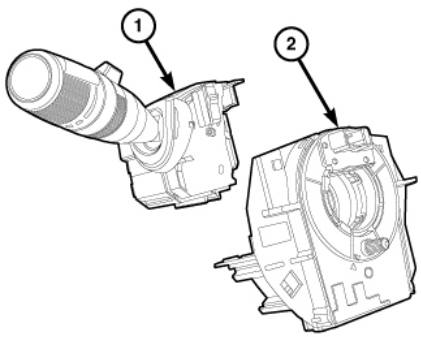
DESCRIPTION

The multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch provides the primary controls for the front and rear wiper and washer systems, the turn signals and for headlamp beam selection. The only visible components of the switch are the control stalk (3), the control sleeve or ring (2) and the control knob (1) that extend through the shrouds on the left side of the steering column. The remainder of the switch including its mounting provisions, its electrical connection and the turn signal cancel actuator are concealed beneath the shrouds.



The switch housing (2) and controls (1) are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. A single integral latch feature (3) and slide tabs on the switch housing engage channels and a striker that are integral to the left side of the mounting bracket that is integral to the clockspring housing (5) that is secured to the top of the steering column.

The multi-function switch housing also contains an electronic circuit board and microprocessor that serve as a Local Interface Network (LIN) data bus slave node. The switch outputs are internally connected directly to the LIN slave node. An integral connector receptacle on the back of the switch housing connects the switch to the vehicle electrical system and to the LIN master node and Controller Area Network (CAN) data bus gateway integral to the Steering Angle Sensor (SAS) on the back of the clockspring housing through dedicated take outs and connectors of the instrument panel wire harness.



The multi-function switch provides the vehicle operator with a control interface for the following functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary WASH position for front washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides detent switching for two front continuous wipe switch positions, LOW speed or HIGH speed and an intermittent wipe mode with five DELAY interval positions. The control knob also has a front momentary MIST or pulse wipe feature switch position.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp HIGH or LOW beams.
- **Headlamp Optical Horn** - The multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Rear Washer Control** - The multi-function switch control sleeve provides a momentary WASH position for rear washer system operation.
- **Rear Wiper Control** - The multi-function switch control sleeve provides detent switching for a single rear intermittent wipe mode.
- **Turn Signal Control** - The multi-function switch control stalk provides both momentary non-detent (lane change) switching or detent switching with automatic cancellation for both the left and right turn signals.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire switch unit must be replaced. The clockspring (with the integral mounting bracket and the Steering Angle Sensor/SAS with the integral LIN master node and CAN gateway) as well as the multi-function switch (with the integral LIN slave node) are each available for separate service replacement.

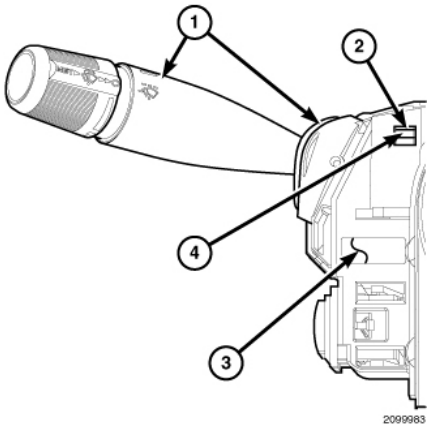
INSTALLATION

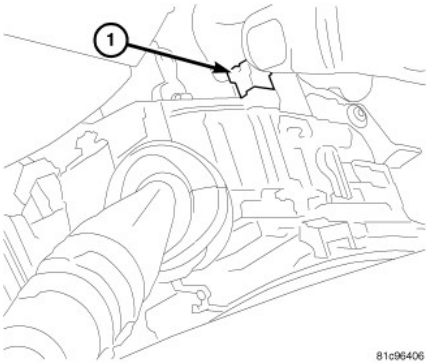
Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Position the multi-function switch (1) housing over the receptacle in the mounting bracket (3) integral to the left side of the clockspring.
2. Slide the switch downward into the mounting bracket receptacle until it is fully seated and the tab (4) of the latch feature integral to the switch housing engages the access window (2) of the bracket.



3. Reconnect the instrument panel wire harness connector (1) to the connector receptacle on the back of the multi-function switch housing.
4. Reinstall the upper and lower shrouds onto the steering column. (Refer to 19 - Steering/Column/SHROUD, Steering Column - Installation) .
5. Reconnect the battery negative cable.



2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

OPERATION

The multi-function switch is a Local Interface Network (LIN) data bus slave node to the Steering Angle Sensor (SAS) integral to the clockspring. The SAS is both a LIN data bus master node and a gateway to the Controller Area Network (CAN) data bus. The multi-function switch sends electronic **switch status** messages over the LIN data bus to the SAS, then the SAS relays electronic **switch request** messages over the CAN data bus to other electronic modules in the vehicle.

If the SAS detects no inputs from the multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals the other electronic modules to implement a fail-safe or default mode of operation. For the exterior lighting system, the multi-function switch fail-safe mode automatically selects LOW beams when the headlamps are turned ON. For the wiper system, the multi-function switch fail-safe mode will maintain the last selected wiper system mode of operation for the remainder of the current ignition cycle, after which the wiper system will default to LOW.

The hard wired circuits for the multi-function switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose the electronics and messaging of this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the multi-function switch is operated to control the functions and features it provides:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary second detent position to activate the washer pump/motor in the FRONT WASH mode. The washer pump/motor will continue to operate for as long as the control knob is held in this position. The multi-function switch sends an electronic **front washer switch status** message over the LIN data bus to the SAS, which relays an electronic **front washer switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the two continuous front wiper detents, to one of five front intermittent wiper detents or to the OFF position to select the FRONT WIPER mode. The multi-function switch sends electronic **front wiper switch status** messages over the LIN data bus to the SAS, which relays an electronic **front wiper switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary first detent position to activate the front wiper MIST mode. The wiper motor will continue to operate, one complete cycle at a time, for as long as the control knob is held in this position. The multi-function switch sends an electronic **front wiper switch status** message over the LIN data bus to the SAS, which relays an electronic **front wiper switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The multi-function switch sends an electronic **beam select switch status** message over the LIN data bus to the SAS, which relays an electronic **beam select switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp HIGH beams will remain illuminated for as long as the control stalk is held in this momentary position and the LOW beams will be restored when the control stalk is released. The multi-function switch sends an electronic **headlamp optical horn switch status** message over the LIN data bus to the SAS, which relays an electronic **headlamp optical horn switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Washer Control** - The control sleeve on the multi-function switch control stalk is rotated counterclockwise toward the instrument panel to the momentary WASH position to activate the washer pump/motor in the REAR WASH mode. The washer pump/motor will continue to operate for as long as the control sleeve is held in this position. The multi-function switch sends an electronic **rear washer switch status** message over the LIN data bus to the SAS, which relays an electronic **rear washer switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Rear Wiper Control** - The control sleeve on the multi-function switch control stalk is rotated clockwise away from the instrument panel to the rear intermittent wiper detent to select the REAR WIPER mode. The multi-function switch sends an electronic **rear wiper switch status** message over the LIN data bus to the SAS, which relays an electronic **rear wiper switch request** message over the CAN data bus to other electronic modules in the vehicle.
- **Turn Signal Control** - The turn signals are requested when the multi-function switch control stalk is moved downward (LEFT signal) or upward (RIGHT signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends from the multi-function switch housing through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the LEFT turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The multi-function switch sends an electronic **turn signal switch status** message over the LIN data bus to the SAS, which relays an electronic **turn signal switch request** message over the CAN data bus to other electronic modules in the vehicle.

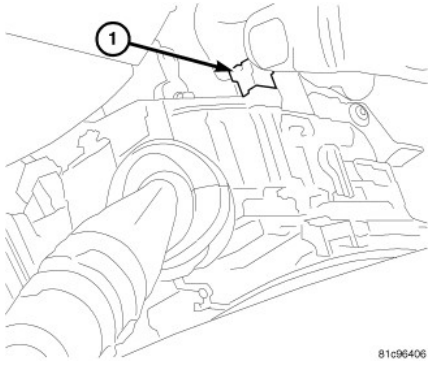
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Disconnect and isolate battery negative cable.
2. Remove the upper and lower shrouds from the steering column. (Refer to 19 - Steering/Column /SHROUD, Steering Column - Removal)
3. Disconnect the instrument panel wire harness connector (1) from the connector receptacle on the back of the multi-function switch housing.



4. Working through the access window (2) of the mounting bracket (3) integral to the left side of the clockspring, depress the tab (4) of the latch feature integral to the multi-function switch (1) housing far enough to disengage the latch.
5. While holding the latch disengaged, slide the switch upward and out of the receptacle in the mounting bracket.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.
- Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	Acrylonitrile Styrene	Lurans	Consoles, Grilles

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
	Acrylite		
ABS	Acrylonitrile Butadiene Styrene	Terluran	"A" Pillars, Consoles, Grilles
ABS/PC	ABS/PC Alloy	Pulse, Proloy, Bayblend	Doors, Instrument Panels
ABS/PVC	ABS/PV Alloy	Proloy, Pulse, Lustran, Cyclovin	Door Panels, Grilles, Trim
BMC	Bulk Molding Compound	BMC	Fender Extensions
EMA	Ehtylene Methyl Acrylate/Ionomer	Surlyn, EMA, Ionomer	Bumper Guards, Pads
METTON	Metton	Metton	Grilles, Kick Panels, Running Boards
MPPO	Modified Polyphenylene Oxide	MPPO	Spoiler Assembly
PA	Polyamid	Zytel, Vydyne, PA, Minlon	Fenders, Quarter Panels
PET	Thermoplastic Polyester	Rynite	Trim
PBT/PPO	PBT/PPO Alloy	Germax	Claddings
PBTP	Polybutylene Therepthalate	PBT, PBTP, Pocan, Valox	Wheel Covers, Fenders, Grilles
PBTP/EEBC	Polybutylene Therepthalate/EEBC Alloy	Bexloy, "M", PBTP/EEBC	Fascias, Rocker Panel, Moldings
PC	Polycarbonate	Lexan, Merlon, Calibre, Makrolon PC	Tail Light Lenses, I/P Trim, Valance Panels
PC/ABS	PC/ABS Alloy	Germax, Bay Blends, Pulse	Doors, Instrument Panels
PPO	Polyphenylene Oxide	Azdel, Hostalen, Marlex, Prfax, Noryl, GTX, PPO	Interior Trim, Door Panels, Splash Shields, Steering Column Shroud
PPO/PA	Polyphenylene/Polyamid	PPO/PA, GTX 910	Fenders, Quarter Panels
PR/FV	Fiberglass Reinforced Plastic	Fiberglass, FV, PR/FV	Body Panels
PS	Polystyrene	Lustrex, Styron, PS	Door Panels, Dash Panels
RTM	Resin Transfer Molding Compound	RTM	Body Panels
SMC	Sheet Molded Compound	SMC	Body Panels
TMC	Transfer Molding Compound	TMC	Grilles
UP	Unsaturated Polyester (Thermosetting)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	Grille Opening Panel, Liftgates, Flareside Fenders, Fender Extensions
EEBC	Ether/Ester Blocked Co-Polymer	EEBC	Bumpers
EEBC/PBTP	EEBC/Polybutylene Terepthalate	EEBC, PBTP, BEXLOY	Bumper, Rocker Panels
EMPP	Ethylene Modified Polypropylene	EMPP	Bumper Covers
EPDM	Ethylene/Propropylene Diene Monomer	EPDM, Nordel, Vistalon	Bumpers
EPM	Ethylene/Propropylene Co-Polymer	EPM	Fenders
MPU	Foam Polyurethane	MPU	Spoilers

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
PE	Polyethylene	Alathon, Dylan, Lupolen, Marlex	-
PP	Polypropylene (Blends)	Noryl, Azdel, Marlox, Dylon, Pravex	Inner Fender, Spoilers, Kick Panels, A-Pillars, Door Panels, B-Pillars, Quarter Panels, Sport Bar Trim, Liftgate Trim, Decklid Trim Scuff Plates, Kick Panels, Consoles
PP/EPDM	PP/EPDM Alloy	PP/EPDM	Spoilers, Grilles
PUR	Polyurethane	Colonels, PUR, PU	Fascias, Bumpers
PUR/PC	PUR/PC Alloy	Texin	Bumpers
PVC	Polyvinyl Chloride	Apex, Geon, Vinylite	Body Moldings, Wire Insulation, Steering Wheels
RIM	Reaction Injected Molded Polyurethane	RIM, Bayflex	Front Fascias, Modular Windows
RRIM	Reinforced Reaction Injected Molded	PUR, RRIM	Fascias, Body Panels, Body Trims
TPE	Thermo Polyethylene	TPE, Hytrel, Bexloy-V	Fascias, Bumpers, Claddings
TPO	Thermopolyolefin	Polytrope, Renflex, Santoprene, Visaflex, ETA, Apex, TPO, Shields, Claddings	Bumpers, End Caps, Telcar, Rubber, Strips, Sight, Interior B-Pillar
TPP	Thermo-Polypropylene	TPP	Bumpers
TPU	Thermopolyurethane, Polyester	TPU, Hytrel, Texin, Estane	Bumpers, Body Side, Moldings, Fenders, Fascias

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be “V'd” at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first “V'd” out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a

true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.

10. Apply adhesive to cover one side of all support squares.

11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.

13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

14. Apply a coat of adhesive to the exposed ends of the support squares.

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.

16. Allow adhesive to cure, and remove all screws.

17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.

19. Mix enough adhesive to cover the entire patch area.

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair .

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

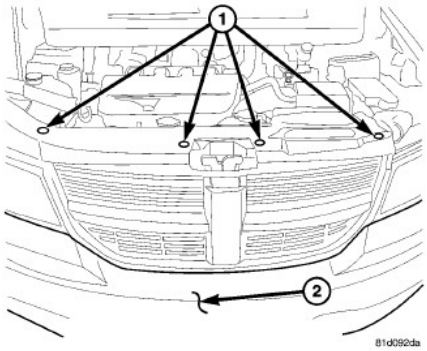
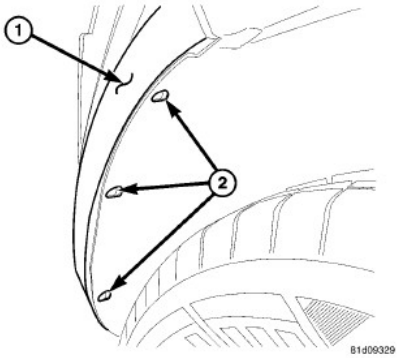
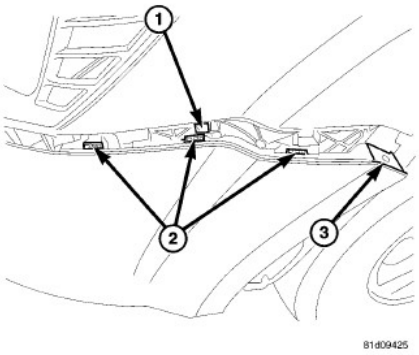
1. Release hood latch and open hood.
2. Remove the pushpins for the fascia (2) at the radiator support.



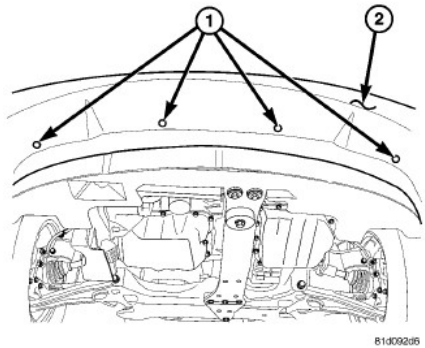
3. Hoist and support vehicle on safety stands. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) , for proper hoisting and jacking procedures.
4. Remove the pop rivets (2) at the wheel well opening.



5. Remove the torx® screw (3) at the wheel well housing.
6. Separate the fascia tabs (2) at the bracket (1).



7. Remove the pushpins (1) for the fascia (2) at the lower closeout panel.

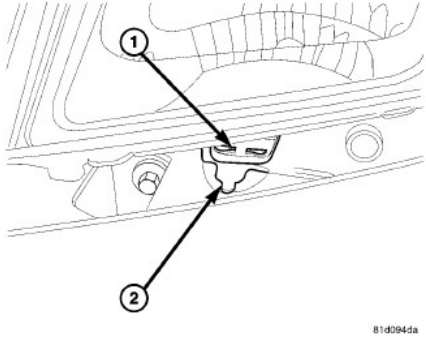


8. Slide the fascia (2) out from the mounting tab (1) under the headlamp.

9. Disengage fog lamp wire connector and side marker connector from body harness, if equipped.

10. Disengage the ambient temp sensor wire connector, if equipped.

11. Remove fascia from vehicle.



2014 Dodge JC - DODGE JOURNEY

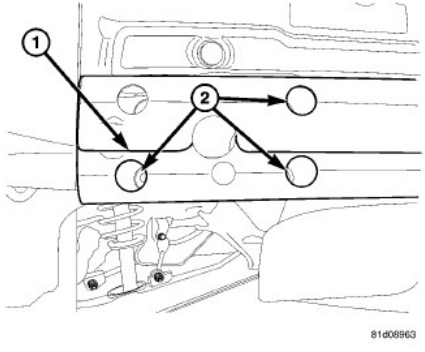
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Position rear bumper reinforcement (1) on vehicle.
2. Install bolts (2) attaching bumper reinforcement to frame rail. Use marks made previously to properly position bumper reinforcement.
3. Tighten bolts (2) to 28 N·m (250 in.lbs.).
4. Install rear fascia (Refer to 13 - Frame and Bumpers/Bumpers/FASCIA, Rear - Installation) .



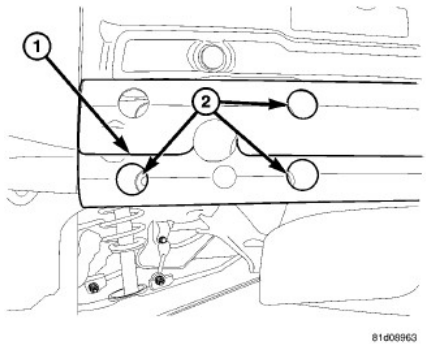
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Remove rear fascia (Refer to 13 - Frame and Bumpers/Bumpers/FASCIA, Rear - Removal) .
2. Support bumper reinforcement (1) on a suitable lifting device.
3. Mark position of bolts (2) on frame rail to aid in installation.
4. Remove bolts (2) attaching rear bumper reinforcement (1) to frame rail.
5. Remove bumper reinforcement (1) from vehicle.



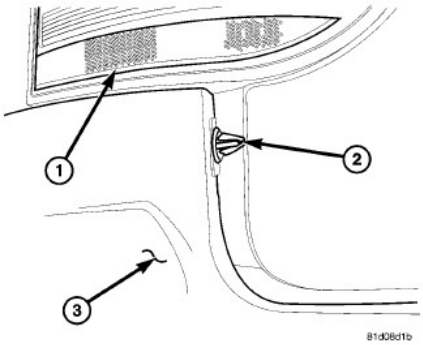
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

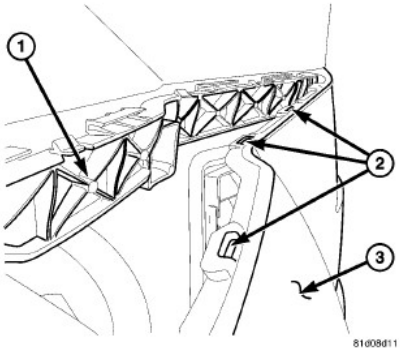
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

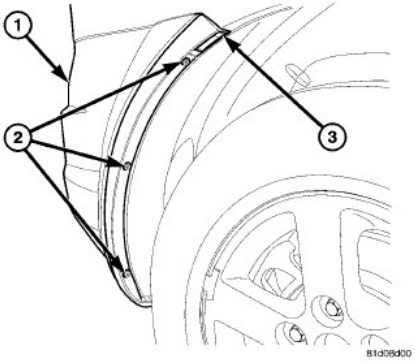
1. Install the fascia (3) to the vehicle and install the pushpin (2) at the tailight (1) to the body.



2. Clip the fascia (3) into the tabs (2) to the bracket (1).

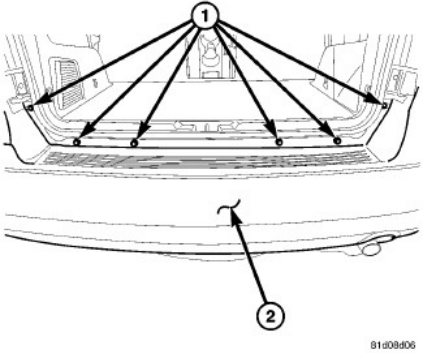


3. Install the torx® screw (3) for the fascia top the wheel opening and then install the pop rivets (2).



4. Install the 6 push pins (1) to secure the fascia (2) to the body.

5. Close the hatch and check for fit.



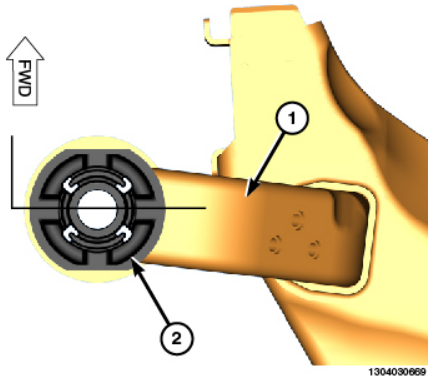
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

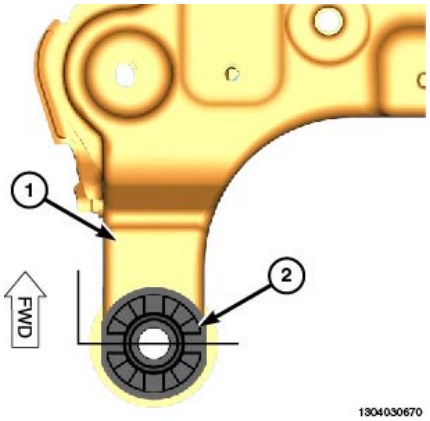
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. Place the front isolator (2) onto the crossmember (1) and position as indicated.



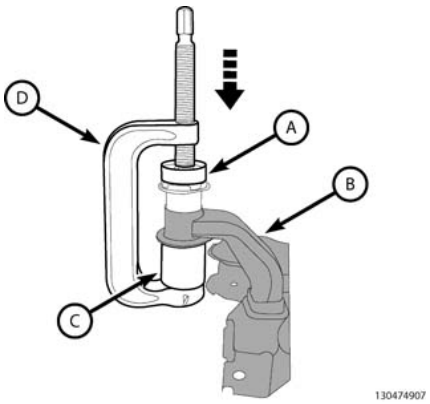
2. Place the rear isolator (2) onto the crossmember (1) and position as indicated.



3.

NOTE: Prior to using special tools, lubricate Press, Ball Joint C-4212F (1) threads to provide ease of use and promote tool longevity.

Assemble tools over isolator crossmember assembly as shown:



A. Press Plug 9678

B. Crossmember

C. Cup, Receiver 9776

D. C-4212F

4. Tighten Press, (D) screw-drive, pressing isolator into crossmember (B). Install isolator until isolator can flange contacts surface of crossmember.

5. Install the crossmember. (Refer to 13 - Frame and Bumpers/Frame/CROSSMEMBER, Front Suspension/Installation)

2014 Dodge JC - DODGE JOURNEY

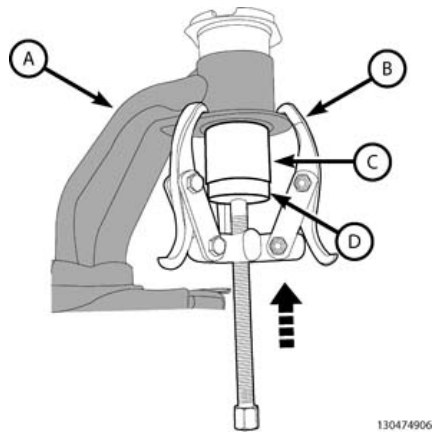
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. Remove the engine cradle crossmember. (Refer to 13 - Frame and Bumpers/Frame /CROSSMEMBER, Front Suspension/Removal)
2. As an installation reference, carefully mark location of isolator (3) requiring removal on crossmember (1) (around isolator can flange) using a marker or crayon. **Do not use a scratch awl to mark location.**

NOTE: Prior to using special tools, lubricate OTC® three jaw puller 1026 or equivalent (B) threads to provide ease of use and promote tool longevity.



3. Assemble tools over isolator crossmember assembly as shown:

A. Crossmember
B. OTC® three jaw puller 1026
C. Remover, Bushing 9334-4
D. Press Plug 9678

4. Tighten OTC® three jaw puller 1026 or equivalent (A) screw-drive, pressing isolator out of the crossmember (A).

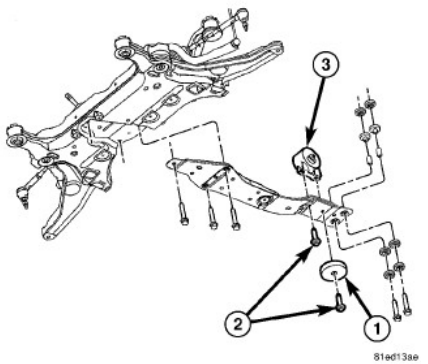
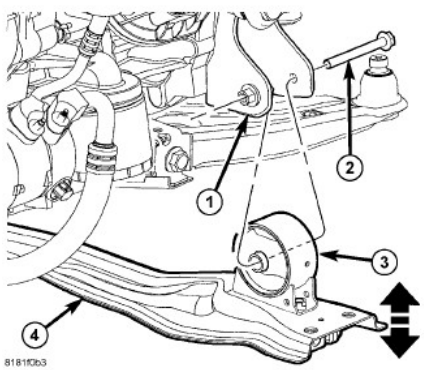
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Install the front engine mount (3) on the crossmember. Install the mounting bolts (2) and damper (1). Tighten the bolts to 50 N·m (37 ft. lbs.).
2. Position the fore-aft crossmember in the engine compartment and install the mounting bolts. Tighten the forward mounting bolts at the radiator support to 55 N·m (41 ft. lbs.). Tighten the rearward mounting bolts at the suspension crossmember to 55 N·m (41 ft. lbs.).



3. Install the front engine mount thru-bolt (4). Tighten the bolt to 60 N·m (44 ft. lbs.).
4. If equipped, install the engine belly pan.
5. Lower the vehicle.



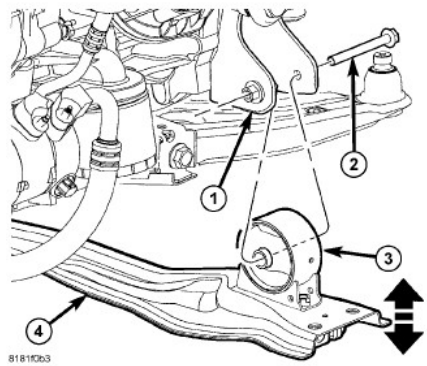
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

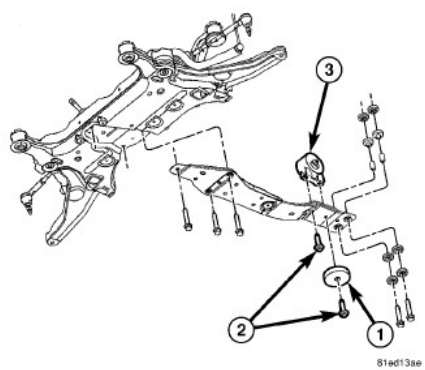
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Raise and support the vehicle (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure) .
2. If equipped, remove the engine belly pan.
3. Remove the front engine mount thru-bolt (2).



4. Remove the fore-aft crossmember forward mounting bolts at the radiator support.
5. Remove the fore-aft crossmember rearward mounting bolts at the crossmember.
6. Remove the fore-aft crossmember.
7. Remove the front engine mount mounting bolts (2) and damper (1). Remove the mount (3) from the crossmember.



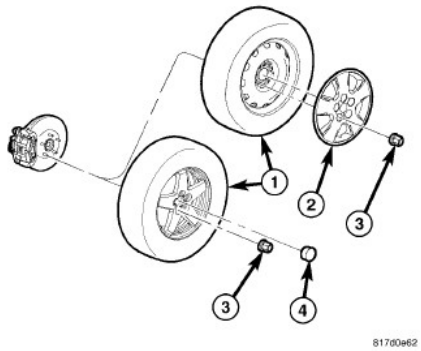
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

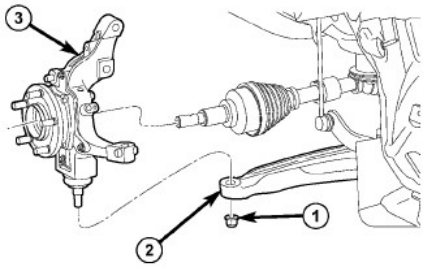
Labor Operations: Click to display a list of Labor Operations associated with this procedure
Special Tools: Click to display a list of tools used in this procedure

1. Raise and support the vehicle. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure)
2. On each side of the vehicle, remove the wheel mounting nuts (3), then the front tire and wheel assembly (1).



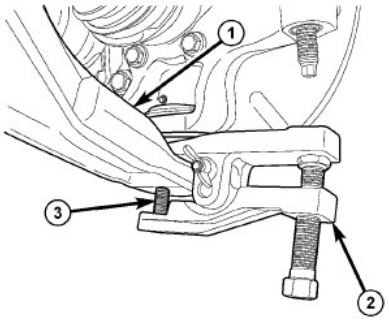
817d0e62

3. On each side of the vehicle, remove the nut (1) attaching the lower ball joint to the lower control arm (2).



819b8498

4. On each side of the vehicle, release the lower ball joint (3) from the lower control arm (1) using Remover (2), Special Tool 9360 . Do not lift the knuckle out of the lower control arm at this time.



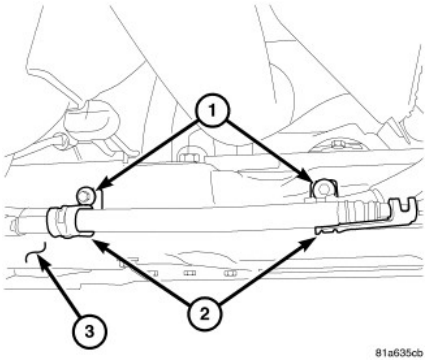
81a30701

5. If equipped, remove the engine belly pan.

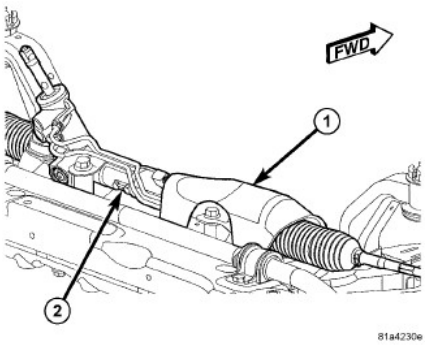
6. Remove the fore/aft crossmember. (Refer to 13 - Frame and Bumpers/Frame/CROSSMEMBER - Removal)

7. Remove the rear engine mount. (Refer to 09 - Engine/Engine Mounting/INSULATOR, Engine Mount - Removal)

8. Remove the screws (1) securing the power steering hose routing clamps (2) to the rear of the crossmember.

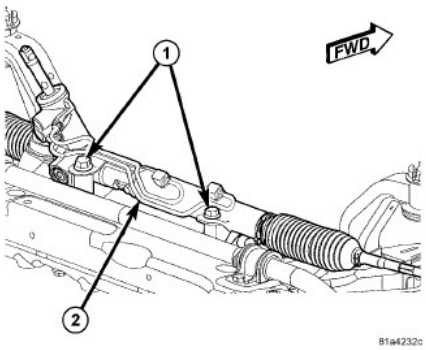


9. Remove the screws and push-pins securing the heat shield (1) over the right side of the steering gear (2).

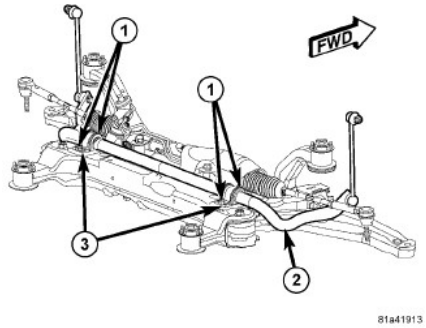


10. Remove the two bolts (1) securing the steering gear (2) to the crossmember.

11. Support the steering gear using a bungee cord or other to keep the steering gear from lowering when the crossmember is lowered.



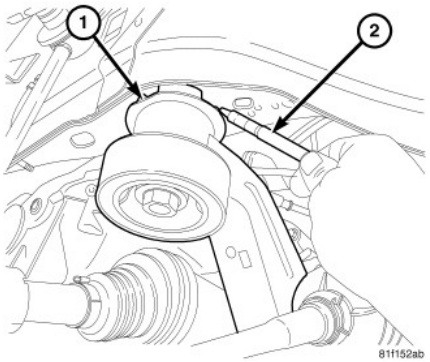
12. Remove the screws (1) securing the stabilizer bushing retainers (3) to the crossmember.



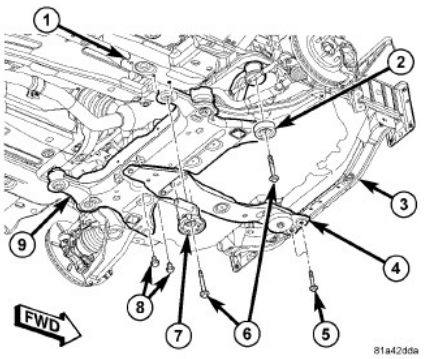
NOTE:

Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

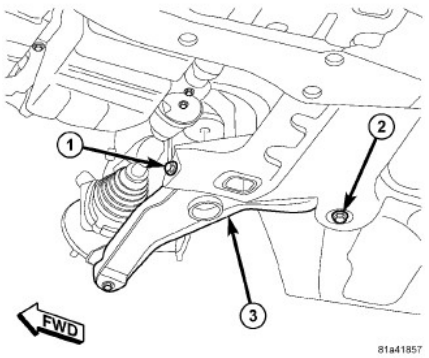
13. Using a crayon or marker (2) that will not break the paint surface, mark the location of the front crossmember (1) on the body near each mounting bolt. **Do not use any type of sharp instrument that will damage the underbody of the vehicle.**



14. Support the crossmember (9) with a transmission jack. Secure the crossmember to the jack.
15. Remove the four mounting bolts (6) securing the front crossmember (9) to the body.
16. Remove the mounting screws (8) securing the front crossmember reinforcement brackets (7) (one each side of vehicle) to the body (1). Remove the brackets.
17. Slowly lower the crossmember and control arms to a comfortable working height using the jack.



18. To remove each lower control arm:
    a. Remove the front bolt (1) attaching the lower control arm (3) to the front suspension crossmember.
    b. Remove the nut on the rear bolt (2) attaching the lower control arm (3) to the front suspension crossmember. Remove the bolt.
    c. Remove the lower control arm (3) from the crossmember.



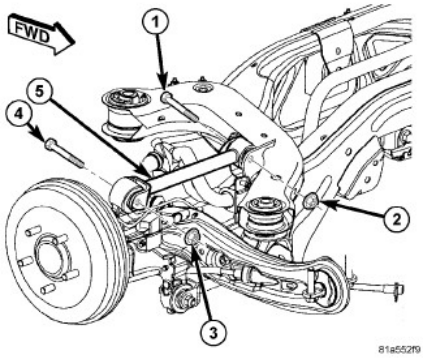
2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

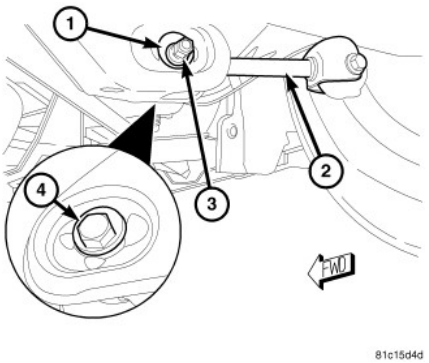
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Support the rear suspension crossmember with a transmission jack. Secure the crossmember to the jack.
2. Slowly raise the crossmember into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal. As the crossmember is raised, guide the rear suspension components into place.
3. Install the four mounting bolts (rear bolts have stud heads) securing the crossmember to the body. Tighten the crossmember mounting bolts to 95 N·m (70 ft. lbs.).
4. Position the crossmember reinforcement brackets (one each side of vehicle) over the crossmember rear mounting bolt head-studs and install the mounting nuts, but do not tighten at this time.
5. Install the mounting screws securing the crossmember reinforcement brackets to the body. Tighten the screws to 55 N·m (41 ft. lbs.).
6. Tighten the mounting nuts securing the reinforcement brackets to the rear crossmember mounting bolts to 50 N·m (37 ft. lbs.).
7. Remove the transmission jack.
8. On each side of the vehicle, position the upper control arm (5) and install the bolt (1) and nut (2) securing the arm to the crossmember. Do not tighten either upper control arm mounting bolts at this time.

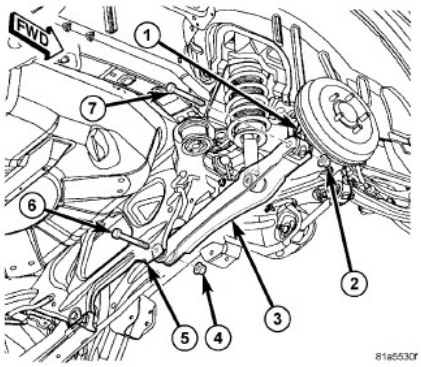


CAUTION: **When installing the cam bolt (4) and washer make sure the cams stay inside the abutments built into the crossmember. Failure to do so can damage the abutments and make toe adjustment difficult.**

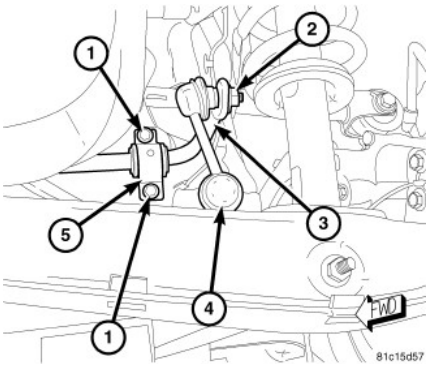


9. On each side of the vehicle:
   a. Position the toe link (2) and install the cam bolt (4) from the front through the crossmember and link. Match the cam on the bolt to the marks made during removal or position the top of the cam to the 12 O'clock position if not available.
   b. Install the cam washer (1) and nut (3) securing the toe link (2) to the crossmember. Do not tighten at this time.

10. On each side of the vehicle, position the lower control arm (3) and install the bolt (6) and nut (4) securing the lower control arm to the crossmember (5). Do not tighten nut and bolt at crossmember or knuckle at this time.



NOTE: When installing the stabilizer bar on a vehicle with all-wheel-drive, position the bar so that the bar loops over the axle half shafts once installed, not under the axle half shafts.



11. Position the stabilizer bar (3) on the rear crossmember.

CAUTION: **Before installing the screws in the following step, it is especially important to clean the threads and apply Mopar® Lock AND Seal Adhesive or equivalent.**

12. Install the two retainers (5 - right side shown) over the cushions at the mounting holes and install the retainer screws (1). Do not tighten the screws at this time.

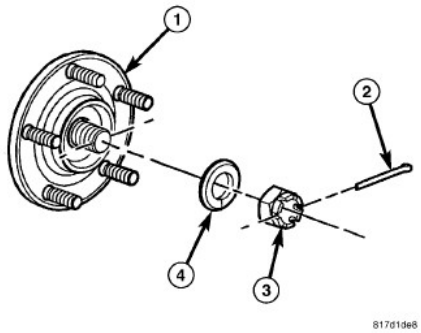
CAUTION: **Before installing the nut in the following step, it is especially important to clean the threads and apply Mopar® Lock AND Seal Adhesive or equivalent.**

13. On each side of the vehicle, install the stabilizer link (4) upper stud in the end of the stabilizer bar (3). Install the nut (2) on the upper stud and while holding the stabilizer link stud stationary, tighten the nut to 48 N·m (35 ft. lbs.).

14. On each side of the vehicle, tighten the stabilizer bar retainer screws (1) to 25 N·m (18 ft. lbs.).

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

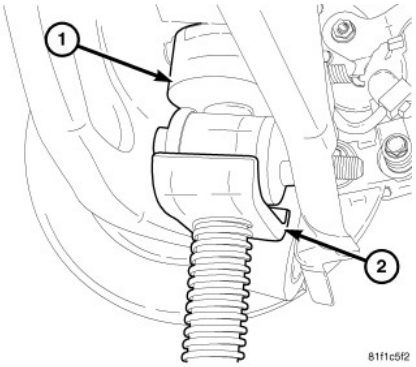
15. If equipped with all-wheel-drive, slide the half shaft into the hub and bearing on each side of the vehicle and hand-start the washer and hub nut (3) Support the shafts to keep them from overextending the joints.



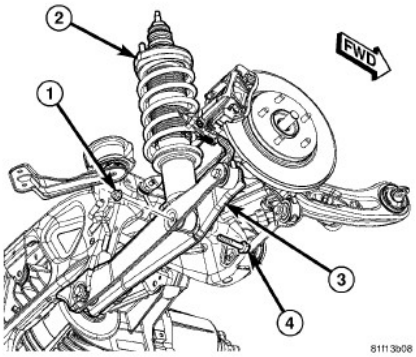
16. If equipped with all-wheel-drive, install the rear driveline module. In place of using a drive-on hoist, place jacks under the outboard ends of the lower control arms and adjust the rear suspension height at the hub and bearings to simulate curb riding height. (Refer to 03 - Differential and Driveline/Rear Driveline Module - Removal) Once the rear driveline module is installed, remove the jacks.

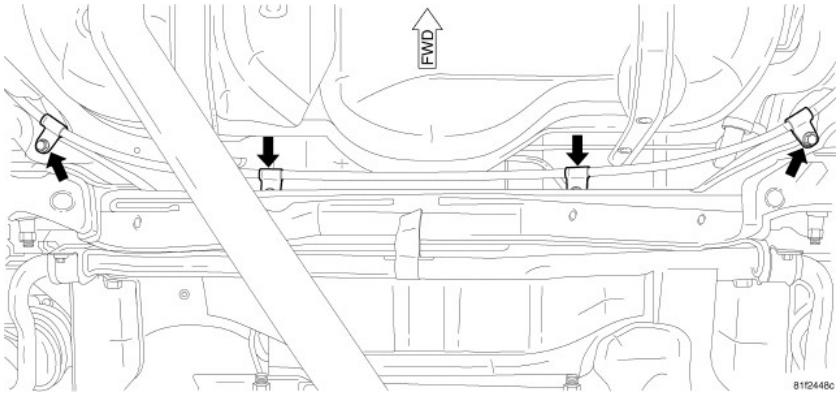
17. On each side of the vehicle, if equipped with load-leveling shocks, place a jack (2) against the lower shock eye and support the lower end of the shock

assembly (1). Lift the shock assembly using the jack until the hole in the lower shock eye lines up with that in the lower control arm.



18. On each side of the vehicle, install the mounting bolt (4) and nut (1) fastening the shock assembly (2) to the lower control arm (3). Do not tighten at this time.

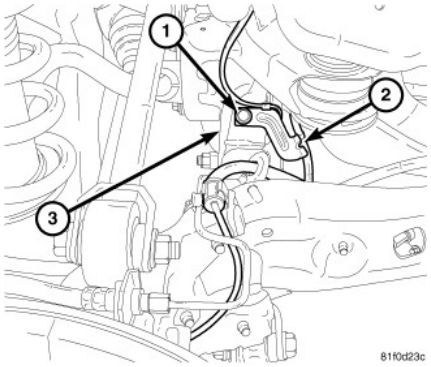




19. Position the four parking brake cable routing clamps along the front of the rear crossmember and install the screws. Tighten the screws to 6 N·m (55 in. lbs.)..

20. Install the exhaust system. (Refer to 11 - Exhaust System/PIPE, Exhaust - Installation) .

21. On each side of the vehicle, attach the wheel speed sensor routing clamp (2) to the rear suspension crossmember (3) using the mounting screw (1). Tighten the mounting screw to 20 N·m (15 ft. lbs.).

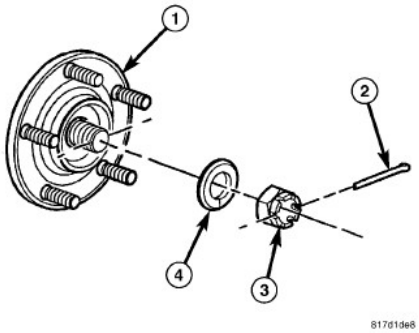


22. While a helper applies the brakes to keep the hub (1) from rotating, on each side of the vehicle:

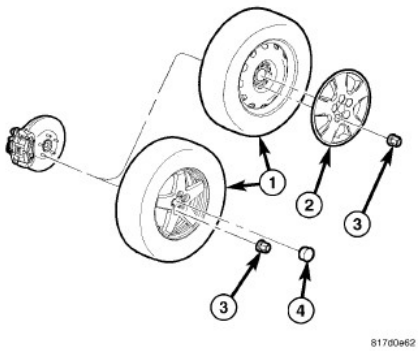
    a. Tighten the hub nut (3) to 245 N·m (181 ft. lbs.).

    b. Insert the cotter pin (2) through the notches in the nut and the hole in half shaft. If the notches in the nut do not line up with the hole in the half shaft, continue to tighten the nut until they do. **Do not loosen the nut.**

    c. Wrap the cotter pin (2) ends tightly around the lock nut.



23. On each side of the vehicle, install tire and wheel assembly (1) (Refer to 22 - Tires and Wheels - Installation) . Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).



24. Lower the vehicle.

25. Position the vehicle on an alignment rack/drive-on lift. Raise the vehicle as necessary to access mounting bolts and nuts.

26. Tighten the lower control arm mounting bolt nut at the crossmember to 105 N·m (77 ft. lbs.).

27. Tighten the lower control arm mounting bolt nut at the knuckle to 105 N·m (77 ft. lbs.).

28. Tighten the shock assembly lower mounting bolt nut to 99 N·m (73 ft. lbs.).

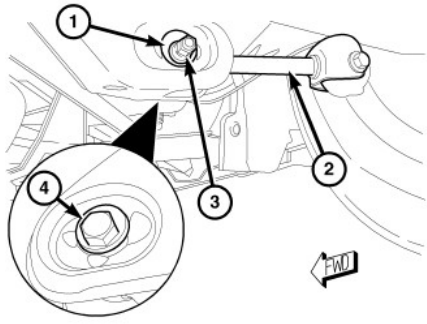
29. Tighten the upper control arm mounting bolt nut at the crossmember to 105 N·m (77 ft. lbs.).

30. Tighten the upper control arm mounting bolt nut at the knuckle to 105 N·m (77 ft. lbs.).

31. Tighten the toe link mounting bolt nut at the knuckle to 105 N·m (77 ft. lbs.).

32. Perform wheel alignment as necessary. (Refer to 02 - Front Suspension/Wheel Alignment - Standard Procedure)

33. Once rear toe is set, while holding the cam bolt (4) head stationary, tighten the toe link mounting cam bolt nut (3) to 100 N·m (74 ft. lbs.).



81c15d4d

2014 Dodge JC - DODGE JOURNEY

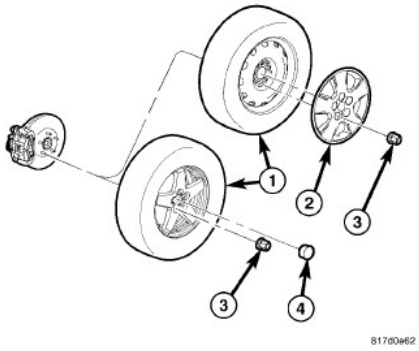
Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

REMOVAL

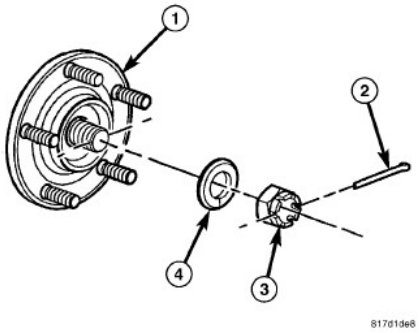
Labor Operations: Click to display a list of Labor Operations associated with this procedure

1. Raise and support the vehicle. (Refer to 04 - Vehicle Quick Reference/Hoisting - Standard Procedure)

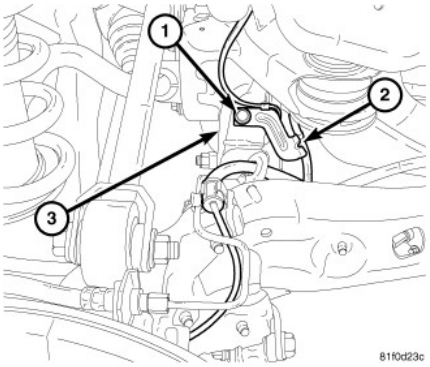
2. On each side of the vehicle, remove the wheel mounting nuts (3), then the front tire and wheel assembly (1).



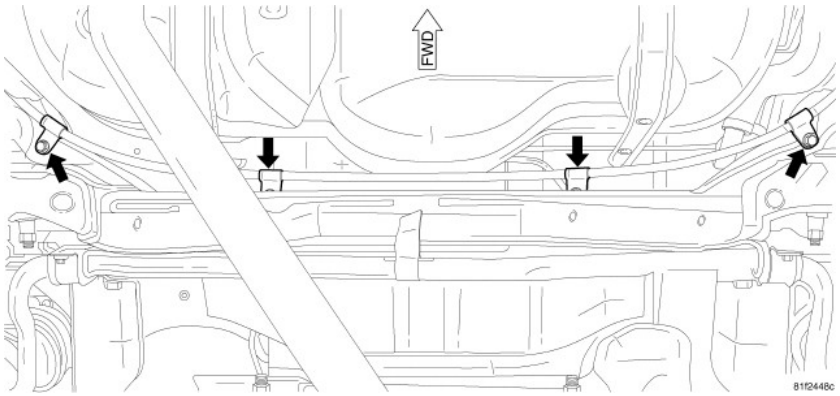
3. If equipped with all-wheel-drive, remove the cotter pin (2) from the hub nut (3) on the end of the axle half shaft. While a helper applies the brakes to keep the hub (1) from rotating, remove the hub nut (3) and washer (4) from the axle half shaft.



4. On each side of the vehicle, remove the screw (1) fastening the wheel speed sensor routing clamp (2) to the rear suspension crossmember (3).

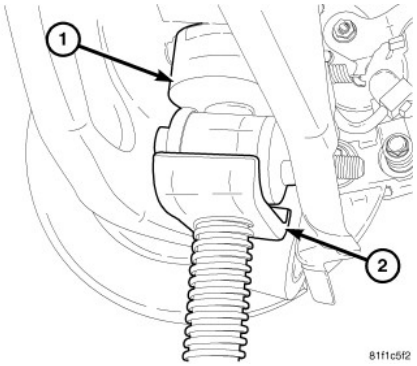


5. Remove the exhaust system from the vehicle. (Refer to 11 - Exhaust System/PIPE, Exhaust - Removal)

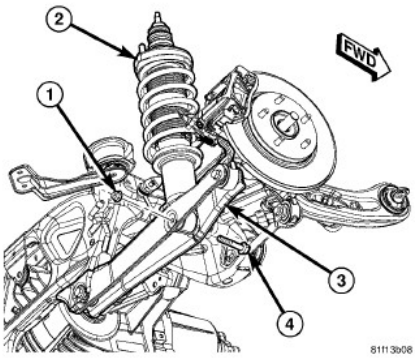


6. Remove the screws securing the four right rear parking brake cable routing clamps to the rear crossmember .

7. On each side of the vehicle, if equipped with load-leveling shocks, support the lower shock (1) with a jack (2) using just enough force to allow easy removal of the lower shock mounting bolt in the following step. Lower the jack following bolt removal.



8. On each side of the vehicle, remove the lower shock mounting nut (1) and bolt (4).



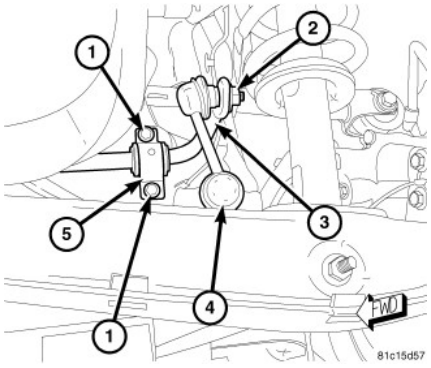
9. If equipped with all-wheel-drive, remove the rear driveline module, but instead of using a drive-on hoist, place jacks under the outboard ends of the lower control arms and adjust the rear suspension height at the hub and bearings to simulate curb riding height. (Refer to 03 - Differential and Driveline/Rear Driveline Module - Removal) Once the rear driveline module is removed, remove the jacks.

10. If equipped with all-wheel-drive, slide the half shaft out of the hub and bearing on each side of the vehicle and remove it.

11. On each side of the vehicle, while holding the stabilizer bar link upper stud stationary, remove the nut (2) securing the link (4) to the stabilizer bar (3).

12. On each side of the vehicle, remove the screws (1) securing the stabilizer bar retainer (5) to the crossmember.

13. Remove the stabilizer bar (3) from the vehicle.

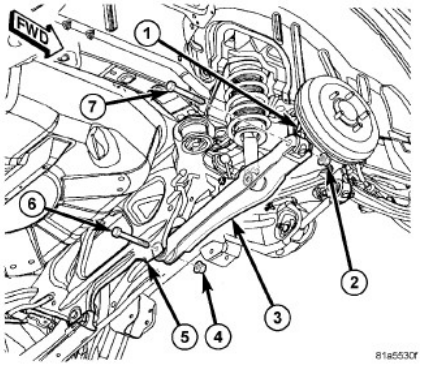


14. On each side of the vehicle:

    a. Loosen (do not remove) the nut (2) and bolt (7) securing the lower control arm (3) to the knuckle (1).

    b. Remove the nut (4) and bolt (6) securing the lower control arm (3) to the rear crossmember (5).

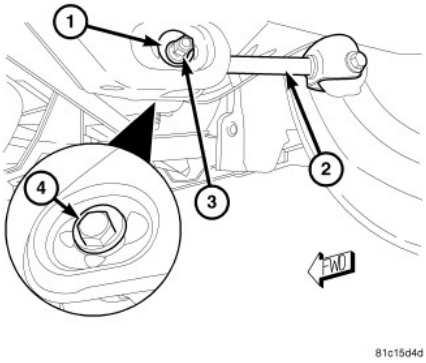
    c. Swing the lower control arm down away from the rear crossmember.



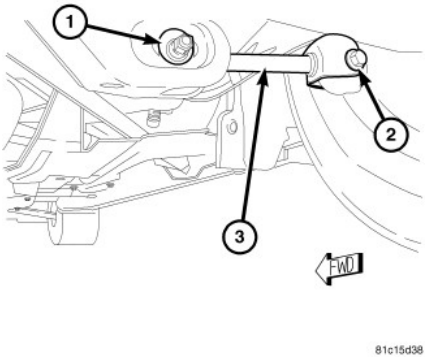
15. On each side of the vehicle:

    a. Mark the position of the cam bolt (4) cams on the crossmember using a paint marker or crayon. Do not use any type marker that will scratch or damage the surface of the crossmember.

    b. While holding the cam bolt (4) head stationary, loosen and remove the toe link mounting cam bolt nut (3) and washer (1). Remove the cam bolt.



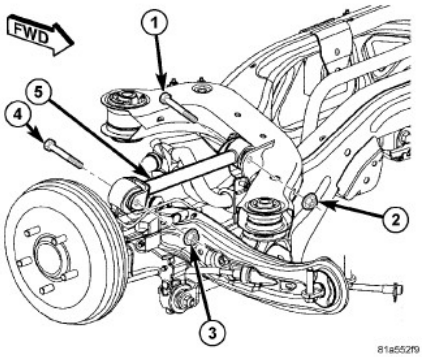
16. On each side of the vehicle, loosen (do not remove) the mounting bolt (2) and nut securing the toe link (3) to the knuckle.



17. On each side of the vehicle:

    a. Loosen (do not remove) the nut (3) and bolt (4) securing the upper control arm (5) to the knuckle.

    b. Remove the nut (2) and bolt (1) securing the upper control arm (5) to the crossmember.



18. On each side of the vehicle, using wire or a bungee cord, support the knuckle to keep it from sagging.

NOTE:

Before lowering the rear suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the crossmember is not reinstalled in exactly the same location as before removal, the rear wheel alignment settings may be lost.

19. Using a crayon or marker that will not break the paint surface, mark the location of the rear suspension crossmember on the body near each mounting bolt. **Do not use any type of sharp instrument that will damage the underbody of the vehicle.**

20. Support the crossmember with a transmission jack. Secure the crossmember to the jack.

21. Remove the two mounting screws securing each crossmember reinforcement bracket (one each side of vehicle) to the body.

22. Remove the mounting nuts securing the crossmember reinforcement brackets to the crossmember rear mounting bolts. Remove the brackets.

23. Remove the four mounting bolts securing the crossmember to the body.

24. Slowly lower the crossmember using the jack.

2014 Dodge JC - DODGE JOURNEY

USE OF HEAT DURING REPAIR

WARNING:

Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

2014 Dodge JC - DODGE JOURNEY

Submodel: | **Engine Type:** V6 | **Liters:** 3.6L
Fuel Delivery: | **Fuel:**

WARNINGS

WARNING:

Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**
- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION:

When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

Restraint Warnings

WARNING:

To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING:

To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING:

To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING:

To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.**

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

WARNING: **To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.**

WARNING: **To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.**

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

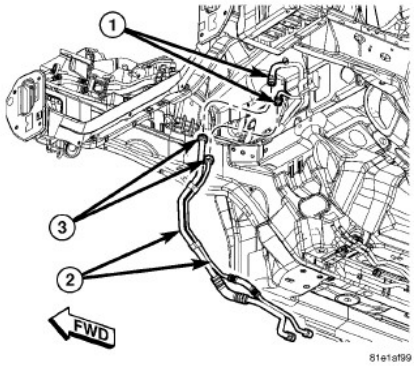
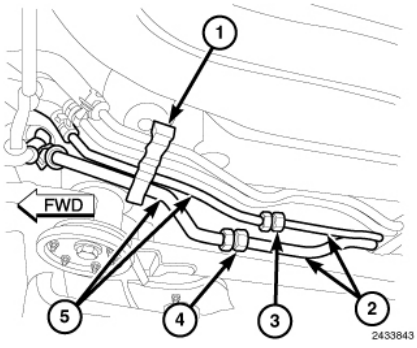
CAUTION: **Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system . Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system (Refer to 24 - Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure) .

NOTE: Replacement of the refrigerant line O-ring seals is required anytime an underbody refrigerant line is disconnected. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.



1. Remove the tape or plugs from the opened refrigerant line fittings.
2. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C underbody extension lines (2) into the engine compartment. Rotate and tilt the A/C underbody extension lines as necessary.
4. Connect the A/C underbody extension lines to the front A/C liquid and suction lines (1).
5. Tighten the liquid line fitting nut (3) to 23 N·m (17 ft. lbs.).
6. Tighten the suction fitting nut to 37 N·m (27 ft. lbs.).
7. Raise and support the vehicle.



8. Remove the tape or plugs from the opened refrigerant line fittings.
9. Lubricate new rubber O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the A/C underbody extension lines (5) to the underbody refrigerant lines (2).
11. Tighten the liquid line fitting nut (3) to 23 N·m (17 ft. lbs.).
12. Tighten the suction fitting nut (4) to 37 N·m (27 ft. lbs.).

13. Position the A/C underbody extension lines into the underbody line bracket (1) and engage the bracket retainer.

14. Lower the vehicle.

15. Reconnect the negative battery cable.

CAUTION: **Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with a variable displacement compressor. Failure to follow these instructions will result in serious A/C compressor damage.**

16. Evacuate the refrigerant system (Refer to 24 - Heating and Air Conditioning/Plumbing - Standard Procedure) .

17. Adjust the refrigerant oil level (Refer to 24 - Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure) .

18. Charge the refrigerant system (Refer to 24 - Heating and Air Conditioning/Plumbing - Standard Procedure) .

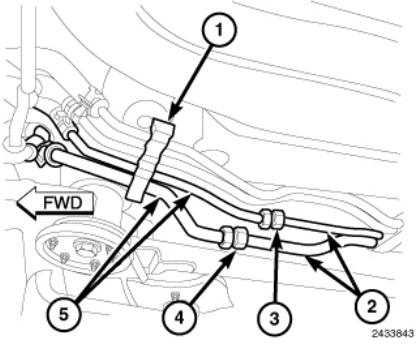
REMOVAL

Labor Operations: Click to display a list of Labor Operations associated with this procedure

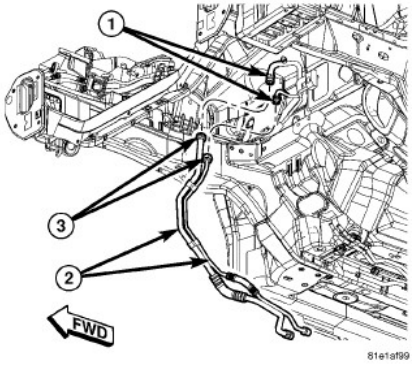
WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

NOTE: To prevent any contaminates from entering the rear heating-A/C system, make sure that the area around the underbody line connections is clean of any dirt or foreign residue prior to disconnecting the lines.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (Refer to 24 - Heating and Air Conditioning/Plumbing - Standard Procedure) .
3. Raise and support the vehicle.
4. Disengage the A/C underbody extension lines (5) from the underbody line bracket (1).



5. Loosen the fitting nuts (3 and 4) that secure the underbody refrigerant lines (2) to the A/C underbody extension lines.
6. Disconnect the underbody refrigerant lines from the A/C underbody extension lines and discard the O-ring seals.
7. Install plugs in, or tape over the opened refrigerant line fittings.
8. Lower the vehicle.
9. Loosen the fitting nuts (3) that secure the A/C underbody extension lines (2) to the front A/C liquid and suction lines (1).
10. Disconnect the A/C underbody extension lines from the front A/C liquid and suction lines and remove and discard the O-ring seals.
11. Rotate and tilt the A/C underbody extension lines as necessary and remove the lines from the vehicle.



12. Install plugs in, or tape over the opened refrigerant line fittings.

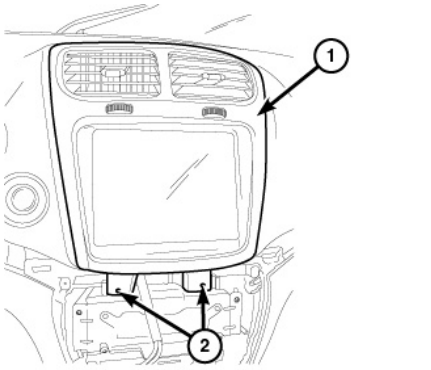
INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

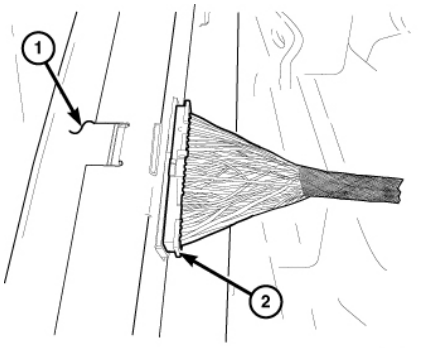
CAUTION: **Do not disconnect/connect the ICSS/switch bank without referring to the appropriate procedure. The harness connector is very fragile and could be damaged if not properly removed/installed.**



3075435

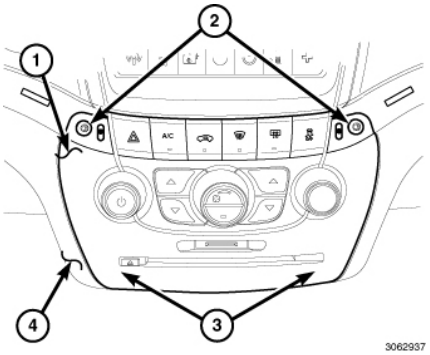
1. Position the center bezel (1) in place and align the spring retainers with the instrument panel.
2. Connect the integrated center stack screen, (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Integrated Center Stack Screen - Installation) .
3. Hand tap center bezel (1) in place ensuring proper seat.
4. Install the fasteners (2) securing the bezel (1) to the I/P. Tighten the fasteners securely.

CAUTION: **Do not disconnect/connect the ICSS/switch bank without referring to the appropriate procedure. The harness connector is very fragile and could be damaged if not properly removed/installed.**



3063961

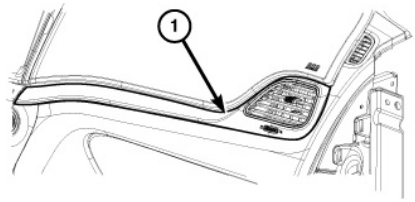
5. Position the switch-bank assembly in place.
6. Connect the electrical connector (2) to the back of the switch-bank assembly (1), (Refer to 08 - Electrical/8J - Instrument Cluster/POD, Switch Bank - Installation)



3062937

7. Position the switch-bank in the I/P and press evenly the engage the two lower clips (3).
8. Install, and tighten the two screws (2) that secure the switch-bank (1) to the I/P (4).

9. Install the instrument panel outlet vent/trim (1), (Refer to 24 - Heating and Air Conditioning/Distribution/OUTLET, Air - Installation) .

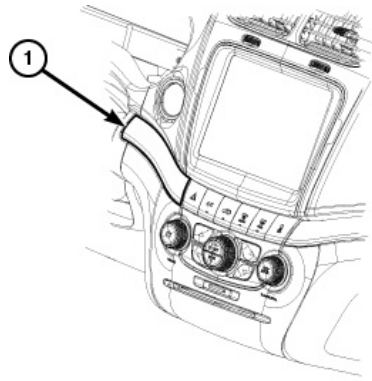


3074932

10. Align and press firmly to install the instrument panel trim (1) located left of the center stack bezel.

11. Install the glove box.

12. Connect the negative battery cable.



3075156

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

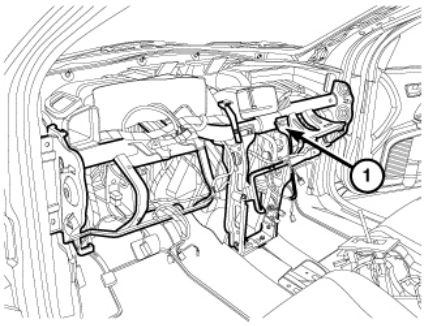
CAUTION: **Do not attempt to install the instrument panel as an assembly. The instrument panel cover/pad must be installed separately.**

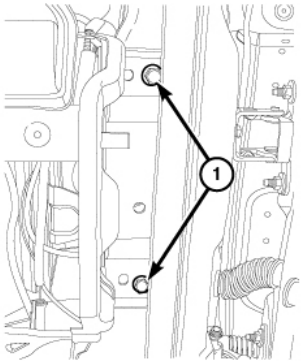
NOTE: LHD model shown in illustrations. RHD model similar.

1. If removed, attach the ductwork to the I/P structure (1).
2. With the help of an assistant, lift the I/P structure (1) and upper HVAC ductwork up and forward to position.



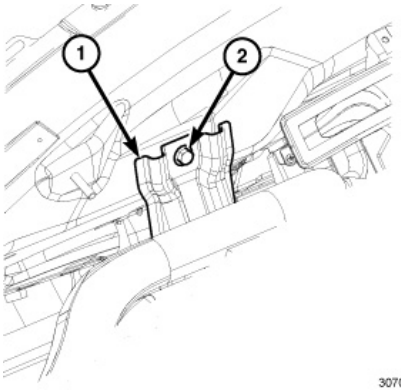
3061316

3. Install the two bolts (1) to each end of the instrument panel. Tighten the bolts to 21 N·m (15 ft. lbs.). Repeat for the opposite side.



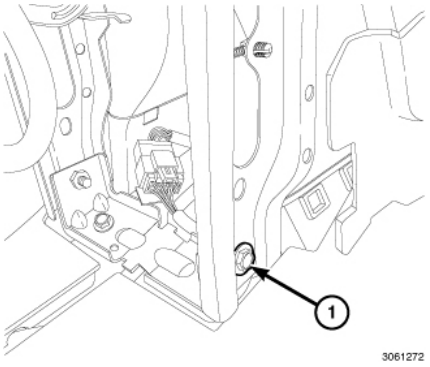
3061254

4. Install the two fence bolts (2) securing the upper brackets (1) near the windshield. Tighten the bolts securely.

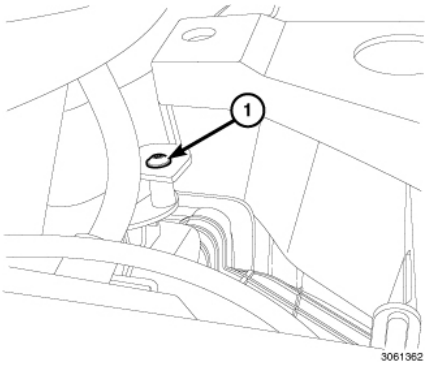


3070569

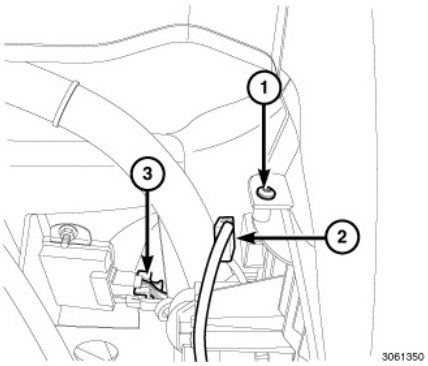
5. Install the fastener (1) securing the I/P structure to the center floor bracket. Tighten the fasteners to 21 N·m (15 ft. lbs.). Repeat on the opposite side.



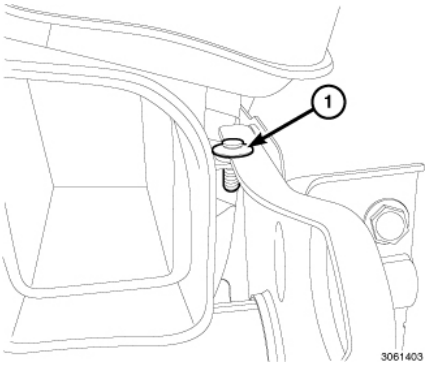
6. Install the fastener (1) securing the duct to the HVAC housing near the center bezel area on the RH side. Tighten the fastener securely.



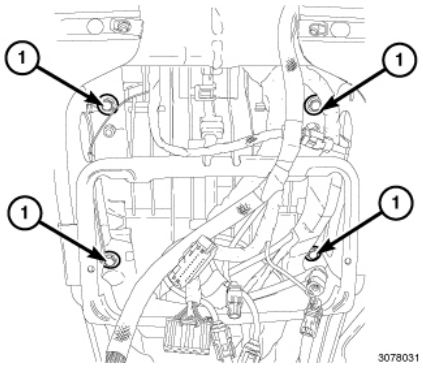
7. Install the fastener (1) securing the duct to the HVAC housing near the center bezel area on the LH side. Tighten the fastener securely.



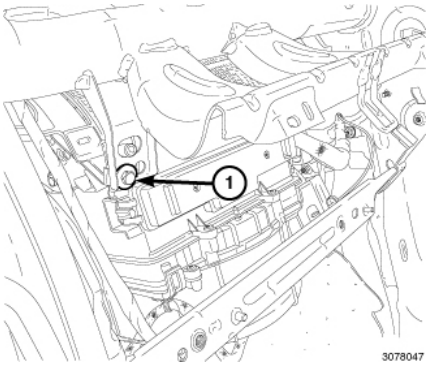
8. Install the fastener (1) securing the outboard HVAC duct to the I/P structure/support.



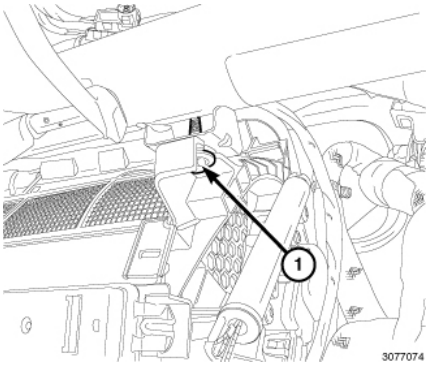
9. Install the I/P structure to HVAC housing bolts (1) located in the center of the structure. Tighten the bolts securely.



10. Install the I/P structure to HVAC housing bolt (1) located on the left side of the HVAC housing. Tighten the bolt securely.

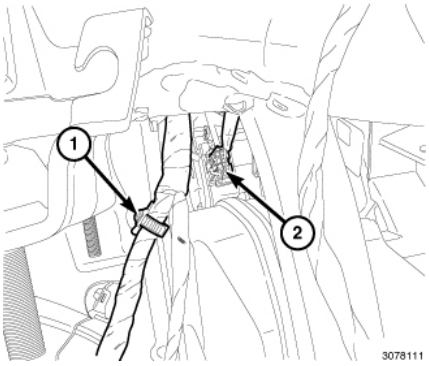


11. Install the I/P structure to HVAC housing bolt (1) located on the right side of the HVAC housing. tighten the bolt securely.

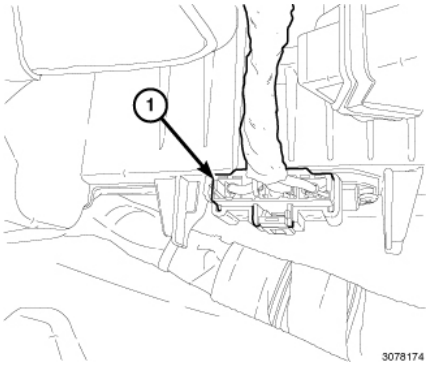


12. Connect the harness (2) to the HVAC housing actuator.

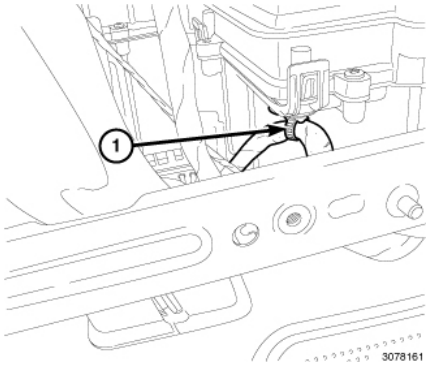
13. Attach the harness retainer from the I/P structure.



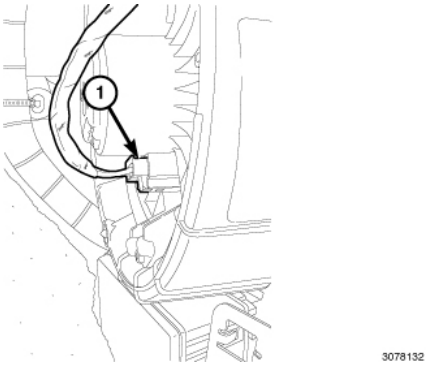
14. Connect the harness (1) to the HVAC housing power module.



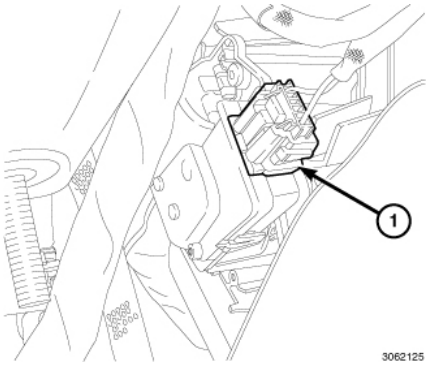
15. Attach the harness (1) from the HVAC housing.



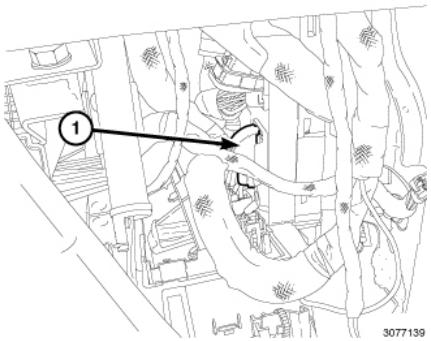
16. Connect the harness (1) from the HVAC housing blower motor.



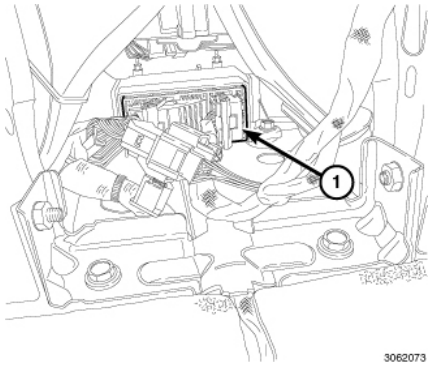
17. Connect the harness (1) to the HVAC housing actuator.



18. Connect the harness (1) to the body control module located on the lower passenger side.



19. Connect the harness (1) to the occupant restraint controller, (Refer to 10 - Restraints/MODULE, Occupant Restraint Controller - Installation) .



20. Connect the vehicle harnesses (1, 2) located on the driver side of the vehicle.

21. Install the instrument panel cover/pad, (Refer to 23 - Body/Instrument Panel/PAD, Instrument Panel - Installation) .

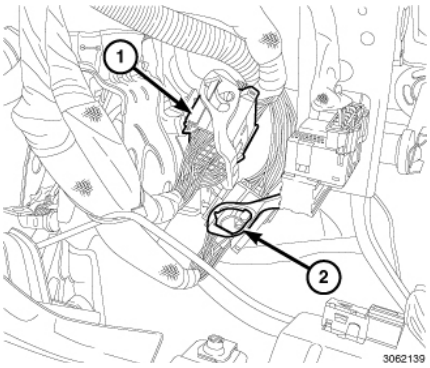
REMOVAL

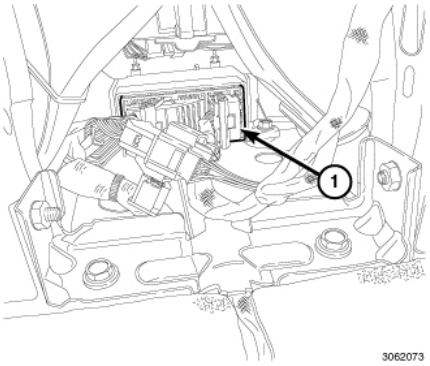
Labor Operations: Click to display a list of Labor Operations associated with this procedure

CAUTION: **Do not attempt to remove the instrument panel as an assembly. The instrument panel cover/pad must be removed prior.**

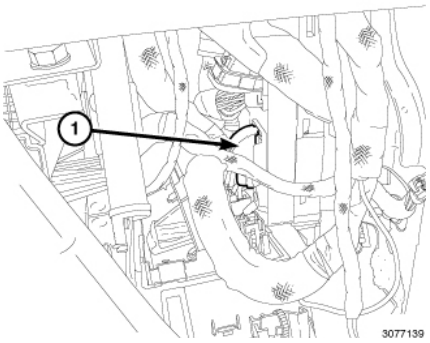
1. Remove the instrument panel cover/pad, (Refer to 23 - Body/Instrument Panel/PAD, Instrument Panel - Removal) .
2. Disconnect the vehicle harnesses (1, 2) located on the driver side of the vehicle.



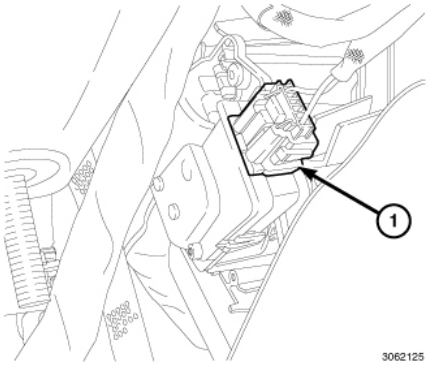
3. Disconnect the harness (1) from the occupant restraint controller, (Refer to 10 - Restraints/MODULE, Occupant Restraint Controller - Removal) .



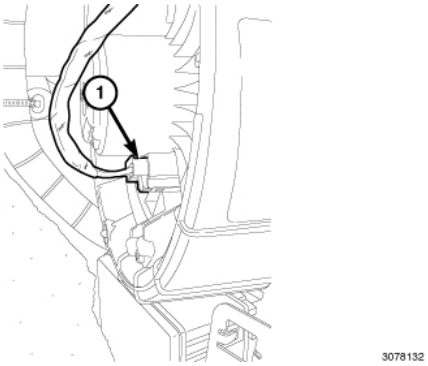
4. Disconnect the harness (1) from the body control module located on the lower passenger side.



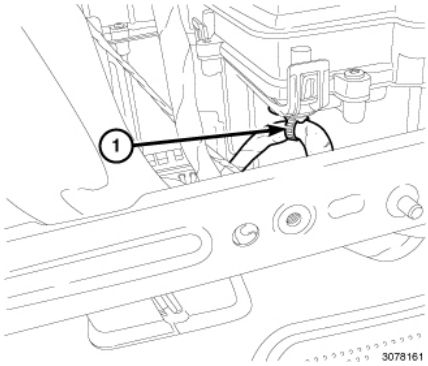
5. Disconnect the harness (1) from the HVAC housing actuator.



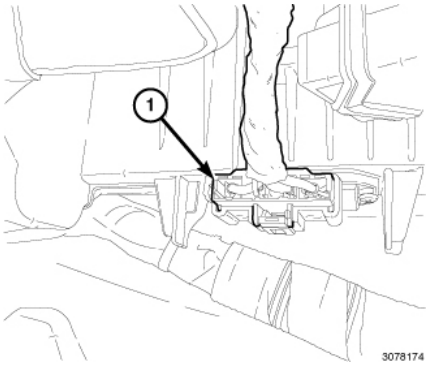
6. Disconnect the harness (1) from the HVAC housing blower motor.



7. Detach the harness (1) from the HVAC housing.

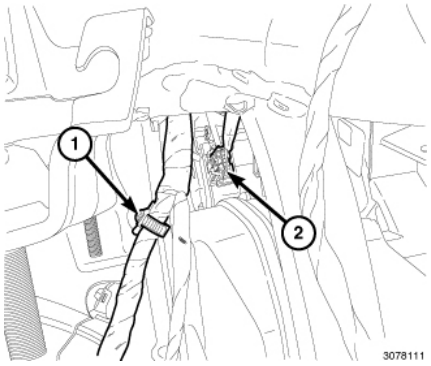


8. Disconnect the harness (1) from the HVAC housing power module.

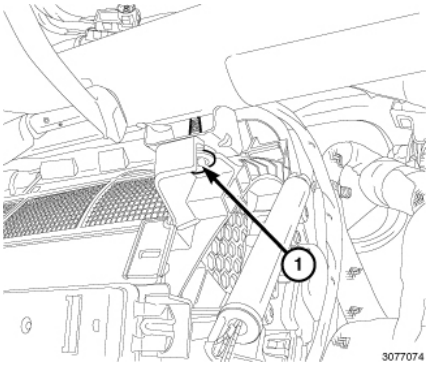


9. Detach the harness retainer from the I/P structure.

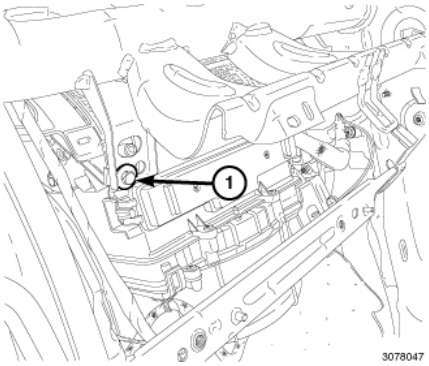
10. Disconnect the harness (2) from the HVAC housing actuator.



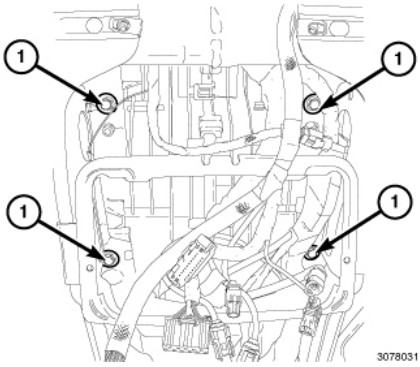
11. Remove the I/P structure to HVAC housing bolt (1) located on the right side of the HVAC housing.



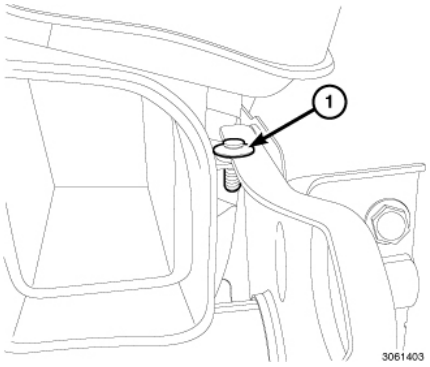
12. Remove the I/P structure to HVAC housing bolt (1) located on the left side of the HVAC housing.



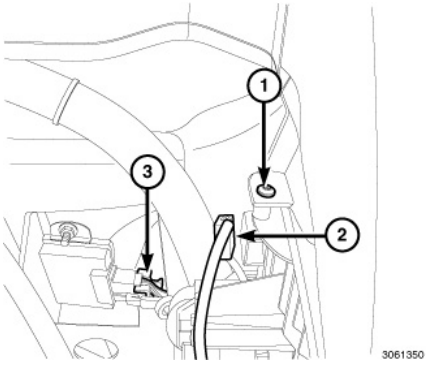
13. Remove the I/P structure to HVAC housing bolts (1) located in the center of the structure.



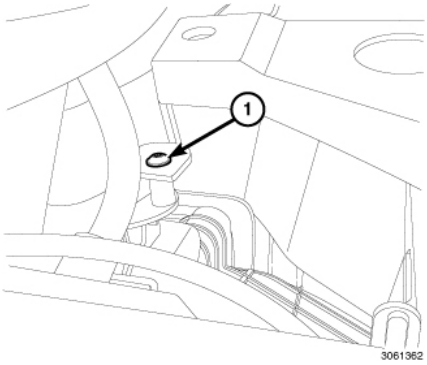
14. Remove the fastener (1) securing the outboard HVAC duct to the I/P structure/support.



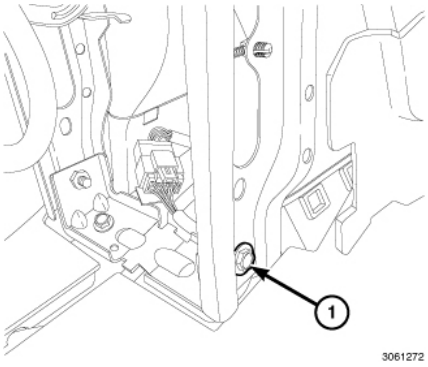
15. Remove the fastener (1) securing the duct to the HVAC housing near the center bezel area on the LH side.



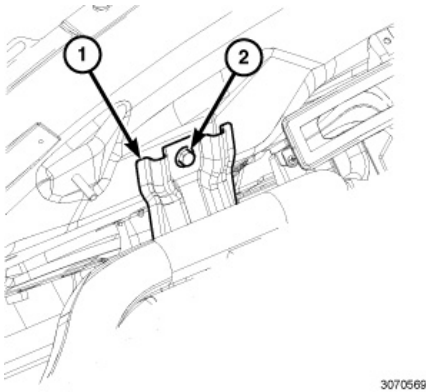
16. Remove the fastener (1) securing the duct to the HVAC housing near the center bezel area on the RH side.



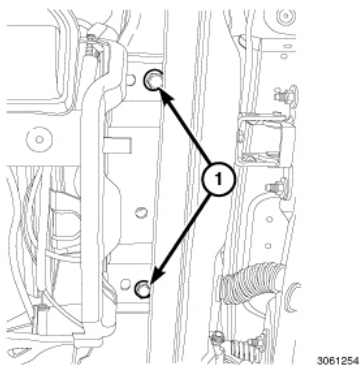
17. Remove the fastener (1) securing the I/P structure to the center floor bracket. Repeat on the opposite side.



18. Remove the two fence bolts (2) securing the upper brackets (1).



19. Remove the two bolts (1) securing the I/P structure side to the vehicle. Repeat for the opposite side.



20. With the help of an assistant, lift the I/P structure (1) and upper HVAC ductwork up and rearward.

21. Remove the I/P structure (1) from the vehicle. If necessary, separate the ductwork from the structure.

INSTALLATION

Labor Operations: Click to display a list of Labor Operations associated with this procedure

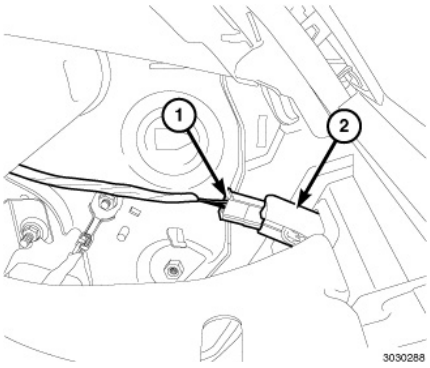
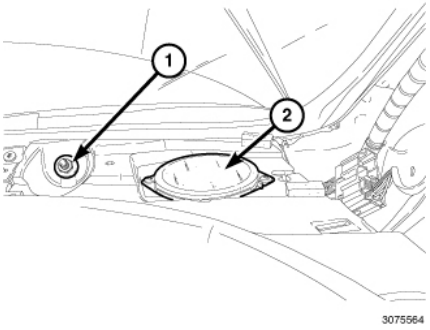
1. With the help of an assistant, position the instrument panel pad near the structure.
2. Connect the pin switch harness connectors (1, 2) located behind the upper right corner of the glove box cavity.

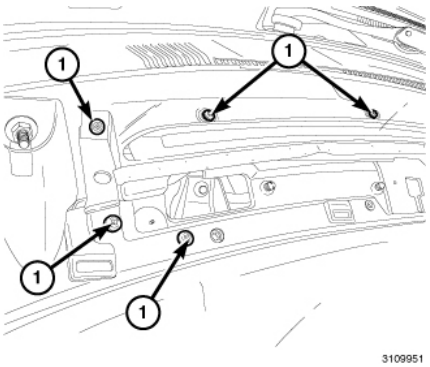


CAUTION: **Make sure that wiring harnesses are routed to the appropriate opening and are not pinched.**

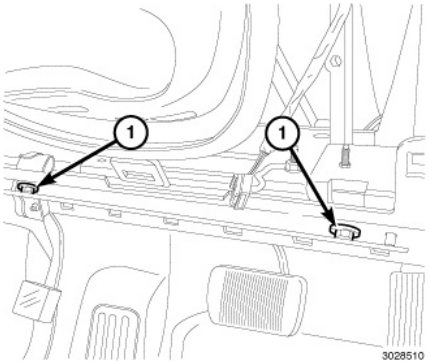
3. Continue to align and position the I/P pad onto the structure.
4. Lower the PAB studs into the bracket located on the structure. Make sure there is no interference between the bracket (2) and the PAB.
5. Install the I/P cover over the tab located on the side by pulling the side of the cover out and forward. Repeat on the opposite side.



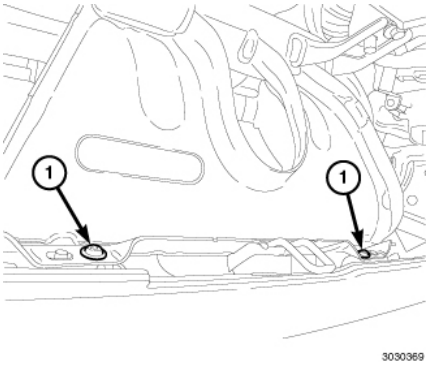
6. Push forward on the I/P cover to engage the snap retainers located around the glove box cavity and lower steering column area.
7. Install the I/P pad fence nut (1) located across the top of the pad near the windshield. Tighten the nuts securely. Repeat for the opposite side.
8. Connect and install the I/P speakers (2), (Refer to 08 - Electrical/8A - Audio and Video/SPEAKER - Installation) .
9. Install the nine I/P cover to defroster duct center trim panel fence screws (1). Tighten the screws securely.



10. Install the two I/P pad to structure bolts (1) located below the steering column. Tighten the bolts securely.



NOTE: View shown is looking from under the glove box opening.

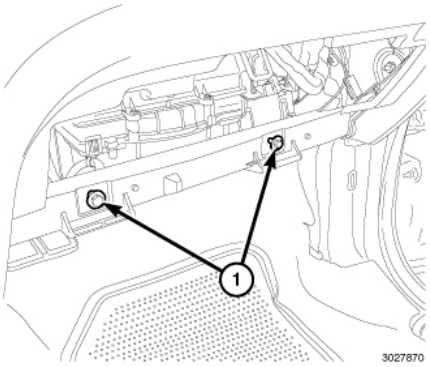


11. Install the I/P pad to structure fasteners (1) located near the glove box striker just under the top of the glove box opening. Tighten the fasteners securely.

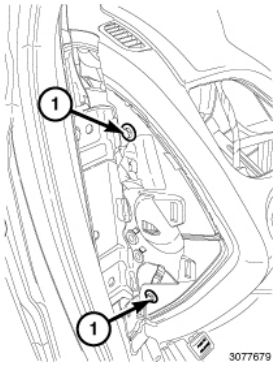
12. Install the fasteners securing the PAB to the structure, (Refer to 10 - Restraints/AIR BAG, Passenger - Installation) .

13. Connect the squib connectors to the passenger side airbag.

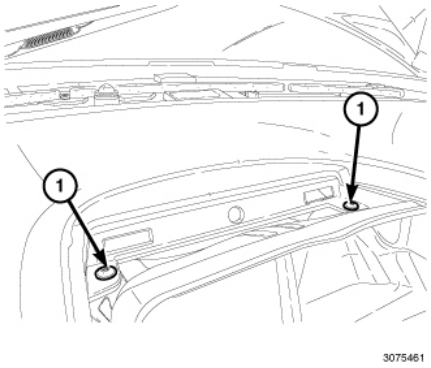
14. Install the I/P pad to structure bolts (1) located on the lower edge of the glove box opening. Tighten the bolts securely.



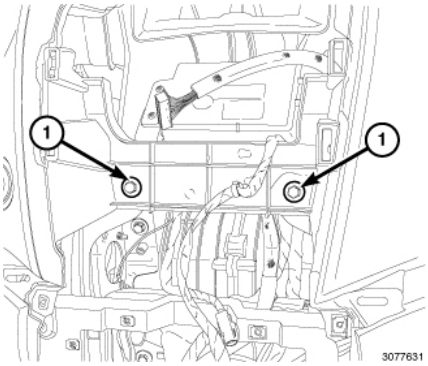
15. Install the two I/P pad to structure bolts (1) located on the side. Tighten the bolts securely. Repeat on the opposite side.



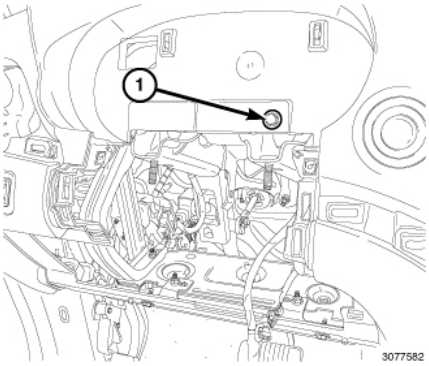
16. Install the two screws located at the top of center stack. Tighten the screws securely.



17. Install the I/P pad to structure bolts (1) located in the middle of the center stack cavity. Tighten the bolts securely.

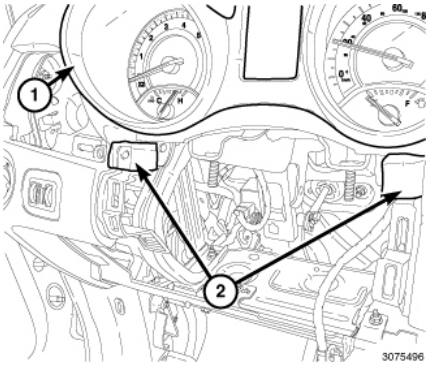


18. Tighten the I/P pad to structure bolt (1) located in the instrument cluster cavity. Tighten the bolt securely.



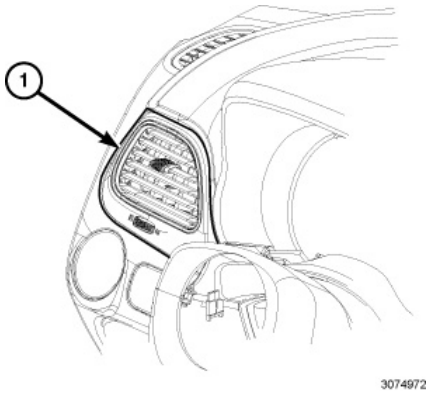
19. Install the instrument cluster (1), (Refer to 08 - Electrical/8J - Instrument Cluster - Installation) .

20. Attach the foam blocks (2) located just below the instrument cluster (1).



21. Access and connect the headlamp/dimmer switch harness connectors through the outlet vent/trim opening.

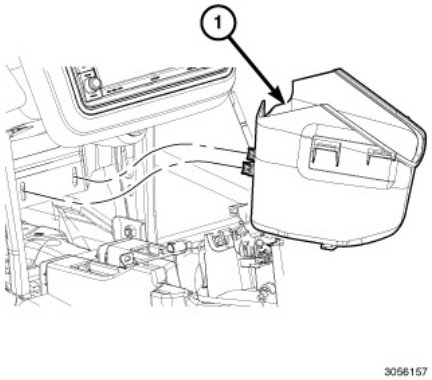
22. Install the instrument panel outlet vent/trim (1), (Refer to 24 - Heating and Air Conditioning/Distribution/OUTLET, Air - Installation) .



23. Connect the lower I/P courtesy lamp/LED, (Refer to 08 - Electrical/8L - Lamps and Lighting/Lamps/Lighting - Interior/LAMP, Courtesy - Installation) .

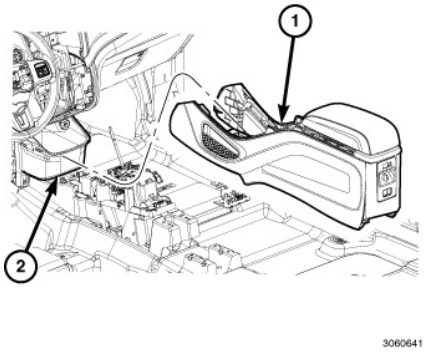
24. Connect and attach the 12V power outlet harness.

25. Install and connect the storage bin (1) from the instrument panel.

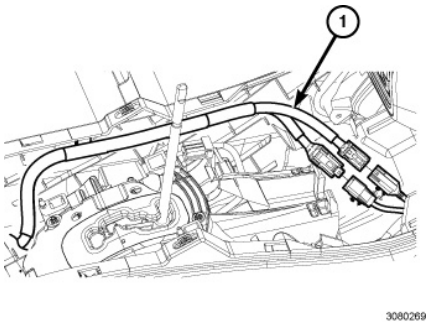


26. Position the floor console (1) into the vehicle.

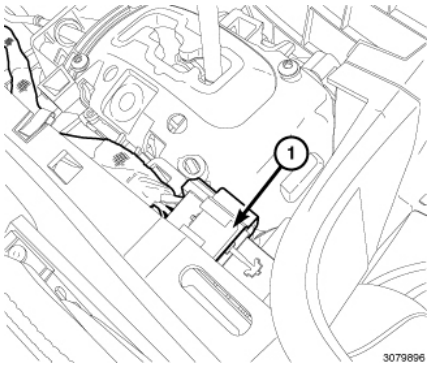
27. Engage the floor console (1) front snap retainers into the lower storage bin (2).



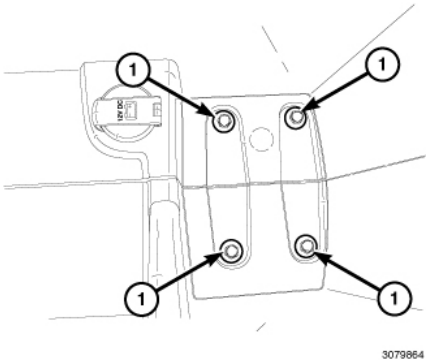
28. Connect the auxiliary/USB harness (1) located forward of the shifter.



29. Disconnect the vehicle harness (1) located near the shifter.



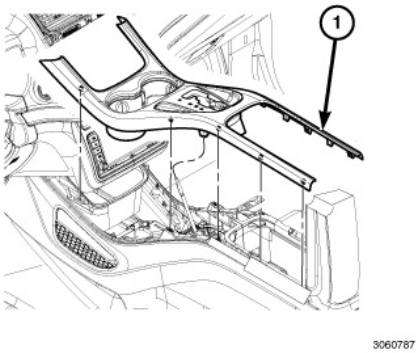
30. Install the four bolts (1) located in the console storage bin. Tighten the bolts securely.



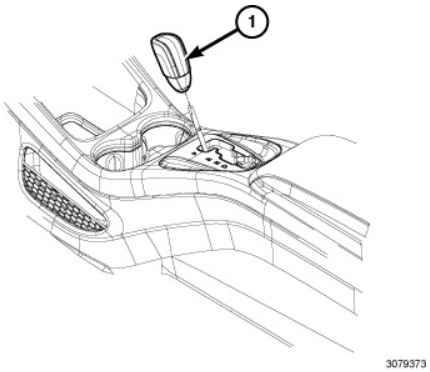
31. Connect and install the shifter bezel (1). Make sure all snap retainers are properly seated.

32. Install the bin liner and coin holder inside the console bin.

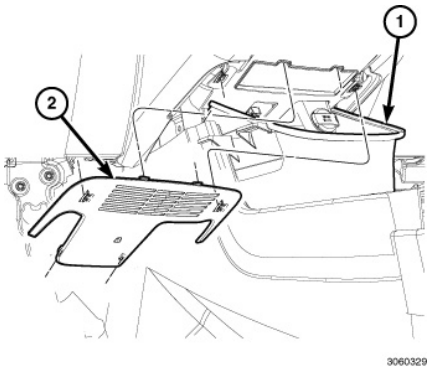
33. Close the console lid.



34. Install the shifter knob (1).

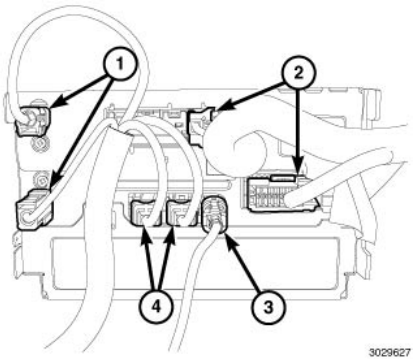


35. Install the gap hider trim panel (2) located above the front storage bin (1). Make sure all snap retainers are properly seated.

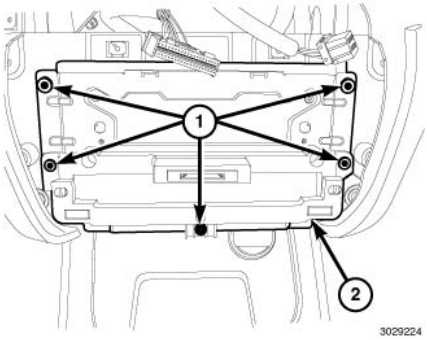


36. Connect the antenna(s) (2), RF HUB and UCI cables (4), video cable (3) and wiring connectors (2) to the Telematics Gateway Module (TGW).

37. Position the TGW into the mounting location.



38. Install the retainers (1) to the TGW.

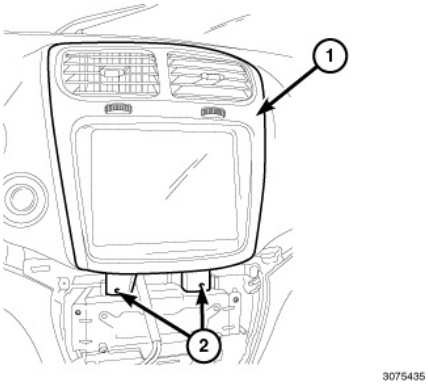


CAUTION: **Do not disconnect/connect the ICSS/switch bank without referring to the appropriate procedure. The harness connector is very fragile and could be damaged if not properly removed/installed.**

39. Connect the integrated center stack screen, (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, Integrated Center Stack Screen - Installation) .

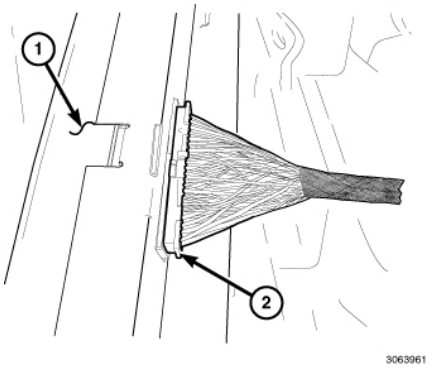
40. Align and push forward to engage the snap retainers securing the center trim bezel (1) to the I/P.

41. Install the two fasteners (2) securing the center trim bezel (1) to the I/P.



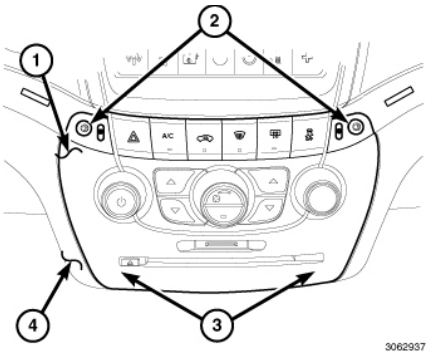
42. Position the switch-bank assembly in place.

43. Connect the electrical connector (2) to the back of the switch-bank assembly (1).

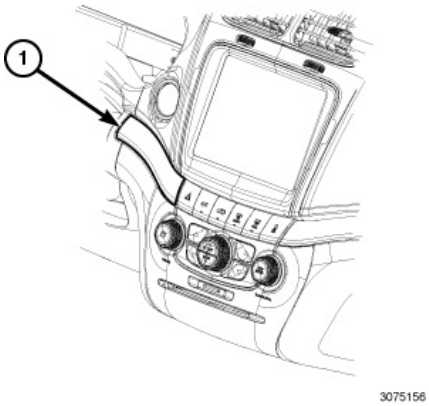


44. Position the switch-bank in the I/P and press evenly the engage the two lower clips (3).

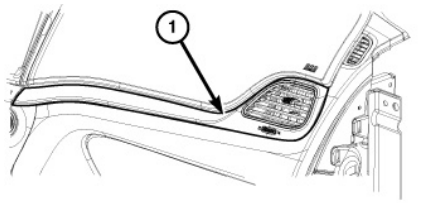
45. Install, and tighten the two screws (2) that secure the switch-bank (1) to the I/P (4).



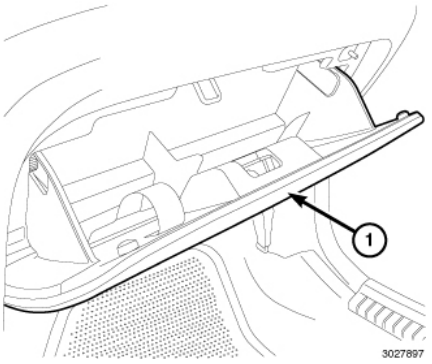
46. Install the instrument panel trim (1) located left of the center stack bezel.



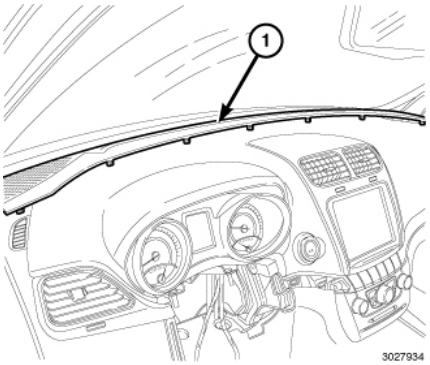
47. Install the instrument panel outlet vent/trim (1), (Refer to 24 - Heating and Air Conditioning/Distribution/OUTLET, Air - Installation) .



48. Install the glove box (1) .



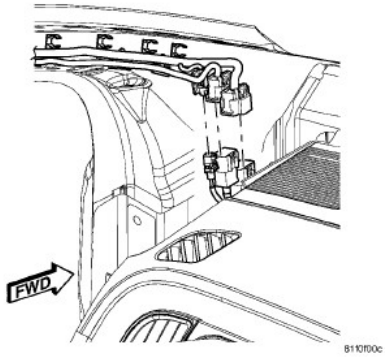
49. Position and install the defroster grille (1) from the instrument panel. Make sure all the snap retainers are properly seated.



NOTE: Left side shown. Right side similar.

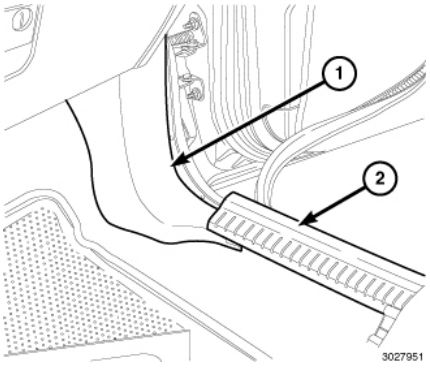
50. Connect the electrical connectors located at the left and right A-pillar.

51. Install the A-pillar trim panels, (Refer to 23 - Body/Interior/PANEL, A-Pillar Trim - Installation) .



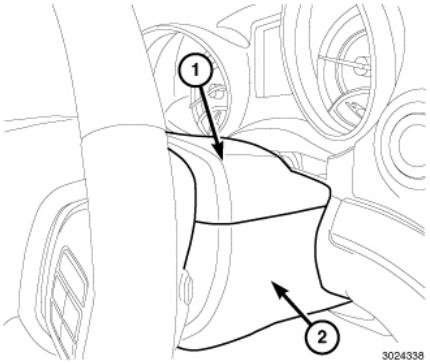
52. Install the lower cowl panel (1).

53. Install the door scuff plate (2).

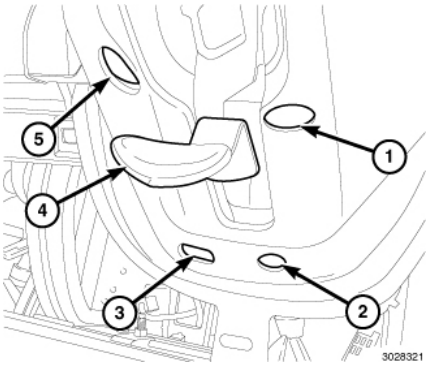


54. Install the steering column as an assembly, (Refer to 19 - Steering/Column - Installation) .

55. Install the upper and lower steering column shrouds (1, 2).

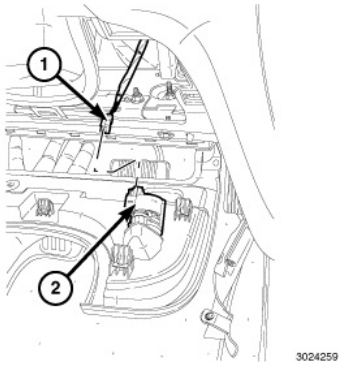


56. Install the fasteners (1, 2, 5) securing the lower and upper steering column shrouds. Tighten the fasteners securely.

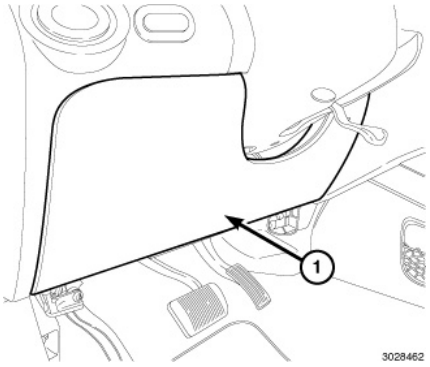


57. If equipped, install the knee blocker airbag, (Refer to 10 - Restraints/AIR BAG, Knee Blocker - Installation) .

58. Position the lower steering column and connect the harness (1) to the aspirator (2).

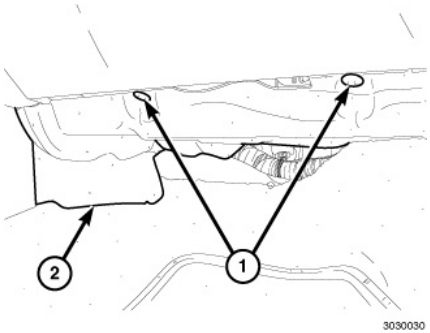


59. Install the lower steering column panel (1). Make sure all snap retainers are properly seated.



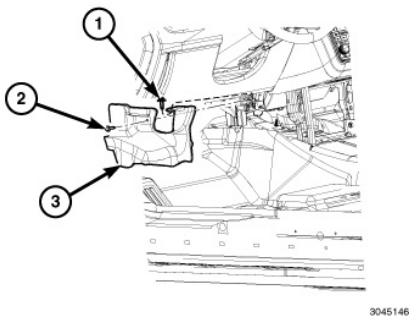
60. Position the hush/silencer panel (2).

61. Install the fasteners (1) from the hush/silencer panel (2) located under the glove box area.



62. Position the close out panel (3).

63. Install the fasteners (1, 2) to the close out panel (3) located under the left hand side of the instrument panel.



NOTE: LHD model shown in illustrations. RHD model similar.

64. Install the instrument panel end cap. Repeat on opposite side.

65. Connect the negative battery cable.
